## DESCRIPTION

The LTC<sup>®</sup>2051 is a dual zero-drift operational amplifier available in the MS8 and SO-8 packages. It operates from a single 2.7V supply while still supporting  $\pm 5\text{V}$  applications. The power consumption is  $750\mu\text{A}$  per op amp.

The LTC2051, despite its miniature size, features uncompromising DC performance. The typical input offset voltage and offset drift are  $0.5\mu\text{V}$  and  $10\text{nV}/^\circ\text{C}$ . The almost zero DC offset and drift are supported with a power supply rejection ratio (PSRR) and common mode rejection ratio (CMRR) of more than 130dB.

The input common mode voltage ranges from the negative supply up to 1V from the positive supply. The LTC2051 also has an enhanced output stage capable of driving loads as low as  $1\text{k}\Omega$  to both supply rails. The open-loop gain, loaded with  $1\text{k}\Omega$ , is in excess of 140dB. The LTC2051 also features a  $1.5\mu\text{V}_{\text{P-P}}$  DC to 10Hz noise and a 3MHz gain bandwidth product.

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

**Note 2:** These parameters are guaranteed by design. Thermocouple effects preclude measurements of these voltage levels during automated testing.

**Note 3:** The LTC2051C, LTC2051HVC is guaranteed to meet specified performance from  $0^\circ\text{C}$  to  $70^\circ\text{C}$  and is designed, characterized and expected to meet these extended temperature limits, but is not tested at  $-40^\circ\text{C}$  and  $85^\circ\text{C}$ . The LTC2051I, LTC2051HVI is guaranteed to meet the extended temperature limits.
