

MAX13053A MAX13054A

+5V, 2Mbps CAN Transceiver with $\pm 65V$ Fault Protection, $\pm 25V$ CMR, and $\pm 25kV$ ESD

General Description

The MAX13053A and MAX13054A are +5V CAN (Control Area Network) transceivers with integrated protection for industrial applications. These devices have extended $\pm 65V$ fault protection for equipment where overvoltage protection is required. It also incorporates high $\pm 25kV$ ESD HBM and an input common mode range (CMR) of $\pm 25V$, exceeding the ISO11898 specification of $-2V$ to $+7V$. This makes these parts well suited for applications that are in electrically noisy environments, where the ground planes are shifting relative to each other. This family features a variety of options to address common CAN application requirements; logic-level supply input V_L for interfacing with 1.62V to 5.5V logic, low-current standby mode, silent-mode to disable the transmitter, and a slow slew rate to minimize EMI.

These devices operate at a high-speed CAN data rate, allowing up to 2Mbps on small networks. Maximum speed on large networks may be limited by the number of nodes in a network, type of cabling, stub length, and other factors. These transceivers include a dominant timeout to prevent bus lockup caused by controller error or by a fault on the TXD input. When TXD remains in the dominant state (low) for longer than T_{DOM} , the driver is switched to the recessive state, releasing the bus. The MAX13053A features a S pin where it enables and disables the transmitter for applications where you need the transceiver to receive only. The MAX13054A features a STBY pin for 3 modes of operation; standby mode for low current consumption, normal high speed mode, or a slow slew rate mode when an external $26.1k\Omega$ is connected between ground and STBY pin.

The MAX13053A and MAX13054A are available in a standard 8-pin SOIC package, and operate over the $-40^\circ C$ to $+125^\circ C$ temperature range.

Applications

- Programmable Logic Controller
- Industrial Automation
- Building Automation
- Instrumentation
- Smart Grid Equipment
- Drone
- Motor Control

Benefits and Features

- Integrated Protection Increases Robustness
 - $\pm 65V$ Fault Tolerant CANH and CANL
 - $\pm 25kV$ ESD HBM (Human Body Model)
 - $\pm 25V$ Extended Common Mode Input Range (CMR)
 - Transmitter Dominant Timeout Prevents Lockup
 - Short-Circuit Protection
 - Thermal Shutdown
- Family Provides Flexible Design Options
 - Slow Slew Rate to Minimize EMI
 - Silent Mode S Disables Transmitter
 - STBY Input for Low-Current Mode
 - 1.62V to 5.5V Logic-Supply (V_L) Range
- High-Speed Operation of Up to 2Mbps
- Operating Temperature Range of $-40^\circ C$ to $+125^\circ C$ in 8-pin SOIC Package

Ordering Information appears at end of data sheet.

Absolute Maximum Ratings

V _{DD}	-0.3V to +6V	Multilayer Board
CANH or CANL (Continuous).....	-65V to +65V	(T _A = +70°C, derate 7.6mW/°C above +70°C.).....
TXD, STBY, S.....	-0.3V to +6V	606.1mW
RXD.....	-0.3V to (V _L + 0.3)V	Operating Temperature Range.....
V _L	-0.3V to (V _{DD} + 0.5V)	-40°C to 125°C
Short-Circuit Duration.....	Continuous	Junction Temperature.....
Continuous Power Dissipation		+150°C
Single-Layer Board		Storage Temperature Range.....
(T _A = +70°C, derate 5.9mW/°C above +70°C.).....		-60°C to +150°C
		Soldering Temperature (reflow).....
		+260°C
		Lead Temperature (soldering, 10sec).....
		+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Information

8 SOIC

PACKAGE CODE	S8+4
Outline Number	21-0041
Land Pattern Number	90-0096
THERMAL RESISTANCE, SINGLE-LAYER BOARD:	
Junction to Ambient (θ _{JA})	170
Junction to Case (θ _{JC})	40
THERMAL RESISTANCE, FOUR-LAYER BOARD:	
Junction to Ambient (θ _{JA})	132
Junction to Case (θ _{JC})	38

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Fault Protection, ±25V CMR, and ±25kV ESD

Pin Configurations

MAX13053A

MAX13054A

Pin Description

PIN		NAME	FUNCTION
MAX13053A	MAX13054A		
1	1	TXD	Transmit Data Input. Drive TXD high to set the driver in the recessive state. Drive TXD low to set the driver in the dominant state. TXD has an internal pullup to V_L .
2	2	GND	Ground
3	3	V_{DD}	Supply Voltage. Bypass V_{DD} to GND with a 0.1 μ F capacitor.
4	4	RXD	Receive Data Output. RXD is high when CANH and CANL are in the recessive state. RXD is low when CANH and CANL are in the dominant state. RXD is referenced to V_L .
5	5	V_L	Logic-Level Voltage Supply Input. Bypass V_L to GND with a 0.1 μ F capacitor as close to the device as possible.
6	6	CANL	CAN Bus-Line Low
7	7	CANH	CAN Bus-Line High
—	8	STBY	Standby Mode. A logic-high on the STBY pin selects the standby mode. In standby mode, the transceiver is not able to transmit data and the receiver is in low power mode. A logic-low on STBY pin puts the transceiver in normal operating mode. A 26.1k Ω external resistor can be used to connect the STBY pin to ground for the slow slew rate.
8	—	S	Silent-Mode Input. Drive S low to enable TXD and to operate in high-speed mode. Drive S high to disable the transmitter. The receiver is active in normal operating mode.

MAX13053A MAX13054A

+5V, 2Mbps CAN Transceiver with ±65V Fault Protection, ±25V CMR, and ±25kV ESD

Detailed Description

The MAX13053A and MAX13054A are a family of fault protected CAN transceivers designed for harsh industrial applications with a number of integrated robust protection feature set. These devices provide a link between the CAN protocol controller and the physical wires of the bus lines in a control area network (CAN). They can be used for DeviceNet applications as well.

The two CAN transceivers are fault protected up to ±65V, making it suitable for applications where overvoltage protection is required. These devices are rated up to a high ±25kV ESD of HBM (human body model), suitable for protection during the manufacturing process, and even in the field where there is human interface for installation and maintenance. In addition, a common mode voltage of ±25V enables communication in noisy environments where there are ground plane differences between different systems due to close proximity of heavy equipment machinery or operation from different transformers. The devices' dominant timeout prevents the bus from being blocked by a hung-up microcontroller, and the outputs CANH and CANL are short-circuit, current-limited, and are protected against excessive power dissipation by thermal shutdown circuitry that places the driver outputs in a high-impedance state.

Both devices can operate up to 2Mbps, while the MAX13054A has an option to slow the slew rate to 8V/μs to minimize EMI, enabling the use of unshielded-twisted or parallel cable. The MAX13054A features a standby mode where it shuts off the transmitter and reduces the current to 45μA typical. These CAN transceivers have a V_L pin where an integrated logic level translator enable it to interface with low voltage microcontrollers down to 1.8V ±10%.

±65V Fault Protection

These devices feature ±65V of fault protection. CANH and CANL data lines are capable of withstanding a short from -65V to +65V. This extended overvoltage range makes it

suitable for applications where accidental shorts to power supply lines are possible due to human intervention.

Transmitter

The transmitter converts a single-ended input signal (TXD) from the local CAN controller to differential outputs for the bus lines CANH and CANL. The truth table for the transmitter and receiver is provided in [Table 1](#).

Transmitter Output Protection

The MAX13053A and MAX13054A protect the transmitter output stage against a short-circuit to a positive or negative voltage by limiting the driver current. Thermal shutdown further protects the devices from excessive temperatures that may result from a short or high ambient temperature. The transmitter returns to normal operation once the temperature is lowered below the threshold.

Transmitter-Dominant Timeout

The devices feature a transmitter dominant timeout (t_{DOM}) that prevents erroneous CAN controllers from clamping the bus to a dominant level by maintaining a continuous low TXD signal. When TXD remains in the dominant state (low) for greater than 2.5ms typical t_{DOM} , the transmitter is disabled, releasing the bus to a recessive state ([Figure 4](#)). After a dominant timeout fault, the transmitter is re-enabled when receiving a rising edge at TXD. The transmitter dominant timeout limits the minimum possible data rate to 9kbps for standard CAN protocol.

Receiver

The receiver reads the differential input from the bus line CANH and CANL and transfers this data as a single-ended output RXD to the CAN controller. It consists of a comparator that senses the difference $V_{DIFF} = (CANH - CANL)$, with respect to an internal threshold of 0.7V. If $V_{DIFF} > 0.9V$, a logic-low is present on RXD. If $V_{DIFF} < 0.5V$, a logic-high is present. The CANH and CANL common-mode range is ±25V. RXD is a logic-high when CANH and CANL are shorted or terminated and undriven.

Table 1. Transmitter and Receiver Truth Table (When Not Connected to the Bus)

STBY	TXD	TXD LOW TIME	CANH	CANL	BUS STATE	RXD
LOW	LOW	$< t_{DOM}$	HIGH	LOW	DOMINANT	LOW
LOW	LOW	$> t_{DOM}$	$V_{DD}/2$	$V_{DD}/2$	RECESSIVE	HIGH
LOW	HIGH	X	$V_{DD}/2$	$V_{DD}/2$	RECESSIVE	HIGH

X = Don't care

MAX13053A MAX13054A

+5V, 2Mbps CAN Transceiver with $\pm 65V$ Fault Protection, $\pm 25V$ CMR, and $\pm 25kV$ ESD

Standby Mode (MAX13054A)

Drive STBY pin high for standby mode, which switches the transmitter off and the receiver to a low current and low-speed state. The supply current is reduced during standby mode. The bus line is monitored by a low differential comparator to detect and recognize a wakeup event on the bus line. Once the comparator detects a dominant bus level greater than $2.5\mu s$ typical t_{WAKE} , RXD pulls low. Drive the STBY low for normal operation.

Slow Slew Rate (MAX13054A)

Connect a $26.1k\Omega$ resistor between ground and the STBY pin. The STBY pin voltage should be between $0.1V$ to $0.6V$ to remain in slow slew rate. This will change the MAX13054A with a slow slew rate of $8V/\mu s$ for rising edge compared with normal mode at $180V/\mu s$. For falling edge, the slow slew rate is $20V/\mu s$ compared with normal mode at $140V/\mu s$.

Silent Mode (MAX13053A)

Drive S high to place the MAX13053A in silent mode. This disables the transmitter regardless of the voltage level at TXD. However, RXD is still active and monitors activity on the bus line.

Logic Compatibility

A separate input V_L allows the MAX13053A and MAX13054A to communicate with logic systems down to $1.62V$ while operating up to a $+5.5V$ supply. This provides a reduced input voltage threshold to the TXD, STBY, and S inputs, and provides a logic-high output at RXD compatible with the microcontroller's supply rail. The logic compatibility eliminates an external logic level translator and longer propagation delay due to level shifting. Connect V_L to V_{DD} to operate with $+5V$ logic systems.

Applications Information

Reduced EMI and Reflections

In multidrop CAN applications, it is important to maintain a single linear bus of uniform impedance that is properly terminated at each end. A star, ring or tree configuration should never be used. Any deviation from the end-to-end wiring scheme creates a stub. High-speed data edges on a stub can create reflections back down to the bus. These reflections can cause data errors by eroding the noise margin of the system.

Although stubs are unavoidable in a multidrop system, care should be taken to keep these stubs as short as possible, especially when operating with high data rates.
