

**STRUCTURE** Silicon Monolithic Integrated Circuit

**TYPE** Three-Terminal Regulator

**PRODUCT SERIES** **BA178XXFP**

**FEATURE** Output current up to 1A

○**Absolute Maximum Rating** (Ta=25°C)

Parameter	Symbol	Limit	Unit
Input Voltage	Vin	35	V
Power Dissipation 1	Pd1	1 <sup>*1</sup>	W
Power Dissipation 2	Pd2	10 <sup>*2</sup>	W
Output Current	Iout	1 <sup>*3</sup>	A
Operating Temperature Range	Topr	-40～+85	°C
Storage Temperature Range	Tstg	-55～+150	°C
Maximum Junction Temperature	Tjmax	150	°C

\*<sup>1</sup> Derating in done 8mW/°C for temperatures above Ta=25°C.

\*<sup>2</sup> Derating in done 80mW/°C for temperatures above Ta=25°C, Mounted on 50mm×50mm×2.0mm Alminium heat sink

\*<sup>3</sup> Pd, ASO should not be exceeded.

○**Recommended Operating Conditions** (Ta=-40～+85°C)

Parameter	Symbol	Type	Min	Max	Unit
Input Voltage	Vin	BA17805FP	7.5	25	V
		BA17806FP	8.5	21	
		BA17807FP	9.5	22	
		BA17808FP	10.5	23

## ○ NOTES FOR USE

- (1) Absolute maximum range  
We are careful enough for quality control about this IC. So, there is no problem under normal operation, excluding that it exceeds the absolute maximum ratings. However, Absolute Maximum Ratings are those values beyond which the life of a device may be destroyed we cannot be defined the failure mode, such as short mode or open mode. Therefore physical security countermeasure, like fuse, is to be given when a specific mode to be beyond absolute maximum ratings is considered.
- (2) Ground voltage  
Make setting of the potential of the GND terminal so that it will be maintained at the minimum in any operating state. Furthermore, check to be sure no terminals are at a potential lower than the GND voltage including an actual electric transient.
- (3) Thermal design  
When you do the kind of use which exceeds Pd, It may be happened to deteriorating IC original quality such as decrease of electric current ability with chip temperature rise. Do not exceed the power dissipation (Pd) of the package specification rating under actual operation, and please design enough temperature margins.
- (4) Short circuit mode between terminals and wrong mounting  
Do not mount the IC in the wrong direction and be careful about the reverse-connection of the power connector. Moreover, this IC might be destroyed when the dust short the terminals between them or GND.
- (5) Operation in the strong electromagnetic field  
Malfunction may be happened when the device is used in the strong electromagnetic field.
- (6) ASO  
Do not exceed the maximum ASO and the absolute maximum ratings of the output transistor.
- (7) Thermal shutdown circuit  
The thermal shutdown circuit (TSD circuit) is built in this product. When IC chip temperature become higher, the thermal shutdown circuit operates and turns output off. The thermal shutdown circuit, which is aimed at isolating the LSI from thermal runaway as much as possible, is not aimed at the protection or guarantee of the LSI. Therefore, do not continuously use the LSI with this circuit operating or use the LSI assuming its operation.
- (8) GND wiring pattern  
Use separate ground lines for control signals and high current power driver outputs. Because these high current outputs that flows to the wire impedance changes the GND voltage for control signal. Therefore, each ground terminal of IC must be connected at the one point on the set circuit board. As for GND of external parts, it is similar to the above-mentioned.
- (9) Internal circuits could be damaged if there are modes in which the electric potential of the application's input and GND are the opposite of the electric potential of the various outputs. Use of a diode or other such bypass is recommended.
- (10) We recommend to put Diode for protection purpose in case of output pin connected with large load of impedance or reserve current occurred at initial and output off.
