NTE7442 Integrated Circuit TTL – 4–Line–to–10–Line BDC–to–Decimal Decoder

Description:

The NTE7442 is a monolithic BCD-to-Decimal decoder in a 16-Lead plastic DIP type package that consists of eight inverters and ten four-input NAND gates. The inverters are connected in pairs to make BCD input data available for decoding by the NAND gates. Full decoding of valid input logic ensures that all outputs remain off for all invalid input conditions.

The NTE7442 BCD-to-Decimal decoder features inputs and outputs that are compatible with most TTL and other saturated low-level logic circuits. DC noise margins are typically one volt.

Features:

- All Outputs are High for Invalid Input Conditions
- Diode-Clamped Inputs
- Also for Application as:
 - 4-Line-to-16-Line Decoder
 - 3-Line-to-8-Line Decoder

Absolute Maximum Ratings: (Note 1)

Note 4. Not more than one output should be shorted at a time.

Note 5. I_{CC} is measured with all outputs open and inputs grounded.

Switching Characteristics: ($V_{CC} = 5\text{V}, T_A = +25^\circ\text{C}$ unless otherwise specified)
