

Title	<i>Reference Design Report for a 12 W Power Supply Using TinySwitch™-4 TNY288PG</i>
Specification	85 VAC – 265 VAC Input, 12 V, 1 A Output
Application	TinySwitch-4 Reference Design
Author	Applications Engineering Department
Document Number	RDR-399
Date	October 9, 2015
Revision	1.2

Summary and Features

- EcoSmart™ – meets all existing and proposed energy efficiency standards including U.S. DOE EISA2007 (Level VI) and European Commission Code of Conduct (Version 5)
 - No-load consumption <140 mW at 265 VAC (no bias winding required)
 - >83% average active-mode efficiency
- BP/M capacitor value selects power MOSFET current limit for greater design flexibility
- Output overvoltage protection (OVP) using primary bias winding sensed shutdown feature
- Tightly toleranced I^2t parameter (-10%, +12%) reduces system cost
 - Increases MOSFET and magnetics power delivery
 - Reduces overload power, which lowers output diode and capacitor costs
- Integrated TinySwitch-4 Safety/Reliability features
 - Accurate ($\pm 5\%$), auto-recovering, hysteretic thermal shutdown function maintains safe PCB temperatures under all conditions
 - Auto-restart protects against output short-circuit and open loop fault conditions
 - >3.2 mm creepage on package enables reliable operation in high humidity and high pollution environments
- Meets EN550022 and CISPR-22 Class B conducted EMI with >12 dB μ V margin
- Meets IEC61000-4-5 Class 3 AC line surge

The products and applications illustrated herein (including circuits external to the products and transformer construction) may be covered by one or more U.S. and foreign patents or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at www.powerint.com.

Important Note:

Although this board was designed to satisfy safety isolation requirements, it has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the power supply.

1 Introduction

This report describes a universal input, 12 V, 1 A flyback power supply using a TNY288PG device from the TinySwitch-4 family of ICs. It contains the complete specification of the power supply, a detailed circuit diagram, the entire bill of materials required to build the supply, extensive documentation of the power transformer, along with test data and oscillographs of the most important electrical waveforms. The board provides a number of user configurable options which are designed to demonstrate the features and flexibility of the TinySwitch-4 family. These include easy adjustment of the device current limit for increased output power or higher efficiency operation, and a latched output overvoltage shutdown.

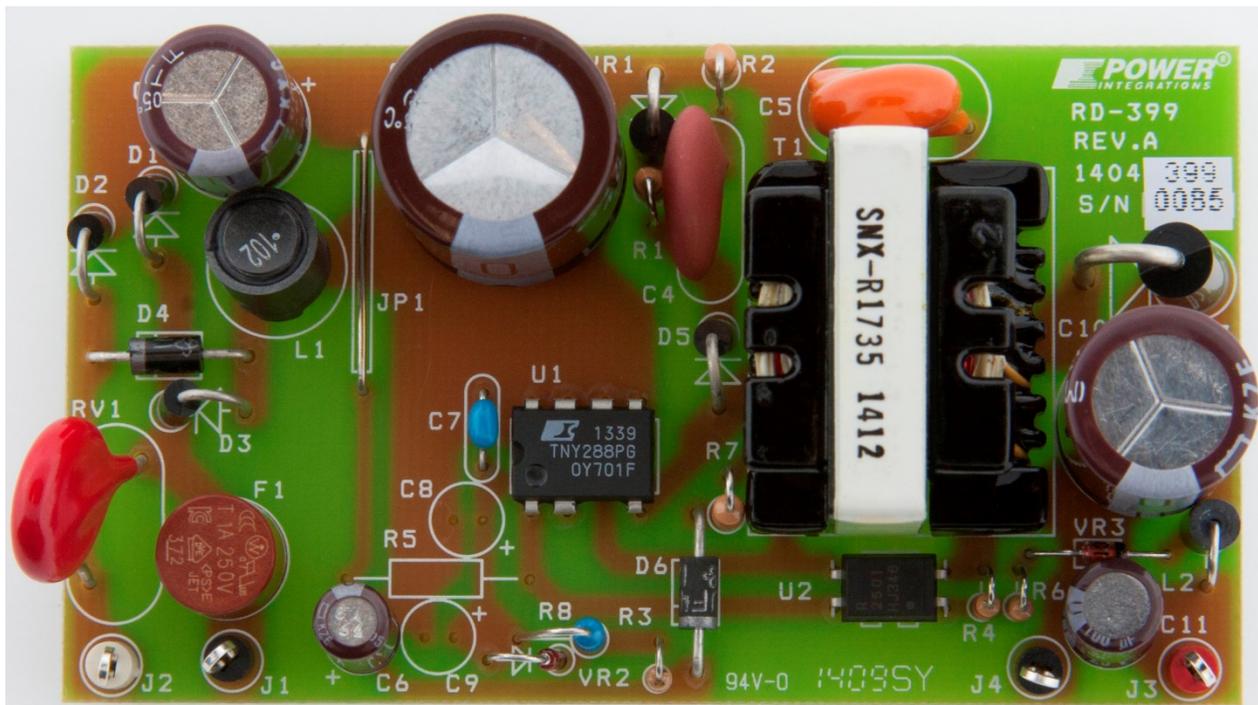

Figure 1 – RD-399 Populated Circuit Board Photograph.

2 Power Supply Specification

The table below represents the minimum acceptable performance of the design. Actual performance is listed in the results section.

Description	Symbol	Min	Typ	Max	Units	Comment
Input						
Voltage	V_{IN}	85		265	VAC	2 Wire – no P.E. w/o UVLO resistor or bias winding With bias winding support
Frequency	f_{LINE}	47	50/60	64	Hz	
No-load Input Power (230 VAC)				0.15	W	
No-load Input Power (230 VAC)				0.025	W	
Output						
Output Voltage	V_{OUT}	11	12	13	V	± 8% 20 MHz bandwidth
Output Ripple Voltage	V_{RIPPLE}			100	mV	
Output Current	I_{OUT}	1			A	
Total Output Power						
Continuous Output Power	P_{OUT}	12			W	With bias sense
Overvoltage Shutdown	V_{OV}	15		18	V	
Efficiency						
Full Load	η	84			%	Measured at P_{OUT} 25 °C Per DOE EISA2007 (Level VI) with TNY278 & standard current limit
Required average efficiency at 25, 50, 75 and 100 % of P_{OUT}	η_{DOE}	83			%	
Environmental						
Conducted EMI		Meets CISPR22B / EN55022B				
Safety		Designed to meet IEC950, UL1950 Class II				
Surge (Differential)		1			kV	1.2/50 μ s surge, IEC 1000-4-5, Series Impedance: Differential Mode: 2 Ω Common Mode: 12 Ω
Surge (Common mode)		2			kV	
Ambient Temperature	T_{AMB}	0		50	°C	Free convection, sea level

3 Schematic

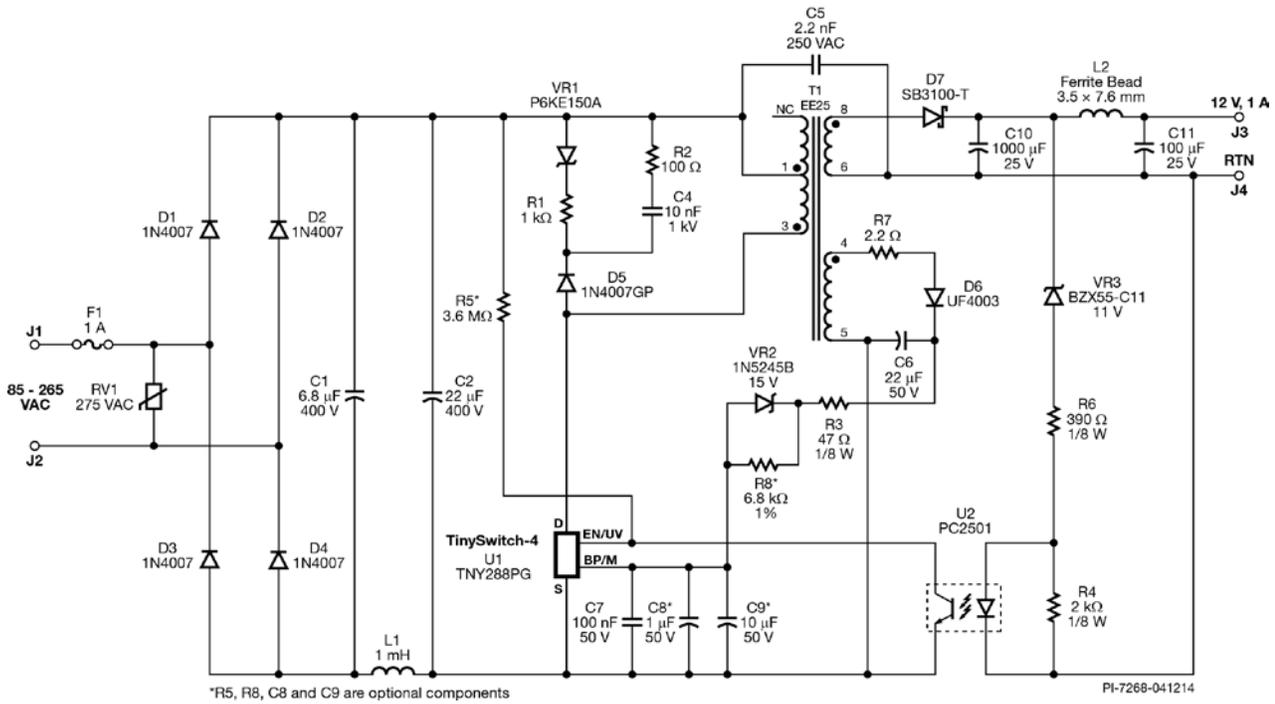

Figure 2 – Schematic.

4 Circuit Description

This circuit is configured as a flyback topology power supply utilizing the TNY288PG. Secondary side constant voltage (CV) regulation is accomplished through optocoupler feedback with a Zener reference.

4.1 Input Rectification and Filtering

The AC input voltage is rectified by input bridge D1 – D4. The rectified DC is then filtered by the bulk storage capacitors C1 and C2. Inductor L1, C1 and C2 form an input pi filter, which attenuates differential mode conducted EMI.

4.2 TNY288PG Operation

The TNY288PG device U1 integrates the power switching device, oscillator, control, startup, and protection functions.

The rectified and filtered input voltage is applied to the primary winding of T1. One side of the power transformer (T1) primary winding is connected to the positive leg of C2, and the other side is connected to the DRAIN (D) pin of U1. At the start of a switching cycle, the controller turns the power MOSFET on and current ramps up in the primary winding, delivering energy from bulk capacitor to transformer. When that current reaches the limit threshold, the controller turns the power MOSFET off. Due to the phasing of the transformer windings and the orientation of the output diode, the stored energy is delivered to the output capacitor during flyback time.

When the power MOSFET turns off, the leakage inductance of the transformer induces a voltage spike on the drain node. The amplitude of that spike is limited by an RCD clamp network that consists of D5, C4 and R2. Resistor R2 and R1 not only damp the high frequency leakage ring that occurs when the power MOSFET turns off, but also limit the reverse current through D5 when the power MOSFET turns on. This allows a slow, low-cost, glass passivated diode (with a recovery time of $\leq 2 \mu\text{s.}$) to be used for D5. The slow diode also improves conducted EMI and efficiency. Zener diode VR1 defines the lowest voltage across C4 when the average switching frequency is low, preventing the clamp becoming a significant load. This increases light load efficiency and reduces standby input power. As the current through VR1 is limited by R1 a low cost standard Zener may be used in place of the TVS type shown.

Using ON/OFF control, U1 skips switching cycles to regulate the output voltage, based on feedback to its ENABLE/UNDERVOLTAGE (EN/UV) pin. The EN/UV pin current is sampled, just prior to each switching cycle, to determine if that switching cycle should be enabled or disabled. If the EN/UV pin current is $< 115 \mu\text{A}$, the next switching cycle begins, and is terminated when the current through the MOSFET reaches the internal current limit threshold. To evenly spread switching cycles, preventing group pulsing, the EN/UV pin threshold current is modulated between $115 \mu\text{A}$ and $60 \mu\text{A}$ based on the state during the

previous cycle. An internal state machine sets the current limit to one of 4 levels appropriate for the operating conditions, ensuring that the switching frequency remains above the audible range until the transformer flux density is low enough to prevent audible noise. This practically eliminates audible noise when standard dip varnishing of the transformer is used.

4.3 Output Rectification and Filtering

Output rectification is provided by D7. Low ESR capacitor C10 achieves minimum output voltage ripple and noise in a small can size for the rated ripple current specification.

A post filter (ferrite bead L2 and C11) attenuates noise and ripple further to meet the specification.

4.4 Feedback and Output Voltage Regulation

The supply's output voltage regulation set point is set by the voltage that develops across Zener diode VR3, R6 and the LED in optocoupler U2. The value of R4 was calculated to bias VR3 to about 0.5 mA when it goes into reverse avalanche conduction. This ensures that it is operating close to its rated knee current. Resistor R6 limits the maximum current during load transients. The values of R4 and R6 can both be varied slightly to fine-tune the output regulation set point. When the output voltage rises above the set point, the LED in U2 becomes forward biased. On the primary-side, the photo-transistor of U2 turns on and draws current out of the EN/UV pin of U1. Just before the start of each switching cycle, the controller checks the EN/UV pin current. If the current flowing out of the EN/UV pin is greater than 115 μ A, that switching cycle will be disabled. As switching cycles are enabled and disabled, the output voltage is kept very close to the regulation set point. For greater output voltage regulation accuracy, a reference IC such as a TL431 can be used in place of VR3.

4.5 Output Overvoltage Shutdown

Overvoltage detection is accomplished by sensing the rectified bias winding voltage. The overvoltage threshold is the sum of VR2 and the BYPASS (BP) pin voltage (15 V + 5.8 V). When an overvoltage condition occurs such that the bias winding output voltage exceeds the threshold voltage, current begins to flow into the BYPASS pin. When this current exceeds 5 mA the internal shutdown circuit in U1 is activated. Reset is accomplished by removing input power and allowing the BYPASS pin voltage to drop below 2 V. Resistors R7 and R3 provide additional filtering of the bias voltage, with R3 also limiting the maximum current into the BYPASS pin in an OV condition

4.6 EMI Design Aspects

In addition to the simple input π filter (C1, L1 and C2) for differential mode EMI, this design makes use of shielding techniques in the transformer to reduce common mode EMI displacement currents. Resistor R2 and C4 are added to act as a damping network

to reduce high frequency transformer ringing. These techniques combined with the frequency jitter of TNY288PG gives excellent conducted and radiated EMI performance.

4.7 Peak Primary Current Limit Selection

The schematic shows three possible values for the capacitor connected to the BP/M pin, C7, C8 and C9. These different capacitor values can be used to exercise the current limit selection feature of the TinySwitch-4 family.

This feature allows the designer to select the current limit appropriate for the application.

- Nominal current limit is selected with a 0.1 μF BP/M pin capacitor and is the normal choice for typical enclosed adapter applications.
- When a 1 μF BP/M pin capacitor is used, the current limit is reduced offering reduced RMS device currents and therefore improved efficiency, at the expense of maximum power capability.
- If a 10 μF BP/M pin capacitor is used, the current limit is increased above nominal, extending the power capability for applications requiring higher power where the thermal conditions allow.

The RD-399 demonstration board comes with a 0.1 μF capacitor installed as C7, which causes U1 to select the standard current limit specified in the TinySwitch-4 data sheet. If C7 were replaced by a 1 μF capacitor (C8 in the BOM, Section 6), the current limit of U1 will be the same as the standard current limit for a TNY287PG device. If a 10 μF capacitor is installed, the current limit of U1 will be the same as the standard current limit for a TNY289PG device. The flexibility of this option enables the designer to do three things. First, it allows to measure the effect of switching to an adjacent device without actually removing and replacing the IC. Second, it allows a larger device to be used with a lower current limit, for higher efficiency. Third, it allows a smaller device to be used with a higher current limit in a design when higher power is not required on a continual basis, which effectively lowers the cost of the supply.

4.8 Undervoltage Lockout

The RD-399 circuit board has a location where an optional undervoltage (UV) lockout detection resistor (R5) can be installed. When installed, MOSFET switching is disabled at start-up until current into the EN/UV pin exceeds 25 μA . This allows the designer to set the input voltage at which MOSFET switching will be enabled by choosing the value of R5. For example, a value of 3.6 $\text{M}\Omega$ requires an input voltage of 65 VAC (92 VDC across C2) before the current into the EN/UV pin exceeds 25 μA . The UV detect function also prevents the output of the power supply from glitching (trying to restart) after output regulation is lost (during shutdown), by disabling MOSFET switching until the input voltage rises above the undervoltage lockout threshold.

7 Transformer Specification

7.1 Electrical Diagram

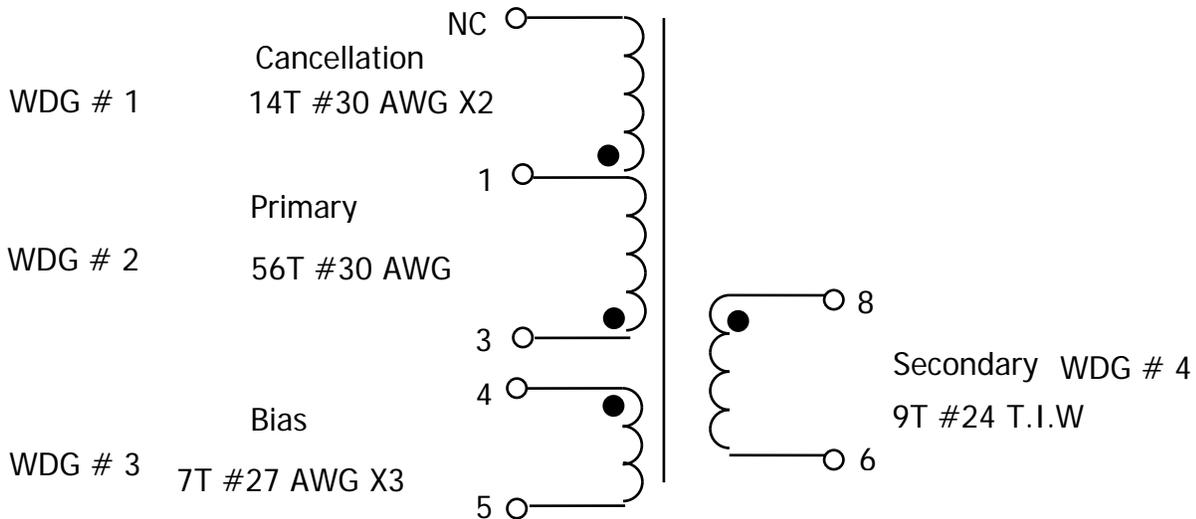

Figure 4 – Transformer Electrical Diagram.

7.2 Electrical Specifications

Electrical Strength	1 second, 60 Hz, from pins 1-5 to pins 6-10.	3000 VAC
Primary Inductance	Pins 1-3, all other windings open, measured at 100 kHz, 0.4 V _{RMS} .	1189 μH ±10%
Resonant Frequency	Pins 1-3, all other windings open.	500 kHz (Min.)
Primary Leakage Inductance	Pins 1-3, with pins 6-8 shorted, measured at 100 kHz, 0.4 V _{RMS} .	50 μH (Max.)

7.3 Material List

Item	Description
[1]	Core: PC40EE25-Z, TDK or equivalent Gapped for A _L of 379.1 nH/T ² .
[2]	Bobbin: EE25, Vertical, 10 pin – Yih-Hwa part # YW-360-02B.
[3]	Magnet Wire: #30 AWG.
[4]	Magnet Wire: #27 AWG.
[5]	Triple Insulated Wire: #24 AWG.
[6]	Tape: 3M # 44 Polyester web. 2.0 mm wide.
[7]	Tape: 3M 1298 Polyester Film, 2.0 mils thick, 8.6 mm wide.
[8]	Tape: 3M 1298 Polyester Film, 2.0 mils thick, 10.7 mm wide.
[9]	Tape: 3M 1298 Polyester Film, 2.0 mils thick, 4.0 mm wide.
[10]	Varnish (applied by dipping only, not vacuum impregnation).

7.4 Transformer Build Diagram

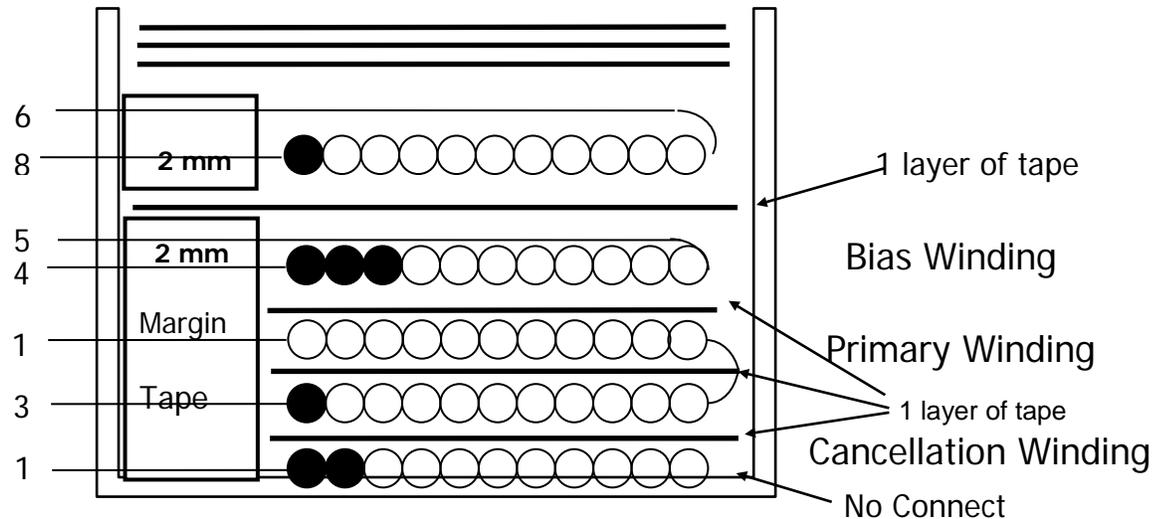

Figure 5 – Transformer Build Diagram.

7.5 Transformer Construction

Bobbin Set-Up Orientation	Set up the bobbin with its pins oriented to the left hand side.
Margin Tape	Apply 2.0 mm margin at the pin side of bobbin using item [6]. Match combined height of shield, primary, and bias windings.
WD1 Cancellation Winding	Start at pin 1. Wind 14 bifilar turns of item [3] from left to right. Wind with tight tension across entire bobbin evenly. Cut the ends of the bifilar and leave floating.
Insulation	1 layer of tape [7] for insulation.
WD #2 Primary Winding	Start at pin 3. Wind 28 turns of item [3] from left to right. Apply 1 layer of tape [7] for insulation. Wind another 28 turns from right to left. Wind with tight tension across entire bobbin evenly. Finish at pin 1.
Insulation	1 layer of tape [7] for insulation.
WD #3 Bias Winding	Start at pin 4, wind 7 trifilar turns of item [4]. Wind from left to right with tight tension. Wind uniformly, in a single layer across entire width of bobbin. Finish on pin 5.
Insulation	1 layer of tape [8] for insulation.
Margin Tape	Apply 2.0 mm margin at the pin side of bobbin using item [6]. Match combined height of secondary windings.
WD #4 Secondary Winding	Start at pin 8, wind 9 turns of item [5] from left to right. Wind uniformly, in a single layer across entire bobbin evenly. Finish on pin 6.
Outer Insulation	3 layers of tape [8] for insulation.
Core Assembly	Assemble and secure core halves using item [1] and item [9].
Varnish	Dip varnish using item [10] (do not vacuum impregnate).

ODS1			0.91	mm	Maximum Outside Diameter for Triple Insulated Wire

Note: Warning shown for gap size should be ignored. It is the result of rounding of the parameter.

9 Performance Data

The ON/OFF control scheme employed by TinySwitch-4 yields virtually constant efficiency across the 25% to 100% load range required for compliance with worldwide energy efficiency standards for external power supplies (EPS). Even at loads below 10% of the supply's full rated output power, efficiency remains above 70%, providing excellent standby performance for applications that require it. This performance is automatic with ON/OFF control. There are no special burst modes that require the designer to consider specific thresholds within the load range in order to achieve compliance with global energy efficiency standards.

All measurements performed at room temperature, 60 Hz input frequency.

9.1 Efficiency

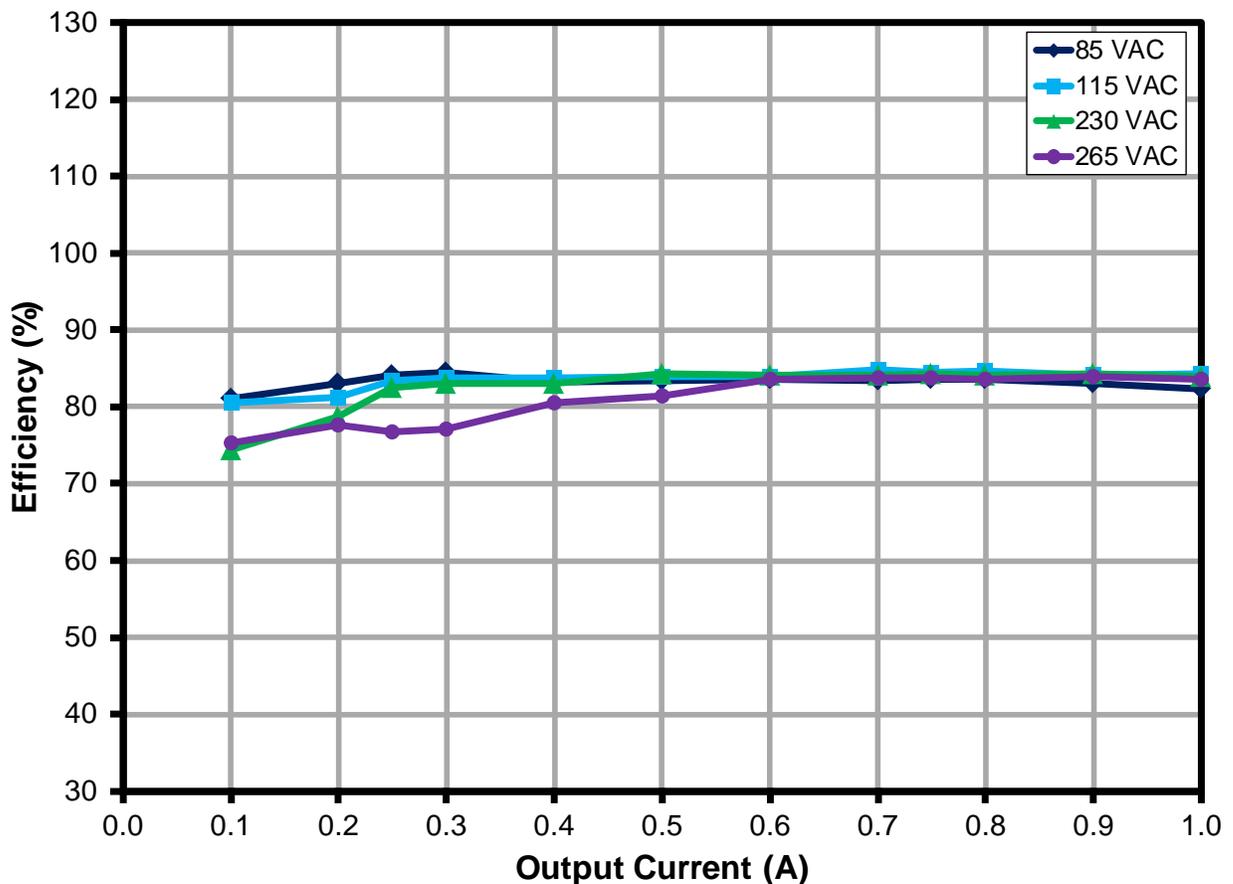

Figure 6 – Efficiency vs. Output Current, Room Temperature, 60 Hz.

9.2 Active Mode Measurement Data

As this design could be used for an external power supply (vs internal) the efficiency requirements for the two toughest external power supply standards (in effect at time of writing) are shown blow.

This design meets both the U.S. DOE EISA2007 (Level VI) and European Code of Conduct (Version 5) limits.

For other standard and the latest, up-to-date information on energy efficiency regulations, please visit the PI Green Room, at:

<http://www.powerint.com/greenroom/regulations.htm>

Measured Performance			Standards				
		V _{IN} (VAC)		EISA2007		EC CoC (v5)	
		115	230	2016 Direct operation	2016 Indirect operation	2014 Tier 1	2016 Tier 2
		Efficiency (%)		Efficiency (%)			
Percent of Full Load	10	80.5	82			70	73
	25	83.5	82.6				
	50	83.9	84.3				
	75	84.4	84.3				
	100	84.4	84				
	Ave	84	84	83	72	80	83
No-Load Input Power [†] (mW)		70 (22)	125 (24)	100	500	150	75
		Compliant		Y	Y	Y	Y

[†] Numbers in parenthesis with IC supplied from optional bias winding.

9.3 No-Load Input Power (R8 Not Installed: No Bias Winding Supplementation)

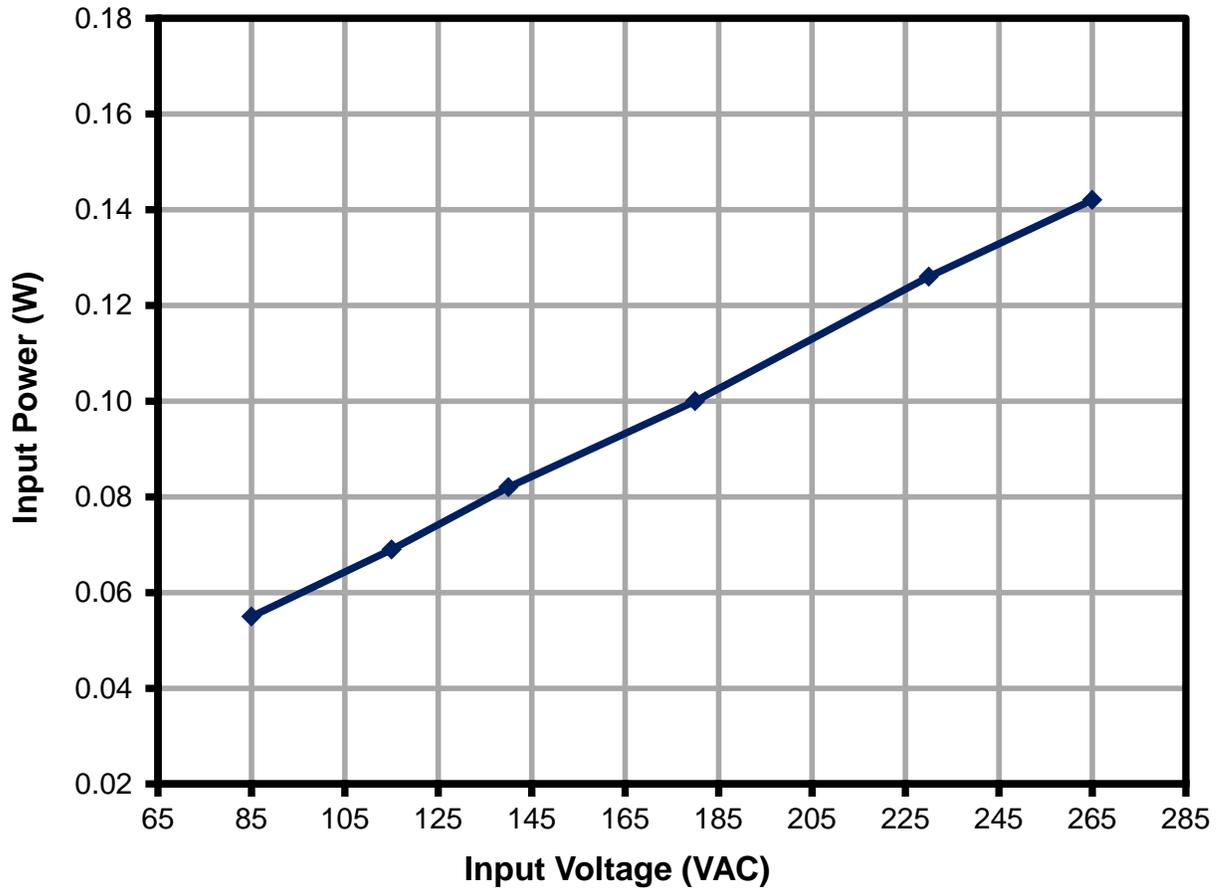

Figure 7 – No-load Input Power vs. Input Line Voltage, Room Temperature, 60 Hz.

9.4 No-Load Input Power (with R8 and IC supplied from bias winding)

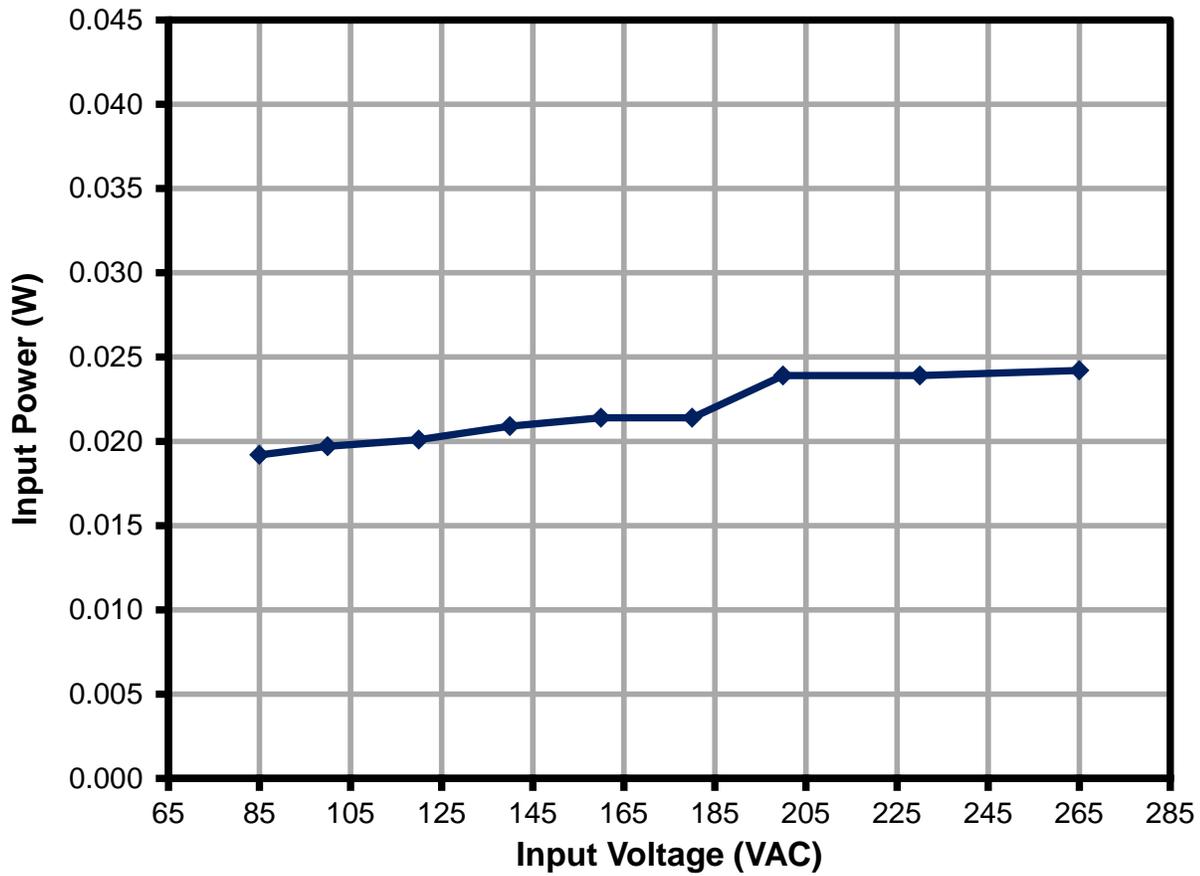

Figure 8 – No-load Input Power vs. Input Line Voltage, Room Temperature, 60 Hz, with Bias Winding.

9.5 Available Standby Output Power

The chart below shows the available output power versus line voltage at input power consumption levels of 1, 2 and 3 watts (respectively). Again, this performance illustrates the value of ON/OFF control, as it automatically maintains a high efficiency, even during very light loading. This simplifies complying with standby requirements that specify that a fair amount of power be available to the load at low input power consumption levels. The TinySwitch-4 ON/OFF control scheme maximizes the amount of output power available to the load in standby operation when the allowable input power is fixed at a low value. This simplifies the design of products such as printers, set-top boxes, DVD players, etc. that must meet stringent standby power consumption requirements.

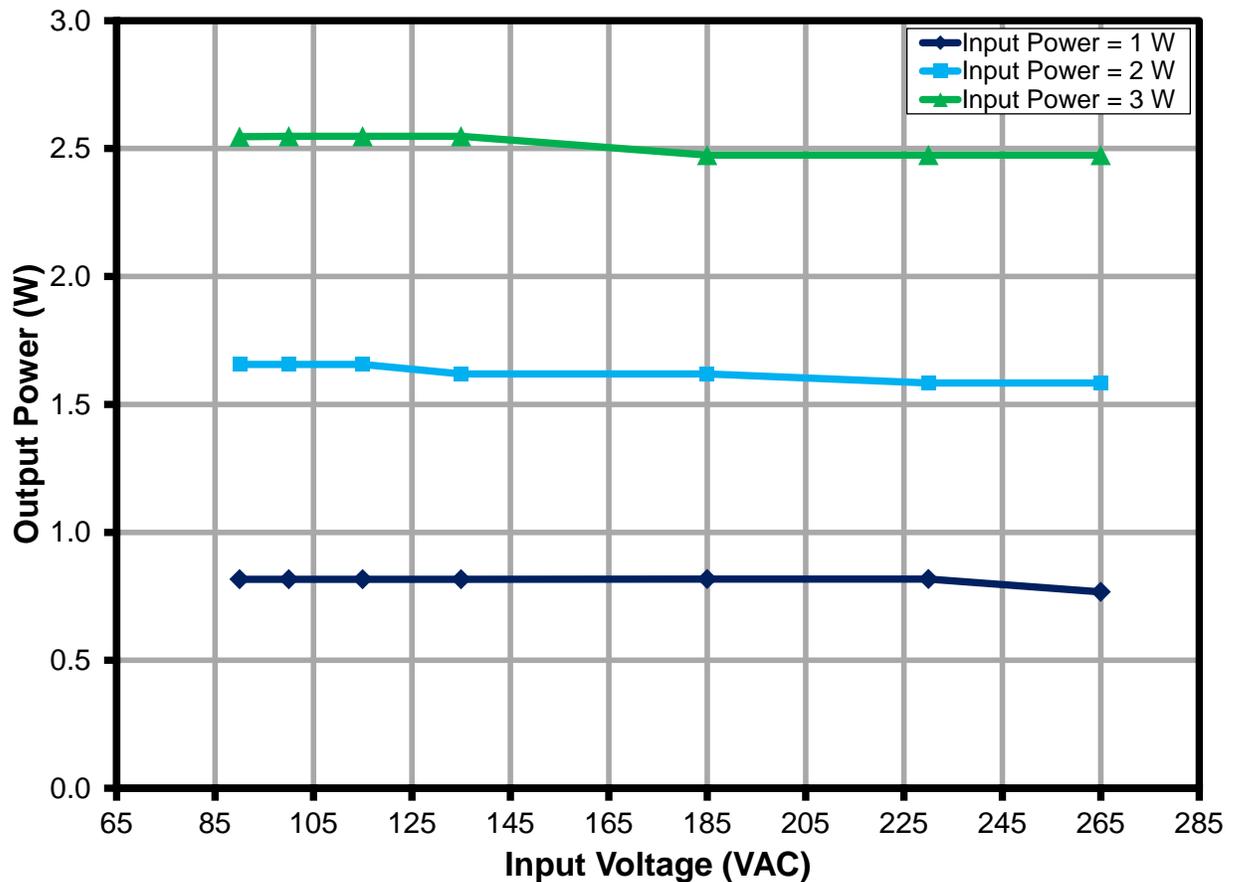

Figure 9 – Available Output Power for 1 W, 2 W and 3 W of Input Power.

9.6 Regulation

9.6.1 Load and Line

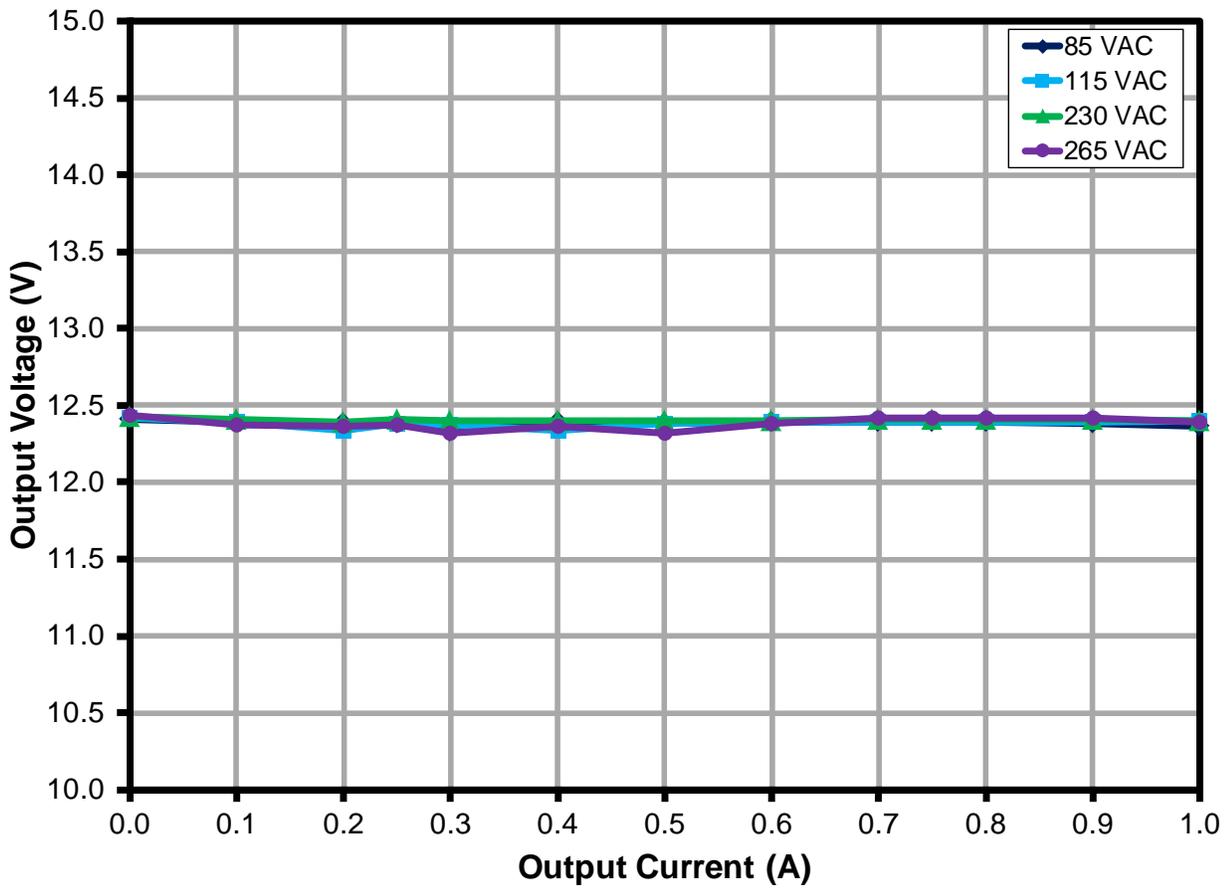

Figure 10 – Load and Line Regulation, Room Temperature.

10 Thermal Performance

Temperature measurements of key components were taken using T-type thermocouples. The thermocouples were soldered directly to a SOURCE pin of the TNY288PG device and to the cathode of the output rectifier. The thermocouples were glued to the output capacitor and to the external core and winding surfaces of transformer T1.

The unit was sealed inside a large box to eliminate any air currents. The box was placed inside a thermal chamber. The ambient temperature within the large box was raised to 50 °C. The unit was then operated at full load and the temperature measurements were taken after they stabilized for 1 hour at 50 °C.

Temperature (°C)		
Item	85 VAC	265 VAC
Ambient	50*	50*
TNY288PG (U1)	83.9	80.9
Transformer Core(T1)	68	71.1
Transformer Winding (T1)	72.3	72.9
Output Rectifier (D7)	79.7	79.5
Output Capacitor (C10)	60.2	60.2

*To simulate operation inside sealed enclosure at 40 °C external ambient.

These results show that all key components have an acceptable rise in temperature.

11.5 Output Ripple Measurements

11.5.1 Ripple Measurement Technique

A modified oscilloscope test probe was used to take output ripple measurements, in order to reduce the pickup of spurious signals. Using the probe adapter pictured in Figure 22, the output ripple was measured with a 1 μF electrolytic, and a 0.1 μF ceramic capacitor connected as shown.

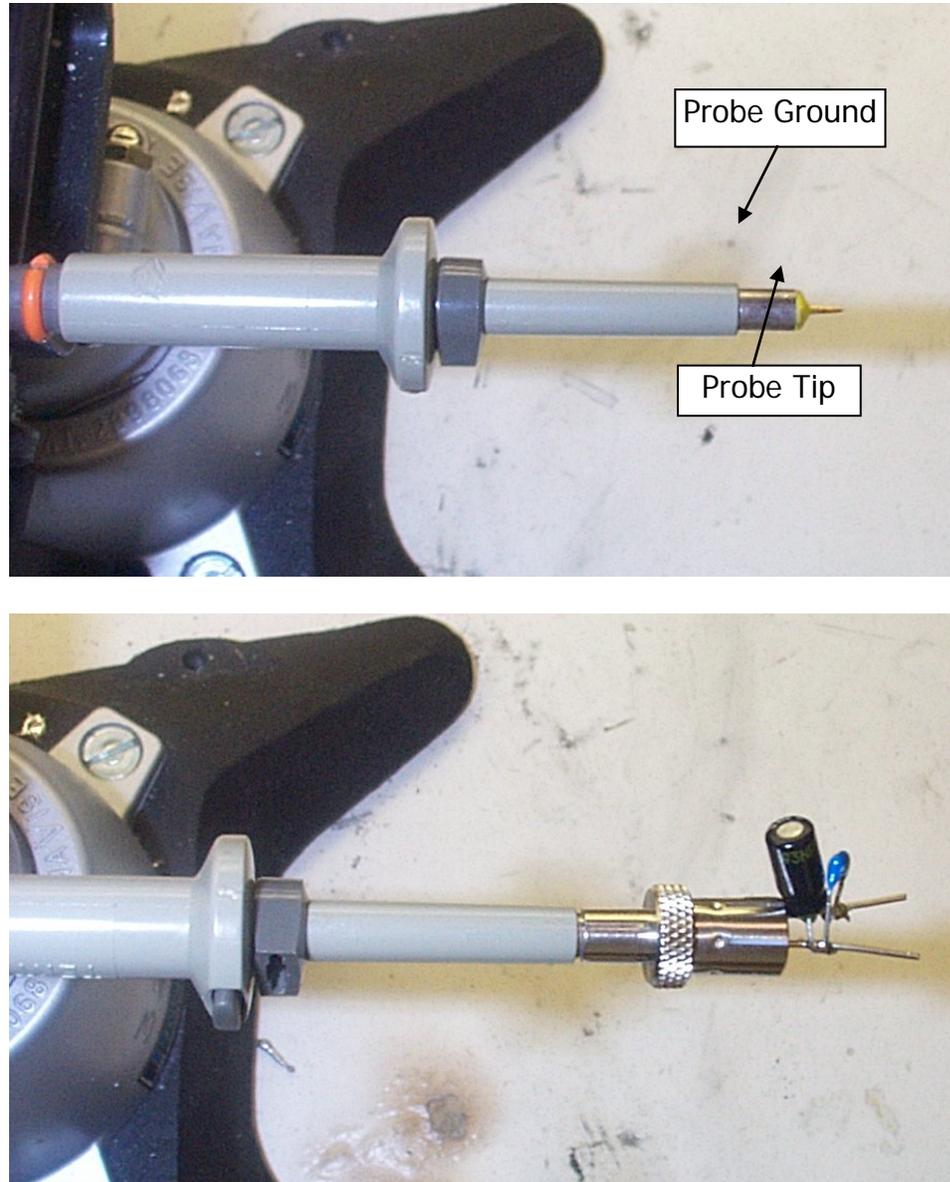

Figure 22 – Oscilloscope Probe Prepared for Ripple Measurement (End Cap and Ground Lead Removed).

265 VAC, No Load.
50 ms, 5 V / div.

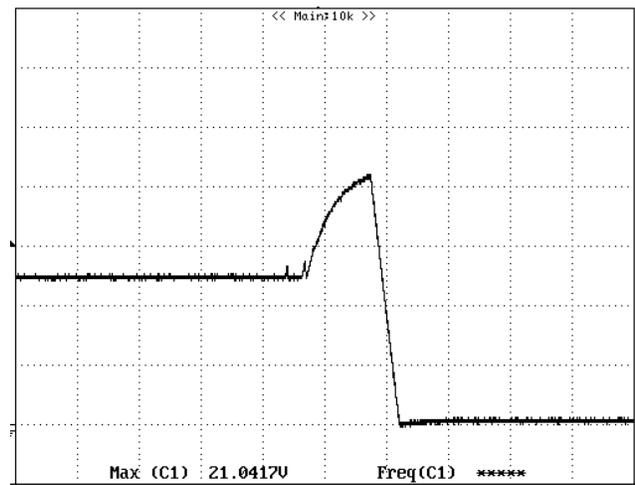

Figure 26 – Overvoltage Shutdown.
265 VAC, Full Load.
50 ms, 5 V / div.

12 Line Surge

Differential input line surge (1.2/50 μ s) testing was completed on a single test unit to IEC61000-4-5. Input voltage was set at 230 VAC / 60 Hz. Output was loaded at full load and operation was verified following each surge event.

Surge Voltage	Phase Angle (°)	Generator Impedance (Ω)	Number of Strikes	Test Result
1 kV Differential	90	2	10	PASS
2 kV Common Mode	90	12	10	PASS

Unit passed under all test conditions.

13 Conducted EMI

Conducted emissions tests were performed at 115 VAC and 230 VAC at full load (12 V, 1 A). Measurements were taken with an Artificial Hand connected and a floating DC output load resistor. A DC output cable was included.

Composite EN55022B / CISPR22B conducted limits are shown. In all cases there was excellent (>10 dB) margin.

13.1 115 VAC, Full Load

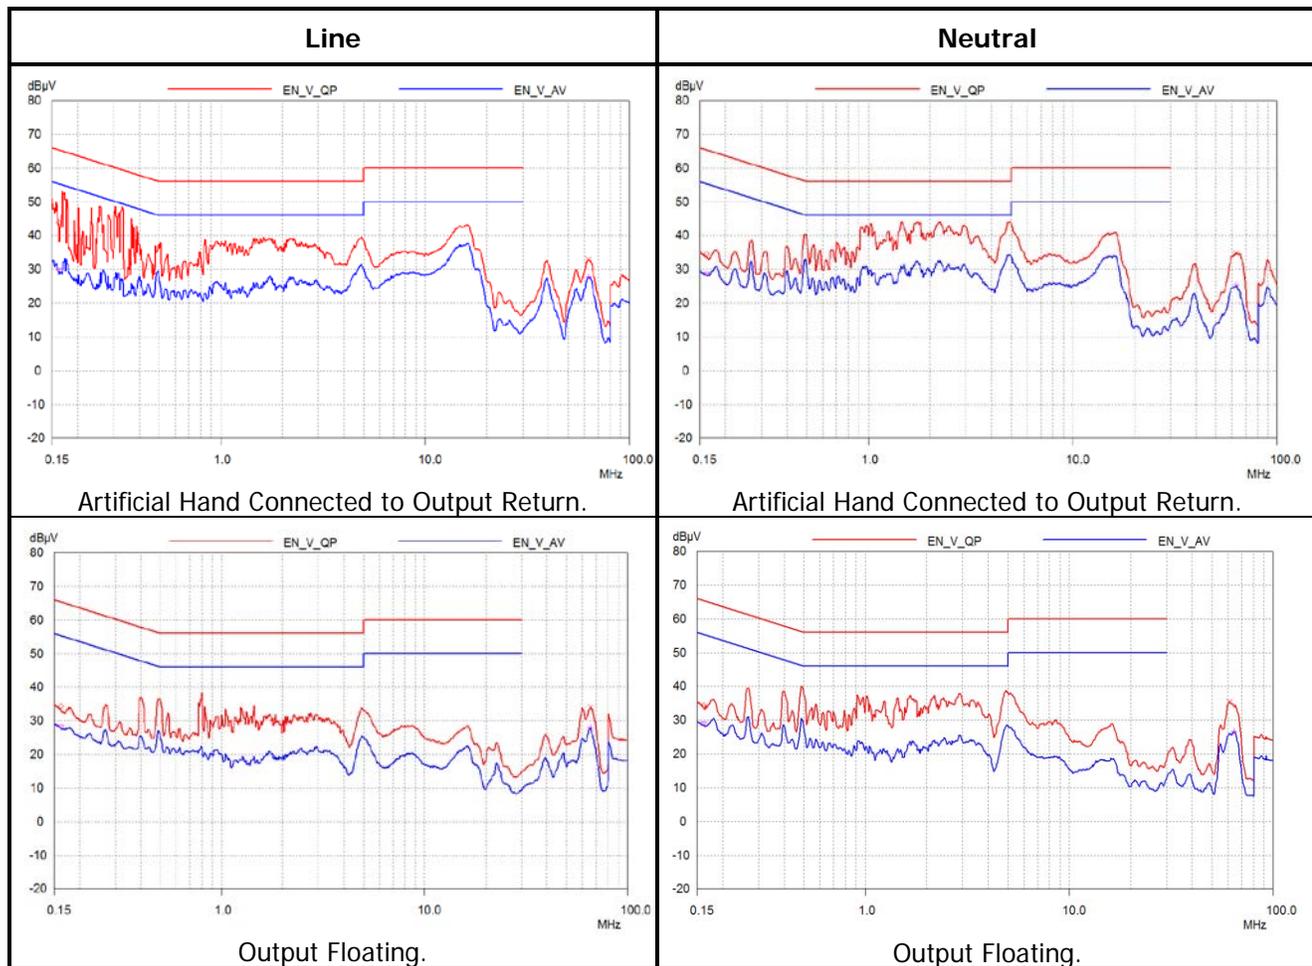

Figure 27 – Conducted EMI at 115 VAC.

13.2 230 VAC, Full Load

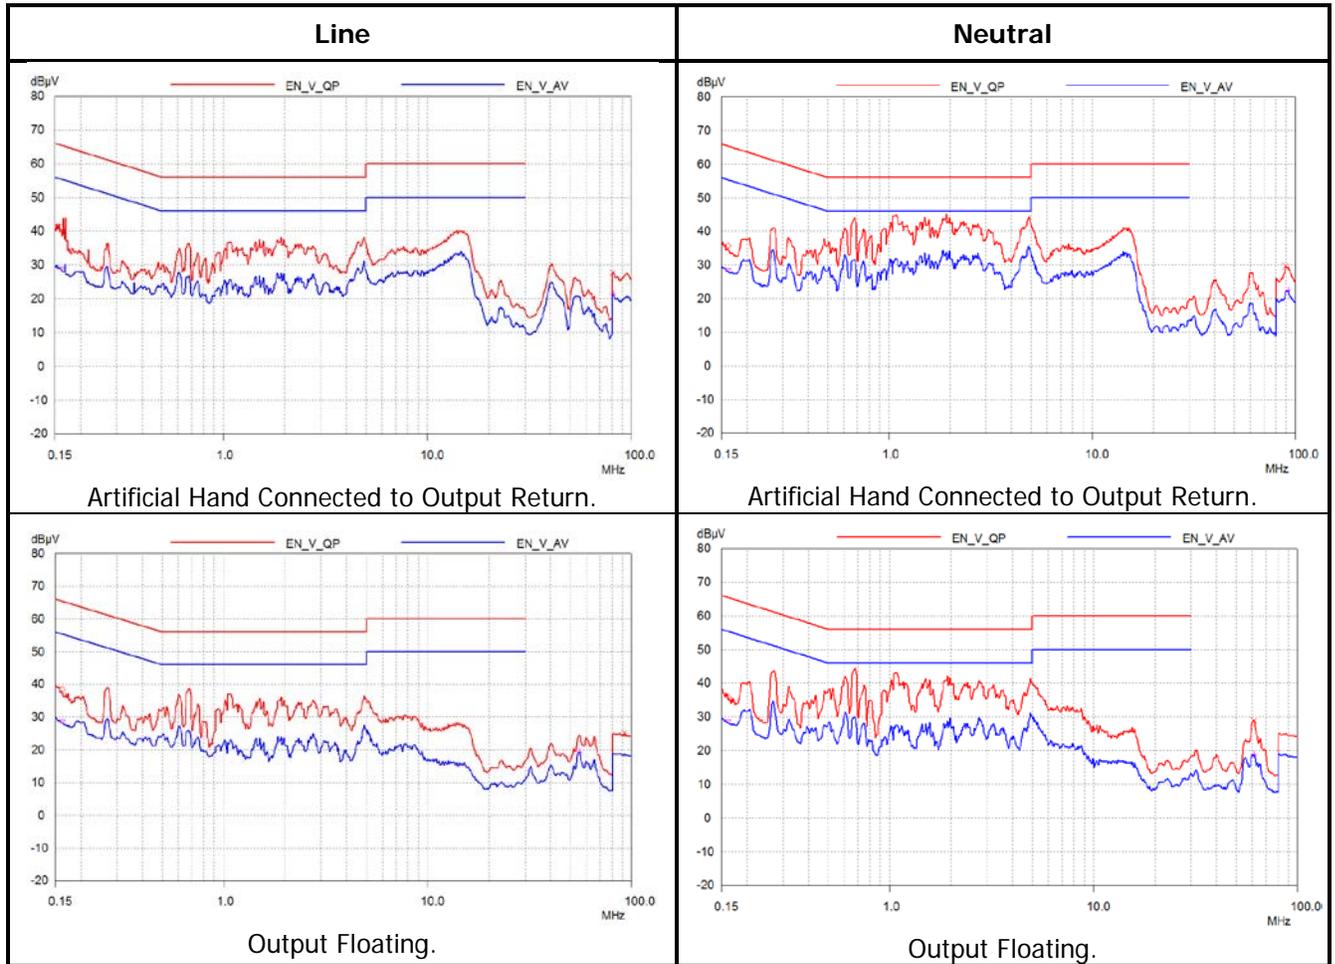

Figure 28 – Conducted EMI at 230 VAC.

14 Audible Noise

An open-frame (no enclosure) unit was tested with an audio precision analyzer, using a microphone positioned one inch from the core of transformer T1. The test was done with the unit in an acoustically isolated and dampened chamber. The load was adjusted until a maximum reading was obtained.

35 dBrA is considered the acceptable limit for frequencies below 18 kHz. An enclosure will typically further reduce measurable acoustic noise levels by an additional 10 dBrA.

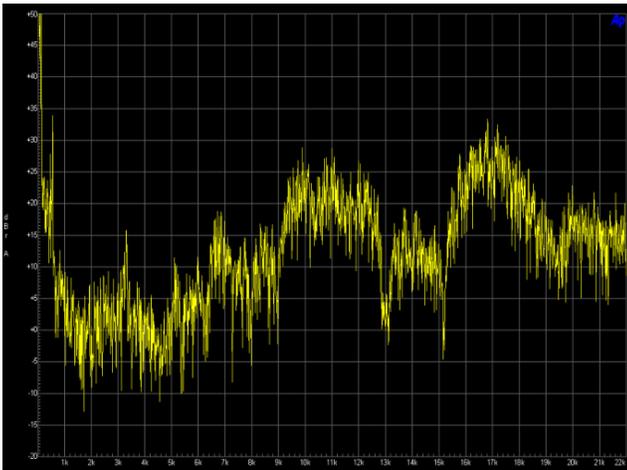

Figure 29 – Audible Noise $V_{IN} = 120 \text{ VAC}$;
 $I_{OUT} = 350 \text{ mA}$.

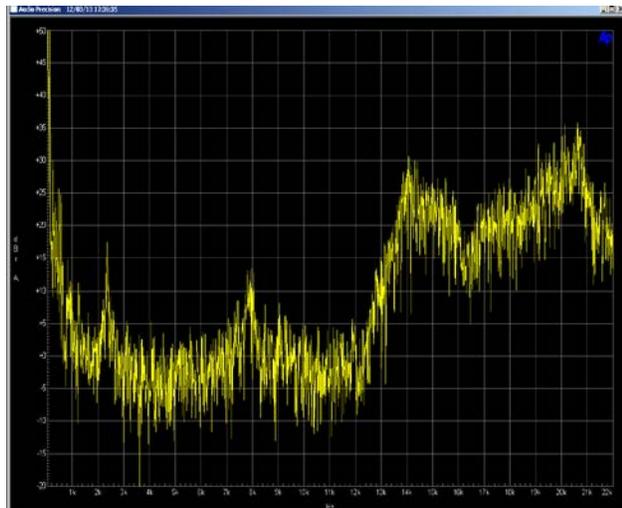

Figure 30 – Audible Noise $V_{IN} = 120 \text{ VAC}$;
 $I_{OUT} = 860 \text{ mA}$.

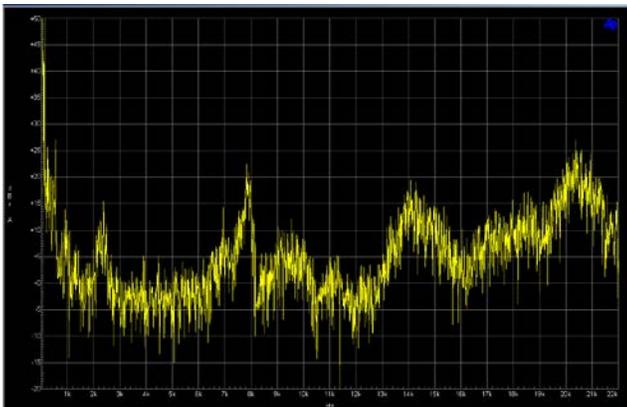

Figure 31 – Audible Noise $V_{IN} = 230 \text{ VAC}$;
 $I_{OUT} = 930 \text{ mA}$.

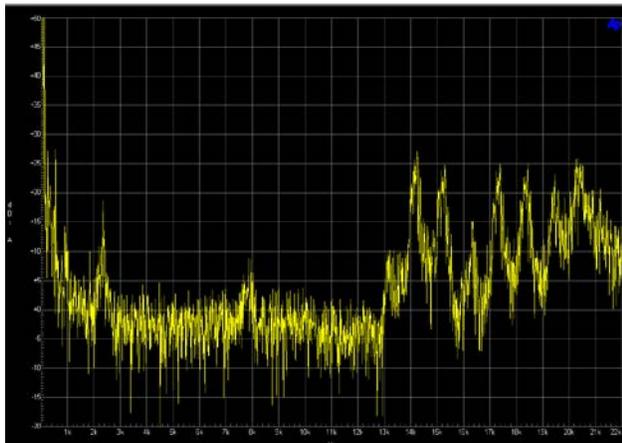

Figure 32 – Audible Noise $V_{IN} = 230 \text{ VAC}$;
 $I_{OUT} = 880 \text{ mA}$.

15 Extended and Reduced Current Limit (I_{LIMIT}) Operation

Capacitors (C8 and C9 on the BOM in Section 6) can be added to the board to try out the $I_{LIMIT+1}$ and $I_{LIMIT-1}$ operation of TNY288PG. When C7 (0.1 μ F) is replaced with a 10 μ F capacitor (C9), the TNY288PG will operate in the $I_{LIMIT+1}$ mode, which increases the maximum primary current limit from the standard maximum limit of 0.55 A to 0.65 A (equal to that of a TNY289PG). This allows a TNY288PG to deliver from 15% to 25% more output power (depending on the output voltage and current).

CAUTION: Because RD-399 was designed for standard I_{LIMIT} operation, It should not be loaded with more than 1.25 A at an elevated temperature for very long (a few minutes) when verifying the performance of TNY288PG in the $I_{LIMIT+1}$ mode, since the other power components (transformer, input bulk capacitors, output diode, output capacitors and primary clamp network) are not sized for sustained operation at more than 12 W.

When C7 is replaced with a 1 μ F capacitor (C8), the TNY288PG will operate in the $I_{LIMIT-1}$ mode, which reduces the maximum current limit from the standard maximum limit of 0.55 A to 0.45 A (equal to that of a TNY277PG). Although this reduces the maximum output power that the supply can deliver, it typically will increase the efficiency, especially at lower output power levels. To take the fullest advantage of the increase in efficiency that can be obtained from $I_{LIMIT-1}$ operation, the power transformer would need to be redesigned slightly.

16 TNY287PG and TNY289PG Operation in RD-399

A TNY287PG device used in the $I_{LIMIT+1}$ mode (a 10 μ F installed in place of C7) will work in the RD-399 reference board, and deliver output power equal to that of a TNY288PG device. This flexibility allows a design engineer the option of using a lower cost part in applications with less demanding thermal requirements.

A TNY289PG device used in the $I_{LIMIT-1}$ mode (a 1 μ F installed in place of C7) will deliver the same output power as a TNY288PG in the standard I_{LIMIT} configuration. This can improve efficiency and lower the temperature rise of the device, which can give greater thermal margin to a design that must operate in high ambient temperature environments.

17 OVP Operation Verification

While the RD-399 is in normal operation, monitor the output with a storage oscilloscope. To cause an overvoltage condition to occur, short-circuit the optocoupler LED (as shown below) to open the feedback control loop. The oscilloscope will capture the output voltage rising until the increasing voltage across VR2 causes it to conduct, and the TNY288PG device latches off. To reset the OVP latch, the AC input power must be removed long enough to allow the input bulk capacitors to fully discharge.

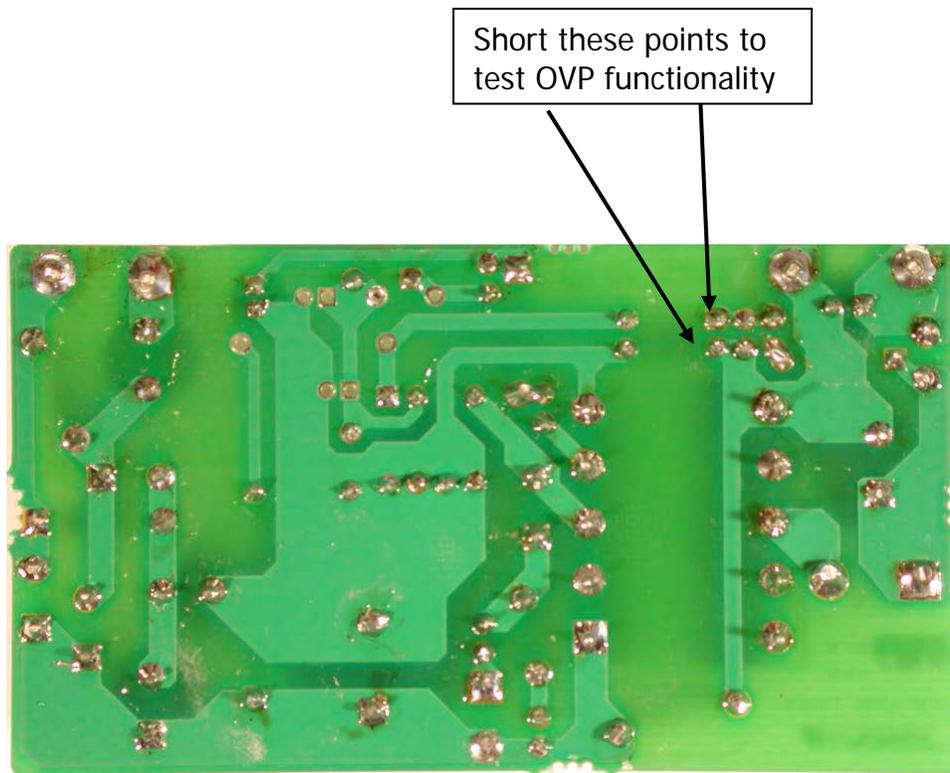

Figure 33 – Point on PCB to Apply Short-Circuit to Trigger OV Shutdown.

18 Revision History

Date	Author	Revision	Description an Changes	Approved
02-Jul-14	RJ	1.1	Initial Release	Apps & Mktg
