## General Description

The MAX40009 evaluation kit (EV kit) is a fully assembled and tested PC board that evaluates the MAX40008/ MAX40009 single comparator with shutdown input. This EV kit comes with a push-pull output MAX40009ANT+ installed that operates off a $V_{D D}$ supply between 1.7 V and 5.5 V . The MAX40009 has a wide input common mode voltage range from -0.2 V to $\mathrm{V}_{\mathrm{DD}}+0.2 \mathrm{~V}$. This EV kit demonstrates the MAX40009ANT+ in an ultra-small, $0.73 \mathrm{~mm} \times 1.1 \mathrm{~mm}, 6$-bump wafer-level package (WLP) with 0.35 mm bump spacing.
The EV kit can be used to evaluate both the MAX40008 and MAX40009 with a 6-bump WLP. To evaluate the MAX40008 (open-drain output version), replace U1 (MAX40009) with the MAX40008 with jumper J1 installed.

## Features

- 300ns Propagation Delay
- Wide Input Common Mode Voltage Range, -0.2 V to $\mathrm{V}_{\mathrm{DD}}+0.2 \mathrm{~V}$
- Hysteresis Adding Configurable
- Evaluates 6-Bump WLP Package
- Fully Assembled and Tested

## Quick Start

## Required Equipment

- Three +5 V DC power supplies $\left(\mathrm{V}_{\mathrm{DD}}, \mathrm{V}_{\mathrm{IN}+}\right.$, and $\left.\mathrm{V}_{\text {PULL }}\right)$
- Two digital multimeters (DMMs)

## Procedure

The MAX40009 EV kit is fully assembled and tested. Follow steps below to verify board operation. Caution: Do not turn on the power supply until all connections are completed.

1) Connect the positive terminal of a DC power supply to the VDD test point and the ground terminal to the GND test point.
2) Connect the positive terminal of a DC power supply to the VPULL test point and the ground terminal to the GND test point when evaluating the MAX40008. This is not necessary when evaluating the MAX40009.
3) Connect the positive terminal of a DC power supply to the INP test point and the ground terminal to the GND test point.
4) Turn on the $V_{D D}$ power supply and set it to any voltage between 1.7 V and 5.5 V .
5) Turn on the VPULL power supply and set it to any voltage between 1.7 V to 5.5 V (MAX40008 only). Do not need VPULL supply when MAX40009 (push-pull output) is used.
6) Turn on the IN+ power supply and set it to the desired level.
7) Monitor the output using a DMM at the VOUT test point and observe its response to varying voltage at IN+. VOUT should be at logic-high (VPULL) when voltage applied on $\mathrm{IN}+$ is greater than $\mathrm{V}_{\mathrm{IN}}$ - and should be at logic-low ( 0 V ) when the voltage applied on $\mathrm{IN}+$ is less than $\mathrm{V}_{\mathrm{IN}}$.

## Detailed Description of Hardware

The MAX40009 EV kit is a fully assembled and tested PC board that evaluates the 6-bump WLP MAX40009ANT+ open-drain output comparator. The EV kit requires a 1.7 V to 5.5 V supply voltage for normal operation. The EV kit can be used to evaluate both the MAX40008 and MAX40009 offered in a WLP package.

## Positive Hysteresis

The EV kit allows user to add external hysteresis in addition to the 4 mV internal hysteresis by usage of adding appropriate resistors on R2 and R1 pads. When R1 and R2 values are chosen in such a way that R1, R2 >> R3 ( $39 \mathrm{k} \Omega$ ) approximately greater 50 x than R 3 , then the equations become:
For the MAX40008 (open-drain) output:

$$
\mathrm{V}_{\mathrm{THP}}^{+}, ~=\mathrm{V}_{\mathrm{IN}} \frac{\mathrm{R} 2+\mathrm{R} 3}{\mathrm{R} 1+\mathrm{R} 2+\mathrm{R} 3}+\mathrm{V}_{\mathrm{PULL}} \frac{\mathrm{R} 1+\mathrm{R} 3}{\mathrm{R} 1+\mathrm{R} 2+\mathrm{R} 3}
$$

and

$$
\mathrm{V}_{\mathrm{THN}}^{+}, ~=\mathrm{V}_{\mathrm{IN}} \frac{\mathrm{R} 2}{\mathrm{R} 1+\mathrm{R} 2}+\mathrm{V}_{\mathrm{OL}} \frac{\mathrm{R} 1}{\mathrm{R} 1+\mathrm{R} 2}
$$

when R1 and R2 >> RP

$$
\begin{gathered}
V_{\mathrm{THP}_{+}}=\mathrm{V}_{\mathrm{IN}} \frac{\mathrm{R} 2}{\mathrm{R} 1+\mathrm{R} 2}+\mathrm{V}_{\mathrm{P}} \frac{\mathrm{R} 1}{\mathrm{R} 1+\mathrm{R} 2} \\
\mathrm{~V}_{\mathrm{HYS}}=\mathrm{V}_{\mathrm{THP}}-\mathrm{V}_{\mathrm{THN}}= \\
\mathrm{V}_{\mathrm{PULL}} \frac{\mathrm{R} 1+\mathrm{R} 3}{\mathrm{R} 1+\mathrm{R} 2+\mathrm{R} 3}+\mathrm{V}_{\mathrm{OL}} \frac{\mathrm{R} 1}{\mathrm{R} 1+\mathrm{R} 2}
\end{gathered}
$$

the term

$$
\begin{gathered}
\mathrm{V}_{\mathrm{OL}} \frac{\mathrm{R} 1}{\mathrm{R} 1+\mathrm{R} 2} \sim 0 \text {, so } \\
\mathrm{V}_{\mathrm{HYS}}=\mathrm{V}_{\mathrm{PULL}} \frac{\mathrm{R} 1+\mathrm{R} 3}{\mathrm{R} 1+\mathrm{R} 2+\mathrm{R} 3}
\end{gathered}
$$

and R5 and R6 set the threshold voltage at IN- input as follows:

$$
\mathrm{V}_{\mathrm{IN}-_{+}}=\mathrm{V}_{\mathrm{DD}} \frac{\mathrm{R} 5}{\mathrm{R} 5+\mathrm{R} 6}
$$

The source providing the signal input at IN+ input should be a low impedance source. High impedance source affects the trip points as the input resistance of the source adds on to R1.

## Logic Level Translation

Use the MAX40008 output for logic-level translation applications. Install jumper J1 and apply the desired supply voltage level at VPULL. Resistors R5 and R6 set the threshold voltage at IN -. Apply the signal to be level translated at $\mathrm{IN}+$. Note that the device's output has an absolute maximum of $(-0.3 \mathrm{~V})$ to +6 V . See Table 1 for jumper configurations.
The pullup supply voltage ( $\mathrm{V}_{\mathrm{PULL}}$ ) can be up to 6 V .
For evaluating MAX40008 replace the U1 (MAX40009ANT+) with MAX40008ANT+ and install jumper J1 to connect to VPULL.

## Table 1. Jumper Settings

| JUMPER | SHUNT POSITION | FUNCTION |
| :---: | :---: | :--- |
| J1 | Installed | Connects Open-Drain output (MAX40008) to VPULL |
|  | Not Installed $^{*}$ | Normal Push-Pull Operation (MAX40009) |
|  | $1-2^{*}$ | The device is in Active Mode |
|  | $2-3$ | The device is Shutdown |
