Processor Supervisory Circuits with Window-Watchdog

Check for Samples: TPS3813J25, TPS3813L30, TPS3813K33, TPS3813I50

FEATURES

- **Window-Watchdog With Programmable Delay and Window Ratio**
- **6-Pin SOT-23 Package**
- **Supply Current of 9 µA (Typ)**
- **Power On Reset Generator With a Fixed Delay Time of 25 ms**
- **Precision Supply Voltage Monitor 2.5 V, 3 V, 3.3 V, 5 V**
- **Open-Drain Reset Output**
- **Temperature Range –40°C to +85°C**

APPLICATIONS

- **Applications Using DSPs, Microcontrollers, or Microprocessors**
- **Safety Critical Systems**
- **Automotive Systems**
- **Heating Systems**

DESCRIPTION

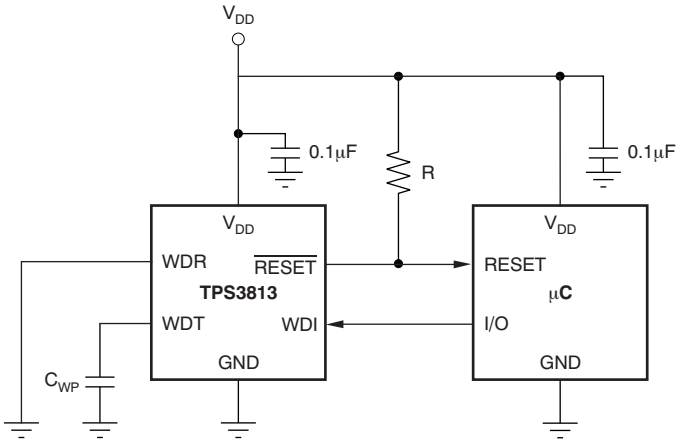
The TPS3813 family of supervisory circuits provide circuit initialization and timing supervision, primarily for DSPs and processor-based systems.

During power on, $\overline{\text{RESET}}$ is asserted when supply voltage (V_{DD}) becomes higher than 1.1 V. Thereafter, the supervisory circuit monitors V_{DD} and keeps $\overline{\text{RESET}}$ active as long as V_{DD} remains below the threshold voltage (V_{IT}). An internal timer delays the return of the output to the inactive state (high) to ensure proper system reset. The delay time, t_d = 25 ms typical, starts after V_{DD} has risen above the threshold voltage (V_{IT}). When the supply voltage drops below the threshold voltage (V_{IT}), the output becomes active (low) again. No external components are required. All the devices of this family have a fixed-sense threshold voltage (V_{IT}) set by an internal voltage divider.

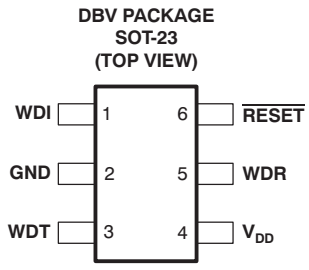
For safety critical applications the TPS3813 family incorporates a so-called window-watchdog with programmable delay and window ratio. The upper limit of the watchdog time-out can be set by either connecting WDT to GND, V_{DD}, or using an external capacitor. The lower limit and thus the window ratio is set by connecting WDR to GND or V_{DD}. The supervised processor now needs to trigger the TPS3813 within this window not to assert a $\overline{\text{RESET}}$.

The product spectrum is designed for supply voltages of 2.5 V, 3 V, 3.3 V, and 5 V. The circuits are available in a 6-pin SOT-23 package.

The TPS3813 devices are characterized for operation over a temperature range of –40°C to 85°C.



Typical Operating Circuit



This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

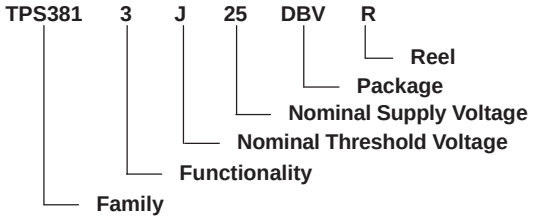
PACKAGE AND ORDERING INFORMATION

PACKAGE INFORMATION(1)

T_A	DEVICE NAME	THRESHOLD VOLTAGE	MARKING
–40°C to +85°C	TPS3813J25DBV	2.25 V	PCDI
	TPS3813L30DBV	2.64 V	PEZI
	TPS3813K33DBV	2.93 V	PFAI
	TPS3813I50DBV	4.55 V	PFBI

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the device product folder at www.ti.com.

Figure 1. ORDERING INFORMATION



ABSOLUTE MAXIMUM RATINGS

Over operating free-air temperature range (unless otherwise noted).(1)

		UNIT
V_{DD}	Supply voltage(2)	7 V
	RESET	–0.3 V to V_{DD} + 0.3 V
	All other pins (2)	–0.3 V to 7 V
I_{OL}	Maximum low output current	5 mA
I_{OH}	Maximum high output current	–5 mA
I_{IK}	Input clamp current (V_I < 0 or V_I > V_{DD})	±20 mA
I_{OK}	Output clamp current (V_O < 0 or V_O > V_{DD})	±20 mA
	Continuous total power dissipation	See Dissipation Rating Table
T_A	Operating free-air temperature range	–40°C to +85°C
T_{stg}	Storage temperature range	–65°C to +150°C
	Soldering temperature	+260°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to GND. For reliable operation the device should not be operated at 7 V for more than t = 1000h continuously.

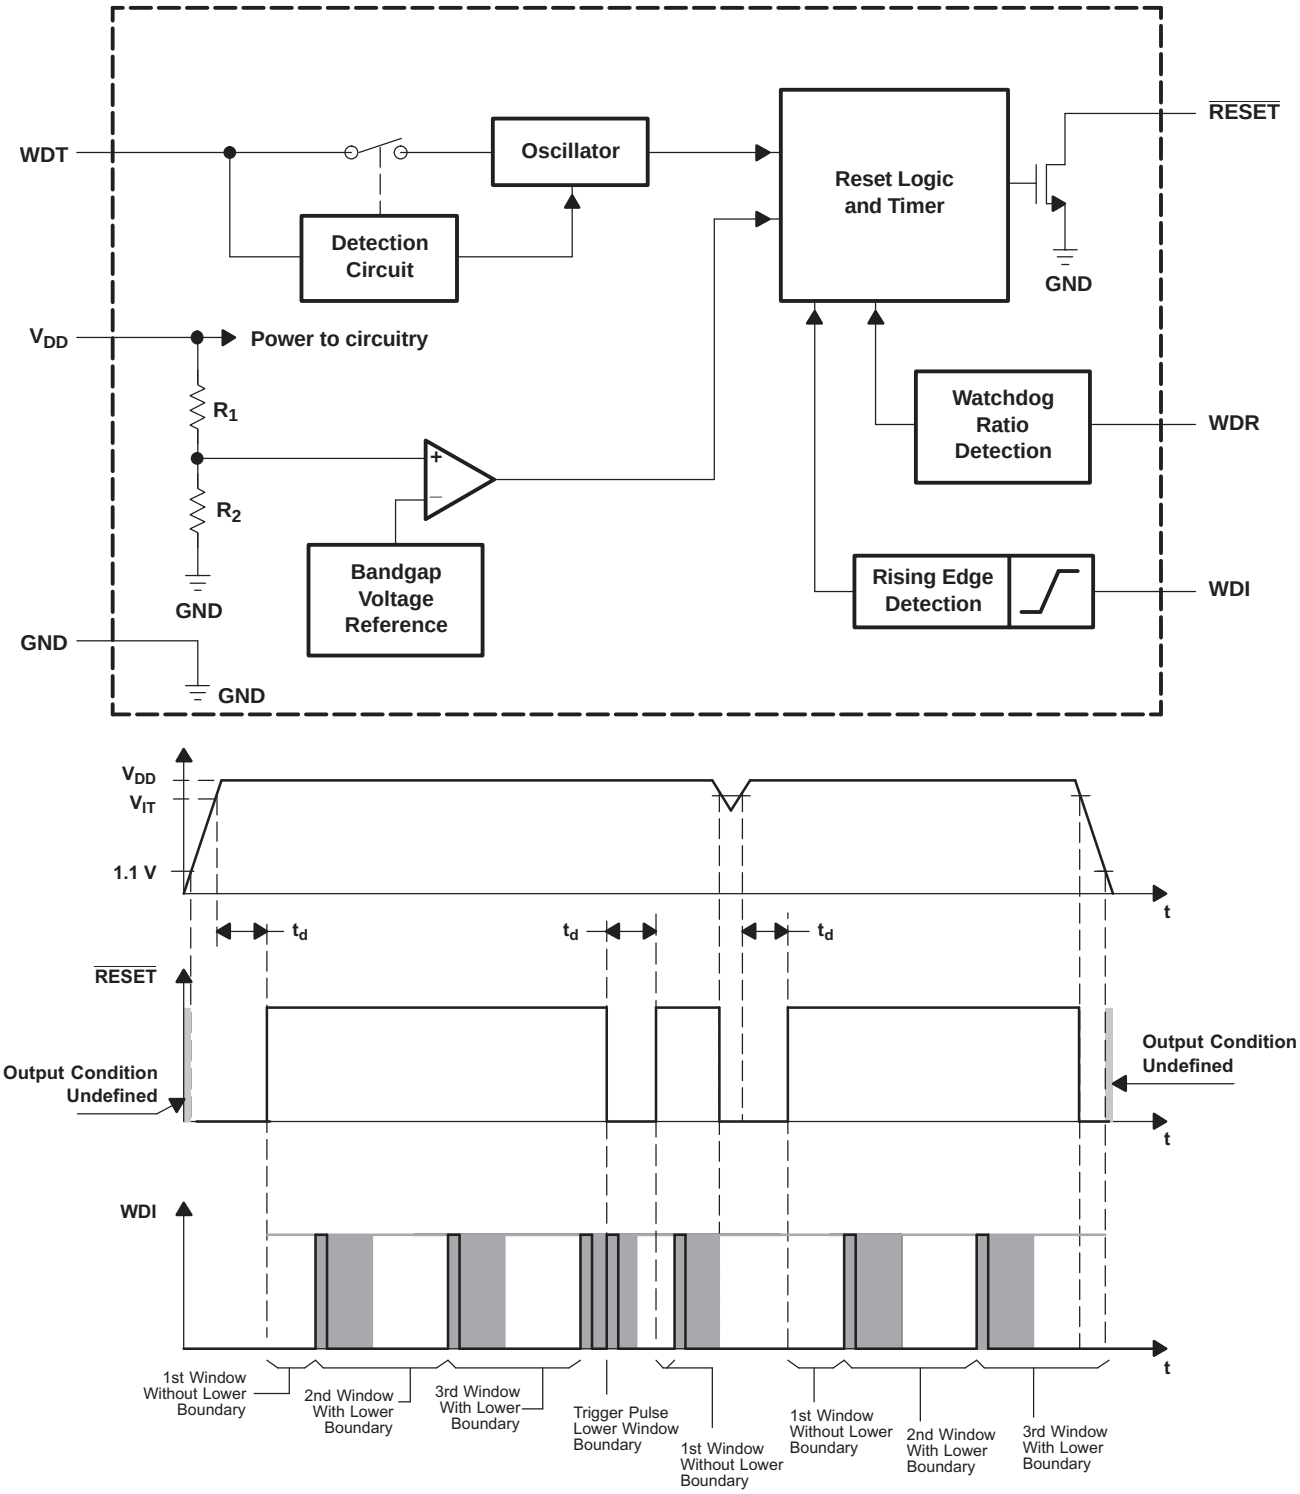
$V_{DD} > V_{IT}$	$\overline{\text{RESET}}$
0	L
1	H



The lower boundary of the watchdog window starts with the rising edge of the WDI trigger pulse. At the same time, all internal timers will be reset. If an external capacitor is used, the lower boundary is impacted due to the different oscillator frequency. This is described in more detail in the following section. The timing diagram and especially the shaded boundary is prepared in a nonreal ratio scale to better visualize the description.

DETAILED DESCRIPTION

IMPLEMENTED WINDOW-WATCHDOG SETTINGS

There are two different ways to set up the watchdog window. The first way is to use the implemented timing which is a default setting. Or, the default settings can be activated by wiring the WDT and WDR pin to V_{DD} or GND. There is a total of four different timings available with these settings. They are listed in the table below.

SELECTED OPERATION MODE		WINDOW FRAME	LOWER WINDOW FRAME
WDT = 0 V	WDR = 0 V	Max = 0.3 s	Max = 9.46 ms
		Typ = 0.25 s	Typ = 7.86 ms
		Min = 0.2 s	Min = 6.27 ms
	WDR = V_{DD}	Max = 0.3 s	Max = 2.43 ms
		Typ = 0.25 s	Typ = 2 ms
		Min = 0.2 s	Min = 1.58 ms
WDT = V_{DD}	WDR = 0 V	Max = 3 s	Max = 93.8 ms
		Typ = 2.5 s	Typ = 78.2 ms
		Min = 2 s	Min = 62.5 ms
	WDR = V_{DD}	Max = 3 s	Max = 23.5 ms
		Typ = 2.5 s	Typ = 19.6 ms
		Min = 2 s	Min = 15.6 ms

To visualize the values named in the table, a timing diagram was prepared. It is used to describe the upper and lower boundary settings. For an application, the important boundaries are the $t_{boundary,max}$ and $t_{window,min}$. Within these values, the watchdog timer should be retriggered to avoid a timeout condition or a boundary violation in the event of a trigger pulse in the lower boundary. The values in the table above are typical and worst case conditions. They are valid over the whole temperature range of –40°C to +85°C.

In the shaded area of Figure 7, it cannot be predicted if the device will detect a violation or not and release a reset. This is also the case between the boundary tolerance of $t_{boundary,min}$ and $t_{boundary,max}$ as well as between $t_{window,min}$ and $t_{window,max}$. It is important to set up the trigger pulses accordingly to avoid violations in these areas.

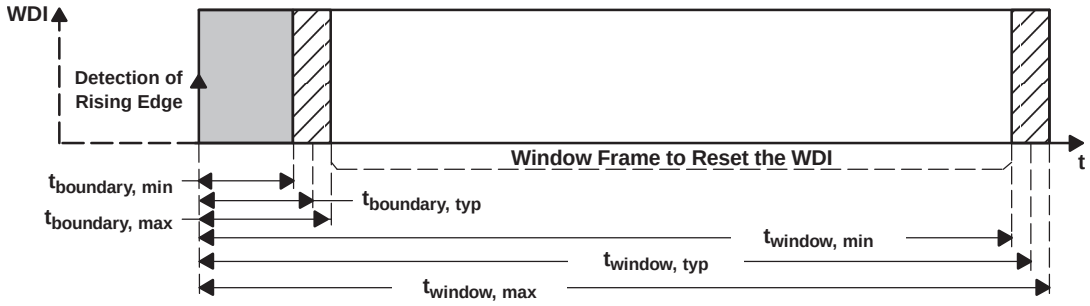

Figure 7. Upper and Lower Boundary Visualization

TIMING RULES OF WINDOW-WATCHDOG

After the reset of the supervisor is released, the lower boundary of the first WDI window is disabled. However, after the first WDI pulse low-to-high transition is detected, the lower boundary function of the window is enabled. All further WDI pulses will need to fit into the configured window frame.

PROGRAMMABLE WINDOW-WATCHDOG BY USING AN EXTERNAL CAPACITOR

The upper boundary of the watchdog timer can be set by an external capacitor connected between the WDT pin and GND. Common consumer electronic capacitors can be used to implement this feature. They should have low ESR and low tolerances since the tolerances have to be considered if the calculations are performed. The first formula is used to calculate the upper window frame. After calculating the upper window frame, the lower boundary can be calculated. As in the last example, the most important values are the $t_{boundary,max}$ and $t_{window,min}$. The trigger pulse has to fit into this window frame.

The external capacitor should have a value between a minimum of 155 pF and a maximum of 63 nF.

SELECTED OPERATION MODE		WINDOW FRAME
WDT = external capacitor $C_{(ext)}$	WDR = 0 V and WDR = V_{DD}	$t_{window,max} = 1.25 \times t_{window,typ}$
		$t_{window,min} = 0.75 \times t_{window,typ}$

$$t_{window,typ} = \left(\frac{C_{(ext)}}{15.55\ pF} + 1 \right) \times 6.25\ ms \quad (1)$$

LOWER BOUNDARY CALCULATION

The lower boundary can be calculated based on the values given in the switching characteristics. Additionally, facts have to be taken into account to verify that the lower boundary is where it is expected. Since the internal oscillator of the window watchdog is running free, any rising edge at the WDI pin will be taken into account at the next internal clock cycle. This happens regardless of the external source. Since the shift between internal and external clock is not known, it is best to consider the worst case condition for calculating this value.

SELECTED OPERATION MODE		LOWER BOUNDARY OF FRAME
WDT = external capacitor $C_{(ext)}$	WDR = 0 V	$t_{boundary,max} = t_{window,max} / 23.5$
		$t_{boundary,typ} = t_{window,typ} / 25.8$
		$t_{boundary,min} = t_{window,min} / 28.7$
	WDR = V_{DD}	$t_{boundary,max} = t_{window,max} / 51.6$
		$t_{boundary,typ} = t_{window,typ} / 64.5$
		$t_{boundary,min} = t_{window,min} / 92.7$

WATCHDOG SOFTWARE CONSIDERATIONS

To benefit from the window watchdog feature and help the watchdog timer monitor the software execution more closely, it is recommended that the watchdog be set and reset at different points in the program rather than pulsing the watchdog input periodically by using the prescaler of a microcontroller or DSP. Furthermore, the watchdog trigger pulses should be set to different timings inside the window frame to release a defined reset, if the program should hang in any subroutine. This allows the window watchdog to detect timeouts of the trigger pulse as well as pulses that distort the lower boundary.

POWER-UP CONSIDERATIONS

Many microcontrollers use general-purpose input/output (GPIO) pins that can be programmed to be either inputs or outputs. During power-up, these I/O pins are typically configured as inputs. If a GPIO pin is used to drive the WDI input pin of the TPS3813, then a pull-down resistor (shown as **R2** in Figure 8) should be added to keep the WDI pin from floating during power-up.

In applications where the WDI input may experience a negative voltage while V_{DD} is ramping between 0 V and 0.8 V, then the V_{DD} slew rate in this range should be greater than 10 V/s. A negative voltage on the WDI input along with a slew rate less than 10 V/s could result in a greatly reduced watchdog window time and reset output delay time.

APPLICATION EXAMPLE

A typical application example (see Figure 8) is used to describe the function of the watchdog in more detail.

To configure the window watchdog function, two pins are provided by the TPS3813. These pins set the window timeout and ratio.

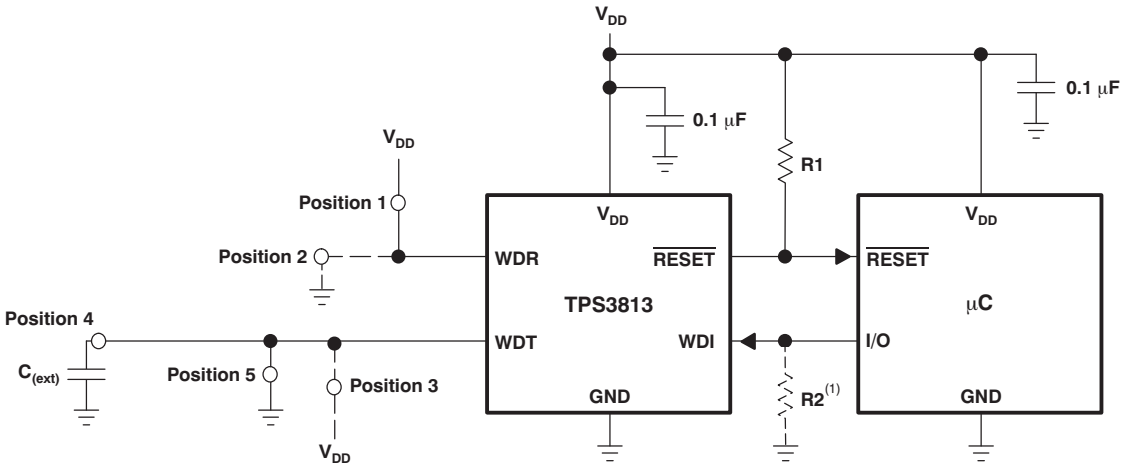
The window watchdog ratio is a fixed ratio, which determines the lower boundary of the window frame. It can be configured in two different frame sizes.

If the window watchdog ratio pin (WDR) is set to V_{DD}, Position 1 in Figure 8, then the lower window frame is a value based on a ratio calculation of the overall window timeout size: For the watchdog timeout pin (WDT) connected to GND, it is a ratio of 1:124.9, for WDT connected to V_{DD}, it is a ratio of 1:127.7, and for an external capacitor connected to WDT, it is a ratio of 1:64.5.

If the window watchdog ratio pin (WDR) is set to GND, Position 2, the lower window frame will be a value based on a ratio calculation of the overall window timeout size: For the watchdog timeout pin (WDT) connected to GND, it will be a ratio of 1:31.8, for WDT connected to V_{DD} it will be 1:32, and for an external capacitor connected to WDT it will be 1:25.8.

The watchdog timeout can be set in two fixed timings of 0.25 seconds and 2.5 seconds for the window or can by programmed by connecting a external capacitor with a low leakage current at WDT.

Example: If the watchdog timeout pin (WDT) is connected to V_{DD}, the timeout will be 2.5 seconds. If the window watchdog ratio pin (WDR) is set in this configuration to a ratio of 1:127.7 by connecting the pin to V_{DD}, the lower boundary is 19.6 ms.



(1) Use this pull-down resistor if a GPIO pin is used to drive the WDI input pin of the TPS3813 to keep the WDI pin from floating during power-up.

REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision F (August 2012) to Revision G **Page**

- Changed voltage from 0.6 V to 1.1 V for bottom figure 5

Changes from Revision E (October 2010) to Revision F **Page**

- Changed from Rev E to Rev F, August 2012 1
- Deleted the Pull-up resistor value row in the ROC table 3

Changes from Revision D (October 2010) to Revision E **Page**

- Added Pull-up resistor value to ROC table for $\overline{\text{RESET}}$ 3

Changes from Revision C (April, 2008) to Revision D **Page**

- Updated table pin descriptions 6
- Changed external capacitor value recommendations in paragraph 2 of *Programmable Window-Watchdog* section 9
- Added *Power-Up Considerations* section 9
- Changed Figure 8 10

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

OTHER QUALIFIED VERSIONS OF TPS3813I50, TPS3813K33 :

- Automotive: TPS3813I50-Q1, TPS3813K33-Q1
- Enhanced Product: TPS3813K33-EP

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

- Enhanced Product - Supports Defense, Aerospace and Medical Applications

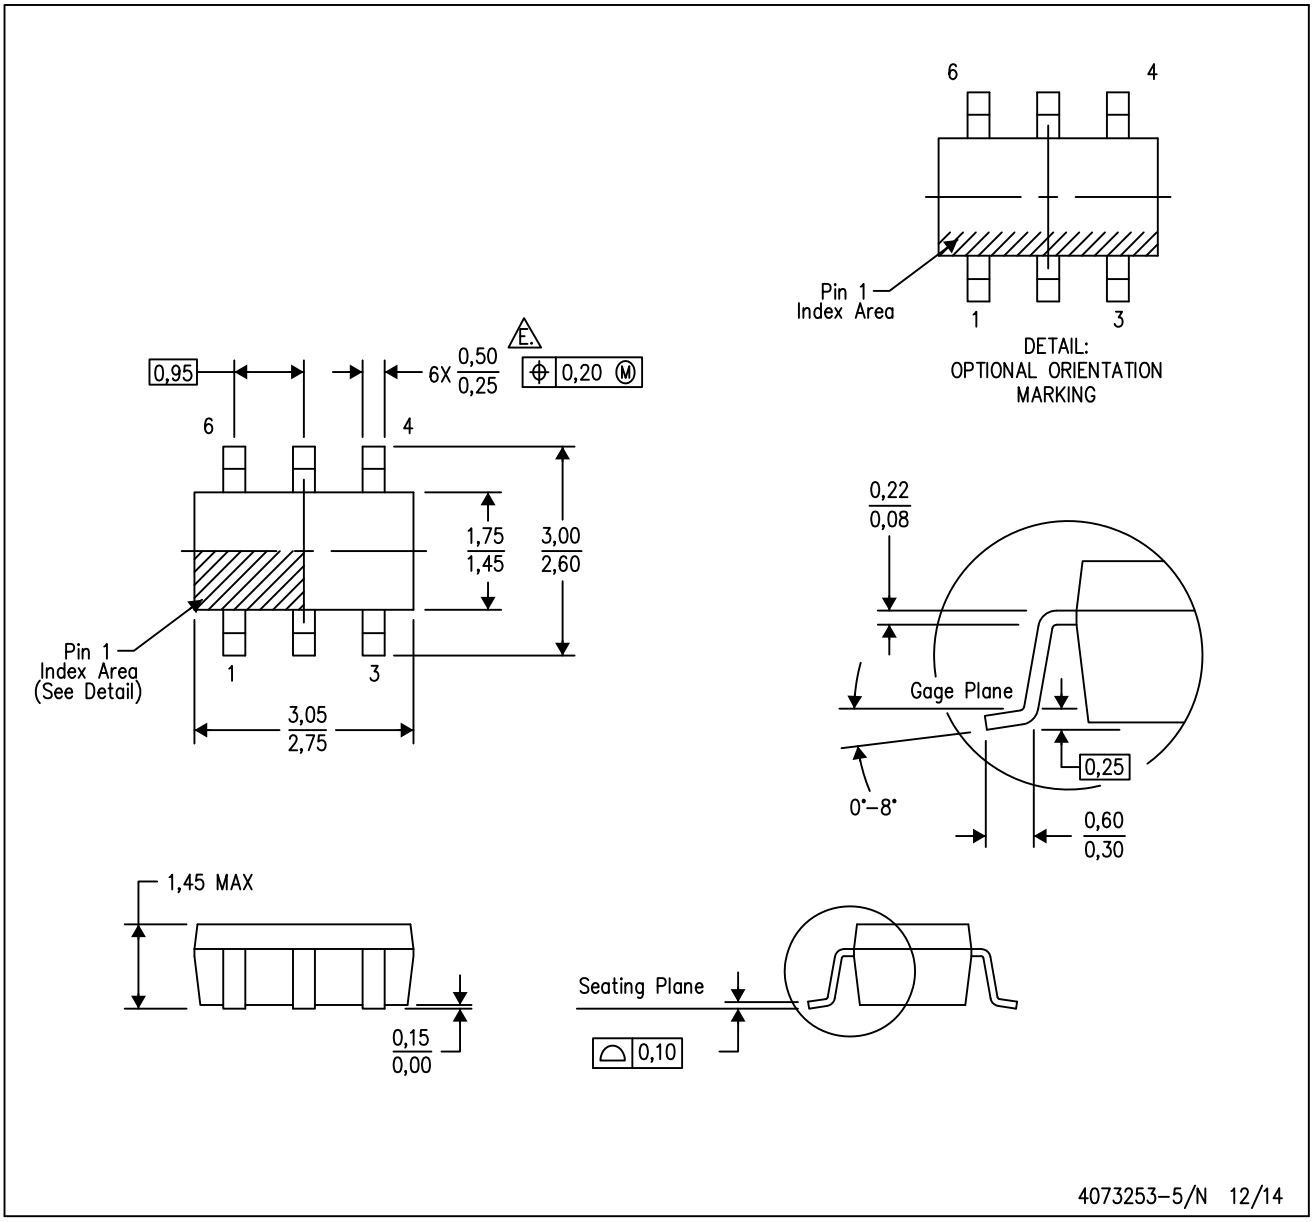
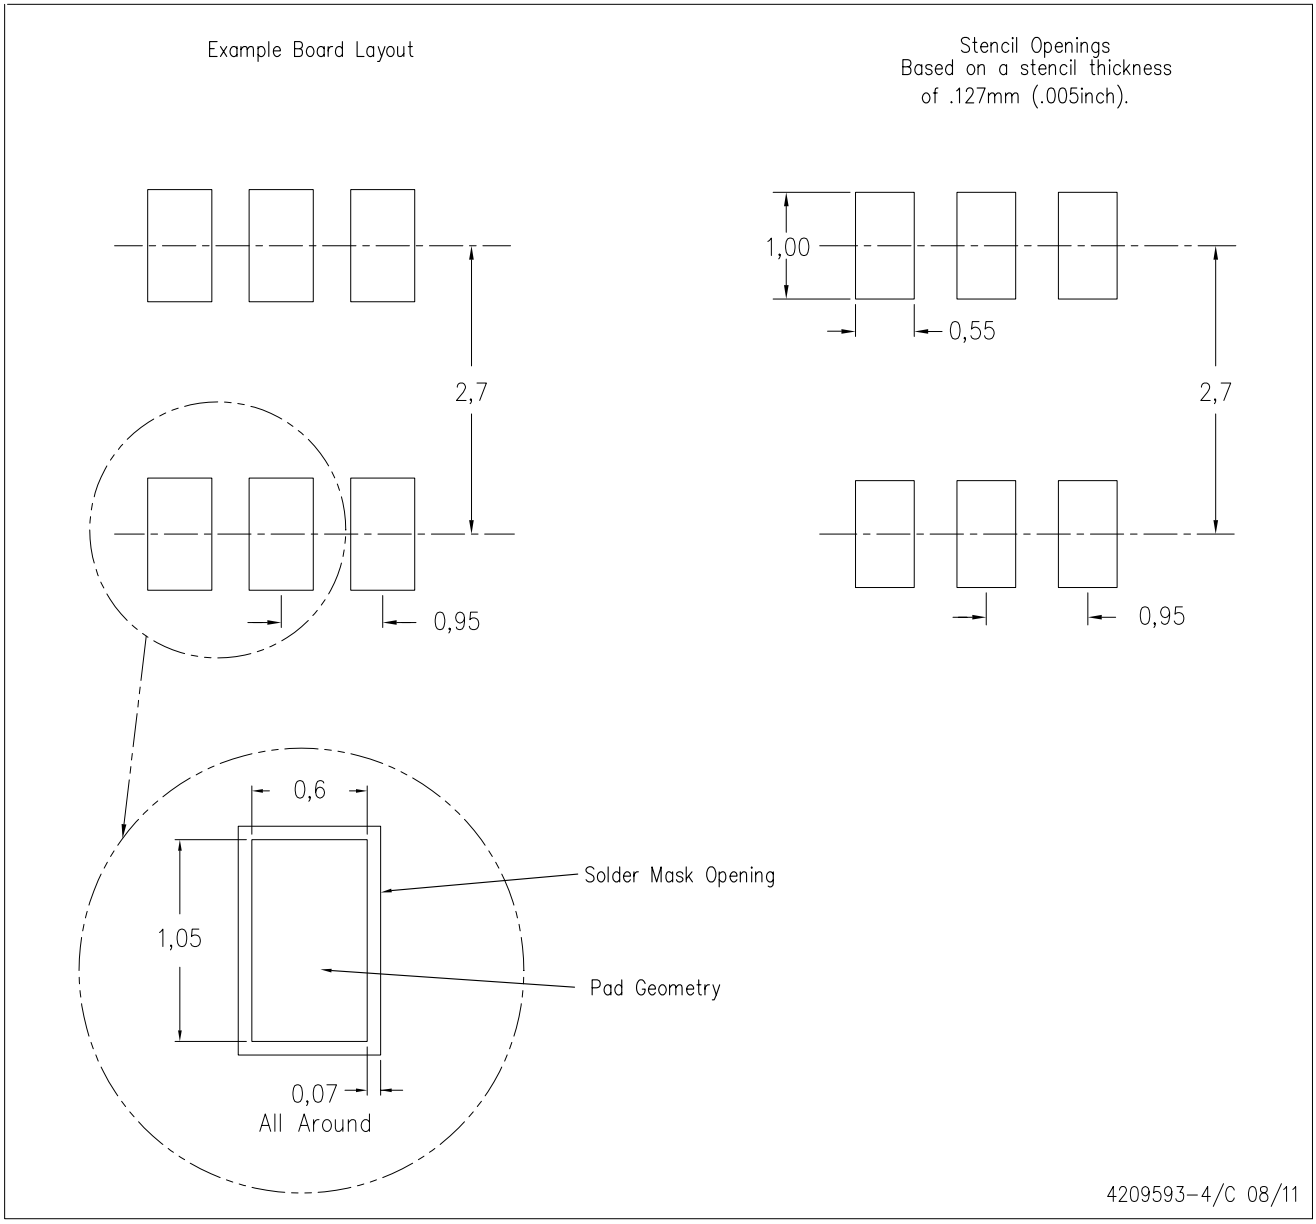
DBV (R–PDSO–G6) PLASTIC SMALL–OUTLINE PACKAGE



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
D. Leads 1,2,3 may be wider than leads 4,5,6 for package orientation.
E. Falls within JEDEC MO–178 Variation AB, except minimum lead width.

DBV (R–PDSO–G6) PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
D. Publication IPC–7351 is recommended for alternate designs.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC–7525 for other stencil recommendations.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
