MCOT128064HV-WM	128 x 6	x 64 OLED Module						
	Specification							
Version: 1	rsion: 1 Date: 17/03/2013							
	Revision							
1	13/03/2013 Fi	rst Issue						

Display F						
Resolution	128 x 64	7				
Appearance	White on Black					
Logic Voltage	3~5V		COHS			
Interface	Multi	compliant				
Module Size	60.50 x 37.00 x 2.00mm					
Operating Temperature	-40°C ~ +80°C	Box Quantity Weight / Displa				
Construction	СОТ					

* - For full design functionality, please use this specification in conjunction with the SSD1309 specification. (Provided Separately)

Display Accessories						
Part Number	Description	AC				

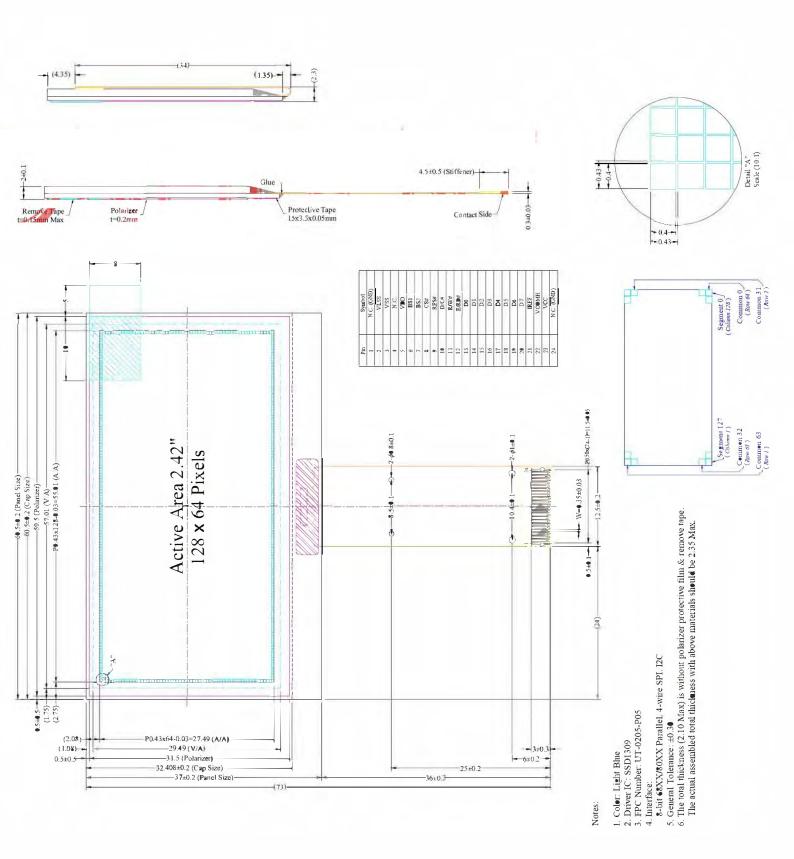

Optional Variants							
Appearance	Voltage						

Functions and Features

- 128X64 Graphic
- Built-in controller
- viewing angle Free
- Wide Temperature -40°C ~ +80°C (Operating)
- RoHS compliant

Mechanical Specification

Item	Description	
Product No.	MCOT128064HV-WM	
Inch	2.42"	
Color	White	
Active Area	55.01(W)×27.49(H)	mm
Panel Size	60.50(W)×37.00(H)×2.00(D)	mm
Dot Size	0.4(W)×0.4(H)	mm
Dot Pitch	0.43(W)×0.43(H)	mm
Display Format	128×64	
Duty Ratio	1/64 Duty	Duty
Controller	SSD1309 or Equivalent	
Operation Temperature	-40~80	°C
Storage Temperature	40~85 MANUFACTURE • SUPPLY	°C
Response Time	≤10	us
Assembly	Connecter	

Pin Description

Power Supply

Pin Number	Symbol	Туре	Function
5	VDD		Power Supply for Logic Circuit
			This is a voltage supply pin. It must be connected to external source.
			Ground of Logic Circuit
3	VSS		This is a ground pin. It also acts as a reference for the logic pins. It must
		P	be connected to external ground.
] '	Power Supply for OEL Panel
23	VCC		This is the most positive voltage supply pin of the chip. It must be
			supplied externally.
2	VLSS		Ground of Analog Circuit
2	VLOO		This is an analog ground pin. It should be connected to VSS externally.

Dirver

Pin Number	Symbol	Туре	Function
			Current reference for Brightness Adjustment
21	IREF		This pin is segment current reference pin. A resistor should be connected
	eele	NI o	between this pin and VSS. Set the current at 10μA maximum.
		7	Voltage Output High Level for COM Signal
22	VCOMH	0	This pin is the input pin for the voltage output high level for COM signals.
			A tantalum capacitor should be connected between this pin and VSS.

Interface

Pin Number	Symbol	Туре	Function				
			Communicating Protocol Select				
			These pins are MCU interface se	election input. See th	e following table:		
6	BS1			BS1	BS2		
	BS2		I2C	1	0		
7	D32		4-wire Serial	0	0		
			8-bit 68xx Parallel	0	1		
			8-bit 80xx Parallel	1	1		
			Power Reset for Controller and	d Driver			
9	RES#		This pin is reset signal input. Wh	en the pin is low, init	ialization of the chip		
			is executed. Keep this pin pull hi	gh during normal ope	eration.		
			Chip Select				
8	CS#		This pin is the chip select input.	The chip is enabled f	or MCU		
			communication only when CS# i	s pulled low.			
			Data/Command Control				
			This pin is Data/Command contr	ol pin. When the pin	is pulled high, the		
			input at D7~D0 will be interpreted as display data. When the pin is pulled				
			low, the input at D7~D0 will be transferred to the command register.				
10	D/C#		When the pin is pulled high and serial interface mode is selected, the data				
			at SDIN will be interpreted as data. When it is pulled low, the data at				
			SDIN will be transferred to the co	ommand register. In	I2C mode, this pin		
			acts as SA0 for slave address se	election. For detail re	lationship to MCU		
	ESIG	N •	interface signals, please refer to	the Tim <mark>i</mark> ng Characte	ristics Diagrams.		
			Read/Write Enable or Read				
			This pin is MCU interface input.	When interfacing to a	a 68XX-series		
			microprocessor, this pin will be ι	ised as the Enable (E	E) signal. Read/write		
12	E/RD#		operation is initiated when this p	in is pulled high and	the CS# is pulled		
12			low. When connecting to an 80X	X-microprocessor, th	nis pin receives the		
			Read (RD#) signal. Data read op	peration is initiated w	hen this pin is pulled		
			low and CS# is pulled low.				
			When serial mode is selected, the	is pin must be conne	ected to VSS.		
			Read/Write Select or Write				
			This pin is MCU interface input.	When interfacing to a	a 68XX-series		
11	R/W#		microprocessor, this pin will be ι	ised as Read/Write (l	R/W#) selection		
	INVIT		input. Pull this pin to "High" for re	ead mode and pull it	to "Low" for write		
			mode.				
			When 80XX interface mode is se	elected, this pin will b	e the Write (WR#)		

			input. Data write operation is initiated when this pin is pulled low and the
			CS# is pulled low.
			When serial or I2C mode is selected, this pin must be connected to VSS.
			Host Data Input/Output Bus
			These pins are 8-bit bi-directional data bus to be connected to the
			microprocessor's data bus. When serial mode is selected, D1 will be the
13~20	D0~D7	I/O	serial data input SDIN and D0 will be the serial clock input SCLK. When
			I2C mode is selected, D2, D1 should be tired together and serve as
			SDAOUT, SDAIN in application and D0 is the serial clock input, SCL.
			Unused pins must be connected to VSS except for D2 in serial mode.

Reserve

Pin Number	Symbol	Туре	Function
4	N.C.	-	Reserved Pin The N.C. pin between function pins is reserved for compatible and flexible design.
1, 24	N.C. (GND)	- D	Reserved Pin (Supporting Pin) The supporting pins can reduce the influences from stresses on the function pins. These pins must be connected to external ground as the ESD protection circuit.

DESIGN • MANUFACTURE • SUPPLY

Block Diagram

MCU Interface Selection: BS1 and BS2

Pins connected to MCU interface: D7~D0, E/RD#, R/W#, D/C#, RES#, and CS#

C1, C3: 0.1µF

C2: 4.7µF

C4: 10µF

C5: 4.7µF / 25V Tantalum Capacitor

R1: $910k\Omega$, R1 = (Voltage at IREF - BGGND) / IREF

DC Characteristics

Item	Symbol	Condition	Min.	Туре	Max.	Unit
Supply Voltage for Logic	Vdd		1.65	3~5	5.3	Volt
Supply Voltage for Display	Vcc	Note 5	12.5	13.0	13.5	Volt
Operating Current for VDD	IDD		-	180	300	μΑ
		Note 6	-	18.5	23.1	mA
Operating Current for VCC	Icc	Note 7	-	27.1	33.9	mA
		Note 8	-	42.3	52.9	mA
Sleep Mode Current for VDD	IDD,SLEEP		-	1	5	μΑ
Sleep Mode Current for VCC	ICC,SLEEP		-	2	10	μΑ

Note 5: Brightness (Lbr) and Supply Voltage for Display (VCC) are subject to the change of the panel characteristics and the customer's request.

Note 6: VDD = 2.8V, VCC = 13.0V, 30% Display Area Turn on.

Note 7: VDD = 2.8V, VCC = 13.0V, 50% Display Area Turn on.

Note 8: VDD = 2.8V, VCC = 13.0V, 100% Display Area Turn on.

Optical Characteristics

Item	Symbol	Conditions	Min.	Тур	Max.	Unit
Brightness(White)	Lbr	Note 5	60	80	-	cd/m²
C.I.E. (White)	(X)	C F 4024	0.25	0.29	0.33	
	(Y)	C.I.E 1931	0.27	0.31	0.35	
Dark Room Contrast	CR	-	-	>10000:1	_	
Viewing anglerange	-	-	-	Free	-	Degree

^{*} Optical measurement taken at VDD = 2.8V, VCC = 13.0V.

Absolute Maximum rating

Item	Symbol	Min.	Тур.	Max.	Unit	Notes
Supply Voltage for Logic	VDD	-0.3	-	5.5	Volt	1,2
Supply Voltage for Display	Vcc	0	-	15	Volt	1,2
Life Time (55 cd/m²)			70,000		Hour	3

Note 1: All the above voltages are on the basis of "VSS = 0V".

Note 2: When this module is used beyond the above absolute maximum ratings, permanent breakage of the module may occur. Also, for normal operations, it is desirable to use this module under the conditions according to Section 3. "Optics". If this module is used beyond these conditions, malfunctioning of the module can occur and the reliability of the module may deteriorate.

Note 3: VCC = 13.0V, Ta = 25°C, 50% Checkerboard.

AC Characteristics

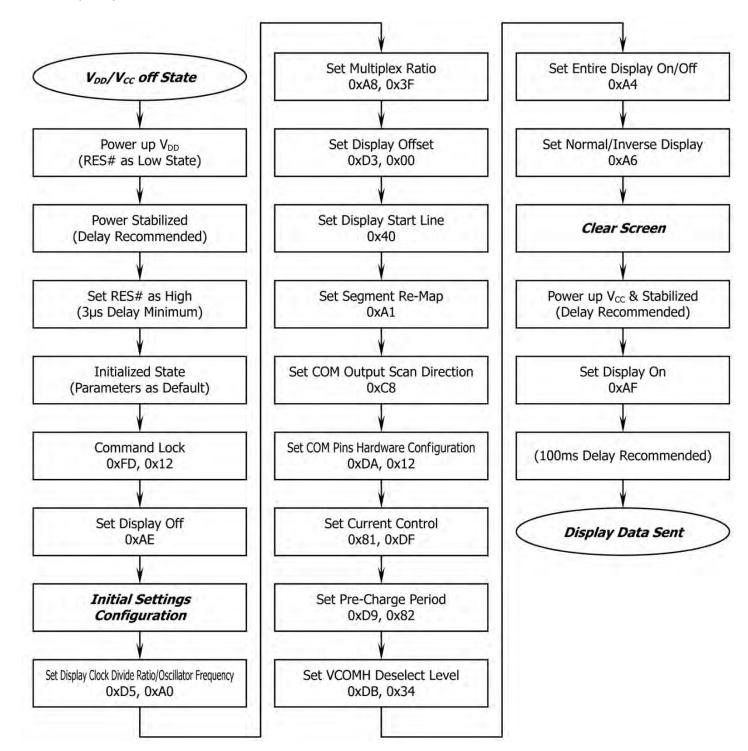

Please refer "SSD1309 specification.

Actual Application Example

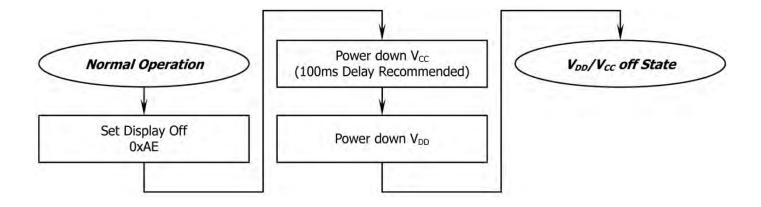

Command usage and explanation of an actual example

<Power up Sequence>

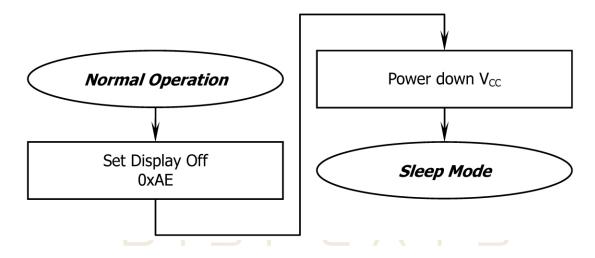

If the noise is accidentally occurred at the displaying window during the operation, please reset the display in order to recover the display function.

<Power down Sequence>

<Entering Sleep Mode>

<Exiting Sleep Mode>
