

Dual High Frequency Differential Amplifiers For Low Power Applications Up to 500MHz

November 1996

Features

- Power Gain 23dB (Typ) 200MHz
- Noise Figure 4.6dB (Typ)..... 200MHz
- Two Differential Amplifiers on a Common Substrate
- Independently Accessible Inputs and Outputs
- Full Military Temperature Range -55°C to 125°C

Applications

- VHF Amplifiers
- VHF Mixers
- Multifunction Combinations - RF/Mixer/Oscillator; Converter/IF
- IF Amplifiers (Differential and/or Cascode)
- Product Detectors
- Doubly Balanced Modulators and Demodulators
- Balanced Quadrature Detectors
- Cascade Limiters
- Synchronous Detectors
- Balanced Mixers
- Synthesizers
- Balanced (Push-Pull) Cascode Amplifiers
- Sense Amplifiers

Description

The CA3049T and CA3102 consist of two independent differential amplifiers with associated constant current transistors on a common monolithic substrate. The six transistors which comprise the amplifiers are general purpose devices which exhibit low 1/f noise and a value of f_T in excess of 1GHz. These feature make the CA3049T and CA3102 useful from DC to 500MHz. Bias and load resistors have been omitted to provide maximum application flexibility.

The monolithic construction of the CA3049T and CA3102 provides close electrical and thermal matching of the amplifiers. This feature makes these devices particularly useful in dual channel applications where matched performance of the two channels is required.

The CA3102 is like the CA3049T except that it has a separate substrate connection for greater design flexibility.

Formerly Developmental Type No. TA6228.

Thermal Information

Thermal Resistance (Typical, Note 2)	θ_{JA} (°C/W)
Metal Can Package	225
PDIP Package	130
SOIC Package	140
Maximum Power Dissipation (Any One Transistor)	300mW
Maximum Junction Temperature (Can Package)	175°C
Maximum Junction Temperature (Plastic Package)	150°C
Maximum Storage Temperature Range	-65°C to 150°C
Maximum Lead Temperature (Soldering 10s)	300°C
(SOIC - Lead Tips Only)	

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

- The collector of each transistor of the CA3049T and CA3102 is isolated from the substrate by an integral diode. The substrate (Terminal 9) must be connected to the most negative point in the external circuit to maintain isolation between transistors and to provide for normal transistor action.
- θ_{JA} is measured with the component mounted on an evaluation PC board in free air.
