

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

32-bit MCUs (up to 2 MB Live-Update Flash and 512 KB SRAM) with FPU, Audio and Graphics Interfaces, HS USB, Ethernet, and Advanced Analog

Operating Conditions

- 2.1V to 3.6V, -40°C to +85°C, DC to 200 MHz
- 2.1V to 3.6V, -40°C to +125°C (Planned)

Core: 200 MHz (up to 330 DMIPS) M-Class

- 16 KB I-Cache, 4 KB D-Cache
- FPU for fast single- and double-precision math
- MMU for optimum embedded OS execution
- microMIPS™ mode for up to 35% smaller code size
- DSP-enhanced core:
 - Four 64-bit accumulators
 - Single-cycle MAC, saturating, and fractional math
 - IEEE 754-compliant
- Code-efficient (C and Assembly) architecture

Clock Management

- Programmable PLLs and oscillator clock sources
- Fail-Safe Clock Monitor (FSCM)
- Independent Watchdog Timers (WDT) and Deadman Timer (DMT)
- Fast wake-up and start-up

Power Management

- Low-power modes (Sleep and Idle)
- Integrated Power-on Reset (POR) and Brown-out Reset (BOR)

Memory Interfaces

- 50 MHz External Bus Interface (EBI)
- 50 MHz Serial Quad Interface (SQI)

Audio and Graphics Interfaces

- Graphics interfaces: EBI or PMP
- Audio data communication: I²S, LJ, and RJ
- Audio control interfaces: SPI and I²C™
- Audio master clock: Fractional clock frequencies with USB synchronization

High-Speed (HS) Communication Interfaces (with Dedicated DMA)

- USB 2.0-compliant Hi-Speed On-The-Go (OTG) controller
- 10/100 Mbps Ethernet MAC with MII and RMII interface

Security Features

- Crypto Engine with RNG for data encryption/decryption and authentication (AES, 3DES, SHA, MD5, and HMAC)
- Advanced memory protection:
 - Peripheral and memory region access control

Direct Memory Access (DMA)

- Eight channels with automatic data size detection
- Programmable Cyclic Redundancy Check (CRC)

Packages

| Type | QFN | | TQFP | | | VTLA | LQFP |
|--------------------|------------|------------|------------|------------|------------|------------|---------------|
| Pin Count | 64 | 64 | 100 | 144 | 124 | 144 | |
| I/O Pins (up to) | 53 | 53 | 78 | 120 | 98 | 120 | |
| Contact/Lead Pitch | 0.50 mm | 0.50 mm | 0.40 mm | 0.50 mm | 0.40 mm | 0.50 mm | 0.50 mm |
| Dimensions | 9x9x0.9 mm | 10x10x1 mm | 12x12x1 mm | 14x14x1 mm | 16x16x1 mm | 9x9x0.9 mm | 20x20x1.40 mm |

Advanced Analog Features

- 12-bit ADC module:
 - 18 Msps with up to six Sample and Hold (S&H) circuits (five dedicated and one shared)
 - Up to 48 analog inputs
 - Can operate during Sleep and Idle modes
 - Multiple trigger sources
 - Six Digital Comparators and six Digital Filters
- Two comparators with 32 programmable voltage references
- Temperature sensor with ±2°C accuracy

Communication Interfaces

- Two CAN modules (with dedicated DMA channels):
 - 2.0B Active with DeviceNet™ addressing support
- Six UART modules (25 Mbps):
 - Supports up to LIN 2.1 and IrDA® protocols
- Six 4-wire SPI modules (up to 50 MHz)
- SQI configurable as an additional SPI module (50 MHz)
- Five I²C modules (up to 1 Mbaud) with SMBus support
- Parallel Master Port (PMP)
- Peripheral Pin Select (PPS) to enable function remap

Timers/Output Compare/Input Capture

- Nine 16-bit or up to four 32-bit timers/counters
- Nine Output Compare (OC) modules
- Nine Input Capture (IC) modules
- Real-Time Clock and Calendar (RTCC) module

Input/Output

- 5V-tolerant pins with up to 32 mA source/sink
- Selectable open drain, pull-ups, pull-downs, and slew rate controls
- External interrupts on all I/O pins
- PPS to enable function remap

Qualification and Class B Support

- AEC-Q100 REVG (Grade 1 -40°C to +125°C) Planned
- Class B Safety Library, IEC 60730
- Back-up internal oscillator

Debugger Development Support

- In-circuit and in-application programming
- 4-wire MIPS® Enhanced JTAG interface
- Unlimited software and 12 complex breakpoints
- IEEE 1149.2-compatible (JTAG) boundary scan
- Non-intrusive hardware-based instruction trace

Software and Tools Support

- C/C++ compiler with native DSP/fractional and FPU support
- MPLAB® Harmony Integrated Software Framework
- TCP/IP, USB, Graphics, and mTouch™ middleware
- MFi, Android™, and Bluetooth® audio frameworks
- RTOS Kernels: Express Logic ThreadX, FreeRTOS™, OPENRTOS®, Micrium® µC/OS™, and SEGGER embOS®

TABLE 1: PIC32MZ EF FAMILY FEATURES

| Device | Program Memory (KB) | Data Memory (KB) | Pins | Packages | Boot Flash Memory (KB) | Remappable Peripherals | | | | | Crypto | RNG | DMA Channels (Programmable/Dedicated) | ADC (Channels) | Analog Comparators | USB 2.0 HS OTG | I ² C™ | PMP | EBI | SQI | RTCC | Ethernet | I/O Pins | JTAG | Trace | |

- Note**
- 1: The RPN pins can be used by remappable peripherals. See [Table 1](#) for the available peripherals and [Section 12.4 “Peripheral Pin Select \(PPS\)”](#) for restrictions.
 - 2: Every I/O port pin (RBx-RGx) can be used as a change notification pin (CNBx-CNGx). See [Section 12.0 “I/O Ports”](#) for more information.
 - 3: Shaded pins are 5V tolerant.
 - 4: The metal plane at the bottom of the device is not connected to any pins and is recommended to be connected to Vss externally.

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at www.microchip.com to receive the most current information on all of our products.

Referenced Sources

This device data sheet is based on the following individual sections of the *"PIC32 Family Reference Manual"*. These documents should be considered as the general reference for the operation of a particular module or device feature.

Note: To access the documents listed below, browse the documentation section of the Microchip website (www.microchip.com).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

1.0 DEVICE OVERVIEW

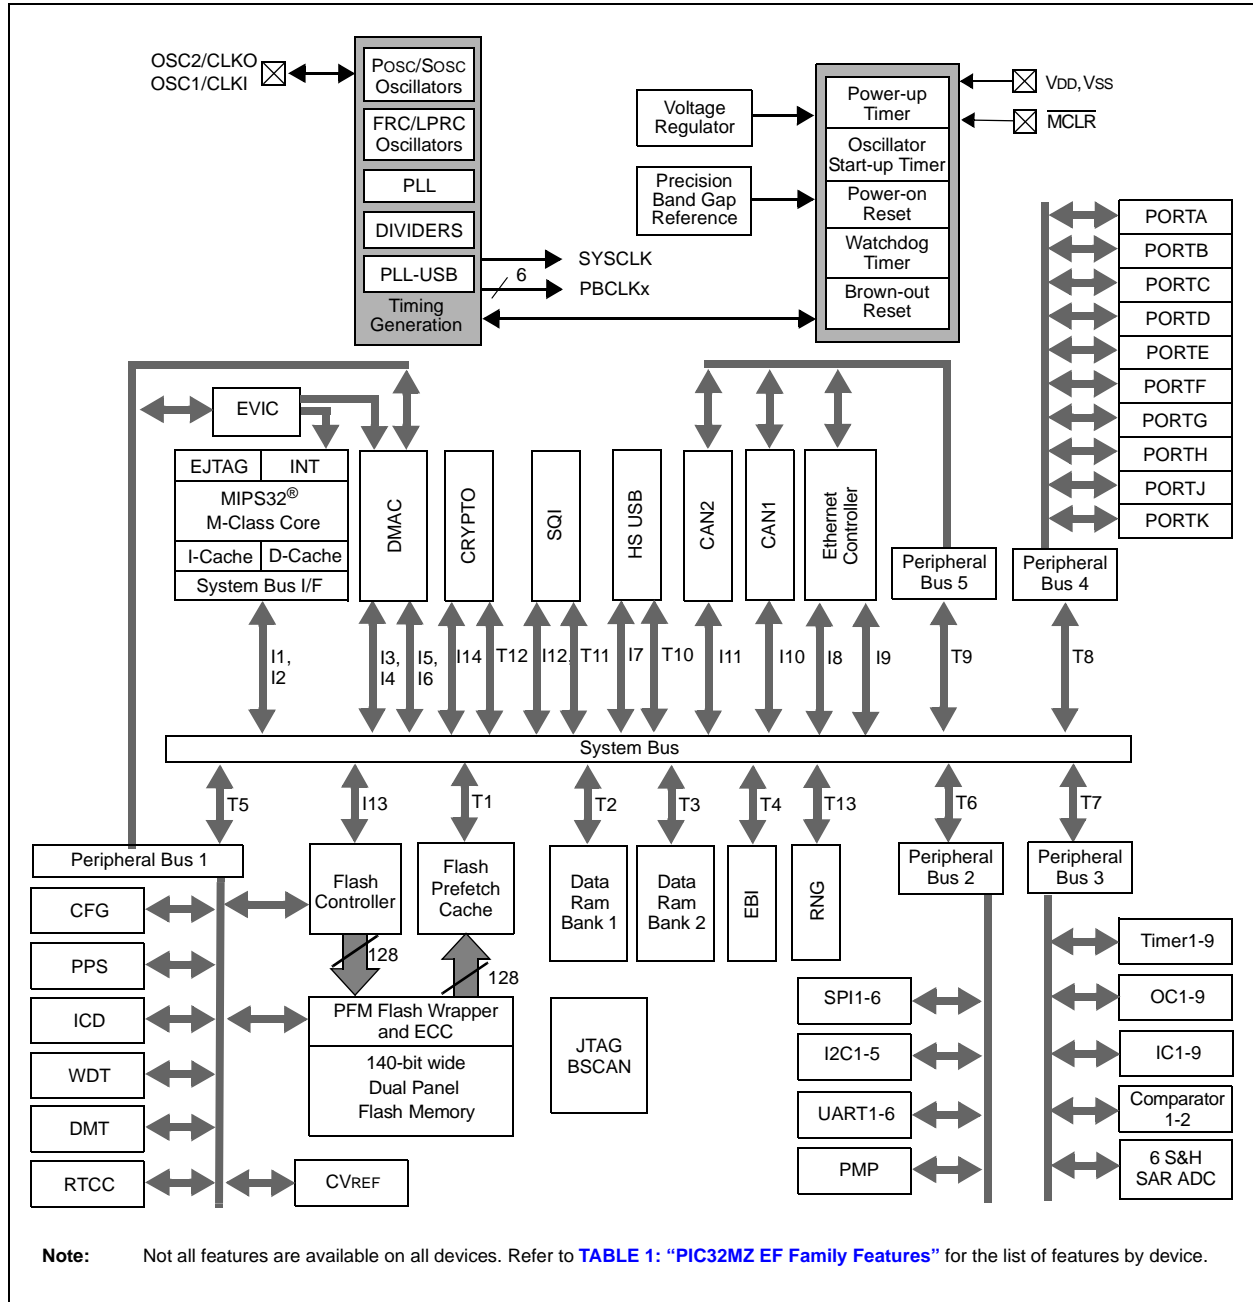

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

This data sheet contains device-specific information for PIC32MZ EF devices.

Figure 1-1 illustrates a general block diagram of the core and peripheral modules in the PIC32MZ EF family of devices.

Table 1-21 through Table 1-22 list the pinout I/O descriptions for the pins shown in the device pin tables (see Table 2 through Table 5).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

2.0 GUIDELINES FOR GETTING STARTED WITH 32-BIT MICROCONTROLLERS

Note 1: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

2.1 Basic Connection Requirements

Getting started with the PIC32MZ EF family of 32-bit Microcontrollers (MCUs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and VSS pins (see [2.2 “Decoupling Capacitors”](#))
- All AVDD and AVSS pins, even if the ADC module is not used (see [2.2 “Decoupling Capacitors”](#))
- MCLR pin (see [2.3 “Master Clear \(MCLR\) Pin”](#))
- PGECx/PGEDx pins, used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see [2.4 “ICSP Pins”](#))
- OSC1 and OSC2 pins, when external oscillator source is used (see [2.7 “External Oscillator Pins”](#))

The following pin(s) may be required as well:

VREF+/VREF- pins, used when external voltage reference for the ADC module is implemented.

Note: The AVDD and AVSS pins must be connected, regardless of ADC use and the ADC voltage reference source.

2.2 Decoupling Capacitors

The use of decoupling capacitors on power supply pins, such as VDD, VSS, AVDD and AVSS is required. See [Figure 2-1](#).

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A value of 0.1 μF (100 nF), 10-20V is recommended. The capacitor should be a low Equivalent Series Resistance (low-ESR) capacitor and have resonance frequency in the range of 20 MHz and higher. It is further recommended that ceramic capacitors be used.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended that the capacitors be placed on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high frequency noise:** If the board is experiencing high frequency noise, upward of tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 μF to 0.001 μF . Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 μF in parallel with 0.001 μF .
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum thereby reducing PCB track inductance.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION

2.2.1 BULK CAPACITORS

The use of a bulk capacitor is recommended to improve power supply stability. Typical values range from 4.7 µF to 47 µF. This capacitor should be located as close to the device as possible.

2.3 Master Clear ($\overline{\text{MCLR}}$) Pin

The $\overline{\text{MCLR}}$ pin provides for two specific device functions:

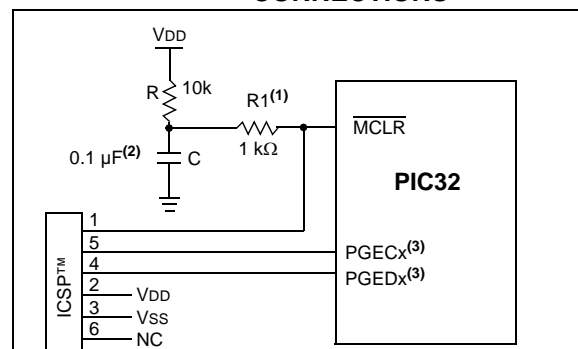

- Device Reset
- Device programming and debugging

Pulling The $\overline{\text{MCLR}}$ pin low generates either a device Reset or a POR, depending on the setting of the SMCLR bit (DEVCFG0<15>). Figure 2-2 illustrates a typical $\overline{\text{MCLR}}$ circuit. During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the $\overline{\text{MCLR}}$ pin. Consequently, specific voltage levels (V_{IH} and V_{IL}) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as illustrated in Figure 2-2, it is recommended that the capacitor C be isolated from the $\overline{\text{MCLR}}$ pin during programming and debugging operations.

Place the components illustrated in Figure 2-2 within one-quarter inch (6 mm) from the $\overline{\text{MCLR}}$ pin.

FIGURE 2-2: EXAMPLE OF $\overline{\text{MCLR}}$ PIN CONNECTIONS

- Note 1:** $470\Omega \leq R1 \leq 1\Omega$ will limit any current flowing into $\overline{\text{MCLR}}$ from the external capacitor C, in the event of $\overline{\text{MCLR}}$ pin breakdown, due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS). Ensure that the $\overline{\text{MCLR}}$ pin V_{IH} and V_{IL} specifications are met without interfering with the Debug/Programmer tools.
- Note 2:** The capacitor can be sized to prevent unintentional Resets from brief glitches or to extend the device Reset period during POR.
- Note 3:** No pull-ups or bypass capacitors are allowed on active debug/program PGECx/PGEDx pins.

2.4 ICSP Pins

The PGECx and PGEDx pins are used for ICSP and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (V_{IH}) and input low (V_{IL}) requirements.

Ensure that the “Communication Channel Select” (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB[®] ICD 3 or MPLAB REAL ICE[™].

For more information on ICD 3 and REAL ICE connection requirements, refer to the following documents that are available from the Microchip web site.

- “Using MPLAB[®] ICD 3” (poster) (DS50001765)
- “MPLAB[®] ICD 3 Design Advisory” (DS50001764)
- “MPLAB[®] REAL ICE[™] In-Circuit Debugger User’s Guide” (DS50001616)
- “Using MPLAB[®] REAL ICE[™] Emulator” (poster) (DS50001749)

2.5 JTAG

The TMS, TDO, TDI and TCK pins are used for testing and debugging according to the Joint Test Action Group (JTAG) standard. It is recommended to keep the trace length between the JTAG connector and the JTAG pins on the device as short as possible. If the JTAG connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the TMS, TDO, TDI and TCK pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (V_{IH}) and input low (V_{IL}) requirements.

2.6 Trace

The trace pins can be connected to a hardware trace-enabled programmer to provide a compressed real-time instruction trace. When used for trace, the TRD3, TRD2, TRD1, TRD0 and TRCLK pins should be dedicated for this use. The trace hardware requires a 22 Ohm series resistor between the trace pins and the trace connector.

2.7 External Oscillator Pins

Many MCUs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to [Section 8.0 “Oscillator Configuration”](#) for details).

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is illustrated in [Figure 2-3](#).

FIGURE 2-3: SUGGESTED OSCILLATOR CIRCUIT PLACEMENT

2.8 Unused I/Os

Unused I/O pins should not be allowed to float as inputs. They can be configured as outputs and driven to a logic-low state.

Alternatively, inputs can be reserved by connecting the pin to V_{SS} through a 1k to 10k resistor and configuring the pin as an input.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

2.9 Designing for High-Speed Peripherals

The PIC32MZ EF family devices have peripherals that operate at frequencies much higher than typical for an embedded environment. [Table 2-1](#) lists the peripherals that produce high-speed signals on their external pins:

TABLE 2-1: PERIPHERALS THAT PRODUCE HS SIGNALS ON EXTERNAL PINS

| Peripheral | High-Speed Signal Pins | Maximum Speed on Signal Pin |
|------------|------------------------|-----------------------------|
| EBI | EBIAX, EBIDx | 50 MHz |
| SQI1 | SQICLK, SQICSx, SQIDx | 50 MHz |
| HS USB | D+, D- | 480 MHz |

Due to these high-speed signals, it is important to consider several factors when designing a product that uses these peripherals, as well as the PCB on which these components will be placed. Adhering to these recommendations will help achieve the following goals:

- Minimize the effects of electromagnetic interference to the proper operation of the product
- Ensure signals arrive at their intended destination at the same time
- Minimize crosstalk
- Maintain signal integrity
- Reduce system noise
- Minimize ground bounce and power sag

2.9.1 SYSTEM DESIGN

2.9.1.1 Impedance Matching

When selecting parts to place on high-speed buses, particularly the SQI bus, if the impedance of the peripheral device does not match the impedance of the pins on the PIC32MZ EF device to which it is connected, signal reflections could result, thereby degrading the quality of the signal.

If it is not possible to select a product that matches impedance, place a series resistor at the load to create the matching impedance. See [Figure 2-4](#) for an example.

FIGURE 2-4: SERIES RESISTOR

2.9.1.2 PCB Layout Recommendations

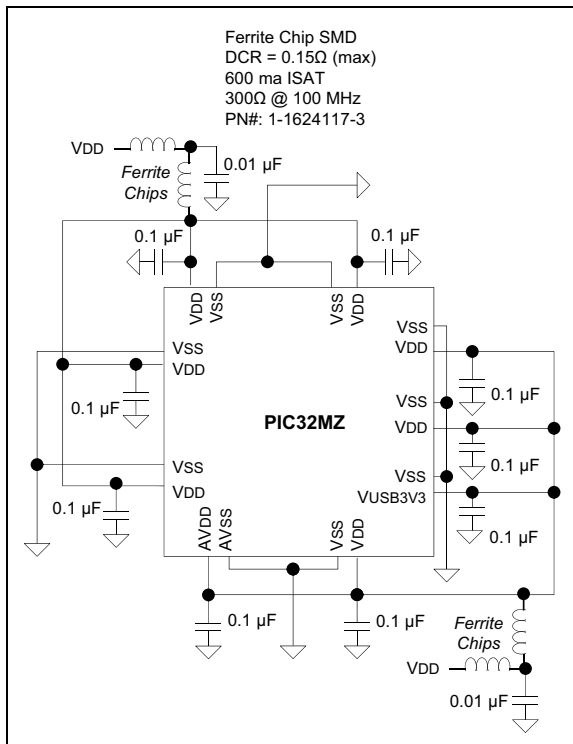

The following list contains recommendations that will help ensure the PCB layout will promote the goals previously listed.

- **Component Placement**
 - Place bypass capacitors as close to their component power and ground pins as possible, and place them on the same side of the PCB
 - Devices on the same bus that have larger setup times should be placed closer to the PIC32MZ EF device
- **Power and Ground**
 - Multi-layer PCBs will allow separate power and ground planes
 - Each ground pin should be connected to the ground plane individually
 - Place bypass capacitor vias as close to the pad as possible (preferably inside the pad)
 - If power and ground planes are not used, maximize width for power and ground traces
 - Use low-ESR, surface-mount bypass capacitors
- **Clocks and Oscillators**
 - Place crystals as close as possible to the PIC32MZ EF device OSC/SOSC pins
 - Do not route high-speed signals near the clock or oscillator
 - Avoid via usage and branches in clock lines (SQICLK)
 - Place termination resistors at the end of clock lines
- **Traces**
 - Higher-priority signals should have the shortest traces
 - Match trace lengths for parallel buses (EBIAX, EBIDx, SQIDx)
 - Avoid long run lengths on parallel traces to reduce coupling
 - Make the clock traces as straight as possible
 - Use rounded turns rather than right-angle turns
 - Have traces on different layers intersect on right angles to minimize crosstalk
 - Maximize the distance between traces, preferably no less than three times the trace width
 - Power traces should be as short and as wide as possible
 - High-speed traces should be placed close to the ground plane

2.9.1.3 EMI Suppression Considerations

The use of LDO regulators is preferred to reduce overall system noise and provide a cleaner power source. However, when utilizing switching Buck/Boost regulators as the local power source for PIC32MZ EF devices, as well as in electrically noisy environments, users should evaluate the use of T-Filters (i.e., L-C-L) on the power pins, as shown in Figure 2-5. In addition to a more stable power source, use of this type of T-Filter can greatly reduce susceptibility to EMI sources and events.

FIGURE 2-5:

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

2.10 Typical Application Connection Examples

Examples of typical application connections are shown in [Figure 2-6](#) and [Figure 2-7](#).

3.0 CPU

Note 1: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 50. “CPU for Devices with MIPS32[®] microAptiv[™] and M-Class Cores”** (DS60001192) of the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

2: The Series 5 Warrior M-class CPU core resources are available at: www.imgtec.com.

The MIPS32[®] M-Class Core is the heart of the PIC32MZ EF family device processor. The CPU fetches instructions, decodes each instruction, fetches source operands, executes each instruction and writes the results of instruction execution to the proper destinations.

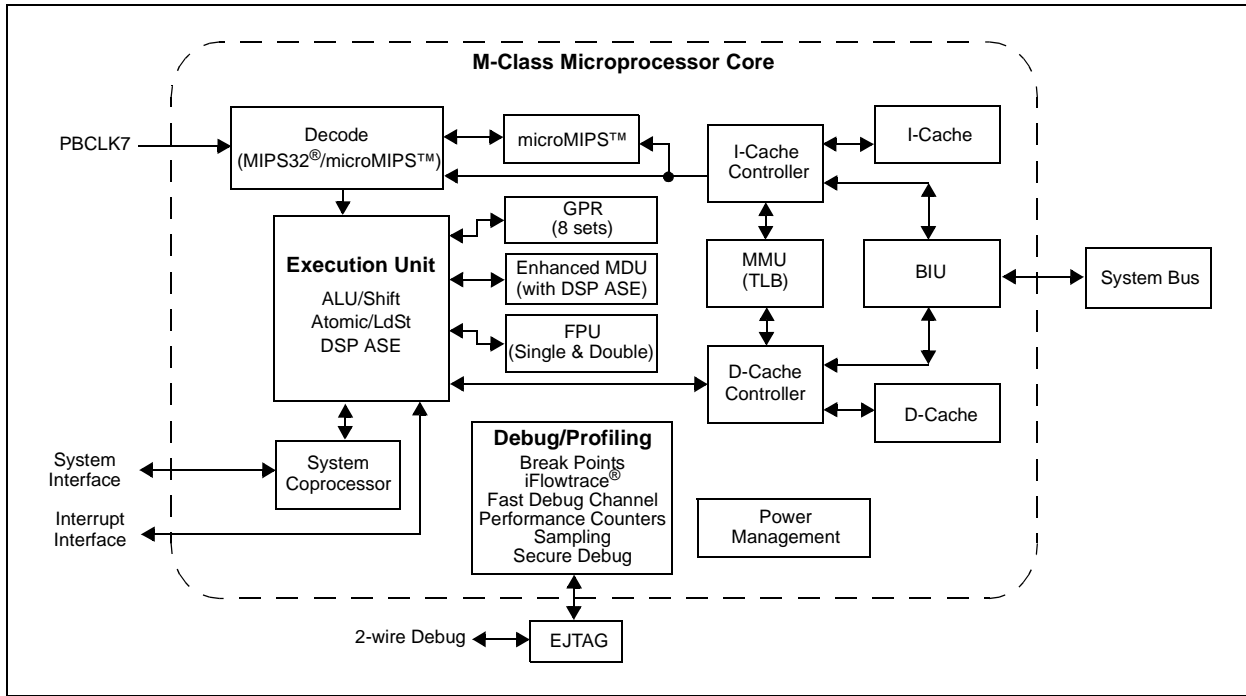

Key features include:

- 5-stage pipeline
- 32-bit address and data paths
- MIPS32 Enhanced Architecture (Release 5):
 - Multiply-accumulate and multiply-subtract instructions
 - Targeted multiply instruction
 - Zero/One detect instructions
 - WAIT instruction
 - Conditional move instructions (MOVN, MOVZ)
 - Vectored interrupts
 - Programmable exception vector base
 - Atomic interrupt enable/disable
 - GPR shadow registers to minimize latency for interrupt handlers
 - Bit field manipulation instructions
 - Virtual memory support
- microMIPS[™] compatible instruction set:
 - Improves code size density over MIPS32, while maintaining MIPS32 performance.
 - Supports all MIPS32 instructions (except branch-likely instructions)
 - Fifteen additional 32-bit instructions and 39 16-bit instructions corresponding to commonly-used MIPS32 instructions
 - Stack pointer implicit in instruction
 - MIPS32 assembly and ABI compatible
- MMU with Translation Lookaside Buffer (TLB) mechanism:
 - 16 dual-entry fully associative Joint TLB
 - 4-entry fully associative Instruction and Data TLB
 - 4 KB pages
- Separate L1 data and instruction caches:
 - 16 KB 4-way Instruction Cache (I-Cache)
 - 4 KB 4-way Data Cache (D-Cache)
- Autonomous Multiply/Divide Unit (MDU):
 - Maximum issue rate of one 32x32 multiply per clock
 - Early-in iterative divide. Minimum 12 and maximum 38 clock latency (dividend (rs) sign extension-dependent)
- Power Control:
 - Minimum frequency: 0 MHz
 - Low-Power mode (triggered by WAIT instruction)
 - Extensive use of local gated clocks
- EJTAG Debug and Instruction Trace:
 - Support for single stepping
 - Virtual instruction and data address/value breakpoints
 - Hardware breakpoint supports both address match and address range triggering.
 - Eight instruction and four data complex breakpoints
- iFlowtrace[®] version 2.0 support:
 - Real-time instruction program counter
 - Special events trace capability
 - Two performance counters with 34 user-selectable countable events
 - Disabled if the processor enters Debug mode
 - Program Counter sampling
- Four Watch registers:
 - Instruction, Data Read, Data Write options
 - Address match masking options
- DSP ASE Extension:
 - Native fractional format data type operations
 - Register Single Instruction Multiple Data (SIMD) operations (add, subtract, multiply, shift)
 - GPR-based shift
 - Bit manipulation
 - Compare-Pick
 - DSP Control Access
 - Indexed-Load
 - Branch
 - Multiplication of complex operands
 - Variable bit insertion and extraction
 - Virtual circular buffers
 - Arithmetic saturation and overflow handling
 - Zero-cycle overhead saturation and rounding operations
- Floating Point Unit (FPU):
 - 1985 IEEE-754 compliant Floating Point Unit
 - Supports single and double precision datatypes
 - 2008 IEEE-754 compatibility control of NaN handling and Abs/Neg instructions
 - Runs at 1:1 core/FPU clock ratio

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

A block diagram of the PIC32MZ EF family processor core is shown in [Figure 3-1](#).

FIGURE 3-1: PIC32MZ EF FAMILY MICROPROCESSOR CORE BLOCK DIAGRAM

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

3.1 Architecture Overview

The MIPS32 M-Class Microprocessor core in PIC32MZ EF family devices contains several logic blocks working together in parallel, providing an efficient high-performance computing engine. The following blocks are included with the core:

- Execution unit
- General Purpose Register (GPR)
- Multiply/Divide Unit (MDU)
- System control coprocessor (CP0)
- Floating Point Unit (FPU)
- Memory Management Unit (MMU)
- Instruction/Data cache controllers
- Power Management
- Instructions and data caches
- microMIPS support
- Enhanced JTAG (EJTAG) controller

3.1.1 EXECUTION UNIT

The processor core execution unit implements a load/store architecture with single-cycle ALU operations (logical, shift, add, subtract) and an autonomous multiply/divide unit. The core contains thirty-two 32-bit General Purpose Registers (GPRs) used for integer operations and address calculation. Seven additional register file shadow sets (containing thirty-two registers) are added to minimize context switching overhead during interrupt/exception processing. The register file consists of two read ports and one write port and is fully bypassed to minimize operation latency in the pipeline.

The execution unit includes:

- 32-bit adder used for calculating the data address
- Address unit for calculating the next instruction address
- Logic for branch determination and branch target address calculation
- Load aligner
- Trap condition comparator
- Bypass multiplexers used to avoid stalls when executing instruction streams where data producing instructions are followed closely by consumers of their results

- Leading Zero/One detect unit for implementing the CLZ and CLO instructions
- Arithmetic Logic Unit (ALU) for performing arithmetic and bitwise logical operations
- Shifter and store aligner
- DSP ALU and logic block for performing DSP instructions, such as arithmetic/shift/compare operations

3.1.2 MULTIPLY/DIVIDE UNIT (MDU)

The processor core includes a Multiply/Divide Unit (MDU) that contains a separate pipeline for multiply and divide operations, and DSP ASE multiply instructions. This pipeline operates in parallel with the Integer Unit (IU) pipeline and does not stall when the IU pipeline stalls. This allows MDU operations to be partially masked by system stalls and/or other integer unit instructions.

The high-performance MDU consists of a 32x32 booth recoded multiplier, four pairs of result/accumulation registers (HI and LO), a divide state machine, and the necessary multiplexers and control logic. The first number shown ('32' of 32x32) represents the *rs* operand. The second number ('32' of 32x32) represents the *rt* operand.

The MDU supports execution of one multiply or multiply-accumulate operation every clock cycle.

Divide operations are implemented with a simple 1-bit-per-clock iterative algorithm. An early-in detection checks the sign extension of the dividend (*rs*) operand. If *rs* is 8 bits wide, 23 iterations are skipped. For a 16-bit wide *rs*, 15 iterations are skipped and for a 24-bit wide *rs*, 7 iterations are skipped. Any attempt to issue a subsequent MDU instruction while a divide is still active causes an IU pipeline stall until the divide operation has completed.

Table 3-1 lists the repeat rate (peak issue rate of cycles until the operation can be reissued) and latency (number of cycles until a result is available) for the processor core multiply and divide instructions. The approximate latency and repeat rates are listed in terms of pipeline clocks.

TABLE 3-1: MIPS32® M-CLASS MICROPROCESSOR CORE HIGH-PERFORMANCE INTEGER MULTIPLY/DIVIDE UNIT LATENCIES AND REPEAT RATES

| Opcode | Operand Size (mul <i>rt</i>) (div <i>rs</i>) | Latency | Repeat Rate |
|--|--|---------|-------------|
| MULT/MULTU, MADD/MADDU, MSUB/MSUBU (HI/LO destination) | 16 bits | 5 | 1 |
| | 32 bits | 5 | 1 |
| MUL (GPR destination) | 16 bits | 5 | 1 |
| | 32 bits | 5 | 1 |
| DIV/DIVU | 8 bits | 12/14 | 12/14 |
| | 16 bits | 20/22 | 20/22 |
| | 24 bits | 28/30 | 28/30 |
| | 32 bits | 36/38 | 36/38 |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

The MIPS architecture defines that the result of a multiply or divide operation be placed in one of four pairs of HI and LO registers. Using the Move-From-HI (MFHI) and Move-From-LO (MFLO) instructions, these values can be transferred to the General Purpose Register file.

In addition to the HI/LO targeted operations, the MIPS32 architecture also defines a multiply instruction, MUL, which places the least significant results in the primary register file instead of the HI/LO register pair. By avoiding the explicit MFLO instruction required when using the LO register, and by supporting multiple destination registers, the throughput of multiply-intensive operations is increased.

Two other instructions, Multiply-Add (MADD) and Multiply-Subtract (MSUB), are used to perform the multiply-accumulate and multiply-subtract operations. The MADD instruction multiplies two numbers and then adds the product to the current contents of the HI and LO registers. Similarly, the MSUB instruction multiplies two operands and then subtracts the product from the HI and LO registers. The MADD and MSUB operations are commonly used in DSP algorithms.

The MDU also implements various shift instructions operating on the HI/LO register and multiply instructions as defined in the DSP ASE. The MDU supports all of the data types required for this purpose and includes three extra HI/LO registers as defined by the ASE.

Table 3-2 lists the latencies and repeat rates for the DSP multiply and dot-product operations. The approximate latencies and repeat rates are listed in terms of pipeline clocks.

TABLE 3-2: DSP-RELATED LATENCIES AND REPEAT RATES

| Op code | Latency | Repeat Rate |
|--|---------|-------------|
| Multiply and dot-product without saturation after accumulation | 5 | 1 |
| Multiply and dot-product with saturation after accumulation | 5 | 1 |
| Multiply without accumulation | 5 | 1 |

3.1.3 SYSTEM CONTROL COPROCESSOR (CP0)

In the MIPS architecture, CP0 is responsible for the virtual-to-physical address translation and cache protocols, the exception control system, the processor's diagnostics capability, the operating modes (Kernel, User and Debug) and whether interrupts are enabled or disabled. Configuration information, such as cache size and set associativity, and the presence of options like microMIPS is also available by accessing the CP0 registers, listed in Table 3-3.

TABLE 3-3: COPROCESSOR 0 REGISTERS

| Register Number | Register Name | Function |
|-----------------|------------------------|--|
| 0 | Index | Index into the TLB array (MPU only). |
| 1 | Random | Randomly generated index into the TLB array (MPU only). |
| 2 | EntryLo0 | Low-order portion of the TLB entry for even-numbered virtual pages (MPU only). |
| 3 | EntryLo1 | Low-order portion of the TLB entry for odd-numbered virtual pages (MPU only). |
| 4 | Context/ UserLocal | Pointer to the page table entry in memory (MPU only). User information that can be written by privileged software and read via the RDHWR instruction. |
| 5 | PageMask/ PageGrain | PageMask controls the variable page sizes in TLB entries. PageGrain enables support of 1 KB pages in the TLB (MPU only). |
| 6 | Wired | Controls the number of fixed (i.e., wired) TLB entries (MPU only). |
| 7 | HWREna | Enables access via the RDHWR instruction to selected hardware registers in Non-privileged mode. |
| 8 | BadVAddr | Reports the address for the most recent address-related exception. |
| | BadInstr | Reports the instruction that caused the most recent exception. |
| | BadInstrP | Reports the branch instruction if a delay slot caused the most recent exception. |
| 9 | Count | Processor cycle count. |
| 10 | EntryHi | High-order portion of the TLB entry (MPU only). |
| 11 | Compare | Core timer interrupt control. |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 3-3: COPROCESSOR 0 REGISTERS (CONTINUED)

| Register Number | Register Name | Function |
|-----------------|----------------|---|
| 12 | Status | Processor status and control. |
| | IntCtl | Interrupt control of vector spacing. |
| | SRSCtl | Shadow register set control. |
| | SRSMap | Shadow register mapping control. |
| | View_IPL | Allows the Priority Level to be read/written without extracting or inserting that bit from/to the Status register. |
| | SRSMAP2 | Contains two 4-bit fields that provide the mapping from a vector number to the shadow set number to use when servicing such an interrupt. |
| 13 | Cause | Describes the cause of the last exception. |
| | NestedExc | Contains the error and exception level status bit values that existed prior to the current exception. |
| | View_RIPL | Enables read access to the RIPL bit that is available in the Cause register. |
| 14 | EPC | Program counter at last exception. |
| | NestedEPC | Contains the exception program counter that existed prior to the current exception. |
| 15 | PRID | Processor identification and revision |
| | Ebase | Exception base address of exception vectors. |
| | CDMMBase | Common device memory map base. |
| 16 | Config | Configuration register. |
| | Config1 | Configuration register 1. |
| | Config2 | Configuration register 2. |
| | Config3 | Configuration register 3. |
| | Config4 | Configuration register 4. |
| | Config5 | Configuration register 5. |
| | Config7 | Configuration register 7. |
| 17 | LLAddr | Load link address (MPU only). |
| 18 | WatchLo | Low-order watchpoint address (MPU only). |
| 19 | WatchHi | High-order watchpoint address (MPU only). |
| 20-22 | Reserved | Reserved in the PIC32 core. |
| 23 | Debug | EJTAG debug register. |
| | TraceControl | EJTAG trace control. |
| | TraceControl2 | EJTAG trace control 2. |
| | UserTraceData1 | EJTAG user trace data 1 register. |
| | TraceBPC | EJTAG trace breakpoint register. |
| | Debug2 | Debug control/exception status 1. |
| 24 | DEPC | Program counter at last debug exception. |
| | UserTraceData2 | EJTAG user trace data 2 register. |
| 25 | PerfCtl0 | Performance counter 0 control. |
| | PerfCnt0 | Performance counter 0. |
| | PerfCtl1 | Performance counter 1 control. |
| | PerfCnt1 | Performance counter 1. |
| 26 | ErrCtl | Software test enable of way-select and data RAM arrays for I-Cache and D-Cache (MPU only). |
| 27 | Reserved | Reserved in the PIC32 core. |
| 28 | TagLo/DataLo | Low-order portion of cache tag interface (MPU only). |
| 29 | Reserved | Reserved in the PIC32 core. |
| 30 | ErrorEPC | Program counter at last error exception. |
| 31 | DeSave | Debug exception save. |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

3.1.4 FLOATING POINT UNIT (FPU)

The Floating Point Unit (FPU), Coprocessor (CP1), implements the MIPS Instruction Set Architecture for floating point computation. The implementation supports the ANSI/IEEE Standard 754 (IEEE for Binary Floating Point Arithmetic) for single- and double-precision data formats. The FPU can be programmed to have thirty-two 32-bit or 64-bit floating point registers used for floating point operations.

The performance is optimized for single precision formats. Most instructions have one FPU cycle throughput and four FPU cycle latency. The FPU implements the multiply-add (MADD) and multiply-sub (MSUB) instructions with intermediate rounding after the multiply function. The result is guaranteed to be the same as executing a MUL and an ADD instruction separately, but the instruction latency, instruction fetch, dispatch bandwidth, and the total number of register accesses are improved.

IEEE denormalized input operands and results are supported by hardware for some instructions. IEEE denormalized results are not supported by hardware in general, but a fast flush-to-zero mode is provided to optimize performance. The fast flush-to-zero mode is enabled through the FCCR register, and use of this mode is recommended for best performance when denormalized results are generated.

The FPU has a separate pipeline for floating point instruction execution. This pipeline operates in parallel with the integer core pipeline and does not stall when the integer pipeline stalls. This allows long-running FPU operations, such as divide or square root, to be partially masked by system stalls and/or other integer unit instructions. Arithmetic instructions are always dispatched and completed in order, but loads and stores can complete out of order. The exception model is “precise” at all times.

Table 3-4 contains the floating point instruction latencies and repeat rates for the processor core. In this table, 'Latency' refers to the number of FPU cycles necessary for the first instruction to produce the result needed by the second instruction. The “Repeat Rate” refers to the maximum rate at which an instruction can be executed per FPU cycle.

TABLE 3-4: FPU INSTRUCTION LATENCIES AND REPEAT RATES

| Op code | Latency (FPU Cycles) | Repeat Rate (FPU Cycles) |
|--|----------------------|--------------------------|
| ABS.[S,D], NEG.[S,D], ADD.[S,D], SUB.[S,D], C.cond.[S,D], MUL.S | 4 | 1 |
| MADD.S, MSUB.S, NMADD.S, NMSUB.S, CABS.cond.[S,D] | 4 | 1 |
| CVT.D.S, CVT.PS.PW, CVT.[S,D].[W,L] | 4 | 1 |
| CVT.S.D, CVT.[W,L].[S,D], CEIL.[W,L].[S,D], FLOOR.[W,L].[S,D], ROUND.[W,L].[S,D], TRUNC.[W,L].[S,D] | 4 | 1 |
| MOV.[S,D], MOVF.[S,D], MOVN.[S,D], MOVT.[S,D], MOVZ.[S,D] | 4 | 1 |
| MUL.D | 5 | 2 |
| MADD.D, MSUB.D, NMADD.D, NMSUB.D | 5 | 2 |
| RECIP.S | 13 | 10 |
| RECIP.D | 26 | 21 |
| RSQRT.S | 17 | 14 |
| RSQRT.D | 36 | 31 |
| DIV.S, SQRT.S | 17 | 14 |
| DIV.D, SQRT.D | 32 | 29 |
| MTC1, DMTC1, LWC1, LDC1, LDXC1, LUXC1, LWXC1 | 4 | 1 |
| MFC1, DMFC1, SWC1, SDC1, SDXC1, SUXC1, SWXC1 | 1 | 1 |

Legend: S = Single D = Double
 W = Word L = Long word

The FPU implements a high-performance 7-stage pipeline:

- Decode, register read and unpack (FR stage)
- Multiply tree - double pumped for double (M1 stage)
- Multiply complete (M2 stage)
- Addition first step (A1 stage)
- Addition second and final step (A2 stage)
- Packing to IEEE format (FP stage)
- Register writeback (FW stage)

The FPU implements a bypass mechanism that allows the result of an operation to be forwarded directly to the instruction that needs it without having to write the result to the FPU register and then read it back.

Table 3-5 lists the Coprocessor 1 Registers for the FPU.

TABLE 3-5: FPU (CP1) REGISTERS

| Register Number | Register Name | Function |
|-----------------|---------------|---|
| 0 | FIR | Floating Point implementation register. Contains information that identifies the FPU. |
| 25 | FCCR | Floating Point condition codes register. |
| 26 | FEXR | Floating Point exceptions register. |
| 28 | FENR | Floating Point enables register. |
| 31 | FCSR | Floating Point Control and Status register. |

3.2 Power Management

The processor core offers a number of power management features, including low-power design, active power management and power-down modes of operation. The core is a static design that supports slowing or halting the clocks, which reduces system power consumption during Idle periods.

3.2.1 INSTRUCTION-CONTROLLED POWER MANAGEMENT

The mechanism for invoking Power-Down mode is through execution of the `WAIT` instruction. For more information on power management, see [Section 33.0 “Power-Saving Features”](#).

3.2.2 LOCAL CLOCK GATING

The majority of the power consumed by the processor core is in the clock tree and clocking registers. The PIC32MZ family makes extensive use of local gated-clocks to reduce this dynamic power consumption.

3.3 L1 Instruction and Data Caches

3.3.1 INSTRUCTION CACHE (I-CACHE)

The I-Cache is an on-core memory block of 16 Kbytes. Because the I-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access rather than having to wait for the physical address translation. The tag holds 22 bits of physical address, a valid bit, and a lock bit. The LRU replacement bits are stored in a separate array.

The I-Cache block also contains and manages the instruction line fill buffer. Besides accumulating data to be written to the cache, instruction fetches that reference data in the line fill buffer are serviced either by a bypass of that data, or data coming from the external interface. The I-Cache control logic controls the bypass function.

The processor core supports I-Cache locking. Cache locking allows critical code or data segments to be locked into the cache on a per-line basis, enabling the system programmer to maximize the efficiency of the system cache.

The cache locking function is always available on all I-Cache entries. Entries can then be marked as locked or unlocked on a per entry basis using the `CACHE` instruction.

3.3.2 DATA CACHE (D-CACHE)

The D-Cache is an on-core memory block of 4 Kbytes. This virtually indexed, physically tagged cache is protected. Because the D-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access. The tag holds 22 bits of physical address, a valid bit, and a lock bit. There is an additional array holding dirty bits and LRU replacement algorithm bits for each set of the cache.

In addition to I-Cache locking, the processor core also supports a D-Cache locking mechanism identical to the I-Cache. Critical data segments are locked into the cache on a per-line basis. The locked contents can be updated on a store hit, but cannot be selected for replacement on a cache miss.

The D-Cache locking function is always available on all D-Cache entries. Entries can then be marked as locked or unlocked on a per-entry basis using the `CACHE` instruction.

3.3.3 ATTRIBUTES

The processor core I-Cache and D-Cache attributes are listed in the Configuration registers (see [Register 3-1](#) through [Register 3-4](#)).

3.4 EJTAG Debug Support

The processor core provides for an Enhanced JTAG (EJTAG) interface for use in the software debug of application and kernel code. In addition to standard User mode and Kernel modes of operation, the processor core provides a Debug mode that is entered after a debug exception (derived from a hardware breakpoint, single-step exception, etc.) is taken and continues until a Debug Exception Return (DERET) instruction is executed. During this time, the processor executes the debug exception handler routine.

The EJTAG interface operates through the Test Access Port (TAP), a serial communication port used for transferring test data in and out of the core. In addition to the standard JTAG instructions, special instructions defined in the EJTAG specification specify which registers are selected and how they are used.

3.5 MIPS DSP ASE Extension

The MIPS DSP Application-Specific Extension Revision 2 is an extension to the MIPS32 architecture. This extension comprises new integer instructions and states that include new HI/LO accumulator register pairs and a DSP control register. This extension is crucial in a wide range of DSP, multimedia, and DSP-like algorithms covering Audio and Video processing applications. The extension supports native fractional format data type operations, register Single Instruction Multiple Data (SIMD) operations, such as add, subtract, multiply, and shift. In addition, the extension includes the following features that are essential in making DSP algorithms computationally efficient:

- Support for multiplication of complex operands
- Variable bit insertion and extraction
- Implementation and use of virtual circular buffers
- Arithmetic saturation and overflow handling support
- Zero cycle overhead saturation and rounding operations

3.6 microMIPS ISA

The processor core supports the microMIPS ISA, which contains all MIPS32 ISA instructions (except for branch-likely instructions) in a new 32-bit encoding scheme, with some of the commonly used instructions also available in 16-bit encoded format. This ISA improves code density through the additional 16-bit instructions while maintaining a performance similar to MIPS32 mode. In microMIPS mode, 16-bit or 32-bit instructions will be fetched and recoded to legacy MIPS32 instruction opcodes in the pipeline's I stage, so that the processor core can have the same microAptiv UP microarchitecture. Because the microMIPS instruction stream can be intermixed with 16-bit halfword or 32-bit word size instructions on halfword or word boundaries, additional logic is in place to address the word misalignment issues, thus minimizing performance loss.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

3.7 M-Class Core Configuration

Register 3-1 through Register 3-4 show the default configuration of the M-Class core, which is included on PIC32MZ EF family devices.

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-25 **FCC<7:1>**: Floating Point Condition Code bits

These bits record the results of floating point compares and are tested for floating point conditional branches and conditional moves.

bit 24 **FS**: Flush to Zero control bit

1 = Denormal input operands are flushed to zero. Tiny results are flushed to either zero or the applied format's smallest normalized number (MinNorm) depending on the rounding mode settings.

0 = Denormal input operands result in an Unimplemented Operation exception.

bit 23 **FCC<0>**: Floating Point Condition Code bits

These bits record the results of floating point compares and are tested for floating point conditional branches and conditional moves.

bit 22 **FO**: Flush Override Control bit

1 = The intermediate result is kept in an internal format, which can be perceived as having the usual mantissa precision but with unlimited exponent precision and without forcing to a specific value or taking an exception.

0 = Handling of Tiny Result values depends on setting of the FS bit.

bit 21 **FN**: Flush to Nearest Control bit

1 = Final result is rounded to either zero or 2E_min (MinNorm), whichever is closest when in Round to Nearest (RN) rounding mode. For other rounding modes, a final result is given as if FS was set to 1.

0 = Handling of Tiny Result values depends on setting of the FS bit.

bit 20 **MAC2008**: Fused Multiply Add mode control bit

0 = Unfused multiply-add. Intermediary multiplication results are rounded to the destination format.

bit 19 **ABS2008**: Absolute value format control bit

1 = ABS.fmt and NEG.fmt instructions compliant with IEEE Standard 754-2008. The ABS and NEG functions accept QNAN inputs without trapping.

bit 18 **NAN2008**: NaN Encoding control bit

1 = Quiet and signaling NaN encodings recommended by the IEEE Standard 754-2008. A quiet NaN is encoded with the first bit of the fraction being 1 and a signaling NaN is encoded with the first bit of the fraction being 0.

bit 17-12 **CAUSE<5:0>**: FPU Exception Cause bits

These bits indicated the exception conditions that arise during execution of an FPU arithmetic instruction.

bit 17 **E**: Unimplemented Operation bit

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. For detailed information, refer to **Section 48. “Memory Organization and Permissions”** in the “*PIC32 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF microcontrollers provide 4 GB of unified virtual memory address space. All memory regions, including program, data memory, SFRs and Configuration registers, reside in this address space at their respective unique addresses. The program and data memories can be optionally partitioned into user and kernel memories. In addition, PIC32MZ EF devices allow execution from data memory.

Key features include:

- 32-bit native data width
- Separate User (KUSEG) and Kernel (KSEG0/KSEG1/KSEG2/KSEG3) mode address space
- Separate boot Flash memory for protected code
- Robust bus exception handling to intercept runaway code
- Cacheable (KSEG0/KSEG2) and non-cacheable (KSEG1/KSEG3) address regions
- Read-Write permission access to predefined memory regions

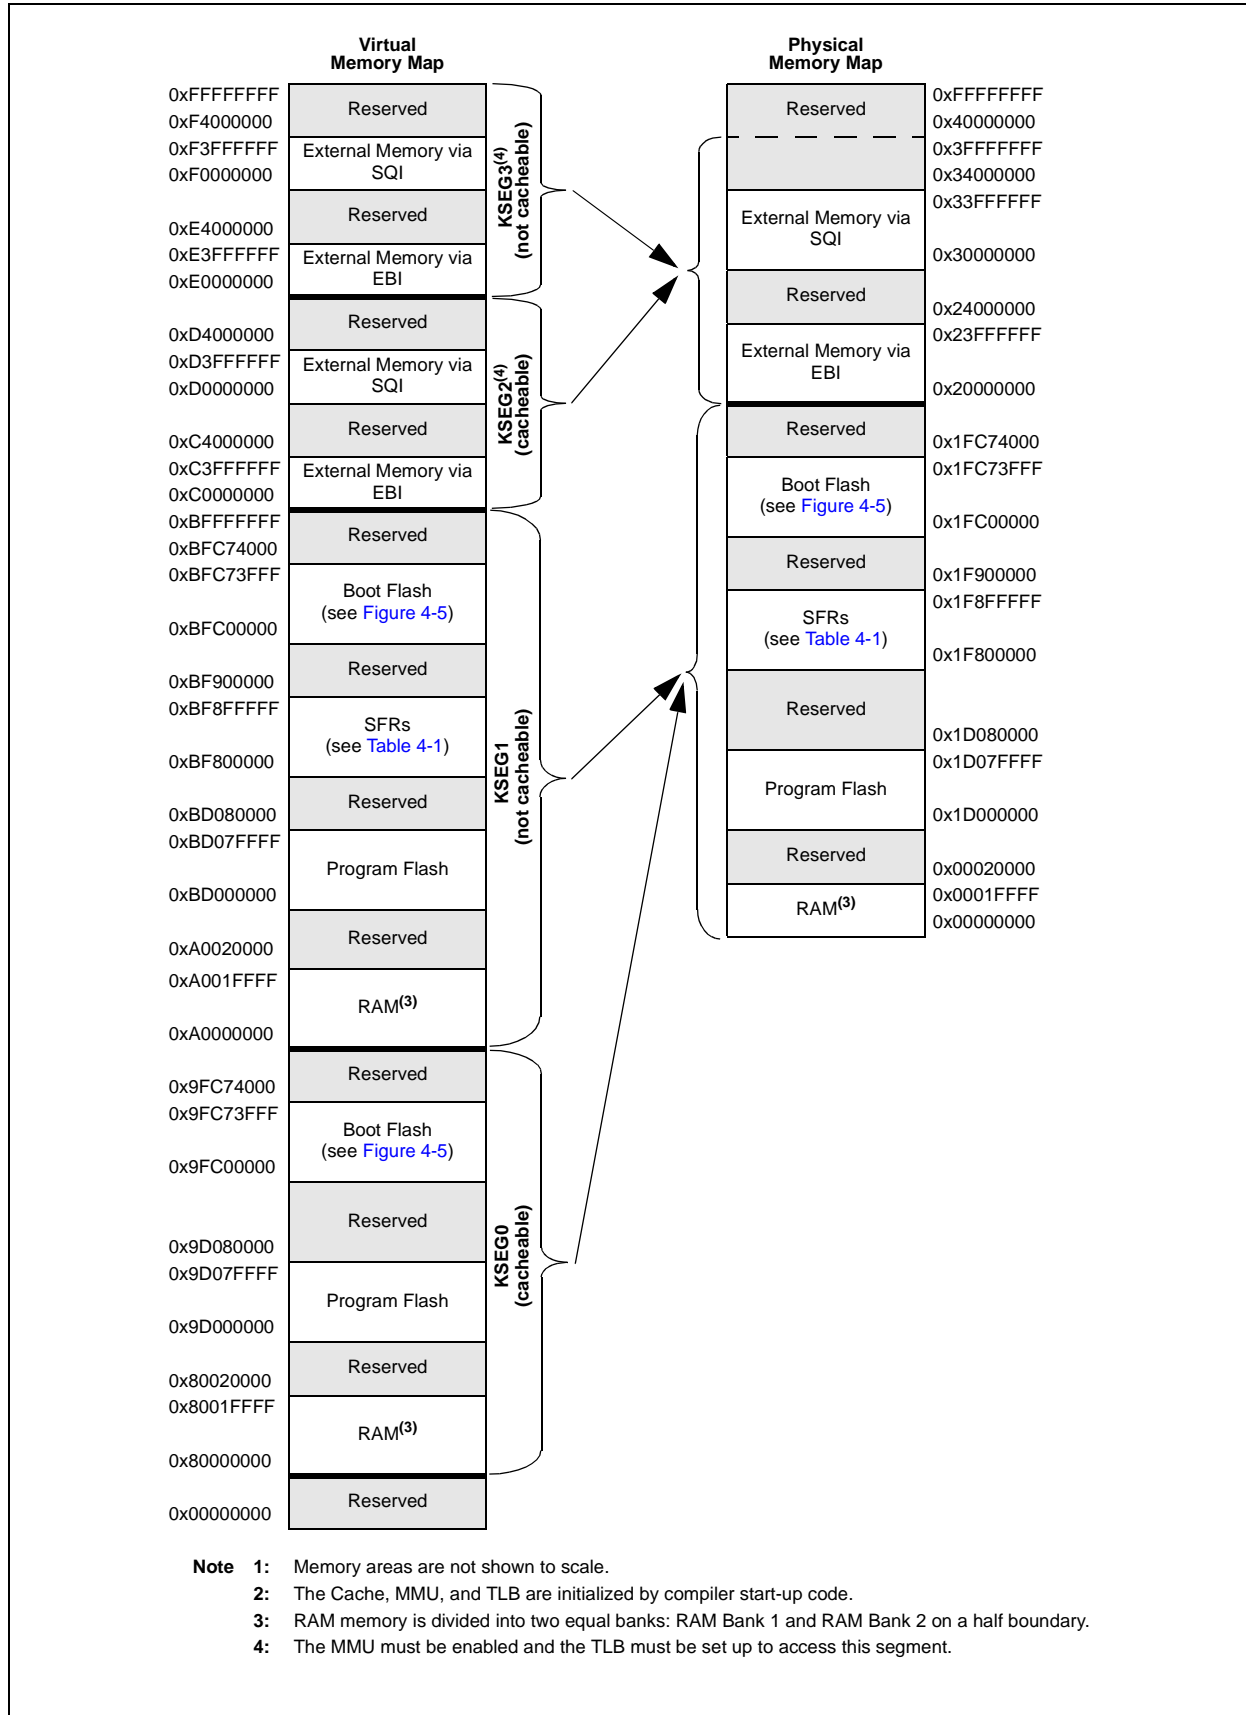

4.1 Memory Layout

PIC32MZ EF microcontrollers implement two address schemes: virtual and physical. All hardware resources, such as program memory, data memory and peripherals, are located at their respective physical addresses. Virtual addresses are exclusively used by the CPU to fetch and execute instructions as well as access peripherals. Physical addresses are used by bus master peripherals, such as DMA and the Flash controller, that access memory independently of the CPU.

The main memory maps for the PIC32MZ EF devices are illustrated in [Figure 4-1](#) through [Figure 4-4](#). [Figure 4-5](#) provides memory map information for boot Flash and boot alias. [Table 4-1](#) provides memory map information for Special Function Registers (SFRs).

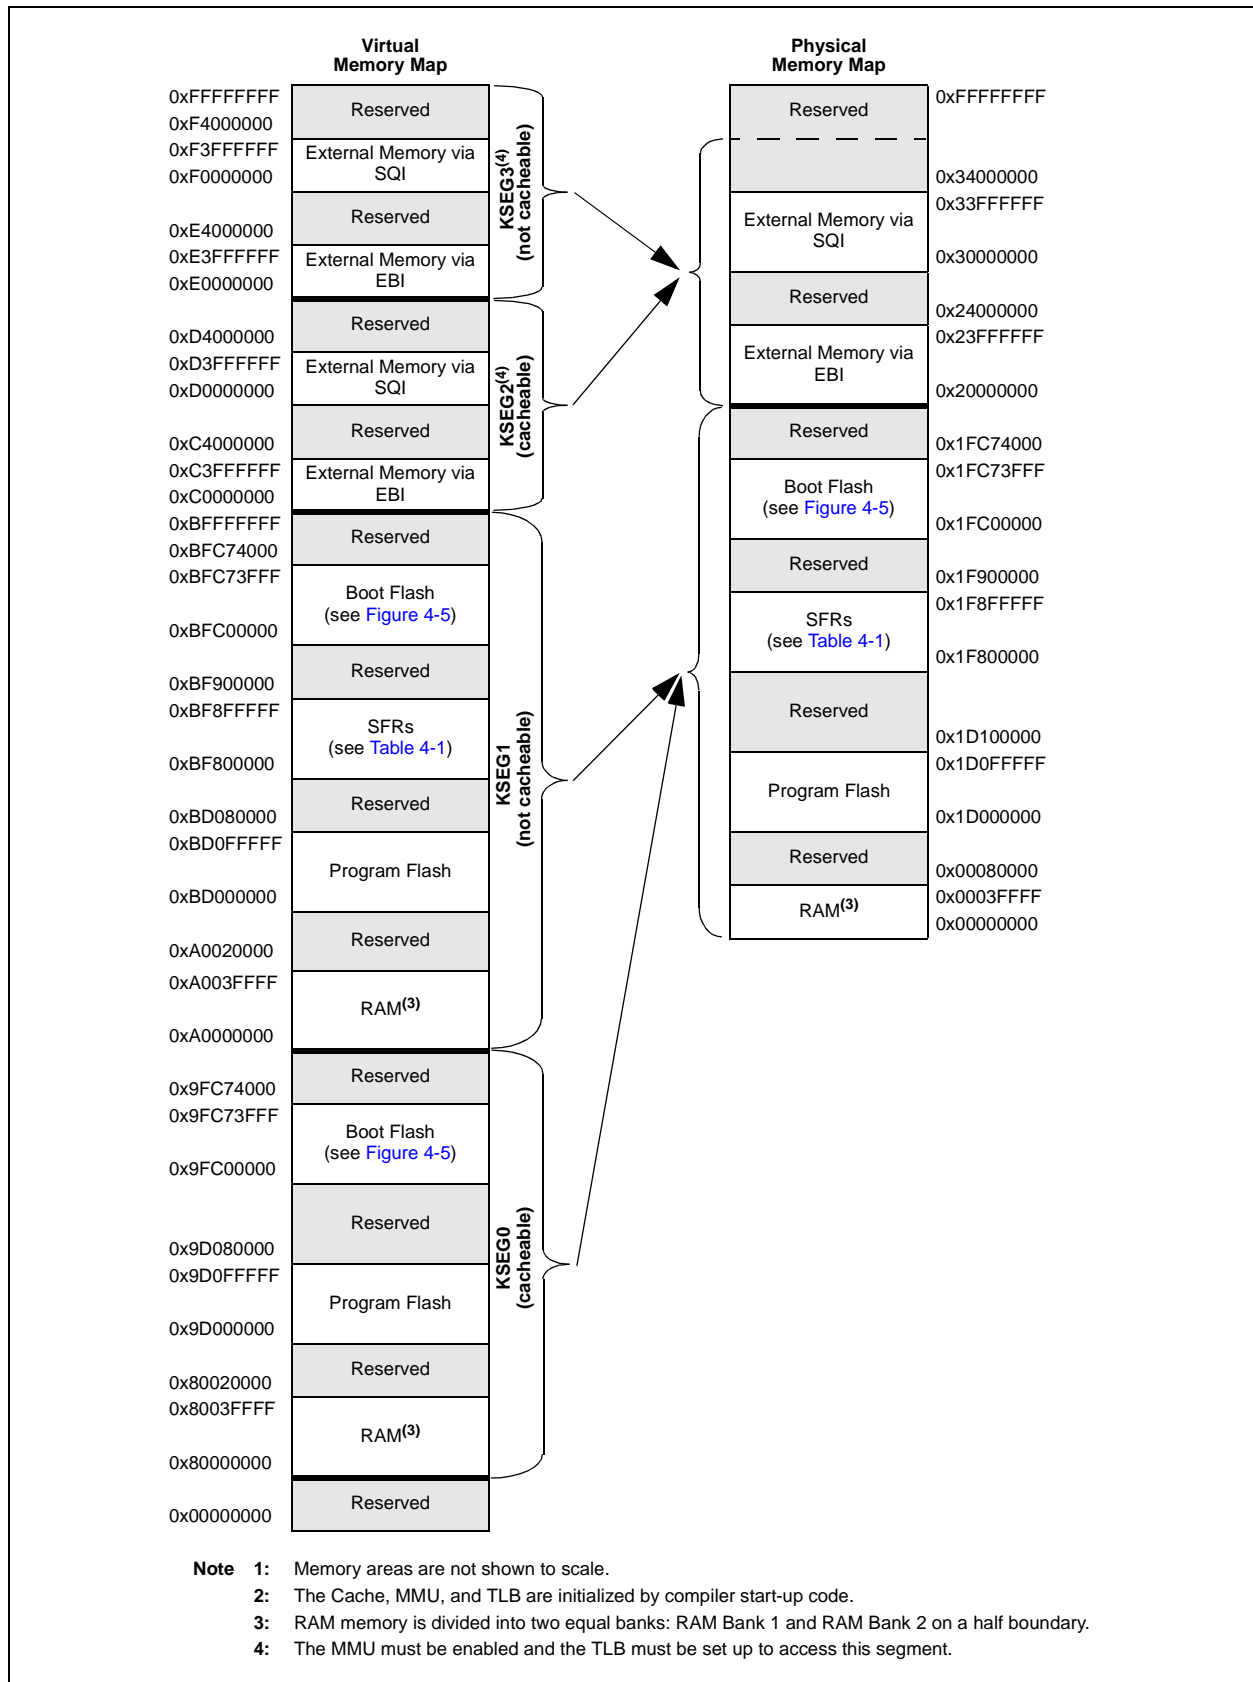

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

4.1.1 BOOT FLASH SEQUENCE AND CONFIGURATION SPACES

Sequence space is used to identify which boot Flash is aliased by aliased regions. If the value programmed into the TSEQ<15:0> bits of the BF1SEQ0 word is equal to or greater than the value programmed into the TSEQ<15:0> bits of the BF2SEQ0 word, Boot Flash 1 is aliased by the lower boot alias region, and Boot Flash 2 is aliased by the upper boot alias region. If TSEQ<15:0> bits of BF2SEQ0 is greater than TSEQ<15:0> bits of BF1SEQ0, the opposite is true (see [Table 4-2](#) and [Table 4-3](#) for BFxSEQ0 word memory locations).

The CSEQ<15:0> bits must contain the one's complement value of the TSEQ<15:0> bits; otherwise, the value of TSEQ<15:0> is considered invalid, and an alternate sequence is used. See [Section 4.1.2 "Alternate Sequence and Configuration Words"](#) for more information.

Once boot Flash memories are aliased, configuration space located in the lower boot alias region is used as the basis for the Configuration words, DEVSIGN0, DEVCP0, and DEVCFGx (and the associated alternate configuration registers). This means that the boot Flash region to be aliased by lower boot alias region memory must contain configuration values in the appropriate memory locations.

| |
|---|
| <p>Note: Do not use word program operation (NVMOP<3:0> = 0001) when programming data into the sequence and configuration spaces.</p> |
|---|

4.1.2 ALTERNATE SEQUENCE AND CONFIGURATION WORDS

Every word in the configuration space and sequence space has an associated alternate word (designated by the letter A as the first letter in the name of the word). During device start-up, primary words are read and if uncorrectable ECC errors are found, the BCFGERR (RCON<27>) flag is set and alternate words are used. If uncorrectable ECC errors are found in primary and alternate words, the BCFGFAIL (RCON<26>) flag is set and the default configuration is used.

Legend:

R = Readable bit

W = Writable bit

P = Programmable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-16 **CSEQ<15:0>**: Boot Flash Complement Sequence Number bits

bit 15-0 **TSEQ<15:0>**: Boot Flash True Sequence Number bits

Note: The BFXSEQ1 through BFXSEQ3 and ABFXSEQ1 through ABFXSEQ3 registers are used for Quad Word programming operation when programming the BFXSEQ0/ABFXSEQ0 registers, and do not contain any valid information.

4.2 System Bus Arbitration

Note: The System Bus interconnect implements one or more instantiations of the SonicsSX[®] interconnect from Sonics, Inc. This document contains materials that are (c) 2003-2015 Sonics, Inc., and that constitute proprietary information of Sonics, Inc. SonicsSX is a registered trademark of Sonics, Inc. All such materials and trademarks are used under license from Sonics, Inc.

As shown in the PIC32MZ EF Family Block Diagram (see [Figure 1-1](#)), there are multiple initiator modules (I1 through I14) in the system that can access various target modules (T1 through T13). [Table 4-4](#) illustrates which initiator can access which target. The System Bus supports simultaneous access to targets by initiators, so long as the initiators are accessing different targets. The System Bus will perform arbitration, if multiple initiators attempt to access the same target.

TABLE 4-4: INITIATORS TO TARGETS ACCESS ASSOCIATION

| Target # | Initiator ID | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

The System Bus arbitration scheme implements a non-programmable, Least Recently Serviced (LRS) priority, which provides Quality Of Service (QOS) for most initiators. However, some initiators can use Fixed High Priority (HIGH) arbitration to guarantee their access to data.

The arbitration scheme for the available initiators is shown in [Table 4-5](#).

TABLE 4-5: INITIATOR ID AND QOS

| Name | ID | QOS |
|------------------|----|-----------------------|
| CPU | 1 | LRS ⁽¹⁾ |
| CPU | 2 | HIGH ^(1,2) |
| DMA Read | 3 | LRS ⁽¹⁾ |
| DMA Read | 4 | HIGH ^(1,2) |
| DMA Write | 5 | LRS ⁽¹⁾ |
| DMA Write | 6 | HIGH ^(1,2) |
| USB | 7 | LRS |
| Ethernet Read | 8 | LRS |
| Ethernet Write | 9 | LRS |
| CAN1 | 10 | LRS |
| CAN2 | 11 | LRS |
| SQI1 | 12 | LRS |
| Flash Controller | 13 | HIGH ⁽²⁾ |
| Crypto | 14 | LRS |

Note 1: When accessing SRAM, the DMAPRI bit (CFGCON<25>) and the CPUPRI bit (CFGCON<24>) provide arbitration control for the DMA and CPU (when servicing an interrupt (i.e., EXL = 1)), respectively, by selecting the use of LRS or HIGH. When using HIGH, the DMA and CPU get arbitration preference over all initiators using LRS.

- 2:** Using HIGH arbitration can have serious negative effects on other initiators. Therefore, it is recommended to not enable this type of arbitration for an initiator that uses significant system bandwidth. HIGH arbitration is intended to be used for low bandwidth applications that require low latency, such as LCC graphics applications.

4.3 Permission Access and System Bus Registers

The System Bus on PIC32MZ EF family of microcontrollers provides access control capabilities for the transaction initiators on the System Bus.

The System Bus divides the entire memory space into fourteen target regions and permits access to each target by initiators via permission groups. Four Permission Groups (0 through 3) can be assigned to each initiator. Each permission group is independent of the others and can have exclusive or shared access to a region.

Using the CFGPG register (see [Register 34-10](#) in [Section 34.0 “Special Features”](#)), Boot firmware can assign a permission group to each initiator, which can make requests on the System Bus.

The available targets and their regions, as well as the associated control registers to assign protection, are described and listed in [Table 4-6](#).

[Register 4-2](#) through [Register 4-10](#) are used for setting and controlling access permission groups and regions.

To change these registers, they must be unlocked in hardware. The register lock is controlled by the PGLOCK Configuration bit (CFGCON<11>). Setting PGLOCK prevents writes to the control registers; clearing PGLOCK allows writes.

To set or clear the PGLOCK bit, an unlock sequence must be executed. Refer to [Section 42. “Oscillators with Enhanced PLL”](#) in the *“PIC32 Family Reference Manual”* for details.

TABLE 4-6: SYSTEM BUS TARGETS AND ASSOCIATED PROTECTION REGISTERS

| Target Number | Target Description ⁽⁵⁾ | SBTxREGy Register | | | | | | | SBTxRDy Register | | SBTxWRy Register | |

Legend: R = Read; R/W = Read/Write; 'x' in a register name = 0-13; 'y' in a register name = 0-8.

Note 1: Reset values for these bits are '0', '1', '1', '1', respectively.

Note 2: The BASE<21:0> bits must be set to the corresponding Physical Address and right shifted by 10 bits. For Read-only bits, this value is set by hardware on Reset.

Note 3: The SIZE<4:0> bits must be set to the corresponding Region Size, based on the following formula: Region Size = $2^{(SIZE-1)} \times 1024$ bytes. For read-only bits, this value is set by hardware on Reset.

Note 4: Refer to the Device Memory Maps (Figure 4-1 through Figure 4-4) for specific device memory sizes and start addresses.

Note 5: See Table 4-1 for information on specific target memory size and start addresses.

Note 6: The SBTxREG1 SFRs are reserved, and therefore, are not listed in this table for this target.

Legend: R = Read; R/W = Read/Write; 'x' in a register name = 0-13; 'y' in a register name = 0-8.

Note 1: Reset values for these bits are '0', '1', '1', '1', respectively.

Note 2: The BASE<21:0> bits must be set to the corresponding Physical Address and right shifted by 10 bits. For Read-only bits, this value is set by hardware on Reset.

Note 3: The SIZE<4:0> bits must be set to the corresponding Region Size, based on the following formula: Region Size = $2^{(SIZE-1)} \times 1024$ bytes. For read-only bits, this value is set by hardware on Reset.

Note 4: Refer to the Device Memory Maps (Figure 4-1 through Figure 4-4) for specific device memory sizes and start addresses.

Note 5: See Table 4-1 for information on specific target memory size and start addresses.

Note 6: The SBTxREG1 SFRs are reserved, and therefore, are not listed in this table for this target.

TABLE 4-7: SYSTEM BUS REGISTER MAP

| Virtual Address (BF8F_#) | Register Name | Bit Range | Bits | | | | | | | | | | | | | | All Resets | | |
|--------------------------|---------------|-----------|-------|-------|--------|--------|--------|--------|-------|-------|-------|-------|-------|-------|-------|-------|------------|-------|------|

5.0 FLASH PROGRAM MEMORY

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 52. “Flash Program Memory with Support for Live Update”** (DS60001193) in the “*PIC32 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices contain an internal Flash program memory for executing user code, which includes the following features:

- Two Flash banks for live update support
- Dual boot support
- Write protection for program and boot Flash
- ECC support

There are three methods by which the user can program this memory:

- Run-Time Self-Programming (RTSP)
- EJTAG Programming
- In-Circuit Serial Programming™ (ICSP™)

RTSP is performed by software executing from either Flash or RAM memory. Information about RTSP techniques is available in **Section 52. “Flash Program Memory with Support for Live Update”** (DS60001193) in the “*PIC32 Family Reference Manual*”.

EJTAG is performed using the EJTAG port of the device and an EJTAG capable programmer.

ICSP is performed using a serial data connection to the device and allows much faster programming times than RTSP.

The EJTAG and ICSP methods are described in the “*PIC32 Flash Programming Specification*” (DS60001145), which is available for download from the Microchip web site (www.microchip.com).

Note: In PIC32MZ EF devices, the Flash page size is 16 KB (4K IW) and the row size is 2 KB (512 IW).

| 7:0 | R/W-0 | R/W-x | U-0 | U-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
| | PFSWAP | BFSWAP | — | — | NVMOP<3:0> | | | |

| | | |
|-------------------|-------------------|--|
| Legend: | HC = Hardware Set | HC = Hardware Cleared |
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared x = Bit is unknown |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **WR:** Write Control bit⁽¹⁾

This bit cannot be cleared and can be set only when WREN = 1 and the unlock sequence has been performed.

- 1 = Initiate a Flash operation
- 0 = Flash operation is complete or inactive

bit 14 **WREN:** Write Enable bit⁽¹⁾

- 1 = Enable writes to the WR bit and disables writes to the NVMOP<3:0> bits
- 0 = Disable writes to WR bit and enables writes to the NVMOP<3:0> bits

bit 13 **WRERR:** Write Error bit⁽¹⁾

This bit can be cleared only by setting the NVMOP<3:0> bits = 0000 and initiating a Flash operation.

- 1 = Program or erase sequence did not complete successfully
- 0 = Program or erase sequence completed normally

bit 12 **LVDERR:** Low-Voltage Detect Error bit⁽¹⁾

This bit can be cleared only by setting the NVMOP<3:0> bits = 0000 and initiating a Flash operation.

- 1 = Low-voltage detected (possible data corruption, if WRERR is set)
- 0 = Voltage level is acceptable for programming

bit 11-8 **Unimplemented:** Read as '0'

bit 7 **PFSWAP:** Program Flash Bank Swap Control bit

This bit is only writable when WREN = 0 and the unlock sequence has been performed.

- 1 = Program Flash Bank 2 is mapped to the lower mapped region and program Flash Bank 1 is mapped to the upper mapped region
- 0 = Program Flash Bank 1 is mapped to the lower mapped region and program Flash Bank 2 is mapped to the upper mapped region

Note 1: These bits are only reset by a Power-on Reset (POR) and are not affected by other reset sources.

- 2: This operation results in a "no operation" (NOP) when the Dynamic Flash ECC Configuration bits = 00 (FECCCON<1:0> (DVCFG0<9:8>)), which enables ECC at all times. For all other FECCCON<1:0> bit settings, this command will execute, but will not write the ECC bits for the word and can cause DED errors if dynamic Flash ECC is enabled (FECCCON<1:0> = 01). Refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) for information regarding ECC and Flash programming.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 5-1: NVMCON: FLASH PROGRAMMING CONTROL REGISTER (CONTINUED)

- bit 6 **BFSWAP**: Boot Flash Bank Alias Swap Control bit
This bit is only writable when WREN = 0 and the unlock sequence has been performed.
1 = Boot Flash Bank 2 is mapped to the lower boot alias and boot Flash Bank 1 is mapped to the upper boot alias
0 = Boot Flash Bank 1 is mapped to the lower boot alias and boot Flash Bank 2 is mapped to the upper boot alias
- bit 5-4 **Unimplemented**: Read as '0'
- bit 3-0 **NVMOP<3:0>**: NVM Operation bits
These bits are only writable when WREN = 0.
1111 = Reserved
.
.
.
1000 = Reserved
0111 = Program erase operation: erase all of program Flash memory (all pages must be unprotected, PWP<23:0> = 0x000000)
0110 = Upper program Flash memory erase operation: erases only the upper mapped region of program Flash (all pages in that region must be unprotected)
0101 = Lower program Flash memory erase operation: erases only the lower mapped region of program Flash (all pages in that region must be unprotected)
0100 = Page erase operation: erases page selected by NVMADDR, if it is not write-protected
0011 = Row program operation: programs row selected by NVMADDR, if it is not write-protected
0010 = Quad Word (128-bit) program operation: programs the 128-bit Flash word selected by NVMADDR, if it is not write-protected
0001 = Word program operation: programs word selected by NVMADDR, if it is not write-protected⁽²⁾
0000 = No operation

- Note 1:** These bits are only reset by a Power-on Reset (POR) and are not affected by other reset sources.
- 2:** This operation results in a "no operation" (NOP) when the Dynamic Flash ECC Configuration bits = 00 (FECCCON<1:0> (DVCFG0<9:8>)), which enables ECC at all times. For all other FECCCON<1:0> bit settings, this command will execute, but will not write the ECC bits for the word and can cause DED errors if dynamic Flash ECC is enabled (FECCCON<1:0> = 01). Refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) for information regarding ECC and Flash programming.

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 31 **PWPUNLOCK**: Program Flash Memory Page Write-protect Unlock bit

1 = Register is not locked and can be modified

0 = Register is locked and cannot be modified

This bit is only clearable and cannot be set except by any reset.

bit 30-24 **Unimplemented**: Read as '0'

bit 23-0 **PWP<23:0>**: Flash Program Write-protect (Page) Address bits

Physical memory below address 0x1Dxxxxxx is write protected, where 'xxxxxx' is specified by PWP<23:0>. When PWP<23:0> has a value of '0', write protection is disabled for the entire program Flash. If the specified address falls within the page, the entire page and all pages below the current page will be protected.

Note: The bits in this register are only writable when the NVMKEY unlock sequence is followed.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

| | x = Bit is unknown |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **LBWPUNLOCK:** Lower Boot Alias Write-protect Unlock bit

1 = LBWPx bits are not locked and can be modified

0 = LBWPx bits are locked and cannot be modified

This bit is only clearable and cannot be set except by any reset.

bit 14-13 **Unimplemented:** Read as '0'

bit 12 **LBWP4:** Lower Boot Alias Page 4 Write-protect bit⁽¹⁾

1 = Write protection for physical address 0x01FC10000 through 0x1FC13FFF enabled

0 = Write protection for physical address 0x01FC10000 through 0x1FC13FFF disabled

bit 11 **LBWP3:** Lower Boot Alias Page 3 Write-protect bit⁽¹⁾

1 = Write protection for physical address 0x01FC0C000 through 0x1FC0FFFF enabled

0 = Write protection for physical address 0x01FC0C000 through 0x1FC0FFFF disabled

bit 10 **LBWP2:** Lower Boot Alias Page 2 Write-protect bit⁽¹⁾

1 = Write protection for physical address 0x01FC08000 through 0x1FC0BFFF enabled

0 = Write protection for physical address 0x01FC08000 through 0x1FC0BFFF disabled

bit 9 **LBWP1:** Lower Boot Alias Page 1 Write-protect bit⁽¹⁾

1 = Write protection for physical address 0x01FC04000 through 0x1FC07FFF enabled

0 = Write protection for physical address 0x01FC04000 through 0x1FC07FFF disabled

bit 8 **LBWP0:** Lower Boot Alias Page 0 Write-protect bit⁽¹⁾

1 = Write protection for physical address 0x01FC00000 through 0x1FC03FFF enabled

0 = Write protection for physical address 0x01FC00000 through 0x1FC03FFF disabled

bit 7 **UBWPUNLOCK:** Upper Boot Alias Write-protect Unlock bit

1 = UBWPx bits are not locked and can be modified

0 = UBWPx bits are locked and cannot be modified

This bit is only user-clearable and cannot be set except by any reset.

bit 6 **Reserved:** This bit is reserved for use by development tools

bit 5 **Unimplemented:** Read as '0'

Note 1: These bits are only available when the NVMKEY unlock sequence is performed and the associated Lock bit (LBWPUNLOCK or UBWPUNLOCK) is set.

Note: The bits in this register are only writable when the NVMKEY unlock sequence is followed.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 5-8: NVMBWP: FLASH BOOT (PAGE) WRITE-PROTECT REGISTER

- bit 4 **UBWP4:** Upper Boot Alias Page 4 Write-protect bit⁽¹⁾
1 = Write protection for physical address 0x01FC30000 through 0x1FC33FFF enabled
0 = Write protection for physical address 0x01FC30000 through 0x1FC33FFF disabled
- bit 3 **UBWP3:** Upper Boot Alias Page 3 Write-protect bit⁽¹⁾
1 = Write protection for physical address 0x01FC2C000 through 0x1FC2FFFF enabled
0 = Write protection for physical address 0x01FC2C000 through 0x1FC2FFFF disabled
- bit 2 **UBWP2:** Upper Boot Alias Page 2 Write-protect bit⁽¹⁾
1 = Write protection for physical address 0x01FC28000 through 0x1FC2BFFF enabled
0 = Write protection for physical address 0x01FC28000 through 0x1FC2BFFF disabled
- bit 1 **UBWP1:** Upper Boot Alias Page 1 Write-protect bit⁽¹⁾
1 = Write protection for physical address 0x01FC24000 through 0x1FC27FFF enabled
0 = Write protection for physical address 0x01FC24000 through 0x1FC27FFF disabled
- bit 0 **UBWP0:** Upper Boot Alias Page 0 Write-protect bit⁽¹⁾
1 = Write protection for physical address 0x01FC20000 through 0x1FC23FFF enabled
0 = Write protection for physical address 0x01FC20000 through 0x1FC23FFF disabled

Note 1: These bits are only available when the NVMKEY unlock sequence is performed and the associated Lock bit (LBWPULOCK or UBWPULOCK) is set.

| |
|---|
| Note: The bits in this register are only writable when the NVMKEY unlock sequence is followed. |
|---|

6.0 RESETS

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 7. “Resets”** (DS60001118) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Reset module combines all Reset sources and controls the device Master Reset signal, SYSRST. The device Reset sources are as follows:

- Power-on Reset (POR)
- Master Clear Reset pin ($\overline{\text{MCLR}}$)
- Software Reset (SWR)
- Watchdog Timer Reset (WDTR)
- Brown-out Reset (BOR)
- Configuration Mismatch Reset (CMR)
- Deadman Timer Reset (DMTR)

A simplified block diagram of the Reset module is illustrated in [Figure 6-1](#).

FIGURE 6-1: SYSTEM RESET BLOCK DIAGRAM

Legend:

R = Readable bit HC = Hardware Cleared
 W = Writable bit U = Unimplemented bit, read as '0'
 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 31-1 **Unimplemented:** Read as '0'
 bit 0 **SWRST:** Software Reset Trigger bit^(1,2)
 1 = Enable software Reset event
 0 = No effect

- Note 1:** The system unlock sequence must be performed before the SWRST bit can be written. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the *"PIC32 Family Reference Manual"* for details.
- 2:** Once this bit is set, any read of the RSWRST register will cause a reset to occur.

REGISTER 6-3: RNMICON: NON-MASKABLE INTERRUPT (NMI) CONTROL REGISTER

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|----------------|----------------|----------------|----------------|----------------|----------------|---------------|---------------|
| 31:24 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | R/W-0 | R/W-0 |
| | — | — | — | — | — | — | DMTO | WDTO |
| 23:16 | R/W-0 | U-0 | U-0 | U-0 | R/W-0 | U-0 | R/W-0 | R/W-0 |
| | SWNMI | — | — | — | GNMI | — | CF | WDT5 |
| 15:8 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
| | NMICNT<15:8> | | | | | | | |
| 7:0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
| | NMICNT<7:0> | | | | | | | |

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

- bit 31-26 **Unimplemented:** Read as '0'
- bit 25 **DMTO:** Deadman Timer Time-out Flag bit
 1 = DMT time-out has occurred and caused a NMI
 0 = DMT time-out has not occurred
 Setting this bit will cause a DMT NMI event, and NMICNT will begin counting.
- bit 24 **WDTO:** Watchdog Timer Time-Out Flag bit
 1 = WDT time-out has occurred and caused a NMI
 0 = WDT time-out has not occurred
 Setting this bit will cause a WDT NMI event, and NMICNT will begin counting.
- bit 23 **SWNMI:** Software NMI Trigger.
 1 = An NMI will be generated
 0 = An NMI will not be generated
- bit 22-20 **Unimplemented:** Read as '0'
- bit 19 **GNMI:** General NMI bit
 1 = A general NMI event has been detected or a user-initiated NMI event has occurred
 0 = A general NMI event has not been detected
 Setting GNMI to a '1' causes a user-initiated NMI event. This bit is also set by writing 0x4E to the NMIKEY<7:0> (INTCON<31:24>) bits.
- bit 18 **Unimplemented:** Read as '0'
- bit 17 **CF:** Clock Fail Detect bit
 1 = FSCM has detected clock failure and caused an NMI
 0 = FSCM has not detected clock failure
 Setting this bit will cause a a CF NMI event, but will not cause a clock switch to the BFRC.
- bit 16 **WDT5:** Watchdog Timer Time-out in Sleep Mode Flag bit
 1 = WDT time-out has occurred during Sleep mode and caused a wake-up from sleep
 0 = WDT time-out has not occurred during Sleep mode
 Setting this bit will cause a WDT NMI.
- bit 15-0 **NMICNT<15:0>:** NMI Reset Counter Value bits
 1111111111111111-0000000000000001 = Number of SYSCLK cycles before a device Reset occurs⁽¹⁾
 0000000000000000 = No delay between NMI assertion and device Reset event

Note 1: When a Watchdog Timer NMI event (when not in Sleep mode) or a Deadman Timer NMI event is triggered the NMICNT will start decrementing. When NMICNT reaches zero, the device is Reset. This NMI reset counter is only applicable to these two specific NMI events.

Note: The system unlock sequence must be performed before the SWRST bit can be written. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the *"PIC32 Family Reference Manual"* for details.

bit 31-1 **Unimplemented:** Read as '0'

bit 0 **VREGS:** Voltage Regulator Stand-by Enable bit
 1 = Voltage regulator will remain active during Sleep
 0 = Voltage regulator will go to Stand-by mode during Sleep

7.0 CPU EXCEPTIONS AND INTERRUPT CONTROLLER

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 8. “Interrupt Controller”** (DS60001108) and **Section 50. “CPU for Devices with MIPS32® microAptiv™ and M-Class Cores”** (DS60001192) of the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices generate interrupt requests in response to interrupt events from peripheral modules. The Interrupt Controller module exists outside of the CPU and prioritizes the interrupt events before presenting them to the CPU.

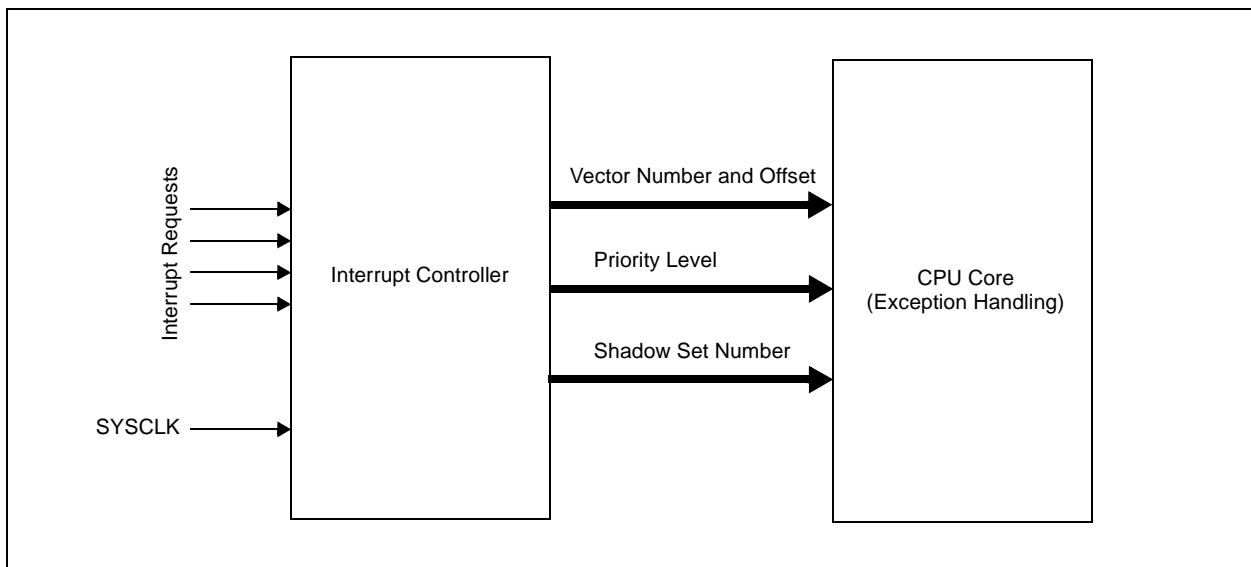

The CPU handles interrupt events as part of the exception handling mechanism, which is described in [Section 7.1 “CPU Exceptions”](#).

The Interrupt Controller module includes the following features:

- Up to 213 interrupt sources and vectors with dedicated programmable offsets, eliminating the need for redirection
- Single and multi-vector mode operations
- Five external interrupts with edge polarity control
- Interrupt proximity timer
- Seven user-selectable priority levels for each vector
- Four user-selectable subpriority levels within each priority
- Seven shadow register sets that can be used for any priority level, eliminating software context switch and reducing interrupt latency
- Software can generate any interrupt

[Figure 7-1](#) shows the block diagram for the Interrupt Controller and CPU exceptions.

FIGURE 7-1: CPU EXCEPTIONS AND INTERRUPT CONTROLLER MODULE BLOCK DIAGRAM

7.1 CPU Exceptions

CPU coprocessor 0 contains the logic for identifying and managing exceptions. Exceptions can be caused by a variety of sources, including boundary cases in data, external events or program errors. [Table 7-1](#) lists the exception types in order of priority.

TABLE 7-1: MIPS32® M-CLASS MICROPROCESSOR CORE EXCEPTION TYPES

| Exception Type (In Order of Priority) | Description | Branches to | Status Bits Set | Debug Bits Set | EXCCODE | XC32 Function Name |
|---|--|---------------------------------|--------------------|-------------------|---------|---------------------------------|
| Highest Priority | | | | | | |
| Reset | Assertion $\overline{\text{MCLR}}$ or a Power-on Reset (POR). | 0xBFC0_0000 | BEV, ERL | — | — | _on_reset |
| Soft Reset | Assertion of a software Reset. | 0xBFC0_0000 | BEV, SR, ERL | — | — | _on_reset |
| DSS | EJTAG debug single step. | 0xBFC0_0480 | — | DSS | — | — |
| DINT | EJTAG debug interrupt. Caused by the assertion of the external EJ_DINT input or by setting the EjtagBrk bit in the ECR register. | 0xBFC0_0480 | — | DINT | — | — |
| NMI | Assertion of NMI signal. | 0xBFC0_0000 | BEV, NMI, ERL | — | — | _nmi_handler |
| Machine Check | TLB write that conflicts with an existing entry. | EBASE+0x180 | MCHECK, EXL | — | 0x18 | _general_exception_handler |
| Interrupt | Assertion of unmasked hardware or software interrupt signal. | See Table 7-2 . | IPL<2:0> | — | 0x00 | See Table 7-2 . |
| Deferred Watch | Deferred watch (unmasked by K DM=>!(K DM) transition). | EBASE+0x180 | WP, EXL | — | 0x17 | _general_exception_handler |
| DIB | EJTAG debug hardware instruction break matched. | 0xBFC0_0480 | — | DIB | — | — |
| WATCH | A reference to an address that is in one of the Watch registers (fetch). | EBASE+0x180 | EXL | — | 0x17 | _general_exception_handler |
| AdEL | Fetch address alignment error. Fetch reference to protected address. | EBASE+0x180 | EXL | — | 0x04 | _general_exception_handler |
| TLBL | Fetch TLB miss or fetch TLB hit to page with V = 0. | EBASE if Status.EXL = 0 | — | — | 0x02 | — |
| | | EBASE+0x180 if Status.EXL == 1 | — | — | 0x02 | _general_exception_handler |
| TLBL Execute Inhibit | An instruction fetch matched a valid TLB entry that had the XI bit set. | EBASE+0x180 | EXL | — | 0x14 | _general_exception_handler |
| Cache Error | Instruction or data reference detects a cache tag or data error. | EBASE+0x100 | — | — | 0x1E | _cache_error_exception |

TABLE 7-1: MIPS32® M-CLASS MICROPROCESSOR CORE EXCEPTION TYPES (CONTINUED)

| Exception Type (In Order of Priority) | Description | Branches to | Status Bits Set | Debug Bits Set | EXCCODE | XC32 Function Name |
|---|--|-------------|--------------------|---|-----------------|----------------------------|
| IBE | Instruction fetch bus error. | EBASE+0x180 | EXL | — | 0x06 | _general_exception_handler |
| Instruction Validity Exceptions | An instruction could not be completed because it was not allowed to access the required resources (Coprocessor Unusable) or was illegal (Reserved Instruction). If both exceptions occur on the same instruction, the Coprocessor Unusable Exception takes priority over the Reserved Instruction Exception. | EBASE+0x180 | EXL | — | 0x0A or 0x0B | _general_exception_handler |
| Execute Exception | An instruction-based exception occurred: Integer overflow, trap, system call, breakpoint, floating point, or DSP ASE state disabled exception. | EBASE+0x180 | EXL | — | 0x08-0x0C | _general_exception_handler |
| Tr | Execution of a trap (when trap condition is true). | EBASE+0x180 | EXL | — | 0x0D | _general_exception_handler |
| DDBL/DDBS | EJTAG Data Address Break (address only) or EJTAG data value break on store (address + value). | 0xBFC0_0480 | — | DDBL or DDBS | — | — |
| WATCH | A reference to an address that is in one of the Watch registers (data). | EBASE+0x180 | EXL | — | 0x17 | _general_exception_handler |
| AdEL | Load address alignment error. User mode load reference to kernel address. | EBASE+0x180 | EXL | — | 0x04 | _general_exception_handler |
| AdES | Store address alignment error. User mode store to kernel address. | EBASE+0x180 | EXL | — | 0x05 | _general_exception_handler |
| TLBL | Load TLB miss or load TLB hit to page with V = 0. | EBASE+0x180 | EXL | — | 0x02 | _general_exception_handler |
| TLBS | Store TLB miss or store TLB hit to page with V = 0. | EBASE+0x180 | EXL | — | 0x03 | _general_exception_handler |
| DBE | Load or store bus error. | EBASE+0x180 | EXL | — | 0x07 | _general_exception_handler |
| DDBL | EJTAG data hardware breakpoint matched in load data compare. | 0xBFC0_0480 | — | DDBL | — | — |
| CBrk | EJTAG complex breakpoint. | 0xBFC0_0480 | — | DIBIMPR, DDBLIMPR, and/or DDBSIMPR | — | — |
| Lowest Priority | | | | | | |

7.2 Interrupts

The PIC32MZ EF family uses variable offsets for vector spacing. This allows the interrupt vector spacing to be configured according to application needs. A unique interrupt vector offset can be set for each vector using its associated OFFx register.

For details on the Variable Offset feature, refer to **8.5.2 “Variable Offset”** in **Section 8. “Interrupt Controller”** (DS60001108) of the *“PIC32 Family Reference Manual”*.

[Table 7-2](#) provides the Interrupt IRQ, vector and bit location information.

TABLE 7-2: INTERRUPT IRQ, VECTOR, AND BIT LOCATION

| Interrupt Source ⁽¹⁾ | XC32 Vector Name | IRQ # | Vector # | Interrupt Bit Location | | | | Persistent Interrupt |
|---------------------------------|-------------------------------|-------|--------------|------------------------|----------|-------------|--------------|----------------------|
| | | | | Flag | Enable | Priority | Sub-priority | |
| Highest Natural Order Priority | | | | | | | | |

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

- Note**
- 1: All registers in this table with the exception of the OFFx registers, have corresponding CLR, SET, and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See [Section 12.3 "CLR, SET, and INV Registers"](#) for more information.
 - 2: This bit or register is not available on 64-pin devices.
 - 3: This bit or register is not available on devices without a CAN module.
 - 4: This bit or register is not available on 100-pin devices.
 - 5: Bits 31 and 30 are not available on 64-pin and 100-pin devices; bits 29 through 14 are not available on 64-pin devices.
 - 6: Bits 31, 30, 29, and bits 5 through 0 are not available on 64-pin and 100-pin devices; bit 31 is not available on 124-pin devices; bit 22 is not available on 64-pin devices.
 - 7: This bit or register is not available on devices without a Crypto module.
 - 8: This bit or register is not available on 124-pin devices.

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

- Note**
- 1: All registers in this table with the exception of the OFFx registers, have corresponding CLR, SET, and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See [Section 12.3 "CLR, SET, and INV Registers"](#) for more information.
 - 2: This bit or register is not available on 64-pin devices.
 - 3: This bit or register is not available on devices without a CAN module.
 - 4: This bit or register is not available on 100-pin devices.
 - 5: Bits 31 and 30 are not available on 64-pin and 100-pin devices; bits 29 through 14 are not available on 64-pin devices.
 - 6: Bits 31, 30, 29, and bits 5 through 0 are not available on 64-pin and 100-pin devices; bit 31 is not available on 124-pin devices; bit 22 is not available on 64-pin devices.
 - 7: This bit or register is not available on devices without a Crypto module.
 - 8: This bit or register is not available on 124-pin devices.

TABLE 7-3: INTERRUPT REGISTER MAP (CONTINUED)

| Virtual Address (BF81_#) | Register Name ⁽¹⁾ | Bit Range | Bits | | | | | | | | | | | | | | | All Resets | | |

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

- Note**
- 1: All registers in this table with the exception of the OFFx registers, have corresponding CLR, SET, and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See [Section 12.3 "CLR, SET, and INV Registers"](#) for more information.
 - 2: This bit or register is not available on 64-pin devices.
 - 3: This bit or register is not available on devices without a CAN module.
 - 4: This bit or register is not available on 100-pin devices.
 - 5: Bits 31 and 30 are not available on 64-pin and 100-pin devices; bits 29 through 14 are not available on 64-pin devices.
 - 6: Bits 31, 30, 29, and bits 5 through 0 are not available on 64-pin and 100-pin devices; bit 31 is not available on 124-pin devices; bit 22 is not available on 64-pin devices.
 - 7: This bit or register is not available on devices without a Crypto module.
 - 8: This bit or register is not available on 124-pin devices.

Legend:

R = Readable bit
-n = Value at POR

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

- bit 31-24 **NMIKEY<7:0>**: Non-Maskable Interrupt Key bits
When the correct key (0x4E) is written, a software NMI will be generated. The status is indicated by the GNMI bit (RNMICON<19>).
- bit 23-13 **Unimplemented**: Read as '0'
- bit 12 **MVEC**: Multi Vector Configuration bit
1 = Interrupt controller configured for multi vectored mode
0 = Interrupt controller configured for single vectored mode
- bit 11 **Unimplemented**: Read as '0'
- bit 10-8 **TPC<2:0>**: Interrupt Proximity Timer Control bits
111 = Interrupts of group priority 7 or lower start the Interrupt Proximity timer
110 = Interrupts of group priority 6 or lower start the Interrupt Proximity timer
101 = Interrupts of group priority 5 or lower start the Interrupt Proximity timer
100 = Interrupts of group priority 4 or lower start the Interrupt Proximity timer
011 = Interrupts of group priority 3 or lower start the Interrupt Proximity timer
010 = Interrupts of group priority 2 or lower start the Interrupt Proximity timer
001 = Interrupts of group priority 1 start the Interrupt Proximity timer
000 = Disables Interrupt Proximity timer
- bit 7-5 **Unimplemented**: Read as '0'
- bit 4 **INT4EP**: External Interrupt 4 Edge Polarity Control bit
1 = Rising edge
0 = Falling edge
- bit 3 **INT3EP**: External Interrupt 3 Edge Polarity Control bit
1 = Rising edge
0 = Falling edge
- bit 2 **INT2EP**: External Interrupt 2 Edge Polarity Control bit
1 = Rising edge
0 = Falling edge
- bit 1 **INT1EP**: External Interrupt 1 Edge Polarity Control bit
1 = Rising edge
0 = Falling edge
- bit 0 **INT0EP**: External Interrupt 0 Edge Polarity Control bit
1 = Rising edge
0 = Falling edge

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

8.0 OSCILLATOR CONFIGURATION

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 42. “Oscillators with Enhanced PLL”** (DS60001250) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

The PIC32MZ EF oscillator system has the following modules and features:

- A total of five external and internal oscillator options as clock sources
- On-Chip PLL with user-selectable input divider, multiplier and output divider to boost operating frequency on select internal and external oscillator sources
- On-Chip user-selectable divisor postscaler on select oscillator sources
- Software-controllable switching between various clock sources
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown with dedicated Back-up FRC (BFRC)
- Dedicated On-Chip PLL for USB peripheral
- Flexible reference clock output
- Multiple clock branches for peripherals for better performance flexibility
- Clock switch/slew control with output divider

A block diagram of the oscillator system is provided in [Figure 8-1](#). The clock distribution is shown in [Table 8-1](#).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

FIGURE 8-1: PIC32MZ EF FAMILY OSCILLATOR DIAGRAM

- Notes:**
1. A series resistor, Rs, may be required for AT strip cut crystals, or to eliminate clipping. Alternately, to increase oscillator circuit gain, add a parallel resistor, Rp.
 2. The internal feedback resistor, Rf, is typically in the range of 2 to 10 MΩ.
 3. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the "*PIC32 Family Reference Manual*" for help in determining the best oscillator components.
 4. PBCLK1 divided by 2 is available on the OSC2 pin in certain clock modes.
 5. Shaded regions indicate multiple instantiations of a peripheral or feature.
 6. Refer to **Table 37-19 in Section 37.0 "Electrical Characteristics"** for frequency limitations.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 8-1: SYSTEM AND PERIPHERAL CLOCK DISTRIBUTION

| Peripheral | Clock Source | | | | | | | | | | | | | | |
|-------------------|------------------|------|------------------|------------------|--------|-----------------------|--------|------------------|--------|------------------|--------|--------|----------|----------|----------|
| | FRC | LPRC | SOSC | SYCLK | USBCLK | PBCLK1 ⁽¹⁾ | PBCLK2 | PBCLK3 | PBCLK4 | PBCLK5 | PBCLK7 | PBCLK8 | REFCLK01 | REFCLK02 | REFCLK03 |
| CPU | | | | | | | | | | | X | | | | |
| WDT | | X | | | | X ⁽²⁾ | | | | | | | | | |
| Deadman Timer | | | | | | X ⁽²⁾ | | | | | X | | | | |
| Flash | X ⁽²⁾ | | | X ⁽²⁾ | | X ⁽²⁾ | | | | | | | | | |
| ADC | X | | | X | | | | X ⁽³⁾ | | | | | | | X |
| Comparator | | | | | | | | X | | | | | | | |
| Crypto | | | | | | | | | | X | | | | | |
| RNG | | | | | | | | | | X | | | | | |
| USB | | | | | X | | | | | X ⁽³⁾ | | | | | |
| CAN | | | | | | | | | | X | | | | | |
| Ethernet | | | | | | | | | | X ⁽³⁾ | | | | | |
| PMP | | | | | | | X | | | | | | | | |
| I ² C™ | | | | | | | X | | | | | | | | |
| UART | | | | | | | X | | | | | | | | |
| RTCC | | X | X | | | X ⁽²⁾ | | | | | | | | | |
| EBI | | | | | | | | | | | | X | | | |
| SQI | | | | | | | | | | X ⁽³⁾ | | | | X | |
| SPI | | | | | | | X | | | | | | X | | |
| Timers | | | X ⁽⁴⁾ | | | | | X | | | | | | | |
| Output Compare | | | | | | | | X | | | | | | | |
| Input Capture | | | | | | | | X | | | | | | | |
| Ports | | | | | | | | | X | | | | | | |
| DMA | | | | X | | | | | | | | | | | |
| Interrupts | | | | X | | | | | | | | | | | |
| Prefetch | | | | X | | | | | | | | | | | |
| OSC2 Pin | | | | | | X ⁽⁵⁾ | | | | | | | | | |

- Note 1:** PBCLK1 is used by system modules and cannot be turned off.
Note 2: SYCLK/PBCLK1 is used to fetch data from/to the Flash Controller, while the FRC clock is used for programming.
Note 3: Special Function Register (SFR) access only.
Note 4: Timer1 only.
Note 5: PBCLK1 divided by 2 is available on the OSC2 pin in certain clock modes.

8.1 Fail-Safe Clock Monitor (FSCM)

The PIC32MZ EF oscillator system includes a Fail-safe Clock Monitor (FSCM). The FSCM monitors the SYCLK for continuous operation. If it detects that the SYCLK has failed, it switches the SYCLK over to the BFRC oscillator and triggers a NMI. The BFRC is an untuned 8 MHz oscillator that will drive the SYCLK during FSCM event. When the NMI is executed, software can attempt to restart the main oscillator or shut down the system.

In Sleep mode both the SYCLK and the FSCM halt, which prevents FSCM detection.

8.2 Oscillator Control Registers

TABLE 8-2: OSCILLATOR CONFIGURATION REGISTER MAP

| Virtual Address (BF80_#) | Register Name ⁽¹⁾ | Bit Range | Bits | | | | | | | | | | | | | | All Resets ⁽²⁾ | | |
|-----------------------------|---------------------------------|-----------|-------------|-------------|-------|-------|----------|--------------|---------|--------|---------|--------------|------------|-------|------------|---------------|---------------------------|-------|------|
| | | | 31/15 | 30/14 | 29/13 | 28/12 | 27/11 | 26/10 | 25/9 | 24/8 | 23/7 | 22/6 | 21/5 | 20/4 | 19/3 | 18/2 | | 17/1 | 16/0 |

| | — | COSC<2:0> | | | — | NOSC<2:0> | | |
| 7:0 | R/W-0 | U-0 | U-0 | R/W-0 | R/W-0, HS | U-0 | R/W-y | R/W-y |
| | CLKLOCK | — | — | SLPEN | CF | — | SOSCEN | OSWEN ⁽¹⁾ |

| | | |
|-------------------|--|------------------------------------|
| Legend: | y = Value set from Configuration bits on POR | HS = Hardware Set |
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared |
| | | x = Bit is unknown |

bit 31-27 **Unimplemented:** Read as '0'

bit 26-24 **FRCDIV<2:0>:** Internal Fast RC (FRC) Oscillator Clock Divider bits

- 111 = FRC divided by 256
- 110 = FRC divided by 64
- 101 = FRC divided by 32
- 100 = FRC divided by 16
- 011 = FRC divided by 8
- 010 = FRC divided by 4
- 001 = FRC divided by 2
- 000 = FRC divided by 1 (default setting)

bit 23 **DRMEN:** Dream Mode Enable bit

- 1 = Dream mode is enabled
- 0 = Dream mode is disabled

bit 22 **Unimplemented:** Read as '0'

bit 21 **SLP2SPD:** Sleep 2-speed Startup Control bit⁽¹⁾

- 1 = Use FRC as SYSCLK until selected clock is ready
- 0 = Use the selected clock directly

bit 20-15 **Unimplemented:** Read as '0'

bit 14-12 **COSC<2:0>:** Current Oscillator Selection bits

- 111 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)
- 110 = Back-up Fast RC (BFRC) Oscillator
- 101 = Internal Low-Power RC (LPRC) Oscillator
- 100 = Secondary Oscillator (SOSC)
- 011 = Reserved
- 010 = Primary Oscillator (Posc) (HS or EC)
- 001 = System PLL (SPLL)
- 000 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)

bit 11 **Unimplemented:** Read as '0'

Note 1: The reset value for this bit depends on the setting of the IESO (DEVCFG1<7>) bit. When IESO = 1, the reset value is '1'. When IESO = 0, the reset value is '0'.

Note: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the "PIC32 Family Reference Manual" for details.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 8-1: OSCCON: OSCILLATOR CONTROL REGISTER

bit 10-8 **NOSC<2:0>**: New Oscillator Selection bits

111 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)

110 = Reserved

101 = Internal Low-Power RC (LPRC) Oscillator

100 = Secondary Oscillator (SOSC)

011 = Reserved

010 = Primary Oscillator (POSC) (HS or EC)

001 = System PLL (SPLL)

000 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)

On Reset, these bits are set to the value of the FNOSC<2:0> Configuration bits (DEVCFG1<2:0>).

bit 7 **CLKLOCK**: Clock Selection Lock Enable bit

1 = Clock and PLL selections are locked

0 = Clock and PLL selections are not locked and may be modified

bit 6-5 **Unimplemented**: Read as '0'

bit 4 **SLPEN**: Sleep Mode Enable bit

1 = Device will enter Sleep mode when a WAIT instruction is executed

0 = Device will enter Idle mode when a WAIT instruction is executed

bit 3 **CF**: Clock Fail Detect bit

1 = FSCM has detected a clock failure

0 = No clock failure has been detected

bit 2 **Unimplemented**: Read as '0'

bit 1 **SOSCEN**: Secondary Oscillator (SOSC) Enable bit

1 = Enable Secondary Oscillator

0 = Disable Secondary Oscillator

bit 0 **OSWEN**: Oscillator Switch Enable bit⁽¹⁾

1 = Initiate an oscillator switch to selection specified by NOSC<2:0> bits

0 = Oscillator switch is complete

Note 1: The reset value for this bit depends on the setting of the IESO (DEVCFG1<7>) bit. When IESO = 1, the reset value is '1'. When IESO = 0, the reset value is '0'.

Note: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 8-2: OSCTUN: FRC TUNING REGISTER

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|----------------|----------------|-------------------------|----------------|----------------|----------------|---------------|---------------|
| 31:24 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 |
| | — | — | — | — | — | — | — | — |
| 23:16 | U-0 | R-0 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 |
| | — | — | — | — | — | — | — | — |
| 15:8 | U-0 | R-0 | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 |
| | — | — | — | — | — | — | — | — |
| 7:0 | U-0 | U-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
| | — | — | TUN<5:0> ⁽¹⁾ | | | | | |

Legend:

R = Readable bit
-n = Value at POR

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

bit 31-6 **Unimplemented:** Read as '0'

bit 5-0 **TUN<5:0>**: FRC Oscillator Tuning bits⁽¹⁾

100000 = Center frequency -2%

100001 =

•

•

•

111111 =

000000 = Center frequency; Oscillator runs at nominal frequency (8 MHz)

000001 =

•

•

•

011110 =

011111 = Center frequency +2%

Note 1: OSCTUN functionality has been provided to help customers compensate for temperature effects on the FRC frequency over a wide range of temperatures. The tuning step size is an approximation, and is neither characterized, nor tested.

Note: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 8-3: SPLLCN: SYSTEM PLL CONTROL REGISTER

| | PLLICK | — | — | — | — | PLLRANGE<2:0> | | |

| | |
|-------------------|--|
| Legend: | y = Value set from Configuration bits on POR |
| R = Readable bit | W = Writable bit U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set '0' = Bit is cleared x = Bit is unknown |

bit 31-27 **Unimplemented:** Read as '0'

bit 26-24 **PLLODIV<2:0>:** System PLL Output Clock Divider bits

- 111 = PLL Divide by 32
- 110 = PLL Divide by 32
- 101 = PLL Divide by 32
- 100 = PLL Divide by 16
- 011 = PLL Divide by 8
- 010 = PLL Divide by 4
- 001 = PLL Divide by 2
- 000 = PLL Divide by 2

The default setting is specified by the FPLLODIV<2:0> Configuration bits in the DEVCFG2 register. Refer to [Register 34-5](#) in [Section 34.0 "Special Features"](#) for information.

bit 23 **Unimplemented:** Read as '0'

bit 22-16 **PLLMULT<6:0>:** System PLL Multiplier bits

- 1111111 = Multiply by 128
- 1111110 = Multiply by 127
- 1111101 = Multiply by 126
- 1111100 = Multiply by 125
-
-
-
- 0000000 = Multiply by 1

The default setting is specified by the FPLLMULT<6:0> Configuration bits in the DEVCFG2 register. Refer to [Register 34-5](#) in [Section 34.0 "Special Features"](#) for information.

bit 15-11 **Unimplemented:** Read as '0'

Note 1: Writes to this register require an unlock sequence. Refer to [Section 42. "Oscillators with Enhanced PLL"](#) (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

2: Writes to this register are not allowed if the SPLL is selected as a clock source (COSC<2:0> = 001).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 8-3: SPLLCON: SYSTEM PLL CONTROL REGISTER

bit 10-8 **PLLIDIV<2:0>**: System PLL Input Clock Divider bits

111 = Divide by 8
110 = Divide by 7
101 = Divide by 6
100 = Divide by 5
011 = Divide by 4
010 = Divide by 3
001 = Divide by 2
000 = Divide by 1

The default setting is specified by the FPLLIDIV<2:0> Configuration bits in the DEVCFG2 register. If the PLLICLK is set for FRC, this setting is ignored by the PLL and the divider is set for Divide-by-1. Refer to Register 34-5 in Section 34.0 “Special Features” for information.

bit 7 **PLLICLK**: System PLL Input Clock Source bit

1 = FRC is selected as the input to the System PLL
0 = Posc is selected as the input to the System PLL

The POR default is specified by the FPLLICLK Configuration bit in the DEVCFG2 register. Refer to Register 34-5 in Section 34.0 “Special Features” for information.

bit 6-3 **Unimplemented**: Read as '0'

bit 2-0 **PLLRRANGE<2:0>**: System PLL Frequency Range Selection bits

111 = Reserved
110 = Reserved
101 = 34-64 MHz
100 = 21-42 MHz
011 = 13-26 MHz
010 = 8-16 MHz
001 = 5-10 MHz
000 = Bypass

The default setting is specified by the FPLLRRNG<2:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in Section 34.0 “Special Features” for information.

Note 1: Writes to this register require an unlock sequence. Refer to Section 42. “Oscillators with Enhanced PLL” (DS60001250) in the “PIC32 Family Reference Manual” for details.

2: Writes to this register are not allowed if the SPLL is selected as a clock source (COSC<2:0> = 001).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

 - 0 = FRC is disabled for not operating

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

9.0 PREFETCH MODULE

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 41. “Prefetch Module for Devices with L1 CPU Cache”** (DS60001183) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Prefetch module is a performance enhancing module that is included in PIC32MZ EF family devices. When running at high-clock rates, Wait states must be inserted into Program Flash Memory (PFM) read transactions to meet the access time of the PFM. Wait states can be hidden to the core by prefetching and storing instructions in a temporary holding area that the CPU can access quickly. Although the data path to the CPU is 32 bits wide, the data path to the PFM is 128 bits wide. This wide data path provides the same bandwidth to the CPU as a 32-bit path running at four times the frequency.

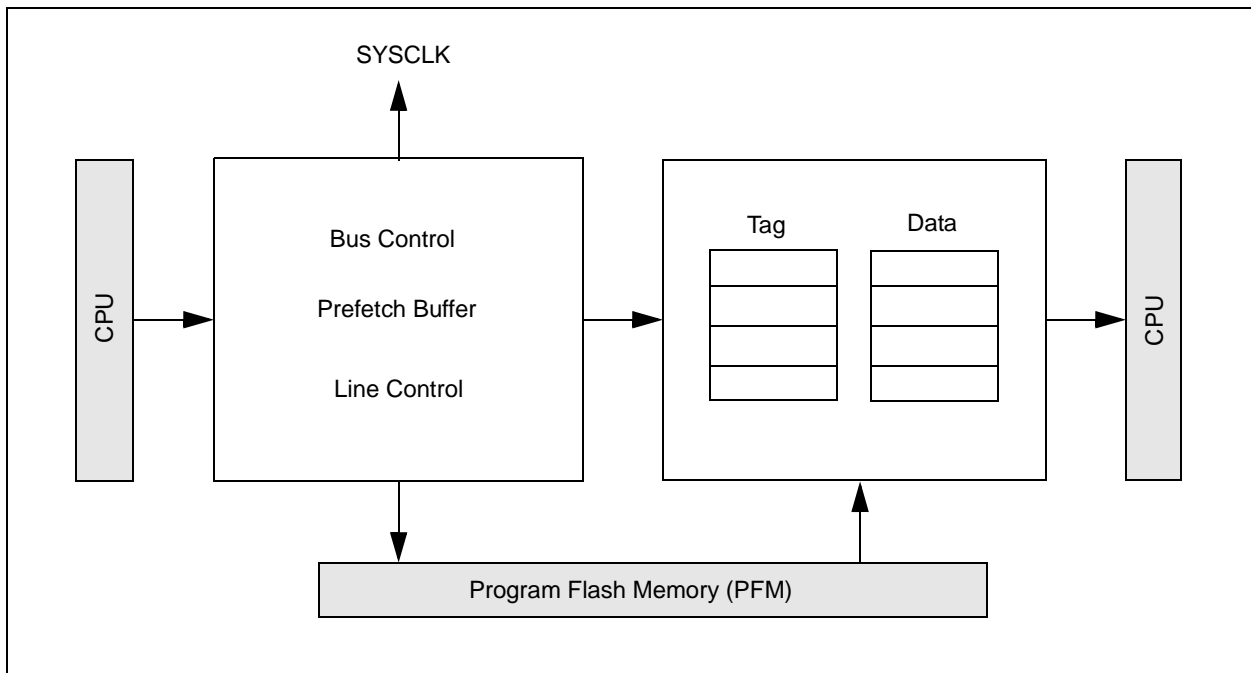

The Prefetch module holds a subset of PFM in temporary holding spaces known as lines. Each line contains a tag and data field. Normally, the lines hold a copy of what is currently in memory to make instructions or data available to the CPU without Flash Wait states.

Key features include:

- 4x16 byte fully-associative lines
- One line for CPU instructions
- One line for CPU data
- Two lines for peripheral data
- 16-byte parallel memory fetch
- Configurable predictive prefetch
- Error detection and correction

A simplified block diagram of the Prefetch module is shown in [Figure 9-1](#).

10.0 DIRECT MEMORY ACCESS (DMA) CONTROLLER

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 31. “Direct Memory Access (DMA) Controller”** (DS60001117) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

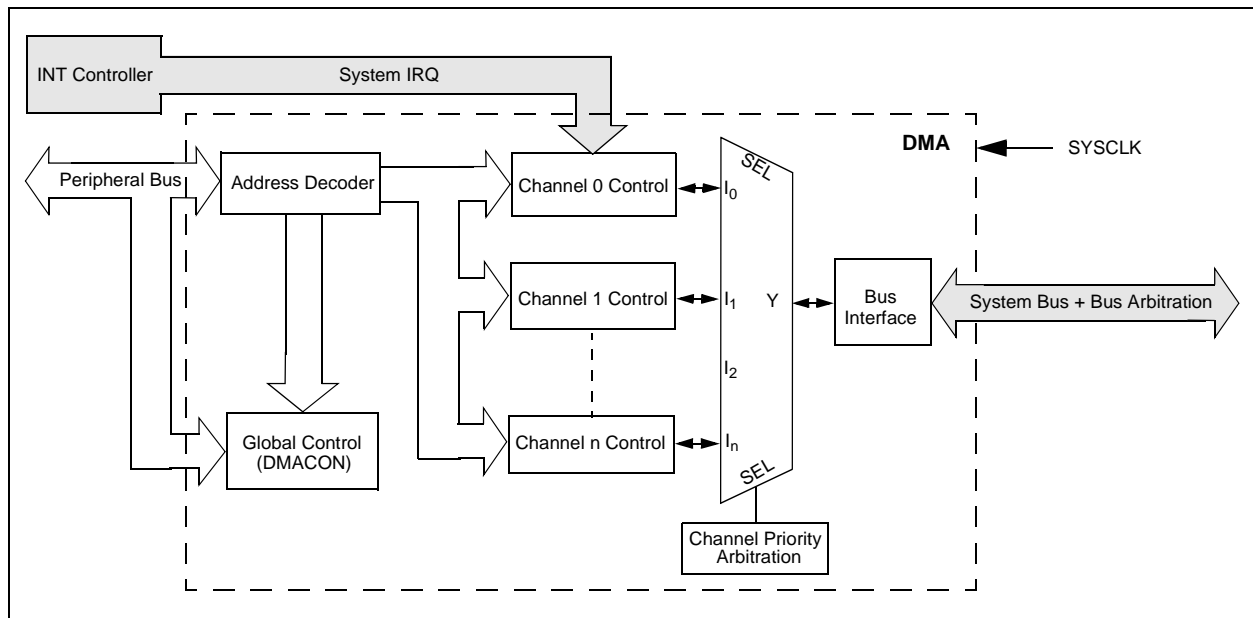

The Direct Memory Access (DMA) Controller is a bus master module useful for data transfers between different devices without CPU intervention. The source and destination of a DMA transfer can be any of the memory mapped modules existent in the device such as SPI, UART, PMP, etc., or memory itself.

Key features include:

- Eight identical channels, each featuring:
 - Auto-increment source and destination address registers
 - Source and destination pointers
 - Memory to memory and memory to peripheral transfers
- Automatic word-size detection:
 - Transfer granularity, down to byte level
 - Bytes need not be word-aligned at source and destination
- Fixed priority channel arbitration

- Flexible DMA channel operating modes:
 - Manual (software) or automatic (interrupt) DMA requests
 - One-Shot or Auto-Repeat Block Transfer modes
 - Channel-to-channel chaining
- Flexible DMA requests:
 - A DMA request can be selected from any of the peripheral interrupt sources
 - Each channel can select any (appropriate) observable interrupt as its DMA request source
 - A DMA transfer abort can be selected from any of the peripheral interrupt sources
 - Up to 2-byte Pattern (data) match transfer termination
- Multiple DMA channel status interrupts:
 - DMA channel block transfer complete
 - Source empty or half empty
 - Destination full or half full
 - DMA transfer aborted due to an external event
 - Invalid DMA address generated
- DMA debug support features:
 - Most recent error address accessed by a DMA channel
 - Most recent DMA channel to transfer data
- CRC Generation module:
 - CRC module can be assigned to any of the available channels
 - CRC module is highly configurable

FIGURE 10-1: DMA BLOCK DIAGRAM

| | CRCEN | CRCAPP ⁽¹⁾ | CRCTYP | — | — | CRCCH<2:0> | | |

Legend:

R = Readable bit
-n = Value at POR

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

bit 31-30 **Unimplemented:** Read as '0'

bit 29-28 **BYTO<1:0>:** CRC Byte Order Selection bits

11 = Endian byte swap on half-word boundaries (i.e., source half-word order with reverse source byte order per half-word)

10 = Swap half-words on word boundaries (i.e., reverse source half-word order with source byte order per half-word)

01 = Endian byte swap on word boundaries (i.e., reverse source byte order)

00 = No swapping (i.e., source byte order)

bit 27 **WBO:** CRC Write Byte Order Selection bit⁽¹⁾

1 = Source data is written to the destination re-ordered as defined by BYTO<1:0>

0 = Source data is written to the destination unaltered

bit 26-25 **Unimplemented:** Read as '0'

bit 24 **BITO:** CRC Bit Order Selection bit

When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):

1 = The IP header checksum is calculated Least Significant bit (LSb) first (i.e., reflected)

0 = The IP header checksum is calculated Most Significant bit (MSb) first (i.e., not reflected)

When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):

1 = The LFSR CRC is calculated Least Significant bit first (i.e., reflected)

0 = The LFSR CRC is calculated Most Significant bit first (i.e., not reflected)

bit 23-13 **Unimplemented:** Read as '0'

bit 12-8 **PLEN<4:0>:** Polynomial Length bits⁽¹⁾

When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):

These bits are unused.

When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):

Denotes the length of the polynomial – 1.

bit 7 **CRCEN:** CRC Enable bit

1 = CRC module is enabled and channel transfers are routed through the CRC module

0 = CRC module is disabled and channel transfers proceed normally

Note 1: When WBO = 1, unaligned transfers are not supported and the CRCAPP bit cannot be set.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 10-4: DCRCCON: DMA CRC CONTROL REGISTER (CONTINUED)

- bit 6 **CRCAPP:** CRC Append Mode bit⁽¹⁾
1 = The DMA transfers data from the source into the CRC but NOT to the destination. When a block transfer completes the DMA writes the calculated CRC value to the location given by CHxDSA
0 = The DMA transfers data from the source through the CRC obeying WBO as it writes the data to the destination
- bit 5 **CRCTYP:** CRC Type Selection bit
1 = The CRC module will calculate an IP header checksum
0 = The CRC module will calculate a LFSR CRC
- bit 4-3 **Unimplemented:** Read as '0'
- bit 2-0 **CRCCH<2:0>:** CRC Channel Select bits
111 = CRC is assigned to Channel 7
110 = CRC is assigned to Channel 6
101 = CRC is assigned to Channel 5
100 = CRC is assigned to Channel 4
011 = CRC is assigned to Channel 3
010 = CRC is assigned to Channel 2
001 = CRC is assigned to Channel 1
000 = CRC is assigned to Channel 0

Note 1: When WBO = 1, unaligned transfers are not supported and the CRCAPP bit cannot be set.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 31-0 **DCRCDATA<31:0>**: CRC Data Register bits

Writing to this register will seed the CRC generator. Reading from this register will return the current value of the CRC. Bits greater than PLEN will return '0' on any read.

When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):

Only the lower 16 bits contain IP header checksum information. The upper 16 bits are always '0'. Data written to this register is converted and read back in 1's complement form (i.e., current IP header checksum value).

When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):

Bits greater than PLEN will return '0' on any read.

bit 31-0 **DCRCXOR<31:0>**: CRC XOR Register bits

When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):

This register is unused.

When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):

1 = Enable the XOR input to the Shift register

0 = Disable the XOR input to the Shift register; data is shifted in directly from the previous stage in the register

| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared x = Bit is unknown |

bit 31-24 **CHPIGN<7:0>**: Channel Register Data bits

Pattern Terminate mode:

Any byte matching these bits during a pattern match may be ignored during the pattern match determination when the CHIPGNEN bit is set. If a byte is read that is identical to this data byte, the pattern match logic will treat it as a "don't care" when the pattern matching logic is enabled and the CHPIGEN bit is set.

bit 23-16 **Unimplemented**: Read as '0'

bit 15 **CHBUSY**: Channel Busy bit

1 = Channel is active or has been enabled
0 = Channel is inactive or has been disabled

bit 14 **Unimplemented**: Read as '0'

bit 13 **CHIPGNEN**: Enable Pattern Ignore Byte bit

1 = Treat any byte that matches the CHPIGN<7:0> bits as a "don't care" when pattern matching is enabled
0 = Disable this feature

bit 12 **Unimplemented**: Read as '0'

bit 11 **CHPATLEN**: Pattern Length bit

1 = 2 byte length
0 = 1 byte length

bit 10-9 **Unimplemented**: Read as '0'

bit 8 **CHCHNS**: Chain Channel Selection bit⁽¹⁾

1 = Chain to channel lower in natural priority (CH1 will be enabled by CH2 transfer complete)
0 = Chain to channel higher in natural priority (CH1 will be enabled by CH0 transfer complete)

bit 7 **CHEN**: Channel Enable bit⁽²⁾

1 = Channel is enabled
0 = Channel is disabled

bit 6 **CHAED**: Channel Allow Events If Disabled bit

1 = Channel start/abort events will be registered, even if the channel is disabled
0 = Channel start/abort events will be ignored if the channel is disabled

bit 5 **CHCHN**: Channel Chain Enable bit

1 = Allow channel to be chained
0 = Do not allow channel to be chained

Note 1: The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).

Note 2: When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 10-7: DCHxCON: DMA CHANNEL x CONTROL REGISTER (CONTINUED)

- bit 4 **CHAEN:** Channel Automatic Enable bit
 1 = Channel is continuously enabled, and not automatically disabled after a block transfer is complete
 0 = Channel is disabled on block transfer complete
- bit 3 **Unimplemented:** Read as '0'
- bit 2 **CHEDET:** Channel Event Detected bit
 1 = An event has been detected
 0 = No events have been detected
- bit 1-0 **CHPRI<1:0>:** Channel Priority bits
 11 = Channel has priority 3 (highest)
 10 = Channel has priority 2
 01 = Channel has priority 1
 00 = Channel has priority 0

- Note 1:** The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).
- 2:** When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **CHPDAT<15:0>:** Channel Data Register bits

Pattern Terminate mode:

Data to be matched must be stored in this register to allow terminate on match.

All other modes:

Unused.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

11.0 HI-SPEED USB WITH ON-THE-GO (OTG)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 51. “Hi-Speed USB with On-The-Go (OTG)”** (DS60001326) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Universal Serial Bus (USB) module contains analog and digital components to provide a USB 2.0 embedded host, device, or OTG implementation with a minimum of external components.

The module supports Hi-Speed, Full-Speed, or Low-Speed in any of the operating modes. This module in Host mode is intended for use as an embedded host and therefore does not implement a UHCI or OHCI controller.

The USB module consists of the RAM controller, packet encode/decode, UTM synchronization, endpoint control, a dedicated USB DMA controller, pull-up and pull-down resistors, and the register interface. A block diagram of the PIC32 USB OTG module is presented in [Figure 11-1](#).

The USB module includes the following features:

- USB Hi-Speed, Full-Speed, and Low-Speed support for host and device
- USB OTG support with one or more Hi-Speed, Full-Speed, or Low-Speed device
- Integrated signaling resistors
- Integrated analog comparators for VBUS monitoring
- Integrated USB transceiver
- Transaction handshaking performed by hardware
- Integrated 8-channel DMA to access system RAM and Flash
- Seven transmit endpoints and seven receive endpoints, in addition to Endpoint 0
- Session Request Protocol (SRP) and Host Negotiation Protocol (HNP) support
- Suspend and resume signaling support
- Dynamic FIFO sizing
- Integrated RAM for the FIFOs, eliminating the need for system RAM for the FIFOs
- Link power management support

Note 1: The implementation and use of the USB specifications, as well as other third party specifications or technologies, may require licensing; including, but not limited to, USB Implementers Forum, Inc. (also referred to as USB-IF). The user is fully responsible for investigating and satisfying any applicable licensing obligations.

2: If the USB module is used, the Primary Oscillator (POSC) is limited to either 12 MHz or 24 MHz.

bit 23-17 **EP7TXIF:EP1TXIF:** Endpoint 'n' TX Interrupt Flag bit
 1 = Endpoint has a transmit interrupt to be serviced
 0 = No interrupt event

bit 16 **EP0IF:** Endpoint 0 Interrupt bit
 1 = Endpoint 0 has an interrupt to be serviced
 0 = No interrupt event

All EPxTX and EP0 bits are cleared when the byte is read. Therefore, these bits must be read independently from the remaining bits in this register to avoid accidental clearing.

bit 15 **ISOUPD:** ISO Update bit (*Device mode only; unimplemented in Host mode*)
 1 = USB module will wait for a SOF token from the time TXPKTRDY is set before sending the packet
 0 = No change in behavior

This bit only affects endpoints performing isochronous transfers when in *Device mode*. This bit is unimplemented in *Host mode*.

bit 14 **SOFTCONN:** Soft Connect/Disconnect Feature Selection bit
 1 = The USB D+/D- lines are enabled and active
 0 = The USB D+/D- lines are disabled and are tri-stated

This bit is only available in *Device mode*.

bit 13 **HSEN:** Hi-Speed Enable bit
 1 = The USB module will negotiate for Hi-Speed mode when the device is reset by the hub
 0 = Module only operates in Full-Speed mode

bit 12 **HSMODE:** Hi-Speed Mode Status bit
 1 = Hi-Speed mode successfully negotiated during USB reset
 0 = Module is not in Hi-Speed mode

In *Device mode*, this bit becomes valid when a USB reset completes. In *Host mode*, it becomes valid when the RESET bit is cleared.

bit 11 **RESET:** Module Reset Status bit
 1 = Reset signaling is present on the bus
 0 = Normal module operation

In *Device mode*, this bit is read-only. In *Host mode*, this bit is read/write.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 11-1: USBCSR0: USB CONTROL STATUS REGISTER 0 (CONTINUED)

- bit 10 **RESUME:** Resume from Suspend control bit
1 = Generate Resume signaling when the device is in Suspend mode
0 = Stop Resume signaling
- In *Device mode*, the software should clear this bit after 10 ms (a maximum of 15 ms) to end Resume signaling. In *Host mode*, the software should clear this bit after 20 ms.
- bit 9 **SUSPMODE:** Suspend Mode status bit
1 = The USB module is in Suspend mode
0 = The USB module is in Normal operations
- This bit is read-only in Device mode. In Host mode, it can be set by software, and is cleared by hardware.
- bit 8 **SUSPEN:** Suspend Mode Enable bit
1 = Suspend mode is enabled
0 = Suspend mode is not enabled
- bit 7 **Unimplemented:** Read as '0'
- bit 6-0 **FUNC<6:0>:** Device Function Address bits
- These bits are only available in *Device mode*. This field is written with the address received through a SET_ADDRESS command, which will then be used for decoding the function address in subsequent token packets.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

- bit 31 **FORCEHST:** Test Mode Force Host Select bit
1 = Forces USB module into *Host mode*, regardless of whether it is connected to any peripheral
0 = Normal operation
- bit 30 **FIFOACC:** Test Mode Endpoint 0 FIFO Transfer Force bit
1 = Transfers the packet in the Endpoint 0 TX FIFO to the Endpoint 0 RX FIFO
0 = No transfer
- bit 29 **FORCEFS:** Test mode Force Full-Speed Mode Select bit
This bit is only active if FORCEHST = 1.
1 = Forces USB module into Full-Speed mode. Undefined behavior if FORCEHS = 1.
0 = If FORCEHS = 0, places USB module into Low-Speed mode.
- bit 28 **FORCEHS:** Test mode Force Hi-Speed Mode Select bit
This bit is only active if FORCEHST = 1.
1 = Forces USB module into Hi-Speed mode. Undefined behavior if FORCEFS = 1.
0 = If FORCEFS = 0, places USB module into Low-Speed mode.
- bit 27 **PACKET:** Test_Packet Test Mode Select bit
This bit is only active if module is in Hi-Speed mode.
1 = The USB module repetitively transmits on the bus a 53-byte test packet. Test packet must be loaded into the Endpoint 0 FIFO before the test mode is entered.
0 = Normal operation
- bit 26 **TESTK:** Test_K Test Mode Select bit
1 = Enters Test_K test mode. The USB module transmits a continuous K on the bus.
0 = Normal operation
This bit is only active if the USB module is in Hi-Speed mode.
- bit 25 **TESTJ:** Test_J Test Mode Select bit
1 = Enters Test_J test mode. The USB module transmits a continuous J on the bus.
0 = Normal operation
This bit is only active if the USB module is in Hi-Speed mode.
- bit 24 **NAK:** Test_SE0_NAK Test Mode Select bit
1 = Enter Test_SE0_NAK test mode. The USB module remains in Hi-Speed mode but responds to any valid IN token with a NAK
0 = Normal operation
This mode is only active if module is in Hi-Speed mode.
- bit 23-20 **Unimplemented:** Read as '0'

bit 31-28 **Unimplemented:** Read as '0'

bit 27 **DISPING:** Disable Ping tokens control bit (*Host mode*)
 1 = USB Module will not issue PING tokens in data and status phases of a Hi-Speed Control transfer
 0 = Ping tokens are issued

bit 26 **DTWREN:** Data Toggle Write Enable bit (*Host mode*)
 1 = Enable the current state of the Endpoint 0 data toggle to be written. Automatically cleared.
 0 = Disable data toggle write

bit 25 **DATATGGL:** Data Toggle bit (*Host mode*)
 When read, this bit indicates the current state of the Endpoint 0 data toggle.
 If DTWREN = 1, this bit is writable with the desired setting.
 If DTWREN = 0, this bit is read-only.

bit 24 **FLSHFIFO:** Flush FIFO Control bit
 1 = Flush the next packet to be transmitted/read from the Endpoint 0 FIFO. The FIFO pointer is reset and the TXPKTRDY/RXPKTRDY bit is cleared. Automatically cleared when the operation completes. Should only be used when TXPKTRDY/RXPKTRDY = 1.
 0 = No Flush operation

bit 23 **SVCSETEND:** Clear SETUPEND Control bit (*Device mode*)
 1 = Clear the SETUPEND bit in this register. This bit is automatically cleared.
 0 = Do not clear

NAKTMOUT: NAK Time-out Control bit (*Host mode*)
 1 = Endpoint 0 is halted following the receipt of NAK responses for longer than the time set by the NAKLIM<4:0> bits (USBICSR<28:24>)
 0 = Allow the endpoint to continue

bit 22 **SVCRPR:** Serviced RXPKTRDY Clear Control bit (*Device mode*)
 1 = Clear the RXPKTRDY bit in this register. This bit is automatically cleared.
 0 = Do not clear

STATPKT: Status Stage Transaction Control bit (*Host mode*)
 1 = When set at the same time as the TXPKTRDY or REQPKT bit is set, performs a status stage transaction
 0 = Do not perform a status stage transaction

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 11-5: USBIE0CSR0: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 0 (ENDPOINT 0) (CONTINUED)

- bit 21 **SENDSTALL:** Send Stall Control bit (*Device mode*)
1 = Terminate the current transaction and transmit a STALL handshake. This bit is automatically cleared.
0 = Do not send STALL handshake.
- REQPKT:** IN transaction Request Control bit (*Host mode*)
1 = Request an IN transaction. This bit is cleared when the RXPKTRDY bit is set.
0 = Do not request an IN transaction
- bit 20 **SETUPEND:** Early Control Transaction End Status bit (*Device mode*)
1 = A control transaction ended before the DATAEND bit has been set. An interrupt will be generated and the FIFO flushed at this time.
0 = Normal operation
This bit is cleared by writing a '1' to the SVCSETEND bit in this register.
- ERROR:** No Response Error Status bit (*Host mode*)
1 = Three attempts have been made to perform a transaction with no response from the peripheral. An interrupt is generated.
0 = Clear this flag. Software must write a '0' to this bit to clear it.
- bit 19 **DATAEND:** End of Data Control bit (*Device mode*)
The software sets this bit when:
- Setting TXPKTRDY for the last data packet
 - Clearing RXPKTRDY after unloading the last data packet
 - Setting TXPKTRDY for a zero length data packet
- Hardware clears this bit.
- SETUPPKT:** Send a SETUP token Control bit (*Host mode*)
1 = When set at the same time as the TXPKTRDY bit is set, the module sends a SETUP token instead of an OUT token for the transaction
0 = Normal OUT token operation
Setting this bit also clears the Data Toggle.
- bit 18 **SENTSTALL:** STALL sent status bit (*Device mode*)
1 = STALL handshake has been transmitted
0 = Software clear of bit
- RXSTALL:** STALL handshake received Status bit (*Host mode*)
1 = STALL handshake was received
0 = Software clear of bit
- bit 17 **TXPKTRDY:** TX Packet Ready Control bit
1 = Data packet has been loaded into the FIFO. It is cleared automatically.
0 = No data packet is ready for transmit
- bit 16 **RXPKTRDY:** RX Packet Ready Status bit
1 = Data packet has been received. Interrupt is generated (when enabled) when this bit is set.
0 = No data packet has been received
This bit is cleared by setting the SVCRRPR bit.
- bit 15-0 **Unimplemented:** Read as '0'

1 = TXPKTRDY will be automatically set when data of the maximum packet size (value in TXMAXP) is loaded into the TX FIFO. If a packet of less than the maximum packet size is loaded, then TXPKTRDY will have to be set manually.
0 = TXPKTRDY must be set manually for all packet sizes
- bit 30 **ISO:** Isochronous TX Endpoint Enable bit (Device mode)
1 = Enables the endpoint for Isochronous transfers
0 = Disables the endpoint for Isochronous transfers and enables it for Bulk or Interrupt transfers.
This bit only has an effect in Device mode. In Host mode, it always returns zero.
- bit 29 **MODE:** Endpoint Direction Control bit
1 = Endpoint is TX
0 = Endpoint is RX
This bit only has any effect where the same endpoint FIFO is used for both TX and RX transactions.
- bit 28 **DMAREQEN:** Endpoint DMA Request Enable bit
1 = DMA requests are enabled for this endpoint
0 = DMA requests are disabled for this endpoint
- bit 27 **FRCDATTG:** Force Endpoint Data Toggle Control bit
1 = Forces the endpoint data toggle to switch and the data packet to be cleared from the FIFO, regardless of whether an ACK was received.
0 = No forced behavior
- bit 26 **DMAREQMD:** Endpoint DMA Request Mode Control bit
1 = DMA Request Mode 1
0 = DMA Request Mode 0
This bit must not be cleared either before or in the same cycle as the above DMAREQEN bit is cleared.
- bit 25 **DATAWEN:** Data Toggle Write Enable bit (Host mode)
1 = Enable the current state of the TX Endpoint data toggle (DATATGGL) to be written
0 = Disables writing the DATATGGL bit
- bit 24 **DATATGGL:** Data Toggle Control bit (Host mode)
When read, this bit indicates the current state of the TX Endpoint data toggle. If DATAWEN = 1, this bit may be written with the required setting of the data toggle. If DATAWEN = 0, any value written to this bit is ignored.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 11-8: USBIENCSR0: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 0 (ENDPOINT 1-7) (CONTINUED)

- bit 23 **INCOMPTX:** Incomplete TX Status bit (Device mode)
1 = For high-bandwidth Isochronous endpoint, a large packet has been split into 2 or 3 packets for transmission but insufficient IN tokens have been received to send all the parts
0 = Normal operation
In anything other than isochronous transfers, this bit will always return 0.
- NAKTMOUT:** NAK Time-out status bit (Host mode)
1 = TX endpoint is halted following the receipt of NAK responses for longer than the NAKLIM setting
0 = Written by software to clear this bit
- bit 22 **CLRDT:** Clear Data Toggle Control bit
1 = Resets the endpoint data toggle to 0
0 = Do not clear the data toggle
- bit 21 **SENTSTALL:** STALL handshake transmission status bit (Device mode)
1 = STALL handshake is transmitted. The FIFO is flushed and the TXPKTRDY bit is cleared.
0 = Written by software to clear this bit
- RXSTALL:** STALL receipt bit (Host mode)
1 = STALL handshake is received. Any DMA request in progress is stopped, the FIFO is completely flushed and the TXPKTRDY bit is cleared.
0 = Written by software to clear this bit
- bit 20 **SENDSTALL:** STALL handshake transmission control bit (Device mode)
1 = Issue a STALL handshake to an IN token
0 = Terminate stall condition
This bit has no effect when the endpoint is being used for Isochronous transfers.
- SETUPPKT:** Definition bit (Host mode)
1 = When set at the same time as the TXPKTRDY bit is set, send a SETUP token instead of an OUT token for the transaction. This also clears the Data Toggle.
0 = Normal OUT token for the transaction
- bit 19 **FLUSH:** FIFO Flush control bit
1 = Flush the latest packet from the endpoint TX FIFO. The FIFO pointer is reset, TXPKTRDY is cleared and an interrupt is generated.
0 = Do not flush the FIFO
- bit 18 **UNDERRUN:** Underrun status bit (Device mode)
1 = An IN token has been received when TXPKTRDY is not set.
0 = Written by software to clear this bit.
- ERROR:** Handshake failure status bit (Host mode)
1 = Three attempts have been made to send a packet and no handshake packet has been received
0 = Written by software to clear this bit.
- bit 17 **FIFONE:** FIFO Not Empty status bit
1 = There is at least 1 packet in the TX FIFO
0 = TX FIFO is empty
- bit 16 **TXPKTRDY:** TX Packet Ready Control bit
The software sets this bit after loading a data packet into the FIFO. It is cleared automatically when a data packet has been transmitted. This bit is also automatically cleared prior to loading a second packet into a double-buffered FIFO.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 11-8: USBIENCSR0: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 0 (ENDPOINT 1-7) (CONTINUED)

bit 15-11 **MULT<4:0>**: Multiplier Control bits

For Isochronous/Interrupt endpoints or of packet splitting on Bulk endpoints, multiplies TXMAXP by MULT+1 for the payload size.

For Bulk endpoints, MULT can be up to 32 and defines the number of "USB" packets of the specified payload into which a single data packet placed in the FIFO should be split, prior to transfer. The data packet is required to be an exact multiple of the payload specified by TXMAXP.

For Isochronous/Interrupts endpoints operating in Hi-Speed mode, MULT may be either 2 or 3 and specifies the maximum number of such transactions that can take place in a single microframe.

bit 10-0 **TXMAXP<10:0>**: Maximum TX Payload per transaction Control bits

This field sets the maximum payload (in bytes) transmitted in a single transaction. The value is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in Full-Speed and Hi-Speed operations.

TXMAXP must be set to an even number of bytes for proper interrupt generation in DMA Mode 1.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

bit 31 **AUTOCLR:** RXPKTRDY Automatic Clear Control bit

- 1 = RXPKTRDY will be automatically cleared when a packet of RXMAXP bytes has been unloaded from the RX FIFO. When packets of less than the maximum packet size are unloaded, RXPKTRDY will have to be cleared manually. When using a DMA to unload the RX FIFO, data is read from the RX FIFO in 4-byte chunks regardless of the RXMAXP.
- 0 = No automatic clearing of RXPKTRDY

This bit should not be set for high-bandwidth Isochronous endpoints.

bit 30 **ISO:** Isochronous Endpoint Control bit (*Device mode*)

- 1 = Enable the RX endpoint for Isochronous transfers
- 0 = Enable the RX endpoint for Bulk/Interrupt transfers

AUTORQ: Automatic Packet Request Control bit (*Host mode*)

- 1 = REQPKT will be automatically set when RXPKTRDY bit is cleared.
- 0 = No automatic packet request

This bit is automatically cleared when a short packet is received.

bit 29 **DMAREQEN:** DMA Request Enable Control bit

- 1 = Enable DMA requests for the RX endpoint.
- 0 = Disable DMA requests for the RX endpoint.

bit 28 **DISNYET:** Disable NYET Handshakes Control/PID Error Status bit (*Device mode*)

- 1 = In Bulk/Interrupt transactions, disables the sending of NYET handshakes. All successfully received RX packets are ACKed including at the point at which the FIFO becomes full.
- 0 = Normal operation.

In Bulk/Interrupt transactions, this bit only has any effect in Hi-Speed mode, in which mode it should be set for all Interrupt endpoints.

PIDERR: PID Error Status bit (*Host mode*)

- 1 = In ISO transactions, this indicates a PID error in the received packet.
- 0 = No error

bit 27 **DMAREQMD:** DMA Request Mode Selection bit

- 1 = DMA Request Mode 1
- 0 = DMA Request Mode 0

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 11-9: USBIENCSR1: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 1 (ENDPOINT 1-7) (CONTINUED)

- bit 26 **DATATWEN:** Data Toggle Write Enable Control bit (*Host mode*)
1 = DATATGGL can be written
0 = DATATGGL is not writable
- bit 25 **DATATGGL:** Data Toggle bit (*Host mode*)
When read, this bit indicates the current state of the endpoint data toggle.
If DATATWEN = 1, this bit may be written with the required setting of the data toggle.
If DATATWEN = 0, any value written to this bit is ignored.
- bit 24 **INCOMPRX:** Incomplete Packet Status bit
1 = The packet in the RX FIFO during a high-bandwidth Isochronous/Interrupt transfer is incomplete because parts of the data were not received
0 = Written by then software to clear this bit
In anything other than Isochronous transfer, this bit will always return 0.
- bit 23 **CLRDT:** Clear Data Toggle Control bit
1 = Reset the endpoint data toggle to 0
0 = Leave endpoint data toggle alone
- bit 22 **SENTSTALL:** STALL Handshake Status bit (*Device mode*)
1 = STALL handshake is transmitted
0 = Written by the software to clear this bit
- RXSTALL:** STALL Handshake Receive Status bit (*Host mode*)
1 = A STALL handshake has been received. An interrupt is generated.
0 = Written by the software to clear this bit
- bit 21 **SENDSTALL:** STALL Handshake Control bit (*Device mode*)
1 = Issue a STALL handshake
0 = Terminate stall condition
- REQPKT:** IN Transaction Request Control bit (*Host mode*)
1 = Request an IN transaction.
0 = No request
This bit is cleared when RXPKTRDY is set.
- bit 20 **FLUSH:** Flush FIFO Control bit
1 = Flush the next packet to be read from the endpoint RX FIFO. The FIFO pointer is reset and the RXPKTRDY bit is cleared. This should only be used when RXPKTRDY is set. If the FIFO is double-buffered, FLUSH may need to be set twice to completely clear the FIFO.
0 = Normal FIFO operation
This bit is automatically cleared.
- bit 19 **DATAERR:** Data Packet Error Status bit (*Device mode*)
1 = The data packet has a CRC or bit-stuff error.
0 = No data error
This bit is cleared when RXPKTRDY is cleared. This bit is only valid when the endpoint is operating in ISO mode. In Bulk mode, it always returns zero.
- DERRNAKT:** Data Error/NAK Time-out Status bit (*Host mode*)
1 = The data packet has a CRC or bit-stuff error. In Bulk mode, the RX endpoint is halted following the receipt of NAK responses for longer than the time set as the NAK limit.
0 = No data or NAK time-out error

bit 31-24 **TXINTERV<7:0>**: Endpoint TX Polling Interval/NAK Limit bits (*Host mode*)

For Interrupt and Isochronous transfers, this field defines the polling interval for the endpoint. For Bulk endpoints, this field sets the number of frames/microframes after which the endpoint should time out on receiving a stream of NAK responses.

The following table describes the valid values and interpretation for these bits:

| Transfer Type | Speed | Valid Values (m) | Interpretation |
|---------------|--------------|------------------|--|
| Interrupt | Low/Full | 0x01 to 0xFF | Polling interval is 'm' frames. |
| | High | 0x01 to 0x10 | Polling interval is $2^{(m-1)}$ frames. |
| Isochronous | Full or High | 0x01 to 0x10 | Polling interval is $2^{(m-1)}$ frames/microframes. |
| Bulk | Full or High | 0x02 to 0x10 | NAK limit is $2^{(m-1)}$ frames/microframes. A value of '0' or '1' disables the NAK time-out function. |

bit 23-22 **SPEED<1:0>**: TX Endpoint Operating Speed Control bits (*Host mode*)

bit 31-0 **DATA<31:0>**: USB Transmit/Receive FIFO Data bits

Writes to this register loads data into the Tx FIFO for the corresponding endpoint. Reading from this register unloads data from the Rx FIFO for the corresponding endpoint.

Transfers may be 8-bit, 16-bit or 32-bit as required, and any combination of access is allowed provided the data accessed is contiguous. However, all transfers associated with one packet must be of the same width so that data is consistently byte-, word- or double-word aligned. The last transfer may contain fewer bytes than the previous transfers in order to complete an odd-byte or odd-word transfer.

0000 = 8 bytes

bit 15-10 **Unimplemented**: Read as '0'

bit 9 **TXEDMA**: TX Endpoint DMA Assertion Control bit

1 = DMA_REQ signal for all IN endpoints will be deasserted when MAXP-8 bytes have been written to an endpoint. This is Early mode.

0 = DMA_REQ signal for all IN endpoints will be deasserted when MAXP bytes have been written to an endpoint. This is Late mode.

bit 8 **RXEDMA**: RX Endpoint DMA Assertion Control bit

1 = DMA_REQ signal for all OUT endpoints will be deasserted when MAXP-8 bytes have been written to an endpoint. This is Early mode.

0 = DMA_REQ signal for all OUT endpoints will be deasserted when MAXP bytes have been written to an endpoint. This is Late mode.

bit 7 **BDEV**: USB Device Type bit

1 = USB is operating as a 'B' device

0 = USB is operating as an 'A' device

bit 6 **FSDEV**: Full-Speed/Hi-Speed device detection bit (*Host mode*)

1 = A Full-Speed or Hi-Speed device has been detected being connected to the port

0 = No Full-Speed or Hi-Speed device detected

bit 5 **LSDEV**: Low-Speed Device Detection bit (*Host mode*)

1 = A Low-Speed device has been detected being connected to the port

0 = No Low-Speed device detected

bit 4-3 **VBUS<1:0>**: VBUS Level Detection bits

11 = Above VBUS Valid

10 = Above AValid, below VBUS Valid

01 = Above Session End, below AValid

00 = Below Session End

bit 2 **HOSTMODE**: Host Mode bit

1 = USB module is acting as a Host

0 = USB module is not acting as a Host

bit 1 **HOSTREQ**: Host Request Control bit

'B' device only:

1 = USB module initiates the Host Negotiation when Suspend mode is entered. This bit is cleared when Host Negotiation is completed.

0 = Host Negotiation is not taking place

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 11-13: USBOTG: USB OTG CONTROL/STATUS REGISTER (CONTINUED)

bit 0 **SESSION:** Active Session Control/Status bit

'A' device:

1 = Start a session

0 = End a session

'B' device:

1 = (Read) Session has started or is in progress, (Write) Initiate the Session Request Protocol

0 = When USB module is in Suspend mode, clearing this bit will cause a software disconnect

Clearing this bit when the USB module is not suspended will result in undefined behavior.

bit 31-24 **VPLEN<7:0>**: VBUS pulsing charge length bits

Sets the duration of the VBUS pulsing charge in units of 546.1 μ s. (The default setting corresponds to 32.77 ms.)

bit 23-20 **WTCON<3:0>**: Connect/Disconnect filter control bits

Sets the wait to be applied to allow for the connect/disconnect filter in units of 533.3 ns. The default setting corresponds to 2.667 μ s.

bit 19-6 **WTID<3:0>**: ID delay valid control bits

Sets the delay to be applied from IDPULLUP being asserted to IDDIG being considered valid in units of 4.369ms. The default setting corresponds to 52.43ms.

bit 15-12 **DMACHANS<3:0>**: DMA Channels bits

These read-only bits provide the number of DMA channels in the USB module. For the PIC32MZ EF family, this number is 8.

bit 11-8 **RAMBITS<3:0>**: RAM address bus width bits

These read-only bits provide the width of the RAM address bus. For the PIC32MZ EF family, this number is 12.

bit 7-4 **RXENDPTS<3:0>**: Included RX Endpoints bits

This read-only register gives the number of RX endpoints in the design. For the PIC32MZ EF family, this number is 7.

bit 3-0 **TXENDPTS<3:0>**: Included TX Endpoints bits

These read-only bits provide the number of TX endpoints in the design. For the PIC32MZ EF family, this number is 7.

bit 23-21 **Unimplemented:** Read as '0'

bit 20 **LPMNAK:** LPM-only Transaction Setting bit
 1 = All endpoints will respond to all transactions other than a LPM transaction with a NAK
 0 = Normal transaction operation
 Setting this bit to '1' will only take effect after the USB module as been LPM suspended.

bit 19-18 **LPMEN<1:0>:** LPM Enable bits (*Device mode*)
 11 = LPM Extended transactions are supported
 10 = LPM and Extended transactions are not supported
 01 = LPM mode is not supported but Extended transactions are supported
 00 = LPM Extended transactions are supported

bit 17 **LPMRES:** LPM Resume bit
 1 = Initiate resume (remote wake-up). Resume signaling is asserted for 50 μ s.
 0 = No resume operation
 This bit is self-clearing.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 11-28: USBLPMR1: USB LINK POWER MANAGEMENT CONTROL REGISTER 1 (CONTINUED)

- bit 16 **LPMXMT**: LPM Transition to the L1 State bit
When in *Device mode*:
1 = USB module will transition to the L1 state upon the receipt of the next LPM transaction. LPMEN must be set to `0b11`. Both LPMXMT and LPMEN must be set in the same cycle.
0 = Maintain current state
When LPMXMT and LPMEN are set, the USB module can respond in the following ways:
- If no data is pending (all TX FIFOs are empty), the USB module will respond with an ACK. The bit will self clear and a software interrupt will be generated.
 - If data is pending (data resides in at least one TX FIFO), the USB module will respond with a NYET. In this case, the bit will not self clear however a software interrupt will be generated.
- When in *Host mode*:
1 = USB module will transmit an LPM transaction. This bit is self clearing, and will be immediately cleared upon receipt of any Token or three time-outs have occurred.
0 = Maintain current state
- bit 15-12 **ENDPOINT<3:0>**: LPM Token Packet Endpoint bits
This is the endpoint in the token packet of the LPM transaction.
- bit 11-9 **Unimplemented**: Read as '0'
- bit 8 **RMTWAK**: Remote Wake-up Enable bit
This bit is applied on a temporary basis only and is only applied to the current suspend state.
1 = Remote wake-up is enabled
0 = Remote wake-up is disabled
- bit 7-4 **HIRD<3:0>**: Host Initiated Resume Duration bits
The minimum time the host will drive resume on the bus. The value in this register corresponds to an actual resume time of:
$$\text{Resume Time} = 50 \mu\text{s} + \text{HIRD} * 75 \mu\text{s}$$

The resulting range is 50 μs to 1200 μs .
- bit 3-0 **LNKSTATE<3:0>**: Link State bits
This value is provided by the host to the peripheral to indicate what state the peripheral must transition to after the receipt and acceptance of a LPM transaction. The only valid value for this register is '1' for Sleep State (L1). All other values are reserved.

12.0 I/O PORTS

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 12. "I/O Ports"** (DS60001120) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

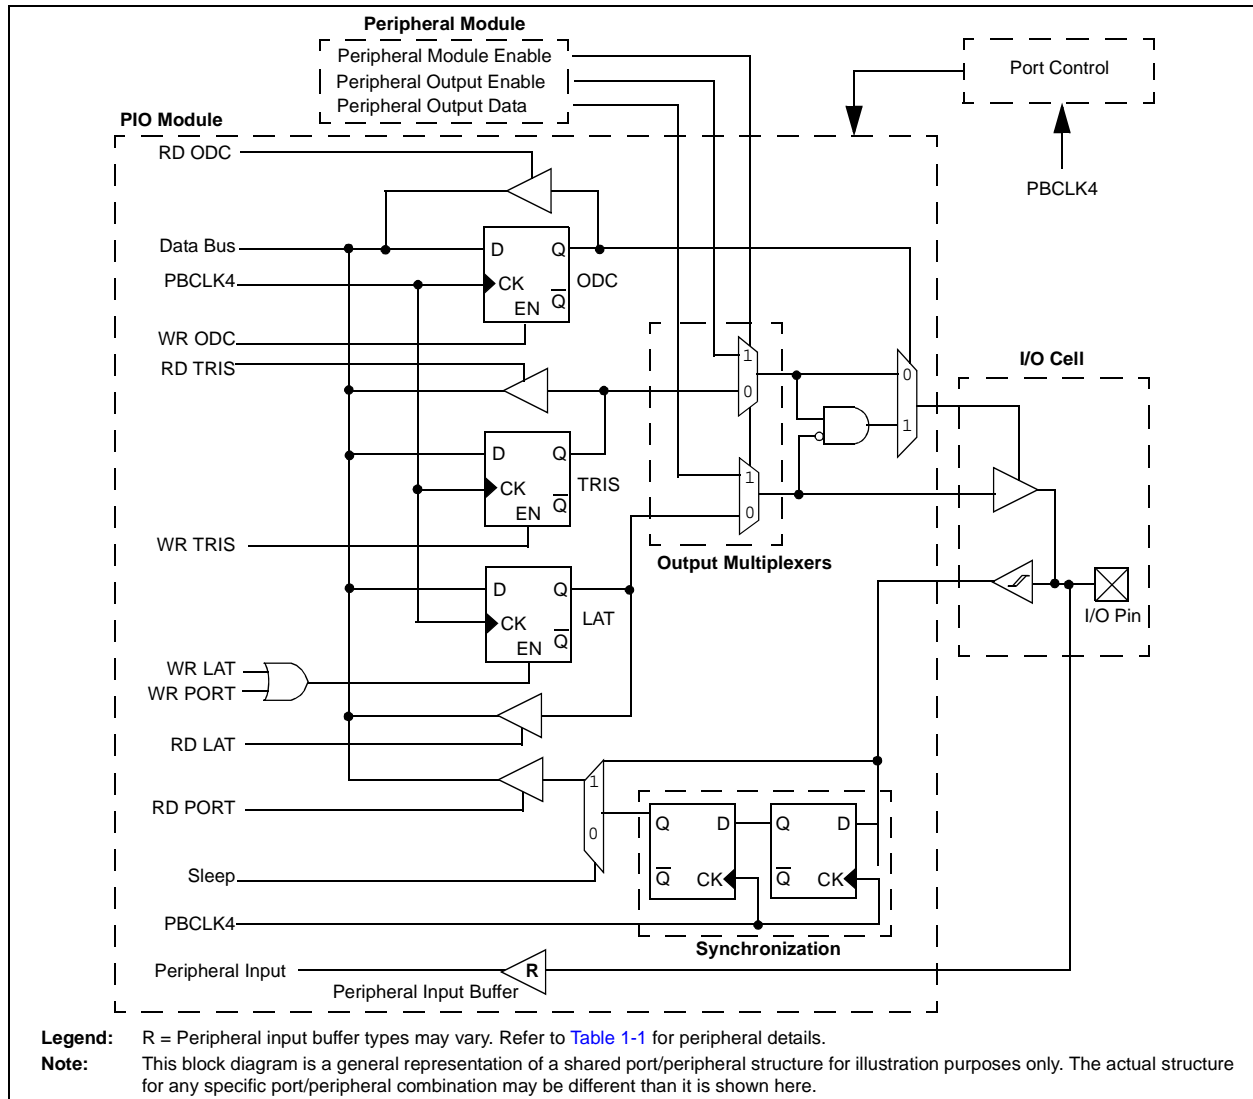

General purpose I/O pins are the simplest of peripherals. They allow the PIC32MZ EF family device to monitor and control other devices. To add flexibility and functionality, some pins are multiplexed with alternate function(s). These functions depend on which peripheral features are on the device. In general, when a peripheral is functioning, that pin may not be used as a general purpose I/O pin.

Some of the key features of the I/O ports are:

- Individual output pin open-drain enable/disable
- Individual input pin weak pull-up and pull-down
- Monitor selective inputs and generate interrupt when change in pin state is detected
- Operation during Sleep and Idle modes
- Fast bit manipulation using CLR, SET and INV registers

Figure 12-1 illustrates a block diagram of a typical multiplexed I/O port.

FIGURE 12-1: BLOCK DIAGRAM OF A TYPICAL MULTIPLEXED PORT STRUCTURE

12.1 Parallel I/O (PIO) Ports

All port pins have up to 14 registers directly associated with their operation as digital I/O. The data direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx) read the latch. Writes to the latch write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

12.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORTx, LATx, and TRISx registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired 5V-tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

Refer to the pin name tables (Table 2 through Table 5) for the available pins and their functionality.

12.1.2 CONFIGURING ANALOG AND DIGITAL PORT PINS

The ANSELx register controls the operation of the analog port pins. The port pins that are to function as analog inputs must have their corresponding ANSEL and TRIS bits set. In order to use port pins for I/O functionality with digital modules, such as Timers, UARTs, etc., the corresponding ANSELx bit must be cleared.

The ANSELx register has a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

If the TRIS bit is cleared (output) while the ANSELx bit is set, the digital output level (VOH or VOL) is converted by an analog peripheral, such as the ADC module or Comparator module.

When the PORT register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

12.1.3 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be an NOP.

12.1.4 INPUT CHANGE NOTIFICATION

The input change notification function of the I/O ports allows the PIC32MZ EF devices to generate interrupt requests to the processor in response to a change-of-state on selected input pins. This feature can detect input change-of-states even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a change-of-state.

Five control registers are associated with the CN functionality of each I/O port. The CNENx registers contain the CN interrupt enable control bits for each of the input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

The CNSTATx register indicates whether a change occurred on the corresponding pin since the last read of the PORTx bit.

Each I/O pin also has a weak pull-up and a weak pull-down connected to it. The pull-ups act as a current source or sink source connected to the pin, and eliminate the need for external resistors when push-button or keypad devices are connected. The pull-ups and pull-downs are enabled separately using the CNPUx and the CNPDx registers, which contain the control bits for each of the pins. Setting any of the control bits enables the weak pull-ups and/or pull-downs for the corresponding pins.

Note: Pull-ups and pull-downs on change notification pins should always be disabled when the port pin is configured as a digital output.

An additional control register (CNCONx) is shown in Register 12-3.

12.2 Registers for Slew Rate Control

Some I/O pins can be configured for various types of slew rate control on its associated port. This is controlled by the Slew Rate Control bits in the SRCON1x and SRCON0x registers that are associated with each I/O port. The slew rate control is configured using the corresponding bit in each register, as shown in Table 12-1.

As an example, writing 0x0001, 0x0000 to SRCON1A and SRCON0A, respectively, will enable slew rate control on the RAO pin and sets the slew rate to the slow edge rate.

TABLE 12-1: SLEW RATE CONTROL BIT SETTINGS

| SRCON1x | SRCON0x | Description |
|---------|---------|--|
| 1 | 1 | Slew rate control is enabled and is set to the slowest edge rate. |
| 1 | 0 | Slew rate control is enabled and is set to the slow edge rate. |
| 0 | 1 | Slew rate control is enabled and is set to the medium edge rate. |
| 0 | 0 | Slew rate control is disabled and is set to the fastest edge rate. |

Note: By default, all of the Port pins are set to the fastest edge rate.

12.3 CLR, SET, and INV Registers

Every I/O module register has a corresponding CLR (clear), SET (set) and INV (invert) register designed to provide fast atomic bit manipulations. As the name of the register implies, a value written to a SET, CLR or INV register effectively performs the implied operation, but only on the corresponding base register and only bits specified as '1' are modified. Bits specified as '0' are not modified.

Reading SET, CLR and INV registers returns undefined values. To see the affects of a write operation to a SET, CLR or INV register, the base register must be read.

12.4 Peripheral Pin Select (PPS)

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin-count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient workarounds in application code or a complete redesign may be the only option.

PPS configuration provides an alternative to these choices by enabling peripheral set selection and their placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The PPS configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to these I/O pins. PPS is performed in software and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

12.4.1 AVAILABLE PINS

The number of available pins is dependent on the particular device and its pin count. Pins that support the PPS feature include the designation "RPn" in their full pin designation, where "RP" designates a remappable peripheral and "n" is the remappable port number.

12.4.2 AVAILABLE PERIPHERALS

The peripherals managed by the PPS are all digital-only peripherals. These include general serial communications (UART, SPI, and CAN), general purpose timer clock inputs, timer-related peripherals (input capture and output compare), interrupt-on-change inputs, and reference clocks (input and output).

In comparison, some digital-only peripheral modules are never included in the PPS feature. This is because the peripheral's function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. These modules include I²C among others. A similar requirement excludes all modules with analog inputs, such as the Analog-to-Digital Converter (ADC).

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/O and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

12.4.3 CONTROLLING PPS

PPS features are controlled through two sets of SFRs: one to map peripheral inputs, and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

12.4.4 INPUT MAPPING

The inputs of the PPS options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The $[pin\ name]R$ registers, where $[pin\ name]$ refers to the peripheral pins listed in Table 12-2, are used to configure peripheral input mapping (see Register 12-1). Each register contains sets of 4 bit fields. Programming these bit fields with an appropriate value maps the RPn pin with the corresponding value to that peripheral. For any given device, the valid range of values for any bit field is shown in Table 12-2.

For example, Figure 12-2 illustrates the remappable pin selection for the U1RX input.

FIGURE 12-2: REMAPPABLE INPUT EXAMPLE FOR U1RX

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 12-2: INPUT PIN SELECTION

| Peripheral Pin | [pin name]R SFR | [pin name]R bits | [pin name]R Value to RPN Pin Selection |
|---------------------|----------------------|---------------------------|--|
| INT3 | INT3R | INT3R<3:0> | 0000 = RPD2 |

| | | | 1101 = RPE8 ⁽¹⁾ |
| | | | 1110 = Reserved |
| | | | 1111 = Reserved |

Note 1: This selection is not available on 64-pin devices.

2: This selection is not available on 64-pin or 100-pin devices.

3: This selection is not available on devices without a CAN module.

12.4.5 OUTPUT MAPPING

In contrast to inputs, the outputs of the PPS options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPNR registers (Register 12-2) are used to control output mapping. Like the $[pin\ name]R$ registers, each register contains sets of 4 bit fields. The value of the bit field corresponds to one of the peripherals, and that peripheral's output is mapped to the pin (see Table 12-3 and Figure 12-3).

A null output is associated with the output register reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

FIGURE 12-3: EXAMPLE OF MULTIPLEXING OF REMAPPABLE OUTPUT FOR RPF0

12.4.6 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. PIC32MZ EF devices include two features to prevent alterations to the peripheral map:

- Control register lock sequence
- Configuration bit select lock

12.4.6.1 Control Register Lock

Under normal operation, writes to the RPNR and $[pin\ name]R$ registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK Configuration bit (CFGCON<13>). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear the IOLOCK bit, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the "PIC32 Family Reference Manual" for details.

12.4.6.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPNR and $[pin\ name]R$ registers. The IOL1WAY Configuration bit (DEVCFG3<29>) blocks the IOLOCK bit from being cleared after it has been set once. If IOLOCK remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session.

13.0 TIMER1

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. “Timers”** (DS60001105) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices feature one synchronous/asynchronous 16-bit timer that can operate as a free-running interval timer for various timing applications and counting external events. This timer can also be used with the Low-Power Secondary Oscillator (SOSC) for real-time clock applications.

The following modes are supported by Timer1:

- Synchronous Internal Timer
- Synchronous Internal Gated Timer
- Synchronous External Timer
- Asynchronous External Timer

13.1 Additional Supported Features

- Selectable clock prescaler
- Timer operation during Sleep and Idle modes
- Fast bit manipulation using CLR, SET and INV registers
- Asynchronous mode can be used with the SOSC to function as a real-time clock
- ADC event trigger

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See [Section 12.3 "CLR, SET, and INV Registers"](#) for more information.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 13-1: T1CON: TYPE A TIMER CONTROL REGISTER (CONTINUED)

bit 2 **TSYNC:** Timer External Clock Input Synchronization Selection bit

When TCS = 1:

1 = External clock input is synchronized

0 = External clock input is not synchronized

When TCS = 0:

This bit is ignored.

bit 1 **TCS:** Timer Clock Source Select bit

1 = External clock from T1CKI pin

0 = Internal peripheral clock

bit 0 **Unimplemented:** Read as '0'

14.0 TIMER2/3, TIMER4/5, TIMER6/7, AND TIMER8/9

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. “Timers”** (DS60001105) of the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

This family of devices features eight synchronous 16-bit timers (default) that can operate as a free-running interval timer for various timing applications and counting external events.

The following modes are supported:

- Synchronous internal 16-bit timer
- Synchronous internal 16-bit gated timer
- Synchronous external 16-bit timer

Four 32-bit synchronous timers are available by combining Timer2 with Timer3, Timer4 with Timer5, Timer6 with Timer7, and Timer8 with Timer9.

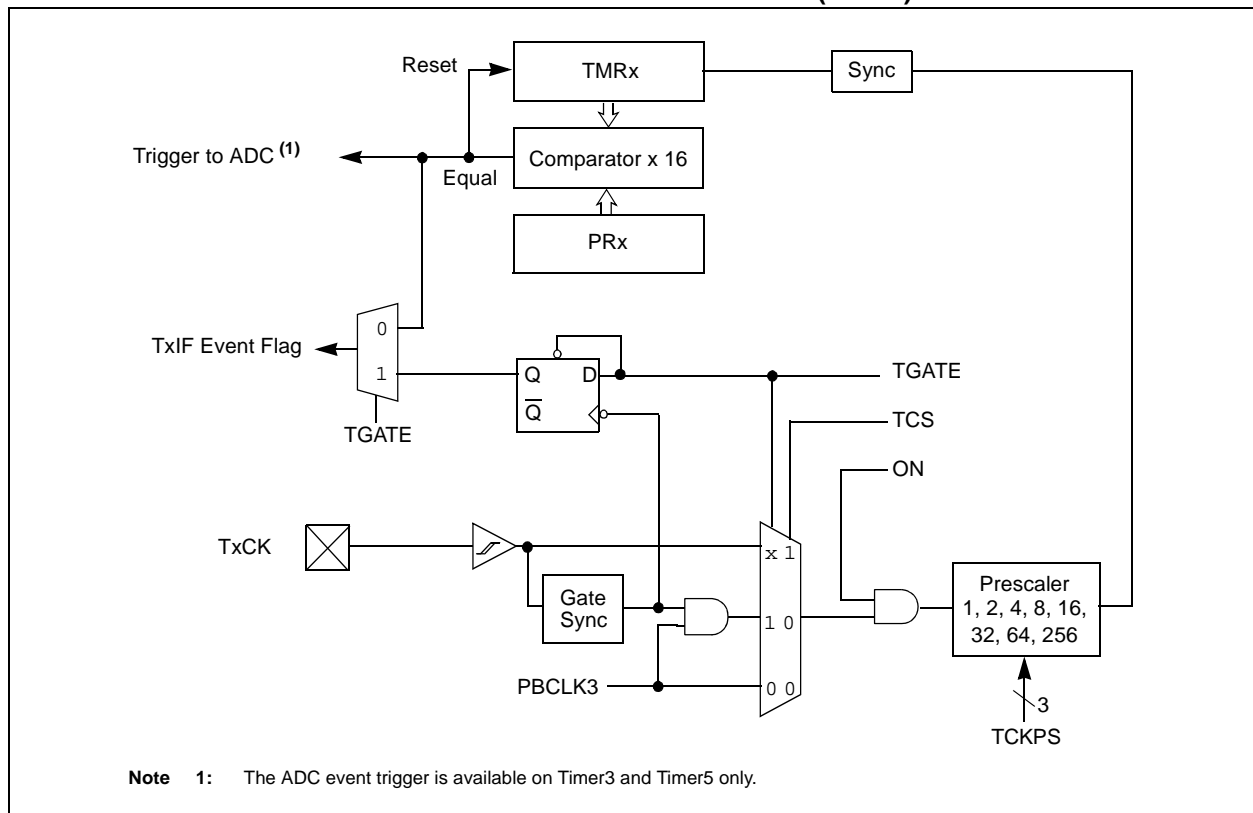

The 32-bit timers can operate in one of three modes:

- Synchronous internal 32-bit timer
- Synchronous internal 32-bit gated timer
- Synchronous external 32-bit timer

14.1 Additional Supported Features

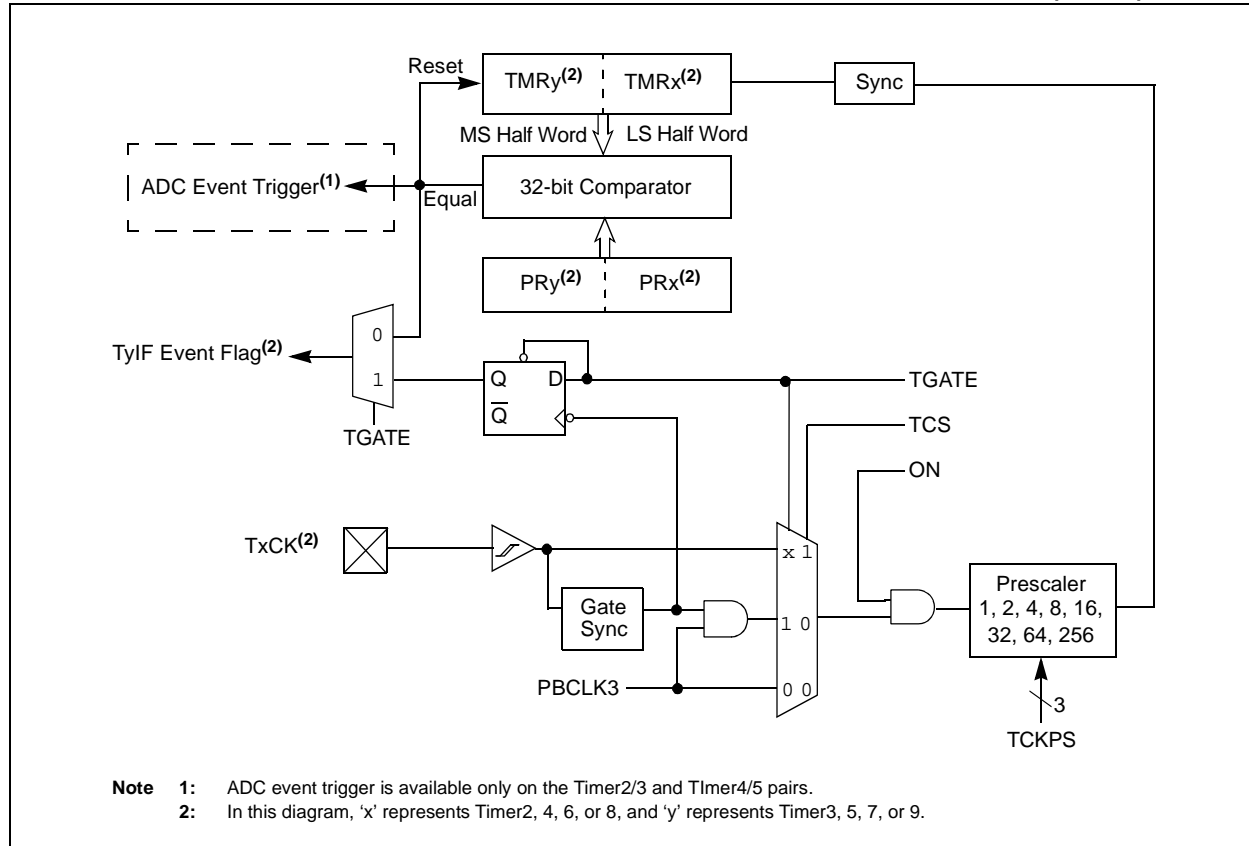

- Selectable clock prescaler
- Timers operational during CPU idle
- Time base for Input Capture and Output Compare modules (Timer2 through Timer7 only)
- ADC event trigger (Timer3 and Timer5 only)
- Fast bit manipulation using CLR, SET, and INV registers

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 14-1: TxCON: TYPE B TIMER CONTROL REGISTER ('x' = 2-9) (CONTINUED)

- bit 2 **Unimplemented:** Read as '0'
- bit 1 **TCS:** Timer Clock Source Select bit⁽¹⁾
 1 = External clock from TxCK pin
 0 = Internal peripheral clock
- bit 0 **Unimplemented:** Read as '0'

- Note 1:** While operating in 32-bit mode, this bit has no effect for odd numbered timers (Timer1, Timer3, Timer5, Timer7, and Timer9). All timer functions are set through the even numbered timers.
- 2:** While operating in 32-bit mode, this bit must be cleared on odd numbered timers to enable the 32-bit timer in Idle mode.
- 3:** This bit is available only on even numbered timers (Timer2, Timer4, Timer6, and Timer8).

15.0 DEADMAN TIMER (DMT)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. “Watchdog, Deadman, and Power-up Timers”** (DS60001114) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

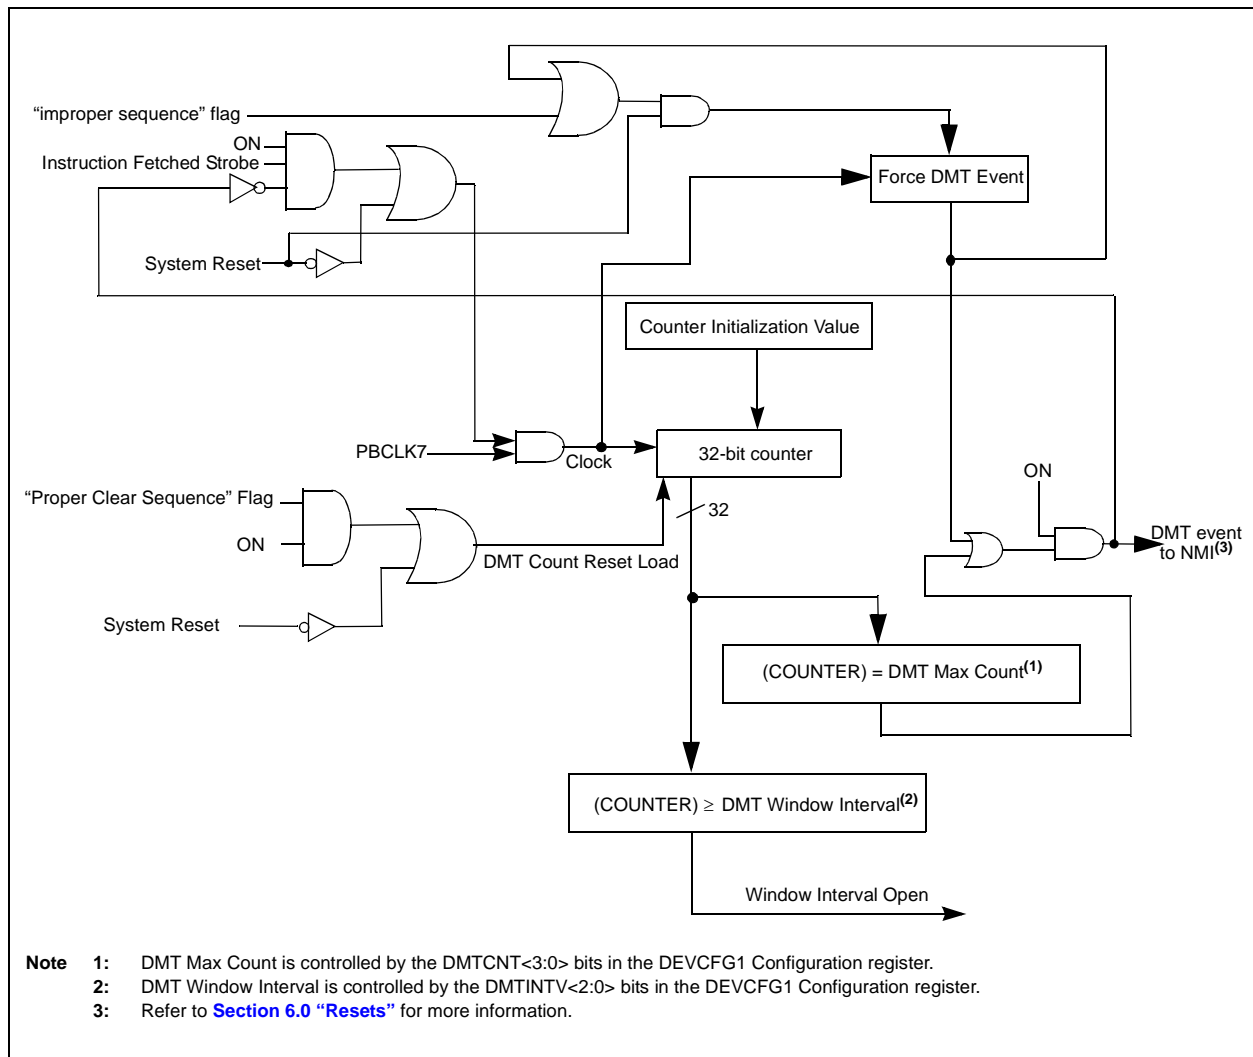

The DMT consists of a 32-bit counter with a time-out count match value as specified by the DMTCNT<3:0> bits in the DEVCFG1 Configuration register.

A Deadman Timer is typically used in mission critical and safety critical applications, where any single failure of the software functionality and sequencing must be detected.

Figure 15-1 shows a block diagram of the Deadman Timer module.

The primary function of the Deadman Timer (DMT) is to reset the processor in the event of a software malfunction. The DMT is a free-running instruction fetch timer, which is clocked whenever an instruction fetch occurs until a count match occurs. Instructions are not fetched when the processor is in Sleep mode.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

16.0 WATCHDOG TIMER (WDT)

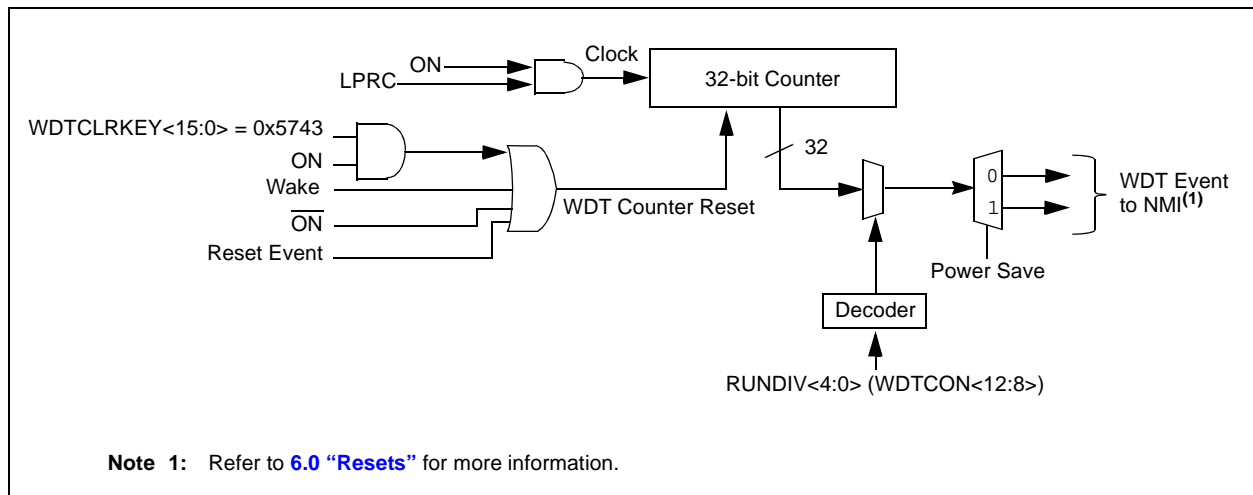

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. “Watchdog, Deadman, and Power-up Timers”** (DS60001114) in the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

When enabled, the Watchdog Timer (WDT) operates from the internal Low-Power Oscillator (LPRC) clock source and can be used to detect system software malfunctions by resetting the device if the WDT is not cleared periodically in software. Various WDT time-out periods can be selected using the WDT postscaler. The WDT can also be used to wake the device from Sleep or Idle mode.

Key features of the WDT module include:

- Configuration or software controlled
- User-configurable time-out period
- Can wake the device from Sleep or Idle

| | |
|-------------------|--|
| Legend: | y = Values set from Configuration bits on POR |
| R = Readable bit | W = Writable bit U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set '0' = Bit is cleared x = Bit is unknown |

- bit 31-16 **WDTCLRKEY:** Watchdog Timer Clear Key bits
To clear the Watchdog Timer to prevent a time-out, software must write the value 0x5743 to this location using a single 16-bit write.
- bit 15 **ON:** Watchdog Timer Enable bit⁽¹⁾
1 = The WDT is enabled
0 = The WDT is disabled
- bit 14-13 **Unimplemented:** Read as '0'
- bit 12-8 **RUNDIV<4:0>:** Watchdog Timer Postscaler Value bits
On reset, these bits are set to the values of the WDTPS<4:0> Configuration bits in DEVCFG1.
- bit 7-1 **Unimplemented:** Read as '0'
- bit 0 **WDTWINEN:** Watchdog Timer Window Enable bit
1 = Enable windowed Watchdog Timer
0 = Disable windowed Watchdog Timer

Note 1: This bit only has control when FWDTEN (DEVCFG1<23>) = 0.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

17.0 INPUT CAPTURE

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 15. “Input Capture”** (DS60001122) of the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

The Input Capture module is useful in applications requiring frequency (period) and pulse measurement.

The Input Capture module captures the 16-bit or 32-bit value of the selected Time Base registers when an event occurs at the ICx pin.

Capture events are caused by the following:

- Capture timer value on every edge (rising and falling), specified edge first

• Prescaler capture event modes:

- Capture timer value on every 4th rising edge of input at ICx pin
- Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select between one of six 16-bit timers for the time base, or two of six 16-bit timers together to form a 32-bit timer. The selected timer can use either an internal or external clock.

Other operational features include:

- Device wake-up from capture pin during Sleep and Idle modes
- Interrupt on input capture event
- 4-word FIFO buffer for capture values; Interrupt optionally generated after 1, 2, 3, or 4 buffer locations are filled
- Input capture can also be used to provide additional sources of external interrupts

FIGURE 17-1: INPUT CAPTURE BLOCK DIAGRAM

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

The timer source for each Input Capture module depends on the setting of the ICACLK bit in the CFGCON register. The available configurations are shown in [Table 17-1](#).

TABLE 17-1: TIMER SOURCE CONFIGURATIONS

| Input Capture Module | Timerx | Timery |
|-------------------------|---------|---------|
| ICACLK (CFGCON<17>) = 0 | | |
| IC1 | Timer2 | Timer3 |
| ⋮ | ⋮ | ⋮ |

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: This register has corresponding CLR, SET and INV registers at its virtual address, plus an offset of 0x4, 0x8 and 0xC, respectively. See [Section 12.3 “CLR, SET, and INV Registers”](#) for more information.

18.0 OUTPUT COMPARE

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 16. “Output Compare”** (DS60001111) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Output Compare module is used to generate a single pulse or a train of pulses in response to selected time base events.

For all modes of operation, the Output Compare module compares the values stored in the OCxR and/or the OCxRS registers to the value in the selected timer.

When a match occurs, the Output Compare module generates an event based on the selected mode of operation.

The following are some of the key features:

- Multiple Output Compare modules in a device
- Programmable interrupt generation on compare event
- Single and Dual Compare modes
- Single and continuous output pulse generation
- Pulse-Width Modulation (PWM) mode
- Hardware-based PWM Fault detection and automatic output disable
- Programmable selection of 16-bit or 32-bit time bases
- Can operate from either of two available 16-bit time bases or a single 32-bit time base
- ADC event trigger

FIGURE 18-1: OUTPUT COMPARE MODULE BLOCK DIAGRAM

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

The timer source for each Output Compare module depends on the setting of the OCACLK bit in the CFGCON register. The available configurations are shown in [Table 18-1](#).

TABLE 18-1: TIMER SOURCE CONFIGURATIONS

| Output Compare Module | Timerx | Timery |
|-------------------------|---------|---------|
| OCACLK (CFGCON<16>) = 0 | | |
| OC1 | Timer2 | Timer3 |

| | | |
|-------------------|------------------|--|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared x = Bit is unknown |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Output Compare Peripheral On bit
 1 = Output Compare peripheral is enabled
 0 = Output Compare peripheral is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
 1 = Discontinue operation when CPU enters Idle mode
 0 = Continue operation in Idle mode

bit 12-6 **Unimplemented:** Read as '0'

bit 5 **OC32:** 32-bit Compare Mode bit
 1 = OCxR<31:0> and/or OCxRS<31:0> are used for comparisons to the 32-bit timer source
 0 = OCxR<15:0> and OCxRS<15:0> are used for comparisons to the 16-bit timer source

bit 4 **OCFLT:** PWM Fault Condition Status bit⁽¹⁾
 1 = PWM Fault condition has occurred (cleared in HW only)
 0 = No PWM Fault condition has occurred

bit 3 **OCTSEL:** Output Compare Timer Select bit⁽²⁾
 1 = Timery is the clock source for this Output Compare module
 0 = Timerx is the clock source for this Output Compare module

bit 2-0 **OCM<2:0>:** Output Compare Mode Select bits
 111 = PWM mode on OCx; Fault pin enabled
 110 = PWM mode on OCx; Fault pin disabled
 101 = Initialize OCx pin low; generate continuous output pulses on OCx pin
 100 = Initialize OCx pin low; generate single output pulse on OCx pin
 011 = Compare event toggles OCx pin
 010 = Initialize OCx pin high; compare event forces OCx pin low
 001 = Initialize OCx pin low; compare event forces OCx pin high
 000 = Output compare peripheral is disabled but continues to draw current

Note 1: This bit is only used when OCM<2:0> = '111'. It is read as '0' in all other modes.

Note 2: Refer to [Table 18-1](#) for Timerx and Timery selections.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

19.0 SERIAL PERIPHERAL INTERFACE (SPI) AND INTER-IC SOUND (I²S)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 23. “Serial Peripheral Interface (SPI)”** (DS60001106) in the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

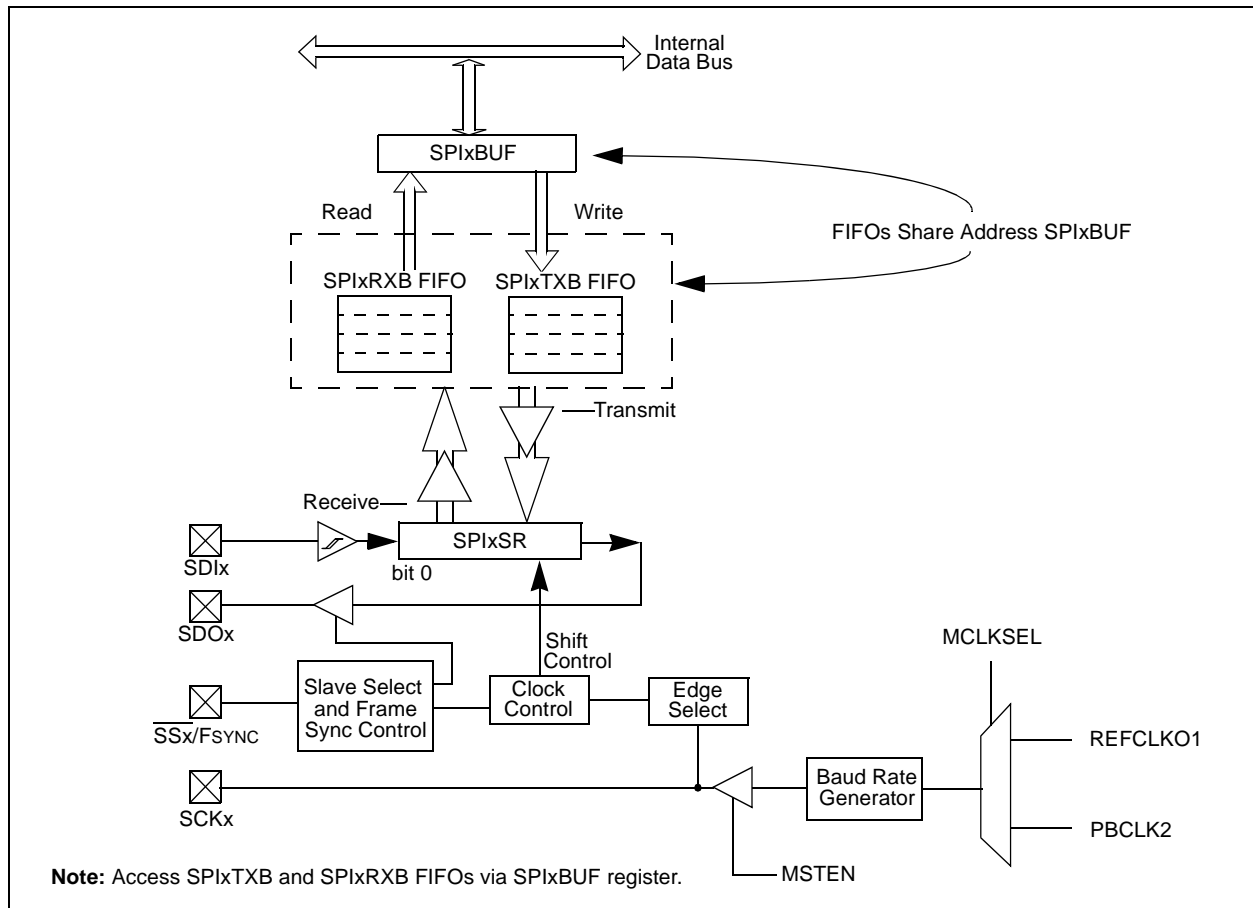

The SPI/I²S module is a synchronous serial interface that is useful for communicating with external peripherals and other microcontroller devices, as well as digital audio devices. These peripheral devices may be Serial EEPROMs, Shift registers, display drivers, Analog-to-Digital Converters (ADC), etc.

The SPI/I²S module is compatible with Motorola® SPI and SIOP interfaces.

Key features of the SPI module include:

- Master and Slave modes support
- Four different clock formats
- Enhanced Framed SPI protocol support
- User-configurable 8-bit, 16-bit and 32-bit data width
- Separate SPI FIFO buffers for receive and transmit
 - FIFO buffers act as 4/8/16-level deep FIFOs based on 32/16/8-bit data width
- Programmable interrupt event on every 8-bit, 16-bit and 32-bit data transfer
- Operation during Sleep and Idle modes
- Audio Codec Support:
 - I²S protocol
 - Left-justified
 - Right-justified
 - PCM

FIGURE 19-1: SPI/I²S MODULE BLOCK DIAGRAM

19.1 SPI Control Registers

TABLE 19-1: SPI1 THROUGH SPI6 REGISTER MAP

| Virtual Address (BF82_#) | Register Name(1) | Bit Range | Bits | | | | | | | | | | | | | | | All Resets | |

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers in this table except SPIxBUF have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See [Section 12.3 “CLR, SET, and INV Registers”](#) for more information.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 19-1: SPIxCON: SPI CONTROL REGISTER (CONTINUED)

- bit 17 **SPIFE**: Frame Sync Pulse Edge Select bit (Framed SPI mode only)
 1 = Frame synchronization pulse coincides with the first bit clock
 0 = Frame synchronization pulse precedes the first bit clock
- bit 16 **ENHBUF**: Enhanced Buffer Enable bit⁽¹⁾
 1 = Enhanced Buffer mode is enabled
 0 = Enhanced Buffer mode is disabled
- bit 15 **ON**: SPI/I²S Module On bit
 1 = SPI/I²S module is enabled
 0 = SPI/I²S module is disabled
- bit 14 **Unimplemented**: Read as '0'
- bit 13 **SIDL**: Stop in Idle Mode bit
 1 = Discontinue operation when CPU enters in Idle mode
 0 = Continue operation in Idle mode
- bit 12 **DISSDO**: Disable SDOx pin bit⁽⁴⁾
 1 = SDOx pin is not used by the module. Pin is controlled by associated PORT register
 0 = SDOx pin is controlled by the module

bit 11-10 **MODE<32,16>**: 32/16-Bit Communication Select bits

When AUDEN = 1:

| MODE32 | MODE16 | Communication |
|--------|--------|---|
| 1 | 1 | 24-bit Data, 32-bit FIFO, 32-bit Channel/64-bit Frame |
| 1 | 0 | 32-bit Data, 32-bit FIFO, 32-bit Channel/64-bit Frame |
| 0 | 1 | 16-bit Data, 16-bit FIFO, 32-bit Channel/64-bit Frame |
| 0 | 0 | 16-bit Data, 16-bit FIFO, 16-bit Channel/32-bit Frame |

When AUDEN = 0:

| MODE32 | MODE16 | Communication |
|--------|--------|---------------|
| 1 | x | 32-bit |
| 0 | 1 | 16-bit |
| 0 | 0 | 8-bit |

- bit 9 **SMP**: SPI Data Input Sample Phase bit
Master mode (MSTEN = 1):
 1 = Input data sampled at end of data output time
 0 = Input data sampled at middle of data output time
Slave mode (MSTEN = 0):
 SMP value is ignored when SPI is used in Slave mode. The module always uses SMP = 0.
- bit 8 **CKE**: SPI Clock Edge Select bit⁽²⁾
 1 = Serial output data changes on transition from active clock state to Idle clock state (see CKP bit)
 0 = Serial output data changes on transition from Idle clock state to active clock state (see CKP bit)
- bit 7 **SSEN**: Slave Select Enable (Slave mode) bit
 1 = \overline{SSx} pin used for Slave mode
 0 = \overline{SSx} pin not used for Slave mode, pin controlled by port function.
- bit 6 **CKP**: Clock Polarity Select bit⁽³⁾
 1 = Idle state for clock is a high level; active state is a low level
 0 = Idle state for clock is a low level; active state is a high level

- Note 1:** This bit can only be written when the ON bit = 0. Refer to [Section 37.0 “Electrical Characteristics”](#) for maximum clock frequency requirements.
- 2:** This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).
- 3:** When AUDEN = 1, the SPI/I²S module functions as if the CKP bit is equal to '1', regardless of the actual value of the CKP bit.
- 4:** This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see [Section 12.4 “Peripheral Pin Select \(PPS\)”](#) for more information).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 19-1: SPIxCON: SPI CONTROL REGISTER (CONTINUED)

- bit 5 **MSTEN**: Master Mode Enable bit
 1 = Master mode
 0 = Slave mode
- bit 4 **DISSDI**: Disable SDI bit⁽⁴⁾
 1 = SDI pin is not used by the SPI module (pin is controlled by PORT function)
 0 = SDI pin is controlled by the SPI module
- bit 3-2 **STXISEL<1:0>**: SPI Transmit Buffer Empty Interrupt Mode bits
 11 = Interrupt is generated when the buffer is not full (has one or more empty elements)
 10 = Interrupt is generated when the buffer is empty by one-half or more
 01 = Interrupt is generated when the buffer is completely empty
 00 = Interrupt is generated when the last transfer is shifted out of SPIxSR and transmit operations are complete
- bit 1-0 **SRXISEL<1:0>**: SPI Receive Buffer Full Interrupt Mode bits
 11 = Interrupt is generated when the buffer is full
 10 = Interrupt is generated when the buffer is full by one-half or more
 01 = Interrupt is generated when the buffer is not empty
 00 = Interrupt is generated when the last word in the receive buffer is read (i.e., buffer is empty)

- Note 1:** This bit can only be written when the ON bit = 0. Refer to [Section 37.0 “Electrical Characteristics”](#) for maximum clock frequency requirements.
- 2:** This bit is not used in the Framed SPI mode. The user should program this bit to ‘0’ for the Framed SPI mode (FRMEN = 1).
- 3:** When AUDEN = 1, the SPI/I²S module functions as if the CKP bit is equal to ‘1’, regardless of the actual value of the CKP bit.
- 4:** This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see [Section 12.4 “Peripheral Pin Select \(PPS\)”](#) for more information).

Legend:

R = Readable bit
-n = Value at POR

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

- bit 31-16 **Unimplemented:** Read as '0'
- bit 15 **SPISGNEXT:** Sign Extend Read Data from the RX FIFO bit
 - 1 = Data from RX FIFO is sign extended
 - 0 = Data from RX FIFO is not sign extended
- bit 14-13 **Unimplemented:** Read as '0'
- bit 12 **FRMERREN:** Enable Interrupt Events via FRMERR bit
 - 1 = Frame Error overflow generates error events
 - 0 = Frame Error does not generate error events
- bit 11 **SPIROVEN:** Enable Interrupt Events via SPIROV bit
 - 1 = Receive overflow generates error events
 - 0 = Receive overflow does not generate error events
- bit 10 **SPITUREN:** Enable Interrupt Events via SPITUR bit
 - 1 = Transmit Underrun Generates Error Events
 - 0 = Transmit Underrun Does Not Generates Error Events
- bit 9 **IGNROV:** Ignore Receive Overflow bit (for Audio Data Transmissions)
 - 1 = A ROV is not a critical error; during ROV data in the FIFO is not overwritten by receive data
 - 0 = A ROV is a critical error which stop SPI operation
- bit 8 **IGNTUR:** Ignore Transmit Underrun bit (for Audio Data Transmissions)
 - 1 = A TUR is not a critical error and zeros are transmitted until the SPIxTXB is not empty
 - 0 = A TUR is a critical error which stop SPI operation
- bit 7 **AUDEN:** Enable Audio CODEC Support bit⁽¹⁾
 - 1 = Audio protocol enabled
 - 0 = Audio protocol disabled
- bit 6-5 **Unimplemented:** Read as '0'
- bit 3 **AUDMONO:** Transmit Audio Data Format bit^(1,2)
 - 1 = Audio data is mono (Each data word is transmitted on both left and right channels)
 - 0 = Audio data is stereo
- bit 2 **Unimplemented:** Read as '0'
- bit 1-0 **AUDMOD<1:0>:** Audio Protocol Mode bit^(1,2)
 - 11 = PCM/DSP mode
 - 10 = Right Justified mode
 - 01 = Left Justified mode
 - 00 = I²S mode

- Note 1:** This bit can only be written when the ON bit = 0.
Note 2: This bit is only valid for AUDEN = 1.

| Legend: | C = Clearable bit | HS = Set in hardware |
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared x = Bit is unknown |

- bit 31-29 **Unimplemented:** Read as '0'
- bit 28-24 **RXBUFELM<4:0>:** Receive Buffer Element Count bits (valid only when ENHBUF = 1)
- bit 23-21 **Unimplemented:** Read as '0'
- bit 20-16 **TXBUFELM<4:0>:** Transmit Buffer Element Count bits (valid only when ENHBUF = 1)
- bit 15-13 **Unimplemented:** Read as '0'
- bit 12 **FRMERR:** SPI Frame Error status bit
 - 1 = Frame error detected
 - 0 = No Frame error detected
 - This bit is only valid when FRMEN = 1.
- bit 11 **SPIBUSY:** SPI Activity Status bit
 - 1 = SPI peripheral is currently busy with some transactions
 - 0 = SPI peripheral is currently idle
- bit 10-9 **Unimplemented:** Read as '0'
- bit 8 **SPITUR:** Transmit Under Run bit
 - 1 = Transmit buffer has encountered an underrun condition
 - 0 = Transmit buffer has no underrun condition
 - This bit is only valid in Framed Sync mode; the underrun condition must be cleared by disabling/re-enabling the module.
- bit 7 **SRMT:** Shift Register Empty bit (valid only when ENHBUF = 1)
 - 1 = When SPI module shift register is empty
 - 0 = When SPI module shift register is not empty
- bit 6 **SPIROV:** Receive Overflow Flag bit
 - 1 = A new data is completely received and discarded. The user software has not read the previous data in the SPIxBUF register.
 - 0 = No overflow has occurred
 - This bit is set in hardware; can only be cleared (= 0) in software.
- bit 5 **SPIRBE:** RX FIFO Empty bit (valid only when ENHBUF = 1)
 - 1 = RX FIFO is empty (CRPTR = SWPTR)
 - 0 = RX FIFO is not empty (CRPTR ≠ SWPTR)
- bit 4 **Unimplemented:** Read as '0'

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 19-3: SPIxSTAT: SPI STATUS REGISTER

- bit 3 **SPITBE:** SPI Transmit Buffer Empty Status bit
 1 = Transmit buffer, SPIxTXB is empty
 0 = Transmit buffer, SPIxTXB is not empty
 Automatically set in hardware when SPI transfers data from SPIxTXB to SPIxSR.
 Automatically cleared in hardware when SPIxBUF is written to, loading SPIxTXB.
- bit 2 **Unimplemented:** Read as '0'
- bit 1 **SPITBF:** SPI Transmit Buffer Full Status bit
 1 = Transmit not yet started, SPITXB is full
 0 = Transmit buffer is not full
 Standard Buffer Mode:
 Automatically set in hardware when the core writes to the SPIBUF location, loading SPITXB.
 Automatically cleared in hardware when the SPI module transfers data from SPITXB to SPIxSR.
 Enhanced Buffer Mode:
 Set when CWPTR + 1 = SRPTR; cleared otherwise
- bit 0 **SPIRBF:** SPI Receive Buffer Full Status bit
 1 = Receive buffer, SPIxRXB is full
 0 = Receive buffer, SPIxRXB is not full
 Standard Buffer Mode:
 Automatically set in hardware when the SPI module transfers data from SPIxSR to SPIxRXB.
 Automatically cleared in hardware when SPIxBUF is read from, reading SPIxRXB.
 Enhanced Buffer Mode:
 Set when SWPTR + 1 = CRPTR; cleared otherwise

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

20.0 SERIAL QUAD INTERFACE (SQI)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 46. “Serial Quad Interface (SQI)”** (DS60001244) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

The SQI module is a synchronous serial interface that provides access to serial Flash memories and other serial devices. The SQI module supports Single Lane (identical to SPI), Dual Lane, and Quad Lane modes.

Key features include:

- Supports Single, Dual, and Quad Lane modes
- Supports Single Data Rate (SDR) and Double Data Rate (DDR) modes
- Programmable command sequence
- eXecute-In-Place (XIP)

- Data transfer:
 - Programmed I/O mode (PIO)
 - Buffer descriptor DMA
- Supports SPI Mode 0 and Mode 3
- Programmable Clock Polarity (CPOL) and Clock Phase (CPHA) bits
- Supports up to two Chip Selects
- Supports up to four bytes of Flash address
- Programmable interrupt thresholds
- 32-byte transmit data buffer
- 32-byte receive data buffer
- 4-word controller buffer

Note: Once the SQI module is configured, external devices are memory mapped into KSEG2 and KSEG3 (see [Figure 4-1](#) through [Figure 4-2](#) in [Section 4.0 “Memory Organization”](#) for more information). The MMU must be enabled and the TLB must be set up to access this memory (refer to [Section 50. “CPU for Devices with MIPS32® microAptiv™ and M-Class Cores”](#) (DS60001192) of the *“PIC32 Family Reference Manual”* for more information).

'0' = Bit is cleared

x = Bit is unknown

bit 31-18 **Unimplemented:** Read as '0'

bit 17-8 **CLKDIV<9:0>:** SQI Clock Tsqi Frequency Select bit⁽¹⁾

1000000000 = Base clock TBC is divided by 2048

0100000000 = Base clock TBC is divided by 1024

0010000000 = Base clock TBC is divided by 512

0001000000 = Base clock TBC is divided by 256

0000100000 = Base clock TBC is divided by 128

0000010000 = Base clock TBC is divided by 64

0000001000 = Base clock TBC is divided by 32

0000000100 = Base clock TBC is divided by 16

0000000010 = Base clock TBC is divided by 8

0000000001 = Base clock TBC is divided by 4

0000000000 = Base clock TBC is divided by 2

Setting these bits to '00000000' specifies the highest frequency of the SQI clock.

bit 7-2 **Unimplemented:** Read as '0'

bit 1 **STABLE:** Tsqi Clock Stable Select bit

This bit is set to '1' when the SQI clock, Tsqi, is stable after writing a '1' to the EN bit.

1 = Tsqi clock is stable

0 = Tsqi clock is not stable

bit 0 **EN:** Tsqi Clock Enable Select bit

When clock oscillation is stable, the SQI module will set the STABLE bit to '1'.

1 = Enable the SQI clock (Tsqi) (when clock oscillation is stable, the SQI module sets the STABLE bit to '1')

0 = Disable the SQI clock (Tsqi) (the SQI module should stop its clock to enter a low power state); SFRs can still be accessed, as they use PBCLK5

Note 1: Refer to [Table](#) in [Section 44.0 "Electrical Characteristics"](#) for the maximum clock frequency specifications.

Legend:

R = Readable bit
-n = Value at POR

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

bit 31-13 **Unimplemented:** Read as '0'

bit 12-8 **TXCMDTHR<4:0>:** Transmit Command Threshold bits

In transmit initiation mode, the SQI module performs a transmit operation when transmit command threshold bytes are present in the TX FIFO. These bits should usually be set to '1' for normal Flash commands, and set to a higher value for page programming. For 16-bit mode, the value should be a multiple of 2.

bit 7-5 **Unimplemented:** Read as '0'

bit 4-0 **RXCMDTHR<4:0>:** Receive Command Threshold bits⁽¹⁾

In receive initiation mode, the SQI module attempts to perform receive operations to fetch the receive command threshold number of bytes in the receive buffer. If space for these bytes is not present in the FIFO, the SQI will not initiate a transfer. For 16-bit mode, the value should be a multiple of 2.

If software performs any reads, thereby reducing the FIFO count, hardware would initiate a receive transfer to make the FIFO count equal to the value in these bits. If software would not like any more words latched into the FIFO, command initiation mode needs to be changed to Idle before any FIFO reads by software.

In the case of Boot/XIP mode, the SQI module will use the System Bus burst size, instead of the receive command threshold value.

Note 1: These bits should only be programmed when a receive is not active (i.e., during Idle mode or a transmit).

Legend:

R = Readable bit
-n = Value at POR

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

bit 31-21 **Unimplemented:** Read as '0'

bit 20 **STATPOS:** Status Bit Position in Flash bit

Indicates the BUSY bit position in the Flash Status register. This bit is added to support all Flash types (with BUSY bit at 0 and at 7).

1 = BUSY bit position is bit 7 in status register
0 = BUSY bit position is bit 0 in status register

bit 19-18 **STATTYPE<1:0>:** Status Command/Read Lane Mode bits

11 = Reserved
10 = Status command and read are executed in Quad Lane mode
01 = Status command and read are executed in Dual Lane mode
00 = Status command and read are executed in Single Lane mode

bit 17-16 **STATBYTES<1:0>:** Number of Status Bytes bits

11 = Reserved
10 = Status command/read is 2 bytes long
01 = Status command/read is 1 byte long
00 = Reserved

bit 15-8 **STATDATA<7:0>:** Status Data bits

These bits contain the status value of the Flash device

bit 7-0 **STATCMD<7:0>:** Status Command bits

The status check command is written into these bits

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

bit 31-29 **Unimplemented:** Read as '0'

bit 28 **INIT2SCHECK:** Flash Initialization 2 Command Status Check bit

- 1 = Check the status after executing the INIT2 command
- 0 = Do not check the status

bit 27-26 **INIT2COUNT<1:0>:** Flash Initialization 2 Command Count bits

- 11 = INIT2CMD1, INIT2CMD2, and INIT2CMD3 are sent
- 10 = INIT2CMD1 and INIT2CMD2 are sent, but INIT2CMD3 is still pending
- 01 = INIT2CMD1 is sent, but INIT2CMD2 and INIT2CMD3 are still pending
- 00 = No commands are sent

bit 25-24 **INIT2TYPE<1:0>:** Flash Initialization 2 Command Type bits

- 11 = Reserved
- 10 = INIT2 commands are sent in Quad Lane mode
- 01 = INIT2 commands are sent in Dual Lane mode
- 00 = INIT2 commands are sent in Single Lane mode

bit 24-16 **INIT2CMD3<7:0>:** Flash Initialization Command 3 bits⁽¹⁾

Third command of the Flash initialization.

bit 15-8 **INIT2CMD2<7:0>:** Flash Initialization Command 2 bits⁽¹⁾

Second command of the Flash initialization.

bit 7-0 **INIT2CMD1<7:0>:** Flash Initialization Command 1 bits⁽¹⁾

First command of the Flash initialization.

Note 1: INIT2CMD1 can be WEN and INIT2CMD2 can be SECTOR UNPROTECT.

Note: Some Flash devices require write enable and sector unprotect commands before write/read operations and this register is useful in working with those Flash types (XIP mode only)

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

21.0 INTER-INTEGRATED CIRCUIT™ (I²C™)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 24. “Inter-Integrated Circuit™ (I²C™)”** (DS60001116) in the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

The I²C module provides complete hardware support for both Slave and Multi-Master modes of the I²C serial communication standard.

Each I²C module has a 2-pin interface:

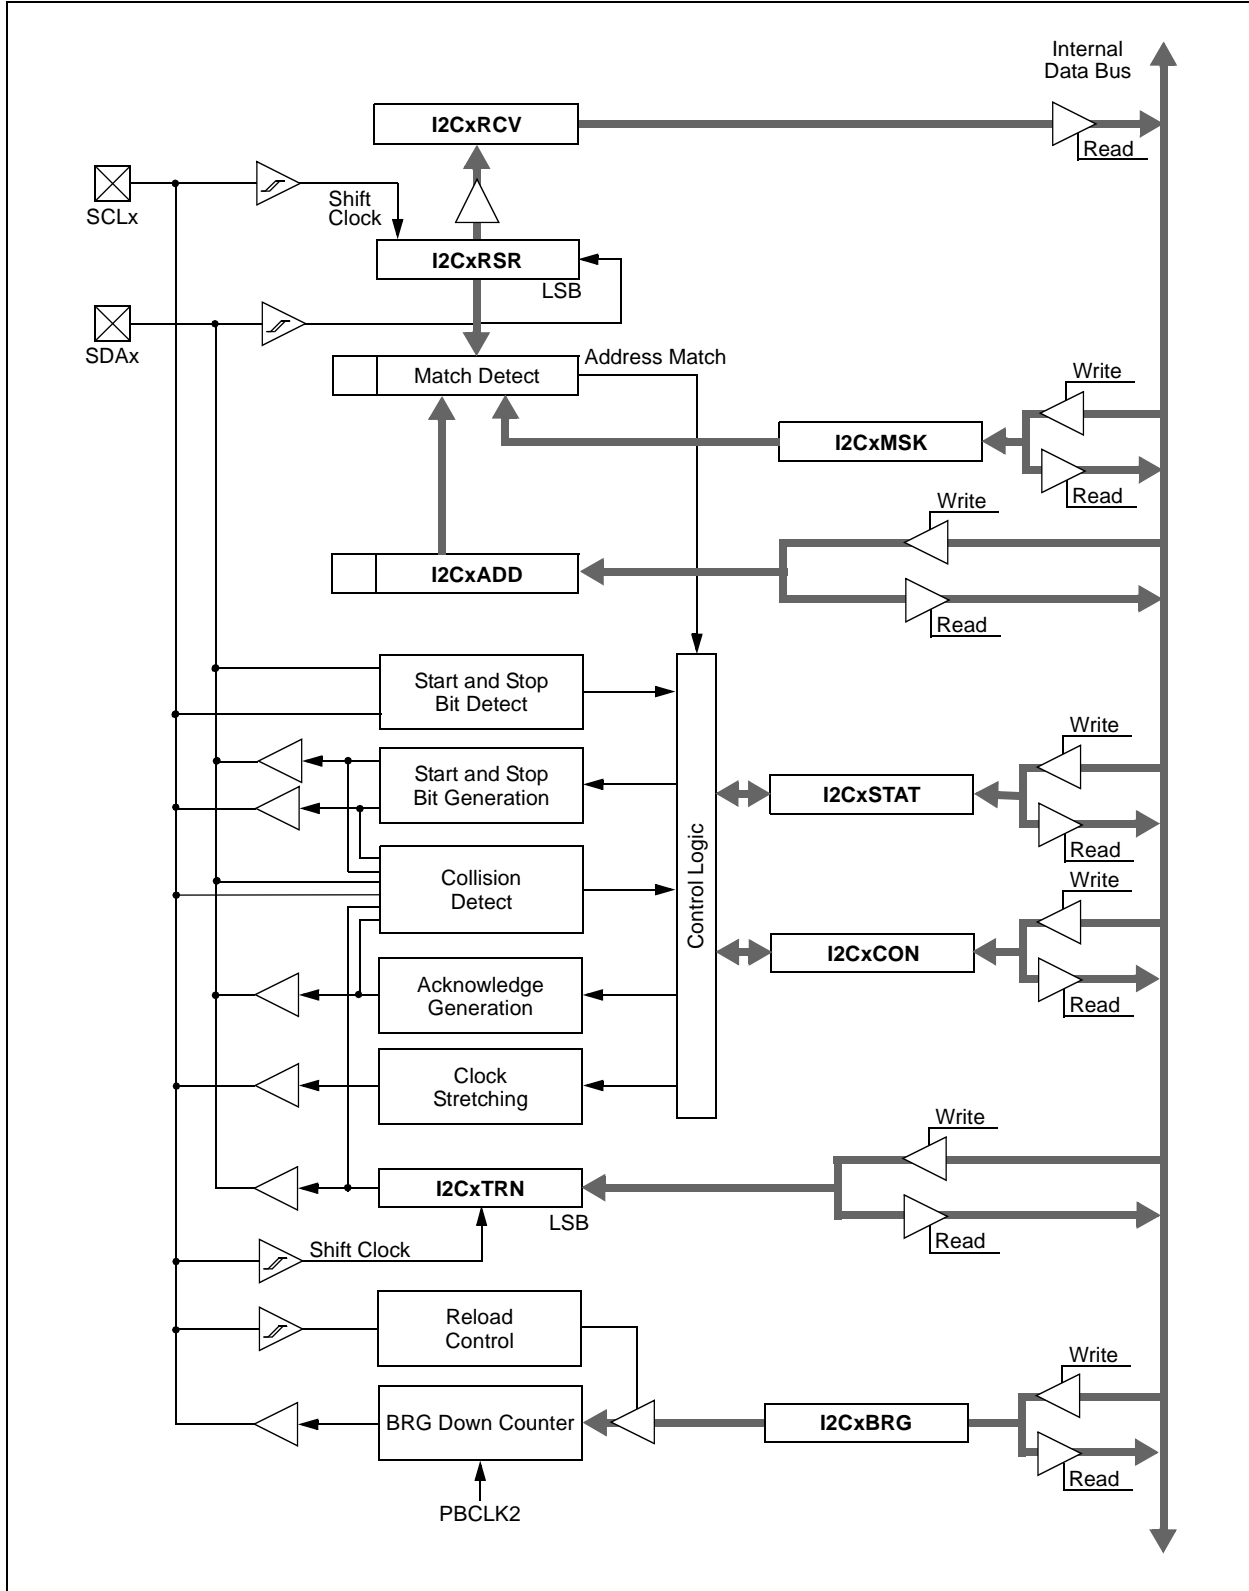

- SCLx pin is clock
- SDAx pin is data

Each I²C module offers the following key features:

- I²C interface supporting both master and slave operation
- I²C Slave mode supports 7-bit and 10-bit addressing
- I²C Master mode supports 7-bit and 10-bit addressing
- I²C port allows bidirectional transfers between master and slaves
- Serial clock synchronization for the I²C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- I²C supports multi-master operation; detects bus collision and arbitrates accordingly
- Provides support for address bit masking
- SMBus support

Figure 21-1 illustrates the I²C module block diagram.

Legend:

R = Readable bit
-n = Value at POR

HC = Cleared in Hardware

W = Writable bit

'1' = Bit is set

U = Unimplemented bit, read as '0'

'0' = Bit is cleared

x = Bit is unknown

bit 31-23 **Unimplemented:** Read as '0'

bit 22 **PCIE:** Stop Condition Interrupt Enable bit (I²C Slave mode only)

1 = Enable interrupt on detection of Stop condition
0 = Stop detection interrupts are disabled

bit 21 **SCIE:** Start Condition Interrupt Enable bit (I²C Slave mode only)

1 = Enable interrupt on detection of Start or Restart conditions
0 = Start detection interrupts are disabled

bit 20 **BOEN:** Buffer Overwrite Enable bit (I²C Slave mode only)

1 = I2CxRCV is updated and ACK is generated for a received address/data byte, ignoring the state of the I2COV bit (I2CxSTAT<6>) only if the RBF bit (I2CxSTAT<2>) = 0
0 = I2CxRCV is only updated when the I2COV bit (I2CxSTAT<6>) is clear

bit 19 **SDAHT:** SDA Hold Time Selection bit

1 = Minimum of 300 ns hold time on SDA after the falling edge of SCL
0 = Minimum of 100 ns hold time on SDA after the falling edge of SCL

bit 18 **SBCDE:** Slave Mode Bus Collision Detect Enable bit (I²C Slave mode only)

1 = Enable slave bus collision interrupts
0 = Slave bus collision interrupts are disabled

bit 18 **AHEN:** Address Hold Enable bit (Slave mode only)

1 = Following the 8th falling edge of SCL for a matching received address byte; SCKREL bit will be cleared and the SCL will be held low.
0 = Address holding is disabled

bit 16 **DHEN:** Data Hold Enable bit (I²C Slave mode only)

1 = Following the 8th falling edge of SCL for a received data byte; slave hardware clears the SCKREL bit and SCL is held low
0 = Data holding is disabled

bit 15 **ON:** I²C Enable bit

1 = Enables the I²C module and configures the SDA and SCL pins as serial port pins
0 = Disables the I²C module; all I²C pins are controlled by PORT functions

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit

1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 21-1: I2CxCON: I²C CONTROL REGISTER (CONTINUED)

- bit 12 **SCLREL:** SCLx Release Control bit (when operating as I²C slave)
1 = Release SCLx clock
0 = Hold SCLx clock low (clock stretch)
If STREN = 1:
Bit is R/W (i.e., software can write '0' to initiate stretch and write '1' to release clock). Hardware clear at beginning of slave transmission. Hardware clear at end of slave reception.
If STREN = 0:
Bit is R/S (i.e., software can only write '1' to release clock). Hardware clear at beginning of slave transmission.
- bit 11 **STRICT:** Strict I²C Reserved Address Rule Enable bit
1 = Strict reserved addressing is enforced. Device does not respond to reserved address space or generate addresses in reserved address space.
0 = Strict I²C Reserved Address Rule not enabled
- bit 10 **A10M:** 10-bit Slave Address bit
1 = I2CxADD is a 10-bit slave address
0 = I2CxADD is a 7-bit slave address
- bit 9 **DISSLW:** Disable Slew Rate Control bit
1 = Slew rate control disabled
0 = Slew rate control enabled
- bit 8 **SMEN:** SMBus Input Levels bit
1 = Enable I/O pin thresholds compliant with SMBus specification
0 = Disable SMBus input thresholds
- bit 7 **GCEN:** General Call Enable bit (when operating as I²C slave)
1 = Enable interrupt when a general call address is received in the I2CxRSR (module is enabled for reception)
0 = General call address disabled
- bit 6 **STREN:** SCLx Clock Stretch Enable bit (when operating as I²C slave)
Used in conjunction with SCLREL bit.
1 = Enable software or receive clock stretching
0 = Disable software or receive clock stretching
- bit 5 **ACKDT:** Acknowledge Data bit (when operating as I²C master, applicable during master receive)
Value that is transmitted when the software initiates an Acknowledge sequence.
1 = Send NACK during Acknowledge
0 = Send ACK during Acknowledge
- bit 4 **ACKEN:** Acknowledge Sequence Enable bit (when operating as I²C master, applicable during master receive)
1 = Initiate Acknowledge sequence on SDAx and SCLx pins and transmit ACKDT data bit. Hardware clear at end of master Acknowledge sequence.
0 = Acknowledge sequence not in progress
- bit 3 **RCEN:** Receive Enable bit (when operating as I²C master)
1 = Enables Receive mode for I²C. Hardware clear at end of eighth bit of master receive data byte.
0 = Receive sequence not in progress
- bit 2 **PEN:** Stop Condition Enable bit (when operating as I²C master)
1 = Initiate Stop condition on SDAx and SCLx pins. Hardware clear at end of master Stop sequence.
0 = Stop condition not in progress
- bit 1 **RSEN:** Repeated Start Condition Enable bit (when operating as I²C master)
1 = Initiate Repeated Start condition on SDAx and SCLx pins. Hardware clear at end of master Repeated Start sequence.
0 = Repeated Start condition not in progress
- bit 0 **SEN:** Start Condition Enable bit (when operating as I²C master)
1 = Initiate Start condition on SDAx and SCLx pins. Hardware clear at end of master Start sequence.
0 = Start condition not in progress

| | | | |
|-------------------|-------------------|------------------------------------|-----------------------|
| Legend: | HS = Hardware Set | HC = Hardware Cleared | SC = Software Cleared |
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | C = Clearable bit |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ACKSTAT:** Acknowledge Status bit
(when operating as I²C™ master, applicable to master transmit operation)
1 = NACK received from slave
0 = ACK received from slave
Hardware set or clear at end of slave Acknowledge.

bit 14 **TRSTAT:** Transmit Status bit (when operating as I²C master, applicable to master transmit operation)
1 = Master transmit is in progress (8 bits + ACK)
0 = Master transmit is not in progress
Hardware set at beginning of master transmission. Hardware clear at end of slave Acknowledge.

bit 13 **ACKTIM:** Acknowledge Time Status bit (Valid in I²C Slave mode only)
1 = I²C bus is in an Acknowledge sequence, set on 8th falling edge of SCL clock
0 = Not an Acknowledge sequence, cleared on 9th rising edge of SCL clock

bit 12-11 **Unimplemented:** Read as '0'

bit 10 **BCL:** Master Bus Collision Detect bit
1 = A bus collision has been detected during a master operation
0 = No collision
Hardware set at detection of bus collision.

bit 9 **GCSTAT:** General Call Status bit
1 = General call address was received
0 = General call address was not received
Hardware set when address matches general call address. Hardware clear at Stop detection.

bit 8 **ADD10:** 10-bit Address Status bit
1 = 10-bit address was matched
0 = 10-bit address was not matched
Hardware set at match of 2nd byte of matched 10-bit address. Hardware clear at Stop detection.

bit 7 **IWCOL:** Write Collision Detect bit
1 = An attempt to write the I2CxTRN register failed because the I²C module is busy
0 = No collision
Hardware set at occurrence of write to I2CxTRN while busy (cleared by software).

bit 6 **I2COV:** Receive Overflow Flag bit
1 = A byte was received while the I2CxRCV register is still holding the previous byte
0 = No overflow
Hardware set at attempt to transfer I2CxRSR to I2CxRCV (cleared by software).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 21-2: I2CxSTAT: I²C STATUS REGISTER (CONTINUED)

- bit 5 **D_A:** Data/Address bit (when operating as I²C slave)
 1 = Indicates that the last byte received was data
 0 = Indicates that the last byte received was device address
 Hardware clear at device address match. Hardware set by reception of slave byte.
- bit 4 **P:** Stop bit
 1 = Indicates that a Stop bit has been detected last
 0 = Stop bit was not detected last
 Hardware set or clear when Start, Repeated Start or Stop detected.
- bit 3 **S:** Start bit
 1 = Indicates that a Start (or Repeated Start) bit has been detected last
 0 = Start bit was not detected last
 Hardware set or clear when Start, Repeated Start or Stop detected.
- bit 2 **R_W:** Read/Write Information bit (when operating as I²C slave)
 1 = Read – indicates data transfer is output from slave
 0 = Write – indicates data transfer is input to slave
 Hardware set or clear after reception of I²C device address byte.
- bit 1 **RBF:** Receive Buffer Full Status bit
 1 = Receive complete, I2CxRCV is full
 0 = Receive not complete, I2CxRCV is empty
 Hardware set when I2CxRCV is written with received byte. Hardware clear when software reads I2CxRCV.
- bit 0 **TBF:** Transmit Buffer Full Status bit
 1 = Transmit in progress, I2CxTRN is full
 0 = Transmit complete, I2CxTRN is empty
 Hardware set when software writes I2CxTRN. Hardware clear at completion of data transmission.

22.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 21. “Universal Asynchronous Receiver Transmitter (UART)”** (DS60001107) in the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

The UART module is one of the serial I/O modules available in PIC32MZ EF devices. The UART is a full-duplex, asynchronous communication channel that communicates with peripheral devices and personal computers through protocols, such as RS-232, RS-485, LIN, and IrDA®. The module also supports the hardware flow control option, with \overline{UxCTS} and \overline{UxRTS} pins, and also includes an IrDA encoder and decoder.

The primary features of the UART module are:

- Full-duplex, 8-bit or 9-bit data transmission
- Even, Odd or No Parity options (for 8-bit data)
- One or two Stop bits
- Hardware auto-baud feature
- Hardware flow control option
- Fully integrated Baud Rate Generator (BRG) with 16-bit prescaler
- Baud rates ranging from 76 bps to 25 Mbps at 100 MHz (PBCLK2)
- 8-level deep First-In-First-Out (FIFO) transmit data buffer
- 8-level deep FIFO receive data buffer
- Parity, framing and buffer overrun error detection
- Support for interrupt-only on address detect (9th bit = 1)
- Separate transmit and receive interrupts
- Loopback mode for diagnostic support
- LIN Protocol support
- IrDA encoder and decoder with 16x baud clock output for external IrDA encoder/decoder support

Figure 22-1 illustrates a simplified block diagram of the UART module.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 22-1: UxMODE: UARTx MODE REGISTER (CONTINUED)

- bit 5 **ABAUD**: Auto-Baud Enable bit
1 = Enable baud rate measurement on the next character – requires reception of Sync character (0x55);
cleared by hardware upon completion
0 = Baud rate measurement disabled or completed
- bit 4 **RXINV**: Receive Polarity Inversion bit
1 = UxRX Idle state is '0'
0 = UxRX Idle state is '1'
- bit 3 **BRGH**: High Baud Rate Enable bit
1 = High-Speed mode – 4x baud clock enabled
0 = Standard Speed mode – 16x baud clock enabled
- bit 2-1 **PDSEL<1:0>**: Parity and Data Selection bits
11 = 9-bit data, no parity
10 = 8-bit data, odd parity
01 = 8-bit data, even parity
00 = 8-bit data, no parity
- bit 0 **STSEL**: Stop Selection bit
1 = 2 Stop bits
0 = 1 Stop bit

Note 1: These bits are present for legacy compatibility, and are superseded by PPS functionality on these devices (see [Section 12.4 “Peripheral Pin Select \(PPS\)”](#) for more information).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 22-2: UxSTA: UARTx STATUS AND CONTROL REGISTER

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|----------------|----------------|----------------|----------------|----------------|----------------|---------------|---------------|

| | UTXISEL<1:0> | | UTXINV | URXEN | UTXBRK | UTXEN | UTXBF | TRMT |
| 7:0 | R/W-0 | R/W-0 | R/W-0 | R-1 | R-0 | R-0 | R/W-0 | R-0 |
| | URXISEL<1:0> | | ADDEN | RIDLE | PERR | FERR | OERR | URXDA |

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 31-25 **Unimplemented:** Read as '0'

bit 24 **ADM_EN:** Automatic Address Detect Mode Enable bit

- 1 = Automatic Address Detect mode is enabled
- 0 = Automatic Address Detect mode is disabled

bit 23-16 **ADDR<7:0>:** Automatic Address Mask bits

When the ADM_EN bit is '1', this value defines the address character to use for automatic address detection.

bit 15-14 **UTXISEL<1:0>:** TX Interrupt Mode Selection bits

- 11 = Reserved, do not use
- 10 = Interrupt is generated and asserted while the transmit buffer is empty
- 01 = Interrupt is generated and asserted when all characters have been transmitted
- 00 = Interrupt is generated and asserted while the transmit buffer contains at least one empty space

bit 13 **UTXINV:** Transmit Polarity Inversion bit

If IrDA mode is disabled (i.e., IREN (UxMODE<12>) is '0'):

- 1 = UxTX Idle state is '0'
- 0 = UxTX Idle state is '1'

If IrDA mode is enabled (i.e., IREN (UxMODE<12>) is '1'):

- 1 = IrDA encoded UxTX Idle state is '1'
- 0 = IrDA encoded UxTX Idle state is '0'

bit 12 **URXEN:** Receiver Enable bit

- 1 = UARTx receiver is enabled. UxRX pin is controlled by UARTx (if ON = 1)
- 0 = UARTx receiver is disabled. UxRX pin is ignored by the UARTx module

bit 11 **UTXBRK:** Transmit Break bit

- 1 = Send Break on next transmission. Start bit followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion
- 0 = Break transmission is disabled or completed

bit 10 **UTXEN:** Transmit Enable bit

- 1 = UARTx transmitter is enabled. UxTX pin is controlled by UARTx (if ON = 1)
- 0 = UARTx transmitter is disabled. Any pending transmission is aborted and buffer is reset

bit 9 **UTXBF:** Transmit Buffer Full Status bit (read-only)

- 1 = Transmit buffer is full
- 0 = Transmit buffer is not full, at least one more character can be written

bit 8 **TRMT:** Transmit Shift Register is Empty bit (read-only)

- 1 = Transmit shift register is empty and transmit buffer is empty (the last transmission has completed)
- 0 = Transmit shift register is not empty, a transmission is in progress or queued in the transmit buffer

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 22-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 7-6 **URXISEL<1:0>**: Receive Interrupt Mode Selection bit
11 = Reserved
10 = Interrupt flag bit is asserted while receive buffer is 3/4 or more full
01 = Interrupt flag bit is asserted while receive buffer is 1/2 or more full
00 = Interrupt flag bit is asserted while receive buffer is not empty (i.e., has at least 1 data character)
- bit 5 **ADDEN**: Address Character Detect bit (bit 8 of received data = 1)
1 = Address Detect mode is enabled. If 9-bit mode is not selected, this control bit has no effect
0 = Address Detect mode is disabled
- bit 4 **RIDLE**: Receiver Idle bit (read-only)
1 = Receiver is Idle
0 = Data is being received
- bit 3 **PERR**: Parity Error Status bit (read-only)
1 = Parity error has been detected for the current character
0 = Parity error has not been detected
- bit 2 **FERR**: Framing Error Status bit (read-only)
1 = Framing error has been detected for the current character
0 = Framing error has not been detected
- bit 1 **OERR**: Receive Buffer Overrun Error Status bit.
This bit is set in hardware and can only be cleared (= 0) in software. Clearing a previously set OERR bit resets the receiver buffer and RSR to empty state.
1 = Receive buffer has overflowed
0 = Receive buffer has not overflowed
- bit 0 **URXDA**: Receive Buffer Data Available bit (read-only)
1 = Receive buffer has data, at least one more character can be read
0 = Receive buffer is empty

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

Figure 22-2 and Figure 22-3 illustrate typical receive and transmit timing for the UART module.

FIGURE 22-2: UART RECEPTION

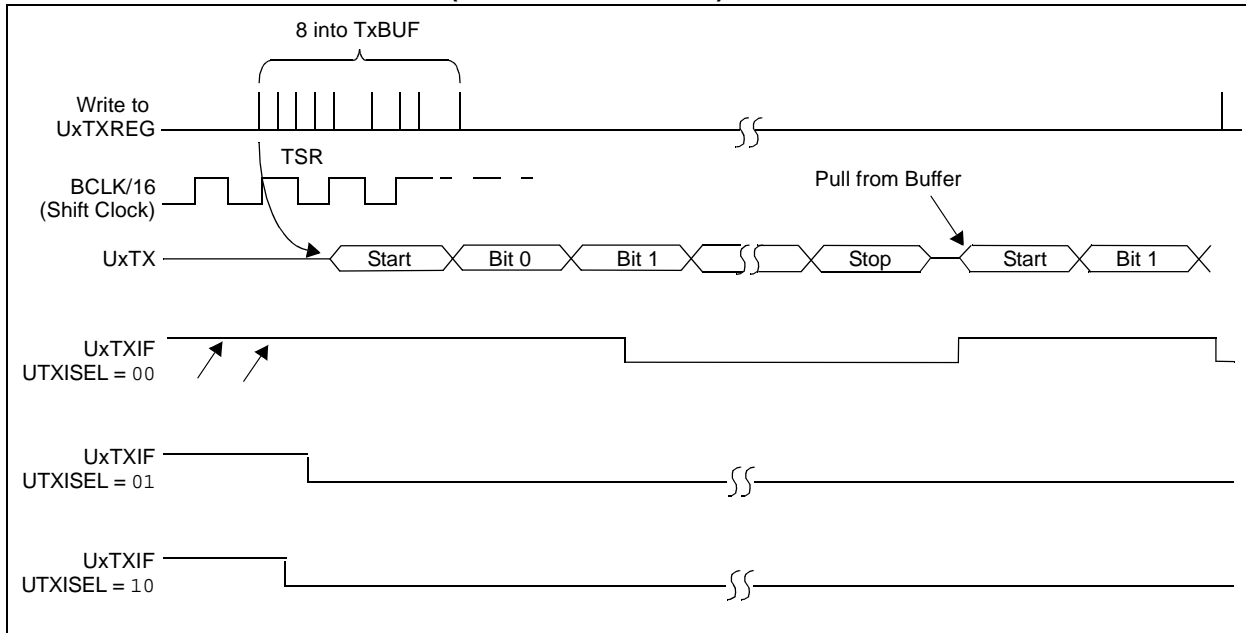

FIGURE 22-3: TRANSMISSION (8-BIT OR 9-BIT DATA)

23.0 PARALLEL MASTER PORT (PMP)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 13. “Parallel Master Port (PMP)”** (DS60001128) in the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

The PMP is a parallel 8-bit/16-bit input/output module specifically designed to communicate with a wide variety of parallel devices, such as communications peripherals, LCDs, external memory devices and microcontrollers. Because the interface to parallel peripherals varies significantly, the PMP module is highly configurable.

Key features of the PMP module include:

- 8-bit, 16-bit interface
- Up to 16 programmable address lines
- Up to two Chip Select lines
- Programmable strobe options:
 - Individual read and write strobes, or
 - Read/write strobe with enable strobe
- Address auto-increment/auto-decrement
- Programmable address/data multiplexing
- Programmable polarity on control signals
- Parallel Slave Port support:
 - Legacy addressable
 - Address support
 - 4-byte deep auto-incrementing buffer
- Programmable Wait states
- Operate during Sleep and Idle modes
- Fast bit manipulation using CLR, SET, and INV registers

Note: On 64-pin devices, data pins PMD<15:8> are not available in 16-bit Master modes.

Legend:

R = Readable bit
-n = Value at POR

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23 **RDSTART:** Start Read on PMP Bus bit
This bit is cleared by hardware at the end of the read cycle.
1 = Start a read cycle on the PMP bus
0 = No effect

bit 22-18 **Unimplemented:** Read as '0'

bit 17 **DUALBUF:** Dual Read/Write Buffers enable bit
This bit is valid in Master mode only.
1 = PMP uses separate registers for reads and writes (PMRADDR, PMDATAIN, PMWADDR, PMDATAOUT)
0 = PMP uses legacy registers (PMADDR, PMDATA)

bit 16 **Unimplemented:** Read as '0'

bit 15 **ON:** Parallel Master Port Enable bit
1 = PMP enabled
0 = PMP disabled, no off-chip access performed

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12-11 **ADRMUX<1:0>:** Address/Data Multiplexing Selection bits
11 = Lower 8 bits of address are multiplexed on PMD<15:0> pins; upper 8 bits are not used
10 = All 16 bits of address are multiplexed on PMD<15:0> pins
01 = Lower 8 bits of address are multiplexed on PMD<7:0> pins, upper bits are on PMA<15:8>
00 = Address and data appear on separate pins

bit 10 **PMPTTL:** PMP Module TTL Input Buffer Select bit
1 = PMP module uses TTL input buffers
0 = PMP module uses Schmitt Trigger input buffer

bit 9 **PTWREN:** Write Enable Strobe Port Enable bit
1 = PMWR/PMENB port enabled
0 = PMWR/PMENB port disabled

bit 8 **PTRDEN:** Read/Write Strobe Port Enable bit
1 = PMRD/PMWR port enabled
0 = PMRD/PMWR port disabled

Note 1: These bits have no effect when their corresponding pins are used as address lines.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 23-1: PMCON: PARALLEL PORT CONTROL REGISTER (CONTINUED)

- bit 7-6 **CSF<1:0>**: Chip Select Function bits⁽¹⁾
11 = Reserved
10 = PMCS1 and PMCS2 function as Chip Select
01 = PMCS2 functions as Chip Select and PMCS1 functions as address bit 14
00 = PMCS1 and PMCS2 function as address bit 14 and address bit 15
- bit 5 **ALP**: Address Latch Polarity bit⁽¹⁾
1 = Active-high (PMALL and PMALH)
0 = Active-low (PMALL and PMALH)
- bit 4 **CS2P**: Chip Select 2 Polarity bit⁽¹⁾
1 = Active-high (PMCS2)
0 = Active-low (PMCS2)
- bit 3 **CS1P**: Chip Select 1 Polarity bit⁽¹⁾
1 = Active-high (PMCS1)
0 = Active-low (PMCS1)
- bit 2 **Unimplemented**: Read as '0'
- bit 1 **WRSP**: Write Strobe Polarity bit
For Slave Modes and Master mode 2 (MODE<1:0> = 00,01,10):
1 = Write strobe active-high (PMWR)
0 = Write strobe active-low (PMWR)
For Master mode 1 (MODE<1:0> = 11):
1 = Enable strobe active-high (PMENB)
0 = Enable strobe active-low (PMENB)
- bit 0 **RDSP**: Read Strobe Polarity bit
For Slave modes and Master mode 2 (MODE<1:0> = 00,01,10):
1 = Read Strobe active-high (PMRD)
0 = Read Strobe active-low (PMRD)
For Master mode 1 (MODE<1:0> = 11):
1 = Read/write strobe active-high (PMRD/PMWR)
0 = Read/write strobe active-low (PMRD/PMWR)

Note 1: These bits have no effect when their corresponding pins are used as address lines.

| 7:0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
| | WAITB<1:0> ⁽¹⁾ | | WAITM<3:0> ⁽¹⁾ | | | | WAITE<1:0> ⁽¹⁾ | |

Legend:

R = Readable bit
-n = Value at POR

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **BUSY:** Busy bit (Master mode only)

- 1 = Port is busy
- 0 = Port is not busy

bit 14-13 **IRQM<1:0>:** Interrupt Request Mode bits

- 11 = Reserved, do not use
- 10 = Interrupt generated when Read Buffer 3 is read or Write Buffer 3 is written (Buffered PSP mode) or on a read or write operation when PMA<1:0> = 11 (Addressable Slave mode only)
- 01 = Interrupt generated at the end of the read/write cycle
- 00 = No Interrupt generated

bit 12-11 **INCM<1:0>:** Increment Mode bits

- 11 = Slave mode read and write buffers auto-increment (MODE<1:0> = 00 only)
- 10 = Decrement ADDR<15:0> and ADDR<14> by 1 every read/write cycle⁽²⁾
- 01 = Increment ADDR<15:0> and ADDR<14> by 1 every read/write cycle⁽²⁾
- 00 = No increment or decrement of address

bit 10 **MODE16:** 8/16-bit Mode bit

- 1 = 16-bit mode: a read or write to the data register invokes a single 16-bit transfer
- 0 = 8-bit mode: a read or write to the data register invokes a single 8-bit transfer

bit 9-8 **MODE<1:0>:** Parallel Port Mode Select bits

- 11 = Master mode 1 (PMCSx, PMRD/PMWR, PMENB, PMA<x:0>, and PMD<15:0>)⁽³⁾
- 10 = Master mode 2 (PMCSx, PMRD, PMWR, PMA<x:0>, and PMD<15:0>)⁽³⁾
- 01 = Enhanced Slave mode, control signals (PMRD, PMWR, PMCSx, PMD<7:0>, and PMA<1:0>)
- 00 = Legacy Parallel Slave Port, control signals (PMRD, PMWR, PMCSx, and PMD<7:0>)

bit 7-6 **WAITB<1:0>:** Data Setup to Read/Write Strobe Wait States bits⁽¹⁾

- 11 = Data wait of 4 TPBCLK2; multiplexed address phase of 4 TPBCLK2
- 10 = Data wait of 3 TPBCLK2; multiplexed address phase of 3 TPBCLK2
- 01 = Data wait of 2 TPBCLK2; multiplexed address phase of 2 TPBCLK2
- 00 = Data wait of 1 TPBCLK2; multiplexed address phase of 1 TPBCLK2 (default)

Note 1: Whenever WAITM<3:0> = 0000, WAITB and WAITE bits are ignored and forced to 1 TPBCLK2 cycle for a write operation; WAITB = 1 TPBCLK2 cycle, WAITE = 0 TPBCLK2 cycles for a read operation.

2: Address bits 14 and 15 are not subject to auto-increment/decrement if configured as Chip Select.

3: The PMD<15:8> bits are not active if the MODE16 bit = 1.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 23-2: PMMODE: PARALLEL PORT MODE REGISTER (CONTINUED)

bit 5-2 **WAITM<3:0>**: Data Read/Write Strobe Wait States bits⁽¹⁾

1111 = Wait of 16 TPBCLK2

•
•
•

0001 = Wait of 2 TPBCLK2

0000 = Wait of 1 TPBCLK2 (default)

bit 1-0 **WAITE<1:0>**: Data Hold After Read/Write Strobe Wait States bits⁽¹⁾

11 = Wait of 4 TPBCLK2

10 = Wait of 3 TPBCLK2

01 = Wait of 2 TPBCLK2

00 = Wait of 1 TPBCLK2 (default)

For Read operations:

11 = Wait of 3 TPBCLK2

10 = Wait of 2 TPBCLK2

01 = Wait of 1 TPBCLK2

00 = Wait of 0 TPBCLK2 (default)

Note 1: Whenever WAITM<3:0> = 0000, WAITB and WAITE bits are ignored and forced to 1 TPBCLK2 cycle for a write operation; WAITB = 1 TPBCLK2 cycle, WAITE = 0 TPBCLK2 cycles for a read operation.

2: Address bits 14 and 15 are is not subject to auto-increment/decrement if configured as Chip Select.

3: The PMD<15:8> bits are not active is the MODE16 bit = 1.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

bit 11-8 **IBxF:** Input Buffer x Status Full bits

1 = Input Buffer contains data that has not been read (reading buffer will clear this bit)

0 = Input Buffer does not contain any unread data

bit 7 **OBE:** Output Buffer Empty Status bit

1 = All readable output buffer registers are empty

0 = Some or all of the readable output buffer registers are full

bit 6 **OBUF:** Output Buffer Underflow Status bit

1 = A read occurred from an empty output byte buffer (must be cleared in software)

0 = No underflow occurred

bit 5-4 **Unimplemented:** Read as '0'

bit 3-0 **OBxE:** Output Buffer x Status Empty bits

1 = Output buffer is empty (writing data to the buffer will clear this bit)

0 = Output buffer contains data that has not been transmitted

Note: This register is only used when the DUALBUF bit (PMCON<17>) is set to '1' and exclusively for reads. If the DUALBUF bit is '0', the PMDIN register ([Register 23-5](#)) is used for reads instead of PMRDIN.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

24.0 EXTERNAL BUS INTERFACE (EBI)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 47. “External Bus Interface (EBI)”** in the “*PIC32 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com/PIC32).

The External Bus Interface (EBI) module provides a high-speed, convenient way to interface external parallel memory devices to the PIC32MZ EF family device.

With the EBI module, it is possible to connect asynchronous SRAM and NOR Flash devices, as well as non-memory devices such as camera sensors and LCDs.

The features of the EBI module depend on the pin count of the PIC32MZ EF device, as shown in [Table 24-1](#).

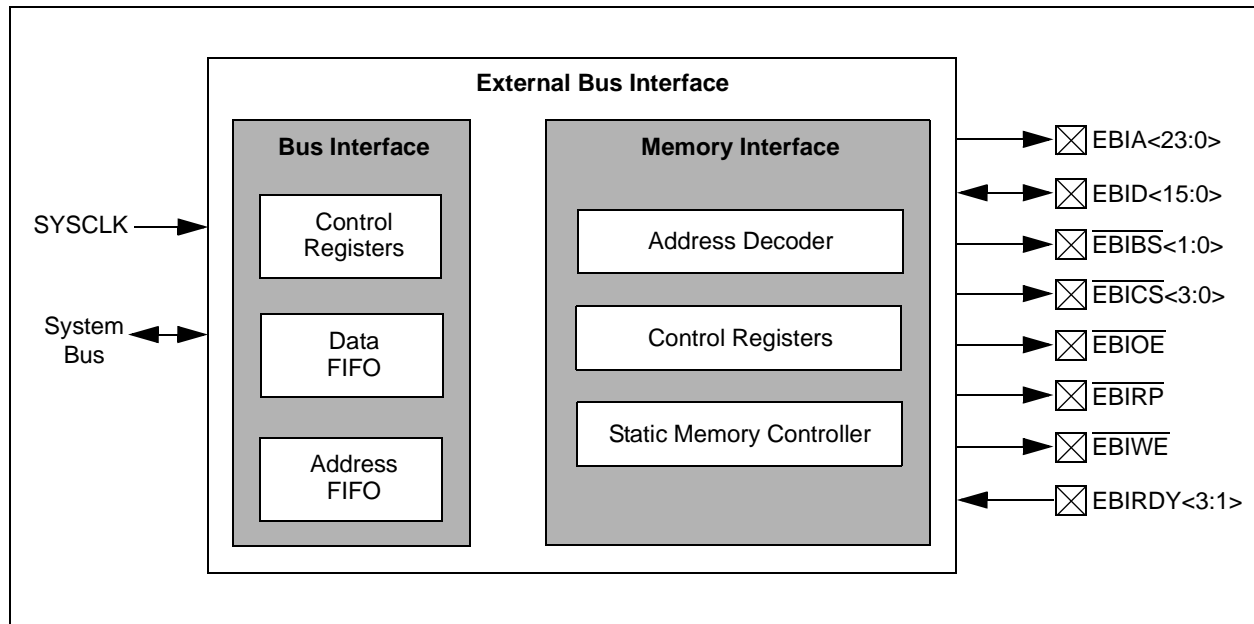

Note: The EBI module is not available on 64-pin devices.

TABLE 24-1: EBI MODULE FEATURES

| Feature | Number of Device Pins | | |
|---------------------------|-----------------------|-----|-----|
| | 100 | 124 | 144 |
| Async SRAM | Y | Y | Y |
| Async NOR Flash | Y | Y | Y |
| Available address lines | 20 | 20 | 24 |
| 8-bit data bus support | Y | Y | Y |
| 16-bit data bus support | Y | Y | Y |
| Available Chip Selects | 1 | 1 | 4 |
| Timing mode sets | 3 | 3 | 3 |
| 8-bit R/W from 16-bit bus | N | N | Y |
| Non-memory device | Y | Y | Y |
| LCD | Y | Y | Y |

Note: Once the EBI module is configured, external devices will be memory mapped and can be access from KSEG2 memory space (see [Figure 4-1](#) through [Figure 4-4](#) in [Section 4.0 “Memory Organization”](#) for more information). The MMU must be enabled and the TLB must be set up to access this memory (refer to [Section 50. “CPU for Devices with MIPS32® microAptiv™ and M-Class Cores”](#) (DS60001192) of the “*PIC32 Family Reference Manual*” for more information).

| -n = Value at POR | ‘1’ = Bit is set | ‘0’ = Bit is cleared x = Bit is unknown |

bit 31-27 **Unimplemented:** Read as ‘0’

bit 26 **RDYMODE:** Data Ready Device Select bit

The device associated with register set ‘x’ is a data-ready device, and will use the EBIRDYx pin.

1 = EBIRDYx input is used

0 = EBIRDYx input is not used

bit 25-24 **PAGESIZE<1:0>:** Page Size for Page Mode Device bits

11 = 32-word page

10 = 16-word page

01 = 8-word page

00 = 4-word page

bit 23 **PAGEMODE:** Memory Device Page Mode Support bit

1 = Device supports Page mode

0 = Device does not support Page mode

bit 22-19 **TPRC<3:0>:** Page Mode Read Cycle Time bits⁽¹⁾

Read cycle time is TPRC + 1 clock cycle.

bit 18-16 **TBTA<2:0>:** Data Bus Turnaround Time bits⁽¹⁾

Clock cycles (0-7) for static memory between read-to-write, write-to-read, and read-to-read when Chip Select changes.

bit 15-10 **TWP<5:0>:** Write Pulse Width bits⁽¹⁾

Write pulse width is TWP + 1 clock cycle.

bit 9-8 **TWR<1:0>:** Write Address/Data Hold Time bits⁽¹⁾

Number of clock cycles to hold address or data on the bus.

bit 7-6 **TAS<1:0>:** Write Address Setup Time bits⁽¹⁾

Clock cycles for address setup time. A value of ‘0’ is only valid in the case of SSRAM.

bit 5-0 **TRC<5:0>:** Read Cycle Time bits⁽¹⁾

Read cycle time is TRC + 1 clock cycle.

Note 1: Please refer to **Section 47. “External Bus Interface (EBI)”** in the *“PIC32 Family Reference Manual”* for the EBI timing diagrams and additional information.

bit 6-1 **Unimplemented:** Read as '0'

bit 0 **SMRP**: Flash Reset/Power-down mode Select bit

After a Reset, the controller internally performs a power-down for Flash, and then sets this bit to '1'.

1 = Flash is taken out of Power-down mode
0 = Flash is forced into Power-down mode

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

25.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

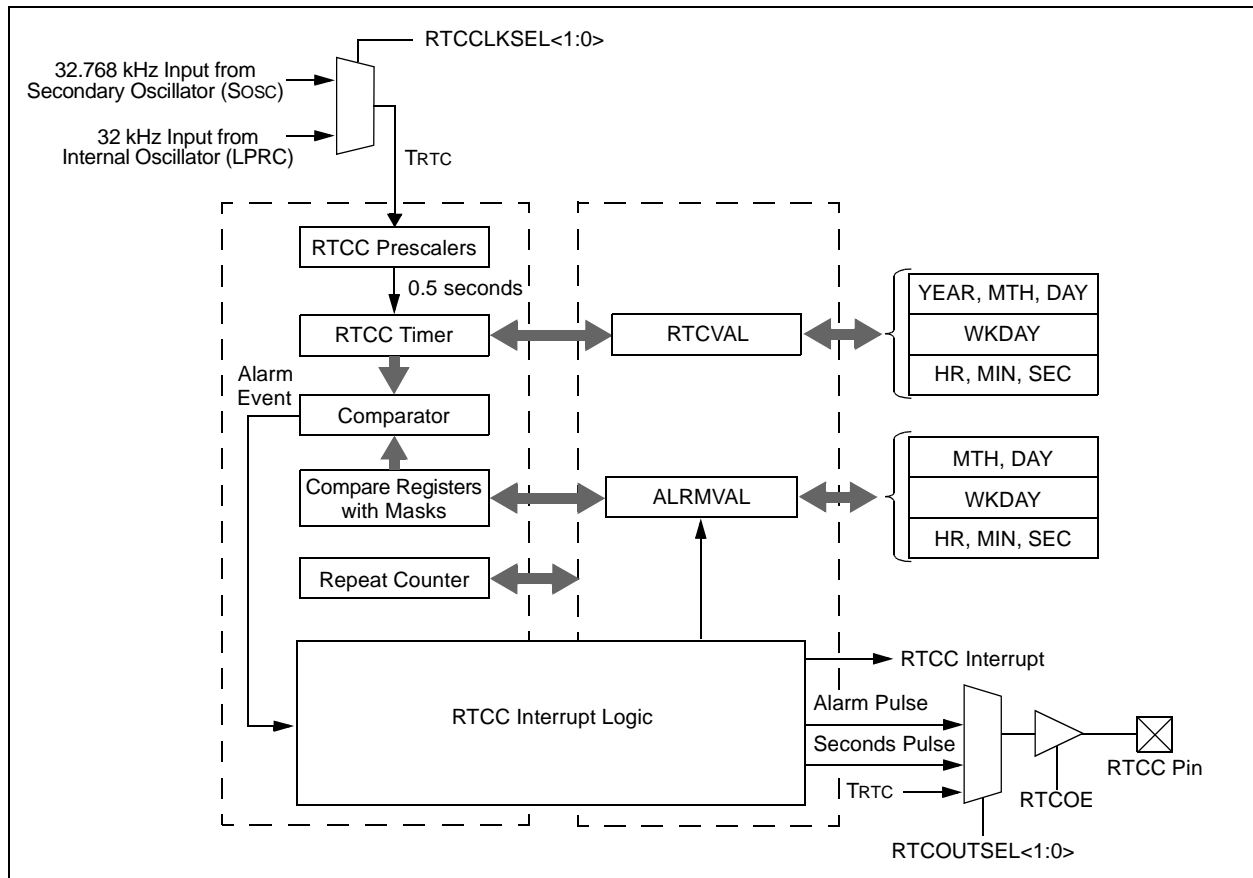

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 29. “Real-Time Clock and Calendar (RTCC)”** (DS60001125) in the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

The RTCC module is intended for applications in which accurate time must be maintained for extended periods of time with minimal or no CPU intervention. Low-power optimization provides extended battery lifetime while keeping track of time.

Key features of the RTCC module include:

- Time: hours, minutes and seconds
- 24-hour format (military time)
- Visibility of one-half second period
- Provides calendar: Weekday, date, month and year
- Alarm intervals are configurable for half of a second, one second, 10 seconds, one minute, 10 minutes, one hour, one day, one week, one month, and one year
- Alarm repeat with decremting counter
- Alarm with indefinite repeat: Chime
- Year range: 2000 to 2099
- Leap year correction
- BCD format for smaller firmware overhead
- Optimized for long-term battery operation
- Fractional second synchronization
- User calibration of the clock crystal frequency with auto-adjust
- Calibration range: ± 0.66 seconds error per month
- Calibrates up to 260 ppm of crystal error
- Uses external 32.768 kHz crystal or 32 kHz internal oscillator
- Alarm pulse, seconds clock, or internal clock output on RTCC pin

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers in this table have corresponding CLR, SET and INV registers at its virtual address, plus an offset of 0x4, 0x8 and 0xC, respectively. See [Section 12.3 "CLR, SET, and INV Registers"](#) for more information.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 25-1: RTCCON: REAL-TIME CLOCK AND CALENDAR CONTROL REGISTER

bit 10-9 **RTCCLKSEL<1:0>**: RTCC Clock Select bits

When a new value is written to these bits, the Seconds Value register should also be written to properly reset the clock prescalers in the RTCC.

11 = Reserved

10 = Reserved

01 = RTCC uses the external 32.768 kHz Secondary Oscillator (SOSC)

00 = RTCC uses the internal 32 kHz oscillator (LPRC)

bit 8-7 **RTCOUTSEL<1:0>**: RTCC Output Data Select bits⁽²⁾

11 = Reserved

10 = RTCC Clock is presented on the RTCC pin

01 = Seconds Clock is presented on the RTCC pin

00 = Alarm Pulse is presented on the RTCC pin when the alarm interrupt is triggered

bit 6 **RTCCLKON**: RTCC Clock Enable Status bit⁽⁵⁾

1 = RTCC Clock is actively running

0 = RTCC Clock is not running

bit 5-4 **Unimplemented**: Read as '0'

bit 3 **RTCWREN**: Real-Time Clock Value Registers Write Enable bit⁽³⁾

1 = Real-Time Clock Value registers can be written to by the user

0 = Real-Time Clock Value registers are locked out from being written to by the user

bit 2 **RTCSYNC**: Real-Time Clock Value Registers Read Synchronization bit

1 = Real-time clock value registers can change while reading (due to a rollover ripple that results in an invalid data read). If the register is read twice and results in the same data, the data can be assumed to be valid.

0 = Real-time clock value registers can be read without concern about a rollover ripple

bit 1 **HALFSEC**: Half-Second Status bit⁽⁴⁾

1 = Second half period of a second

0 = First half period of a second

bit 0 **RTC OE**: RTCC Output Enable bit

1 = RTCC output is enabled

0 = RTCC output is not enabled

Note 1: The ON bit is only writable when RTCWREN = 1.

2: Requires RTCOE = 1 (RTCCON<0>) for the output to be active.

3: The RTCWREN bit can be set only when the write sequence is enabled.

4: This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).

5: This bit is undefined when RTCCLKSEL<1:0> = 00 (LPRC is the clock source).

Note: This register is reset only on a Power-on Reset (POR).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 25-2: RTCALRM: REAL-TIME CLOCK ALARM CONTROL REGISTER

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|--------------------------|----------------------|--------------------|----------------|---------------------------|----------------|---------------|---------------|
| 31:24 | U-0 — | U-0 — | U-0 — | U-0 — | U-0 — | U-0 — | U-0 — | U-0 — |
| 23:16 | U-0 — | U-0 — | U-0 — | U-0 — | U-0 — | U-0 — | U-0 — | U-0 — |
| 15:8 | R/W-0 | R/W-0 | R/W-0 | R-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
| | ALRMEN ^(1,2) | CHIME ⁽²⁾ | PIV ⁽²⁾ | ALRMSYNC | AMASK<3:0> ⁽²⁾ | | | |
| 7:0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
| | ARPT<7:0> ⁽²⁾ | | | | | | | |

Legend:

R = Readable bit
-n = Value at POR

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'
bit 15 **ALRMEN:** Alarm Enable bit^(1,2)

1 = Alarm is enabled
0 = Alarm is disabled

bit 14 **CHIME:** Chime Enable bit⁽²⁾

1 = Chime is enabled – ARPT<7:0> is allowed to rollover from 0x00 to 0xFF
0 = Chime is disabled – ARPT<7:0> stops once it reaches 0x00

bit 13 **PIV:** Alarm Pulse Initial Value bit⁽²⁾

When ALRMEN = 0, PIV is writable and determines the initial value of the Alarm Pulse.
When ALRMEN = 1, PIV is read-only and returns the state of the Alarm Pulse.

bit 12 **ALRMSYNC:** Alarm Sync bit

1 = ARPT<7:0> and ALRMEN may change as a result of a half second rollover during a read.
The ARPT must be read repeatedly until the same value is read twice. This must be done since multiple bits may be changing.
0 = ARPT<7:0> and ALRMEN can be read without concerns of rollover because the prescaler is more than 32 real-time clocks away from a half-second rollover

bit 11-8 **AMASK<3:0>:** Alarm Mask Configuration bits⁽²⁾

0000 = Every half-second
0001 = Every second
0010 = Every 10 seconds
0011 = Every minute
0100 = Every 10 minutes
0101 = Every hour
0110 = Once a day
0111 = Once a week
1000 = Once a month
1001 = Once a year (except when configured for February 29, once every four years)
1010 = Reserved
1011 = Reserved
11xx = Reserved

Note 1: Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.

Note 2: This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.

Note: This register is reset only on a Power-on Reset (POR).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 25-2: RTCALRM: REAL-TIME CLOCK ALARM CONTROL REGISTER (CONTINUED)

bit 7-0 **ARPT<7:0>**: Alarm Repeat Counter Value bits⁽²⁾

11111111 = Alarm will trigger 256 times

•
•
•

00000000 = Alarm will trigger one time

The counter decrements on any alarm event. The counter only rolls over from 0x00 to 0xFF if CHIME = 1.

- Note 1:** Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.
- 2:** This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.

| |
|---|
| Note: This register is reset only on a Power-on Reset (POR). |

26.0 CRYPTO ENGINE

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 49. “Crypto Engine (CE) and Random Number Generator (RNG)”** (DS60001246) in the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

The Crypto Engine is intended to accelerate applications that need cryptographic functions. By executing these functions in the hardware module, software overhead is reduced, and actions such as encryption, decryption, and authentication can execute much more quickly.

The Crypto Engine uses an internal descriptor-based DMA for efficient programming of the security association data and packet pointers (allowing scatter/gather data fetching). An intelligent state machine schedules the Crypto Engines based on the protocol selection and packet boundaries. The hardware engines can perform the encryption and authentication in sequence or in parallel.

Key features of the Crypto Engine are:

- Bulk ciphers and hash engines
- Integrated DMA to off-load processing:
 - Buffer descriptor-based
 - Secure association per buffer descriptor
- Some functions can execute in parallel

Bulk ciphers that are handled by the Crypto Engine include:

- AES:
 - 128-bit, 192-bit, and 256-bit key sizes
 - CBC, ECB, CTR, CFB, and OFB modes
- DES/TDES:
 - CBC, ECB, CFB, and OFB modes

Authentication engines that are available through the Crypto Engine include:

- SHA-1
- SHA-256
- MD-5
- AES-GCM
- HMAC operation (for all authentication engines)

The rate of data that can be processed by the Crypto Engine depends on a number of factors, including:

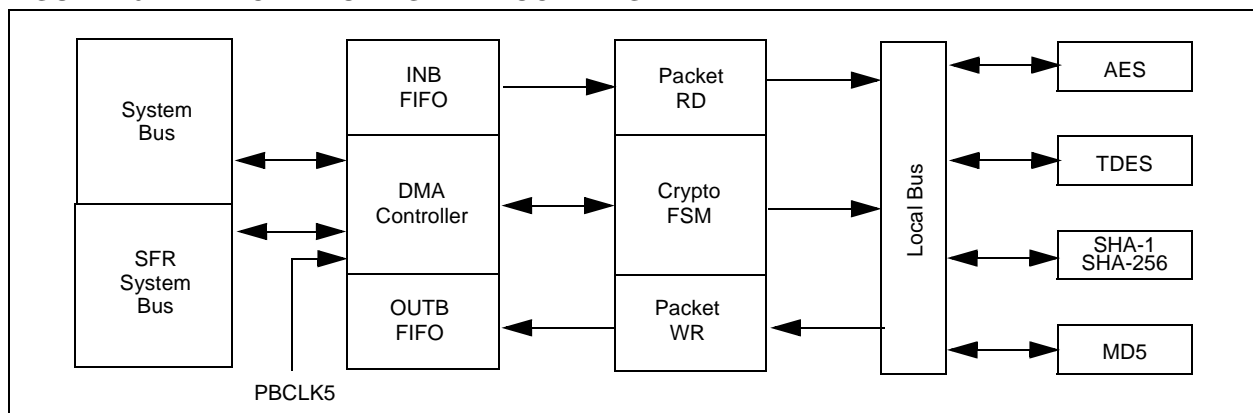

- Which engine is in use
- Whether the engines are used in parallel or in series
- The demands on source and destination memories by other parts of the system (i.e., CPU, DMA, etc.)
- The speed of PBCLK5, which drives the Crypto Engine

Table 26-1 shows typical performance for various engines.

TABLE 26-1: CRYPTO ENGINE PERFORMANCE

| Engine/Algorithm | Performance Factor (Mbps/MHz) | Maximum Mbps (PBCLK5 = 100 MHz) |
|------------------|-------------------------------|---------------------------------|
| DES | 14.4 | 1440 |
| TDES | 6.6 | 660 |
| AES-128 | 9.0 | 900 |
| AES-192 | 7.9 | 790 |
| AES-256 | 7.2 | 720 |
| MD5 | 15.6 | 1560 |
| SHA-1 | 13.2 | 1320 |
| SHA-256 | 9.3 | 930 |

bit 7-0 **TRLRLEN<7:0>**: DMA Trailer Length bits

For every packet, skip this length of locations at the end of the current packet and start putting the next packet.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

26.2 Crypto Engine Buffer Descriptors

Host software creates a linked list of buffer descriptors and the hardware updates them. Table 26-3 provides a list of the Crypto Engine buffer descriptors, followed by format descriptions of each buffer descriptor (see Figure 26-2 through Figure 26-9).

TABLE 26-3: CRYPTO ENGINE BUFFER DESCRIPTORS

| Name (see Note 1) | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 | |
|-------------------|-------------------|--------------------|-------------------|-------------------|-------------------|-------------------|------------------|------------------|------------|
| BD_CTRL | 31:24 | DESC_EN | — | CRY_MODE<2:0> | | | — | — | — |
| | 23:16 | — | SA_FETCH_EN | — | — | LAST_BD | LIFM | PKT_INT_EN | CBD_INT_EN |
| | 15:8 | BD_BUFLEN<15:8> | | | | | | | |
| | 7:0 | BD_BUFLEN<7:0> | | | | | | | |
| BD_SA_ADDR | 31:24 | BD_SAADDR<31:24> | | | | | | | |
| | 23:16 | BD_SAADDR<23:16> | | | | | | | |
| | 15:8 | BD_SAADDR<15:8> | | | | | | | |
| | 7:0 | BD_SAADDR<7:0> | | | | | | | |
| BD_SCRADDR | 31:24 | BD_SRCADDR<31:24> | | | | | | | |
| | 23:16 | BD_SRCADDR<23:16> | | | | | | | |
| | 15:8 | BD_SRCADDR<15:8> | | | | | | | |
| | 7:0 | BD_SRCADDR<7:0> | | | | | | | |
| BD_DSTADDR | 31:24 | BD_DSTADDR<31:24> | | | | | | | |
| | 23:16 | BD_DSTADDR<23:16> | | | | | | | |
| | 15:8 | BD_DSTADDR<15:8> | | | | | | | |
| | 7:0 | BD_DSTADDR<7:0> | | | | | | | |
| BD_NXTPTR | 31:24 | BD_NXTADDR<31:24> | | | | | | | |
| | 23:16 | BD_NXTADDR<23:16> | | | | | | | |
| | 15:8 | BD_NXTADDR<15:8> | | | | | | | |
| | 7:0 | BD_NXTADDR<7:0> | | | | | | | |
| BD_UPDPTR | 31:24 | BD_UPDADDR<31:24> | | | | | | | |
| | 23:16 | BD_UPDADDR<23:16> | | | | | | | |
| | 15:8 | BD_UPDADDR<15:8> | | | | | | | |
| | 7:0 | BD_UPDADDR<7:0> | | | | | | | |
| BD_MSG_LEN | 31:24 | MSG_LENGTH<31:24> | | | | | | | |
| | 23:16 | MSG_LENGTH<23:16> | | | | | | | |
| | 15:8 | MSG_LENGTH<15:8> | | | | | | | |
| | 7:0 | MSG_LENGTH<7:0> | | | | | | | |
| BD_ENC_OFF | 31:24 | ENCR_OFFSET<31:24> | | | | | | | |
| | 23:16 | ENCR_OFFSET<23:16> | | | | | | | |
| | 15:8 | ENCR_OFFSET<15:8> | | | | | | | |
| | 7:0 | ENCR_OFFSET<7:0> | | | | | | | |

Note 1: The buffer descriptor must be allocated in memory on a 64-bit boundary.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

FIGURE 26-2: FORMAT OF BD_CTRL

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|-----------------|----------------|----------------|----------------|----------------|----------------|---------------|---------------|
| 31-24 | DESC_EN | — | CRY_MODE<2:0> | | | — | — | — |
| 23-16 | — | SA_FETCH_EN | — | — | LAST_BD | LIFM | PKT_INT_EN | CBD_INT_EN |
| 15-8 | BD_BUFLEN<15:8> | | | | | | | |
| 7-0 | BD_BUFLEN<7:0> | | | | | | | |

bit 31 **DESC_EN:** Descriptor Enable
1 = The descriptor is owned by hardware. After processing the BD, hardware resets this bit to '0'.
0 = The descriptor is owned by software

bit 30 **Unimplemented:** Must be written as '0'

bit 29-27 **CRY_MODE<2:0>:** Crypto Mode
111 = Reserved
110 = Reserved
101 = Reserved
100 = Reserved
011 = CEK operation
010 = KEK operation
001 = Preboot authentication
000 = Normal operation

bit 22 **SA_FETCH_EN:** Fetch Security Association From External Memory
1 = Fetch SA from the SA pointer. This bit needs to be set to '1' for every new packet.
0 = Use current fetched SA or the internal SA

bit 21-20 **Unimplemented:** Must be written as '0'

bit 19 **LAST_BD:** Last Buffer Descriptors
1 = Last Buffer Descriptor in the chain
0 = More Buffer Descriptors in the chain
After the last BD, the CEBDADDR goes to the base address in CEBDPADDR.

bit 18 **LIFM:** Last In Frame
In case of Receive Packets (from H/W-> Host), this field is filled by the Hardware to indicate whether the packet goes across multiple buffer descriptors. In case of transmit packets (from Host -> H/W), this field indicates whether this BD is the last in the frame.

bit 17 **PKT_INT_EN:** Packet Interrupt Enable
Generate an interrupt after processing the current buffer descriptor, if it is the end of the packet.

bit 16 **CBD_INT_EN:** CBD Interrupt Enable
Generate an interrupt after processing the current buffer descriptor.

bit 15-0 **BD_BUFLEN<15:0>:** Buffer Descriptor Length
This field contains the length of the buffer and is updated with the actual length filled by the receiver.

FIGURE 26-3: FORMAT OF BD_SADDR

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|------------------|----------------|----------------|----------------|----------------|----------------|---------------|---------------|
| 31-24 | BD_SAADDR<31:24> | | | | | | | |
| 23-16 | BD_SAADDR<23:16> | | | | | | | |
| 15-8 | BD_SAADDR<15:8> | | | | | | | |
| 7-0 | BD_SAADDR<7:0> | | | | | | | |

bit 31-0 **BD_SAADDR<31:0>:** Security Association IP Session Address
The sessions' SA pointer has the keys and IV values.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

FIGURE 26-4: FORMAT OF BD_SRCADDR

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|-------------------|----------------|----------------|----------------|----------------|----------------|---------------|---------------|
| 31-24 | BD_SCRADDR<31:24> | | | | | | | |
| 23-16 | BD_SCRADDR<23:16> | | | | | | | |
| 15-8 | BD_SCRADDR<15:8> | | | | | | | |
| 7-0 | BD_SCRADDR<7:0> | | | | | | | |

bit 31-0 **BD_SCRADDR:** Buffer Source Address

The source address of the buffer that needs to be passed through the PE-CRDMA for encryption or authentication. This address must be on a 32-bit boundary.

FIGURE 26-5: FORMAT OF BD_DSTADDR

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|-------------------|----------------|----------------|----------------|----------------|----------------|---------------|---------------|
| 31-24 | BD_DSTADDR<31:24> | | | | | | | |
| 23-16 | BD_DSTADDR<23:16> | | | | | | | |
| 15-8 | BD_DSTADDR<15:8> | | | | | | | |
| 7-0 | BD_DSTADDR<7:0> | | | | | | | |

bit 31-0 **BD_DSTADDR:** Buffer Destination Address

The destination address of the buffer that needs to be passed through the PE-CRDMA for encryption or authentication. This address must be on a 32-bit boundary.

FIGURE 26-6: FORMAT OF BD_NXTADDR

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|-------------------|----------------|----------------|----------------|----------------|----------------|---------------|---------------|
| 31-24 | BD_NXTADDR<31:24> | | | | | | | |
| 23-16 | BD_NXTADDR<23:16> | | | | | | | |
| 15-8 | BD_NXTADDR<15:8> | | | | | | | |
| 7-0 | BD_NXTADDR<7:0> | | | | | | | |

bit 31-0 **BD_NXTADDR:** Next BD Pointer Address Has Next Buffer Descriptor

The next buffer can be a next segment of the previous buffer or a new packet.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

FIGURE 26-7: FORMAT OF BD_UPDPTR

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|-------------------|----------------|----------------|----------------|----------------|----------------|---------------|---------------|
| 31-24 | BD_UPDADDR<31:24> | | | | | | | |
| 23-16 | BD_UPDADDR<23:16> | | | | | | | |
| 15-8 | BD_UPDADDR<15:8> | | | | | | | |
| 7-0 | BD_UPDADDR<7:0> | | | | | | | |

bit 31-0 **BD_UPDADDR:** UPD Address Location
 The update address has the location where the CRDMA results are posted. The updated results are the ICV values, key output values as needed.

FIGURE 26-8: FORMAT OF BD_MSG_LEN

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|-------------------|----------------|----------------|----------------|----------------|----------------|---------------|---------------|
| 31-24 | MSG_LENGTH<31:24> | | | | | | | |
| 23-16 | MSG_LENGTH<23:16> | | | | | | | |
| 15-8 | MSG_LENGTH<15:8> | | | | | | | |
| 7-0 | MSG_LENGTH<7:0> | | | | | | | |

bit 31-0 **MSG_LENGTH:** Total Message Length
 Total message length for the hash and HMAC algorithms in bytes. Total number of crypto bytes in case of GCM algorithm (LEN-C).

FIGURE 26-9: FORMAT OF BD_ENC_OFF

| Bit Range | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |
|-----------|--------------------|----------------|----------------|----------------|----------------|----------------|---------------|---------------|
| 31-24 | ENCR_OFFSET<31:24> | | | | | | | |
| 23-16 | ENCR_OFFSET<23:16> | | | | | | | |
| 15-8 | ENCR_OFFSET<15:8> | | | | | | | |
| 7-0 | ENCR_OFFSET<7:0> | | | | | | | |

bit 31-0 **ENCR_OFFSET:** Encryption Offset
 Encryption offset for the multi-task test cases (both encryption and authentication). The number of AAD bytes in the case of GCM algorithm (LEN-A).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

26.3 Security Association Structure

Table 26-4 shows the Security Association Structure.

The Crypto Engine uses the Security Association to determine the settings for processing a Buffer Descriptor Processor. The Security Association contains:

- Which algorithm to use
- Whether to use engines in parallel (for both authentication and encryption/decryption)
- The size of the key
- Authentication key
- Encryption/decryption key
- Authentication Initialization Vector (IV)
- Encryption IV

TABLE 26-4: CRYPTO ENGINE SECURITY ASSOCIATION STRUCTURE

| Name | Bit 31/23/15/7 | Bit 30/22/14/6 | Bit 29/21/13/5 | Bit 28/20/12/4 | Bit 27/19/11/3 | Bit 26/18/10/2 | Bit 25/17/9/1 | Bit 24/16/8/0 |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

Figure 26-10 shows the Security Association control word structure.

The Crypto Engine fetches different structures for different flows and ensures that hardware fetches minimum words from SA required for processing. The structure is ready for hardware optimal data fetches.

bit 31-30 **Reserved:** Do not use

bit 29 **VERIFY:** NIST Procedure Verification Setting
1 = NIST procedures are to be used
0 = Do not use NIST procedures

bit 28 **Reserved:** Do not use

bit 27 **NO_RX:** Receive DMA Control Setting
1 = Only calculate ICV for authentication calculations
0 = Normal processing

bit 26 **OR_EN:** OR Register Bits Enable Setting
1 = OR the register bits with the internal value of the CSR register
0 = Normal processing

bit 25 **ICVONLY:** Incomplete Check Value Only Flag
This affects the SHA-1 algorithm only. It has no effect on the AES algorithm.
1 = Only three words of the HMAC result are available
0 = All results from the HMAC result are available

bit 24 **IRFLAG:** Immediate Result of Hash Setting
This bit is set when the immediate result for hashing is requested.
1 = Save the immediate result for hashing
0 = Do not save the immediate result

bit 23 **LNC:** Load New Keys Setting
1 = Load a new set of keys for encryption and authentication
0 = Do not load new keys

bit 22 **LOADIV:** Load IV Setting
1 = Load the IV from this Security Association
0 = Use the next IV

bit 21 **FB:** First Block Setting
This bit indicates that this is the first block of data to feed the IV value.
1 = Indicates this is the first block of data
0 = Indicates this is not the first block of data

bit 20 **FLAGS:** Incoming/Outgoing Flow Setting
1 = Security Association is associated with an outgoing flow
0 = Security Association is associated with an incoming flow

bit 19-17 **Reserved:** Do not use

| bit 6-4 | MULTITASK<2:0> : How to Combine Parallel Operations in the Crypto Engine 111 = Parallel pass (decrypt and authenticate incoming data in parallel) 101 = Pipe pass (encrypt the incoming data, and then perform authentication on the encrypted data) 011 = Reserved 010 = Reserved 001 = Reserved 000 = Encryption or authentication or decryption (no pass) |
| bit 3-0 | CRYPTOALGO<3:0> : Mode of operation for the Crypto Algorithm 1111 = Reserved 1110 = AES_GCM (for AES processing) 1101 = RCTR (for AES processing) 1100 = RCBC_MAC (for AES processing) 1011 = ROFB (for AES processing) 1010 = RCFB (for AES processing) 1001 = RCBC (for AES processing) 1000 = REBC (for AES processing) 0111 = TOFB (for Triple-DES processing) 0110 = TCFB (for Triple-DES processing) 0101 = TCBC (for Triple-DES processing) 0100 = TECB (for Triple-DES processing) 0011 = OFB (for DES processing) 0010 = CFB (for DES processing) 0001 = CBC (for DES processing) 0000 = ECB (for DES processing) |

Note 1: This setting does not alter the size of SA_AUTHKEYx or SA_ENCKEYx in the Security Association, only the number of bits of SA_AUTHKEYx and SA_ENCKEYx that are used.

27.0 RANDOM NUMBER GENERATOR (RNG)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 49. “Crypto Engine (CE) and Random Number Generator (RNG)”** (DS60001246) in the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

The Random Number Generator (RNG) core implements a thermal noise-based, True Random Number Generator (TRNG) and a cryptographically secure Pseudo-Random Number Generator (PRNG).

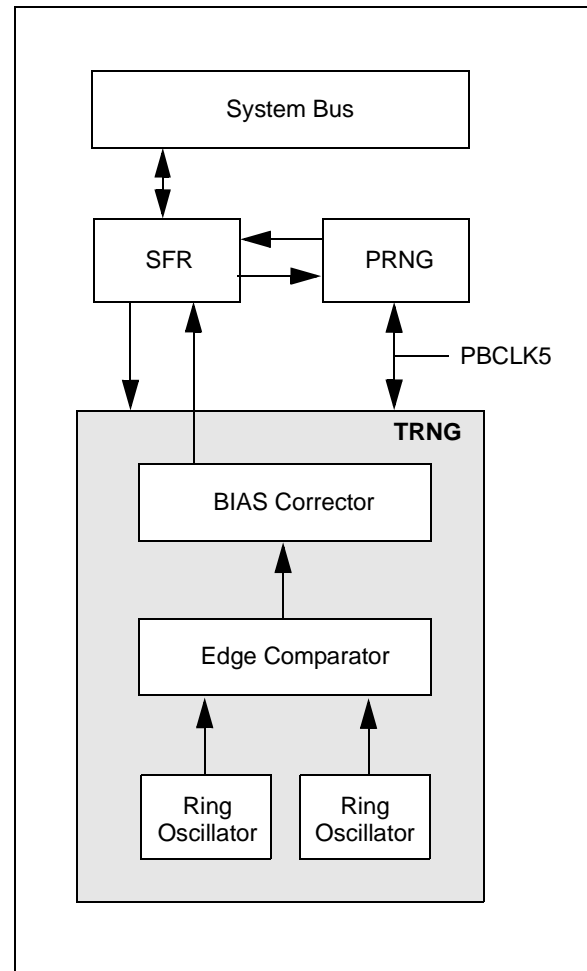

The TRNG uses multiple ring oscillators and the inherent thermal noise of integrated circuits to generate true random numbers that can initialize the PRNG.

The PRNG is a flexible LSFR, which is capable of manifesting a maximal length LFSR of up to 64-bits.

The following are some of the key features of the Random Number Generator:

- TRNG:
 - Up to 25 Mbps of random bits
 - Multi-Ring Oscillator based design
 - Built-in Bias Corrector
- PRNG:
 - LSFR-based
 - Up to 64-bit polynomial length
 - Programmable polynomial
 - TRNG can be seed value

28.0 12-BIT HIGH-SPEED SUCCESSIVE APPROXIMATION REGISTER (SAR) ANALOG-TO-DIGITAL CONVERTER (ADC)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 22. “12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)”** (DS60001344) in the “*PIC32 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com/PIC32).

The 12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC) includes the following features:

- 12-bit resolution
- Six ADC modules with dedicated Sample and Hold (S&H) circuits
- Two dedicated ADC modules can be combined in Turbo mode to provide double conversion rate (clock sources for combined ADC modules must be synchronous)
- Single-ended and/or differential inputs
- Can operate during Sleep mode
- Supports touch sense applications
- Six digital comparators
- Six digital filters supporting two modes:
 - Oversampling mode
 - Averaging mode
- Early interrupt generation resulting in faster processing of converted data
- Designed for motor control, power conversion, and general purpose applications

A simplified block diagram of the ADC module is illustrated in [Figure 28-1](#).

The 12-bit HS SAR ADC has up to five dedicated ADC modules (ADC0-ADC4) and one shared ADC module (ADC7). The dedicated ADC modules use a single input (or its alternate) and are intended for high-speed and precise sampling of time-sensitive or transient inputs. The shared ADC module incorporates a multiplexer on the input to facilitate a larger group of inputs, with slower sampling, and provides flexible automated scanning option through the input scan logic.

For each ADC module, the analog inputs are connected to the S&H capacitor. The clock, sampling time, and output data resolution for each ADC module can be set independently. The ADC module performs the conversion of the input analog signal based on the configurations set in the registers. When conversion is complete, the final result is stored in the result buffer for the specific analog input and is passed to the digital filter and digital comparator if configured to use data from this particular sample. Input to ADCx mapping is illustrated in [Figure 28-2](#).

bit 31 **TRBEN:** Turbo Channel Enable bit

- 1 = Enable the Turbo channel
- 0 = Disable the Turbo channel

bit 30 **TRBERR:** Turbo Channel Error Status bit

- 1 = An error occurred while setting the Turbo channel and Turbo channel function to be disabled regardless of the TRBEN bit being set to '1'.
- 0 = Turbo channel error did not occur

Note: The status of this bit is valid only after the TRBEN bit is set.

bit 29-27 **TRBMST<2:0>:** Turbo Master ADCx bits

- 111 = Reserved
- 110 = ADC4 is selected as the Turbo Master
-
-
- 000 = ADC0 is selected as the Turbo Master

bit 26-24 **TRBSLV<2:0>:** Turbo Slave ADCx bits

- 111 = Reserved
- 110 = ADC4 is selected as the Turbo Slave
-
-
- 000 = ADC0 is selected as the Turbo Slave

bit 23 **FRACT:** Fractional Data Output Format bit

- 1 = Fractional
- 0 = Integer

bit 22-21 **SELRES<1:0>:** Shared ADC (ADC7) Resolution bits

- 11 = 12 bits (default)
- 10 = 10 bits
- 01 = 8 bits
- 00 = 6 bits

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 28-1: ADCCON1: ADC CONTROL REGISTER 1 (CONTINUED)

bit 20-16 **STRGSRC<4:0>**: Scan Trigger Source Select bits

11111 = Reserved

•
•
•

01101 = Reserved

01100 = Comparator 2 (COUT)

01011 = Comparator 1 (COUT)

01010 = OCMP5

01001 = OCMP3

01000 = OCMP1

00111 = TMR5 match

00110 = TMR3 match

00101 = TMR1 match

00100 = INT0 External interrupt

00011 = Reserved

00010 = Global level software trigger (GLSWTRG)

00001 = Global software edge trigger (GSWTRG)

00000 = No Trigger

bit 15 **ON**: ADC Module Enable bit

1 = ADC module is enabled

0 = ADC module is disabled

Note: The ON bit should be set only after the ADC module has been configured.

bit 14 **Unimplemented**: Read as '0'

bit 13 **SIDL**: Stop in Idle Mode bit

1 = Discontinue module operation when device enters Idle mode

0 = Continue module operation in Idle mode

bit 12 **Reserved**: Read as '1'; must be written as '1'.

bit 11 **CVDEN**: Capacitive Voltage Division Enable bit

1 = CVD operation is enabled

0 = CVD operation is disabled

bit 10 **FSSCLKEN**: Fast Synchronous System Clock to ADC Control Clock bit

1 = Fast synchronous system clock to ADC control clock is enabled

0 = Fast synchronous system clock to ADC control clock is disabled

bit 9 **FSPBCLKEN**: Fast Synchronous Peripheral Clock to ADC Control Clock bit

1 = Fast synchronous peripheral clock to ADC control clock is enabled

0 = Fast synchronous peripheral clock to ADC control clock is disabled

bit 8-7 **Unimplemented**: Read as '0'

bit 6-4 **IRQVS<2:0>**: Interrupt Vector Shift bits

To determine interrupt vector address, this bit specifies the amount of left shift done to the ARDYx status bits in the ADCDSTAT1 and ADCDSTAT2 registers, prior to adding with the ADCBASE register.

Interrupt Vector Address = Read Value of ADCBASE and Read Value of ADCBASE = Value written to ADCBASE + x << IRQVS<2:0>, where 'x' is the smallest active input ID from the ADCDSTAT1 or ADCDSTAT2 registers (which has highest priority).

111 = Shift x left 7 bit position

110 = Shift x left 6 bit position

101 = Shift x left 5 bit position

100 = Shift x left 4 bit position

011 = Shift x left 3 bit position

010 = Shift x left 2 bit position

001 = Shift x left 1 bit position

000 = Shift x left 0 bit position

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 28-1: ADCCON1: ADC CONTROL REGISTER 1 (CONTINUED)

- bit 3 **STRGLVL:** Scan Trigger High Level/Positive Edge Sensitivity bit
 1 = Scan trigger is high level sensitive. Once STRIG mode is selected (TRGSRCx<4:0> in the ADCTRGx register), the scan trigger will continue for all selected analog inputs, until the STRIG option is removed.
 0 = Scan trigger is positive edge sensitive. Once STRIG mode is selected (TRGSRCx<4:0> in the ADCTRGx register), only a single scan trigger will be generated, which will complete the scan of all selected analog inputs.
- bit 2-0 **Unimplemented:** Read as '0'

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 28-2: ADCCON2: ADC CONTROL REGISTER 2

| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

- bit 31 **BGVRDY:** Band Gap Voltage/ADC Reference Voltage Status bit
 1 = Both band gap voltage and ADC reference voltages (VREF) are ready
 0 = Either or both band gap voltage and ADC reference voltages (VREF) are not ready
 Data processing is valid only after BGVRDY is set by hardware, so the application code must check that the BGVRDY bit is set to ensure data validity. This bit set to '0' when ON (ADCCON1<15>) = 0.
- bit 30 **REFFLT:** Band Gap/VREF/AVDD BOR Fault Status bit
 1 = Fault in band gap or the VREF voltage while the ON bit (ADCCON1<15>) was set. Most likely a band gap or VREF fault will be caused by a BOR of the analog VDD supply.
 0 = Band gap and VREF voltage are working properly
 This bit is cleared when the ON bit (ADCCON1<15>) = 0 and the BGVRDY bit = 1.
- bit 29 **EOSRDY:** End of Scan Interrupt Status bit
 1 = All analog inputs are considered for scanning through the scan trigger (all analog inputs specified in the ADCCSS1 and ADCCSS2 registers) have completed scanning
 0 = Scanning has not completed
 This bit is cleared when ADCCON2<31:24> are read in software.
- bit 28-26 **CVDCPL<2:0>:** Capacitor Voltage Divider (CVD) Setting bit
 111 = 7 * 2.5 pF = 17.5 pF
 110 = 6 * 2.5 pF = 15 pF
 101 = 5 * 2.5 pF = 12.5 pF
 100 = 4 * 2.5 pF = 10 pF
 011 = 3 * 2.5 pF = 7.5 pF
 010 = 2 * 2.5 pF = 5 pF
 001 = 1 * 2.5 pF = 2.5 pF
 000 = 0 * 2.5 pF = 0 pF
- bit 25-16 **SAMC<9:0>:** Sample Time for the Shared ADC (ADC7) bits
 1111111111 = 1025 TAD7
 •
 •
 •
 0000000001 = 3 TAD7
 0000000000 = 2 TAD7
 Where TAD7 = period of the ADC conversion clock for the Shared ADC (ADC7) controlled by the ADCDIV<6:0> bits.
- bit 15 **BGVRIEN:** Band Gap/VREF Voltage Ready Interrupt Enable bit
 1 = Interrupt will be generated when the BGVRDY bit is set
 0 = No interrupt is generated when the BGVRDY bit is set

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 28-2: ADCCON2: ADC CONTROL REGISTER 2 (CONTINUED)

- bit 14 **REFFLTIEN:** Band Gap/VREF Voltage Fault Interrupt Enable bit
1 = Interrupt will be generated when the REFFLT bit is set
0 = No interrupt is generated when the REFFLT bit is set
- bit 13 **EOSIEN:** End of Scan Interrupt Enable bit
1 = Interrupt will be generated when EOSRDY bit is set
0 = No interrupt is generated when the EOSRDY bit is set
- bit 12 **ADCEIOVR:** Early Interrupt Request Override bit
1 = Early interrupt generation is not overridden and interrupt generation is controlled by the ADCEIEN1 and ADCEIEN2 registers
0 = Early interrupt generation is overridden and interrupt generation is controlled by the ADCGIRQEN1 and ADCGIRQEN2 registers
- bit 11 **Unimplemented:** Read as '0'
- bit 10-8 **ADCEIS<2:0>:** Shared ADC (ADC7) Early Interrupt Select bits
These bits select the number of clocks (T_{AD7}) prior to the arrival of valid data that the associated interrupt is generated.
111 = The data ready interrupt is generated 8 ADC clocks prior to end of conversion
110 = The data ready interrupt is generated 7 ADC clocks prior to end of conversion
•
•
•
001 = The data ready interrupt is generated 2 ADC module clocks prior to end of conversion
000 = The data ready interrupt is generated 1 ADC module clock prior to end of conversion
Note: All options are available when the selected resolution, set by the SELRES<1:0> bits (ADCCON1<22:21>), is 12-bit or 10-bit. For a selected resolution of 8-bit, options from '000' to '101' are valid. For a selected resolution of 6-bit, options from '000' to '011' are valid.
- bit 7 **Unimplemented:** Read as '0'
- bit 6-0 **ADCDIV<6:0>:** Shared ADC (ADC7) Clock Divider bits
11111111 = $254 * T_Q = T_{AD7}$
•
•
•
00000111 = $6 * T_Q = T_{AD7}$
00000110 = $4 * T_Q = T_{AD7}$
00000011 = $2 * T_Q = T_{AD7}$
00000000 = Reserved
The ADCDIV<6:0> bits divide the ADC control clock (T_Q) to generate the clock for the Shared ADC, ADC7 (T_{AD7}).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

- .
- .
- .
- 000011 = 4 * TCLK = Tq
- 000010 = 3 * TCLK = Tq
- 000001 = 2 * TCLK = Tq
- 000000 = TCLK = Tq

bit 23 **DIGEN7**: Shared ADC (ADC7) Digital Enable bit

- 1 = ADC7 is digital enabled
- 0 = ADC7 is digital disabled

bit 22-21 **Unimplemented**: Read as '0'

bit 20 **DIGEN4**: ADC4 Digital Enable bit

- 1 = ADC4 is digital enabled
- 0 = ADC4 is digital disabled

bit 19 **DIGEN3**: ADC3 Digital Enable bit

- 1 = ADC3 is digital enabled
- 0 = ADC3 is digital disabled

Note 1: The SAMP bit has the highest priority and setting this bit will keep the S&H circuit in Sample mode until the bit is cleared. Also, usage of the SAMP bit will cause settings of SAMC<9:0> bits (ADCCON2<25:16>) to be ignored.

- 2: The SAMP bit only connects Class 2 and Class 3 analog inputs to the shared ADC, ADC7. All Class 1 analog inputs are not affected by the SAMP bit.
- 3: The SAMP bit is not a self-clearing bit and it is the responsibility of application software to first clear this bit and only after setting the RQCNVRT bit to start the analog-to-digital conversion.
- 4: Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRCx<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 28-3: ADCCON3: ADC CONTROL REGISTER 3 (CONTINUED)

bit 18 **DIGEN2:** ADC2 Digital Enable bit
 1 = ADC2 is digital enabled
 0 = ADC2 is digital disabled

bit 17 **DIGEN1:** ADC1 Digital Enable bit
 1 = ADC1 is digital enabled
 0 = ADC1 is digital disabled

bit 16 **DIGEN0:** ADC0 Digital Enable bit
 1 = ADC0 is digital enabled
 0 = ADC0 is digital disabled

bit 15-13 **VREFSEL<2:0>:** Voltage Reference (VREF) Input Selection bits

| VREFSEL<2:0> | ADREF+ | ADREF- |
|--------------|----------------------|----------------|
| 1xx | Reserved; do not use | |
| 011 | External VREFH | External VREFL |
| 010 | AVDD | External VREFL |
| 001 | External VREFH | AVss |
| 000 | AVDD | AVss |

bit 12 **TRGSUSP:** Trigger Suspend bit
 1 = Triggers are blocked from starting a new analog-to-digital conversion, but the ADC module is not disabled
 0 = Triggers are not blocked

bit 11 **UPDIEN:** Update Ready Interrupt Enable bit
 1 = Interrupt will be generated when the UPDRDY bit is set by hardware
 0 = No interrupt is generated

bit 10 **UPDRDY:** ADC Update Ready Status bit
 1 = ADC SFRs can be updated
 0 = ADC SFRs cannot be updated

Note: This bit is only active while the TRGSUSP bit is set and there are no more running conversions of any ADC modules.

bit 9 **SAMP:** Class 2 and Class 3 Analog Input Sampling Enable bit^(1,2,3,4)
 1 = The ADC S&H amplifier is sampling
 0 = The ADC S&H amplifier is holding

bit 8 **RQCNVRT:** Individual ADC Input Conversion Request bit
 This bit and its associated ADINSEL<5:0> bits enable the user to individually request an analog-to-digital conversion of an analog input through software.
 1 = Trigger the conversion of the selected ADC input as specified by the ADINSEL<5:0> bits
 0 = Do not trigger the conversion

Note: This bit is automatically cleared in the next ADC clock cycle.

bit 7 **GLSWTRG:** Global Level Software Trigger bit
 1 = Trigger conversion for ADC inputs that have selected the GLSWTRG bit as the trigger signal, either through the associated TRGSRC<4:0> bits in the ADCTRGx registers or through the STRGSRC<4:0> bits in the ADCCON1 register
 0 = Do not trigger an analog-to-digital conversion

Note 1: The SAMP bit has the highest priority and setting this bit will keep the S&H circuit in Sample mode until the bit is cleared. Also, usage of the SAMP bit will cause settings of SAMC<9:0> bits (ADCCON2<25:16>) to be ignored.

2: The SAMP bit only connects Class 2 and Class 3 analog inputs to the shared ADC, ADC7. All Class 1 analog inputs are not affected by the SAMP bit.

3: The SAMP bit is not a self-clearing bit and it is the responsibility of application software to first clear this bit and only after setting the RQCNVRT bit to start the analog-to-digital conversion.

4: Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRCx<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 28-3: ADCCON3: ADC CONTROL REGISTER 3 (CONTINUED)

bit 6 **GSWTRG**: Global Software Trigger bit

1 = Trigger conversion for ADC inputs that have selected the GSWTRG bit as the trigger signal, either through the associated TRGSRC<4:0> bits in the ADCTR_x registers or through the STRGSRC<4:0> bits in the ADCCON1 register

0 = Do not trigger an analog-to-digital conversion

Note: This bit is automatically cleared in the next ADC clock cycle.

bit 5-0 **ADINSEL<5:0>**: Analog Input Select bits

These bits select the analog input to be converted when the RQCNVRT bit is set. As a general rule:

111111 = Reserved

•
•
•

101101 = Reserved

101100 = MAX_AN_INPUT + 2 = IVTEMP

101011 = MAX_AN_INPUT + 1 = IVREF

101010 = MAX_AN_INPUT = AN[MAX_AN_INPUT]

•
•
•

000001 = AN1

000000 = AN0

- Note 1:** The SAMP bit has the highest priority and setting this bit will keep the S&H circuit in Sample mode until the bit is cleared. Also, usage of the SAMP bit will cause settings of SAMC<9:0> bits (ADCCON2<25:16>) to be ignored.
- 2: The SAMP bit only connects Class 2 and Class 3 analog inputs to the shared ADC, ADC7. All Class 1 analog inputs are not affected by the SAMP bit.
 - 3: The SAMP bit is not a self-clearing bit and it is the responsibility of application software to first clear this bit and only after setting the RQCNVRT bit to start the analog-to-digital conversion.
 - 4: Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRC_x<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-0 **CSS31:CSS0**: Analog Common Scan Select bits

1 = Select ANx for input scan

0 = Skip ANx for input scan

Note 1: This bit is not available on 64-pin devices.

Note 1: In addition to setting the appropriate bits in this register, Class 1 and Class 2 analog inputs must select the STRIG input as the trigger source if they are to be scanned through the CSSx bits. Refer to the bit descriptions in the ADCTRGx registers for selecting the STRIG option.

2: If a Class 1 or Class 2 input is included in the scan by setting the CSSx bit to '1' and by setting the TRGSRCx<4:0> bits to STRIG mode (0b11), the user application must ensure that no other triggers are generated for that input using the RQCNVRT bit in the ADCCON3 register or the hardware input or any digital filter. Otherwise, the scan behavior is unpredictable.

bit 31-0 **CMPE31:CMPE0**: ADC Digital Comparator 'x' Enable bits

These bits enable conversion results corresponding to the Analog Input to be processed by the Digital Comparator. CMPE0 enables AN0, CMPE1 enables AN1, and so on.

Note 1: This bit is not available on 64-pin devices.

Note 1: CMPE_x = AN_x, where 'x' = 0-31 (Digital Comparator inputs are limited to AN0 through AN31).
Note 2: Changing the bits in this register while the Digital Comparator is enabled (ENDCMP = 1) can result in unpredictable behavior.

bit 31-16 **DCMPHI<15:0>**: Digital Comparator 'x' High Limit Value bits^(1,2,3)

These bits store the high limit value, which is used by digital comparator for comparisons with ADC converted data.

bit 15-0 **DCMPLO<15:0>**: Digital Comparator 'x' Low Limit Value bits^(1,2,3)

These bits store the low limit value, which is used by digital comparator for comparisons with ADC converted data.

- Note 1:** Changing these bits while the Digital Comparator is enabled (ENDCMP = 1) can result in unpredictable behavior.
- 2:** The format of the limit values should match the format of the ADC converted value in terms of sign and fractional settings.
- 3:** For Digital Comparator 0 used in CVD mode, the DCMPHI<15:0> and DCMPLO<15:0> bits must always be specified in signed format, as the CVD output data is differential and is always signed.

0 = Digital filter is disabled and the AFRDY status bit is cleared
- bit 30 **DATA16EN:** Filter Significant Data Length bit
1 = All 16 bits of the filter output data are significant
0 = Only the first 12 bits are significant, followed by four zeros
Note: This bit is significant only if DFMODE = 1 (Averaging Mode) and FRACT (ADCCON1<23>) = 1 (Fractional Output Mode).
- bit **DFMODE:** ADC Filter Mode bit
1 = Filter 'x' works in Averaging mode
0 = Filter 'x' works in Oversampling Filter mode (default)
- bit 28-26 **OVRSAM<2:0>:** Oversampling Filter Ratio bits
If DFMODE is '0':
111 = 128 samples (shift sum 3 bits to right, output data is in 15.1 format)
110 = 32 samples (shift sum 2 bits to right, output data is in 14.1 format)
101 = 8 samples (shift sum 1 bit to right, output data is in 13.1 format)
100 = 2 samples (shift sum 0 bits to right, output data is in 12.1 format)
011 = 256 samples (shift sum 4 bits to right, output data is 16 bits)
010 = 64 samples (shift sum 3 bits to right, output data is 15 bits)
001 = 16 samples (shift sum 2 bits to right, output data is 14 bits)
000 = 4 samples (shift sum 1 bit to right, output data is 13 bits)
- If DFMODE is '1':
111 = 256 samples (256 samples to be averaged)
110 = 128 samples (128 samples to be averaged)
101 = 64 samples (64 samples to be averaged)
100 = 32 samples (32 samples to be averaged)
011 = 16 samples (16 samples to be averaged)
010 = 8 samples (8 samples to be averaged)
001 = 4 samples (4 samples to be averaged)
000 = 2 samples (2 samples to be averaged)
- bit 25 **AFGIEN:** Digital Filter 'x' Interrupt Enable bit
1 = Digital filter interrupt is enabled and is generated by the AFRDY status bit
0 = Digital filter is disabled

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 28-16: ADCFLTRx: ADC DIGITAL FILTER 'x' REGISTER ('x' = 1 THROUGH 6)

bit 24 **AFRDY**: Digital Filter 'x' Data Ready Status bit
1 = Data is ready in the FLTRDATA<15:0> bits
0 = Data is not ready

Note: This bit is cleared by reading the FLTRDATA<15:0> bits or by disabling the Digital Filter module (by setting AFEN to '0').

bit 23-21 **Unimplemented**: Read as '0'

bit 20-16 **CHNLID<4:0>**: Digital Filter Analog Input Selection bits
These bits specify the analog input to be used as the oversampling filter data source.
11111 = AN31
•
•
•
00010 = AN2
00001 = AN1
00000 = AN0

Note: Only the first 32 analog inputs (Class 1 and Class 2) can use a digital filter.

bit 15-0 **FLTRDATA<15:0>**: Digital Filter 'x' Data Output Value bits
The filter output data is as per the fractional format set in the FRACT (ADCCON1<23>) bit. The FRACT bit should not be changed while the filter is enabled. Changing the state of the FRACT bit after the operation of the filter ended will not update the value of FLTRDATA<15:0> to reflect the new format.

- bit 31 **FEN:** FIFO Enable bit
1 = FIFO is enabled
0 = FIFO is disabled; no data is being saved into the FIFO
- bit 30-29 **Unimplemented:** Read as '0'
- bit 28-24 **ADC4EN:ADC0EN:** ADCx Enable bits ('x' = 0 through 4)
1 = Converted output data of ADCx is stored in the FIFO
0 = Converted output data of ADCx is not stored in the FIFO
Note: While using FIFO, the output data is additionally stored in the respective output data register (ADCDATAx).
- bit 23 **FIEN:** FIFO Interrupt Enable bit
1 = FIFO interrupts are enabled; an interrupt is generated once the FRDY bit is set
0 = FIFO interrupts are disabled
- bit 22 **FRDY:** FIFO Data Ready Interrupt Status bit
1 = FIFO has data to be read
0 = No data is available in the FIFO
Note: This bit is cleared when the FIFO output data in ADCFIFO has been read and there is no additional data ready in the FIFO (that is, the FIFO is empty).
- bit 21 **FWROVERR:** FIFO Write Overflow Error Status bit
1 = A write overflow error in the FIFO has occurred (circular FIFO)
0 = A write overflow error in the FIFO has not occurred
Note: This bit is cleared after ADCFSTAT<23:16> are read by software.
- bit 15-8 **FCNT<7:0>:** FIFO Data Entry Count Status bit
The value in these bits indicates the number of data entries in the FIFO.
- bit 7 **FSIGN:** FIFO Sign Setting bit
This bit reflects the sign of data stored in the ADCFIFO register.
- bit 6-3 **Unimplemented:** Read as '0'
- bit 2-0 **ADCID<2:0>:** ADCx Identifier bits ('x' = 0 through 6)
These bits specify the ADC module whose data is stored in the FIFO.
111 = Reserved
110 = Converted data of ADC6 is stored in FIFO
•
•
•
000 = Converted data of ADC0 is stored in FIFO

bit 31-0 **Unimplemented:** Read as '0'

bit 15-0 **ADCBASE<15:0>:** ADC ISR Base Address bits

This register, when read, contains the base address of the user's ADC ISR jump table. The interrupt vector address is determined by the IRQVS<2:0> bits of the ADCCON1 register specifying the amount of left shift done to the ARDYx status bits in the ADCDSTAT1 and ADCDSTAT2 registers, prior to adding with ADCBASE register.

Interrupt Vector Address = Read Value of ADCBASE and Read Value of ADCBASE = Value written to ADCBASE + x << IRQVS<2:0>, where 'x' is the smallest active analog input ID from the ADCDSTAT1 or ADCDSTAT2 registers (which has highest priority).

| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared x = Bit is unknown |

bit 31-13 **Unimplemented:** Read as '0'

bit 31-0 **EIRDY44:EIRDY32:** Early Interrupt for Corresponding Analog Input Ready bits

1 = This bit is set when the early interrupt event occurs for the specified analog input. An interrupt will be generated if early interrupts are enabled in the ADCEIEN2 register. For the Class 1 analog inputs, this bit will set as per the configuration of the ADCEIS<2:0> bits in the ADCxTIME register. For the shared ADC module, this bit will be set as per the configuration of the ADCEIS<2:0> bits in the ADCCON2 register.

0 = Interrupts are disabled

Note 1: This bit is not available on 64-pin devices.

2: This bit is not available on 64-pin and 100-pin devices.

bit 31-13 **Unimplemented:** Read as '0'

bit 12-0 **AN<44:32>**: ADC Analog Input bits

These bits reflect the system configuration and are updated during boot-up time. By reading these read-only bits, the user application can determine whether or not an analog input in the device is available.

AN<63:32>: Reflects the presence or absence of the respective analog input (AN63-AN32).

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

29.0 CONTROLLER AREA NETWORK (CAN)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 34. "Controller Area Network (CAN)"** (DS60001154) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Controller Area Network (CAN) module supports the following key features:

- Standards Compliance:
 - Full CAN 2.0B compliance
 - Programmable bit rate up to 1 Mbps
- Message Reception and Transmission:
 - 32 message FIFOs
 - Each FIFO can have up to 32 messages for a total of 1024 messages

- FIFO can be a transmit message FIFO or a receive message FIFO
- User-defined priority levels for message FIFOs used for transmission
- 32 acceptance filters for message filtering
- Four acceptance filter mask registers for message filtering
- Automatic response to remote transmit request
- DeviceNet™ addressing support
- Additional Features:
 - Loopback, Listen All Messages and Listen Only modes for self-test, system diagnostics and bus monitoring
 - Low-power operating modes
 - CAN module is a bus master on the PIC32 System Bus
 - Use of DMA is not required
 - Dedicated time-stamp timer
 - Dedicated DMA channels
 - Data-only Message Reception mode

Figure 29-1 illustrates the general structure of the CAN module.

Legend: HC = Hardware Clear S = Settable bit
R = Readable bit W = Writable bit P = Programmable bit r = Reserved bit
U = Unimplemented bit -n = Bit Value at POR: ('0', '1', x = Unknown)

bit 31-28 **Unimplemented:** Read as '0'

bit 27 **ABAT:** Abort All Pending Transmissions bit
1 = Signal all transmit buffers to abort transmission
0 = Module will clear this bit when all transmissions aborted

bit 26-24 **REQOP<2:0>:** Request Operation Mode bits
111 = Set Listen All Messages mode
110 = Reserved - Do not use
101 = Reserved - Do not use
100 = Set Configuration mode
011 = Set Listen Only mode
010 = Set Loopback mode
001 = Set Disable mode
000 = Set Normal Operation mode

bit 23-21 **OPMOD<2:0>:** Operation Mode Status bits
111 = Module is in Listen All Messages mode
110 = Reserved
101 = Reserved
100 = Module is in Configuration mode
011 = Module is in Listen Only mode
010 = Module is in Loopback mode
001 = Module is in Disable mode
000 = Module is in Normal Operation mode

bit 20 **CANCAP:** CAN Message Receive Time Stamp Timer Capture Enable bit
1 = CANTMR value is stored on valid message reception and is stored with the message
0 = Disable CAN message receive time stamp timer capture and stop CANTMR to conserve power

bit 19-16 **Unimplemented:** Read as '0'

bit 15 **ON:** CAN On bit⁽¹⁾
1 = CAN module is enabled
0 = CAN module is disabled

bit 14 **Unimplemented:** Read as '0'

Note 1: If the user application clears this bit, it may take a number of cycles before the CAN module completes the current transaction and responds to this request. The user application should poll the CANBUSY bit to verify that the request has been honored.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 29-1: CiCON: CAN MODULE CONTROL REGISTER (CONTINUED)

- bit 13 **SIDLE:** CAN Stop in Idle bit
 1 = CAN Stops operation when system enters Idle mode
 0 = CAN continues operation when system enters Idle mode
- bit 12 **Unimplemented:** Read as '0'
- bit 11 **CANBUSY:** CAN Module is Busy bit
 1 = The CAN module is active
 0 = The CAN module is completely disabled
- bit 10-5 **Unimplemented:** Read as '0'
- bit 4-0 **DNCNT<4:0>:** Device Net Filter Bit Number bits
 10011-11111 = Invalid Selection (compare up to 18-bits of data with EID)
 10010 = Compare up to data byte 2 bit 6 with EID17 (CiRXFn<17>)
 •
 •
 •
 00001 = Compare up to data byte 0 bit 7 with EID0 (CiRXFn<0>)
 00000 = Do not compare data bytes

Note 1: If the user application clears this bit, it may take a number of cycles before the CAN module completes the current transaction and responds to this request. The user application should poll the CANBUSY bit to verify that the request has been honored.

 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 31-0 **CiFIFOBA<31:0>**: CAN FIFO Base Address bits

These bits define the base address of all message buffers. Individual message buffers are located based on the size of the previous message buffers. This address is a physical address. Note that bits <1:0> are read-only and read '0', forcing the messages to be 32-bit word-aligned in device RAM.

Note 1: This bit is unimplemented and will always read '0', which forces word-alignment of messages.

Note: This register can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> (CiCON<23:21>) = 100).

bit 4-0 **CiFIFOCIn<4:0>**: CAN Side FIFO Message Index bits

TXEN = 1: (FIFO configured as a Transmit Buffer)

A read of this register will return an index to the message that the FIFO will next attempt to transmit.

TXEN = 0: (FIFO configured as a Receive Buffer)

A read of this register will return an index to the message that the FIFO will use to save the next message.

30.0 ETHERNET CONTROLLER

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 35. “Ethernet Controller”** (DS60001155) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Ethernet controller is a bus master module that interfaces with an off-chip Physical Layer (PHY) to implement a complete Ethernet node in a system.

Key features of the Ethernet Controller include:

- Supports 10/100 Mbps data transfer rates
- Supports full-duplex and half-duplex operation

- Supports RMI and MII PHY interface
- Supports MIIM PHY management interface
- Supports both manual and automatic Flow Control
- RAM descriptor-based DMA operation for both receive and transmit path
- Fully configurable interrupts
- Configurable receive packet filtering
 - CRC check
 - 64-byte pattern match
 - Broadcast, multicast and unicast packets
 - Magic Packet™
 - 64-bit hash table
 - Runt packet
- Supports packet payload checksum calculation
- Supports various hardware statistics counters

Figure 30-1 illustrates a block diagram of the Ethernet controller.

| ECRSDV | Carrier Sense – Receive Data Valid |
| ERXD0 | Receive Data |
| ERXD1 | Receive Data |
| ERXERR | Receive Error |

Note: Ethernet controller pins that are not used by selected interface can be used by other peripherals.

TABLE 30-3: MII MODE ALTERNATE INTERFACE SIGNALS (FMIEN = 1, FETHIO = 0)

| Pin Name | Description |
|----------|----------------------|
| AEMDC | Management Clock |
| AEMDIO | Management I/O |
| AETXCLK | Transmit Clock |
| AETXEN | Transmit Enable |
| AETXD0 | Transmit Data |
| AETXD1 | Transmit Data |
| AETXD2 | Transmit Data |
| AETXD3 | Transmit Data |
| AETXERR | Transmit Error |
| AERXCLK | Receive Clock |
| AERXDV | Receive Data Valid |
| AERXD0 | Receive Data |
| AERXD1 | Receive Data |
| AERXD2 | Receive Data |
| AERXD3 | Receive Data |
| AERXERR | Receive Error |
| AECRS | Carrier Sense |
| AECOL | Collision Indication |

Note: The MII mode Alternate Interface is not available on 64-pin devices.

TABLE 30-4: RMII MODE ALTERNATE INTERFACE SIGNALS (FMIEN = 0, FETHIO = 0)

| Pin Name | Description |
|----------|------------------------------------|
| AEMDC | Management Clock |
| AEMDIO | Management I/O |
| AETXEN | Transmit Enable |
| AETXD0 | Transmit Data |
| AETXD1 | Transmit Data |
| AEREFCLK | Reference Clock |
| AECRSDV | Carrier Sense – Receive Data Valid |
| AERXD0 | Receive Data |
| AERXD1 | Receive Data |
| AERXERR | Receive Error |

30.1 Ethernet Control Registers

| | AUTOFC | — | — | MANFC | — | — | — | BUFCDEC |

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

- bit 31-16 **PTV<15:0>**: PAUSE Timer Value bits
 PAUSE Timer Value used for Flow Control.
 This register should only be written when RXEN (ETHCON1<8>) is not set.
 These bits are only used for Flow Control operations.
- bit 15 **ON**: Ethernet ON bit
 1 = Ethernet module is enabled
 0 = Ethernet module is disabled
- bit 14 **Unimplemented**: Read as '0'
- bit 13 **SIDL**: Ethernet Stop in Idle Mode bit
 1 = Ethernet module transfers are paused during Idle mode
 0 = Ethernet module transfers continue during Idle mode
- bit 12-10 **Unimplemented**: Read as '0'
- bit 9 **TXRTS**: Transmit Request to Send bit
 1 = Activate the TX logic and send the packet(s) defined in the TX EDT
 0 = Stop transmit (when cleared by software) or transmit done (when cleared by hardware)
 After the bit is written with a '1', it will clear to a '0' whenever the transmit logic has finished transmitting the requested packets in the Ethernet Descriptor Table (EDT). If a '0' is written by the CPU, the transmit logic finishes the current packet's transmission and then stops any further.
 This bit only affects TX operations.
- bit 8 **RXEN**: Receive Enable bit⁽¹⁾
 1 = Enable RX logic, packets are received and stored in the RX buffer as controlled by the filter configuration
 0 = Disable RX logic, no packets are received in the RX buffer
 This bit only affects RX operations.

Note 1: It is not recommended to clear the RXEN bit and then make changes to any RX related field/register. The Ethernet Controller must be reinitialized (ON cleared to '0'), and then the RX changes applied.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 30-1: ETHCON1: ETHERNET CONTROLLER CONTROL REGISTER 1 (CONTINUED)

bit 7 **AUTOFC:** Automatic Flow Control bit

1 = Automatic Flow Control enabled
0 = Automatic Flow Control disabled

Setting this bit will enable automatic Flow Control. If set, the full and empty watermarks are used to automatically enable and disable the Flow Control, respectively. When the number of received buffers BUFCNT (ETHSTAT<16:23>) rises to the full watermark, Flow Control is automatically enabled. When the BUFCNT falls to the empty watermark, Flow Control is automatically disabled.

This bit is only used for Flow Control operations and affects both TX and RX operations.

bit 6-5 **Unimplemented:** Read as '0'

bit 4 **MANFC:** Manual Flow Control bit

1 = Manual Flow Control is enabled
0 = Manual Flow Control is disabled

Setting this bit will enable manual Flow Control. If set, the Flow Control logic will send a PAUSE frame using the PAUSE timer value in the PTV register. It will then resend a PAUSE frame every $128 * PTV<15:0>/2$ TX clock cycles until the bit is cleared.

Note: For 10 Mbps operation, TX clock runs at 2.5 MHz. For 100 Mbps operation, TX clock runs at 25 MHz.

When this bit is cleared, the Flow Control logic will automatically send a PAUSE frame with a 0x0000 PAUSE timer value to disable Flow Control.

This bit is only used for Flow Control operations and affects both TX and RX operations.

bit 3-1 **Unimplemented:** Read as '0'

bit 0 **BUFCDEC:** Descriptor Buffer Count Decrement bit

The BUFCDEC bit is a write-1 bit that reads as '0'. When written with a '1', the Descriptor Buffer Counter, BUFCNT, will decrement by one. If BUFCNT is incremented by the RX logic at the same time that this bit is written, the BUFCNT value will remain unchanged. Writing a '0' will have no effect.

This bit is only used for RX operations.

Note 1: It is not recommended to clear the RXEN bit and then make changes to any RX related field/register. The Ethernet Controller must be reinitialized (ON cleared to '0'), and then the RX changes applied.

REGISTER 30-11: ETHRXFC: ETHERNET CONTROLLER RECEIVE FILTER CONFIGURATION REGISTER (CONTINUED)

- bit 7 **CR CERREN:** CRC Error Collection Enable bit
1 = The received packet CRC must be invalid for the packet to be accepted
0 = Disable CRC Error Collection filtering
This bit allows the user to collect all packets that have an invalid CRC.
- bit 6 **CR COKEN:** CRC OK Enable bit
1 = The received packet CRC must be valid for the packet to be accepted
0 = Disable CRC filtering
This bit allows the user to reject all packets that have an invalid CRC.
- bit 5 **RUNTERREN:** Runt Error Collection Enable bit
1 = The received packet must be a runt packet for the packet to be accepted
0 = Disable Runt Error Collection filtering
This bit allows the user to collect all packets that are runt packets. For this filter, a runt packet is defined as any packet with a size of less than 64 bytes (when CR COKEN = 0) or any packet with a size of less than 64 bytes that has a valid CRC (when CR COKEN = 1).
- bit 4 **RUNTEN:** Runt Enable bit
1 = The received packet must not be a runt packet for the packet to be accepted
0 = Disable Runt filtering
This bit allows the user to reject all runt packets. For this filter, a runt packet is defined as any packet with a size of less than 64 bytes.
- bit 3 **UCEN:** Unicast Enable bit
1 = Enable Unicast Filtering
0 = Disable Unicast Filtering
This bit allows the user to accept all unicast packets whose Destination Address matches the Station Address.
- bit 2 **NOTMEEN:** Not Me Unicast Enable bit
1 = Enable Not Me Unicast Filtering
0 = Disable Not Me Unicast Filtering
This bit allows the user to accept all unicast packets whose Destination Address does not match the Station Address.
- bit 1 **MCEN:** Multicast Enable bit
1 = Enable Multicast Filtering
0 = Disable Multicast Filtering
This bit allows the user to accept all Multicast Address packets.
- bit 0 **BCEN:** Broadcast Enable bit
1 = Enable Broadcast Filtering
0 = Disable Broadcast Filtering
This bit allows the user to accept all Broadcast Address packets.

- Note 1:** XOR = True when either one or the other conditions are true, but not both.
Note 2: This Hash Table Filter match is active regardless of the value of the HTEN bit.
Note 3: This Magic Packet Filter match is active regardless of the value of the MPEN bit.

x = Bit is unknown

bit 31-15 **Unimplemented:** Read as '0'

bit 14 **TXBUSE:** Transmit BVCI Bus Error Interrupt bit⁽²⁾

1 = BVCI Bus Error has occurred
0 = BVCI Bus Error has not occurred

This bit is set when the TX DMA encounters a BVCI Bus error during a memory access. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 13 **RXBUSE:** Receive BVCI Bus Error Interrupt bit⁽²⁾

1 = BVCI Bus Error has occurred
0 = BVCI Bus Error has not occurred

This bit is set when the RX DMA encounters a BVCI Bus error during a memory access. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 12-10 **Unimplemented:** Read as '0'

bit 9 **EWMARK:** Empty Watermark Interrupt bit⁽²⁾

1 = Empty Watermark pointer reached
0 = No interrupt pending

This bit is set when the RX Descriptor Buffer Count is less than or equal to the value in the RXEWM bit (ETHRXWM<0:7>) value. It is cleared by BUF CNT bit (ETHSTAT<16:23>) being incremented by hardware. Writing a '0' or a '1' has no effect.

bit 8 **FWMARK:** Full Watermark Interrupt bit⁽²⁾

1 = Full Watermark pointer reached
0 = No interrupt pending

This bit is set when the RX Descriptor Buffer Count is greater than or equal to the value in the RXFWM bit (ETHRXWM<16:23>) field. It is cleared by writing the BUF CDEC (ETHCON1<0>) bit to decrement the BUF CNT counter. Writing a '0' or a '1' has no effect.

Note 1: This bit is only used for TX operations.

Note 2: This bit is are only used for RX operations.

Note: It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 30-14: ETHIRQ: ETHERNET CONTROLLER INTERRUPT REQUEST REGISTER

| | |
|-------|--|
| bit 7 | RXDONE: Receive Done Interrupt bit ⁽²⁾ 1 = RX packet was successfully received 0 = No interrupt pending This bit is set whenever an RX packet is successfully received. It is cleared by either a Reset or CPU write of a '1' to the CLR register. |
| bit 6 | PKTPEND: Packet Pending Interrupt bit ⁽²⁾ 1 = RX packet pending in memory 0 = RX packet is not pending in memory This bit is set when the BUFCNT counter has a value other than '0'. It is cleared by either a Reset or by writing the BUFCDEC bit to decrement the BUFCNT counter. Writing a '0' or a '1' has no effect. |
| bit 5 | RXACT: Receive Activity Interrupt bit ⁽²⁾ 1 = RX packet data was successfully received 0 = No interrupt pending This bit is set whenever RX packet data is stored in the RXBM FIFO. It is cleared by either a Reset or CPU write of a '1' to the CLR register. |
| bit 4 | Unimplemented: Read as '0' |
| bit 3 | TXDONE: Transmit Done Interrupt bit ⁽²⁾ 1 = TX packet was successfully sent 0 = No interrupt pending This bit is set when the currently transmitted TX packet completes transmission, and the Transmit Status Vector is loaded into the first descriptor used for the packet. It is cleared by either a Reset or CPU write of a '1' to the CLR register. |
| bit 2 | TXABORT: Transmit Abort Condition Interrupt bit ⁽²⁾ 1 = TX abort condition occurred on the last TX packet 0 = No interrupt pending This bit is set when the MAC aborts the transmission of a TX packet for one of the following reasons: <ul style="list-style-type: none">• Jumbo TX packet abort• Underrun abort• Excessive defer abort• Late collision abort• Excessive collisions abort This bit is cleared by either a Reset or CPU write of a '1' to the CLR register. |
| bit 1 | RXBUFNA: Receive Buffer Not Available Interrupt bit ⁽²⁾ 1 = RX Buffer Descriptor Not Available condition has occurred 0 = No interrupt pending This bit is set by a RX Buffer Descriptor Overrun condition. It is cleared by either a Reset or a CPU write of a '1' to the CLR register. |
| bit 0 | RXOVFLW: Receive FIFO Over Flow Error bit ⁽²⁾ 1 = RX FIFO Overflow Error condition has occurred 0 = No interrupt pending RXOVFLW is set by the RXBM Logic for an RX FIFO Overflow condition. It is cleared by either a Reset or CPU write of a '1' to the CLR register. |

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23-16 **BUFCNT<7:0>:** Packet Buffer Count bits⁽¹⁾

Number of packet buffers received in memory. Once a packet has been successfully received, this register is incremented by hardware based on the number of descriptors used by the packet. Software decrements the counter (by writing to the BUFCDEC bit (ETHCON1<0>)) for each descriptor used) after a packet has been read out of the buffer. The register does not roll over (0xFF to 0x00) when hardware tries to increment the register and the register is already at 0xFF. Conversely, the register does not roll under (0x00 to 0xFF) when software tries to decrement the register and the register is already at 0x0000. When software attempts to decrement the counter at the same time that the hardware attempts to increment the counter, the counter value will remain unchanged.

When this register value reaches 0xFF, the RX logic will halt (only if automatic Flow Control is enabled) awaiting software to write the BUFCDEC bit in order to decrement the register below 0xFF.

If automatic Flow Control is disabled, the RXDMA will continue processing and the BUFCNT will saturate at a value of 0xFF.

When this register is non-zero, the PKTPEND status bit will be set and an interrupt may be generated, depending on the value of the ETHIEN bit <PKTPENDIE> register.

When the ETHRXST register is written, the BUFCNT counter is automatically cleared to 0x00.

Note: BUFCNT will not be cleared when ON is set to '0'. This enables software to continue to utilize and decrement this count.

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **ETHBUSY:** Ethernet Module busy bit⁽⁵⁾

1 = Ethernet logic has been turned on (ON (ETHCON1<15>) = 1) or is completing a transaction

0 = Ethernet logic is idle

This bit indicates that the module has been turned on or is completing a transaction after being turned off.

Note 1: This bit is only used for RX operations.

2: This bit is only affected by TX operations.

3: This bit is only affected by RX operations.

4: This bit is affected by TX and RX operations.

5: This bit will be *set* when the ON bit (ETHCON1<15>) = 1.

6: This bit will be *cleared* when the ON bit (ETHCON1<15>) = 0.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 30-15: ETHSTAT: ETHERNET CONTROLLER STATUS REGISTER (CONTINUED)

bit 6 **TXBUSY:** Transmit Busy bit^(2,6)

1 = TX logic is receiving data
0 = TX logic is idle

This bit indicates that a packet is currently being transmitted. A change in this status bit is not necessarily reflected by the TXDONE interrupt, as TX packets may be aborted or rejected by the MAC.

bit 5 **RXBUSY:** Receive Busy bit^(3,6)

1 = RX logic is receiving data
0 = RX logic is idle

This bit indicates that a packet is currently being received. A change in this status bit is not necessarily reflected by the RXDONE interrupt, as RX packets may be aborted or rejected by the RX filter.

bit 4-0 **Unimplemented:** Read as '0'

- Note 1:** This bit is only used for RX operations.
2: This bit is only affected by TX operations.
3: This bit is only affected by RX operations.
4: This bit is affected by TX and RX operations.
5: This bit will be *set* when the ON bit (ETHCON1<15>) = 1.
6: This bit will be *cleared* when the ON bit (ETHCON1<15>) = 0.

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **RXOVFLWCNT<15:0>:** Dropped Receive Frames Count bits

Increment counter for frames accepted by the RX filter and subsequently dropped due to internal receive error (RXFIFO overrun). This event also sets the RXOVFLW bit (ETHIRQ<0>) interrupt flag.

Note 1: This register is only used for RX operations.

2: This register is automatically cleared by hardware after a read operation, unless the byte enables for bytes 0/1 are '0'.

3: It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

-n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **SOFTRESET:** Soft Reset bit

Setting this bit will put the MACMII in reset. Its default value is '1'.

bit 14 **SIMRESET:** Simulation Reset bit

Setting this bit will cause a reset to the random number generator within the Transmit Function.

bit 13-12 **Unimplemented:** Read as '0'

bit 11 **RESETRMCS:** Reset MCS/RX bit

Setting this bit will put the MAC Control Sub-layer/Receive domain logic in reset.

bit 10 **RESETRFUN:** Reset RX Function bit

Setting this bit will put the MAC Receive function logic in reset.

bit 9 **RESETMCS:** Reset MCS/TX bit

Setting this bit will put the MAC Control Sub-layer/TX domain logic in reset.

bit 8 **RESETTFUN:** Reset TX Function bit

Setting this bit will put the MAC Transmit function logic in reset.

bit 7-5 **Unimplemented:** Read as '0'

bit 4 **LOOPBACK:** MAC Loopback mode bit

1 = MAC Transmit interface is loop backed to the MAC Receive interface
0 = MAC normal operation

bit 3 **TXPAUSE:** MAC TX Flow Control bit

1 = PAUSE Flow Control frames are allowed to be transmitted
0 = PAUSE Flow Control frames are blocked

bit 2 **RXPAUSE:** MAC RX Flow Control bit

1 = The MAC acts upon received PAUSE Flow Control frames
0 = Received PAUSE Flow Control frames are ignored

bit 1 **PASSALL:** MAC Pass all Receive Frames bit

1 = The MAC will accept all frames regardless of type (Normal vs. Control)
0 = The received Control frames are ignored

bit 0 **RXENABLE:** MAC Receive Enable bit

1 = Enable the MAC receiving of frames
0 = Disable the MAC receiving of frames

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-15 **Unimplemented:** Read as '0'

bit 14 **EXCESSDER:** Excess Defer bit

1 = The MAC will defer to carrier indefinitely as per the Standard

0 = The MAC will abort when the excessive deferral limit is reached

bit 13 **BPNOBKOFF:** Backpressure/No Backoff bit

1 = The MAC after incidentally causing a collision during backpressure will immediately retransmit without backoff reducing the chance of further collisions and ensuring transmit packets get sent

0 = The MAC will not remove the backoff

bit 12 **NOBKOFF:** No Backoff bit

1 = Following a collision, the MAC will immediately retransmit rather than using the Binary Exponential Backoff algorithm as specified in the Standard

0 = Following a collision, the MAC will use the Binary Exponential Backoff algorithm

bit 11-10 **Unimplemented:** Read as '0'

bit 9 **LONGPRE:** Long Preamble Enforcement bit

1 = The MAC only allows receive packets which contain preamble fields less than 12 bytes in length

0 = The MAC allows any length preamble as per the Standard

bit 8 **PUREPRE:** Pure Preamble Enforcement bit

1 = The MAC will verify the content of the preamble to ensure it contains 0x55 and is error-free. A packet with errors in its preamble is discarded

0 = The MAC does not perform any preamble checking

bit 7 **AUTOPAD:** Automatic Detect Pad Enable bit^(1,2)

1 = The MAC will automatically detect the type of frame, either tagged or untagged, by comparing the two octets following the source address with 0x8100 (VLAN Protocol ID) and pad accordingly

0 = The MAC does not perform automatic detection

Note 1: Table 30-6 provides a description of the pad function based on the configuration of this register.

2: This bit is ignored if the PADENABLE bit is cleared.

3: This bit is used in conjunction with the AUTOPAD and VLANPAD bits.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 30-24: EMAC1CFG2: ETHERNET CONTROLLER MAC CONFIGURATION 2 REGISTER

- bit 6 **VLANPAD:** VLAN Pad Enable bit^(1,2)
 1 = The MAC will pad all short frames to 64 bytes and append a valid CRC
 0 = The MAC does not perform padding of short frames
- bit 5 **PADENABLE:** Pad/CRC Enable bit^(1,3)
 1 = The MAC will pad all short frames
 0 = The frames presented to the MAC have a valid length
- bit 4 **CRCENABLE:** CRC Enable1 bit
 1 = The MAC will append a CRC to every frame whether padding was required or not. Must be set if the PADENABLE bit is set.
 0 = The frames presented to the MAC have a valid CRC
- bit 3 **DELAYCRC:** Delayed CRC bit
 This bit determines the number of bytes, if any, of proprietary header information that exist on the front of the IEEE 802.3 frames.
 1 = Four bytes of header (ignored by the CRC function)
 0 = No proprietary header
- bit 2 **HUGEFRM:** Huge Frame enable bit
 1 = Frames of any length are transmitted and received
 0 = Huge frames are not allowed for receive or transmit
- bit 1 **LENGTHCK:** Frame Length checking bit
 1 = Both transmit and receive frame lengths are compared to the Length/Type field. If the Length/Type field represents a length then the check is performed. Mismatches are reported on the transmit/receive statistics vector.
 0 = Length/Type field check is not performed
- bit 0 **FULLDPLX:** Full-Duplex Operation bit
 1 = The MAC operates in Full-Duplex mode
 0 = The MAC operates in Half-Duplex mode

- Note 1:** [Table 30-6](#) provides a description of the pad function based on the configuration of this register.
2: This bit is ignored if the PADENABLE bit is cleared.
3: This bit is used in conjunction with the AUTOPAD and VLANPAD bits.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware

TABLE 30-6: PAD OPERATION

| Type | AUTOPAD | VLANPAD | PADENABLE | Action |
|------|---------|---------|-----------|---|
| Any | x | x | 0 | No pad, check CRC |
| Any | 0 | 0 | 1 | Pad to 60 Bytes, append CRC |
| Any | x | 1 | 1 | Pad to 64 Bytes, append CRC |
| Any | 1 | 0 | 1 | If untagged: Pad to 60 Bytes, append CRC If VLAN tagged: Pad to 64 Bytes, append CRC |

bit 31-7 **Unimplemented:** Read as '0'

bit 6-0 **B2BIPKTGP<6:0>:** Back-to-Back Interpacket Gap bits

This is a programmable field representing the nibble time offset of the minimum possible period between the end of any transmitted packet, to the beginning of the next. In Full-Duplex mode, the register value should be the desired period in nibble times minus 3. In Half-Duplex mode, the register value should be the desired period in nibble times minus 6. In Full-Duplex the recommended setting is 0x15 (21d), which represents the minimum IPG of 0.96 μ s (in 100 Mbps) or 9.6 μ s (in 10 Mbps). In Half-Duplex mode, the recommended setting is 0x12 (18d), which also represents the minimum IPG of 0.96 μ s (in 100 Mbps) or 9.6 μ s (in 10 Mbps).

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
-n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 31-15 **Unimplemented:** Read as '0'

bit 14-8 **NB2BIPKTGP1<6:0>:** Non-Back-to-Back Interpacket Gap Part 1 bits

This is a programmable field representing the optional carrierSense window referenced in section 4.2.3.2.1 "Deference" of the IEEE 80.23 Specification. If carrier is detected during the timing of IPGR1, the MAC defers to carrier. If, however, carrier becomes after IPGR1, the MAC continues timing IPGR2 and transmits, knowingly causing a collision, thus ensuring fair access to medium. Its range of values is 0x0 to IPGR2. Its recommend value is 0xC (12d).

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **NB2BIPKTGP2<6:0>:** Non-Back-to-Back Interpacket Gap Part 2 bits

This is a programmable field representing the non-back-to-back Inter-Packet-Gap. Its recommended value is 0x12 (18d), which represents the minimum IPG of 0.96 μ s (in 100 Mbps) or 9.6 μ s (in 10 Mbps).

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

W = Writable bit
'1' = Bit is set

U = Unimplemented bit, read as '0'
'0' = Bit is cleared
x = Bit is unknown

bit 31-14 **Unimplemented:** Read as '0'

bit 13-8 **CWINDOW<5:0>:** Collision Window bits

This is a programmable field representing the slot time or collision window during which collisions occur in properly configured networks. Since the collision window starts at the beginning of transmission, the preamble and SFD is included. Its default of 0x37 (55d) corresponds to the count of frame bytes at the end of the window.

bit 7-4 **Unimplemented:** Read as '0'

bit 3-0 **RETX<3:0>:** Retransmission Maximum bits

This is a programmable field specifying the number of retransmission attempts following a collision before aborting the packet due to excessive collisions. The Standard specifies the maximum number of attempts (attemptLimit) to be 0xF (15d). Its default is '0xF'.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **MACMAXF<15:0>:** Maximum Frame Length bits⁽¹⁾

These bits reset to 0x05EE, which represents a maximum receive frame of 1518 octets. An untagged maximum size Ethernet frame is 1518 octets. A tagged frame adds four octets for a total of 1522 octets. If a shorter/longer maximum length restriction is desired, program this 16-bit field.

Note 1: If a proprietary header is allowed, this bit should be adjusted accordingly. For example, if 4-byte headers are prepended to frames, MACMAXF could be set to 1527 octets. This would allow the maximum VLAN tagged frame plus the 4-byte header.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 15 **RESETMGMT:** Test Reset MII Management bit
 1 = Reset the MII Management module
 0 = Normal Operation

bit 14-6 **Unimplemented:** Read as '0'

bit 5-2 **CLKSEL<3:0>:** MII Management Clock Select 1 bits⁽¹⁾
 These bits are used by the clock divide logic in creating the MII Management Clock (MDC), which the IEEE 802.3 Specification defines to be no faster than 2.5 MHz. Some PHYs support clock rates up to 12.5 MHz.

bit 1 **NOPRE:** Suppress Preamble bit
 1 = The MII Management will perform read/write cycles without the 32-bit preamble field. Some PHYs support suppressed preamble
 0 = Normal read/write cycles are performed

bit 0 **SCANINC:** Scan Increment bit
 1 = The MII Management module will perform read cycles across a range of PHYs. The read cycles will start from address 1 through the value set in EMAC1MADR<PHYADDR>
 0 = Continuous reads of the same PHY

Note 1: Table 30-7 provides a description of the clock divider encoding.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

x = Bit is unknown

bit 31-4 **Unimplemented:** Read as '0'

bit 3 **LINKFAIL:** Link Fail bit

When '1' is returned - indicates link fail has occurred. This bit reflects the value last read from the PHY status register.

bit 2 **NOTVALID:** MII Management Read Data Not Valid bit

When '1' is returned - indicates an MII management read cycle has not completed and the Read Data is not yet valid.

bit 1 **SCAN:** MII Management Scanning bit

When '1' is returned - indicates a scan operation (continuous MII Management Read cycles) is in progress.

bit 0 **MIIMBUSY:** MII Management Busy bit

When '1' is returned - indicates MII Management module is currently performing an MII Management Read or Write cycle.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

31.0 COMPARATOR

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. “Comparator”** (DS60001110) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Analog Comparator module consists of two comparators that can be configured in a variety of ways.

Key features of the Analog Comparator module are:

- Differential inputs
- Rail-to-rail operation
- Selectable output polarity
- Selectable inputs:
 - Analog inputs multiplexed with I/O pins
 - On-chip internal absolute voltage reference
 - Comparator voltage reference (CVREF)
- Selectable interrupt generation

A block diagram of the comparator module is illustrated in [Figure 31-1](#).

Note: To avoid oscillation from the Comparators in Common mode, a low-pass filter is required on the inputs to the Comparator.

FIGURE 31-1: COMPARATOR BLOCK DIAGRAM

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'
 -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Comparator ON bit

1 = Module is enabled. Setting this bit does not affect the other bits in this register

0 = Module is disabled and does not consume current. Clearing this bit does not affect the other bits in this register

bit 14 **COE:** Comparator Output Enable bit

1 = Comparator output is driven on the output CxOUT pin

0 = Comparator output is not driven on the output CxOUT pin

bit 13 **CPOL:** Comparator Output Inversion bit⁽¹⁾

1 = Output is inverted

0 = Output is not inverted

bit 12-9 **Unimplemented:** Read as '0'

bit 8 **COUT:** Comparator Output bit

1 = Output of the Comparator is a '1'

0 = Output of the Comparator is a '0'

bit 7-6 **EVPOL<1:0>:** Interrupt Event Polarity Select bits

11 = Comparator interrupt is generated on a low-to-high or high-to-low transition of the comparator output

10 = Comparator interrupt is generated on a high-to-low transition of the comparator output

01 = Comparator interrupt is generated on a low-to-high transition of the comparator output

00 = Comparator interrupt generation is disabled

bit 5 **Unimplemented:** Read as '0'

bit 4 **CREF:** Comparator Positive Input Configure bit

1 = Comparator non-inverting input is connected to the internal CVREF

0 = Comparator non-inverting input is connected to the CxINA pin

bit 3-2 **Unimplemented:** Read as '0'

bit 1-0 **CCH<1:0>:** Comparator Negative Input Select bits for Comparator

11 = Comparator inverting input is connected to the IVREF

10 = Comparator inverting input is connected to the CxIND pin

01 = Comparator inverting input is connected to the CxINC pin

00 = Comparator inverting input is connected to the CxINB pin

Note 1: Setting this bit will invert the signal to the comparator interrupt generator as well. This will result in an interrupt being generated on the opposite edge from the one selected by EVPOL<1:0>.

0 = Output of Comparator 1 is a '0'

32.0 COMPARATOR VOLTAGE REFERENCE (CVREF)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 20. “Comparator Voltage Reference (CVREF)”** (DS60001109) in the “PIC32 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com/PIC32).

The CVREF module is a 16-tap, resistor ladder network that provides a selectable reference voltage. Although its primary purpose is to provide a reference for the analog comparators, it also may be used independently of them.

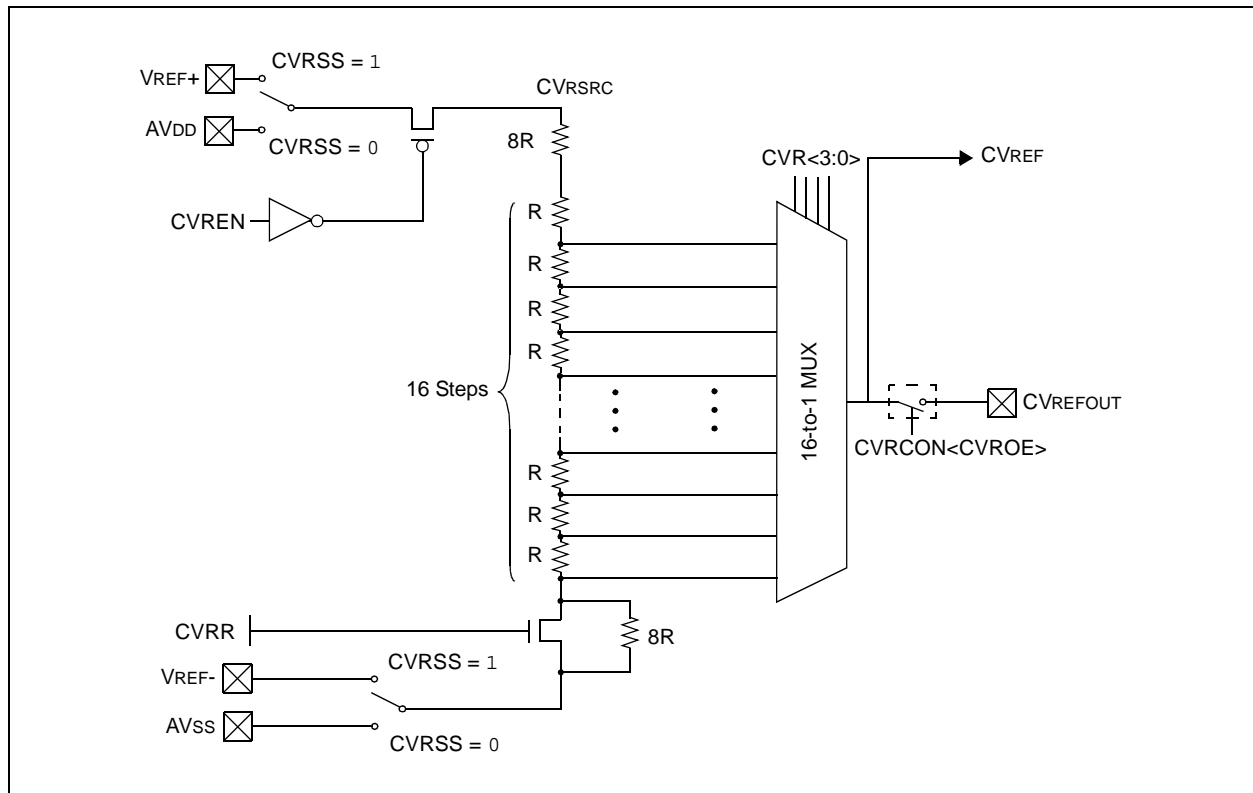

The resistor ladder is segmented to provide two ranges of voltage reference values and has a power-down function to conserve power when the reference is not being used. The module’s supply reference can be provided from either device VDD/VSS or an external voltage reference. The CVREF output is available for the comparators and typically available for pin output.

The comparator voltage reference has the following features:

- High and low range selection
- Sixteen output levels available for each range
- Internally connected to comparators to conserve device pins
- Output can be connected to a pin

A block diagram of the CVREF module is illustrated in [Figure 32-1](#).

FIGURE 32-1: COMPARATOR VOLTAGE REFERENCE BLOCK DIAGRAM

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: The register in this table has corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See [Section 12.3 "CLR, SET, and INV Registers"](#) for more information.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

33.0 POWER-SAVING FEATURES

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 10. “Power-Saving Features”** (DS60001130) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

This section describes power-saving features for the PIC32MZ EF devices. These devices offer various methods and modes that allow the user to balance power consumption with device performance. In all of the methods and modes described in this section, power-saving is controlled by software.

33.1 Power Saving with CPU Running

When the CPU is running, power consumption can be controlled by reducing the CPU clock frequency, lowering the speed of PBCLK7, or selecting a lower power clock source (i.e., LPRC or Sosc).

In addition, the Peripheral Bus Scaling mode is available for each peripheral bus where peripherals are clocked at reduced speed by selecting a higher divider for the associated PBCLKx, or by disabling the clock completely.

33.2 Power-Saving with CPU Halted

Peripherals and the CPU can be Halted or disabled to further reduce power consumption.

33.2.1 SLEEP MODE

Sleep mode has the lowest power consumption of the device power-saving operating modes. The CPU and most peripherals are Halted and the associated clocks are disabled. Select peripherals can continue to operate in Sleep mode and can be used to wake the device from Sleep. See the individual peripheral module sections for descriptions of behavior in Sleep.

Sleep mode includes the following characteristics:

- There can be a wake-up delay based on the oscillator selection
- The Fail-Safe Clock Monitor (FSCM) does not operate during Sleep mode
- The BOR circuit remains operative during Sleep mode
- The WDT, if enabled, is not automatically cleared prior to entering Sleep mode
- Some peripherals can continue to operate at limited functionality in Sleep mode. These peripherals include I/O pins that detect a change in the input signal, WDT, ADC, UART and peripherals that use an external clock input or the internal LPRC oscillator (e.g., RTCC, Timer1 and Input Capture).
- I/O pins continue to sink or source current in the same manner as they do when the device is not in Sleep

The processor will exit, or ‘wake-up’, from Sleep on one of the following events:

- On any interrupt from an enabled source that is operating in Sleep. The interrupt priority must be greater than the current CPU priority.
- On any form of device Reset
- On a WDT time-out

If the interrupt priority is lower than or equal to the current priority, the CPU will remain Halted, but the peripheral bus clocks will start running and the device will enter into Idle mode.

33.2.2 IDLE MODE

In Idle mode, the CPU is Halted; however, all clocks are still enabled. This allows peripherals to continue to operate. Peripherals can be individually configured to Halt when entering Idle by setting their respective SIDL bit. Latency, when exiting Idle mode, is very low due to the CPU oscillator source remaining active.

The device enters Idle mode when the SLPEN bit (OSCCON<4>) is clear and a WAIT instruction is executed.

The processor will wake or exit from Idle mode on the following events:

- On any interrupt event for which the interrupt source is enabled. The priority of the interrupt event must be greater than the current priority of the CPU. If the priority of the interrupt event is lower than or equal to current priority of the CPU, the CPU will remain Halted and the device will remain in Idle mode.
- On any form of device Reset
- On a WDT time-out interrupt

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

33.3 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have effect and read values are invalid.

To disable a peripheral, the associated PMDx bit must be set to '1'. To enable a peripheral, the associated PMDx bit must be cleared (default). See [Table 33-1](#) for more information.

Note: Disabling a peripheral module while its ON bit is set, may result in undefined behavior. The ON bit for the associated peripheral module must be cleared prior to disable a module via the PMDx bits.

TABLE 33-1: PERIPHERAL MODULE DISABLE BITS AND LOCATIONS⁽¹⁾

| Peripheral | PMDx bit Name | Register Name and Bit Location |
|------------------------------|---------------|--------------------------------|
| ADC | ADCMD | PMD1<0> |
| Comparator Voltage Reference | CVRMD | PMD1<12> |

Note 1: Not all modules and associated PMDx bits are available on all devices. See [TABLE 1: “PIC32MZ EF Family Features”](#) for the lists of available peripherals.

2: Module must not be busy after clearing the associated ON bit and prior to setting the USBMD bit.

33.3.1 CONTROLLING CONFIGURATION CHANGES

Because peripherals can be disabled during run time, some restrictions on disabling peripherals are needed to prevent accidental configuration changes. PIC32MZ EF devices include two features to prevent alterations to enabled or disabled peripherals:

- Control register lock sequence
- Configuration bit select lock

33.3.1.1 Control Register Lock

Under normal operation, writes to the PMDx registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the PMDLOCK Configuration bit (CFGCON<12>). Setting PMDLOCK prevents writes to the control registers; clearing PMDLOCK allows writes.

To set or clear PMDLOCK, an unlock sequence must be executed. Refer to **Section 42. “Oscillators with Enhanced PLL”** in the *“PIC32 Family Reference Manual”* for details.

33.3.1.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the PMDx registers. The PMDL1WAY Configuration bit (DEVCFG3<28>) blocks the PMDLOCK bit from being cleared after it has been set once. If PMDLOCK remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable PMD functionality is to perform a device Reset.

TABLE 33-2: PERIPHERAL MODULE DISABLE REGISTER SUMMARY

| Virtual Address (BF80_#) | Register Name ⁽¹⁾ | Bit Range | Bits | | | | | | | | | | | | | | | All Resets | |
|-----------------------------|---------------------------------|-----------|-------|-------|--------|--------|---------|---------|---------|---------|--------|-------|---------|--------|--------|--------|--------|------------|--------|
| | | | 31/15 | 30/14 | 29/13 | 28/12 | 27/11 | 26/10 | 25/9 | 24/8 | 23/7 | 22/6 | 21/5 | 20/4 | 19/3 | 18/2 | 17/1 | | 16/0 |

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See [Section 12.3 “CLR, SET, and INV Registers”](#) for more information.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

34.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 32. “Configuration”** (DS60001124) and **Section 33. “Programming and Diagnostics”** (DS60001129) in the *“PIC32 Family Reference Manual”*, which are available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices include several features intended to maximize application flexibility and reliability and minimize cost through elimination of external components. These are:

- Flexible device configuration
- Joint Test Action Group (JTAG) interface
- In-Circuit Serial Programming™ (ICSP™)
- Internal temperature sensor

34.1 Configuration Bits

PIC32MZ EF devices contain two Boot Flash memories (Boot Flash 1 and Boot Flash 2), each with an associated configuration space. These configuration spaces can be programmed to contain various device configurations. Configuration space that is aliased by the Lower Boot Alias memory region is used to provide values for Configuration registers listed below. See **4.1.1 “Boot Flash Sequence and Configuration Spaces”** for more information.

- [DEVSIGN0/ADEVSIGN0: Device Signature Word 0 Register](#)
- [DEVCP0/ADEVCP0: Device Code-Protect 0 Register](#)
- [DEVCFG0/ADEVCFG0: Device Configuration Word 0](#)
- [DEVCFG1/ADEVCFG1: Device Configuration Word 1](#)
- [DEVCFG2/ADEVCFG2: Device Configuration Word 2](#)
- [DEVCFG3/ADEVCFG3: Device Configuration Word 3](#)

The following run-time programmable Configuration registers provide additional configuration control:

- [CFGCON: Configuration Control Register](#)
- [CFGEBIA: External Bus Interface Address Pin Configuration Register](#)
- [CFGEBIC: External Bus Interface Control Pin Configuration Register](#)
- [CFGPG: Permission Group Configuration Register](#)

In addition, the DEVID register (see [Register 34-11](#)) provides device and revision information, and the DEVSNO and DEVSNI registers contain a unique serial number of the device (see [Register 34-12](#)).

Note: Do not use word program operation (NVMOP<3:0> = 0001) when programming the device words that are described in this section.

34.2 Registers

TABLE 34-1: DEVCFG: DEVICE CONFIGURATION WORD SUMMARY

| R = Readable bit | P = Programmable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared |
| | | x = Bit is unknown |

bit 31 **Reserved:** The reset value of this bit is the same as DEVSIGN0<31>.

bit 30 **EJTAGBEN:** EJTAG Boot Enable bit

- 1 = Normal EJTAG functionality
- 0 = Reduced EJTAG functionality

bit 29-22 **Reserved:** Write as '1'

bit 21 **POSCBOOST:** Primary Oscillator Boost Kick Start Enable bit

- 1 = Boost the kick start of the oscillator
- 0 = Normal start of the oscillator

bit 20-19 **POSCGAIN<1:0>:** Primary Oscillator Gain Control bits

- 11 = 2x gain setting
- 10 = 1.5x gain setting
- 01 = 0.5x gain setting
- 00 = 1x gain setting

bit 18 **SOSCBOOST:** Secondary Oscillator Boost Kick Start Enable bit

- 1 = Boost the kick start of the oscillator
- 0 = Normal start of the oscillator

bit 17-16 **SOSCGAIN<1:0>:** Secondary Oscillator Gain Control bits

- 11 = 2x gain setting
- 10 = 1.5x gain setting
- 01 = 0.5x gain setting
- 00 = 1x gain setting

bit 15 **SMCLR:** Soft Master Clear Enable bit

- 1 = MCLR pin generates a normal system Reset
- 0 = MCLR pin generates a POR Reset

bit 14-12 **DBGPER<2:0>:** Debug Mode CPU Access Permission bits

- 1xx = Allow CPU access to Permission Group 2 permission regions
- x1x = Allow CPU access to Permission Group 1 permission regions
- xx1 = Allow CPU access to Permission Group 0 permission regions
- 0xx = Deny CPU access to Permission Group 2 permission regions
- x0x = Deny CPU access to Permission Group 1 permission regions
- xx0 = Deny CPU access to Permission Group 0 permission regions

When the CPU is in Debug mode and the CPU1PG<1:0> bits (CFGPG<1:0>) are set to a denied permission group as defined by DBGPER<2:0>, the transaction request is assigned Group 3 permissions.

bit 11 **Reserved:** This bit is controlled by debugger/emulator development tools and should not be modified by the user.

Note 1: This bit sets the value of the JTAGEN bit in the CFGCON register.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

REGISTER 34-3: DEVCFG0/ADEVCFG0: DEVICE CONFIGURATION WORD 0 (CONTINUED)

- bit 10 **FSLEEP:** Flash Sleep Mode bit
1 = Flash is powered down when the device is in Sleep mode
0 = Flash remains powered when the device is in Sleep mode
- bit 9-8 **FECCCON<1:0>:** Dynamic Flash ECC Configuration bits
Upon a device Reset, the value of these bits is copied to the ECCCON<1:0> bits (CFGCON<5:4>).
11 = ECC and dynamic ECC are disabled (ECCCON<1:0> bits are writable)
10 = ECC and dynamic ECC are disabled (ECCCON<1:0> bits are locked)
01 = Dynamic Flash ECC is enabled (ECCCON<1:0> bits are locked)
00 = Flash ECC is enabled (ECCCON<1:0> bits are locked; disables word Flash writes)
- bit 7 **Reserved:** Write as '1'
- bit 6 **BOOTISA:** Boot ISA Selection bit
1 = Boot code and Exception code is MIPS32®
(ISAONEXC bit is set to '0' and the ISA<1:0> bits are set to '10' in the CP0 Config3 register)
0 = Boot code and Exception code is microMIPS™
(ISAONEXC bit is set to '1' and the ISA<1:0> bits are set to '11' in the CP0 Config3 register)
- bit 5 **TRCEN:** Trace Enable bit
1 = Trace features in the CPU are enabled
0 = Trace features in the CPU are disabled
- bit 4-3 **ICESEL<1:0>:** In-Circuit Emulator/Debugger Communication Channel Select bits
11 = PGEC1/PGED1 pair is used
10 = PGEC2/PGED2 pair is used
01 = Reserved
00 = Reserved
- bit 2 **JTAGEN:** JTAG Enable bit⁽¹⁾
1 = JTAG is enabled
0 = JTAG is disabled
- bit 1-0 **DEBUG<1:0>:** Background Debugger Enable bits (forced to '11' if code-protect is enabled)
1x = Debugger is disabled
0x = Debugger is enabled

Note 1: This bit sets the value of the JTAGEN bit in the CFGCON register.

34.3 On-Chip Voltage Regulator

The core and digital logic for all PIC32MZ EF devices is designed to operate at a nominal 1.8V. To simplify system designs, devices in the PIC32MZ EF family incorporate an on-chip regulator providing the required core logic voltage from VDD.

34.3.1 ON-CHIP REGULATOR AND POR

It takes a fixed delay for the on-chip regulator to generate an output. During this time, designated as TPU, code execution is disabled. TPU is applied every time the device resumes operation after any power-down, including Sleep mode.

34.3.2 ON-CHIP REGULATOR AND BOR

PIC32MZ EF devices also have a simple brown-out capability. If the voltage supplied to the regulator is inadequate to maintain a regulated level, the regulator Reset circuitry will generate a Brown-out Reset. This event is captured by the BOR flag bit (RCON<1>). The brown-out voltage levels are specific in [Section 37.1 “DC Characteristics”](#).

34.4 On-chip Temperature Sensor

PIC32MZ EF devices include a temperature sensor that provides accurate measurement of a device’s junction temperature (see [Section 37.2 “AC Characteristics and Timing Parameters”](#) for more information).

The temperature sensor is connected to the ADC module and can be measured using the shared S&H circuit (see [Section 28.0 “12-bit High-Speed Successive Approximation Register \(SAR\) Analog-to-Digital Converter \(ADC\)”](#) for more information).

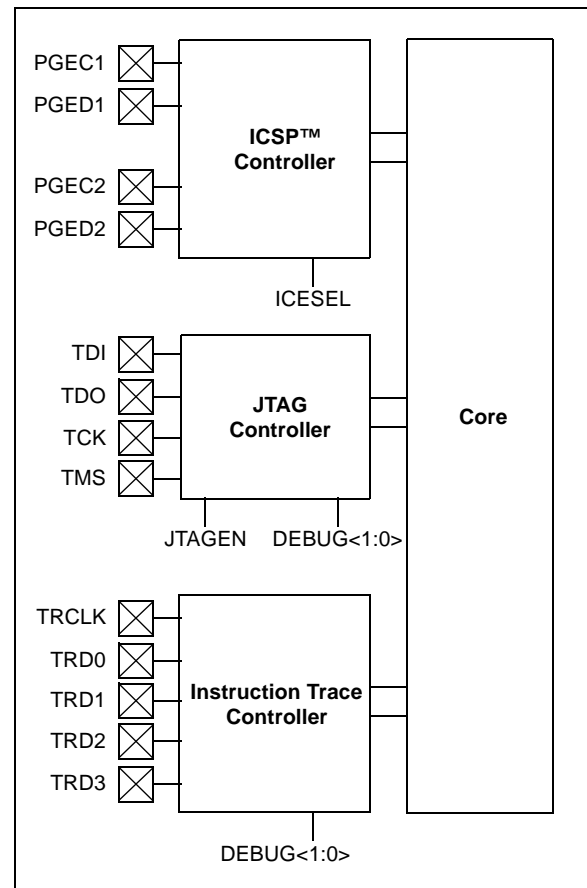

34.5 Programming and Diagnostics

PIC32MZ EF devices provide a complete range of programming and diagnostic features that can increase the flexibility of any application using them. These features allow system designers to include:

- Simplified field programmability using two-wire In-Circuit Serial Programming™ (ICSP™) interfaces
- Debugging using ICSP
- Programming and debugging capabilities using the EJTAG extension of JTAG
- JTAG boundary scan testing for device and board diagnostics

PIC32 devices incorporate two programming and diagnostic modules, and a trace controller, that provide a range of functions to the application developer.

FIGURE 34-1: BLOCK DIAGRAM OF PROGRAMMING, DEBUGGING AND TRACE PORTS

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

35.0 INSTRUCTION SET

The PIC32MZ EF family instruction set complies with the MIPS32[®] Release 5 instruction set architecture. The PIC32MZ EF device family *does not* support the following features:

- Core extend instructions
- Coprocessor 2 instructions

Note: Refer to “MIPS32[®] Architecture for Programmers Volume II: The MIPS32[®] Instruction Set” at www.imgtec.com for more information.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

NOTES:

36.0 DEVELOPMENT SUPPORT

The PIC[®] microcontrollers (MCU) and dsPIC[®] digital signal controllers (DSC) are supported with a full range of software and hardware development tools:

- Integrated Development Environment
 - MPLAB[®] X IDE Software
- Compilers/Assemblers/Linkers
 - MPLAB XC Compiler
 - MPASM[™] Assembler
 - MPLINK[™] Object Linker/
MPLIB[™] Object Librarian
 - MPLAB Assembler/Linker/Librarian for Various Device Families
- Simulators
 - MPLAB X SIM Software Simulator
- Emulators
 - MPLAB REAL ICE[™] In-Circuit Emulator
- In-Circuit Debuggers/Programmers
 - MPLAB ICD 3
 - PICKit[™] 3
- Device Programmers
 - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards, Evaluation Kits and Starter Kits
- Third-party development tools

36.1 MPLAB X Integrated Development Environment Software

The MPLAB X IDE is a single, unified graphical user interface for Microchip and third-party software, and hardware development tool that runs on Windows[®], Linux and Mac OS[®] X. Based on the NetBeans IDE, MPLAB X IDE is an entirely new IDE with a host of free software components and plug-ins for high-performance application development and debugging. Moving between tools and upgrading from software simulators to hardware debugging and programming tools is simple with the seamless user interface.

With complete project management, visual call graphs, a configurable watch window and a feature-rich editor that includes code completion and context menus, MPLAB X IDE is flexible and friendly enough for new users. With the ability to support multiple tools on multiple projects with simultaneous debugging, MPLAB X IDE is also suitable for the needs of experienced users.

Feature-Rich Editor:

- Color syntax highlighting
- Smart code completion makes suggestions and provides hints as you type
- Automatic code formatting based on user-defined rules
- Live parsing

User-Friendly, Customizable Interface:

- Fully customizable interface: toolbars, toolbar buttons, windows, window placement, etc.
- Call graph window

Project-Based Workspaces:

- Multiple projects
- Multiple tools
- Multiple configurations
- Simultaneous debugging sessions

File History and Bug Tracking:

- Local file history feature
- Built-in support for Bugzilla issue tracker

36.2 MPLAB XC Compilers

The MPLAB XC Compilers are complete ANSI C compilers for all of Microchip's 8, 16, and 32-bit MCU and DSC devices. These compilers provide powerful integration capabilities, superior code optimization and ease of use. MPLAB XC Compilers run on Windows, Linux or MAC OS X.

For easy source level debugging, the compilers provide debug information that is optimized to the MPLAB X IDE.

The free MPLAB XC Compiler editions support all devices and commands, with no time or memory restrictions, and offer sufficient code optimization for most applications.

MPLAB XC Compilers include an assembler, linker and utilities. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. MPLAB XC Compiler uses the assembler to produce its object file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

36.3 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code, and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB X IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multipurpose source files
- Directives that allow complete control over the assembly process

36.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

36.5 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC DSC devices. MPLAB XC Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

36.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

36.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

36.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

36.9 PICkit 3 In-Circuit Debugger/Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a full-speed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™ (ICSP™).

36.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.

36.11 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

36.12 Third-Party Development Tools

Microchip also offers a great collection of tools from third-party vendors. These tools are carefully selected to offer good value and unique functionality.

- Device Programmers and Gang Programmers from companies, such as SoftLog and CCS
- Software Tools from companies, such as Gimpel and Trace Systems
- Protocol Analyzers from companies, such as Saleae and Total Phase
- Demonstration Boards from companies, such as MikroElektronika, Digilent® and Olimex
- Embedded Ethernet Solutions from companies, such as EZ Web Lynx, WIZnet and IPLogika®

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

37.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ EF electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC32MZ EF devices are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions, above the parameters indicated in the operation listings of this specification, is not implied.

Absolute Maximum Ratings

(See Note 1)

| | |
|---|---------------------------|
| Ambient temperature under bias | -40°C to +125°C |
| Storage temperature | -65°C to +150°C |
| Voltage on VDD with respect to VSS | -0.3V to +4.0V |
| Voltage on any pin that is not 5V tolerant, with respect to VSS (Note 3)..... | -0.3V to (VDD + 0.3V) |
| Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 2.1V (Note 3)..... | -0.3V to +5.5V |
| Voltage on any 5V tolerant pin with respect to VSS when VDD < 2.1V (Note 3)..... | -0.3V to +3.6V |
| Voltage on D+ or D- pin with respect to VUSB3V3 | -0.3V to (VUSB3V3 + 0.3V) |
| Voltage on VBUS with respect to VSS | -0.3V to +5.5V |
| Maximum current out of VSS pin(s) | 200 mA |
| Maximum current into VDD pin(s) (Note 2)..... | 200 mA |
| Maximum current sunk/sourced by any 4x I/O pin (Note 4)..... | 15 mA |
| Maximum current sunk/sourced by any 8x I/O pin (Note 4)..... | 25 mA |
| Maximum current sunk/sourced by any 12x I/O pin (Note 4)..... | 33 mA |
| Maximum current sunk by all ports | 150 mA |
| Maximum current sourced by all ports (Note 2)..... | 150 mA |

- Note 1:** Stresses above those listed under “**Absolute Maximum Ratings**” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
- 2:** Maximum allowable current is a function of device maximum power dissipation (see [Table 37-2](#)).
- 3:** See the pin name tables ([Table 2](#) through [Table 4](#)) for the 5V tolerant pins.
- 4:** Characterized, but not tested. Refer to parameters [DO10](#), [DO20](#), and [DO20a](#) for the 4x, 8x, and 12x I/O pin lists.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

37.1 DC Characteristics

TABLE 37-1: OPERATING MIPS VS. VOLTAGE

| Characteristic | VDD Range (in Volts) (Note 1) | Temp. Range (in °C) | Max. Frequency | Comment |
|----------------|-------------------------------------|------------------------|--------------------|---------|
| | | | PIC32MZ EF Devices | |
| DC5 | 2.1V-3.6V | -40°C to +85°C | 200 MHz | — |
| DC5b | 2.1V-3.6V | -40°C to +125°C | 180 MHz | Planned |

Note 1: Overall functional device operation at $V_{BORMIN} < V_{DD} < V_{DDMIN}$ is guaranteed, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below V_{DDMIN} . Refer to parameter BO10 in [Table 37-5](#) for BOR values.

TABLE 37-2: THERMAL OPERATING CONDITIONS

| Rating | Symbol | Min. | Typical | Max. | Unit |
|--|--------|-----------------------------|---------|------|------|
| Industrial Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +125 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +85 | °C |
| Extended Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +140 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +125 | °C |
| Power Dissipation: Internal Chip Power Dissipation: $P_{INT} = V_{DD} \times (I_{DD} - S_{IOH})$ I/O Pin Power Dissipation: $P_{I/O} = S \left((V_{DD} - V_{OH}) \times I_{OH} \right) + S \left(V_{OL} \times I_{OL} \right)$ | PD | PINT + PI/O | | | W |
| Maximum Allowed Power Dissipation | PDMAX | $(T_J - T_A) / \theta_{JA}$ | | | W |

TABLE 37-3: THERMAL PACKAGING CHARACTERISTICS

| Characteristics | Symbol | Typical | Max. | Unit | Notes |
|---|---------------|---------|------|------|-------|
| Package Thermal Resistance, 64-pin QFN (9x9x0.9 mm) | θ_{JA} | 28 | — | °C/W | 1 |
| Package Thermal Resistance, 64-pin TQFP (10x10x1 mm) | θ_{JA} | 49 | — | °C/W | 1 |
| Package Thermal Resistance, 100-pin TQFP (12x12x1 mm) | θ_{JA} | 43 | — | °C/W | 1 |
| Package Thermal Resistance, 100-pin TQFP (14x14x1 mm) | θ_{JA} | 40 | — | °C/W | 1 |
| Package Thermal Resistance, 124-pin VTLA (9x9x0.9 mm) | θ_{JA} | 30 | — | °C/W | 1 |
| Package Thermal Resistance, 144-pin TQFP (16x16x1 mm) | θ_{JA} | 42 | — | °C/W | 1 |
| Package Thermal Resistance, 144-pin LQFP (20x20x1.4 mm) | θ_{JA} | 39 | — | °C/W | 1 |

Note 1: Junction to ambient thermal resistance, Theta-JA (θ_{JA}) numbers are achieved by package simulations.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | |
|--------------------------|--------|---|---|---------|------|------------------|----------------------------------|
| Param. No. | Symbol | Characteristics | Min. | Typical | Max. | Units | Conditions |
| Operating Voltage | | | | | | | |
| DC10 | VDD | Supply Voltage (Note 1) | 2.1 | — | 3.6 | V | — |
| DC12 | VDR | RAM Data Retention Voltage (Note 2) | 2.0 | — | — | V | — |
| DC16 | VPOR | VDD Start Voltage to Ensure Internal Power-on Reset Signal (Note 3) | 1.75 | — | — | V | — |
| DC17 | SVDD | VDD Rise Rate to Ensure Internal Power-on Reset Signal | 0.000011 | — | 1.1 | V/ μs | 300 ms to 3 μs @ 3.3V |

Note 1: Overall functional device operation at $V_{BORMIN} < V_{DD} < V_{DDMIN}$ is guaranteed, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below V_{DDMIN} . Refer to parameter BO10 in [Table 37-5](#) for BOR values.

2: This is the limit to which V_{DD} can be lowered without losing RAM data.

3: This is the limit to which V_{DD} must be lowered to ensure Power-on Reset.

TABLE 37-5: ELECTRICAL CHARACTERISTICS: BOR

| DC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | |

| Parameter No. | Typical ⁽³⁾ | Maximum ⁽⁶⁾ | Units | Conditions |
| Operating Current (IDD)⁽¹⁾ | | | | |
| DC20 | 8 | 25 | mA | 4 MHz (Note 4,5) |
| DC21 | 10 | 30 | mA | 10 MHz (Note 5) |
| DC22 | 32 | 65 | mA | 60 MHz (Note 2,4) |
| DC23 | 40 | 75 | mA | 80 MHz (Note 2,4) |
| DC25 | 61 | 95 | mA | 130 MHz (Note 2,4) |
| DC26 | 72 | 110 | mA | 160 MHz (Note 2,4) |
| DC28 | 81 | 120 | mA | 180 MHz (Note 2,4) |
| DC27a | 92 | 130 | mA | 200 MHz (Note 2) |
| DC27b | 78 | 100 | mA | 200 MHz (Note 4,5) |

- Note 1:** A device's IDD supply current is mainly a function of the operating voltage and frequency. Other factors, such as PBCLK (Peripheral Bus Clock) frequency, number of peripheral modules enabled, internal code execution pattern, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.
- 2:** The test conditions for IDD measurements are as follows:
- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
 - OSC2/CLKO is configured as an I/O input pin
 - USB PLL is disabled (USBMD = 1), VUSB3V3 is connected to VSS
 - CPU, Program Flash, and SRAM data memory are operational, Program Flash memory Wait states are equal to two
 - L1 Cache and Prefetch modules are enabled
 - No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
 - WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
 - All I/O pins are configured as inputs and pulled to VSS
 - MCLR = VDD
 - CPU executing `while(1)` statement from Flash
 - RTCC and JTAG are disabled
- 3:** Data in "Typical" column is at 3.3V, +25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.
- 4:** This parameter is characterized, but not tested in manufacturing.
- 5:** Note 2 applies with the following exceptions: L1 Cache and Prefetch modules are disabled, Program Flash memory Wait states are equal to seven.
- 6:** Data in the "Maximum" column is at 3.3V, +85°C at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-7: DC CHARACTERISTICS: IDLE CURRENT (IDLE)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | |
|--|------------------------|------------------------|---|------------------|
| Parameter No. | Typical ⁽²⁾ | Maximum ⁽⁴⁾ | Units | Conditions |
| Idle Current (IDLE): Core Off, Clock on Base Current (Note 1) | | | | |
| DC30a | 7 | 22 | mA | 4 MHz (Note 3) |
| DC31a | 8 | 24 | mA | 10 MHz |
| DC32a | 13 | 32 | mA | 60 MHz (Note 3) |
| DC33a | 21 | 42 | mA | 130 MHz (Note 3) |
| DC34 | 26 | 48 | mA | 180 MHz (Note 3) |
| DC35 | 28 | 52 | mA | 200 MHz |

Note 1: The test conditions for IDLE current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
 - OSC2/CLKO is configured as an I/O input pin
 - USB PLL is disabled (USBPMD = 1), VUSB3V3 is connected to VSS, PBCLKx divisor = 1:128 ('x' ≠ 7)
 - CPU is in Idle mode (CPU core Halted)
 - L1 Cache and Prefetch modules are disabled
 - No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared (except USBPMD)
 - WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
 - All I/O pins are configured as inputs and pulled to VSS
 - $\overline{\text{MCLR}} = \text{VDD}$
 - RTCC and JTAG are disabled
- 2:** Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
- 3:** This parameter is characterized, but not tested in manufacturing.
- 4:** Data in the "Maximum" column is at 3.3V, +85°C at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-8: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

| DC CHARACTERISTICS | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | |
|--|------------------------|--|-------|--|
| Param. No. | Typical ⁽²⁾ | Maximum ⁽⁵⁾ | Units | Conditions |
| Power-Down Current (IPD) (Note 1) | | | | |
| DC40k | 0.7 | 7 | mA | -40°C |
| DC40l | 1.5 | 7 | mA | +25°C |
| DC40n | 7 | 20 | mA | +85°C |
| DC40m | 20 | — | mA | +125°C |
| Base Power-Down Current | | | | |
| Module Differential Current | | | | |
| DC41e | 15 | 50 | μA | 3.6V Watchdog Timer Current: ΔI _{WDT} (Note 3) |
| DC42e | 25 | 50 | μA | 3.6V RTCC + Timer1 w/32 kHz Crystal: ΔI _{RTCC} (Note 3) |
| DC43d | 3 | 3.8 | mA | 3.6V ADC: ΔI _{ADC} (Notes 3, 4) |
| DC44 | 15 | 50 | μA | 3.6V Deadman Timer Current: ΔI _{DMT} (Note 3) |

Note 1: The test conditions for IPD current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
 - OSC2/CLKO is configured as an I/O input pin
 - USB PLL is disabled (USBMD = 1), V_{USB3V3} is connected to V_{SS}
 - CPU is in Sleep mode
 - L1 Cache and Prefetch modules are disabled
 - No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
 - WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
 - All I/O pins are configured as inputs and pulled to V_{SS}
 - MCLR = V_{DD}
 - RTCC and JTAG are disabled
 - Voltage regulator is in Stand-by mode (VREGS = 0)
- 2:** Data in the “Typical” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
- 3:** The Δ current is the additional current consumed when the module is enabled. This current should be added to the base IPD current.
- 4:** Voltage regulator is operational (VREGS = 1).
- 5:** Data in the “Maximum” column is at 3.3V, +85°C at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-9: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) | | | | |
|---|------------|--|---|---------------------|---|-------|---|
| | | | Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |

| DI10 DI18 DI19 | VIL | Input Low Voltage | | | | | |
| | | I/O Pins with PMP | VSS | — | 0.15 * VDD | V | SMBus disabled (Note 4) |
| | | I/O Pins | VSS | — | 0.2 * VDD | V | |
| | | SDAx, SCLx | VSS | — | 0.3 * VDD | V | |
| SDAx, SCLx | VSS | — | 0.8 | V | SMBus enabled (Note 4) | | |
| DI20 DI28a DI29a DI28b DI29b | VIH | Input High Voltage | | | | | |
| | | I/O Pins not 5V-tolerant ⁽⁵⁾ | 0.80 * VDD | — | VDD | V | (Note 4,6) |
| | | I/O Pins 5V-tolerant with PMP ⁽⁵⁾ | 0.80 * VDD | — | 5.5 | V | (Note 4,6) |
| | | I/O Pins 5V-tolerant ⁽⁵⁾ | 0.80 * VDD | — | 5.5 | V | SMBus disabled (Note 4,6) |
| | | SDAx, SCLx on non-5V tolerant pins ⁽⁵⁾ | 0.80 * VDD | — | VDD | V | |
| | | SDAx, SCLx on non-5V tolerant pins ⁽⁵⁾ | 2.1 | — | VDD | V | SMBus enabled, 2.1V ≤ VPIN ≤ 5.5 (Note 4,6) |
| SDAx, SCLx on 5V tolerant pins ⁽⁵⁾ | 0.80 * VDD | — | 5.5 | V | SMBus disabled (Note 4,6) | | |
| SDAx, SCLx on 5V tolerant pins ⁽⁵⁾ | 2.1 | — | 5.5 | V | SMBus enabled, 2.1V ≤ VPIN ≤ 5.5 (Note 4,6) | | |
| DI30 | ICNPU | Change Notification Pull-up Current | — | — | -40 | µA | VDD = 3.3V, VPIN = VSS (Note 3,6) |
| DI31 | ICNPD | Change Notification Pull-down Current⁽⁴⁾ | 40 | — | — | µA | VDD = 3.3V, VPIN = VDD |
| DI50 DI51 DI55 DI56 | IIL | Input Leakage Current (Note 3) | | | | | |
| | | I/O Ports | — | — | ±1 | µA | VSS ≤ VPIN ≤ VDD, Pin at high-impedance |
| | | Analog Input Pins | — | — | ±1 | µA | VSS ≤ VPIN ≤ VDD, Pin at high-impedance |
| | | $\overline{\text{MCLR}}^{(2)}$ | — | — | ±1 | µA | VSS ≤ VPIN ≤ VDD |
| | | OSC1 | — | — | ±1 | µA | VSS ≤ VPIN ≤ VDD, HS mode |

Note 1: Data in “Typical” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

- 2:** The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.
- 3:** Negative current is defined as current sourced by the pin.
- 4:** This parameter is characterized, but not tested in manufacturing.
- 5:** See the pin name tables (Table 2 through Table 4) for the 5V-tolerant pins.
- 6:** The VIH specifications are only in relation to externally applied inputs, and not with respect to the user-selectable internal pull-ups. External open drain input signals utilizing the internal pull-ups of the PIC32 device are guaranteed to be recognized only as a logic “high” internally to the PIC32 device, provided that the external load does not exceed the minimum value of ICNPU. For External “input” logic inputs that require a pull-up source, to guarantee the minimum VIH of those components, it is recommended to use an external pull-up resistor rather than the internal pull-ups of the PIC32 device.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-10: DC CHARACTERISTICS: I/O PIN INPUT INJECTION CURRENT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|--|--|------------------------|-----------------------|-------|---|
| Param. No. | Symbol | Characteristics | Min. | Typical ⁽¹⁾ | Max. | Units | Conditions |
| DI60a | IICL | Input Low Injection Current | 0 | — | -5 ^(2,5) | mA | This parameter applies to all pins, with the exception of RB10. Maximum IICH current for this exception is 0 mA. |
| DI60b | IICH | Input High Injection Current | 0 | — | +5 ^(3,4,5) | mA | This parameter applies to all pins, with the exception of all 5V tolerant pins, OSC1, OSC0, SOSCI, SOSCO, D+, D- and RB10. Maximum IICH current for these exceptions is 0 mA. |
| DI60c | ΣIICT | Total Input Injection Current (sum of all I/O and control pins) | -20 ⁽⁶⁾ | — | +20 ⁽⁶⁾ | mA | Absolute instantaneous sum of all ± input injection currents from all I/O pins (IICL + IICH) ≤ ΣIICT |

Note 1: Data in “Typical” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: VIL source < (VSS - 0.3). Characterized but not tested.

3: VIH source > (VDD + 0.3) for non-5V tolerant pins only.

4: Digital 5V tolerant pins do not have an internal high side diode to VDD, and therefore, cannot tolerate any “positive” input injection current.

5: Injection currents > | 0 | can affect the ADC results by approximately 4 to 6 counts (i.e., VIH Source > (VDD + 0.3) or VIL source < (VSS - 0.3)).

6: Any number and/or combination of I/O pins not excluded under IICL or IICH conditions are permitted provided the “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. If **Note 2**, IICL = ((VSS - 0.3) - VIL source) / RS. If **Note 3**, IICH = ((IICH source - (VDD + 0.3)) / RS). RS = Resistance between input source voltage and device pin. If (VSS - 0.3) ≤ VSOURCE ≤ (VDD + 0.3), injection current = 0.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-11: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | |

TABLE 37-12: DC CHARACTERISTICS: PROGRAM MEMORY⁽³⁾

| DC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|-------|---|---|---------------------|--------|------------|-------------|
| Param. No. | Sym. | Characteristics | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| D130a | EP | Cell Endurance | 10,000 | — | — | E/W | Without ECC |
| D130b | | | 20,000 | — | — | E/W | With ECC |
| D131 | VPR | VDD for Read | VDDMIN | — | VDDMAX | V | — |
| D132 | VPEW | VDD for Erase or Write | VDDMIN | — | VDDMAX | V | — |
| D134a | TRETD | Characteristic Retention | 10 | — | — | Year | Without ECC |
| D134b | | | 20 | — | — | Year | With ECC |
| D135 | IDDP | Supply Current during Programming | — | — | 30 | mA | — |
| D136 | TRW | Row Write Cycle Time (Notes 2, 4) | — | 66813 | — | FRC Cycles | — |
| D137 | TQWW | Quad Word Write Cycle Time (Note 4) | — | 773 | — | FRC Cycles | — |
| D138 | TWW | Word Write Cycle Time (Note 4) | — | 383 | — | FRC Cycles | — |
| D139 | TCE | Chip Erase Cycle Time (Note 4) | — | 515373 | — | FRC Cycles | — |
| D140 | TPFE | All Program Flash (Upper and Lower regions) Erase Cycle Time (Note 4) | — | 256909 | — | FRC Cycles | — |
| D141 | TPBE | Program Flash (Upper or Lower regions) Erase Cycle Time (Note 4) | — | 128453 | — | FRC Cycles | — |
| D142 | TPGE | Page Erase Cycle Time (Note 4) | — | 128453 | — | FRC Cycles | — |

- Note 1:** Data in “Typical” column is at 3.3V, +25°C unless otherwise stated.
Note 2: The minimum PBCLK5 for row programming is 4 MHz.
Note 3: Refer to the “PIC32 Flash Programming Specification” (DS60001145) for operating conditions during programming and erase cycles.
Note 4: This parameter depends on FRC accuracy (see Table 37-20) and FRC tuning values (see the OSCTUN register: Register 8-2).

TABLE 37-13: DC CHARACTERISTICS: PROGRAM FLASH MEMORY WAIT STATES

| DC CHARACTERISTICS | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | |
|---|--------------------|---|------------|--|
| Required Flash Wait States ⁽¹⁾ | SYSClk | Units | Conditions | |
| With ECC: | | | | |
| 0 Wait states | 0 < SYSClk ≤ 66 | MHz | — | |
| 1 Wait state | 66 < SYSClk ≤ 133 | | | |
| 2 Wait states | 133 < SYSClk ≤ 200 | | | |
| Without ECC: | | | | |
| 0 Wait states | 0 < SYSClk ≤ 83 | MHz | — | |
| 1 Wait state | 83 < SYSClk ≤ 166 | | | |
| 2 Wait states | 166 < SYSClk ≤ 200 | | | |

- Note 1:** To use Wait states, the Prefetch module must be enabled (PREFEN<1:0> ≠ 00) and the PFMWS<2:0> bits must be written with the desired Wait state value.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-14: COMPARATOR SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions (see Note 3): 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|------------------------------------|---|---------|-------|-------|---|
| Param. No. | Symbol | Characteristics | Min. | Typical | Max. | Units | Comments |
| D300 | VIOFF | Input Offset Voltage | — | ±10 | — | mV | AVDD = VDD, AVSS = VSS |
| D301 | VICM | Input Common Mode Voltage | 0 | — | VDD | V | AVDD = VDD, AVSS = VSS (Note 2) |
| D302 | CMRR | Common Mode Rejection Ratio | 55 | — | — | dB | Max VICM = (VDD – 1)V (Note 2, 4) |
| D303 | TRESP | Response Time | — | 150 | — | ns | AVDD = VDD, AVSS = VSS (Notes 1, 2) |
| D304 | ON2OV | Comparator Enabled to Output Valid | — | — | 10 | µs | Comparator module is configured before setting the comparator ON bit (Note 2) |
| D305 | IVREF | Internal Voltage Reference | 1.194 | 1.2 | 1.206 | V | — |

- Note 1:** Response time measured with one comparator input at (VDD – 1.5)/2, while the other input transitions from VSS to VDD.
- 2:** These parameters are characterized but not tested.
- 3:** The Comparator module is functional at VBORMIN < VDD < VDDMIN, but with degraded performance. Unless otherwise stated, module functionality is guaranteed, but not characterized.
- 4:** CMRR measurement characterized with a 1 MΩ resistor in parallel with a 25 pF capacitor to VSS.

TABLE 37-15: COMPARATOR VOLTAGE REFERENCE SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions (see Note 3): 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|---------|---|---|------|-----------------|-------|---|
| Param. No. | Symbol | Characteristics | Min. | Typ. | Max. | Units | Comments |
| D312 | TSET | Internal 4-bit DAC Comparator Reference Settling time | — | — | 10 | µs | See Note 1 |
| D313 | DACREFH | CVREF Input Voltage Reference Range | AVSS | — | AVDD | V | CVRSRC with CVRSS = 0 |
| | | | VREF- | — | VREF+ | V | CVRSRC with CVRSS = 1 |
| D314 | DVREF | CVREF Programmable Output Range | 0 | — | 0.625 x DACREFH | V | 0 to 0.625 DACREFH with DACREFH/24 step size |
| | | | 0.25 x DACREFH | — | 0.719 x DACREFH | V | 0.25 x DACREFH to 0.719 DACREFH with DACREFH/32 step size |
| D315 | DACRES | Resolution | — | — | DACREFH/24 | | CVRCON<CVRR> = 1 |
| | | | — | — | DACREFH/32 | | CVRCON<CVRR> = 0 |
| D316 | DACACC | Absolute Accuracy ⁽²⁾ | — | — | 1/4 | LSB | DACREFH/24, CVRCON<CVRR> = 1 |
| | | | — | — | 1/2 | LSB | DACREFH/32, CVRCON<CVRR> = 0 |

- Note 1:** Settling time was measured while CVRR = 1 and CVR<3:0> transitions from '0000' to '1111'. This parameter is characterized, but is not tested in manufacturing.
- 2:** These parameters are characterized but not tested.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

37.2 AC Characteristics and Timing Parameters

The information contained in this section defines PIC32MZ EF device AC characteristics and timing parameters.

FIGURE 37-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

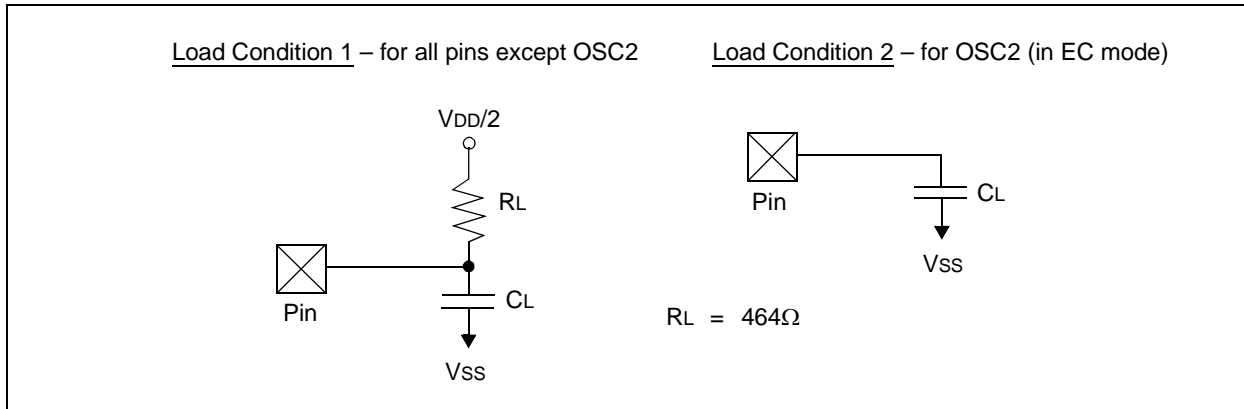

TABLE 37-16: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature $-40^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$ for Industrial $-40^\circ\text{C} \leq T_A \leq +125^\circ\text{C}$ for Extended | | | | |
|--------------------|--------|--|---|------------------------|------|-------|--|
| Param. No. | Symbol | Characteristics | Min. | Typical ⁽¹⁾ | Max. | Units | Conditions |
| DO50 | Cosco | OSC2 Pin | — | — | 15 | pF | In HS mode when the external clock is used to drive OSC1 |
| DO56 | CL | All I/O pins (except pins used as CxOUT) | — | — | 50 | pF | EC mode for OSC2 |
| DO58 | CB | SCLx, SDAx | — | — | 400 | pF | In I ² C™ mode |
| DO59 | CSQI | All SQI pins | — | — | 10 | pF | — |

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

FIGURE 37-2: EXTERNAL CLOCK TIMING

TABLE 37-17: EXTERNAL CLOCK TIMING REQUIREMENTS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|---------------|--|---|------------------------|---------|-------|---|
| Param. No. | Symbol | Characteristics | Minimum | Typical ⁽¹⁾ | Maximum | Units | Conditions |
| OS10 | Fosc | External CLKI Frequency (External clocks allowed only in EC and ECPLL modes) | DC | — | 64 | MHz | EC (Note 2,3) |
| OS13 | Fosc | Oscillator Crystal Frequency | 4 | — | 32 | MHz | HS (Note 2,3) |
| OS15 | | | 32 | 32.768 | 100 | kHz | Sosc (Note 2) |
| OS20 | Tosc | Tosc = 1/Fosc | — | — | — | — | See parameter OS10 for Fosc value |
| OS30 | TosL, TosH | External Clock In (OSC1) High or Low Time | 0.375 x Tosc | — | — | ns | EC (Note 2) |
| OS31 | TosR, TosF | External Clock In (OSC1) Rise or Fall Time | — | — | 7.5 | ns | EC (Note 2) |
| OS40 | TOST | Oscillator Start-up Timer Period (Only applies to HS, HSPLL, and Sosc Clock Oscillator modes) | — | 1024 | — | Tosc | (Note 2) |
| OS41 | TFSCM | Primary Clock Fail Safe Time-out Period | — | 2 | — | ms | (Note 2) |
| OS42 | GM | External Oscillator Transconductance | — | 400 | — | μA/V | VDD = 3.3V, TA = +25°C, HS (Note 2) |

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are characterized but are not tested.

2: This parameter is characterized, but not tested in manufacturing.

3: See parameter [OS50](#) for PLL input frequency limitations.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-18: SYSTEM TIMING REQUIREMENTS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|---------------------------|---|---------|---------|-------|--|
| Param. No. | Symbol | Characteristics | Minimum | Typical | Maximum | Units | Conditions |
| OS51 | FSYS | System Frequency | DC | — | 200 | MHz | USB module disabled |
| | | | 30 | — | 200 | MHz | USB module enabled |
| OS55a | FPB | Peripheral Bus Frequency | DC | — | 100 | MHz | For PBCLKx, 'x' ≠ 7 |
| OS55b | | | DC | — | 200 | MHz | For PBCLK7 |
| OS56 | FREF | Reference Clock Frequency | — | — | 50 | MHz | For REFCLK1, 3, 4 and REFCLK0, 3, 4 pins |

TABLE 37-19: PLL CLOCK TIMING SPECIFICATIONS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|--|---|---------|-------|-------|-----------------------------|
| Param. No. | Symbol | Characteristics ⁽¹⁾ | Min. | Typical | Max. | Units | Conditions |
| OS50 | FIN | PLL Input Frequency Range | 5 | — | 64 | MHz | ECPLL, HSPLL, FRCPLL modes |
| OS52 | TLOCK | PLL Start-up Time (Lock Time) | — | — | 100 | µs | — |
| OS53 | DCLK | CLKO Stability ⁽²⁾ (Period Jitter or Cumulative) | -0.25 | — | +0.25 | % | Measured over 100 ms period |
| OS54 | FVCO | PLL VCO Frequency Range | 350 | — | 700 | MHz | — |
| OS54a | FPLL | PLL Output Frequency Range | 10 | — | 200 | MHz | — |

Note 1: These parameters are characterized, but not tested in manufacturing.

2: This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$EffectiveJitter = \frac{D_{CLK}}{\sqrt{\frac{PBCLK2}{CommunicationClock}}}$$

For example, if PBCLK2 = 100 MHz and SPI bit rate = 50 MHz, the effective jitter is as follows:

$$EffectiveJitter = \frac{D_{CLK}}{\sqrt{\frac{100}{50}}} = \frac{D_{CLK}}{1.41}$$

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-20: INTERNAL FRC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|---|-----------------|---|------|------|-------|--------------------|
| Param. No. | Characteristics | Min. | Typ. | Max. | Units | Conditions |
| Internal FRC Accuracy @ 8.00 MHz⁽¹⁾ | | | | | | |
| F20 | FRC | -5 | — | +5 | % | 0°C ≤ TA ≤ +85°C |
| | | -8 | — | +8 | % | -40°C ≤ TA ≤ +85°C |

Note 1: Frequency calibrated at +25°C and 3.3V. The TUN bits (OSCTUN<5:0>) can be used to compensate for temperature drift.

TABLE 37-21: INTERNAL LPRC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|---|-----------------|---|------|------|-------|--------------------|
| Param. No. | Characteristics | Min. | Typ. | Max. | Units | Conditions |
| Internal LPRC @ 32.768 kHz⁽¹⁾ | | | | | | |
| F21 | LPRC | -8 | — | +8 | % | 0°C ≤ TA ≤ +85°C |
| | | -25 | — | +25 | % | -40°C ≤ TA ≤ +85°C |

Note 1: Change of LPRC frequency as VDD changes.

TABLE 37-22: INTERNAL BACKUP FRC (BFRC) ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|---|-----------------|---|------|------|-------|------------|
| Param. No. | Characteristics | Min. | Typ. | Max. | Units | Conditions |
| Internal BFRC Accuracy @ 8 MHz¹ | | | | | | |
| F22 | BFRC | — | ±30 | — | % | — |

FIGURE 37-3: I/O TIMING CHARACTERISTICS

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-23: I/O TIMING REQUIREMENTS

| AC CHARACTERISTICS | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | |
|--------------------|--------|---|------|---------------------|------|-------|---------------|
| Param. No. | Symbol | Characteristics ⁽²⁾ | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| DO31 | TioR | Port Output Rise Time I/O Pins: 4x Source Driver Pins - RA3, RA9, RA10, RA14, RA15 RB0-RB2, RB4, RB6-RB7, RB11, RB13 RC12-RC15 RD0, RD6-RD7, RD11, RD14 RE8, RE9 RF2, RF3, RF8 RG15 RH0, RH1, RH4-RH6, RH8-RH13 RJ0-RJ2, RJ8, RJ9, RJ11 | — | — | 9.5 | ns | CLOAD = 50 pF |
| | | Port Output Rise Time I/O Pins: 8x Source Driver Pins - RA0-RA2, RA4, RA5 RB3, RB5, RB8-RB10, RB12, RB14, RB15 RC1-RC4 RD1-RD5, RD9, RD10, RD12, RD13, RD15 RE4-RE7 RF0, RF4, RF5, RF12, RF13 RG0, RG1, RG6-RG9 RH2, RH3, RH7, RH14, RH15 RJ3-RJ7, RJ10, RJ12-RJ15 RK0-RK7 | — | — | 8 | ns | CLOAD = 50 pF |
| | | Port Output Rise Time I/O Pins: 12x Source Driver Pins - RA6, RA7 RE0-RE3 RF1 RG12-RG14 | — | — | 3.5 | ns | CLOAD = 50 pF |
| | | | — | — | 2 | ns | CLOAD = 20 pF |
| | | | — | — | 6 | ns | CLOAD = 20 pF |

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated.

Note 2: This parameter is characterized, but not tested in manufacturing.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE 37-23: I/O TIMING REQUIREMENTS (CONTINUED)

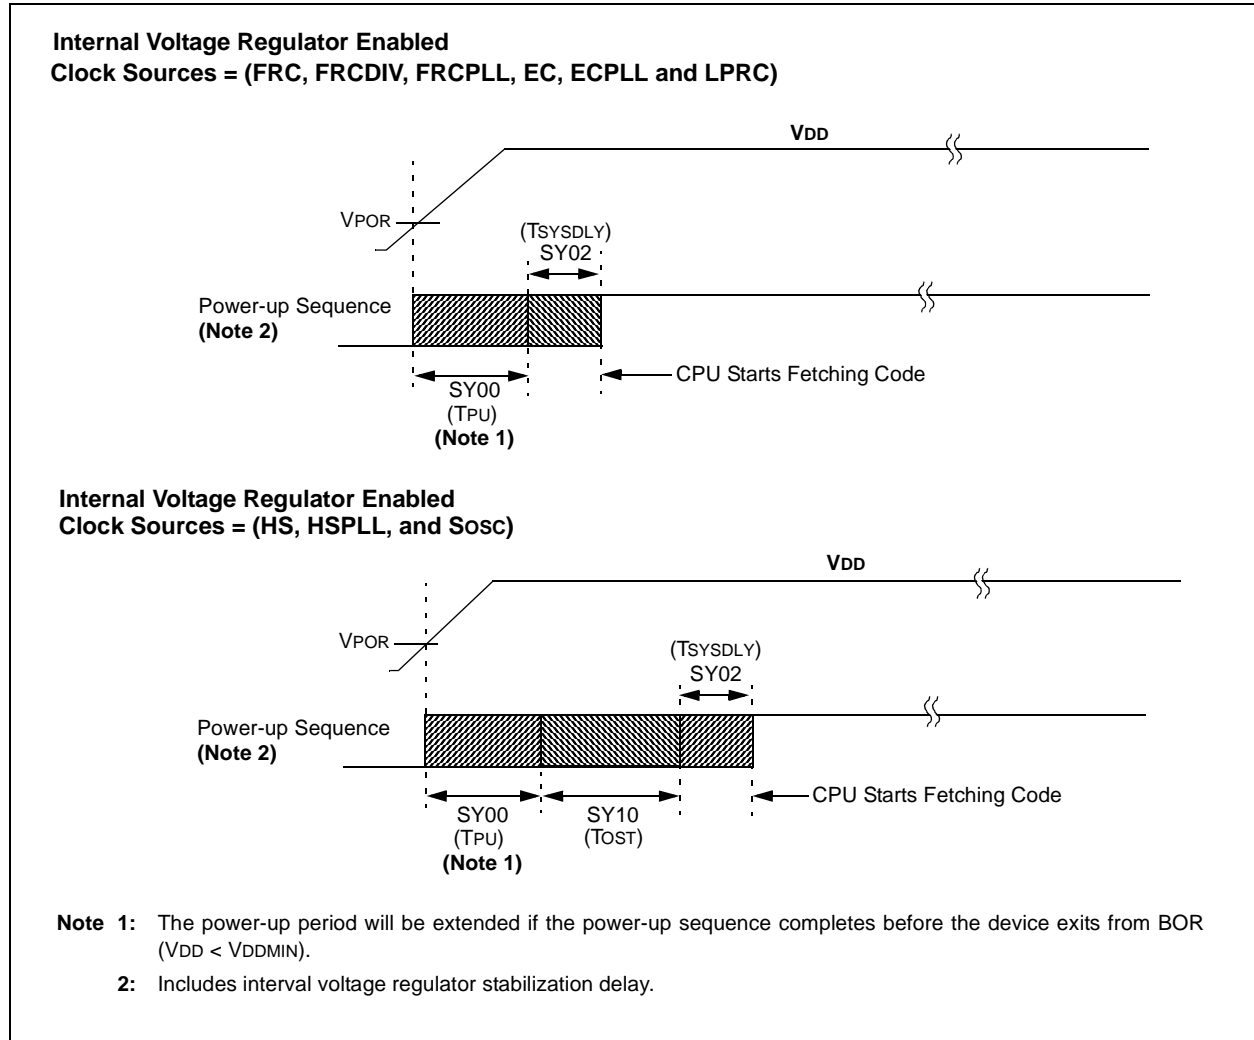

| AC CHARACTERISTICS | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | |
|--------------------|--------|---|------|---------------------|------|-------|---------------|
| Param. No. | Symbol | Characteristics ⁽²⁾ | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| DO32 | TioF | Port Output Fall Time I/O Pins: 4x Source Driver Pins - RA3, RA9, RA10, RA14, RA15 RB0-RB2, RB4, RB6-RB7, RB11, RB13 RC12-RC15 RD0, RD6-RD7, RD11, RD14 RE8, RE9 RF2, RF3, RF8 RG15 RH0, RH1, RH4-RH6, RH8-RH13 RJ0-RJ2, RJ8, RJ9, RJ11 | — | — | 9.5 | ns | CLOAD = 50 pF |

| | | | 10 | — | — | ns | VDD < 2.7V |

- Note 1:** These parameters are characterized, but not tested in manufacturing.
- 2:** Data in “Typical” column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
- 3:** The minimum clock period for SCKx is 20 ns. Therefore, the clock generated in Master mode must not violate this specification.
- 4:** Assumes 30 pF load on all SPIx pins.
- 5:** To achieve maximum data rate, SMP must be set to ‘1’.

Note 2: These parameters are characterized, but not tested in manufacturing.
Note 3: Characterized with a 1 kHz sine wave.
Note 4: The ADC module is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$, but with degraded performance. Unless otherwise stated, module functionality is guaranteed, but not characterized.

39.0 PACKAGING INFORMATION

39.1 Package Marking Information

64-Lead QFN (9x9x0.9 mm)

Example

64-Lead TQFP (10x10x1 mm)

Example

100-Lead TQFP (14x14x1 mm)

Example

| | | |
|----------------|--------|--|
| Legend: | XX...X | Customer-specific information |
| | Y | Year code (last digit of calendar year) |
| | YY | Year code (last 2 digits of calendar year) |
| | WW | Week code (week of January 1 is week '01') |
| | NNN | Alphanumeric traceability code |
| | * | Pb-free JEDEC designator for Matte Tin (Sn) |
| | | This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package. |

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

39.1 Package Marking Information (Continued)

100-Lead TQFP (12x12x1 mm)

Example

124-Lead VTLA (9x9x0.9 mm)

Example

144-Lead TQFP (16x16x1 mm)

Example

144-Lead LQFP (20x20x1.40 mm)

Example

| | | |
|----------------|---|--|
| Legend: | XX...X | Customer-specific information |
| | Y | Year code (last digit of calendar year) |
| | YY | Year code (last 2 digits of calendar year) |
| | WW | Week code (week of January 1 is week '01') |
| | NNN | Alphanumeric traceability code |
| | * | Pb-free JEDEC designator for Matte Tin (Sn) |
| | | This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package. |
| Note: | In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. | |

NOTES:

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

APPENDIX A: MIGRATING FROM PIC32MX5XX/6XX/7XX TO PIC32MZ EF

This appendix provides an overview of considerations for migrating from PIC32MX5XX/6XX/7XX devices to the PIC32MZ EF family of devices. The code developed for PIC32MX5XX/6XX/7XX devices can be ported to PIC32MZ EF devices after making the appropriate changes outlined in the following sections.

The PIC32MZ EF devices are based on a new architecture, and feature many improvements and new capabilities over PIC32MX5XX/6XX/7XX devices.

A.1 Oscillator and PLL Configuration

Because the maximum speed of the PIC32MZ EF family is 200 MHz, the configuration of the oscillator is different from prior PIC32MX5XX/6XX/7XX devices.

[Table A-1](#) summarizes the differences (indicated by **Bold type**) between the family devices for the oscillator.

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|--|---|
| Primary Oscillator Configuration | |
| <p>On PIC32MX devices, XT mode had to be selected if the input frequency was in the 3 MHz to 10 MHz range (4-10 for PLL), and HS mode had to be selected if the input frequency was in the 10 MHz to 20 MHz range.</p> <p>POSCMOD<1:0> (DEVCFG1<9:8>) 11 = Primary Oscillator disabled 10 = HS Oscillator mode selected 01 = XT Oscillator mode selected 00 = External Clock mode selected</p> | <p>On PIC32MZ EF devices, HS mode has a wider input frequency range (4 MHz to 12 MHz). The bit setting of '01' is Reserved.</p> <p>POSCMOD<1:0> (DEVCFG1<9:8>) 11 = Primary Oscillator disabled 10 = HS Oscillator mode selected 01 = Reserved 00 = External Clock mode selected</p> |
| Oscillator Selection | |
| <p>On PIC32MX devices, clock selection choices are as follows:</p> <p>FNOSC<2:0> (DEVCFG1<2:0>) NOSC<2:0> (OSCCON<10:8>) 111 = FRCDIV 110 = FRCDIV16 101 = LPRC 100 = SOSC 011 = POSC with PLL module 010 = POSC (XT, HS, EC) 001 = FRCDIV+PLL 000 = FRC</p> <p>COSC<2:0> (OSCCON<14:12>) 111 = FRC divided by FRCDIV 110 = FRC divided by 16 101 = LPRC 100 = SOSC 011 = POSC + PLL module 010 = POSC 001 = FRCPLL 000 = FRC</p> | <p>On PIC32MZ EF devices, clock selection choices are as follows:</p> <p>FNOSC<2:0> (DEVCFG1<2:0>) NOSC<2:0> (OSCCON<10:8>) 111 = FRCDIV 110 = Reserved 101 = LPRC 100 = SOSC 011 = Reserved 010 = POSC (HS or EC) 001 = System PLL (SPLL) 000 = FRCDIV</p> <p>COSC<2:0> (OSCCON<14:12>) 111 = FRC divided by FRCDIV 110 = BFRC 101 = LPRC 100 = SOSC 011 = Reserved 010 = POSC 001 = System PLL 000 = FRC divided by FRCDIV</p> |
| Secondary Oscillator Enable | |
| <p>FSOSCEN (DEVCFG1<5>)</p> | <p>The location of the SOSCCEN bit in the Flash Configuration Words has moved.</p> <p>FSOSCEN (DEVCFG1<6>)</p> |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES (CONTINUED)

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| PLL Configuration | |
| <p>The FNOSC<2:0> and NOSC<2:0> bits select between POSC and FRC.</p> <p>FNOSC<2:0> (DEVCFG1<2:0>) NOSC<2:0> (OSCCON<10:8>)</p> | <p>Selection of which input clock (POSC or FRC) is now done through the FPLLICK/PLLICK bits.</p> <p>FPLLICK (DEVCFG2<7>) PLLICK (SPLLCON<7>)</p> |
| <p>On PIC32MX devices, the input frequency to the PLL had to be between 4 MHz and 5 MHz. FPLLIDIV selected how to divide the input frequency to give it the appropriate range.</p> <p>FPLLIDIV<2:0> (DEVCFG2<2:0>) 111 = 12x divider 110 = 10x divider 101 = 6x divider 100 = 5x divider 011 = 4x divider 010 = 3x divider 001 = 2x divider 000 = 1x divider</p> | <p>On PIC32MZ EF devices, the input range for the PLL is wider (5 MHz to 64 MHz). The input divider values have changed, and new FPLLNRNG/PLLNRNG bits have been added to indicate under what range the input frequency falls.</p> <p>FPLLIDIV<2:0> (DEVCFG2<2:0>) PLLIDIV<2:0> (SPLLCON<2:0>) 111 = Divide by 8 110 = Divide by 7 101 = Divide by 6 100 = Divide by 5 011 = Divide by 4 010 = Divide by 3 001 = Divide by 2 000 = Divide by 1</p> <p>FPLLNRNG<2:0> (DEVCFG2<6:4>) PLLNRNG<2:0> (SPLLCON<2:0>) 111 = Reserved 110 = Reserved 101 = 34-64 MHz 100 = 21-42 MHz 011 = 13-26 MHz 010 = 8-16 MHz 001 = 5-10 MHz 000 = Bypass</p> |
| <p>On PIC32MX devices, the output frequency of PLL is between 60 MHz and 120 MHz. PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES (CONTINUED)

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|--|---|
| Crystal/Oscillator Selection for USB | |
| Any frequency that can be divided down to 4 MHz using UPLLIDIV, including 4, 8, 12, 16, 20, 40, and 48 MHz. | If the USB module is used, the Primary Oscillator is limited to either 12 MHz or 24 MHz. Which frequency is used is selected using the UPLLFSEL (DEVCFG2<30>) bit. |
| USB PLL Configuration | |
| On PIC32MX devices, the PLL for the USB requires an input frequency of 4 MHz. UPLLIDIV<2:0> (DEVCFG2<10:8>) 111 = 12x divider 110 = 10x divider 101 = 6x divider 100 = 5x divider 011 = 4x divider 010 = 3x divider 010 = 3x divider 001 = 2x divider 000 = 1x divider | On PIC32MZ EF devices, the HS USB PHY requires an input frequency of 12 MHz or 24 MHz. UPLLIDIV has been replaced with UPLLFSEL. UPLLFSEL (DEVCFG2<30>) 1 = UPLL input clock is 24 MHz 0 = UPLL input clock is 12 MHz |
| Peripheral Bus Clock Configuration | |
| On PIC32MX devices, there is one peripheral bus, and the clock for that bus is divided from the SYSCLK using FPBDIV/PBDIV. In addition, the maximum PBCLK frequency is the same as SYSCLK. FPBDIV<1:0> (DEVCFG1<5:4>) PBDIV<1:0> (OSCCON<20:19>) 11 = PBCLK is SYSCLK divided by 8 10 = PBCLK is SYSCLK divided by 4 01 = PBCLK is SYSCLK divided by 2 00 = PBCLK is SYSCLK divided by 1 | On PIC32MZ EF devices, there are eight peripheral buses with their own clocks. FPBDIV is removed, and each PBDIV is in its own register for each PBCLK. The initial PBCLK speed is fixed at reset, and the maximum PBCLK speed is limited to 100 MHz for all buses, with the exception of PBCLK7, which is 200 MHz. PBDIV<6:0> (PBxDIV<6:0>) 1111111 = PBCLKx is SYSCLK divided by 128 1111110 = PBCLKx is SYSCLK divided by 127 • • • 0000011 = PBCLKx is SYSCLK divided by 4 0000010 = PBCLKx is SYSCLK divided by 3 0000001 = PBCLKx is SYSCLK divided by 2 (default value for x < 7) 0000000 = PBCLKx is SYSCLK divided by 1 (default value for x ≥ 7) |
| CPU Clock Configuration | |
| On PIC32MX devices, the CPU clock is derived from SYSCLK. | On PIC32MZ EF devices, the CPU clock is derived from PBCLK7. |
| FRCDIV Default | |
| On PIC32MX devices, the default value for FRCDIV was to divide the FRC clock by two. FRCDIV<2:0> (OSCCON<26:24>) 111 = FRC divided by 256 110 = FRC divided by 64 101 = FRC divided by 32 100 = FRC divided by 16 011 = FRC divided by 8 010 = FRC divided by 4 001 = FRC divided by 2 (default) 000 = FRC divided by 1 | On PIC32MZ EF devices, the default has been changed to divide by one. FRCDIV<2:0> (OSCCON<26:24>) 111 = FRC divided by 256 110 = FRC divided by 64 101 = FRC divided by 32 100 = FRC divided by 16 011 = FRC divided by 8 010 = FRC divided by 4 001 = FRC divided by 2 000 = FRC divided by 1 (default) |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES (CONTINUED)

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| Fail-Safe Clock Monitor (FSCM) | |
| On PIC32MX devices, the internal FRC became the clock source on a failure of the clock source. | On PIC32MZ EF devices, a separate internal Backup FRC (BFRC) becomes the clock source upon a failure at the clock source. |
| On PIC32MX devices, a clock failure resulted in the triggering of a specific interrupt when the switchover was complete. FSCM generates an interrupt. | On PIC32MZ EF devices, a NMI is triggered instead, and must be handled by the NMI routine. FSCM generates a NMI. |
| FCKSM<1:0> (DEVCFG1<15:14>) 1x = Clock switching is disabled, FSCM is disabled 01 = Clock switching is enabled, FSCM is disabled 00 = Clock switching is enabled, FSCM is enabled | The definitions of the FCKSM<1:0> bits has changed on PIC32MZ EF devices. FCKSM<1:0> (DEVCFG1<15:14>) 11 = Clock switching is enabled and clock monitoring is enabled 10 = Clock switching is disabled and clock monitoring is enabled 01 = Clock switching is enabled and clock monitoring is disabled 00 = Clock switching is disabled and clock monitoring is disabled |
| On PIC32MX devices, the CF (OSCCON<3>) bit indicates a clock failure. Writing to this bit initiates a FSCM event. | On PIC32MZ EF devices, the CF (OSCCON<3>) bit has the same functionality as that of PIC32MX device; however, an additional CF(RNMICON<1>) bit is available to indicate a NMI event. Writing to this bit causes a NMI event, but not a FSCM event. |
| On PIC32MX devices, the CLKLOCK (OSCCON<7>) bit is controlled by the FSCM. CLKLOCK (OSCCON<7>) If clock switching and monitoring is disabled (FCKSM<1:0> = 1x): 1 = Clock and PLL selections are locked 0 = Clock and PLL selections are not locked and may be modified If clock switching and monitoring is enabled (FCKSM<1:0> = 0x): Clock and PLL selections are never locked and may be modified. | On PIC32MZ EF devices, the CLKLOCK (OSCCON<7>) bit is not impacted by the FSCM. CLKLOCK (OSCCON<7>) 1 = Clock and PLL selections are locked 0 = Clock and PLL selections are not locked and may be modified |

Table A-2 illustrates the difference in code setup of the respective parts for maximum speed using an external 24 MHz crystal.

TABLE A-2: CODE DIFFERENCES FOR MAXIMUM SPEED USING AN EXTERNAL 24 MHz CRYSTAL

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

A.2 Analog-to-Digital Converter (ADC)

The PIC32MZ EF family of devices has a new Pipelined ADC module that replaces the 10-bit ADC module in PIC32MX5XX/6XX/7XX devices; therefore, the use of **Bold** type to show differences is *not* used in the following table. Note that not all register differences are described in this section; however, the key feature differences are listed in [Table A-3](#).

TABLE A-3: ADC DIFFERENCES

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|--|
| Clock Selection and Operating Frequency (TAD) | |
| <p>On PIC32MX devices, the ADC clock was derived from either the FRC or from the PBCLK.</p> <p>ADRC (AD1CON3<15>) 1 = FRC clock 0 = Clock derived from Peripheral Bus Clock (PBCLK)</p> | <p>On PIC32MZ EF devices, the three possible sources of the ADC clock are FRC, REFCLKO3, and SYSCLK.</p> <p>ADCSEL<1:0> (ADCCON3<31:30>) 11 = FRC 10 = REFCLKO3 01 = SYSCLK 00 = Reserved</p> |
| <p>On PIC32MX devices, if the ADC clock was derived from the PBCLK, that frequency was divided further down, with a maximum divisor of 512, and a minimum divisor of two.</p> <p>ADCS<7:0> (AD1CON3<7:0>) 11111111 = 512 * TPB = TAD • • • 00000001 = 4 * TPB = TAD 00000000 = 2 * TPB = TAD</p> | <p>On PIC32MZ EF devices, any ADC clock source can be divided down separately for each dedicated ADC and the shared ADC, with a maximum divisor of 254. The input clock can also be fed directly to the ADC.</p> <p>ADCDIV<6:0> (ADCTIMEx<22:16>) ADCDIV<6:0> (ADCCON2<6:0>) 11111111 = 254 * TQ = TAD • • • 0000011 = 6 * TQ = TAD 0000010 = 4 * TQ = TAD 0000001 = 2 * TQ = TAD 0000000 = TQ = TAD</p> |
| Scan Trigger Source | |
| <p>On PIC32MX devices, there are four sources that can trigger a scan conversion in the ADC module: Auto, Timer3, INT0, and clearing the SAMP bit.</p> <p>SSRC<2:0> (AD1CON1<7:5>) 111 = Auto convert 110 = Reserved 101 = Reserved 100 = Reserved 011 = Reserved 010 = Timer3 period match 001 = Active transition on INT0 pin 000 = Clearing SAMP bit</p> | <p>On PIC32MZ EF devices, the list of sources for triggering a scan conversion has been expanded to include the comparators, Output Compare, and two additional Timers. In addition, trigger sources can be simulated by setting the RQCNVRT (ADCCON3<8>) bit.</p> <p>STRGSRC<4:0> (ADCCON1<20:16>) 11111 = Reserved • • • 01101 = Reserved 01100 = Comparator 2 COUT 01011 = Comparator 1 COUT 01010 = OCMP5 01001 = OCMP3 01000 = OCMP1 00111 = TMR5 match 00110 = TMR3 match 00101 = TMR1 match 00100 = INT0 00011 = Reserved 00010 = Global level software trigger (GLSWTRG) 00001 = Global software trigger (GSWTRG) 00000 = No trigger</p> |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE A-3: ADC DIFFERENCES (CONTINUED)

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|--|--|
| Output Format | |
| <p>On PIC32MX devices, the output format was decided for all ADC channels based on the setting of the FORM<2:0> bits.</p> <p>FORM<2:0> (AD1CON1<10:8>)</p> <p>011 = Signed Fractional 16-bit 010 = Fractional 16-bit 001 = Signed Integer 16-bit 000 = Integer 16-bit 111 = Signed Fractional 32-bit 110 = Fractional 32-bit 101 = Signed Integer 32-bit 100 = Integer 32-bit</p> | <p>On PIC32MZ EF devices, the FRACT bit determines whether fractional or integer format is used. Then, each input can have its own setting for input (differential or single-ended) and sign (signed or unsigned) using the DIFFx and SIGNx bits in the ADCIMODx registers.</p> <p>FRACT (ADCCON1<23>)</p> <p>1 = Fractional 0 = Integer</p> <p>DIFFx (ADCIMODy)</p> <p>1 = Channel x is using Differential mode 0 = Channel x is using Single-ended mode</p> <p>SIGNx (ADCMODy)</p> <p>1 = Channel x is using Signed Data mode 0 = Channel x is using Unsigned Data mode</p> |
| Interrupts | |
| <p>On PIC32MX devices, an interrupt is triggered from the ADC module when a certain number of conversions have taken place, irrespective of which channel was converted.</p> <p>SMPI<3:0> (AD1CON2<5:2>)</p> <p>1111 = Interrupt for each 16th sample/convert sequence 1110 = Interrupt for each 15th sample/convert sequence • • 0001 = Interrupt for each 2nd sample/convert sequence 0000 = Interrupt for each sample/convert sequence</p> | <p>On PIC32MZ EF devices, the ADC module can trigger an interrupt for each channel when it is converted. Use the Interrupt Controller bits, IEC1<31:27>, IEC2<31:0>, and IEC3<7:0>, to enable/disable them.</p> <p>In addition, the ADC support one global interrupt to indicate conversion on any number of channels.</p> <p>AGIENxx (ADCGIRQENx<y>)</p> <p>1 = Data ready event will generate a Global ADC interrupt 0 = No global interrupt</p> <p>In addition, interrupts can be generated for filter and comparator events.</p> |
| I/O Pin Analog Function Selection | |
| <p>On PIC32MX devices, the analog function of an I/O pin was determined by the PCFGx bit in the AD1PCFG register.</p> <p>PCFGx (AD1PCFG<x>)</p> <p>1 = Analog input pin in Digital mode 0 = Analog input pin in Analog mode</p> | <p>On PIC32MZ EF devices, the analog selection function has been moved into a separate register on each I/O port. Note that the sense of the bit is different.</p> <p>ANSxy (ANSELx<y>)</p> <p>1 = Analog input pin in Analog mode 0 = Analog input pin in Digital mode</p> |
| Electrical Specifications and Timing Requirements | |
| <p>Refer to “Section 31. Electrical Characteristics” in the PIC32MX5XX/6XX/7XX Data Sheet for ADC module specifications and timing requirements.</p> | <p>On PIC32MZ EF devices, the ADC module sampling and conversion time and other specifications have changed. Refer to 37.0 “Electrical Characteristics” for more information.</p> |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

A.3 CPU

The CPU in the PIC32MZ EF family of devices has been changed to the MIPS32 M-Class MPU architecture. This CPU includes DSP ASE, internal data and instruction L1 caches, and a TLB-based MMU.

Table A-4 summarizes some of the key differences (indicated by **Bold** type) in the internal CPU registers.

TABLE A-4: CPU DIFFERENCES

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|--|---|
| L1 Data and Instruction Cache and Prefetch Wait States | |
| <p>On PIC32MX devices, the cache was included in the prefetch module outside the CPU.</p> <p>PREFEN<1:0> (CHECON<5:4>) 11 = Enable predictive prefetch for both cacheable and non-cacheable regions 10 = Enable predictive prefetch for non-cacheable regions only 01 = Enable predictive prefetch for cacheable regions only 00 = Disable predictive prefetch</p> <p>DCSZ<1:0> (CHECON<9:8>) Changing these bits causes all lines to be reinitialized to the "invalid" state. 11 = Enable data caching with a size of 4 lines 10 = Enable data caching with a size of 2 lines 01 = Enable data caching with a size of 1 line 00 = Disable data caching</p> <p>CHECOH (CHECON<16>) 1 = Invalidate all data and instruction lines 0 = Invalidate all data and instruction lines that are not locked</p> | <p>On PIC32MZ EF devices, the CPU has a separate L1 instruction and data cache in the core. The PREFEN<1:0> bits still enable the prefetch module; however, the K0<2:0> bits in the CP0 registers controls the internal L1 cache for the designated regions.</p> <p>PREFEN<1:0> (PRECON<5:4>) 11 = Enable predictive prefetch for any address 10 = Enable predictive prefetch for CPU instructions and CPU data 01 = Enable predictive prefetch for CPU instructions only 00 = Disable predictive prefetch</p> <p>K0<2:0> (CP0 Reg 16, Select 0) 011 = Cacheable, non-coherent, write-back, write allocate 010 = Uncached 001 = Cacheable, non-coherent, write-through, write allocate 000 = Cacheable, non-coherent, write-through, no write allocate</p> |
| <p>PFMWS<2:0> (CHECON<2:0>) 111 = Seven Wait states 110 = Six Wait states 101 = Five Wait states 100 = Four Wait states 011 = Three Wait states 010 = Two Wait states (61-80 MHz) 001 = One Wait state (31-60 MHz) 000 = Zero Wait state (0-30 MHz)</p> | <p>The Program Flash Memory read wait state frequency points have changed in PIC32MZ EF devices. The register for accessing the PFMWS field has changed from CHECON to PRECON.</p> <p>PFMWS<2:0> (PRECON<2:0>) 111 = Seven Wait states • • • 011 = Three Wait states 010 = Two Wait states (133-200 MHz) 001 = One Wait state (66-133 MHz) 000 = Zero Wait states (0-66 MHz)</p> <p>Note: Wait states listed are for ECC enabled.</p> |
| Core Instruction Execution | |
| <p>On PIC32MX devices, the CPU can execute MIPS16e instructions and uses a 16-bit instruction set, which reduces memory size.</p> <p>MIPS16e®</p> | <p>On PIC32MZ EF devices, the CPU can operate a mode called microMIPS. microMIPS mode is an enhanced MIPS32® instruction set that uses both 16-bit and 32-bit opcodes. This mode of operation reduces memory size with minimum performance impact.</p> <p>microMIPS™ The BOOTISA (DEVCFG0<6>) Configuration bit controls the MIPS32 and microMIPS modes for boot and exception code. 1 = Boot code and Exception code is MIPS32® (ISAONEXC bit is set to '0' and the ISA<1:0> bits are set to '10' in the CP0 Config3 register) 0 = Boot code and Exception code is microMIPS™ (ISAONEXC bit is set to '1' and the ISA<1:0> bits are set to '11' in the CP0 Config3 register)</p> |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

A.4 Resets

The PIC32MZ EF family of devices has updated the resets modules to incorporate the new handling of NMI resets from the WDT, DMT, and the FSCM. In addition, some bits have been moved, as summarized in [Table A-5](#).

TABLE A-5: RESET DIFFERENCES

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|--|--|
| Power Reset | |
| VREGS (RCON<8>) 1 = Regulator is enabled and is on during Sleep mode 0 = Regulator is disabled and is off during Sleep mode | The VREGS bit, which controls whether the internal regulator is enabled in Sleep mode, has been moved from RCON in PIC32MX5XX/6XX/7XX devices to a new PWRCON register in PIC32MZ EF devices. VREGS (PWRCON<0>) 1 = Voltage regulator will remain active during Sleep 0 = Voltage regulator will go to Stand-by mode during Sleep |
| Watchdog Timer Reset | |
| On PIC32MX devices, a WDT expiration immediately triggers a device reset. WDT expiration immediately causes a device reset. | On PIC32MZ EF devices, the WDT expiration now causes a NMI. The WDTO bit in RNMICON indicates that the WDT caused the NMI. A new timer, NMICNT, runs when the WDT NMI is triggered, and if it expires, the device is reset. WDT expiration causes a NMI, which can then trigger the device reset. WDTO (RNMICON<24>) 1 = WDT time-out has occurred and caused a NMI 0 = WDT time-out has not occurred NMICNT<7:0> (RNMICON<7:0>) |

A.5 USB

The PIC32MZ EF family of devices has a new Hi-Speed USB module, which requires the updated USB stack from Microchip. In addition, the USB PLL was also updated. See [Section A.1 “Oscillator and PLL Configuration”](#) for more information and [Table A-6](#) for a list of additional differences.

TABLE A-6: USB DIFFERENCES

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| Debug Mode | |
| On PIC32MX devices, when stopping on a breakpoint during debugging, the USB module can be configured to stop or continue execution from the Freeze Peripherals dialog in MPLAB X IDE. | On PIC32MZ EF devices, the USB module continues operating when stopping on a breakpoint during debugging. |
| VBUSON Pin | |
| PIC32MX devices feature a VBUSON pin for controlling the external transceiver power supply. | On PIC32MZ EF devices, the VBUSON pin is not available. A port pin can be used to achieve the same functionality. |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

A.6 DMA

The DMA controller in PIC32MZ EF devices is similar to the DMA controller in PIC32MX5XX/6XX/7XX devices. New features include the extension of pattern matching to two by bytes and the addition of the optional Pattern Ignore mode. [Table A-7](#) lists differences (indicated by **Bold** type) that will affect software migration.

TABLE A-7: DMA DIFFERENCES

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| Read/Write Status on Error | |
| RDWR (DMASTAT<3>) 1 = Last DMA bus access when an error was detected was a read 0 = Last DMA bus access when an error was detected was a write | The RDWR bit has moved from DMASTAT<3> in PIC32MX5XX/6XX/7XX devices to DMASTAT<31> in PIC32MZ EF devices. RDWR (DMASTAT<31>) 1 = Last DMA bus access when an error was detected was a read 0 = Last DMA bus access when an error was detected was a write |
| Source-to-Destination Transfer | |
| On PIC32MX devices, a DMA channel performs a read of the source data and completes the transfer of this data into the destination address before it is ready to read the next data from the source. | On PIC32MZ EF devices, the DMA implements a 4-deep queue for data transfers. A DMA channel reads the source data and places it into the queue, regardless of whether previous data in the queue has been delivered to the destination address. |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

A.7 Interrupts and Exceptions

The key difference between Interrupt Controllers in PIC32MX5XX/6XX/7XX devices and PIC32MZ EF devices concerns vector spacing. Previous PIC32MX devices had fixed vector spacing, which is adjustable in set increments, and every interrupt had the same amount of space. PIC32MZ EF devices replace this with a variable offset spacing, where each interrupt has an offset register to determine where to begin execution.

In addition, the IFSx, IECx, and IPCx registers for old peripherals have shifted to different registers due to new peripherals. Please refer to [Section 7.0 “CPU Exceptions and Interrupt Controller”](#) to determine where the interrupts are now located.

[Table A-8](#) lists differences (indicated by **Bold** type) in the registers that will affect software migration.

TABLE A-8: INTERRUPT DIFFERENCES

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| Vector Spacing | |
| <p>On PIC32MX devices, the vector spacing was determined by the VS field in the CPU core.</p> <p>VS<4:0> (IntCtl<9:5>: CP0 Register 12, Select 1) 10000 = 512-byte vector spacing 01000 = 256-byte vector spacing 00100 = 128-byte vector spacing 00010 = 64-byte vector spacing 00001 = 32-byte vector spacing 00000 = 0-byte vector spacing</p> | <p>On PIC32MZ EF devices, the vector spacing is variable and determined by the Interrupt controller. The VOFFx<17:1> bits in the OFFx register are set to the offset from EBASE where the interrupt service routine is located.</p> <p>VOFFx<17:1> (OFFx<17:1>) Interrupt Vector ‘x’ Address Offset bits</p> |
| Shadow Register Sets | |
| <p>On PIC32MX devices, there was one shadow register set which could be used during interrupt processing. Which interrupt priority could use the shadow register set was determined by the FSRSEL field in DEVCFG3 and SS0 on INTCON.</p> <p>FSRSSEL<2:0> (DEVCFG3<18:16>) 111 = Assign Interrupt Priority 7 to a shadow register set 110 = Assign Interrupt Priority 6 to a shadow register set • • • 001 = Assign Interrupt Priority 1 to a shadow register set 000 = All interrupt priorities are assigned to a shadow register set</p> <p>SS0 (INTCON<16>) 1 = Single vector is presented with a shadow register set 0 = Single vector is not presented with a shadow register set</p> | <p>On PIC32MZ EF devices, there are seven shadow register sets, and each priority level can be assigned a shadow register set to use via the PRIxSS<3:0> bits in the PRISS register. The SS0 bit is also moved to PRISS<0>.</p> <p>PRIxSS<3:0> PRISS<y:z> 1xxx = Reserved (by default, an interrupt with a priority level of x uses Shadow Set 0) 0111 = Interrupt with a priority level of x uses Shadow Set 7 0110 = Interrupt with a priority level of x uses Shadow Set 6 • • • 0001 = Interrupt with a priority level of x uses Shadow Set 1 0000 = Interrupt with a priority level of x uses Shadow Set 0</p> <p>SS0 (PRISS<0>) 1 = Single vector is presented with a shadow register set 0 = Single vector is not presented with a shadow register set</p> |
| Status | |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

A.8 Flash Programming

The PIC32MZ EF family of devices incorporates a new Flash memory technology. Applications ported from PIC32MX5XX/6XX/7XX devices that take advantage of Run-time Self Programming will need to adjust the Flash programming steps to incorporate these changes.

Table A-9 lists the differences (indicated by **Bold** type) that will affect software migration.

TABLE A-9: FLASH PROGRAMMING DIFFERENCES

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| Program Flash Write Protection | |
| <p>On PIC32MX devices, the Program Flash write-protect bits are part of the Flash Configuration words (DEVCFG0).</p> <p>PWP<7:0> (DEVCFG0<19:12>) 11111111 = Disabled 11111110 = 0xBD000FFF 11111101 = 0xBD001FFF 11111100 = 0xBD002FFF 11111011 = 0xBD003FFF 11111010 = 0xBD004FFF 11111001 = 0xBD005FFF 11111000 = 0xBD006FFF 11110111 = 0xBD007FFF 11110110 = 0xBD008FFF 11110101 = 0xBD009FFF 11110100 = 0xBD00AFFF 11110011 = 0xBD00BFFF 11110010 = 0xBD00CFFF 11110001 = 0xBD00DFFF 11110000 = 0xBD00EFFF 11101111 = 0xBD00FFFF • • • 01111111 = 0xBD07FFFF</p> | <p>On PIC32MZ EF devices, the write-protect register is contained separately as the NVMPWP register. It has been expanded to 24 bits, and now represents the address below, which all Flash memory is protected. Note that the lower 14 bits are forced to zero, so that all memory locations in the page are protected.</p> <p>PWP<23:0> (NVMPWP<23:0>) Physical memory below address 0x1Dxxxxxx is write protected, where 'xxxxxx' is specified by PWP<23:0>. When PWP<23:0> has a value of '0', write protection is disabled for the entire program Flash. If the specified address falls within the page, the entire page and all pages below the current page will be protected.</p> |
| Code Protection | |
| <p>On PIC32MX devices, code protection is enabled by the CP (DEVCFG<28>) bit.</p> | <p>On PIC32MZ EF devices, code protection is enabled by the CP (DEVCP0<28>) bit.</p> |
| Boot Flash Write Protection | |
| <p>On PIC32MX devices, Boot Flash write protection is enable by the BWP (DEVCFG<24>) bit and protects the entire Boot Flash memory.</p> | <p>On PIC32MZ EF devices, Boot Flash write protection is divided into pages and is enable by the LBWPx and UBWPx bits in the NVMBWP register.</p> |
| Low-Voltage Detect Status | |
| <p>LVDSTAT (NVMCON<11>) 1 = Low-voltage event is active 0 = Low-voltage event is not active</p> | <p>The LVDSTAT bit is not available in PIC32MZ EF devices.</p> |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

A.9 Other Peripherals and Features

Most of the remaining peripherals on PIC32MZ EF devices act identical to their counterparts on PIC32MX-5XX/6XX/7XX devices. The main differences have to do with handling the increased peripheral bus clock speed and additional clock sources.

Table A-10 lists the differences (indicated by **Bold** type) that will affect software and hardware migration.

TABLE A-10: PERIPHERAL DIFFERENCES

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|--|---|
| I²C™ | |
| On PIC32MX devices, all pins are 5V-tolerant. | On PIC32MZ EF devices, the I2C4 port uses non-5V tolerant pins, and will have different VOL/VOH specifications. |
| I2CxBRG<11:0> | The Baud Rate Generator register has been expanded from 12 bits to 16 bits. I2CxBRG< 15:0 > |
| Watchdog Timer | |
| Clearing the Watchdog Timer on PIC32MX5XX/6XX/7XX devices required writing a '1' to the WDTCLR bit. | On PIC32MZ EF devices, the WDTCLR bit has been replaced with the 16-bit WDTCLRKEY, which must be written with a specific value (0x5743) to clear the Watchdog Timer. In addition, the WDTSPGM (DEVCFG1<21>) bit is used to control operation of the Watchdog Timer during Flash programming. |
| WDTCLR (WDTCON<0>) | WDTCLRKEY<15:0> (WDTCON<31:16>) |
| RTCC | |
| On PIC32MX devices, the output of the RTCC pin was selected between the Seconds Clock or the Alarm Pulse. RTCSECSEL (RTCCON<7>) 1 = RTCC Seconds Clock is selected for the RTCC pin 0 = RTCC Alarm Pulse is selected for the RTCC pin | On PIC32MZ EF devices, the RTCC Clock is added as an option. RTCSECSEL has been renamed RTCOUTSEL and expanded to two bits. RTCOUTSEL<1:0> (RTCCON<8:7>) 11 = Reserved 10 = RTCC Clock is presented on the RTCC pin 01 = Seconds Clock is presented on the RTCC pin 00 = Alarm Pulse is presented on the RTCC pin when the alarm interrupt is triggered |
| On PIC32MX devices, the Secondary Oscillator (SOSC) serves as the input clock for the RTCC module. | On PIC32MZ EF devices, an additional clock source, LPRC, is available as a choice for the input clock. RTCCLKSEL<1:0> (RTCCON<10:9>) 11 = Reserved 10 = Reserved 01 = RTCC uses the external 32.768 kHz Sosc 00 = RTCC uses the internal 32 kHz oscillator (LPRC) |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE A-10: PERIPHERAL DIFFERENCES (CONTINUED)

| Comparator/Comparator Voltage Reference | |
| <p>On PIC32MX devices, it was possible to select the VREF+ pin as the output to the CVREFOUT pin.</p> <p>VREFSEL (CVRCON<10>)</p> <p>1 = CVREF = VREF+ 0 = CVREF is generated by the resistor network</p> | <p>On PIC32MZ EF devices, the CVREFOUT pin must come from the resistor network.</p> <p>This bit is not available.</p> |
| <p>On PIC32MX devices, the internal voltage reference (IVREF) could be chosen by the BGSEL<1:0> bits.</p> <p>BGSEL<1:0> (CVRCON<9:8>)</p> <p>11 = IVREF = VREF+ 10 = Reserved 01 = IVREF = 0.6V (nominal, default) 00 = IVREF = 1.2V (nominal)</p> | <p>On PIC32MZ EF devices, IVREF is fixed and cannot be changed.</p> <p>These bits are not available.</p> |
| Change Notification | |
| <p>On PIC32MX devices, Change Notification is controlled by the CNCON, CNEN, and CNPUE registers.</p> | <p>On PIC32MZ EF devices, Change Notification functionality has been relocated into each I/O port and is controlled by the CNPUx, CNPDx, CNCONx, CNENx, and CNSTATx registers.</p> |
| System Bus | |
| <p>On PIC32MX devices, the System Bus registers can be used to configure RAM memory for data and program memory partitions, cacheability of Flash memory, and RAM Wait states. These registers are: BMXCON, BMXDKPBA, BMXDUDBA, BMXDUPBA, BMXPUPBA, BMXDRMSZ, BMXPFMSZ, and BMXBOOTSZ.</p> | <p>On PIC32MZ EF devices, a new System Bus is utilized that supports using RAM memory for program or data without the need for special configuration. Therefore, no special registers are associated with the System Bus to configure these features.</p> |
| <p>On PIC32MX devices, various arbitration modes are used as initiators on the System Bus. These modes can be selected by the BMXARB<2:0> (BMXCON<2:0>) bits.</p> | <p>On PIC32MZ EF devices, a new arbitration scheme has been implemented on the System Bus. All initiators use the Least Recently Served (LRS) scheme, with the exception of the DMA, CPU, and the Flash Controller.</p> <p>The Flash Controller always has High priority over LRS initiators.</p> <p>The DMA and CPU (when servicing an interrupt) can be selected to have LRS or High priority using the DMAPRI (CFGCON<25>) and CPUPRI (CFGCON<24>) bits.</p> |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

A.10 Package Differences

In general, PIC32MZ EF devices are mostly pin compatible with PIC32MX5XX/6XX/7XX devices; however, some pins are not. In particular, the VDD and VSS pins have been added and moved to different pins. In addition, I/O functions that were on fixed pins now will largely be on remappable pins.

TABLE A-11: PACKAGE DIFFERENCES

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|--|
| VCAP Pin | |
| On PIC32MX devices, an external capacitor is required between a VCAP pin and GND, which provides a filtering capacitor for the internal voltage regulator. A low-ESR capacitor (typically 10 μ F) is required on the VCAP pin. | On PIC32MZ EF devices, this requirement has been removed. No VCAP pin. |
| VDD and VSS Pins | |
| VDD on 64-pin packages: 10, 26, 38, 57 VDD on 100-pin packages: 2, 16, 37, 46, 62, 86 | There are more VDD pins on PIC32MZ EF devices, and many are located on different pins. VDD on 64-pin packages: 8, 26, 39, 54, 60 VDD on 100-pin packages: 14, 37, 46, 62, 74, 83, 93 |
| VSS on 64-pin packages: 9, 25, 41 VSS on 100-pin packages: 15, 36, 45, 65, 75 | There are more VSS pins on PIC32MZ EF devices, and many are located on different pins. VSS on 64-pin packages: 7, 25, 35, 40, 55, 59 VSS on 100-pin packages: 13, 36, 45, 53, 63, 75, 84, 92 |
| PPS I/O Pins | |
| All peripheral functions are fixed as to what pin upon which they operate. | Peripheral functions on PIC32MZ EF devices are now routed through a PPS module, which routes the signals to the desired pins. When migrating software, it is necessary to initialize the PPS I/O functions in order to get the signal to and from the correct pin. PPS functionality for the following peripherals: <ul style="list-style-type: none"> • CAN • UART • SPI (except SCK) • Input Capture • Output Compare • External Interrupt (except INT0) • Timer Clocks (except Timer1) • Reference Clocks (except REFCLK2) |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

APPENDIX B: MIGRATING FROM PIC32MZ EC TO PIC32MZ EF

This appendix provides an overview of considerations for migrating from PIC32MZ EC devices to the PIC32MZ EF family of devices. The code developed for PIC32MZ EC devices can be ported to PIC32MZ EF devices after making the appropriate changes outlined in the following sections.

The PIC32MZ EF devices are similar to PIC32MZ EC devices, with many feature improvements and new capabilities.

B.1 Oscillator and PLL Configuration

A number of new features have been added to the oscillator and PLL to enhance their ability to work with crystals and to change frequencies.

[Table B-1](#) summarizes the differences (indicated by **Bold** type) between the family differences for the oscillator.

TABLE B-1: OSCILLATOR DIFFERENCES

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|--|
| Primary Oscillator Crystal Power | |
| On PIC32MZ EC devices, the crystal HS Posc mode is only functional with crystals that have certain characteristics, such as very low ESR. | On PIC32MZ EF devices, some DEVCFG0 bits have been added to allow control over the strength of the oscillator and to add a kick start boost. POSCBOOST (DEVCFG0<21>) 1 = Boost the kick start of the oscillator 0 = Normal start of the oscillator POSCGAIN<1:0> (DEVCFG0<20:19>) 11 = 2x gain setting 10 = 1.5x gain setting 01 = 0.5x gain setting 00 = 1x gain setting Note that the default for POSCGAIN (2x gain setting) may over-drive crystals and shorten their life. It is the responsibility of the designer to ensure crystals are operated properly. |
| Secondary Oscillator Crystal Power | |
| On PIC32MZ EC devices, the Secondary Oscillator (SOSC) is not functional. | On PIC32MZ EF devices, the Secondary Oscillator is now functional, and provides similar strength and kick start boost features as the POSC. SOSCBOST (DEVCFG0<18>) 1 = Boost the kick start of the oscillator 0 = Normal start of the oscillator SOSCGAIN<1:0> (DEVCFG0<17:16>) 11 = 2x gain setting 10 = 1.5x gain setting 01 = 0.5x gain setting 00 = 1x gain setting Note that the default for SOSCGAIN (2x gain setting) may over-drive crystals and shorten their life. It is the responsibility of the designer to ensure crystals are operated properly. |
| Clock Status Bits | |
| On PIC32MZ EC devices, the SOSCRDY bit (OSCCON<22>) indicates when the Secondary Oscillator is ready. There are no indications of other oscillator status. | A new register, CLKSTAT, has been added, which includes the SOSCRDY bit (CLKSTAT<4>). In addition, new status bits are available: <ul style="list-style-type: none"> • LPRCRDY (CLKSTAT<5>) • POSCRDY (CLKSTAT<2>) • DIVSPLLRDY (CLKSTAT<1>) • FRCRDY (CLKSTAT<0>) |
| Clock Switching | |
| On PIC32MZ EC devices, clock switches occur as soon as the switch command is issued. Also, the only clock sources that can be divided are the output of the PLL, and the FRC. | To reduce power spikes during clock switches, PIC32MZ EF devices add a clock slewing feature, so that clock switches can be controlled in their rate and size. The SLEWCON register controls this feature. The SLEWCON register also features a SYSCLK divider, so that all of the possible clock sources may be divided further as needed. |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

B.2 Analog-to-Digital Converter (ADC)

The PIC32MZ EC family features a Pipelined ADC module, while the PIC32MZ EF family of devices has an entirely new 12-bit High-Speed SAR ADC module. Nearly all registers in this new ADC module differ from the registers in PIC32MZ EC devices. Due to this difference, code will not port from PIC32MZ EC devices to PIC32MZ EF devices. [Table B-2](#) lists some of the differences in registers to note to adapt code as quickly as possible.

TABLE B-2: ADC DIFFERENCES

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|---|
| Clock Selection and Operating Frequency (TAD) | |
| <p>On PIC32MZ EC devices, there are three possible sources of the ADC clock: FRC, REFCLKO3, and SYSCLK.</p> <p>ADCSEL<1:0> (AD1CON1<9:8>) 11 = FRC 10 = REFCLKO3 01 = SYSCLK 00 = Reserved</p> | <p>On PIC32MZ EF devices, there are four sources for the ADC clock. In addition to the ones for PIC32MZ EC, PBCLK4 is added as a source. Also, the clock source selection is in a different register.</p> <p>ADCSEL<1:0> (ADCCON3<31:30>) 11 = FRC 10 = REFCLKO3 01 = SYSCLK 00 = PBCLK4</p> |
| Scan Trigger Sources | |
| <p>On PIC32MZ EC devices, there are 10 available trigger sources for starting ADC sampling and conversion.</p> <p>STRGSRC<4:0> (AD1CON1<26:22>) 11111 = Reserved • • • 01101 = Reserved 01100 = Comparator 2 COUT 01011 = Comparator 1 COUT 01010 = OCMP5 01001 = OCMP3 01000 = OCMP1 00111 = TMR5 match 00110 = TMR3 match 00101 = TMR1 match 00100 = INTO 00011 = Reserved 00010 = Reserved 00001 = Global Software Trigger (GSWTRG) 00000 = No trigger</p> | <p>On PIC32MZ EF devices, two new sources have been added. One is a shared trigger source (STRIG). The other is a Global Level Software Trigger (GLSWTRG). With the GLSWTRG, the conversions continue until the bit is cleared in software.</p> <p>TRGSRC<4:0> (ADCTRGx<y:z>) 11111 = Reserved • • • 01101 = Reserved 01100 = Comparator 2 COUT 01011 = Comparator 1 COUT 01010 = OCMP5 01001 = OCMP3 01000 = OCMP1 00111 = TMR5 match 00110 = TMR3 match 00101 = TMR1 match 00100 = INTO 00011 = STRIG 00010 = Global Level Software Trigger (GLSWTRG) 00001 = Global Software Trigger (GSWTRG) 00000 = No trigger</p> |
| ADC Calibration | |
| <p>PIC32MZ EC devices require calibration values be copied into the AD1CALx registers before turning on the ADC. These values come from the DEVADCx registers.</p> | <p>PIC32MZ EF devices do not require this step, and the corresponding registers are not available.</p> |
| Debug Mode | |
| <p>On PIC32MZ EC devices, the ADC module continues operating when stopping on a breakpoint during debugging.</p> | <p>On PIC32MZ EF devices, the ADC module will stop during debugging when stopping on a breakpoint.</p> |
| Electrical Specifications and Timing Requirements | |
| <p>Refer to the “Electrical Characteristics” chapter in the PIC32MZ EC data sheet for ADC module specifications and timing requirements.</p> | <p>On PIC32MZ EF devices, the ADC module sampling and conversion time and other specifications have changed. Refer to 37.0 “Electrical Characteristics” for more information.</p> |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

B.3 CPU

The CPU in PIC32MZ EC devices is the microAptiv™ MPU architecture. The CPU in the PIC32MZ EF devices is the Series 5 Warrior M-Class M5150 MPU architecture. Most PIC32MZ EF M-Class core features are identical to the microAptiv™ core in PIC32MZ EC devices. The main differences are that in PIC32MZ EF devices, a floating-point unit (FPU) is included for improved math performance, and PC Sampling for performance measurement.

B.4 System Bus

The system bus on PIC32MZ EF devices is similar to the system bus on PIC32MZ EC devices. There are two key differences listed in [Table B-3](#).

TABLE B-3: SYSTEM BUS DIFFERENCES

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|---|
| Permission Groups during NMI | |
| On PIC32MZ EC devices, the permission group in which the CPU is part of is lost during NMI handling, and must be manually restored. | On PIC32MZ EF devices, the prior permission group is preserved, and is restored when the CPU returns from the NMI handler. |
| DMA Access | |
| The DMA can access the peripheral registers on Peripheral Bus 1. | On PIC32MZ EF devices, the DMA no longer has access to registers on Peripheral Bus 1. Refer to Table 4-4 for details on which peripherals are now excluded. |

B.5 Flash Controller

The Flash controller on PIC32MZ EF devices adds the ability both to control boot Flash aliasing, and for locking the current swap settings. [Table B-4](#) lists these differences.

TABLE B-4: FLASH CONTROLLER DIFFERENCES

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|--|
| Boot Flash Aliasing | |
| On PIC32MZ EC devices, boot flash aliasing is done through the DEVSEQ0 register, but no further changes are possible without rebooting the processor. | On PIC32MZ EF devices, the initial boot flash aliasing is still determined by the DEVSEQ0 register, but the BFSWAP bit (NVMCON<6>) reflects the state of the aliasing, and can be modified to change it during run-time. BFSWAP (NVMCON<6>) 1 = Boot Flash Bank 2 is mapped to the lower boot alias, and Boot Flash bank 1 is mapped to the upper boot alias 0 = Boot Flash Bank 1 is mapped to the lower boot alias, and Boot Flash Bank 2 is mapped to the upper boot alias |
| PFM and BFM Swap Locking | |
| On PIC32MZ EC devices, the swapping of PFM is always available. | On PIC32MZ EF devices, a new control, SWAPLOCK<1:0> (NVMCON2<7:6>) allows the locking of PFSWAP and BFSWAP bits, and can restrict any further changes. SWAPLOCK<1:0> (NVMCON2<7:6>) 11 = PFSWAP and BFSWAP are not writable and SWAPLOCK is not writable 10 = PFSWAP and BFSWAP are not writable and SWAPLOCK is writable 01 = PFSWAP and BFSWAP are not writable and SWAPLOCK is writable 00 = PFSWAP and BFSWAP are writable and SWAPLOCK is writable |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

B.6 Resets

On PIC32MZ EF devices, the Reset module adds eight bits to the NMICNT field to make the time-out period before device Reset longer, as described in [Table B-5](#).

TABLE B-5: RESETS DIFFERENCES

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|--|--|
| Countdown to Reset During NMIs | |
| On PIC32MZ EC devices, the NMICNT<7:0> field is eight bits long, giving a maximum of 256 instructions before the device Reset. | On PIC32MZ EF devices, the NMICNT<15:0> field is now 16 bits long, giving a longer period of time (up to 65,536 instructions) prior to a device Reset. |

B.7 USB

On PIC32MZ EF devices, a new USBCRCON register has been added to assist in controlling the reset of the USB module, and triggering interrupts based on VBUS voltage levels. This register also overcomes an errata on PIC32MZ EC devices that requires a three second start-up on the USB module.

B.8 I/O Ports

On PIC32MZ EF devices, many of the I/O pins now feature slew rate control bits to control how fast the pin makes a low-to-high or high-to-low transition. The Change Notification feature has also been enhanced to allow detection of level events in addition to edge detection.

B.9 Watchdog Timer

PIC32MZ EF devices use a new Watchdog Timer, although the overall control through the DEVCFGx words remains identical to that of PIC32MZ EC devices. [Table B-6](#) lists two more changes, as well.

TABLE B-6: WATCHDOG TIMER DIFFERENCES

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|--|---|
| Watchdog Timer Postscaler | |
| On PIC32MZ EC devices, the SWDTPS<4:0> bits (WDTCON<6:2>) reflect the postscaler setting for the Watchdog Timer. | On PIC32MZ EF devices, the field has been changed to the RUNDIV<4:0> bits (WDTCON<12:8>). |
| Watchdog Windowed Mode | |
| On PIC32MZ EC devices, WDTWINEN is at bit position 1 (WDTCON<1>). | On PIC32MZ EF devices, WDTWINEN is now at bit position 0 (WDTCON<0>). |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

B.10 Serial Quad Interface (SQI)

On PIC32MZ EF devices, the SQI module supports double-data-rate (DDR) memories. Refer to [20.0 “Serial Quad Interface \(SQI\)”](#) and [Section 46. “Serial Quad Interface \(SQI\)”](#) (DS60001128) for information.

B.11 PMP

On PIC32MZ EF devices, the PMP features the ability to buffer reads and writes in both directions, and can read and write from different addresses. Refer to [23.0 “Parallel Master Port \(PMP\)”](#) and [Section 43. “Parallel Master Port”](#) (DS60001346) for information.

B.12 Crypto Engine

[Table B-7](#) lists the changes available for the Crypto Engine.

TABLE B-7: CRYPTO DIFFERENCES

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|--|
| Output Data Format | |
| On PIC32MZ EC devices, the output of the Crypto Engine is always in big-endian format, usually requiring a software (or DMA) solution to put the data into little-endian format, which the core handles natively. | On PIC32MZ EF devices, the SWAPOEN bit (CECON<7>) has been added to control output byte swapping. This bit, when enabled, will byte-swap the output. |

B.13 Device Configuration and Control

A number of enhancements have been added to the PIC32MZ EF devices that allow greater control and flexibility on the device. Some bit fields have also changed location. [Table B-8](#) lists these changes.

TABLE B-8: DEVICE CONFIGURATION AND CONTROL DIFFERENCES

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|--|
| MCLR Pin Configuration | |
| On PIC32MZ EC devices, the MCLR pin always generate a system reset. | On PIC32MZ EF devices, the $\overline{\text{MCLR}}$ pin can now be configured to generate either a system Reset or an emulated POR Reset. SMCLR (DEVCFG0<15>) 1 = MCLR pin generates a normal system Reset 0 = MCLR pin generates an emulated POR Reset |
| I/O Analog Charge Pump | |
| Low VDD environments cause attenuation of analog inputs. | A new bit enables an I/O charge pump, which improves analog performance when operating at lower VDD. IOANCPEN (CFGCON<7>) 1 = Charge pump is enabled 0 = Charge pump is disabled |
| EBI Ready Pin Control | |
| EBIRDYINV<3:1> (CFGEBIC<30:28>) EBIRDYEN<3:1> (CFGEBIC<26:24>) | The EBIRDY control bits have been moved. EBIRDYINV<3:1> (CFGEBIC<31:29>) EBIRDYEN<3:1> (CFGEBIC<27:25>) |

APPENDIX C: REVISION HISTORY

Revision A (January 2015)

This is the initial released version of the document.

Revision B (July 2015)

The document status was updated from Advance Information to Preliminary.

The revision includes the following major changes, which are referenced by their respective chapter in [Table C-1](#).

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE C-1: MAJOR SECTION UPDATES

| Section Name | Update Description |
|--|---|
| 32-bit MCUs (up to 2 MB Live-Update Flash and 512 KB SRAM) with FPU, Audio and Graphics Interfaces, HS USB, Ethernet, and Advanced Analog | The Operating Conditions were updated to: 2.1V to 3.6V. |
| 4.0 “Memory Organization” | Legal information on the System Bus was added (see 4.2 “System Bus Arbitration”). |
| 5.0 “Flash Program Memory” | The BOOTSWAP bit in the NVMCON register was changed to: BFSWAP (see Register 5-1). |
| 6.0 “Resets” | The NVMLTA bit was removed from the RCON register (see Register 6-1). The GNMI bit was added to the RNMICON register (see Register 6-3). |
| 7.0 “CPU Exceptions and Interrupt Controller” | The ADC FIFO Data Ready Interrupt, IRQ 45, was added (see Table 7-2). ADC FIFO bits were added, and Note 7 regarding devices without a Crypto module was added to the Interrupt Register Map (see Table 7-3). The NMIKEY<7:0> bits were added to the INTCON register (see Register 7-1). |
| 8.0 “Oscillator Configuration” | The SPLLRDY bit was removed and the SPLLDIVRDY bit was added to the CLKSTAT register (see Register 8-8). |
| 11.0 “Hi-Speed USB with On-The-Go (OTG)” | The VBUSIE and VBUSIF bits were changed to: VBUSERRIE and VBUSERRIF, respectively in the USBCSR2 register (see Register 11-3). |
| 15.0 “Deadman Timer (DMT)” | The POR values were updated for the PSCNT<4:0> bits in the Post Status Configure DMT Count Status register (see Register 15-6). The POR values were updated for the PSINTV<2:0> bits in the Post Status Configure DMT Interval Status register (see Register 15-7). |
| 16.0 “Watchdog Timer (WDT)” | The WDTCON register was updated (see Register 16-1). |
| 23.0 “Parallel Master Port (PMP)” | The PMDOUT, PMDIN, and PMRDIN registers were added (see Register 23-4 , Register 23-4 , and Register 23-10). The PMADDR, PMWADDR, and PMRADDR registers were updated (see Register 23-3 , Register 23-8 , and Register 23-9). The PMRDATA register was removed. |
| 24.0 “External Bus Interface (EBI)” | Reset values for the EBIMSK2, EBIMSK3, EBISMT0-EBISMT2, and EBIFTRPD registers were updated in the EBI Register Map (see Table 24-2). POR value changes were implemented to the EBI Static Memory Timing Register (see Register 24-3). |

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

TABLE C-1: MAJOR SECTION UPDATES (CONTINUED)

| Section Name | Update Description |
|---|---|
| 27.0 “Random Number Generator (RNG)” | The TRNGMODE bit was added to the RNGCON register (see Register 27-2). |
| 28.0 “12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)” | <p>The S&H Block Diagram was updated (see Figure 28-2).</p> <p>The registers, ADCTRG4 through ADCTRG8, were removed.</p> <p>The bit value definitions for the ADCSEL<1:0> and CONCLKDIV<5:0> bits in the ADCCON3 register were updated (see Register 28-3).</p> <p>The bit names in the ADC Status registers (Register 28-12 and Register 28-13) were updated to match the names in the SFR summary table.</p> <p>The ADCTRGSNS register was updated (see Register 28-26).</p> <p>The POR values were changed in the ADC System Configuration registers (see Register 28-34 and Register 28-35).</p> |
| 34.0 “Special Features” | The FDBGWP bit was removed from the DEVCFG0/ADEVCFG0 registers (see Register 34-3). |
| 37.0 “Electrical Characteristics” | <p>V-Temp ($-40^{\circ}\text{C} \leq \text{TA} \leq +105^{\circ}\text{C}$) information was removed from all tables.</p> <p>The operating conditions voltage range was updated in the Absolute Maximum Ratings and in all tables to: 2.1V to 3.6V.</p> <p>Notes on Maximum value operating conditions were added to the Operating, Idle, and Power-Down Current tables (see Table 37-6, Table 37-7, and Table 37-8, respectively).</p> <p>The conditions for System Timing Requirement parameters OS55a and OS55b were updated (see Table 37-18).</p> <p>The Internal FRC Accuracy specifications were updated (see Table 37-20).</p> <p>The Internal LPRC Accuracy specifications were updated (see Table 37-21).</p> <p>The ADC Module Specifications were updated (see Table 37-38).</p> <p>The Analog-to-Digital Conversion Timing Requirements were updated (see Table 37-39).</p> |
| Appendix B: “Migrating from PIC32MZ EC to PIC32MZ EF” | This appendix was added, which provides an overview of considerations for migrating from PIC32MZ EC devices to the PIC32MZ EF family of devices. |
| Product Identification System | V-Temp ($-40^{\circ}\text{C} \leq \text{TA} \leq +105^{\circ}\text{C}$) information was removed. |

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

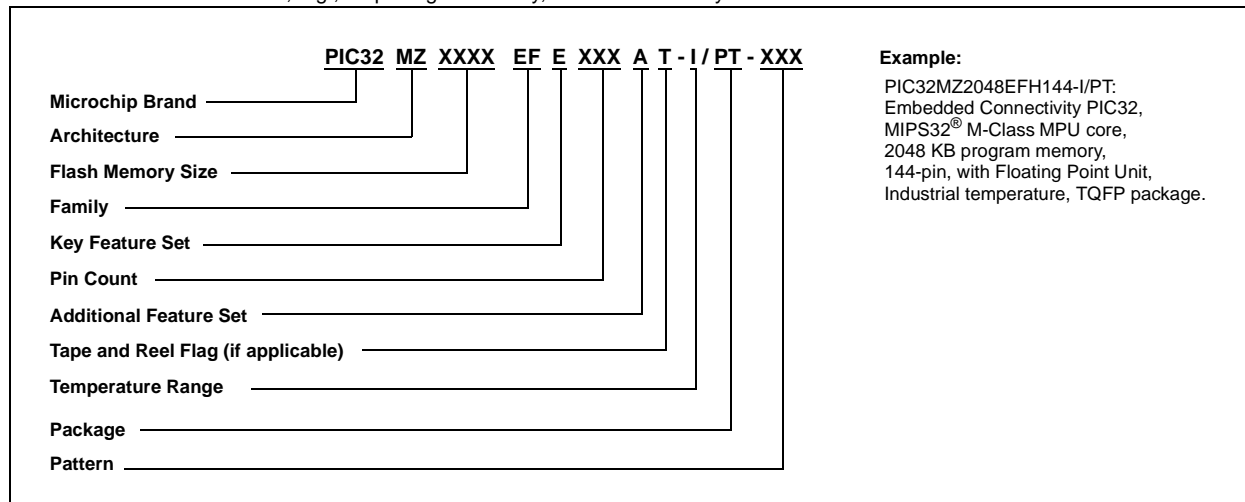

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://microchip.com/support>

PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

Example:
 PIC32MZ2048EFH144-I/PT:
 Embedded Connectivity PIC32,
 MIPS32[®] M-Class MPU core,
 2048 KB program memory,
 144-pin, with Floating Point Unit,
 Industrial temperature, TQFP package.

Flash Memory Family

| | |
|-------------------|--|
| Architecture | MZ = MIPS32 [®] M-Class MPU Core |
| Flash Memory Size | 0512 = 512 KB 1024 = 1024 KB 2048 = 2048 KB |
| Family | EF = Embedded Connectivity Microcontroller Family with Floating Point Unit |
| Key Feature | E = PIC32 EF Family Features (no CAN, no Crypto) F = PIC32 EF Family Features (CAN, no Crypto) G = PIC32 EF Family Features (no CAN, no Crypto) H = PIC32 EF Family Features (CAN, no Crypto) K = PIC32 EF Family Features (Crypto and CAN) M = PIC32 EF Family Features (Crypto and CAN) |
| Pin Count | 064 = 64-pin 100 = 100-pin 124 = 124-pin 144 = 144-pin |
| Temperature Range | I = -40°C to +85°C (Industrial) E = -40°C to +125°C (Extended) |
| Package | MR = 64-Lead (9x9x0.9 mm) QFN (Plastic Quad Flatpack) PT = 64-Lead (10x10x1 mm) TQFP (Thin Quad Flatpack) PT = 100-Lead (12x12x1 mm) TQFP (Thin Quad Flatpack) PF = 100-Lead (14x14x1 mm) TQFP (Thin Quad Flatpack) TL = 124-Lead (9x9x0.9 mm) VTLA (Very Thin Leadless Array) PH = 144-Lead (16x16x1 mm) TQFP (Thin Quad Flatpack) PL = 144-Lead (20x20x1.40 mm) LQFP (Low Profile Quad Flatpack) |
| Pattern | Three-digit QTP, SQTP, Code or Special Requirements (blank otherwise) ES = Engineering Sample |

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, flexPWR, JukeBlox, KEELOQ, KEELOQ logo, Klear, LANCheck, MediaLB, MOST, MOST logo, MPLAB, OptoLyzer, PIC, PICSTART, PIC³² logo, RightTouch, SpyNIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

The Embedded Control Solutions Company and mTouch are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, ECAN, In-Circuit Serial Programming, ICSP, Inter-Chip Connectivity, KlearNet, KlearNet logo, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, RightTouch logo, REAL ICE, SQI, Serial Quad I/O, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademarks of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949 ==

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
