

CLOUD SOLUTION

Charge Amps Cloud

Having connected charging stations is for us an obvious choice. Our cloud has three levels of administration, and our REST API facilitates an infinite number of integrations with other platforms and applications.

Our cloud currently consists of three different levels of administration, all adapted to different types of user – partner, administrator and end user. Are you an installer responsible for the operation of several different installations, or perhaps a treasurer in a housing association who administers all charging stations in your system? Or are you an end customer with one or two charging stations installed at your home? All levels have different interfaces adapted to the relevant needs.

Some of the features available in the cloud:

- Reporting/invoicing data
- Statistics
- Identification
- Phase allocation
- Dynamic load balancing
- White-label solutions
- Open API for seamless integration with payment or IT systems
- Scheduling of charging
