## Applications

- Measurement of starting current for electric motors
- Measurement of motor temperature rise with temperature sensors
- Measurement of direct current, e.g. automotive batteries

## Features

### Display Memory (data hold)

The momentary measured value can be "frozen" at the display.

### Data Logging (max., min., peak)

Measured values can be stored for long-term observation of measured quantities. At the same time, maximum, minimum and peak values (**METRAClip88** only) are acquired for the duration of the selected recording time.

### True Inrush

Measurement of motor starting current characteristics based upon the relationship between amplitude and time.

This function makes it possible to track rapid current changes of the damped sinusoidal oscillation type by measuring successive TRMS values which are calculated over 1/2, 1, 2 1/2, 5 and 10 periods based upon the largest calculated TRMS value, and are refreshed via a half-wave.

## Relative and Differential Measurements (**METRAClip88** only)

A momentary measured value can be saved as a reference value. A differential value based on the momentary measured value and the reference value can be generated and displayed for each following measurement. Alternatively, the differential value can be related to the reference value and displayed as a relative value as a percentage for each following measurement.

## Safety Devices

- Visual indication is provided in the event that the measuring range is exceeded.
- An intermittent acoustic signal warns the user of voltages which are equal to or larger than the safety voltage of 1000 V<sub>DC</sub> or TRMS.

## Automatic Shutdown

The device is shut down automatically in the event that none of the keys or the rotary switch are activated for a duration of 10 minutes. Automatic shutdown can be deactivated.

## Measured Value Recording and Data Transmission via Bluetooth to the PC with the METRAClip87

The recording function can be used to continuously save measurement results to the device at a specified interval. As a standard feature, a recording interval of 60 seconds is preset at the device. This value can be set to anywhere between 1 and 600 seconds (10 minutes) in the configuration mode.

### Overview of Possible Recording Intervals

Data Type	Maximum Number of Recording Intervals	Maximum Recording Duration with 1 Second Interval	Max. Recording Duration with 600 Second Interval
V, A, $\Omega$	3000	16 minutes	160 hours
W	3000	3.5 minutes	35 hours
THD	3000	11 minutes (2 second interval)	55 hours
Harmonics	3000	8 minutes	80 hours

Data stored to the device can be transmitted wirelessly to a PC with the Bluetooth function.

## Evaluation with a PC Program

With a connection between the clamp and the PC, the measurement data to be transmitted to the evaluation program at the PC can be selected by the user. The measurement data can then be displayed as a graphic or exported to an Excel table.
