

## TPS4005x Wide-Input Synchronous Buck Controller

### 1 Features

- Operating Input Voltage 8 V to 40 V
- Input Voltage Feed-Forward Compensation
- < 1% Internal 0.7-V Reference
- Programmable Fixed-Frequency up to 1-MHz Voltage Mode Controller
- Internal Gate-Drive Outputs for High-Side and Synchronous N-Channel MOSFETs
- 16-Pin PowerPAD™ Package ( $\theta_{JC} = 2^{\circ}\text{C/W}$ )
- Thermal Shutdown
- Externally Synchronizable
- Programmable High-Side Sense Short-Circuit Protection
- Programmable Closed-Loop Soft-Start
- TPS40054 Source Only
- TPS40055 Source and Sink
- TPS40057 Source and Sink With  $V_O$  Prebias

### 2 Applications

- Power Modules
- Networking and Telecom
- Industrial and Servers

### 3 Description

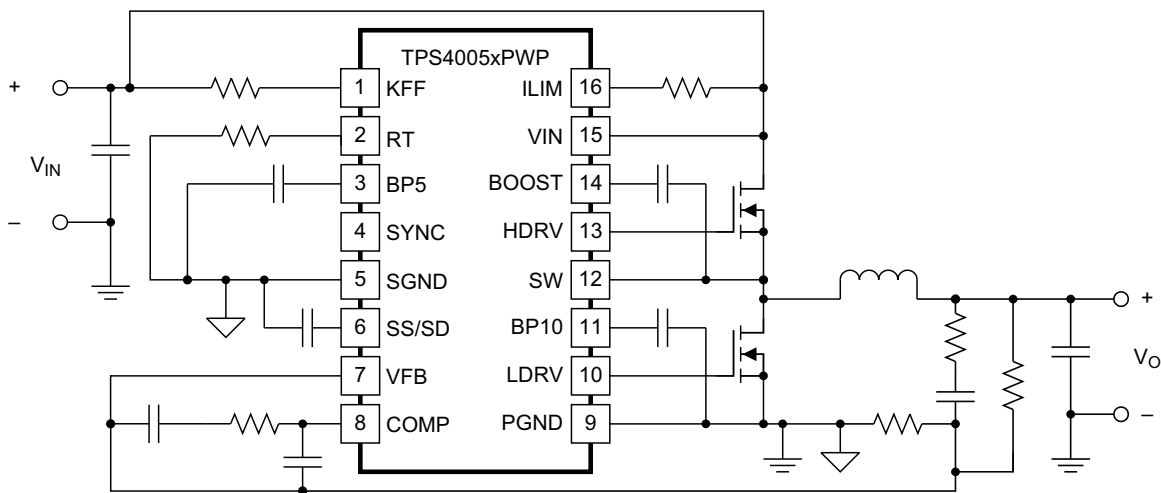

The TPS4005x is a family of high-voltage, wide-input (8 V to 40 V), synchronous, step-down controllers. The TPS4005x family offers design flexibility with a variety of user-programmable functions, including soft-start, UVLO, operating frequency, voltage feed-forward, high-side current limit, and loop compensation.

The TPS4005x uses voltage feed-forward control techniques to provide good line regulation over the wide (4:1) input voltage range, and fast response to input line transients. Near-constant modulator gain with input variation eases loop compensation. The externally programmable current limit provides pulse-by-pulse current limit, as well as hiccup mode operation using an internal fault counter for longer duration overloads.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS4005x	HTSSOP (16)	5.00 mm x 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 5 Pin Configuration and Functions

- A. For more information on the PWP package, refer to the application report, PowerPAD™ Thermally Enhanced Package ([SLMA002](#)).
- B. PowerPAD™ heat slug must be connected to SGND (pin 5) or electrically isolated from all other pins.

### Pin Functions

PIN NAME	NO.	I/O	DESCRIPTION
BOOST	14	O	Gate drive voltage for the high side N-channel MOSFET. The BOOST voltage is 9 V greater than the SW voltage. A 0.1- $\mu$ F ceramic capacitor should be connected from this pin to the drain of the lower MOSFET.
BP5	3	O	5-V reference. This pin should be bypassed to ground with a 0.1- $\mu$ F ceramic capacitor. This pin may be used with an external DC load of 1 mA or less.
BP10	11	O	10-V reference used for gate drive of the N-channel synchronous rectifier. This pin should be bypassed by a 1- $\mu$ F ceramic capacitor. This pin may be used with an external DC load of 1 mA or less.
COMP	8	O	Output of the error amplifier, input to the PWM comparator. A feedback network is connected from this pin to the VFB pin to compensate the overall loop. The comp pin is internally clamped above the peak of the ramp to improve large signal transient response.
HDRV	13	O	Floating gate drive for the high-side N-channel MOSFET. This pin switches from BOOST (MOSFET on) to SW (MOSFET off).
ILIM	16	I	Current limit pin, used to set the overcurrent threshold. An internal current sink from this pin to ground sets a voltage drop across an external resistor connected from this pin to VCC. The voltage on this pin is compared to the voltage drop ( $V_{IN} - SW$ ) across the high-side MOSFET during conduction.
KFF	1	I	A resistor is connected from this pin to VIN to program the amount of voltage feed-forward and UVLO level. The current fed into this pin is internally divided and used to control the slope of the PWM ramp.
LDRV	10	O	Gate drive for the N-channel synchronous rectifier. This pin switches from BP10 (MOSFET on) to ground (MOSFET off).
PGND	9		Power ground reference for the device. There should be a low-impedance path from this pin to the source(s) of the lower MOSFET(s).
RT	2	I	A resistor is connected from this pin to ground to set the internal oscillator and switching frequency.
SGND	5		Signal ground reference for the device.
SS/SD	6	I	Soft-start programming and shutdown pin. A capacitor connected from this pin to ground programs the soft-start time. The capacitor is charged with an internal current source of 2.3 $\mu$ A. The resulting voltage ramp on the SS/SD pin is used as a second non-inverting input to the error amplifier. The output voltage begins to rise when $V_{SS/SD}$ is approximately 0.85 V. The output continues to rise and reaches regulation when $V_{SS/SD}$ is approximately 1.55 V. The controller is considered shut down when $V_{SS/SD}$ is 125 mV or less. The internal circuitry is enabled when $V_{SS/SD}$ is 210 mV or greater. When $V_{SS/SD}$ is less than approximately 0.85 V, the outputs cease switching and the output voltage ( $V_O$ ) decays while the internal circuitry remains active.
SW	12	I	This pin is connected to the switched node of the converter and used for overcurrent sensing. The TPS40054 also uses this pin for zero current sensing.
SYNC	4	I	Synchronization input for the device. This pin can be used to synchronize the oscillator to an external master frequency. If synchronization is not used, connect this pin to SGND.
VFB	7	I	Inverting input to the error amplifier. In normal operation the voltage on this pin is equal to the internal reference voltage, 0.7 V.
VIN	15	I	Supply voltage for the device.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range unless otherwise noted<sup>(1)</sup>

		MIN	MAX	UNIT
V <sub>IN</sub>	VFB, SS/SD, SYNC	-0.3	6	
	VIN, SW	-0.3	45	
	SW, transient < 50 ns		-2.5	
	SW, transient < 50 ns, V <sub>VIN</sub> < 14 V		-5.0	
	KFF, with I <sub>IN(max)</sub> = -5 mA	-0.3	11	
V <sub>O</sub>	COMP, RT, SS/SD	-0.3	6	
	KFF		5	mA
I <sub>O</sub>	RT		200	μA
T <sub>J</sub>	Maximum junction temperature <sup>(2)</sup>		150	°C
T <sub>J</sub>	Operating junction temperature	-40	125	
T <sub>stg</sub>	Storage temperature range	-55	150	°C

- (1) Stresses beyond those listed under [Absolute Maximum Ratings](#) may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [Recommended Operating Conditions](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Device may shut down at junction temperatures below 150°C.

### 6.2 Recommended Operating Conditions

		MIN	MAX	UNIT
V <sub>IN</sub>	Input voltage	8	40	V
T <sub>A</sub>	Operating free-air temperature	-40	85	°C

## 7 Detailed Description

### 7.1 Overview

The TPS4005x family of synchronous buck controllers are designed to operate over a wide range of input voltages (8 V to 40 V). These devices offer a variety of user programmable functions such as operating frequency, soft-start, voltage feed-forward, high-side current limit, and external loop compensation.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Setting the Switching Frequency (Programming the Clock Oscillator)

The TPS4005x has independent clock oscillator and ramp generator circuits. The clock oscillator serves as the master clock to the ramp generator circuit. The switching frequency,  $f_{SW}$  in kHz, of the clock oscillator is set by a single resistor ( $R_T$ ) to ground. The clock frequency is related to  $R_T$ , in k $\Omega$  by Equation 1 and the relationship is charted in Figure 1.

$$R_T = \left( \frac{1}{f_{SW} \times 17.82 \times 10^{-6}} - 17 \right) \text{ k}\Omega \quad (1)$$

#### 7.3.2 Programming The Ramp Generator Circuit

The ramp generator circuit provides the actual ramp used by the PWM comparator. The ramp generator provides voltage feed-forward control by varying the PWM ramp slope with line voltage, while maintaining a constant ramp magnitude. Varying the PWM ramp directly with line voltage provides excellent response to line variations because the PWM does not have to wait for loop delays before changing the duty cycle (see Figure 6).

## Feature Description (continued)

**Figure 6. Voltage Feed-Forward Effect On Pwm Duty Cycle**

The PWM ramp must be faster than the master clock frequency or the PWM is prevented from starting. The PWM ramp time is programmed via a single resistor ( $R_{KFF}$ ) pulled up to  $V_{IN}$ .  $R_{KFF}$  is related to  $R_T$ , and the minimum input voltage,  $V_{IN(min)}$  through the following:

$$R_{KFF} = (V_{IN(min)} - V_{KFF}) \times (58.14 \times R_T + 1340) \Omega$$

where

- $V_{IN(min)}$  is the ensured minimum startup voltage (the actual startup voltage is nominally about 10% lower at 25°C).  $V_{IN(min)}$  should be programmed equal to or greater than 8.0 V to ensure start-up and shutdown through the programmed UVLO through KFF pin.
- $R_T$  is the timing resistance in k $\Omega$
- $V_{KFF}$  is the voltage at the KFF pin (typical value is 3.48 V) (2)

The curve showing the  $R_{KFF}$  required for a given switching frequency,  $f_{SW}$ , and  $V_{UVLO}$  is shown in [Figure 2](#).

For low-input voltage and high duty-cycle applications, the voltage feed-forward may limit the duty cycle prematurely. This does not occur for most applications. The voltage control loop controls the duty cycle and regulates the output voltage. For more information on large duty cycle operation, refer to Application Note ([SLUA310](#)), *Effect of Programmable UVLO on Maximum Duty Cycle*.

### 7.3.3 UVLO Operation

The TPS4005x uses variable (user-programmable) UVLO protection. See the [Programming the Ramp Generator](#) section for more information on setting the UVLO voltage. The UVLO circuit holds the soft-start low until the input voltage exceeds the user-programmable undervoltage threshold.

The TPS4005x uses the feed-forward pin, KFF, as a user-programmable low-line UVLO detection. This variable low-line UVLO threshold compares the PWM ramp duration to the oscillator clock period. An undervoltage condition exists if the TPS4005x receives a clock pulse before the ramp has reached 90% of its full amplitude. The ramp duration is a function of the ramp slope, which is directly related to the current into the KFF pin. The KFF current is a function of the input voltage and the resistance from KFF to the input voltage. The KFF resistor can be referenced to the oscillator frequency as described in [Equation 2](#).

The programmable UVLO function uses a 3-bit counter to prevent spurious shut-downs or turn-ons due to spikes or fast line transients. When the counter reaches a total of seven counts in which the ramp duration is shorter than the clock cycle, a powergood signal is asserted and a soft-start initiated, and the upper and lower MOSFETS are turned off.

Once the soft-start is initiated, the UVLO circuit must see a total count of seven cycles in which the ramp duration is longer than the clock cycle before an undervoltage condition is declared (see [Figure 7](#)).

**Feature Description (continued)**

**Figure 7. Undervoltage Lockout Operation**

The tolerance on the UVLO set point also affects the maximum duty cycle achievable. If the UVLO starts the device at 10% below the nominal startup voltage, the maximum duty cycle is reduced approximately 10% at the nominal startup voltage.

The impedance of the input voltage can cause the input voltage, at the controller, to sag when the converter starts to operate and draw current from the input source. Therefore, there is voltage hysteresis that prevents nuisance shutdowns at the UVLO point. With  $R_T$  chosen to select the operating frequency and  $R_{KFF}$  chosen to select the startup voltage, the approximate amount of hysteresis voltage is shown in [Figure 3](#).

Some applications may require an additional circuit to prevent false restarts at the UVLO voltage level. This applies to applications which have high impedance on the input voltage line or which have excessive ringing on the  $V_{IN}$  line. The input voltage impedance can cause the input voltage to sag enough at startup to cause a UVLO shutdown and subsequent restart. Excessive ringing can also affect the voltage seen by the device and cause a UVLO shutdown and restart. A simple external circuit provides a selectable amount of hysteresis to prevent the nuisance UVLO shutdown.

Assuming a hysteresis current of 10%  $I_{KFF}$ , and the peak detector charges to 8 V and  $V_{IN(min)} = 10$  V, the value of  $R_A$  is calculated by [Equation 3](#) using a  $R_{KFF} = 71.5$  k $\Omega$ .

$$R_A = \frac{R_{KFF} \times (8 - 3.48)}{0.1 \times (V_{IN(min)} - 3.48)} = 495 \text{ k}\Omega = 499 \text{ k}\Omega \quad (3)$$

$C_A$  is chosen to maintain the peak voltage between switching cycles to keep the capacitor charge from drooping 0.1 V (from 8 V to 7.9 V).

$$C_A = \frac{(8 - 3.48)}{(R_A \times 7.9 \times f_{SW})} \quad (4)$$

The value of  $C_A$  may calculate to less than 10 pF, but some standard value up to 47 pF works adequately. The diode can be a small-signal switching diode or Schottky rated for more than 20 V. [Figure 8](#) shows a typical implementation using a small switching diode.

The tolerance on the UVLO set point also affects the maximum duty cycle achievable. If the UVLO starts the device at 10% below the nominal startup voltage, the maximum duty cycle is reduced approximately 10% at the nominal startup voltage.

## Feature Description (continued)

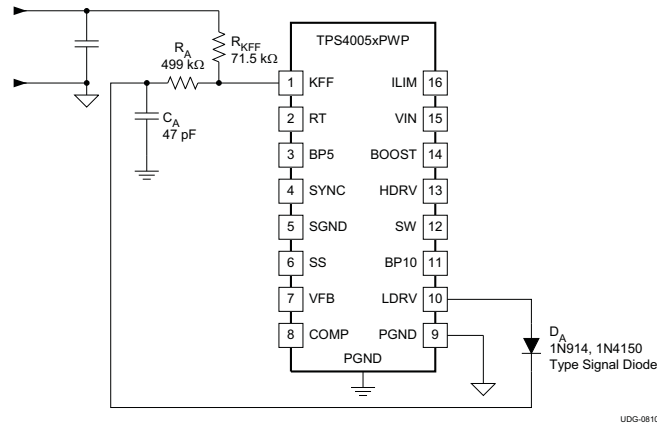

Figure 8. Hysteresis for Programmable UVLO

### 7.3.4 BP5 and BP10 Internal Voltage Regulators

Startup characteristics of the BP5 and BP10 regulators over different temperature ranges are shown in [Figure 4](#) and [Figure 5](#). Slight variations in the BP5 occurs dependent upon the switching frequency. Variation in the BP10 regulation characteristics is also based on the load presented by switching the external MOSFETs.

### 7.3.5 Programming Soft-Start

The TPS4005x uses a closed-loop soft-start system to ensure a controlled ramp of the output during startup. The reference voltage used for the startup is derived in the following manner. A capacitor ( $C_{SS/SD}$ ) is connected to the SS/SD pin. There is a ramped voltage generated at this pin by charging  $C_{SS/SD}$  with a current source. A value of 0.85 V is subtracted from the voltage at the SS/SSD pin and is applied to a non-inverting input of the error amplifier. This is the effective soft-start ramp voltage,  $V_{SSRMP}$ . The error amplifier also has the 0.7-V reference ( $V_{FB}$ ) voltage applied to a non-inverting input. The structure of the error amplifier input stage is such that the lower of  $V_{FB}$  or  $V_{SSRMP}$  becomes the dominant voltage that the error amplifier uses to regulate the FB pin. This provides a clean, closed-loop startup while  $V_{SSRMP}$  is lower than  $V_{FB}$  and a precision reference regulated supply as  $V_{SSRMP}$  climbs above  $V_{FB}$ . To ensure a controlled ramp-up of the output voltage, the soft-start time should be greater than the L-C<sub>O</sub> time constant as described in [Equation 5](#).

$$t_{START} \geq 2\pi \times \sqrt{L \times C_O} \quad (\text{seconds})$$

where

- $t_{START}$  is the startup ramp time in s (5)

There is a direct correlation between  $t_{START}$  and the input current required during startup. The faster  $t_{START}$ , the higher the input current required during startup. This relationship is described in more detail in the section titled, [Programming the Current Limit](#) which follows. The soft-start capacitance,  $C_{SS/SD}$ , is described in [Equation 6](#).

For applications in which the  $V_{IN}$  supply ramps up slowly (typically between 50 ms and 100 ms), it may be necessary to increase the soft-start time to between approximately 2 ms and 5 ms to prevent nuisance UVLO tripping. The soft-start time should be longer than the time that the  $V_{IN}$  supply transitions between 6 V and 7 V.

$$C_{SS/SD} = \left( \frac{I_{SS/SD}}{V_{FB}} \right) \times t_{START} \quad (\text{F})$$

where

- $I_{SS/SD}$  is the soft-start charge current (typical value is 2.35  $\mu\text{A}$ )
- $V_{FB}$  is the feedback reference voltage (typical value is 0.7 V) (6)

## Feature Description (continued)

### 7.3.6 Programming Current Limit

The TPS4005x uses a two-tier approach for overcurrent protection. The first tier is a pulse-by-pulse protection scheme. Current limit is implemented on the high-side MOSFET by sensing the voltage drop across the MOSFET when the gate is driven high. The MOSFET voltage is compared to the voltage dropped across a resistor connected from VIN pin to the ILIM pin when driven by a constant current sink. If the voltage drop across the MOSFET exceeds the voltage drop across the ILIM resistor, the switching pulse is immediately terminated. The MOSFET remains off until the next switching cycle is initiated.

The second tier consists of a fault counter. The fault counter is incremented on an overcurrent pulse and decremented on a clock cycle without an overcurrent pulse. When the counter reaches 7, a restart is issued and seven soft-start cycles are initiated. Both the upper and lower MOSFETs are turned off during this period. The counter is decremented on each soft-start cycle. When the counter is decremented to zero, the PWM is re-enabled. If the fault has been removed the output starts up normally. If the output is still present the counter counts seven overcurrent pulses and re-enters the second-tier fault mode. See [Figure 9](#) for typical overcurrent protection waveforms.

The minimum current limit setpoint ( $I_{ILIM}$ ) is calculated in [Equation 7](#).

$$I_{ILIM} = \left( \frac{C_O \times V_O}{t_{START}} \right) + I_{LOAD} \text{ (A)}$$

where

- $I_{LOAD}$  is the load current at startup

(7)

**Figure 9. Typical Current Limit Protection Waveforms**

The current limit programming resistor ( $R_{ILIM}$ ) is calculated using [Equation 8](#). Care must be taken in choosing the values used for  $V_{OS}$  and  $I_{SINK}$  in the equation. To ensure the output current at the overcurrent level, the minimum value of  $I_{SINK}$  and the maximum value of  $V_{OS}$  must be used. The main purpose is hard fault protection of the power switches.

$$R_{ILIM} = \frac{I_{OC} \times R_{DS(on)[max]} + V_{OS}}{1.12 \times I_{SINK}} + \frac{42.86 \times 10^{-3}}{I_{SINK}} \text{ (}\Omega\text{)}$$

where

- $I_{SINK}$  is the current into the ILIM pin and is 8.5  $\mu$ A, minimum
- $I_{OC}$  is the overcurrent setpoint which is the DC output current plus one-half of the peak inductor current
- $V_{OS}$  is the overcurrent comparator offset and is –20 mV, maximum

(8)

## Feature Description (continued)

### 7.3.7 Synchronizing to an External Supply

The TPS4005x can be synchronized to an external clock through the SYNC pin. Synchronization occurs on the falling edge of the SYNC signal. The synchronization frequency should be in the range of 20% to 30% higher than its programmed free-run frequency. The clock frequency at the SYNC pin replaces the master clock generated by the oscillator circuit. Pulling the SYNC pin low programs the TPS4005x to freely run at the frequency programmed by  $R_T$ .

The higher synchronization must be factored in when programming the PWM ramp generator circuit. If the PWM ramp is interrupted by the SYNC pulse, a UVLO condition is declared and the PWM becomes disabled. Typically this is of concern under low-line conditions only. In any case,  $R_{KFF}$  needs to be adjusted for the higher switching frequency. In order to specify the correct value for  $R_{KFF}$  at the synchronizing frequency, calculate a *dummy* value for  $R_T$  that would cause the oscillator to run at the synchronizing frequency. Do not use this value of  $R_T$  in the design.

$$R_{T(\text{dummy})} = \left( \frac{1}{f_{\text{SYNC}} \times 17.82 \times 10^{-6}} - 17 \right) (\text{k}\Omega)$$

where

- $f_{\text{SYNC}}$  is the synchronizing frequency in kHz (9)

Use the value of  $R_{T(\text{dummy})}$  to calculate the value for  $R_{KFF}$ .

$$R_{KFF} = \left( V_{\text{IN}(\text{min})} - V_{KFF} \right) \times \left( 58.14 \times R_{T(\text{dummy})} + 1340 \right) \Omega$$

where

- $R_{T(\text{dummy})}$  is in k $\Omega$  (10)

This value of  $R_{KFF}$  ensures that UVLO is not engaged when operating at the synchronization frequency.

### 7.3.8 Loop Compensation

Voltage-mode buck-type converters are typically compensated using Type III networks. Since the TPS4005x uses voltage feedforward control, the gain of the PWM modulator with voltage feedforward circuit must be included. The generic modulator gain is described in [Figure 10](#). Duty cycle,  $D$ , varies from 0 to 1 as the control voltage,  $V_C$ , varies from the minimum ramp voltage to the maximum ramp voltage,  $V_S$ . Also, for a synchronous buck converter,  $D = V_O / V_{\text{IN}}$ . To get the control voltage to output voltage modulator gain in terms of the input voltage and ramp voltage,

$$D = \frac{V_O}{V_{\text{IN}}} = \frac{V_C}{V_S} \quad \text{or} \quad \frac{V_O}{V_C} = \frac{V_{\text{IN}}}{V_S} \quad (11)$$

With the voltage feedforward function, the ramp slope is proportional to the input voltage. Therefore the modulator DC gain is independent to the change of input voltage.

For the TPS4005x, with  $V_{\text{IN}(\text{min})}$  being the minimum input voltage required to cause the ramp excursion to reach the maximum ramp amplitude of  $V_{\text{RAMP}}$ , the modulator dc gain is shown in [Equation 12](#).

$$A_{\text{MOD}} = \left( \frac{V_{\text{IN}(\text{min})}}{V_{\text{RAMP}}} \right) \quad \text{or} \quad A_{\text{MOD}(\text{dB})} = 20 \times \log \left( \frac{V_{\text{IN}(\text{min})}}{V_{\text{RAMP}}} \right) \quad (12)$$

For a buck converter using voltage mode control there is a double pole due to the output L- $C_O$ . The double pole is located at the frequency calculated in [Equation 13](#).

$$f_{\text{LC}} = \frac{1}{2\pi \times \sqrt{L \times C_O}} \quad (\text{Hertz}) \quad (13)$$

There is also a zero created by the output capacitance,  $C_O$ , and its associated ESR. The ESR zero is located at the frequency calculated in [Equation 14](#).

**Feature Description (continued)**

$$f_z = \frac{1}{2\pi \times ESR \times C_O} \text{ (Hertz)} \tag{14}$$

Calculate the value of  $R_{BIAS}$  to set the output voltage,  $V_O$ .

$$R_{BIAS} = \frac{0.7 \times R1}{V_O - 0.7} \Omega \tag{15}$$

The maximum crossover frequency (0 dB loop gain) is set by [Equation 16](#).

$$f_C = \frac{f_{SW}}{4} \text{ (Hertz)} \tag{16}$$

Typically,  $f_C$  is selected to be close to the midpoint between the L- $C_O$  double pole and the ESR zero. At this frequency, the control to output gain has a  $-2$  slope ( $-40$  dB/decade), while the Type III topology has a  $+1$  slope ( $20$  dB/decade), resulting in an overall closed loop  $-1$  slope ( $-20$  dB/decade). [Figure 11](#) shows the modulator gain, L-C filter, output capacitor ESR zero, and the resulting response to be compensated.

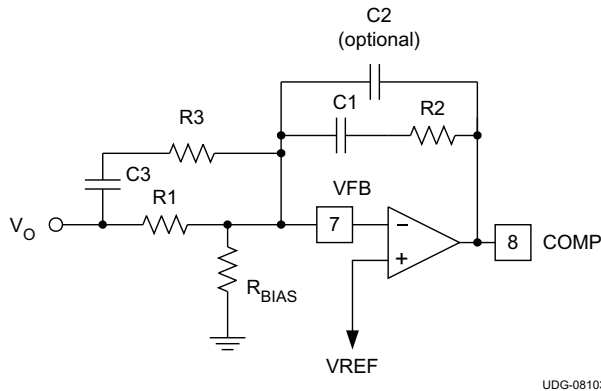

**Figure 10. PWM Modulator Relationships**

**Figure 11. Modulator Gain vs Switching Frequency**

A Type III topology, shown in [Figure 12](#), has two zero-pole pairs in addition to a pole at the origin. The gain and phase boost of a Type III topology is shown in [Figure 13](#). The two zeros are used to compensate the L- $C_O$  double pole and provide phase boost. The double pole is used to compensate for the ESR zero and provide controlled gain roll-off. In many cases the second pole can be eliminated and the amplifier's gain roll-off used to roll-off the overall gain at higher frequencies.

## Feature Description (continued)

UDG-08103

Figure 12. Type III Compensation Configuration

Figure 13. Type III Compensation Gain and Phase

The poles and zeros for a Type III network are described in Equation 17 through Equation 20.

$$f_{Z1} = \frac{1}{2\pi \times R2 \times C1} \text{ (Hz)} \quad (17)$$

$$f_{Z2} = \frac{1}{2\pi \times R1 \times C3} \text{ (Hz)} \quad (18)$$

$$f_{P1} = \frac{1}{2\pi \times R2 \times C2} \text{ (Hz)} \quad (19)$$

$$f_{P2} = \frac{1}{2\pi \times R3 \times C3} \text{ (Hz)} \quad (20)$$

The value of R1 is somewhat arbitrary, but influences other component values. A value between 50 kΩ and 100 kΩ usually yields reasonable values.

The unity gain frequency is described in Equation 21.

$$f_C = \frac{1}{2\pi \times R1 \times C2 \times G} \text{ (Hertz)}$$

where

- G is the reciprocal of the modulator gain at  $f_C$  (21)

The modulator gain as a function of frequency at  $f_C$ , is described in Equation 22.

$$A_{MOD}(f) = A_{MOD} \times \left( \frac{f_{LC}}{f_C} \right)^2 \text{ and } G = \frac{1}{A_{MOD}(f)} \quad (22)$$

Care must be taken not to load down the output of the error amplifier with the feedback resistor, R2, that is too small. The error amplifier has a finite output source and sink current which must be considered when sizing R2. A value that is too small does not allow the output to swing over its full range.

$$R2_{(MIN)} = \frac{V_C (max)}{I_{SOURCE} (min)} = \frac{3.5 \text{ V}}{2 \text{ mA}} = 1750 \ \Omega \quad (23)$$

## 7.4 Device Functional Modes

The TPS40057 is safe for prebiased outputs, not turning on the synchronous rectifier until the high-side FET has already started switching. The TPS40054 operates in one quadrant and sources output current only, allowing for paralleling of converters and ensures that one converter does not sink current from another converter. This controller also emulates a non-synchronous buck converter at light loads where the inductor current goes discontinuous. At continuous output inductor currents the controller operates as a synchronous buck converter to optimize efficiency. The TPS40055 operates in two quadrants, sourcing and sinking output current.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS4005x family of synchronous buck controllers are designed to operate over a wide range of input voltages (8 V to 40 V). These devices are used to convert a higher DC input voltage to a lower DC output voltage for a variety of applications. Use the following design procedure to select key component values for this family of devices.

#### 8.1.1 Selecting the Inductor Value

The inductor value determines the magnitude of ripple current in the output capacitors as well as the load current at which the converter enters discontinuous mode. Too large an inductance results in lower ripple current but is physically larger for the same load current. An inductance that is too small results in larger ripple currents and a greater number of (or more expensive output capacitors for) the same output ripple voltage requirement. A good compromise is to select the inductance value such that the converter does not enter discontinuous mode until the load approximated somewhere between 10% and 30% of the rated output. The inductance value is described in [Equation 24](#).

$$L = \frac{(V_{IN} - V_O) \times V_O}{V_{IN} \times \Delta I \times f_{SW}} \quad (\text{Henries})$$

where

- $V_O$  is the output voltage
  - $\Delta I$  is the peak-to-peak inductor current
- (24)

#### 8.1.2 Calculating the Output Capacitance

The output capacitance depends on the output ripple voltage requirement, output ripple current, as well as any output voltage deviation requirement during a load transient.

The output ripple voltage is a function of both the output capacitance and capacitor ESR. The worst-case output ripple is described in [Equation 25](#).

$$\Delta V = \Delta I \times \left( \text{ESR} + \left( \frac{1}{8 \times C_O \times f_{SW}} \right) \right)$$

where

- $C_O$  is the output capacitance
  - ESR is the equivalent series resistance of the output capacitance
- (25)

The output ripple voltage is typically between 90% and 95% due to the ESR component.

The output capacitance requirement typically increases in the presence of a load transient requirement. During a step load, the output capacitance must provide energy to the load (light to heavy load step) or absorb excess inductor energy (heavy to light load step) while maintaining the output voltage within acceptable limits. The amount of capacitance depends on the magnitude of the load step, the speed of the loop and the size of the inductor.

## Application Information (continued)

Stepping the load from a heavy load to a light load results in an output overshoot. Excess energy stored in the inductor must be absorbed by the output capacitance. The energy stored in the inductor is described in [Equation 26](#).

$$E_L = \frac{1}{2} \times L \times I^2 \quad (\text{Joules}) \quad (26)$$

where

$$I^2 = \left[ (I_{OH})^2 - (I_{OL})^2 \right] \quad (\text{Amperes}^2)$$

- $I_{OH}$  is the output current under heavy load conditions
- $I_{OL}$  is the output current under light load conditions

(27)

Energy in the capacitor is described in [Equation 28](#).

$$E_C = \frac{1}{2} \times C \times V^2 \quad (\text{Joules}) \quad (28)$$

where

$$V^2 = \left[ (V_f)^2 - (V_i)^2 \right] \quad (\text{Volts}^2)$$

where

- $V_f$  is the final peak capacitor voltage
- $V_i$  is the initial capacitor voltage

(29)

Substituting [Equation 27](#) into [Equation 26](#), then substituting [Equation 29](#) into [Equation 28](#), then setting [Equation 28](#) equal to [Equation 26](#), and then solving for  $C_O$  yields the capacitance described in [Equation 30](#).

$$C_O = \frac{L \times \left[ (I_{OH})^2 - (I_{OL})^2 \right]}{\left[ (V_f)^2 - (V_i)^2 \right]} \quad (\text{Farads}) \quad (30)$$

### 8.1.3 Calculating the Boost and BP10 Bypass Capacitor

The BOOST capacitance provides a local, low impedance source for the high-side driver. The BOOST capacitor should be a good quality, high-frequency capacitor. The size of the bypass capacitor depends on the total gate charge of the MOSFET and the amount of droop allowed on the bypass capacitor. The BOOST capacitance is described in [Equation 31](#).

$$C_{BOOST} = \frac{Q_g}{\Delta V} \quad (\text{Farads}) \quad (31)$$

The 10-V reference pin, BP10V provides energy for both the synchronous MOSFET and the high-side MOSFET via the BOOST capacitor. Neglecting any efficiency penalty, the BP10V capacitance is described in [Equation 32](#).

$$C_{BP10} = \frac{(Q_{gHS} + Q_{gSR})}{\Delta V} \quad (\text{Farads}) \quad (32)$$

### 8.1.4 DV-DT Induced Turn-On

MOSFETs are susceptible to  $dv/dt$  turn-on particularly in high-voltage ( $V_{DS}$ ) applications. The turn-on is caused by the capacitor divider that is formed by  $C_{GD}$  and  $C_{GS}$ . High  $dv/dt$  conditions and drain-to-source voltage, on the MOSFET causes current flow through  $C_{GD}$  and causes the gate-to-source voltage to rise. If the gate-to-source voltage rises above the MOSFET threshold voltage, the MOSFET turns on, resulting in large shoot-through currents. Therefore, the SR MOSFET should be chosen so that the  $Q_{GD}$  charge is smaller than the  $Q_{GS}$  charge.

## Application Information (continued)

### 8.1.5 High-Side MOSFET Power Dissipation

The power dissipated in the external high-side MOSFET is comprised of conduction and switching losses. The conduction losses are a function of the  $I_{RMS}$  current through the MOSFET and the  $R_{DS(on)}$  of the MOSFET. The high-side MOSFET conduction losses are defined by Equation 33.

$$P_{COND} = (I_{RMS})^2 \times R_{DS(on)} \times (1 + TC_R \times [T_J - 25^\circ C]) \quad (\text{Watts})$$

where

- $TC_R$  is the temperature coefficient of the MOSFET  $R_{DS(on)}$  (33)

The  $TC_R$  varies depending on MOSFET technology and manufacturer, but typically ranges between 3500 ppm/°C and 7000 ppm/°C.

The  $I_{RMS}$  current for the high-side MOSFET is described in Equation 34.

$$I_{RMS} = I_{OUT} \times \sqrt{d} \quad (A_{RMS}) \quad (34)$$

The switching losses for the high-side MOSFET are described in Equation 35.

$$P_{SW(fsw)} = (V_{IN} \times I_{OUT} \times t_{SW}) \times f_{SW} \quad (\text{Watts})$$

where

- $I_O$  is the DC output current
- $t_{SW}$  is the switching rise time, typically < 20 ns
- $f_{SW}$  is the switching frequency (35)

Typical switching waveforms are shown in Figure 14.

UDG-02139

Figure 14. Inductor Current and SW Node Waveforms

The maximum allowable power dissipation in the MOSFET is determined by Equation 36.

$$P_T = \frac{(T_J - T_A)}{\theta_{JA}} \quad (\text{Watts})$$

where

- $P_T = P_{COND} + P_{SW(fsw)}$  (W)
- $\theta_{JA}$  is the package thermal impedance (36)

## Application Information (continued)

### 8.1.6 Synchronous Rectifier MOSFET Power Dissipation

The power dissipated in the synchronous rectifier MOSFET is comprised of three components:  $R_{DS(on)}$  conduction losses, body diode conduction losses, and reverse recovery losses.  $R_{DS(on)}$  conduction losses can be defined using [Equation 31](#) and the RMS current through the synchronous rectifier MOSFET is described in [Equation 37](#).

$$I_{RMS} = I_O \times \sqrt{1 - d} \quad (\text{Amperes}_{RMS}) \quad (37)$$

The body-diode conduction losses are due to forward conduction of the body diode during the anti-cross conduction delay time. The body diode conduction losses are described by [Equation 38](#).

$$P_{DC} = 2 \times I_O \times V_F \times t_{DELAY} \times f_{SW} \quad (\text{Watts})$$

where

- $V_F$  is the body diode forward voltage
  - $t_{DELAY}$  is the delay time just before the SW node rises
- (38)

The 2-multiplier is used because the body diode conducts twice during each cycle (once on the rising edge and once on the falling edge). The reverse recovery losses are due to the time it takes for the body diode to recover from a forward bias to a reverse blocking state. The reverse recovery losses are described in [Equation 39](#).

$$P_{RR} = 0.5 \times Q_{RR} \times V_{IN} \times f_{SW} \quad (\text{Watts})$$

where

- $Q_{RR}$  is the reverse recovery charge of the body diode
- (39)

The  $Q_{RR}$  is not always described in a MOSFET data sheet, but may be obtained from the MOSFET vendor. The total synchronous rectifier MOSFET power dissipation is described in [Equation 40](#).

$$P_{SR} = P_{DC} + P_{RR} + P_{COND} \quad (\text{Watts}) \quad (40)$$

### 8.1.7 TPS4005x Power Dissipation

The power dissipation in the TPS4005x is largely dependent on the MOSFET driver currents and the input voltage. The driver current is proportional to the total gate charge,  $Q_g$ , of the external MOSFETs. Driver power (neglecting external gate resistance, ( refer to *PowerPAD Thermally Enhanced Package* <sup>[2]</sup> ) can be calculated from [Equation 41](#).

$$P_D = Q_g \times V_{DR} \times f_{SW} \quad (\text{Watts/driver}) \quad (41)$$

And the total power dissipation in the TPS4005x, assuming the same MOSFET is selected for both the high-side and synchronous rectifier, is described in [Equation 42](#).

$$P_T = \left( \frac{2 \times P_D}{V_{DR}} + I_Q \right) \times V_{IN} \quad (\text{Watts}) \quad (42)$$

or

$$P_T = (2 \times Q_g \times f_{SW} + I_Q) \times V_{IN} \quad (\text{Watts})$$

where

- $I_Q$  is the quiescent operating current (neglecting drivers)
- (43)

The maximum power capability of the PowerPAD package is dependent on the layout as well as air flow. The thermal impedance from junction to air, assuming 2 oz. copper trace and thermal pad with solder and no air flow,

$$\theta_{JA} = 36.515^\circ\text{C/W} \quad (44)$$

The maximum allowable package power dissipation is related to ambient temperature by [Equation 45](#).

$$P_T = \frac{T_J - T_A}{\theta_{JA}} \quad (\text{Watts}) \quad (45)$$

## Application Information (continued)

Substituting Equation 38 into Equation 43 and solving for  $f_{sw}$  yields the maximum operating frequency for the TPS4005x. The result is described in Equation 46.

$$f_{sw} = \left( \frac{\left( \frac{(T_J - T_A)}{\theta_{JA} \times V_{IN}} \right) - I_Q}{2 \times Q_g} \right) \text{ (Hz)} \tag{46}$$

## 8.2 Typical Application

Figure 15 shows component selection for the 10-V to 24-V to 3.3-V at 8 A dc-to-dc converter specified in the design example. For an 8-V input application, it may be necessary to add a Schottky diode from BP10 to BOOST to get sufficient gate drive for the upper MOSFET. As seen in Figure 4, the BP10 output is about 6 V with the input at 8 V so the upper MOSFET gate drive may be less than 5 V.

A Schottky diode is shown connected across the synchronous rectifier MOSFET as an optional device that may be required if the layout causes excessive negative SW node voltage, greater than or equal to 2 V.

TPS40054-Q1, TPS40055-Q1, and TPS40057-Q1 automotive qualified versions TPS40055-EP Enhanced product 4.5 to 18V controller with power good TPS40195 4.5 to 18V controller with synchronization power good TPS40200 Wide input nonsynchronous DC-DC controller

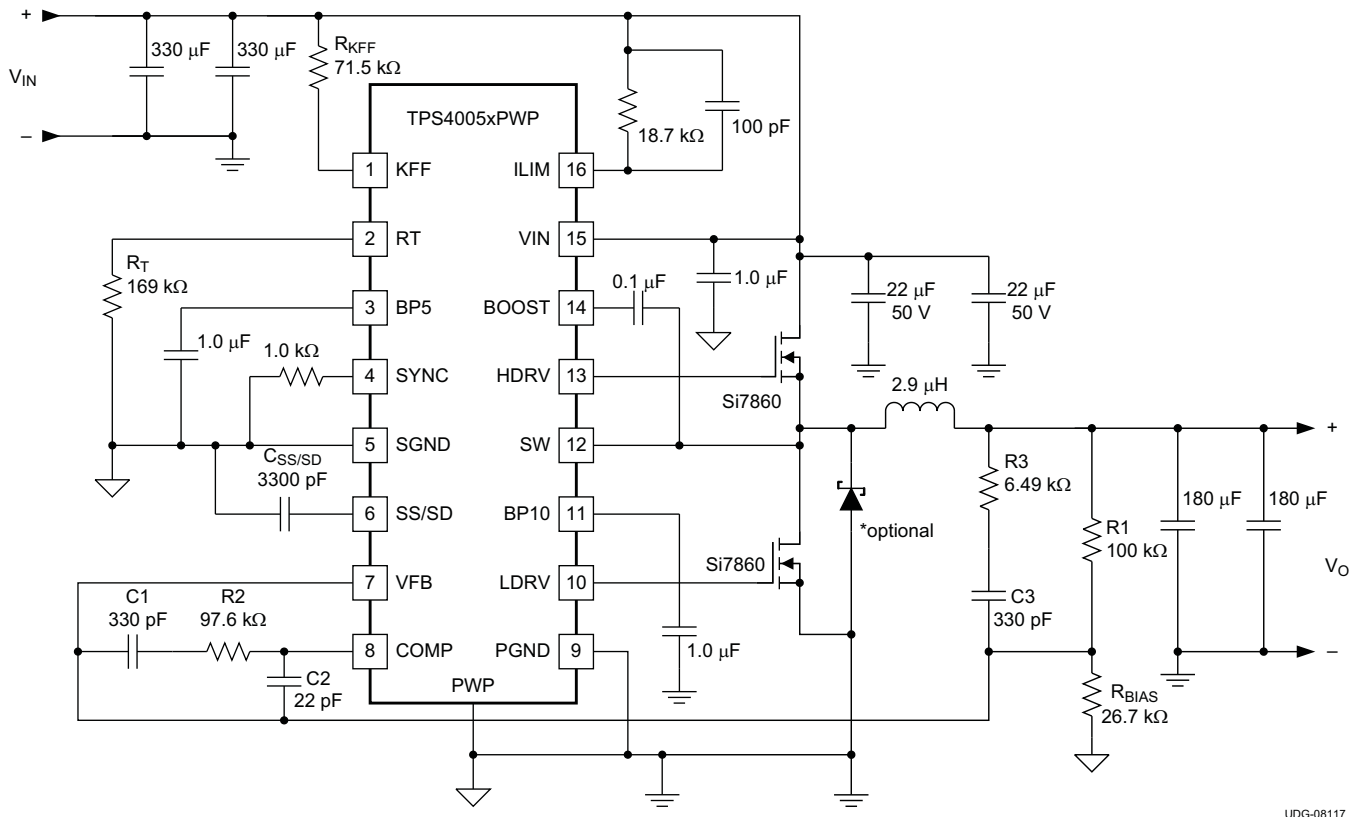

Figure 15. 24-V to 3.3-V at 8-A DC-DC Converter Design Example

### 8.2.1 Design Requirements

- Input voltage: 10 Vdc to 24 Vdc
- Output voltage: 3.3 V  $\pm 2\%$  ( $3.234 \leq V_O \leq 3.366$ )
- Output current: 8 A (maximum, steady state), 10 A (surge, 10 ms duration, 10% duty cycle maximum)

## Typical Application (continued)

- Output ripple: 33 mV<sub>PP</sub> at 8 A
- Output load response: 0.3 V ≥ 10% to 90% step load change, from 1 A to 7 A
- Operating temperature: -40°C to 85°C
- f<sub>SW</sub> = 300 kHz

### 8.2.2 Detailed Design Procedure

#### 8.2.2.1 Calculate Maximum and Minimum Duty Cycles

$$D_{\text{MIN}} = \frac{V_{\text{O}(\text{min})}}{V_{\text{IN}(\text{max})}} = \frac{3.234}{24} = 0.135 \quad D_{\text{MAX}} = \frac{V_{\text{O}(\text{max})}}{V_{\text{IN}(\text{min})}} = \frac{3.366}{10} = 0.337 \quad (47)$$

#### 8.2.2.2 Select Switching Frequency

The switching frequency is based on the minimum duty cycle ratio and the propagation delay of the current limit comparator. In order to maintain current limit capability, the on time of the upper MOSFET, t<sub>ON</sub>, must be greater than 300 ns (see [Electrical Characteristics Table](#)). Therefore:

$$\left( \frac{V_{\text{O}(\text{min})}}{V_{\text{IN}(\text{max})}} \right) = \left( \frac{t_{\text{ON}}}{t_{\text{SW}}} \right) \quad \text{or} \quad \frac{1}{t_{\text{SW}}} = f_{\text{SW}} = \left( \frac{\left( \frac{V_{\text{O}(\text{min})}}{V_{\text{IN}(\text{max})}} \right)}{t_{\text{ON}}} \right) \quad (48)$$

Using 400 ns to provide margin,

$$f_{\text{SW}} = \frac{0.135}{400 \text{ ns}} = 337 \text{ kHz} \quad (49)$$

Since the oscillator can vary by 10%, decrease f<sub>SW</sub>, by 10%

$$f_{\text{SW}} = 0.9 \times 337 \text{ kHz} = 303 \text{ kHz}$$

and therefore choose a frequency of 300 kHz.

#### 8.2.2.3 Select Δi

In this case Δi is chosen so that the converter enters discontinuous mode at 20% of nominal load.

$$\Delta i = I_{\text{O}} \times 2 \times 0.2 = 8 \times 2 \times 0.2 = 3.2 \text{ A} \quad (50)$$

#### 8.2.2.4 Calculate the High-Side MOSFET Power Losses

Power losses in the high-side MOSFET (Si7860DP) at 24-V<sub>IN</sub> where switching losses dominate can be calculated from [Equation 51](#).

$$I_{\text{RMS}} = I_{\text{O}} \times \sqrt{d} = 8 \times \sqrt{0.135} = 2.93 \text{ A} \quad (51)$$

Substituting [Equation 34](#) into [Equation 33](#) yields

$$P_{\text{COND}} = 2.93^2 \times 0.008 \times (1 + 0.007 \times (150 - 25)) = 0.129 \text{ W} \quad (52)$$

and from [Equation 35](#), the switching losses can be determined.

$$P_{\text{SW}(f_{\text{SW}})} = (V_{\text{IN}} \times I_{\text{O}} \times t_{\text{SW}}) \times f_{\text{SW}} = 24 \text{ V} \times 8 \text{ A} \times 20 \text{ ns} \times 300 \text{ kHz} = 1.152 \text{ W} \quad (53)$$

The MOSFET junction temperature can be found by substituting [Equation 52](#) and [Equation 53](#) into [Equation 36](#):

$$T_{\text{J}} = (P_{\text{COND}} + P_{\text{SW}}) \times \theta_{\text{JA}} + T_{\text{A}} = (0.129 + 1.152) \times 40 + 85 = 136^{\circ}\text{C} \quad (54)$$

## Typical Application (continued)

### 8.2.2.5 Calculate Synchronous Rectifier Losses

The synchronous rectifier MOSFET has two loss components, conduction, and diode reverse recovery losses. The conduction losses are due to  $I_{RMS}$  losses as well as body diode conduction losses during the dead time associated with the anti-cross conduction delay.

The  $I_{RMS}$  current through the synchronous rectifier from [Equation 37](#):

$$I_{RMS} = I_O \times \sqrt{1 - d} = 8 \times \sqrt{1 - 0.135} = 7.44 A_{RMS} \quad (55)$$

The synchronous MOSFET conduction loss from [Equation 33](#) is:

$$P_{COND} = 7.44^2 \times 0.008 \times (1 + 0.007 \times (150 - 25)) = 0.83 W \quad (56)$$

The body diode conduction loss from [Equation 38](#) is:

$$P_{DC} = 2 \times I_O \times V_{FD} \times t_{DELAY} \times f_{SW} = 2 \times 8.0 A \times 0.8 V \times 100 ns \times 300 kHz = 0.384 \quad (57)$$

The body diode reverse recovery loss from [Equation 39](#) is:

$$P_{RR} = 0.5 \times Q_{RR} \times V_{IN} \times f_{SW} = 0.5 \times 30 nC \times 24 V \times 300 kHz = 0.108 W \quad (58)$$

The total power dissipated in the synchronous rectifier MOSFET from [Equation 40](#) is:

$$P_{SR} = P_{RR} + P_{COND} + P_{DC} = 0.108 + 0.83 + 0.384 = 1.322 W \quad (59)$$

The junction temperature of the synchronous rectifier at 85°C is:

$$T_J = P_{SR} \times \theta_{JA} + T_A = (1.322) \times 40 + 85 = 139^\circ C \quad (60)$$

In typical applications, paralleling the synchronous rectifier MOSFET with a Schottky rectifier increases the overall converter efficiency by approximately 2% due to the lower power dissipation during the body diode conduction and reverse recovery periods.

### 8.2.2.6 Calculate the Inductor Value

The inductor value is calculated from [Equation 24](#).

$$L = \frac{(24 - 3.3 V) \times 3.3 V}{24 V \times 3.2 A \times 300 kHz} = 2.96 \mu H \quad (61)$$

A 2.9- $\mu$ H Coev DXM1306-2R9 or 2.6- $\mu$ H Panasonic ETQ-P6F2R9LFA can be used.

### 8.2.2.7 Set the Switching Frequency

The clock frequency is set with a resistor ( $R_T$ ) from the RT pin to ground. The value of  $R_T$  can be found from [Equation 1](#), with  $f_{SW}$  in kHz.

$$R_T = \left( \frac{1}{f_{SW} \times 17.82 \times 10^{-6}} - 17 \right) k\Omega = 170 k\Omega \quad \therefore \text{use } 169 k\Omega \quad (62)$$

### 8.2.2.8 Program the Ramp Generator Circuit

The PWM ramp is programmed through a resistor ( $R_{KFF}$ ) from the KFF pin to  $V_{IN}$ . The ramp generator also controls the input UVLO voltage. For an undervoltage level of 10 V,  $R_{KFF}$  can be calculated from [Equation 2](#):

$$R_{KFF} = (V_{IN(min)} - 3.48) \times (58.14 \times R_T + 1340) = 72.8 k\Omega \quad \therefore \text{use } 71.5 k\Omega \quad (63)$$

### 8.2.2.9 Calculate the Output Capacitance ( $C_O$ )

In this example the output capacitance is determined by the load response requirement of  $\Delta V = 0.3 V$  for a 1-A to 8-A step load.  $C_O$  can be calculated using [Equation 30](#):

### Typical Application (continued)

$$C_O = \frac{2.9 \mu \times \left( (8 \text{ A})^2 - (1 \text{ A})^2 \right)}{\left( (3.3)^2 - (3.0)^2 \right)} = 97 \mu\text{F} \quad (64)$$

Using Equation 25 calculate the ESR required to meet the output ripple requirements.

$$33 \text{ mV} = 3.2 \text{ A} \left( \text{ESR} + \left( \frac{1}{8 \times 97 \mu\text{F} \times 300 \text{ kHz}} \right) \right) \quad (65)$$

$$\text{ESR} = 10.3 \text{ m}\Omega - 4.3 \text{ m}\Omega = 6.0 \text{ m}\Omega \quad (66)$$

For this design example two Panasonic SP EEFUEOJ1B1R capacitors, (6.3 V, 180  $\mu\text{F}$ , 12 m $\Omega$ ) are used.

#### 8.2.2.10 Calculate the Soft-Start Capacitor ( $C_{\text{SS/SD}}$ )

This design requires a soft-start time ( $t_{\text{START}}$ ) of 1 ms.  $C_{\text{SS/SD}}$  can be calculated using Equation 6:

$$C_{\text{SS/SD}} = \frac{2.35 \mu\text{A}}{0.7 \text{ V}} \times 1 \text{ ms} = 3.36 \text{ nF} \cong 3300 \text{ pF} \quad (67)$$

#### 8.2.2.11 Calculate the Current Limit Resistor ( $R_{\text{ILIM}}$ )

The current limit set point depends on  $t_{\text{START}}$ ,  $V_O$ ,  $C_O$  and  $I_{\text{LOAD}}$  at startup as shown in Equation 7. For this design,

$$I_{\text{ILIM}} > \frac{360 \mu\text{F} \times 3.3 \text{ V}}{1 \text{ ms}} + 8.0 \text{ A} = 9.2 \text{ A} \quad (68)$$

For this design, add  $I_{\text{ILIM}}$  (9.2 A) to one-half the ripple current (1.6 A) and increase this value by 30% to allow for tolerances. This yields a overcurrent setpoint ( $I_{\text{OC}}$ ) of 14 A.  $R_{\text{DS(on)}}$  is increased 30% ( $1.3 \times 0.008$ ) to allow for MOSFET heating. Using Equation 8 to calculate  $R_{\text{ILIM}}$ .

$$R_{\text{ILIM}} = \frac{14 \times 0.0104 - 0.020}{1.12 \times 8.5 \times 10^{-6}} + \frac{42.86 \times 10^{-3}}{8.5 \times 10^{-6}} = 18.24 \text{ k}\Omega \cong 18.7 \text{ k}\Omega \quad (69)$$

#### 8.2.2.12 Calculate Loop Compensation Values

Calculate the DC modulator gain ( $A_{\text{MOD}}$ ) from Equation 12:

$$A_{\text{MOD}} = \frac{10}{2} = 5.0 \quad A_{\text{MOD(dB)}} = 20 \times \log(5) = 14 \text{ dB} \quad (70)$$

Calculate the output filter L- $C_O$  poles and  $C_O$ ESR zeros from Equation 13 and Equation 14:

$$f_{\text{LC}} = \frac{1}{2\pi \sqrt{L \times C_O}} = \frac{1}{2\pi \sqrt{2.9 \mu\text{H} \times 360 \mu\text{F}}} = 4.93 \text{ kHz} \quad (71)$$

and

$$f_z = \frac{1}{2\pi \times \text{ESR} \times C_O} = \frac{1}{2\pi \times 0.006 \times 360 \mu\text{F}} = 73.7 \text{ kHz} \quad (72)$$

Select the close-loop 0 dB crossover frequency,  $f_c$ . For this example  $f_c = 20 \text{ kHz}$ .

Select the double zero location for the Type III compensation network at the output filter double pole at 4.93 kHz.

Select the double pole location for the Type III compensation network at the output capacitor ESR zero at 73.7 kHz.

The amplifier gain at the crossover frequency of 20 kHz is determined by the reciprocal of the modulator gain  $A_{\text{MOD}}$  at the crossover frequency from Equation 22:

$$A_{\text{MOD(f)}} = A_{\text{MOD}} \times \left( \frac{f_{\text{LC}}}{f_c} \right)^2 = 5 \times \left( \frac{4.93 \text{ kHz}}{20 \text{ kHz}} \right)^2 = 0.304 \quad (73)$$

### Typical Application (continued)

And also from Equation 22:

$$G = \frac{1}{A_{\text{MOD}(f)}} = \frac{1}{0.304} = 3.29 \quad (74)$$

Choose  $R1 = 100 \text{ k}\Omega$

The poles and zeros for a type III network are described in Equation 17 through Equation 21.

$$f_{Z2} = \frac{1}{2\pi \times R1 \times C3} \therefore C3 = \frac{1}{2\pi \times 100 \text{ k}\Omega \times 4.93 \text{ kHz}} = 323 \text{ pF, choose } 330 \text{ pF} \quad (75)$$

$$f_{P2} = \frac{1}{2\pi \times R3 \times C3} \therefore R3 = \frac{1}{2\pi \times 330 \text{ pF} \times 73.3 \text{ kHz}} = 6.55 \text{ k}\Omega, \text{ choose } 6.49 \text{ k}\Omega \quad (76)$$

$$f_C = \frac{1}{2\pi \times R1 \times C2 \times G} \therefore C2 = \frac{1}{2\pi \times 100 \text{ k}\Omega \times 3.29 \times 20 \text{ kHz}} = 24.2 \text{ pF, choose } 22 \text{ pF} \quad (77)$$

$$f_{P1} = \frac{1}{2\pi \times R2 \times C2} \therefore R2 = \frac{1}{2\pi \times 22 \text{ pF} \times 73.3 \text{ kHz}} = 98.2 \text{ k}\Omega, \text{ choose } 97.6 \text{ k}\Omega \quad (78)$$

$$f_{Z1} = \frac{1}{2\pi \times R2 \times C1} \therefore C1 = \frac{1}{2\pi \times 97.6 \text{ k}\Omega \times 4.93 \text{ kHz}} = 331 \text{ pF, choose } 330 \text{ pF} \quad (79)$$

Calculate the value of  $R_{\text{BIAS}}$  from Equation 15 with  $R1 = 100 \text{ k}\Omega$ .

$$R_{\text{BIAS}} = \frac{0.7 \text{ V} \times R1}{V_O - 0.7 \text{ V}} = \frac{0.7 \text{ V} \times 100 \text{ k}\Omega}{3.3 \text{ V} - 0.7 \text{ V}} = 26.9 \text{ k}\Omega, \text{ choose } 26.7 \text{ k}\Omega \quad (80)$$

#### 8.2.2.13 Calculate the Boost and BP10V Bypass Capacitance

The size of the bypass capacitor depends on the total gate charge of the MOSFET being used and the amount of droop allowed on the bypass capacitor. The BOOST capacitance for the Si7860DP, allowing for a 0.5 voltage droop on the BOOST pin from Equation 31 is:

$$C_{\text{BOOST}} = \frac{Q_g}{\Delta V} = \frac{18 \text{ nC}}{0.5 \text{ V}} = 36 \text{ nF} \quad (81)$$

and the BP10V capacitance from Equation 32 is

$$C_{\text{BP}(10 \text{ V})} = \frac{Q_{\text{gHS}} + Q_{\text{gSR}}}{\Delta V} = \frac{2 \times Q_g}{\Delta V} = \frac{36 \text{ nC}}{0.5 \text{ V}} = 72 \text{ nF} \quad (82)$$

For this application, a 0.1- $\mu\text{F}$  capacitor is used for the BOOST bypass capacitor and a 1.0- $\mu\text{F}$  capacitor is used for the BP10V bypass.

## Typical Application (continued)

### 8.2.3 Application Curves

The TPS40055EVM-001 application curves are shown in Figure 16 to Figure 20 for reference.

## 9 Power Supply Recommendations

These devices are designed to operate from an input voltage supply between 8 V and 40 V. This supply must be well regulated. Proper bypassing of input supplies and internal regulators is critical for noise performance, as is PCB layout and grounding scheme. See the recommendations in the [Layout](#) section.

## 10 Layout

### 10.1 Layout Guidelines

The TPS4005x provides separate signal ground (SGND) and power ground (PGND) pins. It is important that circuit grounds are properly separated. Each ground should consist of a plane to minimize its impedance if possible. The high power *noisy* circuits such as the output, synchronous rectifier, MOSFET driver decoupling capacitor (BP10), and the input capacitor should be connected to PGND plane at the input capacitor.

Sensitive nodes such as the FB resistor divider,  $R_T$ , and ILIM should be connected to the SGND plane. The SGND plane should only make a single point connection to the PGND plane.

Component placement should ensure that bypass capacitors (BP10 and BP5) are located as close as possible to their respective power and ground pins. Also, sensitive circuits such as FB,  $R_T$  and ILIM should not be located near high  $dv/dt$  nodes such as HDRV, LDRV, BOOST, and the switch node (SW).

### 10.2 Layout Example

The TPS40055EVM-001 layout is shown in [Figure 21](#) to [Figure 25](#) for reference.

**Figure 21. Top Side Component Assembly**

Layout Example (continued)

Figure 23. Internal Layer 1 Copper

**Layout Example (continued)**

**Figure 24. Internal Layer 2 Copper**

**Figure 25. Bottom Layer Copper**

## 10.3 MOSFET Packaging

MOSFET package selection depends on MOSFET power dissipation and the projected operating conditions. In general, for a surface-mount applications, the DPAK style package provides the lowest thermal impedance ( $\theta_{JA}$ ) and, therefore, the highest power dissipation capability. However, the effectiveness of the DPAK depends on proper layout and thermal management. The  $\theta_{JA}$  specified in the MOSFET data sheet refers to a given copper area and thickness. In most cases, a lowest thermal impedance of 40°C/W requires one square inch of 2-ounce copper on a G-10/FR-4 board. Lower thermal impedances can be achieved at the expense of board area. Please refer to the selected MOSFET's data sheet for more information regarding proper mounting.

## 11 Device and Documentation Support

### 11.1 Device Support

The following devices have characteristics similar to the TPS40054/5/7 and may be of interest.

**Table 1. Related Devices**

DEVICE	DESCRIPTION
TPS40055-EP	Enhanced performance TPS40055.
TPS40054-Q1	Automotive qualified versions of the TPS4005x series.
TPS40057-Q1	
TPS40055-Q1	
TPS40192	4.5-V to 18-V Controller with Synchronization Power Good
TPS40193	
TPS40200	Wide-Input Nonsynchronous DC-DC Controller

### 11.2 Documentation Support

#### 11.2.1 Related Documentation

- Balogh, Laszlo, *Design and Application Guide for High Speed MOSFET Gate Drive Circuits*, Texas Instruments/Unitrode Corporation, Power Supply Design Seminar, SEM-1400 Topic 2.
- PowerPAD Thermally Enhanced Package* Texas Instruments, Semiconductor Group, Technical Brief ([SLMA002](#))

### 11.3 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## THERMAL PAD MECHANICAL DATA

### PWP (R-PDSO-G16) PowerPAD™ SMALL PLASTIC OUTLINE

#### THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

### Products

Audio	<a href="http://www.ti.com/audio">www.ti.com/audio</a>
Amplifiers	<a href="http://amplifier.ti.com">amplifier.ti.com</a>
Data Converters	<a href="http://dataconverter.ti.com">dataconverter.ti.com</a>
DLP® Products	<a href="http://www.dlp.com">www.dlp.com</a>
DSP	<a href="http://dsp.ti.com">dsp.ti.com</a>
