1. Overview

The M16C/62P Group (M16C/62P, M16C/62PT) of single-chip microcomputers are built using the high performance silicon gate CMOS process using a M16C/60 Series CPU core and are packaged in a 80-pin, 100-pin and 128-pin plastic molded QFP. These single-chip microcomputers operate using sophisticated instructions featuring a high level of instruction efficiency. With 1M bytes of address space, they are capable of executing instructions at high speed. In addition, this microcomputer contains a multiplier and DMAC which combined with fast instruction processing capability, makes it suitable for control of various OA, communication, and industrial equipment which requires high-speed arithmetic/logic operations.

1.1 Applications

Audio, cameras, television, home appliance, office/communications/portable/industrial equipment, automobile, etc.

Specifications written in this manual are believed to be accurate, but are not guaranteed to be entirely free of error. Specifications in this manual may be changed for functional or performance improvements. Please make sure your manual is the latest edition.

NOTES :
1. ROM size depends on microcomputer type.
2. RAM size depends on microcomputer type.
3. To use a UART2, set the CRD bit in the U2C0 register to “1” ($\overline{\text{CTS}}$/$\overline{\text{RTS}}$ function disabled).
4. There is no external connections for port P1, P4_4 to P4_7, P7_2 to P7_5 and P9_1 in 80-pin version. Set the direction bits in these ports to “1” (output mode), and set the output data to “0” (“L”) using the program.

1.6 Pin Description

Table 1.17 Pin Description (100-pin and 128-pin Version) (1)

Signal Name	Pin Name	I/O Type	Power Supply(3)	Description
Power supply input	VCC1,VCC2 VSS	I	–	Apply 2.7 to 5.5 V to the VCC1 and VCC2 pins and 0 V to the VSS pin. The VCC apply condition is that VCC1 ≥ VCC2. (1, 2)
Analog power supply input	AVCC AVSS	I	VCC1	Applies the power supply for the A/D converter. Connect the AVCC pin to VCC1. Connect the AVSS pin to VSS.
Reset input	$\overline{\text{RESET}}$	I	VCC1	The microcomputer is in a reset state when applying “L” to the this pin.
CNVSS	CNVSS	I	VCC1	Switches processor mode. Connect this pin to VSS to when after a reset to start up in single-chip mode. Connect this pin to VCC1 to start up in microprocessor mode.
External data bus width select input	BYTE	I	VCC1	Switches the data bus in external memory space. The data bus is 16 bits long when the this pin is held "L" and 8 bits long when the this pin is held "H". Set it to either one. Connect this pin to VSS when an single-chip mode.
Bus control pins (4)	D0 to D7	I/O	VCC2	Inputs and outputs data (D0 to D7) when these pins are set as the separate bus.
	D8 to D15	I/O	VCC2	Inputs and outputs data (D8 to D15) when external 16-bit data bus is set as the separate bus.
	A0 to A19	O	VCC2	Output address bits (A0 to A19).
	A0/D0 to A7/D7	I/O	VCC2	Input and output data (D0 to D7) and output address bits (A0 to A7) by timesharing when external 8-bit data bus are set as the multiplexed bus.
	A1/D0 to A8/D7	I/O	VCC2	Input and output data (D0 to D7) and output address bits (A1 to A8) by timesharing when external 16-bit data bus are set as the multiplexed bus.
	$\overline{\text{CS0}}$ to $\overline{\text{CS3}}$	O	VCC2	Output $\overline{\text{CS0}}$ to $\overline{\text{CS3}}$ signals. $\overline{\text{CS0}}$ to $\overline{\text{CS3}}$ are chip-select signals to specify an external space.
	$\overline{\text{WRL}}$/$\overline{\text{WR}}$ $\overline{\text{WRH}}$/$\overline{\text{BHE}}$ $\overline{\text{RD}}$	O	VCC2	Output $\overline{\text{WRL}}$, $\overline{\text{WRH}}$, ($\overline{\text{WR}}$, $\overline{\text{BHE}}$), $\overline{\text{RD}}$ signals. $\overline{\text{WRL}}$ and $\overline{\text{WRH}}$ or $\overline{\text{BHE}}$ and $\overline{\text{WR}}$ can be switched by program. • $\overline{\text{WRL}}$, $\overline{\text{WRH}}$ and $\overline{\text{RD}}$ are selected The $\overline{\text{WRL}}$ signal becomes "L" by writing data to an even address in an external memory space. The $\overline{\text{WRH}}$ signal becomes "L" by writing data to an odd address in an external memory space. The $\overline{\text{RD}}$ pin signal becomes "L" by reading data in an external memory space. • $\overline{\text{WR}}$, $\overline{\text{BHE}}$ and $\overline{\text{RD}}$ are selected The $\overline{\text{WR}}$ signal becomes "L" by writing data in an external memory space. The $\overline{\text{RD}}$ signal becomes "L" by reading data in an external memory space. The $\overline{\text{BHE}}$ signal becomes "L" by accessing an odd address. Select $\overline{\text{WR}}$, $\overline{\text{BHE}}$ and $\overline{\text{RD}}$ for an external 8-bit data bus.
	ALE	O	VCC2	ALE is a signal to latch the address.
	$\overline{\text{HOLD}}$	I	VCC2	While the $\overline{\text{HOLD}}$ pin is held "L", the microcomputer is placed in a hold state.
	$\overline{\text{HLDA}}$	O	VCC2	In a hold state, $\overline{\text{HLDA}}$ outputs a "L" signal.
	$\overline{\text{RDY}}$	I	VCC2	While applying a "L" signal to the $\overline{\text{RDY}}$ pin, the microcomputer is placed in a wait state.

I : Input O : Output I/O : Input and output

Power Supply : Power supplies which relate to the external bus pins are separated as VCC2, thus they can be interfaced using the different voltage as VCC1.

NOTES:

1. In this manual, hereafter, VCC refers to VCC1 unless otherwise noted.
2. In M16C/62PT, apply 4.0 to 5.5 V to the VCC1 and VCC2 pins. Also the apply condition is that VCC1 = VCC2.
3. When use VCC1 > VCC2, contacts due to some points or restrictions to be checked.
4. Bus control pins in M16C/62PT cannot be used.

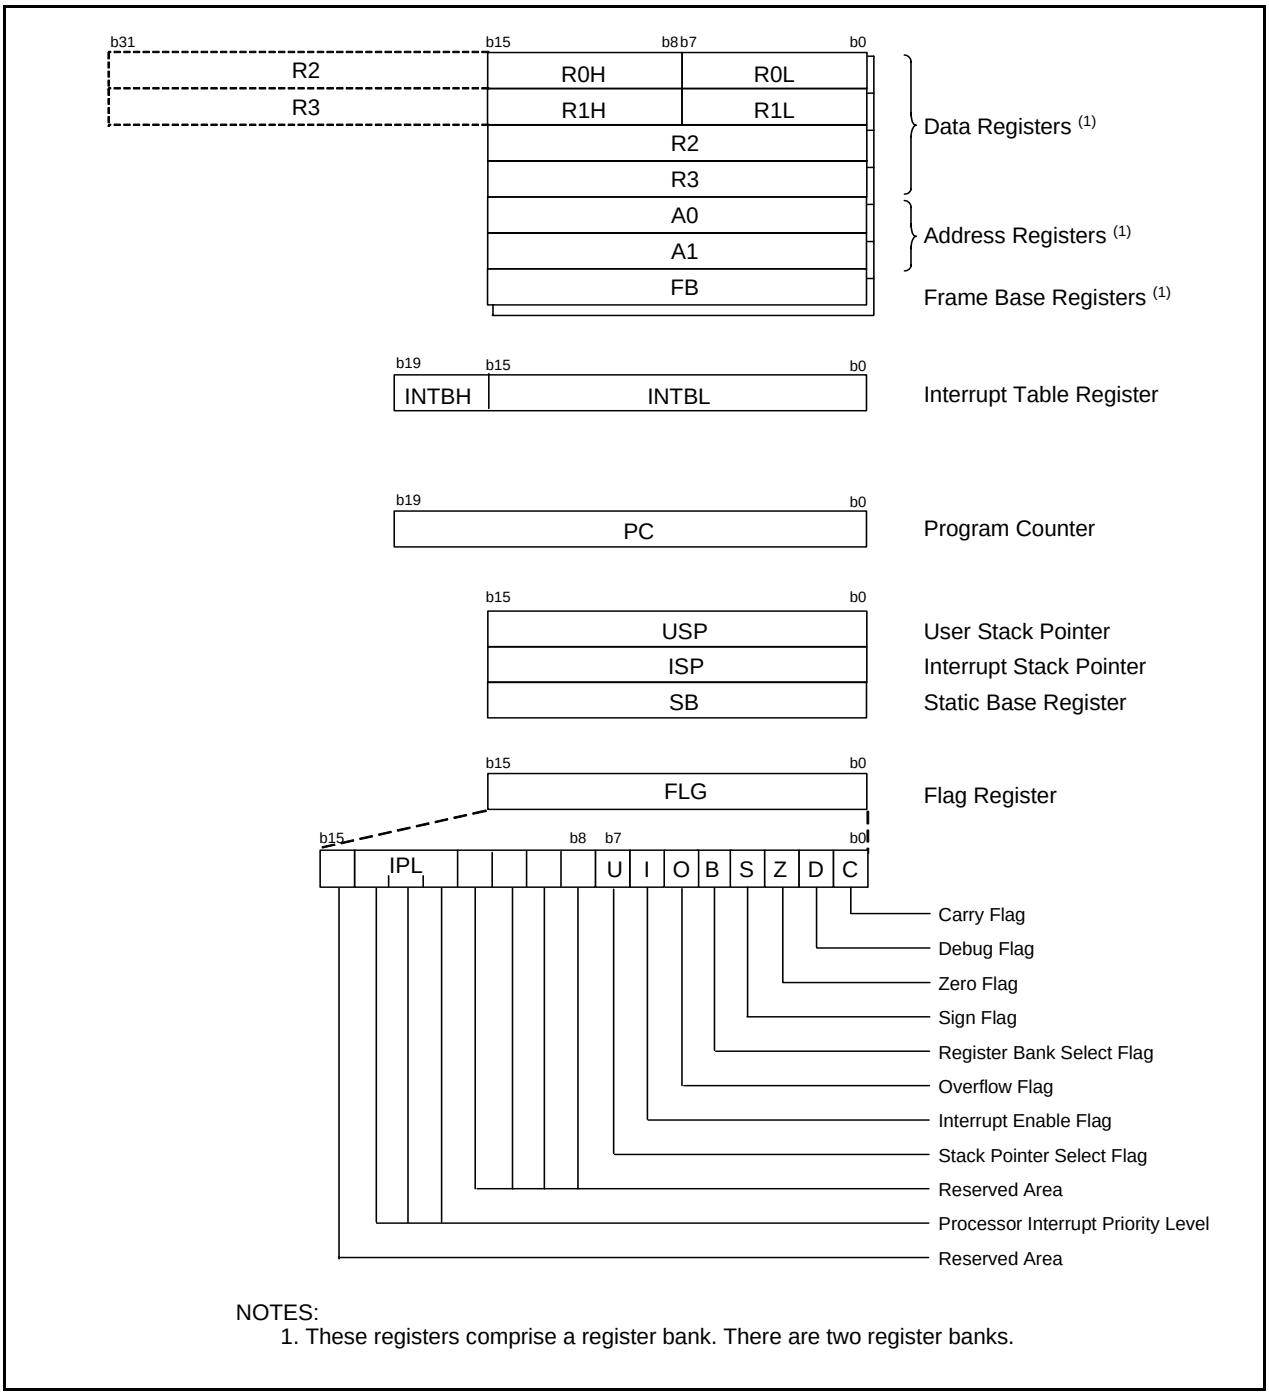
2. Central Processing Unit (CPU)

Figure 2.1 shows the CPU registers. The CPU has 13 registers. Of these, R0, R1, R2, R3, A0, A1 and FB comprise a register bank. There are two register banks.



NOTES:
1. These registers comprise a register bank. There are two register banks.

Figure 2.1 Central Processing Unit Register

2.1 Data Registers (R0, R1, R2 and R3)

The R0 register consists of 16 bits, and is used mainly for transfers and arithmetic/logic operations. R1 to R3 are the same as R0.

The R0 register can be separated between high (R0H) and low (R0L) for use as two 8-bit data registers.

R1H and R1L are the same as R0H and R0L. Conversely, R2 and R0 can be combined for use as a 32-bit data register (R2R0). R3R1 is the same as R2R0.

2.2 Address Registers (A0 and A1)

The register A0 consists of 16 bits, and is used for address register indirect addressing and address register relative addressing. They also are used for transfers and logic/logic operations. A1 is the same as A0.
In some instructions, registers A1 and A0 can be combined for use as a 32-bit address register (A1A0).

2.3 Frame Base Register (FB)

FB is configured with 16 bits, and is used for FB relative addressing.

2.4 Interrupt Table Register (INTB)

INTB is configured with 20 bits, indicating the start address of an interrupt vector table.

2.5 Program Counter (PC)

PC is configured with 20 bits, indicating the address of an instruction to be executed.

2.6 User Stack Pointer (USP) and Interrupt Stack Pointer (ISP)

Stack pointer (SP) comes in two types: USP and ISP, each configured with 16 bits.
Your desired type of stack pointer (USP or ISP) can be selected by the U flag of FLG.

2.7 Static Base Register (SB)

SB is configured with 16 bits, and is used for SB relative addressing.

2.8 Flag Register (FLG)

FLG consists of 11 bits, indicating the CPU status.

2.8.1 Carry Flag (C Flag)

This flag retains a carry, borrow, or shift-out bit that has occurred in the arithmetic/logic unit.

2.8.2 Debug Flag (D Flag)

The D flag is used exclusively for debugging purpose. During normal use, it must be set to “0”.

2.8.3 Zero Flag (Z Flag)

This flag is set to “1” when an arithmetic operation resulted in 0; otherwise, it is “0”.

2.8.4 Sign Flag (S Flag)

This flag is set to “1” when an arithmetic operation resulted in a negative value; otherwise, it is “0”.

2.8.5 Register Bank Select Flag (B Flag)

Register bank 0 is selected when this flag is “0” ; register bank 1 is selected when this flag is “1”.

2.8.6 Overflow Flag (O Flag)

This flag is set to “1” when the operation resulted in an overflow; otherwise, it is “0”.

2.8.7 Interrupt Enable Flag (I Flag)

This flag enables a maskable interrupt.
Maskable interrupts are disabled when the I flag is “0”, and are enabled when the I flag is “1”. The I flag is cleared to “0” when the interrupt request is accepted.

2.8.8 Stack Pointer Select Flag (U Flag)

ISP is selected when the U flag is “0”; USP is selected when the U flag is “1”.
The U flag is cleared to “0” when a hardware interrupt request is accepted or an INT instruction for software interrupt Nos. 0 to 31 is executed.

2.8.9 Processor Interrupt Priority Level (IPL)

IPL is configured with three bits, for specification of up to eight processor interrupt priority levels from level 0 to level 7.
If a requested interrupt has priority greater than IPL, the interrupt is enabled.

2.8.10 Reserved Area

When write to this bit, write “0”. When read, its content is indeterminate.

3. Memory

Figure 3.1 is a Memory Map of the M16C/62P group. The address space extends the 1M bytes from address 00000h to FFFFFh.
The internal ROM is allocated in a lower address direction beginning with address FFFFFh. For example, a 64-Kbyte internal ROM is allocated to the addresses from F0000h to FFFFFh.
As for the flash memory version, 4-Kbyte space (block A) exists in 0F000h to 0FFFFh. 4-Kbyte space is mainly for storing data. In addition to storing data, 4-Kbyte space also can store programs.
The fixed interrupt vector table is allocated to the addresses from FFFDCh to FFFFFh. Therefore, store the start address of each interrupt routine here.
The internal RAM is allocated in an upper address direction beginning with address 00400h. For example, a 10-Kbyte internal RAM is allocated to the addresses from 00400h to 02BFFh. In addition to storing data, the internal RAM also stores the stack used when calling subroutines and when interrupts are generated.
The SRF is allocated to the addresses from 00000h to 003FFh. Peripheral function control registers are located here. Of the SFR, any area which has no functions allocated is reserved for future use and cannot be used by users.
The special page vector table is allocated to the addresses from FFE00h to FFFDBh. This vector is used by the JMPS or JSRS instruction. For details, refer to the **M16C/60 and M16C/20 Series Software Manual**.
In memory expansion and microprocessor modes, some areas are reserved for future use and cannot be used by users. Use M16C/62P (80-pin version) and M16C/62PT in single-chip mode. The memory expansion and microprocessor modes cannot be used

NOTES:
1. Referenced to V_{CC1}=4.5 to 5.5V, 3.0 to 3.6V at Topr = 0 to 60 °C (D3, D5, U3, U5) unless otherwise specified.
2. n denotes the number of block erases.
3. Program and Erase Endurance refers to the number of times a block erase can be performed.
   If the program and erase endurance is n (n=100, 1,000, or 10,000), each block can be erased n times.
   For example, if a 4 Kbytes block A is erased after writing 1 word data 2,048 times, each to a different address, this counts as one program and erase endurance. Data cannot be written to the same address more than once without erasing the block. (Rewrite prohibited)
4. Maximum number of E/W cycles for which operation is guaranteed.
5. Topr = -40 to 85 °C (D3, D7, U3, U7) / -20 to 85 °C (D5, D9, U5, U9).
6. Referenced to V_{CC1} = 4.5 to 5.5V, 3.0 to 3.6V at T_{opr} = -40 to 85 °C (D7, U7) / -20 to 85 °C (D9, U9) unless otherwise specified.
7. Table 5.7 applies for block A or block 1 program and erase endurance > 1,000. Otherwise, use Table 5.6.
8. To reduce the number of program and erase endurance when working with systems requiring numerous rewrites, write to unused word addresses within the block instead of rewrite. Erase block only after all possible addresses are used. For example, an 8-word program can be written 256 times maximum before erase becomes necessary.
   Maintaining an equal number of erasure between block A and block 1 will also improve efficiency. It is important to track the total number of times erasure is used.
9. Should erase error occur during block erase, attempt to execute clear status register command, then block erase command at least three times until erase error disappears.
10. Set the PM17 bit in the PM1 register to “1” (wait state) when executing more than 100 times rewrites (D7, D9, U7 and U9).
11. Customers desiring E/W failure rate information should contact their Renesas technical support representative.

1. $V_{det4} > V_{det3}$.
2. Where reset level detection voltage is less than 2.7 V, if the supply power voltage is greater than the reset level detection voltage, the microcomputer operates with f(BCLK) ≤ 10MHz.
3. $V_{det3r} > V_{det3}$ is not guaranteed.
4. The voltage detection circuit is designed to use when VCC1 is set to 5V.

NOTES:

1. Calculated according to the BCLK frequency as follows:

$$\frac{0.5\times10^{9}}{f(BCLK)} - 40[ns]$$ f(BCLK) is 12.5MHz or less.

2. Calculated according to the BCLK frequency as follows:

$$\frac{0.5\times10^{9}}{f(BCLK)} - 10[ns]$$

3. This standard value shows the timing when the output is off, and does not show hold time of data bus.
   Hold time of data bus varies with capacitor volume and pull-up (pull-down) resistance value.
   Hold time of data bus is expressed in
   $t = -CR \times \ln(1 - V_{OL} / V_{CC2})$
   by a circuit of the right figure.
   For example, when V_{OL} = 0.2V_{CC2}, C = 30pF, R = 1kΩ, hold time of output "L" level is
   $t = -30pF \times 1k\Omega \times \ln(1 - 0.2V_{CC2} / V_{CC2})$
   = 6.7ns.

NOTES:

1. Calculated according to the BCLK frequency as follows:

$$\frac{0.5\times10^{9}}{f(BCLK)} - 40[ns]$$ f(BCLK) is 12.5MHz or less.

2. Calculated according to the BCLK frequency as follows:

$$\frac{0.5\times10^{9}}{f(BCLK)} - 10[ns]$$

3. This standard value shows the timing when the output is off, and does not show hold time of data bus.
   Hold time of data bus varies with capacitor volume and pull-up (pull-down) resistance value.
   Hold time of data bus is expressed in
   $t = -CR \times \ln(1 - V_{OL} / V_{CC2})$
   by a circuit of the right figure.
   For example, when $V_{OL} = 0.2V_{CC2}$, C = 30pF, R = 1kΩ, hold time of output "L" level is
   $t = -30pF \times 1k\Omega \times \ln(1 - 0.2V_{CC2} / V_{CC2})$
   = 6.7ns.

NOTES:
1. Referenced to V_{CC1}=4.5 to 5.5V at T_{opr} = 0 to 60 °C unless otherwise specified.
2. n denotes the number of block erases.
3. Program and Erase Endurance refers to the number of times a block erase can be performed.
   If the program and erase endurance is n (n=100, 1,000, or 10,000), each block can be erased n times.
   For example, if a 4 Kbytes block A is erased after writing 1 word data 2,048 times, each to a different address, this counts as one program and erase endurance. Data cannot be written to the same address more than once without erasing the block. (Rewrite prohibited)
4. Maximum number of E/W cycles for which operation is guaranteed.
5. Ta (ambient temperature)=55 °C. As to the data hold time except Ta=55 °C, please contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor.
6. Referenced to V_{CC1} = 4.5 to 5.5V at T_{opr} = –40 to 85 °C (B7, U7 (T version)) / –40 to 125 °C (B7, U7 (V version)) unless otherwise specified.
7. Table 5.54 applies for block A or block 1 program and erase endurance > 1,000. Otherwise, use Table 5.53.
8. To reduce the number of program and erase endurance when working with systems requiring numerous rewrites, write to unused word addresses within the block instead of rewrite. Erase block only after all possible addresses are used. For example, an 8-word program can be written 256 times maximum before erase becomes necessary.
   Maintaining an equal number of erasure between block A and block 1 will also improve efficiency. It is important to track the total number of times erasure is used.
9. Should erase error occur during block erase, attempt to execute clear status register command, then block erase command at least three times until erase error disappears.
10. Set the PM17 bit in the PM1 register to “1” (wait state) when executing more than 100 times rewrites (B7 and U7).
11. Customers desiring E/W failure rate information should contact their Renesas technical support representative.
