

Duplex Filters 40/160 LD 0003 - 0045 40/160 LDN 0040 - 0400

Filters for inline installation for continuous operation

With integrated pressure equalisation valve

Optimised flow characteristics by 3D - computer aided design

Low pressure drop

Special high efficient filter media

Operation pressure 40/160 bar Connection up to SAE $1\frac{1}{2}$ "

Quality assured!

Duplex Filters

40/160 LD 0003 - 0045 40/160 LDN 0040 - 0400

Operating pressure 40/160 bar Operating temperature -10° C to $+100^{\circ}$ C Connection up to SAE $1^{1}/2^{"}$

Application

Filtration of hydraulic fluids and lubricants. Filtration of liquids. Direct installation in pipelines to provide wear protection of subsequent components and systems.

Design

Filter Head with inlet & outlet ports and spigots to locate filter elements.. Screwed Filter Bowl. Materials: See spare parts list in this brochure.

Filter Element

Pleated design with optimal pleat density and various filter material. The filter element is the most important part of the system "Filter" with respect to availability and corrosion protection for the installation.

The deciding factors for selection are the degree of purity of the operating medium, the initial differential pressure, and the dirt retaining capacity.

Further details can be found in our brochure "Filter Elements".

Our computer programme

"EPE-FILTERSELECT" enables an optimal filter selection.

Accessories

Maintenance Indicator

These monitor the degree of clogging of the filter elements and are available as visual or visual/electric displays with one or two shift points.

Bypass Valve

For the protection of the filter elements during cold start and when the differential pressure is exceeded due to clogging.

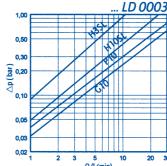

Vent Valve

For venting air from the filter during start up and for safe depressurisation.

Performance Characteristics

Oil Viscosity: 30 mm²/s Specific gravity < 0.9 kg/dm³

 Δp -Q-characteristic lines for complete filters recommended start- Δp for layout = 0.8 bar recommended velocity for layout = 3.5 m/s

Maintenance Indicator

The maintenance indicator monitors the degree of clogging of the filter elements. They are available as visual or visual/electrical displays. See "Maintenance Indicator" brochure for technical data.

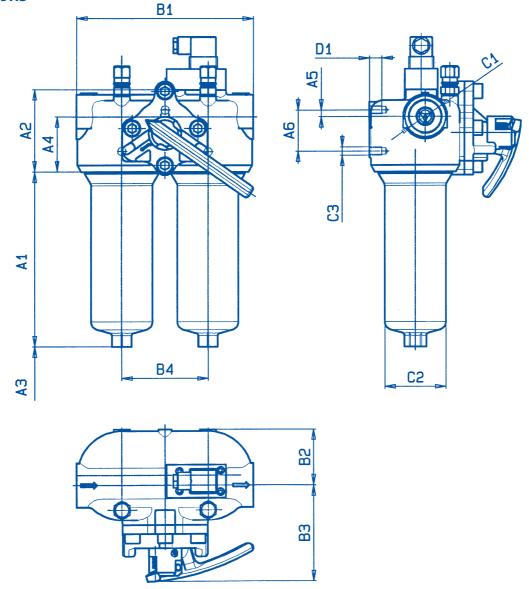

Filter Switching Symbol

*P = Buna N; V = Viton; E = Ethylene Propylene; N = Neoprene possible

Dimensions

Filter housing for filter element in accordance with EPE standard

Quality and Standardisation

The development, manufacture and assembly of EPE-industrial filters and filter elements is carried out within the framework of a certified quality management system in accordance with DIN EN ISO 9001.

The stability calculation and testing of the filters proceeds according to actual standards, as well as in accordance with national and international norms.

The CE-identification mark according to the Pressure Equipment Directive 97/23/EG depends upon the individual application and operating conditions. On request we will classify the filters.

Certification of the filters by accredited institutions (for example TÜV, GL, LRS, LRS, ABS, BV, DNV, DRIRE, UDT, etc.) is available on request.

Installation, Starting Maintenance

Installation

Check that the pressure rating of the filter is suitable for the system in which it is being installed. Screw the filter head (Part 1) onto the mounting device, taking into account the direction of flow (directional arrow) and installation height of the filter element (Part 3). Remove filter entry and exit plugs, screw filter into the pipe-line, taking care to avoid stress on the components.

Connection of electrical maintenance indicator

Connect using three pole cable, paying attention to breaking capacity on the rating plate of the filter (Part 10). Connection variants:

Connection

 1. Closer
 1 (black) + 3 (blue)

 2. Opener
 1 (black) + 2 (brown)

 3. Changer
 1 (black) + 2 (brown) + 3 (blue)

Starting

Switch on service pump Ventilate filter by opening the vent valve (Part 11), close when operating liquid appears. Switch lever indicates the side of maintenance.

Maintenance

The filter element is clogged and must be changed or cleaned when at operating temperature the red pointer on the Maintenance indicator (Part 10) is hard against the plastic cap. and/or the switching process on the electrical indicator is triggered.

Filter Element Service

Pull the switch-over lever and switch over to the second filter. Open the vent valve (Part 11) on the filterhalf taken out of operation and reduce the pressure.

Unscrew the filter (Part 2) and remove the filter element (Part 3) with slight rotatation, from the centering spigot on the filter head. Check the filter head for cleanliness and clean if necessary. Replace filter elements H ... -SL, P ... and VS ... Clean the filter element with

material G ... The effectiveness of cleaning is dependent on the type of dirt and the level of the differential pressure at the time of changing

the filter element.

If the differential pressure is more than 50 % of the value obtaining before the filter change, then the element G ... is to be replaced. Using a light rotation movement, place new or cleaned filter elements on the centering spigot.

Check O-ring (Part 16) in the filter housing and replace when damaged or worn.

Screw on the filter head and tighten the hexagon with appropriate tool. Put back into operation as described above.

Information

When disassembling the filters make sure that the filter inlet and outlet are drained separately!

Technical specification are subject to change!
