Notes:

1. These values apply bidirectionally for any value of resistance between the gate and Main Terminal 1.
2. This value applies for 50-Hz full-sine-wave operation with resistive load. Above 85°C derate linearly to 110°C case temperature at the rate of 160 mA/°C.
3. This value applies for one 50-Hz full-sine-wave when the device is operating at (or below) the rated value of on-state current. Surge may be repeated after the device has returned to original thermal equilibrium. During the surge, gate control may be lost.
4. This value applies for one 50-Hz half-sine-wave when the device is operating at (or below) the rated value of on-state current. Surge may be repeated after the device has returned to original thermal equilibrium. During the surge, gate control may be lost.
5. This value applies for a maximum averaging time of 20 ms.

Note 6: These parameters must be measured using pulse techniques,  $t_w = \leq 1\mu s$ , duty cycle  $\leq 2\%$ , voltage-sensing contacts, separate from the current-carrying contacts are located within 3.2mm (1/8 inch) from the device body.

Note 7: The triacs are triggered by a 15-V (open circuit amplitude) pulse supplied by a generator with the following characteristics:  $R_G = 100\Omega$ ,  $t_{p(g)} = 20\mu s$ ,  $t_r = \leq 15ns$ ,  $f = 1\text{ kHz}$ .
