- Pilot operated valves for reducing system pressure at the consumer (pilot oil internal only)
- 3-way version (P-A/A-T),  $p_{\min} = p$  in T
- Adjustable by means of the solenoid current, see 2 Characteristic Curve, Technical Data and selected valve 3 electronics
- Solenoid type  $I_{\text{max}} = 0.8 \text{ A}$
- 5 to 7 - Pressure limitation to a safe level even with faulty electronics
  - (solenoid current  $I > I_{max}$ )
  - For subplate attachment, mounting hole configuration to ISO 4401-03-02-0-94 Subplates as per catalog sheet RE 45053 (order separately)
    - Plug-in connector to DIN 43650-AM2 included in scope of delivery
    - External trigger electronics with ramps and valve calibration in the following versions/designs (order separately)
      - Plug, setpoint 0...+10 V or 4...20 mA, RE 30264
      - Module, setpoint 0...+10 V, RE 30222
      - Europe card, setpoint 0...+10 V, RE 30109

#### Function, sectional diagram

#### General

Type DRE6X proportional pressure reducing valves are pilot operated, with a 3-way main stage. The pilot valve (pressure relief valve pilot stage) is supplied internally with a controlled flow of pilot oil via P.

The valves are actuated by a proportional solenoid acting against a spring. The solenoid armature is cushioned to aid stability. The interior of the solenoid is filled with pressure fluid and connected via T.

Bleeding is achieved by means of a screw plug. With these valves, the pressure in A (consumer) can be infinitely adjusted and reduced in relation to the solenoid current.

#### Basic principle

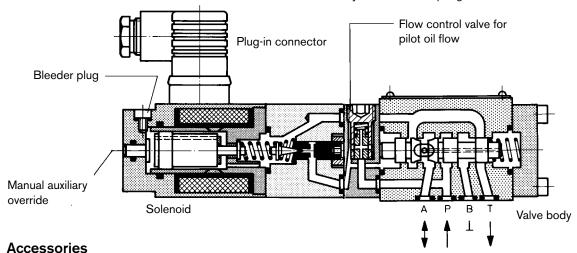

To adjust the system pressure in A, a setpoint is set in the trigger electronics. Based on this setpoint, the electronics control the solenoid coil with regulated PWM (pulse-width-modulated) current. The current is modulated with a dither, to ensure minimal hysteresis.

The proportional solenoid converts the current to a mechanical force, and the armature plunger pre-stresses the main spring in the pilot stage. The pilot stage is supplied with oil from P at a flow rate of <0.6 l/min via a flow control valve. The pilot pressure is compared with the consumer pressure (plus spring) in A and regulated (P-A/A-T).

The spring results in  $p_{\rm Amin} = p$  in T.

#### Pressure limitation for maximum safety

If a fault occurs in the electronics, so that the solenoid current  $(I_{\rm max})$  would exceed its specified level in an uncontrolled manner, the pressure cannot rise above the level determined by the maximum spring force.
