### 1 Description

TRIO POWER - robust and distributed power supplies with IP67 degree of protection

The TRIO POWER power supplies with IP67 protection are distinguished by their functionality and robust design. The combination of dustproofness and therefore full touch protection is indicated by the first number of the IP code (IP6x). The second number (IPx7) indicates protection against temporary submersion in water. This means that use in particularly difficult ambient conditions is always ensured.

The dynamic boost (1.5 x  $I_N$  for 5 seconds) safely absorbs starting currents and brief overload situations during operation, and without a dip in the output voltage. On the device side, the power supply is equipped with coded circular connectors.

### Features

- Tool-free connection with no danger of mismatching, \_ thanks to coded circular connectors
- Safe operation, thanks to electrically and mechanically extremely robust design
- Worldwide use, thanks to wide-range input
- Fixed 24 V DC output voltage
- Reliable starting of heavy loads, thanks to dynamic boost (1.5 x  $I_N$  for 5 seconds)
- Simplified error diagnostics for remote signaling via DC-OK signal contact
- OVP (Over Voltage Protection) limits surge voltages to ≤30 V DC (EN 61131-2)

## Technical data (short form)

Input voltage range	100 V AC 240 V AC ±10 % 110 V DC 250 V DC ±10 %
Nominal input voltage range	100 V AC 240 V AC 110 V DC 250 V DC
Mains buffering	> 15 ms (120 V AC) > 15 ms (230 V AC)
Nominal output voltage (U <sub>N</sub> )	24 V DC ±1 %
Nominal output current (I <sub>N</sub> ) Dynamic Boost (I <sub>Dyn.Boost</sub> )	10 A 15 A (5 s)
Output power (P <sub>N</sub> ) Output power (P <sub>Dyn. Boost</sub> )	240 W 360 W
Efficiency	typ. 91 % (120 V AC) typ. 93 % (230 V AC)
Residual ripple	≤ 10 mV <sub>PP</sub>
MTBF (IEC 61709, SN 29500)	> 1800000 h (25 °C) > 1000000 h (40 °C) > 480000 h (60 °C)
Ambient temperature (operation)	-25 °C 70 °C (Derating >60°C: 2.5 %/K)
Startup type tested	-25 °C
Dimensions W/H/D	136 mm / 240 mm / 53 mm
Weight	1.5 kg

Make sure you always use the latest documentation.

It can be downloaded from the product at phoenixcontact.net/products.

# 4 Technical data

# Input data

i

All technical specifications are nominal values and are based on an ambient temperature of 25°C and 70% relative humidity at 2000 m above sea level.

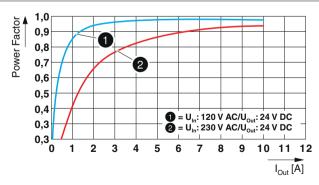

Input voltage range (for DC, connect a suitable fuse)	100 V AC 240 V AC ±10 % 110 V DC 250 V DC ±10 %
Nominal input voltage range	100 V AC 240 V AC 110 V DC 250 V DC
Switch-on voltage typ.	≥ 95 V DC
Shut-down voltage typ.	< 95 V DC
Electric strength, max.	≤ 300 V AC (15 s)
Network type	Star network (TN, TT, IT (PE))
Frequency range (f <sub>N</sub> )	50 Hz 60 Hz ±10 %
Current consumption (for nominal values) typ.	2.8 A (100 V AC) 1.2 A (240 V AC) 2.4 A (110 V DC) 1.1 A (250 V DC)
Switch-on time	<1s
Discharge current to PE	< 3.5 mA
Mains buffering	> 15 ms (120 V AC) > 15 ms (230 V AC)
Inrush current integral (I <sup>2</sup> t)	< 0.5 A <sup>2</sup> s
Inrush current limitation after 1 ms	typ. 25 A
Input fuse internal (device protection)	6.3 A
Recommended breaker for input protection	6 A 16 A (US/CAN: branch circuit protection < 20 A) (Characteristic B, C, D, K or comparable)

# 5 Symbols used

In this data sheet, symbols are used to draw your attention to important information and potential dangers.

# WARNING

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety measures that follow this symbol to avoid possible personal injuries.

There are different categories of personal injury that are indicated by a signal word.

# WARNING

This indicates a hazardous situation which, if not avoided, could result in death or serious injury.

# CAUTION

This indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

# NOTE

Indication of a required action which if it is not performed may cause damage or malfunction to the device, hardware/software, or surrounding property.

This symbol and the accompanying text provide the reader with additional information or refer to detailed sources of information.

# 6 Safety regulations and installation notes

_	
	i
_	

Before mounting, starting up or operating the power supply, carefully read through the data sheet.

# WARNING: Danger to life by electric shock!

- Only qualified specialist personnel may mount, start up, and operate the power supply.
- Establish connection correctly and ensure protection against electric shock.
- It must be possible to switch off the device outside the power supply in accordance with the regulations of EN 61010-1 (e.g., by line protection on the primary side).
- The protective conductor connection ⊕ for the supply source must be wired to the ground conductor contact ⊕ in the field-side circular connector.
- Never carry out work when voltage is present.

# 

- Observe the national safety and accident prevention regulations.
- Assembly and electrical installation must correspond to the state of the art.
- The die-cast housing and the device-side circular connectors satisfy the requirements of IP67 protection.
- Outdoor mounting is allowed.
- Avoid an installation location with direct sunlight.
- If the ambient temperature at the mounting location is >45°C, prevent direct contact with the power supply. For example, use an additional control cabinet (restricted access location).
- Observe the mechanical and thermal limits at the installation location.
- Mount the power supply in the normal mounting position (device-side circular connectors below).
- Adequate keep-out zones must be ensured for heat emission.
- Ensure that the primary-side wiring and secondary-side wiring are the correct size and have sufficient fuse protection.
- The connection parameters, e.g., required stripping lengths for the wiring, can be found in the installation information for the respective field-side circular connector.
- Use copper cables with an operating temperature ≥105°C (ambient temperature <85°C).</li>
- The power supply is approved for connection to TN, TT, and IT (PE) power grids (star networks) with a maximum phase-to-phase voltage of 240 V AC.
- The power supply is maintenance-free.
  Repairs may only be carried out by the manufacturer. The warranty no longer applies if the housing is opened.
- The power supply may only be used for its intended use.

# 7 Design

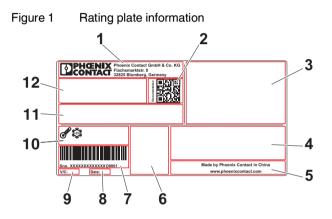

# 7.1 Rating plate

In accordance with the German Product Safety Law (ProdSG) it is only permissible to make such products available on the market if they meet certain safety standards. It must be ensured at all times that users are not exposed to hazards.

In accordance with ProdSG, every device must therefore be fitted with a rating plate. All relevant information on the safe use of the device must also be included.

The power supply device rating plate is located on the front of the housing (as viewed from the front).

# 7.2 Device connections and functional elements

Device connections are labeled with connection tags to ensure clear and definitive identification.

The connection tags are split into the following connection levels:

Connection level	Description
1.	AC input
2.	DC output
3.	Signal contact

# 7.4 Device dimensions

Figure 4 Device dimensions (dimensions in mm)

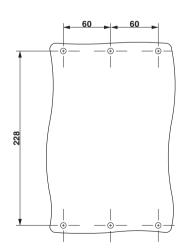

# 7.5 Drilling pattern for fixing holes

i

The power supply is mounted on a flat, loadbearing surface. Fix the power supply in place at the outer corners with at least four mounting screws (hole dimensions: 120 x 228 mm).

If the operating conditions are particularly difficult, e.g., due to vibration, six mounting screws can be used.

Figure 5 Drilling pattern for fixing holes (dimensions in mm)

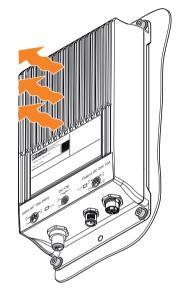

# 8 Mounting/remove

The power supply is mounted on a console or directly on a flat mounting surface (wall mounting). Mounting on structural or strut profiles is also possible.

# 8.1 Heat dissipation

Heat is dissipated from the power supply as radiant heat via the heatsink integrated in the housing cover. During mounting, observe the minimum distances specified for the device side (see section: keep-out zones).

# 8.2 Mounting position

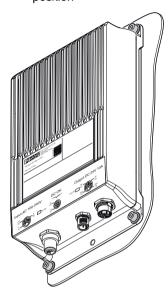

The specified technical data for the power supply is based on nominal operation.

The power supply is not subject to positiondependent derating.

Figure 7

Power supply installed in the normal mounting position

### 8.3 Installation height

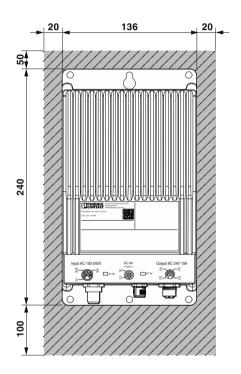

You can operate the power supply without power limitations up to an installation altitude of 2000 m. For altitudes higher than 2000 m, different specifications apply due to the differing air pressure and the reduced convection cooling associated with this (see section: Technical data, Ambient conditions).

### 8.4 Keep-out areas

In the normal mounting position, the power supply is mounted on a flat surface with mounting screws.

# 8.5 Mounting the power supply unit

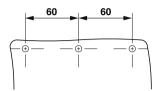

A supporting substructure, mounting wall, or structural profile is essential for the installation of the power supply. The device-side connector (circular connector) is at the bottom when installing in the standard installation position. The die-cast housing is fixed with two or four screws, depending on the type of mounting. Use either Allen screws (such as M5 x 40, ISO 4762) or hexalobular internal driving screws (such as 5 x 40, ISO 10664). In order to secure the screws, use spring washers in accordance with ISO 10670.

Depending on the required mounting position of the power supply, use the temporary mounting aid (eye) to accurately prepare the four mounting holes. They are located in the middle on the top or bottom mounting flange.

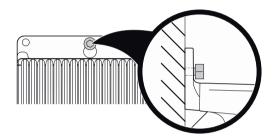

# 8.5.1 Wall mounting / temporary fixing (mounting aid)

Figure 9 Drilling pattern for temporary mounting

For temporary fixing, use the same screws as for standard fixing (e.g., M5 x 40, ISO 4762 or hexalobular internal driving screws, e.g.,  $5 \times 40$ , ISO 10664).

Figure 10 Schematic diagram of temporary mounting aid

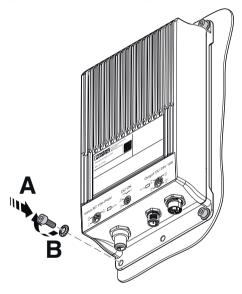

Proceed as follows to temporarily secure the power supply:

- 1. Select the appropriate mounting location and the required mounting position. Observe the required keepout zones.
- 2. Depending on the mounting position, one or two drill holes are needed as a temporary mounting aid.
- 3. Drill the necessary number of drill holes using a suitable drill, depending on the type of fixing (threaded or wall plug mounting).
- 4. Prepare the drill hole(s) for the temporary mounting aid (tap M5 thread or insert 8 x 70 mm wall plug).
- 5. Screw the required number of screws into the fixing holes using a suitable tool so that the screws are still protruding by min. 10 mm.
- 6. Place the power supply onto the screws, so that they hold it securely in place.
- 7. Now perform the actual wall mounting process (see section: Wall mounting)

## 8.5.2 Wall mounting

Proceed as follows to mount the power supply:

- 1. Copy the entire drilling pattern onto the substructure or mounting wall.
- 2. Select suitable fixing material depending on the substructure or mounting wall
- 3. Drill the necessary number of drill holes using a suitable drill, depending on the type of fixing (threaded or wall plug mounting).
- 4. Prepare the drill hole(s) for the temporary mounting aid (tap M5 thread or insert 8 x 70 mm wall plug).
- 5. Fix the die-cast housing in place using four screws and four spring washers
- 6. Check that the die-cast housing is securely mounted
- Figure 11 Schematic diagram of wall mounting

# 8.5.3 Structural profile

Proceed as follows to mount the power supply:

- 1. Position the two sliding blocks for fixing in the mounting profile
- 2. Use the center fixing holes (top, bottom) to fix the diecast housing
- 3. Fix the die-cast housing in place using two screws and two spring washers
- 4. Check that the die-cast housing is securely mounted

### 8.6 Removing the power supply unit

For added security, before loosening all the mounting screws, use the two screws of the temporary mounting aid again.

To remove the power supply, perform the same procedure for the relevant type of fixing (wall mounting, structural profile mounting) in reverse.

# 9 Device-side circular connectors

On the device side, all the connection contacts of the power supply are circular connectors. For the respective contact assignment of the circular connectors for the device supply or load supply, please refer to the relevant section on the input, output or signaling.

For protection against fatal electric shock, the diecast housing is wired internally to the protective conductor connection of the device-side circular connector for the AC input voltage.

Optionally available circular connectors are required for the field-side connection of the power supply (see accessories).

## 9.1 Coding of field-side circular connectors

Each field-side circular connector that is required is assigned its special function with different coding. Incorrect connection between Input AC, Output DC, and floating signal contact 13/14 is therefore impossible.

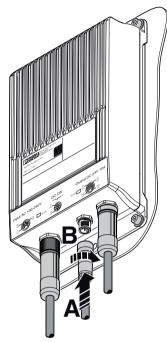

For the coding of field-side circular connectors, refer to the table below:

Device-side marking	Coding
Input AC	S-coded
Output DC	
13/14 (floating contact)	A-coded

# 9.2 Connecting field-side circular connectors

The field-side circular connectors to be used are coded like the device-side circular connectors. This ensures clear assignment between AC device supply, DC load supply, and the signal contact. Unintentional incorrect connection is prevented.

Figure 13 Schematic diagram, connecting field-side circular connectors

Proceed as follows to connect the field-side circular connectors:

- A Depending on their assigned functionality and coding, securely attach the field-side circular connectors to the device-side circular connectors.
- B To lock the circular connectors, tighten the screw locking by turning it clockwise.

## 9.3 Releasing field-side circular connectors

To release the field-side circular connectors, perform the same procedure in reverse.

# 10 Input AC

The power supply is approved for connection to TN, TT, and IT (PE) power grids (star networks) with a maximum phase-to-phase voltage of 240 V AC.

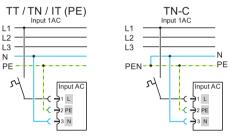

Connection is via the device-side circular connector, connection level 1 (Input AC).

## 10.1 Primary side connection and fuse protection

The installation of the power supply must conform to the regulations of EN 61010. It must be possible to switch off the power supply using a suitable disconnect device outside the power supply. For example, the primary-side line protection is suitable for this (see technical data).

## 10.1.1 1AC supply network

Figure 14 Permissible network types for AC supply

# 10.1.2 DC supply network

Operation on DC power grids is also possible in accordance with the DC nominal input voltage.

## **DANGER: Hazardous voltage**

When operating the power supply on a DC voltage system, observe the maximum permissible input voltage (see section: Technical data).

The primary-side fuse protection in DC operation must cover all poles.

# NOTE: Damage possible if an incorrect fuse is used

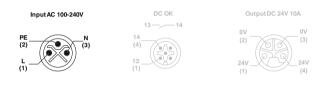

In DC operation, only use fuses that are approved for DC voltages.

Schematic diagram, two-phase fuse protection Figure 15

#### Position of circular connector Input AC 10.2

Figure 16 Device-side position and contact assignment of circular connector Input AC

Contact assign- ment	Description
Contact plug 1	L/+ (mains supply)
Contact plug 2	Protective conductor connection PE
Contact plug 3	N/- (mains supply)

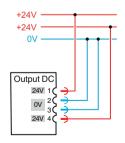

### 11 **Output DC**

A DC voltage for supplying the load is provided at the output of the power supply.

Upon delivery, the power supply is preset to a nominal output voltage of 24 V DC. The output voltage value cannot be changed.

Connection is via the device-side circular connector, connection level 2 (Output DC).

Wiring principle, DC output Figure 17

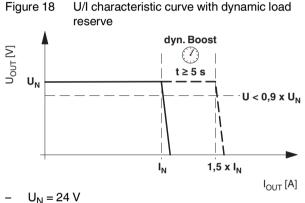

#### Protection of the secondary side 11.1

The power supply is electronically short-circuit-proof and no-load-proof. In the event of an error, the output voltage is limited

Overvoltage protection (OVP) limits surge voltages at the DC output to ≤30 V DC (EN 61131-2)

#### **Output characteristic curve** 11.2

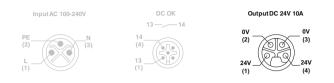

The power supply works with a dynamic power reserve, the dynamic boost, as shown in the U/I characteristic curve in the figure. In the event of a secondary-side short circuit or overload, the output current is limited to 1.5 x I<sub>N</sub>. The module does not switch off, but supplies a continuous output current instead. The secondary voltage is then reduced until the short circuit is eliminated. The U/I characteristic curve with the dynamic power reserve enables high switch-on currents of capacitive loads or inductive loads to be supplied reliably.

- $I_{N} = 10 A$
- $P_{N} = 240 W$
- $I_{dyn. BOOST} = 15 A (5 s)$
- P<sub>dyn. BOOST</sub> = 360 W (5 s)

### Position of circular connector Output DC 11.3

Figure 19 Device-side position and contact assignment of circular connector Output DC

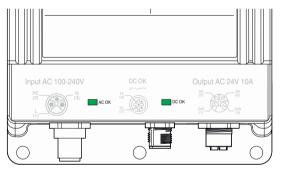

Contact assign- ment	Description
Contact socket 1	+24 V DC
Contact socket 2	0 V DC
Contact socket 3	0 V DC
Contact socket 4	+24 V DC

### 12 Signaling

Two LEDs (AC OK, DC OK) and a floating signal contact (N/ O contact 13/14) are available for preventive function monitoring of the power supply.

### 12.1 AC OK LED

The AC OK LED is available for function monitoring. When the power supply is supplied with the necessary AC supply voltage, the LED is steady green. If the supplied input voltage falls below the threshold value of  $0.55 \times AC_N$  (AC<sub>N</sub> = 90 V AC), the power supply switches off.

### DC OK-LED 12.2

The DC OK LED is available for function monitoring. When the output voltage is >90% of the nominal output voltage U<sub>OUT</sub> (24 V DC), the LED is steady green. If the DC output voltage falls below the specified limit value, e.g., due to disruption of the supplied DC output load, the LED is no longer activated.

#### Floating signal contact 12.3

A floating switch contact can be used to forward data to a higher-level control system. If the input voltage  $(0.55 \times AC_N)$ is undershot or the nominal output voltage  $U_{OUT}$  is <90%, the switch contact (N/O contact 13/14) opens.

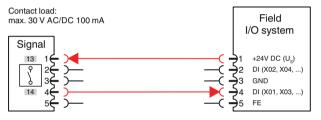

Connection is via the device-side circular connector, connection level 3 (signal contact).

Schematic diagram, floating signal contact Figure 21

Contact load: max. 30 V AC/DC 100 mA

# NOTE: Observe maximum current carrying capacity

For the external wiring of the floating switch contact, observe the maximum permissible current carrying capacity of: 30 V AC/DC, 100 mA
