5:4	0h RW	csi_irq: CSI receiver interrupt request
3	0h RW	csi_pkt_eol: End of Line of Frame packet from CSI receiver

Bit Range	Default & Access	Description
2	0h RW	csi_pkt_sol: Start of Line packet from CSI receiver
1	0h RW	csi_pkt_eof: End of Frame packet from CSI receiver
0	0h RW	csi_pkt_sof: Start of Frame packet from CSI receiver

15.8.844 reg_isel_gpr_reg_gp_syncgen_enable_type (isel_gpr_reg_gp_syncgen_enable)—Offset 90000h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_syncgen_enable: [ISPMMADR] + 90000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_reg_gp_syncgen_enable: Unused
0	0h RW	reg_gp_syncgen_enable: Enables (value=1) or disables (value=0) the Sync Generator.

15.8.845 reg_isel_gpr_reg_gp_syncgen_free_running_type (isel_gpr_reg_gp_syncgen_free_running)—Offset 90004h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_syncgen_free_running: [ISPMMADR] + 90004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_reg_gp_syncgen_free_running: Unused
0	0h RW	reg_gp_syncgen_free_running: Sets the sync generator in free running mode (value=1) or let it stall in sync with either the PRBS or TPG (value=0)

15.8.846 reg_isel_gpr_reg_gp_syncgen_pause_type (isel_gpr_reg_gp_syncgen_pause)—Offset 90008h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_syncgen_pause: [ISPMADR] + 90008h

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_reg_gp_syncgen_pause: Unused

Bit Range	Default & Access	Description
0	0h RW	reg_gp_syncgen_pause: Sets the sync generator in pause mode (value=1) or not (value=0)

15.8.847 reg_isel_gpr_reg_gp_nr_frames_type (isel_gpr_reg_gp_nr_frames)—Offset 9000Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_nr_frames: [ISPMADDR] + 9000Ch

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	unused_reg_gp_nr_frames: Unused
13:0	0h RW	reg_gp_nr_frames: Sets the sync generator parameter Number of Frames

15.8.848 reg_isel_gpr_reg_gp_syngen_nr_pix_type (isel_gpr_reg_gp_syngen_nr_pix)—Offset 90010h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_syngen_nr_pix: [ISPMADDR] + 90010h

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	unused_reg_gp_syngen_nr_pix: Unused
13:0	0h RW	reg_gp_syngen_nr_pix: Sets the number of active pixels per line in the Sync Generator

15.8.849 reg_isel_gpr_reg_gp_syngen_nr_lines_type (isel_gpr_reg_gp_syngen_nr_lines)—Offset 90014h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_syngen_nr_lines: [ISPMMADR] + 90014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	unused_reg_gp_syngen_nr_lines: Unused
13:0	0h RW	reg_gp_syngen_nr_lines: Sets the number of lines per frame in the Sync generator

15.8.850 **reg_isel_gpr_reg_gp_syngen_hblank_cycles_type** (isel_gpr_reg_gp_syngen_hblank_cycles)—Offset 90018h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_syngen_hblank_cycles: [ISPMADDR] + 90018h

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	unused_reg_gp_syngen_hblank_cycles: Unused
13:0	0h RW	reg_gp_syngen_hblank_cycles: Sets the number of cycles between the end-of-line and start-of-line pulses.

15.8.851 **reg_isel_gpr_reg_gp_syngen_vblank_cycles_type** (isel_gpr_reg_gp_syngen_vblank_cycles)—Offset 9001Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_syngen_vblank_cycles: [ISPMADDR] + 9001Ch

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	unused_reg_gp_syngen_vblank_cycles: Unused
13:0	0h RW	reg_gp_syngen_vblank_cycles: Sets the number of cycles between the end-of-frame and start-of-frame pulses.

15.8.852 reg_isel_gpr_reg_gp_isel_sof_type (isel_gpr_reg_gp_isel_sof)—Offset 90020h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_sof: [ISPMADR] + 90020h

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_reg_gp_isel_sof: Unused
0	0h RW	reg_gp_isel_sof: Sets the input selector gp_sof input.

15.8.853 reg_isel_gpr_reg_gp_isel_eof_type (isel_gpr_reg_gp_isel_eof)—Offset 90024h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_eof: [ISPMADR] + 90024h

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_gp_isel_eof								reg_gp_isel_eof

Bit Range	Default & Access	Description
31:1	0h RW	unused_reg_gp_isel_eof: Unused
0	0h RW	reg_gp_isel_eof: Sets the input selector gp_eof input.

15.8.854 reg_isel_gpr_reg_gp_isel_sol_type (isel_gpr_reg_gp_isel_sol)—Offset 90028h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_sol: [ISPMADR] + 90028h

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_gp_isel_sol								reg_gp_isel_sol

Bit Range	Default & Access	Description
31:1	0h RW	unused_reg_gp_isel_sol: Unused
0	0h RW	reg_gp_isel_sol: Sets the input selector gp_sol input.

15.8.855 reg_isel_gpr_reg_gp_isel_eol_type (isel_gpr_reg_gp_isel_eol)—Offset 9002Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_eol: [ISPMADDR] + 9002Ch

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_reg_gp_isel_eol: Unused
0	0h RW	reg_gp_isel_eol: Sets the input selector gp_eol input.

15.8.856 reg_isel_gpr_reg_gp_isel_ifsr_enable_type (isel_gpr_reg_gp_isel_ifsr_enable)—Offset 90030h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_ifsr_enable: [ISPMADDR] + 90030h

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
0	0h RW	reg_gp_isel_tpg_enable_b: Enables the test pattern generator for port b

15.8.861 reg_isel_gpr_reg_gp_isel_hor_cnt_mask_type (isel_gpr_reg_gp_isel_hor_cnt_mask)—Offset 90044h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_hor_cnt_mask: [ISPMMADR] + 90044h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	unused_reg_gp_isel_hor_cnt_mask: Unused
13:0	0h RW	reg_gp_isel_hor_cnt_mask: Sets the horizontal counter mask in the Input selector

15.8.862 reg_isel_gpr_reg_gp_isel_ver_cnt_mask_type (isel_gpr_reg_gp_isel_ver_cnt_mask)—Offset 90048h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_ver_cnt_mask: [ISPMMADR] + 90048h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	unused_reg_gp_isel_ver_cnt_mask: Unused
13:0	0h RW	reg_gp_isel_ver_cnt_mask: Sets the vertical counter mask in the Input selector

15.8.863 reg_isel_gpr_reg_gp_isel_xy_cnt_mask_type (isel_gpr_reg_gp_isel_xy_cnt_mask)—Offset 9004Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_xy_cnt_mask: [ISPMMADR] + 9004Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	unused_reg_gp_isel_xy_cnt_mask: Unused

Bit Range	Default & Access	Description
11:0	0h RW	reg_gp_isel_xy_cnt_mask: Sets the xy counter mask in the Input selector

15.8.864 reg_isel_gpr_reg_gp_isel_hor_cnt_delta_type (isel_gpr_reg_gp_isel_hor_cnt_delta)—Offset 90050h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_hor_cnt_delta: [ISPMMADR] + 90050h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
unused_reg_gp_isel_hor_cnt_delta								reg_gp_isel_hor_cnt_delta	

Bit Range	Default & Access	Description
31:4	0h RW	unused_reg_gp_isel_hor_cnt_delta: Unused
3:0	0h RW	reg_gp_isel_hor_cnt_delta: sets the horizontal counter delta in the Input selector

15.8.865 reg_isel_gpr_reg_gp_isel_ver_cnt_delta_type (isel_gpr_reg_gp_isel_ver_cnt_delta)—Offset 90054h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_ver_cnt_delta: [ISPMMADR] + 90054h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

15.8.867 reg_isel_gpr_reg_gp_isel_tpg_red1_type (isel_gpr_reg_gp_isel_tpg_red1)—Offset 9005Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_red1: [ISPMADR] + 9005Ch

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	unused_reg_gp_isel_tpg_red1: Unused
11:0	0h RW	reg_gp_isel_tpg_red1: Defines the red1 color for test pattern generator

15.8.868 reg_isel_gpr_reg_gp_isel_tpg_green1_type (isel_gpr_reg_gp_isel_tpg_green1)—Offset 90060h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_green1: [ISPMADR] + 90060h

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	unused_reg_gp_isel_tpg_green1: Unused
11:0	0h RW	reg_gp_isel_tpg_green1: Defines the green1 color for test pattern generator

15.8.869 reg_isel_gpr_reg_gp_isel_tpg_blue1_type (isel_gpr_reg_gp_isel_tpg_blue1)—Offset 90064h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_blue1: [ISPMADDR] + 90064h

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	unused_reg_gp_isel_tpg_blue1: Unused
11:0	0h RW	reg_gp_isel_tpg_blue1: Defines the blue1 color for test pattern generator

15.8.870 reg_isel_gpr_reg_gp_isel_tpg_red2_type (isel_gpr_reg_gp_isel_tpg_red2)—Offset 90068h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_red2: [ISPMADR] + 90068h

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_gp_isel_tpg_red2					reg_gp_isel_tpg_red2			

Bit Range	Default & Access	Description
31:12	0h RW	unused_reg_gp_isel_tpg_red2: Unused
11:0	0h RW	reg_gp_isel_tpg_red2: Defines the red2 color for test pattern generator

15.8.871 reg_isel_gpr_reg_gp_isel_tpg_green2_type (isel_gpr_reg_gp_isel_tpg_green2)—Offset 9006Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_green2: [ISPMADR] + 9006Ch

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	unused_reg_gp_isel_tpg_green2: Unused
11:0	0h RW	reg_gp_isel_tpg_green2: Defines the green2 color for test pattern generator

15.8.872 reg_isel_gpr_reg_gp_isel_tpg_blue2_type (isel_gpr_reg_gp_isel_tpg_blue2)—Offset 90070h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_gpr_reg_gp_isel_tpg_blue2: [ISPMMADR] + 90070h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:12	0h RW	unused_reg_gp_isel_tpg_blue2: Unused
11:0	0h RW	reg_gp_isel_tpg_blue2: Defines the blue2 color for test pattern generator

Bit Range	Default & Access	Description
31:5	0h RW	unused_reg_gp_isel_fmt_type: Unused
4:0	0h RW	reg_gp_isel_fmt_type: Sets the format type input for the Input selector

15.8.875 reg_isel_gpr_reg_gp_isel_data_sel_type (isel_gpr_reg_gp_isel_data_sel)—Offset 9007Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_data_sel: [ISPMADDR] + 9007Ch

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
unused_reg_gp_isel_data_sel								reg_gp_isel_data_sel

Bit Range	Default & Access	Description
31:2	0h RW	unused_reg_gp_isel_data_sel: Unused
1:0	0h RW	reg_gp_isel_data_sel: Select value for the data multiplexer in the Input selector

15.8.876 reg_isel_gpr_reg_gp_isel_sband_sel_type (isel_gpr_reg_gp_isel_sband_sel)—Offset 90080h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_isel_sband_sel: [ISPMADDR] + 90080h

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

15.8.878 reg_isel_gpr_reg_gp_syncgen_hor_cnt_type (isel_gpr_reg_gp_syncgen_hor_cnt)—Offset 90088h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_syncgen_hor_cnt: [ISPMADR] + 90088h

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	unused_reg_gp_syncgen_hor_cnt: Unused
13:0	0h RO	reg_gp_syncgen_hor_cnt: Returns the value of the horizontal counter in the sync generator

15.8.879 reg_isel_gpr_reg_gp_syncgen_ver_cnt_type (isel_gpr_reg_gp_syncgen_ver_cnt)—Offset 9008Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_syncgen_ver_cnt: [ISPMADR] + 9008Ch

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	unused_reg_gp_syncgen_ver_cnt: Unused
13:0	0h RO	reg_gp_syncgen_ver_cnt: Returns the value of the vertical counter in the sync generator

15.8.880 reg_isel_gpr_reg_gp_syncgen_frame_cnt_type (isel_gpr_reg_gp_syncgen_frame_cnt)—Offset 90090h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_gpr_reg_gp_syncgen_frame_cnt: [ISPMMADR] + 90090h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:14	0h RW	unused_reg_gp_syncgen_frame_cnt: Unused

Default: 00000000h

Bit Range	Default & Access	Description
31:26	0h RW	unused_send_to_GP_FIFO: Unused
25:0	0h WO	send_to_GP_FIFO: Send data to input selector GP FIFO

15.8.883 reg_isel_fa_check_send_to_GP_FIFO_type (isel_fa_check_send_to_GP_FIFO)—Offset 90108h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_fa_check_send_to_GP_FIFO: [ISPMMADR] + 90108h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000001h

Bit Range	Default & Access	Description
31:1	0h RW	unused_check_send_to_GP_FIFO: Unused
0	1h WO	check_send_to_GP_FIFO: Check for availability of GP FIFO. Returns 1 if a word can be send to the input selector, without it being stalled

15.8.884 reg_isel_irq_ctrl_reg_irq_edge_type (isel_irq_ctrl_reg_irq_edge)—Offset 90200h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_irq_ctrl_reg_irq_edge: [ISPMMADR] + 90200h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
unused_reg_irq_mask								reg_irq_mask

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_irq_ctrl_reg_irq_clear: [ISPMMADR] + 9020Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
unused_reg_irq_clear								reg_irq_clear			

Bit Range	Default & Access	Description
31:4	0h RW	unused_reg_irq_clear: Unused
3:0	0h WO	reg_irq_clear: Clears (set to '0') bits in reg_irq_status. When writing a '1' into a bit of this register, the corresponding bit in the req_irq_status is cleared. When writing a '0' into a bit of this register, the corresponding bit in the req_irq_status is not affected.

15.8.888 reg_isel_irq_ctrl_reg_irq_enable_type (isel_irq_ctrl_reg_irq_enable)—Offset 90210h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_irq_ctrl_reg_irq_enable: [ISPMMADR] + 90210h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
unused_reg_irq_enable								reg_irq_enable			

Bit Range	Default & Access	Description
31:4	0h RW	unused_reg_irq_enable: Unused
3:0	0h RW	reg_irq_enable: Indicates for each bit whether an interrupt cause as monitored by the req_irq_status register also affects the IRQ pin (value='1') or not (value='0')

15.8.889 reg_isel_irq_ctrl_reg_irq_level_not_pulse_type (isel_irq_ctrl_reg_irq_level_not_pulse)—Offset 90214h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_irq_ctrl_reg_irq_level_not_pulse: [ISPMADR] + 90214h

ISPMADR Type: PCI Configuration Register (Size: 32 bits)

15.8.902 mem_isp_base_dmem_data_mem_sl_ipdmem_data_mem_first_type (isp_base_dmem_data_mem_sl_ipdmem_data_mem_first)—Offset 200000h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isp_base_dmem_data_mem_sl_ipdmem_data_mem_first: [ISPMMADR] + 200000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	data_mem_first : Read Latency of 2 cycles. Write latency of 0 cycles

15.8.903 mem_isp_base_dmem_data_mem_sl_ipdmem_data_mem_last_type (isp_base_dmem_data_mem_sl_ipdmem_data_mem_last)—Offset 203FFCh

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isp_base_dmem_data_mem_sl_ipdmem_data_mem_last:
[ISPMADDR] + 203FFCh

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	data_mem_last: Read Latency of 2 cycles. Write latency of 0 cycles

15.8.904 mem_scp_dmem_mem_sl_ip_dmem_mem_first_type (scp_dmem_mem_sl_ip_dmem_mem_first)—Offset 300000h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

scp_dmem_mem_sl_ip_dmem_mem_first: [ISPMADDR] + 300000h

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	mem_first: Read Latency of 2 cycles. Write latency of 0 cycles

15.8.905 mem_scp_dmem_mem_sl_ip_dmem_mem_last_type (scp_dmem_mem_sl_ip_dmem_mem_last)—Offset 307FFCh

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

scp_dmem_mem_sl_ip_dmem_mem_last: [ISPMADDR] + 307FFCh

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	mem_last: Read Latency of 2 cycles. Write latency of 0 cycles

15.8.906 reg_fa_sp_isp_send_to_SP_type (fa_sp_isp_send_to_SP)— Offset 380008h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

fa_sp_isp_send_to_SP: [ISPMADDR] + 380008h

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h WO	send_to_SP: Send data to SP streaming input port

15.8.907 reg_fa_sp_isp_send_to_ISP_type (fa_sp_isp_send_to_ISP)— Offset 38000Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

fa_sp_isp_send_to_ISP: [ISPMADDR] + 38000Ch

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h WO	send_to_ISP : Send data to ISP streaming input port

15.8.908 reg_fa_sp_isp_check_receive_from_SP_type (fa_sp_isp_check_receive_from_SP)—Offset 380010h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

fa_sp_isp_check_receive_from_SP: [ISPMMADR] + 380010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
unused_check_receive_from_SP								check_receive_from_SP

Bit Range	Default & Access	Description
31:1	0h RW	unused_check_receive_from_SP : Unused
0	1h RO	check_receive_from_SP : Check for potential stalling for receiving data on SP streaming output port. Returns 1 if a receive from SP would lead to a stall. Returns 0 if a token is available from the SP.

15.8.909 reg_fa_sp_isp_check_receive_from_ISP_type (fa_sp_isp_check_receive_from_ISP)—Offset 380014h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

fa_sp_isp_check_receive_from_ISP: [ISPMMADR] + 380014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000001h

Bit Range	Default & Access	Description
31:1	0h RW	unused_check_receive_from_ISP: Unused
0	1h RO	check_receive_from_ISP: Check for potential stalling for receiving data on ISP streaming output port. Returns 1 if a receive from ISP would lead to a stall. Returns 0 if a token is available from the ISP.

15.8.910 reg_fa_sp_isp_check_send_to_SP_type (fa_sp_isp_check_send_to_SP)—Offset 380018h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

fa_sp_isp_check_send_to_SP: [ISPMADDR] + 380018h

ISPMADDR Type: PCI Configuration Register (Size: 32 bits)

ISPMADDR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:1	0h RW	unused_check_send_to_SP: Unused
0	0h RO	check_send_to_SP: Check for potential stalling for sending data to SP streaming input port. Returns 1 if a send to SP would lead to a stall. Returns 0 when there is space left in the SP token FIFO

15.8.911 reg_fa_sp_isp_check_send_to_ISP_type (fa_sp_isp_check_send_to_ISP)—Offset 38001Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

fa_sp_isp_check_send_to_ISP: [ISPMMADR] + 38001Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

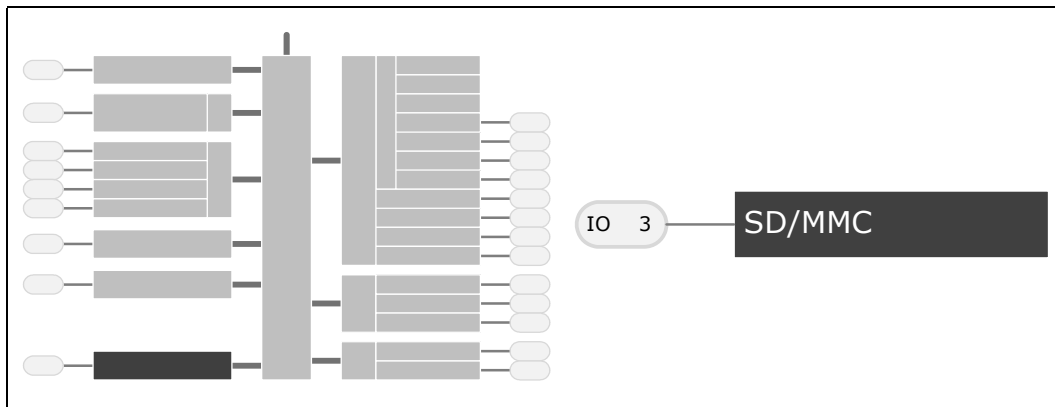

Bit Range	Default & Access	Description
31:1	0h RW	unused_check_send_to_ISP: Unused
0	0h RO	check_send_to_ISP: Check for potential stalling for sending data to ISP streaming input port. Returns 1 if a send to ISP would lead to a stall. Returns 0 when there is space left in the ISP token FIFO

16 Storage Control Cluster (eMMC, SDIO, SD Card)

The Storage Control Cluster (SCC) consists of SDIO, SD Card and eMMC controllers to support mass storage and IO devices.

- One eMMC 4.5 interface
- One SD Card 3.0 interface
- One SDIO 3.0 interface for SDIO-based WIFI

Note: All units in the SCC support both PCI mode and ACPI mode of operation. A level shifter may be needed on the platform for SDIO 3.0 compliance. An eMMC 4.41 controller also exists but shouldn't be used.

16.1 Signal Descriptions

See [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 179. eMMC Signals

Signal Name	Direction Power	Description
MMC1_CLK	O V1P8S	eMMC Clock The frequency may vary between 400 kHz and 200 MHz.
MMC1_D[7:0]	I/O V1P8S	eMMC Port Data bits 0 to 7 Bidirectional port used to transfer data to and from eMMC device. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using either D[0]-D[3] or D[0]-D[7], by the MultiMedia Card controller. The MultiMedia Card includes internal pull-ups for data lines D[1]-D[7]. Immediately after entering the 4-bit mode, the card disconnects the internal pull ups of lines D[1], D[2], and D[3]. Correspondingly, immediately after entering to the 8-bit mode the card disconnects the internal pull-ups of lines D[1]-D[7].
MMC1_CMD	I/O V1P8S	eMMC Port Command This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.
MMC1_RCOMP	-	eMMC RCOMP This signal is used for pre-driver slew rate compensation.
MMC1_RST#	O V1P8S	eMMC Reset Signals Active low to reset.

Table 180. SDIO Signals

Signal Name	Direction Power	Description
SD2_CLK	O V1P8S	SDIO Clock The frequency may vary between 24 and 50MHz.
SD2_D[2:0]	I/O V1P8S	SDIO Port Data bits 0 to 2 Bidirectional port used to transfer data to and from SDIO device. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using D[0]-D[3].
SD2_D[3]_CD#	I/O V1P8S	SDIO Port Data bit 3 Bidirectional port used to transfer data to and from the SDIO device. Also, Card Detect . Active low when device is present.
SD2_CMD	I/O V1P8S	SDIO Port Command This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.

Table 181. SD Card Signals

Signal Name	Direction Power	Description
SD3_CLK	O VSDIO	SD Card Clock The frequency may vary between 24 and 50 MHz.
SD3_D[3:0]	I/O VSDIO	SD Card Data bits 0 to 3 Bidirectional port used to transfer data to and from SD card. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using D[0]-D[3].
SD3_CD#	I/O V1P8S	SD Card Detect Active low when a card is present. Floating (pulled high with internal PU) when a card is not present.
SD3_CMD	I/O VSDIO	SD Card Command This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.
SD3_1P8EN	O V1P8S	SD Card 1.8V Enable Indicates the voltage of the SD Card to the power delivery subsystem. The default voltage (3.3 V) is requested when this signal is driven low. 1.8 V is requested when this signal is high. This voltage change applies to the SD3_V1P8V3P3_S3 (VSDIO) rail on the SoC.
SD3_RCOMP	-	SD Card RCOMP This signal is used for pre-driver slew rate compensation.
SD3_WP	I V1P8S	SD Card Write Protect Active high to protect from write.
SD3_PWREN#	O V1P8S	SD Card Power Enable This signal is used to enable power on a SD device.

16.2 Features

16.2.1 eMMC Interface Features

- eMMC 4.5 controller supported
- Transfers the data in 1 bit, 4 bit and 8 bit modes.
- Transfers data in the following speed classes: Baseline (1, 4, 8 bit up to 25Mhz), HS SDR/DDR (4, 8 bit up to 50Mhz) and HS200 (4, 8 bit up to 200MHz - 4.5 controller only)
- Cyclic Redundancy Check CRC7 for command and CRC16 for data integrity.
- Supports MMC Plus and MMC mobile.
- Supports both round-robin and priority-based arbitration for transmit operation.
- Run-time configurability of channel ID bits.

16.2.2 SDIO/SD Card Interface Features

- Up to 400Mbps per second data rate using 4 parallel data lines.
- Transfers the data in 1 bit and 4 bit SD modes and SPI mode.
- Transfers the data in following UHS-I modes: HS ,DDR50 and SDR12/25.
- Cyclic Redundancy Check CRC7 for command and CRC16 for data integrity.
- Designed to work with I/O cards, Read-only cards and Read/Write cards.
- Supports Read wait Control, Suspend/Resume operation.

Note: SDIO only validated with WIFI devices.

16.2.3 Storage Interfaces Overview

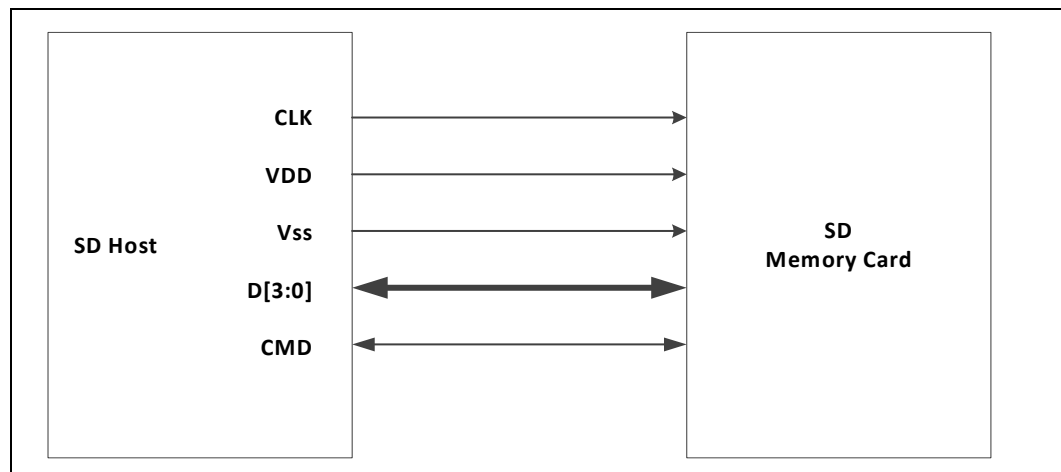

This section provides a very high level overview of the SD, SDIO, eMMC 4.5 specification. Refer to the SD and eMMC specifications for complete details.

16.2.3.1 SD Card 3.0 Bus Interface

The SD Card bus has a single master, single slaves (card), synchronous topology (refer to [Figure 100](#)). During initialization process commands are sent to the card, allowing the application to detect the card and assign logical addresses to the physical slot. All data communication in the Card Identification Mode uses the command line (CMD) only.

SD bus allows dynamic configuration of the number of data lines. After power up, by default, the SD Card will use only SD3_D[0] for data transfer. After initialization the host can change the bus width (number of active data lines). This feature allows easy trade off between hardware cost and system performance. Note that while DAT1-SD3_D[3:1] are not in use, the SoC will tri-state those signals.

Figure 100. SD Memory Card Bus Topology

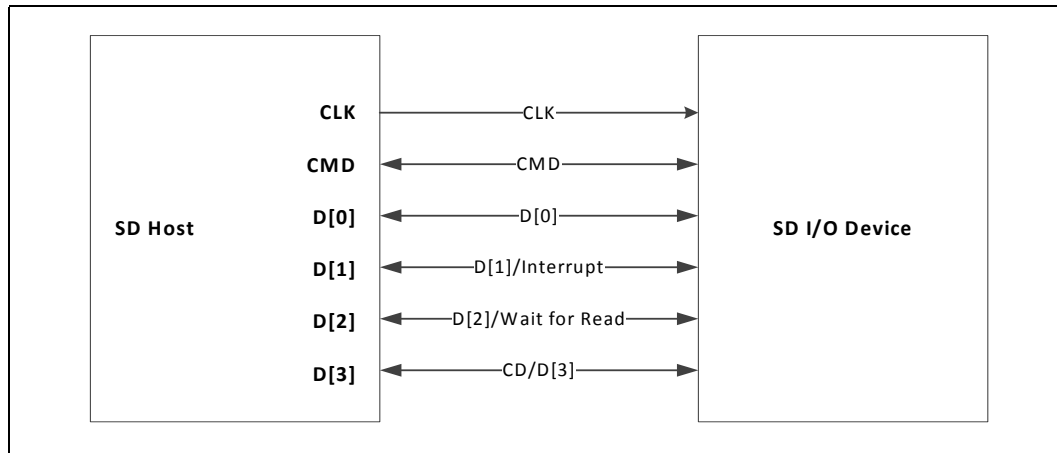

16.2.3.2 SDIO 3.0 Interface

The SDIO interface is the very much like the SD card interface. The SoC supports one SDIO device for wireless devices only (no memory card support).

Note: SDIO interface does not support WAKE function.

Figure 101. SDIO Device Bus Topology

16.2.3.3 eMMC4.5 Interface

Figure 102. eMMC Interface

16.3 References

The controller is configured to comply with:

- SD Specification Part 01 Physical Layer Specification version 3.00, April 16, 2009
- SD Specification Part E1 SDIO Specification version 3.00, December 16, 2010
- SD Specification Part A2 SD Host Controller Standard Specification version 3.00, February 18, 2010
- SD Specification Part 03 security Specification version 1.01, April 15, 2001

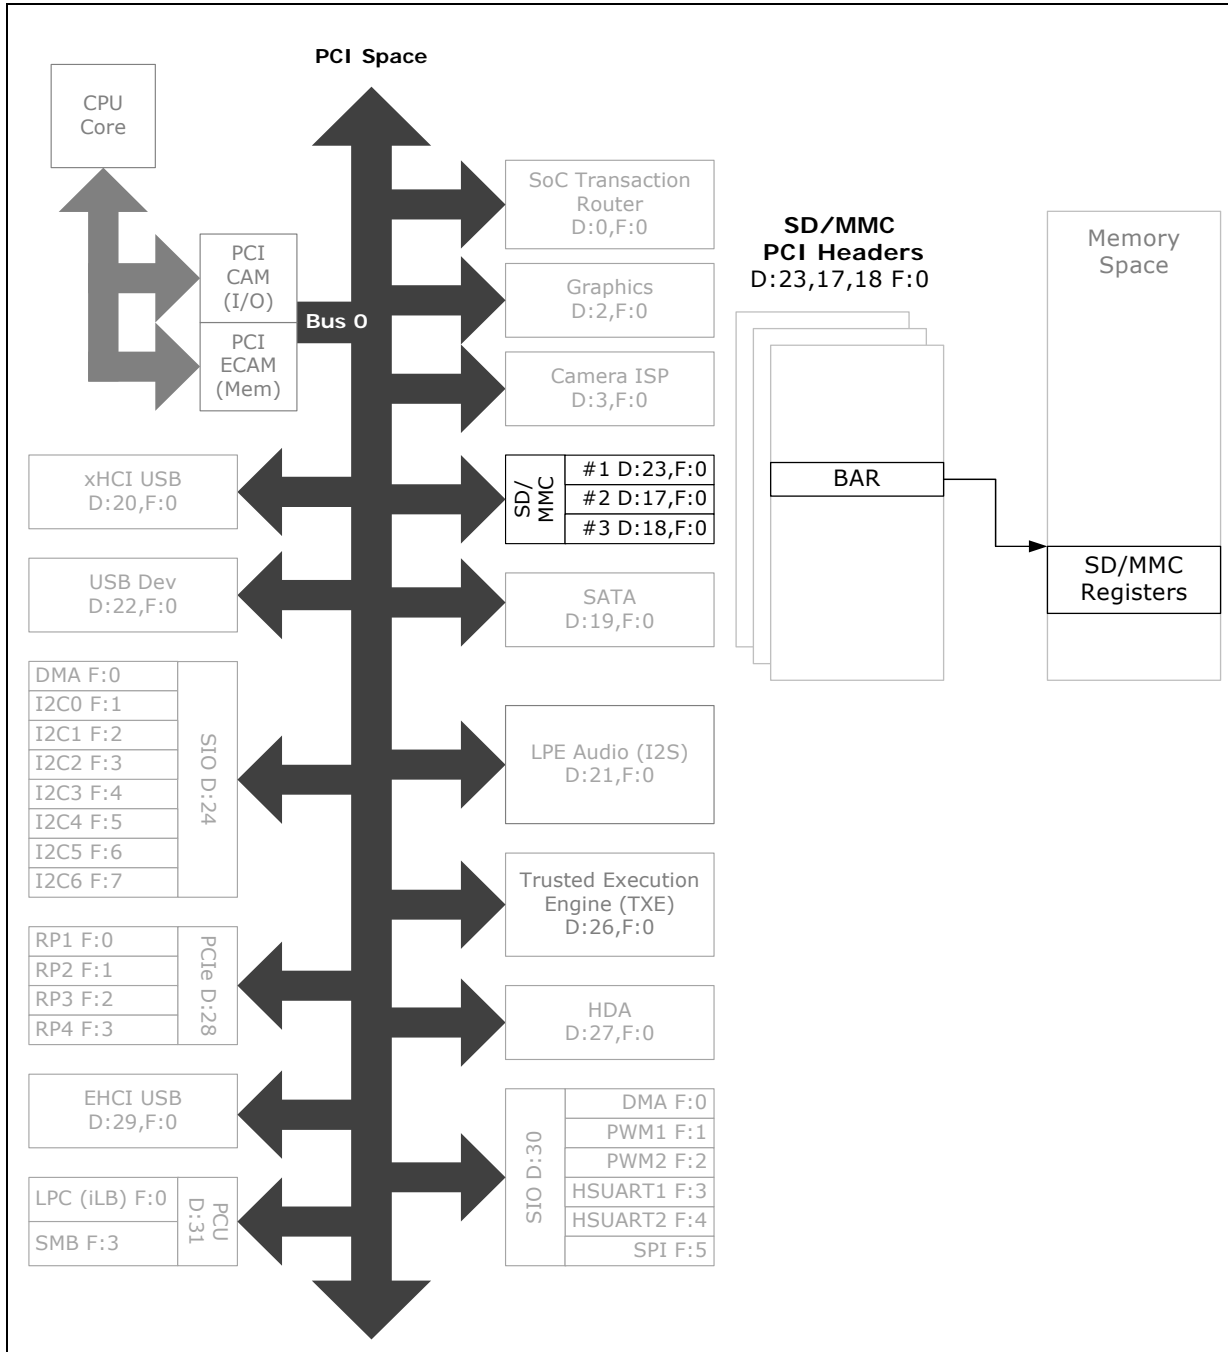

- Embedded MultiMedia Card (eMMC) Product Standard v4.51, JESD84-A451

16.4 Register Map

Refer to [Chapter 3, "Register Access Methods"](#) and [Chapter 4, "Mapping Address Spaces"](#) for additional information.

16.5 SDIO for Wifi PCI Configuration Registers

Table 182. Summary of SDIO for Wifi PCI Configuration Registers—0/17/0

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"Device ID and Vendor ID Register (DEVVENDID)—Offset 0h" on page 1751	00000000h
4–7h	4	"Status and Command Register (STATUSCOMMAND)—Offset 4h" on page 1752	00100000h
8–Bh	4	"Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h" on page 1753	00000000h
C–Fh	4	"Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch" on page 1753	00000000h
10–13h	4	"Base Address Register (BAR)—Offset 10h" on page 1754	00000000h
14–17h	4	"Base Address Register 1 (BAR1)—Offset 14h" on page 1755	00000000h
2C–2Fh	4	"Subsystem Vendor ID and Subsystem ID Register (SUBSYSTEMID)—Offset 2Ch" on page 1755	00000000h
30–33h	4	"Expansion ROM Base Address Register (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 1756	00000000h
34–37h	4	"Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h" on page 1756	00000080h
3C–3Fh	4	"Interrupt Register (INTERRUPTREG)—Offset 3Ch" on page 1757	00000100h
80–83h	4	"Power Management Capability ID Register (POWERCAPID)—Offset 80h" on page 1758	48030001h
84–87h	4	"Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h" on page 1758	00000008h
A0–A3h	4	"General Purpose Read Write Register1 (GEN_REGRW1)—Offset A0h" on page 1759	00000000h
A4–A7h	4	"General Purpose Read Write Register2 (GEN_REGRW2)—Offset A4h" on page 1759	00000000h
A8–ABh	4	"General Purpose Read Write Register3 (GEN_REGRW3)—Offset A8h" on page 1760	00000000h
AC–AFh	4	"General Purpose Read Write Register4 (GEN_REGRW4)—Offset Ach" on page 1760	00000000h
C0–C3h	4	"General Purpose Input Register (GEN_INPUT_REGRW)—Offset C0h" on page 1761	00000000h
F8–FBh	4	"Manufacturers ID Register (MANID)—Offset F8h" on page 1761	00000000h

16.5.1 Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + 0h

Default: 00000000h

31	28	24	20	16	12	8	4	0																															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DEVICEID																VENDORID																							

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Device ID (DEVICEID) : Device ID identifies the particular AHB device. This is tied to a strap at the top level.
15:0	0000h RO	Vendor ID (VENDORID) : Vendor ID is a unique ID provided by PCI SIG which identifies the manufacturer of the device. This is tied to a strap at the top level.

16.5.2 Status and Command Register (STATUSCOMMAND)—Offset 4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + 4h

Default: 00100000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	1	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0	RMA RCA	Reserved1	CAPLIST INTR_STATUS	Reserved2	Reserved3	INTR_DISABLE Reserved4 SERR_ENABLE	Reserved5	BME MSE Reserved6

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved0 : Reserved.
29	0h RW/1C	Received Master Abort (RMA) : If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a '1' to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port
28	0h RW/1C	Received Target Abort (RCA) : If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port
27:21	00h RO	Reserved1 : Reserved.
20	1h RO	Capabilities List (CAPLIST) : Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required then this bit should be tied to 0.
19	0h RO	Interrupt Status (INTR_STATUS) : This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	Reserved2 : Reserved.
15:11	00h RO	Reserved3 : Reserved.
10	0h RW	Interrupt Disable (INTR_DISABLE) : Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt; i.e., Bridge does not send Interrupt Assert message through the IOSF SideBand Channel. Reset value of this bit is 0.
9	0h RO	Reserved4 : Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	SERR# Enable (SERR_ENABLE) : This bit controls the sending of DO_SERR messages on IOSF SB.
7:3	00h RO	Reserved5 : Reserved.
2	0h RW	Bus Master Enable (BME) : If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	Memory Space Enable (MSE) : This bit controls Bridges response to downstream memory accesses. When set, accesses to the memory space of the device are enabled. Reset value of this bit is 0.
0	0h RO	Reserved6 : Reserved.

16.5.3 Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + 8h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
CLASS_CODES							RID		

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Class Code (CLASS_CODES) : This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	Revision ID (RID) : Identifies the revision of a particular AHB device. This is tied to a strap at the top level.

16.5.4 Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	0h RO	Multifunction Device (MULFNDEV): This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device.
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Doesn't apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

16.5.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1s.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + 2Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SUBSYSTEMID				SUBSYSTEMVENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	Subsystem ID (SUBSYSTEMID): This register should be implemented for any function that could be instantiated more than once in a given system. Th is register makes it possible for the operating environment to distinguish one audio subsystem from the other. This is a Read Write Once register.
15:0	0000h RW/O	Subsystem Vendor ID (SUBSYSTEMVENDORID): This register should be implemented for any function that could be instantiated more than once in a given system. This register enables the operating environment to distinguish one subsystem from the other. This is a Read Write Once register.

16.5.8 Expansion ROM Base Address Register (EXPANSION_ROM_BASEADDR)—Offset 30h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + 30h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
EXPANSION_ROM_BASE								

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Expansion ROM Base Address (EXPANSION_ROM_BASE): Value of all 0s indicates no support for Expansion ROM.

16.5.9 Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h

Access Method

16.5.11 Power Management Capability ID Register (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + 80h

Default: 48030001h

31	28	24	20	16	12	8	4	0							
0	1	0	0	0	1	0	0	0							
0	0	0	0	0	0	0	0	1							
PMESUPPORT					Reserved0				VERSION		NXTCAP			POWER_CAP	

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	PME_Support (PMESUPPORT) : This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. bit(14) X 1XXXb - PME# can be asserted from D3hot. bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap.
26:19	00h RO	Reserved0 : Reserved.
18:16	3h RO	Version (VERSION) : Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	Next Capability (NXTCAP) : Points to the next capability structure. This points to NULL.
7:0	01h RO	Power Management Capability (POWER_CAP) : Indicates this is power management capability.

16.5.12 Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + 84h

Default: 00000008h

31	28	24	20	16	12	8	4	0					
0	0	0	0	0	0	0	0	0					
0	0	0	0	0	0	0	0	1					
Reserved0					PMESTATUS	Reserved1		PMEENABLE	Reserved2		NO_SOFT_RESET	Reserved3	POWERSTATE

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + A4h

Default: 00000000h

31	28	24	20	16	12	8	4	0

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	GEN_REG_RW4: Reserved.

16.5.17 General Purpose Input Register (GEN_INPUT_REGRW)—Offset C0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + C0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	GEN_REG_INPUT_RW: Reserved.

16.5.18 Manufacturers ID Register (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Manufacturer ID (MANID): This register is brought out as straps to the top level.

16.6 SDIO for Wifi Memory Mapped IO Registers

Table 183. Summary of SDIO for Wifi Memory Mapped I/O Registers—BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h" on page 1764	00000000h
4–5h	2	"Block Size Register (BLK_SIZE)—Offset 4h" on page 1765	0000h
6–7h	2	"Block Count Register (BLK_COUNT)—Offset 6h" on page 1766	0000h
8–Bh	4	"Argument 1 Register (ARGUMENT)—Offset 8h" on page 1767	00000000h
C–Dh	2	"Transfer Mode Register (TX_MODE)—Offset Ch" on page 1767	0000h
E–Fh	2	"Command Register (CMD)—Offset Eh" on page 1769	0000h
10–13h	4	"Response Register 0 (RESPONSE0)—Offset 10h" on page 1770	00000000h
14–17h	4	"Response Register 2 (RESPONSE2)—Offset 14h" on page 1770	00000000h
18–1Bh	4	"Response Register 4 (RESPONSE4)—Offset 18h" on page 1771	00000000h
1C–1Fh	4	"Response Register 6 (RESPONSE6)—Offset 1Ch" on page 1771	00000000h
20–23h	4	"Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h" on page 1772	00000000h
24–27h	4	"Present State Register (PRE_STATE)—Offset 24h" on page 1772	1FFF0000h
28–28h	1	"Host Control 1 Register (HOST_CTL)—Offset 28h" on page 1776	00h

16.6.1 SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<p>SDMA System Address (sys_adr): (1) SDMA System Address This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. (2)</p> <p>Argument 2 This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.</p>

16.6.2 Block Size Register (BLK_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

Access Method

Type: Memory Mapped I/O Register
 (Size: 16 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
tx_blk_size_12	boundary	tr_blk_size		

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	TX_BLK_SIZE_12 (tx_blk_size_12): Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.

Bit Range	Default & Access	Field Name (ID): Description
14:12	000b RW	<p>Host SDMA Buffer Boundary (boundary): The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at each boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register.</p> <ul style="list-style-type: none"> • 000b = 4K bytes (Detects A11 carry out) • 001b = 8K bytes (Detects A12 carry out) • 010b = 16K Bytes (Detects A13 carry out) • 011b = 32K Bytes (Detects A14 carry out) • 100b = 64K bytes (Detects A15 carry out) • 101b = 128K Bytes (Detects A16 carry out) • 110b = 256K Bytes (Detects A17 carry out) • 111b = 512K Bytes (Detects A18 carry out)
11:0	000h RW	<p>Transfer Block Size (tr_blk_size): This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2 <i>Determining Buffer Block Length</i>). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored.</p> <ul style="list-style-type: none"> • 0800h = 2048 Bytes • . . . • 0200h = 512 Bytes • 01FFh = 511 Bytes • . . . • 0004h = 4 Bytes • 0003h = 3 Bytes • 0002h = 2 Bytes • 0001h = 1 Byte • 0000h = No data transfer

16.6.3 Block Count Register (BLK_COUNT)—Offset 6h

This register is used to configure the number of data blocks.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 6h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
blk_count				

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	<p>Blocks Count For Current Transfer (blk_count): This register is enabled when Block Count Enable in the Transfer Mode register is set to 1, and is valid only for multiple block transfers. The Host Driver shall set this register to a value between 1 and the maximum block count. The HC decrements the block count after each block transfer, and stops when the count reaches zero. Setting the block count to 0 results in no data blocks being transferred. This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When saving transfer context as a result of a Suspend command, the number of blocks yet to be transferred can be determined by reading this register. When restoring transfer context prior to issuing a Resume command, the HD shall restore the previously saved block count.</p> <ul style="list-style-type: none"> • 0000h = Stop Count • 0001h = 1 block • 0002h = 2 blocks • ... • FFFFh = 65535 blocks

16.6.4 Argument 1 Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Command Argument 1 (argument): The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

16.6.5 Transfer Mode Register (TX_MODE)—Offset Ch

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to Data Present Select in the Command register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the Command Inhibit (DAT) in the Present State register is 1.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

			blk_count_en	dma_en

Bit Range	Default & Access	Field Name (ID): Description
15:9	00h RO	Reserved (rsvd): Reserved.
8	0b RW	BOOT_EN (boot_en): To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	SPI_MODE (spi_mode): SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	CMD_COMP_ATA (cmd_comp_ata): Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	BLK_SEL (blk_sel): Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	Data Transfer Direction Select (data_tr_dir): This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller, and it is set to 0 for all other commands. <ul style="list-style-type: none"> 1 = Read (Card to Host) 0 = Write (Host to Card)
3:2	0b RW	AUTO_CMD_EN (auto_cmd_en): This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	Block Count Enable (blk_count_en): This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. <ul style="list-style-type: none"> 1 = Enable 0 = Disable
0	0b RW	DMA Enable (dma_en): This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). <ul style="list-style-type: none"> 1 = DMA Data transfer 0 = No data transfer or Non DMA data transfer

16.6.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + Eh

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
rsvd	cmd_index	cmd_type	data_pr_sel cmd_index_chk_en cmd_crc_chk_en	reserved resp_type_sel

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	Rsvd (rsvd): Reserved.
13:8	0h RW	Command Index (cmd_index): These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	Command Type (cmd_type): There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. (1) Suspend Command If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). (2) Resume Command The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. (3) Abort Command If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction). <ul style="list-style-type: none"> • 11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR • 10b = Resume -- CMD52 for writing 'Function Select' in CCCR • 01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR • 00b = Normal -- Other commands
5	0b RW	Data Present Select (data_pr_sel): This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command. <ul style="list-style-type: none"> • 1 = Data Present • 0 = No Data Present

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	Command Index Check Enable (cmd_index_chk_en) : If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. <ul style="list-style-type: none"> 1 = Enable 0 = Disable
3	0b RW	Command CRC Check Enable (cmd_crc_chk_en) : If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. 16.6.11 Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h

32-bit data port register to access internal buffer.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits) **Offset:** [BAR] + 20h
BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Buffer Data (buf_data): The Host Controller buffer can be accessed through this 32-bit Data Port register. Refer to section 1.7.

16.6.12 Present State Register (PRE_STATE)—Offset 24h

The Host Driver can get status of the Host Controller from this 32-bit read only register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits) **Offset:** [BAR] + 24h
BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 1FFF0000h

Bit Range	Default & Access	Field Name (ID): Description
16	1b RO	<p>Card Inserted (crd_ins): This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power.</p> <ul style="list-style-type: none"> 1 = Card Inserted 0 = Reset or Debouncing or No Card
15:12	0h RO	Reserved1 (reserved1): Reserved.
11	0b RO	<p>Buffer Read Enable (buf_rd_en): This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the Buffer Read Ready interrupt.</p> <ul style="list-style-type: none"> 1 = Read enable 0 = Read disable
10	0b RO	<p>Buffer Write Enable (buf_wr_en): This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the Buffer Write Ready interrupt. The Host Controller should neither set Buffer Write Enable nor generate Buffer Write Ready Interrupt after the last block data is written to the Buffer Data Port Register.</p> <ul style="list-style-type: none"> 1 = Write enable 0 = Write disable
9	0b RO	<p>Read Transfer Active (rd_tx_active): This status is used for detecting completion of a read transfer. Refer to Section 3.12.3 for sequence details. This bit is set to 1 for either of the following conditions:</p> <ul style="list-style-type: none"> After the end bit of the read command. When read operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. <p>This bit is cleared to 0 for either of the following conditions:</p> <ul style="list-style-type: none"> When the last data block as specified by block length is transferred to the System. In case of ADMA2, end of read operation is designated by Descriptor Table. When all valid data blocks in the Host Controller have been transferred to the System and no current block transfers are being sent as a result of the Stop At Block Gap Request being set to 1. <p>A Transfer Complete interrupt is generated when this bit changes to 0.</p> <ul style="list-style-type: none"> 1 = Transferring data 0 = No valid data

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p>Write Transfer Active (wr_tx_active): This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller. Refer to Section 3.12.4 for more details on the sequence of events. This bit is set in either of the following cases:</p> <ul style="list-style-type: none"> • After the end bit of the write command. • When write operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. <p>This bit is cleared in either of the following cases:</p> <ul style="list-style-type: none"> • After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) In case of ADMA2, transfer count is designated by Descriptor Table. • After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request. <p>During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as the result of the Stop At Block Gap Request being set. This status is useful for the Host Driver in determining non DAT line commands can be issued during write busy.</p> <ul style="list-style-type: none"> • 1 Transferring data • 0 No valid data
7:3	00h RO	Reserved (reserved): Reserved.
2	0b RO	<p>DAT Line Active (dat_in_active): This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> • After the end bit of the read command. • When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer. <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> • When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request. <p>The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> • After the end bit of the write command. • When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer. <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> • When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request. <p>(c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13.</p> <ul style="list-style-type: none"> • 1 = DAT Line Active • 0 = DAT Line Inactive

Bit Range	Default & Access	Field Name (ID): Description
1	0b RO	<p>Command Inhibit (DAT) (cmd_inhibit_dat): This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. Note: The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0.</p> <ul style="list-style-type: none"> 1 Cannot issue command which uses the DAT line 0 Can issue command which uses the DAT line
0	0b RO	<p>Command Inhibit (CMD) (cmd_inhibit_cmd): Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set.</p> <ul style="list-style-type: none"> 1 Cannot issue command 0 Can issue command using only CMD line

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	<p>Interrupt at Block Gap (int_blk_gap): This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card.</p> <ul style="list-style-type: none"> • 1 = Enabled • 0 = Disabled
2	0b RW	<p>Read Wait Control (rd_wait_ctl): The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.</p> <ul style="list-style-type: none"> • 1 = Enable Read Wait Control • 0 = Disable Read Wait Control
1	0b RW	<p>Continue Request (cont_req): This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases:</p> <ul style="list-style-type: none"> • In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts. • In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts. <p>Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored.</p> <ul style="list-style-type: none"> • 1 = Restart • 0 = Not affect
0	0b RW	<p>Stop at Block Gap Request (stp_blk_gap_req): This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12.</p> <ul style="list-style-type: none"> • 1 = Stop • 0 = Transfer

16.6.16 Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

sdclk_freq_sel		upper_sdclk_freq_sel	rsvd	sd_clk_en int_clk_stable int_clk_en

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	<p>SDCLK Frequency Select (sdclk_freq_sel): This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. (1) 8-bit Divided Clock Mode This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. (1) 8-bit Divided Clock Mode</p> <ul style="list-style-type: none"> • 80h = base clock divided by 256 • 40h = base clock divided by 128 • 20h = base clock divided by 64 • 10h = base clock divided by 32 • 08h = base clock divided by 16 • 04h = base clock divided by 8 • 02h = base clock divided by 4 • 01h = base clock divided by 2 • 00h = base clock(10MHz and up) <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register.</p> <ul style="list-style-type: none"> • 400KHz divider value • 25MHz divider value • 50MHz divider value <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz.</p> <p>(2) 10-bit Divided Clock Mode Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported.</p> <ul style="list-style-type: none"> • 3FFh = 1/2046 Divided Clock • N = 1/2N Divided Clock (Duty 50%) • 002h = 1/4 Divided Clock • 001h = 1/2 Divided Clock • 000h = Base Clock (10MHz and up) • 3FFh = Base Clock * M / 1024 • • N - 1 = Base Clock * M / N • • 002h = Base Clock * M / 3 • 001h = Base Clock * M / 2 • 000h = Base Clock * M <p>This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.</p>

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	Upper Bits of SDCLK Frequency Select (upper_sdclk_freq_sel): Host Controller Versions 1.00 and 2.00 do not support these bits and they are treated as 00b fixed value (ROC). Host Controller Version 3.00 shall support these bits to expand SDCLK Frequency Select to 10-bit. Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.
5:3	0h RO	Rsvd (rsvd): Reserved.
2	0b RW	SD Clock Enable (sd_clk_en): The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card.</p> <ul style="list-style-type: none"> • 1 = Reset • 0 = Work <p>When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.</p>

16.6.20 Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p>Card Interrupt (crd_int): Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts.</p> <ul style="list-style-type: none"> 1 = Generate Card Interrupt 0 = No Card Interrupt
7	0b RW/1C	<p>Card Removal (crd_rm): This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> 1 = Card removed 0 = Card state stable or Debouncing
6	0b RW/1C	<p>Card Insertion (crd_ins): This status is set if the Card Inserted in the Present State register changes from 0 to 1. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed, because the card detect state may possibly be changed when the Host Driver clears this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> 1 Card inserted 0 Card state stable or Debouncing
5	0b RW/1C	<p>Buffer Read Ready (buf_rd_rdy): This status is set if the Buffer Read Enable changes from 0 to 1. Refer to the Buffer Read Enable in the Present State register. While performing tuning procedure (Execute Tuning is set to 1), Buffer Read Ready is set to 1 for every CMD19 execution.</p> <ul style="list-style-type: none"> 1 = Ready to read buffer 0 = Not ready to read buffer
4	0b RW/1C	<p>Buffer Write Ready (buf_wr_rdy): This status is set if the Buffer Write Enable changes from 0 to 1. Refer to the Buffer Write Enable in the Present State register.</p> <ul style="list-style-type: none"> 1 = Ready to write buffer 0 = Not ready to write buffer
3	0b RW/1C	<p>DMA Interrupt (dma_int): This status is set if the Host Controller detects the Host SDMA Buffer boundary during transfer. Refer to the Host SDMA Buffer Boundary in the Block Size register. Other DMA interrupt factors may be added in the future. In case of ADMA, by setting Int field in the descriptor table, Host Controller generates this interrupt. Suppose that it is used for debugging. This interrupt shall not be generated after the Transfer Complete.</p> <ul style="list-style-type: none"> 1 = DMA Interrupt is generated 0 = No DMA Interrupt
2	0b RW/1C	<p>Block Gap Event (blk_gap_event): If the Stop At Block Gap Request in the Block Gap Control register is set, this bit is set when both a read / write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this bit is not set to 1. (1) In the case of a Read Transaction This bit is set at the falling edge of the DAT Line Active Status, when the transaction is stopped at SD Bus timing. The Read Wait shall be supported in order to use this function. Refer to Section 3.12.3 for timing details. p (1) In the case of a Write Transaction This bit is set at the falling edge of Write Transfer Active Status (after getting CRC status at SD Bus timing). Refer to Section 3.12.4 for more details on the sequence of events.</p> <ul style="list-style-type: none"> 1 = Transaction stopped at block gap 0 = No Block Gap Event

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	Vendor Specific Error Status (vend_spec_err_status): Reserved.
14	0b RW	Boot Command Timeout Error (boot_cmd_timeout_err): Occur if the boot are access command is issued to the agent which has no permission to access the boot area.
13	0b RW	CEATA Error (ceata_err): Occurs when ATA command termination has occurred due to an error condition the device has encountered.
12	0b RW	Target Response Error (tgt_rsp_err): Occurs when detecting ERROR in m_hresp(dma transaction).
11:10	0h RO	Reserved (rsvd): Reserved.
9	0b RW	ADMA Error (adma_err): This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. In addition, the Host Controller generates this Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. ADMA Error State in the ADMA Error Status indicates that an error occurs in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor. <ul style="list-style-type: none"> 0 = error 1 = no error
8	0b RW	Auto CMD12 Error (cmd12_err): Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. <ul style="list-style-type: none"> 1 = error 0 = no error
7	0b RW	Current Limit Error (cur_limit_err): By setting the SD Bus Power bit in the Power Control register, the Host Controller is requested to supply power for the SD Bus. If the Host Controller supports the Current Limit function, it can be protected from an illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1 means the Host Controller is not supplying power to SD card due to some failure. Reading 0 means that the Host Controller is supplying power and no error has occurred. The Host Controller may require some sampling time to detect the current limit. If the Host Controller does not support this function, this bit shall always be set to 0. <ul style="list-style-type: none"> 1 = power fail 0 = no error
6	0b RW	Data End Bit Error (data_end_bit_err): Occurs either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status. <ul style="list-style-type: none"> 1 = error 0 = no error
5	0b RW	Data CRC Error (data_crc_err): Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC status having a value of other than 010b.
4	0b RW	Data Timeout Error (data_timeout_err): This bit is set when detecting one of following timeout conditions. <ul style="list-style-type: none"> Busy timeout for R1b,R5b type Busy timeout after Write CRC status Write CRC Status timeout Read Data timeout 1 = time out 0 = no error

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	Command Index Error (cmd_index_err): This bit is set if a Command Index error occurs in the command response. <ul style="list-style-type: none"> 1 = error 0 = no error
2	0b RW	Command End Bit Error (cmd_end_bit_err): This bit is set when detecting that the end bit of a command response is 0. <ul style="list-style-type: none"> 1 = End Bit Error generated 0 = no error
1	0b RW	Command CRC Error (cmd_crc_err): Command CRC Error is generated in two cases. If a response is returned and the Command Timeout Error is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between Command CRC Error and Command Timeout Error). <ul style="list-style-type: none"> 1 = CRC Error Generated. 0 = no error
0	0b RW	Command Timeout Error (cmd_timeout_err): This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case Command CRC Error shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and Command CRC Error) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller. <ul style="list-style-type: none"> 1 = time out 0 = no Error

16.6.22 Normal Interrupt Status Enable (NRM_INT_STATUS_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

16.6.32 ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST_CADR: This state is never set because do not generate ADMA error in this state.

- ST_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. In this case, ADMA Error State indicates that an error occurs at ST_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + 54h

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
DEVICEID				VENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Device ID (DEVICEID) : Device ID identifies the particular AHB device. This is tied to a strap at the top level.
15:0	0000h RO	Vendor ID (VENDORID) : Vendor ID is a unique ID provided by PCI SIG which identifies the manufacturer of the device. This is tied to a strap at the top level.

16.7.2 Status and Command Register (STATUSCOMMAND)—Offset 4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + 4h

Default: 00100000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	1	0	0	0	0	0
Reserved0	RMA RCA	Reserved1	CAPLIST INTR_STATUS	Reserved2	Reserved3	INTR_DISABLE Reserved4 SERR_ENABLE	Reserved5	BME MSE Reserved6

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved0 : Reserved.
29	0h RW/1C	Received Master Abort (RMA) : If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a '1' to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port
28	0h RW/1C	Received Target Abort (RCA) : If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port
27:21	00h RO	Reserved1 : Reserved.
20	1h RO	Capabilities List (CAPLIST) : Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required then this bit should be tied to 0.
19	0h RO	Interrupt Status (INTR_STATUS) : This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	Reserved2 : Reserved.
15:11	00h RO	Reserved3 : Reserved.
10	0h RW	Interrupt Disable (INTR_DISABLE) : Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt; i.e., Bridge does not send Interrupt Assert message through the IOSF SideBand Channel. Reset value of this bit is 0.
9	0h RO	Reserved4 : Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	SERR# Enable (SERR_ENABLE) : This bit controls the sending of DO_SERR messages on IOSF SB.
7:3	00h RO	Reserved5 : Reserved.
2	0h RW	Bus Master Enable (BME) : If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	Memory Space Enable (MSE) : This bit controls Bridges response to downstream memory accesses. When set, accesses to the memory space of the device are enabled. Reset value of this bit is 0.
0	0h RO	Reserved6 : Reserved.

16.7.3 Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + 8h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
CLASS_CODES							RID		

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Class Code (CLASS_CODES) : This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	Revision ID (RID) : Identifies the revision of a particular AHB device. This is tied to a strap at the top level.

16.7.4 Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved0: Reserved.
23	0h RO	Multifunction Device (MULFNDEV): This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device.
22:16	00h RO	Header Type (HEADERTYPE): Implements Type 0 Configuration header.
15:8	00h RO	Latency Timer (LATTIMER): Doesnt apply to PCI Express. Hardwired to 00h.
7:0	00h RW	Cache Line Size (CACHELINE_SIZE): Doesnt apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

16.7.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	Base Address (BASEADDR): Base address of the AHB device memory space. Taken from Strap values as 1s.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	Subsystem ID (SUBSYSTEMID): This register should be implemented for any function that could be instantiated more than once in a given system. Th is register makes it possible for the operating environment to distinguish one audio subsystem from the other. This is a Read Write Once register.
15:0	0000h RW/O	Subsystem Vendor ID (SUBSYSTEMVENDORID): This register should be implemented for any function that could be instantiated more than once in a given system. This register enables the operating environment to distinguish one subsystem from the other. This is a Read Write Once register.

16.7.8 Expansion ROM Base Address Register (EXPANSION_ROM_BASEADDR)—Offset 30h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + 30h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Expansion ROM Base Address (EXPANSION_ROM_BASE): Value of all 0s indicates no support for Expansion ROM.

16.7.9 Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h

Access Method

16.7.11 Power Management Capability ID Register (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + 80h

Default: 48030001h

31	28	24	20	16	12	8	4	0							
0	1	0	0	0	1	0	0	0							
0	0	0	0	0	0	0	0	1							
PMESUPPORT					Reserved0				VERSION		NXTCAP			POWER_CAP	

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	PME_Support (PMESUPPORT) : This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. bit(14) X 1XXXb - PME# can be asserted from D3hot. bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap.
26:19	00h RO	Reserved0 : Reserved.
18:16	3h RO	Version (VERSION) : Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	Next Capability (NXTCAP) : Points to the next capability structure. This points to NULL.
7:0	01h RO	Power Management Capability (POWER_CAP) : Indicates this is power management capability.

16.7.12 Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + 84h

Default: 00000008h

31	28	24	20	16	12	8	4	0					
0	0	0	0	0	0	0	0	0					
0	0	0	0	0	0	0	0	1					
Reserved0					PMESTATUS	Reserved1		PMEEENABLE	Reserved2		NO_SOFT_RESET	Reserved3	POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Reserved0: Reserved.
15	0h RW/1C	PME Status (PMESTATUS): 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit in this register.
14:9	00h RO	Reserved1: Reserved.
8	0h RW	PME Enable (PMEENABLE): A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	Reserved2: Reserved.
3	1h RO	No Soft Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for upstream decode on fabric ports.

16.7.13 General Purpose Read Write Register1 (GEN_REGRW1)—Offset A0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + A0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	GEN_REG_RW1: capabilities over-ride for the sd/sdio/emmc host controller (bits 31:0)

16.7.14 General Purpose Read Write Register2 (GEN_REGRW2)—Offset A4h

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	GEN_REG_RW4: Reserved.

16.7.17 General Purpose Input Register (GEN_INPUT_REGRW)—Offset C0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + C0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	GEN_REG_INPUT_RW: Reserved.

16.7.18 Manufacturers ID Register (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Manufacturer ID (MANID): This register is brought out as straps to the top level.

16.8.1 SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<p>SDMA System Address (sys_adr): (1) SDMA System Address This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. (2)</p> <p>Argument 2 This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.</p>

16.8.2 Block Size Register (BLK_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

Access Method

Type: Memory Mapped I/O Register
 (Size: 16 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
tx_blk_size_12	boundary	tr_blk_size		

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	TX_BLK_SIZE_12 (tx_blk_size_12): Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.

Bit Range	Default & Access	Field Name (ID): Description
14:12	000b RW	<p>Host SDMA Buffer Boundary (boundary): The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at each boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register.</p> <ul style="list-style-type: none"> • 000b = 4K bytes (Detects A11 carry out) • 001b = 8K bytes (Detects A12 carry out) • 010b = 16K Bytes (Detects A13 carry out) • 011b = 32K Bytes (Detects A14 carry out) • 100b = 64K bytes (Detects A15 carry out) • 101b = 128K Bytes (Detects A16 carry out) • 110b = 256K Bytes (Detects A17 carry out) • 111b = 512K Bytes (Detects A18 carry out)
11:0	000h RW	<p>Transfer Block Size (tr_blk_size): This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2 <i>Determining Buffer Block Length</i>). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored.</p> <ul style="list-style-type: none"> • 0800h = 2048 Bytes • . . . • 0200h = 512 Bytes • 01FFh = 511 Bytes • . . . • 0004h = 4 Bytes • 0003h = 3 Bytes • 0002h = 2 Bytes • 0001h = 1 Byte • 0000h = No data transfer

16.8.3 Block Count Register (BLK_COUNT)—Offset 6h

This register is used to configure the number of data blocks.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 6h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
blk_count				

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	<p>Blocks Count For Current Transfer (blk_count): This register is enabled when Block Count Enable in the Transfer Mode register is set to 1, and is valid only for multiple block transfers. The Host Driver shall set this register to a value between 1 and the maximum block count. The HC decrements the block count after each block transfer, and stops when the count reaches zero. Setting the block count to 0 results in no data blocks being transferred. This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When saving transfer context as a result of a Suspend command, the number of blocks yet to be transferred can be determined by reading this register. When restoring transfer context prior to issuing a Resume command, the HD shall restore the previously saved block count.</p> <ul style="list-style-type: none"> • 0000h = Stop Count • 0001h = 1 block • 0002h = 2 blocks • ... • FFFFh = 65535 blocks

16.8.4 Argument 1 Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Command Argument 1 (argument): The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

16.8.5 Transfer Mode Register (TX_MODE)—Offset Ch

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to Data Present Select in the Command register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the Command Inhibit (DAT) in the Present State register is 1.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

0	0	0	0	0
rsvd		boot_en	spi_mode	cmd_comp_ata
		blk_sel	data_tr_dir	auto_cmd_en
			blk_count_en	dma_en

Bit Range	Default & Access	Field Name (ID): Description
15:9	00h RO	Reserved (rsvd): Reserved.
8	0b RW	BOOT_EN (boot_en): To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	SPI_MODE (spi_mode): SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	CMD_COMP_ATA (cmd_comp_ata): Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	BLK_SEL (blk_sel): Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	Data Transfer Direction Select (data_tr_dir): This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller, and it is set to 0 for all other commands. <ul style="list-style-type: none"> 1 = Read (Card to Host) 0 = Write (Host to Card)
3:2	0b RW	AUTO_CMD_EN (auto_cmd_en): This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	Block Count Enable (blk_count_en): This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. <ul style="list-style-type: none"> 1 = Enable 0 = Disable
0	0b RW	DMA Enable (dma_en): This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). <ul style="list-style-type: none"> 1 = DMA Data transfer 0 = No data transfer or Non DMA data transfer

16.8.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + Eh

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
rsvd	cmd_index	cmd_type	data_pr_sel cmd_index_chk_en cmd_crc_chk_en	reserved resp_type_sel

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	Rsvd (rsvd): Reserved.
13:8	0h RW	Command Index (cmd_index): These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	Command Type (cmd_type): There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. (1) Suspend Command If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). (2) Resume Command The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. (3) Abort Command If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction). <ul style="list-style-type: none"> • 11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR • 10b = Resume -- CMD52 for writing 'Function Select' in CCCR • 01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR • 00b = Normal -- Other commands
5	0b RW	Data Present Select (data_pr_sel): This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command. <ul style="list-style-type: none"> • 1 = Data Present • 0 = No Data Present

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	Command Index Check Enable (cmd_index_chk_en): If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. <ul style="list-style-type: none"> 1 = Enable 0 = Disable
3	0b RW	Command CRC Check Enable (cmd_crc_chk_en): If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 below.) <ul style="list-style-type: none"> 1 = Enable 0 = Disable

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	Command Response (cmd_resp): The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.8.9 Response Register 4 (RESPONSE4)—Offset 18h

This register is used to store responses from SD cards.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	Command Response (cmd_resp): The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register

16.8.10 Response Register 6 (RESPONSE6)—Offset 1Ch

This register is used to store responses from SD cards.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	Command Response (cmd_resp): The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. 16.8.11 Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h

32-bit data port register to access internal buffer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 20h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	Buffer Data (buf_data): The Host Controller buffer can be accessed through this 32-bit Data Port register. Refer to section 1.7.

16.8.12 Present State Register (PRE_STATE)—Offset 24h

The Host Driver can get status of the Host Controller from this 32-bit read only register.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 24h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 1FFF0000h

Bit Range	Default & Access	Field Name (ID): Description
16	1b RO	<p>Card Inserted (crd_ins): This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power.</p> <ul style="list-style-type: none"> 1 = Card Inserted 0 = Reset or Debouncing or No Card
15:12	0h RO	Reserved1 (reserved1): Reserved.
11	0b RO	<p>Buffer Read Enable (buf_rd_en): This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the Buffer Read Ready interrupt.</p> <ul style="list-style-type: none"> 1 = Read enable 0 = Read disable
10	0b RO	<p>Buffer Write Enable (buf_wr_en): This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the Buffer Write Ready interrupt. The Host Controller should neither set Buffer Write Enable nor generate Buffer Write Ready Interrupt after the last block data is written to the Buffer Data Port Register.</p> <ul style="list-style-type: none"> 1 = Write enable 0 = Write disable
9	0b RO	<p>Read Transfer Active (rd_tx_active): This status is used for detecting completion of a read transfer. Refer to Section 3.12.3 for sequence details. This bit is set to 1 for either of the following conditions:</p> <ul style="list-style-type: none"> After the end bit of the read command. When read operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. <p>This bit is cleared to 0 for either of the following conditions:</p> <ul style="list-style-type: none"> When the last data block as specified by block length is transferred to the System. In case of ADMA2, end of read operation is designated by Descriptor Table. When all valid data blocks in the Host Controller have been transferred to the System and no current block transfers are being sent as a result of the Stop At Block Gap Request being set to 1. <p>A Transfer Complete interrupt is generated when this bit changes to 0.</p> <ul style="list-style-type: none"> 1 = Transferring data 0 = No valid data

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p>Write Transfer Active (wr_tx_active): This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller. Refer to Section 3.12.4 for more details on the sequence of events. This bit is set in either of the following cases:</p> <ul style="list-style-type: none"> • After the end bit of the write command. • When write operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. <p>This bit is cleared in either of the following cases:</p> <ul style="list-style-type: none"> • After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) In case of ADMA2, transfer count is designated by Descriptor Table. • After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request. <p>During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as the result of the Stop At Block Gap Request being set. This status is useful for the Host Driver in determining non DAT line commands can be issued during write busy.</p> <ul style="list-style-type: none"> • 1 Transferring data • 0 No valid data
7:3	00h RO	<p>Reserved (reserved): Reserved.</p>
2	0b RO	<p>DAT Line Active (dat_in_active): This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> • After the end bit of the read command. • When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer. <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> • When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request. <p>The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> • After the end bit of the write command. • When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer. <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> • When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request. <p>(c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13.</p> <ul style="list-style-type: none"> • 1 = DAT Line Active • 0 = DAT Line Inactive

Bit Range	Default & Access	Field Name (ID): Description
1	0b RO	<p>Command Inhibit (DAT) (cmd_inhibit_dat): This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. Note: The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0.</p> <ul style="list-style-type: none"> 1 Cannot issue command which uses the DAT line 0 Can issue command which uses the DAT line
0	0b RO	<p>Command Inhibit (CMD) (cmd_inhibit_cmd): Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set.</p> <ul style="list-style-type: none"> 1 Cannot issue command 0 Can issue command using only CMD line

16.8.13 Host Control 1 Register (HOST_CTL)—Offset 28h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + 28h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h

7	0	0	0	0	0	0	0
crd_det_sig_sel	crd_det_tst_lv	sd8_bit_mode	dma_sel	hi_spd_en	data_tx_wid	led_ctl	

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	<p>Card Detect Signal Selection (crd_det_sig_sel): This bit selects source for the card detection.</p> <ul style="list-style-type: none"> 1 = The Card Detect Test Level is selected (for test purposes) 0 = SDCD# is selected (for normal use) <p>When the source for the card detection is switched, the interrupt should be disabled during the switching period by clearing the Interrupt Status/Signal Enable register in order to mask unexpected interrupt being caused by the glitch. The Interrupt Status/Signal Enable should be disabled during the period of debouncing.</p>

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	Card Detect Test Level (crd_det_tst_lv) : This bit is enabled while the Card Detect Signal Selection is set to 1, and it indicates whether or not the card is inserted. <ul style="list-style-type: none"> 1 = Card Inserted 0 = No Card
5	0b RW	SD8 Bit Mode (sd8_bit_mode) : This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card.
4:3	00b RW	DMA Select (dma_sel) : One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the Capabilities register. Use of selected DMA is determined by DMA Enable of the Transfer Mode register. <ul style="list-style-type: none"> 00 = SDMA is selected 01 = Reserved (New assignment is not allowed) 10 = 32-bit Address ADMA2 is selected 11 = Reserved (will be modified by Version 4.00)
2	0b RW	High Speed Enable (hi_spd_en) : This bit is optional. Before setting this bit, the Host Driver shall check the High Speed Support in the Capabilities register. If this bit is set to 0 (default), the Host Controller outputs CMD line and DAT lines at the falling edge of the SD Clock (up to 25MHz). If this bit is set to 1, the Host Controller outputs CMD line and DAT lines at the rising edge of the SD Clock (up to 50MHz). If Preset Value Enable in the Host Control 2 register is set to 1, Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitches. After setting this field, the Host Driver sets SD Clock Enable again. <ul style="list-style-type: none"> 1 = 4-bit mode 0 = 1-bit mode
1	0b RW	Data Transfer Width (data_tx_wid) : Reserved.
0	0b RW	LED Control (led_ctl) : This bit selects the data width of the Host Controller. The Host Driver shall set it to match the data width of the SD card. <ul style="list-style-type: none"> 1 = 4-bit mode 0 = 1-bit mode

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	HW Reset (hw_rst): Reserved.
3:1	0h RW	SD Bus Voltage Select (sd_bus_volt_sel): By setting these bits, the Host Driver selects the voltage level for the SD card. Before setting this register, the Host Driver shall check the Voltage Support bits in the Capabilities register. If an unsupported voltage is selected, the Host System shall not supply SD Bus voltage. <ul style="list-style-type: none"> • 111b = 3.3V (Typ.) • 110b = 3.0V (Typ.) • 101b = 1.8V (Typ.) • 100b 000b Reserved
0	0b RW	SD Bus Power (sd_bus_pwr): Before setting this bit, the SD Host Driver shall set SD Bus Voltage Select. If the Host Controller detects the No Card state, this bit shall be cleared. If this bit is cleared, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state) and drive SDCLK to low level (Refer to Section 2.2.14) For SD Controller, this bit controls the bus voltage to SDMMC3. For SDIO Controller, power to SDIO device on SDMMC2 is not controlled by this bit. GPIO register and pin can be used to controller the SDIO device power. For eMMC Controller, power to eMMC device on SDMMC1 is not controlled by this bit. GPIO register and pin or alternative solutions can be used. <ul style="list-style-type: none"> • 1 = Power on • 0 = Power off

16.8.15 Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + 2Ah

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h

7	0	0	0	4	0	0	0	0
rsvd			drive_ccsd	int_blk_gap	rd_wait_ctl	cont_req	stp_blk_gap_req	

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	Reserved (rsvd): Reserved.
4	0b RW	DRIVE_CCSD (drive_ccsd): If the driver set this bit (change from ???0??? to ???1???), Host controller will send command completion.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	<p>Interrupt at Block Gap (int_blk_gap): This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card.</p> <ul style="list-style-type: none"> • 1 = Enabled • 0 = Disabled
2	0b RW	<p>Read Wait Control (rd_wait_ctl): The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.</p> <ul style="list-style-type: none"> • 1 = Enable Read Wait Control • 0 = Disable Read Wait Control
1	0b RW	<p>Continue Request (cont_req): This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases:</p> <ul style="list-style-type: none"> • In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts. • In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts. <p>Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored.</p> <ul style="list-style-type: none"> • 1 = Restart • 0 = Not affect
0	0b RW	<p>Stop at Block Gap Request (stp_blk_gap_req): This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12.</p> <ul style="list-style-type: none"> • 1 = Stop • 0 = Transfer

16.8.16 Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

Access Method

0	0	0	0	0
sdclk_freq_sel		upper_sdclk_freq_sel	rsvd	sd_clk_en int_clk_stable int_clk_en

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	<p>SDCLK Frequency Select (sdclk_freq_sel): This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. (1) 8-bit Divided Clock Mode This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. (1) 8-bit Divided Clock Mode</p> <ul style="list-style-type: none"> • 80h = base clock divided by 256 • 40h = base clock divided by 128 • 20h = base clock divided by 64 • 10h = base clock divided by 32 • 08h = base clock divided by 16 • 04h = base clock divided by 8 • 02h = base clock divided by 4 • 01h = base clock divided by 2 • 00h = base clock(10MHz and up) <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register.</p> <ul style="list-style-type: none"> • 400KHz divider value • 25MHz divider value • 50MHz divider value <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz.</p> <p>(2) 10-bit Divided Clock Mode Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported.</p> <ul style="list-style-type: none"> • 3FFh = 1/2046 Divided Clock • N = 1/2N Divided Clock (Duty 50%) • 002h = 1/4 Divided Clock • 001h = 1/2 Divided Clock • 000h = Base Clock (10MHz and up) • 3FFh = Base Clock * M / 1024 • • N - 1 = Base Clock * M / N • • 002h = Base Clock * M / 3 • 001h = Base Clock * M / 2 • 000h = Base Clock * M <p>This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.</p>

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	Upper Bits of SDCLK Frequency Select (upper_sdclk_freq_sel) : Host Controller Versions 1.00 and 2.00 do not support these bits and they are treated as 00b fixed value (ROC). Host Controller Version 3.00 shall support these bits to expand SDCLK Frequency Select to 10-bit. Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.
5:3	0h RO	Rsvd (rsvd) : Reserved.
2	0b RW	SD Clock Enable (sd_clk_en) : The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared. <ul style="list-style-type: none"> 1 = Enable 0 = Disable
1	0b RO	Internal Clock Stable (int_clk_stable) : This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. Note : This is useful when using PLL for a clock oscillator that requires setup time. <ul style="list-style-type: none"> 1 = Ready 0 = Not Ready
0	0b RW	Internal Clock Enable (int_clk_en) : This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection. <ul style="list-style-type: none"> 1 = Oscillate 0 = Stop

16.8.18 Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

0	0b RW	<p>Software Reset For All (sw_rst_all): This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card.</p> <ul style="list-style-type: none"> • 1 = Reset • 0 = Work <p>When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.</p>

16.8.20 Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
15	0b RO	Error Interrupt (err_int): If any of the bits in the Error Interrupt Status register are set, then this bit is set. Therefore the Host Driver can efficiently test for an error by checking this bit first. This bit is read only. <ul style="list-style-type: none"> 1 = Error 0 = No Error
14	0b RW/1C	BOOT_TER_INT (boot_ter_int): boot ter int
13	0b RW/1C	BOOT_ACK_RCV (boot_ck_rcv): boot ack rcv
12	0b RO	Re-Tuning Event (re_tune): This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning. <ul style="list-style-type: none"> 1 Re-Tuning should be performed 0 Re-Tuning is not required
11	0b RO	INT_C (int_c): This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_C interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> 1 = INT_C is detected 0 = No interrupt is detected
10	0b RO	INT_B (int_b): This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_B interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> 1 = INT_B is detected 0 = No interrupt is detected
9	0b RO	INT_A (int_a): This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_A interrupt factor. Refer to the Shared Bus Control register. <ul style="list-style-type: none"> 1 = INT_A is detected 0 = No interrupt is detected

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p>Card Interrupt (crd_int): Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts.</p> <ul style="list-style-type: none"> 1 = Generate Card Interrupt 0 = No Card Interrupt
7	0b RW/1C	<p>Card Removal (crd_rm): This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> 1 = Card removed 0 = Card state stable or Debouncing
6	0b RW/1C	<p>Card Insertion (crd_ins): This status is set if the Card Inserted in the Present State register changes from 0 to 1. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed, because the card detect state may possibly be changed when the Host Driver clears this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> 1 Card inserted 0 Card state stable or Debouncing
5	0b RW/1C	<p>Buffer Read Ready (buf_rd_rdy): This status is set if the Buffer Read Enable changes from 0 to 1. Refer to the Buffer Read Enable in the Present State register. While performing tuning procedure (Execute Tuning is set to 1), Buffer Read Ready is set to 1 for every CMD19 execution.</p> <ul style="list-style-type: none"> 1 = Ready to read buffer 0 = Not ready to read buffer
4	0b RW/1C	<p>Buffer Write Ready (buf_wr_rdy): This status is set if the Buffer Write Enable changes from 0 to 1. Refer to the Buffer Write Enable in the Present State register.</p> <ul style="list-style-type: none"> 1 = Ready to write buffer 0 = Not ready to write buffer
3	0b RW/1C	<p>DMA Interrupt (dma_int): This status is set if the Host Controller detects the Host SDMA Buffer boundary during transfer. Refer to the Host SDMA Buffer Boundary in the Block Size register. Other DMA interrupt factors may be added in the future. In case of ADMA, by setting Int field in the descriptor table, Host Controller generates this interrupt. Suppose that it is used for debugging. This interrupt shall not be generated after the Transfer Complete.</p> <ul style="list-style-type: none"> 1 = DMA Interrupt is generated 0 = No DMA Interrupt
2	0b RW/1C	<p>Block Gap Event (blk_gap_event): If the Stop At Block Gap Request in the Block Gap Control register is set, this bit is set when both a read / write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this bit is not set to 1. (1) In the case of a Read Transaction This bit is set at the falling edge of the DAT Line Active Status, when the transaction is stopped at SD Bus timing. The Read Wait shall be supported in order to use this function. Refer to Section 3.12.3 for timing details. p (1) In the case of a Write Transaction This bit is set at the falling edge of Write Transfer Active Status (after getting CRC status at SD Bus timing). Refer to Section 3.12.4 for more details on the sequence of events.</p> <ul style="list-style-type: none"> 1 = Transaction stopped at block gap 0 = No Block Gap Event

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW/1C	<p>Transfer Complete (tx_comp): This bit is set when a read / write transfer and a command with busy is completed. (1) In the case of a Read Transaction This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. (2) In the case of a Write Transaction This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. (3) In the case of a command with busy This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error.</p> <ul style="list-style-type: none"> • 1 = Command execution is completed • 0 = Not complete <p>While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.</p>
0	0b RW/1C	<p>Command Complete (cmd_comp): This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec.</p> <ul style="list-style-type: none"> • 1 = Command complete • 0 = No command complete

16.8.21 Error Interrupt Status Register (ERR_INT_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	Vendor Specific Error Status (vend_spec_err_status): Reserved.
14	0b RW	Boot Command Timeout Error (boot_cmd_timeout_err): Occur if the boot are access command is issued to the agent which has no permission to access the boot area.
13	0b RW	CEATA Error (ceata_err): Occurs when ATA command termination has occurred due to an error condition the device has encountered.
12	0b RW	Target Response Error (tgt_rsp_err): Occurs when detecting ERROR in m_hresp(dma transaction).
11:10	0h RO	Reserved (rsvd): Reserved.
9	0b RW	ADMA Error (adma_err): This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. In addition, the Host Controller generates this Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. ADMA Error State in the ADMA Error Status indicates that an error occurs in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor. <ul style="list-style-type: none"> 0 = error 1 = no error
8	0b RW	Auto CMD12 Error (cmd12_err): Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. <ul style="list-style-type: none"> 1 = error 0 = no error
7	0b RW	Current Limit Error (cur_limit_err): By setting the SD Bus Power bit in the Power Control register, the Host Controller is requested to supply power for the SD Bus. If the Host Controller supports the Current Limit function, it can be protected from an illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1 means the Host Controller is not supplying power to SD card due to some failure. Reading 0 means that the Host Controller is supplying power and no error has occurred. The Host Controller may require some sampling time to detect the current limit. If the Host Controller does not support this function, this bit shall always be set to 0. <ul style="list-style-type: none"> 1 = power fail 0 = no error
6	0b RW	Data End Bit Error (data_end_bit_err): Occurs either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status. <ul style="list-style-type: none"> 1 = error 0 = no error
5	0b RW	Data CRC Error (data_crc_err): Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC status having a value of other than 010b.
4	0b RW	Data Timeout Error (data_timeout_err): This bit is set when detecting one of following timeout conditions. <ul style="list-style-type: none"> Busy timeout for R1b,R5b type Busy timeout after Write CRC status Write CRC Status timeout Read Data timeout <ul style="list-style-type: none"> 1 = time out 0 = no error

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	Command Index Error (cmd_index_err): This bit is set if a Command Index error occurs in the command response. <ul style="list-style-type: none"> 1 = error 0 = no error
2	0b RW	Command End Bit Error (cmd_end_bit_err): This bit is set when detecting that the end bit of a command response is 0. <ul style="list-style-type: none"> 1 = End Bit Error generated 0 = no error
1	0b RW	Command CRC Error (cmd_crc_err): Command CRC Error is generated in two cases. If a response is returned and the Command Timeout Error is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between Command CRC Error and Command Timeout Error). <ul style="list-style-type: none"> 1 = CRC Error Generated. 0 = no error
0	0b RW	Command Timeout Error (cmd_timeout_err): This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case Command CRC Error shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and Command CRC Error) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller. <ul style="list-style-type: none"> 1 = time out 0 = no Error

16.8.22 Normal Interrupt Status Enable (NRM_INT_STATUS_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

16.8.31 Force Event Register for Error Interrupt Status (FORCE_EVENT_ERR_INT_STAT)—Offset 52h

Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

- Writing 1 : set each bit of the Error Interrupt Status Register
- Writing 0 : no effect

Note: By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

16.8.32 ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST_CADR: This state is never set because do not generate ADMA error in this state.

- ST_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. In this case, ADMA Error State indicates that an error occurs at ST_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

Access Method

The upper and lower 4-bits indicate the version.</p> <ul style="list-style-type: none"> • 00h = SD Host Specification Version 1.00 • 01h = SD Host Specification Version 2.00, Including the feature of the ADMA and Test Register • 02h = SD Host Specification Version 3.00 • others = Reserved

16.9 eMMC 4.5 PCI Configuration Registers

Table 186. Summary of eMMC 4.5 PCI Configuration Registers—0/23/0

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"Device ID and Vendor ID Register (DEVVENDID)—Offset 0h" on page 1863	00000000h
4–7h	4	"Status and Command Register (STATUSCOMMAND)—Offset 4h" on page 1864	00100000h
8–Bh	4	"Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h" on page 1865	00000000h
C–Fh	4	"Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch" on page 1865	00000000h
10–13h	4	"Base Address Register (BAR)—Offset 10h" on page 1866	00000000h
14–17h	4	"Base Address Register 1 (BAR1)—Offset 14h" on page 1867	00000000h
2C–2Fh	4	"Subsystem Vendor ID and Subsystem ID Register (SUBSYSTEMID)—Offset 2Ch" on page 1867	00000000h
30–33h	4	"Expansion ROM Base Address Register (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 1868	00000000h
34–37h	4	"Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h" on page 1868	00000080h
3C–3Fh	4	"Interrupt Register (INTERRUPTREG)—Offset 3Ch" on page 1869	00000100h
80–83h	4	"Power Management Capability ID Register (POWERCAPID)—Offset 80h" on page 1870	48030001h
84–87h	4	"Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h" on page 1870	00000008h
A0–A3h	4	"General Purpose Read Write Register1 (GEN_REGRW1)—Offset A0h" on page 1871	00000000h
A4–A7h	4	"General Purpose Read Write Register2 (GEN_REGRW2)—Offset A4h" on page 1871	00000000h
A8–ABh	4	"General Purpose Read Write Register3 (GEN_REGRW3)—Offset A8h" on page 1872	00000000h
AC–AFh	4	"General Purpose Read Write Register4 (GEN_REGRW4)—Offset Ach" on page 1872	00000000h
C0–C3h	4	"General Purpose Input Register (GEN_INPUT_REGRW)—Offset C0h" on page 1873	00000000h
F8–FBh	4	"Manufacturers ID Register (MANID)—Offset F8h" on page 1873	00000000h

16.9.1 Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 0h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
DEVICEID				VENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Device ID (DEVICEID) : Device ID identifies the particular AHB device. This is tied to a strap at the top level.
15:0	0000h RO	Vendor ID (VENDORID) : Vendor ID is a unique ID provided by PCI SIG which identifies the manufacturer of the device. This is tied to a strap at the top level.

16.9.2 Status and Command Register (STATUSCOMMAND)—Offset 4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 4h

Default: 00100000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	1	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0	RMA RCA	Reserved1	CAPLIST INTR_STATUS	Reserved2	Reserved3	INTR_DISABLE Reserved4 SERR_ENABLE	Reserved5	BME MSE Reserved6

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved0 : Reserved.
29	0h RW/1C	Received Master Abort (RMA) : If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a '1' to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port
28	0h RW/1C	Received Target Abort (RCA) : If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port
27:21	00h RO	Reserved1 : Reserved.
20	1h RO	Capabilities List (CAPLIST) : Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required then this bit should be tied to 0.
19	0h RO	Interrupt Status (INTR_STATUS) : This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	Reserved2 : Reserved.
15:11	00h RO	Reserved3 : Reserved.
10	0h RW	Interrupt Disable (INTR_DISABLE) : Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt; i.e., Bridge does not send Interrupt Assert message through the IOSF SideBand Channel. Reset value of this bit is 0.
9	0h RO	Reserved4 : Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	SERR# Enable (SERR_ENABLE) : This bit controls the sending of DO_SERR messages on IOSF SB.
7:3	00h RO	Reserved5 : Reserved.
2	0h RW	Bus Master Enable (BME) : If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	Memory Space Enable (MSE) : This bit controls Bridges response to downstream memory accesses. When set, accesses to the memory space of the device are enabled. Reset value of this bit is 0.
0	0h RO	Reserved6 : Reserved.

16.9.3 Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 8h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
CLASS_CODES							RID		

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	Class Code (CLASS_CODES) : This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	Revision ID (RID) : Identifies the revision of a particular AHB device. This is tied to a strap at the top level.

16.9.4 Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + Ch

Default: 00000000h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	Subsystem ID (SUBSYSTEMID): This register should be implemented for any function that could be instantiated more than once in a given system. Th is register makes it possible for the operating environment to distinguish one audio subsystem from the other. This is a Read Write Once register.
15:0	0000h RW/O	Subsystem Vendor ID (SUBSYSTEMVENDORID): This register should be implemented for any function that could be instantiated more than once in a given system. This register enables the operating environment to distinguish one subsystem from the other. This is a Read Write Once register.

16.9.8

Expansion ROM Base Address Register (EXPANSION_ROM_BASEADDR)—Offset 30h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 30h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Expansion ROM Base Address (EXPANSION_ROM_BASE): Value of all 0s indicates no support for Expansion ROM.

16.9.9

Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Reserved0: Reserved.
15	0h RW/1C	PME Status (PMESTATUS): 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit in this register.
14:9	00h RO	Reserved1: Reserved.
8	0h RW	PME Enable (PMEENABLE): A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	Reserved2: Reserved.
3	1h RO	No Soft Reset (NO_SOFT_RESET): This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved3: Reserved.
1:0	0h RW	Power State (POWERSTATE): This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for upstream decode on fabric ports.

16.9.13 General Purpose Read Write Register1 (GEN_REGRW1)—Offset A0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + A0h

Default: 00000000h

31	28	24	20	16	12	8	4	0																											
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
GEN_REG_RW1																																			

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	GEN_REG_RW1: capabilities over-ride for the sd/sdio/emmc host controller (bits 31:0)

16.9.14 General Purpose Read Write Register2 (GEN_REGRW2)—Offset A4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + A4h

Default: 00000000h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
CAP_REG_SEL																						GEN_REG_RW2	

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	CAP_REG_SEL: select if the capability will come from the GEN PCI register or from a hard wire
30:0	0h RW	GEN_REG_RW2: capabilities over-ride for the sd/sdio/emmc host controller (bits 62:32)

16.9.15 General Purpose Read Write Register3 (GEN_REGRW3)—Offset A8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + A8h

Default: 00000000h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
GEN_REG_RW3																							

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	GEN_REG_RW3: Reserved.

16.9.16 General Purpose Read Write Register4 (GEN_REGRW4)—Offset ACh

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + ACh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	GEN_REG_RW4: Reserved.

16.9.17 General Purpose Input Register (GEN_INPUT_REGRW)—Offset C0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + C0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	GEN_REG_INPUT_RW: Reserved.

16.9.18 Manufacturers ID Register (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	Manufacturer ID (MANID): This register is brought out as straps to the top level.

16.10 eMMC 4.5 Memory Mapped IO Registers

Table 187. Summary of eMMC 4.5 Memory Mapped I/O Registers—BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h" on page 1876	00000000h

16.10.1 SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<p>SDMA System Address (sys_adr): (1) SDMA System Address This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. (2)</p> <p>Argument 2 This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.</p>

16.10.2 Block Size Register (BLK_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

Access Method

Type: Memory Mapped I/O Register
 (Size: 16 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
tx_blk_size_12	boundary	tr_blk_size		

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	TX_BLK_SIZE_12 (tx_blk_size_12): Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.

Bit Range	Default & Access	Field Name (ID): Description
14:12	000b RW	<p>Host SDMA Buffer Boundary (boundary): The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at each boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register.</p> <ul style="list-style-type: none"> • 000b = 4K bytes (Detects A11 carry out) • 001b = 8K bytes (Detects A12 carry out) • 010b = 16K Bytes (Detects A13 carry out) • 011b = 32K Bytes (Detects A14 carry out) • 100b = 64K bytes (Detects A15 carry out) • 101b = 128K Bytes (Detects A16 carry out) • 110b = 256K Bytes (Detects A17 carry out) • 111b = 512K Bytes (Detects A18 carry out)
11:0	000h RW	<p>Transfer Block Size (tr_blk_size): This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2 <i>Determining Buffer Block Length</i>). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored.</p> <ul style="list-style-type: none"> • 0800h = 2048 Bytes • . . . • 0200h = 512 Bytes • 01FFh = 511 Bytes • . . . • 0004h = 4 Bytes • 0003h = 3 Bytes • 0002h = 2 Bytes • 0001h = 1 Byte • 0000h = No data transfer

16.10.3 Block Count Register (BLK_COUNT)—Offset 6h

This register is used to configure the number of data blocks.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 6h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:23, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:9	00h RO	Reserved (rsvd): Reserved.
8	0b RW	BOOT_EN (boot_en): To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	SPI_MODE (spi_mode): SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	CMD_COMP_ATA (cmd_comp_ata): Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	BLK_SEL (blk_sel): Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	Data Transfer Direction Select (data_tr_dir): This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller, and it is set to 0 for all other commands. <ul style="list-style-type: none"> 1 = Read (Card to Host) 0 = Write (Host to Card)
3:2	0b RW	AUTO_CMD_EN (auto_cmd_en): This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	Block Count Enable (blk_count_en): This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. <ul style="list-style-type: none"> 1 = Enable 0 = Disable
0	0b RW	DMA Enable (dma_en): This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). <ul style="list-style-type: none"> 1 = DMA Data transfer 0 = No data transfer or Non DMA data transfer

16.10.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

16.10.12 Present State Register (PRE_STATE)—Offset 24h

The Host Driver can get status of the Host Controller from this 32-bit read only register.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 24h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:23, F:0] + 10h

Default: 1FFF0000h

Bit Range	Default & Access	Field Name (ID): Description
16	1b RO	<p>Card Inserted (crd_ins): This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power.</p> <ul style="list-style-type: none"> 1 = Card Inserted 0 = Reset or Debouncing or No Card
15:12	0h RO	Reserved1 (reserved1): Reserved.
11	0b RO	<p>Buffer Read Enable (buf_rd_en): This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the Buffer Read Ready interrupt.</p> <ul style="list-style-type: none"> 1 = Read enable 0 = Read disable
10	0b RO	<p>Buffer Write Enable (buf_wr_en): This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the Buffer Write Ready interrupt. The Host Controller should neither set Buffer Write Enable nor generate Buffer Write Ready Interrupt after the last block data is written to the Buffer Data Port Register.</p> <ul style="list-style-type: none"> 1 = Write enable 0 = Write disable
9	0b RO	<p>Read Transfer Active (rd_tx_active): This status is used for detecting completion of a read transfer. Refer to Section 3.12.3 for sequence details. This bit is set to 1 for either of the following conditions:</p> <ul style="list-style-type: none"> After the end bit of the read command. When read operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. <p>This bit is cleared to 0 for either of the following conditions:</p> <ul style="list-style-type: none"> When the last data block as specified by block length is transferred to the System. In case of ADMA2, end of read operation is designated by Descriptor Table. When all valid data blocks in the Host Controller have been transferred to the System and no current block transfers are being sent as a result of the Stop At Block Gap Request being set to 1. <p>A Transfer Complete interrupt is generated when this bit changes to 0.</p> <ul style="list-style-type: none"> 1 = Transferring data 0 = No valid data

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p>Write Transfer Active (wr_tx_active): This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller. Refer to Section 3.12.4 for more details on the sequence of events. This bit is set in either of the following cases:</p> <ul style="list-style-type: none"> • After the end bit of the write command. • When write operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. <p>This bit is cleared in either of the following cases:</p> <ul style="list-style-type: none"> • After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) In case of ADMA2, transfer count is designated by Descriptor Table. • After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request. <p>During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as the result of the Stop At Block Gap Request being set. This status is useful for the Host Driver in determining non DAT line commands can be issued during write busy.</p> <ul style="list-style-type: none"> • 1 Transferring data • 0 No valid data
7:3	00h RO	<p>Reserved (reserved): Reserved.</p>
2	0b RO	<p>DAT Line Active (dat_in_active): This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> • After the end bit of the read command. • When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer. <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> • When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request. <p>The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> • After the end bit of the write command. • When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer. <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> • When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request. <p>(c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13.</p> <ul style="list-style-type: none"> • 1 = DAT Line Active • 0 = DAT Line Inactive

Bit Range	Default & Access	Field Name (ID): Description
1	0b RO	<p>Command Inhibit (DAT) (cmd_inhibit_dat): This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. Note: The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0.</p> <ul style="list-style-type: none"> 1 Cannot issue command which uses the DAT line 0 Can issue command which uses the DAT line
0	0b RO	<p>Command Inhibit (CMD) (cmd_inhibit_cmd): Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set.</p> <ul style="list-style-type: none"> 1 Cannot issue command 0 Can issue command using only CMD line

7:5	0h RO	Reserved (rsvd): Reserved.
4	0b RW	DRIVE_CCSD (drive_ccsd): If the driver set this bit (change from ???0??? to ???1???), Host controller will send command completion.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	<p>Interrupt at Block Gap (int_blk_gap): This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card.</p> <ul style="list-style-type: none"> • 1 = Enabled • 0 = Disabled
2	0b RW	<p>Read Wait Control (rd_wait_ctl): The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.</p> <ul style="list-style-type: none"> • 1 = Enable Read Wait Control • 0 = Disable Read Wait Control
1	0b RW	<p>Continue Request (cont_req): This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases:</p> <ul style="list-style-type: none"> • In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts. • In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts. <p>Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored.</p> <ul style="list-style-type: none"> • 1 = Restart • 0 = Not affect
0	0b RW	<p>Stop at Block Gap Request (stp_blk_gap_req): This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12.</p> <ul style="list-style-type: none"> • 1 = Stop • 0 = Transfer

16.10.16 Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

0	0	0	0	0
sdclk_freq_sel		upper_sdclk_freq_sel	rsvd	sd_clk_en int_clk_stable int_clk_en

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	<p>SDCLK Frequency Select (sdclk_freq_sel): This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. (1) 8-bit Divided Clock Mode This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. (1) 8-bit Divided Clock Mode</p> <ul style="list-style-type: none"> • 80h = base clock divided by 256 • 40h = base clock divided by 128 • 20h = base clock divided by 64 • 10h = base clock divided by 32 • 08h = base clock divided by 16 • 04h = base clock divided by 8 • 02h = base clock divided by 4 • 01h = base clock divided by 2 • 00h = base clock(10MHz and up) <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register.</p> <ul style="list-style-type: none"> • 400KHz divider value • 25MHz divider value • 50MHz divider value <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz.</p> <p>(2) 10-bit Divided Clock Mode Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported.</p> <ul style="list-style-type: none"> • 3FFh = 1/2046 Divided Clock • N = 1/2N Divided Clock (Duty 50%) • 002h = 1/4 Divided Clock • 001h = 1/2 Divided Clock • 000h = Base Clock (10MHz and up) • 3FFh = Base Clock * M / 1024 • • N - 1 = Base Clock * M / N • • 002h = Base Clock * M / 3 • 001h = Base Clock * M / 2 • 000h = Base Clock * M <p>This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.</p>

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	Upper Bits of SDCLK Frequency Select (upper_sdclk_freq_sel): Host Controller Versions 1.00 and 2.00 do not support these bits and they are treated as 00b fixed value (ROC). Host Controller Version 3.00 shall support these bits to expand SDCLK Frequency Select to 10-bit. Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.
5:3	0h RO	Rsvd (rsvd): Reserved.
2	0b RW	SD Clock Enable (sd_clk_en): The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared. <ul style="list-style-type: none"> 1 = Enable 0 = Disable
1	0b RO	Internal Clock Stable (int_clk_stable): This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. Note: This is useful when using PLL for a clock oscillator that requires setup time. <ul style="list-style-type: none"> 1 = Ready 0 = Not Ready
0	0b RW	Internal Clock Enable (int_clk_en): This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection. <ul style="list-style-type: none"> 1 = Oscillate 0 = Stop

The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card.</p> <ul style="list-style-type: none"> • 1 = Reset • 0 = Work <p>When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.</p>

16.10.20 Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	<p>Card Interrupt (crd_int): Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts.</p> <ul style="list-style-type: none"> • 1 = Generate Card Interrupt • 0 = No Card Interrupt
7	0b RW/1C	<p>Card Removal (crd_rm): This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> • 1 = Card removed • 0 = Card state stable or Debouncing
6	0b RW/1C	<p>Card Insertion (crd_ins): This status is set if the Card Inserted in the Present State register changes from 0 to 1. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed, because the card detect state may possibly be changed when the Host Driver clears this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> • 1 Card inserted • 0 Card state stable or Debouncing
5	0b RW/1C	<p>Buffer Read Ready (buf_rd_rdy): This status is set if the Buffer Read Enable changes from 0 to 1. Refer to the Buffer Read Enable in the Present State register. While performing tuning procedure (Execute Tuning is set to 1), Buffer Read Ready is set to 1 for every CMD19 execution.</p> <ul style="list-style-type: none"> • 1 = Ready to read buffer • 0 = Not ready to read buffer
4	0b RW/1C	<p>Buffer Write Ready (buf_wr_rdy): This status is set if the Buffer Write Enable changes from 0 to 1. Refer to the Buffer Write Enable in the Present State register.</p> <ul style="list-style-type: none"> • 1 = Ready to write buffer • 0 = Not ready to write buffer
3	0b RW/1C	<p>DMA Interrupt (dma_int): This status is set if the Host Controller detects the Host SDMA Buffer boundary during transfer. Refer to the Host SDMA Buffer Boundary in the Block Size register. Other DMA interrupt factors may be added in the future. In case of ADMA, by setting Int field in the descriptor table, Host Controller generates this interrupt. Suppose that it is used for debugging. This interrupt shall not be generated after the Transfer Complete.</p> <ul style="list-style-type: none"> • 1 = DMA Interrupt is generated • 0 = No DMA Interrupt
2	0b RW/1C	<p>Block Gap Event (blk_gap_event): If the Stop At Block Gap Request in the Block Gap Control register is set, this bit is set when both a read / write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this bit is not set to 1. (1) In the case of a Read Transaction This bit is set at the falling edge of the DAT Line Active Status, when the transaction is stopped at SD Bus timing. The Read Wait shall be supported in order to use this function. Refer to Section 3.12.3 for timing details. p (1) In the case of a Write Transaction This bit is set at the falling edge of Write Transfer Active Status (after getting CRC status at SD Bus timing). Refer to Section 3.12.4 for more details on the sequence of events.</p> <ul style="list-style-type: none"> • 1 = Transaction stopped at block gap • 0 = No Block Gap Event

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW/1C	<p>Transfer Complete (tx_comp): This bit is set when a read / write transfer and a command with busy is completed. (1) In the case of a Read Transaction This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. (2) In the case of a Write Transaction This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. (3) In the case of a command with busy This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error.</p> <ul style="list-style-type: none"> • 1 = Command execution is completed • 0 = Not complete <p>While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.</p>
0	0b RW/1C	<p>Command Complete (cmd_comp): This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec.</p> <ul style="list-style-type: none"> • 1 = Command complete • 0 = No command complete

16.10.21 Error Interrupt Status Register (ERR_INT_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	Command Index Error (cmd_index_err): This bit is set if a Command Index error occurs in the command response. <ul style="list-style-type: none"> 1 = error 0 = no error
2	0b RW	Command End Bit Error (cmd_end_bit_err): This bit is set when detecting that the end bit of a command response is 0. <ul style="list-style-type: none"> 1 = End Bit Error generated 0 = no error
1	0b RW	Command CRC Error (cmd_crc_err): Command CRC Error is generated in two cases. If a response is returned and the Command Timeout Error is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between Command CRC Error and Command Timeout Error). <ul style="list-style-type: none"> 1 = CRC Error Generated. 0 = no error
0	0b RW	Command Timeout Error (cmd_timeout_err): This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case Command CRC Error shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and Command CRC Error) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller. <ul style="list-style-type: none"> 1 = time out 0 = no Error

16.10.22 Normal Interrupt Status Enable (NRM_INT_STATUS_EN)— Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 34h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:23, F:0] + 10h

16.10.32 ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST_CADR: This state is never set because do not generate ADMA error in this state.

- ST_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. In this case, ADMA Error State indicates that an error occurs at ST_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

Access Method

17 Serial ATA (SATA)

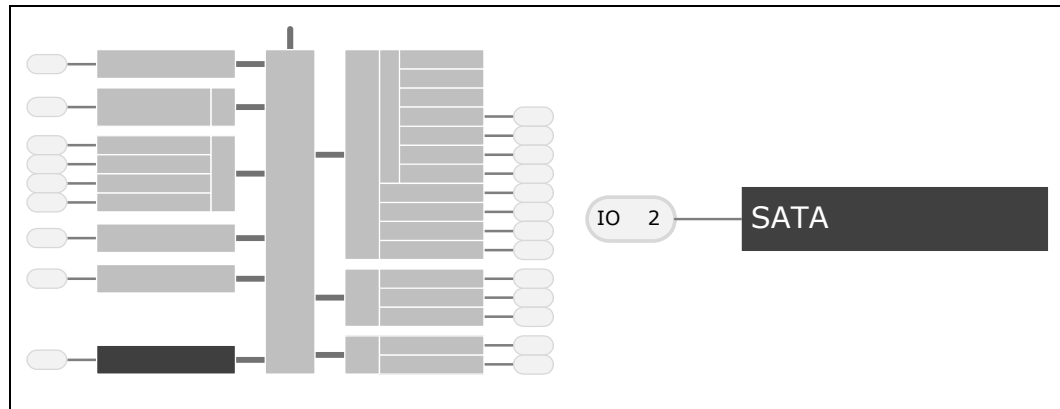

The SoC has one integrated SATA host controller that supports independent DMA operation on up to 2 ports and supports data transfer rates of 1.5 Gb/s (150 MB/s) and 3.0 Gb/s (300 MB/s). The SATA controller contains two modes of operation—a legacy mode using I/O space, and an AHCI mode using memory space. Software that uses legacy mode will not have AHCI capabilities.

The SoC supports the Serial ATA Specification, Revision 2.6. The SoC also supports several optional sections of the SATA Revision 2.0 Specifications: Extensions to Serial ATA 1.0 Specification, Revision 1.0 (AHCI support is required for some elements).

The SATA controllers feature two sets of interface signals (ports) that can be independently enabled or disabled (they cannot be tri-stated or driven low). Each interface is supported by an independent DMA controller.

The SATA controllers interact with an attached mass storage device through a register interface that is equivalent to that presented by a traditional IDE host adapter. The host software follows existing standards and conventions when accessing the register interface and follows standard command protocol conventions.

Note: SATA interface transfer rates are independent of UDMA mode settings. SATA interface transfer rates will operate at the bus's maximum speed, regardless of the UDMA mode reported by the SATA device or the system BIOS.

17.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin

- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 188. Signals

Signal Name	Direction Plat. Power	Description
SATA_GP[0]	I V1P8S	Serial ATA 0 General Purpose: This is an input pin which can be configured as an interlock switch or as a general purpose I/O, depending on the platform. When used as an interlock switch status indication, this signal should be driven to '0' to indicate that the switch is closed, and to '1' to indicate that the switch is open.
SATA_GP[1]	I V1P8S	Serial ATA 1 General Purpose: Same as above.
SATA_LED#	O V1P8S	Serial ATA LED: This is an open-collector output pin driven during SATA command activity. It is to be connected to external circuitry that can provide the current to drive a platform LED. When active, the LED is on. When tristated, the LED is off.
SATA_TXP[1:0] SATA_TXN[1:0]	O VPCIESATA	Serial ATA Port 1 and 0: These are outbound high-speed differential signals to Port 1 and 0.
SATA_RXP[1:0] SATA_RXN[1:0]	I VPCIESATA	Serial ATA Port 1 and 0: These are inbound high-speed differential signals to Port 1 and 0.
SATA_DEVSLP[1:0]	I/O V1P8S	These pins are used for hardware DEVSLP enabling. SATA_DEVSLP[0] is multiplexed with SATA_GPI[1], MMC1_RST#. SATA_DEVSLP[1] is multiplexed with LPE_I2S2_CLK.
SATA_RCOMP_P SATA_RCOMP_N	O	These pins are used to connect the external resistors used for Rcomp. Please contact your Intel representative for details.

17.2 Features

17.2.1 Supported Features

Table 189. SATA Feature List (Sheet 1 of 2)

Feature	Description
Native Command Queuing (NCQ)	Allows the device to reorder commands for more efficient data transfers
Auto Activate for DMA	Collapses a DMA Setup then DMA Activate sequence into a DMA Setup only
Hot Plug Support	Allows for device detection without power being applied and ability to connect and disconnect devices without prior notification to the system
Asynchronous Signal Recovery	Provides a recovery from a loss of signal or establishing communication after hot plug
3 Gb/s Transfer Rate	Capable of data transfers up to 3 Gb/s
ATAPI Asynchronous Notification	A mechanism for a device to send a notification to the host that the device requires attention

Table 189. SATA Feature List (Sheet 2 of 2)

Feature	Description
Host & Link Initiated Power Management	Capability for the host controller or device to request Partial and Slumber interface power states
Staggered Spin-Up	Enables the host to spin up hard drives sequentially to prevent power load problems on boot
Command Completion Coalescing	Reduces interrupt and completion overhead by allowing a specified number of commands to complete and then generating an interrupt to process the commands

Table 190. SATA/AHCI Feature Matrix

Feature	AHCI Disabled	AHCI Enabled
Native Command Queuing (NCQ)	N/A	Supported
Auto Activate for DMA	N/A	Supported
Hot Plug Support	N/A	Supported
Asynchronous Signal Recovery	N/A	Supported
3 Gb/s Transfer Rate	Supported	Supported
ATAPI Asynchronous Notification	N/A	Supported
Host & Link Initiated Power Management	N/A	Supported
Staggered Spin-Up	Supported	Supported
Command Completion Coalescing	N/A	N/A

17.2.2 Theory of Operation

17.2.2.1 Standard ATA Emulation

The SoC contains a set of registers that shadow the contents of the legacy IDE registers. The behavior of the Command and Control Block registers, PIO, and DMA data transfers, resets, and interrupts are all emulated.

Note: The SoC will assert INTR when the master device completes the EDD command regardless of the command completion status of the slave device. If the master completes EDD first, an INTR is generated and BSY will remain '1' until the slave completes the command. If the slave completes EDD first, BSY will be '0' when the master completes the EDD command and asserts INTR. Software must wait for busy to clear (0) before completing an EDD command, as required by the ATA5 through ATA7 (T13) industry standards.

17.2.2.2 48-Bit LBA Operation

The SATA host controller supports 48-bit LBA through the host-to-device register FIS when accesses are performed using writes to the task file. The SATA host controller will ensure that the correct data is put into the correct byte of the host-to-device FIS.

There are special considerations when reading from the task file to support 48-bit LBA operation. Software may need to read all 16-bits. Since the registers are only 8-bits wide and act as a FIFO, a bit must be set in the device/control register, which is at offset 3F6h for primary and 376h for secondary (or their native counterparts).

If software clears Bit 7 of the control register before performing a read, the last item written will be returned from the FIFO. If software sets Bit 7 of the control register before performing a read, the first item written will be returned from the FIFO.

17.2.3 AHCI Operation

The SoC provides hardware support for Advanced Host Controller Interface (AHCI), a programming interface for SATA host controllers developed through a joint industry effort. AHCI defines transactions between the SATA controller and software and enables advanced performance and usability with SATA. Platforms supporting AHCI may take advantage of performance features such as no master/slave designation for SATA devices—each device is treated as a master—and hardware assisted native command queuing. AHCI also provides usability enhancements such as Hot-Plug. AHCI requires appropriate software support (such as, an AHCI driver) and for some features, hardware support in the SATA device or additional platform hardware.

The SoC supports all of the mandatory features of the *Serial ATA Advanced Host Controller Interface Specification*, Revision 1.3 and many optional features, such as hardware assisted native command queuing, aggressive power management, LED indicator support, and Hot-Plug through the use of interlock switch support (additional platform hardware and software may be required depending upon the implementation).

Note: For reliable device removal notification while in AHCI operation without the use of interlock switches (surprise removal), interface power management should be disabled for the associated port.

17.5.1 Identifiers (ID)—Offset 0h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **ID:** [B:0, D:19, F:0] + 0h

Default: 0F208086h

31	28	24	20	16	12	8	4	0
0	0	0	0	1	1	1	1	0
0	0	0	1	0	0	0	0	0
1	0	0	0	0	1	0	0	0
0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	0
1	0	0	0	0	0	0	0	0
0	0	1	1	0	0	0	0	0
DID				VID				

Bit Range	Default & Access	Description
31:16	0F20h RO	Device ID (DID): The specific value is dependent on config bits and fuses. The value is product specific. VLV SATA DID can be within the range of 0F20-0F27 and 0F2E and 0F2F. However, since VLV SATA does not support RAID, DID can be either 0F20 or 0F2E.
15:0	8086h RO	Vendor ID (VID): 16-bit field which indicates the company vendor as Intel.

17.5.2 Command (CMD)—Offset 4h

Access Method

Type: PCI Configuration Register (Size: 16 bits) **CMD:** [B:0, D:19, F:0] + 4h

Default: 0000h

15	12	8	4	0										
0	0	0	0	0										
RSVD0				ID	FBE	SEE	WCC	PEE	VGA	MWIE	SCE	BME	MSE	IOSE

Bit Range	Default & Access	Description
15:11	0b RO	RSVD0: Reserved
10	0h RW	Interrupt Disable (ID): This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. When set, internal INTx# will not be generated. When cleared, internal INTx# is generated if there is an interrupt and MSI is not enabled.
9	0h RO	Fast Back-to-Back Enable (FBE): Reserved.
8	0h RW	SERR# Enable (SEE): When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation. When cleared to 0, it is not.
7	0h RO	Wait Cycle Enable (WCC): Reserved.
6	0h RW	Parity Error Response Enable (PEE): When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated.
5	0h RO	VGA Palette Snooping Enable (VGA): Reserved.
4	0h RO	Memory Write and Invalidate Enable (MWIE): Reserved.
3	0h RO	Special Cycle Enable (SCE): Reserved.
2	0h RW	Bus Master Enable (BME): Controls the SATA Controller's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.
1	0h RW	Memory Space Enable (MSE): Controls access to the SATA Controller's target memory space (for AHCI).
0	0h RW	I/O Space Enable (IOSE): Controls access to the SATA Controller's target I/O space.

17.5.3 Device Status (STS)—Offset 6h

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

STS: [B:0, D:19, F:0] + 6h

Default: 02B0h

15	12	8	4	0								
0	0	0	0	0								
DPE	SSE	RMA	RTA	STA	DEVT	DPD	FBC	RSVD0	RSV	CL	IS	RSVD1

Bit Range	Default & Access	Description
15	0h RW/1C	Detected Parity Error (DPE) : Set when the SATA Controller detects a parity error on its interface.
14	0h RW/1C	Signaled System Error (SSE) : Set when SATA Controller generates an SERR#.
13	0h RW/1C	Received Master-Abort Status (RMA) : Set when the SATA Controller receives a master abort to a cycle it generated.
12	0h RW/1C	Received Target-Abort Status (RTA) : Set when the SATA Controller receives a target abort to a cycle it generated.
11	0h RW/1C	Signaled Target-Abort Status (STA) : This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	1h RO	DEVSEL# Timing Status (DEVT) : Controls the device select time for the SATA Controller's PCI interface.
8	0h RW/1C	Master Data Parity Error Detected (DPD) : Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set. This bit can only be set on read completions received from the backbone where there is a parity error.
7	1h RO	Fast Back-to-Back Capable (FBC) : Reserved.
6	0b RO	RSVD0 : Reserved
5	1h RO	66 MHz Capable (RSV) : Reserved.
4	1h RO	Capabilities List (CL) : Indicates the presence of a capabilities list. The minimum requirement for the capabilities list must be PCI power management for the SATA Controller.
3	0h RO	Interrupt Status (IS) : Reflects the state of INTx# messages, IRQ14 or IRQ15. This bit is set when the interrupt is to be asserted. This bit is a 0 after the interrupt is cleared
2:0	0b RO	RSVD1 : Reserved

17.5.4 Revision ID (RID)—Offset 8h

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

RID: [B:0, D:19, F:0] + 8h

Default: 00h

7	4	0
0	0	0
RID		

Bit Range	Default & Access	Description
7:0	00h RO	Revision ID (RID) : Indicates stepping of the host controller hardware.

17.5.5 Programming Interface (PI)—Offset 9h

This register definition depends on the CC.SCC field. When the CC.SCC is 01h(IDE mode), register definition corresponds to 1st table. When CC.SCC is 06h(AHCI mode), register definition follows the 2nd table.

Access Method

Type: PCI Configuration Register (Size: 8 bits) **PI:** [B:0, D:19, F:0] + 9h

Default: 8Ah

7			4				0
1	0	0	0	1	0	1	0
BMS	RSVD0			SNC	SNE	PNC	PNE

Bit Range	Default & Access	Description
7	1h RO	Bus Master Support (BMS): Indicates the SATA Controller supports bus master operation.
6:4	0b RO	RSVD0: Reserved
3	1h RO	Secondary Mode Native Capable (SNC): Indicates that the secondary controller supports both legacy and native modes.
2	0h RW	Secondary Mode Native Enable (SNE): Determines the mode that the secondary channel is operating in. 0 corresponds to 'compatibility', 1 means PCI native. If this bit is set by SW, then the PNE bit must also be set by SW. While in theory these bits can be programmed separately, such a configuration is not supported by today's software and is not supported by this hardware. If this bit is left unchanged before switching, the result is indeterminate.
1	1h RO	Primary Mode Native Capable (PNC): Indicates that the primary controller supports both legacy and native modes.
0	0h RW	Primary Mode Native Enable (PNE): Determines the mode that the primary channel is operating in. 0 corresponds to 'compatibility', 1 means PCI native. If this bit is set by SW, then the SNE bit must also be set by SW. While in theory these bits can be programmed separately, such a configuration is not supported by today's software and is not supported by this hardware. If this bit is left unchanged before switching, the result is indeterminate.

17.5.6 Class Code (CC)—Offset Ah

Access Method

Type: PCI Configuration Register (Size: 16 bits) **CC:** [B:0, D:19, F:0] + Ah

Default: 0106h

15		12		8		4		0
0	0	0	0	0	0	0	1	0
BCC				SCC				

Bit Range	Default & Access	Description
15:8	01h RO	Base Class Code (BCC) : Indicates that this is a mass storage device.
7:0	06h RO	Sub Class Code (SCC) : The value reported in this field is dependent on MAP.SMS and various fuses and configuration bits. The value is product specific. For VLV this field may read 01h (IDE) or 06h (AHCI).

17.5.7 Cache Line Size (CLS)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

CLS: [B:0, D:19, F:0] + Ch

Default: 00h

Bit Range	Default & Access	Description
7:0	00h RO	Cache Line Size (CLS) : This register has no meaning for the SATA controller.

17.5.8 Master Latency Timer (MLT)—Offset Dh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

MLT: [B:0, D:19, F:0] + Dh

Default: 00h

Bit Range	Default & Access	Description
7:0	00h RO	Master Latency Timer (MLT) : This register has no meaning for the SATA controller.

17.5.9 Header Type (HTYPE)—Offset Eh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

HTYPE: [B:0, D:19, F:0] + Eh

Default: 00h

7				4					0
0	0	0	0	0	0	0	0	0	0
MFD	HL								

Bit Range	Default & Access	Description
7	0h RO	Multi-function Device (MFD) : Indicates this controller is not part of a multi-function device.
6:0	00h RO	Header Layout (HL) : Indicates that the controller uses a target device layout.

17.5.10 Primary Command Block Base Address (PCMDBA)—Offset 10h

This 8-byte I/O space is used in Native Mode for the Primary Controller's Command Block.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PCMDBA: [B:0, D:19, F:0] + 10h

Default: 00000001h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	1	
RSVD0				BAR				RSVD1	RTE

Bit Range	Default & Access	Description
31:16	0b RO	RSVD0 : Reserved
15:3	0h RW	Base Address (BAR) : Base address of the I/O space (8 consecutive I/O locations).
2:1	0b RO	RSVD1 : Reserved
0	1h RO	Resource Type Indicator (RTE) : Indicates a request for IO space.

17.5.11 Primary Control Block Base Address (PCTLBA)—Offset 14h

This 4-byte I/O space is used in Native Mode for the Primary Controller's Control Block.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PCTLBA: [B:0, D:19, F:0] + 14h

Default: 00000001h

Bit Range	Default & Access	Description
31:16	0b RO	RSVD0 : Reserved
15:2	0h RW	Base Address (BAR) : Base address of the I/O space (4 consecutive I/O locations).
1	0b RO	RSVD1 : Reserved
0	1h RO	Resource Type Indicator (RTE) : Indicates a request for IO space.

17.5.12 Secondary Command Block Base Address (SCMDBA)—Offset 18h

This 8-byte I/O space is used in Native Mode for the Secondary Controller's Command Block.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SCMDBA: [B:0, D:19, F:0] + 18h

Default: 00000001h

Bit Range	Default & Access	Description
31:16	0b RO	RSVD0 : Reserved
15:3	0h RW	Base Address (BAR) : Base address of the I/O space (8 consecutive I/O locations).
2:1	0b RO	RSVD1 : Reserved
0	1h RO	Resource Type Indicator (RTE) : Indicates a request for IO space.

17.5.13 Secondary Control Block Base Address (SCTLBA)—Offset 1Ch

This 4-byte I/O space is used in Native Mode for the Secondary Controller's Control Block.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SCTLBA: [B:0, D:19, F:0] + 1Ch

Default: 00000001h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	1	
RSVD0				BAR				RSVD1	RTE

Bit Range	Default & Access	Description
31:16	0b RO	RSVD0: Reserved
15:2	0h RW	Base Address (BAR): Base address of the I/O space (4 consecutive I/O locations).
1	0b RO	RSVD1: Reserved
0	1h RO	Resource Type Indicator (RTE): Indicates a request for IO space.

17.5.14 Legacy IDE Base Address / AHCI Index Data Pair Base Address (LBAR)—Offset 20h

This BAR is used to allocate I/O space for the SFF-8038i mode of operation (aka Bus Master IDE) and if CC.SCC is not 01h, it is used to allocate I/O space for the AHCI index/data pair mechanism as well. Note that hardware does not clear the BA bits (including BA4) when switching from IDE mode to non-IDE mode or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after mode switching.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

LBAR: [B:0, D:19, F:0] + 20h

Default: 00000001h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	1	
RSVD0				BA				RSVD1	RTE

Bit Range	Default & Access	Description
31:16	0b RO	RSVD0: Reserved

Bit Range	Default & Access	Description
15:4	0h RW	Base Address (BA) : Base address of the I/O space. Note for Base Address bit 4: When CC.SCC is 01h, this bit will be RW resulting in requesting 16B of I/O space. When CC.SCC is not 01h, this bit will be RO=0 resulting in requesting 32B of I/O space.
3:1	0b RO	RSVD1 : Reserved
0	1h RO	Resource Type Indicator (RTE) : Indicates a request for IO space.

17.5.15 AHCI Base Address/Serial ATA Index Data Pair Base Address (ABAR)—Offset 24h

When the programming interface is not IDE (i.e. CC.SCC is not 01h), this register is named ABAR. When the programming interface is IDE, this register becomes SIDPBA. Note that hardware does not clear those BA bits when switching from IDE SKU to non-IDE SKU or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after SKU switching (as indicated by a change in CC.SCC). In the case, this register will then have to be re-programmed to a proper value. When the programming interface is not IDE, the register represents a memory BAR allocating space for the AHCI memory registers. Note that bit[31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MBytes and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted. When the programming interface is IDE, the register becomes an I/O BAR allocating 16 bytes of I/O space for the I/O mapped registers defined in Memory Registers. Note that although 16 bytes of locations are allocated, only 8 bytes are used as SINDX and SDATA registers; with the remaining 8 bytes preserved for future enhancement.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

ABAR: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
BA							PF	TP	RTE

Bit Range	Default & Access	Description
31:4	0h RW	Base Address (BA) : When programming interface is non IDE, this is base address of register memory space (aligned to 2 KB). Bits 31:11 are RW, bits 10:4 are RO of 0; When programming interface is IDE, this is base address of the I/O space. Bits 31:16 are RO of 0, bits 15:4 are RW
3	0h RO	Prefetchable (PF) : When programming interface is non IDE, this indicates that this range is not prefetch-able
2:1	0h RO	Type (TP) : When programming interface is non IDE, this indicates that this range can be mapped anywhere in 32-bit address space
0	0h RO	Resource Type Indicator (RTE) : When programming interface is non IDE, this indicates a request for register memory space; When programming interface is IDE, this indicates a request for IO space.

17.5.16 Sub System Identifiers (SS)—Offset 2Ch

This register is initialized to logic 0 by the assertion of Backbone Reset. This register can be written only once after Backbone Reset de-assertion.

Access Method

Type: PCI Configuration Register
(Size: 32 bits) **SS:** [B:0, D:19, F:0] + 2Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
SSID				SSVID				

Bit Range	Default & Access	Description
31:16	0000h RW/O	Subsystem ID (SSID): This is written by BIOS. No hardware action taken on this value.
15:0	0000h RW/O	Subsystem Vendor ID (SSVID): This is written by BIOS. No hardware action taken on this value.

17.5.17 Capabilities Pointer (CAP)—Offset 34h

Access Method

Type: PCI Configuration Register
(Size: 8 bits) **CAP:** [B:0, D:19, F:0] + 34h

Default: 80h

7	4	0
1	0	0
C		

Bit Range	Default & Access	Description
7:0	80h RW/L	Capability Pointer (CP): Indicates that the first capability pointer offset is offset 80h (the Message Signaled Interrupt capability). The following capability structures are linked by default which is meant for non-IDE mode: CAP.CP - 80h (MSI) - 70h (PCI Power) - A8h (SATA) - 00h end. BIOS may alter the capability structure list above (by programming a leading capability structure's Next Pointer field) if BIOS wants to bypass any specific capability.[Br] If BIOS intends to operate in IDE mode, BIOS is requested to program this field to 70h and the subsequent capability list as such: CAP.CP - 70h (PCI Power) - end. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.

17.5.18 Interrupt Information (INTR)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 16 bits) **INTR:** [B:0, D:19, F:0] + 3Ch

Default: 0100h

15	12	8	4	0
0	0	0	0	0
0	0	0	1	0
0	0	0	0	0
0	0	0	0	0
IPIN				ILINE

Bit Range	Default & Access	Description
15:8	01h RO	Interrupt Pin (IPIN): This register tells which interrupt pin the device function uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#.
7:0	00h RW	Interrupt Line (ILINE): Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

17.5.19 Minimum Grant (MGNT)—Offset 3Eh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

MGNT: [B:0, D:19, F:0] + 3Eh

Default: 00h

7	4	0
0	0	0
0	0	0
0	0	0
MGNT		

Bit Range	Default & Access	Description
7:0	00h RO	MGNT: Minimum Grant

17.5.20 Maximum Latency (MLAT)—Offset 3Fh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

MLAT: [B:0, D:19, F:0] + 3Fh

Default: 00h

7	4	0
0	0	0
0	0	0
0	0	0
MLAT		

Bit Range	Default & Access	Description
7:0	00h RO	MLAT: Maximum Latency

17.5.21 Primary Timing (PTIM)—Offset 40h

This controls the timings driven on the parallel cable.

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

PTIM: [B:0, D:19, F:0] + 40h

Default: 0000h

15		12		8				4				0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DE	D1STE	ISP		RSVDO		RCT		DTE1	PPE1	IE1	TIM1	DTE0	PPE0	IE0	TIM0

Bit Range	Default & Access	Description
15	0h RW	Decode Enable (DE): Enables the SATA Controller to decode the Command Blocks (1F0-1F7h for primary, 170-177h for secondary or their native BAR equivalents) and Control Block (3F6h for primary and 376h for secondary or their native BAR equivalents). This bit still has functionality in SATA - if this bit is not set, the port that is mapped to this range will not be decoded.
14	0h RW	Device 1 Separate Timing Enable (D1STE): This register is not used by SATA controller.
13:12	0h RW	IORDY Sample Point (ISP): This register is not used by SATA controller.
11:10	0b RO	RSVDO: Reserved
9:8	0h RW	Recovery Time (RCT): This register is not used by SATA controller.
7	0h RW	Device 1 DMA Timing Enable (DTE1): This register is not used by SATA controller.
6	0h RW	Device 1 Prefetch/Posting Enable (PPE1): This register is not used by SATA controller.
5	0h RW	Device 1 IORDY Sample Point Enable (IE1): This register is not used by SATA controller.
4	0h RW	Device 1 Fast Timing Bank (TIM1): This register is not used by SATA controller.
3	0h RW	Device 0 DMA Timing Enable (DTE0): This register is not used by SATA controller.
2	0h RW	Device 0 Prefetch/Posting Enable (PPE0): This register is not used by SATA controller.
1	0h RW	Device 0 IORDY Sample Point Enable (IE0): This register is not used by SATA controller.
0	0h RW	Device 0 Fast Timing Bank (TIM0): This register is not used by SATA controller.

17.5.22 Secondary Timing (STIM)—Offset 42h

This controls the timings driven on the parallel cable.

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

STIM: [B:0, D:19, F:0] + 42h

Default: 0000h

15		12		8		4		0				
0	0	0	0	0	0	0	0	0

6	0h RW	Device 1 Prefetch/Posting Enable (PPE1): This register is not used by SATA controller.
5	0h RW	Device 1 IORDY Sample Point Enable (IE1): This register is not used by SATA controller.
4	0h RW	Device 1 Fast Timing Bank (TIM1): This register is not used by SATA controller.
3	0h RW	Device 0 DMA Timing Enable (DTE0): This register is not used by SATA controller.
2	0h RW	Device 0 Prefetch/Posting Enable (PPE0): This register is not used by SATA controller.
1	0h RW	Device 0 IORDY Sample Point Enable (IE0): This register is not used by SATA controller.
0	0h RW	Device 0 Fast Timing Bank (TIM0): This register is not used by SATA controller.

17.5.23 Device 1 IDE Timing (D1TIM)—Offset 44h

This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 8 bits) **D1TIM:** [B:0, D:19, F:0] + 44h

Default: 00h

7	4	0
0	0	0
RSVD		

Bit Range	Default & Access	Description
7:0	0h RW	RSVD: Reserved

17.5.24 Synchronous DMA Control (Synchronous_DMA_Control)—Offset 48h

This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 8 bits) **Synchronous_DMA_Control:** [B:0, D:19, F:0] + 48h

Default: 00h

7	4	0
0	0	0
RSVD		

Bit Range	Default & Access	Description
7:0	0h RW	RSVD: Reserved

17.5.25 Synchronous_DMA_Timing—Offset 4Ah

This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 16 bits) **Synchronous_DMA_Timing:** [B:0, D:19, F:0] + 4Ah

Default: 0000h

15	12	8	4	0
0	0	0	0	0
RSVD				

Bit Range	Default & Access	Description
15:0	0h RW	RSVD: Reserved

17.5.26 IDE I/O Configuration (IIOC)—Offset 54h

This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 32 bits) **IIOC:** [B:0, D:19, F:0] + 54h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVD								

Bit Range	Default & Access	Description
31:0	0h RW	RSVD: Reserved

17.5.27 PCI Power Management Capability ID (PID)—Offset 70h

Access Method

Type: PCI Configuration Register (Size: 16 bits) **PID:** [B:0, D:19, F:0] + 70h

Default: A801h

15	12	8	4	0											
1	0	1	0	1	0	0	0	0	0	0	0	0	0	0	1
NEXT								CID							

Bit Range	Default & Access	Description
15:8	A8h RW/L	Next Capability (NEXT): A8h is location of the Serial ATA Capability structure. This is recommended for non-IDE mode. If the controller is to operate in IDE mode, BIOS is requested to program this field to 00h indicating the end (recommended setting). The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	01h RO	Cap ID (CID): Indicates that this pointer is a PCI power management capability.

17.5.28 PCI Power Management Capabilities (PC)—Offset 72h

Access Method

Type: PCI Configuration Register (Size: 16 bits) **PC:** [B:0, D:19, F:0] + 72h

Default: 4003h

15	12	8	4	0
0	1	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	1	1	
PME_Support		D2_Support	D1_Support	Aux_Current
				DSI
				RSVD0
				PMEC
				VS

Bit Range	Default & Access	Description
15:11	08h RO	PME_Support: By default with CC.SCC=01h, the default value is 00000 which indicates no PME Support in IDE mode. When CC.SCC is not 01h in non-IDE mode, the default value is 01000 which indicates PME# can be generated from the D3HOT state in the SATA controller.
10	0h RO	D2_Support: The D2 state is not supported.
9	0h RO	D1_Support: The D1 state is not supported.
8:6	0h RO	Aux_Current: PME# from D3COLD state is not supported, therefore this field is 000b.
5	0h RO	Device Specific Initialization (DSI): Indicates that no device-specific initialization is required.
4	0b RO	RSVD0: Reserved
3	0h RO	PME Clock (PMEC): Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	Version (VS): Indicates support for Revision 1.2 of the PCI Power Management Specification.

17.5.29 PCI Power Management Control and Status (PMCS)—Offset 74h

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

PMCS: [B:0, D:19, F:0] + 74h

Default: 0008h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
1	0	0	0	0
PMES	RSVD0	PMEE	RSVD1	NSFRST
				RSVD2
				PS

Bit Range	Default & Access	Description
15	0h RW	PME Status (PMES): This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated. -Note: Whenever CC.SCC=01h either by default or just being updated, hardware shall automatically change the attribute to RO of 0.
14:9	0b RO	RSVD0: Reserved

Bit Range	Default & Access	Description
8	0h RW	PME Enable (PMEE) : When CC.SCC is not 01h, this bit is RW. When set, the SATA controller generates PME# from D3HOT on a wake event. Whenever CC.SCC=01h either by default or just being updated, hardware shall automatically change the attribute to RO of 0 since there is no PME Support in IDE mode. Note: Software is advised to clear PMEE together with PMES prior to changing CC.SCC thru MAP.SMS.
7:4	0b RO	RSVD1 : Reserved
3	1h RO	No Soft Reset (NSFRST) : A 1 indicates that devices transitioning from D3hot to D0 because of Power_State commands do not perform an internal reset. Configuration context is preserved. Upon transition from the D3hot to the D0 initialized state, no additional operating system intervention is required to preserve configuration context beyond writing to the Power_State bits. Regardless of this bit, the controller transition from D3hot to the D0 by a system or bus segment reset will return to the state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0b RO	RSVD2 : Reserved
1:0	0h RW	Power State (PS) : This field is used both to determine the current power state of the SATA Controller and to set a new power state. The values are: 00 = D0 state; 11 = D3HOT state. When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. If software attempts to write a 10 or 01 to these bits, the write will be ignored. Refer to PCI PM specification section 8.2.2. on software requirements in ensuring I/O space, memory space and Bus Master are disabled prior to entering D3 state.

17.5.30 Message Signaled Interrupt Identifier (MID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

MID: [B:0, D:19, F:0] + 80h

Default: 7005h

15	12	8	4	0
0	1	1	1	0
		0	0	0
		0	0	0
				0
				0
				1
				0
				1
NEXT				CID

Bit Range	Default & Access	Description
15:8	70h RW/L	Next Pointer (NEXT) : Indicates the next item in the list is the PCI power management pointer. This is the recommended value. BIOS may program this field to A8h indicating that the next item is Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	05h RO	Capability ID (CID) : Capabilities ID indicates MSI.

17.5.31 Message Signaled Interrupt Message Control (MC)—Offset 82h

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

MC: [B:0, D:19, F:0] + 82h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
RSVDO		C64	MME	MMC
				MSIE

Bit Range	Default & Access	Description
15:8	0b RO	RSVDO: Reserved
7	0h RO	64 Bit Address Capable (C64): Capable of generating a 32-bit message only.
6:4	0h RO	Multiple Message Enable (MME): When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].
3:1	0h RO	Multiple Message Capable (MMC): Not supported.
0	0h RW	MSI Enable (MSIE): If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Note that CMD.ID bit has not effect on MSI. Software must clear this bit to 0 to disable MSI first before changing the number of messages allocated in the MMC field. Software must also make sure this bit is cleared to 0 when operating in legacy mode (for AHCI SKUs when GHC.AE = 0). This bit is RW when CC.SCC is not 01h and is read-only 0 when CC.SCC is 01h.

17.5.32 Message Signaled Interrupt Message Address (MA)—Offset 84h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

MA: [B:0, D:19, F:0] + 84h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
ADDR								RSVDO

Bit Range	Default & Access	Description
31:2	0h RW	Address (ADDR): Lower 32 bits of the system specified message address, always DWORD aligned.
1:0	0b RO	RSVDO: Reserved

17.5.33 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

MD: [B:0, D:19, F:0] + 88h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
DATA				

Bit Range	Default & Access	Description
15:0	0h RW	Data (DATA): This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

17.5.34 Port Mapping Register (MAP)—Offset 90h

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

MAP: [B:0, D:19, F:0] + 90h

Default: 0420h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
RSVD0		SPDO	SPD	SMS
			SC	RSVD1
				MV

Bit Range	Default & Access	Description
15:12	0b RO	RSVD0: Reserved
11:10	1h RO	SATA Port Disable (SPDO): A 1 in a bit position corresponding to the SATA port prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPDO. And only then BIOS configures the PCS.PxE.
9:8	0h RO	SATA Port Disable (SPD): A 1 in a bit position corresponding to the SATA port prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPDO. And only then BIOS configures the PCS.PxE.
7:6	0h RW	SATA Mode Select (SMS): Software (SW) programs these bits to control the mode in which the SATA HBA should operate: 00b = IDE mode which requires LBC01.LBGE=1 (refer to LBC01, LBC23 and LBC45 register in SIR register space); 01b = AHCI mode; 10b = RAID mode; 11b = Reserved. Notes : SW shall not manipulate MAP.SMS during runtime operation; i.e. the OS will not do this. The BIOS may choose to switch from one mode to another during POST. IDE mode can be selected when AHCI and/or RAID are enabled. After switching from AHCI/RAID back to IDE mode, the number of usable ports on SATA Controller 1 shall be reduced to 4, dependent on SKUs. AHCI mode may only be selected when MV = 00b. AHCI mode may be selected when RAID feature is enabled by fuse. VLV does not support RAID mode. Programming these bits with values that are illegal will result in in-deterministic behavior by the HW.

Bit Range	Default & Access	Description
5	1h RW	SATA Port-to-Controller Configuration (SC) : This bit changes number of SATA port availability within each SATA controller. When MAP.SPD[5] is 1 and MAP.SPD[4] is 1, this bit is reserved and is read-only 1 else it's RW-zero. When this bit is 0: Up to 2 SATA ports are available in the SATA controller 1 with port[1:0]. When this bit to 1: Up to 2 SATA ports are available in the SATA controller 1 with port [1:0]. For SMS=IDE mode, this bit should be 0 (note that this irrespective of the number of SATA ports). The number of port availability in this controller shall be discoverable thru this controller's config PCS.PxE, AHCI CAP.NP and AHCI PI[x] register fields. Prior to changing the state of this bit, all ports must be in quiescent state with no commands outstanding. Refer to Single and Dual Controller Switching Requirement for additional software and hardware requirements.
4:2	0b RO	RSVD1 : Reserved
1:0	0h RO	Map Value (MV) : This register is reserved.

17.5.35 Port Control and Status (PCS)—Offset 92h

By default, the SATA ports are set (by hardware) to the disabled state (e.g. bits[5:0] == 0) as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. Note: AHCI specific notes: If an AHCI-aware or RAID enabled operating system is being booted then system BIOS shall insure that all supported SATA ports are enabled prior to passing control to the OS. Once the AHCI aware OS is booted it becomes the enabling/disabling policy owner for the individual SATA ports. This is accomplished by manipulating a port's PxSCTL.DET and PxCMD.SUD fields. Because an AHCI or RAID aware OS will typically not have knowledge of the PxE bits and because the PxE bits act as master on/off switches for the ports, pre-boot software must insure that these bits are set to 1 prior to booting the OS, regardless as to whether or not a device is currently on the port.

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

PCS: [B:0, D:19, F:0] + 92h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
ORM	RSVD0	RSVD	PIP	POP
			RSVD1	P1E
				P0E

Bit Range	Default & Access	Description
15	0h RW	OOB Retry Mode (ORM) : When cleared, the SATA controller will not retry after an OOB failure. When set, the SATA controller will continue to retry after an OOB failure until successful (infinite retry). BIOS is requested to program this field to 1.
14	0b RO	RSVD0 : Reserved
13:10	0h RO	RSVD : Reserved
9	0h RO	Port 1 Present (P1P) : Same as P0P, except for port 1.

Bit Range	Default & Access	Description
8	0h RO	Port 0 Present (POP) : When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing P0E bit leads to clearing of this bit after implementation delay. Note: For system software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting P0E bit to 1.
7:2	0b RO	RSVD1 : Reserved
1	0h RW	Port 1 Enabled (P1E) : When MAP.SPD[1] is 1, this bit is reserved and read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 1 and takes precedence over P1CMD.SUD.
0	0h RW	Port 0 Enabled (P0E) : When MAP.SPD[0] is 1, this bit is reserved and read-only 0. When set, the port is enabled. When cleared, the port is disabled. When enabled, the port can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This bit takes precedence over P0CMD.SUD. Note: The recommendation for software code that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again immediately shall refer to the polling requirement as described in P0P register bit. At any time that BIOS or software is clearing PCS.PxE from 1 to 0, due to time needed for port staggering hardware process (up to 2 ports) to complete, BIOS and software shall delay the write to set the TM.PCD register by 1.4us.

17.5.36 Test Mode Register (TM)—Offset 94h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

TM: [B:0, D:19, F:0] + 94h

Default: 00000000h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD				PCD	RSVD0																		

Bit Range	Default & Access	Description
31:26	0h RO	Reserved (RSVD) : Reserved.
25:24	0h RW	Port Clock Disable (PCD) : When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally.
23:0	0b RO	RSVD0 : Reserved

17.5.37 SATA General Configuration (SATAGC)—Offset 9Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SATAGC: [B:0, D:19, F:0] + 9Ch

Default: 00000000h

Bit Range	Default & Access	Description
31	0h RW/O	Register Lock (REGLOCK): BIOS can set this bit to 1 to lock the following registers with RW/L attribute: CAP,CP, MID.NEXT, PIE.NEXT, SATACR0.NEXT. Once locked the register attribute of above list changes from RW/L to RO holding the existing value. BIOS is requested to program this field to 1 prior to hand off to OS. If BIOS needs the SATA host controller to change operation a few times (i.e. changing CC.SCC mode) and need different capability structures for each specific operation mode, BIOS need not activate the lock until BIOS is ready to hand off to OS. BIOS may need to separate write access to this byte offset (x9Fh) from write to the lower 3-byte of the dword (x9C-9Eh) if there is a need to program the lower 3-byte dword location early during boot process.
30:15	0b RO	RSVD0: Reserved
14:12	0h RW	Write Request_Size Select/Max_Payload_Size (WRRSELMP5): These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size; 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller.
11:10	0b RO	RSVD1: Reserved
9	0h RW	Unsupported Request Reporting Enable (URRE): If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.
8	0h RW/1C	Unsupported Request Detected (URD): Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW.
7	0h RW/O	Alternate ID Enable (AIE): When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile. When programmed to a 1, HW will not report these device id's. The value is product specific. Note: Programming this bit to a 1 will prevent the Windows in-box version of the Intel AHCI driver from loading on the platform - will require that the user perform an 'F6' install of the Intel driver that is appropriate for the reported DID. This field is applicable when the AHCI is configured for RAID mode of operation. It has no impact for AHCI and IDE modes of operation. Note: BIOS is recommended to program this bit prior to programming the MAP.SMS field to reflect RAID. This field is reset by Backbone Reset and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5. This insures that the value is properly and cannot be changed during runtime.
6	0h RW/O	AIE0 DevID Selection (DEVIDSEL): This register allows BIOS to select Device ID when AIE=0 and Server Feature Disable Fuse 7 =0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Refer to config register offset 09h PI for usage. 0 : 2822h; 1 : 2826h. NOTE: When Server Feature (SATA AIE DEVIDSEL) Disable Fuse 7 is programmed to 1, this disables the writeability of this DEVIDSEL register bit, and becomes RO with a value of 0, which only allows a choice of 2822h.
5	0h RW/O	FLR Capability Selection (FLRCSSEL): This allows the FLR Capability to be bypassed. Refer to config offset B0h. BIOS is requested to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h.
4:0	0b RO	RSVD2: Reserved

17.5.38 SATA Initialization Register Index (SIRI)—Offset A0h

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

SIRI: [B:0, D:19, F:0] + A0h

Default: 00h

Bit Range	Default & Access	Description
7:2	00h RW	Index (IDX) : 6-bit index pointer into the 256-byte space. Data is written into the SIRD register and read from the SIRD register. This point to a DWord register. The byte enables on the SIRD register affect what will be written. Note that this 256-byte register space setting is applicable to all ports in both SATA controllers 1 and 2 (if supported). Refer to SATA Initialization Register section for detail of the register space.
1:0	0b RO	RSVD0 : Reserved

17.5.39 SATA Initialization Register Data (SIRD)—Offset A4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SIRD: [B:0, D:19, F:0] + A4h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RW	Data (DTA) : 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

17.5.40 Serial ATA Capability Register 0 (SATACRO)—Offset A8h

This register shall be read-only 0 when CC.SCC is 01h. Note that the SATACRO.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure. And FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SATACRO: [B:0, D:19, F:0] + A8h

Default: 00100012h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	1	0	0	0	0	0
RSVDO				MAJREV	MINREV	NEXT	CAP	

Bit Range	Default & Access	Description
31:24	0b RO	RSVDO: Reserved
23:20	1h RO	Major Revision (MAJREV): Major revision number of the SATA Capability Pointer implemented.
19:16	0h RO	Minor Revision (MINREV): Minor revision number of the SATA Capability Pointer implemented.
15:8	00h RW/L	Next Capability Pointer (NEXT): 00h indicating the final item in the Capability List. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	12h RO	Capability ID (CAP): The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

17.5.41 Serial ATA Capability Register 1 (SATACR1)—Offset ACh

This register shall be read-only 0 when CC.SCC is 01h.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SATACR1: [B:0, D:19, F:0] + ACh

Default: 00000048h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVDO				BAROFST				BARLOC

Bit Range	Default & Access	Description
31:16	0b RO	RSVDO: Reserved
15:4	004h RO	BAR Offset (BAROFST): Indicates the offset into the BAR where the AHCI Index/Data pair are located (in Dword granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR (BAR4). A value of 004h indicates offset 10h. 000h = 0h offset; 001h = 4h offset; 002h = 8h offset; 003h = Ch offset; 004h = 10h offset ... FFFh = 3FFFh offset (max 16 KB)
3:0	8h RO	BAR Location (BARLOC): Indicates the absolute PCI Configuration Register address of the BAR containing the Index/Data pair (in Dword granularity). The Index and Data I/O registers reside within the space defined by LBAR (BAR4) in the SATA controller. A value of 8h indicates offset 20h, which is LBAR (BAR4). 0000 - 0011b = reserved; 0100b = 10h (=) BAR0; 0101b = 14h (=) BAR1; 0110b = 18h (=) BAR2; 0111b = 1Ch (=) BAR3; 1000b = 20h (=) LBAR; 1001b = 24h (=) BAR5; 1010 - 1110b = reserved; 1111b = Index/Data pair in PCI Configuration space which is not supported.

17.5.42 FLR Capability ID (FLRCID)—Offset B0h

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

FLRCID: [B:0, D:19, F:0] + B0h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
NEXT				CID

Bit Range	Default & Access	Description
15:8	00h RO	Next Capability (NEXT): 00h indicating the final item in the Capability List.
7:0	00h RO	Capability ID (CID): The value of this field depends on the FLRCSSEL bit. SATAGC.FLRCSSEL = 0, Capability ID = 13h; SATAGC.FLRCSSEL = 1, Capability ID = 00h (capability is bypassed).

17.5.43 FLR Control (FLRCTL)—Offset B4h

This register shall be read-only 0 when SATAGC.FLRCSSEL=1.

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

FLRCTL: [B:0, D:19, F:0] + B4h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
RSVD				

Bit Range	Default & Access	Description
15:0	0h RO	RSVD: Reserved

17.5.44 Scratch Pad (SP)—Offset D0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SP: [B:0, D:19, F:0] + D0h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
D								

Bit Range	Default & Access	Description
31:0	0h RW	Data (DT) : This is a read/write register that is available for software to use. No hardware action is taken on this register.

17.5.45 BIST FIS Control/Status (BFCS)—Offset E0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

BFCS: [B:0, D:19, F:0] + E0h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
RSVDO						BFS	BFF	P1BFI
						POBFI	BFP	RSVD1

Bit Range	Default & Access	Description
31:12	0b RO	RSVDO : Reserved
11	0h RW	BIST FIS Successful (BFS) : This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device
10	0h RW	BIST FIS Failed (BFF) : This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device
9	0h RW	Port 1 BIST FIS Initiate (P1BFI) : When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P1E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS.
8	0h RW	Port 0 BIST FIS Initiate (POBFI) : When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P0E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS.
7:2	0h RW	BIST FIS Parameters (BFP) : These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller. This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller. The specific bit definitions are: Bit 7 (T) Far End Transmit mode; bit 6 (A) Align Bypass mode; bit 5 (S) Bypass Scrambling; bit 4 (L) Far End Retimed Loopback; bit 3 (F) Far End Analog Loopback; bit 2 (P) Primitive bit for use with Transmit mode.
1:0	0b RO	RSVD1 : Reserved

17.5.46 BIST FIS Transmit Data 1 (BFTD1)—Offset E4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

BFTD1: [B:0, D:19, F:0] + E4h

Bit Range	Default & Access	Description
27:24	8h RO	Dot portion of Process ID (DPID): Indicates the dot. Process is reflected in bits [7:0]. The value is product specific.
23:16	0h RO	Stepping Identifier (SID): This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change. The value is product specific.
15:8	0Fh RO	Manufacturer Identifier (MID): Indicates Intel.
7:0	B1h RO	Process/Dot Identifier (PID): Indicates the Process. Dot is reflected in bits [27:24]. The value is product specific.

17.6 SATA Legacy IO Registers

Table 192. Summary of SATA Legacy I/O Registers—LBAR

Offset	Size	Register ID—Description	Default Value
0h	1	"Primary Command (PCMD)—Offset 0h" on page 1953	00h
2h	1	"Primary Status (PSTS)—Offset 2h" on page 1954	00h
4h	4	"Primary Descriptor Table Pointer (PDTP)—Offset 4h" on page 1954	00000000h
8h	1	"Secondary Command (SCMD)—Offset 8h" on page 1955	00h
Ah	1	"Secondary Status (SSTS)—Offset Ah" on page 1955	00h
Ch	4	"Secondary Descriptor Table Pointer (SDTP)—Offset Ch" on page 1956	00000000h
10h	4	"AHCI Index Register (INDEX)—Offset 10h" on page 1957	00000000h
14h	4	"AHCI Data Register (DATA)—Offset 14h" on page 1958	00000000h

17.6.1 Primary Command (PCMD)—Offset 0h

Access Method

Type: I/O Register
(Size: 8 bits)

PCMD: [LBAR] + 0h

LBAR Type: PCI Configuration Register (Size: 32 bits)

LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00h

7	4	0
0	0	0
RSVD0	RWC	RSVD1
START		

Bit Range	Default & Access	Description
7:4	0b RO	RSVD0: Reserved
3	0h RW	Read / Write Control (RWC): Sets the direction of the bus master transfer: 0 = memory to device, 1 = device to memory. This bit must not be changed when the bus master function is active.
2:1	0b RO	RSVD1: Reserved
0	0h RW	Start/Stop Bus Master (START): Setting this bit enables bus master operation of the controller. Bus master operation does not actually start unless the Bus Master Enable bit in PCI configuration space is also set. Clearing it halts bus master operation. All state information is lost when this bit is written to 0; Master mode operation cannot be stopped and then resumed. If this bit is reset while bus master operation is still active and the device has not yet finished its data transfer, the bus master command is said to be aborted. If this bit is cleared to 0 prior to the DMA data transfer being initiated by the drive in a device to memory data transfer, then not DMAT will be sent to terminate the data transfer. SW intervention (e.g. sending SRST) is required to reset the interface in this condition. This bit is intended to be cleared by software after the data transfer is completed - as indicated by either the ACT bit being cleared in the status register, or the I bit being set in the status register, or both.

17.6.2 Primary Status (PSTS)—Offset 2h

Access Method

Type: I/O Register
(Size: 8 bits)

PSTS: [LBAR] + 2h

LBAR Type: PCI Configuration Register (Size: 32 bits)

LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00h

7				4				0
0	0	0	0	0	0	0	0	0
S	D1DC	D0DC		RSVDO		I	ERR	ACT

Bit Range	Default & Access	Description
7	0h RO	Simplex Only (S) : This read-only bit indicates whether or not I both bus master channels (primary and secondary) can be operated at the same time. If the bit is a 0, then the channels operate independently and can be used at the same time. If the bit is a 1, then only one channel may be used at a time.
6	0h RW	Device 1 DMA Capable (D1DC) : A scratchpad bit set by SW to indicate that device 1 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
5	0h RW	Device 0 DMA Capable (D0DC) : A scratchpad bit set by SW to indicate that device 0 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
4:3	0b RO	RSVDO : Reserved
2	0h RW/1C	Interrupt (I) : This bit is set when a device FIS is received with the I bit has been set provided that software has not disabled interrupt via the nIEN bit of Device Control Register.
1	0h RW/1C	Error (ERR) : This bit is set when the controller encounters an error during the transfer and must stop the transfer. See Error Handling for the list of errors that set this bit.
0	0h RO	Active (ACT) : Set by the host when the START bit is written to the Command register, and cleared by the host when the last transfer for a region is performed, where EOT for that region is set in the region descriptor, and when the START bit is cleared in the Command register and the controller has returned to an idle condition.

17.6.3 Primary Descriptor Table Pointer (PDTP)—Offset 4h

Access Method

Type: I/O Register
(Size: 32 bits)

PDTP: [LBAR] + 4h

LBAR Type: PCI Configuration Register (Size: 32 bits)

LBAR Reference: [B:0, D:19, F:0] + 20h

Bit Range	Default & Access	Description
7:4	0b RO	RSVDO : Reserved
3	0h RW	Read / Write Control (RWC) : Sets the direction of the bus master transfer: 0 = memory to device, 1 = device to memory. This bit must not be changed when the bus master function is active.
2:1	0b RO	RSVD1 : Reserved
0	0h RW	Start/Stop Bus Master (START) : Setting this bit enables bus master operation of the controller. Bus master operation does not actually start unless the Bus Master Enable bit in PCI configuration space is also set. Clearing it halts bus master operation.

17.6.5 Secondary Status (SSTS)—Offset Ah

Access Method

Type: I/O Register
(Size: 8 bits)

SSTS: [LBAR] + Ah

LBAR Type: PCI Configuration Register (Size: 32 bits)

LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00h

7		4		0
0	0	0	0	0
S	D1DC	D0DC	RSVDO	I
				ERR
				ACT

Bit Range	Default & Access	Description
7	0h RO	Simplex Only (S) : This read-only bit indicates whether or not I both bus master channels (primary and secondary) can be operated at the same time. If the bit is a 0, then the channels operate independently and can be used at the same time. If the bit is a 1, then only one channel may be used at a time.
6	0h RW	Device 1 DMA Capable (D1DC) : A scratchpad bit set by SW to indicate that device 1 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
5	0h RW	Device 0 DMA Capable (D0DC) : A scratchpad bit set by SW to indicate that device 0 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
4:3	0b RO	RSVDO : Reserved
2	0h RW/1C	Interrupt (I) : This bit is set when a device FIS is received with the I bit has been set provided that software has not disabled interrupt via the nIEN bit of Device Control Register.
1	0h RW/1C	Error (ERR) : This bit is set when the controller encounters an error during the transfer and must stop the transfer. See Error Handling for the list of errors that set this bit.
0	0h RO	Active (ACT) : Set by the host when the START bit is written to the Command register, and cleared by the host when the last transfer for a region is performed, where EOT for that region is set in the region descriptor, and when the START bit is cleared in the Command register and the controller has returned to an idle condition.

17.6.6 Secondary Descriptor Table Pointer (SDTP)—Offset Ch

Access Method

Type: I/O Register
(Size: 32 bits)

SDTP: [LBAR] + Ch

LBAR Type: PCI Configuration Register (Size: 32 bits)

DBA								RSVDO

Bit Range	Default & Access	Description
31:2	00000000h RW	Descriptor Base Address (DBA) : Corresponds to A[31:2]. This table must not cross a 64K boundary in memory. When read, the current value of the pointer is returned
1:0	0b RO	RSVDO : Reserved

17.6.7 AHCI Index Register (INDEX)—Offset 10h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEX/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

Access Method

Type: I/O Register
(Size: 32 bits)

INDEX: [LBAR] + 10h

LBAR Type: PCI Configuration Register (Size: 32 bits)

LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0
RSVD0								INDEX	RSVD1		

Bit Range	Default & Access	Description
31:11	0b RO	RSVD0: Reserved
10:2	000h RO	Index (INDEX): This Index register is used to select the Dword offset of the Memory Mapped AHCI register to be accessed. A Dword, Word or Byte access is specified by the active byte enables of the I/O access to the Data register.
1:0	0b RO	RSVD1: Reserved

17.6.8 AHCI Data Register (DATA)—Offset 14h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEXT/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

Access Method

Type: I/O Register
(Size: 32 bits)

DATA: [LBAR] + 14h

LBAR Type: PCI Configuration Register (Size: 32 bits)

LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RW	Data (DATA): This Data register is a window through which data is read or written to the memory mapped register pointed to by the Index register. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by Index.

17.7 SATA Index Pair IO Registers

Table 193. Summary of SATA Index Pair I/O Registers—ABAR

Offset	Size	Register ID—Description	Default Value
0h	4	“Serial ATA Index (SINDX)—Offset 0h” on page 1959	00000000h
4h	4	“Serial ATA Data (SDATA)—Offset 4h” on page 1960	00000000h

17.7.1 Serial ATA Index (SINDX)—Offset 0h

All of these I/O registers are in the core well. They are exposed only when CC.SCC is 01h (i.e. IDE programming interface). These are Index/Data Pair registers that are used to access the SerialATA superset registers (SerialATA Status, SerialATA Control and SerialATA Error). The I/O space for these registers is allocated through SIDPBA. Locations with offset from 08h to 0Fh are reserved for future expansion. Software write operations to the reserved locations shall have no effect while software read operations to the reserved locations shall return 0. Refer to Serial ATA Index/Data Pair Superset Registers for more details.

Access Method

Type: I/O Register
(Size: 32 bits)

SINDX: [ABAR] + 0h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

17.8.1 HBA Capabilities (GHC_CAP)—Offset 0h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon Backbone Reset.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

GHC_CAP: [ABAR] + 0h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: DF20FF02h

31	28	24	20	16	12	8	4	0												
1	1	0	1	1	1	1	1	0	0	1	0									
S64A	SCQA	SSNTF	SMPS	SSS	SALP	SAL	SCLO	ISS	SNZO	SAM	SMP	FBSS	PMD	SSC	PSC	NCS	CCCS	EMS	SXS	NP

Bit Range	Default & Access	Description
31	1h RW/O	Supports 64-bit Addressing (S64A): Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.
30	1h RW/O	Supports Native Command Queuing Acceleration (SCQA): Indicates the SATA controller supports Serial-ATA Native Command Queuing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activate optimization through the FIS.
29	0h RO	Supports SNotification Register (SSNTF): When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0, the HBA does not support the PxSNTF (SNotification) register and its associated functionality.
28	1h RW/O	Supports Mechanical Presence Switch (SMPS): When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization.
27	1h RW/O	Supports Staggered Spin-up (SSS): Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initialization.
26	1h RW/O	Supports Aggressive Link Power Management (SALP): Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved.

Bit Range	Default & Access	Description
25	1h RW/O	Supports Activity LED (SAL): Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity.
24	1h RW/O	Supports Command List Override (SCLO): When set to 1, indicates that the HBA supports the PxCMD.CLO bit and its associated function. When cleared to 0, The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue software reset if these bits are still set from a previous operation.
23:20	2h RW/O	Interface Speed Support (ISS): Indicates the maximum speed the S-ATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. 0000 = Reserved; 0001 = Gen 1 (1.5 Gbps); 0010 = Gen 2 (3 Gbps); 0011 = Gen 3 (6 Gbps); 0100 - 1111 = Reserved.
19	0h RO	Supports Non-Zero DMA Offsets (SNZO): Reserved as per AHCI 1.3
18	0h RW/O	Supports AHCI mode only (SAM): The SATA controller may optionally support AHCI access mechanism only. A value of 0 indicates that in addition to the native AHCI mechanism (via ABAR), the SATA controller implements a legacy, task-file based register interface such as SFF-8038i. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.
17	0h RO	Supports Port Multiplier (SMP): Not supported.
16	0h RO	FIS-based Switching Supported (FBSS): Not supported.
15	1h RO	PIO Multiple DRQ Block (PMD): If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol.
14	1h RW/O	Slumber State Capable (SSC): The SATA controller supports the slumber state.
13	1h RW/O	Partial State Capable (PSC): The SATA controller supports the partial state.
12:8	1Fh RO	Number of Command Slots (NCS): 1Fh indicating support for 32 slots.
7	0h RO	Command Completion Coalescing Supported (CCCS): When set to 1, indicates that the HBA supports command completion coalescing. When command completion coalescing is supported, the HBA has implemented the CCC_CTL and the CCC_PORTS global HBA registers. When cleared to 0, indicates that the HBA does not support command completion coalescing and the CCC_CTL and CCC_PORTS global HBA registers are not implemented.
6	0h RO	Enclosure Management Supported (EMS): Not supported
5	0h RW/O	Supports External SATA (SXS): When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible. If this bit is set, software may refer to the PxCMD.ESP bit to determine whether a specific port has its signal connector externally accessible as a signal only connector (i.e. power is not part of that connector). When the bit is cleared to 0, indicates that the HBA has no Serial ATA ports that have a signal only connector externally accessible.
4:0	02h RO	Number of Ports (NP): 0's based value indicating the maximum number of ports supported. Note that the number of ports indicated in this field may be more than the number of ports indicated in the PI register. Number of ports shall be dependent on MAP.SC and PCIe/SATA muxing configuration where if ANY of these parameter disable a particular port then that port is disabled and not counted. The maximum number of ports supported by SIP is 2 and the least is 0 (i.e. Function Disable). In the case of 0 port configuration, the value of NP is a don't care (while implementation has it fixed as 07h). Any combination in between is supported by SATA host controller. Indicates the number of supported ports.

17.8.2 Global HBA Control (GHC)—Offset 4h

This register controls various global actions of the HBA.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

GHC: [ABAR] + 4h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
AE	RSVDO						MRSM	IE	HR

Bit Range	Default & Access	Description
31	0h RW	AHCI Enable (AE): When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. When set, software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. When cleared, software will only communicate with the HBA using legacy mechanisms. Software shall set this bit to 1 before accessing other AHCI registers. Note: The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is 0, then GHC.AE should be RW and shall have a reset value of 0. If CAP.SAM is 1, then AE shall be read only and shall have a reset value of 1.
30:3	0b RO	RSVDO: Reserved
2	0h RO	MSI Revert to Single Message (MRSM): When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e. hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME (MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled); MC.MMC = 0 (multiple messages requested); MC.MME = 0 (more than one message allocated); MC.MME != MC.MMC (messages allocated not equal to number requested). When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated is false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. The HBA shall always revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. Value of MRSM is a don't care when GHC.HR=1.
1	0h RW	Interrupt Enable (IE): This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.
0	0h RW/1S	HBA Reset (HR): When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. When the HBA has performed the reset action, it will reset this bit to 0. A software write of 0 will have no effect. For a description on which bits are reset when this bit is set, see the AHCI specification, section 10.3.3.

17.8.3 Interrupt Status (IS)—Offset 8h

This register indicates which of the ports within the controller have an interrupt pending and require service.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

IS: [ABAR] + 8h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
RSVDO								IPS1	IPS0

Bit Range	Default & Access	Description
31:2	0b RO	RSVDO: Reserved
1	0h RW/1C	Interrupt Pending Status Port 1 (IPS1): If set, indicates that port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 1 physically.
0	0h RW/1C	Interrupt Pending Status Port 0 (IPS0): If set, indicates that port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 0 physically.

17.8.4 Ports Implemented (GHC_PI)—Offset Ch

This register indicates which ports are exposed to the HBA. It is loaded by platform BIOS. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. There is BIOS programming requirement on the PI register. Please refer to section 7.9.13.1.1 for details.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

GHC_PI: [ABAR] + Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
RSVDO								PI1	PI0

Bit Range	Default & Access	Description
31:2	0b RO	RSVDO: Reserved

Bit Range	Default & Access	Description
1	0h RW/O	Port 1 Implemented (PI1) : If set, then port 1 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 1 is not available.
0	0h RW/O	Port 0 Implemented (PI0) : If set, then port 0 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 0 is not available.

17.8.5 AHCI Version (VS)—Offset 10h

This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

VS: [ABAR] + 10h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00010300h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	1	0
0	0	0	0	0	0	0	0	0
MJR					MNR			

Bit Range	Default & Access	Description
31:16	0001h RO	Major Version Number (MJR) : Indicates the major version is 1
15:0	0300h RO	Minor Version Number (MNR) : Indicates the minor version is 30

17.8.6 HBA Capabilities Extended (GHC_CAP2)—Offset 24h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon Backbone Reset.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

GHC_CAP2: [ABAR] + 24h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 0000003Ch

0	0	0	0	0	0	0	0	0				
0	0	0	0	0	0	0	0	0				
0	0	0	0	0	0	0	0	0				
RSVD0							DES0	SADM	SDS	APST	RSVD1	BOH

Default: 00311C02h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
OFST				RPID				

Bit Range	Default & Access	Description
31:16	0031h RO	Offset (OFST): The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	1C02h RO	RAID Platform ID (RPID): Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

17.8.10 Premium Feature Block (PFB)—Offset C4h

These registers indicate to the Intel Rapid Storage Technology AHCI driver that those premium RAID features that can be supported on the platform.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

PFB: [ABAR] + C4h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
RSVD0			RSVD_1	RSVD_2
			RSVD_3	SEA
			SOI	

Bit Range	Default & Access	Description
15:5	0b RO	RSVD0: Reserved
4	0h RO	Reserved (RSVD_1): Read value is the same as VSP.PFS.
3	0h RO	Reserved (RSVD_2): Read value is the same as VSP.PFS.
2	0h RO	Reserved (RSVD_3): Read value is the same as VSP.PFS.
1	0h RO	Supports Email Alert (SEA): Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.
0	0h RO	Supports OEM IOCTL (SOI): Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.

17.8.11 SW Feature Mask (SFM)—Offset C8h

The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

SFM: [ABAR] + C8h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 003Fh

15	12	8	4	0
0	0	0	1	1
RSVDO	OROM_UI_Normal_Delay	Smart_Response_Technology	IRRT_Only_on_ESATA	LED_Locate
				HDDUNLOCK
				OROM_UI_and_BANNER
			IRRT	R5
				R10
				R1
				R0

Bit Range	Default & Access	Description
15:12	0b RO	RSVDO: Reserved
11:10	0h RW/O	OROM UI Normal Delay. (OROM_UI_Normal_Delay): Values of these bits specify the delay of the OROM UI Splash Screen in a normal status. 00 = 2 secs (default and previous value); 01 = 4 secs; 10 = 6 secs; 11 = 8 secs. If bit 5 == 0, then these values are disregarded.
9	0h RW/O	Smart Response Technology. (Smart_Response_Technology): If set to 1, then Smart Response Technology is enabled. If cleared to 0, the feature is disabled.
8	0h RW/O	RRT Only on ESATA (IRRT_Only_on_ESATA): If set to 1, then only RRT volumes can span internal and external SATA ports (e.g. eSATA). If cleared to 0, then any RAID volume can span internal and external SATA ports (e.g. eSATA).
7	0h RW/O	LED Locate (LED_Locate): If set to 1, then LED/SGPIO hardware is attached and the ping to locate feature is enabled in the OS.
6	0h RW/O	HDDUNLOCK: If set to 1, then HDD password unlock is enabled in the OS.
5	1h RW/O	OROM UI and BANNER (OROM_UI_and_BANNER): If set to 1, then the OROM UI is displayed. When cleared to 0, the OROM UI and BANNER are not displayed if all disks and volumes have a normal status.
4	1h RW/O	RRT (IRRT): If set to 1, then Rapid Recovery Technology is enabled.
3	1h RW/O	R5: If set to 1, then RAID5 is enabled
2	1h RW/O	R10: If set to 1, then RAID10 is enabled

Bit Range	Default & Access	Description
1	1h RW/O	R1 : If set to 1, then RAID1 is enabled
0	1h RW/O	RO : If set to 1, then RAID0 is enabled

17.8.12 Port-Command List Base Address (PxCLB0)—Offset 100h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxCLB0: [ABAR] + 100h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

Bit Range	Default & Access	Description
31:10	000000h RW	Command List Base Address (CLB) : Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0b RO	RSVD0 : Reserved

17.8.13 Port-Command List Base Address Upper 32-bits (PxCLBU0)—Offset 104h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxCLBU0: [ABAR] + 104h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RW	Command List Base Address Upper (CLBU) : Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

17.8.14 Port-FIS Base Address (PxFB0)—Offset 108h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxFB0: [ABAR] + 108h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
FB							RSVDO	

Bit Range	Default & Access	Description
31:8	0000000h RW	FIS Base Address (FB): Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0b RO	RSVDO: Reserved

17.8.15 Port-FIS Base Address Upper 32-bits (PxFBU0)—Offset 10Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxFBU0: [ABAR] + 10Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
FBU								

Bit Range	Default & Access	Description
31:0	00000000h RW	FIS Base Address Upper (FBU): Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

17.8.16 Port-Interrupt Status (PxIS0)—Offset 110h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxIS0: [ABAR] + 110h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	28	24	20	16	12	8	4	0										
0	0	0	0	0	0	0	0	0										
CPDS	TFES	HBFS	HBDS	IFS	INFS	RSVD0	OFS	IPMS	PRCS	RSVD1	DMPS	PCS	DPS	UFS	SDBS	DSS	PSS	DHRS

Bit Range	Default & Access	Description
31	0h RO	Cold Presence Detect Status (CPDS): The SATA controller does not support cold presence detect.
30	0h RW/1C	Task File Error Status (TFES): This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	Host Bus Fatal Error Status (HBFS): Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C	Host Bus Data Error Status (HBDS): Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	Interface Fatal Error Status (IFS): Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	Interface Non-fatal Error Status (INFS): Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0b RO	RSVD0: Reserved
24	0h RW/1C	Overflow Status (OFS): Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	Incorrect Port Multiplier Status (IPMS): Not supported
22	0h RO	PhyRdy Change Status (PRCS): When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0b RO	RSVD1: Reserved
7	0h RW/1C	Device Mechanical Presence Status (DMPS): When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO	Port Connect Change Status (PCS): 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C	Descriptor Processed (DPS): A PRD with the I. bit set has transferred all of its data.
4	0h RO	Unknown FIS Interrupt (UFS): When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C	Set Device Bits Interrupt (SDBS): A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	DMA Setup FIS Interrupt (DSS): A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.

Bit Range	Default & Access	Description
1	0h RW/1C	PIO Setup FIS Interrupt (PSS) : A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	Device to Host Register FIS Interrupt (DHRS) : A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

17.8.17 Port-Interrupt Enable (PxIE0)—Offset 114h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxIE0: [ABAR] + 114h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	28	24	20	16	12	8	4	0

CPDS	TFEE	HBFE	HBDE	IFE	INFE	RSVDO	OFE	IPME	PRCE	RSVD1	DMPE	PCE	DPE	UFE	SDBE	DSE	PSE	DHRE

Bit Range	Default & Access	Description
31	0h RO	Cold Presence Detect Enable (CPDS) : The SATA controller does not support cold presence detect.
30	0h RW	Task File Error Enable (TFEE) : When set, GHC.IE is set, and POS.TFES is set, the HBA shall generate an interrupt.
29	0h RW	Host Bus Fatal Error Enable (HBFE) : When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	Host Bus Data Error Enable (HBDE) : When set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	Interface Fatal Error Enable (IFE) : When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	Interface Non-fatal Error Enable (INFE) : When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0b RO	RSVDO : Reserved
24	0h RW	Overflow Enable (OFE) : When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	Incorrect Port Multiplier Enable (IPME) : When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt.
22	0h RW	PhyRdy Change Interrupt Enable (PRCE) : When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0b RO	RSVD1 : Reserved
7	0h RW	Device Mechanical Enable (DMPE) : When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Description
6	0h RW	Port Change Interrupt Enable (PCE): When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	Descriptor Processed Interrupt Enable (DPE): When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	Unknown FIS Interrupt Enable (UFE): When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	Set Device Bits FIS Interrupt Enable (SDBE): When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	DMA Setup FIS Interrupt Enable (DSE): When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	PIO Setup FIS Interrupt Enable (PSE): When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	Device to Host Register FIS Interrupt Enable (DHRE): When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Description
24	0h RW	Device is ATAPI (ATAPI) : When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	Automatic Partial to Slumber Transitions Enabled (APSTE) : When set to 1, the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0 - the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1 - if CAP2.APST is set to 1; if CAP2.APST is cleared to 0 - software shall treat this bit as reserved.
22	0h RO	FIS-based Switching Capable Port (FBSCP) : The SATA controller does not support FIS-Based Switching.
21	0h RW/O	External SATA Port (ESP) : When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to 1, then the port may experience hot plug events.
20	0h RO	Cold Presence Detection (CPD) : The SATA controller does not support cold presence detect.
19	0h RW/O	Mechanical Presence Switch Attached to Port (MPSP) : If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	Hot Plug Capable Port (HPCP) : This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RO	Port Multiplier Attached (PMA) : Not supported
16	0b RO	RSVD0 : Reserved
15	0h RO	Command List Running (CR) : When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	FIS Receive Running (FR) : When this bit is set it indicates that the FIS Receive DMA engine for the port is running.
13	0h RO	Mechanical Presence Switch State (MPSS) : The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	00h RO	Current Command Slot (CCS) : Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7	0b RO	RSVD1 : Reserved
6	0h RO	PHYSLP Present (PSP) : If set to 1, the platform supports PHYSLP on this port. If cleared to 0, the platform does not support PHYSLP on this port. This bit may only be set to 1 if CAP2.SPS is set to 1.

Bit Range	Default & Access	Description
7	0h RO	Status Busy (STS_BSY): Status - Indicates the interface is busy.
6:4	7h RO	Status Rsvd0 (STS_RSVD0): Status - Not Applicable.
3	1h RO	Status Drq (STS_DRQ): Status - Indicates a data transfer is requested.
2:1	3h RO	Status Rsvd1 (STS_RSVD1): Status - Not Applicable.
0	1h RO	Status Err (STS_ERR): Status - Indicates an error during the transfer.

17.8.20 Port-Signature (PxSIG0)—Offset 124h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxSIG0: [ABAR] + 124h

0	0	0	0	0	0	0	0	0
RSVD0				IPM	SPD	DET		

Bit Range	Default & Access	Description
31:12	0b RO	RSVD0: Reserved

Bit Range	Default & Access	Description
11:8	0h RO	Interface Power Management (IPM): Indicates the current interface state 0h = Device not present or communication not established. 1h = Interface in active state. 2h = Interface in PARTIAL power management state. 6h = Interface in SLUMBER power management state. 8h = PHYSLP asserted. All other values reserved. This field reflects the interface power management state for both device and host initiated power management. Note: If an automatic partial to slumber transition occurs, PxSSTS.IPM shall reflect that the host has entered slumber (PxSSTS.IPM = 6h.)
7:4	0h RO	Current Interface Speed (SPD): Indicates the negotiated interface communication speed. 0h = Device not present or communication not established. 1h = Generation 1 communication rate negotiated. 2h = Generation 2 communication rate negotiated. 3h = Generation 3 communication rate negotiated. All other values reserved
3:0	0h RO	Device Detection (DET): Indicates the interface device detection and Phy state. 0h = No device detected and Phy communication not established. 1h = Device presence detected but Phy communication not established. 3h = Device presence detected and Phy communication established. 4h = Phy in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved. Note that, while the true reset default value of this register is 0h, the value read from this register depends on drive presence and the point in time within the initialization process when the register is read. Note: The means by which the implementation determines device presence may be vendor specific. However, device presence shall always be indicated anytime a COMINIT signal is received.

17.8.22 Port-Serial ATA Control (PxSCTL0)—Offset 12Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxSCTL0: [ABAR] + 12Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

RSVD0				PMP	SPM	IPM	SPD	DET															

Bit Range	Default & Access	Description
31:20	0b RO	RSVDO: Reserved
19:16	0h RW	Port Multiplier Port (PMP): This field is not used by AHCI.
15:12	0h RW	Select Power Management (SPM): This field is not used by AHCI.
11:8	0h RW	Interface Power Management Transitions Allowed (IPM): Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. 0h No interface restrictions 1h Transitions to the PARTIAL state disabled 2h Transitions to the SLUMBER state disabled 3h Transitions to both PARTIAL and SLUMBER states disabled 4h Transitions to the DEVSLP power management state are disabled 5h Transitions to the Partial and DEVSLP power management states are disabled 6h Transitions to the Slumber and DEVSLP power management states are disabled 7h Transitions to the Partial, Slumber and DEVSLP power management states are disabled All other values reserved

Bit Range	Default & Access	Description
7:4	0h RW	Speed Allowed (SPD) : Indicates the highest allowable speed of the interface. 0h No speed negotiation restrictions. 1h Limit speed negotiation to Generation 1 communication rate. 2h Limit speed negotiation to a rate not greater than Generation 2 communication rate. 3h Limit speed negotiation to a rate not greater than Generation 3 communication rate. All other values reserved. Note: If software changes SPD after port has been enabled, software is required to perform a port reset via DET=1h.
3:0	0h RW	Device Detection Initialization (DET) : Controls HBA's device detection and interface initialization. 0h No device detection or initialization action requested. 1h Perform interface communication initialization sequence to establish communication. This is functionally equivalent to a hard reset and results in the interface being reset and communications reinitialized. While this field is 1h, COMRESET is continuously transmitted on the interface. Software should leave the DET field set to 1h for a minimum of 1 millisecond to ensure that a COMRESET is sent on the interface. 4h Disable the Serial ATA interface and put Phy in offline mode. All other values reserved. This field may only be changed when PxCMD.ST is '0'. Changing this field while the HBA is running results in undefined behavior. When PxCMD.ST is set to '1', this field should have a value of 0h. It is permissible to implement any of the Serial ATA defined behaviors for transmission of COMRESET when PxSCTL.DET = 1h

17.8.23 Port-Serial ATA Error (PxSERR0)—Offset 130h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DIAG												ERR																			

Bit Range	Default & Access	Description
31:16	0000h RW/1C	Diagnostics (DIAG) : Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. Bit Field 31:27 Reserved 26 Exchanged (X): When set to one this bit indicates that a change in device presence has been detected since the last time this bit was cleared. The means by which the implementation determines that the device presence has changed is vendor specific. This bit shall always be set to one anytime a COMINIT signal is received. This bit is reflected in the P0IS.PCS bit. 25 Unrecognized FIS Type (F): Indicates that one or more FISs were received by the Transport layer with good CRC, but had a type field that was not recognized. 24 Transport state transition error (T): Indicates that an error has occurred in the transition from one state to another within the Transport layer since the last time this bit was cleared. 23 Link Sequence Error (S): Indicates that one or more Link state machine error conditions were encountered. The Link Layer state machine defines the conditions under which the link layer detects an erroneous transition. 22 Handshake Error (H): Indicates that one or more R_ERR handshake response was received in response to frame transmission. Such errors may be the result of a CRC error detected by the recipient, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame. 21 CRC Error (C): Indicates that one or more CRC errors occurred with the Link Layer. 20 Disparity Error (D): This field is not used by AHCI. 19 10B to 8B Decode Error (B): Indicates that one or more 10B to 8B decoding errors occurred. 18 Comm Wake (W): Indicates that a Comm Wake signal was detected by the Phy. 17 Phy Internal Error (I): Indicates that the Phy detected some internal error. 16 PhyRdy Change (N): When set to 1 this bit indicates that the internal PhyRdy signal changed state since the last time this bit was cleared. The state of this bit is reflected in the PxIS.PCS interrupt status bit and an interrupt will be generated if enabled.

Bit Range	Default & Access	Description
15:0	0000h RW/1C	Error (ERR): The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. 15:12 Reserved 11 Internal Error (E): The SATA controller failed due to a master or target abort when attempting to access system memory. 10 Protocol Error (P): A violation of the Serial ATA protocol was detected. 9 Persistent Communication or Data Integrity Error (C): A communication error that was not recovered occurred that is expected to be persistent. Persistent communications errors may arise from faulty interconnect with the device, from a device that has been removed or has failed, or a number of other causes. 8 Transient Data Integrity Error (T): A data integrity error occurred that was not recovered by the interface. 7:2 Reserved 1 Recovered Communications Error (M): Communications between the device and host was temporarily lost but was re-established. This can arise from a device temporarily being removed, from a temporary loss of Phy synchronization, or from other causes and may be derived from the PhyNRdy signal between the Phy and Link layers. 0 Recovered Data Integrity Error (I): A data integrity error occurred that was recovered by the interface through a retry operation or other recovery action.

31	28	24	20	16	12	8	4	0															
0	0	0	1	1	1	0	0	0	0	0	0	1	0	0	0	1	0						
RSVD0				DM				DITO				MDAT				DETO				DSP		ADSE	

Bit Range	Default & Access	Description
31:29	0b RO	RSVD0: Reserved
28:25	Fh RW/O	DITO Multiplier (DM) : 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).
24:15	004h RW	DEVSLP Idle Timeout (DITO) : This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.
14:10	0Ah RW	DEVSLP Minimum Assertion Time (MDAT) : This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information.
9:2	14h RW	DEVSLP Exit Timeout (DETO) : This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information.
1	1h RW/O	DEVSLP Present (DSP) : If set to 1, the platform supports DEVSLP on this port. If cleared to 0, the platform does not support DEVSLP on this port.
0	0h RW	Aggressive DEVSLP Enable (ADSE) : When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted.

17.8.27 Port-Command List Base Address (PxCLB1)—Offset 180h

Access Method

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
CLBU								

Bit Range	Default & Access	Description
31:0	00000000h RW	Command List Base Address Upper (CLBU): Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

17.8.29 Port-FIS Base Address (PxFB1)—Offset 188h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxFB1: [ABAR] + 188h

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Bit Range	Default & Access	Description
31	0h RO	Cold Presence Detect Status (CPDS): The SATA controller does not support cold presence detect.
30	0h RW/1C	Task File Error Status (TFES): This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	Host Bus Fatal Error Status (HBFS): Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C	Host Bus Data Error Status (HBDS): Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	Interface Fatal Error Status (IFS): Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	Interface Non-fatal Error Status (INFS): Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0b RO	RSVDO: Reserved
24	0h RW/1C	Overflow Status (OFS): Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	Incorrect Port Multiplier Status (IPMS): Not supported
22	0h RO	PhyRdy Change Status (PRCS): When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0b RO	RSVD1: Reserved
7	0h RW/1C	Device Mechanical Presence Status (DMPS): When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO	Port Connect Change Status (PCS): 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C	Descriptor Processed (DPS): A PRD with the I. bit set has transferred all of its data.
4	0h RO	Unknown FIS Interrupt (UFS): When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C	Set Device Bits Interrupt (SDBS): A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	DMA Setup FIS Interrupt (DSS): A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C	PIO Setup FIS Interrupt (PSS): A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	Device to Host Register FIS Interrupt (DHRS): A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

17.8.32 Port-Interrupt Enable (PxIE1)—Offset 194h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxIE1: [ABAR] + 194h

ABAR Type: PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Description
31	0h RO	Cold Presence Detect Enable (CPDS) : The SATA controller does not support cold presence detect.
30	0h RW	Task File Error Enable (TFEE) : When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	Host Bus Fatal Error Enable (HBFE) : When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	Host Bus Data Error Enable (HBDE) : When set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	Interface Fatal Error Enable (IFE) : When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	Interface Non-fatal Error Enable (INFE) : When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0b RO	RSVDO : Reserved
24	0h RW	Overflow Enable (OFE) : When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	Incorrect Port Multiplier Enable (IPME) : When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt.
22	0h RW	PhyRdy Change Interrupt Enable (PRCE) : When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0b RO	RSVD1 : Reserved
7	0h RW	Device Mechanical Enable (DMPE) : When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW	Port Change Interrupt Enable (PCE) : When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	Descriptor Processed Interrupt Enable (DPE) : When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	Unknown FIS Interrupt Enable (UFE) : When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	Set Device Bits FIS Interrupt Enable (SDBE) : When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Description
27	0h RW	Aggressive Slumber Partial (ASP) : When set to 1, and the ALPE bit is set, the HBA shall aggressively enter Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter Partial state when it clears a bit in the PxCI or PxSACT register and the register values are both 0h. If CAP.SALP is cleared to 0, software shall treat this bit as reserved.
26	0h RW	Aggressive Link Power Management Enable (ALPE) : When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.
25	0h RW	Drive LED on ATAPI Enable (DLAE) : When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software
24	0h RW	Device is ATAPI (ATAPI) : When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	Automatic Partial to Slumber Transitions Enabled (APSTE) : When set to 1, the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0 - the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1 - if CAP2.APST is set to 1; if CAP2.APST is cleared to 0 - software shall treat this bit as reserved.
22	0h RO	FIS-based Switching Capable Port (FBSCP) : The SATA controller does not support FIS-Based Switching.
21	0h RW/O	External SATA Port (ESP) : When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to 1, then the port may experience hot plug events.
20	0h RO	Cold Presence Detection (CPD) : The SATA controller does not support cold presence detect.
19	0h RW/O	Mechanical Presence Switch Attached to Port (MPSP) : If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	Hot Plug Capable Port (HPCP) : This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RO	Port Multiplier Attached (PMA) : Not supported
16	0b RO	RSVDO : Reserved
15	0h RO	Command List Running (CR) : When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	FIS Receive Running (FR) : When this bit is set it indicates that the FIS Receive DMA engine for the port is running.
13	0h RO	Mechanical Presence Switch State (MPSS) : The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.

Bit Range	Default & Access	Description
12:8	00h RO	Current Command Slot (CCS): Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCi is set to 3h, the next command that will be issued is from command slot 1.
7	0b RO	RSVD1: Reserved
6	0h RO	PHYSLP Present (PSP): If set to 1, the platform supports PHYSLP on this port. If cleared to 0, the platform does not support PHYSLP on this port. This bit may only be set to 1 if CAP2.SPS is set to 1.
5	0h RW	Aggressive PHYSLP Enable (APSE): This bit is read/write for HBAs that support aggressive PHYSLP management (CAP2.SAPM == 1). This bit is read-only for HBAs that do not support aggressive PHYSLP management (CAP2.SPS == 0). When this bit is set to 1, the HBA shall assert the PHYSLP signal after the port has been idle (PxCi == 0h and PxSACT == 0h) for the amount of time specified by the GHC.PITO register. When this bit is cleared to 0, the HBA does not enter PHYSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxCMD.PSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the PHYSLP signal if asserted.
4	0h RW	FIS Receive Enable (FRE): When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	Command List Override (CLO): Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	Power On Device (POD): The SATA controller does not support cold presence detect.
1	0h RW	Spin-Up Device (SUD): This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1 for HBAs that do not support staggered spin-up. On an edge detect from 0 to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to 0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0 and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	Start (ST): When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCi and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

17.8.36 Port-Serial ATA Status (PxSSTS1)—Offset 1A8h

Access Method

Type: Memory Mapped I/O Register

11:8	0h RO	Interface Power Management (IPM): Indicates the current interface state 0h = Device not present or communication not established. 1h = Interface in active state. 2h = Interface in PARTIAL power management state. 6h = Interface in SLUMBER power management state. 8h = PHYSLP asserted. All other values reserved. This field reflects the interface power management state for both device and host initiated power management. Note: If an automatic partial to slumber transition occurs, PxSSTS.IPM shall reflect that the host has entered slumber (PxSSTS.IPM = 6h.)
7:4	0h RO	Current Interface Speed (SPD): Indicates the negotiated interface communication speed. 0h = Device not present or communication not established. 1h = Generation 1 communication rate negotiated. 2h = Generation 2 communication rate negotiated. 3h = Generation 3 communication rate negotiated. All other values reserved
3:0	0h RO	Device Detection (DET): Indicates the interface device detection and Phy state. 0h = No device detected and Phy communication not established. 1h = Device presence detected but Phy communication not established. 3h = Device presence detected and Phy communication established. 4h = Phy in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved. Note that, while the true reset default value of this register is 0h, the value read from this register depends on drive presence and the point in time within the initialization process when the register is read. Note: The means by which the implementation determines device presence may be vendor specific. However, device presence shall always be indicated anytime a COMINIT signal is received.

17.8.37 Port-Serial ATA Control (PxSCTL1)—Offset 1ACh

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxSCTL1: [ABAR] + 1ACh

ABAR Type: PCI Configuration Register (Size: 32 bits)

ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
		RSVDO		PMP	SPM	IPM	SPD	DET

Bit Range	Default & Access	Description
31:20	0b RO	RSVDO: Reserved
19:16	0h RW	Port Multiplier Port (PMP): This field is not used by AHCI.
15:12	0h RW	Select Power Management (SPM): This field is not used by AHCI.
11:8	0h RW	Interface Power Management Transitions Allowed (IPM): Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. 0h No interface restrictions 1h Transitions to the PARTIAL state disabled 2h Transitions to the SLUMBER state disabled 3h Transitions to both PARTIAL and SLUMBER states disabled 4h Transitions to the DEVSLP power management state are disabled 5h Transitions to the Partial and DEVSLP power management states are disabled 6h Transitions to the Slumber and DEVSLP power management states are disabled 7h Transitions to the Partial, Slumber and DEVSLP power management states are disabled All other values reserved
7:4	0h RW	Speed Allowed (SPD): Indicates the highest allowable speed of the interface. 0h No speed negotiation restrictions. 1h Limit speed negotiation to Generation 1 communication rate. 2h Limit speed negotiation to a rate not greater than Generation 2 communication rate. 3h Limit speed negotiation to a rate not greater than Generation 3 communication rate. All other values reserved. Note: If software changes SPD after port has been enabled, software is required to perform a port reset via DET=1h.
3:0	0h RW	Device Detection Initialization (DET): Controls HBA's device detection and interface initialization. 0h No device detection or initialization action requested. 1h Perform interface communication initialization sequence to establish communication. This is functionally equivalent to a hard reset and results in the interface being reset and communications reinitialized. While this field is 1h, COMRESET is continuously transmitted on the interface. Software should leave the DET field set to 1h for a minimum of 1 millisecond to ensure that a COMRESET is sent on the interface. 4h Disable the Serial ATA interface and put Phy in offline mode. All other values reserved. This field may only be changed when PxCMD.ST is '0'. Changing this field while the HBA is running results in undefined behavior. When PxCMD.ST is set to '1', this field should have a value of 0h. It is permissible to implement any of the Serial ATA defined behaviors for transmission of COMRESET when PxSCTL.DET = 1h

17.8.38 Port-Serial ATA Error (PxSERR1)—Offset 1B0h

Access Method

17.8.39 Port-Serial ATA Active (PxSACT1)—Offset 1B4h

Access Method

				cri_dynkalign_eco3302703_mode	cri_dynkalign_eco3302703_ovren	reg_rxpwrfsm_pibiasoff_ovrride	cri_reset_kalignck	cri_ebptrrst
				cri_comdispfix	cri_forcebankhit	cri_kalignmode_1_0	cri_skpprocdis	cri_elasticbuffer_maskdis

Bit Range	Default & Access	Description
31:28	0h RW	reg_rxpwrfsm_pibiasoff_delay_3_0 : Override value for delay (in 2ns increments) between deassertion of opianclkbufen and opibiasen
27:24	0h RW	cri_sqdbexittimer_override_3_0 : Rx squelch exit debounce timer
23:18	0h RW	cri_sqdbentrytimer_override_5_0 : Rx squelch entry debounce timer
17:16	0h RW	reg_rxdrcgtsqsel_1_0 : Squelch output select

Bit Range	Default & Access	Description
15	0h RW	cri_reut_SlaveSideDataCheckingEn : Enable REUT slave side checking while in loopback slave
14	0h RW	cri_sqdbtimer_ovren : Squelch debounce timer override enable
13	0h RW	cri_rxpwrfsm_timer_ovren : Rx power management fsm timer override enable
12	0h RW	reg_rxidle : Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	cri_rxrawdata_sel : When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	cri_dynkalign_eco3302703_mode : Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	cri_dynkalign_eco3302703_ovren : Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	reg_rxpwrfsm_pibiasoff_ovr : When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	cri_reset_kalignlck : When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	cri_ebptrrst : Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	cri_comdispfix : Chicken bit to force disparity in dynamic K-align mode
4	0h RW	cri_forcebankhit : Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	cri_kalignmode_1_0 : KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	cri_skpprocdis : SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	cri_elasticbuffer_maskdis : Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

17.17.4 PCS_DWORD3 (pcs_dword3)—Offset Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword3: [Port: 0xA3] + (2200h + Ch)

Op Codes:
0h - Read, 1h - Write

Default: 5515ACAAh

cri_dfx_patbuf_23_16			cri_dfx_patbuf_31_24			cri_dfx_patbuf_39_32			cri_dfx_patbuf_47_40		

Bit Range	Default & Access	Description
31:24	57h RW	cri_dfx_patbuf_23_16 : Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
23:16	55h RW	cri_dfx_patbuf_31_24 : Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
15:8	55h RW	cri_dfx_patbuf_39_32 : Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

Bit Range	Default & Access	Description
22	0h RW	cri_dfx_marginmode : Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	cri_dfx_chk_sel : Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-)8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	cri_dfx_patchken : Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	cri_dfx_patgenen : Pattern Generator Enable This will activate the Dfx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	cri_dfx_clrerrcnt : Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	cri_dfx_lcereset : Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	cri_dfx_lcestart : Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	cri_dfx_patbuf_7_0 : Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not = '1'.
7:0	63h RW	cri_dfx_patbuf_15_8 : Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.17.7 PCS_DWORD6 (pcs_dword6)—Offset 18h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword6: [Port: 0xA3] + (2200h + 18h)

Op Codes:

0h - Read, 1h - Write

Default: FFFFFFFFh

31	28	24	20	16	12	8	4	0							
1	1	1	1	1	1	1	1	1							
cri_dfx_prbseed_7_0				cri_dfx_prbseed_15_8				cri_dfx_prbseed_23_16				cri_dfx_prbseed_31_24			

Bit Range	Default & Access	Description
31:24	FFh RW	cri_dfx_prbseed_7_0 : PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.

Bit Range	Default & Access	Description
26:24	0h RW	reg_cdr_override_2_0 : Override for cdr_override strap
23	0h RW	reg_ebuffmode : Override for ebuffmode (no functionality in p1271 phase1 design)
22:21	0h RW	reg_usedclockchannel_1_0 : Selects the active clock channel
20	0h RW	reg_usedclockchannel_ovrride : When asserted selects reg_usedclockchannel[1:0]
19	0h RW	reg_gbl_ovrride : Global override select
18	0h RW	reg_tx1_pclkon_inp2 : When asserted keeps PCLK running in P2 mode. For DP this is used for Lane1
17	0h RW	reg_tx2_pclkon_inp2 : When asserted keeps PCLK running in P2 mode. This is reserved (no impact) for PCIe/DMI and used for DP Lane2
16	0h RW	reg_tx2_txenable : Override for i_txenable for tx2
15:12	0h RW	cri_rxeb_ptr_init_3_0 : Config override for initial value of Rx elastic buffer read pointer
11	0h RW	reg_powerfsm_ovrride : When asserted overrides for Tx power fsm are selected
10	0h RW	reg_suspend : Override for suspend
9	0h RW	reg_pclkcfinput : Override for pclkcfinput strap
8	0h RW	reg_useqclock : Override for useqclock; MUX select for I or Q clk for TX clocking
7:4	Ch RW	cri_rxeb_hiwater_3_0 : Elastic buffer high watermark based on which SKP is removed
3:0	4h RW	cri_rxeb_lowater_3_0 : Elastic buffer low watermark based on which SKP is added

17.17.10 PCS_DWORD9 (pcs_dword9)—Offset 24h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword9: [Port: 0xA3] + (2200h + 24h)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h

30:28	0h RW	sqelch_shunt_cnt_2_0 : Squelch Shunt Pulse Duration Override Value 000 = No shunt pulse generated 001 = 1 susclk cycles ... 111 = 7 susclk cycles
27	0h RW	reserved520 : reserved
26	0h RW	i_rxsqfsm_timerselect : Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.

Bit Range	Default & Access	Description
25	0h RW	i_rxsq_asyncmode_h : Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	i_rxsquelchstby_h : Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.
23:18	0h RW	reserved519 : reserved
17:16	0h RW	cri_dfx_evenoddmask_1_0 : Pattern Checker Even/Odd Bit Error Mask Select 00 : no masking; all errors will be counted 01: select odd path, mask even path; only errors on bits [1,3,5,7,9] are counted 10: select even path, mask odd path; only errors on bits [0,2,4,6,8] are counted 11: reserved;
15:12	0h RW	reserved518 : reserved
11:10	0h RW	cri_dfx_lce2patsrc_1_0 : Local Compare Engine 2 Pattern Source In a lane with two Tx paths, this selects between using Pattern Buffer or PRBS as source of LCE patterns for the second LCE. The DFXLCEPATSRC selects for the first LCE. 0 : Pattern Buffer (default) 1 : PRBS
9:8	0h RW	cri_dfx_lcepatsrc_1_0 : Local Compare Engine Pattern Source. Selects between using Pattern Buffer or PRBS as source of LCE patterns. 00 : Pattern Buffer; use LCE default training pattern; 01: Pattern Buffer; use the first 40b of pattern buffer for training. 10: PRBS; use LCE default training pattern; 11: PRBS; use the first 40b of pattern buffer for training.
7:6	0h RW	reserved517 : reserved
5:4	0h RW	txloadgen_ctr_val : TxLoadGen Pulse Width Control Controls the pulse width of txloadgenen from PCS to Tx upar. This is used in MAC initiated digital far end loopback mode in PCIE family. 00 - txloadgenen pulse width is 4 symbol clocks (default) 01- txloadgenen pulse width is 2 symbol clocks 10 - txloadgenen pulse not generated 11 - txloadgenen pulse width is 6 symbol clocks
3	0h RW	cri_txhighpowerei_ovrden : TxHighPowerEI Override Mode Enable 0 - TxHighPowerEI to TxuPAR driven by Logic 1 - TxHighPowerEI to TxuPAR driven by override register value(s).
2	0h RW	cri_tx1highpowerei_ovrdval : Tx1HighPowerEI Override Value Valid when cri_txhighpowerei_ovrden = 1'b1. 0 - Tx1HighPowerEI disabled 1 - Tx1HighPowerEI enabled
1	0h RW	cri_tx2highpowerei_ovrdval : Tx2HighPowerEI Override Value Valid when cri_txhighpowerei_ovrden = 1'b1. 0 - Tx2HighPowerEI disabled 1 - Tx2HighPowerEI enabled
0	1h RW	p2_fast_exit_en : P2 Fast Exit Mode Enable Common Mode sustainer will be enabled during P2 when this bit is asserted. 1: P2 Fast Exit Mode Enable 0: P2 Fast Exit Mode Disable

Bit Range	Default & Access	Description
31:30	0h RW	oirefdxsel_1_0 : IREF Voltage Monitor Select Selects voltage to monitor within the IREF block. 00 - vref 01 - pgate 10 - vbc 11 - vref loop
29	0h RW	iopampsfpn_h : (NOT USED - noconned)
28	0h RW	iopampfn_h : (NOT USED - noconned)
27	0h RW	iopampn_h : DC Monitor Unity-Gain Buffer Enable 0: disable (default) 1: enable
26	0h RW	iopampn_h : (NOT USED - noconned)
25	0h RW	monanapgen : DC Monitor to Monitor Port Enable Enables DC monitor passgate to monitor port via analog observability abutment.
24	1h RW	monubufbypassen : DC Monitor Unity-Gain Buffer Bypass 0: no bypass 1: bypass (default - required for LRC)
23:22	0h RW	reserved522 : reserved
21	0h RW	reg_ivrefen : IvrefEn Override Value Register is valid when override mode is enabled (ivrefen_ovrd). During this mode, this register will have direct control to enable/disable the ivref opamp. 0 - Disable ivref opamp 1 - Enable ivref opamp
20	0h RW	ivrefen_ovrd : IvrefEn Override Select 0 - the enable for the ivref opamp (ivrefen) is driven by the FSM. 1 - the ivrefen is driven by the register (reg_ivrefen).
19:17	0h RW	reserved523 : reserved
16	0h RW	oirefcurmonsel : IREF Current Monitor Select Enables current mirror from the IREF block to the 'shared' analog monitor port.
15	0h RW	lrcdisable : LRC Disable This bit disables the LRC. Any token received is passed to the next lane.
14:12	0h RW	reserved521 : reserved

Bit Range	Default & Access	Description
11	0h RW	lrc_rdy_pulsegen : LRC Ready PulseGen Generates a pulse 1 cal_clk cycle wide on the lrc_rdy signal to all four targets; does not recompute local Rcomp code. Values in DWD 0x14 (*rccodes[7:0]) will be latched into targets. User must clear this bit before generating another pulse. Note: User should disable PM and PER. FSM can take control and codes can be overridden.
10:9	0h RW	lrc_rdy_target_1_0 : LRC Ready Pulse Target Indicates which lrc target to recompute when lrc_rdy_ovd is strobed 00: irefrcode 01: txrcode 10: rxtermrcode 11: rxvgarrcode
8	0h RW	lrc_rdy_ovd : LRC Ready Override Recomputes the selected local rcomp code and generates a pulse 1 cal_clk cycle wide on the lrc_rdy signal that is selected in bits [2:1]. User must clear this bit before generating another pulse. Note: User should disable PM and PER. FSM can take control and codes can be overridden.
7	0h RW	rxtermprcen : PM RCOMP Enable for Rx Termination 1 - Enables the RCOMP update to occur while RX is in power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
6	0h RW	rxvgaprcen : PM RCOMP Enable for Rx VGA (Same description as the RxTerm PM Rcomp Enable.)
5	0h RW	txpmrcen : PM RCOMP Enable for Tx 1 - Enables the RCOMP update to occur while TX is in power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
4	0h RW	irefpmrcen : IREF PM RCOMP Enable 1 - Enables the RCOMP update to occur while TX/RX is in the P1 or P2 (partial or slumber) power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
3	0h RW	rxtermprccen : Periodic RCOMP Enable for Rx Termination 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
2	0h RW	rxvgaperrcen : Periodic RCOMP Enable for Rx VGA 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
1	0h RW	txperrcen : Periodic RCOMP Enable for Tx 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
0	1h RW	irefperrcen : Periodic RCOMP Enable for Iref 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword18: [Port: 0xA3] + (2200h + 48h)

Op Codes:

0h - Read, 1h - Write

Default: 00008080h

Bit Range	Default & Access	Description
31:24	0h RW	iamp0calcode_7_0 : IREF Opamp Calibration Codes These bits are written by the calibration state machine. Bit7 - Calibration enable that configures the target into a calibration mode Bit6 - Calibration sign bit Bit[5:0] - Calibration magnitude [lyonel to check bit7 functionality].
23:20	0h RW	cal_num : Calibration Number or Address numbers of cal targets or address for specific cal target if cal_type = 1
19	0h RW	cal_start : Calibration Start This bit is used to start a Cal cycle via IOSF-SB. The cal cycle will follow the normal cal cycle as set by cal_num, cal_type, cal_inv and cal_rst. The Cal cycle starts when this bit transitions 0 1 1 = Run Cal. 0 = wait (default)
18	0h RW	cal_type : Calibration Type Enable calibration of one cal target defined by cal_num 0 = multi 1 = single
17	0h RW	cal_inv : Calibration Feedback Invert Inverse the logic of counter increment decrement depends on the FB
16	0h RW	cal_rst : Calibration Reset Reset state machine
15:14	1h RW	calclkdivsel_1_0 : Calibration Clock Divider Select 00 - div2 of CRICLK 01 - div4 of CRICLK 10 - div8 of CRICLK 11 - div16 of CRICLK Note: Calibration clock period target is 160nS
13	0h RO	reserved525 : reserved
12	0h RO	calib_done : Calibration Completion Indicator
11:8	Fh RW	cal_fb_count : Calibration Cycle Count Limit per target Each calibration target is clocked for 16 * cal_fb_count clock cycles. Max is 240 clock cycles (default)
7:6	0h RW	adc_acctime_1_0 : ADC Accumulation Time Select This selects the conversion time for the Analog to Digital Converter. ADC clock frequency is set by bits [5:4] in this register. 00: 1024 ADC clocks (default) 01: 512 ADC clocks 10: 256 ADC clocks 11: Infinite (ADC in continuous accumulation) Note: If LRC mode and set to '11', then adctime = 1024cycles.
5:4	1h RW	adc_clksel_1_0 : ADC Clock Frequency Select This selects the input clock frequency to the Analog to Digital Converter. 00: CRI clock div2 01: CRI clock div1 10: CRI clock div4 11: CRI clock div8 NOTE: Target is 50Mhz.
3:1	0h RW	adc muxsel_2_0 : ADC Analog Mux Select This selects the analog voltage input to the Analog to Digital Converter. 000: Vss 001: Vcc 010: LRC R1 voltage divider 011: LRC sense net 100: input from Tx 101: input from Rx (or Tx #2) 110: input from Clock 111: input from reference generator Note: Mux select is controlled by the FSM during LRC.
0	0h RW	adcstart : ADC start This bit resets the ADC counter and starts a new acquisition. This bit should remain 1'b1 while the ADC is active and acquiring data. 0: Disable ADC logic and analog circuitry 1: Enable ADC and start A2D conversion.

Bit Range	Default & Access	Description
31:24	0h RW	reserved528: reserved
23:17	0h RW	reserved527: reserved
16	1h RW	cri_lanereset_clkgatecti: 1: The assertion of lane reset will have the effect of gating the susclk and de-asserting the internal laneclkreq. This mode is only valid when the data lane dynamic clock gating mode is set to a non-zero value (i.e. 01, 10, and 11). 0: The assertion of lane reset will have no effect on the gating of susclk and state of the internal laneclkreq signal.
15	1h RW	cri_lanereqforce: Controls whether the internal laneclkreq will be forced to 1 or 0 when cfg_data_dynclkgate_mode is set to 00 or 10. 1: force laneclkreq high 0: force laneclkreq low. This mode will likely be used when one of the lanes is disabled while other lanes in the family are enabled. In this case the internal laneclkreq of the disabled lane should be de-asserted (not influencing the clk gating decision)
14:10	10h RW	cri_susclkdisable_delay_4_0: This register will control the number of cycles to delay the susclk enable de-assertion, in addition to the de-assertion of the laneclkreq signal sent out of the datalane. The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay
9:8	0h RW	cri_data_dynclkgate_mode_1_0: Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal.
7	0h RW	cri_eios_waittime_ovren: EIOS Wait Time Override Enable for Rx Turn OFF 0: hardware value for EIOS wait timer is selected. 1: selects cri_eios_waittime[6:0]

Bit Range	Default & Access	Description
31:30	0h RW	otxclkbytsel_1_0 : Select if to bypass the divided normal clock with some other clock. 2'b00: Don't bypass. Regular clock. 2'b01: bypass the RX clock - dataratefit must be '11' 2'b10: Reserved 2'b11: bypass the sparetxclk clock - dataratefit must be '11'
29:27	0h RW	ofrcdataratefit_2_0 : Forces TX data rate 3'b0XX - don't force a value. get it from the I/F pin 3'b100 - no divide (2UIs per clock cyc) 3'b101 - divide by 2 3'b110 - divide by 4 3'b111 - divide by 8 - used also for bypassing with other clocks
26	0h RW	odistxfelbpin : when asserted - disables the i_txfelben pin at the interface and force it 0. (needed in case the pin is asserted in KX or sata1 mode)
25	0h RW	otxclkampbypsn : 0': Normal operation '1': Enable of the passgate connected from the analog clock N to the control of the DC correction cell. The feedback OTA is disabled.
24	0h RW	otxclkampbyppsp : 0': Normal operation '1': Enable of the passgate connected from the analog clock P to the control of the DC correction cell. The feedback OTA is disabled.
23	0h RO	reserved539 : reserved
22	0h RW	odfxanamuxen : Enables analog signals probing mux out. When enabled the Vref of Tx-detect-Rx circuit is observed. Note that only one lane is allowed to have the analog mux enabled to avoid collisions.
21:20	0h RW	odfxanamuxsel_1_0 : selects analog signal to be sent to analog port in common lane. This bus has no affect at all currently because there is only one analog signal for observation which is observed by odfxanamuxen
19:18	0h RW	obs_tx_gated_supply_1_0 : Monitor gated vcc supply to Tx upar
17:16	0h RO	reserved538 : reserved
15:12	0h RW	oobsdigselectupn_3_0 : selects data to be sent to observability port output 'o_obsup_nsg'. Same mapping as oobsdigselectdownn[3:0]
11:8	0h RW	oobsdigselectupp_3_0 : selects data to be sent to observability port output 'o_obsup_psg'. Same mapping as oobsdigselectdownp[3:0]
7:4	0h RW	oobsdigselectdownn_3_0 : Reserved.
3:0	0h RW	oobsdigselectdownp_3_0 : Reserved.

17.18.14 TX_DWORD13 (tx_dword13)—Offset 34h

Access Method

Bit Range	Default & Access	Description
31:30	0h RW	ospare1_1_0 : reserved
29	0h RW	osimmode : Counter threshold of receive-detect, NTL, strong-common-mode is shortened dramatically for fast simulation purposes. (does not impose risk to circuitry but electrical spec will not met)
28	0h RW	ontlmodepin2pin : 0 - NTL procedure will be done per pad while both pads are pulled to the same rail. 1 - NTL procedure will be done per pad while the pads are pulled to opposite rails.
27	0h RW	ofrcdatapathdis : DFT feature to optionally be used with other registers
26	0h RW	ofrcdatapathen : DFT feature to optionally be used with other registers
25	0h RW	ofrcdrvbydis : DFT feature to optionally be used with other registers
24	0h RW	ofrcdrvbypen : DFT feature to optionally be used with other registers
23	0h RW	odfttxclkcaptesten : Enables the finger capacitor quality check in the DCC block in Tx-clock block. The test is for shorts between the capacitor terminals.
22	1h RW	otxdccbyps_1 : Tx DCC Bypass Override Puts DCC (duty cycle correction) circuit in bypass mode 0 - clock's duty cycle is not fixed
21:19	0h RW	ofrcnmos32idv_2_0 : change the value iabut_idvpms32_h[1:0] pushes to txclk 3'b0?? - don't affect the idv comp 3'b100 - pull the idv information to be always at slow 3'b101 - pull the idv information a bit slower. 3'b110 - pull the idv information a bit faster. 3'b111 - pull the idv information to be always at fast
18:16	0h RW	ofrcpms32idv_2_0 : change the value iabut_idvpms32_h[1:0] pushes to txclk 3'b0?? - don't affect the idv comp 3'b100 - pull the idv information to be always at slow 3'b101 - pull the idv information a bit slower. 3'b110 - pull the idv information a bit faster. 3'b111 - pull the idv information to be always at fast
15	0h RW	visa_en : VISA Enable for the Tx VISA logic
14:12	0h RW	ovisa1_clksel_2_0 : VISA Clock Select for Lane1. Selects the source synchronous clock to be used for data being sent on lane1.
11:8	0h RW	ovisa1_lanesel_3_0 : VISA Lane Select for Lane1. Selects the byte of data to be sent out on lane1.
7	0h RW	ovisa_bypass : VISA Bypass. Allows for signals to be passed asynchronously through VISA block. Applies to both lane0 and lane1. 0 : Flop signals in local VISA block (default) 1 : Bypass flops in local VISA block
6:4	0h RW	ovisa0_clksel_2_0 : VISA Clock Select for Lane0. Selects the source synchronous clock to be used for data being sent on lane0.
3:0	0h RW	ovisa0_lanesel_3_0 : VISA Lane Select for Lane0. Selects data byte to be driven out of VISA-0 byte. Can be either clocked or unclocked data

17.18.16 TX_DWORD15 (tx_dword15)—Offset 3Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

tx_dword15: [Port: 0xA3] + (2280h + 3Ch)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h

17.19.1 PCS_DWORD0 (pcs_dword0)—Offset 0h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword0: [Port: 0xA3] + (2400h + 0h)

Op Codes:

0h - Read, 1h - Write

Default: 00010080h

Bit Range	Default & Access	Description
21	1h RW	cri_rxdigfiltseq_enable : When 1 enables unsquelch based Rx power up in P0 or P0s
20	0h RW	reg_txfsmdelay_ovrd : Override enable bit for reg_txfsm_4us_delay
19:16	0h RW	reg_txfsm_4us_delay_11_8 : Override counter value for 4 us delay in txfsm lane reset to txbiasen delay
15:14	0h RW	reg_pclk_rate_1_0 : Override for pclk_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
13:12	0h RW	reg_rate_1_0 : Override for i_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
11:9	0h RW	reg_phymode_2_0 : Override for PHY Mode Selection 000 = PCIE 001 = USB3 010 = GbE 011 = SATA/SAPIS 100 = Display 101 = DMI 110 = CIO 111 =Reserved
8	0h RW	reg_modeovren : When asserted selects register override bits for phymode, datawidth etc
7:6	1h RW	reg_datawidth : Override for Tx data interface width. 00 - Unused 01 - x8/x10 width (default) 10 - x16/x20 width 11 - x32/x40 width
5	1h RW	soft_reset_n : Active low soft reset override
4	0h RW	reg_diginelben : Override for near end digital loopback.
3	0h RW	reg_digifelben : Override for far end digital loopback
2	0h RW	reg_strapgroup_ovrden : Override Enable for Strap Group
1	0h RW	reg_yank_timer_done_b_ovrd : Override for yank_timer_done_b
0	0h RW	reg_yank_timer_done_b_ovrd_en : Override Enable for yank_timer_done_b

17.19.3 PCS_DWORD2 (pcs_dword2)—Offset 8h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword2: [Port: 0xA3] + (2400h + 8h)

Op Codes:

0h - Read, 1h - Write

Default: 00000000h

Bit Range	Default & Access	Description
4	0h RW	cri_forcebankhit : Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	cri_kalignmode_1_0 : KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	cri_skpprocdis : SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	cri_elasticbuffer_maskdis : Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

17.19.4 PCS_DWORD3 (pcs_dword3)—Offset Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword3: [Port: 0xA3] + (2400h + Ch)

Op Codes:

0h - Read, 1h - Write

Default: 5515ACAAh

31	28	24	20	16	12	8	4	0							
0	1	0	1	0	1	0	1	0							
0	1	0	1	0	0	0	1	0							
0	1	0	1	0	1	1	0	0							
1	1	0	0	1	0	1	0	1							
0	1	0	1	0	1	0	1	0							
cri_dfx_patbuf_55_48				cri_dfx_patbuf_63_56				cri_dfx_patbuf_71_64				cri_dfx_patbuf_79_72			

Bit Range	Default & Access	Description
31:24	55h RW	cri_dfx_patbuf_55_48 : Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
23:16	15h RW	cri_dfx_patbuf_63_56 : Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
15:8	ACh RW	cri_dfx_patbuf_71_64 : Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
7:0	AAh RW	cri_dfx_patbuf_79_72 : Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

Bit Range	Default & Access	Description
31	0h RW	cri_dfx_patbuftrain: Pattern Buffer Manual Training When DFXPATBUFTRAINOVR and DFXLCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
30:28	0h RW	cri_dfx_prbspoly_2_0: PRBS Polynomial Select the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. PRBS support 10b or 8b, which is indicated by the msb. 000 - $x^{16} + x^5 + x^4 + x^3 + 1$ (USB3/PCIe Scrambler) (8b) 001 - $x^{16} + x^{15} + x^{13} + x^4 + 1$ (SATA scrambler) (8b) 010 - $x^{31} + x^{28} + 1$ (8b) 011 - $x^7 + x^6 + 1$ (8b) 100 - $x^{15} + x^{14} + 1$ (10b) 101 - $x^{23} + x^{18} + 1$ (10b) 110 - $x^{31} + x^{28} + 1$ (10b) 111 - $x^7 + x^6 + 1$ (10b)
27:26	0h RW	cri_dfx_patbufsize_1_0: Pattern Buffer Size Select the size of the Pattern Buffer to use. The MSB will always be bit 79. The LSB will depend on this select and the DFXLCEDATAWIDTH (10b or 8b mode). 00 : full 80b buffer (Default) 01 : 70b (while in 10b mode), 56b (while in 8b mode) 10 : 40b (while in 10b mode), 32b (while in 8b mode) 11 : 10b (while in 10b mode), 8b (while in 8b mode)
25	0h RW	cri_dfx_patbufloop: Pattern Buffer Looping Enable Enables looping of the Pattern Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
24	0h RW	cri_dfx_patbufdwidth: Pattern Buffer Data Width Selects between 10 bit or 8 bit data width for the Pattern Buffer. Determines where in the Tx/Rx path the data is inserted/retrieved. 0 : 10b (default) 1 : 8b
23	0h RW	cri_dfx_patbuftrainovr: Pattern Buffer Training Override Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Pattern Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training
22	0h RW	cri_dfx_marginmode: Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	cri_dfx_chk_sel: Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	cri_dfx_patchken: Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	cri_dfx_patgenen: Pattern Generator Enable This will activate the Dfx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	cri_dfx_clrerrcnt: Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	cri_dfx_lcereset: Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	cri_dfx_lcestart: Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	cri_dfx_patbuf_7_0: Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not = '1'.
7:0	63h RW	cri_dfx_patbuf_15_8: Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.19.7 PCS_DWORD6 (pcs_dword6)—Offset 18h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword6: [Port: 0xA3] + (2400h + 18h)

Op Codes:

0h - Read, 1h - Write

Default: FFFFFFFFh

31	28	24	20	16	12	8	4	0							
1	1	1	1	1	1	1	1	1							
cri_dfx_prbseed_7_0				cri_dfx_prbseed_15_8				cri_dfx_prbseed_23_16				cri_dfx_prbseed_31_24			

Bit Range	Default & Access	Description
31:24	FFh RW	cri_dfx_prbseed_7_0: PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.
23:16	FFh RW	cri_dfx_prbseed_15_8: PRBS Seed See cri_dfx_prbseed[7:0] description.
15:8	FFh RW	cri_dfx_prbseed_23_16: PRBS Seed See cri_dfx_prbseed[7:0] description.
7:0	FFh RW	cri_dfx_prbseed_31_24: PRBS Seed See cri_dfx_prbseed[7:0] description.

17.19.8 PCS_DWORD7 (pcs_dword7)—Offset 1Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword7: [Port: 0xA3] + (2400h + 1Ch)

Op Codes:

0h - Read, 1h - Write

Default: 00000009h

31	28	24	20	16	12	8	4	0																																															
0	0	0	0	0	0	0	0	1																																															
dfx_cri_errcnt_7_0				dfx_cri_errcnt_15_8				i_rxcaldone				dfx_cri_licmgerr				cri_dfx_patgen2active				dfx_cri_patbufallfail				dfx_cri_patchkactive				dfx_cri_patgenactive				dfx_cri_licetraindone				dfx_cri_licetrainactive				reserved501				cri_dfx_patgen2en				cri_dfx_maxerrcnt_1_0				cri_dfx_prbstraintcnt_3_0			

Bit Range	Default & Access	Description
31:24	X RO	dfx_cri_errcnt_7_0 : Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERASET.
23:16	X RO	dfx_cri_errcnt_15_8 : Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERASET.
15	X RO	i_rxcaldone : RX Calibration Cycles Complete Indicator
14	X RO	dfx_cri_lcemgnerr : Local Compare Engine Margin Error Indicates that the error counter has reached its max value. This can be used by the Rx uppartition during Margin Mode to determine when the eye width has closed.
13	X RO	cri_dfx_patgen2active : Pattern Generator 2 Active status indicator In a lane with two Tx paths, this indicates that the second Pattern Generator is in progress. The DFXPATGENACTIVE will only indicate that the first Pattern Generator is in progress.
12	X RO	dfx_cri_patbufallfail : Pattern Buffer All Fail status indicator Indicates that there has not been a single matching Pattern Buffer pattern. This could signify that an error occurred during training.
11	X RO	dfx_cri_patchkactive : Pattern Checker Active status indicator Indicates that the Pattern Checker is in progress (either Pattern Buffer or PRBS).
10	X RO	dfx_cri_patgenactive : Pattern Generator Active status indicator Indicates that the Pattern Generator is in progress (either Pattern Buffer or PRBS).
9	X RO	dfx_cri_lcetraindone : Local Compare Engine Training Done status indicator Indicates that the Pattern Checker training is completed (either Pattern Buffer or PRBS). The Pattern Checker is now synchronized to the Pattern Generator.
8	X RO	dfx_cri_lcetrainactive : Local Compare Engine Training Active status indicator Indicates that the Pattern Checker training is in progress (either Pattern Buffer or PRBS).
7	0h RW	reserved501 : reserved
6	0h RW	cri_dfx_patgen2en : Pattern Generator 2 Enable In a lane with two Tx paths, this enables the second Pattern Generator. The DFXPATGENEN will enable the first Pattern Generator. 0 : Disable second Pattern Generator (default) 1 : Enable second Pattern Generator
5:4	0h RW	cri_dfx_maxerrcnt_1_0 : Maximum Error Count Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. 00 : 2^{16} (default) 01 : 2^{10} 10 : 2^8 11 : 2^4
3:0	9h RW	cri_dfx_prbstraincnt_3_0 : PRBS Training Count The number of consecutive cycles that the Pattern Checker's PRBS must be error free before it is considered synchronized. Default is 9.

17.19.9 PCS_DWORD8 (pcs_dword8)—Offset 20h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword8: [Port: 0xA3] + (2400h + 20h)

Op Codes:

0h - Read, 1h - Write

Default: 000000C4h

31	28	24	20	16	12	8	4	0									
0	0	0	0	0	0	0	1	0									
0	0	0	0	0	0	0	1	0									
0	0	0	0	0	0	0	0	0									
0	0	0	0	0	0	0	0	0									
reg_partial	reg_slumber	reg_tx2_cdr_override_2_0	reg_cdr_override_2_0	reg_ebuffmode	reg_usedclockchannel_1_0	reg_usedclockchannel_ovrride	reg_gbl_ovrride	reg_tx1_pclkon_inp2	reg_tx2_pclkon_inp2	reg_tx2_txenable	cri_rxeb_ptr_init_3_0	reg_powerfsm_ovrride	reg_suspend	reg_pclkcfginput	reg_useqclock	cri_rxeb_hiwater_3_0	cri_rxeb_lowwater_3_0

Bit Range	Default & Access	Description
31	0h RW	reg_partial : Override for i_partial
30	0h RW	reg_slumber : Override for i_slumber
29:27	0h RW	reg_tx2_cdr_override_2_0 : Override for cdr_override strap for second tx2
26:24	0h RW	reg_cdr_override_2_0 : Override for cdr_override strap
23	0h RW	reg_ebuffmode : Override for ebuffmode (no functionality in p1271 phase1 design)
22:21	0h RW	reg_usedclockchannel_1_0 : Selects the active clock channel
20	0h RW	reg_usedclockchannel_ovrride : When asserted selects reg_usedclockchannel[1:0]
19	0h RW	reg_gbl_ovrride : Global override select
18	0h RW	reg_tx1_pclkon_inp2 : When asserted keeps PCLK running in P2 mode. For DP this is used for Lane1
17	0h RW	reg_tx2_pclkon_inp2 : When asserted keeps PCLK running in P2 mode. This is reserved (no impact) for PCIe/DMI and used for DP Lane2
16	0h RW	reg_tx2_txenable : Override for i_txenable for tx2
15:12	0h RW	cri_rxeb_ptr_init_3_0 : Config override for initial value of Rx elastic buffer read pointer
11	0h RW	reg_powerfsm_ovrride : When asserted overrides for Tx power fsm are selected
10	0h RW	reg_suspend : Override for suspend
9	0h RW	reg_pclkcfginput : Override for pclkcfginput strap
8	0h RW	reg_useqclock : Override for useqclock; MUX select for I or Q clk for TX clocking
7:4	Ch RW	cri_rxeb_hiwater_3_0 : Elastic buffer high watermark based on which SKP is removed

Bit Range	Default & Access	Description
31:28	0h RW	reg_rxpwrfsm_timer_WAIT_RX_PI_CLK_3_0 : Rx Power state m/c timer value used to enable PI clock
27:24	0h RW	reg_rxpwrfsm_timer_ENABLE_RX_3_0 : Rx Power state m/c timer value used to enable receivers
23:20	0h RW	reg_rxpwrfsm_timer_RX_SQEN_3_0 : Rx Power FSM Rx Squelch Enable Timer Override Value Affect squelch enable startup sequence during 'synchronous' squelch startup mode. 0000 - Invalid 0001 - 1 susclk period ... 1111 - 15 susclk period
19:16	0h RW	reg_rxpwrfsm_timer_WAIT_RX_PIBIAS_3_0 : Rx Power state m/c timer value used to enable PI BIAS
15:8	0h RW	reg_clk_valid_cnt_7_0 : Over ride value for clock valid delay in clock top block before toggling phystatus.
7	0h RW	reg_rxterm : Override for i_rxterm
6	0h RW	reg_rxpolarity : Override for i_rxpolarity
5	0h RW	reg_rxeqtrain : Override for i_rxeqtrain
4	0h RW	reg_rxsquelchen : Override for i_rxsquelchen
3	0h RW	cri_rxpwrfsm_sqentimer_ovrden : Squelch Enable Timer Override Enable Used to override the squelch enable timer in PCS with the timer value set by the Rx Squelch Enable timer register (reg_rxpwrfsm_timer_RX_SQEN[3:0]).
2	0h RW	reg_rxintfltren_override : Rx Integral Filter Override Select 0: selects i_rxintfltren_l input pin. 1: selects reg_rxintfltren_l register
1	0h RW	reg_rxintfltren_l : Override for Rx integral filter enable i_rxintfltren_l
0	0h RW	reg_clk_valid_cnt_ovrd : Override enable for reg_clk_valid_cnt

17.19.12 PCS_DWORD11 (pcs_dword11)—Offset 2Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword11: [Port: 0xA3] + (2400h + 2Ch)

Op Codes:

0h - Read, 1h - Write

Default: 0F000000h

Bit Range	Default & Access	Description
29	0h RW	reg_slowclk_ovrden : Slow Clock Override Enable When set 1'b1, reg_slowclocken and reg_sclk250en are valid. When cleared 1'b0, output of FSM will drive slow clock enable.
28:24	0h RW	reg_txloadgenen2txen_fall_delay_4_0 : reserved
23:20	7h RW	o_cmlmuxsthse1_3_0 : CML Mux strength control
19:16	Ah RW	o_cmlsthse1_3_0 : RX CML driver strength
15:12	0h RW	o_pcise1_3_0 : I clk phase correction control
11:8	0h RW	o_pcqse1_3_0 : Q clk phase correction control
7	0h RW	o_phaseicen : Iclk phase correction enable.
6	0h RW	o_phaseqcen : Qclk phase correction enabled.
5	0h RW	o_pcbypass : Phase correction bypass.
4	1h RW	o_slowclocken : Slow clock 1 enable Only valid if slow clock override enable is set 1'b1
3	1h RW	o_sclk250en : Slow clock 2 enable Only valid if slow clock override enable is set 1'b1
2:0	0h RW	cri_kalign_com_cnt : Upper 3 bits of a 7-bit counter that counts number of COM characters found. Used for special SAPIS mode where spread spectrum clocking can be utilized. Note: This register is used in conjunction with another PCS register cri_kalignmode[1:0] = 10 Register value Minimum COM count to achieve symbol lock 000 - 18 001 - 34 010 - 50 011 - 66 100 - 82 101 - 98 110 - 114 111 - 130

Bit Range	Default & Access	Description
31	0h RW	sqelch_shunt_ovrd_en: Squelch Shunt Pulse Duration Override Enable Overrides the hardware default shunt pulse duration value 1: Shunt Pulse Duration Override Enable 0: Shunt Pulse Duration Override Disable
30:28	0h RW	sqelch_shunt_cnt_2_0: Squelch Shunt Pulse Duration Override Value 000 = No shunt pulse generated 001 = 1 susclk cycles ... 111 = 7 susclk cycles
27	0h RW	reserved520: reserved
26	0h RW	i_rxsqfsm_timersel: Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.
25	0h RW	i_rxsq_asyncmode_h: Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	i_rxsquelchstby_h: Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

Bit Range	Default & Access	Description
23:18	0h RW	reserved519 : reserved
17:16	0h RW	cri_dfx_evenoddmask_1_0 : Pattern Checker Even/Odd Bit Error Mask Select 00 : no masking; all errors will be counted 01: select odd path, mask even path; only errors on bits [1,3,5,7,9] are counted 10: select even path, mask odd path; only errors on bits [0,2,4,6,8] are counted 11: reserved;

Bit Range	Default & Access	Description
16	1h RW	cri_lanereset_clkgatectl : 1: The assertion of lane reset will have the effect of gating the susclk and de-asserting the internal laneclkreq. This mode is only valid when the data lane dynamic clock gating mode is set to a non-zero value (i.e. 01, 10, and 11). 0: The assertion of lane reset will have no effect on the gating of susclk and state of the internal laneclkreq signal.
15	1h RW	cri_lanereqforce : Controls whether the internal laneclkreq will be forced to 1 or 0 when <code>cfg_data_dynclkgate_mode</code> is set to 00 or 10. 1: force laneclkreq high 0: force laneclkreq low. This mode will likely be used when one of the lanes is disabled while other lanes in the family are enabled. In this case the internal laneclkreq of the disabled lane should be de-asserted (not influencing the clk gating decision)
14:10	10h RW	cri_susclkdisable_delay_4_0 : This register will control the number of cycles to delay the susclk enable de-assertion, in addition to the de-assertion of the laneclkreq signal sent out of the datalane. The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay
9:8	0h RW	cri_data_dynclkgate_mode_1_0 : Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal.

opisorate8b_h	obeacondivratio	ouniqetrangenmethod_1_0	oscaledcompmethod_1_0	odeemswinggenmethod	odownscaleampmethod	omargin101_7_0	omargin100_7_0	omargin011_7_0

Bit Range	Default & Access	Description
31	0h RW	opisorate8b_h: if '0' the PISO is of 10 bits (the whole bus) if '1' the PISO is of 8 bits (The LSBs) It's relevant both in normal Tx and in loopback mode. Use: '1' in PCI-E gen 3 and CIO (if supported) '0' for all other interfaces
30	0h RW	obeacondivratio: Div ration of beacon signal from ick_suslow clock '0' - Beacon freq will be as sus clock freq '1' - Beacon freq will be 1/4 of sus clock freq (note LFPS spec is 10-50MHz)
29:28	0h RW	ouniqetrangenmethod_1_0: Used to define if we use uniq-transition-bit scaling or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't activate uniq-transition-bit When '01' - if fast-clock is not divided (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. When '10' - if fast-clock is not divided or divided by 2 (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. (will probably be down-scaling amount of slices) When '11' - activate uniq-transition-bit
27:26	3h RW	oscaledcompmethod_1_0: Used to define if we use scaling of the compensation values or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't used scaled comp When '01' - if fast-clock is not divided (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp When '10' - if fast-clock is not divided or divided by 2 (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp (will probably be down-scaling amount of slices) When '11' - if fast-clock is not divided (gen2?) use scaled-comp otherwise (gen1?) don't use scaled-comp (will probably be up-scaling amount of slices)
25	0h RW	odeemswinggenmethod: Used to select scaling of -3.5dB deemphasis either ow2tapgen1deemph3p5[7:0] or ow2tapgen2deemph3p5[7:0] When '0' - if fast-clock is not divided use gen2 otherwise use gen1 When '1' - if fast-clock is not divided or divided by 2 use gen2 otherwise use gen1
24	0h RW	odownscaleampmethod: when margin='001', this bit with dataratefit are used to select between margin000 (for gen2) and margin101 (for gen1) when '0' - if fast-clock is not divided use margin000 (gen2) otherwise use margin101 (gen1) when '1' - if fast-clock is not divided or divided by 2 use margin000 (gen2) otherwise use margin101 (gen1)
23:16	78h RW	omargin101_7_0: factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p to be used in Gen1 mode (Gen1/Gen2 depends on dataratefit and downscaleamp register)
15:8	20h RW	omargin100_7_0: factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/4Vp2p
7:0	40h RW	omargin011_7_0: factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/2Vp2p

18 USB Host Controller Interfaces (xHCI, EHCI)

The USB Host Controllers (xHCI, EHCI) supports:

- One (1) Super Speed (SS) port on xHCI
- Four (4) Low Speed (LS)/Full Speed (FS)/High Speed (HS) ports on xHCI or EHCI
- Two (2) High Speed (HS) High Speed Inter-Chip (HSIC) ports on xHCI

Note: The SS port must share a LS/FS/HS port to have a full SS connector leaving three LS/FS/HS ports available.

Note: Only one host controller (either xHCI or EHCI) can be used. To enable HSIC and SS ports, xHCI must be used.

18.1 Signal Descriptions

See [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 207. USB 3 SS Signals

Signal Name	Direction Plat Power	Description
USB3_TXP/N[0]	O V1P0A	Data Out: High speed serialized data outputs. Used for debug mode in xHCI operation.
USB3_RXP/N[0]	I V1P0A	Data In: High speed serialized data inputs. Used for debug mode in xHCI operation.
USB3_REXT[0]	I	Resistor Compensation: An external resistor must be connected between this pin and package ground. Contact your Intel representative for details.

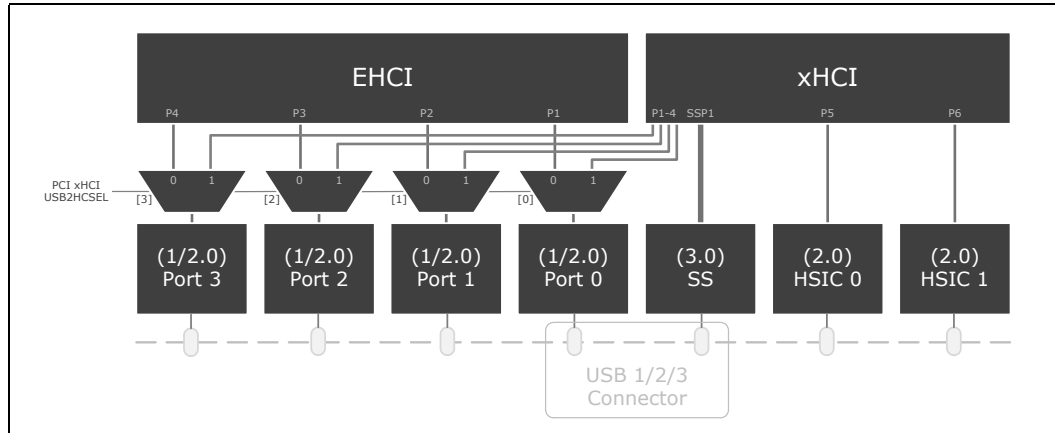

Table 208. USB 2 FS/HS Signals

Signal Name	Direction Plat. Power	Description
USB_DP/N[0:3]	I/O VUSB2	USB Data: High speed serialized data I/O. Note: USB_DP/N[1] used for debug mode in EHCI operation only. SS port must be implemented to have debug mode during xHCI operation.
USB_OC[0:1]#	I V1P8A	Over-Current Protection: Over-current notification for all USB ports (SS/FS/HS/LS).
USB_RCOMPI	I	Resistor Compensation: An external resistor must be connected. Contact your Intel representative for details.
USB_RCOMPO	O	Resistor Compensation: An external resistor must be connected. Contact your Intel representative for details.

Table 209. USB 2 HSIC Signals

Signal Name	Direction Plat. Power	Description
USB_HSIC[0:1]_DATA	I/O V1P24A	HSIC Data: High speed serialized data.
USB_HSIC[0:1]_STROBE	I/O V1P24A	HSIC Strobe: Strobe reference for data.
USB_HSIC_RCOMP	I	Resistor Compensation: An external resistor must be connected. Contact your Intel representative for details.

Figure 105.xHCI and EHCI Port Mapping

Note: xHCI (3.0) SS is the debug port for xHCI controller.
Note: EHCI (1/2.0) Port 1 is the debug port of the EHCI controller

18.2 USB 3.0 xHCI (Extensible Host Controller Interface)

The xHCI compliant host controller can control up to 7 USB host ports. It supports devices conforming to USB 1.x to 3.0 at bit rates up to 5 Gbps.

18.2.1 Features of USB 3.0 Host

The USB 3.0 Super Speed data interface is a four wire differential (TX and RX pairs) interface that supports simultaneous bi-directional data transmission. The interface supports a bit rate of 5 Gbps with a maximum theoretical data throughput over 3.2 Gbps due to 8b/10b symbol encoding scheme and protocol overhead (link flow control, packet framing and protocol overhead).

Low Frequency Periodic signaling (LFPS) is used to communicate initialization, training and power management information across a link that is in low power link state without using Super Speed signaling. This reduces power consumption.

The USB3.0 port may be paired with any USB2 port at the connector – selection of any USB2 port other than port 0 will require the appropriate mapping. [Figure 105](#) shows the USB3 port paired with USB2 port 0.

USB3.0 Controller Features

- Supported by xHCI software host controller interface
- USB3 port disable
- Supports local dynamic clock gating and trunk clock gating
- Supports USB 3.0 LPM (U0, U1, U2, and U3) and also a SS Disabled low power state

- Support for USB3 Debug Device

Note: Recommended not to disconnect the connection when a debug session is in progress.

18.2.2 Features of USB HSIC

HSIC is a 2-signal (strobe and data) source synchronous serial interface for on board inter-chip USB communication. The interface uses 240 MHz DDR signaling to provide High-Speed 480 Mb/s USB transfers which are 100% host driver compatible with traditional USB cable connected topologies. Full Speed (FS) and Low Speed (LS) USB transfers are not directly supported by the HSIC interface.

For details of HSIC applications supported, Contact local Intel Sales office.

Major feature and performance highlights are as follows:

- Supported by xHCI software host controller interface
- High-Speed 480 Mb/s data rate only
- Source-synchronous serial interface
- Interface Power is only consumed when a transfer is in progress
- No hot plug removal/attach at HSIC pins
- Signals driven at 1.2V standard LVCMOS levels
- Designed for low power applications
- Support for two host ports compliant to High Speed Inter-Chip Supplement (HSIC) to the USB 2.0 Specification. (USB 2.0)

18.3 USB 2.0 Enhanced Host Controller Interface (EHCI)

The EHCI compliant host controller supports up to 4 USB 2.0 ports in legacy mode. USB 2.0 allows data transfers up to 480 Mbps. The controller integrates a Root Matching Hub (RMH) to support USB 1.1 devices.

Note: The EHCI is not used when the xHCI is used. The EHCI is primarily present for legacy usage, in cases when xHCI support is not available.

Note: Intel recommends using the xHCI controller for the USB2.0 ports irrespective of whether USB3.0 ports are implemented. The EHCI controller is provided for legacy OS/driver compatibility which is generally not required for tablet platforms. Using the xHCI controller will deliver significant power and performance benefits.

When following this recommendation on a platform with no USB3.0 support, the Windows logo requirement of USB debug port may not be met. Please consult with Intel regarding the impact of this.

Note: Unlike the xHCI, bandwidth of all four ports on the EHCI is shared across a single HS (480 Mbps) internal link.

18.3.1 Features of EHCI USB 2.0 Controller

The EHCI USB2.0 Controller supports the following features:

- Compliant with the specification for: USB 1.x, 2.0 (1.5 Mbps, 12 Mbps, 480 Mbps).
- 4 Ports shared with xHCI controller
- Enhanced EHCI descriptor caching
- All ports provided through USB Rate Matching Hubs (RMH) to support FS/LS devices
- Supports one Debug port at USB2 transfer rates
- Supports of USB suspend mode including PLL turn off in S0.
- Supports wakeup from suspend states S5 and remote-suspend wakeup
- All USB2 ports provide support for HS/FS/LS devices
- Per port USB disable
- Supports local dynamic clock gating and trunk clock gating
- Supports USB 2.0 LPM (L0, L1 and L2 low power states)

0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
RSVD	ID	FBE	SERR	WCC
				PER
				VPS
				MWI
				SCE
				BME
				MSE
				IOSE

Bit Range	Default & Access	Field Name (ID): Description
15:11	00h RO	Reserved (RSVD): Reserved. Power Well: Core
10	0b RW	Interrupt Disable (ID): When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable. Power Well: Core
9	0b RO	Fast Back to Back Enable (FBE): Reserved. Power Well: Core
8	0b RW	SERR# Enable (SERR): When set to 1, the XHC is capable of generating (internally) SERR#. See section on error handling. Power Well: Core
7	0b RO	Wait Cycle Control (WCC): Reserved. Power Well: Core

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	Parity Error Response (PER) : When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#. Power Well : Core
5	0b RO	VGA Palette Snoop (VPS) : Reserved. Power Well : Core
4	0b RO	Memory Write Invalidate (MWI) : Reserved. Power Well : Core
3	0b RO	Special Cycle Enable (SCE) : Reserved. Power Well : Core
2	0b RW	Bus Master Enable (BME) : When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus. Power Well : Core
1	0b RW	Memory Space Enable (MSE) : This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set. Power Well : Core
0	0b RO	I/O Space Enable (IOSE) : Reserved as 0. Read-Only. Power Well : Core

18.6.4 Device Status (STS)—Offset 6h

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:20, F:0] + 6h

Default: 0290h

15	12	8	4	0
0	0	0	0	0

				DEVT
				MDPED
				FBBC
				UDF
				MC
				CL
				IS
				RSVD

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW/1C	Detected Parity Error (DPE) : This bit is set by the Intel PCH whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location. Power Well : Core

Bit Range	Default & Access	Field Name (ID): Description
14	0b RW/1C	Signaled System Error (SSE): This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. See error handling section for complete list of conditions handled. Software clears this bit by writing a 1 to this bit location. Power Well: Core
13	0b RW/1C	Received Master-Abort Status (RMA): This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location. Power Well: Core
12	0b RW/1C	Received Target Abort Status (RTA): This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location. Power Well: Core
11	0b RW/1C	Signaled Target-Abort Status (STA): This bit is used to indicate when the XHC function responds to a cycle with a target abort. Power Well: Core
10:9	01b RO	DEVSEL# Timing Status (DEVT): This 2-bit field defines the timing for DEVSEL# assertion. Read-Only. Power Well: Core
8	0b RW/1C	Master Data Parity Error Detected (MDPED): This bit is set by the Intel PCH whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location. Power Well: Core
7	1b RO	Fast Back-to-Back Capable (FBBC): Reserved as 1 Read-Only. Power Well: Core
6	0b RO	User Definable Features (UDF): Reserved as 0. Read-Only. Power Well: Core
5	0b RO	66 MHz Capable (MC): Reserved as 0. Read-Only. Power Well: Core
4	1b RO	Capabilities List (CL): Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer. Power Well: Core
3	0b RO/V	Interrupt Status (IS): This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit. Power Well: Core
2:0	000b RO	Reserved (RSVD): Reserved. Power Well: Core

18.6.5 Revision ID (RID)—Offset 8h

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + 8h

Default: 00h

7	4	0
0	0	0
RID		

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	Revision ID (RID): See Chap 6 for value. Power Well: Core

18.6.6 Programming Interface (PI)—Offset 9h

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + 9h

Default: 30h

7	4	0
0	1	0
PI		

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	Programming Interface (PI): A value of 30h indicates that this USB Host Controller conforms to the XHCI specification. Power Well: Core

18.6.7 Sub Class Code (SCC)—Offset Ah

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + Ah

Default: 03h

7	4	0
0	0	1
SCC		

Bit Range	Default & Access	Field Name (ID): Description
7:0	03h RO	Sub Class Code (SCC): A value of 03h indicates that this is a Universal Serial Bus Host Controller. Power Well: Core

18.6.8 Base Class Code (BCC)—Offset Bh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + Bh

Default: 0Ch

7				4				0
0	0	0	0	0	1	1	0	0
				BCC				

Bit Range	Default & Access	Field Name (ID): Description
7:0	0Ch RO	Base Class Code (BCC): A value of 0Ch indicates that this is a Serial Bus controller. Power Well: Core

18.6.9 Master Latency Timer (MLT)—Offset Dh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + Dh

Default: 00h

7				4				0
0	0	0	0	0	0	0	0	0
				MLT				

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	Master Latency Timer (MLT): Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0. Power Well: Core

18.6.10 Header Type (HT)—Offset Eh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + Eh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
0	0b RO	Resource Type Indicator (RTE): This bit is hardwired to 0 indicating that the base address field in this register maps to memory space Power Well: Core

18.6.12 USB Subsystem Vendor ID (SSVID)—Offset 2Ch

This register is modified and maintained by BIOS

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:20, F:0] + 2Ch

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
SSVID				

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/L	USB Subsystem Vendor ID (SSVID): This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others. NOT for EDS:Writes to this register are controlled by the Access Control bit (ACCTRL). Power Well: Core

18.6.13 USB Subsystem ID (SSID)—Offset 2Eh

This register is modified and maintained by BIOS

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:20, F:0] + 2Eh

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
SSID				

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/L	USB Subsystem ID (SSID): BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). NOT for EDS: Writes to this register are controlled by the Access Control bit (ACCTRL). Power Well: Core

18.6.14 Capabilities Pointer (CAP_PTR)—Offset 34h

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + 34h

Default: 70h

7	4	0
0	1	0
CAP_PTR		

Bit Range	Default & Access	Field Name (ID): Description
7:0	70h RO	Capabilities Pointer (CAP_PTR): This register points to the starting offset of the capabilities ranges. Power Well: Core

18.6.15 Interrupt Line (ILINE)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + 3Ch

Default: 00h

7	4	0
0	0	0
ILINE		

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	Interrupt Line (ILINE): This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. Power Well: Core

18.6.16 Interrupt Pin (IPIN)—Offset 3Dh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + 3Dh

Default: 00h

7	4	0
0	0	0
IPIN		

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	Interrupt pin (IPIN): Bits 3:0 reflect the value programmed in the interrupt pin registers in chipset configuration space. Bits 7:4 are hardwired to 0000b. See Chap 6 for value. Power Well: Core

18.6.17 XHC System Bus Configuration 1 (XHCC1)—Offset 40h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:20, F:0] + 40h

Default: 000000FDh

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW/O	Access Control (ACCTRL): This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset. Power Well: Core
30:25	00h RW	ECO1: ECO bits are used during silicon bringup for FIBing. NOT for EDS Power Well: Core
24	0b RW	Master/Target Abort SERR (RMTASERR): When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit. Power Well: Core
23	0b RW/C	Unsupported Request Detected (URD): Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'. Power Well: Core
22	0b RW	Unsupported Request Report Enable (URRE): When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit. Power Well: Core
21:19	000b RW	Inactivity Initiated L1 Enable (IIL1E): If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk Power Well: Core

Bit Range	Default & Access	Field Name (ID): Description
18	0b RW	XHC Initiated L1 Enable (XHCIL1E) : If set, allow the XHC initiated L1 power mangement to be enabled. Power Well : Core
17	0b RW	D3 Initiated L1 Enable (D3IL1E) : If set, allow PCI device state D3 initiated L1 power managment to be enables. This bit can only be set if the XHCI L1 Override P2 chicken bit is set. Power Well : Core
16:12	00h RW	Periodic Complete Pre Wake Time (PCPWT) : signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represnets the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less Power Well : Core
11	0h RW	SW Assisted xHC Idle (SWAXHCI) : This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state. Power Well : Core
10:8	000b RW	L23 to Host Reset Acknowledge Wait Count (L23HRAWC) : If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk Power Well : Core

(Size: 8 bits)

Offset: [B:0, D:20, F:0] + 60h

Default: 30h

7				4					0
0	0	1	1	0	0	0	0	0	0
				SBRN					

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	Serial Bus Release Number (SBRN) : A value of 30h indicates that this controller follows USB release 3.0. Power Well: SUS

18.6.22 Frame Length Adjustment (FLADJ)—Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + 61h

Default: 20h

7:4	0h RW/L	Default Best Effort Service Latency Deep (DBESLD): Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters. Power Well: Core
3:0	0h RW/L	Default Best Effort Service Latency (DBESL): If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters. Power Well: Core

18.6.24 PCI Power Management Capability ID (PM_CID)—Offset 70h

Access Method

Type: PCI Configuration Register
(Size: 8 bits) **Offset:** [B:0, D:20, F:0] + 70h

Default: 01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	01h RO	PCI Power Management Capability ID (PM_CID): A value of 01h indicates that this is a PCI Power Management capabilities field. Power Well: Core

18.6.25 Next Item Pointer #1 (PM_NEXT)—Offset 71h

This register is modified and maintained by BIOS

Access Method

Type: PCI Configuration Register
(Size: 8 bits) **Offset:** [B:0, D:20, F:0] + 71h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	Next Item Pointer #1 (PM_NEXT): This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed. Power Well: Core

18.6.26 Power Management Capabilities (PM_CAP)—Offset 72h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the Intel PCH is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

Access Method

15	12	8	4	0
0	0 0 0	0 0 0	0 0 0 0	1 0 0 0
PME_Status	Data_Scale	Data_Select	PME_En	RSVD
				NSR
				RSVD2
				PowerState

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW/1C	PME_Status: This bit is set when the Intel PCH XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded. Power Well: SUS
14:13	00b RO	Data_Scale: The Intel PCH hardwires these bits to 00 because it does not support the associated Data register. Power Well: Core
12:9	0h RO	Data_Select: The Intel PCH hardwires these bits to 0000 because it does not support the associated Data register. Power Well: Core
8	0b RW	PME_En: A 1 enables the Intel PCH XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded. Power Well: SUS
7:4	0h RO	Reserved (RSVD): Reserved. Power Well: Core
3	1b RO	No Soft Reset (NSR): , this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled. Power Well: Core
2	0b RO	Reserved (RSVD2): Reserved. Power Well: Core
1:0	00b RW	PowerState: This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the Intel PCH must not accept accesses to the XHC memory range, but the configuration space must still be accessible. Power Well: Core

18.6.28 Message Signaled Interrupt CID (MSI_CID)—Offset 80h

15:0	0000h RW	Data: This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data. Power Well: Core

18.6.34 High Speed Configuration 1 (HSCFG1)—Offset A0h

Not for EDS

Access Method

Type: PCI Configuration Register
(Size: 32 bits) **Offset:** [B:0, D:20, F:0] + A0h

Default: 00000100h

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RW	Loop Number (UTMILPBKLOOPN_3_0): Number of repeatable fixed pattern within a packet Note: Connect register bit 3 to counter bit 7, register bit 2 to counter bit 5, register bit 1 to counter bit 3, register bit 0 to counter bit 1. Counter bits 6, 4, 2 and 0 will be tied off to 0. Hence, the programmable loop number shall be: 0000b: 0 loop 0001b: 2 loops 0010b: 4 loops 0011b: 6 loops 0100b: 8 loops 0101b: 10 loops 0110b: 12 loops 0111b: 14 loops 1000b: 16 loops 1001b: 18 loops 1010b: 20 loops 1011b: 22 loops 1100b: 24 loops 1101b: 26 loops 1110b: 28 loops 1111b: 30 loops (max) Power Well: Core
7:6	0h RW	Operational Mode (UTMIOPMODE_1_0): Operational Mode in test mode. These signals select between various operational modes: 00b: Normal Operation 01b: Non-Driving 10b: Disable Bit Stuffing and NRZI encoding 11b: Reserved Power Well: Core
5	0h RW	Termination Select (UTMITERMSEL): Termination Select in test mode. This signal selects between the FS and HS terminations: 0b: HS termination enabled 1b: FS termination enabled Power Well: Core
4:3	0h RW	Transceiver Select (UTMIXCVRSELECT_1_0): Transceiver Select in test mode. This signal selects between the LS, FS and HS transceivers: 00b: HS transceiver enabled 01b: FS transceiver enabled 10b: LS transceiver enabled 11b: Reserved Power Well: Core
2:1	0h RO	UTMI + Loopback Status (UTMILPBKSTS): Loopback Status for port selected by UTMIDFTPS 00b: Reset condition 01b: Comparator has started receiving data and the received data matches with the TX pattern. 10b: Comparator has started receiving data the received data does not match with the TX pattern but there was no assertion of RC error from UTMI. 11b: Comparator has started receiving data and RX ERROR was asserted for at least one clock by UTMI. Note that this does not reflect the status of pattern comparison since RX error from UTMI is unexpected for loopback. Power Well: Core
0	0h RW	Loopback Enable (UTMILPBKEN): Enable loopback test mode. If asserted, loopback test mode is enabled Power Well: Core

18.6.51 Manufacturing Process ID (MANID)—Offset F8h

Not for EDS

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:20, F:0] + F8h

Default: 00000F00h

31	28	24	20	16	12	8	4	0																			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0	0
Rsvd				DPID				SID				MNFR				PPID											

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW	Loopback Pattern (UTMILPBKPATSEL): Near end loopback pattern generation type: 0b: Fixed pattern 1b: USB2 test packet Power Well: Core
0	0b RW	Loopback Type (UTMILPBKTYPE): Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 0b: Digital Near-End Loopback (DNELB) 1b: Analog Near-End Loopback (ANELB) Note: Analog Far-End Loopback (AFELB) is not supported Power Well: Core

18.7 USB xHCI Memory Mapped I/O Registers

18.7.1 Capability Registers Length (CAPLENGTH)—Offset 0h

This register is used as an offset to add to register base, to find the beginning of the Operational Register Space. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [MBAR] + 0h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 80h

7	4	0
1	0	0
CAPLENGTH		

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	Capability Registers Length (CAPLENGTH): This field is used as an offset to add to register base, to find the beginning of the Operational Register Space. Power Well: Core

18.7.2 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

This is a two-byte register containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this register represents a major revision, and the least significant bit is the minor revision, e.g. 0100h corresponds to xHCI version 1.0. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [MBAR] + 2h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0100h RO	<p>Host Controller Interface Version Number (HCIVERSION): This is a two-byte field containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this field represents a major revision, and the least significant bit is the minor revision, e.g. 0100h corresponds to xHCI version 1.0.</p> <p>Power Well: Core</p>

18.7.3 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

This register defines basic structural parameters supported by this xHC implementation: Number of Device Slots support, Interrupters, Root Hub ports, etc. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 4h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 07000820h

Bit Range	Default & Access	Field Name (ID): Description
31:24	07h RO	<p>Number of Ports (MaxPorts): This field specifies the maximum Port Number value, i.e the highest number of Port Register Sets that are addressable in the Operational Register Space (refer to the xHCI for USB specification). Valid values are in the range of 1h to FFh.</p> <p>The value in this field shall reflect the maximum Port Number value assigned by an <i>xHCI Supported Protocol Capability</i>, described in the xHCI for USB specification. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set.</p> <p>Power Well: Core</p>
23:19	00h RW/L	<p>Rsvd1: Reserved.</p> <p>Power Well: Core</p>

Bit Range	Default & Access	Field Name (ID): Description
25:8	00000h RW/L	Rsvd1 : Reserved. Power Well : Core
7:4	5h RW/L	Event Ring Segment Table Max (ERSTMax) : Valid values are 0-15. This field determines the maximum value supported by the <i>Event Ring Segment Table Base Size</i> registers (5.5.2.3.1), where The maximum number of Event Ring Segment Table entries = 2^(ERST Max) e.g. if the ERST Max = 7, then the xHC <i>Event Ring Segment Table(s)</i> supports up to 128 entries, if ERST Max = 15, then 32K entries, etc. Power Well : Core
3:0	4h RW/L	Isochronous Scheduling Threshold (IST) : The value in this field indicates to system software the minimum distance (in time) that it is required to stay ahead of the host controller while adding TRBs, in order to have the host controller process them at the correct time. The value shall be specified in terms of number of frames/microframes. If bit [3] of IST is cleared to '0', software can add a TRB no later than IST[2:0] microframes before that TRB is scheduled to be executed. If bit [3] of IST is set to '1', software can add a TRB no later than IST[2:0] frames before that TRB is scheduled to be executed. Refer to the xHCI for USB specification for details on how software uses this information for scheduling isochronous transfers. Power Well : Core

18.7.5 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

This register defines link exit latency related structural parameters. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00040001h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
U2DEL				Rsvd1				U1DEL

Bit Range	Default & Access	Field Name (ID): Description
31:16	0004h RW/L	U2 Device Exit Latency (U2DEL) : Worst case latency to transition from U2 to U0. Applies to all root hub ports. The following are permissible values: <ul style="list-style-type: none"> • 0000h = Zero • 0001h = Less than 1 s • 0002h = Less than 2 s • 07FFh = Less than 2047 s. • 0800-FFFFh = Reserved Power Well : Core

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW/L	Rsvd1: Reserved. Power Well: Core
7:0	01h RW/L	U1 Device Exit Latency (U1DEL): Worst case latency to transition a root hub Port Link State (PLS) from U1 to U0. Applies to all root hub ports. The following are permissible values: <ul style="list-style-type: none"> • 01h = Less than 1 s • 02h = Less than 2 s • ... • 0Ah = Less than 10 s • 0B-FFh = Reserved Power Well: Core

18.7.6 Capability Parameters (HCCPARAMS)—Offset 10h

The default values for all fields in this register are implementation dependent. This register defines optional capabilities supported by the xHCI. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 10h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 200071E1h

31	28	24	20	16	12	8	4	0
0	0	1	0	0	0	0	0	0
0	0	0	0	0	0	0	0	1
		xECP			MaxPSASize	Rsvd1	PAE	NSS
							LTC	LHRC
							PIIND	PPC
							CSZ	BNC
								AC64

Bit Range	Default & Access	Field Name (ID): Description
31:16	2000h RW/L	xHCI Extended Capabilities Pointer (xECP): This field indicates the existence of a capabilities list. The value of this field indicates a relative offset, in 32-bit words, from Base to the beginning of the first extended capability. For example, using the offset of Base is 1000h and the xECP value of 0068h, we can calculate the following effective address of the first extended capability: 1000h + (0068h ((2) -) 1000h + 01A0h -) 11A0h a. This is not tightly coupled with the USBBASE address register mapping control. Power Well: Core
15:12	7h RW/L	Maximum Primary Stream Array Size (MaxPSASize): This field identifies the maximum size Primary Stream Array that the xHC supports. The Primary Stream Array size = 2^(MaxPSASize+1). Valid MaxPSASize values are 0 to 15, where 0 indicates that Streams are not supported. Power Well: Core
11:9	0h RW/L	Rsvd1: Reserved. Power Well: Core

Bit Range	Default & Access	Field Name (ID): Description
8	1b RW/L	<p>Parse All Event Data (PAE): This flag indicates whether the host controller implementation parses all Event Data TRBs while advancing to the next TD after a Short Packet, or skips all but the first Event Data TRB. A 1 in this bit indicates that all Event Data TRBs are parsed. A 0 in this bit indicates that only the first Event Data TRB is parsed. Refer to the xHCI for USB specification.</p> <p>Power Well: Core</p>
7	1b RW/L	<p>No Secondary SID Support (NSS): This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported. Refer to the xHCI for USB specification.</p> <p>Power Well: Core</p>
6	1b RW/L	<p>Latency Tolerance Messaging Capability (LTC): This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported. Refer to the xHCI for USB specification.</p> <p>Power Well: Core</p>
5	1b RW/L	<p>Light HC Reset Capability (LHRC): This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the <i>Light Host Controller Reset</i> (LHCRST) flag in the USBCMD register. Refer to the xHCI for USB specification.</p> <p>Power Well: Core</p>
4	0b RW/L	<p>Port Indicators (PIND): This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a 1, the port status and control registers include a read/ writeable field for controlling the state of the port indicator. Refer to the xHCI for USB specification for the definition of the <i>Port Indicator Control</i> field.</p> <p>Power Well: Core</p>
3	0b RO	<p>Port Power Control (PPC): This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port does not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register. See the xHCI for USB specification.</p> <p>Power Well: Core</p>
2	0b RW/L	<p>Context Size (CSZ): If this bit is set to 1, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0, then the xHC uses 32 byte Context data structures. Note: This flag does <i>not</i> apply to Stream Contexts.</p> <p>Power Well: Core</p>
1	0b RW/L	<p>BW Negotiation Capability (BNC): This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation:</p> <ul style="list-style-type: none"> 0 = BW Negotiation not implemented 1 = BW Negotiation implemented <p>Refer to the xHCI for USB specification for more information on Bandwidth Negotiation.</p> <p>Power Well: Core</p>

Bit Range	Default & Access	Field Name (ID): Description
0	1b RW/L	<p>64-bit Addressing Capability (AC64): This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the high order 32 bits of 64 bit register and data structure pointer fields. Values for this flag have the following interpretation:</p> <ul style="list-style-type: none"> 0 = 32-bit address memory pointers implemented 1 = 64-bit address memory pointers implemented <p>If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32 bits of 64 bit data structure pointer fields, and system software shall ignore the high order 32 bits of 64 bit xHC registers.</p> <p>Power Well: Core</p>

18.7.7 Doorbell Offset (DBOFF)—Offset 14h

This register defines the offset of the Doorbell Array base address from the Base.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 14h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Rsvd2						EU3S	EWE	CRS	CSS	LHCRST	Rsvd1	HSEE	INTE	HCRST	RS

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RO	Rsvd2 : Reserved. Power Well: Core
11	0b RW	Enable U3 MFINDEX Stop (EU3S) : When set to 1, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0 the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. Refer to the xHCI for USB specification for more information. Power Well: Core
10	0b RW	Enable Wrap Event (EWE) : When set to 1, the xHC shall generate an MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0 no MFINDEX Wrap Events are generated. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the generation of MFINDEX Wrap Events to VFs shall be emulated by the VMM. Power Well: Core

Bit Range	Default & Access	Field Name (ID): Description
9	0b RW	<p>Controller Restore State (CRS): When set to 1, and HCHalted (HCH) = 1, then the xHC shall perform a Restore State operation and restore its internal state. When set to 1 and <i>Run/Stop</i> (R/S) = 1 or <i>HCHalted</i> (HCH) = 0, or when cleared to 0, no Restore State operation shall be performed. This flag always returns 0 when read. Refer to the <i>Restore State Status</i> (RSS) flag in the USBSTS register for information on Restore State completion. Refer to the xHCI for USB specification, for more information. Note that undefined behavior may occur if a Restore State operation is initiated while <i>Save State Status</i> (SSS) = 1.</p> <p>When this register is exposed by a Virtual Function (VF), this bit only controls restoring the state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.</p> <p>Power Well: Core</p>
8	0b RW	<p>Controller Save State (CSS): When written by software with 1 and HCHalted (HCH) = 1, then the xHC shall save any internal state that may be restored by a subsequent Restore State operation. When written by software with 1 and HCHalted (HCH) = 0, or written with 0, no Save State operation shall be performed. This flag always returns 0 when read. Refer to the <i>Save State Status</i> (SSS) flag in the USBSTS register for information on Save State completion. Refer to the xHCI for USB specification for more information on xHC Save/Restore operation. Note that undefined behavior may occur if a Save State operation is initiated while <i>Restore State Status</i> (RSS) = 1.</p> <p>When this register is exposed by a Virtual Function (VF), this bit only controls saving the state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.</p> <p>Power Well: Core</p>
7	0b RW	<p>Light Host Controller Reset (LHCRST): Optional normative. If the <i>Light HC Reset Capability</i> (LHRC) bit in the HCCPARAMS register is 1, then this flag allows the driver to reset the xHC without affecting the state of the ports.</p> <p>A system software read of this bit as 0 indicates the <i>Light Host Controller Reset</i> has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1 indicates the <i>Light Host Controller Reset</i> has not yet completed.</p> <p>If not implemented, a read of this flag shall always return a 0.</p> <p>All registers in the Aux Power well shall maintain the values that had been asserted prior to the Light Host Controller Reset. (Refer to the xHCI for USB specification for more information.)</p> <p>When this register is exposed by a Virtual Function (VF), this bit only generates a Light Reset to the xHC instance presented by the selected VF, e.g. disabling the VF's device slots and setting the associated VF Run bit to Stopped. Refer to the xHCI for USB specification for more information.</p> <p>Power Well: Core</p>
6:4	0h RO	<p>Rsvd1: Reserved.</p> <p>Power Well: Core</p>
3	0b RW	<p>Host System Error Enable (HSEE): When this bit is a 1, and the HSE bit in the USBSTS register is a 1, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit. Refer to the xHCI for USB specification for more information.</p> <p>When this register is exposed by a Virtual Function (VF), the effect of the assertion of this bit on the Physical Function (PF0) is determined by the VMM. Refer to the xHCI for USB specification for more information.</p> <p>Power Well: Core</p>

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW	<p>Interrupter Enable (INTE): This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is a 1, then Interrupter host system interrupt generation is allowed, i.e. the xHC shall issue an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSIX, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism.</p> <p>When this register is exposed by a Virtual Function (VF), this bit only enables the set of Interrupters assigned to the selected VF.</p> <p>Power Well: Core</p>
1	0b RW	<p>Host Controller Reset (HCRST): This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to a Chip Hardware Reset.</p> <p>When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on the USB is immediately terminated. A USB reset shall not be driven on USB2 downstream ports, however a Hot or Warm Reseta shall be initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software shall reinitialize the host controller, as described in the xHCI for USB specification, in order to return the host controller to an operational state.</p> <p>This bit is cleared to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this bit and shall not write any xHC Operational or Runtime registers until while HCRST is 1. Note, the completion of the xHC reset process is not gated by the Root Hub port reset process. Software shall not set this bit to 1 when the HCHalted (HCH) bit in the USBSTS register is a 0. Attempting to reset an actively running host controller may result in undefined behavior. When this register is exposed by a Virtual Function (VF), this bit only resets the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.</p> <p>Power Well: Core</p>
0	0b RW	<p>Run/Stop (RS):</p> <ul style="list-style-type: none"> • 1 = Run • 0 = Stop <p>When set to a 1, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to a 1. When this bit is cleared to 0, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halts. Refer to section 5.4.1.1 for more information on how R/S shall be managed. The xHC shall halt within 16 ms. after software clears the Run/Stop bit if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a 1 to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1). Doing so may yield undefined results. Writing a 0 to this flag when the xHC is in the Running state (i.e. HCH = 0) and any Event Rings are in the Event Ring Full state (refer to section 4.9.4) may yield undefined resultsresult in lost events. When this register is exposed by a Virtual Function (VF), this bit only controls the run state of the xHC instance presented by the selected VF.</p> <p>Power Well: Core</p>

18.7.10 USB Status (USBSTS)—Offset 84h

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register. Software sets a bit to '0' in this register by writing a '1' to it (RW1C). Refer to specification *eXtensible Host Controller Interface for Universal Serial Bus (xHCI)* for additional information concerning USB interrupt conditions.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:13	00000h RO	Rsvd3: Reserved. Power Well: Core
12	0b RO	Host Controller Error (HCE): This bit is not preset in HC, this is deviation from XHCI 1.0 spec. Power Well: Core
11	0b RO	Controller Not Ready (CNR): This is deviation from XHCI 1.0 spec. Power Well: Core
10	0b RW/C	Save/Restore Error (SRE): If an error occurs during a Save or Restore operation, this bit shall be set to 1. This bit shall be cleared to 0 when a Save or Restore operation is initiated or when written with 1. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Save/Restore completion status for the selected VF. Refer to the xHCI for USB specification for more information. Power Well: Core
9	0b RO	Restore State Status (RSS): When the Controller Restore State (CRS) flag in the USBCMD register is written with 1 this bit shall be set to 1 and remain 1 while the xHC restores its internal state. When the Restore State operation is complete, this bit shall be cleared to 0. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the restoring the state for the selected VF. Refer to the xHCI for USB specification for more information. Power Well: Core
8	0b RO	Save State Status (SSS): When the <i>Controller Save State</i> (CSS) flag in the USBCMD register is written with 1, this bit shall be set to 1 and remain 1 while the xHC saves its internal state. When the Save State operation is complete, this bit shall be cleared to 0. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the saving the state for the selected VF. Refer to the xHCI for USB specification for more information. Power Well: Core
7:5	0h RO	Rsvd2: Reserved. Power Well: Core

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW/C	<p>Port Change Detect (PCD): The xHC sets this bit to a 1 when any port has a change bit transition from a 0 to a 1. This bit is allowed to be maintained in the Aux Power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the xHC, this bit is loaded with the OR of all of the PORTSC change bits. Refer to the xHCI for USB specification for more information. This bit provides system software an efficient means of determining if there has been Root Hub port activity. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Root Hub Ports associated with the Device Slots assigned to the selected VF. Refer to the xHCI for USB specification for more information.</p> <p>Power Well: Core</p>
3	0b RW/C	<p>Event Interrupt (EINT): The xHC sets this bit to 1 when the <i>Interrupt Pending (IP)</i> bit of any Interrupter transitions from 0 to 1. Refer to the xHCI for USB specification for usage information. Software that uses <i>EINT</i> shall clear it prior to clearing any IP flags. A race condition may occur if software clears the <i>IP</i> flags, then clears the <i>EINT</i> flag, and between the operations another <i>IP</i> 0 to '1' transition occurs. In this case, the new IP transition shall be lost. When this register is exposed by a Virtual Function (VF), this bit is the logical 'OR' of the IP bits for the Interrupters assigned to the selected VF. And it shall be cleared to 0 when all associated interrupter IP bits are cleared, i.e. all the VFs Interrupter Event Ring(s) are empty. Refer to the xHCI for USB specification for more information.</p> <p>Power Well: Core</p>
2	0b RW/C	<p>Host System Error (HSE): The xHC sets this bit to 1 when a serious error is detected, either internal to the xHC or during a host system access involving the xHC module. (In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Master Abort, and PCI Target Abort.) When this error occurs, the xHC clears the Run/Stop (R/S) bit in the USBCMD register to prevent further execution of the scheduled TDs. If the HSEE bit in the USBCMD register is a 1, the xHC shall also assert out-of-band error signaling to the host. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the assertion of this bit affects all VFs and reflects the Host System Error state of the Physical Function (PF0). Refer to the xHCI for USB specification for more information.</p> <p>Power Well: Core</p>
1	0b RO	<p>Rsvd1: Reserved.</p> <p>Power Well: Core</p>
0	1b RO	<p>HCHalted (HCH): This bit is a 0 whenever the <i>Run/Stop (R/S)</i> bit is a 1. The xHC sets this bit to 1 after it has stopped executing as a result of the <i>Run/Stop (R/S)</i> bit being cleared to 0, either by software or by the xHC hardware (e.g. internal error). If this bit is '1', then SOFs, microSOFs, or Isochronous Timestamp Packets (ITP) shall not be generated by the xHC, and any received Transaction Packet shall be dropped. When this register is exposed by a Virtual Function (VF), this bit only reflects the Halted state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.</p> <p>Power Well: Core</p>

18.7.11 Page Size (PAGESIZE)—Offset 88h

The default value for this register is implementation dependent.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 88h

MBAR Type: PCI Configuration Register (Size: 64 bits)

31:16	0000h RO	Rsvd1: Reserved. Power Well: Core
15:0	0001h RO	Page Size (PAGESIZE): This field defines the page size supported by the xHC implementation. This xHC supports a page size of $2^{(n+12)}$ if bit n is Set. For example, if bit 0 is Set, the xHC supports 4k byte page sizes. For a Virtual Function, this register reflects the page size selected in the <i>System Page Size</i> field of the SR-IOV Extended Capability structure. For the Physical Function 0, this register reflects the implementation dependent default xHC page size. Various xHC resources reference PAGESIZE to describe their minimum alignment requirements. The maximum possible page size is 128M. Power Well: Core

18.7.12 Device Notification Control (DNCTRL)—Offset 94h

This register is used by software to enable or disable the reporting of the reception of specific USB Device Notification Transaction Packets. A *Notification Enable* (Nx, where x = 0 to 15) flag is defined for each of the 16 possible device notification types. If a flag is set for a specific notification type, a Device Notification Event shall be generated when the respective notification packet is received. After reset, all notifications are disabled. Refer to specification *eXtensible Host Controller Interface for Universal Serial Bus (xHCI)*. This register shall be written as a Dword. Byte writes produce undefined results.

Access Method

18.7.19 Port 1 Power Management Status and Control USB2 (PORTPMSC1USB2)—Offset 484h

This register is in the Aux Power well. It is only reset by platform hardware during a cold reset or in response to a *Host Controller Reset* (HCRST). The USB2 Port Power Management Status and Control register provides the USB2 LPM parameters necessary for the xHC to generate a LPM Token to the downstream device.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 484h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

31:28	0h RW	Port Test Control (PTC): Note: This register is sticky. Power Well: SUS
27:17	000h RO	Rsvd1: Reserved. Power Well: Core
16	0b RO	Hardware LPM Enable (HLE): Reserved. Power Well: SUS
15:8	00h RW	L1 Device Slot (L1DS): Note: This register is sticky. System software sets this field to indicate the ID of the Device Slot associated with the device directly attached to the Root Hub port. A value of 0 indicates no device is present. The xHC uses this field to lookup information necessary to generate the LPM Token packet. Power Well: SUS
7:4	0h RW	Best Effort Service Latency (HIRD): Note: This register is sticky. System software sets this field to indicate to the recipient device how long the xHC will drive resume if it (the xHC) initiates an exit from L1. For more information about <i>BESL</i> value encoding, refer to the xHCI for USB specification. Note that the <i>BESL</i> field is used by both software and hardware controlled LPM. Refer to the xHCI for USB specification for more information on <i>BESL</i> use and how <i>DBESL</i> may be used to establish an initial value for <i>BESL</i> . Power Well: SUS
3	0b RW	Remote Wake Enable (RWE): Note: This register is sticky. System software sets this flag to enable or disable the device for remote wake from L1. The value of this flag shall temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, revision 2.0, Chapter 9. Power Well: SUS

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	<p>L1 Status (L1S): Note: This register is sticky. This field is used by software to determine whether an L1- based suspend request (LPM transaction) was successful, specifically:</p> <ul style="list-style-type: none"> 0 = Invalid - This field shall be ignored by software. 1 = Success - Port successfully transitioned to L1 (ACK) 2 = Not Yet - Device is unable to enter L1 at this time (NYET) 3 = Not Supported - Device does not support L1 transitions (STALL) 4 = Timeout/Error - Device failed to respond to the LPM Transaction or an error occurred 5-7 = Reserved <p>The value of this field is only valid when the port resides in the L0 or L1 state (<i>PLS</i> = 0 or 2). Refer to the xHCI for USB specification for more information.</p> <p>Power Well: SUS</p>

18.7.20 Port X Hardware LPM Control Register (PORTHLPM1)—Offset 48Ch

There are 9 PORTHLPM registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh and 50Ch. This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The field definitions depend on the protocol supported. For USB3, this register is reserved and shall be treated by software as RsvdP. For USB2, the definition is given below. Fields contain parameters necessary for xHC to automatically generate an LPM Token to the downstream device.

18.7.35 Port X Hardware LPM Control Register (PORTHLPM6)—Offset 4DCh

There are 9 PORTHLPM registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh and 50Ch. This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The field definitions depend on the protocol supported. For USB3, this register is reserved and shall be treated by software as RsvdP. For USB2, the definition is given below. Fields contain parameters necessary for xHC to automatically generate an LPM Token to the downstream device.

IMODC				IMODI				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	Interrupt Moderation Counter (IMODC): Down counter. Loaded with the IMODI value whenever <i>IP</i> is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags both equal '1', and EHB = '0'. This counter may be written directly by software at any time to alter the interrupt rate. Power Well: Core
15:0	0FA0h RW	Interrupt Moderation Interval (IMODI): Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty. Power Well: Core

18.7.42 Event Ring Segment Table Size 1 (ERSTSZ1)—Offset 2028h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. $x = 1, 2, \dots 8$.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 2028h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Rsvd1: Reserved. Power Well: Core
15:0	0000h RW	Event Ring Segment Table Size (ERSTS): This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled. Power Well: Core

18.7.43 Event Ring Segment Table Base Address Low 1 (ERSTBA_LO1)—Offset 2030h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 2030h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0000000h RW	Event Ring Segment Table Base Address Register (ERSTBA_LO): This field defines the low order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0. Power Well: Core
5:0	00h RO	Rsvd1: Reserved. Power Well: Core

18.7.44 Event Ring Segment Table Base Address High 1 (ERSTBA_HI 1)—Offset 2034h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HI_x registers, with x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 2034h

ERDP							EHB	DESI

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RW	Event Ring Dequeue Pointer (ERDP) : This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer. Power Well: Core
3	0b RW/C	Event Handler Busy (EHB) : This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information. Power Well: Core
2:0	0h RW	Dequeue ERST Segment Index (DESI) : This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in. Power Well: Core

18.7.53 Event Ring Dequeue Pointer High 2 (ERDP_HI2)—Offset 205Ch

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 205Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	Event Ring Dequeue Pointer (ERDP): This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer. Power Well: Core

18.7.54 Interrupter 3 Management (IMAN3)—Offset 2060h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 2060h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RO	Rsvd1: Reserved. Power Well: Core
1	0b RW	Interrupt Enable (IE): Reserved. Power Well: Core
0	0b RW/C	Interrupt Pending (IP): Reserved. Power Well: Core

18.7.55 Interrupter 3 Moderation (IMOD3)—Offset 2064h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 2064h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 0000FA0h

ERSTBA_HI											

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	Event Ring Segment Table Base Address (ERSTBA_HI) : This field defines the high order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0. Power Well: Core

18.7.73 Event Ring Dequeue Pointer Low 5 (ERDP_LO5)—Offset 20B8h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 20B8h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

ERDP							EHB	DESI

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RW	Event Ring Dequeue Pointer (ERDP) : This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer. Power Well: Core
3	0b RW/C	Event Handler Busy (EHB) : This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information. Power Well: Core
2:0	0h RW	Dequeue ERST Segment Index (DESI) : This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in. Power Well: Core

18.7.74 Event Ring Dequeue Pointer High 5 (ERDP_HI5)—Offset 20BCh

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 20BCh

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	Event Ring Dequeue Pointer (ERDP) : This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer. Power Well : Core

18.7.75 Interrupter 6 Management (IMAN6)—Offset 20C0h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 20C0h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RW	Event Ring Dequeue Pointer (ERDP) : This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer. Power Well: Core
3	0b RW/C	Event Handler Busy (EHB) : This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information. Power Well: Core
2:0	0h RW	Dequeue ERST Segment Index (DESI) : This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in. Power Well: Core

18.7.95 Event Ring Dequeue Pointer High 8 (ERDP_HI8)—Offset 211Ch

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 211Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	Event Ring Dequeue Pointer (ERDP): This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer. Power Well: Core

18.7.96 Door Bell 1 (DOORBELL1)—Offset 3000h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 3000h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	DB Stream ID (DBSID): If the endpoint of a Device Context Doorbell defines Streams, then this field shall be used to identify which Stream of the endpoint the doorbell reference is targeting. System software is responsible for ensuring that the value written to this field is valid. If the endpoint defines Streams (<i>MaxPStreams</i> > 0), then 0, 65535 (No Stream) and 65534 (Prime) are reserved Stream ID values and shall not be written to this field. If the endpoint does not define Streams (<i>MaxPStreams</i> = 0) and a non-'0' value is written to this field, the doorbell reference shall be ignored. This field only applies to <i>Device Context Doorbells</i> and shall be cleared to 0 for <i>Host Controller Command Doorbells</i> . This field returns 0 when read. Power Well: Core
15:8	00h RO	Rsvd1: Reserved. Power Well: Core

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	<p>DB Target (DBT): This field defines the target of the doorbell reference. The table below defines the xHC notification that is generated by ringing the doorbell. Note that Doorbell Register 0 is dedicated to Command Ring and decodes this field differently than the other Doorbell Registers.</p> <ul style="list-style-type: none"> • Device Context Doorbells (1-255) • 0 = Reserved • 1 = Control EP 0 Enqueue Pointer Update • 2 = EP 1 OUT Enqueue Pointer Update • 3 = EP 1 IN Enqueue Pointer Update • 4 = EP 2 OUT Enqueue Pointer Update • 5 = EP 2 IN Enqueue Pointer Update • ... • 30 = EP 15 OUT Enqueue Pointer Update • 31 = EP 15 IN Enqueue Pointer Update • 32:247 = Reserved • 248:255 = Vendor Defined • Host Controller Doorbell (0) • 0 = Command Doorbell • 248:255 = Vendor Defined <p>This field returns '0' when read, and should be treated as 'undefined' by software. When the Command Doorbell is written, the DB Stream ID field shall be cleared to 0.</p> <p>Power Well: Core</p>

18.7.97 Door Bell 2 (DOORBELL2)—Offset 3004h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 3004h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<p>DB Stream ID (DBSID): Refer to field descriptions for the DOORBELL1 register.</p> <p>Power Well: Core</p>
15:8	00h RO	<p>Rsvd1: Reserved.</p> <p>Power Well: Core</p>
7:0	00h RW	<p>DB Target (DBT): Refer to field descriptions for the DOORBELL1 register.</p> <p>Power Well: Core</p>

18.7.98 Door Bell 3 (DOORBELL3)—Offset 3008h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 3008h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	DB Stream ID (DBSID): Refer to field descriptions for the DOORBELL1 register. Power Well: Core
15:8	00h RO	Rsvd1: Reserved. Power Well: Core
7:0	00h RW	DB Target (DBT): Refer to field descriptions for the DOORBELL1 register. Power Well: Core

18.7.99 Door Bell 4 (DOORBELL4)—Offset 300Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 300Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	DB Stream ID (DBSID): Refer to field descriptions for the DOORBELL1 register. Power Well: Core

Bit Range	Default & Access	Field Name (ID): Description

26	0b RW	Overwrite PCIe P2 to P1 (OVR_PCIE_P2_P1): When set to 1 will overwrite a PCIe powerdown state of P2 to P1. Power Well: SUS
25	0b RW	Set Internal SSV 1 (SET_ISSV_1): When set to 1 set the internal SSV to 1. Power Well: SUS
24	0b RW	Clear Internal SSV 0 (CLR_ISSV_0): When set to 1 clear the internal SSV to 0. Power Well: SUS
23	1b RW	Enable save_restore_enable SW Loading (EN_SRE_SW_LD): This is a bit that enables the save_restore_enable signal being loaded when a software command has set Save bit. This is a debug function. Power Well: SUS
22	0b RW	RESERVED (RSVD_1): Reserved. Power Well: SUS
21	0b RW	Force save_restore 1 (FORCE_SR1): When set to 1, it will force the save_restore flag to 1. This flag is an bit to ensure that we have masked the update during low power state. If software write this bit to 1, it must write it to 0 in order to resume the normal save and restore function. Power Well: SUS
20	0b RW	cfg pcie txreg rd (CPTR): Reserved. Power Well: SUS
19	1b RW	cfg iob drivestrength[1] (CIDS1): Reserved. Power Well: SUS
18	1b RW	cfg iob drivestrength[0] (CIDS0): Reserved. Power Well: SUS
17	0b RW	Enable CFG USB P2 (EN_CFG_UP2): When set to '1' enable cfg usb p2 Power Well: SUS
16	1b RW	cfg clk gate dis (CCGD): Reserved. Power Well: SUS
15	1b RW	Enable CFG RXDET P3 (EN_CFG_RDP3): When set to '1' enable cfg rxdet p3 Power Well: SUS
14	0b RW	Enable CFG PIPE Reset (EN_CFG_PIPE_RST): When set to '1' enable cfg pipe rst Power Well: SUS

Bit Range	Default & Access	Field Name (ID): Description
13	1b RW	Enable Filter TX Idle (EN_FILT_TX_IDLE) : When set to 1 enables a filter function to TX electrical idle signal at PCIe PIPE. We have a filter that will set TXelectidle signal of PCIe PIPE to 1 whenever we are in isolation state or power down transition states. Power Well: SUS
12	1b RW	Enable Host Engine Generate PME (EN_HE_GEN_PME) : This is a global switch to enable or not enable the host engine to generate a PME message. Power Well: SUS
11	1b RW	Enable Isolation (EN_ISOL) : When set to '1' enable isolation Power Well: SUS
10	1b RW	Enable L1 Caused P2 Overwrite (EN_L1_P2_OVR) : Set 1 to enable a new feature. This new feature is designed to use L1 as a state to identify whether we should do P2 Overwrite or not. We used to use P1 state to identify whether or not to invoke P2 overwrite function. Power Well: SUS
9	0b RW	Enable Core Clock Gating (EN_CORE_CG) : When set to '1' enable core clock gating based on low power state entered Power Well: SUS
8	0b RW	Enable PHY Status Timeout (EN_PHY_STS_TO) : When set to '1' enable PHY status timeout function which is designed to cover the PCIePHY issue that we may have not able to detect the PHY status toggle. Power Well: SUS
7	1b RW	Ignore aux_pm_en PCIe Core (IGN_APE_PC) : When set to '1' ignore the aux_pm_en reg from PCIe core to continue the remote wake/clock switching support Power Well: SUS
6	0b RW	Enable P2 Overwrite P1 (EN_P2_OVR_P1) : When set to '1' enable P2 overwrite P1 when PCIe core has indicated the transition from P0 to P1. This is to enable entering the even lower power state. Power Well: SUS
5	1b RW	Enable P2 Remote Wake (EN_P2_REM_WAKE) : When set 1 '1' enable the remote wake function by allowing P2 clock/switching and P2 entering Power Well: SUS
4:1	0h RW	Forced PM State (FORCED_PM_STATE) : Reserved. Power Well: SUS
0	0b RW	Initiate Force PM State (INIT_FPMS) : When set to '1' force PM state to go to the state indicated in bit 4:1 Power Well: SUS

Bit Range	Default & Access	Field Name (ID): Description
24	1b RW	<p>Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE): This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCIe core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register.</p> <ul style="list-style-type: none"> 1 = enables this feature 0 = disables this feature. <p>Power Well: SUS</p>
23	0b RW	<p>DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):</p> <ul style="list-style-type: none"> 1 = do not assert PLC for disconnection 0 = assert PLC for disconnection <p>Power Well: SUS</p>
22	0b RW	<p>TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2: This bit enables a feature in PCIe core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error.</p> <ul style="list-style-type: none"> 1 = treat Logic IDLE as TS2 received when in some PCIe LTSSM state. 0 = disable this feature. <p>Power Well: SUS</p>
21	1b RW	<p>Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT): We added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter.</p> <ul style="list-style-type: none"> 1 = disables p2 overwrite due to the D3HOT where PCIe core enters the L1. 0 = enables P2 overwrite even if we are in D3Hot. <p>Power Well: SUS</p>
20	1b RW	<p>Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3):</p> <ul style="list-style-type: none"> 1 = enables the port to enter U3 automatically when in U1/U2 0 = disables the port to enter U3 automatically when in U1/U2 <p>Power Well: SUS</p>

18.7.190 Debug Capability ID Register (DCID)—Offset 8480h

The Debug Capability *ID Register* links the USB Debug Capability into the xHCI list of Extended Capabilities and defines its basic capabilities. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 8480h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 0005000Ah

Bit Range	Default & Access	Field Name (ID): Description
31:16	00h RW	Reserved (RSVD): Reserved. Power Well: Core
15:8	00h RW	Doorbell Target (DBTGT): This field defines the target of the doorbell reference. The table below defines the Debug Capability notification that is generated by ringing the doorbell. <ul style="list-style-type: none"> 0 = Data EP 1 OUT Enqueue Pointer Update 1 = Data EP 1 IN Enqueue Pointer Update 2:255 = Reserved This field returns '0' when read and the value should be treated as undefined by software. Power Well: Core
7:0	00h RW	Reserved (RSVD_1): Reserved. Power Well: Core

18.7.192 Debug Capability Event Ring Segment Table Size Register (DCERSTSZ)—Offset 8488h

The Debug Capability *Event Ring Segment Table Size Register* defines the number of segments supported by the Debug Capability Event Ring Segment Table.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 8488h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	Reserved (RSVD): Reserved. Power Well: Core
15:0	0000h RW	Event Ring Segment Table Size (ERSTS): This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the <i>Debug Capability Event Ring Segment Table Base Address</i> register. The maximum value supported by an xHC implementation for this register is defined by the <i>DCERST Max</i> field in the DCID register. See the xHCI USB specification for more information. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'. Power Well: Core

18.7.193 Debug Capability Event Ring Segment Table Base Address Register (DCERSTBA)—Offset 8490h

The *Debug Capability Event Ring Segment Table Base Address Register* identifies the start address of the Debug Capability Event Ring Segment Table.

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

Offset: [MBAR] + 8490h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:4	00000000 000000h RW	Event Ring Segment Table Base Address Register (ERSTBAR): This field defines the high order bits of the start address of the Debug Capability Event Ring Segment Table. Software shall initialize this register before setting the <i>Debug Capability Enable</i> field in the DCCTRL register to 1. Power Well: Core
3:0	0h RW	Reserved (RSVD): Reserved. Power Well: Core

18.7.194 Debug Capability Event Ring Dequeue Pointer Register (DCERDP)—Offset 8498h

The *Debug Capability Event Ring Dequeue Pointer Register* is written by software to define the Debug Capability Event Ring Dequeue Pointer location to the xHC. Software updates this pointer when it has finished the evaluation of an Event(s) on the Debug Capability Event Ring.

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

Offset: [MBAR] + 8498h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:4	00000000 000000h RW	Dequeue Pointer (DQP) : This field defines the high order bits of the 64-bit address of the current Debug Capability Event Ring Dequeue Pointer. Software shall initialize this register before setting the <i>Debug Capability Enable</i> field in the DCCTRL register to '1'. Power Well : Core
3	0b RW	Reserved (RSVD) : Reserved. Power Well : Core
2:0	0h RW	Dequeue ERST Segment Index (DESI) : This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in. Power Well : Core

18.7.195 Debug Capability Control Register (DCCTRL)—Offset 84A0h

The *Debug Capability Control Register* is used to manage the Debug Capability.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 84A0h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0																							
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DCE	DADDR				DMBS				RSVD				DRC	HIT	HOT	LSE	DCR														

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	Debug Capability Enable (DCE) : Setting this bit to a 1 enables xHCI USB Debug Capability operation. This bit is a 0 if the USB Debug Capability is disabled. Clearing this bit releases the Root Hub port assigned to the Debug Capability, and terminates any Debug Capability Transfer or Event Ring activity. Power Well : Core
30:24	00h RO	Device Address (DADDR) : This field reports the USB device address assigned to the Debug Device during the enumeration process. This field is valid when the <i>Dbc Run</i> bit is 1. Power Well : Core
23:16	00h RO	Debug Max Burst Size (DMBS) : This field identifies the maximum burst size supported by the bulk endpoints of this DbC implementation. LPT-LP USB Debug Device does not support bursting. Power Well : Core

Bit Range	Default & Access	Field Name (ID): Description
15:5	000h RO	Reserved (RSVD): Reserved. Power Well: Core
4	0b RW/C	DbC Run Change (DRC): This bit shall be set to '1' when DCR bit is cleared to '0', i.e. by any DbC Port State transition that exits the DbC-Configured state. While this bit is 1 the <i>Debug Capability Doorbell Register</i> (DCDB) is disabled. Software shall clear this bit to re-enable the DCDB. Power Well: Core
3	0b RW/S	Halt IN TR (HIT): While this bit is 1 the Debug Capability shall generate STALL TPs for all OUT DPs received for the IN TR. The Debug Capability shall clear this bit when a ClearFeature(ENDPOINT_HALT) request is received for the endpoint. This field is valid only when the Debug Capability is in Run Mode (DCR = 1). When not in Run Mode, this field shall return 0 when read, and writes will have no effect. Refer to the xHCI USB specification for more information. Power Well: Core
2	0b RW/S	Halt OUT TR (HOT): While this bit is 1 the Debug Capability shall generate STALL TPs for all IN TPs received for the OUT TR. The Debug Capability shall clear this bit when a ClearFeature(ENDPOINT_HALT) request is received for the endpoint. This field is valid only when the Debug Capability is in Run Mode (DCR = 1). When not in Run Mode, this field shall return 0 when read, and writes will have no effect. Refer to the xHCI USB specification for more information. Power Well: Core
1	0b RW	Link Status Event Enable (LSE): Setting this bit to a 1 enables the Debug Capability to generate Port Status Change Events due to the <i>Port Link Status Change</i> bit transitioning from a 0 to a 1. Refer to the xHCI USB specification for more information. Power Well: Core
0	0b RO	DbC Run (DCR): When 0, Debug Device is not in the Configured state. When 1, Debug Device is in the Configured state and bulk Data pipe transactions are accepted by Debug Capability and routed to the IN and OUT Transfer Rings. A 0 to 1 transition of the <i>Port Reset</i> (DCPORTSC:PR) bit will clear this bit to 0. Power Well: Core

18.7.196 Debug Capability Status Register (DCST)—Offset 84A4h

The *Debug Capability Status Register* reports capability related status information to software.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 84A4h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
DPNUM				RSVD				ERNE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Debug Port Number (DPNUM) : This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port. Power Well: Core
23:1	000000h RO	Reserved (RSVD) : Reserved. Power Well: Core
0	0b RO	Event Ring Not Empty (ERNE) : When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the <i>Debug Capability Event Ring Dequeue Pointer</i> register. Power Well: Core

18.7.197 Debug Capability Port Status and Control Register (DCPORTSC)—Offset 84A8h

The fields of the *Debug Capability PORTSC Register* are defined below and provide information about the state of the Root Hub port that is assigned to the Debug Capability. Note that the fields in this register function differently than those in a normal *Port Status and Control Register* (described in section 5.4.8) because the Root Hub port assigned to the Debug Capability is acting as an Upstream Facing Port, not a Downstream Facing Port.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 84A8h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software.</p> <ul style="list-style-type: none"> 0 = Debug Capability Root Hub port is disabled. 1 = Debug Capability Root Hub port is enabled. <p>When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note: This bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.</p> <p>Power Well: Core</p>
0	0b RO	<p>Current Connect Status (CCS):</p> <ul style="list-style-type: none"> '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. '0' = No Debug Host is present. <p>This value reflects the current state of the port, and may not correspond to the value reported by the <i>Connect Status Change</i> (CSC) field in the <i>Port Status Change Event</i> that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'.</p> <p>Power Well: Core</p>

18.7.198 Debug Capability Context Pointer Register (DCCP)—Offset 84B0h

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

Offset: [MBAR] + 84B0h

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	DbC Protocol (DBCPR): This field is presented by the Debug Device in the USB Interface Descriptor <i>bInterfaceProtocol</i> field. <ul style="list-style-type: none"> 0 = Debug Target vendor defined 1 = GNU Remote Debug Command Set supported 2-255 = Reserved Power Well: Core

18.7.200 Debug Capability Device Descriptor Info Register 2 (DCDDI2)—Offset 84BCh

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 84BCh

MBAR Type: PCI Configuration Register (Size: 64 bits)

MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

F8-FBh	4	"Manufacturer's ID (MANID)—Offset F8h" on page 2368	00000F86h

Bit Range	Default & Access	Field Name (ID): Description
29	0b RWC	<p>Received Master-Abort Status (RMA_0): This bit is set when USB2, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. This event can optionally generate an SERR# by setting the SERR# Enable bit and the SERR on Aborts Enable (bit 3, offset 84h). Software clears this bit by writing a '1' to this bit location.</p> <p>Power Well: Core</p>
28	0b RWC	<p>Received Target Abort Status (RTA_0): This bit is set when USB2, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. This event can optionally generate an SERR# by setting the SERR# Enable bit and the SERR on Aborts Enable (bit 3, offset 84h). Software clears this bit by writing a '1' to this bit location.</p> <p>Power Well: Core</p>
27	0b RO	<p>Signaled Target-Abort Status (STA_0): This bit is used to indicate when the USB2 function responds to a cycle with a target abort. There is no reason for this to happen, so this bit will be hard-wired to '0'. Read-Only</p> <p>Power Well: Core</p>
26:25	01b RO	<p>DEVSEL# Timing Status (DEVT_0): This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.</p> <p>Power Well: Core</p>
24	0b RWC	<p>Master Data Parity Error Detected (MDPED_0): This bit is set whenever a data parity error is detected on a USB2 read completion packet on the internal interface to the USB2 host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a '1' to this bit location.</p> <p>Power Well: Core</p>
23	1b RO	<p>Fast Back-to-Back Capable (FBCAP_0): Reserved as '1'.</p> <p>Power Well: Core</p>
22	0b RO	<p>User Definable Features (UDF_0): Reserved as '0'</p> <p>Power Well: Core</p>
21	0b RO	<p>66 Mhz Capable (CLKCAP_0): Reserved as '0'</p> <p>Power Well: Core</p>
20	1b RO	<p>Capabilities List (CAPLIST_0): Hardwired to '1' indicating that offset 34h contains a valid capabilities pointer.</p> <p>Power Well: Core</p>
19	0b RO	<p>Interrupt Status (INTRSTS_0): This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.</p> <p>Power Well: Core</p>
18:11	00000000b RO	<p>Reserved (RSVD): Reserved.</p>

Bit Range	Default & Access	Field Name (ID): Description
10	0b RW	Interrupt Disable (INTRDIS_0): When cleared to '0', the function is capable of generating interrupts. When '1', the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable. This bit defaults to '0'. This bit is added as part of the PCI 2.3 Specification. Power Well: Core
9	0b RO	Fast Back to Back Enable (FBE_0): Reserved as '0'. Power Well: Core
8	0b RW	SERR# Enable (SERREN_0): on a memory read completion (if SERR on Aborts Enable is also set) Detection of an address or command parity error and the Parity Error Response bit is setDetection of a data parity error (when the data is going to the EHC) and the Parity Error Response bit is set Power Well: Core
7	0b RO	Wait Cycle Control (WCC_0): Reserved as '0'. Power Well: Core
6	0b RW	Parity Error Response (PER_0): When set to 1, the USB2 Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the EHCI specification. If it detects bad parity on the address or command phases when this bit is set to 1, the host controller does not take the cycle, halts the host controller (if currently not halted) and sets the host system error bit in the USBSTS register. Note that this applies to both requests and completions from the system interface. See section 9.19.2.4 for information regarding parity errors detected by the Prefetch DMA Engine. This bit must be set in order for the parity errors to generate SERR#. Power Well: Core
5	0b RO	VGA Palette Snoop (VGAPS_0): Reserved as '0' Power Well: Core
4	0b RO	Postable Memory Write Enable (PMWE_0): Reserved as '0' Power Well: Core
3	0b RO	Special Cycle Enable (SCE_0): Reserved as '0' Power Well: Core
2	0b RW	Bus Master Enable (BME_0): When set, bus mastering from EHCI is allowed, and will generate memory reads and writes for USB transfers. Notes on the EHC implementation: - Writes to change this bit occur immediately. Specifically, a write followed by a read will return the updated value. - When the BME bit is changed from 1 to 0, the EHC will cease accessing main memory within 2 microframes (250 usec). During this time, any number of reads and/or writes to memory may occur. - Clearing the BME bit shuts down the EHC DMA engines in the same manner that clearing the Run/Stop does. However, the schedule status bits and the HCHalted bit do not change based on the BME value. Power Well: Core
1	0b RW	Memory Space Enable (MSE_0): This bit controls access to the USB2 Memory Space registers. If this bit is set, accesses to the USB2 registers are enabled. The Base Address register for USB2 should be programmed before this bit is set. Power Well: Core

Bit Range	Default & Access	Field Name (ID): Description
0	0b RO	I/O Space Enable (IOSE_0): Reserved as '0'. Power Well: Core

18.8.3 Revision ID and Programming Interface and Sub/Base Class Code (RID_PI_CC)—Offset 8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + 8h

Default: 0C032000h

31	28	24	20	16	12	8	4	0							
0	0	0	0	1	1	0	0	0							
0	0	0	0	0	0	1	0	0							
0	0	0	0	0	0	0	0	0							
BCC_0				SCC_0				PI_0				RID_0			

Bit Range	Default & Access	Field Name (ID): Description
31:24	0Ch RO	Base Class Code (BCC_0): A value of 0Ch indicates that this is a Serial Bus controller. Power Well: Core
23:16	03h RO	Sub Class Code (SCC_0): A value of 03h indicates that this is a Universal Serial Bus Host Controller. Power Well: Core
15:8	20h RO	Programming Interface (PI_0): A value of 20h indicates that this USB2 Host Controller conforms to the EHCI specification. Power Well: Core
7:0	00h RO	Revision ID (RID_0): The value reported in this register indicates stepping of the host controller hardware. Power Well: Core

18.8.4 Reserved and Master Latency Timer and Header Type (RSVD_MLT_HT)—Offset Ch

Reserved, for padding Master Latency Timer Header Type Reserved

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0					
0	0	0	0	0	0	0	0	0					
RSVD				MFB_0	CFG_LYT_0				MLT_0	RSVD			

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	Reserved (RSVD): Reserved.
23	0b RO	Multi Function Bit (MFB_0): When set to 1 this indicates that this is a multifunction device. Default to 0 since EHCI is at function 0, no other function beyond. Power Well: Core
22:16	0000000b RO	Configuration Layout (CFG_LYT_0): Hardwired to 0 to indicate a standard PCI configuration layout. Power Well: Core
15:8	00h RO	Master Latency Timer (MLT_0): Because the USB2 controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0 Power Well: Core
7:0	00h RO	Reserved (RSVD): Reserved.

18.8.5 Memory Base Address (MBAR)—Offset 10h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

31:8	000000h RO	Reserved (RSVD) : Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	50h RO	Capabilities Pointer (CAP_PTR_0) : This register points to the starting offset of the USB2 capabilities ranges. Power Well: Core

18.8.8 Interrupt Line and Interrupt Pin and Reserved (ILINE_IPIN_RSVD)—Offset 3Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + 3Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0		
RSVD				IPIN_0				ILINE_0			

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	Reserved (RSVD) : Reserved.
15:8	00h RO	Interrupt Pin (IPIN_0) : Bits 3:0 reflect the value programmed in the interrupt pin registers in chipset configuration space. Bits 7:4 are hardwired to 0000b. NOTE: As a single function device, only INTA# may be used while the other three interrupt lines have no meaning. (refer to PCI 3.0 spec section 2.2.6 Interrupt Pins) Power Well: Core
7:0	00h RW	Interrupt line (ILINE_0) : This data is not used by the SOC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. Reset: core well and D3-to-D0. Power Well: Core

18.8.9 PCI Power Management Capability ID and Next Item Pointer #1 and PM Capabilities (PM_CID_NEXT_CAP)—Offset 50h

PCI Power Management Capabilities ID Next Item Pointer #1 Power Management Capabilities

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + 50h

Default: C9C35801h

31	28	24	20	16	12	8	4	0															
1	1	0	0	1	0	0	1	1	0	1	0	1	1	0	0	0	0	0	0	0	0	0	1
RSVD				D2SUP_0	D1SUP_0	AUXCUR_0	DSI_0	RSVD	PMECLK_0	VERS_0	PM_NEXT_0				PM_CID_0								

Bit Range	Default & Access	Field Name (ID): Description
31:27	11001b RO	Reserved (RSVD): Reserved.
26	0b RO	D2_Support (D2SUP_0): The D2 state is not supported. Reset: core well, but not D3-to-D0. Power Well: Core
25	0b RO	D1_Support (D1SUP_0): The D1 state is not supported. Reset: core well, but not D3-to-D0. Power Well: Core
24:22	111b RW/L	Aux_Current (AUXCUR_0): The USB2 SIP EHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known. Power Well: Core
21	0b RO	DSI (DSI_0): The Intel EHC reports 0, indicating that no device-specific initialization is required. Reset: core well, but not D3-to-D0. Power Well: Core
20	0b RO	Reserved (RSVD): Reserved.
19	0b RO	PME Clock (PMECLK_0): The Intel EHC reports 0, indicating that no PCI clock is required to generate PME#. Reset: core well, but not D3-to-D0. Power Well: Core
18:16	011b RW/L	Version (VERS_0): Version: The Intel EHC reports 011, indicating that it complies with Revision 1.21 of the PCI Power Management Specification. Note: As contingency plan, the bit can be reverted by BIOS to 010b to support PCI PM Revision 1.1, by manipulating the offset80h Access Control register's WRT_RDONLY bit. Power Well: Core
15:8	58h RW/L	Next Item Pointer #1 (PM_NEXT_0): This register defaults to 58h, which indicates that the next capability registers begin at configuration offset 58h. This register is writable when the WRT_RDONLY bit is set. This allows BIOS to effectively hide the Debug Port capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of 58h implies Debug Port and FLR capabilities visible 98h implies Debug Port invisible, next capability is FLR 00h implies that both Debug port and FLR capability are hidden Note that this value is never expected to be programmed. Reset: core well, but not D3-to-D0 Power Well: Core

Bit Range	Default & Access	Field Name (ID): Description
3	1b RO	No Soft Reset (NO_SOFT_RESET) : A '0' indicates device does perform an internal reset upon D3hot to D0 transition via software control of the PowerState bits. Configuration Context is lost. Full re-initialization sequence is needed to return the device to D0 Initialized.(Default to '1') Note: As contingency plan, the bit can be reverted by BIOS to 0, by manipulating the offset80h Access Control register's WRT_RDONLY bit. Power Well : Resume
2	0b RO	Reserved (RSVD) : Reserved.
1:0	00b RW	PowerState (PWRST_0) : This 2-bit field is used both to determine the current power state of EHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3hot state, the accesses to the EHC memory range must not be accepted; but the configuration space must still be accessible. When not in the D0 state, the generation of the interrupt output is blocked. Specifically, the PIRQ[H] is not asserted when not in the D0 state. When software changes this value from the D3hot state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function. Power Well : Resume

18.8.11 Debug Port Capability ID and Next Item Pointer #2 and Debug Port Base Offset (DP_CID_NEXT_BASE)—Offset 58h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + 58h

Default: 20A0980Ah

31	28	24	20	16	12	8	4	0																							
0	0	1	0	0	0	0	0	1	0	1	0	0	0	0	0	1	0	0	1	1	0	0	0	0	0	0	0	1	0	1	0
BARNUM_0				DPOFFSET_0				RSVD				DP_CID_0																			

Bit Range	Default & Access	Field Name (ID): Description
31:29	001b RO	BAR Number (BARNUM_0) : Read-Only. This field is hardwired to 001b to indicate the memory BAR at offset 10h in the EHCI configuration space. Reset: Not applicable. Power Well : Core
28:16	00A0h RO	Debug Port Offset (DPOFFSET_0) : This field is hardwired to 0A0h to indicate that the debug port registers begin at offset A0h in the EHCI memory range. Reset: Not applicable. Power Well : Core
15:8	98h RO	Reserved (RSVD) : Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	20h RO	Serial Bus Release Number (SBRN_0) : value of 20h indicates that this controller follows USB release 2.0 Power Well : Resume

18.8.13 Port Disable Override and RMH Device Removable (PDO_RMHDR)—Offset 64h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + 64h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0

0	0	0	0	0	0	0	0	0
RSVD	DRBM_0			RSVD	RSVD			

Bit Range	Default & Access	Field Name (ID): Description
31:25	0000000b RO	Reserved (RSVD) : Reserved.
24:17	00h RW	Device Removable Bit Map (DRBM_0) : A 1 in a given bit position in this field indicates that the corresponding downstream port of the RMH is connected to a non-removable device. A 0 indicates that the port is exposed to the user. Bits 8:1 are mapped to Ports 8:1. This bits control the value returned by the RMH in the DeviceRemovable field of the Hub Descriptor. A 1 in a given bit position in this register will result in the corresponding bit in the DeviceRemovable field of the hub descriptor being set to 1 as well (indicating that the port is connected to a non-removable device). System BIOS is expected to set these values upon Boot and resume from Sx states. Power Well : Core
16:8	00000000b RO	Reserved (RSVD) : Reserved.
7:0	00h RO	Reserved (RSVD) : Reserved.

18.8.14 USB2 Legacy Support Extended Capability (ULSEC)—Offset 68h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + 68h

Default: 00000001h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	1	
RSVD				HCOSOS_0	RSVD		HCBIOS_0	NxtEHCIcapP_0	CapID_0

Bit Range	Default & Access	Field Name (ID): Description
31:25	0000000b RO	Reserved (RSVD): Reserved.
24	0b RW	HC OS Owned Semaphore (HCOSOS_0): System software sets this bit to request ownership of the EHCI controller. Ownership is obtained when this bit reads as 1 and the HC BIOS Owned Semaphore bit reads as clear. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition. Power Well: Resume
23:17	0000000b RO	Reserved (RSVD): Reserved.
16	0b RW	HC BIOS Owned Semaphore (HCBIOS_0): The BIOS sets this bit to establish ownership of the EHCI controller. System BIOS will clear this bit in response to a request for ownership of the EHCI controller by system software. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition. Power Well: Resume
15:8	00h RO	Next EHCI Capability Pointer (NxtEHCIcapP_0): A value of 00h indicates that there are no EHCI Extended Capability structures in this device. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition. Power Well: Resume
7:0	01h RO	Capability ID (CapID_0): A value of 01h indicates that this EHCI Extended Capability is the Legacy Support Capability. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition. Power Well: Resume

18.8.15 USB2 Legacy Support Control/Status (ULSCS)—Offset 6Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + 6Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RWC	SMI on BAR (SMIonBAR_0): This bit is set to '1' whenever the Base Address Register (BAR) is written. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition. Power Well: Resume
30	0b RWC	SMI on PCI Command (SMIonPCCom_0): This bit is set to '1' whenever the PCI Command Register is written. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition. Power Well: Resume
29	0b RWC	SMI on OS Ownership Change (SMIonOSSC_0): This bit is set to '1' whenever the HC OS Owned Semaphore bit in the USB2 Legacy Support Extended Capability register transitions from 1 to a 0 or 0 to a 1. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition. Power Well: Resume
28:22	00h RO	Reserved (RSVD): Reserved.
21	0b RO	SMI on Async Advance (SMIonAA_0): Shadow bit of the Interrupt on Async Advance bit in the USB2STS register. To clear this bit system software must write a one to the Interrupt on Async Advance bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition. Power Well: Resume
20	0b RO	SMI on Host System Error (SMIonHSE_0): Shadow bit of Host System Error bit in the USB2STS. To clear this bit system software must write a one to the Host System Error bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition. Power Well: Resume

Bit Range	Default & Access	Field Name (ID): Description
19	0b RO	<p>SMI on Frame List Rollover (SMIonFLR_O): Shadow bit of Frame List Rollover bit in the USB2STS register. To clear this bit system software must write a one to the Frame List Rollover bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
18	0b RO	<p>SMI on Port Change Detect (SMIonPCD_O): Shadow bit of Port Change Detect bit in the USB2STS register. To clear this bit system software must write a one to the Port Change Detect bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
17	0b RO	<p>SMI on USB Error (SMIonUE_O): Shadow bit of USB Error Interrupt (USBERRINT) bit in the USB2STS register. To clear this bit system software must write a one to the USB Error Interrupt bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
16	0b RO	<p>SMI on USB Complete (SMIoUSBC_O): Shadow bit of USB Interrupt (USBINT) bit in the USB2STS register. To clear this bit system software must write a one to the USB Interrupt bit in the USB2STS register. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
15	0b RW	<p>SMI on BAR Enable (SMIonBARE_O): When this bit is '1' and SMIonBAR_0 is '1', then the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
14	0b RW	<p>SMI on PCI Command Enable (SMIonPCICE_O): When this bit is '1' and SMI on PCI Command is '1', then the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
13	0b RW	<p>SMI on OS Ownership Enable (SMIonOSSOE_O): When this bit is a one AND the OS Ownership Change bit is one, the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
12:6	00h RO	<p>Reserved (RSVD): Reserved.</p>
5	0b RW	<p>SMI on Async Advance Enable (SMIonAAE_O): When this bit is a one, and the SMI on Async Advance bit is a one, the host controller will issue an SMI immediately. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	<p>SMI on Host System Error Enable (SMI onHSEE_0): When this bit is a one, and the SMI on Host System Error is a one, the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
3	0b RW	<p>SMI on Frame List Rollover Enable (SMI onFLRE_0): When this bit is a one, and the SMI on Frame List Rollover bit is a one, the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
2	0b RW	<p>SMI on Port Change Enable (SMI onPCE_0): When this bit is a one, and the SMI on Port Change Detect bit is a one, the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
1	0b RW	<p>SMI on USB Error Enable (SMI onUSBEE_0): When this bit is a one, and the SMI on USB Error bit is a one, the host controller will issue an SMI immediately. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>
0	0b RW	<p>SMI on USB Complete Enable (SMI onUSBCE_0): When this bit is a one, and the SMI on USB Complete bit is a one, the host controller will issue an SMI immediately. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.</p> <p>Power Well: Resume</p>

18.8.16 Intel-Specific USB2 SMI (ISU2SMI)—Offset 70h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + 70h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0

				SMIonHCRst_0	SMIonPOEn_0			SMIonPMSCREn_0
							SMIonAsyncEn_0	SMIonPeriodicEn_0
							SMIonCFEn_0	SMIonHCHaltedEn_0
							SMIonHCRstEn_0	

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RWC	SMI on PortOwner (SMIonPO1_0) : Bits 29:22 correspond to the Port Owner bits for ports 1 (22) through 8 (29). These bits are set to '1' whenever the associated Port Owner bits transition from 0-)1 or 1-)0. Software clears these bits by writing a one. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition Power Well: Resume
21	0b RWC	SMI on PMCSR (SMIonPMCSR_0) : This bit is set to '1' whenever software modifies the Power State bits in the Power Management Control/Status register. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition Power Well: Resume
20	0b RWC	SMI on Async (SMIonAsync_0) : This bit is set to '1' whenever the Async Schedule Enable bit transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition Power Well: Resume
19	0b RWC	SMI on Periodic (SMIonPeriodic_0) : This bit is set to '1' whenever the Periodic Schedule Enable bit transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition Power Well: Resume
18	0b RWC	SMI on CF (SMIonCF_0) : This bit is set to '1' whenever the Configure Flag transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition Power Well: Resume
17	0b RWC	SMI on HCHalted (SMIonHCHalted_0) : This bit is set to '1' whenever HCHalted transitions to '1' as a result of the Run/Stop bit being cleared. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition Power Well: Resume

Bit Range	Default & Access	Field Name (ID): Description
16	0b RWC	<p>SMI on HCRreset (SMI onHCRst_0): This bit is set to '1' whenever HCRESET transitions to '1'. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p>Power Well: Resume</p>
15:6	000h RW	<p>SMI on PortOwner Enable (SMI onPOEn_0): When any of these bits are '1' and the corresponding SMI on PortOwner bits are '1', then the host controller will issue an SMI. Unused ports should have their corresponding bits cleared. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p>Power Well: Resume</p>
5	0b RW	<p>SMI on PMSCR Enable (SMI onPMSCREn_0): When this bit is '1' and SMI on PMSCR is '1', then the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p>Power Well: Resume</p>
4	0b RW	<p>SMI on Async Enable (SMI onAsyncEn_0): When this bit is '1' and SMI on Async is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p>Power Well: Resume</p>
3	0b RW	<p>SMI on Periodic Enable (SMI onPeriodicEn_0): When this bit is '1' and SMI on Periodic is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p>Power Well: Resume</p>
2	0b RW	<p>SMI on CF Enable (SMI onCFEn_0): When this bit is '1' and SMI on CF is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p>Power Well: Resume</p>
1	0b RW	<p>SMI on HCHalted Enable (SMI onHCHaltedEn_0): When this bit is a '1' and SMI on HCHalted is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p>Power Well: Resume</p>
0	0b RW	<p>SMI on HCRreset Enable (SMI onHCRstEn_0): When this bit is a '1' and SMI on HCHalted is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition</p> <p>Power Well: Resume</p>

18.8.19 Manufacturer's ID (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:29, F:0] + F8h

Default: 00000F86h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	0	0	0	0	1	1	0
RSVD				DPID_0				MSID_0				MAN_0				PPID_0							

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved (RSVD): Reserved.
27:24	0h RO	Dot portion of Process ID (DPID_0): Dot portion of Process ID: Indicates the dot Note: Process is reflected in bits [7:0] This is SIP customer implementation specific and SIP customer need to tie off the field accordingly. Power Well: Core
23:16	00h RO	Manufacturing Stepping Identifier (MSID_0): Stepping ID: This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change. This is SIP customer implementation specific and SIP customer need to tie off the field accordingly. Implementation Note: A single Stepping ID can be implemented that is readable from all functions in the chip because all of them are incremented in lock-step. Power Well: Core
15:8	0Fh RO	Manufacturer (MAN_0): 0Fh = Intel Power Well: Core
7:0	86h RO	Process portion of process ID (PPID_0): Process portion of process ID: Indicates the process. Note: Dot is reflected in bits [27:24] This is SIP customer implementation specific and SIP customer need to tie off the field accordingly. Implementation Note: It is recommended that the Manufacturing ID is implemented in one place and readable from all functions. This minimizes the changes required for a process shrink. Power Well: Core

18.9 USB EHCI Memory Mapped IO Registers

Default: 01000020h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0100h RO	Host Controller Interface Version Number (HCIVERSION_B0_0): This is a two-byte register containing a BCD encoding of the version number of interface that this host controller interface conforms. Power Well: Core
15:8	00h RO	Reserved (RSVD): Reserved.
7:0	20h RO	Capability Registers Length (CAPLENGTH_0): This register is used as an offset to add to the Memory Base Register to find the beginning of the Operational Register Space. This is fixed at 20h, indicating that the Operation Registers begin at offset 20h. Power Well: Resume

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RO	<p>Number of Ports per Companion Controller (N_PCC_0): This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software. Read-Only. This register is only reset by the resume power well going low. It is not reset by a D3-to-D0 state transition or HCRESET (Host Controller Reset)</p> <p>Power Well: Core</p>
7	0b RO	<p>Port Routing Rules (PRR_0): This field indicates the method used by this implementation for how all ports are mapped to companion controllers. This is hardwired to 0, indicating that the first N_PCC (=2) ports are routed to the lowest numbered function companion host controller, the next N_PCC ports are routed to the next lowest function companion controller, and so on</p> <p>Power Well: Resume</p>
6:5	00b RO	Reserved (RSVD): Reserved.
4	0b RO	Reserved (RSVD): Reserved.
3:0	8h RW	<p>N_PORTS (NPORTS_0): This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1H to FH. The default value for the EHCI controller indicates 8 ports. BIOS may overwrite the default value to properly describe the board or chip SKU . (please refer to RMH Configuration Details in section 1.23.2). A zero in this field is undefined. Integrated RMH - If USB-R is disabled, this should be updated by BIOS to 2 such that the EHC reports 2ports to be default, port 0 assigned to the RMH and port 1 assigned to the debug device. If USB-R is enabled, the number reported should be updated to 3 by BIOS (port 2 will be assigned to USB-R in this case) Legacy Mode - The default value for the EHCI controller indicates 8 ports. If USB-R support is enabled, BIOS should account for the additional ports in calculating the value to write to this field.</p> <p>Power Well: Resume</p>

18.9.3 Host Controller Capability Parameters (HCCPARAMS)— Offset 8h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 8h

MBAR Type: PCI Configuration Register (Size: 32 bits)

MBAR Reference: [B:0, D:29, F:0] + 10h

Default: 00036881h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	1
RSVD				ASPFC_0	PSPFC_0	EECP_0	IST_0	RSVD
							ASPC_0	PFLF_0
								AC64_0

Bit Range	Default & Access	Field Name (ID): Description
31:18	00000000 00000b RO	Reserved (RSVD): Reserved.
17	1b RW	Asynchronous Schedule Prefetch Capability (ASPFC_0): This bit indicates that the hardware supports the Asynch schedule prefetch enable bit in the USB command register. Power Well: Resume
16	1b RW	Periodic Schedule Prefetch Capability (PSPFC_0): This bit indicates that the EHC hardware supports the Periodic Schedule prefetch bit in the USB2 Command Register. Power Well: Core
15:8	68h RO	EHCI Extended Capabilities Pointer (EECP_0): This field is hardwired to 68h, indicating that the EHCI capabilities list exists and begins at offset 68h in the PCI configuration space. Power Well: Resume
7:4	8h RO	Isochronous Scheduling Threshold (IST_0): This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller holds a set of isochronous data structures (one or more) before flushing the state. When bit [7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame. Refer to the EHCI specification for details on how software uses this information for scheduling isochronous transfers. The Intel USB2 hardwires this field to 8h. Power Well: Resume
3	0b RO	Reserved (RSVD): Reserved.
2	0b RO	Asynchronous Schedule Park Capability (ASPC_0): This bit is hardwired to 0 indicating that the Host Controller does not support this optional feature. Power Well: Resume

Bit Range	Default & Access	Field Name (ID): Description
23:16	08h RW	<p>Interrupt Threshold Control (ITC_0): This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined. Value Maximum Interrupt Interval 00h Reserved 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames (default, equates to 1 ms) 10h 16 micro-frames (2 ms) 20h 32 micro-frames (4 ms) 40h 64 micro-frames (8 ms) Refer to Section 4 in the EHCI specification for interrupts affected by this field.</p> <p>Power Well: Core</p>
15:14	00b RO	<p>Reserved (RSVD): Reserved.</p>
13	0b RO	<p>Reserved (RSVD): Reserved.</p>
12	0h RO	<p>Reserved (RSVD): Reserved.</p>
11:8	0h RO	<p>Unimplemented Asynchronous Park Mode Bits (UAPMB_0): This field is hardwired to 000b because the host controller does not support this optional feature.</p> <p>Power Well: Core</p>
7	0b RO	<p>Light Host Controller Reset (LHCR_0): Read Only 0b. The Intel EHC does not implement this optional reset and hardwires this bit to 0.</p> <p>Power Well: Core</p>
6	0b RW	<p>Interrupt on Async Advance Doorbell (IAAD_0): This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Async Advance Enable bit in the USBINTR register is a one then the host controller will assert an interrupt at the next interrupt threshold. See the EHCI specification for operational details. The host controller sets this bit to a zero after it has set the Interrupt on Async Advance status bit in the USBSTS register to a one. Software should not write a one to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.</p> <p>Power Well: Core</p>
5	0b RW	<p>Asynchronous Schedule Enable (ASE_0): This bit controls whether the host controller skips processing the Asynchronous Schedule. Values mean: 0b Do not process the Asynchronous Schedule 1b Use the ASYNCLISTADDR register to access the Asynchronous Schedule.</p> <p>Power Well: Core</p>

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	<p>Periodic Schedule Enable (PSE_0): This bit controls whether the host controller skips processing the Periodic Schedule. Values mean: 0b Do not process the Periodic Schedule 1b Use the PERIODICLISTBASE register to access the Periodic Schedule.</p> <p>Power Well: Core</p>
3:2	00b RO	<p>Frame List Size (FLS_0): This field is R/W only if Programmable Frame List Flag in the HCCPARAMS registers is set to a one. . This field specifies the size of the frame list. The size the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index. Values mean:00b 1024 elements (4096 bytes) Default value; 01b 512 elements (2048 bytes); 10b 256 elements (1024 bytes) - for resource-constrained environments</p> <p>Power Well: Core</p>
1	0b RW	<p>Host Controller Reset (HCRESET_0): This control bit used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset. When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. Note: PCI Configuration registers and Host Controller Capability Registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Port ownership will be disowned by the host controller(s), with the side effects described in the EHCI spec. Software must reinitialize the host controller in order to return the host controller to an operational state. This bit is set to zero by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Software should not set this bit to a one when the HCHalted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller will result in undefined behavior. This reset must be used to leave EHCI port test modes.</p> <p>Power Well: Core</p>
0	0b RW	<p>Run/Stop (RS_0): 1=Run. 0=Stop. When set to a 1, the Host Controller proceeds with execution of the schedule. The Host Controller continues execution as long as this bit is set to a 1. When this bit is set to 0, the Host Controller completes the current and any actively pipelined transactions on the USB and then halts. The Host Controller must halt within 16 microframes after software clears the Run bit. The HC Halted bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software should not write a 1 to this field unless the host controller is in the Halted state (i.e. HCHalted in the USBSTS register is a one). The following table explains how the different combinations of Run and Halted must be interpreted: Run/Stop Halted Interpretation 0 0 Valid- in the process of halting 0 1 Valid- halted 1 0 Valid-running 1 1 Invalid- the HCHalted bit clears immediately Memory read cycles initiated by the EHC that receive any status other than Successful will result in this bit being cleared (and also affect the Host Error bit).</p> <p>Power Well: Core</p>

Bit Range	Default & Access	Field Name (ID): Description
12	1b RO	<p>HCHalted (HCHALT_0): This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to 1 after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g. internal error). The Prefetch-Based Pause feature prevents this bit from transitioning to 0 if it is currently has a request pending, in addition to the regular DMA engines.</p> <p>Power Well: Core</p>
11:6	000000b RO	<p>Reserved (RSVD): Reserved.</p>
5	0b RWC	<p>Interrupt on Async Advance (IAA_0): System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source.</p> <p>Power Well: Core</p>
4	0b RWC	<p>Host System Error (HSE_0): The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. Memory read cycles initiated by the EHC that receive any status other than Successful will result in this bit being set. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs. A hardware interrupt is generated to the system (if enabled in the Interrupt Enable Register).</p> <p>Power Well: Core</p>
3	0b RWC	<p>Frame List Rollover (FLR_0): The Host Controller sets this bit to a one when the Frame List Index (see Section 9.3.2.4) rolls over from its maximum value to zero. Since the USB2 SIP only supports the 1024-entry Frame List Size, the Frame List Index rolls over every time FRNUM[13] toggles.</p> <p>Power Well: Core</p>
2	0b RWC	<p>Port Change Detect (PCD_0): The Host Controller sets this bit to a one when any port for which the Port Owner bit is set to zero has a change bit transition from a zero to a one or a Force Port Resume bit transition from a zero to a one as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to a one after system software has relinquished ownership of a connected port by writing a zero to a port's Port Owner bit. This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force port resume, over-current change, enable/disable change and connect status change). Regardless of the implementation, whenever this bit is readable (i.e., in the D0 state), it must provide a valid view of the Port Status registers.</p> <p>Power Well: Core</p>

Bit Range	Default & Access	Field Name (ID): Description
1	0b RWC	USB Error Interrupt (USBERRINT_0) : The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (e.g., error counter underflow). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and Bit 0 are set. See the EHCI specification for a list of the USB errors that will result in this interrupt being asserted. Power Well: Core
0	0b RWC	USB Interrupt (USBINT_0) : The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set. The Host Controller also sets this bit to 1 when a short packet is detected (actual number of bytes received was less than the expected number of bytes). Power Well: Core

18.9.6 USB2 Interrupt Enable (USB2INTR)—Offset 28h

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO	Reserved (RSVD): Reserved.
22	0b RW	Wake on Over-current Enable (WKOCE_PO_0): Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set. Power Well: Resume
21	0b RW	Wake on Disconnect Enable (WKDSCNTE_PO_0): Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0). Power Well: Resume
20	0b RW	Wake on Connect Enable (WKCNNTE_PO_0): Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1). Power Well: Resume

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	<p>Port Test Control (PTC_PO_0): When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.</p> <p>Power Well: Resume</p>
15:14	00b RW	<p>Port Indicator Control (PIC_PO_0): Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.</p> <p>Power Well: Resume</p>
13	1b RW	<p>Port Owner (PO_PO_0): This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.</p> <p>Power Well: Resume</p>
12	1b RO	<p>Port Power (PP_PO_0): Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.</p> <p>Power Well: Resume</p>
11:10	00b RO	<p>Line Status (LS_PO_0): These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset</p> <p>Power Well: Resume</p>

Bit Range	Default & Access	Field Name (ID): Description
9	0b RO	Reserved (RSVD): Reserved.
8	0b RW	<p>Port Reset (PORTRST_PO_0): 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.</p> <p>Power Well: Resume</p>
7	0b RW	<p>Suspend (SUSP_PO_0): 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when: Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.</p> <p>Power Well: Resume</p>

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	<p>Force Port Resume (FPR_PO_0): 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.</p> <p>Power Well: Resume</p>
5	0b RWC	<p>Over-current Change (OCC_PO_0): This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.</p> <p>Power Well: Resume</p>
4	0b RO	<p>Over-current Active (OACT_PO_0): 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.</p> <p>Power Well: Resume</p>
3	0b RWC	<p>Port Enable/Disable Change (PEDC_PO_0): 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.</p> <p>Power Well: Resume</p>
2	0b RO	<p>Reserved (RSVD): Reserved.</p>

Bit Range	Default & Access	Field Name (ID): Description
21	0b RW	<p>Wake on Disconnect Enable (WKDSCNTE_PO_0): Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0).</p> <p>Power Well: Resume</p>
20	0b RW	<p>Wake on Connect Enable (WKCNNTE_PO_0): Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1).</p> <p>Power Well: Resume</p>
19:16	0h RW	<p>Port Test Control (PTC_PO_0): When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.</p> <p>Power Well: Resume</p>
15:14	00b RW	<p>Port Indicator Control (PIC_PO_0): Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.</p> <p>Power Well: Resume</p>
13	1b RW	<p>Port Owner (PO_PO_0): This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.</p> <p>Power Well: Resume</p>

Bit Range	Default & Access	Field Name (ID): Description
12	1b RO	<p>Port Power (PP_PO_0): Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.</p> <p>Power Well: Resume</p>
11:10	00b RO	<p>Line Status (LS_PO_0): These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset</p> <p>Power Well: Resume</p>
9	0b RO	<p>Reserved (RSVD): Reserved.</p>
8	0b RW	<p>Port Reset (PORTRST_PO_0): 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.</p> <p>Power Well: Resume</p>

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	<p>Suspend (SUSP_PO_0): 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when: Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.</p> <p>Power Well: Resume</p>
6	0b RW	<p>Force Port Resume (FPR_PO_0): 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.</p> <p>Power Well: Resume</p>
5	0b RWC	<p>Over-current Change (OCC_PO_0): This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.</p> <p>Power Well: Resume</p>

Bit Range	Default & Access	Field Name (ID): Description
4	0b RO	<p>Over-current Active (OACT_PO_0): 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO	Reserved (RSVD): Reserved.
22	0b RW	Wake on Over-current Enable (WKOCE_PO_0): Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set. Power Well: Resume
21	0b RW	Wake on Disconnect Enable (WKDSCNTE_PO_0): Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0). Power Well: Resume
20	0b RW	Wake on Connect Enable (WKCNNTE_PO_0): Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1). Power Well: Resume

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	<p>Port Test Control (PTC_PO_0): When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.</p> <p>Power Well: Resume</p>
15:14	00b RW	<p>Port Indicator Control (PIC_PO_0): Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.</p> <p>Power Well: Resume</p>
13	1b RW	<p>Port Owner (PO_PO_0): This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.</p> <p>Power Well: Resume</p>
12	1b RO	<p>Port Power (PP_PO_0): Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.</p> <p>Power Well: Resume</p>
11:10	00b RO	<p>Line Status (LS_PO_0): These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset</p> <p>Power Well: Resume</p>

Bit Range	Default & Access	Field Name (ID): Description
9	0b RO	Reserved (RSVD): Reserved.
8	0b RW	<p>Port Reset (PORTRST_PO_0): 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.</p> <p>Power Well: Resume</p>
7	0b RW	<p>Suspend (SUSP_PO_0): 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when: Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.</p> <p>Power Well: Resume</p>

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	<p>Force Port Resume (FPR_PO_0): 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.</p> <p>Power Well: Resume</p>
5	0b RWC	<p>Over-current Change (OCC_PO_0): This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.</p> <p>Power Well: Resume</p>
4	0b RO	<p>Over-current Active (OACT_PO_0): 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.</p> <p>Power Well: Resume</p>
3	0b RWC	<p>Port Enable/Disable Change (PEDC_PO_0): 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.</p> <p>Power Well: Resume</p>
2	0b RO	<p>Reserved (RSVD): Reserved.</p>

Bit Range	Default & Access	Field Name (ID): Description
1	0b RWC	<p>Connect Status Change (CSC_PO_0): 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.</p> <p>Power Well: Resume</p>
0	0b RO	<p>Current Connect Status (CCS_PO_0): 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.</p> <p>Power Well: Resume</p>

19:16	0h RW	<p>Port Test Control (PTC_PO_0): When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.</p> <p>Power Well: Resume</p>
15:14	00b RW	<p>Port Indicator Control (PIC_PO_0): Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.</p> <p>Power Well: Resume</p>
13	1b RW	<p>Port Owner (PO_PO_0): This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.</p> <p>Power Well: Resume</p>
12	1b RO	<p>Port Power (PP_PO_0): Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.</p> <p>Power Well: Resume</p>
11:10	00b RO	<p>Line Status (LS_PO_0): These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset</p> <p>Power Well: Resume</p>

Bit Range	Default & Access	Field Name (ID): Description
9	0b RO	Reserved (RSVD): Reserved.
8	0b RW	<p>Port Reset (PORTRST_PO_0): 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.</p> <p>Power Well: Resume</p>
7	0b RW	<p>Suspend (SUSP_PO_0): 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when: Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.</p> <p>Power Well: Resume</p>

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	<p>Force Port Resume (FPR_PO_0): 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.</p> <p>Power Well: Resume</p>
5	0b RWC	<p>Over-current Change (OCC_PO_0): This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.</p> <p>Power Well: Resume</p>
4	0b RO	<p>Over-current Active (OACT_PO_0): 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.</p> <p>Power Well: Resume</p>
3	0b RWC	<p>Port Enable/Disable Change (PEDC_PO_0): 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.</p> <p>Power Well: Resume</p>
2	0b RO	<p>Reserved (RSVD): Reserved.</p>

Bit Range	Default & Access	Field Name (ID): Description
21	0b RW	<p>Wake on Disconnect Enable (WKDSCNTE_PO_0): Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0).</p> <p>Power Well: Resume</p>
20	0b RW	<p>Wake on Connect Enable (WKCNNTE_PO_0): Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1).</p> <p>Power Well: Resume</p>
19:16	0h RW	<p>Port Test Control (PTC_PO_0): When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.</p> <p>Power Well: Resume</p>
15:14	00b RW	<p>Port Indicator Control (PIC_PO_0): Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. 1	0b RWC	<p>Connect Status Change (CSC_PO_0): 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.</p> <p>Power Well: Resume</p>
0	0b RO	<p>Current Connect Status (CCS_PO_0): 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.</p> <p>Power Well: Resume</p>

18.9.20 Debug Port Control/Status Register (DP_CTRLSTS)— Offset A0h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + A0h

MBAR Type: PCI Configuration Register (Size: 32 bits)

MBAR Reference: [B:0, D:29, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD	OWNERCNT_0	RSVD	RSVD	DONESTS_0	LINKIDSTS_0	RSVD	EXCP_STS_0	ERRGOODSTS_0
	ENABLEDCNT_0					INUSECNT_0		GOCNT_0
								WRRDCNT_0
								DATALENCNT_0

Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	Reserved (RSVD): Reserved.
30	0b RW	OWNER_CNT (OWNERCNT_0): When software writes a 1 to this bit, the ownership of the debug port is forced to the EHCI controller (i.e. immediately taken away from the companion Classic USB Host Controller) If the port was already owned by the EHCI controller, then setting this bit has no effect. This bit overrides all of the ownership-related bits in the standard EHCI registers. Note that the value in this bit does not affect the value reported in the PORTSC Port Owner bit. Power Well: Core
29	0b RO	Reserved (RSVD): Reserved.
28	0b RW	ENABLED_CNT (ENABLEDCNT_0): This bit = 1 if the debug port is enabled for operation. Software can clear this by writing a zero to it. The hardware clears the bit for the same conditions where hardware clears the Port Enable/Disable bit (in the PORTSC register). (Note this bit is not cleared when software clears the Port Enabled/Disabled bit in the PORTSC.) Software can directly set this bit if the port is already enabled in the associated Port Status and Control register (this is enforced by the hardware). Reset default = 0. Power Well: Core
27:17	00000000 00b RO	Reserved (RSVD): Reserved.

Bit Range	Default & Access	Field Name (ID): Description
16	0b RWC	DONE_STS (DONESTS_0) : Read/Write-Clear. This bit is set by hardware to indicate that the request is complete. Writing a 1 to this bit will clear it if it is set. Writing a 0 to this bit has no effect. Reset default = 0 Power Well: Core
15:12	0000b RO	LINK_ID_STS (LINKIDSTS_0) : Read-Only. This field identifies the link interface. It is hardwired to 0h to indicate that it is a USB Debug Port. Power Well: Core
11	0b RO	Reserved (RSVD) : Reserved.
10	0b RO	IN_USE_CNT (INUSECNT_0) : Set by software to indicate that the port is in use. Cleared by software to indicate that the port is free and may be used by other software. This bit is cleared after reset. (This bit has no affect on hardware.) Power Well: Core
9:7	000b RO	EXCEPTION_STS (EXCP_STS_0) : Read-Only. This field indicates the exception when the ERROR_GOOD#_STS bit is set. This field should be ignored if the ERROR_GOOD#_STS bit is 0. 000 No Error. Note: this should not be seen, since this field should only be checked if there is an erro. 001 Transaction error: indicates the USB2 transaction had an error (CRC, bad PID, timeout, etc.) 010 HW error. Request was attempted (or in progress) when port was suspended or reset. All Others are reserved Reset default = 000b Power Well: Core
6	0b RO	ERROR_GOOD_STS (ERRGOODSTS_0) : Read-Only. The hardware clears this bit to 0 upon the proper completion of a read or write. The hardware sets this bit to indicate that an error has occurred. Details on the nature of the error are provided in the Exception field. Reset default = 0. Power Well: Core
5	0b RW	GO_CNT (GOCNT_0) : Software sets this bit to cause the hardware to perform a read or write request. Writing a 0 to this bit has no effect. Writing a 1 to this bit when it is already set may result in undefined behavior. When set, the hardware clears this bit when the hardware sets the DONE_STS bit. Reset default = 0. Power Well: Core
4	0b RW	WRITE_READ_CNT (WRRDCNT_0) : Software sets this bit to indicate that the current request is a write. Software clears this bit to indicate that the current request is a read. Reset default = 0. Power Well: Core

Bit Range	Default & Access	Field Name (ID): Description
3:0	0000b RW	<p>DATA_LEN_CNT (DATALENCNT_0): This field is used to indicate the size of the data to be transferred. Reset default = 0h. For write operations, this field is set by software to indicate to the hardware how many bytes of data in Data Buffer are to be transferred to the console. A value of 0h indicates that a zero-length packet should be sent. A value of 1-8 indicates 1-8 bytes are to be transferred. Values 9-Fh are illegal and how hardware behaves if used is undefined. For read operations, this field is set by hardware to indicate to software how many bytes in Data Buffer are valid in response to a read operation. A value of 0h indicates that a zero length packet was returned and the state of Data Buffer is not defined. A value of 1-8 indicates 1-8 bytes were received. Hardware is not allowed to return values 9-Fh. The transferring of data always starts with byte 0 in the data area and moves toward byte 7 until the transfer size is reached.</p> <p>Power Well: Core</p>

19 USB Device Controller Interfaces (3.0, ULPI)

The SoC implements a single USB 3.0 device controller, where the platform acts as a peripheral to another device or another PC.

The USB Device controller supports connections at Super Speed (3.0) on the USB3DEV interface, and High and Full speeds (2.0/1.x) on the ULPI interface. To support High and Full Speed devices on ULPI, an external PHY is required.

Note: The ULPI interface must be implemented even if only SuperSpeed support is required. The USB3DEV interface will not operate if the ULPI interface is disabled.

19.0.1 Signal Descriptions

See [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

Table 215. USB 3.0 Device Signals

Signal Name	Direction Plat. Power	Description
USB3DEV_RXP/N[0]	I V1P0S	Data In: High speed serialized data inputs
USB3DEV_TXP/N[0]	O V1P0S	Data Out: High speed serialized data outputs.
USB3DEV_REXT[0]		Resistor Compensation: An external resistor must be connected between this pin and package ground. Contact your Intel representative for details.

Table 216. USB ULPI Device Signals

Signal Name	Direction Plat. Power	Description
USB_ULPI_CLK	I V1P8A	Interface Clock By default, control and data signals are synchronous to clock.
USB_ULPI_DATA[7:0]	I/O V1P8A	Bi-directional data bus Driven low by the Link during idle. The Link starts a transfer by sending a non-zero pattern. The PHY must assert USB_ULPI_DIR before using the data bus. A turnaround cycle is required every time that USB_ULPI_DIR toggles.
USB_ULPI_DIR	I V1P8A	Direction of the data bus By default, USB_ULPI_DIR is low and the PHY listens for non-zero data from the Link. The PHY asserts USB_ULPI_DIR to get control of the data bus.
USB_ULPI_NXT	I V1P8A	Next Data The PHY drives USB_ULPI_NXT high to throttle the data bus
USB_ULPI_STP	O V1P8A	Stop data The Link drives USB_ULPI_STP high to signal the end of its data stream. The Link can also drive USB_ULPI_STP high to request data bus access from the PHY
USB_ULPI_REFCLK	O V1P8A	Reference clock ULPI reference clock for external PHY
USB_ULPI_RST#	O V1P8A	Reset Used to reset the external PHY. Not part of ULPI specification. Optionally used by driver.

19.1 USB Device Controller

The USB device controller can control one USB 3.0 Device port. Either a combo SS + ULPI Device port, or UPLI only port. It supports hosts conforming to USB 3.0 at bit rates up to 5 Gbps on USB3DEV interface as well as USB 2.0 hosts at up to 480 Mbps via a PHY on ULPI.

19.1.1 Features

Features supported by the Device Controller include:

- Enumerable by both ACPI and PCI. The USB3 device subsystem is designed to appear to the OS as a true PCI device. It will also support ACPI-enumerated methods.
- Device controller registers and data structures are implemented as extensions to the EHCI programmers interface.
- Support for LPM (Link Power Management)

Some of the key features of the ULPI device controller are:

- Supports up to 8 endpoints when acting as device
- 8-bit data interface transmitted at 60 MHz ULPI clock

Note: Recommended not to disconnect the connection when a debug session is in progress.

19.1.2 Power Management Features

The USB 3.0 device subsystem supports the following device power states:

- D0: Functional and highest power state.
- RTD3 (D3): Software managed deepest low power state in which state is saved/restored if needed prior to entry/exit

19.1.2.1 D0

This is the Functional and highest power state. The USB 3.0 device subsystem is in this state when the USB link is in U0 (U0 is the normal operational state where packets can be transmitted and received).

19.1.2.2 D3

D3 is a low power state that is used when the link is suspended; for example, U3 (U3 is a link state where a device is put into a suspend state. Significant link and device powers are saved).

This is a software directed state in which the controller is either power gated or the power is disabled.

19.1.3 Interrupts

A Functional Interrupt is generated by the logic in the USB device controller core to indicate the occurrence of an event needing application intervention. The design of the USB device core is such that events such as “link change” that would traditionally trigger an interrupt through an interrupt status register, are instead delivered to an ‘Event buffer’ in host memory, together with an interrupt indicating this.

19.3 Register Map

See Chapters [Section 3, “Register Access Methods” on page 63](#) and [Section 4, “Mapping Address Spaces” on page 69](#) for additional information. Also note that the device controller also contains both device and host registers. The host functionality of this controller is not fully functional and should not be used. See the USB Host chapter for host controllers.

§

19.4 USB 3.0 Device PCI Configuration Registers

Table 217. Summary of USB 3.0 Device PCI Configuration Registers—0/22/0

Offset	Size	Register ID—Description	Default Value
0h	4	"reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 2447	00000000h
4h	4	"reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h" on page 2447	00100000h
8h	4	"reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h" on page 2448	00000000h
Ch	4	"reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch" on page 2449	00000000h
10h	4	"reg_BAR_type (BAR)—Offset 10h" on page 2450	00000000h
14h	4	"reg_BAR1_type (BAR1)—Offset 14h" on page 2450	00000000h
2Ch	4	"reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch" on page 2451	00000000h
30h	4	"reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 2451	00000000h
34h	4	"reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h" on page 2452	00000080h
3Ch	4	"reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch" on page 2452	00000100h
80h	4	"reg_POWERCAPID_type (POWERCAPID)—Offset 80h" on page 2453	48030001h
84h	4	"reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h" on page 2454	00000008h
F8h	4	"reg_MANID_type (MANID)—Offset F8h" on page 2454	00000000h

19.4.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

DEVVENDID: [B:0, D:22, F:0] + 0h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
DEVICEID				VENDORID				

Bit Range	Default & Access	Description
31:16	0000h RO	DEVICEID: Reserved.
15:0	0000h RO	VENDORID: Reserved.

19.4.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h

STATUSCOMMAND- Status and Command

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

STATUSCOMMAND: [B:0, D:22, F:0] + 4h

Default: 00100000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	1	0	0	0	0	0
0	0	0	0	0	0	0	0	0
Reserved0	RMA	RCA	Reserved1	CAPLIST	Reserved2	Reserved3	INTR_DISABLE	Reserved4
				INTR_STATUS			SERR_ENABLE	Reserved5
								BME
								MSE
								Reserved6

Bit Range	Default & Access	Description
31:30	0h RO	Reserved0: Reserved.
29	0h RW/1C	RMA: Reserved.
28	0h RW/1C	RCA: Reserved.
27:21	00h RO	Reserved1: Reserved.
20	1h RO	CAPLIST: Reserved.
19	0h RO	INTR_STATUS: Reserved.
18:16	0h RO	Reserved2: Reserved.
15:11	00h RO	Reserved3: Reserved.
10	0h RW	INTR_DISABLE: Reserved.
9	0h RO	Reserved4: Reserved.
8	0h RW	SERR_ENABLE: Reserved.
7:3	00h RO	Reserved5: Reserved.
2	0h RW	BME: Reserved.
1	0h RW	MSE: Reserved.
0	0h RO	Reserved6: Reserved.

19.4.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

REVCLASSCODE: [B:0, D:22, F:0] + 8h

Default: 00000000h

Bit Range	Default & Access	Description
31:8	000000h RO	CLASS_CODES: Reserved.
7:0	00h RO	RID: Reserved.

19.4.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

CLLATHEADERBIST: [B:0, D:22, F:0] + Ch

Default: 00000000h

Bit Range	Default & Access	Description
31:24	00h RO	Reserved0: Reserved.
23	0h RO	MULFNDEV: Reserved.
22:16	00h RO	HEADERTYPE: Reserved.
15:8	00h RO	LATTIMER: Reserved.
7:0	00h RW	CACHELINE_SIZE: Reserved.

19.4.5 reg_BAR_type (BAR)—Offset 10h

BAR -Base Address Register

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

BAR: [B:0, D:22, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
BASEADDR						SIZEINDICATOR	PREFETCHABLE	TYPE	MESSAGE_SPACE

Bit Range	Default & Access	Description
31:12	00000h RW	BASEADDR: Reserved.
11:4	00h RO	SIZEINDICATOR: Reserved.
3	0h RO	PREFETCHABLE: Reserved.
2:1	0h RO	TYPE: Reserved.
0	0h RO	MESSAGE_SPACE: Reserved.

19.4.6 reg_BAR1_type (BAR1)—Offset 14h

BAR1 -Base Address Register1

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

BAR1: [B:0, D:22, F:0] + 14h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
BASEADDR1						SIZEINDICATOR1	PREFETCHABLE1	TYPE1	MESSAGE_SPACE1

Bit Range	Default & Access	Description
31:0	00000000h RO	EXPANSION_ROM_BASE: Reserved.

19.4.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

CAPABILITYPTR: [B:0, D:22, F:0] + 34h

Default: 00000080h

Bit Range	Default & Access	Description
31:8	000000h RO	Reserved0: Reserved.
7:0	80h RO	CAPPTR_POWER: Reserved.

19.4.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

INTERRUPTREG: [B:0, D:22, F:0] + 3Ch

Default: 00000100h

31	28	24	20	16	12	8	4	0		
0	0	0	0	0	0	0	0	0		
0	0	0	0	0	0	0	1	0		
0	0	0	0	0	0	0	0	0		
MAX_LAT				MIN_GNT				Reserved0	INTPIN	INTLINE

Bit Range	Default & Access	Description
31:24	00h RO	MAX_LAT : Reserved.
23:16	00h RO	MIN_GNT : Reserved.
15:12	0h RO	Reserved0 : Reserved.
11:8	1h RO	INTPIN : Reserved.
7:0	00h RW	INTLINE : Reserved.

19.4.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h

POWERCAPID - PowerManagement Capability ID

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

POWERCAPID: [B:0, D:22, F:0] + 80h

Default: 48030001h

31	28	24	20	16	12	8	4	0	
0	1	0	0	1	0	0	0	0	
1	0	0	0	0	0	0	0	0	
0	0	0	0	0	1	1	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	1	
PMESUPPORT				Reserved0	VERSION	NXTCAP	POWER_CAP		

Bit Range	Default & Access	Description
31:27	09h RO	PMESUPPORT : Reserved.
26:19	00h RO	Reserved0 : Reserved.
18:16	3h RO	VERSION : Reserved.
15:8	00h RO	NXTCAP : Reserved.
7:0	01h RO	POWER_CAP : Reserved.

Bit Range	Default & Access	Description
31:0	00000000h RO	MANID: Reserved.

Bit Range	Default & Access	Description
19	0b RW	u2_pme_en: Determines whether ULPI flis PME events are allowed to trigger PME events to brige/GPIO
18	0b RW	core_pme_en: Determines whether core PME events are allowed to trigger PME events to brige/GPIO
17	0b RW	ulpiphy_refclk_disable: Feeds logic that generates the 19.2MHz clkreq signal
16	0b RW	ipma_cmn_refclk_disable: Feeds through PIMA PHY into 25MHz clkreq signal
15:14	00b RW	hub_port_perm_attach: Indicates if the device attached to a downstream port is permanently attached or not
13	0b RW	host_port_power_control: This port defines the bit [3] of Capability Parameters (HCCPARAMS). Change the PPC value through the pin Port Power Control (PPC). This indicates whether the host controller implementation includes port power control. ? 0 - Indicates that the port does not have port power switches. ? 1 - Indicates that the port has port power switches.
12	0b RW	xhci_revision: This signal is used to select the xHCI revision that the host controller complies with
11:8	0000b RW	bus_filter_bypass: Bus Filter Bypass. Disables the internal bus filters that are enabled by DWC_USB3_EN_BUS_FILTERS coreConsultant parameter. This static signal is present only when DWC_USB3_EN_BUS_FILTERS is 1. It is expected that this signal is set or reset at power-on reset and is not changed during the normal operation of the core.
7	0b RW	Reserved2: reserved
6	0b RW	Reserved1: reserved
5	0b RW	otg_phy_pwr_off_veto: Indicates that PHY suspend power should not power off even on RTD3hot (Note that the PHY core power is turned off during RTD3hot in line with the OTG core, as a function of otg_cnt_pwr_off_veto)
4	0b RW	otg_cnt_pwr_off_veto: Indicates that controller power should not power off even on RTD3hot. Also a veto signal to keep LPPLL on. Note: Currently LPPLL results in a veto for S0iX flows
3	0b RW	Brdg_rst: reset the core see also regRW1[31]
2	0b RW	Reserved0: reserved
1:0	00b RW	pm_power_state_request: This port defines the PCI power management state requested by the software. When the core is configured with two power rail support (DWC_USB3_EN_PWROPT=2), the valid states are: ? 00: D0 ? 11: D3 Active State

19.5.2 reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h

General Purpose Read Write Register2

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

GEN_REGRW2: [B:0, D:22, F:0] + A4h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RW	GEN_REG_RW2: Reserved.

19.5.3 reg_GEN_REGRW3_type (GEN_REGRW3)—Offset A8h

General Purpose Read Write Register3

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

GEN_REGRW3: [B:0, D:22, F:0] + A8h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RW	GEN_REG_RW3: Reserved.

19.5.4 reg_GEN_REGRW4_type (GEN_REGRW4)—Offset ACh

General Purpose Read Write Register4

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

GEN_REGRW4: [B:0, D:22, F:0] + ACh

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RW	GEN_REG_RW4: Reserved.

19.5.5 reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h

General Purpose Input Register

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

GEN_INPUT_REGRW: [B:0, D:22, F:0] + C0h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
pmgt_gate_bus_clk	b0dbg_ram_clk_gated	phy_u3dsport_vbus_ctrl	phy_u2dsport_vbus_ctrl	host_current_belt	reserved	host_system_err	gsts_buserraddvid	reserved1
					current_power_state_u3pmu	current_power_state_u2pmu	connect_state_u3pmu	connect_state_u2pmu
					utmi_l1_suspend_com_n	utmi_suspend_com_n	utmi_suspend_n	usb2_enumspeed
								b2rl_cur_mode

Bit Range	Default & Access	Description
31	0b RO	pmgt_gate_bus_clk : Indicates that the conditions are appropriate for some internal modules to receive a gated bus_clk. This signal is used by the test environment to verify low power operation.
30	0b RO	b0dbg_ram_clk_gated : Indicates that the internal ram_clk is being gated. It indicates whether ram_clk_gated is turned on or off. This signal is used by the test environment to verify low power.
29	0b RO	phy_u3dsport_vbus_ctrl : When the PMU is in the D0 state, this PHY-side output is fed directly from the core without any intervening logic. The core-side input is called core_u3dsport_vbus_ctrl.
28	0b RO	phy_u2dsport_vbus_ctrl : When the PMU is in the D0 state, this PHY-side output is fed directly from the core without any intervening logic. The core-side input is called core_u2dsport_vbus_ctrl.
27:16	000h RO	host_current_belt : Current BELT Value. This signal indicates the minimum value of all received BELT values and the BELT that is set by the Set LTV command. This signal is valid only in Host mode.
15	0b RO	reserved : Reserved.
14	0b RO	host_system_err : Host System Error. Indicates that a Host System Error has occurred as reflected in the USBSTS.HSE field.
13	0b RO	gsts_buserraddvid : Bus error.
12	0b RO	reserved1 : Reserved.

Bit Range	Default & Access	Description
11:10	00b RO	current_power_state_u3pmu : The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
9:8	00b RO	current_power_state_u2pmu : The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
7	0b RO	connect_state_u3pmu : When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in U3). When '0', indicates the PMU has no connection to the host or any device.
6	0b RO	connect_state_u2pmu : When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in L1, L2). When '0', indicates the PMU has no connection to the host or any device
5	0b RO	utmi_l1_suspend_com_n : Common L1 suspend
4	0b RO	utmi_suspend_com_n : Common suspend
3	0b RO	utmi_suspend_n : USB 2.0 Port Suspend
2:1	00b RO	usb2_enumspeed : Device Enumerated Speed
0	0b RO	b2r1_cur_mode : Current Mode. Current Mode 1'b0 Host ,1'b1 Device

19.6 USB 3.0 Device Memory Mapped I/O Registers

Table 219. Summary of USB 3.0 Device Memory Mapped I/O Registers—BAR

Offset	Size	Register ID—Description	Default Value
0h	4	"CAPLENGTH—Offset 0h" on page 2467	00960020h

MAXPORTS				HCSPARAMS1_RSVD1				MAXINTRS				MAXSLOTS			

Bit Range	Default & Access	Description
31:24	02h RO	MAXPORTS: Number of Ports (MaxPorts). This field specifies the maximum Port Number value, i.e. the highest numbered Port Register Set that are addressable in the Operational Register Space (refer to Table 29). Valid values are in the range of 1h to FFh. The value in this field shall reflect the maximum Port Number value assigned by an xHCI Supported Protocol Capability, described in section 7.2. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set.

XECP				MAXPSASIZE	HCCPARAMS_RSVD	SBD	FSE	NSS
						LTC	LHRC	PIND
							PPC	CSZ
							BNC	AC64

Bit Range	Default & Access	Description
31:16	220h RO	XECP: Based on configuration, core automatically updates it

Bit Range	Default & Access	Description
15:12	fh RO	MAXPSASIZE : Maximum Primary Stream Array Size
11:10	0h RO	HCCPARAMS_RSVD : Reserved
9	0h RO	SBD : Secondary Bandwidth Domain Reporting (SBD)
8	0h RO	FSE : For xHCI 0.96, this field is Force Stopped Event (FSE) / For xHCI 1.0, this field is Parse All Event Data (PAE)
7	0h RO	NSS : No Secondary SID Support (NSS). This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported. (refer to Sections 4.12.2 and 6.2.3).
6	1h RO	LTC : Latency Tolerance Messaging Capability (LTC). This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported. Refer to section 4.13.1 for more information on LTM.
5	0h RO	LHRC : Light HC Reset Capability (LHRC). This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the Light Host Controller Reset (LHCRST) flag in the USB_CMD register (refer to Section 5.4.1).
4	0h RO	PIND : Port Indicators (PIND). This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a 1, the port status and control registers include a read/writeable field for controlling the state of the port indicator. Refer to Section 5.4.8 for definition of the Port Indicator Control field.
3	1h RO	PPC : Port Power Control (PPC). This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port do not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register (refer to Section 5.4.8).
2	1h RO	CSZ : Context Size (CSZ). If this bit is set to 1, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0, then the xHC uses 32 byte Context data structures. Note: This flag does not apply to Stream Contexts.
1	0h RO	BNC : BW Negotiation Capability (BNC). This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation: for Value 0 Description BW Negotiation not implemented. for Value 1 Description BW Negotiation implemented. Refer to section 4.16 of XHCI specification for more information on Bandwidth Negotiation.
0	0h RO	AC64 : 64-bit Addressing Capability (AC64). This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the high order 32 bits of 64 bit register and data structure pointer fields. Values for this flag have the following interpretation: for Value 0 Description 32-bit address memory pointers implemented. for Value 1 description 64-bit address memory pointers implemented. If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32 bits of 64 bit data structure pointer fields, and system software shall ignore the high order 32 bits of 64 bit xHC registers.

19.6.6 DBOFF—Offset 14h

Doorbell Offset Register

Access Method

0	0	0	0	0	0	0	0	0							
RSVD8						EU3S	EWE	CRS	CSS	LHCRST	RSVD7	HSEE	INTE	HCRST	R_S

Bit Range	Default & Access	Description
31:12	0h RO	RSVD8: reserved
11	0h RW	EU3S: Enable U3 MFINDEX Stop (EU3S) - RW. Default = 0. When set to 1, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0 the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. Refer to section 4.14.2 for more information.
10	0h RW	EWE: Enable Wrap Event (EWE) - RW. Default = 0. When set to 1, the xHC shall generate a MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0 no MFINDEX Wrap Events are generated. Refer to section 4.14.2 for more information. When this register is exposed by a Virtual Function (VF), the generation of MFINDEX Wrap Events to VFs shall be emulated by the VMM.

Bit Range	Default & Access	Description
9	0h RW	CRS: Controller Restore State: This command is similar to the USBCMD. CRS bit in host mode and initiates the restore process. When software sets this bit to '1', the controller immediately sets DSTS.RSS to '1'. When the controller has finished the restore process, it sets DSTS.RSS to '0'.
8	0h RW	CSS: Controller Save State: This command is similar to the USBCMD. CSS bit in host mode and initiates the save process. When software sets this bit to '1', the controller immediately sets DSTS.SSS to '1'. When the controller has finished the save process, it sets DSTS.SSS to '0'.
7	0h RW	LHCRST: Light Host Controller Reset (LHCRST) RO or RW. Optional normative. Default = 0. If the Light HC Reset Capability (LHRC) bit in the HCCPARAMS register is 1, then this flag allows the driver to reset the xHC without affecting the state of the ports. A system software read of this bit as 0 indicates the Light Host Controller Reset has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1 indicates the Light Host Controller Reset has not yet completed. If not implemented, a read of this flag shall always return a 0. All registers in the Aux Power well shall maintain the values that had been asserted prior to the Light Host Controller Reset. Refer to section 4.23.1 for more information. When this register is exposed by a Virtual Function (VF), this bit only generates a Light Reset to the xHC instance presented by the selected VF, e.g. Disable the VFs device slots and set the associated VF Run bit to Stopped. Refer to section 8 for more information.
6:4	0h RO	RSVD7: Reserved
3	0h RW	HSEE: Host System Error Enable (HSEE) RW. Default = 0. When this bit is a 1, and the HSE bit in the USBSTS register is a 1, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit. Refer to section 4.10.2.6 for more information. When this register is exposed by a Virtual Function (VF), the effect of the assertion of this bit on the Physical Function (PF0) is determined by the VMM. Refer to section 8 for more information.
2	0h RW	INTE: Interrupter Enable (INTE) RW. Default = 0. This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is a 1, then Interrupter host system interrupt generation is allowed, e.g. the xHC shall issue an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSI-X, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism. When this register is exposed by a Virtual Function (VF), this bit only enables the set of Interrupters assigned to the selected VF. Refer to section 7.7.2 for more information.
1	0h RW	HCRST: Host Controller Reset (HCRST) RW. Default = 0. This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to a Chip Hardware Reset. When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on the USB is immediately terminated. A USB reset shall not be driven on USB2 downstream ports, however a Hot or Warm Reset shall be initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software shall reinitialize the host controller as described in Section 4.1 in order to return the host controller to an operational state. This bit is cleared to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this bit and shall not write any xHC Operational or Runtime registers until while HCRST is 1. Note, the completion of the xHC reset process is not gated by the Root Hub port reset process. Software shall not set this bit to 1 when the HCHalted (HCH) bit in the USBSTS register is a 0. Attempting to reset an actively running host controller may result in undefined behavior. When this register is exposed by a Virtual Function (VF), this bit only resets the xHC instance presented by the selected VF. Refer to section 8 for more information.

Bit Range	Default & Access	Description
0	0h RW	R_S : Run/Stop (R/S) RW. Default = 0. 1 = Run. 0 = Stop. When set to a 1, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to a 1. When this bit is cleared to 0, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halts. Refer to section 5.4.1.1 for more information on how R/S shall be managed. The xHC shall halt within 16 ms. after software clears the Run/Stop bit if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a 1 to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1). Doing so may yield undefined results. Writing a 0 to this flag when the xHC is in the Running state (i.e. HCH = 0) and any Event Rings are in the Event Ring Full state (refer to section 4.9.4) may result in lost events. When this register is exposed by a Virtual Function (VF), this bit only controls the run state of the xHC instance presented by the selected VF. Refer to section 8 for more information.

19.6.10 USBSTS—Offset 24h

USB Command Register Bit Definitions

Access Method

RSVD11					HCE	CNR	SRE	RSS	SSS	RSVD10	PCD	EINT	HSE	RSVD9	HCH

Bit Range	Default & Access	Description
31:13	0h RO	RSVD11 : reserved
12	0h RO	HCE : Host Controller Error (HCE) - RO. Default = 0. '0' = No internal xHC error conditions exist '1' = Internal xHC error condition. This flag shall be set to indicate that an internal error condition has been detected which requires software to reset and reinitialize the xHC. Refer to section 4.24.1 of xhci specification for more information.
11	0h RO	CNR : Controller Not Ready (CNR) - RO. Default = '1'. '0' = Ready '1' = Not Ready. Software shall not write any Doorbell or Operational register of the xHC, other than the USBSTS register, until CNR = '0'. This flag is set by the xHC after a Chip Hardware Reset and cleared when the xHC is ready to begin accepting register writes. This flag shall remain cleared ('0') until the next Chip Hardware Reset.
10	0h RO	SRE : Save/Restore Error (SRE) -RW1C. Default = '0'. If an error occurs during a Save or Restore operation this bit shall be set to '1'. This bit shall be cleared to '0' when a Save or Restore operation is initiated or when written with '1'. Refer to section 4.23.2 of xhci specification for more information.
9	0h RO	RSS : Restore State Status: This bit is similar to the USBSTS.RSS in host mode. When the controller has finished the save process, it will complete the command by setting DSTS.RSS to '0'.
8	0h RO	SSS : Save State Status: This bit is similar to the USBSTS.SSS in host mode. When the controller has finished the save process, it will complete the command by setting DSTS.SSS to '0'

19.6.11 PAGESIZE—Offset 28h

Page Size Register Bit Definitions. This register is used by software to enable or disable the reporting of the reception of specific USB Device Notification Transaction Packets. A Notification Enable (Nx, where x = 0 to 15) flag is defined for each of the 16 possible device notification types. If a flag is set for a specific notification type, a Device Notification Event shall be generated when the respective notification packet is received. After reset all notifications are disabled. Refer to section 6.4.2.7. This register shall be written as a Dword. Byte writes produce undefined results.

CMD_RING_PNTR							RSVD14	CRR	CA	CS	RCS

Bit Range	Default & Access	Description
31:6	0h RW	CMD_RING_PNTR: Command Ring Pointer - RW. Default = 0. This field defines high order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. Writes to this field are ignored when Command Ring Running (CRR) = 1. If the CRCR is written while the Command Ring is stopped (CCR = 0), the value of this field shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CCR = 0) then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. Reading this field always returns 0.
5:4	0h RO	RSVD14: reserved

Bit Range	Default & Access	Description
3	0h RW	CRR: Command Ring Running (CRR) - RO. Default = 0. This flag is set to 1 if the Run/Stop (R/S) bit is 1 and the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. It is cleared to 0 when the Command Ring is stopped after writing a 1 to the Command Stop (CS) or Command Abort (CA) flags, or if the R/S bit is cleared to 0.
2	0h RW	CA: Command Abort (CA) - RW1S. Default = 0. Writing a 1 to this bit shall immediately terminate the currently executing command, stop the Command Ring, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped. Refer to section 4.6.1.2 for more information on aborting a command. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) = 0. Reading this bit always returns 0.
1	0h RW	CS: Command Stop (CS) - RW1S. Default = 0. Writing a 1 to this bit shall stop the operation of the Command Ring after the completion of the currently executing command, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped and the Command TRB Pointer set to the current value of the Command Ring Dequeue Pointer. Refer to section 4.6.1.1 for more information on stopping a command. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) = 0. Reading this bit shall always return 0.
0	0h RW	RCS: Ring Cycle State (RCS) - RW. This bit identifies the value of the xHC Consumer Cycle State (CCS) flag for the TRB referenced by the Command Ring Pointer. Refer to section 4.9.3 for more information. Writes to this flag are ignored if Command Ring Running (CRR) is 1. If the CRCR is written while the Command Ring is stopped (CRR = 0), then the value of this flag shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CRR = 0), then the Command Ring shall begin fetching Command TRBs using the current value of the internal Command Ring CCS flag. Reading this flag always returns 0.

Default: 00000000h

Bit Range	Default & Access	Description
31	0h RW	WPR: Warm Port Reset (WPR) RW1S/RsvdZ. Default = 0. When software writes a 1 to this bit, the Warm Reset sequence as defined in the USB3 Specification is initiated and the PR flag is set to 1. Once initiated, the PR, PRC, and WRC flags shall reflect the progress of the Warm Reset sequence. This flag shall always return 0 when read. Refer to section 4.19.5.1. of XHCI specification. This flag only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
30	0h RW	DR: Device Removable (DR) - RO. This flag indicates if this port has a removable device attached. 1 = Device is non-removable. 0 = Device is removable.
29:28	0h RO	RSVD20: reserved
27	0h RW	WOE: Wake on Over-current Enable (WOE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to over-current conditions as system wake-up events. Refer to section 4.15 for operational model.
26	0h RW	WDE: Wake on Disconnect Enable (WDE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device disconnects as system wake-up events. Refer to section 4.15 for operational model.
25	0h RW	WCE: Wake on Connect Enable (WCE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device connects as system wake-up events. Refer to section 4.15 for operational model.
24	0h RO	RSVD19: reserved
23	0h RW	CEC: Port Config Error Change (CEC) RW1CS/RsvdZ. Default = 0. This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.2 for more information on change bit usage. Note: This flag is valid only for USB3 protocol ports. For USB2 protocol ports this bit shall be RsvdZ.
22	0h RW	PLC: Port Link State Change (PLC) RW1CS. Default = 0. This flag is set to 1 due to the following PLS transitions mentioned in the XHCI specification
21	0h RW	PRC: Port Reset Change (PRC) RW1CS. Default = 0. This flag is set to 1 due to a '1' to '0' transition of Port Reset (PR). e.g. when any reset processing (Warm or Hot) on this port is complete. Note that this flag shall not be set to 1 if the reset processing was forced to terminate due to software clearing PP or PED to '0'. 0 = No change. 1 = Reset complete. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5. Refer to section 4.19.2 for more information on change bit usage.
20	0h RW	OCC: Over-current Change (OCC) RW1CS. Default = 0. This bit shall be set to a 1 when there is a 0 to 1 or 1 to 0 transition of Over-current Active (OCA). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
19	0h RW	WRC: Warm Port Reset Change (WRC) RW1CS/RsvdZ. Default = 0. This bit is set when Warm Reset processing on this port completes. 0 = No change. 1 = Warm Reset complete. Note that this flag shall not be set to 1 if the Warm Reset processing was forced to terminate due to software clearing PP or PED to '0'. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.1. Refer to section 4.19.2 for more information on change bit usage. This bit only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
18	0h RW	PEC: Port Enabled/Disabled Change (PEC) RW1CS. Default = 0. 1 = change in PED. 0 = No change. Note that this flag shall not be set if the PED transition was due to software setting PP to 0. Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. For a USB2 protocol port, this bit shall be set to 1 only when the port is disabled due to the appropriate conditions existing at the EOF2 point (refer to section 11.8.1 of the USB2 Specification for the definition of a Port Error). For a USB3 protocol port, this bit shall never be set to 1.

Bit Range	Default & Access	Description
17	0h RW	CSC: Connect Status Change (CSC) RW1CS. Default = 0. 1 = Change in CCS. 0 = No change. This flag indicates a change has occurred in the ports Current Connect Status (CCS) or Cold Attach Status (CAS) bits. Note that this flag shall not be set if the CCS transition was due to software setting PP to 0, or the CAS transition was due to software setting WPR to 1. The xHC sets this bit to 1 for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be setting an already-set bit (i.e., the bit will remain 1). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
16	0h RW	LWS: Port Link State Write Strobe (LWS) RW. Default = 0. When this bit is set to 1 on a write reference to this register, this flag enables writes to the PLS field. When 0, write data in PLS field is ignored. Reads to this bit return 0.
15:14	0h RW	PIC: Port Indicator Control (PIC) RWS. Default = 0. Writing to these bits has no effect if the Port Indicators (PIND) bit in the HCCPARAMS register is a 0.
13:10	0h RW	PORTSPEED: Port Speed (Port Speed) ROS. Default = 0. This field identifies the speed of the connected USB Device. This field is only relevant if a device is connected (CCS = 1) in all other cases this field shall indicate Undefined Speed. (more information in the XHCI specification)
9	1h RW	PP: Port Power (PP) RWS. Default = 1. This flag reflects a port's logical, power control state. Because host controllers can implement different methods of port power switching, this flag may or may not represent whether (VBus) power is actually applied to the port. When PP equals a '0' the port is nonfunctional and shall not report attaches, detaches, or Port Link State (PLS) changes. However, the port shall report over-current conditions when PP = 0 if PPC = 0. After modifying PP, software shall read PP and confirm that it is reached its target state before modifying it again, undefined behavior may occur if this procedure is not followed. 0 = This port is in the Powered-off state. 1 = This port is not in the Powered-off state. If the Port Power Control (PPC) flag in the HCCPARAMS register is '1', then xHC has port power control switches and this bit represents the current setting of the switch ('0' = off, '1' = on). If the Port Power Control (PPC) flag in the HCCPARAMS register is '0', then xHC does not have port power control switches and each port is hard wired to power, and not affected by this bit. When an over-current condition is detected on a powered port, the xHC shall transition the PP bit in each affected port from a 1 to 0 (removing power from the port). Note: If this is an SSIC Port, then the DSP Disconnect process is initiated by '1' to '0' transition of PP. Refer to section 5.1.2 in the SSIC Spec for more information. Refer to section 4.19.4 for more information.
8:5	5h RW	PLS: Port Link State (PLS) RWS. Default = RxDetect (5). This field is used to power manage the port and reflects its current link state. When the port is in the Enabled state, system software may set the link U state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port.
4	0h RW	PR: Port Reset (PR) RW1S. Default = 0. 1 = Port Reset signaling is asserted. 0 = Port is not in Reset. When software writes a 1 to this bit generating a 0 to 1 transition, the bus reset sequence is initiated; USB2 protocol ports shall execute the bus reset sequence as defined in the USB2 Spec. USB3 protocol ports shall execute the Hot Reset sequence as defined in the USB3 Spec. PR remains set until reset signaling is completed by the root hub. Note that software shall write a 1 to this flag to transition a USB2 port from the Polling state to the Enabled state. Refer to sections 4.15.2.3 and 4.19.1.1. This flag is 0 if PP is 0.
3	0h RW	OCA: Over-current Active (OCA) RO. Default = 0. 1 = This port currently has an over-current condition. 0 = This port does not have an over-current condition. This bit shall automatically transition from a 1 to a 0 when the over-current condition is removed.
2	0h RO	RSVD18: reserved

Bit Range	Default & Access	Description
1	0h RW	PED: Port Enabled/Disabled (PED) RW1CS. Default = 0. 1 = Enabled. 0 = Disabled. Ports may only be enabled by the xHC. Software cannot enable a port by writing a 1 to this flag. A port may be disabled by software writing a 1 to this flag. This flag shall automatically be cleared to 0 by a disconnect event or other fault condition. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller or bus events. When the port is disabled (PED = 0) downstream propagation of data is blocked on this port, except for reset. For USB2 protocol ports: When the port is in the Disabled state, software shall reset the port (PR = 1) to transition PED to 1 and the port to the Enabled state. For USB3 protocol ports: When the port is in the Polling state (after detecting an attach), the port shall automatically transition to the Enabled state and set PED to 1 upon the completion of successful link training. When the port is in the Disabled state, software shall write a 5 (RxDetect) to the PLS field to transition the port to the Disconnected state. Refer to section 4.19.1.2. PED shall automatically be cleared to 0 when PR is set to 1, and set to 1 when PR transitions from 1 to 0 after a successful reset. Refer to Port Reset (PR) bit for more information on how the PED bit is managed. Note that when software writes this bit to a 1, it shall also write a 0 to the PR bit . This flag is 0 if PP is 0.
0	0h RW	CCS: Current Connect Status (CCS) ROS. Default = 0. 1 = A device is connected to the port. 0 = A device is not connected. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change (CSC) bit to be set to 1. Refer to sections 4.19.3 and 4.19.4 for more details on the Connect Status Change (CSC) assertion conditions. This flag is 0 if PP is 0.

19.6.19 PORTPMSC1—Offset 424h

Access Method

0	0	0	0	0	0	0	0	0	
PORT_TEST_CONTROL				RSVD21				L1DS	
HIRD		RWE		LIS					

Bit Range	Default & Access	Description
31:28	0h RW	PORT_TEST_CONTROL: reserved
27:16	0h RO	RSVD21: reserved
15:8	0h RW	L1DS: Reg field L1DSLOT

Bit Range	Default & Access	Description
7:4	0h RW	HIRD: Host Initiated Resume Duration (HIRD) - RW. Default = '0'. System software sets this field to indicate to the recipient device how long the xHC will drive resume if it (the xHC) initiates an exit from L1. The HIRD value is encoded as follows: Value Description 0h 50 s. (default) 1h 125 s. 2h 200 s. Fh 1.175 ms. The value of 0000b is interpreted as 50 s. Each incrementing value up adds 75 s. to the previous value. For example, 0001b is 125 s, 0010b is 200s and so on. Based on this rule, the maximum value resume drive time is at encoding value 1111b which represents 1.2ms. Note that the HIRD field is used by both software and hardware controlled LPM. Refer to section 4.23.5.1.1 of xhci specification for more information on HIRD use. Refer to Section 4.1 of the USB2 LPM spec for more information on the use of the HIRD field.
3	0h RW	RWE: Port Test Control
2:0	0h RO	L1S: L1 Status (L1S) - RO. Default = 0. This field is used by software to determine whether an L1based suspend request (LMP transaction) was successful, specifically: Value Meaning 0 Invalid - This field shall be ignored by software. 1 Success - Port successfully transitioned to L1 (ACK) 2 Not Yet - Device is unable to enter L1 at this time (NYET) 3 Not Supported -Device does not support L1 transitions (STALL) 4 Timeout/Error -Device failed to respond to the LPM Transaction or an error occurred 5-7 Reserved The value of this field is only valid when the port resides in the L0 or L1 state (PLS = '0' or '2'). Refer to section 4.23.5.1.1 for more information.

RSVD				HIRDD		L1TIMEOUT		HIRDM

Bit Range	Default & Access	Description
31:14	0h RO	RSVD: reserved
13:10	0h RW	HIRDD: Best Effort Service Latency Deep (BESLD) - RWS. Default = 0. System software sets this field to indicate to the recipient device how long the xHC will drive resume on an exit from U2. Refer to section 4.23.5.1.1.1 for more information on BESLD use. The BESLD value encoding is defined in Table 13. Refer to section 5.2.6 for information on how DBESLD may be used to establish an initial value for BESLD
9:2	0h RW	L1TIMEOUT: L1 Timeout RWS. Default = 00h. Timeout value for the L1 inactivity timer (LPM Timer). This field shall be set to 00h by the assertion of PR to 1. Refer to section 4.23.5.1.1.1 for more information on L1 Timeout operation. The following are permissible values: for 00h 128 s. (default). for 01h 256 s. for 02h 512 s. for 03h 768 s. . . . for FFh 65,280 s.
1:0	0h RW	HIRDM: Host Initiated Resume Duration Mode (HIRDM) - RWS. Default = 0h. Indicates which HIRD value should be used. The following are permissible values: for 0 Initiate L1 using BESL only on timeout. (default). for 1 Initiate L1 using BESLD on timeout. If rejected by device, initiate L1 using BESL. for 3-2 Reserved.

19.6.22 PORTSC2—Offset 430h

A host controller shall implement one or more port registers. The number of port registers implemented by a particular instantiation of a host controller is documented in the HCSPARAMS1 register (Section 5.3.3). Software uses this information as an input parameter to determine how many ports need to be serviced

								PIC
								PORTSPEED
								PP
								PLS
								PR
								OCA
								RSVD23
								PED
								CCS

Bit Range	Default & Access	Description
31	0h RW	WPR: Warm Port Reset (WPR) RW1S/RsvdZ. Default = 0. When software writes a 1 to this bit, the Warm Reset sequence as defined in the USB3 Specification is initiated and the PR flag is set to 1. Once initiated, the PR, PRC, and WRC flags shall reflect the progress of the Warm Reset sequence. This flag shall always return 0 when read. Refer to section 4.19.5.1. This flag only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
30	0h RW	DR: Device Removable (DR) - RO. This flag indicates if this port has a removable device attached. 1 = Device is non-removable. 0 = Device is removable.
29:28	0h RO	RSVD25: reserved
27	0h RW	WOE: Wake on Over-current Enable (WOE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to over-current conditions as system wake-up events. Refer to section 4.15 for operational model.
26	0h RW	WDE: Wake on Disconnect Enable (WDE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device disconnects as system wake-up events. Refer to section 4.15 for operational model.
25	0h RW	WCE: Wake on Connect Enable (WCE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device connects as system wake-up events. Refer to section 4.15 for operational model.
24	0h RO	RSVD24: reserved
23	0h RW	CEC: Port Config Error Change (CEC) RW1CS/RsvdZ. Default = 0. This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.2 of XHCI specification for more information on change bit usage. Note: This flag is valid only for USB3 protocol ports. For USB2 protocol ports this bit shall be RsvdZ.
22	0h RW	PLC: Port Link State Change (PLC) RW1CS. Default = 0. This flag is set to 1 due to the PLS transitions in the XHCI specification
21	0h RW	PRC: Port Reset Change (PRC) RW1CS. Default = 0. This flag is set to 1 due to a '1' to '0' transition of Port Reset (PR). e.g. when any reset processing (Warm or Hot) on this port is complete. Note that this flag shall not be set to 1 if the reset processing was forced to terminate due to software clearing PP or PED to '0'. 0 = No change. 1 = Reset complete. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5 of XHCI specification. Refer to section 4.19.2 of XHCI specification. for more information on change bit usage.
20	0h RW	OCC: Over-current Change (OCC) RW1CS. Default = 0. This bit shall be set to a 1 when there is a 0 to 1 or 1 to 0 transition of Over-current Active (OCA). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
19	0h RW	WRC: Warm Port Reset Change (WRC) RW1CS/RsvdZ. Default = 0. This bit is set when Warm Reset processing on this port completes. 0 = No change. 1 = Warm Reset complete. Note that this flag shall not be set to 1 if the Warm Reset processing was forced to terminate due to software clearing PP or PED to '0'. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.1. Refer to section 4.19.2 for more information on change bit usage. This bit only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
18	0h RW	PEC: Port Enabled/Disabled Change (PEC) RW1CS. Default = 0. 1 = change in PED. 0 = No change. Note that this flag shall not be set if the PED transition was due to software setting PP to 0. Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. For a USB2 protocol port, this bit shall be set to 1 only when the port is disabled due to the appropriate conditions existing at the EOF2 point (refer to section 11.8.1 of the USB2 Specification for the definition of a Port Error). For a USB3 protocol port, this bit shall never be set to 1.

Bit Range	Default & Access	Description
17	0h RW	CSC: Connect Status Change (CSC) RW1CS. Default = 0. 1 = Change in CCS. 0 = No change. This flag indicates a change has occurred in the ports Current Connect Status (CCS) or Cold Attach Status (CAS) bits. Note that this flag shall not be set if the CCS transition was due to software setting PP to 0, or the CAS transition was due to software setting WPR to 1. The xHC sets this bit to 1 for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be setting an already-set bit (i.e., the bit will remain 1). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
16	0h RW	LWS: Port Link State Write Strobe (LWS) RW. Default = 0. When this bit is set to 1 on a write reference to this register, this flag enables writes to the PLS field. When 0, write data in PLS field is ignored. Reads to this bit return 0.
15:14	0h RW	PIC: Port Indicator Control (PIC) RWS. Default = 0. Writing to these bits has no effect if the Port Indicators (PIND) bit in the HCCPARAMS register is a 0
13:10	0h RW	PORTSPEED: Port Speed (Port Speed) ROS. Default = 0. This field identifies the speed of the connected USB Device. This field is only relevant if a device is connected (CCS = 1) in all other cases this field shall indicate Undefined Speed.
9	1h RW	PP: Port Power (PP) RWS. Default = 1. This flag reflects a port's logical, power control state. Because host controllers can implement different methods of port power switching, this flag may or may not represent whether (VBus) power is actually applied to the port. When PP equals a '0' the port is nonfunctional and shall not report attaches, detaches, or Port Link State (PLS) changes. However, the port shall report over-current conditions when PP = 0 if PPC = 0. After modifying PP, software shall read PP and confirm that it is reached its target state before modifying it again, undefined behavior may occur if this procedure is not followed. 0 = This port is in the Powered-off state. 1 = This port is not in the Powered-off state. If the Port Power Control (PPC) flag in the HCCPARAMS register is '1', then xHC has port power control switches and this bit represents the current setting of the switch ('0' = off, '1' = on). If the Port Power Control (PPC) flag in the HCCPARAMS register is '0', then xHC does not have port power control switches and each port is hard wired to power, and not affected by this bit. When an over-current condition is detected on a powered port, the xHC shall transition the PP bit in each affected port from a 1 to 0 (removing power from the port). Note: If this is an SSIC Port, then the DSP Disconnect process is initiated by '1' to '0' transition of PP. Refer to section 5.1.2 in the SSIC Spec for more information. Refer to section 4.19.4 for more information.
8:5	5h RW	PLS: Port Link State (PLS) RWS. Default = RxDetect (5). This field is used to power manage the port and reflects its current link state. When the port is in the Enabled state, system software may set the link U state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port.
4	0h RW	PR: Port Reset (PR) RW1S. Default = 0. 1 = Port Reset signaling is asserted. 0 = Port is not in Reset. When software writes a 1 to this bit generating a 0 to 1 transition, the bus reset sequence is initiated; USB2 protocol ports shall execute the bus reset sequence as defined in the USB2 Spec. USB3 protocol ports shall execute the Hot Reset sequence as defined in the USB3 Spec. PR remains set until reset signaling is completed by the root hub. Note that software shall write a 1 to this flag to transition a USB2 port from the Polling state to the Enabled state. Refer to sections 4.15.2.3 and 4.19.1.1. of XHCI specification. This flag is 0 if PP is 0.
3	0h RW	OCA: Over-current Active (OCA) RO. Default = 0. 1 = This port currently has an over-current condition. 0 = This port does not have an over-current condition. This bit shall automatically transition from a 1 to a 0 when the over-current condition is removed.

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
RSVD29								IE	IP

Bit Range	Default & Access	Description
31:2	0h RO	RSVD29: reserved
1	0h RW	IE: Interrupt Enable (IE) RW. Default = 0. This flag specifies whether the Interrupter is capable of generating an interrupt. When this bit and the IP bit are set (1), the Interrupter shall generate an interrupt when the Interrupter Moderation Counter reaches 0. If this bit is 0, then the Interrupter is prohibited from generating interrupts.
0	0h RW	IP: Interrupt Pending (IP) - RW1C. Default = 0. This flag represents the current state of the Interrupter. If IP = 1, an interrupt is pending for this Interrupter. A 0 value indicates that no interrupt is pending for the Interrupter. Refer to section 4.17.5 of XHCI specification for the conditions that modify the state of this flag.

19.6.27 IMOD—Offset 464h

Interrupter Moderation Register. Software may use this register to pace (or even out) the delivery of interrupts to the host CPU. This register provides a guaranteed inter-interrupt delay between interrupts asserted by the xHC, regardless of USB traffic conditions. To independently validate configuration settings, software may use the following algorithm to convert the inter-interrupt Interval value to the common 'interrupts/sec' performance metric:

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

IMOD: [BAR] + 464h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000FA0h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	1	1	1
IMODC						IMODI		

Bit Range	Default & Access	Description
31:16	0h RW	IMODC: Interrupt Moderation Counter (IMODC) - RW. Default = undefined. Down counter. Loaded with the IMODI value whenever IP is cleared to '0', counts down to '0', and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be directly written by software at any time to alter the interrupt rate.

Bit Range	Default & Access	Description
15:0	fa0h RW	IMODI : Interrupt Moderation Interval (IMODI) - RW. Default = '4000' (~1ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.

19.6.28 ERSTSZ—Offset 468h

Event Ring Segment Table Size Register Bit Definitions.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ERSTSZ: [BAR] + 468h

BAR Type: PCI Configuration Register (Size: 32 bits)

RSVD30				ERS_TABLE_SIZE				

Bit Range	Default & Access	Description
31:16	0h RO	RSVD30 : reserved
15:0	0h RW	ERS_TABLE_SIZE : Event Ring Segment Table Size RW. Default = 0. This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (5.3.4). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.

Bit Range	Default & Access	Description
4	0h RW	INCR32BRSTENA : INCR32 Burst Type Enable
3	0h RW	INCR16BRSTENA : INCR16 Burst Type Enable
2	1h RW	INCR8BRST : INCR8 Burst Type Enable
1	1h RW	INCR4BRSTENA : INCR4 Burst Type Enable
0	0h RW	INCRBRSTENA : Undefined Length INCR Burst Type Enable (INCRBrstEna). Input to BUS-GM When enabled, this has higher priority than other burst types. For the AHB configuration. if this bit is set to 1, AHB master tries to do only one INCR burst for each transfer unless it has to break it at a 1Kbyte boundary. If this bit is set to 0, the AHB master may still use INCR burst type at the beginning and end bursts of transfers to align the address. The middle bursts are INCR4/8/16, depending when the type is enabled.

19.6.60 GSBUSCFG1—Offset C104h

Global SoC Bus Configuration Register 1

Access Method

GTXTHRCFG_RSVD4	USBXMITPKTCNTEN	GTXTHRCFG_RSVD3	USBXMITPKTCNT	USBMAXTXBURSTSIZE	GTXTHRCFG_RSVD2	GTXTHRCFG_RSVD1		

Bit Range	Default & Access	Description
31:30	0h RW	GTXTHRCFG_RSVD4: Reserved
29	1h RW	USBXMITPKTCNTEN: USB Transmit Packet Count Enable (USBTxPktCntSel). This field enables/disables the USB transmission multi-packet thresholding: 0: USB transmission multi-packet thresholding is disabled, the core can only start transmission on the USB after the entire packet has been fetched into the corresponding TXFIFO. 1: USB transmission multi-packet thresholding is enabled. The core can only start transmission on the USB after USB Transmit Packet Count amount of packets for the USB transaction (burst) are already in the corresponding TXFIFO This mode is only valid in the host mode. It is only used for SuperSpeed.
28	0h RO	GTXTHRCFG_RSVD3: Reserved
27:24	3h RO	USBXMITPKTCNT: USB Transmit Packet Count (USBTxPktCnt) This field specifies the number of packets that must be in the TXFIFO before the core can start transmission for the corresponding USB transaction (burst). This field is only valid when the USB Transmit Packet Count Enable field is set to one. Valid values are from 1 to 15.
23:16	0Ah RW	USBMAXTXBURSTSIZE: USB Maximum TX Burst Size: When USBTxPktCntSel is one, this field specifies the Maximum Bulk OUT burst the core should do. When the system bus is slower than the USB, TX FIFO can underrun during a long burst. User can program a smaller value to this field to limit the TX burst size that the core can do. It only applies to SS Bulk, Isochronous, and Interrupt OUT endpoints in the host mode. Valid values are from 1 to 16.
15:11	0h RO	GTXTHRCFG_RSVD2: Reserved
10:0	0h RW	GTXTHRCFG_RSVD1: Reserved

19.6.62 GRXTHRCFG—Offset C10Ch

Global Rx Threshold Control Register

Access Method

Bit Range	Default & Access	Description
1	0h RW	GBLHIBERNATIONEN : This bit enables hibernation at the global level. If hibernation is not enabled via this bit, the PMU immediately accepts the D0-)D3 and D3-)D0 power state change requests, but does not save or restore any core state. In addition, the PMUs will never drive the PHY interfaces and let the core continue to drive the PHY interfaces.
0	0h RW	DSBLCLKGTNG : Disable Clock Gating

MAC3FLADJ								NOEXTRDL				PSQEXTRRESSP				SPRSCTRLTRANSEN				RESBWHSEPS				CMDEVADDR				USBHSTINAUTORETRYEN				GUCTL_RSVD1				DTCT				DTFT			

Bit Range	Default & Access	Description
31:22	1ffh RW	MAC3FLADJ:
21	0h RW	NOEXTRDL:
20:18	0h RW	PSQEXTRESSP:
17	0h RW	SPRSCTRLTRANSEN: Sparse Control Transaction Enable: Some devices are slow in responding to Control transfers. Scheduling multiple transactions in one microframe/frame can cause these devices to misbehave. If this bit is set to 1'b1, the host controller schedules transactions for a Control transfer in different microframes/frames.
16	0h RW	RESBWHSEPS: Reserving 85% Bandwidth for HS Periodic EPs
15	1h RW	CMDEVADDR: Compliance Mode for Device Address: When this bit is 1'b1, Slot ID may have different value than Device Address if max_slot_enabled (128. n 1'b1: Increment Device Address on each Address Device command. n 1'b0: Device Address is equal to Slot ID. The xHCI compliance requires this bit to be set to 1'. The 0' mode is for debug purpose only. This all ows you to easily identify a device connected to a port in the Lecroy or Eliisys trace during hardware debug. This bit is valid in Host and DRD configuration and is used in host mode operation only. Ignore this bit in device mode.
14	1h RW	USBHSTINAUTORETRYEN: Host IN Auto Retry: When set, this field enables the Auto Retry feature. For IN transfers (non-isochronous) that encounter data packets with CRC errors or internal overrun scenarios, the auto retry feature causes the Host core to reply to the device with a non-terminating retry ACK (that is, an ACK transaction packet with Retry = 1 and NumP != 0). If the Auto Retry feature is disabled (default), the core will respond with a terminating retry ACK (that is, an ACK transaction packet with Retry = 1 and NumP = 0). n 1'b0: Auto Retry Disabled n 1'b1: Auto Retry Enabled In device mode this bit should be 0
13:11	0h RO	GUCTL_RSVD1:
10:9	3h RW	DTCT: Device Timeout Coarse Tuning: This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. The core first checks the DTCT value. If it is 0, then the timeout value is defined by the DTFT. If it is non-zero, then it uses the following timeout values: n 2'b00: 0 usec -) use DTFT value instead n 2'b01: 500 usec n 2'b10: 1.5 msec n 2'b11: 6.5 msec
8:0	0h RW	DTFT: Device Timeout Fine Tuning: This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. For DTFT field to take effect, DTCT must be set to 2'b00. The DTFT value is the number of 125 MHz clocks * 256 to count before considering a device timeout. For the 125 MHz clk (8 ns period), this is calculated as follows: (DTFT value) * 256 * (8 ns) Quick Reference: n if DTFT = 0x2, 2*256*8 = 4usec timeout n if DTFT = 0x5, 5*256*8 = 10usec timeout n if DTFT = 0xA, 10*256*8 = 20usec timeout n if DTFT = 0x10, 16*256*8 = 32usec timeout n if DTFT = 0x19, 25*256*8 = 51usec timeout n if DTFT = 0x31, 49*256*8 = 100usec timeout n if DTFT = 0x62, 98*256*8 = 200usec timeout

Bit Range	Default & Access	Description
31:24	0h RO	DCFG_RSVD:
23	0h RW	IGNSTRMPP: Reserved

Bit Range	Default & Access	Description
31:30	0h RO	DSTS_RSVD2:
29	0h RO	DCNRD: Value After Reset: 0x1 Device Controller Not Ready: The bit indicates that the core is in the process of completing the state transitions after exiting from hibernation. Software must wait for this bit to be de-asserted to zero before processing DS TS.USBLnk
28	0h RW	SRE: Save/Restore Error (SRE) -RW1C. Default = '0'. If an error occurs during a Save or Restore operation this bit shall be set to '1'. This bit shall be cleared to '0' when a Save or Restore operation is initiated or when written with '1'. Refer to section 4.23.2 for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Save/Restore completion status for the selected VF. Refer to section 8 for more information.x
27:26	0h RO	DSTS_RSVD1:
25	0h RO	RSS: Restore State Status: This bit is similar to the USBSTS.RSS in host mode. When the controller has finished the save process, it will complete the command by setting DSTS.RSS to '0'
24	0h RO	SSS: Save State Status: This bit is similar to the USBSTS.SSS in host mode. When the controller has finished the save process, it will complete the command by setting DSTS.SSS to '0'.
23	0h RO	COREIDLE: flag Value After Reset: 0x1 Core Idle
22	0h RO	DEVCTRLHLT: Device Controller Halted
21:18	4h RO	USBLNKST: flag Value After Reset: 0x0 Reg field USBLNKST
17	1h RO	RXFIFOEMPTY: RxFIFO Empty
16:3	0h RO	SOFFN: Frame/Microframe Number of the Received SOF: When the core is operating at high-speed, this field contains a microframe number. When the core is operating at full- or low-speed, this field contains a frame number.
2:0	4h RO	CONNECTSPD: Reg field CONNECTSPD

19.6.250 OCFG—Offset CC00h

OTG Configuration Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OCFG: [BAR] + CC00h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0		
0	0	0	0	0	0	0	0	0		
RSVD0								OTG_Version	HNPCap	SRPCap

Bit Range	Default & Access	Description
31:3	0h RO	RSVD0: reserved

Bit Range	Default & Access	Description
3	0h RW	SesReq: Session Request: n 1'b0: No session request n 1'b1: Session request The application sets this bit to initiate a session request on the USB. Writing 1'b1 to this field will trigger the core to send SRP (data line pulsing) on PHY interface. In the absence of OEVT.OTGBDevSessVldDetEvt after a session request, the application must wait for atleast TB_SRP_FAIL time (6 secs) before initiating another session request. This field returns 1'b0 when read.
2	0h RW	TermSelDLPulse: TermSel DLine Pulsing Selection: This bit selects utmi_termselect to drive data line pulse during SRP. n 1'b0: Data line pulsing using utmi_txvalid (default). n 1'b1: Data line pulsing using utmi_termsel.
1	0h RW	DevSetHNPEn: Device Set RSP/HNP Enable: n 1'b0: RSP/HNP is not enabled in the application n 1'b1: RSP/HNP is enabled in the application The application sets this bit in the following scenario: n In HS/Fs mode, when it successfully receives a SetFeature.SetHNPEnable command from the connected USB host. n In SS mode, when it has sent a b3_ntf_hst_rel to the A-device, or the A-device has sent an a3_ntf_host_req. Note: The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode.
0	0h RW	HstSetHNPEn: Host Set RSP/HNP Enable: n 1'b0: Host Set RSP/HNP is not enabled n 1'b1: Host Set RSP/HNP is enabled The application sets this bit in the following scenario: n In HS/Fs mode, when it has successfully enabled HNP (using the SetFeature.SetHNPEnable command) from the connected device. n In SS mode, when it has successfully enabled b3_rsp_enable feature in RSP-capable Device using SetFeature command while operating as an A-Host, or when it has received a b3_ntf_hst_rel through SetFeature command while operating as A-peripheral. Note: The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode.

19.6.252 OEVT—Offset CC08h

Bit Range	Default & Access	Description
31	1h RO	DeviceMode: Device Mode: Indicates whether the device is in A-device or B-device mode based on utmiotg_iddig n 1'b0: A-Device mode n1'b1: B-Device mode The rest of the OTG Event Information bits (OTGxxxxEvtInfo) in OEVT register will be based on the contents of this field.

Bit Range	Default & Access	Description
30:25	0h RO	RSVDO : reserved
24	0h RO	OTGConIDStsChngEvt : Write Behavior: oneToClear Connector ID Status Change Event: Set in both A-Dev/B-Dev Mode. This event is generated when there is a change in connector ID status.
23:21	0h RO	RSVD1 : reserved
20	0h RO	OTGADevBHostEndEvt : Write Behavior: oneToClear A-device B-Host End Event: Set in A-device Mode Only. The event is generated when B-device has completed its host role. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
19	0h RO	OTGADevHostEvt : Write Behavior: oneToClear A-device host event: Set in A-device Mode Only. This event is generated when A-device enters host role. In HS/FS mode, it occurs after the initial connect to a B-device as A-host as well as when there is a role change from A-peripheral to A-host. Note: This bit is applicable only for OTG 2.0 mode of operation.
18	0h RO	OTGADevHNPChngEvt : Write Behavior: oneToClear A-Dev HNP Change Event: Set in A-device Mode Only. The event is generated when there is an HNP attempt. Note: This bit is applicable only for OTG 2.0 mode of operation.
17	0h RO	OTGADevSRPDetEvt : Write Behavior: oneToClear SRP Detect Event: Set in A-device Mode Only. This event is asserted when a session request from the B-device is detected via SRP. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
16	0h RO	OTGADevSessEndDetEvt : Write Behavior: oneToClear Session End Detected Event: Set in A-device Mode Only. This event is asserted when the utmisrp_avalid signal goes low indicating the end of a session. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation
15:12	0h RO	RSVD2 : Reserved
11	0h RO	OTGBDevBHostEndEvt : Write Behavior: oneToClear B-Device B-Host End Event: Set in B-device Mode Only. This event is generated when B-device has completed its host role. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
10	0h RO	OTGBDevHNPChngEvt : Write Behavior: oneToClear B-Dev HNP Change Event: Set in B-Device Mode only. This event is generated when there is a Success or Failure of an HNP attempt. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
9	0h RO	OTGBDevSessVldDetEvt : Write Behavior: oneToClear Session Valid Detected Event: Set in B-device Mode Only. This event is asserted when there is a valid Vbus from A-device and B-device succeeds in starting a session. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
8	0h RO	OTGBDevVBUSChngEvt : Write Behavior: oneToClear Vbus Change Event: Set in B-device Mode Only. This event is asserted when the utmisrp_bvalid signal goes low (indicating the end of a session), or goes high. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
7:4	0h RO	RSVD3 : reserved
3	0h RO	BSesVld : Indicates the Device mode transceiver status. Indicates the Device mode transceiver status. The core updates this bit when OEVTEN.OTGBDevVBUSChngEvt is set. 1b0: B-session is not valid 1b1: B-session is valid Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
2	0h RO	HstNegSts : Host Negotiation Status: The core updates this bit when any of the following bits is set: n OEVTEN.OTGADevHNPChngEvt n OEVTEN.OTGBDevHNPChngEvt This bit indicates Host Negotiation Success or Failure. n 1'b0: Host negotiation failure. In A-device, for HS/FS, this indicates an imminent end of session indication from the core. In B-device, for HS/LS, it indicates that the timer used to wait for an A-device to signal a connection (b_ase0_brst_tmout in OTG 2.0) timed out resulting in B-device staying as B-peripheral. n 1'b1: Host negotiation success. This indicates that the host negotiation was successful. Note: This bit is applicable only for OTG 2.0 mode of operation.

Bit Range	Default & Access	Description
16	0h RW	OTGDevSessEndDetEvtEn : Session End Detected Event Enable (OTGDevSessEndDetEvtEn) When this bit is set, OEVT.OTGDevSessEndEvt is enabled. Else the event is disabled
15:12	0h RO	RSVD2 : reserved
11	0h RW	OTGBDevBHostEndEvtEn : B-device B-Host End Event Enable: When this bit is set, OEVT.OTGBDevHostEndEvt is enabled. If not, the event is disabled
10	0h RW	OTGBDevHNPChngEvtEn : B-Dev HNP Change Event Enable: When this bit is set, OEVT.OTGBDevHNPChngEvt is enabled. If not, the event is disabled
9	0h RW	OTGBDevSessVldDetEvtEn : Session Valid Detected Event Enable (OTGBDevSessVldDetEvtEn) Set in B-device Mode Only: This Event is asserted when there is a valid VBUS from A-device and B-device succeeds in starting a session.
8	0h RW	OTGBDevVBUSChngEvtEn : Vbus Change Event Enable: When this bit is set, OEVT.OTGBDevVBUSChngEvt is enabled. If not, the event is disabled
7:0	0h RO	RSVD3 : reserved

20 Intel® High Definition Audio

The Intel® High Definition Audio (Intel® HD Audio) is an architecture and infrastructure to support high-quality audio implementations for PCs.

Note: The High Definition Audio interface is multiplexed on the same balls as LPE_I2S[1:0].

Note: When High Definition Audio is active, the LPE Audio functionality is disabled.

The Intel® High Definition Audio (Intel® HD Audio) controller consists of a set of DMA engines that are used to move samples of digitally encoded data between system memory and internal/external CODECs. The controller communicates with the internal/external CODECs over the Intel® HD Audio serial link. The output DMA engines move digital data from system memory to a D-A converter in a CODEC. The SoC implements a single Serial Data Output (SDO) signal that is connected to the external CODECs. The input DMA engines move digital data from the A-D converter in the CODEC to system memory. The platform supports up to two external CODECs by implementing two Serial Data Input (SDI) signals, each being dedicated to a single CODEC.

Audio software renders outbound, and processes inbound data to/from buffers in memory. The location of the individual buffers is described by a Buffer Descriptor List that is fetched and processed by the audio controller. The data in the buffers is arranged in a pre-defined format. The output DMA engines fetch the digital data from memory and reformat it based on the programmed sample rate, bits/sample and number of channels. The data from the output DMA engines is then combined and serially sent to the CODEC(s) over the Intel® HD Audio link. The input DMA engines receive data from the CODEC(s) over the Intel® HD Audio link and format the data based on the programmable attributes for that stream. The data is then written to memory in the predefined format for software to process. Each DMA engine moves one "stream" of data. A single CODEC can accept or generate multiple "streams" of data, one for each A-D or D-A converter in the CODEC. Multiple CODECs can accept the same output "stream" processed by a single DMA engine.

Codec commands and responses are also transported to and from the CODEC via DMA engines. The DMA engine dedicated to transporting commands from the Command Output Ring Buffer (CORB) in memory to the CODEC(s) is called the CORB engine. The DMA engine dedicated to transporting responses from the CODEC(s) to the Response Input Ring Buffer in memory is called the RIRB engine. Every command sent to a CODEC yields a response from that CODEC. Some commands are “broadcast” type commands in which case a response will be generated from each CODEC. A CODEC may also be programmed to generate unsolicited responses, which the RIRB engine also processes. The platform also supports Programmed IO-based Immediate Command/Response transport mechanism that can be used by BIOS prior to memory initialization.

20.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

Table 221. Signals

Signal Name	Direction Plat. Power	Description
HDA_RST#	O VAUD	Intel HD Audio Reset: Master H/W reset to external Codecs
HDA_SYNC	O VAUD	Intel HD Audio Sync: 48 kHz fixed rate
HDA_CLK	O VAUD	Intel HD Audio Bit Clock (Output): 24 MHz serial data clock generated by the Intel HD Audio controller
HDA_SDO	O VAUD	Intel HD Audio Data Out: Serial TDM data output to the Codec(s). The serial output is double-pumped for a bit rate of 48 Mb/s
HDA_SDI[1:0]	I/O VAUD	Intel HD Audio Serial Data In[1:0]: Serial TDM data input from the CODEC(s). The serial input is single-pumped for a bit rate of 24 Mb/s.
HDA_LPE_RCOMP	O	Impedance/ current Compensation Output.

The signals in the table above are all muxed and maybe used by other functions.

20.2 Features

The Intel® HD Audio Controller supports the following features:

- Supports MSI and legacy interrupt delivery
- Support for ACPI D3 and D0 Device States
- Supports up to:
 - 6 streams (three input, three output)
 - 16 channels per stream
 - 32 bits/sample
 - 192 kHz sample rate
- 24 MHz HDA_CLK supports
 - SDO double pumped at 48 Mb/s
 - SDI single pumped at 24 Mb/s
- Supports 1.5V mode only
- Supports optional Immediate Command/Response mechanism

20.4 Register Map

See Chapters 3 and 4 for additional information.

Note: PCI mode is supported, but not PCIe mode. Must set TM1.HAPD bit to 1b for PCI mode.

Figure 107. Intel® HD Audio Register Map

20.5 HD Audio PCI Configuration Registers

Table 222. Summary of HD Audio PCI Configuration Registers—0/27/0

Offset	Size	Register ID—Description	Default Value
0h	2	"VID—Offset 0h" on page 2668	8086h
2h	2	"DID—Offset 2h" on page 2668	0F04h
4h	2	"CMD—Offset 4h" on page 2669	0000h
6h	2	"STS—Offset 6h" on page 2670	0010h
8h	1	"RID—Offset 8h" on page 2671	00h
9h	1	"PI—Offset 9h" on page 2671	00h
Ah	1	"SCC—Offset Ah" on page 2671	03h
Bh	1	"BCC—Offset Bh" on page 2672	04h
Ch	1	"CLS—Offset Ch" on page 2672	00h
Dh	1	"LT—Offset Dh" on page 2673	00h
Eh	1	"HTYPE—Offset Eh" on page 2673	00h
Fh	1	"BIST—Offset Fh" on page 2673	00h
10h	4	"AZLBAR—Offset 10h" on page 2674	00000004h
14h	4	"AZUBAR—Offset 14h" on page 2674	00000000h
2Ch	2	"SVID—Offset 2Ch" on page 2675	0000h
2Eh	2	"SID—Offset 2Eh" on page 2675	0000h
34h	1	"CAPPTR—Offset 34h" on page 2675	50h
3Ch	1	"INTLN—Offset 3Ch" on page 2676	00h
3Dh	1	"INTPN—Offset 3Dh" on page 2676	01h
40h	1	"AZCTL—Offset 40h" on page 2677	01h
42h	1	"IOBC—Offset 42h" on page 2677	00h
43h	1	"TM1—Offset 43h" on page 2678	57h
4Ch	1	"DCKCTL—Offset 4Ch" on page 2678	00h
4Dh	1	"DCKSTS—Offset 4Dh" on page 2679	80h
50h	2	"PID—Offset 50h" on page 2679	6001h
52h	2	"PC—Offset 52h" on page 2680	C842h
54h	4	"PCS—Offset 54h" on page 2681	00000000h
60h	2	"MID—Offset 60h" on page 2681	7005h
62h	2	"MMC—Offset 62h" on page 2682	0080h
64h	4	"MMLA—Offset 64h" on page 2682	00000000h
68h	4	"MMUA—Offset 68h" on page 2683	00000000h
6Ch	2	"MMD—Offset 6Ch" on page 2683	0000h
70h	2	"PXID—Offset 70h" on page 2684	0010h
72h	2	"PXC—Offset 72h" on page 2684	0091h
74h	4	"DEVCAP—Offset 74h" on page 2685	10000000h
78h	2	"DEVCAP—Offset 74h" on page 2685	0800h

Default: 0F04h

15	12	8	4	0
0	0	0	0	0
1	1	1	1	0
0	0	0	0	0
0	1	0	0	0
DID				

Bit Range	Default & Access	Description
15:0	0f04h RO	DID: Device ID: This field identifies the particular device. DID[15:7] indicates SoC, DID[6:1]=6'b000010 indicates HDAudio device, DID[0] comes from fuse indicates HDAudio SKU

20.5.3 CMD—Offset 4h

Command

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

CMD: [B:0, D:27, F:0] + 4h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
Reserved				ID
Reserved				FBE
Reserved				SEN
Reserved				WCC
Reserved				PER
Reserved				VGS
Reserved				MWI
Reserved				SCE
Reserved				BME
Reserved				MSE
Reserved				IOS

Bit Range	Default & Access	Description
15:11	0000h RO	Reserved: Reserved
10	0h RW	ID: Interrupt Disable
9	0h RO	FBE: Fast back to back enable. Not implemented.
8	0h RW	SEN: SERR enable
7	0h RO	WCC: Wait Cycle Control. Not implemented.
6	0h RW	PER: Parity error response. Not implemented.
5	0h RO	VGS: VGA Pallete Snoop. Not implemented.
4	0h RO	MWI: Memory write and invalidate enable. Not implemented.
3	0h RO	SCE: Special cycle enable. Not implemented.
2	0h RW	BME: Bus master enable

Bit Range	Default & Access	Description
1	0h RW	MSE: Memory space enable
0	0h RO	IOS: I/O space enabled. Not implemented.

20.5.4 STS—Offset 6h

Status

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

STS: [B:0, D:27, F:0] + 6h

Default: 0010h

15	12	8	4	0
0	0	0	1	0
DPE	SERRS	RMA	RTA	STA
				DEVT
				MDPE
				FBC
				Reserved
				C66
				CLIST
				IS
				Reserved_1

Bit Range	Default & Access	Description
15	0h RO	DPE: Detected parity error. Not implemented.
14	0h RO	SERRS: SERR Status
13	0h WOC	RMA: Recieved master abort
12	0h RO	RTA: Recieved target abort. Not implemented.
11	0h RO	STA: Signaled target abort. Not implemented.
10:9	0h RO	DEVT: DEVSEL timing status. Not implemented.
8	0h RO	MDPE: Master data parity error. Not implemented.
7	0h RO	FBC: Fast back to back capable. Not implemented.
6	0h RO	Reserved: Reserved
5	0h RO	C66: 66MHz capable. Not implemented.
4	1h RO	CLIST: Capabilities list exist
3	0h RO	IS: Interrupt Status. Shows legacy interrupt signal status. Doesn't apply to MSI.

Bit Range	Default & Access	Description
2:0	0h RO	Reserved_1: reserved

20.5.5 RID—Offset 8h

Revision ID

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

RID: [B:0, D:27, F:0] + 8h

Default: 00h

Bit Range	Default & Access	Description
7:0	0h RO	RID: Revision ID

20.5.6 PI—Offset 9h

Programming Interface

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

PI: [B:0, D:27, F:0] + 9h

Default: 00h

Bit Range	Default & Access	Description
7:0	0h RO	PI: Programming Interface

20.5.7 SCC—Offset Ah

Sub Class Code

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

SCC: [B:0, D:27, F:0] + Ah

Default: 03h

Bit Range	Default & Access	Description
7:0	03h RO	SCC: Sub Class Code

20.5.8 BCC—Offset Bh

Base Class Code

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

BCC: [B:0, D:27, F:0] + Bh

Default: 04h

Bit Range	Default & Access	Description
7:0	04h RO	BCC: Base Class Code

20.5.9 CLS—Offset Ch

Cache line size

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

CLS: [B:0, D:27, F:0] + Ch

Default: 00h

Bit Range	Default & Access	Description
7:0	0h RW	CLS: Cache line size

20.5.10 LT—Offset Dh

Latency timer

Access Method

Type: PCI Configuration Register (Size: 8 bits) **LT:** [B:0, D:27, F:0] + Dh

Default: 00h

Bit Range	Default & Access	Description
7:0	0h RO	LT: Latency timer

20.5.11 HTYPE—Offset Eh

Header type

Access Method

Type: PCI Configuration Register (Size: 8 bits) **HTYPE:** [B:0, D:27, F:0] + Eh

Default: 00h

Bit Range	Default & Access	Description
7:0	0h RO	HTYPE: Header type

20.5.12 BIST—Offset Fh

Built in self test. Not implemented.

Access Method

Type: PCI Configuration Register (Size: 8 bits) **BIST:** [B:0, D:27, F:0] + Fh

Default: 00h

20.5.15 SVID—Offset 2Ch

subsystem vendor ID

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

SVID: [B:0, D:27, F:0] + 2Ch

Default: 0000h

Bit Range	Default & Access	Description
15:0	0h RWO	SVID: subsystem vendor ID. This field is written by BIOS. No hardware action is taken according to this register

20.5.16 SID—Offset 2Eh

subsystem ID

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

SID: [B:0, D:27, F:0] + 2Eh

Default: 0000h

Bit Range	Default & Access	Description
15:0	0h RWO	SID: subsystem ID. This field is written by BIOS. No hardware action is taken according to this register

20.5.17 CAPPTR—Offset 34h

Capabilities pointer

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

CAPPTR: [B:0, D:27, F:0] + 34h

Default: 50h

Bit Range	Default & Access	Description
7:0	50h RO	CAPPTR : Capabilities pointer

20.5.18 INTLN—Offset 3Ch

Interrupt Line

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

INTLN: [B:0, D:27, F:0] + 3Ch

Default: 00h

7				4				0
0	0	0	0	0	0	0	0	0
Reserved				INTLN	INTLN			

Bit Range	Default & Access	Description
7:0	0h RW	INTLN : Interrupt Line

20.5.19 INTPN—Offset 3Dh

Interrupt Pin

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

INTPN: [B:0, D:27, F:0] + 3Dh

Default: 01h

7				4				0
0	0	0	0	0	0	0	0	1
Reserved				INTPN	INTPN			

Bit Range	Default & Access	Description
7:4	0h RO	Reserved : Reserved
3:0	1h RO	IP (INTPN) : Interrupt Pin

20.5.20 AZCTL—Offset 40h

Azalia controller

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

AZCTL: [B:0, D:27, F:0] + 40h

Default: 01h

7				4					0
0	0	0	0	0	0	0	0	0	1
Reserved								AZ_AC97	

Bit Range	Default & Access	Description
7:1	0h RO	Reserved: Reserved
0	1h RO	AZ_AC97# (AZ_AC97): This register is always 1'b1 indicating Azalia

20.5.21 IOBC—Offset 42h

IO Buffer control

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

IOBC: [B:0, D:27, F:0] + 42h

Default: 00h

7				4					0
0	0	0	0	0	0	0	0	0	0
Reserved_0			ASRC	Reserved_1		AVDDIS	MVSEL	VMODE	

Bit Range	Default & Access	Description
7:6	0h RO	Reserved_0: Reserved
5:4	0h RO	ASRC: Audio buffer slew rate control
3	0h RO	Reserved_1: Reserved
2	0h RO	AVDDIS: Automatic voltage detector disable
1	0h RO	MVSEL: Manual voltage select

Bit Range	Default & Access	Description
0	0h RO	VMODE : voltage mode

20.5.22 TM1—Offset 43h

Test mode 1

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

TM1: [B:0, D:27, F:0] + 43h

Default: 57h

7				4				0
0	1	0	1	0	1	1	1	1
RSVD	RSVD	RSVD	RSVD	HAPD	RSVD	RSVD	RSVD	RSVD

Bit Range	Default & Access	Description
7	0h RO	Reserved (RSVD) : Reserved.
6	1h RO	Reserved (RSVD) : Reserved.
5	0h RO	Reserved (RSVD) : Reserved.
4	1h RO	Reserved (RSVD) : Reserved.
3	0h RWO	HAPD : HD Audio PCI/PCIe# device
2	1h RO	Reserved (RSVD) : Reserved.
1	1h RO	Reserved (RSVD) : Reserved.
0	1h RO	Reserved (RSVD) : Reserved.

20.5.23 DCKCTL—Offset 4Ch

Docking control

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

DCKCTL: [B:0, D:27, F:0] + 4Ch

Default: 00h

7				4					0
0	0	0	0	0	0	0	0	0	0
Reserved								DA	

Bit Range	Default & Access	Description
7:1	0h RO	Reserved: reserved
0	0h RW	DA: Dock attach

20.5.24 DCKSTS—Offset 4Dh

Docking status

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

DCKSTS: [B:0, D:27, F:0] + 4Dh

Default: 80h

7				4					0
1	0	0	0	0	0	0	0	0	0
DS	Reserved							DM	

Bit Range	Default & Access	Description
7	1h RWO	DS: Docking support
6:1	0h RO	Reserved: reserved
0	0h RO	DM: Dock Mated

20.5.25 PID—Offset 50h

Power Management Capability ID

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

PID: [B:0, D:27, F:0] + 50h

Default: 6001h

15	12	8	4	0											
0	1	1	0	0	0	0	0	0	0	0	0	0	0	1	
NEXTCAP								CAPID							

Bit Range	Default & Access	Description
15:8	60h RO	NEXTCAP: Next Capability.
7:0	01h RO	CAPID: Capability ID.

20.5.26 PC—Offset 52h

Power Management Capabilities

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

PC: [B:0, D:27, F:0] + 52h

Default: C842h

15	12	8	4	0											
1	1	0	0	1	0	0	0	0	1	0	0	0	0	1	0
PMES				D2S	D1S	AC			DSI	Reserved	PMEC	VS			

Bit Range	Default & Access	Description
15:11	19h RO	PMES: PME_Support (PMES): Indicates PME# can be generated from D3 and D0 states.
10	0h RO	D2S: D2 state. Not supported.
9	0h RO	D1S: D1 state. Not supported.
8:6	1h RO	AC: Aux Current
5	0h RO	DSI: Device specific initialization
4	0h RO	Reserved: Reserved
3	0h RO	PMEC: PME Clock. Does not apply.
2:0	2h RO	VS: Version (VS): Indicates support for Revision 1.1 of the PCI Power Management Specification.

20.5.27 PCS—Offset 54h

Power Management control and status

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PCS: [B:0, D:27, F:0] + 54h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
DT		BPCCE	B23	Reserved_0	PMES	Reserved_1	PMEE	Reserved_2	PS

Bit Range	Default & Access	Description
31:24	0h RO	DT: Data. Does not apply.
23	0h RO	BPCCE: Bus power control enable. Does not apply.
22	0h RO	B23: Does not apply.
21:16	0h RO	Reserved_0: Reserved
15	0h RW1C	PMES: PME Status (PMES): This bit is set when the Intel HD Audio controller would normally assert the PME# signal independent of the state of the PME_En bit. This bit resides in the Suspend well. This bit is in the Suspend well and cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
14:9	0h RO	Reserved_1: Reserved
8	0h RW	PMEE: PME enable
7:2	0h RO	Reserved_2: reserved
1:0	0h RW	PS: Power State (PS): This field is used both to determine the current power state of the Intel HD Audio controller and to set a new power state. The values are: 00 D0 state 11 D3HOT state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, the Intel HD Audio controllers configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. When software changes this value from the D3HOT state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function.

20.5.28 MID—Offset 60h

MSI Capability ID

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

MID: [B:0, D:27, F:0] + 60h

Default: 7005h

15	12	8	4	0
0	1	1	1	0
0	0	0	0	0
0	0	0	0	0
0	1	0	1	0
0	1	0	1	0
NEXTCAP				CAPID

Bit Range	Default & Access	Description
15:8	70h RO	NEXTCAP: Next Capability. The value of this field depends on the TM1.HAPD bit. When TM1.HAPD is 0, this field has a value of 70h where it points to the PCI Express capability structure. When TM1.HAPD bit is 1, this field has a value of 00h to indicate that this is the last capability structure in the list.
7:0	05h RO	CAPID: Capability ID.

20.5.29 MMC—Offset 62h

MSI Message Control

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

MMC: [B:0, D:27, F:0] + 62h

Default: 0080h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
0	0	0	0	0
Reserved				ADD64
Reserved				MME
Reserved				MMC
Reserved				ME

Bit Range	Default & Access	Description
15:8	0h RO	Reserved: Reserved
7	1h RO	ADD64: 64-bit Address support
6:4	0h RO	MME: Multiple Message Enable
3:1	0h RO	MMC: Multiple Message Capable
0	0h RW	ME: MSI Enable (ME): If set to 1 an MSI will be generated instead of an INTx# signal. If set to 0, an MSI may not be generated.

20.5.30 MMLA—Offset 64h

MSI Lower Address

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

MMLA: [B:0, D:27, F:0] + 64h

Default: 00000000h

Bit Range	Default & Access	Description
31:2	0h RW	MLA: MSI Lower Address
1:0	0h RO	Reserved: Reserved

20.5.31 MMUA—Offset 68h

MSI Upper Address

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

MMUA: [B:0, D:27, F:0] + 68h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	MUA: MSI Upper Address

20.5.32 MMD—Offset 6Ch

MSI Data

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

MMD: [B:0, D:27, F:0] + 6Ch

Default: 0000h

Bit Range	Default & Access	Description
15:0	0h RW	MD: MSI Data

20.5.33 PXID—Offset 70h

PCIe Capability ID

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

PXID: [B:0, D:27, F:0] + 70h

Default: 0010h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	1	0
0	0	0	0	0
NEXTCAP			CAPID	

Bit Range	Default & Access	Description
15:8	00h RO	NEXTCAP: Next Capability.
7:0	10h RO	CAPID: Capability ID.

20.5.34 PXC—Offset 72h

PCI express capabilities

Access Method

Type: PCI Configuration Register
(Size: 16 bits)

PXC: [B:0, D:27, F:0] + 72h

Default: 0091h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
0	0	0	1	0
0	0	0	0	1
Reserved	IMN	SI	DPT	CV

Bit Range	Default & Access	Description
15:14	0h RO	Reserved: reserved
13:9	0h RO	IMN: Interrupt message number
8	0h RO	SI: Slot implemented
7:4	9h RO	DPT: Device/port type
3:0	1h RO	CV: Capability version

Default: 0800h

NXTCAP										CV					PCIECID																	

Bit Range	Default & Access	Description
31:20	130h RWO	NXTCAP: Next Capability Offset (NXTCAP): Points to the next capability header, which is the Root Complex Link Declaration Enhanced Capability Header. This register is RWO to support removing the Root Complex Topology Capability from the PCI Express Extended Capability List. For systems which support the Root Complex Topology Capability Structure, boot BIOS should write a 130h to this register, otherwise boot BIOS should write a 000h to this register.
19:16	1h RWO	CV: Capability Version (CV): This register is RWO to support removing the PCI Express Extended Capabilities from Azalia. For systems which support the PCI Express Virtual Channel capability and the Root Complex Topology Capability Structure, boot BIOS should write a 1h to this register, otherwise boot BIOS should write a 0h to this register.
15:0	2h RWO	PCIECID: PCI Express Extended Capability ID (PCIECID): This register is RWO to support removing the PCI Express Extended Capabilities from Azalia. For systems which support the PCI Express Virtual Channel capability and the Root Complex Topology Capability Structure, boot BIOS should write a 0002h to this register, otherwise boot BIOS should write a 0000h to this register.

Bit Range	Default & Access	Description
15:12	4h RW	NUMBER_OF_OUTPUT_STREAMS_SUPPORTED: 0011b indicates that in this SoC, Intel HD Audio controller supports three output streams.
11:8	4h RW	NUMBER_OF_INPUT_STREAMS_SUPPORTED: 0011b indicates that in this SoC, Intel HD Audio controller supports three output streams.
7:3	00h RO	NUMBER_OF_BIDIRECTIONAL_STREAMS_SUPPORTED: 00000b indicates that the Intel HD Audio controller supports 0 bidirectional streams.
2:1	0h RO	NUMBER_OF_SERIAL_DATA_OUT_SIGNALS: 00b indicates that the Intel HD Audio controller supports one Serial Data Output signal.

Bit Range	Default & Access	Description
0	01h RW	BIT_ADDRESS_SUPPORTED: A 1 indicates that the Intel HD Audio controller supports 64 bit addressing for BDL addresses data buffer addresses and command buffer addresses.

20.6.2 VMIN—Offset 2h

Minor Version

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

VMIN: [AZLBAR] + 2h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00h

7		4		0
0	0	0	0	0
MINOR_VERSION				

Bit Range	Default & Access	Description
7:0	00h RO	MINOR_VERSION: Indicates SoC supports minor revision number 00h of the Intel HD Audio specification.

20.6.3 VMAJ—Offset 3h

Major Version

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

VMAJ: [AZLBAR] + 3h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 01h

7		4		0
0	0	0	0	1
MAJOR_VERSION				

Bit Range	Default & Access	Description
7:0	01h RO	MAJOR_VERSION: Indicates SoC supports major revision number 1 of the Intel HD Audio specification.

20.6.4 OUTPAY—Offset 4h

Output Payload Capability

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

OUTPAY: [AZLBAR] + 4h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 003Ch

15	12	8	4	0
0	0	0	1	0
0	0	0	1	0
0	0	0	1	0
OUTPUT_PAYLOAD_CAPABILITY				

Bit Range	Default & Access	Description
15:0	003Ch RO	OUTPUT_PAYLOAD_CAPABILITY: Indicates the total output payload available on the link. This does not include bandwidth used for command and control. This measurement is in 16 bit word quantities per 48 kHz frame. The default link clock speed of 24.000 MHz the data is double pumped provides 1000 bits per frame or 62.5 words in total. 40 bits are used for command and control leaving 60 words available for data payload. 00h 0 words 01h 1 word payload FFh 255h word payload

20.6.5 INPAY—Offset 6h

Input Payload Capability

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

INPAY: [AZLBAR] + 6h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 001Dh

15	12	8	4	0
0	0	0	0	1
0	0	0	0	1
0	0	0	1	1
0	0	0	1	1
INPUT_PAYLOAD_CAPABILITY				

Bit Range	Default & Access	Description
15:0	001Dh RO	INPUT_PAYLOAD_CAPABILITY: Indicates the total input payload available on the link. This does not include bandwidth used for response. This measurement is in 16 bit word quantities per 48 kHz frame. The default link clock speed of 24.000 MHz provides 500 bits per frame or 31.25 words in total. 36 bits are used for response leaving 29 words for data payload. 00h 0 words 01h 1 word payload FFh 255h word payload

20.6.6 GCTL—Offset 8h

Global Control

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

GCTL: [AZLBAR] + 8h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:9	0h RO	RESERVED0: reserved
8	0h RW	ACCEPT_UNSOLICITED_RESPONSE_ENABLE: If UNSOL is a 1 Unsolicited Responses from the codecs are accepted by the controller and placed into the Response Input Ring Buffer. If UNSOL is a 0 unsolicited responses are not accepted and dropped on the floor.
7:2	00h RO	RESERVED1: reserved
1	0h RW	FLUSH_CONTROL: Writing a 1 to this bit initiates a flush. When the flush completion is received by the controller hardware sets the Flush Status bit and clears this Flush Control bit. Before a flush cycle is initiated the DMA Position Buffer must be programmed with a valid memory address by software but the DMA Position Buffer bit 0 need not be set to enable the position reporting mechanism. Also all streams must be stopped the associated RUN bit must be 0 . When the flush is initiated the controller will flush pipelines to memory to guarantee that the hardware is ready to transition to a D3 state. Setting this bit is not a critical step in the power state transition if the content of the FIFOs is not critical.
0	0h RW	CONTROLLER_RESET: Writing a 0 to this bit causes the Intel HD Audio controller to be reset. All state machines FIFO s and non Suspend well memory mapped configuration registers except ECAP and PCI Configuration Registers in the controller will be reset. The Intel HD Audio link RESET signal will be asserted and all other link signals will be driven to their reset values. After the hardware has completed sequencing into the reset state it will report a 0 in this bit. Software must read a 0 from this bit to verify that the controller is in reset. Writing a 1 to this bit causes the controller to exit its reset state and de assert the Intel HD Audio link RESET signal. Software is responsible for setting clearing this bit such that the minimum Intel HD Audio link RESET signal assertion pulse width specification is met. When the controller hardware is ready to begin operation it will report a 1 in this bit. Software must read a 1 from this bit before accessing any controller registers. The CRST bit defaults to a 0 after hardware reset therefore software needs to write a 1 to this bit to begin operation. Note that the CORB RIRB RUN bits and all Stream RUN bits must be verified cleared to zero before CRST is written to 0 asserted in order to assure a clean re start. When setting or clearing CRST software must ensure that minimum link timing requirements minimum RESET assertion time etc. are met. When CRST is 0 indicating that the controller is in reset writes to all Intel HD Audio memory mapped registers are ignored as if the device is not present. The only exception is the Global Control register containing the CRST bit itself. The Global Control register is write able as a DWord Word or Byte even when CRST is 0 if the byte enable for the byte containing the CRST bit Byte Enable 0 is active. If Byte Enable 0 is not active writes to the Global Control register will be ignored when CRST is 0. When CRST is 0 reads to Intel HD Audio memory mapped registers will return their default value except for registers that are not reset with PLTRST or on a D3hot to D0 transition.

20.6.7 WAKEEN—Offset Ch

Wake Enable

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

WAKEEN: [AZLBAR] + Ch

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00h

0	0	0	1	0
INPUT_STREAM_PAYLOAD_CAPABILITY				

Bit Range	Default & Access	Description
15:0	0018h RO	INPUT_STREAM_PAYLOAD_CAPABILITY: Indicates maximum number of words per frame for any single input stream. This measurement is in 16 bit word quantities per 48 kHz frame. 24 Words 48B is the maximum supported therefore a value of 18h is reported in this register. Software must ensure that a format which would cause more words per frame than indicated is not programmed into the Input Stream Descriptor register. 00h 0 words 01h 1 word payload FFh 255h word payload

20.6.14 WALCLK—Offset 30h

Wall Clock Counter

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

WALCLK: [AZLBAR] + 30h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
WALL_CLOCK_COUNTER									

Bit Range	Default & Access	Description
31:0	0h RO	WALL_CLOCK_COUNTER: 32 bit counter that is incremented on each link BCLK period and rolls over from FFFF_FFFFh to 0000_0000h. This counter will roll over to zero with a period of approximately 179 seconds. This counter is enabled while the BCLK bit is set to 1. Software uses this counter to synchronize between multiple controllers. Will be reset on controller reset.

20.6.15 SSYNC—Offset 38h

Stream Synchronization

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSYNC: [AZLBAR] + 38h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

RESERVED0						STREAM_SYNCHRONIZATION_BITS		

Bit Range	Default & Access	Description
31:8	0h RO	RESERVED0: reserved
7:0	00h RW	STREAM_SYNCHRONIZATION_BITS: The Stream Synchronization bits when set to 1 block data from being sent on or received from the link. Each bit controls the associated Stream Descriptor bit 0 corresponds to the first Stream Descriptor etc. To synchronously start a set of DMA engines the bits in the SSYNC register are first set to a 1. The RUN bits for the associated Stream Descriptors are then set to a 1 to start the DMA engines. When all streams are ready FIFORDY 1 the associated SSYNC bits can all be set to 0 at the same time and transmission or reception of bits to or from the link will begin together at the start of the next full link frame. To synchronously stop streams first the bits are set in the SSYNC register and then the individual RUN bits in the Stream Descriptors are cleared by software. The streams are numbered and the SSYNC bits assigned sequentially based on their order in the register set. Bit 0 Input Stream 1 Bit 1 Input Stream 2 Bit 2 Input Stream 3 Bit 3 Input Stream 4 Bit 4 Output Stream 1 Bit 5 Output Stream 2 Bit 6 Output Stream 3 Bit 7 Output Stream 4 Each bit can be reset by their respective stream reset.

20.6.16 CORBLBASE—Offset 40h

CORB Lower Base Address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CORBLBASE: [AZLBAR] + 40h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
CORB_LOWER_BASE_ADDRESS								CORB_LOWER_BASE_UNIMPLEMENTED_BITS	

Bit Range	Default & Access	Description
31:7	0h RW	CORB_LOWER_BASE_ADDRESS: Lower address of the Command Output Ring Buffer allowing the CORB Base Address to be assigned on any 64 B boundary. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.
6:0	00h RO	CORB_LOWER_BASE_UNIMPLEMENTED_BITS: Hardwired to 0. This requires the CORB to be allocated with 128 byte granularity to allow for cache line fetch optimizations.

20.6.17 CORBUBASE—Offset 44h

CORB Upper Base Address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CORBUBASE: [AZLBAR] + 44h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	CORB_UPPER_BASE_ADDRESS: Upper 32 bits of address of the Command Output Ring Buffer. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.

20.6.18 CORBWP—Offset 48h

CORB Write Pointer

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

CORBWP: [AZLBAR] + 48h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

Bit Range	Default & Access	Description
15:8	00h RO	RESERVED0: reserved
7:0	00h RW	CORB_WRITE_POINTER: Software writes the last valid CORB entry offset into this field in Dword granularity. The DMA engine fetches commands from the CORB until the Read Pointer matches the Write Pointer. Supports 256 CORB entries 256 x 4B 1KB . This field may be written while the DMA engine is running.

20.6.19 CORBRP—Offset 4Ah

CORB Read Pointer

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

CORBRP: [AZLBAR] + 4Ah

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
0	0	0	0	0
CORB_READ_POINTER_RESET	RESERVED0		CORB_READ_POINTER	

Bit Range	Default & Access	Description
15	0h RW	CORB_READ_POINTER_RESET: Software writes a 1 to this bit to reset the CORB Read Pointer to 0 and clear any residual pre fetched commands in the CORB hardware buffer within the Intel Audio controller. The hardware will physically update this bit to 1 when the CORB Pointer reset is complete. Software must read a 1 to verify that the reset completed correctly. Software must clear this bit back to 0 and read back the 0 to verify that the clear completed correctly. The CORB DMA engine must be stopped prior to resetting the Read Pointer or else DMA transfer may be corrupted.
14:8	00h RO	RESERVED0: reserved
7:0	00h RO	CORB_READ_POINTER: Software reads this field to determine how many commands it can write to the CORB without over running. The value read indicates the CORB Read Pointer offset in Dword granularity. The offset entry read from this field has been successfully fetched by the DMA controller and may be over written by software. Supports 256 CORB entries 256 x 4B 1KB . This field may be read while the DMA engine is running.

20.6.20 CORBCTL—Offset 4Ch

CORB Control

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

CORBCTL: [AZLBAR] + 4Ch

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00h

Bit Range	Default & Access	Description
7:2	00h RO	RESERVED0: reserved
1	0h RW	ENABLE_CORB_DMA_ENGINE: 0 DMA Stop 1 DMA Run After SW writes a 0 to this bit the HW may not stop immediately. The hardware will physically update the bit to a 0 when the DMA engine is truly stopped. SW must read a 0 from this bit to verify that the DMA is truly stopped.
0	0h RW	CORB_MEMORY_ERROR_INTERRUPT_ENABLE: If this bit is set and GIE and CIE are enabled the controller will generate an interrupt if the MEI status bit is set.

20.6.21 CORBSTS—Offset 4Dh

CORB Status

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

CORBSTS: [AZLBAR] + 4Dh

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00h

7	0	0	0	4	0	0	0	0	0
RESERVED0				CORB_MEMORY_ERROR_INDICATION					

Bit Range	Default & Access	Description
7:1	00h RO	RESERVED0: reserved
0	0h RW	CORB_MEMORY_ERROR_INDICATION: If this status bit is set the controller has detected an error in the pathway between the controller and memory. This may be an ECC bit error or any other type of detectable data error which renders the command data fetched invalid. Software can clear this bit by writing a 1 to it. However this type of error leaves the audio subsystem in an unviable state and typically requires CRST .

20.6.22 CORBSIZE—Offset 4Eh

CORB Size

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

CORBSIZE: [AZLBAR] + 4Eh

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 42h

7	1	0	0	4	0	0	1	0
CORB_SIZE_CAPABILITY				RESERVED0		CORB_SIZE

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	IMMEDIATE_COMMAND_WRITE: The command to be sent to the codec via the Immediate Command mechanism is written to this register. The command stored in this register is sent out over the link during the next available frame after a 1 is written to the ICB bit.

20.6.31 IR—Offset 64h

Immediate Response

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

IR: [AZLBAR] + 64h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	IMMEDIATE_RESPONSE_READ: This register contains the response received from a codec resulting from a command sent via the Immediate Command mechanism. If multiple codecs responded in the same frame there is no guarantee as to which response will be latched. Therefore broadcast type commands must not be issued via the Immediate Command mechanism.

20.6.32 ICS—Offset 68h

Immediate Command Status

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

ICS: [AZLBAR] + 68h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
RESERVED0				IMMEDIATE_RESULT_VALID
				IMMEDIATE_COMMAND_BUSY

Bit Range	Default & Access	Description
15:2	0000h RO	RESERVED0: reserved
1	0h RW	IMMEDIATE_RESULT_VALID: This bit is set to a 1 by hardware when a new response is latched into the IRR register. This is a status flag indicating that software may read the response from the Immediate Response register. Software must clear this bit by writing a one to it before issuing a new command so that the software may determine when a new response has arrived.
0	0h RW	IMMEDIATE_COMMAND_BUSY: When this bit as read as a 0 it indicates that a new command may be issued using the Immediate Command mechanism. When this bit transitions from a 0 to a 1 via software writing a 1 the controller issues the command currently stored in the Immediate Command register to the codec over the link. When the corresponding response is latched into the Immediate Response register the controller hardware sets the IRV flag and clears the ICB bit back to 0. SW may write this bit to a 0 if the bit fails to return to 0 after a reasonable timeout period. Note that an Immediate Command must not be issued while the CORB RIRB mechanism is operating otherwise the responses conflict. This must be enforced by software.

20.6.33 DPLBASE—Offset 70h

DMA Position Lower Base Address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DPLBASE: [AZLBAR] + 70h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:7	0h RW	DMA_POSITION_LOWER_BASE_ADDRESS: Lower 32 bits of the DMA Position Buffer Base Address. This register field must not be written when any DMA engine is running or the DMA transfer may be corrupted. This same address is used by the Flush Control and must be programmed with a valid value before the FLCNRTL bit is set.
6:1	00h RO	DMA_POSITION_LOWER_BASE_UNIMPLEMENTED_BITS: Hardwired to 0 to force 128 byte buffer alignment for cache line write optimizations.
0	0h RW	DMA_POSITION_BUFFER_ENABLE: When this bit is set to a 1 the controller will write the DMA positions of each of the DMA engines to the buffer in main memory periodically typically once frame . Software can use this value to know what data in memory is valid data. The controller must guarantee that the values in the DMA Position Buffer that the software can read represent positions in the stream for which valid data exists in the Stream s DMA buffer. This has particular relevance in systems which support isochronous transfer the stream positions in the software visible memory buffer must represent stream data which has reached the Global Observation point.

20.6.34 DPUBASE—Offset 74h

DMA position Upper Base Address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DPUBASE: [AZLBAR] + 74h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	DMA_POSITION_UPPER_BASE_ADDRESS: Upper 32 bits of address of the DMA Position Buffer Base Address. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.

20.6.35 ISDOCTL_STS—Offset 80h

Input Stream Descriptor 0 Control and status

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ISDOCTL_STS: [AZLBAR] + 80h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00040000h

31	28	24	20	16	12	8	4	0							
0	0	0	0	0	0	0	0	0							
RESERVED1	FIFO_READY	DESCRIPTOR_ERROR	FIFO_ERROR	BUFFER_COMPLETION_INTERRUPT_STATUS	RESERVED2	STREAM_NUMBER	BIDIRECTIONAL_DIRECTION_CONTROL	TRAFFIC_PRIORITY	STRIPE_CONTROL	RESERVED0	DESCRIPTOR_ERROR_INTERRUPT_ENABLE	FIFO_ERROR_INTERRUPT_ENABLE	INTERRUPT_ON_COMPLETION_ENABLE	STREAM_RUN	STREAM_RESET

Bit Range	Default & Access	Description
31:30	0h RO	RESERVED1: reserved
29	0h RO	FIFO_READY: For input streams the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set.
28	0h RW	DESCRIPTOR_ERROR: Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
27	0h RW	FIFO_ERROR: Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an input stream this indicates a FIFO overrun occurring while the RUN bit is set. When this happens the FIFO pointers don't increment and the incoming data is not written into the FIFO thereby being lost.
26	0h RW	BUFFER_COMPLETION_INTERRUPT_STATUS: This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
25:24	0h RO	RESERVED2: reserved

Bit Range	Default & Access	Description
23:20	0h RW	STREAM_NUMBER: This value reflects the Tag associated with the data being transferred on the link. When an input stream is detected on any of the SDIx signals that match this value the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number two different SDIx inputs may not be configured with the same stream number. 0000 Reserved Indicates Unused 0001 Stream 1 1110 Stream 14 1111 Stream 15
19	0h RO	BIDIRECTIONAL_DIRECTION_CONTROL: This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	01h RO	TRAFFIC_PRIORITY: Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RO	STRIPE_CONTROL: This field is meaningless for input streams.
15:5	000h RO	RESERVED0: reserved
4	0h RW	DESCRIPTOR_ERROR_INTERRUPT_ENABLE: Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set.
3	0h RW	FIFO_ERROR_INTERRUPT_ENABLE: This bit controls whether the occurrence of a FIFO error overrun for input will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped.
2	0h RW	INTERRUPT_ON_COMPLETION_ENABLE: This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur.
1	0h RW	STREAM_RUN: When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW	STREAM_RESET: Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

20.6.36 ISDLPB—Offset 84h

Input Stream Descriptor 0 Link Position in Buffer

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ISDLPB: [AZLBAR] + 84h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000000h

Bit Range	Default & Access	Description
31:0	0h RO	LINK_POSITION_IN_BUFFER: Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0.

20.6.37 ISDOCBL—Offset 88h

Input Stream Descriptor 0 Cyclic Buffer Length

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ISDOCBL: [AZLBAR] + 88h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	CYCLIC_BUFFER_LENGTH: Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0. Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted.

20.6.38 ISD0LVI—Offset 8Ch

Input Stream Descriptor 0 Last Valid Index

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

ISD0LVI: [AZLBAR] + 8Ch

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
RESERVED0		LAST_VALID_INDEX		

Bit Range	Default & Access	Description
15:8	00h RO	RESERVED0: reserved
7:0	00h RW	LAST_VALID_INDEX: The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0

Bit Range	Default & Access	Description
15:0	00h RW	FIFO_SIZE : Indicates the maximum number of bytes that could be revicted by the controller at one time. This is the maximum number of bytes that may have been received from the link but not yet DMA d into memory and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in ISD0FMT register. As the default value is zero, SW must write to the respective ISD0FMT register to kick of the FIFO size calculation, and read back to find out the HW allocated FIFO size.

20.6.41 ISD0FMT—Offset 92h

Input Stream Descriptor 0 Format

Access Method

20.6.51 ISD1BDLPLBA—Offset B8h

Input Stream Descriptor 1 Buffer Descriptor List Pointer Lower Base Address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ISD1BDLPLBA: [AZLBAR] + B8h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:7	0h RW	BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS: Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1.
6:1	00h RO	RESERVED0: reserved
0	0h RW	PROTECT: When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved.

20.6.52 ISD1BDLPUBA—Offset BCh

Input Stream Descriptor 1 Buffer Descriptor List Pointer Upper Base Address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ISD1BDLPUBA: [AZLBAR] + BCh

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS: Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted.

20.6.53 ISD2CTL_STS—Offset C0h

Input Stream Descriptor 2 Control and status

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ISD2CTL_STS: [AZLBAR] + C0h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00040000h

Bit Range	Default & Access	Description
31:0	0h RO	LINK_POSITION_IN_BUFFER: Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0.

20.6.55 ISD2CBL—Offset C8h

Input Stream Descriptor 2 Cyclic Buffer Length

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ISD2CBL: [AZLBAR] + C8h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	0
CYCLIC_BUFFER_LENGTH									

Bit Range	Default & Access	Description
31:0	0h RW	CYCLIC_BUFFER_LENGTH: Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted.

20.6.56 ISD2LVI—Offset CCh

Input Stream Descriptor 2 Last Valid Index

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

ISD2LVI: [AZLBAR] + CCh

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
RESERVED0				LAST_VALID_INDEX

Bit Range	Default & Access	Description
15:8	00h RO	RESERVED0: reserved
7:0	00h RW	LAST_VALID_INDEX: The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0

20.6.57 ISD2FIFOW—Offset CEh

Input Stream Descriptor 2 FIFO Eviction Watermark

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

ISD2FIFOW: [AZLBAR] + CEh

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0004h

15	12	8	4	0
0	0	0	0	0
RESERVED0				FIFO_WATERMARK

Bit Range	Default & Access	Description
15:3	0000h RO	RESERVED0: reserved
2:0	04h RO	FIFO_WATERMARK: Indicates the minimum number of bytes accumulated in the FIFO before the controller will start an eviction of data. The HD Audio controller hardwires the FIFO Watermark either 32B or 64B based on the following. For input streams the FIFOW value is determined by the EM3.ISRWS SEM3.ISRWS field.

20.6.58 ISD2FIFOS—Offset D0h

Input Stream Descriptor 2 FIFO Size

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

ISD2FIFOS: [AZLBAR] + D0h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
FIFO_SIZE				

Bit Range	Default & Access	Description
15:0	00h RW	FIFO_SIZE: Indicates the maximum number of bytes that could be received by the controller at one time. This is the maximum number of bytes that may have been received from the link but not yet DMA d into memory and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in ISD2FMT register. As the default value is zero, SW must write to the respective ISD2FMT register to kick of the FIFO size calculation, and read back to find out the HW allocated FIFO size.

20.6.59 ISD2FMT—Offset D2h

Input Stream Descriptor 2 Format

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

ISD2FMT: [AZLBAR] + D2h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS							RESERVED0		PROTECT

Bit Range	Default & Access	Description
31:7	0h RW	BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS: Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1.
6:1	00h RO	RESERVED0: reserved
0	0h RW	PROTECT: When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved.

20.6.61 ISD2BDLPUBA—Offset DCh

Input Stream Descriptor 2 Buffer Descriptor List Pointer Upper Base Address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ISD2BDLPUBA: [AZLBAR] + DCh

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS: Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted.

20.6.62 ISD3CTL_STS—Offset E0h

Input Stream Descriptor 3 Control and status

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ISD3CTL_STS: [AZLBAR] + E0h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00040000h

31	28	24	20	16	12	8	4	0							
0	0	0	0	0	0	0	0	0							
RESERVED1	FIFO_READY	DESCRIPTOR_ERROR	FIFO_ERROR	BUFFER_COMPLETION_INTERRUPT_STATUS	RESERVED2	STREAM_NUMBER	BIDIRECTIONAL_DIRECTION_CONTROL	TRAFFIC_PRIORITY	STRIPE_CONTROL	RESERVED0	DESCRIPTOR_ERROR_INTERRUPT_ENABLE	FIFO_ERROR_INTERRUPT_ENABLE	INTERRUPT_ON_COMPLETION_ENABLE	STREAM_RUN	STREAM_RESET

Bit Range	Default & Access	Description
31:30	0h RO	RESERVED1: reserved
29	0h RO	FIFO_READY: For input streams the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set.
28	0h RW	DESCRIPTOR_ERROR: Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
27	0h RW	FIFO_ERROR: Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an input stream this indicates a FIFO overrun occurring while the RUN bit is set. When this happens the FIFO pointers don't increment and the incoming data is not written into the FIFO thereby being lost.
26	0h RW	BUFFER_COMPLETION_INTERRUPT_STATUS: This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
25:24	0h RO	RESERVED2: reserved

Bit Range	Default & Access	Description
23:20	0h RW	STREAM_NUMBER: This value reflects the Tag associated with the data being transferred on the link. When an input stream is detected on any of the SDIx signals that match this value the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number two different SDIx inputs may not be configured with the same stream number. 0000 Reserved Indicates Unused 0001 Stream 1 1110 Stream 14 1111 Stream 15
19	0h RO	BIDIRECTIONAL_DIRECTION_CONTROL: This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	01h RO	TRAFFIC_PRIORITY: Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RO	STRIPE_CONTROL: This field is meaningless for input streams.
15:5	000h RO	RESERVED0: reserved
4	0h RW	DESCRIPTOR_ERROR_INTERRUPT_ENABLE: Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set.
3	0h RW	FIFO_ERROR_INTERRUPT_ENABLE: This bit controls whether the occurrence of a FIFO error overrun for input will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped.
2	0h RW	INTERRUPT_ON_COMPLETION_ENABLE: This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur.
1	0h RW	STREAM_RUN: When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW	STREAM_RESET: Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

20.6.63 ISD3LP1B—Offset E4h

Input Stream Descriptor 3 Link Position in Buffer

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ISD3LP1B: [AZLBAR] + E4h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RO	LINK_POSITION_IN_BUFFER: Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0.

31:30	0h RO	RESERVED1: reserved
29	0h RO	FIFO_READY: For output streams the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link. This bit defaults to 0 on reset because the FIFO is cleared on a reset.
28	0h RW	DESCRIPTOR_ERROR: Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
27	0h RW	FIFO_ERROR: Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an output stream this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
26	0h RW	BUFFER_COMPLETION_INTERRUPT_STATUS: This bit is set to 1 by the hardware after the last sample of a buffer byte has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
25:24	0h RO	RESERVED2: reserved
23:20	0h RW	STREAM_NUMBER: This value reflects the Tag associated with the data being transferred on the link. When data controlled by this descriptor is sent out over the link it will have this stream number encoded on the SYNC signal. 0000 Reserved Indicates Unused 0001 Stream 1 1110 Stream 14 1111 Stream 15
19	0h RO	BIDIRECTIONAL_DIRECTION_CONTROL: This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	01h RO	TRAFFIC_PRIORITY: Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RO	STRIPE_CONTROL: For output streams it controls the number of SDO signals to stripe data across. Only one SDO is supported in the HD Audio controller. Therefore it is hardwired to 0 s.
15:5	000h RO	RESERVED0: reserved

Bit Range	Default & Access	Description
4	0h RW	DESCRIPTOR_ERROR_INTERRUPT_ENABLE: Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set.
3	0h RW	FIFO_ERROR_INTERRUPT_ENABLE: This bit controls whether the occurrence of a FIFO error under run for output will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped.
2	0h RW	INTERRUPT_ON_COMPLETION_ENABLE: This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur.
1	0h RW	STREAM_RUN: When set to 1 the DMA engine associated with this output stream will be enabled to transfer data in the main memory to FIFO. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this output stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW	STREAM_RESET: Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

20.6.72 OSD0LP1B—Offset 104h

Output Stream Descriptor 0 Link Position in Buffer

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OSD0LP1B: [AZLBAR] + 104h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

0	0	0	0	0	0	0	0	0
LINK_POSITION_IN_BUFFER								

Bit Range	Default & Access	Description
31:0	0h RO	LINK_POSITION_IN_BUFFER: Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0.

20.6.73 OSD0CBL—Offset 108h

Output Stream Descriptor 0 Cyclic Buffer Length

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OSD0CBL: [AZLBAR] + 108h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	CYCLIC_BUFFER_LENGTH: Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted.

20.6.74 OSD0LVI—Offset 10Ch

Output Stream Descriptor 0 Last Valid Index

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

OSD0LVI: [AZLBAR] + 10Ch

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
FIFO_SIZE				

Bit Range	Default & Access	Description
15:0	00h RW	FIFO_SIZE: Indicates the maximum number of bytes that could be fetched by the controller at one time. This is the maximum number of bytes that may have been DMA d into memory but not yet transmitted on the link and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in OSD0FMT register. As the default value is zero, SW must write to the OSD0FMT register to kick of the FIFO size calculation and read back to find out the HW allocated FIFO size.

20.6.77 OSD0FMT—Offset 112h

Output Stream Descriptor 0 Format

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

OSD0FMT: [AZLBAR] + 112h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS: Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted.

20.6.89 OSD2CTL_STS—Offset 140h

Output Stream Descriptor 2 Control and status

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OSD2CTL_STS: [AZLBAR] + 140h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00040000h

Bit Range	Default & Access	Description
4	0h RW	DESCRIPTOR_ERROR_INTERRUPT_ENABLE: Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set.
3	0h RW	FIFO_ERROR_INTERRUPT_ENABLE: This bit controls whether the occurrence of a FIFO error under run for output will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped.
2	0h RW	INTERRUPT_ON_COMPLETION_ENABLE: This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur.
1	0h RW	STREAM_RUN: When set to 1 the DMA engine associated with this output stream will be enabled to transfer data in the main memory to FIFO. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this output stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW	STREAM_RESET: Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

20.6.90 OSD2LP1B—Offset 144h

Output Stream Descriptor 2 Link Position in Buffer

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OSD2LP1B: [AZLBAR] + 144h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

LINK_POSITION_IN_BUFFER								

Bit Range	Default & Access	Description
31:0	0h RO	LINK_POSITION_IN_BUFFER: Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0.

20.6.91 OSD2CBL—Offset 148h

Output Stream Descriptor 2 Cyclic Buffer Length

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OSD2CBL: [AZLBAR] + 148h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	CYCLIC_BUFFER_LENGTH: Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted.

20.6.92 OSD2LVI—Offset 14Ch

Output Stream Descriptor 2 Last Valid Index

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

OSD2LVI: [AZLBAR] + 14Ch

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
RESERVED0			LAST_VALID_INDEX	

Bit Range	Default & Access	Description
15:8	00h RO	RESERVED0: reserved
7:0	00h RW	LAST_VALID_INDEX: The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0

20.6.93 OSD2FIFOW—Offset 14Eh

Output Stream Descriptor 2 FIFO Fetch Watermark

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

OSD2FIFOW: [AZLBAR] + 14Eh

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0004h

15	12	8	4	0
0	0	0	0	0
RESERVED0			FIFO_WATERMARK	

Bit Range	Default & Access	Description
15:3	0000h RO	RESERVED0: reserved

Bit Range	Default & Access	Description
2:0	04h RO	FIFO_WATERMARK: Indicates the minimum number of bytes free in the FIFO before the controller will start a fetch of data. The HD Audio controller hardwires the FIFO Watermark either 32B or 64B based on the following. For output streams the FIFOW value is determined by the EM4.OSRWS SEM4.OSRWS field.

20.6.94 OSD2FIFOS—Offset 150h

Output Stream Descriptor 2 FIFO Size

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

OSD2FIFOS: [AZLBAR] + 150h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

15	12	8	4	0
0	0	0	0	0
FIFO_SIZE				

Bit Range	Default & Access	Description
15:0	00h RW	FIFO_SIZE: Indicates the maximum number of bytes that could be fetched by the controller at one time. This is the maximum number of bytes that may have been DMA d into memory but not yet transmitted on the link and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in OSD2FMT register. As the default value is zero, SW must write to the OSD2FMT register to kick of the FIFO size calculation and read back to find out the HW allocated FIFO size.

20.6.95 OSD2FMT—Offset 152h

Output Stream Descriptor 2 Format

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

OSD2FMT: [AZLBAR] + 152h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

15	0	0	0	0	12	0	0	0	0	8	0	0	0	0	4	0	0	0	0
RESERVED0	SAMPLE_BASE_RATE	SAMPLE_BASE_RATE_MULTIPLE				SAMPLE_BASE_RATE_DIVISOR				RESERVED1	BITS_PER_SAMPLE				NUMBER_OF_CHANNELS				

Bit Range	Default & Access	Description
15	0h RO	RESERVED0: reserved
14	0h RW	SAMPLE_BASE_RATE: Sample Base Rate (BASE): 0=48kHz 1=44.1kHz
13:11	0h RW	SAMPLE_BASE_RATE_MULTIPLE: Sample Base Rate Multiple (MULT): 000=48kHz/44.1kHz or less 001=x2 96kHz 88.2kHz 32kHz 010=x3 144kHz 011=x4 192kHz 176.4kHz 100-111 Reserved
10:8	0h RW	SAMPLE_BASE_RATE_DIVISOR: Sample Base Rate Divisor (DIV): 000 Divide by 1, 48kHz 44.1kHz 001 Divide by 2, 24kHz 22.05kHz 010 Divide by 3, 16kHz 32kHz 011 Divide by 4, 11.025kHz 100 Divide by 5, 9.6kHz 101 Divide by 6, 8kHz 110 Divide by 7 111 Divide by 8, 6kHz
7	0h RO	RESERVED1: reserved
6:4	0h RW	BITS_PER_SAMPLE: Bits per Sample (BITS): 000=8 bits. The data will be packed in memory in 8 bit containers on 16 bit boundaries 001=16 bits. The data will be packed in memory in 16 bit containers on 16 bit boundaries 010=20 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 011=24 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 100=32 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 101-111 Reserved
3:0	0h RW	NUMBER_OF_CHANNELS: Number of channels in each frame of the stream 0000=1 0001=2 1111=16

20.6.96 OSD2BDLPLBA—Offset 158h

Output Stream Descriptor 2 Buffer Descriptor List Pointer Lower Base Address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OSD2BDLPLBA: [AZLBAR] + 158h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:7	0h RW	BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS: Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1.
6:1	00h RO	RESERVED0: reserved
0	0h RW	PROTECT: When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved.

20.6.97 OSD2BDLPUBA—Offset 15Ch

Output Stream Descriptor 2 Buffer Descriptor List Pointer Upper Base Address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OSD2BDLPUBA: [AZLBAR] + 15Ch

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS: Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted.

20.6.98 OSD3CTL_STS—Offset 160h

Output Stream Descriptor 3 Control and status

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OSD3CTL_STS: [AZLBAR] + 160h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00040000h

Bit Range	Default & Access	Description
4	0h RW	DESCRIPTOR_ERROR_INTERRUPT_ENABLE: Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set.
3	0h RW	FIFO_ERROR_INTERRUPT_ENABLE: This bit controls whether the occurrence of a FIFO error under run for output will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped.
2	0h RW	INTERRUPT_ON_COMPLETION_ENABLE: This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur.
1	0h RW	STREAM_RUN: When set to 1 the DMA engine associated with this output stream will be enabled to transfer data in the main memory to FIFO. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this output stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW	STREAM_RESET: Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

20.6.99 OSD3LPIB—Offset 164h

Output Stream Descriptor 3 Link Position in Buffer

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OSD3LPIB: [AZLBAR] + 164h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

LINK_POSITION_IN_BUFFER								

Bit Range	Default & Access	Description
31:0	0h RO	LINK_POSITION_IN_BUFFER: Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0.

20.6.100 OSD3CBL—Offset 168h

Output Stream Descriptor 3 Cyclic Buffer Length

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

OSD3CBL: [AZLBAR] + 168h

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	CYCLIC_BUFFER_LENGTH: Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted.

20.6.101 OSD3LVI—Offset 16Ch

Output Stream Descriptor 3 Last Valid Index

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

OSD3LVI: [AZLBAR] + 16Ch

AZLBAR Type: PCI Configuration Register (Size: 32 bits)

AZLBAR Reference: [B:0, D:27, F:0] + 10h

Default: 0000h

Bit Range	Default & Access	Description
31:0	0h RO	LINK_POSITION_IN_BUFFER_ALIAS: This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0.

21 Low Power Engine (LPE) for Audio (I²S)

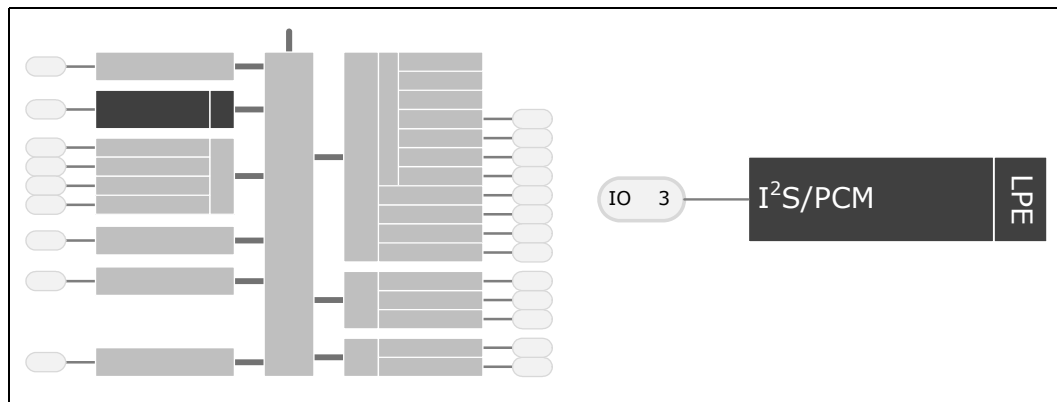

The Low Power Engine for Audio provides acceleration for common audio and voice functions. The voice and audio engine provides a mechanism for rendering audio and voice streams and tones from the operating system, applications to an audio or voice codec, and ultimately to the speaker, headphones, or Bluetooth headsets.

Audio streams in the SoC can be encoded and decoded by the Low Power Engine (LPE) in the Audio subsystem.

LPE Audio provides three external I²S audio interfaces.

Note: LPE_I2S[1:0] are multiplexed on the same balls as High Definition Audio.

Note: When LPE is active, the High Definition Audio functionality is disabled.

21.1 Signal Descriptions

See [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 224. LPE Signals

Signal Name	Direction Plat. Power	Description
LPE_I2S2[0:2]_CLK	I/O V1P8S	Clock signal for I ² S
LPE_I2S2[0:2]_FRM	I/O V1P8S	Frame select signal for I ² S
LPE_I2S2[0:2]_DATAIN	I V1P8S	RX data for I ² S
LPE_I2S2[0:2]_DATAOUT	O V1P8S	TX data for I ² S

† All LPE signals are muxed and may be used by other functions.

21.2 Features

The LPE Audio Subsystem consists of the following:

- Integrated, power-efficient 32-bit architecture core with 24-bit audio processing instructions
- Core processing speeds up to 343 MHz
- Closely Coupled Memories (CCMs)
 - 80KB Instruction RAM
 - 160KB Data RAM
 - 48KB Instruction Cache
 - 96KB Data Cache
- Very low-power consumption coupled with high-fidelity 24-bit audio
- Dual-issue, static, super-scalar VLIW processing engine
- Mode-less switching between 16-, 24-, and 64-bit dual-issue instructions
- Dual MACs which can operate with 32 x 16-bit and/or 24 x 24-bit operands
- Inter-Process Communication (IPC) mechanism to communicate with the SoC Processor Core including 4KB mailbox memory
- Flexible audio interfaces include three SSPs with I²S port functionality for I-directional audio transfers
 - I²S mode supports PCM payloads
 - Frame counters for all I²S ports
- High Performance DMA
 - DMA IP to support multiple outstanding transactions
 - Interleaved scatter-gather support for Audio DMA transfers
- Clock switching logic including new frequency increments

- External timer function with an always running clock.

The LPE core runs at a peak clock frequency of 343 MHz and has dedicated on-chip program and data memories and caches. The LPE core can access shared SRAM blocks, and external DRAM through OCP fabric. It communicates with audio peripherals using the audio sub-fabric, and employs Inter-Processor Communication (IPC) mechanism to communicate with the SoC Processor Core.

The Audio subsystem includes two OCP-based DMA engines. These DMA engines support single and multi-block transfers. They can be configured to transfer data between DRAM and audio CCMs or transfer data between CCMs and the audio peripheral interfaces

All these interfaces are peripherals in the Audio subsystem. LPE, LPE DMA, or the SoC processor core may access the peripherals during normal operation. The PMC may access all peripherals during specific tasks such as at boot time or during power state changes. A complete audio solution based on an internal audio processing engine which includes several I²S-based output ports.

The audio core used is a dedicated audio DSP core designed specifically for audio processing (decoding, post-processing, mixing, etc.)

Note: LPE requires systems with more than 512MB memory. This is required since the LPE firmware must reside at a stolen memory location on 512MB boundaries below 3 GiB. The LPE firmware itself is ~1MB, and is reserved by BIOS for LPE use.

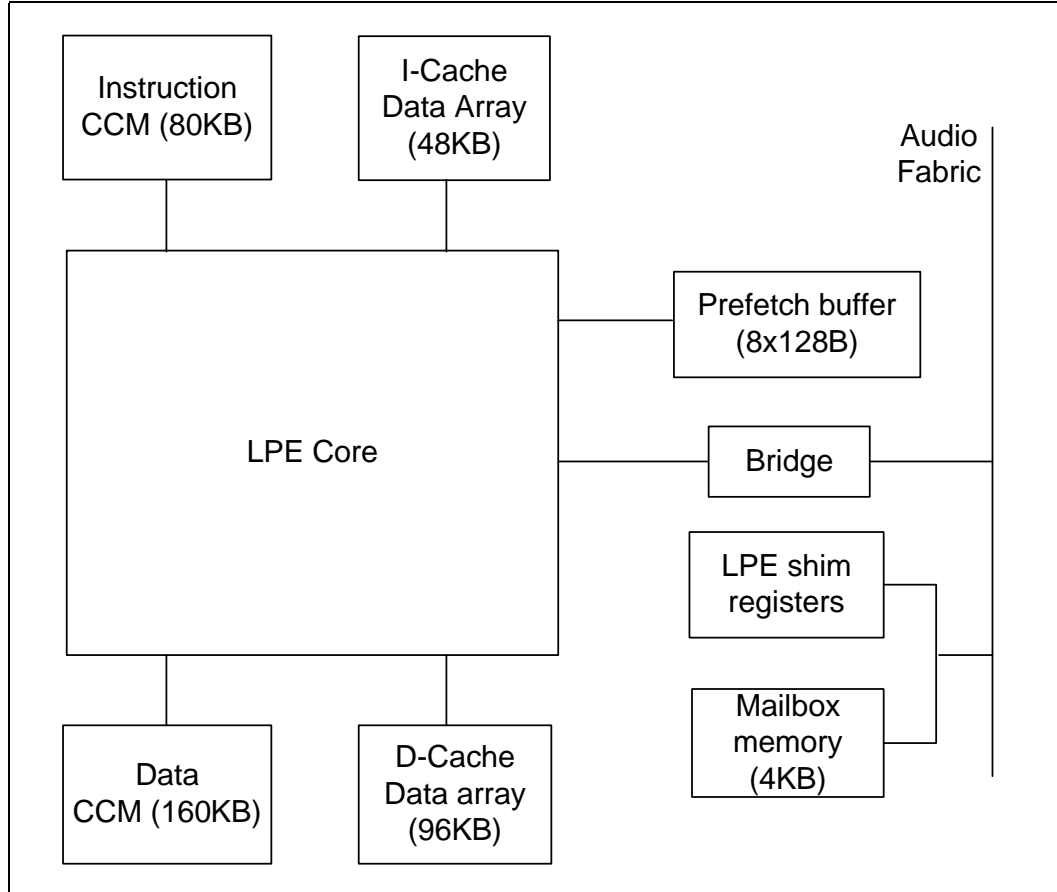

21.3 Detailed Block Level Description

21.3.1 LPE Core

The LPE core in the SoC runs at maximum frequency of 343 MHz and interfaces with the rest of the SoC system through the OCP bus. It is one of the masters on the Audio Sub-Fabric. The SoC Processor Core and LPE DMA engines are the other masters on the fabric. The following figure shows the LPE core and its interfaces.

Figure 109. Memory Connections for LPE

21.3.3 Instruction Closely Coupled Memory (CCM)

Instruction CCM for the core is used for loading commonly used routines as well as time-critical processing. Examples of time critical processing are acoustic echo cancellation and noise cancellation during voice calls.

Instruction CCM is initialized after reset by an external DMA controller. Runtime update of instruction CCM can be done either using explicit instructions or using an external DMA controller with inbound access.

21.3.4 Data Closely Coupled Memory (CCM)

Data CCM can be initialized after reset by an external DMA controller using inbound access. Runtime update of data CCM can be done either using stores to Data CCM or using an external DMA controller with inbound access.

21.3.5 Mailbox Memory and Data Exchange

The mailbox memory is a shared memory region in LPE address space that is accessible by the SoC Processor Core, PMC, and LPE. It is used when Doorbell registers cannot hold all the information that one processor wishes to communicate to the other. A typical example of such data blocks are audio stream related parameters when starting a new stream. The structures of data communicated through the mailbox are not defined in hardware so that software may partition the mailbox memory in any desired way and create any meaningful structures required.

21.4 Software Implementation Considerations

21.4.1 SoC Processor Core Cache Coherence

Traffic generated by the LPE core is considered non-cacheable and non-coherent with respect to the SoC Processor Core cache. DMA traffic is considered cacheable and checked for coherency with the SoC Processor Core cache.

Implications of this implementation are as follows:

- All code and tables for the LPE core need to be explicitly flushed from the SoC Processor Core cache if they are ever accessed.
- If the LPE core directly accesses data buffers in system DDR, the driver must explicitly flush the buffer from the SoC Processor Core cache
- If DMA accesses data buffers from system DRAM, the driver need not flush the data buffer from the SoC Processor Core cache.

21.4.2 Interrupts

21.4.2.1 LPE Peripheral Interrupts

Each of the LPE peripherals generates its own interrupts. SSP0, SSP1, and SSP2 have one interrupt each. Each of the DMA channels have individual interrupt lines. These interrupts are connected to the LPE core through the PISR register. The same interrupts are routed to IOAPIC through the ISRX register. The LPE core and SoC Processor Core have individual masks to enable these interrupts.

21.4.2.2 Interrupts Between SoC Processor Core and the LPE

The interrupts between the SoC Processor Core and the LPE are handled through the inter-processor communication registers. Whenever the SoC Processor Core writes to the IPCX communication register an interrupt is generated to the LPE. The LPE firmware sees there is a message waiting from the SoC Processor Core, and reads the IPCX register for the data. This data is a pre-configured message, where the message structure has been decided beforehand between the SoC Processor Core and the LPE. Similarly we have the IPCD register for the communication between the LPE and SoC Processor Core. Once the LPE writes to the IPCD register, an interrupt should be generated for the SoC Processor Core and the SoC Processor Core should read the message from the IPCD register and act accordingly. From a software viewpoint, the mechanism remains the same as before. From a hardware view point, the interrupt to IA-32 gets routed by means of the IOAPIC block. The IPC from Audio to SoC Processor Core gets a dedicated interrupt line to the IOAPIC.

21.4.2.3 Interrupts between PMC and LPE

The interrupts between PMC and LPE are also handled using Inter Process Communication registers.

21.4.3 Power Management Options for the LPE Core

- WAITI
 - Allows the LPE core to suspend operation until an interrupt occurs by executing the optional WAITI instruction.
- External Run/Stall Control Signal
 - This processor input allows external logic to stall large portions of the LPE pipeline by shutting off the clock to much of the processor's logic to reduce operating power when the LPE computational capabilities are not immediately needed by the system.

Note: Using the WAITI instruction to power down the processor will save more power than use of the external run/stall signal because the WAITI instruction disables more of the LPE's internal clocks.

21.4.4 External Timer

This timer always runs from SSP clock (before M/N divider) at 19.2/25MHz. The timer starts running once the run bit (refer to the External timer register definition for details) is set and the clear bit is cleared.

The timer generates an Interrupt pulse when the counter value matches the “match” value. The interrupt does not get generated if the match value is set to “0”. The timer runs in free running mode and rolls over after all 32 bits have become all 1’s.

The timer continues to run as long as the run bit is set. Once the run bit is cleared the timer holds the current value. The clear bit needs to be set to restart the timer from “0”.

21.5 Clocks

21.5.1 Clock Frequencies

Table 225 shows the clock frequency options for the Audio functional blocks.

Table 225. Clock Frequencies

Clock	Frequency	Notes
Audio core	25/50/100/200/267/343 MHz	Audio input clock trunk. CCU drives one of several frequencies as noted.
DMA 0	25/50 MHz	DMA clock
DMA1	25/50 MHz	DMA clock
Audio fabric clock	25/50 MHz	Fabric clock derived from audio core clock
SSP0 Clock	Fabric side: 25/50 MHz Link side: Up to 19.2/25 MHz	SSP0 clock domains
SSP1 Clock	Fabric side: 25/50 MHz Link side: Up to 19.2/25 MHz	SSP1 clock domains
SSP2 Clock	Fabric side: 25/50 MHz Link side: Up to 19.2/25 MHz	SSP2 clock domains

21.5.2 50 MHz Clock for LPE

50 MHz, the 2X OSC clock, is added to increase MIPS for low power MP3 mode. This frequency will be supplied by the clock doubler internal to the SoC’s Clock Control Unit.

21.5.3 Cache and CCM Clocking

Data CCM, Data cache, Instruction CCM, and Instruction Cache run off of the LPE clock. These memories are in a single clock domain.

Note: All Data CCM and Instruction CCM run in the same clock domain.

21.5.4 SSP Clocking

SSP could be used as either clock masters or clock slaves. Consequently, these IP have dual clock domains.

The first clock domain is clocked from an internal clock (e.g., fabric clock) and is used for generic logic like interrupt generation and register access.

The second clock domain drives the serial shift register (either driven internally or externally). When driven internally, this clock can be sourced from XTAL clock 25 MHz or PLL 19.2 MHz. These clocks are then divided down within the serial interface IP to generate the final bit clock for the interface.

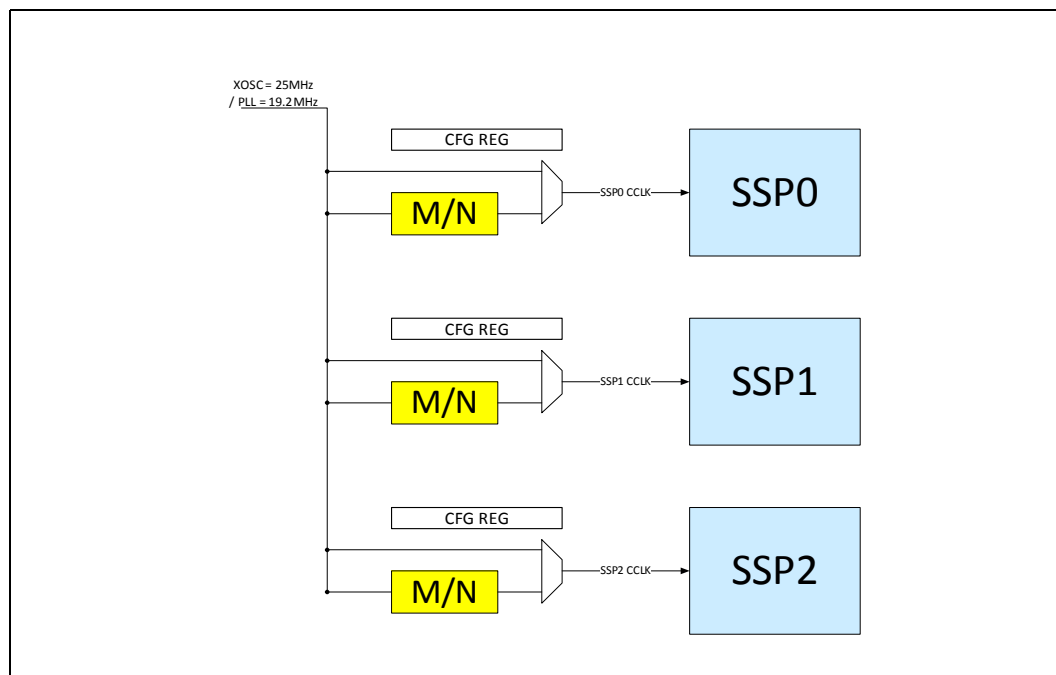

After power on, if the SSP input IO clock is in high state, first transition of the clock from high to low may be missing due to the Soc clock gating logic.

Note: "Frame Master" mode cannot be used when operating as clock slave and "Frame Slave" mode cannot be used when operating as clock master.

21.5.5 M/N Divider

LPE SSP in master mode uses the SSP CCLK to drive the serial clock. It has very limited option to divide CCLK. An M/N divider is added between the 19.2/25 MHz clock (XOSC) from CCU to each SSP CCLK input as shown in following diagram:

Figure 110.SSP CCLK Structure

Note: The maximum SSP CCLK frequency is listed in Table 132.

The LPE M/N divider is designed to produce a clock signal for the SSP block used in master mode. The divider is based on a generic NOM/DENOM divider. The supplied Master clock is 25 MHz (XTAL) or 19.2 MHz (LPPLL), but usually be used by the 25 MHz clock.

This mechanism is good for a wide spectrum of generated clocks. Two registers must be configured to get the target SSP clock. The values for the Nominator and Denominator registers are the smallest divider of:

$$\frac{Nominator}{Denominator} = \frac{Source_clock}{Target_clock}$$

21.5.5.1 Example

If we want to generate 17.64 MHz (=400x44.1 KHz) output clock out of 25 MHz clock, we need to program "NOM = 441" and "DENOM = 625":

$$17.64 \text{ MHz} = (441/625) \times 25 \text{ MHz}$$

In general the M over N can generate fractional divisor that could be used for generating the required clocks for Audio codec. [Table 226](#) describes some configuration options of this generic divider:

Table 226. M/N Values, Examples

Source Clock Frequency	Requested Clock	M/N Value
25 MHz	48 KHz	6/3125
	48K x 24 = 1.152 MHz	1152/25000
	48K x32 = 1.536 MHz	1536/25000
	48K x 64 = 3.072 MHz	3072/25000
	44.1 KHz	441/250000
	48K x 400 = 19.2 MHz	96/125
	44.1K x 400 = 17.64 MHz	441/625

21.5.5.2 Accuracy and Jitter

The output of the M/N is equal to the desired clock in average with Jitter of 20nTXE for 25 MHz input clock.

21.5.5.3 Configuration

Following configurable fields per M/N divider/SSP are in LPE shim registers:

Table 227. M/N Configurable Fields

Field	Width	Description
Bypass	1 bit	When set M/N divider is bypass. Clock from CCU is connected directly to SSP CCLK
EN	1 bit	Enable the divider
Update	1 bit	Update divider parameters
M Value	20 bits	Nominator value
N Value	20 bits	Denominator value

21.6 SSP (I²S)

The SoC audio subsystem consists of the LPE Audio Engine and three Synchronous Serial Protocol (SSP) ports. These ports are used in PCM mode and enable simultaneous support of voice and audio streams over I²S. The SoC audio subsystem also includes two DMA controllers dedicated to the LPE. The LPE DMA controllers are used for transferring data between external memory and CCMs, between CCMs and the SSP ports, and between CCMs. All peripheral ports can operate simultaneously.

21.6.1 Introduction

The Enhanced SSP Serial Ports are full-duplex synchronous serial interfaces. They can connect to a variety of external analog-to-digital (A/D) converters, audio, and telecommunication codecs, and many other devices which use serial protocols for transferring data. Formats supported include National* Microwire, Texas Instruments* Synchronous Serial Protocol (SSP), Motorola* Serial Peripheral Interface (SPI) protocol and a flexible Programmable Serial Port protocol (PSP).

The Enhanced SSPs operate in master mode (the attached peripheral functions as a slave) or slave mode (the attached peripheral functions as a master), and support serial bit rates from 0 to 25 Mbps, dependent on the input clock. Serial data formats range from 4 to 32-bits in length. Two on-chip register blocks function as independent FIFOs for transmit and receive data.

FIFOs may be loaded or emptied by the system processor using single transfers or DMA burst transfers of up to the FIFO depth. Each 32-bit word from the bus fills one entry in a FIFO using the lower significant bits of a 32-bit word.

21.6.2 SSP Features

The SSP port features are:

- Inter-IC Sound (I²S) protocols, are supported by programming the Programmable Serial Protocol (PSP).
- One FIFO for transmit data (TXFIFO) and a second, independent, FIFO for receive data (RXFIFO), where each FIFO is 16 samples deep x 32 bits wide
- Data sample sizes from 8, 16, 18 and 24bits

- 12.5 Mbps maximum serial bit-rate in both modes: master and slave.
- Clock master or slave mode operations
- Receive-without-transmit operation
- Network mode with up to eight time slots for PSP formats, and independent transmit/receive in any/all/none of the time slots.
- After updating SSP configuration, for example active slot count, the SSP will need to be disabled and enabled again. In other words, a SSP will not function correctly if a user changes the configuration setting on the fly.

21.6.3 Operation

Serial data is transferred between the LPE core or the SoC Processor Core and an external peripheral through FIFOs in one of the SSP ports. Data transfers between an SSP port and memory are initiated by either the LPE core or the SoC Processor Core using programmed I/O, or by DMA bursts. Although it is possible to initiate transfers directly from the SoC Processor Core, current driver design uses LPE for all PCM operations. Separate transmit and receive FIFOs and serial data paths permit simultaneous transfers in both directions to and from the external peripheral, depending on the protocols chosen.

Programmed I/O can transfer data between:

- The LPE core and the FIFO Data register for the TXFIFO
- The SoC Processor Core and the FIFO Data register for the TXFIFO
- The LPE core and the FIFO Data register for the RXFIFO
- The SoC Processor Core and the FIFO Data register for the RXFIFO
- The SoC Processor Core and the control or status registers
- The LPE core and the control or status registers

DMA bursts can transfer data between:

- Universal memory and the FIFO Data register for the TXFIFO
- Universal memory and the FIFO Data register for the RXFIFO
- Universal memory and the sequentially addressed control or status registers

21.6.4 LPE and DMA FIFO Access

The LPE or DMA access data through the Enhanced SSP Port's Transmit and Receive FIFOs. An LPE access takes the form of programmed I/O, transferring one FIFO entry per access. LPE accesses would normally be triggered off of an SSSR Interrupt and must always be 32 bits wide. LPE Writes to the FIFOs are 32 bits wide, but the serializing logic will ignore all bits beyond the programmed FIFO data size (EDSS/DSS value). LPE Reads to the FIFOs are also 32 bits wide, but the Receive data written into the RX FIFO (from the RXD line) is stored with zeroes in the MSBs down to the programmed data size. The FIFOs can also be accessed by DMA bursts, which must be

in multiples of 1, 2 or 4 bytes, depending upon the EDSS value, and must also transfer one FIFO entry per access. When the SSCR0.EDSS bit is set, DMA bursts must be in multiples of 4 bytes (the DMA must have the Enhanced SSP configured as a 32-bit peripheral). The DMA's width register must be at least the SSP data size programmed into the SSP control registers EDSS and DSS. The FIFO is seen as one 32-bit location by the processor. For Writes, the Enhanced SSP port takes the data from the Transmit FIFO, serializes it, and sends it over the serial wire (I2S[2:0]_DATAOUT) to the external peripheral. Receive data from the external peripheral (on I2S[2:0]_DATAIN) is converted to parallel words and stored in the Receive FIFO.

A programmable FIFO trigger threshold, when exceeded, generates an Interrupt or DMA service request that, if enabled, signals the CPU or DMA respectively to empty the Receive FIFO or to refill the Transmit FIFO.

The Transmit and Receive FIFOs are differentiated by whether the access is a Read or a Write transfer. Reads automatically target the Receive FIFO, while Writes will write data to the Transmit FIFO. From a memory-map perspective, they are at the same address. FIFOs are 16 samples deep by 32 bits wide. Each read or write is to 1 SSP sample.

21.6.5 Supported Formats

The SSP consists of four pins that are used to transfer data between the SoC and external Audio codecs, modems, or other peripherals. Although four serial-data formats exist, each has the same basic structure, and in all cases the following pins are used in the following manner:

- I2Sx_CLK—Defines the bit rate at which serial data is driven onto and sampled from the port
- I2Sx_FRM—Defines the boundaries of a basic data "unit," comprised of multiple serial bits
- I2Sx_DATAIN—The serial data path for transmitted data, from system to peripheral
- I2Sx_DATAOUT—The serial data path for received data, from peripheral to system

A data frame can contain from 4 to 32 bits, depending on the selected format. Serial data is transmitted most significant bit first. The Programmable Serial Protocol (PSP) format is used to implement I²S.

Master and Slave modes are supported. When driven by the Enhanced SSP, the I2Sx_CLK only toggles during active transfers (not continuously) unless ECRA/ECRB functions are used. When the I2Sx_CLK is driven by another device, it is allowed to be either continuous or only driven during transfers, but certain restrictions on PSP parameters apply.

Normally, the serial clock (I2Sx_CLK), if driven by the Enhanced SSP Port, only toggles while an active data transfer is underway. There are several conditions, however, that may cause the clock to run continuously. If the Receive With Out Transmit mode is enabled by setting the SSCR1.RWOT bit to 1, the I2Sx_CLK will toggle regardless of whether Transmit data exists within the Transmit FIFO. The I2Sx_CLK will also toggle

continuously if the Enhanced SSP is in Network mode, or if ECRA, or ECRB is enabled. At other times, I2Sx_CLK will be held in an inactive I2Sx_FRM or idle state, as defined by the specified protocol under which it operates.

21.6.5.1 Programmable Serial Protocol (PSP)

There are many variations of the frame behavior for different codecs and protocol formats. To allow flexibility the PSP format allows I2Sx_FRM to be programmable in direction, delay, polarity, and width. Master and Slave modes are supported. PSP can be programmed to be either full or half duplex.

The I2Sx_CLK function behavior varies between each format. PSP lets programmers choose which edge of I2Sx_CLK to use for switching Transmit data, and for sampling Receive data. In addition, programmers can control the idle state for I2Sx_CLK and the number of active clocks that precede and follow the data transmission.

The PSP format provides programmability for several parameters that determine the transfer timings between data samples. There are four possible serial clock sub-modes, depending on the I2Sx_CLK edges selected for driving data and sampling received data, and the selection of idle state of the clock.

For the PSP format, the Idle and Disable modes of the I2Sx_DATAOUT, I2Sx_CLK, and I2Sx_FRM are programmable by means of the SSPSP.ETDS, SSPSP.SCMODE and SSPSP.SFRMP bits. When Transmit data is ready, the I2Sx_CLK will remain in its Idle state for the number of serial clock (I2Sx_CLK) clock periods programmed within the Start Delay (SSPSP.STRTDLY) field. I2Sx_CLK will then start toggling, I2Sx_DATAOUT will remain in the idle state for the number of cycles programmed within the Dummy Start (SSPSP.DMYSTRT) field. The I2Sx_FRM signal will be asserted after the number of half-clocks programmed in the SSPSP.SFRDLY field. The I2Sx_FRM signal will remain asserted for the number of clocks programmed within the SSPSP.SFRMWIDTH then de-assert. Four to 32 bits can be transferred per frame. Once the last bit (LSB) is transferred, the I2Sx_CLK will continue toggling based off the Dummy Stop (SSPSP.DMYSTOP) field. I2Sx_DATAOUT either retains the last value transmitted or is forced to zero, depending on the value programmed within the End of Transfer Data State (SSPSP.ETDS) field, when the controller goes into Idle mode, unless the Enhanced SSP port is disabled or reset (which forces I2Sx_DATAOUT to zero).

With the assertion of I2Sx_FRM, Receive data is simultaneously driven from the peripheral on I2Sx_DATAIN, most significant bit first. Data transitions on I2Sx_CLK based on the Serial Clock Mode selected and is sampled by the controller on the opposite edge. When the Enhanced SSP is a master to the frame synch (I2Sx_FRM) and a slave to the clock (I2Sx_CLK), then at least three extra clocks (I2Sx_CLKs) will be needed at the beginning and end of each block of transfers to synchronize control signals from the APB clock domain into the SSP clock domain (a block of transfers is a group of back-to-back continuous transfers).

Figure 111. Programmable Serial Protocol Format

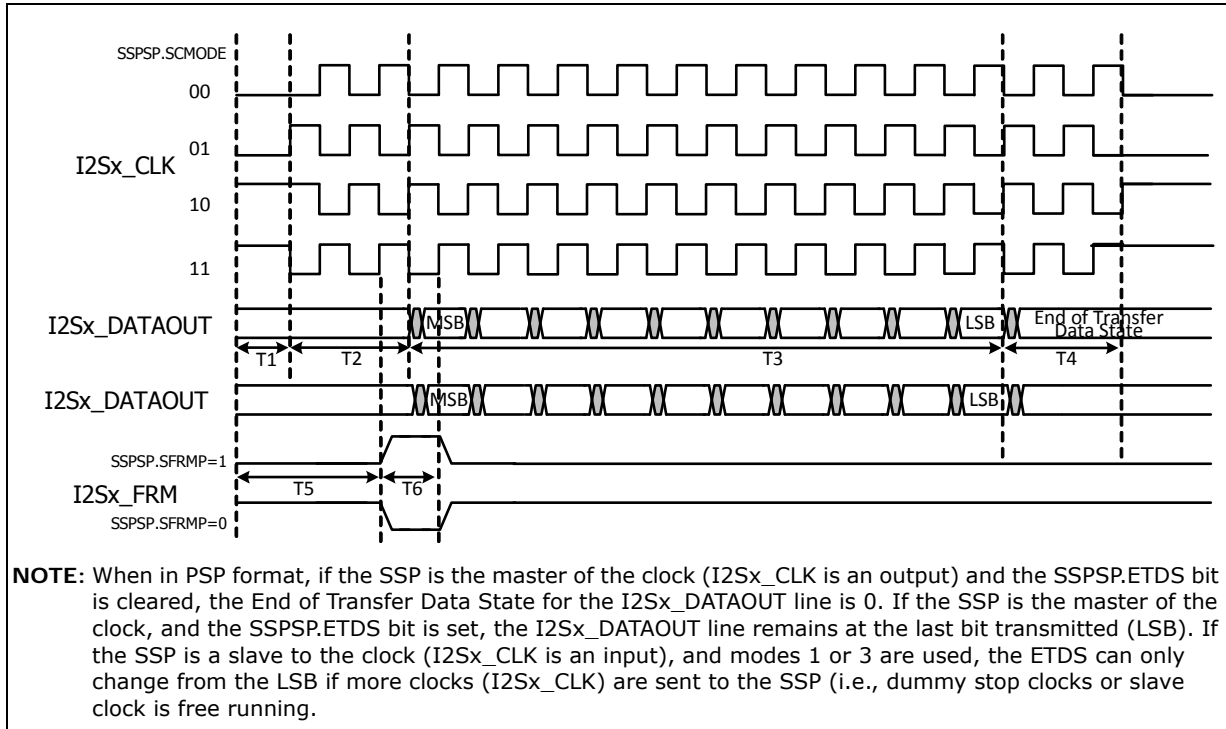

Figure 112. Programmable Serial Protocol Format (Consecutive Transfers)

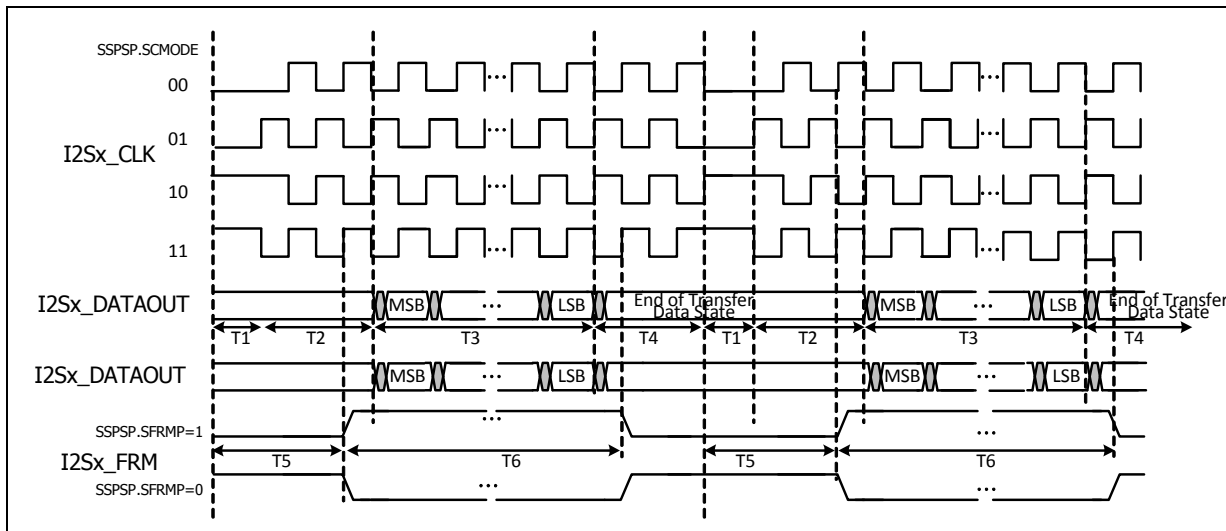

Table 228. Programmable Protocol Parameters

Symbol	Definition (Register.Bit Field)	Range	Units
	Serial Clock Mode (SSPSP.SCMODE)	(Drive, Sample, I2Sx_CLK Idle) 0 = Fall, Rise, Low 1 = Rise, Fall, Low 2 = Rise, Fall, High 3 = Fall, Rise, High	
	Serial Frame Polarity (SSPSP.SFRMP)	High or Low	
T1	Start Delay (SSPSP.STRTDLY)	0-7	Clock Period
T2	Dummy Start (SSPSP.DMYSTRT)	0-3	Clock Period
T3	Data Size (SSCRO.EDSS AND SSCRO.DSS)	4-32	Clock Period
T4	Dummy Stop (SSPSP.DMYSTOP)	0-3	Clock Period
T5	I2Sx_FRM Delay (SPSP.SFRMDLY)	0-88	Half Clock Period
T6	I2Sx_FRM Width (SSPSP.SFRMWDTH)	1-44	Clock Period
	End of Transfer Data State (SSPSP.ETDS)	Low or [bit 0]	

Note: The I2Sx_FRM Delay must not extend beyond the end of T4. I2Sx_FRM Width must be asserted for at least 1 I2Sx_CLK, and should be de-asserted before the end of the T4 cycle (for example, in terms of time, not bit values, $(T5 + T6) \leq (T1 + T2 + T3 + T4)$, $1 \leq T6 < (T2 + T3 + T4)$, and $(T5 + T6) \geq (T1 + 1)$ to ensure that I2Sx_FRM is asserted for at least 2 edges of the I2Sx_CLK). The T1 Start Delay value should be programmed to 0 when the I2Sx_CLK is enabled by either of the SSCR1.ECRA or SSCR1.ECRB bits. While the PSP can be programmed to generate the assertion of I2Sx_FRM during the middle of the data transfer (after the MSB was sent), the Enhanced SSP will not be able to receive data in Frame slave mode (SSCR1.SFRMDIR = 1) if the assertion of Frame is not before the MSB is sent (i.e. $T5 \leq T2$ if SSCR1.SFRMDIR = 1). Transmit Data will transition from the "End of Transfer Data State" to the next MSB value upon the assertion of Frame. The Start Delay field should be programmed to 0 whenever I2Sx_CLK or I2Sx_FRM is configured as an input. Clock state is not defined between two active frame periods. Clock can be active or inactive between two active frame periods.

21.7 Programming Model

The CPU or DMA access data through the Enhanced SSP Port's Transmit and Receive FIFOs. A CPU access takes the form of programmed I/O, transferring one FIFO entry per access. CPU accesses would normally be triggered off of an SSSR Interrupt and

must always be 32 bits wide. The CPU Writes to the FIFOs are 32 bits wide, but the serializing logic will ignore all bits beyond the programmed FIFO data size (EDSS/DSS value). CPU Reads to the FIFOs are also 32 bits wide, but the Receive data written into the RX FIFO (from the RXD line) is stored with zeroes in the MSBs down to the programmed data size. The FIFOs can also be accessed by DMA bursts, which must be in multiples of 1, 2, or 4 bytes, depending upon the EDSS value, and must also transfer one FIFO entry per access. When the SSCR0.EDSS bit is set, DMA bursts must be in multiples of 4 bytes (the DMA must have the Enhanced SSP configured as a 32-bit peripheral). The DMA DCMD.width register must be at least the SSP data size programmed into the SSP control registers EDSS and DSS. The FIFO is seen as one 32-bit location by the processor. For Writes, the Enhanced SSP port takes the data from the Transmit FIFO, serializes it, and sends it over the serial wire (I2Sx_DATAOUT) to the external peripheral. Receive data from the external peripheral (on I2Sx_DATAIN) is converted to parallel words and stored in the Receive FIFO.

A programmable FIFO trigger threshold, when exceeded, generates an Interrupt or DMA service request that, if enabled, signals the IA-32 CPU or DMA respectively to empty the Receive FIFO or to refill the Transmit FIFO. The Transmit and Receive FIFOs are differentiated by whether the access is a Read or a Write transfer. Reads automatically target the Receive FIFO, while Writes will write data to the Transmit FIFO. From a memory-map perspective, they are at the same address. Each read or write is 1 SSP sample.

21.7.1 PIO and DMA Programming Considerations

All CPU and DMA accesses transfer one FIFO entry per access. Data in the FIFOs is always stored with one 32-bit value per data sample, regardless of the format data word length. Within each 32-bit field, the stored data sample is right-justified, with the least significant bit of the word in bit 0. In the Receive FIFO, unused bits are packed as zeroes above the most significant bit. In the Transmit FIFO, unused don't-care bits are above the most significant bit (i.e., DMA and CPU access do not have to write to the unused bit locations). Logic in the Enhanced SSP automatically formats data in the Transmit FIFO so that the sample is properly transmitted on I2Sx_DATAOUT in the selected frame format.

Two separate and independent FIFOs are present for Transmit (to peripheral) and Receive (from peripheral) serial data. FIFOs are filled or emptied by programmed I/O or DMA bursts.

21.7.1.1 Programmed IO Considerations

FIFO filling and emptying can be performed by the processor in response to an Interrupt from the FIFO logic. Each FIFO has a programmable FIFO trigger threshold at which an Interrupt is triggered. When the number of entries in the Receive FIFO exceeds the SSCR1.RFT value, an interrupt is generated (if enabled), which signals the CPU to empty the Receive FIFO. When the number of entries in the Transmit FIFO is less than or equal to the SSCR1.TFT value plus 1, an Interrupt is generated (if enabled), which signals the CPU to refill the Transmit FIFO.

Users can also poll the Enhanced SSP Status register to determine how many samples are in a FIFO, and whether the FIFO is full or empty. Software is responsible for ensuring that the proper RFT and TFT values are chosen to prevent ROR and TUR error conditions.

Note: If the software attempts to read from an empty Receive FIFO, it will receive a duplicate of the previously read value.

21.7.1.2 DMA Considerations

The DMA controller can also be programmed to transfer data to and from the Enhanced SSP FIFOs. To prevent over-runs of the Transmit FIFO or under-runs of the Receive FIFO when using the DMA, be careful when setting the Transmit and Receive FIFO trigger threshold levels.

There are restrictions on how the DMA can be programmed when used with the SSP Controller.

- The DMA Transfer Width must be greater than or equal to the SSP data size. For example if the SSP Data Size is 16b then the DMA Transfer Width should be 16b.
- The DMA may not support the DMA Transfer Width of the SSP Data Size and therefore the DMA Transfer Width must be larger than the SSP Data Size. If this is the case then software must manage any extra data bits.
- The DMA Burst Transaction Length for RX must be less than or equal to the RX Threshold.
- The DMA Burst Transaction Length for TX must be less than or equal to the number of empty locations in the TX FIFO. A safe value is the Total TX FIFO Size - TX Threshold.
- DMA must be in Fixed Address mode to read or write the SSP Data Register.

In full-duplex formats where the Enhanced SSP always receives the same number of data samples as it transmits, the DMA should be set up to transmit and receive the same number of bytes.

Note: A TFT value of 0 means that there is one sample left in the TX FIFO.

Because the Enhanced SSP is not flow controlled, software must program the TX FIFO Threshold (TFT), RX FIFO Threshold (RFT), and the DMA burst size to ensure that a TX FIFO overflow or RX FIFO underflow does not occur. Software must also ensure that the Enhanced SSP DMA requests are properly prioritized in the system to prevent fatal overruns and under-runs.

The programming model for using the DMA is as follows:

- Program the total number of Transmit/Receive byte lengths, DMA burst, and DMA Width in the DMA.
- Set the preferred values in the Enhanced SSP Control registers.
- Enable the Enhanced SSP by setting SSCR0.SSE.
- Set the run bit in DMA Command Register.

- The DMA will wait for either the Transmit or Receive Service requests.
- If the Transmit/Receive byte length is not an even multiple of the transfer burst size, a trailing byte condition may occur.

21.7.2 Trailing Bytes in the Receive FIFO

When the number of samples in the Receive FIFO is less than its FIFO trigger threshold level, and no additional data is received, the remaining bytes are called trailing bytes. Trailing bytes can be handled by either the DMA or the processor, as indicated by the SSCR1.TRAIL bit. Trailing bytes are identified by means of a timeout mechanism and the existence of data within the Receive FIFO.

21.7.2.1 Timeout

A timeout condition exists when the Receive FIFO has been idle for a period of time (in APB clocks) defined by the value programmed within the Timeout register (SSTO). When a timeout occurs, the receiver timeout interrupt SSSR.TINT bit will be set to a 1, and if the Timeout Interrupt is enabled SSCR1.TINTE=1, a Timeout Interrupt will occur to signal the processor that a timeout condition has occurred. The timeout timer is reset after a new sample is received. Once the SSSR.TINT bit is set it must be cleared by software by writing a 1 to it. Clearing this bit also causes the Timeout Interrupt, if enabled, to be de-asserted.

21.7.2.2 Peripheral Trailing Byte Interrupt

It is possible for the DMA to reach the end of its Descriptor chain while removing Receive FIFO data. When this happens, the processor is forced to take over because the DMA can no longer service the Enhanced SSP request until a new chain is linked. When the DMA has reached the end of its Descriptor chain, and there is data in the receive FIFO, the Enhanced SSP will do the following:

- Sets the peripheral trailing byte interrupt SSSR.PINT bit to 1
- Asserts the Enhanced SSP Interrupt to signal to the processor that a Peripheral Trailing Byte Interrupt condition has occurred (if SSCR1.PINTE=1 to enable the interrupt).
- Sets the SSSR.EOC status bit which must be cleared by software. If more data is received after the EOC bit was set (and EOC bit is still set), then the SSSR.PINT bit will be set to a 1.

Once the SSSR.PINT bit is set, it must be cleared by software by writing a 1 to it. Clearing the SSSR.PINT bit also de-asserts the Peripheral Interrupt if it has been enabled (SSCR1.PINTE=1).

The remaining bytes must then be removed by means of a processor I/O as described in the processor-based method below, or by reprogramming a new Descriptor chain and restarting the DMA. Programmers need to be aware of this possibility. Refer to the DMA chapter for details on Descriptor programming and "end of chain" events.

21.7.2.3 Removing Trailing Bytes (Processor Based SSCR1.TRAIL=0)

This is the default method indicated by a zero in the SSCR1.TRAIL bit. In this case, no Receive DMA service request is generated. To read out the trailing bytes, software should wait for the timeout Interrupt and then read all remaining entries as indicated by the SSSR.RFL and SSSR.RNE bits within the Enhanced SSP Status register (SSSR).

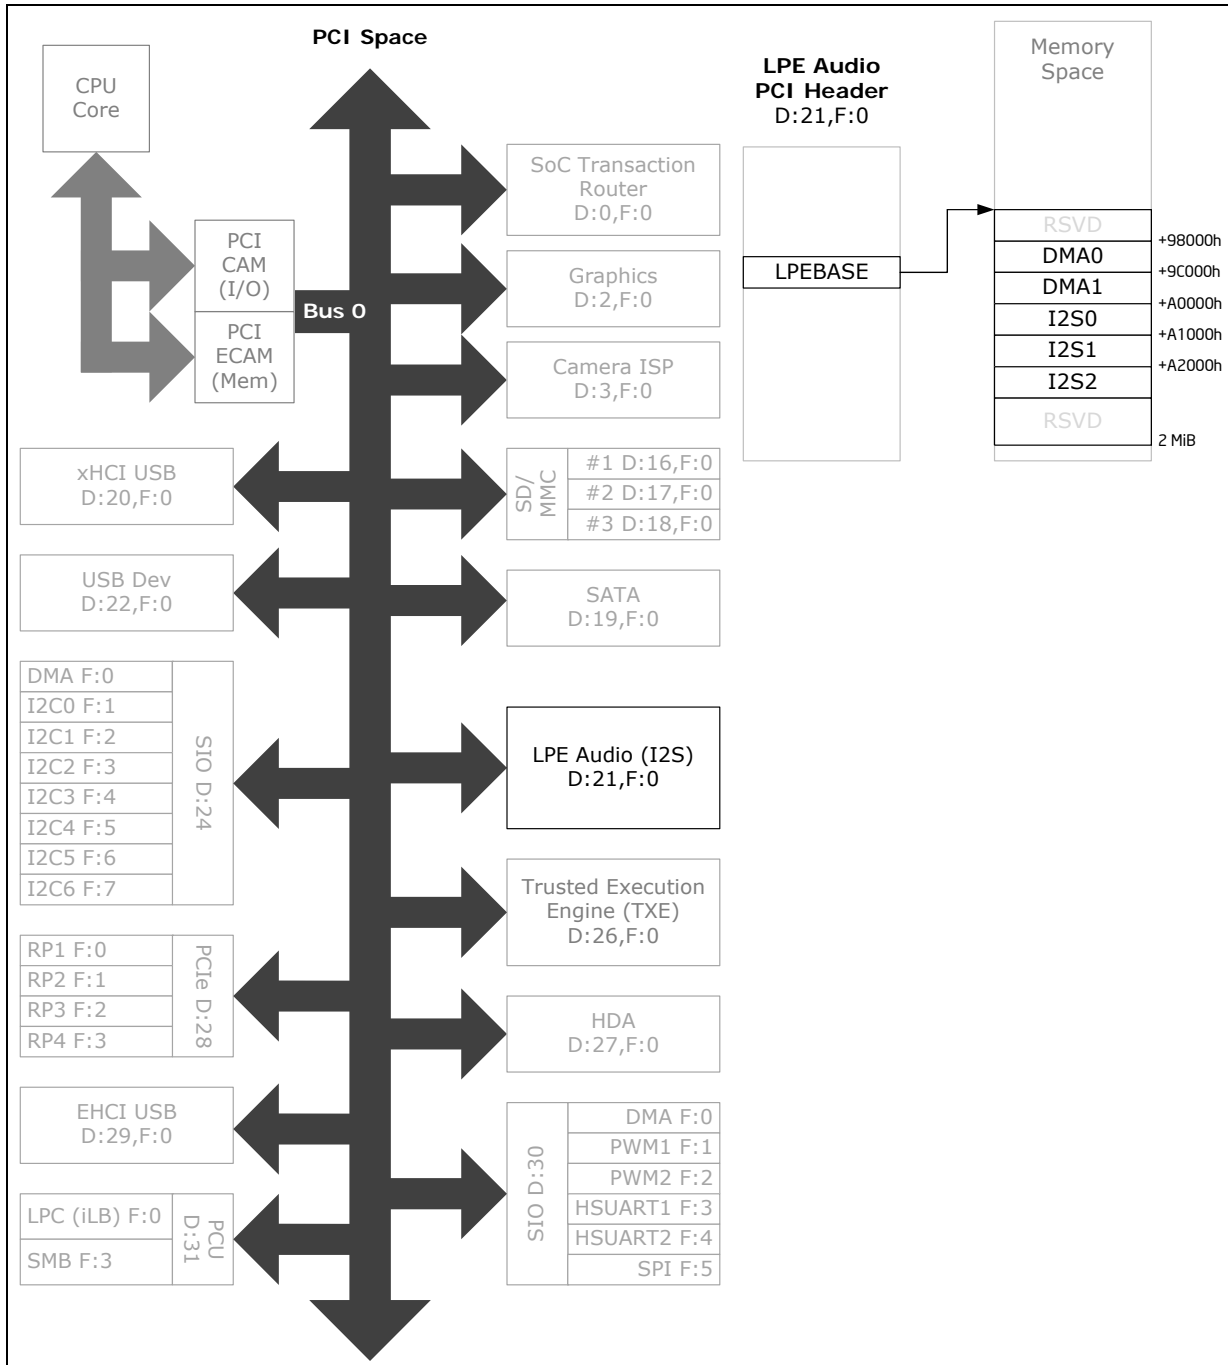

Note: To use the Trailing bytes feature through the CPU, the Timeout Interrupt must be enabled by setting SSCR1.TINTE=1 (to enable the interrupt).

21.7.2.4 Removing Trailing Bytes (DMA Based SSCR1.TRAIL=1)

When the DMA is to handle trailing bytes (SSCR1.TRAIL = 1) a DMA service request is automatically issued for the remaining number of samples left in the Receive buffer. The DMA will then empty the contents of the Receive buffer unless the DMA reaches the end of its Descriptor chain. If a timeout occurs, the processor is only interrupted by means of a Timeout Interrupt if it has been enabled by setting SSCR1.TINTE=1. When handling trailing bytes by means of the DMA, if a timeout occurs and the receive FIFO is empty, an End-of-Receive (EOR) will be sent to the DMA Controller. If an EOC occurs at the time that the last sample is read out of the FIFO (the DMA descriptor chain was just exactly long enough), and the timeout counter is still running (that is, a time out has not occurred and the SSTO register is non-zero), then, when the time out does occur, the Enhanced SSP will generate a DMA request which will create an RAS interrupt from the DMA. When this occurs, software must re-program the DMA registers and re-enable the channel for the Enhanced SSP to send its EOR to the DMA controller.

Bit Range	Default & Access	Description
31:30	0h RO	Reserved0: reserved
29	0h RW/1C	RMA: Received Master Abort: Not Implemented
28	0h RW/1C	RCA: Received Target Abort: Not Implemented
27:21	00h RO	Reserved1: reserved
20	1h RO	CAPLIST: Capabilities List: Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at the configuration offset 34h.
19	0h RO	INTR_STATUS: Interrupt Status: This bit reflects state of interrupt in the device Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, is the device/function interrupt message sent. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	Reserved2: reserved
15:11	00h RO	Reserved3: reserved
10	0h RW	INTR_DISABLE: Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt, which is the Bridge does not send Interrupt Assert message through the IOSF Sideband Channel. Reset value of this bit is 0. This bit has no connection with the interrupt status bit
9	0h RO	Reserved4: reserved
8	0h RW	SERR_ENABLE: not implemented
7:3	00h RO	Reserved5: reserved
2	0h RW	BME: If this bit is 0, the Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	MSE: Memory Space Enable: This bit controls Bridge response to downstream memory accesses. When set, accesses to memory space of the device is enabled. Reset value of this bit is 0.
0	0h RO	Reserved6: reserved

21.9.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits) **REVCLASSCODE:** [0/21/0] + 8h

Default: 04010000h

Bit Range	Default & Access	Description
31:8	040100h RO	CLASS_CODES: Class Code
7:0	00h RO	RID: Revision ID

21.9.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits) **CLLATHEADERBIST:** [0/21/0] + Ch

Default: 00000000h

Bit Range	Default & Access	Description
31:24	00h RO	Reserved0: Reserved
23	0h RO	MULFNDEV: MULFNDEV
22:16	00h RO	HEADERTYPE: Header Type: Implements Type 0 Configuration header.

Bit Range	Default & Access	Description
15:8	00h RO	LATTIMER: Latency Timer: This register is implemented as R/W with default as 0. Similar to other Intel IPs.
7:0	00h RW	CACHELINE_SIZE: Cacheline Size: This register is implemented as R/W with default as 0. Similar to other Intel IPs.

21.9.5 reg_BAR_type (BAR)—Offset 10h

BAR -Base Address Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

BAR: [0/21/0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	BASEADDR: Base Address register
11:4	00h RO	SIZEINDICATOR: Size indicator
3	0h RO	PREFETCHABLE: Indicates that this BAR is not prefetchable.
2:1	0h RO	TYPE: 00 indicates BAR lies in 32bit address range
0	0h RO	MESSAGE_SPACE: message space

21.9.6 reg_BAR1_type (BAR1)—Offset 14h

BAR1 -Base Address Register1

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

BAR1: [0/21/0] + 14h

Default: 00000000h

Bit Range	Default & Access	Description
31:12	00000h RW	BASEADDR1 : This field is present if BAR1 is enabled through private configuration space. Memory accesses to BAR1 region are aliased to the PCI configuration space. The BAR1 region is always 4K.
11:4	00h RO	SIZEINDICATOR1 : Always is 0 as minimum size is 4K
3	0h RO	PREFETCHABLE1 : Indicates that this BAR is not prefetchable
2:1	0h RO	TYPE1 : 00 indicates BAR lies in 32bit address range
0	0h RO	MESSAGE_SPACE1 : message space

21.9.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SUBSYSTEMID: [0/21/0] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Description
31:16	0000h RW/O	SUBSYSTEMID : Subsystem ID
15:0	0000h RW/O	SUBSYSTEMVENDORID : Subsystem Vendor

21.9.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

EXPANSION_ROM_BASEADDR: [0/21/0] + 30h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RO	EXPANSION_ROM_BASE: Value of all zeros indicates no support for Expansion ROM

21.9.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CAPABILITYPTR: [0/21/0] + 34h

Default: 00000080h

Bit Range	Default & Access	Description
31:8	000000h RO	Reserved0: reserved
7:0	80h RO	CAPPTR_POWER: Indicates what the next capability is. This capability points to the PM Capability, 0x80, structure.

Bit Range	Default & Access	Description
31:27	00h RO	PMESUPPORT: This 5-bit field indicates the power states in which the function can assert the PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal at the same time in that power state. bit 11 X XXX1b: PME# can be asserted from D0 bit 12 X XX1Xb: PME# can be asserted from D1. Bridge does not support this state. bit 13 X X1XXb: PME# can be asserted from D2. Bridge does not support this state. bit 14 X 1XXXb: PME# can be asserted from D3hot bit 15 1 XXXXb: PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap.
26:19	00h RO	Reserved0: reserved
18:16	3h RO	VERSION: Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	NXTCAP: Points to the next capability structure. This points to NULL
7:0	01h RO	POWER_CAP: Indicates this is power management capability.

21.9.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

reserved

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PMECTRLSTATUS: [0/21/0] + 84h

Default: 00000008h

31	28	24	20	16	12	8	4	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
0	0	0	0	0	0	0	0	0	
		Reserved0		Reserved1	PMEENABLE	Reserved2	NO_SOFT_RESET	Reserved3	POWERSTATE

Bit Range	Default & Access	Description
31:16	0000h RO	Reserved0: reserved
15	0h RW/1C	PMESTATUS: 0 Software clears the bit by writing a 1 to it. 1 This bit is set when the PME# signal is asserted independent of the state of the PME Enable bit
14:9	00h RO	Reserved1: reserved
8	0h RW	PMEENABLE: pme enable
7:4	0h RO	Reserved2: reserved
3	1h RO	NO_SOFT_RESET: This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset. Configuration Context is preserved.

Bit Range	Default & Access	Description
2	0h RO	Reserved3: reserved
1:0	0h RW	POWERSTATE: This field is used both to determine the current power state and to set a new power state. The values are: 00 D0 state 11 D3HOT state Others Reserved Note: If the software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally. The data is discarded and no state change occurs. Note: When in the D3HOT states, interrupts are blocked. D3Hot cannot be used for downstream decode on fabric ports.

21.9.13 reg_MANID_type (MANID)—Offset F8h

Manufacturers ID

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

MANID: [0/21/0] + F8h

Default: 01000F00h

7:3	00h RO	Reserved5 : reserved
2	0h RW	BME : If this bit is 0,the Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	MSE : Memory Space Enable: This bit controls Bridge response to downstream memory accesses. When set, accesses to memory space of the device is enabled. Reset value of this bit is 0.
0	0h RO	Reserved6 : reserved

21.10.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

REVCLASSCODE: [0/21/0] + 8h

Default: 04010000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	1	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
CLASS_CODES							RID	

Bit Range	Default & Access	Description
2:1	0h RO	TYPE1 : 00 indicates BAR lies in 32bit address range
0	0h RO	MESSAGE_SPACE1 : message space

21.10.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SUBSYSTEMID: [0/21/0] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Description
31:16	0000h RW/O	SUBSYSTEMID : Subsystem ID
15:0	0000h RW/O	SUBSYSTEMVENDORID : Subsystem Vendor

21.10.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

EXPANSION_ROM_BASEADDR: [0/21/0] + 30h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RO	EXPANSION_ROM_BASE: Value of all zeros indicates no support for Expansion ROM

21.10.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CAPABILITYPTR: [0/21/0] + 34h

Default: 00000080h

Bit Range	Default & Access	Description
31:8	000000h RO	Reserved0: reserved
7:0	80h RO	CAPPTR_POWER: Indicates what the next capability is. This capability points to the PM Capability, 0x80, structure.

21.10.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

INTERRUPTREG: [0/21/0] + 3Ch

Default: 00000100h

Access Method

Type: Memory Mapped I/O Register
 (Size: 32 bits)

MANID: [0/21/0] + F8h

Default: 01000F00h

Bit Range	Default & Access	Description
31:0	01000F00h RO	MANID: Manufacturing ID

21.11 Memory Mapped Shim Registers

Table 231. Summary of LPE Shim Memory Mapped I/O Registers—BAR

Offset	Size	Register ID—Description	Default Value
0h	8	"reg_CSR_type (CSR)—Offset 0h" on page 2838	0000000001E40001h

4	0b RW	IAPIS_SSP1 : SSP1 Interrupt Mask for IA 1: Interrupt is masked 0: Interrupt is unmasked
3	0b RW	IAPIS_SSP0 : SSP0 Interrupt Mask for IA 1: Interrupt is masked 0: Interrupt is unmasked
2	0b RO	RSVD2 : Reserved
1	0b RW	LPE_IA_IPC_Request_Mask : LPE to IA IPC Request Mask 1: Interrupt is masked 0: Interrupt is unmasked
0	0b RW	LPE_IA_IPC_Done_Mask : LPE to IA IPC Done Mask 1: Interrupt is masked 0: Interrupt is unmasked

21.11.7 reg_IMRD_type (IMRD)—Offset 30h

IMRD

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

IMRD: [BAR + 140000h] + 30h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Description
62	0b RW	LPE_IA_DONE : Done. When the bit is set, the LPE completed the operation and requests attention
61:0	000000000 00000000h RW	IA_LPE_MSG : IA-32 to LPE Message

21.11.9 reg_IPCD_type (IPCD)—Offset 40h

Inter-process Status and Message register for LPE contains a message sent from LPE to IA-32 CPU. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When IA-32 CPU reads the message code from the register, and writes back with the bit 63 cleared. When the IA-32 CPU processes the message sent by LPE, it may set bit 63 in IPCD to assert interrupt request to LPE. The LPE must not attempt to write into IPCLPEIA if bit 63 is set.

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

IPCD: [BAR + 140000h] + 40h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Description
63	0b RW	LPE_IA_BUSY : Busy. When this bit is cleared, the IA CPU is Ready to accept a new message
62	0b RW	IA_LPE_DONE : Done. When the bit is set, the IA CPU completed operation and requests attention from LPE
61:0	000000000 00000000h RW	LPE_IA_MSG : LPE to IA CPU Message

21.11.10 reg_ISRSC_type (ISRSC)—Offset 48h

ISRSC

Access Method

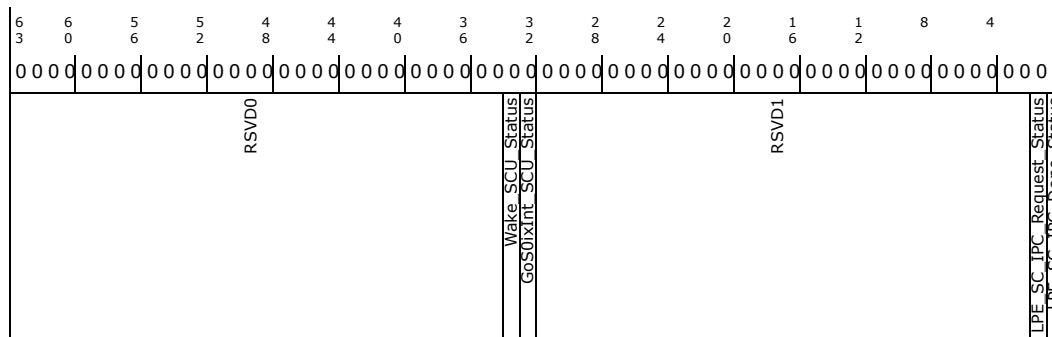

Type: Memory Mapped I/O Register
(Size: 64 bits)

ISRSC: [BAR + 140000h] + 48h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Description
63:34	0b RO	RSVD0: Reserved
33	0b RW/1C	Wake_SCU_Status: This bit is set by hardware when a blocked transaction is detected. It generates a wake to the SCU
32	0b RW/1C	GoS0ixInt_SCU_Status: This bit is set by expiry of the Re-entry timer. The bit gets set only if GoS0ixInt_En bit is set and this interrupt is unmasked.
31:2	0b RO	RSVD1: Reserved
1	0b RO	LPE_SC_IPC_Request_Status: IPCLPESC Interrupt Request 1: interrupt when LPE writes a message into IPCLPESC register with bit 63 set 0: Deasserted
0	0b RW/1C	LPE_SC_IPC_Done_Status: IPCSC Interrupt Request 1: interrupt when LPE writes a message into IPCSC register with bit 62 set is asserted 0: Deasserted.

21.11.11 reg_ISRLPESC_type (ISRLPESC)—Offset 50h

ISRLPESC

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

ISRLPESC: [BAR + 140000h] + 50h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

empty. Setting Busy also asserts interrupt request to LPE if the interrupt is enabled in the IMRLPESC. After LPE reads the message code from the register, it must perform a write with bit 63 cleared. The SC CPU must not attempt to write into IPCIA if bit 63 is set.

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

IPCSC: [BAR + 140000h] + 68h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Description
63	0b RW	SC_LPE_BUSY: Busy. When this bit is cleared, the LPE Ready to accept a message
62	0b RW	LPE_SC_DONE: Done. When the bit is set, the LPE completed the operation and requests attention
61:0	000000000 00000000h RW	SC_LPE_MSG: SC to LPE Message

21.11.15 reg_IPCLPESC_type (IPCLPESC)—Offset 70h

Inter-process Status and Message register for LPE contains a message sent from LPE to SC. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When SC reads the message code from the register, and writes back with the bit 63 cleared. When the SC CPU processes the message sent by LPE, it may set bit 62 in IPCLPESC to assert interrupt request to LPE. The LPE must not attempt to write into IPCD if bit 63 is set.

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

IPCLPESC: [BAR + 140000h] + 70h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Description
63	0b RW	LPE_SC_BUSY: Busy. When this bit is cleared, the SC CPU is Ready to accept a new message
62	0b RW	SC_LPE_DONE: Done. When the bit is set, the SC CPU completed operation and requests attention from LPE
61:0	0h RW	LPE_SC_MSG: LPE to SC CPU Message

21.11.16 reg_CLKCTL_type (CLKCTL)—Offset 78h

LPE Clock Control Register

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

CLKCTL: [BAR + 140000h] + 78h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000070013h

Bit Range	Default & Access	Description
63:32	0b RO	RSVD0: Reserved
31:25	0000000b RO	RSVD: Reserved
24:19	0b RO	RSVD1: Reserved
18	1b RW	EN_SSP2_CLK: clock output enable
17	1b RW	EN_SSP1_CLK: clock output enable
16	1b RW	EN_SSPO_CLK: clock output enable

Bit Range	Default & Access	Description
15:7	0b RO	RSVD2: Reserved
6	0b RO	OSC_MODE: 1 indicates that PLL is turned off
5	0b RW/1S	FRCHNGGO: Go bit indicating that the value in 2:0 can be applied to core. This bit will get cleared on the rising edge of the ack from Clock Control Unit.
4	1b RO	FRCHNGACK: Sets on the falling edge of ack. A 1'b1 indicates that the frequency change is done. The bit auto clears on the rising edge of frequency change request.
3	0b RO	RSVD3: Reserved
2:0	011b RW	CLK_DIV: 000: 25 MHz(XTAL) 001: 25 Mhz(XTAL) 010: 50 Mhz(2xXTAL) 011: 50 Mhz(default) 100: 100 Mhz 101: 200 Mhz 110: 267 Mhz 111: 343 Mhz

21.11.17 reg_FR_LAT_REQ_type (FR_LAT_REQ)—Offset 80h

LPE

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

FR_LAT_REQ: [BAR + 140000h] + 80h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Description
63:7	0b RO	RSVD0: Reserved
6:4	0b RW	Latency_tol: Latency tolerance for Cache Misses is listed here. SCU firmware is required to read this register and make a decision on whether it can enter a lower power state and still meet the latency tolerance.
3	0b RO	RSVD1: Reserved
2:0	0b RW	Required_freq: The following encoding specifies the frequency that the Audio Cluster requires for current operations. 000: 25 MHz(XTAL) 001: 25 Mhz(XTAL) 010: 50 Mhz(2xXTAL) 011: 50 Mhz(default) 100: 100 Mhz 101: 200 Mhz 110: 267 Mhz 111: 343 Mhz Please note, that this does not guarantee that this frequency will be generated from the CCU. The SCU firmware is required to read this register before making a decision on entering lower power states.

21.11.18 reg_CHICKEN_BITS_type (CHICKEN_BITS)—Offset 88h

LPE

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

CHICKEN_BITS: [BAR + 140000h] + 88h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Description
63:8	0b RO	RSVDO: Reserved
7	0b RW	DMA_Debug_Select: Setting this bit will select DMA 1 debug signals to be routed to the VISA Mux.
6	0b RW	XT_posted_only_traffic: Setting this bit will select make all the traffic from Tensilica to be posted.
5	0b RW	IPC_wakes_SCU: Setting this to 1 will cause the IPC to be fed into the wake cone for SCU.
4	0b RW	bug_2431329_fix_disable: Setting this to 1 will disable the synopsys compatible hardware handshake mechanism. Keep this set to 0 for regular hardware handshake operation.
3	0b RW	disable_ssp2_dma_finish: Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers.
2	0b RW	disable_ssp1_dma_finish: Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers.
1	0b RW	disable_ssp0_dma_finish: Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers.
0	0b RW	waiti_fix_enable: Setting this bit to 1 makes the frequency change request to be valid only if the core is in WAITI.

21.11.19 reg_ISRPSH_type (ISRPSH)—Offset 90h

ISRPSH

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

ISRPSH: [BAR + 140000h] + 90h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Description
62	0b RW	LPE_PSH_DONE : Done. When the bit is set, the LPE completed the operation and requests attention
61:0	000000000 00000000h RW	PSH_LPE_MSG : PSH to LPE Message

21.11.24 reg_IPCLPEPSH_type (IPCLPEPSH)—Offset B8h

Inter-process Status and Message register for LPE contains a message sent from LPE to PSH. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When PSH reads the message code from the register, and writes back with the bit 63 cleared. When the PSH CPU processes the message sent by LPE, it may set bit 62 in IPCLPEPSH to assert interrupt request to LPE. The LPE must not attempt to write into IPCD if bit 63 is set.

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

IPCLPEPSH: [BAR + 140000h] + B8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Description
63	0b RW	LPE_PSH_BUSY : Busy. When this bit is cleared, the PSH CPU is Ready to accept a new message
62	0b RW	PSH_LPE_DONE : Done. When the bit is set, the PSH CPU completed operation and requests attention from LPE
61:0	0h RW	LPE_PSH_MSG : LPE to PSH CPU Message

21.11.25 reg_EXT_TIMER_CNTL_type (EXT_TIMER_CNTL)—Offset C0h

External Timer Control Register

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

EXT_TIMER_CNTL: [BAR + 140000h] + C0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Description
31:0	0b RO	Ext_Timer_Readvalue: Shows the current count value of the timer

21.11.27 reg_SOix_TIMER_CNTL_type (SOix_TIMER_CNTL)—Offset D0h

External Timer Control Register

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

SOix_TIMER_CNTL: [BAR + 140000h] + D0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Description
63	0b RW	SOix_Timer_Run: Timer Run bit. The timer runs only when this bit is set. It resumes running from the current value in the readvalue bits. Clearing the bit pauses the timer.
62	0b RW/S	SOix_Timer_Clear: Timer Clear bit. Clears the timer and sets the value back to zero. This should also be reflected in the readvalue bits
61:32	0b RO	RSVD0: Reserved
31:0	0b RW	SOix_Timer_Matchvalue: The timer will generate a pulse when the Readvalue reaches Matchvalue. The pulse causes a level interrupt to get set in the PISR register. The PISR interrupt needs to be cleared before the next pulse is generated. The timer keeps counting beyond the Readvalue. Setting the Matchvalue to zero makes this a free running timer and no interrupt will be generated in this case. For correct operation, the ISR should either set a new Matchvalue or set it to zero. If nothing is done, the timer will roll over and trigger an interrupt again when it reaches the Matchvalue.

21.11.28 reg_SOix_TIMER_STAT_type (SOix_TIMER_STAT)—Offset D8h

External Timer Control Register

Access Method

Type: Memory Mapped I/O Register
(Size: 64 bits)

SOix_TIMER_STAT: [BAR + 140000h] + D8h

BAR Type: PCI Configuration Register (Size: 32 bits)

21.12.1 SSP Control 0 Register (SSCR0)—Offset 0h

The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSCR0: [BAR + 0A0000h] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0								
0	0	0	0	0	0	0	0	0								
MOD	ACS	RSVD	RSVD	RSVD	FRDC	TIM	RIM	NCS	EDSS	SCR			SSE	ECS	FRF	DSS

Bit Range	Default & Access	Description
31	0b RW	Mode Select (MOD): 0 = Normal SSP Mode 1 = Network Mode
30	0b RW	Audio Clock Select (ACS): 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPCLK)
29	0b RO	Reserved (RSVD): Reserved.
28	0b RO	Reserved (RSVD): Reserved.
27	0b RO	Reserved (RSVD): Reserved.
26:24	000b RW	Frame Rate Divider Control (FRDC): Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots).
23	0b RW	Transmit FIFO Under Run Interrupt Mask (TIM): 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt
22	0b RW	Receive FIFO Over Run Interrupt Mask (RIM): 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt
21	0b RW	Network Clock Select (NCS): 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPCLK)
20	0b RW	Extended Data Size Select (EDSS): 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits
19:8	000h RW	Serial Clock Rate (SCR): Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0b RW	Synchronous Serial Port Enable (SSE): 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled
6	0b RW	External Clock Select (ECS): 0 = On-chip clock used to produce the SSP's serial clock (SSPCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	00b RW	Frame Format (FRF): 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP)
3:0	0000b RW	Data Size Select (DSS): With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

21.12.2 SSP Control 1 Register (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Bit Range	Default & Access	Description
15	0b RW	Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF) : 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0b RW	Enable FIFO Write/Read (test mode bit) (EFWR) : 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled
13:10	0000b RW	Receive FIFO Trigger Threshold (RFT) : Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
9:6	0000b RW	Transmit FIFO Trigger Threshold (TFT) : Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
5	0b RW	Microwire Transmit Data Size (MWDS) : 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted
4	0b RW	Motorola SPI SSPCLK Phase Setting (SPH) : 0 = SSPCLK is inactive one cycle at the start of a frame and 1/2 cycle at the end of a frame 1 = SSPCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame
3	0b RW	Motorola SPI SSPCLK polarity setting (SPO) : 0 = The inactive or idle state of SSPCLK is low 1 = The inactive or idle state of SSPCLK is high
2	0b RW	Loop-Back Mode (test mode bit) (LBM) : 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0b RW	Transmit FIFO Interrupt Enable (TIE) : 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled
0	0b RW	Receive FIFO Interrupt Enable (RIE) : 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled

21.12.3 SSP Status Register (SSSR)—Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSSR: [BAR + 0A0000h] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000F004h

Bit Range	Default & Access	Description
1:0	00b RO	RSVD3: Reserved

21.12.4 SSP Interrupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

6	0b RW	Test Receive FIFO service request (TRFS): 0 = No receive FIFO service request 1 = Generates non-maskable interrupt to CPU and a DMA request for receive FIFO
5	0b RW	Test Transmit FIFO service request (TTFS): 0 = No transmit FIFO service request pending 1 = Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO
4:0	00000b RO	RSVD2: Reserved

21.12.5 SSP Data Register (SSDR)—Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the

register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

7:0	00h RW	RX Time Slot Active (RTSA): 0 = SSP will not receive data in this time slot 1 = SSP will receive data in this time slot

21.12.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSTSS: [BAR + 0A0000h] + 38h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

NMBSY	RSVD							TSS

Bit Range	Default & Access	Description
31	0b RO	Network Mode Busy (NMBSY): 0 = No frame is currently active (in network mode only) 1 = SSP is in network mode and a frame is currently active
30:3	0000000h RO	RSVD: Reserved
2:0	000b RO	Time Slot Status (TSS): Value indicates which time slot is currently active

21.12.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the

Bit Range	Default & Access	Description
31:12	0b RO	RSVDO: Reserved
11	0b RW	ASRC Interrupt Mask (ASRC_INTR_MASK): Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold. Software should override this bit, since it have no reset value
10	0b RW	ASRC frame count enable (ASRC_FRM_CNTR_EN): Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately.
9	0b RW/AC	ASRC Counter Clear (ASRC_CNTR_CLR): Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared.
8	0b RW	ASRC Counter enable (ASRC_CNTR_EN): Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value.
7	1b RW	Fifo empty fix enable (FIFO_EMPTY_FIX_EN): Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit.
6	1b RW	Underrun fix enable (UNDRN_FIX_EN): OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug.
5:4	00b RW	Reserved: This is a RW bit with no effect on IP behavior
3	0b RW	Clock Delay Enable (CLK_DEL_EN): When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock
2	0b RW	Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN): When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable
1	0b RW	Mode 1 Underrun Fix (Underrun_fix_1): Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority.
0	0b RW	Mode 0 Underrun Fix (Underrun_fix_0): Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1

21.12.13 SSP Frame Select Register (SSFS)—Offset 44h

The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSFS: [BAR + 0A0000h] + 44h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

RSVDO								FRAME_SEL

Bit Range	Default & Access	Description
31:4	0b RO	RSVDO: Reserved
3:0	0001b RW	Frame Select Enable (FRAME_SEL): Each bit in this field corresponds to a frame signal of the SSP Controller. Not all SSP controllers have all frame selects pinned out so consult the pin list for indication of which SSP controllers support how many frame signals. [Bit 0] Frame Select 0 Master and Slave Supported [Bit 1] Frame Select 1 Master Only [Bit 2] Frame Select 2 Master Only [Bit 3] Frame Select 3 Master Only 0 = Frame Select Disabled 1 = Frame Select Enabled

21.12.14 SSP Slot Frame Counter Register[0-7] (FRAME_CNT[0-7])— Offset 48h, Count 8, Stride 4h

The slot frame counter is typically used in Audio modes and increments the counter every two SSPCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

FRAME_CNT[0-7]: [BAR + 0A0000h] + 48h + [0-7]*4h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
FCNT_EN	RSVDO			FCNT_RST	FCNT			

Bit Range	Default & Access	Description
31	0b RW	Slot Frame Count Enable (FCNT_EN): 0 = Disable frame counter. 1 = Enable frame counter.
30:25	0b RO	RSVDO: Reserved
24	0b WO	Slot Frame Count Reset (FCNT_RST): SSP frame counter reset. Writing a 1 to this bit clears the frame counter.
23:0	000000h RO	Slot Frame Count (FCNT): SSP frame count.

21.12.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SFIFOL: [BAR + 0A0000h] + 68h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: FFFF0000h

Bit Range	Default & Access	Description
31:16	FFFFh RO	Receive FIFO Level (RFL): Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit.
15:0	0000h RO	Transmit FIFO Level (TFL): Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.

21.12.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SFIFOTT: [BAR + 0A0000h] + 6Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
13	0b RO	Reserved (RSVD): Reserved.
12	0b RO	Reserved (RSVD): Reserved.
11	0b RW	I2S VISA Enable (I2S_VISA_EN): Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals
10	1b RW	I2S Receive Enable (I2S_RX_EN): When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
9	1b RW	I2S Transmit Enable (I2S_TX_EN): When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
8	0b RO	Reserved (RSVD): Reserved.
7:6	00b RO	Reserved (RSVD): Reserved.
5	0b RO	Reserved (RSVD): Reserved.
4	0b RW	I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN): This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
3	0b RW	I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN): This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
2	1b RO	Reserved (RSVD): Reserved.
1	0b RW	I2S Mode Enable (I2S_MODE_EN): This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled
0	0b RW	Frame Master Enable (FRM_MST_EN): When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled

21.12.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSCR4: [BAR + 0A0000h] + 74h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Description
0	0b RO	Reserved (RSVD): Reserved.

21.12.20 ASRC Free Running Timer (ASRC_FRT)—Offset 7Ch

This is a 32 bit free running counter that can be enabled, paused or cleared using bits in the SSCR2_XR register. The value reflected here will be noted down in the timer snapshot register when the frame count matches the frame threshold

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

MOD	ACS	RSVD	RSVD	RSVD	FRDC	TIM	RIM	NCS	EDSS	SCR			SSE	ECS	FRF	DSS

Bit Range	Default & Access	Description
31	0b RW	Mode Select (MOD): 0 = Normal SSP Mode 1 = Network Mode
30	0b RW	Audio Clock Select (ACS): 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPCLK)
29	0b RO	Reserved (RSVD): Reserved.
28	0b RO	Reserved (RSVD): Reserved.
27	0b RO	Reserved (RSVD): Reserved.
26:24	000b RW	Frame Rate Divider Control (FRDC): Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots).
23	0b RW	Transmit FIFO Under Run Interrupt Mask (TIM): 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt
22	0b RW	Receive FIFO Over Run Interrupt Mask (RIM): 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt
21	0b RW	Network Clock Select (NCS): 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPCLK)
20	0b RW	Extended Data Size Select (EDSS): 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits
19:8	000h RW	Serial Clock Rate (SCR): Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0b RW	Synchronous Serial Port Enable (SSE): 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled
6	0b RW	External Clock Select (ECS): 0 = On-chip clock used to produce the SSP's serial clock (SSPCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	00b RW	Frame Format (FRF): 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP)
3:0	0000b RW	Data Size Select (DSS): With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

21.13.2 SSP Control 1 Register (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Bit Range	Default & Access	Description
15	0b RW	Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF) : 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0b RW	Enable FIFO Write/Read (test mode bit) (EFWR) : 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled
13:10	0000b RW	Receive FIFO Trigger Threshold (RFT) : Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
9:6	0000b RW	Transmit FIFO Trigger Threshold (TFT) : Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
5	0b RW	Microwire Transmit Data Size (MWDS) : 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted
4	0b RW	Motorola SPI SSPCLK Phase Setting (SPH) : 0 = SSPCLK is inactive one cycle at the start of a fram and 1/2 cycle at the end of a frame 1 = SSPCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame
3	0b RW	Motorola SPI SSPCLK polarity setting (SPO) : 0 = The inactive or idle state of SSPCLK is low 1 = The inactive or idle state of SSPCLK is high
2	0b RW	Loop-Back Mode (test mode bit) (LBM) : 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0b RW	Transmit FIFO Interrupt Enable (TIE) : 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled
0	0b RW	Receive FIFO Interrupt Enable (RIE) : 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled

21.13.3 SSP Status Register (SSSR)—Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

1:0	00b RO	RSVD3: Reserved

21.13.4 SSP Interrupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

21.13.5 SSP Data Register (SSDR)—Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the

register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSDR: [BAR + 0A1000h] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RO	Data (DATA): Data word to be written to/read from transmit/receive FIFO. When reading from this register when the SSP is disabled (SSE=0) then this will return indeterminate data.

21.13.6 SSP Time-Out Register (SSTO)—Offset 28h

The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes and reads are undetermined.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSTO: [BAR + 0A1000h] + 28h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

2:0	000b RO	Time Slot Status (TSS): Value indicates which time slot is currently active

21.13.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the

SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSACD: [BAR + 0A1000h] + 3Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

3	0b RW	SYSCLK Divider Bypass (SCDB): 0 = SYSCLK is divided by 4 before being sent to SSP 1 = SYSCLK is not divided before being sent to SSP
2:0	000b RW	Audio Clock Divider Select (ACDS): Value indicates which divider will be used by the clock unit to create the SYSCLK output pin. Clock divider value will be 2^ACDS, max ACDS = 5.

21.13.12 SSP Control 2 Register (SSCR2)—Offset 40h

The command status register 2 is extension of command status register and contains various feature enable and disables.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSCR2: [BAR + 0A1000h] + 40h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 000000C0h

31	28	24	20	16	12	8	4	0
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD0						ASRC_INTR_MASK	Reserved	0
						ASRC_FRM_CNTR_EN	CLK_DEL_EN	0
						ASRC_CNTR_CLR	SLV_EXT_CLK_RUN_EN	0
						ASRC_CNTR_EN	Underrun_fix_1	0
						FIFO_EMPTY_FIX_EN	Underrun_fix_0	0
						UNDRN_FIX_EN		0

Bit Range	Default & Access	Description
31:12	0b RO	RSVDO: Reserved
11	0b RW	ASRC Interrupt Mask (ASRC_INTR_MASK): Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold. Software should override this bit, since it have no reset value
10	0b RW	ASRC frame count enable (ASRC_FRM_CNTR_EN): Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately.
9	0b RW/AC	ASRC Counter Clear (ASRC_CNTR_CLR): Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared.
8	0b RW	ASRC Counter enable (ASRC_CNTR_EN): Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value.
7	1b RW	Fifo empty fix enable (FIFO_EMPTY_FIX_EN): Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit.
6	1b RW	Underrun fix enable (UNDRN_FIX_EN): OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug.
5:4	00b RW	Reserved: This is a RW bit with no effect on IP behavior
3	0b RW	Clock Delay Enable (CLK_DEL_EN): When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock
2	0b RW	Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN): When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable
1	0b RW	Mode 1 Underrun Fix (Underrun_fix_1): Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority.
0	0b RW	Mode 0 Underrun Fix (Underrun_fix_0): Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1

21.13.13 SSP Frame Select Register (SSFS)—Offset 44h

The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSFS: [BAR + 0A1000h] + 44h

BAR Type: PCI Configuration Register (Size: 32 bits)

FCNT_EN	RSVDO			FCNT_RST	FCNT			

Bit Range	Default & Access	Description
31	0b RW	Slot Frame Count Enable (FCNT_EN): 0 = Disable frame counter. 1 = Enable frame counter.
30:25	0b RO	RSVDO: Reserved
24	0b WO	Slot Frame Count Reset (FCNT_RST): SSP frame counter reset. Writing a 1 to this bit clears the frame counter.
23:0	000000h RO	Slot Frame Count (FCNT): SSP frame count.

21.13.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SFIFOL: [BAR + 0A1000h] + 68h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: FFFF0000h

Bit Range	Default & Access	Description
31:16	FFFFh RO	Receive FIFO Level (RFL): Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit.
15:0	0000h RO	Transmit FIFO Level (TFL): Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.

21.13.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SFIFOTT: [BAR + 0A1000h] + 6Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
13	0b RO	Reserved (RSVD): Reserved.
12	0b RO	Reserved (RSVD): Reserved.
11	0b RW	I2S VISA Enable (I2S_VISA_EN): Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals
10	1b RW	I2S Receive Enable (I2S_RX_EN): When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
9	1b RW	I2S Transmit Enable (I2S_TX_EN): When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
8	0b RO	Reserved (RSVD): Reserved.
7:6	00b RO	Reserved (RSVD): Reserved.
5	0b RO	Reserved (RSVD): Reserved.
4	0b RW	I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN): This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
3	0b RW	I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN): This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
2	1b RO	Reserved (RSVD): Reserved.
1	0b RW	I2S Mode Enable (I2S_MODE_EN): This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled
0	0b RW	Frame Master Enable (FRM_MST_EN): When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled

21.13.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSCR4: [BAR + 0A1000h] + 74h

Bit Range	Default & Access	Description
31:26	0b RO	RSVD0: Reserved
25:1	0000000h RW	Frame Assert Width (FRM_ASRT_WIDTH): This field controls the width of the asserted period of frame in I2S, LJ and PCM master modes. A value of 1 indicates a width of 2 bit clock period, 2 indicates a width of 3 bit clock periods, etc. The frame width is Frame Assert Width + 1.

Bit Range	Default & Access	Description
0	0b RO	Reserved (RSVD): Reserved.

21.13.20 ASRC Free Running Timer (ASRC_FRT)—Offset 7Ch

This is a 32 bit free running counter that can be enabled, paused or cleared using bits in the SSCR2_XR register. The value reflected here will be noted down in the timer snapshot register when the frame count matches the frame threshold

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ASRC_FRT: [BAR + 0A1000h] + 7Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	00000000h RO/V	ASRC free running timer (FREE_RUN_TIMER): This field reflects the value of the free running timer.

21.13.21 Frame Threshold for ASRC Frame Count (ASRC_FTC)—Offset 80h

The frame threshold value at which the timer snapshot will be taken is written here.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ASRC_FTC: [BAR + 0A1000h] + 80h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:16	0b RO	RSVDO: Reserved
15:0	0000h RW	ASRC Frame Threshold (ASRC_FTC): The 16 bit frame threshold value needs to be written here. Every time the frame count matches the frame threshold a snapshot of the free running timer will be taken and stored in the snapshot register. An interrupt will be generated as well. If the frame threshold is changed on the fly during operation then the following behavior is expected. Previous value = A, New value value = B If B > A : The frame counter keeps counting up to the new value. Nothing happens when the frame counter reaches the old value of A. If B < A : The frame counter resets to zero on the next frame. No interrupt or snapshot is generated in this case.

21.13.22 ASRC Timer Snapshot (ASRC_SNPSHT)—Offset 84h

Frame Snapshot Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ASRC_SNPSHT: [BAR + 0A1000h] + 84h

BAR Type: PCI Configuration Register (Size: 32 bits)

21.14.1 SSP Control 0 Register (SSCR0)—Offset 0h

The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSCR0: [BAR + 0A2000h] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0								
0	0	0	0	0	0	0	0	0								
MOD	ACS	RSVD	RSVD	RSVD	FRDC	TIM	RIM	NCS	EDSS	SCR			SSE	ECS	FRF	DSS

Bit Range	Default & Access	Description
31	0b RW	Mode Select (MOD): 0 = Normal SSP Mode 1 = Network Mode
30	0b RW	Audio Clock Select (ACS): 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPCLK)
29	0b RO	Reserved (RSVD): Reserved.
28	0b RO	Reserved (RSVD): Reserved.
27	0b RO	Reserved (RSVD): Reserved.
26:24	000b RW	Frame Rate Divider Control (FRDC): Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots).
23	0b RW	Transmit FIFO Under Run Interrupt Mask (TIM): 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt
22	0b RW	Receive FIFO Over Run Interrupt Mask (RIM): 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt
21	0b RW	Network Clock Select (NCS): 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPCLK)
20	0b RW	Extended Data Size Select (EDSS): 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits
19:8	000h RW	Serial Clock Rate (SCR): Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0b RW	Synchronous Serial Port Enable (SSE): 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled
6	0b RW	External Clock Select (ECS): 0 = On-chip clock used to produce the SSP's serial clock (SSPCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	00b RW	Frame Format (FRF): 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP)
3:0	0000b RW	Data Size Select (DSS): With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

21.14.2 SSP Control 1 Register (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Bit Range	Default & Access	Description
15	0b RW	Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF) : 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0b RW	Enable FIFO Write/Read (test mode bit) (EFWR) : 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled
13:10	0000b RW	Receive FIFO Trigger Threshold (RFT) : Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
9:6	0000b RW	Transmit FIFO Trigger Threshold (TFT) : Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting.
5	0b RW	Microwire Transmit Data Size (MWDS) : 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted
4	0b RW	Motorola SPI SSPCLK Phase Setting (SPH) : 0 = SSPCLK is inactive one cycle at the start of a frame and 1/2 cycle at the end of a frame 1 = SSPCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame
3	0b RW	Motorola SPI SSPCLK polarity setting (SPO) : 0 = The inactive or idle state of SSPCLK is low 1 = The inactive or idle state of SSPCLK is high
2	0b RW	Loop-Back Mode (test mode bit) (LBM) : 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally
1	0b RW	Transmit FIFO Interrupt Enable (TIE) : 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled
0	0b RW	Receive FIFO Interrupt Enable (RIE) : 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled

21.14.3 SSP Status Register (SSSR)—Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSSR: [BAR + 0A2000h] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 0000F004h

Bit Range	Default & Access	Description
1:0	00b RO	RSVD3: Reserved

21.14.4 SSP Interrupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

6	0b RW	Test Receive FIFO service request (TRFS): 0 = No receive FIFO service request 1 = Generates non-maskable interrupt to CPU and a DMA request for receive FIFO
5	0b RW	Test Transmit FIFO service request (TTFS): 0 = No transmit FIFO service request pending 1 = Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO
4:0	00000b RO	RSVD2: Reserved

21.14.5 SSP Data Register (SSDR)—Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the

register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

Access Method

2:0	000b RO	Time Slot Status (TSS): Value indicates which time slot is currently active

21.14.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the

Bit Range	Default & Access	Description
31:12	0b RO	RSVDO: Reserved
11	0b RW	ASRC Interrupt Mask (ASRC_INTR_MASK): Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold. Software should override this bit, since it have no reset value
10	0b RW	ASRC frame count enable (ASRC_FRM_CNTR_EN): Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately.
9	0b RW/AC	ASRC Counter Clear (ASRC_CNTR_CLR): Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared.
8	0b RW	ASRC Counter enable (ASRC_CNTR_EN): Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value.
7	1b RW	Fifo empty fix enable (FIFO_EMPTY_FIX_EN): Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit.
6	1b RW	Underrun fix enable (UNDRN_FIX_EN): OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug.
5:4	00b RW	Reserved: This is a RW bit with no effect on IP behavior
3	0b RW	Clock Delay Enable (CLK_DEL_EN): When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock
2	0b RW	Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN): When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable
1	0b RW	Mode 1 Underrun Fix (Underrun_fix_1): Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority.
0	0b RW	Mode 0 Underrun Fix (Underrun_fix_0): Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1

21.14.13 SSP Frame Select Register (SSFS)—Offset 44h

The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSFS: [BAR + 0A2000h] + 44h

FCNT_EN	RSVDO			FCNT_RST	FCNT			

Bit Range	Default & Access	Description
31	0b RW	Slot Frame Count Enable (FCNT_EN): 0 = Disable frame counter. 1 = Enable frame counter.
30:25	0b RO	RSVDO: Reserved
24	0b WO	Slot Frame Count Reset (FCNT_RST): SSP frame counter reset. Writing a 1 to this bit clears the frame counter.
23:0	000000h RO	Slot Frame Count (FCNT): SSP frame count.

21.14.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SFIFOL: [BAR + 0A2000h] + 68h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: FFFF0000h

Bit Range	Default & Access	Description
31:16	FFFFh RO	Receive FIFO Level (RFL): Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit.
15:0	0000h RO	Transmit FIFO Level (TFL): Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.

21.14.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SFIFOTT: [BAR + 0A2000h] + 6Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
13	0b RO	Reserved (RSVD): Reserved.
12	0b RO	Reserved (RSVD): Reserved.
11	0b RW	I2S VISA Enable (I2S_VISA_EN): Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals
10	1b RW	I2S Receive Enable (I2S_RX_EN): When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
9	1b RW	I2S Transmit Enable (I2S_TX_EN): When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational.
8	0b RO	Reserved (RSVD): Reserved.
7:6	00b RO	Reserved (RSVD): Reserved.
5	0b RO	Reserved (RSVD): Reserved.
4	0b RW	I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN): This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
3	0b RW	I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN): This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable
2	1b RO	Reserved (RSVD): Reserved.
1	0b RW	I2S Mode Enable (I2S_MODE_EN): This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled
0	0b RW	Frame Master Enable (FRM_MST_EN): When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled

21.14.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSCR4: [BAR + 0A2000h] + 74h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Description
0	0b RO	Reserved (RSVD): Reserved.

21.14.20 ASRC Free Running Timer (ASRC_FRT)—Offset 7Ch

This is a 32 bit free running counter that can be enabled, paused or cleared using bits in the SSCR2_XR register. The value reflected here will be noted down in the timer snapshot register when the frame count matches the frame threshold

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ASRC_FRT: [BAR + 0A2000h] + 7Ch

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
FREE_RUN_TIMER								

Bit Range	Default & Access	Description
31:0	00000000h RO/V	ASRC free running timer (FREE_RUN_TIMER): This field reflects the value of the free running timer.

21.14.21 Frame Threshold for ASRC Frame Count (ASRC_FTC)—Offset 80h

The frame threshold value at which the timer snapshot will be taken is written here.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ASRC_FTC: [BAR + 0A2000h] + 80h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0
RSVD0								
ASRC_FTC								

Bit Range	Default & Access	Description
31:16	0b RO	RSVDO: Reserved
15:0	0000h RW	ASRC Frame Threshold (ASRC_FTC): The 16 bit frame threshold value needs to be written here. Every time the frame count matches the frame threshold a snapshot of the free running timer will be taken and stored in the snapshot register. An interrupt will be generated as well. If the frame threshold is changed on the fly during operation then the following behavior is expected. Previous value = A, New value value = B If B > A : The frame counter keeps counting up to the new value. Nothing happens when the frame counter reaches the old value of A. If B < A : The frame counter resets to zero on the next frame. No interrupt or snapshot is generated in this case.

21.14.22 ASRC Timer Snapshot (ASRC_SNPSHT)—Offset 84h

Frame Snapshot Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ASRC_SNPSHT: [BAR + 0A2000h] + 84h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ASRC_TIMER_SNAPSHOT																							

Bit Range	Default & Access	Description
31:0	00000000h RO	ASRC Frame Snapshot (ASRC_TIMER_SNAPSHOT): This field holds the 32 bit snapshot value. The value is noted on the clock cycle when the frame threshold matches the frame count.

21.14.23 ASRC Frame Count (ASRC_FRMCNT)—Offset 88h

Frame Count Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ASRC_FRMCNT: [BAR + 0A2000h] + 88h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:16	0b RO	RSVDO: Reserved
15:0	0000h RO	ASRC Frame Count (ASRC_FRM_COUNT): This is the current frame count. This is a debug register and the value is noted in this register only when the LSB of the frame counter flips. If the counter is cleared when it was at an even value, the cleared value is not reflected here.

21.15 Low Power Audio DMA0 Memory Mapped IO Registers

21.15.1 reg_SAR_type (SAR0)—Offset 0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SAR0: [BAR + 98000h] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	SAR: Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.2 reg_DAR_type (DAR0)—Offset 8h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DARO: [BAR + 98000h] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	DAR: Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.3 reg_LLPO_type (LLPO)—Offset 10h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation $LLP.LOC \neq 0$ is used to set up the type of DMA transfer—single or multi-block. Table shows how the method of updating the channel registers is a function of $LLP.LOC \neq 0$. If $LLP.LOC$ is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. $LLP.LOC \neq 0$ contains the pointer to the next LLI for block chaining using linked lists, The $LLPx$ register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

LLPO: [BAR + 98000h] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:2	00000000h RW	LOC: Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	RSVD2: Reserved

21.15.4 reg_CTL_LO_type (CTL_LO0)—Offset 18h

This register contains fields that control the DMA transfer. The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CTL_LO0: [BAR + 98000h] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:29	0h RO	RSVD: Reserved
28	0h RW	LLP_SRC_EN: Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	LLP_DST_EN: Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	RSVD1: RSVD
21:20	0h RW	TT_FC: Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	RSVD2: Reserved
18	0h RW	DST_SCATTER_EN: Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	SRC_GATHER_EN: Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	SRC_MSIZ: Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0h RW	DEST_MSIZ: Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0h RW	SINC: Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)

Bit Range	Default & Access	Description
28:18	0h RW	CH_WEIGHT: Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2 ¹¹ -1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	DONE: If status write-back is enabled, the upper word of the control register, CTL_HIin, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0h RW	BLOCK_TS: Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2 ¹⁷ - 1) = (128 KB - 1).

21.15.6 reg_SSTAT_type (SSTAT0)—Offset 20h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSTAT0: [BAR + 98000h] + 20h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

DSTAT								

Bit Range	Default & Access	Description
31:0	0h RW	DSTAT : Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

21.15.8 reg_SSTATAR_type (SSTATAR0)—Offset 30h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSTATAR0: [BAR + 98000h] + 30h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	SSTATAR : Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

21.15.9 reg_DSTATAR_type (DSTATAR0)—Offset 38h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DSTATAR0: [BAR + 98000h] + 38h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	DSTATAR : Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

21.15.10 reg_CFG_LO_type (CFG_LO0)—Offset 40h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CFG_LO0: [BAR + 98000h] + 40h

BAR Type: PCI Configuration Register (Size: 32 bits)

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DST_PER_EXT		SRC_PER_EXT		WR_ISSUE_THD				RD_ISSUE_THD				DST_PER		SRC_PER																	

Bit Range	Default & Access	Description
31:30	0h RW	DST_PER_EXT : Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0h RW	SRC_PER_EXT : Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0h RW	WR_ISSUE_THD : Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to $(2^{10}-1 = 1023)$ but should not exceed maximum Write burst size = $(2 \wedge \text{DST_MSIZE}) * \text{TW}$.
17:8	0h RW	RD_ISSUE_THD : Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to $(2^{10}-1 = 1023)$ but should not exceed maximum Read burst size = $(2 \wedge \text{SRC_MSIZE}) * \text{TW}$.
7:4	0h RW	DST_PER : Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0h RW	SRC_PER : Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

21.15.12 reg_SGR_type (SGR0)—Offset 48h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SGR0: [BAR + 98000h] + 48h

BAR Type: PCI Configuration Register (Size: 32 bits)

31:20	0h RW	DSC : Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0h RW	DSI : Destination scatter interval.

21.15.14 reg_SAR_type (SAR1)—Offset 58h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SAR1: [BAR + 98000h] + 58h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	SAR: Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.15 reg_DAR_type (DAR1)—Offset 60h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DAR1: [BAR + 98000h] + 60h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	DAR: Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.16 reg_LL1_type (LLP1)—Offset 68h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation $LLP.LOC \neq 0$ is used to set up the type of DMA transfer—single or multi-block. Table shows how the method of updating the channel registers is a function of $LLP.LOC \neq 0$. If $LLP.LOC$ is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. $LLP.LOC \neq 0$ contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

LLP1: [BAR + 98000h] + 68h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Description
31:29	0h RO	RSVD: Reserved
28	0h RW	LLP_SRC_EN: Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	LLP_DST_EN: Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	RSVD1: RSVD
21:20	0h RW	TT_FC: Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	RSVD2: Reserved
18	0h RW	DST_SCATTER_EN: Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	SRC_GATHER_EN: Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	SRC_MSIZ: Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0h RW	DEST_MSIZ: Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0h RW	SINC: Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)

Bit Range	Default & Access	Description
28:18	0h RW	CH_WEIGHT : Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2 ¹¹ -1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	DONE : If status write-back is enabled, the upper word of the control register, CTL_HIin, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0h RW	BLOCK_TS : Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2 ¹⁷ - 1) = (128 KB - 1).

21.15.19 reg_SSTAT_type (SSTAT1)—Offset 78h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSTAT1: [BAR + 98000h] + 78h

BAR Type: PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Description
31:30	0h RW	DST_PER_EXT : Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0h RW	SRC_PER_EXT : Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0h RW	WR_ISSUE_THD : Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to $(2^{10}-1 = 1023)$ but should not exceed maximum Write burst size = $(2^{DST_MSIZE}) * TW$.
17:8	0h RW	RD_ISSUE_THD : Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to $(2^{10}-1 = 1023)$ but should not exceed maximum Read burst size = $(2^{SRC_MSIZE}) * TW$.
7:4	0h RW	DST_PER : Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0h RW	SRC_PER : Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

21.15.25 reg_SGR_type (SGR1)—Offset A0h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

19:0	0h RW	DSI : Destination scatter interval.

21.15.27 reg_SAR_type (SAR2)—Offset B0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SAR2: [BAR + 98000h] + B0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	SAR: Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.28 reg_DAR_type (DAR2)—Offset B8h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DAR2: [BAR + 98000h] + B8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	DAR: Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.29 reg_LL2_type (LLP2)—Offset C0h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation $LLP.LOC \neq 0$ is used to set up the type of DMA transfer—single or multi-block. Table shows how the method of updating the channel registers is a function of $LLP.LOC \neq 0$. If $LLP.LOC$ is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. $LLP.LOC \neq 0$ contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

LLP2: [BAR + 98000h] + C0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:2	00000000h RW	LOC: Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	RSVD2: Reserved

21.15.30 reg_CTL_LO_type (CTL_LO2)—Offset C8h

This register contains fields that control the DMA transfer. The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CTL_LO2: [BAR + 98000h] + C8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Description
31:29	0h RO	RSVD: Reserved
28	0h RW	LLP_SRC_EN: Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	LLP_DST_EN: Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	RSVD1: RSVD
21:20	0h RW	TT_FC: Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	RSVD2: Reserved
18	0h RW	DST_SCATTER_EN: Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	SRC_GATHER_EN: Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	SRC_MSIZ: Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0h RW	DEST_MSIZ: Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0h RW	SINC: Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)

Bit Range	Default & Access	Description
28:18	0h RW	CH_WEIGHT: Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2 ¹¹ -1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	DONE: If status write-back is enabled, the upper word of the control register, CTL_HIin, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0h RW	BLOCK_TS: Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2 ¹⁷ - 1) = (128 KB - 1).

21.15.32 reg_SSTAT_type (SSTAT2)—Offset D0h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSTAT2: [BAR + 98000h] + D0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:30	0h RW	DST_PER_EXT : Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0h RW	SRC_PER_EXT : Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0h RW	WR_ISSUE_THD : Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to $(2^{10}-1 = 1023)$ but should not exceed maximum Write burst size = $(2 \wedge \text{DST_MSIZE}) * \text{TW}$.
17:8	0h RW	RD_ISSUE_THD : Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to $(2^{10}-1 = 1023)$ but should not exceed maximum Read burst size = $(2 \wedge \text{SRC_MSIZE}) * \text{TW}$.
7:4	0h RW	DST_PER : Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0h RW	SRC_PER : Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

21.15.38 reg_SGR_type (SGR2)—Offset F8h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	SAR: Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.41 reg_DAR_type (DAR3)—Offset 110h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DAR3: [BAR + 98000h] + 110h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	DAR: Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.42 reg_LL3_type (LLP3)—Offset 118h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation $LLP.LOC \neq 0$ is used to set up the type of DMA transfer—single or multi-block. Table shows how the method of updating the channel registers is a function of $LLP.LOC \neq 0$. If $LLP.LOC$ is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. $LLP.LOC \neq 0$ contains the pointer to the next LLI for block chaining using linked lists. The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Bit Range	Default & Access	Description
31:29	0h RO	RSVD: Reserved
28	0h RW	LLP_SRC_EN: Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	LLP_DST_EN: Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	RSVD1: RSVD
21:20	0h RW	TT_FC: Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	RSVD2: Reserved
18	0h RW	DST_SCATTER_EN: Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	SRC_GATHER_EN: Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	SRC_MSIZ: Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0h RW	DEST_MSIZ: Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0h RW	SINC: Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)

Bit Range	Default & Access	Description
28:18	0h RW	CH_WEIGHT : Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2 ¹¹ -1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	DONE : If status write-back is enabled, the upper word of the control register, CTL_HIin, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0h RW	BLOCK_TS : Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2 ¹⁷ - 1) = (128 KB - 1).

21.15.45 reg_SSTAT_type (SSTAT3)—Offset 128h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSTAT3: [BAR + 98000h] + 128h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	SSTAT : Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

21.15.46 reg_DSTAT_type (DSTAT3)—Offset 130h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Bit Range	Default & Access	Description
31:30	0h RW	DST_PER_EXT : Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0h RW	SRC_PER_EXT : Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0h RW	WR_ISSUE_THD : Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to $(2^{10}-1 = 1023)$ but should not exceed maximum Write burst size = $(2^{DST_MSIZE}) * TW$.
17:8	0h RW	RD_ISSUE_THD : Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to $(2^{10}-1 = 1023)$ but should not exceed maximum Read burst size = $(2^{SRC_MSIZE}) * TW$.
7:4	0h RW	DST_PER : Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0h RW	SRC_PER : Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

21.15.51 reg_SGR_type (SGR3)—Offset 150h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SGR3: [BAR + 98000h] + 150h

BAR Type: PCI Configuration Register (Size: 32 bits)

19:0	0h RW	DSI : Destination scatter interval.

21.15.53 reg_SAR_type (SAR4)—Offset 160h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SAR4: [BAR + 98000h] + 160h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	SAR: Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.54 reg_DAR_type (DAR4)—Offset 168h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DAR4: [BAR + 98000h] + 168h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	DAR: Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.55 reg_LLQ_type (LLP4)—Offset 170h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation $LLP.LOC \neq 0$ is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of $LLP.LOC \neq 0$. If $LLP.LOC$ is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. $LLP.LOC \neq 0$ contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

LLP4: [BAR + 98000h] + 170h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:2	00000000h RW	LOC: Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	RSVD2: Reserved

21.15.56 reg_CTL_LO_type (CTL_LO4)—Offset 178h

This register contains fields that control the DMA transfer. The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CTL_LO4: [BAR + 98000h] + 178h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:29	0h RO	RSVD: Reserved
28	0h RW	LLP_SRC_EN: Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	LLP_DST_EN: Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	RSVD1: RSVD
21:20	0h RW	TT_FC: Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	RSVD2: Reserved
18	0h RW	DST_SCATTER_EN: Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	SRC_GATHER_EN: Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	SRC_MSIZ: Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0h RW	DEST_MSIZ: Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0h RW	SINC: Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)

Bit Range	Default & Access	Description
28:18	0h RW	CH_WEIGHT: Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2 ¹¹ -1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	DONE: If status write-back is enabled, the upper word of the control register, CTL_HIin, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0h RW	BLOCK_TS: Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2 ¹⁷ - 1) = (128 KB - 1).

21.15.58 reg_SSTAT_type (SSTAT4)—Offset 180h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSTAT4: [BAR + 98000h] + 180h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	SSTAT : Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

21.15.59 reg_DSTAT_type (DSTAT4)—Offset 188h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DSTAT4: [BAR + 98000h] + 188h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	DSTAT : Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

21.15.60 reg_SSTATAR_type (SSTATAR4)—Offset 190h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSTATAR4: [BAR + 98000h] + 190h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	SSTATAR : Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

21.15.61 reg_DSTATAR_type (DSTATAR4)—Offset 198h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DSTATAR4: [BAR + 98000h] + 198h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	DSTATAR : Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

21.15.62 reg_CFG_LO_type (CFG_LO4)—Offset 1A0h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CFG_LO4: [BAR + 98000h] + 1A0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

DST_PER_EXT		SRC_PER_EXT		WR_ISSUE_THD				RD_ISSUE_THD				DST_PER		SRC_PER													

Bit Range	Default & Access	Description
31:30	0h RW	DST_PER_EXT : Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range.
29:28	0h RW	SRC_PER_EXT : Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range.
27:18	0h RW	WR_ISSUE_THD : Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to $(2^{10}-1 = 1023)$ but should not exceed maximum Write burst size = $(2 \wedge \text{DST_MSIZE}) * \text{TW}$.
17:8	0h RW	RD_ISSUE_THD : Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to $(2^{10}-1 = 1023)$ but should not exceed maximum Read burst size = $(2 \wedge \text{SRC_MSIZE}) * \text{TW}$.
7:4	0h RW	DST_PER : Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS
3:0	0h RW	SRC_PER : Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS

21.15.64 reg_SGR_type (SGR4)—Offset 1A8h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SGR4: [BAR + 98000h] + 1A8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:20	0h RW	SGC : Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0h RW	SIG : Source gather interval.

21.15.65 reg_DSR_type (DSR4)—Offset 1B0h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DSR4: [BAR + 98000h] + 1B0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0			
0	0	0	0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31:20	0h RW	DSC : Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0h RW	DSI : Destination scatter interval.

21.15.66 reg_SAR_type (SAR5)—Offset 1B8h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SAR5: [BAR + 98000h] + 1B8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	SAR: Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.67 reg_DAR_type (DAR5)—Offset 1C0h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DAR5: [BAR + 98000h] + 1C0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:0	0h RW	DAR: Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

21.15.68 reg_LL5_type (LLP5)—Offset 1C8h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation $LLP.LOC \neq 0$ is used to set up the type of DMA transfer—single or multi-block. Table shows how the method of updating the channel registers is a function of $LLP.LOC \neq 0$. If $LLP.LOC$ is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. $LLP.LOC \neq 0$ contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

LLP5: [BAR + 98000h] + 1C8h

Bit Range	Default & Access	Description
31:2	00000000h RW	LOC: Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	RSVD2: Reserved

21.15.69 reg_CTL_LO_type (CTL_LO5)—Offset 1D0h

This register contains fields that control the DMA transfer. The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CTL_LO5: [BAR + 98000h] + 1D0h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0								
0	0	0	0	0	0	0	0	0								
0	0	0	0	0	0	0	0	0								
0	0	0	0	0	0	0	0	0								
RSVD	LLP_SRC_EN	LLP_DST_EN	RSVD1	TT_FC	RSVD2	DST_SCATTER_EN	SRC_GATHER_EN	SRC_MSIZ	DEST_MSIZ	SINC	RSVD3	DINC	RSVD4	SRC_TR_WIDTH	DST_TR_WIDTH	INT_EN

Bit Range	Default & Access	Description
31:29	0h RO	RSVD: Reserved
28	0h RW	LLP_SRC_EN: Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	LLP_DST_EN: Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	RSVD1: RSVD
21:20	0h RW	TT_FC: Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h RO	RSVD2: Reserved
18	0h RW	DST_SCATTER_EN: Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	SRC_GATHER_EN: Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	SRC_MSIZ: Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field.
13:11	0h RW	DEST_MSIZ: Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field.
10	0h RW	SINC: Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)

Bit Range	Default & Access	Description
9	0h RO	RSVD3: Reserved
8	0h RW	DINC: Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h RO	RSVD4: Reserved
6:4	0h RW	SRC_TR_WIDTH: Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	DST_TR_WIDTH: Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width (4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	INT_EN: Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

21.15.70 reg_CTL_HI_type (CTL_HI5)—Offset 1D4h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CTL_HI5: [BAR + 98000h] + 1D4h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0															
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
CH_CLASS				CH_WEIGHT				DONE		BLOCK_TS													

Bit Range	Default & Access	Description
31:29	0h RW	CH_CLASS: Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Description
28:18	0h RW	CH_WEIGHT : Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2 ¹¹ -1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	DONE : If status write-back is enabled, the upper word of the control register, CTL_HIin, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0h RW	BLOCK_TS : Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2 ¹⁷ - 1) = (128 KB - 1).

21.15.71 reg_SSTAT_type (SSTAT5)—Offset 1D8h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

SSTAT5: [BAR + 98000h] + 1D8h

BAR Type: PCI Configuration Register (Size: 32 bits)

BAR Reference: [B:0, D:21, F:0] + 10h

Default: 00000000h

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SSTAT																																			

Bit Range	Default & Access	Description
31:0	0h RW	SSTAT : Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

21.15.72 reg_DSTAT_type (DSTAT5)—Offset 1E0h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Access Method
