4. Product Description

The Swissbit X-75m2 Solid State Drive (SSD) leverages the M.2 SATA industry-standard form factor and connectivity as well as support for AES encryption, E2E security and TCG OPAL standards. Combined with a SATA Gen3 controller and Triple-Level Cell (TLC) 3D NAND flash technology, the X-75m2 realizes a robust non-volatile storage solution for today's embedded storage applications. The flash of the smaller capacity drives (≤ 120 GBytes) is managed using a mixture of storage as pseudo Single-Level Cell (pSLC) and TLC. This combination allows smaller drives, with fewer flash channels, to maintain a sufficient balance of endurance and performance. A functional block diagram of the X-75m2 SSD is provided below in Figure 1.

Figure 1: X-75m2 SATA Functional Block Diagram
The X-75m2 SSD incorporates a 75-position edge connector with B and M keys to support host read/write, control, and power activity per the applicable JEDEC and SATA IO specifications[3].

The on-board SATA Gen3 controller manages the interface between the host and the non-volatile NAND flash memory array. The controller is designed to support SATA Gen3 (6 Gbit/s) interface speeds and is fully backward compatible with SATA Gen2 (3 Gbit/s) and SATA Gen1 (1.5 Gbit/s) to enable the broadest possible range of platform compatibility. The controller utilizes an ARC 700 processing core, providing an optimum balance between read/write performance, Data Care Management and power fail protection.

Swissbit's X-75m2 SSDs deliver an impressive IOPS rate and endurance by combining TLC 3D NAND flash technology with a high-end controller architecture, firmware and an optimized configuration. The SSDs are designed for applications requiring high data transfer rates (see Table 3: Read/Write Performance). This performance is achieved through an on-board DRAM cache and the 4-channel NAND flash controller interface that supports ONFI and Toggle 2 (400 MT/s) interface speeds. In addition, the X-75m2 series features Swissbit's proven power fail safety and support for the ATA security feature set, NCQ, TRIM, advanced wear leveling, bad block management and in-field firmware updates.

An on-controller LDPC Error Correction Code (ECC) engine provides the X-75m2 hardware ECC, which is capable of correcting up to 165 bits per 1 KByte page (BCH equivalent). This engine, combined with Swissbit's Data Care Management firmware, provides active data management strategies to ensure data integrity and extract the maximum possible endurance and reliability from the NAND flash array. These strategies include, but are not limited to, Global Wear Leveling, Adaptive Read Refresh and Dynamic Block Remapping.

The risk of data loss as a result of an unexpected power fail event is mitigated using a robust sequence of voltage regulators, capacitors and detectors designed to ensure a graceful shutdown of the controller and NAND flash array. The combination of hardware and firmware power fail features prevents the possibility of resident data being corrupted during an unexpected power failure.

[7] Client and Enterprise workloads follow the JEDEC JESD219 standard. Enterprise workload values are measured based on 168 hours of runtime. 1 TByte = 10^{12} bytes

[8] According to JEDEC (JESD47l), the time to write the full TBW is a minimum of 18 months. Higher average daily data volume reduces the specified TBW. The values listed are estimates and are subject to change without notice.

[9] Because the JEDEC master trace file for the Client workload is designed for capacities ≥ 60 GBytes, the TBW and DWPD values for the capacities below 60 GBytes are estimates

[10] DWPD values are based on a service life of 3 years

7. ATA Commands

This section provides information on the ATA commands supported by the SSD. The commands are issued to the device by loading the required registers in the command block with the supplied parameter and then writing the command code to the register. For backward compatibility, some commands are implemented as a "no operation". See the following Table 14 for a list of ATA commands the device supports. For details about setting up the command registers, see the latest ATA Specification.
