# AN12645

# Getting Started with K32L2B + NxH3670 Gaming Use Case

Rev. 0 — 01/2020 Application Note

## 1 Introduction

#### 1.1 Overview

This document describes the hardware design of K32L2B Bluetooth Low

Energy (Bluetooth LE) Audio System and software architecture (top-level design) of Host Controller (K32L2B). This document is provided for those who intend to have a systematic view of K32L2B Bluetooth LE Audio System. They can also refer to relevant ANs if need more introduction about Dongle (K32L2B Dongle), Headset (K32L2B Headset) and OTA

**Contents** 

(K32L2B OTA).

- Hardware introduction introduces the hardware composition of K32L2B Dongle and Headset, as well as the connection diagram.
- Software introduction introduces audio data path and software framework.

## 1.2 Summary

This document provides necessary information on how to get started on the **K32L2B Bluetooth LE Audio System** based on FRDM-K32L2B board and NxH3670 SDK boards.

The system consists of a Dongle and a Headset, using K32L2B as Host Controller.

- **Dongle**: The Dongle has a USB interface that connects to PC. Dongle is responsible for setting up a wireless audio link with Headset.
- Headset: The Headset has a speaker, a microphone and some User Interface (UI) components, such as, buttons, sliders, rotary switches and LED. Headset is responsible for receiving audio data sent from Dongle and sending the recorded audio to Dongle.

#### 1.3 Reference documents

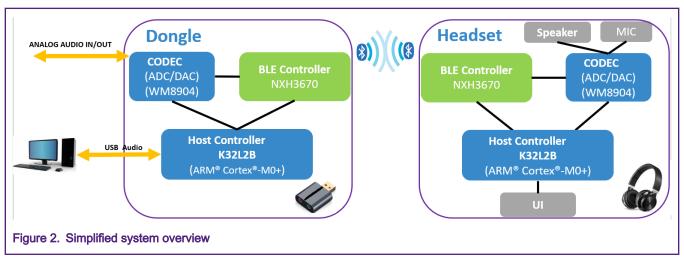

Table 1. References

| Reference                   | Definition   |
|-----------------------------|--|
| K32L2B Dongle               | K32L2B USB Dongle with NXH3670                                   |
| K32L2B Headset              | K32L2B Headset with NXH3670                                      |
| K32L2B OTA                  | K32L2B Bluetooth LE Audio System OTA operation steps             |
| K32L2B Emulating the PS Bus | Emulating the I <sup>2</sup> S bus master with the FlexIO module |

## 2 Hardware introduction

# 2.1 System overview

Figure 2 shows the simplified system overview.

As shown in Figure 2, the audio transfer process include the folloiwng steps:

- 1. The NXH3670 boots up, starts and then communicates with K32L2B through the SPI interface.
- 2. Assuming NXH3670 can work well after Step 1, we use the USB interface to transfer audio stream from PC to host controller. The 48 KHz USB audio is converted to an I2S signal, and then transmitted to NXH3670 of Dongle through the I<sup>2</sup>S master emulated by FlexIO (K32L2B Emulating the I<sup>2</sup>S Bus).
- 3. The audio stream can be transmitted to NXH3670 of Headset automatically. Users can hear voices with their headsets.

The current K32L2B Bluetooth LE Audio System includes FRDM-K32L2B board and NxH3670 SDK boards (KL27 Dongle and Headset board to provide the basic Audio function respectively). This platform can:

- · Send audio stream from PC to Headset.
- Receive control signal and recorded audio from Headset to PC.
- · Update new firmware through Over The Air (OTA).

Getting Started with K32L2B + NxH3670 Gaming Use Case, Rev. 0, 01/2020

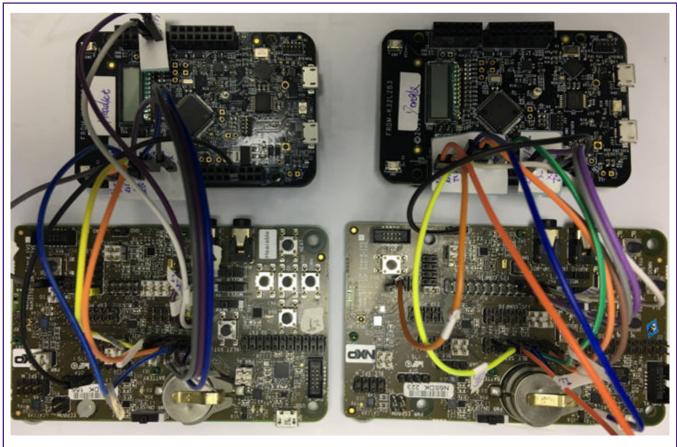

Figure 3. K32L2B Bluetooth LE audio system hardware

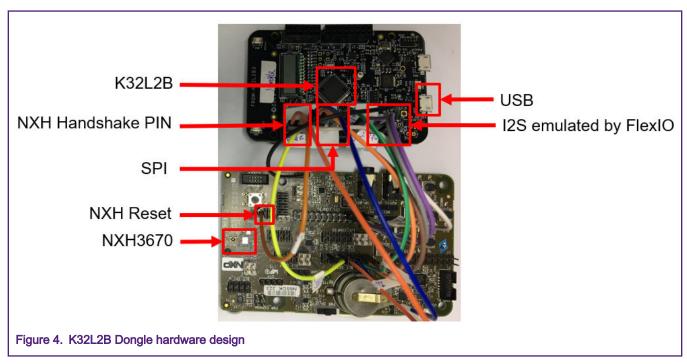

As shown in Figure 3,

- In the Dongle part, the host controller is K32L2B and the Bluetooth LE device is NXH3670 on KL27 Dongle board. K32L2B configures and communicates with NXH3670 through the SPI interface. K32L2B transfers audio data to NXH3670 through the I<sup>2</sup>S bus emulated by FlexIO.
- In the Headset part, the host controller is K32L2B and the Bluetooth LE device is NXH3670 on KL27 Headset board.
   K32L2B configures and communicates with NXH3670 through the SPI interface and configures CODEC using the I<sup>2</sup>C interface.

# 2.2 K32L2B Dongle

This section describes the current hardware design of K32L2B Dongle based on FRDM-K32L2B and KL27 Dongle board. Figure 4 shows the components and interfaces.

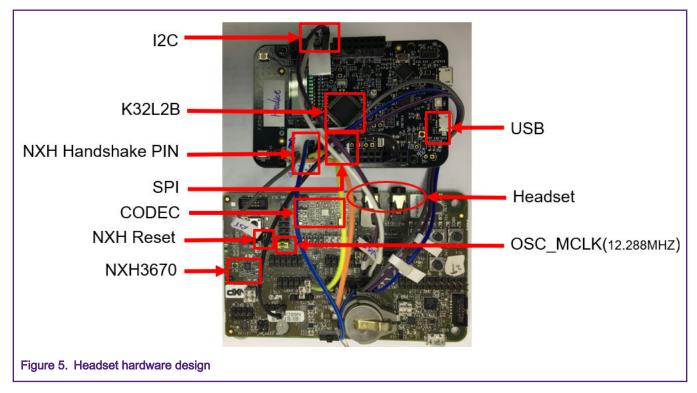

Application Note 3/15

User can use a USB cable to connect J13 (FRDM-K32L2B) with PC to power or download firmware.

#### 2.3 Headset

This section describes the current hardware design of K32L2B Headset based on FRDM-K32L2B and KL27 Headset board. Figure 5 shows the components and interfaces.

#### NOTE

- In the Headset design, we use I<sup>2</sup>C interface to configure CODEC.
- The NXH3670 communicates with CODEC using I<sup>2</sup>S (as shown in Figure 5, the attached jumpers of 9-10, 11-12, and 13-14 indicate that they can transfer data directly without the extra operation of K32L2B.
- User must make sure the existence of jumper 9-10 (J10 CLK\_SELECT, the yellow jumper OSC\_MCLK
   (12.288 MHz) in Figure 5), as it is used to obtain 12.288 MHz frequency and then can provide 24.576 MHz
   frequency to I2S\_MCLK.

## 3 Software introduction

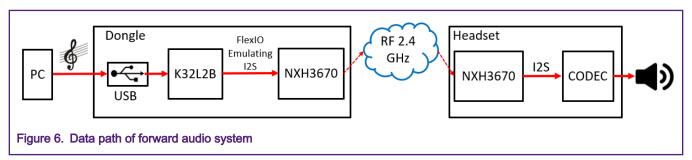

# 3.1 Audio path

The Bluetooth LE Audio System consists of two channels:

- 1. The forward-channel transmits the audio from the PC to the Headset.
- 2. The backward-channel transmits the microphone signal from the Headset to the PC.

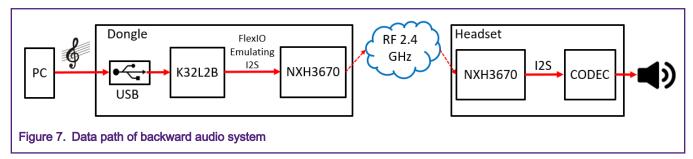

#### 3.1.1 Forward audio channel

- · The forward-channel is a stereo-channel.
- The RF transports the forward-channel as 16-bit samples @ 48 KHz sample-rate.
- The I<sup>2</sup>S bus emulated by FlexIO and USB signals uses 48 KHz sample-rate.

#### 3.1.2 Backward audio channel

- The backward-channel is a mono-channel, only the left channel used.
- The RF transports the backward channel as 16-bit samples @ 16 KHz sample-rate.
- The I<sup>2</sup>S bus emulated by FlexIO and USB signals uses 48 KHz sample-rate.

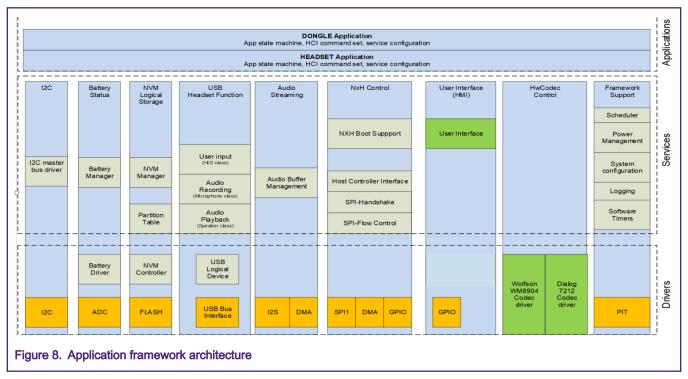

Application Note

## 3.2 Application framework

The Application framework defines the software architecture of the reference application. The focus is modularity, code re-use and software maintainability.

- 1. The top layer is Application Layer, which is strictly application specific.
- The layer below is called Services Layer.
- 3. Underneath the Service Layer is Driver Layer which controls the hardware.
- 4. Board Support Package (BSP) contains the board-specific software, such as, hardware initialization, GPIO-pin configuration, clock settings, etc.

Figure 8 shows the entire application architecture.

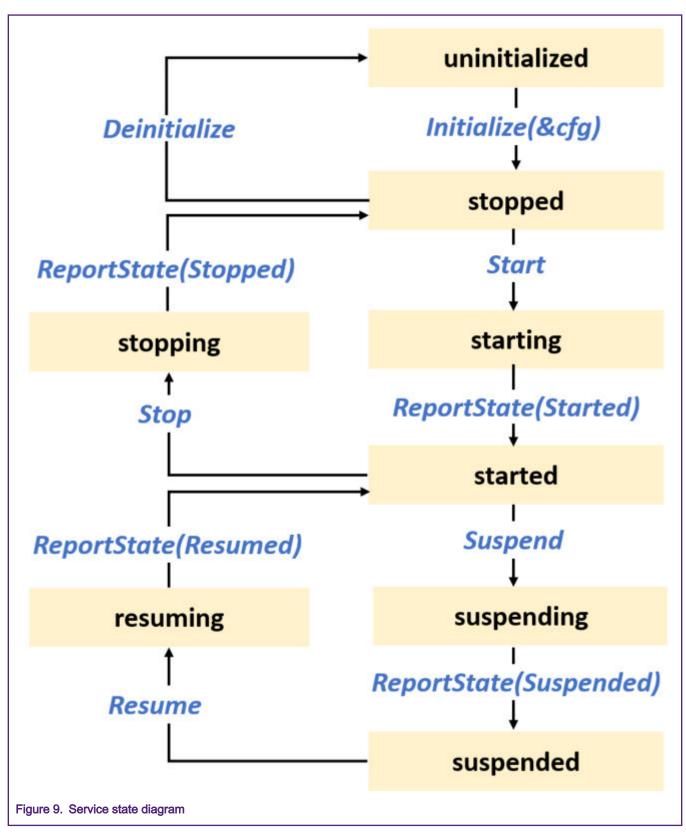

Users can design their own application or service on need. This document gives a brief introduction to the state machine that will be used to control other services and the application.

Users can decide what service to perform in a state as they wish. For example,

• The state of an uninitialized USB-service is uninitialized, and then the state will change from Uninitialized to Stopped by calling API initialize (&cfg) and executing successfully.

Figure 9 shows the mandatory API and corresponding state machine.

For example, the state can jump from Starting to Started by calling ReportState (Started).

 ${\tt FRAMEWORK\_ServiceReportState~(\&g\_XXXServiceApi,~kSTATE\_Started);}$ 

# 3.3 Firmware development

## 3.3.1 Setting up the environment

This section introduces how to set up the MDK environment and the materials required in each step are described in Table 2.

Table 2. Materials required in Firmware development

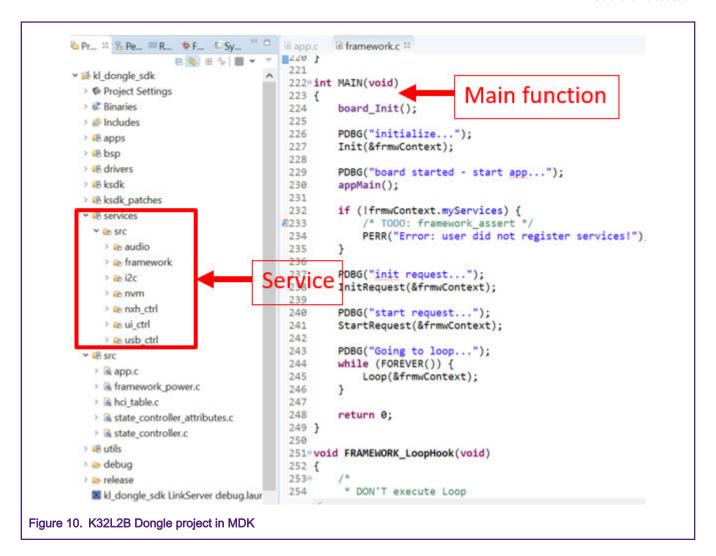

| List     | Description  |
|----------|--|
| PC       | Host device connected to the development board   |
| Debugger | <ul> <li>Default CMSIS-DAP firmware in the debugger onboard.</li> <li>Replace the default CMSIS-DAP firmware with J-LINK firmware if user want to use JLink.exe to download Bin file without IDE.</li> </ul> |
| IDE      | MDK (V5.26.2.0)  |
| Demos    | <ul> <li>K32L2B+NxH3670.Zip for Gaming use case, including:</li> <li>Bin files that can be download through JLink.exe.</li> <li>Debug version of demo that can be used to redeveloped.</li> </ul>            |

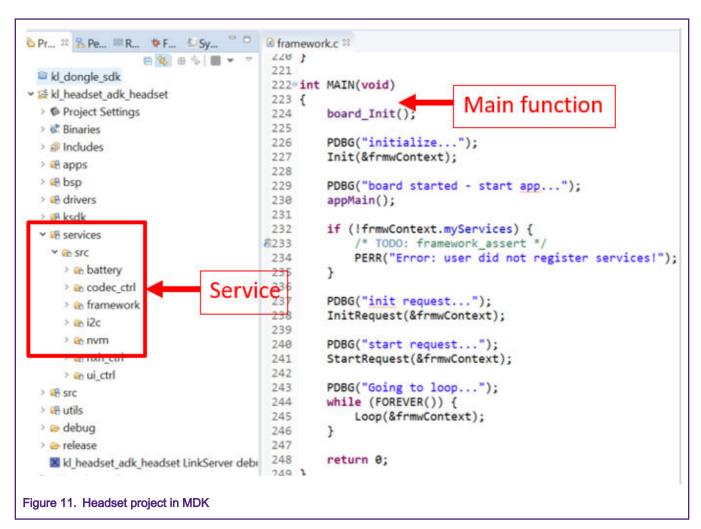

## 3.3.2 Software based on MDK

This document ports five demos:

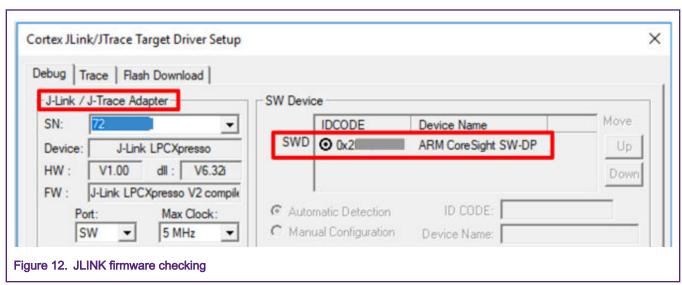

- Dongle
- K32L2B\_Headset
- K32L2B\_OTA\_Dongle
- K32L2B\_OTA\_Headset
- K32L2B\_SSB

Figure 10 and Figure 11 list two demos as references for users if they want to port the demo to other boards.

If users want to use <code>JLink.exe</code> to download Bin file, make sure they have <code>J-LINK</code> firmware in Debugger onboard (MDK can be used for checking), as shown in Figure 12.

The following files are required for users if they want to download **Bin** files from PC to K32L2B:

• J-LINK.exe

- JLinkARM.dll
- XXXX.bat
- XXXX.txt
- Bin

For example, as shown in Figure 13:

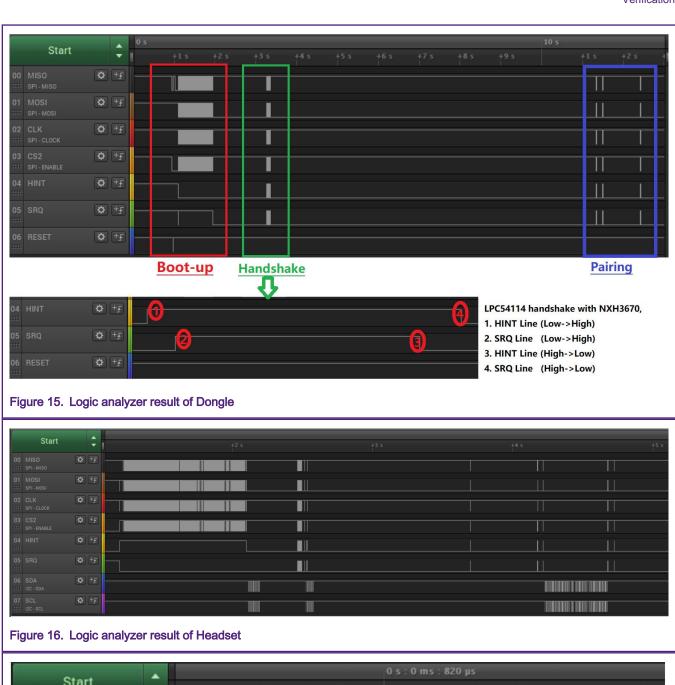

- bat.bat: Its content is call JLink.exe -CommanderScript bat.txt and it is responsible for calling JLink.exe.
- bat.txt: It defines where to download the specified Bin files.
- Bin.bin: Users can provide related Bin file according their real needs.

## 4 Verification

## 4.1 Logic analyzer results

Figure 15, Figure 16, and Figure 17 help users to make sure that the K32L2B Bluetooth LE Audio System is working well.

Application Note

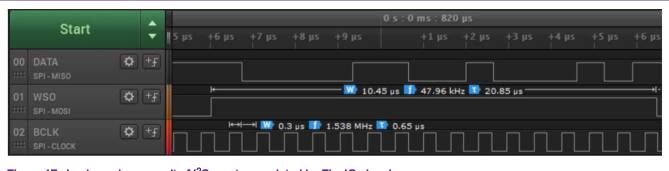

Figure 17. Logic analyzer result of I<sup>2</sup>S master emulated by FlexIO signal

Application Note 12 / 15

## 4.2 Getting started with gaming user case

This application provides two cases for users:

- · Play audio
- OTA

### 4.2.1 Play audio

Users can follow the steps below to verify the audio play function of K32L2B Bluetooth LE Audio System.

- 1. Connect the hardware following the introduction of Hardware design.
- 2. Make sure that related demos have been downloaded correctly, no matter using IDE or JLINK.exe. Power on NXH3670 using the PWR ON/OFF button, and then boot-up, start and communicate with it.
- 3. Wait for Dongle to be paired and connected with Headset successfully.

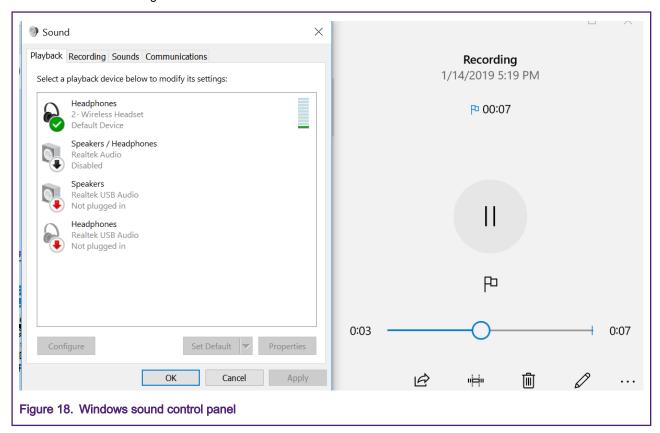

The two NXH3670 are paired first and then connected.

For SDK Dongle board, the red LED is blinking while pairing, ON when paired, and OFF when connected.

For K32L2B Dongle, the blue LED is ON while pairing and OFF when paired, and the red LED is OFF when connected.

4. Select **Headphones** as the playback device for playing music.

Connect J10 with PC using USB cable instead of J13.

#### 4.2.2 OTA

Use can upload new firmware that brings new features through OTA.

To save time for users, the flashtool does not update existing firmware. For more information, users can refer to K32L2B OTA.

## 5 Conclusion

This document provides basic introduction of the K32L2B Bluetooth LE Audio System. Users can use Dongle and Headset to verify related functions.
