Table 26.84 ETNBnMAFCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	MAFC[15:0]	Multicast Address Frame Counter These bits indicate the number of multicast frames that have been received.

MAFC[15:0] Multicast Address Frame Counter Bits

These bits indicate the number of multicast frames that have been received.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

26.3.69 ETNBnIFCTL — Communication Interface Control Register

The ETNBnIFCTL register specifies the communication interface.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 1000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IFS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 26.85 ETNBnIFCTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	IFS	This bit selects the communication interface. 0: MII mode 1: Setting prohibited

26.4 Operation

The Ethernet AVB consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the MII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. The information is referred to as descriptors. The AVB- DMAC reads data for transmission from the storage area for data to be transmitted and writes received data to the storage area for received data according to the information described in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports a MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the MII. It also performs CRC checking of Ethernet frames received from the MII and writes the frames to the reception FIFO.

26.4.1 AVB-DMAC Operating Modes

Figure 26.5, Operating Mode of AVB-DMAC illustrates the operating modes of the AVB-DMAC.

Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset)
- Configuration of the operating mode configuration bits (ETNBnCCC.OPC) in the AVB-DMAC mode register

The current operating mode can be determined by reading the operating mode status bits in the AVB- DMAC status register (ETNBnCSR.OPS).

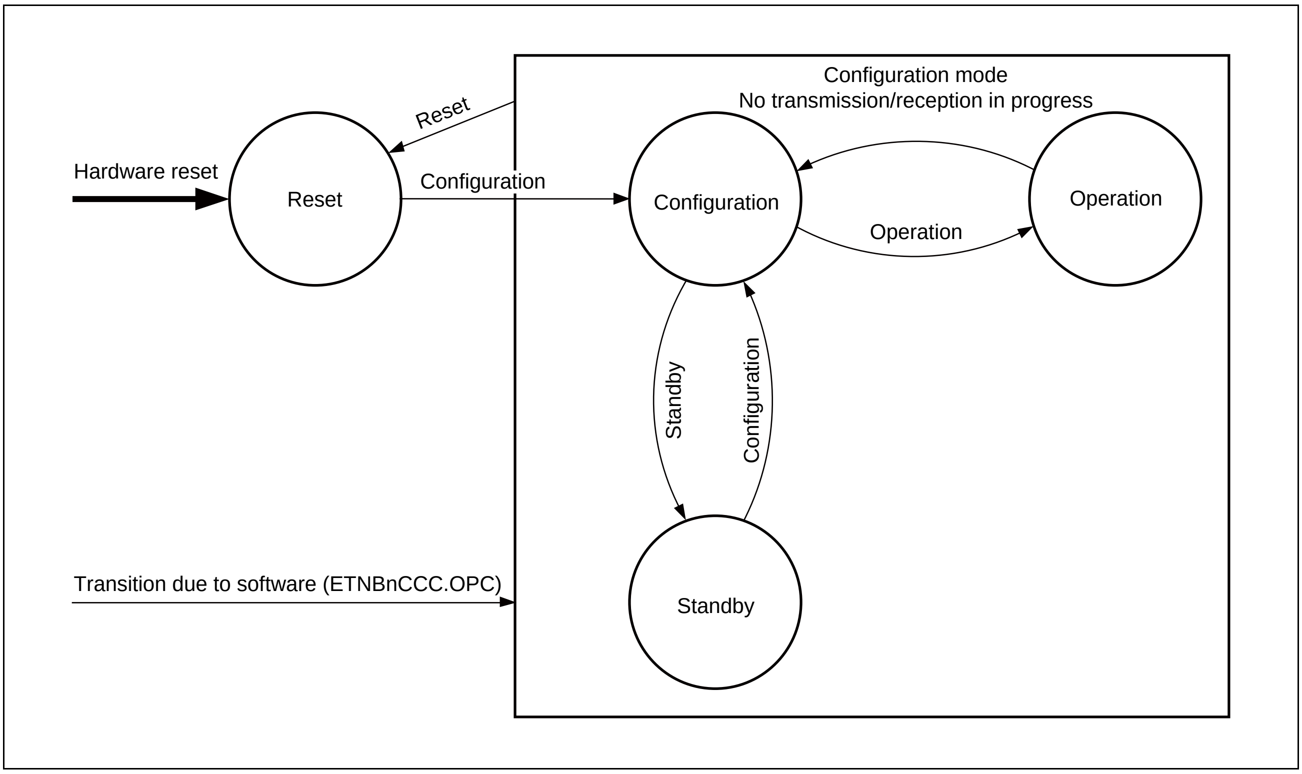

Figure 26.5 Operating Mode of AVB-DMAC

26.4.1.1 Operating Modes

(1) Reset Mode
After a hardware reset, the AVB-DMAC enters reset mode.
In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

NOTE

When the operating mode transfers to reset mode all registers, except the ETNBnIFCTL register, are initialized to their reset values.

(2) Configuration Mode
In configuration mode, various settings for the AVB-DMAC can be made.
The operating functions are stopped and all status registers are initialized to their reset values. The E-MAC functions in this mode.

(3) Operation Mode
In operation mode, all functions of the AVB-DMAC can operate. Ethernet communications can only proceed in this mode.
In operation mode, do not set E-MAC again.

(4) Standby Mode
In standby mode, the E-MAC can only be used to control the operating mode. Other functions cannot be used.

26.4.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC mode register (ETNBnCCC.OPC) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVB-DMAC status register (ETNBnCSR.OPS).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (ETNBnCCC.OPC) (**Figure 26.6, Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)**).

For transitions from operation mode to configuration mode, follow the procedure in **Figure 26.7, Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)** because any transmission and reception in progress will be executed before the transition to configuration mode.

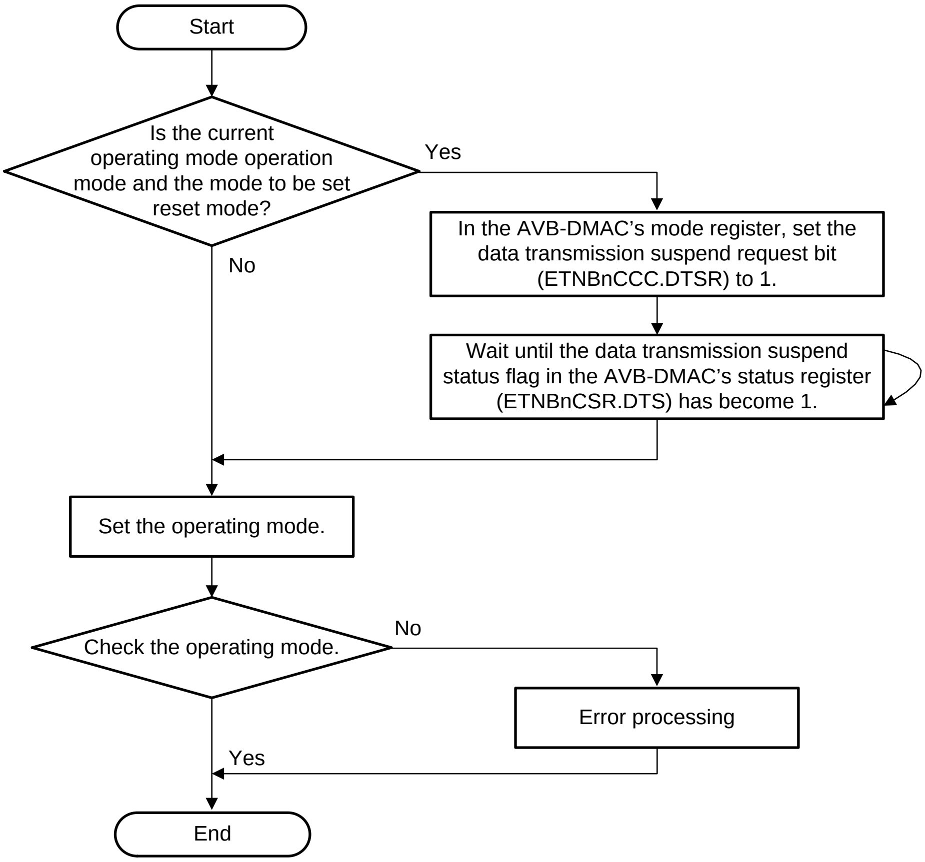

Figure 26.6 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

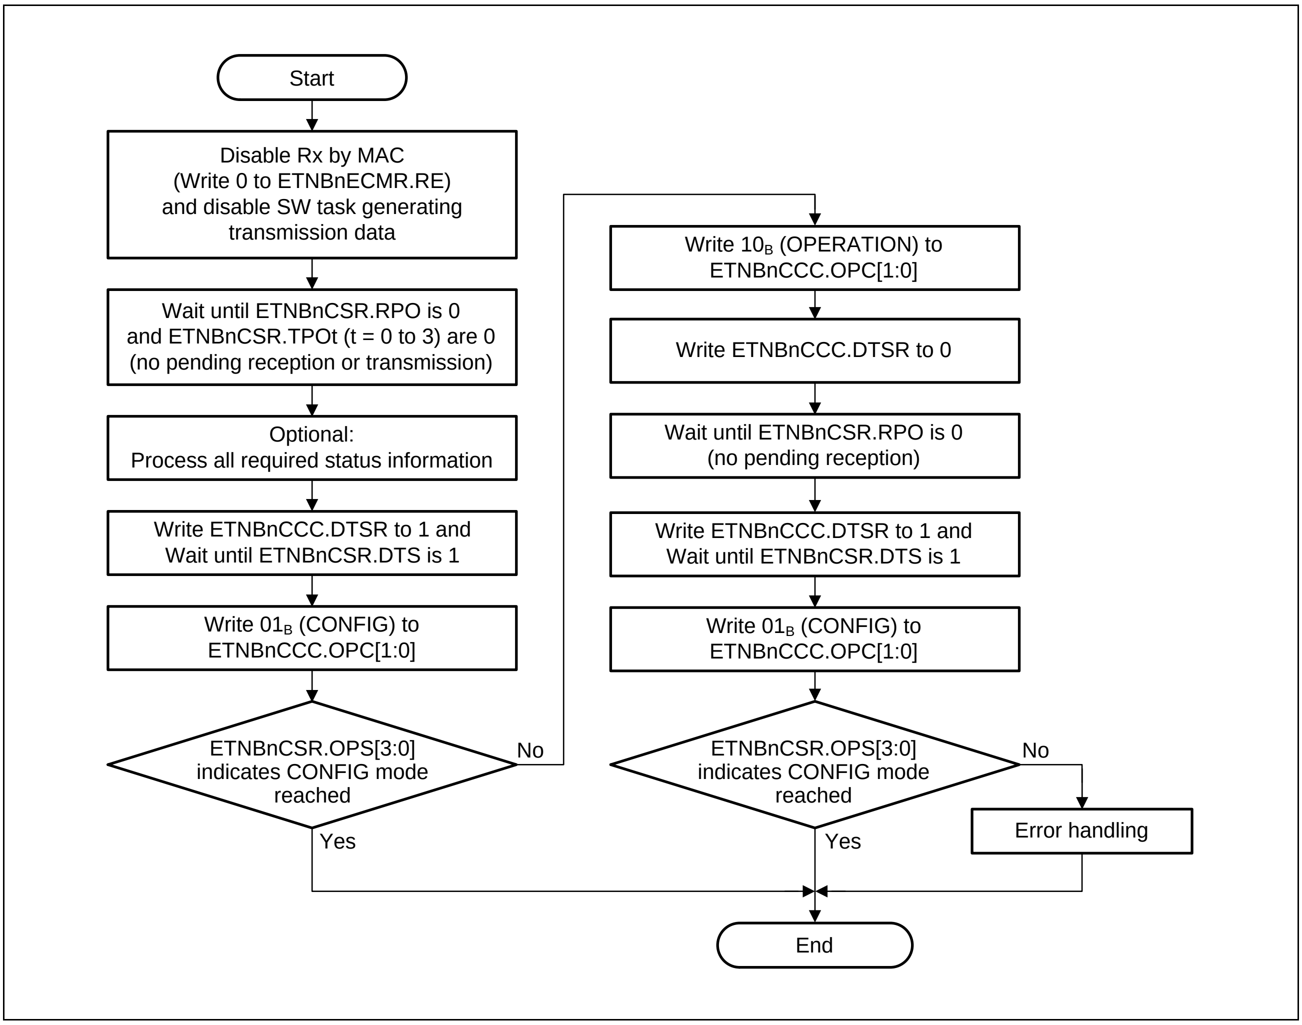

Figure 26.7 Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (ETNBnCSR.OPS) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and URAM is in progress, this is completed (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and URAM, this is completed (frames for transmission remaining in the URAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

NOTES

When the operating mode shifts to configuration mode, all status registers are cleared. We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (ETNBnCSR.RPO) and the transmit process status bits (ETNBnCSR.TPO0 to 3) in the AVB-DMAC status register are set to 0.

5. Capture all of the required status information.
6. Set the operating mode configuration bits in the AVB-DMAC mode register (ETNBnCCC.OPC) to initiate the transition to configuration mode.

26.4.1.3 Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.

(1) Hardware Reset
Resetting of the LSI chip leads to resetting of the entire EthernetAVB module. The operating mode shifts to reset mode.

26.4.2 Common Control for Transmission and Reception

26.4.2.1 Initialization Procedure

Figure 26.8, Outline of the Initialization Procedure shows the overall initialization procedure in outline.

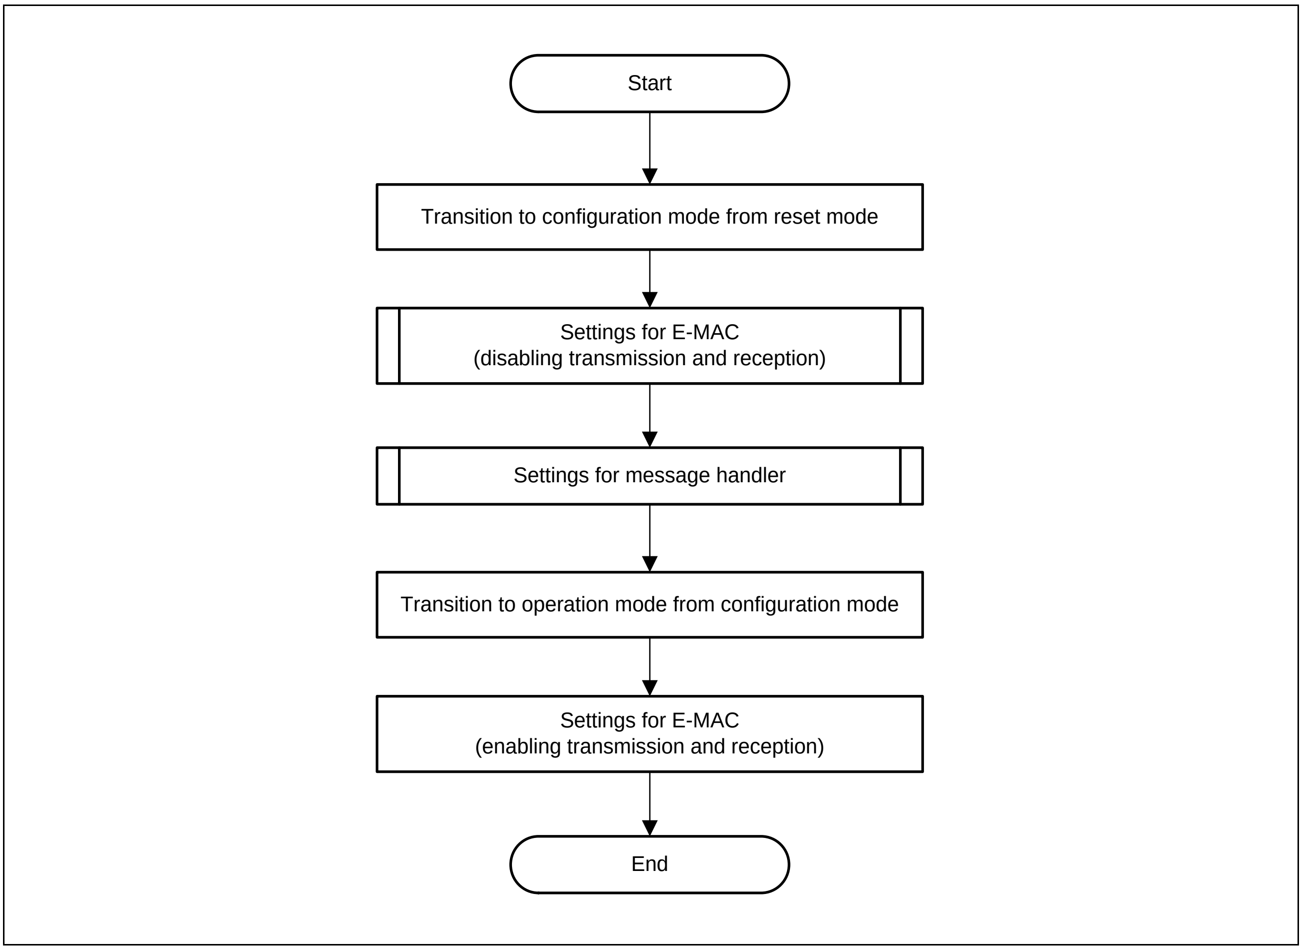

Figure 26.8 Outline of the Initialization Procedure

(1) Initializing the Receiver Section

Before starting reception, follow the procedure below.

Set the operating mode to operation mode or standby mode, and do not enable reception until the settings for the AVB-DMAC are completed.

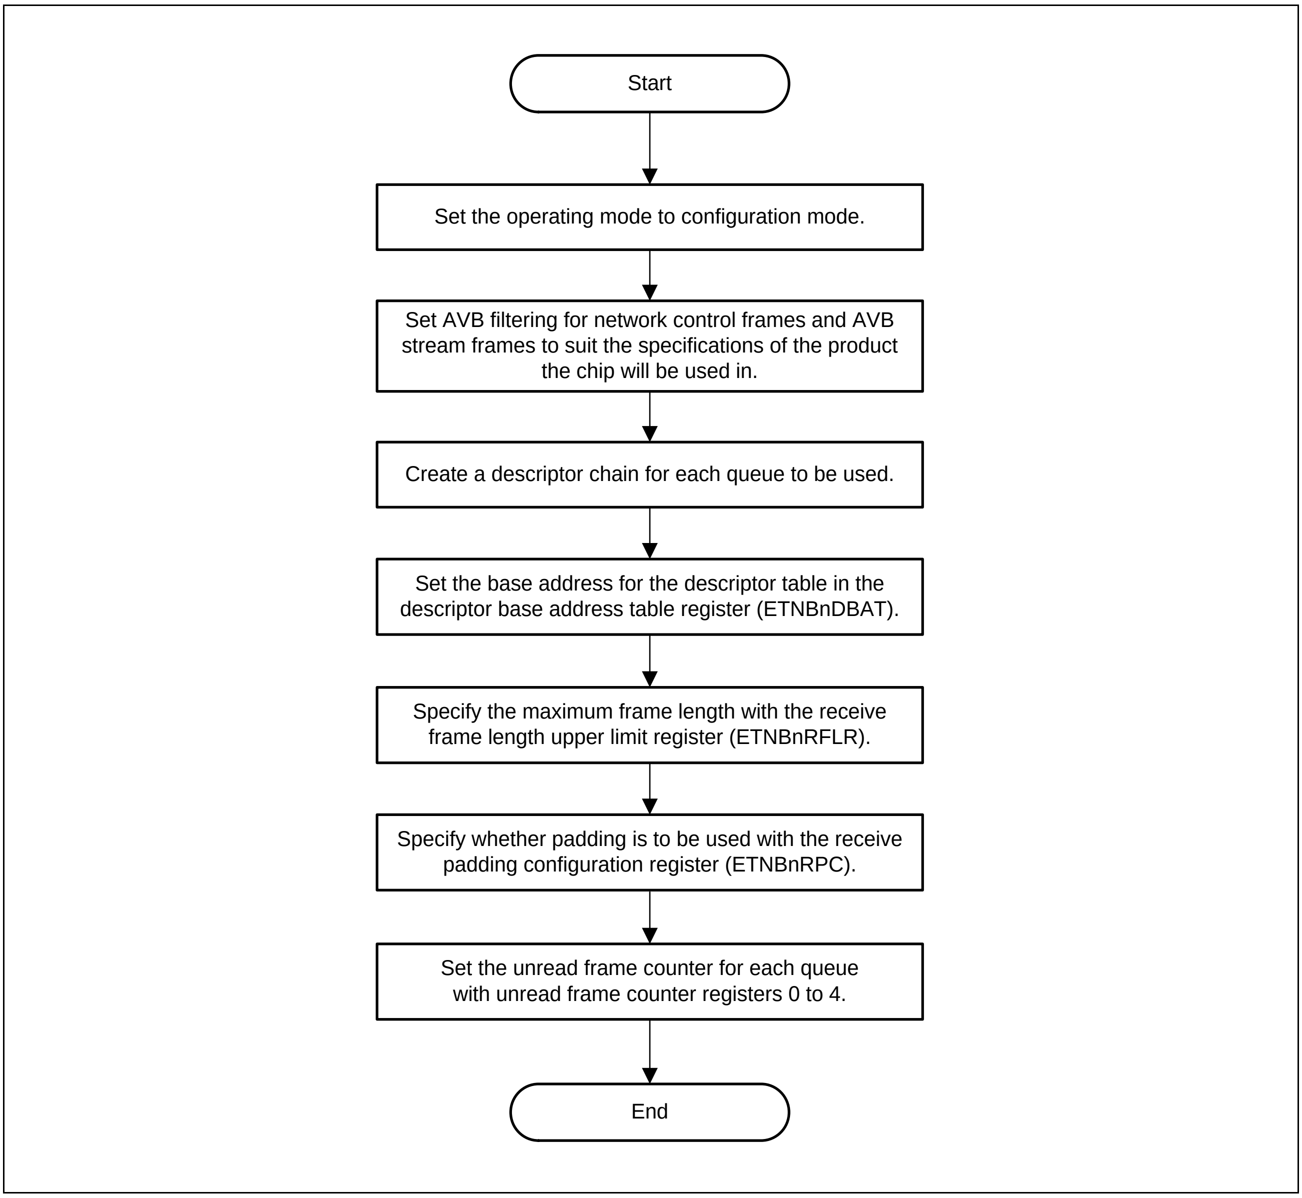

Figure 26.9 Procedure for Initializing the Receiver Section

(2) Initializing the Transmitter Section

Figure 26.10, Procedure for Initializing the Transmitter Section illustrates initialization of the transmitter section.

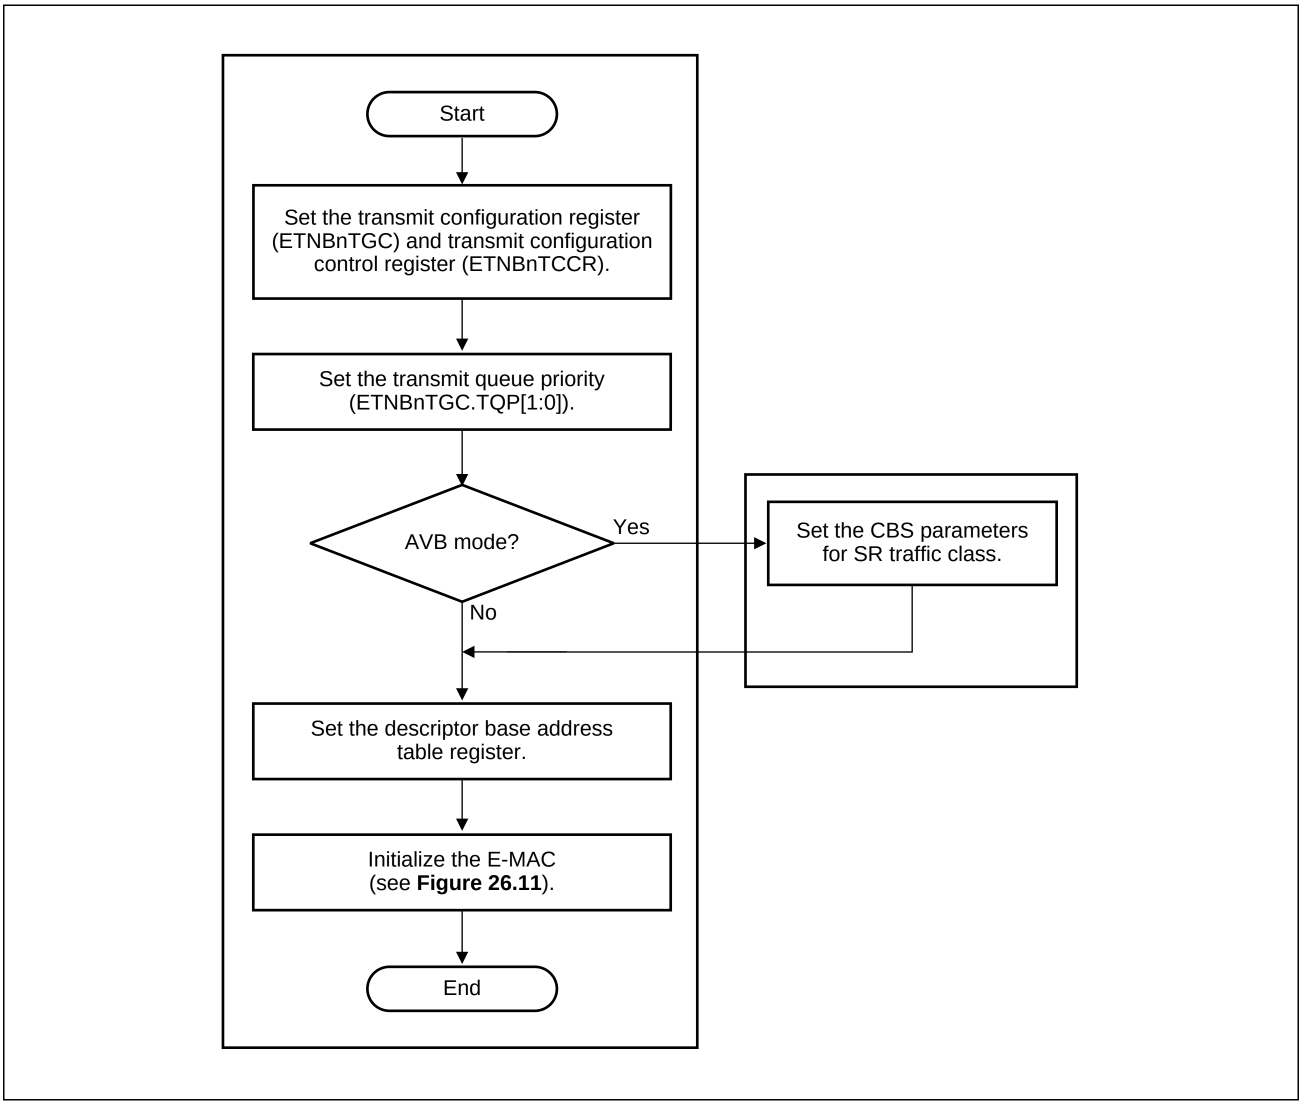

Figure 26.10 Procedure for Initializing the Transmitter Section

(3) Configuration the E-MAC Block

Figure 26.11, Procedure for Configuration the E-MAC Block illustrates configuration of the E-MAC block.

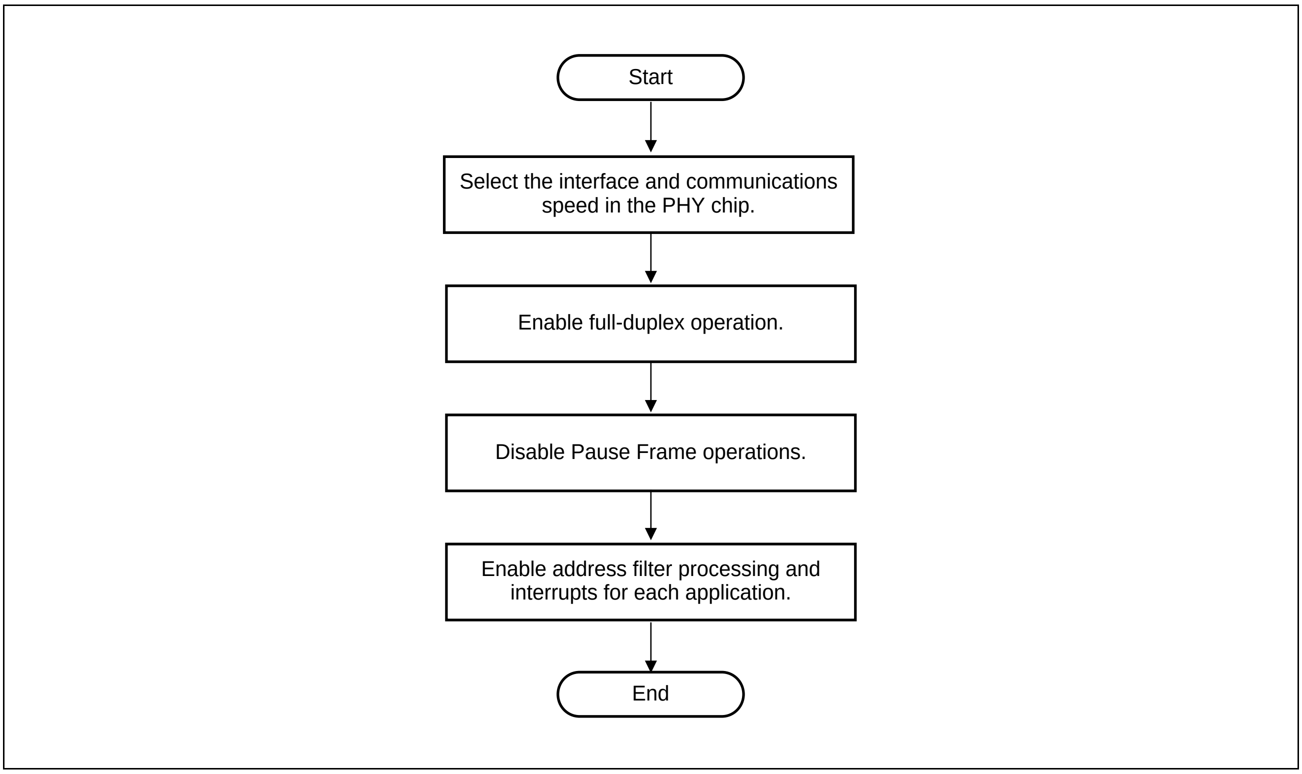

Figure 26.11 Procedure for Configuration the E-MAC Block

(4) Configuration of the Message Handler Section

Figure 26.12, Configuration of the Message Handler Section illustrates configuration the message handler section.

For a description of how to set up the descriptors and the CBS traffic shaping parameters, see **Section 26.4.3, Descriptors**, and **Section 26.4.6, CBS (Credit-Based Shaping)**.

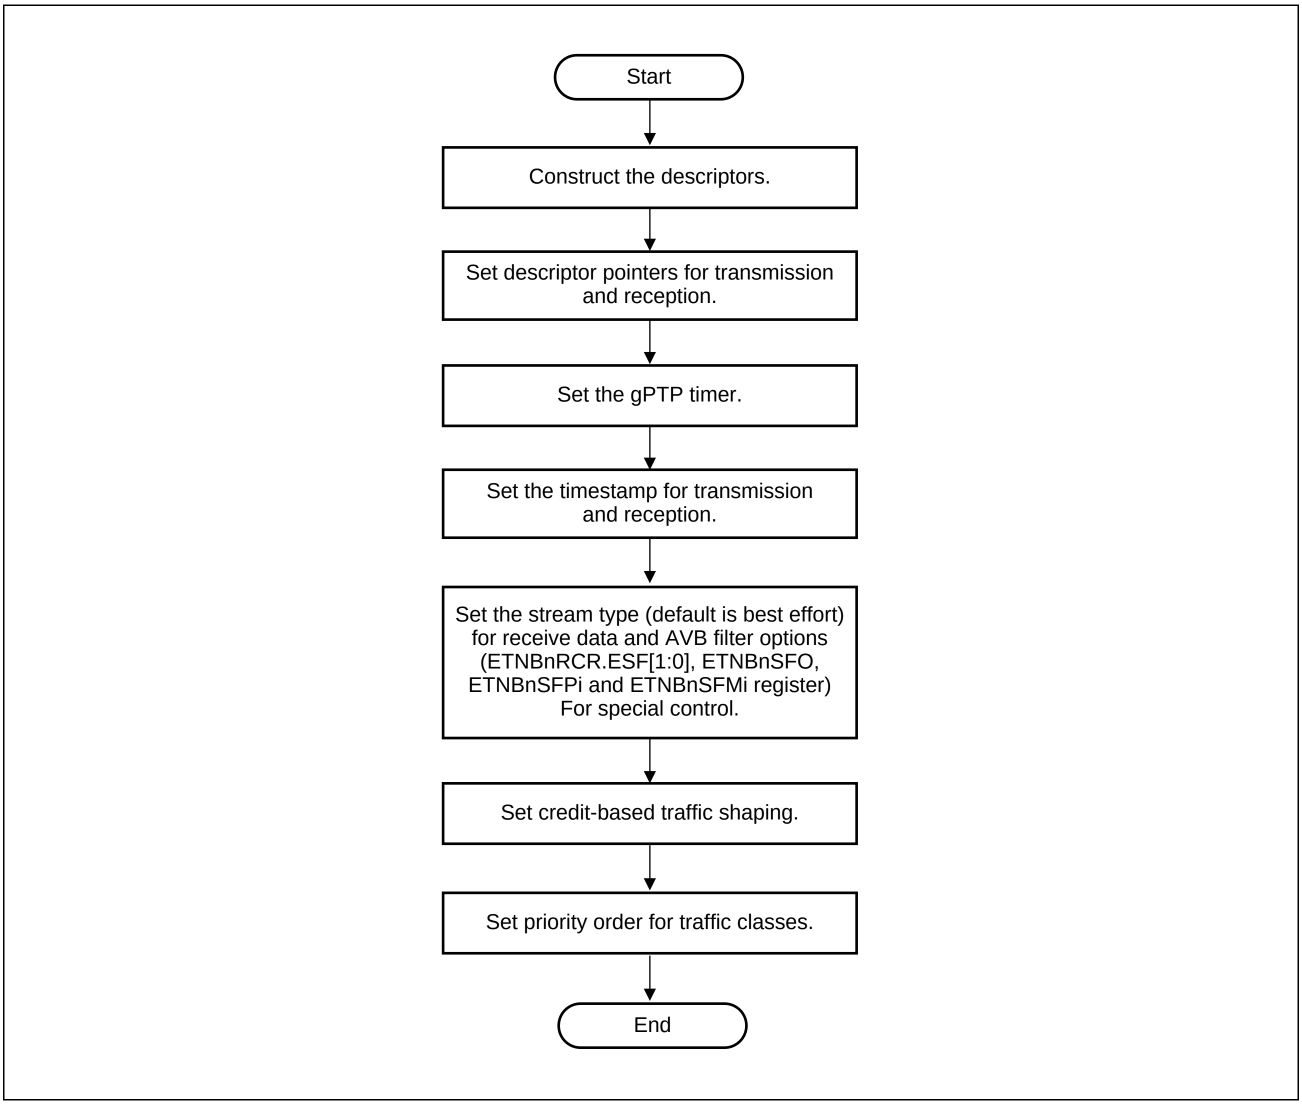

Figure 26.12 Configuration of the Message Handler Section

26.4.2.2 Scheduling Reception and Transmission

The AVB-DMAC normally has independent buses for transmission and reception. Furthermore, the four processes of fetching, storing, transmission and reception are basically independent of one another. Fetching and storing, however, share the same bus master so cannot be executed simultaneously. Access to the bus master is controlled by the scheduler.

Figure 26.13, Schematic View of AVB-DMAC Operations in Transmission and Reception is a schematic view of AVB-DMAC operations in transmission and reception.

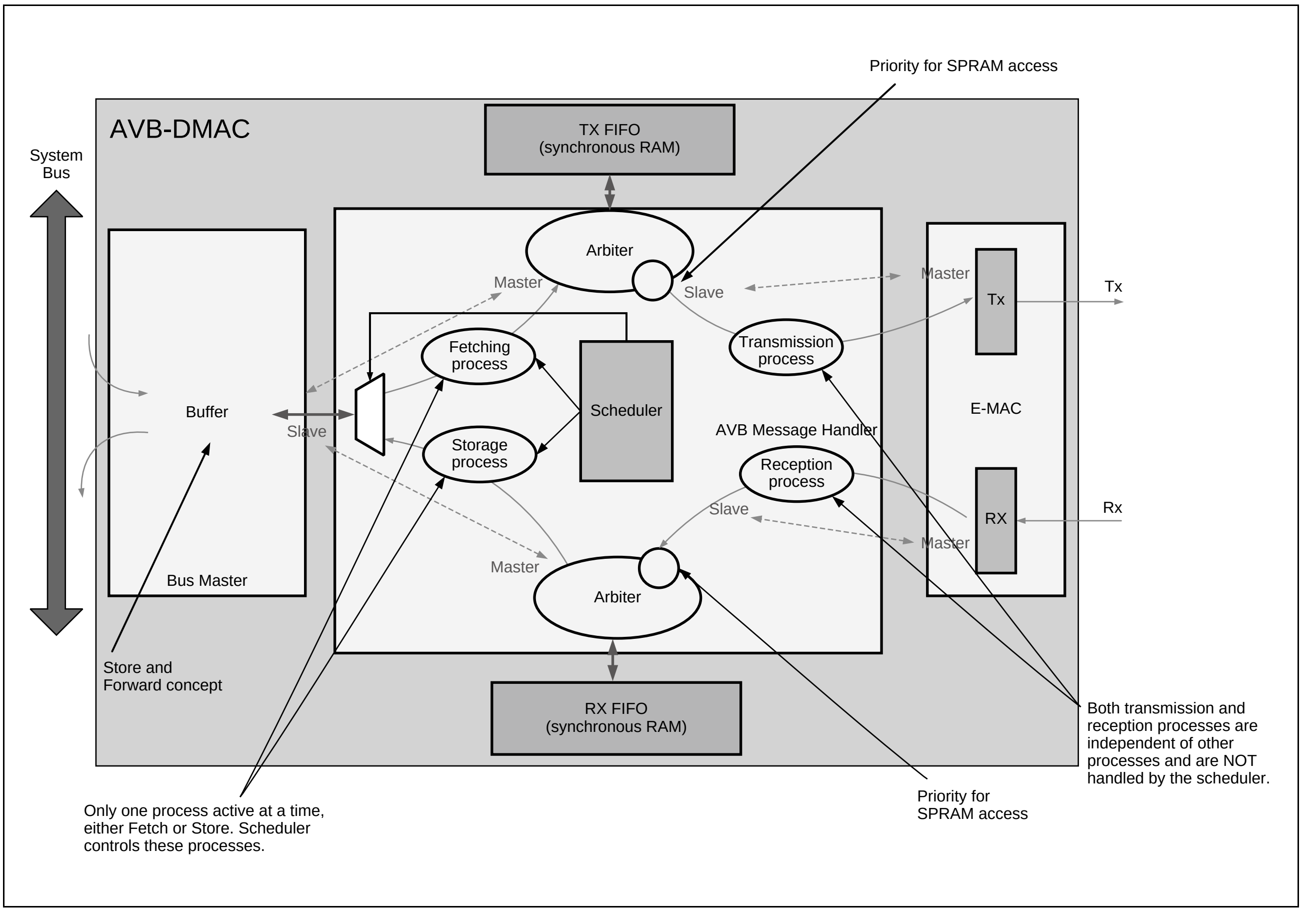

Figure 26.13 Schematic View of AVB-DMAC Operations in Transmission and Reception

Storing and fetching are alternately performed. When the number of frames held by the reception FIFO reaches the warning level, storing takes precedence over fetching.

(1) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP) has no effect.

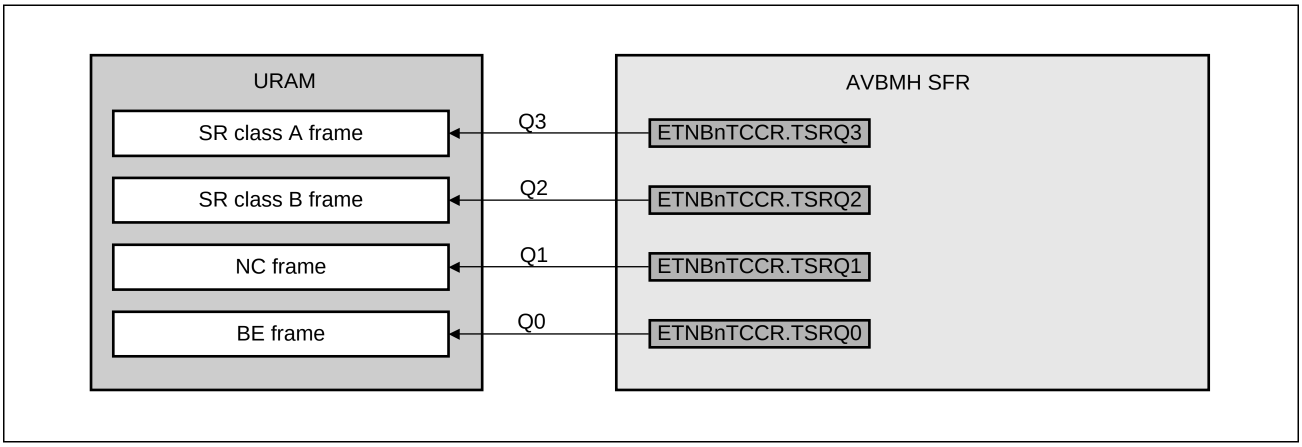

Figure 26.14 Class Associations of Queues for the Scheduler

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (ETNBnTGC.TBDt) and on the frame size that can be fetched to the transmission FIFO.

When the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP) are 00_B or 01_B, the priority order is Q3 → Q2 → Q1 → Q0.

When the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP) are 11_B, the priority order is Q1 → Q3 → Q2 → Q0.

26.4.2.3 Checking Integrity

The AVB-DMAC is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

(1) Concept of Integrity Checking in Reception

The purpose of receive integrity check is to prevent error frames from being stored in the URAM.

If an error frame is stored, information to identify the frame as an error frame is appended to the data from the frame in the URAM.

CAUTION

If a special descriptor chain is to be used for header/data separation on reception, an error that breaks the sequence may lead to storage space for synchronization running out. In such cases, software interaction or re-synchronization via the EOS descriptor is required.

(2) Concept of Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.

Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

(3) Items for Monitoring in Both Reception and Transmission

(a) Errors in Access to the URAM for Reading of Descriptors

The same descriptor may be processed again because the current descriptor address (ETNBnCDARq.CDA) is not changed.

If this problem occurs in a divided frame, the sequence may be broken.

- In reception
  - The received frame will be lost.
  - The same problem will occur for the next frame of data received for the same queue.
- In transmission
  - The transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is set to 0.
  - The frame will be lost from the transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI- Bus.

(b) Illegal Configuration of a Descriptor by an Application

The same descriptor may be processed again because the current descriptor address (ETNBnCDARq.CDA) is not changed.

If this problem occurs in a divided frame, the sequence may be broken.

- In reception
  - The received frame will be lost.
  - The same problem will occur for the next frame of data received for the same queue.
- In transmission
  - The transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is set to 0.
  - The frame will be lost from the transmission FIFO.

(c) Errors in Access to the URAM for Writing of Descriptors

As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated.

As DESCR.DT was not updated, hardware and software synchronization may have been disengaged.

Errors in access to write descriptors to the URAM are detected from the response signal of the AXI- Bus.

(4) Items for Monitoring in Reception

(a) Errors in Access to the URAM for Writing of Data or Timestamps

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- When an access error occurs in a divided frame, the descriptor sequence may be damaged and queues may be unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus.

(b) Errors in Access for Reading from the Reception FIFO

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- When an access error occurs in a divided frame, the descriptor sequence may be damaged and queues may be unusable.
- Errors of this type are detected by the ECC checker for the reception FIFO.

(c) Damaged Data in the Reception FIFO

- Received frames are all invalidated.
- All frames stored in reception FIFO are discarded. At this time, the number of frames and queue information cannot be captured.

If damaged data in the reception FIFO is an error due to the reception FIFO, this is detected by the AVB-DMAC.

(5) Items for Monitoring in Transmission

(a) Errors in Access for Reading Data from the URAM

- Data that have already been fetched are discarded from the transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:
  As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
  - The current descriptor address (ETNBnCDARq.CDA) is not updated.
  - The transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is set to 0.

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

(b) Overflow of the Transmission FIFO

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

(c) Errors in Access for Reading of the Transmission FIFO

The AVB-DMAC is incapable of detecting an error in reading of the transmission FIFO, resulting in the transmission of a broken frame.

Errors of this type are detected by the ECC checker for the transmission FIFO.

(d) Frame size error during transmission

- As in the case where no error occurs, the current descriptor address (ETNBnCDARq.CDA) and the transmit start bit in the transmit configuration control register (ETNBnTCCR.TSRQt) are updated. Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is 1997 or more bytes. Such frames are cut out and transmitted.

(e) Damaged Data in the Transmission FIFO

- Fetching is not affected by damaged data.
- Since damaged data from the FIFO is only detected during frame transmission, an unexpected frame data may be transmitted.

If damaged data in the transmission FIFO is an error due to the transmission FIFO, this is detected by the AVB-DMAC.

26.4.3 Descriptors

26.4.3.1 Data Representation in URAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the URAM.

The memory in the URAM for use by the AVB-DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without using the AVB-DMAC.

Figure 26.15, Example of URAM Memory Map shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Respective descriptors can generate interrupts after completion of processing. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see **Section 26.4.4.2, Setting Up Reception Descriptors**, and **Section 26.4.5.2, Setting Up Transmission Descriptors**.

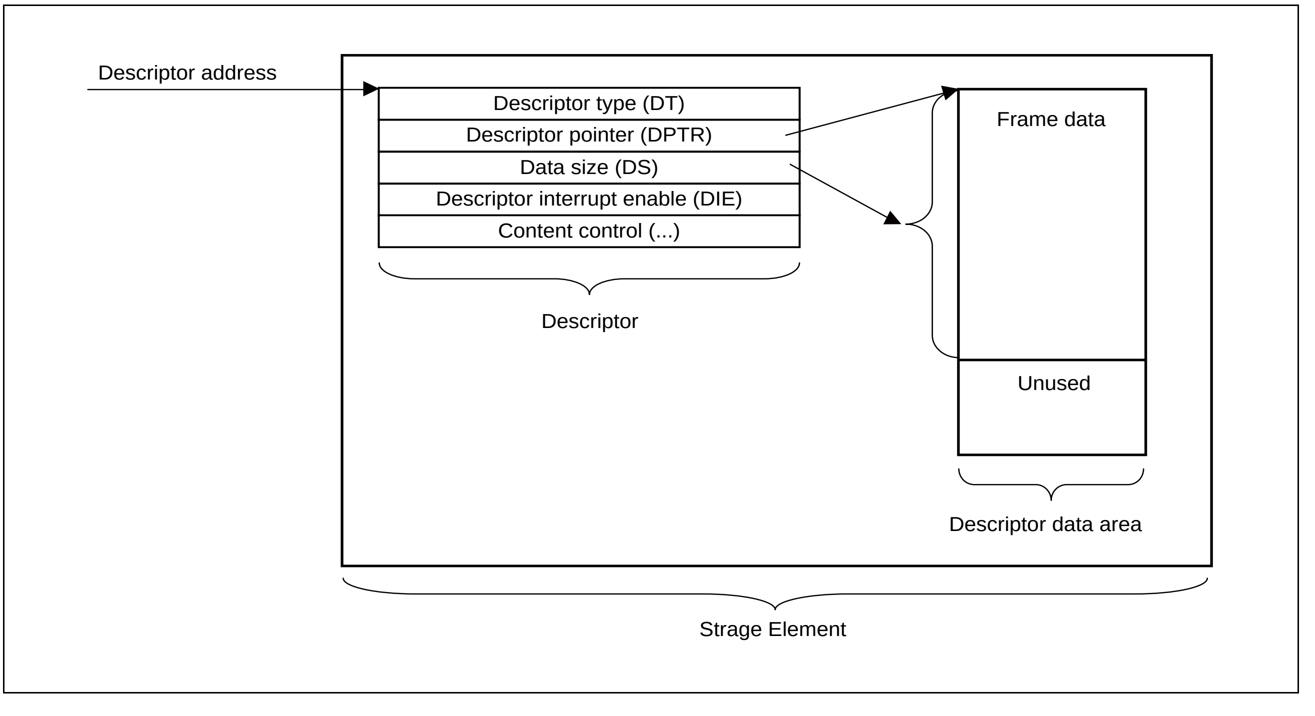

Figure 26.15 Example of URAM Memory Map

The descriptor must be aligned with a 32-bit boundary in the URAM.

Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP timestamps is enabled.

The frame data must also be aligned with a 32-bit boundary in the URAM.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the residual bytes in the data area are set as unused bytes.

CAUTION

AVB-DMAC will store the data area pointed by descriptor for specified data size, even if there is no enough space.

26.4.3.2 Using Descriptor Chains in Queues

Transmission and reception descriptors in the URAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see **Section 26.4.3.6, Descriptor Type**.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 26.16, Outline of the Basic Descriptor Chains shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

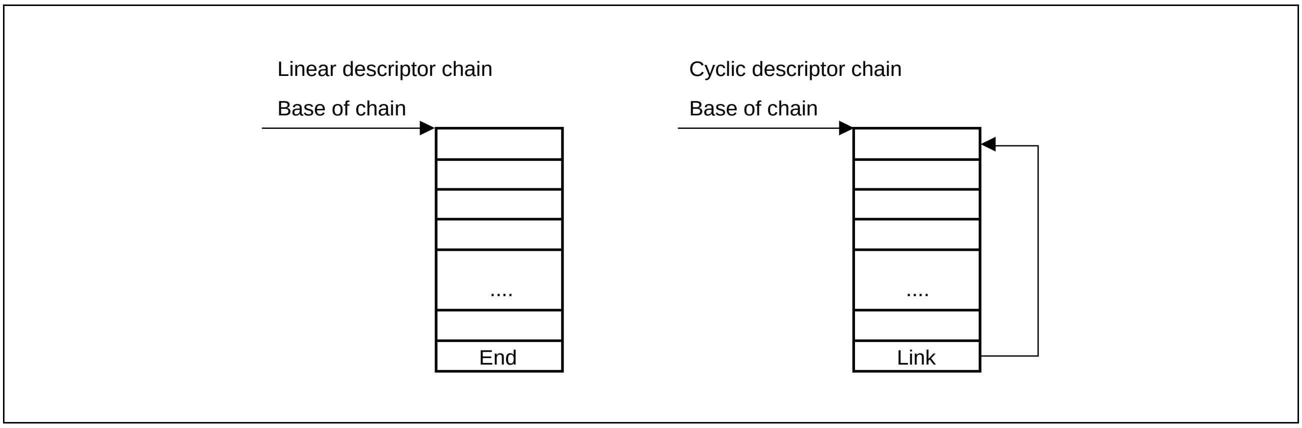

Figure 26.16 Outline of the Basic Descriptor Chains

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in **Section 26.4.4.2, Setting Up Reception Descriptors**, and **Section 26.4.5.2, Setting Up Transmission Descriptors**.

26.4.3.3 Descriptor Base Address Table

Concerning the base address table to be written in the URAM, set the address of the top descriptor of respective queues.

Entries 0 to 3 are used to access transmission queues 0 to 3. Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. The link descriptor does not need to be updated because it does not change even after descriptor processing, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (ETNBnDBAT).

Figure 26.17, Example of a Base Address Table for Reception and Transmission Queues shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains of a topology.

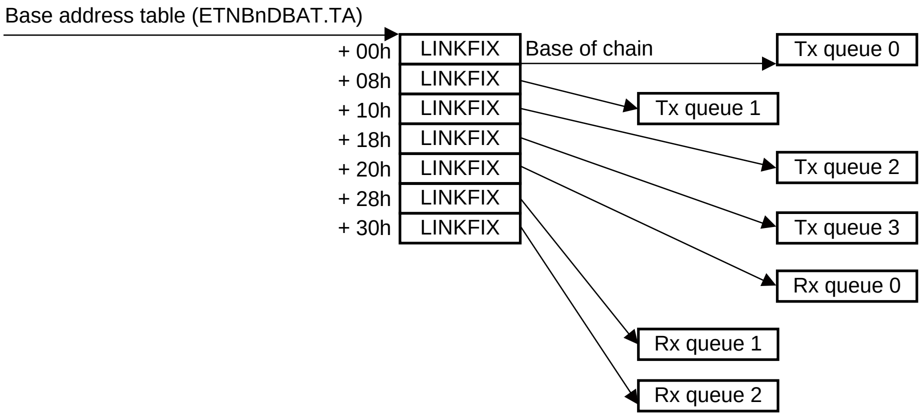

Figure 26.17 Example of a Base Address Table for Reception and Transmission Queues

CAUTION

The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

26.4.3.4 Descriptor Chain Processing

When a descriptor is currently being processed or the queue for a descriptor is active, the current descriptor is a descriptor to be processed. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (ETNBnCDARq).

The current descriptor is stored in a register or descriptor as described below.

- In the descriptor base address table registers for all q queues (ETNBnDBAT) (ETNBnDBAT.TA + 8 × q) when the operating mode shifts to operation mode.
- In the descriptor base address table register (ETNBnDBAT) (ETNBnDBAT.TA + 8 × q) when a base address load request is issued for a queue q by setting the corresponding bit (ETNBnDLR.LBAq) in the descriptor base address load request register.
- It is set to DESCR.DPTR when a link descriptor (LINK, LINKFIX) is processed.

After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue (8 bytes for normal descriptors and 20 bytes for extended descriptors). The AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

26.4.3.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enable bits (DESCR.DIE) in each descriptor selects disabling or generation of the descriptor interrupt.

The descriptor interrupt is a common resource that is shared between reception and transmission queues. Software control of the descriptor interrupt provides a flexible method of application-specific flag processing.

Figure 26.18, Method of Descriptor Interrupt Generation illustrates the way in which the AVB-DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (ETNBnDIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (ETNBnDIS.DPFi) being set.

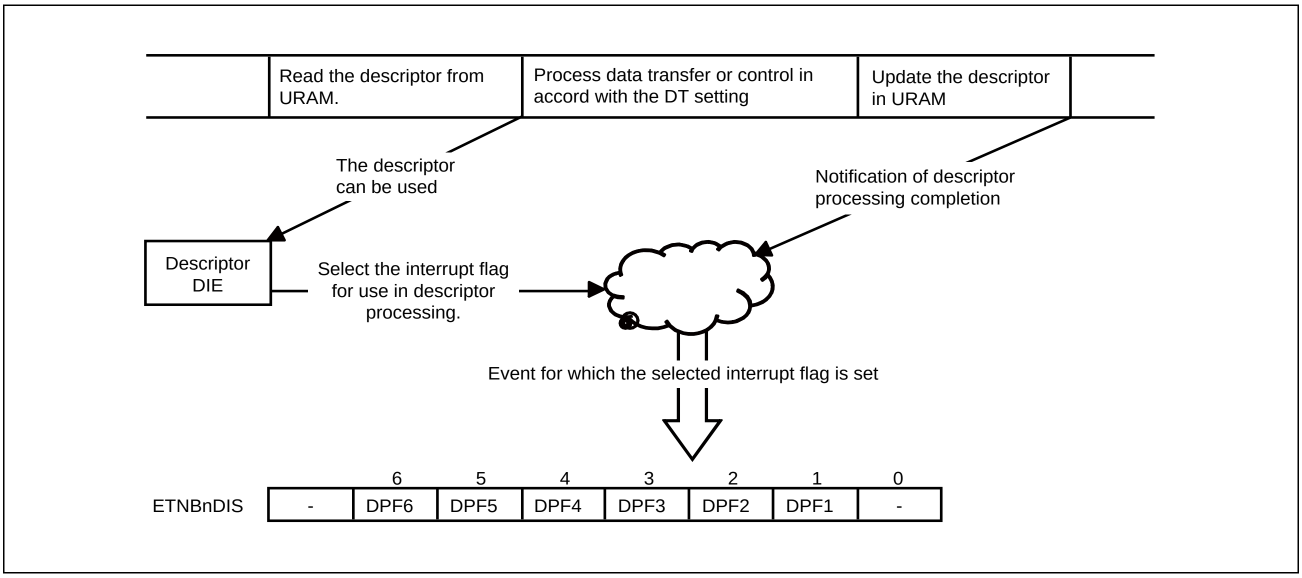

Figure 26.18 Method of Descriptor Interrupt Generation

26.4.3.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the AVB-DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 26.86, Summary of Descriptor Types is a summary of the descriptor types available for the AVB-DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- The descriptor cannot be changed by hardware (AVB-DMAC).

Definition of HW:

- The descriptor is processed by hardware (AVB-DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (AVB-DMAC) processes the descriptor and subsequently changes the descriptor type.

Invalid:

This descriptor type is not used in transfer in the given direction (transmission or reception). Do not write the value to the descriptor type (DESCR.DT) field.

Hardware does not process the descriptor type. The current descriptor address (ETNBnCDARq.CDA) is not changed even when the queue is of a descriptor type of this setting.

Table 26.86 Summary of Descriptor Types

Name	DT	Description	Reception	Transmission
Frame data				
FSTART	5	Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor.	SW	HW
FMID	4	Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor.	SW	HW
FEND	6	Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor.	SW	HW
FSINGLE	7	Frame Single The descriptor points to valid data for a complete frame.	SW	HW
Chain control				
LINK	8	Link Defines the next descriptor in the chain.	HW	HW
LINKFIX	9	Fixed Link Defines the next descriptor in the chain, but not changed by AVB-DMAC after processing.	SW	SW
EOS	10	End Of Set Control element to split descriptor chain. Chain stops and waits for user interaction.	HW	HW
HW/SW arbitration				
FEMPTY	12	Frame Empty A descriptor related to frame data but not containing valid data for a frame	HW	SW
FEMPTY_IS	13	Frame Empty Incremental Start A descriptor related to frame data but not containing valid data for a frame DESCR.DPTR sets the base address of an “incremental data area” in the URAM.	HW	Invalid
FEMPTY_IC	14	Frame Empty Incremental Continue A descriptor related to frame data but not containing valid data for a frame Data indicated by the pointer are for storage in an incremental data area in the URAM.	HW	Invalid
FEMPTY_ND	15	Frame Empty No Data Storage A descriptor related to frame data but not containing valid data for a frame The descriptor is processed in the same way as FEMPTY but data are not stored in the URAM.	HW	Invalid
LEMPTY	2	Link Empty A link descriptor for processing by the AVB-DMAC	SW	SW
EEMPTY	3	EOS Empty An EOS descriptor for processing by the AVB-DMAC	SW	SW
DT0	0	Reserved	Invalid	Invalid
DT1	1	Reserved	Invalid	Invalid
DT11	11	Reserved	Invalid	Invalid

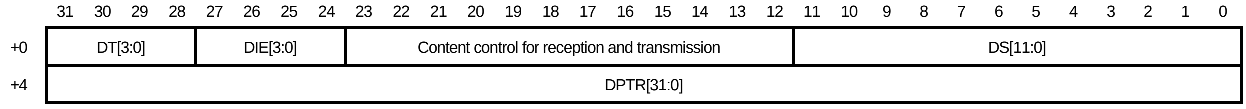
(1) Layout of General Descriptors in the URAM

The AVB-DMAC updates processed descriptors in the URAM. The field to be changed in a descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by "—" in the figure).

(2) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.

- Normal descriptor (usable in both reception and transmission)



- Extended descriptor (usable only in reception)

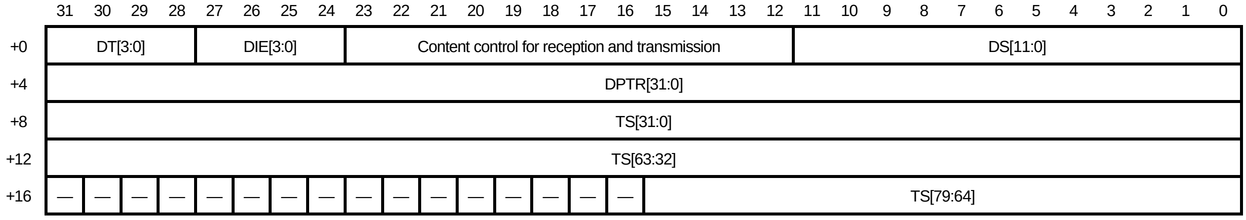


Table 26.87 Contents of Frame Data Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see **Section 26.4.4.2, Setting Up Reception Descriptors**, and **Section 26.4.5.2, Setting Up Transmission Descriptors**.
DIE[3:0]	Descriptor Interrupt Enable 0000_B: Descriptor interrupt is disabled. 0001_B to 1111_B: The corresponding descriptor interrupt is generated (ETNBnDIS.DPFi).
—	Content Control For details, see **Section 26.4.4.2, Setting Up Reception Descriptors**, and **Section 26.4.5.2, Setting Up Transmission Descriptors**.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.
TS[79:0]	Timestamp Timestamp of the received frame (only available in extended descriptors)

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

The upper reserved bits of TS[79:0] are set to 0000_H after the time stamp is stored.

(3) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND) is shown below.

The allocation of bits in the arbitration descriptors for use in reception is the same as in frame data descriptors.

- Normal descriptor

Table 26.88 Contents of Hardware/Software Arbitration Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 12: FEMPTY 13: FEMPTY_IS 14: FEMPTY_IC 15: FEMPTY_ND For details, see **Table 26.86, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable 0000_B: Descriptor interrupt is disabled. 0001_B to 1111_B: The corresponding descriptor interrupt is generated (ETNBnDIS.DPFi).
—	Content Control For details, see **Section 26.4.4.2, Setting Up Reception Descriptors**, and **Section 26.4.5.2, Setting Up Transmission Descriptors**.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.
TS[79:0]	Timestamp Timestamp of the received frame (only available in extended descriptors)

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

When the descriptor is an extended descriptor, it has a 12-byte unused area.

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IS descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IC descriptor, the descriptor type (DT) and descriptor interrupt enable (DIE) are used.

In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

(4) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

- Normal descriptor

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
+0	DT[3:0]				DIE[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
+4	DPTR[31:0]																															

Table 26.89 Contents of Link Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 8: LINK 9: LINKFIX For details, see **Table 26.86, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable 0000_B: Descriptor interrupt is disabled. 0001_B to 1111_B: The corresponding descriptor interrupt is generated (ETNBnDIS.DPFi).
—	Content Control For details, see **Section 26.4.4.2, Setting Up Reception Descriptors**, and **Section 26.4.5.2, Setting Up Transmission Descriptors**.
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

When the descriptor is an extended descriptor, it has a 12-byte unused area.

(5) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
+0	DT[3:0]				DIE[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
+4	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 26.90 Contents of Other Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see **Table 26.86, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable 0000_B: Descriptor interrupt is disabled. 0001_B to 1111_B: The corresponding descriptor interrupt is generated (ETNBnDIS.DPFi).

CAUTION

When the descriptor is an extended descriptor, it has a 12-byte unused area.

(6) How to Use Frame Data Descriptors

The descriptor data area size field (DESCR.DS) can specify up to 2048 bytes of Ethernet frame data per data area. Settings higher than 2048 (bytes) cannot be made.

In general, Ethernet frames are not of uniform length. The AVB-DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Frames divided based on a frame data structure can also be supported.

To handle both frames divided up into multiple data areas and descriptors for complete single frames, four types (DESCR.DT) FSTART, FEND, FMID, and FSINGLE are defined.

Figure 26.19, Mapping of Frame Data shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the URAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

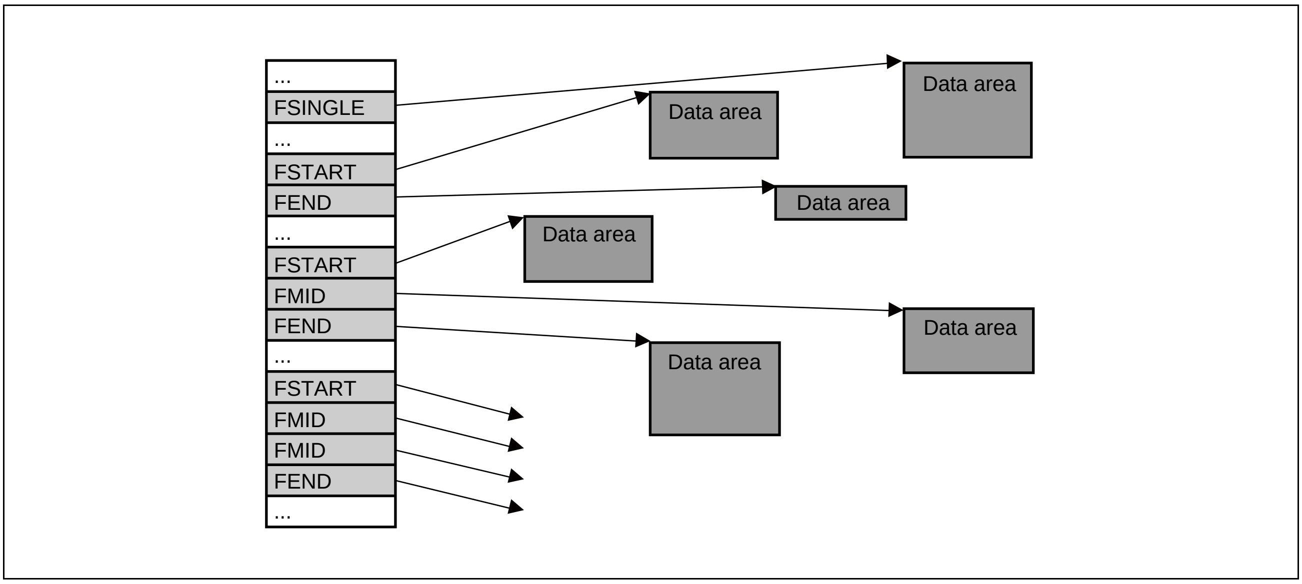

Figure 26.19 Mapping of Frame Data

For reception, set the descriptor data areas to the maximum size (i.e. give DESCR.DS its maximum value). The AVB-DMAC will store received frame data in the given area. If a received frame has more data than the maximum size, the AVB-DMAC will divide the data up.

For transmission, set the frame data size to the actual data size. The AVB-DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

A descriptor data area including unused space produces an empty space between frame data. In reception, an “incremental data area” can be used to prevent empty spaces. For incremental data areas, see **Section 26.4.4.3(2), Incremental Data Areas**.

As well as reducing the memory capacity taken up by the descriptor area in the URAM, division into frames can be used to identify different sections of data (e.g. for separating a header and data).

(7) How to Use Chain Control Descriptors

(a) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see **Section 26.4.3.2, Using Descriptor Chains in Queues**)

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). Take care, however, to check the current descriptor address register q (ETNBnCDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

(b) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQq) is cleared.

In reception, when the frame currently received is one divided for storage (e.g., received data whose frames are the FMID type or FEND type for storage), the data is not fully stored and the receive queue full interrupt (ETNBnRIS2.QFFr) is generated.

(8) How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are used to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

(a) FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission.

(b) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

(c) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used.

(9) Synchronization between Descriptor Access by Hardware and Software

In primary HW/SW synchronization, the descriptor type (DESCR.DT) allocated to the URAM is usable. This makes it possible to minimize access by the AVB-DMAC to the SFR via the CPU, leading to higher performance.

Basic concepts of synchronization:

- Descriptor sets are allocated so that it is exclusively used by hardware or software, depending on the direction of transmission (see **Table 26.86, Summary of Descriptor Types**).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type assigned to hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

26.4.3.7 Tips for Optimizing Performance in Handling Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the URAM.

They are not requirements, but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment (this does not apply to extended descriptors).
- While in operation mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Make an access to frame data in units of 128-byte blocks maximum.
- Design the descriptor chains in ways that minimize parallelism of processing.
  This helps in dividing the chains into segments allocated to different cache pages, and in arranging the different segments exclusively for access by software or hardware.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

26.4.4 Control in Reception

The point of the AVB-DMAC is to transfer data between the E-MAC and URAM without intervention by the CPU.

Create descriptors that define the amounts of frame data to be stored and the locations. After the E- MAC receives a frame, it stores the received frame data and the conditions of reception as the MAC state. If the descriptor is extended, the timestamp is also stored. For a description of how to set up descriptors for use in reception, see **Section 26.4.4.2, Setting Up Reception Descriptors**.

The AVB-DMAC filters received frames to separate them into various classifications (separation filtering). More specifically, this is done to separate received frames into the various reception queues and to set the priorities of different classes of received frames. For more on separation filtering, see **Section 26.4.4.1(1), Separation Filtering**.

Figure 26.20, Mechanism of General Reception Queue Selection shows the reception data bus and the selection of queues for use in reception.

Each frame received from the E-MAC is stored in the reception FIFO; in parallel with this, the frame is analyzed to identify its type and the target queue number. After the E-MAC completes reception, the target queue number is generated and stored in the reception FIFO. Appending of a reception flag depends on the storage of one frame among the reception queues in the URAM, and the unread frame counter (UFC) is also associated with frame storage.

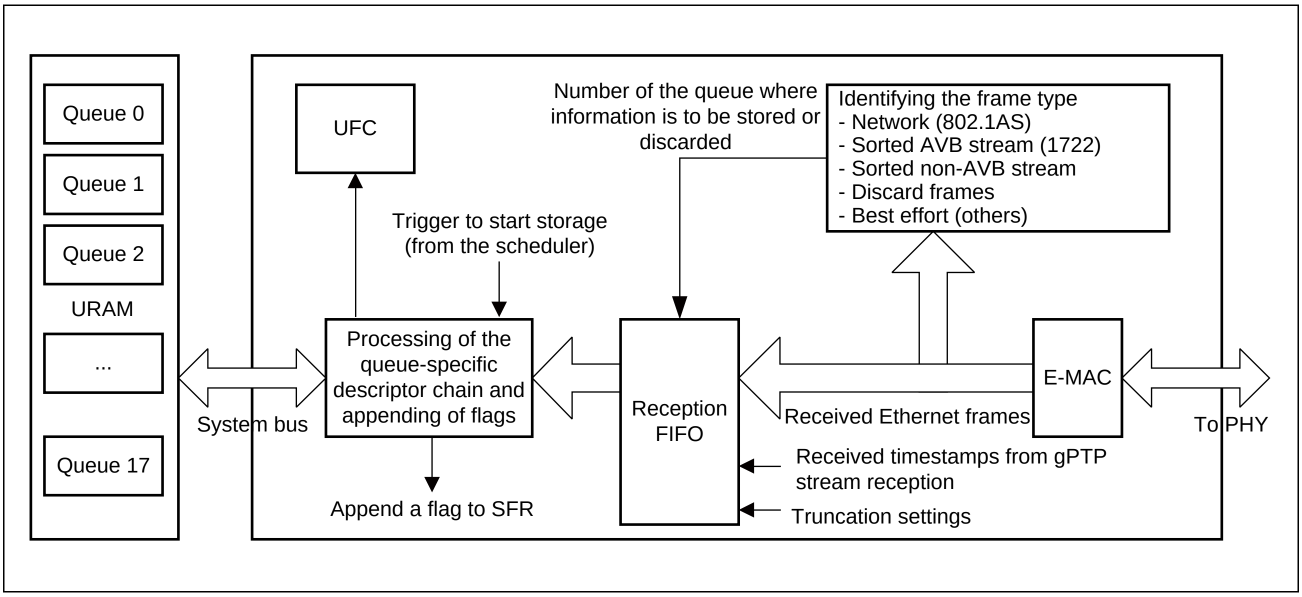

Figure 26.20 Mechanism of General Reception Queue Selection

26.4.4.1 Reception Queues

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the URAM.

There are two conditions for the AVB-DMAC to discard a received frame.

Detection of an Error During Reception by the E-MAC

- Whether error frames are discarded or stored in reception queue 0 (best effort) depends on the setting of the error frame enable bit in the receive configuration register (ETNBnRCR.EFFS). If error frames are to be stored (ETNBnRCR.EFFE = 1), they are always stored in queue 0 (best effort). In this case, characteristics specific to the queue (e.g. truncation) will vary. If the storage of timestamps for reception queue 0 (best effort) is enabled (the timestamp enable bit in the receive configuration register ETNBnRCR.ETS0 = 1), timestamps are stored even for error frames.
- The separation filter is unable to determine where the frame data should be stored.

Receive Frame Failure in the Separation Filter

- Whether discarding error frames or storing in reception queue 0 (best effort) depends on the stream filtering select bit (ETNBnRCR.ESF) in the receive configuration register.

The flowchart in **Figure 26.21, Mechanism of Reception Queue Selection** shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E- MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

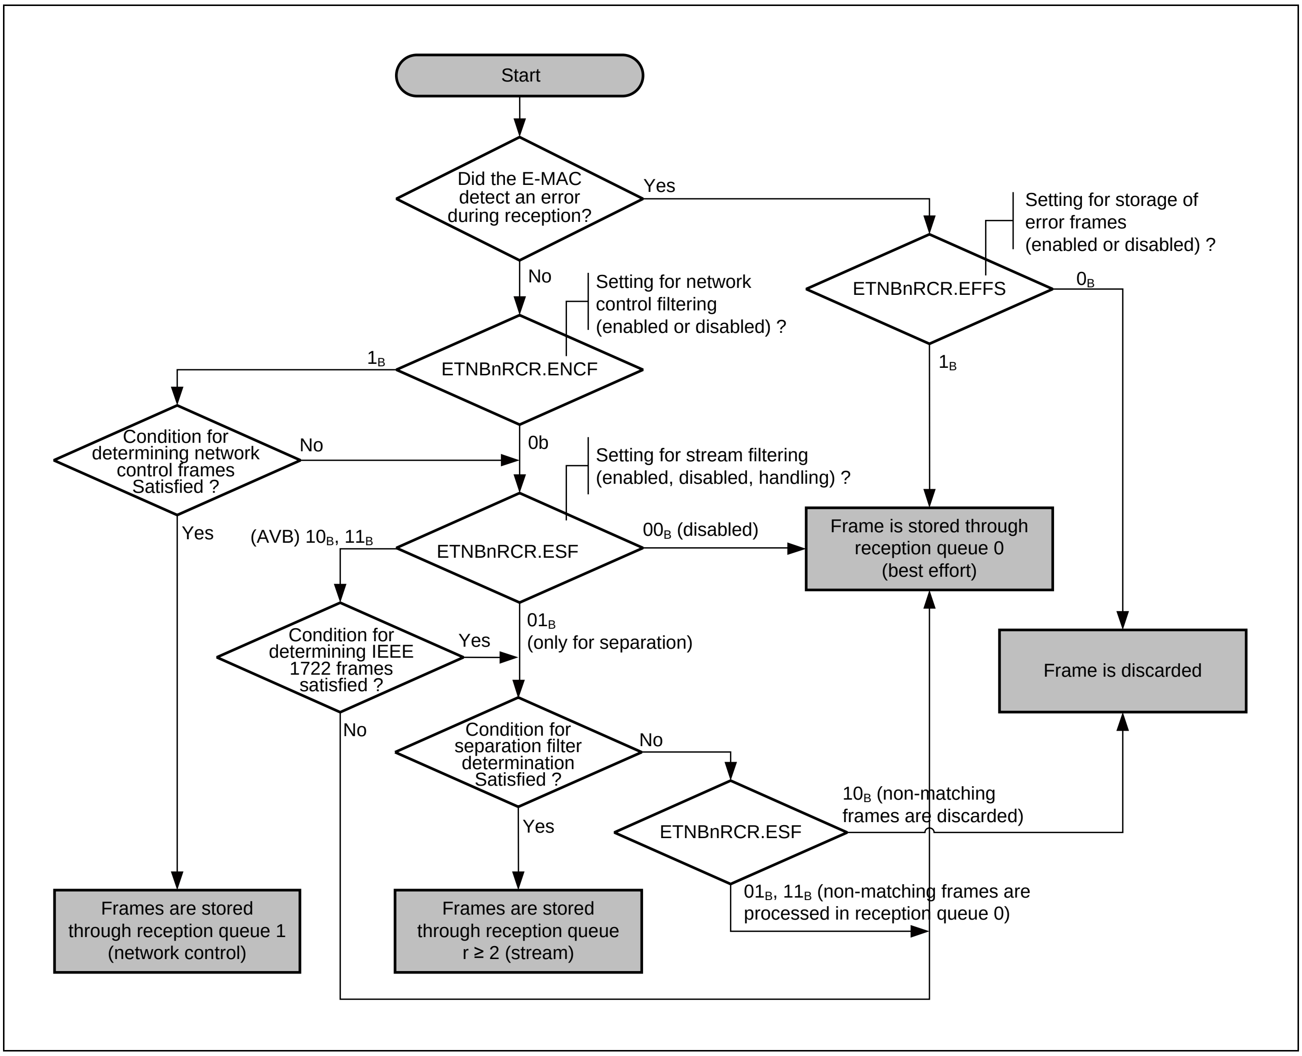

Figure 26.21 Mechanism of Reception Queue Selection

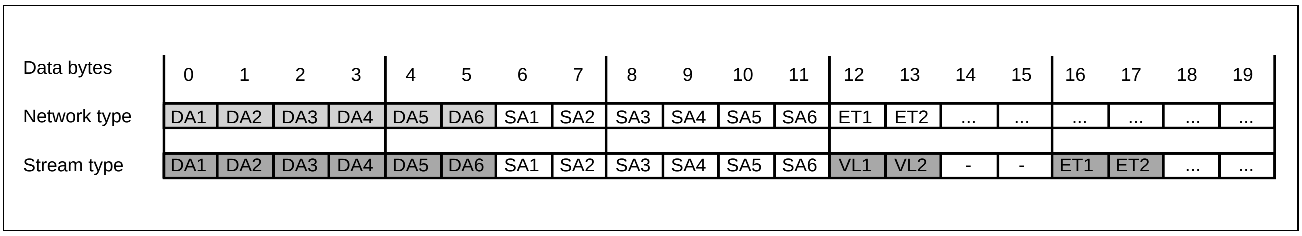
Notes on the Meanings of Entries in the Flowchart

- “Condition for determining network control frames”
  The Ethernet destination address (DA) is 01:80:C2:00:00:0E.
  The Ethernet type (ET) is 88:F7.
- “Condition for determining IEEE 1722 frames”
  The Ethernet destination address (DA) is within the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF.
  The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00. The Ethernet type (ET) is 22:F0.
- “Condition for separation filter determination”
  See **Section 26.4.4.1 (1), Separation Filtering**.

Figure 26.22, Data Bytes of Ethernet Frames Used in Classification shows the allocation of bits related to the network and stream types in Ethernet frames. The preambles of Ethernet frames are not taken into account.



Data bytes	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
Network type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	ET1	ET2	...	...	...	...	...	...
Stream type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	VL1	VL2	-	-	ET1	ET2	...	...

Figure 26.22 Data Bytes of Ethernet Frames Used in Classification

(1) Separation Filtering

Separation filtering involves the checking of up to 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (ETNBnSFO.FBP)), selects the part of frames to be used in separation filtering. There is also a common filter mask (separation filter mask configuration register i(ETNBnSFMi.CFM)), which limits the separation filter processing to a bit mask that can be set to the lower number of bytes or can be set appropriately.

Examples

To use one byte in separation, set separation filter mask configuration register 0 (ETNBnSFM0.CFM) to 0000 00FF$_H$ and separation filter mask configuration register 1 (ETNBnSFM1.CFM) to 0000 0000$_H$.

To use seven bytes in separation, set separation filter mask configuration register 0 (ETNBnSFM0.CFM) to FFFF FFFF$_H$ and separation filter mask configuration register 1 (ETNBnSFM1.CFM) to 00FF FFFF$_H$.

CAUTION

If bits at some positions are set to 0b in the separation mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to 0b. Only those bits in which the separation filter pattern configuration register i (ETNBnSFPi.FPs) setting is equal to the separation filter mask configuration register i (ETNBnSFMi.CFM) are sorted by matching with received data.

Figure 26.23, Separation Filtering shows separation filtering. The selected data from a received frame (Rx_Frame[63:0]) are masked by the common filter mask. As a result, the selected frame data can be obtained. This value is compared with all filter patterns. The separation filter circuit in the AVB-DMAC selects the filter pattern that matches the queue having the lowest index s or selects a flag to indicate that there is no matching separation pattern.

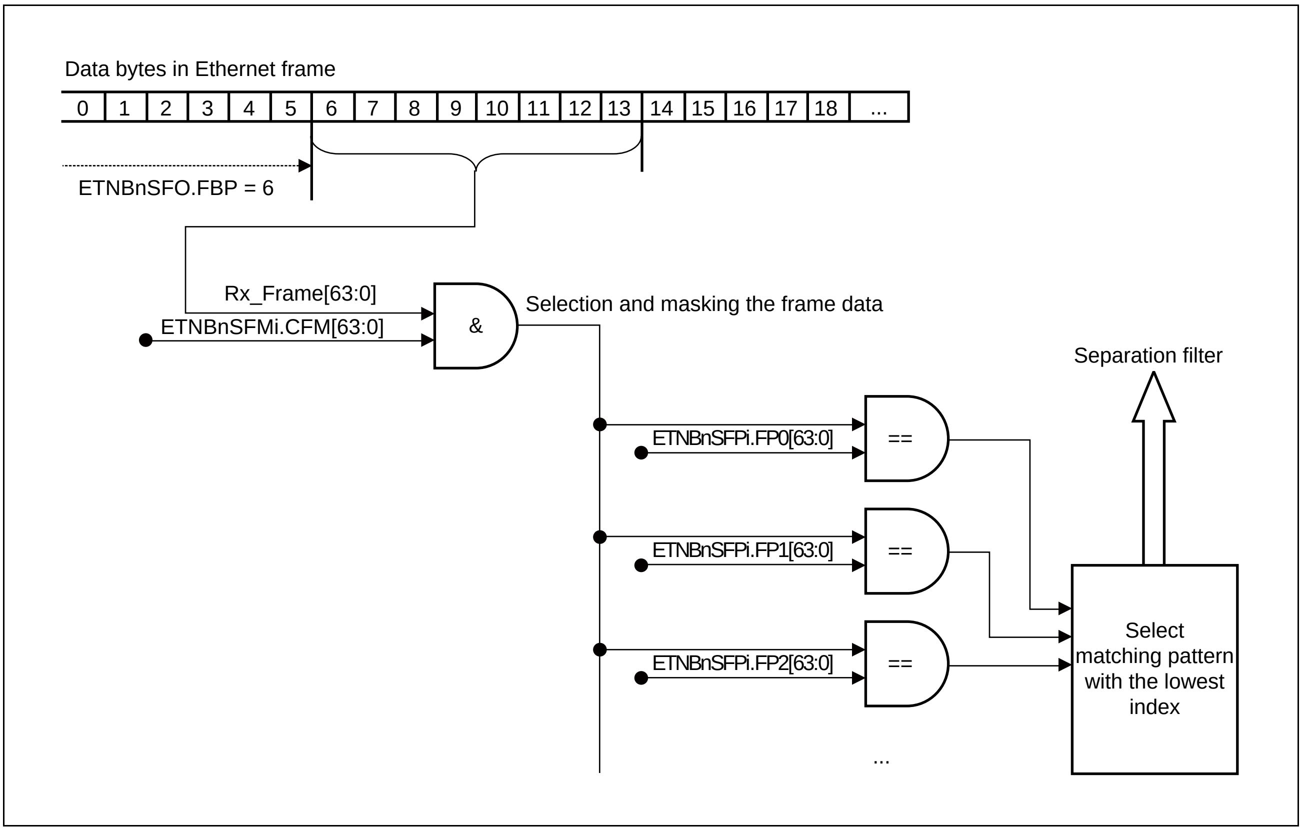


Figure 26.23 Separation Filtering

(2) Stream Separation

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of “Talker” and “Listener”. A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various A/V streams are identified by 8-byte stream IDs.

The number of end stations within an AVB network and their roles differ with the application.

The stream ID is a general pattern of the AVB network for identifying one stream. **Figure 26.24, IEEE 1722 Frame Layout and Stream ID** shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

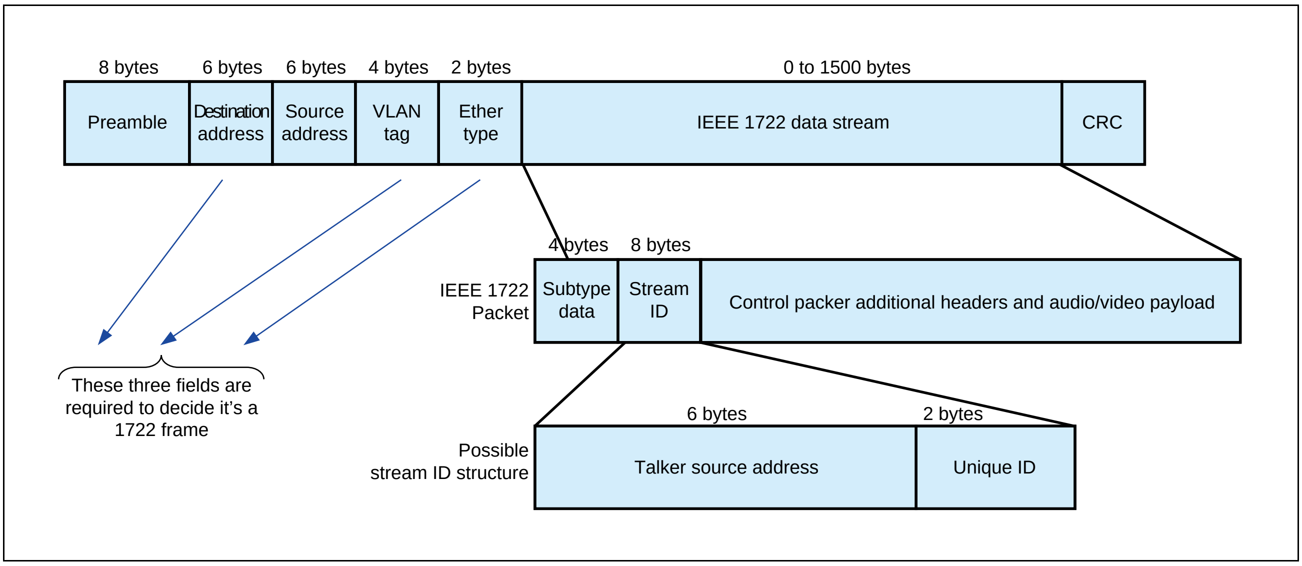

Figure 26.24 IEEE 1722 Frame Layout and Stream ID

The IEEE 1722 standard stipulates that the stream ID field starts from the 23rd byte (not counting the preamble). Accordingly, set the separation filter offset (ETNBnSFO.FBP) to 22 in operations on IEEE 1722 streams. Set the separation filter mask (ETNBnSFMi) and separation filter pattern (ETNBnSFPi) in accord with the specification of the product in which the chip is being used.

Example: In the example of a stream ID shown in **Figure 26.24, IEEE 1722 Frame Layout and Stream ID**, the current application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set ETNBnSFM0.CFM to FFFF $FFFF_H$ and ETNBnSFM1.CFM to FFFF $FFFF_H$.
- To divide streams from respective talkers into individual queues, set ETNBnSFM0.CFM to FFFF $FFFF_H$ and ETNBnSFM1.CFM to 0000 $FFFF_H$. This excludes the unique ID from the filter condition.

26.4.4.2 Setting Up Reception Descriptors

For reception, the descriptor mechanism is essentially as described in **Section 26.4.3, Descriptors**.

This section describes memory operations that are especially required in handling reception queues.

(1) Reception Descriptor Types

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 26.91, Descriptor Types in Reception shows the descriptor types used in reception.

Table 26.91 Descriptor Types in Reception

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	No data is stored in receive queues. The ETNBnRIS2.QFFr bit indicates that queue r is full and the received frame is not stored. This descriptor is used again for processing of the next reception, if any.	Not changed
Frame Middle (FMID)	Same as FSTART	Not changed
Frame End (FEND)	Same as FSTART	Not changed
Frame Single (FSINGLE)	Same as FSTART	Not changed
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	A stop point defined by software has been reached. A frame of this type within a divided frame (writing of FMID or FEND) stops the frame being stored and the frame is lost. ETNBnRIS2.QFFr indicates that the frame has been lost. If this happens at the start of a frame (writing of FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain.	EEMPTY
Frame Empty (FEMPTY)	The descriptor can be used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see **Section 26.4.4.3(1), Storing Frame Data in the Descriptor Data Area**.	FSTART, FMID, FEND, or FSINGLE
Frame Empty Incremental Start (FEMPTY_IS)	The descriptor can be used to store received data. All data for the frame are stored in the descriptor's data area. DESCR.DPTR indicates the base address of the incremental data area. For details, see **Section 26.4.4.3(2), Incremental Data Areas**.	FEND or FSINGLE
Frame Empty Incremental Continue (FEMPTY_IC)	The descriptor can be used to store received data. The remaining bytes of frame data are stored in the descriptor's data area. DESCR.DPTR is undefined, but is written back at the start position within the incremental data area after processing. For details, see **Section 26.4.4.3(2), Incremental Data Areas**.	FEND or FSINGLE
Frame Empty No Data storage (FEMPTY_ND)	The descriptor can be used to store received data. Up to DESCR.DS bytes are captured from the reception FIFO but not stored. After processing, DESCR.DS is written back as 0. For details, see **Section 26.4.4.3(1)(c), No Data are Stored**.	FSTART, FMID, FEND or FSINGLE
Link Empty (LEMPTY)	Same as FSTART	Not changed
EOS Empty (EEMPTY)	Same as FSTART	Not changed

(2) Configuration of Reception Frame Data Descriptors

Figure 26.25, Configuration of Descriptor for a Received Frame shows the configuration of descriptors for use with reception queues. The reception- specific fields are the same whether the descriptor is normal or extended. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TR) are described in **Table 26.92, Configuration of a Received Descriptor**.

For the other fields and the descriptor types, see **Section 26.4.3.6, Descriptor Type**.

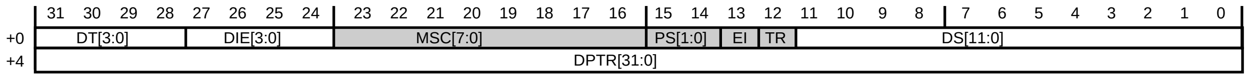

Figure 26.25 Configuration of Descriptor for a Received Frame

Table 26.92 Configuration of a Received Descriptor

Bit Name	Function
MSC	MAC Status Code These bits indicate errors in reception detected by the E-MAC. In the case of a divided frame, these bits are set to the same value within all descriptors for the frame data. Details of the bits are as follows. MSC[7]: Received frame has a multicast address. MSC[6]: Fixed to 0 MSC[5]: Fixed to 0 MSC[4]: Received frame has residual bits. MSC[3]: Received frame is too long*1 MSC[2]: Received frame is too short MSC[1]: Error in frame reception*2 MSC[0]: Received frame has a CRC error.
PS	Padding Selection These bits specify whether frame data are to be padded when stored in the incremental data area. Insertion of padding data is in accord with the settings in the ETNBnRPC register. 00_B: Padding is not to be inserted. 01_B: Padding data may be inserted. This depends on the ETNBnRPC settings. Other settings are prohibited.
EI	Error Indication This bit indicates the detection of an error in frame data while a frame was being stored. The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, storage of the frame is aborted. 0: No error 1: Error is detected
TR	Truncation Indication This bit will be set if received data is more than 4092 bytes, and received data will be truncate to 4092 bytes. These bits are set to the same value within all frame data descriptors for a divided frame. 0: Data have not been truncated. 1: Data have been truncated.

Note 1. “Received frame is too long” is set when MAC receive the frame that length is more than ETNBnRFLR configuration value.

Note 2. “Error in frame reception” is set when MAC detect AVB_RX_DV = 1 and AVB_RX_ER = 1 while reception.

CAUTION

The ETNBnRCR.EFFS bit specifies whether or not frames with errors detected by the E-MAC are to be stored in the URAM. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

26.4.4.3 Reception Processing

After initialization, the AVB-DMAC becomes able to select a proper reception queue and store it in the descriptor data area in the URAM. Received data is stored into the URAM as long as the descriptor data area capacity suffices.

Received frames are classified and stored in the reception FIFO in accord with the algorithm described in **Section 26.4.4.1(1), Separation Filtering**. The frames are sorted, truncated, or discarded by the separation filter on reception by the MAC before stored in the reception FIFO. The following data are stored in the reception FIFO.

- MAC status of received frames
- Length of received frames
- Timestamp of received frames
- Target reception queue
- Received frame data

If the reception FIFO contains even one frame, the scheduler executes storing in the reception queue (see **Section 26.4.2.2, Scheduling Reception and Transmission**).

If there is even one empty data descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor or the UFC stop level has been reached) are discarded from the reception FIFO. This ensures that one queue being full does not prevent the storage of data in the other queues.

(1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
  - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data to be stored in the descriptor data area arrive in divided form.
  - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the AVB-DMAC in the last step of descriptor processing, so software can always access the descriptor assigned to DESCR.DT.

When normal synchronization mode is used, the CPU can write FEMPTYxxx directly to the descriptor type field after processing the stored element. Do not change the descriptor or any part of the descriptor data area after FEMPTYxxx is written to DESCR.DT.

(a) Storing Frame Data for a Whole Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FEMPTY or FEMPTY_ND descriptor is stored in place of the FSINGLE descriptor after processing.

Also, the FEMPTY_IS and FEMPTY_IC descriptors, which always hold the full frame data for the reception FIFO, are stored in place of the FSINGLE descriptor after processing.

(b) Storing Frame Data as Divided Frames

Divided frames are handled in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI and DESCR.TS are only valid in the last descriptor of the sequence for a divided frame.

CAUTION

If the data area size setting in DESCR.DS is not a multiple of four, the number of bytes set in DESCR.DS is fetched from the reception FIFO and the remaining bytes are used as the next storage area.

After a received frame is divided into different descriptors, handle each storage element separately, and allocate the descriptor type, intending software, after processing.

Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame to the next trigger point.

(c) No Data are Stored

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor for that part so that it is not stored in the URAM. Not storing the data negates the need for bandwidth on the data bus, improving the overall performance.

When an FEMPTY_ND descriptor is processed, DESCR.DS is set to 0. This brings the frame data section of the descriptor into agreement with the FEMPTY type. DESCR.DS = 0 is for the unique identification of the descriptor after writing.

(2) Incremental Data Areas

Secure space in the URAM for storing received data. Even when data are placed in the URAM area such that all descriptor data areas of a chain are contiguous, a received frame being shorter than the descriptor data area will lead to an empty space. **Figure 26.26, A Reception Queue Using Individual Descriptor Data Areas** shows an example of settings and the memory map.

Certain applications require that data areas be contiguous (e.g. when received data are to be processed other than by hardware as A/V codec modules). When the length of received frames differs (e.g. when payloads vary between having one or two A/V packages), the use of a static pointer in the descriptor produces empty spaces in the data area. This may necessitate direct additional processing to remove the empty spaces.

Accordingly, and to reduce the CPU load imposed by copying data, the AVB-DMAC supports an “incremental data area” function.

When incremental data areas are in use, all descriptors use a common data area for storage. One descriptor (FEMPTY_IS) defines the base address of the incremental data area and the next descriptor (FEMPTY_IC) in the descriptor chain to store receive data. **Figure 26.27, Reception Queue Using a Common Incremental Data Area** shows an example of settings and the memory map.

Use of an incremental data area does not reduce the memory space in the individual descriptor data areas.

The hardware and software synchronization strategy and performance are also not changed.

It is also possible to divide a frame up among various descriptors in a way that reflects its structure (e.g. one descriptor for the Ethernet header and one for the data payload).

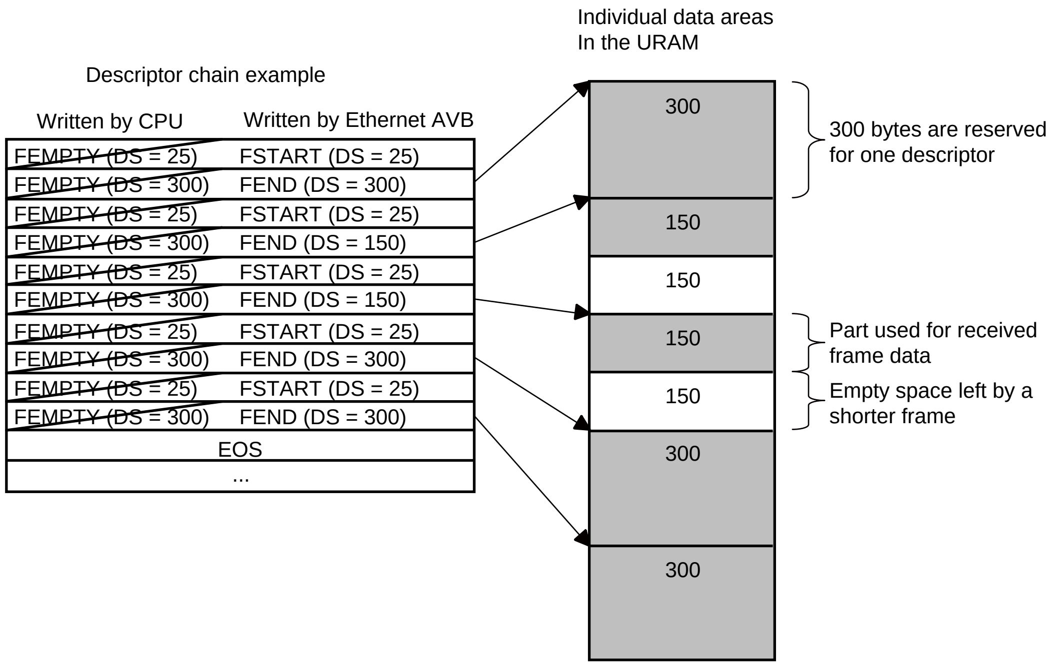

Figure 26.26 A Reception Queue Using Individual Descriptor Data Areas

Figure 26.26, A Reception Queue Using Individual Descriptor Data Areas and **Figure 26.27, Reception Queue Using a Common Incremental Data Area** show how control of the data storage areas by a descriptor chain varies according to whether individual or incremental data areas are in use. The chains are configured for storing received frames consisting of a 25-byte header ((which is treated as one descriptor outside of the range of this example) and a 150- or 300-byte payload (whether one or two 150-byte payload packages are transmitted with one Ethernet frame depends on the data source).

In **Figure 26.26, A Reception Queue Using Individual Descriptor Data Areas**, the EOS descriptor is added as an example of a re-synchronization point. If the frame source transmits a frame containing more than 325 bytes, the frame will be divided among three descriptors, meaning that synchronization of the header and data sequences is lost. Despite this, however, the frame is not divided across the EOS descriptor, so even if the synchronization is off before EOS, AVB-DMAC handles the next descriptor chain as normal. The EOS is not required because the incremental descriptor always stores all data being processed while an incremental data area is in use.

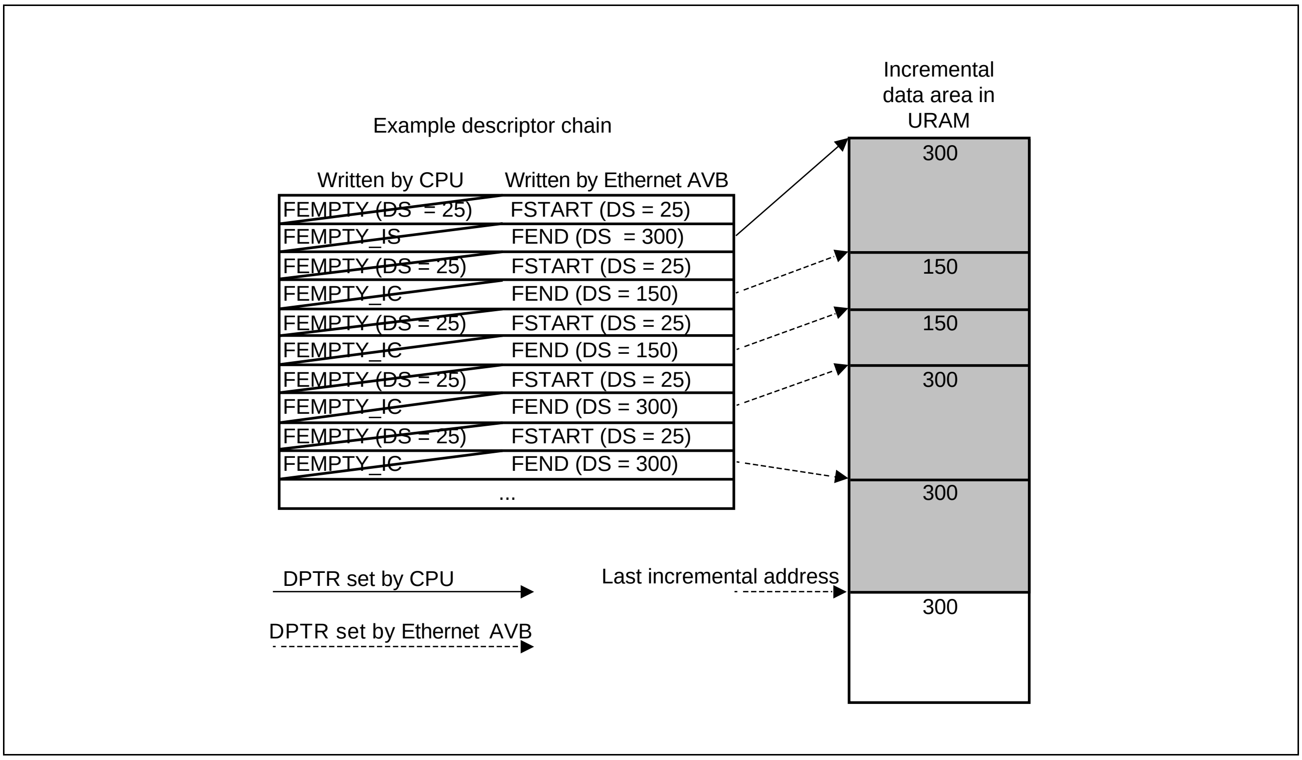

Figure 26.27 Reception Queue Using a Common Incremental Data Area

As **Figure 26.27, Reception Queue Using a Common Incremental Data Area** shows, when data are stored in an incremental data area, the descriptor pointers in the FEMPTY_IC descriptors (DESCR.DPTR) are updated. Accordingly, the resulting FEND or FSINGLE descriptor is in the same format as after writing to an FEMPTY descriptor.

Software captures received data from an incremental data area that has no empty storage areas between frame data. All empty spaces are allocated to the end of the incremental data areas. Incremental data areas are limited to multiples of four bytes. When the amount of data for storage in an incremental data area is not a multiple of four bytes, from one to three bytes of empty space will be produced.
DESCR.DS can be read to check for such empty spaces.

It is not possible to directly control the amount of received data to be stored from the incremental descriptor (FEMPTY_IS, FEMPTY_IC) because other descriptors (FEMPTY and FEMPTY_ND) are also applicable with DESCR.DS. All received data in the chain are always stored in an incremental descriptor.

(a) Setting Up an Incremental Data Area

A descriptor chain in the incremental data area having N descriptors (one FEMPTY_IS and N-1 FEMPTY_IC) means that a storage area for the maximum of N times the capacity must be prepared.

As **Figure 26.27, Reception Queue Using a Common Incremental Data Area** shows, DESCR.DPTR of an FEMPTY_IS descriptor indicates the base address of the incremental data area. The DPTR in FEMPTY_IC descriptor indicates the address of next store data.

(b) Processing an Incremental Data Area Based on Descriptors

Since data processing by the CPU is the same regardless of how the AVB-DMAC stores the data, data stored in an incremental data area do not require any special handling.

(c) Padding

Use padding for received frame data that are not aligned correctly in the specified memory structure. Padding can be set individually for each descriptor. Accordingly, in the reception of divided frames, padding can be restricted to only those frames that require it (e.g. A/V payload data.)

Padding can also be used to optimize system performance in an incremental data area (e.g. to prevent inefficient access by aligning received data with 32-byte boundaries in the incremental data area), as well as to fulfill application-specific requirements for specified memory structures (e.g. formats required by other modules that will be processing the received data).

Padding can only be used in an incremental data area. The value 0000 0000_H is always used in padding.

Padding is the addition of the number of words (from one to seven 32-bit words) set in the stored padding counter in the receive padding configuration register (ETNBnRPC.PCNT). This padding is repeatedly inserted in accord with the value in the stored data counter (ETNBnRPC.DCN) (from one to 255 32-bit words). When the stored data counter (ETNBnRPC.DCNT) reaches 0, however, padding is not repeated.

The first word of padding is always inserted at the position specified by DESCR.DPTR. When divided frames are in use, a padding word can be inserted at any byte position, and padding is handled on a 32- bit basis (e.g. an incremental data area where the first descriptor is for a 42-byte header data and the second descriptor holds padded payload data).

The next figure shows a general example of how padding is inserted and an example of setting up padding. A indicates frame data A received from the E-MAC, while B indicates frame data already stored in the descriptor data area (32-bit word units).

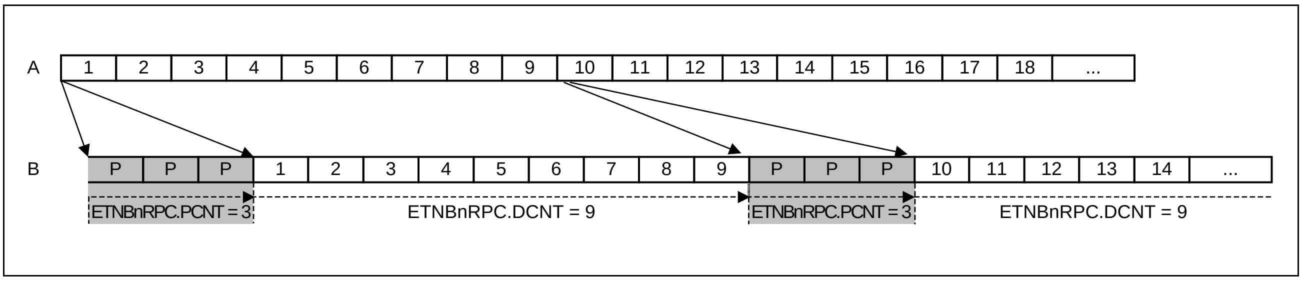

Figure 26.28 Example of a Padding Setting

Both padding and received frame data are counted in the descriptor size (DESCR.DS).

(3) Mode with Write-Back

Constructing a descriptor chain requires software (see **Figure 26.29, Flow of Reception Descriptor Processing (with Write-Back)**).

In the example in the figure, the variable SWdescr (software descriptor pointer) is a structure to identify a descriptor being processed. SWdescr must be initialized after operation mode is entered and a descriptor base address load request (ETNBnDLR.LBAq) is executed (condition for starting the flow of software operations).

The frame_processing() function processes the stored data. The function can use SWdescr.DT to check whether processing of a frame is completed. How frame data are processed differs with the application, so create functions that handle processing in accord with the specification.

The processing section is common to all modes of reception. The number of frames processed in response to each trigger can be restricted. When multiple frames have to be processed in a batch, waiting for individual trigger boxes must be skipped for these frames.

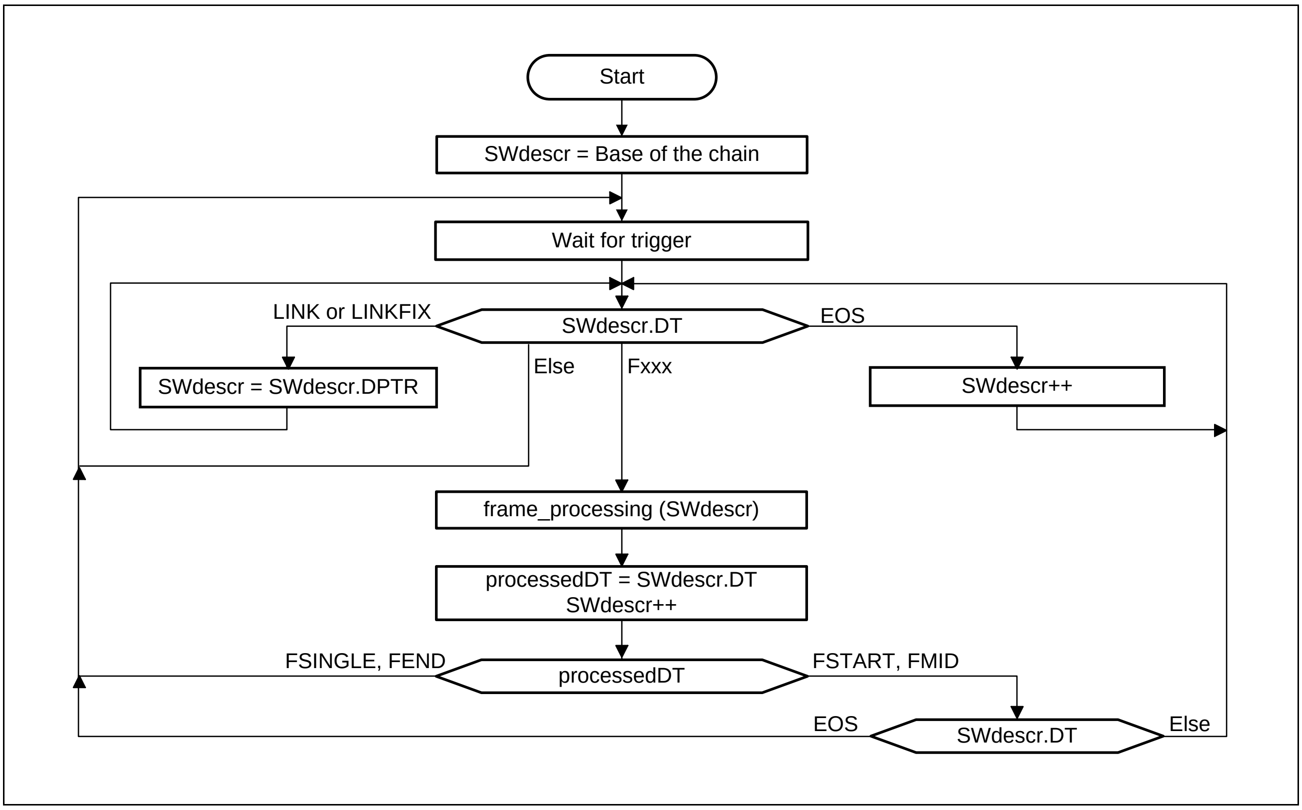

Figure 26.29 Flow of Reception Descriptor Processing (with Write-Back)

(4) Support for Reception Timestamps

Capturing reception timestamps is essential for IEEE 802.1AS time synchronization. Other types of received frames may also require that a reception timestamp be appended; this depends on the application. The AVB-DMAC supports reception timestamps based on the gPTP timer by storing timestamps that have been captured when the frame delimiter (SDF) for a received frame starts in the last frame data descriptor (FEND or FSINGLE). For the gPTP timer, see **Section 26.4.7.1, gPTP Timer**.

When timestamps are to be stored, use extended descriptors for the entire reception queue. Furthermore, timestamps are always stored for reception queue 1 (Network Control). Timestamps for reception queue 0 (best effort) and reception queue r ($r \geq 2$; for stream data) can be selected by the timestamp enable bits in the receive configuration register (ETNBnRCR.ETS0 or ETNBnRCR.ETS2).

26.4.4.4 Unread Frame Counters

Each reception queue has an unread frame counter (ETNBnUFCVi). Use the unread frame counter configuration bits in the receive queue configuration register (ETNBnRQCi.UFCCr) to select from among the four stop levels for each unread frame counter. The 0 setting disables the stop functions. For how to set this up, see **Figure 26.30, Overview of an Unread Frame Counter**.

Operations of the AVB-DMAC (hardware) and CPU (software) drive an unread frame counter (UFC) in the following ways.

- The hardware indicates that it has added a new frame to the descriptor chain for the queue (this increments the counter).
- Software indicates how many frames from the descriptor chain it has processed by writing to the corresponding bits of the unread frame counter decrement register for the queue (this decrements the register by the number written).

The unread frame counter is based on the number of frames stored in the URAM and is only incremented by one even when a received frame is divided into different descriptors. Failure in storing a descriptor chain requires care because this may unread frame counter may fail in synchronization as described in **Section 26.4.4.4(1), Unread Frame (UFC) Synchronization Failure**.

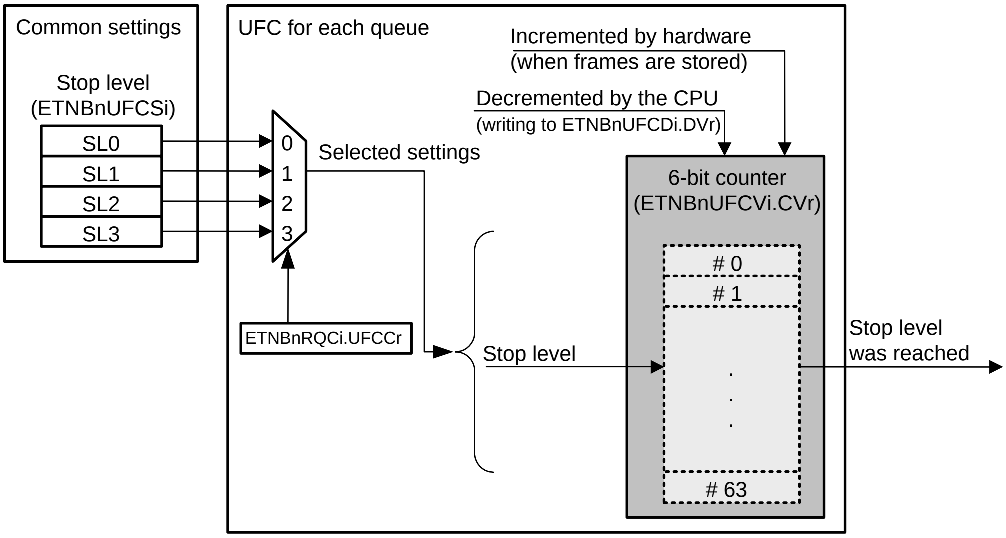

Figure 26.30 Overview of an Unread Frame Counter

Unless synchronization of hardware and software is not established, the current unread frame counter value (ETNBnUFCVi.CVr) indicates the number of unread frames in the queue.

The indicator that the stop level has been reached prevents the storage of further received frames in the descriptor chain. Selecting 0 as the stop level disables this function. Otherwise, further received frames for the queue are discarded once its unread frame counter reaches the stop level. When the unread frame counter stop function activates, the receive queue full interrupt flag in the receive interrupt status register 2 (ETNBnRIS2.QFFr) is set.

Set the unread frame counter stop level configuration register (ETNBnUFCS) for each reception queue that will use the unread frame counter function while the current operating mode is configuration mode.

(1) Unread Frame (UFC) Synchronization Failure

The unread frame counters do not recognize failure to store a frame in the URAM. In other words, the AVB-DMAC increments the counter for a queue each time it captures a frame for that queue from the reception FIFO whether or not it succeeds in storing the frame normally in the descriptor chain.

In general, synchronization of hardware and software fails under the following conditions.

- An unread frame counter reaching its maximum value

  When the value of a counter in an unread frame counter register i (ETNBnUFCVi) (i = 0 to 4) reaches 63, synchronization can fail.
  The CPU can only judge that a failure in synchronization has not occurred when the stop level is set to 63.

- A queue not having enough space for a descriptor or the associated data

  In this case, the corresponding receive queue full interrupt flag (ETNBnRIS2.QFFr) in receive interrupt status register 2 is set.
  If an unread frame counter reaches its stop level write-back mode (ETNBnRQCi.RSM[1:0] = 00_B), the receive queue full interrupt flag (ETNBnRIS2.QFFr) in the receive interrupt status register 2 is set. Software must respond to this.

- A problem occurring during access to memory

  The unread frame counter may set flags to frames over the number of frames actually usable for a descriptor chain, and consequently, it causes synchronization to fail. To retrieve the correct starting point for operations, use the descriptor base address load request (ETNBnDLR.LBAq) for the given queue.

26.4.5 Transmission Control

Areas in the URAM for storing transmission descriptors must also be secured (for descriptors, see **Section 26.4.3, Descriptors**).

The AVB-DMAC fetches data from the URAM in accord with the procedure the descriptor describes. Descriptors are retaining information about tags of transmit frames, too. The tag information is used to maintain the relationships between state information and timestamps for the software and the AVB- DMAC. After completion of transmission of frames, information about the statuses and timestamps of transmitted frames are accessible.

26.4.5.1 Transmission Modes

The AVB-DMAC has two modes of transmission.

- AVB transmission mode

  Selection of the transmit configuration register transmission queue priority (ETNBnTGC.TQP[1:0] bits set to 01_B or 11_B).

- Non-AVB transmission mode

  Selection of the transmit configuration register transmission queue priority (ETNBnTGC.TQP[1:0] bits set to 00_B).

(1) AVB Transmission Mode

AVB transmission supports the control of traffic through the output port to implement various traffic classes.

(a) Support for Traffic Classes and Associated Priority

When transmission is in AVB transmission mode, streams of traffic are transmitted in accord with the part of the AVB specification called Forwarding and Queuing for Time Sensitive Streams (FQTSS; for details on this, see the IEEE 802.1Q standard).

In the AVB specification, at least one queue for a reserving stream under the Stream Reservation Protocol (SR stream) and at least one queue for a non-SR stream are present, and high-priority queues are reserved for SRP traffic.

The AVB-DMAC supports four traffic classes: SR Class A, SR Class B, Network Control (NC) traffic (gPTP frames), and best effort (BE) traffic. Allocating a specific queue to Network Control (NC) frames ensures the control of synchronization.

The AVB-DMAC realizes compliance with the AVB standards by handling queues with the following architecture (in terms of traffic classes).

- Four transmission queues (Q3, Q2, Q1, and Q0) are available.
- Q3 and Q2 are for SR streams (one each for Class A and Class B).
- Q1 is for low-bandwidth Network Control (NC) traffic (gPTP frames)
- Q0 is for other types of traffic (MSRPDU*[1], MVRPDU*[2], best effort (BE), etc.)

Note 1. MSRPDU: Multiple Stream Registration Protocol Data Unit
Note 2. MVRPDU: Multiple VLAN Registration Protocol Data Unit

Fetching from queues proceeds in order of priority of the above traffic types. Three systems of priority are available through the setting of the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP[1:0]). In the default priority scheme, which is called AVB mode 1 (selected by ETNBnTGC.TQP[1:0] = 01_B), operation of the AVB-DMAC is fully in accord with the AVB specification. AVB mode 2 (transmit queue priority bits (ETNBnTGC.TQP[1:0] = 11_B) is an alternative priority scheme and varies from the AVB specification. Using this scheme thus requires more care. The other setting (ETNBnTGC.TQP[1:0] = 00_B) is for non-AVB-mode transmission.

Table 26.93 Default and Alternative Priority Orders in AVB Transmission Mode

Priority Schemes (AVB Mode)	Priority Order of Queues
AVB mode 1 (Default)	Q3 (SR Class A) > Q2 (SR Class B) > Q1 (NC) > Q0 (BE)
AVB mode 2 (Alternative)	Q1 (NC) > Q3 (SR Class A) > Q2 (SR Class B) > Q0 (BE)

(b) Transmission Selecting Algorithm and CBS

The algorithm the AVB-DMAC applies to select frames for transmission is in accord with the specifications under *Section 8.6.8, Transmission selection, of the IEEE 802.1Q standard*. For AVB mode, the CBS (credit-based shaping) algorithm is applied to the Class A and Class B SR queues (Q3 and Q2). Use of the CBS enables correct handling of the priorities of transmission from the SR queues.
For the CBS algorithm, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

When all the following conditions are determined as True, an SR queue (Q3 or Q2) is selected and transmitted at the specified time.

- The queue contains at least one frame ready for transmission.
- The queue has available credit.
- Unless an SR queue satisfies the above conditions, a higher priority queue is not present (not ready for transmission).

A non-SR queue (Q1 or Q0) is selected if the conditions below both hold.

- The queue contains at least one frame ready for transmission.
- As well as the above condition, a higher priority queue is not present (not ready for transmission).

Figure 26.31, Flow of Selection for Transmission in AVB Mode 1 (Default) and **Figure 26.32, Flow of Selection for Transmission in AVB Mode 2 (Alternative)** are flowcharts of selection for transmission in AVB mode 1 (default) and AVB mode 2 (alternative).

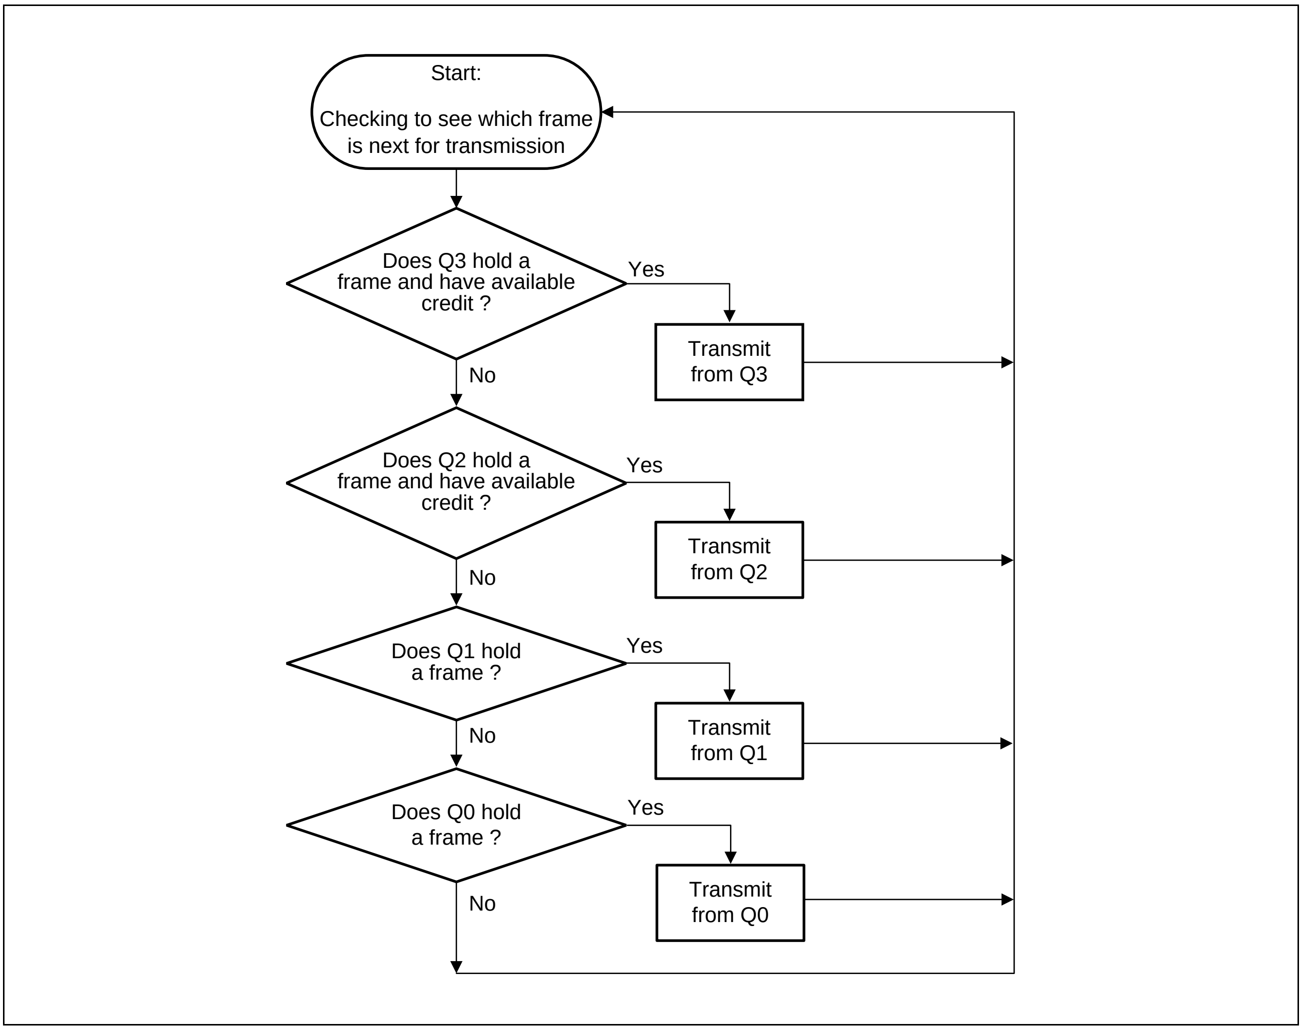

Figure 26.31 Flow of Selection for Transmission in AVB Mode 1 (Default)

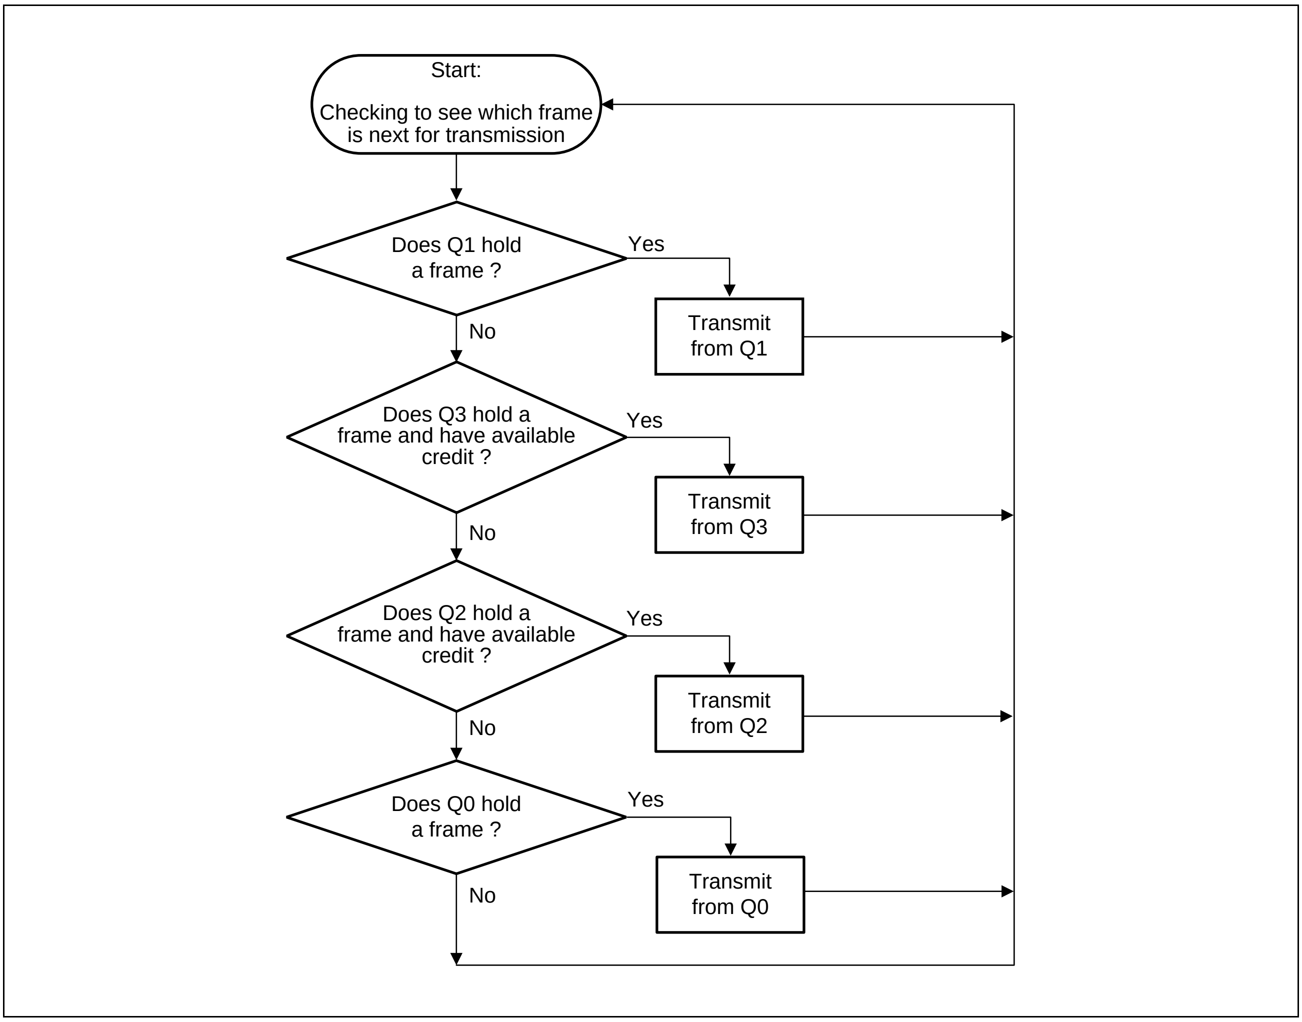

Figure 26.32 Flow of Selection for Transmission in AVB Mode 2 (Alternative)

(2) Non-AVB Transmission Mode

In non-AVB transmission mode, an absolute priority scheme is used. The SR Class is not supported and the CBS algorithm is not used.

In non-AVB transmission mode (when the transmit queue priority bits in the transmit configuration register (ETNBnTGC.TQP[1:0]) are 00_B), data is fetched for transmission in a strict order of priority (Q3 > Q2 > Q1 > Q0).

Figure 26.33, Flow of Selection for Transmission in Non-AVB Mode shows the flow of selection in non-AVB transmission mode.

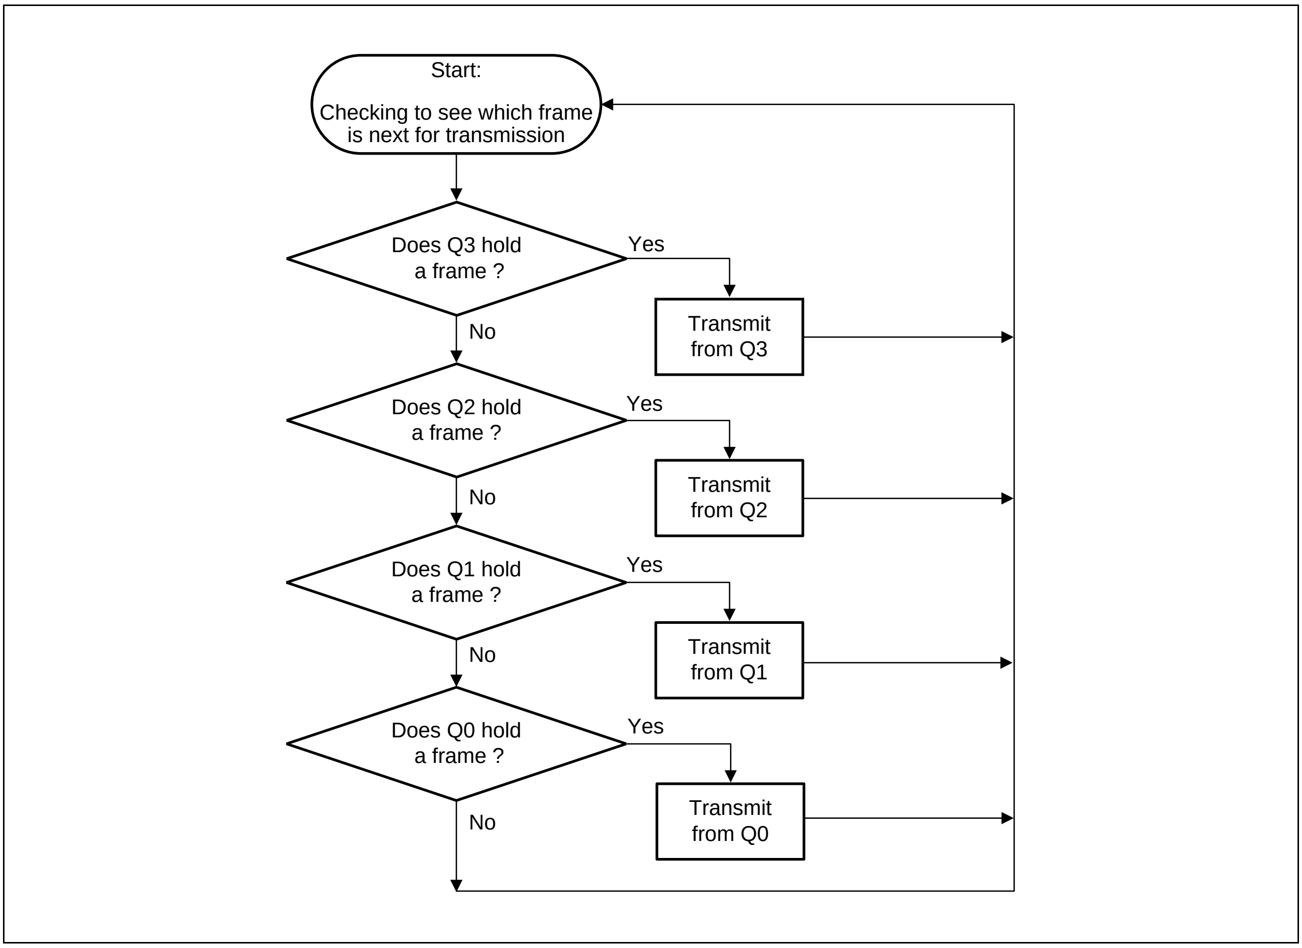

Figure 26.33 Flow of Selection for Transmission in Non-AVB Mode

(3) Setting the Size of the Transmission FIFO

The transmission FIFO is made up of 124 clusters. Each cluster can hold up to 128 bytes.

The size of the part of the transmission FIFO for use by each of the four transmission queues can be set by the corresponding transmit queue configuration t bits in the transmit control register (ETNBnTGC.TBDt). The maximum number of clusters required can be determined from the maximum length of frames for transmission from the queue t.

General Usage Examples:

Q0: Frames containing up to 1500 bytes → 1500/128 = 11.7 → 12 clusters

Q1: Frames containing up to 1024 bytes → 1024/128 = 8.0 → 8 clusters

Q3: Frames containing up to 1996 bytes → 1996/128 = 15.6 → 16 clusters

Q4: Frames containing up to 1996 bytes → 1996/128 = 15.6 → 16 clusters

When the depth of all transmission queues is 2, the following number of clusters is required.
$2 \times (12 + 8 + 16 + 16) + 16 = 2 \times 52 + 16 = 120$

26.4.5.2 Setting Up Transmission Descriptors

(1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 26.94, Descriptor Types in Transmission shows the descriptor types used in transmission.

Table 26.94 Descriptor Types in Transmission

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	The AVB-DMAC fetches the first of the data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame Middle (FMID)	The AVB-DMAC fetches the second or subsequent data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame End (FEND)	The AVB-DMAC fetches the last of the data for the divided frame. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to processing of the next descriptor.	FEMPTY
Frame Single (FSINGLE)	The AVB-DMAC fetches the frame of data. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to processing of the next descriptor.	FEMPTY
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	This is a transmission stop point defined by software This leads to clearing of the transmit start request bit (ETNBnTCCR.TSRQt), which stops transmission. When the ETNBnTCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor.	EEMPTY
Frame Empty (FEMPTY)	No frame data are ready for transmission This leads to clearing of the transmit start request bit (ETNBnTCCR.TSRQt), which stops transmission. When the ETNBnTCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing starts at this descriptor.	Not changed
Link Empty (LEMPTY)	Same as FEMPTY	Not changed
EOS Empty (EEMPTY)	Same as FEMPTY	Not changed

(2) Configuration of Transmission Frame Data Descriptors

Figure 26.34, Configuration of Descriptor for a Transmitted Frame shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.TSR, and DESCR.TAG) are described in **Table 26.95, Configuration of a Transmission Descriptor**.

For the other fields and the descriptor types, see **Section 26.4.3.6, Descriptor Type**.

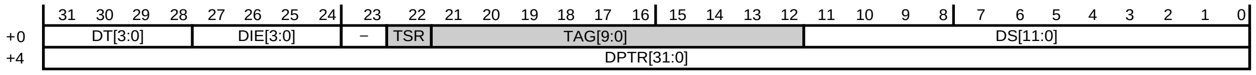

Figure 26.34 Configuration of Descriptor for a Transmitted Frame

Table 26.95 Configuration of a Transmission Descriptor

Bit Name	Function
TSR	Timestamp Store Request This bit specifies whether the transmission timestamp is to be stored within the EthernetAVB module. 0: The timestamp FIFO within the EthernetAVB module does not retain a transmission timestamp. 1: The timestamp FIFO within the EthernetAVB module retains a transmission timestamp. Only control this bit while the current DESCR.DT is FEND or FSINGLE.
TAG	Frame Tag This TAG field is used to associate each frame data with a timestamp. Frame TAG is not required but is recommended. Only control this bit while the current DESCR.DT is FEND or FSINGLE.

For the timestamp FIFO function, see **Section 26.4.5.4, Timestamping in Transmission**.

26.4.5.3 Transmission

(1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) starts the transfer of frames to the corresponding transmission queue.

The descriptor to the current descriptor address of the queue (ETNBnCDARq.CDA) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the AVB-DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in **Section 26.4.3, Descriptors**).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue that is currently being processed in the descriptor base address load request register, ETNBnDLR), processing proceeds to the new descriptor chain. Changing the chain does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 26.35, Descriptor Processing During Transmission shows descriptor processing during transmission.

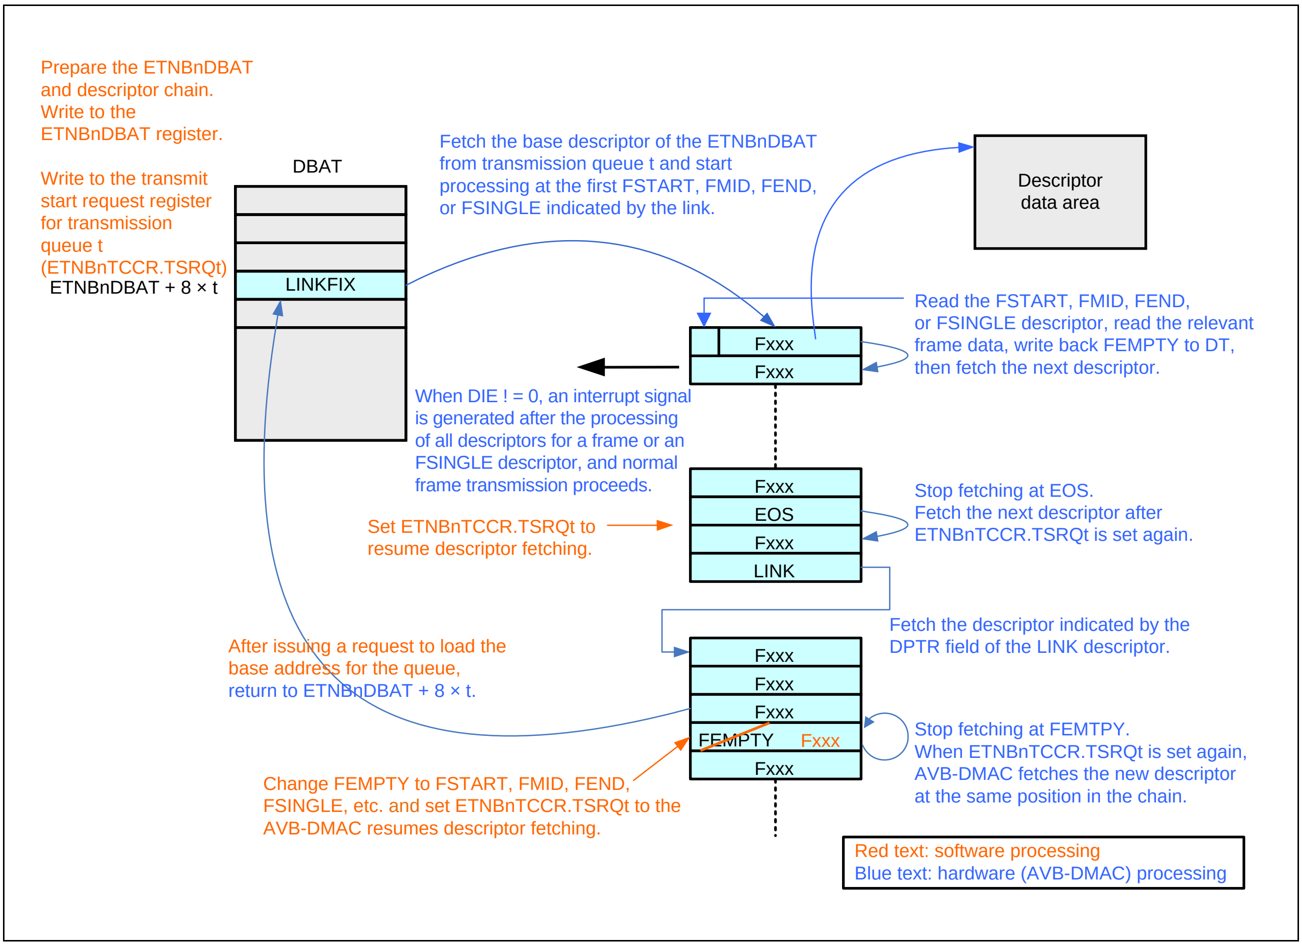

Figure 26.35 Descriptor Processing During Transmission

(2) Examples of Descriptor Usage

(a) Immediate Frame Transmission

Immediate frame transmission is a pattern in which fetching by the AVB-DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as HW/SW synchronization stop points.
Create descriptor chains that have FEMTPY descriptors at the stop points.

Figure 26.36, Software Flow for Immediate Frame Transmission shows the flow for software implementing this pattern.

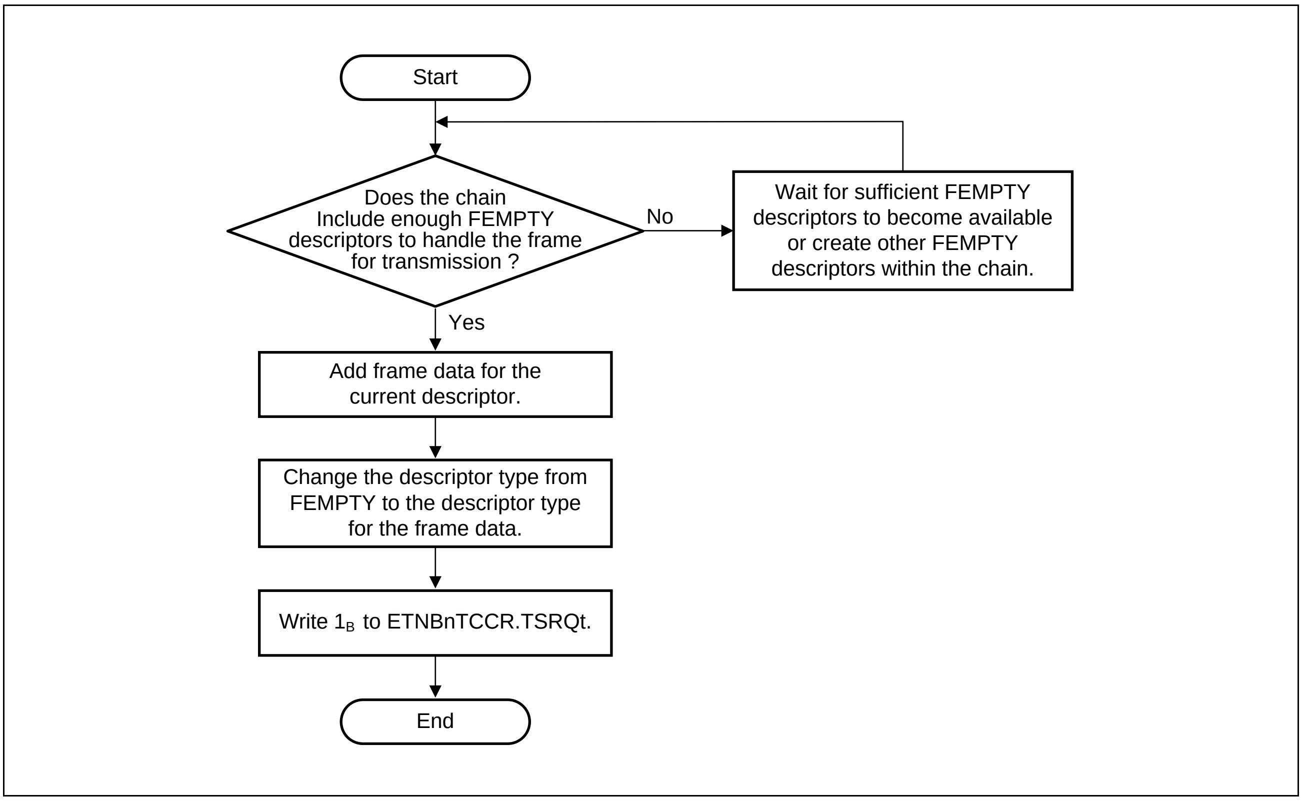

Figure 26.36 Software Flow for Immediate Frame Transmission

Figure 26.37, Software and AVB-DMAC Operations for Immediate Frame Transmission shows software and AVB-DMAC operations for immediate frame transmission.

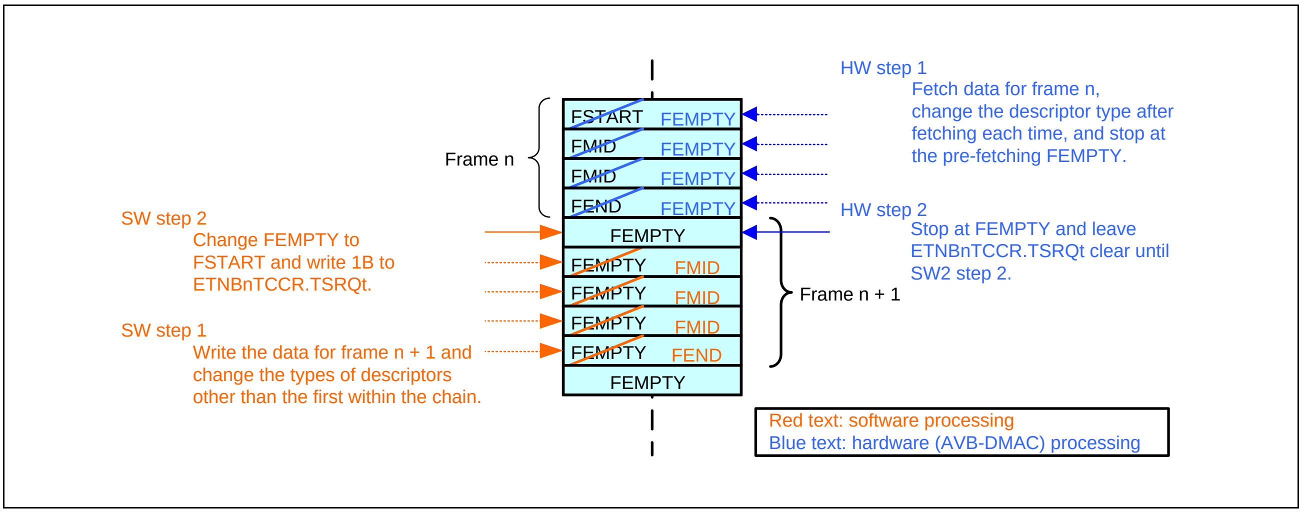

Figure 26.37 Software and AVB-DMAC Operations for Immediate Frame Transmission

(b) Frame Set Transmission with Changing of the Active Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points.

Start by creating a descriptor chain that has a FEMPTY descriptor at its stop point.

Figure 26.38, Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain shows the software flow in this pattern.

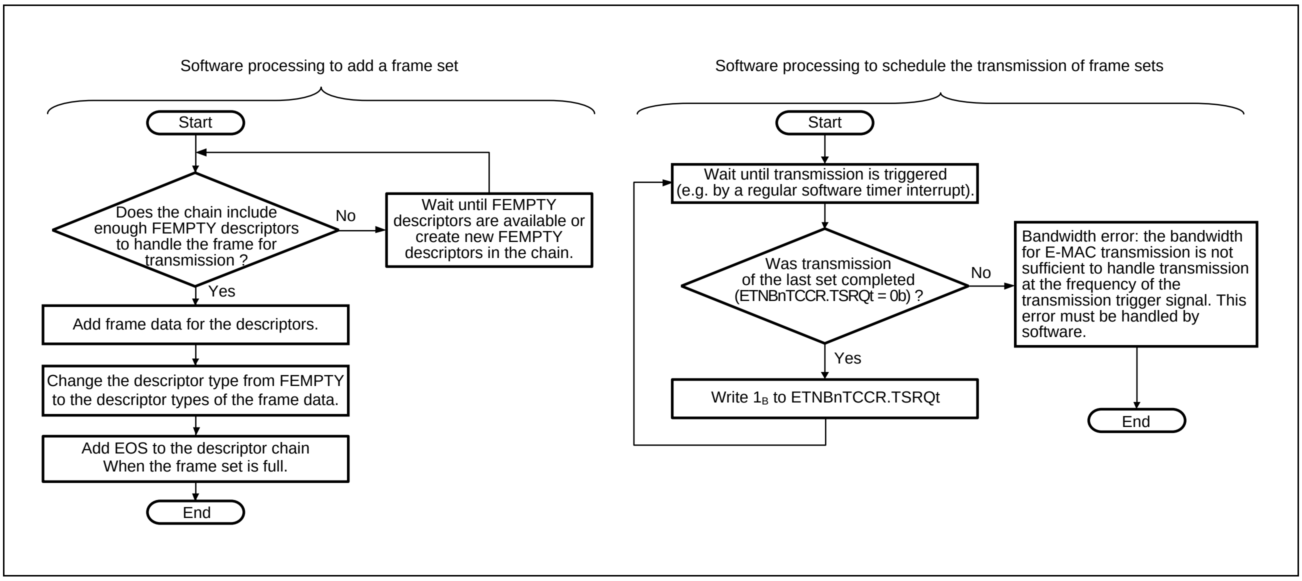

Figure 26.38 Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain

Figure 26.39, SW and AVB-DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain shows software and AVB-DMAC operations for frame set transmission.

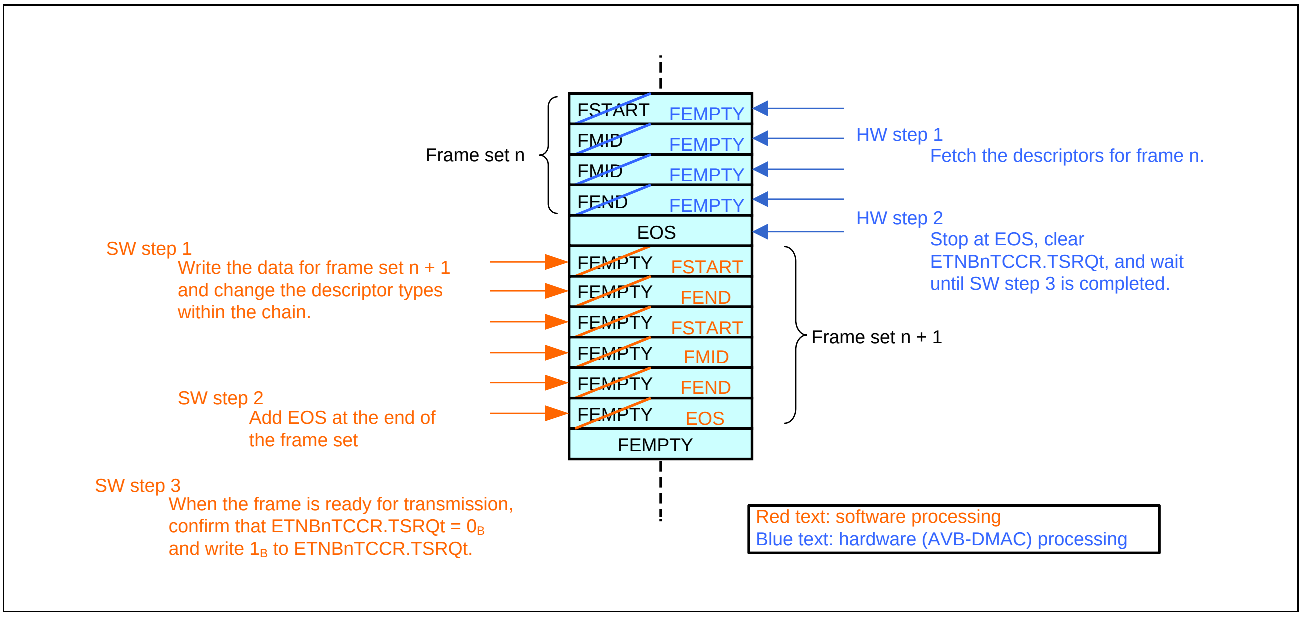

Figure 26.39 SW and AVB-DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain

(c) Frame Set Transmission Using a Shadow Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified into the active chain and shadow chains. EOS descriptors are used for the stop points.

Create descriptor chains that have FEMTPY descriptors at the stop points.

Figure 26.40, Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain shows the flow for software implementing this pattern.

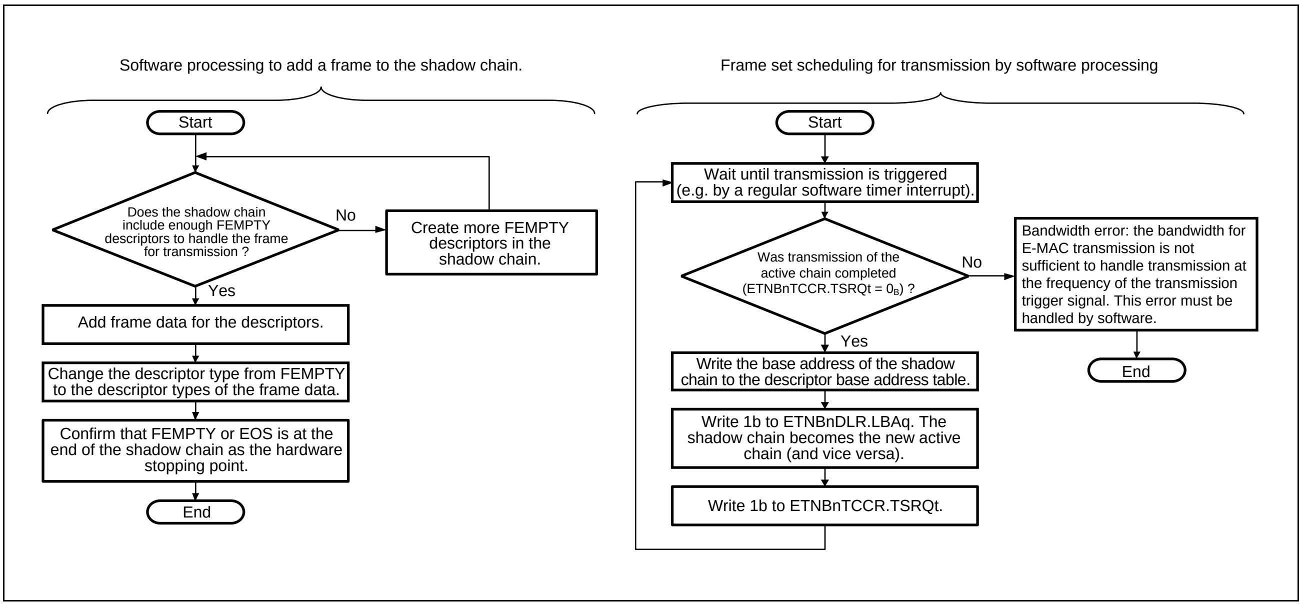

Figure 26.40 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

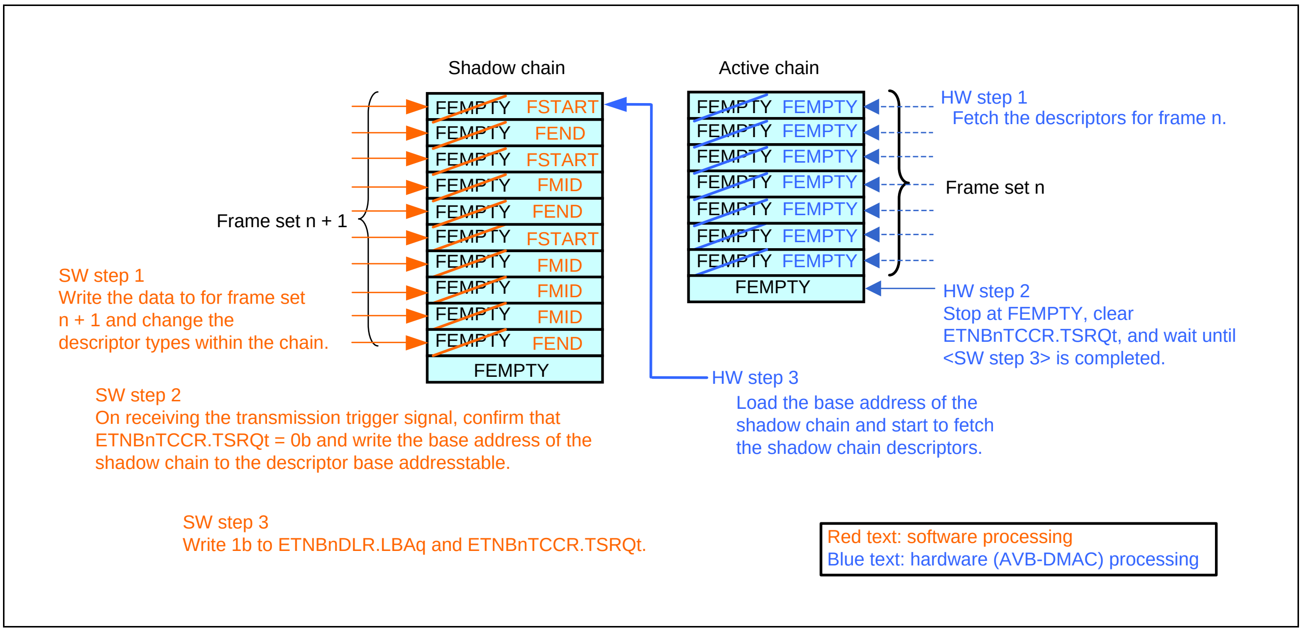
Figure 26.41, SW and AVB-DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain shows software and AVB-DMAC operations for frame set transmission.



HW step 1
Fetch the descriptors for frame n.

HW step 2
Stop at FEMPTY, clear ETNBnTCCR.TSRQt, and wait until <SW step 3> is completed.

SW step 1
Write the data to for frame set n + 1 and change the descriptor types within the chain.

HW step 3
Load the base address of the shadow chain and start to fetch the shadow chain descriptors.

SW step 2
On receiving the transmission trigger signal, confirm that ETNBnTCCR.TSRQt = 0b and write the base address of the shadow chain to the descriptor base addresstable.

SW step 3
Write 1b to ETNBnDLR.LBAq and ETNBnTCCR.TSRQt.

26.4.5.4 Timestamping in Transmission

Transmission timestamps are important in satisfying the requirements for time synchronization of the IEEE 802.1AS standard. This information can also be useful to other applications and in testing. The AVB-DMAC supports the storage of timestamps for transmitted frames. The timestamp values are based on the gPTP timer and are captured at the same time as sending of the Start of Frame Delimiter (SFD) for transmitted frames.

When the timestamp storage request field (DESCR.TSR) is set to 1, selecting storage of a timestamp, the tag number defined in the tag field (DESCR.TAG) of the last descriptor in a set (FEND) or of an FSINGLE descriptor for the frame being transmitted is stored with the timestamp. To make identification and association easy, the values of timestamp are stored together with tag numbers. The timestamp FIFO is accessible at any time.

Figure 26.42, Mechanism to Support Transmission Timestamps shows the mechanism supporting transmission timestamping.

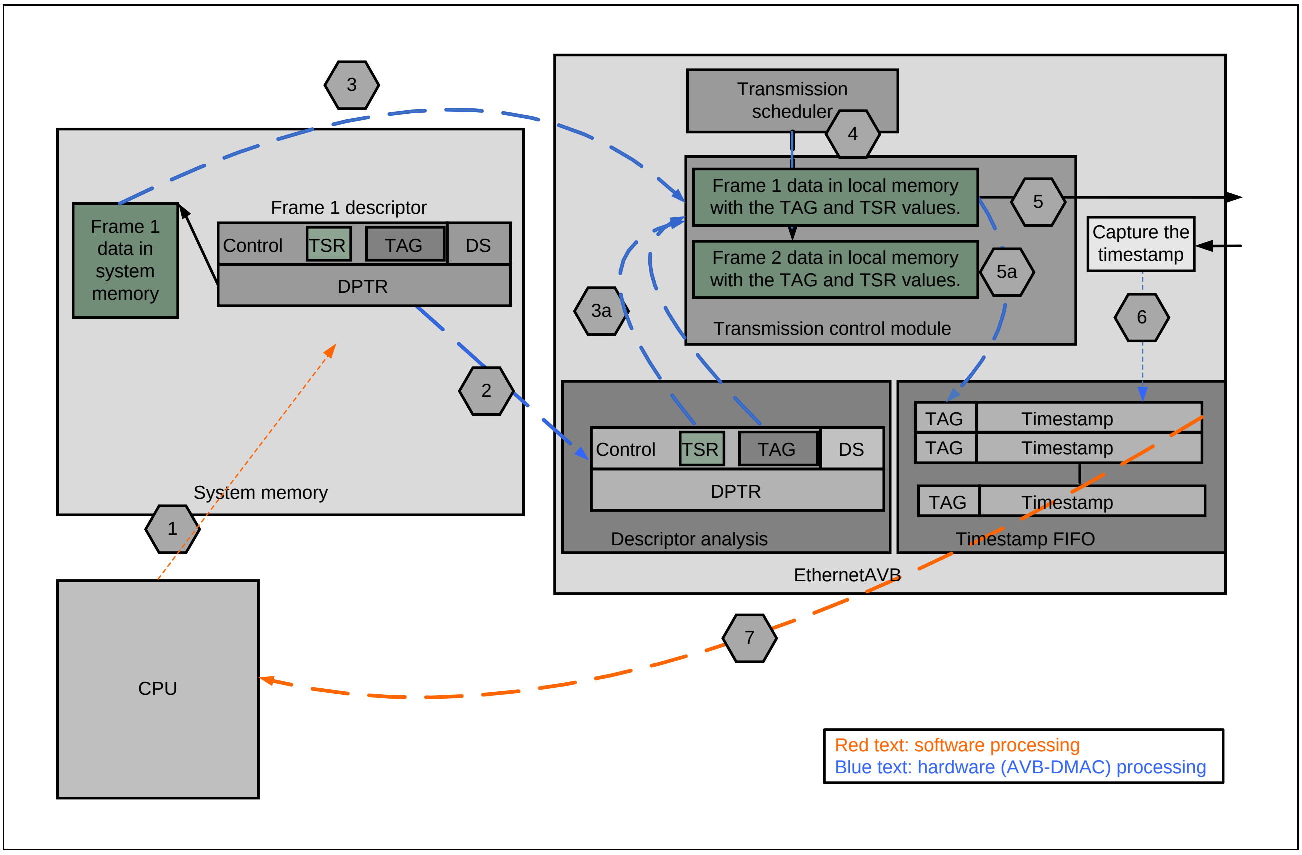

Figure 26.42 Mechanism to Support Transmission Timestamps

The method of using this function is described below:

1. Secure space in the URAM for the frame requiring timestamping.
   Write the tag number of the frame to the frame tag field (DESCR.TAG) and set the timestamp storage request field (DESCR.TSR) to 1.
2. The AVB-DMAC fetches and analyzes the descriptor. The timestamp storage request field (DESCR.TSR) is 1, so it recognizes that transmitting this frame also requires storage of the timestamp.
3. The AVB-DMAC fetches the data for frame 1 and temporarily stores the frame in internal memory for scheduling.
   3a: The frame tag field (DESCR.TAG) and timestamp storage request field (DESCR.TSR) are stored with the fetched data.)
4. Under the control of priority settings according to credit-based shaping (CBS) or another scheme, the transmission scheduler determines the time to transmit frame 1.
5. Transmission of frame 1 starts.
   5a: The information relating to frame 1 is stored in the timestamp FIFO.
6. The gPTP timestamp is captured at the start of sending the frame delimiter (SFD) for transmission and stored with the tag in the timestamp FIFO. On completion of the transmission, an interrupt is generated. For this to happen, the descriptor interrupt control register (ETNBnDIC) must be set beforehand.
7. The entry can now be read from the timestamp FIFO.

Use the timestamp FIFO for the time synchronization of frames with IEEE 802.1AS compliance.

Timestamping can also be used with other frames, but take care not to allow the timestamp FIFO to overflow. When the FIFO is full, further timestamps supplied to it are lost.

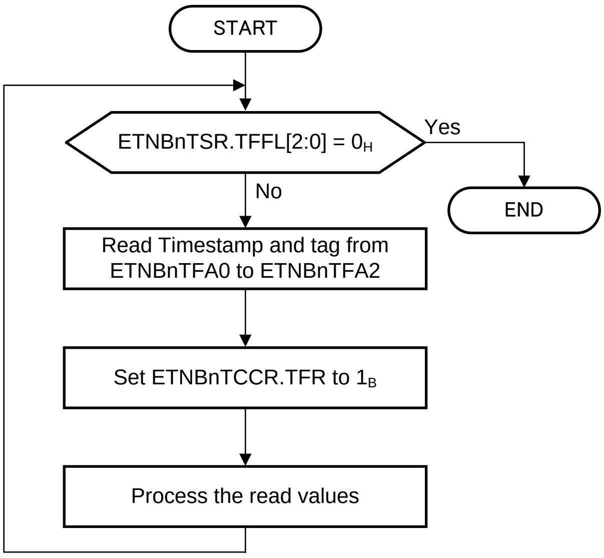

Figure 26.43 Flow of Transmission Timestamping

(1) Ending Transmission

Figure 26.44, Procedures for Ending Transmission shows the procedure for ending transmission.

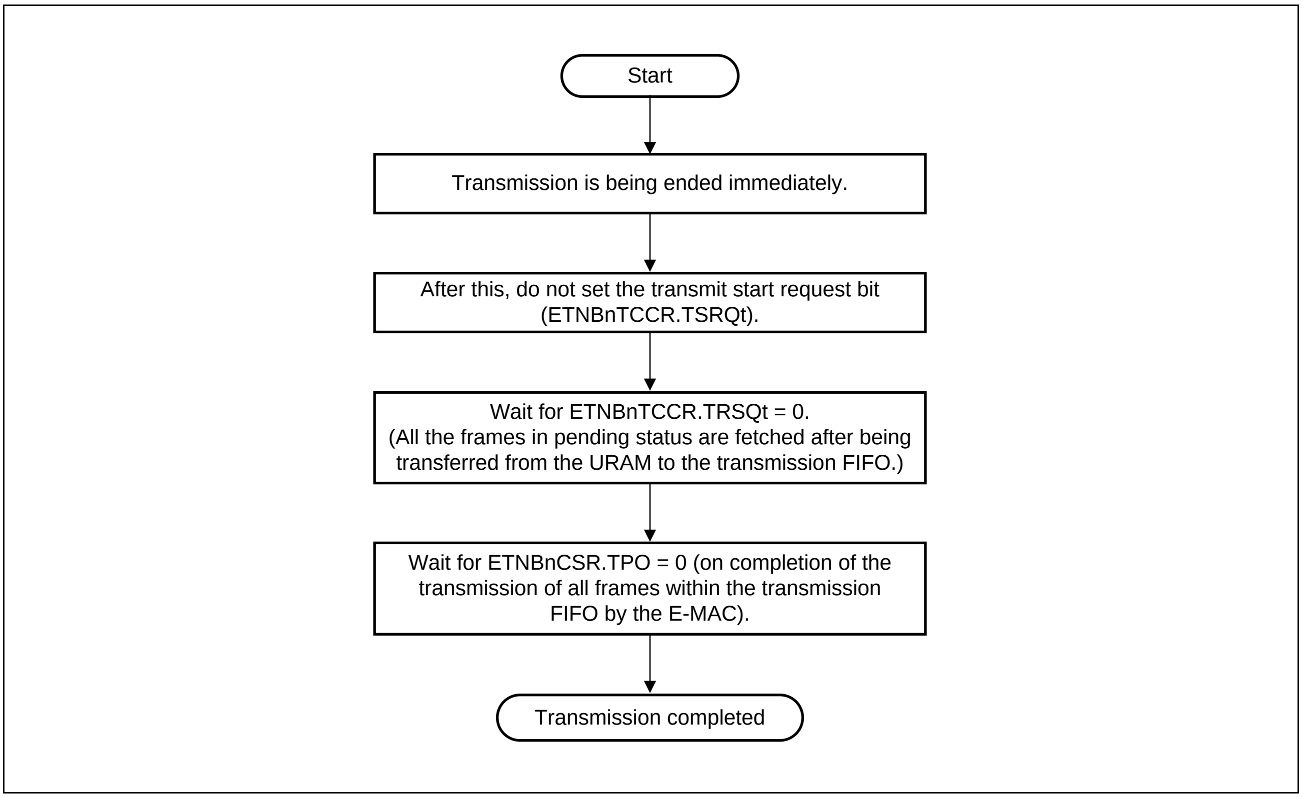

Figure 26.44 Procedures for Ending Transmission

26.4.6 CBS (Credit-Based Shaping)

In AVB transmission mode (i.e. when the transmit queue priority field in the transmit configuration register (ETNBnTGC.TQP) is 01B or 11B), transmission queues Q3 and Q2 are respectively assigned to Class A and Class B stream traffic and the CBS (Credit Based Shaping) algorithm is used to select the transmission queues in order to satisfy the Forwarding and Queuing for Time Sensitive Streams (FQTSS) specification (see *Section 8.6.8* or *Section 34* in *IEEE 802.1Q*).

The CBS algorithm is based on the concept of transmission credit for each queue. Credit can be thought of as the degree to which a queue has the “right” to transmit at a given time. Actually, in AVB transmission mode as specified in IEEE 802.1Q, queues that are subject to the CBS algorithm are able to transmit when the following conditions are met.

- At least one frame is stored in the queue.
- The credit for the queue is 0 or a positive value.

The credit for a transmission queue is incremented while one or more frames from the queue are present in the transmission FIFO but transmission of these frames is not proceeding. This state is indicated by the transmission process status bit for queue t in the AVB-DMAC status register (ETNBnCSR.TPOt) being clear (0). The credit is decremented while transmission of a frame from the queue is in progress. This mechanism is used to control transmission so that the transmission of frames from the queues for each of the traffic classes does not exceed the specified maximum bandwidth.

IEEE 802.1Q defines the following parameters for queues under the control of the CBS algorithm.

portTransmitRate:	Maximum transmission data rate of an external port. The E-MAC determines this parameter.
bandwidthFraction:	Maximum fraction of portTransmitRate that can be used for a queue.
idleSlope:	Rate of change of credit for a queue when transmission of frames from the queue is not proceeding so the credit value (in bits per second) is increasing. idleSlope is also equal to the maximum fraction of the total bandwidth (portTransmitRate) that is available to the given queue under a specified condition (frames from the queue can be placed in a continuous stream. See Annex L of IEEE 802.Q. idleSlope = bandwidthFraction × portTransmitRate
sendSlope:	Rate of change of credit for a queue while transmission of a frame from the queue is in progress so the credit value is decreasing. (in bits per second). The value of sendSlope is defined as follows: sendSlope = idleSlope – portTransmitRate

Furthermore, the values below are used to define individual traffic classes (or queues for the classes) under control of the algorithm. See Annex L of IEEE 802.Q.

maxFrameSize:	Maximum size of frames (in bits) of the corresponding traffic class that can be transmitted from a port
maxInterferenceSize:	Maximum burst size (in bits) by which delays for the corresponding traffic class can be allowed
hiCredit:	Maximum credit value (positive number). Can be calculated by using the following equation: hiCredit = maxInterferenceSize × (idleSlope / portTransmitRate)
loCredit:	Minimum credit value (negative number). Can be calculated by using the following equation: loCredit = maxFrameSize × (sendSlope / portTransmitRate)

Figure 26.45, CBS (Credit-Based Shaping) Operation shows how the CBS algorithm works and the meaning of the above parameters.

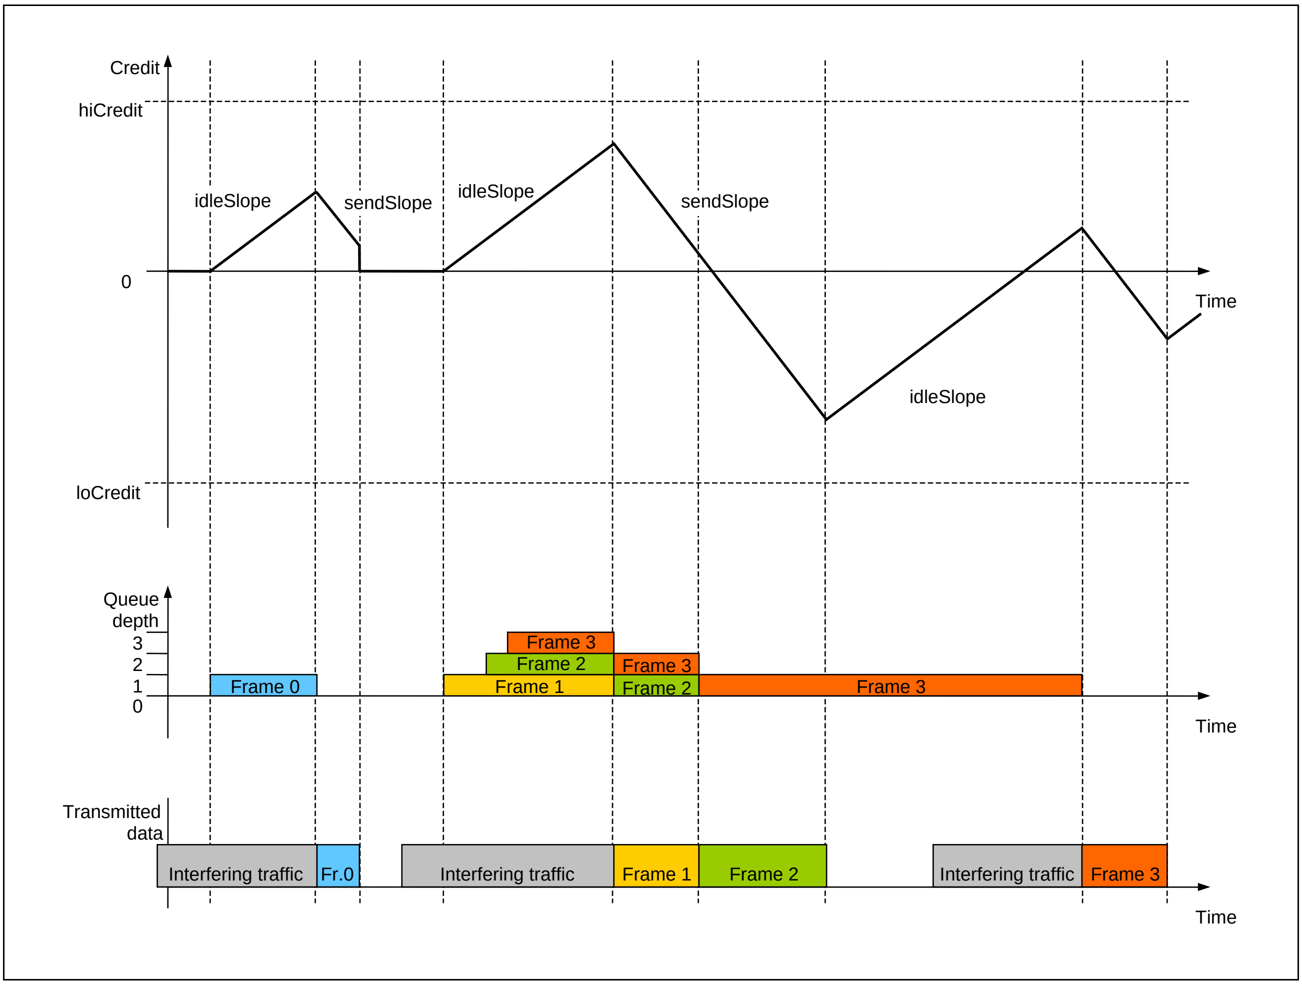

Figure 26.45 CBS (Credit-Based Shaping) Operation

Figure 26.46, CBS (Credit-Based Shaping) Operation in the AVB-DMAC shows the implementation of CBS in the AVB-DMAC.

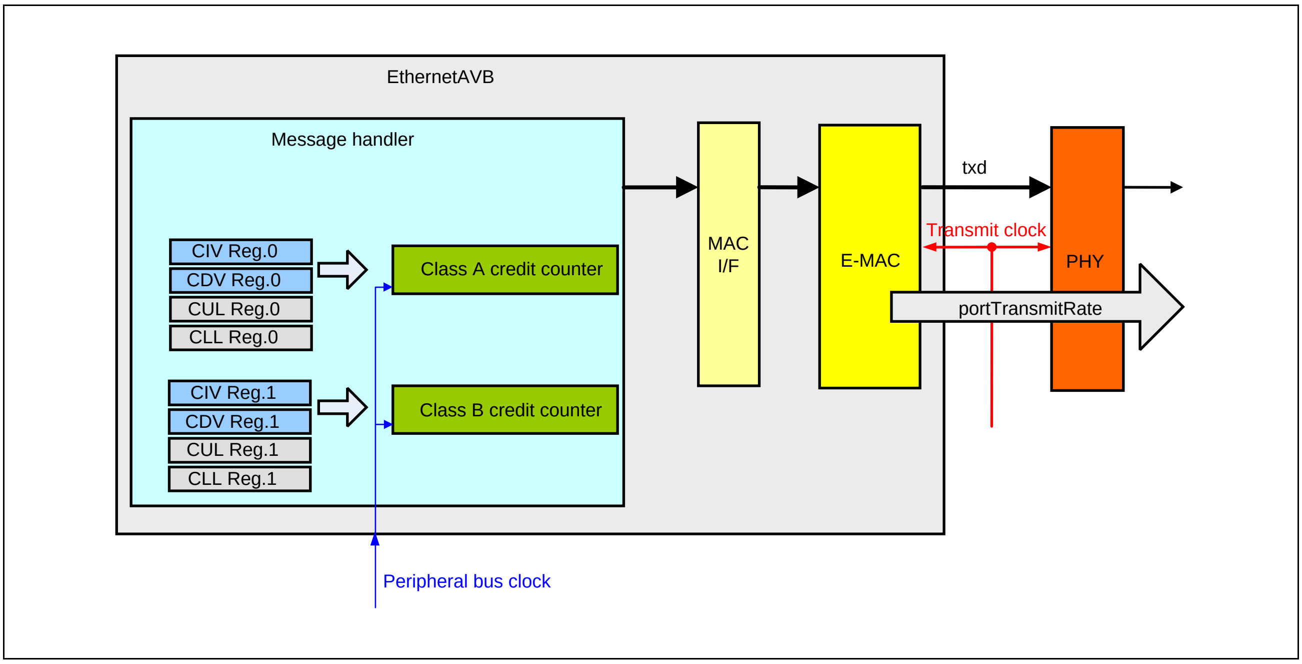

Figure 26.46 CBS (Credit-Based Shaping) Operation in the AVB-DMAC

The above implementation is based on “credit counters” for the respective traffic classes (SR Class A and Class B). The following parameters apply for these classes.

CBS increment value (CIV): Signed positive number
The credit is incremented by this amount every peripheral bus clock cycle while a frame from the queue is pending but transmission has not started (idleSlope).

CBS decrement value (CDV): Signed negative number
The credit is decremented by this amount every peripheral bus clock cycle while transmission of a frame from the queue is proceeding (sendSlope).

The CBS increment value (CIV) and CBS decrement value (CDV) are defined as follows.
CIV = idleSlope × Mfactor
CDV = sendSlope × Mfactor

Mfactor is a multiplier factor to ensure accuracy for CIV and CDV. CIV and CDV are calculated by using the following equations.
CIV = (portTransmitRate/CHI_freq) × bwFraction × Mfactor
CDV = (portTransmitRate/CHI_freq) × (bwFraction – 1) × Mfactor

CHI_freq is the frequency of the peripheral bus clock. The credit counters are driven by the peripheral bus clock, so calculating the slope parameters for CBS requires (1/CHI_freq).

Use software to prepare Mfactor for the CBS parameters. All queues for the same Class must have the same CBS parameters. Mfactor for a specified Class c can be changed during operation, unless transmission is pending for that Class (i.e. the transmit process status bit in the AVB-DMAC status register (ETNBnCSR.TPOt) = 0). At that time, the credit counter values for Class A and Class B are 0.

Note that the credit value will not match a new incrementation or decrementation parameter if Mfactor is changed while the credit counter value is non-zero. Mfactor is not present in the AVB-DMAC registers.

Set the CIV and CDV parameters in the CBS increment value registers c (ETNBnCIVRc) and the CBS decrement value registers c (ETNBnCDVRc). These are treated as dynamic settings since they should be updated when streams are registered or erased in accord with IEEE 802.1Qat.

The AVB-DMAC also has CBS upper limit registers c (ETNBnCULc) (the upper limit registers for Classes A and B) and CBS lower limit registers c (ETNBnCLLc) (the lower limit registers for Classes A and B). Set Mfactor to match the credit value and set the upper limit (hiCredit) and the lower limit (loCredit) for each class as defined above.

CUL = hiCredit × Mfactor = maxInterferenceSize × bwFraction × Mfactor
CLL = loCredit × Mfactor = maxFrameSize × (bwFraction - 1) × Mfactor

Example:

Assume that portTransmitRate = 100 Mbps, CHI_freq = 60 MHz and bwFraction = 3 %.
Then idleSlope and sendSlope represented as one bit vs. cycles of the peripheral bus clock are as follows.

idleSlope = (portTransmitRate/CHI_freq) × bwFraction = 100/60 (Mbps/MHz) × 3 % = 0.050 of a bit per peripheral bus clock cycle

sendSlope = idleSlope – (portTransmitRate / CHI_freq) = –1.616 bits per peripheral bus clock cycle Let Mfactor be 100, then CIV and CDV parameters are determined as follows.

CIV = idleSlope × Mfactor = 5.0
CDV = sendSlope × Mfactor = –161.6

26.4.6.1 Restrictions on CIV, CDV and Mfactor

The maximum value (the minimum value for negative numbers) up to which the credit counter will not overflow determines the maximum values of CIV and CDV that can be set in the CBS registers. This maximum credit value is equivalent to the worst case of the hiCredit value, and the maximum values for Class A and Class B are calculated as follows.

<Conditions>

- Class A maximum value (hiCredit_max_classA)
  classA bwFraction ≅ 100 %
  Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum frame size.
  hiCredit_max_classA ≅ maxInterferenceSize for Class A = Interference due to one max. sized frame = header + max. size payload + CRC (2000 bytes) + preamble (8 bytes) + IFG (12 bytes) + processing_delay (≅ 80 bytes) ≅ 2100 bytes
- Class B maximum value (hiCredit_max_classB)
  classB bwFraction ≅ 100 %
  Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum size of frames in the Class A transmission queue and other transmission queues.
  hiCredit_max_classB ≅ maxInterferenceSize for Class B = Interference due to two max-size frames = 2× hiCredit_max_classA ≅ 4200 bytes

hiCredit_max_classA = 16800
hiCredit_max_classB = 33600

The maximum values that can be selected with Mfactor for the 32-bit signed counter without overflow are:
Mfactor_max_classA = $2^{31} - 1$ / hiCredit_max_classA ≅ 127826 and
Mfactor_max_classB = $2^{31} - 1$ / hiCredit_max_classB ≅ 63913.

A high degree of accuracy can be achieved even with a low bandwidth. In Class B, bandwidthFraction = 0.05 % and the bandwidth error < 0.1 %.
The maximum value of CIV is calculated from the following equation.
CIV = idleSlope x Mfactor = (portTransmitRate / CHI_freq) × bandwidthFraction × Mfactor

When Mfactor is the maximum value and bandwidthFraction is the maximum value (up to 100 %):
CIV_max_classA = (portTransmitRate / CHI_freq) × Mfactor_max_classA and
CIV_max_classB = (portTransmitRate / CHI_freq) × Mfactor_max_classB.

Table 26.96, Example of Maximum Values for Class A and Class B CIV Parameters shows examples of values for portTransmitRate and peripheral clock frequency. Note that the values in the table are the limits of CIV up to which the 32-bit credit counter will not overflow. The CIV parameters are implemented as 16 bits + a sign bit, so a further limit of CIV ≤ 65535 applies to both Class A and Class B.

Table 26.96 Example of Maximum Values for Class A and Class B CIV Parameters

portTransmitRate	clk_chi[MHz]	CIV_max_classA	CIV_max_classB
100 Mbps	50	255652	127826
100 Mbps	60	213043	106521

26.4.6.2 Credit Incrementation During Inter-Frame Gaps (IFGs)

The inter-frame gap (IFG) after a frame is transmitted is not treated as part of frame transmission by the CSB credit counter. During an IFG, the credit is incremented for all SR queues that have pending frames or negative credit. **Figure 26.47, Credit Operations during IFGs** illustrates credit operations during IFGs.

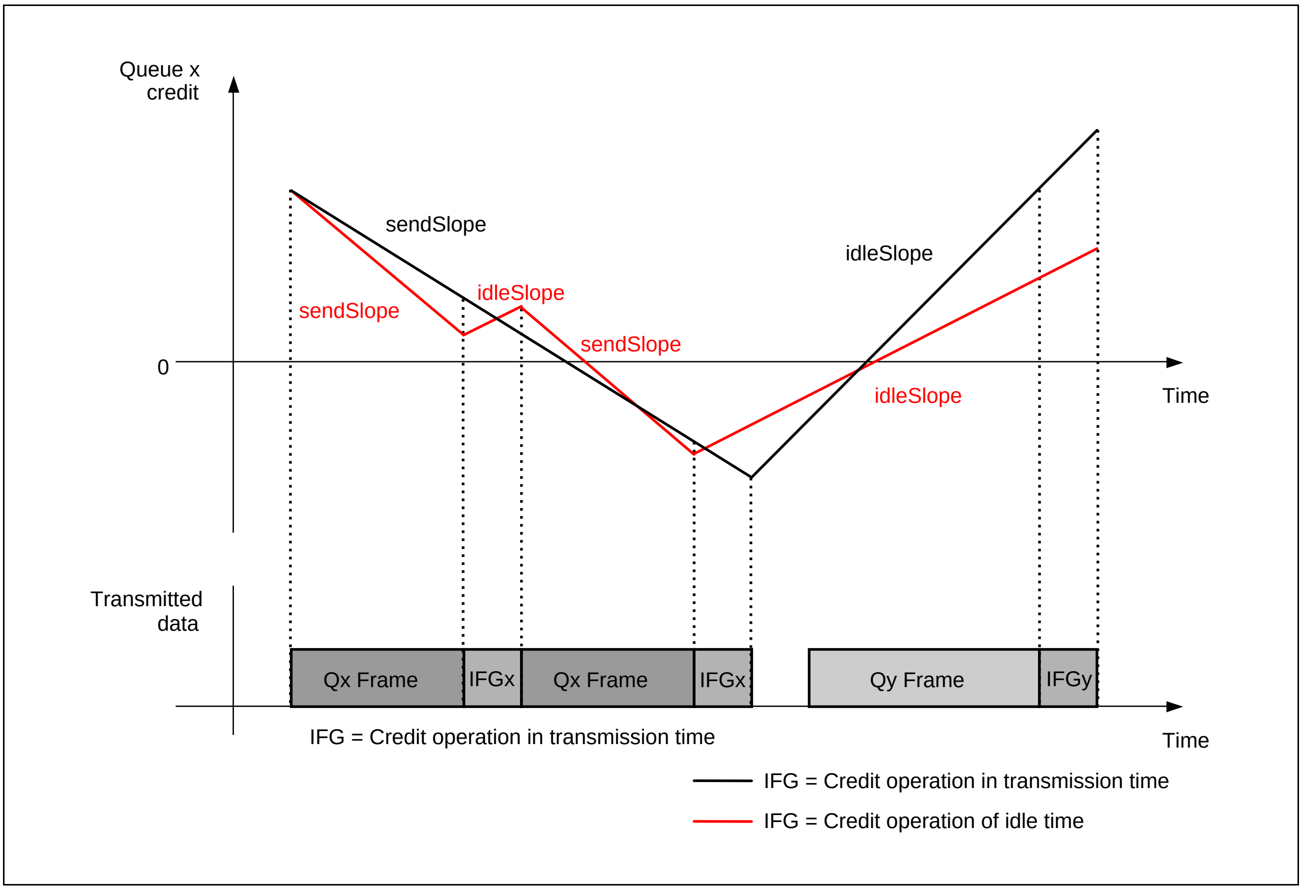

Figure 26.47 Credit Operations during IFGs

Accordingly, the IFG need not be included in calculation of the bandwidth requirements for the specified SR Class when deciding the idleSlope, sendSlope, and CIV and CDV parameters. However, IFG must also be included in the calculation in order to confirm that the total bandwidth allocated to all SR Classes does not exceed 100 % of portTransmitRate. This is described in *Section 35.2.2.8.4 of IEEE 802.1Q*.

26.4.6.3 Example

The case of a Class A 48-kHz stereo audio stream among Ethernet frames is described as an example.

After every Class A measurement interval (125 µs), 80 octets consisting of two sets of six 32-bit samples plus a 32-octet header are stored as audio data within a frame. The IEEE 802.3 also imposes a 42-octet media-specific framing overhead (an 8-octet preamble, 14-octet IEEE 802.3 header, 4-octet IEEE 802.1Q priority/VID Tag, 4-octet CRC, and 12-octet IFG) are also added. Accordingly, the total frame size is 80 + 42 = 122, and one such frame is transmitted after every class measurement interval.

This represents a total bandwidth of about 7.8 Mbits per second (122 octets × 8 bits per octet × 8000 frames per second) for this class. If the E-MAC is assumed to run at 100 Mbps (portTransmitRate), this is equivalent to the allocation of about 7.8 % of the total bandwidth to each Class A queue. If other traffic classes are to share the total transmission bandwidth, checking that this 7.8 % allocation does not lead to the total allocation of bandwidth being greater than 100 % of portTransmitRate is required.

To obtain the CIV and CDV parameters for a given class, the IFG must not be taken into account in calculation of the frame size must not include the IFG. For this case, therefore, we obtain an 80-bit payload + 30-bit overhead = 110-octet measurement interval for the class → the total bandwidth for the class = 7.04 Mbps = 7.04 % of portTransmitRate.

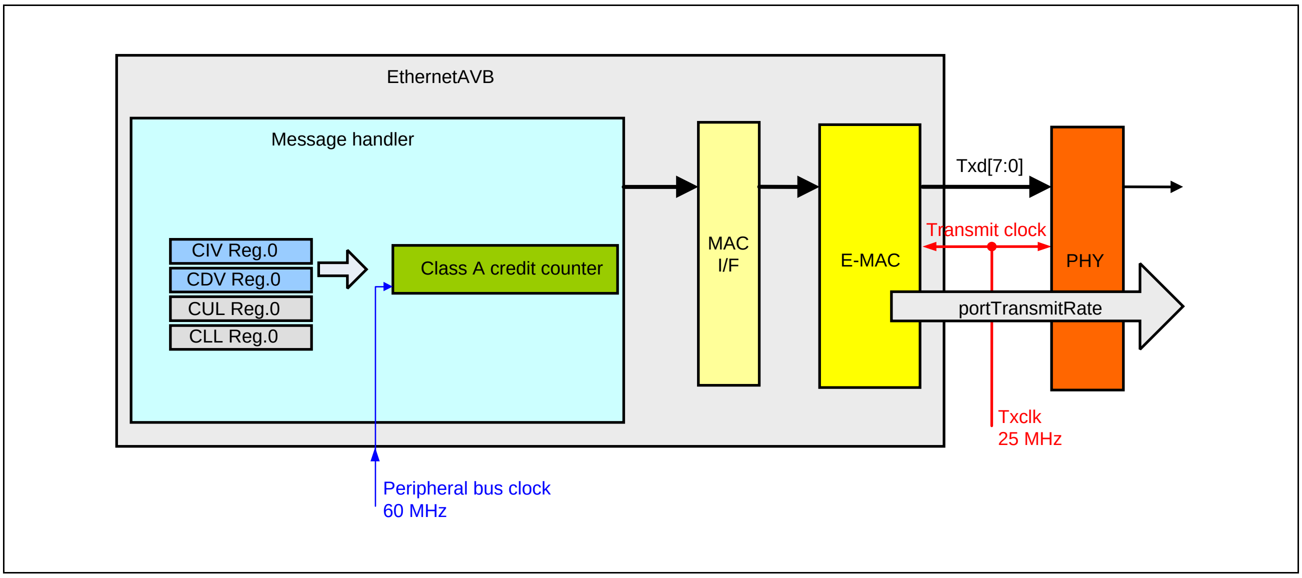

Figure 26.48 Example of CBS Settings

Given that:

- the E-MAC runs at 100 Mbps, so portTransmitRate = 100 Mbps and
- Peripheral bus clock (operating clock for the credit counter) frequency = 60 MHz,

securing a bandwidth of 7.04 Mbits/sec for Class A requires configuring the CBS parameters as follows.

- bandwidthFraction = 7.04 %
- idleSlope = (portTransmitRate / CHI_freq) × bandwidthFraction ≅ 0.1173 bits per peripheral bus clock cycle
- sendSlope = idleSlope – (portTransmitRate / CHI_freq) ≅ –1.5493 bits per peripheral bus clock cycle

When Mfactor = 100, the parameters are as follows.

- CIV = idleSlope × Mfactor = 11.7333 bits per peripheral bus clock cycle
- CDV = sendSlope × Mfactor = –154.9333 bits per peripheral bus clock cycle
  These are the final values for setting in the ETNBnCIVR1 and ETNBnCDVR1 registers.

26.4.7 IEEE802.1: gPTP

26.4.7.1 gPTP Timer

An 84-bit timer is provided to support the gPTP function. **Figure 26.49, Definitions of gPTP Timer Bits and Related Bits** shows the definitions of bits for the timer and in related registers. gPTP timer will start after ETNBnCCC.CSEL configure and transit to operation mode.

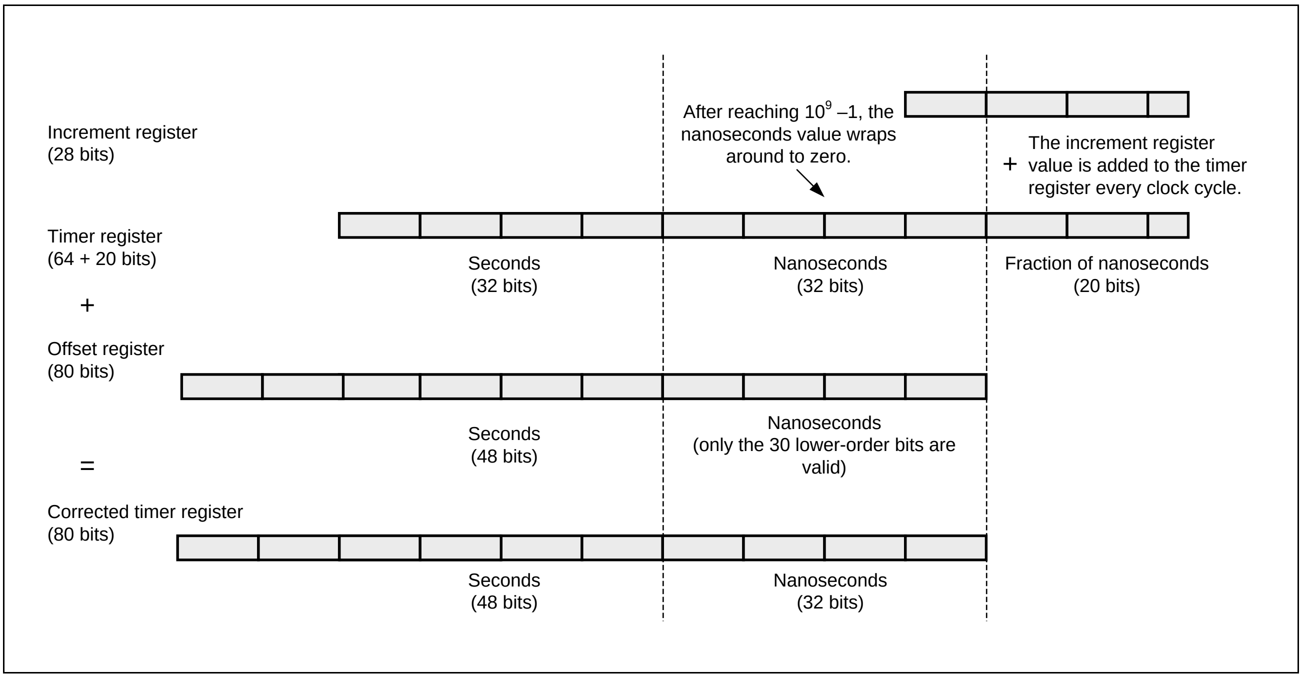

Figure 26.49 Definitions of gPTP Timer Bits and Related Bits

The higher-order 32 bits indicate seconds. For the next 32 bits, counting by one corresponds to the passage of 1 ns. The lower-order 20 bits are a fractional value (less than 1 ns). Software can only read the 32 higher-order bits, indicating seconds, and the subsequent 32-bits, indicating nanoseconds. The 20 lower-order 20 bits, representing less than 1 ns, are not readable. They are only used within the AVB-DMAC to maintain accuracy in time measurement.

The timer can be reset by setting the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) to 01_B. These bits are set to 00_B on completion of normal resetting of the timer.

After the timer starts, the value in the gPTP timer increment register (ETNBnGTI.TIV) is added to the value of the gPTP timer every clock cycle.

After setting a value in the gPTP timer increment register (ETNBnGTI.TIV), set the timer increment value setting request bit in the gPTP configuration control register (ETNBnGCCR.LTI). If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed.

An offset to the gPTP timer is also available. If this is required, set the value in the gPTP timer offset register (ETNBnGTOi.TOV). After setting a value in this register, set the timer offset value setting request bit in the gPTP configuration control register (ETNBnGCCR.LTO). If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed. When adding an offset, take care that it does not exceed 80 bits.

The value of the gPTP timer can be read from the gPTP timer capture register (ETNBnGCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (ETNBnGCCR.TCSS) to select the timer value for capture as the value of the gPTP timer, the corrected value of the gPTP timer (value with the offset added), or the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) to 11_B initiates the capture. Once normal capture of the timer is complete, the value of the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) returns to 00_B.

The timer for gPTP operates as a free-running timer but can be synchronized with the Grandmaster clock.

26.4.7.2 Free-Running Operation

The IEEE 802.1 AS standard for timing and synchronization does not prescribe the physical adjustment of local clocks to the Grandmaster clock. To avoid negative effects from the correction procedure, we recommend the use of a free-running timer.

As a free-running timer, the timer counts the local time in seconds or nanoseconds. The gPTP timer increment register (ETNBnGTI.TIV) is set to 1 ns (the setting value = $0010\ 0000_H$) and the gPTP timer offset register (ETNBnGTOi.TOV) is set to 0. The ratio information captured at the time of the gPTP delay measurement and synchronization procedures is used to correct the frequency ratio to that of the Grandmaster clock. The Grandmaster clock can be calculated from the local clock by using the information collected during the gPTP measurement and synchronization procedures.

26.4.7.3 Synchronization with the Grandmaster Clock

In situations requiring physical synchronization of the local clock with the Grandmaster clock, the fractional nanoseconds value (the 20 lower-order bits of the gPTP timer) is used to make the adjustment. Specifically, the increment value is finely adjusted to correct for deviations of the clock frequency from that of the Grandmaster clock.

Use the timer offset value (in the gPTP timer offset registers, ETNBnGTOi.TOV) to correct for offsets from the theoretical value (at start-up, etc.). The sum of the timer value and the offset register is the “corrected timer” value.

Note that only the nanoseconds portion of the gPTP timer offset registers (ETNBnGTOi.TOV[31:0]) is valid.

The following equation gives a method of calculating the increment (ETNBnGTI.TIV) from the frequency of the gPTP clock and its deviation from that of the Grandmaster clock. Variable d is the deviation ($d = 10^{-6}$ for 1 ppm).

$$ETNBnGTI.TIV = round\left(\frac{2^{20}GHz}{f_{GPTP}} \times (1 + d)\right)$$

After adjusting for the current deviation of clock frequency, re-set the gPTP timer increment register (ETNBnGTI.TIV).

After calculating the new offset value, re-set the gPTP timer offset register (ETNBnGTOi.TOV).

26.4.7.4 Support Provided by the gPTP Timer in Transmission and Reception

The timer value described above is used in the timestamp values captured when start frame delimiters are detected in reception and generated in transmission.

Captured timestamp values for received frames are stored in the corresponding descriptors. Those for transmitted frames are stored with tag information in the timestamp FIFO. The timestamp values are thus correlated with both transmitted and received frames.

Note that the use of corrected timer values can introduce an error due to the offset correction in the gPTP synchronization procedure.

Errors due to the SDF notification and the asynchronous interface between the timer modules must also be taken into account.

26.4.8 Support for IEEE 1722

For IEEE 1722, the following two functions are supported.

- Output and capture of values in the IEEE 1722 AVTP (Audio/Video Transport Protocol) presentation time format
- Comparison of IEEE 1722 AVTP presentation timestamps

The 32-bit AVTP timestamp field of IEEE 1722 frames holds the AVTP presentation time when the AVTP timestamp enable bit in the frame is 1. The AVTP timestamp field is generated from the pPTP timer and is given as seconds (gPTP_seconds) and nanoseconds (gPTP_nanoseconds) according to the following equation.

AVTP timestamp = (gPTP_seconds × 10^9 + gPTP_nanoseconds) modulo 2^{32}

The AVTP presentation time can be read from the gPTP timer capture register (ETNBnGCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (ETNBnGCCR.TCSS) to select the timer value for capture as the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR[1:0]) to 11_B initiates the capture. The value is obtained by adding the maximum transit time defined in the gPTP maximum transit time register (ETNBnGMTT.MTTV) to the corrected timer value. The AVTP presentation time wraps around approximately every four seconds.

CAUTION

The AVTP presentation time captured in ETNBnGCTi.CTV is only valid when the corrected timer value is in synchronization with the Grandmaster clock. That is, the timer increment and timer offset values for the corrected timer value must be adjusted during the synchronization procedure so that the corrected gPTP clock is physically adjusted to match the time kept by the Grandmaster clock.

26.4.9 Flow Control

The E-MAC supports flow control for full-duplex operation in compliance with the IEEE 802.3 standards. This flow control is applicable to both reception and transmission. In regard to the transmission of PAUSE frames, flow control operates in the following ways.

(1) PAUSE Frame Transmission
PAUSE frames can also be transmitted in response to software operations. Writing a timer value to the manual PAUSE frame register (ETNBnMPR) starts the transmission of a PAUSE frame. This only causes the transmission of one PAUSE frame.

(2) PAUSE Frame Reception
After reception of a PAUSE frame, transmission of the next frame does not proceed until the time indicated by the Timer value elapses. However, transmission of a frame currently being transmitted continues. PAUSE frames are only received while the operation mode for flow control in reception in the E-MAC mode register (ETNBnECMR.RXF) is set to "1". The number of received PAUSE frames is counted.

(3) PAUSE Frames with the Timer Value 0
The setting of the 0-time PAUSE frame enable bit (ETNBnECMR.ZPF) enables or disables the reception and transmission of PAUSE frames with the TIME parameter value 0.

- When control of PAUSE frames with the TIME parameter value 0 is enabled
  A PAUSE frame with the TIME parameter value 0 is transmitted when the capacity of the reception FIFO is less than the value of the Receive FIFO Warning Level bits (ETNBnRCR.RFCL[12:0]) while the time indicated by the TIME parameter value has not elapsed.
  Reception of a PAUSE frame with the TIME parameter value 0 leads to release from the transmission standby state.
- When control of PAUSE frames with the TIME parameter value 0 is disabled
  PAUSE frames with the TIME parameter value 0 are not transmitted. Received PAUSE frames with the TIME parameter value 0 are discarded.

26.4.10 Interrupts

The EthernetAVB module has three EI level interrupts from the AVB-DMAC and one EI level interrupt from the E-MAC.

Table 26.97, EthernetAVB Interrupts lists interrupts.

Table 26.97 EthernetAVB Interrupts

Interrupt Source Name
Transmit/receive data management interrupt
Error management interrupt
Other management (FIFO caution level, etc.) interrupt
E-MAC interrupt

The AVB-DMAC related interrupts include descriptor interrupts (15 sources), error interrupts (5 sources), reception interrupts (38 sources), transmission interrupts (2 sources), and gPTP interrupts (3 sources). From the CPU's perspective, each appears as three of the above four interrupt sources.

The states of an AVB-DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (ETNBnDIS)
- Error interrupt status register (ETNBnEIS)
- Receive interrupt status register (ETNBnRIS0 to 2)
- Transmit interrupt status register (ETNBnTIS)
- gPTP interrupt status register (ETNBnGIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can only be checked by reading the interrupt summary status register (ETNBnISS) and the queue full error interrupt status bit in the error interrupt status register (ETNBnEIS.QFS). This reduces the load on the CPU.

26.4.10.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the following interrupt sources are generated:

- Receive frame interrupt in the receive interrupt status register 0 (ETNBnRIS0.FRFr)
- Descriptor interrupt in the descriptor interrupt status register (ETNBnDIS.DPFi)

The general error interrupt state can be checked by reading the descriptor interrupt summary bits in the interrupt summary status register (ETNBnISS.DPSi) or the receive FIFO warning interrupt summary bit (ETNBnISS.RFWS).

26.4.10.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Timestamp FIFO full error interrupt in the error interrupt status register (ETNBnEIS.TFFF)
- CBS limitation interrupts in the error interrupt status register (ETNBnEIS.CULF1, ETNBnEIS.CULF0, ETNBnEIS.CLLF1, ETNBnEIS.CLLF0)
- Separation Error in the error interrupt status register (ETNBnEIS.SEF)
- Queue Error in the error interrupt status register (ETNBnEIS.QEF)
- MAC Transmission Error in the error interrupt status register (ETNBnEIS.MTEF)
- MAC Reception Error in the error interrupt status register (ETNBnEIS.MREF)
- Receive FIFO full interrupt in the receive interrupt status register 2 (ETNBnRIS2.RFFF)
- Receive queue full interrupt in the receive interrupt status register 2 (ETNBnRIS2.QFFr)

The general error interrupt state can be checked by reading the error interrupt summary bit in the interrupt summary status register (ISS.ES).

26.4.10.3 Other Management (FIFO Warning, etc.) Interrupts

The other management (FIFO warning, etc.) interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

(1) Reception related interrupt
Receive FIFO warning interrupt in the receive interrupt status register 1 (ETNBnRIS1.RFWF)

(2) Transmission related interrupts
Timestamp FIFO warning interrupt in the transmit interrupt status register (ETNBnTIS.TFWF) Timestamp FIFO update interrupt in the transmit interrupt status register (ETNBnTIS.TFUF)

(3) gPTP related interrupts
AVTP presentation time match interrupt in the gPTP interrupt status register (ETNBnGIS.PTMF)

The general error interrupt state can be checked by reading the receive FIFO warning error interrupt status bit in the interrupt summary status register (ETNBnISS.RFWS), the timestamp FIFO warning interrupt status bit (ETNBnISS.TFWS), the timestamp FIFO update interrupt status bit (ETNBnISS.TFUS), and the gPTP Interrupt Summary (ETNBnISS.CGIS).

26.4.10.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the E-MAC interrupt source is generated.

The general error interrupt state can be checked by reading the E-MAC interrupt summary bit in the interrupt summary status register (ETNBnISS.MS).

26.4.11 Flows of Operations

26.4.12.2 Accessing MII Registers

MII registers in the PHY-LSI are accessed via ETNBnPIR in this LSI. ETNBnPIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3µ.

(1) MII Management Frame Format

Figure 26.69, MII Management Frame Format shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in **(2), MII Register Access Procedure**.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0*[1]	D..D	
Write	1..1	01	01	00001	RRRRR	10	D..D	X

Remark:

PRE: 32 consecutive 1s
ST: Write of 01_B indicating start of frame
OP: Write of code indicating access type
PHYAD: Write of 00001_B if the PHY-LSI address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI register address.
REGAD: Write of 0001_B if the register address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI register address.
TA: Time for switching data transmission source on MII interface
(a) Write: 10_B written
(b) Read: Bus release (notation: Z0) performed
DATA: 16-bit data. Sequential write or read from MSB
(a) Write: 16-bit data write
(b) Read: 16-bit data read
IDLE: Wait time until next MII management format input
(a) Write: Independent bus release (notation: X) performed
(d) Read: Bus already released in TA: control unnecessary

Note 1. The 2nd bit of TA only the ETNBnPIR.MDC bit should be written and ETNBnPIR.MMD should remain 0.

Figure 26.69 MII Management Frame Format

(2) MII Register Access Procedure

The program accesses MII registers via ETNBnPIR. Access is implemented by a combination of 1-bit- unit data write, 1-bit-unit data read, bus release, and independent bus release. **Figure 26.70, 1-Bit Data Write Flowchart** to **Figure 26.73, Independent Bus Release Flowchart (IDLE in Write in Figure 26.69)** show the MII register access timing. The timing will differ depending on the PHY-LSI type.

26.4.13 Usage Notes

26.4.13.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. **Figure 26.74, Data Subject to Checksum Calculation** shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. **Figure 26.75, Data after Checksum Data Addition** shows schematics of Ethernet frames to which the checksum data has been added.

CAUTION

Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

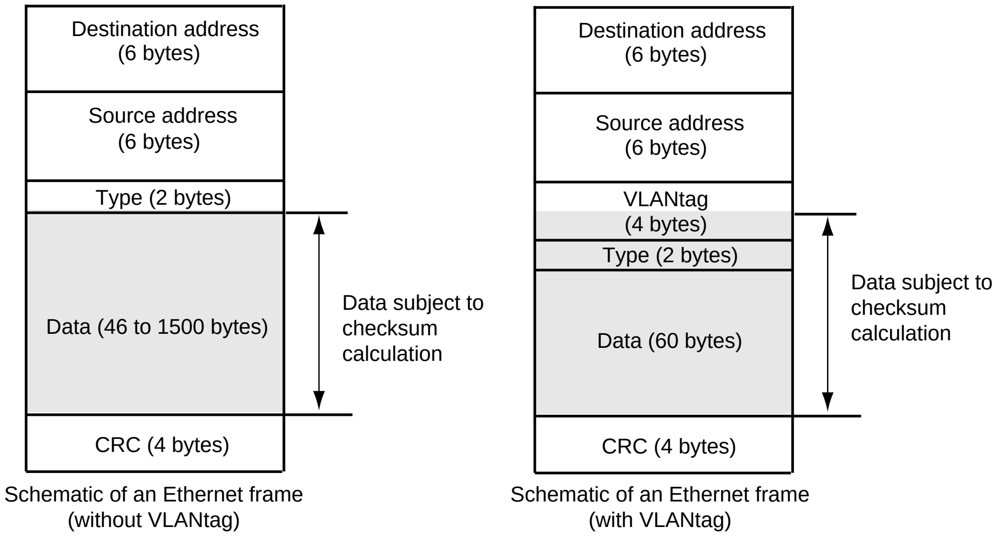

Figure 26.74 Data Subject to Checksum Calculation

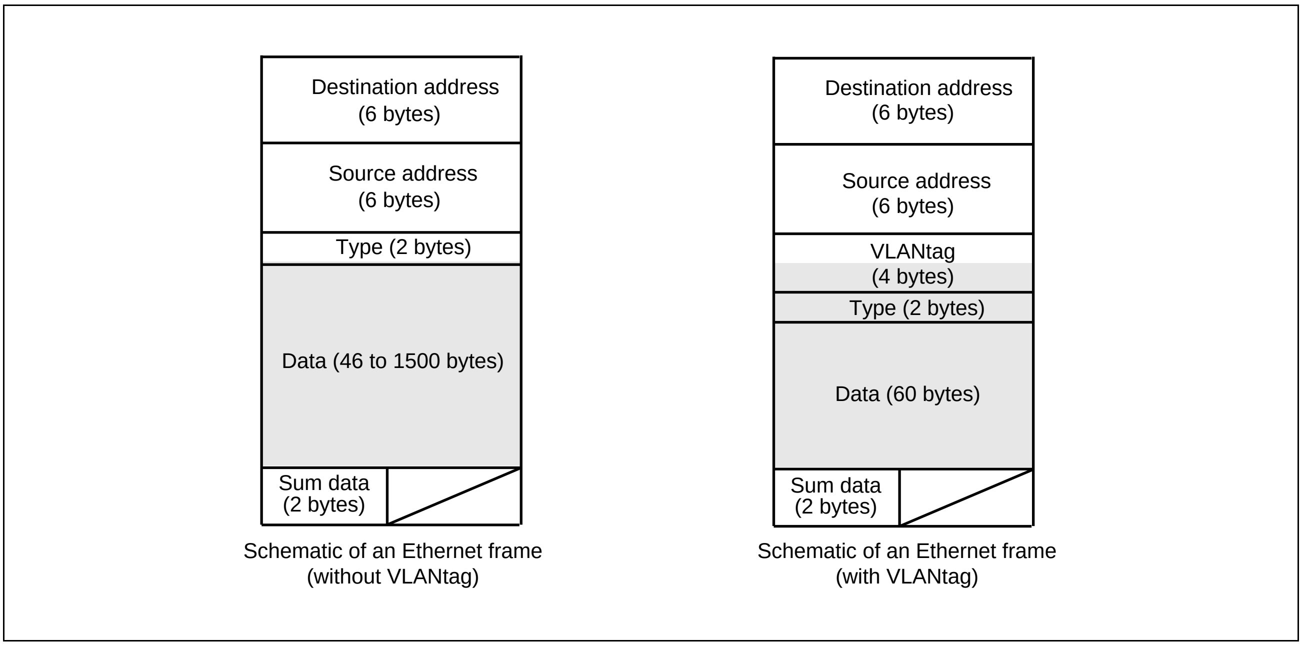

Figure 26.75 Data after Checksum Data Addition

26.4.13.2 Rx-FIFO Read Error May Not be Flagged when Using FEMPTY_ND Descriptor

After reading the last byte targeted to the FEMPTY_ND descriptor, there can be up to 3 bytes read from Rx-FIFO targeted to the next descriptor of the same frame. Rx-FIFO read errors of not stored data due to FEMPTY_ND are neither flagged in DESCR.EI nor by ETNBnEIS.QEF as per target specification.

When external ECC logic flags detect Rx-FIFO read error related to last byte targeted to FEMPTY_ND descriptor, data in the next descriptor may be corrupted without notification.

The issue is limited to implementations where Rx-FIFO error information is provided to Ethernet AVB and also to applications using FEMPTY_ND descriptor.

The issue only occurs when the first byte saved in the descriptor following FEMPTY_ND is not a multiple of 4 bytes inside the received frame.

Use a FEMPTY descriptor to store unwanted data if consistent error flagging is required.

26.4.13.3 When Trying to Release Non-Existing Timestamp FIFO Entry, New FIFO Update Flag May be Lost

When SW releases an entry of timestamp FIFO by writing ETNBnTCCR.TFR while this FIFO is empty (ETNBnTSR.TFFL is set to 0), flagging of next FIFO update may be inconsistent. The next timestamp is correctly stored in FIFO and the fill level is incremented to 1 but ETNBnTIS.TFUF is not set to 1.

The issue is limited to applications releasing FIFO entries without checking if there are entries available.

Do not release not existing FIFO entries.

26.4.13.4 gPTP Compare May Fail for Range of Compare Values

When the comparison value (ETNBnGPTC.PTCV) is in the range of [x – 1 to x + 1] (x is the configured increment value in ETNBnGTI.TIV), it may happen that a comparison match is not detected when Timer wraps around.

The issue is limited to applications using the AVTP comparison function. Do not configure comparison values inside the critical range.

26.4.13.5 UFC Stop Level Triggers ETNBnRIS2.QFFr Even No Received Frame is Lost

When a received frame is dropped due to non-availability of empty descriptor, ETNBnRIS2.QFFr is correctly set to 1.

Additionally, when ETNBnUFCVi.CVr reached the configured stop level (ETNBnUFCS.SLj), the queue full flag (ETNBnRIS2.QFFr) is set to 1 even before any further received frame is dropped.

The issue is limited to applications using unread frame counter with stop level function.

Such application gets information about lost received frames which in fact might not have lost.

26.4.13.6 ETNBnRIS0.FRFr may be lost when Data Processing Stops Close to or Below the Configured Warning Level.

When SW decrements UFC counter value (CV) to WL-1, resulting CV can still be WL due to recent new storage completion, ETNBnRIS0.FRFr is set to 0.

Any further reception will set ETNBnRIS0.FRFr as normal.

The issue is limited to applications using a single frame interrupt triggered by ETNBnRIS0.FRFr and not be able to process each interrupt in time.

The missing interrupt due to this effect is automatically recovered by the next frame reception as usual.

26.4.13.7 Notes on Using the Intelligent Checksum Function

The checksum calculation using the intelligent checksum function is not affected by the padding insertion specified by the receive data padding configuration register (ETNBnRPC). This is because the checksum calculation is performed when transferring the receive data from E-MAC to AVB-DMAC, while the padding of the receive data is performed when transferring the receive data from AVB-DMAC to the receive buffer in memory.

26.4.13.8 Receive Frame Interrupt and Descriptor Interrupt may be issued before Completion of Writing Data

When receive frame interrupt is issued, the software should check that the descriptor type is updated correctly before processing the frame data.

The descriptor type is shown in the descriptor field DESCR.DT (the address of the current descriptor is shown by the register ETNBnCDARq). If DESCR.DT is not yet updated by the DMA hardware (e.g. from FEMPTY to FEND), then the write of data to the memory is not completed. In that case the software should repeat checking the descriptor type until an update has happened.

Alternatively the software can use the Unread Frame Counter (UFC) value to compare with its processed descriptors to confirm there is no missing descriptor from the last received interrupt.

26.5 Detection and Correction of Errors in Ethernet AVB RAM

For details of ECC, see **Section 40A.2.6, ECC for Peripheral RAM**, **Section 40B.2.6, ECC for Peripheral RAM**.

Section 27 Single Edge Nibble Transmission (RSENT)

This section contains a generic description of the Renesas single edge nibble transmission (RSENT).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RSENT.

27.1 Features of RH850/F1KH, RH850/F1KM RSENT

27.1.1 Number of Units

This microcontroller has the following number of RSENT units.

Each RSENT unit has single channel interface.

Table 27.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	2	2	2
Name	RSENTn (n = 0, 1)	RSENTn (n = 0, 1)	RSENTn (n = 0, 1)

Table 27.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	2	2	2	2
Name	RSENTn (n = 1)	RSENTn (n = 0, 1)	RSENTn (n = 0, 1)	RSENTn (n = 0, 1)	RSENTn (n = 0, 1)

Table 27.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	2	2	2	2
Name	RSENTn (n = 0, 1)	RSENTn (n = 0, 1)	RSENTn (n = 0, 1)	RSENTn (n = 0, 1)

Table 27.4 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RSENT units are identified by the index “n”; for example, RSENTnTSPC (n = 0, 1) indicates the RSENTn time stamp register.

27.1.2 Register Base Addresses

RSENTn base addresses are listed in the following table.

RSENTn register addresses are given as offsets from the base addresses.

Table 27.5 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<RSENT0_base>	FFCF 0000_H
<RSENT1_base>	FFCF 0100_H

27.1.3 Clock Supply

The RSENTn clock supply is shown in the following table.

Table 27.6 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RSENTn	SENT Commutation Clock	CKSCLK_IPERI2	Commutation clock
	Register Access Clock (PCLK)	CPUCLK_L	Bus clock

Note: Commutation clock must be either 16 MHz or in the range of 32 MHz to 40 MHz and register access clock frequency can be in the range 16 MHz to 60 MHz.

27.1.4 Interrupt Requests

RSENTn interrupt requests are listed in the following table.

Table 27.7 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RSENT0			
INTSENT0SI	RSENT status interrupt	347	—
INTSENT0RI	RSENT receive interrupt	348	123
RSENT1			
INTSENT1SI	RSENT status interrupt	349	—
INTSENT1RI	RSENT receive interrupt	350	124

27.1.5 Reset Sources

RSENTn reset sources are listed in the following table. RSENTn is initialized by these reset sources.

Table 27.8 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
RSENTn	All reset sources (ISORES)

27.1.6 External Input/Output Signals

External input/output signals of RSENT are listed below.

Table 27.9 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RSENT0		
sent_rx	RSENT Receive Data Input	SENT0RX
sent_spc	RSENT SPC Extension Output	SENT0SPCO
RSENT1		
sent_rx	RSENT Receive Data Input	SENT1RX
sent_spc	RSENT SPC Extension Output	SENT1SPCO

27.2 Overview

Overview of Functions

The RSENT interface supports the following standard specification (SAE J2716 version APR2016) functions (with extensions for support of 8 nibble data):

- Triple speed expansion Tick Time: Clock cycle (1 µs to 90 µs)
- Variable data transmission rate
  - up to 74.9 kbps (based on 8 nibble data at 3us clock rate)
  - up to 224.7 kbps (based on 8 nibble data at 1us clock rate)
- Unidirectional communication: Between the sensor and MCU
- Bidirectional communication: Between the sensor and MCU (supported in SPC mode)
- Single edge data transmission: Coded by the temporal distance of two serially-detected falling edges on a data line
- Transmission frame with up to 8 data nibbles and additionally status and communications nibbles
- Data transmission protected with CRC is available.
  - CRC data can be read with the RSENTnSRXD.SCRC and RSENTnFRXD.FCRC bits.
- Calibration phase in each data frame (RSENTnCPL.CPLV bits)
- Multiple sensors can connect to the RSENT channel that has the standard expansion function.

  Received data from sensors is detected by software or DMA.
- The timestamp function: Master or slave can be selected for the RSENT module. (RSENTnTSPC.TMS bit)
- The RSENT circuit consists of the following functions:
  - Data receive part
  - Clock recovery
  - Register group

27.2.1 Block Diagram

The following figure shows a block diagram of the RSENT module.

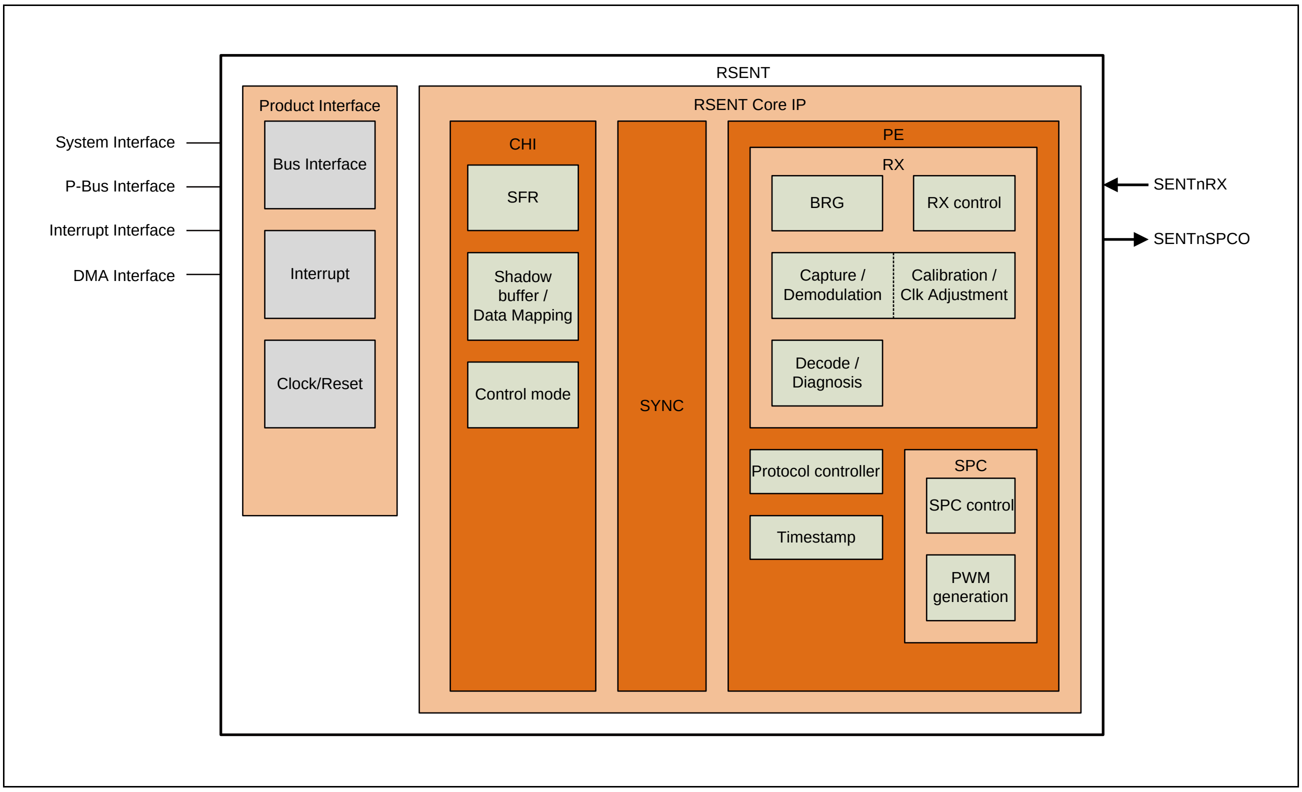

Figure 27.1 Block Diagram of RSENT

27.3 Registers

27.3.1 List of Registers

RSENT registers are listed in the following table.

For details about <RSENTn_base>, see **Section 27.1.2, Register Base Addresses**.

Table 27.10 List of Registers

Module Name	Register Name	Abbreviation	Address
RSENTn	RSENT timestamp register	RSENTnTSPC	<RSENTn_base> + 0000_H
	RSENT timestamp counter	RSENTnTSC	<RSENTn_base> + 0004_H
	RSENT communication configuration register	RSENTnCC	<RSENTn_base> + 0010_H
	RSENT baud rate prescaler register	RSENTnBRP	<RSENTn_base> + 0014_H
	RSENT interrupt/DMA enable register	RSENTnIDE	<RSENTn_base> + 0018_H
	RSENT mode control register	RSENTnMDC	<RSENTn_base> + $001C_H$
	RSENT SPC transmission register	RSENTnSPCT	<RSENTn_base> + 0020_H
	RSENT mode status register	RSENTnMST	<RSENTn_base> + 0024_H
	RSENT communication status register	RSENTnCS	<RSENTn_base> + 0028_H
	RSENT communication status clear register	RSENTnCSC	<RSENTn_base> + $002C_H$
	RSENT slow channel receive timestamp register	RSENTnSRTS	<RSENTn_base> + 0030_H
	RSENT slow channel receive data register	RSENTnSRXD	<RSENTn_base> + 0034_H
	RSENT calibration pulse length register	RSENTnCPL	<RSENTn_base> + 0038_H
	RSENT message length register	RSENTnML	<RSENTn_base> + $003C_H$
	RSENT fast channel receive timestamp register	RSENTnFRTS	<RSENTn_base> + 0040_H
	RSENT fast channel receive data register	RSENTnFRXD	<RSENTn_base> + 0044_H
	RSENT calibration pulse length mirror register	RSENTnCPLM	<RSENTn_base> + 0050_H
	RSENT message length mirror register	RSENTnMLM	<RSENTn_base> + 0054_H
	RSENT fast channel receive timestamp mirror register	RSENTnFRTSM	<RSENTn_base> + 0058_H
	RSENT expanded fast channel receive data register 0	RSENTnEFRD0	<RSENTn_base> + $005C_H$
	RSENT expanded fast channel receive data register 1	RSENTnEFRD1	<RSENTn_base> + 0060_H

27.3.2 RSENTnTSPC — RSENT Timestamp Register

Access: This register can be read or written in 32-bit units.

Address: <RSENTn_base> + 0000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TMS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	TTM[6:0]							—	TTPV[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.11 RSENTnTSPC Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
16	TMS	Timestamp Mode Selection 0: Master mode 1: Slave mode
15	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
14 to 8	TTM[6:0]	Timestamp Tick Multiplier 0000000_B: 1 0000001_B: 2 0000010_B: 3 : 1111111_B: 128
7	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
6 to 0	TTPV[6:0]	Timestamp Tick Prescaler Value 0000000_B: 1 0000001_B: 2 0000010_B: 3 : 1111111_B: 128

RSENTnTSPC.TMS (Timestamp Mode Selection)

This bit defines the timestamp counter synchronization mode.
For information about the timestamp clock settings, see **Section 27.4.2.1, Timestamp**.
When this bit is set to 0, the timestamp counter operates in master mode.
When writing $0000\ 0000_H$ to RSENTnTSC, the timestamp counter is cleared. In addition all RSENT timestamp counters operating as slave of RSENT are also cleared. For master-slave interconnection, see **Section 27.4.2.1(2), Timestamp Counter Operation**.
When this bit is set to 1, the timestamp counter operates in slave mode.
The timestamp counter is only cleared when writing $0000\ 0000_H$ to the timestamp counter of RSENT module that operates in master mode.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

The RSENT module operating in slave mode should have the same timestamp counter prescaler settings as the RSENT module that operates in master mode.
The CPU should not set this bit to 1 for RSENT module that operates in master mode.

RSENTnTSPC.TTM (Timestamp Tick Multiplier)

These bits define the multiplication value of the 1-µs time tick used for the timestamp counter.
For timestamp clock configuration, see **Section 27.4.2.1, Timestamp**.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode
(the RSENTnMST.OMS bits are 001_B).

RSENTnTSPC.TTPV (Timestamp Tick Prescaler Value)

These bits define the prescaler value to generate a 1-µs clock tick.
For timestamp clock configuration, see **Section 27.4.2.1, Timestamp**.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode
(the RSENTnMST.OMS bits are 001_B).
The CPU should configure this value in such a way that, based on the supplied communication clock, a 1-µs clock tick is generated.

27.3.3 RSENTnTSC — RSENT Timestamp Counter

Access:	This register can be read or written in 32-bit units.
Address:	<RSENTn_base> + 0004$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TS[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.12 RSENTnTSC Register Contents

Bit Position	Bit Name	Function
31 to 0	TS[31:0]	Timestamp counter value

RSENTnTSC.TS (Timestamp)

These bits indicate the current timestamp counter value.
The CPU can only write desired values to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001$_B$).
When the timestamp counter is configured to operate in slave mode (RSENTnTSPC.TMS = 1), writing to this register has no effect when the RSENT module is in either of the OPERATION IDLE or OPERATION ACTIVE modes (the RSENTnMST.OMS bits are either 011$_B$ or 101$_B$).
The timestamp counter is incremented on every timestamp counter tick (as configured in the RSENTnTSPC.TTPV and RSENTnTSPC.TTM bits) when the RSENT module is in either of the OPERATION IDLE or OPERATION ACTIVE modes (the RSENTnMST.OMS bits are either 011$_B$ or 101$_B$).
When the timestamp counter is configured to operate in master mode (RSENTnTSPC.TMS = 0), the CPU writes 0000 0000$_H$ to these bits and RSENTnTSC.TS is set to 0000 0000$_H$.

When the slave mode setting is made for the timestamp counter of channel n (RSENTnTSPC.TMS = 1), writing to the timestamp counter of the channel that is the master for channel n leads to the RSENTnTSC.TS bits being set to 0000 0000$_H$.

For timestamp mode selection, see **Section 27.4.2.1, Timestamp**.

27.3.4 RSENTnCC — RSENT Communication Configuration Register

Access:	This register can be read or written in 32-bit units.
Address:	<RSENTn_base> + 0010_H
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SOPC	FCM	SCCD	FCCD	DCF	SMF[1:0]		PPTC	PPC	NDN[2:0]			SPCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.13 RSENTnCC Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
12	SOPC	SPC Output Polarity Control 0: SPC pulse active high 1: SPC pulse active low
11	FCM	Frame Check Method 0: Check against next calibration pulse 1: Check against previous calibration pulse
10	SCCD	Slow Channel CRC Check 0: Slow channel CRC check enabled 1: Slow channel CRC check disabled
9	FCCD	Fast Channel CRC Check 0: Fast channel CRC check enabled 1: Fast channel CRC check disabled
8	DCF	Data nibble CRC Format 0: SAE J2716 2010/2016 format 1: pre SAE J2716 2010 format
7, 6	SMF[1:0]	Serial Message Format 00_B: No serial message extraction 01_B: Short serial message format 10_B: Enhanced serial message format 11_B: Setting prohibited
5	PPTC	Pause Pulse Type Configuration 0: Pause pulse for variable message length 1: Pause pulse for fixed message length
4	PPC	Pause Pulse Configuration 0: Pause pulse absent 1: Pause pulse present

Table 27.13 RSENTnCC Register Contents

Bit Position	Bit Name	Function
3 to 1	NDN[2:0]	Number of Data Nibbles 000_B: 1 data nibble 001_B: 2 data nibbles 010_B: 3 data nibbles 011_B: 4 data nibbles 100_B: 5 data nibbles 101_B: 6 data nibbles 110_B: 7 data nibbles 111_B: 8 data nibbles
0	SPCE	SPC Mode Enable 0: SPC mode disabled 1: SPC mode enabled

RSENTnCC.SOPC (SPC Output Polarity Control)

When this bit is set to 0, the SPC pulse is sent as an active high signal. The default output value is low level.
When this bit is set to 1, the SPC pulse is sent as an active low signal. The default output value is high level.
For SPC operation, see also **Section 27.4.4, SPC Function**.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

NOTE

Any change to this bit from the default value becomes effective on the output value when entering the OPERATION ACTIVE mode (the RSENTnMST.OMS bits are 101_B). When entering RESET mode (the RSENTnMST.OMS bits are 000_B), the output level is set to the default value (low level).

RSENTnCC.FCM (Frame Check Method)

When this bit is set to 0, the current calibration pulse is compared to the next received calibration pulse.
The buffer update mechanism is operating according to the preferred option as described in SAE J2716 2016.
When this bit is set to 1, the current calibration pulse is compared to the previously received calibration pulse.
The buffer update mechanism is operating according to the second option as described in SAE J2716 2016 which should be only used if extra latency to process the second calibration pulse cannot be tolerated.
For buffer update timings, see also **Section 27.4.3.2(3), Fast Channel Message Reception**.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnCC.SCCD (Slow Channel CRC Check Disable)

When this bit is set to 1, the CRC check for the slow channel is disabled. In this case, messages are stored in the slow channel message reception buffer with the received CRC.
When this bit is set to 1, the RSENTnCS.SCS bit is not set.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnCC.FCCD (Fast Channel CRC Check Disable)

When this bit is set to 1, the CRC check for the fast channel is disabled. In this case, messages are stored in the fast channel message reception buffer with the received CRC.
When this bit is set to 1, the RSENTnCS.FCS bit is not set.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnCC.DCF (Data Nibble CRC Format)

This bit selects between the SAE J2716 2016 data nibble CRC format and the legacy format.
When this bit is set to 0 the recommended CRC implementation according to SAE J2716 2016 *Section 5.4.2.2* is selected.
When this bit is set to 1 the legacy CRC implementation according to SAE J2716 2008 (refer to SAE J2716 2016 *Section 5.4.2.1*) is selected.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (RSENTnMST.OMS = 001_B)

RSENTnCC.SMF (Serial Message Format)

These bits define the serial message format expected to be received for automatic extraction.
When these bits are set to 00_B, no serial message is extracted and the status and communications nibbles are stored in the RSENTnSRXD register.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).
The CPU shall set these bits to 00_B when RSENTnCC.SPCE is set to 1 and more than one sensor is connected to the RSENT module.

RSENTnCC.PPTC (Pause Pulse Type Configuration)

This bit defines the pause pulse type.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).
The CPU should not set this bit to 1 when the RSENTnCC.PPC bit is set to 0.

RSENTnCC.PPC (Pause Pulse Configuration)

This bit defines the presence or absence of the pause pulse.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnCC.NDN (Number of Data Nibbles)

These bits define the number of data nibbles included in an SENT message.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnCC.SPCE (SPC Mode Enable)

This bit enables the SPC mode.
For details about SPC mode operation, see also **Section 27.4.4, SPC Function**.
The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

27.3.5 RSENTnBRP — RSENT Baud Rate Prescaler Register

Access: This register can be read or written in 32-bit units.

Address: <RSENTn_base> + 0014$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
27 to 24	TTF[3:0]	Time Tick Decimal Fraction 0000$_B$: 0.0 µs 0001$_B$: 0.1 µs 0010$_B$: 0.2 µs : 1000$_B$: 0.8 µs 1001$_B$: 0.9 µs Other than above: Setting prohibited
23	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
22 to 16	TTI[6:0]	Time Tick Integer 0000000$_B$: 1 µs 0000001$_B$: 2 µs 0000010$_B$: 3 µs : 1011000$_B$: 89 µs 1011001$_B$: 90 µs Other than above: Setting prohibited
15	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
14 to 8	SCDV[6:0]	Sample Clock Division Value 0000000$_B$: 1 0000001$_B$: 2 0000010$_B$: 3 : 1111110$_B$: 127 1111111$_B$: 128
7 to 5	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.

Table 27.14 RSENTnBRP Register Contents

Bit Position	Bit Name	Function
4 to 0	SCMV[4:0]	Sample Clock Multiplication Value 00000_B: 1 00001_B: 2 00010_B: 3 : 11110_B: 31 11111_B: 32

RSENTnBRP.TTF (Time Tick Decimal Fraction)

These bits define the decimal part of the tick length in 0.1-µs granularity.
For tick length configuration, see **Section 27.4.2.2(2), RX and SPC Tick Settings**.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnBRP.TTI (Time Tick Integer)

These bits define the integer part of the tick length.
For tick length configuration, see **Section 27.4.2.2(2), RX and SPC Tick Settings**.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnBRP.SCDV (Sample Clock Division Value)

These bits define the division value for the sample clock generation logic.
For RSENTnBRP settings, see **Section 27.4.2.2(1), RX BRP Setting**.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

RSENTnBRP.SCMV (Sample Clock Multiplication Value)

These bits define the multiplication value for the sample clock generation logic.
For RSENTnBRP settings, see **Section 27.4.2.2(1), RX BRP Setting**.
The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001_B).

27.3.6 RSENTnIDE — RSENT Interrupt/DMA Enable Register

Access: This register can be read or written in 32-bit units.

Address: <RSENTn_base> + 0018$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 27.15 RSENTnIDE Register Contents

Bit Position	Bit Name	Function
0	FRIE	Fast Channel Receive Interrupt Enable 0: Interrupt disabled 1: Interrupt enabled

RSENTnIDE.SEIE (Slow Channel Encoding Error Interrupt Enable)

This bit enables the generation of the slow channel encoding error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.SMIE (Slow Channel Message Lost Interrupt Enable)

This bit enables the generation of the slow channel message lost interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.SCIE (Slow Channel CRC Error Interrupt Enable)

This bit enables the generation of the slow channel CRC error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.NRIE (No Response Error Interrupt Enable)

This bit enables the generation of the no response error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).
The CPU should not set this bit when the SPC mode is disabled (RSENTnCC.SPCE set to 0).

RSENTnIDE.CVIE (Calibration Pulse Length Variation Error Interrupt Enable)

This bit enables the generation of the calibration pulse length variation error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.CLIE (Calibration Pulse Length Error Interrupt Enable)

This bit enables the generation of the calibration pulse length error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.FNIE (Fast Channel Nibble Count Error Interrupt Enable)

This bit enables the generation of the fast channel nibble count error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.FEIE (Fast Channel Nibble Encoding Error Interrupt Enable)

This bit enables the generation of the fast channel nibble encoding error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.FMIE (Fast Channel Message Lost Interrupt Enable)

This bit enables the generation of the fast channel message lost interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.FCIE (Fast Channel CRC Error Interrupt Enable)

This bit enables the generation of the fast channel CRC error interrupt.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).

RSENTnIDE.FRIE (Fast Channel Receive Interrupt Enable)

This bit enables the generation of the fast channel receive interrupt.
The fast channel receive interrupt can be also used to notify a DMA request.
The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are 000_B).

27.3.7 RSENTnMDC — RSENT Mode Control Register

Access: This register can be read or written in 32-bit units.

Address: <RSENTn_base> + $001C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	OMC[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 27.16 RSENTnMDC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
2 to 0	OMC[2:0]	Operation Mode Control 000_B: RESET 001_B: CONFIGURATION 011_B: OPERATION IDLE 101_B: OPERATION ACTIVE Other than above: Setting prohibited

RSENTnMDC.OMC (Operation Mode Control)

These bits are used to control the operation mode of the RSENT module.

- 000_B: RESET
  In RESET mode, the mode can only be changed to CONFIGURATION mode.
- 001_B: CONFIGURATION
  In CONFIGURATION mode, the mode can only be changed to RESET mode or OPERATION ACTIVE mode.
- 011_B: OPERATION IDLE
  In OPERATION IDLE mode, the mode can be changed to OPERATION ACTIVE mode, CONFIGURATION mode, or RESET mode.
- 101_B: OPERATION ACTIVE
  In OPERATION ACTIVE mode, the mode can be changed to OPERATION IDLE mode, CONFIGURATION mode, or RESET mode. However, it is recommended to process to the OPERATION IDLE mode first.
  For the recommended methods to change between operation modes, see **Section 27.4.3.1, Changing Operation Modes**.
- Other than above: Setting prohibited
  The CPU should not write any other value than listed above into this register.
  The CPU should follow the mode change flows as shown in **Section 27.4.3.1, Changing Operation Modes**.

27.3.8 RSENTnSPCT — RSENT SPC Transmission Register

Access: This register can be read or written in 32-bit units.

Address: <RSENTn_base> + 0020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	TLL[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.17 RSENTnSPCT Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.
6 to 0	TLL[6:0]	Length of the Trigger Low Phase in Ticks 0000000_B: 1 tick 0000001_B: 2 ticks 0000010_B: 3 ticks : 1111110_B: 127 ticks 1111111_B: 128 ticks

RSENTnSPCT.TLL (Trigger Low Length)

These bits define the length of the SPC trigger pulse.

When the CPU writes to these bits, an SPC trigger pulse with the configured length is sent starting from the next SPC trigger tick. In case RSENTnCS.NRS is set by the RSENT module following a write to these bits, no SPC trigger pulse is sent.

For details about SPC communication, see **Section 27.4.4, SPC Function**.

The CPU can only write to these bits if the RSENT module is in the OPERATION ACTIVE mode (the RSENTnMST.OMS bits are 101_B) and SPC communication is enabled (RSENTnCC.SPCE is 1_B).

It is important to note that two consecutive write access might not cause a no response error as the previous request might not have started yet.

After writing to this register, the CPU should wait for at least one SPC trigger tick before writing again to this register.

27.3.9 RSENTnMST — RSENT Mode Status Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + 0024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	OMS[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.18 RSENTnMST Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read.
2 to 0	OMS[2:0]	Operation Mode 000_B: RESET 001_B: CONFIGURATION 011_B: OPERATION IDLE 101_B: OPERATION ACTIVE Other than above: Reserved

RSENTnMST.OMS (Operation Mode Status)

These bits indicate the current operation mode. These bits are read only.
These bits are updated after a mode change request is made in the RSENTnMDC.OMC register.

- 000_B: RESET mode
  When in RESET mode, all registers are set to their reset values and write access to all registers except the RSENTnMDC register is disabled.
  When in RESET mode, SENT communication is disabled.
- 001_B: CONFIGURATION mode
  When in CONFIGURATION mode, write access to the timestamp registers (RSENTnTSPC and RSENTnTSC register), configuration registers (RSENTnCC and RSENTnBRP register), RSENTnIDE register, and mode control register (RSENTnMDC.OMC) is enabled.
  When in CONFIGURATION mode, SENT communication is disabled.
  When entering CONFIGURATION mode, all status registers and receive buffer registers are set to their reset values.
- 011_B: OPERATION IDLE mode
  In OPERATION IDLE mode, no reception or SPC trigger transmission is possible.
  When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.
- 101_B: OPERATION ACTIVE mode
  In OPERATION ACTIVE mode, reception and SPC trigger transmission are possible.
- Other than above: Reserved

27.3.10 RSENTnCS — RSENT Communication Status Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + 0028$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

1	FCS	Fast Channel CRC Error Interrupt Status 0: Not detected 1: Detected

Table 27.19 RSENTnCS Register Contents

Bit Position	Bit Name	Function
0	FRS	Fast Channel Receive Interrupt Status 0: Not detected 1: Detected

RSENTnCS.SES (Slow Channel Encoding Error Status)

This bit represents the slow channel encoding error status.
This bit is read only.
In the short serial message format (RSENTnCC.SMF = 01_B), this bit is set when the sequence on serial start bit (bit #3) is different from “1000 0000 0000 0000_B” (a single 1 and 15 0s).
In the enhanced serial message format (RSENTnCC.SMF = 10_B), this bit is set when following the reception of a start sequence (“0111 1110_B”) on the serial data bit 3, bit 13 or bit 18 are not received as “0”.
When this bit is set in the short serial message format the received communication and status nibble is used to assemble a serial message.
When this bit is set in the enhanced serial message format the RSENT module checks the presence of a new start sequence at the same time and uses the received communication and status nibble to assemble a serial message.
This bit is cleared when writing 1 to RSENTnCSC.SEC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.SMS (Slow Channel Message Lost Status)

This bit represents the slow channel message lost status.
This bit is read only.
This bit is set when there is an attempt to update the slow channel message reception buffer, but the previous message has not been read yet.
This bit is cleared when writing 1 to RSENTnCSC.SEC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.SCS (Slow Channel CRC Error Status)

This bit represents the slow channel CRC error status.
This bit is read only.
This bit is set when a CRC error is detected on the slow channel and the slow channel CRC detection is enabled (RSENTnCC.SCCD is set to 0).
This bit is cleared when writing 1 to RSENTnCSC.SCC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.NRS (No Response Error Status)

This bit represents the no response error status.
This bit is read only.
This bit is set when

- The CPU writes to the RSENTnSPCT.TLL bits and
- SPC mode enabled (RSENTnCC.SPCE set to 1) and
- No complete response was received from the sensor for the previous SPC trigger.

This bit is set after 4 PCLK + 5 clkc (Maximum time) from the CPU writes to the RSENTnSPCT.TLL.
This bit is cleared when writing 1 to RSENTnCSC.NRC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.CVS (Calibration Pulse Length Variation Error Status)

This bit represents the calibration pulse length variation error status.
This bit is read only.
When RSENTnCC.PPTC is 0, then this bit is set when two successive calibration pulses differ by more than 1.5625 %.
When RSENTnCC.PPTC is 1, this bit is never set. In this mode (pause pulse with fixed message length), the CPU needs to check the variation of the ratio of calibration pulse to message length by reading the RSENTnCPL and RSENTnML registers.
This bit is cleared when writing 1 to RSENTnCSC.CVC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.CLS (Calibration Pulse Length Error Status)

This bit represents the calibration pulse length error status.
This bit is read only.
This bit is set when the measured calibration pulse length is less than 42 clock ticks or more than 70 clock ticks (deviation of 25 % from nominal length).
This bit is cleared when writing 1 to RSENTnCSC.CLC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.FNS (Fast Channel Nibble Count Error Status)

This bit represents the fast channel nibble count error status.
This bit is read only.
This bit is set when there is an unexpected number of falling edges between two calibration pulses.
This bit is cleared when writing 1 to RSENTnCSC.FNC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.FES (Fast Channel Nibble Encoding Error Status)

This bit represents the fast channel nibble encoding error status.
This bit is read only.
This bit is set when on the fast channel a measured nibble period is less than 12 clock ticks or more than 27 clock ticks.
This bit is cleared when writing 1 to RSENTnCSC.FEC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.FMS (Fast Channel Message Lost Status)

This bit represents the fast channel message lost status.
This bit is read only.
This bit is set when the fast channel message reception buffer is updated, but the previous messages in the foreground and background buffer have not been read yet.
This bit is cleared when writing 1 to RSENTnCSC.FMC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.FCS (Fast Channel CRC Error Status)

This bit represents the fast channel CRC error status.
This bit is read only.
This bit is set when a CRC error is detected on the fast channel and the fast channel CRC detection is enabled (RSENTnCC.FCCD is set to 0).
This bit is cleared when writing 1 to RSENTnCSC.FCC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

RSENTnCS.FRS (Fast Channel Receive Status)

This bit represents the fast channel receive status.
This bit is read only.
This bit is set when the fast channel message reception buffer was updated.
This bit is cleared when the CPU reads the RSENTnFRXD or RSENTnEFRD1 register.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

27.3.11 RSENTnCSC — RSENT Communication Status Clear Register

Access: This register can be read or written in 32-bit units.

Address: <RSENTn_base> + $002C_H$

Value after reset: $0000\ 0000_H$

0	Reserved	When read, the value after reset is read. When writing, write the initial value after reset.

RSENTnCSC.SEC (Slow Channel Encoding Error Clear)

Writing 1 sets RSENTnCS.SES to 0. Writing 0 has no effect. This bit is always read as 0.

RSENTnCSC.SMC (Slow Channel Message Lost Clear)

Writing 1 sets RSENTnCS.SMS to 0. Writing 0 has no effect. This bit is always read as 0.

RSENTnCSC.SCC (Slow Channel CRC Error Clear)

Writing 1 sets RSENTnCS.SCS to 0. Writing 0 has no effect. This bit is always read as 0.

RSENTnCSC.NRC (No Response Error Clear)

Writing 1 sets RSENTnCS.NRS to 0. Writing 0 has no effect. This bit is always read as 0.

RSENTnCSC.CVC (Calibration Pulse Length Variation Error Clear)

Writing 1 sets RSENTnCS.CVS to 0. Writing 0 has no effect. This bit is always read as 0.

RSENTnCSC.CLC (Calibration Pulse Length Error Clear)

Writing 1 sets RSENTnCS.CLS to 0. Writing 0 has no effect. This bit is always read as 0.

RSENTnCSC.FNC (Fast Channel Nibble Count Error Clear)

Writing 1 sets RSENTnCS.FNS to 0. Writing 0 has no effect. This bit is always read as 0.

RSENTnCSC.FEC (Fast Channel Nibble Encoding Error Clear)

Writing 1 sets RSENTnCS.FES to 0. Writing 0 has no effect. This bit is always read as 0.

RSENTnCSC.FMC (Fast Channel Message Lost Clear)

Writing 1 sets RSENTnCS.FMS to 0. Writing 0 has no effect. This bit is always read as 0.

RSENTnCSC.FCC (Fast Channel CRC Error Clear)

Writing 1 sets RSENTnCS.FCS to 0. Writing 0 has no effect. This bit is always read as 0.

27.3.12 RSENTnSRTS — RSENT Slow Channel Receive Timestamp Register

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	<RSENTn_base> + 0030_H
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STS[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.21 RSENTnSRTS Register Contents

Bit Position	Bit Name	Function
31 to 0	STS[31:0]	Slow Channel Receive Timestamp

RSENTnSRTS.STS (Slow Channel Timestamp)

These bits are read only.

These bits are updated when the slow channel message reception buffer is updated with the timestamp counter value of the last frame provided to the slow channel message.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

27.3.13 RSENTnSRXD — RSENT Slow Channel Receive Data Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + 0034_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SND	—	SCRC[5:0]						—	—	—	SMGC	IDD[19:16]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.22 RSENTnSRXD Register Contents

Bit Position	Bit Name	Function
31	SND	Slow Channel New Data 0: Slow channel frame data is not updated since last read. 1: Slow channel frame data is updated since last read.
30	Reserved	When read, the value after reset is read.
29 to 24	SCRC[5:0]	Slow Channel CRC Data
23 to 21	Reserved	When read, the value after reset is read.
20	SMGC	Slow Channel Configuration Bit Data
19 to 0	IDD[19:0]	Slow Channel Data / ID Information

RSENTnSRXD.SND (Slow Channel New Data)

This bit indicates that the slow channel message reception buffer is holding data that has not been read.
This bit is read only.
This bit is set when the slow channel message reception buffer is updated.
This bit is cleared automatically whenever it is read.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnSRXD.SCRC (Slow Channel CRC)

These bits are representing the slow channel CRC data.
These bits are read only.
These bits are updated when the slow channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnSRXD.SMGC (Slow Channel Configuration Bit)

This bit represents the slow channel configuration bit.
This bit is read only.
This bit is updated when the slow channel message reception buffer is updated.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnSRXD.IDD (ID/Data)

These bits are representing the slow channel data and ID information.
The alignment within this register depends on the message format. For details, see **Section 27.4.3.2(5), Slow Channel Message Reception**.
These bits are read only.
These bits are updated when the slow channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

27.3.14 RSENTnCPL — RSENT Calibration Pulse Length Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + 0038$_{H}$

Value after reset: 0000 0000$_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPLV [16]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CPLV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.23 RSENTnCPL Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is read.
16 to 0	CPLV[16:0]	Calibration Pulse Length Value of Received Message

RSENTnCPL.CPLV (Calibration Pulse Length Value)

These bits are used by the CPU to calculate the ratio of two consecutive calibration pulses or the calibration pulse to message length in pause pulse with fixed message length mode for message diagnostics.
For details, refer to *Section 5.3.3* of the SAE J2716 2016 specification.
These bits are read only.
In modes other than pause pulse with fixed message length mode (RSENTnCC.PPTC = 1$_{B}$) or SPC mode (RSENTnCC.SPCE = 1$_{B}$), these bits are invalid and should not be used.
Updating of the fast channel message reception buffer is storage of the value counted over the calibration pulse length (one tick time × the number of ticks between calibration pulses) based on the sample clock (f_{SAMPLE} = 16 MHz).
These bits are cleared when the RSENTnMST.OMS bits are changed to 001$_{B}$ (CONFIGURATION).

27.3.15 RSENTnML — RSENT Message Length Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + $003C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	MLV[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MLV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.24 RSENTnML Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read.
20 to 0	MLV[20:0]	Message Length Value of Received Message

RSENTnML.MLV (Message Length Value)

These bits are used by the CPU to calculate the ratio of the calibration pulse to message length in pause pulse with fixed message length mode for message diagnostics.

These bits are read only.

In modes other than pause pulse with fixed message length, these bits are invalid and should not be used.

These bits are updated with the measured message length in sample clock ticks when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

27.3.16 RSENTnFRTS — RSENT Fast Channel Receive Timestamp Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + 0040_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FTS[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FTS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.25 RSENTnFRTS Register Contents

Bit Position	Bit Name	Function
31 to 0	FTS[31:0]	Fast Channel Receive Timestamp

RSENTnFRTS.FTS (Fast Channel Receive Timestamp)

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

27.3.17 RSENTnFRXD — RSENT Fast Channel Receive Data Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + 0044_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SNDM	FND	FCCN[1:0]		FCRC[3:0]				ND[23:16]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ND[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.26 RSENTnFRXD Register Contents

Bit Position	Bit Name	Function
31	SNDM	Slow Channel New Data Mirror 0: Slow channel frame data is not updated since last read. 1: Slow channel frame data is updated since last read.
30	FND	Fast Channel New Data 0: Fast channel frame data is not updated since last read. 1: Fast channel frame data is updated since last read.
29, 28	FCCN[1:0]	Fast Channel Communication Nibble
27 to 24	FCRC[3:0]	Fast Channel CRC Data
23 to 0	ND[23:0]	Fast Channel Nibble Data

RSENTnFRXD.SNDM (Slow Channel New Data Mirror)

This bit indicates that the slow channel message reception buffer is holding data that has not been read.
This bit is read only.
This bit is set when the slow channel message reception buffer is updated.
This bit is cleared automatically whenever the slow channel new data bit (RSENTnSRXD.SND) is read.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnFRXD.FND (Fast Channel New Data)

This bit indicates that the fast channel message reception buffer is holding data that has not been read.
This bit is read only.
This bit is set when the fast channel message reception buffer is updated.
This bit is cleared automatically whenever RSENTnFRXD or RSENTnEFRD1 is read.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnFRXD.FCCN (Fast Channel Communication Nibble)

These bits are representing the fast channel communication nibble bits [1:0].
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnFRXD.FCRC (Fast Channel CRC)

These bits are representing the fast channel CRC data.
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnFRXD.ND (Fast Channel Nibble Data)

These bits are representing the fast channel nibble data.
The alignment of the nibble data depends on nibble count. For details, see **Section 27.4.3.2(3), Fast Channel Message Reception**.
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

27.3.18 RSENTnCPLM — RSENT Calibration Pulse Length Mirror Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + 0050_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPLVM [16]
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CPLVM[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.27 RSENTnCPLM Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is read.
16 to 0	CPLVM[16:0]	Calibration Pulse Length Value (Mirror) of Received Message

RSENTnCPLM.CPLVM (Calibration Pulse Length Value (Mirror))

These bits are mirror bit of the RSENTnCPL.CPLV.
These bits are read only.
In modes other than pause pulse with fixed message length mode (RSENTnCC.PPTC = 1_B) or SPC mode (RSENTnCC.SPCE = 1_B), these bits are invalid and should not be used.
Updating of the fast channel message reception buffer is storage of the value counted over the calibration pulse length (one tick time × the number of ticks between calibration pulses) based on the sample clock (f_{SAMPLE} = 16 MHz).
These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

27.3.19 RSENTnMLM — RSENT Message Length Mirror Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + 0054$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	MLVM[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MLVM[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.28 RSENTnMLM Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read.
20 to 0	MLVM[20:0]	Message Length Value (Mirror) of Received Message

RSENTnMLM.MLVM (Message Length Value (Mirror))

These bits are mirror bit of the RSENTnML.MLV.

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001$_B$ (CONFIGURATION).

27.3.20 RSENTnFRTSM — RSENT Fast Channel Receive Timestamp Mirror Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + 0058$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FTSM[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	FTSM[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.29 RSENTnFRTSM Register Contents

Bit Position	Bit Name	Function
31 to 0	FTSM[31:0]	Fast Channel Receive Timestamp (Mirror)

RSENTnFRTSM.FTSM (Fast Channel Receive Timestamp (Mirror))

These bits are mirror bit of the RSENTnFRTS.FTS.

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001$_B$ (CONFIGURATION).

27.3.21 RSENTnEFRD0 — RSENT Expanded Fast Channel Receive Data Register 0

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + $005C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SNDM	FND	FCCN[1:0]		FCRC[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.30 RSENTnEFRD0 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read.
7	SNDM	Slow Channel New Data (Mirror) 0: Slow channel frame data is not updated since last read. 1: Slow channel frame data is updated since last read.
6	FND	Fast Channel New Data 0: Fast channel frame data is not updated since last read. 1: Fast channel frame data is updated since last read.
5 to 4	FCCN[1:0]	Fast Channel Communication Nibble Bits [1:0]
3 to 0	FCRC[3:0]	Fast Channel CRC Data

RSENTnEFRD0.SNDM (Slow Channel New Data (Mirror))

This bit indicates that the slow channel message reception buffer is holding data that has not been read.
This bit is read only.
This bit is set when the slow channel message reception buffer is updated.
This bit is cleared automatically whenever the slow channel new data bit (RSENTnSRXD.SND) is read.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnEFRD0.FND (Fast Channel New Data)

This bit indicates that the fast channel message reception buffer is holding data that has not been read.
This bit is read only.
This bit is set when the fast channel message reception buffer is updated.
This bit is cleared automatically whenever RSENTnFRXD or RSENTnEFRD1 is read.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnEFRD0.FCCN (Fast Channel Communication Nibble)

These bits are representing the fast channel communication nibble bits [1:0].
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

RSENTnEFRD0.FCRC (Fast Channel CRC)

These bits are representing the fast channel CRC data.
These bits are read only.
These bits are updated when the fast channel message reception buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

27.3.22 RSENTnEFRD1 — RSENT Expanded Fast Channel Receive Data Register 1

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RSENTn_base> + 0060_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ND[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ND[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.31 RSENTnEFRD1 Register Contents

Bit Position	Bit Name	Function
31 to 0	ND[31:0]	Fast Channel Nibble Data

RSENTnEFRD1.ND (Nibble Data)

These bits are representing the fast channel nibble data.

The alignment of the nibble data depends on nibble count. For details, see **Section 27.4.3.2(3), Fast Channel Message Reception**.

These bits are read only.

These bits are updated when the fast channel message reception buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001_B (CONFIGURATION).

27.4 Operation

27.4.1 Modes of Operation

The RSENT module can be in one of the following modes:

- RESET mode
- CONFIGURATION mode
- OPERATION IDLE mode
- OPERATION ACTIVE mode

The CPU should follow the mode change flows as shown in **Section 27.4.3.1, Changing Operation Modes**.

The current operation mode status can be seen in the RSENTnMST.OMS bits.

Figure 27.2, Transition between Operation Modes shows the possible transitions between the channel modes:

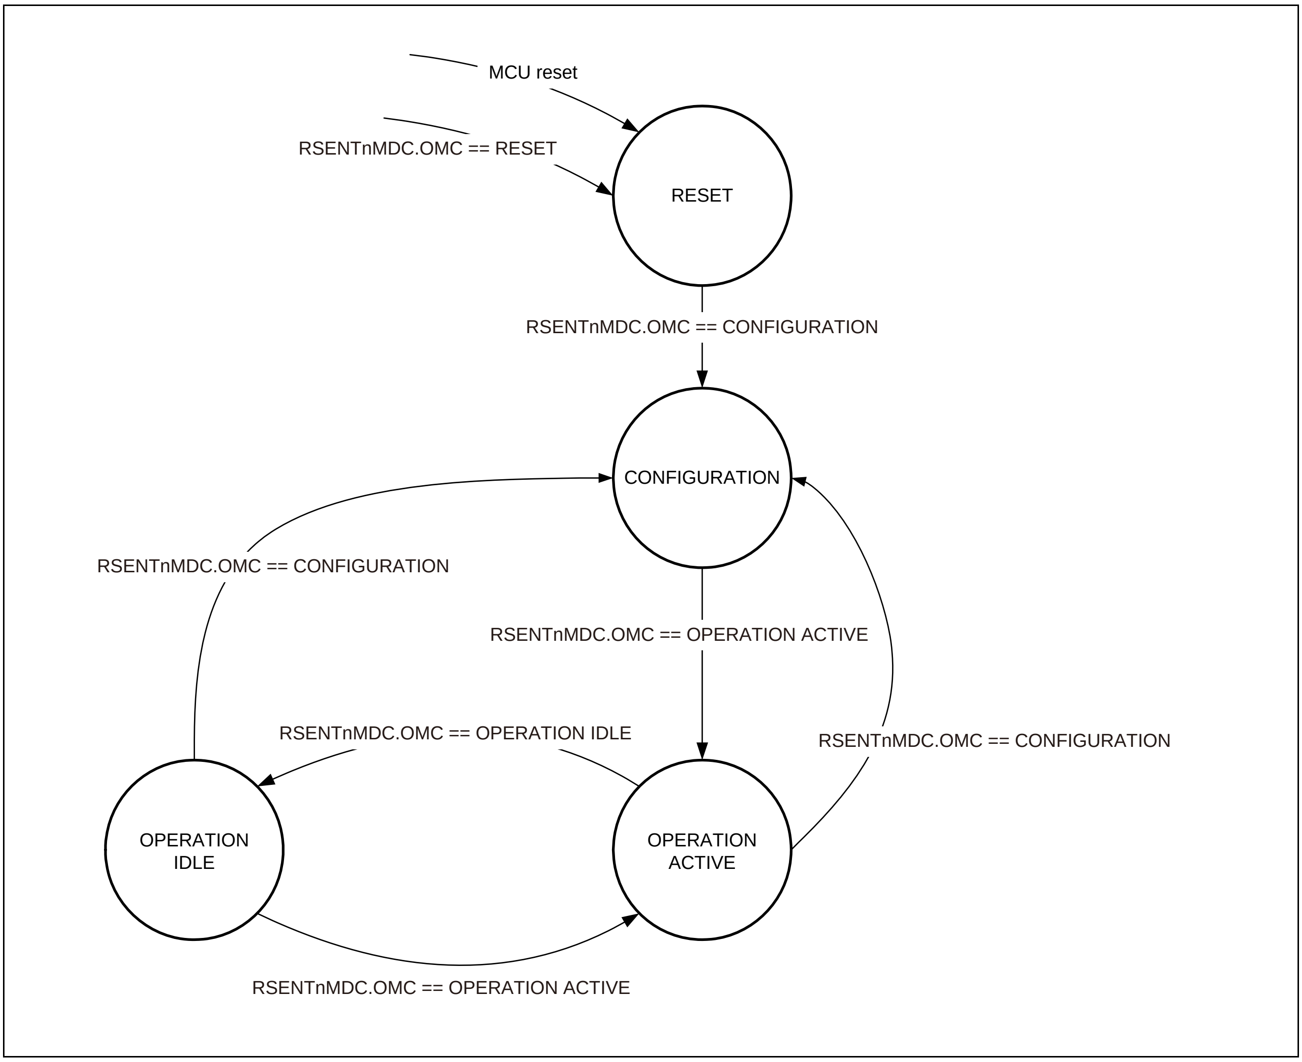

Figure 27.2 Transition between Operation Modes

27.4.1.1 RESET Mode

This mode is the initial mode that the RSENT module automatically enters after the hardware reset (MCU reset) is cleared. Its purpose is to provide a clean reset of the registers in the RSENT module.

The RESET mode is also entered after the RSENTnMDC.OMC bits have been set to 000_B. In this state, all, configuration, control (except RSENTnMDC.OMC bits), and status registers are set to their reset value. Any on-going transmission or reception process is stopped immediately and the interface pins of the RSENT module are set to their default values.

Read access to all registers is possible in this state. Write access is limited to the RSENTnMDC register.

27.4.1.2 CONFIGURATION Mode

The CONFIGURATION mode is entered after the RSENTnMDC.OMC bits have been set to 001_B.

The interface pins of the RSENT module are set to their default values.

Regarding the output polarity setting of SENTnSPCO pin and the timing that becomes effective, please refer to the explanation of “RSENTnCC.SOPC (SPC Output Polarity Control)” in **Section 27.3.4, RSENTnCC — RSENT Communication Configuration Register**.

In this state, all status registers (RSENTnCS) and the receive buffer registers (RSENTnSRTS, RSENTnSRXD, RSENTnCPL, RSENTnML, RSENTnFRTS, and RSENTnFRXD) are set to their default value.

Read access to all registers is possible in this state.

Write access is limited to both timestamp registers (RSENTnTSPC and RSENTnTSC) and configuration registers (RSENTnCC, RSENTnBRP, RSENTnIDE, RSENTnMDC, and RSENTnCSC).

27.4.1.3 OPERATION IDLE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to 011_B.

In OPERATION IDLE mode, no reception and transmission are done.

When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.

Read access to all registers is possible in this state.

Write access is granted only to RSENTnTSC, RSENTnIDE, RSENTnMDC, and RSENTnCSC.

27.4.1.4 OPERATION ACTIVE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to 101_B.

In OPERATION ACTIVE mode, transmission and reception can take place.

Frame reception and status flagging starts after a valid calibration pulse (including the falling edge at the beginning) was detected.

Read access to all registers is possible in this state.

Write access is granted only to RSENTnTSC, RSENTnIDE, RSENTnMDC, RSENTnSPCT, and RSENTnCSC.

27.4.1.5 Register Behavior in Operation Modes

Table 27.32, Register Behavior in Operation Modes shows the register behavior when the RSENT module transitions to the indicated operation modes. The table also gives an overview about the access restriction in each operation mode.

Table 27.32 Register Behavior in Operation Modes

		MCU Reset	RESET		CONFIGURATION		OPERATION IDLE		OPERATION ACTIVE	
Register Name	Symbol	Change	Change	R/W	Change	R/W	Change	R/W	Change	R/W
Timestamp register	RSENTnTSPC	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R	Unchanged	R
Timestamp counter register	RSENTnTSC	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R/W *1	Unchanged	R/W *1
Communication configuration register	RSENTnCC	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R	Unchanged	R
Baud rate prescaler register	RSENTnBRP	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R	Unchanged	R
Interrupt/DMA enable register	RSENTnIDE	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R/W	Unchanged	R/W
Mode control register	RSENTnMDC	0000 0000$_H$	0000 0000$_H$	R/W	Unchanged	R/W	Unchanged	R/W	Unchanged	R/W
SPC transmission register	RSENTnSPCT	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R	Unchanged	R	Unchanged	R/W
Mode status register	RSENTnMST	0000 0000$_H$	0000 0000$_H$	R	0000 0001$_H$	R	0000 0003$_H$	R	0000 0005$_H$	R
Communication status register	RSENTnCS	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Communication status clear register	RSENTnCSC	0000 0000$_H$	0000 0000$_H$	R	Unchanged	R/W	Unchanged	R/W	Unchanged	R/W
Slow channel receive timestamp register	RSENTnSRTS	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Slow channel receive data register	RSENTnSRXD	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Calibration pulse length register	RSENTnCPL	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Message length register	RSENTnML	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Fast channel receive timestamp register	RSENTnFRTS	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Fast channel receive data register	RSENTnFRXD	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Calibration pulse length mirror register	RSENTnCPLM	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Message length mirror register	RSENTnMLM	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Fast channel receive timestamp mirror register	RSENTnFRTSM	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Expanded fast channel receive data register 0	RSENTnEFRD0	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R
Expanded fast channel receive data register 1	RSENTnEFRD1	0000 0000$_H$	0000 0000$_H$	R	0000 0000$_H$	R	Unchanged	R	Unchanged	R

Note 1. Means write restriction exists.

27.4.2 Clock Configuration

27.4.2.1 Timestamp

(1) Timestamp Clock Configuration

RSENT incorporates the timestamp counter.

The minimum required resolution of the timestamp is 1 µs. Depending on the applied communication frequency (clkc), the user should configure the RSENTnTSPC.TTPV bits to achieve the 1-µs resolution. The input frequency is divided by the configured timestamp prescaler value RSENTnTSPC.TTPV.

Depending on the configured tick lengths, the resolution can be decreased by configuring the RSENTnTSPC.TTM bits. The already divided input frequency is divided further by the value of the RSENTnTSPC.TTM bits.

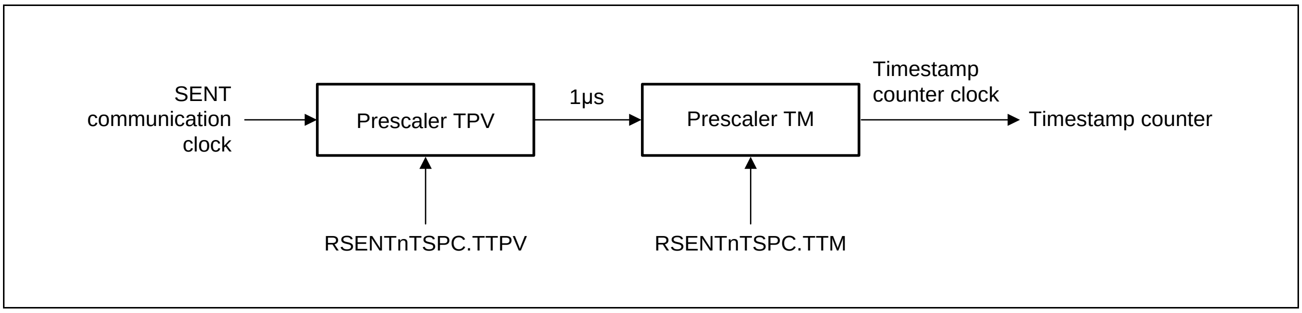

Figure 27.3 Timestamp Counter Clock Generation

(2) Timestamp Counter Operation

The timestamp counter value can be initialized to any value by writing to the RSENTnTSC.TS bits only when the RSENT module is in CONFIGURATION mode.

When timestamp counters are configured to operate in master mode (RSENTnTSPC.TMS = 0), the CPU can reset the timestamp counter by writing $0000\ 0000_H$ to the RSENTnTSC.TS bits when the RSENT module is in OPERATION IDLE or OPERATION ACTIVE mode.

When timestamp counters are configured to operate in slave mode (RSENTnTSPC.TMS = 1), the timestamp counter is cleared when the CPU writes $0000\ 0000_H$ to the RSENTnTSC.TS bits of the channel set in the master when the RSENT module is in OPERATION IDLE or OPERATION ACTIVE mode. The RSENT module operating in slave mode should have the same timestamp counter prescaler settings as master RSENT module. When timestamp counter synchronization occurs, the internal timestamp counter prescalers are also synchronized.

The current timestamp counter value can be read from the RSENTnTSC.TS bits.

When the RSENT module is in OPERATION ACTIVE mode, each received message is stored with its related timestamp. Timestamp values are taken for fast channel and slow channel data.

The timestamp value is captured when the calibration pulse is detected.

The timestamp value for the fast channel is stored in the RSENTnFRTS.FTS or RSENTnFRTSM.FTSM register field when the fast channel message reception buffer is updated.

The timestamp value for the slow channel is stored in the RSENTnSRTS.STS bits. The timestamp value for the slow channel is identical to the timestamp value of the last fast channel message contributing to the slow channel message.

In case timestamp counter synchronization is required, the following flow should be used.

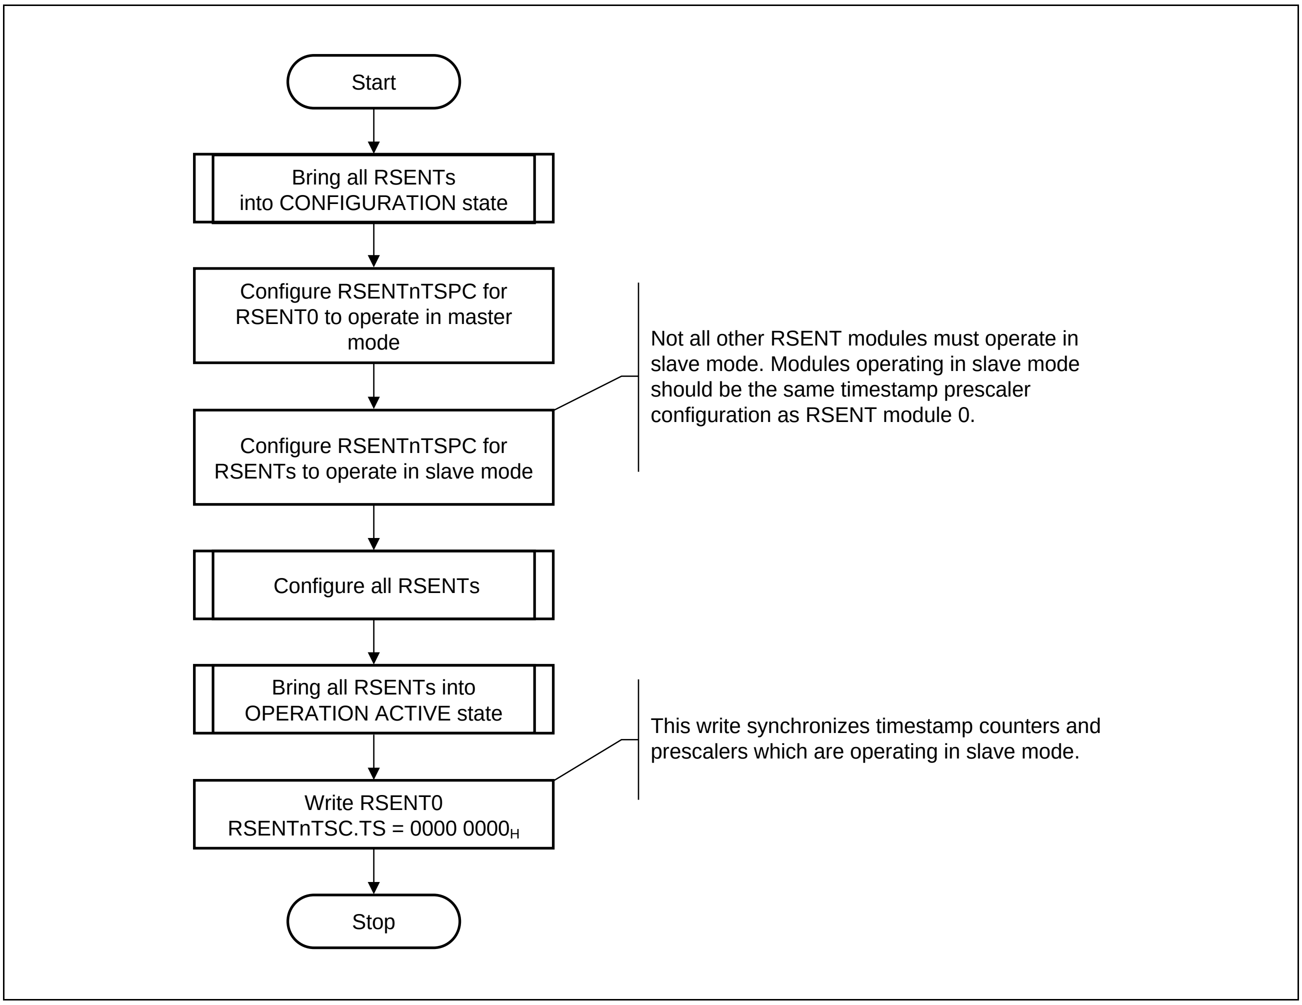

Figure 27.4 Timestamp Counter Synchronization

Further synchronization can be done as long as master RSENT module is in either OPERATION ACTIVE or OPERATION IDLE state.

27.4.2.2 Communication Clock Configuration

(1) RX BRP Setting

Use the formula below to obtain the settings for RSENTnBRP.SCDV and RSENTnBRP.SCMV in accord with $f_{COMMUNICATION}$ to be used (the frequency of the clkc clock) so that the sample clock frequency is 16 MHz (for example, if the settings are for RSENTnBRP.SCDV = 4/RSENTnBRP.SCMV = 6, replace this with RSENTnBRP.SCDV = 2/RSENTnBRP.SCMV = 3). The input clock (clkc clock) is frequency-divided according to the settings of RSENTnBRP.SCDV and RSENTnBRP.SCM to generate the sample clock.

Set $f_{COMMUNICATION}$ (the frequency of the clkc clock) so that it falls within the range from 32 to 40 MHz (or at precisely 16 MHz). Use the formula below to obtain the values for RSENTnBRP.SCDV and RSENTnBRP.SCM such that the sample clock frequency becomes 16 MHz.

$$f_{SAMPLE} = 16\ MHz = f_{COMMUNICATION} \times \frac{Sample\ Clock\ Multiplication\ Value\ (RSENTnBRP.SCMV + 1)}{Sample\ Clock\ Division\ Value\ (RSENTnBRP.SCDV + 1)}$$

$$\begin{aligned} Where\ Sample\ Clock\ Multiplication\ Value\ &= 2\ (RSENTnBRP.SCMV\ =\ 5'd1), \\ Sample\ Clock\ Division\ Value\ &=\ 5\ (RSENTnBRP.SCDV\ =\ 7'd4), \\ f_{COMMUNICATION}\ &=\ 40MHz \\ f_{SAMPLE} &= 40 \times 2/5 = 16MHz \end{aligned}$$

(2) RX and SPC Tick Settings

The used tick length in RX and SPC function can be configured with the RSENTnBRP.TTI and RSENTnBRP.TTF bits. Tick lengths from 1.0 μs to 90.0 μs with a resolution of 0.1 μs can be configured.

The RSENTnBRP.TTI holds the integer part of the tick length and the RSENTnBRP.TTF bits hold the fractional part of the tick length. The tick length is then calculated by:

$$\begin{aligned} &T_{TICK} = T_{RSENTnBRP.TTI} + T_{RSENTnBRP.TTF} \\ &Where\ RSENTnBRP.TTI\ =\ 0, RSENTnBRP.TTF\ =\ 3 \\ &T_{TICK} = 1 + 0.3 = 1.3\ \mu s \end{aligned}$$

27.4.3 RSENT Operation

27.4.3.1 Changing Operation Modes

Once initialization has been completed in CONFIGURATION mode, operation can be enabled by entering OPERATION ACTIVE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION ACTIVE and waiting for the RSENTnMST.OMS to transition to OPERATION ACTIVE.

Once in OPERATION ACTIVE mode the RSENT module begins to receive messages or SPC communication can be started depending on the configuration.

Figure 27.5, Communication Enable Flow shows the communication enabled flow assuming that the RSENT module is in RESET mode:

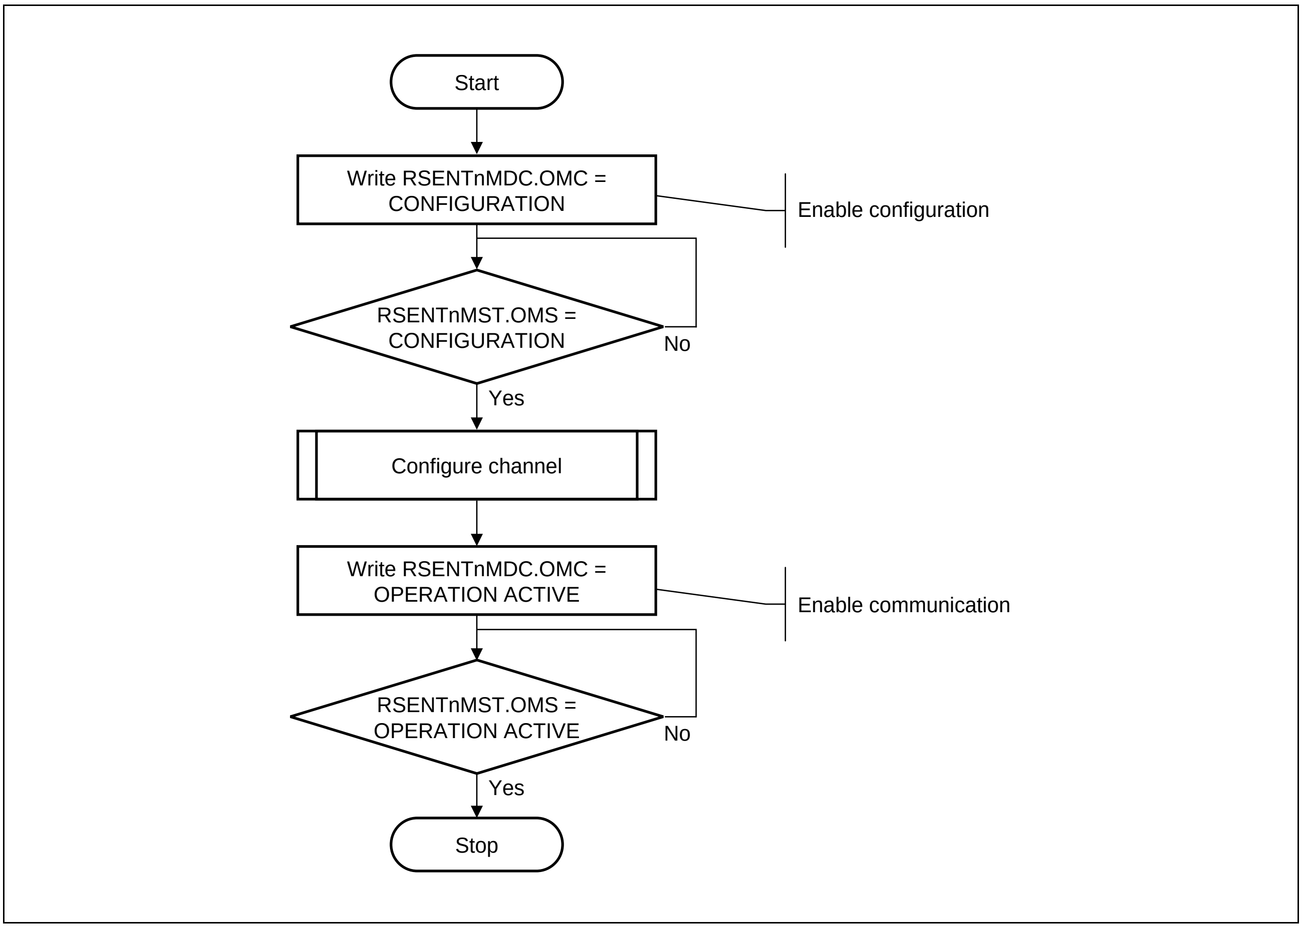

Figure 27.5 Communication Enable Flow

To leave OPERATION ACTIVE mode, communication should be disabled first by entering OPERATION IDLE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION IDLE and waiting for the RSENTnMST.OMS bits to transition to OPERATION IDLE.

However, when the SPC mode is enabled (RSENTnCC.SPCE set to 1) and the SPC trigger transmission has not been requested after the previous SPC communication has been completed (e.g. successful reception for the previous SPC trigger transmission), the RSENT module can directly enter the CONFIGURATION mode.

The transition between OPERATION ACTIVE and OPERATION IDLE depends on the setting of the RSENTnCC.SPCE bit.

(1) RSENTnCC.SPCE = 0

In case a reception is currently ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the receive buffer was updated or error was flagged (see **Section 27.4.3.2(3), Fast Channel Message Reception**).

In case no reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place immediately.

(2) RSENTnCC.SPCE = 1

In case a reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

In case a no response error is flagged, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place at the same time as the error flagging.

The mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the sequence of making a SPC trigger and receiving the response has been completed. This means when a response was already received, the transition takes place immediately. When the response is still pending, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

CONFIGURATION mode can be entered by writing CONFIGURATION to the RSENTnMDC.OMC bits and waiting for the RSENTnMST.OMS to transition to CONFIGURATION.

Once CONFIGURATION mode is entered, the remaining status and message information stored in the RSENT module is lost since status and message information is cleared in CONFIGURATION mode.

Figure 27.6, Communication Disable Flow shows the communication disable flow assuming that the RSENT module is in OPERATION ACTIVE mode.

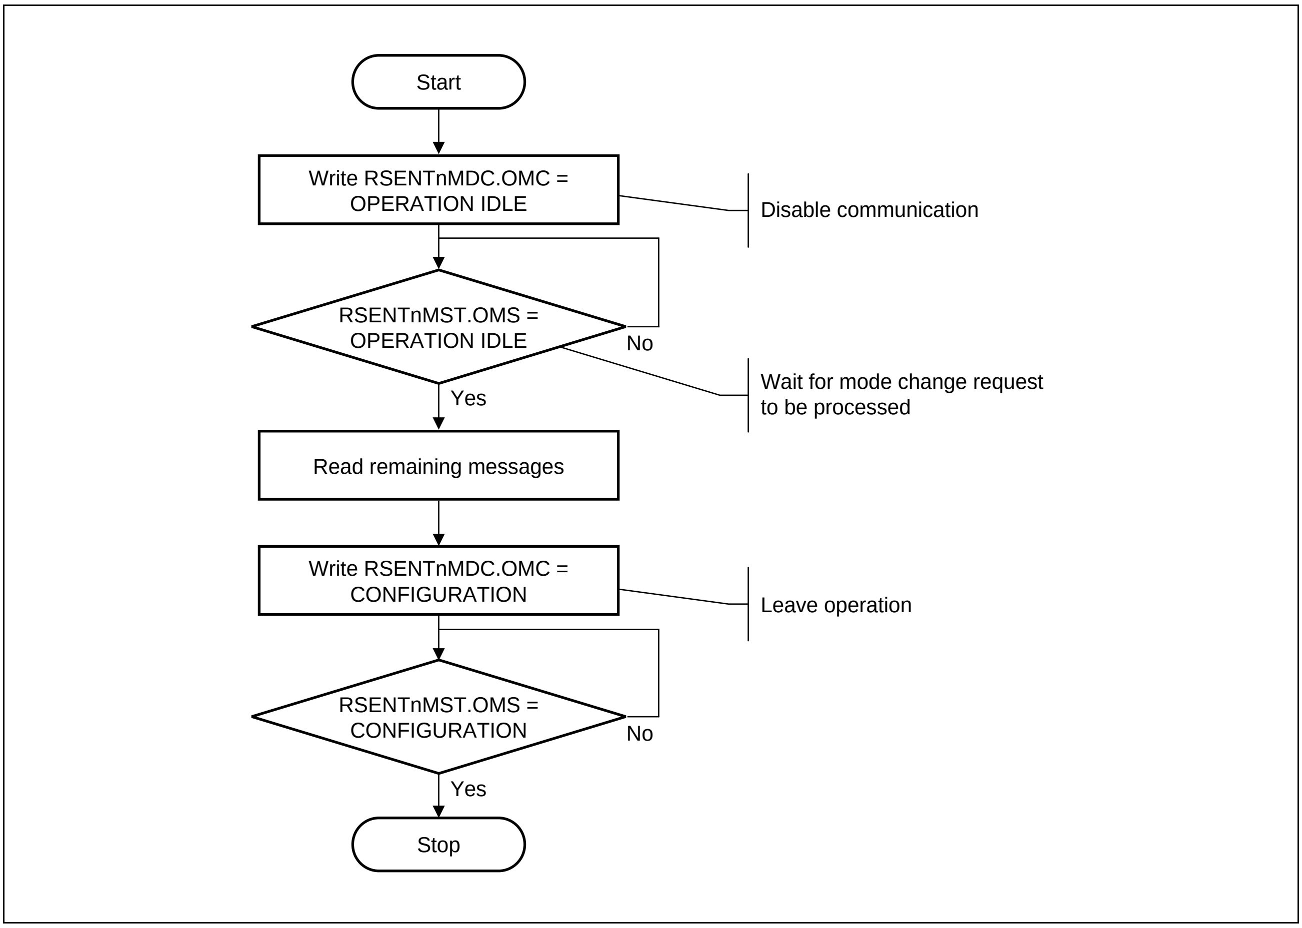

Figure 27.6 Communication Disable Flow

27.4.3.2 Message Reception

SENT message reception is composed of the calibration pulse reception followed by the data nibble pulse reception.

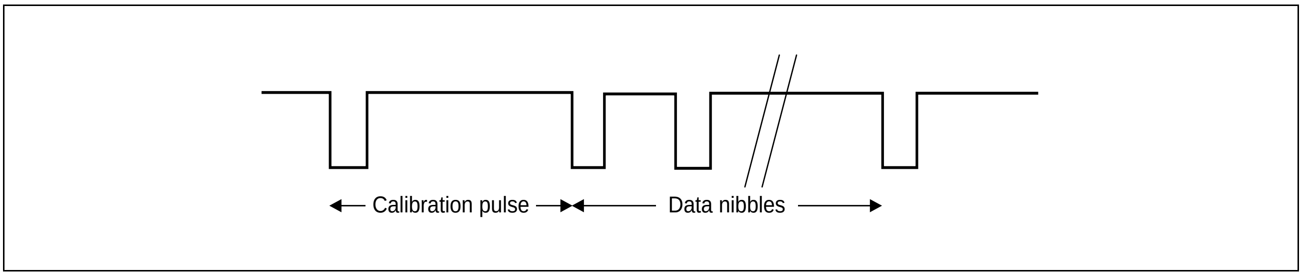

Figure 27.7 SENT Received Message Structure

(1) Calibration Pulse Reception

Within the calibration pulse reception phase the internally generated clock tick is adjusted to the transmit clock speed.

In addition, the calibration pulse is used to end the previous message and perform message diagnostics. The RSENT module supports automatic calibration pulse length diagnostics in variable message length modes (RSENTnCC.PPTC = 0). In case the calibration pulse ratio check fails, the calibration pulse length variation error flag (RSENTnCS.CVS) is set to 1.

(2) Data Nibble Reception

The receive function of the RSENT module is a straightforward capture and compare function. The RSENT module receives sensor information encoded by the temporal distance of two consecutive falling edges on the data line. The temporal distance (the Number of Clock Ticks) is captured and compared against a set of values to determine the actual nibble value. The data encoding is illustrated in **Table 27.33, Data Nibble Encoding** below.

Table 27.33 Data Nibble Encoding

Nibble Period (Number of Clock Ticks)	Nibble Value (Binary)
12	0000_B
13	0001_B
14	0010_B
15	0011_B
16	0100_B
17	0101_B
18	0110_B
19	0111_B
20	1000_B
21	1001_B
22	1010_B
23	1011_B
24	1100_B
25	1101_B
26	1110_B
27	1111_B

The received data nibbles are composed into an SENT message which is then stored in the fast channel message reception buffer.

Any other received nibble period during the reception of data nibbles will cause a fast channel nibble encoding error.

(3) Fast Channel Message Reception

Messages received on the fast message channel are stored in a receive buffer.

A fast channel message reception buffer is composed of the calibration pulse length register (RSENTnCPL), the message length register (RSENTnML), the fast channel receive timestamp register (RSENTnFRTS), and the fast channel receive data register (RSENTnFRXD).

All registers are placed on successive addresses that allows transferring the register content into memory using DMA.

The RSENT module is equipped with a double receive buffer structure that allows the storage of two complete SENT messages including the related timestamp and message length information. Message decoding and assembling are done in a separate register stage.

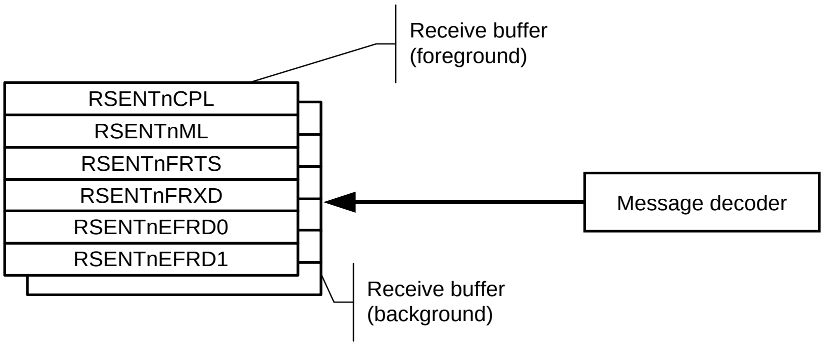

Figure 27.8 Fast Channel Message Reception Buffer

The first received message is placed into the message buffer that can be accessed by the CPU. This buffer (except the RSENTnFRXD.SNDM and RSENTnEFRD0.SNDM bit) is not updated any more until the RSENTnFRXD or RSENTnEFRD1 register was read.

When a new message is placed into a receive buffer, the RSENTnFRXD.FND and RSENTnEFRD0.FND bit is set. At the same time, the RSENTnCS.FRS bit is set and, if enabled, a receive interrupt request is generated.

When the foreground receive buffer is holding an unprocessed message (the RSENTnFRXD.FND and RSENTnEFRD0.FND bit is 1), any further incoming message is placed in the background buffer. The background buffer is updated with any further incoming messages. In case an unprocessed background message buffer message is overwritten, the RSENTnCS.FMS bit is set to 1.

When the CPU reads the RSENTnFRXD or RSENTnEFRD1 register and there is valid data in the background buffer, the data previously located in the background buffer becomes available in the receive buffer and is accessible by the CPU. If enabled, a new interrupt request for fast channel data is generated and RSENTnCS.FRS is set.

When the RSENTnFRXD.FND and RSENTnEFRD0.FND/RSENTnCS.FRS bit is not set, the data in the receive buffer is not defined and the CPU should not access the receive buffer.

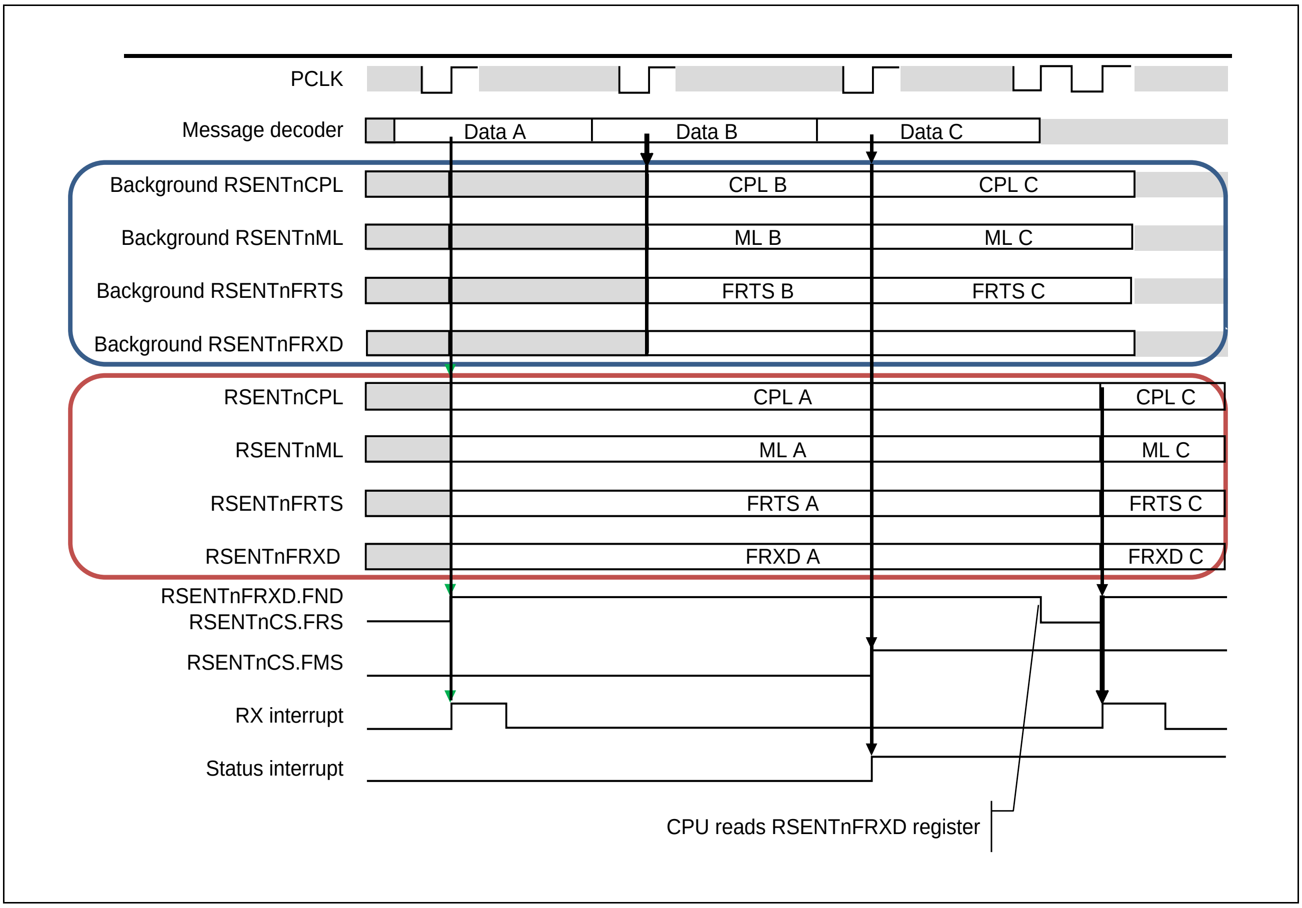

Figure 27.9 Fast Channel Message Reception Buffer Update Timing

The update timing of the receive buffer depends on the applied configuration as depicted in **Figure 27.10, Buffer Update in Variable Message Length Mode and Preferred Check Method** to **Figure 27.13, Buffer Update in SPC Mode**.

The RSENTnFRTS register is updated with the current timestamp counter register value when the calibration pulse is detected.

The data alignment in the RSENTnFRXD register depends on the nibble data count (RSENTnCC.NDN).

Table 27.34 Data Nibble Alignment in RSENTnFRXD Register

RSENTnFRXD RSENTnCC.NDN	23:20	19:16	15:12	11:8	7:4	3:0
000_B	Undefined	Undefined	Undefined	Undefined	Undefined	Nibble 1
001_B	Undefined	Undefined	Undefined	Undefined	Nibble 1	Nibble 2

111_B	Nibble 1	Nibble 2	Nibble 3	Nibble 4	Nibble 5	Nibble 6	Nibble 7	Nibble 8

(a) SAE Operation with Variable Message Length and Preferred Check Method (RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 0, RSENTnCC.FCM = 0)

In this operation mode, the RSENT module automatically performs the check for successive calibration pulse variation according to the preferred option in the J2716 2016 specification. In this mode, message diagnostics is done after the calibration pulse was received following a message.

If this check is passed, the message reception buffer is updated.

If this check is not passed, the message reception buffer is not updated and RSENTnCS.CVS is set to 1.

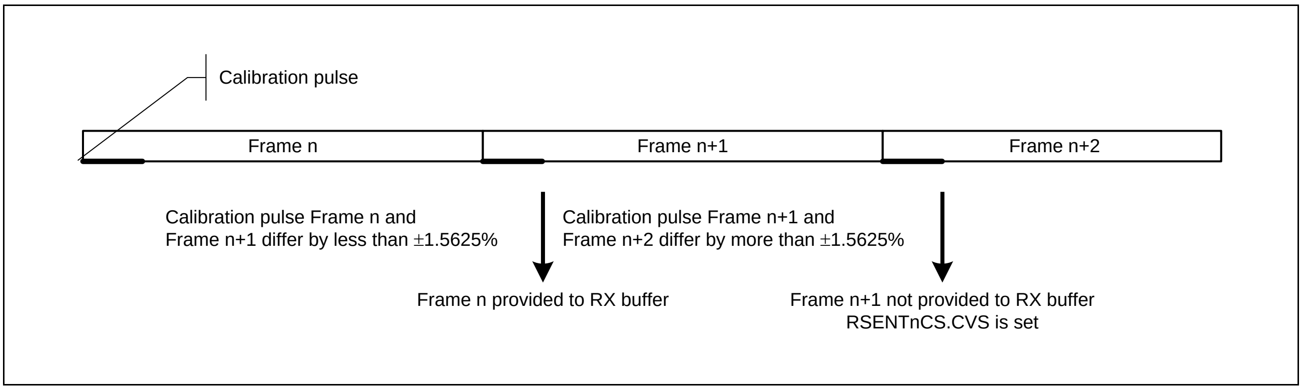

Figure 27.10 Buffer Update in Variable Message Length Mode and Preferred Check Method

(b) SAE Operation with Variable Message Length and Optional Check Method (RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 0, RSENTnCC.FCM = 1)

In this operation mode, the RSENT module automatically performs the check for successive calibration pulse variation according to the optional frame check method as described in the J2716 2016 specification. In this mode, the calibration pulse of the current frame is compared to the calibration pulse of the last valid preceding frame.

If this check is passed, the message reception buffer is updated.

If this check is not passed, the message reception buffer is not updated and RSENTnCS.CVS is set to 1.

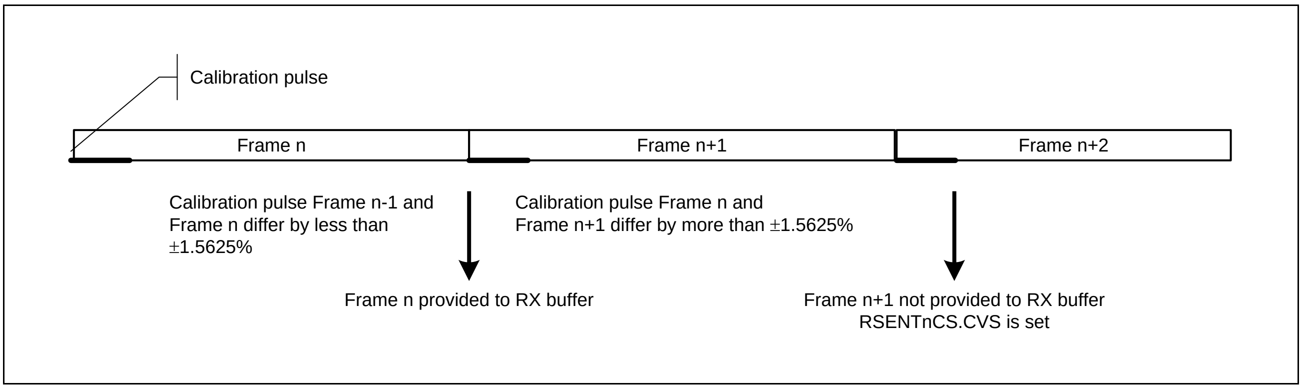

Figure 27.11 Buffer Update in Variable Message Length Mode and Optional Check Method

(c) SAE Operation with Fixed Message Length (RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 1)

In this mode, the RSENT module does not perform the check for calibration pulse and message length ratio according to the preferred option in the J2716 2016 specification. In this mode, the RSENT module provides the calibration pulse length in the RSENTnCPL register and the message length information in the RSENTnML register. The numbers provided are based on samples.

The message buffer is updated at the beginning of the following calibration pulse irrespective of the values in the RSENTnCPL and RSENTnML registers. The CPU needs to calculate the ratio and either accept or discard the message.

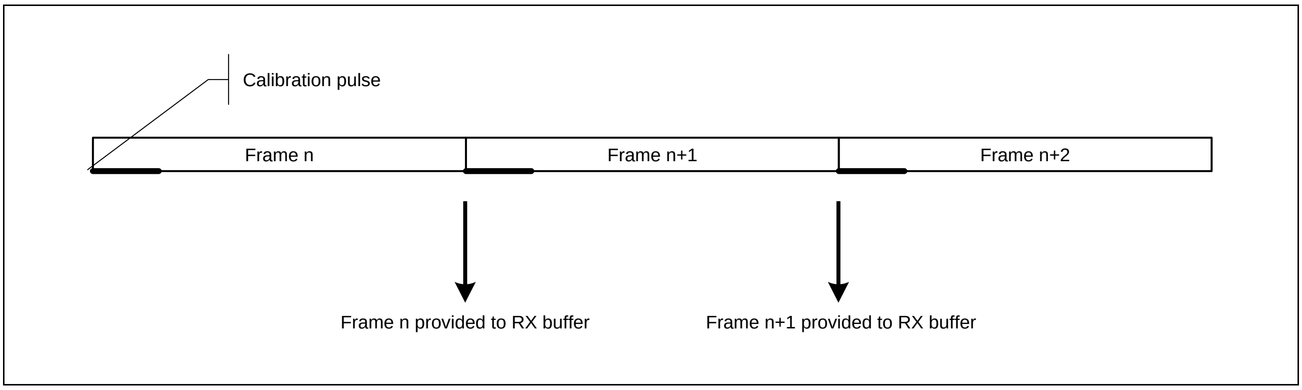

Figure 27.12 Buffer Update in Fixed Message Length Mode

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.

(d) SPC Operation (RSENTnCC.SPCE = 1)

In this operation mode, sensor data transmission is done following a SPC master trigger pulse. Within SAE SENT communication, the calibration pulse or pause pulse is terminating the previous message. In SPC communication, the sensor is only sending data following a SPC trigger request. An end pulse sent by the sensor is terminating the message. The message buffer is updated at the beginning of the end pulse.

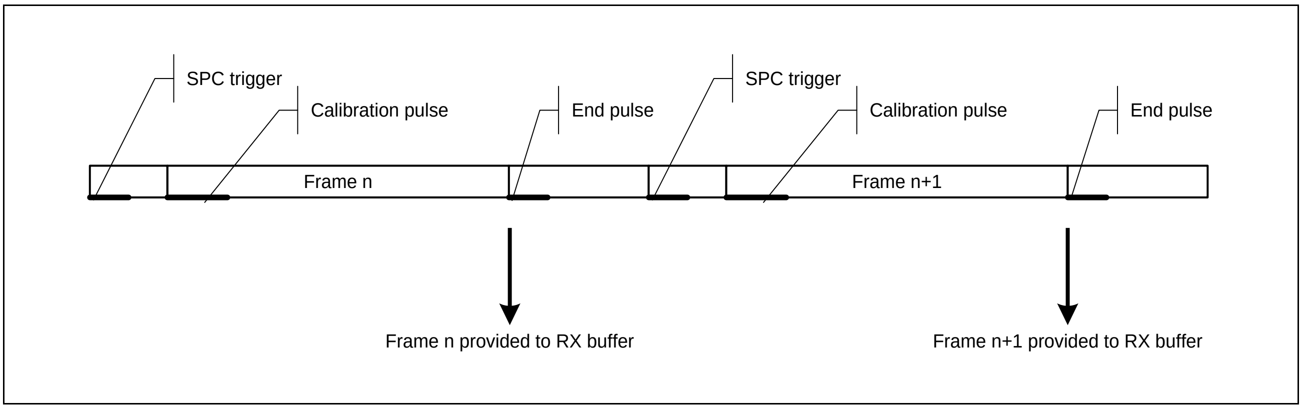

Figure 27.13 Buffer Update in SPC Mode

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.

The RSENT module provides the calibration pulse length in the RSENTnCPL register and the message length information in the RSENTnML register. The numbers provided are based on samples. The CPU needs to calculate the ratio of calibration pulses and/or message length and either accept or discard the message.

In case of variable message length mode, the RSENT module cannot perform this check because the receive timing of the next calibration pulse depends on the next SPC trigger timing.

(4) Fast Channel Reception Flow

In **Figure 27.14, Fast Channel Reception Flow**, the recommended reception flow for the fast channel message reception buffer is shown.

When using a polling or event driven method, the CPU should only read the setting of the RSENTnCS.FRS bit to check the availability of new fast channel data.

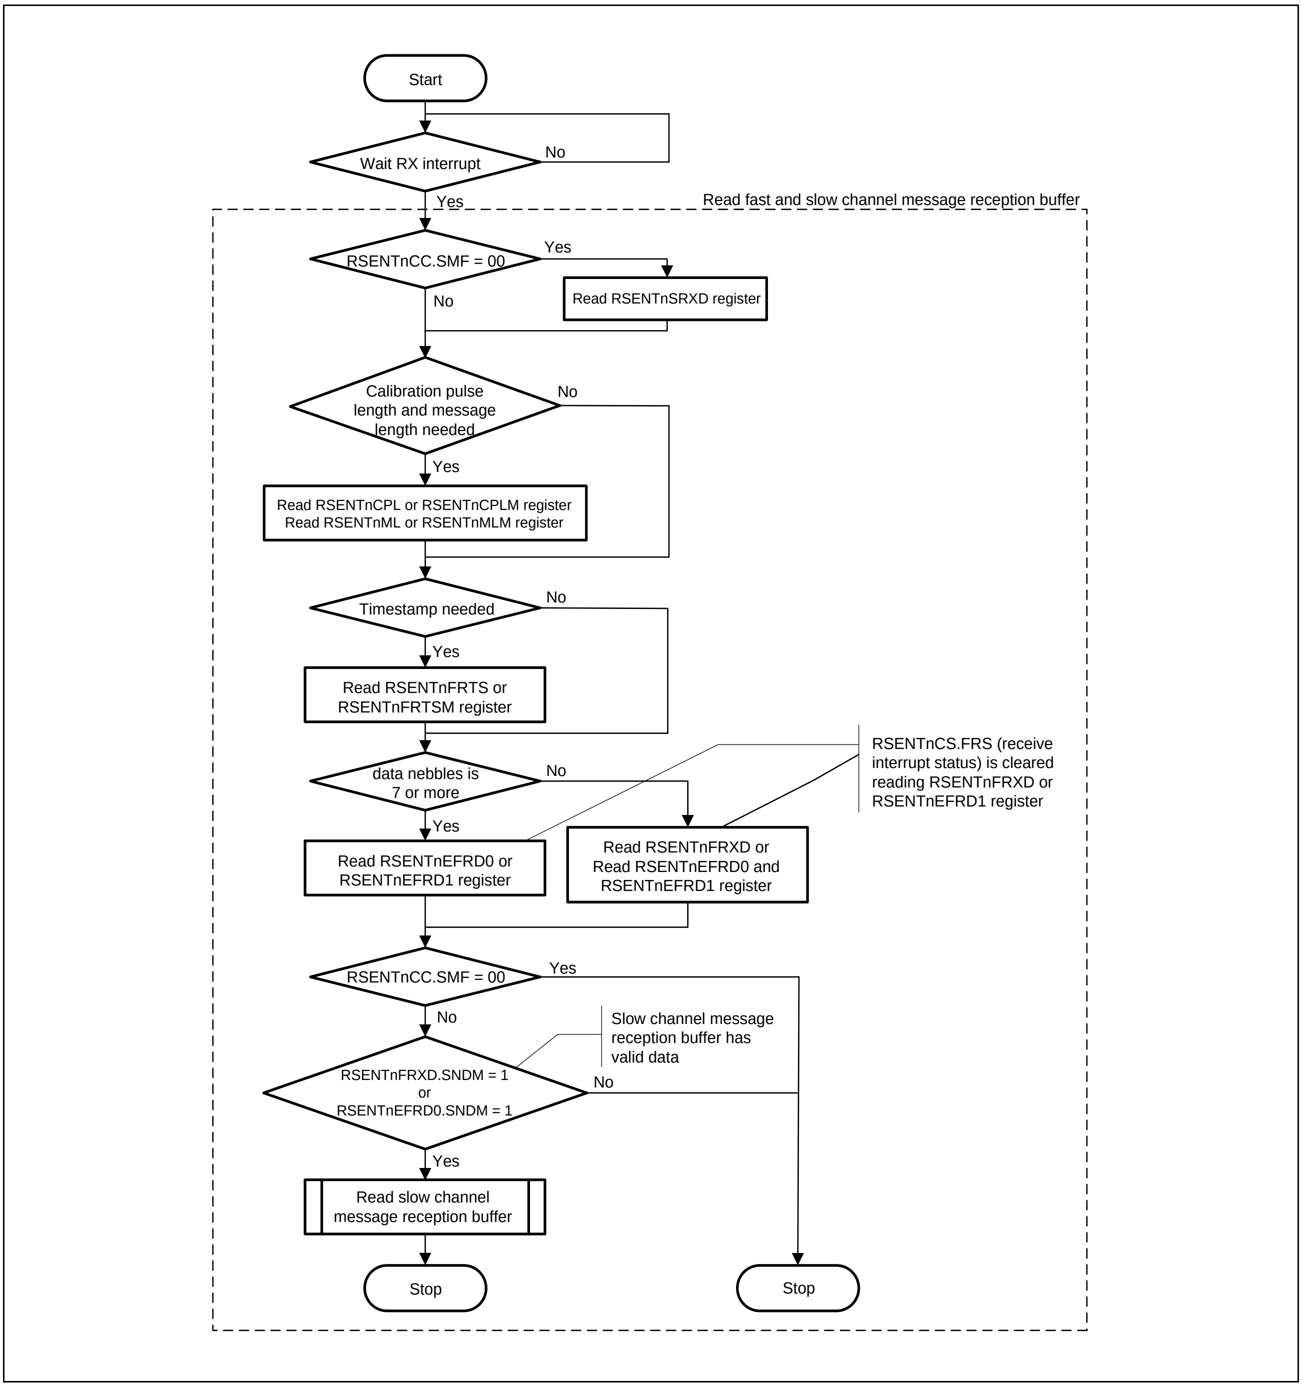

Figure 27.14 Fast Channel Reception Flow

In any case, the CPU should keep the order in reading the receive buffer registers as shown in the flow. The RSENTnFRXD or RSENTnEFRD0 register should be the last register to be accessed.

The handling of the slow channel message reception buffer is described in **Section 27.4.3.2(6), Slow Channel Reception Flow**.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU. In case the variation check fails, the CPU must discard the received message.

(5) Slow Channel Message Reception

The RSENT module supports extraction of the slow message out of the fast channel messages by using the bits 3 and 2 out of the status and communication nibble. In order to enable the slow channel extraction, the CPU should set the RSENTnCC.SMF bits to the expected serial message format.

When no serial message extraction is selected (RSENTnCC.SMF = 00_B), the RSENTnSRXD register becomes part of the fast channel message reception buffer structure (including background buffer) and RSENTnSRTS register should be ignored. The status and communications nibbles is placed in the RSENTnSRXD.IDD bits. Furthermore no slow channel new data and slow channel message lost flags are generated.

In order to receive the slow channel serial message, all fast channel serial messages contributing to a slow channel serial message must be received successfully and the received slow channel serial message must comply with the selected serial message format.

A message lost on the fast channel does not impact the reception on the slow channel.

A slow channel message reception buffer is composed of the slow channel receive timestamp register (RSENTnSRTS) and the slow channel receive data register (RSENTnSRXD).

In opposite to the fast channel message reception buffer, the slow channel message reception buffer does not support a double receive buffer structure; only a single receive buffer structure is available.

Message decoding and assembling is done in a separate register stage.

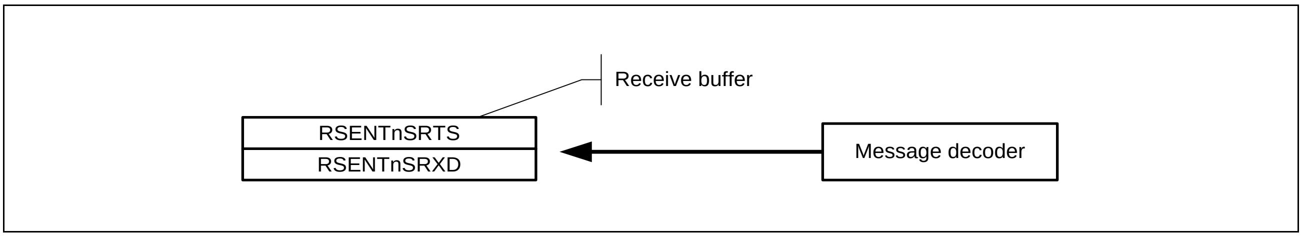

Figure 27.15 Slow Channel Message Reception Buffer

The slow channel message reception buffer is updated at the same time as the fast channel message reception buffer that holds the last status and communication nibble required for the slow channel message. The RSENTnSRXD.SND bit is set to 1 at the same time.

Further updates to the buffer are not carried out until after the RSENTnSRXD.SND bit has been read.

When the receive buffer is holding an unprocessed message (RSENTnSRXD.SND is 1), any further incoming message is lost (the slow channel message reception buffer is not updated) and RSENTnCS.SMS is set to 1.

When the CPU reads the RSENTnSRXD register, RSENTnSRXD.SND is automatically cleared.

The RSENTnSRTS register is updated with the current timestamp counter register value of the last frame contributing to the slow channel message.

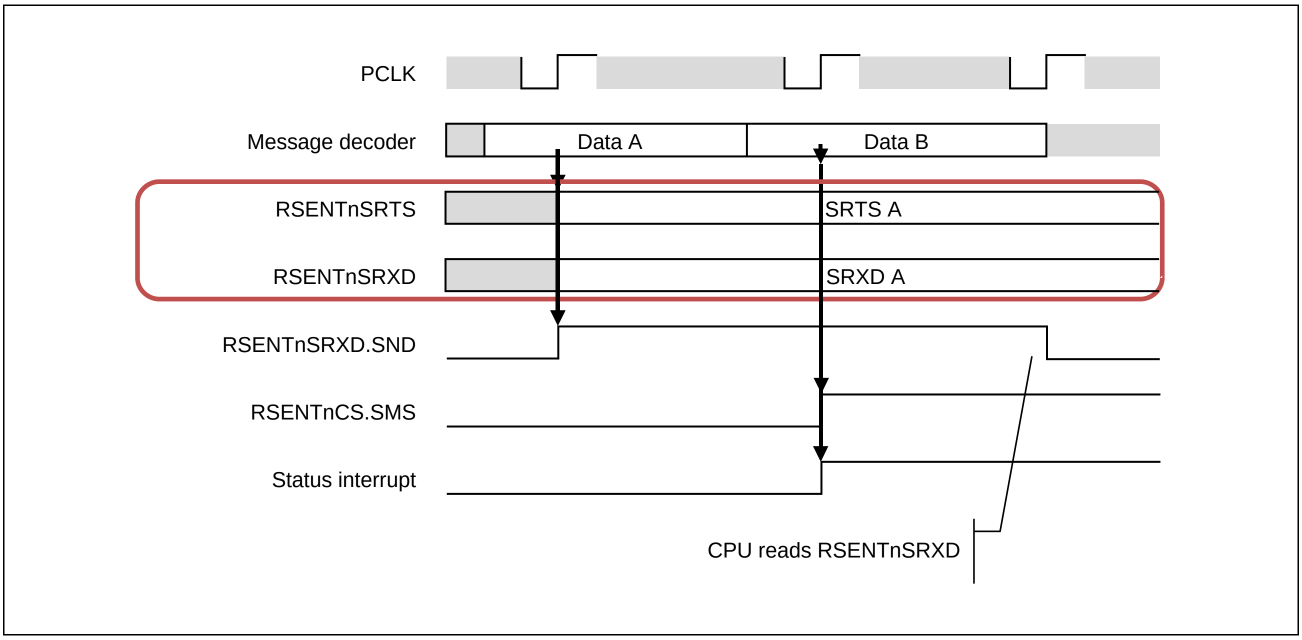

Figure 27.16 Slow Channel Message Reception Buffer Update Timing

The data alignment in the RSENTnSRXD register depends on the slow channel message format (RSENTnCC.SMF) and the received configuration bit.

Table 27.36 Data Alignment in RSENTnSRXD Register

RSENTn CC.SMF	RSENTnSRXD. SMGC	RSENTnSRXD. IDD[19:16]	RSENTnSRXD. IDD[15:12]	RSENTnSRXD. IDD[11:8]	RSENTnSRXD. IDD[7:4]	RSENTnSRXD. IDD[3:0]
00_B	Undefined	Undefined	Undefined	Undefined	Undefined	Status and communication nibble
01_B	Undefined	Undefined	Undefined	Message ID[3:0]	DATA[7:4]	DATA[3:0]
10_B	0	Message ID[7:4]	Message ID[3:0]	DATA[11:8]	DATA[7:4]	DATA[3:0]
10_B	1	Message ID[3:0]	DATA[15:12]	DATA[11:8]	DATA[7:4]	DATA[3:0]

(6) Slow Channel Reception Flow

In **Figure 27.17, Slow Channel Reception Flow**, the recommended reception flow for the slow channel message reception buffer is shown. When the slow channel receive data is required, this process should be executed as part of the fast channel reception flow.

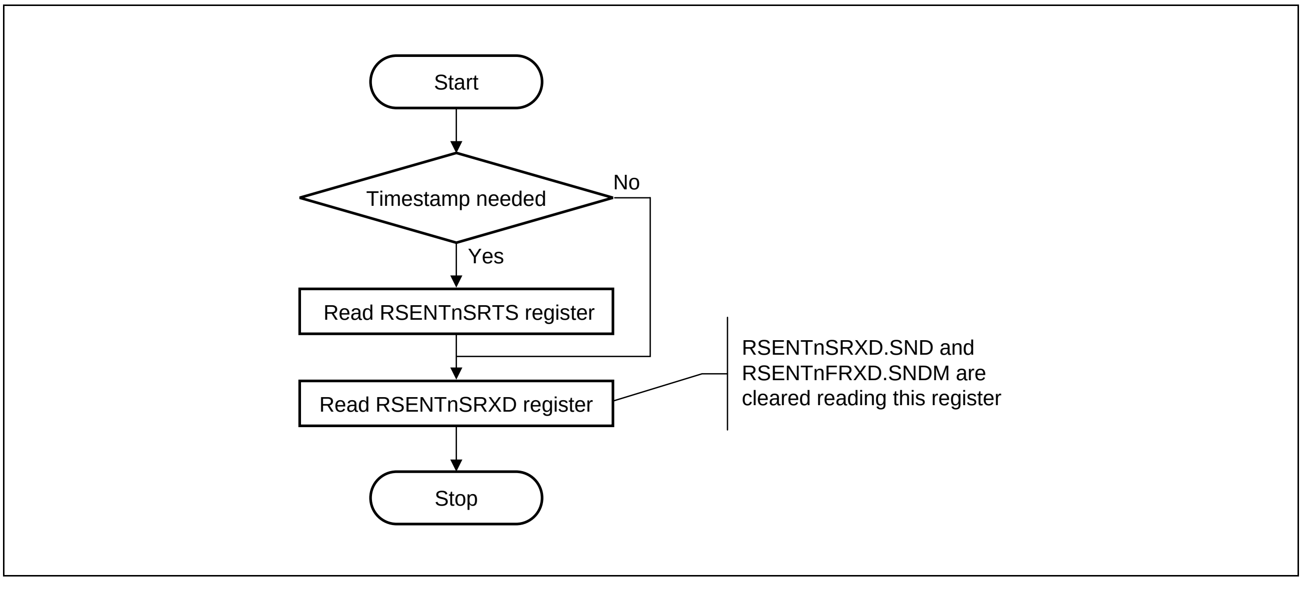

Figure 27.17 Slow Channel Reception Flow

In any case, the CPU should keep the order in reading the slow channel message reception buffer registers as shown in the flow. The RSENTnSRXD.SND bit should be accessed as last.

(7) DMA Flow

In case of DMA usage, the start address for the DMA usage and the number of transfers define which part of the receive buffer will be transferred. The RSENTnFRXD or RSENTnEFRD1 register should be the last register to be accessed using a 32 bit access method.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU. In case the variation check fails, the CPU must discard the received message.

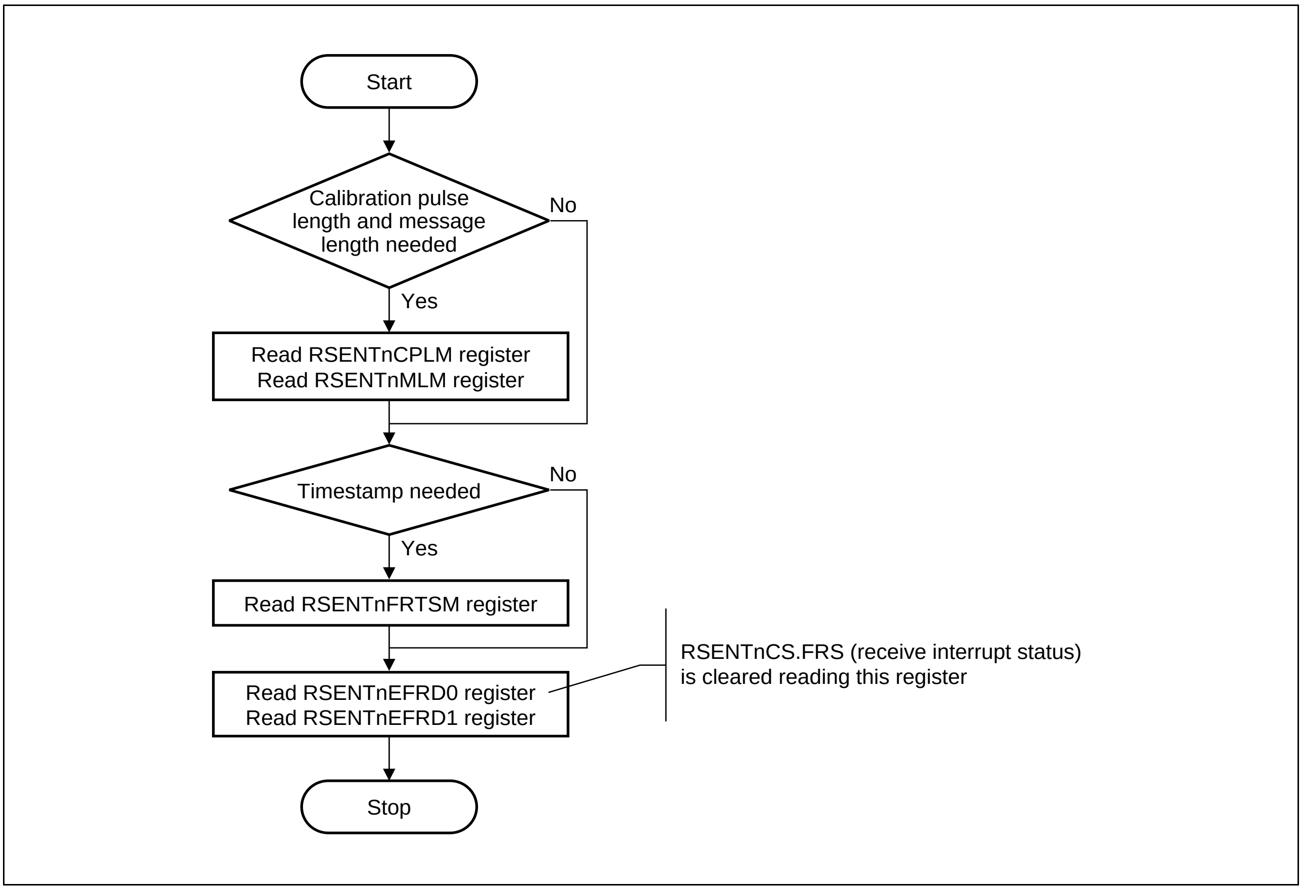

Figure 27.18 DMA Reception Flow

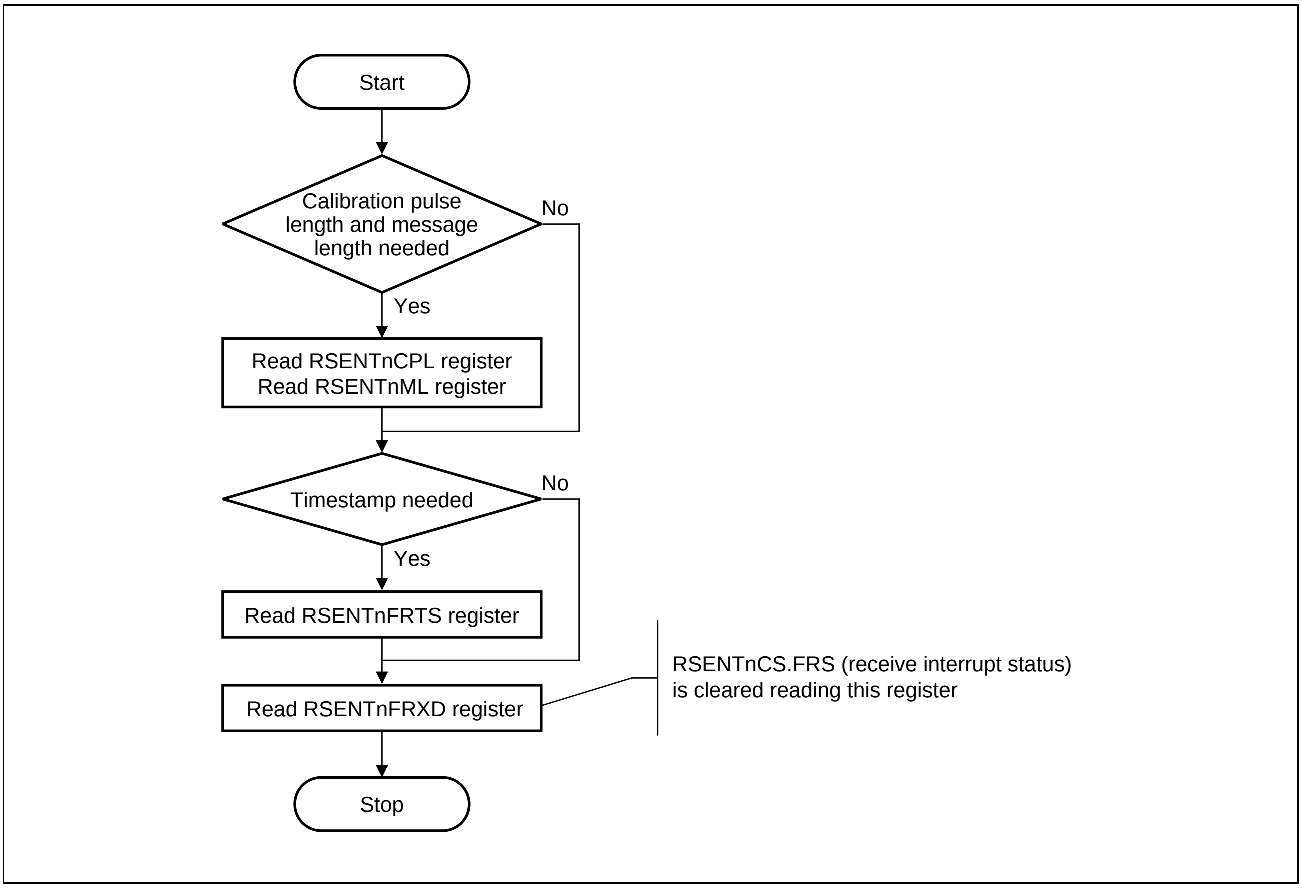

Figure 27.19 DMA Reception Flow (Data nibbles are 6 or less)

In the software processing, when the transferred data set, the CPU should check the status of the transferred RSENTnFRXD.SNDM bit. If this bit is set to 1, then the user needs to read the slow channel message reception buffer if needed.

(8) Error Flagging

The message lost error flag (RSENTnCS.SMS or RSENTnCS.FMS) is set when a new message's diagnostics pass before the previous message is read.

The SPC communication error (shown in RSENTnCS.NRS) is flagged when the CPU writes to RSENTnSPCT.TLL before/during response reception.

The timing at which the fast channel reception error flags (RSENTnCS.CVS, RSENTnCS.CLS, RSENTnCS.FNS, RSENTnCS.FES, and RSENTnCS.FCS) and the slow channel reception error flags (RSENTnCS.SCS, and RSENTnCS.SES) are updated varies with the setting of bits in the communications configuration register (RSENTnCC.SPCE, RSENTnCC.FCM, RSENTnCC.PPC, and RSENTnCC.PPTC).

Table 27.37, Timing to Set Error Flag (RSENTnCC.SPCE = 0) and **Table 27.38, Timing to Set Error Flag (RSENTnCC.SPCE = 1)** list the timings with which the error flags corresponding to each setting are updated.

In case a nibble encoding error or calibration pulse length error is detected, message reception is terminated immediately. No further error flagging for this message is done. Message decoding starts again after a calibration pulse without calibration length error (RSENTnCS.CLS) is detected.

Table 27.37 Timing to Set Error Flag (RSENTnCC.SPCE = 0)

RSENTnCC.SPCE	0							
RSENTnCC.FCM	0				1			
RSENTnCC.PPC	0		1		0		1	
RSENTnCC.PPTC	0	1	0	1	0	1	0	1
RSENTnCS.FCS	EC	X	EC	IM	IM	X	IM	IM
RSENTnCS.FES	EC	X	EC	IM	IM	X	IM	IM
RSENTnCS.FNS	EC	X	EC	—	—	X	—	—
RSENTnCS.SCS	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.SES	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.CLS	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.CVS	EC	X	EC	—	EC	X	EC	—

Note: EC: End of calibration pulse (on the falling edge of a valid calibration pulse)
IM: Immediately upon detection (immediately when the error is detected)
—: Error flag not detected
X: Setting prohibited

NOTE

When RSENTnCC.PPC and RSENTnCC.PPTC are 1, the mode is pause pulse with fixed message length.

When this mode, this diagnostic can be used as the receiver does not need to wait for the next calibration pulse to diagnose the current received frame, so RSENTnCS.FNS and RSENTnCS.CVS are not set.

Table 27.38 Timing to Set Error Flag (RSENTnCC.SPCE = 1)

RSENTnCC.SPCE	1							
RSENTnCC.FCM	0				1			
RSENTnCC.PPC	0		1		0		1	
RSENTnCC.PPTC	0	1	0	1	0	1	0	1
RSENTnCS.FCS	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.FES	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.FNS	—	X	—	—	—	X	—	—
RSENTnCS.SCS	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.SES	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.CLS	IM	X	IM	IM	IM	X	IM	IM
RSENTnCS.CVS	—	X	—	—	—	X	—	—

Note: IM: Immediately upon detection (immediately when the error is detected)
—: Error flag not detected
X: Setting prohibited

NOTE

In case the sensor stops communication, no buffer update or status update for last message takes place. The SW should take care of this by timeout checks.

SPC mode is a communication of only one frame that is start the SPC trigger to the starting point. The Error flags are immediately set when they are detected. So RSENTnCS.FNE and RSENTnCS.CVS are not set.

When a transition to OPERATION IDLE is configured in RSENTnMDC.OMC and an error for the calibration or the fast channel reception is detected in the message in which the mode transition was requested, the error is not flagged and the message is aborted.

In case of a fast channel encoding error or a calibration pulse length error the OPERATION IDLE mode is entered immediately.

In case of a fast channel nibble count error, fast channel CRC error, or fast channel calibration pulse variation error the OPERATION IDLE state is entered at the end of the next status and communications nibble.

RERSENTnCS.FNS is only set after a valid calibration pulse was detected and all following nibbles have a valid length (≥ 12 ticks and ≤ 27 ticks) or no nibble was received between two valid calibration pulses.

RSENTnCS.FES is only set if the nibble with an encoding error occurred in the communication and status nibble, CRC nibble or in one of the expected data nibbles.

If SPC is enabled (RSENTnCC.SPCE = 1), RSENTnCS.CLS is set if a calibration pulse was expected but the pulse length does not meet the calibration pulse range. If SPC is disabled (RSENTnCC.SPCE = 0), RSENTnCS.CLS is set only after a valid calibration pulse has been received and a calibration pulse was expected but the pulse length does not meet the calibration pulse range.

During re-synchronization additional error flags might be set which is not affecting the reception of the following frame.

27.4.4 SPC Function

The RSENT module supports an extension of the J2716 specification known as SPC, whereby the RSENT module can pull down the RX line to initiate SENT message transmission.

The user can configure the polarity of the sent_spc port.

The text below describes the behavior of the sent_spc port with the default settings of RSENTnCC.SOPC. When the value of RSENTnCC.SOPC after a reset is changed, the sent_spc port operates with inverted polarity.

The user can enable or disable the SPC extension by setting the RSENTnCC.SPCE bit. When the RSENTnCC.SPCE bit is set to 0, SPC is disabled. The sent_spc port is driven low by the RSENT module, allowing normal SENT reception to take place. When the RSENTnCC.SPCE bit is set to 1, SPC is enabled and the sent_spc port can be driven high by the RSENT module to request a frame transmission by the sensor.

The transmission function of the RSENT module is a straightforward PWM function. The purpose of this function is to communicate in direction to the sensor by the output sent_spc. With the sent_spc output, the RSENT module can pull down the signal line by an external transistor.

The signal line will be held low for a configured length of tick time specified in the RSENTnSPCT.TLL bits.

The Tick time is configured with the RSENTnBRP.TTI bits and the RSENTnBRP.TTF bits which are equal to the transmission tick time. For details, see **Section 27.4.2.2(2), RX and SPC Tick Settings**.

In a single sensor system, this function can be used to trigger data transmission from the sensor. Further data can be sent to the sensor by varying the trigger pulse length. In a multi sensor system, this function can be used to address a dedicated sensor and request a data transmission.

Once RSENT SPC initialization is complete, transmission can be triggered by writing the trigger pulse width to the RSENTnSPCT.TLL register. When a transmission is triggered, the trigger pulse with the configured length is sent. Then a frame reception is expected. After frame reception was done, a new trigger pulse can be sent.

Writing to RSENTnSPCT.TLL requests a SPC trigger transmission. After writing to RSENTnSPCT.TLL, the CPU should read RSENTnCS.NRS to check whether the previous request was completed or not.

In case RSENTnCS.NRS is set, no SPC trigger is sent and any potentially ongoing reception at this time is aborted. The CPU should clear RSENTnCS.NRS by writing 1 to RSENTnCSC.NRC. The CPU can write again to RSENTnSPCT.TLL to request a SPC trigger transmission.

In case RSENTnCS.NRS is not set, the CPU should set a reception timeout counter in software. If a reception occurs before the timeout counter elapses, the user should process the received slow and fast channel data as shown in the fast channel reception flow (**Figure 27.14, Fast Channel Reception Flow**) and slow channel reception flow (**Figure 27.17, Slow Channel Reception Flow**).

When the timeout counter elapses without any successful reception, the addressed sensor seems not to send any valid response. The CPU should analyze the RSENTnCS register to analyze the reason for no successful reception. A new request can be made considering that when RSENTnCS.NRS gets set no SPC trigger is sent.

Purpose of the timeout function is to define a timeout window for response reception in software.

Figure 27.20, Transmission Flow shows a transmission flow with a timeout function implemented in software. The timeout function is optional and can be omitted if not needed.

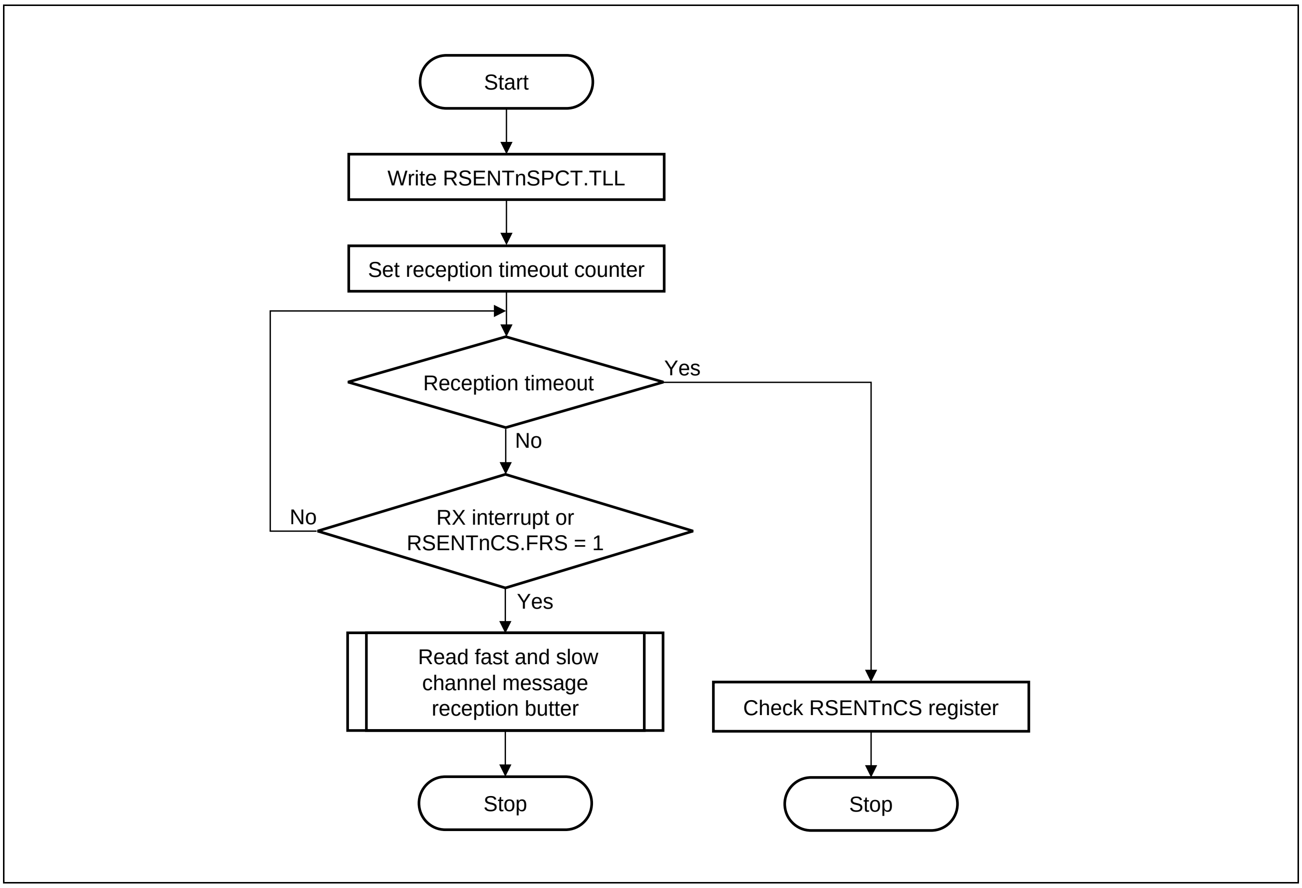

Figure 27.20 Transmission Flow

27.4.5 Interrupts and Checks

The RSENT module provides two interrupt lines.

The successful fast channel receive interrupt notifies the CPU that the fast channel message reception buffer was updated and is holding a set of valid received data. Also, the reception status bit is set (RSENTnCS.FRS).

The status interrupt notifies the CPU that at least one of the error flags or message lost flags in the RSENTnCS register is set.

Whether a status flag in the RSENTnCS register is contributing to the generation of an interrupt event or not can be set individually.

The execution of the CRC checks can be disabled for the slow channel and fast channel individually. In case a check is disabled, the CRC of the received message is not checked and the related error flag is never set.

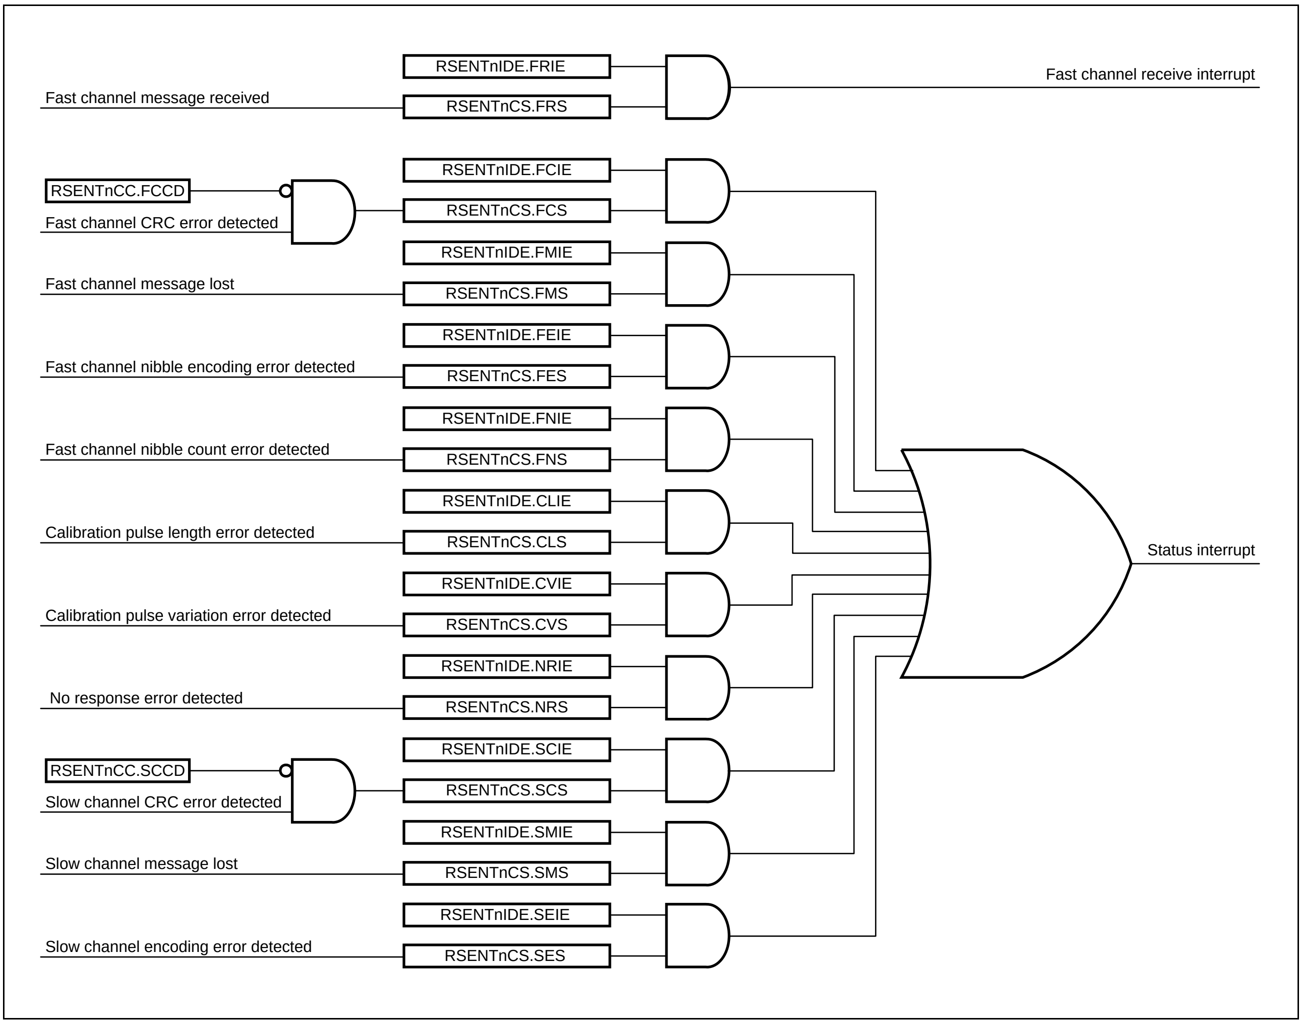

Figure 27.21 Interrupt Structure

Table 27.39, Status Flag Influence to Receive Buffer Behavior gives an overview about the relationship between set status flags and the buffer update.

Table 27.39 Status Flag Influence to Receive Buffer Behavior

RSENTnCS	Fast Channel Message Reception Buffer	Slow Channel Message Reception Buffer
FRS	Updated	Updated if all status and communications nibbles of slow channel messages are received and RSENTnCS.SES = 0 and RSENTnCS.SCS = 0
FCS	Not updated	Receive process aborted. Search for new start condition
FMS	Message lost	Not impacted
FES	Not updated	Receive process aborted. Search for new start condition
FNS	Not updated	Receive process aborted. Search for new start condition
CLS	Not updated	Receive process aborted. Search for new start condition
CVS	Not updated	Receive process aborted. Search for new start condition
NRS	Not updated	Receive process aborted. Search for new start condition
SCS	Not impacted	Not updated
SMS	Not impacted	Message lost
SES	Not impacted	Receive process aborted. Search for new start condition

Section 28 Reserved

Section 29 Window Watchdog Timer (WDTA)

This section contains a generic description of the Window Watchdog Timer (WDTA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of WDTA.

29.1 Features of RH850/F1KH, RH850/F1KM WDTA

29.1.1 Number of Units

This microcontroller has the following number of WDTA units.

Each WDTA unit has single channel interface.

Table 29.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	3	3	3
Name	WDTAn (n = 0 to 2)	WDTAn (n = 0 to 2)	WDTAn (n = 0 to 2)

Table 29.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	2	2	2	2	2
Name	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)

Table 29.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	2	2	2	2
Name	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)	WDTAn (n = 0, 1)

Table 29.4 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual window watchdog timer units are identified by the index “n”: for example, WDTAnWDTE (n = 0 to 2) is the WDTAn enable register.

Table 29.5 Index (RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual window watchdog timer units are identified by the index “n”: for example, WDTAnWDTE (n = 0, 1) is the WDTAn enable register.

29.1.2 Register Base Addresses

WDTAn base addresses are listed in the following table.

WDTAn register addresses are given as offsets from the base addresses.

Table 29.6 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<WDTA0_base>	FFED 0000_H
<WDTA1_base>	FFED 1000_H
<WDTA2_base>	FFED 2000_H

Table 29.7 Register Base Addresses (RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<WDTA0_base>	FFED 0000_H
<WDTA1_base>	FFED 1000_H

29.1.3 Clock Supply

The WDTAn clock supply is shown in the following table.

Table 29.8 Clock Supply (RH850/F1KH-D8)

Unit Name	Unit Clock Name	Supply Clock Name	Description
WDTA0	WDTATCKI	CKSCLK_AWDTA	Timer count clock
	Register access clock	CPUCLK_L	Bus clock
WDTA1	WDTATCKI	LS IntOSC f_{RL}	Timer count clock
	Register access clock	CPUCLK_L	Bus clock
WDTA2	WDTATCKI	LS IntOSC f_{RL}	Timer count clock
	Register access clock	CPUCLK_L	Bus clock

Table 29.9 Clock Supply (RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
WDTA0	WDTATCKI	CKSCLK_AWDTA	Timer count clock
	Register access clock	CPUCLK_L	Bus clock
WDTA1	WDTATCKI	LS IntOSC f_{RL}	Timer count clock
	Register access clock	CPUCLK_L	Bus clock

29.1.4 Interrupt Requests

WDTAn interrupt requests are listed in the following table.

Table 29.10 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
WDTA0			
INTWDTAn	WDTA0 75% interrupt	40	—
WDTA1			
INTWDTAn	WDTA1 75% interrupt	41	—
WDTA2			
INTWDTAn	WDTA2 75% interrupt	42	—

Table 29.11 Interrupt Requests (RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
WDTA0			
INTWDTAn	WDTA0 75% interrupt	40	—
WDTA1			
INTWDTAn	WDTA1 75% interrupt	41	—

Table 29.12 Interrupt Request (FE Level Non-Maskable Interrupt) (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Name	DMA Trigger Number
WDTA0			
WDTAnTNMI	WDTA0 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA0NMI	—
WDTA1			
WDTAnTNMI	WDTA1 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA1NMI	—
WDTA2			
WDTAnTNMI	WDTA2 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA2NMI	—

Table 29.13 Interrupt Request (FE Level Non-Maskable Interrupt) (RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Name	DMA Trigger Number
WDTA0			
WDTAnTNMI	WDTA0 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA0NMI	—
WDTA1			
WDTAnTNMI	WDTA1 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA1NMI	—

29.1.5 Reset Sources

WDTAn reset sources are listed in the following table. WDTAn is initialized by these reset sources.

Table 29.14 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
WDTA0	Reset sources (AWORES)
WDTA1	All reset sources (ISORES)
WDTA2	All reset sources (ISORES)

Note: WDTA1 and WDTA2 are stopped in STOP mode.

Table 29.15 Reset Sources (RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
WDTA0	Reset sources (AWORES)
WDTA1	All reset sources (ISORES)

Note: WDTA1 is stopped in STOP mode.

29.1.6 Internal Input/Output Signals

The internal input/output signals of WDTA are listed in the following table.

Table 29.16 Internal Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Connection
WDTAnTRES	Watchdog timer reset	Reset controller (WDTA0RES)
WDTAnTRES	Watchdog timer reset	Reset controller (WDTA1RES)
WDTAnTRES	Watchdog timer reset	Reset controller (WDTA2RES)

Table 29.17 Internal Input/Output Signals (H850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Connection
WDTAnTRES	Watchdog timer reset	Reset controller (WDTA0RES)
WDTAnTRES	Watchdog timer reset	Reset controller (WDTA1RES)

29.1.7 State in RUN Mode and Stand-by Modes

The state of the WDTA in respective RUN mode and stand-by modes are listed in the following table.

Table 29.18 States in Respective RUN Mode and Stand-by Modes (RH850/F1KH-D8)

Run Mode/Stand-by Mode	State of WDTA0	State of WDTA1	State of WDTA2
RUN mode (HALT state)	Operation enabled	Operation enabled	Operation enabled
STOP mode	Operation enabled	Operation stopped	Operation stopped
DeepSTOP mode	Operation enabled	Power off	Power off
Cyclic RUN mode	Operation enabled	Operation prohibited	Operation prohibited
Cyclic STOP mode	Operation enabled	Operation stopped	Operation stopped

Table 29.19 States in Respective RUN Mode and Stand-by Modes (H850/F1KM-S4, RH850/F1KM-S1)

Run Mode/Stand-by Mode	State of WDTA0	State of WDTA1
RUN mode (HALT state)	Operation enabled	Operation enabled
STOP mode	Operation enabled	Operation stopped
DeepSTOP mode	Operation enabled	Power off
Cyclic RUN mode	Operation enabled	Operation prohibited
Cyclic STOP mode	Operation enabled	Operation stopped

29.2 Overview

29.2.1 Functional Overview

WDTA has the following functions:

- Selection of the operation mode after reset, by using the option bytes

  Enabling/disabling of WDTA, starting/stopping of the counter after reset, setting of the counter overflow time, and enabling/disabling of the VAC function can be selected. WDTA startup options to be set by the option bytes are described in **Table 29.20, WDTA Start-Up Options (RH850/F1KH-D8)** and **Table 29.21, WDTA Start-Up Options (RH850/F1KM-S4, RH850/F1KM-S1)**.

- WDTA trigger function

  Writing an activation code to the WDTA trigger register starts WDTA and restarts the counter. Activation codes include fixed activation codes and variable activation codes (VAC function). In a variable activation code, a different value from the previous time (variable value) is written to the WDTA trigger register, which causes the counter to be restarted.

- 75% interrupt request signal

  An interrupt request signal can be generated when the WDTA counter reaches 75% of the overflow interval time (this function can be enabled or disabled by the setting of WDTAnMD.WDTAnWIE).

- Window function

  The period during which writing to the WDTA trigger register is valid (window-open period) can be set. Writing to the WDTA trigger register during a period other than the window-open period causes an error.

- WDTA error detection function

  When an error is detected, a non-maskable interrupt request or an internal reset is generated.

  For details about the error sources, see **Section 29.5.3, WDTA Error Detection**.

Table 29.20 WDTA Start-Up Options (RH850/F1KH-D8)

Start-Up Option	Function	Description	Option Byte
OPWDEN	WDTA setting	Enables/disables the WDTA. 0: WDTA is disabled 1: WDTA is enabled	● WDTA0: OPBT0.WDT0_0 ● WDTA1: OPBT0.WDT1_0 ● WDTA2: OPBT0.WDT2_0
OPWDOVF[2:0]	Overflow interval time reset value setting	Specifies the reset value of the overflow interval time control bits WDTAnMD.WDTAnOVF[2:0].	WDTA0/WDTA1/WDTA2: OPBT0.WDT_[2:0]
OPWDRUN	Start mode setting	Specifies the start mode. 0: Software trigger start mode 1: Default start mode For details, see **Section 29.5.1, WDTA after Reset Release**.	● WDTA0: OPBT0.WDT0_1 ● WDTA1: OPBT0.WDT1_1 ● WDTA2: OPBT0.WDT2_1
OPWDVAC	Variable activation code selection	Specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing. 0: WDTAnWDTE (fixed) 1: WDTAnEVAC (variable) When WDTAnWDTE is selected, the value to be written to the register (activation code) is fixed (ACH). When WDTAnEVAC is selected, the activation code to be written to the register is variable. For details, see **Section 29.5.2, WDTA Trigger** and **Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used**.	● WDTA0: OPBT0.WDT0_3 ● WDTA1: OPBT0.WDT1_3 ● WDTA2: OPBT0.WDT2_3

Table 29.21 WDTA Start-Up Options (RH850/F1KM-S4, RH850/F1KM-S1)

Start-Up Option	Function	Description	Option Byte
OPWDEN	WDTA setting	Enables/disables the WDTA. 0: WDTA is disabled 1: WDTA is enabled	• WDTA0: OPBT0.WDT0_0 • WDTA1: OPBT0.WDT1_0
OPWDOVF[2:0]	Overflow interval time reset value setting	Specifies the reset value of the overflow interval time control bits WDTAnMD.WDTAnOVF[2:0].	WDTA0/WDTA1: OPBT0.WDT_[2:0]
OPWDRUN	Start mode setting	Specifies the start mode. 0: Software trigger start mode 1: Default start mode For details, see **Section 29.5.1, WDTA after Reset Release**.	• WDTA0: OPBT0.WDT0_1 • WDTA1: OPBT0.WDT1_1
OPWDVAC	Variable activation code selection	Specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing. 0: WDTAnWDTE (fixed) 1: WDTAnEVAC (variable) When WDTAnWDTE is selected, the value to be written to the register (activation code) is fixed (AC_H). When WDTAnEVAC is selected, the activation code to be written to the register is variable. For details, see **Section 29.5.2, WDTA Trigger** and **Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used**.	• WDTA0: OPBT0.WDT0_3 • WDTA1: OPBT0.WDT1_3

NOTE

For the option byte settings, see **Section 44.9, Option Bytes**.

29.2.2 Block Diagram

Figure 29.1, Block Diagram of the Window Watchdog Timer A shows the main components of the WDTA.

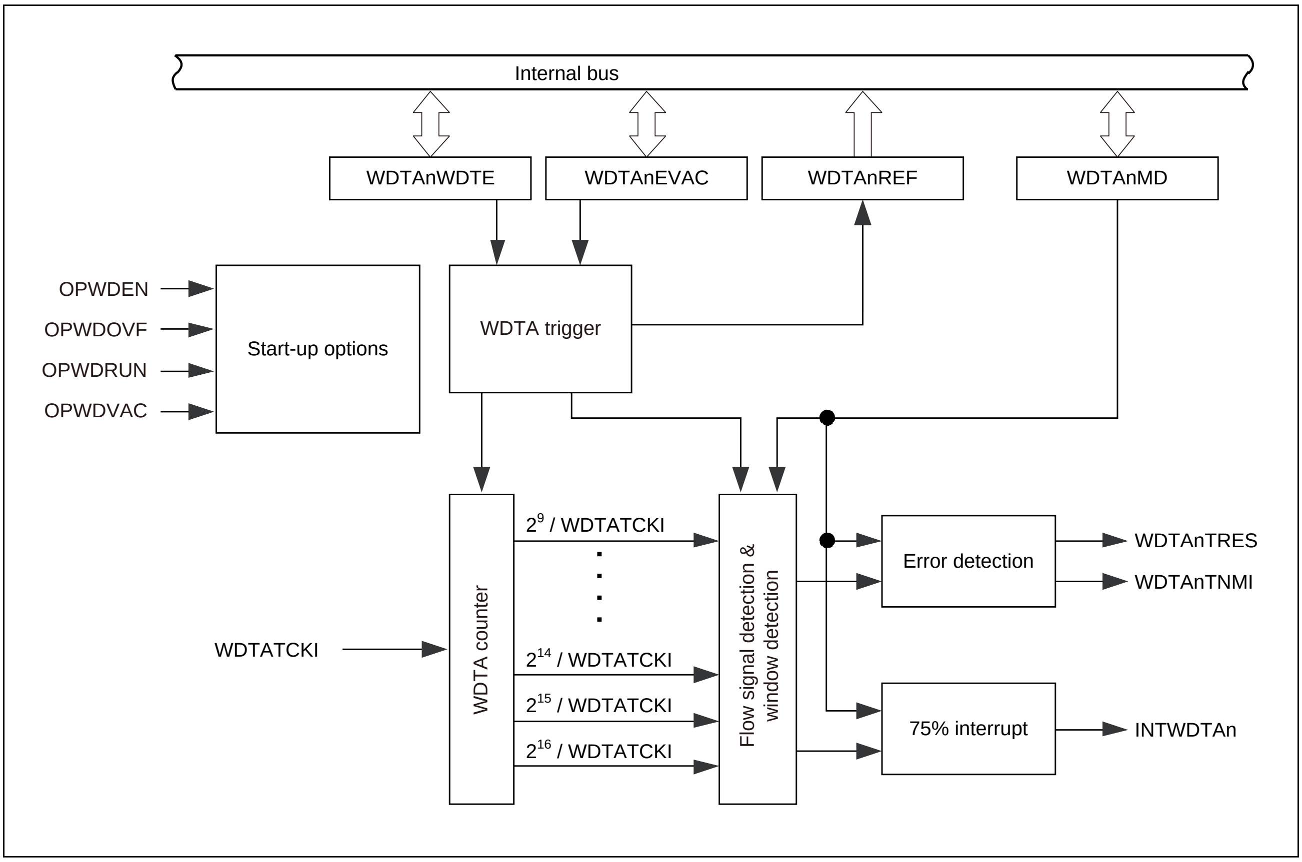

Figure 29.1 Block Diagram of the Window Watchdog Timer A

29.3 Registers

29.3.1 List of Registers

WDTA registers are listed in the following table.

For details about <WDTAn_base>, see **Section 29.1.2, Register Base Addresses**.

Table 29.22 List of Registers

Module Name	Register Name	Symbol	Address
WDTAn	WDTA enable register	WDTAnWDTE	<WDTAn_base> + 0000_H
	WDTA enable VAC register	WDTAnEVAC	<WDTAn_base> + 0004_H
	WDTA reference value register	WDTAnREF	<WDTAn_base> + 0008_H
	WDTA mode register	WDTAnMD	<WDTAn_base> + $000C_H$

29.3.2 WDTAnWDTE — WDTA Enable Register

This register is the WDTA trigger register when the VAC function is not used (start-up option OPWDVAC = 0).

Writing AC_H to this register generates a WDTA trigger and starts or restarts the WDTA counter.
See **Section 29.5.2, WDTA Trigger**, for details.

The behavior of this register depends on the setting of the start-up option (OPWDVAC), see **Table 29.25, WDTAnWDTE Behavior**.

WDTA0 is initialized by AWORES.
WDTA1 and WDTA2 are initialized by a reset of any type.

Access:	This register can be read or written in 8-bit units.
Address:	<WDTAn_base> + 0000_H
Value after reset:	The initial value depends on the start-up options (OPWDEN, OPWDRUN and OPWDVAC). See **Table 29.24, Values of WDTAnRUN7 after Reset**.

Bit	7	6	5	4	3	2	1	0
	WDTAnRUN[7:0]							
Value after reset	0/1	0	1	0	1	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.23 WDTAnWDTE Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnRUN[7:0]	Writing the fixed activation code (AC_H) generates the WDTA trigger and starts/restarts the WDTAn counter. Writing a value other than AC_H generates an error. The WDTAn cannot be stopped once it is started. See **Table 29.25, WDTAnWDTE Behavior**, when reading from or writing to these bits.

The WDTAnRUN7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is disabled (OPWDVAC = 0). **Table 29.24, Values of WDTAnRUN7 after Reset** lists the values of the WDTAnRUN7 bit after reset according to the start-up options.

Table 29.24 Values of WDTAnRUN7 after Reset

Start-Up Options				
OPWDEN	OPWDVAC	OPWDRUN	Start Mode	Value of WDTAnRUN7 after Reset
1	0	1	Default start	1
		0	Software trigger start	0

The behavior of WDTAnWDTE during read/write accesses depends on the OPWDVAC setting, as shown in **Table 29.25, WDTAnWDTE Behavior**.

Table 29.25 WDTAnWDTE Behavior

		WDTAnWDTE	
OPWDVAC	Description	Read	Write
0	The VAC function is disabled. WDTAnWDTE is enabled.	$2C_H$ is returned (in software trigger start mode, before the activation of WDTAn). AC_H is returned (after the activation of WDTAn).	WDTA trigger Write AC_H*1.
1	The VAC function is enabled. WDTAnWDTE is disabled.	$2C_H$ is returned.	Writing is ignored.

Note 1. Any other write value will cause an error.

29.3.3 WDTAnEVAC — WDTA Enable VAC Register

This register is the WDTA trigger register when the VAC function is used (start-up option OPWDVAC = 1).

Writing a correct activation code to this register generates a WDTA trigger and starts or restarts the WDTA counter. For details, see **Section 29.5.2, WDTA Trigger**. For details about the activation codes when the VAC function is used, see **Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

The behavior of this register depends on the setting of the start-up option (OPWDVAC). See **Table 29.28, WDTAnEVAC Behavior**.

WDTA0 is initialized by AWORES.
WDTA1 and WDTA2 are initialized by a reset of any type.

Access: This register can be read or written in 8-bit units.

Address: <WDTAn_base> + 0004_H

Value after reset: The initial value depends on the start-up options (OPWDEN, OPWDRUN and OPWDVAC). See **Table 29.27, Values of WDTAnEVAC7 after Reset**.

Bit	7	6	5	4	3	2	1	0
	WDTAnEVAC[7:0]							
Value after reset	0/1	0	1	0	1	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.26 WDTAnEVAC Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnEVAC [7:0]	Writing a variable activation code generates the WDTA trigger and starts/restarts the WDTAn counter. Writing an incorrect activation code generates an error. The WDTAn cannot be stopped once it is started. See **Table 29.28, WDTAnEVAC Behavior**, when reading from or writing to these bits.

The WDTAnEVAC7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is enabled (OPWDVAC = 1). **Table 29.27, Values of WDTAnEVAC7 after Reset** lists the values of the WDTAnEVAC7 bit after reset according to the start-up options.

Table 29.27 Values of WDTAnEVAC7 after Reset

Start-Up Options				
OPWDEN	OPWDVAC	OPWDRUN	Start Mode	Value of WDTAnEVAC7 after Reset
1	1	1	Default start	1
		0	Software trigger start	0

The behavior of WDTAnEVAC during read/write accesses depends on the OPWDVAC setting, as shown in **Table 29.28, WDTAnEVAC Behavior**.

Table 29.28 WDTAnEVAC Behavior

OPWDVAC	Description	WDTAnEVAC	
		Read	Write
0	The VAC function is disabled. WDTAnEVAC is disabled.	$2C_H$ is returned.	Writing is ignored.
1	The VAC function is enabled. WDTAnEVAC is enabled.	$2C_H$ is returned (in software trigger start mode, before the activation of WDTAn). The variable activation code written last is read (after the activation of WDTAn).	Write the variable activation code*[1] For details, see **Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

Note 1. Any other write value will cause an error.

29.3.4 WDTAnREF — WDTA Reference Value Register

This register contains the reference value for calculating the activation code of the VAC function. It is automatically updated after every trigger operation. See **Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

If the VAC function is disabled (OPWDVAC = 0), reading this register returns 00_H.

WDTA0 is initialized by AWORES.
WDTA1 and WDTA2 are initialized by a reset of any type.

Access:	This register is a read-only register that can be read in 8-bit units.
Address:	<WDTAn_base> + 0008_H
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	WDTAnREF[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 29.29 WDTAnREF Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnREF[7:0]	Reference value for activation code calculation for the VAC function.

29.3.5 WDTAnMD — WDTA Mode Register

This register specifies the overflow interval time, 75% interrupt enable/disable, the error mode, and the window-open period.

The value of this register can be updated only once after reset release and before the first trigger is generated. The updated value will be effective after a maximum of 3 x Timer count clock cycles once the WDTA trigger register is written.

Updating this register after the first WDTA trigger is generated generates an error, but an error does not occur if the same value has been written to it.

WDTA0 is initialized by AWORES.

WDTA1 and WDTA2 are initialized by a reset of any type.

Access:	This register can be read or written in 8-bit units.
Address:	<WDTAn_base> + $000C_H$
Value after reset:	The initial value depends on the start-up options (OPWDOVF[2:0]). See **Table 29.21, WDTA Start-Up Options**.

</table>

29.4 Interrupt Sources

WDTA checks the status of the WDTA counter value, detects illegal accesses to the WDTA-related registers, and generates an interrupt request. The following are WDTA interrupt requests:

(1) INTWDTAn (WDTA timer count 75% interrupt request)
An interrupt request signal is generated at 75% of the counter overflow time of the WDTA timer.
An interrupt request signal can be enabled or disabled by using the WDTA mode register (WDTAnMD).

(2) WDTAnTNMI (WDTA error detection interrupt)

Detection of a WDTA error to generation of an NMI interrupt request. The WDTA mode register (WDTAnMD) can be used to switch between an NMI interrupt and a reset. For details about WDTA errors, see **Section 29.5.3, WDTA Error Detection**.

29.5 Functions

29.5.1 WDTA after Reset Release

29.5.1.1 Start Modes

There are two start modes (software start mode and default start mode) when WDTAn starts after reset release. The start mode can be selected by the start-up option.

The start mode selection is listed in **Table 29.31, Start Modes**.

Table 29.31 Start Modes

Start-Up Option OPWDRUN	Start Mode	Description
0	Software trigger	• The WDTA counter stops (0000_H) after reset release. • Writing an activation code to the WDTA trigger register starts WDTA.
1	Default	The WDTA counter starts after reset release.

29.5.1.2 WDTA Settings after Reset Release

(1) **Table 29.32, WDTA Settings after Reset Release** shows the WDTA settings after reset release.

Table 29.32 WDTA Settings after Reset Release

Function	Setting	Remark
WDTA enable/disable	Specified by start-up options	
Start mode		
VAC function		
WDTA overflow interval time	Specified by start-up options	Modification is possible only once by the setting of the WDTA mode register (WDTAnMD).
75% interrupt mode	75% interrupt disabled	
Behavior on error detection	Reset generation	
Window-open period	100%	

The setting of the WDTA mode register (WDTAnMD) is enabled behind a maximum of 3 x Timer count clock cycles when the first WDTA trigger is generated (writing an activation code to WDTAnWDTE and WDTAnEVAC). Perform the WDTAnMD register setting before a WDTA trigger is generated.

Setting of WDTA by using WDTAnMD is possible only once. If the value set to WDTAnMD is changed after a WDTA trigger is generated, an error occurs. However, an error does not occur if the same value is set.

29.5.1.3 Default Start Mode Timing

The default start mode timing and the changes to the WDTA settings are illustrated in **Figure 29.2, Timing Diagram of WDTA Start in Default Start Mode**.

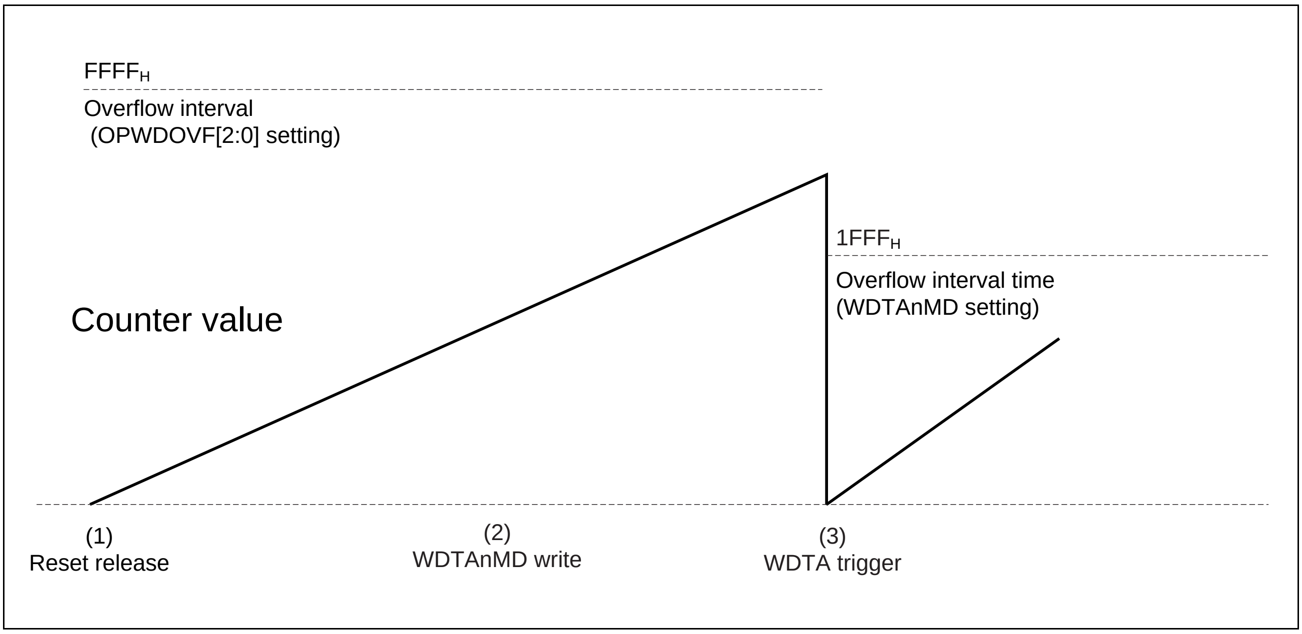

Figure 29.2 Timing Diagram of WDTA Start in Default Start Mode

The timing diagram shown in **Figure 29.2, Timing Diagram of WDTA Start in Default Start Mode** shows the following behaviors:

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

Example: Overflow interval time after reset release = 2^{16}/WDTATCKI (OPWDOVF[2:0] = 111_B)

(2) WDTAnMD is set before a WDTA trigger is generated. Note that the setting is not applied immediately.

(3) Write to the WDTA trigger register before the WDTA counter overflows.
The WDTAnMD setting is applied by the generation of a WDTA trigger behind a maximum of 3 x Timer count clock.

Example: Overflow interval time after a WDTA trigger is generated = 2^{13}/WDTATCKI

29.5.1.4 Software Trigger Start Mode Timing

The software trigger start mode timing and the changes to the WDTA settings are illustrated in **Figure 29.3, Timing Diagram of WDTA Start in Software Trigger Start Mode**.

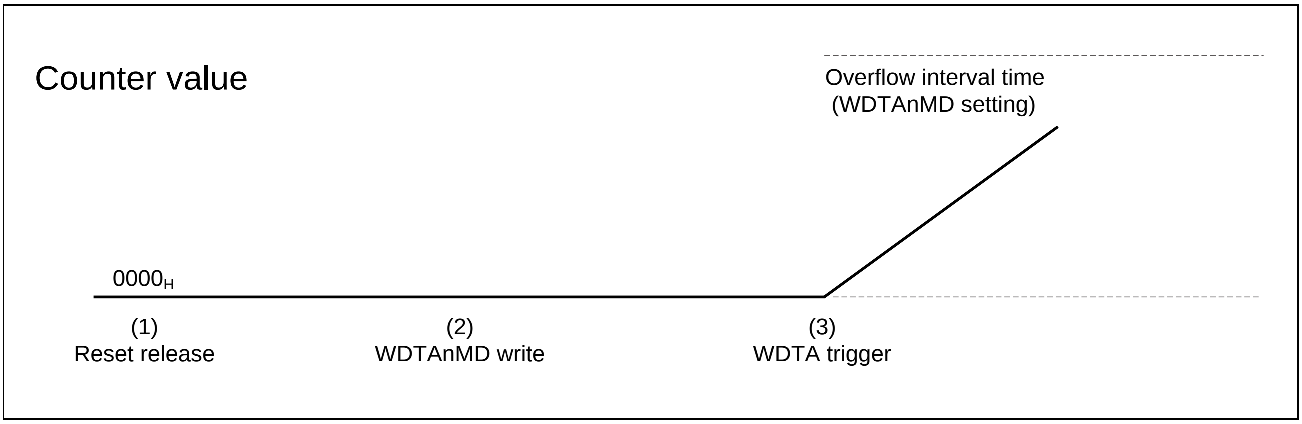

Figure 29.3 Timing Diagram of WDTA Start in Software Trigger Start Mode

The timing diagram shown in **Figure 29.3, Timing Diagram of WDTA Start in Software Trigger Start Mode** shows the following behaviors:

(1) The WDTA counter value remains 0000_H until the first trigger is generated after reset release. The overflow interval time is set by start-up options, but this setting has no effect because the counter is not operating.

(2) WDTAnMD is set before a WDTA trigger is generated. Note that the setting is not applied immediately.

(3) The WDTA counter starts by the generation of a WDTA trigger.
After the generation of a WDTA trigger behind a maximum of 3 x Timer count clock, the overflow interval time specified in WDTAnMD and other settings are applied.

29.5.2 WDTA Trigger

Writing a special value called an activation code to the WDTA enable register (WDTAnWDTE) and the WDTA enable VAC register (WDTAnEVAC) leads to generation of a WDTA trigger.

The WDTA trigger has the following functions:

- Starting the WDTA counter in software trigger start mode
- Restarting the WDTA counter
- Setting the WDTA mode specified by the WDTAnMD register (only for the first WDTA trigger after reset release)

The WDTA trigger register, which generates a WDTA trigger, is specified by the start-up option OPWDVAC.

Table 29.33, WDTA Trigger Registers and Activation Codes lists the WDTA trigger registers and activation codes.

Table 29.33 WDTA Trigger Registers and Activation Codes

Type of Activation Code	Trigger Register	Activation Code
Fixed (OPWDVAC = 0)	WDTAnWDTE	AC_H
Variable (OPWDVAC = 1)	WDTAnEVAC	For details, see **Section 29.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

CAUTION

- When successively writing the processing to clear WDTA, the clear processing below is not acknowledged for the following period:
  "12 × CPU clock*[1] cycles + 6 × WDT clock*[2] cycles"
- After writing the processing to clear WDTA and then changing to standby mode during the above-mentioned period, the clear processing below is not acknowledged for the following period after return from stand-by mode:
  "6 × CPU clock*[1] cycles + 3 × WDT clock*[2] cycles"

Note 1. CPU clock: Clock selected by CKSC_CPUCLKS_CTL and CKSC_CPUCLKD_CTL

Note 2. WDT clock: Clock selected by CKSC_AWDTAD_CTL is used for WDTA0.
LS IntOSC is used for WDTA1 and WDTA2.

29.5.2.1 Calculating an Activation Code when the VAC Function is Used

Use the following expression to calculate the variable activation code (ExpectWDTE) to be set in the WDTA trigger register (WDTAnEVAC) when the VAC function is used, by using the WDTA reference value register (WDTAnREF):

ExpectWDTE = AC_H – WDTAnREF (previous)

Note that the value in the WDTAnREF register is updated every time a start-code is written to the trigger register WDTAnEVAC. Use the following expression to calculate the updated value of the WDTAnREF register:

WDTAnREF (following) = (rotate the value of ExpectWDTE to the left by 1 bit)

Table 29.34, Expected Variable Activation Code Development lists the variable activation codes according to the number of WDTA triggers.

Table 29.34 Expected Variable Activation Code Development

No*1	WDTAnREF (Previous)		ExpectWDTE (AC_H - WDTAnREF)		WDTAnREF (Following)	
0	0000 0000	00_H	1010 1100	AC_H	0101 1001	59_H
1	0101 1001	59_H	0101 0011	53_H	1010 0110	$A6_H$
2	1010 0110	$A6_H$	0000 0110	06_H	0000 1100	$0C_H$
…	…	…	…	…	…	…

Note 1. Number of triggers after reset

NOTE

Writing an incorrect activation code generates an error.

29.5.3 WDTA Error Detection

WDTA detects an error, including generation of the WDTA count overflow or illegal operations.

The following events are detected as errors:

- WDTA counter overflow
- Incorrect activation code is written to the WDTA trigger register
- Writing to the trigger register at a time outside the window-open period
- When the setting value in the WDTA mode register (WDTAnMD) is changed after the first WDTA trigger is generated
- When the value of the WDTA mode register (WDTAnMD) is changed twice before the first WDTA trigger is generated*[1]

Note 1. In this case, WDTAnRES is generated regardless setting of WDTA error mode bit (WDTAnMD.WDTAnERM).

29.5.3.1 WDTA Error Mode

When a WDTA error is detected, either an NMI interrupt or a reset is generated according to the setting of the WDTA error mode bit (WDTAnMD.WDTAnERM). The error mode bit after reset release is set to the reset mode.

- WDTAnMD.WDTAnERM = 0: NMI mode
- WDTAnMD.WDTAnERM = 1: Reset mode

Figure 29.4, Timing Diagram of WDTA NMI Request or Reset Generation shows the reset or NMI request generation when the counter overflows and default start mode is selected.

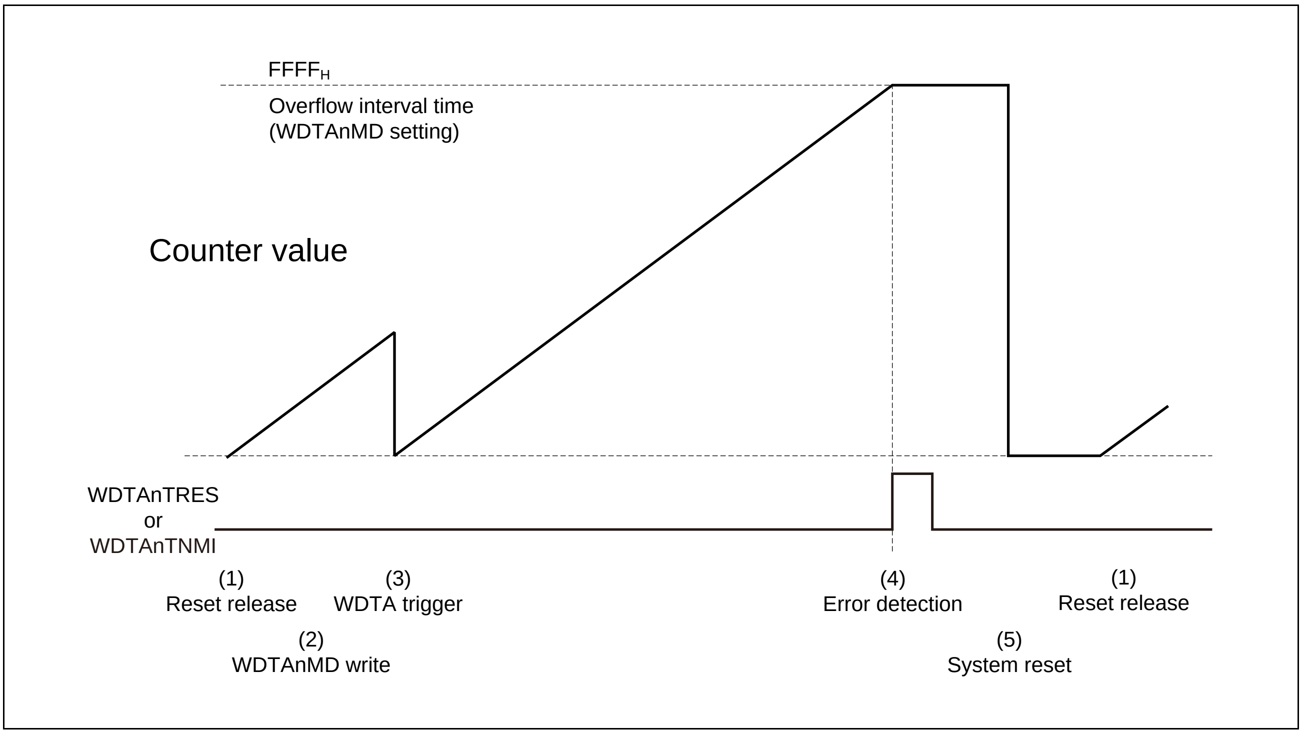

Figure 29.4 Timing Diagram of WDTA NMI Request or Reset Generation

The timing diagram shown in **Figure 29.4, Timing Diagram of WDTA NMI Request or Reset Generation** shows the following behaviors:

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated.
In this case, 2^{16}/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated.
The counter value remains until a system reset is performed.

(5) When the system is reset, the counter is cleared and stops until reset release.

29.5.4 75% Interrupt Request Signals

When the WDTA counter reaches 75% of the time set for the overflow interval, the interrupt request INTWDTAn is generated.

This function can be enabled or disabled by the WDTAnMD.WDTAnWIE register.

Figure 29.5, Timing Diagram of WDTA 75% Interrupt Request Signals shows the 75% interrupt request generated under following conditions:

- Default start mode is selected.
- 75% interrupt request is enabled after the first WDTA trigger is generated
- WDTA overflow interval time is 2^{16}/WDTATCKI

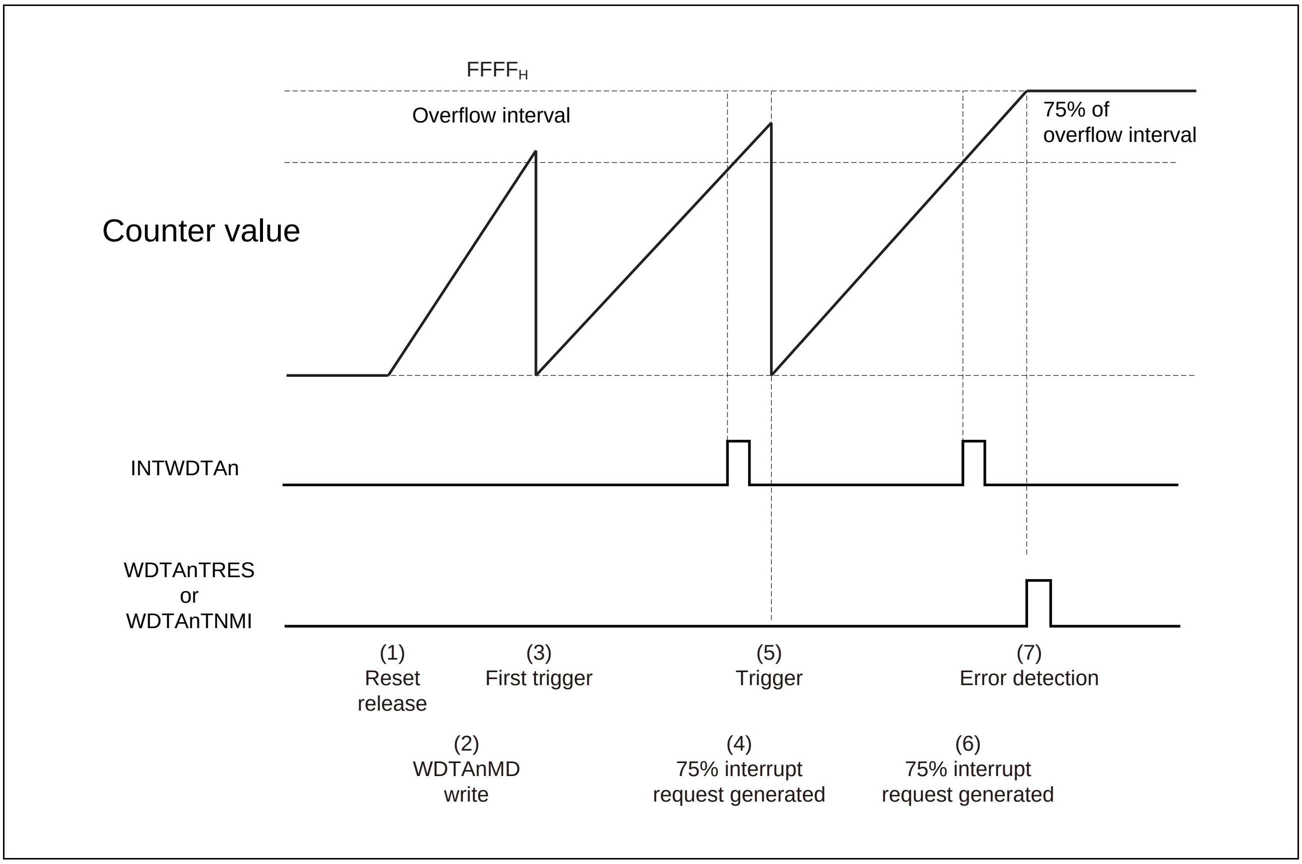

Figure 29.5 Timing Diagram of WDTA 75% Interrupt Request Signals

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated. In this case, 2^{16}/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) When the WDTA counter reaches 75% of the overflow interval timer, interrupt request INTWDTAn is generated.

(5) The WDTA trigger restarts counting.

(6) When the WDTA counter reaches 75% of the overflow interval timer, interrupt request INTWDTAn is generated.

(7) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.

29.5.5 Window Function

The period when a WDTA trigger is valid (window-open period) can be set. If the window-open period is set to the value less than 100%, the generation of a WDTA trigger not in the window-open period causes an error. The window-open period after reset release is 100%. The period is set to the value by the WDTAnMD.WDTAnWS[1:0] setting after the first WDTA trigger is generated.

Figure 29.6, Timing Diagram of WDTA Window Function shows the behavior of the window function under the following conditions.

- Default start mode is selected.
- 25% window-open period is enabled after the first WDTA trigger is generated (WDTAnWS[1:0] = 00_B)
- WDTA overflow interval time is 2^{16}/WDTATCKI

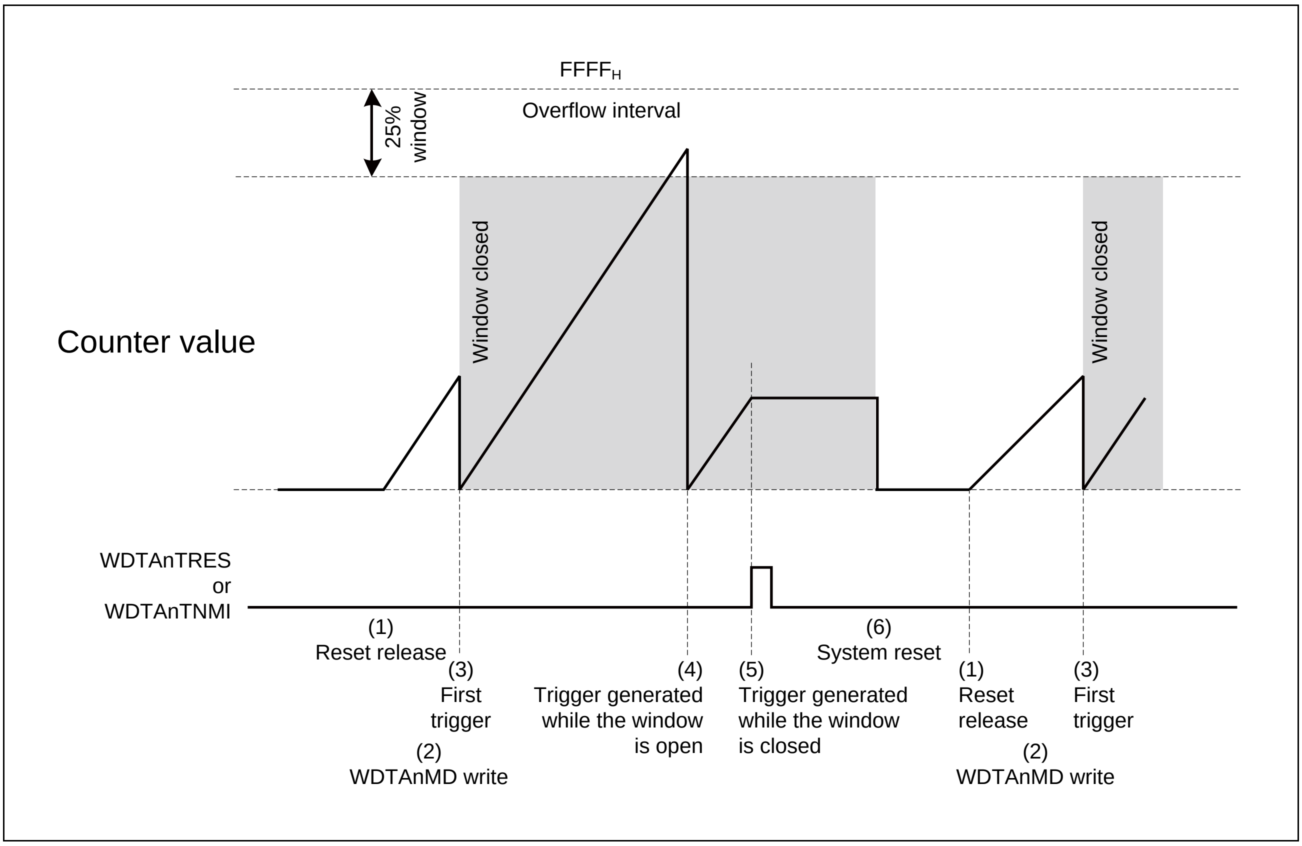

Figure 29.6 Timing Diagram of WDTA Window Function

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated. In this case, 2^{16}/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) During the window-open period, the WDTA trigger restarts counting.

(5) During the window-closed period, an error is detected by the WDTA trigger. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.

(6) When the system is reset, the counter is cleared and stops until reset release.

Section 30 OS Timer (OSTM)

This section contains a generic description of the OS Timer (OSTM).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of OSTM.

30.1 Features of RH850/F1KH, RH850/F1KM OSTM

30.1.1 Number of Units

This microcontroller has the following number of units of the OSTM.

Each OSTM unit has single channel interface.

Table 30.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	10	10	10
Name	OSTMn (n = 0 to 9)	OSTMn (n = 0 to 9)	OSTMn (n = 0 to 9)

Table 30.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	5	5	5	5	5
Name	OSTMn (n = 0 to 4)	OSTMn (n = 0 to 4)	OSTMn (n = 0 to 4)	OSTMn (n = 0 to 4)	OSTMn (n = 0 to 4)

Table 30.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	OSTMn (n = 0)	OSTMn (n = 0)	OSTMn (n = 0)	OSTMn (n = 0)

Table 30.4 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual OSTM units are identified by the index “n”; for example, OSTMnCNT is the OSTM counter register.

30.1.2 Register Base Addresses

OSTM base addresses are listed in the following table.

OSTM register addresses are given as offsets from the base addresses.

Table 30.5 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<OSTM0_base>	FFD7 0000$_H$
<OSTM1_base>	FFD7 0100$_H$
<OSTM2_base>	FFD7 0200$_H$
<OSTM3_base>	FFD7 0300$_H$
<OSTM4_base>	FFD7 0400$_H$
<OSTM5_base>	FFD7 1000$_H$
<OSTM6_base>	FFD7 1100$_H$
<OSTM7_base>	FFD7 1200$_H$
<OSTM8_base>	FFD7 1300$_H$
<OSTM9_base>	FFD7 1400$_H$

Table 30.6 Register Base Addresses (RH850/F1KM-S4)

Base Address Name	Base Address
<OSTM0_base>	FFD7 0000$_H$
<OSTM1_base>	FFD7 0100$_H$
<OSTM2_base>	FFD7 0200$_H$
<OSTM3_base>	FFD7 0300$_H$
<OSTM4_base>	FFD7 0400$_H$

Table 30.7 Register Base Address (RH850/F1KM-S1)

Base Address Name	Base Address
<OSTM0_base>	FFD7 0000$_H$

30.1.3 Clock Supply

The OSTM clock supply is shown in the following table.

Table 30.8 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
OSTMn	PCLK	CPUCLK_L	Timer count clock
	Register access clock	CPUCLK_L	Bus clock

30.1.4 Interrupt Requests

OSTM interrupt requests are listed in the following table.

Table 30.9 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
OSTM0			
OSTMTINT	OSTM0 interrupt	84 (INTOSTM0)	—

30.1.5 Reset Sources

OSTM reset sources are listed in the following table. OSTM is initialized by these reset sources.

Table 30.14 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
OSTMn	All reset sources (ISORES)

30.2 Overview

OSTM is a 32-bit timer/counter.

It can be used in interval timer mode or in free-run compare mode. The settings for operating mode specify the direction of counting (up or down) to control the generation of interrupt requests.

30.2.1 Functional Overview

OSTM has the following features.

- Two operating modes
  - Interval timer mode
  - Free-run compare mode
- OSTMTINT interrupt

30.2.2 Block Diagram

The following block diagram shows the main components of OSTM.

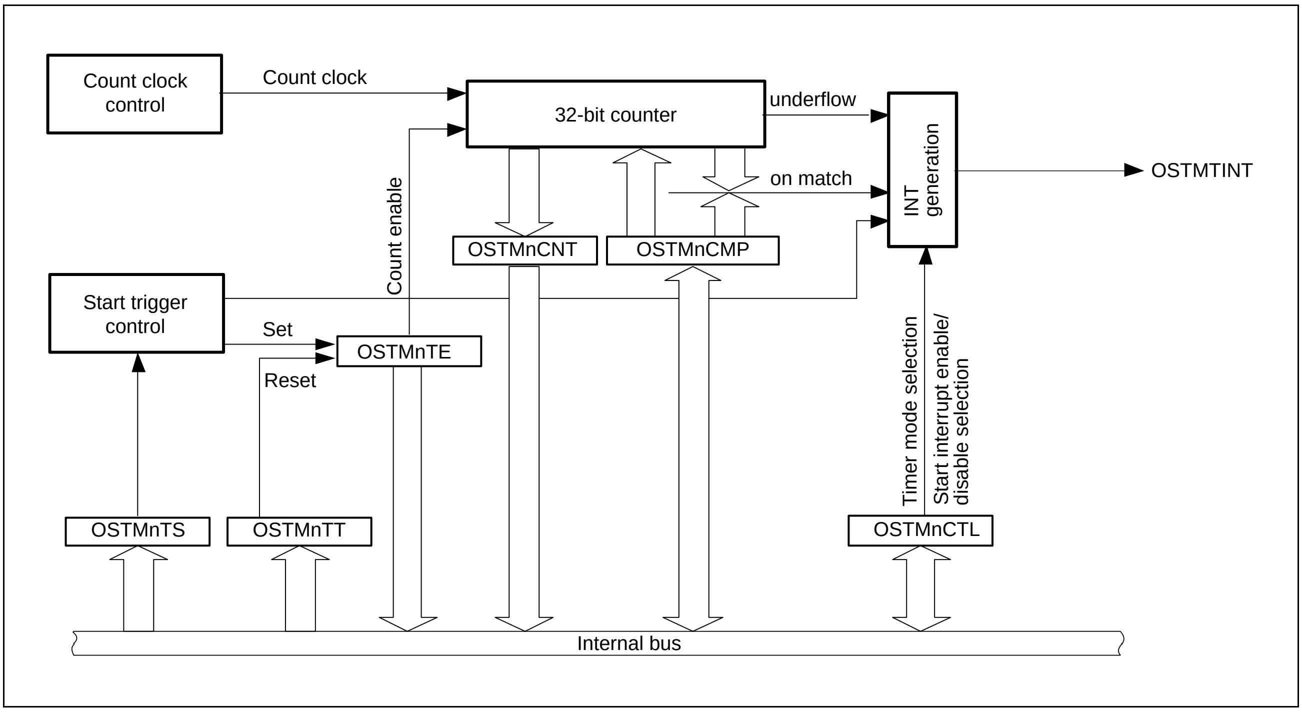

Figure 30.1 Block Diagram of OSTM

30.2.3 Count Clock

The count clock used by OSTM is PCLK.

30.2.4 Interrupt Sources (OSTMTINT)

An OSTMTINT interrupt request is generated on counter underflow (interval timer mode) or when the counter matches the compare value (free-run compare mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

This is illustrated in the following figure.

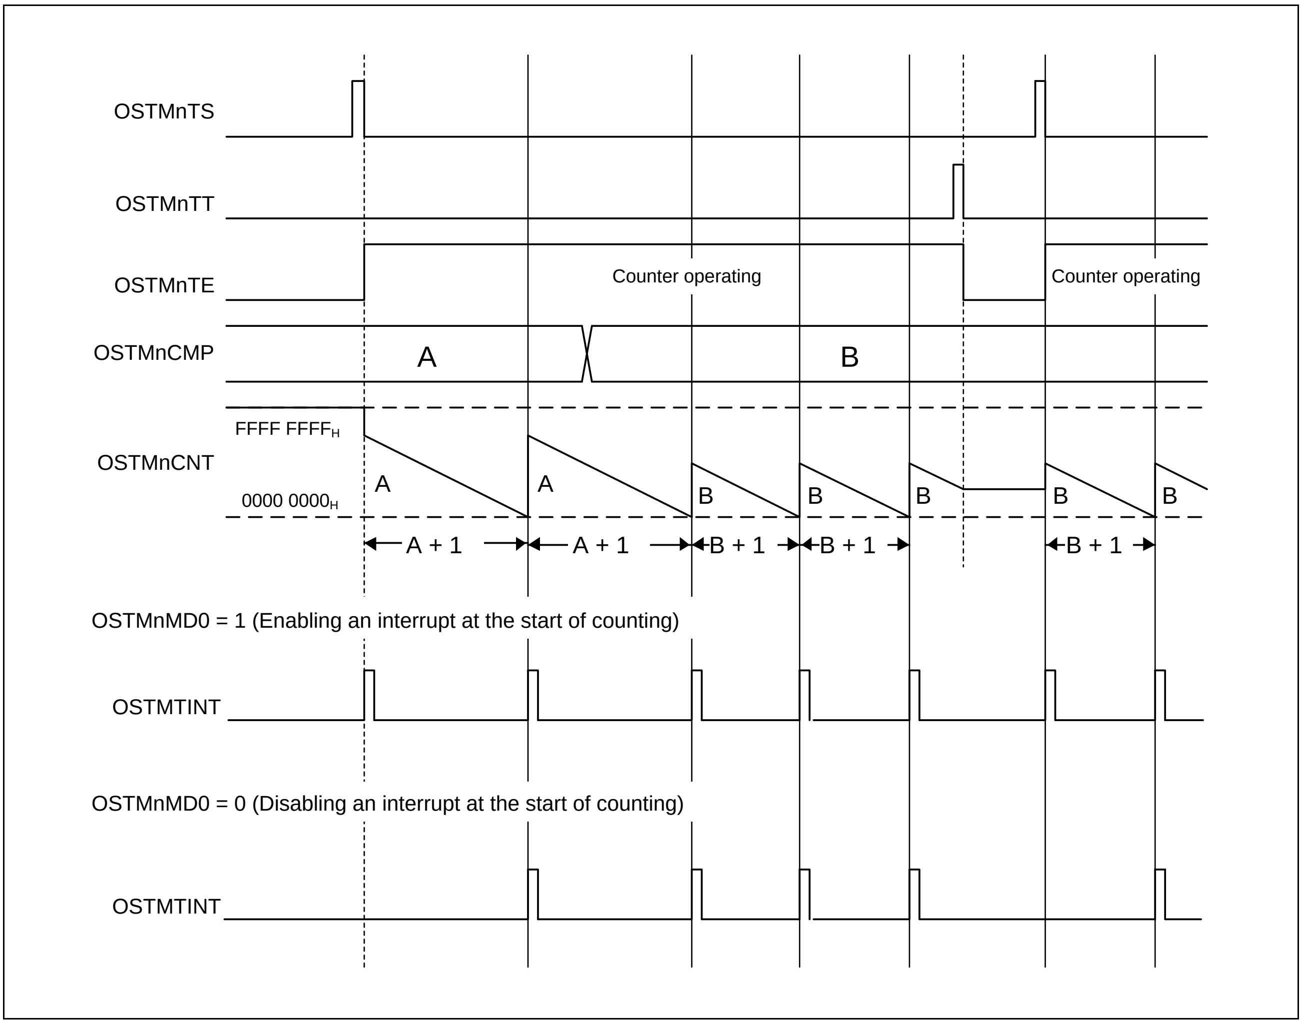

Figure 30.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

30.3 Registers

30.3.1 List of Registers

OSTM registers are listed in the following table.

For details about <OSTMn_base>, see **Section 30.1.2, Register Base Addresses**.

Table 30.15 List of Registers

Module Name	Register Name	Symbol	Address
OSTMn	OSTMn compare register	OSTMnCMP	<OSTMn_base> + 00_H
	OSTMn counter register	OSTMnCNT	<OSTMn_base> + 04_H
	OSTMn count enable status register	OSTMnTE	<OSTMn_base> + 10_H
	OSTMn count start trigger register	OSTMnTS	<OSTMn_base> + 14_H
	OSTMn count stop trigger register	OSTMnTT	<OSTMn_base> + 18_H
	OSTMn control register	OSTMnCTL	<OSTMn_base> + 20_H
	OSTMn emulation register	OSTMnEMU	<OSTMn_base> + 24_H

30.3.2 OSTMnCMP — OSTMn Compare Register

This register stores the start value of the down-counter or the value with which the counter is compared, depending on the operation mode.

Access: This register can be read or written in 32-bit units.

Address: <OSTMn_base> + 00_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.16 OSTMnCMP Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCMP[31:0]	• In interval timer mode: start value of the down-counter • In free-run compare mode: compare value

30.3.3 OSTMnCNT — OSTMn Counter Register

This register indicates the counter value of the timer.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <OSTMn_base> + 04_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCNT[31:16]

Table 30.17 OSTMnCNT Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCNT[31:0]	Timer counter value

Table 30.18, Correspondence among Operating Mode, Counting Direction, and Start Value lists the correspondence among the OSTM operating mode, counting direction, and start value. The start value indicates the value to be read after the operating mode is changed.

Table 30.18 Correspondence among Operating Mode, Counting Direction, and Start Value

Timer Operating Mode	OSTMnCTL.OSTMnMD1	Counting Direction	Start Value
Interval timer mode	0*1	Down	FFFF $FFFF_H$
Free-run compare mode	1	Up	0000 0000_H

Note 1. Value after reset.

30.3.4 OSTMnTE — OSTMn Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <OSTMn_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 30.19 OSTMnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	OSTMnTE	Indicates whether the counter is enabled or disabled: 0: Counter disabled 1: Counter enabled This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1. Setting OSTMnTT.OSTMnTT to 1 resets this bit to 0.

NOTE

If the counter is disabled, the counter value retains its value.

If the counter is restarted, it

- restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
- restarts counting up from the counter value $0000\ 0000_H$ if it is in free-run compare mode.

30.3.5 OSTMnTS — OSTMn Count Start Trigger Register

This register starts the counter.

Access:	This register is a write-only register that can be written in 8-bit units.
Address:	<OSTMn_base> + 14_H
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 30.20 OSTMnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OSTMnTS	Starts the counter: 0: This setting is invalid. 1: Starts the counter and sets OSTMnTE.OSTMnTE = 1. ● In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1. ● In free-run compare mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1.

30.3.6 OSTMnTT — OSTMn Count Stop Trigger Register

This register stops the counter.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <OSTMn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 30.21 OSTMnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OSTMnTT	Stops the counter: 0: This setting is invalid. 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit.

30.3.7 OSTMnCTL — OSTMn Control Register

This register specifies the operating mode for the counter and controls the generation of OSTMTINT interrupt requests when counting starts.

Although this register is readable and writable, this register can only be written when OSTMnTS.OSTMnTE = 0.

Access: This register can be read or written in 8-bit units.

Address: <OSTMn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OSTMnMD1	OSTMnMD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 30.22 OSTMnCTL Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OSTMnMD1	Specifies the operating mode for the counter: 0: Interval timer mode 1: Free-run compare mode
0	OSTMnMD0	Controls the generation of OSTMTINT interrupt requests at the start of counting: 0: Interrupts when counting starts are disabled. 1: Interrupts when counting starts are enabled.

30.3.8 OSTMnEMU — OSTMn Emulation Register

This register controls operation in combination with SVSTOP.

Access:	This register can be read or written in 8-bit units. Only proceed with writing while the counter is stopped (OSTMnTE.OSTMnTE = 0 and EPC.SVSTOP = 0).
Address:	<OSTMn_base> + 24_H
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	OSTMnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 30.23 OSTMnEMU Register Contents

Bit Position	Bit Name	Function
7	OSTMnSVSDIS	When EPC.SVSTOP = 0 Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on) regardless of the value of this bit (0/1). When EPC.SVSTOP = 1 0: The count clock is stopped when the debugger acquires control of the microcontroller (at breakpoints and so on). 1: Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

30.4 Operation

30.4.1 Starting and Stopping OSTM

OSTM is started and stopped as follows:

Starting the Timer

OSTM is started by the following setting.

- Setting the OSTMnTS.OSTMnTS bit to 1

The OSTMnTE.OSTMnTE status bit is set to 1.

The counter starts to count up or down in accordance with the settings for operating mode. For details, see **Section 30.4.2, Interval Timer Mode** and **Section 30.4.3**, **Free-Run Compare Mode**.

Stopping the Timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops OSTM.

This also clears the OSTMnTE.OSTMnTE status bit.

30.4.2 Interval Timer Mode

In interval timer mode, OSTM can be used as a reference timer generating interrupt requests at fixed intervals.

30.4.2.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMTINT interrupt request is generated when the counter underflows (reaches $0000\ 0000_H$).

To select interval timer mode, set OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next $0000\ 0000_H$ is reached. Then the counter continues with the new value.

OSTMTINT Period

The periods of OSTMTINT is:

- OSTMTINT generation period = count clock period × (OSTMnCMP + 1)

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode.

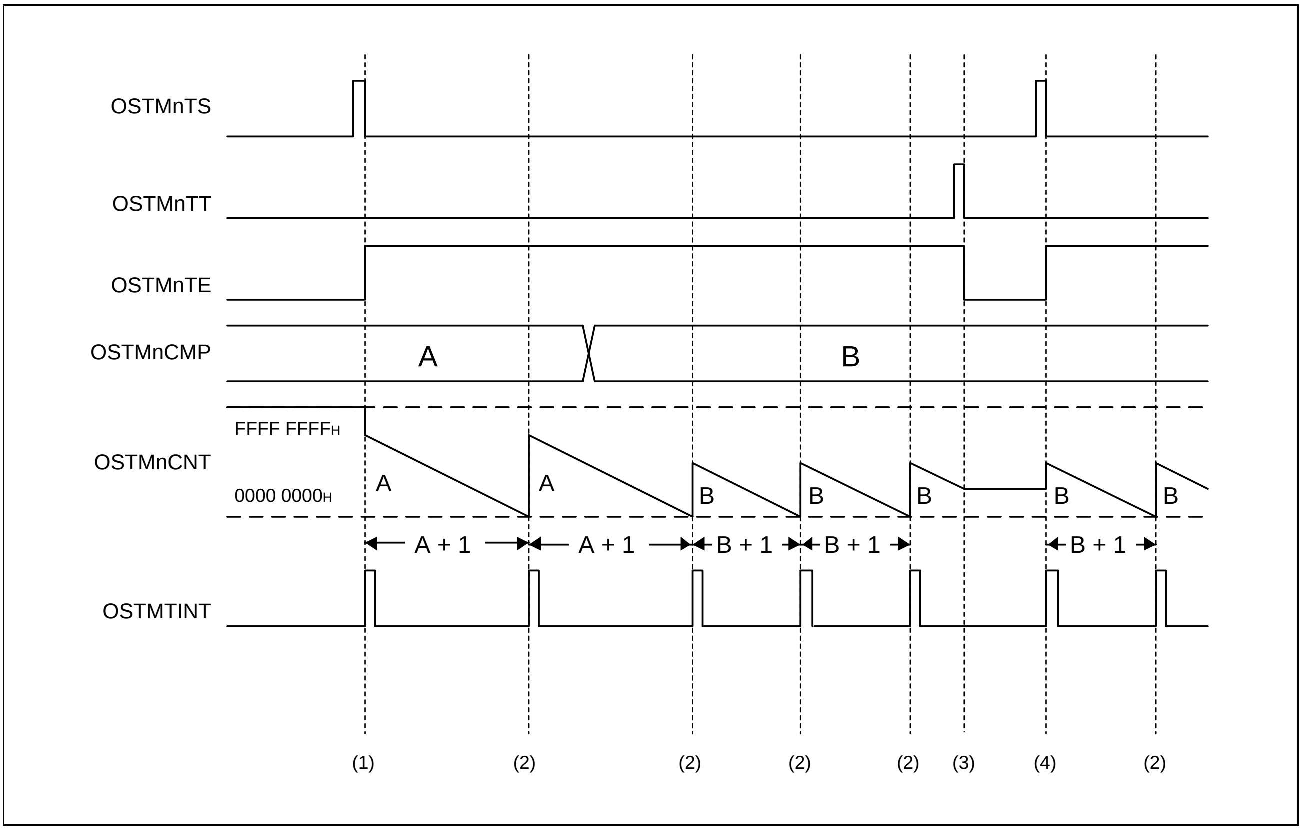

Figure 30.3 Timing Diagram of OSTM in Interval Timer Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting down from the value of OSTMnCMP.
If OSTMnCTL.OSTMnMD0 is 1, OSTMTINT interrupt requests are generated at the start of counting. The OSTMnCNT register indicates the counter value.

(2) When the counter reaches 0000 0000_H, an OSTMTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.

(4) When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

Forced Restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 during counting.

The counter loads the start value from the OSTMnCMP register and continues to count down.

The following figure shows the timing in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1).

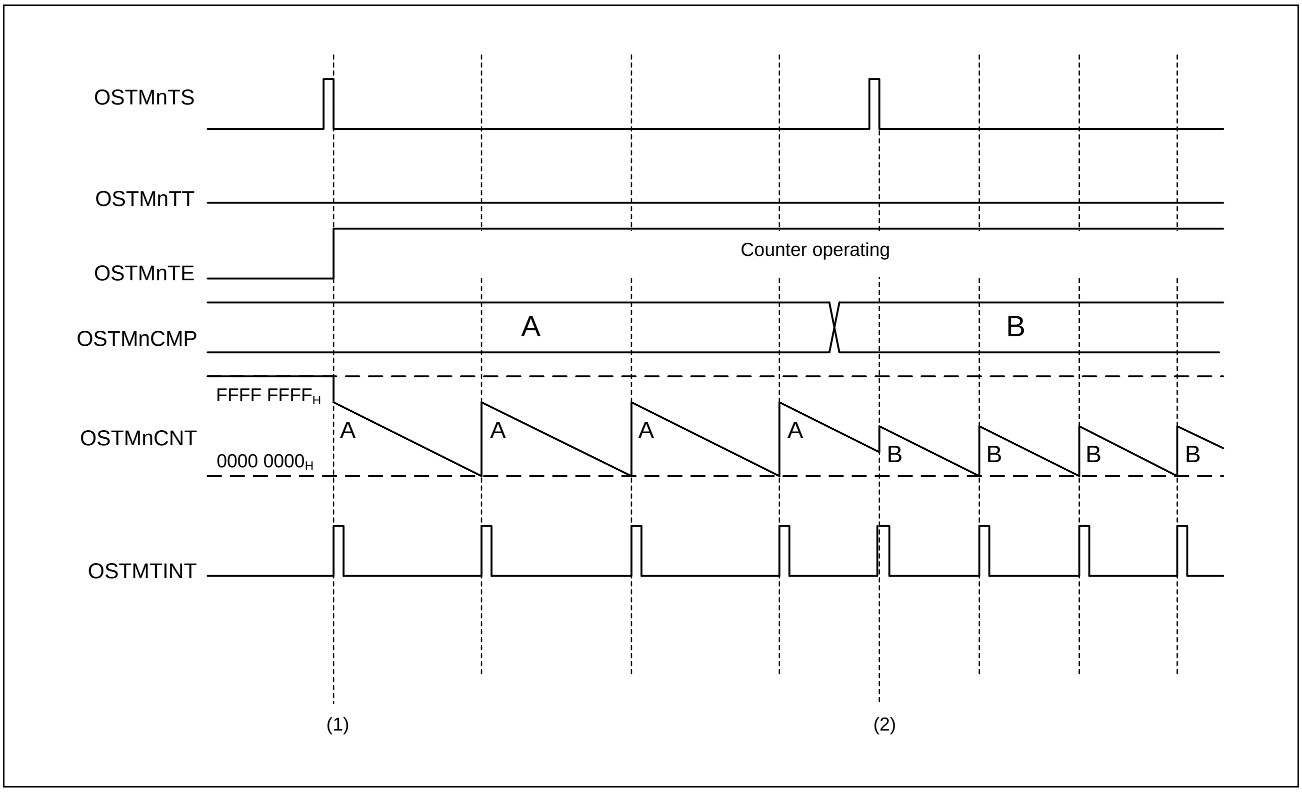

Figure 30.4 Timing Diagram of Forced Restart in Interval Timer Mode

The timing diagram above shows the following operations:

(1) The counter is started and stopped as described under **Figure 30.3, Timing Diagram of OSTM in Interval Timer Mode**.

(2) Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated when counting starts.

30.4.2.2 Operation when OSTMnCMP = 0000 0000_H

When OSTMnCMP = 0000 0000_H, OSTM behaves as follows.

- When the counter is enabled, the OSTMTINT interrupt request is always set to 1.

The following figure shows operations of OSTM when OSTMnCMP = 0000 0000_H, and counter-start interrupts are enabled.

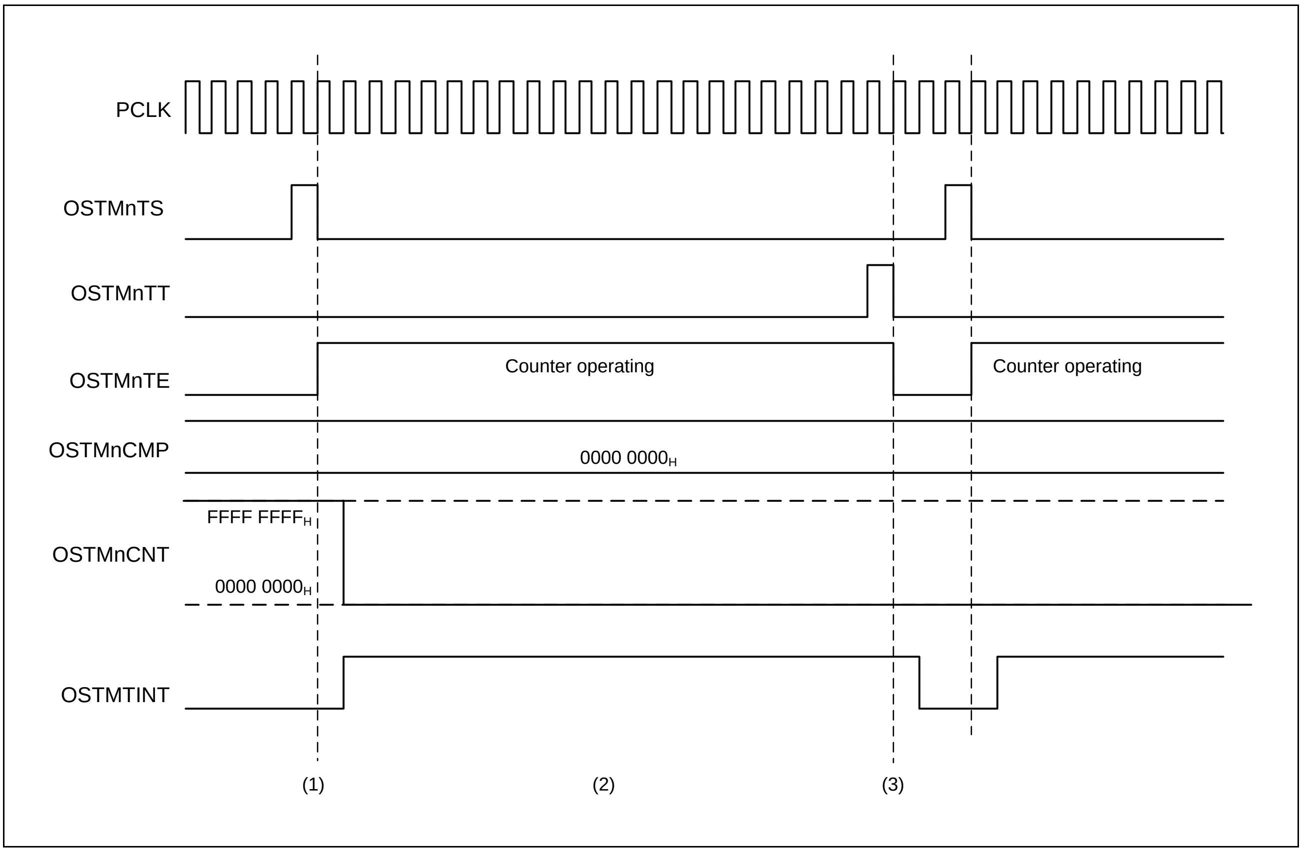

Figure 30.5 Timing Diagram when OSTMnCMP = 0000 0000_H in Interval Timer Mode

The timing diagram above shows the following operations:

(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value 0000 0000_H is retained in OSTMnCMP.

(2) The OSTMTINT interrupt request is continuously asserted.

(3) After the counter stops, the OSTMTINT interrupt request signal is deasserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

30.4.2.3 Setting Procedure for Interval Timer Mode

The setting procedure in interval timer mode after reset release is described below:

Setting Procedure

(1) Set the start value of the counter in the OSTMnCMP register.

(2) Select interval timer mode by setting the OSTMnCTL.OSTMnMD1 bit to 0.

(3) Enable or disable interrupts when counting starts (OSTMnCTL.OSTMnMD0).

30.4.3 Free-Run Compare Mode

30.4.3.1 Basic Operation in Free-Run Compare Mode

In free-run compare mode, the counter counts up from 0000 0000_H to FFFF $FFFF_H$. When the value of the OSTMnCMP register matches the current counter value, an OSTMTINT interrupt request is output.

In free-run compare mode, set OSTMnCTL.OSTMnMD1 = 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

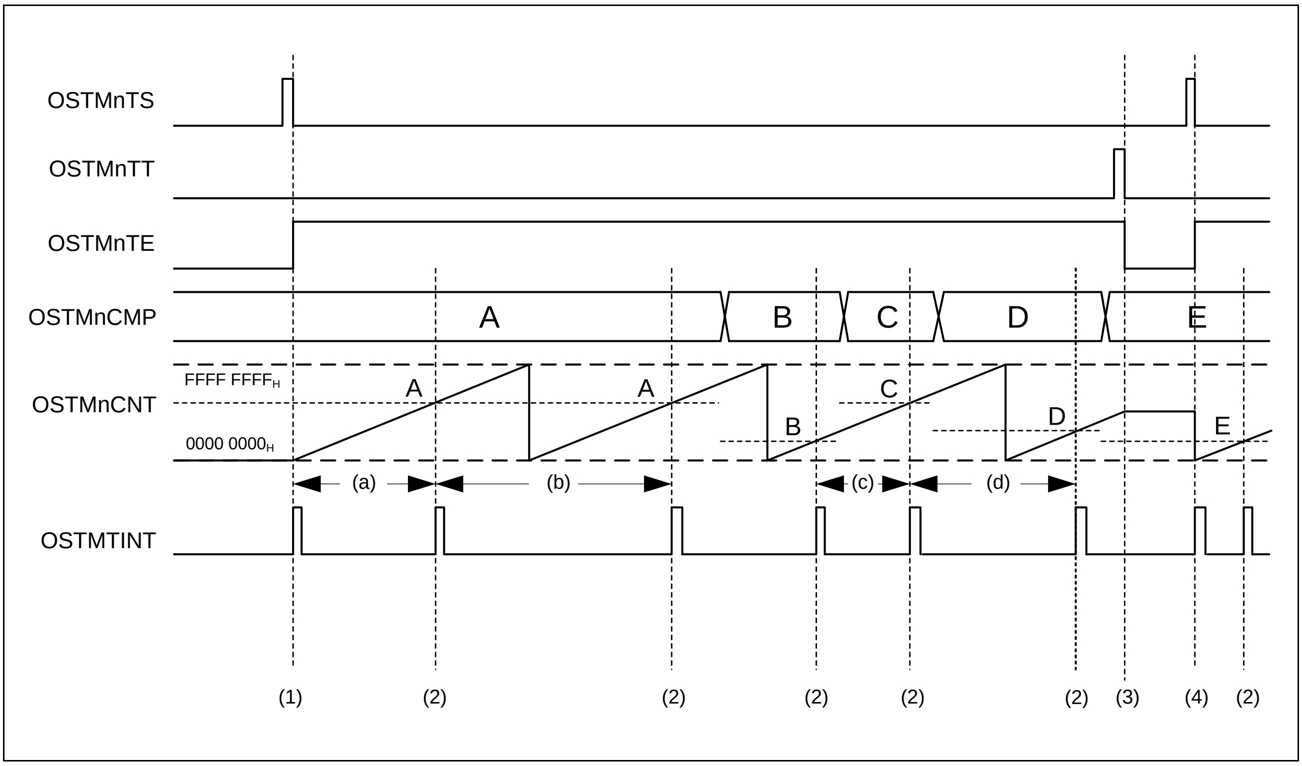

Figure 30.6 Timing Diagram of OSTM in Free-Run Compare Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1.
The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from 0000 0000_H to FFFF $FFFF_H$. The OSTMnCNT register indicates the counter value.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated at the start of counting.

(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMTINT interrupt request is generated.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.

(4) Counting by the counter restarts from 0000 0000_H when OSTMnTS.OSTMnTS = 1.

OSTMTINT Period

The OSTMTINT generation period is different depending on the starting time. If OSTMnCMP is rewritten during operation, the period is changed according to the size of the new and old compare values.

Table 30.24 OSTMTINT Generation Timing

Old Value for Comparison	New Value for Comparison	Counter Value at Time of Rewriting	Period of OSTMTINT Generation	Label in Timing Diagram
Counter starts			(A + 1) × count clock period	(a)
A	A	No rewriting	(FFFF FFFF_H + 1) × count clock period	(b)
B	C > B	B < counter value < C	(C – B) × count clock period	(c)
C	D < C	Counter value > D,C	(FFFF FFFF_H – C + D + 1) × count clock period	(d)

Forced Restart

Forced restarting of the counter does not proceed if the OSTMnTS.OSTMnTS bit is set during counting. The counter ignores the attempted setting and continues counting.

30.4.3.2 Operation when OSTMnCMP = 0000 0000_H

The following figure shows the operation of OSTM when OSTMnCMP = 0000 0000_H, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

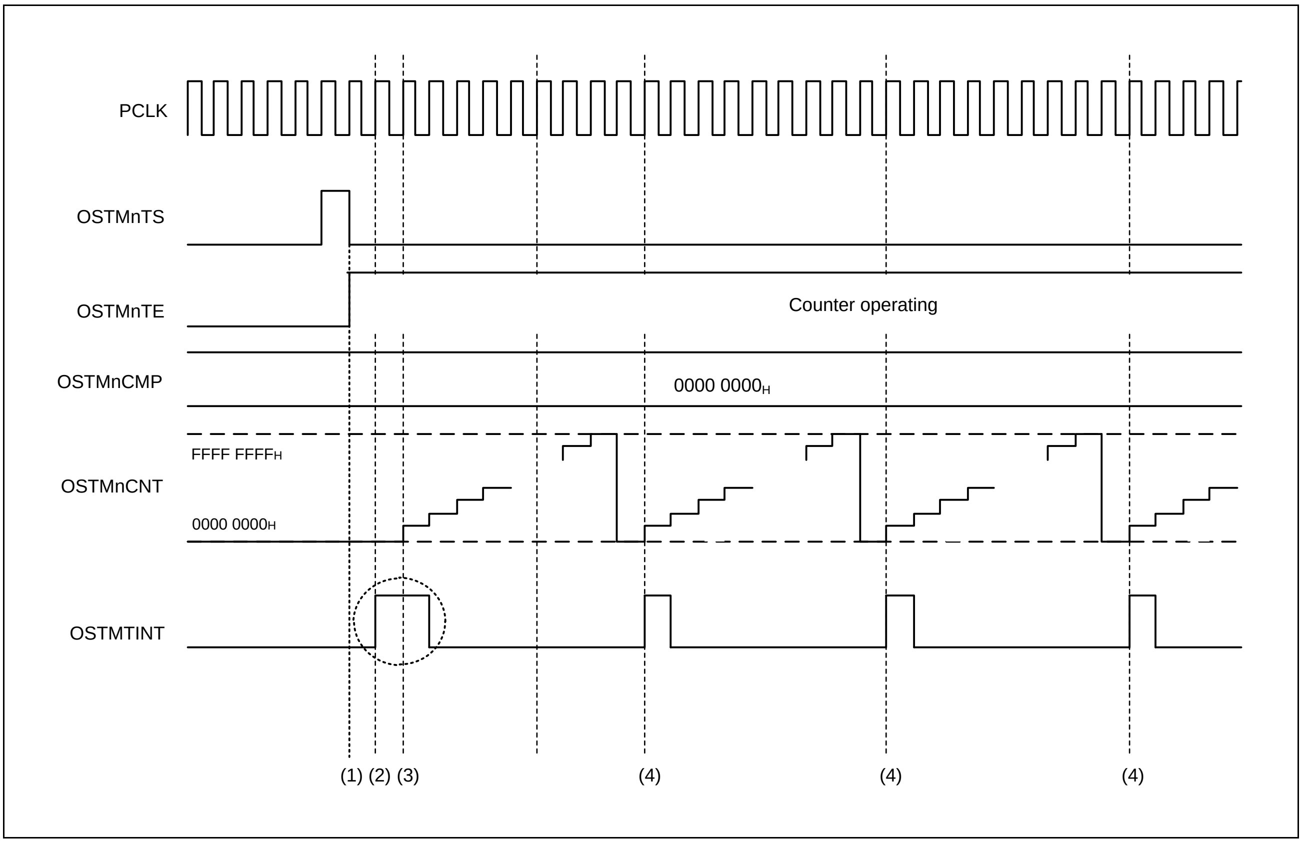

Figure 30.7 Timing Diagram when OSTMnCMP = 0000 0000_H in Free-Run Compare Mode

The timing diagram above shows the following operations.

(1) Once the counter starts, it counts up from 0000 0000_H to FFFF $FFFF_H$.

(2) An OSTMTINT interrupt request is generated when counting starts.

(3) If the current counter value matches OSTMnCMP, an OSTMTINT interrupt request is generated.
If OSTMnCMP = 0000 0000_H as shown above, OSTMTINT is generated over two clock cycles.

(4) An OSTMTINT interrupt request is generated for each clock cycle (FFFF $FFFF_H$ + 1).

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

30.4.3.3 Setting Procedure for Free-Run Compare Mode

The setting procedure in free-run compare mode after reset release is described below:

Setting Procedure

(1) Set the compare value in the OSTMnCMP register.

(2) Select free-run compare mode by setting the OSTMnCTL.OSTMnMD1 bit to 1.

(3) Enable or disable interrupts when counting starts by the OSTMnCTL.OSTMnMD0 bit.

Section 31 Timer Array Unit B (TAUB)

This section contains a generic description of the timer array unit B (TAUB).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of TAUB.

31.1 Features of RH850/F1KH, RH850/F1KM TAUB

31.1.1 Number of Units and Channels

This microcontroller has the following number of TAUB units and channels.

Table 31.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	2	2	2
Name	TAUBn (n = 0, 1)	TAUBn (n = 0, 1)	TAUBn (n = 0, 1)

Table 31.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	2	2	2
Name	TAUBn (n = 0)	TAUBn (n = 0)	TAUBn (n = 0, 1)	TAUBn (n = 0, 1)	TAUBn (n = 0, 1)

Table 31.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	1	1
Name	—	—	TAUBn (n = 0)	TAUBn (n = 0)

Table 31.4 TAUBn Unit Configurations and Channels (RH850/F1KH-D8)

Unit Name TAUBn	Number of Channels per Unit	RH850/F1KH-D8 176 Pins (32 ch)	RH850/F1KH-D8 233 Pins (32 ch)	RH850/F1KH-D8 324 Pins (32 ch)

Unit Name TAUBn	Number of Channels per Unit	RH850/F1KM-S1 48 Pins (—)	RH850/F1KM-S1 64 Pins (—)	RH850/F1KM-S1 80 Pins (16 ch)	RH850/F1KM-S1 100 Pins (16 ch)
TAUB0	16	—	—	✓	✓

Table 31.7 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual TAUB units are identified by the index “n”; for example, TAUBnTOM is the TAUBn channel output mode register.
m	The TAUB has 16 channels. Throughout this section, the individual channels are identified by the index “m”, thus a certain channel is denoted as CHm (m = 0 to 15). The even numbered channels (m = 0, 2, 4, 6, 8, 10, 12, 14) are denoted as CHm_even. The odd numbered channels (m = 1, 3, 5, 7, 9, 11, 13, 15) are denoted as CHm_odd.

31.1.2 Register Base Addresses

TAUBn base addresses are listed in the following table.

TAUBn register addresses are given as offsets from the base addresses.

Table 31.8 Register Base Addresses (RH850/F1KH-D8)

Name	Base Address
<TAUB0_base>	FFE3 0000_H
<TAUB1_base>	FFE3 1000_H

Table 31.9 Register Base Addresses (RH850/F1KM-S4)

Name	Base Address
<TAUB0_base>	FFE3 0000_H
<TAUB1_base>	FFE3 1000_H

Table 31.10 Register Base Address (RH850/F1KM-S1)

Name	Base Address
<TAUB0_base>	FFE3 0000_H

31.1.3 Clock Supply

The TAUBn clock supply is shown in the following table.

Table 31.11 TAUBn Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAUBn	PCLK	CKSCLK_IPERI2	Timer count clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI2	Bus clock

31.1.4 Interrupt Requests

TAUBn interrupt requests are listed in the following table.

Table 31.12 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
TAUB0			
INTTAUB0I0	Channel 0 interrupt	142	33 to 38
INTTAUB0I1	Channel 1 interrupt	143	33 to 38
INTTAUB0I2	Channel 2 interrupt	144	33 to 38
INTTAUB0I3	Channel 3 interrupt	145	33 to 38
INTTAUB0I4	Channel 4 interrupt	146	33 to 38
INTTAUB0I5	Channel 5 interrupt	147	33 to 38
INTTAUB0I6	Channel 6 interrupt	148	33 to 38
INTTAUB0I7	Channel 7 interrupt	149	33 to 38
INTTAUB0I8	Channel 8 interrupt	150	33 to 38
INTTAUB0I9	Channel 9 interrupt	151	33 to 38

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2C.12, Noise Filter & Edge/Level Detector**.

31.1.7 TAUBn Input Selection

The output from port TAUBnIm (n = 0, 1, m = 0 to 15) can be input to TAUBTTINm (m = 0 to 15) as shown in the following figure.

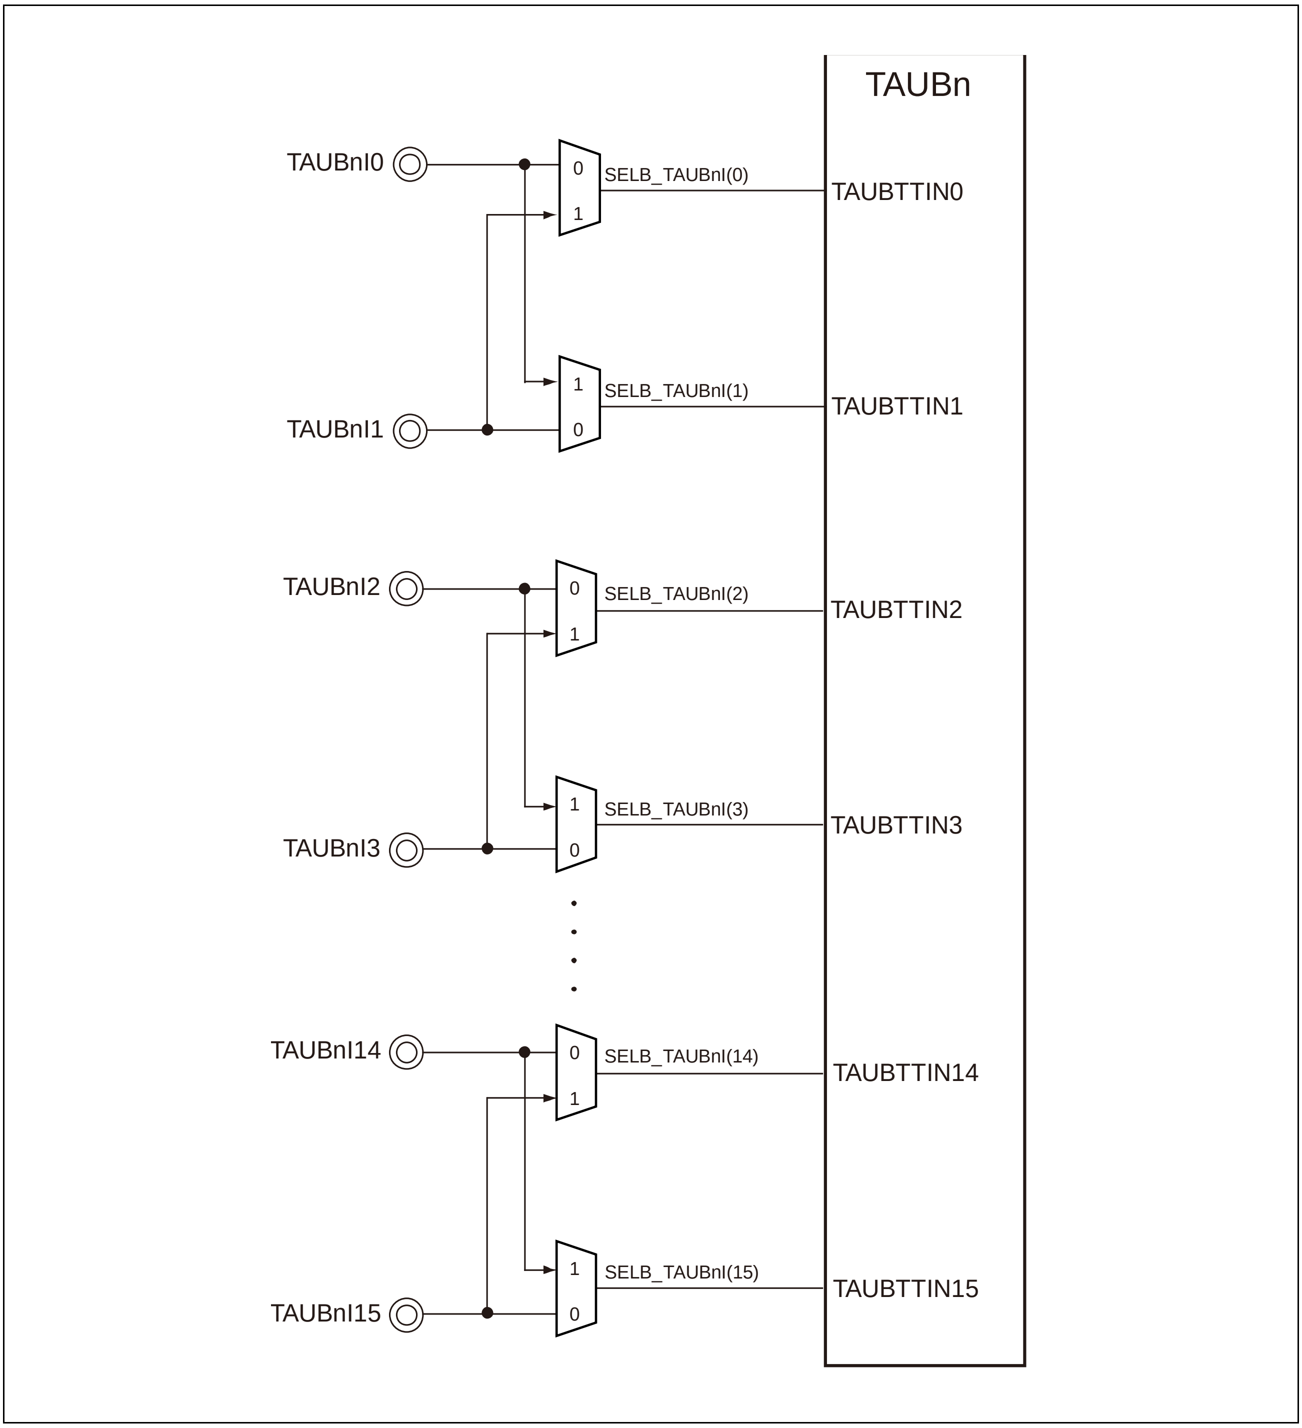

Figure 31.1 TAUBn Input/Output and Interrupt Request Signals

The following table shows the input signals to several TAUBn inputs.

Table 31.19 TAUBn Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Input Signal	Function	Settings
TAUBTTIN[m]	Port TAUBnI[m]	SELB_TAUBnI[m] = 0
	Port TAUBnI[m + 1]	SELB_TAUBnI[m] = 1
TAUBTTIN[m + 1]	Port TAUBnI[m + 1]	SELB_TAUBnI[m + 1] = 0
	Port TAUBnI[m]	SELB_TAUBnI[m + 1] = 1

Note: m = 0, 2, 4, 6, 8, 10, 12, 14

31.1.7.1 List of Registers

Input signal selection register is listed in the following table.

Table 31.20 List of Registers (RH850/F1KH-D8)

Module Name	Register Name	Symbol	Address
TAUBn input selection registers			
SL_TAUBn	TAUBTTINm input signal selection register	SELB_TAUB0I	FFE3 2000_H
	TAUBTTINm input signal selection register	SELB_TAUB1I	FFE3 3000_H

Table 31.21 List of Registers (RH850/F1KM-S4)

Module Name	Register Name	Symbol	Address
TAUBn input selection registers

Table 31.24 SELB_TAUB1I Register Contents

Bit Position	Bit Name	Function
15 to 0	SELB_TAUB1Im (m = 0 to 15)	Selection of TAUBTTINm input signal

TAUB Input	Bit[m+1]	Bit[m]	Input signal
TAUBTTIN[m]	x	0	Selection of port TAUB1I[m]
	x	1	Selection of port TAUB1I[m + 1]
TAUBTTIN[m+1]	0	x	Selection of port TAUB1I[m + 1]
	1	x	Selection of port TAUB1I[m]

NOTE: m = 0, 2, 4, 6, 8, 10, 12, 14

CAUTION

Do not change the input signal of the each channel during the timer counting.

31.2 Overview

31.2.1 Functional Overview

The TAUB has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUB is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUBnCNTm and a 16-bit data register TAUBnCDRm to hold the count start value and compare value.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels. The synchronous operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

31.2.2 Terms

In this section, the following terms are used:

Independent channel operation function/synchronous channel operation function

TAUB has 16 channels, and provides an independent channel operation function whereby individual channels operate independently and a synchronous channel operation function whereby multiple channels operate in combination.

- The independent channel operation function can be used by any channel independently of all other channels.
- The synchronous channel operation function is implemented using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”.
A channel group has one master channel and one or more slave channels.

Upper/lower channel

Depending on the channel number m, a channel with a smaller number or with a larger number is referred to as “upper” or “lower” channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

Example:
For channel 5, channel 3 is an upper channel and channel 9 is a lower channel. Channel 0 is the highest channel and channel 15 is the lowest channel.

The following describes the functional blocks:

Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK3 are derived from PCLK by a configurable prescaler division factor of 2^0 to 2^{15}.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- TAUBTTINm input signal valid edge

Controller

The controller controls the main operations of the counter:

- Operating mode (selected with the TAUBnCMORm.TAUBnMD[4:0] bits)
- Counter start enable (TAUBnTS.TAUBnTSm) and counter stop (TAUBnTT.TAUBnTTm)
  When counter start is enabled, status flag TAUBnTE.TAUBnTEm is set.
- Count direction (up/down) (can be controlled by the master channel)

Trigger selector

The counter starts automatically when it is enabled (TAUBnTE.TAUBnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- INTTAUBnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUBTTOUTm generation unit.

Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used in synchronous operation functions. The data registers (TAUBnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

31.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 31.25 Functional List of TAUB Operations

Operation Function		Setting Example
Independent Channel Operation Functions		**Section 31.12**
	Interval Timer Function	**Section 31.12.1**

31.2.4 TAUB I/O and Interrupt Request Signals

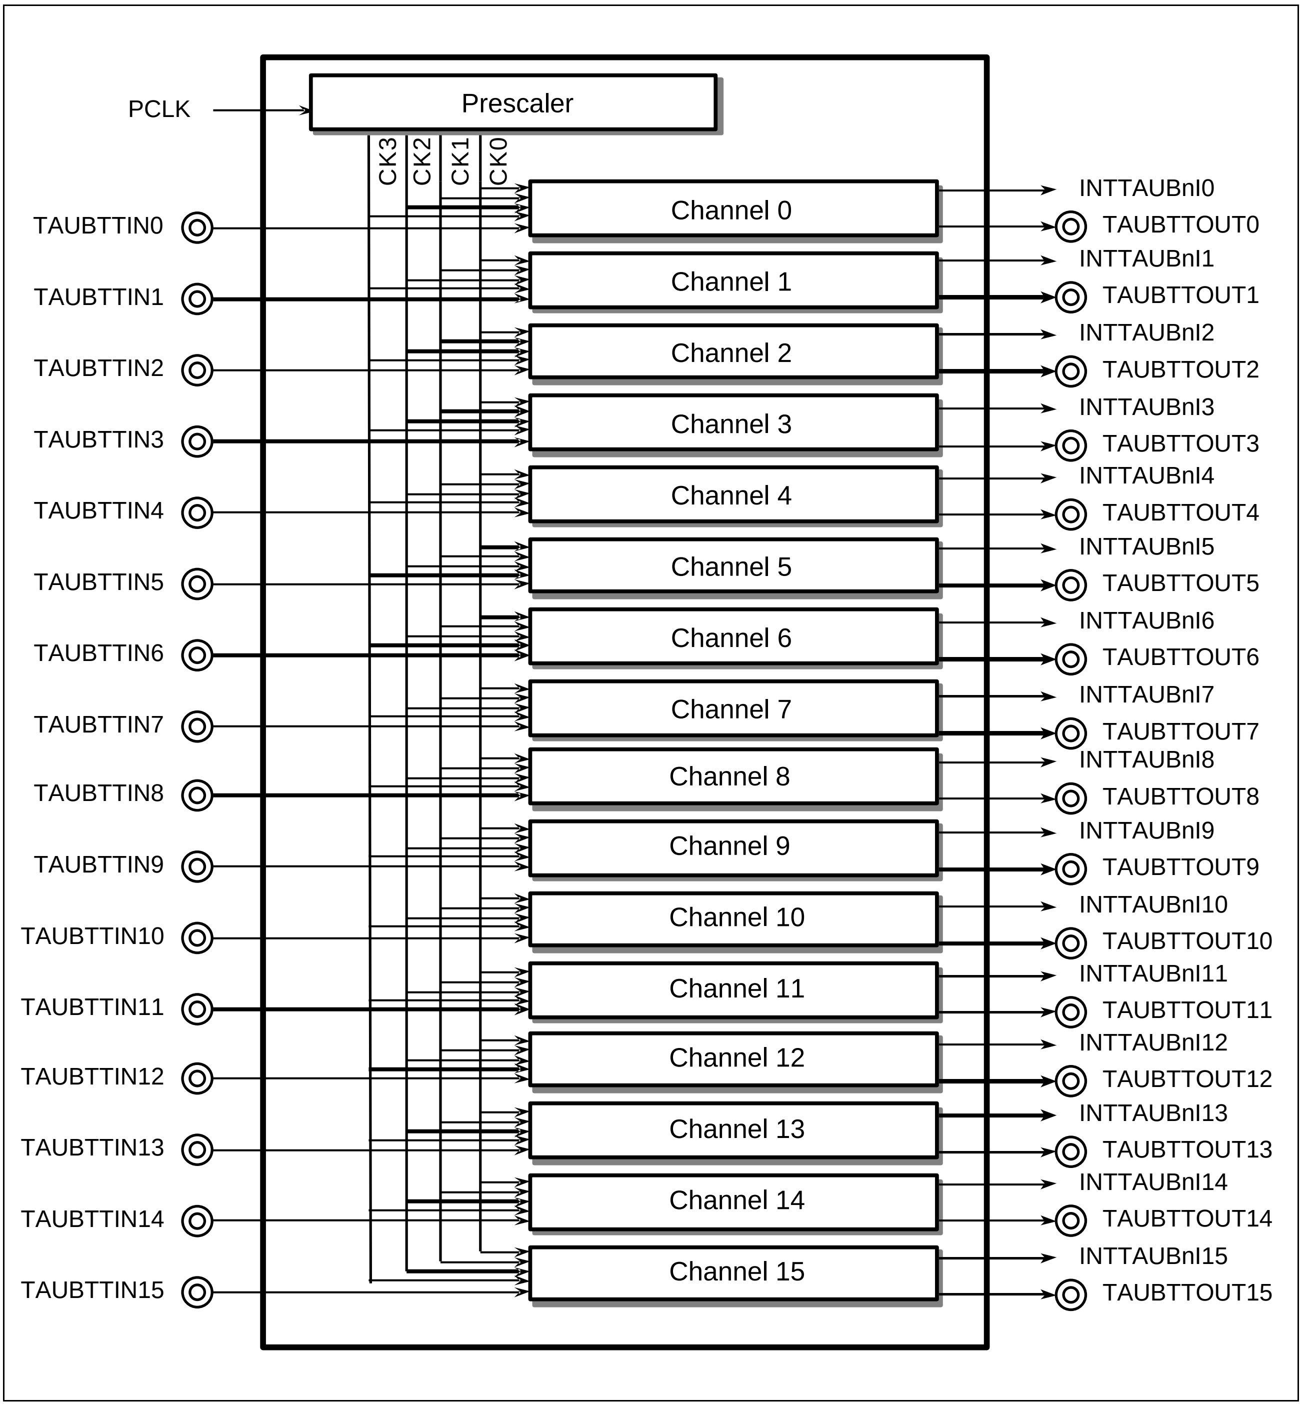

Figure 31.2 TAUB Input/Output and Interrupt Request Signals

31.2.5 Block Diagram

The following figure shows the main components of the TAUB.

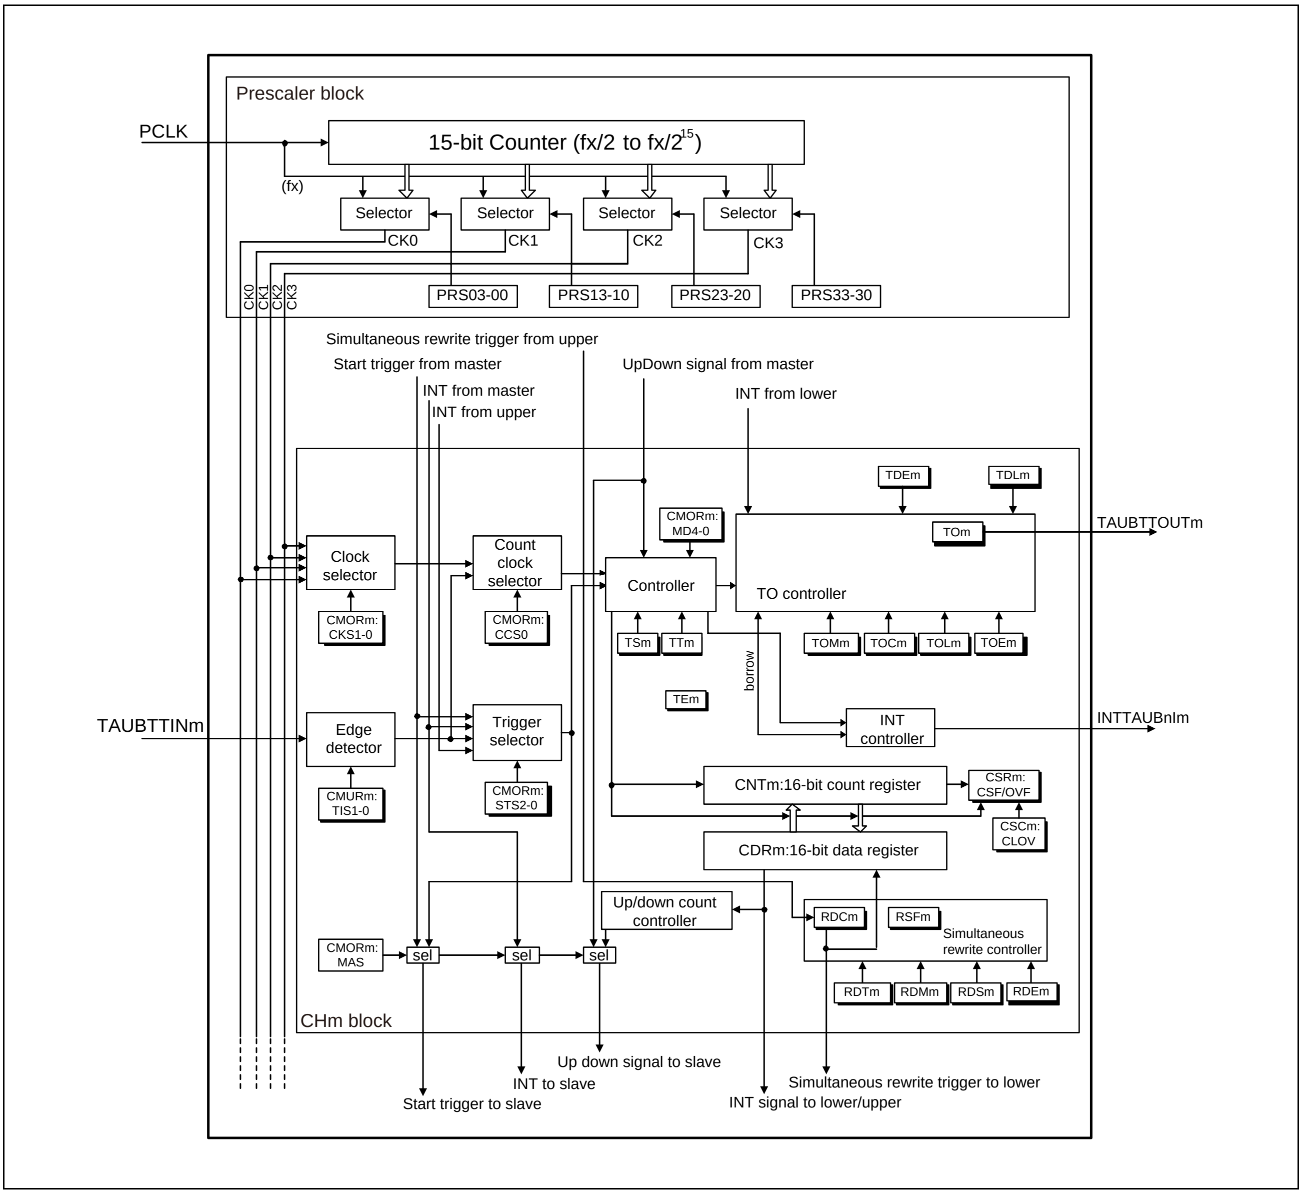

Figure 31.3 Block Diagram of the TAUB

The prefix “TAUBn” has been omitted from the register names for the sake of clarity in the above figure.

31.2.6 Description of Blocks

The following describes the functional blocks:

Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK3 are derived from PCLK by a configurable prescaler division factor of 2^0 to 2^{15}.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- TAUBTTINm input signal valid edge

Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUBnCMORm.TAUBnMD[4:0])
- Counter start enable (TAUBnTS.TAUBnTSm) and counter stop (TAUBnTT.TAUBnTTm)
  When counter start is enabled, status flag TAUBnTE.TAUBnTEm is set.
- Count direction (up/down) (can be controlled by the master channel)

Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUBnTE.TAUBnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- Input of TAUBTTINm valid edge
- INTTAUBnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUBTTOUTm generation unit

Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used if multiple channels like synchronous operation functions are used. The data registers (TAUBnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

TAUBnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

31.3 Registers

31.3.1 List of Registers

TAUB registers are listed in the following table.

For details about <TAUBn_base>, see **Section 31.1.2, Register Base Addresses**.

Table 31.26 List of Registers

Module Name	Register Name	Symbol	Address
TAUBn prescaler registers			
TAUBn	TAUBn prescaler clock select register	TAUBnTPS	<TAUBn_base> + 240_H
TAUBn control registers			
TAUBn	TAUBn channel data register	TAUBnCDRm	<TAUBn_base> + 0_H + m × 4_H
	TAUBn channel counter register	TAUBnCNTm	<TAUBn_base> + 80_H + m × 4_H
	TAUBn channel mode OS register	TAUBnCMORm	<TAUBn_base> + 200_H + m × 4_H
	TAUBn channel mode user register	TAUBnCMURm	<TAUBn_base> + $C0_H$ + m × 4_H
	TAUBn channel status register	TAUBnCSRm	<TAUBn_base> + 140_H + m × 4_H
	TAUBn channel status clear trigger register	TAUBnCSCm	<TAUBn_base> + 180_H + m × 4_H
	TAUBn channel start trigger register	TAUBnTS	<TAUBn_base> + $1C4_H$
	TAUBn channel enable status register	TAUBnTE	<TAUBn_base> + $1C0_H$
	TAUBn channel stop trigger register	TAUBnTT	<TAUBn_base> + $1C8_H$
TAUBn output registers			
TAUBn	TAUBn channel output enable register	TAUBnTOE	<TAUBn_base> + $5C_H$
	TAUBn channel output register	TAUBnTO	<TAUBn_base> + 58_H
	TAUBn channel output mode register	TAUBnTOM	<TAUBn_base> + 248_H
	TAUBn channel output configuration register	TAUBnTOC	<TAUBn_base> + $24C_H$
	TAUBn channel output active level register	TAUBnTOL	<TAUBn_base> + 040_H
	TAUBn channel dead time output enable register	TAUBnTDE	<TAUBn_base> + 250_H
	TAUBn channel dead time output level register	TAUBnTDL	<TAUBn_base> + 54_H
TAUBn reload data registers			
TAUBn	TAUBn channel reload data enable register	TAUBnRDE	<TAUBn_base> + 260_H
	TAUBn channel reload data mode register	TAUBnRDM	<TAUBn_base> + 264_H
	TAUBn channel reload data control channel select register	TAUBnRDS	<TAUBn_base> + 268_H
	TAUBn channel reload data control register	TAUBnRDC	<TAUBn_base> + $26C_H$
	TAUBn channel reload data trigger register	TAUBnRDT	<TAUBn_base> + 44_H
	TAUBn channel reload status register	TAUBnRSF	<TAUBn_base> + 48_H
TAUBn emulation register			
TAUBn	TAUBn emulation register	TAUBnEMU	<TAUBn_base> + 290_H

31.3.2 Details of TAUBn Prescaler Registers

31.3.2.1 TAUBnTPS — TAUBn Prescaler Clock Select Register

This register specifies the clocks CK0, CK1, CK2, and CK3 for all channels of the PCLK prescaler.

Access: This register can be read or written in 16-bit units.

Address: <TAUBn_base> + 240_H

Value after reset: $FFFF_H$

<table>
<tr><td>Bit</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>

</table>

NOTE

The TAUBn clock input PCLK is specified in the first part of this section, **Section 31.1.3, Clock Supply**.

31.3.3 Details of TAUBn Control Registers

31.3.3.1 TAUBnCDRm — TAUBn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operation mode specified in TAUBnCMORm.TAUBnMD[4:1].

Access:	This register can be read or written in 16-bit units. • When this register functions as a capture register, only reading is possible. Write operation is ignored. • When this register functions as a compare register, reading and writing is possible.
Address:	<TAUBn_base> + m × 4_H
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.28 TAUBnCDRm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnCDR[15:0]	Data register for the capture/compare value.

31.3.3.2 TAUBnCNTm — TAUBn Channel Counter Register

This register is the channel m counter register.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUBn_base> + 80$_H$ + m × 4$_H$

Value after reset: FFFF$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.29 TAUBnCNTm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnCNT[15:0]	16-bit counter value.

The read value depends on the counter, the operation mode change, and the values of the TAUBnTS.TAUBnTSm and TAUBnTT.TAUBnTTm bits.

The initial counter read value depends on the operation mode and how the counter was stopped:

- by a reset
- by a counter stop trigger (TAUBnTT.TAUBnTTm = 1)

The following table lists the initial counter read values after the counter has stopped (TAUBnTE.TAUBnTEm = 0) and re-enabled (TAUBnTS.TAUBnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUBnTS.TAUBnTSm = 1) for modes where the counter waits for a start trigger.

Table 31.30 TAUBnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUBnCNTm		
		Start Value^{*1}	After Stop Trigger	After One Count
Interval timer mode	Count down	FFFF$_H$	Stop value	—
Judge mode	Count down	FFFF$_H$	Stop value	—
Capture mode	Count up	0000$_H$	Stop value	—
Event count mode	Count down	FFFF$_H$	Stop value	—
One-count mode	Count down	FFFF$_H$	Stop value	FFFF$_H$
Capture and one-count mode	Count up	0000$_H$	Stop value	Capture value + 1 (TAUBnCDRm)
Judge and one-count mode	Count down	FFFF$_H$	Stop value	TAUBnCNTm value – 1
Count-up/-down mode	Count up/down	FFFF$_H$	Stop value	—
Pulse one-count mode	Count down	FFFF$_H$	Stop value	0000$_H$
Count capture mode	Count up	0000$_H$	Stop value	—
Gate count mode	Count down	FFFF$_H$	Stop value	Stop value
Capture and gate count mode	Count up	0000$_H$	Stop value	Stop value

Note 1. The value set for TAUBnCNTm when operation mode is changed after reset release

31.3.3.3 TAUBnCMORm — TAUBn Channel Mode OS Register

This register controls channel m operation.

Access: This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

Address: <TAUBn_base> + 200_H + m × 4_H

Value after reset: 0000_H

Table 31.31 TAUBnCMORm Register Contents

Bit Position	Bit Name	Function
4 to 0	TAUBnMD[4:0]	Specifies the operation mode. For details, refer to the settings for individual functions.

TAUBn MD4	TAUBn MD3	TAUBn MD2	TAUBn MD1	TAUBn MD0	Description
0	0	0	0	1/0	Interval timer mode
0	0	0	1	1/0	Judge mode
0	0	1	0	1/0	Capture mode
0	0	1	1	0	Event count mode
0	1	0	0	1/0	One-count mode
0	1	0	1	1/0	Setting prohibited
0	1	1	0	0	Capture and one-count mode
0	1	1	1	1/0	Judge and one-count mode
1	0	0	0	0	Setting prohibited
1	0	0	1	0	Count-up/-down mode
1	0	1	0	1/0	Pulse one-count mode
1	0	1	1	1/0	Count capture mode
1	1	0	0	0	Gate count mode
1	1	0	1	0	Capture and gate count mode

Mode	Role of TAUBnMD0 Bit
Interval timer mode Capture mode Count capture mode	Specifies whether INTTAUBnIm is output at the beginning of count operation (when a start trigger is entered) or not. 0: INTTAUBnIm is not output. 1: INTTAUBnIm is output.
Event count mode Count-up/-down mode	This bit should be set to 0 (INTTAUBnIm signal is not output at the beginning of count operation).
One-count mode Pulse one-count mode	Enables/disables start trigger detection during counting. 0: Disables detection. 1: Enables detection. **CAUTION:** ● In one-count mode, INTTAUBnIm signal is not output at the beginning of count operation. ● In pulse one-count mode, INTTAUBnIm signal is output at the beginning of count operation.
Gate count mode	This bit should be set to 0 (start trigger detection during counting is disabled).
Capture and one-count mode Capture and gate count mode	This bit should be set to 0. **CAUTION:** INTTAUBnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled.
Judge mode Judge and one-count mode	Specifies INTTAUBnIm output timing. 0: When TAUBnCNTm ≤ TAUBnCDRm 1: When TAUBnCNTm > TAUBnCDRm

31.3.3.4 TAUBnCMURm — TAUBn Channel Mode User Register

This register specifies the type of valid edge detection used for the TAUBTTINm input.

Access: This register can be read or written in 8-bit units.

Address: <TAUBn_base> + $C0_H$ + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 31.32 TAUBnCMURm Register Contents

<table>

</table>
● Edge detection for TAUBTTINm input signals is performed based on the operation clock selected by TAUBnCMORm.TAUBnCKS[1:0].</td></tr>
</table>

31.3.3.5 TAUBnCSRm — TAUBn Channel Status Register

This register indicates the count direction and the overflow status of the counter for channel m.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <TAUBn_base> + 140_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnCSF	TAUBnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 31.33 TAUBnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	TAUBnCSF	Indicates the count direction: 0: Counts up 1: Counts down The read value of this bit is only valid in the following mode: ● Up/Down Count mode
0	TAUBnOVF	Indicates the counter overflow status: 0: No overflow occurred 1: Overflow occurred This bit is used only in the following modes: ● Capture mode ● Capture and one-count mode The function of this bit depends on the setting of control bits TAUBnCMORm.TAUBnCOS[1:0].

31.3.3.6 TAUBnCSCm — TAUBn Channel Status Clear Trigger Register

This register is a trigger register for clearing the overflow flag TAUBnCSRm.TAUBnOVF of channel m.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H

Address: <TAUBn_base> + 180_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUBnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 31.34 TAUBnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUBnCLOV	0: No function 1: Clears the overflow flag TAUBnCSRm.TAUBnOVF

31.3.3.7 TAUBnTS — TAUBn Channel Start Trigger Register

This register enables the counter for each channel.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000$_H$

Address: <TAUBn_base> + 1C4$_H$

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TS15	TAUBn TS14	TAUBn TS13	TAUBn TS12	TAUBn TS11	TAUBn TS10	TAUBn TS09	TAUBn TS08	TAUBn TS07	TAUBn TS06	TAUBn TS05	TAUBn TS04	TAUBn TS03	TAUBn TS02	TAUBn TS01	TAUBn TS00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 31.35 TAUBnTS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTSm	Enables the counter for channel m: 0: No function 1: Enables the counter and sets TAUBnTE.TAUBnTEm = 1. TAUBnTE.TAUBnTEm = 1 only enables the counter. Whether the counter starts depends on the selected operation mode.

31.3.3.8 TAUBnTE — TAUBn Channel Enable Status Register

This register indicates whether counter is enabled or disabled.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUBn_base> + 1C0$_H$

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TE15	TAUBn TE14	TAUBn TE13	TAUBn TE12	TAUBn TE11	TAUBn TE10	TAUBn TE09	TAUBn TE08	TAUBn TE07	TAUBn TE06	TAUBn TE05	TAUBn TE04	TAUBn TE03	TAUBn TE02	TAUBn TE01	TAUBn TE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.36 TAUBnTE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTEm	Indicates whether counter for channel m is enabled or disabled: 0: Counter disabled 1: Counter enabled Setting TAUBnTS.TAUBnTSm to 1 sets this bit to 1. Setting TAUBnTT.TAUBnTTm to 1 resets this bit to 0.

31.3.3.9 TAUBnTT — TAUBn Channel Stop Trigger Register

This register stops the counter for each channel.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000$_H$.

Address: <TAUBn_base> + 1C8$_H$

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TT15	TAUBn TT14	TAUBn TT13	TAUBn TT12	TAUBn TT11	TAUBn TT10	TAUBn TT09	TAUBn TT08	TAUBn TT07	TAUBn TT06	TAUBn TT05	TAUBn TT04	TAUBn TT03	TAUBn TT02	TAUBn TT01	TAUBn TT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 31.37 TAUBnTT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTTm	Stops the counter of channel m: 0: No function 1: Stops the counter and resets TAUBnTE.TAUBnTEm. TAUBnCNTm, TAUBnTO.TAUBnTOm, and TAUBTTOUTm all retain the values they had before the counter was stopped.

31.3.4 Details of TAUBn Simultaneous Rewrite Registers

31.3.4.1 TAUBnRDE — TAUBn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUBnCDRm/TAUBnTOLm.

Access: This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

Address: <TAUBn_base> + 260$_H$

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn RDE15	TAUBn RDE14	TAUBn RDE13	TAUBn RDE12	TAUBn RDE11	TAUBn RDE10	TAUBn RDE09	TAUBn RDE08	TAUBn RDE07	TAUBn RDE06	TAUBn RDE05	TAUBn RDE04	TAUBn RDE03	TAUBn RDE02	TAUBn RDE01	TAUBn RDE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 31.38 TAUBnRDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDEm	Enables/disables simultaneous rewrite of the data register of channel m: 0: Disables simultaneous rewrite 1: Enabled simultaneous rewrite

31.3.4.2 TAUBnRDS — TAUBn Channel Reload Data Control Channel Select Register

This register selects the control channel for simultaneous rewrite.

Access: This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

Address: <TAUBn_base> + 268$_H$

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 31.39 TAUBnRDS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDSm	Specifies which channel is controlled for the simultaneous rewrite trigger: 0: Master channel 1: Another upper channel

31.3.4.3 TAUBnRDM — TAUBn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

Access: This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

Address: <TAUBn_base> + 264_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 31.40 TAUBnRDM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDMm	Selects when the signal that triggers simultaneous rewrite is generated: 0: When the master channel counter starts counting 1: At the top of a triangle wave cycle These bits only apply when TAUBnRDE.TAUBnRDEm = 1 and TAUBnRDS.TAUBnRDSm = 0.

31.3.4.4 TAUBnRDC — TAUBn Channel Reload Data Control Register

This register specifies the channel that generates the INTTAUBnIm signal that triggers simultaneous rewrite.

Access: This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0

Address: <TAUBn_base> + $26C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn RDC15	TAUBn RDC14	TAUBn RDC13	TAUBn RDC12	TAUBn RDC11	TAUBn RDC10	TAUBn RDC09	TAUBn RDC08	TAUBn RDC07	TAUBn RDC06	TAUBn RDC05	TAUBn RDC04	TAUBn RDC03	TAUBn RDC02	TAUBn RDC01	TAUBn RDC00

Table 31.41 TAUBnRDC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDCm	Specifies whether the channel generates a simultaneous rewrite trigger signal or not. 0: Does not operate as a simultaneous rewrite trigger channel. 1: Operates as a simultaneous rewrite trigger channel. These bits only apply when TAUBnRDE.TAUBnRDEm = 1 and TAUBnRDS.TAUBnRDSm = 1.

31.3.4.5 TAUBnRDT — TAUBn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000_H.

Address: <TAUBn_base> + 044_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn RDT15	TAUBn RDT14	TAUBn RDT13	TAUBn RDT12	TAUBn RDT11	TAUBn RDT10	TAUBn RDT09	TAUBn RDT08	TAUBn RDT07	TAUBn RDT06	TAUBn RDT05	TAUBn RDT04	TAUBn RDT03	TAUBn RDT02	TAUBn RDT01	TAUBn RDT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 31.42 TAUBnRDT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDTm	Triggers the simultaneous rewrite enabling state: 0: No function. Writing 0 is ignored (the operation is not affected). 1: The simultaneous rewrite enabling flag (TAUBnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger. These bits only apply when: ● TAUBnRDE.TAUBnRDEm = 1

31.3.4.6 TAUBnRSF — TAUBn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUBn_base> + 048_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn RSF15	TAUBn RSF14	TAUBn RSF13	TAUBn RSF12	TAUBn RSF11	TAUBn RSF10	TAUBn RSF09	TAUBn RSF08	TAUBn RSF07	TAUBn RSF06	TAUBn RSF05	TAUBn RSF04	TAUBn RSF03	TAUBn RSF02	TAUBn RSF01	TAUBn RSF00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.43 TAUBnRSF Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRSFm	Indicates the simultaneous rewrite status: 0: Indicates simultaneous rewrite is completed due to the generation of the simultaneous rewrite trigger. 1: Indicates the simultaneous rewrite trigger waiting state when simultaneous rewrite is enabled (TAUBnRDTm = 1).

31.3.5 Details of TAUBn Output Registers

31.3.5.1 TAUBnTOE — TAUBn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

Access: This register can be read or written in 16-bit units.

Address: <TAUBn_base> + $5C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TOE15	TAUBn TOE14	TAUBn TOE13	TAUBn TOE12	TAUBn TOE11	TAUBn TOE10	TAUBn TOE09	TAUBn TOE08	TAUBn TOE07	TAUBn TOE06	TAUBn TOE05	TAUBn TOE04	TAUBn TOE03	TAUBn TOE02	TAUBn TOE01	TAUBn TOE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 31.44 TAUBnTOE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOEm	Enables/disables independent channel output mode: 0: Disables independent channel output mode (controlled by software) 1: Enables independent channel output mode

31.3.5.2 TAUBnTO — TAUBn Channel Output Register

This register specifies and reads the level of TAUBTTOUTm.

Access: This register can be read or written in 16-bit units.

Address: <TAUBn_base> + 58_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 31.45 TAUBnTO Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOm	Specifies/reads the level of TAUBTTOUTm: 0: Low 1: High Only TAUBnTOm bits for which Independent Channel Output function is disabled (TAUBnTOEm = 0) can be written.

31.3.5.3 TAUBnTOM — TAUBn Channel Output Mode Register

This register specifies the output mode of each channel.

Access: This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

Address: <TAUBn_base> + 248_H

Value after reset: 0000_H

Table 31.47 TAUBnTOC Register Contents

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>15 to 0</td><td>TAUBnTOCm</td><td>Specifies the output mode:
0: Operation mode 1
1: Operation mode 2
The output mode also depends on TAUBnTOM.TAUBnTOMm, as can be seen in the following table.
<table>
<tr><th>TOMm</th><th>TOCm</th><th>Description</th></tr>
<tr><td>0</td><td>0</td><td>Toggle mode: Toggles when INTTAUBnIm occurs.</td></tr>
<tr><td></td><td>1</td><td>Set/reset mode: Set when INTTAUBnIm occurs upon count start and reset when INTTAUBnIm occurs due to detection of a match between TAUBnCNTm and TAUBnCDRm.</td></tr>
<tr><td>1</td><td>0</td><td>Synchronous channel operation mode 1:
Set when INT occurs on the master channel and reset when INT occurs on the slave channel.</td></tr>
<tr><td></td><td>1</td><td>Synchronous channel operation mode 2:
Set when INTTAUBnIm occurs while the slave channel is counting down and reset when INTTAUBnIm occurs while the slave channel is counting up.</td></tr>
</table>
</td></tr>
</table>

31.3.5.5 TAUBnTOL — TAUBn Channel Output Active Level Register

This register specifies the output logic of the channel output bit (TAUBnTO.TAUBnTOm).

Access: This register can be read or written in 16-bit units.

Address: <TAUBn_base> + 040_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 31.48 TAUBnTOL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOLm	Specifies the output logic of the channel m output bit (TAUBnTO.TAUBnTOm): 0: Positive logic (active high) 1: Negative logic (active low) The setting of these bits applies to all channel output modes other than independent channel output mode controlled by software and independent channel output mode 1.

31.3.6 Details of TAUBn Dead Time Output Registers

31.3.6.1 TAUBnTDE — TAUBn Channel Dead Time Output Enable Register

This register enables/disables dead time operation for each channel.

Access: This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

Address: <TAUBn_base> + 250_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 31.50 TAUBnTDL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTDLm	Selects the phase period to which dead time is added: 0: Positive phase period 1: Negative phase period These bits only apply when: ● TAUBnTOE.TAUBnTOEm, TAUBnTOM.TAUBnTOMm, TAUBnTOC.TAUBnTOCm, TAUBnTDE.TAUBnTDEm = 1

31.3.7 TAUBn Emulation Register

31.3.7.1 TAUBnEMU — TAUBn Emulation Register

This register controls SVSTOP operations.

Access: This register can be read or written in 8-bit units.

Write to this register only when the counter is stopped (TAUBnTE.TAUBnTEm = 0) and when EPC.SVSTOP = 0.

Address: <TAUBn_base> + 290_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TAUBnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 31.51 TAUBnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUBnSVSDIS	(When EPC.SVSTOP = 0) Regardless of the value of this bit (1/0), the count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint). (When EPC.SVSTOP = 1) 0: The count clock stops when the debugger obtains the control of the microcontroller (e.g., at a breakpoint). 1: The count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

31.4 General Operating Procedure

The following describes the general operation procedure for the TAUBn:

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUBTTOUTm is also initialized and outputs a low level.

1. Set the TAUBnTPS register to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUBn function:
   - Set the operation mode
   - Set the channel output mode
   - Set any other control bits
3. Enable the counter by setting the TAUBnTS.TAUBnTSm bit to 1.
   The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUBnTT.TAUBnTTm bit to 1. The counter can be forcibly restarted by setting the TAUBnTS.TAUBnTSm bit to 1.
5. Stop the function by setting the TAUBnTT.TAUBnTTm bit to 1.

NOTE

- A detailed description of the required control bits and the operation of the individual functions is given below.
  - **Section 31.12, Independent Channel Operation Functions**
  - **Section 31.14, Synchronous Channel Operation Functions**
- The function can be changed while the counter is stopped (TAUBnTE.TAUBnTEm=0).

31.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in **Section 31.5.1, Rules of Synchronous Channel Operation Function**.

Two special features for synchronous channel operation are detailed in the following:

- **Section 31.5.2, Simultaneous Start and Stop of Synchronous Channel Counters**
- **Section 31.6, Simultaneous Rewrite**

31.5.1 Rules of Synchronous Channel Operation Function

Number of master and slave channels

- Only even channels (CH0, CH2, CH4, …) can be set as master channels.
  Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 and the lower channels (CH3, CH4, CH5, …) can be set as slave channels.
- If multiple master channels are used, a range of slave channels that includes another master channel cannot be set for a given master channel.
  Example: If CH0 and CH4 are master channels, CH1 to CH3 can be set as slave channels for CH0, but CH5 to CH15 cannot.

Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the same value to the TAUBnCMORm.TAUBnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave channel usage and operation clocks are illustrated in **Figure 31.4, Grouping of the Channels and Assignment of Operation Clocks**.

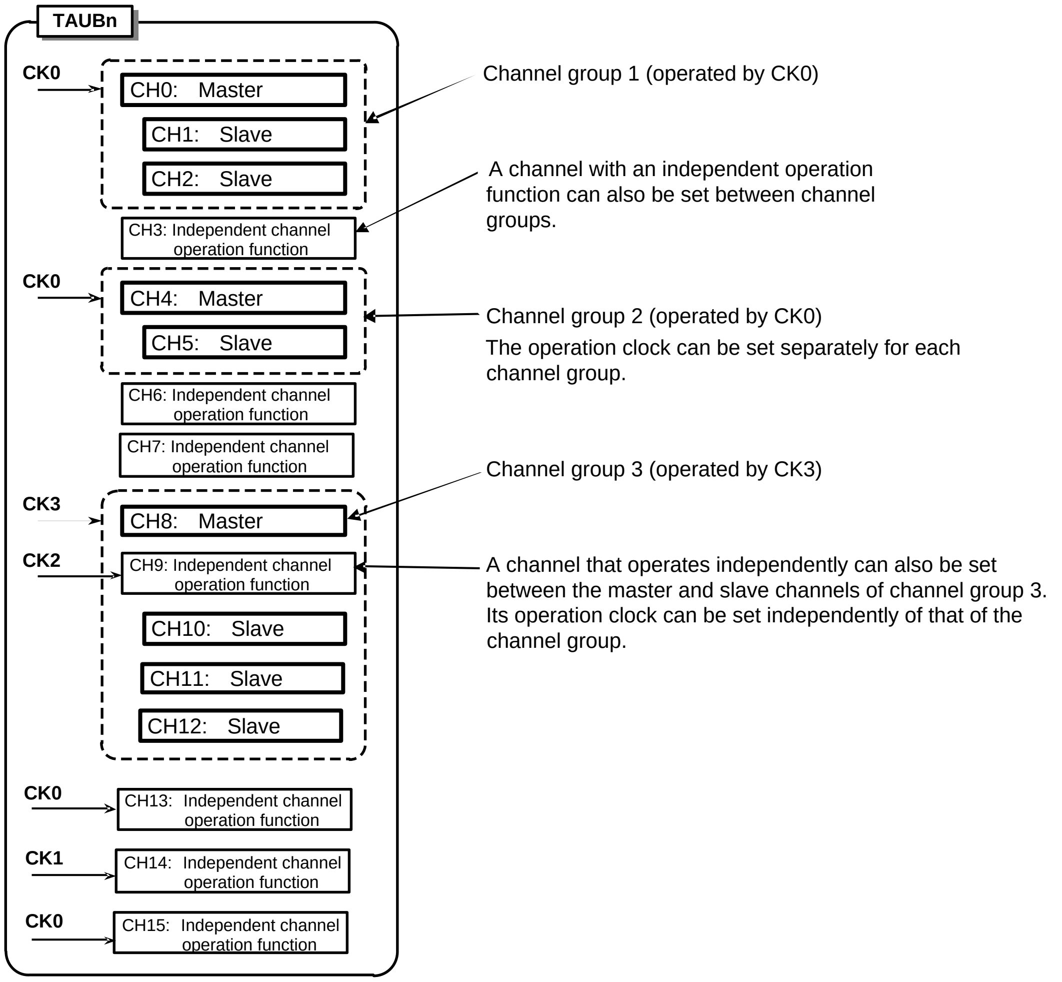

Figure 31.4 Grouping of the Channels and Assignment of Operation Clocks

31.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit.

31.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUBnTS.TAUBnTSm bits of the channels must be set at the same time.
- To simultaneously stop synchronized channels, the TAUBnTT.TAUBnTTm bits of the channels must be set at the same time.

Setting the TAUBnTS.TAUBnTSm bits to 1 sets the corresponding TAUBnTE.TAUBnTEm bits to 1, enabling counting. The exact time that it starts depends on the operation mode.

31.6 Simultaneous Rewrite

31.6.1 Introduction

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUBnCDRm and TAUBnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUBnIm being issued on the upper channel specified by TAUBnRDC.TAUBnRDCm

There are three methods for simultaneous rewrite. These are listed in the following table, along with how to specify them and when they cause simultaneous rewrite to be triggered.

Table 31.52 Simultaneous Rewrite Methods and when They are Triggered

Method	Trigger	TAUBnRDE. TAUBnRDEm	TAUBnRDS. TAUBnRDSm	TAUBnRDM. TAUBnRDMm
—	No simultaneous rewrite	0	0	0
A	The master channel (re)starts counting	1	0	0
B	Counting is started in the master channel. The master channel starts counting down at the peak of triangular wave of the corresponding slave channel.	1	0	1
C1	INTTAUBnIm is generated on an upper channel specified by TAUBnRDC.TAUBnRDCm	1	1	0/1

The following table lists which of these three methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in **Section 31.13, Independent Channel Simultaneous Rewrite Functions** and **Section 31.14, Synchronous Channel Operation Functions**.

31.6.2 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite.

The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

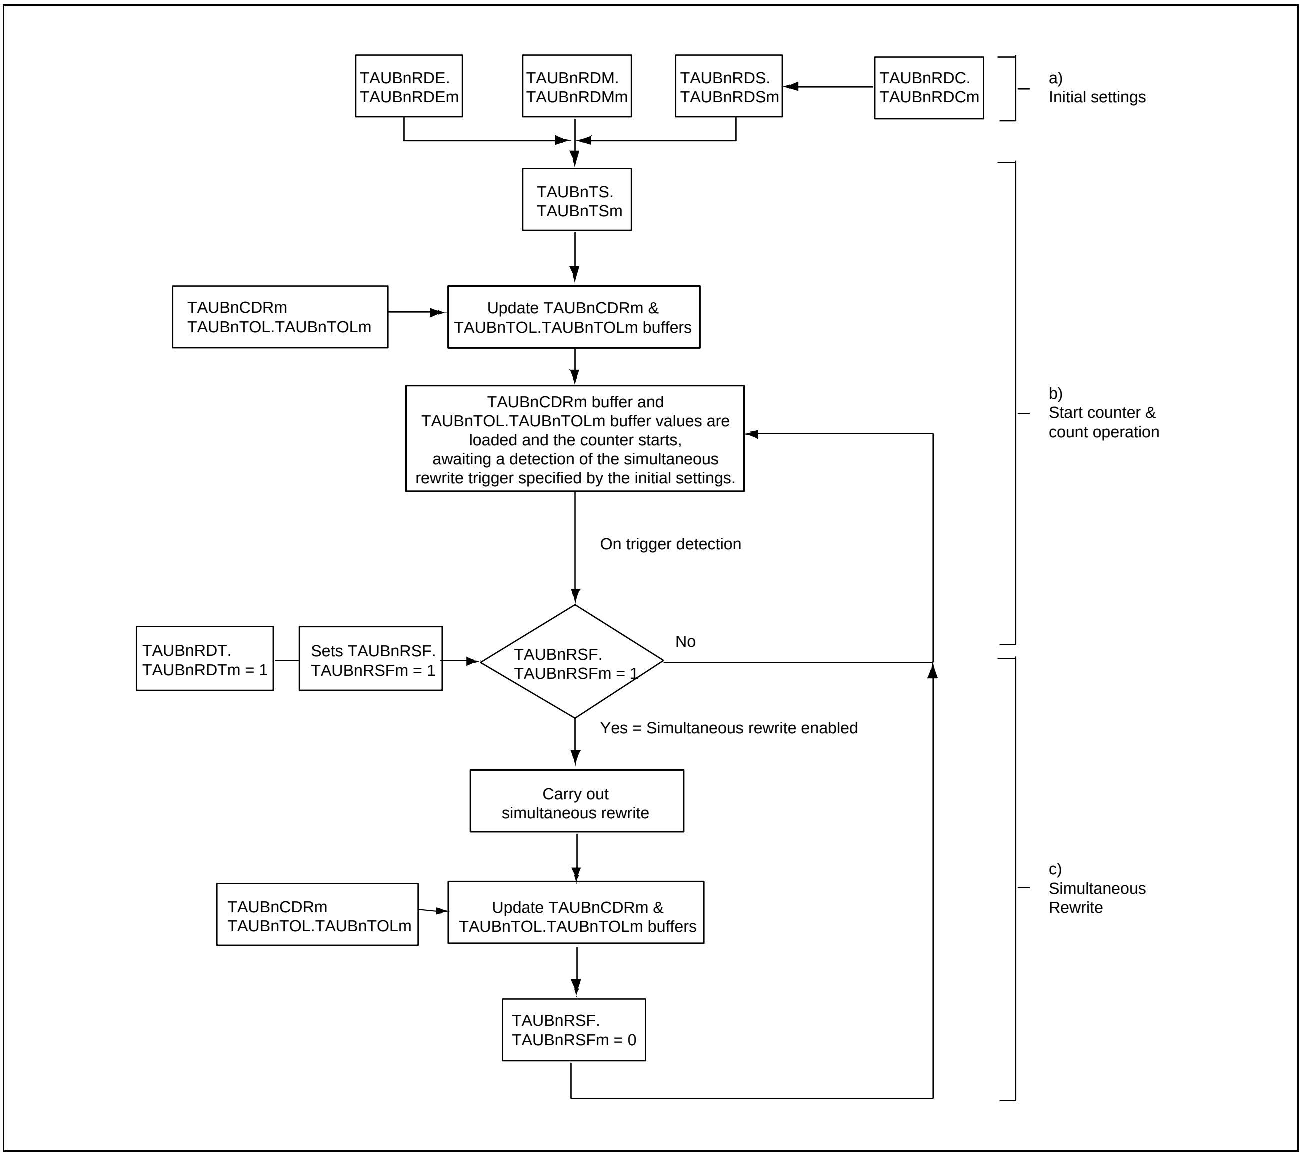

Figure 31.5 General Procedure for Simultaneous Rewrite

31.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUBnRDE.TAUBnRDEm = 1.
- To select the type of simultaneous rewrite, set TAUBnRDM.TAUBnRDMm and TAUBnRDS.TAUBnRDSm according to the values in **Table 31.52, Simultaneous Rewrite Methods and when They are Triggered**.
- Specify a simultaneous rewrite trigger channel by using TAUBnRDC.TAUBnRDCm. (Prerequisite: TAUBnRDS.TAUBnRDSm has been set to the upper channel.)

31.6.2.2 Start Counter and Count Operation

- To start all the TAUBnCNTm counters in the channel group, set the corresponding TAUBnTS.TAUBnTSm bits to 1. TAUBnTOL.TAUBnTOLm and the values in the data registers (TAUBnCDRm) are written to the corresponding TAUBnTOL.TAUBnTOLm buffer (TAUBnTOL.TAUBnTOLm buf) and data buffer registers (TAUBnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1 sets the reload flag (TAUBnRSF.TAUBnRSFm) to 1, enabling simultaneous rewrite. TAUBnRSF.TAUBnRSFm remains at 1 until simultaneous rewrite has taken place.
- When the specified trigger for simultaneous rewrite is detected, the TAUBnRSF.TAUBnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUBnRSF.TAUBnRSFm = 1). If it is, simultaneous rewrite is carried out. Otherwise, simultaneous rewrite is not carried out, and the system awaits the next simultaneous rewrite trigger detection.

31.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled (TAUBnRSF.TAUBnRSFm = 1) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then written to the corresponding counters and the values are applied the next time the counter starts or restarts.
- When simultaneous rewrite is finished, the TAUBnRSF.TAUBnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

31.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUBnRDE.TAUBnRDEm, TAUBnRDS.TAUBnRDSm, TAUBnRDM.TAUBnRDMm, and TAUBnRDC.TAUBnRDCm cannot be changed while the counter is in operation (TAUBnTE.TAUBnTEm = 1).
- TAUBnTOL.TAUBnTOLm can only be rewritten during operation in PWM output function or triangle PWM output function. For all other output functions, TAUBnTOL.TAUBnTOLm must be written before the counter starts. If it is rewritten in another function mode, TAUBTTOUTm outputs an invalid wave.
- When a simultaneous rewrite trigger is issued on an upper channel (TAUBnRDS.TAUBnRDSm = 1), the TAUBnRDC.TAUBnRDCm bit controls all the lower channels. This means that if the TAUBnRDC.TAUBnRDCm bits of CH2 and CH7 are set to 1 and the TAUBnRDC.TAUBnRDCm bits of other channels are set to 0, CH2 and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger generation channel (TAUBnRDE.TAUBnRDEm and TAUBnRDS.TAUBnRDSm = 1) but no upper channel is set (TAUBnRDC.TAUBnRDC[15:0] = 0), simultaneous rewrite cannot take place.

31.6.4 Types of Simultaneous Rewrite

In the following section, the three simultaneous rewrite methods are explained using timing diagrams.

31.6.4.1 Simultaneous Rewrite when the Master Channel (Re)Starts Counting (Method A)

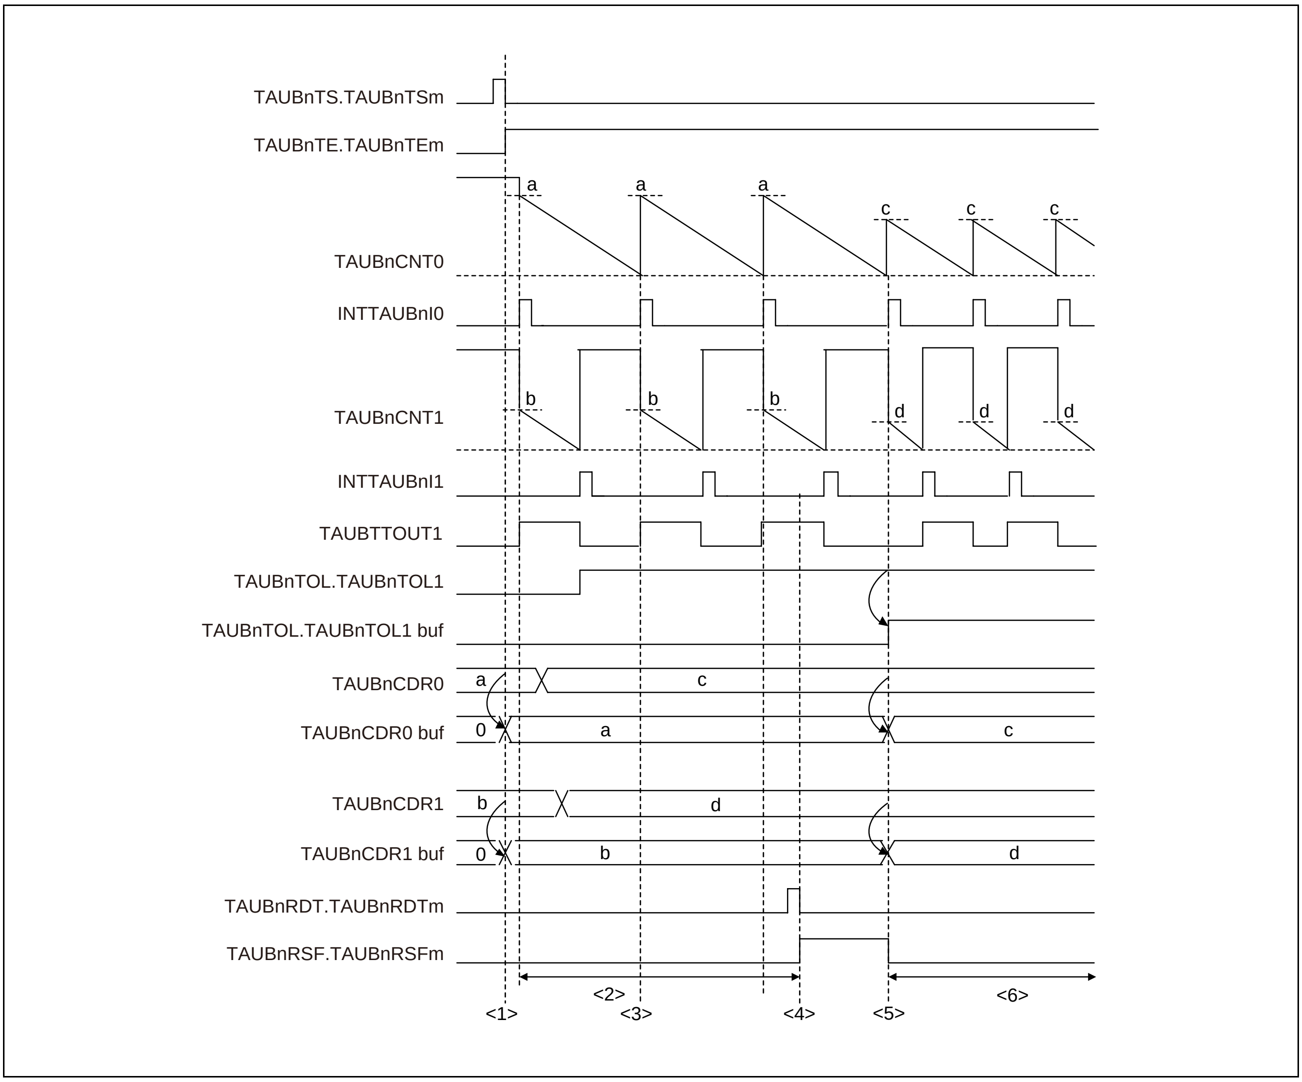

Figure 31.6 Simultaneous Rewrite when the Master Channel (Re)Starts Counting

Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

Description:

(1) When TAUBnTS.TAUBnTSm = 1 is set, the value of TAUBnCDRm is copied to the TAUBnCDRm buffer and the value of TAUBnTOL.TAUBnTOLm is copied to the TAUBnTOL.TAUBnTOLm buffer.

(2) The TAUBnCDRm and TAUBnTOL.TAUBnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUBnRSF.TAUBnRSFm = 0)

(4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.

(5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

31.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel (Method B)

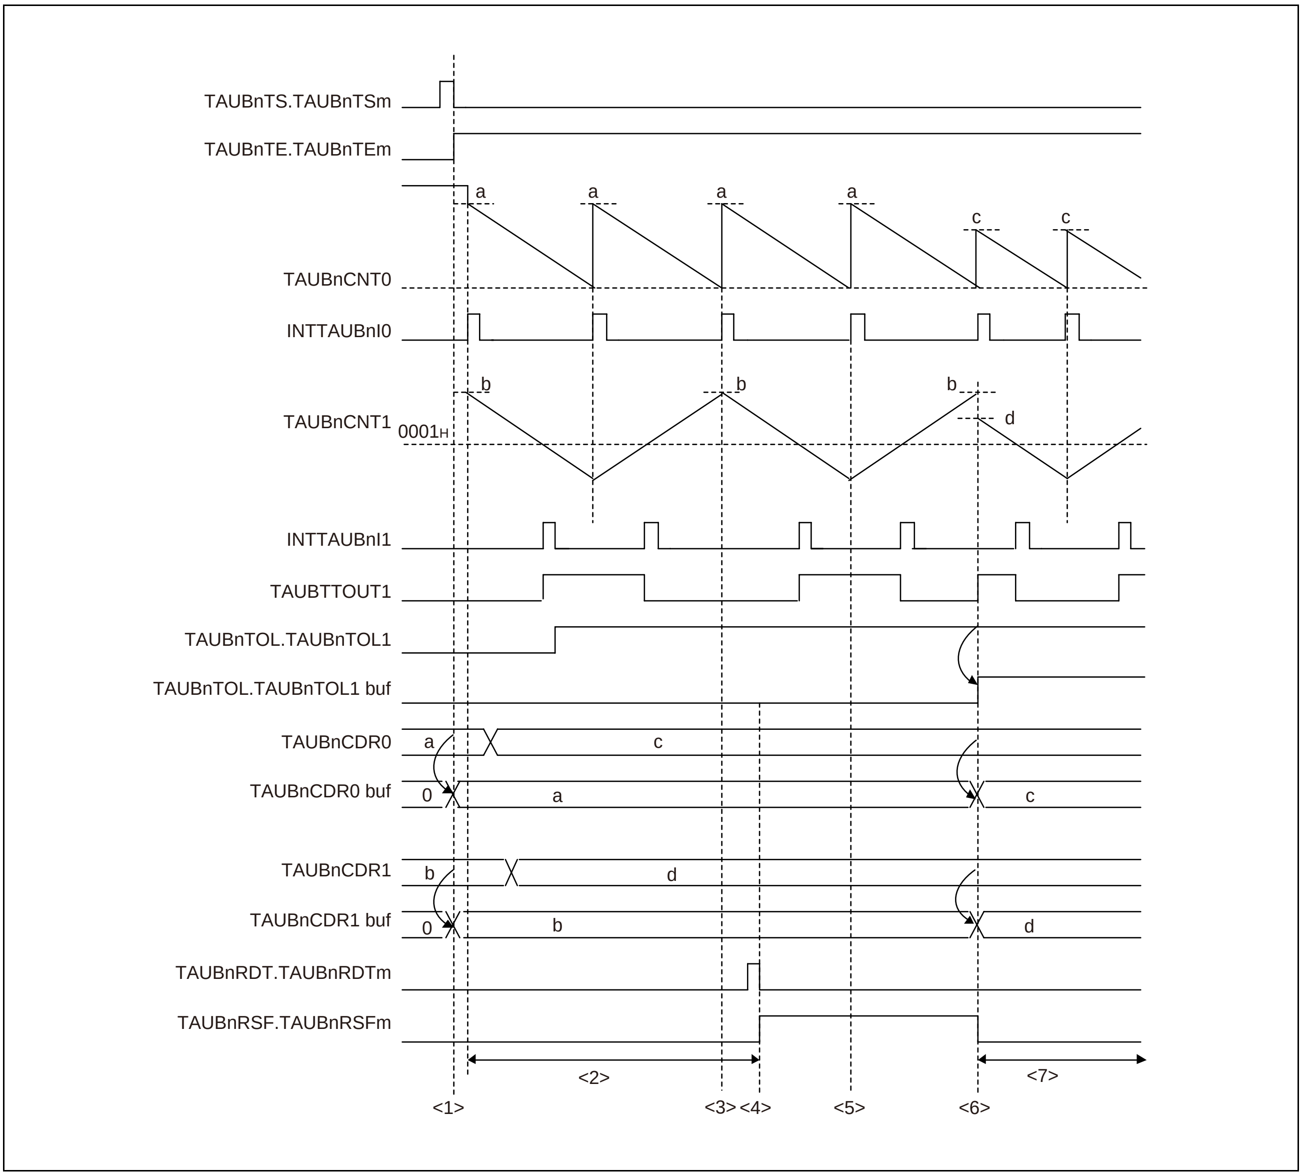

Figure 31.7 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel

Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

Description:

(1) When TAUBnTS.TAUBnTSm = 1 is set, the value of TAUBnCDRm is copied to the TAUBnCDRm buffer.

(2) The TAUBnCDRm and TAUBnTOL registers can be written at any time.

(3) Simultaneous rewrite does not occur because it is disabled (TAUBnRSF.TAUBnRSFm = 0).

(4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.

(6) Simultaneous rewrite takes place at the start timing of the top of the triangular cycle. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.

(7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

31.6.4.3 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm (Method C1)

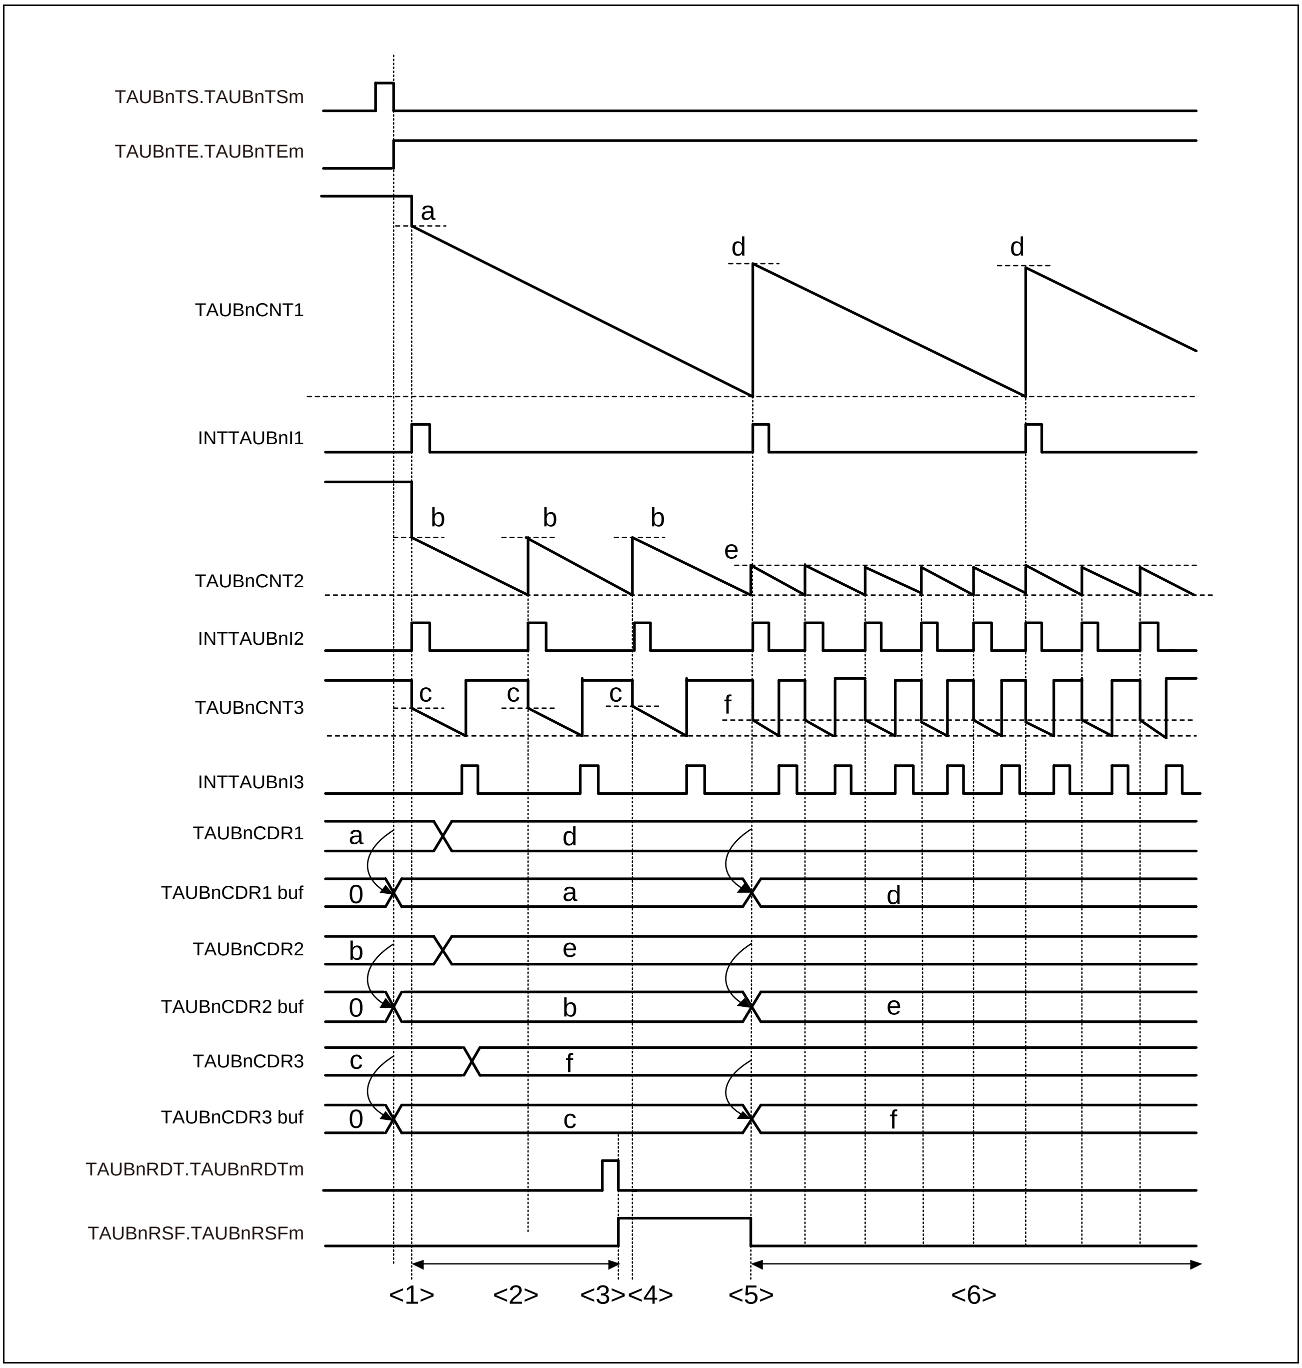

Figure 31.8 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm

Setting:

CH1 is an upper channel used counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C1 is applied. The TAUBnRDC register specifies a channel which generates simultaneous rewrite triggers.

Description:

(1) When TAUBnTS.TAUBnTSm is set to 1, the TAUBnCDRm value is copied to the TAUBnCDRm buffer.

(2) The TAUBnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1, the status flag is set (TAUBnRSF.TAUBnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches 0000_H. The TAUBnCDRm values are loaded into the corresponding TAUBnCDRm buffers.

(6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUBnCDRm register can be rechanged.

31.7 Channel Output Modes

The output of the TAUBTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUBnTOE.TAUBnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUBnTO.TAUBnTOm) is sent to the output pin (TAUBTTOUTm).
- By TAUB signals (TAUBnTOE.TAUBnTOEm = 1)
  When controlled by TAUB signals, the output level of TAUBTTOUTm is set or reset or toggled by internal signals. The value of TAUBnTO.TAUBnTOm is updated accordingly to reflect the value of TAUBTTOUTm.
  - Independently (TAUBnTOM.TAUBnTOMm = 0)
    In case of independent operation, the output of the TAUBTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUBnTOM.TAUBnTOMm = 0).
  - Synchronously (TAUBnTOM.TAUBnTOMm = 1)
    In case of synchronous operation, the output of the TAUBTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUBnTOM.TAUBnTOMm = 1).

The TAUBnTO.TAUBnTOm bit can always be read to determine the current value of TAUBTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 31.54, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 31.7.2, Channel Output Modes Controlled Independently by TAUBn Signals**
- **Section 31.7.3, Channel Output Modes Controlled Synchronously by TAUBn Signals**

Batch operation of TAUBnTOm bit

Whether a set value is reflected to the TAUBnTOm bit or not is controlled by the TAUBnTOE.TAUBnTOEm bit.

The TAUBnTOm setting is written only to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit = 0 when a write to the TAUBnTO register is attempted. No TAUBnTOm setting is reflected to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit = 1.

NOTE

The TAUBnTO.TAUBnTOm bit is placed so that its bit number corresponds to a channel number.

Output logic

Positive logic or negative logic of the output is specified by control bit TAUBnTOL.TAUBnTOLm.

The value of TAUBnTOL.TAUBnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. If TAUBnTOL.TAUBnTOLm is changed after the counter starts, the output of TAUBTTOUTm is undefined.

See **Section 31.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 31.54, Channel Output Modes**.

Table 31.54 Channel Output Modes

Channel Output Mode	TAUBnTOE.TAUBnTOEm	TAUBnTOM.TAUBnTOMm	TAUBnTOC.TAUBnTOCm	TAUBnTDE.TAUBnTDEm
By software				
Independent channel output mode controlled by software	0	x		
By TAUB signals, independently				
Independent channel output mode 1	1	0	0	0
Independent channel output mode 2			1	
By TAUB signals, synchronously				
Synchronous channel output mode 1	1	1	0	0
Synchronous channel output mode 2			1	0
Synchronous channel output mode 2 with dead time output				1

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

NOTE

The following bits cannot be changed during count operation (TAUBnTE.TAUBnTEm = 1):

- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

31.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUBTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUBnTOE.TAUBnTOEm = 0).

(1) Set TAUBnTO.TAUBnTOm to specify the initial level of the TAUBTTOUTm output.

(2) Set channel output mode according to **Table 31.54, Channel Output Modes**, and the output logic using the TAUBnTOL.TAUBnTOLm bit.

(3) Start the counter (TAUBnTS.TAUBnTSm = 1).

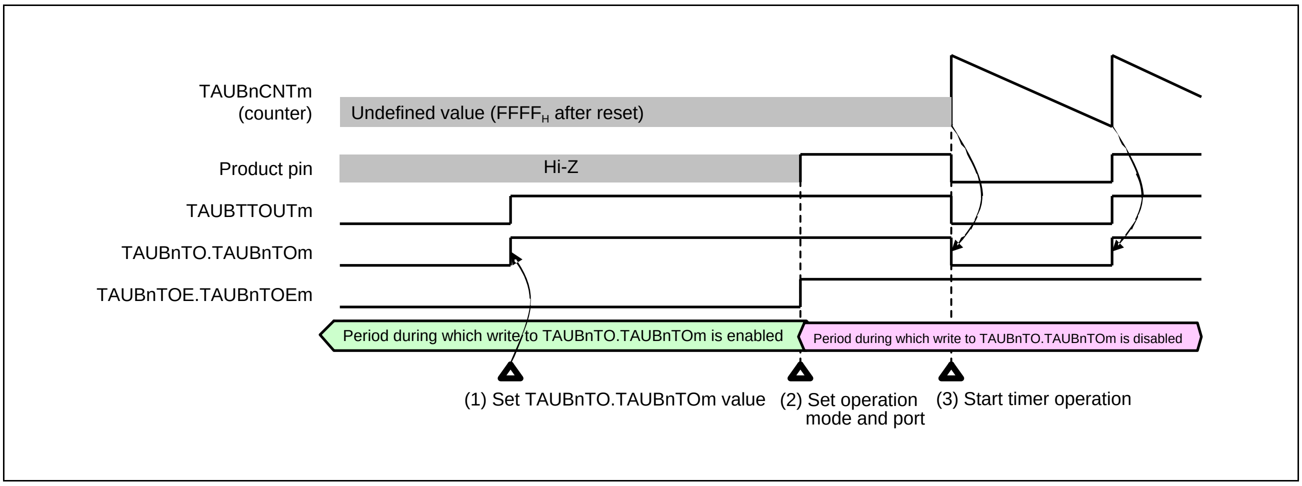

Figure 31.9 General Procedure for Specifying a TAUBTTOUTm Channel Output Mode

31.7.2 Channel Output Modes Controlled Independently by TAUBn Signals

This section lists the channel output modes that are controlled independently by TAUBn signals. The control bits used to specify a mode are listed in **Table 31.54, Channel Output Modes**.

31.7.2.1 Independent Channel Output Mode 1

Set/reset conditions

In this output mode, TAUBTTOUTm toggles when INTTAUBnIm is detected. The value of TAUBnTOL.TAUBnTOLm is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 31.54, Channel Output Modes**.

31.7.2.2 Independent Channel Output Mode 2

Set/reset conditions

In this output mode, TAUBTTOUTm is set when INTTAUBnIm occurs at the time of count start, and reset when INTTAUBnIm occurs due to a match between TAUBnCNTm and TAUBnCDRm.

Prerequisites

There are no prerequisites other than those shown in **Table 31.54, Channel Output Modes**.

31.7.3 Channel Output Modes Controlled Synchronously by TAUBn Signals

This section lists the channel output modes that are controlled synchronously by TAUBn signals. The control bits used to specify a mode are listed in **Table 31.54, Channel Output Modes**.

31.7.3.1 Synchronous Channel Output Mode 1

Set/reset conditions

In this output mode, INTTAUBnIm of master channel serves as a set signal and INTTAUBnIm of the slave channel as a reset signal. If INTTAUBnIm of the master channel and INTTAUBnIm of the slave channel are generated at the same time, INTTAUBnIm of the slave channel (reset signal) has priority over INTTAUBnIm (set signal) of the master channel, i.e., the master channel is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 31.54, Channel Output Modes**.

31.7.3.2 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is triangular wave PWM output at TAUBTTOUTm. For details, see **Section 31.14.5, Triangle PWM Output Function**.

Set/reset conditions

TAUBnCNTm of the slave channel counts down and up alternatively. When it passes 0001_H it generates an interrupt, causing TAUBTTOUTm to toggle.

Prerequisites

A set of two channels is required to generate the triangle PWM output. TAUBTTOUTm should be set to 0 before the function starts.

31.7.3.3 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUBTTOUTm. The set/reset conditions are shown in **Figure 31.10, Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output**.

Set/reset conditions

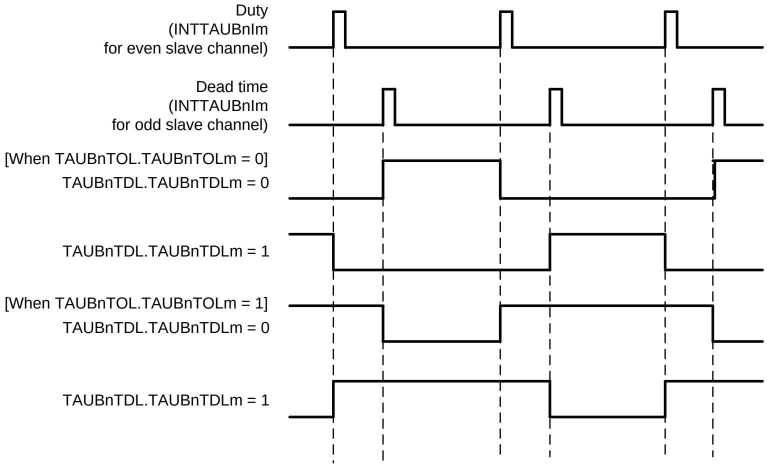

Figure 31.10 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output

With regard to the edge to which dead time is added, set TAUBnTDL.TAUBnTDLm = 0 for rising edges and TAUBnTDL.TAUBnTDLm = 1 for falling edges.

Prerequisites

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel
  The master channel should be set to interval timer mode.
- One even slave channel
  The even slave channel should be set to count-up/-down mode.
- One odd slave channel (even channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUBnTOE.TAUBnTOEm
- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

31.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUBnTS.TAUBnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

31.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-Up/-Down Mode, and Count Capture Mode

The counter starts operating at the next count clock after TAUBnTS.TAUBnTSm is set to 1. The value of data register is also loaded when the counter starts.

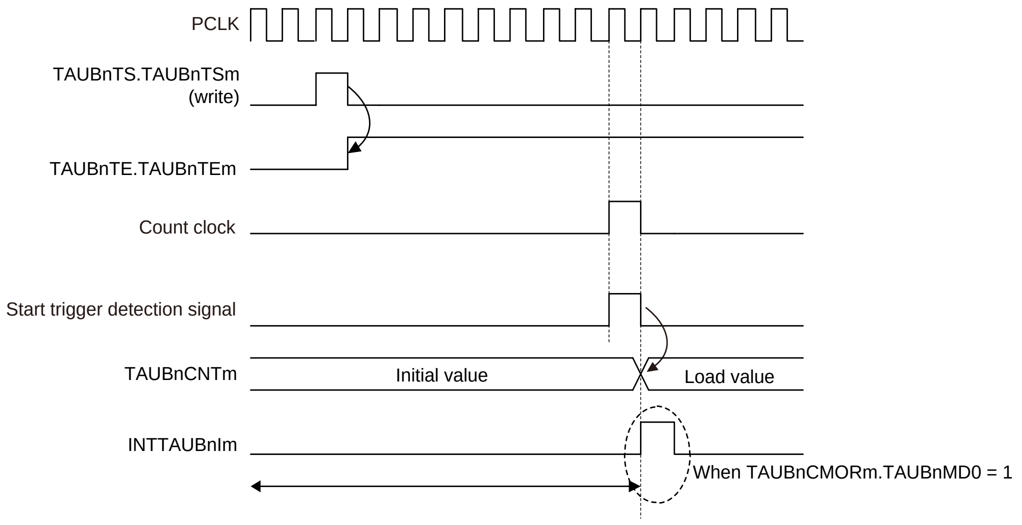

Figure 31.11 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Up/Down Count Mode, and Count Capture Mode

NOTE

Make sure to set TAUBnCMORm.TAUBnMD0 to 0 when using the count-up/-down mode.

31.8.2 Event Count Mode

The value of data register is loaded as soon as TAUBnTS.TAUBnTSm is set to 1. The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

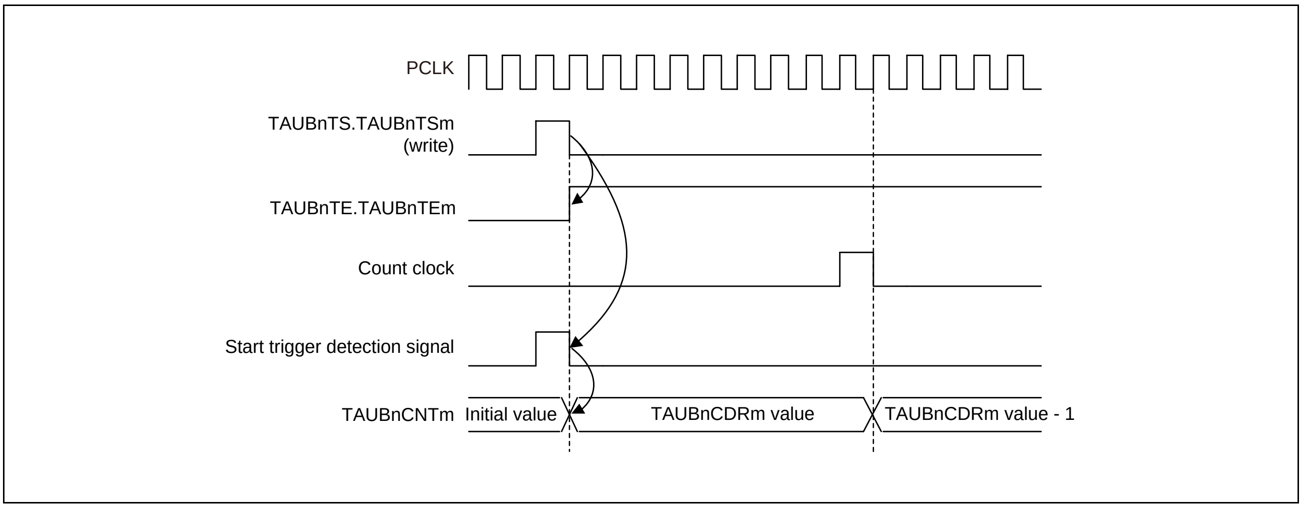

Figure 31.12 Start Timing in Event Count Mode

31.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUBTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which are irrelevant to start of counter operation, determine the frequency with which all operations take place.

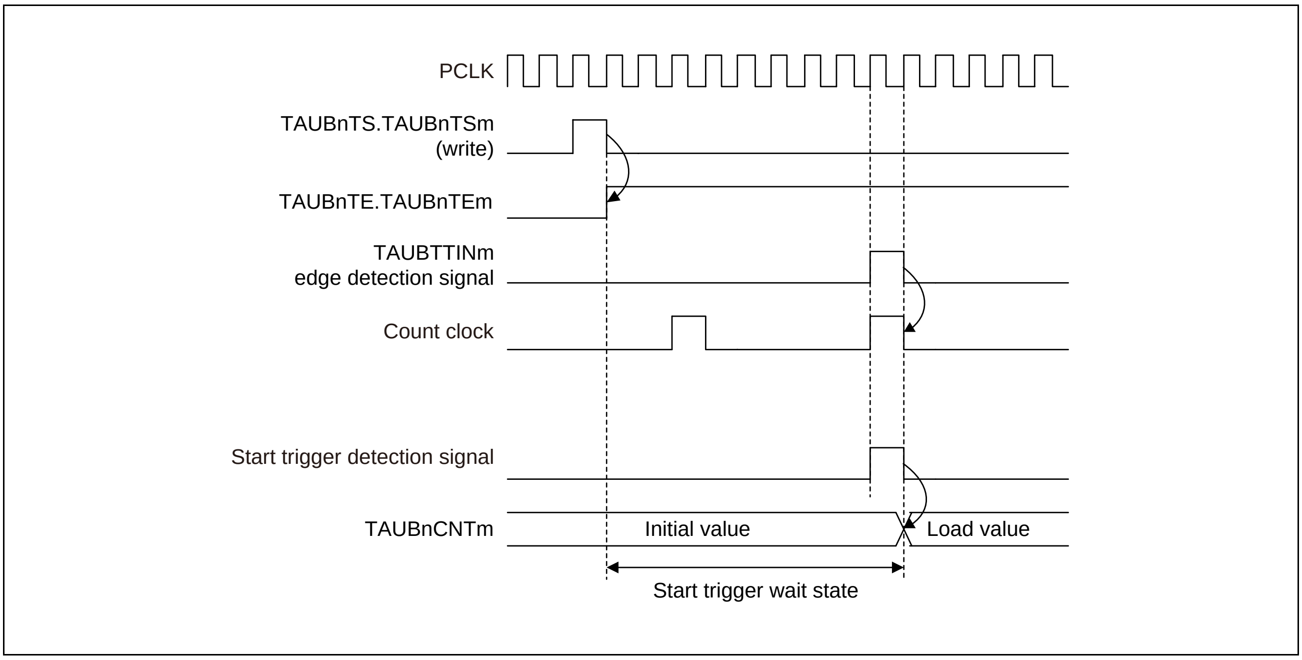

Figure 31.13 Count Start Timing in Other Operating Modes

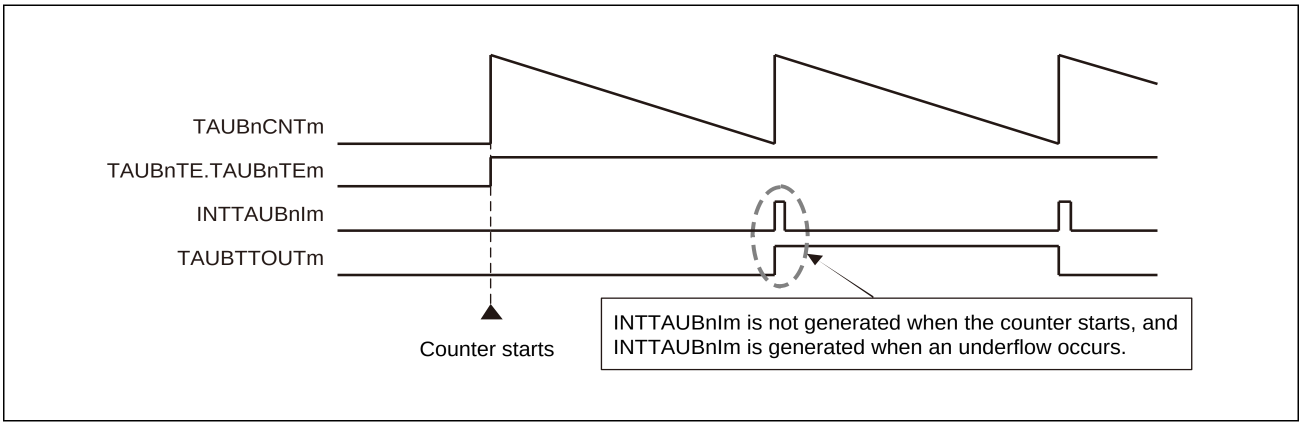
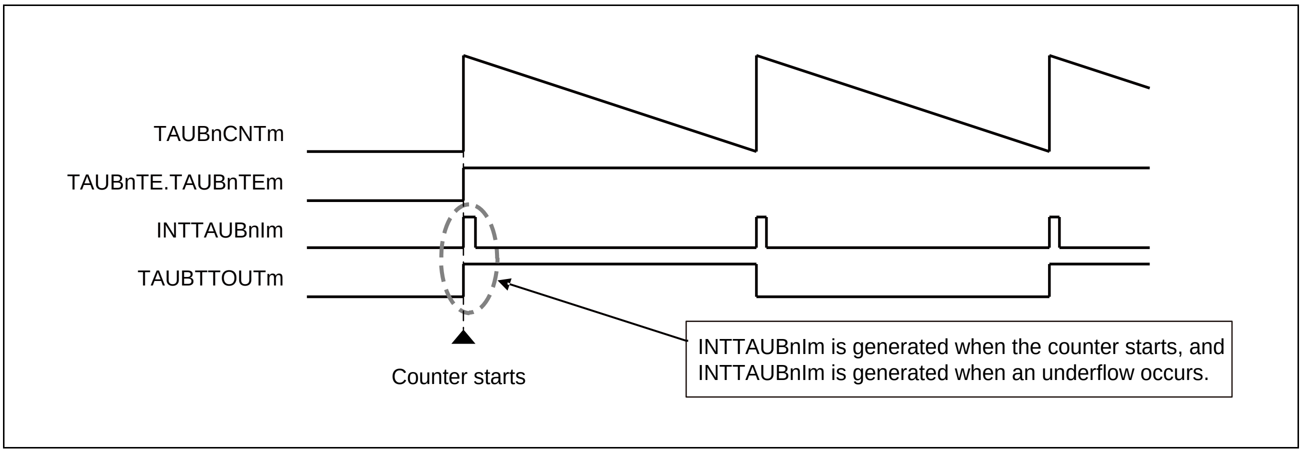
31.9 TAUBTTOUTm Output and INTTAUBnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUBnIm is generated using the TAUBnCMORm.TAUBnMD0 bit. The generation of INTTAUBnIm when the TAUBnCMORm.TAUBnMD0 bit starts counting and the effect to TAUBTTOUTm depend on the selected function. For details, refer to the description of TAUBnCMORm.TAUBnMD0 of each function.



INTTAUBnIm is not generated when the counter starts, and INTTAUBnIm is generated when an underflow occurs.

Figure 31.14 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMD0 = 0)



INTTAUBnIm is generated when the counter starts, and INTTAUBnIm is generated when an underflow occurs.

Figure 31.15 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMD0 = 1)

31.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches $FFFF_H$ and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operation in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches 0000_H at the same time as the first channel overflows (TAUBnCNTm = $FFFF_H$).
- Set TAUBnCDRm of the second channel to $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUBTTINm input.
- The trigger detection settings (TAUBnCMORm.TAUBnSTS[2:0] and TAUBnCMURm.TAUBnTIS[1:0]) must be identical for both channels.

Result:

The down-counter of the second channel reaches 0000_H at exactly the same time as the up-counter of the first channel overflows (TAUBnCNTm = $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

31.10.1 Example of Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the TAUBTTINm input interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input pulse interval measurement function exceeds $FFFF_H$.

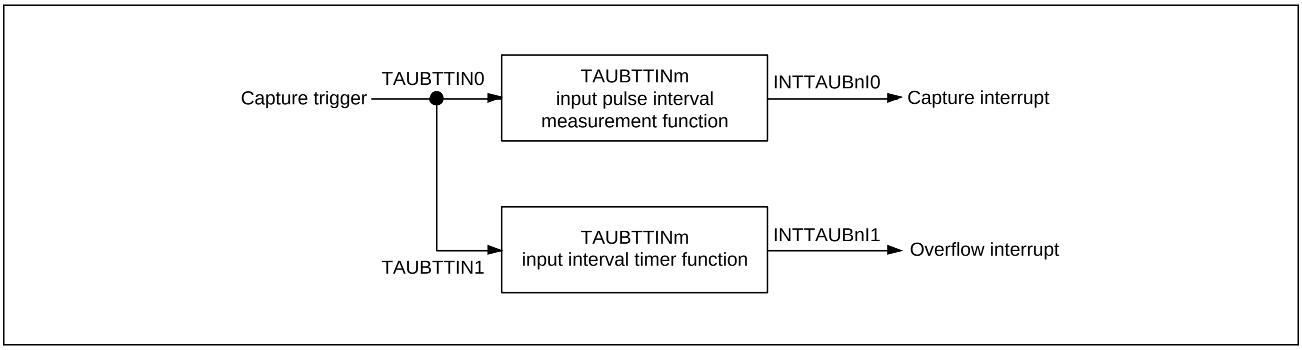


Figure 31.16 Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

Timing diagram

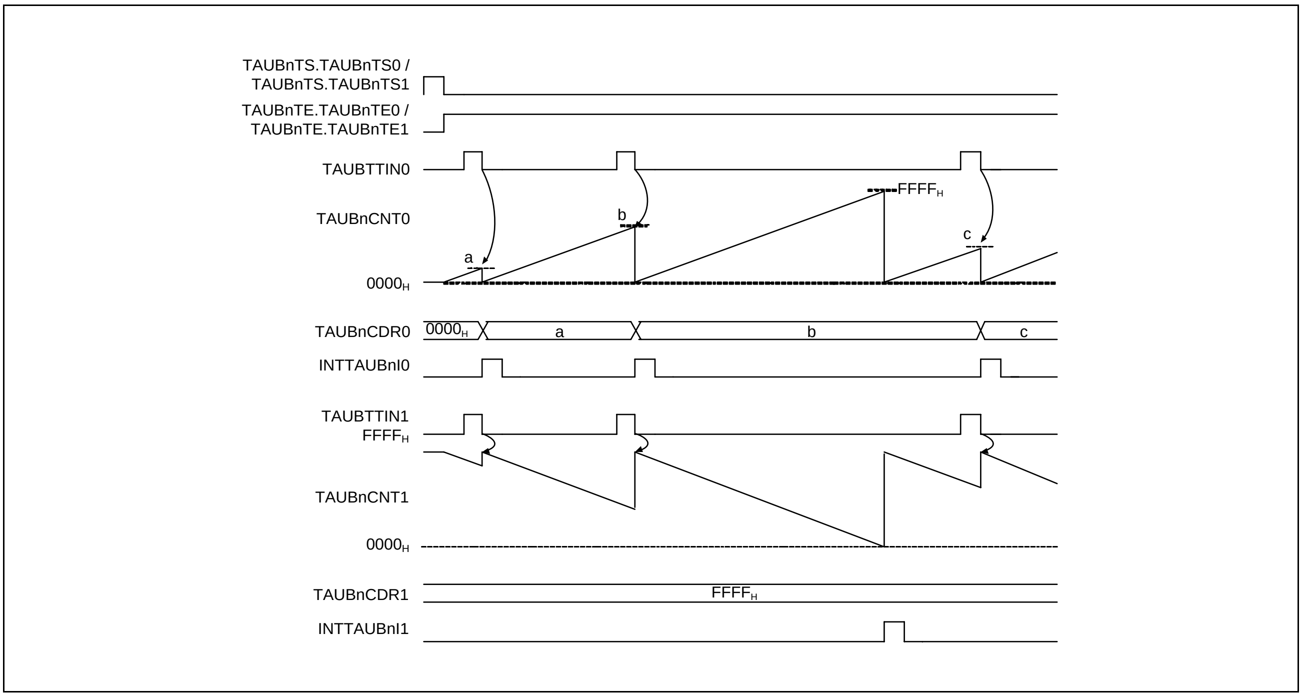

Figure 31.17 Interrupt Generation by Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

31.10.2 Example of Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm width measurement) can detect the overflow when TAUBnCNTm of the TAUBTTINm input signal width measurement function exceeds $FFFF_H$.

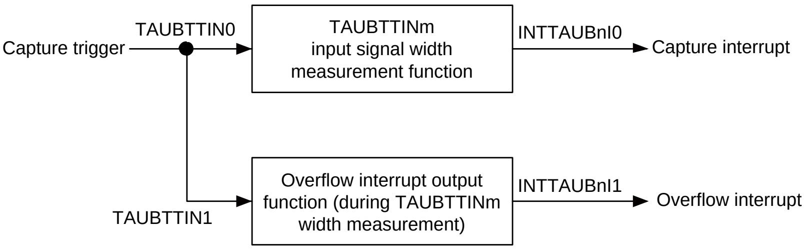

Figure 31.18 Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

Timing diagram

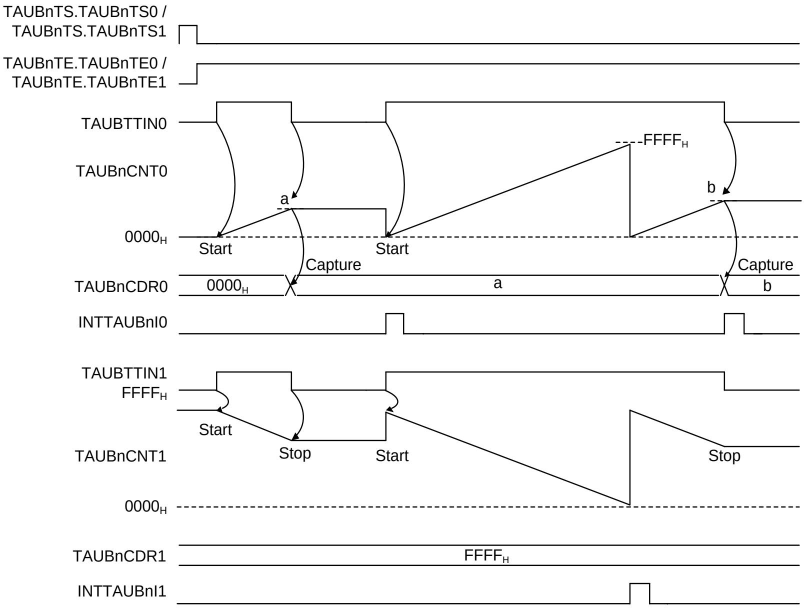

Figure 31.19 Interrupt Generation by Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

31.10.3 Example of Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

When the counters of both channels are enabled simultaneously, INTTAUBnIm of the interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input position detection function exceeds FFFF$_H$.

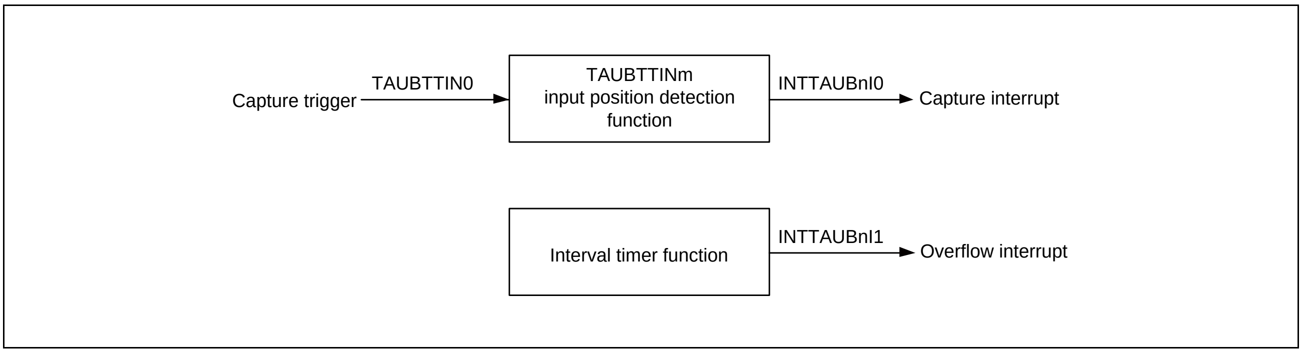

Figure 31.20 Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

Timing diagram

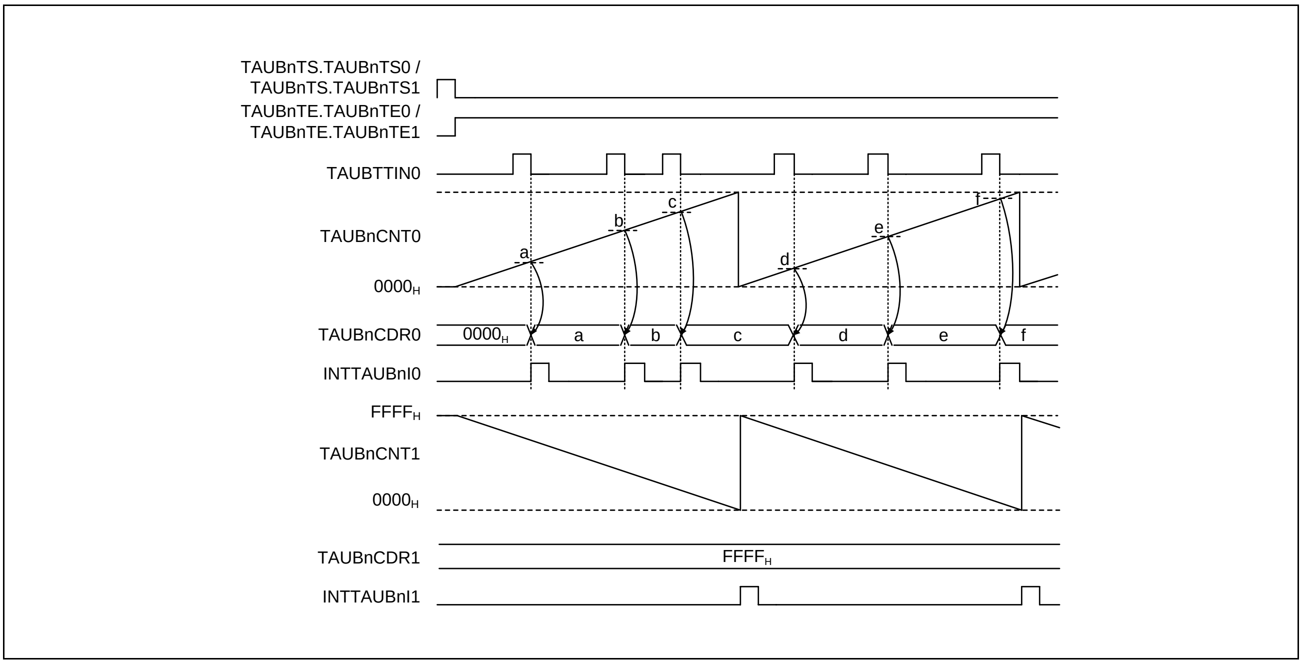

Figure 31.21 Interrupt Generation by Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

31.10.4 Example of Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm input period count detection) can detect the overflow when TAUBnCNTm of the TAUBTTINm input period count detection function exceeds FFFF$_H$.

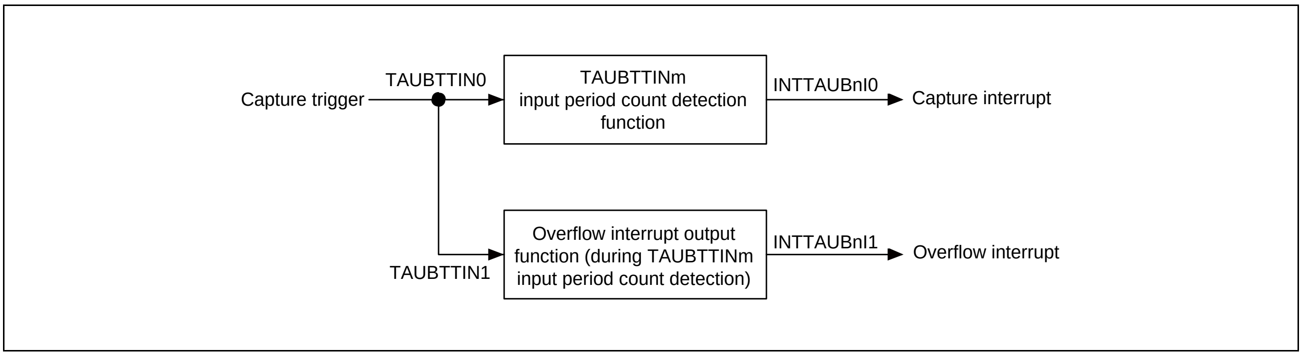

Figure 31.22 Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (TAUBTTINm Input Period Count Detection)

Timing diagram

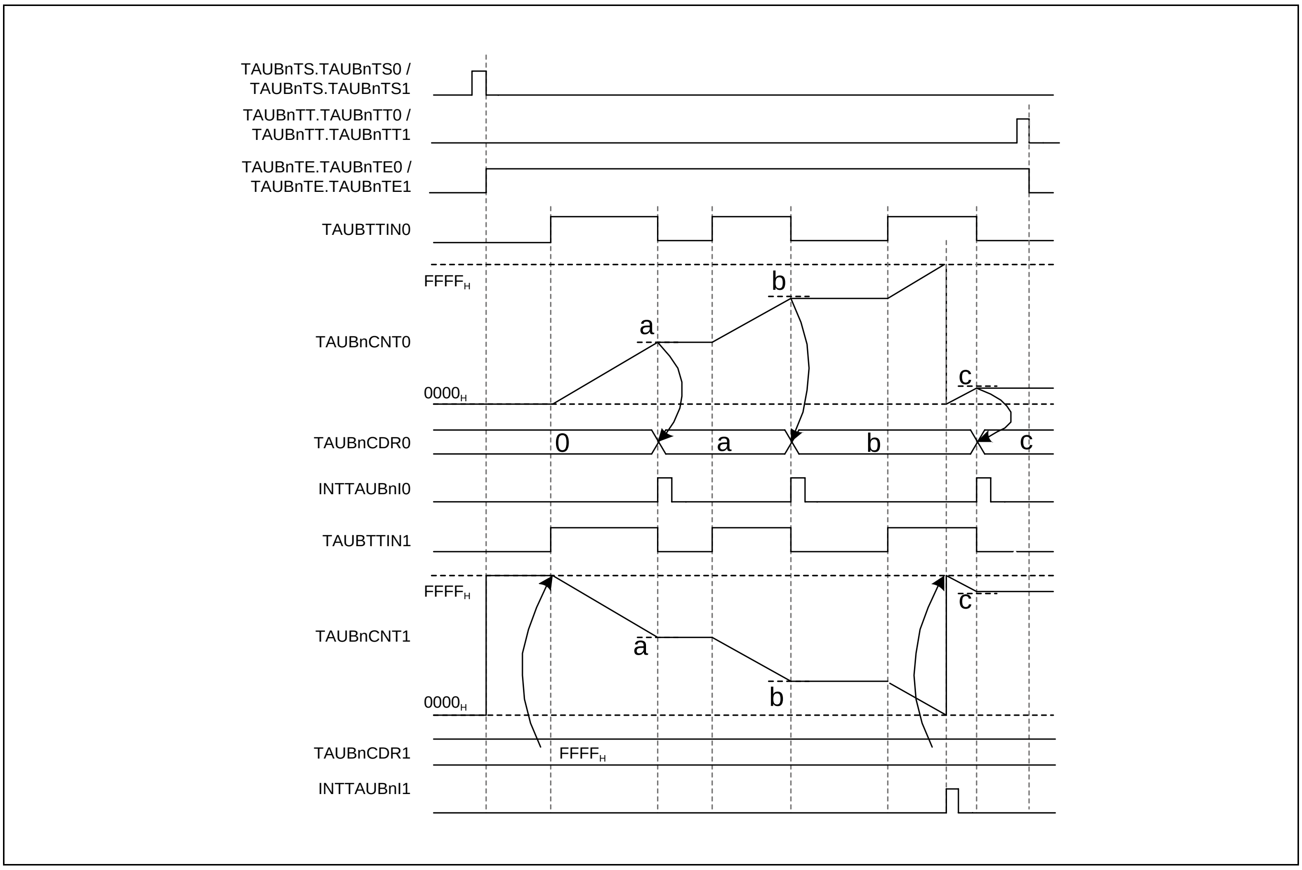

Figure 31.23 Interrupt Generation by Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

31.11 TAUBTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

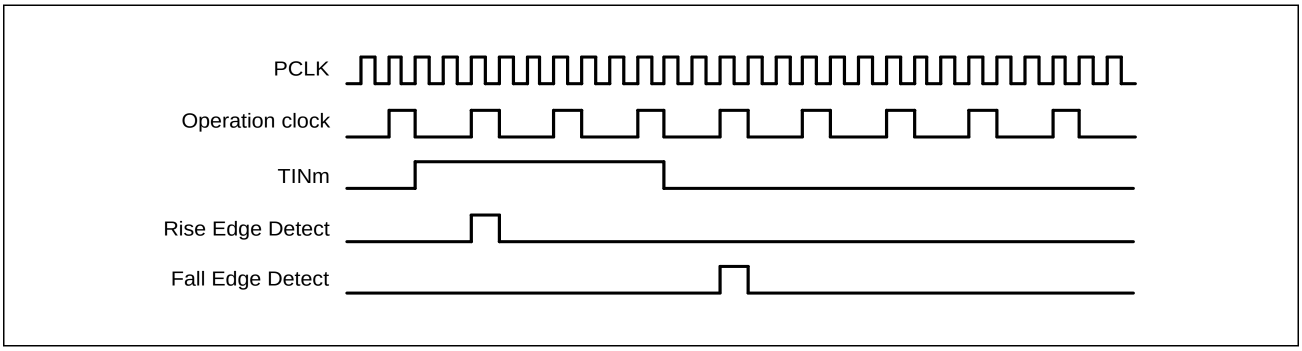

Figure 31.24 Basic Edge Detection Timing

Figure 31.24, Basic Edge Detection Timing is an image of the operation timing. Actually, the delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn will be generated.

31.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUB. For a general overview of independent channel operation functions, see **Section 31.2, Overview**.

31.12.1 Interval Timer Function

31.12.1.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals. When an interrupt is generated, the TAUBTTOUTm signal toggles, resulting in a square wave.

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

When the counter reaches 0000_H, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle. This results in an inverted TAUBTTOUTm signal output when TAUBnCMORm.TAUBnMD0 is set to 1.

31.12.1.2 Equations

INTTAUBnIm cycle = count clock cycle × (TAUBnCDRm + 1)

TAUBTTOUTm square wave cycle = count clock cycle × (TAUBnCDRm + 1) × 2

31.12.1.3 Block Diagram and General Timing Diagram

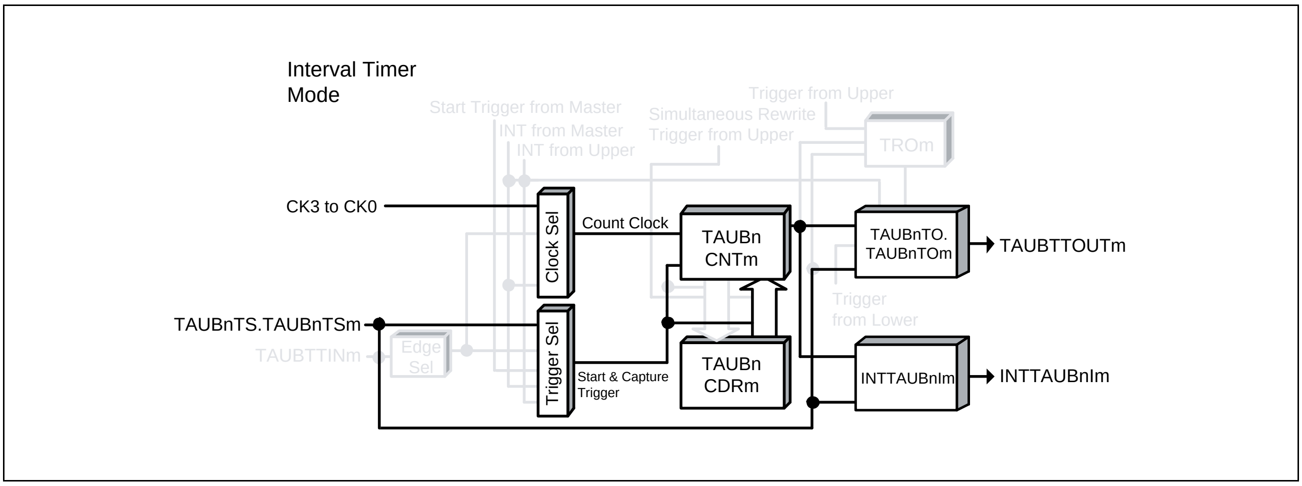

Figure 31.25 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

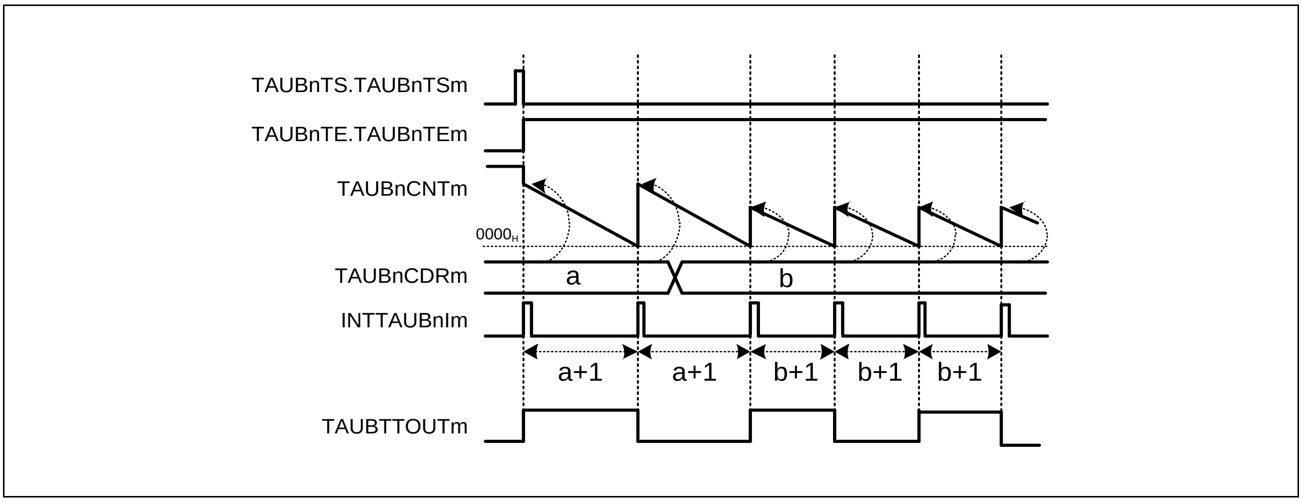

Figure 31.26 General Timing Diagram for Interval Timer Function

31.12.1.4 Register Settings

(1) TAUBnCMORm

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode

Table 31.57 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	Write 0_B.
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUBnTOE.TAUBnTOEm = 0. TAUBTTOUTm can then be controlled independently of the interrupts.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Interval Timer Function. Therefore, these registers must be set to 0.

Table 31.58 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

31.12.1.5 Operating Procedure for Interval Timer Function

Table 31.59 Operating Procedure for Interval Timer Function

		Operation	Status of TAUBn
	Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.55, Contents of the TAUBnCMORm Register for Interval Timer Function** and **Table 31.56, Contents of the TAUBnCMURm Register for Interval Timer Function** Set the value of the TAUBnCDRm register Set the channel output mode by setting the control bits as described in **Table 31.57, Control Bit Settings for Independent Channel Output Mode 1**	Channel operation is stopped.
Restart operation	Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated and TAUBTTOUTm toggles.
	During operation	The TAUBnCDRm register value can be changed at any time. The TAUBnCNTm register can be read at all times.	● TAUBnCNTm counts down. When the counter reaches 0000_H: ● TAUBnCNTm reloads the TAUBnCDRm value and continues count operation INTTAUBnIm is generated and TAUBTTOUTm toggles.
	Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

31.12.1.6 Specific Timing Diagrams

(1) TAUBnCDRm = 0000$_H$, count clock = PCLK/2

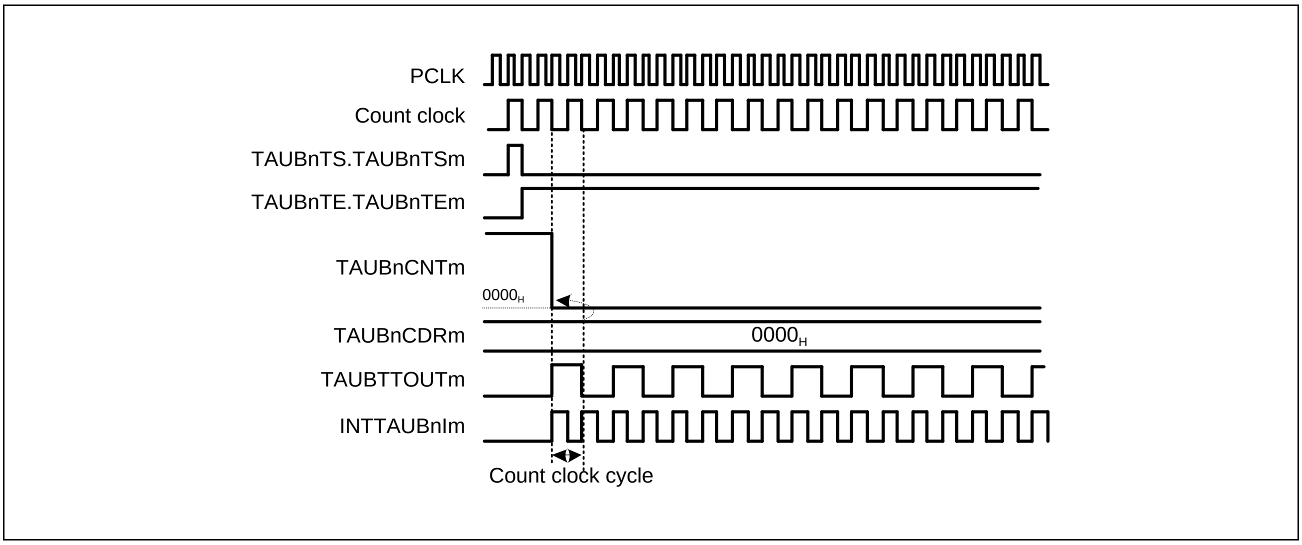

Figure 31.27 TAUBnCDRm = 0000$_H$, Count Clock = PCLK/2

- TAUBnCDRm = 0000$_H$, and the count clock = PCLK/2, the TAUBnCDRm value is written to TAUBnCNTm every count clock, meaning that TAUBnCNTm is always 0000$_H$.
- INTTAUBnIm is generated every count clock, resulting in TAUBTTOUTm toggling every count clock.

(2) TAUBnCDRm = 0000_H, count clock = PCLK

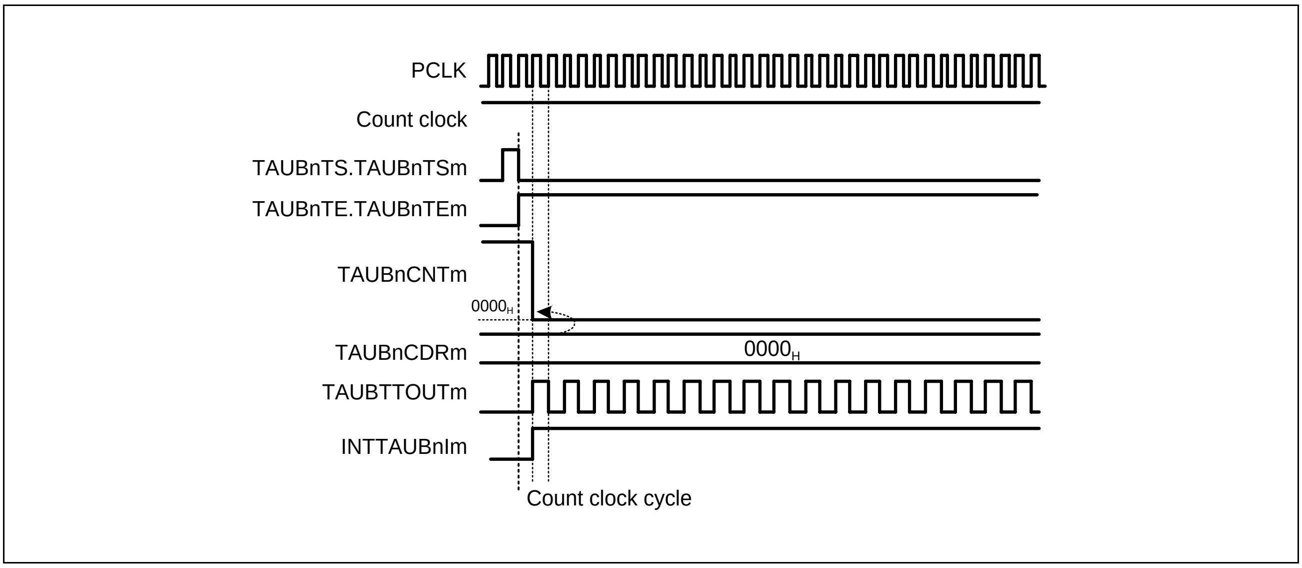

Figure 31.28 TAUBnCDRm = 0000_H, Count Clock = PCLK

- TAUBnCDRm = 0000_H, and the count clock = PCLK, the TAUBnCDRm value is written to TAUBnCNTm every PCLK clock, meaning that TAUBnCNTm is always 0000_H.
- INTTAUBnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
  TAUBTTOUTm is toggled every PCLK clock.

(3) Operation stop and restart (TAUBnCMORm TAUBnMD0 = 1)

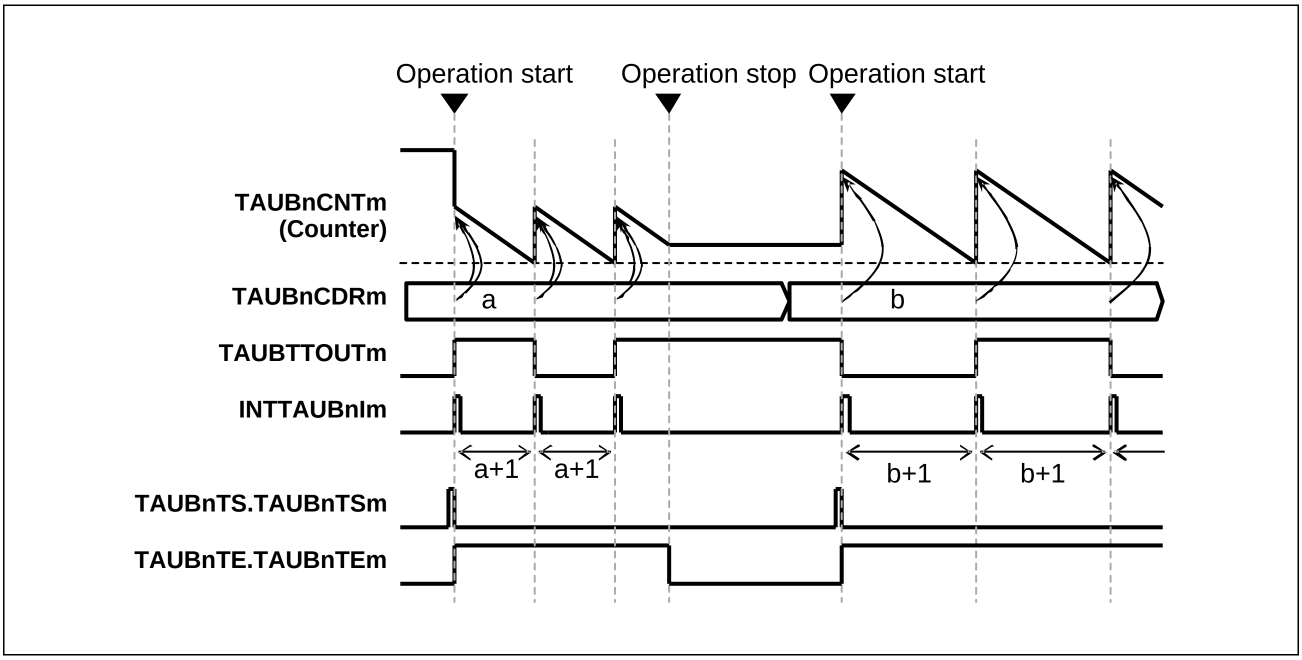

Figure 31.29 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 = 1

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm and TAUBTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1.

(4) Operation stop and restart (TAUBnCMORm.TAUBnMD0 = 0)

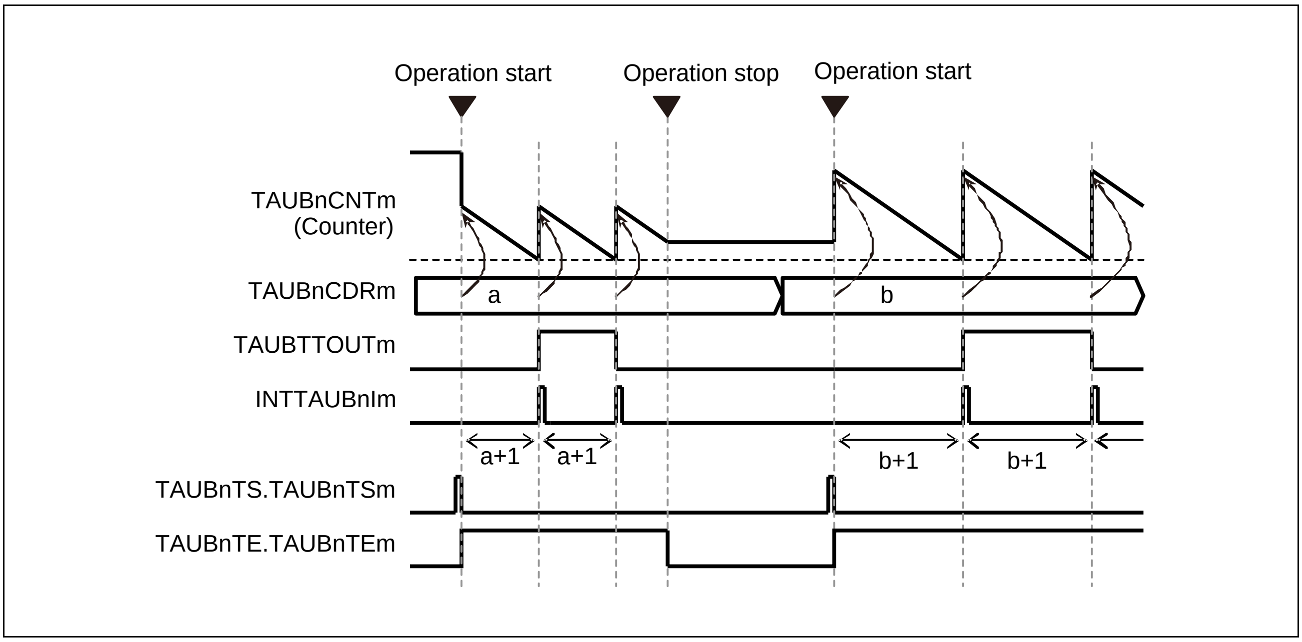

Figure 31.30 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 = 0

(5) Forced restart (TAUBnCMORm.TAUBnMD0 = 1)

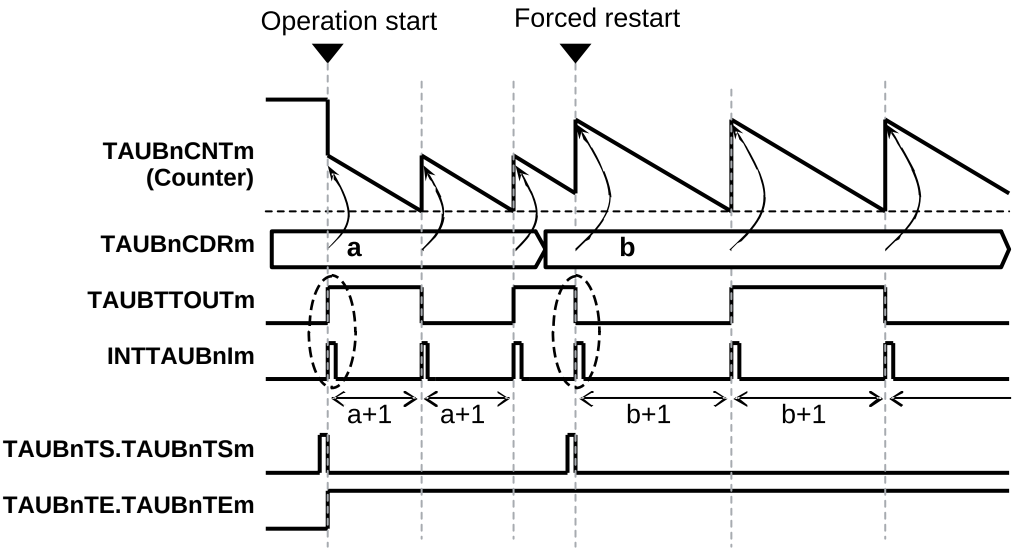

Figure 31.31 Forced Restart Operation, TAUBnCMORm.TAUBnMD0 = 1

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt at start or restart is generated and the output TAUBTTOUTm toggles.

(6) Forced restart (TAUBnCMORm.TAUBnMD0 = 0)

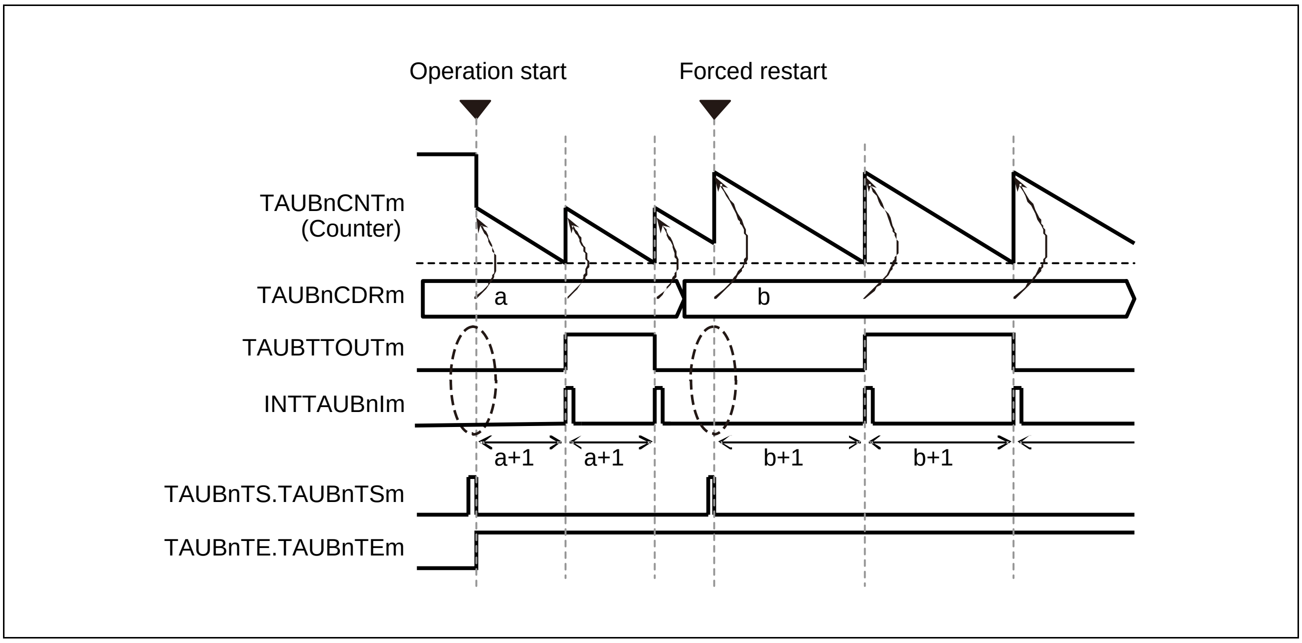

Figure 31.32 Forced Restart Operation (TAUBnCMORm.TAUBnMD0 = 0)

- The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle.

31.12.2 TAUBTTINm Input Interval Timer Function

31.12.2.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals or when a valid TAUBTTINm input edge is detected.

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

INTTAUBnIm is generated when the counter reaches 0000_H or by an effective TAUBTTINm input edge. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The type of edge used as the trigger is specified using the TAUBnCMURm.TAUBnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

31.12.2.2 Block Diagram and General Timing Diagram

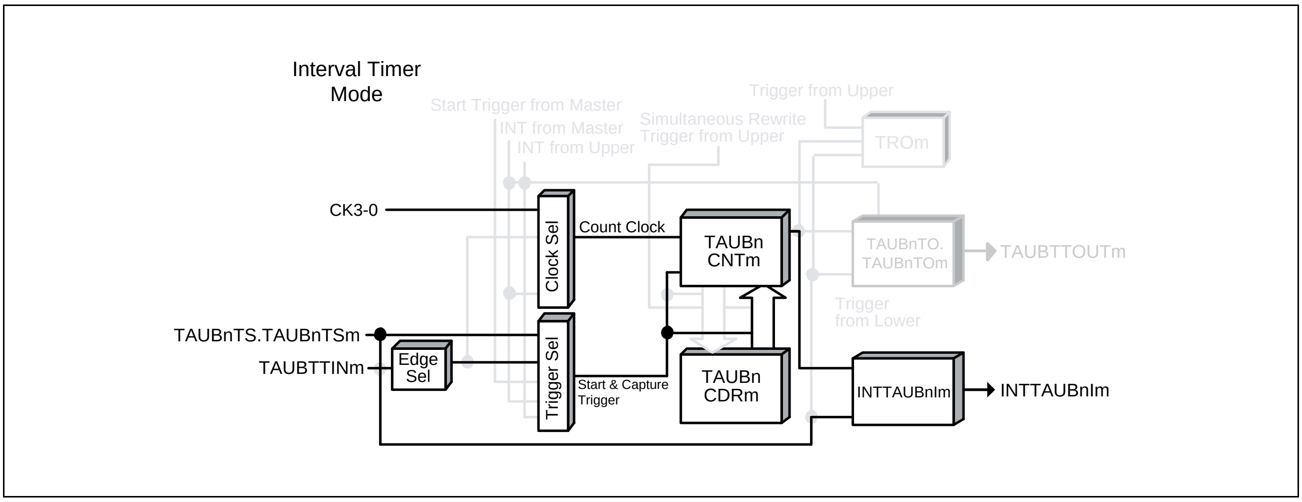

Figure 31.33 Block Diagram for TAUBTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1).
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

(3) Channel output mode

This function does not use channel output mode.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Interval Timer Function. Therefore, these registers must be set to 0.

Table 31.62 Simultaneous Rewrite Settings for TAUBTTINm Input Interval Timer Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

31.12.2.4 Operating Procedure for TAUBTTINm Input Interval Timer Function

Table 31.63 Operating Procedure for TAUBTTINm Input Interval Timer Function

Restart operation

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.60, Contents of the TAUBnCMORm Register for TAUBTTINm Input Interval Timer Function** and **Table 31.61, Contents of the TAUBnCMURm Register for TAUBTTINm Input Interval Timer Function** Set the value of the TAUBnCDRm register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated.
During operation	The values of the TAUBnCMURm.TAUBnTIS[1:0] and the TAUBnCDRm register can be changed at any time. The TAUBnCNTm register can be read at all times. Detection of TAUBTTINm edge	TAUBnCNTm counts down. When the counter reaches 0000_H: ● TAUBnCNTm reloads the TAUBnCDRm value and continues count operation ● INTTAUBnIm is generated When a TAUBTTINm input valid edge is detected during count operation, TAUBnCNTm reloads the TAUBnCDRm value and continues count operation. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1 TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stop and retain their current values.

31.12.2.5 Specific Timing Diagrams

The timing diagrams in **Section 31.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by an effective TAUBTTINm input edge.

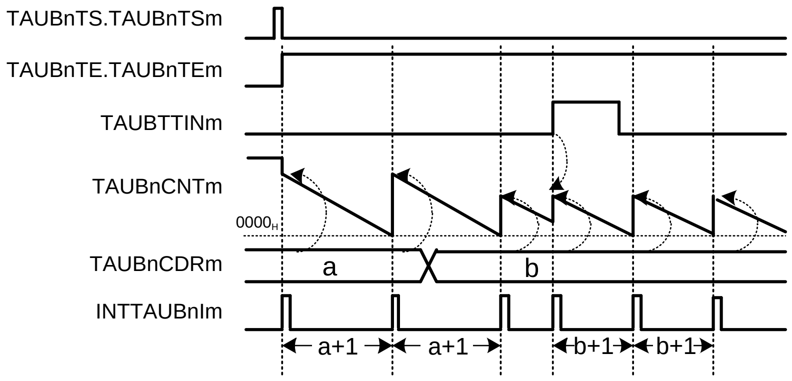

Figure 31.35 Counter Triggered by Rising TAUBTTINm Input Edge (TAUBnCMURm.TAUBnTIS[1:0] = 01_B), TAUBnCMORm.TAUBnMD0 = 1

- If an effective TAUBTTINm input edge is detected, an interrupt INTTAUBnIm is generated. In this example, the effective edge is a rising edge (TAUBnCMURm.TAUBnTIS[1:0] = 01_B).

31.12.3 Clock Divide Function

31.12.3.1 Overview

Summary

This function is used as a frequency divider. The frequency of the input signal TAUBTTINm is divided by a factor related to TAUBnCDRm, and an interrupt INTTAUBnIm is generated.

Prerequisites

- TAUBTTINm must have a fixed frequency
- The operation mode must be set to interval timer mode, see **Table 31.64, Contents of the TAUBnCMORm Register for Clock Divide Function**

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value, using TAUBTTINm as the count clock.

When the counter value reaches 0000_H, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm = 1, which in turn sets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm stops but retain their values. The function can be restarted by setting TAUBnTS.TAUBnTSm = 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.

Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated.

NOTE

The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits.

31.12.3.2 Block Diagram and General Timing Diagram

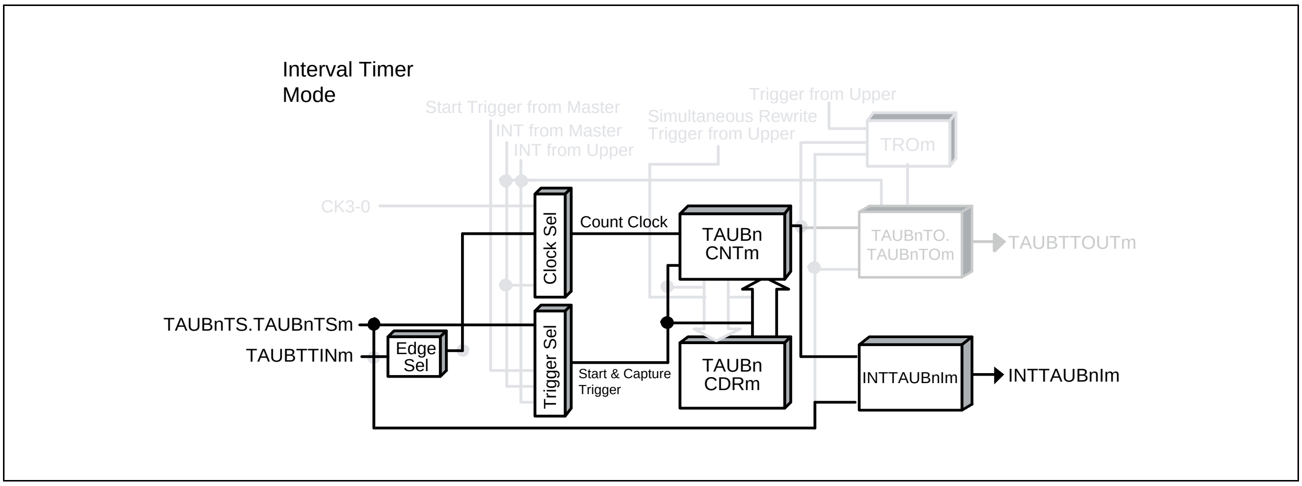

Figure 31.36 Block Diagram for Clock Divide Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

(3) Channel output mode

This function does not use channel output mode.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Clock Divide Function. Therefore, these registers must be set to 0.

Table 31.66 Simultaneous Rewrite Settings for Clock Divide Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

31.12.3.4 Operating Procedure for Clock Divide Function

Table 31.67 Operating Procedure for Clock Divide Function

		Operation	Status of TAUBn
	Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.64, Contents of the TAUBnCMORm Register for Clock Divide Function** and **Table 31.65, Contents of the TAUBnCMURm Register for Clock Divide Function** Set the value of the TAUBnCDRm register.	Channel operation is stopped.
Restart operation	Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 is set to 1, INTTAUBnIm is generated.
	During operation	The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at all times.	When a TAUBTTINm input edge is detected, TAUBnCNTm counts down. When the counter reaches 0000_H: ● TAUBnCNTm loads the TAUBnCDRm value and continues count operation ● INTTAUBnIm is generated
	Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

31.12.3.5 Specific Timing Diagrams

(1) TAUBnCDRm = 0000$_H$

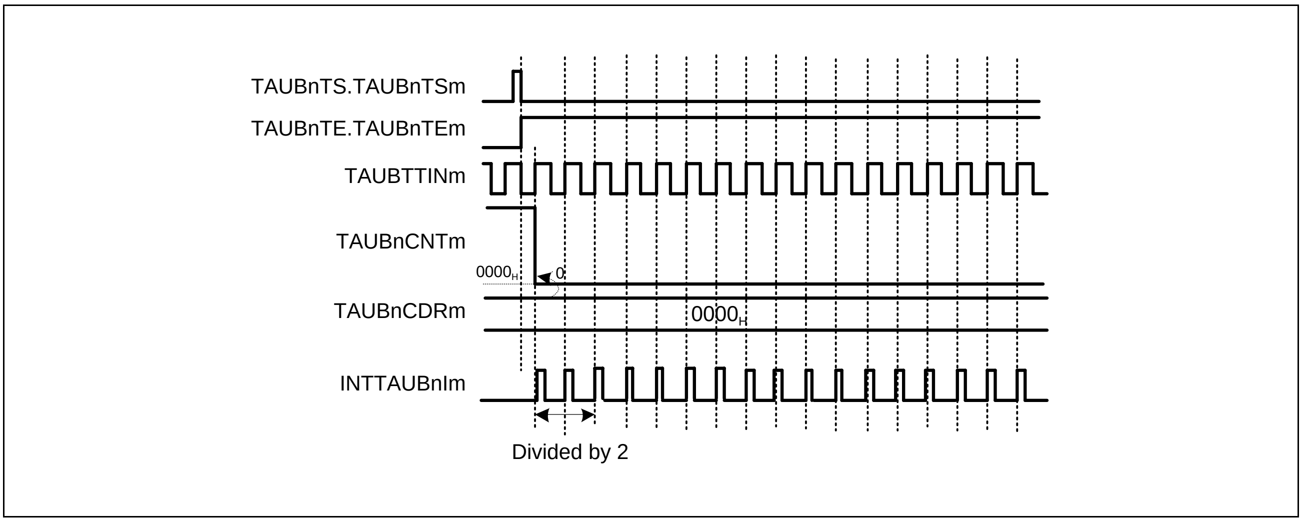

Figure 31.38 TAUBnCDRm = 0000$_H$, TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01$_B$

- If TAUBnCDRm is 0000$_H$, TAUBnCNTm is also always 0000$_H$.
- INTTAUBnIm is generated every count clock.

Figure 31.38, TAUBnCDRm = 0000H, TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01B is an image of the operation timing. Actually, there is a delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn.

(2) Operation restart

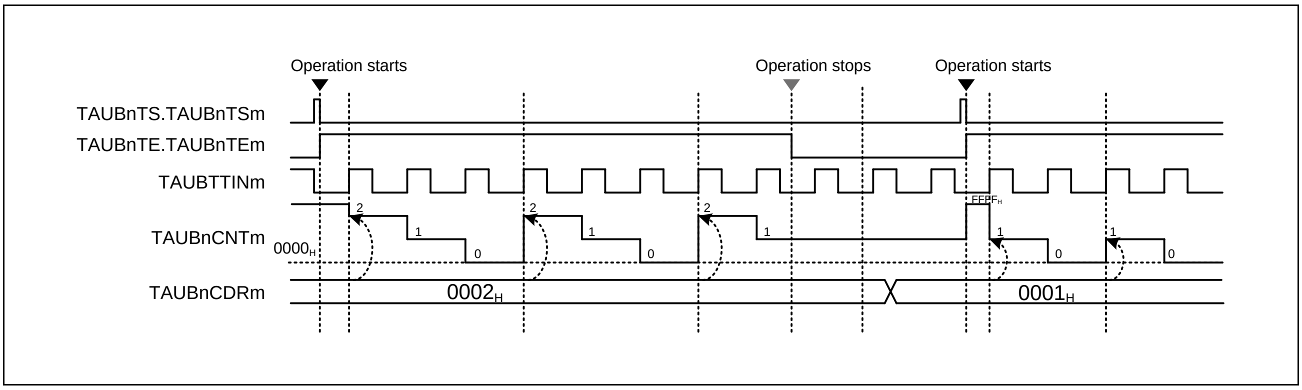

Figure 31.39 Operation Restart (TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01$_B$)

(3) Forced restart

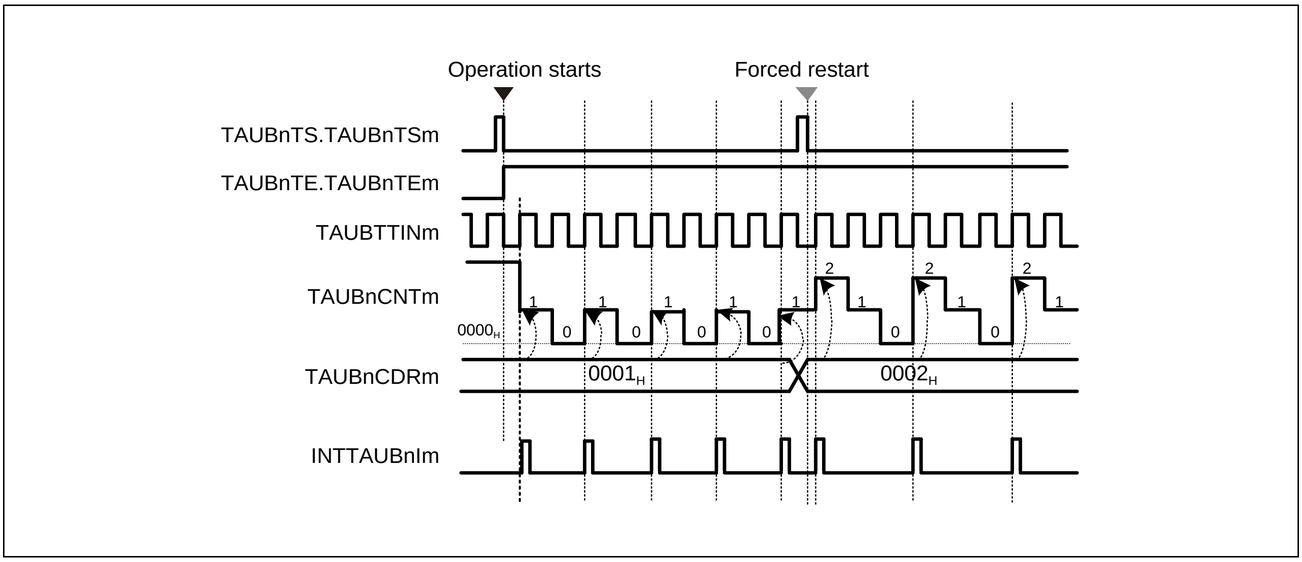

Figure 31.40 Forced Restart (TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

To forcibly restart the counter.

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- The value of TAUBnCDRm is written to TAUBnCNTm and the count operation restarts.

31.12.4 External Event Count Function

31.12.4.1 Overview

Summary

This function is used as an event timer. It generates an interrupt (INTTAUBnIm) when a specific number of valid edges of TAUBTTINm input are detected.

Prerequisites

- The operation mode must be set to event count mode, see **Table 31.68, Contents of the TAUBnCMORm Register for External Event Count Function**
- TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When the counter starts, the current value of TAUBnCDRm is written to TAUBnCNTm.

When an effective TAUBTTINm input edge is detected, the value of TAUBnCNTm reduces by 1. TAUBnCNTm retains this value until a valid TAUBTTINm input edge is detected or the counter is restarted.

When effective edges are detected (TAUBnCDRm + 1) times, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues to operate.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

31.12.4.2 Equations

Number of valid edges,
detected before INTTAUBnIm is generated = TAUBnCDRm + 1

31.12.4.3 Block Diagram and General Timing Diagram

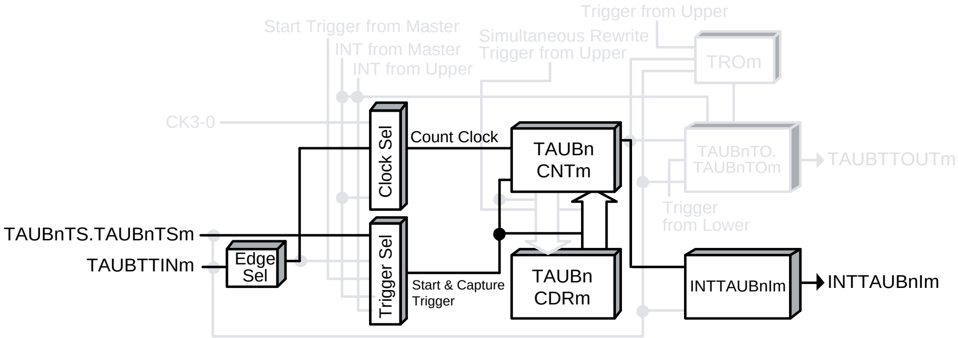

Figure 31.41 Block Diagram for External Event Count Function

The following settings apply to the general timing diagram.

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Falling edge is detected. 01: Rising edge is detected. 10: Both edges are detected. 11: Setting prohibited

(3) Channel output mode

The channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the External Event Count Function.

Therefore, these registers must be set to 0.

Table 31.70 Simultaneous Rewrite Settings for External Event Count Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

31.12.4.5 Operating Procedure for External Event Count Function

Table 31.71 Operating Procedure for External Event Count Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.68, Contents of the TAUBnCMORm Register for External Event Count Function** and **Table 31.69, Contents of the TAUBnCMURm Register for External Event Count Function** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value and waits for detection of the TAUBTTINm input edge.
During operation	Detection of TAUBTTINm edges. The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at any time.	TAUBnCNTm performs count-down operation each time a TAUBTTINm input edge is detected. When effective edges are detected (TAUBnCDRm + 1) times: ● TAUBnCNTm loads the TAUBnCDRm value and continues count operation ● INTTAUBnIm is generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

31.12.4.6 Specific Timing Diagrams

(1) TAUBnCDRm = 0000_H

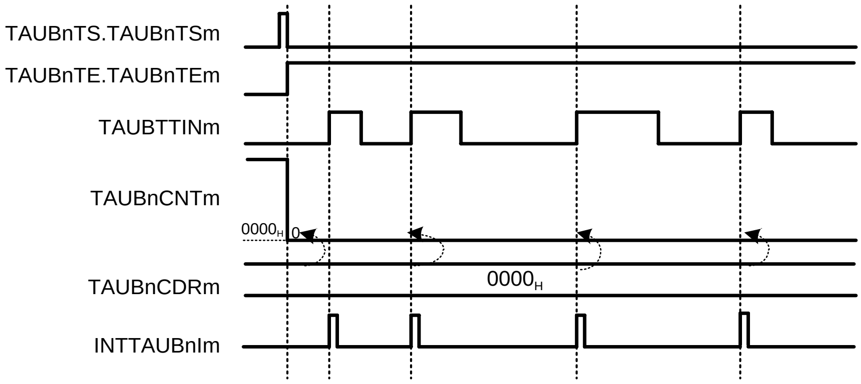

Figure 31.43 TAUBnCDRm = 0000_H, TAUBnCMURm.TAUBnTIS[1:0] = 01_B

- If 0000_H = TAUBnCDRm, 0000_H is loaded to TAUBnCNTm every time a valid TAUBTTINm input edge is detected.

This means, INTTAUBnIm is generated every time a valid TAUBTTINm input edge is detected.

(2) Operation stop and restart

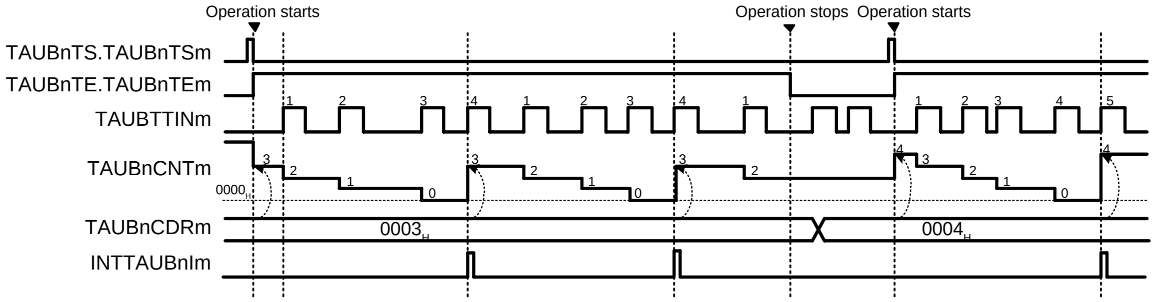

Figure 31.44 Operation Stop and Restart (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm stops and the current value is retained. TAUBTTINm continues and TAUBnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm loads the TAUBnCDRm value and restarts count operation.

(3) Forced restart

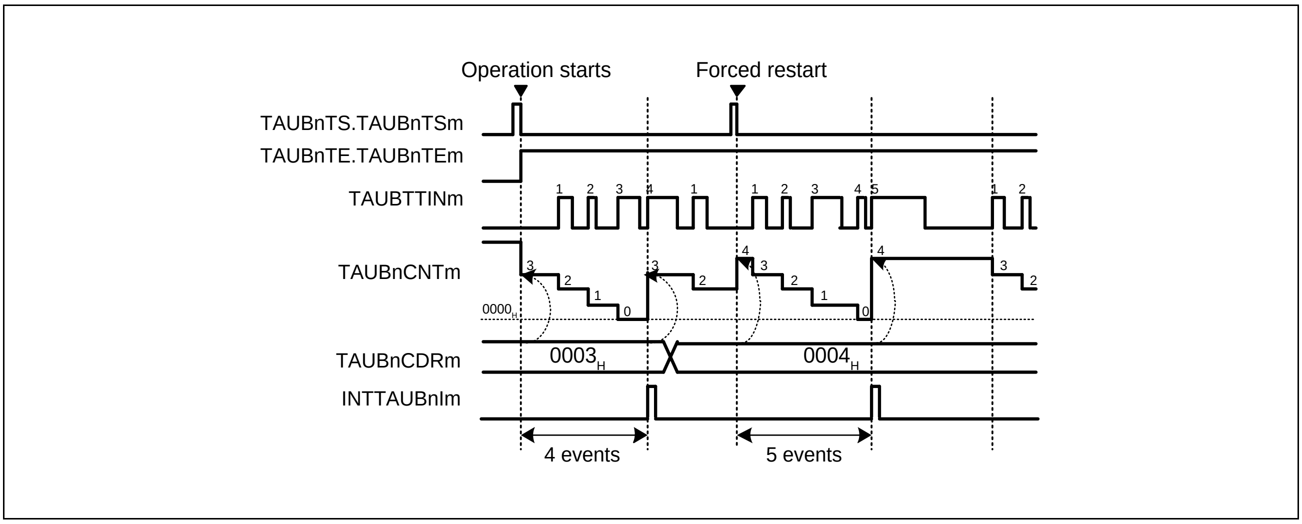

Figure 31.45 Forced Restart (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

A forced restart applies the new TAUBnCDRm value to TAUBnCNTm immediately.

- The counter can be restarted (without stopping it first), by setting TAUBnTS.TAUBnTSm to 1 during operation.
- The value of TAUBnCDRm is loaded to TAUBnCNTm and the counter awaits the next valid TAUBTTINm input edge.

31.12.5 One-Pulse Output Function

31.12.5.1 Overview

Summary

This function generates an interrupt (INTTAUBnIm) when a valid TAUBTTINm input edge is detected and subsequently, in a specific interval. TAUBTTINm input signal pulses that occur within the defined interval are ignored.

Prerequisites

- The operation mode must be set to pulse one-count mode. (See **Table 31.72, Contents of the TAUBnCMORm Register for One-Pulse Output Function**).
- Trigger detection must be disabled during counting (TAUBnCMORm.TAUBnMD0 = 0).

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input edge is detected. The value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from the TAUBnCDRm value, and an interrupt is generated.

When the counter reaches 0001_H an interrupt is generated. The counter stops at 0000_H and awaits the next effective TAUBTTINm input edge.

When the counter is counting down, further TAUBTTINm input signals are ignored, i.e. the counter does not reset.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

31.12.5.2 Equations

Interval between TAUBTTINm and INTTAUBnIm = count clock cycle × TAUBnCDRm

(3) Channel output mode

This function does not use channel output mode.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the One-Pulse Output Function.
Therefore, these registers must be set to 0.

Table 31.74 Simultaneous Rewrite Settings for One-Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

31.12.5.5 Operating Procedure for One-Pulse Output Function

Table 31.75 Operating Procedure for One-Pulse Output Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.72, Contents of the TAUBnCMORm Register for One-Pulse Output Function** and **Table 31.73, Contents of the TAUBnCMURm Register for One-Pulse Output Function** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value.
During operation	The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at all times.	INTTAUBnIm is generated when TAUBnCNTm starts. TAUBnCNTm counts down. When the counter reaches 0001_H, INTTAUBnIm is generated. TAUBnCNTm stops counting and waits for a trigger. If a trigger occurs while TAUBnCNTm is counting, the trigger is ignored. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

31.12.6 TAUBTTINm Input Pulse Interval Measurement Function

31.12.6.1 Overview

Summary

This function captures the count value and uses this value and the overflow bit TAUBnCSRm.TAUBnOVF to measure the interval of the TAUBTTINm input signal.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter TAUBnCNTm starts counting up from 0000_H. When a valid TAUBTTINm edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter resets to 0000_H and subsequently continues operation.

If the counter reaches $FFFF_H$ before a valid TAUBTTINm edge is detected, it overflows to 0000_H. The counter is reset to 0000_H and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

Table 31.76 Effects of an Overflow

TAUBnCMORm. TAUBnCOS[1:0]	When Overflow Occurs		When a Valid TAUBTTINm Input is then Detected	
	TAUBnCDRm	TAUBnCSRm. TAUBnOVF	TAUBnCDRm, TAUBnCNTm	TAUBnCSRm. TAUBnOVF
00	Unchanged	0	TAUBnCNTm loaded to TAUBnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUBnCNTm set to 0, TAUBnCDRm unchanged	Unchanged
11		1		

If TAUBnCMORm.TAUBnCOS[0] is 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the interval of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

The function can be stopped by setting TAUBnTT.TAUBnTTm = 1, which in turn sets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm stops but retains its value. While the function is stopped, TAUBTTINm input valid edge detection and TAUBnCNTm capture are not performed.

The counter is reset to 0000_H and subsequently continues operation.

Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the interrupt at start or restart is not generated.

NOTE

When TAUBnCMORm.TAUBnCOS[1:0] = 10_B or 11_B, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

31.12.6.2 Equations

TAUBTTINm input pulse interval = count clock cycle ×

[(TAUBnCSRm.TAUBnOVF × ($FFFF_H$ + 1)) + TAUBnCDRm capture value + 1]

31.12.6.3 Block Diagram and General Timing Diagram

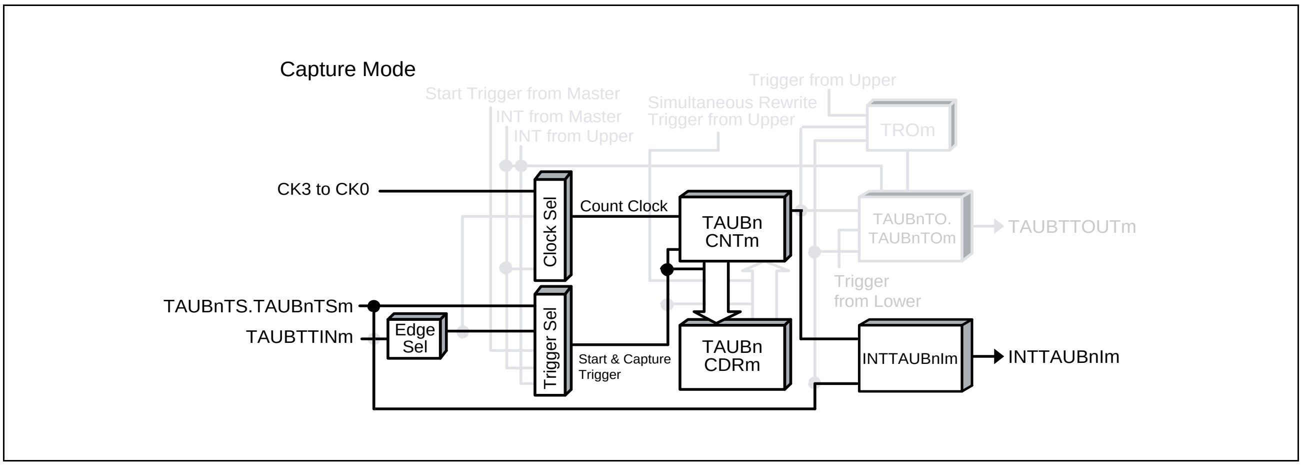

Figure 31.48 Block Diagram for TAUBTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)
- When a valid TAUBTTINm input is detected after an overflow TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] = 00_B)

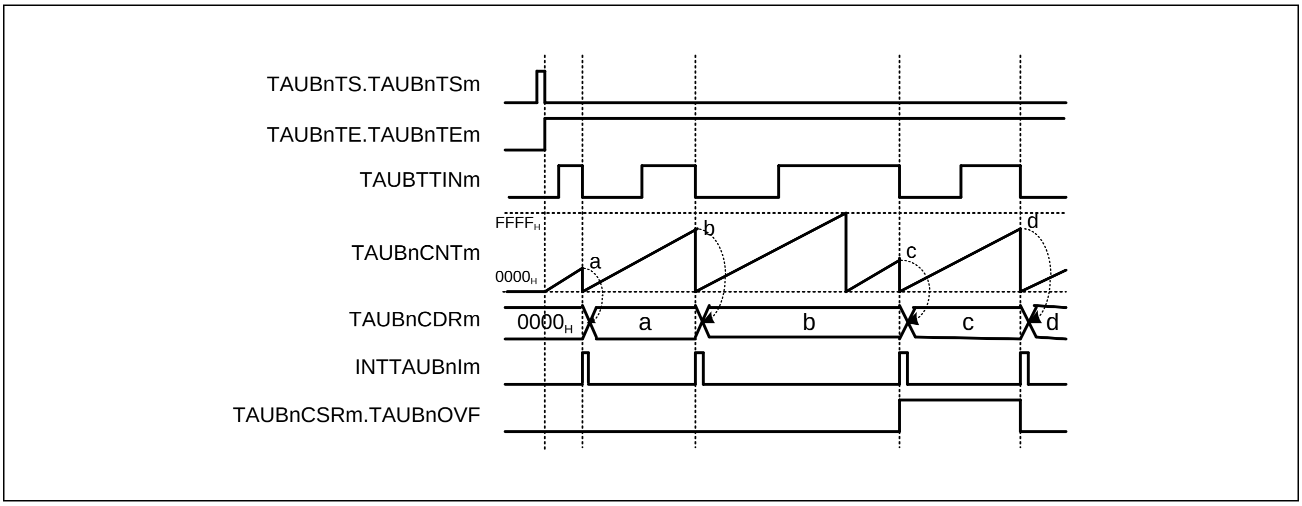

Figure 31.49 General Timing Diagram for TAUBTTINm Input Pulse Interval Measurement Function

1, 0	TAUBnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

(3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Pulse Interval Measurement Function. Therefore, these registers must be set to 0.

Table 31.79 Simultaneous Rewrite Settings for TAUBTTINm Input Pulse Interval Measurement Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

31.12.6.5 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

Table 31.80 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.77, Contents of the TAUBnCMORm Register for TAUBTTINm Input Pulse Interval Measurement Function** and **Table 31.78, Contents of the TAUBnCMURm Register for TAUBTTINm Input Pulse Interval Measurement Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm is cleared to 0000_H. INTTAUBnIm is generated when TAUBnCMORm.TAUBnMD0 is set to 1.
During operation	Detection of TAUBTTINm edges. The values of TAUBnCMURm.TAUBnTIS[1:0] bits can be changed at any time. The TAUBnCDRm and TAUBnCSRm registers can be read at any time. The TAUBnCSCm.TAUBnCLOV bit can be set to 1. (The TAUBnCSRm.TAUBnOVF bit can be cleared to 0.)	TAUBnCNTm starts to count up from 0000_H. When a TAUBTTINm valid edge is detected: ● TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and returns to 0000_H ● INTTAUBnIm is then generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values.

Restart operation

31.12.6.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUBnCMORm.TAUBnCOS[1:0] = 00_B

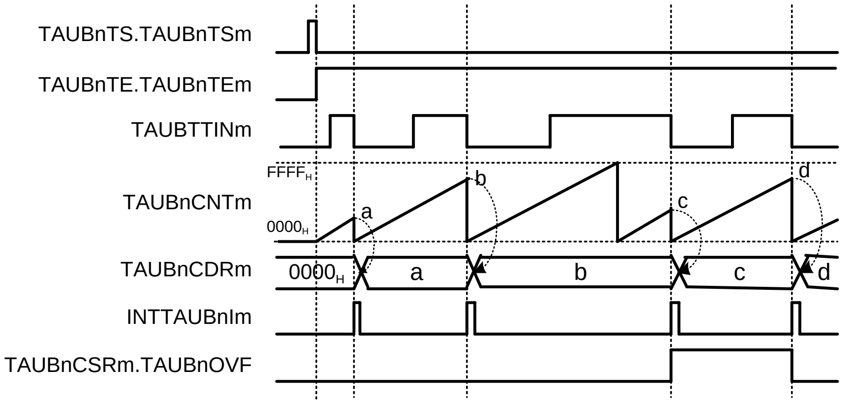

Figure 31.50 TAUBnCMORm.TAUBnCOS[1:0] = 00_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is loaded to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.

(2) TAUBnCMORm.TAUBnCOS[1:0] = 01_B

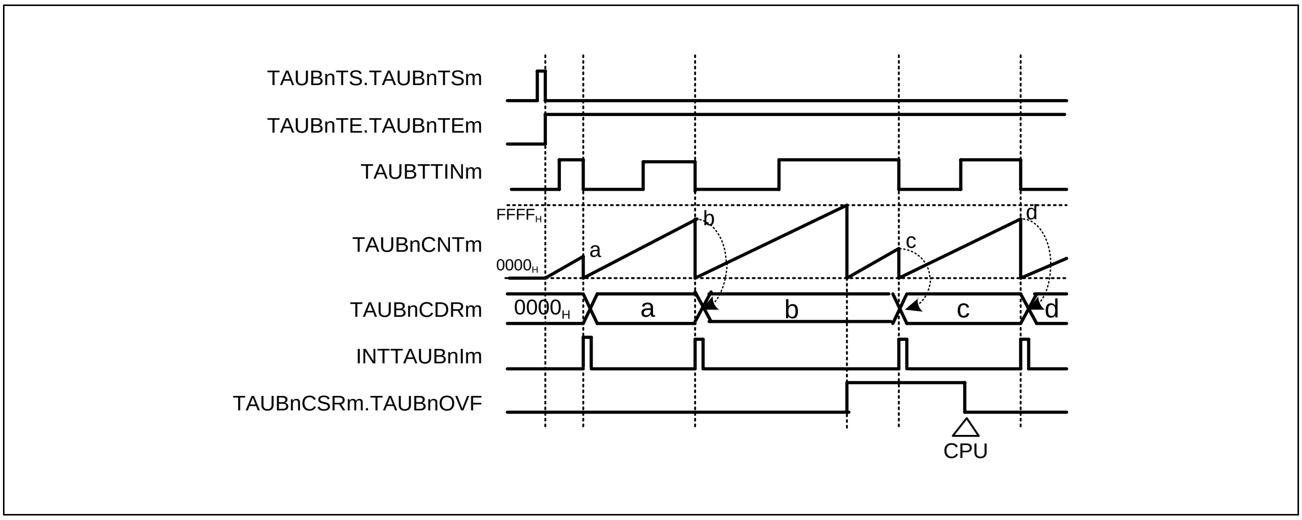

Figure 31.51 TAUBnCMORm.TAUBnCOS[1:0] = 01_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command. (TAUBnCSCm.TAUBnCLOV bit = 1)

(3) TAUBnCMORm.TAUBnCOS[1:0] = 10_B

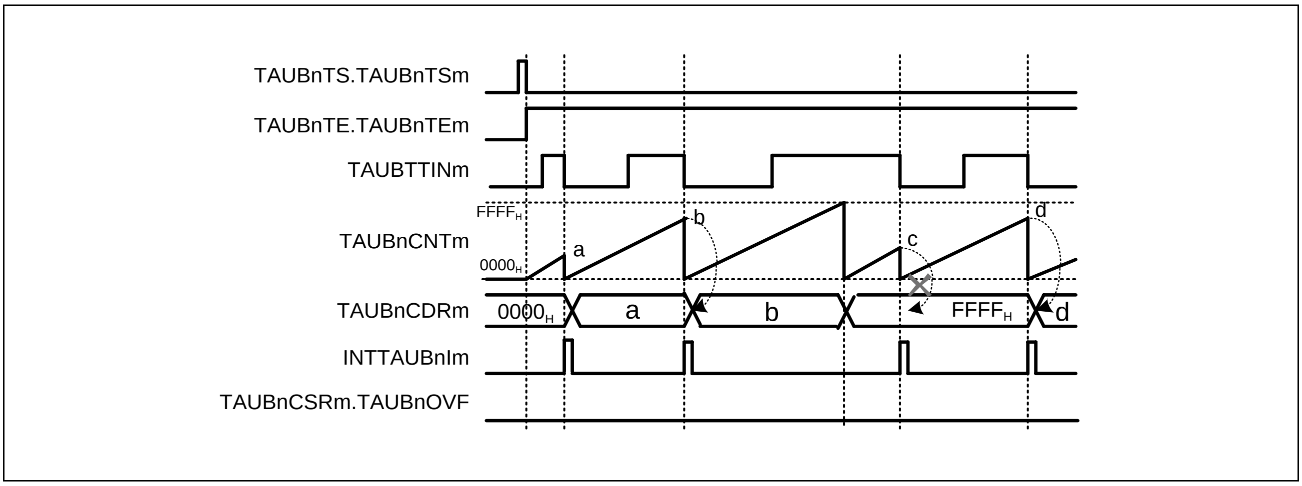

Figure 31.52 TAUBnCMORm.TAUBnCOS[1:0] = 10_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$ and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.

(4) TAUBnCMORm.TAUBnCOS[1:0] = 11_B

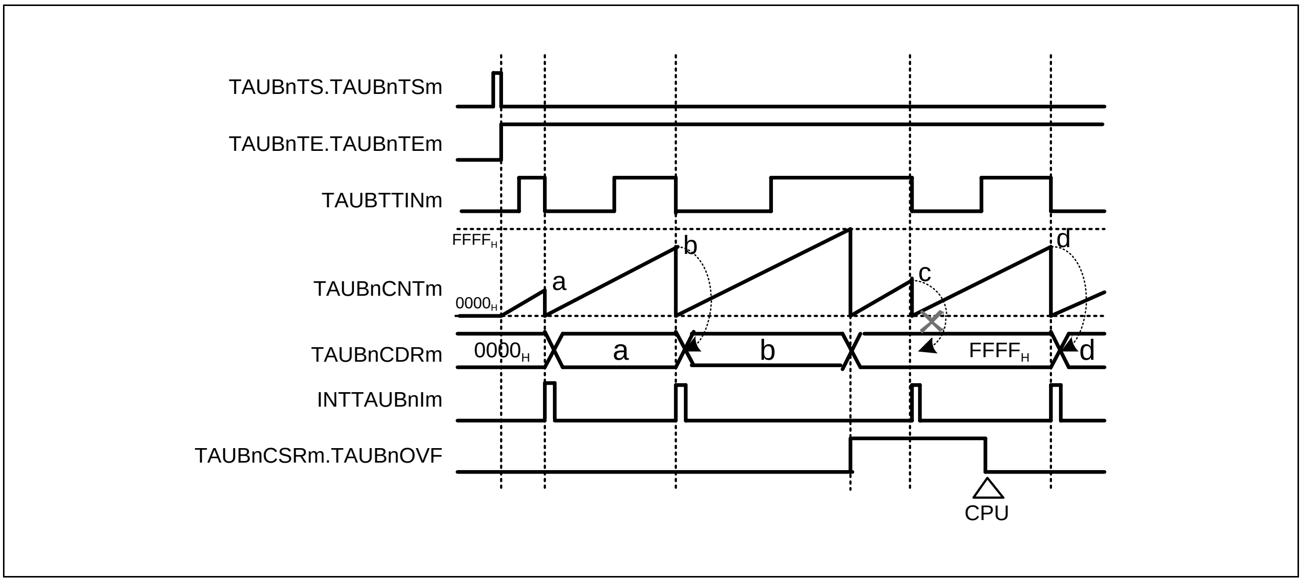

Figure 31.53 TAUBnCMORm.TAUBnCOS[1:0] = 11_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$, and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

(5) When rising and falling edge detection are selected (TAUBnCMORm.TAUBnMD0 = 1)

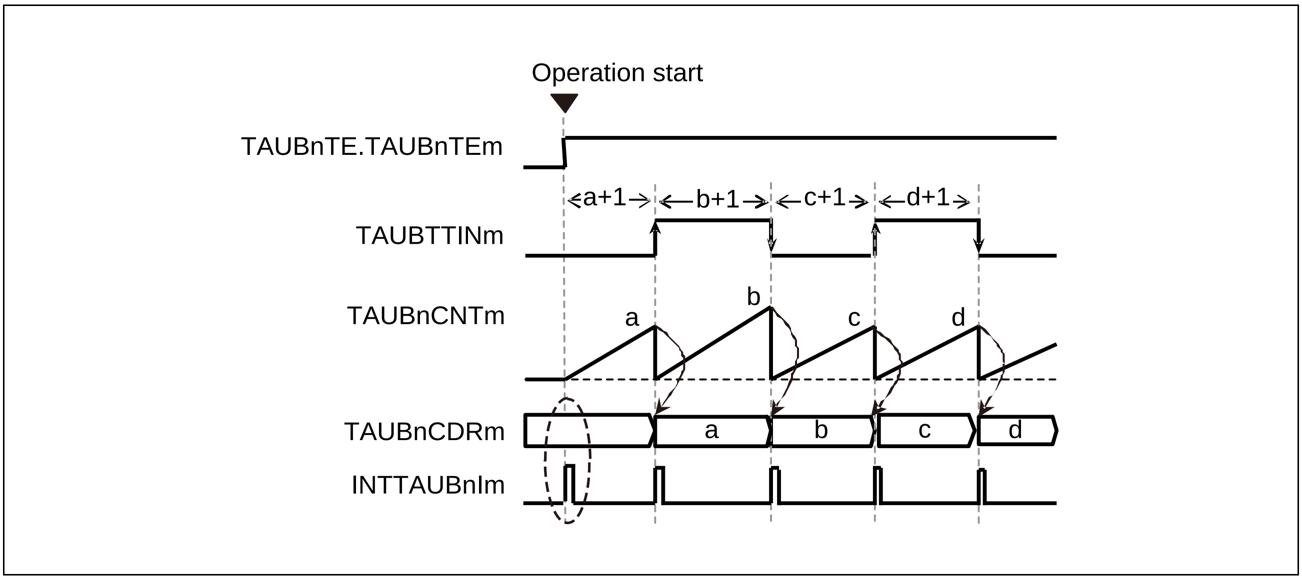

Figure 31.54 TAUBnCMORm.TAUBnMD0 = 1

Setting TAUBnCMURm.TAUBnTIS[1:0] to 10_B (detection of both edges selected) measures the TAUBTTINm rising and falling edge intervals.

(6) Operation stop and operation restart (TAUBnCMORm.TAUBnMD0 = 0)

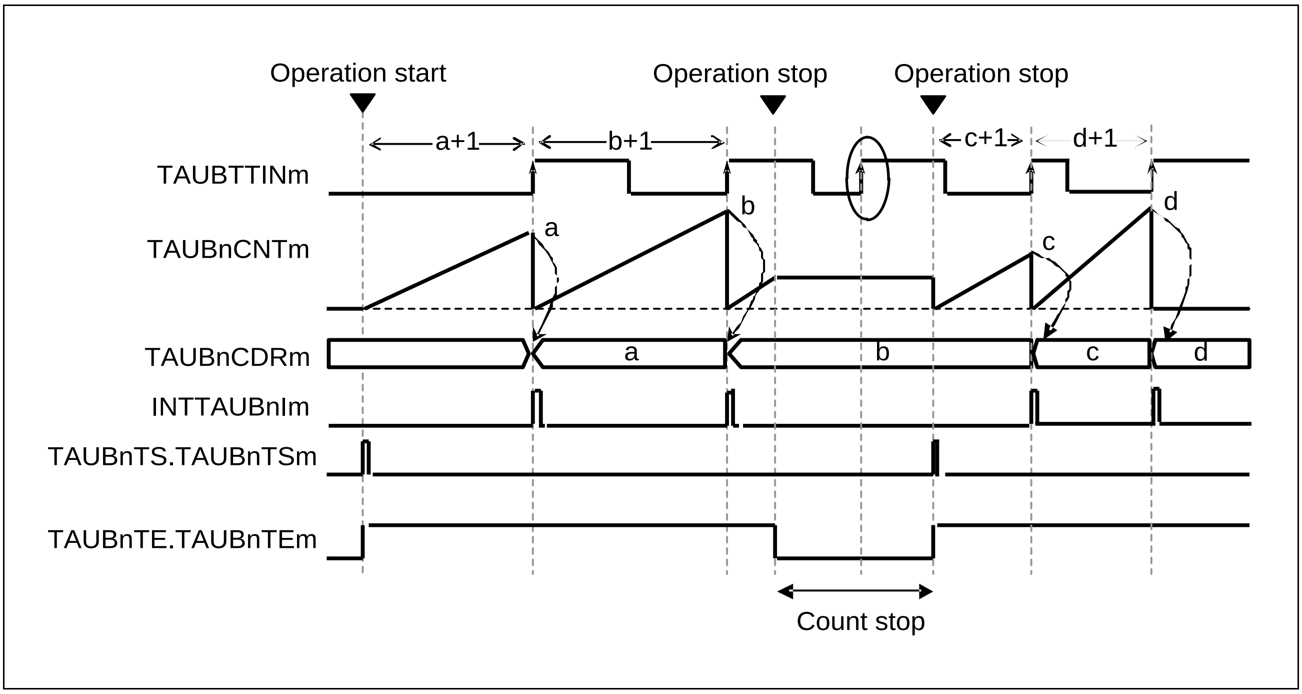

Figure 31.55 Operation Stop and Operation Restart (TAUBnCMORm.TAUBnMD0 = 0)

Setting TAUBnTT.TAUBnTTm to 1 clears TAUBnTE.TAUBnTEm to 0, which stops the count operation. At this time, TAUBnCNTm retains the status and stops.

When TAUBnTE.TAUBnTEm retains 0 (operation stopped), TAUBTTINm input is ignored (edge detection is ignored and capture operation is not performed).

Setting TAUBnTS.TAUBnTSm to 1 clears the counter to 0000_H and restarts count-up operation.

31.12.7 TAUBTTINm Input Signal Width Measurement Function

31.12.7.1 Overview

Summary

This function measures the width of a TAUBTTINm signal by starting counting on one edge of the TAUBTTINm signal and capturing the counter value on the opposite edge.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm start edge is detected, the counter TAUBnCNTm starts counting up from 0000_H. When a valid TAUBTTINm stop edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter retains its value (TAUBnCDRm + 1) and awaits the next valid TAUBTTINm input start edge.

If the counter reaches $FFFF_H$ before a valid TAUBTTINm stop edge is detected, it overflows. The counter is reset to 0000_H and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

Table 31.81 Effects of an Overflow

TAUBnCMORm. TAUBnCOS[1:0]	When Overflow Occurs		When a Valid TAUBTTINm Input Stop Edge is Detected	
	TAUBnCDRm	TAUBnCSRm. TAUBnOVF	TAUBnCDRm, TAUBnCNTm	TAUBnCSRm. TAUBnOVF
00	Unchanged	0	TAUBnCNTm written to TAUBnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUBnCNTm stops counting TAUBnCDRm unchanged	Unchanged
11		1		

If TAUBnCMORm.TAUBnCOS[0] = 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the width of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

This function cannot be forcibly restarted.

NOTE

When TAUBnCMORm.TAUBnCOS[1] = 1, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

31.12.7.2 Equations

TAUBTTINm input signal width = count clock cycle ×

[(TAUBnCSRm.OVF × (FFFF$_H$ + 1)) + TAUBnCDRm capture value + 1]

31.12.7.3 Block Diagram and General Timing Diagram

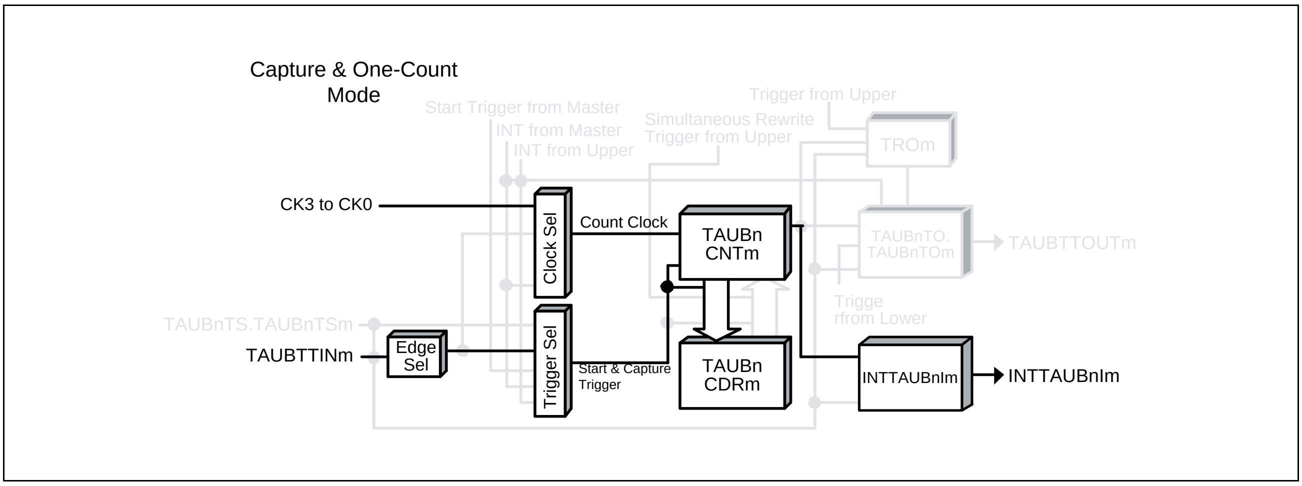

Figure 31.56 Block Diagram for TAUBTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11$_B$)
- When a valid TAUBTTINm input is detected after an overflow, TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] = 00$_B$)

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	10: Rising and falling edge detection (low width measurement) 11: Rising and falling edge detection (high width measurement)

(3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Signal Width Measurement Function. Therefore, these registers must be set to 0.

Table 31.84 Simultaneous Rewrite Settings for TAUBTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

31.12.7.5 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

Table 31.85 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

		Operation	Status of TAUBn
	Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.82, Contents of the TAUBnCMORm Register for TAUBTTINm Input Signal Width Measurement Function** and **Table 31.83, Contents of the TAUBnCMURm Register for TAUBTTINm Input Signal Width Measurement Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Restart operation	Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When a TAUBTTINm start edge is detected, TAUBnCNTm start edge to count up.
	During operation	The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time. TAUBnCSCm.TAUBnCLOV bit can be set to 1.	TAUBnCNTm starts to count up from 0000_H. When a TAUBTTINm valid edge is detected: ● TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and retains its value ● INTTAUBnIm is then generated. ● The count stops at the value transferred to TAUBnCDRm + 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. Afterwards, this procedure is repeated.
	Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TEm is cleared to 0 and the counter stops. TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values.

31.12.7.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUBnCMORm.TAUBnCOS[1:0] = 00_B

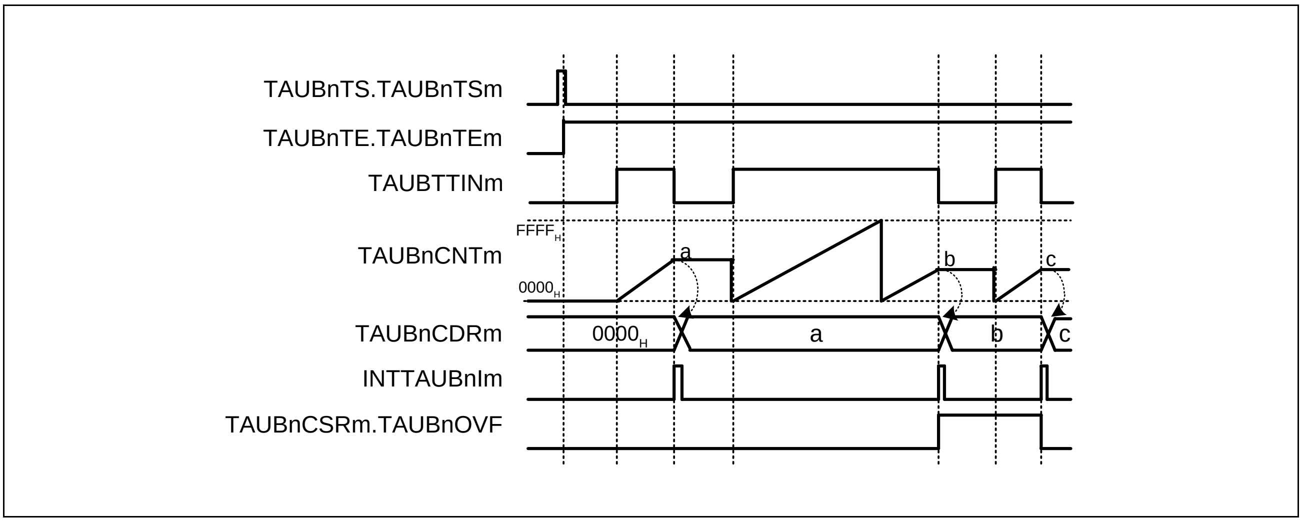

Figure 31.58 TAUBnCMORm.TAUBnCOS[1:0] = 00_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.

(2) TAUBnCMORm.TAUBnCOS[1:0] = 01_B

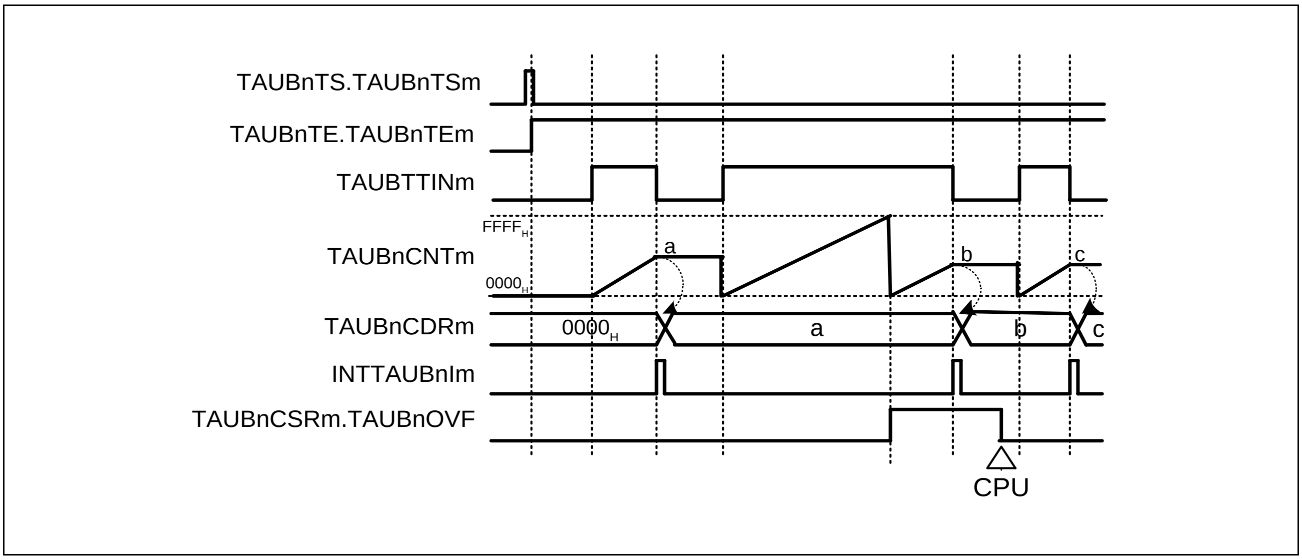

Figure 31.59 TAUBnCMORm.TAUBnCOS[1:0] = 01_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command (The TAUBnCSCm.TAUBnCLOV bit = 1).

(3) TAUBnCMORm.TAUBnCOS[1:0] = 10_B

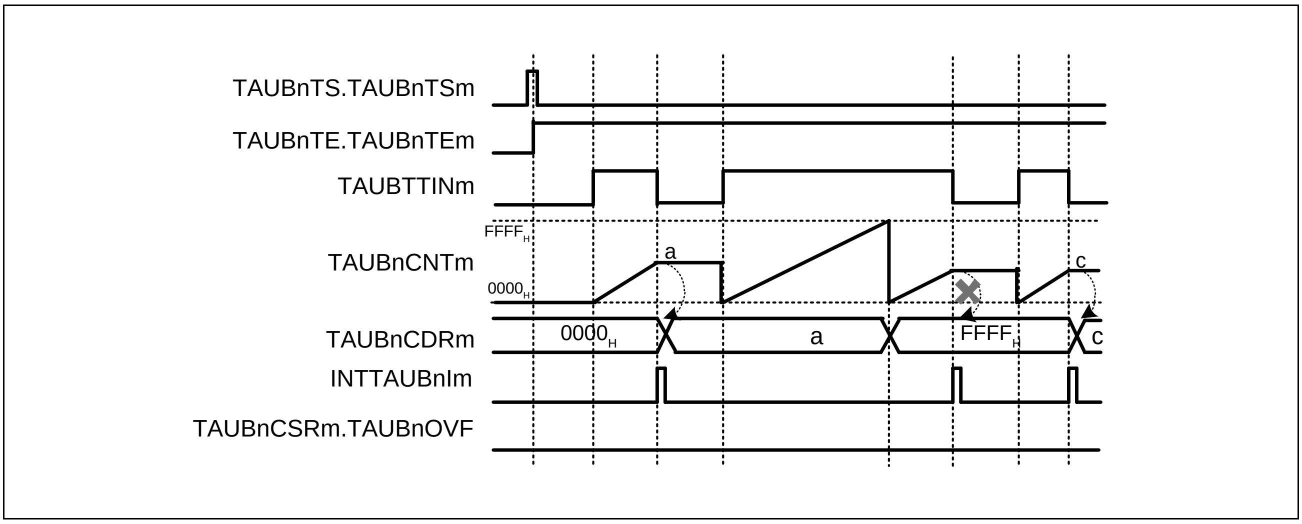

Figure 31.60 TAUBnCMORm.TAUBnCOS[1:0] = 10_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$ and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.

(4) TAUBnCMORm.TAUBnCOS[1:0] = 11_B

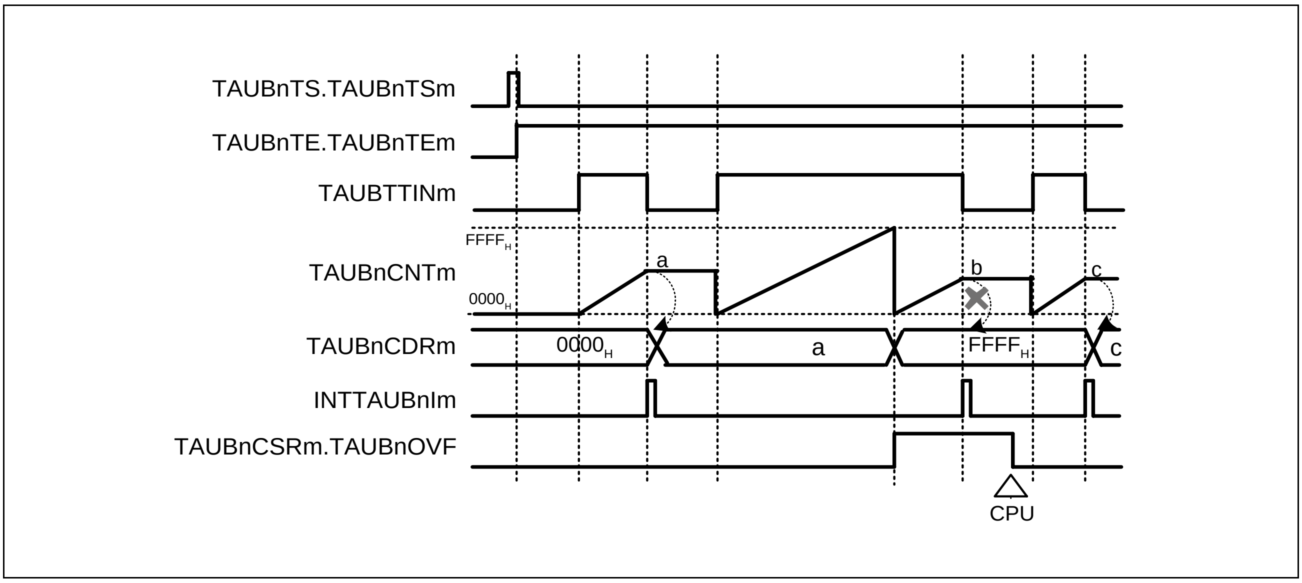

Figure 31.61 TAUBnCMORm.TAUBnCOS[1:0] = 11_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$, and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

(5) When an overflow occurs (high width measurement)

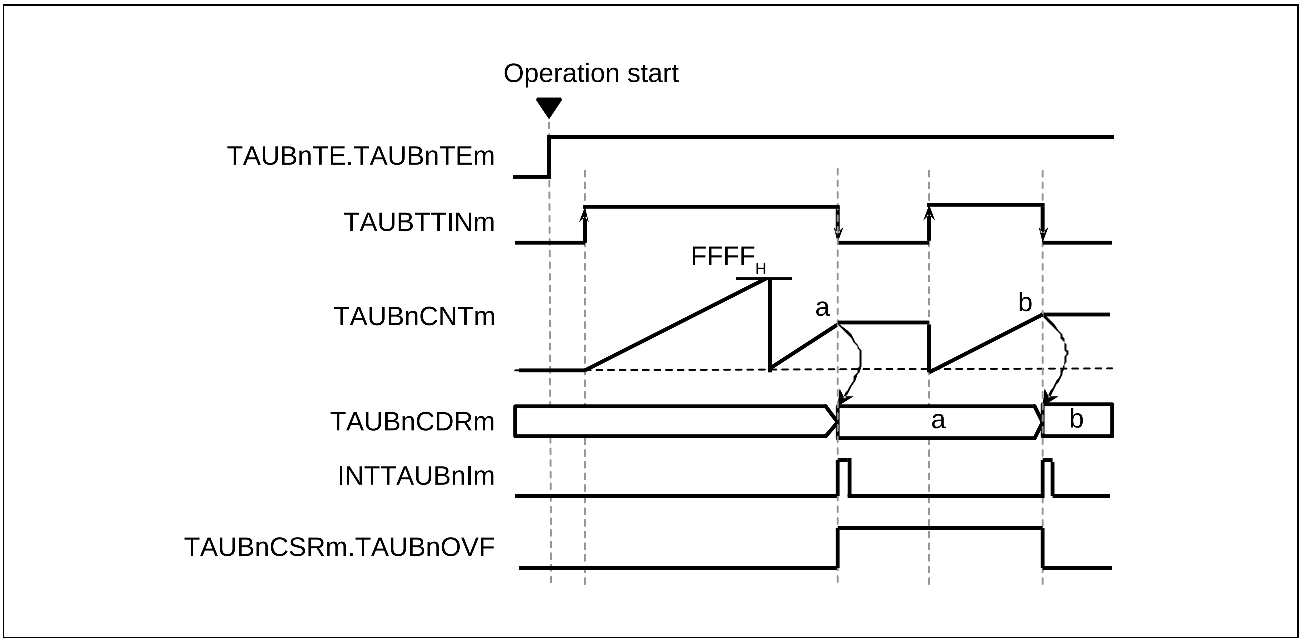

Figure 31.62 When an Overflow Occurs

When a capture trigger is input after the counter value has overflowed, the counter value is transferred to TAUBnCDRm and at the same time TAUBnCSRm.TAUBnOVF is set to 1.

TAUBnCSRm.TAUBnOVF is kept at 1 until the next capture trigger occurs.

If the next capture trigger is not accompanied by an overflow, TAUBnCSRm.TAUBnOVF is cleared to 0.

TAUBTTINm input signal width (example when TAUBnCSRm.TAUBnOVF is 1 and TAUBnCDRm is a)
= count clock cycle × ((10000_H × TAUBnCSRm.TAUBnOVF) + (TAUBnCDRm capture value + 1))
= count clock cycle × ((10000_H × 1) + (a+1))
= count clock cycle × (10000_H + a+1)

31.12.8 TAUBTTINm Input Position Detection Function

31.12.8.1 Overview

Summary

This function measures the interval of input signals by capturing the counter value on a valid edge of the TAUBTTINm signal.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter starts to count from 0000_H. When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The count operation continues.

When the counter reaches $FFFF_H$, the counter restarts from 0000_H.

NOTE

The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits.

Conditions

If the TAUBnCMORm.MD0 bit is set to 0, the first interrupt after a start or restart is not generated.

31.12.8.2 Equations

Function duration at a TAUBTTINm input pulse =

count clock cycle × (TAUBnCDRm capture value + 1)

31.12.8.3 Block Diagram and General Timing Diagram

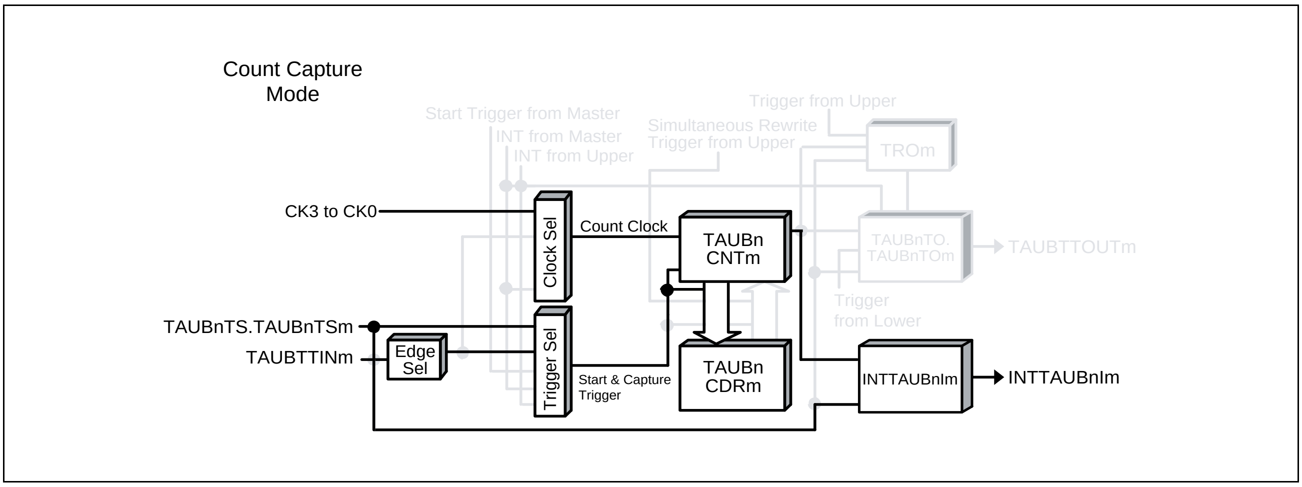

Figure 31.63 Block Diagram for TAUBTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

31.12.8.5 Operating Procedure for TAUBTTINm Input Position Detection Function

Table 31.89 Operating Procedure for TAUBTTINm Input Position Detection Function

Restart operation

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.86, Contents of the TAUBnCMORm Register for TAUBTTINm Input Position Detection Function** and **Table 31.87, Contents of the TAUBnCMURm Register for TAUBTTINm Input Position Detection Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. INTTAUBnIm is generated when TAUBnCMORm.TAUBnMD0 is set to 1.
During operation	The values of TAUBnCMURm.TAUBnTIS[1:0] bits can be changed at any time. The TAUBnCDRm and TAUBnCSRm registers can be read at any time.	TAUBnCNTm starts to count up from 0000_H. When a TAUBTTINm valid edge is detected: ● TAUBnCNTm transfers (captures) its value to TAUBnCDRm ● INTTAUBnIm is output. ● The counter value is not cleared to 0000_H and TAUBnCNTm continues count operation. Afterwards, this procedure is repeated. If TAUBnCNTm reaches $FFFF_H$, the counter restarts from 0000_H.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

31.12.8.6 Specific Timing Diagrams

(1) Operation stop and restart

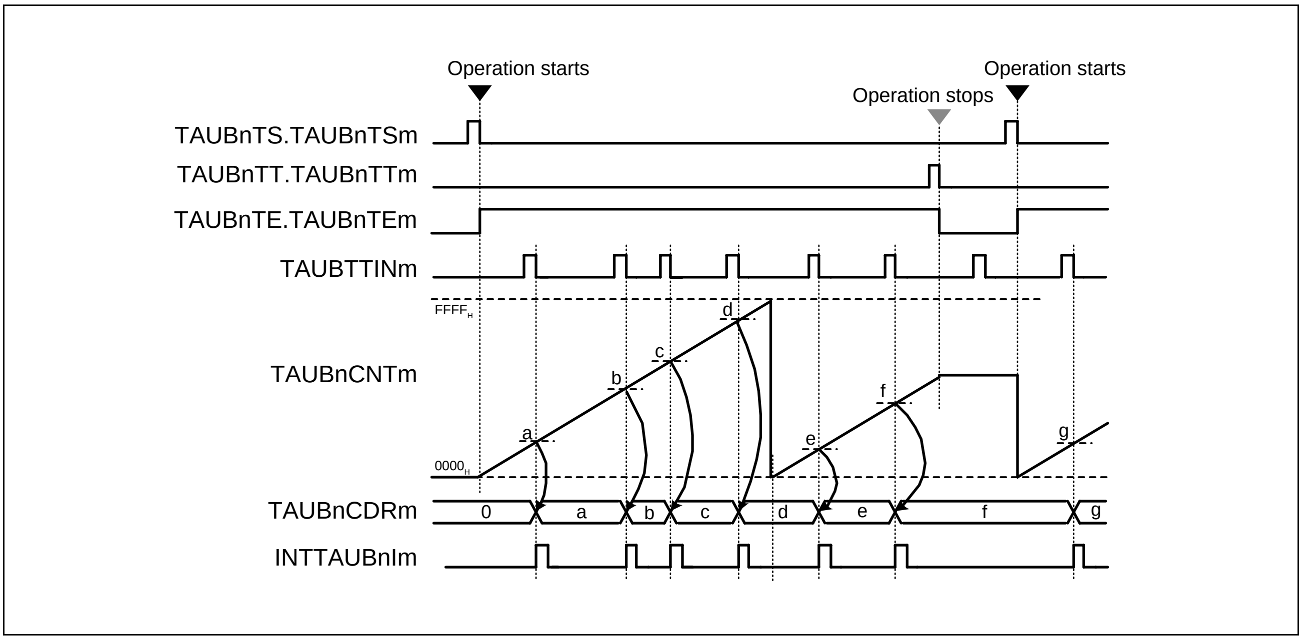

Figure 31.65 Operation Stop and Restart (TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TEm to 0.
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from 0000_H.

31.12.9 TAUBTTINm Input Period Count Detection Function

31.12.9.1 Overview

Summary

This function measures the cumulative width of a TAUBTTINm input signal.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter awaits a valid TAUBTTINm input edge.

When a valid TAUBTTINm input start edge is detected, the counter starts to count from 0000_H.

When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The counter stops and retains its value (TAUBnCDRm + 1) until the next valid TAUBTTINm input start edge is detected.

When a next valid TAUBTTINm input start edge is detected, the counter restarts from the value retained while stopping.

If the counter reaches $FFFF_H$, the counter restarts from 0000_H.

NOTES

1. The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits.
2. As this function is to measure the TAUBTTINm input signal width, setting TAUBnTS.TAUBnTSm to 1 is disabled while TAUBnTE.TAUBnTEm = 1.

Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11_B, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

31.12.9.2 Equations

Cumulative TAUBTTINm input width =

count clock cycle × (TAUBnCDRm capture value + 1)

31.12.9.3 Block Diagram and General Timing Diagram

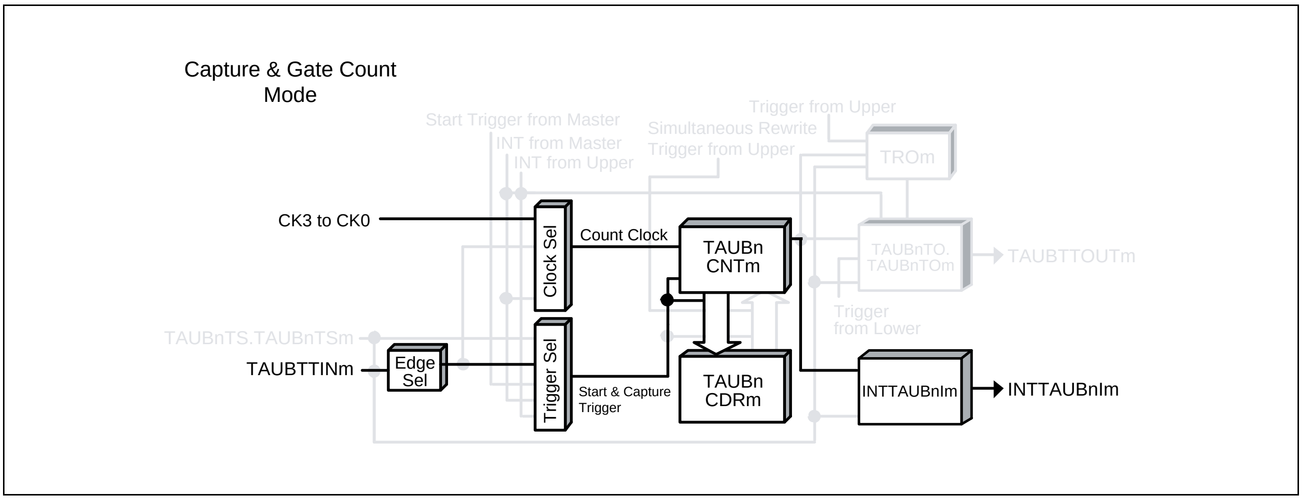

Figure 31.66 Block Diagram for TAUBTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

31.12.9.5 Operating Procedure for TAUBTTINm Input Period Count Detection Function

Table 31.93 Operating Procedure for TAUBTTINm Input Period Count Detection Function

Restart operation

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.90, Contents of the TAUBnCMORm Register for TAUBTTINm Input Period Count Detection Function** and **Table 31.91, Contents of the TAUBnCMURm Register for the TAUBTTINm Input Period Count Detection Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.
During operation	Detection of TAUBTTINm edges. The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time.	When a TAUBTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUBnCNTm starts to count up from the stop value. When TAUBnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUBnCDRm and INTTAUBnIm is generated. Counting stops at the “value transferred to TAUBnCDRm + 1” value and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When TAUBnCNTm reaches FFFF_{H}, the counter restarts from 0000_{H}. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

31.12.9.6 Specific Timing Diagrams

31.12.9.7 Operation stop and restart

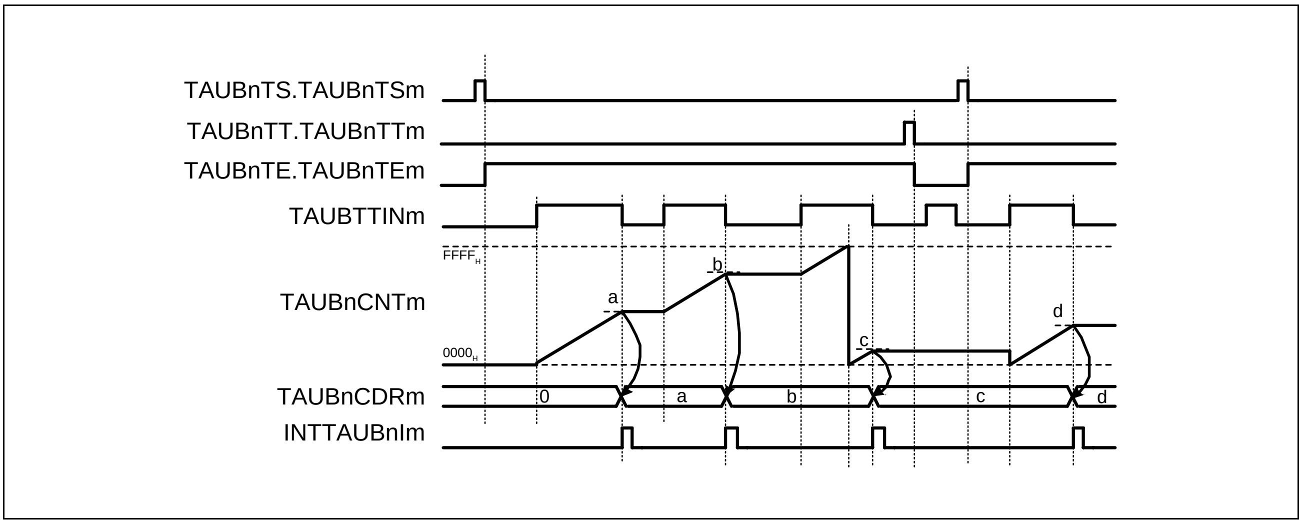

Figure 31.68 Operation Stop and Restart (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from 0000_H.

31.12.10 TAUBTTINm Input Pulse Interval Judgment Function

31.12.10.1 Overview

Summary

This function outputs the result of a comparison between the count value (TAUBnCNTm) and the value in the channel data register (TAUBnCDRm) when a TAUBTTINm input pulse occurs. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid edge is detected or TAUBnTS.TAUBnTSm is set to 1, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. TAUBnCNTm reloads the value of TAUBnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches 0000_H before a TAUBTTINm valid edge is detected, TAUBnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

Conditions

The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:

- If TAUBnCMORm.TAUBnMD0 = 0, INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm.
- If TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated when TAUBnCNTm > TAUBnCDRm.

(3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Pulse Interval Judgment Function. Therefore, these registers must be set to 0.

Table 31.96 Simultaneous Rewrite Settings for TAUBTTINm Input Pulse Interval Judgment Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), sets these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

31.12.10.4 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function

Table 31.97 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.94, Contents of the TAUBnCMORm Register for TAUBTTINm Input Pulse Interval Judgment Function** and **Table 31.95, Contents of the TAUBnCMURm Register for TAUBTTINm Input Pulse Interval Judgment Function** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value.
During operation	The following register can be changed at any time: TAUBnCDRm register	When TAUBnCMORm.TAUBnMD0 = 0 If TAUBnCNTm ≤ TAUBnCDRm when a TAUBTTINm input edge is detected, INTTAUBnIm is generated. When TAUBnCMORm.TAUBnMD0 = 1 If TAUBnCNTm > TAUBnCDRm when a TAUBTTINm input edge is detected, INTTAUBnIm is generated. If a TAUBTTINm input edge is detected, then TAUBnCNTm starts to count down from the value of TAUBnCDRm. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

31.12.11 TAUBTTINm Input Signal Width Judgment Function

31.12.11.1 Overview

Summary

This function compares the count value (TAUBnCNTm) for the high or low level width of a TAUBTTINm input signal and the TAUBnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUBnIm.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm input start edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid stop edge is detected, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. The counter TAUBnCNTm retains its value until the next TAUBTTINm valid start edge is detected, regardless of the result of the comparison.

If the counter reaches 0000_H before a valid TAUBTTINm stop edge is detected, TAUBnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

Conditions

- The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:
  - If TAUBnCMORm.TAUBnMD0 = 0, INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm.
  - If TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated when TAUBnCNTm > TAUBnCDRm.
- The TAUBnCMURm.TAUBnTIS[1:0] bits specify the type of width measurement:
  - For high width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = 11_B) the start edge is a rising TAUBTTINm edge and the stop edge is a falling TAUBTTINm edge.
  - For low width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = 10_B) the start edge is a falling TAUBTTINm edge and the stop edge is a rising TAUBTTINm edge.
- Setting TAUBnTS.TAUBnTSm to 1 is prohibited during operation.

31.12.11.2 Block Diagram and General Timing Diagram

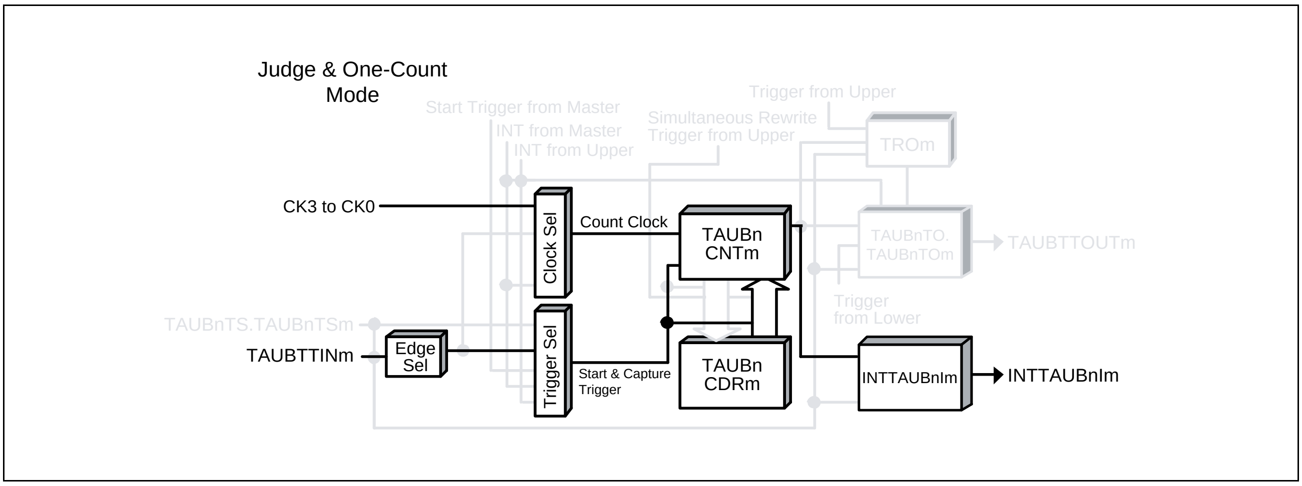

Figure 31.71 Block Diagram for TAUBTTINm Input Signal Width Judgment Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm (TAUBnCMORm.TAUBnMD0 = 0)
- TAUBTTINm valid start edge = rising edge, TAUBTTINm valid stop edge = falling edge (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

31.12.11.4 Operating Procedure for TAUBTTINm Input Signal Width Judgment Function

Table 31.101 Operating Procedure for TAUBTTINm Input Signal Width Judgment Function

		Operation	Status of TAUBn
	Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.98, Contents of the TAUBnCMORm Register for TAUBTTINm Input Signal Width Judgment Function** and **Table 31.99, Contents of the TAUBnCMURm Register for TAUBTTINm Input Signal Width Judgment Function** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Restart operation	Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.
	During operation	The following register can be changed at any time: ● TAUBnCDRm register	If a TAUBTTINm start edge is detected, then TAUBnCNTm starts to count down from the value of TAUBnCDRm. When TAUBnCMORm.TAUBnMD0 = 0 If TAUBnCNTm ≤ TAUBnCDRm when a TAUBTTINm input stop edge is detected, INTTAUBnIm is generated. When TAUBnCMORm.TAUBnMD0 = 1 If TAUBnCNTm > TAUBnCDRm when a TAUBTTINm input stop edge is detected, INTTAUBnIm is generated. Afterwards, this procedure is repeated.
	Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

31.12.12 Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

31.12.12.1 Overview

Summary

This function measures the width of an individual TAUBTTINm input signal. An interrupt is generated if the TAUBTTINm input width is longer than $FFFF_H + 1$.

Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to $FFFF_H$.

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. $FFFF_H$ is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUBTTINm input start edge is detected, TAUBnCNTm loads $FFFF_H$ and starts to count down.

If the counter reaches 0000_H before a stop edge is detected, an interrupt is generated.

Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11_B, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

31.12.12.2 Block Diagram and General Timing Diagram

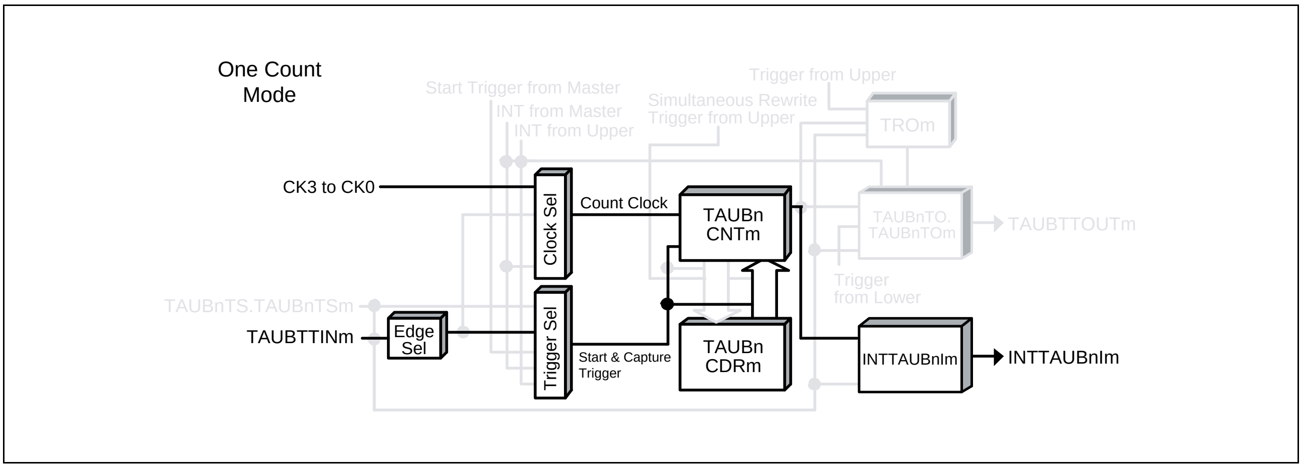

Figure 31.73 Block Diagram for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

Table 31.105 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

		Operation	Status of TAUBn
	Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.102, Contents of the TAUBnCMORm Register for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)** and **Table 31.103, Contents of the TAUBnCMURm Register for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)** Set the value of the TAUBnCDRm register to FFFF$_H$.	Channel operation is stopped.
Restart operation	Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the start edge. When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value (FFFF$_H$).
	During operation	The TAUBnCNTm register can be read at any time.	TAUBnCNTm counts down. When the counter reaches 0000$_H$: INTTAUBnIm is generated When a TAUBTTINm input stop edge is detected during count operation: TAUBnCNTm stops and retains its current value. When a TAUBTTINm input start edge is detected while the counter is stopped: The TAUBnCDRm value (FFFF$_H$) is loaded to TAUBnCNTm again and the counter starts to count down. Afterwards, this procedure is repeated.
	Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

31.12.13 Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

31.12.13.1 Overview

Summary

This function measures the cumulative width of a TAUBTTINm input signal. An interrupt is generated and an overflow interrupt can be output if the cumulative TAUBTTINm input width is longer than $FFFF_H$.

Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to $FFFF_H$

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. $FFFF_H$ is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUBTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000_H an interrupt is generated. $FFFF_H$ is written to TAUBnCNTm and the counter continues to count down until a TAUBTTINm input stop edge is detected.

Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, the TAUBTTINm input low width is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11_B, the TAUBTTINm input high width is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

31.12.13.2 Block Diagram and General Timing Diagram

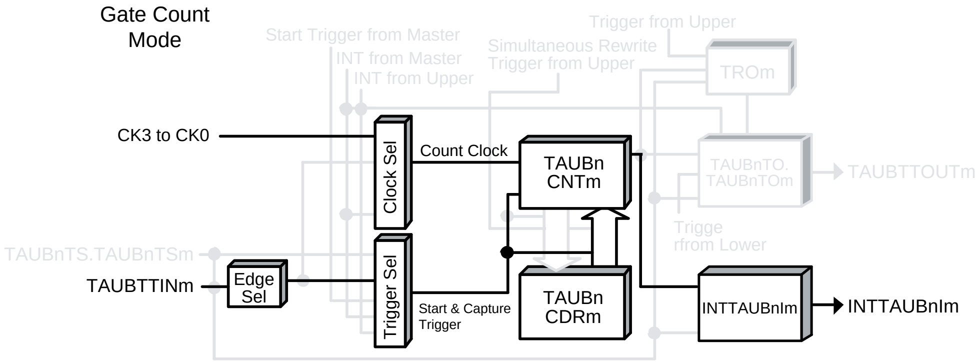

Figure 31.75 Block Diagram for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

31.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

Table 31.109 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

Restart operation

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 31.106, Contents of the TAUBnCMORm Register for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)** and **Table 31.107, Contents of the TAUBnCMURm Register for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)** Set the value of the TAUBnCDRm register to FFFF_H.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1 TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1. TAUBnCNTm waits for detection of the start edge. When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value (FFFF_H).
During operation	The TAUBnCNTm register can be read at all times.	TAUBnCNTm counts down. When the counter reaches 0000_H: INTTAUBnIm is generated TAUBnCNTm reloads the TAUBnCDRm value (FFFF_H) and continues count operation When a TAUBTTINm input stop edge is detected during count operation: TAUBnCNTm stops and retains its current value. When a TAUBTTINm input start edge is detected while the counter is stopped: TAUBnCNTm starts to count down from the stop value. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

31.13 Independent Channel Simultaneous Rewrite Functions

The following describes functions that carry out simultaneous rewrite:

31.13.1 Simultaneous Rewrite Trigger Generation Function Type 1

31.13.1.1 Overview

Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals. The upper channel is for generating the simultaneous rewrite trigger (TAUBnRDC.TAUBnRDCm = 1), and the lower channels are for conducting simultaneous rewrite when triggered from the upper channel (TAUBnRDC.TAUBnRDCm = 0).

Prerequisites

- Two (or more) channels that are lower than the channel used as the upper channel, each with simultaneous rewrite enabled (TAUBnRDE.TAUBnRDEm = 1)
- The operation mode of the upper channel must be set to interval timer mode, see **Table 31.110, Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1.**
- For the operation modes that can be set to the lower channels, see **Table 31.53, Channel Functions and the Methods They Use for Simultaneous Rewrite.**
- In this function, TAUBTTOUTm is not used for all the channels.

Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) of the upper and lower channel(s) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of the data register buffer of the upper channel (TAUBnCDRm buf) is written to the counter (TAUBnCNTm) and the counter starts to count down from this value.
The counter(s) of the lower channel(s) start to count as specified by their selected operating modes.

When a counter reaches 0000_H, an interrupt is generated from the channel.
The corresponding TAUBnCNTm then reloads the current TAUBnCDRm buffer value and subsequently continues operation.

If the channel where the interrupt occurs is specified as the trigger channel for simultaneous rewrite (TAUBnRDC.TAUBnRDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUBnRSF.TAUBnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

Condition

- The channel which is monitored for INTTAUBnIm is specified by setting TAUBnRDC.TAUBnRDCm = 1 for the corresponding channel. The TAUBnRDC.TAUBnRDCm bit must be 0 for all other channels in which simultaneous rewrite should take place.

31.13.1.2 Equations

Simultaneous rewrite trigger generation cycle = count clock cycle × (TAUBnCDRm + 1)

To control simultaneous rewrite, the following condition must be satisfied:

[For PWM]

TAUBnCDRm = [(value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1) × number of interrupts] – 1

[For triangle PWM]

TAUBnCDRm = [(value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1) × 2 × number of interrupts] – 1

That is, the ratio of TAUBnCDRm + 1 and value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

Note that the cycle for the triangle PWM is twice the cycle for the PWM

31.13.1.3 Block Diagram and General Timing Diagram

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the upper channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function. However, it can be used in independent channel output mode controlled by software.

(4) Simultaneous rewrite for the upper channel

Table 31.112 Simultaneous Rewrite Settings for the Upper Channel in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	1: Selects an upper channel as the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The signal that controls simultaneous rewrite is loaded when the master channel starts counting
TAUBnRDC.TAUBnRDCm	1: Channel is monitored for an INTTAUBnIm signal that is used as the simultaneous rewrite trigger

31.13.1.5 Register Settings for the Lower Channel(s)

(1) TAUBnCMORm for the lower channel(s)

For the TAUBnCMORm register of the lower channels, follow the TAUBnCMORm register settings for the operation mode that can be set. (See **Table 31.53, Channel Functions and the Methods They Use for Simultaneous Rewrite**)

(2) TAUBnCMURm for the lower channel(s)

For the TAUBnCMURm register of the lower channels, follow the TAUBnCMURm register settings for the operation mode that can be set. (See **Table 31.53, Channel Functions and the Methods They Use for Simultaneous Rewrite**)

(3) Channel output mode for the lower channel(s)

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see **Table 31.53, Channel Functions and the Methods They Use for Simultaneous Rewrite**.

(4) Simultaneous rewrite for the lower channel(s)

Table 31.113 Simultaneous Rewrite Settings for the Lower Channel in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	1: Selects an upper channel as the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The signal that controls simultaneous rewrite is loaded when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

31.13.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Table 31.114 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Restart operation

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers for the upper channel as described in **Table 31.110, Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1** and **Table 31.111, Contents of the TAUBnCMURm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1** Set the TAUBnCMORm and TAUBnCMURm registers for the lower channel as described in **Section 31.13.1.5, Register Settings for the Lower Channel(s)** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated.
During operation	TAUBnRDT.TAUBnRDTm, TAUBnCDRm.TAUBnCDR can be changed. TAUBnRSF.TAUBnRSFm can be read at all times.	TAUBnCNTm counts down. When the counter reaches 0000_H: TAUBnCNTm reloads the TAUBnCDRm value and continues count operation INTTAUBnIm is generated Simultaneous rewrite is controlled when INTTAUBnIm is generated from the channel where TAUBnRDC.TAUBnRDCm is set to 1. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

31.14 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the Timer Array Unit B. For a general overview of synchronous channel operation, see Overview.

31.14.1 PWM Output Function

31.14.1.1 Overview

Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the pulse width (duration) of the TAUBTTOUTm to be set. The pulse cycle is set in the master channel. The pulse width is set in the slave channel.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 31.115, Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function**.
- The operation mode of the slave channel(s) must be set to one-count mode, see **Table 31.118, Contents of the TAUBnCMORm Register for the Slave Channel of the PWM Output Function**.
- TAUBTTOUTm is not used for the master channel of this function.
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 1.

Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave) toggles, which realizes a PWM output.

- Master channel:

When the counter of the master channel reaches 0000_H, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter loads the TAUBnCDRm value and counts down.

- Slave channel:

INTTAUBnIm generated on the master channel triggers the counter of the slave channel(s). The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value. The TAUBTTOUTm signal is set to the active level.

When the counter reaches 0000_H, i.e. duty time has elapsed, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset to the inactive level. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

Conditions

Set Simultaneous rewrite with this function. Please see **Section 31.6, Simultaneous Rewrite**.

31.14.1.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUBnCDRm (slave) / (TAUBnCDRm (master) + 1)) × 100

- Duty cycle = 0%
  TAUBnCDRm (slave) = 0000_H
- Duty cycle = 100%
  TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

31.14.1.3 Block Diagram and General Timing Diagram

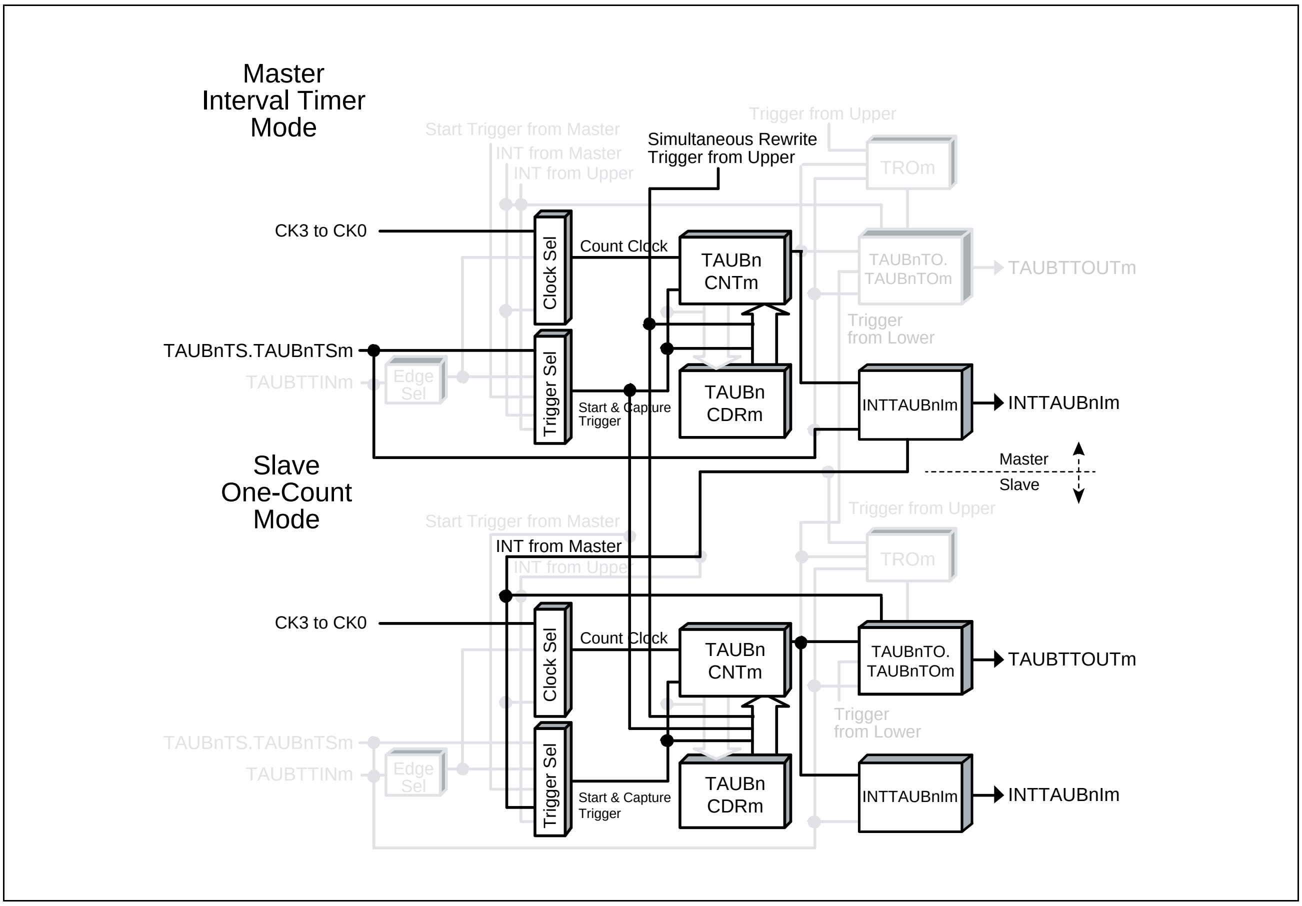

Figure 31.79 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

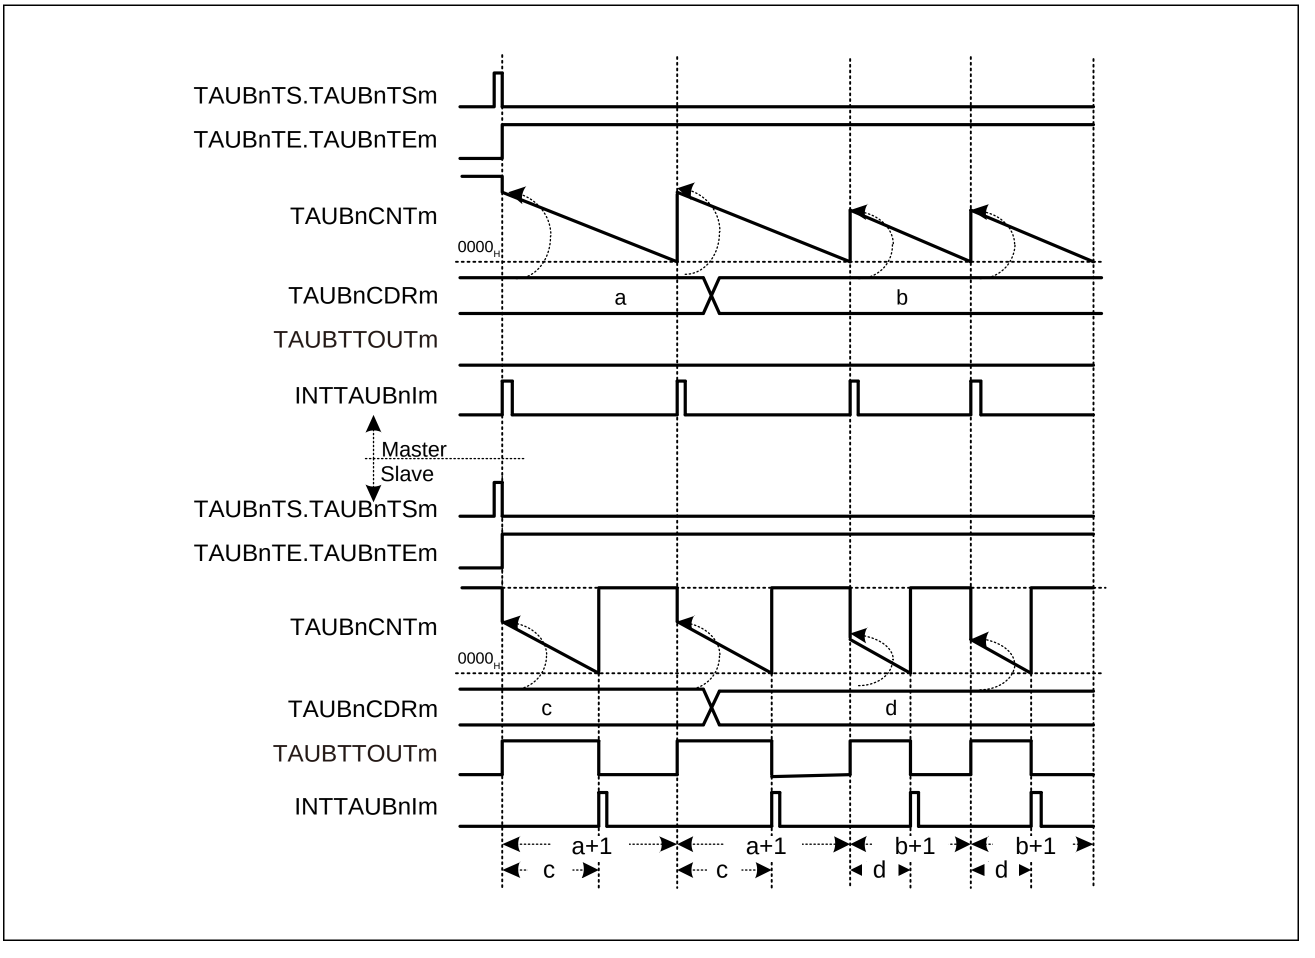

Figure 31.80 General Timing Diagram for PWM Output Function

NOTE

- The interval between the start of the count and an interrupt being generated is the value of corresponding TAUBnCDRm + 1.
- TAUBTTOUTm of the slave channel will rise with a delay of one count clock after the rising of INTTAUBnIm of the master channel.

31.14.1.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 31.115 Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 1_B.
10 to 8	TAUBnSTS[2:0]	Write 000_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000_B.
0	TAUBnMD0	Write 1_B.

(2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 31.116 Contents of the TAUBnCMURm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the master channel

The channel output mode is not used by this function.

(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.117 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

When used in TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel operating in **Section 31.13.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Configure the operation following the conditions below.

- The channel set to Simultaneous Rewrite Trigger Output Function Type 1: TAUBnRDCm = 1, TAUBnRDSm = 1
  The setting value of TAUBnCDRm to this channel is as follows.
  = ((setting value of TAUBnCDRm of the master channel subject to simultaneous rewrite + 1) × number of interrupts) – 1
- Master channel: TAUBnRDCm = 0, TAUBnRDSm = 1
- Slave channel: TAUBnRDCm = 0, TAUBnRDSm = 1

Although the value of duty exceeds 100% when the setting value of TAUBnCDRm (slave) > the setting value of TAUBnCDRm (master) + 1, the output will be aggregated to 100%.

31.14.1.5 Register Settings for the Slave Channel(s)

(1) TAUBnCMORm for the slave channel(s)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 31.118 Contents of the TAUBnCMORm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 100_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0100_B.
0	TAUBnMD0	Write 1_B.

(2) TAUBnCMURm for the slave channel(s)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 31.119 Contents of the TAUBnCMURm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the slave channel(s)

Table 31.120 Control Bit Settings for Synchronous Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.121 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

31.14.1.6 Operating Procedure for PWM Output Function

Table 31.122 Operating Procedure for PWM Output Function

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.1.4, Register Settings for the Master Channel**. Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.1.5, Register Settings for the Slave Channel(s)**. Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave) is set.
During operation	TAUBnCDRm can be changed at any time. TAUBnTOL.TAUBnTOLm can be changed. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel loads TAUBnCDRm and counts down. When the counter reaches 0000_H: ● INTTAUBnIm (master) is generated ● TAUBnCNTm (master) loads the TAUBnCDRm value and continues count operation ● TAUBnCNTm (slave) loads the TAUBnCDRm value and counts down ● TAUBTTOUTm (slave) is set to the active level When TAUBnCNTm (slave) reaches 0000_H: ● The counter of TAUBnCNTm (slave) stops. ● INTTAUBnIm (slave) is generated ● TAUBTTOUTm (slave) is set to the inactive level
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

31.14.1.7 Specific Timing Diagrams

(1) Duty cycle = 0%

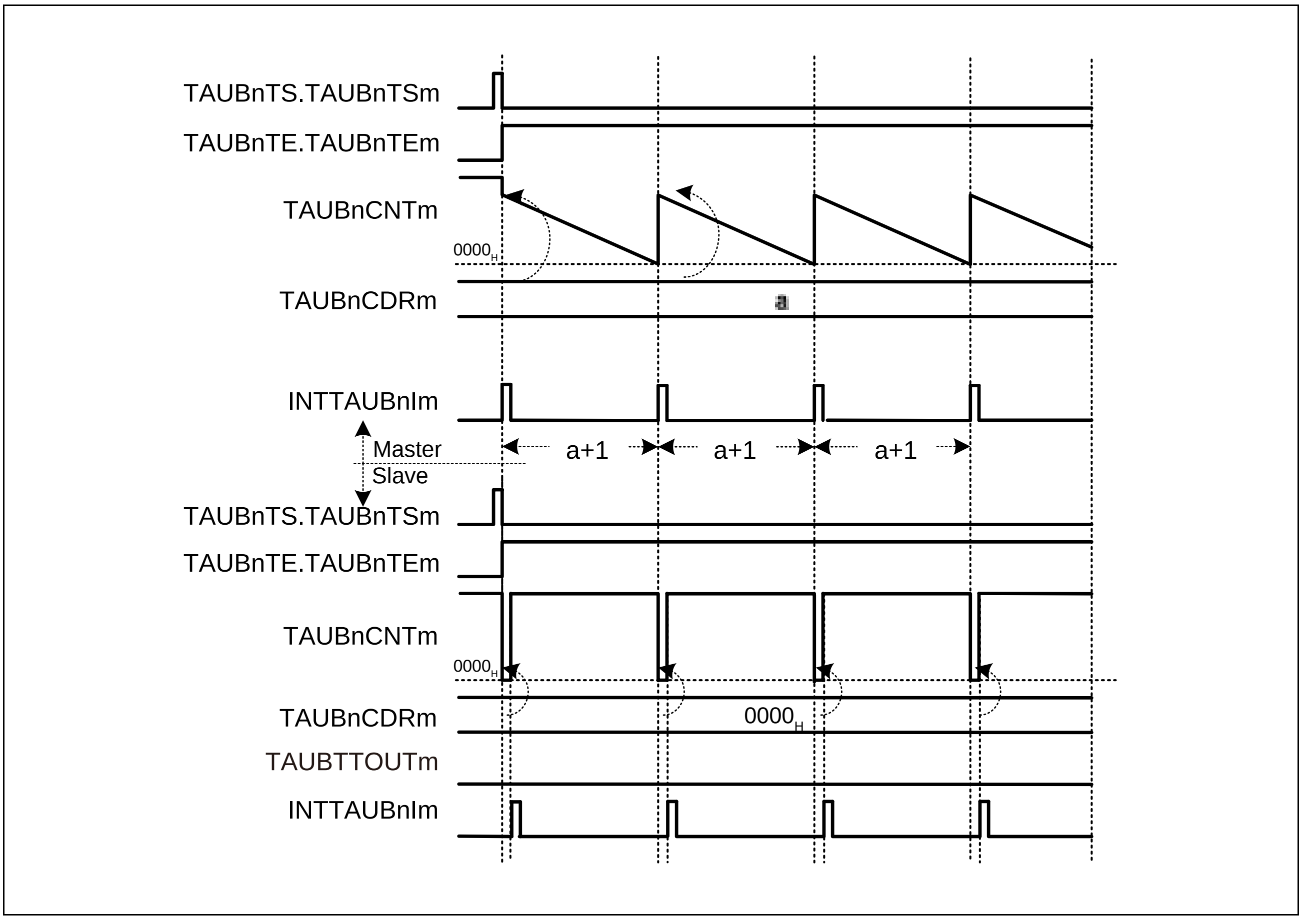

Figure 31.81 TAUBnCDRm (slave) = 0000_H,
Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

- Every time the master channel generates an interrupt (INTTAUBnIm), 0000_H is written to TAUBnCNTm (slave). As a result, a slave channel interrupt (INTTAUBnIm) is generated at the same time and TAUBTTOUTm remains inactive.
- TAUBnCNTm (slave) generates an interrupt every time the value of TAUBnCDRm is loaded.

(2) Duty cycle = 100%

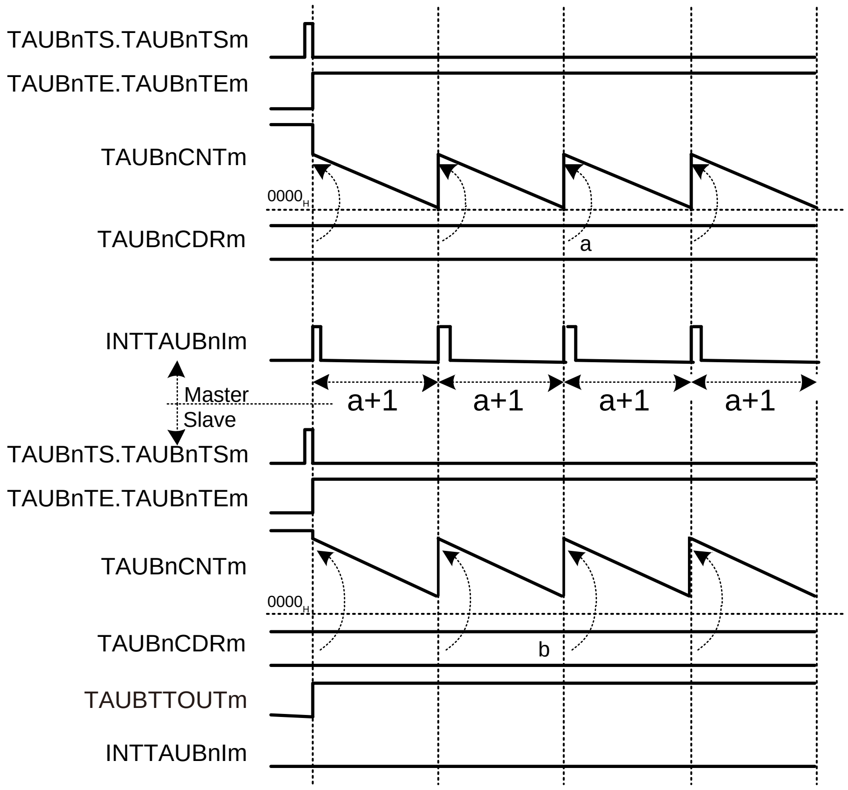

Figure 31.82 TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1,
Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

If the value TAUBnCDRm (slave) is higher than the value TAUBnCDRm (master), the counter of the slave channel cannot reach 0000_H and cannot generate interrupts. The TAUBTTOUTm remains at active state.

(3) Operation stop and restart

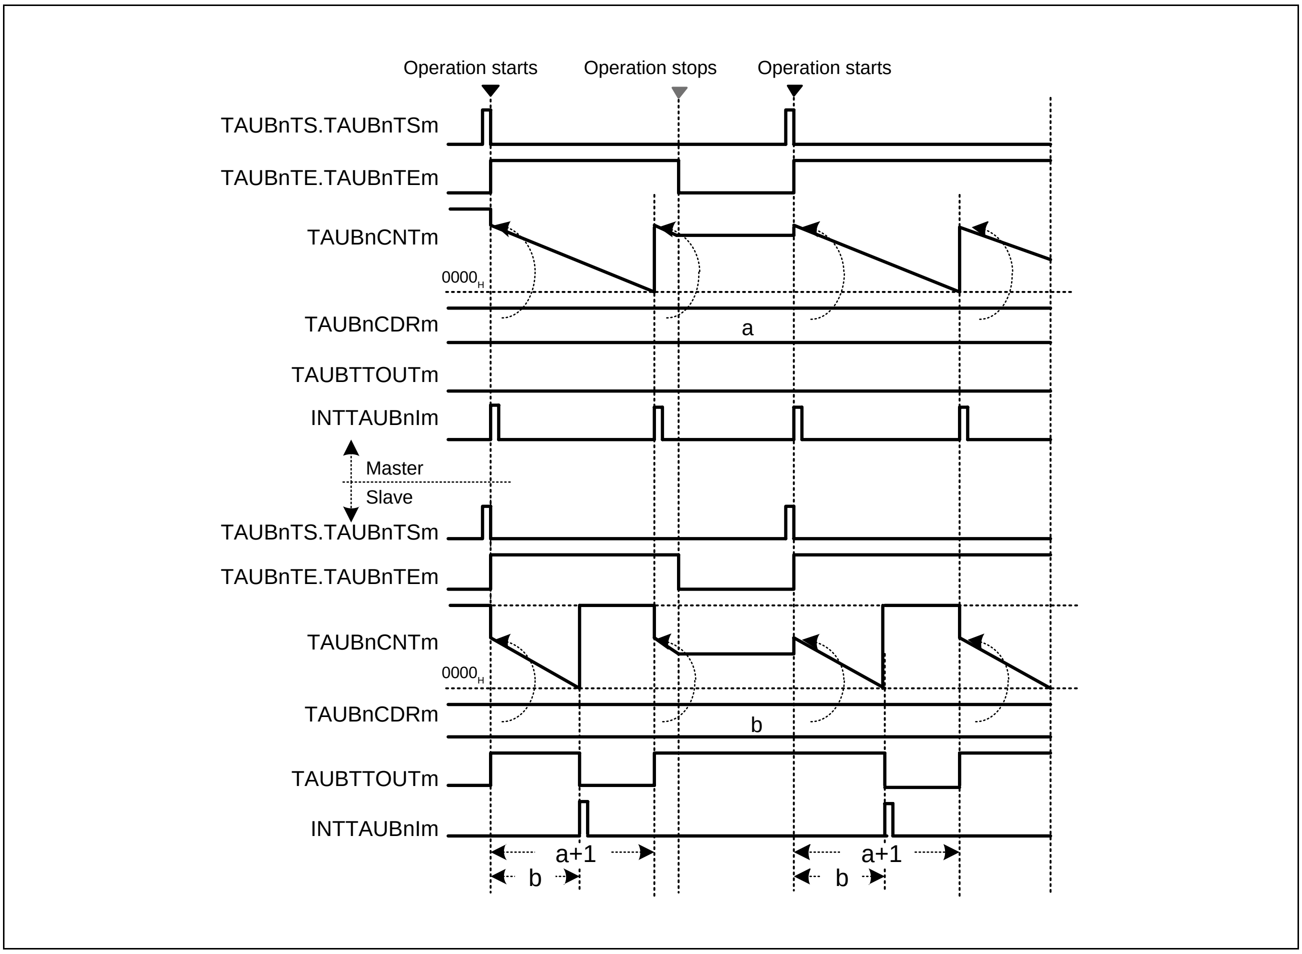

Figure 31.83 Operation Stop and Restart, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm of the master and slave channel(s) to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm and TAUBTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm of master and slave channel(s) to 1. TAUBnCNTm of master and slave channel reload the current values of TAUBnCDRm and start to count down from these values.

(4) Operation stop and restart (Slave output, Initialization)

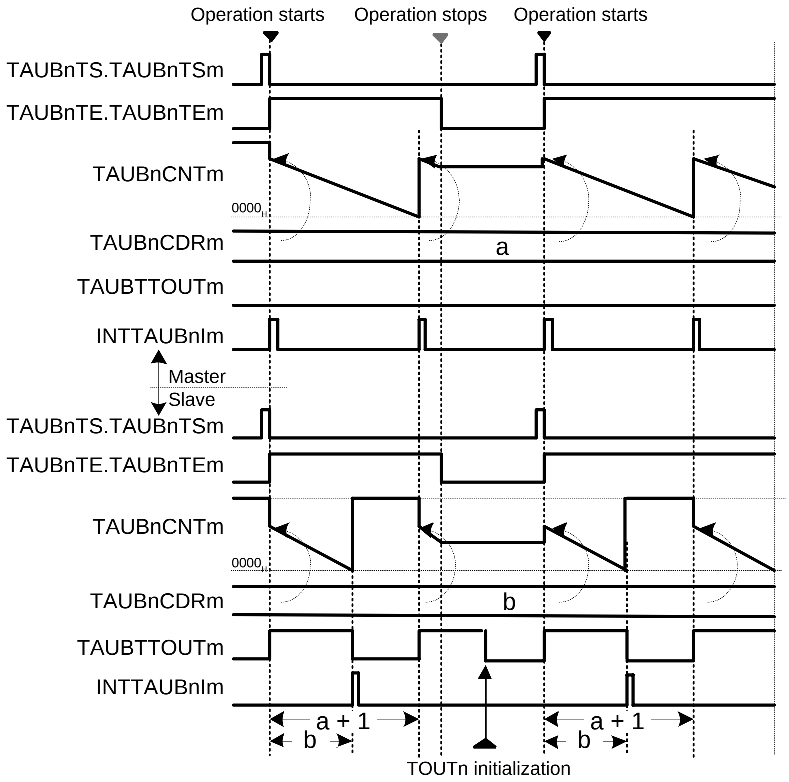

Figure 31.84 Operation Stop and Restart (Slave Output, Initialization)

When TAUBnTOE.TAUBnTOEm of the slave channel is set to 0 while TAUBnTE.TAUBnTEm = 0 and the inactive level of TAUBTTOUTm is written in the TAUBnTO.TAUBnTOm, the output level of TAUBTTOUTm (slave channel) becomes active when INTTAUBnIm is issued when the count operation is started after restart.

31.14.2 One-Shot Pulse Output Function

31.14.2.1 Overview

Summary

This function outputs a signal pulse with a defined pulse width and a specific delay time compared to an external input signal pulse by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to one-count mode, see **Table 31.123, Contents of the TAUBnCMORm Register for the Master Channel of the One-Shot Pulse Output Function**
- The operation mode of the slave channel must be set to pulse one-count mode, see **Table 31.126, Contents of the TAUBnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function**
- TAUBTTOUTm is not used for the master channel of this function
- The channel output mode of the slave channel must be set to independent channel output mode 2.
- TAUBTTINm (master) has to be detected while TAUBnCNTm (master) and TAUBnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUBTTINm (slave).

Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) for master and slave channels to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

- Master channel:
  When the next valid TAUBTTINm input edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm. The counter starts to count down from this value. If TAUBnCMORm.TAUBnMD0 = 0, a trigger (TAUBTTINm) which is detected within the delay time is ignored.
  When the counter of the master channel reaches 0000_H, INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next valid TAUBTTINm input edge.
- Slave channel:
  INTTAUBnIm generated on the master channel triggers the counter of the slave channel. The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value.
  An interrupt is generated and the TAUBTTOUTm signal is set.
  When the counter reaches 0001_H, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter remains at 0000_H and awaits the next INTTAUBnIm of the master channel.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

The counter of the master channel can be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

NOTES

1. If a forced restart of the counter is executed during operation, the width of the output signal does not correspond to the value of TAUBnCDRm (slave).
2. The TAUBTTINm input signal is sampled at the frequency of the operating clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits. As a result, the output cycle of TAUBTTOUTm has an error of ± 1 operation clock cycle.

Conditions

- If TAUBnCMORm.TAUBnMD0 of the master channel is set to 0, during counting detected TAUBTTINm input edges are ignored.
- Simultaneous rewrite can be used with this function. Please see **Section 31.6, Simultaneous Rewrite**.

31.14.2.2 Equations

Delay from trigger input to pulse output

= (TAUBnCDRm (master) + 1) × count clock cycle

Pulse width = (TAUBnCDRm (slave)) × count clock cycle

31.14.2.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 31.123 Contents of the TAUBnCMORm Register for the Master Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_{B}.
11	TAUBnMAS	Write 1_{B}.
10 to 8	TAUBnSTS[2:0]	Write 001_{B}.
7, 6	TAUBnCOS[1:0]	Write 00_{B}.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0100_{B}.
0	TAUBnMD0	0: Disables start trigger detection during counting 1: Enables start trigger detection during counting

(2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 31.124 Contents of the TAUBnCMURm Register for the Master Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

(3) Channel output mode for the master channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.125 Simultaneous Rewrite Settings for the Master Channel of the One-Shot Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

31.14.2.5 Register Settings for the Slave Channel

(1) TAUBnCMORm for the slave channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 31.126 Contents of the TAUBnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channels must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 100_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 1010_B.
0	TAUBnMD0	0: Disables start trigger detection during counting 1: Enables start trigger detection during counting The value of the MD0 bit of the master and slave channels must be identical.

(2) TAUBnCMURm for the slave channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 31.127 Contents of the TAUBnCMURm Register for the Slave Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the slave channel

Table 31.128 Control Bit Settings for Independent Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	1: Enables independent channel output mode
TAUBnTOM.TAUBnTOMm	0: Independent channel output
TAUBnTOC.TAUBnTOCm	1: Operating mode 2
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	0: Disables dead time operation
TAUBnTDL.TAUBnTDLm	0: When dead time operation is disabled (TAUBnTDE.TAUBnTDEm = 0), set these bits to 0

(4) Simultaneous rewrite for the slave channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.129 Simultaneous Rewrite Settings for the Slave Channel of the One-Shot Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

31.14.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 31.130 Operating Procedure for One-Shot Pulse Output Function

		Operation	Status of TAUBn
	Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.2.4, Register Settings for the Master Channel**. Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.2.5, Register Settings for the Slave Channel**. Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Restart operation	Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the master channel awaits a TAUBTTINm input.
	During operation	TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	When a valid TAUBTTINm input edge is detected, TAUBnCNTm of the master channel loads the TAUBnCDRm value and counts down. When the counter reaches 0000_H: ● INTTAUBnIm (master) is generated ● TAUBnCNTm (master) is reset to $FFFF_H$ and waits for the next valid TAUBTTINm input edge. ● TAUBnCNTm (slave) reloads the TAUBnCDRm value and starts to count down ● INTTAUBnIm (slave) is generated ● TAUBTTOUTm (slave) is set to the active level. When TAUBnCNTm (slave) reaches 0001_H: ● The counter of TAUBnCNTm (slave) stops. ● INTTAUBnIm (slave) is generated ● TAUBTTOUTm (slave) is set to an inactive level.
	Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

31.14.2.7 Specific Timing Diagrams

(1) TAUBnCDRm (master) = 0000$_H$

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00$_B$)

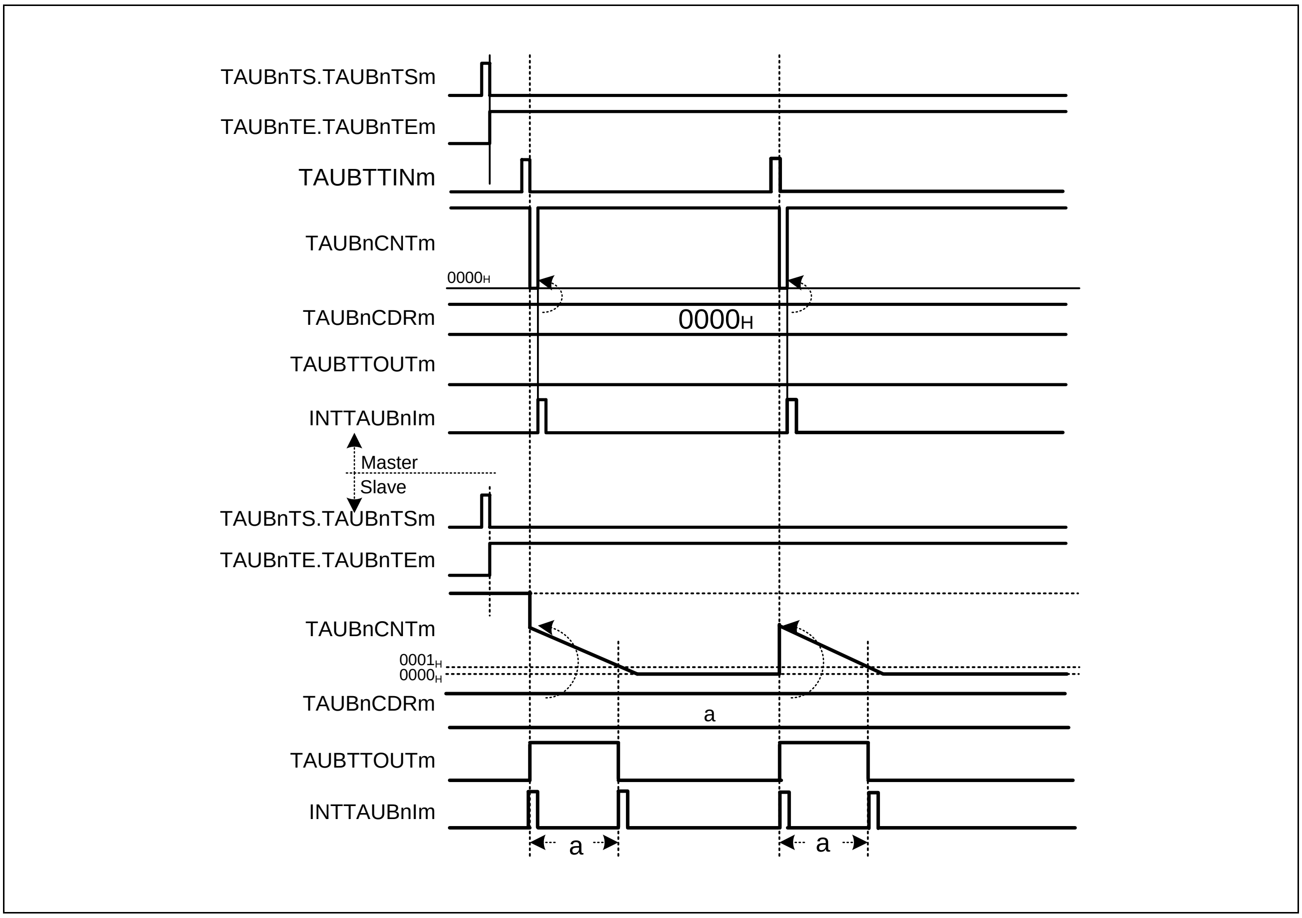

Figure 31.87 TAUBnCDRm (Master) = 0000$_H$

- When a valid TAUBTTINm input edge is detected, the value 0000$_H$ is written to TAUBnCNTm (master). The counter is set to 0000$_H$ for one count and returns to FFFF$_H$.
  Thus, the slave channel starts to count down one count clock later to TAUBTTINm (master).

(2) TAUBnCDRm (slave) = 0000$_H$

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00$_B$)

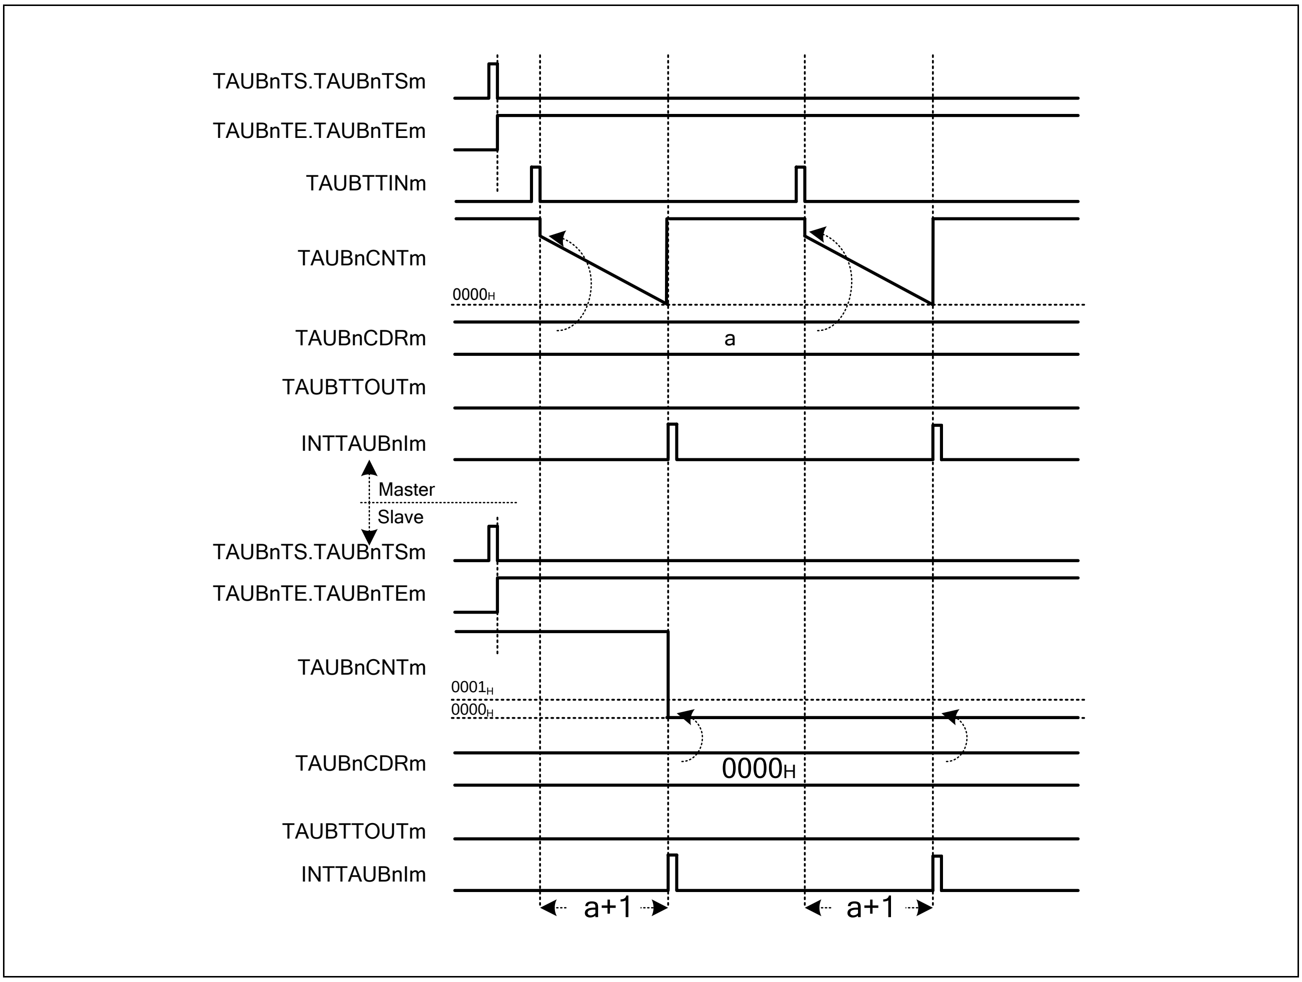

Figure 31.88 TAUBnCDRm (Slave) = 0000$_H$

- TAUBTTOUTm remains at inactive state, because the pulse width is zero.

(3) TAUBnCMORm.TAUBnMD0 = 0

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

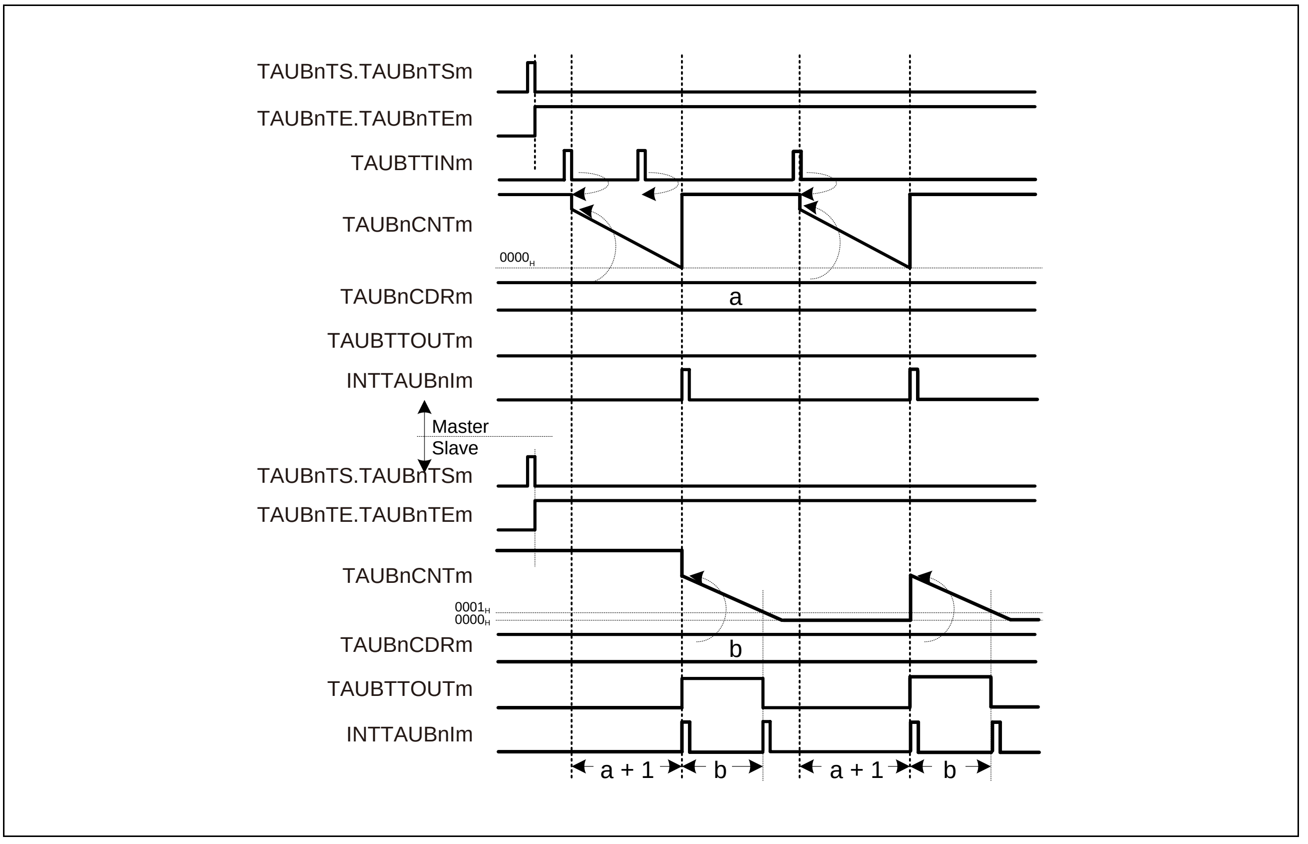

Figure 31.89 TAUBnCMORm.TAUBnMD0 = 0

- Even when an effective edge is input to TAUBTTINm while the counter of the master channel counts down, the counter continues counting down.

(4) TAUBnCMORm.TAUBnMD0 = 1

The following settings apply to this diagram.

- Start trigger detection enabled during counting (TAUBnCMORm.TAUBnMD0 = 1)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

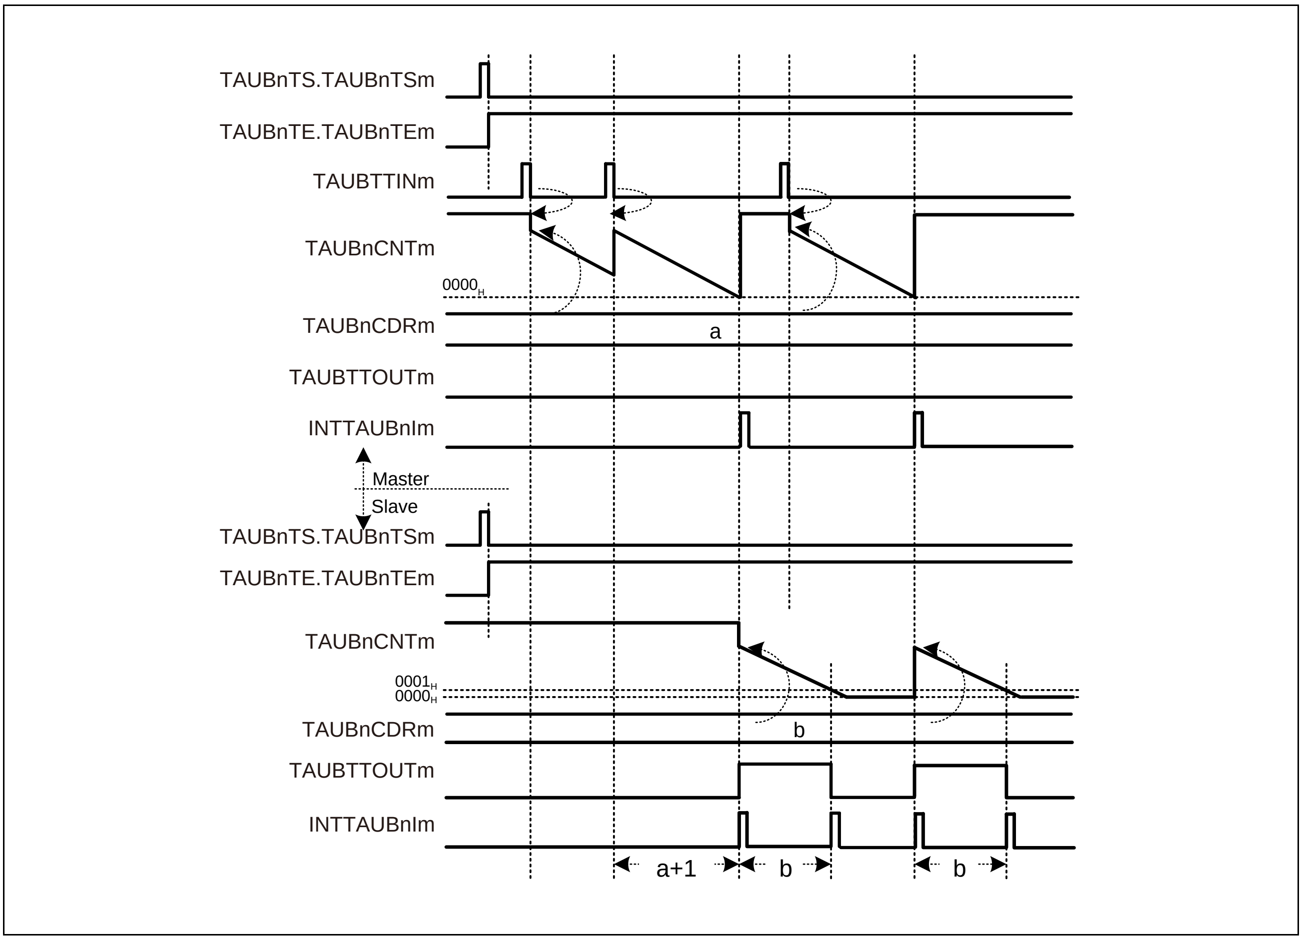

Figure 31.90 TAUBnCMORm.TAUBnMD0 = 1

- If a valid TAUBTTINm input edge is detected while the counter of the master channel counts down, TAUBnCNTm reloads the value of TAUBnCDRm. The counter restarts to count down.

This means the delay for INTTAUBnIm generation interval is extended by the value of TAUBnCNTm at the time when a valid TAUBTTINm input edge is detected.

(5) Operation stop and restart

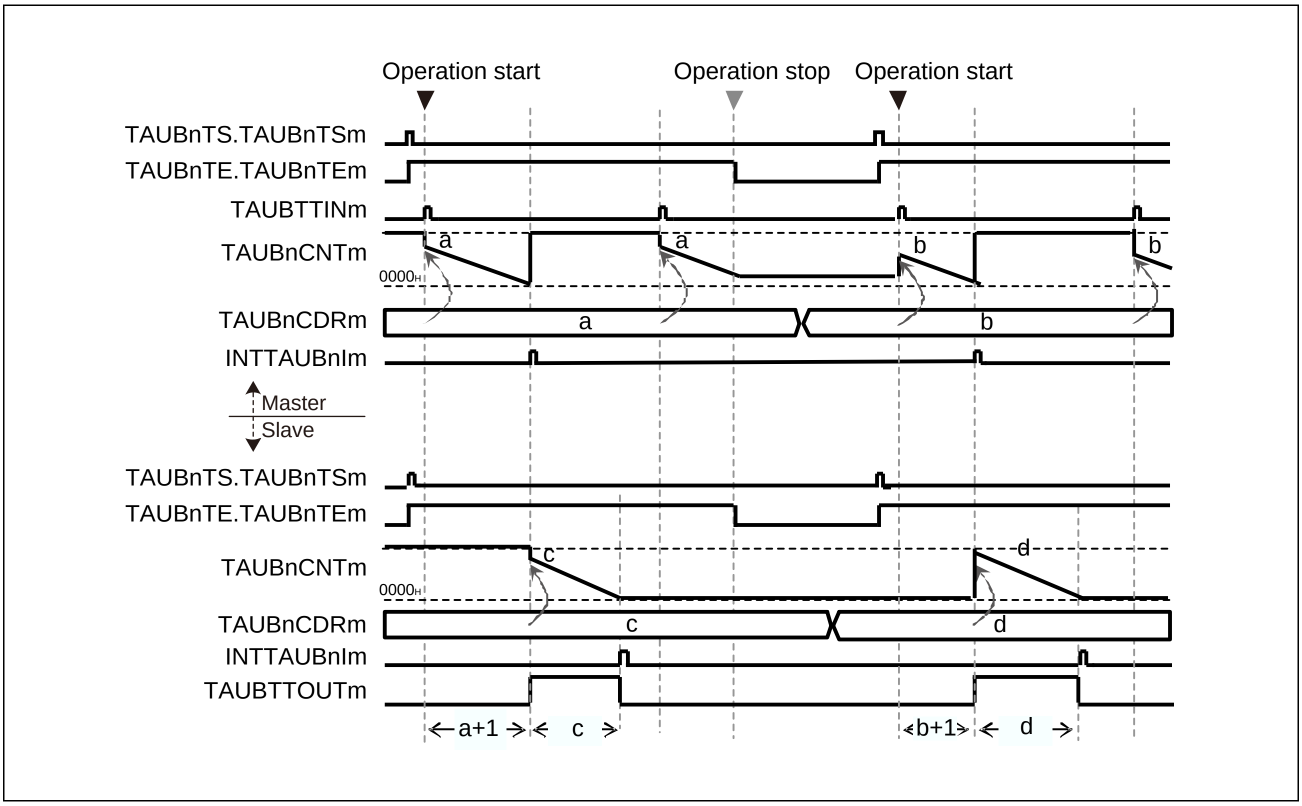

Figure 31.91 Stopping and Restarting the Operation

Setting TTm of the master and slave channels to 1 clears TAUBnTE.TAUBnTEm to 0, thereby stopping the count operation. If this happens, TAUBnCNTm and TAUBTTOUTm stop operation with the values retained.

Setting TAUBnTS.TAUBnTSm of the master and slave channels to 1 concurrently sets TAUBnTE.TAUBnTEm to 1.

When the start trigger is detected while the TAUBnTE.TAUBnTEm is set to 1, the TAUBnCDRm value is transferred to TAUBnCNTm and the operation restarts.

(6) Restarting the master channel while the slave channel is counting

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

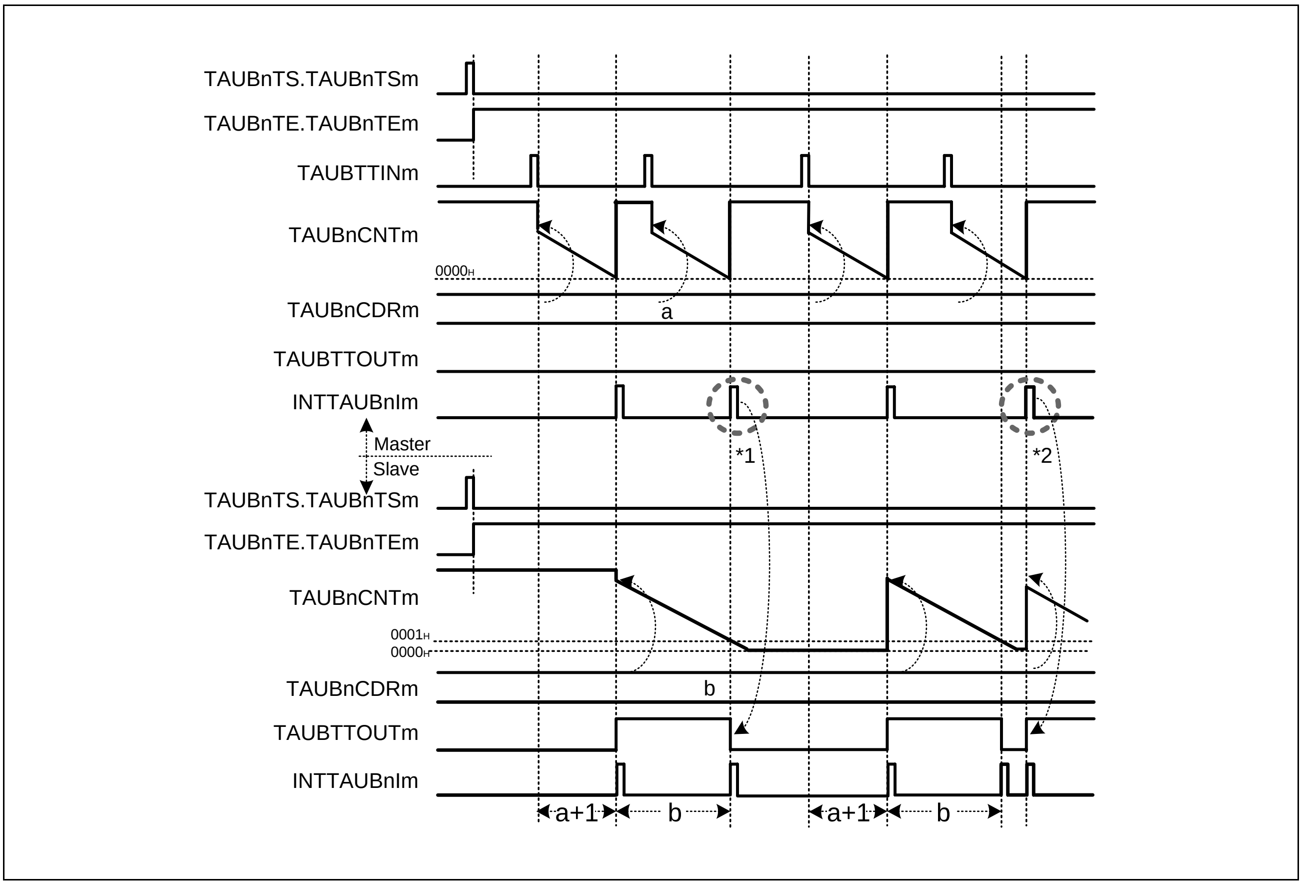

Figure 31.92 Input Interval of TAUBTTINm ≤ Delay Time + Pulse Width + 1

- If the master channel generates an interrupt before the counter of the slave channel has reached 0001_H or exactly when 0001_H is reached*[1], the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUBnCDRm (slave) is reloaded. An interrupt is generated and TAUBTTOUTm toggles. If TAUBnCNTm (master) has started to count down while the TAUBnCNTm (slave) is still counting*[2], TAUBTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

31.14.3 Delay Pulse Output Function

31.14.3.1 Overview

Summary

This function outputs two signals. The reference signal has a defined pulse width and pulse cycle specified using the master channel and slave channel 1.
Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by amount specified in slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1.
  The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified in slave channel 2.

Prerequisites

- Four channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 31.131, Contents of the TAUBnCMORm Register for the Master Channel of the Delay Pulse Output Function**.
- The operation mode of slave channels 1 and 2 must be set to one-count mode, see **Table 31.134, Contents of the TAUBnCMORm Register for the Slave Channel 1 of the Delay Pulse Output Function** and **Table 31.138, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Delay Pulse Output Function**.
- The operation mode of slave channel 3 must be set to pulse one-count mode, see **Table 31.141, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Delay Pulse Output Function**
- TAUBTTOUTm is not used for the master channel and slave channel 2
- The channel output mode of slave channel 1 must be set to synchronous channel output mode 1.
- The channel output mode of slave channel 3 must be set to independent channel output mode 1.

Description

The counters of the channel group are enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm to 1, enabling count operation.

- Master channel:

  The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value. INTTAUBnIm is generated on the master channel.
  When the counter of the master channel reaches 0000_H, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter reloads the TAUBnCDRm value and counts down.

- Slave channels 1 and 2:

  When the slave channels 1 and 2 detect an interrupt from the master channel, they start to count down from the current value of TAUBnCDRm. The TAUBTTOUTm signal (slave 1) is set.

  - Slave channel 1:
    When the counter of slave channel 1 reaches 0000_H (duty time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel.

  - Slave channel 2:
    When the counter of slave channel 2 reaches 0000_H, delay time has elapsed and INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel.
    INTTAUBnIm (slave channel 2) triggers the counter of slave channel 3

- Slave channel 3:

  When slave channel 3 detects an interrupt from slave channel 2, it starts to count down from the current value of TAUBnCDRm. INTTAUBnIm is generated and the TAUBTTOUTm signal (slave 3) is set.
  When the counter of slave channel 3 reaches 0001_H, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset.
  The output from slave channel 3 is the delayed PWM pulse.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. Please see **Section 31.6, Simultaneous Rewrite**.

31.14.3.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

Duty width 1 = (TAUBnCDRm (slave 1)) × count clock cycle

Delay = (TAUBnCDRm (slave 2) + 1) × count clock cycle

Duty width 2 = (TAUBnCDRm (slave 3)) × count clock cycle

Where the setting of the delay is within the following range:

$0000_H \leq$ TAUBnCDRm (slave 2) < TAUBnCDRm (master)

NOTES

1. The output waveform of TAUBTTOUTm (slave 3) is the output waveform of TAUBTTOUTm (slave 1) delayed for the delay generated by slave 2. It cannot be delayed for more than the pulse cycle.
2. When INTTAUBnIm of slave 2 occurs while slave 3 is counting, slave 3 restarts the operation. Therefore, the output waveform of TAUBTTOUTm (slave 3) retains the active level. (In this case, TAUBTTOUTm (slave 3) cannot output the waveform of the delayed basic pulse of TAUBTTOUTm (slave 1).)

31.14.3.3 Block Diagram and General Timing Diagram

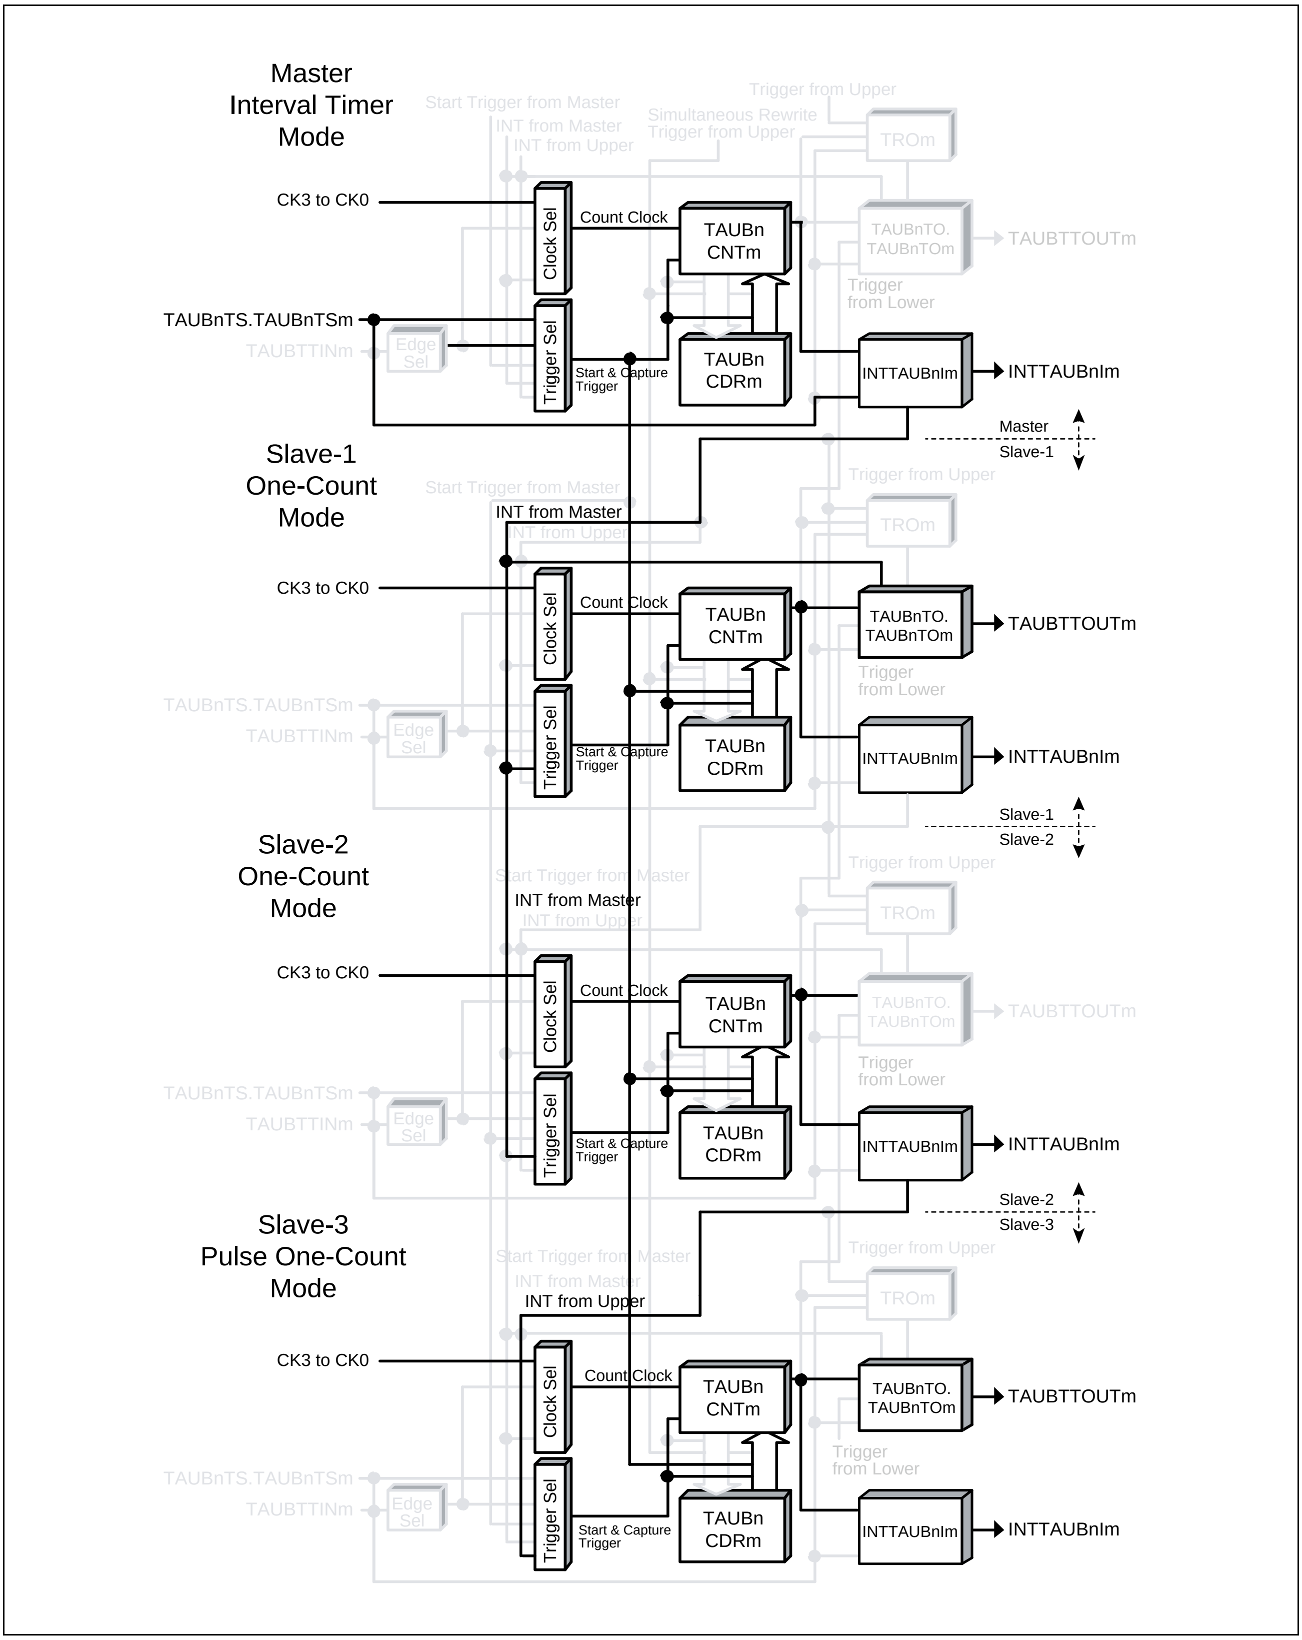

Figure 31.93 Block Diagram for Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

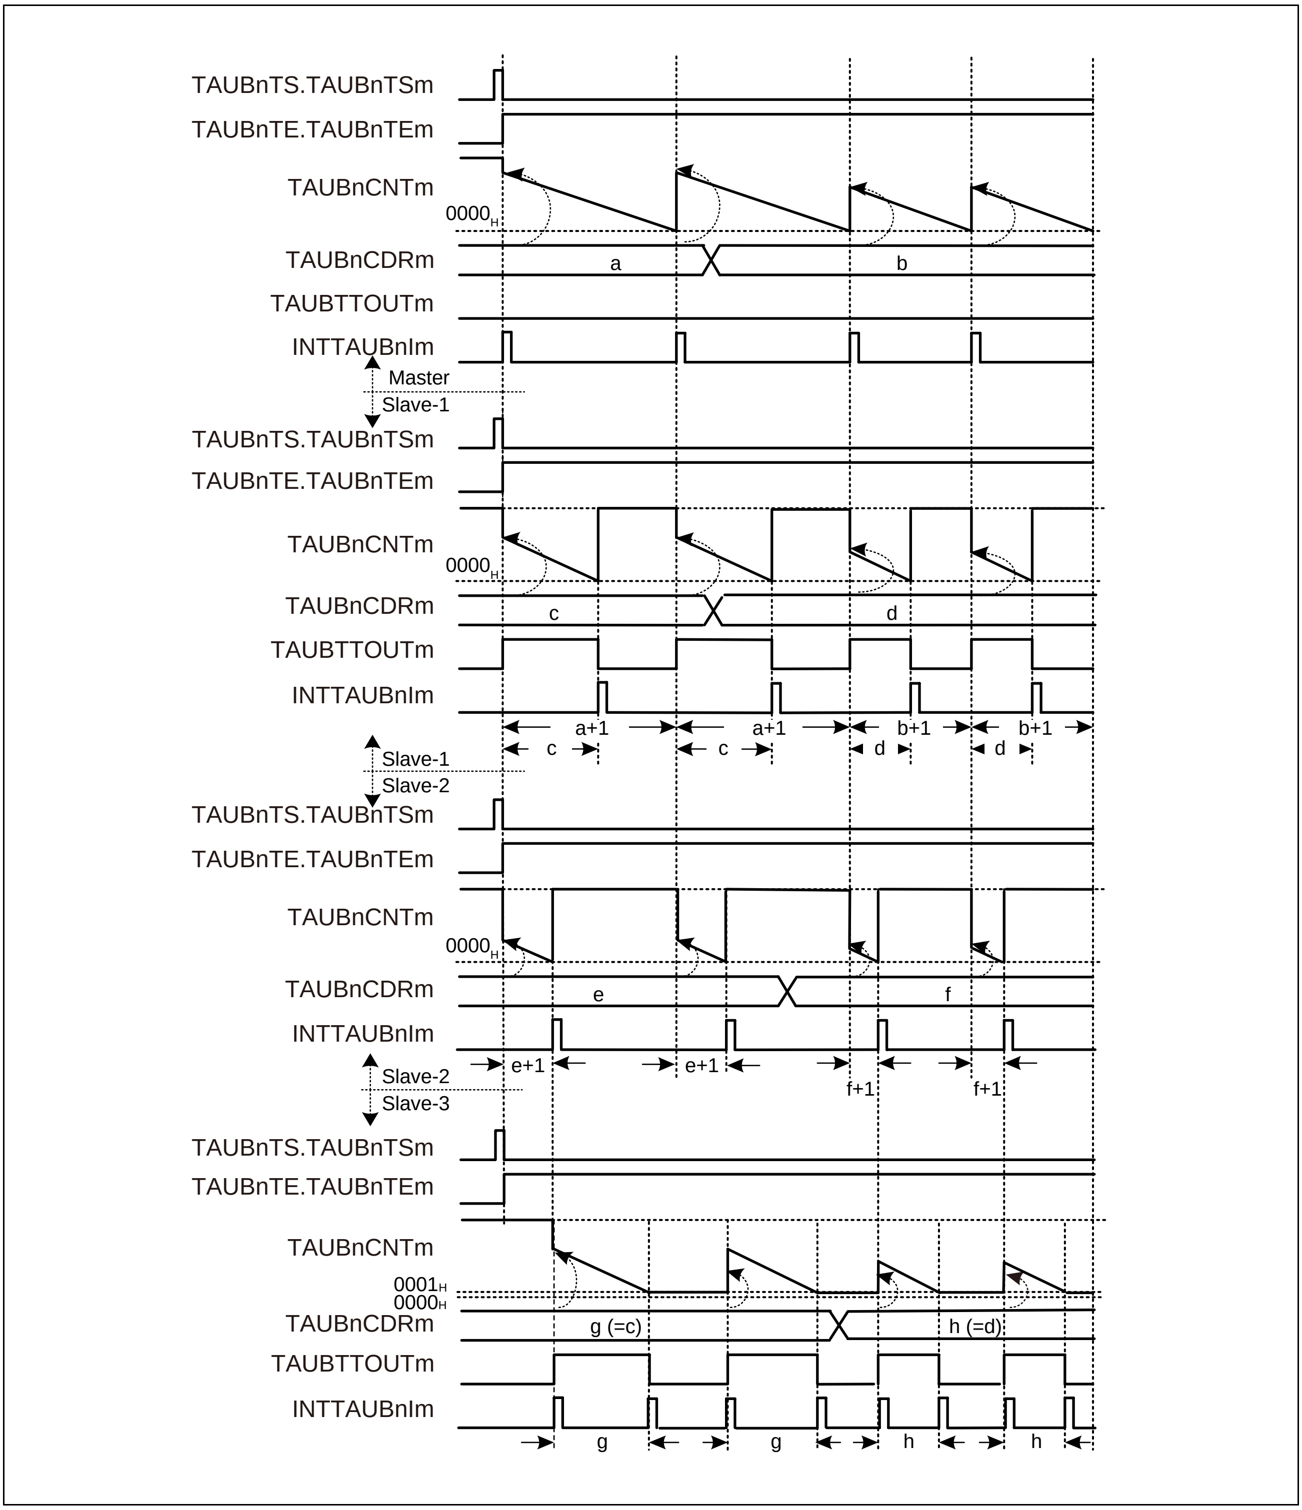

Figure 31.94 General Timing Diagram for Delay Pulse Output Function

31.14.3.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 2

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite for slave channel 2

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.140 Simultaneous Rewrite Settings for Slave Channel 2 of the Delay Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

31.14.3.7 Register Settings for Slave Channel 3

(1) TAUBnCMORm for slave channel 3

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 3

Table 31.143 Control Bit Settings for Independent Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simulta00neous rewrite for slave channel 3

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.144 Simultaneous Rewrite Settings for Slave Channel 3 of the Delay Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

31.14.3.8 Operating Procedure for Delay Pulse Output Function

Table 31.145 Operating Procedure for Delay Pulse Output Function

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.3.4, Register Settings for the Master Channel**. Slave channel 1: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.3.5, Register Settings for Slave Channel 1**. Slave channel 2: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.3.6, Register Settings For Slave Channel 2**. Slave channel 3: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.3.7, Register Settings for Slave Channel 3**. Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.

Table 31.145 Operating Procedure for Delay Pulse Output Function

Restart operation

	Operation	Status of TAUBn
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master channel and slave channels 1 and 2 start. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave 1) is set.
During operation	TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel and slave channels 1 and 2 load TAUBnCDRm and count down. When the counter of the master channel reaches 0000_H: ● INTTAUBnIm (master) is generated ● TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation ● TAUBnCNTm (slave 1 and slave 2) reload the TAUBnCDRm value and start counting down ● TAUBTTOUTm (slave 1) is set When TAUBnCNTm (slave 1) reaches 0000_H: ● INTTAUBnIm (slave 1) is generated ● TAUBTTOUTm (slave 1) is reset When TAUBnCNTm (slave 2) reaches 0000_H: ● INTTAUBnIm (slave 2) is generated ● INTTAUBnIm (slave 3) is generated ● TAUBTTOUTm (slave 3) is set ● TAUBnCNTm (slave 3) reloads the TAUBnCDRm value and starts counting down When TAUBnCNTm (slave 3) reaches 0001_H: ● INTTAUBnIm (slave 3) is generated ● TAUBTTOUTm (slave 3) is reset
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

31.14.3.9 Specific Timing Diagrams

(1) Duty cycle (slave 3) = 100%

The following values apply to the figure below.

- TAUBnCDRm (master) = $000A_H$
- TAUBnCDRm (slave 1) = $000B_H$
- TAUBnCDRm (slave 2) = 0000_H
- TAUBnCDRm (slave 3) = $000B_H$

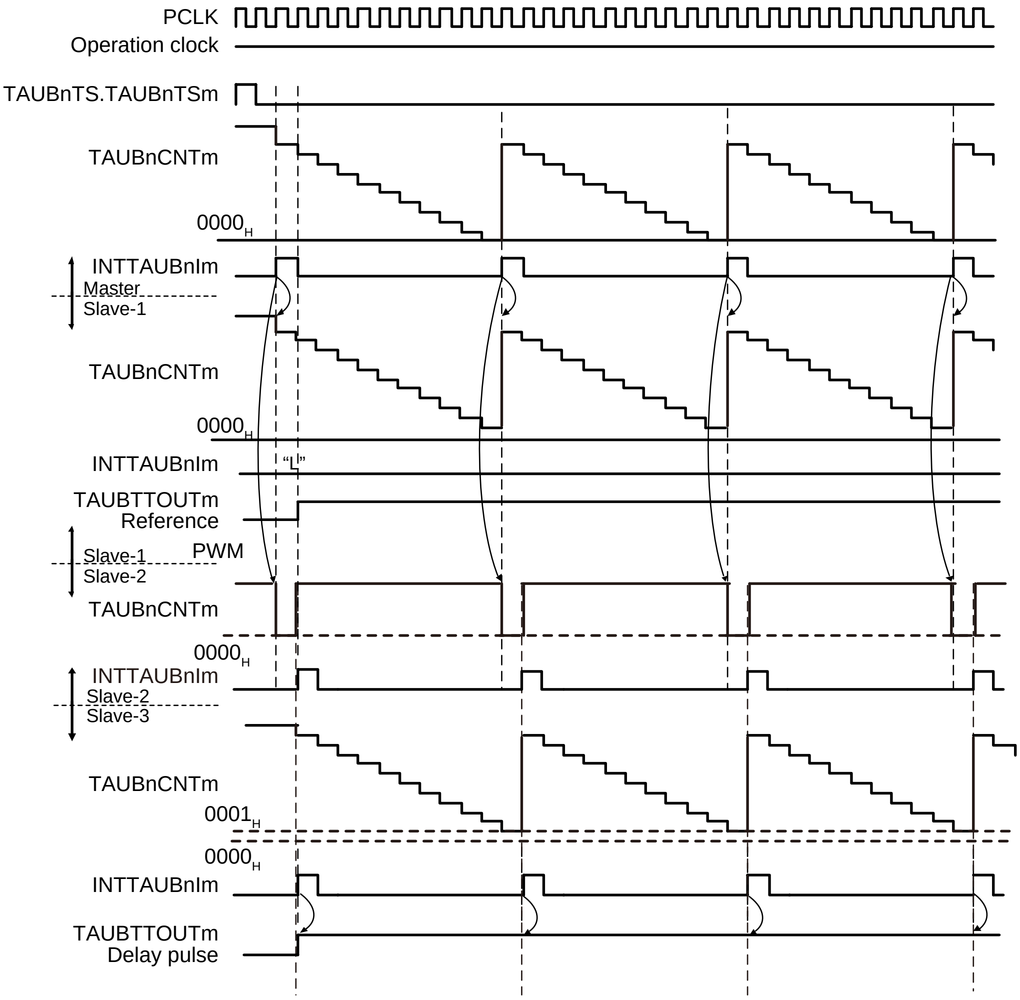

Figure 31.95 Duty Cycle (Slave 3) = 100%

- If the value of TAUBnCDRm (slave 1 and 3) is higher than the value of TAUBnCDRm (master), the counter of slave channel 1 cannot reach 0000_H and cannot generate interrupt request signals. TAUBTTOUTm of channels 1 and 3 remain in the active state.

(2) TAUBTTOUTm (slave 1) = TAUBTTOUTm (slave 3)

The following values apply to the figure below.

- TAUBnCDRm (master) = $000A_H$
- TAUBnCDRm (slave 1) = 0005_H
- TAUBnCDRm (slave 2) = 0000_H
- TAUBnCDRm (slave 3) = 0005_H

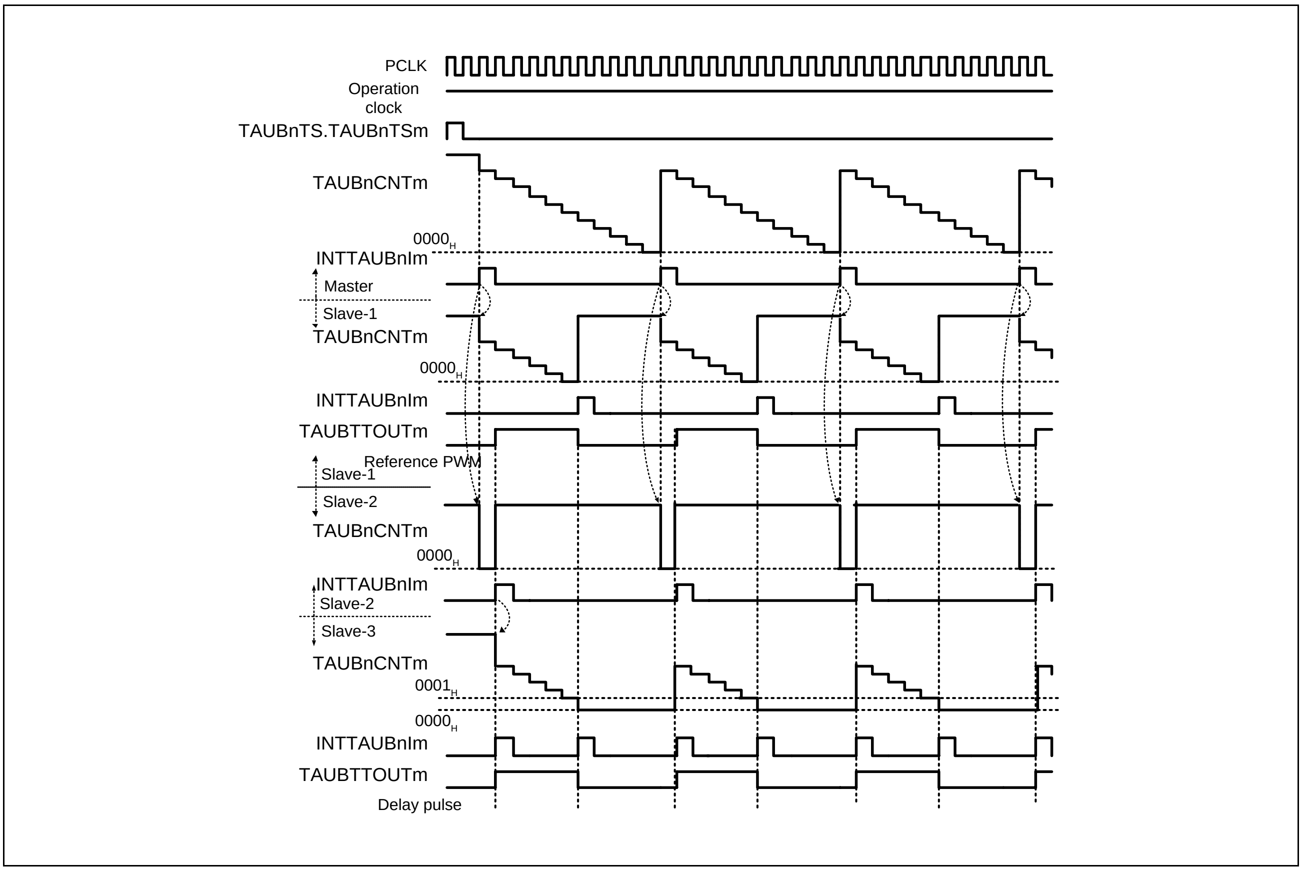

Figure 31.96 TAUBTTOUTm (Slave 1) = TAUBTTOUTm (Slave 3)

- If TAUBnCDRm (slave 2) = 0000_H, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1. The reference pulse and the delay pulse are output with a delay of one clock count.

31.14.4 AD Conversion Trigger Output Function Type 1

31.14.4.1 Overview

Summary

This function is identical to **Section 31.14.1, PWM Output Function** except that TAUBTTOUTm is not output.

This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

31.14.4.2 Block Diagram and General Timing Diagram

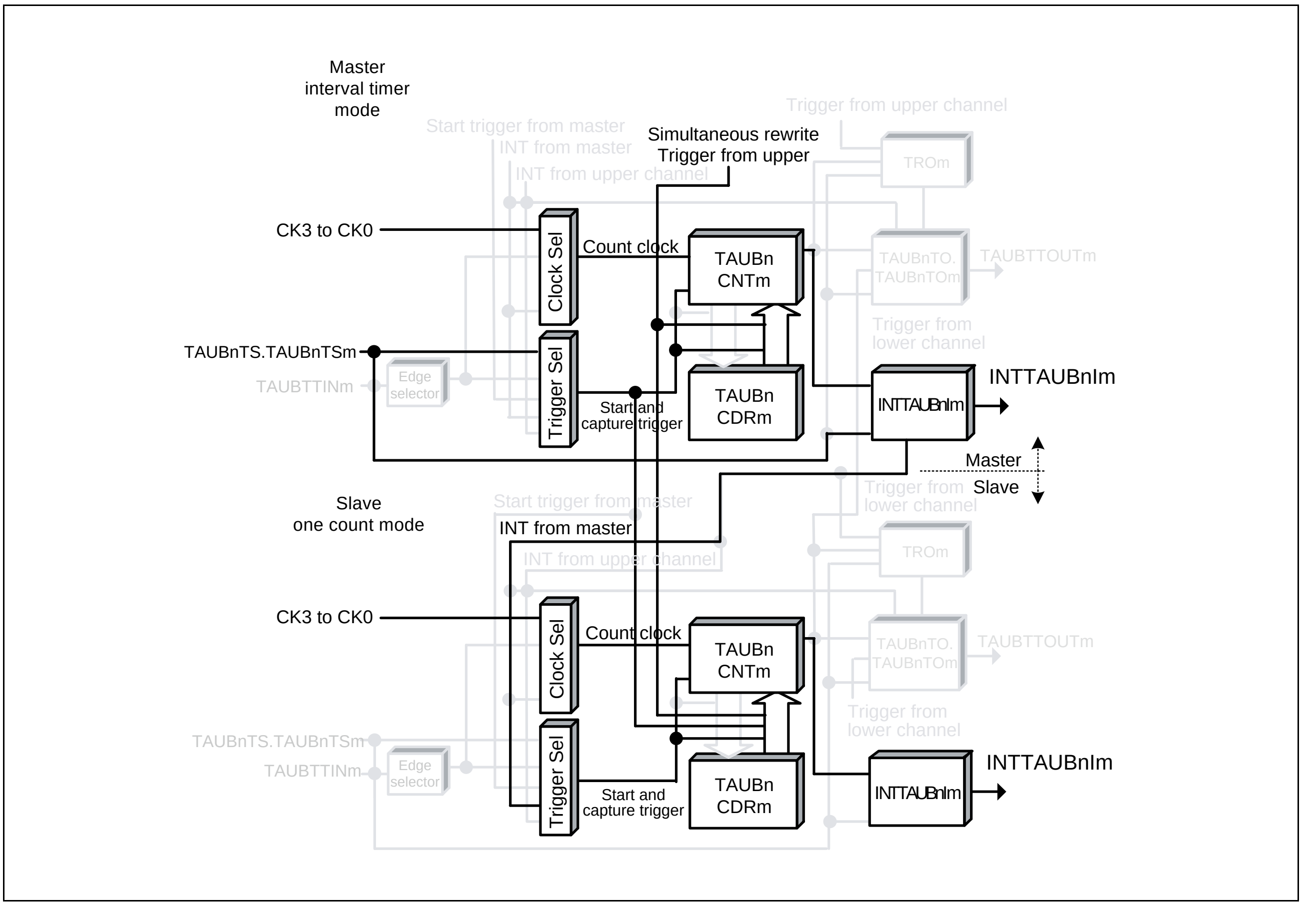

Figure 31.97 Block Diagram for AD Conversion Trigger Output Function Type 1

The following settings apply to the general timing diagram.

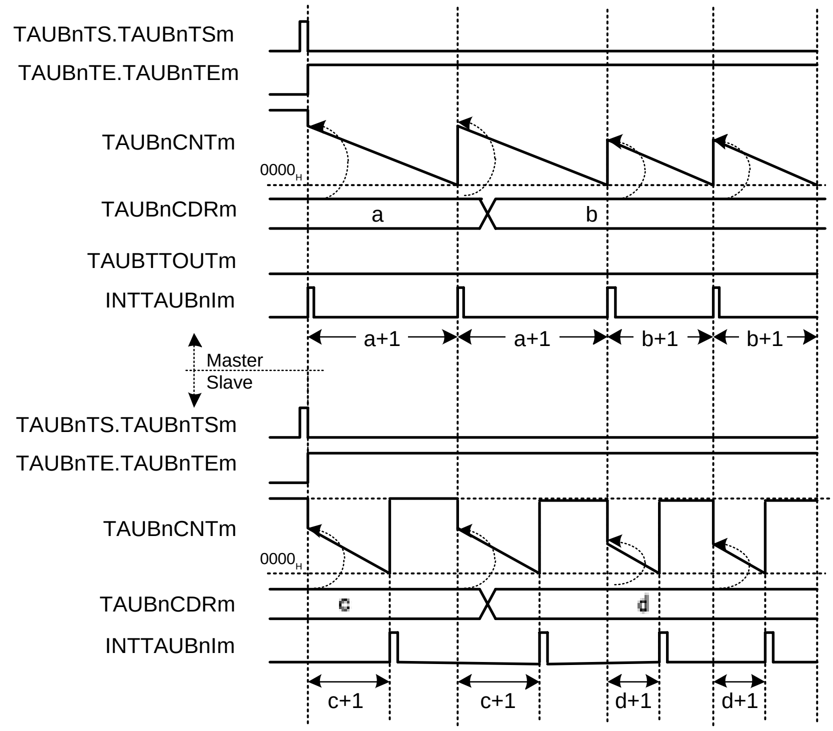

Figure 31.98 General Timing Diagram for AD Conversion Trigger Output Function Type 1

31.14.5 Triangle PWM Output Function

31.14.5.1 Overview

Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUTm to be set using the master and slave channel(s) respectively.

The master channel generates a carrier cycle from two pulse cycles. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slaves counter.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 31.146, Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function**.
- The operation mode of the slave channel(s) must be set to up down count mode, see **Table 31.150, Contents of the TAUBnCMORm Register for the Slave Channel of the Triangle PWM Output Function**.
- The channel output mode of the master channel must be set to independent channel output mode 1.
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 2.
- The following settings establish TAUBTTOUTm at high level for the down status of the carrier cycle.
  - If the TAUBnCMORm.TAUBnMD0 (master) bit is set to 0, TAUBnTO.TAUBnTOm must be set to 1 while TAUBnTOE.TAUBnTOEm is 0. (recommended)
  - If the TAUBnCMORm.TAUBnMD0 (master) bit is set to 1, TAUBnTO.TAUBnTOm must be set to 0 while TAUBnTOE.TAUBnOEm is 0.

Functional description

The counters are enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 for every channel. This in turn sets TAUBnTE.TAUBnTEm, enabling count operation. The current values of TAUBnCDRm (master and slave) are written to TAUBnCNTm (master and slave) and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:
  When the counter of the master channel reaches 0000_H (pulse cycle time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then reloads the TAUBnCDRm value and counts down.
- Slave channel:
  INTTAUBnIm generated on the master channel triggers the counter of the slave channel:
  - If the slave counter currently counts down, it changes count direction.
  - If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

When the counter of the slave channel reaches 0001_H while counting up or down, INTTAUBnIm is generated and the TAUBTTOUTm (slave) signal is set or reset.

The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.

TAUBTTOUTm can be switched between positive and negative phase setting TAUBnTOL.TAUBnTOLm during operation.

The counters can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

Conditions

Simultaneous rewrite can be used with this function. Please see **Section 31.6, Simultaneous Rewrite**.

31.14.5.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUBnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUBnCDRm (master) + 1) × 2 × count clock cycle

Duty cycle =

[(TAUBnCDRm (master) + 1 - TAUBnCDRm (slave))/ (TAUBnCDRm (master) + 1)] × 100

- Duty cycle = 100%
  TAUBnCDRm (slave) = 0000_H
- Duty cycle = 0%
  TAUBnCDRm (slave) $\geq$ TAUBnCDRm (master) + 1

31.14.5.3 Block Diagram and General Timing Diagram

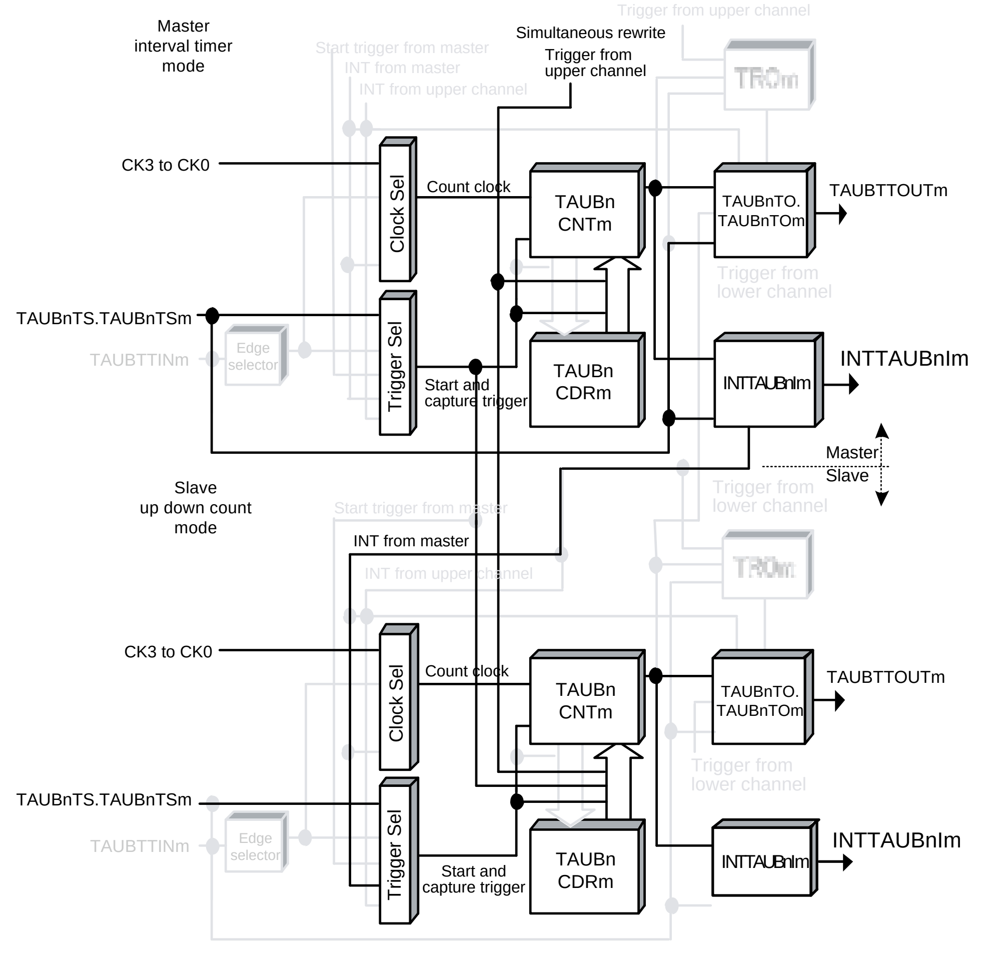

Figure 31.99 Block Diagram for Triangle PWM Output Function

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

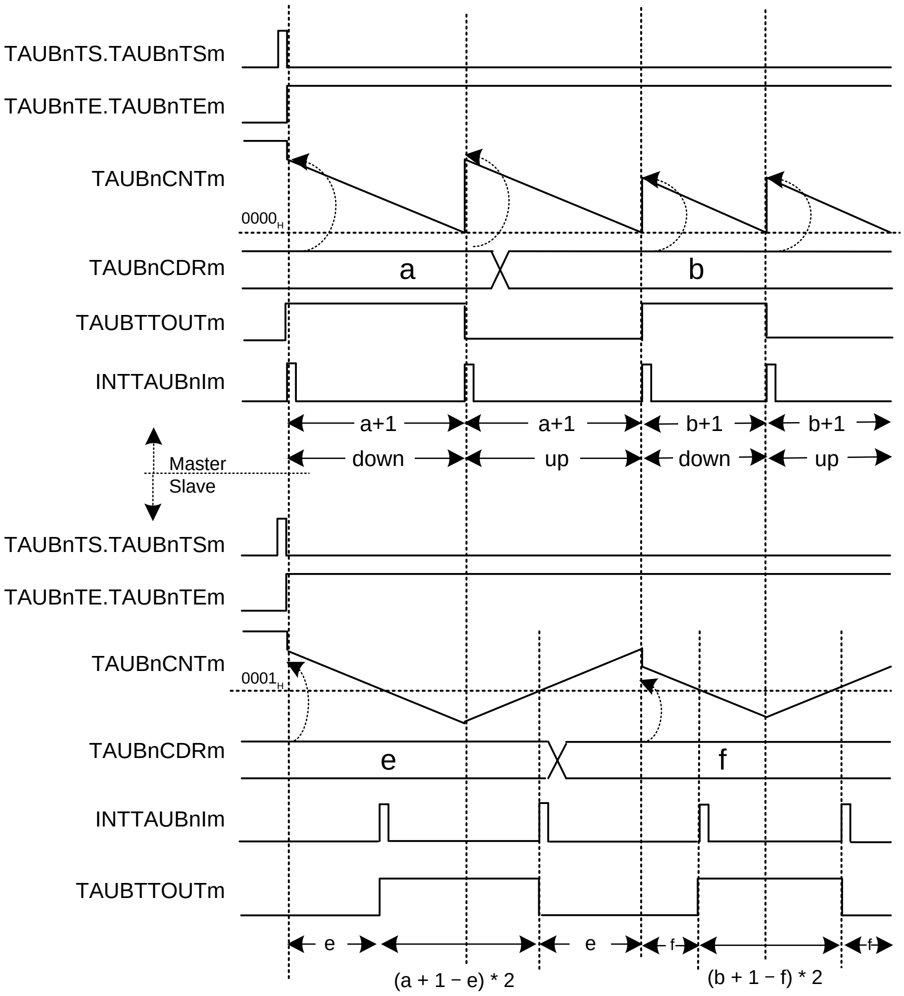

Figure 31.100 General Timing Diagram for Triangle PWM Output Function

31.14.5.4 Register Settings for the Master Channel

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the slave channel(s)

Table 31.152 Control Bit Settings for Synchronous Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.153 Simultaneous Rewrite Settings for the Slave Channel of the Triangle PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

31.14.5.6 Operating Procedure for Triangle PWM Output Function

Table 31.154 Operating Procedure for Triangle PWM Output Function

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.5.4, Register Settings for the Master Channel** Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.5.5, Register Settings for the Slave Channel(s)** Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUBnIm (master) is generated on the master channel when TAUBnCMORm.TAUBnMD0 set to 1.
During operation	TAUBnCDRm can be changed at any time. TAUBnTOL.TAUBnTOLm can be changed. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master and slave channels loads TAUBnCDRm and counts down. When the counter of the master channel reaches 0000$_H$: ● INTTAUBnIm (master) is generated ● TAUBTTOUTm (master) toggles ● TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation. ● TAUBnCNTm (slave) reloads the TAUBnCDRm value or counts in the reverse direction. When TAUBnCNTm of the slave = 0001$_H$: ● INTTAUBnIm (slave) is generated ● TAUBTTOUTm (slave) is set (in count-down status) or reset (in count-up status)
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

31.14.5.7 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnCDRm = a = 5_H
- Slave channel:
  - TAUBnCDRm = 6_H

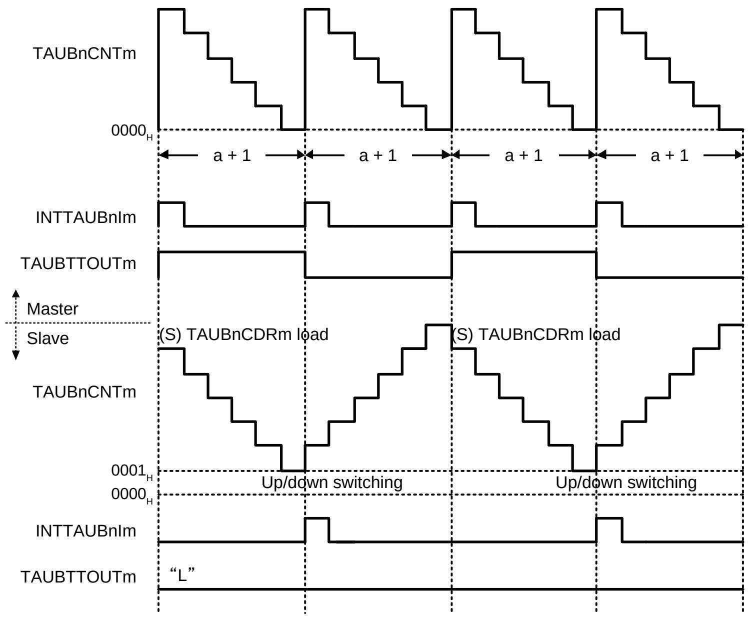

Figure 31.101 TAUBnCDRm (Slave) ≥ TAUBnCDRm (Master) + 1

- If TAUBnCDRm (slave) ≥ TAUBnCDRm (master) +1, INTTAUBnIm of slave channel is not generated during counting down. The set signal is never detected, so TAUBTTOUTm remains at low state.

(2) Duty cycle = 100%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnCDRm = a = 5_H
- Slave channel:
  - TAUBnCDRm = 0_B

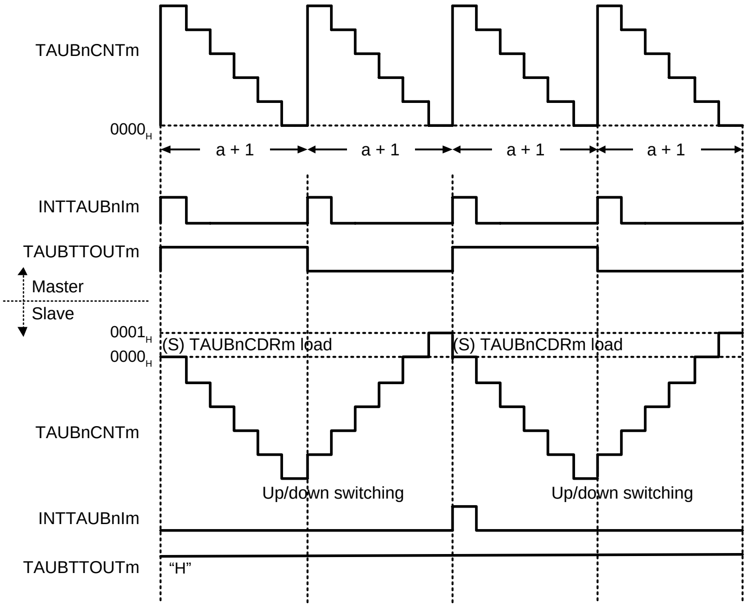

Figure 31.102 TAUBnCDRm (Slave) = 0000_H

- If TAUBnCDRm (slave) = 0000_H, INTTAUBnIm of slave channel is not generated during counting up. The reset signal is never detected, so TAUBTTOUTm remains at high state.

31.14.6 Triangle PWM Output Function with Dead Time

31.14.6.1 Overview

Summary

This function generates multiple triangle PWM outputs with a defined dead time by using a master and two or more slave channels. The resulting PWM signals with the dead time are output via TAUBTTOUTm of the slave channels 2 and 3. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUTm to be set using the master and slave channel(s) respectively.

The master generates a carrier cycle. The first pulse controls the down status and the second pulse controls the up status of the slaves counter.

An interrupt on slave 2 causes TAUBTTOUTm of the slave channels to be set or reset.
Depending on the settings of TAUBnTDL.TAUBnTDLm, delay time is added to positive or negative logic side of the signal (i.e. whether TAUBTTOUTm is set or reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

Prerequisites

- Three channels. Select an even channel CH (a) and an odd channel CH (a + 1) for slave channel 2 and 3 respectively.
- The operation mode of the master channel must be set to interval timer mode, see **Table 31.156, Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time**
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even-numbered channel (a), and slave channel 3 is an odd-numbered channel (a + 1). Slave channel 1 can be used as a separate timer (independent function).
- The operation mode of slave channel 2 must be set to up down mode, see **Table 31.160, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time**
  Furthermore, slave channel 2 must be an even channel
- The operation mode of slave channel 3 must be set to one-count mode, see **Table 31.164, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time**
  Furthermore, slave channel 3 must be an odd channel
- The channel output mode of the master channel must be set to independent channel output mode 1
- The channel output mode of the slave channels 2 and 3 must be set to synchronous channel output mode 2.
- The following settings establish TAUBTTOUTm at high level for the down status of the carrier cycle.
  - If the TAUBnCMORm.MD0 (master) bit is set to 0, TAUBnTO.TAUBnTOm must be set to 1 while TAUBnTOE.TAUBnTOEm is 0. (recommended)
  - If the TAUBnCMORm.MD0 (master) bit is set to 1, TAUBnTO.TAUBnTOm must be set to 0 while TAUBnTOE.TAUBnTOEm is 0.

NOTE

Slave channel 1 is not used for Triangle PWM Output Function with Dead Time. Slave channel 1 can be used as a separate timer (independent function).

Functional description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current values of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:

  When the counter of the master channel reaches 0000_H, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. The counter reloads the TAUBnCDRm value and counts down.

- Slave channel 2:

  INTTAUBnIm generated on the master channel triggers the counter of the slave channel 2:

  - If the slave counter currently counts down, it changes count direction.
  - If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.
When the counter value of slave channel 2 reaches 0001_H, INTTAUBnIm is generated.

- Slave channel 3:

  INTTAUBnIm of slave channel 2 triggers the counter of slave channel 3. The current value of TAUBnCDRm (slave 3) is written to TAUBnCNTm (slave 3) and the counter starts to count down from this TAUBnCDRm value.
  When the counter reaches 0000_H, INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of slave channel 2.

The TAUBnTDL.TAUBnTDLm settings of the corresponding channel specify whether it is set/reset immediately, or after dead time has elapsed, as shown in **Table 31.155, Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2**.

The TAUBnTOL.TOLm settings specify whether set corresponds to a high signal (TAUBnTOL.TAUBnTOLm = 0) or a low signal (TAUBnTOL.TAUBnTOLm = 1).

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

TAUBnCDRm value of slave channel 2 can be set to 0000_H to output 100% TAUBTTOUTm.

NOTE

If a forced restart is executed during operation, TAUBTTOUTm is not output as a triangle PWM signal.

Conditions

Simultaneous rewrite can be used with this function. Please see **Section 31.6, Simultaneous Rewrite**.

TAUBnTOL.TAUBnTOLm and TAUBnTDL.TAUBnTDLm bits should be set before the counter starts, and slave channels 2 and 3 should have opposite TAUBnTOL.TAUBnTOLm settings or opposite TAUBnTDL.TAUBnTDLm settings.

Table 31.155 Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2

TAUBnTDL.TAUBnTDLm	Count Direction of Slave Channel 2 when Interrupt is Generated	TAUBTTOUTm Set/Reset Timing
0	Down	Set after dead time has elapsed
	Up	Reset immediately
1	Down	Set immediately
	Up	Reset after dead time has elapsed

31.14.6.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUBnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUBnCDRm (master) + 1) × 2 × count clock cycle

PWM signal width (positive phase) = [(TAUBnCDRm (master) + 1 – TAUBnCDRm (slave 2)) × 2 – (TAUBnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (negative phase) = [(TAUBnCDRm (master) + 1 – TAUBnCDRm (slave 2)) × 2 + (TAUBnCDRm (slave 3) + 1)] × count clock cycle

31.14.6.3 Block Diagram and General Timing Diagram

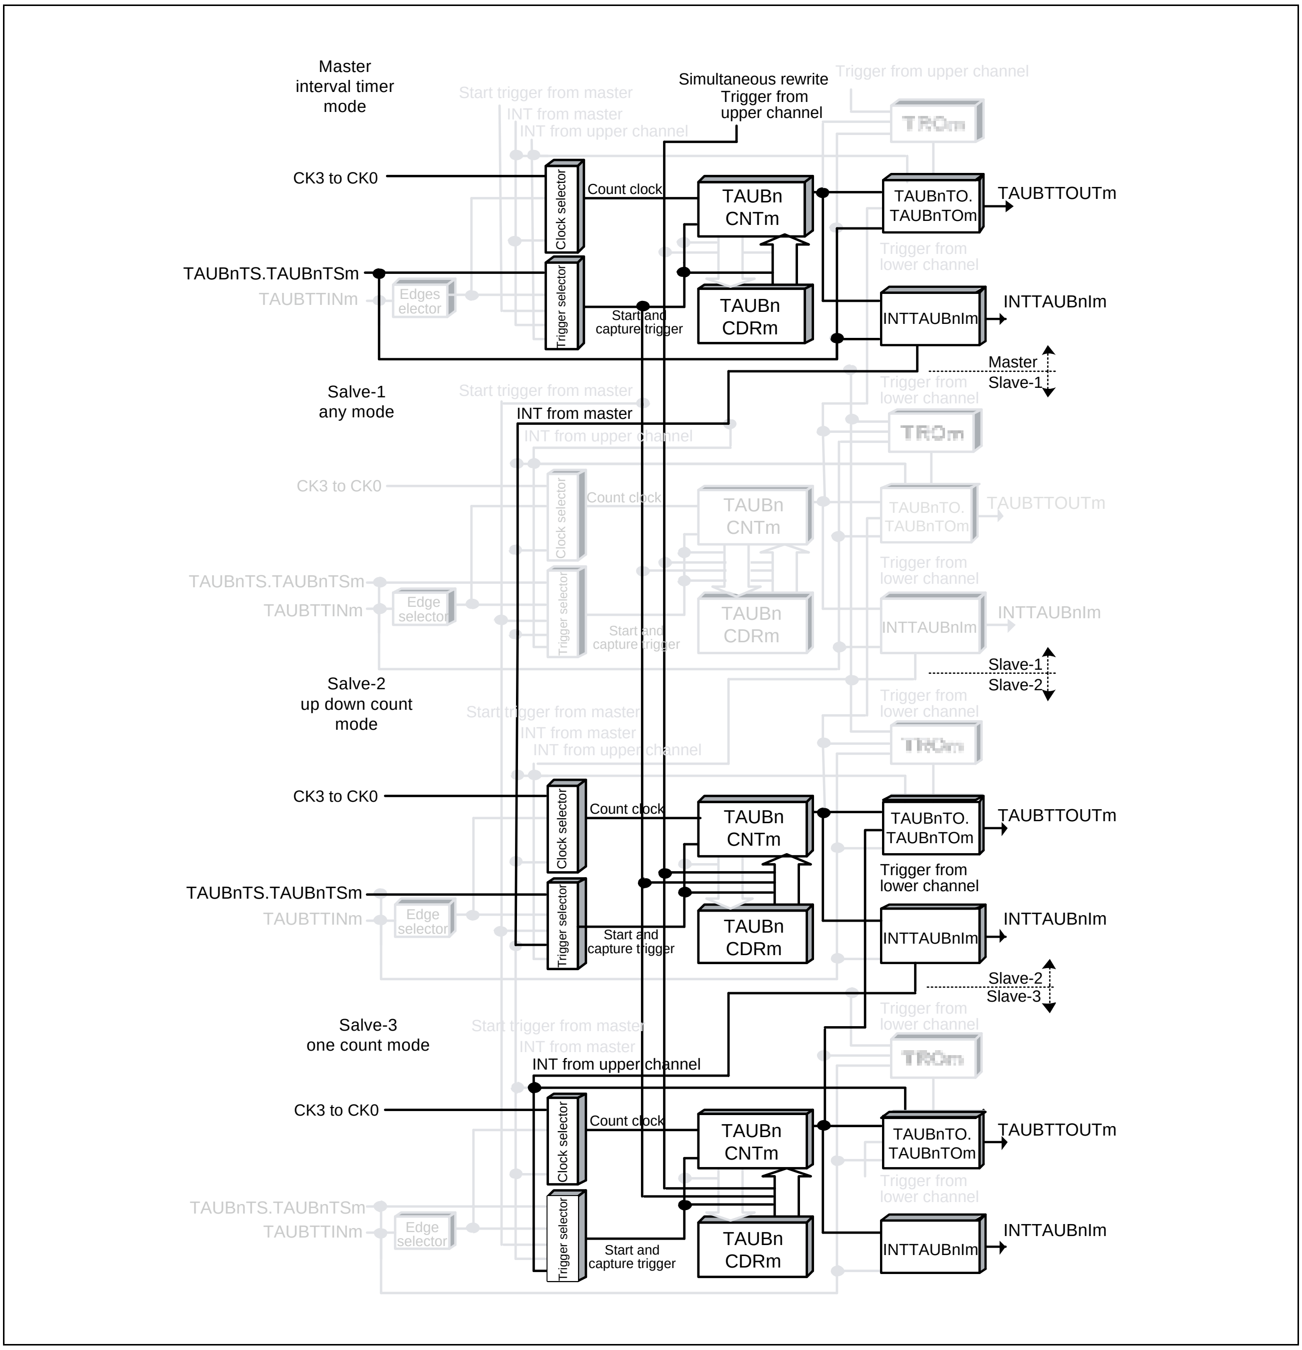

Figure 31.103 Block Diagram for Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Slave channel 2:
  - INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
  - TAUBnTDL.TAUBnTDLm = 0
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Enables start trigger detection during counting (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnTDL.TAUBnTDLm = 1
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)

R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 31.156 Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 1_B.
10 to 8	TAUBnSTS[2:0]	Write 000_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000_B.
0	TAUBnMD0	0: INTTAUBnIm not generated and TAUBTTOUTm does not toggle at operation start 1: Generates INTTAUBnIm and toggles TAUBTTOUTm at operation start

(2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 31.157 Contents of the TAUBnCMURm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the master channel

Table 31.158 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	Write 0_B.
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.159 Simultaneous Rewrite Settings for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

If TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel that generates the simultaneous rewrite trigger signal.

31.14.6.5 Register Settings for Slave Channel 2

(1) TAUBnCMORm for slave channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBn MD0

Table 31.160 Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 111_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 1001_B.
0	TAUBnMD0	Write 0_B.

(2) TAUBnCMURm for slave channel 2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 31.161 Contents of the TAUBnCMURm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 2

Table 31.162 Control Bit Settings for Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 1_B.
TAUBnTDL.TAUBnTDLm	0: Dead time is added to the positive phase 1: Dead time is added to the negative phase

CAUTION

Set TAUBnTDL.TAUBnTDLm exclusively to the odd channel.

(4) Simultaneous rewrite for slave channel 2

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.163 Simultaneous Rewrite Settings for Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

31.14.6.6 Register Settings for Slave Channel 3

(1) TAUBnCMORm for slave channel 3

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 31.164 Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 110_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0100_B.
0	TAUBnMD0	Write 1_B.

(2) TAUBnCMURm for slave channel 3

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 31.165 Contents of the TAUBnCMURm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 3

Table 31.166 Control Bit Settings for Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 1_B.
TAUBnTDL.TAUBnTDLm	0: Dead time is added to the positive phase 1: Dead time is added to the negative phase

CAUTION

Set TAUBnTDL.TAUBnTDLm exclusively to the even channel.

(4) Simultaneous rewrite for slave channel 3

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 31.167 Simultaneous Rewrite Settings for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

31.14.6.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 31.168 Operating Procedure for Triangle PWM Output with Dead Time

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.6.4Register Settings for the Master Channel** Slave channel 2: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.6.5, Register Settings for Slave Channel 2** Slave channel 3: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 31.14.6.6, Register Settings for Slave Channel 3** Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUBnIm (master) is generated when TAUBnCMORm.TAUBnMD0 is set to 1 on the master channel.
During operation	TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel and slave channel 2 load TAUBnCDRm and count down. When the counter of the master channel reaches 0000$_H$: ● INTTAUBnIm (master) is generated ● TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation ● TAUBnCNTm (slave 2) reloads the TAUBnCDRm value or counts in the reverse direction When TAUBnCNTm (slave 2) reaches 0001$_H$: INTTAUBnIm (slave 2) is generated TAUBnCNTm of slave channel 3 loads the TAUBnCDRm value and counts down When TAUBnCNTm of slave channel 3 = 0000$_H$: INTTAUBnIm is generated
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

31.14.6.8 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

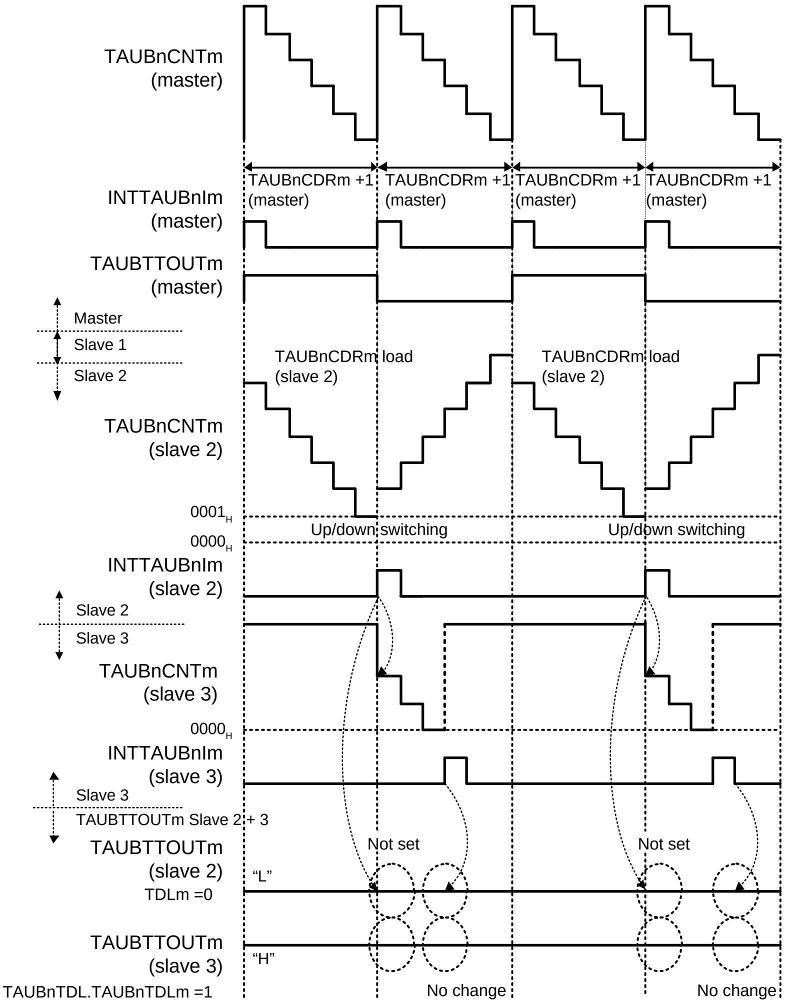

Figure 31.105 TAUBnCDRm (Slave 2) ≥ TAUBnCDRm (Master) + 1

- If TAUBnCDRm (slave 2) ≥ TAUBnCDRm (master), the counter of slave channel cannot reach 0000_H during counting down. Therefore TAUBTTOUTm cannot toggle, i.e. it remains at its initial state. The interrupt from slave channel 2 occurs during count up, therefore it is a reset signal.

(2) Duty cycle = 100%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

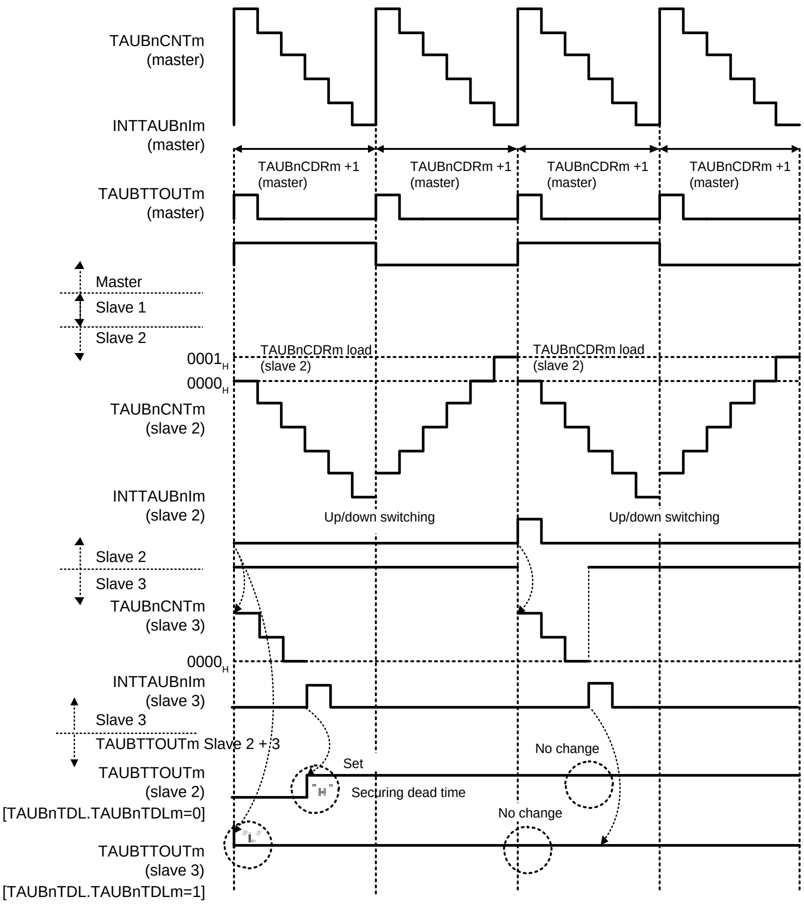

Figure 31.106 TAUBnCDRm (Slave 2) = 0000_H

- If TAUBnCDRm (slave 2) = 0000_H the counter of slave channel cannot reach 0001_H while counting up and therefore cannot generate an INTTAUBnIm while counting up.
  - The set conditions for a channel in which TAUBnTDL.TAUBnTDLm = 0 are met after dead time has elapsed. TAUBTTOUTm toggles but remains in the new state because the reset conditions are never satisfied for such a channel.
  - Slave channel 3 in the above diagram is set when the counter starts.
    However, the reset conditions for a channel in which TAUBnTDL.TAUBnTDLm = 1 are never satisfied so TAUBTTOUTm remains in its initial state for such a slave channel.

(3) TAUBTTOUTm (slave 2) = 0% and TAUBTTOUTm (slave 3) ≥ 0%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

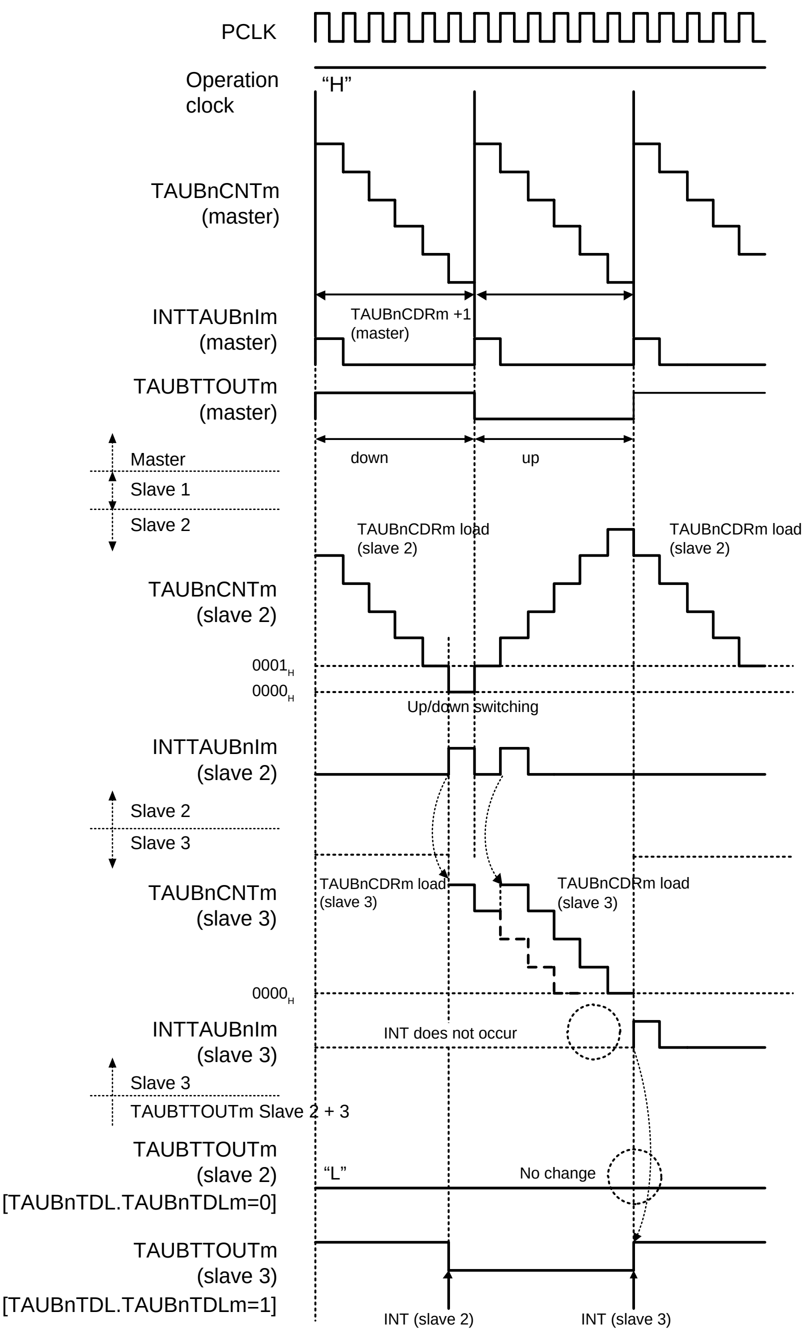

Figure 31.107 TAUBnCDRm (Master) = 0005_H, TAUBnCDRm (Slave 2) = 0005_H TAUBnCDRm (Slave 3) = 0004_H

- When the counter of slave channel 2 reaches 0000_H after detecting that the counter reached 0001_H, INTTAUBnIm (slave 2) is generated. The counter of slave channel 3 starts to count down.
- If another INTTAUBnIm (slave 2) is generated while the counter of slave channel 3 is still counting down, the value of TAUBnCDRm (slave 3) is reloaded and the counter restarts counting down from this value.
- In the diagram above, the first interrupt on channel 2 occurs while the counter is counting down, and the second while it is counting up.
- After the first interrupt, a slave for which TAUBnTDL.TAUBnTDLm = 0 waits for dead time to elapse before setting. However, if another interrupt occurs on slave 2, before the dead time has elapsed, the counter is counting up, so the signal acts as a reset signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm = 0 always remains inactive.
- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 is set and reset as normal when the corresponding INTTAUBnIm is generated.

(4) TAUBTTOUTm (slave 2) > 0% and TAUBTTOUTm (slave 3) = 100%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

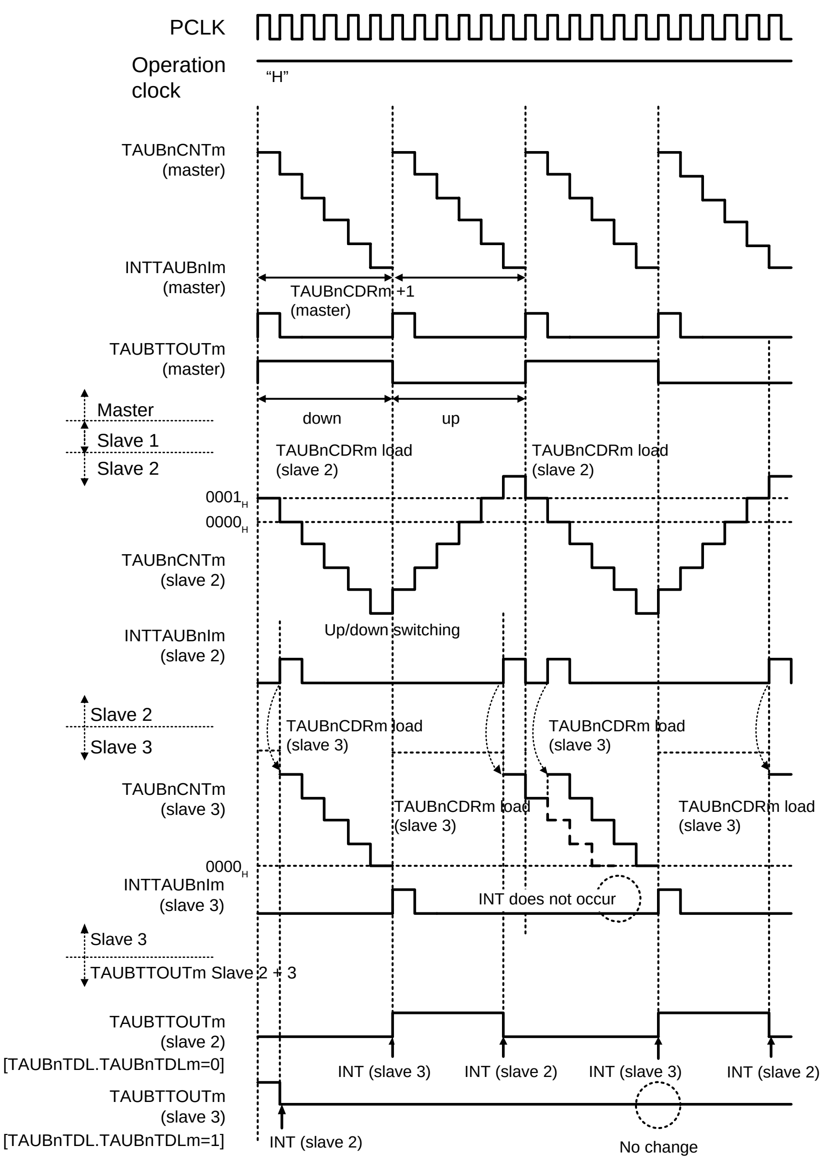

Figure 31.108 TAUBnCDRm (Master) = 0005H, TAUBnCDRm (Slave 2) = 0001H TAUBnCDRm (Slave 3) = 0004H PWM Signal Width (Negative Phase) ≥ Carrier Cycle

- After the second interrupt on slave channel 2, a slave for which TAUBnTDL.TAUBnTDLm = 1 is reset after the dead time has elapsed. However if another interrupt occurs on slave 2 before the dead time has elapsed, slave channel 3 is restarted, and then if an interrupt on slave channel 3 is generated, the counter is counting up, so the signal acts as a setting signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm = 1 always remains active.
- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 0 is set and reset as normal when the corresponding INTTAUBnIm is generated.

(5) Inhibited INTTAUBnIm to set TAUBTTOUTm positive phase period

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

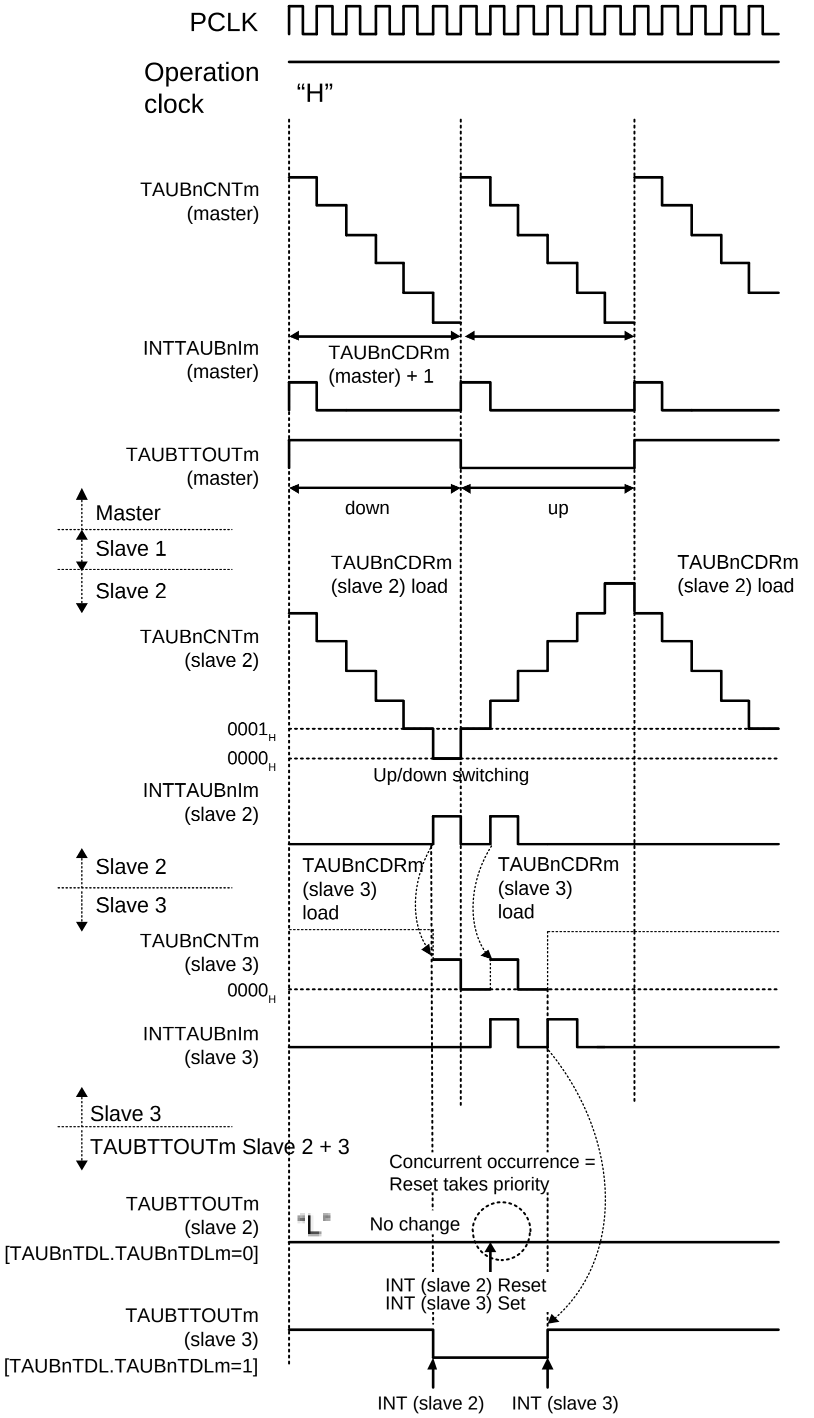

Figure 31.109 TAUBnCDRm (Master) = 0005$_H$, TAUBnCDRm (Slave 2) = 0005$_H$, TAUBnCDRm (Slave 3) = 0001$_H$
PWM Signal Width (Positive Phase) = 0

- The counter of slave channel 3 reaches 0000_H and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm = 0 (slave channel 2 in this example).
- If slave channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, this reset signal is given priority if TAUBnTOL.TAUBnTOLm = 0 (if TAUBnTOL.TAUBnTOLm = 1, the set signal is given priority).
- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 0 remains in the value after reset.

(6) Inhibited INTTAUBnIm to set TAUBTTOUTm negative phase period

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

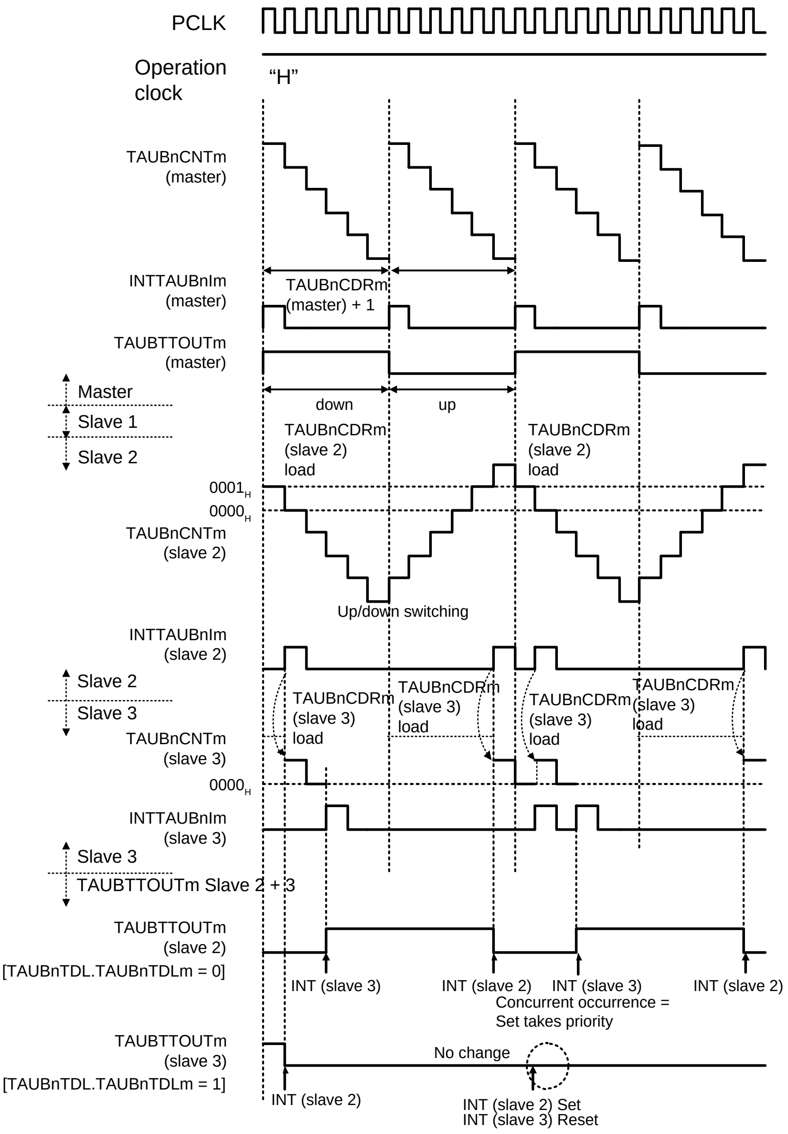

Figure 31.110 TAUBnCDRm (Master) = 0005H, TAUBnCDRm (Slave 2) = 0001H, TAUBnCDRm (Slave 3) = 0001H
PWM Signal Width (Negative Phase) = Carrier Cycle

- The counter of slave channel 3 reaches 0000$_H$ and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm = 1 (slave 3 in this example).
- If slave channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, the set signal is given priority if TAUBnTOL.TAUBnTOLm = 1 (if TAUBnTOL.TAUBnTOLm = 0, the reset signal is given priority).
- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 remains in the value after reset.

(7) Slave 2 TAUBnCDRm = 0000$_H$ (Duty cycle = 100%)

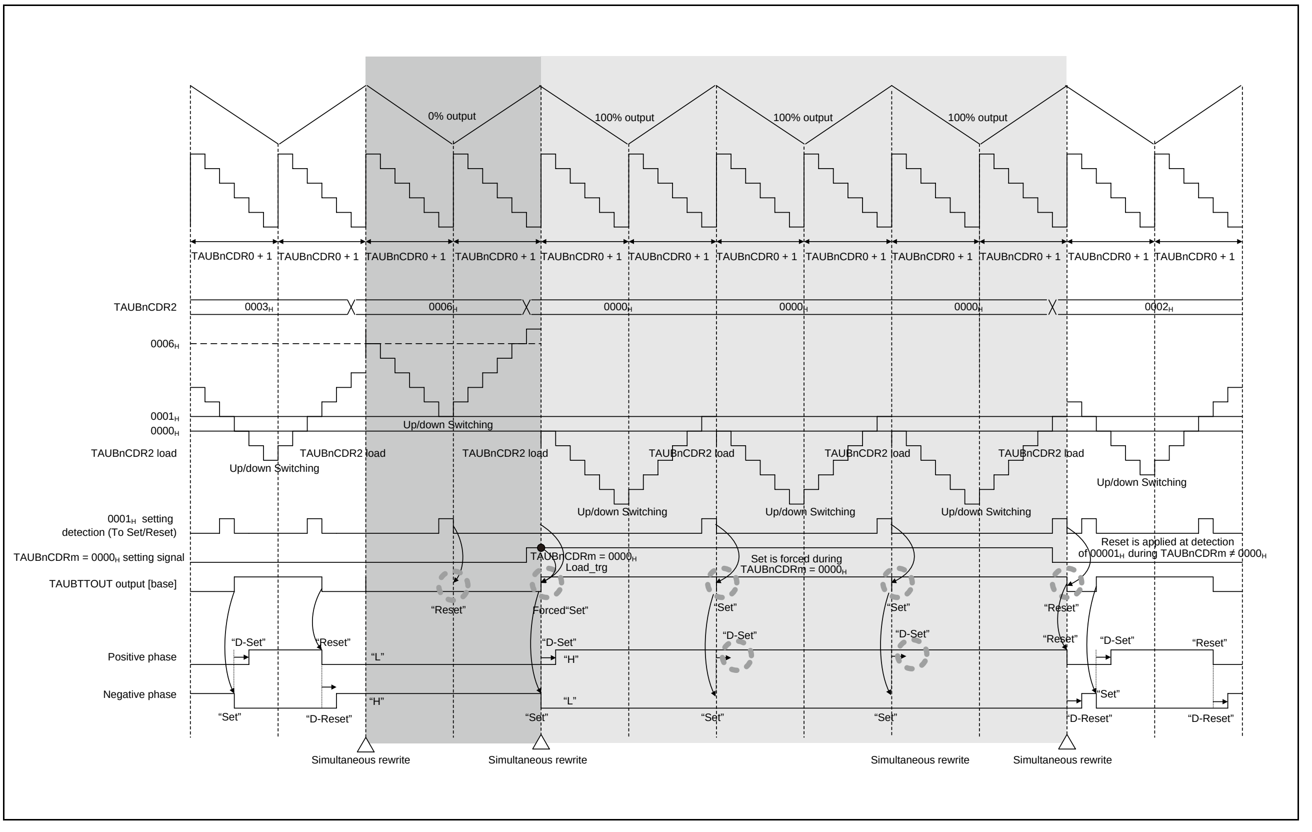

Figure 31.111 Slave 2 TAUBnCDRm = 0000$_H$ (Duty cycle = 100%)

When rewriting (slave channel 2) TAUBnCDRm ≠ 0000$_H$ to (slave channel 2) TAUBnCDRm = 0000$_H$ (100% output), set the negative phase side at the start of the carrier cycle, and set the positive phase side after dead time is secured.

When rewriting (slave channel 2) TAUBnCDRm = 0000$_H$ (100% output) to (slave channel 2) TAUBnCDRm ≠ 0000$_H$, reset the positive phase side at the end of the carrier cycle, and reset the negative phase side after dead time is secured.

31.14.7 A/D Conversion Trigger Output Function Type 2

31.14.7.1 Overview

Summary

This function is identical to **Section 31.14.5, Triangle PWM Output Function**, except that TAUBTTOUTm is not output.

This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

31.14.7.2 Block Diagram and General Timing Diagram

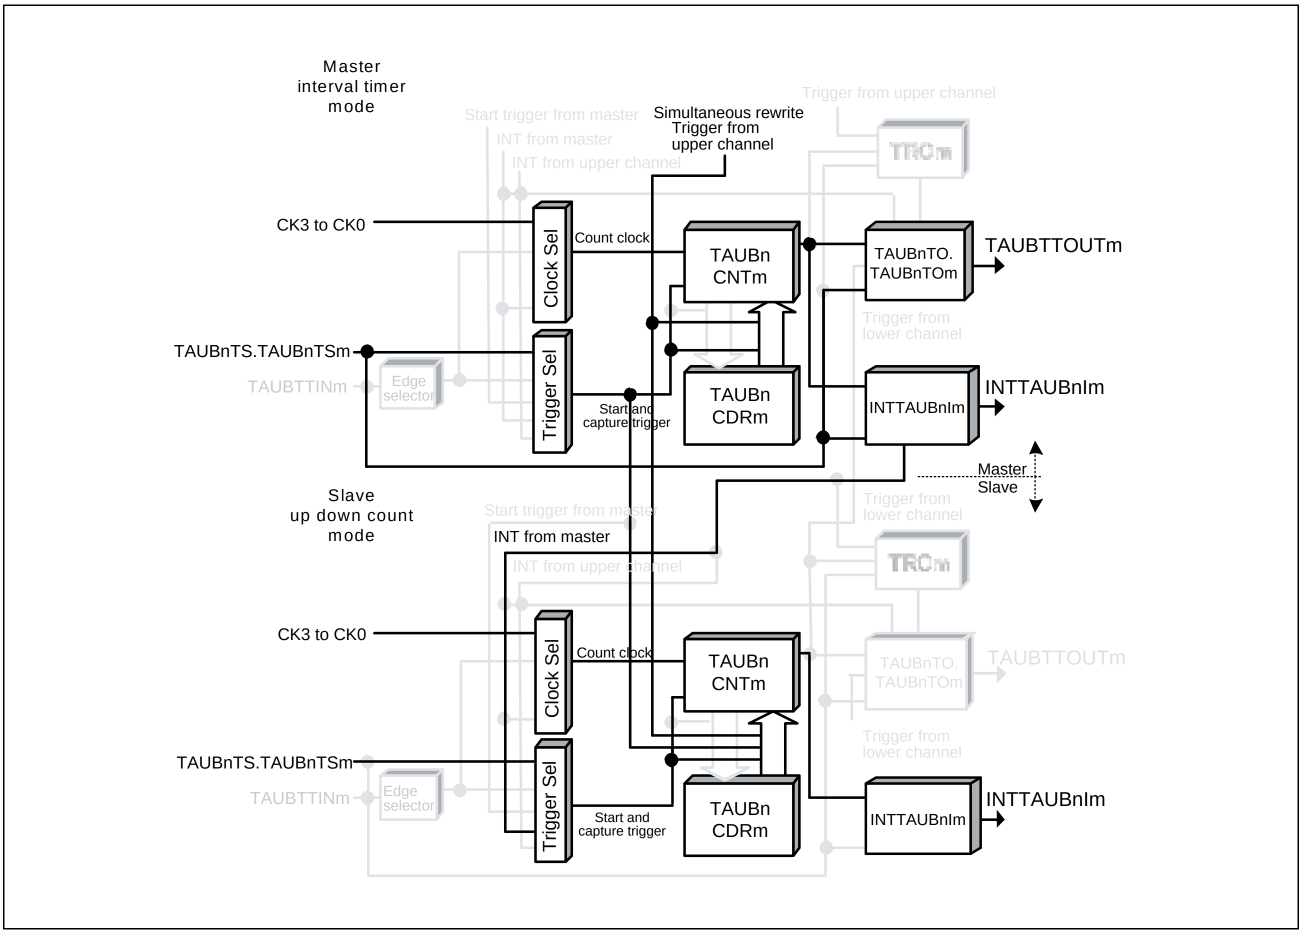

Figure 31.112 Block Diagram for A/D Conversion Trigger Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

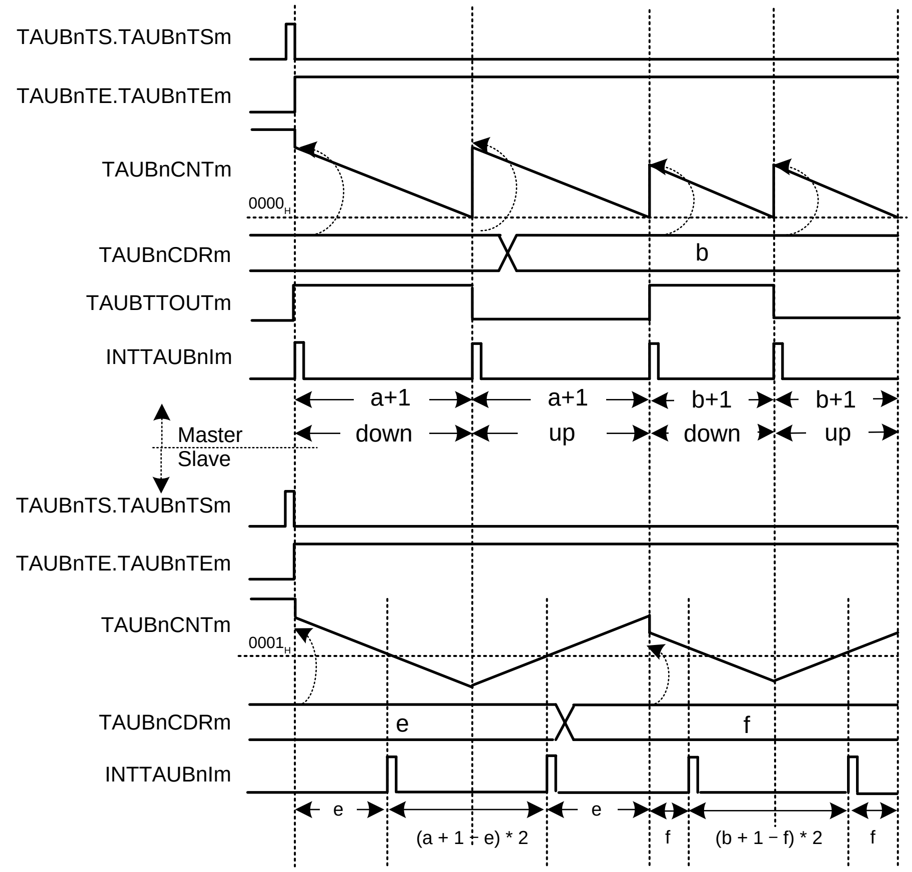

Figure 31.113 General Timing Diagram for A/D Conversion Trigger Output Function Type 2

Section 32 Timer Array Unit D (TAUD)

This section contains a generic description of the timer array unit D (TAUD).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of TAUD.

32.1 Features of RH850/F1KH, RH850/F1KM TAUD

32.1.1 Number of Units and Channels

This microcontroller has the following number of TAUD units and channels.

Table 32.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1

Table 32.7 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual TAUD units are identified by the index “n”; for example, TAUDnTOM is the TAUDn channel output mode register.
m	The TAUD has 16 channels. Throughout this section, the individual channels are identified by the index “m”, thus a certain channel is denoted as CHm (m = 0 to 15). The even numbered channels (m = 0, 2, 4, 6, 8, 10, 12, 14) are denoted as CHm_even. The odd numbered channels (m = 1, 3, 5, 7, 9, 11, 13, 15) are denoted as CHm_odd.

32.1.2 Register Base Address

TAUDn base address is listed in the following table.

TAUDn register addresses are given as an offset from the base address.

Table 32.8 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<TAUD0_base>	FFE2 0000_H

32.1.3 Clock Supply

The TAUDn clock supply is shown in the following table.

Table 32.9 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAUDn	PCLK	CKSCLK_IPERI1	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	Bus clock

32.1.4 Interrupt Requests

TAUDn interrupt requests are listed in the following table.

Table 32.10 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
TAUD0			
INTTAUD0I0	Channel 0 interrupt	8, 132	0 to 3, 17, 18
INTTAUD0I1	Channel 1 interrupt	48	0 to 3, 17, 18
INTTAUD0I2	Channel 2 interrupt	9, 158	0 to 3, 17, 18
INTTAUD0I3	Channel 3 interrupt	49	0 to 3, 17, 18
INTTAUD0I4	Channel 4 interrupt	10, 133	0 to 3, 17, 18
INTTAUD0I5	Channel 5 interrupt	50	0 to 3, 17, 18
INTTAUD0I6	Channel 6 interrupt	11, 134	0 to 3, 17, 18
INTTAUD0I7	Channel 7 interrupt	51	0 to 3, 17, 18
INTTAUD0I8	Channel 8 interrupt	12, 135	0 to 3, 17, 18
INTTAUD0I9	Channel 9 interrupt	52	0 to 3, 17, 18
INTTAUD0I10	Channel 10 interrupt	13, 159	0 to 3, 17, 18
INTTAUD0I11	Channel 11 interrupt	53	0 to 3, 17, 18
INTTAUD0I12	Channel 12 interrupt	14, 160	0 to 3, 17, 18
INTTAUD0I13	Channel 13 interrupt	54	0 to 3, 17, 18
INTTAUD0I14	Channel 14 interrupt	15, 161	0 to 3, 17, 18
INTTAUD0I15	Channel 15 interrupt	55	0 to 3, 17, 18

32.1.5 Reset Sources

TAUDn reset sources are listed in the following table. TAUDn is initialized by these reset sources.

Table 32.11 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
TAUDn	All reset sources (ISORES)

32.1.6 External Input/Output Signals

External input/output signals of TAUDn are listed below.

Table 32.12 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
TAUD0		
TAUDTTIN0	Channel 0 input*[1]	TAUD0I0
TAUDTTIN1	Channel 1 input*[1]	TAUD0I1
TAUDTTIN2	Channel 2 input*[1]	TAUD0I2
TAUDTTIN3	Channel 3 input*[1]	TAUD0I3
TAUDTTIN4	Channel 4 input*[1]	TAUD0I4
TAUDTTIN5	Channel 5 input*[1]	TAUD0I5
TAUDTTIN6	Channel 6 input*[1]	TAUD0I6
TAUDTTIN7	Channel 7 input*[1]	TAUD0I7
TAUDTTIN8	Channel 8 input*[1]	TAUD0I8
TAUDTTIN9	Channel 9 input*[1]	TAUD0I9
TAUDTTIN10	Channel 10 input*[1]	TAUD0I10
TAUDTTIN11	Channel 11 input*[1]	TAUD0I11
TAUDTTIN12	Channel 12 input*[1]	TAUD0I12
TAUDTTIN13	Channel 13 input*[1]	TAUD0I13
TAUDTTIN14	Channel 14 input*[1]	TAUD0I14
TAUDTTIN15	Channel 15 input*[1]	TAUD0I15
TAUDTTOUT0	Channel 0 output	TAUD0O0
TAUDTTOUT1	Channel 1 output	TAUD0O1
TAUDTTOUT2	Channel 2 output	TAUD0O2
TAUDTTOUT3	Channel 3 output	TAUD0O3
TAUDTTOUT4	Channel 4 output	TAUD0O4
TAUDTTOUT5	Channel 5 output	TAUD0O5
TAUDTTOUT6	Channel 6 output	TAUD0O6
TAUDTTOUT7	Channel 7 output	TAUD0O7
TAUDTTOUT8	Channel 8 output	TAUD0O8
TAUDTTOUT9	Channel 9 output	TAUD0O9
TAUDTTOUT10	Channel 10 output	TAUD0O10
TAUDTTOUT11	Channel 11 output	TAUD0O11
TAUDTTOUT12	Channel 12 output	TAUD0O12
TAUDTTOUT13	Channel 13 output	TAUD0O13
TAUDTTOUT14	Channel 14 output	TAUD0O14
TAUDTTOUT15	Channel 15 output	TAUD0O15

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector** and **Section 2C.12, Noise Filter & Edge/Level Detector**.

32.1.7 Internal Input/Output Signals

The internal input/output signals of TAUDn are listed below.

Table 32.13 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Connected to
TAUDnTSSTm	Simultaneous channel start trigger input	PIC
TAUDnTUDCm (m = 0, 2, 8)	TAUD master up/down signal output	PIC

32.1.8 TAUD0 Input Selection

The output from port TAUD0Im (m = 0 to 15) can be input to TAUDTTINm (m = 0 to 15) as shown in the following figure.

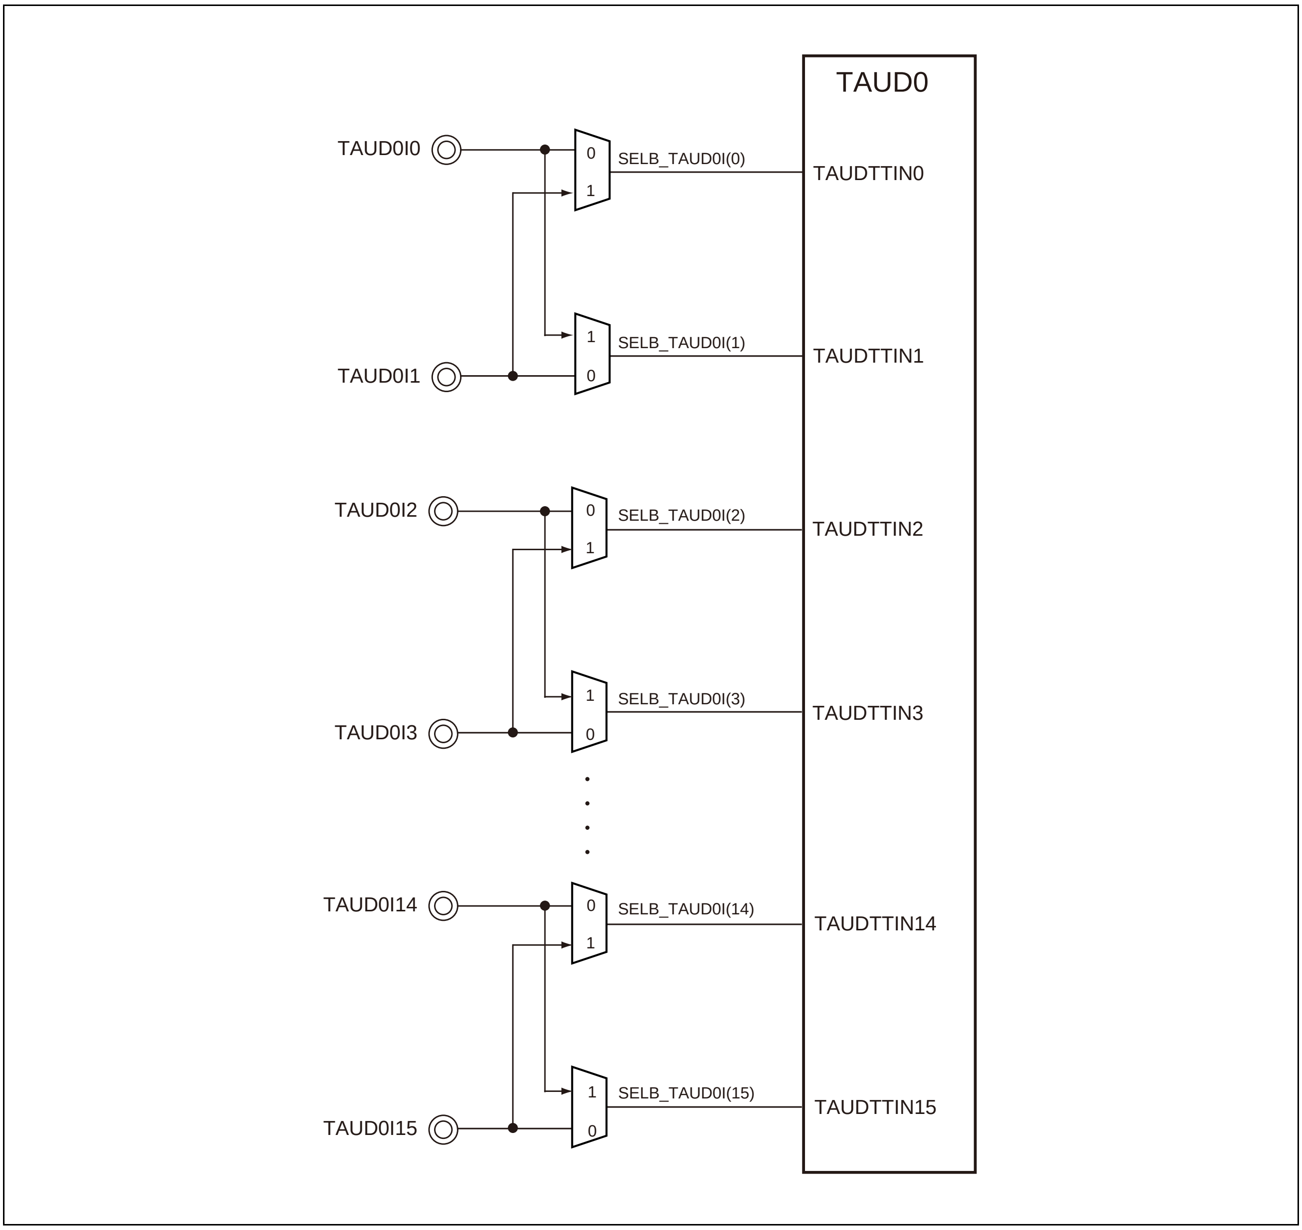

Figure 32.1 Selection of Signals Input to TAUD0

The following table shows the method of selecting input signals to several TAUD0 inputs.

Table 32.14 TAUD0 Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Input Signal	Function	Settings
TAUDTTIN [m]	Port TAUD0I[m]	SELB_TAUD0I [m] = 0
	Port TAUD0I[m + 1]	SELB_TAUD0I [m] = 1
TAUDTTIN [m + 1]	Port TAUD0I[m + 1]	SELB_TAUD0I [m + 1] = 0
	Port TAUD0I[m]	SELB_TAUD0I [m + 1] = 1

32.1.8.1 List of Registers

Input signal selection register is listed in the following table.

Table 32.15 List of Register

Module Name	Register Name	Symbol	Address
TAUDn input selection register			
SL_TAUDn	TAUDTTINm input signal selection register	SELB_TAUD0I	FFE2 4000_H

32.1.8.2 SELB_TAUD0I — TAUDTTINm Input Signal Selection Register

This register selects the TAUDTTINm input signals.

Access: This register can be read or written in 16-bit units.

Address: FFE2 4000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CAUTION

Do not change the input signal of each channel during the timer counting.

32.2 Overview

32.2.1 Functional Overview

The TAUD has the following functions:

- 16 channels
- 16-bit counter and 16-bit data register per channel
- Independent channel operation
- Synchronous channel operation (master and slave operation)
- Generation of different types of output signal
- Real-time output
- Counter can be triggered by external signal
- Interrupt generation

The Timer Array Unit D is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUDnCNTm and a 16-bit data register TAUDnCDRm to hold the start or compare value of the counter.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate in different operation modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, its operation mode and functions are not affected by those of other channels. When a channel is operated synchronously it is either a master or a slave. A master channel can have multiple slaves, and the state of one channel affects that of the other channels. For example, this means that one channel can control when another starts to count, is reset, etc.

32.2.2 Terms

In this section, the following terms are used.

Independent / synchronous channel operation

Independent or synchronous channel operation describes the dependency of channels on each other:

- If a channel operates independently of all other channels, this is called independent channel operation.
- If a channel operates depending on other channels, this is called synchronous channel operation.

Channel group

In synchronous channel operation, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

Operation mode

An operation mode can be selected for every channel m. The operation mode defines the basic operation and features of a channel.

In synchronous channel operation, every channel in the channel group can operate in a different operation mode.

Examples are “Capture Mode”, “Event Count Mode”, and “Interval Timer Mode”.

Channel output mode

The channel output mode defines the operation of TAUDTTOUTm

- of a single channel (independent output operation) or
- of all channels in a channel group (synchronous output operation).

Examples are “Independent Channel Output Mode 1” and “Synchronous Channel Output Mode 2 with Dead Time Output”.

Channel operation function

The channel operation function defines the complete function and all features

- of a single channel (independent channel operation) or
- of all channels in a channel group (synchronous channel operation).

Upper / lower channel

Depending on the channel number m, a channel with a smaller number or with a larger number is referred to as “upper” or “lower” channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

Example:

For channel 5, channel 3 is an upper channel and channel 9 is a lower channel.

32.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 32.17 Functional List of TAUD Operations

Operation Function	Example

32.2.4 TAUD I/O and Interrupt Request Signals

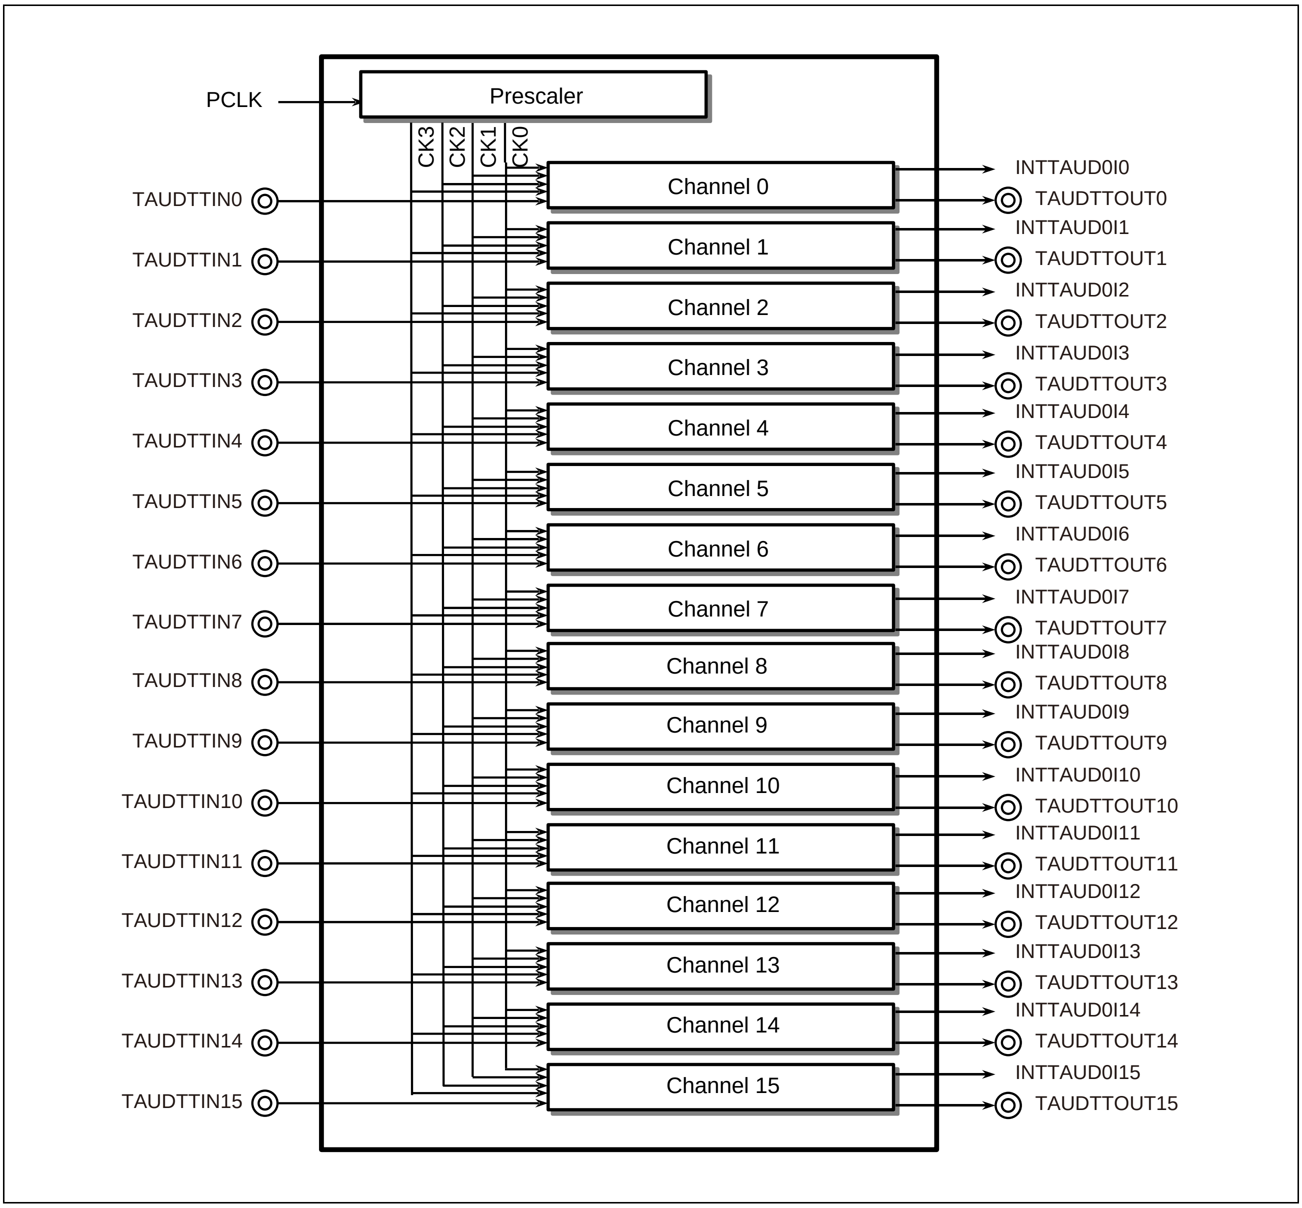

Figure 32.2 TAUD I/O and Interrupt Request Signals

32.2.5 Block Diagram

Figure 32.3, Block Diagram of the TAUD shows the main components of the TAUD.

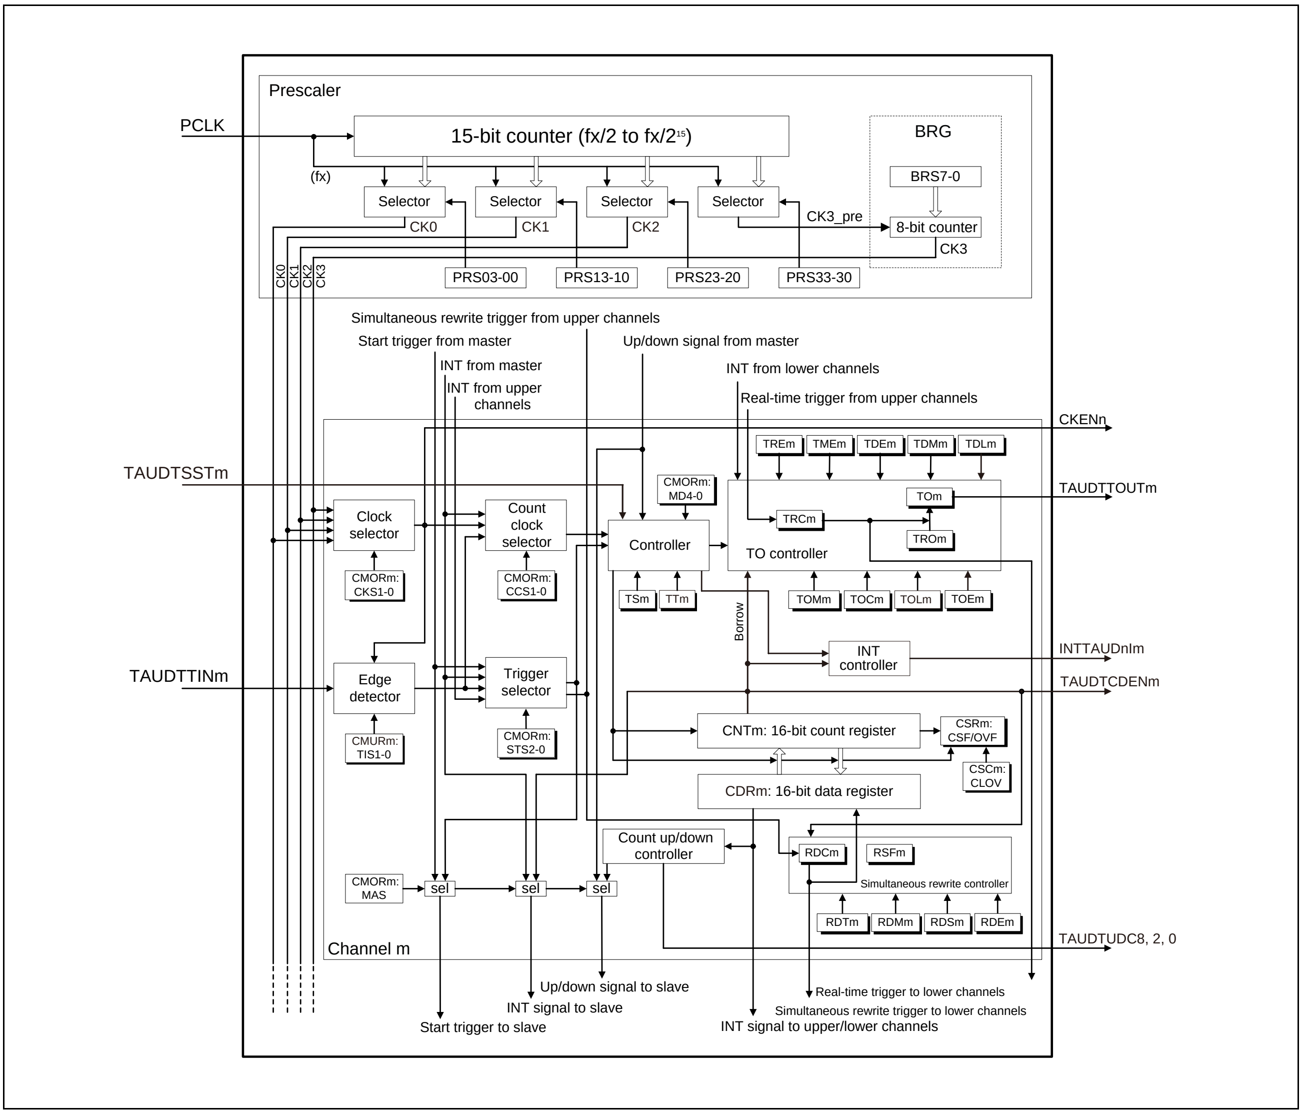

Figure 32.3 Block Diagram of the TAUD

The module name “TAUDn” has been omitted from the register names for the sake of clarity in the above figure.

32.2.6 Description of Blocks

The following describes the functional blocks:

Prescaler block

The prescaler block provides up to four clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived from PCLK by a configurable prescaler division factor of 2^0 to 2^{15}. The fourth count clock CK3 can be adjusted more precisely by using BRG to set an additional division factor that is not a power of 2.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- INTTAUDnIm from master channel
- TAUDTTINm input signal valid edge

Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUDnCMORm.TAUDnMD[4:0])
- Counter start enable (TAUDnTS.TAUDnTSm) and counter stop (TAUDnTT.TAUDnTTm)
  When counter start is enabled, status flag TAUDnTE.TAUDnTEm is set.
- Count direction (up/down) (can be controlled by master channel)

Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUDnTE.TAUDnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

- Synchronous channel start trigger input TAUDnTSSTm
- TAUDTTINm input signal valid edge
- INTTAUDnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUDTTOUTm generation unit.

Simultaneous rewrite controller

Simultaneous rewrite control is a function that can be used in synchronous operating modes. The data registers (TAUDnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

TAUDnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

32.3 Registers

32.3.1 List of Registers

TAUD registers are listed in the following table.

For details about <TAUDn_base>, see **Section 32.1.2, Register Base Address**.

Table 32.18 List of Registers

Module Name	Register Name	Symbol	Address
TAUDn prescaler registers			
TAUDn	TAUDn prescaler clock select register	TAUDnTPS	<TAUDn_base> + 240_H
	TAUDn prescaler baud rate setting register	TAUDnBRS	<TAUDn_base> + 244_H
TAUDn control registers			
TAUDn	TAUDn channel data register	TAUDnCDRm	<TAUDn_base> + m × 4_H
	TAUDn channel counter register	TAUDnCNTm	<TAUDn_base> + 80_H + m × 4_H
	TAUDn channel mode OS register	TAUDnCMORm	<TAUDn_base> + 200_H + m × 4_H
	TAUDn channel mode user register	TAUDnCMURm	<TAUDn_base> + $C0_H$ + m × 4_H
	TAUDn channel status register	TAUDnCSRm	<TAUDn_base> + 140_H + m × 4_H
	TAUDn channel status clear trigger register	TAUDnCSCm	<TAUDn_base> + 180_H + m × 4_H
	TAUDn channel start trigger register	TAUDnTS	<TAUDn_base> + $1C4_H$
	TAUDn channel enable status register	TAUDnTE	<TAUDn_base> + $1C0_H$
	TAUDn channel stop trigger register	TAUDnTT	<TAUDn_base> + $1C8_H$
TAUDn output registers			
TAUDn	TAUDn channel output enable register	TAUDnTOE	<TAUDn_base> + $5C_H$
	TAUDn channel output register	TAUDnTO	<TAUDn_base> + 58_H
	TAUDn channel output mode register	TAUDnTOM	<TAUDn_base> + 248_H
	TAUDn channel output configuration register	TAUDnTOC	<TAUDn_base> + $24C_H$
	TAUDn channel output active level register	TAUDnTOL	<TAUDn_base> + 040_H
	TAUDn channel dead time output enable register	TAUDnTDE	<TAUDn_base> + 250_H
	TAUDn channel dead time output mode register	TAUDnTDM	<TAUDn_base> + 254_H
	TAUDn channel dead time output level register	TAUDnTDL	<TAUDn_base> + 54_H
	TAUDn channel real-time output register	TAUDnTRO	<TAUDn_base> + $4C_H$
	TAUDn channel real-time output enable register	TAUDnTRE	<TAUDn_base> + 258_H
	TAUDn channel real-time output control register	TAUDnTRC	<TAUDn_base> + $25C_H$
	TAUDn channel modulation output enable register	TAUDnTME	<TAUDn_base> + 50_H
TAUDn reload data registers			
TAUDn	TAUDn channel reload data enable register	TAUDnRDE	<TAUDn_base> + 260_H
	TAUDn channel reload data mode register	TAUDnRDM	<TAUDn_base> + 264_H
	TAUDn channel reload data control channel select register	TAUDnRDS	<TAUDn_base> + 268_H
	TAUDn channel reload data control register	TAUDnRDC	<TAUDn_base> + $26C_H$
	TAUDn channel reload data trigger register	TAUDnRDT	<TAUDn_base> + 44_H
	TAUDn channel reload status register	TAUDnRSF	<TAUDn_base> + 48_H
TAUDn emulation register			
TAUDn	TAUDn emulation register	TAUDnEMU	<TAUDn_base> + 290_H

32.3.2 Details of TAUDn Prescaler Registers

32.3.2.1 TAUDnTPS — TAUDn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescaler. CK3 is generated by dividing CK3_PRE by the factor specified in TAUDnBRS.

Access: This register can be read or written in 16-bit units.

Address: <TAUDn_base> + 240_H

Value after reset: $FFFF_H$

NOTE

The TAUDn clock input PCLK is specified in the first part of this section, **Section 32.1.3, Clock Supply**.

32.3.2.2 TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUDnTPS.TAUDnPRS3[3:0].

Access: This register can be read or written in 8-bit units.

Address: <TAUDn_base> + 244_H

Value after reset: 00_H

32.3.3 Details of TAUDn Control Registers

32.3.3.1 TAUDnCDRm — TAUDn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUDnCMORm.TAUDnMD[4:1].

Access: This register can be read or written in 16-bit units.

- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

Address: <TAUDn_base> + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.21 TAUDnCDRm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnCDR [15:0]	Data register for capture/compare values

32.3.3.2 TAUDnCNTm — TAUDn Channel Counter Register

This is a channel m counter register.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUDn_base> + 80$_H$ + m × 4$_H$

Value after reset: FFFF$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.22 TAUDnCNTm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnCNT [15:0]	16-bit counter value

A read value depends on a counter value, a changed operating mode, TAUDnTS.TAUDnTSm or TAUDnTT.TAUDnTTm bit value.

The initial read value of the counter depends on an operating mode and how the counter is stopped.

- Stop by a reset
- Stop by a counter stop trigger (TAUDnTT.TAUDnTTm = 1)

Table 32.23, TAUDnCNTm Read Values after Re-Enabling Counter lists the initial counter read values after the counter is stopped (TAUDnTE.TAUDnTEm = 0) and re-enabled (TAUDnTS.TAUDnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUDnTS.TAUDnTSm = 1) with the counter waiting for a start trigger.

Table 32.23 TAUDnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUDnCNTm Value		
		Start Value*[1]	After Stop Trigger	After One Count
Interval timer mode	Count down	FFFF$_H$	Stop value	—
Judge mode	Count down	FFFF$_H$	Stop value	—
Capture mode	Count up	0000$_H$	Stop value	—
Event count mode	Count down	FFFF$_H$	Stop value	—
One-count mode	Count down	FFFF$_H$	Stop value	FFFF$_H$
Capture and one-count mode	Count up	0000$_H$	Stop value	Capture value + 1 (TAUDnCDRm)
Judge and one-count mode	Count down	FFFF$_H$	Stop value	TAUDnCNTm value – 1
Count-up/-down mode	Count down/up	FFFF$_H$	Stop value	—
Pulse one-count mode	Count down	FFFF$_H$	Stop value	0000$_H$
Count capture mode	Count up	0000$_H$	Stop value	—
Gate count mode	Count down	FFFF$_H$	Stop value	Stop value
Capture and gate count mode	Count up	0000$_H$	Stop value	Stop value

Note 1. The value set for TAUDnCNTm when the operating mode is changed after a reset is deasserted.

32.3.3.3 TAUDnCMORm — TAUDn Channel Mode OS Register

This register controls channel m operation.

Access: This register can be read or written in 16-bit units. Writable only when the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 200_H + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

</table>

Table 32.24 TAUDnCMORm Register Contents

Bit Position	Bit Name	Function
4 to 0	TAUDnMD[4:0]	Specifies an operating mode.

TAUDn MD4	TAUDn D3	TAUDn MD2	TAUDn MD1	TAUDn MD0	Functional Description
0	0	0	0	1/0	Interval timer mode
0	0	0	1	1/0	Judge mode
0	0	1	0	1/0	Capture mode
0	0	1	1	0	Event count mode
0	1	0	0	1/0	One-count mode
0	1	0	1	1/0	Setting prohibited
0	1	1	0	0	Capture and one-count mode
0	1	1	1	1/0	Judge and one-count mode
1	0	0	0	0	Setting prohibited
1	0	0	1	0	Count-up/-down mode
1	0	1	0	1/0	Pulse one-count mode
1	0	1	1	1/0	Count capture mode
1	1	0	0	0	Gate count mode
1	1	0	1	0	Capture and gate count mode

Mode	Role of TAUDnMD0 Bit
Interval timer mode Capture mode Count capture mode	Specifies whether INTTAUDnIm is generated at the beginning of count operation (when a start trigger is entered) or not. 0: INTTAUDnIm is not generated. 1: INTTAUDnIm is generated.
Event count mode Count-up/-down mode	This bit should be set to 0 (the INTTAUDnIm signal is not output at the beginning of count operation).
One-count mode Pulse one-count mode	Enables/disables start trigger detection during counting. 0: Disables detection. 1: Enables detection. **CAUTION:** ● INTTAUDnIm signal is not output at the beginning of count operation in one-count mode. ● INTTAUDnIm signal is output at the beginning of count operation in pulse onecount mode.
Gate count mode	This bit should be set to 0 (disables start trigger detection during counting).
Capture and one-count mode Capture and gate count mode	This bit should be set to 0. **CAUTION:** INTTAUDnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled.
Judge mode Judge and one-count mode	Specifies INTTAUDnIm output timing. 0: When TAUDnCNTm ≤ TAUDnCDRm 1: When TAUDnCNTm > TAUDnCDRm

32.3.3.4 TAUDnCMURm — TAUDn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUDTTINm input.

Access: This register can be read or written in 8-bit units.

Address: <TAUDn_base> + C0$_{H}$ + m × 4$_{H}$

Value after reset: 00$_{H}$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.25 TAUDnCMURm Register Contents

● Edge detection of TAUDTTINm input signal is based on the operation clock selected by TAUDnCMORm.TAUDnCKS[1:0].</td></tr>
</table>

32.3.3.5 TAUDnCSRm — TAUDn Channel Status Register

This register indicates the count direction and overflow status of channel m counter.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <TAUDn_base> + 140_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnCSF	TAUDnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 32.26 TAUDnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	TAUDnCSF	Indicates a count direction. 0: Count-up 1: Count-down The read value of this bit is valid only in the following mode: ● Count-up/-down mode
0	TAUDnOVF	Indicates counter overflow status. 0: No overflow occurs. 1: Overflow occurs. This bit is used only in the following modes: ● Capture mode ● Capture and one-count mode The function of this bit depends on the setting of control bit TAUDnCMORm.TAUDnCOS[1:0].

32.3.3.6 TAUDnCSCm — TAUDn Channel Status Clear Trigger Register

This is a trigger register for clearing the overflow flag TAUDnCSRm.TAUDnOVF of channel m.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H.

Address: <TAUDn_base> + 180_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUDnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 32.27 TAUDnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUDnCLOV	0: No function 1: Clears overflow flag TAUDnCSRm.TAUDnOVF.

32.3.3.7 TAUDnTS — TAUDn Channel Start Trigger Register

This register enables the counter operation of each channel.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000_H.

Address: <TAUDn_base> + $1C4_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TS15	TAUDn TS14	TAUDn TS13	TAUDn TS12	TAUDn TS11	TAUDn TS10	TAUDn TS09	TAUDn TS08	TAUDn TS07	TAUDn TS06	TAUDn TS05	TAUDn TS04	TAUDn TS03	TAUDn TS02	TAUDn TS01	TAUDn TS00

Table 32.28 TAUDnTS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTSm	Enables the counter operation of channel m. 0: No function 1: Enables the counter operation and sets TAUDnTE.TAUDnTEm to 1. The counter operation is only enabled when TAUDnTE.TAUDnTEm is set to 1. Whether counting is started or not depends on a selected operating mode.

32.3.3.8 TAUDnTE — TAUDn Channel Enable Status Register

This register enables/disables a counter operation.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUDn_base> + 1C0$_{H}$

Value after reset: 0000$_{H}$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.29 TAUDnTE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTEm	Enables/disables the counter operation of channel m. 0: Disables counter operation. 1: Enables counter operation. This bit is set to 1 when trigger input of TAUDnTSSTm (synchronous channel start trigger signal) is detected or when TAUDnTS.TAUDnTSm is set to 1. This bit is set to 0 when TAUDnTT.TAUDnTTm is set to 1.

32.3.3.9 TAUDnTT — TAUDn Channel Stop Trigger Register

This register stops the counter operation of each channel.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000$_{H}$.

Address: <TAUDn_base> + 1C8$_{H}$

Value after reset: 0000$_{H}$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 32.30 TAUDnTT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTTm	Stops the counter operation of channel m. 0: No function 1: Stops the counter operation and resets TAUDnTE.TAUDnTEm. TAUDnCNTm, TAUDnTO.TAUDnTOm, and TAUDTTOUTm retain the values provided before the counter is stopped.

32.3.4 Details of TAUDn Simultaneous Rewrite Registers

32.3.4.1 TAUDnRDE — TAUDn Channel Reload Data Enable Register

This register enables/disables simultaneous rewrite of TAUDnCDRm/TAUDnTOLm data register.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 260_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RDE15	TAUDn RDE14	TAUDn RDE13	TAUDn RDE12	TAUDn RDE11	TAUDn RDE10	TAUDn RDE09	TAUDn RDE08	TAUDn RDE07	TAUDn RDE06	TAUDn RDE05	TAUDn RDE04	TAUDn RDE03	TAUDn RDE02	TAUDn RDE01	TAUDn RDE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.31 TAUDnRDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDEm	Enables/disables simultaneous rewrite of the data register of channel m. 0: Disables simultaneous rewrite 1: Enables simultaneous rewrite

32.3.4.2 TAUDnRDS — TAUDn Channel Reload Data Control Channel Select Register

This register selects a channel that controls simultaneous rewrite.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 268_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RDS15	TAUDn RDS14	TAUDn RDS13	TAUDn RDS12	TAUDn RDS11	TAUDn RDS10	TAUDn RDS09	TAUDn RDS08	TAUDn RDS07	TAUDn RDS06	TAUDn RDS05	TAUDn RDS04	TAUDn RDS03	TAUDn RDS02	TAUDn RDS01	TAUDn RDS00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.32 TAUDnRDS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDSm	Selects a channel that controls a simultaneous rewrite trigger. 0: Master channel 1: Another upper channel

32.3.4.3 TAUDnRDM — TAUDn Channel Reload Data Mode Register

This register selects the timing for generating a simultaneous rewrite control signal.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 264$_{H}$

Value after reset: 0000$_{H}$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RDM15	TAUDn RDM14	TAUDn RDM13	TAUDn RDM12	TAUDn RDM11	TAUDn RDM10	TAUDn RDM09	TAUDn RDM08	TAUDn RDM07	TAUDn RDM06	TAUDn RDM05	TAUDn RDM04	TAUDn RDM03	TAUDn RDM02	TAUDn RDM01	TAUDn RDM00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.33 TAUDnRDM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDMm	Selects the timing for generating a simultaneous rewrite trigger signal. 0: When the master channel counter starts to count 1: At the peak of cycle of triangular wave These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and TAUDnRDS.TAUDnRDSm = 0.

32.3.4.4 TAUDnRDC — TAUDn Channel Reload Data Control Register

This register specifies a channel which generates an INTTAUDnIm signal to trigger simultaneous rewrite.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 26C$_{H}$

Value after reset: 0000$_{H}$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RDC15	TAUDn RDC14	TAUDn RDC13	TAUDn RDC12	TAUDn RDC11	TAUDn RDC10	TAUDn RDC09	TAUDn RDC08	TAUDn RDC07	TAUDn RDC06	TAUDn RDC05	TAUDn RDC04	TAUDn RDC03	TAUDn RDC02	TAUDn RDC01	TAUDn RDC00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 32.34 TAUDnRDC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDCm	Specifies whether the channel generates a simultaneous rewrite trigger signal or not. 0: Does not operate as a simultaneous rewrite trigger channel. 1: Operates as a simultaneous rewrite trigger channel. These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and TAUDnRDS.TAUDnRDSm = 1.

32.3.4.5 TAUDnRDT — TAUDn Channel Reload Data Trigger Register

This register triggers a simultaneous rewrite enabling state.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000_H.

Address: <TAUDn_base> + 044_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RDT15	TAUDn RDT14	TAUDn RDT13	TAUDn RDT12	TAUDn RDT11	TAUDn RDT10	TAUDn RDT09	TAUDn RDT08	TAUDn RDT07	TAUDn RDT06	TAUDn RDT05	TAUDn RDT04	TAUDn RDT03	TAUDn RDT02	TAUDn RDT01	TAUDn RDT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 32.35 TAUDnRDT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDTm	Triggers a simultaneous rewrite enabling state. 0: No function 1: The simultaneous rewrite enabling flag (TAUDnRSFm) is set to 1. The system waits for a simultaneous rewrite trigger. These bits only apply when: ● TAUDnRDE.TAUDnRDEm = 1

32.3.4.6 TAUDnRSF — TAUDn Channel Reload Status Register

This flag register indicates simultaneous rewrite status.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUDn_base> + 048_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RSF15	TAUDn RSF14	TAUDn RSF13	TAUDn RSF12	TAUDn RSF11	TAUDn RSF10	TAUDn RSF09	TAUDn RSF08	TAUDn RSF07	TAUDn RSF06	TAUDn RSF05	TAUDn RSF04	TAUDn RSF03	TAUDn RSF02	TAUDn RSF01	TAUDn RSF00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.36 TAUDnRSF Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRSFm	Indicates simultaneous rewrite status. 0: Indicates that simultaneous rewrite has been completed due to the generation of simultaneous rewrite trigger. 1: Indicates that the system waits for a simultaneous rewrite trigger in the simultaneous rewrite enabling state (TAUDnRDTm = 1).

32.3.5 Details of TAUDn Output Registers

32.3.5.1 TAUDnTOE — TAUDn Channel Output Enable Register

This register enables/disables the independent channel output mode controlled by software.

Access: This register can be read or written in 16-bit units.

Address: <TAUDn_base> + 5C_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TOE15	TAUDn TOE14	TAUDn TOE13	TAUDn TOE12	TAUDn TOE11	TAUDn TOE10	TAUDn TOE09	TAUDn TOE08	TAUDn TOE07	TAUDn TOE06	TAUDn TOE05	TAUDn TOE04	TAUDn TOE03	TAUDn TOE02	TAUDn TOE01	TAUDn TOE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.37 TAUDnTOE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOEm	Enables/disables the independent channel output function. 0: Disables the independent timer output function (controlled by software). 1: Enables the independent timer output function.

32.3.5.2 TAUDnTO — TAUDn Channel Output Register

This register specifies and reads a TAUDTTOUTm level.

Access: This register can be read or written in 16-bit units.

Address: <TAUDn_base> + 58_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TO15	TAUDn TO14	TAUDn TO13	TAUDn TO12	TAUDn TO11	TAUDn TO10	TAUDn TO09	TAUDn TO08	TAUDn TO07	TAUDn TO06	TAUDn TO05	TAUDn TO04	TAUDn TO03	TAUDn TO02	TAUDn TO01	TAUDn TO00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.38 TAUDnTO Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOm	Specifies and reads a TAUDTTOUTm level. 0: Low level 1: High level Only TAUDnTOm bits for which Independent Channel Output function is disabled (TAUDnTOEm = 0) can be written.

32.3.5.3 TAUDnTOM — TAUDn Channel Output Mode Register

This register specifies the output mode of each channel.

Access: This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 248$_{H}$

Value after reset: 0000$_{H}$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TOM15	TAUDn TOM14	TAUDn TOM13	TAUDn TOM12	TAUDn TOM11	TAUDn TOM10	TAUDn TOM09	TAUDn TOM08	TAUDn TOM07	TAUDn TOM06	TAUDn TOM05	TAUDn TOM04	TAUDn TOM03	TAUDn TOM02	TAUDn TOM01	TAUDn TOM00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.39 TAUDnTOM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOMm	Specifies an output mode. 0: Independent channel operation 1: Synchronous channel operation

32.3.5.4 TAUDnTOC — TAUDn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUDnTOMm.

Access: This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 24C$_{H}$

Value after reset: 0000$_{H}$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TOC15	TAUDn TOC14	TAUDn TOC13	TAUDn TOC12	TAUDn TOC11	TAUDn TOC10	TAUDn TOC09	TAUDn TOC08	TAUDn TOC07	TAUDn TOC06	TAUDn TOC05	TAUDn TOC04	TAUDn TOC03	TAUDn TOC02	TAUDn TOC01	TAUDn TOC00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.40 TAUDnTOC Register Contents

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>15 to 0</td><td>TAUDnTOCm</td><td>Specifies an output mode.
0: Operating mode 1
1: Operating mode 2
As listed below, the output mode depends on the setting of TAUDnTOM.TAUDnTOMm.
<table>
<tr><th>TAUDnTOMm</th><th>TAUDnTOCm</th><th>Functional Description</th></tr>
<tr><td>0</td><td>0</td><td>Toggle mode: Toggle operation is conducted when INTTAUDnIm occurs.</td></tr>
<tr><td>0</td><td>1</td><td>Set/reset mode: Set when INTTAUDnIm occurs at the beginning of count operation, and reset when INTTAUDnIm is caused by detection of a match between TAUDnCNTm and TAUDnCDRm.</td></tr>
<tr><td>1</td><td>0</td><td>Synchronous channel operating mode 1: Set when INT occurs on master channels, and reset when INT occurs on slave channels.</td></tr>
<tr><td>1</td><td>1</td><td>Synchronous channel operating mode 2: Set when INTTAUDnIm occurs in count-down status, and reset when INTTAUDnIm occurs in count-up status.</td></tr>
</table>
</td></tr>
</table>

32.3.5.5 TAUDnTOL — TAUDn Channel Output Active Level Register

This register specifies the output logic of channel output bit (TAUDnTO.TAUDnTOm).

Access: This register can be read or written in 16-bit units.

Address: <TAUDn_base> + 040_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 32.41 TAUDnTOL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOLm	Specifies the output logic of channel m output bit (TAUDnTO.TAUDnTOm). 0: Positive logic (active high) 1: Negative logic (active low) The setting of these bits applies to all channel output modes other than independent channel output mode controlled by software and independent channel output mode 1 and independent channel output mode 1 with real-time output.

32.3.6 Details of TAUDn Dead Time Output Registers

32.3.6.1 TAUDnTDE — TAUDn Channel Dead Time Output Enable Register

This register enables/disables the dead time operation of every channel.

Access: This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 250_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TDE15	TAUDn TDE14	TAUDn TDE13	TAUDn TDE12	TAUDn TDE11	TAUDn TDE10	TAUDn TDE09	TAUDn TDE08	TAUDn TDE07	TAUDn TDE06	TAUDn TDE05	TAUDn TDE04	TAUDn TDE03	TAUDn TDE02	TAUDn TDE01	TAUDn TDE00

Table 32.42 TAUDnTDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTDEm	Enables/disables the dead time control operation of channel m. 0: Disables dead time operation 1: Enables dead time operation. The same setting should be made for both even and odd slave channels in pairs. These bit settings are applied when: • TAUDnTOE.TAUDnTOEm, TAUDnTOM.TAUDnTOMm, TAUDnTOC.TAUDnTOCm = 1

32.3.6.2 TAUDnTDM — TAUDn Channel Dead Time Output Mode Register

This register specifies the timing to add dead time during dead time output.

Access: This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 254_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TDM15	TAUDn TDM14	TAUDn TDM13	TAUDn TDM12	TAUDn TDM11	TAUDn TDM10	TAUDn TDM09	TAUDn TDM08	TAUDn TDM07	TAUDn TDM06	TAUDn TDM05	TAUDn TDM04	TAUDn TDM03	TAUDn TDM02	TAUDn TDM01	TAUDn TDM00

Table 32.44 TAUDnTDL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTDLm	Selects a phase in which dead time is added. 0: Normal phase 1: Reverse phase These bit settings are applied when: ● TAUDnTOE.TAUDnTOEm, TAUDnTOM.TAUDnTOMm, TAUDnTOC.TAUDnTOCm, TAUDnTDE.TAUDnTDEm = 1

32.3.7 Details of TAUDn Real-time/Modulation Output Registers

32.3.7.1 TAUDnTRE — TAUDn Channel Real-time Output Enable Register

This register enables/disables real-time output.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 258_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TRE15	TAUDn TRE14	TAUDn TRE13	TAUDn TRE12	TAUDn TRE11	TAUDn TRE10	TAUDn TRE09	TAUDn TRE08	TAUDn TRE07	TAUDn TRE06	TAUDn TRE05	TAUDn TRE04	TAUDn TRE03	TAUDn TRE02	TAUDn TRE01	TAUDn TRE00

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.45 TAUDnTRE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTREm	Enables or disables real-time output of channel m. 0: Disables real-time output 1: Enables real-time output. These bit settings are applied only when TAUDnTOE.TAUDnTOEm = 1. When TAUDnTRE.TAUDnTREm = 0, TAUDTTOUTm is not affected by real-time output. When TAUDnTRE.TAUDnTREm = 1, TAUDTTOUTm outputs the value of real-time output bit TAUDnTRO.TAUDnTROm in response to a timer operation.

32.3.7.2 TAUDnTRC — TAUDn Channel Real-time Output Control Register

This register controls the real-time output trigger of each channel.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + $25C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
15 to 0	TAUDnTROm	Sets a value which is output to TAUDTTOUTm. 0: Low 1: High TAUDnTROm value is not output to TAUDTTOUTm when TAUDnTRE.TAUDnTREm = 0, even if a real-time output trigger occurs.

32.3.7.4 TAUDnTME — TAUDn Channel Modulation Output Enable Register

This register enables/disables modulation output for timer output and real-time output.

Access: This register can be read or written in 16-bit units.

Address: <TAUDn_base> + 050$_H$

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TME15	TAUDn TME14	TAUDn TME13	TAUDn TME12	TAUDn TME11	TAUDn TME10	TAUDn TME09	TAUDn TME08	TAUDn TME07	TAUDn TME06	TAUDn TME05	TAUDn TME04	TAUDn TME03	TAUDn TME02	TAUDn TME01	TAUDn TME00

Table 32.48 TAUDnTME Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTMEm	Enables/disables modulation output for timer output and real-time output of channel m. 0: Disables modulation 1: Enables modulation These bit settings are applied only when TAUDnTOE.TAUDnTOEm and TAUDnTRE.TAUDnTREm = 1.

32.3.8 TAUDn Emulation Register

32.3.8.1 TAUDnEMU — TAUDn Emulation Register

This register controls SVSTOP operations.

Access:	This register can be read or written in 8-bit units. Perform write operations when the counter is stopped (TAUDnTE.TAUDnTEm = 0) and (EPC.SVSTOP = 0).
Address:	<TAUDn_base> + 290_H
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	TAUDnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 32.49 TAUDnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUDnSVSDIS	When EPC.SVSTOP bit = 0: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0). When EPC.SVSTOP bit = 1: 0: The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint). 1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

32.4 Operating Procedure

The following lists the general operation procedure for the TAUDn.

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUDTTOUTm is also initialized and outputs a low level.

(1) Set the TAUDnTPS and TAUDnBRS registers to specify the clock frequency of CK0 to CK3.

(2) Configure the desired TAUDn function:

- Set the operation mode
- Set the channel output mode
- Set any other control bits

(3) Enable the counter by setting the TAUDnTS.TAUDnTSm bit to 1.
The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.

(4) If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUDnTT.TAUDnTTm bit to 1. The counter can be forcibly restarted by setting the TAUDnTS.TAUDnTSm bit to 1.

(5) Stop the function by setting the TAUDnTT.TAUDnTTm bit to 1.

NOTES

1. A detailed description of the required control bits and the operation of the individual functions are given in **Section 32.12, Independent Channel Operation Functions** and **Section 32.15, Synchronous Channel Operation Functions**.
2. The function can be changed while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

32.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels). Several rules apply to the settings of channels. These rules are detailed in **Section 32.5.1, Rules of Synchronous Channel Operation**.

Two special features for synchronous channel operation are detailed in the following:

- **Section 32.5.2, Simultaneous Start and Stop of Synchronous Channel Counters**
- **Section 32.6, Simultaneous Rewrite**

32.5.1 Rules of Synchronous Channel Operation

Number of master and slave channels

- Only even channels (CH0, CH2, CH4, …) can be set as master channels. Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 and the lower channels (CH3, CH4, CH5, …) can be set as slave channels.
- If multiple master channels are used, slave channels cannot cross the master channels.
  Example: If CH0 and CH4 are master channels, CH1 to CH3 can be set as slave channels for CH0, but CH5 to CH15 cannot.

Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the TAUDnCMORm.TAUDnCKS[1:0] bits of the slave and master channel.

The basic concepts of master/slave usage and operation clocks are illustrated in **Figure 32.4, Grouping of Channels and Assignment of Operatiion Clocks**.

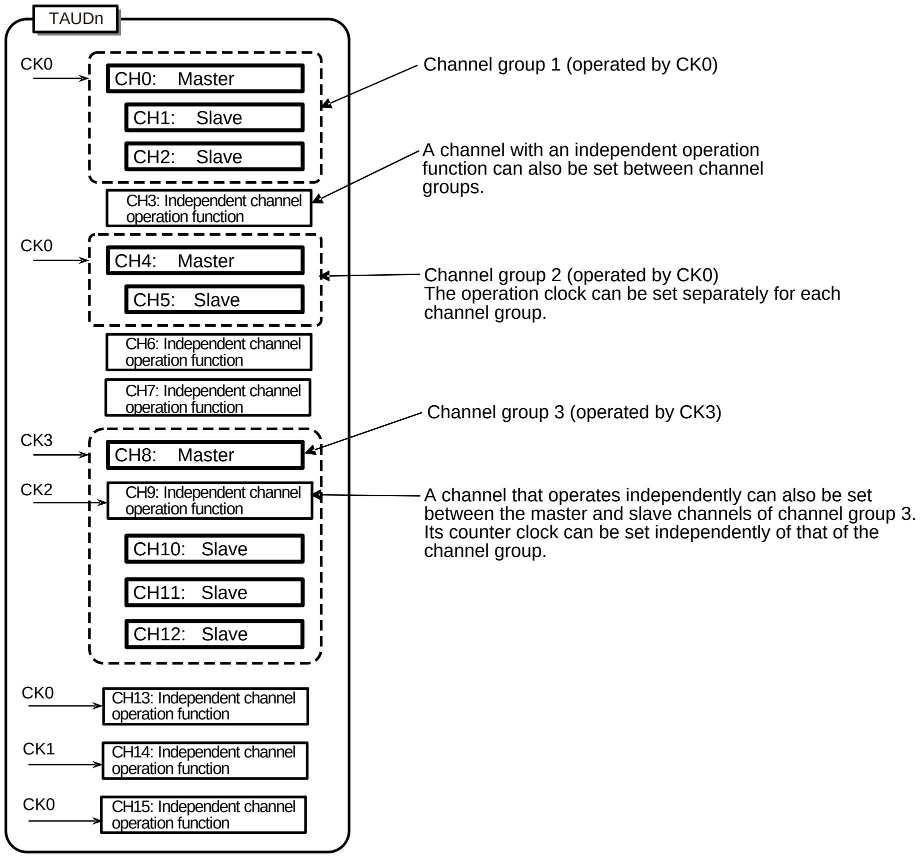

Figure 32.4 Grouping of Channels and Assignment of Operatiion Clocks

Control trigger signal for master/slave channels

- Master channels can output control trigger signals to slave channels.
- Slave channels can use control trigger signals from master channels but cannot output control trigger signals for their own to lower channels.
- Master channels cannot use control trigger signals from upper master channels.

32.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit and between the units.

32.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUDnTS.TAUDnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUDnTT.TAUDnTTm bits of the channels should be set at the same time.

Setting to the TAUDnTS.TAUDnTSm bits to 1 also sets the corresponding TAUDnTE.TAUDnTEm bits to 1, enabling counting. The count start timing depends on operating mode.

32.5.2.2 Simultaneous Start between the Units

Counters in different units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

For details about how to perform simultaneous start between the units, see **Section 36.8, Simultaneous Start Trigger Function**.

32.6 Simultaneous Rewrite

32.6.1 Overview of Operations

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUDnCDRm and TAUDnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUDnIm being issued on the upper channel specified by TAUDnRDC.TAUDnRDCm

There are four methods for simultaneous rewrite. These are listed in **Table 32.50, Simultaneous Rewrite Methods and when They are Triggered**, along with how to specify them and when they cause simultaneous rewrite to be triggered.

Table 32.50 Simultaneous Rewrite Methods and when They are Triggered

Method	Simultaneous Rewrite Triggered when	TAUDnRDE. TAUDnRDEm	TAUDnRDS. TAUDnRDSm	TAUDnRDM. TAUDnRDMm
—	No simultaneous rewrite	0	0	0
A	The master channel (re)starts counting	1	0	0
B	Counting is started in the master channel. The master channel starts counting down at the peak of triangular cycle of the corresponding slave channel.	1	0	1
C1	INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm	1	1	0/1
C2	INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm that in turn is triggered by an external signal	1	1	0/1

Table 32.51, Channel Functions and the Methods They Use for Simultaneous Rewrite lists which of these four methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in **Section 32.14 Independent Channel Simultaneous Rewrite Functions**, **Section 32.15, Synchronous Channel Operation Functions**, and **Section 32.16, Synchronous Non-Complementary and Complementary Modulation Output Functions**.

Table 32.51 Channel Functions and the Methods They Use for Simultaneous Rewrite

32.6.2 How to Control Simultaneous Rewrite

Figure 32.5, General Procedure for Simultaneous Rewrite shows the general procedure for simultaneous rewrite. The three main blocks (initial settings, start and counter count operation, and simultaneous rewrite) are explained afterwards.

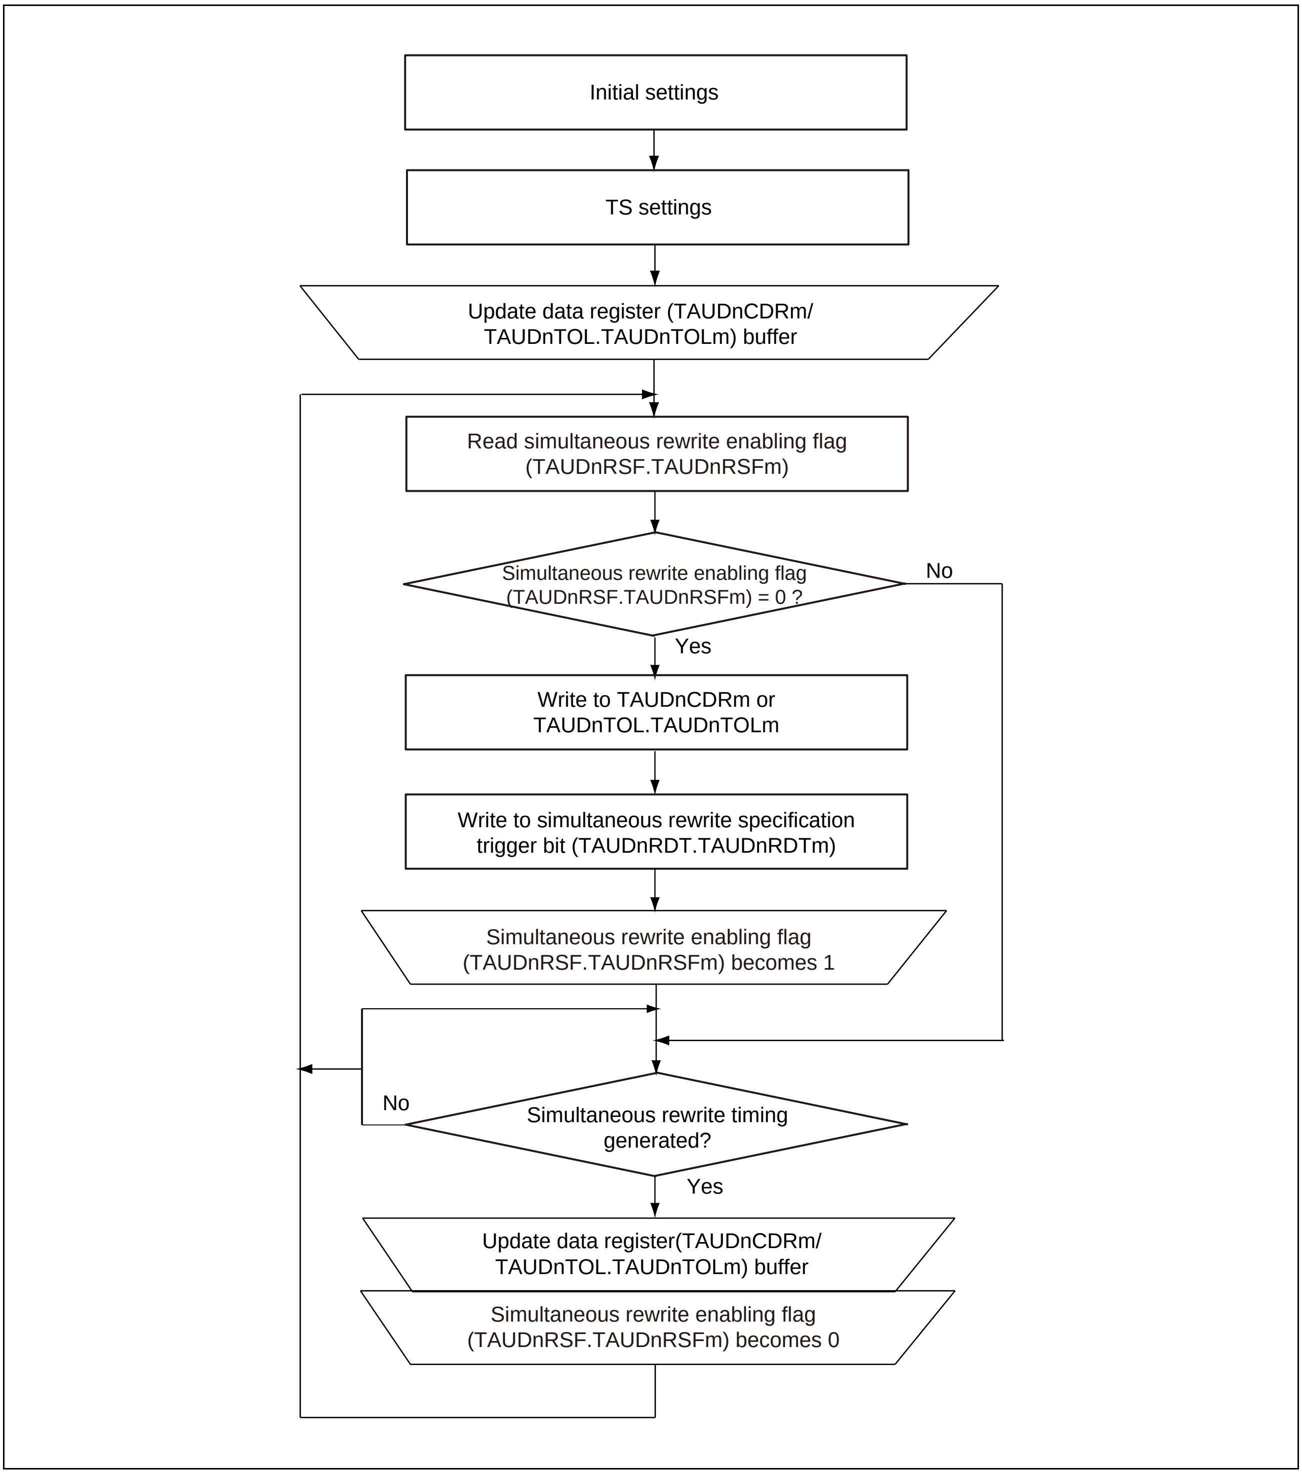

Figure 32.5 General Procedure for Simultaneous Rewrite

32.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUDnRDE.TAUDnRDEm = 1
- To select the type of simultaneous rewrite, set TAUDnRDM.TAUDnRDMm and TAUDnRDS.TAUDnRDSm according to the values listed in **Table 32.50, Simultaneous Rewrite Methods and when They are Triggered**.
- Specify a simultaneous rewrite trigger channel by using TAUDnRDC.TAUDnRDCm. (Prerequisite: TAUDnRDS.TAUDnRDSm has been set to the upper channel.)

32.6.2.2 Start Counter and Count Operation

- To start all the TAUDnCNTm counters of the channel group, set the corresponding TAUDnTS.TAUDnTSm bits to 1. The values of TAUDnTOL.TAUDnTOLm and the data registers (TAUDnCDRm) are loaded into the corresponding TAUDnTOL.TAUDnTOLm buffer (TAUDnTOL.TAUDnTOLm buf) and data buffer registers (TAUDnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1 sets the reload flag (TAUDnRSF.TAUDnRSFm) to 1, enabling simultaneous rewrite. TAUDnRSF.TAUDnRSFm remains set to 1 until simultaneous rewrite is completed.
- When the specified trigger for simultaneous rewrite is detected, the TAUDnRSF.TAUDnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUDnRSF.TAUDnRSFm = 1). If it is, simultaneous rewrite is carried out. Otherwise the simultaneous rewrite is not carried out and waits for the next trigger detection.

32.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled (TAUDnRSF.TAUDnRSFm = 1) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and are applied the next time the counter starts or restarts.
- When simultaneous rewrite is complete, the TAUDnRSF.TAUDnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

32.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUDnRDE.TAUDnRDEm, TAUDnRDS.TAUDnRDSm, TAUDnRDM.TAUDnRDMm, and TAUDnRDC.TAUDnRDCm cannot be changed while the counter is in operation (TAUDnTE.TAUDnTEm = 1).
- TAUDnTOL.TAUDnTOLm can only be rewritten during operation with PWM output function or triangle PWM output function. For all other output functions, TAUDnTOL.TAUDnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUDTTOUTm outputs an invalid wave.
- When an upper channel is used as a channel issuing the simultaneous rewrite trigger (TAUDnRDS.TAUDnRDSm = 1), the TAUDnRDC.TAUDnRDCm bit controls all the lower channels. This means that if the TAUDnRDC.TAUDnRDCm bits of CH2 and CH7 are set to 1 and the TAUDnRDC.TAUDnRDCm bits of other channels are set to 0, CH2 and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger (TAUDnRDE.TAUDnRDEm and TAUDnRDS.TAUDnRDSm = 1) but no upper channel is set (TAUDnRDC.TAUDnRDC[15:0] = 0), simultaneous rewrite cannot take place.

32.6.4 Types of Simultaneous Rewrite

In the following section, the four simultaneous rewrite methods are explained using timing diagrams.

32.6.4.1 Simultaneous Rewrite when the Master Channel (Re)starts Counting (Method A)

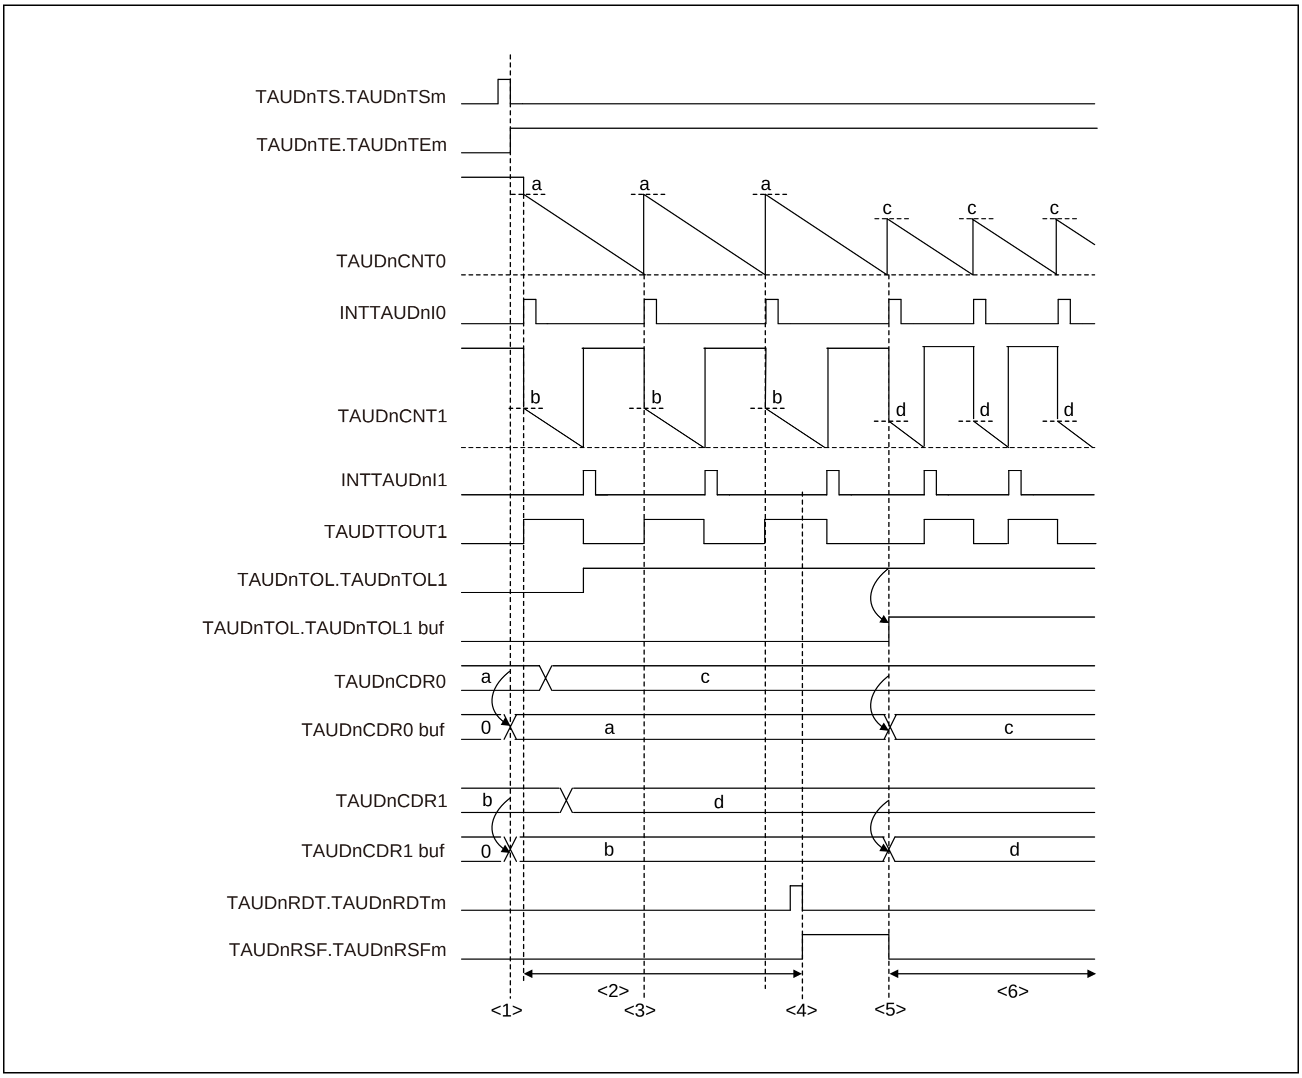

Figure 32.6 Simultaneous Rewrite when the Master Channel (Re)starts Counting

Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer and TAUDnTOL.TAUDnTOLm value is copied to the TAUDnTOL.TAUDnTOLm buffer.

(2) The TAUDnCDRm and TAUDnTOL.TAUDnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm = 0)

(4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.

(5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer and the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

32.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel (Method B)

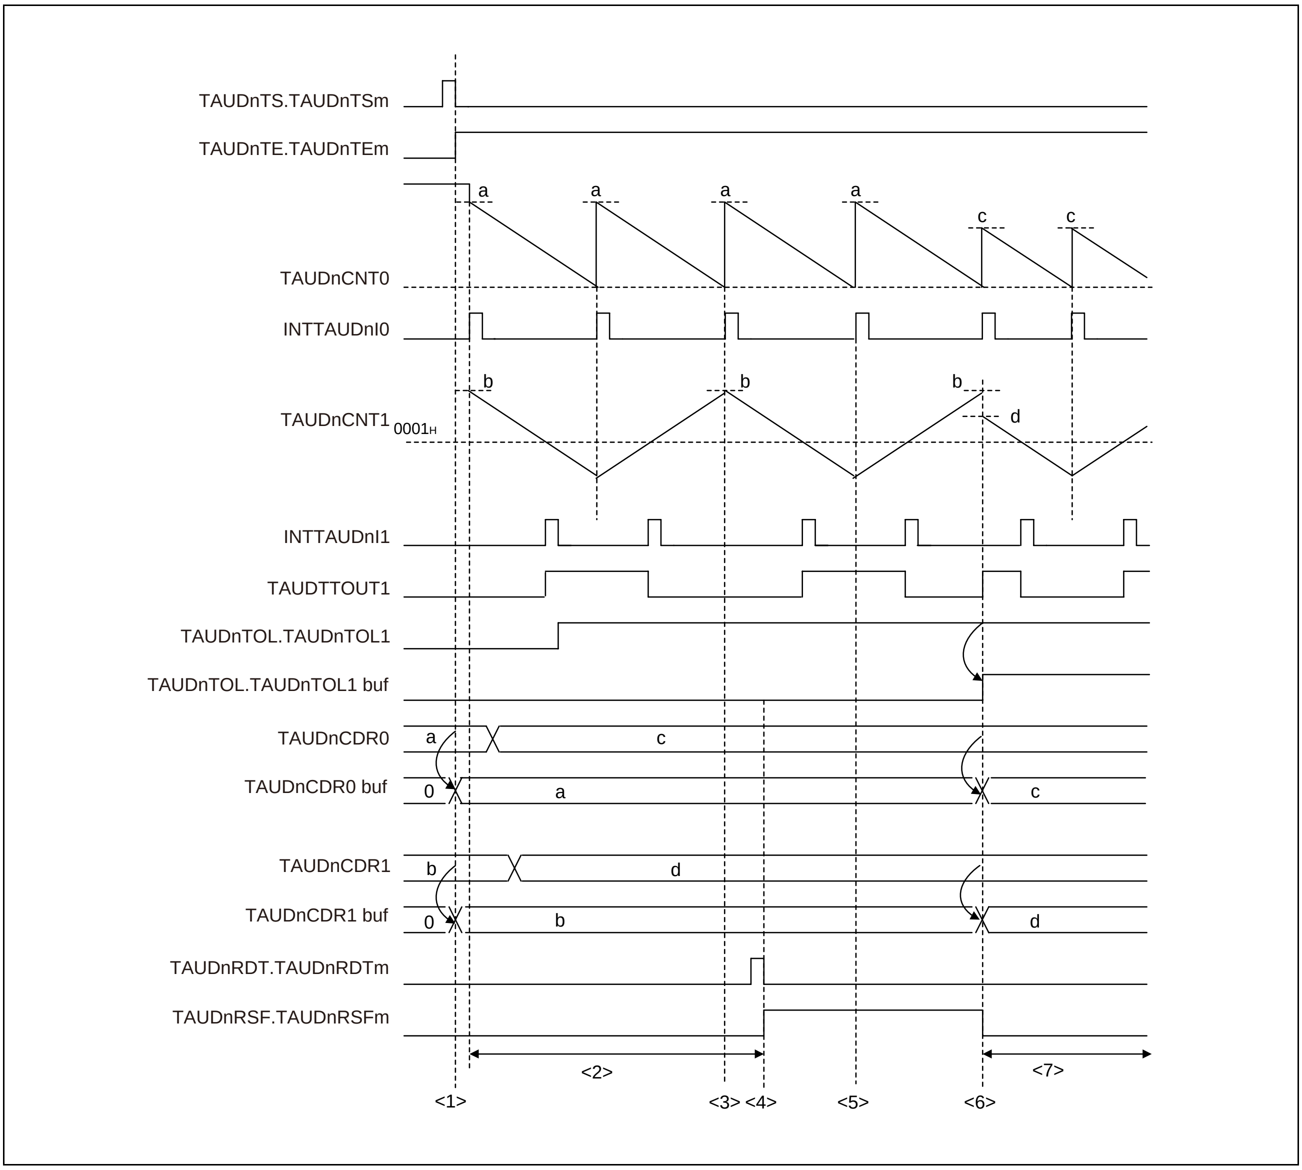

Figure 32.7 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel

Setting:

CH0 is the master channel which performs counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer.

(2) The TAUDnCDRm and TAUDnTOL registers can be written at any time.

(3) Simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm = 0).

(4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.

(6) Simultaneous rewrite takes place at the top of the triangular cycle. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer, the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.

(7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

32.6.4.3 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm (Method C1)

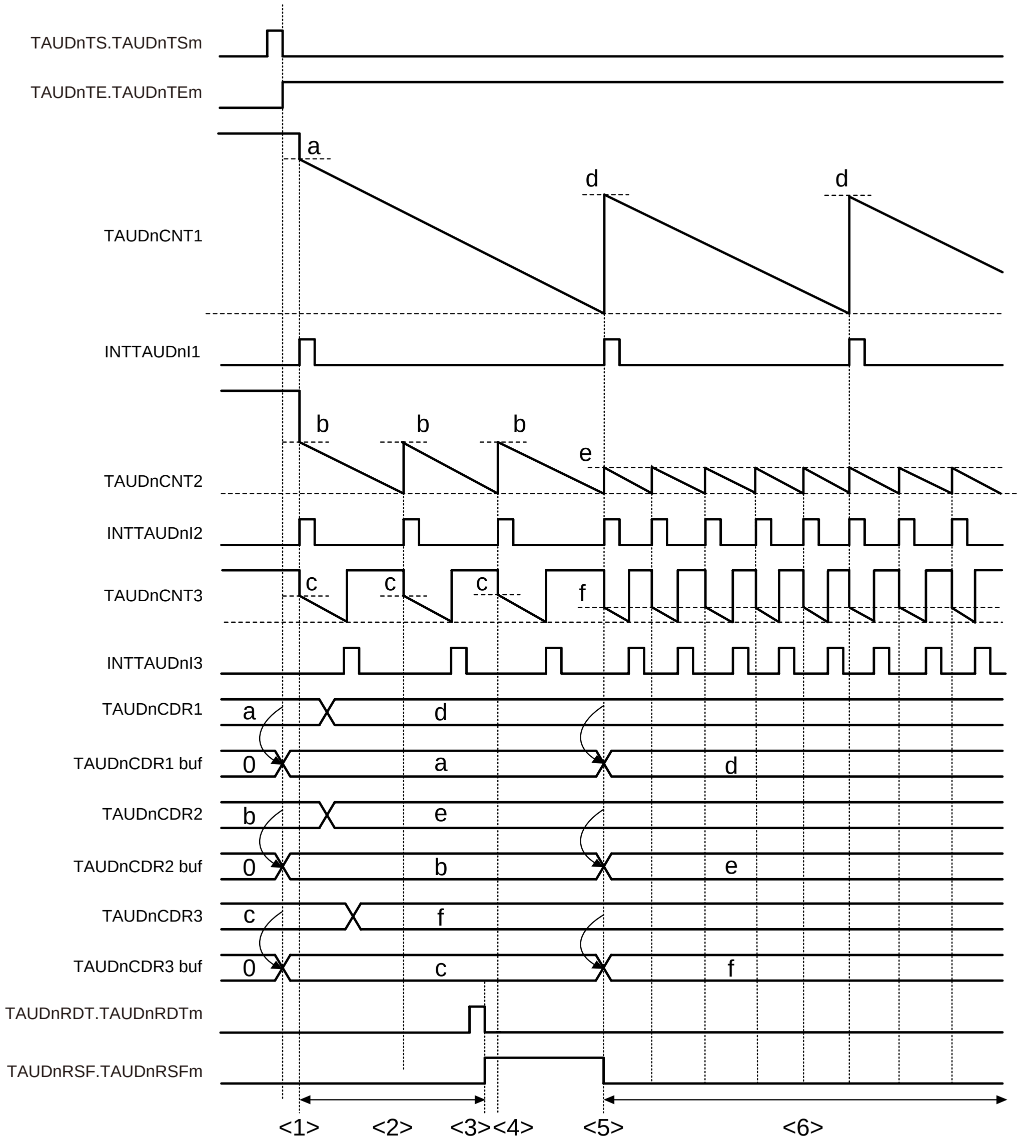

Figure 32.8 Simultaneous Rewrite When INTTAUDnIm Is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm

Setting:

CH1 is an upper channel which performs counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C1 is applied. The TAUDnRDC register specifies a channel which generates simultaneous rewrite triggers.

Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer.

(2) The TAUDnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1, the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches 0000_H. The TAUDnCDRm values are loaded into the corresponding TAUDnCDRm buffers.

(6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be rechanged.

32.6.4.4 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal (Method C2)

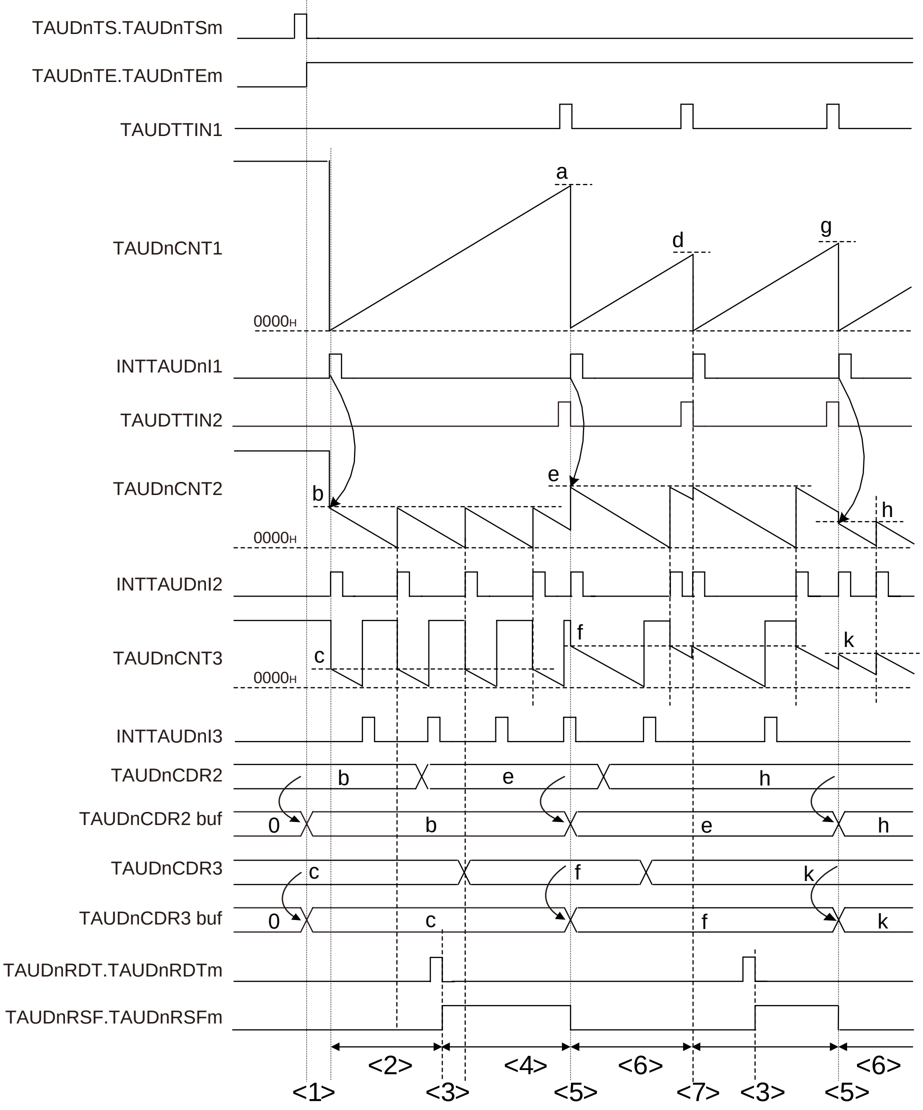

Figure 32.9 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal

Setting:

CH1 is an upper channel which performs counting up, CH2 is a master channel, and CH3 is the slave channel. The synchronous channel operation method C2 is applied. The TAUDnRDC register specifies which upper channel is monitored for an INTTAUDnIm trigger.

Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer. However, as TAUDnCDR1 operates in capture mode, TAUDnCDR1 value is not copied to the TAUDnCDR1 buffer.

(2) The TAUDnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1, the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is caused by external signal TIN1. The TAUDnCDRm values are written to the corresponding TAUDnCDRm buffers.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be changed again.

(7) An external signal occurs at TIN2 but simultaneous rewrite does not take place because it is disabled (TAUDnRSF.TAUDnRSFm = 0).

32.7 Channel Output Modes

The output of the TAUDTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUDnTOE.TAUDnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUDnTO.TAUDnTOm) is sent to the output pin (TAUDTTOUTm).
- By TAUD signals (TAUDnTOE.TAUDnTOEm = 1)
  When controlled by TAUD signals, the output level of TAUDTTOUTm is set or reset or toggled by internal signals. The value of TAUDnTO.TAUDnTOm is updated accordingly to reflect the value of TAUDTTOUTm.
  - Independently (TAUDnTOM.TAUDnTOMm = 0)
    In case of independent operation, the output of the TAUDTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUDnTOM.TAUDnTOMm = 0).
  - Synchronously (TAUDnTOM.TAUDnTOMm = 1)
    In case of synchronous operation, the output of the TAUDTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUDnTOM.TAUDnTOMm = 1).

The TAUDnTO.TAUDnTOm bit can always be read to determine the current value of TAUDTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 32.52, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 32.7.2, Channel Output Modes Controlled Independently by TAUDn Signals**
- **Section 32.7.3, Channel Output Modes Controlled Synchronously by TAUDn Signals**

Batch operation of TAUDnTOm bit

Whether a set value is reflected to the TAUDnTOm bit or not is controlled by the TAUDnTOE.TAUDnTOEm bit.

The TAUDnTOm setting is written only to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit = 0 when a write to the TAUDnTO register is attempted. No TAUDnTOm setting is reflected to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit = 1.

NOTE

TAUDnTO.TAUDnTOm bit is placed so that its bit number corresponds to a channel number.

Output logic

Positive logic or negative logic of the output is specified by control bit TAUDnTOL.TAUDnTOLm.

The value of TAUDnTOL.TAUDnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. Otherwise, changes to TAUDnTOL.TAUDnTOLm result in an undefined TAUDTTOUTm signal output.

See **Section 32.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 32.52, Channel Output Modes**.

Table 32.52 Channel Output Modes

Channel Output Mode	TAUDn TOE. TAUDn TOEm	TAUDn TOM. TAUDn TOMm	TAUDn TOC. TAUDn TOCm	TAUDn TDE. TAUDn TDEm	TAUDn TRE. TAUDn TREm	TAUDn TME. TAUDn TMEm	TAUDn TDM. TAUDn TDMm
By software							
Independent channel output mode controlled by software	0	X					
By TAUD signals, independently							
Independent channel output mode 1	1	0	0	0	0	0	0
with real-time output					1		
Independent channel output mode 2			1		0		
By TAUD signals, synchronously							
Synchronous channel output mode 1	1	1	0	0	0	0	0
with non-complementary modulation output					1	X	
Synchronous channel output mode 2			1	0	0	0	0
with dead time output				1			
with one-phase PWM output							1
with complementary modulation output					1	1	0
with non-complementary modulation output			1	0			

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

NOTES

1. The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm = 1):
   - TAUDnTOM.TAUDnTOMm
   - TAUDnTOC.TAUDnTOCm
   - TAUDnTDE.TAUDnTDEm
   - TAUDnTRE.TAUDnTREm
   - TAUDnTDM.TAUDnTDMm
2. The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm = 1) except in channel output modes with modulation output:
   - TAUDnTME.TAUDnTMEm
   - TAUDnTDL.TAUDnTDLm

32.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUDTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUDnTOE.TAUDnTOEm = 0).

(1) Set TAUDnTO.TAUDnTOm to specify the initial level of the TAUDTTOUTm output.

(2) Set channel output mode according to **Table 32.52, Channel Output Modes**, and the output logic using the TAUDnTOL.TAUDnTOLm bit.

(3) Start the counter (TAUDnTS.TAUDnTSm = 1).

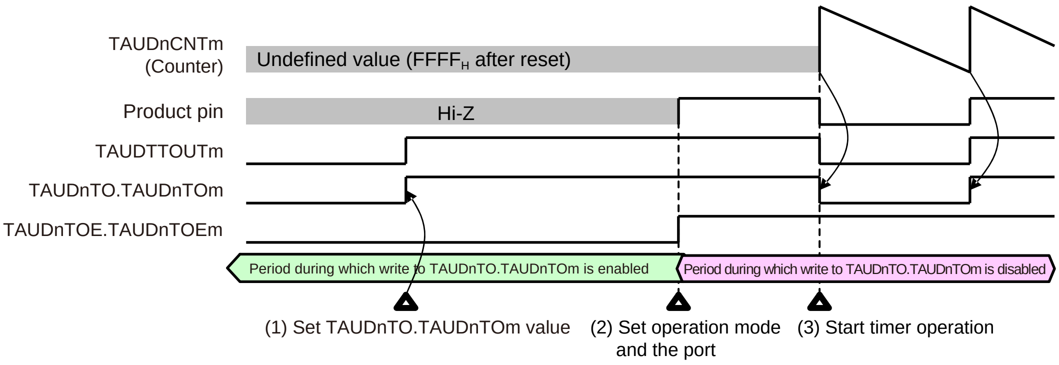

Figure 32.10 General Procedure for Specifying a TAUDTTOUTm Channel Output Mode

32.7.2 Channel Output Modes Controlled Independently by TAUDn Signals

This section lists the channel output modes that are controlled independently by TAUDn signals. The control bits used to specify a mode are listed in **Table 32.52, Channel Output Modes**.

32.7.2.1 Independent Channel Output Mode 1

Set/reset conditions

In this output mode, TAUDTTOUTm toggles when INTTAUDnIm is detected. The value of TAUDnTOL.TAUDnTOLm is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 32.52, Channel Output Modes**.

32.7.2.2 Independent Channel Output Mode 1 with Real-Time Output

In this output mode, the value of TAUDnTRO.TAUDnTROm bit of the trigger channel is output to TAUDTTOUTm. The trigger channel is specified by setting the corresponding TAUDnTRC.TAUDnTRCm bit to 1. It controls all lower channels for which TAUDnTRC.TAUDnTRCm = 0.

Set/reset conditions

The value of TAUDnTRO.TAUDnTROm bit is sent to TAUDTTOUTm only when an INTTAUDnIm interrupt occurs on the trigger channel. The interrupt is generated either:

- at certain specified intervals or
- on detection of a valid TAUDTTINm input edge/counter start

The type of trigger is set using the TAUDnCMORm.TAUDnMD[4:1] bits.

Prerequisites

Both the master and slave channels can be set as a trigger generation channel. A channel for which TAUDnTRC.TAUDnTRCm is set to 1 serves as a trigger generation channel regardless of the value of TAUDnTRE.TAUDnTREm.

If there is no channel for which TAUDnTRC.TAUDnTRCm is set to 1 or if TAUDnTRC.TAUDnTRC0 = 0, real-time output cannot take place.

This can be seen in **Figure 32.11, Real-Time Output**.

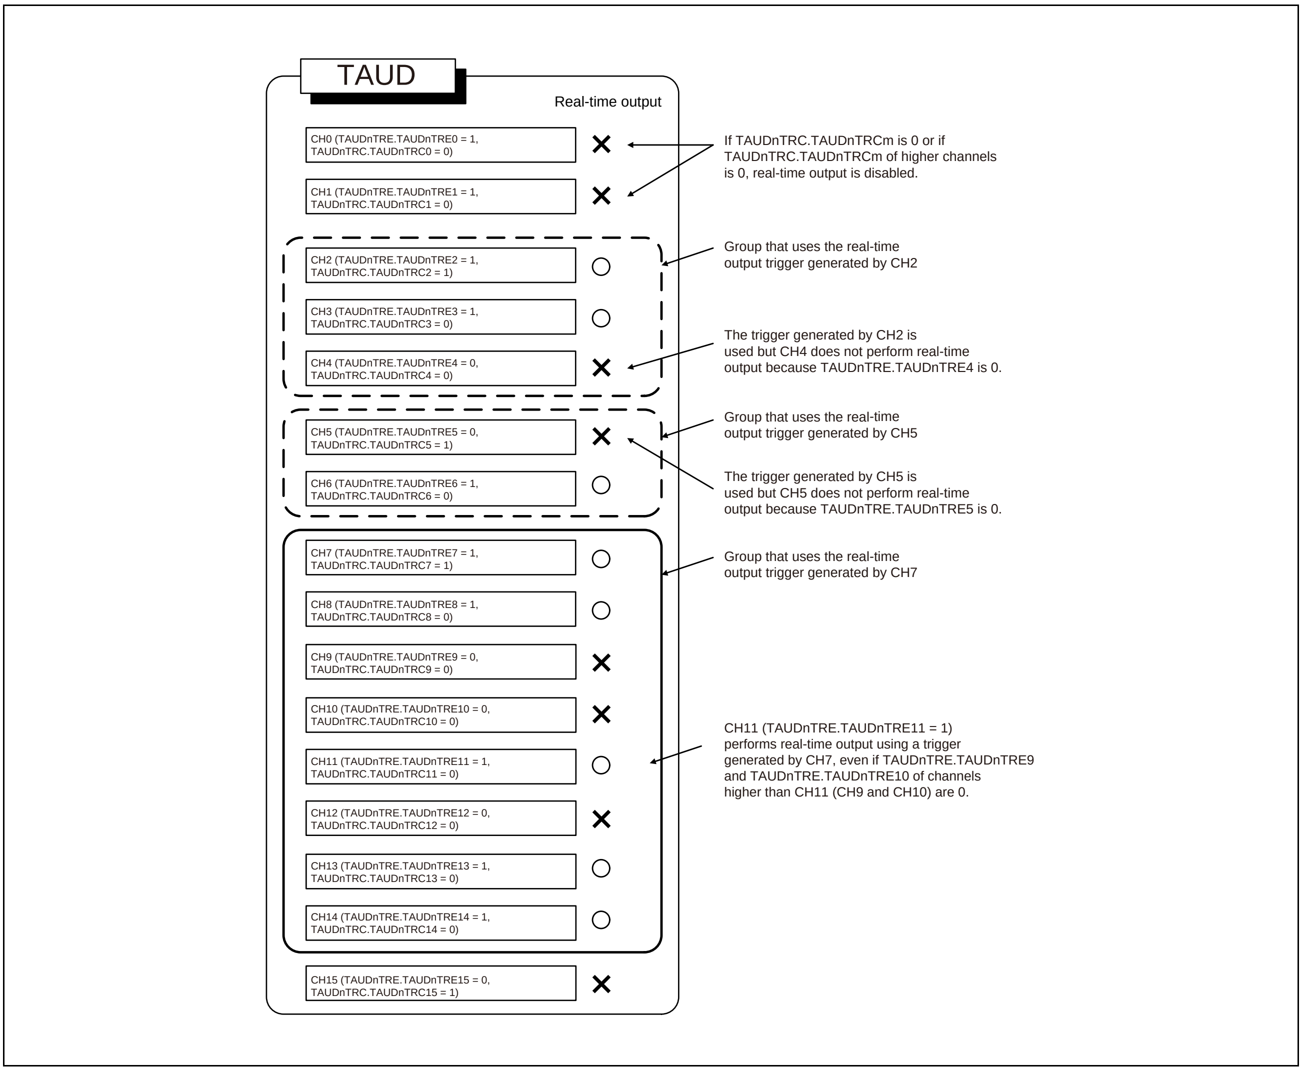

Figure 32.11 Real-Time Output

32.7.2.3 Independent Channel Output Mode 2

Set/reset conditions

In this output mode, TAUDTTOUTm is set when INTTAUDnIm occurs at the time of count start, and reset when INTTAUDnIm occurs due to a match between TAUDnCNTm and TAUDnCDRm.

Prerequisites

There are no prerequisites other than those shown in **Table 32.52, Channel Output Modes**.

32.7.3 Channel Output Modes Controlled Synchronously by TAUDn Signals

This section lists the channel output modes that are controlled synchronously by TAUDn signals. The control bits used to specify a mode are listed in **Table 32.52, Channel Output Modes**.

32.7.3.1 Synchronous Channel Output Mode 1

Set/reset conditions

In this output mode, INTTAUDnIm of master channel serves as a set signal and INTTAUDnIm of the slave channel as a reset signal. If INTTAUDnIm of master channel and INTTAUDnIm of the slave channel are generated at the same time, INTTAUDnIm of the slave channel (reset signal) has priority over INTTAUDnIm (set signal) of master channel, i.e., the master channel is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 32.52, Channel Output Modes**.

32.7.3.2 Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

Set/reset conditions

In this output mode, TAUDTTOUTm outputs the result of an AND operation between the PWM output and the real-time output bit (TAUDnTRO.TAUDnTROm) of a channel.

The phase period to which the dead time is added is specified using the TAUDnTDL.TAUDnTDLm bit; for positive phase set TAUDnTDL.TAUDnTDLm = 0 and for negative phase set TAUDnTDL.TAUDnTDLm = 1.

Prerequisites

A set of at least three channels is required to generate the PWM output. The master channel and slave channel 1 generate a period, and slave channel 2 generates the duty cycle. In typical applications, five more slave channels are also used that operate in the same manner as slave channel 2.

Only the PWM output and the real-time output bit of the same channel can be combined.

TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed, its new value is applied upon detection of INTTAUDnIm on the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on the master channel.

32.7.3.3 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is a triangle PWM output at TAUDTTOUTm. For details, see **Section 32.15.7, Triangle PWM Output Function**.

Set/reset conditions

TAUDnCNTm of the slave channel counts down and up alternatively. When it passes 0001_H it generates an interrupt, causing TAUDTTOUTm to toggle.

Prerequisites

A set of two channels is required to generate the triangle PWM output. TAUDTTOUTm should be set to 0 before the function starts.

32.7.3.4 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in **Figure 32.12, Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output**.

Set/reset conditions

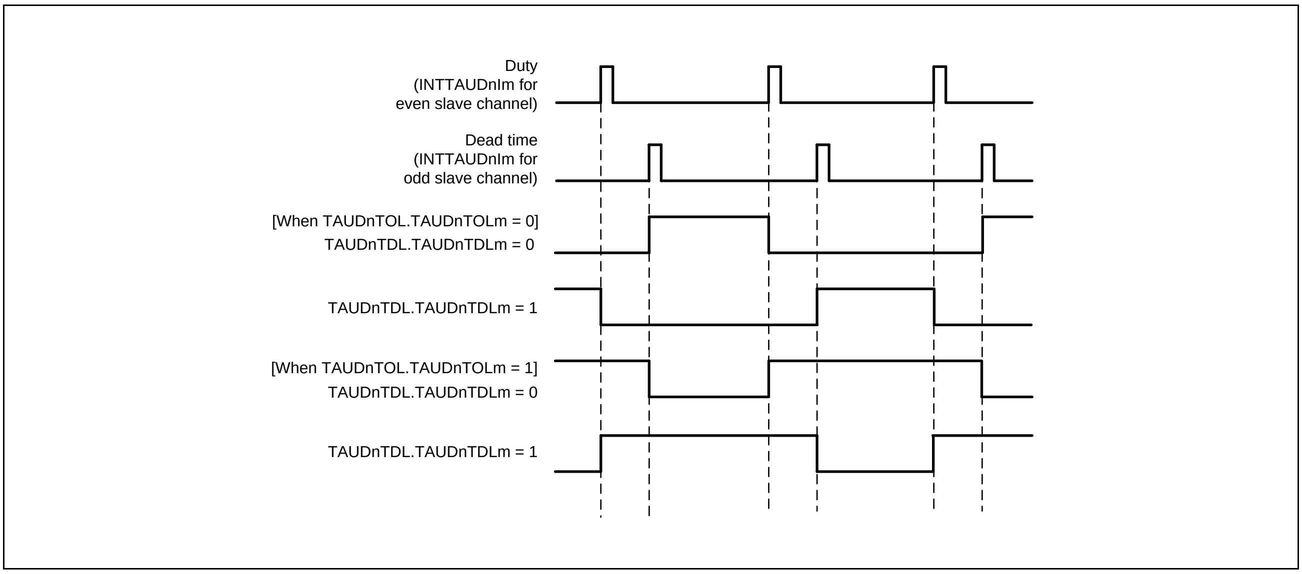

Figure 32.12 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm = 0 for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges.

Prerequisites

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel
  The master channel should be set to interval timer mode.
- One even slave channel
  The even slave channel should be set to count-up/-down mode.
- One odd slave channel (even channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm

- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

32.7.3.5 Synchronous Channel Output Mode 2 with One-Phase PWM Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in **Figure 32.13, Set/Reset Conditions for Synchronous Channel Output Mode 2 with One-Phase PWM Output**.

Set/reset conditions

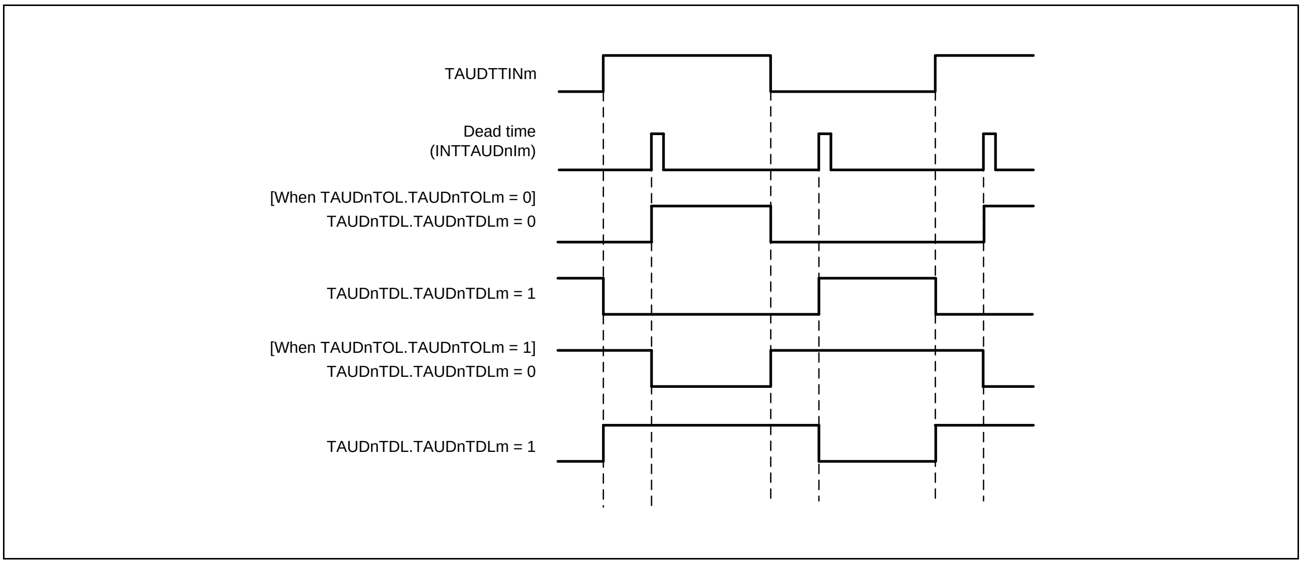

Figure 32.13 Set/Reset Conditions for Synchronous Channel Output Mode 2 with One-Phase PWM Output

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm = 0 for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges.

Prerequisites

One-phase PWM output control requires a set of two channels:

- One even slave channel
- One odd slave channel (even channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm
- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

32.7.3.6 Synchronous Channel Output Mode 2 with Complementary Modulation Output

Set/reset conditions

In this output mode, TAUDTTOUTm outputs a PWM signal, a high signal, or a low signal depending on the value of real-time output bit (TAUDnTRO.TAUDnTROm), the modulation output bit (TAUDnTME.TAUDnTMEm), and the output level bit (TAUDnTOL.TAUDnTOLm) of a pair of slave channels.

For details, see **Section 32.16.3, Complementary Modulation Output Function**.

Prerequisites

A set of at least four channels is required for this mode. The master channel and slave channel 1 generate a period, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time. Slave channels 2 and 3 are a pair. In typical applications, four more channels are also used, which operates in the same manner as slave channels 2 and 3 respectively.

TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed during operation, its new value is applied upon detection of INTTAUDnIm at the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on an even slave channel.

32.7.3.7 Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

The difference from synchronous channel output mode 1 with non-complementary modulation output is the PWM wave shape.

Mode 1 has a square wave while mode 2 has a triangular wave.

32.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUDnTS.TAUDnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

32.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUDnTS.TAUDnTSm is set to 1. The value of data register is also loaded when the counter starts.

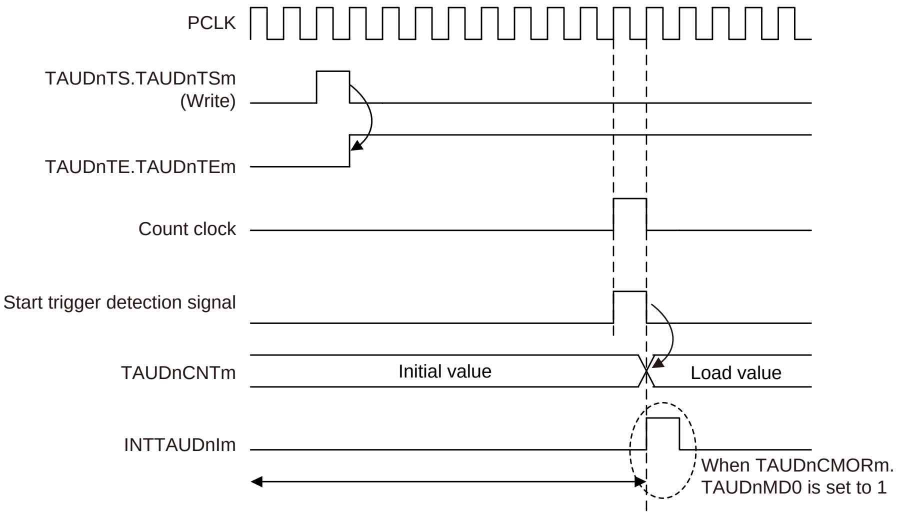

Figure 32.14 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode

NOTE

Make sure to set TAUDnCMORm.TAUDnMD0 to 0 when using the count-up/-down mode.

32.8.2 Event Count Mode

The value of data register is loaded as soon as TAUDnTS.TAUDnTSm is set to 1. The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

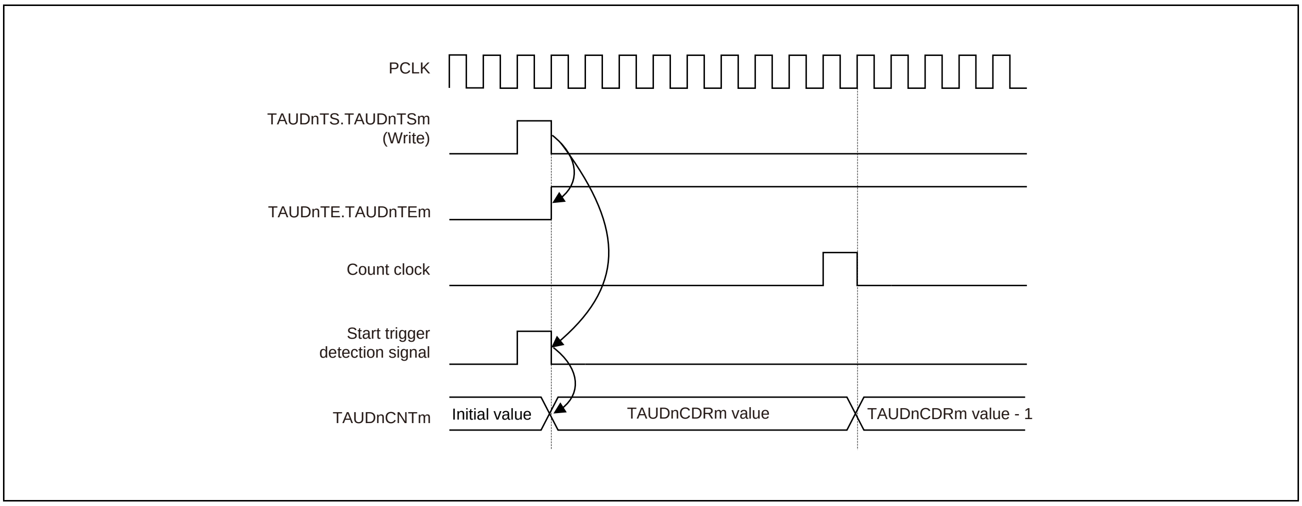

Figure 32.15 Start Timing in Event Count Mode

32.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUDTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which are irrelevant to start of counter operation, determine the frequency with which all operations take place.

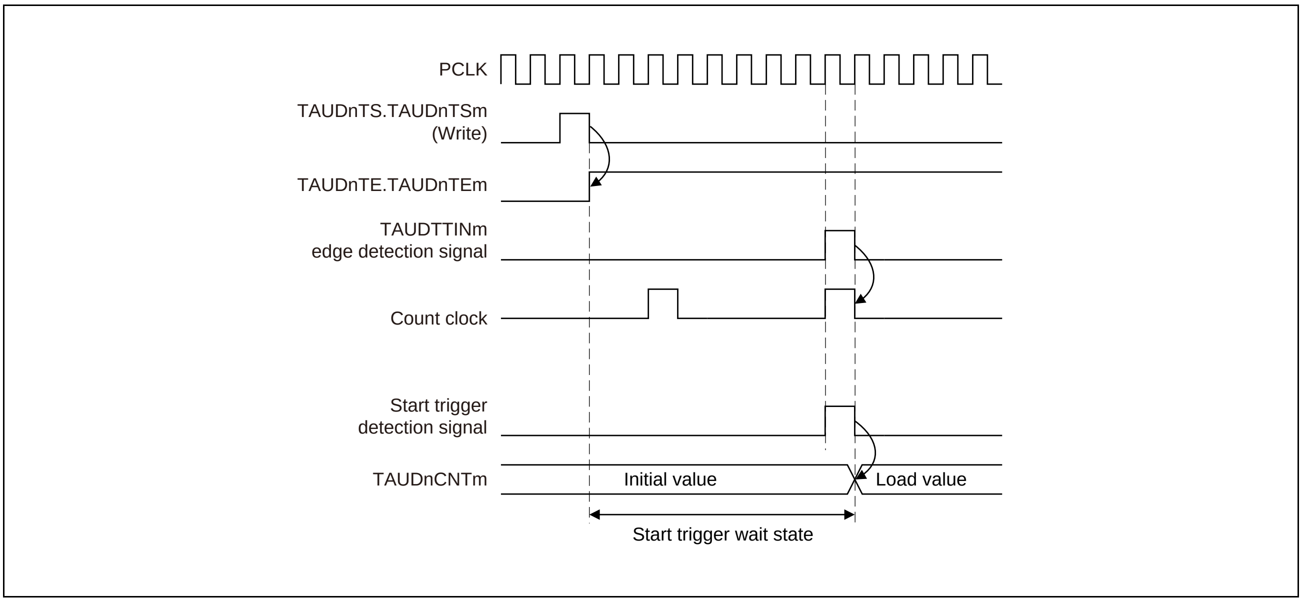

Figure 32.16 Count Start Timing in Other Operating Modes

32.9 TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUDnIm is generated using the TAUDnCMORm.TAUDnMD0 bit. The generation of INTTAUDnIm when the TAUDnCMORm.TAUDnMD0 bit starts counting and the effect to TAUDTTOUTm depend on the selected function. For details, refer to the description of TAUDnCMORm.TAUDnMD0 of each function.

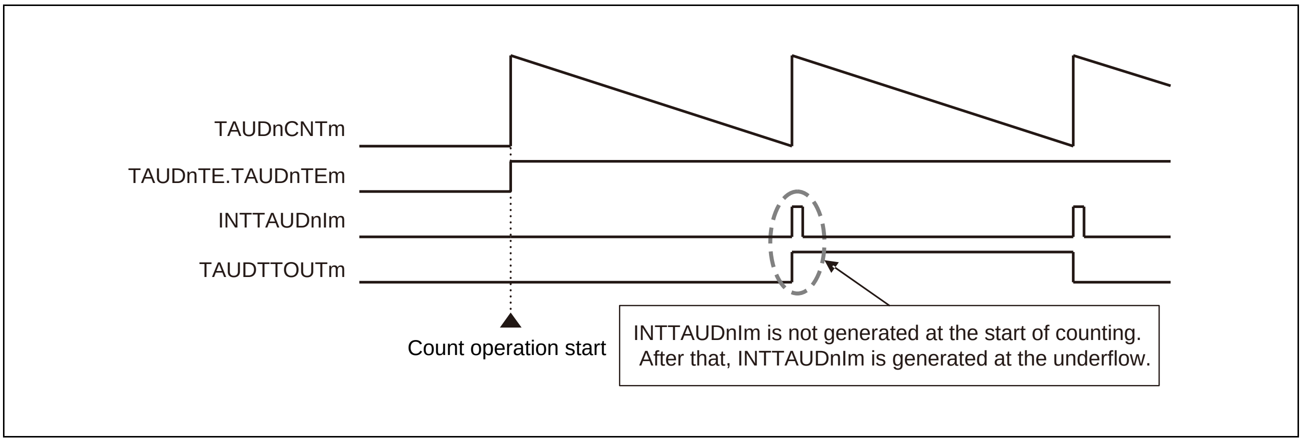

Figure 32.17 INTTAUDnIm Generation Timing (when TAUDnCMORm.TAUDnMD0 = 0)

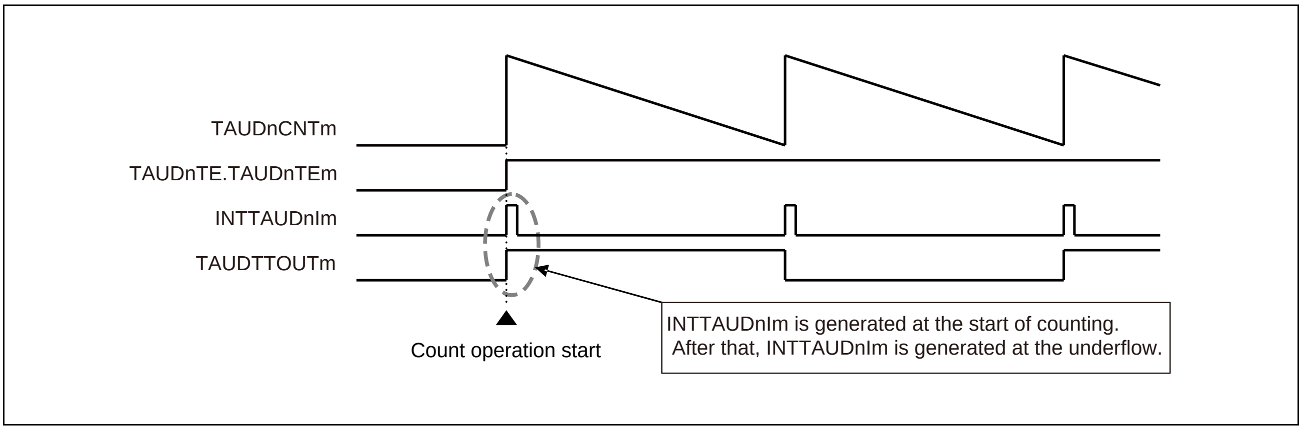

Figure 32.18 INTTAUDnIm Generation Timing (when TAUDnCMORm.TAUDnMD0 = 1)

32.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches $FFFF_H$ and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operation in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches 0000_H at the same time as the first channel overflows (TAUDnCNTm = $FFFF_H$).
- Set TAUDnCDRm of the second channel to $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUDTTINm input.
- The trigger detection settings (TAUDnCMORm.TAUDnSTS[2:0] and TAUDnCMURm.TAUDnTIS[1:0]) must be identical for both channels.

Result:

The down-counter of the second channel reaches 0000_H at exactly the same time as the up-counter of the first channel overflows (TAUDnCNTm = $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

32.10.1 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the TAUDTTINm input interval timer function can detect the overflow when TAUDnCNTm of the TAUDTTINm input pulse interval measurement function exceeds $FFFF_H$.

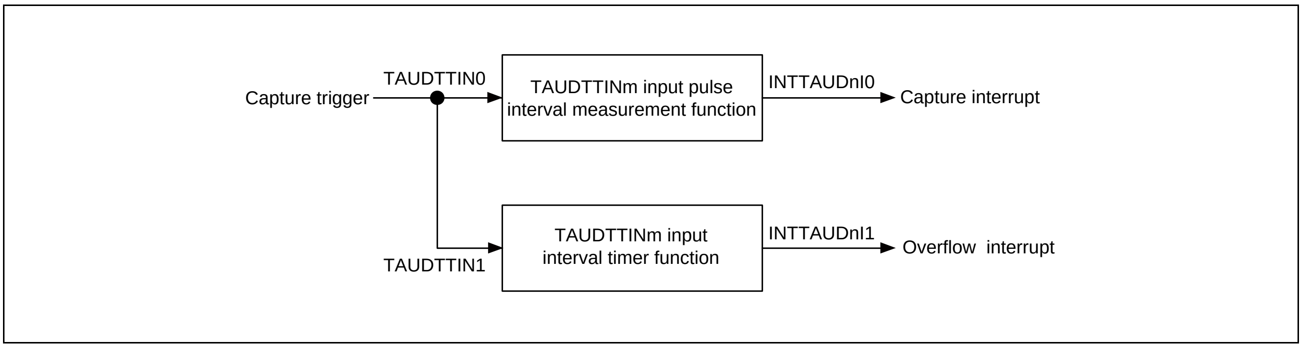

Figure 32.19 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

Timing diagram

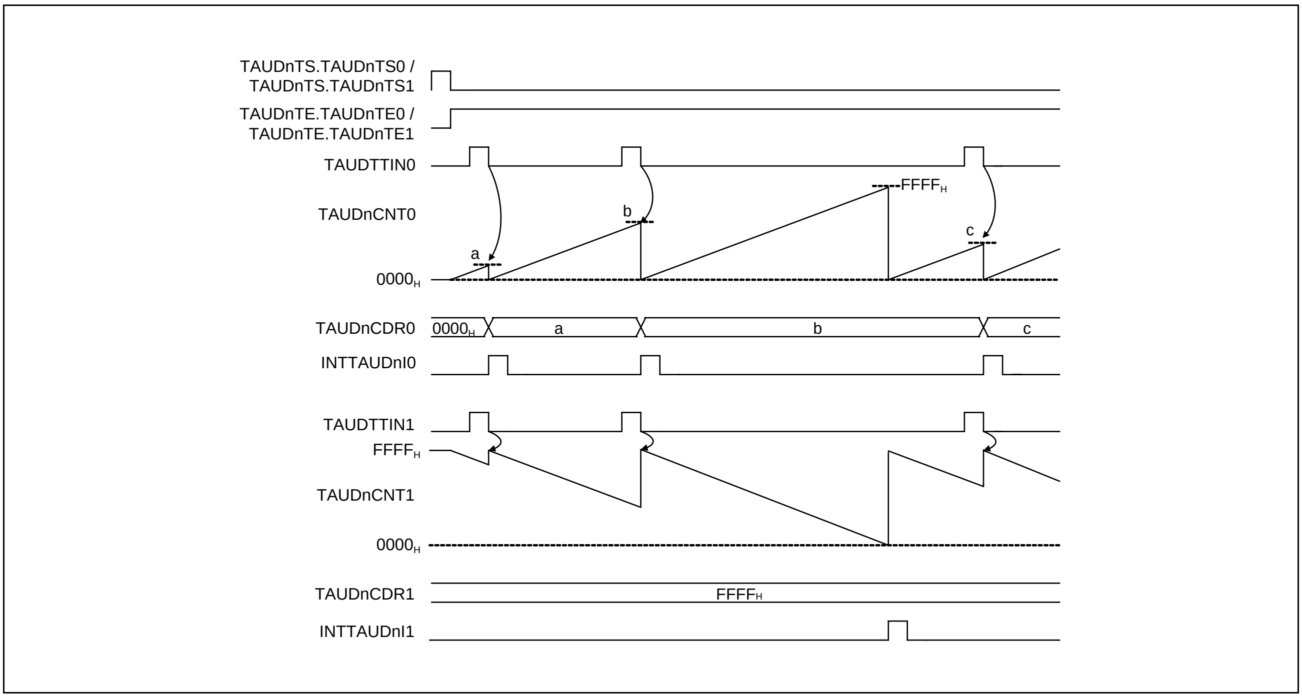

Figure 32.20 Interrupt Generation via Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

32.10.2 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the overflow interrupt output function (at measuring the TAUDTTINm width) can detect the overflow when TAUDnCNTm of the TAUDTTINm input signal width measurement function exceeds $FFFF_H$.

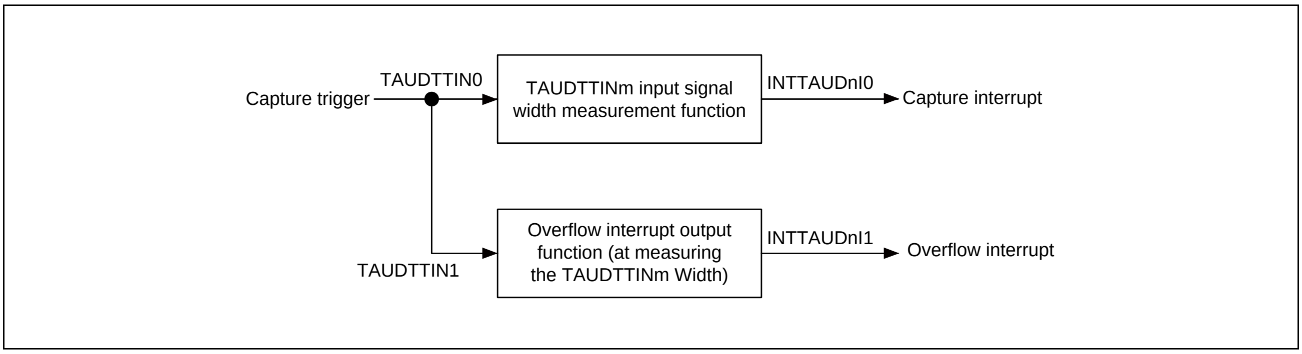

Figure 32.21 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

Timing diagram

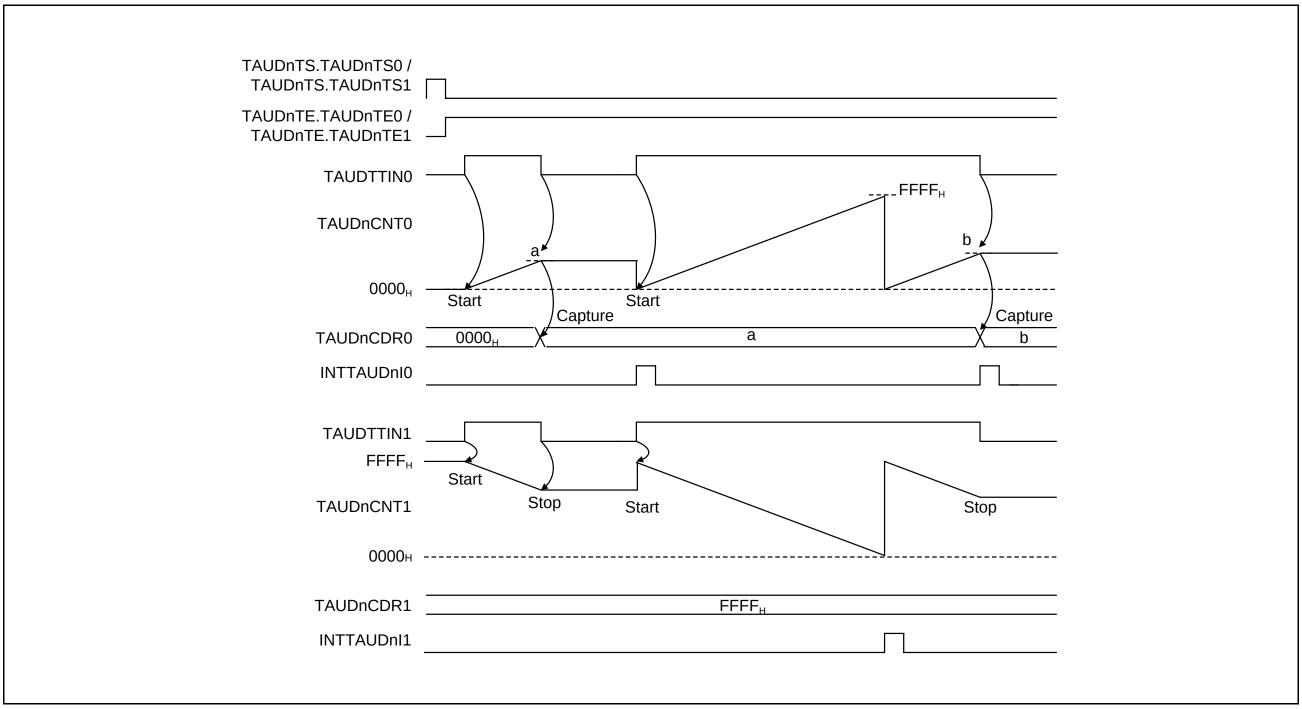

Figure 32.22 Interrupt Generation via Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

32.10.3 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

When the counters of both channels are enabled simultaneously, INTTAUDnIm of the interval timer function can detect the overflow when TAUDnCNTm of the TAUDTTINm input position detection function exceeds $FFFF_H$.

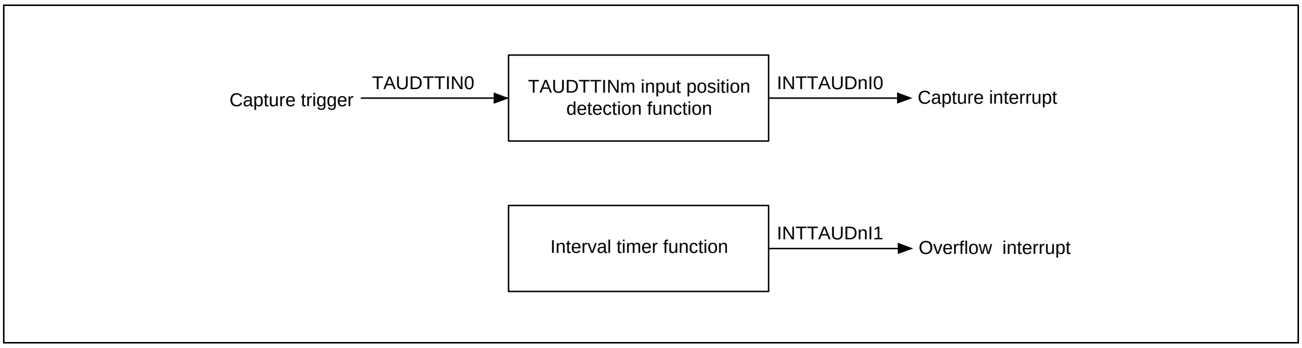

Figure 32.23 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

Timing diagram

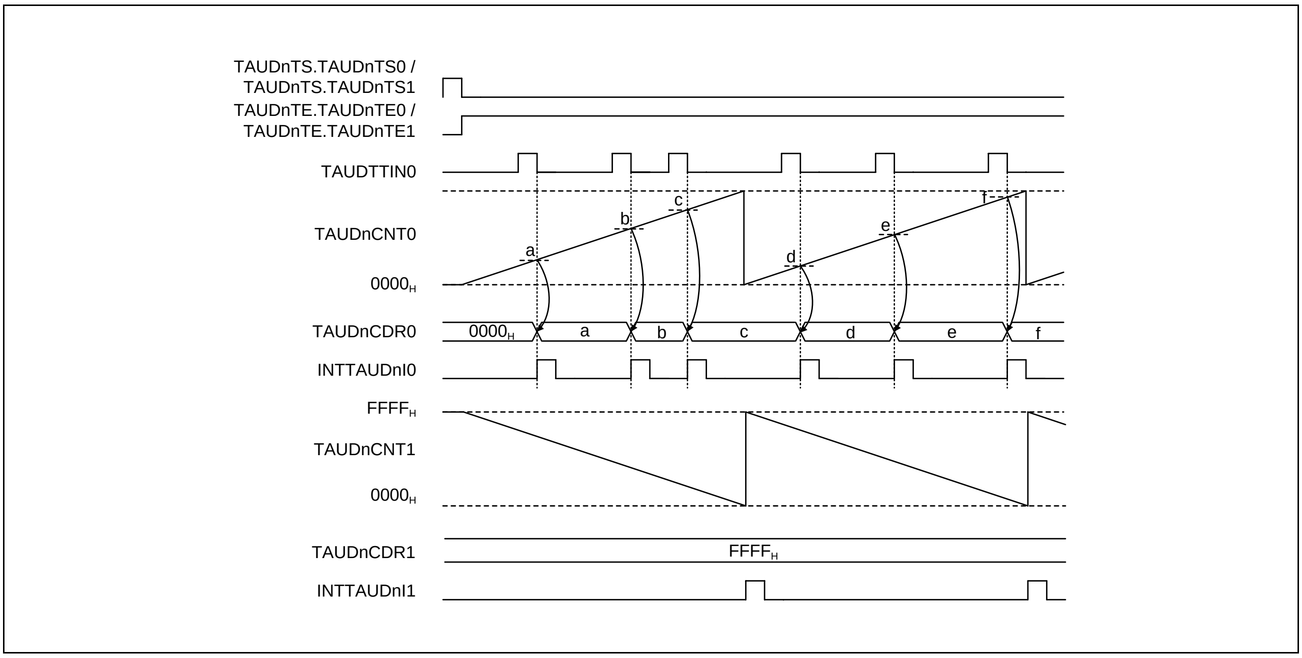

Figure 32.24 Interrupt Generation via Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

32.10.4 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the overflow interrupt output function (at detecting the TAUDTTINm input period count) can detect the overflow when TAUDnCNTm of the TAUDTTINm input period count detection function exceeds $FFFF_H$.

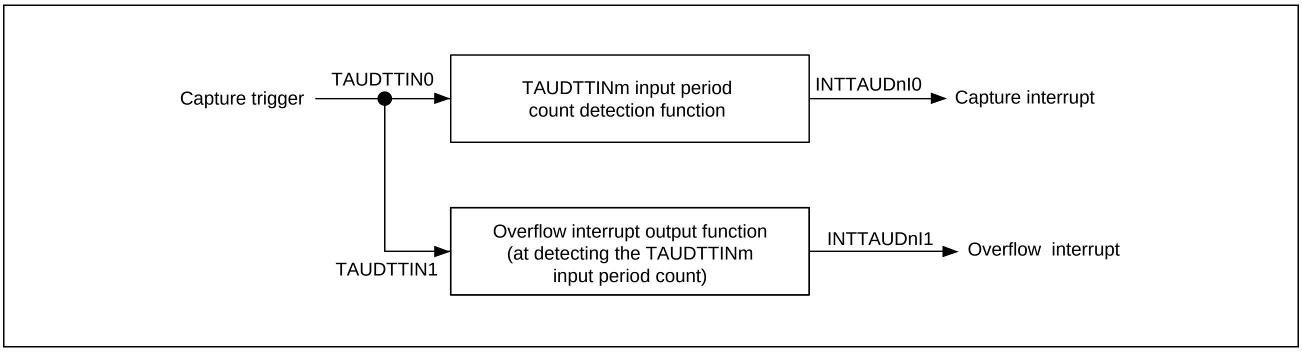

Figure 32.25 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

Timing diagram

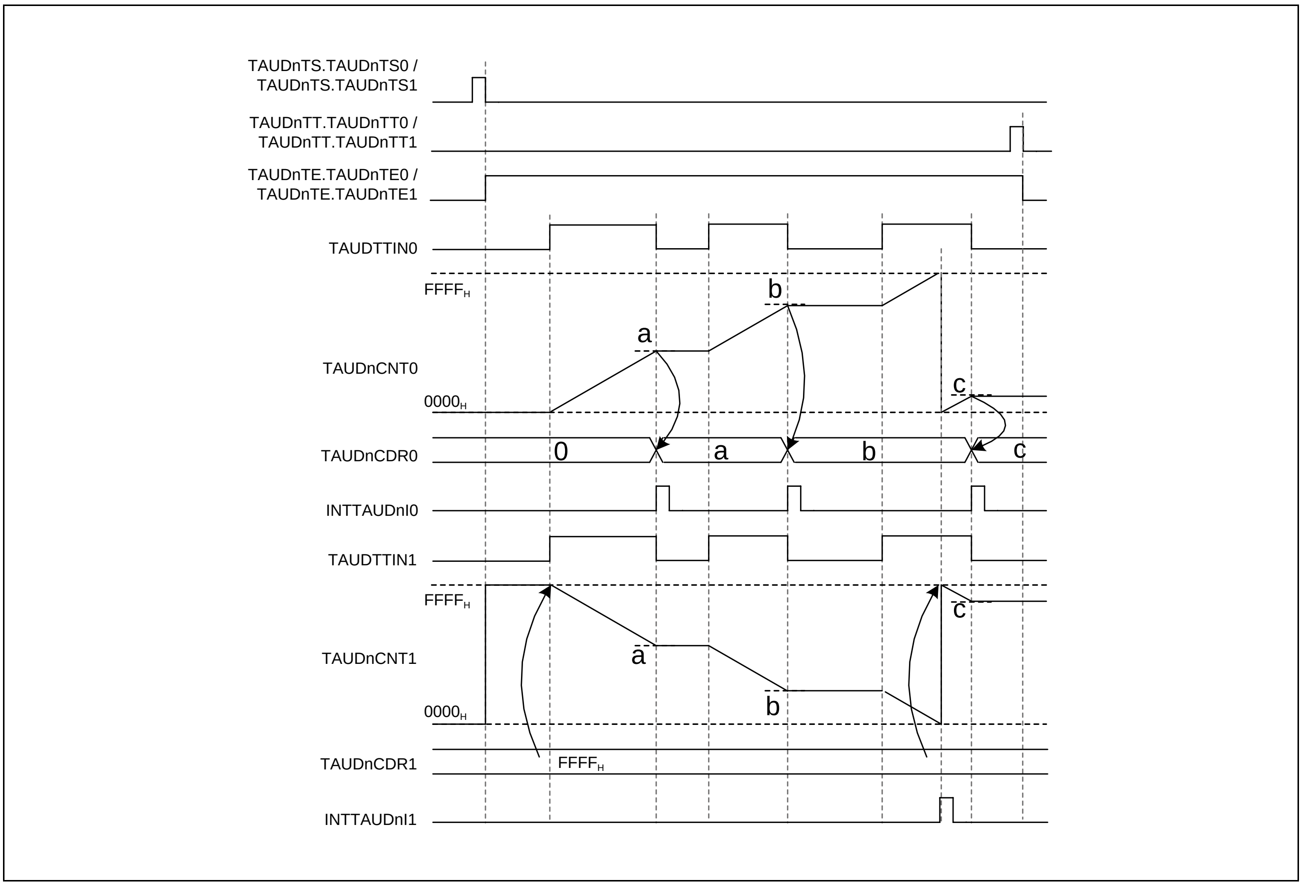

Figure 32.26 Interrupt Generation via Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

32.11 TAUDTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

Figure 32.27, Basic Edge Detection Timing shows when edge detection takes place.

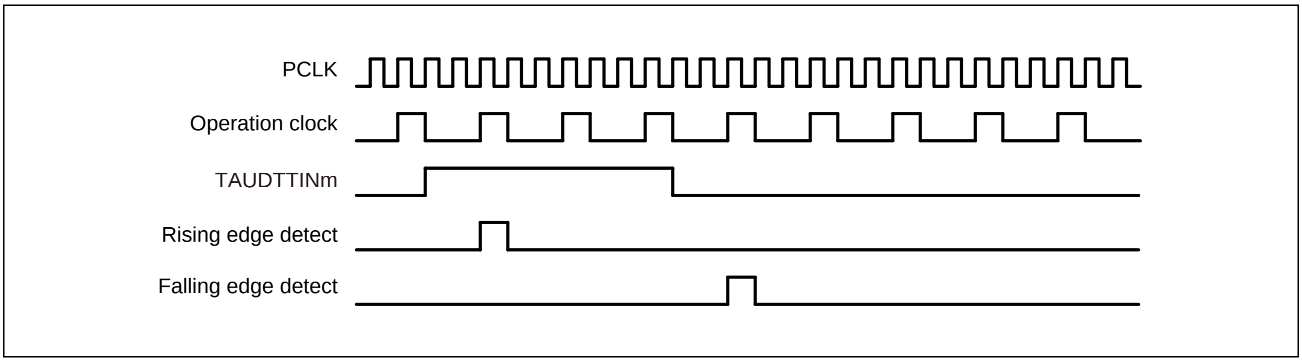

Figure 32.27 Basic Edge Detection Timing

Figure 32.27, Basic Edge Detection Timing shows an operation timing image. Actually, a noise filter or synchronization circuit which is located between the TAUDnIm pin and TAUDn causes a delay time.

32.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the Timer Array Unit D. For a general overview of independent channel operation, see **Section 32.2, Overview**.

This section describes functions that generate interrupts at regular intervals or with a specified delay.

32.12.1 Interval Timer Function

32.12.1.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operation mode must be set to Interval Timer Mode, see **Table 32.53, Contents of the TAUDnCMORm Register for Interval Timer Function**.
- The channel output mode must be set to Independent Channel Output Mode 1, see **Section 32.7, Channel Output Modes**.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is written to TAUDnCNTm and the counter starts to count down from this value.

When the counter reaches 0000_H, INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and subsequently continues operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm stop but retain their values. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in a negative TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

32.12.1.2 Equations

INTTAUDnIm cycle = count clock cycle × (TAUDnCDRm + 1)

TAUDTTOUTm square wave cycle = count clock cycle × (TAUDnCDRm + 1) × 2

32.12.1.3 Block Diagram and General Timing Diagram

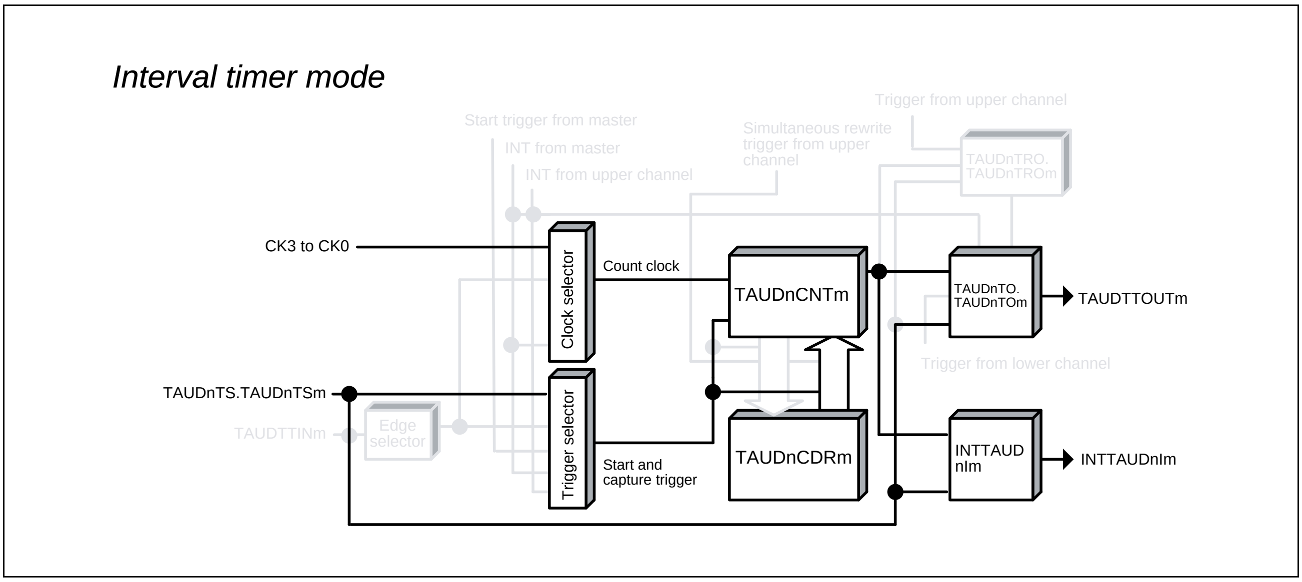

Figure 32.28 Block Diagram of Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 1).

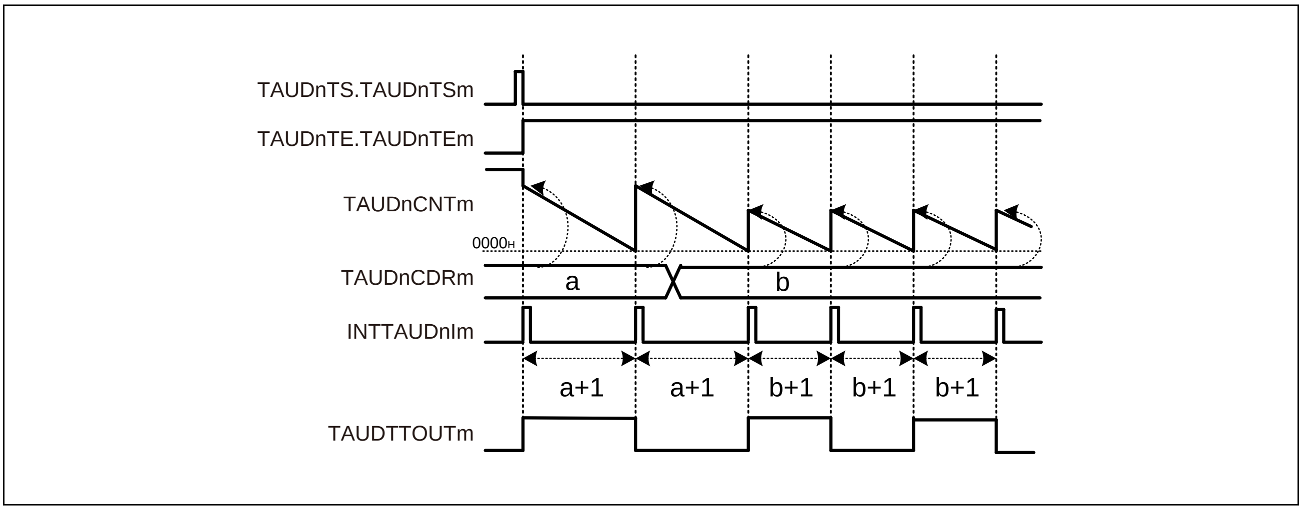

Figure 32.29 General Timing Diagram of Interval Timer Function

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode

Table 32.55 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Section 32.7, Channel Output Modes**.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the interval timer function. Therefore, these registers should be set to 0.

Table 32.56 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.12.1.5 Operating Procedure for Interval Timer Function

Table 32.57 Operating Procedure for Interval Timer Function

		Operation	TAUDn Status
	Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.53, Contents of the TAUDnCMORm Register for Interval Timer Function**, and **Table 32.54, Contents of the TAUDnCMURm Register for Interval Timer Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 32.55, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Restart Operation	Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. When TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated and TAUDTTOUTm toggles.
	During Operation	The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000_H: ● The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. ● INTTAUDnIm is generated and TAUDTTOUTm toggles.
	Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.12.1.6 Specific Timing Diagrams

(1) TAUDnCDRm = 0000$_H$, count clock = PCLK/2

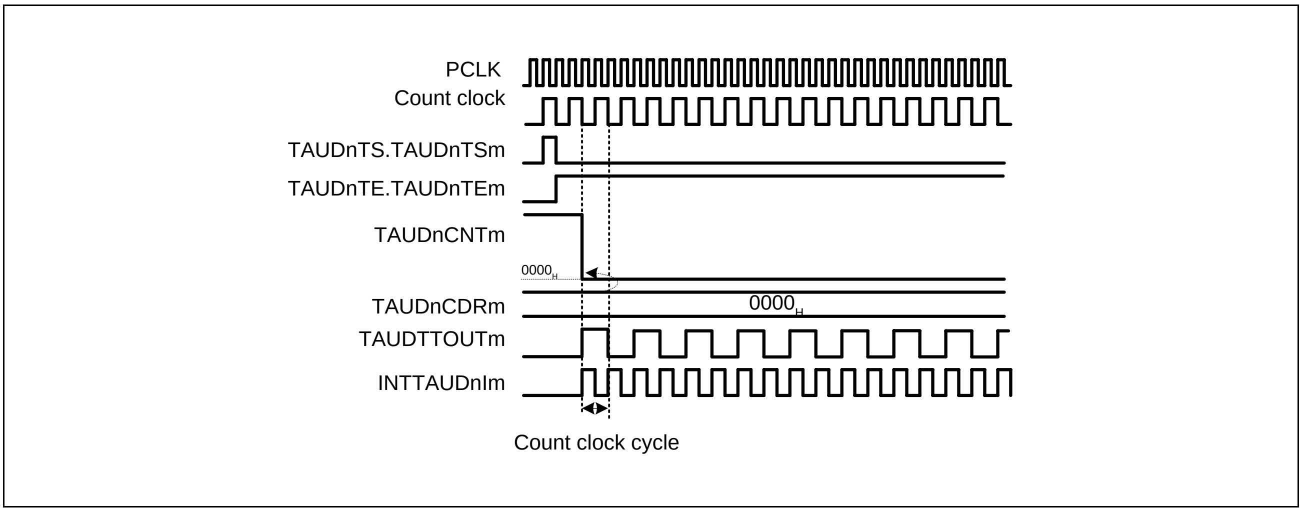

Figure 32.30 TAUDnCDRm = 0000$_H$, Count Clock = PCLK/2

- If TAUDnCDRm = 0000$_H$ and the count clock = PCLK/2, the TAUDnCDRm value is loaded into TAUDnCNTm every count clock, meaning that TAUDnCNTm is always 0000$_H$.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

(2) TAUDnCDRm = 0000$_H$, count clock = PCLK

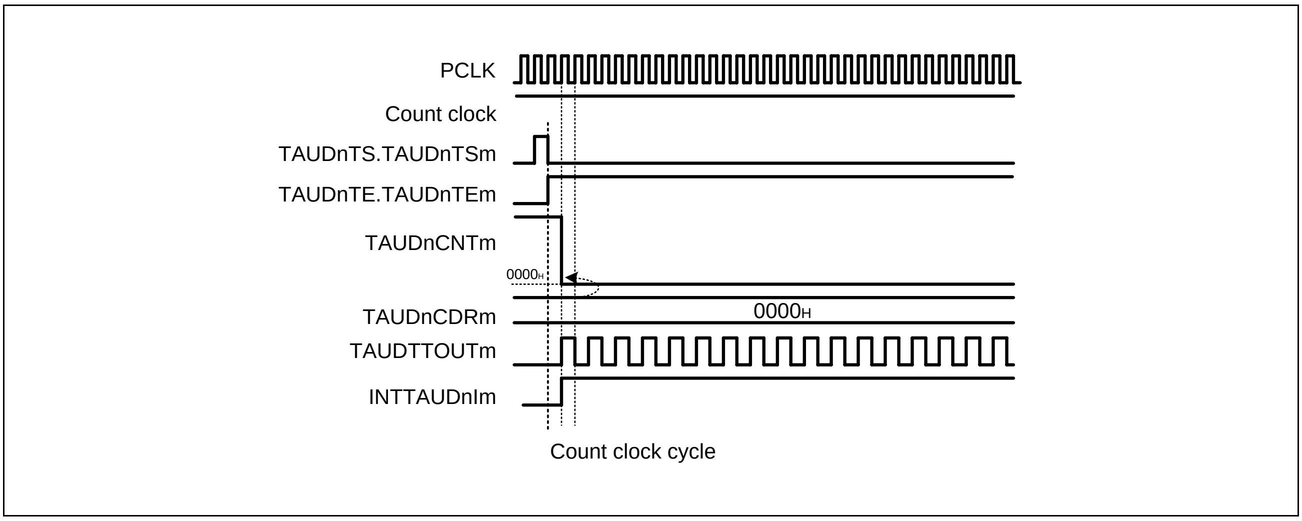

Figure 32.31 TAUDnCDRm = 0000$_H$, Count Clock = PCLK

- If TAUDnCDRm = 0000$_H$ and the count clock = PCLK, the TAUDnCDRm value is loaded into TAUDnCNTm every PCLK clock, meaning that TAUDnCNTm is always 0000$_H$.
- INTTAUDnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
  TAUDTTOUTm is toggled every PCLK clock.

(3) Operation Stop and Restart

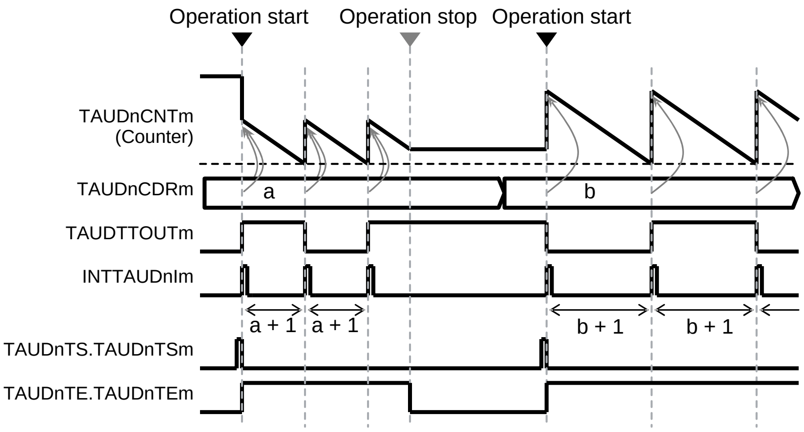

Figure 32.32 Operation Stop and Restart (TAUDnCMORm.TAUDnMD0 = 1)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm and TAUDTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

(4) Forced Restart (TAUDnCMORm.TAUDnMD0 = 1)

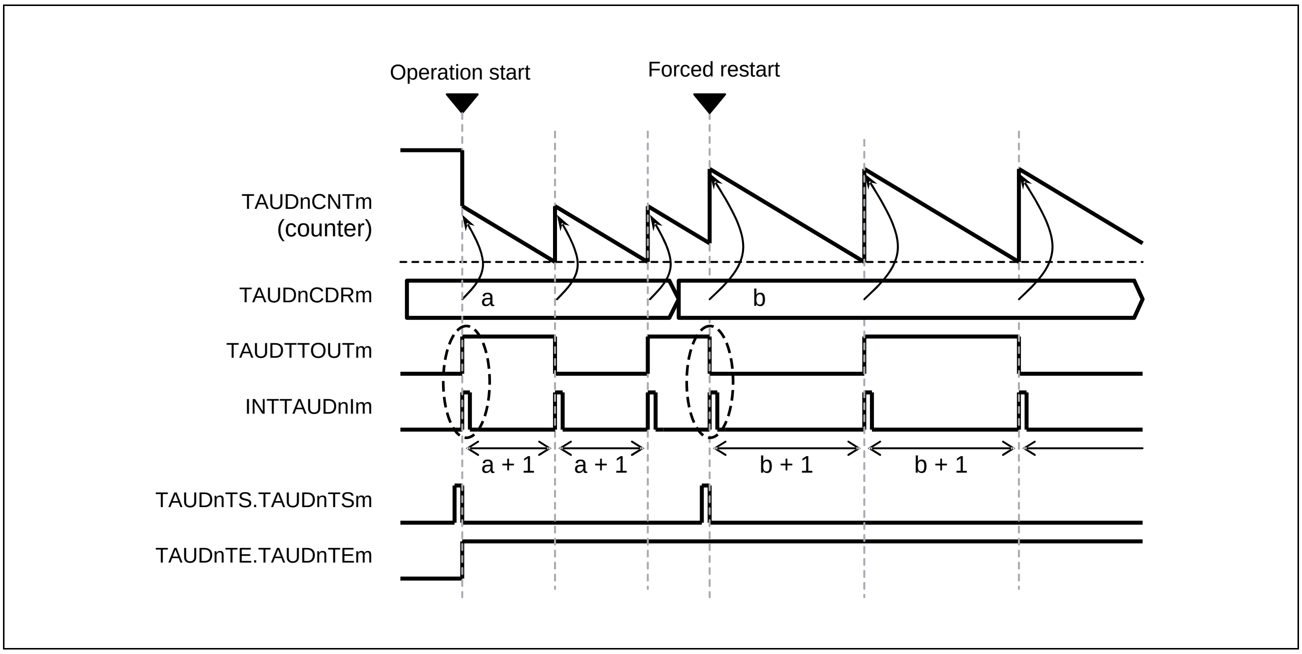

Figure 32.33 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 1)

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 1, the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUDnCDRm value is reflected to TAUDnCNTm and counting starts. Execute a forced restart to reflect the changed TAUDnCDRm value immediately.
- When a forced restart is made, an interrupt (INTTAUDnIm) is generated and TAUDTTOUTm is inverted.

(5) Forced Restart (TAUDnCMORm.TAUDnMD0 = 0)

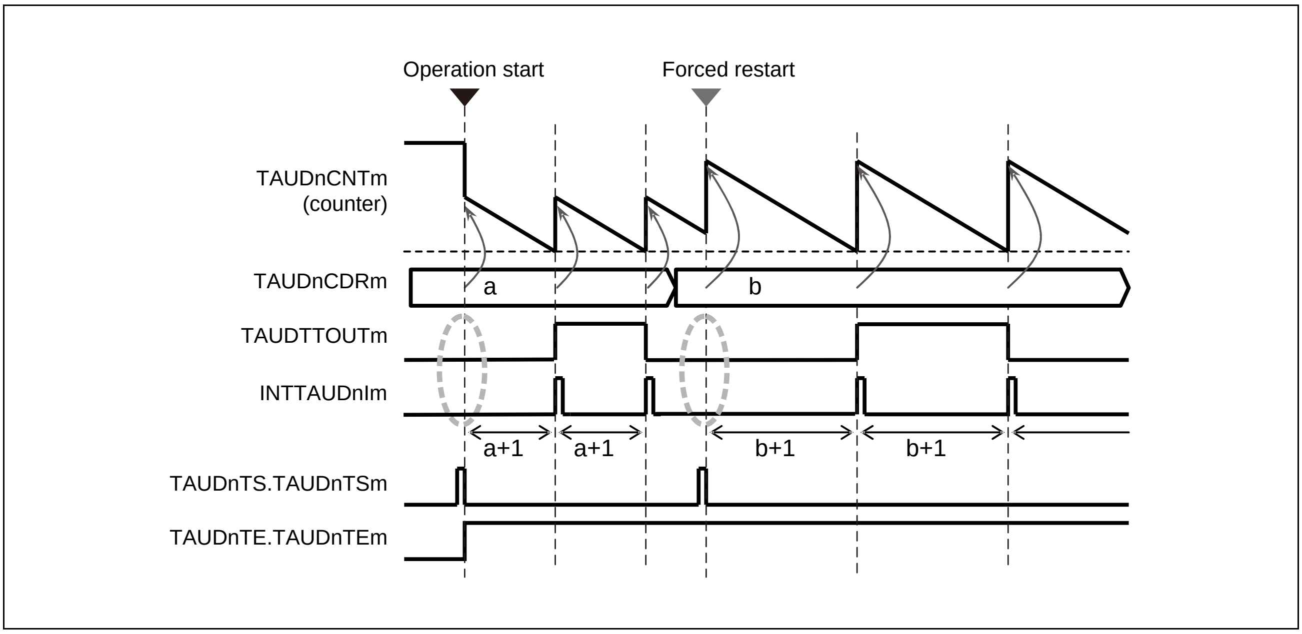

Figure 32.34 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 0)

- When a forced restart is made, an interrupt (INTTAUDnIm) is not generated and TAUDTTOUTm is not inverted.

32.12.2 TAUDTTINm Input Interval Timer Function

32.12.2.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals or when a valid TAUDTTINm input edge is detected. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operating mode should be set to interval timer mode. See **Table 32.58, Contents of the TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function**.
- The channel output mode should be set to independent channel output mode 1. See **Section 32.7, Channel Output Modes**.

Functional description

This function operates in an identical manner to the interval timer function (see **Section 32.12.1, Interval Timer Function**) except that this function is restarted by a valid TAUDTTINm input edge. The type of edge used as a trigger is specified using the TAUDnCMURm.TAUDnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

32.12.2.2 Equations

INTTAUDnIm cycle = count clock cycle × (TAUDnCDRm + 1)

TAUDTTOUTm square wave cycle = count clock cycle × (TAUDnCDRm + 1) × 2

32.12.2.3 Block Diagram and General Timing Diagram

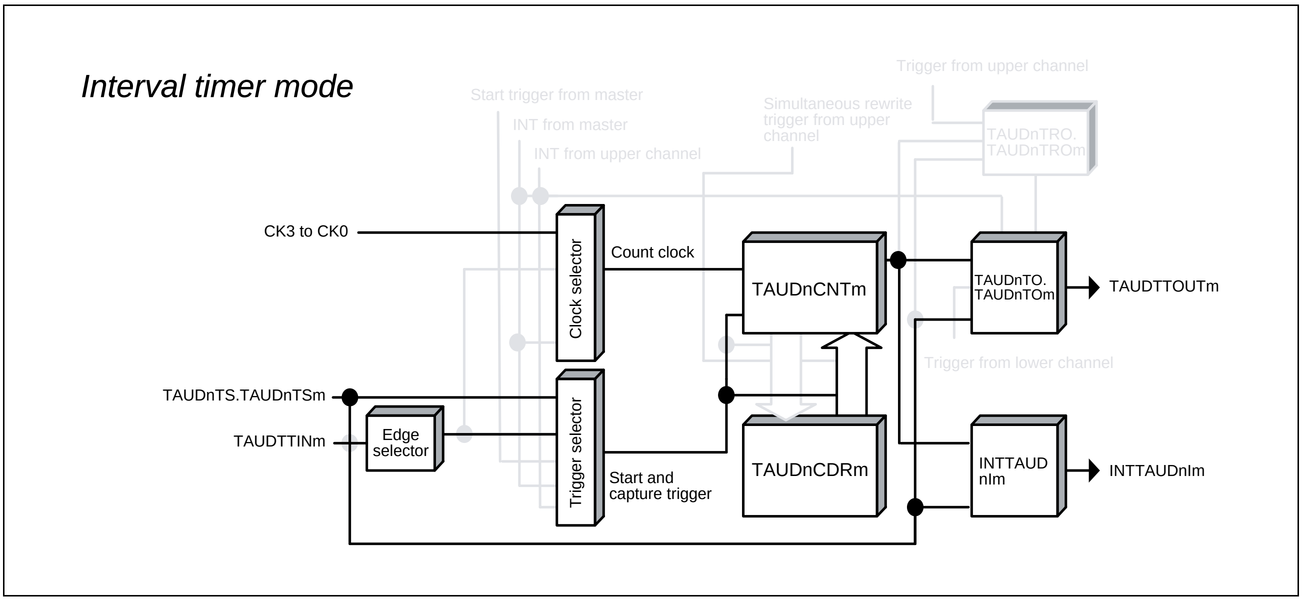

Figure 32.35 Block Diagram of TAUDTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 1).
- Rising edge detection (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

TAUDnTME.TAUDnTMEm	0: Disables modulation

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Section 32.7, Channel Output Modes**.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm Input Interval Timer Function. Therefore, these registers should be set to 0.

Table 32.61 Simultaneous Rewrite Settings for TAUDTTINm Input Interval Timer Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.12.2.5 Operating Procedure for TAUDTTINm Input Interval Timer Function

Table 32.62 Operating Procedure for TAUDTTINm Input Interval Timer Function

		Operation	TAUDn Status
	Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.58, Contents of the TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function**, and **Table 32.59, Contents of the TAUDnCMURm Register for TAUDTTINm Input Interval Timer Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 32.60, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Restart Operation	Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. When TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated and TAUDTTOUTm toggles.
	During Operation	The values of the TAUDnCMURm.TAUDnTIS[1:0] and the TAUDnCDRm register are changeable at any time. The TAUDnCNTm register can be read at all times. Detection of TAUDTTINm edge	TAUDnCNTm counts down. When the counter reaches 0000_H: ● The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. ● INTTAUDnIm is generated and TAUDTTOUTm toggles. When a TAUDTTINm input valid edge is detected during count operation, the TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. Afterwards, this procedure is repeated.
	Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.12.2.6 Specific Timing Diagrams

The timing diagrams in **Section 32.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by a valid TAUDTTINm input edge.

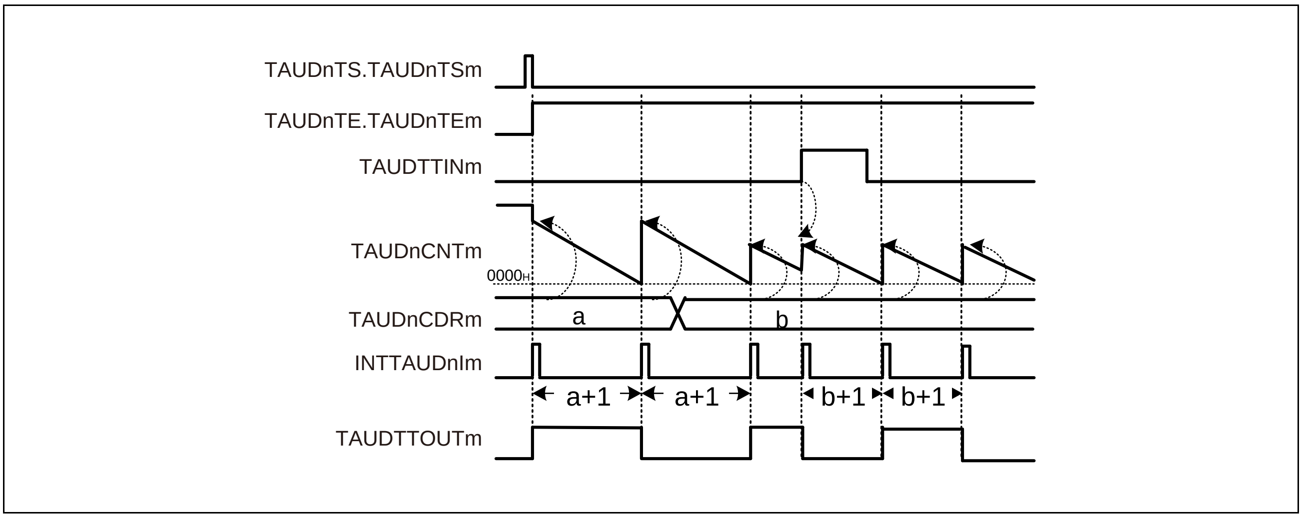

Figure 32.37 Counter Triggered by Rising TAUDTTINm Input Edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B), TAUDnCMORm.TAUDnMD0 = 1

- If a valid TAUDTTINm input edge is detected, an interrupt is generated which causes TAUDTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

32.12.3 Clock Divide Function

32.12.3.1 Overview

Summary

This function is used as a frequency divider. The frequency of the input signal TAUDTTINm is divided by a factor related to TAUDnCDRm, and the resulting signal is output to TAUDTTOUTm.

Prerequisites

- TAUDTTINm should have a fixed frequency.
- The operating mode should be set to interval timer mode. (See **Table 32.63, Contents of the TAUDnCMORm Register for Clock Divide Function**.)
- The channel output mode should be set to independent channel output mode 1. (See **Section 32.7, Channel Output Modes**.)

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value, using TAUDTTINm as a count clock.

When the counter value reaches 0000_H, INTTAUDnIm occurs and TAUDTTOUTm signal is toggled. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The value of TAUDnCDRm can be rewritten at any time. The changed value of TAUDnCDRm is applied when the counter starts to count down next time.

The counter can be stopped by setting TAUDnTT.TAUDnTTm = 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm and TAUDTTOUTm stop but retain their values. The function can be restarted by setting TAUDnTS.TAUDnTSm = 1. The counter can also be forcibly restarted without making a stop by setting TAUDnTS.TAUDnTSm = 1 during operation (forced restart).

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in a negative TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

NOTE

TAUDTTINm input signals are sampled at the frequency of the operation clock set by TAUDnCMORm.TAUDnCKS[1:0] bits. Therefore, the TAUDTTOUTm output clock cycle has an error of ± 1 operation clock cycle.

32.12.3.2 Equations

- When rising edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/[(TAUDnCDRm + 1) × 2]
- When falling edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/[(TAUDnCDRm + 1) × 2]
- When falling and rising edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/(TAUDnCDRm + 1)

32.12.3.3 Block Diagram and General Timing Diagram

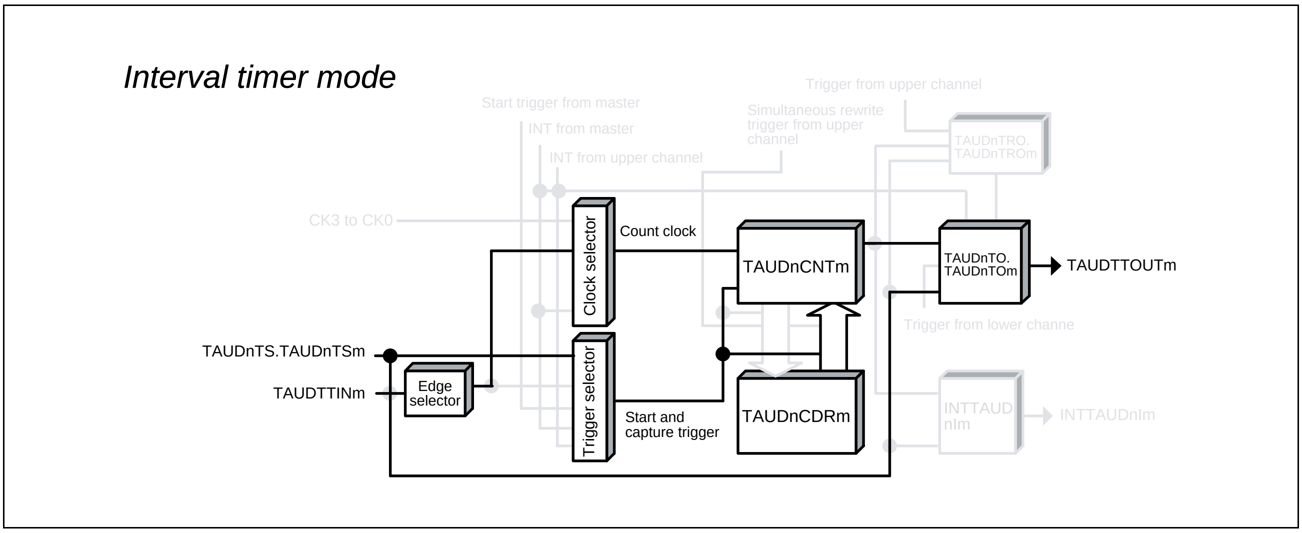

Figure 32.38 Block Diagram of Clock Divide Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

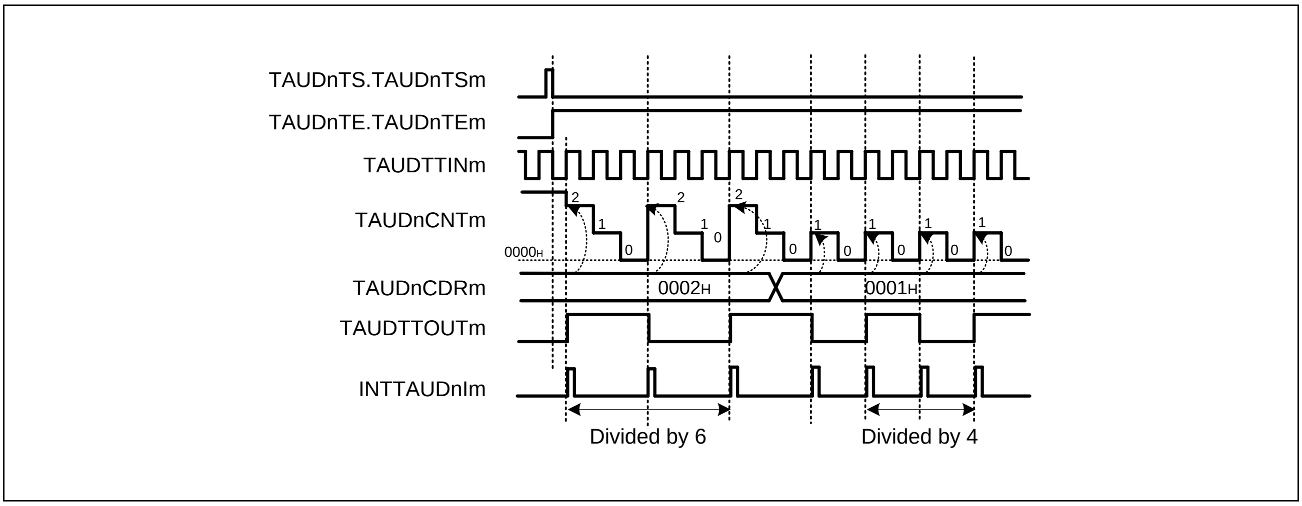

Figure 32.39 General Timing Diagram of Clock Divide Function

TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the clock divide function. Therefore, these registers should be set to 0.

Table 32.66 Simultaneous Rewrite Settings for Clock Divide Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.12.3.5 Operating Procedure for Clock Divide Function

Table 32.67 Operating Procedure for Clock Divide Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.63, Contents of the TAUDnCMORm Register for Clock Divide Function**, and **Table 32.64, Contents of the TAUDnCMURm Register for Clock Divide Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 32.65, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm loads TAUDnCDRm value. If TAUDnCMORm.TAUDnMD0 is set to 1, INTTAUDnIm is generated and TAUDTTOUTm is toggled.
During Operation	The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When the counter reaches 0000_H: ● TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. ● INTTAUDnIm is generated. ● TAUDTTOUTm is toggled. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm and TAUDTTOUTm retain their current values.

32.12.3.6 Specific Timing Diagrams

(1) TAUDnCDRm = 0000_H

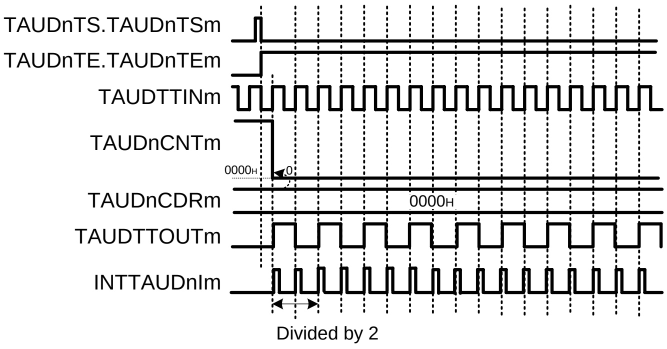

Figure 32.40 TAUDnCDRm = 0000_H, TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01_B

- If TAUDnCDRm is 0000_H, TAUDnCNTm is always 0000_H.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

Figure 32.40, TAUDnCDRm = 0000H, TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01B shows an operation timing example. Actually, there is a delay from TINm detection until TOUTm output because of the delay time of a noise filter or synchronization circuit placed between the TAUDnIm pin and TAUDn.

(2) Operation Restart

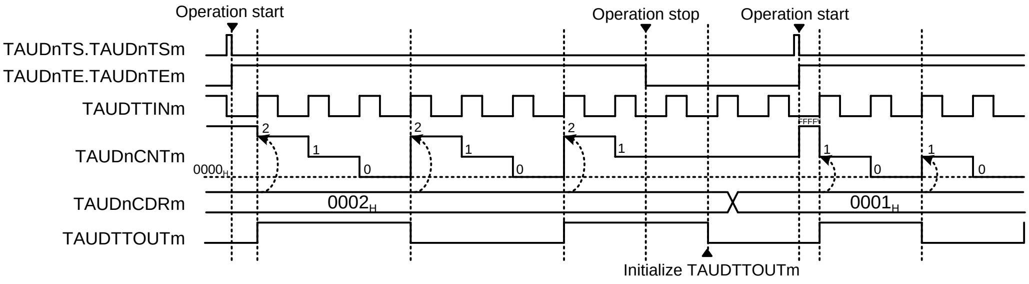

Figure 32.41 Operation Restart
(TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

To reset the value of TAUDTTOUTm:

- Set TAUDnTOE.TAUDnTOEm = 0 when the counter is stopped (TAUDnTE.TAUDnTEm = 0).
- Then, write either 0 or 1 to TAUDnTO.TAUDnTOm to set the new start value of TAUDTTOUTm.

(3) Forced Restart

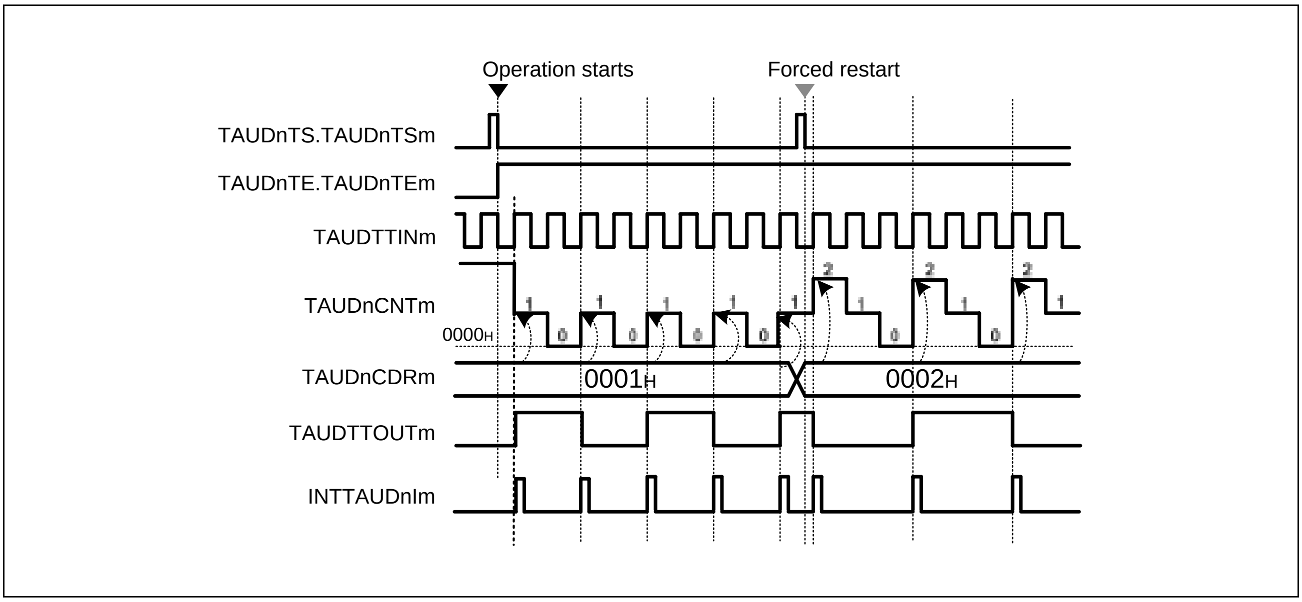

Figure 32.42 Forced Restart Operation
(TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm = 1 during operation.
- The value of TAUDnCDRm is written to TAUDnCNTm and the count operation restarts.
- TAUDTTOUTm restarts at the same level as before the forced restart.

32.12.4 External Event Count Function

32.12.4.1 Overview

Summary

This function is used as an event timer, which generates an interrupt (INTTAUDnIm) when a specific number of valid TAUDTTINm input edges are detected.

Prerequisites

- The operating mode should be set to the event count mode. (See **Table 32.68, Contents of the TAUDnCMORm Register for External Event Count Function**.)
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When the counter starts, the current value of TAUDnCDRm is loaded into TAUDnCNTm.

When a valid TAUDTTINm input edge is detected, the value of TAUDnCNTm decrements by 1. TAUDnCNTm retains this value until a valid TAUDTTINm input edge is detected or the counter is restarted.

When the valid edge is detected for the (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. The counter can also be restarted without stopping it first (forced restart) by setting TAUDnTS.TAUDnTSm to 1 during operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

An edge type used as a trigger is specified by TAUDnCMURm.TAUDnTIS[1:0] bits.

- When TAUDnCMURm.TAUDnTIS[1:0] = 00_B, falling edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = 01_B, rising edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = 10_B, both edges are counted.

32.12.4.2 Equations

Number of valid edges detected before INTTAUDnIm generation = TAUDnCDRm + 1

32.12.4.3 Block Diagram and General Timing Diagram

32.12.4.5 Operating Procedure for External Event Count Function

Table 32.71 Operating Procedure for External Event Count Function

		Operation	TAUDn Status
	Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.68, Contents of the TAUDnCMORm Register for External Event Count Function**, and **Table 32.69, Contents of the TAUDnCMURm Register for External Event Count Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Restart Operation	Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm loads TAUDnCDRm value and waits for TAUDTTINm input edge detection.
	During Operation	Detection of TAUDTTINm edge The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When effective edges are detected (TAUDnCDRm + 1) times: ● TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. ● INTTAUDnIm is generated. Afterwards, this procedure is repeated.
	Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

32.12.4.6 Specific Timing Diagrams

(1) TAUDnCDRm = 0000$_H$

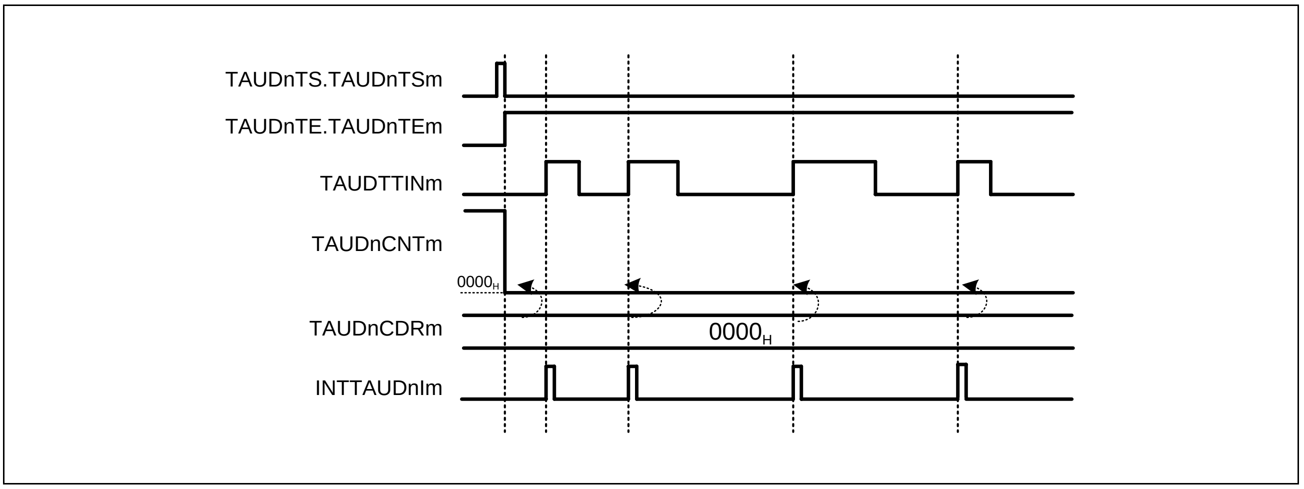

Figure 32.45 TAUDnCDRm = 0000$_H$, TAUDnCMURm.TAUDnTIS[1:0] = 01$_B$

- If 0000$_H$ = TAUDnCDRm, 0000$_H$ is loaded into TAUDnCNTm each time a valid TAUDTTINm input edge is detected.
  In other words, INTTAUDnIm is generated each time a valid TAUDTTINm input edge is detected.

(2) Operation Stop and Restart

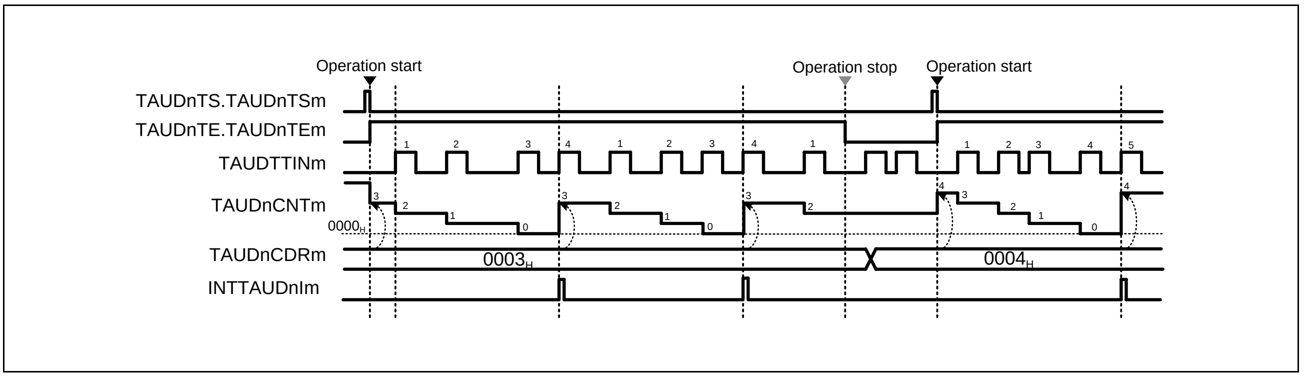

Figure 32.46 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = 01$_B$)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value. TAUDTTINm continues and TAUDnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm loads the TAUDnCDRm value and restarts count operation.

(3) Forced Restart

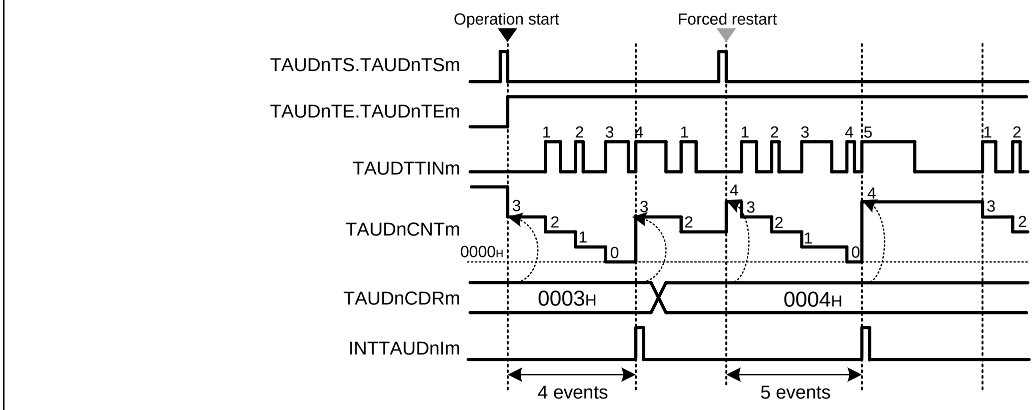

Figure 32.47 Forced Restart Operation (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

Once a forced restart is made, the changed TAUDnCDRm value is applied to TAUDnCNTm immediately.

- The counter can be restarted without making a stop by setting TAUDnTS.TAUDnTSm to 1 during operation.
- The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter awaits the next valid TAUDTTINm input edge.

32.12.5 Delay Count Function

32.12.5.1 Overview

Summary

This function generates interrupts (INTTAUDnIm), which have a defined delay to the TAUDTTINm input signal. TAUDTTINm input signal pulses that occur within the delay period are ignored.

Prerequisites

- The operating mode should be set to one-count mode. See **Table 32.72, Contents of the TAUDnCMORm Register for Delay Count Function**.
- TAUDTTOUTm is not used with this function.
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches 0000_H, an interrupt is generated. The counter returns to $FFFF_H$ and awaits the next valid TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

32.12.5.2 Equations

Delay between TAUDTTINm and INTTAUDnIm = count clock cycle × (TAUDnCDRm + 1)

32.12.5.3 Block Diagram and General Timing Diagram

(3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function. However, this mode can be used in independent channel output mode controlled by software.

(4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the delay count function. Therefore, these registers should be set to 0.

Table 32.74 Simultaneous Rewrite Settings for Delay Count Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.12.5.5 Operating Procedure for Delay Count Function

Table 32.75 Operating Procedure for Delay Count Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.72, Contents of the TAUDnCMORm Register for Delay Count Function**, and **Table 32.73, Contents of the TAUDnCMURm Register for Delay Count Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a start edge is detected, the TAUDnCDRm value is loaded in TAUDnCNTm.
During Operation	The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000_H. INTTAUDnIm is generated. TAUDnCNTm stops counting, returns $FFFF_H$, and waits for a trigger. If a trigger occurs while TAUDnCNTm is counting, the trigger is ignored. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its value.

Restart Operation

32.12.6 One-Pulse Output Function

32.12.6.1 Overview

Summary

This function generates an interrupt (INTTAUDnIm) when a valid TAUDTTINm input edge is detected and at a defined interval afterward. TAUDTTINm input signal pulses that occur within the defined interval are ignored. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operation mode should be set to pulse one-count mode. (See **Table 32.76, Contents of the TAUDnCMORm Register for One-Pulse Output Function**.)
- The channel output mode should be set to independent channel output mode 2. (See **Section 32.7, Channel Output Modes**.)
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. An interrupt is generated and TAUDTTOUTm is set to active level.

When the counter reaches 0001_H, an interrupt is generated and TAUDTTOUTm is set to the inactive level. The counter stops at 0000_H and awaits the next valid TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

32.12.6.2 Equations

Interval between TAUDTTINm and INTTAUDnIm = TAUDTTOUTm (timer output) width = count clock cycle × TAUDnCDRm

32.12.6.3 Block Diagram and General Timing Diagram

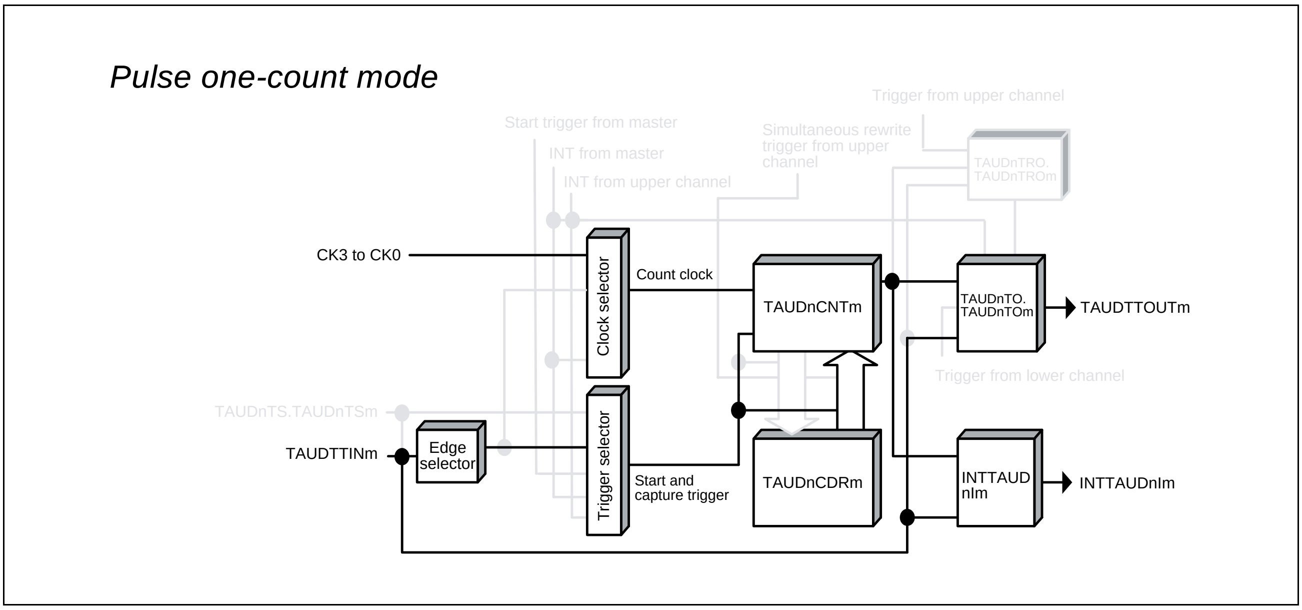

Figure 32.50 Block Diagram of One-Pulse Output Function

The following settings apply to the general timing diagram.

(3) Channel Output Mode

Table 32.78 Control Bit Settings in Independent Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode controlled by software.
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Table 32.52, Channel Output Modes**.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the One-Pulse Output Function. Therefore, these registers should be set to 0.

Table 32.79 Simultaneous Rewrite Settings for One-Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.12.6.5 Operating Procedure for One-Pulse Output Function

Table 32.80 Operating Procedure for One-Pulse Output Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.76, Contents of the TAUDnCMORm Register for One-Pulse Output Function**, and **Table 32.77, Contents of the TAUDnCMURm Register for One-Pulse Output Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 32.78, Control Bit Settings in Independent Channel Output Mode 2**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a start edge is detected, TAUDnCNTm loads the TAUDnCDRm value.
During Operation	The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at all times.	INTTAUDnIm is generated when TAUDnCNTm starts and TAUDTTOUTm is set to its active level. TAUDnCNTm counts down. When the counter reaches 0001_H: ● INTTAUDnIm is generated. ● TAUDTTOUTm is set to its inactive level. TAUDnCNTm stops counting and waits for a trigger. If a trigger occurs while TAUDnCNTm is counting, the trigger is ignored.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.12.7 TAUDTTINm Input Pulse Interval Measurement Function

32.12.7.1 Overview

Summary

This function captures the count value and uses this value and the overflow bit TAUDnCSRm.TAUDnOVF to measure the interval of the TAUDTTINm input signals.

Prerequisites

- The operating mode should be set to capture mode. See **Table 32.82, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function**.
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter TAUDnCNTm starts to count up from 0000_H. When a valid TAUDTTINm edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter resets to 0000_H and subsequently continues operation.

If the counter reaches $FFFF_H$ before a valid TAUDTTINm edge is detected, it overflows to 0000_H. The counter is reset to 0000_H and subsequently continues operation. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

Table 32.81 Effects of Overflow

TAUDnCMORm. TAUDnCOS[1:0]	When Overflow Occurs		When a Valid TAUDTTINm Input is Detected	
	TAUDnCDRm	TAUDnCSRm. TAUDnOVF	TAUDnCDRm, TAUDnCNTm	TAUDnCSRm. TAUDnOVF
00	Unchanged	0	TAUDnCNTm loaded into TAUDnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUDnCNTm set to 0, TAUDnCDRm unchanged	Unchanged
11		1		

When TAUDnCMORm.TAUDnCOS[0] = 1, the overflow bit (TAUDnCSRm.TAUDnOVF) can be cleared only by setting TAUDnCSCm.TAUDnCLOV = 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the interval of the TAUDTTINm signal. However, if an overflow occurs multiple times before a valid TAUDTTINm input is detected, the overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

The function can be stopped by setting TAUDnTT.TAUDnTTm = 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm stops but retains its value. While the function is stopped, valid TAUDTTINm input edge detection and TAUDnCNTm capture are not performed.

The counter is reset to 0000_H and subsequently continues operation.

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

NOTE

When TAUDnCMORm.TAUDnCOS[1:0] = 10_B or 11_B, the value of TAUDnCNTm is not loaded into TAUDnCDRm when the first valid TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

32.12.7.2 Equations

TAUDTTINm input pulse interval = count clock cycle × [(TAUDnCSRm.TAUDnOVF × ($FFFF_H$ + 1)) + TAUDnCDRm capture value + 1]

32.12.7.3 Block Diagram and General Timing Diagram

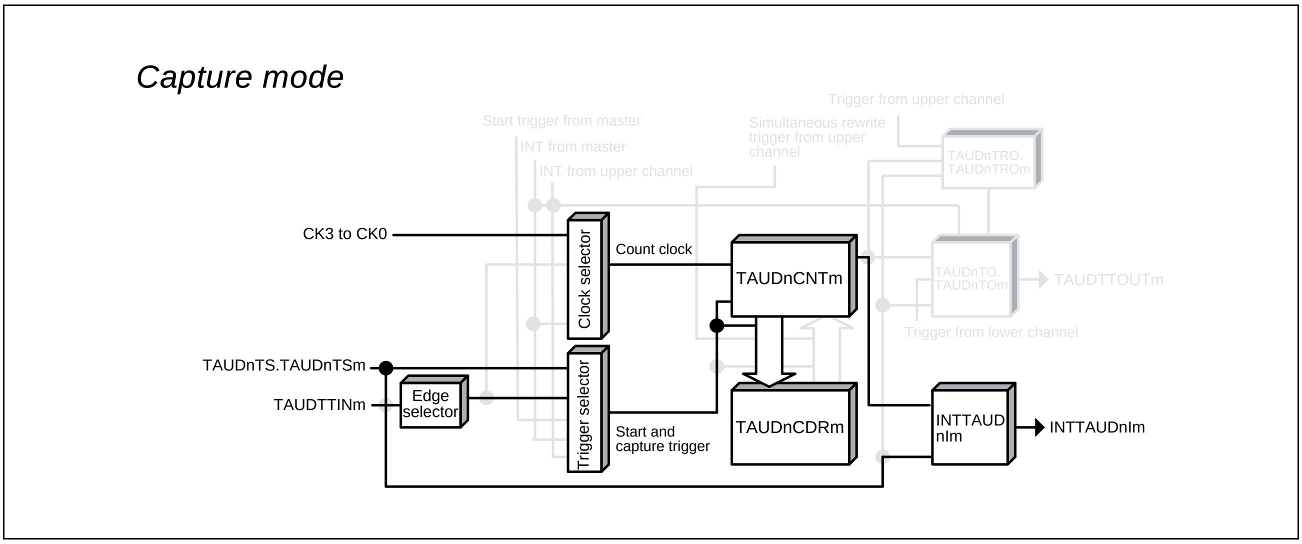

Figure 32.52 Block Diagram of TAUDTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 0).
- Falling edge detection (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)
- When a valid TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1 (TAUDnCMORm.TAUDnCOS[1:0] = 00_B).

(3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input pulse interval measurement function. Therefore, these registers should be set to 0.

Table 32.84 Simultaneous Rewrite Settings for TAUDTTINm Input Pulse Interval Measurement Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.12.7.5 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

Table 32.85 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

		Operation	TAUDn Status
	Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.82, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function**, and **Table 32.83, Contents of the TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Measurement Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Restart Operation	Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000_H. INTTAUDnIm is generated when TAUDnCMORm.TAUDnMD0 is set to 1.
	During Operation	Detection of TAUDTTINm edge The values of TAUDnCMURm.TAUDnTIS[1:0] bits can be changed at any time. The TAUDnCDRm and TAUDnCSRm registers can be read at any time. TAUDnCSCm.TAUDnCLOV can be written to 1. (TAUDnCSRm.TAUDnOVF bit is cleared to 0.)	TAUDnCNTm starts to count up from 0000_H. When a TAUDTTINm valid edge is detected: ● TAUDnCNTm transfers (captures) its value to TAUDnCDRm, and returns to 0000_H. ● INTTAUDnIm is then generated. Afterwards, this procedure is repeated.
	Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values.

32.12.7.6 Specific Timing Diagrams: Overflow Operation

(1) TAUDnCMORm.TAUDnCOS[1:0] = 00B

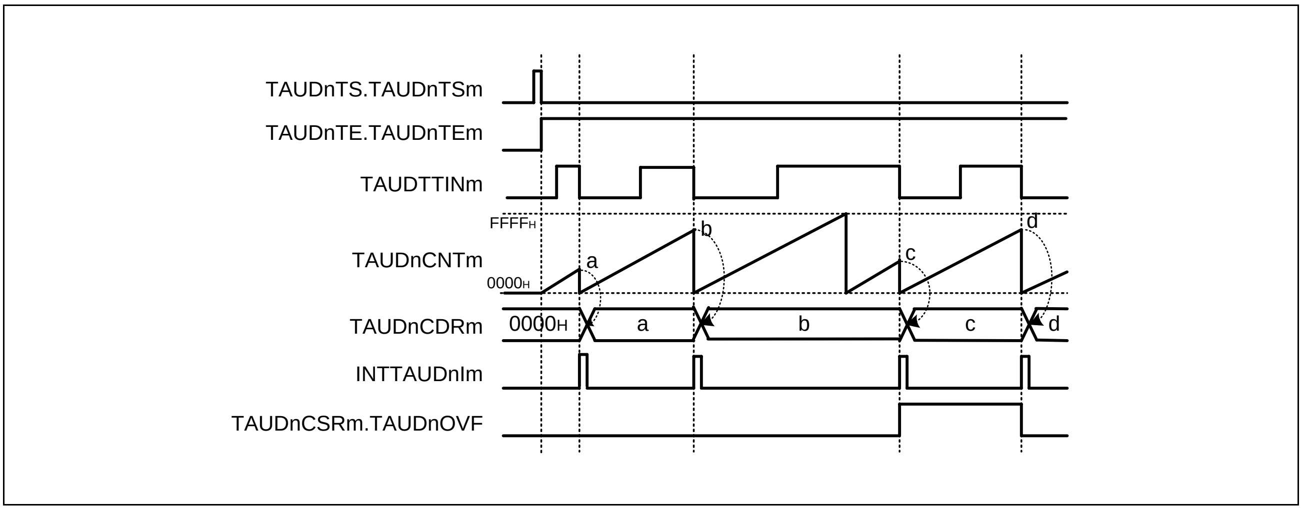

Figure 32.54 TAUDnCMORm.TAUDnCOS[1:0] = 00B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0.

(2) TAUDnCMORm.TAUDnCOS[1:0] = 01_B

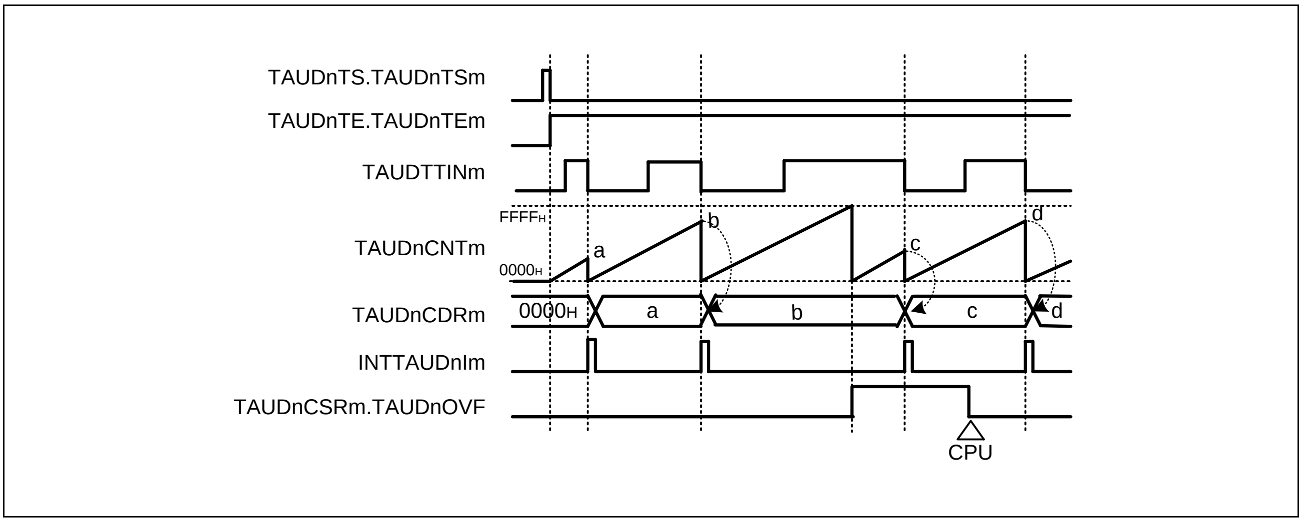

Figure 32.55 TAUDnCMORm.TAUDnCOS[1:0] = 01_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to1.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).

(3) TAUDnCMORm.TAUDnCOS[1:0] = 10_B

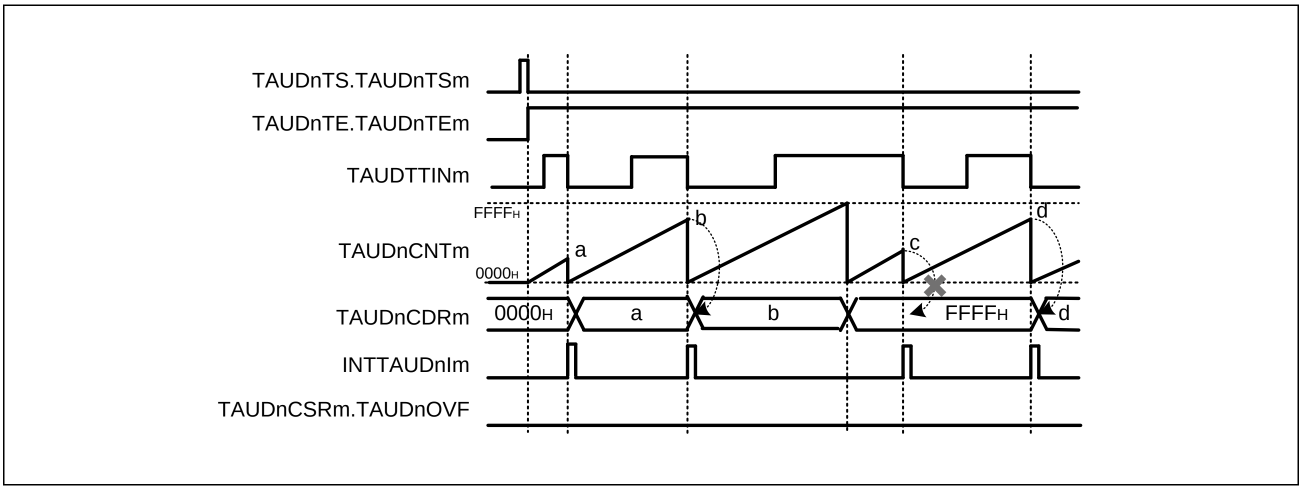

Figure 32.56 TAUDnCMORm.TAUDnCOS[1:0] = 10_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm is reset to 0, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.

(4) TAUDnCMORm.TAUDnCOS[1:0] = 11_B

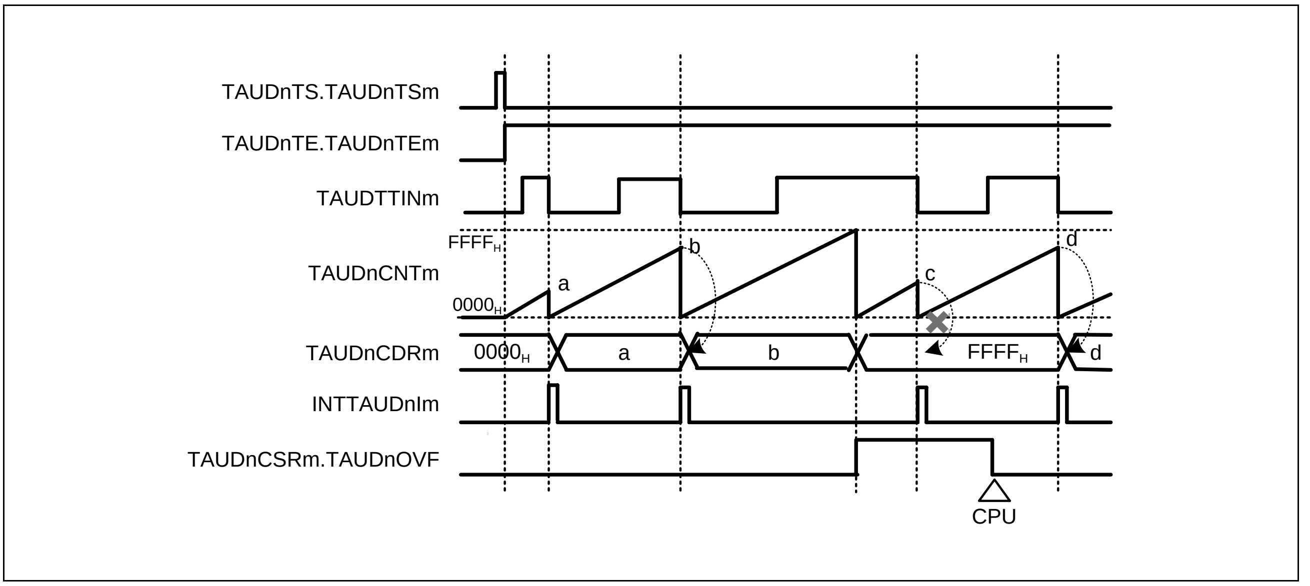

Figure 32.57 TAUDnCMORm.TAUDnCOS[1:0] = 11_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm is reset to 0, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

32.12.8 TAUDTTINm Input Signal Width Measurement Function

32.12.8.1 Overview

Summary

This function measures the width of a TAUDTTINm signal, by starting the count at one edge of TAUDTTINm and capturing the count value at the other edge.

Prerequisites

- The operating mode should be set to capture and one-count mode. See **Table 32.87, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function**.
- TAUDTTOUTm is not used with this function.
- TAUDnCMORm.TAUDnMD0 should be set to 0.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When a valid TAUDTTINm start edge is detected, the counter TAUDnCNTm starts to count up from 0000_H. When a valid TAUDTTINm stop edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter retains its value (TAUDnCDRm +1) and awaits the next valid TAUDTTINm input start edge.

If the counter reaches $FFFF_H$ before a valid TAUDTTINm stop edge is detected, it overflows. The counter is reset to 0000_H and subsequently continues operation. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

Table 32.86 Effects of Overflow

TAUDnCMORm. TAUDnCOS[1:0]	When Overflow Occurs		When a Valid TAUDTTINm Input Stop Edge is Detected	
	TAUDnCDRm	TAUDnCSRm. TAUDnOVF	TAUDnCDRm, TAUDnCNTm	TAUDnCSRm. TAUDnOVF
00	Unchanged	0	TAUDnCNTm loaded into TAUDnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUDnCNTm stops counting TAUDnCDRm unchanged	Unchanged
11		1		

When TAUDnCMORm.TAUDnCOS[0] = 1, overflow bit TAUDnCSRm.TAUDnOVF can be cleared only by setting TAUDnCSCm.TAUDnCLOV to 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the width of the TAUDTTINm signal. However, if an overflow occurs multiple times before a valid TAUDTTINm input is detected, overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

This function cannot be forcibly restarted.

NOTE

When TAUDnCMORm.TAUDnCOS[1] = 1, the value of TAUDnCNTm is not loaded to TAUDnCDRm when the first valid TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

32.12.8.2 Equations

TAUDTTINm input signal width = count clock cycle × [(TAUDnCSRm.TAUDnOVF × (FFFF$_H$ + 1)) + TAUDnCDRm capture value + 1]

32.12.8.3 Block Diagram and General Timing Diagram

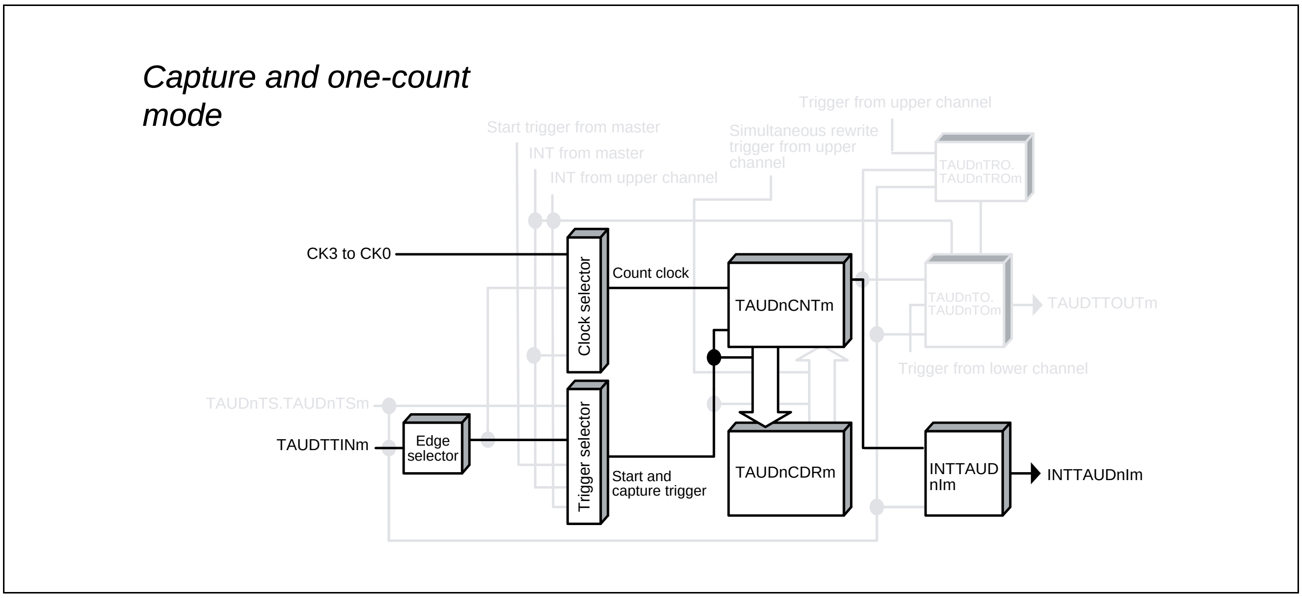

Figure 32.58 Block Diagram of TAUDTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11$_B$)
- When a valid TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1. (TAUDnCMORm.TAUDnCOS[1:0] = 00$_B$)

1, 0	TAUDnTIS[1:0]	10: Detection of rising and falling edges (low width measurement) 11: Detection of rising and falling edges (high width measurement)

(3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input signal width measurement function. Therefore, these registers should be set to 0.

Table 32.89 Simultaneous Rewrite Settings for TAUDTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.12.8.5 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

Table 32.90 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.87, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function**, and **Table 32.88, Contents of the TAUDnCMURm Register For TAUDTTINm Input Signal Width Measurement Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a TAUDTTINm start edge is detected, TAUDnCNTm starts to count up.
During Operation	TAUDnCDRm, TAUDnCNTm, and TAUDnCSRm registers can be read at any time. TAUDnCSCm.TAUDnCLOV bit can be set to 1.	TAUDnCNTm starts to count up from 0000_H. When TAUDTTINm valid edge is detected: ● TAUDnCNTm transfers (captures) its value to TAUDnCDRm, and retains its value. INTTAUDnIm is then generated. Counting stops at the “value that transferred to TAUDnCDRm + 1” and TAUDnCNTm waits for detection of the TAUDTTINm start edge. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values.

32.12.8.6 Specific Timing Diagrams: Overflow Operation

(1) TAUDnCMORm.TAUDnCOS[1:0] = 00_B

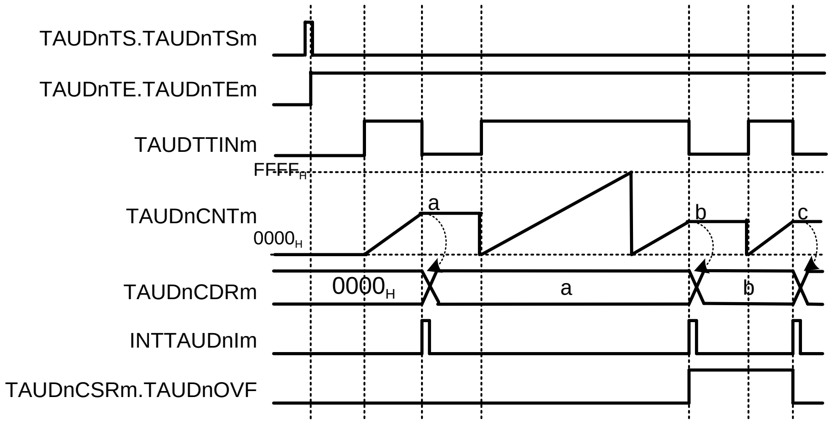

Figure 32.60 TAUDnCMORm.TAUDnCOS[1:0] = 00_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0.

(2) TAUDnCMORm.TAUDnCOS[1:0] = 01B

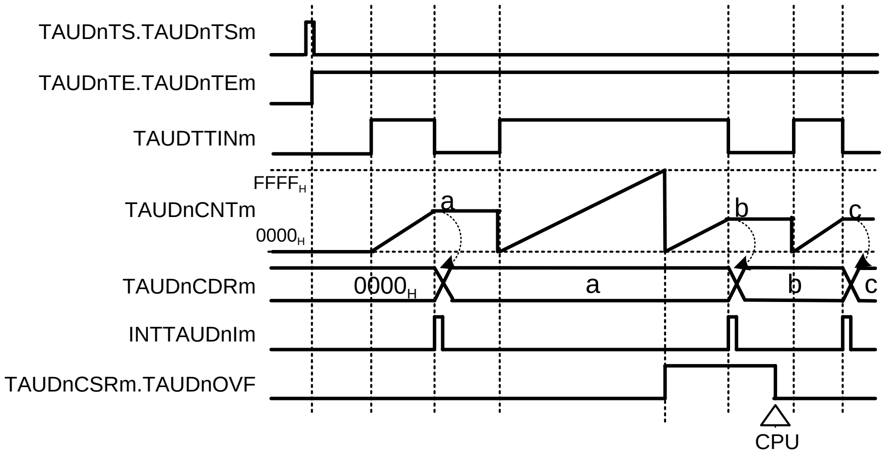

Figure 32.61 TAUDnCMORm.TAUDnCOS[1:0] = 01B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).

(3) TAUDnCMORm.TAUDnCOS[1:0] = 10_B

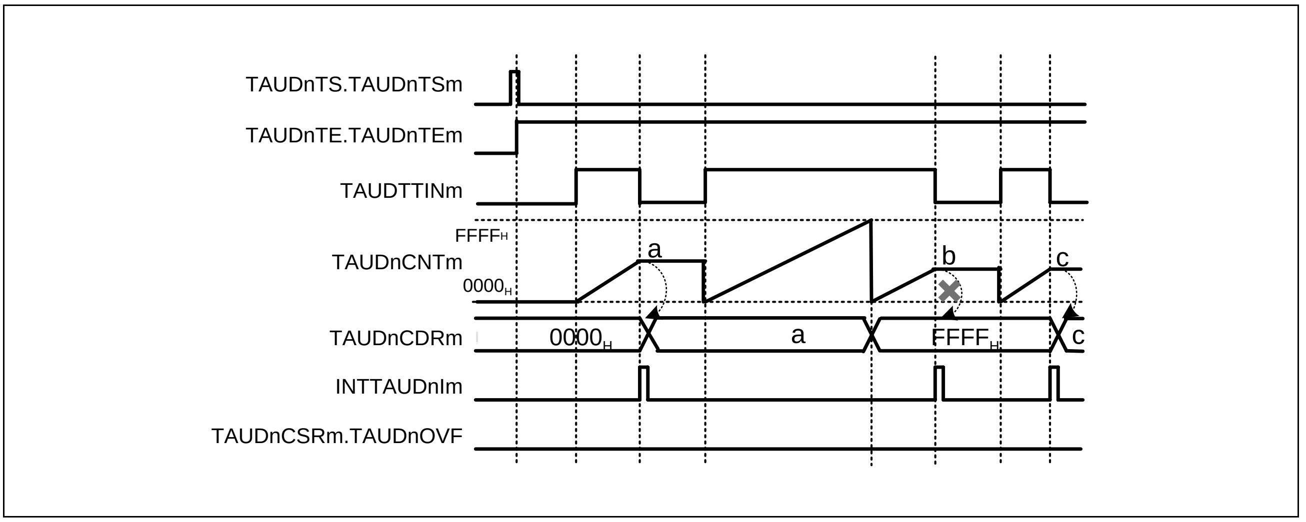

Figure 32.62 TAUDnCMORm.TAUDnCOS[1:0] = 10_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm stops counting, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.

(4) TAUDnCMORm.TAUDnCOS[1:0] = 11_B

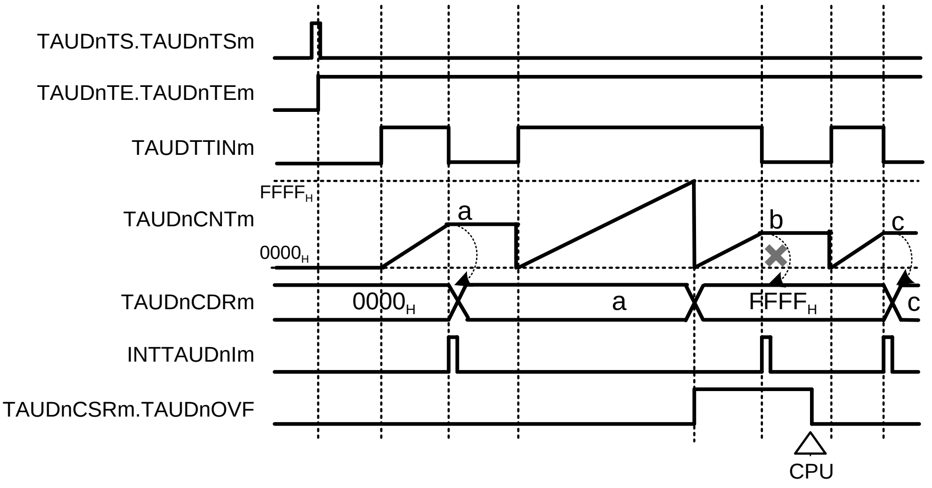

Figure 32.63 TAUDnCMORm.TAUDnCOS[1:0] = 11_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm stops counting, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

32.12.9 TAUDTTINm Input Position Detection Function

32.12.9.1 Overview

Summary

This function measures the input signal duration by capturing the count value at the valid edge of TAUDTTINm.

Prerequisites

- The operating mode should be set to count capture mode. (See **Table 32.91, Contents of the TAUDnCMORm Register for TAUDTTINm Input Position Detection Function**.)
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter starts counting from 0000_H. When a valid TAUDTTINm input edge is detected, the current value of TAUDnCNTm is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The count operation continues.

When the counter reaches $FFFF_H$, the counter restarts from 0000_H.

NOTE

The TAUDTTINm input signal is sampled at the frequency of the operation clock, specified by TAUDnCMORm.TAUDnCKS[1:0] bits.

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt does not occur at the beginning of operation or after restart. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

(3) Channel Output Mode

The channel output mode is not used by this function.

(4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input position detection function. Therefore, these registers should be set to 0.

Table 32.93 Simultaneous Rewrite Settings for TAUDTTINm Input Position Detection Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0

32.12.9.5 Operating Procedure for TAUDTTINm Input Position Detection Function

Table 32.94 Operating Procedure for TAUDTTINm Input Position Detection Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.91, Contents of the TAUDnCMORm Register for TAUDTTINm Input Position Detection Function**, and **Table 32.92, Contents of the TAUDnCMURm Register for TAUDTTINm Input Position Detection Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm occurs.
During Operation	The values of TAUDnCMURm.TAUDnTIS[1:0] bits can be changed at any time. The TAUDnCDRm and TAUDnCSRm registers can be read at any time.	TAUDnCNTm starts to count up from 0000_H. When a valid TAUDTTINm edge is detected: ● TAUDnCNTm transfers (captures) its own value to TAUDnCDRm. ● Outputs INTTAUDnIm. ● The counter is not cleared to 0000_H and TAUDnCNTm continues counting. Afterwards, this procedure is repeated. When TAUDnCNTm reaches $FFFF_H$, the counter restarts from 0000_H.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

32.12.9.6 Specific Timing Diagrams

(1) Operation Stop and Restart

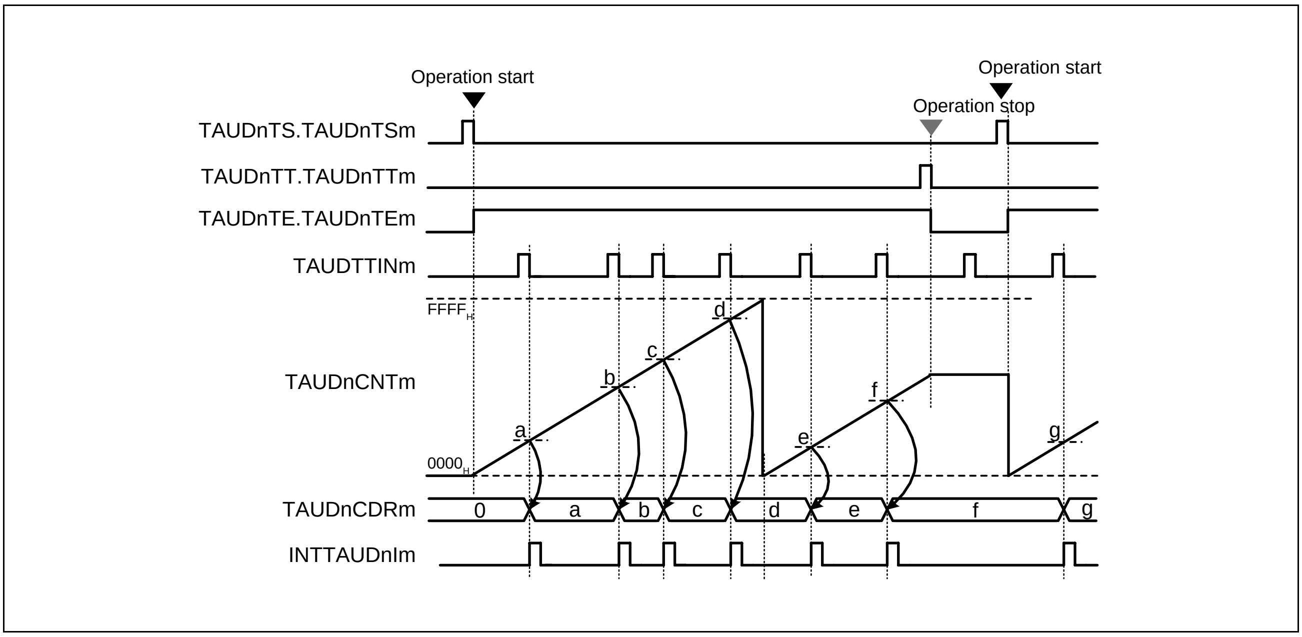

Figure 32.66 Operation Stop and Restart
(TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

- The counter can stop operating by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value.
- If the counter stops operating, valid TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm restarts to count from 0000_H.

32.12.10 TAUDTTINm Input Period Count Detection Function

32.12.10.1 Overview

Summary

This function measures the cumulative width of a TAUDTTINm input signal.

Prerequisites

- The operating mode should be set to capture and gate count mode. (See **Table 32.95, Contents of the TAUDnCMORm Register for TAUDTTINm Input Period Count Detection Function**.)
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter awaits a valid TAUDTTINm input edge.

When a valid TAUDTTINm input start edge is detected, the counter starts to count from 0000_H.

When a valid TAUDTTINm input stop edge is detected, the current TAUDnCNTm value is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The counter stops and retains its value (TAUDnCDRm + 1) until the next valid TAUDTTINm input start edge is detected.

When the next valid TAUDTTINm input start edge is detected, the counter restarts to count from the value retained when stopped.

If the counter reaches $FFFF_H$, the counter restarts from 0000_H.

NOTES

1. TAUDTTINm input signal is sampled at the frequency of an operation clock set by the TAUDnCMORm.TAUDnCKS[1:0] bits.
2. As this function is to measure the TAUDTTINm input signal width, setting TAUDnTS.TAUDnTSm to 1 is disabled while TAUDnTE.TAUDnTEm = 1.

Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, the TAUDTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11_B, the TAUDTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

32.12.10.2 Equations

Cumulative TAUDTTINm input width =
count clock cycle × (TAUDnCDRm capture value + 1)

32.12.10.3 Block Diagram and General Timing Diagram

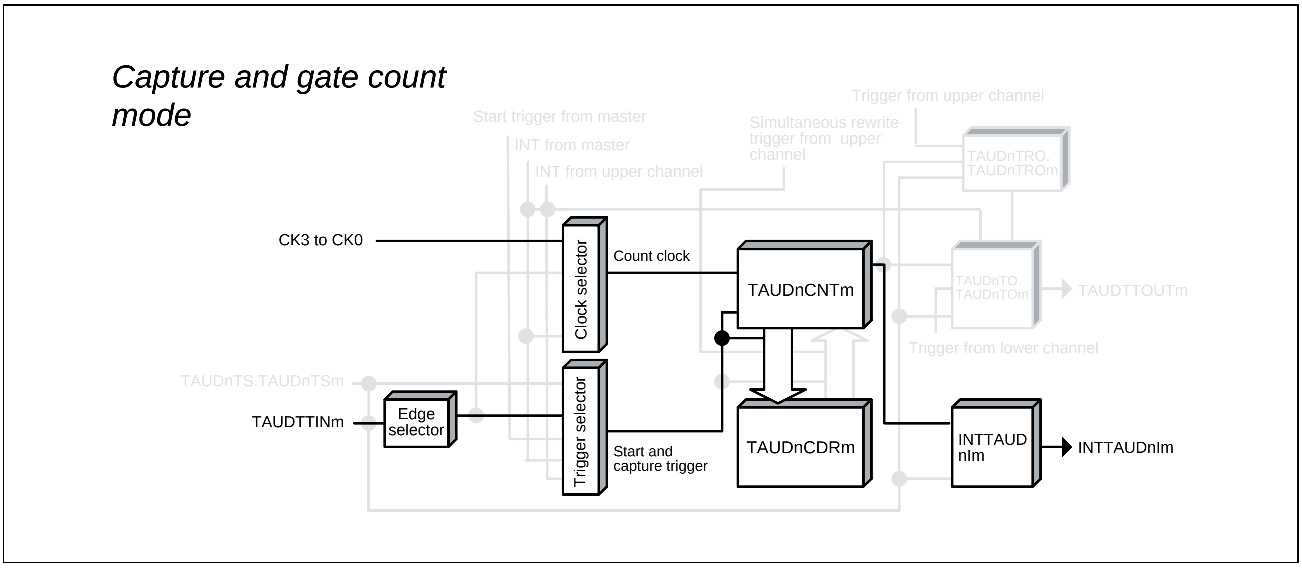

Figure 32.67 Block Diagram of TAUDTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

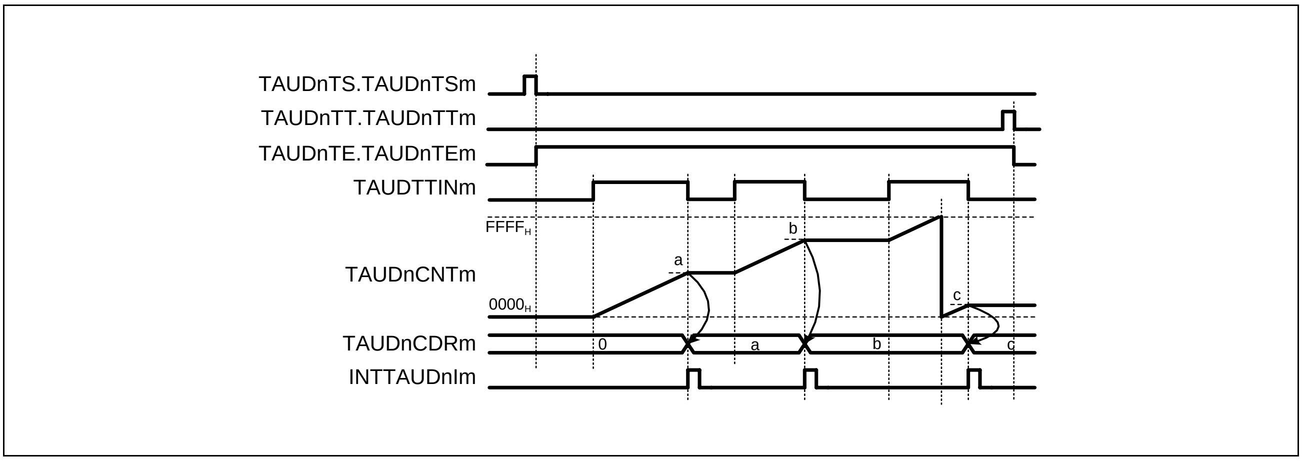

Figure 32.68 General Timing Diagram of TAUDTTINm Input Period Count Detection Function

32.12.10.5 Operating Procedure for TAUDTTINm Input Period Count Detection Function

Table 32.98 Operating Procedure for TAUDTTINm Input Period Count Detection Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.95, Contents of the TAUDnCMORm Register for TAUDTTINm Input Period Count Detection Function**, and **Table 32.96, Contents of the TAUDnCMURm Register for TAUDTTINm Input Period Count Detection Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge.
During Operation	Detection of TAUDTTINm edge The TAUDnCDRm, TAUDnCNTm, and TAUDnCSRm registers can be read at any time.	When a TAUDTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUDnCNTm starts counting up from the stop value. When TAUDnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUDnCDRm and INTTAUDnIm is generated. Counting stops at the “value transferred to TAUDnCDRm + 1” and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When TAUDnCNTm reaches $FFFF_H$, the counter restarts from 0000_H. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

32.12.10.6 Specific Timing Diagrams

(1) Operation stop and restart

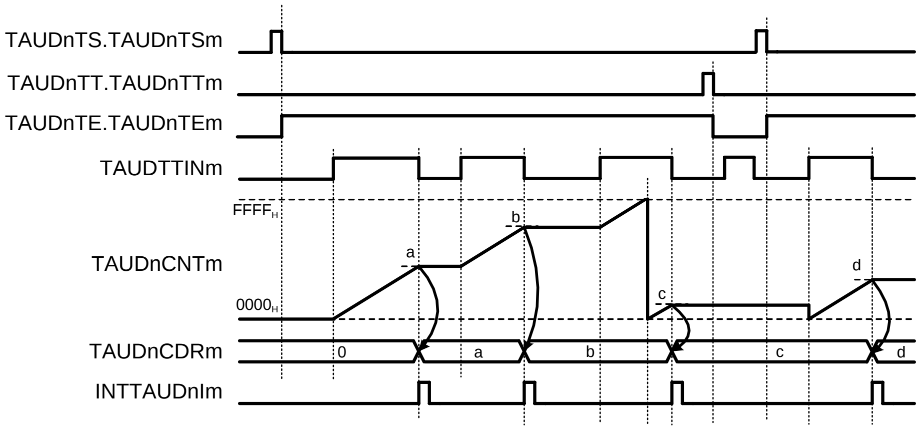

Figure 32.69 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value.
- If the counter is stopped, valid TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm restarts to count from 0000_H.

32.12.11 TAUDTTINm Input Pulse Interval Judgment Function

32.12.11.1 Overview

Summary

This function outputs the result of a comparison between the count value (TAUDnCNTm) and the value in the channel data register (TAUDnCDRm) when a TAUDTTINm input pulse occurs. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true.

Prerequisites

- The operating mode should be set to judge mode. See **Table 32.99, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Judgment Function**.
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When a TAUDTTINm valid edge is detected or TAUDnTS.TAUDnTSm is set to 1, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. TAUDnCNTm reloads the value of TAUDnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches 0000_H before a TAUDTTINm valid edge is detected, TAUDnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:

- If TAUDnCMORm.TAUDnMD0 = 0, INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm.
- If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm.

1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges 11: Setting prohibited

(3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous Rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input pulse interval judgment function. Therefore, these registers should be set to 0.

Table 32.101 Simultaneous Rewrite Settings for TAUDTTINm Input Pulse Interval Judgment Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.12.11.4 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

Table 32.102 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.99, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Judgment Function**, and **Table 32.100, Contents of the TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Judgment Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCDRm value is loaded into TAUDnCNTm.
During Operation	The following register can be changed at any time: ● TAUDnCDRm register	When TAUDnCMORm.TAUDnMD0 = 0 If TAUDnCNTm ≤ TAUDnCDRm when a TAUDTTINm input edge is detected, INTTAUDnIm is generated. When TAUDnCMORm.TAUDnMD0 = 1 If TAUDnCNTm > TAUDnCDRm when a TAUDTTINm input edge is detected, INTTAUDnIm is generated. If a TAUDTTINm input edge is detected, then TAUDnCNTm starts to count down from the value of TAUDnCDRm. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

32.12.12 TAUDTTINm Input Signal Width Judgment Function

32.12.12.1 Overview

Summary

This function compares the count value (TAUDnCNTm) for the high or low level width of a TAUDTTINm input signal and the TAUDnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUDnIm.

Prerequisites

- The operating mode should be set to judge and one-count mode. (See **Table 32.103, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Judgment Function**.)
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When a valid TAUDTTINm input start edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When a TAUDTTINm valid stop edge is detected, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. The counter TAUDnCNTm retains its value until the next valid TAUDTTINm start edge is detected, regardless of the result of the comparison.

If the counter reaches 0000_H before a valid TAUDTTINm stop edge is detected, TAUDnCNTm overflows and is set to $FFFF_H$. The counter then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

- The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:
  - If TAUDnCMORm.TAUDnMD0 = 0, INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm.
  - If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm.
- The TAUDnCMURm.TAUDnTIS[1:0] bits specify a type of width measurement:
  - For high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B), TAUDTTINm rising edge is used as a start edge and TAUDTTINm falling edge as a stop edge.
  - For low width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 10_B), TAUDTTINm falling edge is used as a start edge and TAUDTTINm rising edge as a stop edge.
- Setting TAUDnTS.TAUDnTSm to 1 is prohibited during operation.

32.12.12.2 Block Diagram and General Timing Diagram

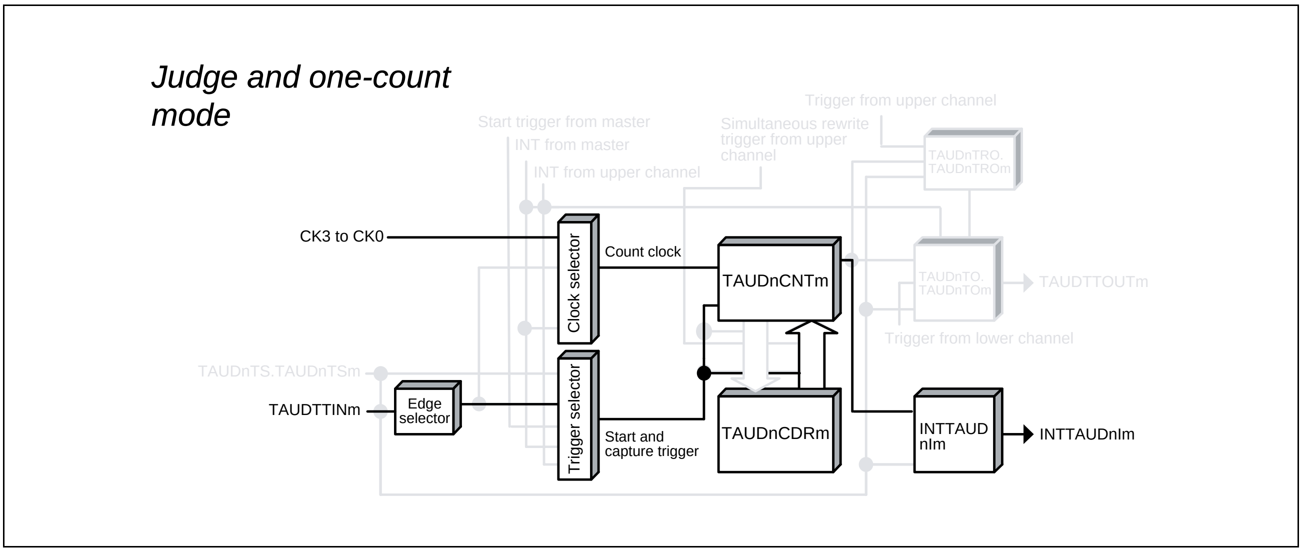

Figure 32.72 Block Diagram of TAUDTTINm Input Signal Width Judgment Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm (TAUDnCMORm.TAUDnMD0 = 0).
- TAUDTTINm valid start edge = rising edge, TAUDTTINm valid stop edge = falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

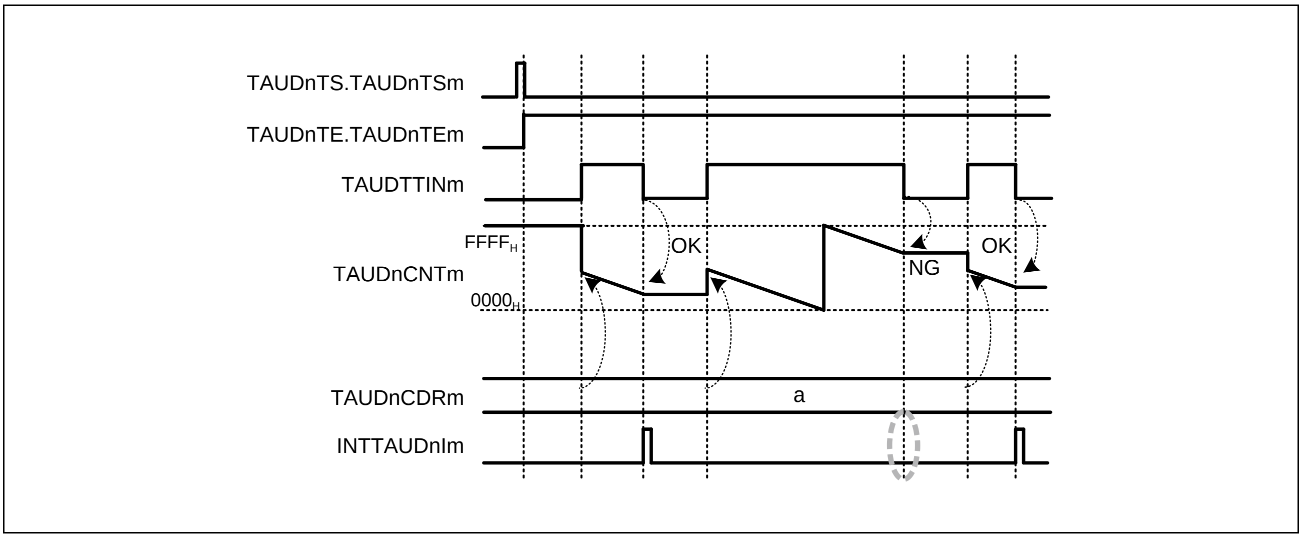

Figure 32.73 General Timing Diagram of TAUDTTINm Input Signal Width Judgment Function

32.12.12.4 Operating Procedure for TAUDTTINm Input Signal Width Judgment Function

Table 32.106 Operating Procedure for TAUDTTINm Input Signal Width Judgment Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.103, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Judgment Function**, and **Table 32.104, Contents of the TAUDnCMURm Register for TAUDTTINm Input Signal Width Judgment Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge.
During Operation	The following register can be changed at any time: ● TAUDnCDRm register	Upon detection of a TAUDTTINm start edge, TAUDnCNTm starts count down from the value of TAUDnCDRm. When TAUDnCMORm.TAUDnMD0 = 0 If TAUDnCNTm ≤ TAUDnCDRm when a TAUDTTINm input stop edge is detected, INTTAUDnIm is generated. When TAUDnCMORm.TAUDnMD0 = 1 If TAUDnCNTm > TAUDnCDRm when a TAUDTTINm input stop edge is detected, INTTAUDnIm is generated. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

32.12.13 Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

32.12.13.1 Overview

Summary

This function measures the width of an individual TAUDTTINm input signal. An interrupt is generated if the TAUDTTINm input width is longer than $FFFF_H + 1$.

Prerequisites

- The operation mode must be set to One-Count Mode (see **Table 32.107, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**).
- TAUDTTOUTm is not used for this function.
- The value of TAUDnCDRm must be set to $FFFF_H$.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. $FFFF_H$ is loaded to TAUDnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUDTTINm input start edge is detected, TAUDnCNTm loads $FFFF_H$ and starts to count down.

If the counter reaches 0000_H before a stop edge is detected, an interrupt is generated.

Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, the TAUDTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11_B, the TAUDTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

32.12.13.2 Block Diagram and General Timing Diagram

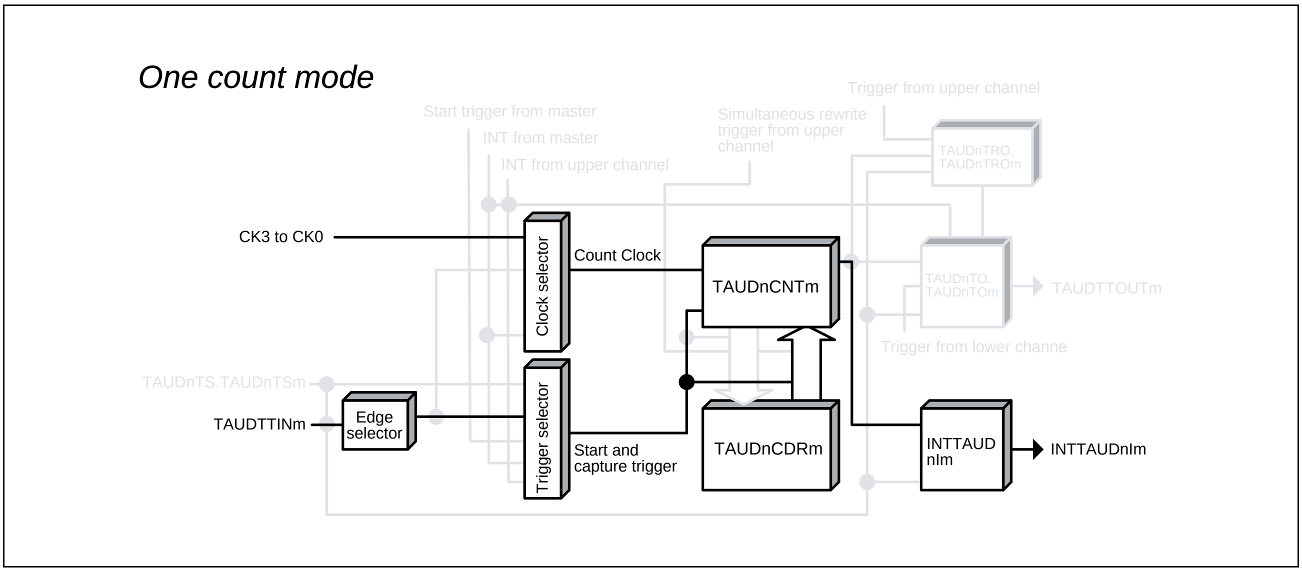

Figure 32.74 Block Diagram for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

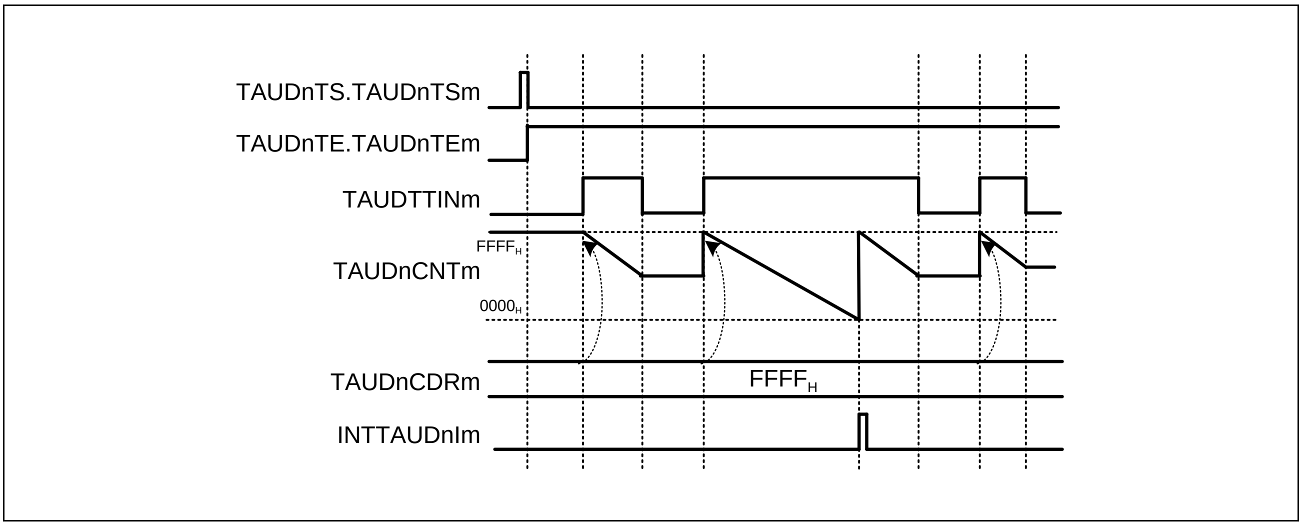

Figure 32.75 General Timing Diagram for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

32.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

Table 32.110 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.107, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**, and **Table 32.108, Contents of the TAUDnCMURm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**. Set the value of TAUDnCDRm register to FFFF_{H}.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the start edge. When a start edge is detected, TAUDnCNTm loads the TAUDnCDRm value (FFFF_{H}).
During Operation	The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down. When the counter reaches 0000_{H}: INTTAUDnIm is generated. When TAUDTTINm input stop edge is detected during count operation: ● TAUDnCNTm stops and retains its current value. When TAUDTTINm input start edge is detected while the counter is stopped: ● TAUDnCNTm loads the TAUDnCDRm value (FFFF_{H}) again, and continues to count down. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

32.12.14 Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

32.12.14.1 Overview

Summary

This function measures the cumulative width of a TAUDTTINm input signal. If the cumulative TAUDTTINm input width is longer than $FFFF_H$, an interrupt is generated and an overflow interrupt can be output.

Prerequisites

- The operation mode must be set to Gate Count Mode, (see **Table 32.111, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)**).
- TAUDTTOUTm is not used with this function.
- The value of TAUDnCDRm must be set to $FFFF_H$.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. $FFFF_H$ is loaded to TAUDnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUDTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000_H an interrupt is generated. $FFFF_H$ is loaded to TAUDnCNTm and the counter continues to count down until a TAUDTTINm input stop edge is detected.

Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, the TAUDTTINm input low width is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11_B, the TAUDTTINm input high width is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

32.12.14.2 Block Diagram and General Timing Diagram

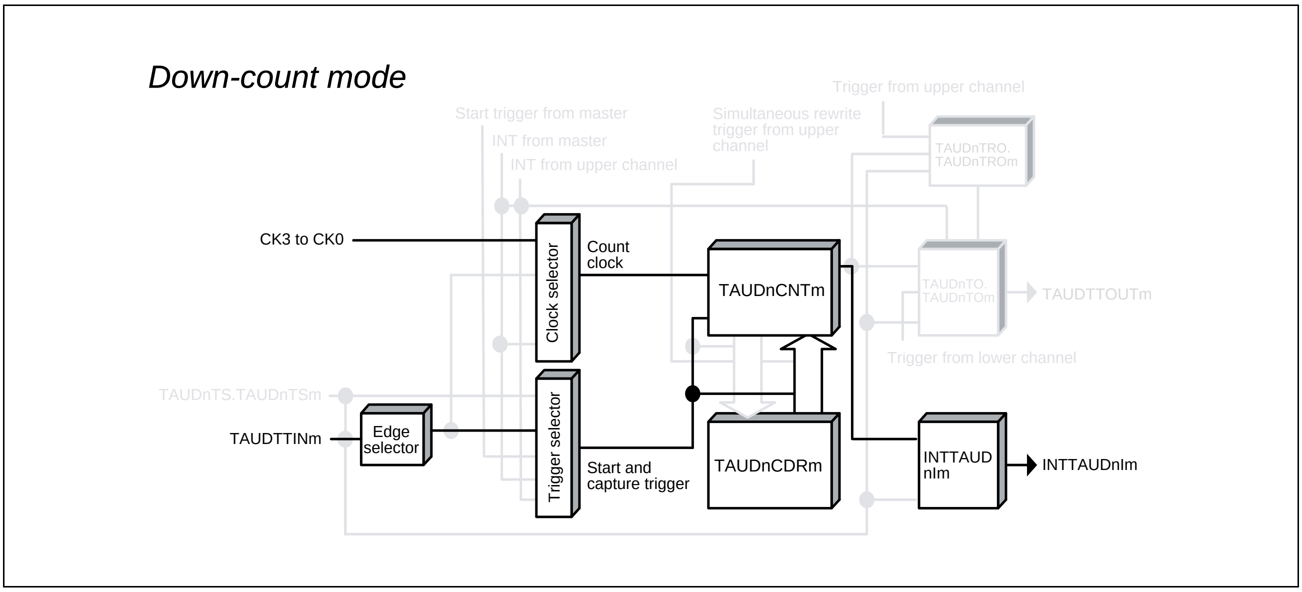

Figure 32.76 Block Diagram for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

32.12.14.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

Table 32.114 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

Restart Operation

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 32.111, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)**, and **Table 32.112, Contents of the TAUDnCMURm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)**. Set the value of TAUDnCDRm register to FFFF$_{H}$.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the start edge. When a start edge is detected, TAUDnCNTm loads the TAUDnCDRm value (FFFF$_{H}$).
During Operation	The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000$_{H}$: ● INTTAUDnIm is generated. ● TAUDnCNTm loads the TAUDnCDRm value (FFFF$_{H}$) and continues to count down. When TAUDTTINm input stop edge is detected during count operation: ● TAUDnCNTm stops and retains the current value. When TAUDTTINm input start edge is detected while the counter is stopped: ● TAUDnCNTm counts down from the stop value. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

32.12.15 One-Phase PWM Output Function

32.12.15.1 Overview

Summary

This function adds dead time to a TAUDTTINm input signal. The resulting PWM signal is output via TAUDTTOUTm of the channel and TAUDTTOUTm of upper channels.

Prerequisites

- Each of two (or more) channels is enabled for dead time control (TAUDnTDE.TAUDnTDEm = 1).
- The operating mode for the lower channel should be set to one-count mode. (See **Table 32.116, Contents of the TAUDnCMORm Register for the Lower Channel of the One-Phase PWM Output Function**.)
- Any operating mode can be set to upper channels.
- Channel output mode for upper and lower channels should be set to synchronous channel output mode 2 with one-phase PWM output. (See **Section 32.7, Channel Output Modes**.)

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches 0000_H, an interrupt occurs. The counter is reset to $FFFF_H$ and waits for the next valid TAUDTTINm input start edge.

Table 32.115 TAUDTTOUTm to which Dead Time is Added and State of TAUDTTINm

TAUDnCMURm. TAUDnTIS[1:0]	TAUDnTOL. TAUDnTOLm	TAUDTTOUTm to which Dead Time is Added	TAUDnTDL. TAUDnTDLm	TAUDTTINm State when Added
10	0	TAUDTTOUTm low	0	High
			1	Low
	1	TAUDTTOUTm high	0	High
			1	Low
11	0	TAUDTTOUTm low	0	Low
			1	High
	1	TAUDTTOUTm high	0	Low
			1	High

Conditions

- TAUDnCMURm.TAUDnTIS[1:0] bits specify the type of width measurement:
  - TAUDnCMURm.TAUDnTIS[1:0] = 10_B: Uses both edges as valid edges for detection (Low width measurement).
  - TAUDnCMURm.TAUDnTIS[1:0] = 11_B: Uses both edges as valid edges for detection (High width measurement).
- The TAUDnTDL.TAUDnTDLm bit specifies the operation of TAUDTTOUTm for each channel when an interrupt or valid TAUDTTINm edge is detected on the lower channel:
  - If TAUDnTDL.TAUDnTDLm = 0, an interrupt is used as a TAUDTTOUTm set trigger and a valid TAUDTTINm edge as a TAUDTTOUTm reset trigger.
  - If TAUDnTDL.TAUDnTDLm = 1, a valid TAUDTTINm edge is used as a TAUDTTOUTm set trigger and an interrupt as a TAUDTTOUTm reset trigger.
- This function cannot make a forced restart.

32.12.15.2 Block Diagram and General Timing Diagram

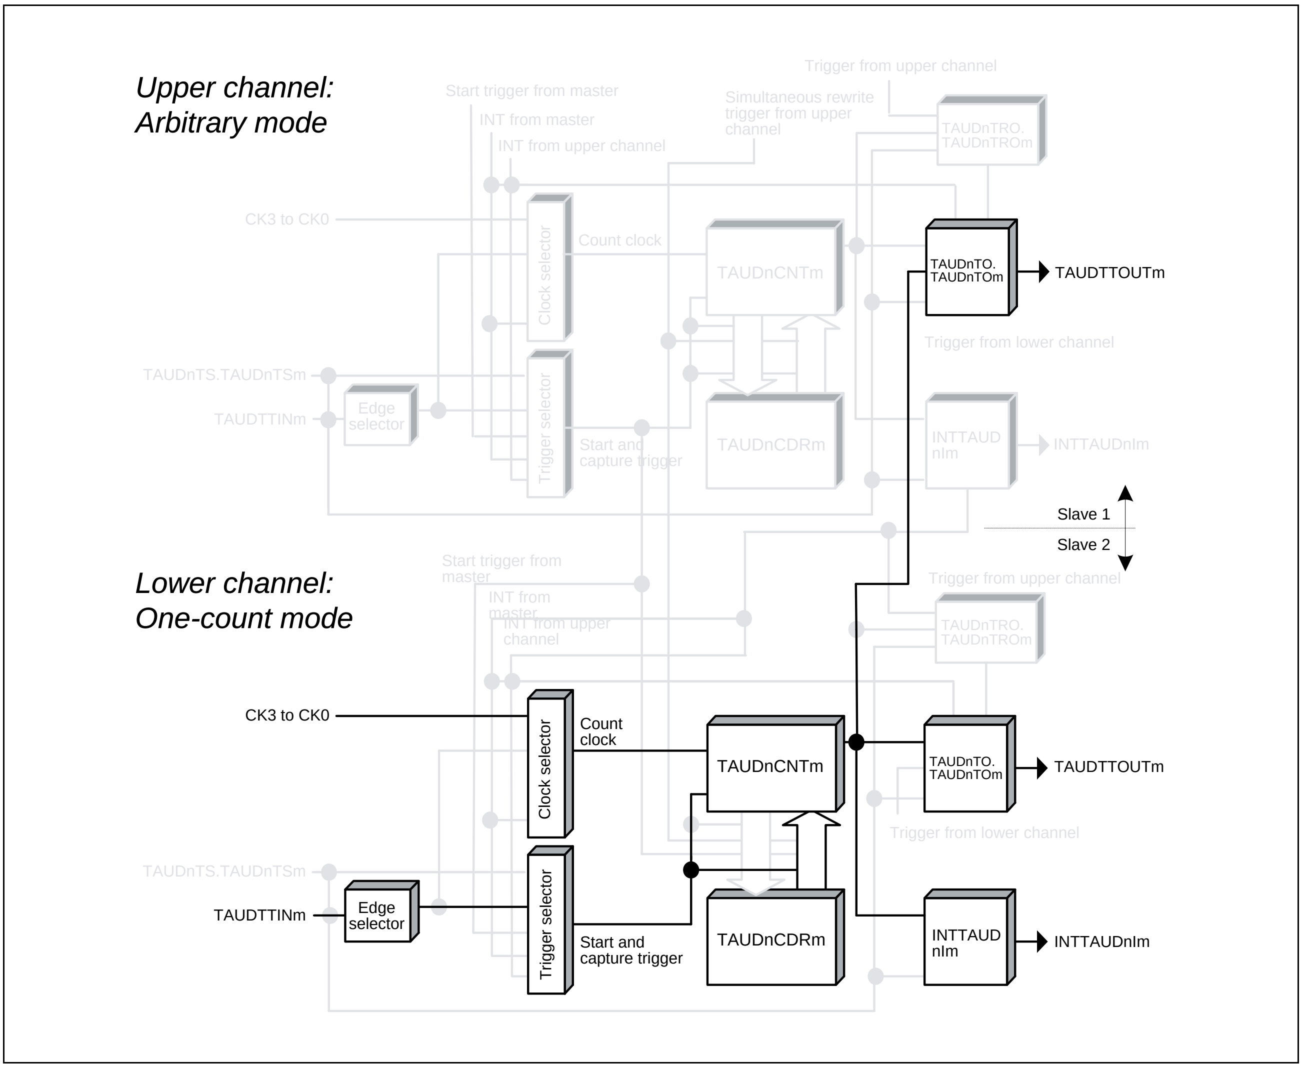

Figure 32.78 Block Diagram of One-Phase PWM Output Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

This setting considers a duty as an active high.

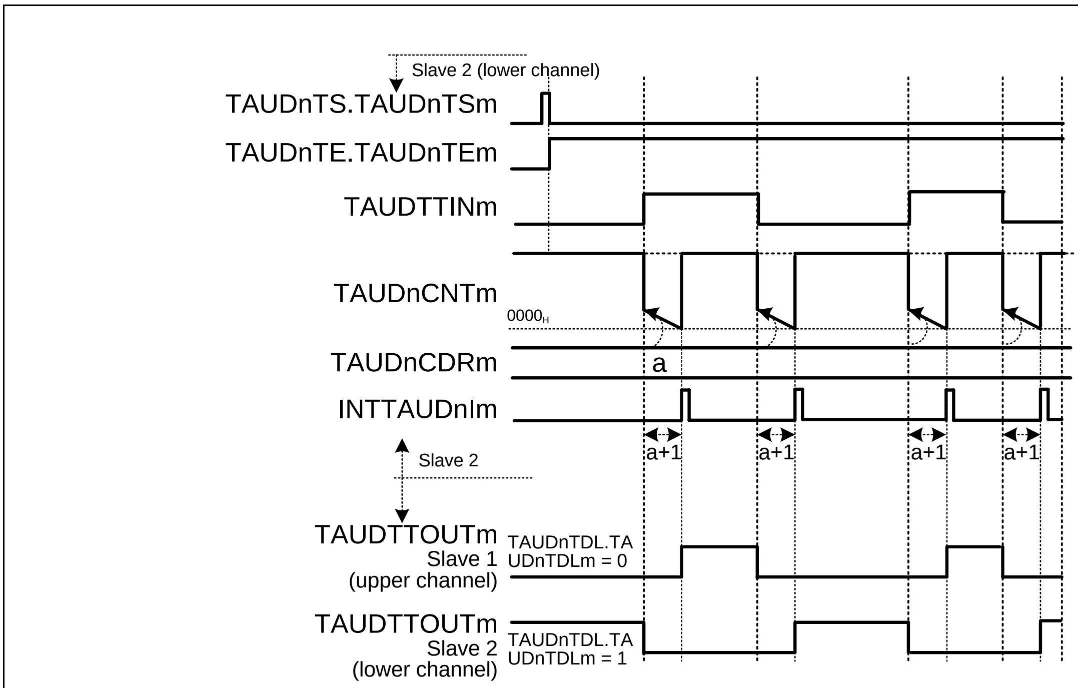

Figure 32.79 General Timing Diagram of One-Phase PWM Output Function

Table 32.117 Contents of the TAUDnCMURm Register for the Lower Channel of the One-Phase PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	10: Detection of rising and falling edges (low width measurement) 11: Detection of rising and falling edges (high width measurement)

(3) Channel Output Mode for Lower Channels

Table 32.118 Control Bit Settings in Synchronous Channel Output Mode 2 with One-Phase PWM Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	1: Adds dead time upon detection of a TAUDTTINm input edge on a lower odd channel.
TAUDnTDL.TAUDnTDLm	0: Adds dead time of the positive-phase width 1: Adds dead time of the negative-phase width
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from upper channels.

(4) Simultaneous Rewrite for Lower Channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the one-phase PWM output function. Therefore, these registers should be set to 0.

Table 32.119 Simultaneous Rewrite Settings for One-Phase PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.12.15.4 Register Settings for Upper Channels

TAUDnCMORm register for upper channels can be set arbitrarily.

(2) TAUDnCMURm for Upper Channels

TAUDnCMURm register for upper channels can be set arbitrarily.

(3) Channel Output Mode for Upper Channels

Table 32.120 Control Bit Settings for Upper Channels in Synchronous Channel Output Mode 2 with One-Phase PWM Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	1: Adds dead time upon detection of a TAUDTTINm input edge on a lower odd channel.
TAUDnTDL.TAUDnTDLm	0: Adds dead time of the positive-phase width 1: Adds dead time of the negative-phase width
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from lower channels.

(4) Simultaneous Rewrite for Upper Channels

Simultaneous rewrite register for upper channels can be set arbitrarily.

32.12.15.5 Operating Procedure for One-phase PWM Output Function

Table 32.121 Operating Procedure for One-phase PWM Output Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for the lower channel as described in **Table 32.116, Contents of the TAUDnCMORm Register for the Lower Channel of the One-Phase PWM Output Function**, and **Table 32.117, Contents of the TAUDnCMURm Register for the Lower Channel of the One-Phase PWM Output Function**. Set TAUDnCMORm and TAUDnCMURm registers for the upper channel as described in **Section 32.12.15.4, Register Settings for Upper Channels**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 32.118, Control Bit Settings in Synchronous Channel Output Mode 2 with One-Phase PWM Output**.	Channel operation is stopped.
Start Operation	Set TAUDnTOE.TAUDnTOEm (slave channels 1 and 2) to 1 (at restart time only). Set TAUDnTS.TAUDnTSm = 1 for slave channel 2. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 (slave channel 2) and TAUDnCNTm waits for detection of TAUDTTINm start edge. TAUDnCNTm loads TAUDnCDRm value.
During Operation	The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at any time.	TAUDnCNTm of slave channel 2 counts down. When the counter reaches 0000_H: ● INTTAUDnIm is generated. ● TAUDnCNTm stops counting. TAUDTTOUTm is changed by a TAUDTTINm edge detection signal and slave channel 2 INTTAUDnIm signal to output one-phase PWM waveform with dead time. Afterwards, this operation is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm = 1 for slave channel 2. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm and TAUDTTOUTm retain their current values.

Restart Operation

32.13 Independent Channel Real-Time Functions

This section describes functions that output the value of the TAUDnTRO.TAUDnTROm bit in real time.

32.13.1 Real-Time Output Function Type 1

32.13.1.1 Overview

Summary

This function outputs a value of the TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated at certain specified intervals.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm = 1), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger (TAUDnTRC.TAUDnTRCm = 0).

Prerequisites

- Channels should use the TAUDTTOUTm control of other channels.
- The operating mode for the upper channel should be set to interval timer mode. (See **Table 32.122, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 1**.)
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output. (See **Section 32.7, Channel Output Modes**.)
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREm = 1).

Functional description

The counter of the upper channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The current value of the data register of the upper channel (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.

When the counter of the upper channel reaches 0000_H, INTTAUDnIm is generated and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1). TAUDnCNTm then reloads the TAUDnCDRm value to continue operation subsequently.

The TAUDTTOUTm signal changes only when an interrupt is generated, and when its value is different from the current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.

Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels that do not generate a real-time output trigger.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm = 0) or if the channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel’s TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.

- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1) and TAUDnTRC.TAUDnTRCm = 0, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not output. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

32.13.1.2 Equations

INTTAUDnIm generation cycle = count clock cycle × (TAUDnCDRm value + 1)

(2) TAUDnCMURm for Lower Channels

The TAUDnCMURm register for lower channels can be set arbitrarily.

(3) Channel Output Mode for Lower Channels

Table 32.126 Control Bit Settings for the Lower Channels in Independent Channel Output Mode 1 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTDL.TAUDnTDLm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTRE.TAUDnTREm	1: Enables real-time output
TAUDnTRO.TAUDnTROm	0: Real-time output is low 1: Real-time output is high
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for Lower Channels

Simultaneous rewrite registers for lower channels can be set arbitrarily.

32.13.1.6 Operating Procedure for Real-Time Output Function Type 1

Table 32.127 Operating Procedure for Real-Time Output Function Type 1

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for upper channels as described in **Table 32.122, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 1**, and **Table 32.123, Contents of the TAUDnCMURm Register for the Upper Channel of Real-Time Output Function Type 1**. Set TAUDnCMORm and TAUDnCMURm registers for lower channels as described in **Section 32.13.1.5, Register Settings for Lower Channels**. Set the value of TAUDnCDRm register (only channels with TAUDnTRC.TAUDnTRCm = 1) Set channel output mode by setting the control bits as described in **Table 32.124, Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output**. Set channel output mode by setting the control bits as described in **Table 32.126, Control Bit Settings for the Lower Channels in Independent Channel Output Mode 1 with Real-Time Output**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm = 1 on the channel with TAUDnTRC.TAUDnTRCm set to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	[Channel with TAUDnTRC.TAUDnTRCm set to 1] TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm is generated.
During Operation	TAUDnCDRm and TAUDnTRO.TAUDnTROm can be changed at any time. The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down. When the counter reaches 0000_H: ● The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. ● INTTAUDnIm is generated. ● TAUDTTOUTm outputs the current value of the real-time output bit TAUDnTRO.TAUDnTROm. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. Both TAUDnCNTm and TAUDTTOUTm retain their current values.

Restart Operation

32.13.1.7 Specific Timing Diagrams

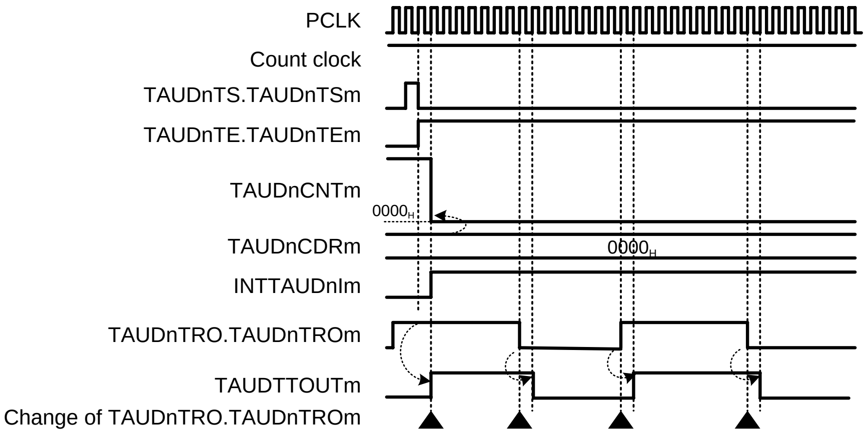

Figure 32.82 TAUDnCDRm = 0000$_H$, TAUDnCMORm.TAUDnMD0 = 1

- The value of TAUDTTOUTm changes according to the setting of TAUDnTRO.TAUDnTROm with a delay of one PCLK cycle.

32.13.2 Real-Time Output Function Type 2

32.13.2.1 Overview

Summary

This function outputs the value of TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated when a valid TAUDTTINm input edge is detected or the function starts.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm = 1), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger (TAUDnTRC.TAUDnTRCm = 0).

Prerequisites

- Channels should use the TAUDTTOUTm control of the other channels.
- The operating mode for the upper channel should be set to capture mode. (See **Table 32.128, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 2**.)
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output. (See **Section 32.7, Channel Output Modes**.)
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREm = 1).

Functional description

The counter for upper channels is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The counter starts to count up.

When a valid TAUDTTINm input edge is generated on one of upper channels, an interrupt occurs and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1).

The TAUDTTOUTm signal changes only when an interrupt is generated, and when TAUDTTOUTm value is different from the current value of TAUDnTRO.TAUDnTROm during the occurrence of the interrupt.

Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels that do not generate a real-time output trigger.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm = 0) or if the channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel’s TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.
- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1) and TAUDnTRC.TAUDnTRCm = 0, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not output. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

32.13.2.2 Block Diagram and General Timing Diagram

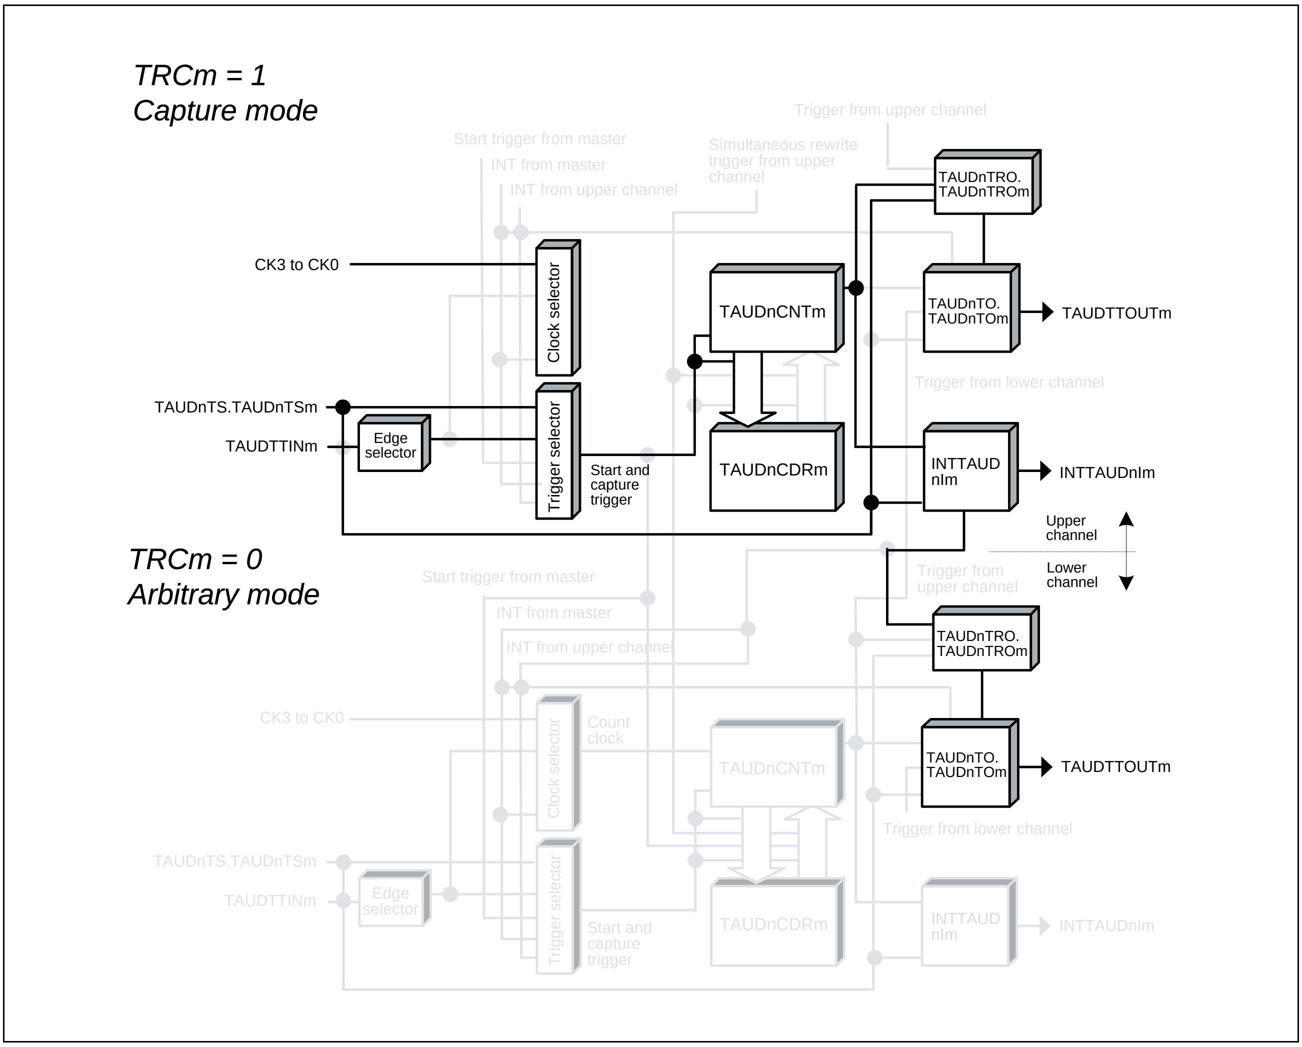

Figure 32.83 Block Diagram of Real-Time Output Function Type 2

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)

TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output
TAUDnTRO.TAUDnTROm	0: Real-time output is low 1: Real-time output is high
TAUDnTRC.TAUDnTRCm	1: Channel m generates a unique real-time output trigger
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for Upper Channels

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the real-time output function type 2. Therefore, these registers should be set to 0.

Table 32.131 Simultaneous Rewrite Settings for Real-Time Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.13.2.4 Register Settings for Lower Channels

(1) TAUDnCMORm for Lower Channels

The TAUDnCMORm register for lower channels can be set arbitrarily.

(2) TAUDnCMURm for Lower Channels

The TAUDnCMURm register for lower channels can be set arbitrarily.

(3) Channel Output Mode for Lower Channels

Table 32.132 Control Bit Settings for Lower Channels in Independent Channel Output Mode 1 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low 1: Real-time output is high
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for Lower Channels

Simultaneous rewrite registers for lower channels can be set arbitrarily.

32.13.2.5 Operating Procedure for Real-Time Output Function Type 2

Table 32.133 Operating Procedure for Real-Time Output Function Type 2

		Operation	TAUDn Status
	Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for upper channels as described in **Table 32.128, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 2**, and **Table 32.129, Contents of the TAUDnCMURm Register for the Upper Channel of Real-Time Output Function Type 2**. Set TAUDnCMORm and TAUDnCMURm registers for the lower channel as described in **Register** Settings for Lower Channels**, Register Settings for Lower Channels**. The TAUDnCDRm register functions as a capture register (only channels with TAUDnTRC.TAUnTRCm = 1). Set channel output mode by setting the control bits as described in **Table 32.130, Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output**. Set channel output mode by setting the control bits as described in **Table 32.132, Control Bit Settings for Lower Channels in Independent Channel Output Mode 1 with Real-Time Output**.	Channel operation is stopped.
Restart Operation	Start Operation	Set TAUDnTS.TAUDnTSm = 1 on the channel with TAUDnTRC.TAUDnTRCm set to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	[Channel with TAUDnTRC.TAUDnTRCm set to 1] TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000_H. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm is generated.
	During Operation	TAUDnTRO.TAUDnTROm can be changed at any time.	TAUDnCNTm starts to count up from 0000_H. When a valid TAUDTTINm input edge is detected: ● TAUDnCNTm captures the TAUDnCDRm value, and the counter is cleared to 0000_H. ● INTTAUDnIm is generated. ● When the TAUDTTINm input valid edge is detected immediately after the generation of an overflow, the TAUDnCSRm.TAUDnOVF bit is set to 1. When detected before the generation of an overflow, the TAUDnCSRm.TAUDnOVF bit is cleared to 0. TAUDTTOUTm outputs the current value of real-time output bit TAUDnTRO.TAUDnTROm. Afterwards, this procedure is repeated.
	Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm, TAUDnCSRm.TAUDnOVF, and TAUDTTOUTm retain their current values.

32.13.2.6 Specific Timing Diagrams

(1) Operation Start and Stop

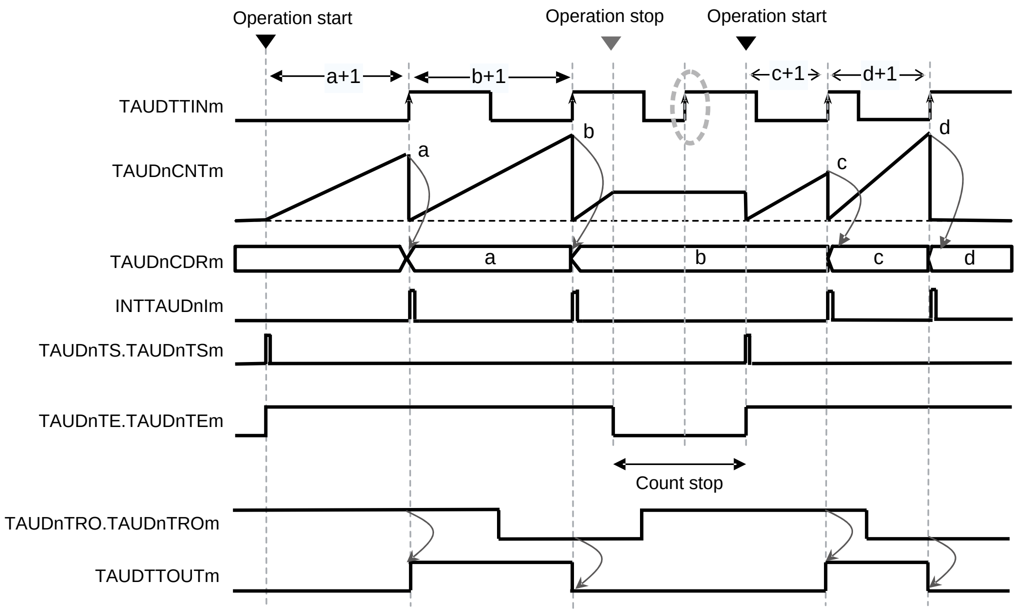

Figure 32.85 Operation Start and Stop (TAUDnCMORm.TAUDnMD0 = 0)

- When TAUDnTS.TAUDnTSm is set to 1, the counter starts counting up.
- When a valid input edge is detected, the current value of the counter is written to the data register (TAUDnCDRm) and an interrupt is generated.
- TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) and the counter resets and starts to count up again.
- The TAUDTTOUTm signal only changes when an interrupt is generated, and then only when its value is different from the current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.
- If the counter is stopped (TAUDnTE.TAUDnTEm = 0), valid input edges are ignored and no interrupt is generated.

32.14 Independent Channel Simultaneous Rewrite Functions

This section describes functions that carry out simultaneous rewrite.

32.14.1 Simultaneous Rewrite Trigger Generation Function Type 1

32.14.1.1 Overview

Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals.

The upper channel is a channel which generates a simultaneous rewrite trigger (TAUDnRDC.TAUDnRDCm = 1), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger (TAUDnRDC.TAUDnRDCm = 0).

Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite (TAUDnRDE.TAUDnRDEm = 1).
- The operating mode for the upper channel should be set to interval timer mode. (See **Table 32.134, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**.)
- For the operating mode that can be set for lower channels, see **Table 32.51, Channel Functions and the Methods They Use for Simultaneous Rewrite**.
- TAUDTTOUTm is not used for any channel in this function.

Functional description

The counter operation is enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) for upper and lower channels to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of the data register buffer for upper channels (TAUDnCDRm buf) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value. The counter for lower channels start to count according to the selected operating mode.

Once the counter reaches 0000_H, an interrupt occurs on the channel. The current value of the corresponding TAUDnCDRm buffer is loaded into TAUDnCNTm to continue operation subsequently.

If the channel where an interrupt occurs is specified as a trigger channel for simultaneous rewrite (TAUDnRDC.TAUDnRDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUDnRSF.TAUDnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnRDC.TAUDnRDCm = 1 for the corresponding channel. The TAUDnRDC.TAUDnRDCm bit should be set to 0 for all other channels in which simultaneous rewrite should take place.

- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

32.14.1.2 Equations

Simultaneous rewrite trigger generation cycle = count clock cycle × (TAUDnCDRm + 1)

To control simultaneous rewrite, the following condition should be satisfied:

[PWM]

TAUDnCDRm = [(value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1) × number of interrupts] – 1

[Triangle PWM]

TAUDnCDRm = [(value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1) × 2 × number of interrupts] – 1

That is, the ratio of TAUDnCDRm + 1 and value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

For triangle PWM, remember that the cycle doubles.

32.14.1.3 Block Diagram and General Timing Diagram

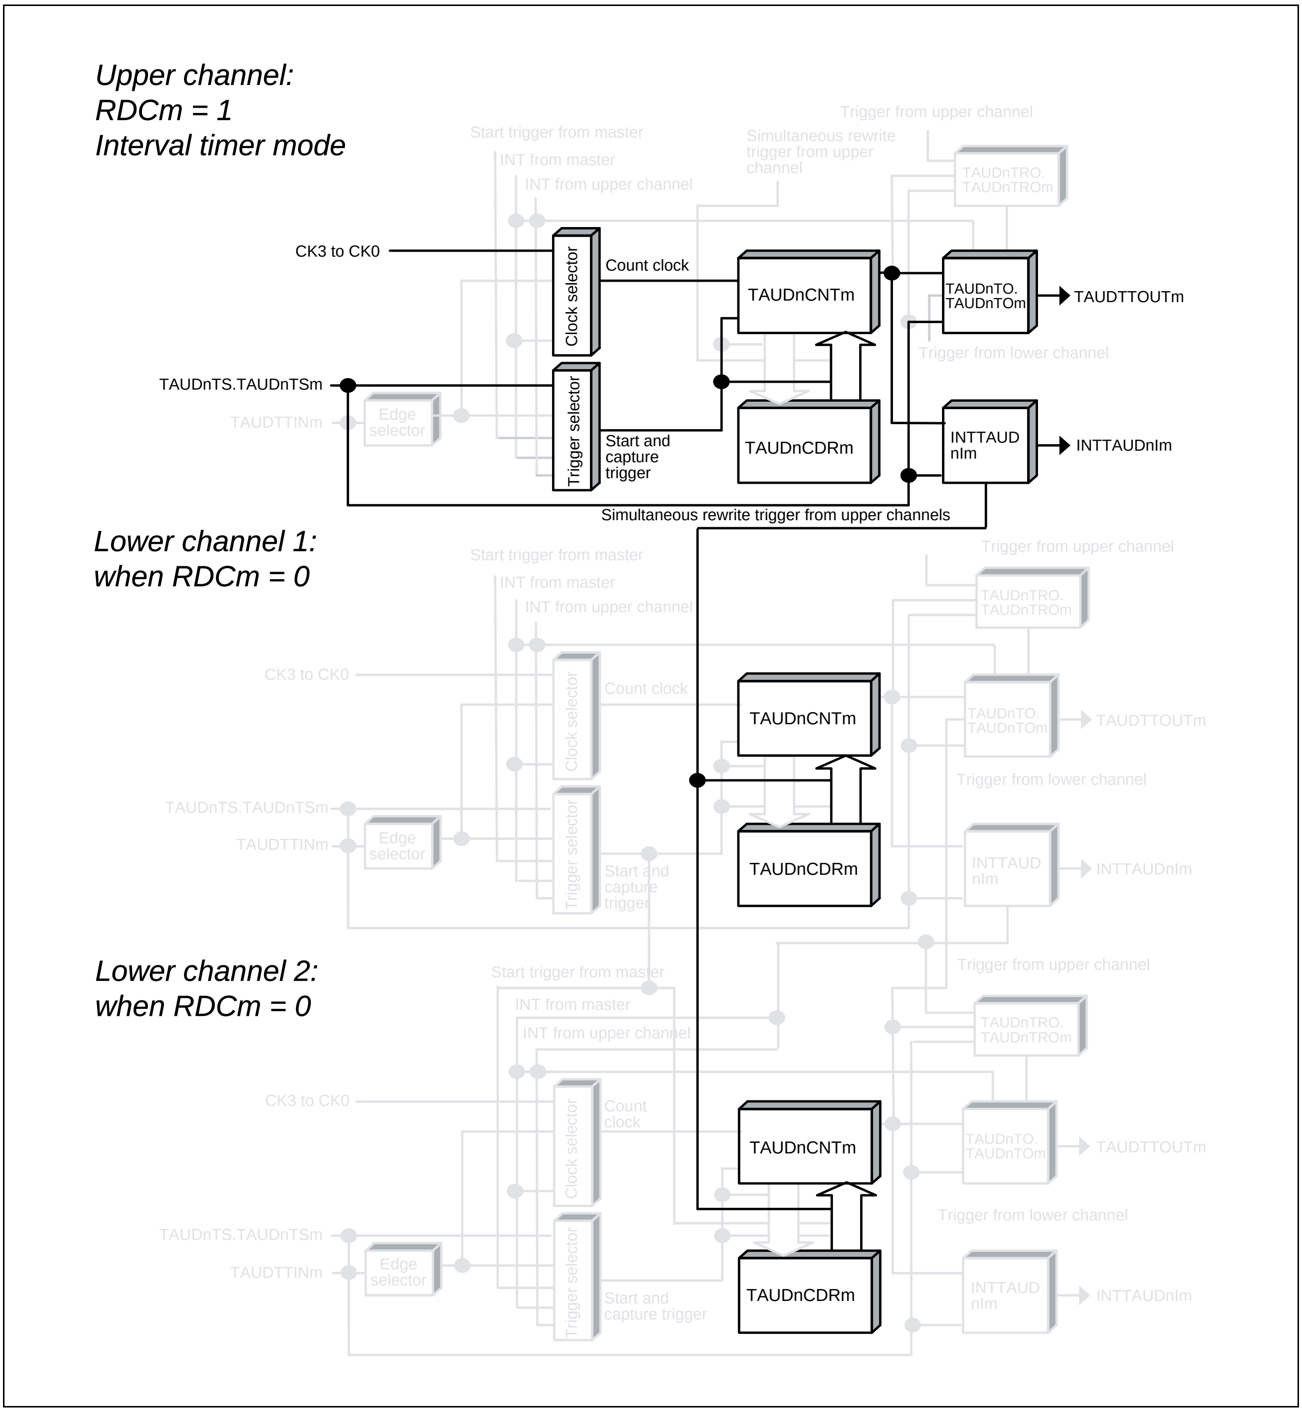

Figure 32.86 Block Diagram of Simultaneous Rewrite Trigger Generation Function Type 1

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

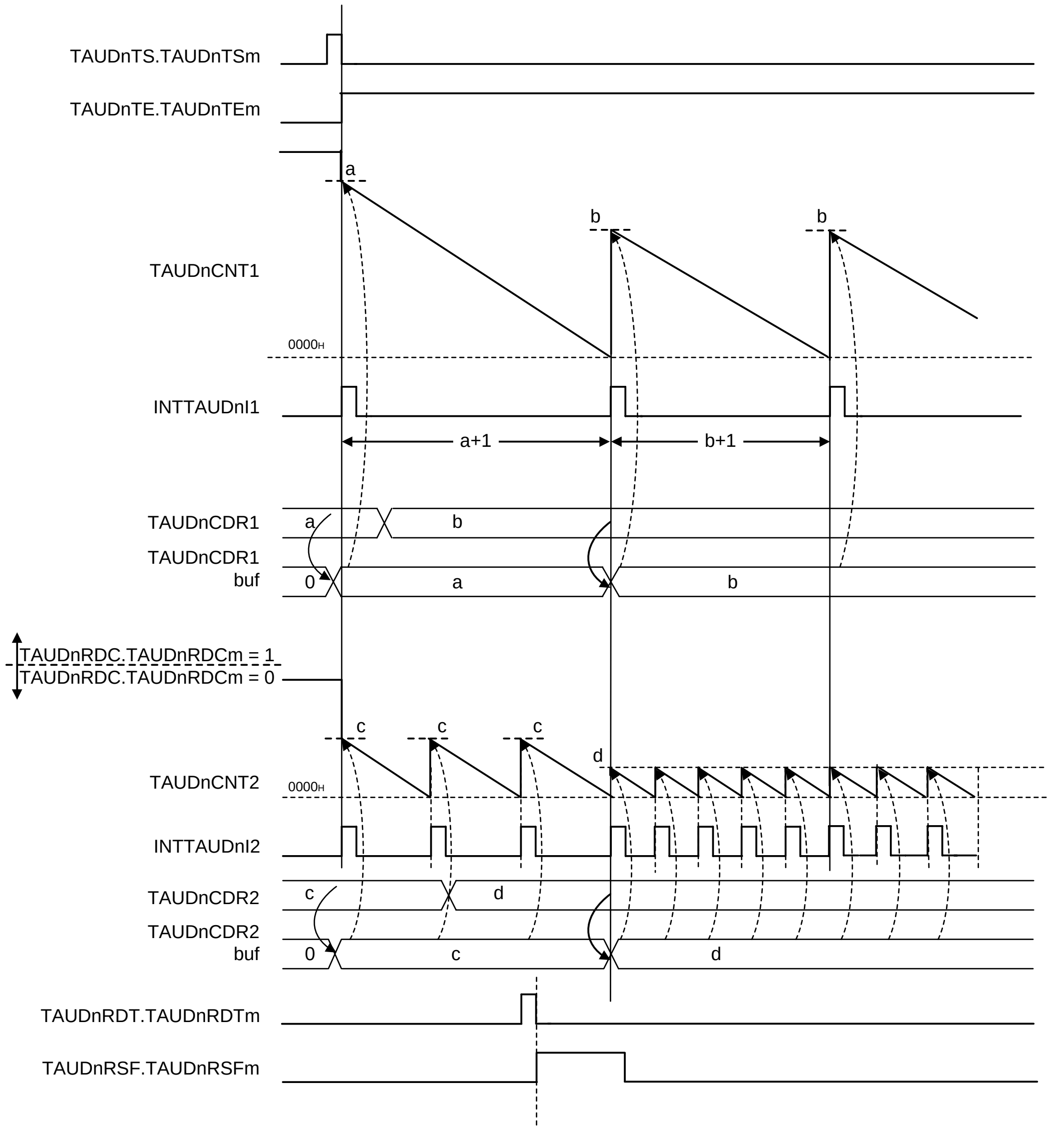

Figure 32.87 General Timing Diagram of Simultaneous Rewrite Trigger Generation Function Type 1

1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for Upper Channels

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function. However, this mode can be used in independent channel output mode controlled by software.

(4) Simultaneous Rewrite for Upper Channels

Table 32.136 Simultaneous Rewrite Settings for Upper Channels in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts counting.
TAUDnRDC.TAUDnRDCm	1: Monitors INTTAUDnIm signal which triggers a simultaneous rewrite on the channel.

32.14.1.5 Register Settings for Lower Channels

(1) TAUDnCMORm for Lower Channels

TAUDnCMORm register for lower channels must follow the TAUDnCMORm register settings in the operating mode which can be set. (See **Table 32.51, Channel Functions and the Methods They Use for Simultaneous Rewrite**.)

(2) TAUDnCMURm for Lower Channels

TAUDnCMURm register for lower channels must follow the TAUDnCMURm register settings in the operating mode which can be set. (See **Table 32.51, Channel Functions and the Methods They Use for Simultaneous Rewrite**.)

(3) Channel Output Mode for Lower Channels

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see **Table 32.50, Simultaneous Rewrite Methods and when They are Triggered**.

(4) Simultaneous Rewrite for Lower Channels

Table 32.137 Simultaneous Rewrite Settings for Lower Channels in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts counting.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

32.14.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Table 32.138 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for the upper channel as described in **Table 32.134, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**, and **Table 32.135, Contents of the TAUDnCMURm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**. Set TAUDnCMORm and TAUDnCMURm registers for lower channels as described in **Section 32.14.1.5, Register Settings for Lower Channels**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCDRm value is loaded into TAUDnCNTm. If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated.
During Operation	TAUDnRDT.TAUDnRDTm and TAUDnCDRm.TAUDnCDR are changeable. TAUDnRSF.TAUDnRSFm can be always read.	TAUDnCNTm counts down. When the counter reaches 0000_H: ● The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. ● INTTAUDnIm is generated. If INTTAUDnIm is generated on the channel where TAUDnRDC.TAUDnRDCm is set to 1, simultaneous rewrite is controlled. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

32.14.2 Simultaneous Rewrite Trigger Generation Function Type 2

32.14.2.1 Overview

Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. In this function, the interrupt is generated when a valid TAUDTTINm input edge is detected or the function starts.

The upper channel is a channel which generates a simultaneous rewrite trigger (TAUDnRDC.TAUDnRDCm = 1), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger (TAUDnRDC.TAUDnRDCm = 0).

Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite (TAUDnRDE.TAUDnRDEm = 1).
- The operation mode of the upper channel must be set to Capture Mode (see **Table 32.139, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 2**).
- For the operation mode that can be set for a lower channel, see **Table 32.51, Channel Functions and the Methods They Use for Simultaneous Rewrite**.

Functional description

The counter operation is enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) for upper and lower channels to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter for the upper channel starts to count up, and then the counter for lower channels start to count according to the selected operating mode.

When a TAUDTTINm input edge occurs on the upper channel, an interrupt is generated. The trigger is detected by the lower channel(s), which then also generate an interrupt.

When TAUDnRDC.TAUDnRDCm = 1 on the upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUDnRSF.TAUDnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

Conditions

- The channel which is monitored for INTTAUDnIm is specified by setting TAUDnRDC.TAUDnRDCm = 1 for the corresponding channel. The TAUDnRDC.TAUDnRDCm bit must be 0 for all other channels in which simultaneous rewrite should take place.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 1, an interrupt is generated when the function starts. For details see **Section 32.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

32.14.2.2 Block Diagram and General Timing Diagram

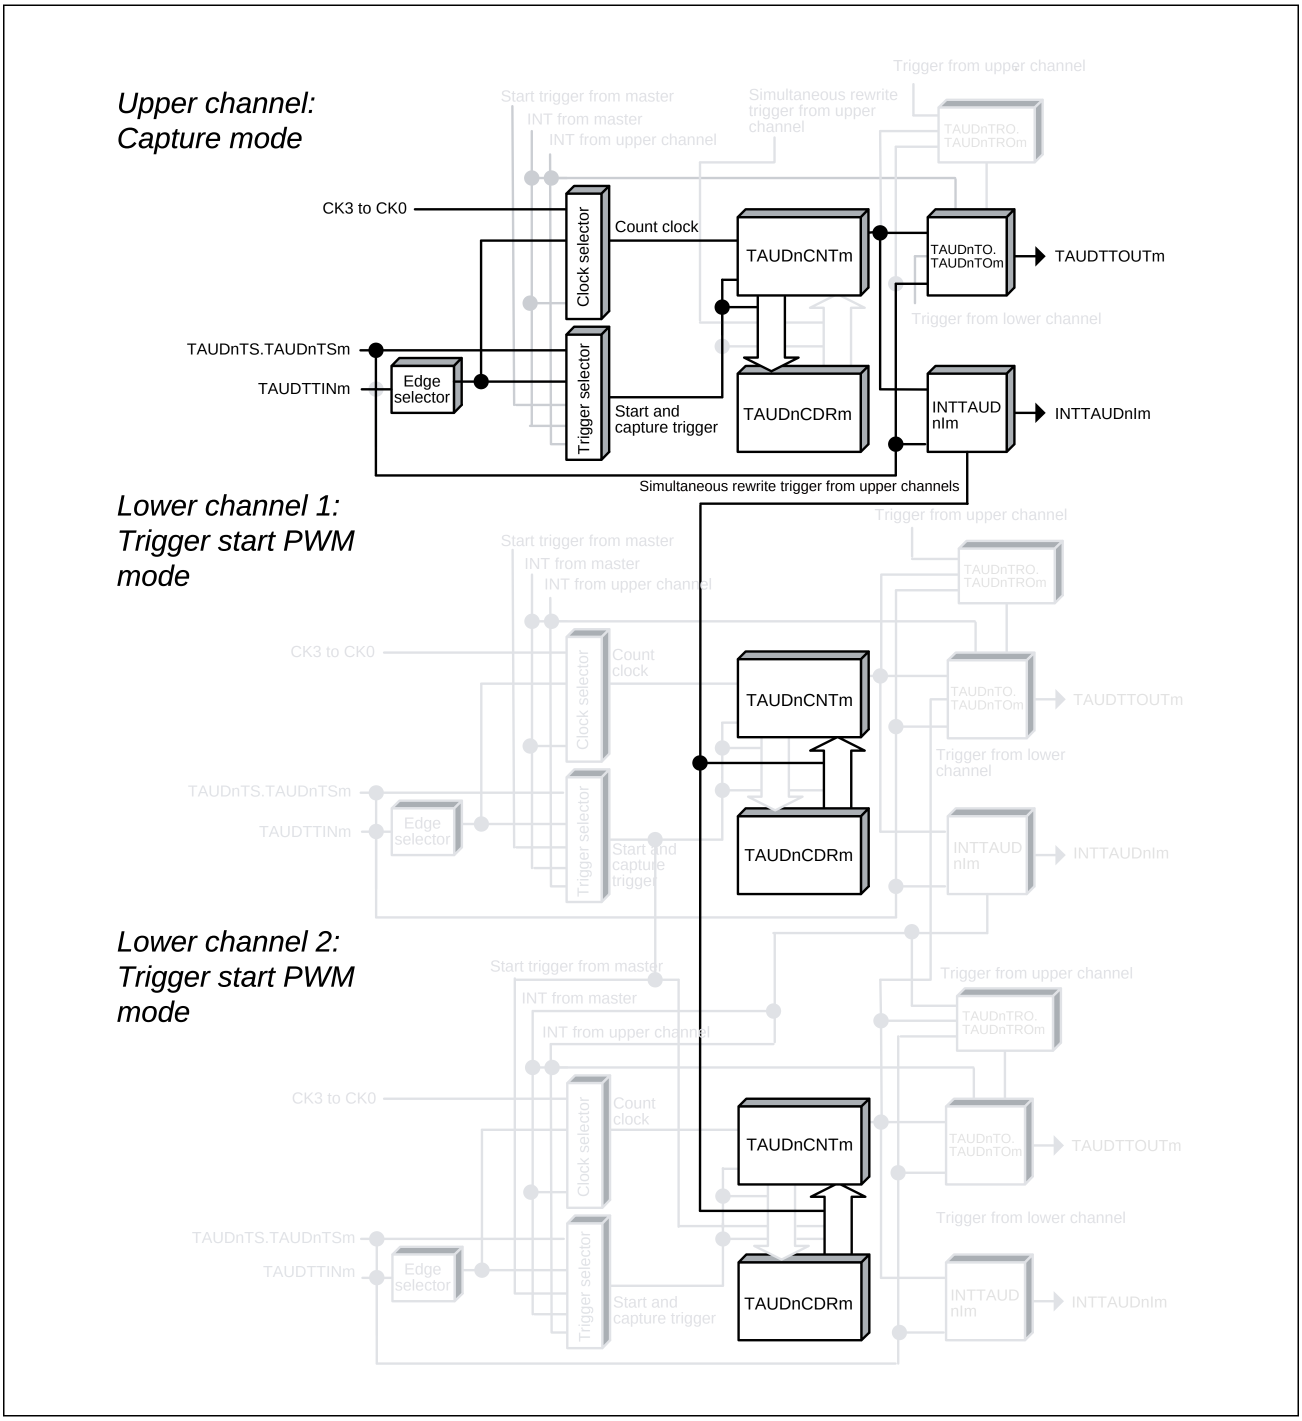

Figure 32.88 Block Diagram for Simultaneous Rewrite Trigger Generation Function Type 2

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)
- Upper channel (CH1) generates simultaneous rewrite trigger.

(3) Channel Output Mode for Lower Channels

Output can be made according to the trigger start PWM mode setting.

(4) Simultaneous Rewrite for Lower Channels

Table 32.144 Simultaneous Rewrite Settings for the Lower Channel in Simultaneous Rewrite Trigger Generation Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

32.14.2.5 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 2

Table 32.145 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 2

	Operation	TAUDn Status
Initial Channel Setting	Set the TAUDnCMORm and TAUDnCMURm registers for the upper channel as described in **Table 32.139, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 2** and **Table 32.140, Contents of the TAUDnCMURm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 2**. Set the TAUDnCMORm and TAUDnCMURm registers for the lower channel as described in **Table 32.142, Contents of the TAUDnCMORm Register for the Lower channel of Simultaneous Rewrite Trigger Generation Function Type 2** and **Table 32.143, Contents of the TAUDnCMURm Register for the Lower Channel of Simultaneous Rewrite Trigger Generation Function Type 2**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000$_H$. INTTAUDnIm is generated when TAUDnCMORm.TAUDnMD0 is set to 1.
During Operation	TAUDnRDT.TAUDnRDTm can be set at any time. TAUDnRSF.TAUDnRSFm can be read at any time.	TAUDnCNTm counts up from 0000$_H$. When a TAUDTTINm valid edge is detected: ● TAUDnCNTm transfers (captures) its value to TAUDnCDRm and returns to 0000$_H$. ● INTTAUDnIm is generated. Simultaneous rewrite is controlled when INTTAUDnIm is generated from the channel where TAUDnRDC.TAUDnRDCm is set to 1. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and it retains its current value.

Restart Operation

32.15 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the timer array unit D. For a general overview of synchronous channel operation, see **Section 32.2, Overview**.

This section describes functions that generate PWM signals at regular intervals.

32.15.1.1 Overview

Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty cycle of the TAUDTTOUTm to be set. The pulse cycle is set in the master channel. The duty cycle is set in the slave channel.

Prerequisites

- Two channels
- The operating mode for the master channel should be set to interval timer mode. (See **Table 32.146, Contents of the TAUDnCMORm Register for the Master Channel of the PWM Output Function**.)
- The operating mode for the slave channels should be set to one-count mode. (See **Table 32.149, Contents of the TAUDnCMORm Register for the Slave Channel of the PWM Output Function**.)
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channels should be set to Synchronous Channel Output Mode 1. (See **Section 32.7, Channel Output Modes**.)

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm, and the counter starts counting down from the TAUDnCDRm value. If an INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set/reset, PWM output is made.

- Master channel:
  When the master channel counter reaches 0000_H and the pulse cycle time has passed, INTTAUDnIm is generated. The counter loads TAUDnCDRm value into TAUDnCNTm and counts down.
- Slave channel:
  When INTTAUDnIm is generated on the master channel, the counter operation of the slave channel is triggered. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave) and the counter starts counting down from the TAUDnCDRm value. TAUDTTOUTm signal is set to the active level.
  When the counter reaches to 0000_H (duty time has elapsed), INTTAUDnIm is generated and a TAUDTTOUTm signal is set to an inactive level. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnIm (start of the next pulse cycle) of the master channel.

The counter can stop operating by setting the TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

Set Simultaneous rewrite with this function. See **Section 32.6, Simultaneous Rewrite**.

32.15.1.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUDnCDRm (slave)/(TAUDnCDRm (master) + 1)) × 100

- Duty cycle = 0%
  TAUDnCDRm (slave) = 0000$_H$
- Duty cycle = 100%
  TAUDnCDRm (slave) $\geq$ TAUDnCDRm (master) + 1

32.15.1.3 Block Diagram and General Timing Diagram

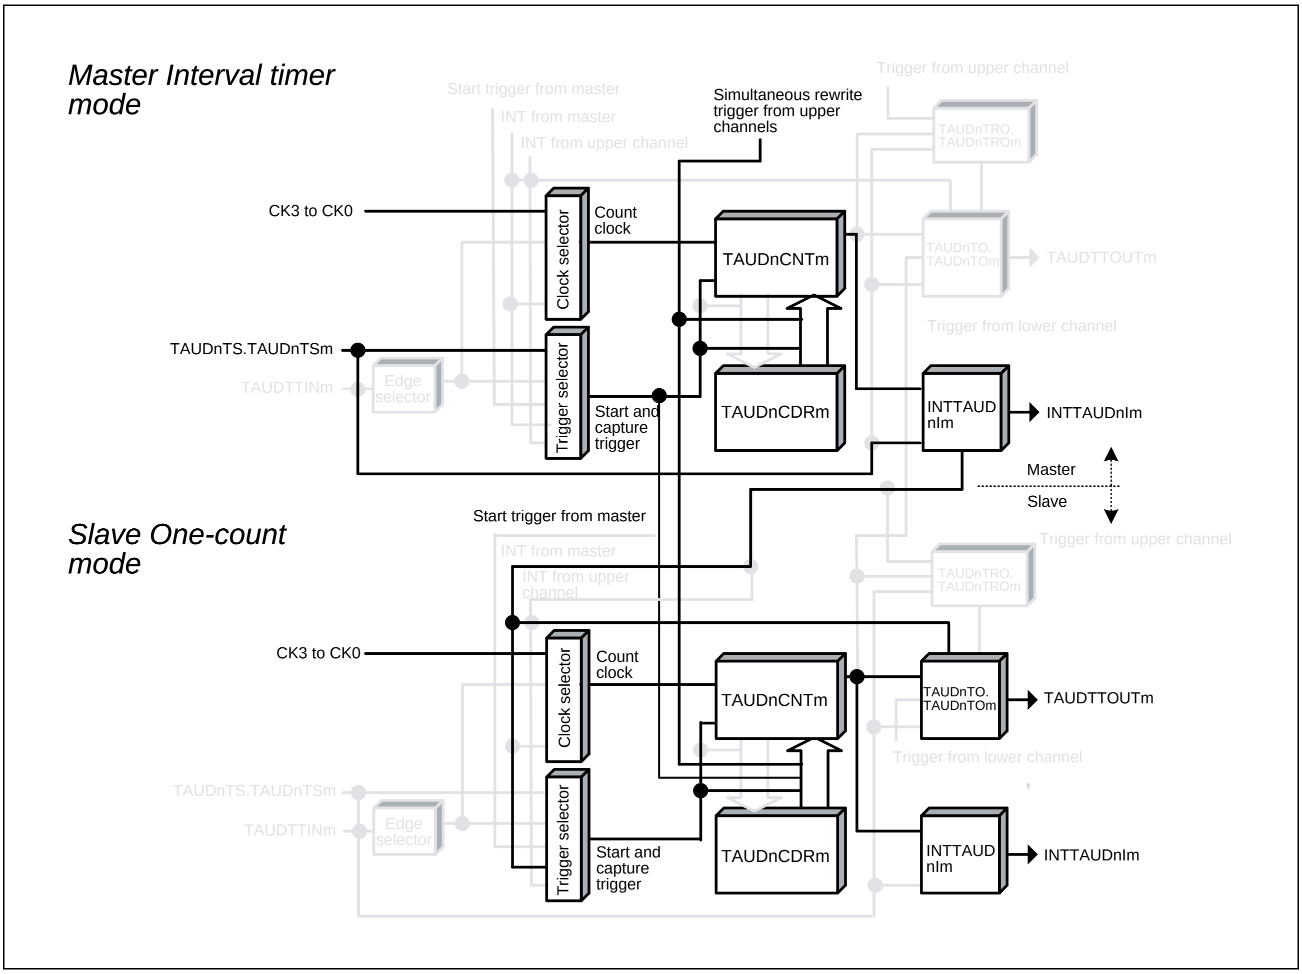

Figure 32.90 Block Diagram of PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

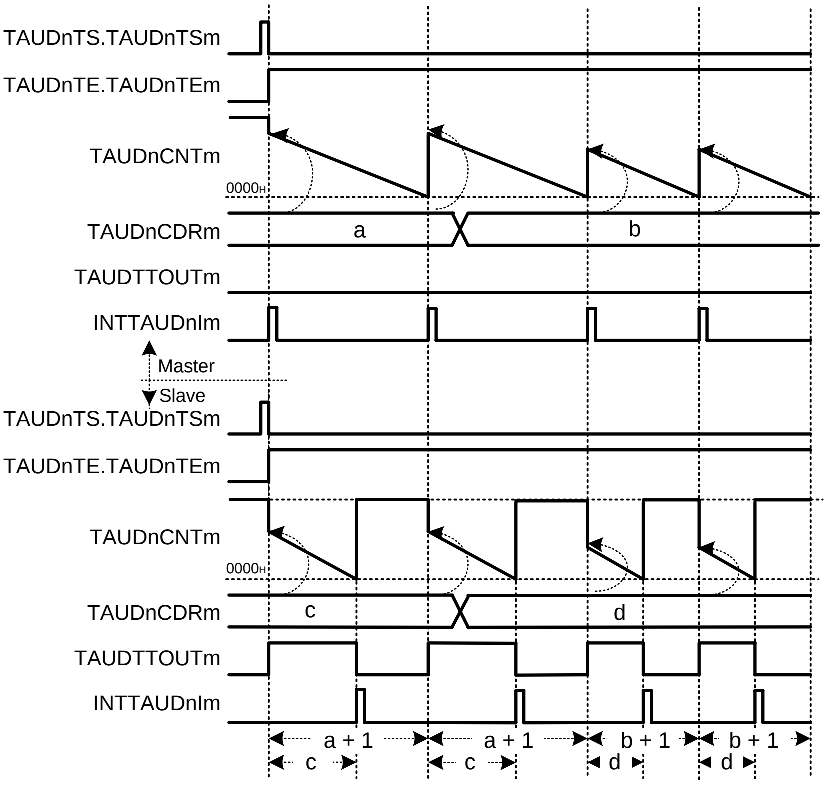

Figure 32.91 General Timing Diagram of PWM Output Function

NOTES

1. The interval between the start of the count and an interrupt being generated is the value of corresponding TAUDnCDRm + 1.
2. TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

32.15.1.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.146 Contents of the TAUDnCMORm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	1: INTTAUDnIm generated at the beginning of operation.

(2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.147 Contents of the TAUDnCMURm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for the Master Channel

The channel output mode is not used with this function.

(4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.148 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

NOTE

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires a channel higher than the master channel that operates with **Section 32.14.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Conduct operation settings under the following conditions:

- Simultaneous rewrite trigger output function type 1 setting channel: TAUDnRDCm = 1, TAUDnRDSm = 1
  TAUDnCDRm settings for this channel are as follows:
  = ((TAUDnCDR setting for the master channel targeted for simultaneous rewrite + 1) × interrupt count) – 1
- Master channel: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channel: TAUDnRDCm = 0, TAUDnRDSm = 1

If TAUDnCDRm (slave) setting > TAUDnCDRm (master) setting + 1, the duty value (which exceeds 100%) is aggregated to be 100% output.

32.15.1.5 Register Settings for Slave Channels

(1) TAUDnCMORm for Slave Channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.149 Contents of the TAUDnCMORm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is valid.

(2) TAUDnCMURm for Slave Channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.150 Contents of the TAUDnCMURm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for Slave Channels

Table 32.151 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.152 Simultaneous Rewrite Settings for Slave Channels of PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

32.15.1.6 Operating Procedure for PWM Output Function

Table 32.153 Operating Procedure for PWM Output Function

Restart Operation

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.1.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.1.5, Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set.
During operation	TAUDnCDRm can be changed at any time. TAUDnTOL.TAUDnTOLm can be changed. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000_H: ● INTTAUDnIm (master) is generated. ● TAUDnCDRm value is loaded into TAUDnCNTm (master) to continue count operation. ● TAUDnCDRm value is loaded into TAUDnCNTm (slave) to perform counting down. ● TAUDTTOUTm (slave) is set to the active level. If TAUDnCNTm (slave) reaches 0000_H: ● INTTAUDnIm (slave) is generated. ● TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.15.1.7 Specific Timing Diagrams

(1) Duty cycle = 0%

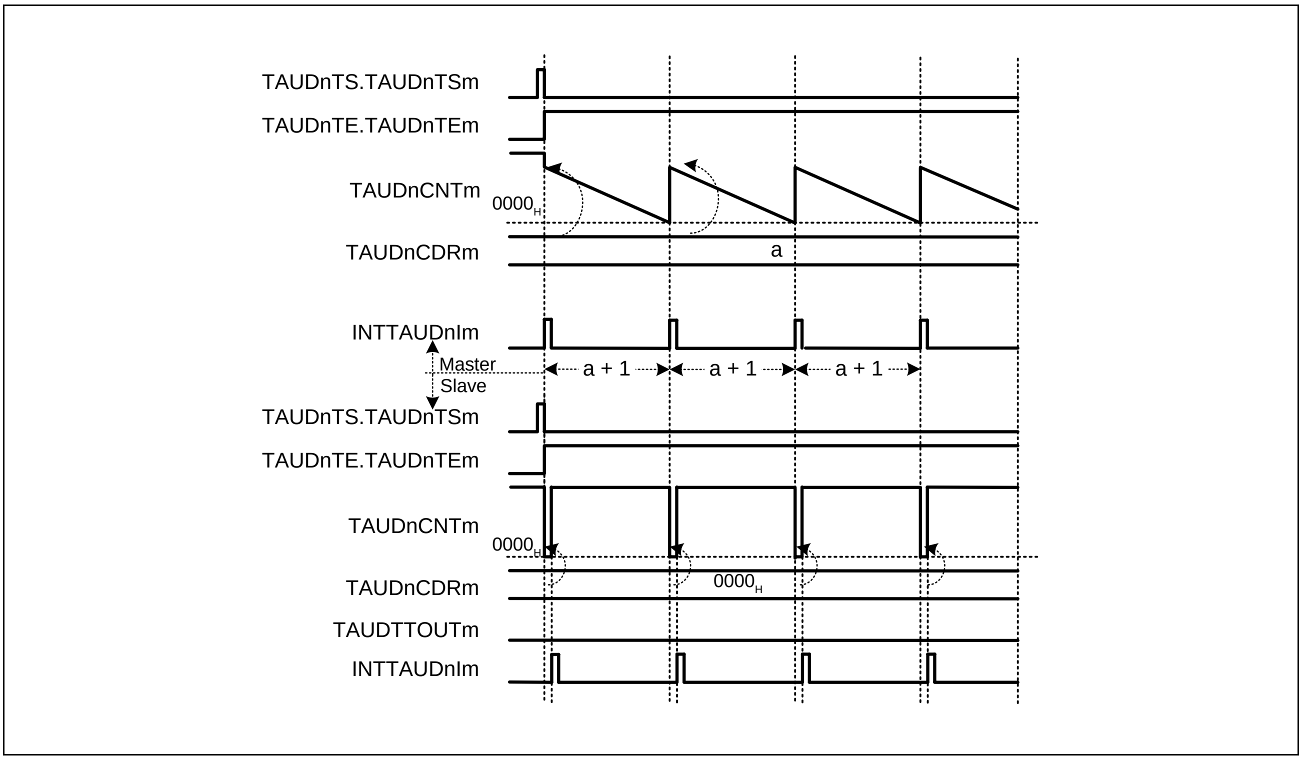

Figure 32.92 TAUDnCDRm (Slave) = 0000_H,
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- Every time the master channel generates an interrupt (INTTAUDnIm), 0000_H is loaded into TAUDnCNTm (slave). As a result, a slave channel interrupt (INTTAUDnIm) is generated at the same time and TAUDTTOUTm remains inactive.
- TAUDnCDRm value is loaded into TAUDnCNTm (slave) to generate an interrupt.

(2) Duty cycle = 100%

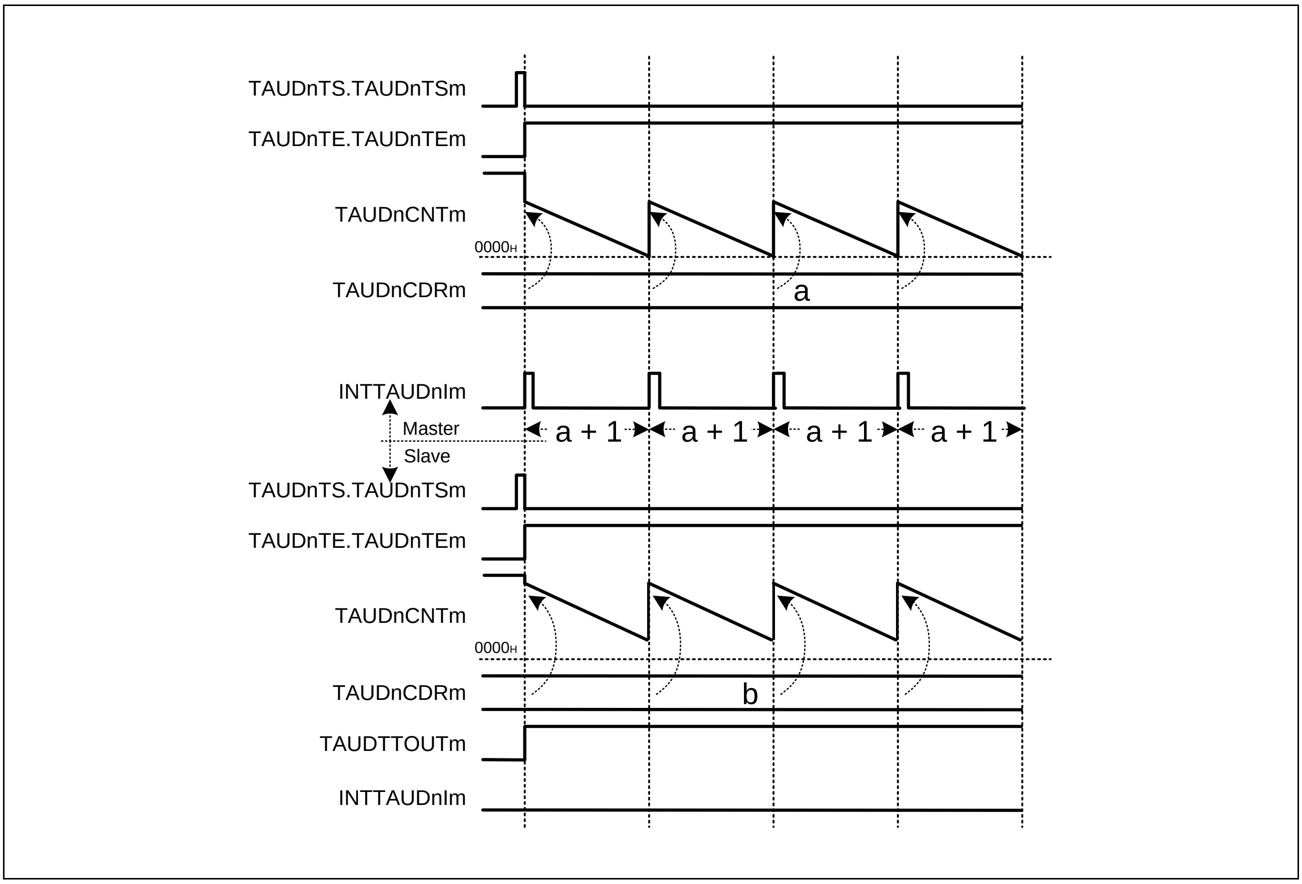

Figure 32.93 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- If TAUDnCDRm (slave) value is greater than TAUDnCDRm (master) value, the slave channel counter does not reach 0000_H and consequently, no interrupt occurs. TAUDTTOUTm remains active.

(3) Operation Stop and Restart

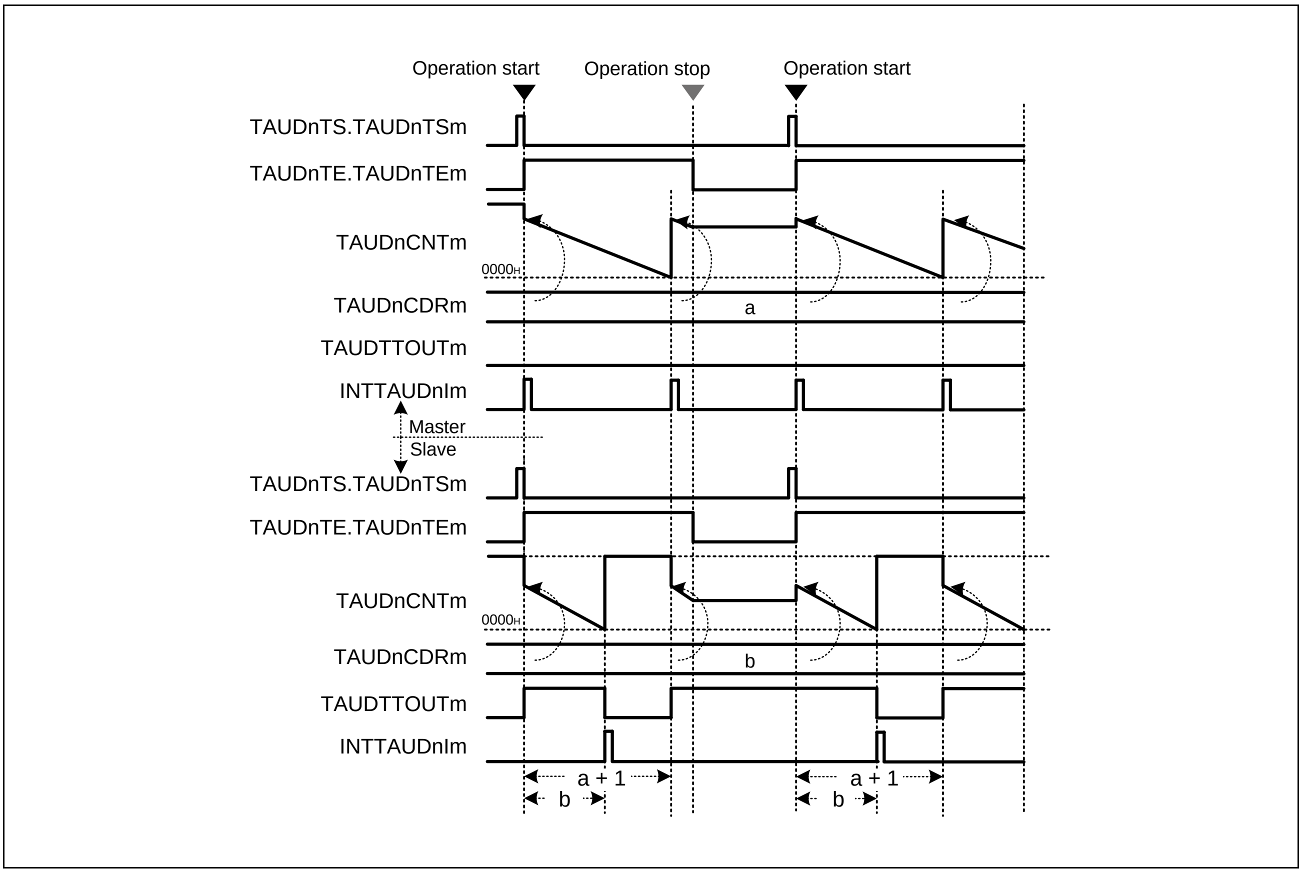

Figure 32.94 Operation Stop and Restart
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm and TAUDTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm of master and slave channels to 1. TAUDnCDRm values of the master and slave channels are loaded to TAUDnCNTm and start to count down from these values.

32.15.2 One-Shot Pulse Output Function

32.15.2.1 Overview

Summary

This function outputs a signal pulse with a specific pulse width and delay time (both defined relative to an external input signal pulse) by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

Prerequisites

- Two channels
- The operating mode for the master channel should be set to one-count mode. (See **Table 32.154, Contents of the TAUDnCMORm Register for the Master Channel of the One-Shot Pulse Output Function**.)
- The operating mode for slave channels should be set to pulse one-count mode. (See **Table 32.157, Contents of the TAUDnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function**.)
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channel should be set to independent channel output mode 2. (See **Section 32.7, Channel Output Modes**.)
- TAUDTTINm (master) has to be detected while TAUDnCNTm (master) and TAUDnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUDTTINm (slave).

Functional description

The counters are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) to 1 for the master and slave channels. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation.

- Master channel:
  When the next valid TAUDTTINm input edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm. The counter starts to count down from this value. If TAUDnCMORm.TAUDnMD0 = 0, a trigger (TAUDTTINm) which is detected within the delay time is ignored.
  When the counter of master channel reaches 0000_H, INTTAUDnIm is generated. The counter is reset to $FFFF_H$ and waits for the next valid TAUDTTINm input edge.
- Slave channel:
  INTTAUDnIm generated on master channel triggers the counter operation of slave channel. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave). The counter starts counting down from this value. An interrupt occurs and the TAUDTTOUTm signal is set.
  When the counter reaches 0001_H, INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter stops at 0000_H and waits for the next INTTAUDnIm of master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Setting TAUDnTS.TAUDnTSm to 1 while counting allows the counter to restart counting of master channel without making a stop (forced restart).

Conditions

- If TAUDnCMORn.TAUDnMD0 of master channel is set to 0, TAUDTTINm input edges detected during counting are ignored.
- Simultaneous rewrite can be used with this function. See **Section 32.6, Simultaneous Rewrite**.

32.15.2.2 Equations

Delay from trigger input to pulse output

= (TAUDnCDRm (master) + 1) × count clock cycle

Pulse width = (TAUDnCDRm (slave)) × count clock cycle

32.15.2.3 Block Diagram and General Timing Diagram

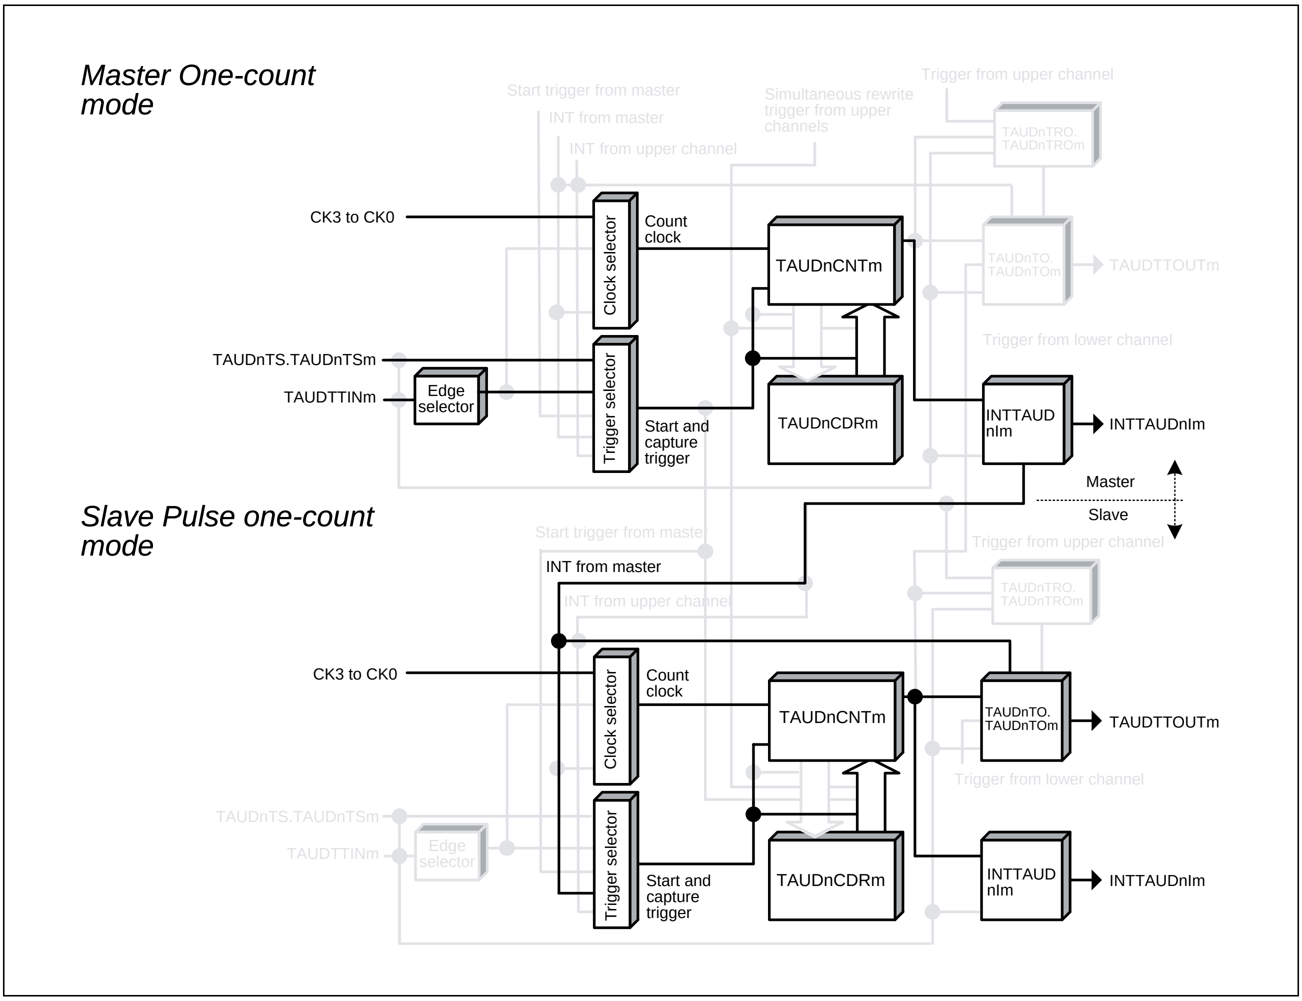

Figure 32.95 Block Diagram of One-Shot Pulse Output Function

The following settings apply to the general timing diagram.

- Start trigger detection is disabled during counting (TAUDnCMORm.TAUDnMD0 = 0).
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

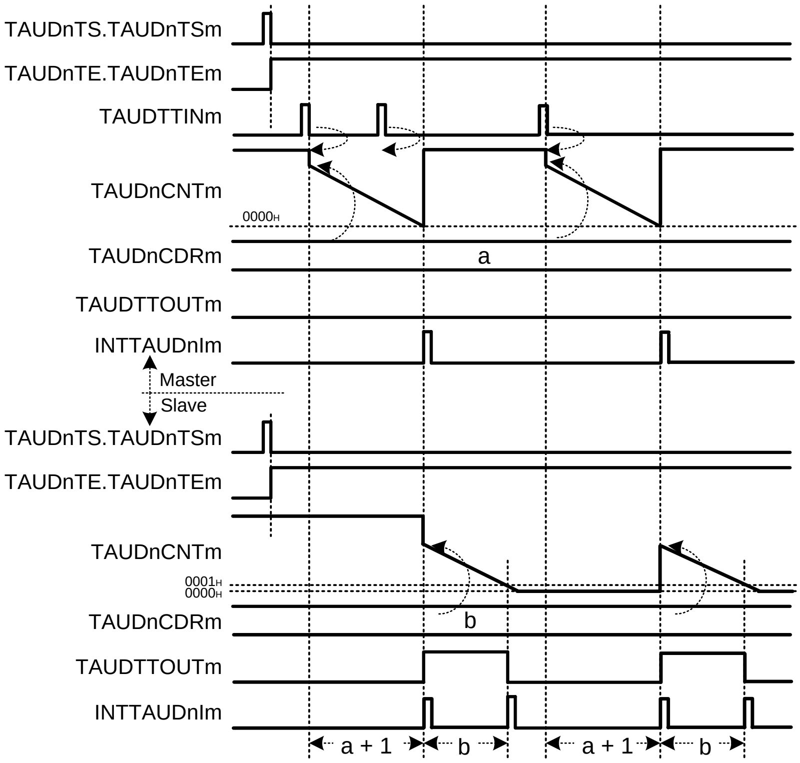

Figure 32.96 General Timing Diagram of One-Shot Pulse Output Function

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for the Slave Channel

Table 32.159 Control Bit Settings in Independent Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTDL.TAUDnTDLm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.160 Simultaneous Rewrite Settings for Slave Channels of One-Shot Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

32.15.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 32.161 Operating Procedure for One-Shot Pulse Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.2.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and channel output mode as described in **Section 32.15.2.5, Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the master channel awaits a TAUDTTINm input.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	When valid TAUDTTINm input edge is detected, TAUDnCDRm value of master channel is loaded into TAUDnCNTm to perform counting down. When the counter reaches 0000$_H$: ● INTTAUDnIm (master) is generated. ● TAUDnCNTm (master) is reset to FFFF$_H$ and waits for the next valid TAUDTTINm input edge. ● TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to perform counting down. ● INTTAUDnIm (slave) is generated. ● TAUDTTOUTm (slave) is set to the active level. When TAUDnCNTm (slave) reaches 0001$_H$: ● INTTAUDnIm (slave) is generated. ● TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

32.15.2.7 Specific Timing Diagrams

(1) TAUDnCDRm (master) = 0000_H

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

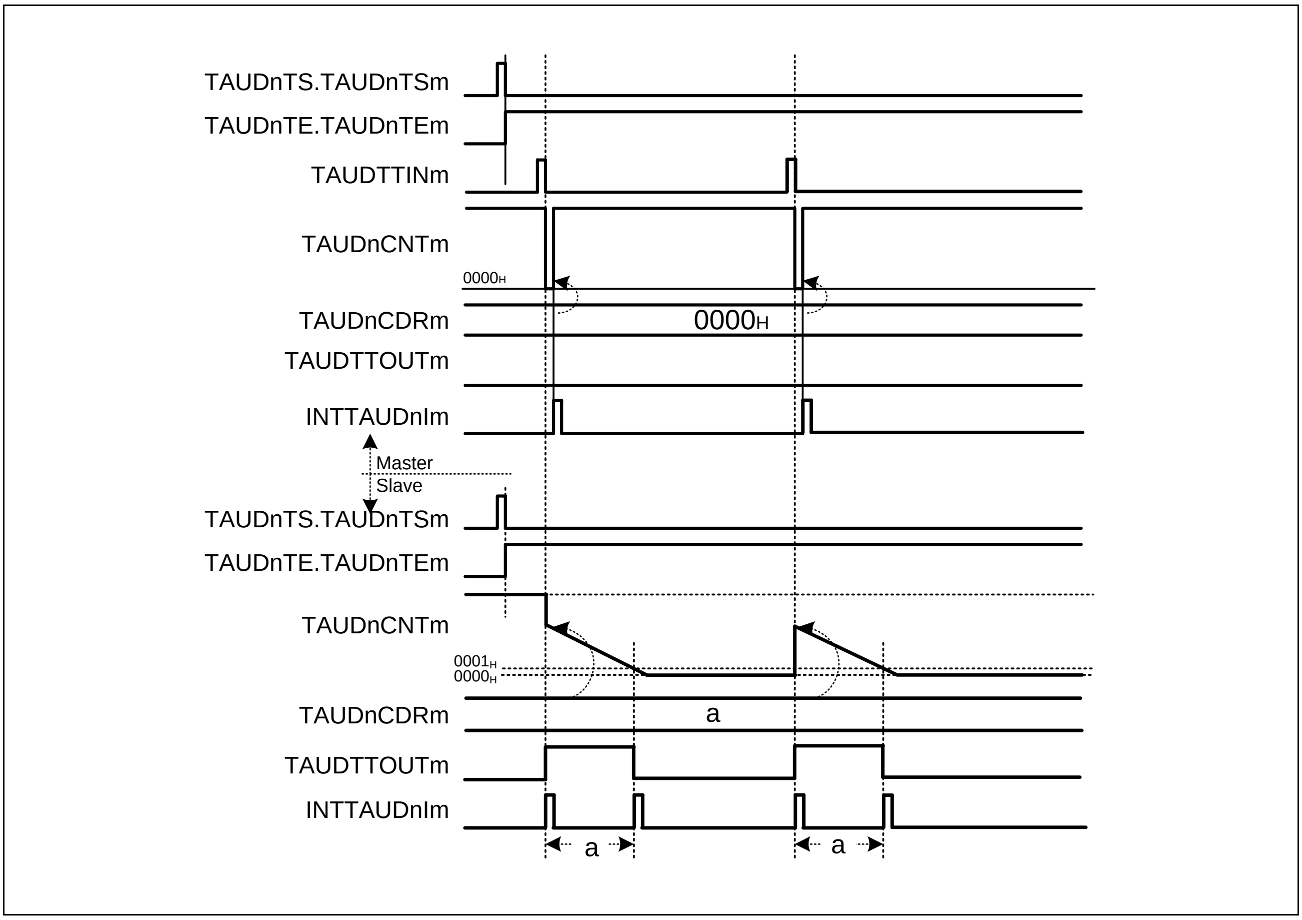

Figure 32.97 TAUDnCDRm (Master) = 0000_H

- When a valid TAUDTTINm input edge is detected, the value 0000_H is written to TAUDnCNTm (master). The counter is set to 0000_H for one count and returns to $FFFF_H$.
  Thus the slave channel starts to count down one count clock later than TAUDTTINm (master).

(2) TAUDnCDRm (slave) = 0000_H

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

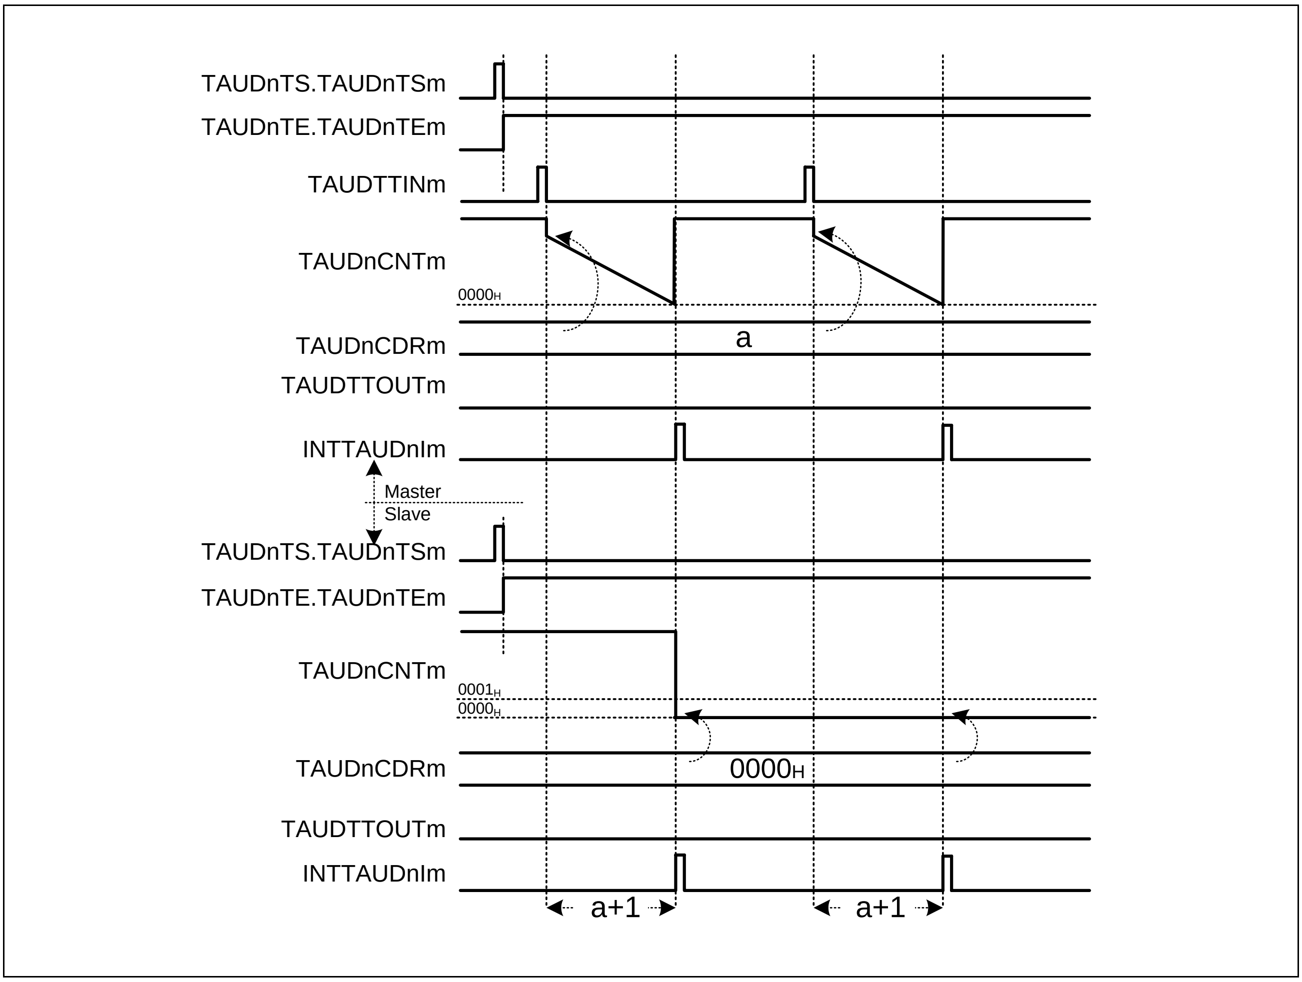

Figure 32.98 TAUDnCDRm (Slave) = 0000_H

- TAUDTTOUTm remains inactive, because the pulse width is zero.

(3) TAUDnCMORm.TAUDnMD0 = 1

The following settings apply to this diagram.

- Enables start trigger detection while counting. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

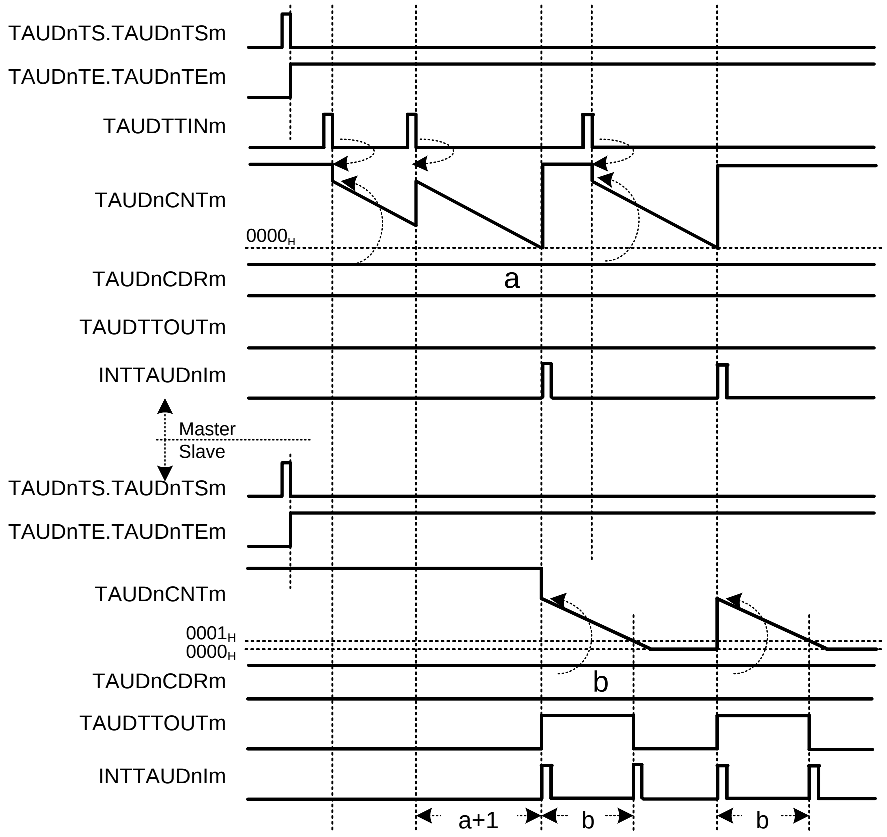

Figure 32.99 TAUDnCMORm.TAUDnMD0 = 1

- If a valid TAUDTTINm input edge is detected while the counter of the master channel counts down, TAUDnCNTm reloads the value of TAUDnCDRm. The counter restarts to count down.
  This means the delay is extended by the value of TAUDnCNTm at the time when a valid TAUDTTINm input edge is detected.

(4) Restarting the Master Channel while the Slave Channel is Counting

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

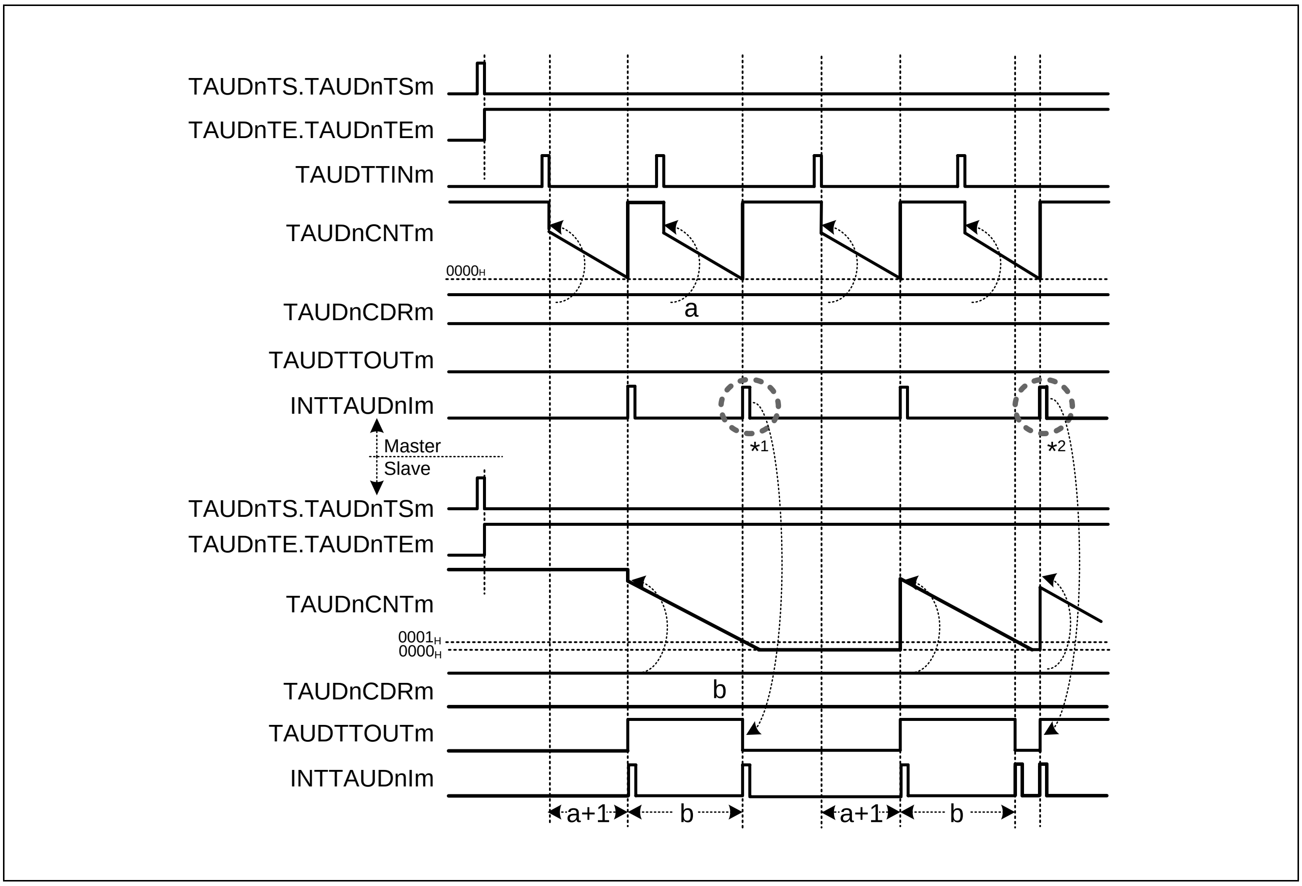

Figure 32.100 TAUDTTINm input interval ≤ Delay Time + Pulse Width +1

- If the master channel generates an interrupt before the counter of the slave channel has reached 0001_H or exactly when 0001_H is reached*[1], the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUDnCDRm (slave) is reloaded. An interrupt is generated and TAUDTTOUTm toggles. If TAUDnCNTm (master) has started to count down while the TAUDnCNTm (slave) is still counting*[2], TAUDTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

32.15.3 Trigger Start PWM Output Function

32.15.3.1 Overview

Summary

This function generates a PWM output using a master and a slave channel. It enables the pulse cycle (frequency) and the duty of the TAUDTTOUTm to be set. The pulse cycle is specified using the master channel. The duty is specified using the slave channel. The Trigger Start PWM Output Function is identical to PWM Output Function except that the master channel of this function can be reset by a valid TAUDTTINm input edge.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to Interval Timer Mode (see **Table 32.162, Contents of the TAUDnCMORm Register for the Master Channel of the Trigger Start PWM Output Function**).
- The operation mode of the slave channel must be set to One-Count Mode (see **Table 32.165, Contents of the TAUDnCMORm Register for the Slave Channel of the Trigger Start PWM Output Function**).
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode of the slave channel must be set to Synchronous Channel Output Mode 1 (see **Section 32.6, Simultaneous Rewrite**).

Functional description

The counters (master and slave) are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The current value of TAUDnCDRm is loaded to TAUDnCNTm, and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel, and a PWM output is realized by setting and resetting TAUDTTOUTm (slave).

- Master channel:
  The current value of TAUDnCDRm is loaded to the counter (TAUDnCNTm), INTTAUDnIm is generated and the counter starts to count down from this value.
  When the counter reaches 0000_H and the pulse cycle time has elapsed, INTTAUDnIm is generated and the counters (master and slave) load the current TAUDnCDRm values.
  If a valid TAUDTTINm input edge is detected, the counter of the master channel loads the current TAUDnCDRm value, restarts counting down and generates an interrupt.
- Slave channel:
  When the slave detects an interrupt from the master channel, it starts to count down from the current value of TAUDnCDRm. The TAUDTTOUTm signal is set to the active level.
  When the counter reaches 0000_H (duty time has elapsed), INTTAUDnIm is generated and the TAUDTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channels, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. See **Section 32.6, Simultaneous Rewrite**.

32.15.3.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = [TAUDnCDRm (slave) / (TAUDnCDRm (master) + 1)] × 100

- Duty cycle = 0%
  TAUDnCDRm (slave) = 0000_H
- Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

32.15.3.3 Block Diagram and General Timing Diagram

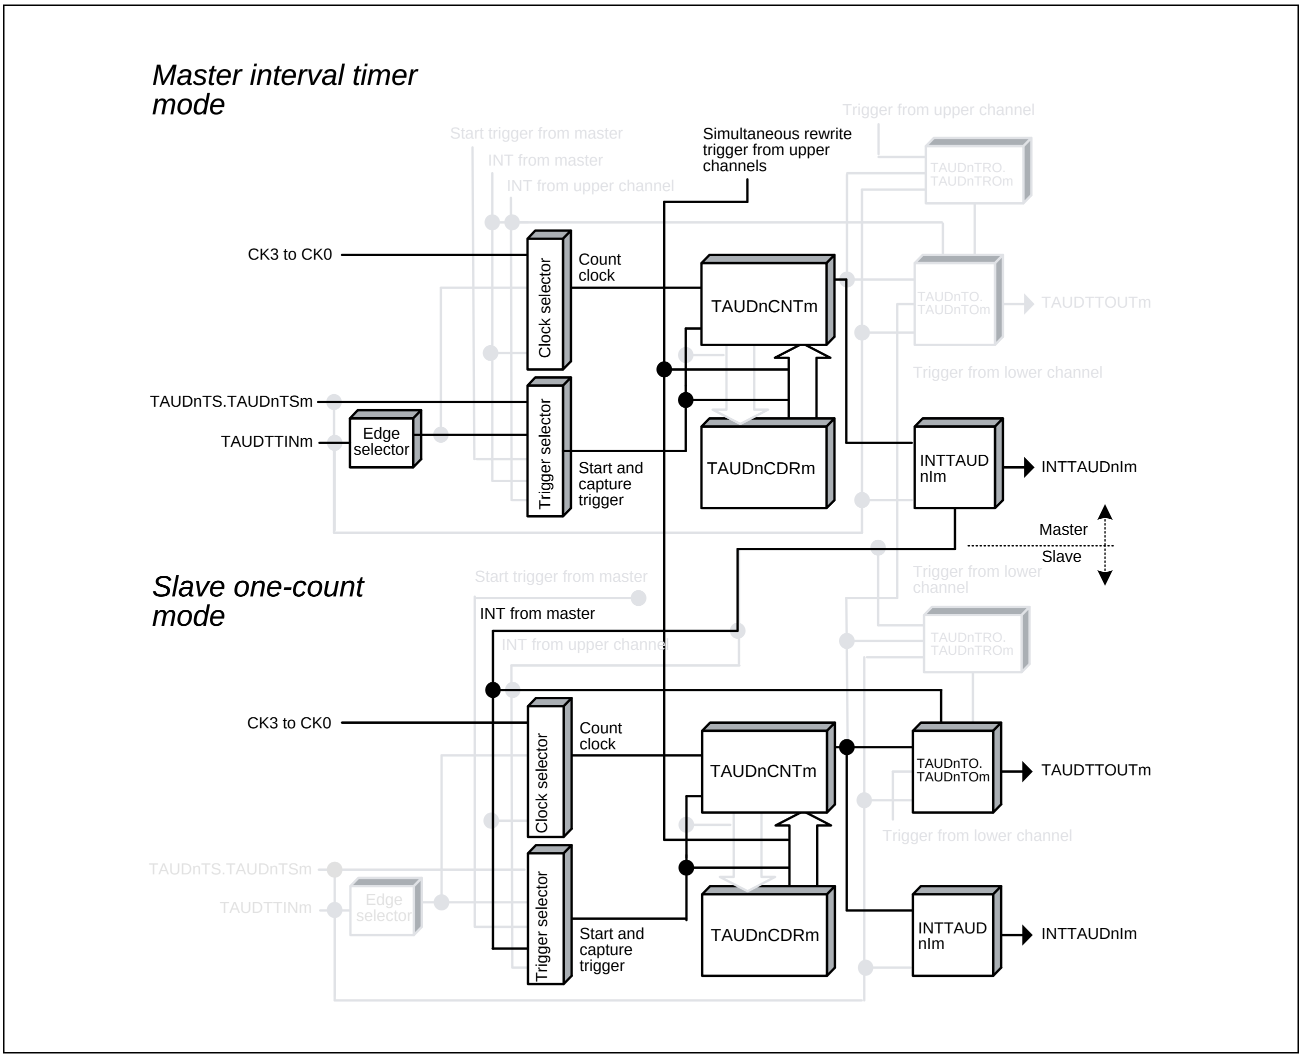

Figure 32.101 Block Diagram for Trigger Start PWM Output Function

The following settings apply to the general timing diagram.

- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)
- Positive logic (TAUDnTOL.TAUDnTOLm (slave) = 0)

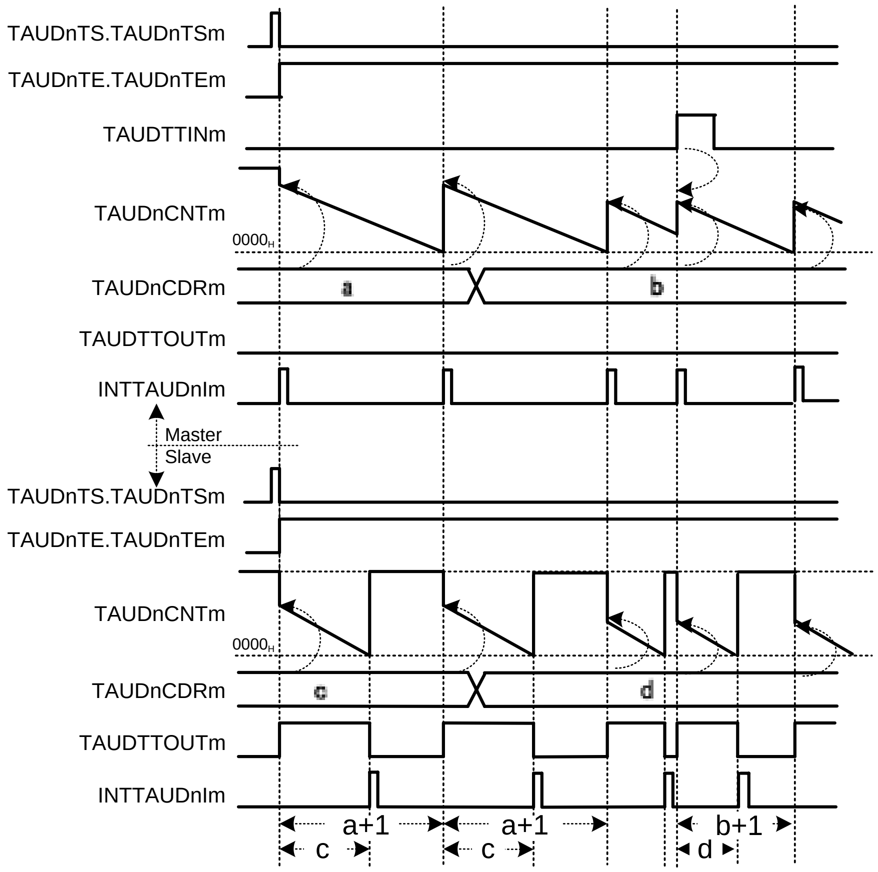

Figure 32.102 General Timing Diagram for Trigger Start PWM Output Function

NOTE

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

32.15.3.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.166 Contents of the TAUDnCMURm Register for the Slave Channel of the Trigger Start PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for the Slave Channel

Table 32.167 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.168 Simultaneous Rewrite Settings for the Slave Channel of the Trigger Start PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

32.15.3.6 Operating Procedure for Trigger Start PWM Output Function

Table 32.169 Operating Procedure for Trigger Start PWM Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.3.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.3.5, Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000_H: ● INTTAUDnIm (master) is generated. ● TAUDnCDRm value is loaded into TAUDnCNTm (master) to continue count operation. ● TAUDnCNTm (slave) loads the TAUDnCDRm value and starts to count down ● TAUDTTOUTm (slave) is set When TAUDnCNTm of the slave = 0000_H: ● INTTAUDnIm (slave) is generated. ● TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops. If a TAUDTTINm input is detected on the master channel while TAUDnCNTm of the master channel is counting down: ● TAUDnCNTm (master and slave) loads the TAUDnCDRm value and counts down ● INTTAUDnIm (master) is generated. ● TAUDTTOUTm (slave) is set to the active level.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

32.15.3.7 Specific Timing Diagrams

(1) Duty cycle = 0%

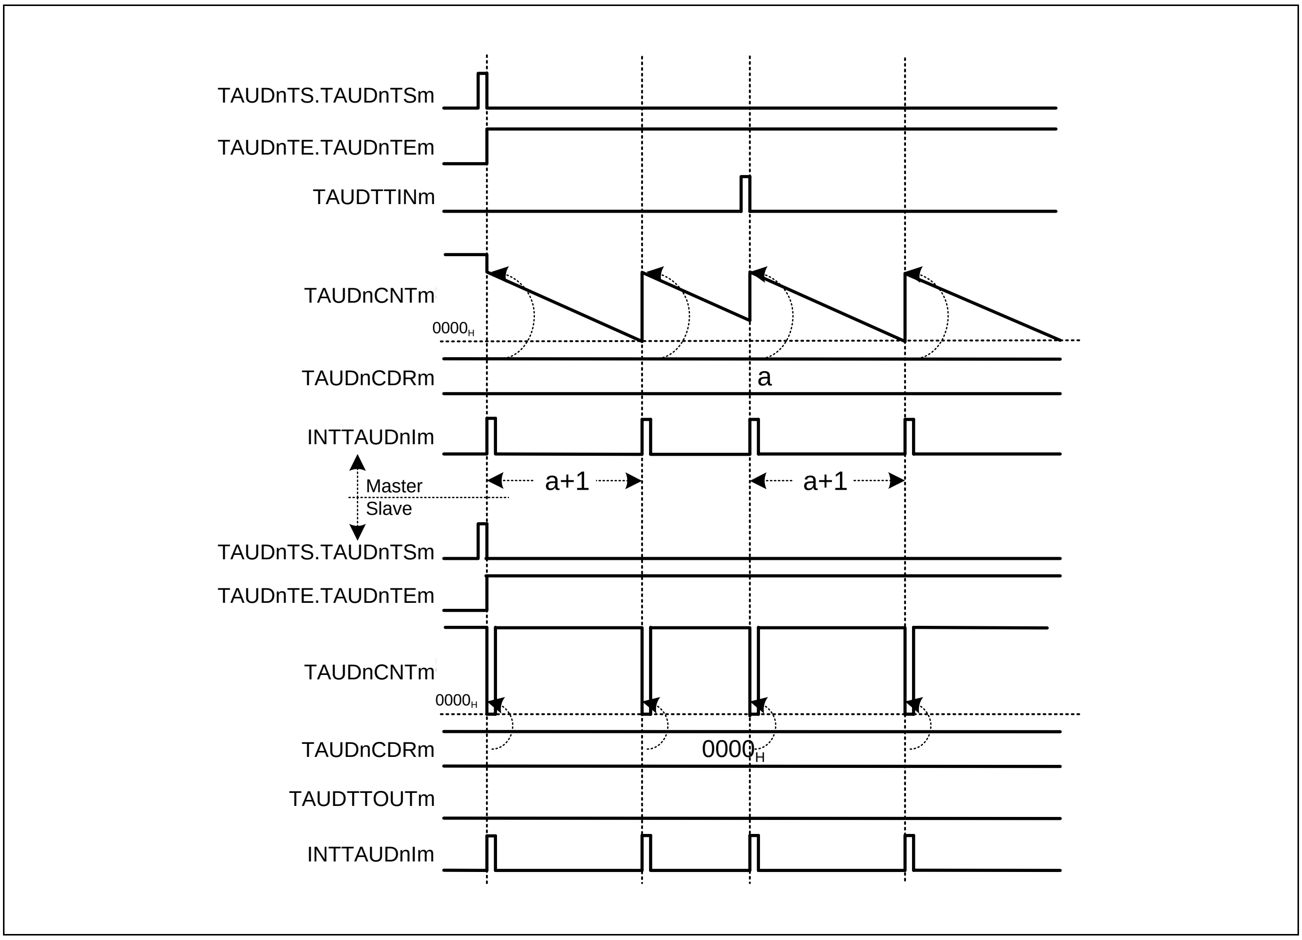

Figure 32.103 TAUDnCDRm (Slave) = 0000$_H$,
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)
Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = 00$_B$)

- Every time the master channel generates an interrupt (INTTAUDnIm), 0000$_H$ is written to TAUDnCNTm (slave). Therefore, TAUDnCNTm (slave) cannot start to count and TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The detection of a valid TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).

(2) Duty cycle = 100%

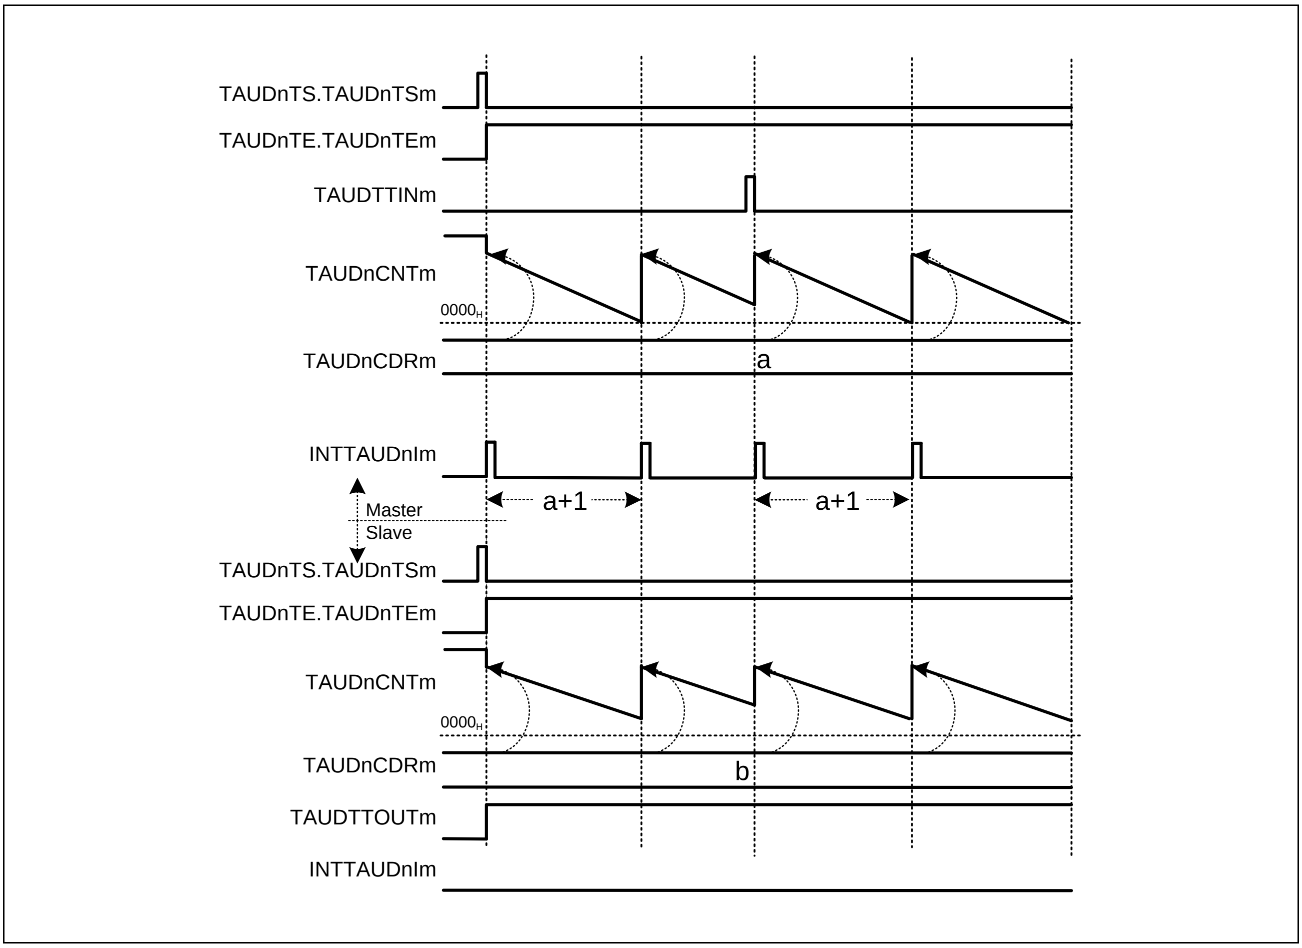

Figure 32.104 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1,
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)
Falling Edge Detection (TAUDnCMURm.TIS[1:0] = 00_B)

- If the value TAUDnCDRm (slave) is higher than the value TAUDnCDRm (master), the counter of the slave channel cannot reach 0000_H and cannot generate interrupts.
  The TAUDTTOUTm remains at active state.
  The detection of a valid TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).

(3) TAUDTTINm Detection and Active Slave Counter

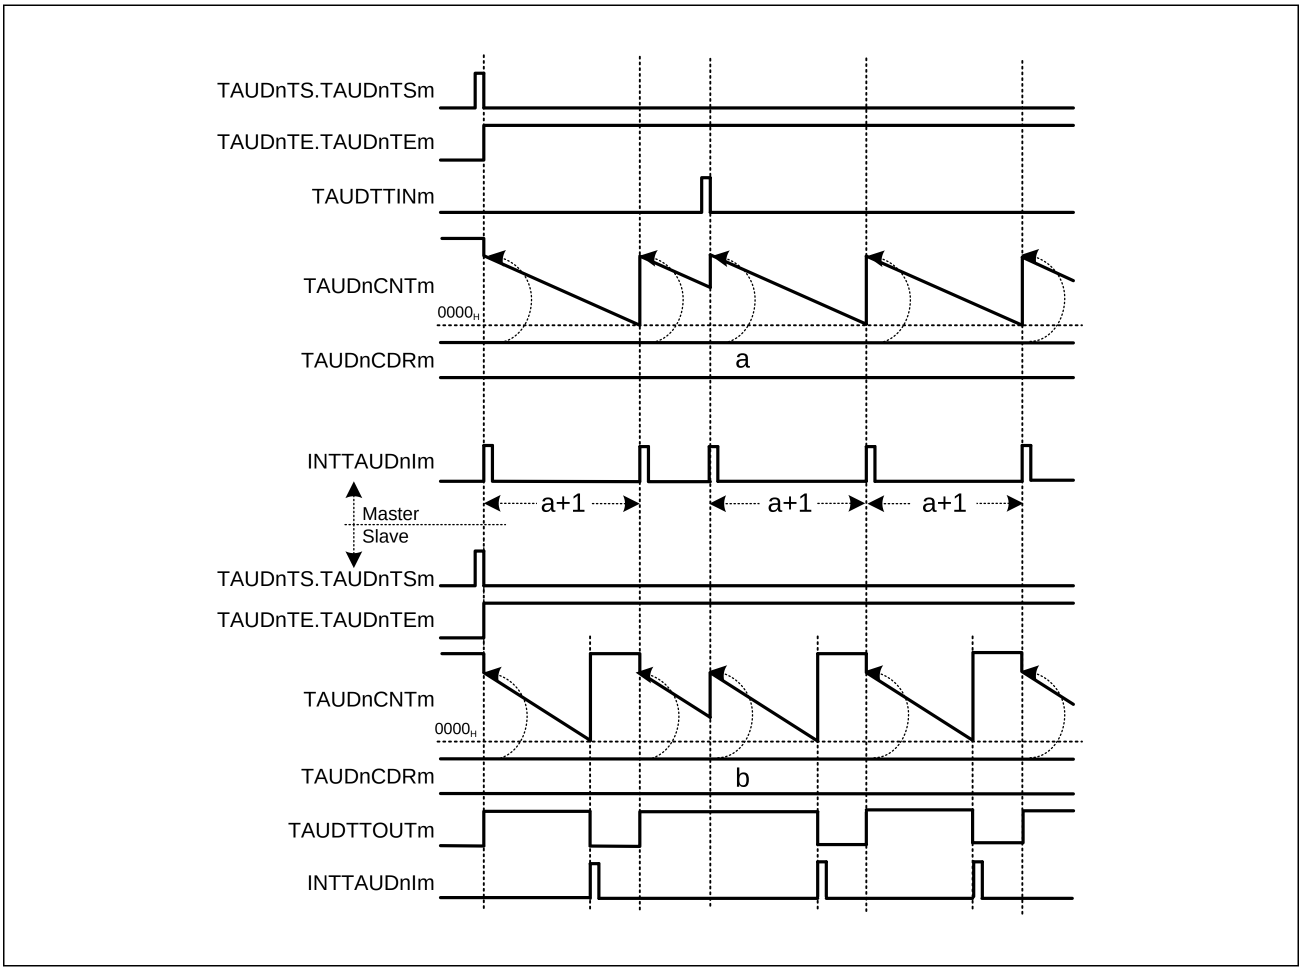

Figure 32.105 Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)
Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

- If TAUDnCNTm (slave) reloads the value TAUDnCDRm (slave) while it is still counting down, TAUDTTOUTm remains unchanged and extends the duty.
  The duty does not correspond to the value of the slave’s data register.

32.15.4 Delay Pulse Output Function

32.15.4.1 Overview

Summary

This function outputs two signals. The pulse width and pulse cycle of the reference signal are defined using the master channel and slave channel 1. Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by the amount specified on slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1. The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified on slave channel 2.

Prerequisites

- Four channels
- The operating mode for the master channel should be set to interval timer mode. (See **Table 32.170, Contents of the TAUDnCMORm Register for the Master Channel of the Delay Pulse Output Function**.)
- The operating mode for slave channels 1 and 2 should be set to one-count mode. (See **Table 32.173, Contents of the TAUDnCMORm Register for Slave Channel 1 of the Delay Pulse Output Function** and **Table 32.177, Contents of the TAUDnCMORm Register for Slave Channel 2 of the Delay Pulse Output Function**.)
- The operating mode for slave channel 3 should be set to pulse one-count mode. (See **Table 32.180, Contents of the TAUDnCMORm Register for Slave Channel 3 of the Delay Pulse Output Function**.)
- TAUDTTOUTm is not used with the master channel and slave channel 2.
- The channel output mode for slave channel 1 should be set to synchronous channel output mode 1. (See **Section 32.7, Channel Output Modes**.)
- The channel output mode for slave channel 3 should be set to independent channel output mode 2. (See **Section 32.7, Channel Output Modes**.)

Functional description

The counters of the channel group are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation.

- Master channel:
  The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel.
  When the counter value of master channel reaches 0000_H and pulse cycle time has elapsed, INTTAUDnIm is generated. The TAUDnCDRm value is reloaded into the counter to perform counting down.
- Slave channels 1 and 2:
  Slave channels 1 and 2 start to count down from the current TAUDnCDRm value when detecting an interrupt from the master channel. TAUDTTOUTm signal (slave 1) is set.
- Slave channel 1:
  When the counter of slave channel 1 reaches 0000_H (duty time has elapsed), INTTAUDnIm is generated and

TAUDTTOUTm signal is reset. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnIm of master channel.

  - Slave channel 2:
    When the counter of slave channel 2 reaches 0000_H and delay time has elapsed, INTTAUDnIm is generated. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnIm of master channel.
    Generating INTTAUDnIm (slave channel 2) triggers the counter of slave channel 3.

- Slave channel 3:
  When slave channel 3 detects an interrupt from slave channel 2, its counter starts counting down from the current value of TAUDnCDRm. INTTAUDnIm is generated and the TAUDTTOUTm signal (slave channel 3) is set.
  When the counter of slave channel 3 reaches 0001_H, INTTAUDnIm is generated and the TAUDTTOUTm signal is reset.
  The delayed PWM pulse is output from slave channel 3.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. See **Section 32.6, Simultaneous Rewrite**.

32.15.4.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty width 1 = (TAUDnCDRm (slave 1)) × count clock cycle

Delay width = (TAUDnCDRm (slave 2) + 1) × count clock cycle

Duty width 2 = (TAUDnCDRm (slave 3)) × count clock cycle

However, the delay width shall be set within the following range:
$0000_H \leq$ TAUDnCDRm (slave 2) < TAUDnCDRm (master)

NOTES

1. The waveform of TAUDTTOUTm (slave 3) becomes the waveform made by delaying the waveform of TAUDTTOUTm (slave 1) by the quantity generated by slave 2. It is impossible to make a delay longer than the pulse cycle.
2. If INTTAUD0Im of slave 2 is generated while slave 3 is counting, slave 3 restarts operation. Therefore, the waveform of TAUDTTOUTm (slave 3) is retained on the active level. In this case, TAUDTTOUTm (slave 3) cannot output the waveform generated by delaying the basic pulse of TAUDTTOUTm (slave 1).

32.15.4.3 Block Diagram and General Timing Diagram

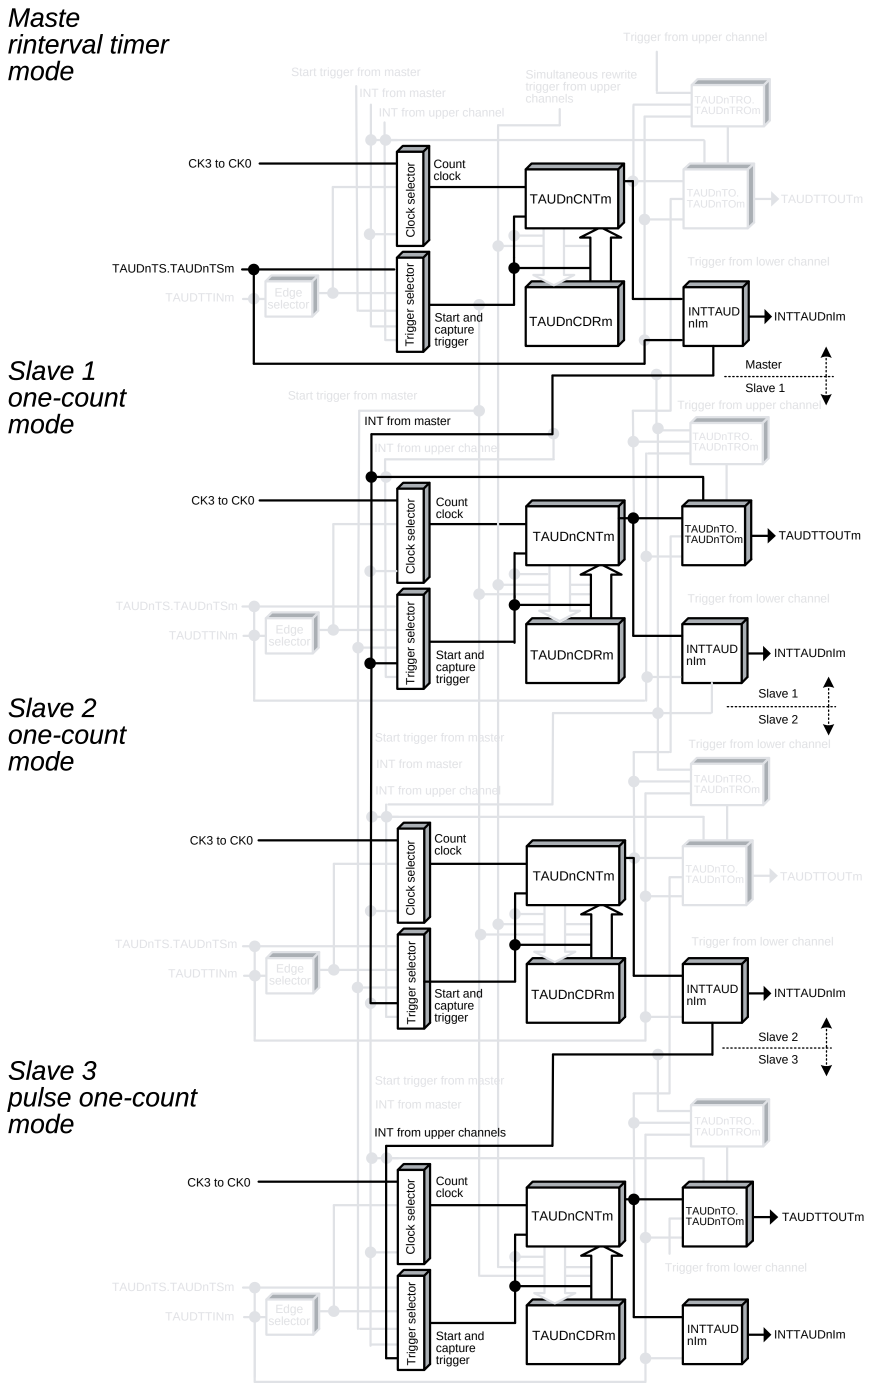

Figure 32.106 Block Diagram of Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUDnTOL.TAUDnTOLm = 0)
- Slave channel 3: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

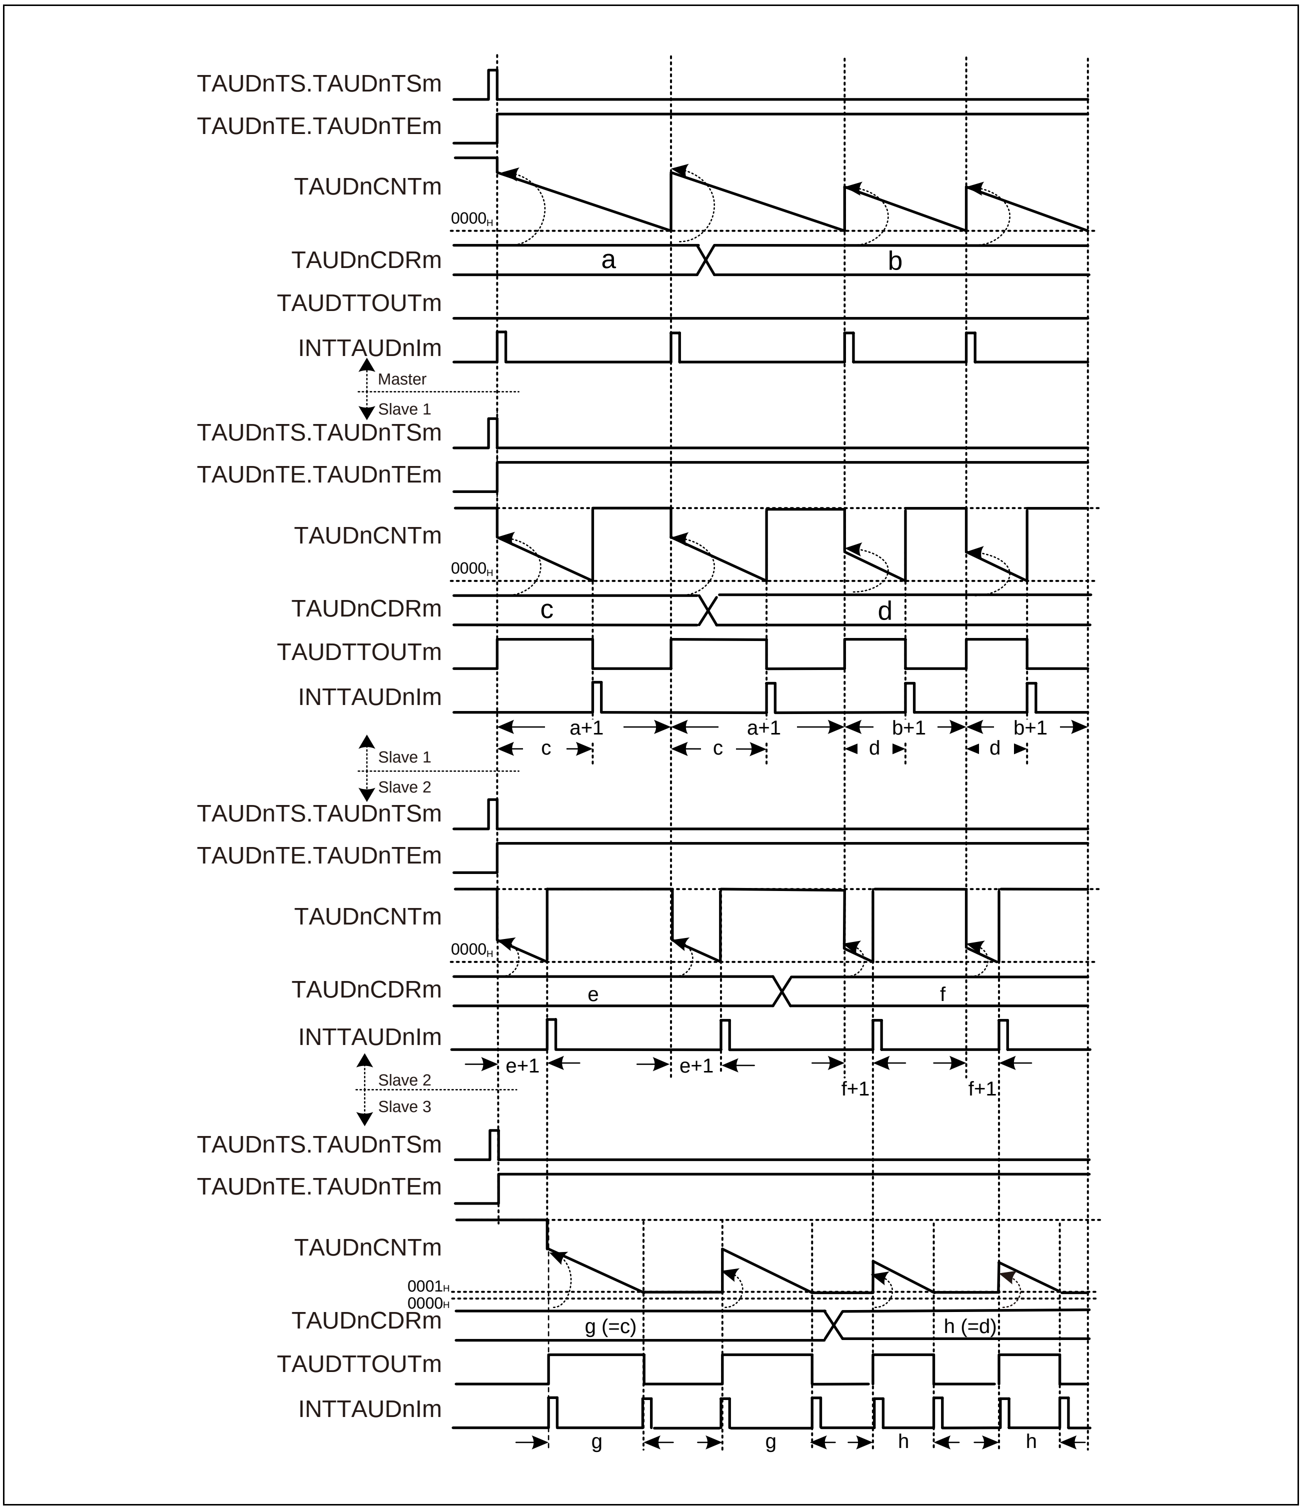

Figure 32.107 General Timing Diagram of Delay Pulse Output Function

NOTE

TAUDTTOUTm of slave channel 1 rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

32.15.4.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Table 32.181 Contents of the TAUDnCMURm Register for Slave Channel 3 of the Delay Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for Slave Channel 3

Table 32.182 Control Bit Settings in Independent Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for Slave Channel 3

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.183 Simultaneous Rewrite Settings for Slave Channel 3 of Delay Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

32.15.4.8 Operating Procedure for Delay Pulse Output Function

Table 32.184 Operating Procedure for Delay Pulse Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.4.4, Register Settings for the Master Channel**. Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.4.5, Register Settings for Slave Channel 1**. Slave channel 2: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.4.6, Register Settings for Slave Channel 2**. Slave channel 3: Set the TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.4.7, Register Settings for Slave Channel 3**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.

Table 32.184 Operating Procedure for Delay Pulse Output Function

Restart Operation

	Operation	TAUDn Status
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master channel and slave channels 1 and 2 start. INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave channel 1) is set.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel and slave channels 1 and 2 is loaded to TAUDnCNTm and count down. When the counter of master channel reaches 0000_H: ● INTTAUDnIm (master) is generated. ● TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation. ● TAUDnCDRm value is reloaded into TAUDnCNTm (slave 1/2) to count down. ● TAUDTTOUTm (slave 1) is set. When TAUDnCNTm (slave 1) reaches 0000_H: ● INTTAUDnIm (slave 1) is generated. ● TAUDTTOUTm (slave 1) is reset. When TAUDnCNTm (slave 2) reaches 0000_H: ● INTTAUDnIm (slave 2) is generated. ● INTTAUDnIm (slave 3) is generated. ● TAUDTTOUTm (slave 3) is set. ● TAUDnCDRm value is reloaded into TAUDnCNTm (slave 3) to count down operation. When TAUDnCNTm (slave 3) reaches 0001_H: ● INTTAUDnIm (slave 3) is generated. ● TAUDTTOUTm (slave 3) is reset.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.15.4.9 Specific Timing Diagrams

(1) Duty cycle (slave 3) = 100%

The following values apply to **Figure 32.108, Duty Cycle (Slave 3) = 100%**:

- TAUDnCDRm (master) = $000A_H$
- TAUDnCDRm (slave 1) = $000B_H$
- TAUDnCDRm (slave 2) = 0000_H
- TAUDnCDRm (slave 3) = $000B_H$

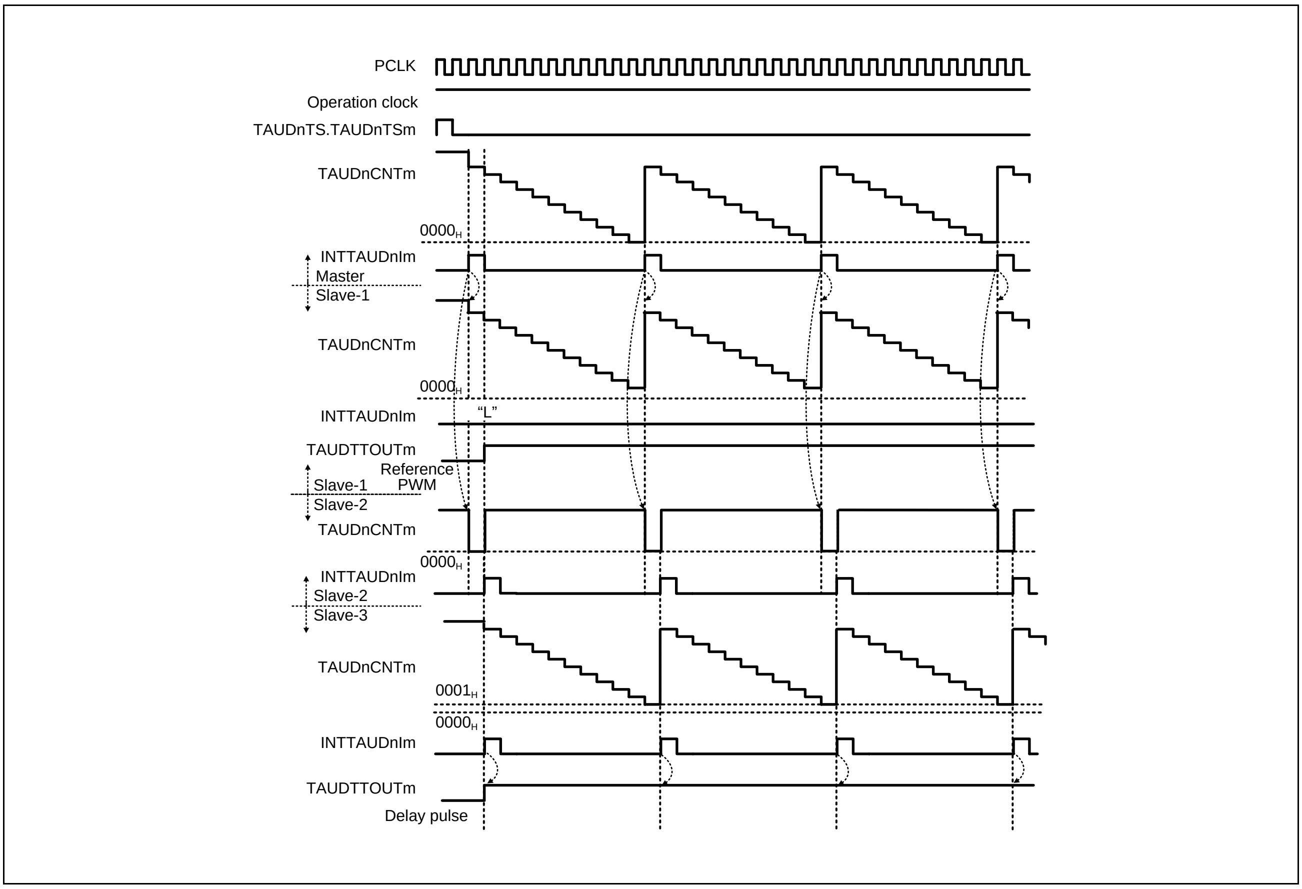

Figure 32.108 Duty Cycle (Slave 3) = 100%

- If the value of TAUDnCDRm (slaves 1 and 3) is higher than the value of TAUDnCDRm (master), the counter of the slave channel 1 cannot reach 0000_H and cannot generate interrupts. TAUDTTOUTm of channels 1 and 3 remain in the active state.

(2) TAUDTTOUTm (slave 1) = TAUDTTOUTm (slave 3)

The following values apply to **Figure 32.109, TAUDTTOUTm (Slave 1) = TAUDTTOUTm (Slave 3)**.

- TAUDnCDRm (master) = $000A_H$
- TAUDnCDRm (slave 1) = 0005_H
- TAUDnCDRm (slave 2) = 0000_H
- TAUDnCDRm (slave 3) = 0005_H

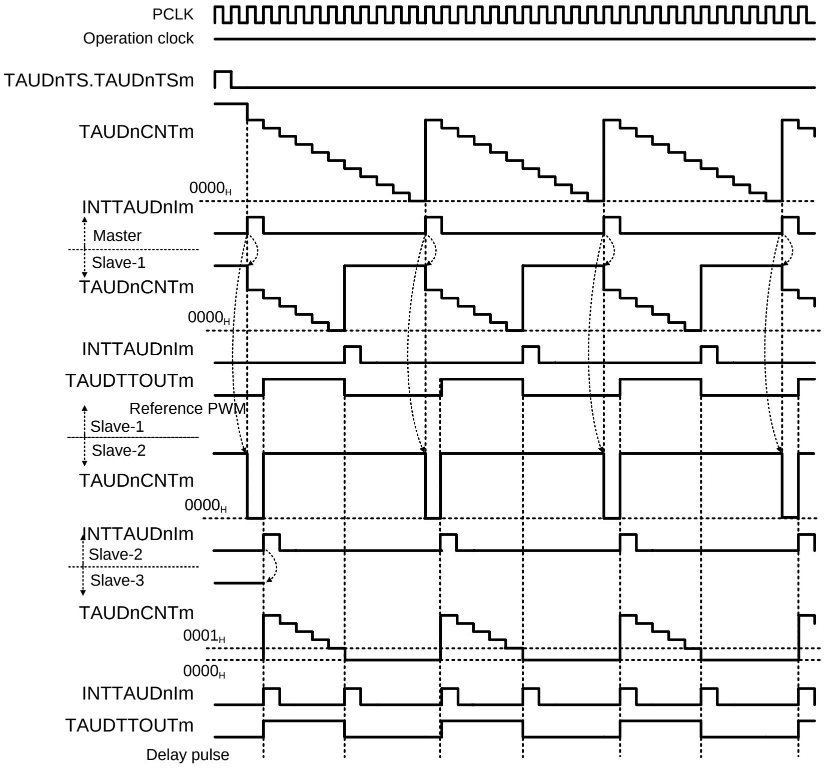

Figure 32.109 TAUDTTOUTm (Slave 1) = TAUDTTOUTm (Slave 3)

- If TAUDnCDRm (slave 2) = 0000_H, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1. The reference pulse and the delay pulse are output with a delay of one clock count.

32.15.5 Offset Trigger Output Function

32.15.5.1 Overview

Summary

This function generates a PWM output using a master channel and a slave channel, enabling the pulse width (duration) of the TAUDTTOUTm to be set. The pulse cycle is set by detecting a valid input edge of master channel. The pulse width is specified on the slave channel.

Prerequisites

- Two channels
- The operating mode for the master channel should be set to capture mode. (See **Table 32.185, Contents of the TAUDnCMORm Register for the Master Channel of the Offset Trigger Output Function**.)
- The operating mode for slave channels should be set to one-count mode. (See **Table 32.188, Contents of the TAUDnCMORm Register for the Slave Channel of the Offset Trigger Output Function**.)
- The output mode for slave channels should be set to synchronous channel output mode 1. (See **Section 32.7, Channel Output Modes**.)
- TAUDTTOUTm is not used with the master channel of this function.

Functional description

The counter can be enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This makes TAUDnTE.TAUDnTEm = 1, enabling count operation. The master channel counter (TAUDnCNTm) starts to count up from 0000_H.

- Master channel:
  When a valid TAUDTTINm input edge is detected, the current value of the counter (TAUDnCNTm) is loaded into the data register of master channel (TAUDnCDRm). INTTAUDnIm is generated and the counter restarts to count up from 0000_H.
- Slave channel:
  If INTTAUDnIm is generated on the master channel, the TAUDTTOUTm (slave) signal is set and the counter of the slave channel is triggered. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave) and the counter starts to count down from this value.
  When the counter reaches 0000_H (duty time has elapsed), INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

32.15.5.2 Equations

Pulse width = (TAUDnCDRm (slave)) × count clock cycle

Duty cycle [%] = [TAUDnCDRm (slave)/(TAUDnCDRm (master) + 1)] × 100

- Duty cycle = 0%
  TAUDnCDRm (slave) = 0000_H
- Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

32.15.5.3 Block Diagram and General Timing Diagram

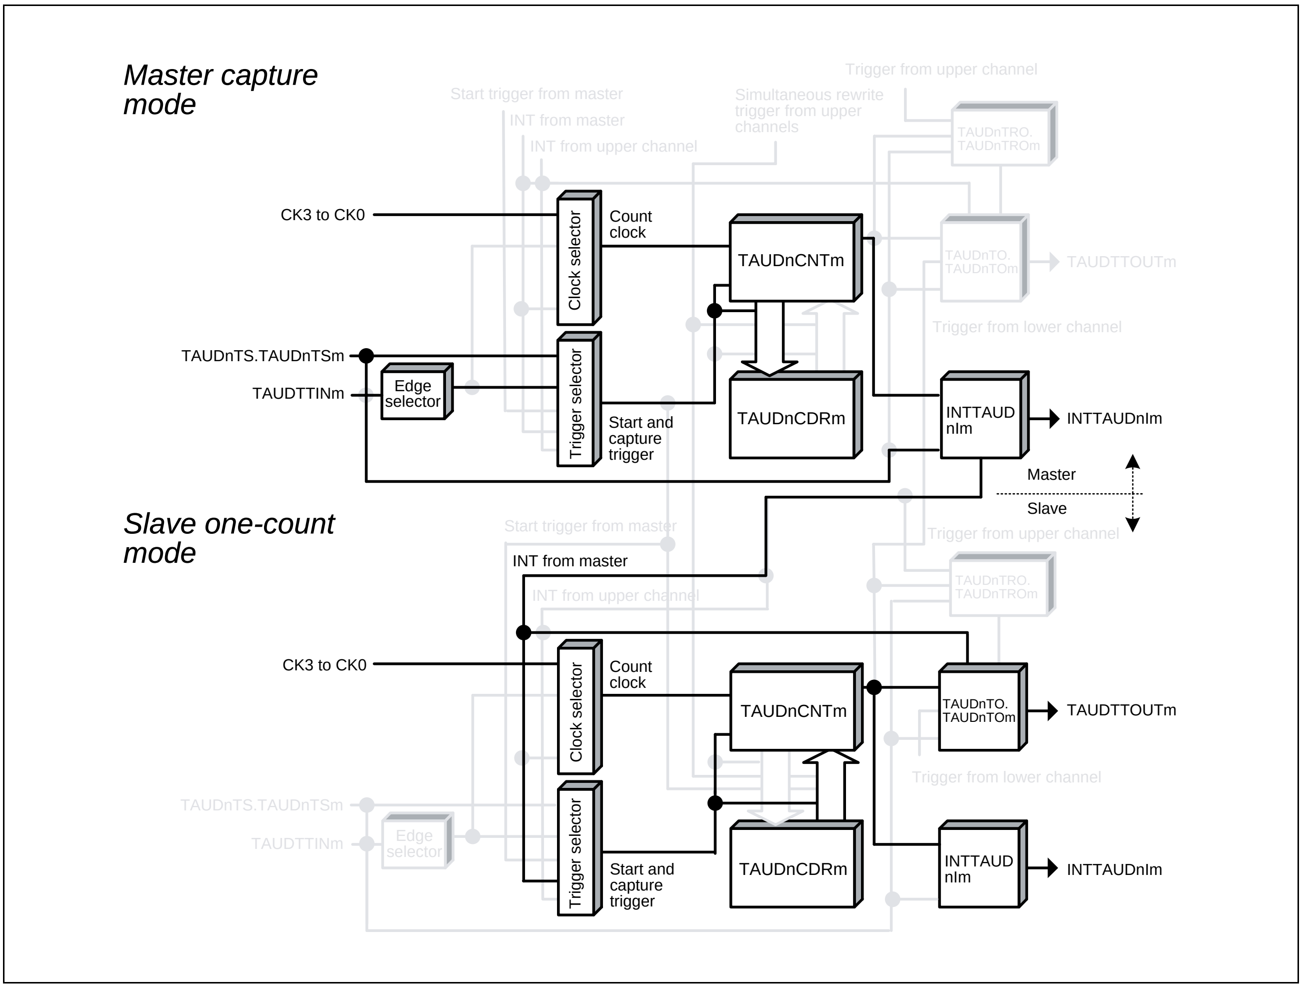

Figure 32.110 Block Diagram of Offset Trigger Output Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

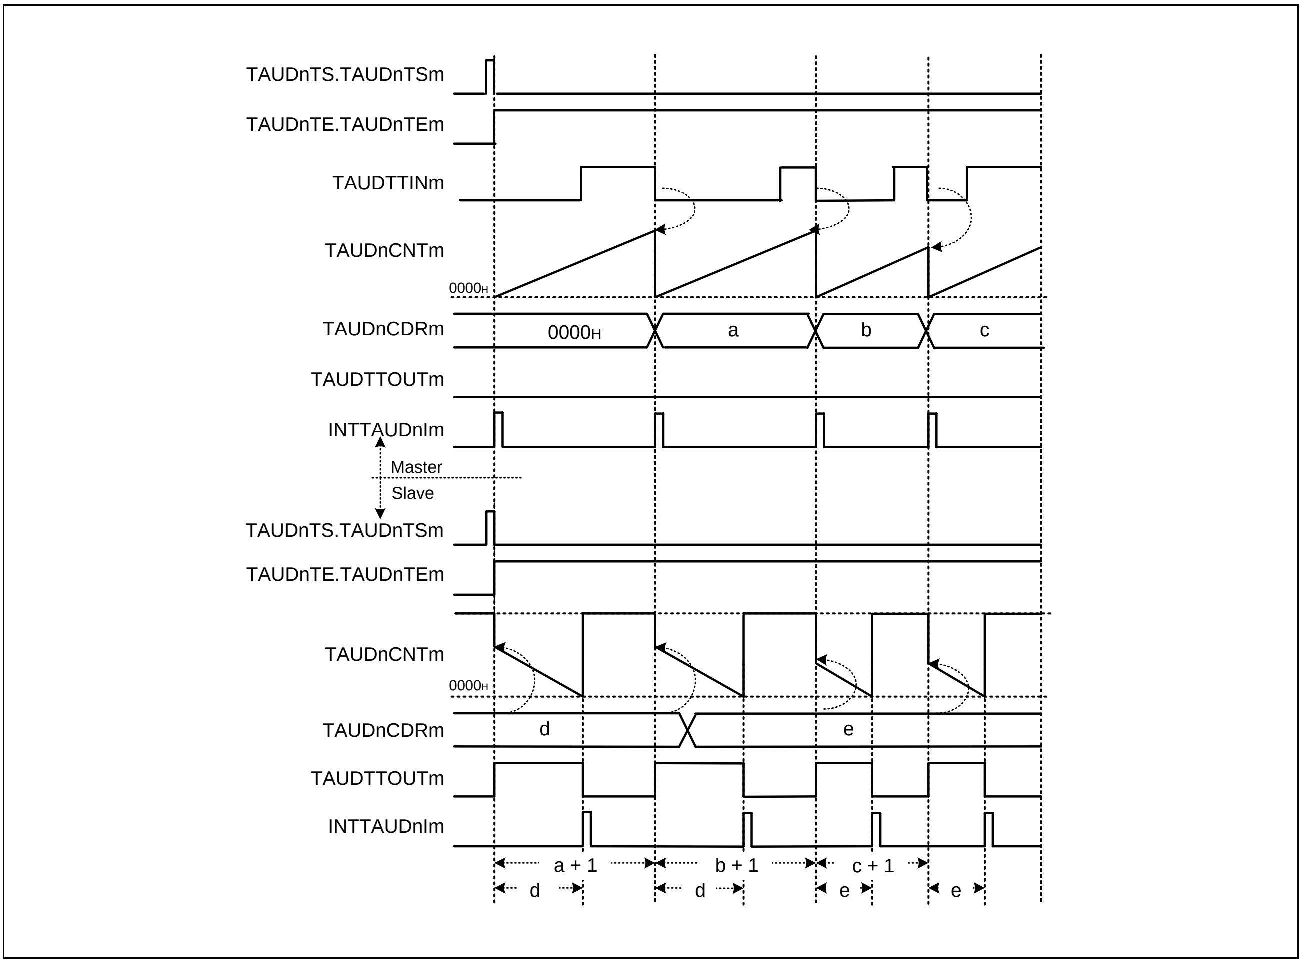

Figure 32.111 General Timing Diagram of Offset Trigger Output Function

NOTE

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

32.15.5.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0

Table 32.186 Contents of the TAUDnCMURm Register for the Master Channel of the Offset Trigger Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges 11: Setting prohibited

(3) Channel Output Mode for the Master Channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

(4) Simultaneous Rewrite for the Master Channel

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the offset trigger output function. Therefore, these registers should be set to 0.

Table 32.187 Simultaneous Rewrite Settings for the Master Channel of Offset Trigger Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.15.5.5 Register Settings for Slave Channels

(1) TAUDnCMORm for Slave Channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

(2) TAUDnCMURm for Slave Channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.189 Contents of the TAUDnCMURm Register for the Slave Channel of the Offset Trigger Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for Slave Channels

Table 32.190 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for Slave Channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the offset trigger output function. Therefore, these registers should be set to 0.

Table 32.191 Simultaneous Rewrite Settings for Slave Channels of Offset Trigger Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

32.15.5.6 Operating Procedure for Offset Trigger Output Function

Table 32.192 Operating Procedure for Offset Trigger Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.5.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and channel output mode as described in **Section 32.15.5.5, Register Settings for Slave Channels**. The TAUDnCDRm register of master channel functions as a capture register. Set the value of TAUDnCDRm register of slave channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start: ● TAUDnCNTm (master) counts up. ● TAUDnCDRm value is loaded into TAUDnCNTm (slave) to perform counting down. INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCSCm.TAUDnCLOV can be set to 1. TAUDnCDRm of slave channel can be changed after the generation of INTTAUDnIm (master). TAUDnCNTm and TAUDnCSRm can be read at any time.	When TAUDnCNTm of the slave = 0000$_H$: ● INTTAUDnIm (slave) is generated. ● TAUDTTOUTm (slave) is reset, and the counter of slave channel stops. When TAUDTTINm input edge is detected on the master channel: ● INTTAUDnIm (master) is generated. ● TAUDnCNTm (master) is reset to 0000$_H$ and then continues count operation subsequently. ● TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to perform counting down. ● TAUDTTOUTm (slave) is set.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

32.15.5.7 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to this diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

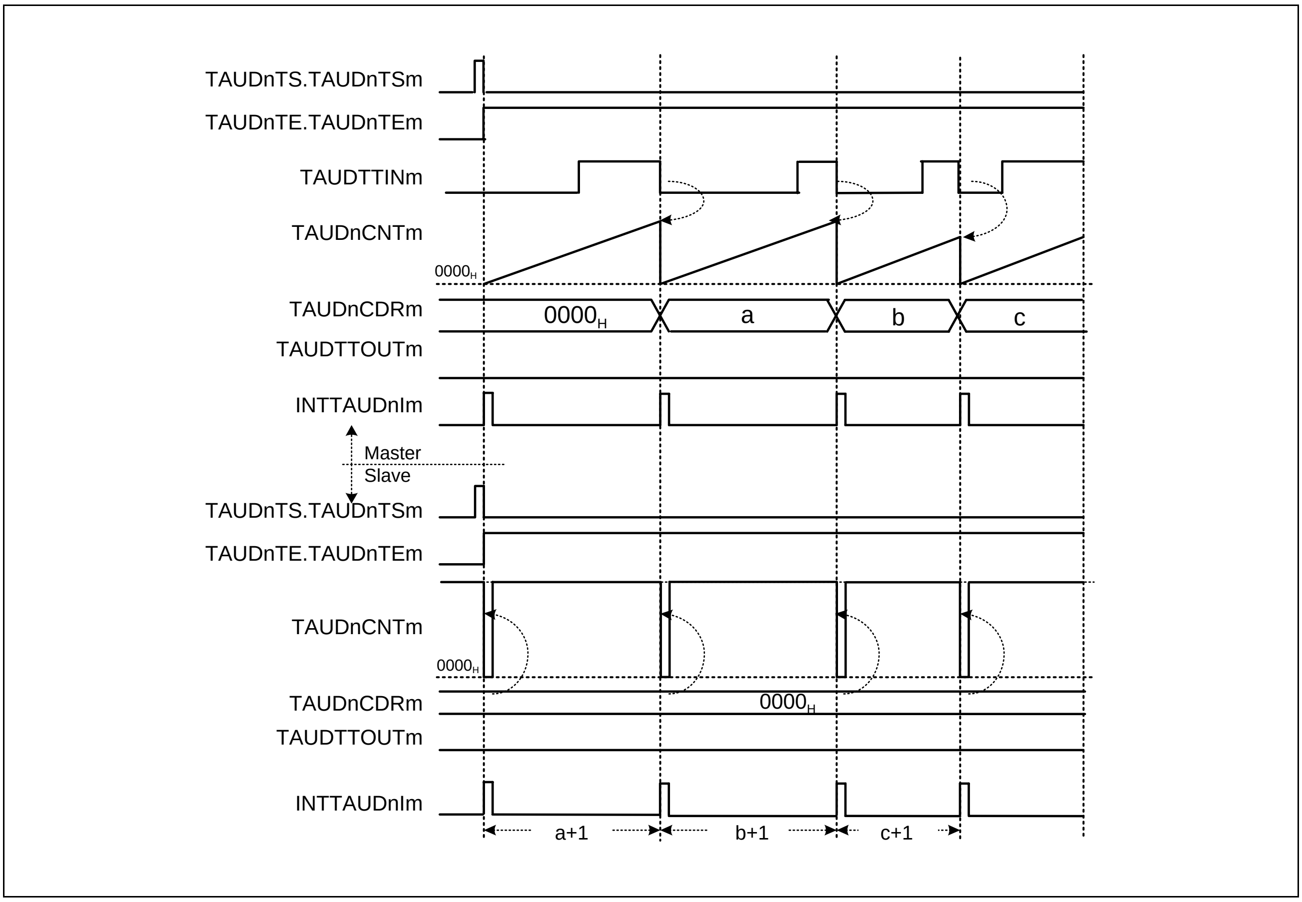

Figure 32.112 TAUDnCDRm (Slave) = 0000_H

- When TAUDnCDRm (slave) = 0000_H, 0000_H is written to TAUDnCNTm every time the master channel generates an interrupt (INTTAUDnIm), and TAUDnCNTm cannot start to count. The TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The slave and the master channels generate interrupts in the same cycle.

(2) Duty cycle = 100%

The following settings apply to this diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

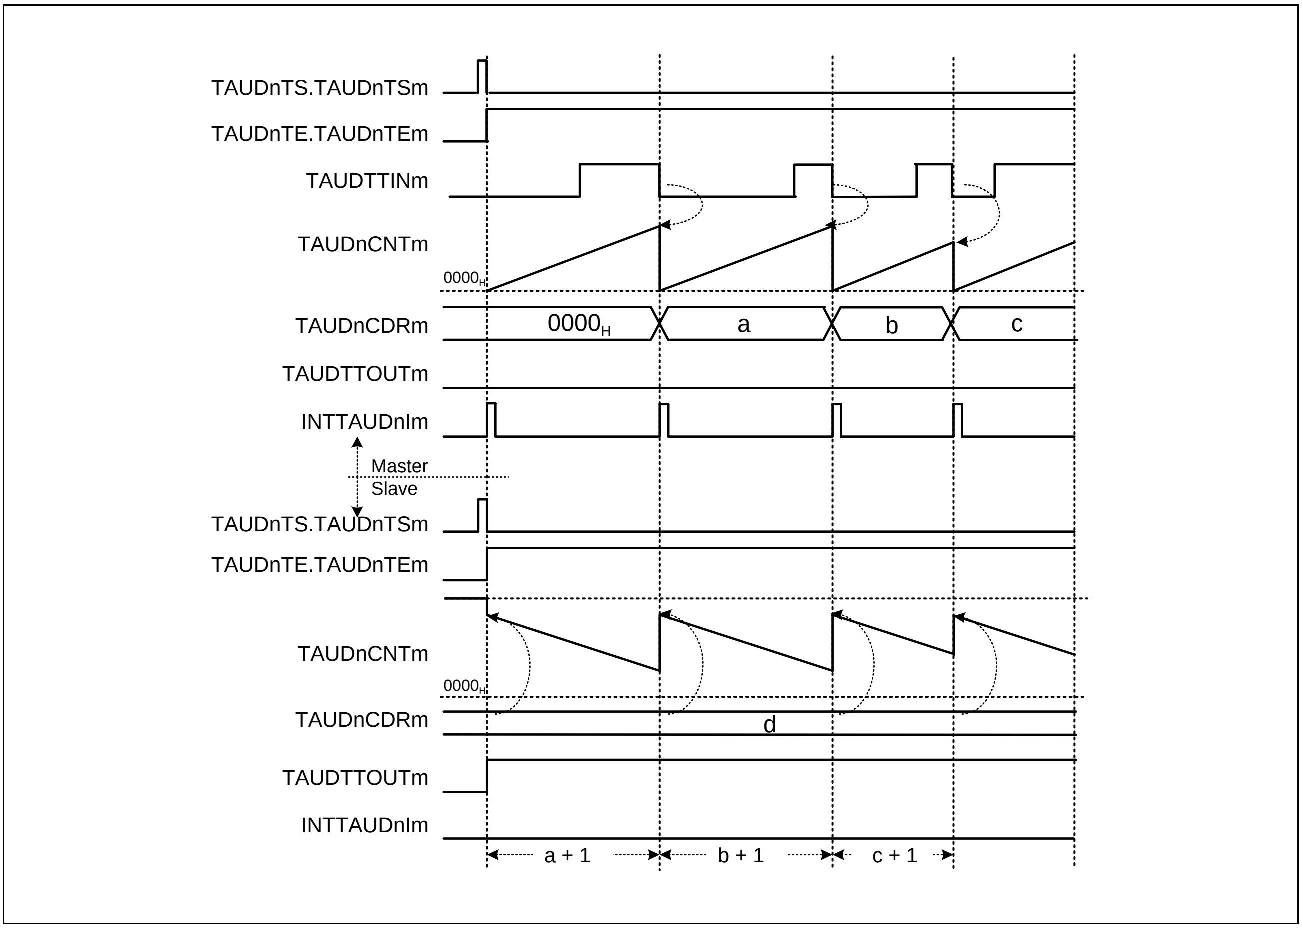

Figure 32.113 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1

- If the value TAUDnCDRm (slave) is higher than the interval of valid input edges, the counter of the slave channel cannot reach 0000_H and cannot generate interrupts. The TAUDTTOUTm remains at active state.

32.15.6 A/D Conversion Trigger Output Function Type 1

32.15.6.1 Overview

Summary

This function is identical to **Section 32.15.1, PWM Output Function**, except that TAUDTTOUTm is not output.

This function is enabled by setting the channel output mode for the slave to independent channel output mode controlled by software.

32.15.6.2 Block Diagram and General Timing Diagram

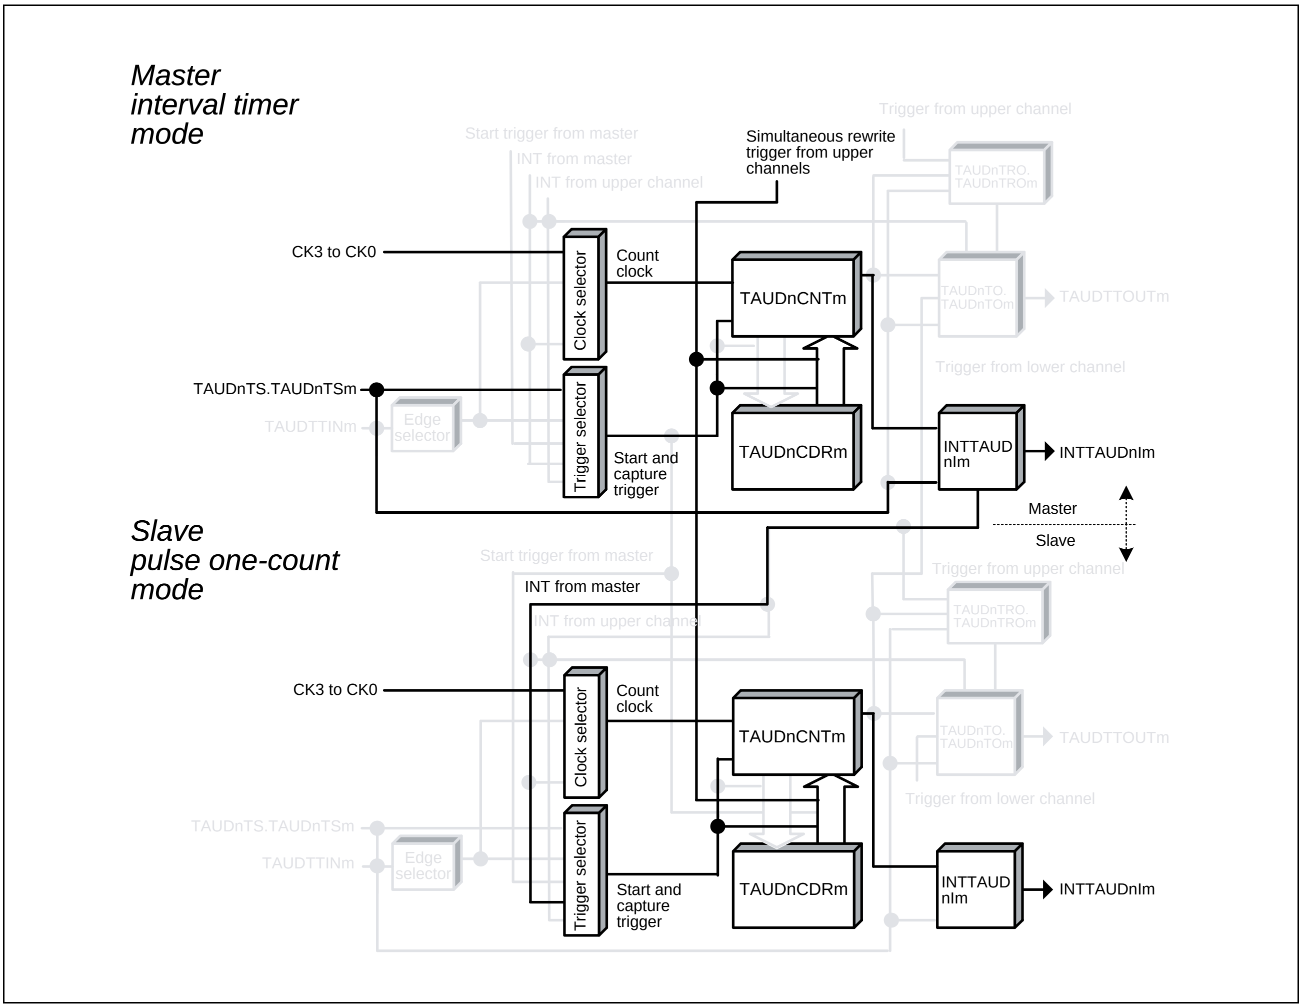

Figure 32.114 Block Diagram of A/D Conversion Trigger Output Function Type 1

The following settings apply to the general timing diagram.

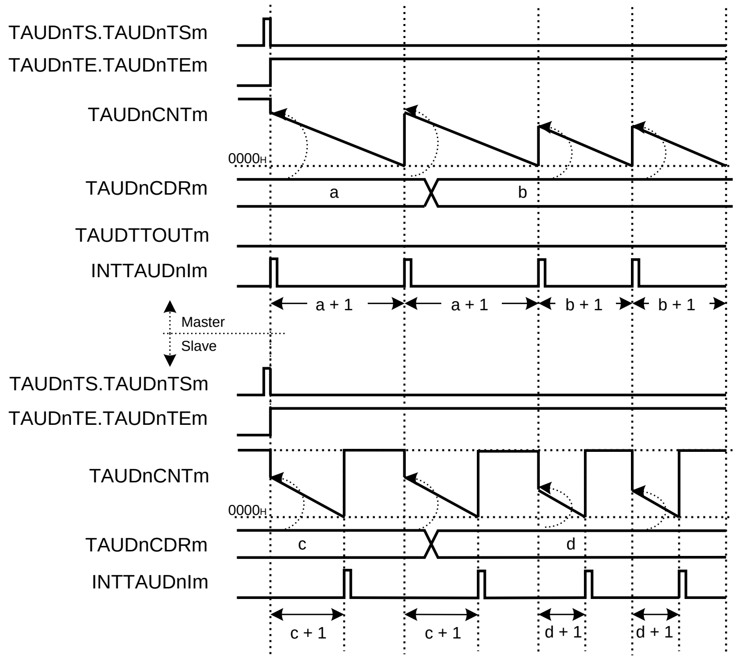

Figure 32.115 General Timing Diagram of A/D Conversion Trigger Output Function Type 1

32.15.7 Triangle PWM Output Function

32.15.7.1 Overview

Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUDTTOUTm to be set using the master and slave channels respectively.

The master channel generates a carrier cycle. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slave counter.

Prerequisites

- Two channels
- The operating mode for the master channels should be set to interval timer mode. (See **Table 32.193, Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function**.)
- The operating mode for slave channels should be set to count-up/-down mode. (See **Table 32.197, Contents of the TAUDnCMORm Register for the Slave Channel of the Triangle PWM Output Function**.)
- The channel output mode for the master channel should be set to independent channel output mode 1. (See **Section 32.7, Channel Output Modes**.)
- The channel output mode for slave channels should be set to synchronous channel output mode 2. (See **Section 32.7, Channel Output Modes**.)
- The following settings allow the TAUDTTOUTm signal to be at high level during the down status of a carrier cycle.
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTOm should be set to 1 while TAUDnTOE.TAUDnTOEm is set to 0 (recommended setting).
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTOm should be set to 0 while TAUDnTOE.TAUDnTOEm is set to 0.

Functional description

The counters are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for every channel. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current values of TAUDnCDRm (master and slave) are loaded into TAUDnCNTm (master and slave) and the counters start counting down from these values. When the TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1, an interrupt is generated and TAUDTTOUTm signal of master toggles.

- Master channel:
  When the counter of master channel reaches 0000_H (pulse cycle time has elapsed), INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and counts down.
- Slave channel:
  If INTTAUDnIm is generated on the master channel, the counter of the slave channel is triggered.
  - If the slave counter is counting down, the count direction changes.
  - If the slave counter is counting up, the TAUDnCDRm value is reloaded and the counter starts to count down.

When the counter of the slave channel reaches 0001_H while counting up or down, INTTAUDnIm is generated and the TAUDTTOUTm (slave) signal is set/reset.
The counter continues count-up/-down and waits for the next INTTAUDnIm of the master channel.

Setting TAUDnTOL.TAUDnTOLm allows TAUDTTOUTm signal switching between normal phase and reverse phase during operation.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

Conditions

This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.

32.15.7.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

Duty cycle 100 [%] =
[(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave))/(TAUDnCDRm (master) + 1)] × 100

- Duty cycle = [%]
  TAUDnCDRm (slave) = 0000_H
- Duty cycle = 0%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

32.15.7.3 Block Diagram and General Timing Diagram

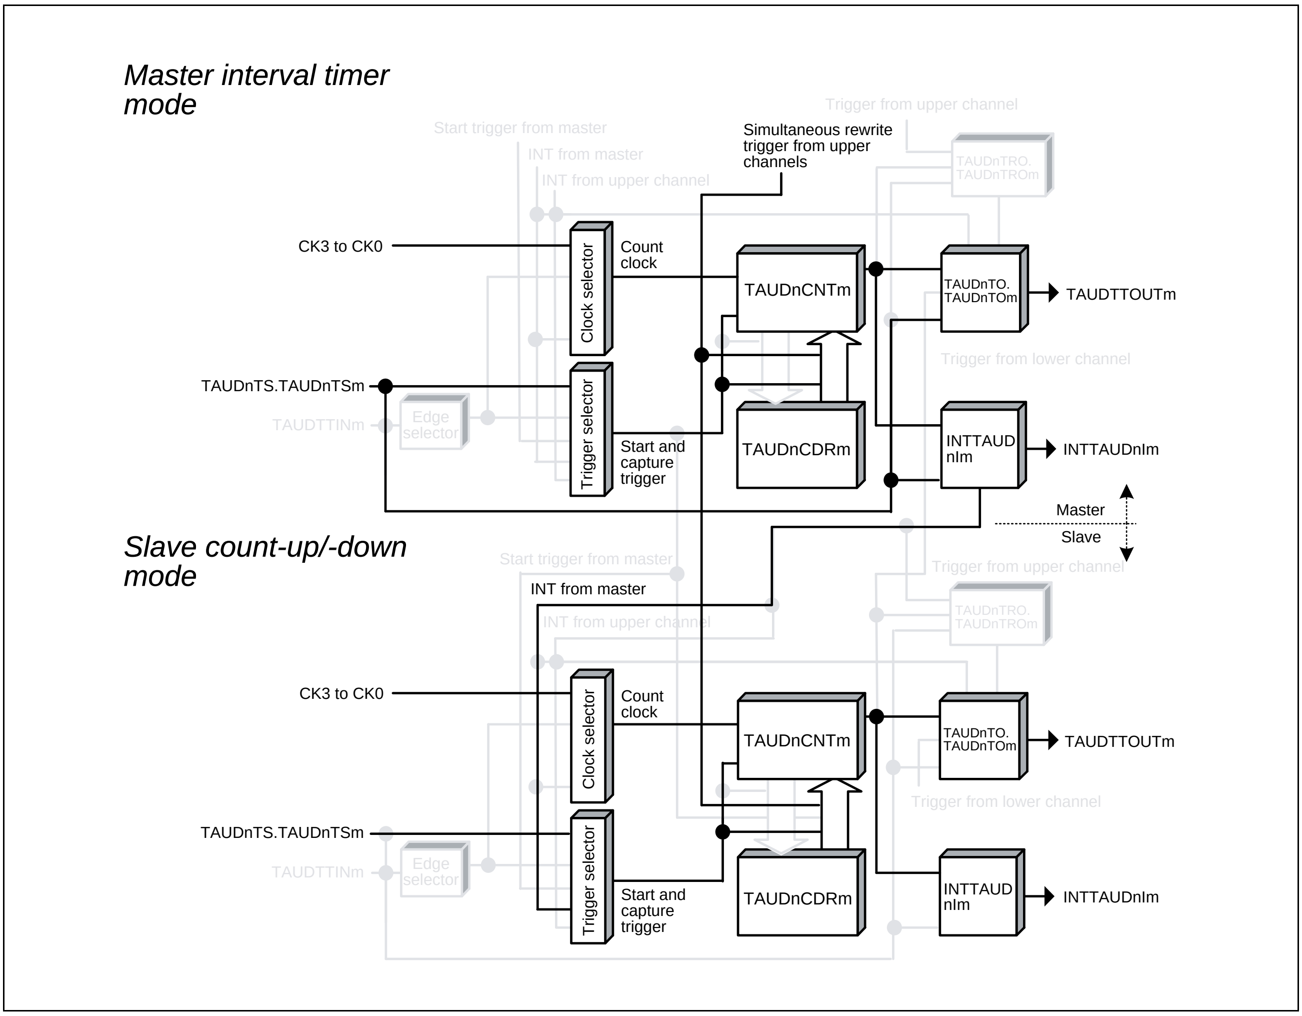

Figure 32.116 Block Diagram of Triangle PWM Output Function

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

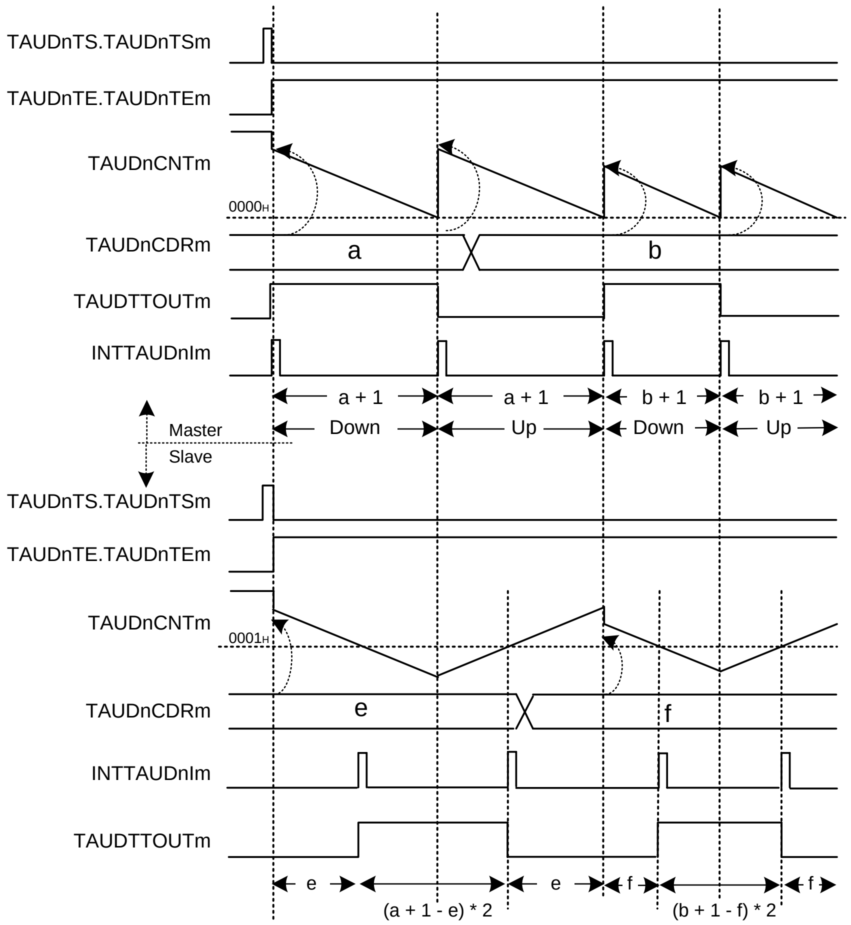

Figure 32.117 General Timing Diagram of Triangle PWM Output Function

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for the Master Channel

Table 32.195 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.196 Simultaneous Rewrite Settings for the Master Channel of Triangle PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

32.15.7.5 Register Settings for Slave Channels

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for Slave Channels

Table 32.199 Control Bit Settings in Synchronous Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for Slave Channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.200 Simultaneous Rewrite Settings for Slave Channels of Triangle PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when the master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

32.15.7.6 Operating Procedure for Triangle PWM Output Function

Table 32.201 Operating Procedure for Triangle PWM Output Function

		Operation	TAUDn Status
	Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.7.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.7.5, Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Restart Operation	Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm (master) is generated on the master channel if TAUDnCMORm.TAUDnMD0 is set to 1.
	During Operation	TAUDnCDRm can be changed at any time. TAUDnTOL.TAUDnTOLm can be changed. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master and slave channels is loaded into TAUDnCNTm to count down. When the counter of master channel reaches 0000_H: ● INTTAUDnIm (master) is generated. ● TAUDTTOUTm (master) is toggled. ● TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation. ● TAUDnCDRm value is reloaded into TAUDnCNTm (slave) or counting is started in opposite direction. When TAUDnCNTm of slave channel reaches 0001_H: ● INTTAUDnIm (slave) is generated. ● TAUDTTOUTm (slave) is set in the count-down status or reset in count-up status.
	Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.15.7.7 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnCDRm = a = 5_H
- Slave channel:
  - TAUDnCDRm = 6_H

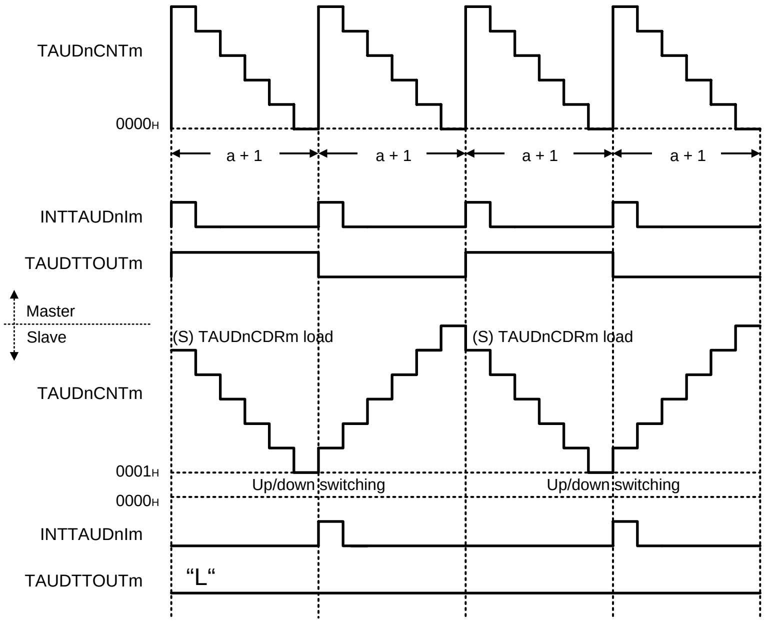

Figure 32.118 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1

- If TAUDnCDRm (slave) value ≥ TAUDnCDRm (master) value +1, INTTAUDnIm of the slave channel is not generated while counting down. TAUDTTOUTm remains low because there is no set signal to be detected.

(2) Duty cycle = 100%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnCDRm = a = 5_H
- Slave channel:
  - TAUDnCDRm = 0_H

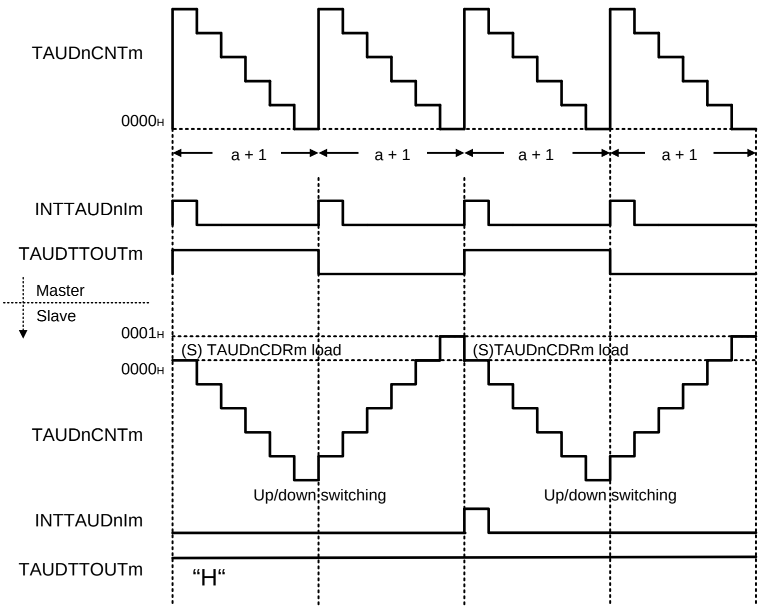

Figure 32.119 TAUDnCDRm (Slave) = 0000_H

- If TAUDnCDRm (slave) = 0000_H, INTTAUDnIm of the slave channel is not generated while counting up. TAUDTTOUTm remains high because there is no reset signal to be detected.

32.15.8 Triangle PWM Output Function with Dead Time

32.15.8.1 Overview

Summary

This function generates multiple triangle PWM outputs with a predefined dead time added by using a master and two or more slave channels. The resulting PWM signals with dead time are output via TAUDTTOUTm of the slave channels 2 and 3, enabling the pulse cycle (frequency) and the duty cycle of TAUDTTOUTm to be set using the master and slave channels.

Carrier cycles are generated on the master channel. The first pulse controls the down status of the slave counter and the second one controls the up status.

An interrupt on slave 2 causes TAUDTTOUTm of slave channels to be set/reset. Depending on the settings of TAUDnTDL.TAUDnTDLm, delay time is added to positive or negative logic side of the signal (i.e., whether TAUDTTOUTm is set/reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

Prerequisites

- Three channels. For slave channels 2 and 3, select even channel CH (a) and odd channel CH (a + 1).
- The operating mode for the master channel should be set to interval timer mode. (See **Table 32.203, Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time**)
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even channel (a), and slave channel 3 is an odd channel (a + 1). Slave channel 1 can be used as a separate timer (independent function).
- The operating mode for slave channel 2 should be set to count-up/-down mode (See **Table 32.207, Contents of the TAUDnCMORm Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time**). Slave channel 2 should be an even channel.
- The operating mode for slave channel 3 should be set to one-count mode (See **Table 32.211, Contents of the TAUDnCMORm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time**). Slave channel 3 should be an odd channel.
- The channel output mode for the master channel should be set to independent channel output mode 1. (See **Section 32.7, Channel Output Modes**)
- The output mode for slave channels 2 and 3 should be set to synchronous channel output mode 2 with dead time output. (See **Section 32.7, Channel Output Modes**)
- The following settings make a TAUDTTOUTm signal at high level during the down status of the carrier cycle:
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTOm should be set to 1 while TAUDnTOE.TAUDnTOEm is set to 0 (recommended setting).
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTOm should be set to 0 while TAUDnTOE.TAUDnTOEm is set to 0.

NOTE

The triangle PWM output function with dead time does not use slave channel 1. Slave channel 1 can be used as a separate timer (independent function).

Functional description

The counter starts by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This makes TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. If TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1, an interrupt is generated and the master's TAUDTTOUTm signal is toggled.

- Master channel:
  When the counter of the master channel reaches 0000_H, an INTTAUDnIm is generated and the TAUDTTOUTm signal is toggled. The TAUDnCDRm value is reloaded to continue counting down.
- Slave channel 2:
  If INTTAUDnIm is generated on the master channel, the counter of slave channel 2 is triggered.
  - If the slave counter is counting down, the counting direction changes.
  - If the slave counter is counting up, the TAUDnCDRm value is reloaded and the counter starts counting down.

The counter continues to count down/up and waits for the next INTTAUDnIm of the master channel.
When the counter value of slave channel 2 reaches 0001_H, INTTAUDnIm is generated

- Slave channel 3:
  If INTTAUDnIm is generated on slave channel 2, the counter of slave channel 3 is triggered. The current value of TAUDnCDRm (slave 3) is loaded into TAUDnCNTm (slave 3) and the counter starts to count down from the TAUDnCDRm value.
  When the counter reaches 0000_H, INTTAUDnIm occurs. The counter returns to $FFFF_H$ and waits for the next INTTAUDnIm of slave channel 2.

As described in **Table 32.202, Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2**, the set/reset timing (right after occurrence of an interrupt or after dead time has elapsed) depends on the TAUDnTDL.TAUDnTDLm setting of the corresponding channel.

The setting of TAUDnTOL.TAUDnTOLm also determines whether a high level signal (TAUDnTOL.TAUDnTOLm = 0) or a low level signal (TAUDnTOL.TAUDnTOLm = 1) is output from the corresponding channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

TAUDTTOUTm can be 100% output by setting the TAUDnCDRm value of slave channel 2 to 0000_H.

Conditions

This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.

TAUDnTOL.TAUDnTOLm and TAUDnTDL.TAUDnTDLm should be set before start of count operation. Slave channels 2 and 3 should have the opposite settings of TAUDnTDL.TAUDnTDLm.

Table 32.202 Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2

TAUDnTDL. TAUDnTDLm	Count Direction of Slave Channel 2 upon Occurrence of Interrupt	TAUDTTOUTm Set/Reset Timing
0	Down	Set after elapse of dead time
	Up	Reset right after interrupt occurs
1	Down	Set right after interrupt occurs
	Up	Reset after elapse of dead time

32.15.8.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

PWM signal width (normal phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2)) × 2 – (TAUDnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (reverse phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2)) × 2 + (TAUDnCDRm (slave 3) + 1)] × count clock cycle

32.15.8.3 Block Diagram and General Timing Diagram

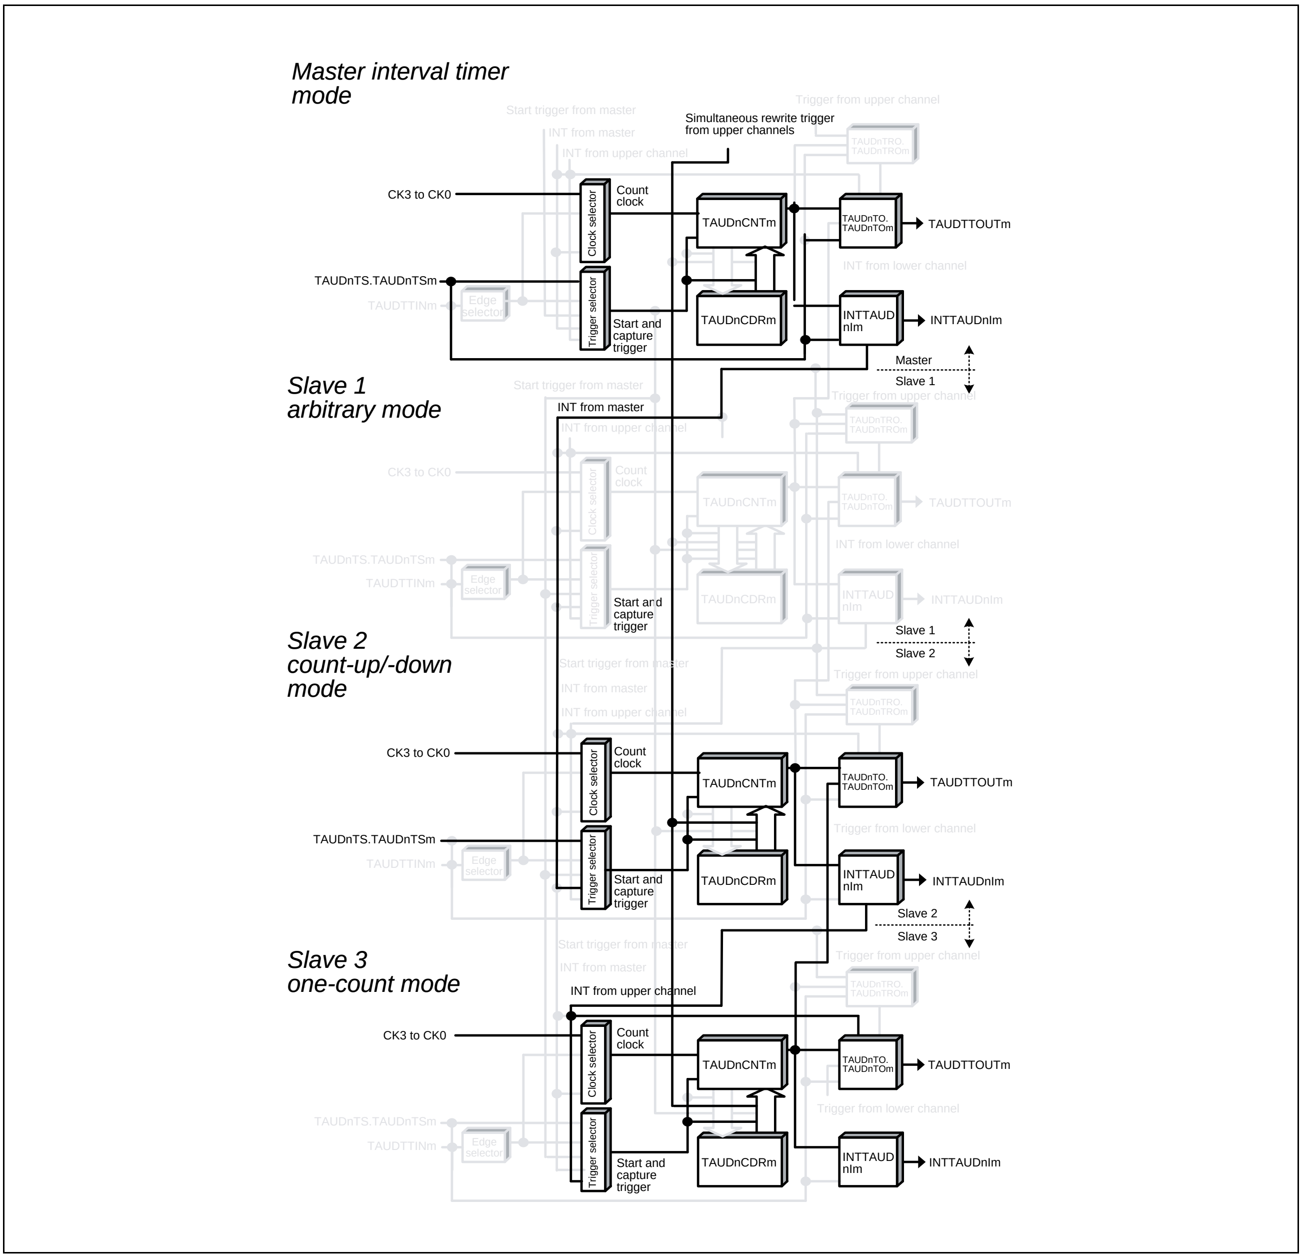

Figure 32.120 Block Diagram of Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Slave channel 2:
  - INTTAUDnIm not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
  - TAUDnTDL.TAUDnTDLm = 0
  - Positive logic (TAUDnTOL.TAUDnTOLm = 0)

- Slave channel 3:
  - Enables start trigger detection during counting (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnTDL.TAUDnTDLm = 1
  - Positive logic (TAUDnTOL.TAUDnTOLm = 0)

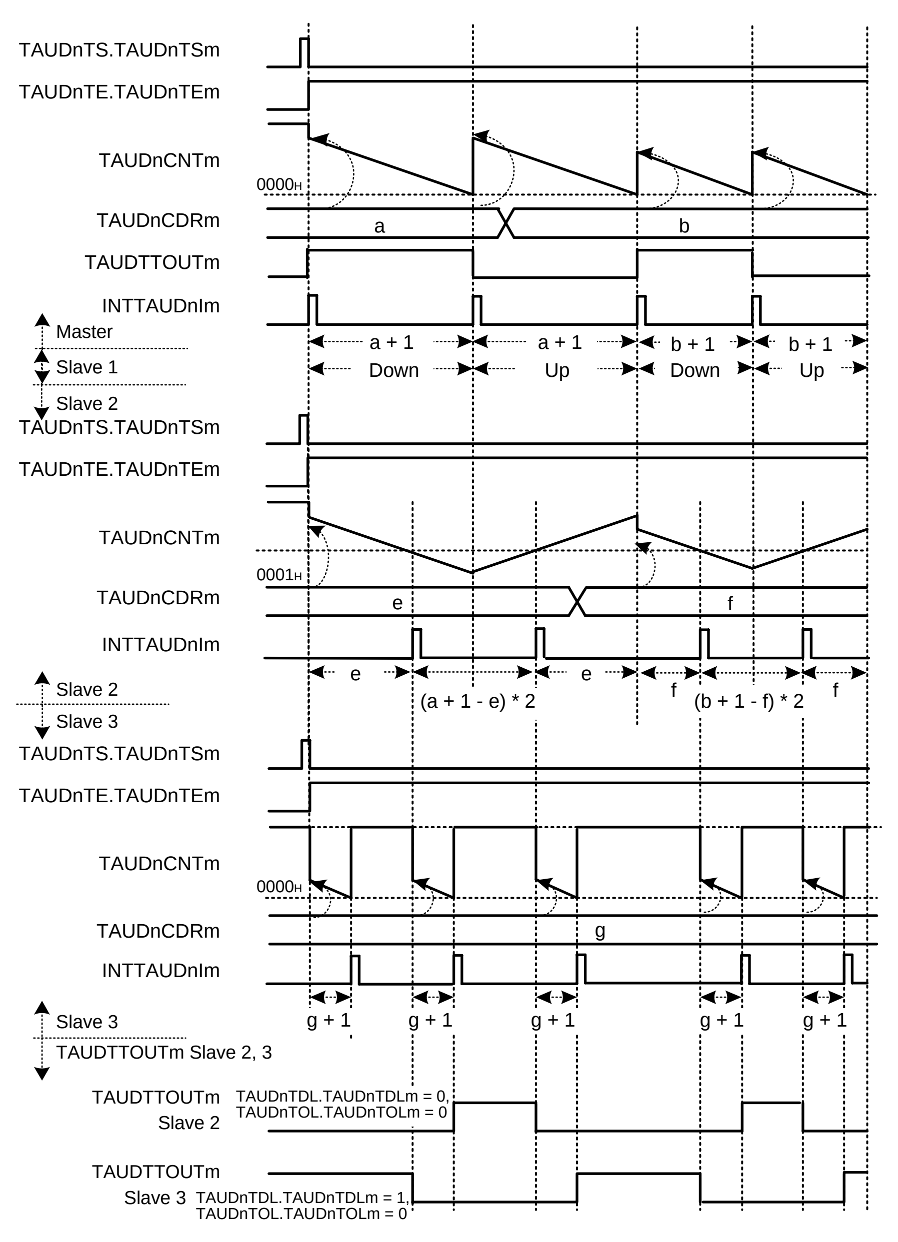

Figure 32.121 General Timing Diagram of Triangle PWM Output Function with Dead Time

32.15.8.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.203 Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated and TAUDTTOUTm is not toggled at the beginning of operation. 1: INTTAUDnIm is generated and TAUDTTOUTm is toggled at the beginning of operation.

(2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.204 Contents of the TAUDnCMURm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for the Master Channel

Table 32.205 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.206 Simultaneous Rewrite Setting for the Master Channel of Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

32.15.8.5 Register Settings for Slave Channel 2

(1) TAUDnCMORm for Slave Channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.207 Contents of the TAUDnCMORm Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	111: Up/down output trigger signal of master channel
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1001: Count-up/-down mode
0	TAUDnMD0	0: INTTAUDnIm not generated at the beginning of operation.

(2) TAUDnCMURm for Slave Channel 2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.208 Contents of the TAUDnCMURm Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for Slave Channel 2

Table 32.209 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from odd channels.

(4) Simultaneous Rewrite for Slave Channel 2

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.210 Simultaneous Rewrite Settings for Slave Channel 2 of Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

32.15.8.6 Register Settings for Slave Channel 3

(1) TAUDnCMORm for Slave Channel 3

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.211 Contents of the TAUDnCMORm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	110: Dead time output signal of the TAUDTTOUTm generation unit
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

(2) TAUDnCMURm for Slave Channel 3

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.212 Contents of the TAUDnCMURm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for Slave Channel 3

Table 32.213 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from even channels.

(4) Simultaneous Rewrite for Slave Channel 3

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.214 Simultaneous Rewrite Settings for Slave Channel 3 of Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

32.15.8.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 32.215 Operating Procedure for Triangle PWM Output Function with Dead Time

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.8.4, Register Settings for the Master Channel**. Slave channel 2: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.8.5, Register Settings for Slave Channel 2**. Slave channel 3: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.8.6, Register Settings for Slave Channel 3**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm (master) is generated on the master channel if TAUDnCMORm.TAUDnMD0 is set to 1.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel and slave channel 2 is loaded into TAUDnCNTm to perform counting down. When the counter of master channel reaches 0000_H: ● INTTAUDnIm (master) is generated. ● TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation. ● TAUDnCDRm value is reloaded into TAUDnCNTm (slave 2) or counting is started in opposite direction. When TAUDnCNTm of slave channel 2 reaches 0001_H: ● INTTAUDnIm (slave 2) is generated. ● TAUDnCDRm value of slave channel 3 is loaded into TAUDnCNTm perform counting down. When TAUDnCNTm of slave channel 3 reaches 0000_H: ● INTTAUDnIm is generated.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.15.8.8 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to the general timing diagram in **Figure 32.122, TAUDnCDRm (Slave 2) ≥ TAUDnCDRm (Master) + 1**.

- Slave channel 2:
  - Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
  - Negative logic (TAUDnTDL.TAUDnTDLm = 1)

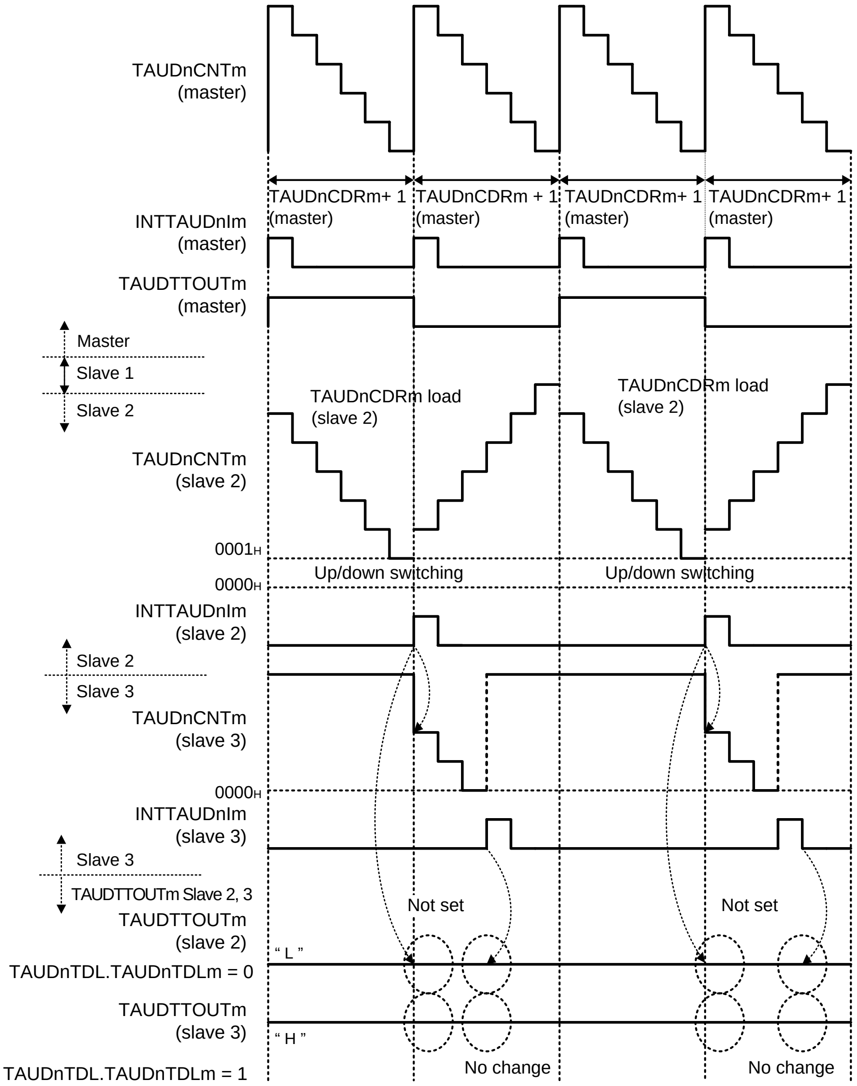

Figure 32.122 TAUDnCDRm (Slave 2) ≥ TAUDnCDRm (Master) + 1

- If TAUDnCDRm (slave 2) is greater than TAUDnCDRm (master), the counter of slave channel does not reach 0000_H while counting down. Therefore, TAUDTTOUTm signal is not set/reset and remains in the initial state. This signal becomes a reset signal because an interrupt occurs on slave channel 2 during count-up operation.

(2) Duty cycle = 100%

The following settings apply to the general timing diagram in **Figure 32.123, TAUDnCDRm (Slave) = 0000H**.

- Slave channel 2:
  - Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
  - Negative logic (TAUDnTDL.TAUDnTDLm = 1)

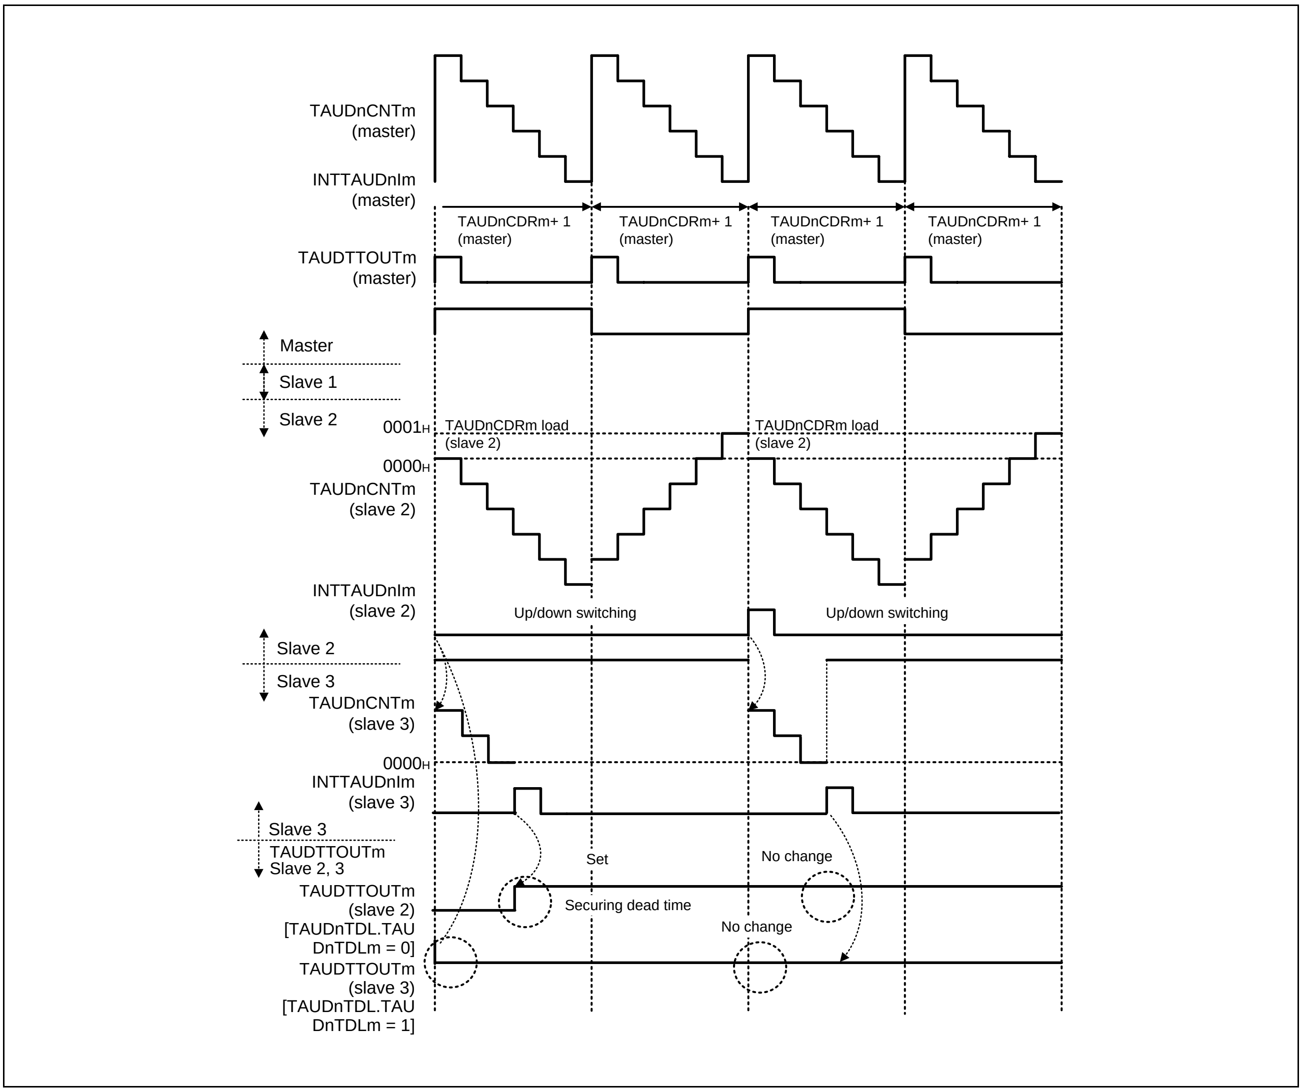

Figure 32.123 TAUDnCDRm (Slave) = 0000_H

- If TAUDnCDRm (slave 2) = 0000_H, the slave channel counter does not reach 0001_H while counting up. Therefore, no INTTAUDnIm is generated during count-up operation.
  - The set conditions for a channel with TAUDnTDL.TAUDnTDLm = 0 are met after elapse of dead time. TAUDTTOUTm is left in a newly set state even if a set/reset is made because no reset conditions are satisfied on such a channel.
  - Slave channel 3 in the above diagram is set when the counter starts. However, TAUDTTOUTm is left in an initial state on the slave channel with TAUDnTDL.TAUDnTDLm = 1 because no reset conditions are satisfied on that channel.

32.15.9 A/D Conversion Trigger Output Function Type 2

32.15.9.1 Overview

Summary

This function is identical to **Section 32.15.7, Triangle PWM Output Function**, except that TAUDTTOUTm is not output.

This function is enabled by setting channel output mode for the slave to independent channel output mode controlled by software.

32.15.9.2 Block Diagram and General Timing Diagram

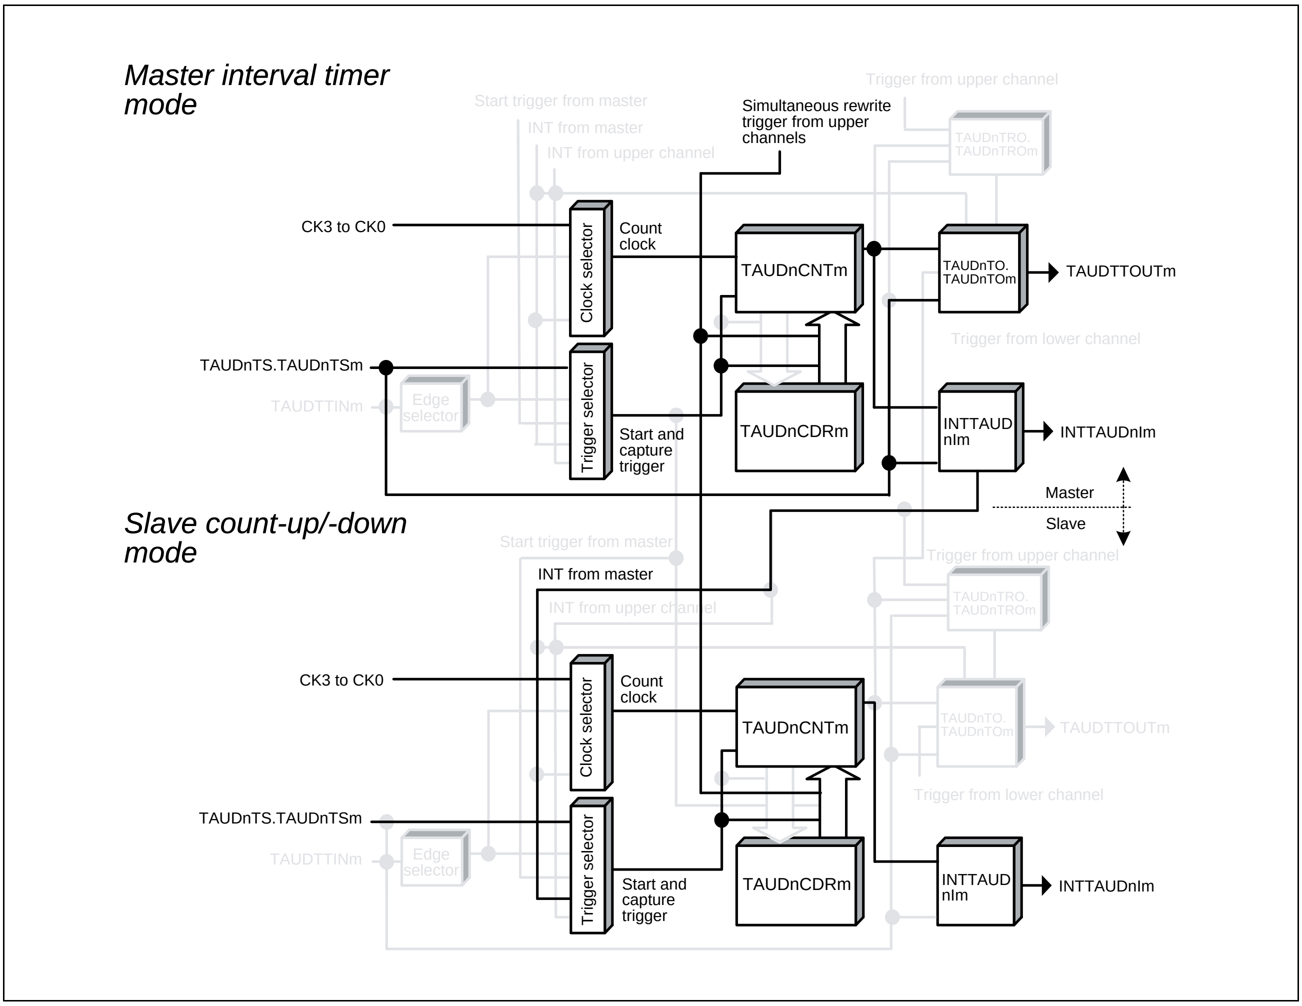

Figure 32.124 Block Diagram of A/D Conversion Trigger Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

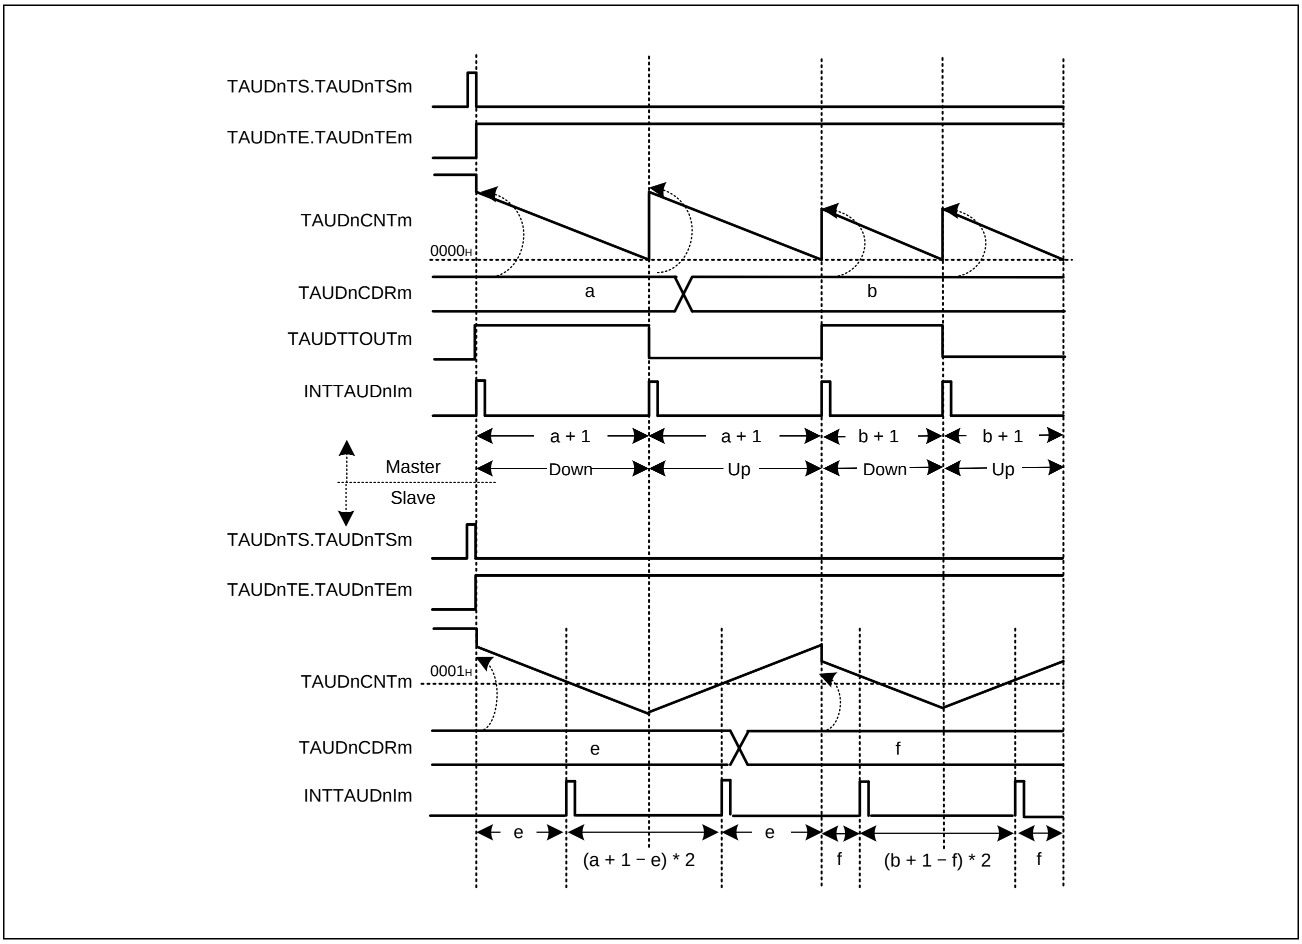

Figure 32.125 General Timing Diagram of A/D Conversion Trigger Output Function Type 2

32.15.10 Interrupt Request Signals Culling Function

32.15.10.1 Overview

Summary

This function divides the number of interrupts of the master channel by a specified value using a slave channel.

The interrupt request signals culling function is a sub function of the following functions:

- PWM Output Function (See **Section 32.15.1, PWM Output Function**)
- Triangle PWM Output Function (See **Section 32.15.7, Triangle PWM Output Function**)
- Triangle PWM Output Function with Dead Time (See **Section 32.15.8, Triangle PWM Output Function with Dead Time**)

Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode. (See **Table 32.216, Contents of the TAUDnCMORm Register for the Master Channel of the Interrupt Request Signals Culling Function**)
- The operation mode of the slave channel must be set to Event Count Mode. (See **Table 32.219, Contents of the TAUDnCMORm Register for the Slave Channel of the Interrupt Request Signals Culling Function**)
- This function does not use TAUDTTOUTm.

Functional description

The counters (master and slave) are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for both channels. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current value of the data register of the master channel and slave channel (TAUDnCDRm) are written to the counter (TAUDnCNTm).

- Master channel:
  When the counter of the master channel reaches 0000_H, INTTAUDnIm is generated and TAUDnCDRm value is reloaded to TAUDnCNTm.
- Slave channel:
  Every time the master channel generates an INTTAUDnIm, the counter of the slave channel decrements by one. When the counter reaches 0000_H, it awaits the next interrupt from the master channel. This causes TAUDnCNTm (slave) to reload the value of TAUDnCDRm, and an INTTAUDnIm is generated.

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channels, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm of master and slave channels stops but retains its value.

Conditions

This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.

32.15.10.2 Equations

Interrupt division operator = TAUDnCDRm (slave channel)

- One INTTAUDnIm is generated for the INTTAUDnIm count of the master channel defined by TAUDnCDRm (slave channel) + 1.

32.15.10.3 Block Diagram and General Timing Diagram

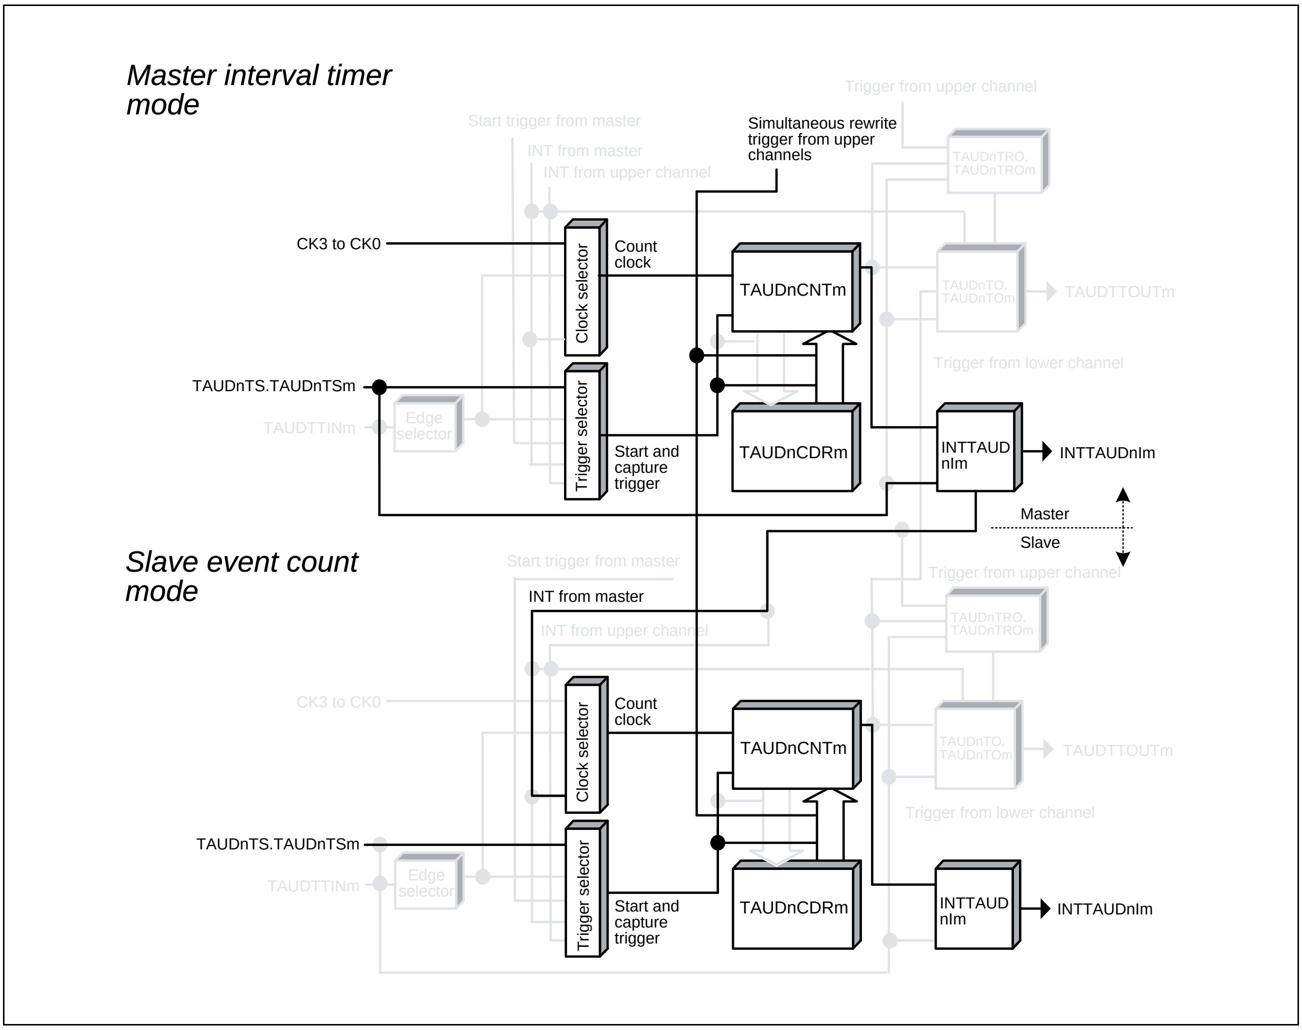

Figure 32.126 Block Diagram of Interrupt Request Signals Culling Function

The following settings apply to the general timing diagram.

Master channel:

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

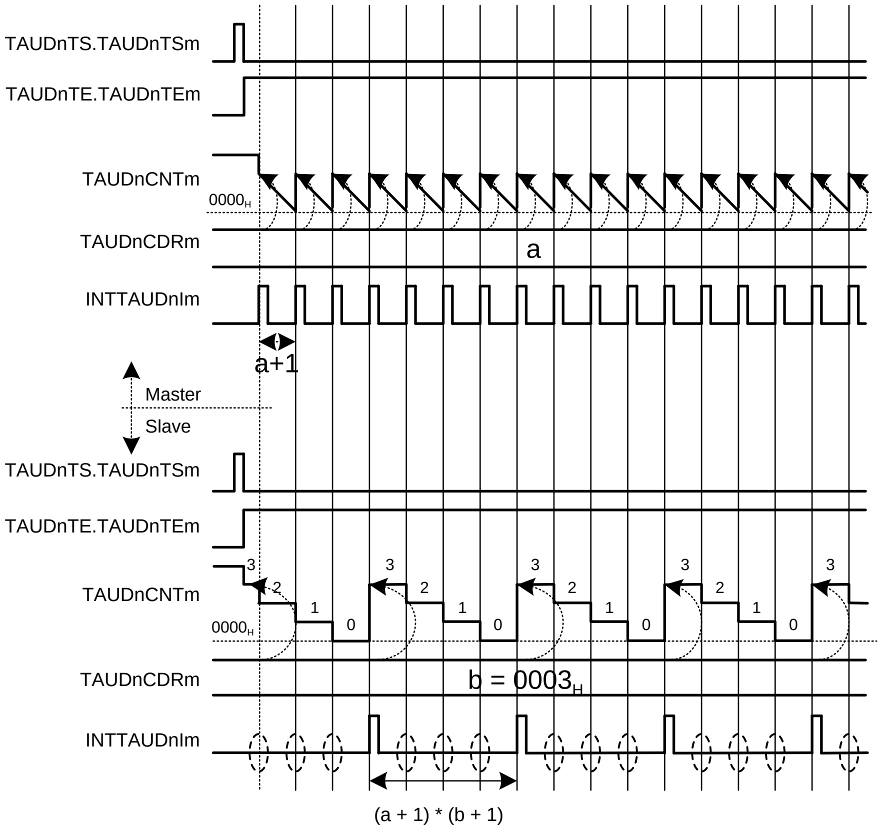

Figure 32.127 General Timing Diagram of Interrupt Request Signals Culling Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for the Slave Channel

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous Rewrite for the Slave Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.221 Simultaneous Rewrite Settings for the Slave Channel of Interrupt Request Signals Culling Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

32.15.10.6 Operating Procedure for Interrupt Request Signals Culling Function

Table 32.222 Operating Procedure for Interrupt Request Signals Culling Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.10.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.15.10.5, Register Settings for the Slave Channel**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000_H: • INTTAUDnIm (master) is generated. • TAUDnCNTm (master) loads TAUDnCDRm value and continues count operation. • TAUDnCNTm of slave channels counts down each time INTTAUDnIm of master channel is detected. When TAUDnCNTm of the slave = 0000_H: • INTTAUDnIm (slave) is generated. • The TAUDnCDRm value is loaded in TAUDnCNTm (slave) and count operation continues.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

32.15.10.7 Specific Timing Diagrams

(1) Interrupt count (master) = interrupt count (slave)

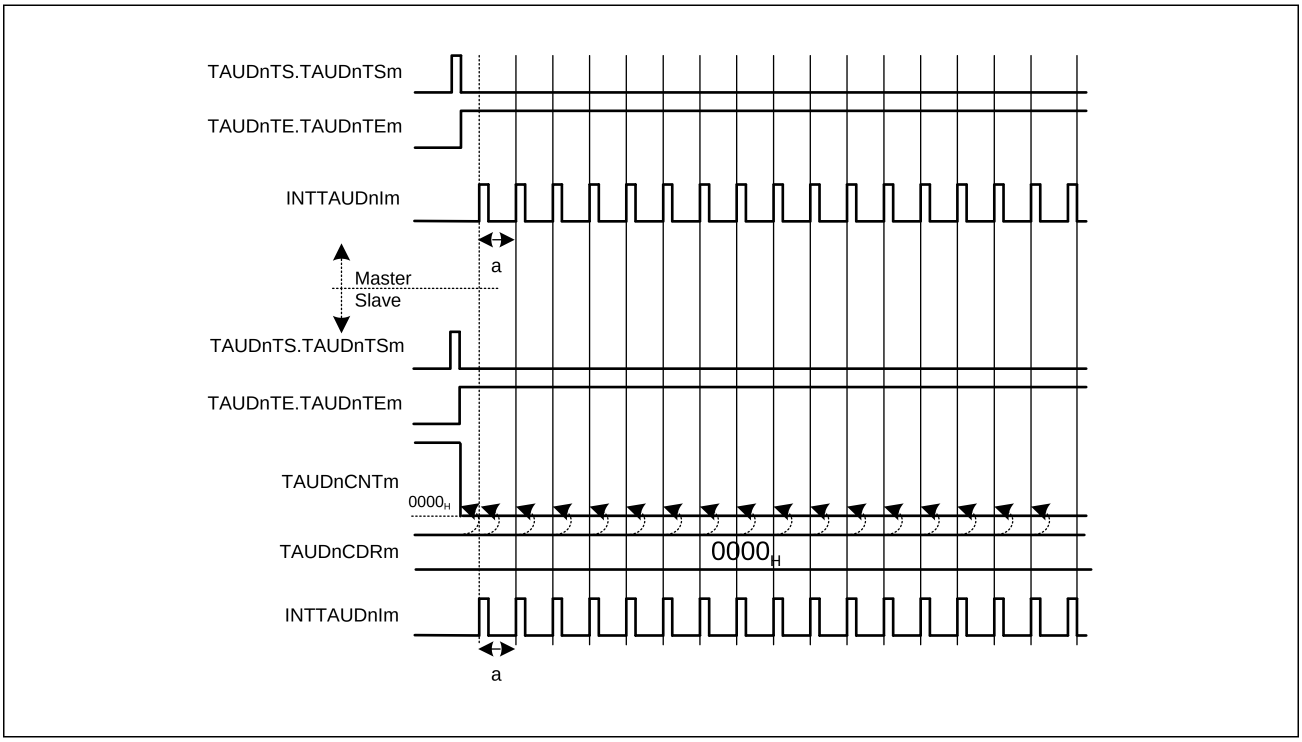

Figure 32.128 TAUDnCDRm (Slave) = 0000_H

- If TAUDnCDRm = 0000_H, the TAUDnCDRm value of the slave channel is loaded into TAUDnCNTm each time INTTAUDnIm of master channel is detected. In other words, TAUDnCNTm is always 0000_H.
- Therefore, an interrupt occurs on the master channel and simultaneously an interrupt occurs on slave channels.

32.16 Synchronous Non-Complementary and Complementary Modulation Output Functions

This section describes functions that generate 6-phase PWM output or triangle PWM output using a master channel and seven slave channels.

32.16.1 Non-Complementary Modulation Output Function Type 1

32.16.1.1 Overview

Summary

This function outputs a PWM signal, a high-level signal, or a low-level signal from TAUDTTOUTm depending on the values of the real-time output bits (TAUDnTRO.TAUDnTROm) and the modulation output enable bits (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See **Table 32.224, Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1**).
- The operating mode for slave channels 1 to 7 should be set to one-count mode (See **Table 32.227, Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1**, and **Table 32.230, Contents of the TAUDnCMORm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1**).
- TAUDTTOUTm is not used with the master channel of this function.
- TAUDTTOUTm of slave channel 1 is not used with this function, but TAUDnTRC.TAUDnTRCm should be set to 1 (See **Section 32.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 1 with non-complementary modulation output (See **Section 32.7, Channel Output Modes**).
- TAUDnCDRm of slave channel 1 should be set to 0000_H.

Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down. When the counter reaches 0000_H, INTTAUDnIm is generated.

- Slave channel 1:
  Slave channel 1 is set as a channel that triggers real-time output (TAUDnTRC.TAUDnTRCm = 1). If an interrupt occurs on slave channel 1 (TAUDnCDRm is fixed to 0000_H), the value of real-time output bit (TAUDnTRO.TAUDnTROm) of the channel that monitors the interrupt on slave channel 1 is reflected to the TAUDTTOUTm output. After that, the counter returns to $FFFF_H$ and waits for the next interrupt of master channel.
- Slave channel 2:
  Slave channel 2 generates a PWM output. The master channel specifies a PWM output cycle and slave channel 2 specifies a duty cycle. After generating an interrupt, the counter returns to $FFFF_H$ and awaits the next interrupt from the master channel.

Slave channels 3 to 7 operate like slave channel 2.

As described in **Table 32.223, TAUDTTOUTm Output of Slave Channels for Non-Complementary Modulation Output Function Type 1 (TAUDnTOL.TAUDnTOLm = 0)**, a signal output from TAUDTTOUTm depends on the value of the real-time output bit (TAUDnTRO.TAUDnTROm) and modulation output bit (TAUDnTME.TAUDnTMEm) of slave channel.

This function cannot use a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

- If TAUDnTME.TAUDnTMEm = 0 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel’s TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
  - If the channel’s TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm = 1 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel’s TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM (positive logic) corresponding to the channel.
  - If the channel’s TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

Table 32.223 TAUDTTOUTm Output of Slave Channels for Non-Complementary Modulation Output Function Type 1 (TAUDnTOL.TAUDnTOLm = 0)

TAUDnTME.TAUDnTMEm	TAUDnTRO.TAUDnTROm	TAUDTTOUTm Output
0	0	Low level
	1	High level
1	0	Low level
	1	PWM (positive logic)

- This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.
- TAUDnCDRm value of slave channel 1 should be set to 0000_H so that a real-time output is triggered at the same time with PWM generation on slave channels 2 to 7.
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.

32.16.1.2 Equations

Slave channels 2 to 7:

Pulse period = [TAUDnCDRm (master) + 1] × count clock cycle

Duty time = [TAUDnCDRm (slave)] × count clock cycle

32.16.1.3 Block Diagram and General Timing Diagram

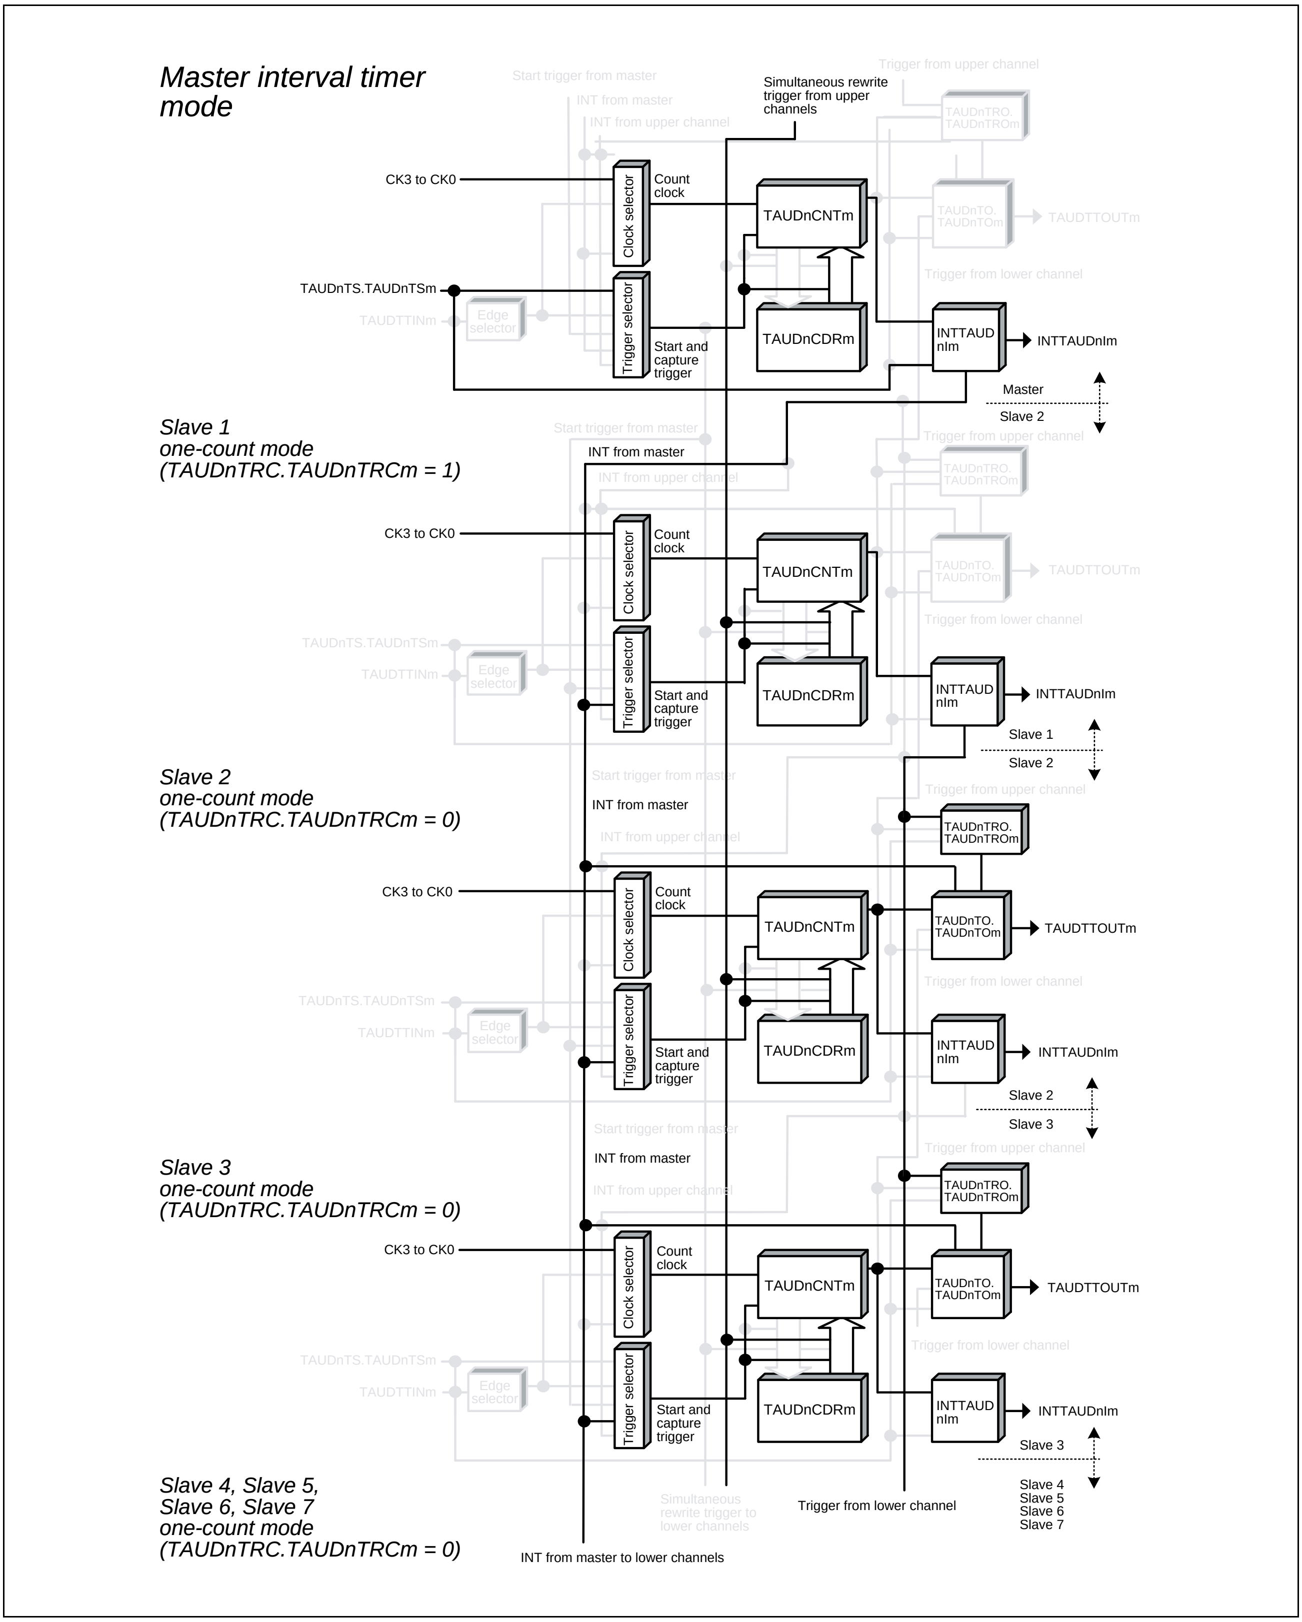

Figure 32.129 Block Diagram of Non-Complementary Modulation Output Function Type 1

The following settings apply to the general timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

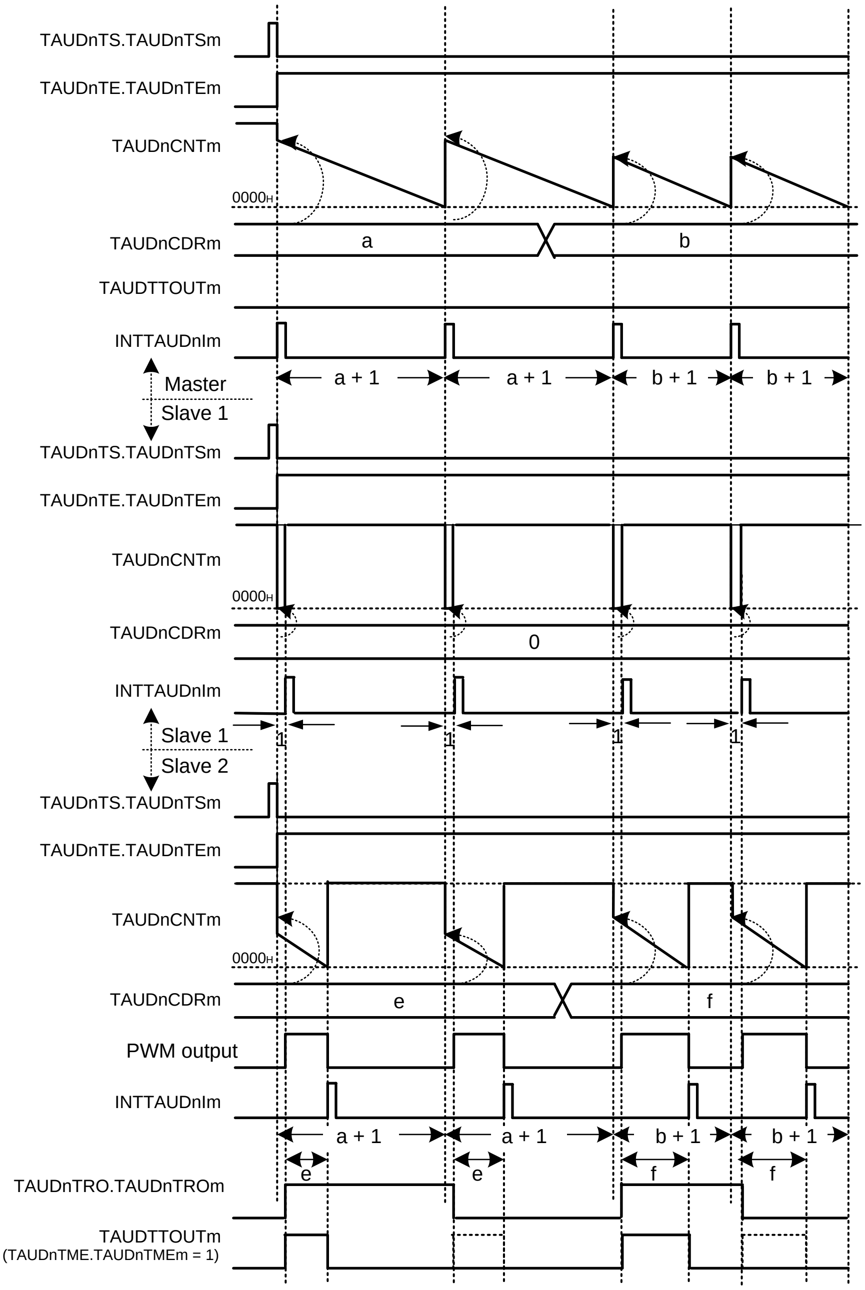

Figure 32.130 General Timing Diagram of Non-Complementary Modulation Output Function Type 1

NOTE

TAUDTTOUTm of slave channel 2 rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

32.16.1.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.224 Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	1: INTTAUDnIm is generated at the beginning of operation or at a restart time.

(2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.225 Contents of the TAUDnCMURm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for the Master Channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

(4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.226 Simultaneous Rewrite Settings for the Master Channel of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

NOTE

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires an upper channel higher than the master channel that operates with **Section 32.14.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Conduct operation settings under the following conditions.

- Simultaneous rewrite trigger output function type 1 setting channel: TAUDnRDCm = 1, TAUDnRDSm = 1
  In addition, TAUDnCDRm settings for this channel are as follows.
  = ((TAUDnCDR setting for the master channel targeted for simultaneous rewrite + 1) × Interrupt count) – 1
- Master channel: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channel: TAUDnRDCm = 0, TAUDnRDSm = 1

32.16.1.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for Slave Channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.227 Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is valid.

(2) TAUDnCMURm for Slave Channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.228 Contents of the TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

(4) Simultaneous Rewrite for Slave Channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.229 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

32.16.1.6 Register Settings for Slave Channels 2 to 7

(1) TAUDnCMORm for Slave Channels 2 to 7

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is valid.

(2) TAUDnCMURm for Slave Channels 2 to 7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.231 Contents of the TAUDnCMURm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for Slave Channels 2 to 7

Table 32.232 Control Bit Settings in Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

(4) Simultaneous Rewrite of Slave Channels 2 to 7

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.233 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

32.16.1.7 Operating Procedure for Non-Complementary Modulation Output Function Type 1

Table 32.234 Operating Procedure for Non-Complementary Modulation Output Function Type 1

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.16.1.4, Register Settings for the Master Channel**. Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.16.1.5, Register Settings for Slave Channel 1**. Slave channels 2 to 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.16.1.6, Register Settings for Slave Channels 2 to 7**. Set the value of TAUDnCDRm register of every channel. Set a pulse cycle with TAUDnCDRm of master channel, 0000_H in TAUDnCDRm of slave channel 1, and duty width with TAUDnCDRm of slave channels 2 to 7. Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.	Channel operation is stopped.

Table 32.234 Operating Procedure for Non-Complementary Modulation Output Function Type 1

Restart Operation

	Operation	TAUDn Status
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down.
During Operation	TAUDnCDRm, TAUDnTRO.TAUDnTROm, and TAUDnTMEm.TAUDnTMEm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel, slave channel 1 and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. When the counter of master channel reaches 0000_H: ● INTTAUDnIm is generated. ● TAUDnCDRm value of master channel is reloaded into TAUDnCNTm to continue counting down. ● PWM output signals of slave channels 2 to 7 are set. ● TAUDnCDRm value of slave channel 1 is reloaded into TAUDnCNTm to perform counting down. ● TAUDnCDRm value of slave channels 2 to 7 is reloaded into TAUDnCNTm to perform counting down. ● When the counter of slave channel 1 reaches 0000_H: – INTTAUDnIm is generated. – The TAUDnTRO.TAUDnTROm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output. ● When the counter of slave channels 2 to 7 reaches 0000_H: – INTTAUDnIm is generated. – PWM output signals of slave channels 2 to 7 are set. TAUDTTOUTm of slave channels 2 to 7 outputs a PWM signal, a high-level signal or low-level signal depending on the values of real-time output bits (TAUDnTRO.TAUDnTROm) and modulation output bit (TAUDnTME.TAUDnTMEm) of a pair of slave channels.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.16.1.8 Specific Timing Diagrams

The following settings apply to the specific timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

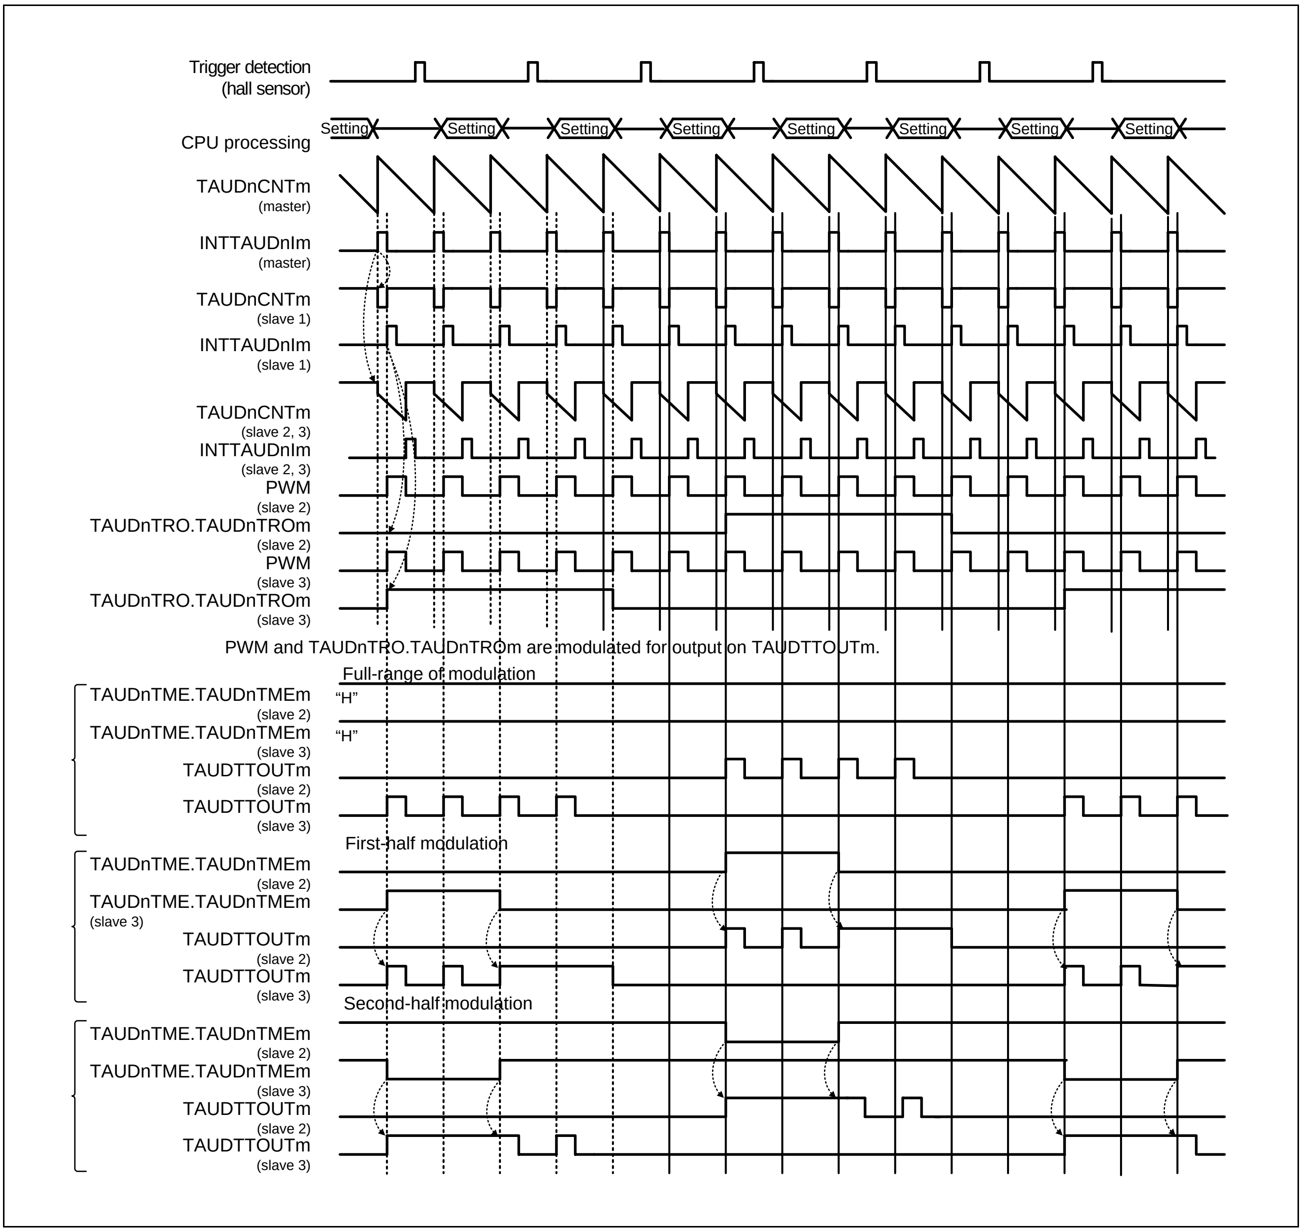

Figure 32.131 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 1

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The "Setting" symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and master channel cycle. According to the modified setting, modulation waveforms are output from TAUDTTOUTm.

A TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

32.16.2 Non-Complementary Modulation Output Function Type 2

32.16.2.1 Overview

Summary

This function outputs a triangular PWM output signal, a high-level signal, or low-level signal from TAUDTTOUTm depending on the real-time output bit value (TAUDnTRO.TAUDnTROm) and the modulation output enable bit value (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See **Table 32.236, Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 2**).
- The operating mode for slave channel 1 should be set to event count mode (See **Table 32.240, Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2**).
- The operating mode for slave channels 2 to 7 should be set to count-up/-down mode (See **Table 32.243, Contents of the TAUDnCMORm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2**).
- The output mode for the master channel should be set to independent channel output mode 1. (See **Section 32.7, Channel Output Modes**.)
- This function does not use TAUDTTOUTm of slave channel 1 but TAUDnTRC.TAUDnTRCm should be set to 1 (See **Section 32.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with non-complementary modulation output (See **Section 32.7, Channel Output Modes**).

Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm).

- Master channel:
  The counter of master channel starts to count down. When the counter reaches 0000_H, INTTAUDnIm is generated.
- Slave channel 1:
  When slave channel 1 detects an interrupt from the master channel, the TAUDnCNTm value is decremented. When an interrupt from the master channel is detected (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, the TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.
  Since slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm = 1), if an interrupt occurs on slave channel 1, the real-time output bit (TAUDnTRO.TAUDnTROm) of the channel which monitors an interrupt on the corresponding channel is reflected to the TAUDTTOUTm output.
- Slave channel 2:
  Once detecting an interrupt from the master channel, TAUDnCNTm counts in the reverse direction. When an interrupt is detected during count-up operation, TAUDnCDRm value is reloaded and then the counter starts to count down.
  If TAUDnCNTm = 0001_H, an interrupt occurs and a PWM output signal is set/reset.

The combined use of the master channel and slave channel 2 generates a PWM output signal. The master channel generates a PWM output cycle and slave channel 2 generate a duty cycle.

Slave channels 3 to 7 operate like slave channel 2.

A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROm) and a modulation output bit value (TAUDnTME.TAUDnTMEm) of the slave channel, as described in **Table 32.235, TAUDTTOUTm Output of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0)**.

This function cannot make a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

- If TAUDnTME.TAUDnTMEm = 0 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel’s TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
  - If the channel’s TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm = 1 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel’s TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM (positive logic) corresponding to the channel.
  - If the channel’s TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

Table 32.235 TAUDTTOUTm Output of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0)

TAUDnTME.TAUDnTMEm	TAUDnTRO.TAUDnTROm	TAUDTTOUTm Output
0	0	Low level
	1	High level
1	0	Low level
	1	PWM (positive logic)

- This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.

32.16.2.2 Equations

Slave channels 2 to 7:

Carrier cycle (down/up) = [TAUDnCDRm (master) + 1] × 2 × count clock cycle

Duty time = [TAUDnCDRm (master) + 1 - TAUDnCDRm (slave)] × 2 × count clock cycle

32.16.2.3 Block Diagram and General Timing Diagram

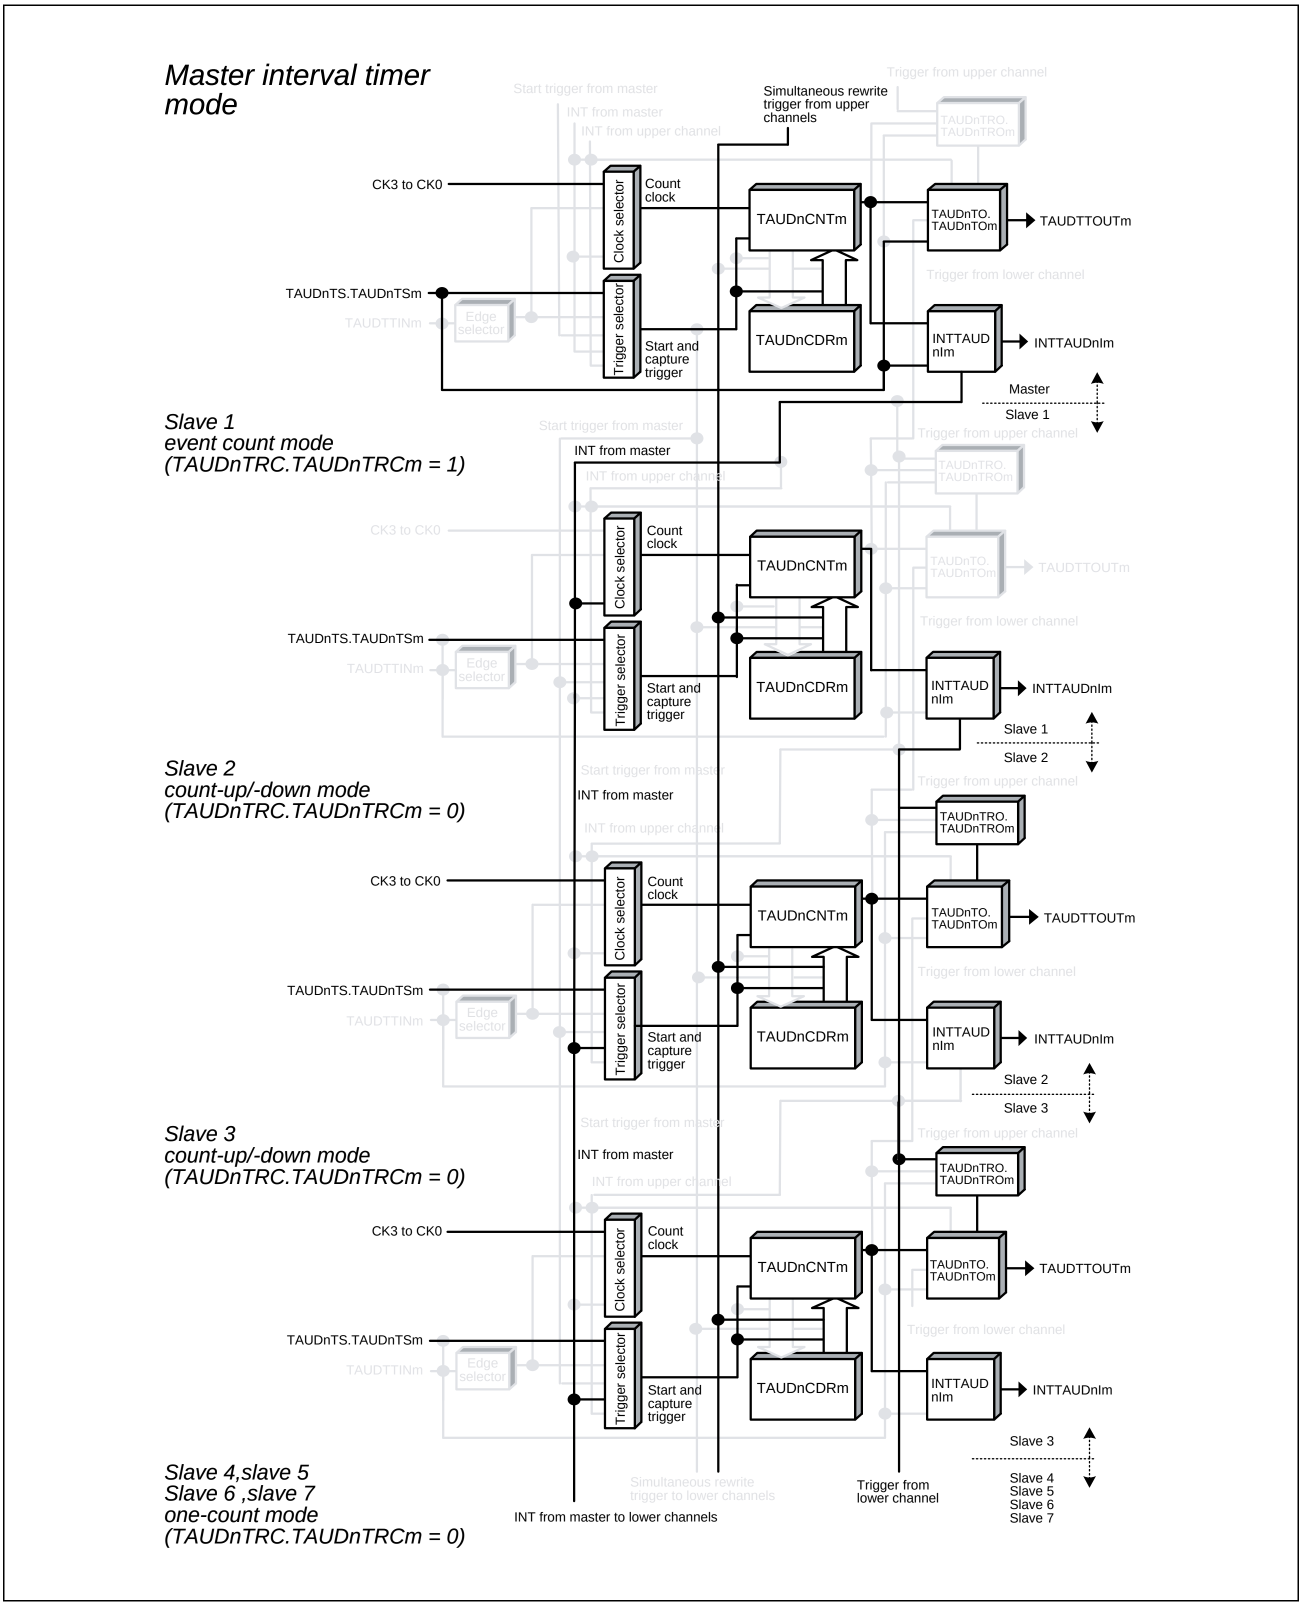

Figure 32.132 Block Diagram of Non-Complementary Modulation Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

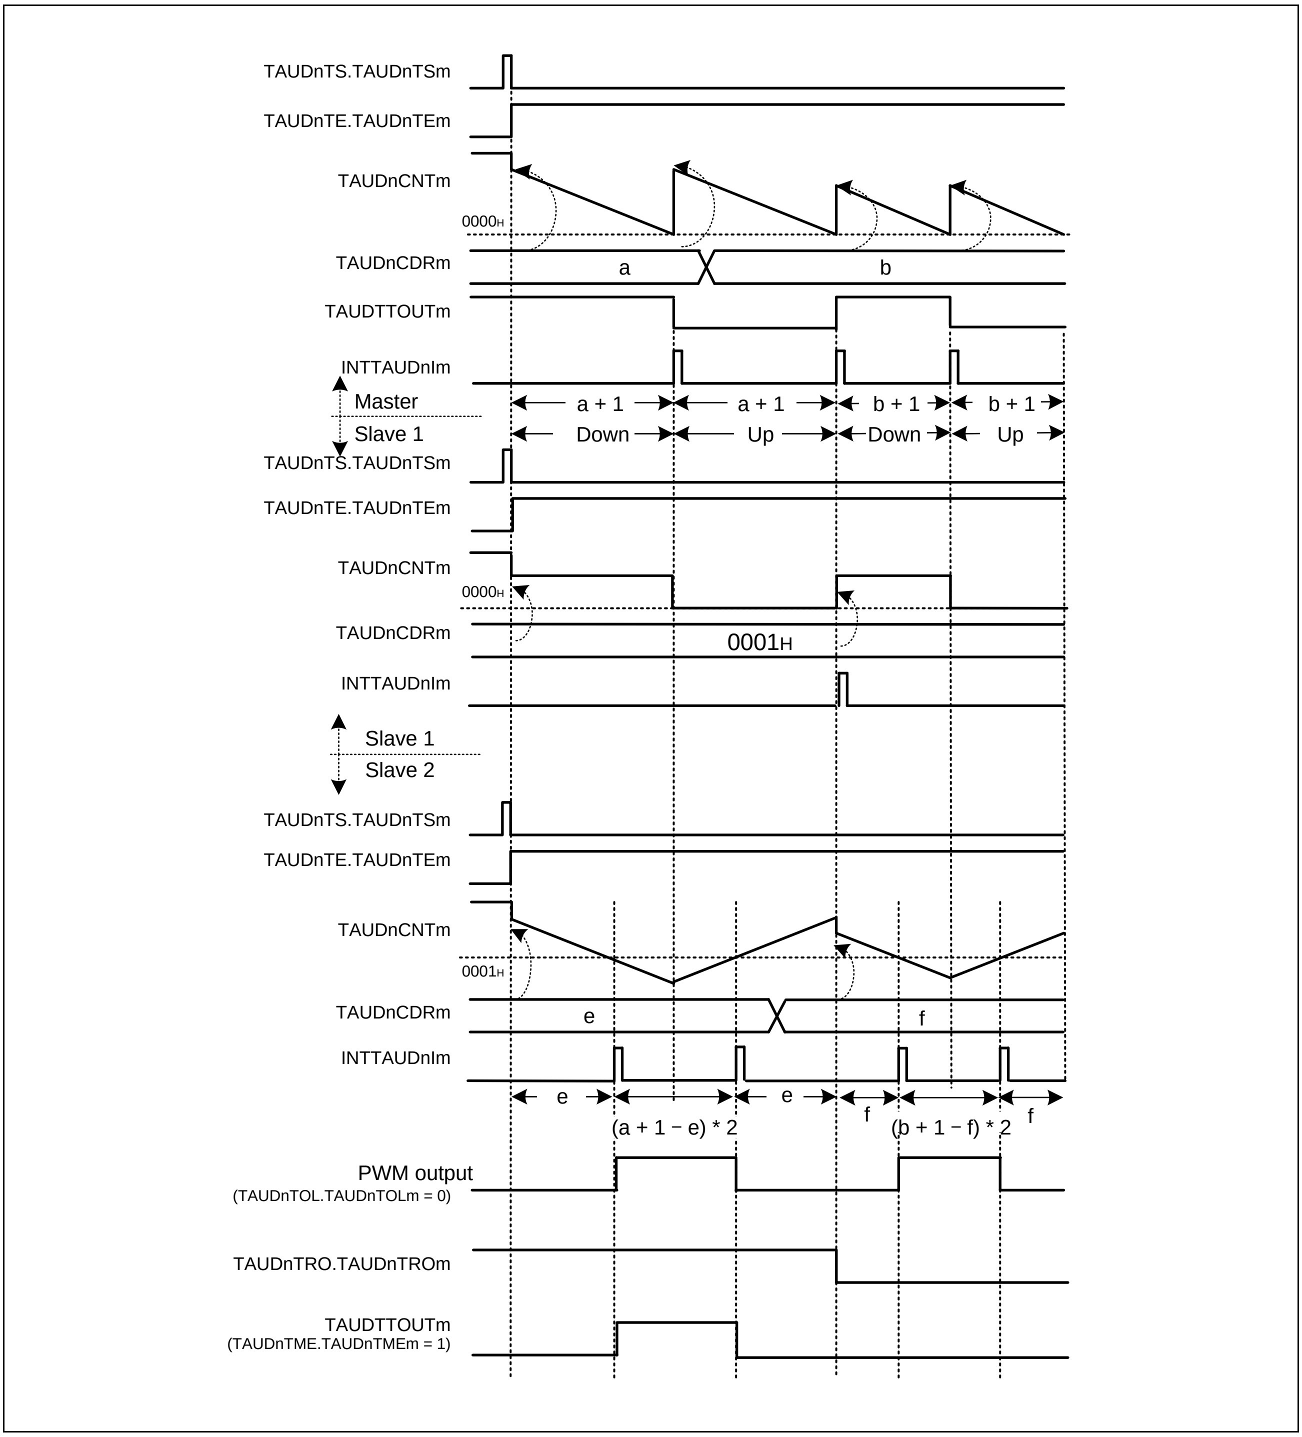

Figure 32.133 General Timing Diagram of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time. 1: INTTAUDnIm is generated at the beginning of operation or at a restart time.

(2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.237 Contents of the TAUDnCMURm Register for the Master channel of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for the Master Channel

Table 32.238 Control Bit Settings for the Master Channel in Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (toggle mode with TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.239 Simultaneous Rewrite Settings for the Master Channel of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

32.16.2.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for Slave Channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.240 Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	11: INTTAUDnIm of the master channel is used as the count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software. 011: Triggers simultaneous rewrite.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0011: Event count mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

(2) TAUDnCMURm for Slave Channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.241 Contents of the TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

(4) Simultaneous Rewrite for Slave Channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.242 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Output Mode for Slave Channels 2 to 7

Table 32.245 Control Bit Settings in Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: The upper channel generates the real-time output trigger for channel m
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

(4) Simultaneous Rewrite for Slave Channels 2 to 7

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.246 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

32.16.2.7 Operating Procedure for Non-Complementary Modulation Output Function Type 2

Table 32.247 Operating Procedure for Non-Complementary Modulation Output Function Type 2

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.16.2.4, Register Settings for the Master** Channel. Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.16.2.5, Register Settings for Slave Channel 1**. Slave channels 2 to 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.16.2.6, Register settings for slave channels 2 to 7**. Set the value of TAUDnCDRm register of every channel. Set pulse cycle in TAUDnCDRm of master channel, and in TAUDnCDRm of slave channel 1, set the number of interrupts from master channel to be ignored before slave channel 1 generates a real-time output trigger. Set duty width in TAUDnCDRm of slave channels 2 to 7. Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.	Channel operation is stopped.

Table 32.247 Operating Procedure for Non-Complementary Modulation Output Function Type 2

		Operation	TAUDn Status
Restart Operation	Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down.
	During Operation	TAUDnCDRm, TAUDnTRO.TAUDnTROm, and TAUDnTMEm.TAUDnTMEm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	The TAUDnCDRm value of master channel and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. The TAUDnCDRm value of slave channel 1 is loaded and the counter waits for an interrupt from the master channel. When the counter of master channel reaches 0000_H: ● INTTAUDnIm is generated. ● TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down. ● The TAUDnCNTm value of slave channel 1 decrements by 1 and the counter waits for a next interrupt from the master channel. ● TAUDnCNTm of slave channels 2 to 7 reloads the TAUDnCDRm value, or performs counting in opposite direction. ● At the same timing when the TAUDnCDRm value is loaded, the TAUDnTME.TAUDnTMEm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output. ● When slave channel 1 detects an interrupt from the master channel for the (TAUDnCDRm + 1) times: – INTTAUDnIm is generated. – The TAUDnTRO.TAUDnTROm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output. ● When the counter of slave channels 2 to 7 reaches 0001_H: – INTTAUDnIm is generated. – PWM output signals of slave channels 2 to 7 are set/reset.
	Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.16.2.8 Specific Timing Diagrams

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

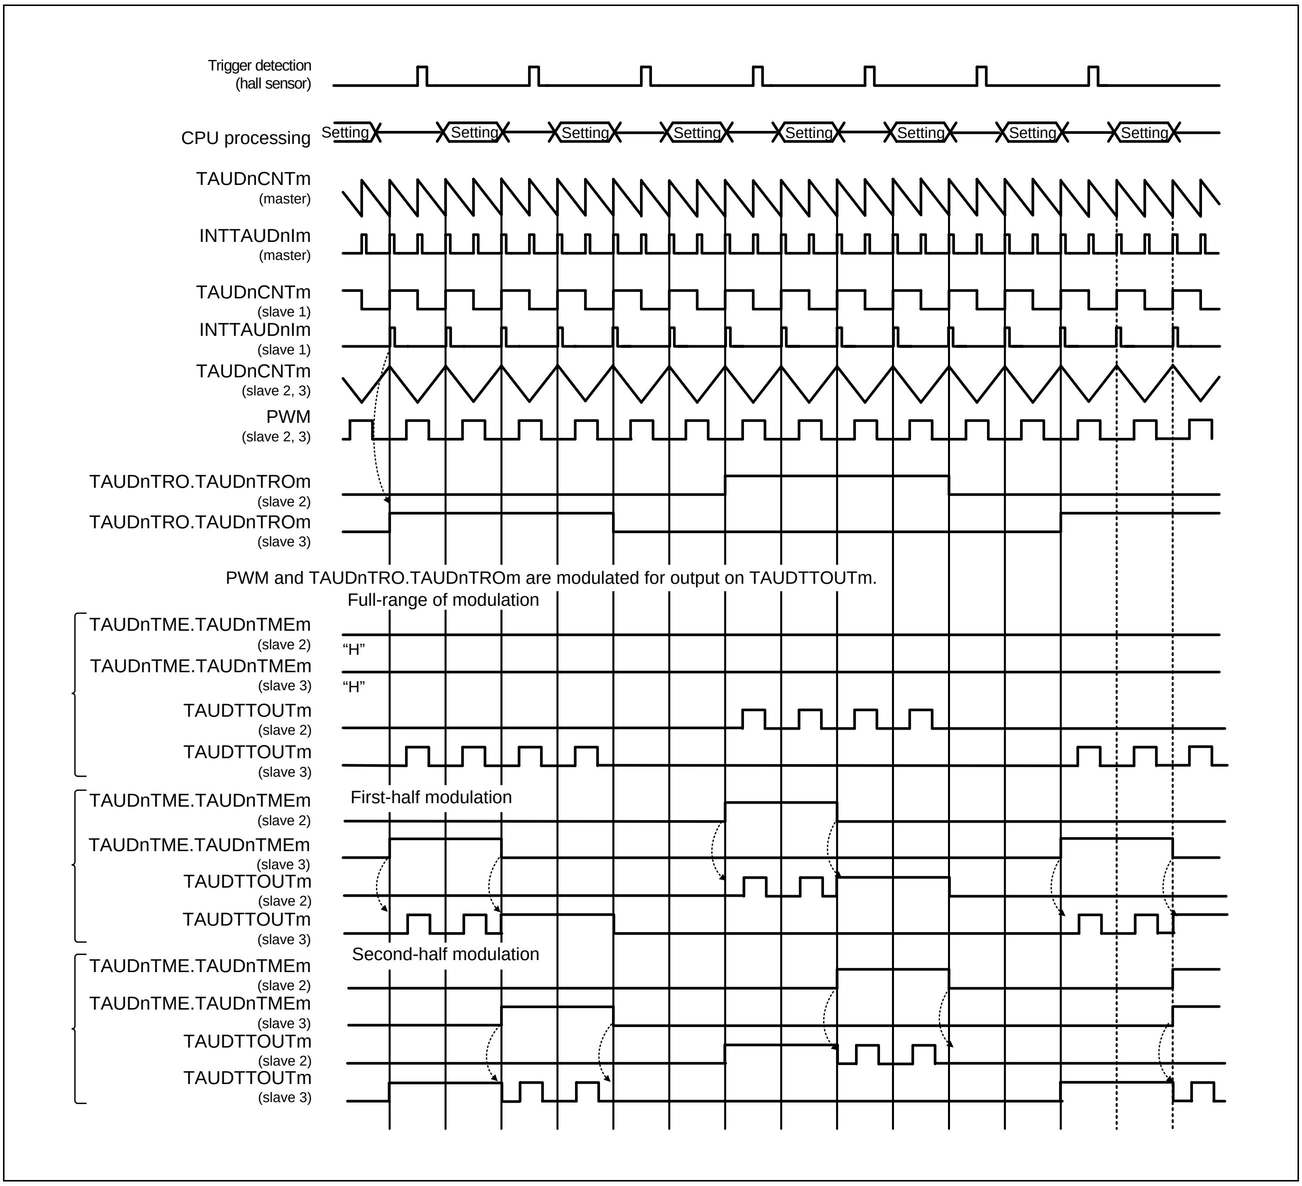

Figure 32.134 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 2

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The "Setting" symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

32.16.3 Complementary Modulation Output Function

32.16.3.1 Overview

Summary

This function outputs a triangle PWM output signal, a high-level signal, or low-level signal from TAUDTTOUTm with dead time added, depending on the real-time output bit value (TAUDnTRO.TAUDnTROm) and the modulation output bit value (TAUDnTME.TAUDnTMEm) of a pair of slave channels, and an output level bit value (TAUDnTDL.TAUDnTDLm). Three pairs of channels are typically used.

Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See **Table 32.249, Contents of the TAUDnCMORm Register for the Master Channel of the Complementary Modulation Output Function**).
- The operating mode for slave channel 1 should be set to event count mode (See **Table 32.253, Contents of the TAUDnCMORm Register for Slave Channel 1 of the Complementary Modulation Output Function**).
- The operating mode for slave channels 2, 4 and 6 should be set to count-up/-down mode (See **Table 32.256, Contents of the TAUDnCMORm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function**).
- The operating mode for slave channels 3, 5 and 7 should be set to one-count mode (See **Table 32.260, Contents of the TAUDnCMORm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function**).
  In addition, as the number of occurrences of an interrupt for slave channels 3, 5 and 7 within the carrier cycle is not uniquely determined, do not use the interrupt as an interrupt source.
- The output mode for master channels should be set to independent channel output mode 1 (See **Section 32.7, Channel Output Modes**).
- This function does not use TAUDTTOUTm of slave channel 1 but TAUDnTRC.TAUDnTRCm should be set to 1 (See **Section 32.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with complementary modulation output (See **Section 32.7, Channel Output Modes**).

Functional description

- Master channel:
  The counter of the master channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) of the master channel is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.
  When the counter of master channel reaches 0000_H, INTTAUDnIm is generated. This decrements the counter value of slave channel 1 by 1 and the counter of slave channel 2 starts to count in the opposite direction.
- Slave channel 1:
  When the counter reaches 0000_H, slave channel 1 waits for the next interrupt from the master channel. And the TAUDnCDRm value is reloaded into TAUDnCNTm (slave 1) and INTTAUDnIm is generated.
  Slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm = 1). The value of real-time output bit (TAUDnTRO.TAUDnTROm) of each channel is applied to the channel that detects the occurrence of an

interrupt on slave channel 1 by an interrupt. The real-time output bit value can be changed in any timing by application software but a new value is not applied until an interrupt occurs on slave channel 1.

- Slave channel 2:
  When the slave channel 2 counter reaches 0001_H, the slave channel 3 counter starts counting down. When the slave channel 3 counter reaches 0000_H, an interrupt occurs.
- Slave channels 2 and 3:
  The combined use of the master channel and slave channels 2 and 3 generates a PWM output signal. The master channel generates a PWM output cycle, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time.
- Slave channels 4 to 7:
  Slave channels 4 and 6 operate like slave channel 2. Slave channels 5 and 7 operate like slave channel 3.

A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROm), a modulation output bit value (TAUDnTME.TAUDnTMEm), and an output level bit value (TAUDnTDL.TAUDnTDLm) of the slave channel, as described in **Table 32.248, TAUDTTOUTm Output (TAUDnTOL.TAUDnTOLm = 0) for a Pair of Slave Channels of Complementary Modulation Output Function**.

It is, however, prohibited that a high-level signal is output from both channel 2 and channel 3 (in order to prevent a motor driver short circuit).

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

- If TAUDnTME.TAUDnTMEm of a pair of channels is set to 1 (TAUDnTOL.TAUDnTOLm = 0):
  - If TAUDnTRO.TAUDnTROm of one channel is set to 1, TAUDTTOUTm outputs the corresponding PWM of the channel.
  - If TAUDnTRO.TAUDnTROm of both channels is set to 0, TAUDTTOUTm of a pair outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm of a pair of channels is set to 0 (TAUDnTOL.TAUDnTOLm = 0):
  - If TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm of the channel outputs a high-level signal.
  - If TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm of the channel outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic.

Table 32.248 TAUDTTOUTm Output (TAUDnTOL.TAUDnTOLm = 0) for a Pair of Slave Channels of Complementary Modulation Output Function

TAUDnTME.TAUDnTME02	TAUDnTME.TAUDnTME03	TAUDnTRO.TAUDnTRO02	TAUDnTRO.TAUDnTRO03	TAUDnTDL.TAUDnTDL02	TAUDnTDL.TAUDnTDL03	TAUDTTOUT2 Output	TAUDTTOUT3 Output

1	1	0	0	X	X	Low level	Low level
		0	1	1	0	~PWM	PWM
		1	0	0	1	PWM	~PWM
		1	1	X	X	Setting prohibited	Setting prohibited

NOTES

1. In the above table, PWM indicates a positive PWM signal and ~PWM indicates an inverted PWM signal (positive logic). PWM and ~PWM are set by TAUDnTDL.TAUDnTDLm.
2. Any settings not listed above are prohibited.

- If TAUDnTME.TAUDnTMEm is continuously set to 1 while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, full modulation is applied.
- If TAUDnTME.TAUDnTMEm is set to 1 at the first half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, first-half modulation is applied.
- If TAUDnTME.TAUDnTMEm is set to 1 at the second half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, second-half modulation is applied.
- Whether dead time is added to a normal or reverse phase PWM signal when two channels become high-level signal outputs simultaneously depends on a TAUDnTDL.TAUDnTDLm bit value.
  - If TAUDnTDL.TAUDnTDLm = 0, dead time is added to a normal phase PWM signal.
  - If TAUDnTDL.TAUDnTDLm = 1, dead time is added to a reverse phase PWM signal.
  - The operation defined by a TAUDnTDL.TAUDnTDLm bit value should be conducted by application software during operation. To modify TAUDnTDL.TAUDnTDLm, rewrite it during the period when TAUDnTRO.TAUDnTROm is 00_B.
- The TAUDnCDRm value of slave channel 1 should be set to the value to generate INTTAUDnIm of slave channel 1 at a carrier cycle (peak interrupt timing).
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7:
  - If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
  - If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7:
  - If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.
  - If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
- This function enables simultaneous rewrite. See **Section 32.6, Simultaneous Rewrite**.

32.16.3.2 Equations

Pulse period = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

For slave channels 2 and 3:

PWM signal width (positive phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2) × 2) – (TAUDnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (negative phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2) × 2) + (TAUDnCDRm (slave 3) + 1)] × count clock cycle

For slave channels 4 to 7:

Slave channels 4 and 6 are calculated in the same way as slave channel 2, whereas slave channels 5 and 7 are calculated as slave channel 3.

32.16.3.3 Block Diagram and General Timing Diagram

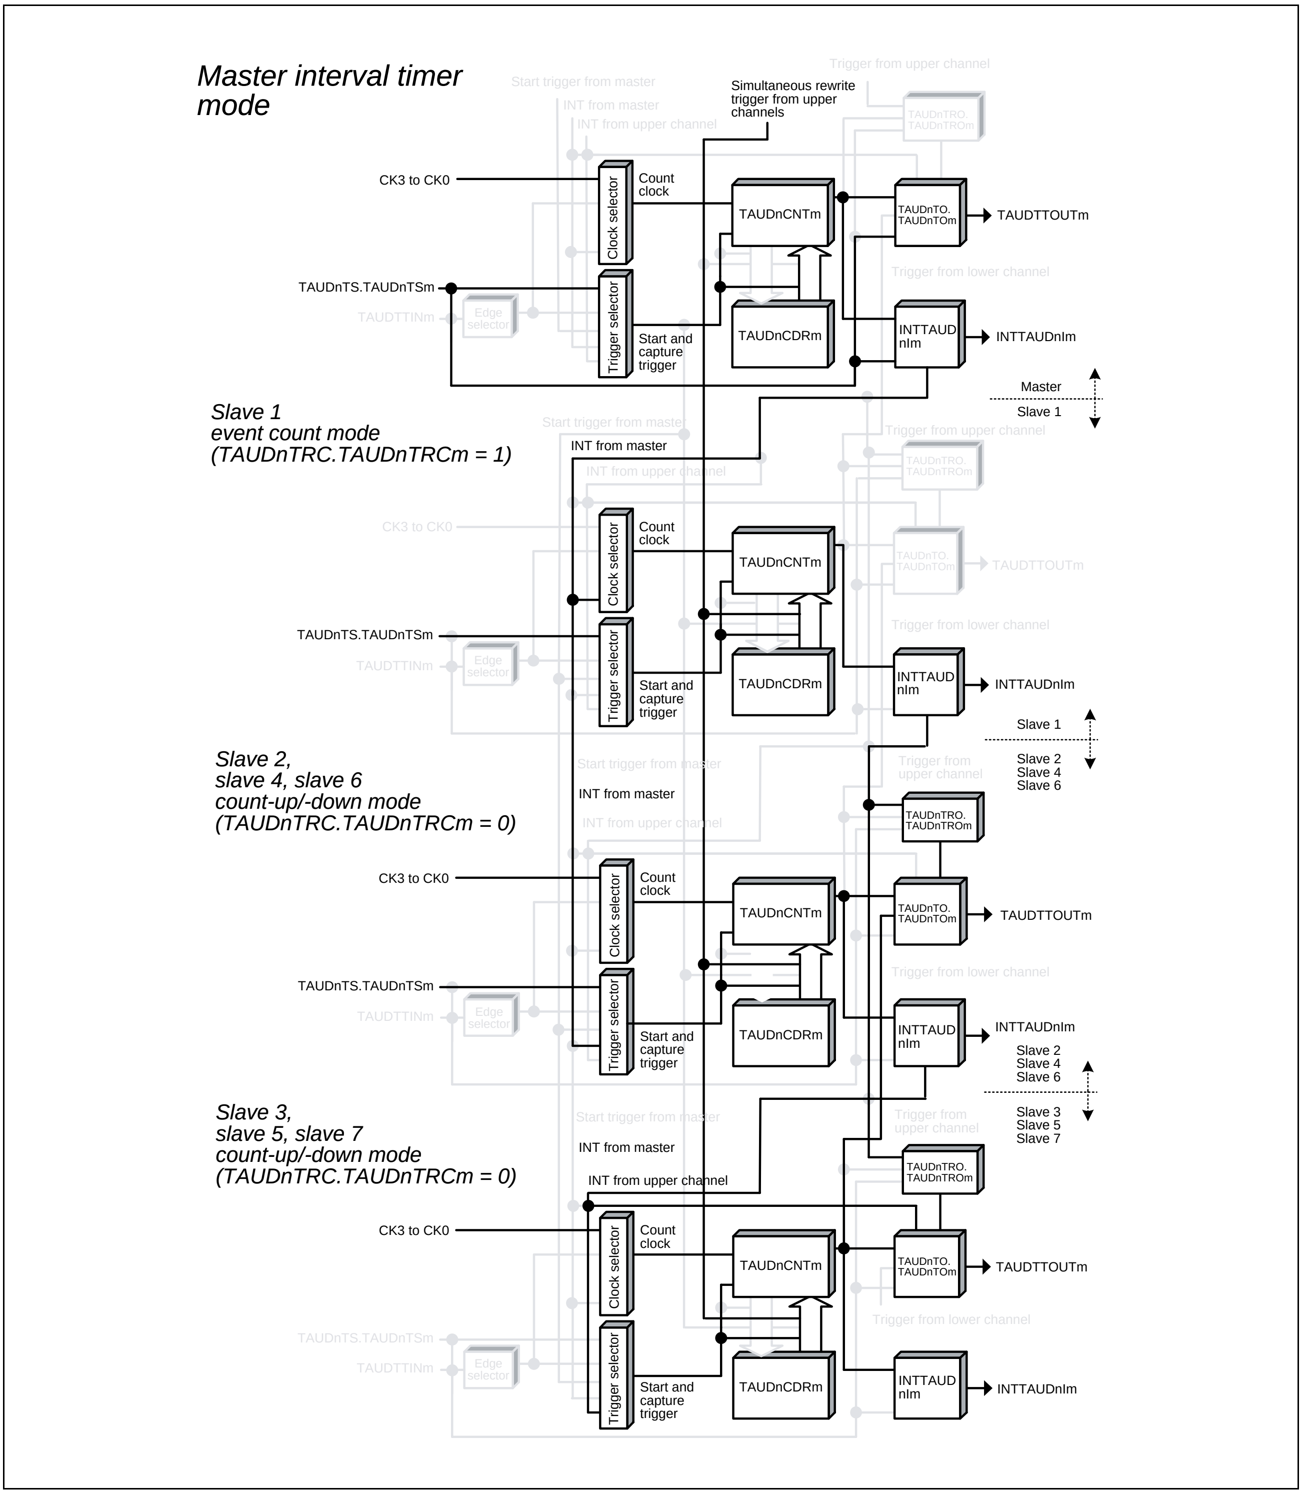

Figure 32.135 Block Diagram of Complementary Modulation Output Function

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channel 1: TAUDnCDRm = 0001_H
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

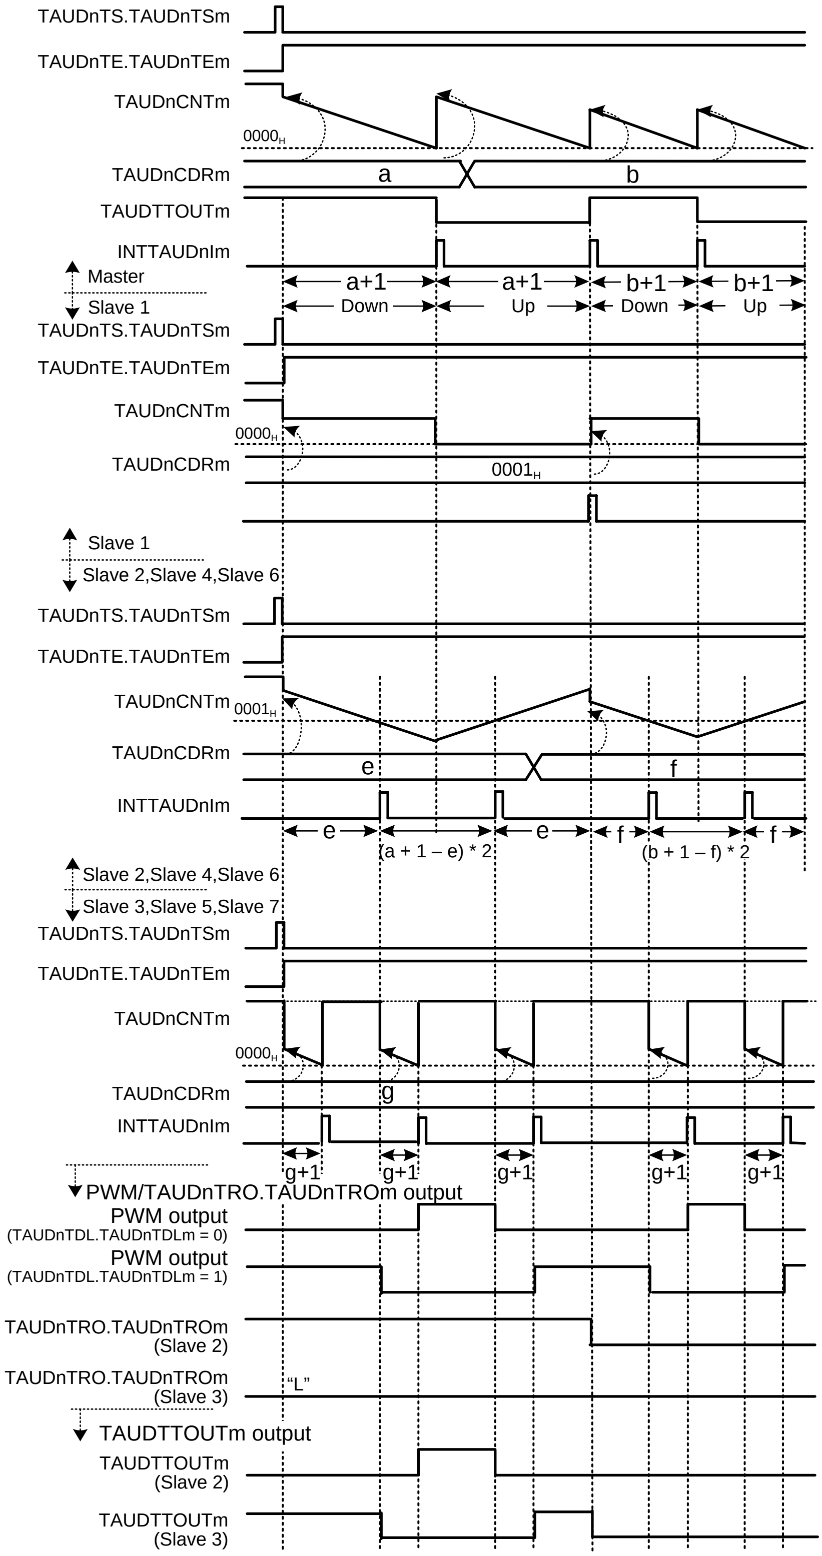

Figure 32.136 General Timing Diagram of Complementary Modulation Output Function

32.16.3.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the Master Channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.249 Contents of the TAUDnCMORm Register for the Master Channel of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated and TAUDTTOUTm is not toggled at the beginning of operation or at a restart time. 1: INTTAUDnIm is generated to toggle TAUDTTOUTm at the beginning of an operation.

(2) TAUDnCMURm for the Master Channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.250 Contents of the TAUDnCMURm Register for the Master Channel of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode for the Master Channel

Table 32.251 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous Rewrite for the Master Channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.252 Simultaneous Rewrite Settings for the Master Channel of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

32.16.3.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for Slave Channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.253 Contents of the TAUDnCMORm Register for Slave Channel 1 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	11: INTTAUDnIm of the master channel is used as the count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software. 011: Triggers simultaneous rewrite.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0011: Event count mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

(2) TAUDnCMURm for Slave Channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.254 Contents of the TAUDnCMURm Register for Slave Channel 1 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel Output Mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

(4) Simultaneous Rewrite for Slave Channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.255 Simultaneous Rewrite Settings for Slave Channel 1 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

32.16.3.6 Register settings for slave channels 2, 4, and 6

(1) TAUDnCMORm for Slave Channels 2, 4, and 6

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.256 Contents of the TAUDnCMORm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	111: Up/down output trigger signal of master channel
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1001: Count-up/-down mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

(2) TAUDnCMURm for Slave Channels 2, 4, and 6

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.257 Contents of the TAUDnCMURm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Output mode for Slave Channels 2, 4, and 6

Table 32.258 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

CAUTION

At the PWM output, set TAUDnTDL.TAUDnTDLm exclusively from odd channels.

(4) Simultaneous Rewrite for Slave Channels 2, 4, and 6

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.259 Simultaneous Rewrite Settings for Slave Channels 2, 4, and 6 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

32.16.3.7 Register settings for slave channels 3, 5, and 7

(1) TAUDnCMORm for Slave Channels 3, 5, and 7

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 32.260 Contents of the TAUDnCMORm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	110: Dead time trigger
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

(2) TAUDnCMURm for Slave Channels 3, 5, and 7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.261 Contents of the TAUDnCMURm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Output Mode for Slave Channels 3, 5, and 7

Table 32.262 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

CAUTION

At the PWM output, set TAUDnTDL.TAUDnTDLm exclusively from even channels.

(4) Simultaneous Rewrite for Slave Channels 3, 5, and 7

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 32.263 Simultaneous Rewrite Settings for Slave Channels 3, 5, and 7 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

32.16.3.8 Operating Procedure for Complementary Modulation Output Function

Table 32.264 Operating Procedure for Complementary Modulation Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.16.3.4, Register Settings for the Master Channel**. Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.16.3.5, Register Settings for Slave Channel 1**. Slave channels 2, 4, and 6: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.16.3.6, Register settings for slave channels 2, 4, and 6**. Slave channels 3, 5, and 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 32.16.3.7, Register settings for slave channels 3, 5, and 7**. Set the value of TAUDnCDRm register of every channel. Set a pulse cycle using TAUDnCDRm of master channel, and an interrupt count of master channel to be ignored using TAUDnCDRm of slave channel 1. Also set a duty width in TAUDnCDRm of slave channels 2, 4, and 6, and a dead time delay on slave channels 3, 5, and 7. Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.	Channel operation is stopped.

Table 32.264 Operating Procedure for Complementary Modulation Output Function

		Operation	TAUDn Status
Restart Operation	Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down.
	During Operation	TAUDnCDRm, TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. TAUDnCDRm value of slave channel 1 is loaded and the counter waits for a master channel interrupt. When the counter of master channel reaches 0000_H: ● INTTAUDnIm is generated. ● TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down. ● TAUDnCNTm value of slave channel 1 decrements by 1 and the counter waits for the next master channel interrupt. ● TAUDnCNTm of slave channels 2, 4, and 6 reloads the TAUDnCDRm value, or performs counting in opposite direction. ● At the same timing when the TAUDnCDRm value of slave channels 2, 4, and 6 is loaded, the TAUDnTME.TAUDnTMEm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output. ● The counter of slave channel 1 waits for the next interrupt from the master channel when reaching 0000_H. When the interrupt is detected: – TAUDnCDRm value is reloaded into TAUDnCNTm and the counter waits for the next master channel interrupt. – INTTAUDnIm is generated. – TAUDnTRO.TAUDnTROm is changeable. ● When the counter of slave channels 2, 4, and 6 reaches 0001_H: – INTTAUDnIm is generated. – PWM output of slave channel m is set/reset (when the specified condition of the channel output mode is matched). – TAUDnCDRm value of slave channels 3, 5, and 7 is loaded into TAUDnCNTm to perform counting down. ● When the counter of slave channels 3, 5, and 7 reaches 0000_H: – INTTAUDnIm is generated. – PWM output of slave channel m is set/reset (when the specified condition of the channel output mode is matched).
	Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

32.16.3.9 Specific Timing Diagrams

The following settings apply to the timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channel 1: TAUDnCDRm = 0001_H
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

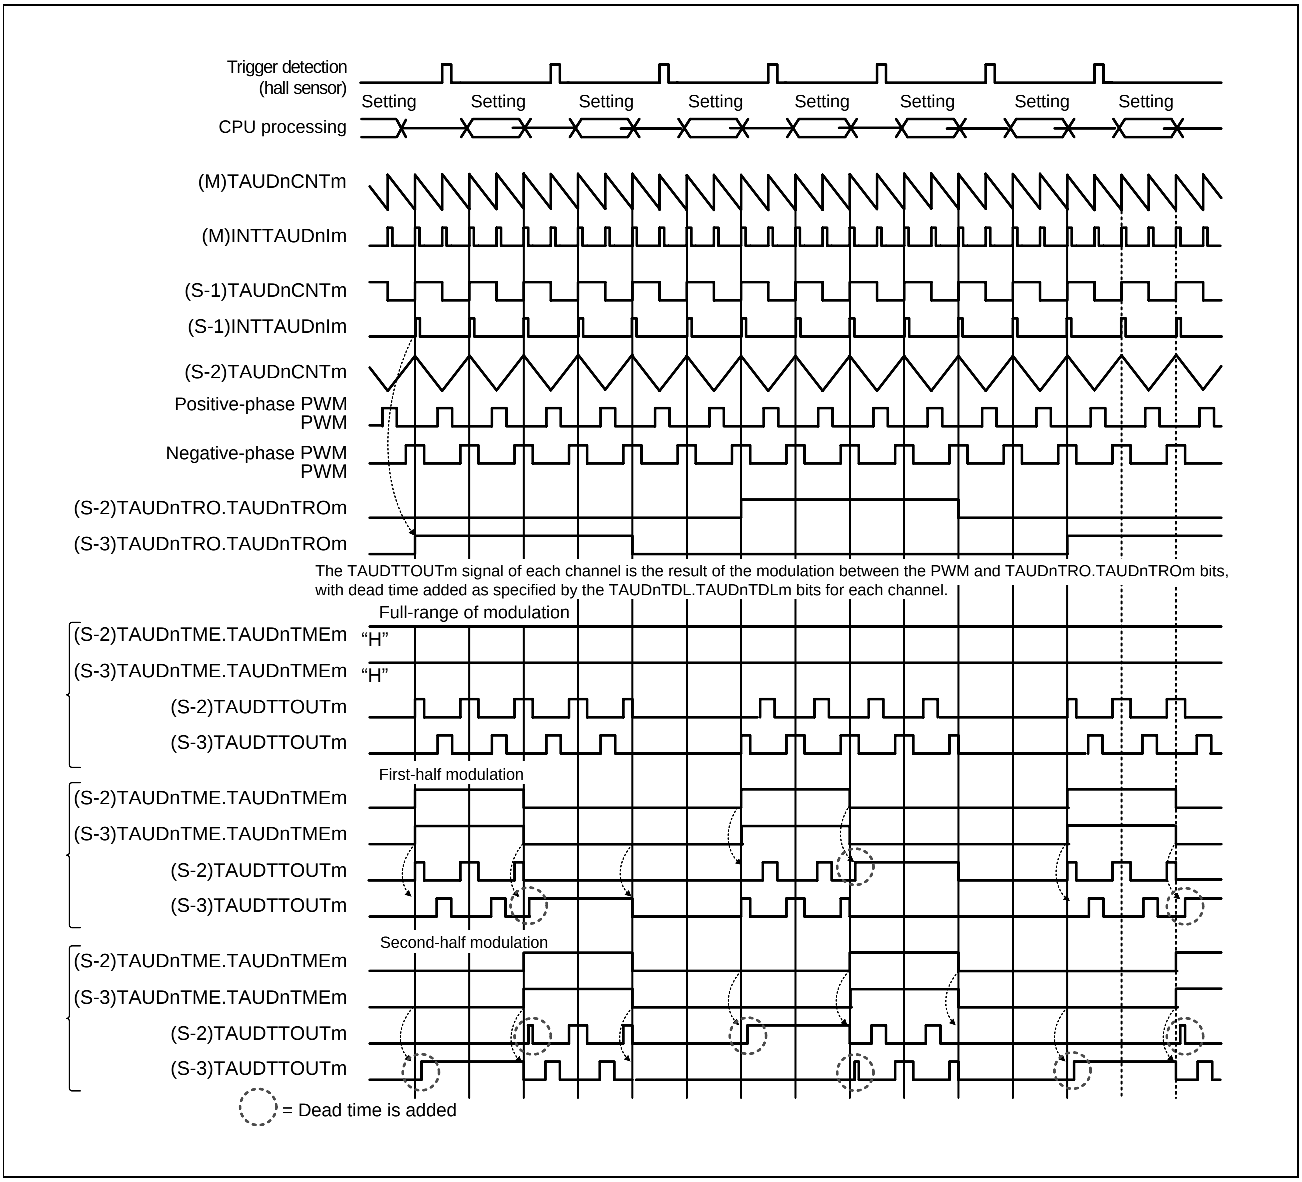

Figure 32.137 Specific Timing Diagram of Complementary Modulation Output Function

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

A modulated PWM output signal and TAUDnTRO.TAUDnTROm bit value are output from slave channels 2 and 3.

TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm settings are reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is specified by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

NOTE

Dead time is added to suppress simultaneous change of PWM edges of normal and reverse phases.

The “Setting” symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, TAUDnTRO.TAUDnTROm, and TAUDnTDL.TAUDnTDLm can be changed.

Section 33 Timer Array Unit J (TAUJ)

This section contains a generic description of the timer array unit J (TAUJ).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of TAUJ.

33.1 Features of RH850/F1KH, RH850/F1KM TAUJ

33.1.1 Number of Units and Channels

This microcontroller has the following number of TAUJ units and channels.

Table 33.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins

Table 33.7 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual TAUJ units are identified by the index “n”; for example, TAUJnTOM is the TAUJn channel output mode register.
m	The TAUJ has 4 channels. Throughout this section, the individual channels are identified by the index “m”, thus a certain channel is denoted as CHm (m = 0 to 3). The even numbered channels (m = 0, 2) are denoted as CHm_even. The odd numbered channels (m = 1, 3) are denoted as CHm_odd.

33.1.2 Register Base Addresses

TAUJn base addresses are listed in the following table.

TAUJn register addresses are given as offsets from the base addresses.

Table 33.8 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<TAUJ0_base>	FFE5 0000_H
<TAUJ1_base>	FFE5 1000_H
<TAUJ2_base>	FFE5 0100_H
<TAUJ3_base>	FFE5 1100_H

33.1.3 Clock Supply

The TAUJn clock supply is shown in the following table.

Table 33.9 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAUJ0	PCLK	CKSCLK_ATAUJ	Timer count clock
	Register access clock	CPUCLK_L, CKSCLK_ATAUJ	Bus clock
TAUJ1	PCLK	CKSCLK_IPERI1	Timer count clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	Bus clock
TAUJ2	PCLK	CKSCLK_ATAUJ	Timer count clock
	Register access clock	CPUCLK_L, CKSCLK_ATAUJ	Bus clock
TAUJ3	PCLK	CKSCLK_IPERI1	Timer count clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	Bus clock

33.1.4 Interrupt Requests

TAUJn interrupt requests are listed in the following table.

Table 33.10 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
TAUJ0			
INTTAUJ0I0	Channel 0 interrupt	80	21
INTTAUJ0I1	Channel 1 interrupt	81	80
INTTAUJ0I2	Channel 2 interrupt	82	81
INTTAUJ0I3	Channel 3 interrupt	83	22
TAUJ1			
INTTAUJ1I0	Channel 0 interrupt	168	46
INTTAUJ1I1	Channel 1 interrupt	169	100
INTTAUJ1I2	Channel 2 interrupt	170	47
INTTAUJ1I3	Channel 3 interrupt	171	101
TAUJ2			
INTTAUJ2I0	Channel 0 interrupt	277	103
INTTAUJ2I1	Channel 1 interrupt	278	104
INTTAUJ2I2	Channel 2 interrupt	279	105
INTTAUJ2I3	Channel 3 interrupt	280	106
TAUJ3			
INTTAUJ3I0	Channel 0 interrupt	281	107
INTTAUJ3I1	Channel 1 interrupt	282	108
INTTAUJ3I2	Channel 2 interrupt	283	109
INTTAUJ3I3	Channel 3 interrupt	284	110

33.1.5 Reset Sources

TAUJn reset sources are listed in the following table. TAUJn is initialized by these reset sources.

Table 33.11 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
TAUJ0	All reset sources except the transition to DeepSTOP mode (AWORES)
TAUJ1	All reset sources (ISORES)
TAUJ2	All reset sources except the transition to DeepSTOP mode (AWORES)
TAUJ3	All reset sources (ISORES)

33.1.6 External Input/Output Signals

External input/output signals of TAUJn are listed below.

Table 33.12 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
TAUJ0		
TAUJTTIN0, TAUJTTIN1	Channel 0, 1 input	TAUJ0I0, TAUJ0I1
TAUJTTIN2	Channel 2 input	TAUJ0I2 or RTCA0OUT*[1] or TAUJTTOUT0 (TAUJ1)*[1]
TAUJTTIN3	Channel 3 input	TAUJ0I3 or RTCA0OUT*[1] or TAUJTTOUT0 (TAUJ1)*[1]
TAUJTTOUT0 to TAUJTTOUT3	Channel 0 to 3 output	TAUJ0O0 to TAUJ0O3
TAUJ1		
TAUJTTIN0 to TAUJTTIN3	Channel 0 to 3 input	TAUJ1I0 to TAUJ1I3
TAUJTTOUT0 to TAUJTTOUT3	Channel 0 to 3 output	TAUJ1O0 to TAUJ1O3
TAUJ2		
TAUJTTIN0, TAUJTTIN1	Channel 0, 1 input	TAUJ2I0, TAUJ2I1
TAUJTTIN2	Channel 2 input	TAUJ2I2 or TAUJTTOUT0(TAUJ3)*[1]
TAUJTTIN3	Channel 3 input	TAUJ2I3 or TAUJTTOUT0(TAUJ3)*[1]
TAUJTTOUT0 to TAUJTTOUT3	Channel 0 to 3 output	TAUJ2O0 to TAUJ2O3
TAUJ3		
TAUJTTIN0 to TAUJTTIN3	Channel 0 to 3 input	TAUJ3I0 to TAUJ3I3
TAUJTTOUT0 to TAUJTTOUT3	Channel 0 to 3 output	TAUJ3O0 to TAUJ3O3

Note 1. For details, see **Section 33.1.8, TAUJ0 / TAUJ2 Input Selection**.

33.1.7 Internal Input/Output Signals

The internal input/output signals of TAUJn are listed below.

Table 33.13 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Connected to
TAUJnTSSTm*[1]	Simultaneous channel start trigger input	PIC

Note 1. n = 1 only. TAUJ0TSSTm is not connected to PIC.

33.1.8 TAUJ0 / TAUJ2 Input Selection

TAUJ0 Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

The 1-Hz pulse output (RTCA0OUT) from RTCA0 and the output (TAUJTTOUT0) from TAUJ1 can be input to TAUJTTIN2 and TAUJTTIN3 as shown in the following figure.

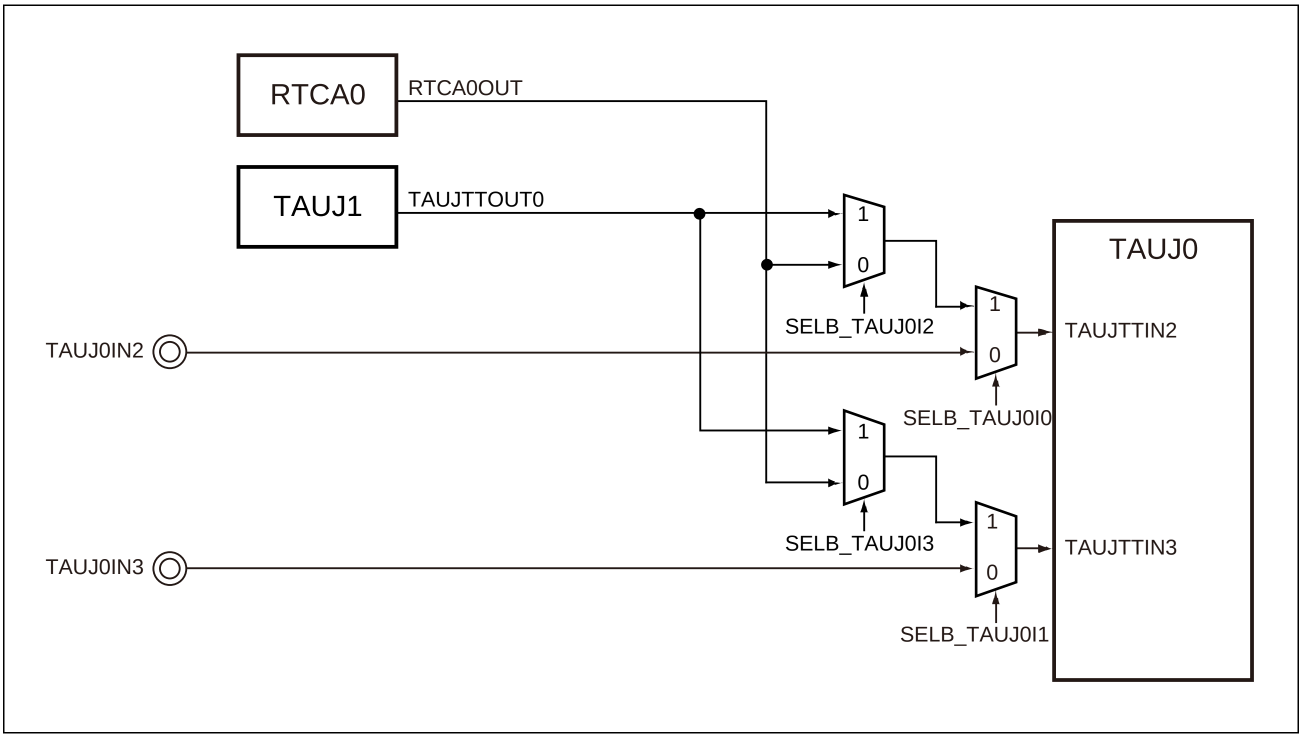

Figure 33.1 Selection of Signals Input to TAUJ0

TAUJ2 Input Selection (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

The output from TAUJ3 (TAUJTTOUT0) can be input to TAUJTTIN2 and TAUJTTIN3 as shown in the following figure.

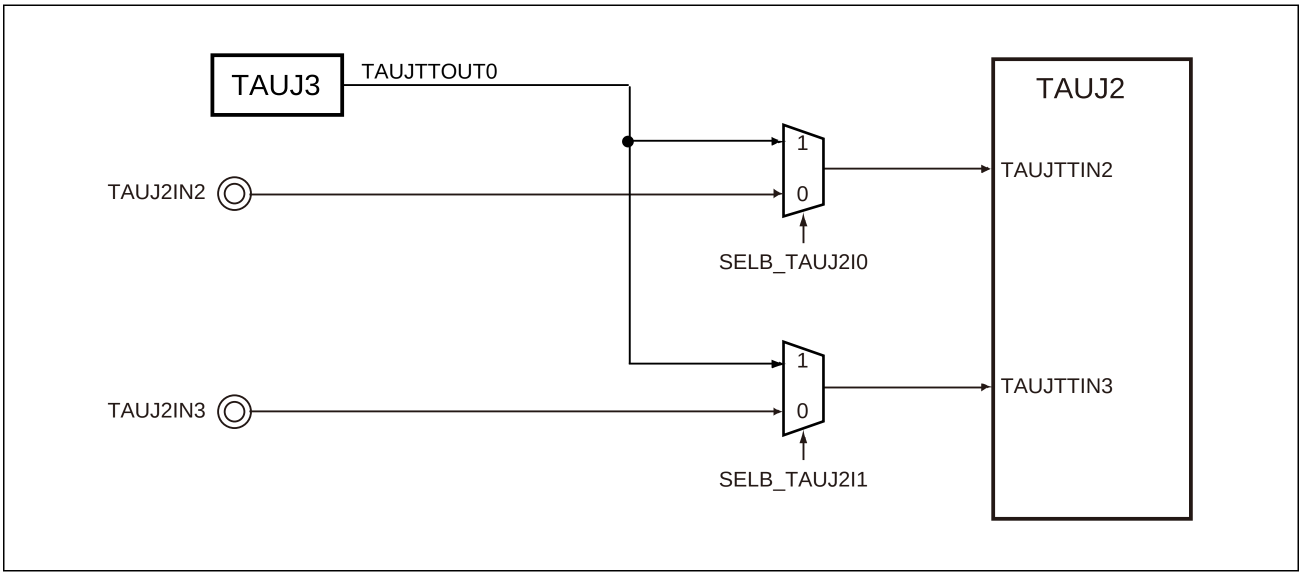

Figure 33.2 Selection of Signals Input to TAUJ2

The following table shows how to select signals input to the TAUJ.

Table 33.14 TAUJ0 Input Selections

Input Signal	Function	Settings			
		SELB_ TAUJ0I3	SELB_ TAUJ0I2	SELB_ TAUJ0I1	SELB_ TAUJ0I0
TAUJTTIN2	Port TAUJ0I2	—	—	—	0
	RTCA0OUT (Real-time clock 1-Hz output)	—	0	—	1
	TAUJTTOUT0 (TAUJ1)	—	1	—	1
TAUJTTIN3	Port TAUJ0I3	—	—	0	—
	RTCA0OUT (Real-time clock 1-Hz output)	0	—	1	—
	TAUJTTOUT0 (TAUJ1)	1	—	1	—

Table 33.15 TAUJ2 Input Selections

Input Signal	Function	Settings	
		SELB_ TAUJ2I1	SELB_ TAUJ2I0
TAUJTTIN2	Port TAUJ2I2	—	0
	TAUJTTOUT0 (TAUJ3)	—	1
TAUJTTIN3	Port TAUJ2I3	0	—
	TAUJTTOUT0 (TAUJ3)	1	—

33.1.8.1 List of Registers

Input signal selection register is listed in the following table.

Table 33.16 List of Registers

Module Name	Register Name	Symbol	Address
TAUJn input selection registers			
SL_TAUJn	TAUJTTINm input signal selection register	SELB_TAUJ0I	FFE5 4000$_H$
	TAUJTTINm input signal selection register	SELB_TAUJ2I	FFE5 4004$_H$

33.1.8.2 SELB_TAUJ0I — TAUJTTINm Input Signal Selection Register

This register selects the TAUJ0 input signals.

Access: This register can be read or written in 8-bit units.

Address: FFE5 4000$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SELB_TAUJ0I3	SELB_TAUJ0I2	SELB_TAUJ0I1	SELB_TAUJ0I0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.17 SELB_TAUJ0I Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	SELB_TAUJ0I3	Selection of TAUJTTIN3 input signal: 0: RTCA0OUT 1: TAUJTTOUT0 (TAUJ1)
2	SELB_TAUJ0I2	Selection of TAUJTTIN2 input signal: 0: RTCA0OUT 1: TAUJTTOUT0 (TAUJ1)
1	SELB_TAUJ0I1	Selection of TAUJTTIN3 input signal: 0: Port TAUJ0I3 1: Timer Input
0	SELB_TAUJ0I0	Selection of TAUJTTIN2 input signal: 0: Port TAUJ0I2 1: Timer Input

33.1.8.3 SELB_TAUJ2I — TAUJTTINm Input Signal Selection Register

This register selects the input signals to several TAUJ2 inputs.

Access: This register can be read or written in 8-bit units.

Address: FFE5 4004_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SELB_TAUJ2I1	SELB_TAUJ2I0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 33.18 SELB_TAUJ2I Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	SELB_TAUJ2I1	Selection of TAUJTTIN3 input signal: 0: Port TAUJ2I3 1: TAUJTTOUT0 (TAUJ3)
0	SELB_TAUJ2I0	Selection of TAUJTTIN2 input signal: 0: Port TAUJ2I2 1: TAUJTTOUT0 (TAUJ3)

33.2 Overview

33.2.1 Functional Overview

The TAUJ has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUJ is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 4 channels, each equipped with a 32-bit counter TAUJnCNTm and a 32-bit data register TAUJnCDRm to hold the count start value or compare value.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate in two operating modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels.

The synchronous operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

33.2.2 Terms

In this section, the following terms are used.

Independent channel operation function/synchronous operation channel operation function

TAUJ has 4 channels, and provides an independent channel operation function that individual channels operate independently and a synchronous channel operation function that is implemented by using a combination of channels.

- The independent channel operation function can be used any channel independently of all other channels.
- The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

Upper/lower channel

Based on the channel number m, a channel with a smaller channel number or higher channel number can be referred to as “upper” or “lower” channel:

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

For instance, as to channel 2, channel 1 is an upper channel and channel 3 is a lower channel. Channel 0 is the highest channel and channel 3 is the lowest channel.

33.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 33.19 Functional List of TAUJ Operations

Operation Function		Example
Independent Channel Operation Functions		**Section 33.12**
	Interval Timer Function	**Section 33.12.1**
	TAUJTTINm Input Interval Timer Function	**Section 33.12.2**
	TAUJTTINm Input Pulse Interval Measurement Function	**Section 33.12.3**
	TAUJTTINm Input Signal Width Measurement Function	**Section 33.12.4**
	TAUJTTINm Input Position Detection Function	**Section 33.12.5**
	TAUJTTINm Input Period Count Detection Function	**Section 33.12.6**
	Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)	**Section 33.12.7**
	Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)	**Section 33.12.8**
Synchronous Channel Operation Functions		**Section 33.13**
	PWM Output Function	**Section 33.13.1**

33.2.4 TAUJ I/O and Interrupt Request Signals

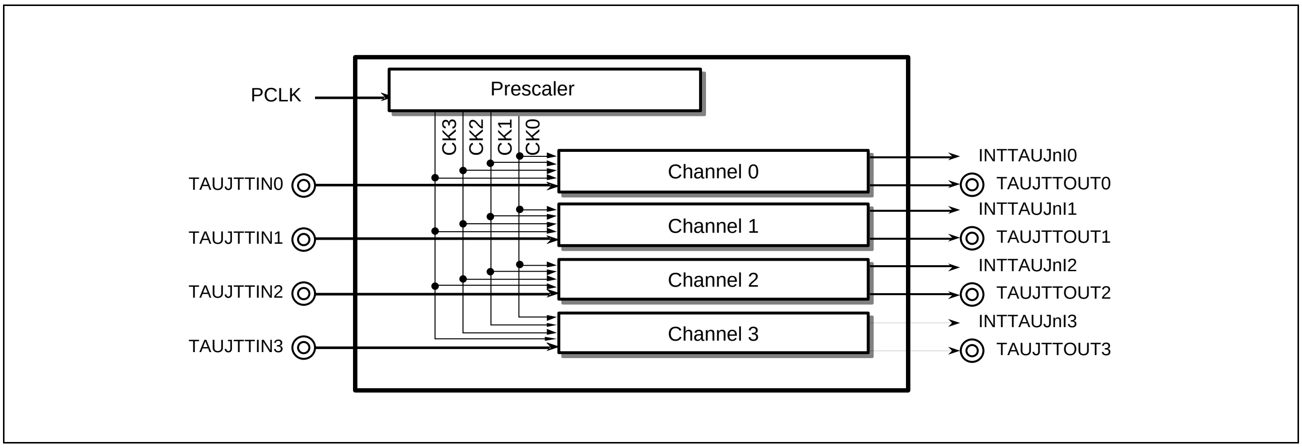

Figure 33.3 TAUJ I/O and Interrupt Request Signals

33.2.5 Block Diagram

The following figure shows the main components of the TAUJ.

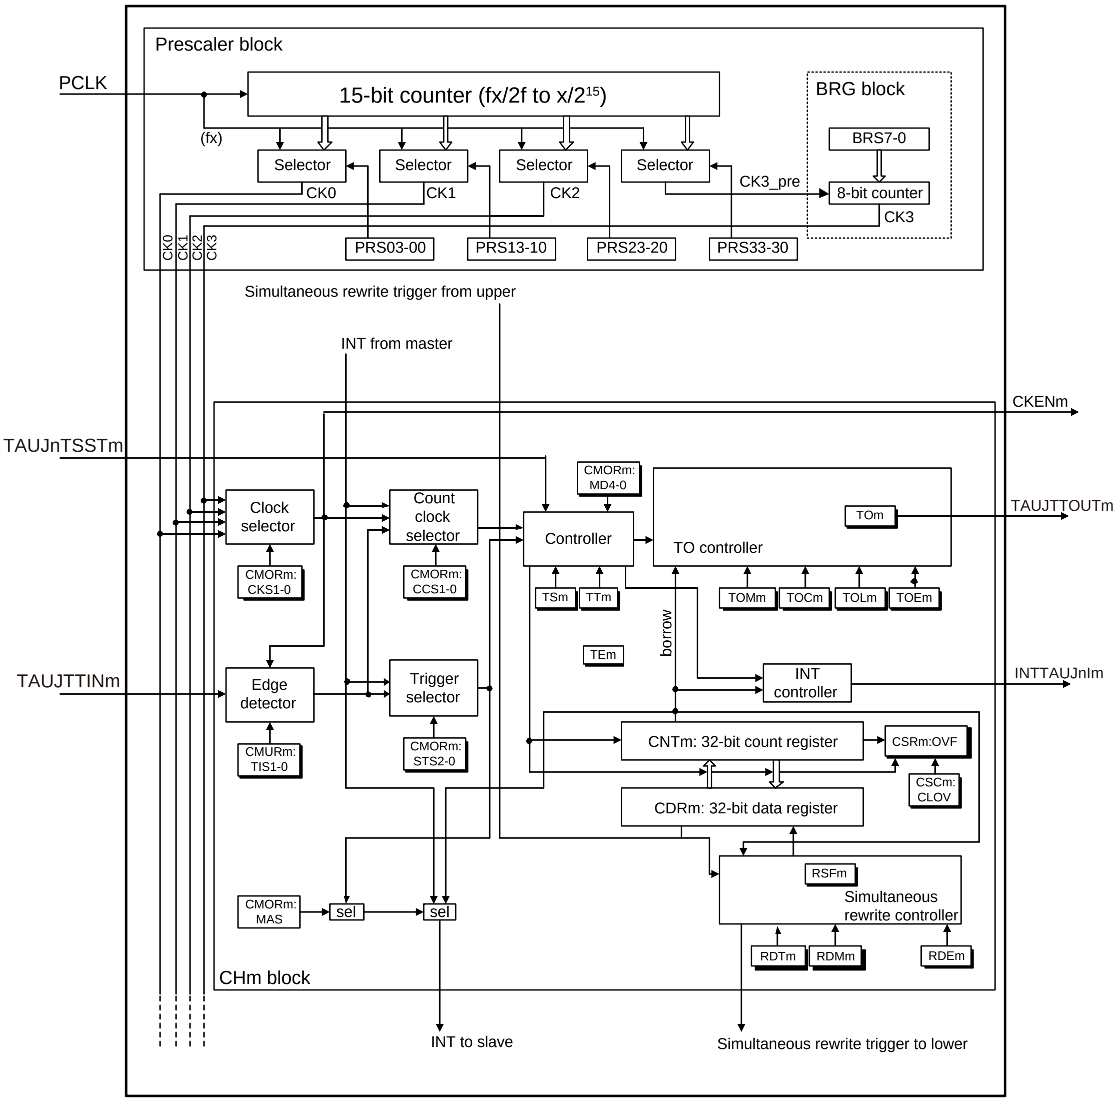

Figure 33.4 Block Diagram of the TAUJ

The prefix “TAUJn” has been omitted from the register names for the sake of clarity in the above figure.

33.2.6 Description of Block Diagram

The following describes the functional blocks.

Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived by dividing PCLK in the prescaler division factor of 2^0 to 2^{15}. The fourth count clock, CK3, is derived by dividing PCLK by a division factor that is not a power of 2 by using the baud rate generator.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source.

- One of CK0 to CK3 clocks (selected by the clock selector)

Controller

The controller controls the main operations of the counter.

- Operating mode (selected with the TAUJnCMORm.TAUJnMD[4:0] bits)
- Counter start enable (TAUJnTS.TAUJnTSm) and counter stop (TAUJnTT.TAUJnTTm)

When counter start is enabled, status flag TAUJnTE.TAUJnTEm is set.

Trigger selector

The counter starts automatically when it is enabled (TAUJnTE.TAUJnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

- Synchronous channel start trigger input TAUJnTSSTm
- Valid edge of the TAUJTTINm input signal
- INTTAUJnIm from the master channel

Simultaneous rewrite controller

Simultaneous rewrite control is enabled in synchronous operating modes. The data registers of all channels in a channel group (TAUJnCDRm) can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

TAUJnTO controller

The output control of every channel enables the generation of various output signals such as PWM signals.

33.3 Registers

33.3.1 List of Registers

TAUJ registers are listed in the following table.

For details about <TAUJn_base>, see **Section 33.1.2, Register Base Addresses**.

Table 33.20 List of Registers

Module Name	Register Name	Symbol	Address
TAUJn prescaler registers			
TAUJn	TAUJn prescaler clock select register	TAUJnTPS	<TAUJn_base> + 90_H
	TAUJn prescaler baud rate setting register	TAUJnBRS	<TAUJn_base> + 94_H
TAUJn control registers			
TAUJn	TAUJn channel data register	TAUJnCDRm	<TAUJn_base> + m × 4_H
	TAUJn channel counter register	TAUJnCNTm	<TAUJn_base> + 10_H + m × 4_H
	TAUJn channel mode OS register	TAUJnCMORm	<TAUJn_base> + 80_H + m × 4_H
	TAUJn channel mode user register	TAUJnCMURm	<TAUJn_base> + 20_H + m × 4_H
	TAUJn channel status register	TAUJnCSRm	<TAUJn_base> + 30_H + m × 4_H
	TAUJn channel status clear trigger register	TAUJnCSCm	<TAUJn_base> + 40_H + m × 4_H
	TAUJn channel start trigger register	TAUJnTS	<TAUJn_base> + 54_H
	TAUJn channel enable status register	TAUJnTE	<TAUJn_base> + 50_H
	TAUJn channel stop trigger register	TAUJnTT	<TAUJn_base> + 58_H
TAUJn output registers			
TAUJn	TAUJn channel output enable register	TAUJnTOE	<TAUJn_base> + 60_H
	TAUJn channel output register	TAUJnTO	<TAUJn_base> + $5C_H$
	TAUJn channel output mode register	TAUJnTOM	<TAUJn_base> + 98_H
	TAUJn channel output configuration register	TAUJnTOC	<TAUJn_base> + $9C_H$
	TAUJn channel output active level register	TAUJnTOL	<TAUJn_base> + 64_H
TAUJn reload data registers			
TAUJn	TAUJn channel reload data enable register	TAUJnRDE	<TAUJn_base> + $A0_H$
	TAUJn channel reload data mode register	TAUJnRDM	<TAUJn_base> + $A4_H$
	TAUJn channel reload data trigger register	TAUJnRDT	<TAUJn_base> + 68_H
	TAUJn channel reload status register	TAUJnRSF	<TAUJn_base> + $6C_H$
TAUJn emulation register			
TAUJn	TAUJn emulation register	TAUJnEMU	<TAUJn_base> + $A8_H$

33.3.2 Details of TAUJn Prescaler Registers

33.3.2.1 TAUJnTPS — TAUJn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescalers. CK3 is generated by dividing CK3_PRE by the factor specified in TAUJnBRS.

Access: This register can be read or written in 16-bit units.

Address: <TAUJn_base> + 90_H

Value after reset: $FFFF_H$

Table 33.21 TAUJnTPS Register Contents

Bit Position	Bit Name	Function
3 to 0	TAUJnPRS0[3:0]	Specifies a CK0 clock.

TAUJnPRS0[3:0]	CK0 Clock
0000_B	$PCLK/2^0$
0001_B	$PCLK/2^1$
0010_B	$PCLK/2^2$
0011_B	$PCLK/2^3$
0100_B	$PCLK/2^4$
0101_B	$PCLK/2^5$
0110_B	$PCLK/2^6$
0111_B	$PCLK/2^7$
1000_B	$PCLK/2^8$
1001_B	$PCLK/2^9$
1010_B	$PCLK/2^{10}$
1011_B	$PCLK/2^{11}$
1100_B	$PCLK/2^{12}$
1101_B	$PCLK/2^{13}$
1110_B	$PCLK/2^{14}$
1111_B	$PCLK/2^{15}$

The above bits are rewritable only when all the counters using CK0 are stopped (TAUJnTE.TAUJnTEm = 0).

NOTE

TAUJn clock input PCLK is defined in the first part of this section, **Section 33.1.3, Clock Supply**.

33.3.2.2 TAUJnBRS — TAUJn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUJnTPS. TAUJnPRS3[3:0].

Access: This register can be read or written in 8-bit units.

Address: <TAUJn_base> + 94_H

Value after reset: 00_H

33.3.3 Details of TAUJn Control Registers

33.3.3.1 TAUJnCDRm — TAUJn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUJnCMORm.TAUJnMD[4:1].

Access: This register can be read or written in 32-bit units.

- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

Address: <TAUJn_base> + 0_H + m × 4_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 0	TAUJnCDR[31:0]	Data register for capture/compare values

33.3.3.2 TAUJnCNTm — TAUJn Channel Counter Register

This is a channel m counter register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <TAUJn_base> + 10_H + m × 4_H

Value after reset: FFFF FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 33.24 TAUJnCNTm Register Contents

Bit Position	Bit Name	Function
31 to 0	TAUJnCNT[31:0]	32-bit counter value

The read value depends on a counter, an operating mode change, or TAUJnTS.TAUJnTSm/TAUJnTT.TAUJnTTm bit value.

The initial counter read value depends on the operating mode and how the counter is stopped.

- By a reset
- By a counter stop trigger (TAUJnTT.TAUJnTTm = 1)

The following table lists the initial counter read values after the counter is stopped (TAUJnTE.TAUJnTEm = 0) and re-enabled (TAUJnTS.TAUJnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUJnTS.TAUJnTSm = 1) with the counter waiting for a start trigger.

Table 33.25 TAUJnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUJnCNTm		
		Start Value*1	After Stop Trigger	After One Count
Interval timer mode	Count down	FFFF FFFF$_H$	Stop value	—
Capture mode	Count up	0000 0000$_H$	Stop value	—
One-count mode	Count down	FFFF FFFF$_H$	Stop value	FFFF FFFF$_H$
Capture and one-count mode	Count up	0000 0000$_H$	Stop value	Capture value + 1 (TAUJnCDRm)
Count capture mode	Count up	0000 0000$_H$	Stop value	—
Gate count mode	Count down	FFFF FFFF$_H$	Stop value	Stop value
Capture and gate count mode	Count up	0000 0000$_H$	Stop value	Stop value

Note 1. The value set for TAUJnCNTm when operating mode is changed after a reset is deasserted

33.3.3.3 TAUJnCMORm — TAUJn Channel Mode OS Register

This register controls channel m operation.

Access: This register can be read or written in 16-bit units.

Writable only when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + 80_H + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 33.26 TAUJnCMORm Register Contents

Bit Position	Bit Name	Function
4 to 0	TAUJnMD[4:0]	Specifies an operating mode.

TAUJn MD4	TAUJn MD3	TAUJn MD2	TAUJn MD1	TAUJn MD0	Functional Description
0	0	0	0	1/0	Interval timer mode
0	0	0	1	1/0	Setting prohibited
0	0	1	0	1/0	Capture mode
0	0	1	1	0	Setting prohibited
0	1	0	0	1/0	One-count mode
0	1	0	1	1/0	Setting prohibited
0	1	1	0	0	Capture and one-count mode
0	1	1	1	1/0	Setting prohibited
1	0	0	0	0	Setting prohibited
1	0	0	1	0	Setting prohibited
1	0	1	0	1/0	Setting prohibited
1	0	1	1	1/0	Count capture mode
1	1	0	0	0	Gate count mode
1	1	0	1	0	Capture and gate count mode

Mode	Role of TAUJnMD0 Bit
Interval timer mode Capture mode Count capture mode	Specifies whether INTTAUJnIm is generated at the beginning of count operation (when a start trigger is entered) or not. 0: INTTAUJnIm is not generated. 1: INTTAUJnIm is generated.
One-count mode	Enables/disables start trigger detection during counting. 0: Disables detection. 1: Enables detection. **CAUTION:** In one-count mode, INTTAUJnIm signal is not output at the beginning of count operation.
Capture and one-count mode Gate count mode Capture and gate count mode	This bit should be set to 0. **CAUTION:** INTTAUJnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled.

33.3.3.4 TAUJnCMURm — TAUJn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUJTTINm input.

Access: This register can be read or written in 8-bit units.

Address: <TAUJn_base> + 20_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 33.27 TAUJnCMURm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	Specifies a valid edge of TAUJTTINm input signal.

TAUJnTIS1	TAUJnTIS0	Functional Description
0	0	Falling edge
0	1	Rising edge
1	0	Detection of falling and rising edges (selection of low width measurement) Start trigger: Falling edge Stop trigger (capture): Rising edge
1	1	Detection of falling and rising edges (selection of high width measurement) Start trigger: Rising edge Stop trigger (capture): Falling edge

Edge detection of TAUJTTINm input signal is based on the operation clock selected by TAUJnCMORm.TAUJnCKS[1:0].

33.3.3.5 TAUJnCSRm — TAUJn Channel Status Register

This register indicates the overflow status of channel m.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <TAUJn_base> + 30_H + m × 4_H

Value after reset: $0X_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUJnOVF
Value after reset	0	0	0	0	0	0	—	0
R/W	R	R	R	R	R	R	R	R

Table 33.28 TAUJnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	Reserved	When read, an undefined value is returned.
0	TAUJnOVF	Indicates the counter overflow status: 0: No overflow occurs 1: Overflow occurs This bit is used only in the following modes: ● Capture mode ● Capture and one-count mode The function of this bit depends on the setting of control bits TAUJnCMORm.TAUJnCOS[1:0].

33.3.3.6 TAUJnCSCm — TAUJn Channel Status Clear Trigger Register

This register is a trigger register for clearing the overflow flag TAUJnCSRm.TAUJnOVF of channel m.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 40_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUJnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 33.29 TAUJnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUJnCLOV	0: No function 1: Clears the overflow flag TAUJnCSRm.TAUJnOVF

33.3.3.7 TAUJnTS — TAUJn Channel Start Trigger Register

This register enables the counter operation for each channel.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 54_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTS03	TAUJnTS02	TAUJnTS01	TAUJnTS00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 33.30 TAUJnTS Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	TAUJnTSm	Enables the counter operation for channel m: 0: No function 1: Enables the counter operation and sets TAUJnTE.TAUJnTEm = 1. Only the counter operation is enabled even if TAUJnTE.TAUJnTEm = 1. Whether the counter is started or not depends on the selected operating mode.

33.3.3.8 TAUJnTE — TAUJn Channel Enable Status Register

This register indicates whether a counter operation is enabled.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <TAUJn_base> + 50_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTE03	TAUJnTE02	TAUJnTE01	TAUJnTE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 33.31 TAUJnTE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	TAUJnTEm	Indicates whether channel m's counter operation is enabled. 0: Counter operation is disabled 1: Counter operation is enabled This bit is set to 1 when trigger input of TAUJnTSSTm (synchronous channel start trigger signal) is detected or when TAUJnTS.TAUJnTSm is set to 1. This bit is reset to 0 when TAUJnTT.TAUJnTTm is set to 1.

33.3.3.9 TAUJnTT — TAUJn Channel Stop Trigger Register

This register stops the counter operation of each channel.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 58_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTT03	TAUJnTT02	TAUJnTT01	TAUJnTT00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 33.32 TAUJnTT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	TAUJnTTm	Stops channel m’s counter operation. 0: No function 1: Stops the counter operation and resets TAUJnTE.TAUJnTEm. TAUJnCNTm, TAUJnTO.TAUJnTOm, and TAUJTTOUTm retain the values provided before the counter is stopped.

33.3.4 Details of TAUJn Simultaneous Rewrite Register

33.3.4.1 TAUJnRDE — TAUJn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUJnCDRm. It also enables and disables simultaneous rewrite of the data register TAUJnTOLm for the PWM output function.

Access: This register can be read or written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

Address: <TAUJn_base> + $A0_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDE03	TAUJnRDE02	TAUJnRDE01	TAUJnRDE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.33 TAUJnRDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnRDEm	Enables/disables simultaneous rewrite of the data register of channel m: 0: Disables simultaneous rewrite 1: Enabled simultaneous rewrite

33.3.4.2 TAUJnRDM — TAUJn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

Access: This register can be read or written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

Address: <TAUJn_base> + $A4_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDM03	TAUJnRDM02	TAUJnRDM01	TAUJnRDM00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.34 TAUJnRDM Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnRDMm	Specifies when the signal that triggers simultaneous rewrite is generated: 0: When the master channel counter starts counting 1: No function These bits only apply when TAUJnRDE.TAUJnRDEm = 1.

33.3.4.3 TAUJnRDT — TAUJn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 68_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDT03	TAUJnRDT02	TAUJnRDT01	TAUJnRDT00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 33.35 TAUJnRDT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	TAUJnRDTm	Triggers the simultaneous rewrite enabling state. 0: No function 1: Simultaneous rewrite enabling state is triggered. The simultaneous rewrite enabling flag (TAUJnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger. These bits only apply when: • TAUJnRDE.TAUJnRDEm = 1

33.3.4.4 TAUJnRSF — TAUJn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <TAUJn_base> + $6C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRSF03	TAUJnRSF02	TAUJnRSF01	TAUJnRSF00
Value after reset	0	0	0	0	0	0	0	0

Table 33.36 TAUJnRSF Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	TAUJnRSFm	Indicates the simultaneous rewrite status. 0: Indicates that simultaneous rewrite has been completed due to the generation of simultaneous rewrite trigger. 1: Indicates that the system waits for a simultaneous rewrite trigger in the simultaneous rewrite enabling state (TAUJnRDTm = 1).

33.3.5 Details of TAUJn Output Registers

33.3.5.1 TAUJnTOE — TAUJn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

Access: This register can be read or written in 8-bit units.

Address: <TAUJn_base> + 60_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOE03	TAUJnTOE02	TAUJnTOE01	TAUJnTOE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.37 TAUJnTOE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOEm	Enables/disables independent channel output function: 0: Disables independent timer output function (controlled by software) 1: Enables independent timer output function

33.3.5.2 TAUJnTO — TAUJn Channel Output Register

This register specifies and reads the level of TAUJTTOUTm.

Access: This register can be read or written in 8-bit units.

Address: <TAUJn_base> + $5C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTO03	TAUJnTO02	TAUJnTO01	TAUJnTO00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.38 TAUJnTO Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOm	Specifies and reads the level of TAUJTTOUTm: 0: Low 1: High Only TAUJnTOm bits for which Independent Channel Output function is disabled (TAUJnTOEm = 0) can be written.

33.3.5.3 TAUJnTOM — TAUJn Channel Output Mode Register

This register specifies the output mode of each channel.

Access: This register can be read or written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + 98_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOM03	TAUJnTOM02	TAUJnTOM01	TAUJnTOM00
Value after reset	0	0	0	0	0	0	0	0

Table 33.39 TAUJnTOM Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOMm	Specifies the channel output mode: 0: Independent channel output mode 1: Synchronous channel output mode The output mode depends on the settings of channel output control (TAUJnTOE.TAUJnTOEm) bits.

33.3.5.4 TAUJnTOC — TAUJn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUJnTOMm.

Access: This register can be read or written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + $9C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOCm	Specifies the output mode: 0: Operation mode 1 (= Toggle mode) 1: No function This bit must be set to 0 for all output modes except independent channel output mode controlled by software. The output mode also depends on TAUJnTOM.TAUJnTOMm, as shown in the following table.

TAUJnTOMm	TAUJnTOCm	Functional Description
0	0	Toggle mode: Toggling proceeds when INTTAUJnIm occurs.
0	1	No function
1	0	Synchronous channel operation mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel.
1	1	No function

33.3.5.5 TAUJnTOL — TAUJn Channel Output Active Level Register

This register specifies the output logic of the channel output bit (TAUJnTO.TAUJnTOm).

Access: This register can be read or written in 8-bit units.

Address: <TAUJn_base> + 64_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOL03	TAUJnTOL02	TAUJnTOL01	TAUJnTOL00

Table 33.41 TAUJnTOL Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOLm	Specifies the output logic of the channel m output bit (TAUJnTO.TAUJnTOm): 0: Positive logic (active high) 1: Negative logic (active low) These bits apply in all channel output modes except independent channel output mode controlled by software and independent channel output mode 1.

33.3.6 TAUJn Emulation Register

33.3.6.1 TAUJnEMU — TAUJn Emulation Register

This register controls operation by SVSTOP.

Access: This register can be read or written in 8-bit units.

A write should be performed when counters are stopped (TAUJnTE.TAUJnTEm = 0) and (EPC.SVSTOP = 0).

Address: <TAUJn_base> + $A8_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TAUJn SVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 33.42 TAUJnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUJnSVSDIS	When EPC.SVSTOP bit = 0: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0). When EPC.SVSTOP bit = 1: 0: The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint). 1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

33.4 Operating Procedure

The following lists the general operation procedure for the TAUJn:

After a reset is deasserted, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUJTTOUTm is also initialized and outputs a low level.

1. Set the TAUJnTPS and TAUJnBRS registers to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUJn function:
   - Set the operation mode
   - Set any other control bits
3. Enable the counter by setting the TAUJnTS.TAUJnTSm bit to 1.
   The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUJnTT.TAUJnTTm bit to 1. The counter can be forcibly restarted by setting the TAUJnTS.TAUJnTSm bit to 1.
5. Stop the function by setting the TAUJnTT.TAUJnTTm bit to 1.

NOTES

1. A detailed description of the required control bits and the operation of the individual functions are given in **Section 33.12, Independent Channel Operation Functions** and **Section 33.13, Synchronous Channel Operation Functions**.
2. The function can be changed while the counter is stopped (TAUJnTE.TAUJnTEm = 0).

33.5 Concepts of Synchronous Channel Operation Function

The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in **Section 33.5.1, Rules of Synchronous Channel Operation Function**.

The synchronous channel operation function are detailed in the following section.

- **Section 33.13, Synchronous Channel Operation Functions**

33.5.1 Rules of Synchronous Channel Operation Function

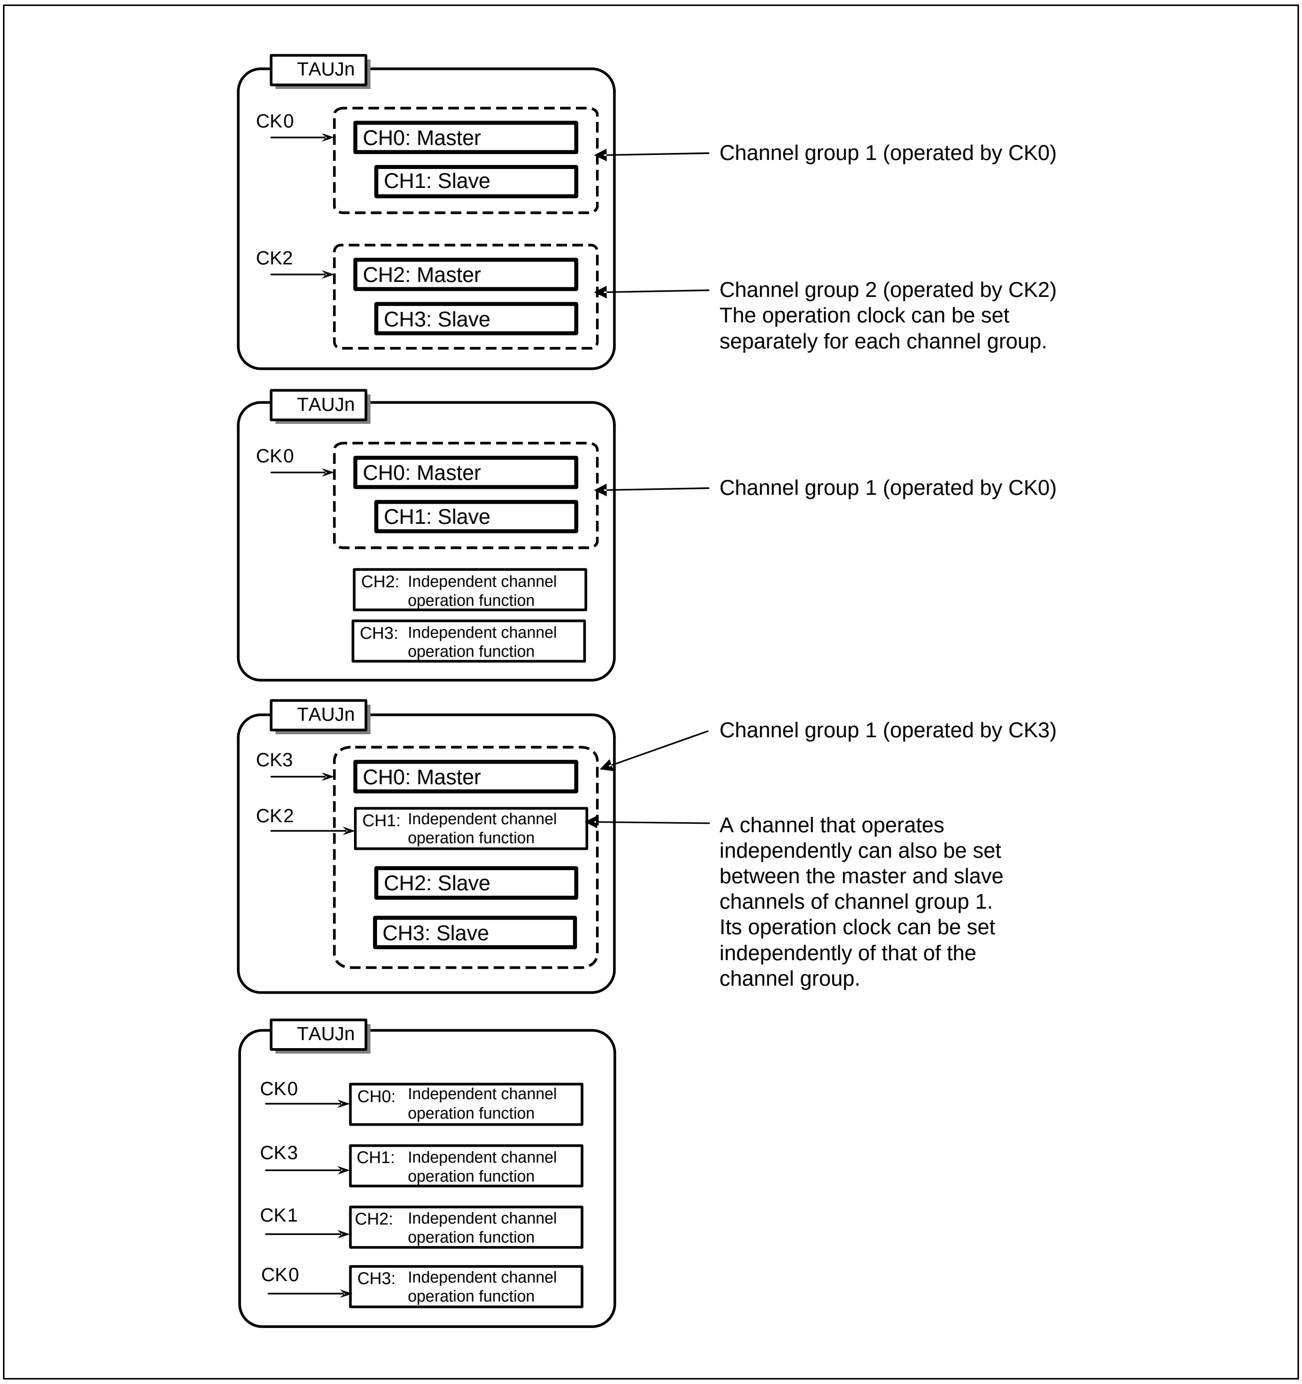
Number of master and slave channels

- Only even channels (CH0, CH2) can be set as master channels. Any channel other than CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 can be set as slave channel.
- If two master channels are used, slave channels cannot cross the master.
  Example: If CH0 and CH2 are master channels, CH1 can be set as slave channel for CH0, but CH3 cannot.

Operation clock

- The same operation clock should be set for the master channel and the synchronized slave channel. This is achieved by setting the same value in the TAUJnCMORm.TAUJnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave usage and operation clocks are illustrated in **Figure 33.5, Grouping of Channels and Assignment of Operation Clocks**.



Channel group 1 (operated by CK0)

Channel group 2 (operated by CK2)
The operation clock can be set
separately for each channel group.

Channel group 1 (operated by CK0)

Channel group 1 (operated by CK3)

A channel that operates independently can also be set between the master and slave channels of channel group 1. Its operation clock can be set independently of that of the channel group.

Figure 33.5 Grouping of Channels and Assignment of Operation Clocks

33.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously, both within a TAUJ unit and between TAUJ units.

33.5.2.1 Simultaneous Start and Stop within a TAUJ Unit

- To simultaneously start synchronized channels, the TAUJnTS.TAUJnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUJnTT.TAUJnTTm bits of the channels should be set at the same time.

Setting 1 in the TAUJnTS.TAUJnTSm bits sets the corresponding TAUJnTE.TAUJnTEm bits to 1, enabling counting. The count start timing of the counter depends on the operating mode.

33.5.2.2 Simultaneous Start between TAUJ Units

Counters in different TAUJ units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

For details about how to perform simultaneous start between the units, see **Section 36.8, Simultaneous Start Trigger Function**.

33.6 Simultaneous Rewrite

33.6.1 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite. The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

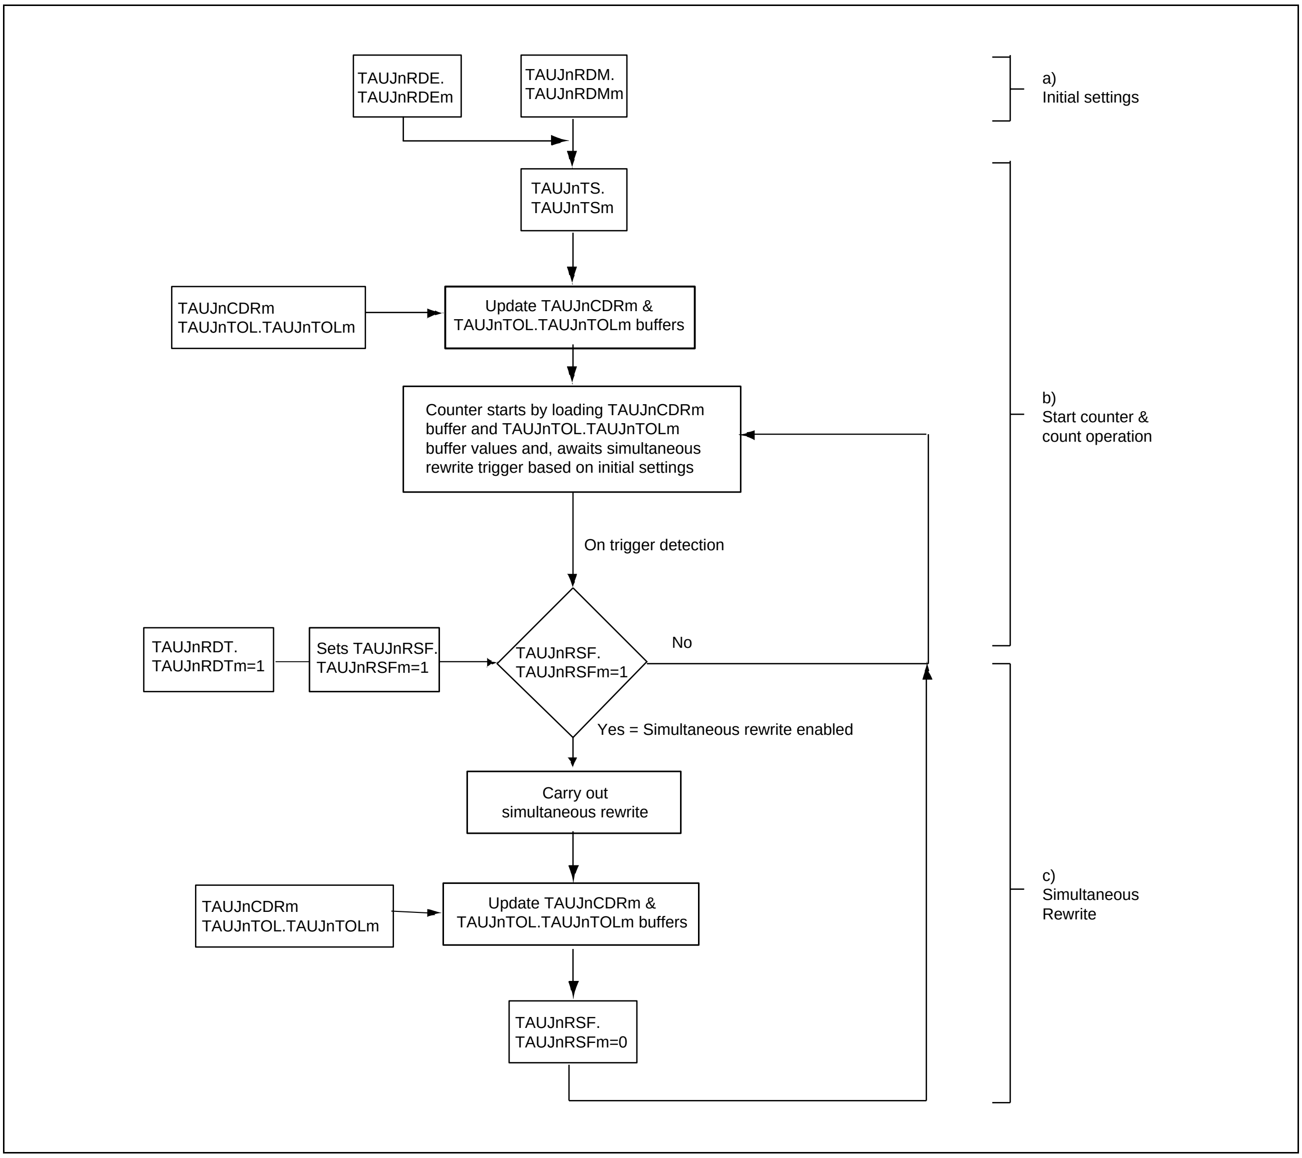


Figure 33.6 General Procedure for Simultaneous Rewrite

33.6.1.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUJnRDE.TAUJnRDEm = 1.
- To select simultaneous rewrite when the master channel starts counting, set TAUJnRDM.TAUJnRDMm.

33.6.1.2 Start Counter and Count Operation

- To start all the TAUJnCNTm counters in the channel group, set the corresponding TAUJnTS.TAUJnTSm bits to 1. The values of TAUJnTOL.TAUJnTOLm and the data registers (TAUJnCDRm) are loaded into the corresponding TAUJnTOL.TAUJnTOLm buffer (TAUJnTOL.TAUJnTOLm buf) and data buffer registers (TAUJnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUJnRDT.TAUJnRDTm) to 1 sets the reload flag (TAUJnRSF.TAUJnRSFm) to 1, enabling simultaneous rewrite. TAUJnRSF.TAUJnRSFm remains set to 1 until simultaneous rewrite is completed.
- When a specified trigger for simultaneous rewrite is detected, the TAUJnRSF.TAUJnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1). If enabled, simultaneous rewrite is carried out. Otherwise simultaneous rewrite is not carried out and the system waits for detection of the next simultaneous rewrite trigger.

33.6.1.3 Simultaneous Rewrite

- When the simultaneous rewrite trigger is detected and simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1), the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and the values are applied the next time the counter starts or restarts.
- When the simultaneous rewrite is complete, the TAUJnRSF.TAUJnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

33.6.2 Other General Rules for Simultaneous Rewrite

The following rules also apply.

- TAUJnRDE.TAUJnRDEm and TAUJnRDM.TAUJnRDMm cannot be changed while the counter is in operation (TAUJnTE.TAUJnTEm = 1).
- TAUJnTOL.TAUJnTOLm can be rewritten only during operation using the PWM output function. For all other functions, TAUJnTOL.TAUJnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUJTTOUTm outputs an invalid waveform.

33.6.3 Simultaneous Rewrite Procedure

The simultaneous rewrite procedure with PWM output function is described in the following figure.

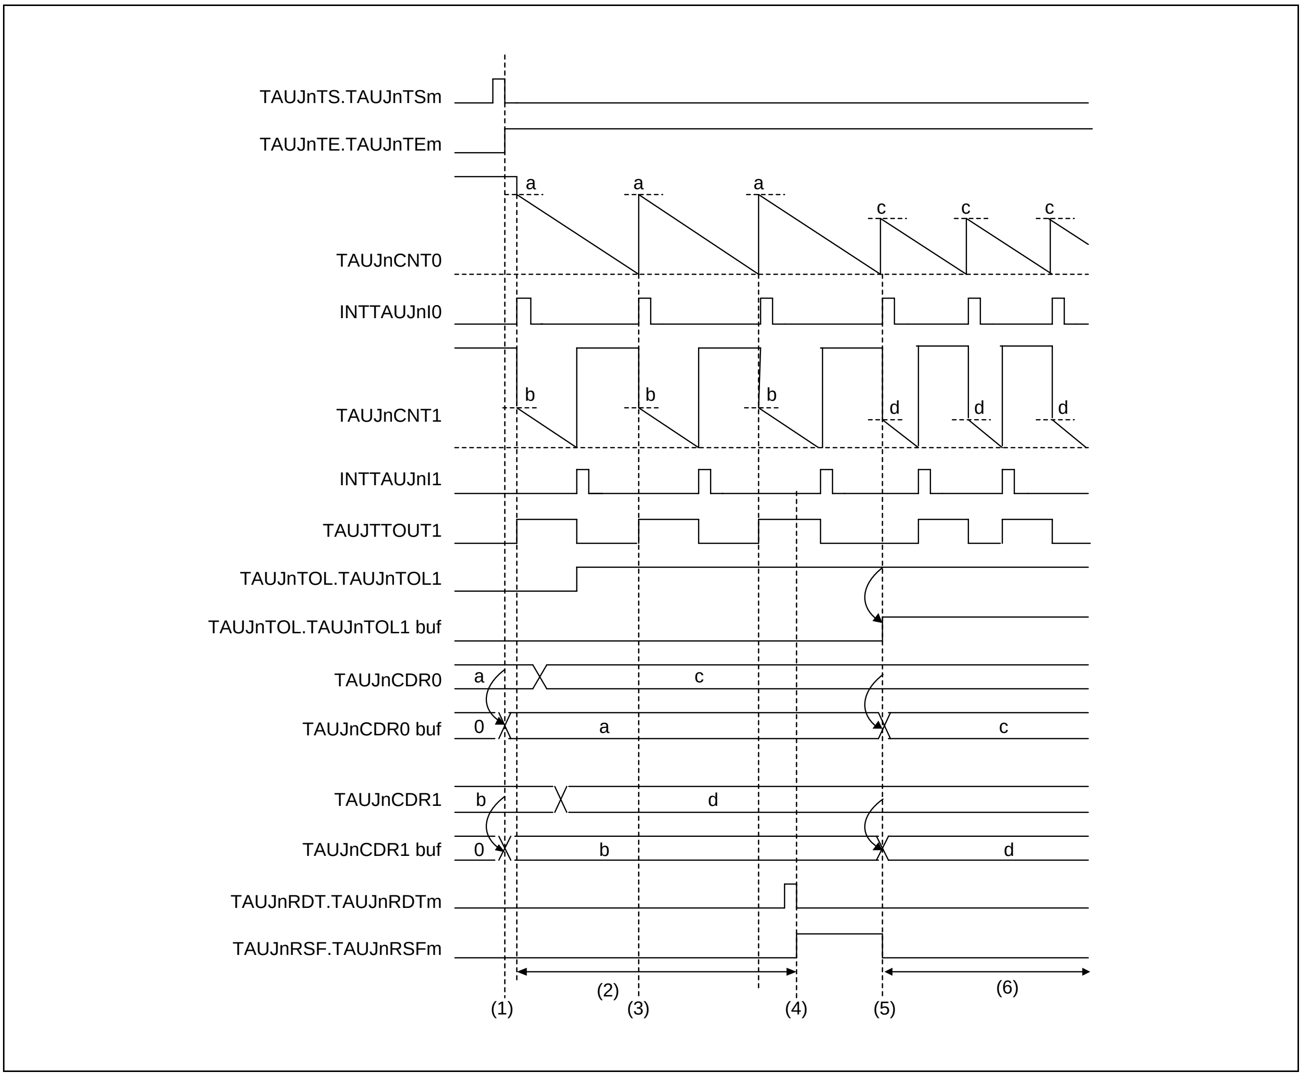

Figure 33.7 Simultaneous Rewrite with PWM Output Function

Setting:

CH0 is a master channel of PWM output function, and CH1 is a slave channel of PWM output function. Simultaneous rewrite is applied when the master channel starts counting.

Description:

(1) When TAUJnTS.TAUJnTSm = 1 is set, the value of TAUJnCDRm is copied to the TAUJnCDRm buffer and the value of TAUJnTOL.TAUJnTOLm is copied to the TAUJnTOL.TAUJnTOLm buffer.

(2) The TAUJnCDRm and TAUJnTOL.TAUJnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUJnRSF.TAUJnRSFm = 0).

(4) The reload data trigger bit (TAUJnRDT.TAUJnRDTm) is set to 1 which sets the status flag (TAUJnRSF.TAUJnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite is triggered when CH0 restarts counting, because simultaneous rewrite is enabled. The TAUJnCDRm value is loaded into the TAUJnCDRm buffer and the TAUJnTOL.TAUJnTOLm value is loaded into the TAUJnTOL.TAUJnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUJnCDRm and TAUJnTOL.TAUJnTOLm can be changed again.

33.7 Channel Output Modes

The output of the TAUJTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUJnTOE.TAUJnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUJnTO.TAUJnTOm) is sent to the output pin (TAUJTTOUTm).
- By TAUJ signals (TAUJnTOE.TAUJnTOEm = 1)
  When controlled by TAUJ signals, the output level of TAUJTTOUTm is set or reset or toggled by internal signals. The value of TAUJnTO.TAUJnTOm is updated accordingly to reflect the value of TAUJTTOUTm.
  - Independently (TAUJnTOM.TAUJnTOMm = 0)
    In case of independent operation, the output of the TAUJTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUJnTOM.TAUJnTOMm = 0).
  - Synchronously (TAUJnTOM.TAUJnTOMm = 1)
    In case of synchronous operation, the output of the TAUJTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUJnTOM.TAUJnTOMm = 1).

The TAUJnTO.TAUJnTOm bit can always be read to determine the current value of TAUJTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 33.43, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 33.7.2, Channel Output Modes Controlled Independently by TAUJn Signals**
- **Section 33.7.3, Channel Output Modes Controlled Synchronously by TAUJn Signals**

Batch operation of TAUJnTOm bit

Whether a set value is reflected to the TAUJnTOm bit or not is controlled by the TAUJnTOE.TAUJnTOEm bit.

The TAUJnTOm setting is written only to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 0 when a write to the TAUJnTO register is attempted. No TAUJnTOm setting is reflected to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 1.

NOTE

TAUJnTO.TAUJnTOm bit is placed so that its bit number corresponds to a channel number.

Output logic

Positive logic or negative logic of the output is specified by control bit TAUJnTOL.TAUJnTOLm.

The value of TAUJnTOL.TAUJnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function. Otherwise, changes to TAUJnTOL.TAUJnTOLm result in an undefined TAUJTTOUTm signal output.

See **Section 33.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 33.43, Channel Output Modes**.

Table 33.43 Channel Output Modes

Channel Output Mode	TAUJnTOE.TAUJnTOEm	TAUJnTOM.TAUJnTOMm
By software		
Independent channel output mode controlled by software	0	x
By TAUJ signals, independently		
Independent channel output mode 1	1	0
By TAUJ signals, synchronously		
Synchronous channel output mode 1	1	1

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

NOTE

The following bits cannot be changed during count operation (TAUJnTE.TAUJnTEm = 1):

- TAUJnTOM.TAUJnTOMm
- TAUJnTOC.TAUJnTOCm

33.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUJTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUJnTOE.TAUJnTOEm = 0).

(1) Set TAUJnTO.TAUJnTOm to specify the initial level of the TAUJTTOUTm output.

(2) Set channel output mode according to **Table 33.43, Channel Output Modes**, and the output logic using the TAUJnTOL.TAUJnTOLm bit.

(3) Start the counter (TAUJnTS.TAUJnTSm = 1).

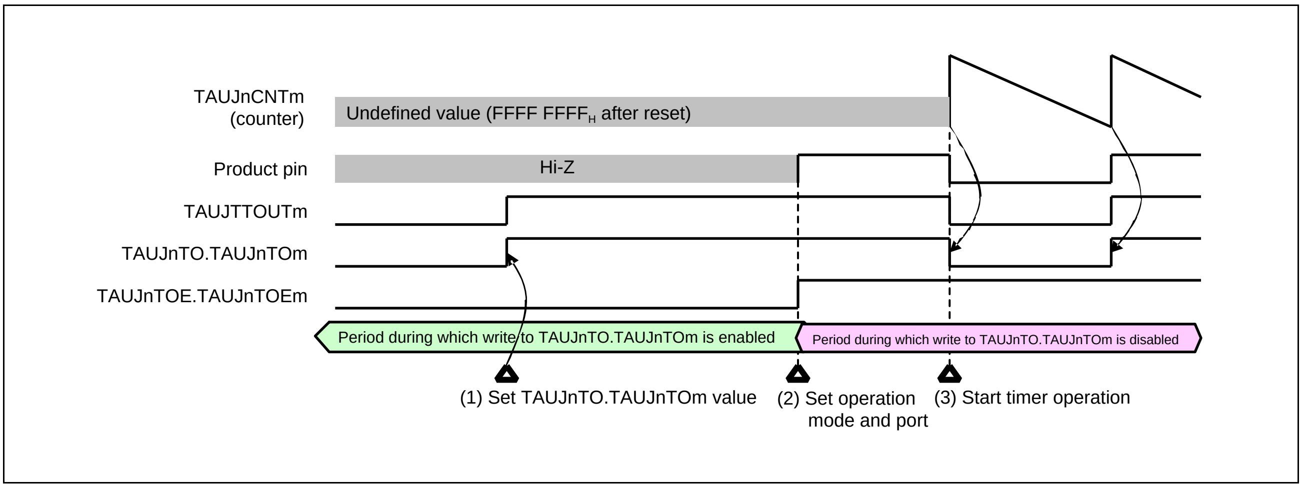

Figure 33.8 General Procedure for Specifying a TAUJTTOUTm Channel Output Mode

33.7.2 Channel Output Modes Controlled Independently by TAUJn Signals

This section lists the channel output modes that are controlled independently by TAUJn signals. The control bits used to specify a mode are listed in **Table 33.43, Channel Output Modes**.

33.7.2.1 Independent Channel Output Mode 1

Set/reset conditions

In this output mode, TAUJTTOUTm toggles when INTTAUJnIm is detected. The value of TAUJnTOL.TAUJnTOLm is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 33.43, Channel Output Modes**.

33.7.3 Channel Output Modes Controlled Synchronously by TAUJn Signals

This section lists the channel output modes that are controlled synchronously by TAUJn signals. The control bits used to specify a mode are listed in **Table 33.43, Channel Output Modes**.

33.7.3.1 Synchronous Channel Output Mode 1

Set/reset conditions

In this output mode, INTTAUJnIm of master channel serves as a set signal and INTTAUJnIm of the slave channel as a reset signal. If INTTAUJnIm of the master channel and INTTAUJnIm of the slave channel are generated at the same time, INTTAUJnIm of the slave channel (reset signal) has priority over INTTAUJnIm (set signal) of the master channel, i.e., the master channel is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 33.43, Channel Output Modes**.

33.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUJnTS.TAUJnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

33.8.1 Interval Timer Mode, Capture Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUJnTS.TAUJnTSm is set to 1. The value of data register is also loaded when the counter starts.

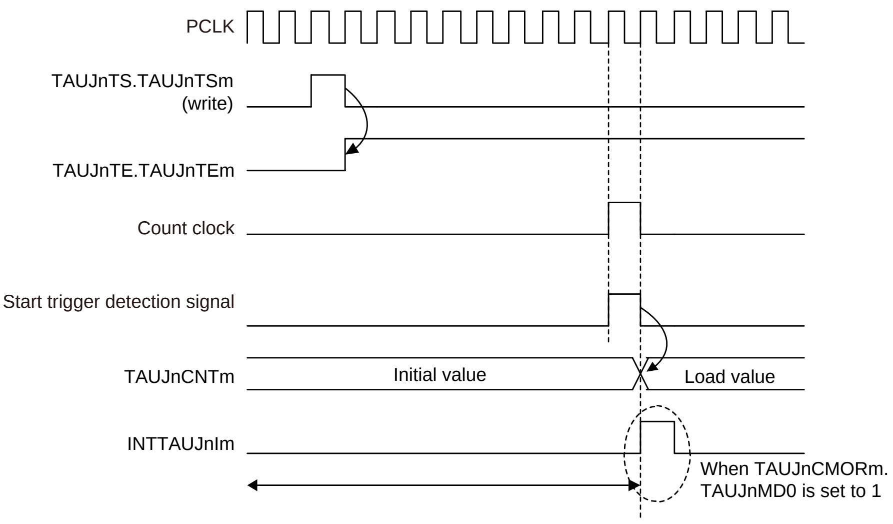

Figure 33.9 Start Timing in Interval Timer Mode, Capture Mode, and Count Capture Mode

33.8.2 Other Operating Modes

In other operating modes, count clock cycle is irrelevant to start of counter operation. The counter operation start timing is triggered only upon detection of a valid edge of TAUJTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which is irrelevant to start of counter operation, determine the frequency with which all operations take place.

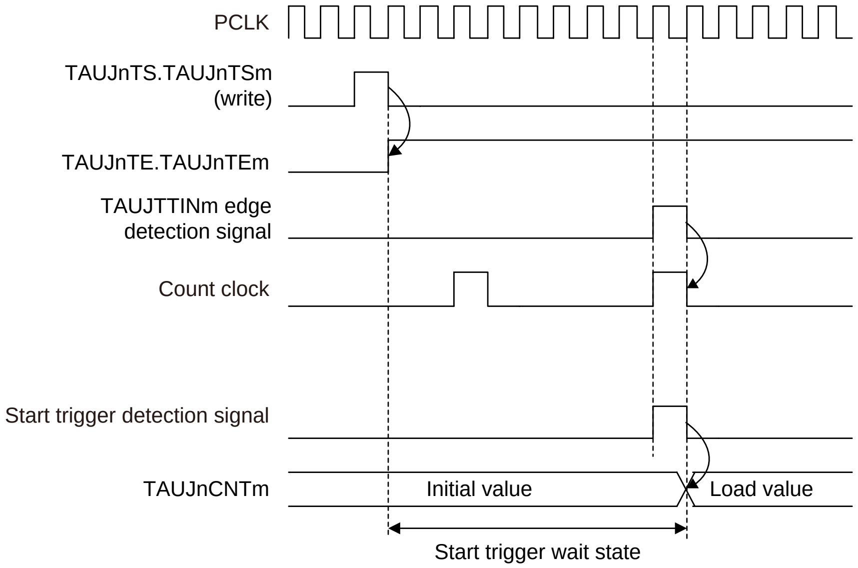

Figure 33.10 Count Start Timing in Other Operating Modes

33.9 TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUJnIm is generated using the TAUJnCMORm.TAUJnMD0 bit. The generation of INTTAUJnIm when the TAUJnCMORm.TAUJnMD0 bit starts counting and the effect to TAUJTTOUTm depend on the selected function. For details, refer to the description of TAUJnCMORm.TAUJnMD0 of each function.

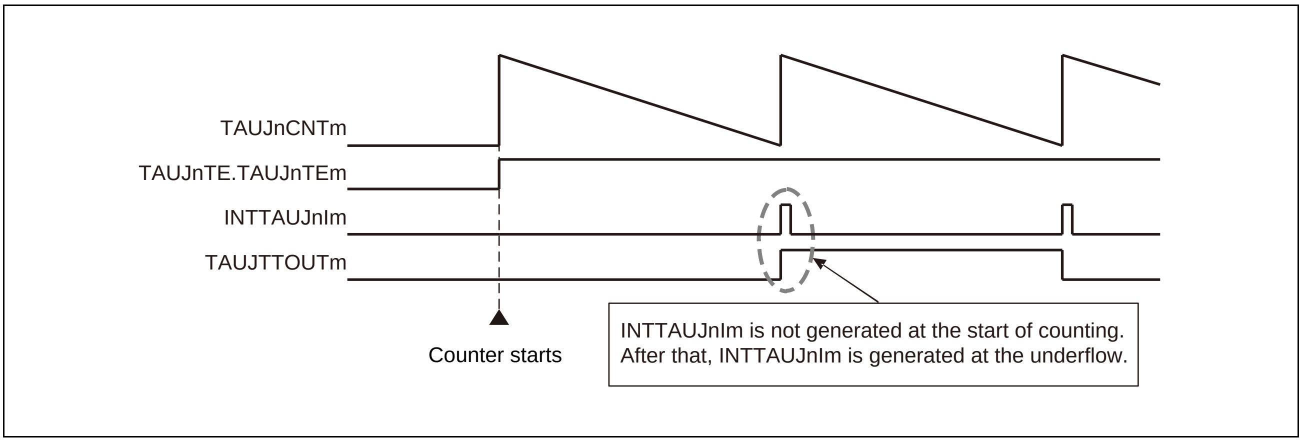

Figure 33.11 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 0)

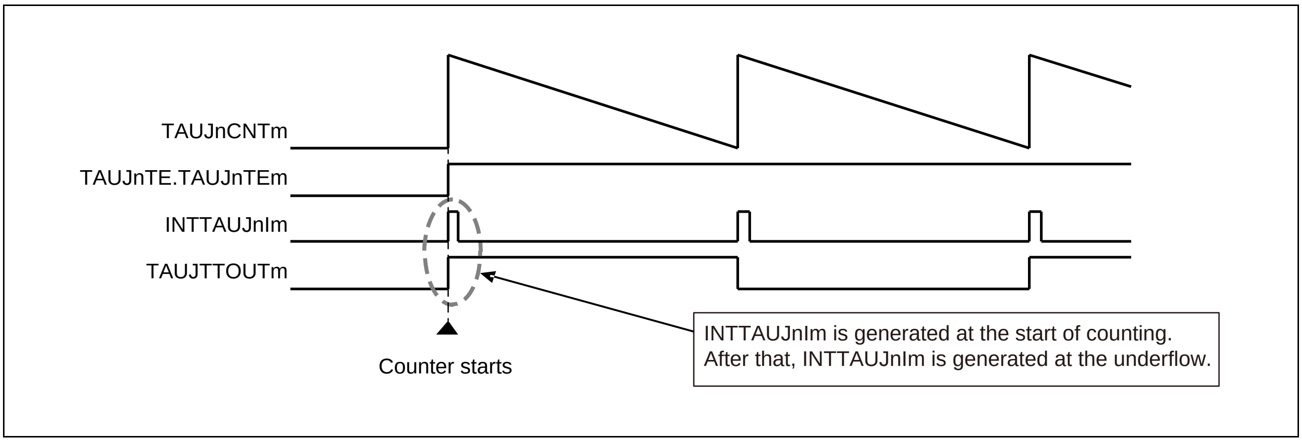

Figure 33.12 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 1)

33.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches FFFF FFFF_H and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operations in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches 0000 0000_H at the same time as the first channel overflows (TAUJnCNTm = FFFF FFFF_H).
- Set TAUJnCDRm of the second channel to FFFF FFFF_H.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUJTTINm input.
- The trigger detection settings (TAUJnCMORm.TAUJnSTS[2:0] and TAUJnCMURm.TAUJnTIS[1:0]) must be identical for both channels.

Result:

The down-counter of the second channel reaches 0000 0000_H at exactly the same time as the up-counter of the first channel overflows (TAUJnCNTm = FFFF FFFF_H). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

33.10.1 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

When the capture trigger is input simultaneously to TAUJTTINm of both channels, INTTAUJnIm of the interval timer function can detect the overflow when TAUJnCNTm of the TAUJTTINm input position detection function exceeds FFFF FFFF$_H$.

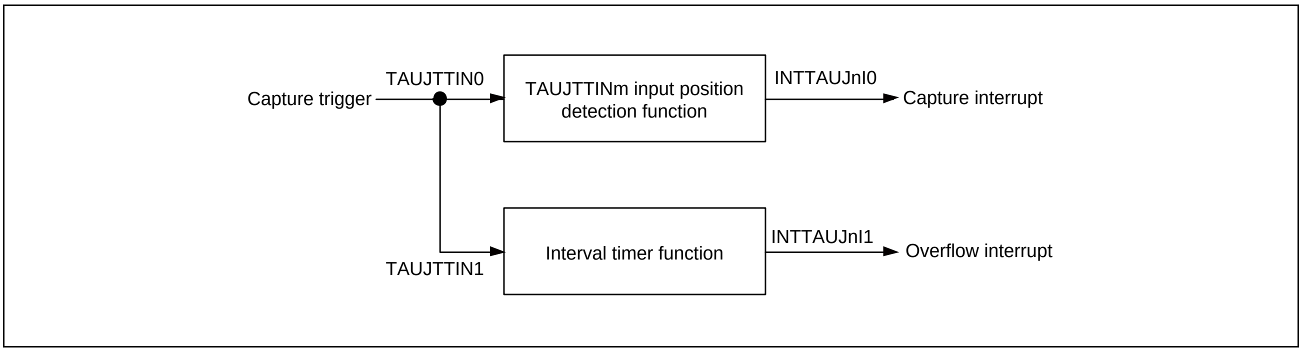

Figure 33.13 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

Timing diagram

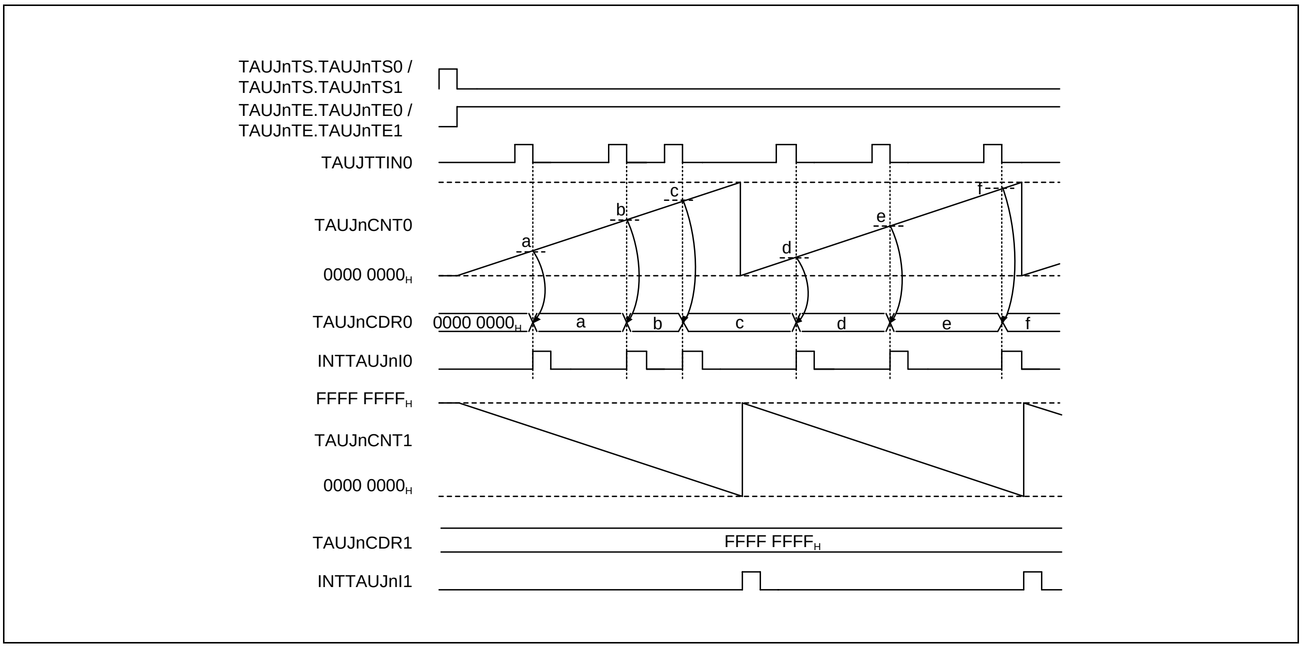

Figure 33.14 Interrupt Generation via Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

33.11 TAUJTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

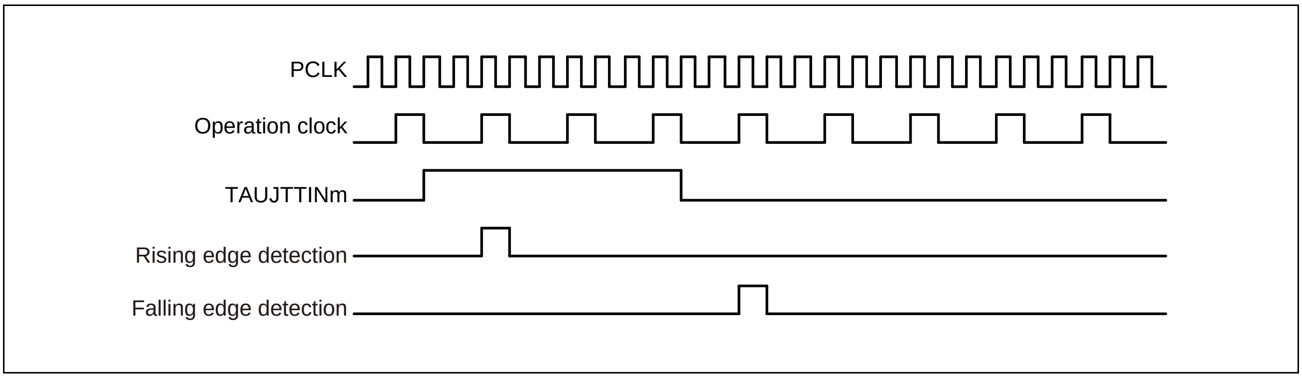

Figure 33.15 Basic Edge Detection Timing

Figure 33.15, Basic Edge Detection Timing shows an image of operation timing. In the actual operation, delay time occurs due to noise filter and synchronization circuit between the TAUJnIm pin and TAUJn.

33.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUJ. For a general overview of independent channel operation functions, see **Section 33.2, Overview**.

33.12.1 Interval Timer Function

33.12.1.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave.

Functional description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counter starts to count down from this value.

When the counter reaches 0000 0000_H, INTTAUJnIm is generated and the TAUJTTOUTm signal toggles. TAUJnCNTm then loads the TAUJnCDRm value and subsequently continues operation.

The value of TAUJnCDRm can be rewritten at any time, and the changed value of TAUJnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0. TAUJnCNTm and TAUJTTOUTm stop but retain their values. The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.

Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUJTTOUTm does not toggle. This results in a reverted TAUJTTOUTm signal compared to when TAUJnCMORm.TAUJnMD0 is set to 1.

33.12.1.2 Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTTOUTm square wave cycle = count clock cycle × (TAUJnCDRm+1) × 2

33.12.1.3 Block Diagram and General Timing Diagram

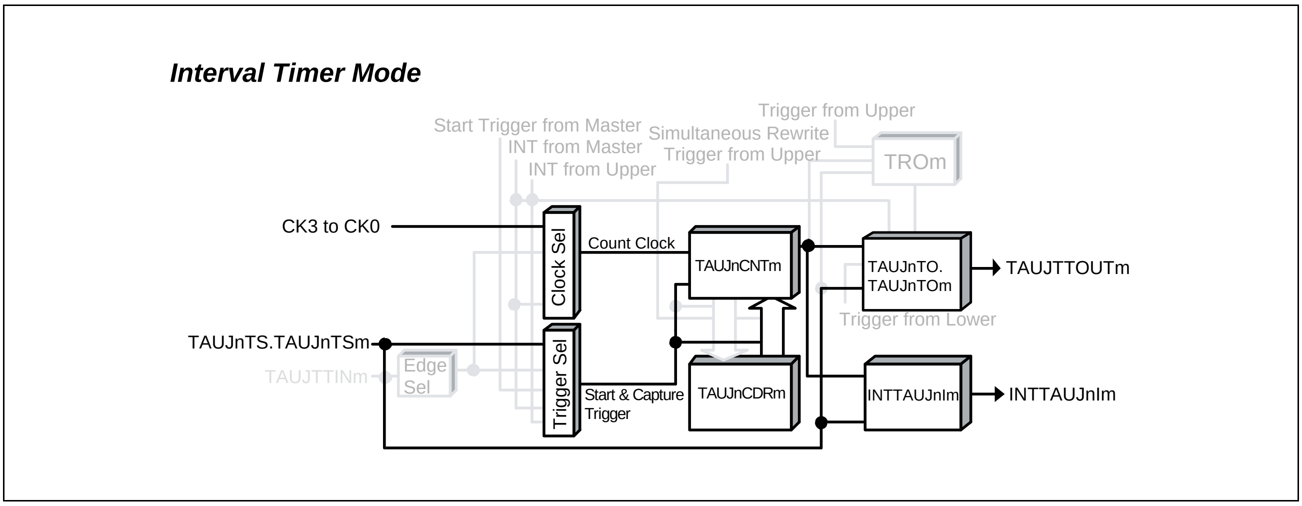

Figure 33.16 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1).

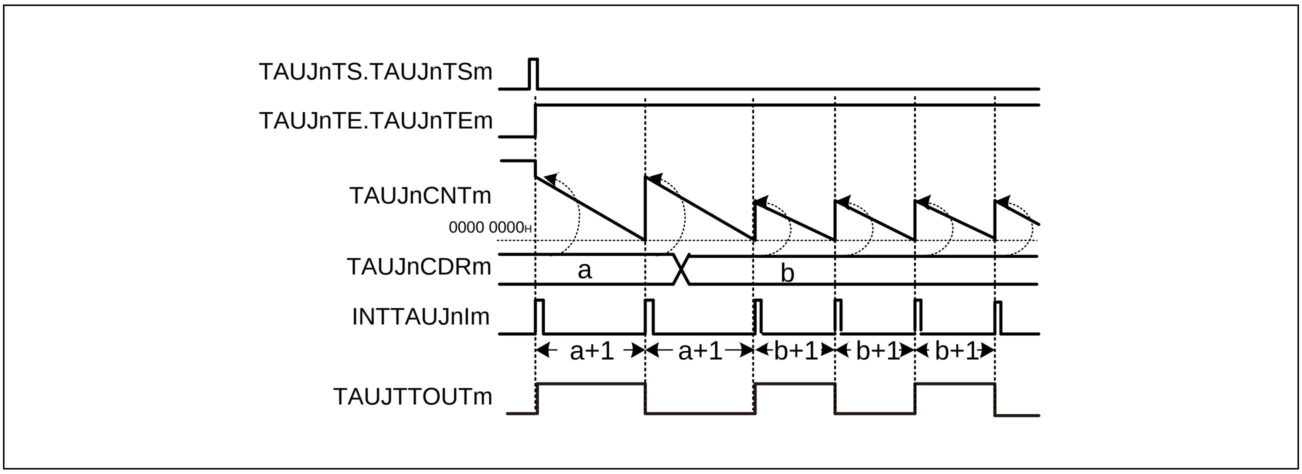

Figure 33.17 General Timing Diagram for Interval Timer Function

7, 6	TAUJnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUJnMD[4:1]	Write 0000_B.
0	TAUJnMD0	0: INTTAUJnIm is not generated and TAUJTTOUTm does not toggle when operation starts or restarts. 1: Generates INTTAUJnIm and toggles TAUJTTOUTm when operation starts or restarts.

(2) TAUJnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 33.45 Contents of the TAUJnCMURm register for Interval Timer Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Not used, so set to 00.

(3) Channel Output Mode

Table 33.46 Control Bit Settings in Independent Channel Output Mode 1

Bit name	Setting
TAUJnTOE.TAUJnTOEm	Write 1_B.
TAUJnTOM.TAUJnTOMm	Write 0_B.
TAUJnTOC.TAUJnTOCm	Write 0_B.
TAUJnTOL.TAUJnTOLm	Write 0_B.

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details see **Section 33.7, Channel Output Modes**.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the interval timer function. Therefore, these registers must be set to 0.

Table 33.47 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

33.12.1.5 Operating Procedure for Interval Timer Function

Table 33.48 Operating Procedure for Interval Timer Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 33.44, Contents of the TAUJnCMORm register for Interval Timer Function** and **Table 33.45, Contents of the TAUJnCMURm register for Interval Timer Function**. Set the value of the TAUJnCDRm register. Set the channel output mode by setting the control bits as described in **Table 33.46, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm loads the TAUJnCDRm value. When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTTOUTm toggles.
During operation	The TAUJnCDRm register value can be changed at any time. The TAUJnCNTm register can be read at all times.	TAUJnCNTm counts down. When the counter reaches 0000 0000_H: ● TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. ● INTTAUJnIm is generated and TAUJTTOUTm toggles.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart operation

33.12.1.6 Specific Timing Diagrams

(1) TAUJnCDRm = 0000 0000$_H$, Count Clock = PCLK/2

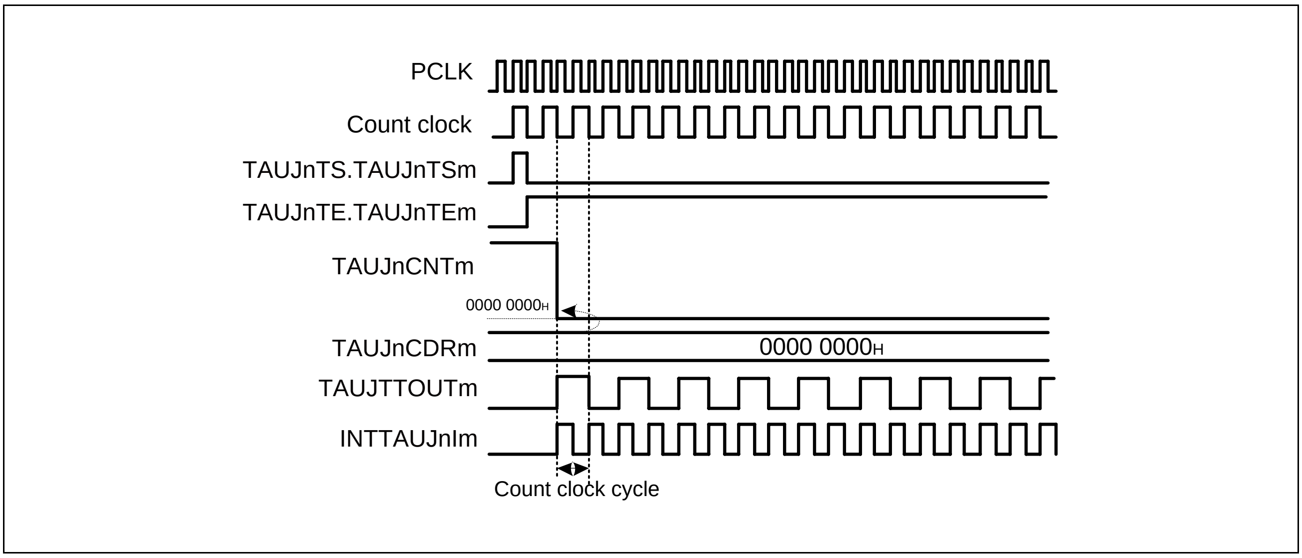

Figure 33.18 TAUJnCDRm = 0000 0000$_H$, Count Clock = PCLK/2

- If TAUJnCDRm = 0000 0000$_H$ and the count clock = PCLK/2, the TAUJnCDRm value is loaded to TAUJnCNTm every count clock, meaning that TAUJnCNTm is always 0000 0000$_H$.
- INTTAUJnIm is generated every count clock, resulting in TAUJTTOUTm toggling every count clock.

(2) TAUJnCDRm = 0000 0000$_H$, Count Clock = PCLK

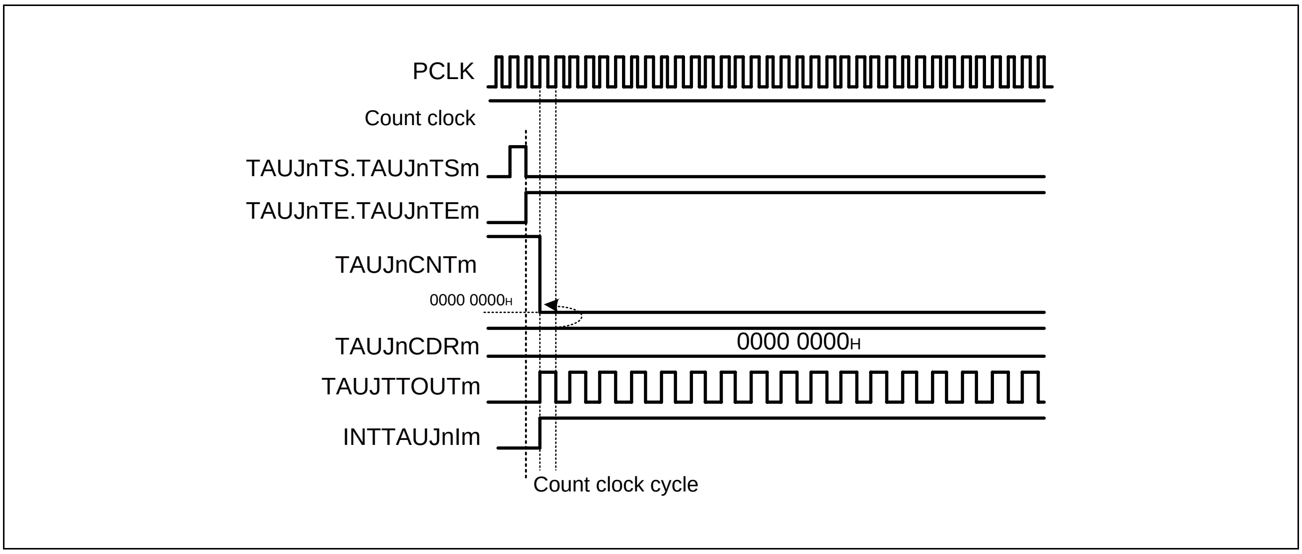

Figure 33.19 TAUJnCDRm = 0000 0000$_H$, Count Clock = PCLK

- If TAUJnCDRm = 0000 0000$_H$ and the count clock = PCLK, the TAUJnCDRm value is loaded to TAUJnCNTm every PCLK clock, meaning that TAUJnCNTm is always 0000 0000$_H$.
- INTTAUJnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
  TAUJTTOUTm is toggled every PCLK clock.

(3) Operation Stop and Restart

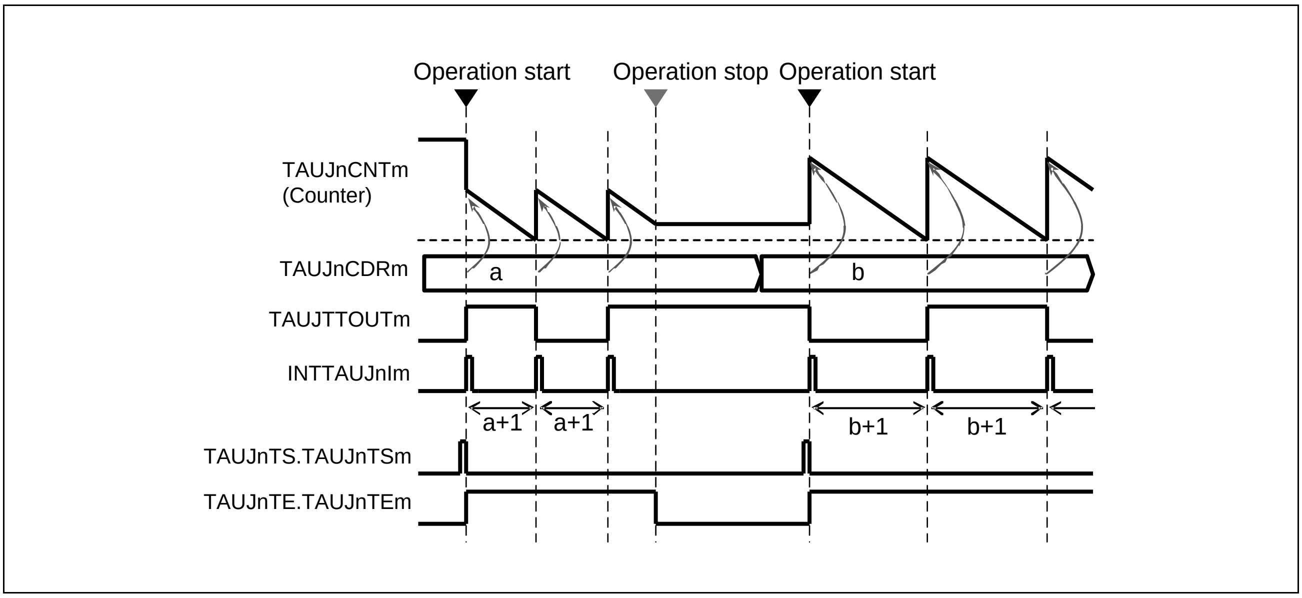

Figure 33.20 Operation Stop and Restart (TAUJnCMORm.TAUJnMD0 = 1)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1.

(4) Forced Restart

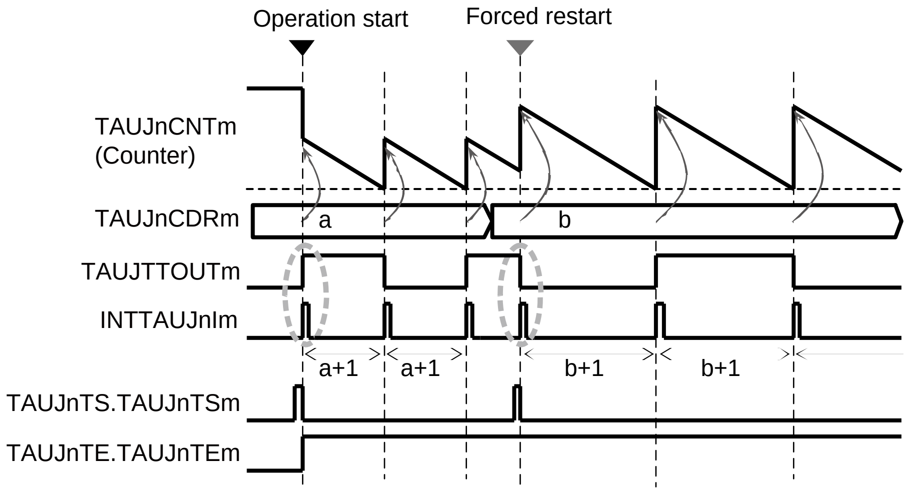

Figure 33.21 Forced Restart Operation (TAUJnCMORm.TAUJnMD0 = 1)

- The counter can be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.
- If the TAUJnCMORm.TAUJnMD0 bit is set to 1, the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUJnCDRm value is reflected to TAUJnCNTm and counting starts. Execute a forced restart to reflect the changed TAUJnCDRm value immediately.

33.12.2 TAUJTTINm Input Interval Timer Function

33.12.2.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals or when a valid TAUJTTINm input edge is detected. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave. Output of square waves is only supported for TAUJ0.

Description

This function operates in an identical manner to the interval timer function (see **Section 33.12.1, Interval Timer Function**), except that this function is restarted by a valid TAUJTTINm input edge. The type of edge used as the trigger is specified using the TAUJnCMURm.TAUJnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

33.12.2.2 Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTTOUTm square wave cycle = count clock cycle × (TAUJnCDRm + 1) × 2

33.12.2.3 Block Diagram and General Timing Diagram

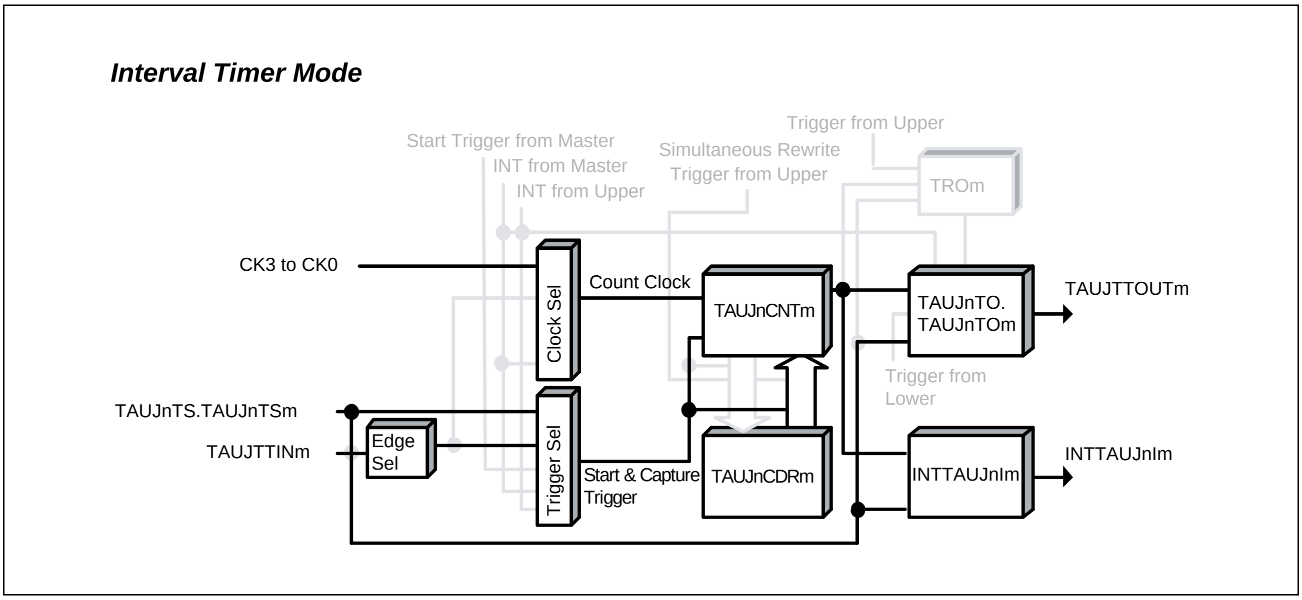

Figure 33.22 Block Diagram for TAUJTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1).
- Rising edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 01_B)

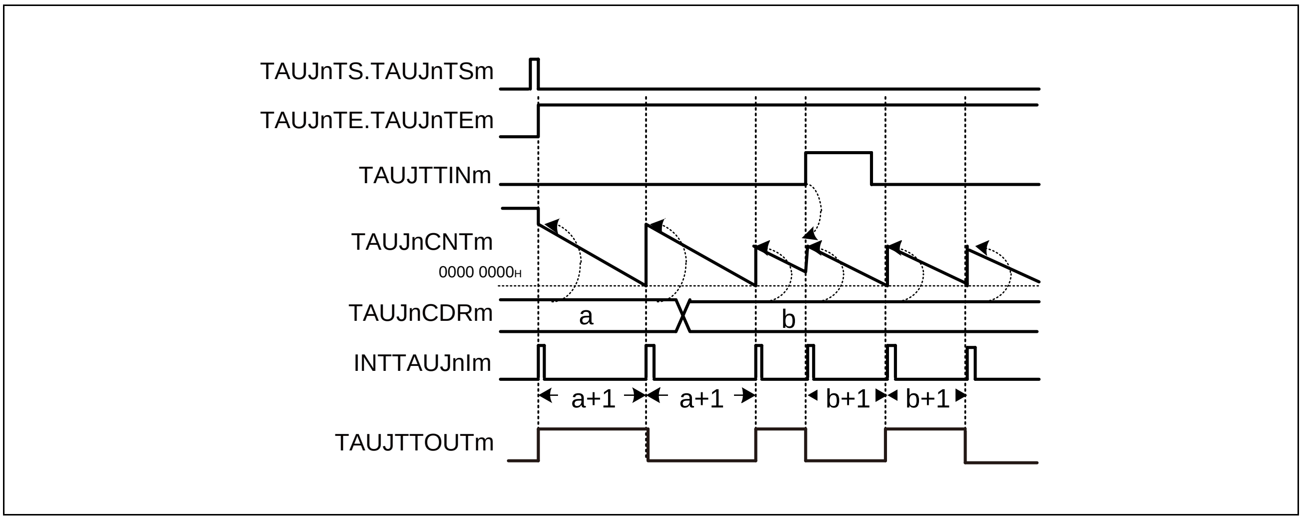

Figure 33.23 General Timing Diagram for TAUJTTINm Input Interval Timer Function

(3) Channel Output Mode

Table 33.51 Control Bit Settings for Independent Channel Output Mode 1

Bit name	Setting
TAUJnTOE.TAUJnTOEm	Write 1_B.
TAUJnTOM.TAUJnTOMm	Write 0_B.
TAUJnTOC.TAUJnTOCm	Write 0_B.
TAUJnTOL.TAUJnTOLm	Write 0_B.

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details see **Section 33.7, Channel Output Modes**.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input interval timer function. Therefore, these registers must be set to 0.

Table 33.52 Simultaneous Rewrite Settings for TAUJTTINm Input Interval Timer Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

33.12.2.5 Operating Procedure for TAUJTTINm Input Interval Timer Function

Table 33.53 Operating Procedure for TAUJTTINm Input Interval Timer Function

		Operation	Status of TAUJn
	Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 33.49, Contents of the TAUJnCMORm register for TAUJTTINm Input Interval Timer Function** and **Table 33.50, Contents of the TAUJnCMURm register for TAUJTTINm Input Interval Timer Function**. Set the value of the TAUJnCDRm register Set the channel output mode by setting the control bits as described in **Table 33.51, Control Bit Settings for Independent Channel Output Mode 1**.	Channel operation is stopped.
Restart operation	Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm loads the TAUJnCDRm value. When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTTOUTm toggles.
	During operation	The values of the TAUJnCMURm.TAUJnTIS[1:0] and TAUJnCDRm registers can be changed at any time. The TAUJnCNTm register can be read at all times. Detection of TAUJTTINm edge	TAUJnCNTm counts down. When the counter reaches 0000 0000$_H$: ● TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. ● INTTAUJnIm is generated and TAUJTTOUTm toggles. When a TAUJTTINm input valid edge is detected during count operation, TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. Afterwards, this procedure is repeated.
	Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

33.12.2.6 Specific Timing Diagrams

The timing diagrams in **Section 33.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by a valid TAUJTTINm input edge.

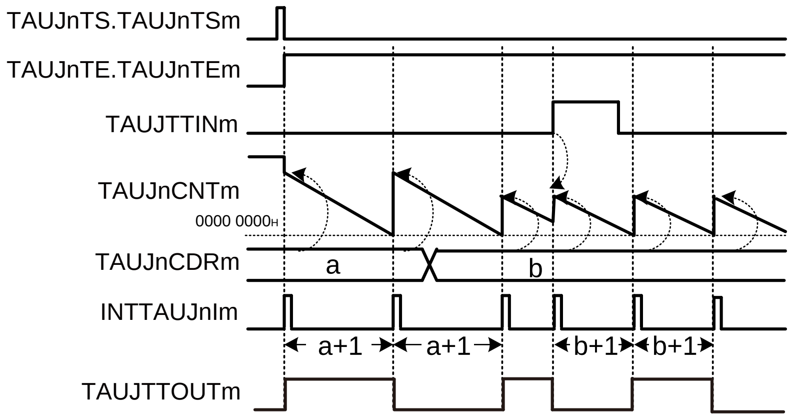

Figure 33.24 Counter Triggered by Rising TAUJTTINm Input Edge (TAUJnCMURm.TAUJnTIS[1:0] = 01_B), TAUJnCMORm.TAUJnMD0 = 1

If a valid TAUJTTINm input edge is detected, an interrupt is generated which causes TAUJTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUJnCMURm.TAUJnTIS[1:0] = 01_B).

33.12.3 TAUJTTINm Input Pulse Interval Measurement Function

33.12.3.1 Overview

Summary

This function captures the count value and uses this value and the overflow bit TAUJnCSRm.TAUJnOVF to measure the interval of the TAUJTTINm input signals.

Prerequisites

TAUJTTOUTm is not used for this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter TAUJnCNTm starts counting up from 0000 0000_H. When a valid TAUJTTINm edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter resets to 0000 0000_H and subsequently continues operation.

If the counter reaches FFFF $FFFF_H$ before a valid TAUJTTINm edge is detected, it overflows to 0000 0000_H. The counter is reset to 0000 0000_H and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

Table 33.54 Effects of an Overflow

TAUJnCMORm. TAUJnCOS[1:0]	When Overflow Occurs		When a Valid TAUJTTINm Input is then Detected	
	TAUJnCDRm	TAUJnCSRm. TAUJnOVF	TAUJnCDRm and TAUJnCNTm	TAUJnCSRm. TAUJnOVF
00	Unchanged	0	TAUJnCNTm loaded to TAUJnCDRm	1
01		1		
10	Set to FFFF $FFFF_H$	0	TAUJnCNTm set to 0, TAUJnCDRm unchanged	Unchanged
11		1		

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV = 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the interval of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

The function can be stopped by setting TAUJnTT.TAUJnTTm = 1, which in turn sets TAUJnTE.TAUJnTEm = 0. TAUJnCNTm stops but retains its value. While the function is stopped, TAUJTTINm input valid edge detection and TAUJnCNTm capture are not performed.

Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 33.9, TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts**.

NOTE

When TAUJnCMORm.TAUJnCOS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

33.12.3.2 Equations

TAUJTTINm input pulse interval = count clock cycle ×
[(TAUJnCSRm.TAUJnOVF × (FFFF FFFF_H + 1)) + TAUJnCDRm capture value + 1]

33.12.3.3 Block Diagram and General Timing Diagram

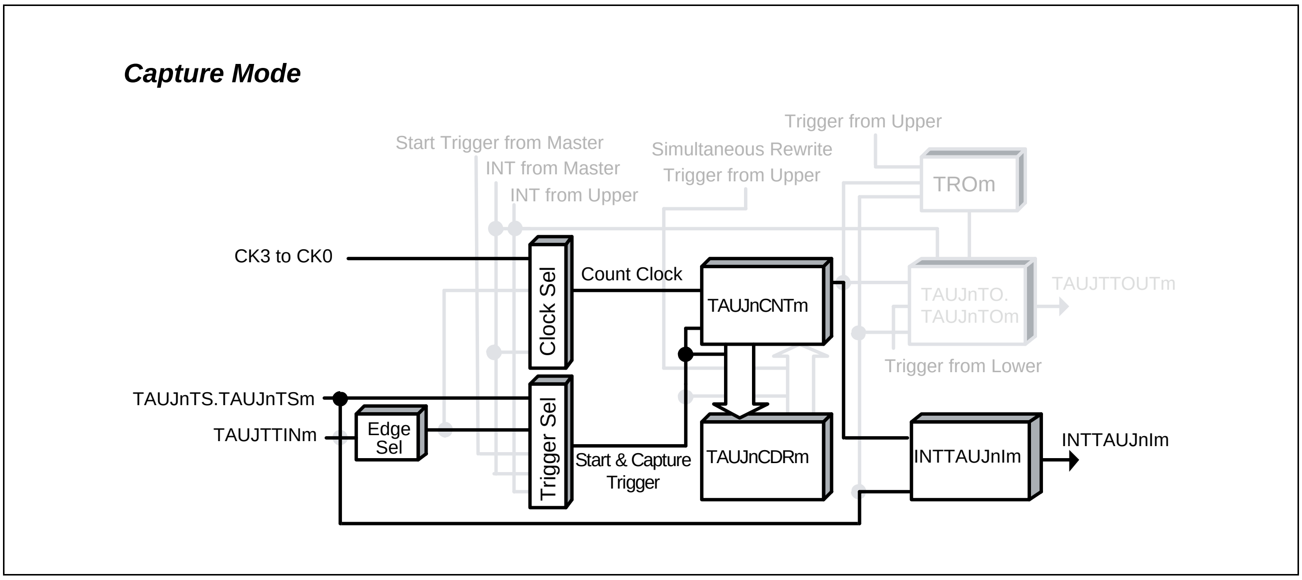

Figure 33.25 Block Diagram for TAUJTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00_B)
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = 00_B).

(2) TAUJnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 33.56 Contents of the TAUJnCMURm Register for TAUJTTINm Input Pulse Interval Measurement Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

(3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used by this function.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input pulse interval measurement function. Therefore, these registers must be set to 0.

Table 33.57 Simultaneous Rewrite Settings for TAUJTTINm Input Pulse Interval Measurement Function

Bit name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

33.12.3.5 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function

Table 33.58 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 33.55, Contents of the TAUJnCMORm Register for TAUJTTINm Input Pulse Interval Measurement Function** and **Table 33.56, Contents of the TAUJnCMURm Register for TAUJTTINm Input Pulse Interval Measurement Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm is cleared to 0000 0000_H. INTTAUJnIm is generated when TAUJnCMORm.TAUJnMD0 is set to 1.
During operation	Detection of TAUJTTINm edges. The values of the TAUJnCMURm.TAUJnTIS[1:0] bits can be changed at any time. The TAUJnCDRm and TAUJnCSRm registers can be read at any time. TAUJnCSCm.TAUJnCLOV bit can be written to 1. (TAUJnCSRm.TAUJnOVF bit is cleared to 0.)	TAUJnCNTm starts to count up from 0000 0000_H. When a TAUJTTINm valid edge is detected: ● TAUJnCNTm transfers (captures) its value to TAUJnCDRm, and returns to 0000 0000_H. ● INTTAUJnIm is then generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values.

Restart operation

33.12.3.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUJnCMORm.TAUJnCOS[1:0] = 00_B

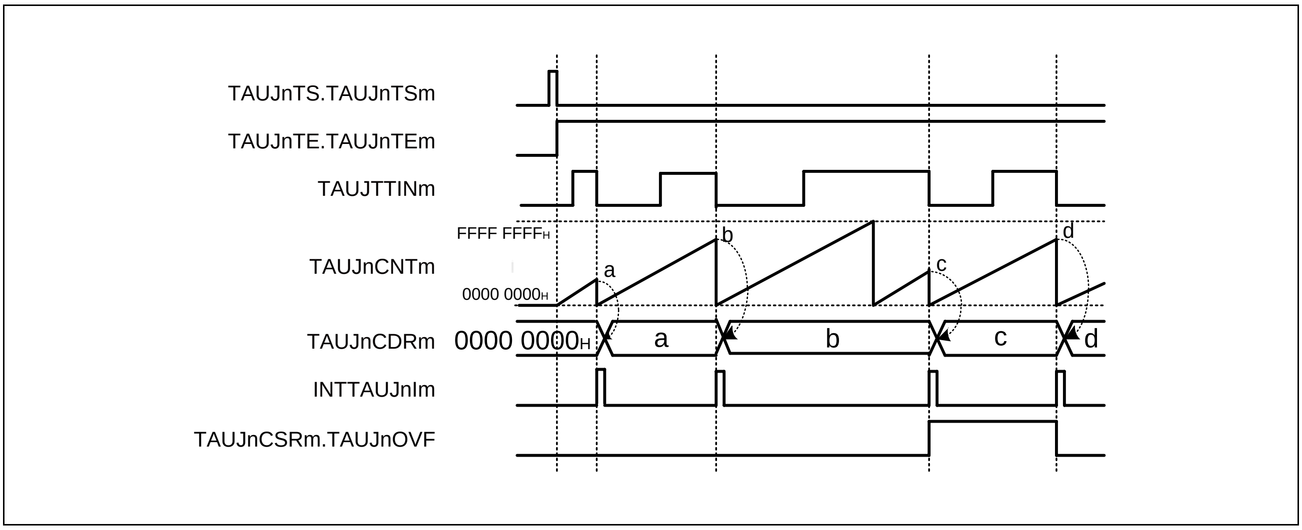

Figure 33.27 TAUJnCMORm.TAUJnCOS[1:0] = 00_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- If the next valid TAUJTTINm input edge is detected when no overflow occurs, TAUJnCSRm.TAUJnOVF is cleared to 0.

(2) TAUJnCMORm.TAUJnCOS[1:0] = 01_B

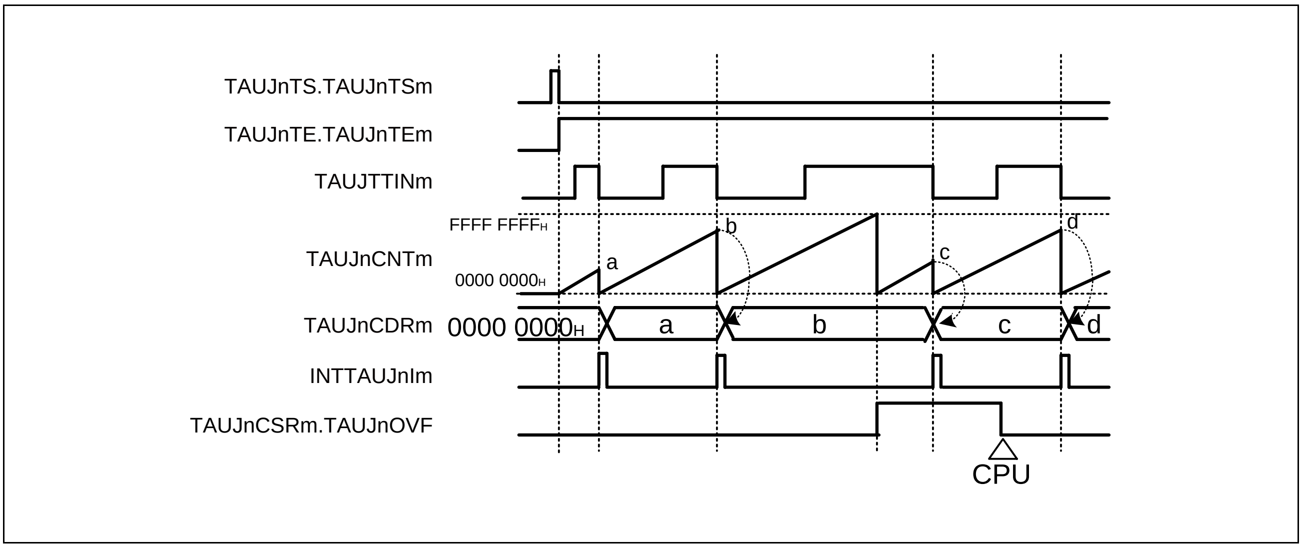

Figure 33.28 TAUJnCMORm.TAUJnCOS[1:0] = 01_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

(3) TAUJnCMORm.TAUJnCOS[1:0] = 10_B

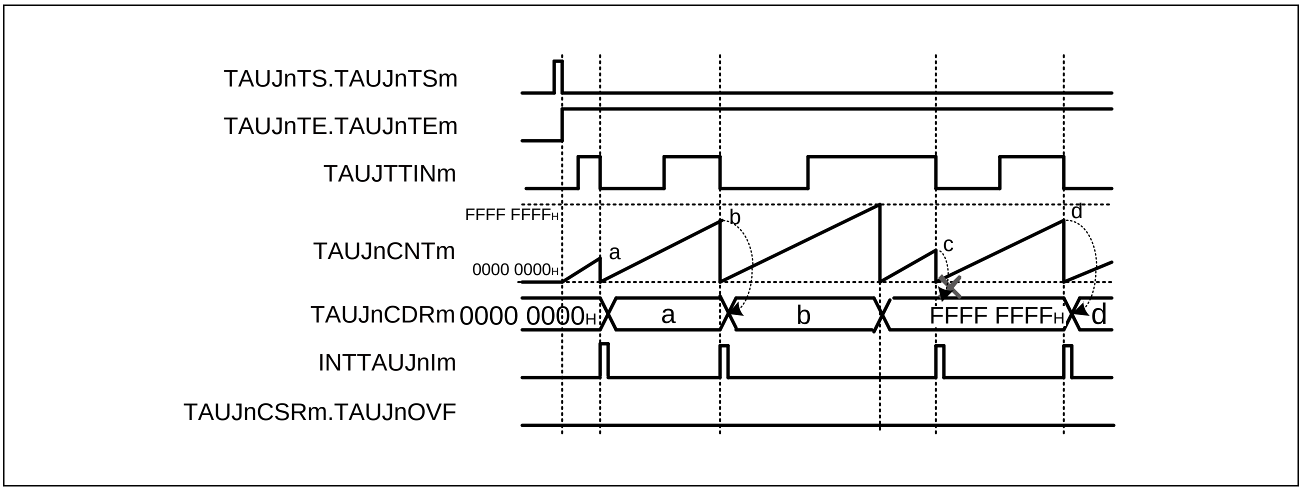

Figure 33.29 TAUJnCMORm.TAUJnCOS[1:0] = 10_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF_H and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.

(4) TAUJnCMORm.TAUJnCOS[1:0] = 11_B

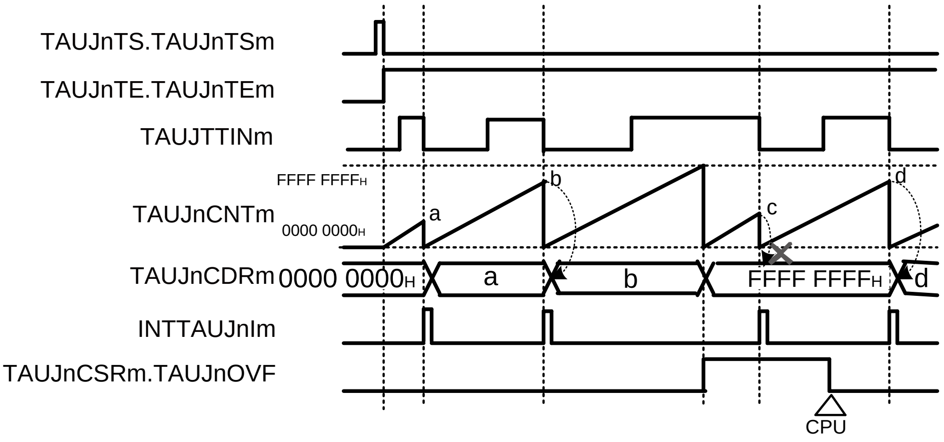

Figure 33.30 TAUJnCMORm.TAUJnCOS[1:0] = 11_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, TAUJnCDRm is set to FFFF $FFFF_H$, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

33.12.4 TAUJTTINm Input Signal Width Measurement Function

33.12.4.1 Overview

Summary

This function measures the width of a TAUJTTINm signal by starting counting on one edge of the TAUJTTINm signal and capturing the counter value on the opposite edge.

Prerequisites

TAUJTTOUTm is not used for this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. When a valid TAUJTTINm start edge is detected, the counter TAUJnCNTm starts counting up from 0000 0000_H. When a valid TAUJTTINm stop edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter retains its value and awaits the next valid TAUJTTINm input start edge.

If the counter reaches FFFF $FFFF_H$ before a valid TAUJTTINm stop edge is detected, it overflows. The counter is reset to 0000 0000_H and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

Table 33.59 Effects of an Overflow

TAUJnCMORm.TAUJnCOS[1:0]	When Overflow Occurs		When a Valid TAUJTTINm Input Stop Edge is Detected	
	TAUJnCDRm	TAUJnCSRm.TAUJnOVF	TAUJnCDRm and TAUJnCNTm	TAUJnCSRm.TAUJnOVF
00	Unchanged	0	TAUJnCNTm is loaded to TAUJnCDRm.	1
01		1		
10	Set to FFFF $FFFF_H$	0	TAUJnCNTm stops counting, TAUJnCDRm unchanged	Unchanged
11		1		

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV to 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the width of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

This function cannot be forcibly restarted.

NOTE

When TAUJnCMORm.COS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

33.12.4.2 Equations

TAUJTTINm input signal width = count clock cycle ×
[(TAUJnCSRm.TAUJnOVF × (FFFF $FFFF_H$ + 1)) + TAUJnCDRm capture value + 1]

33.12.4.3 Block Diagram and General Timing Diagram

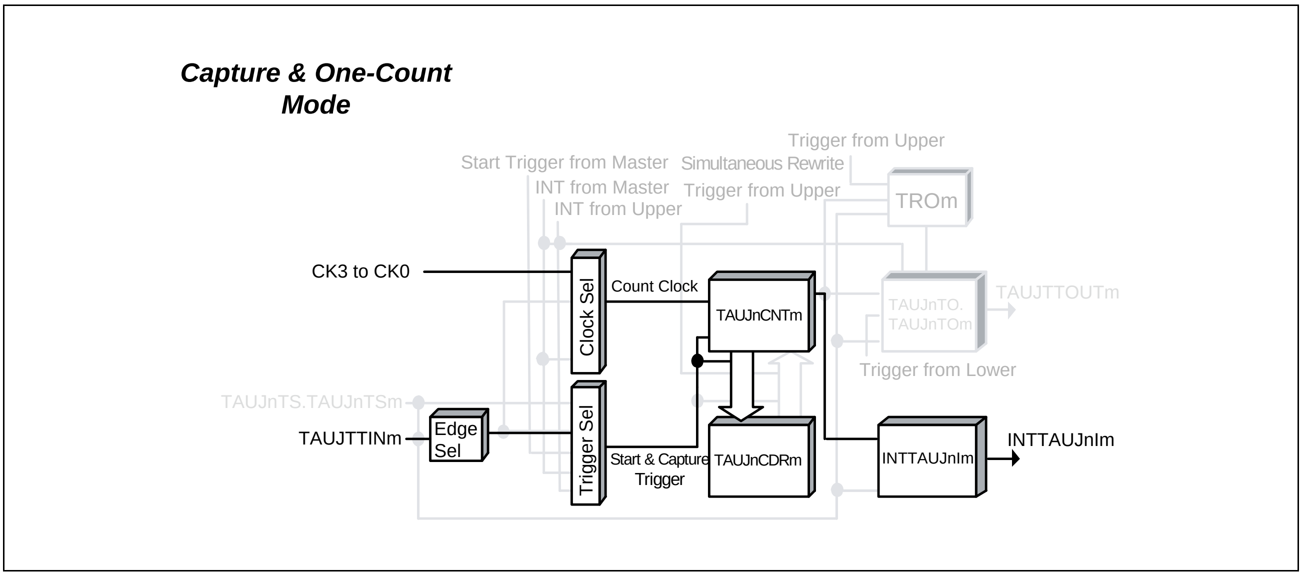

Figure 33.31 Block Diagram for TAUJTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = 00_B).

1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (low width measurement) 11: Rising and falling edge detection (high width measurement)

(3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input signal width measurement function. Therefore, these registers must be set to 0.

Table 33.62 Simultaneous Rewrite Settings for TAUJTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

33.12.4.5 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

Table 33.63 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

		Operation	Status of TAUJn
	Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 33.60, Contents of the TAUJnCMORm Register for TAUJTTINm Input Signal Width Measurement Function** and **Table 33.61, Contents of the TAUJnCMURm Register for TAUJTTINm Input Signal Width Measurement Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Restart operation	Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge. When a TAUJTTINm start edge is detected, TAUJnCNTm starts to count up.
	During operation	The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time. The TAUJnCSCm.TAUJnCLOV bit can be set to 1.	TAUJnCNTm starts to count up from 0000 0000_H. When a TAUJTTINm valid edge is detected: ● TAUJnCNTm transfers (captures) its value to TAUJnCDRm, and retains its value. ● INTTAUJnIm is then generated. ● Counting stops at the "value that transferred to TAUJnCDRm + 1" and TAUJnCNTm waits for detection of the TAUJTTINm start edge. Afterwards, this procedure is repeated.
	Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values.

33.12.4.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUJnCMORm.TAUJnCOS[1:0] = 00_B

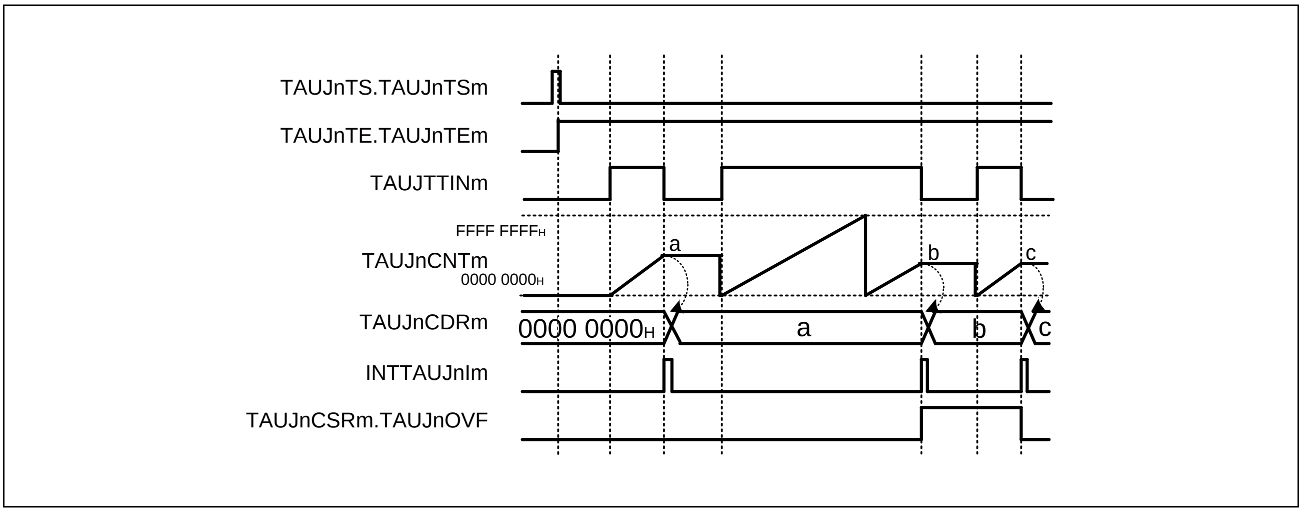

Figure 33.33 TAUJnCMORm.TAUJnCOS[1:0] = 00_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge with no overflow occurring, TAUJnCSRm.TAUJnOVF is cleared to 0.

(2) TAUJnCMORm.TAUJnCOS[1:0] = 01_B

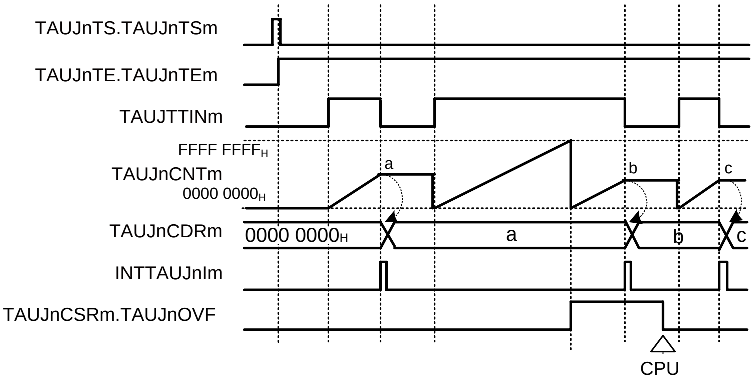

Figure 33.34 TAUJnCMORm.TAUJnCOS[1:0] = 01_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

(3) TAUJnCMORm.TAUJnCOS[1:0] = 10_B

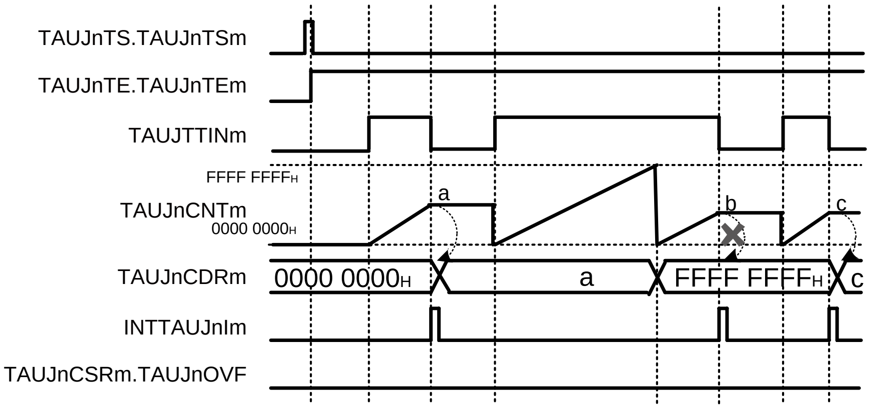

Figure 33.35 TAUJnCMORm.TAUJnCOS[1:0] = 10_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$ and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.

(4) TAUJnCMORm.TAUJnCOS[1:0] = 11_B

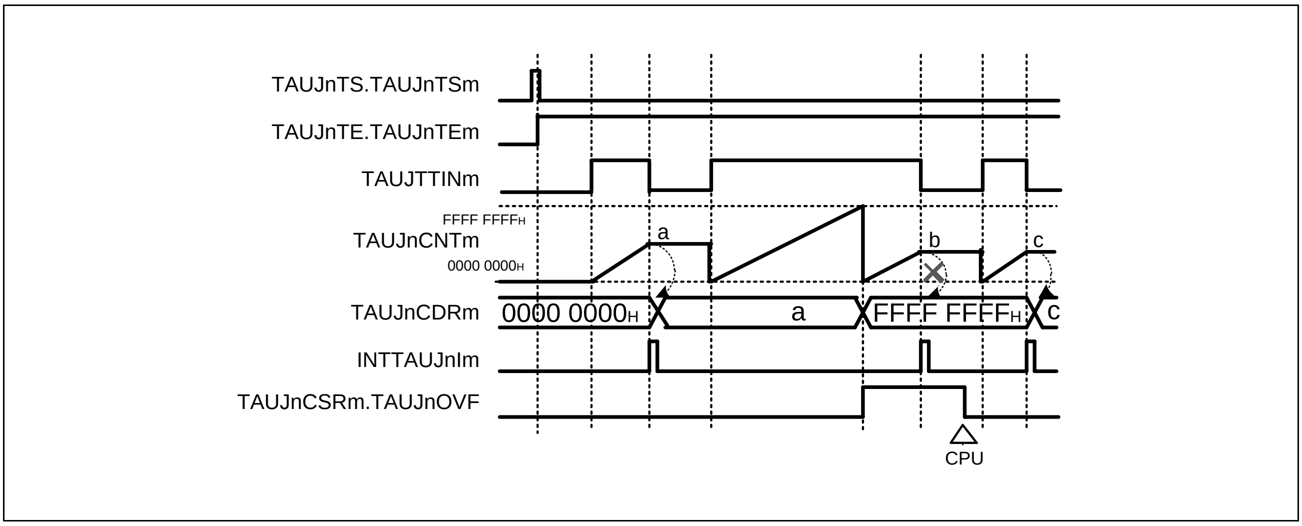

Figure 33.36 TAUJnCMORm.TAUJnCOS[1:0] = 11_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, TAUJnCDRm is set to FFFF $FFFF_H$, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

33.12.5 TAUJTTINm Input Position Detection Function

33.12.5.1 Overview

Summary

This function measures the interval of input signals by capturing the counter value on a valid edge of the TAUJTTINm signal.

Prerequisites

TAUJTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter starts to count from 0000 0000_H. When a valid TAUJTTINm input edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter continues to count.

When the counter reaches FFFF $FFFF_H$, the counter restarts from 0000 0000_H.

NOTE

The input TAUJTTINm is sampled at the frequency of the operation clock, specified by TAUJnCMORm.TAUJnCKS[1:0] bits.

Conditions

If the TAUJnCMORm. TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated.

33.12.5.2 Equations

Function duration at a TAUJTTINm input pulse =
count clock cycle × (TAUJnCDRm capture value + 1)

33.12.5.3 Block Diagram and General Timing Diagram

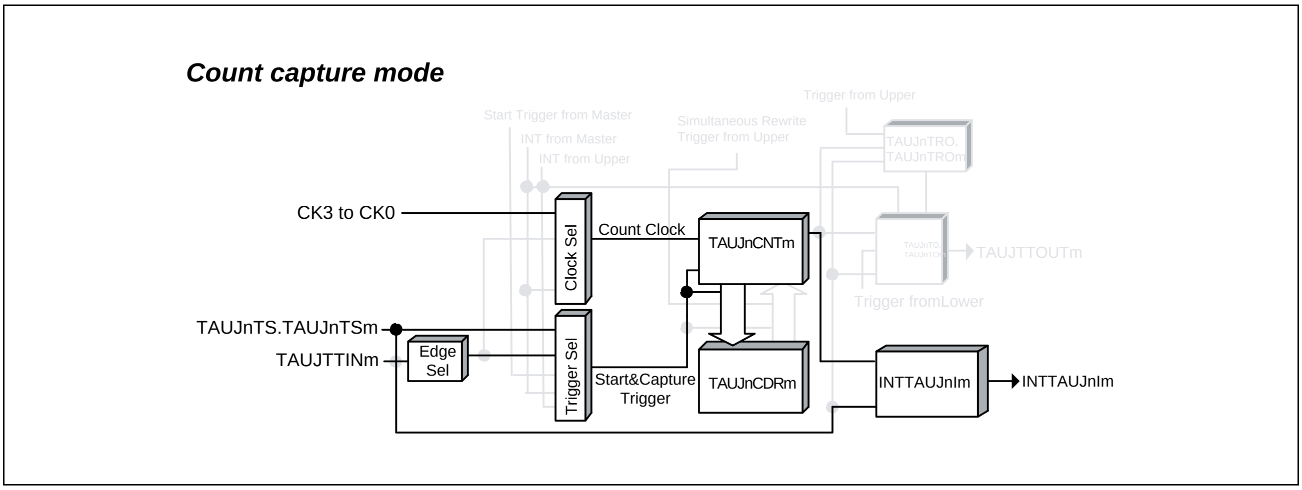

Figure 33.37 Block Diagram of TAUJTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00_B)

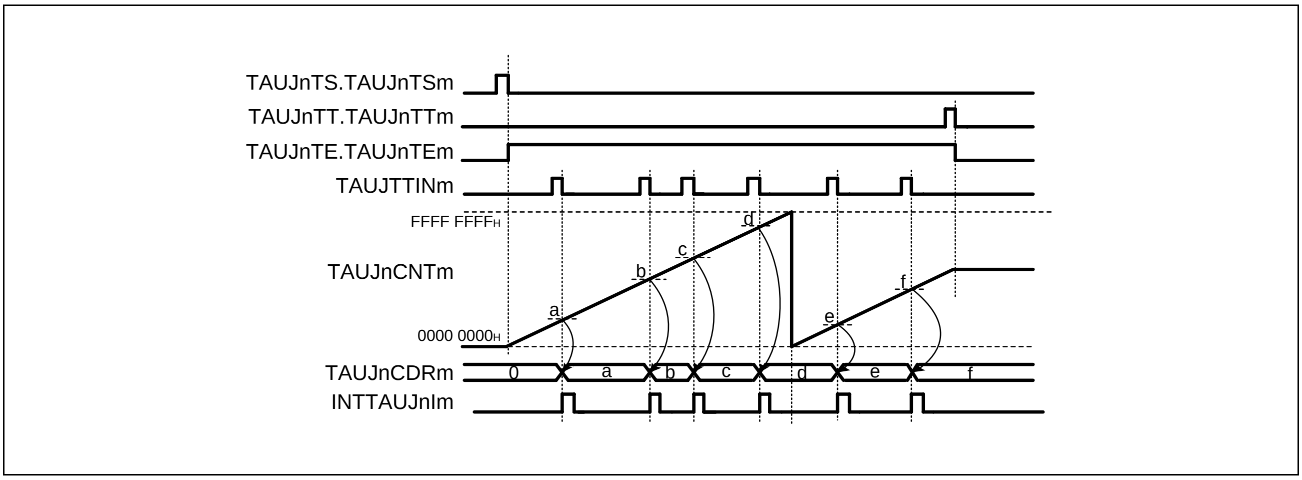

Figure 33.38 General Timing Diagram for TAUJTTINm Input Position Detection Function

(3) Channel Output Mode

The channel output mode is not used by this function.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input position detection function. Therefore, these registers must be set to 0.

Table 33.66 Simultaneous Rewrite Settings for TAUJTTINm Input Position Detection Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0

33.12.5.5 Operating Procedure for TAUJTTINm Input Position Detection Function

Table 33.67 Operating Procedure for TAUJTTINm Input Position Detection Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 33.64, Contents of the TAUJnCMORm Register for TAUJTTINm Input Position Detection Function** and **Table 33.65, Contents of the TAUJnCMURm Register for TAUJTTINm Input Position Detection Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. INTTAUJnIm is generated when TAUJnCMORm.TAUJnMD0 is set to 1.
During operation	The values of the TAUJnCMURm.TAUJnTIS[1:0] bits can be changed at any time. The TAUJnCDRm and TAUJnCSRm registers can be read at any time.	TAUJnCNTm starts to count up from $0000\ 0000_H$. When a TAUJTTINm valid edge is detected: ● TAUJnCNTm transfers (captures) its value to TAUJnCDRm. ● INTTAUJnIm is output. ● The counter value is not cleared to $0000\ 0000_H$ and TAUJnCNTm continues count operation. Afterwards, this procedure is repeated. When TAUJnCNTm reaches $FFFF\ FFFF_H$, the counter restarts from $0000\ 0000_H$.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

33.12.5.6 Specific Timing Diagrams

(1) Operation Stop and Restart

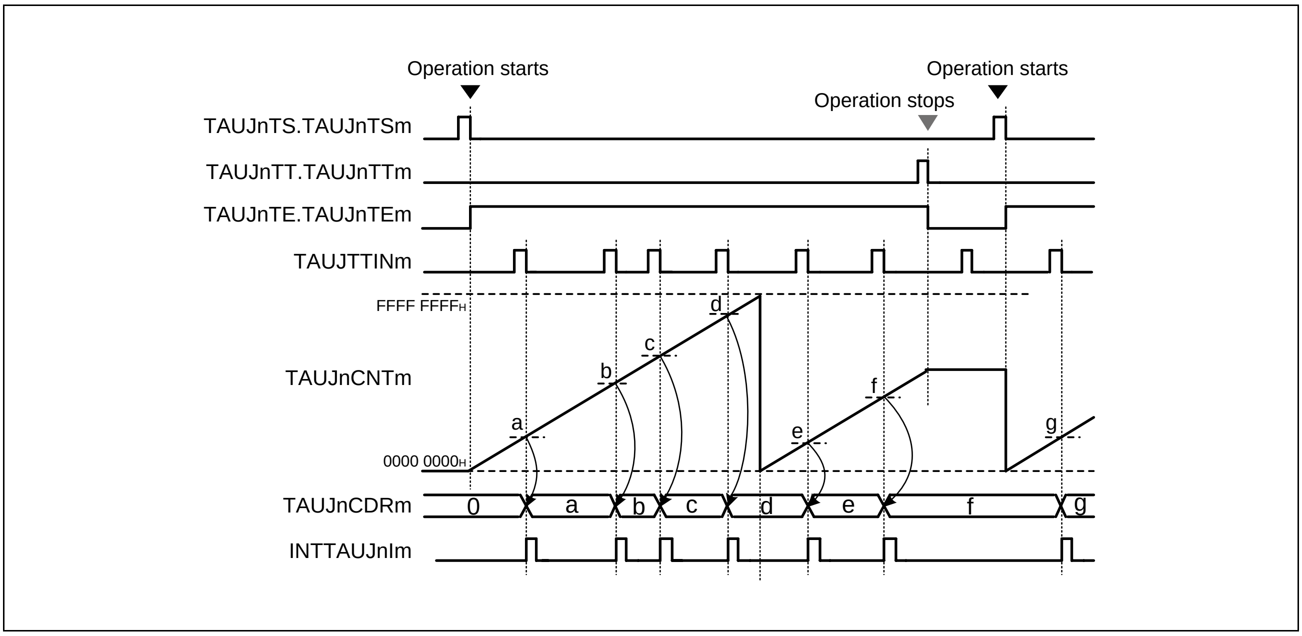

Figure 33.39 Operation Stop and Restart (TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. TAUJnCNTm restarts to count from 0000 0000_H.

33.12.6 TAUJTTINm Input Period Count Detection Function

33.12.6.1 Overview

Summary

This function measures the cumulative width of a TAUJTTINm input signal.

Prerequisites

TAUJTTOUTm is not used for this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter awaits a valid TAUJTTINm input edge.

When a valid TAUJTTINm input start edge is detected, the counter starts to count from 0000 0000_H.

When a valid TAUJTTINm input stop edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter stops and retains its value until the next valid TAUJTTINm input start edge is detected.

When the next valid TAUJTTINm input start edge is detected, the counter restarts counting from the stop value.

When the counter reaches FFFF $FFFF_H$, the counter restarts from 0000 0000_H.

This function cannot be forcibly restarted.

NOTE

The input TAUJTTINm signal is sampled at the frequency of the operation clock, specified by the TAUJnCMORm.TAUJnCKS[1:0] bits.

Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10_B, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11_B, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

33.12.6.2 Equations

Cumulative TAUJTTINm input width =
count clock cycle × (TAUJnCDRm capture value + 1)

33.12.6.3 Block Diagram and General Timing Diagram

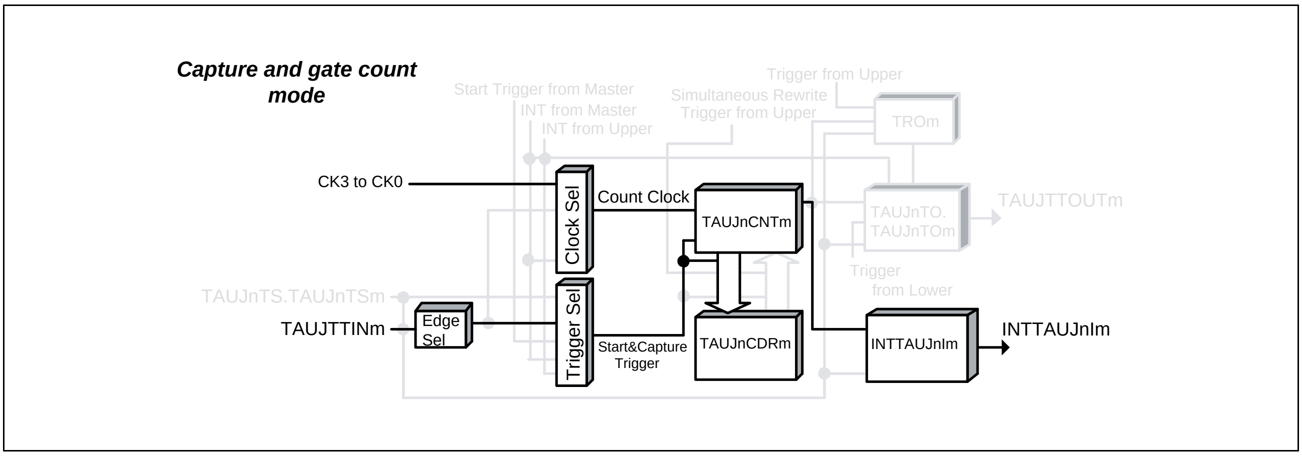

Figure 33.40 Block Diagram for TAUJTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (Low width measurement) 11: Rising and falling edge detection (High width measurement)

(3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input period count detection function. Therefore, these registers must be set to 0.

Table 33.70 Simultaneous Rewrite Settings for TAUJTTINm Input Period Count Detection Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0

33.12.6.5 Operating Procedure for TAUJTTINm Input Period Count Detection Function

Table 33.71 Operating Procedure for TAUJTTINm Input Period Count Detection Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 33.68, Contents of the TAUJnCMORm Register for TAUJTTINm Input Period Count Detection Function** and **Table 33.69, Contents of the TAUJnCMURm Register for TAUJTTINm Input Period Count Detection Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge.
During operation	TAUJTTINm edge detection The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time.	When a TAUJTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUJnCNTm starts to count up from the stop value. When TAUJnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUJnCDRm and INTTAUJnIm is generated. Counting stops at the “value transferred to TAUJnCDRm + 1” and TAUJnCNTm waits for detection of the TAUJTTINm start edge. When TAUJnCNTm reaches FFFF FFFF$_H$, the counter restarts from 0000 0000$_H$. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

33.12.6.6 Specific Timing Diagrams

(1) Operation Stop and Restart

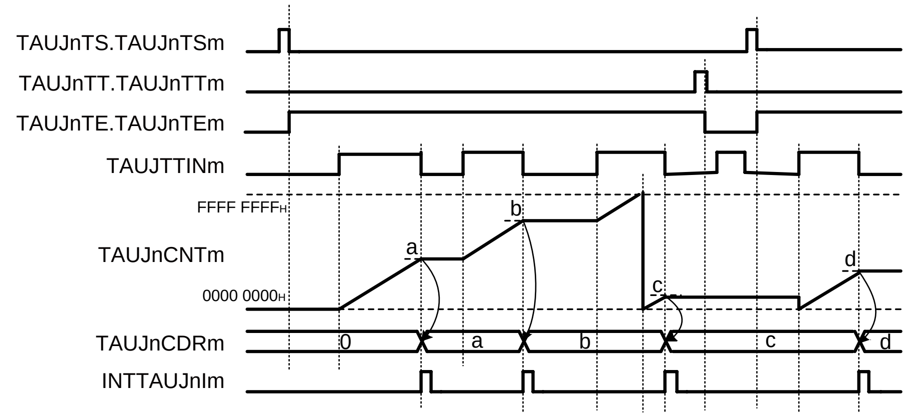

Figure 33.42 Operation Stop and Restart (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. TAUJnCNTm restarts to count from 0000 0000_H.

33.12.7 Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

33.12.7.1 Overview

Summary

This function measures the width of an individual TAUJTTINm input signal. An interrupt is generated if the TAUJTTINm input width is longer than FFFF FFFF_H + 1.

Prerequisites

- TAUJTTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFFF FFFF_H.

Description

he counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF FFFF_H is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUJTTINm input start edge is detected, TAUJnCNTm loads FFFF FFFF_H and starts to count down.

If the counter reaches 0000 0000_H before a stop edge is detected, an interrupt is generated.

Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10_B, the TAUJTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11_B, the TAUJTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

33.12.7.2 Block Diagram and General Timing Diagram

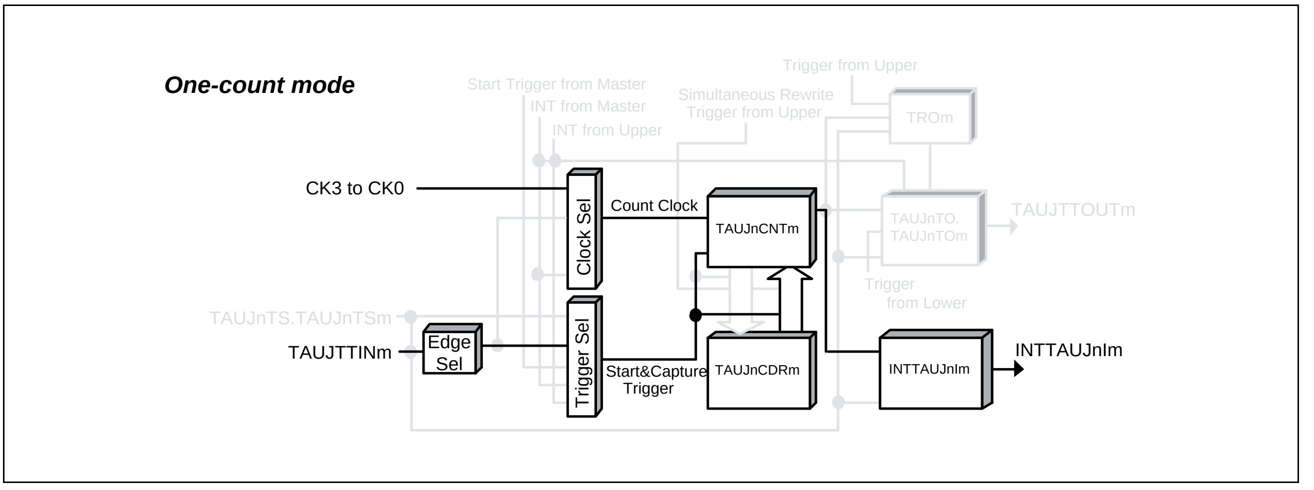

Figure 33.43 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

(3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the overflow interrupt output function (during TAUJTTINm width measurement). Therefore, these registers must be set to 0.

Table 33.74 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

Bit name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0

33.12.7.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

Table 33.75 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 33.72, Contents of the TAUJnCMORm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)** and **Table 33.73, Contents of the TAUJnCMURm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)**. Set the value of the TAUJnCDRm register to FFFF FFFF$_H$.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUJTTINm start edge.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the start edge. When a start edge is detected, TAUJnCNTm loads the TAUJnCDRm value (FFFF FFFF$_H$).
During operation	The TAUJnCNTm register can be read at any time.	TAUJnCNTm counts down. When the counter reaches 0000 0000$_H$: ● INTTAUJnIm is generated. When a reverse edge of TAUJTTINm is detected during count operation: ● TAUJnCNTm stops counting and waits for a trigger. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

33.12.8 Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

33.12.8.1 Overview

Summary

This function measures the cumulative width of a TAUJTTINm input signal. An interrupt is generated if the cumulative TAUJTTINm input width is longer than FFFF FFFF_H, and an overflow interrupt can be output.

Prerequisites

- TAUJTTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFFF FFFF_H.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF FFFF_H is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUJTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000 0000_H an interrupt is generated. FFFF FFFF_H is loaded to TAUJnCNTm and the counter continues to count down until a TAUJTTINm input stop edge is detected.

Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10_B, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11_B, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

33.12.8.2 Block Diagram and General Timing Diagram

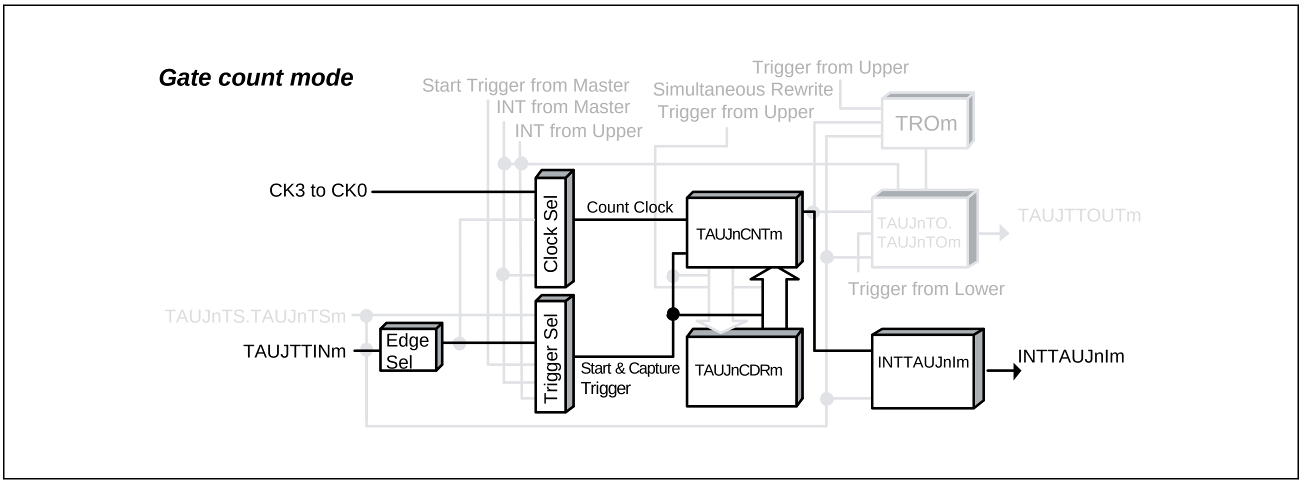

Figure 33.45 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

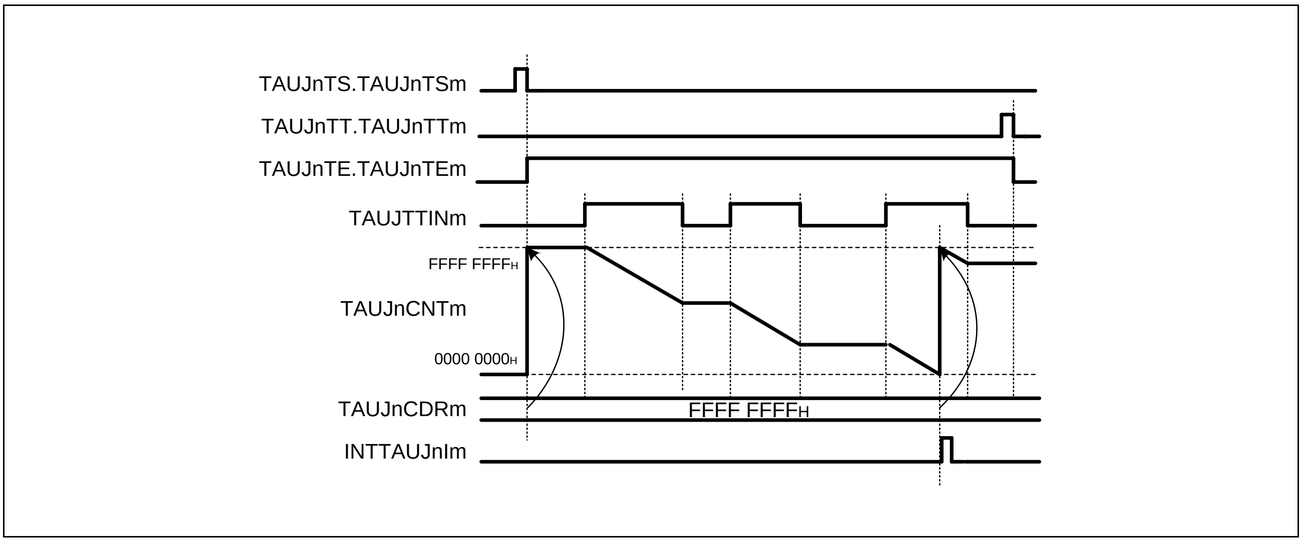

Figure 33.46 General Timing Diagram For Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (Low width measurement) 11: Rising and falling edge detection (High width measurement)

(3) Channel Output Mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous Rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the Overflow Interrupt Output Function (During TAUJTTINm Input Period Count Detection). Therefore, these registers must be set to 0.

Table 33.78 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

33.12.8.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

Table 33.79 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 33.76, Contents of the TAUJnCMORm Register for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)** and **Table 33.77, Contents of the TAUJnCMURm Register for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)**. Set the value of the TAUJnCDRm register to FFFF FFFF$_{H}$.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUJTTINm start edge.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the start edge. When a start edge is detected, the value of TAUJnCDRm (FFFF FFFF$_{H}$) is loaded to TAUJnCNTm.
During operation	The TAUJnCNTm register can be read at all times	TAUJnCNTm counts down. When the counter reaches 0000 0000$_{H}$: ● INTTAUJnIm is generated. ● TAUJnCNTm loads the TAUJnCDRm value (FFFF FFFF$_{H}$) and continues to count down. When a reverse edge of TAUJTTINm is detected during count operation: ● TAUJnCNTm stops and retains the stop value. When a TAUJTTINm valid edge is detected while the counter is stopped: ● TAUJnCNTm counts down from the stop value. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

33.13 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the TAUJ. For a general overview of synchronous channel operation, see **Section 33.2, Overview**.

33.13.1 PWM Output Function

33.13.1.1 Overview

Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty of the TAUJTTOUTm to be set. The pulse cycle is set in the master channel. The duty is set in the slave channel.

Prerequisites

- Two channels
- The operation mode for the master channel should be set to the interval timer mode. (See **Table 33.80, Contents of the TAUJnCMORm Register for the Master Channel of the PWM Output Function**.)
- The operation mode for the slave channel should be set to the one-count mode. (See **Table 33.83, Contents of the TAUJnCMORm Register for the Slave Channel of the PWM Output Function**.)
- TAUJTTOUTm is not used for the master channel of this function.
- The channel output mode for the slave channels should be set to synchronous channel output mode 1. (See **Section 33.7, Channel Output Modes**.)

Description

The counters are enabled by setting the channel trigger bits (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counters start to count down from these values. INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set or reset to realize the PWM output.

- Master channel:

  When the counter of the master channel reaches 0000 0000_H and pulse cycle time has elapsed, INTTAUJnIm is generated. The TAUJnCDRm value is loaded to TAUJnCNTm, and the counter counts down.

- Slave channel(s):

  INTTAUJnIm generated on the master channel triggers the counter of the slave channel(s). The current value of TAUJnCDRm (slave) is loaded to TAUJnCNTm (slave) and the counter starts to count down from this value. The TAUJTTOUTm signal is set to the active level.
  When the counter reaches 0000 0000_H, i.e. duty time has elapsed, INTTAUJnIm is generated and the TAUJTTOUTm signal is set to the inactive level. The counter returns to FFFF $FFFF_H$ and awaits the next INTTAUJnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1 for the master and slave channel(s), which in turn sets TAUJnTE.TAUJnTEm to 0. TAUJnCNTm and TAUJTTOUTm of master and slave channel(s) stop but retain their values. The counters can be restarted by setting TAUJnTS.TAUJnTSm to 1.

Conditions

Set Simultaneous rewrite with this function. Please see **Section 33.6, Simultaneous Rewrite**.

33.13.1.2 Equations

Pulse cycle = (TAUJnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUJnCDRm (slave)/(TAUJnCDRm (master) +1)) × 100

- Duty cycle = 0%
  TAUJnCDRm (slave) = $0000\ 0000_{H}$
- Duty cycle = 100%
  TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1

33.13.1.3 Block Diagram and General Timing Diagram

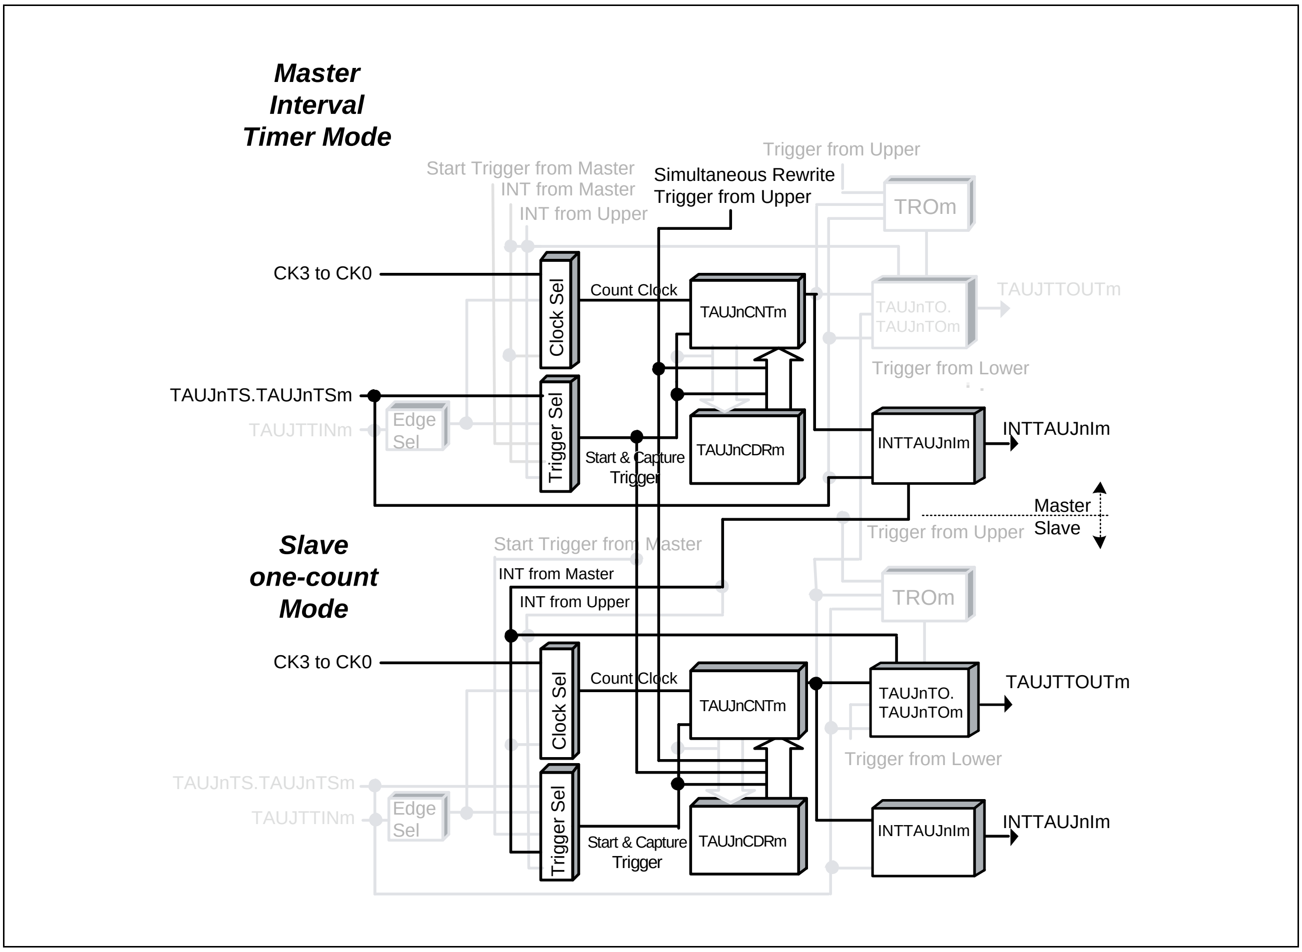

Figure 33.47 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUJnTOL.TAUJnTOLm = 0)

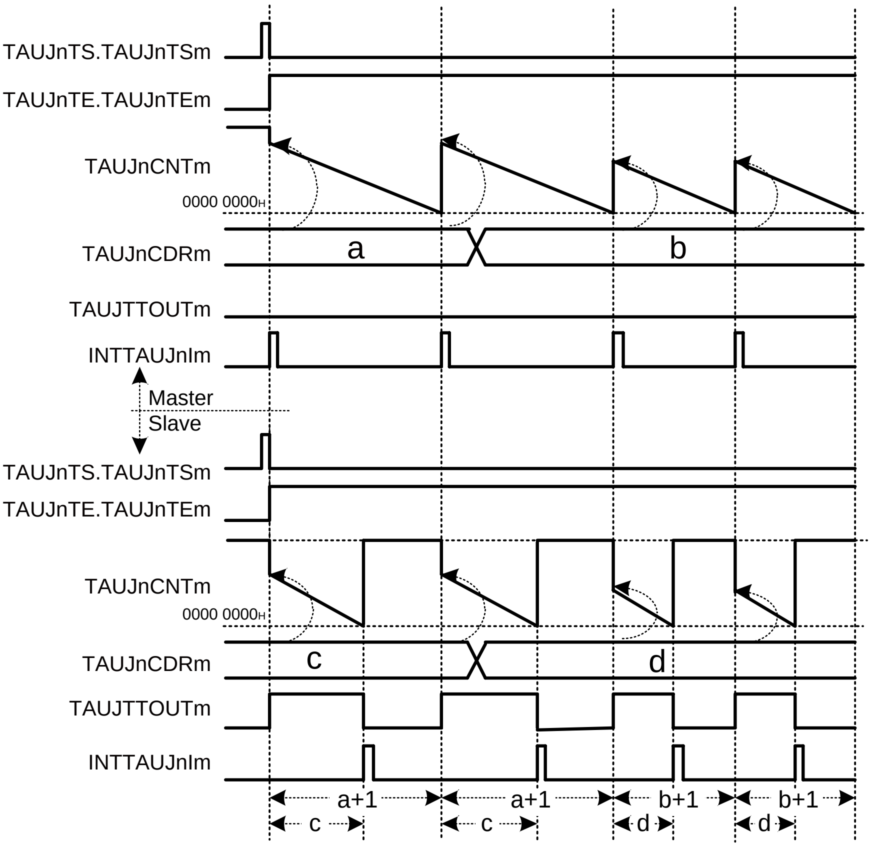

Figure 33.48 General Timing Diagram for PWM Output Function

NOTE

- The interval between the start of the count and an interrupt being generated is the value of corresponding TAUJnCDRm + 1.
- TAUJTTOUTm of the slave channel will rise with a delay of one count clock after the rising of INTTAUJnIm of the master channel.

33.13.1.4 Register Settings for the Master Channel

TAUJnTOE.TAUJnTOEm	Write 1_B.
TAUJnTOM.TAUJnTOMm	Write 1_B.
TAUJnTOC.TAUJnTOCm	Write 0_B.
TAUJnTOL.TAUJnTOLm	0: Positive logic 1: Negative logic

(4) Simultaneous Rewrite for the Slave Channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 33.86 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function

Bit name	Setting
TAUJnRDE.TAUJnRDEm	1: Enables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting.

33.13.1.6 Operating Procedure for PWM Output Function

Table 33.87 Operating Procedure for PWM Output Function

	Operation	Status of TAUJn
Initial channel setting	Master channel: Set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in **Section 33.13.1.4, Register Settings for the Master Channel**. Slave channel: Set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in **Section 33.13.1.5, Register Settings for the Slave Channel(s)**. Set the values of the TAUJnCDRm registers of all channels.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm of the master and slave channels to 1 simultaneously. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set.
During operation	TAUJnCDRm can be changed at any time. TAUJnCNTm and TAUJnRSF.TAUJnRSFm can be read at any time. TAUJnRDT.TAUJnRDTm can be changed during operation.	TAUJnCNTm of the master channel loads TAUJnCDRm and counts down. When the counter reaches $0000\ 0000_H$: ● INTTAUJnIm (master) is generated. ● TAUJnCNTm (master) loads the TAUJnCDRm value and continues count operation. ● TAUJnCNTm (slave) loads the TAUJnCDRm value and counts down. ● TAUJTTOUTm (slave) is set to the active level. When TAUJnCNTm (slave) reaches $0000\ 0000_H$: ● INTTAUJnIm (slave) is generated. ● TAUJTTOUTm (slave) is set to the inactive level.
Stop operation	Set TAUJnTT.TAUJnTTm of the master and slave channels to 1 simultaneously. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart operation

33.13.1.7 Specific Timing Diagrams

(1) Duty cycle = 0%

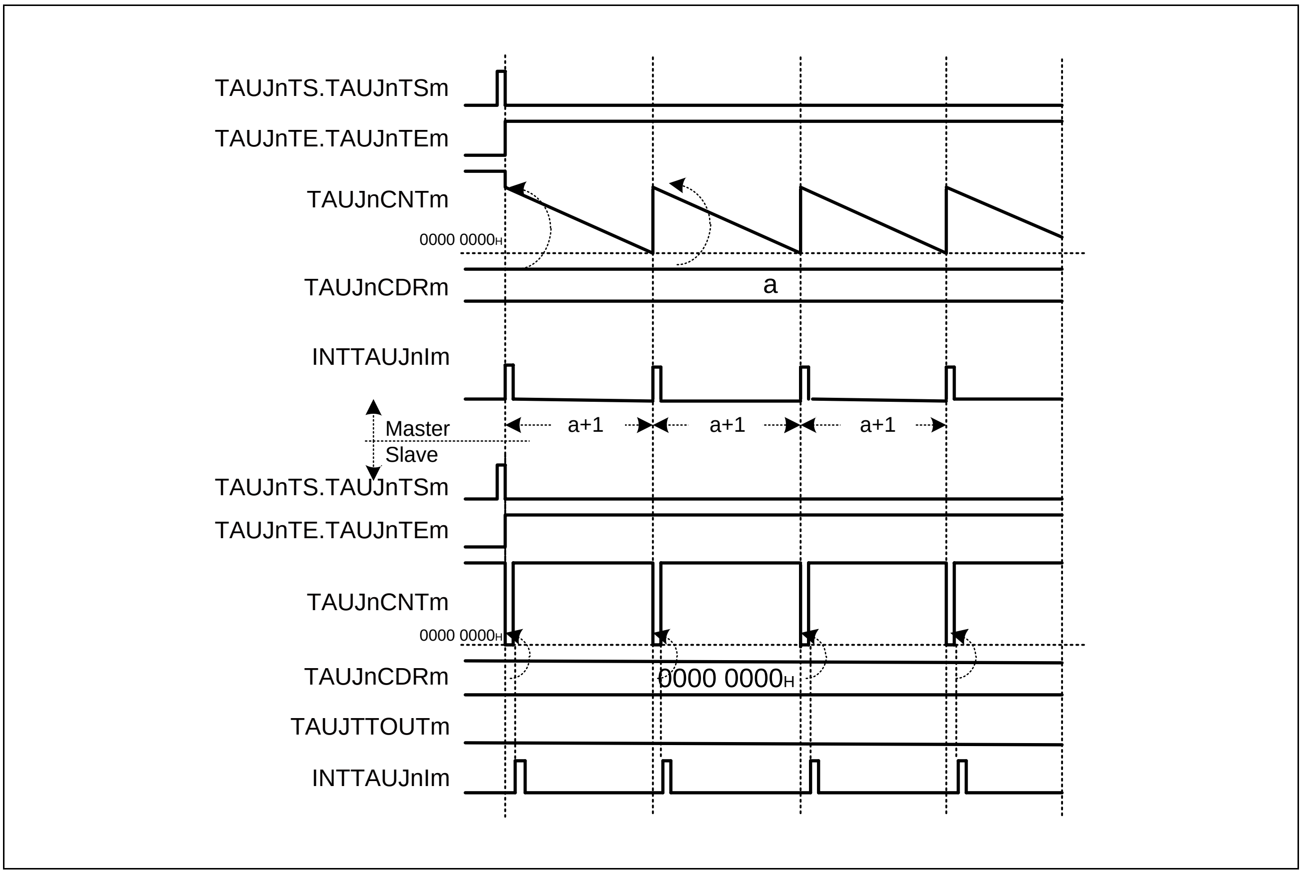

Figure 33.49 TAUJnCDRm (slave) = 0000 0000$_H$, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

- Every time the master channel generates an interrupt (INTTAUJnIm), 0000 0000$_H$ is loaded to TAUJnCNTm (slave). As a result, a slave channel interrupt (INTTAUJnIm) is generated at the same time and TAUJTTOUTm remains inactive.
- The value of TAUJnCDRm is loaded into TAUJnCNTm (slave) to generate an interrupt.

(2) Duty cycle = 100%

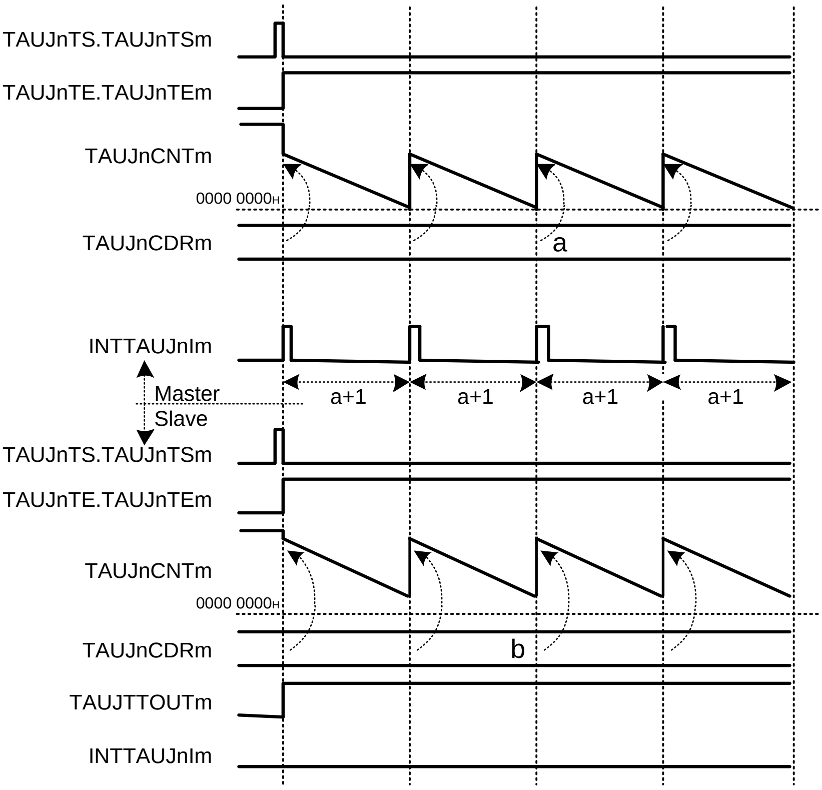

Figure 33.50 TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

If the TAUJnCDRm (slave) value is greater than the TAUJnCDRm (master) value, no interrupt occurs because the counter of the slave channel does not reach 0000 0000_H. TAUJTTOUTm remains active.

(3) Operation Stop and Restart

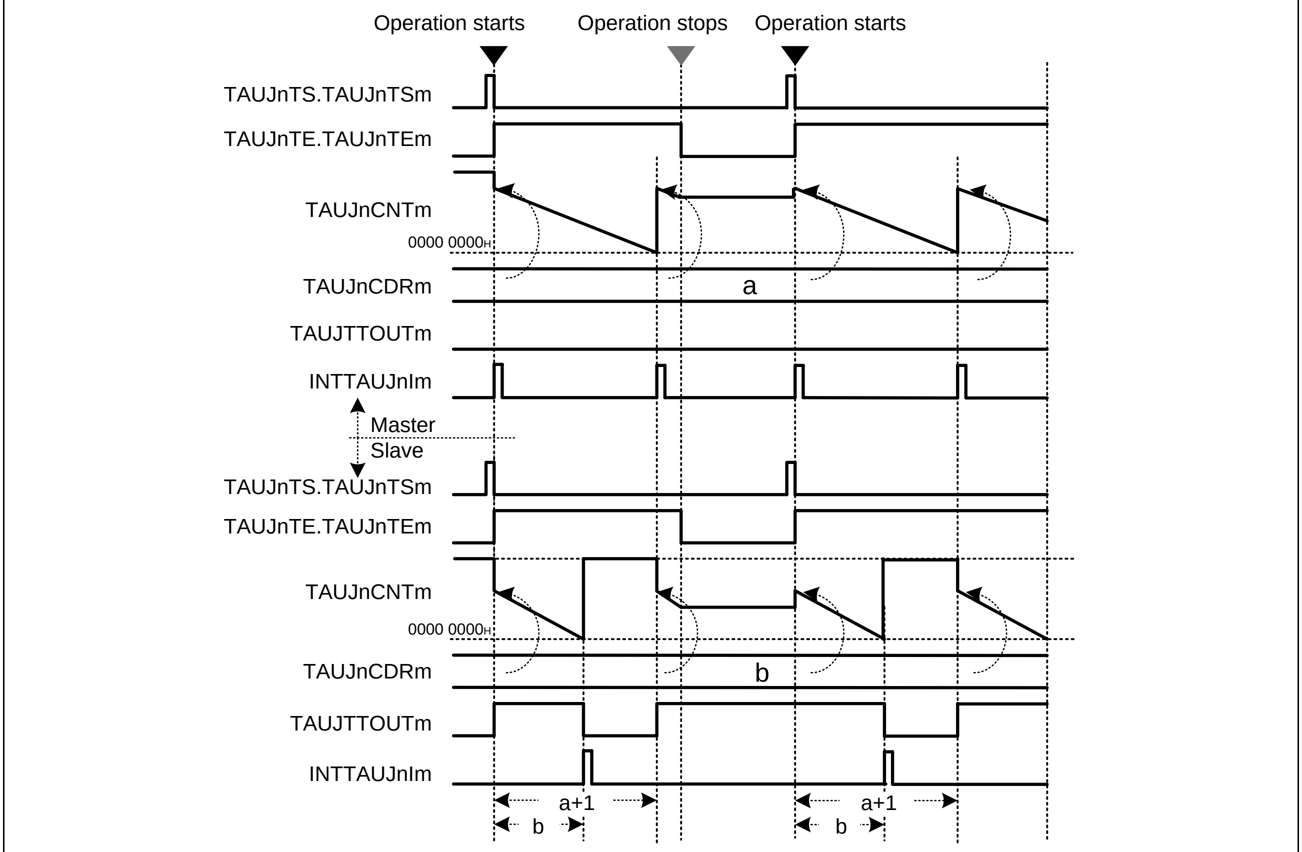

Figure 33.51 Operation Stop and Restart, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm of master and slave channels to 1. This sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTTOUTm of every channel stop and retain their current values. No interrupt occurs.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm of master and slave channels to 1. The TAUJnCDRm value of master and slave channels is loaded into TAUJnCNTm. The counter starts to count down from this value.

Section 34 Real-Time Clock (RTCA)

This section contains a generic description of the Real-Time Clock (RTCA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RTCA.

34.1 Features of RH850/F1KH, RH850/F1KM RTCA

34.1.1 Number of Units

This microcontroller has the following number of RTCA units.

Table 34.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	RTCAn (n = 0)	RTCAn (n = 0)	RTCAn (n = 0)

Table 34.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	RTCAn (n = 0)	RTCAn (n = 0)	RTCAn (n = 0)	RTCAn (n = 0)	RTCAn (n = 0)

Table 34.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	RTCAn (n = 0)	RTCAn (n = 0)	RTCAn (n = 0)	RTCAn (n = 0)

Table 34.4 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RTCA units are identified by the index “n”; for example, RTCAnCTL0 (n = 0) is the RTCAn control register 0.

34.1.2 Register Base Address

RTCAn base address is listed in the following table.

RTCAn register addresses are given as an offset from the base address.

Table 34.5 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<RTCA0_base>	FFE7 8000$_H$

34.1.3 Clock Supply

The RTCAn clock supply is shown in the following table.

Table 34.6 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RTCAn	RTCATCKI	CKSCLK_ARTCA	Macro clock
	PCLK	CPUCLK_L	Module clock
	Register access clock	CPUCLK_L	Bus clock

34.1.4 Interrupt Requests

RTCAn interrupt requests are listed in the following table.

Table 34.7 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RTCA0			
INTRTCA01S	1-second interval interrupt	209	—
INTRTCA0AL	Alarm interrupt	210	—
INTRTCA0R	Fixed interval interrupt	211	—

34.1.5 Reset Sources

RTCAn reset sources are listed in the following table. RTCAn is initialized by these reset sources.

Table 34.8 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
RTCAn	Power-up reset (PURES)

34.1.6 External Input/Output Signals

External input/output signals of RTCAn are listed below.

Table 34.9 External Input/Output Signal (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RTCA0		
RTCAT1HZ	1-Hz pulse output	RTCA0OUT^{*1}

Note 1. RTCA0OUT is connected to TAUJ0. For details, see **Section 33, Timer Array Unit J (TAUJ)**.

CAUTION

When port P8_6 is used as RTCA0OUT, port P8_6 pin outputs a low-level $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is deasserted.

For details, see **Section 2A.11.1.1, P8_6: $\overline{\text{RESETOUT}}$, Section 2B.11.1.1, P8_6: $\overline{\text{RESETOUT}}$** and **Section 2C.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

34.2 Overview

34.2.1 Functional Overview

The Real-Time Clock (RTCA) has the following features:

- Count clock selection from 32 kHz to 4 MHz
- Counters for years, months, day of the month, day of the week, hours, minutes, seconds, and a sub-counter. The calendar covers 99 years. Leap years are handled by hardware automatically.
- One Hz pulse output function
- Fixed interval interrupt function
- Alarm interrupt function
- Clock error correction function if a 32.768-kHz count clock is used

34.2.2 Block Diagram

The block diagram shows the main components of the RTCA.

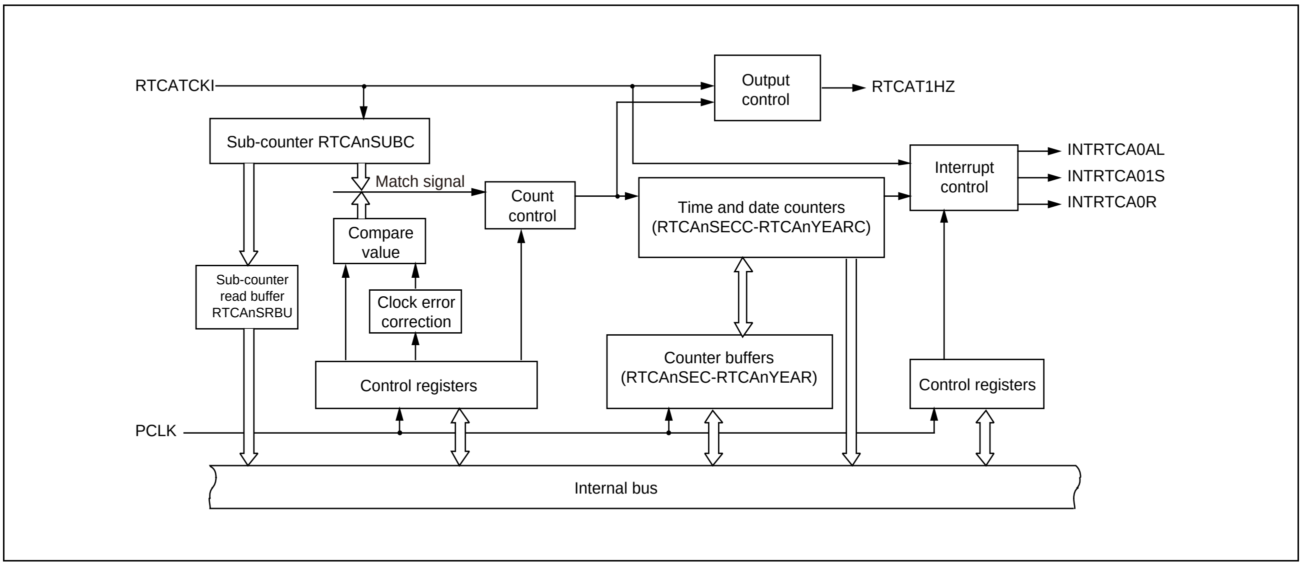

Figure 34.1 Block Diagram of the RTCA

34.2.3 Description of Blocks

The Real-Time Clock RTCA provides information about the present time and date and can generate wake-up signals (interrupts, alarms). This information is derived from the count clock RTCATCKI.

Sub-counter

RTCATCKI is the input to the sub-counter RTCAnSUBC. The sub-counter counts up from 0 until it reaches the compare value. The compare value is always defined as the frequency of RTCATCKI – 1 (in Hz). Thus, the sub-counter overflows after one second. It is then reset to 0 and triggers the seconds counter RTCAnSECC (and, if specified, the interrupt INTRTCA01S).

The sub-counter can generate a fixed interval interrupt every 0.25 seconds, 0.5 seconds, or 1 second, and a 1-Hz output pulse.

Time and date counters

The counters for minutes, hours, day of the week, day of the month, months, and years also count up. They have their own overflow limits. If all the lower counters overflow, the upper counter counts up.

The overflow limit of the counter for the day of the month (RTCAnDAYC) depends on the present month (28, 30, or 31 days) and (in February) on the year counter RTCAnYEARC (years 0, 4, 8, 12, etc. are considered leap years).

The hours counter RTCAnHOURC can be switched between 12- and 24-hour formats.

The counters for seconds, minutes, hours, day of the month, and months can generate a fixed interval interrupt upon overflow (INTRTCA0R).

The counters for minutes, hours, and day of the week can also generate an alarm interrupt (INTRTCA0AL), e.g. every Tuesday and Thursday at 10:32.

Counter buffers

All counters can be read directly at any time. The clock signal used to access the read/write registers and the count clock are usually asynchronous. An overflow of the sub-counter during the read operation can make all read values obsolete. Therefore, reading the counters must be performed using a special procedure. For details, see **Section 34.5.3, Reading Clock Counters**.

For reasons of synchronization, the counters cannot be written directly.

For reading and writing, all counters are accompanied by buffer registers. The buffer registers provide a synchronized way for reading the counters and for setting time and date. When they are used, the operation of the sub-counter must first be suspended and then re-activated (see also **Section 34.5.3, Reading Clock Counters** and **Section 34.5.2, Updating Clock Counters**).

The RTCAnTIMEC and RTCAnCALC registers and their corresponding buffer registers can be used to check and set the time (hours, minutes and seconds) or the date (day of the week, day of the month, month, and year) with one read/write operation.

34.3 Registers

34.3.1 List of Registers

RTCA registers are listed in the following table.

<RTCAn_base> is defined in **Section 34.1.2, Register Base Address**.

Table 34.10 List of Registers

Module Name	Register Name	Symbol	Address
RTCA control registers			
RTCAn	RTCA control register 0	RTCAnCTL0	<RTCAn_base> + 00_H
	RTCA control register 1	RTCAnCTL1	<RTCAn_base> + 04_H
	RTCA control register 2	RTCAnCTL2	<RTCAn_base> + 08_H
RTCA sub-counter registers			
RTCAn	RTCA sub-count register	RTCAnSUBC	<RTCAn_base> + $0C_H$
	RTCA sub-count register read buffer	RTCAnSRBU	<RTCAn_base> + 10_H
	RTCA clock error correction register	RTCAnSUBU	<RTCAn_base> + 38_H
	RTCA sub-counter compare register	RTCAnSCMP	<RTCAn_base> + $3C_H$
RTCA clock counter and buffer registers			
RTCAn	RTCA seconds count register	RTCAnSECC	<RTCAn_base> + $4C_H$
	RTCA seconds count buffer register	RTCAnSEC	<RTCAn_base> + 14_H
	RTCA minutes count register	RTCAnMINC	<RTCAn_base> + 50_H
	RTCA minutes count buffer register	RTCAnMIN	<RTCAn_base> + 18_H
	RTCA hours count register	RTCAnHOURC	<RTCAn_base> + 54_H
	RTCA hours count buffer register	RTCAnHOUR	<RTCAn_base> + $1C_H$
	RTCA day of the week count register	RTCAnWEEKC	<RTCAn_base> + 58_H
	RTCA day of the week count buffer register	RTCAnWEEK	<RTCAn_base> + 20_H
	RTCA day of the month count register	RTCAnDAYC	<RTCAn_base> + $5C_H$
	RTCA day of the month count buffer register	RTCAnDAY	<RTCAn_base> + 24_H
	RTCA month count register	RTCAnMONC	<RTCAn_base> + 60_H
	RTCA month count buffer register	RTCAnMONTH	<RTCAn_base> + 28_H
	RTCA year count register	RTCAnYEARC	<RTCAn_base> + 64_H
	RTCA year count buffer register	RTCAnYEAR	<RTCAn_base> + $2C_H$
RTCA special counter and buffer registers			
RTCAn	RTCA time count register	RTCAnTIMEC	<RTCAn_base> + 68_H
	RTCA time count buffer register	RTCAnTIME	<RTCAn_base> + 30_H
	RTCA calendar count register	RTCAnCALC	<RTCAn_base> + $6C_H$
	RTCA calendar count buffer register	RTCAnCAL	<RTCAn_base> + 34_H
RTCA alarm time setting registers			
RTCAn	RTCA alarm minute setting register	RTCAnALM	<RTCAn_base> + 40_H
	RTCA alarm hour setting register	RTCAnALH	<RTCAn_base> + 44_H
	RTCA alarm day of the week setting register	RTCAnALW	<RTCAn_base> + 48_H
RTCA emulation register			
RTCAn	RTCA emulation register	RTCAnEMU	<RTCAn_base> + 74_H

34.3.2 Details of RTCA Control Registers

34.3.2.1 RTCAnCTL0 — RTCA Control Register 0

This register controls the count operation of the sub-counter RTCAnSUBC, the format (12-hour/24-hour) of the hours counter RTCAnHOURC and the alarm hour setting register RTCAnALH, and the operation mode.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: <RTCAn_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnCE	RTCAnCEST	RTCAnAMPM	RTCAnSLSB	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R	R	R	R

Table 34.11 RTCAnCTL0 Register Contents

Bit Position	Bit Name	Function
7	RTCAnCE	Starts/stops the sub-counter RTCAnSUBC operation. 0: Stops the sub-counter operation. All output pins and all status flags in control register RTCAnCTL2 are cleared. 1: Starts the sub-counter operation. The sub-counter counts up.
6	RTCAnCEST	Indicates the operation enabled/stopped status of the sub-counter: 0: Operation stopped status 1: Operation enabled status For details on how to use this status flag, see **Section 34.5.1, Initial Setting of the RTCA**.
5	RTCAnAMPM	Selects the format of the hours counter RTCAnHOURC and the alarm hour setting register RTCAnALH: 0: 12-hour format (1 to 12, am/pm) 1: 24-hour format (0 to 23, military time) For details on the format, see **Table 34.23, 12- and 24-Hour Format**.
4	RTCAnSLSB	Selects the operation mode: 0: 32.768 kHz mode*[1] 1: Frequency selection mode For details on the operation modes, see **Section 34.4, Operation**. The operation mode must not be changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1). For details on the initialization of RTCAn, see **Section 34.5.1, Initial Setting of the RTCA**.
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. This setting not supported in the RH850/F1KM-S4 100-pin product and RH850/F1KM-S1 all products.

34.3.2.2 RTCAnCTL1 — RTCA Control Register 1

This register controls the interrupt request generation and the 1-Hz pulse output.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: <RTCAn_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnEN1HZ	RTCAnENALM	RTCAnEN1S	RTCAnCT[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.12 RTCAnCTL1 Register Contents

</table>
If the settings of RTCAnCT[2:0] are changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), a glitch may be output to INTRTCA0R. Implement appropriate interrupt mask processing procedures.</td></tr>
</table>

34.3.2.3 RTCAnCTL2 — RTCA Control Register 2

This register contains status information and controls the data transfer from the sub-counter RTCAnSUBC to the dedicated sub-counter read buffer RTCAnSRBU and the operation setting of the clock counters (RTCAnSECC to RTCAnYEARC).

Access: This register can be read or written in 8-bit or 1-bit units.

Address: <RTCAn_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnWUST	RTCAnWSST	RTCAnRSST	RTCAnRSUB	RTCAnWST	RTCAnWAIT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R	R/W

Table 34.13 RTCAnCTL2 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	RTCAnWUST	Indicates whether RTCAnSUBU write operation has been completed: 0: RTCAnSUBU write completed 1: RTCAnSUBU write in progress The write operation ends with the next sub-counter overflow. While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1) and if write operation to RTCAnSUBU is completed, this bit is set to 1. See **Section 34.5.5, Writing to RTCAnSUBU**, for details.
4	RTCAnWSST	Indicates whether RTCAnSCMP write operation has been completed: 0: RTCAnSCMP write completed 1: RTCAnSCMP write in progress The write operation ends with the next sub-counter overflow. While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1) and if write operation to RTCAnSCMP is completed, this bit is set to 1. See **Section 34.5.6, Writing to RTCAnSCMP**, for details.
3	RTCAnRSST	Indicates whether the value of the sub-counter (RTCAnSUBC) has been transferred to the sub-count register read buffer (RTCAnSRBU): 0: Transfer in progress, or waiting for a transfer trigger 1: Transfer completed This bit is cleared (transfer is triggered) by RTCAnRSUB=1.This bit is automatically set when the transfer is completed. See **Section 34.5.4, Reading RTCAnSRBU**, for details.
2	RTCAnRSUB	Triggers transfer of the value of the sub-counter (RTCAnSUBC) to the dedicated read buffer (RTCAnSRBU) or clears the transfer state of the sub-counter: 0: Transfer status (RTCAnRSST) is cleared. 1: Transfer is triggered. This bit is used to read the value of RTCAnSRBU when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1). The value of RTCAnSUBC is synchronized with RTCATCKI and loaded to RTCAnSRBU. For details, see **Section 34.5.4, Reading RTCAnSRBU**.

Table 34.13 RTCAnCTL2 Register Contents

Bit Position	Bit Name	Function
1	RTCAnWST	Indicates the status of all clock counters (RTCAnSECC to RTCAnYEARC): 0: All clock counters are running. 1: All clock counters are stopped The sub-counter is still running. The clock counters must be stopped before reading or writing clock counter values during sub-counter operation (RTCAnCTL0.RTCAnCE = 1). To stop the clock counters, set RTCAnWAIT = 1.
0	RTCAnWAIT	Restarts/stops all clock counters (RTCAnSECC to RTCAnYEARC): 0: Restarts all clock counters either immediately or immediately after the clock counter write operation finishes. 1: Stops all clock counters temporarily. The sub-counter is still running. The clock counters must be stopped before reading or writing counter buffers during sub-counter operation (RTCAnCTL0.RTCAnCE = 1). **CAUTION:** Only one overflow can be held internally. When two overflows occur, the seconds counter is incremented only by one when it is restarted. Thus, the procedure must be completed within one second.

34.3.3 Details of RTCA Sub-Counter Registers

34.3.3.1 RTCAnSUBC — RTCA Sub-Count Register

This counter counts the 1-second reference time. It operates using the count clock RTCATCKI.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	<RTCAn_base> + 0C$_H$
Value after reset:	0000 0000$_H$

This register is initialized:

- When write operation is performed to the seconds count buffer register (RTCAnSEC) or to the time count buffer register (RTCAnTIME) and the value is reflected to the seconds count register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSUBC[21:16]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 34.14 RTCAnSUBC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 0	RTCAnSUBC[21:0]	Sub-counter value The sub-counter only operates while RTCAnCTL0.RTCAnCEST = 1.

NOTES

1. This sub-counter operates with RTCATCKI while the read operation is clocked by PCLK. Reading this sub-counter during operation (RTCAnCTL0.RTCAnCEST = 1) is asynchronous to RTCATCKI and can lead to wrong results. Use the sub-count register read buffer (RTCAnSRBU) to read the sub-counter value during operation. For details, see **Section 34.5.4, Reading RTCAnSRBU**.
2. The count-operation of this sub-counter depends on the selected operation mode. See **Section 34.4, Operation**, for details.

34.3.3.2 RTCAnSRBU — RTCA Sub-Count Register Read Buffer

This register is the read buffer for the sub-counter RTCAnSUBC.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RTCAn_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSRBU[21:16]

Table 34.15 RTCAnSRBU Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 0	RTCAnSRBU[21:0]	Sub-counter value at the time of the last RTCAnSUBC read. When RTCAnCTL2.RTCAnRSUB is set to 1, the value of the RTCAnSUBC is loaded to the read buffer in synchronization with RTCATCKI.

NOTE

Perform RTCAnSRBU read according to the flow described in **Section 34.5.4, Reading RTCAnSRBU**.

34.3.3.3 RTCAnSUBU — RTCA Clock Error Correction Register

This register enables and specifies clock error correction. This register only applies in 32.768-kHz mode (RTCAnCTL0.RTCAnSLSB = 0).

For details on clock error correction, see **Section 34.4.4, Clock Error Correction**.

Access: This register can be read or written in 8-bit units.

Note the following when writing this register during sub-counter operation:

- Previous RTCAnSUBU write must be completed (RTCAnCTL2.RTCAnWUST = 0).
- The write operation ends with the next sub-counter overflow.

Address: <RTCAn_base> + 38_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnDEV	RTCAnF6	RTCAnF[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.16 RTCAnSUBU Register Contents

Bit Position	Bit Name	Function
7	RTCAnDEV	Specifies how often clock error correction is performed per minute: 0: Three times every minute (when RTCAnSECC equals 00, 20, and 40) 1: Once every minute (when RTCAnSECC equals 00)
6	RTCAnF6	Specifies whether the sub-counter value is incremented or decremented: 0: Incremented (+ correction) Incrementation value = (RTCAnF[5:0] value – 1) × 2 1: Decremented (– correction) Decrementation value = (inverted data of RTCAnF[5:0] value + 1) × 2
5 to 0	RTCAnF[5:0]	Error correction value

NOTES

1. When RTCAnF[5:1] = 00000_B, clock error correction is not performed.
2. Perform RTCAnSUBU write as described in
   - **Section 34.5.1, Initial Setting of the RTCA**, and
   - **Section 34.5.5, Writing to RTCAnSUBU**.

34.3.3.4 RTCAnSCMP — RTCA Sub-Counter Compare Register

This register sets the compare value of the sub-counter RTCAnSUBC in frequency selection mode (RTCAnCTL0.RTCAnSLSB = 1).

When the sub-counter values matches the value of this register, an overflow signal is output to the seconds counter RTCAnSECC and the sub-counter is cleared.

Set the value for this register according to the frequency of the input clock RTCATCKI.

Access: This register can be read or written in 32-bit units.

Note the following when writing this register during sub-counter operation:

- Previous RTCAnSCMP write must be completed (RTCAnCTL2.RTCAnWSST = 0).
- The write operation ends with the next sub-counter overflow.

Address: <RTCAn_base> + $3C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSCMP[21:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.17 RTCAnSCMP Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 0	RTCAnSCMP[21:0]	Sub-counter compare value in frequency selection mode.

Example

The following example illustrates the setting of RTCAnSCMP:

- RTCATCKI = 4 MHz = 4,000,000 Hz
- RTCAnSCMP = 4,000,000 – 1 = 3,999,999 (decimal code) = $3D08FF_H$
- The seconds counter RTCAnSECC is triggered when the sub-counter value changes from $3D08FF_H$ to 0_H.

NOTES

1. The operation of the RTCA cannot be guaranteed if a value of 3198 (decimal code) or lower is set in this register.
2. Perform RTCAnSCMP write as described in **Section 34.5.1, Initial Setting of the RTCA** and **Section 34.5.6, Writing to RTCAnSCMP**.

34.3.4 Details of RTCA Clock Counter and Buffer Registers

34.3.4.1 RTCAnSECC — RTCA Seconds Count Register

This register is the seconds counter. It counts seconds from 00 to 59 in BCD.

This register counts as follows.

- It is triggered by every overflow of the sub-counter RTCAnSUBC.

  If the sub-counter overflows while the seconds counter is stopped (RTCAnCTL2.RTCAnWST = 1), the seconds counter behaves as follows:

  - If one sub-counter overflow occurs while the seconds counter is stopped, the overflow is held internally.
    The seconds counter is incremented by one when it is restarted.
  - If two or more overflows occur while the seconds counter is stopped, the overflow count cannot be held internally.
    The seconds counter is incremented by one when it is restarted.
  - If the seconds counter was updated while the seconds counter is stopped, the sub-counter overflow(s) are ignored.
- It outputs an overflow signal when the value changes from 59 to 00. The overflow signal triggers the minutes counter (RTCAnMINC).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + $4C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnSECC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 34.18 RTCAnSECC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnSECC[6:0]	Seconds in BCD

NOTES

1. Perform RTCAnSECC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the seconds count buffer register RTCAnSEC or to the clock time setting register RTCAnTIME. See

- **Section 34.5.1, Initial Setting of the RTCA**, and
- **Section 34.5.2, Updating Clock Counters**

34.3.4.2 RTCAnSEC — RTCA Seconds Count Buffer Register

This register is a buffer register to read/write the seconds counter RTCAnSECC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnSEC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.19 RTCAnSEC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnSEC[6:0]	Seconds in BCD

NOTES

1. When writing this register, only decimal values between 00 and 59 in BCD are allowed.
2. Perform RTCAnSEC read/write as described in
   - **Section 34.5.1, Initial Setting of the RTCA**,
   - **Section 34.5.2, Updating Clock Counters**, and
   - **Section 34.5.3, Reading Clock Counters**.

34.3.4.3 RTCAnMINC — RTCA Minutes Count Register

This register is the minutes counter. It counts minutes from 00 to 59 in BCD.

This register counts as follows.

- It is triggered by every overflow of the seconds counter RTCAnSECC.
- It outputs an overflow signal when the value changes from 59 to 00. The overflow signal triggers the hours counter (RTCAnHOURC).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 50_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnMINC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 34.20 RTCAnMINC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnMINC[6:0]	Minutes in BCD

NOTES

1. Perform RTCAnMINC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the minutes count buffer register RTCAnMIN or to the time count buffer register RTCAnTIME. See
   - **Section 34.5.1, Initial Setting of the RTCA**, and
   - **Section 34.5.2, Updating Clock Counters**.

34.3.4.4 RTCAnMIN — RTCA Minutes Count Buffer Register

This register is a buffer register to read/write the minutes counter RTCAnMINC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnMIN[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.21 RTCAnMIN Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnMIN[6:0]	Minutes in BCD

NOTES

1. When writing this register, only decimal values between 00 and 59 in BCD are allowed.
2. Perform RTCAnMIN read/write as described in
   - **Section 34.5.1, Initial Setting of the RTCA**,
   - **Section 34.5.2, Updating Clock Counters**, and
   - **Section 34.5.3, Reading Clock Counters**.

34.3.4.5 RTCAnHOURC — RTCA Hours Count Register

This register is the hours counter. It counts the hours in BCD. The count range depends on the selected hour format. See **Table 34.23, 12- and 24-Hour Format**.

This register counts as follows.

- It is triggered by every overflow of the minutes counter RTCAnMINC.
- It outputs an overflow signal when the value changes from 23 to 00 (in 24-hour format) or from 31 to 12 (in 12-hour format). The overflow signal triggers two counters:
  - Day of the week counter (RTCAnWEEKC)
  - Day of the month counter (RTCAnDAYC)

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 54_H

Value after reset: 12_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnHOURC[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R	R	R	R	R	R

Table 34.22 RTCAnHOURC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	RTCAnHOURC[5:0]	Hours in BCD. See **Table 34.23, 12- and 24-Hour Format**, for details.

NOTES

1. Perform RTCAnHOURC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the hours count buffer register RTCAnHOUR or to the time count buffer register RTCAnTIME. See
   - **Section 34.5.1, Initial Setting of the RTCA**, and
   - **Section 34.5.2, Updating Clock Counters**.

12- or 24-hour format

The count values of RTCAnHOURC depend on the selected hour format.

If 12-hour format is selected (RTCAnCTL0.RTCAnAMPM = 0), bit 5 in the RTCAnHOURC register is the am/pm indicator:

- RTCAnHOURC[5] = 0: am
- RTCAnHOURC[5] = 1: pm

The following table shows the count range of RTCAnHOURC in both 12- and 24-hour format.

Table 34.23 12- and 24-Hour Format

12-Hour Format (RTCAnAMPM = 0)			24-Hour Format (RTCAnAMPM = 1)	
Time	RTCAnHOURC		Time	RTCAnHOURC
0 am	12_H		0	00_H
1 am	01_H		1	01_H
2 am	02_H		2	02_H
3 am	03_H		3	03_H
4 am	04_H		4	04_H
5 am	05_H		5	05_H
6 am	06_H		6	06_H
7 am	07_H		7	07_H
8 am	08_H		8	08_H
9 am	09_H		9	09_H
10 am	10_H		10	10_H
11 am	11_H		11	11_H
0 pm	32_H	↓	12	12_H
1 pm	21_H	pm indicator in 12-hour format: RTCAnHOUR.RTCAnHOUR[5] = 1	13	13_H
2 pm	22_H		14	14_H
3 pm	23_H		15	15_H
4 pm	24_H		16	16_H
5 pm	25_H		17	17_H
6 pm	26_H		18	18_H
7 pm	27_H		19	19_H
8 pm	28_H		20	20_H
9 pm	29_H		21	21_H
10 pm	30_H		22	22_H
11 pm	31_H		23	23_H

34.3.4.6 RTCAnHOUR — RTCA Hours Count Buffer Register

This register is a buffer register to read/write the hours counter RTCAnHOURC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + $1C_H$

Value after reset: 12_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnHOUR[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.24 RTCAnHOUR Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RTCAnHOUR[5:0]	Hours in BCD See **Table 34.23, 12- and 24-Hour Format**, for details.

NOTES

1. When writing this register, only the following decimal values in BCD are allowed:
   - 12-hour format (RTCAnCTL0.RTCAnAMPM = 0):
     01 to 12 or 21 to 32
   - 24-hour format (RTCAnCTL0.RTCAnAMPM = 1):
     00 to 23
2. Perform RTCAnHOUR read/write as described in
   - **Section 34.5.1, Initial Setting of the RTCA**,
   - **Section 34.5.2, Updating Clock Counters**, and
   - **Section 34.5.3, Reading Clock Counters**.

34.3.4.7 RTCAnWEEKC — RTCA Day of the Week Count Register

This register is the day of the week counter. It counts from 0 to 6.

This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 58_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	RTCAnWEEKC[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 34.25 RTCAnWEEKC Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	RTCAnWEEKC[2:0]	Day of the week

NOTES

1. Perform RTCAnWEEKC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the day of the week count buffer register RTCAnWEEK or to the calendar count buffer register RTCAnCAL. See
   - **Section 34.5.1, Initial Setting of the RTCA**, and
   - **Section 34.5.2, Updating Clock Counters**.

34.3.4.8 RTCAnWEEK — RTCA Day of the Week Count Buffer Register

This register is a buffer register to read/write the day of the week counter RTCAnWEEKC.

There is no particular correspondence between the value of RTCAnWEEK and the day of the week. Set the correspondence according to the application to be used.

Example: 0 = Sunday, 1 = Monday, …, 6 = Saturday

Access:	This register can be read or written in 8-bit units.
Address:	<RTCAn_base> + 20_H
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	RTCAnWEEK[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 34.26 RTCAnWEEK Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	RTCAnWEEK[2:0]	Day of the week

NOTES

1. When writing this register, only decimal values between 0 and 6 in BCD are allowed.
2. Perform RTCAnWEEK read/write as described in
    - **Section 34.5.1, Initial Setting of the RTCA**,
    - **Section 34.5.2, Updating Clock Counters**, and
    - **Section 34.5.3, Reading Clock Counters**.

34.3.4.9 RTCAnDAYC — RTCA Day of the Month Count Register

This register is the day of the month counter. It counts from 01 to a maximum of 31 in BCD, depending on the value of the month counter (RTCAnMONC) and the year counter (RTCAnYEARC):

- 01 to 31 (January, March, May, July, August, October, December)
- 01 to 30 (April, June, September, November)
- 01 to 29 (February, leap year)
- 01 to 28 (February, non-leap year)

Years 0, 4, 8, 12, etc., are considered leap years.

This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.
- It outputs an overflow signal when the value changes from 28, 29, 30, or 31 to 01, depending on the current month and year. The overflow signal triggers the month counter (RTCAnMONC).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + $5C_H$

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnDAYC[5:0]					
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 34.27 RTCAnDAYC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	RTCAnDAYC[5:0]	Day of the month in BCD

NOTES

1. Perform RTCAnDAYC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the day of the month count buffer register RTCAnDAY or to the calendar count buffer register RTCAnCAL. See
    - **Section 34.5.1, Initial Setting of the RTCA**, and
    - **Section 34.5.2, Updating Clock Counters**.

34.3.4.10 RTCAnDAY — RTCA Day of the Month Count Buffer Register

This register is a buffer register to read/write the day of the month counter RTCAnDAYC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 24_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnDAY[5:0]					
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.28 RTCAnDAY Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RTCAnDAY[5:0]	Day of the month in BCD

NOTES

1. When writing this register, only decimal values between 01 and 31 in BCD are allowed:
   - 01 to 31 (January, March, May, July, August, October, December)
   - 01 to 30 (April, June, September, November)
   - 01 to 29 (February, leap year)
   - 01 to 28 (February, non-leap year)
2. Perform RTCAnDAY read/write as described in
   - **Section 34.5.1, Initial Setting of the RTCA**,
   - **Section 34.5.2, Updating Clock Counters**, and
   - **Section 34.5.3, Reading Clock Counters**.

34.3.4.11 RTCAnMONC — RTCA Month Count Register

This register is the month counter. It counts the month of the year, starting from 01 to 12 in BCD.

This register counts as follows.

- It is triggered by every overflow of the counter for the day of the month RTCAnDAYC.
- It outputs an overflow signal when the value changes from 12 to 01. The overflow signal triggers the year counter (RTCAnYEARC).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 60_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RTCAnMONC[4:0]				
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 34.29 RTCAnMONC Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned.
4 to 0	RTCAnMONC[4:0]	Month of the year in BCD

NOTES

1. Perform RTCAnMONC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the month count buffer register RTCAnMONTH or to the calendar count buffer register RTCAnCAL. See
   - **Section 34.5.1, Initial Setting of the RTCA**, and
   - **Section 34.5.2, Updating Clock Counters**.

34.3.4.12 RTCAnMONTH — RTCA Month Count Buffer Register

This register is a buffer register to read/write the month counter RTCAnMONC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 28_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RTCAnMONTH[4:0]				
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 34.30 RTCAnMONTH Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	RTCAnMONTH[4:0]	Month of the year in BCD

NOTES

1. When writing this register, only decimal values between 01 and 12 in BCD are allowed.
2. Perform RTCAnMONTH read/write as described in
   - **Section 34.5.1, Initial Setting of the RTCA**,
   - **Section 34.5.2, Updating Clock Counters**, and
   - **Section 34.5.3, Reading Clock Counters**.

34.3.4.13 RTCAnYEARC — RTCA Year Count Register

This register is the year counter. It counts years from 00 to a maximum of 99 in BCD.

Years 00, 04, 08, …, 92, and 96 (every four years) are considered leap years.

This register counts as follows.

- It is triggered by every overflow of the month counter RTCAnMONC.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 64_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnYEARC[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 34.31 RTCAnYEARC Register Contents

Bit Position	Bit Name	Function
7 to 0	RTCAnYEARC[7:0]	Year in BCD

NOTES

1. Perform RTCAnYEARC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the year count buffer register RTCAnYEAR or to the calendar count buffer register RTCAnCAL. See
   - **Section 34.5.1, Initial Setting of the RTCA**, and
   - **Section 34.5.2, Updating Clock Counters**.

34.3.4.14 RTCAnYEAR — RTCA Year Count Buffer Register

This register is a buffer register to read/write the year counter RTCAnYEARC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + $2C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnYEAR[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.32 RTCAnYEAR Register Contents

Bit Position	Bit Name	Function
7 to 0	RTCAnYEAR[7:0]	Year in BCD

NOTES

1. When writing this register, only decimal values between 00 and 99 in BCD are allowed.
2. Perform RTCAnYEAR read/write as described in
   - **Section 34.5.1, Initial Setting of the RTCA**,
   - **Section 34.5.2, Updating Clock Counters**, and
   - **Section 34.5.3, Reading Clock Counters**.

34.3.5 Details of RTCA Special Counter and Buffer Registers

34.3.5.1 RTCAnTIMEC — RTCA Time Count Register

This register enables the RTCAnHOURC, RTCAnMINC, and RTCAnSECC counters to be read simultaneously.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RTCAn_base> + 68_H

Value after reset: $0012\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnHOURC[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	RTCAnMINC[6:0]							—	RTCAnSECC[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 34.33 RTCAnTIMEC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 16	RTCAnHOURC[5:0]	Hours in BCD. See **Table 34.23, 12- and 24-Hour Format**, for details.
15	Reserved	When read, the value after reset is returned.
14 to 8	RTCAnMINC[6:0]	Minutes in BCD
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnSECC[6:0]	Seconds in BCD

NOTES

1. Perform RTCAnTIMEC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the time count buffer register RTCAnTIME. See
   - **Section 34.5.1, Initial Setting of the RTCA**, and
   - **Section 34.5.2, Updating Clock Counters**.

34.3.5.2 RTCAnTIME — RTCA Time Count Buffer Register

This register enables the RTCAnHOUR, RTCAnMIN, and RTCAnSEC buffer registers to be read/written simultaneously.

Access:	This register can be read or written in 32-bit units.
Address:	<RTCAn_base> + 30_H
Value after reset:	$0012\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnHOUR[5:0]

Table 34.34 RTCAnTIME Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 16	RTCAnHOUR[5:0]	Hours in BCD See **Table 34.23, 12- and 24-Hour Format**, for details.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14 to 8	RTCAnMIN[6:0]	Minutes in BCD
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnSEC[6:0]	Seconds in BCD

NOTE

Perform RTCAnTIME read/write as described in

- **Section 34.5.1, Initial Setting of the RTCA**,
- **Section 34.5.2, Updating Clock Counters**, and
- **Section 34.5.3, Reading Clock Counters**.

34.3.5.3 RTCAnCALC — RTCA Calendar Count Register

This register enables the RTCAnYEARC, RTCAnMONC, RTCAnDAYC, and RTCAnWEEKC counters to be read simultaneously.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RTCAn_base> + 6C$_H$

Value after reset: 0001 0100$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RTCAnYEARC[7:0]								—	—	—	RTCAnMONC[4:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 34.35 RTCAnCALC Register Contents

Bit Position	Bit Name	Function
31 to 24	RTCAnYEARC[7:0]	Year in BCD
23 to 21	Reserved	When read, the value after reset is returned.
20 to 16	RTCAnMONC[4:0]	Month of the year in BCD
15, 14	Reserved	When read, the value after reset is returned.
13 to 8	RTCAnDAYC[5:0]	Day of the month in BCD
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	RTCAnWEEKC[2:0]	Day of the week in BCD

NOTES

1. Perform RTCAnCALC read according to the flow described in **Section 34.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the clock time setting register RTCAnCAL. See
   - **Section 34.5.1, Initial Setting of the RTCA**, and
   - **Section 34.5.2, Updating Clock Counters**.

34.3.5.4 RTCAnCAL — RTCA Calendar Count Buffer Register

This register enables the RTCAnYEAR, RTCAnMONTH, RTCAnDAY, and RTCAnWEEK buffer registers to be read/written simultaneously.

Access:	This register can be read or written in 32-bit units.
Address:	<RTCAn_base> + 34_H
Value after reset:	$0001\ 0100_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RTCAnYEAR[7:0]								—	—	—	RTCAnMONTH[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	RTCAnDAY[5:0]						—	—	—	—	—	RTCAnWEEK[2:0]		
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Table 34.36 RTCAnCAL Register Contents

Bit Position	Bit Name	Function
31 to 24	RTCAnYEAR[7:0]	Year in BCD
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 16	RTCAnMONTH[4:0]	Month of the year in BCD
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	RTCAnDAY[5:0]	Day of the month in BCD
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	RTCAnWEEK[2:0]	Day of the week in BCD

NOTE

Perform RTCAnCAL read/write as described in

- **Section 34.5.1, Initial Setting of the RTCA**,
- **Section 34.5.2, Updating Clock Counters**, and
- **Section 34.5.3, Reading Clock Counters**.

34.3.6 Details of RTCA Alarm Time Setting Registers

34.3.6.1 RTCAnALM — RTCA Alarm Minute Setting Register

This register specifies the minute of the alarm interrupt.

For details and example settings, see **Section 34.4.3, Alarm Interrupt Function**.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 40_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnALM[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.37 RTCAnALM Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnALM[6:0]	Minute of the alarm interrupt in BCD

NOTES

1. If decimal values outside the range of 00 to 59 in BCD are set, no alarm interrupt request will be generated.
2. When the setting of RTCAnALM is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to INTRTCA0AL. Implement appropriate interrupt mask processing procedures.

34.3.6.2 RTCAnALH — RTCA Alarm Hour Setting Register

This register specifies the hour of the alarm interrupt.

For details and example settings, see **Section 34.4.3, Alarm Interrupt Function**.

Access: This register can be read or written in 8-bit units.
Address: <RTCAn_base> + 44_H
Value after reset: 12_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnALH[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.38 RTCAnALH Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RTCAnALH[5:0]	Hour of the alarm interrupt in BCD

NOTES

1. If decimal values outside the following range are set, no alarm interrupt request will be generated:
   - 12-hour format (RTCAnCTL0.RTCAnAMPM = 0): 01 to 12 or 21 to 32
   - 24-hour format (RTCAnCTL0.RTCAnAMPM = 1): 00 to 23
2. When the setting of RTCAnALH is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to INTRTCA0AL. Implement appropriate interrupt mask processing procedures.

34.3.6.3 RTCAnALW — RTCA Alarm Day of the Week Setting Register

This register specifies the day(s) of the week of the alarm interrupt.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 48_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnALW[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.39 RTCAnALW Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnALW[6:0]	Specifies day of the week m (m = 0 to 6) as a day, when an alarm interrupt request is generated: 0: No alarm interrupt request is generated on day m. 1: Alarm interrupt request is generated on day m at the time set using RTCAnALM and RTCAnALH. The bits of this register correspond to the count value of the day of the week counter (RTCAnWEEKC).

NOTE

When the setting of RTCAnALW is changed during sub-counter operation (RTCAnCTL0.RTCAnCE = 1), a glitch may be output to INTRTCA0AL. Implement appropriate interrupt mask processing procedures.

Example

If Sunday is RTCAnWEEK = 0, Monday is RTCAnWEEK = 1, Tuesday is RTCAnWEEK = 2, …, Saturday is RTCAnWEEK = 6:

- To set the alarm for Sunday, set RTCAnALW = $0000\ 0001_B$.
- To set the alarm for Monday and Wednesday, set RTCAnALW = $0000\ 1010_B$.
- To set the alarm for Tuesday, Thursday, and Saturday, set RTCAnALW = $0101\ 0100_B$.

For more examples, see **Section 34.4.3, Alarm Interrupt Function**.

34.3.7 RTCA Emulation Register

34.3.7.1 RTCAnEMU — RTCA Emulation Register

This register controls operation by SVSTOP.

Access: This register can be read or written in 8-bit or 1-bit units.

A write should be performed when EPC.SVSTOP = 0.

Address: <RTCAn_base> + 74_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 34.40 RTCAnEMU Register Contents

Bit Position	Bit Name	Function
7	RTCAnSVSDIS	When the EPC.SVSTOP bit is set to 0: Count clock is supplied when the debugger gains microcontroller control (at a breakpoint, etc.) regardless of the value of this bit. When the EPC.SVSTOP bit is set to 1: 0: Count clock is stopped when the debugger gains microcontroller control (as at a breakpoint). 1: Count clock continues to be supplied when the debugger gains microcontroller control (at a breakpoint, etc.).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

34.4 Operation

The RTCA provides two operation modes:

- Frequency selection mode
- 32.768-kHz mode

The operation mode that can be used depends on the available input clock RTCATCKI. The operation mode specifies the sub-counter compare value that is used to trigger the seconds counter and thus all subsequent counters. Clock error correction is only possible in 32.768-kHz mode.

The following table provides an overview of the properties of the two operation modes.

Table 34.41 RTCA Operation Mode Overview

		32.768-kHz Mode	
	Frequency Selection Mode	Clock Correction Disabled	Clock Correction Enabled
Allowed input clock RTCATCKI	Any frequency from 32 kHz to 4 MHz	32.768 kHz	Any frequency from 32.76180000 kHz to 32.77420000 kHz
Sub-counter RTCAnSUBC operation	● Counter overflow at value of RTCAnSCMP ● RTCAnSCMP must be set to RTCATCKI-1 (in Hz)	Counter overflow at $7FFF_H$	Counter overflow at $7FFF_H$ or Every 20 or 60 seconds: $7FFF_H$ ±RTCAnSUBU.RTCAnF[5:0]

The operation mode is selected by control bit RTCAnCTL0.RTCAnSLSB. For details on how to set the operation mode during RTCA initialization, see **Section 34.5.1, Initial Setting of the RTCA**.

CAUTIONS

1. The input clock RTCATCKI must not be outside the allowed frequency range.
2. The operation mode must not be changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1).

34.4.1 Clock Counter Format

The clock counters (RTCAnSECC to RTCAnYEARC) operate on binary coded decimals (BCD): Each digit is represented by its own binary sequence.

Depending on the valid data range, the number of bits for a digit differs. For example, the tens digit of the month of the year counter has only one bit (for 0 and 1) whereas the tens digit of the minutes counter has 3 bits (for 0 to 5).

The following table lists the decimals 0 to 59 in binary and BCD.

Table 34.42 Example of BCD Code – Seconds or Minutes Counter (0 to 59)

Decimal	Binary	BCD
0	000000	000 0000
1	000001	000 0001
2	000010	000 0010
3	000011	000 0011
4	000100	000 0100
5	000101	000 0101
6	000110	000 0110
7	000111	000 0111
8	001000	000 1000
9	001001	000 1001
10	001010	001 0000
11	001011	001 0001
12	001100	001 0010
:	:	:
58	111010	101 1000
59	111011	101 1001

34.4.2 Fixed Interval Interrupt Function

Interrupt INTRTCA0R can be specified to occur after every 0.25 seconds, 0.5 seconds, 1 (full) second, 1 (full) minute, 1 (full) hour, 1 (full) day, or 1 (full) month.

The fixed interval interrupt function is controlled by bits RTCAnCTL1.RTCAnCT[2:0].

34.4.3 Alarm Interrupt Function

Interrupt INTRTCA0AL can be specified to occur at a certain time on one or several days of the week. This interrupt can be used as a wake-up signal.

The alarm interrupt function is enabled and disabled by bit RTCAnCTL1.RTCAnENALM.

The alarm setting is specified by the following control registers:

- RTCAnALW selects the weekday(s).

The allocation of bits to weekdays is defined by the day of the week count buffer register RTCAnWEEK.

- RTCAnALH and RTCAnALM specify the hour and minute in BCD.

Examples

The following tables show some exemplary settings of the alarm control registers for both 12-hour and 24-hour format.

In this example, Sunday is RTCAnWEEK = 0, Monday is RTCAnWEEK = 1, Tuesday is RTCAnWEEK = 2, …, Saturday is RTCAnWEEK = 6:

Table 34.43 Alarm Setting in 12-Hour Format (RTCAnCTL0.RTCAnAMPM = 0)

Alarm Setting Time	RTCAnALW	RTCAnALH	RTCAnALM
Sunday 7:00 am	01_H	07_H	00_H
Sunday, Monday 12:15 pm	03_H	32_H	15_H
Monday, Wednesday, Friday 5:30 pm	$2A_H$	25_H	30_H
Daily, 10:45 pm	$7F_H$	30_H	45_H

Table 34.44 Alarm Setting in 24-Hour Format (RTCAnCTL0.RTCAnAMPM = 1)

Alarm Setting Time	RTCAnALW	RTCAnALH	RTCAnALM
Sunday 7:00	01_H	07_H	00_H
Sunday, Monday 12:15	03_H	12_H	15_H
Monday, Wednesday, Friday 17:30	$2A_H$	17_H	30_H
Daily, 22:45	$7F_H$	22_H	45_H

34.4.4 Clock Error Correction

CAUTION

This is not supported in the RH850/F1KM-S4 100-pin product and RH850/F1KM-S1 all products.

Clock error correction compensates for deviations of the oscillator from the nominal clock rate. With clock error correction input clock rates from 32.76180 kHz to 32.77420 kHz are possible.

The clock error correction function is only available in 32.768-kHz operation mode. In this operation mode, a nominal clock rate of 32.768 kHz is expected and the sub-counters overflow value is fixed to $7FFF_H$.

The following figures illustrate the clock error when the input clock rate deviates from the nominal clock.

RTCATCKI = 32.768 kHz

Figure 34.2, RTCATCKI = 32.768 kHz, No Clock Error Correction Required shows the timing diagram if RTCATCKI matches the nominal clock rate of 32.768 kHz. No clock error correction is required.

Counting from 0 to 32767 (0 to $7FFF_H$) with a 32.768-kHz clock is exactly equal to one second.

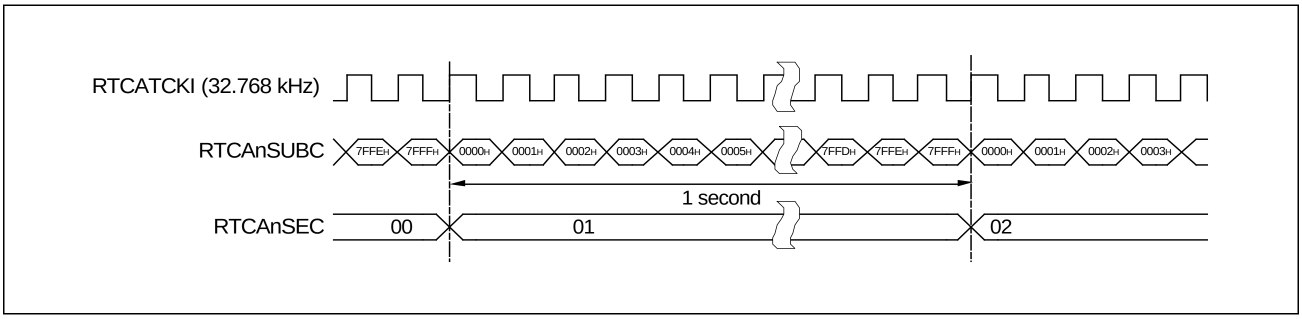

Figure 34.2 RTCATCKI = 32.768 kHz, No Clock Error Correction Required

RTCATCKI = 32.769 kHz

Figure 34.3, RTCATCKI = 32.769 kHz, No Clock Error Correction Enabled shows the timing diagram if RTCATCKI deviates from the nominal clock rate of 32.768 kHz. In this example, RTCATCKI is connected to a 32.769-kHz oscillator. Clock error correction is not enabled.

Counting from 0 to 32767 (0 to $7FFF_H$) with a 32.769-kHz clock is equal to approximately 0.99997 seconds (32768/32769). A "+ error" (faster than 32.768-kHz) occurs. In one month, RTCA deviates approximately –79 seconds from the real time.

Error = (32768/32769 - 1) × 60 (s) × 60 (min) × 24 (h) × 30 (d)

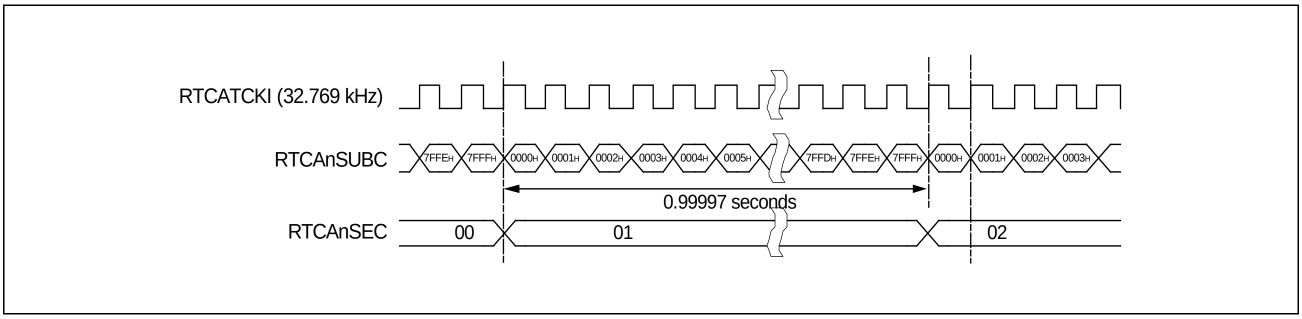

Figure 34.3 RTCATCKI = 32.769 kHz, No Clock Error Correction Enabled

Clock error correction is performed by stretching/reducing the 1-second period of the sub-counter at regular intervals. The sub-counter's upper limit of $7FFF_H$ is increased or decreased by setting the following parameters in register RTCAnSUBU:

- A correction value greater than one
- An operator (add/subtract)
- An interval (20 or 60 seconds)

The corrected overflow value becomes effective every 20 or 60 seconds, so that on the average RTCAnSECC is triggered exactly every second.

34.4.4.1 Setting the Correction Value and the Operator

The correction value and operator are specified by the RTCAnF6, RTCAnF[5:0] bits of the RTCAnSUBU register:

- RTCAnF6 specifies whether the overflow value is incremented or decremented.
- RTCAnF[5:0] specifies the correction value.

The correction values are calculated as follows:

Table 34.45 Correction Value Settings

RTCAnF6	Increment/Decrement	Correction Value
0	Increment	(Value of RTCAnF[5:0] – 1) × 2
1	Decrement	(Inverted value of RTCAnF[5:0] + 1) × 2

Some examples are given in the following table:

Table 34.46 Correction Value Examples

RTCAnF6	RTCAnF[5:0]	Correction Value	Count Limit of RTCAnSUBC
0	15_H	$(15_H – 1) × 2 = 40$	32768 + 40 = 32808
1	15_H	$(\overline{15_H} + 1) × 2$ $= (2A_H + 1) × 2$ $= 86$	32768 – 86 = 32682

34.4.4.2 Impact of the Repetition Interval

The correction value set by RTCAnF6, RTCAnF[5:0] does not change the count limit of RTCAnSUBC every second. The repetition interval at which the correction value becomes effective is specified by bit RTCAnDEV.

This bit also influences the size of the correctable frequency range and the correction accuracy.

The following table summarizes the RTCAnDEV settings.

Table 34.47 Setting of Bit RTCAnSUBU.RTCAnDEV

RTCAnDEV	Count Limit of RTCAnSUBC is Changed	Frequency Range that can be Corrected	Correction Accuracy
0	Every 20 seconds when RTCAnSECC = 00, 20, or 40	32.76180000 to 32.77420000 kHz	
1	Every 60 seconds when RTCAnSECC = 00	32.76593333 to 32.77006667 kHz	Three times higher than for RTCAnDEV = 0

34.4.4.3 Sample Settings

The frequencies that can be corrected, as well as the setting values of bits RTCAnDEV, RTCAnF6, and RTCAnF[5:0], are listed in the following table.

Table 34.48 Correctable Frequency Range when RTCAnDEV = 0

Input Clock Frequency	RTCAnF6	RTCAnF[5:0]	Correction Value of RTCAnSUBC
—	0	000000	No correction
—	0	000001	No correction
32.76810000 kHz	0	000010	Once every 20 s, RTCAnSUBC count value + 2
32.76820000 kHz	0	000011	Once every 20 s, RTCAnSUBC count value + 4
32.76830000 kHz	0	000100	Once every 20 s, RTCAnSUBC count value + 6
:	:	:	:
32.77400000 kHz	0	111101	Once every 20 s, RTCAnSUBC count value + 120
32.77410000 kHz	0	111110	Once every 20 s, RTCAnSUBC count value + 122
32.77420000 kHz (upper limit)	0	111111	Once every 20 s, RTCAnSUBC count value + 124
—	1	000000	No correction
—	1	000001	No correction
32.76180000 kHz (lower limit)	1	000010	Once every 20 s, RTCAnSUBC count value – 124
32.76190000 kHz	1	000011	Once every 20 s, RTCAnSUBC count value – 122
32.76200000 kHz	1	000100	Once every 20 s, RTCAnSUBC count value – 120
:	:	:	:
32.76770000 kHz	1	111101	Once every 20 s, RTCAnSUBC count value – 6
32.76780000 kHz	1	111110	Once every 20 s, RTCAnSUBC count value – 4
32.76790000 kHz	1	111111	Once every 20 s, RTCAnSUBC count value – 2

Table 34.49 Correctable Frequency Range when RTCAnDEV = 1

Input Clock Frequency	RTCAnF6	RTCAnF[5:0]	Correction Value of RTCAnSUBC
—	0	000000	No correction
—	0	000001	No correction
32.76803333 kHz	0	000010	Once every 60 s, RTCAnSUBC count value + 2
32.76806667 kHz	0	000011	Once every 60 s, RTCAnSUBC count value + 4
32.76810000 kHz	0	000100	Once every 60 s, RTCAnSUBC count value + 6
:	:	:	:
32.77000000 kHz	0	111101	Once every 60 s, RTCAnSUBC count value + 120
32.77003333 kHz	0	111110	Once every 60 s, RTCAnSUBC count value + 122
32.77006667 kHz (upper limit)	0	111111	Once every 60 s, RTCAnSUBC count value + 124
—	1	000000	No correction
—	1	000001	No correction
32.76593333 kHz (lower limit)	1	000010	Once every 60 s, RTCAnSUBC count value – 124
32.76596667 kHz	1	000011	Once every 60 s, RTCAnSUBC count value – 122
32.76600000 kHz	1	000100	Once every 60 s, RTCAnSUBC count value – 120
:	:	:	:
32.76790000 kHz	1	111101	Once every 60 s, RTCAnSUBC count value – 6
32.76793333 kHz	1	111110	Once every 60 s, RTCAnSUBC count value – 4
32.76796667 kHz	1	111111	Once every 60 s, RTCAnSUBC count value – 2

34.5 Procedures for Setup, Writing and Reading

The following subsections provide flow charts that illustrate the procedures for RTCA setup and for reading and writing the RTCA clock counters.

34.5.1 Initial Setting of the RTCA

The RTCA must be stopped before setting the initial setting value of each counter.

34.5.1.1 RTCA Stop Procedure

Stop the RTCA according to the following flow.

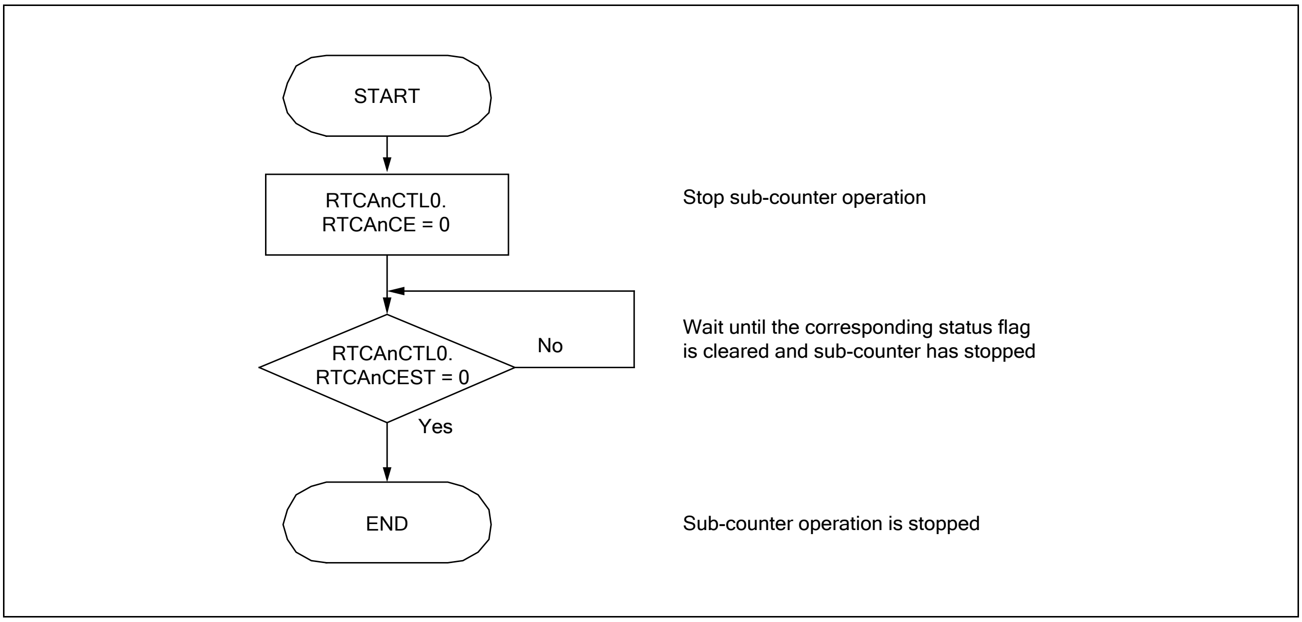

Figure 34.4 RTCA Stop Procedure

34.5.1.2 RTCA Initialization Procedure

Perform the initial setting of the RTCA according to the following flow:

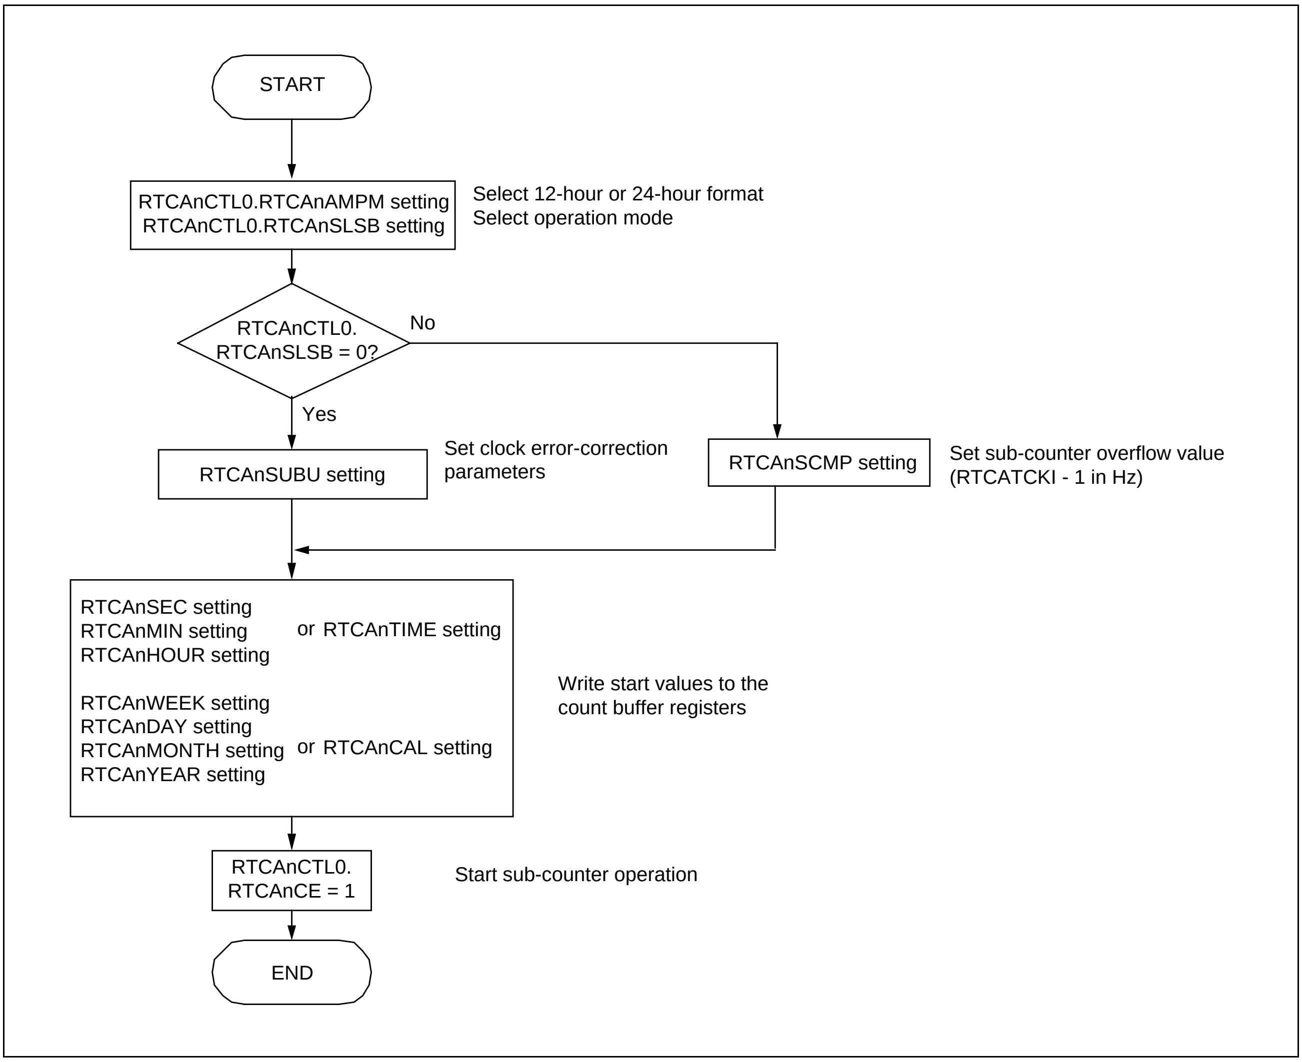

Figure 34.5 RTCA Initial Setup Procedure

CAUTION

The internal clock counter is synchronized with RTCATCKI.

In addition, two RTCATCKI periods are required before the clock counter starting behind END of the above flow.

Therefore, PCLK must be continuously supplied until the completion of the initial setting.

Check that RTCAnCTL0.RTCAnCEST = 1, when the supply of PCLK is stopped after setting the initial setting value of RTCA.

34.5.2 Updating Clock Counters

The clock counters RTCAnSECC to RTCAnYEARC can be stopped and updated while the sub-counter is running.

To update the clock counter when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow the flowchart shown below.

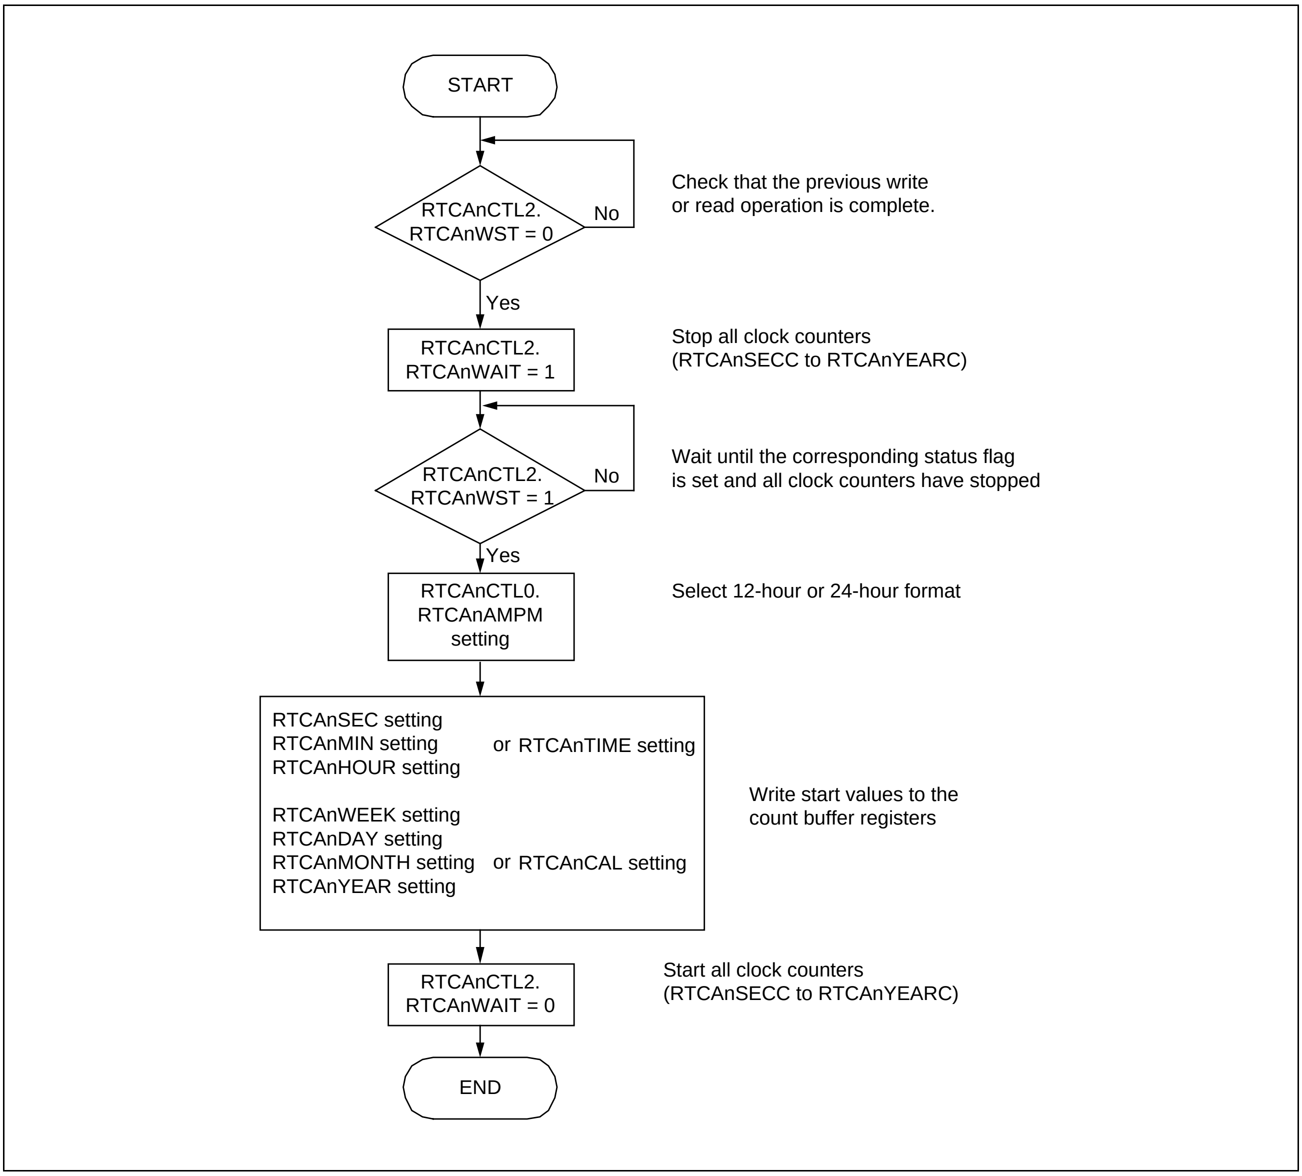

Figure 34.6 Updating Clock Counter Values

CAUTIONS

1. The internal clock counter is synchronized with RTCATCKI.
   In addition, two RTCATCKI periods are required before the clock counter updating behind END of the above flow.
   Therefore, PCLK must be continuously supplied until the completion of the clock counter updating.
   Check that RTCAnCTL2.RTCAnWST = 0 before stopping the supply of PCLK after the completion of clock counter updating.
2. The update procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more:

3. Only one sub-counter overflow can be held internally and increment the seconds counter after restarting the clock counters if the value is held.
4. If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.

34.5.3 Reading Clock Counters

There are two methods to read the clock counters while sub-counter operation is enabled:

- Reading count buffer registers
- Reading counter registers

The advantages and disadvantages of the two methods are summarized in the following table.

Table 34.50 Comparison of the Two Read Methods

	Advantage	Disadvantage
Reading count buffer registers	It is unnecessary to read clock counters several times because the clock counters are read synchronously.	A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT = 1 and completion of data transfer.
Reading count registers	Program wait state does not occur.	If the sub-counter increments, the clock counters must be read several times because they are read asynchronously to RTCATCKI.

34.5.3.1 Procedure for Reading Count Buffer Registers

The following operations are necessary:

1. Stop all clock counters (RTCAnCTL2.RTCAnWAIT = 1). The value of the clock counters is transferred to the corresponding count buffer registers.
2. Read the count buffer registers.

A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT = 1 and completion of data transfer.

The maximum delay is three PCLK periods plus two RTCATCKI periods. For example, if the RTCA operates with PCLK = 40 MHz and RTCATCKI = 32.768 kHz, the delay is about 61 µs.

To read the count buffer register when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1), follow the flowchart shown below.

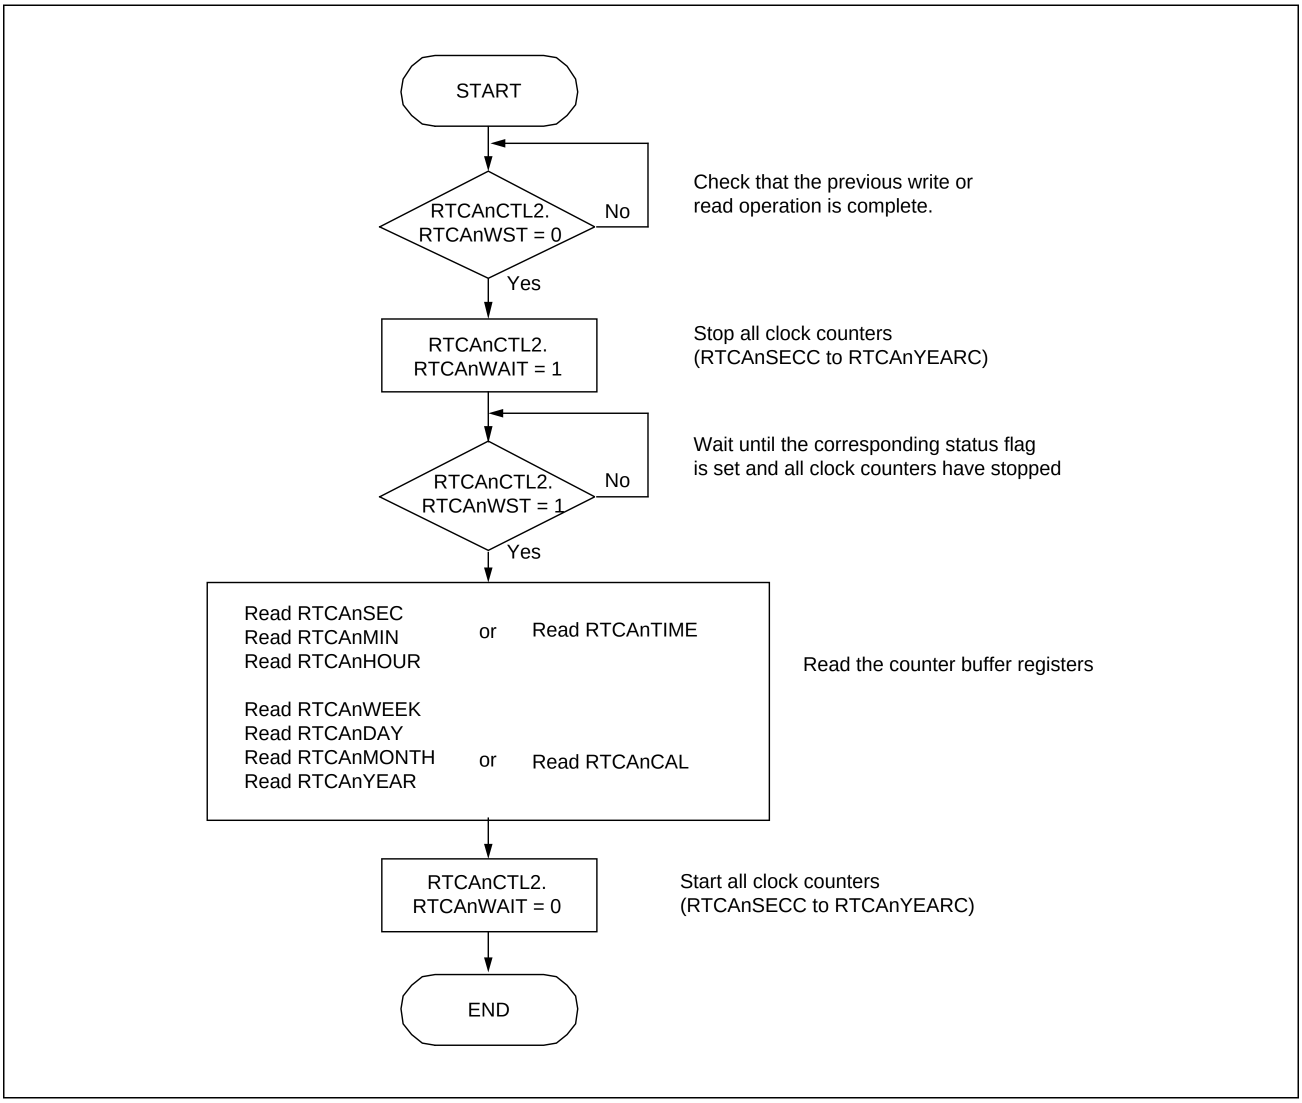

Figure 34.7 Reading Clock Count Buffer Registers

CAUTIONS

1. The internal clock counter is synchronized with RTCATCKI.
   In addition, two RTCATCKI periods are required before resuming counter behind END of the above flow.
   Therefore, PCLK must be continuously supplied until the counter resuming.
   Check that RTCAnCTL0.RTCAnCEST = 1 first to stop the supply of PCLK after count buffer register reading.
2. The reading procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more.
3. Only one sub-counter overflow can be held internally. If there is a value held internally when the clock counter restarts, the seconds counter will be incremented by 1.
4. If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.

34.5.3.2 Procedure for Reading Counter Registers Directly

To ensure that the sub-counter did not overflow while reading the counters, the seconds counter RTCAnSECC must be read twice in the beginning and at the end of the procedure. The first read value is compared with the second read value.

- First read value = second read value:
  No overflow of sub-counter occurred during counter read operation.
- First read value ≠ second read value:
  Overflow of the sub-counter occurred during counter read operation. The counters must be read again to get the current counter values.

To read the counter register directly when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow the flowchart shown below.

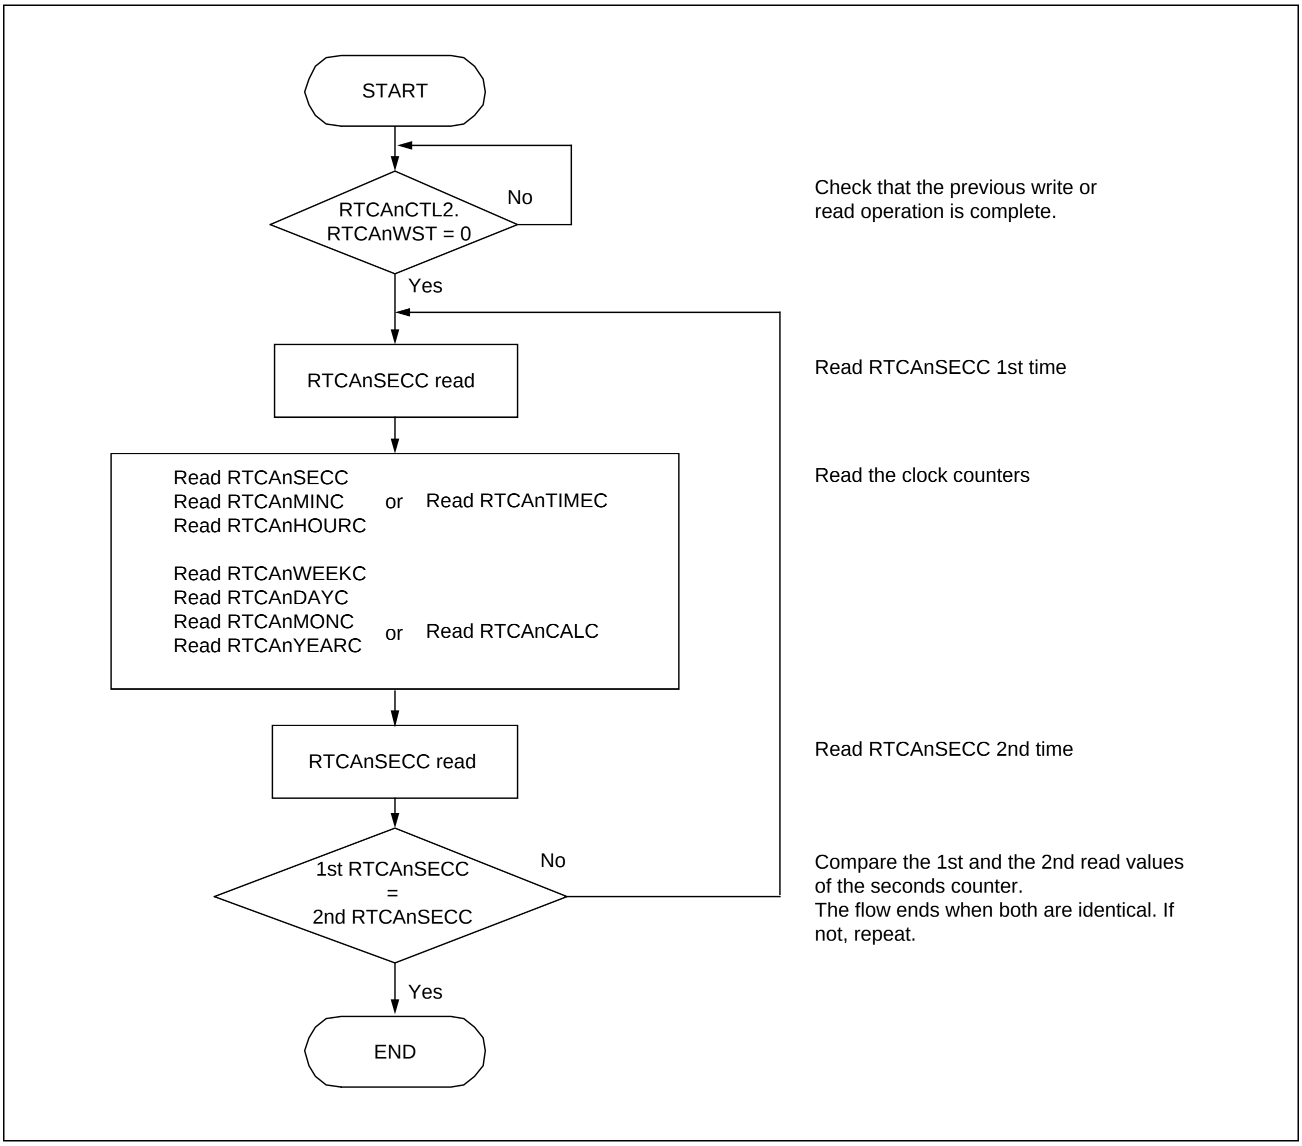

Figure 34.8 Reading Clock Counter Registers

NOTE

The procedure must be completed within one second.

34.5.4 Reading RTCAnSRBU

RTCAnSRBU is the read buffer register for the sub-counter.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), read RTCAnSRBU according to the following flow.

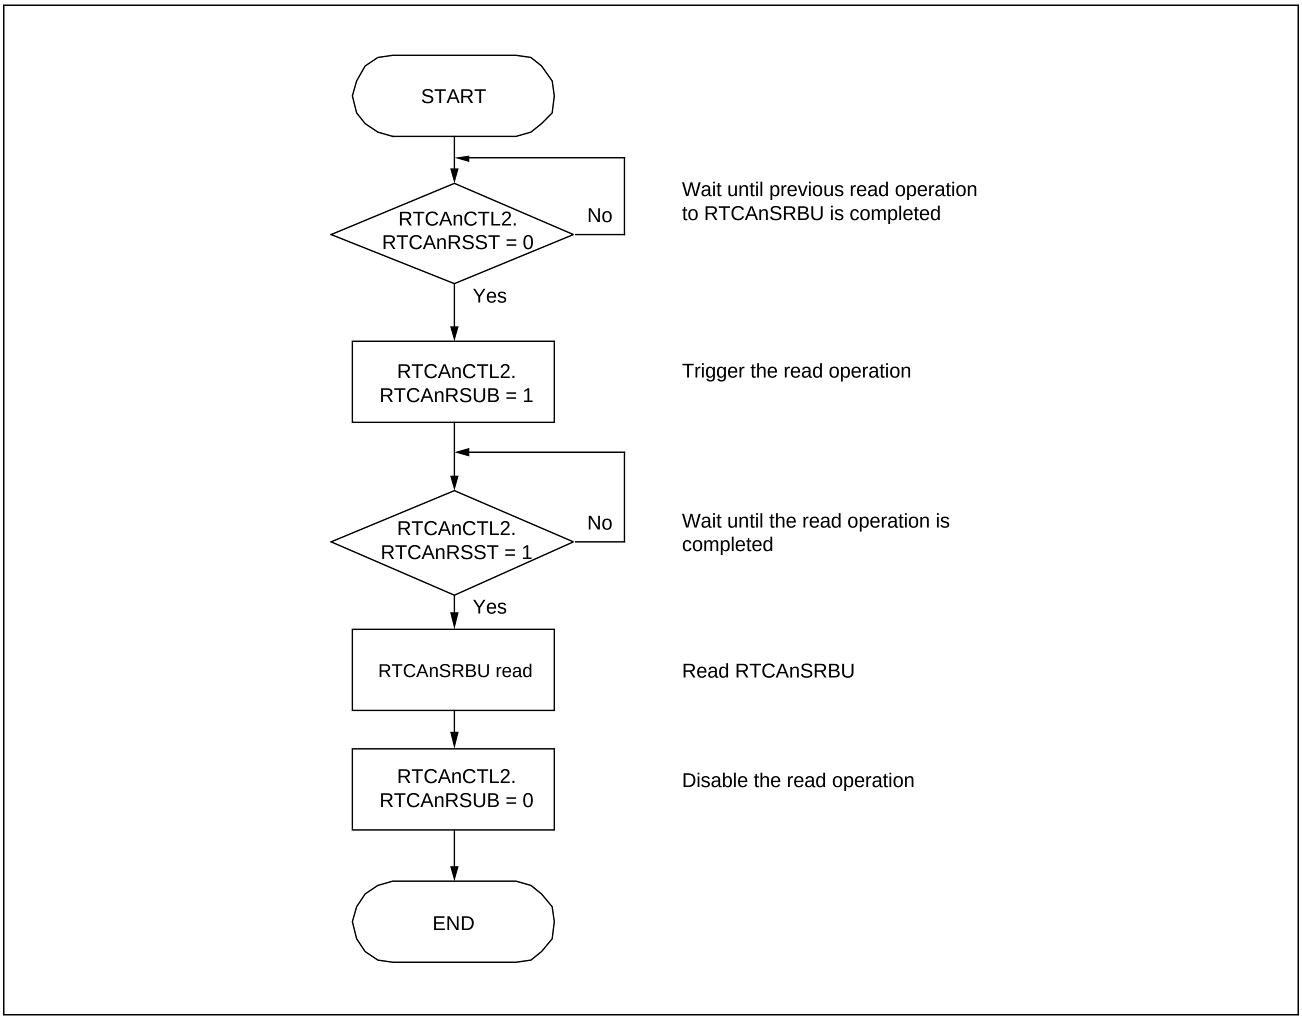

Figure 34.9 Reading the RTCAnSRBU Register

34.5.5 Writing to RTCAnSUBU

RTCAnSUBU is the clock error correction register for the sub-counter.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), write to RTCAnSUBU according to the flow described below.

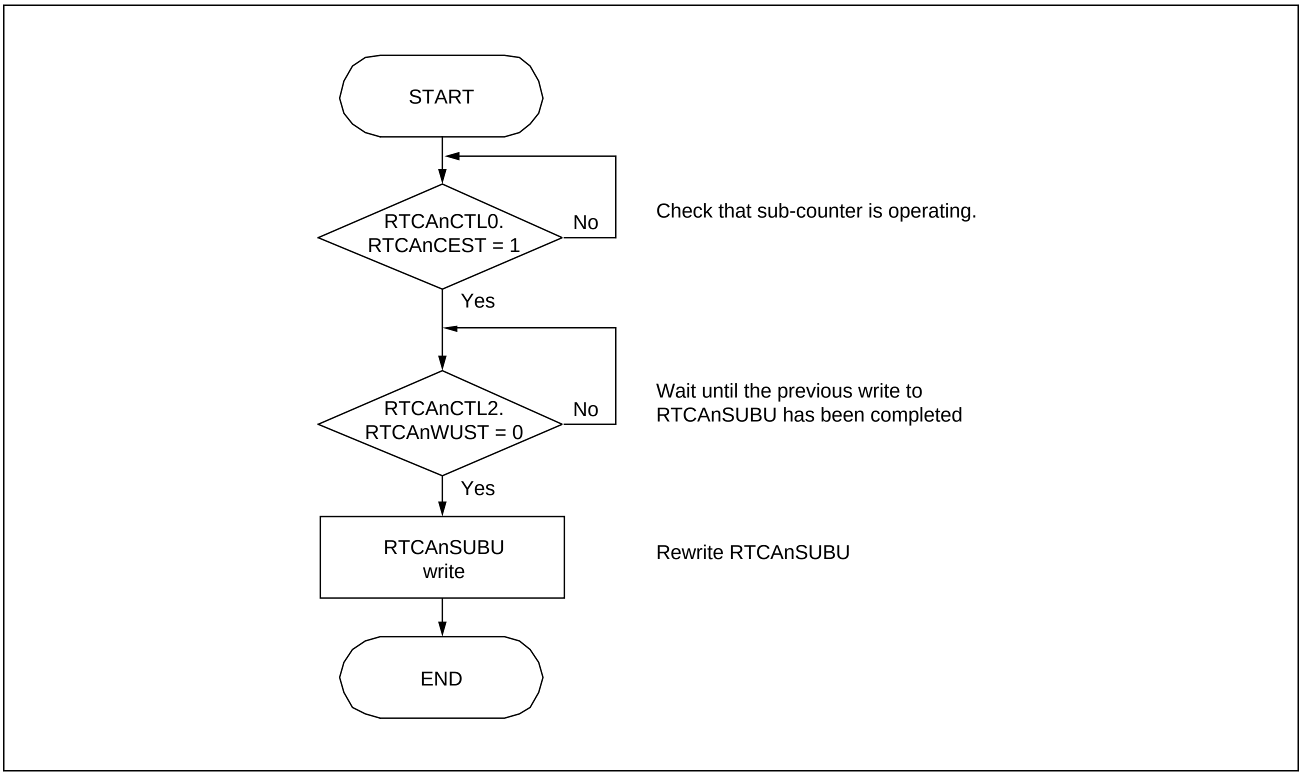

Figure 34.10 Writing to the RTCAnSUBU Register

NOTE

While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), the status flag RTCAnCTL2.RTCAnWUST is set when RTCAnSUBU is written to. It is cleared when the write operation to RTCAnSUBU is completed. This is synchronous with the next RTCAnSUBC overflow.

RTCAnCTL2.RTCAnWUST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWUST = 1 at the beginning of this flow).

34.5.6 Writing to RTCAnSCMP

RTCAnSCMP is the sub-counter compare register.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), write to RTCAnSCMP according to the flow described below.

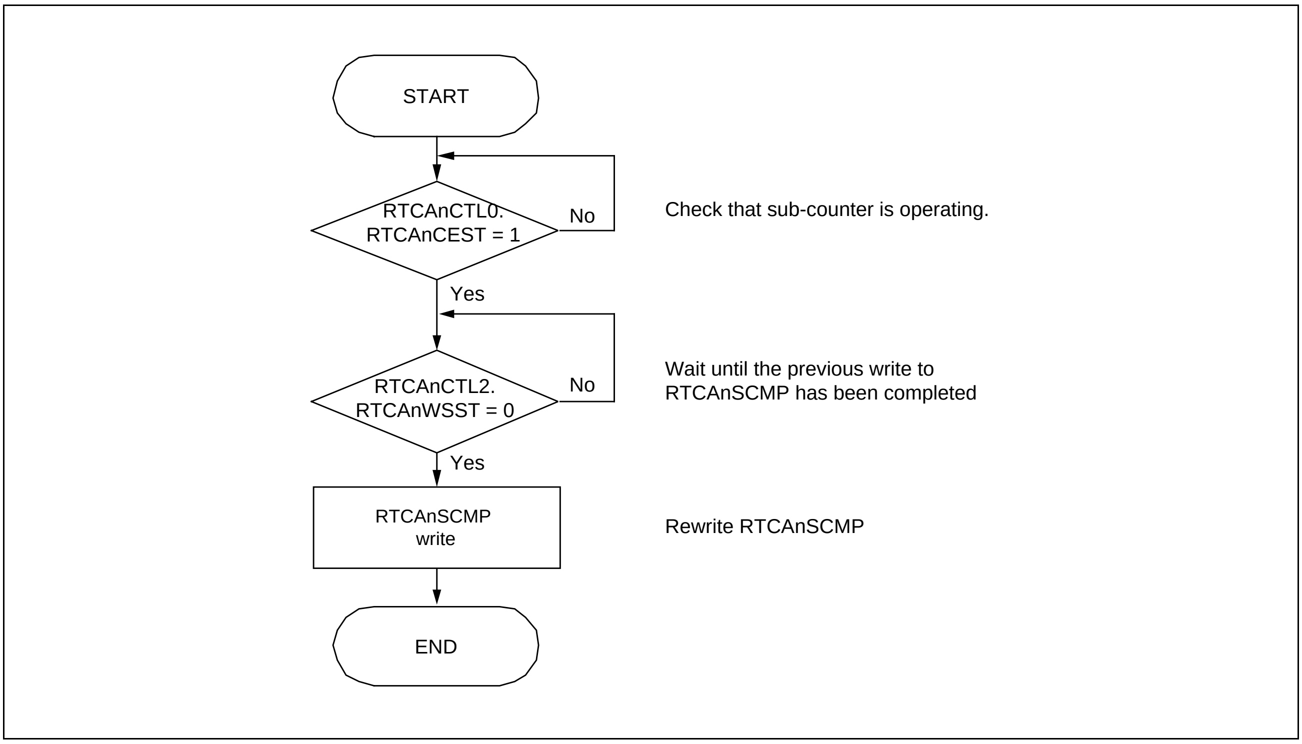

Figure 34.11 Writing the RTCAnSCMP Register

NOTE

While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), the status flag RTCAnCTL2.RTCAnWSST is set when RTCAnSCMP is written to. It is cleared when the write operation to RTCAnSCMP is completed. This is synchronous with the next RTCAnSUBC overflow.

RTCAnCTL2.RTCAnWSST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWSST = 1 at the beginning of this flow).

34.6 Timing Diagrams

34.6.1 Timing of Counter Start

The following diagram illustrates the counter start after setting the time in the buffer registers.

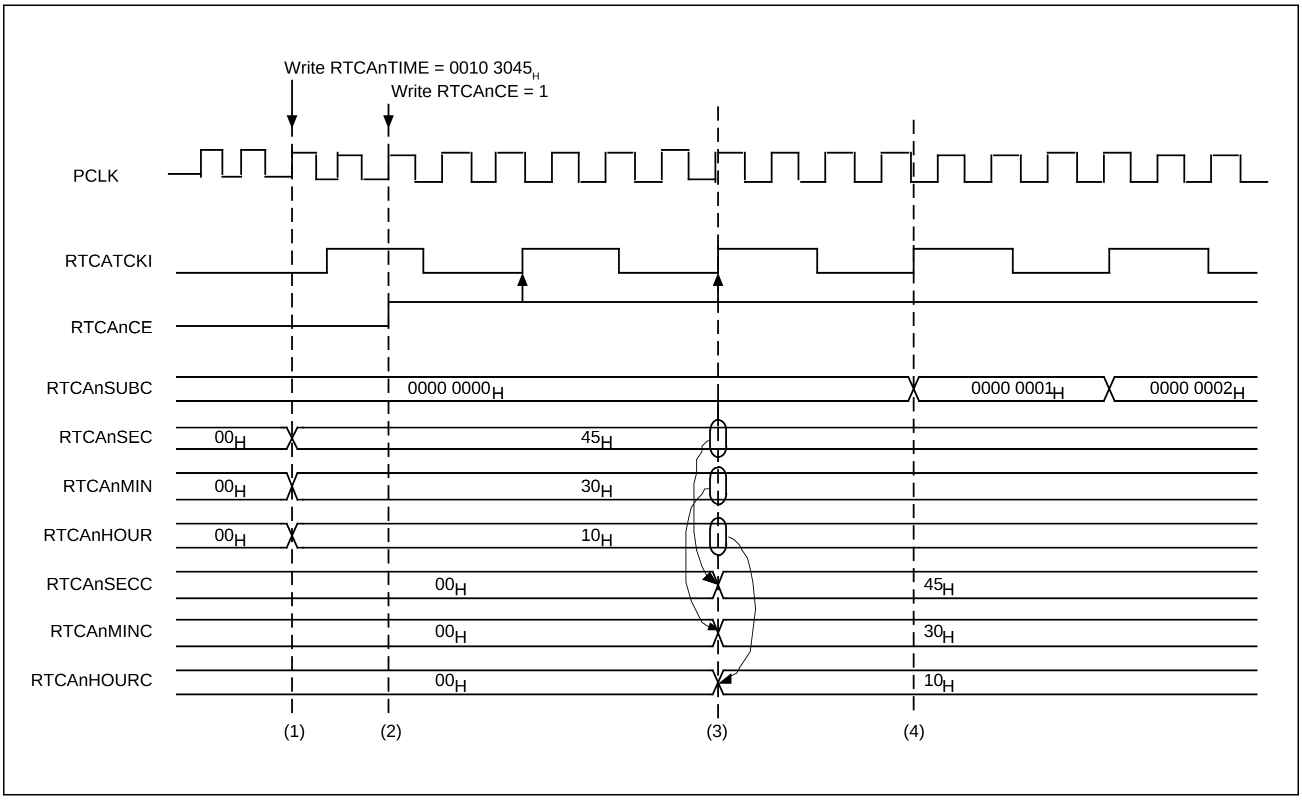

Figure 34.12 Counter Start Timing

The timing diagram above shows the following:

(1) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME = 0010 3045_H. Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.

(2) Sub-counter operation is started by setting RTCAnCTL0.RTCAnCE = 1.

(3) When the second rising edge of RTCATCKI occurs, the buffer register values are loaded to the corresponding count registers.

(4) When the next rising edge of RTCATCKI occurs, count up of the sub-counter starts.

34.6.2 Timing of Clock Counter Update while Counter Is Enabled

The following diagram illustrates the counter restart after setting the time in the buffer registers.

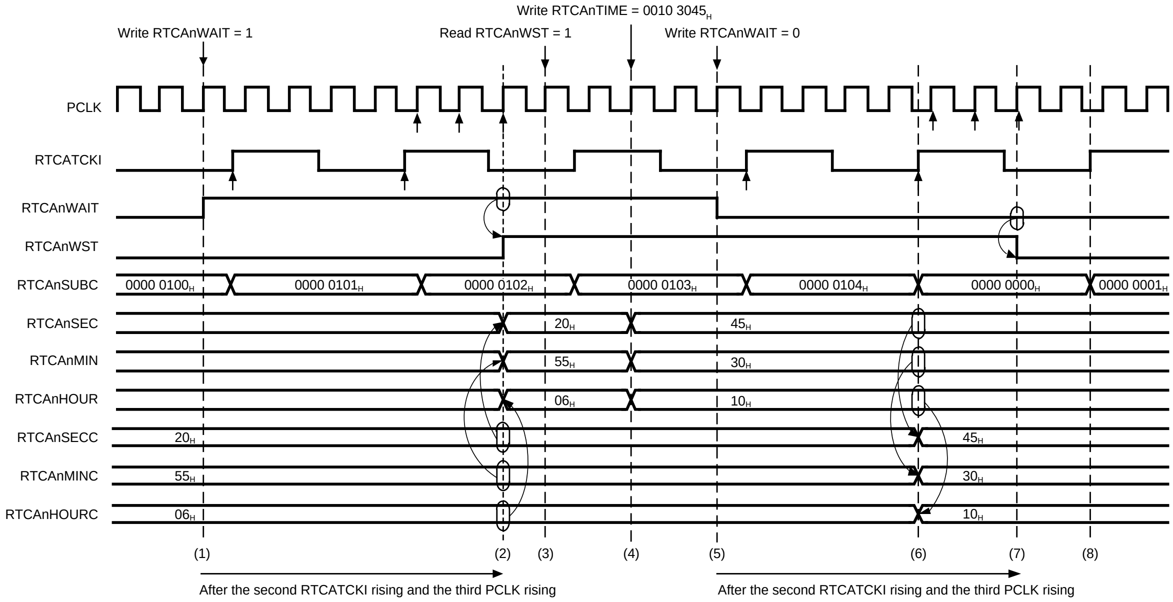

Figure 34.13 Clock Counter Update Timing

The timing diagram above shows the following:

(1) Trigger the clock counters stop (RTCAnCTL2.RTCAnWAIT = 1).

(2) RTCAnCTL2.RTCAnWST is set to 1 after the second rising edge of RTCATCKI and the third rising edge of PCLK, and the counter clock stops. The sub-counter continues counting.

(3) RTCAnCTL2.RTCAnWST = 1 can be readable.

(4) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME to 0010 3045_H. Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.

(5) Trigger the clock counters restart (RTCAnCTL2.RTCAnWAIT = 0).

(6) When the second rising edge of RTCATCKI occurs, the values of the buffer registers are loaded to the corresponding count registers. Write operation to RTCAnSECC is performed and RTCAnSUBC is cleared.

(7) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnWST is set to 0.

(8) Clock counter operation is resumed.

34.6.3 Timing of Sub-Counter Read Buffer Reading while Counter is Enabled

The following diagram illustrates the timing when reading the sub-counter read buffer RTCAnSRBU.

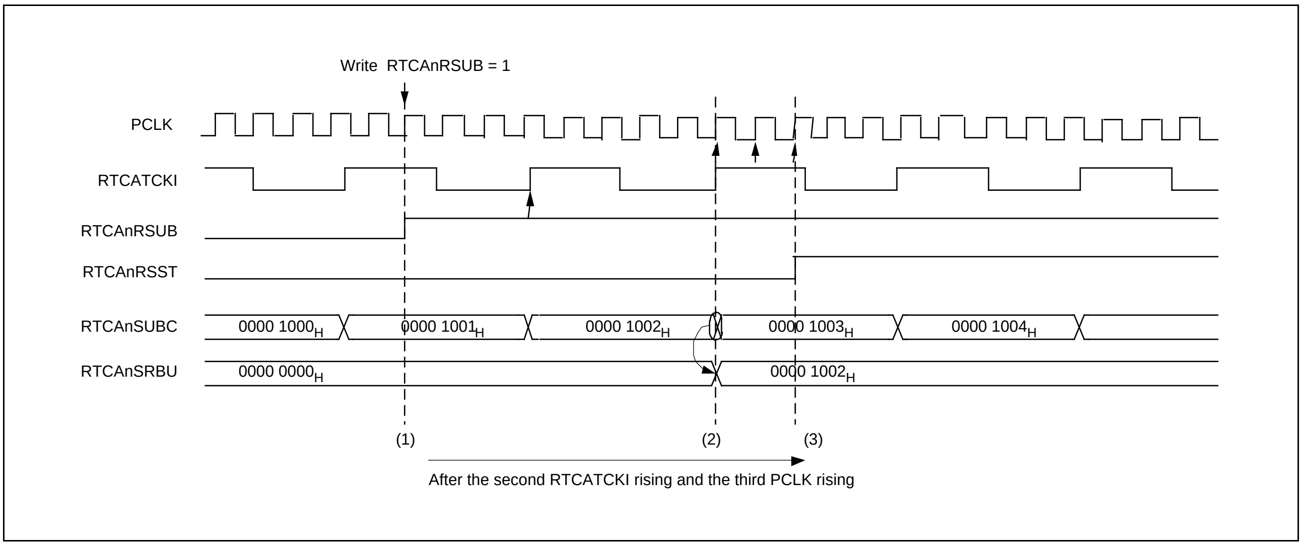

Figure 34.14 Timing when Reading the Sub-Counter Read Buffer Register Value

The timing diagram above shows the following:

(1) Setting RTCAnRSUB = 1 triggers loading of the sub-counter value to RTCAnSRBU.

(2) When the second rising edge of RTCATCKI occurs, the value of RTCAnSUBC is loaded to RTCAnSRBU.

(3) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnRSST is set to 1 and RTCAnSRBU can be read.

Section 35 Encoder Timer (ENCA)

This section contains a generic description of the Encoder Timer (ENCA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of ENCA.

35.1 Features of RH850/F1KH, RH850/F1KM ENCA

35.1.1 Number of Units

This microcontroller has the following number of ENCA units.

Table 35.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	ENCAn (n = 0)	ENCAn (n = 0)	ENCAn (n = 0)

Table 35.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	ENCAn (n = 0)	ENCAn (n = 0)	ENCAn (n = 0)	ENCAn (n = 0)	ENCAn (n = 0)

Table 35.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	ENCAn (n = 0)	ENCAn (n = 0)	ENCAn (n = 0)	ENCAn (n = 0)

Table 35.4 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual ENCA units are identified by the index “n”; for example, ENCAnCTL (n = 0) is the ENCAn control register.

35.1.2 Register Base Address

ENCAn base address is listed in the following table.

ENCAn register addresses are given as an offset from the base address.

Table 35.5 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<ENCA0_base>	FFE8 0000_H

35.1.3 Clock Supply

The ENCAn clock supply is shown in the following table.

Table 35.6 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
ENCAn	PCLK	CKSCLK_IPERI1	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	Bus clock

35.1.4 Interrupt Requests

ENCAn interrupt requests are listed in the following table.

Table 35.7 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
ENCA0			
ENCATIOV	Overflow interrupt	85	—
ENCATIUD	Underflow interrupt	86	—
ENCATINT0	Capture/compare match interrupt 0	87	—
ENCATINT1	Capture/compare match interrupt 1	88	—
ENCATIEC	Encoder clear interrupt	89	—

35.1.5 Reset Sources

ENCAn reset sources are listed in the following table. ENCAn is initialized by these reset sources.

Table 35.8 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
ENCAn	All reset sources (ISORES)

35.1.6 External Input/Output Signals

External input/output signals of ENCAn are listed below.

Table 35.9 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
ENCA0		
ENCATTIN0	ENCAn capture trigger input 0*[1]	ENCA0TIN0
ENCATTIN1	ENCAn capture trigger input 1*[1]	ENCA0TIN1
ENCAnE0	ENCAn encoder input 0*[1]	ENCA0E0
ENCAnE1	ENCAn encoder input 1*[1]	ENCA0E1
ENCAnEC	ENCAn encoder clear input*[1]	ENCA0EC

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector** and **Section 2C.12, Noise Filter & Edge/Level Detector**.

35.1.7 Internal Input/Output Signals

Input/output signals to be connected between ENCA and PIC are listed below.

Table 35.10 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Connected to
ENCATSST	Simultaneous start trigger	PIC
ENCATTIN1	ENCAn capture trigger input 1	PIC

35.2 Overview

35.2.1 Functional Overview

- Generation of the counter control signal from the encoder input signal, and count operation in synchronization with PCLK
- Capture function for capturing the counter value with an external trigger signal
- Compare function for compare match judgment with the counter value
- Two capture/compare registers that can be set separately for capture operation and for compare operation
- Interrupt mask function for masking the interrupt request signal output as a result of compare match judgment during compare operation
- Function for loading the value of the capture/compare register to the counter upon underflow occurrence
- Encoder input signal can be used as the timer counter clear condition
- Edge or level can be selected for determining the presence of the encoder input signal that is used as the timer counter clear condition
- Detection of counter overflow and underflow and output of error flags and error occurrence interrupts
- Five interrupts: two capture/compare interrupts, one counter clear interrupt, one overflow interrupt, and one underflow interrupt

35.2.2 Block Diagram

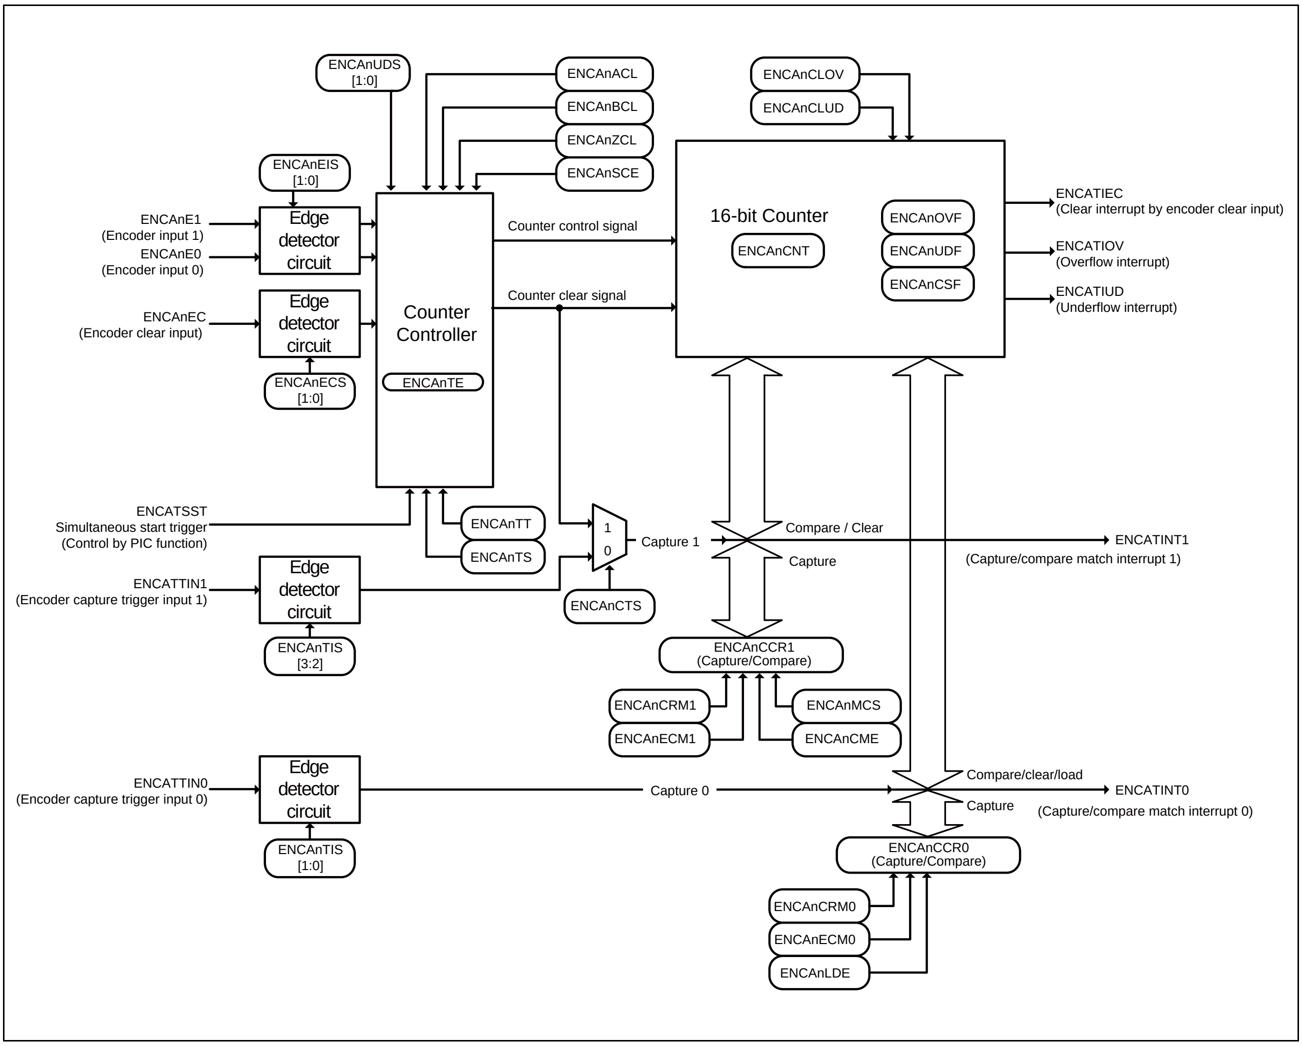

Figure 35.1 ENCA Block Diagram

35.3 Registers

35.3.1 List of Registers

ENCA registers are listed in the following table.

<ENCAn_base> is defined in **Section 35.1.2, Register Base Address**.

Table 35.11 List of Registers

Module Name	Register Name	Symbol	Address
ENCAn	ENCAn capture/compare register 0	ENCAnCCR0	<ENCAn_base>
	ENCAn capture/compare register 1	ENCAnCCR1	<ENCAn_base> + 04_H
	ENCAn counter register	ENCAnCNT	<ENCAn_base> + 08_H
	ENCAn status flag register	ENCAnFLG	<ENCAn_base> + $0C_H$
	ENCAn status flag clear register	ENCAnFGC	<ENCAn_base> + 10_H
	ENCAn timer enable status register	ENCAnTE	<ENCAn_base> + 14_H
	ENCAn timer start trigger register	ENCAnTS	<ENCAn_base> + 18_H
	ENCAn timer stop trigger register	ENCAnTT	<ENCAn_base> + $1C_H$
	ENCAn I/O control register 0	ENCAnIOC0	<ENCAn_base> + 20_H
	ENCAn control register	ENCAnCTL	<ENCAn_base> + 40_H
	ENCAn I/O control register 1	ENCAnIOC1	<ENCAn_base> + 44_H
	ENCAn emulation register	ENCAnEMU	<ENCAn_base> + 48_H

35.3.2 ENCAnCTL — ENCAn Control Register

This register is used to configure various operation settings of the Encoder Timer.

Access:	This register can be read or written in 16-bit units. Writing to this register during operation is prohibited.
Address:	<ENCAn_base> + 40_H
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAn CME	ENCAn MCS	—	—	—	—	ENCAn CRM1	ENCAn CRM0	ENCAn CTS	—	—	ENCAn LDE	ENCAn ECM1	ENCAn ECM0	ENCAnUDS [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Table 35.12 ENCAnCTL Register Contents

Bit Position	Bit Name	Function
15	ENCAnCME	Encoder Clear Mask Enable This bit is used to enable/disable masking of compare-match interrupt detection when the compare function is used. 0: Disables the compare-match interrupt (ENCATINT1) mask function for the ENCAnCCR1 register 1: Enables the compare-match interrupt (ENCATINT1) mask function for the ENCAnCCR1 register. This bit is valid only when ENCAnCRM1 = 0. When this bit is set to “1”, setting ENCAnECM1 to “1” is prohibited.
14	ENCAnMCS	Encoder Mask Clear Select This bit is used to select the trigger for cancelling masking of compare-match interrupt detection ENCATINT1 when the compare function is used. This bit is valid only when ENCAnCRM1 = 0. 0: Masking of compare-match interrupt detection is canceled when the ENCAnCCR1 register is written. 1: Masking of compare match interrupt detection is canceled when one of the following three operations is performed. – Timer counter clear operation accompanying encoder clear input – Timer counter clear operation upon compare-match between ENCAnCNT and ENCAnCCR0 when ENCAnECM0 = 1 – Loading from ENCAnCCR0 to the timer counter upon underflow detection when ENCAnLDE = 1
13 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	ENCAnCRM1	ENCAnCCR1 Register Mode 0: ENCAnCCR1 used as compare register. 1: ENCAnCCR1 used as capture register.
8	ENCAnCRM0	ENCAnCCR0 Register Mode 0: ENCAnCCR0 used as compare register. 1: ENCAnCCR0 used as capture register.
7	ENCAnCTS	ENCAnCCR1 Capture Trigger Select This is a trigger selection bit for the capture operation to the ENCAnCCR1 register. This bit is valid only when ENCAnCRM1 = 1. 0: Uses ENCATTIN1 of capture trigger 1 signal as the capture trigger for the ENCAnCCR1 register. 1: The counter clear signal selected with ENCAnSCE is used as the capture trigger for the ENCAnCCR1 register.
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 35.12 ENCAnCTL Register Contents

Bit Position	Bit Name	Function
4	ENCAnLDE	ENCAn Counter Load Enable This bit is used to enable/disable setting value loading to the counter upon underflow occurrence. This bit is valid only when ENCAnCRM0 = 0. When ENCAnCRM0 = 1, loading of the ENCAnCCR0 register setting value to the counter upon occurrence of an underflow is not performed, regardless of the value of this bit. 0: Disables loading of ENCAnCCR0 register setting value to counter upon occurrence of a counter underflow. 1: Enables loading of ENCAnCCR0 register setting value to counter upon occurrence of a counter underflow.
3	ENCAnECM1	Encoder Clear Mode 1 This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR1 setting value. This bit is valid only when ENCAnCRM1 = 0. 0: Does not clear the counter to 0000_H upon match of timer counter value and ENCAnCCR1 setting value. 1: Clears the counter to 0000_H upon match of timer counter value and ENCAnCCR1 setting value if the next count is a down-count.
2	ENCAnECM0	Encoder Clear Mode 0 This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR0 setting value. This bit is valid only when ENCAnCRM0 = 0. 0: Does not clear the counter to 0000_H upon match of timer counter value and ENCAnCCR0 setting value. 1: Clears the counter to 0000_H upon match of timer counter value and ENCAnCCR0 setting value if the next count is an up-count.
1, 0	ENCAnUDS[1:0]	Up/down Count Selection 1 and 0 These are the counter up/down control bits using ENCAnE0 and ENCAnE1. 00: Upon detection of valid edge of ENCAnE0, - down-count when ENCAnE1 = H, - up-count when ENCAnE1 = L 01: Upon detection of valid edge of ENCAnE0, up-count, Upon detection of valid edge of ENCAnE1, down-count 10: At rising edge of ENCAnE0, down-count At falling edge of ENCAnE0, up-count However, count operation is performed only when ENCAnE1 = L. 11: Detection of both edges of ENCAnE0, ENCAnE1. The count operation is determined based on the combination of the detected edge and level.

35.3.3 ENCAnIOC0 — ENCAn I/O Control Register 0

This register is used to select the input edge of capture triggers 0 and 1 (ENCATTIN0, ENCATTIN1).

Access: This register can be read or written in 8-bit units.

Address: <ENCAn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	ENCAnTIS[3:2]		ENCAnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 35.13 ENCAnIOC0 Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2	ENCAnTIS[3:2]	Input Edge Selection for Capture Trigger 1 These bits are valid only when ENCAnCTL.ENCAnCRM1 = 1 and ENCAnCTL.ENCAnCTS = 0. All other settings of ENCAnCRM1 and ENCAnCTS are invalid. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection
1, 0	ENCAnTIS[1:0]	Input Edge Selection for Capture Trigger 0 These bits are valid only when ENCAnCTL.ENCAnCRM0 = 1. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

35.3.4 ENCAnIOC1 — ENCAn I/O Control Register 1

This register is used to perform the clear condition setting and edge selection for input from the encoder.

Access: This register can be read or written in 8-bit units.
Writing to this register during operation is prohibited.

Address: <ENCAn_base> + 44_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ENCAnSCE	ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnECS[1:0]		ENCAnEIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 35.14 ENCAnIOC1 Register Contents

Bit Position	Bit Name	Function
7	ENCAnSCE	Encoder Special-Clear Enable This is an encoder special clear enable bit. When setting this bit to 1, set ENCAnUDS1, ENCAnUDS0 to 10_B or 11_B. The operation is not guaranteed if this bit is set to 1 with ENCAnUDS1, ENCAnUDS0 set to 00_B or 01_B. 0: Clears the counter upon detection of ENCAnEC valid edge (set with ENCAnECS1 and ENCAnECS0). 1: Clears the counter upon detection of input level condition of ENCAnE0, ENCAnE1 and ENCAnEC (set with ENCAnZCL bit, ENCAnBCL bit, and ENCAnACL bit).
6	ENCAnZCL	Input-Z Clear Condition Selection This bit is used to set the condition for clearing the encoder clear input (ENCAnEC) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
5	ENCAnBCL	Input-B Clear Condition Selection This bit is used to set the condition for clearing the encoder input 1 (ENCAnE1) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
4	ENCAnACL	Input-A Clear Condition Selection This bit is used to set the condition for clearing the encoder input 0 (ENCAnE0) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
3, 2	ENCAnECS[1:0]	Encoder Clear Input Edge Selection 1 and 0 These are the encoder clear input edge selection bits. These bits are valid only when ENCAnSCE = 0; they are invalid when ENCAnSCE = 1. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

Table 35.14 ENCAnIOC1 Register Contents

Bit Position	Bit Name	Function
1, 0	ENCAnEIS[1:0]	Encoder Edge Input Selection 1 and 0 These are the encoder input edge selection bits. These bits are valid when ENCAnUDS1, ENCAnUDS0 = 00_B or 01_B, and are invalid when ENCAnUDS1, ENCAnUDS0 = 10_B or 11_B. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

35.3.5 ENCAnFLG — ENCAn Status Flag Register

This register holds the status flags of the timer counter of ENCAn.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ENCAn_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENCAnCSF	ENCAnUDF	ENCAnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 35.15 ENCAnFLG Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2	ENCAnCSF	Counter Status Flag This bit reflects the current timer counter operation. 0: Timer counter in up-count status 1: Timer counter in down-count status
1	ENCAnUDF	Underflow Flag This bit reflects the occurrence of an underflow during the timer counter operation. This bit is cleared to 0 at the start of count operation. 0: This flag is cleared upon any of the following events: – “1” is written to ENCAnFGC.ENCAnCLUD – The flag is cleared to 0 by setting ENCAnTS bit to “1” when ENCAnTE = 0 or by setting the simultaneous start trigger input (ENCATSST signal) to “High”. 1: This flag is set to “1” upon occurrence of an underflow during the encoder timer count operation.
0	ENCAnOVF	Overflow Flag This bit reflects the occurrence of an overflow during the timer counter operation. This bit is cleared to 0 at the start of count operation. 0: This flag is cleared upon any of the following events: – “1” is written to ENCAnFGC.ENCAnCLOV – The flag is cleared to 0 by setting ENCAnTS bit to “1” when ENCAnTE = 0 or by setting the simultaneous start trigger input (ENCATSST signal) to “High”. 1: This flag is set to “1” upon occurrence of an overflow during the encoder timer count operation.

35.3.6 ENCAnFGC — ENCAn Status Flag Clear Register

This register is used to clear the timer counter status flags of ENCAnFLG.

Access: This register is a write-only register that can be written in 8-bit units.

This register always returns 0 when read.

Address: <ENCAn_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ENCAnCLUD	ENCAnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 35.16 ENCAnFGC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	ENCAnCLUD	Underflow Flag Clear This bit clears the underflow flag. 0: Writing is ignored. 1: Clears ENCAnUDF of the ENCAnFLG register (clears underflow detection).
0	ENCAnCLOV	Overflow Flag Clear This bit clears the overflow flag. 0: Writing is ignored. 1: Clears ENCAnOVF of the ENCAnFLG register (clears overflow detection).

35.3.7 ENCAnCCR0 — ENCAn Capture/Compare Register 0

This register is a 16-bit capture/compare register 0.

Access: This register can be read or written in 16-bit units.

When this register functions as a capture register, only reading is possible. Write operation is ignored.

When this register functions as a compare register, reading and writing is possible.

Address: <ENCAn_base> + 00_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCCR0[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 35.17 ENCAnCCR0 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCCR0[15:0]	Capture/Compare Register 0 Upon occurrence of an underflow, the setting value of this register may be loaded to the counter according to the ENCAnCTL.ENCAnLDE setting. See the description of the ENCAnLDE bit in ENCA control register ENCAnCTL for details. ● If ENCAnCTL.ENCAnCRM0 = 0: ENCAnCCR0 is a compare register. Set the value to be compared with the timer counter value. ● If ENCAnCTL.ENCAnCRM0 = 1: ENCAnCCR0 is a capture register. The captured timer counter value is stored.

35.3.8 ENCAnCCR1 — ENCAn Capture/Compare Register 1

This register is a 16-bit capture/compare register 1.

Access: This register can be read or written in 16-bit units.

When this register functions as a capture register, only reading is possible. Write operation is ignored.

When this register functions as a compare register, reading and writing is possible.

Address: <ENCAn_base> + 04_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCCR1[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 35.18 ENCAnCCR1 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCCR1[15:0]	Capture/Compare Register 1 During capture operation, the capture trigger to this register differs according to the ENCAnCTL.ENCAnCTS setting. See the description of the ENCAnCTS bit in ENCA control register ENCAnCTL for details. ● If ENCAnCTL.ENCAnCRM1 = 0: ENCAnCCR1 is a compare register. Set the value to be compared with the timer counter value. ● If ENCAnCTL.ENCAnCRM1 = 1: ENCAnCCR1 is a capture register. The captured timer counter value is stored.

35.3.9 ENCAnCNT — ENCAn Counter Register

This register is the 16-bit timer counter register.

Access: This register can be read or written in 16-bit units.
This register can be written only when the operation is stopped.

Address: <ENCAn_base> + 08_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCNT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 35.19 ENCAnCNT Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCNT[15:0]	Counter Register ● ENCAnTE.ENCAnTE status: 0 (initial setting): Count stop An arbitrary value can be set to timer counter. ● ENCAnTE.ENCAnTE status: 0 → 1 (operation start): Count operation start Up/down count operation is started with the set arbitrary value. ● ENCAnTE.ENCAnTE status: 1 (operating): Counting Up/down count operation is performed. ● ENCAnTE.ENCAnTE status: 1 → 0 (stopped): Count stop The counter value immediately before the operation was stopped is held, and the count operation is stopped.

35.3.10 ENCAnTE — ENCAn Timer Enable Status Register

This register indicates the operating status of ENCAn.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ENCAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 35.20 ENCAnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	ENCAnTE	Timer Status Enable This is a status bit that indicates the operation enabled/stopped status of ENCAn. This bit is cleared to 0 when “1” is written to ENCAnTT.ENCAnTT. This bit is set to “1” when “1” is written to ENCAnTS.ENCAnTS, or when the input signal of ENCATSST is set to High level. 0: Operation stopped status 1: Operation enabled status

35.3.11 ENCAnTS — ENCAn Timer Start Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation enabled state.

Access: This register is a write-only register that can be written in 8-bit units.

It is always read as 00_H. This register can be written only when ENCAnTE.ENCAnTE is 0.

Address: <ENCAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 35.21 ENCAnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ENCAnTS	Timer Start Trigger This is the trigger bit that sets the ENCAn to the operation enabled state. 0: Writing is ignored. 1: The ENCAn is set to the operation enabled state by setting ENCAnTE.ENCAnTE = 1.

35.3.12 ENCAnTT — ENCAn Timer Stop Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation stopped state.

Access: This register is a write-only register that can be written in 8-bit units.

It is always read as 00_H.

Address: <ENCAn_base> + $1C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 35.22 ENCAnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ENCAnTT	Timer Stop Trigger This is the trigger bit that sets the ENCAn to the operation stopped state. 0: Writing is ignored. 1: Clears ENCAnTE.ENCAnTE to “0”, to set the ENCAn to the count operation stopped state.

35.3.13 ENCAnEMU — ENCAn Emulation Register

This register controls operations by SVSTOP.

Access: This register can be read or written in 8-bit units.

Writing to this register should be performed in the counter operation stopped status (ENCAnTE.ENCAnTE = 0 and EPC.SVSTOP = 0).

Address: <ENCAn_base> + 48_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ENCAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 35.23 ENCAnEMU Register Contents

Bit Position	Bit Name	Function
7	ENCAnSVSDIS	● When EPC.SVSTOP bit = 0: The count clock continues to be provided when the debugger assumes control of the microcontroller (at a break point, etc.), regardless of the value of this bit (1 or 0). ● When EPC.SVSTOP bit = 1: 0: The count clock is stopped when the debugger assumes control of the microcontroller (at a break point, etc.). 1: The count clock continues to be provided when the debugger assumes control of the microcontroller (at a break point, etc.).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

35.4 Operation

The ENCAn operates the timer counter with counter up/down control and clear control by encoder inputs. The ENCAnCCR0 and ENCAnCCR1 registers can be used as dedicated compare registers or as dedicated capture registers.

35.4.1 Timer Counter Operation

The timer counter operations of the ENCAn are described below.

The figure below shows the operation phases. See the corresponding section with the section number for detailed descriptions on each operation.

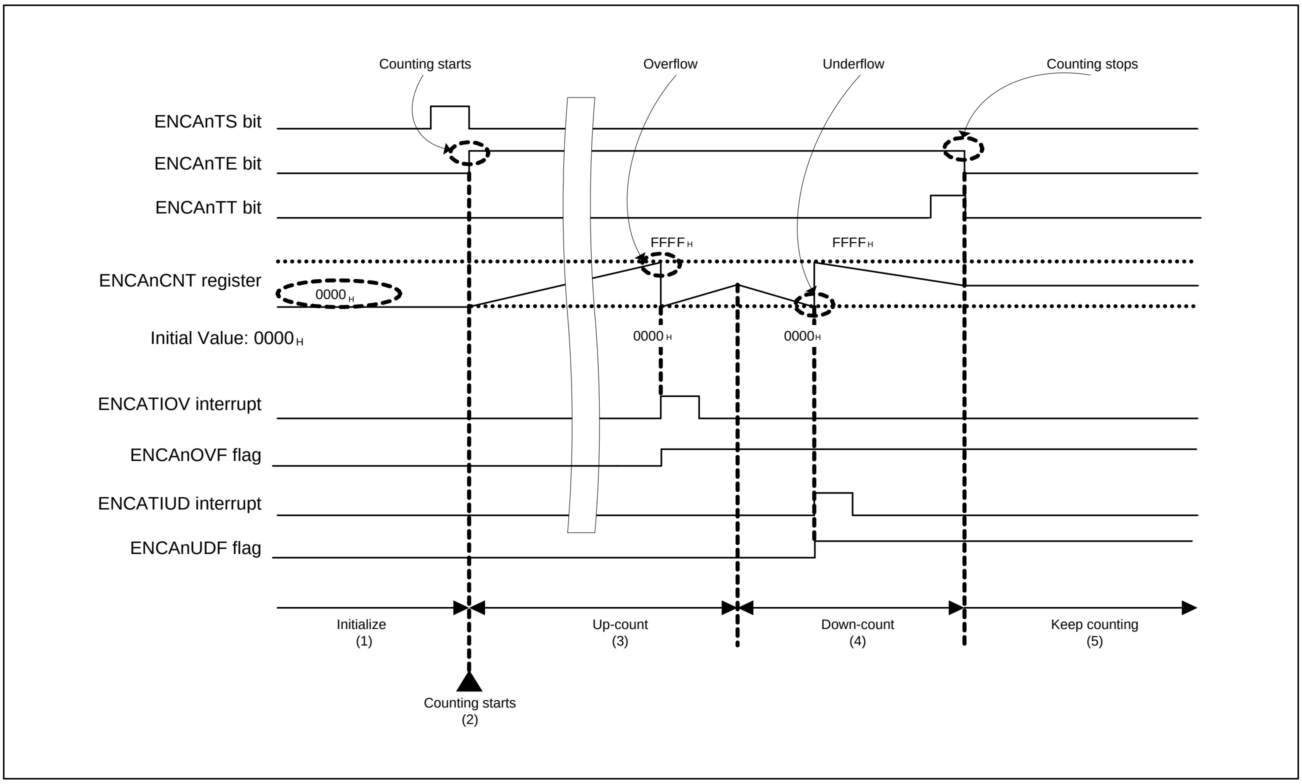

Figure 35.2 Timer Counter Initial Value Setting/Start/Stop

(1) Timer Counter Initial Value Setting

The initial value of the ENCAn counter register (ENCAnCNT) can be set in the counter operation stopped status (ENCAnTE = 0).

(2) Timer Counter Startup

By writing “1” to the timer start trigger bit (ENCAnTS), the timer status enable bit (ENCAnTE) is set to “1”, the count operation is enabled, and counting operation is performed upon detection of the valid edge of the encoder input.

(3) Overflow Operation

An overflow occurs when up-counting is performed when the counter value is $FFFF_H$. If the counter value changes from $FFFF_H$ to 0000_H, an overflow interrupt (ENCATIOV) is generated, and the overflow flag (ENCAnOVF) is set to “1”. The overflow flag (ENCAnOVF) is cleared to “0” when “1” is set to the overflow flag clear bit (ENCAnCLOV). For details about the operation, see **Section 35.6.1, Overflow Occurrence and Overflow Flag Clear Operation**.

(4) Underflow Operation

An underflow occurs when down-counting is performed when the counter value is 0000_H. If the counter value changes from 0000_H to $FFFF_H$, an underflow interrupt (ENCATIUD) is generated, and the underflow flag (ENCAnUDF) is set to “1”. The underflow flag (ENCAnUDF) is cleared to “0” when “1” is set to the underflow flag clear bit (ENCAnCLUD). For details about the operation, see **Section 35.6.2, Underflow Occurrence and Underflow Flag Clear Operation**.

(5) Timer Counter Stop

By writing “1” to the timer stop trigger bit (ENCAnTT), the timer status enable bit (ENCAnTE) is cleared to “0”, and the count operation is stopped. At this time, the timer counter is not reset to 0000_H and holds the value before count operation stop.

35.4.2 Up/Down Control of Timer Counter

Up/down control is performed by judging the phase of the encoder inputs (ENCAnE0, ENCAnE1) according to the settings of ENCAnUDS1, ENCAnUDS0.

35.4.2.1 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 00_B

Table 35.24 When ENCAnUDS1, ENCAnUDS0 Bits = 00_B

		Operation Description		
ENCAnUDS1	ENCAnUDS0	ENCAnE0 Pin	ENCAnE1 Pin	Count Operation
0	0	Rising edge	High level	Down
		Falling edge		
		Rising and falling edges		
		Rising edge	Low level	Up
		Falling edge		
		Rising and falling edges		

The valid edge for ENCAnE0 is specified by setting ENCAnEIS1, ENCAnEIS0.

Up/down count operation is performed when the valid edges and levels of ENCAnE0 and ENCAnE1 match.

The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits = 00_B.

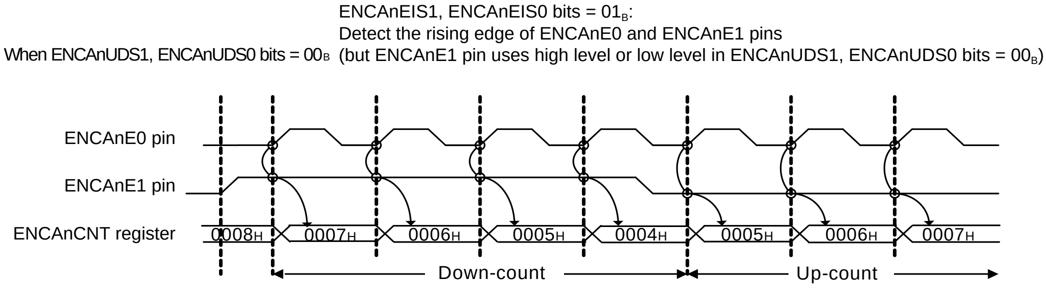

Figure 35.3 Count Operation when the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 00_B

35.4.2.2 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 01_B

Table 35.25 When the ENCAnUDS1, ENCAnUDS0 Bits = 01_B

		Operation Description		
ENCAnUDS1	ENCAnUDS0	ENCAnE0 Pin	ENCAnE1 Pin	Count Operation
0	1	Low level	Rising edge	Down
			Falling edge	
			Rising and falling edges	
		High level	Rising edge	
			Falling edge	
			Rising and falling edges	
		Rising edge	Low level	Up
		Falling edge		
		Rising and falling edges		
		Rising edge	High level	
		Falling edge		
		Rising and falling edges		
		Simultaneous input		Hold

The valid edges for ENCAnE0 and ENCAnE1 are specified by setting ENCAnEIS1, ENCAnEIS0.

Up/down count operation is performed when the valid edges and levels of the ENCAnE0 and ENCAnE1 pins match, and the count is held when the valid edges overlap.

The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits = 01_B.

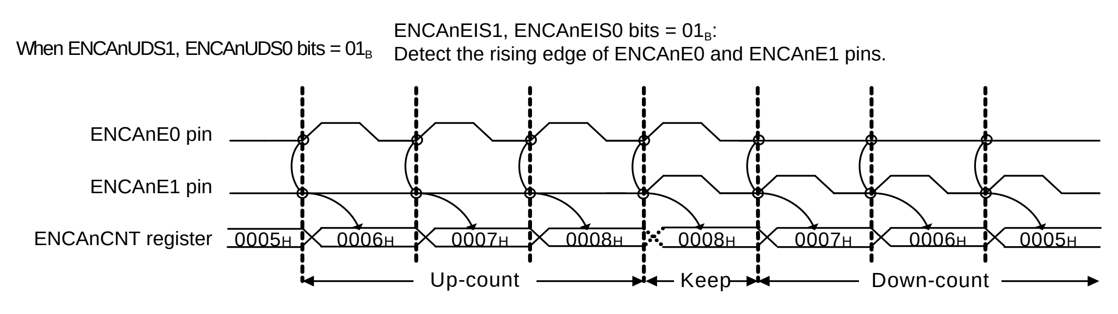

Figure 35.4 Count Operation when the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 01_B

35.4.2.3 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 10_B

Table 35.26 When the ENCAnUDS1, ENCAnUDS0 Bits = 10_B

		Operation Description		
ENCAnUDS1	ENCAnUDS0	ENCAnE0 Pin	ENCAnE1 Pin	Count Operation
1	0	Rising edge	Low level	Down
		Rising edge	Falling edge	
		Falling edge	Low level	Up
		Falling edge	Falling edge	
		Low level	Rising edge	Hold
		Rising edge	Rising edge	
		High level	Rising edge	
		Falling edge	Rising edge	
		Low level	Falling edge	
		Rising edge	High level	
		High level	Falling edge	
		Falling edge	High level	

The valid edge specification for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS1, ENCAnEIS0) is invalid.

The following timing chart shows the count operation when the ENCAnUDS1, ENCAnUDS0 bits = 10_B.

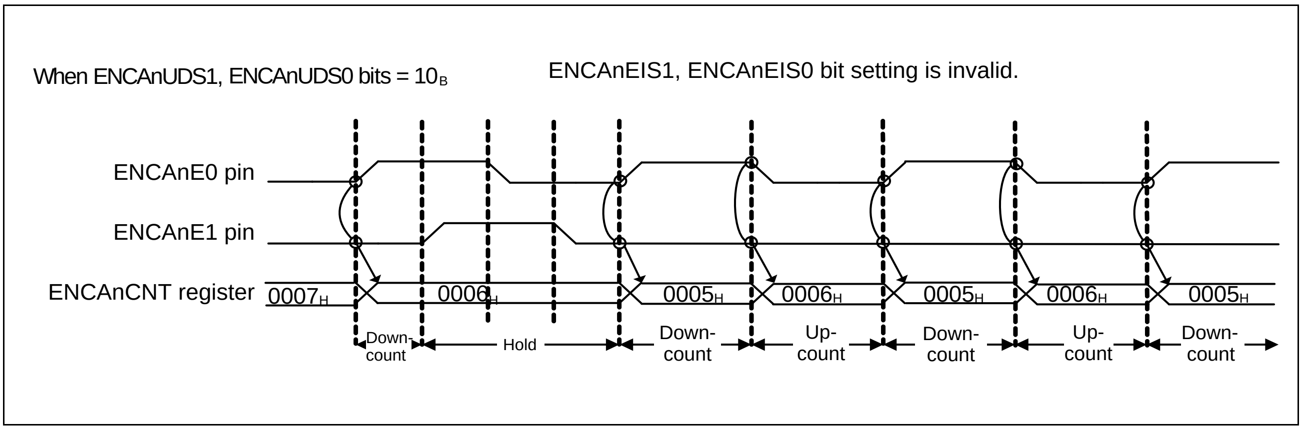

Figure 35.5 Count Operation when ENCAnUDS1, ENCAnUDS0 Bits in ENCAnCTL Register = 10_B

35.4.2.4 When ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 11_B

Table 35.27 When ENCAnUDS1, ENCAnUDS0 Bits = 11_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 Pin	ENCAnE1 Pin	Count Operation
1	1	Low level	Falling edge	Down
		Rising edge	Low level	
		High level	Rising edge	
		Falling edge	High level	
		Rising edge	High level	Up
		High level	Falling edge	
		Falling edge	Low level	
		Low level	Rising edge	
		Simultaneous input		Hold

Valid edge specification for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS1, ENCAnEIS0) is invalid.

The counter value is held when the valid edges of ENCAnE0 and ENCAnE1 overlap.

The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits = 11_B.

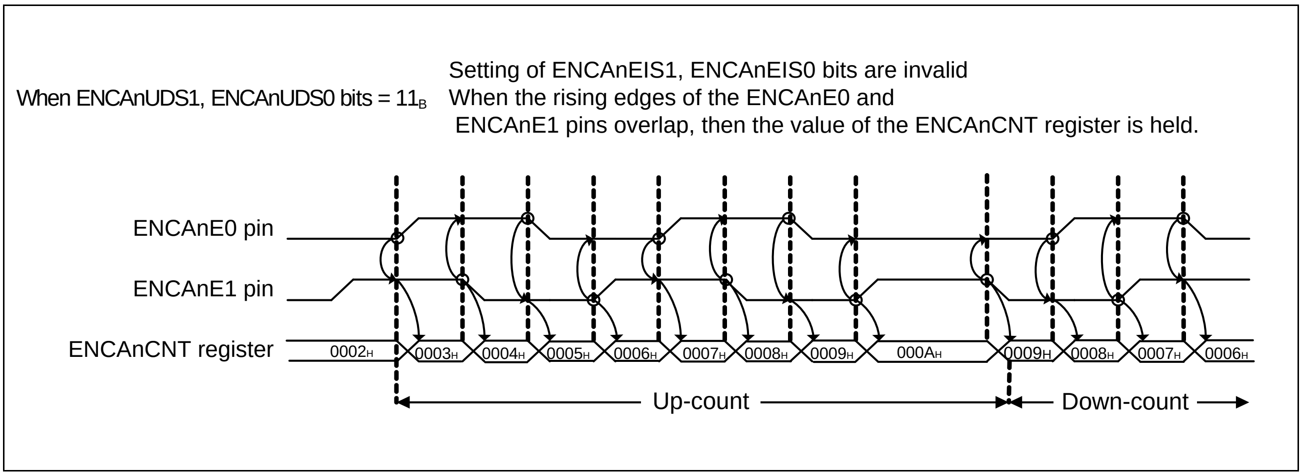

Figure 35.6 Count Operation when ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 11_B

35.4.3 Timer Counter Clear Control by Encoder Input

The timer counter is cleared to 0000_H by encoder clear input (ENCAnEC).

Two types of clearing methods can be selected by controlling the ENCAnSCE, ENCAnZCL, ENCAnBCL, ENCAnACL, ENCAnECS1, and ENCAnECS0 bits of the ENCAnIOC1 register.

Table 35.28 Timer Counter Clear Control by Encoder Input

Clearing method	ENCAnSCE	ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnECS1, ENCAnECS0
(1)	0	Invalid	Invalid	Invalid	Valid
(2)	1	Valid	Valid	Valid	Invalid

35.4.3.1 Clearing Method when ENCAnSCE = 0

- Upon detection of the valid edge of ENCAnEC, the timer counter is cleared to 0000_H in synchronization with the operation clock.
- The valid edge of ENCAnEC is specified by the setting of the ENCAnECS1 and ENCAnECS0 bits.
- The settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

For details about clear operation when ENCAnSCE = 0, see the timing chart in **Section 35.6.19, Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0**.

35.4.3.2 Clearing Method when ENCAnSCE = 1

- When the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs are detected, the timer counter is cleared to 0000_H in synchronization with the operating clock.
- Specify the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs by the settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits.
- The settings of the ENCAnECS1 and ENCAnECS0 bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

The clearing conditions of the timer counter according to the ENCAnZCL, ENCAnBCL, and ENCAnACL settings are listed in the table below.

Table 35.29 Clearing Conditions of the Timer Counter

Counter Clear Condition Setting			Encoder Pin Input Level		
ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnEC	ENCAnE1	ENCAnE0
0	0	0	Low	Low	Low
0	0	1	Low	Low	High
0	1	0	Low	High	Low
0	1	1	Low	High	High
1	0	0	High	Low	Low
1	0	1	High	Low	High
1	1	0	High	High	Low
1	1	1	High	High	High

35.4.4 Functions of ENCAnCCR0

35.4.4.1 Compare Function

- When ENCAnCRM0 = 0, the ENCAnCCR0 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR0 setting value, a compare 0 match interrupt (ENCATINT0) is output.
- When ENCAnECM0 = 1, the timer counter is cleared to 0000_H in synchronization with the operating clock upon compare match if the next count operation is up-count.

Table 35.30 Compare Function of ENCAnCCR0

ENCAnCCR0 Function	Compare Match Clear Control	Next Count Operation	Timer Counter Clearing Upon Compare Match with ENCAnCCR0
ENCAnCRM0	ENCAnECM0		
0 (Compare)	0	Up-count	Does not clear (continues count operation).
		Down-count	
	1	Up-count	Clears timer counter to 0000_H.
		Down-count	Does not clear (continues count operation).

When ENCAnLDE = 1

- Upon occurrence of an underflow, the setting value of the ENCAnCCR0 register is loaded to the timer counter.
- An underflow interrupt (ENCATIUD) is output.

NOTE

For the timing chart when ENCAnLDE = 1, see **Section 35.6.8, Using the ENCAnLDE Function Immediately after Startup** to **Section 35.6.12, Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input**.

35.4.4.2 Capture Function

- When ENCAnCRM0 = 1, the ENCAnCCR0 register functions as a dedicated capture register.
- Upon valid edge detection of the capture trigger input 0 (ENCATTIN0), the value of the timer counter is stored into ENCAnCCR0.
- A capture 0 interrupt (ENCATINT0) is output during capture operation.

NOTE

For details about capture operation for ENCAnCCR0, see the timing charts in **Section 35.6.14, Capture Operation between Count Clocks (ENCAnCCR0)** and **Section 35.6.17, Encoder Operation when Compare Match Clear Control is Disabled**.

35.4.5 Functions of ENCAnCCR1

35.4.5.1 Compare Function

- When ENCAnCRM1 = 0, the ENCAnCCR1 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR1 setting value, a compare 1 match interrupt (ENCATINT1) is output.
- When ENCAnECM1 = 1, the timer counter is cleared to 0000_H in synchronization with the operating clock upon compare match if the next count operation is down-count.

Table 35.31 Compare Function of ENCAnCCR1

ENCAnCCR1 Function	Compare Match Clear Control	Next Count Operation	Timer Counter Clearing Upon Compare Match with ENCAnCCR1
ENCAnCRM1	ENCAnECM1		
0 (Compare)	0	Up-count	Does not clear (continues count operation).
		Down-count	
	1	Up-count	Does not clear (continues count operation).
		Down-count	Clears timer counter to 0000_H.

Compare match interrupt mask function

- When ENCAnCME = 1, the compare 1 match interrupt mask function is enabled. In this state, the compare 1 match interrupt is output upon the first match of the value of the timer counter and the ENCAnCCR1 setting value, and interrupts are then masked for the second and subsequent compare matches.
- When ENCAnCME = 1 and ENCAnMCS = 0, a compare 1 match interrupt is output once upon the first compare match by writing to the ENCAnCCR1 register (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCAnCME = 1 and ENCAnMCS = 1, a compare 1 match interrupt is output once upon the first compare match by a timer counter clear operation accompanying encoder clear input or by a timer counter clear operation upon match between the ENCAnCCR0 register value and the timer counter value (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCAnCME = 1, ENCAnMCS = 1 and ENCAnLDE = 1, a compare 1 match interrupt is output once upon the first compare match by a loading operation of the ENCAnCCR0 register to the timer counter upon underflow detection (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- Setting ENCAnECM1 to “1” is prohibited when enabling the compare 1 match interrupt mask function.

Table 35.32 Compare Match Interrupt Mask Function of ENCAnCCR1

ENCAnCCR1 Function	Compare 1 Match Interrupt Mask	Interrupt Mask Cancel Trigger	Compare 1 Match Interrupt Output upon Compare Match with ENCAnCCR1
ENCAnCRM1	ENCAnCME	ENCAnMCS	
0 (Compare)	0 (Mask function disabled)	— (Setting invalid)	Outputs compare 1 match interrupt upon each compare match.
	1 (Mask function enabled)	0 (Write operation to ENCAnCCR1)	Outputs compare 1 match interrupt once upon the first compare match. (Interrupts are masked for the second and subsequent matches until the cancel trigger occurs.)
		1 (Timer counter clear operation) (Loading from ENCAnCCR0 to the timer counter upon underflow occurrence when ENCAnLDE = 1)	

35.4.5.2 Capture Function

When ENCAnCRM1 = 1, the ENCAnCCR1 register functions as a dedicated capture register.

NOTE

For details about capture operation to ENCAnCCR1, see the timing chart in **Section 35.6.13, Capture Operation between Count Clocks (ENCAnCCR1)**.

The operations for each of the ENCAnCTS settings are shown in the table below.

Table 35.33 Operations for Each of the ENCAnCTS Settings

ENCAnCCR1 Function	Capture Trigger Selection			
ENCAnCRM1	ENCAnCTS	Capture Trigger Signal	Timer Counter Clearing	Interrupt Occurrence
1 (Capture)	0	Capture trigger 1 input (ENCATTIN1)	Does not clear timer counter.	(1) Capture 1 interrupt (ENCATINT1)
	1	Encoder clear input (set with ENCAnSCE)	Clears timer counter.	(1) Capture 1 interrupt (ENCATINT1) (2) Encoder clear interrupt (ENCATIEC)

NOTE

For details about the timing chart when ENCAnCTS = 0 or ENCAnCTS = 1, see the following:

Section 35.6.3, Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin), **Section 35.6.4, Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)**, **Section 35.6.5, Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)**, **Section 35.6.11, Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin)** and **Section 35.6.12, Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input**.

35.4.5.3 Timer Counter Clearing upon Compare Register Match

Timer counter clearing upon compare match between the value of the timer counter and the ENCAnCCR0/1 setting value, according to the settings of the ENCAnECM1 and ENCAnECM0 bits in the ENCAnCTL register, is detailed in the following table.

Table 35.34 Timer Counter Clearing Operation upon Compare Register Match

ENCAnECM1 and ENCAnECM0	Next Count Operation	Timer Counter Clearing upon Compare Match with ENCAnCCR1	Timer Counter Clearing upon Compare Match with ENCAnCCR0
00	Up-count	Does not clear (continues count operation).	Does not clear (continues count operation).
	Down-count	Does not clear (continues count operation).	Does not clear (continues count operation).
01	Up-count	Does not clear (continues count operation).	Clears timer counter to 0000_H.
	Down-count	Does not clear (continues count operation).	Does not clear (continues count operation).
10	Up-count	Does not clear (continues count operation).	Does not clear (continues count operation).
	Down-count	Clears timer counter to 0000_H.	Does not clear (continues count operation).
11	Up-count	Does not clear (continues count operation).	Clears timer counter to 0000_H.
	Down-count	Clears timer counter to 0000_H.	Does not clear (continues count operation).

35.4.6 Startup/Stop of Timer Counter

35.4.6.1 Startup of Timer

The timer operation can be started by setting the ENCAnTS bit to “1”.

PIC setting enables simultaneous start with other timers. For details, see **Section 36.8, Simultaneous Start Trigger Function**.

35.4.6.2 Stop of Timer

When the ENCAnTT bit is set to “1”, the ENCAnTE bit becomes “0” and the timer stops.

35.5 ENCAn Setting Sequences

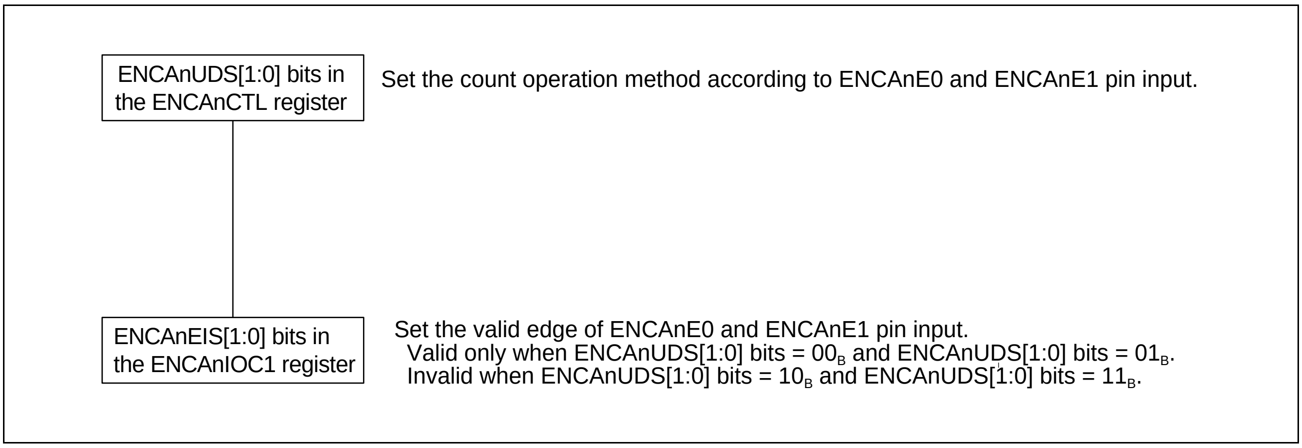
35.5.1 ENCAn Setting Procedure

The ENCAn setting procedure is described below.

Table 35.35 ENCAn Setting Procedure

Initial Setting	Action	Setting status
Initial setting	Reset deassertion	Power-on status, operation stopped status. (Writing to each register is enabled)
ENCAn initial setting	Perform the following initial settings. ● Setting for counter ● Setting for counter clear ● Setting for ENCAnCCR0 register ● Setting for ENCAnCCR1 register	This is the count operation stopped status. The value of the ENCAnTE bit indicating the operating status is 0.
	Perform the counter initial value settings. ● Set any 16-bit value to ENCAnCNT register. (When, after setting this register, the ENCAnTS bit is set to “1”, the counter operation starts from the set count value.)	The set value is set as the initial value of the counter register.
Operation start	Perform the counter operation start setting. ● Set the ENCAnTS bit to “1”.	This is the counter operation starts status. The value of the ENCAnTE bit indicating the operating status is 1, and the count clock is supplied to the internal circuit.
Operating	Only those registers whose setting can be changed during operation can be rewritten. ● ENCAnCCR0 register setting. ● ENCAnCCR1 register setting. ● ENCAnIOC0 register setting.	The count operation set with the initial setting is performed, and up/down counting is performed according to ENCAnE0 and ENCAnE1 pins.
Operation stop	Perform the counter operation stop setting during operation. ● Set the ENCAnTT bit to “1”.	This is the counter operation stopped status. The value of the ENCAnTE bit indicating the operating status is 0.
ENCAn stop	Reset	The setting registers are initialized.

35.5.1.1 Initial Setting Procedure for the Counter

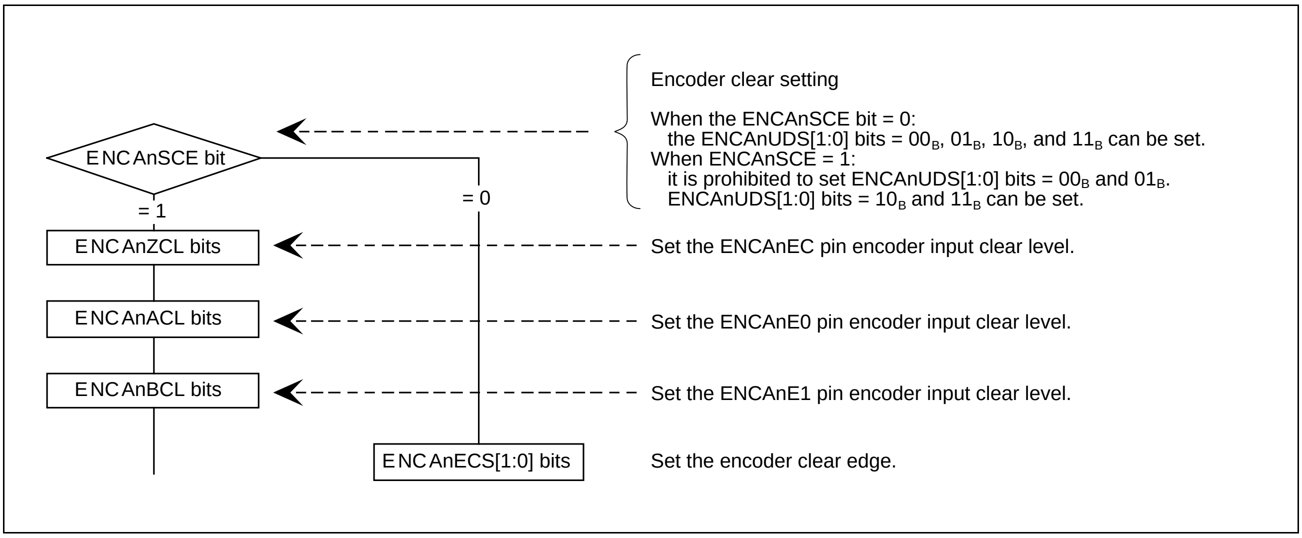


Set the count operation method according to ENCAnE0 and ENCAnE1 pin input.

Set the valid edge of ENCAnE0 and ENCAnE1 pin input.
Valid only when ENCAnUDS[1:0] bits = 00_B and ENCAnUDS[1:0] bits = 01_B.
Invalid when ENCAnUDS[1:0] bits = 10_B and ENCAnUDS[1:0] bits = 11_B.

Figure 35.7 Initial Setting Procedure for the Counter

35.5.1.2 Initial Setting Procedure for Counter Clear



Encoder clear setting

When the ENCAnSCE bit = 0:
the ENCAnUDS[1:0] bits = 00_B, 01_B, 10_B, and 11_B can be set.
When ENCAnSCE = 1:
it is prohibited to set ENCAnUDS[1:0] bits = 00_B and 01_B.
ENCAnUDS[1:0] bits = 10_B and 11_B can be set.

Set the ENCAnEC pin encoder input clear level.

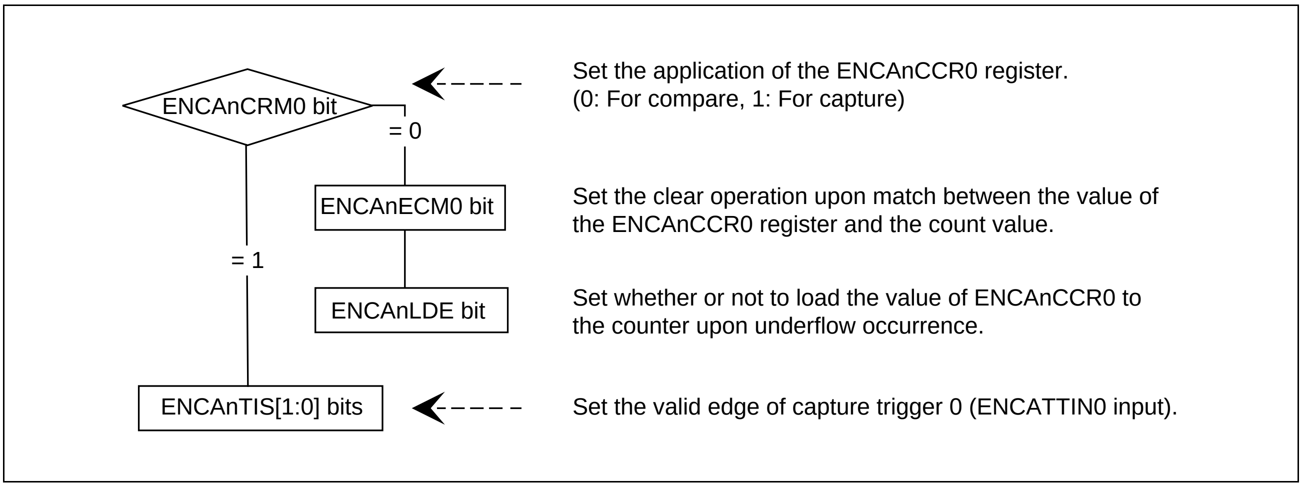
Set the ENCAnE0 pin encoder input clear level.

Set the ENCAnE1 pin encoder input clear level.

Set the encoder clear edge.

Figure 35.8 Initial Setting Procedure for Counter Clear

35.5.1.3 Setting Procedure for ENCAnCCR0 Register



Set the application of the ENCAnCCR0 register.
(0: For compare, 1: For capture)

Set the clear operation upon match between the value of the ENCAnCCR0 register and the count value.

Set whether or not to load the value of ENCAnCCR0 to the counter upon underflow occurrence.

Set the valid edge of capture trigger 0 (ENCATTIN0 input).

Figure 35.9 Setting Procedure for ENCAnCCR0 Register

35.5.1.4 Setting Procedure for ENCAnCCR1 Register

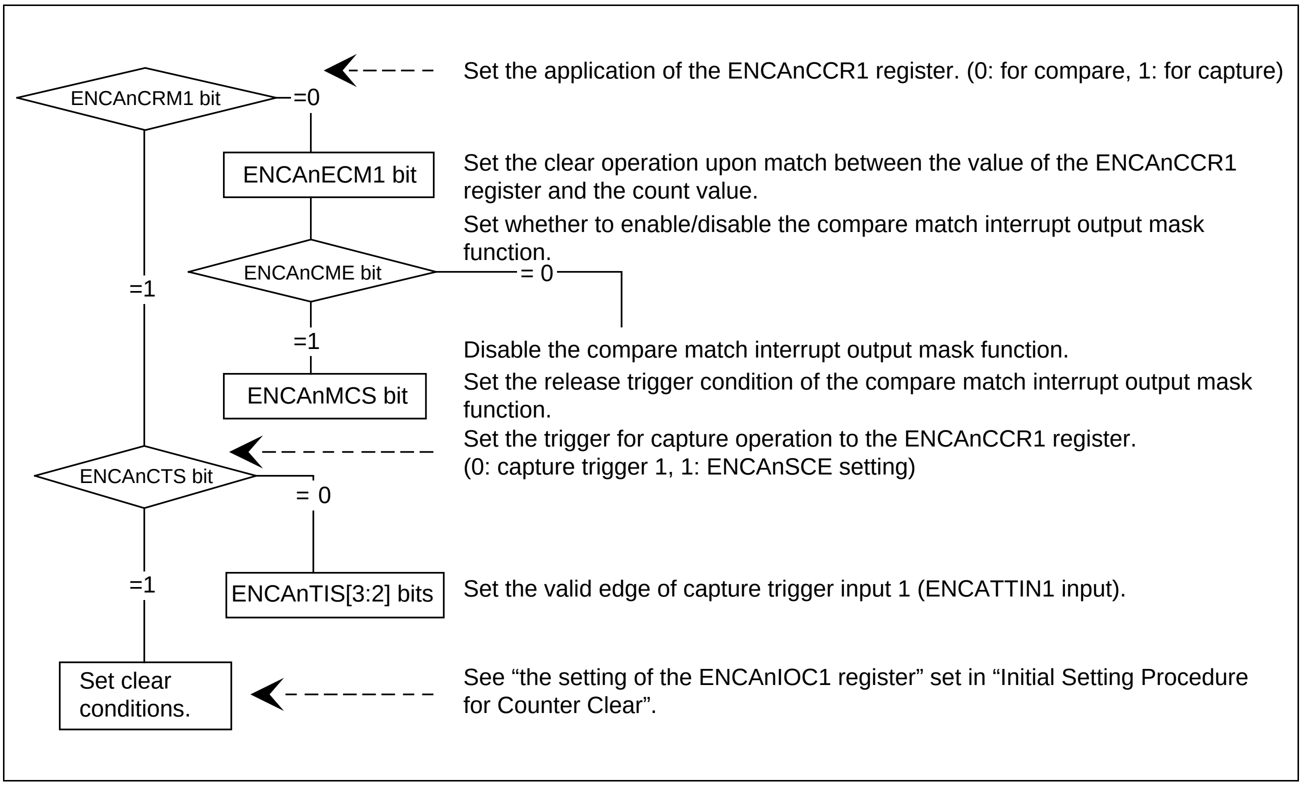


Figure 35.10 Setting Procedure for ENCAnCCR1 Register

35.6 Timing Chart

35.6.1 Overflow Occurrence and Overflow Flag Clear Operation

An overflow occurs when up-counting is performed when the counter value is FFFF_H. Once an overflow occurs, an overflow interrupt (ENCATIOV) is output and the overflow flag (ENCAnOVF) is set to 1. When the overflow clear bit (ENCAnCLOV) is set to 1, the overflow flag (ENCAnOVF) is cleared to 0.

The operations of overflow occurrence and overflow flag clearing are described below.

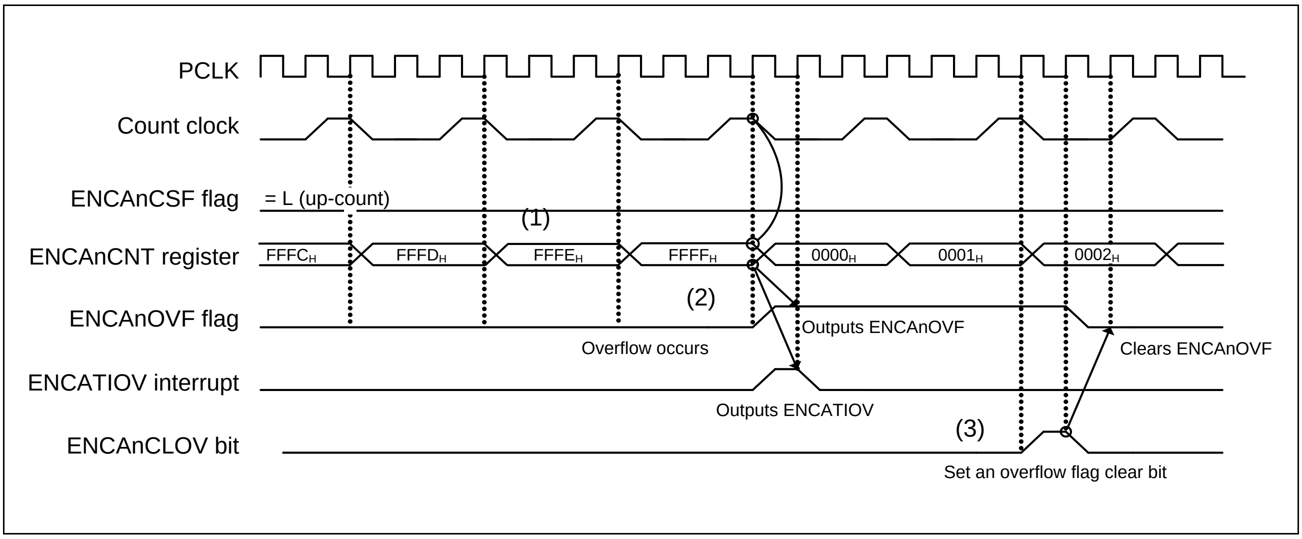

Figure 35.11 Settings of Overflow Occurrence and Overflow Flag Clear

(1) The count value is counted up from FFFE_H to FFFF_H.

(2) When the count value changes from FFFF_H to 0000_H, an overflow occurs. At the same time, an overflow interrupt is output and the overflow flag is set to 1.

(3) By setting the ENCAnCLOV bit in the ENCAnFGC register to 1 by the overflow flag clearing method, the overflow flag is cleared to 0. The overflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 when the ENCAnTE bit in the ENCAnTE register is 0, or setting the input signal of ENCATSST (simultaneous start trigger input) to “High”.

35.6.2 Underflow Occurrence and Underflow Flag Clear Operation

An underflow occurs when down-counting is performed when the counter value is 0000_H.
Once an underflow occurs, an underflow interrupt (ENCATIUD) is output and the underflow flag (ENCAnUDF) is set to 1. When the underflow clear bit (ENCAnCLUD) is set to 1, the underflow flag (ENCAnUDF) is cleared to 0.

The operations of underflow occurrence and underflow flag clearing are described below.

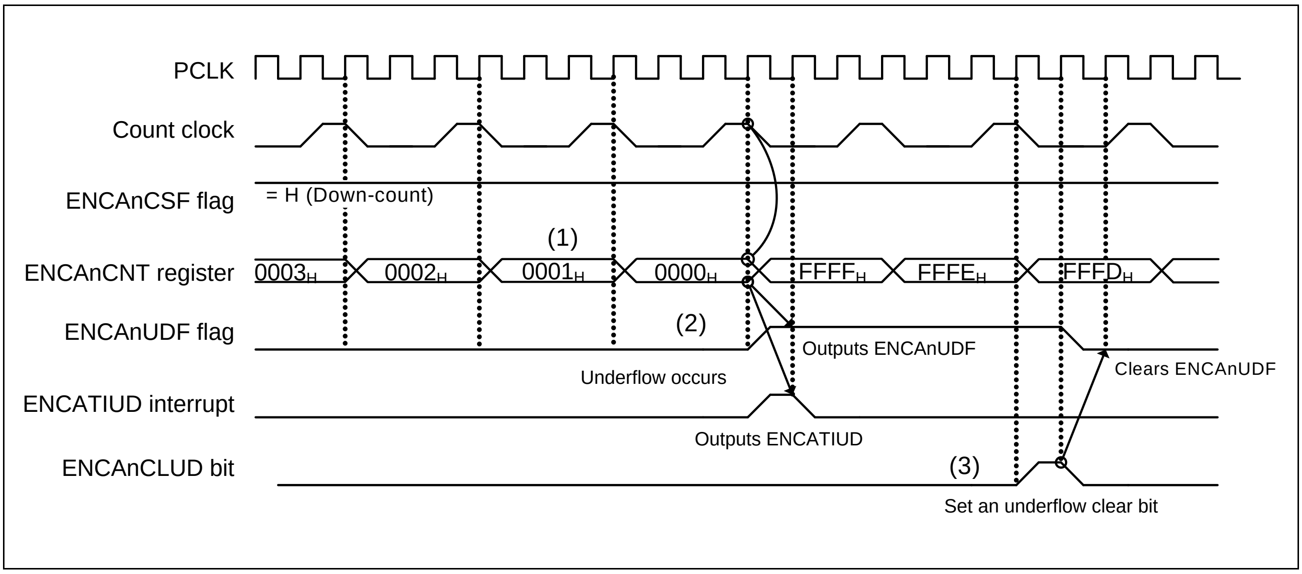

Figure 35.12 Settings of Underflow Occurrence and Underflow Flag Clear

(1) The count value is counted down from 0001_H to 0000_H.

(2) When the count value changes from 0000_H to $FFFF_H$, an underflow occurs. At the same time, an underflow interrupt is output and the underflow flag is set to 1.

(3) By setting the ENCAnCLUD bit in the ENCAnFGC register to 1 by the underflow flag clearing method, the underflow flag is cleared to 0. The underflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 when the ENCAnTE bit in the ENCAnTE register is 0, or by setting the input signal of ENCATSST (simultaneous start trigger) to “High”.

35.6.3 Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

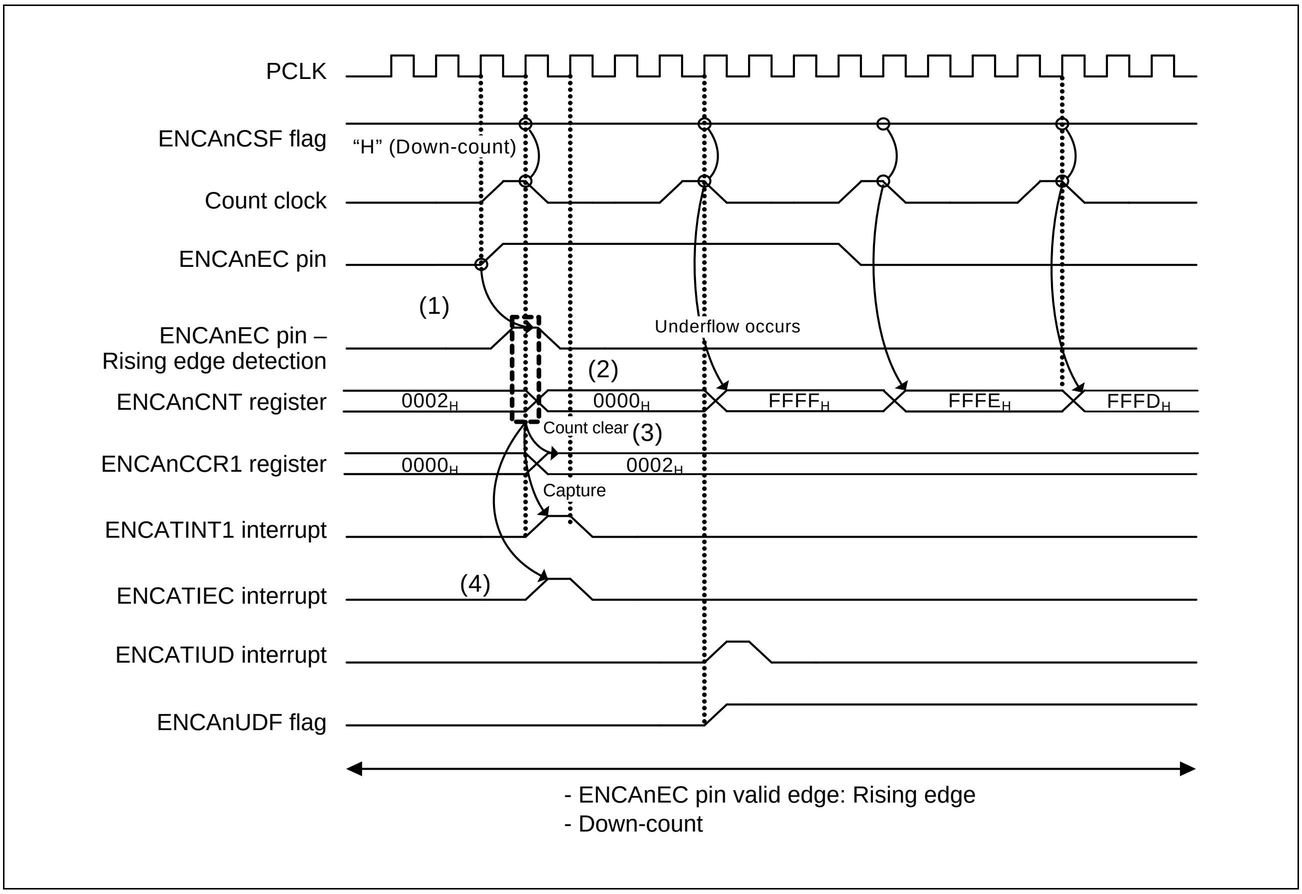

Figure 35.13 Timing Chart of Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

Setting conditions

- ENCAnCRM1 bit in the ENCAnCTL register = 1
  (Select the ENCAnCCR1 register as capture.)
- ENCAnCTS bit in the ENCAnCTL register = 1
  (Select the ENCAnEC pin input as capture trigger input.)
- ENCAnECS1 and ENCAnECS0 bits in the ENCAnIOC1 register = 01_B
  (Select the ENCAnEC pin input as rising edge detection.)

(1) Capture operation is performed by the rising edge of the ENCAnEC pin input trigger.

(2) Clearing is performed by the ENCAnEC pin input and the count value is set to 0000_H.

(3) The counter value (0002_H) is captured in the ENCAnCCR1 register by the rising edge of the ENCAnEC pin input.

(4) At the same time, a clear interrupt (ENCATIEC) and capture interrupt (ENCATINT1) due to the ENCAnEC pin input are output.

35.6.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

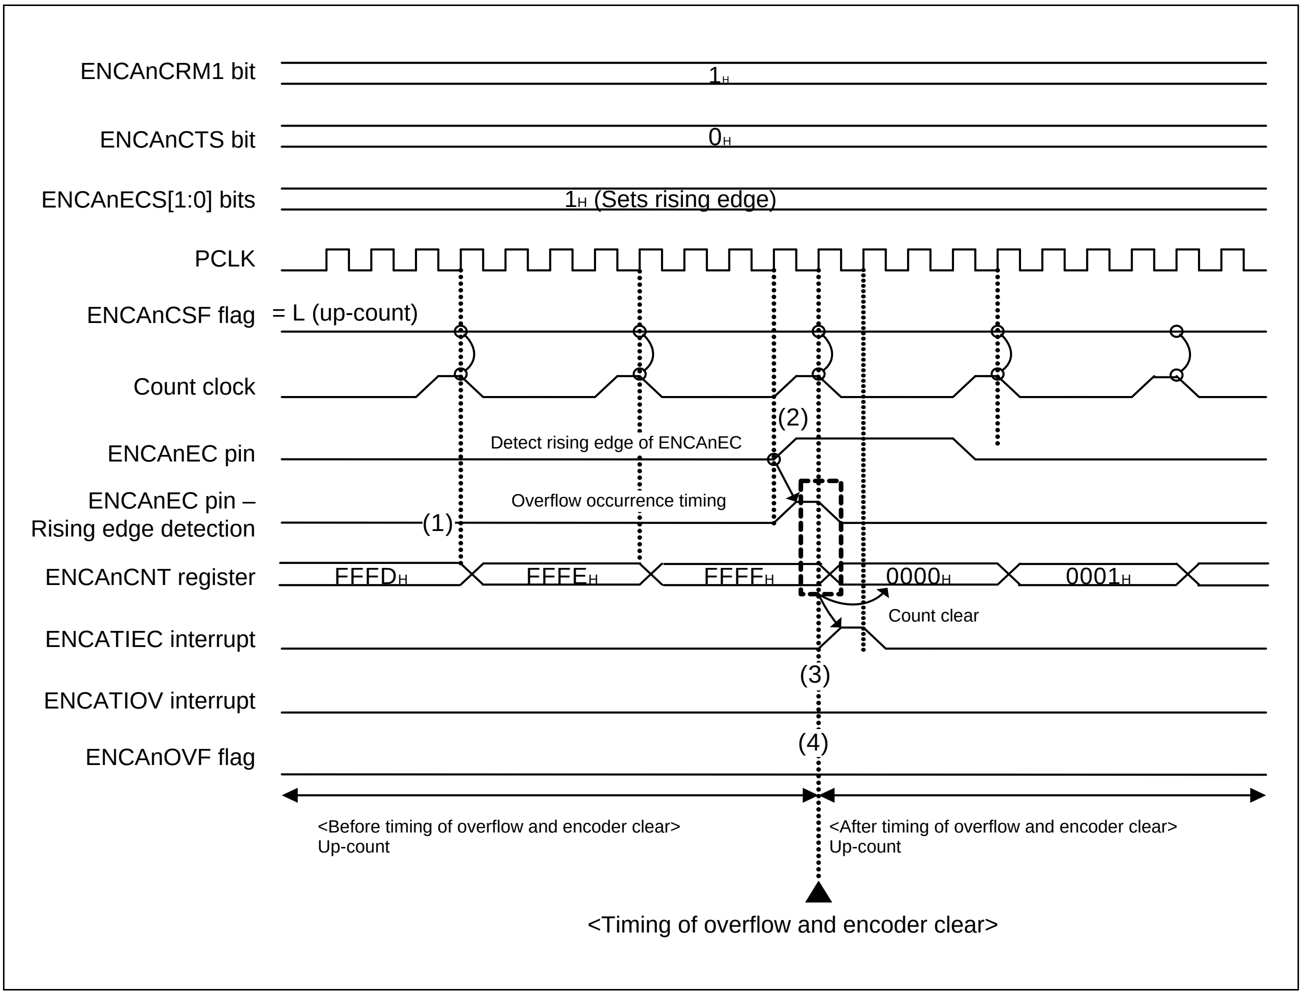

Figure 35.14 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)

(1) An up-count from $FFFD_H$ is continuously performed.

(2) When an overflow occurs if the count value is $FFFF_H$, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. The counter value is cleared to 0000_H.

(3) When the counter value is cleared by the encoder clear input, a clear interrupt (ENCATIEC) by encoder clear input is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the overflow occurrence, an overflow interrupt is not output (An overflow does not occur. Clear operation is performed by the encoder clear input).

(4) Because an overflow does not occur as is the case with step 3, the overflow flag is not set.

35.6.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

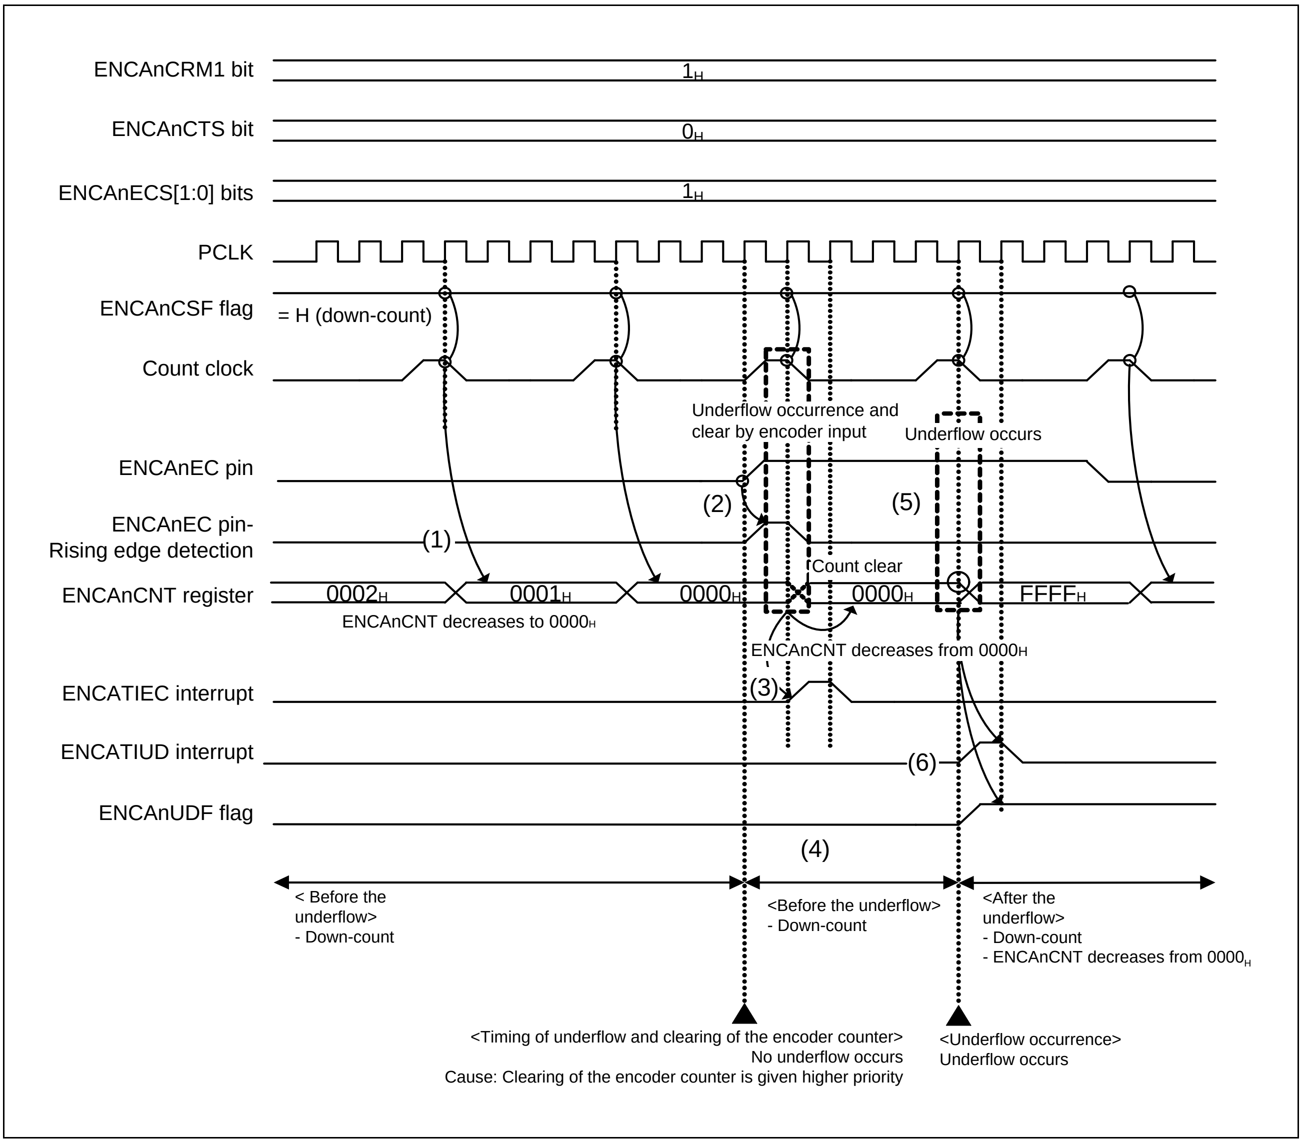

Figure 35.15 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

(1) A down-count from 0002_H is continuously performed.

(2) When an underflow occurs if the count value is 0000_H, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. Even if the next clock signal is input during clear operation, the counter value remains at 0000_H.

(3) When the counter value is cleared by the encoder clear input, an encoder clear interrupt (ENCATIEC) is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the underflow occurrence, an underflow interrupt is not output (An underflow does not occur. Clear operation is performed by the encoder clear input).

(4) Because an underflow does not occur as is the case with step 3, the underflow flag is not set.

(5) When a further down-count is performed after the counter value changes to 0000_H by clear operation by the encoder clear input, the counter value changes from 0000_H to $FFFF_H$, and an underflow occurs.

(6) When an underflow occurs, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

35.6.6 Overflow Operation Immediately after Startup

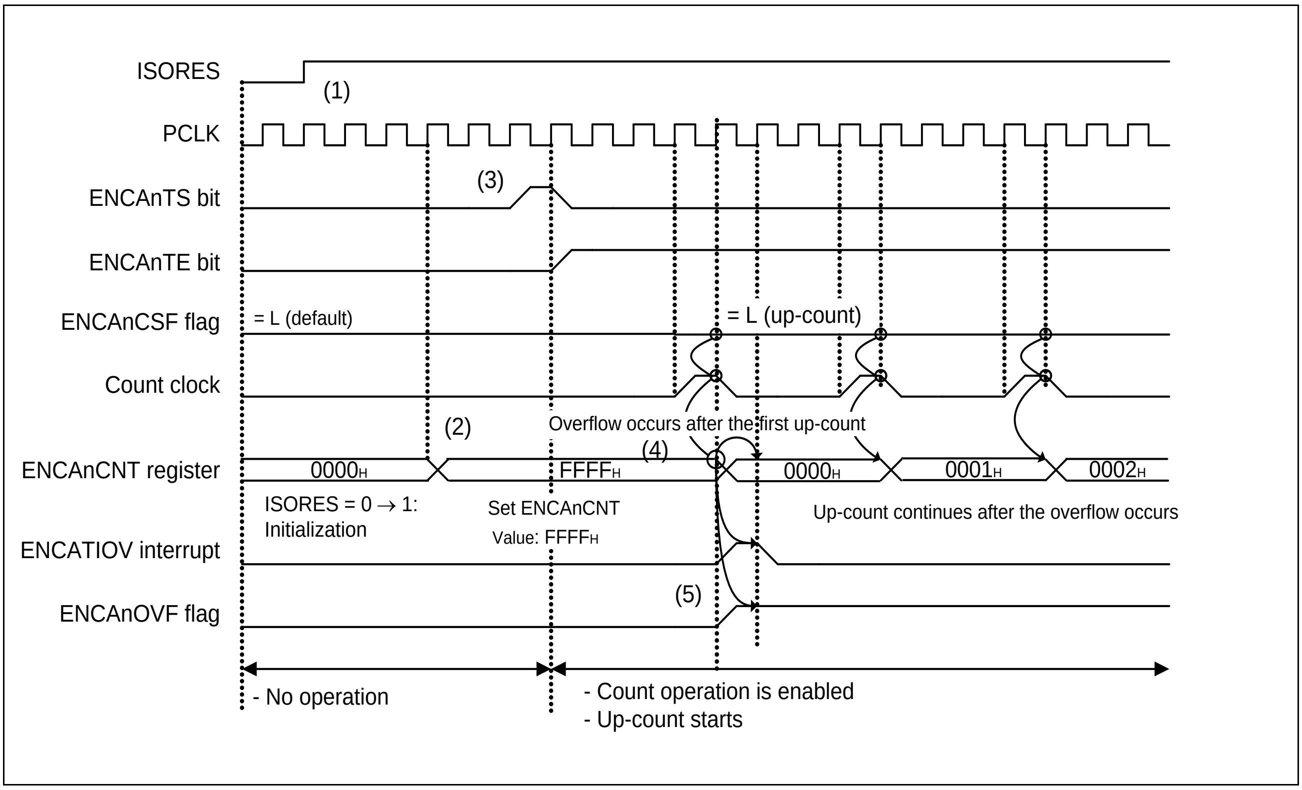

Figure 35.16 Overflow Operation Immediately after Startup

(1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.

(2) The timer counter is set to $FFFF_H$ as the initial value.

(3) ENCAnTS is set to “1”, and operation starts. ENCAnTE changes to “1”, which indicates that operation is enabled.

(4) When an up-count is performed from $FFFF_H$ which is the initially set count value, the counter value changes from $FFFF_H$ to 0000_H, and an overflow occurs immediately after operation starts.

(5) At the same time, by an overflow occurrence immediately after operation starts, an overflow interrupt (ENCATIOV) is output, and the overflow flag (ENCAnOVF) is set.

35.6.7 Underflow Operation Immediately after Startup

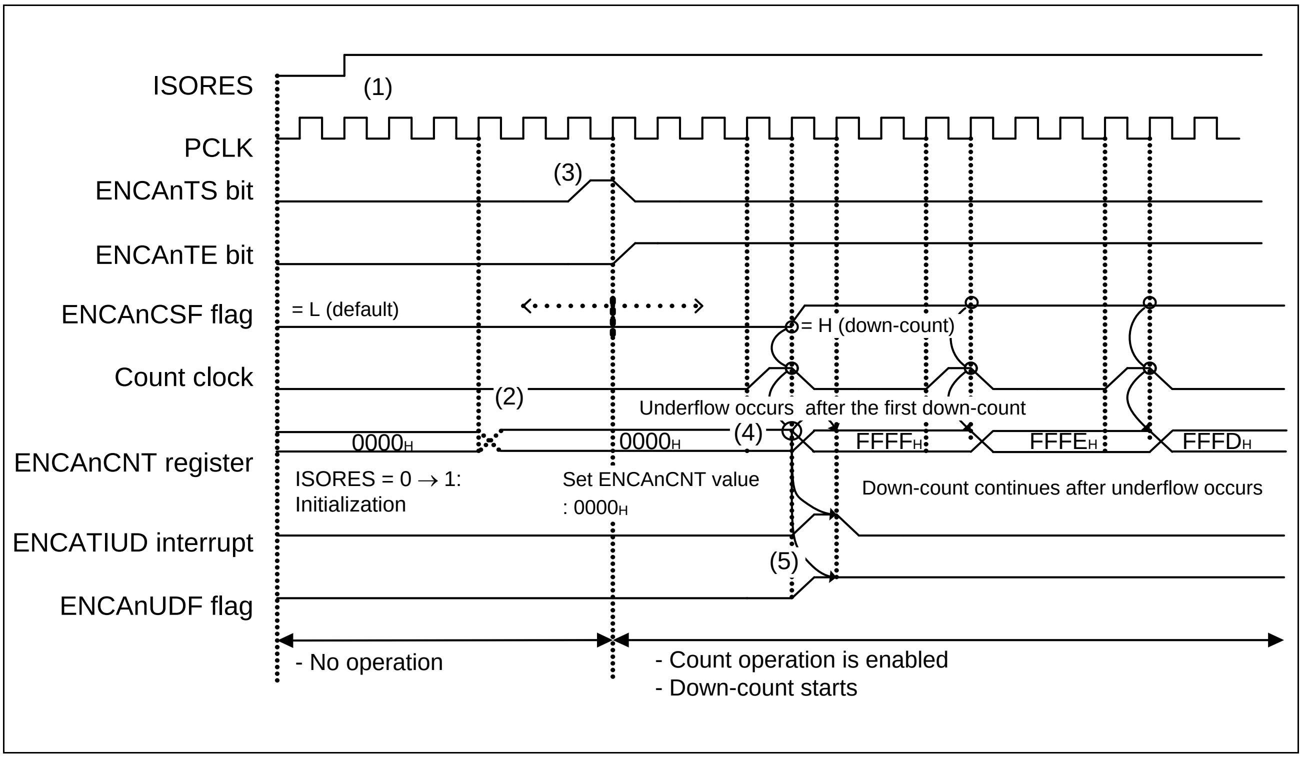

Figure 35.17 Underflow Operation Immediately after Startup

(1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.

(2) The timer counter is set to 0000_H as the initial value.

(3) ENCAnTS is set to “1”, and operation starts. ENCAnTE changes to “1”, which indicates that operation is enabled.

(4) When a down-count is performed from 0000_H which is the initially set count value, the counter value changes from 0000_H to $FFFF_H$, and an underflow occurs immediately after operation starts.

(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

35.6.8 Using the ENCAnLDE Function Immediately after Startup

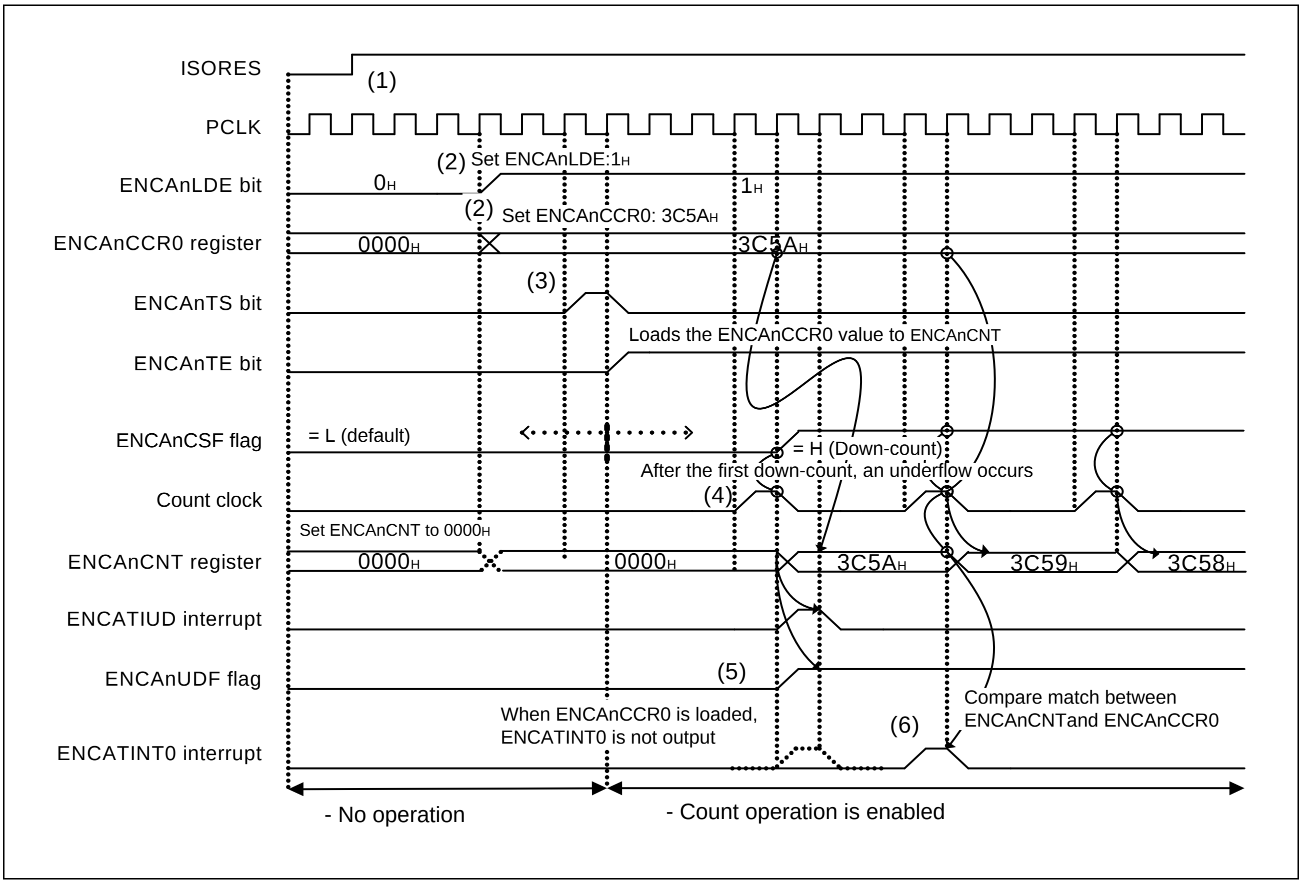

Figure 35.18 Using the ENCAnLDE Function Immediately after Startup

(1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.

(2) The load enable bit (ENCAnLDE) is set to “1”, capture/compare register 0 (ENCAnCCR0) is set to 3C5A$_H$, and the timer counter is set to the initial value 0000$_H$.

(3) ENCAnTS is set to “1”, and operation starts. ENCAnTE changes to “1”, which indicates that operation is enabled.

(4) When a down-count is performed from 0000$_H$ which is the initially set count value, an underflow occurs immediately after operation starts. Because ENCAnLDE is set to “1”, the ENCAnCCR0 value, 3C5A$_H$, is loaded to the timer counter (ENCATINT0 is not output during loading).

(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set (after an underflow occurs, down-count operation from the loaded value (3C5A$_H$) continues).

(6) After the ENCAnCCR0 value is loaded to ENCAnCNT, a match with ENCAnCCR0 is detected, and ENCATINT0 is output.

35.6.9 ENCAnLDE Function (Loading Count Value)

(1) <When ENCAnLDE = 0>

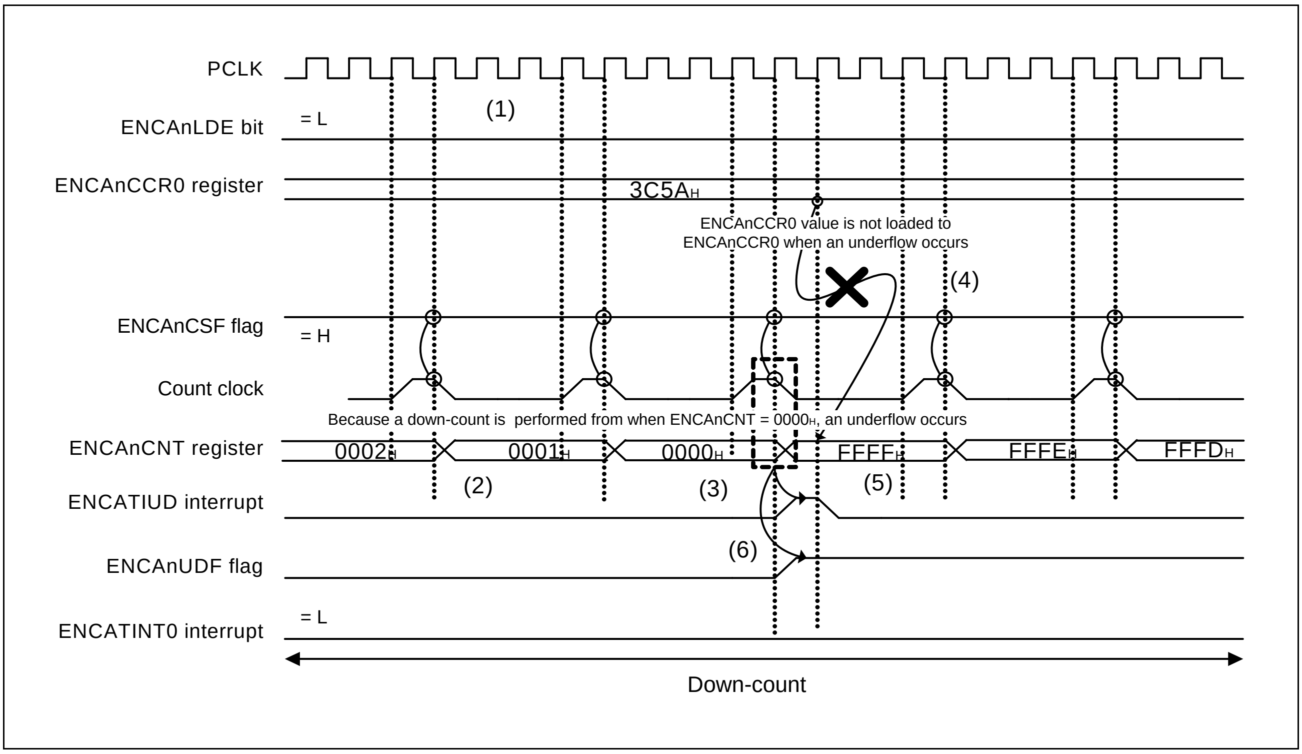

Figure 35.19 ENCAnLDE Function (when ENCAnLDE = 0)

(1) ENCAnLDE is set to “0” (even if an underflow occurs, the ENCAnCCR0 value is not loaded).

(2) A down-count is performed: 0002_H → 0001_H → 0000_H

(3) When a further down-count is performed after the counter value changes to 0000_H, an underflow occurs.

(4) Because ENCAnLDE is set to “0”, the setting value of the ENCAnCCR0 register is not loaded to the counter even if an underflow occurs.

(5) Operation changes to underflow operation (counter value: 0000_H → $FFFF_H$).

(6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

(2) <When ENCAnLDE = 1>

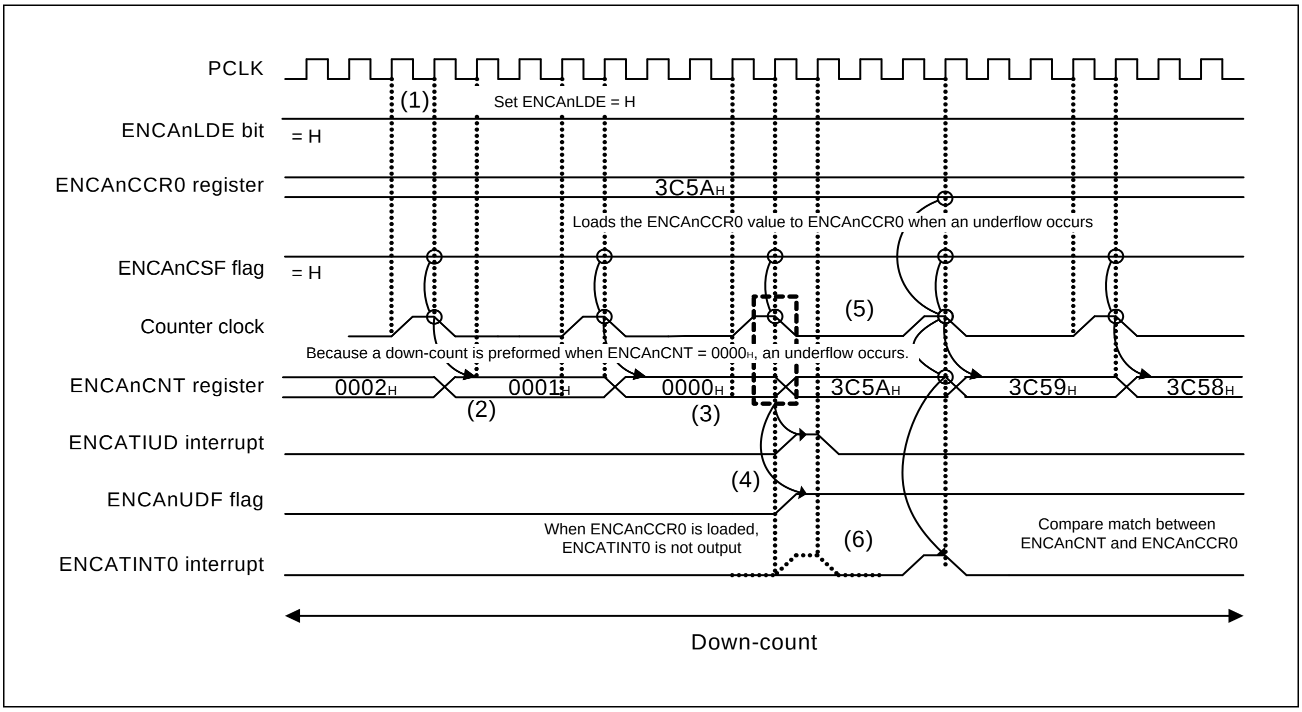

Figure 35.20 ENCAnLDE Function (when ENCAnLDE = 1)

(1) ENCAnLDE is set to “1” (if an underflow occurs, the ENCAnCCR0 value is loaded to the counter).

(2) A down-count is performed: 0002_H → 0001_H → 0000_H

(3) When a further down-count is performed after the counter value changes to 0000_H, an underflow occurs.

(4) An underflow interrupt is output, and the underflow flag is set.

(5) Because ENCAnLDE is set to “1”, the setting value of the ENCAnCCR0 register is loaded to the counter if an underflow occurs. ENCAnCNT is set to $3C5A_H$.

(6) After the ENCAnCCR0 value is set to ENCAnCNT, if the ENCAnCNT value matches the ENCAnCCR0 value on a count clock, a compare match interrupt (ENCATINT0) is output.

35.6.10 Conflict between ENCAnLDE Function (Loading Counter Value) and Rewrite of ENCAnCCR0 Register

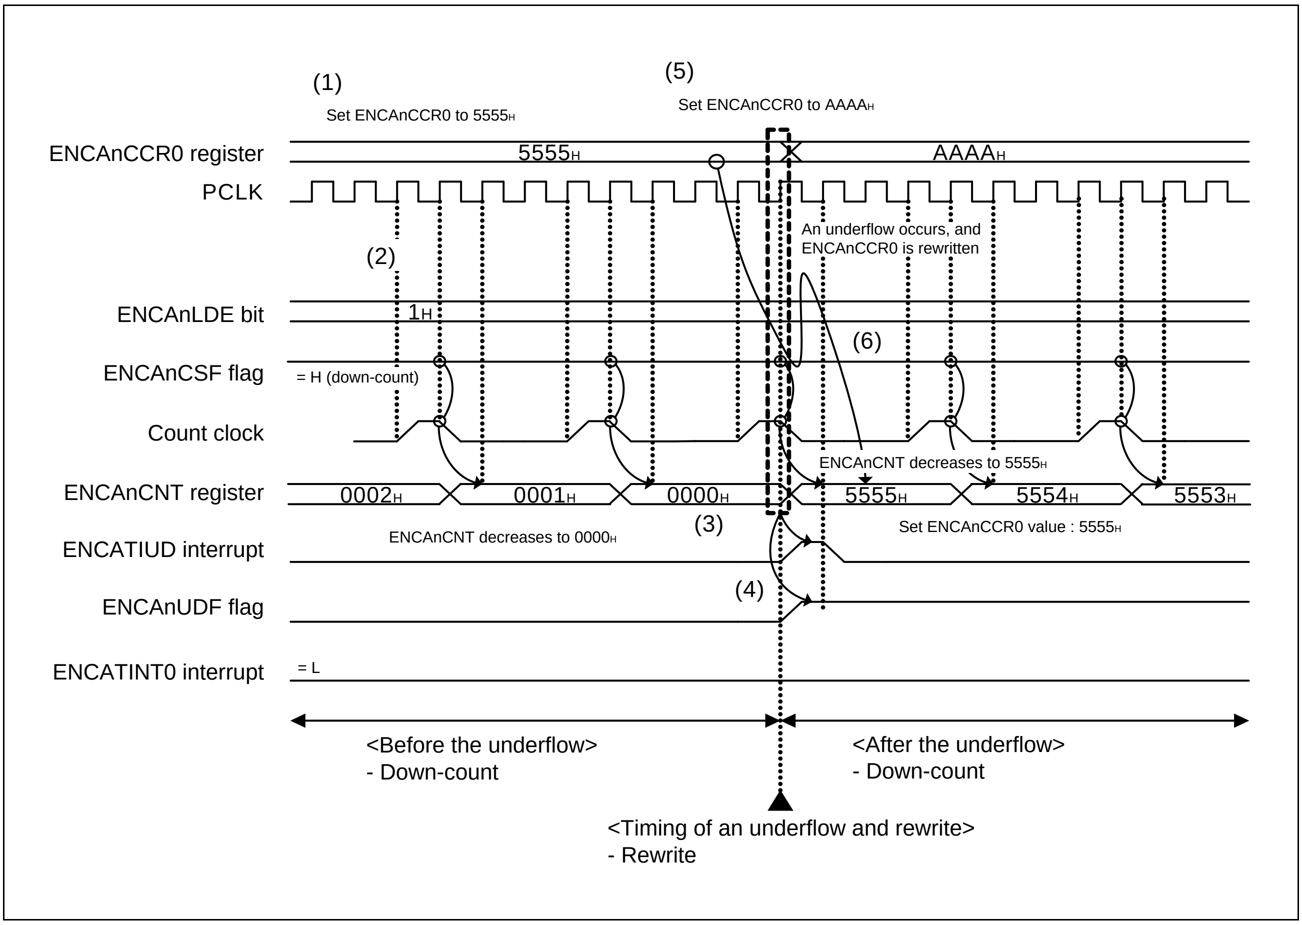

Figure 35.21 Conflict between ENCAnLDE Function and Rewrite of ENCAnCCR0 Register

(1) The ENCAnCCR0 register is currently set to 5555_H.

(2) ENCAnLDE is currently set to “1”.

(3) A down-count is performed ($0002_H \rightarrow 0001_H \rightarrow 0000_H$), and an underflow occurs.

(4) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

(5) When an underflow occurs, the ENCAnCCR0 register value is changed from 5555_H to $AAAA_H$.

(6) Additionally, when an underflow occurs, the ENCAnCCR0 value before the rewrite was performed (5555_H) is set in ENCAnCNT.

35.6.11 Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

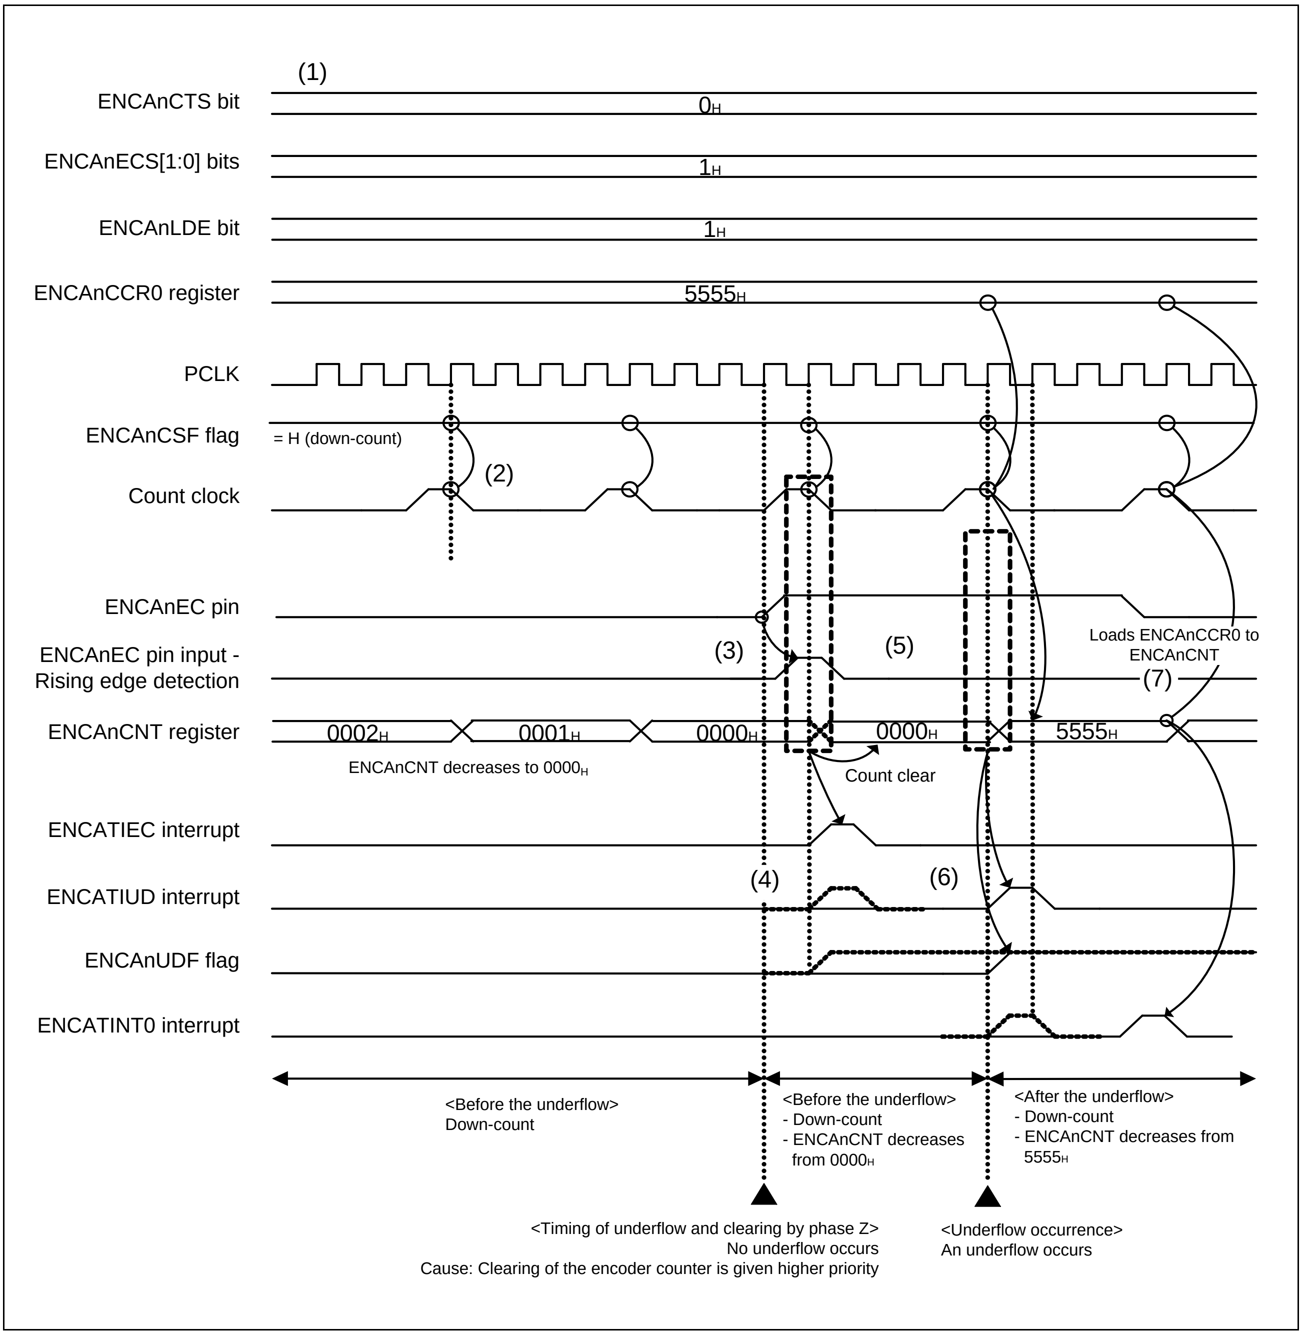

Figure 35.22 Conflict between ENCAnLDE Function and Clear Operation by Encoder Clear Input

(1) The values are set as follows: ENCAnCTS = 0, ENCAnECS[1:0] = 01_B, ENCAnLDE = 1, and ENCAnCCR0 = 5555_H.

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When the count value becomes 0000_H, the rising edge of ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.

(4) Because a count clear is performed when the count value reaches 0000_H, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when

the count value is 0000_H. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

(5) After the count value is cleared to 0000_H by clear operation by the encoder clear input, a down-count is performed and an underflow occurs.

(6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

(7) Because ENCAnLDE = “1”, if an underflow occurs, the ENCAnCCR0 value is loaded to ENCAnCNT.

(8) After the ENCAnCCR0 value is set to ENCAnCNT, a compare match is detected according to the count clock. If the ENCAnCNT value matches the ENCAnCCR0 value, a compare match interrupt (ENCATINT0) is output.

35.6.12 Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input

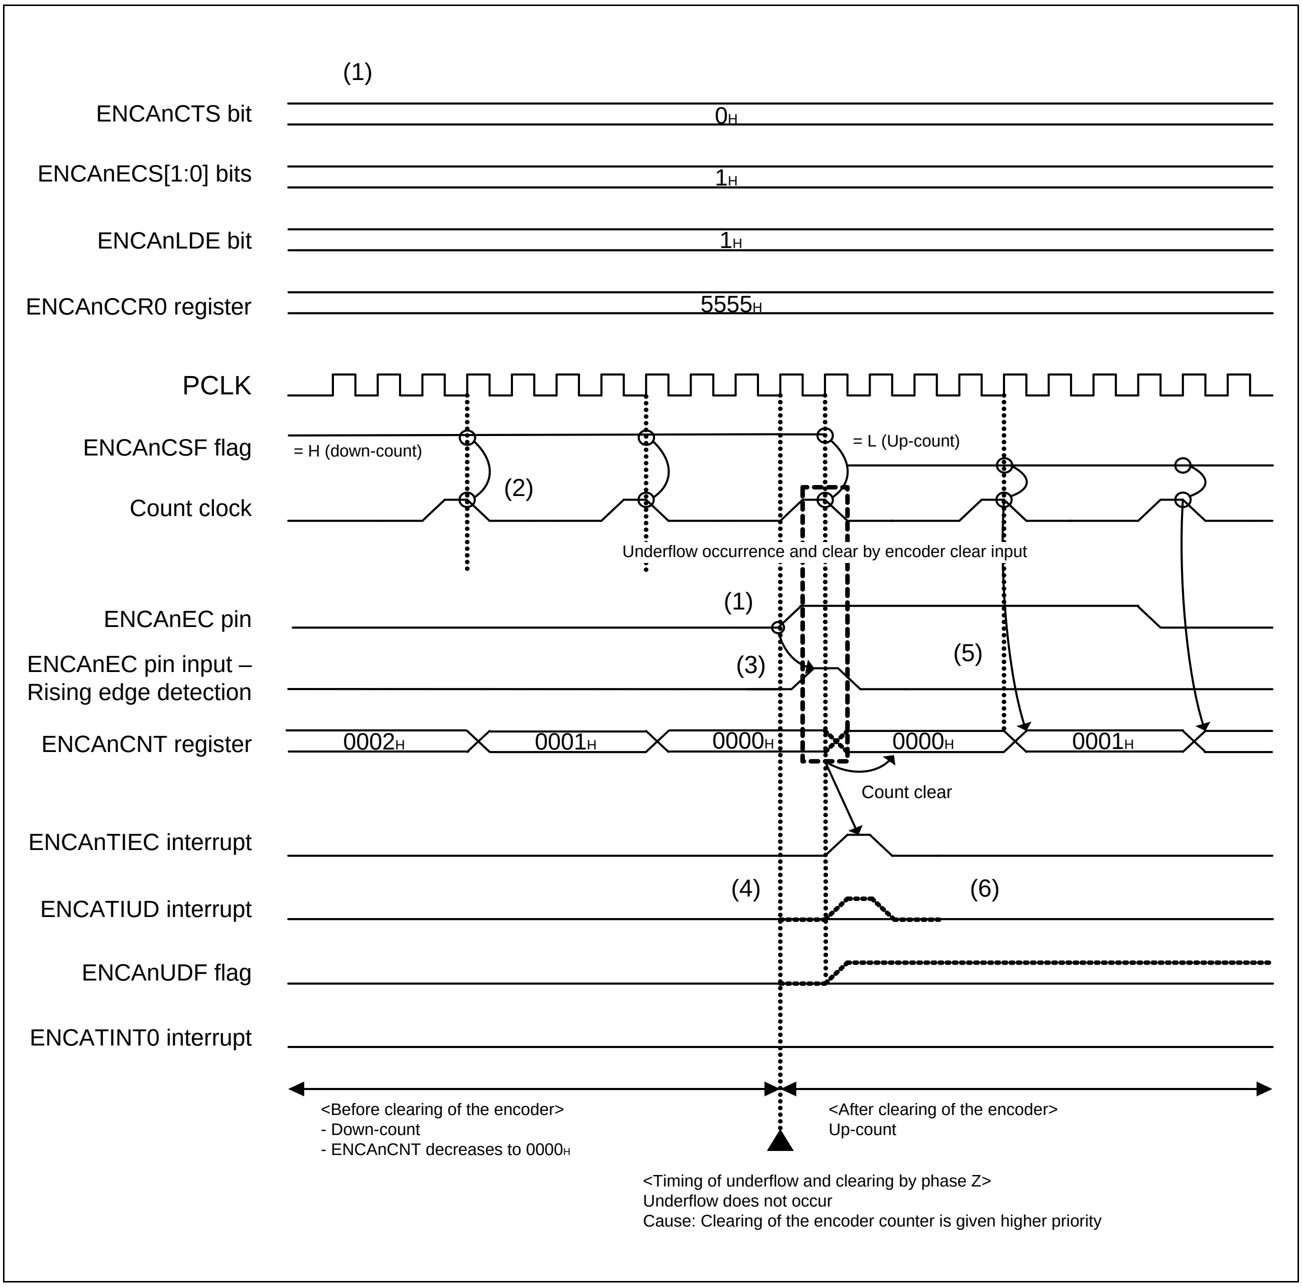

Figure 35.23 Up-count after Conflict between ENCAnLDE Function and Encoder Clear

(1) The values are set as follows: ENCAnCTS = 0, ENCAnECS[1:0] = 01_B, ENCAnLDE = 1, and ENCAnCCR0 = 5555_H.

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When the count value becomes 0000_H, the rising edge of ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.

(4) Because a count clear is performed when the count value reaches 0000_H, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when

the count value is 0000_H. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

(5) After the count value is cleared to 0000_H by clear operation by the encoder clear input, an up-count is performed.

(6) An underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

35.6.13 Capture Operation between Count Clocks (ENCAnCCR1)

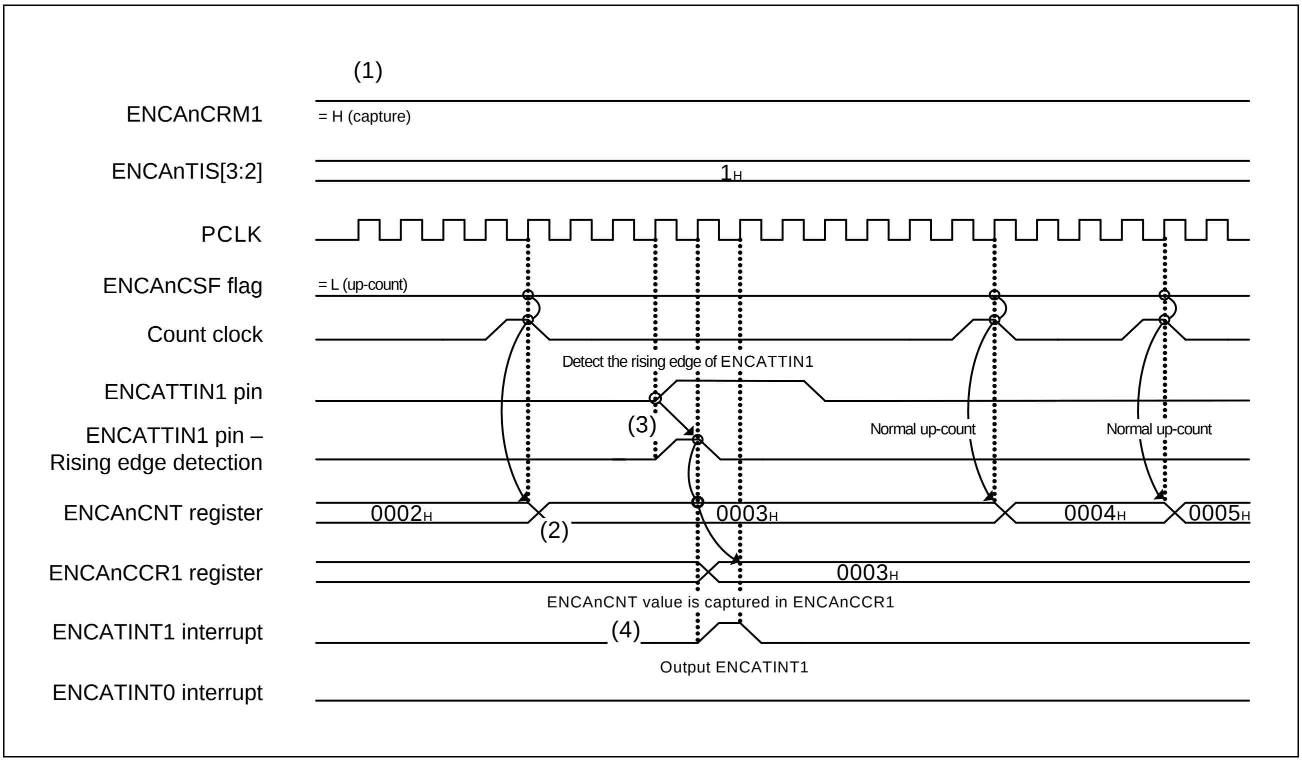

Figure 35.24 Capture Operation between Count Clocks (ENCAnCCR1)

(1) The values are set as follows: ENCAnCRM1 = 1, and ENCAnTIS[3:2] = 01_B.

(2) An up-count is performed.

(3) The rising edge of the ENCATTIN1 input is detected, and the count value is captured in ENCAnCCR1.

(4) An interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register is output.

35.6.14 Capture Operation between Count Clocks (ENCAnCCR0)

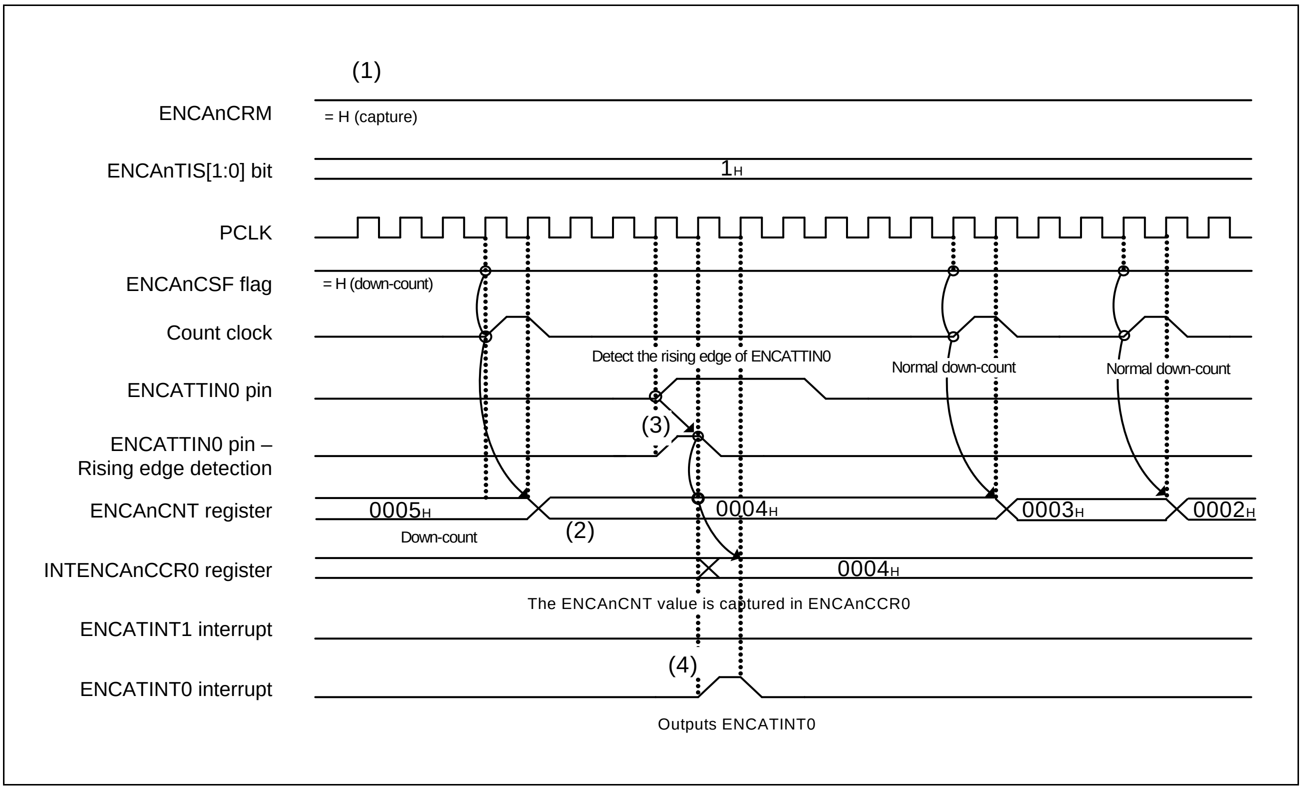

Figure 35.25 Capture Operation between Count Clocks (ENCAnCCR0)

(1) The values are set as follows: ENCAnCRM0 = 1, and ENCAnTIS[1:0] = 01_B.

(2) A down-count is performed.

(3) The rising edge of the ENCATTIN0 input is detected, and the count value is captured in ENCAnCCR0.

(4) An interrupt (ENCATINT0) corresponding to the capture to the ENCAnCCR0 register is output.

35.6.15 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0

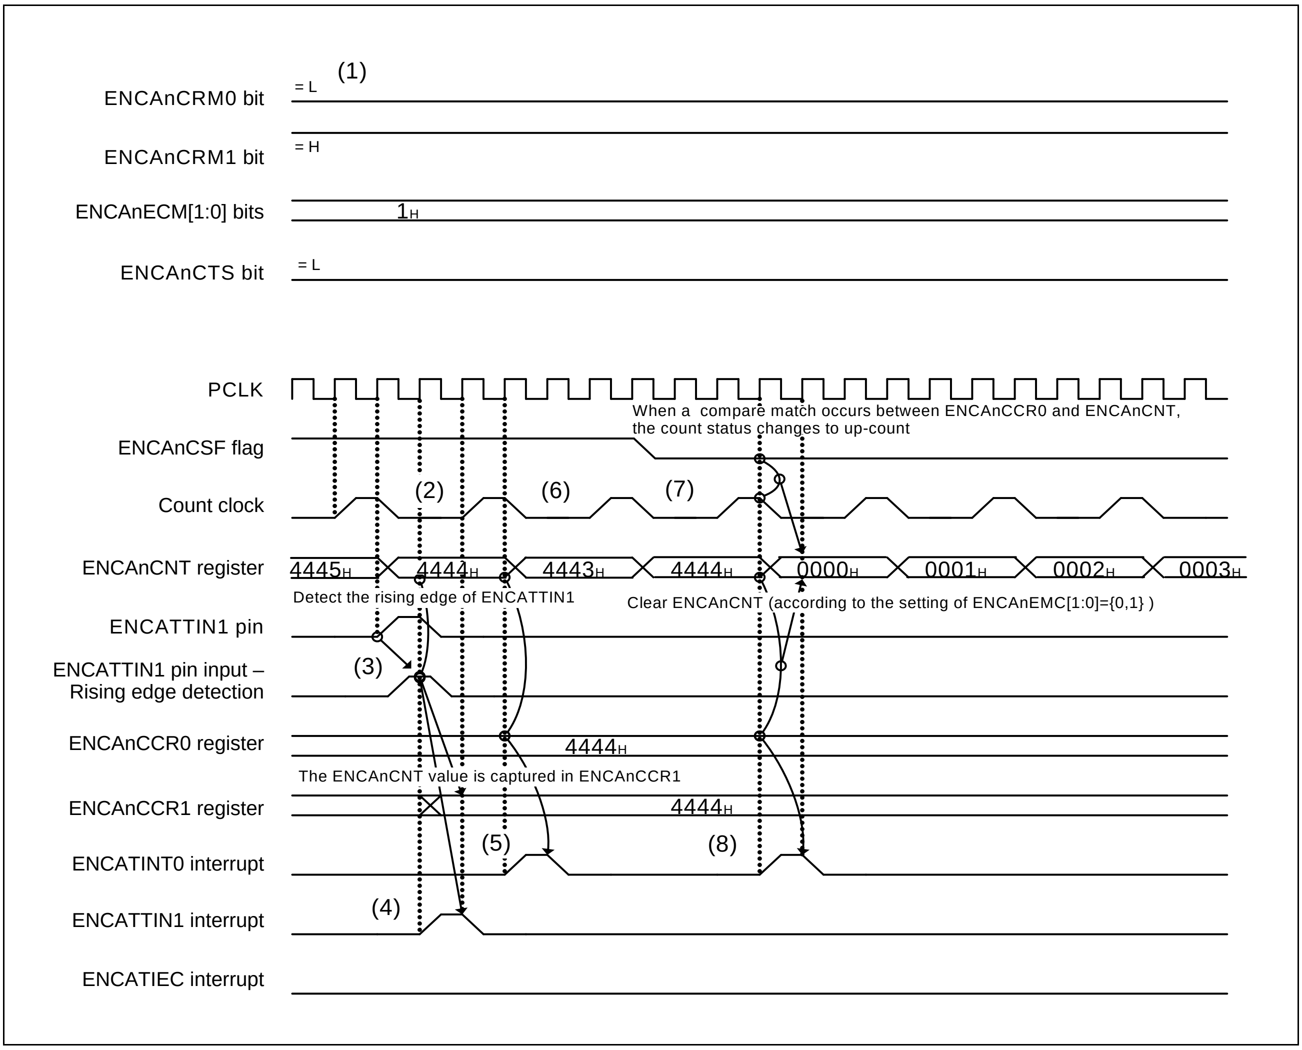

Figure 35.26 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0

(1) The values are set as follows: ENCAnCCR0 = 4444_H, ENCAnCRM0 = 0, ENCAnCRM1 = 1, ENCAnECM[1:0] = 01_B, and ENCAnCTS = 0.

(2) A down-count is performed.

(3) The rising edge of the ENCATTIN1 input is detected, and the ENCAnCNT value (4444_H) is captured in the ENCAnCCR1 register.

(4) An interrupt signal (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register is output.

(5) When a compare match occurs between ENCAnCNT (counted down from 4445_H to 4444_H) and ENCAnCCR0 (4444_H), a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

(6) The count operation changes to up-count.

(7) When ENCAnCNT is counted up from 4443_H to 4444_H, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 (01_B), and the ENCAnCNT value changes to 0000_H.

(8) When ENCAnCNT changes to 4444_H, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

35.6.16 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1

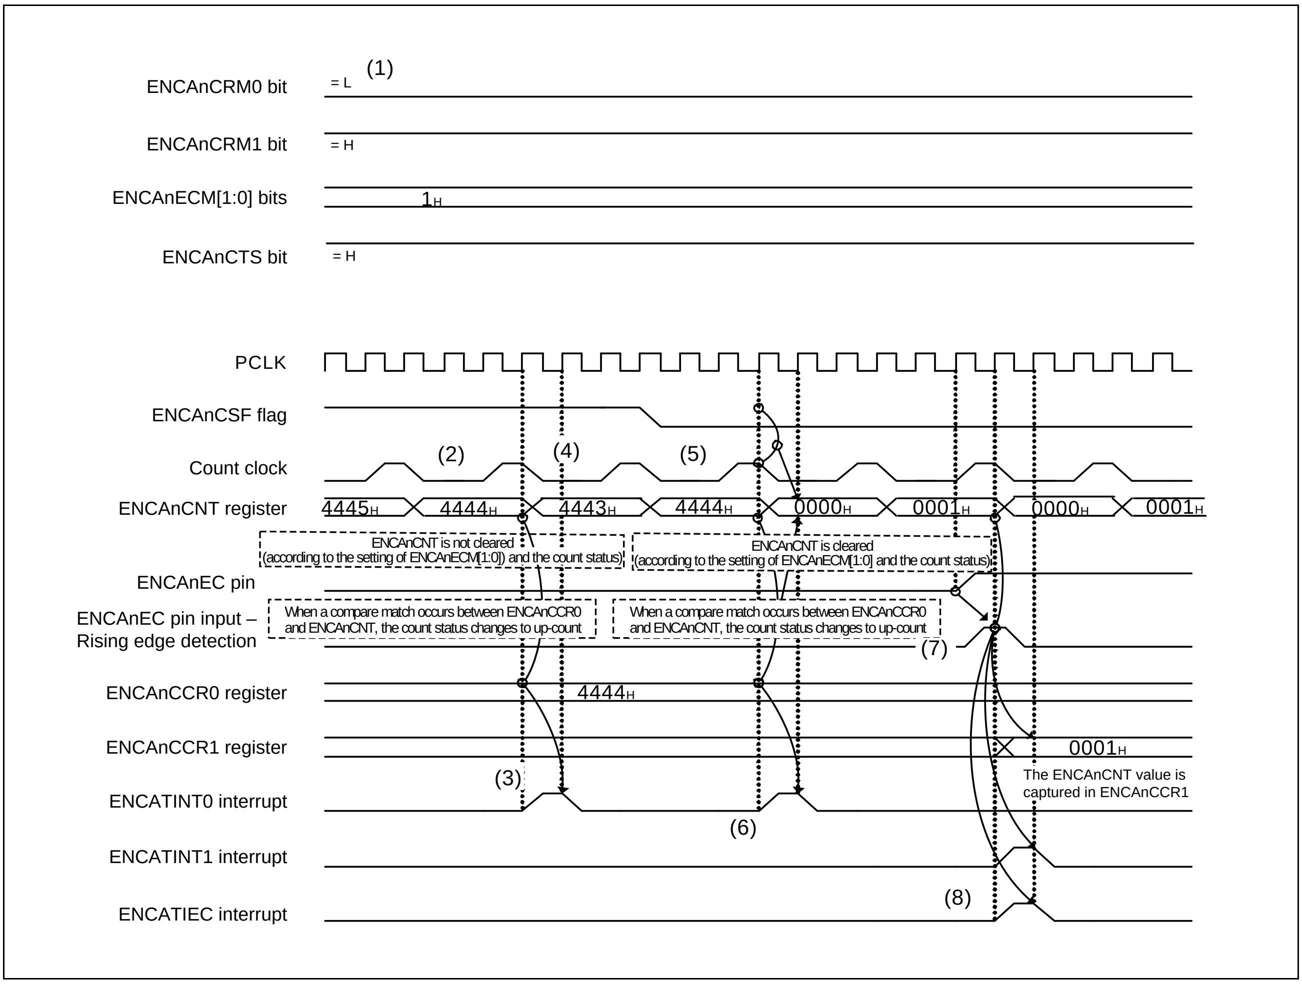

Figure 35.27 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1

(1) The values are set as follows: ENCAnCCR0 = 4444_H, ENCAnCRM0 = 0, ENCAnCRM1 = 1, ENCAnECM[1:0] = 01_B, and ENCAnCTS = 1.

(2) A down-count is performed.

(3) When a compare match occurs between ENCAnCNT (counted down from 4445_H to 4444_H) and ENCAnCCR0 (4444_H), a compare/capture interrupt (ENCATINT0) is output.

(4) The count operation changes to up-count.

(5) When ENCAnCNT is counted up from 4443_H to 4444_H, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 (01_B), and the ENCAnCNT value changes to 0000_H.

(6) When ENCAnCNT changes to 4444_H, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

(7) After the count value is cleared, an up-count is performed, and the count value changes to 0001_H. At this point, the ENCAnCNT value (0001_H) is captured in ENCAnCCR1 by detecting the rising edge of the ENCAnEC signal, and the counter is cleared to 0000_H.

(8) An interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (ENCATIEC) by ENCAnEC are output.

35.6.17 Encoder Operation when Compare Match Clear Control is Disabled

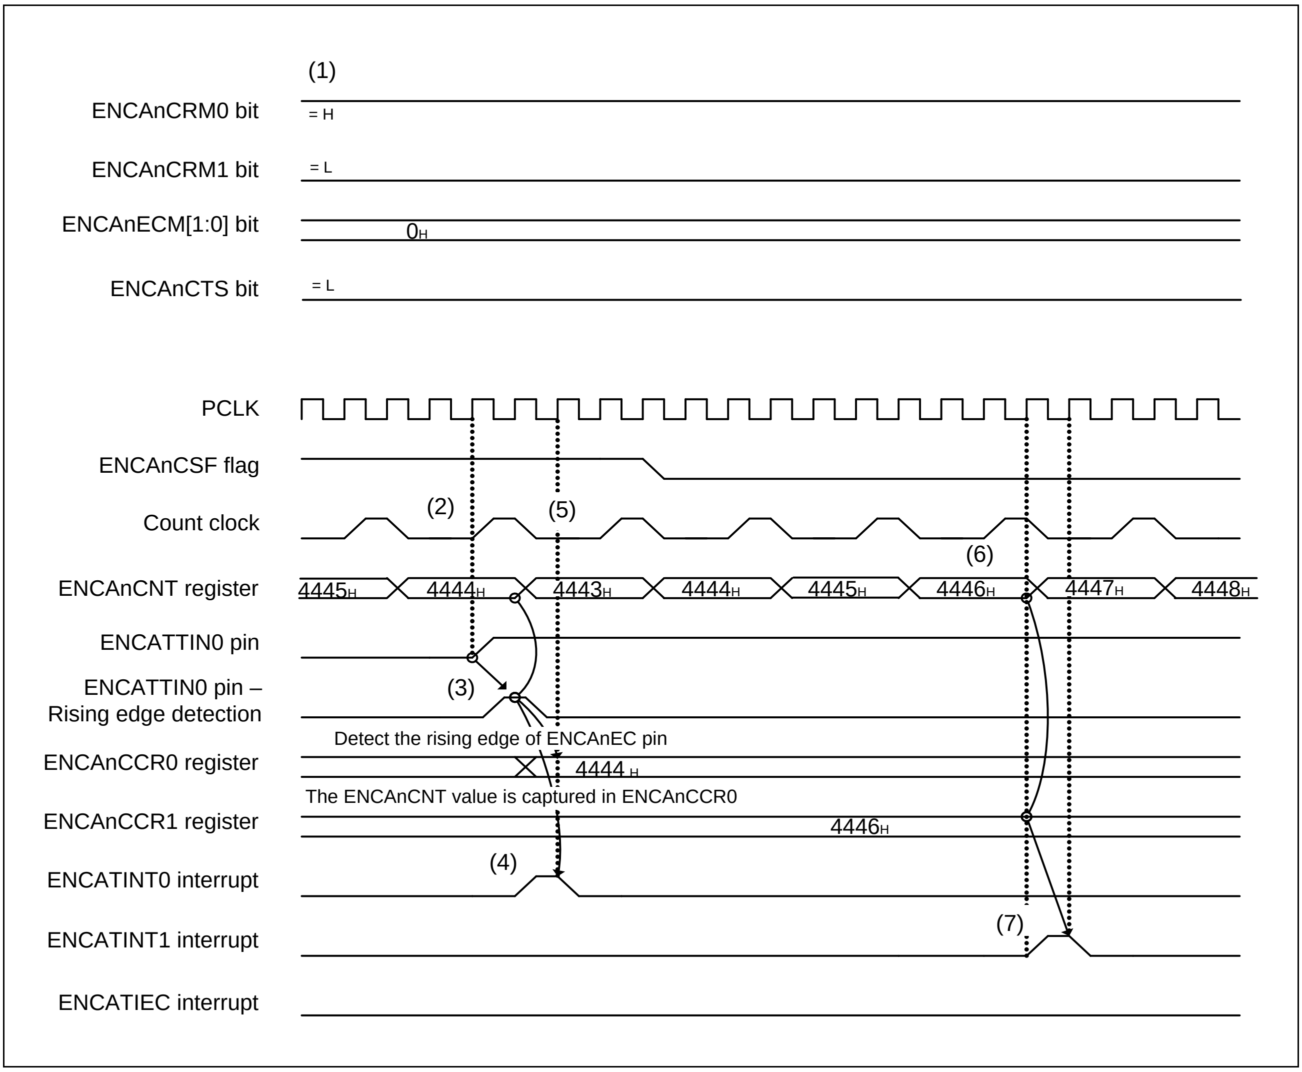

Figure 35.28 Encoder Operation when Compare Match Clear Control is Disabled

(1) The values are set as follows: ENCAnCCR1 = 4446_H, ENCAnCRM0 = 1, ENCAnCRM1 = 0, ENCAnECM[1:0] = 00_B, and ENCAnCTS = 0.

(2) A down-count is performed.

(3) When the rising edge of ENCATTIN0 is detected, the ENCAnCNT value (4444_H) is captured in ENCAnCCR0.

(4) An interrupt signal (ENCATINT0) corresponding to the capture to the ENCAnCCR0 register is output.

(5) The count operation changes to up-count.

(6) When ENCAnCNT changes to 4446_H, a compare match with ENCAnCCR1 is detected.

(7) A compare match interrupt (ENCATINT1) with ENCAnCCR1 is output.

35.6.18 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, ENCAnE1 when ENCAnSCE = 1

35.6.18.1 Accompanying Capture Operation

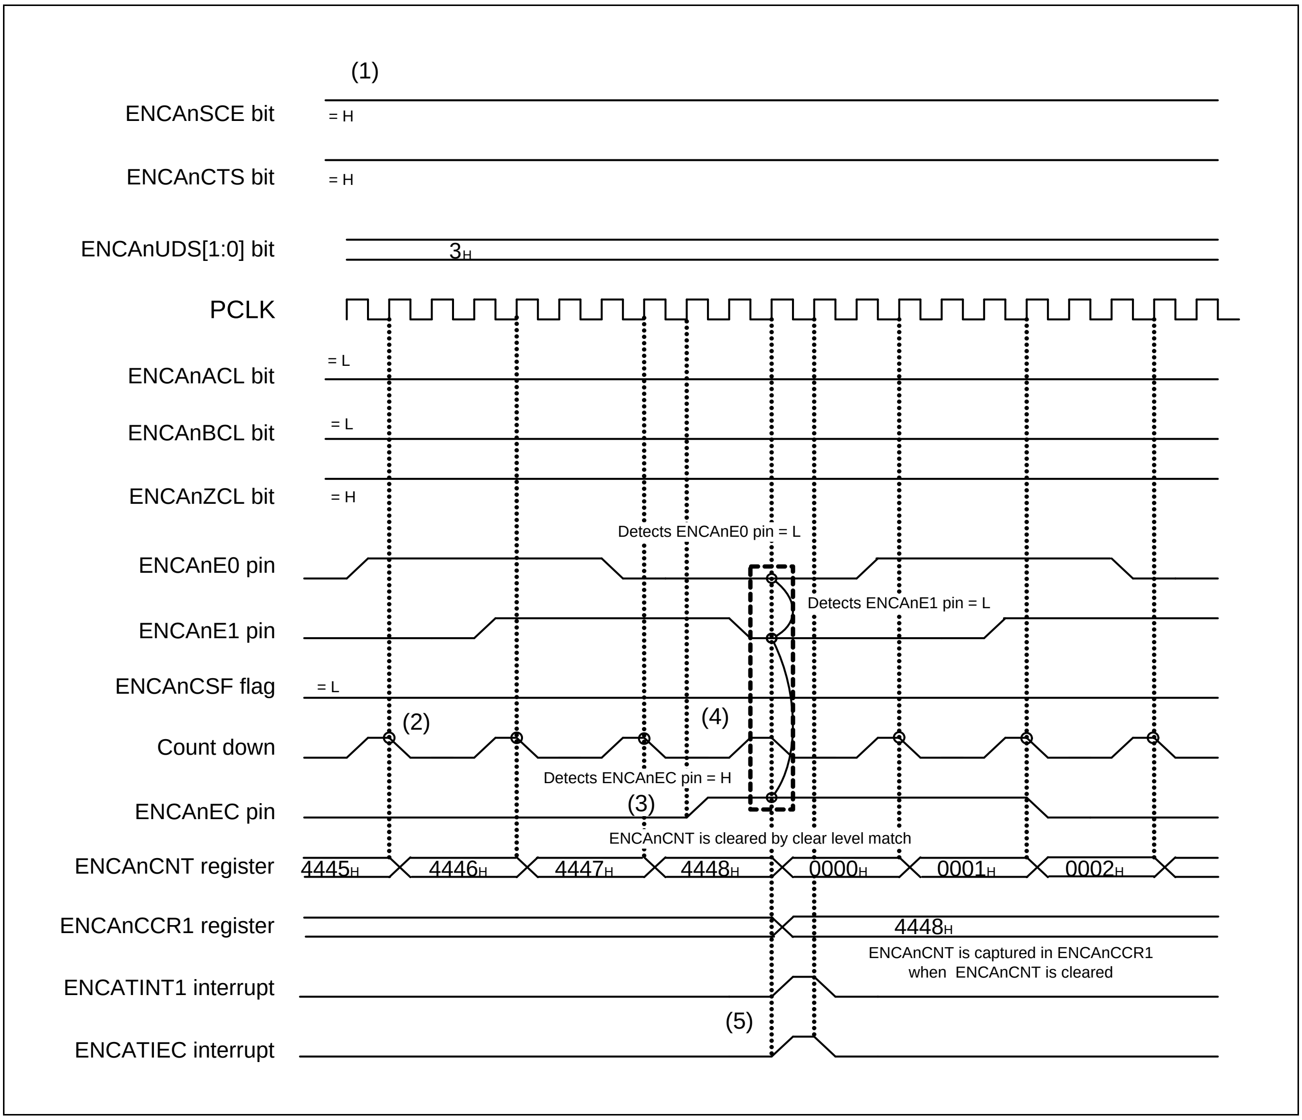

Figure 35.29 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, ENCAnE1 when ENCAnSCE = 1

(1) The values are set as follows: ENCAnSCE = 1, ENCAnCTS = 1, ENCAnUDS[1:0] =11_B, ENCAnACL = 0, ENCAnBCL = 0, and ENCAnZCL = 1.

(2) An up-count is performed.

(3) The count value is not cleared upon the rising edge of ENCAnEC.

(4) When ENCAnE0, ENCAnE1 and ENCAnEC reach the set clear level, the count value is cleared. The count value is captured in ENCAnCCR1 at the time of the clearing.

(5) At the time of the clearing, an interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (ENCATIEC) by ENCAnEC are output.

35.6.18.2 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

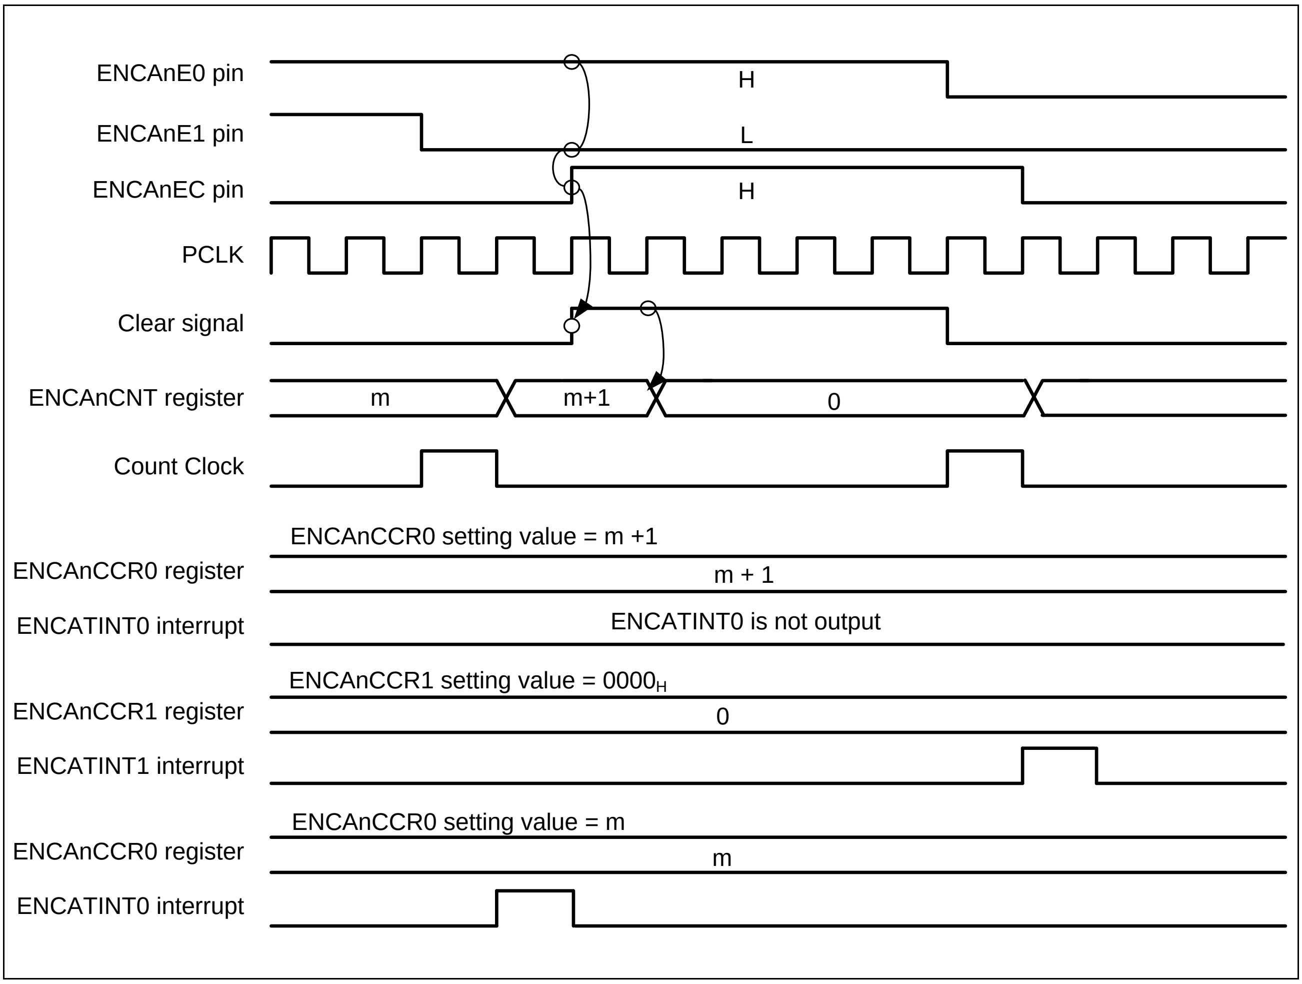

Figure 35.30 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count

35.6.18.3 When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

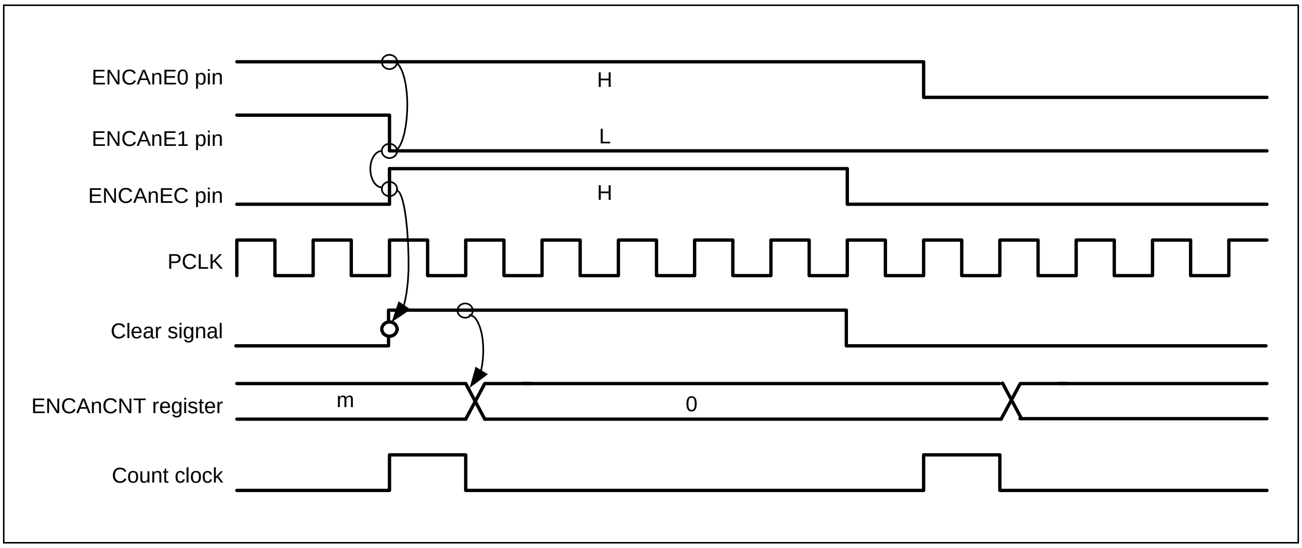

Figure 35.31 Clearing Timing for when the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count

35.6.18.4 When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

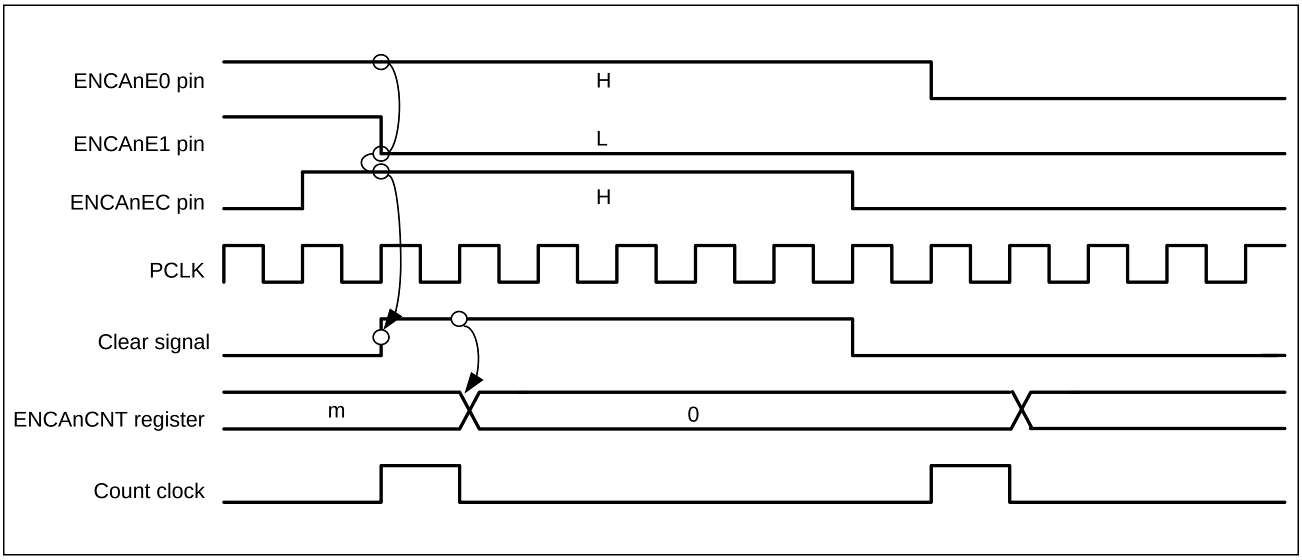

Figure 35.32 Clearing Timing for when the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count

35.6.18.5 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

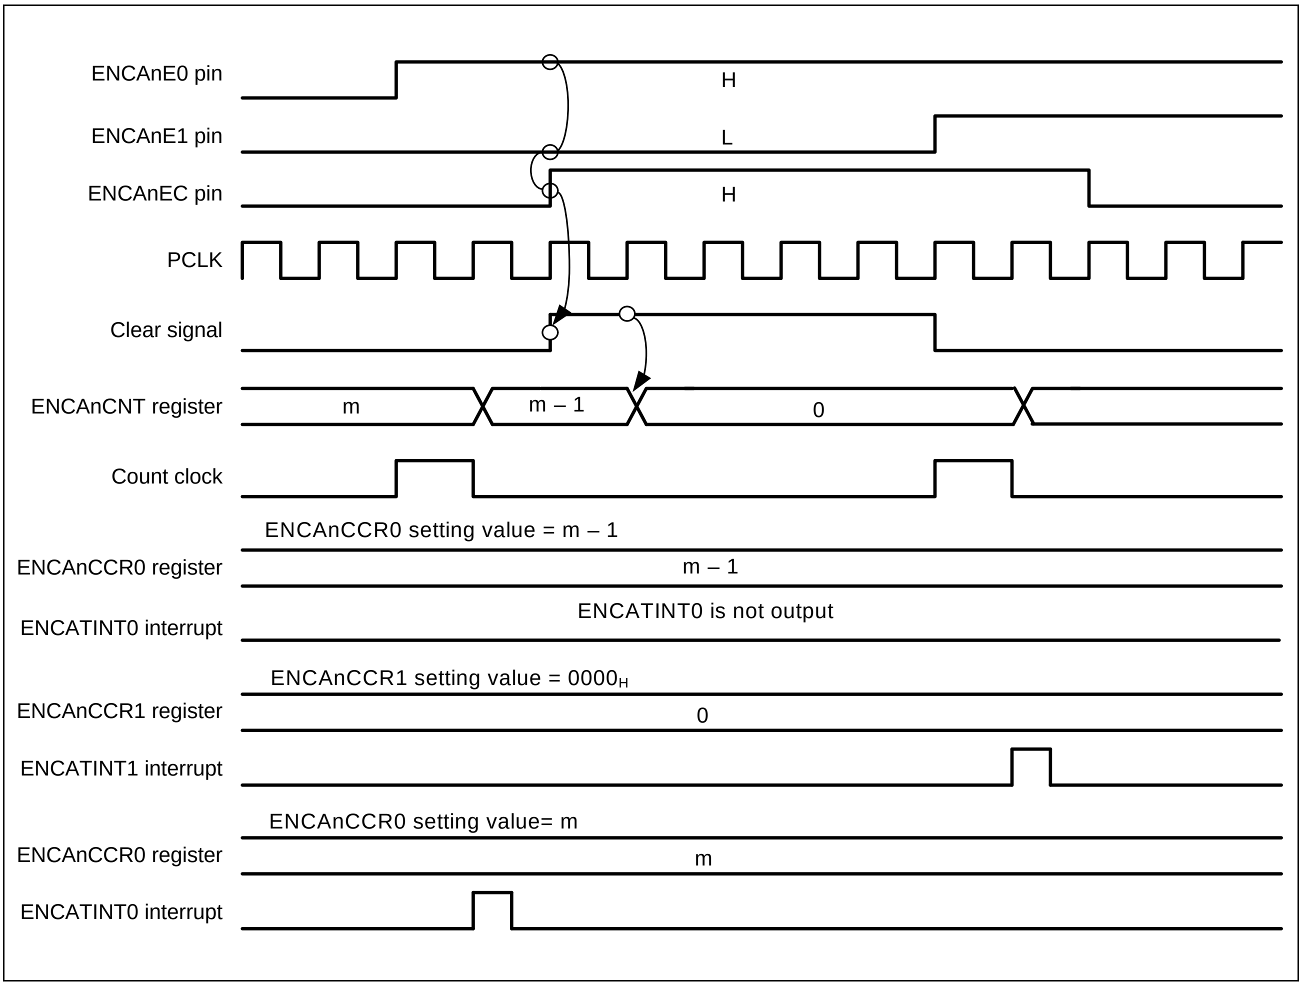

Figure 35.33 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count

35.6.19 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0

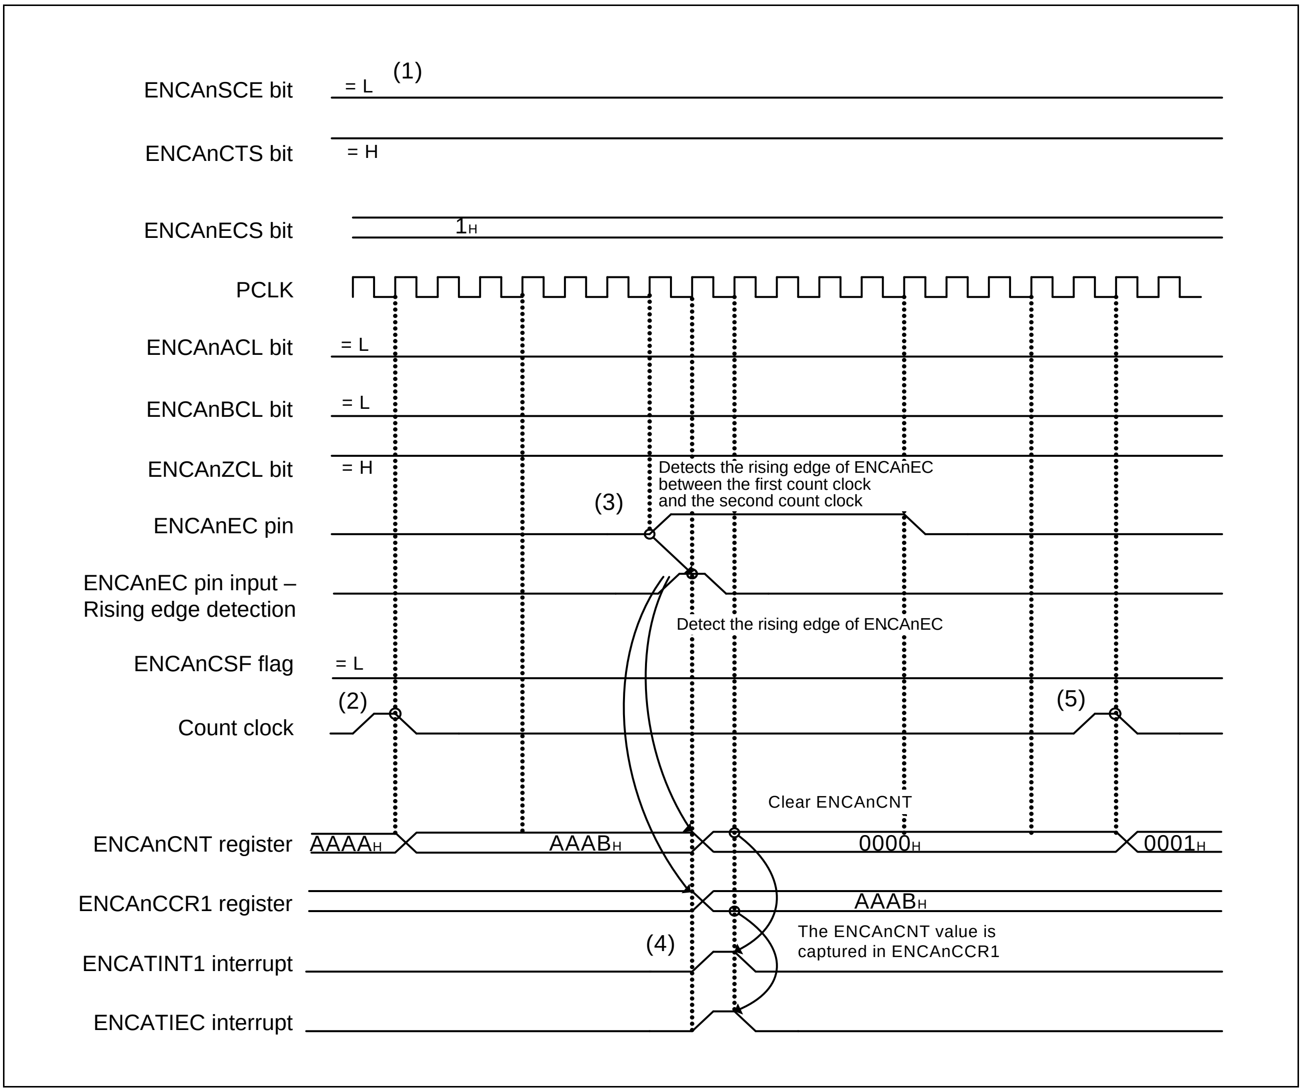

Figure 35.34 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0

(1) The values are set as follows: ENCAnSCE = 0, ENCAnCTS = 1, and ENCAnECS[1:0] = 01_B.

(2) An up-count is performed.

(3) The rising edge of the ENCAnEC input is detected, and the ENCAnCNT value ($AAAB_H$) is captured in the ENCAnCCR1 register. Concurrently, clear operation by ENCAnEC is performed, and ENCAnCNT is cleared to 0000_H.

(4) A capture interrupt 1 (ENCATINT1) to the ENCAnCCR1 register and an encoder clear interrupt (ENCATIEC) by ENCAnEC are output.

(5) After the count value is cleared, an up-count is performed, and the count value changes to 0001_H.

Section 36 Motor Control

This section contains a generic description of the Motor Control.

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the Motor Control.

36.1 Features of RH850/F1KH, RH850/F1KM Motor Control

36.1.1 Number of Units

Motor control function comprises the timer motor control units (TAPA) and the peripheral interconnection unit (PIC) to connect the TAPA unit to peripheral timers, and generates motor control waveforms by using a combination of peripheral timers and A/D converters.

This microcontroller has the following number of TAPA and PIC units.

Table 36.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
TAPA			
Number of Units	1	1	1
Name	TAPAn (n = 0)	TAPAn (n = 0)	TAPAn (n = 0)
PIC			
Number of Units	1	1	1
Name	PIC0	PIC0	PIC0

Table 36.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
TAPA					
Number of Units	1	1	1	1	1
Name	TAPAn (n = 0)	TAPAn (n = 0)	TAPAn (n = 0)	TAPAn (n = 0)	TAPAn (n = 0)
PIC					
Number of Units	1	1	1	1	1
Name	PIC0	PIC0	PIC0	PIC0	PIC0

Table 36.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
TAPA				
Number of Units	1	1	1	1
Name	TAPAn (n = 0)	TAPAn (n = 0)	TAPAn (n = 0)	TAPAn (n = 0)
PIC				
Number of Units	1	1	1	1
Name	PIC0	PIC0	PIC0	PIC0

Table 36.4 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the unit of a timer and A/D converter used by TAPA and the motor control function is identified by the index “n”; for example, TAPAnCTL0 (n = 0) is TAPAn control register 0.
m	The channel of a used timer and A/D converter is identified by the index “m”. For example, the TAUDn channel is described as CHm.
x	The scan group of an A/D converter is identified by the index “x” (x = 1 to 3).
j	The scan trigger number of an A/D converter is identified by the index “j” (j = 0 to 2).

The following table lists the values indicated by the indices of each product.

Table 36.5 Indices of Products (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Indices of Each Product
All Products
m = 0 to 15 (e.g. TAUDn)
x = 1 to 3
j = 0 to 2

36.1.2 Register Base Addresses

Base addresses of TAPAn and PIC0 are listed in the following table.

Register addresses of TAPAn and PIC0 are given as offsets from the base addresses.

Table 36.6 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<TAPA0_base>	FFE9 0000$_H$
<PIC0_base>	FFDD 0000$_H$

36.1.3 Clock Supply

The TAPAn and PIC0 clock supplies are listed in the following table.

Table 36.7 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAPAn	PCLK	CKSCLK_IPERI1	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	Bus clock
PIC0	PCLK	CKSCLK_IPERI1	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	Bus clock

36.1.4 Interrupt Requests

TAPAn interrupt requests are listed in the following table.

Table 36.8 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
TAPA0			
INTTAPA0IPEK0	Peak interrupt 0	16, 116	—
INTTAPA0IVLY0	Valley interrupt 0	17, 117	—

36.1.5 Reset Sources

Reset sources of TAPAn and PIC0 are listed in the following table. TAPAn and PIC0 are initialized by these reset sources.

Table 36.9 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
TAPAn	All reset sources (ISORES)
PIC0	All reset sources (ISORES)

36.1.6 External Input/Output Signals

External output signals of TAPAn and PIC0 are listed below.

Table 36.10 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
PIC0		
TOUTU	Motor control output U phase (positive)	TAPA0UP
TOUTUB	Motor control output U phase (negative)	TAPA0UN
TOUTV	Motor control output V phase (positive)	TAPA0VP
TOUTVB	Motor control output V phase (negative)	TAPA0VN
TOUTW	Motor control output W phase (positive)	TAPA0WP
TOUTWB	Motor control output W phase (negative)	TAPA0WN
TAPA0		
TAPATHASIN	Motor control output Hi-Z control input	TAPA0ESO

CAUTION

For the port pins that are used as TAPA0UP, TAPA0UN, TAPA0VP, TAPA0VN, TAPA0WP and TAPA0WN, set the output driver strength to high (PDSCn_m = 1).

36.1.7 Internal Output Signals

The internal output signals of TAPAn and PIC0 are listed below.

Table 36.11 Internal Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Connected to
TAPA0		
$\overline{\text{TAPATHZOUT0}}$	TAPA0UP/TAPA0UN output buffers Hi-Z control output*1	Port
$\overline{\text{TAPATHZOUT1}}$	TAPA0VP/TAPA0VN output buffers Hi-Z control output*1	Port
$\overline{\text{TAPATHZOUT2}}$	TAPA0WP/TAPA0WN output buffers Hi-Z control output*1	Port
TAPATADOUT0	A/D trigger signal 0 output*2	ADCA0 hardware trigger expansion
TAPATADOUT1	A/D trigger signal 1 output*2	ADCA0 hardware trigger expansion
PIC0		
TAPATHASIN	TAPA0 asynchronous Hi-Z control signal*1,*3	TAPA0
TAPATSIM0	TAUD master channel interrupt signal (TAUD0: INTTAUD0I0,INTTAUD0I2, INTTAUD0I8)	TAPA0
TAPATUDCM0	TAUD master up/down signal (TAUD0: TAUD0UDC0, TAUD0UDC2, TAUD0UDC8)	TAPA0
TAPATCDENS0	TAUD slave 0 match detect*4 (ADCA0 hardware trigger expansion: ADOPA1ADCATTIN00)	TAPA0
TAPATCDENS1	TAUD slave 1match detect*4 (ADCA0 hardware trigger expansion: ADOPA2ADCATTIN00)	TAPA0

Note 1. See **Section 36.4.6, TAPA0 Hi-Z Control Input Selection** for details.

Note 2. These signals can be used to as a trigger source to start the A/D converter. See **Table 38.78, List of A/D Conversion Hardware Triggers**.

Note 3. This input signal is passed through a noise filter. See **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector**, **Section 2C.12, Noise Filter & Edge/Level Detector**, **Section 2A.13, Description of Port Noise Filter & Edge/Level Detection**, **Section 2B.13, Description of Port Noise Filter & Edge/Level Detection**, and **Section 2C.13, Description of Port Noise Filter & Edge/Level Detection**.

Note 4. These signals are selected by the H/W trigger selection bit of the ADCA0 A/D converter. See **Table 38.78, List of A/D Conversion Hardware Triggers**.

36.2 Overview

36.2.1 Functional Overview

The motor control function provides the following functions by combining the motor control unit (TAPA) and Timer Array Unit D (TAUDn) or A/D (ADCAn):

- Asynchronous Hi-Z control function
  Hi-Z control for TAUDn output can be performed by using pin input or error signals.
- Interrupt signal output function
  Request signals for two types of interrupts, peak interrupts and valley interrupts, can be output by the INTn signals output by TAUDn.
- A/D conversion start trigger selection function
  An A/D conversion start trigger can be output by the INTn signals output by TAUDn.

Additionally, the motor control function provides also the following functions by combining the motor control unit (TAPA) and the peripheral interconnection (PIC):

- Timer simultaneous start trigger function
  The respective channels of TAUD0 and TAUJ1, and the ENCAn timer can be started simultaneously.
- Trigger and pulse width measuring function
  Measurement of trigger periods can be performed by inputting ENCAn interrupt signals to TAUDn or TAUJ1.
- A/D trigger encoder capture function
  The value of the ENCAn counter can be captured at the A/D conversion start trigger timing.
- Three-phase PWM output with dead time / High-accuracy triangle PWM output with dead time
  Three-phase PWM output with dead time can be performed by TAUDn.
- Delay pulse output with dead time
  Delay pulses (with dead time) for the cycle timing can be output.

36.2.2 Basic Structure of Motor Control

The peripheral block configuration of the motor control function is shown below.

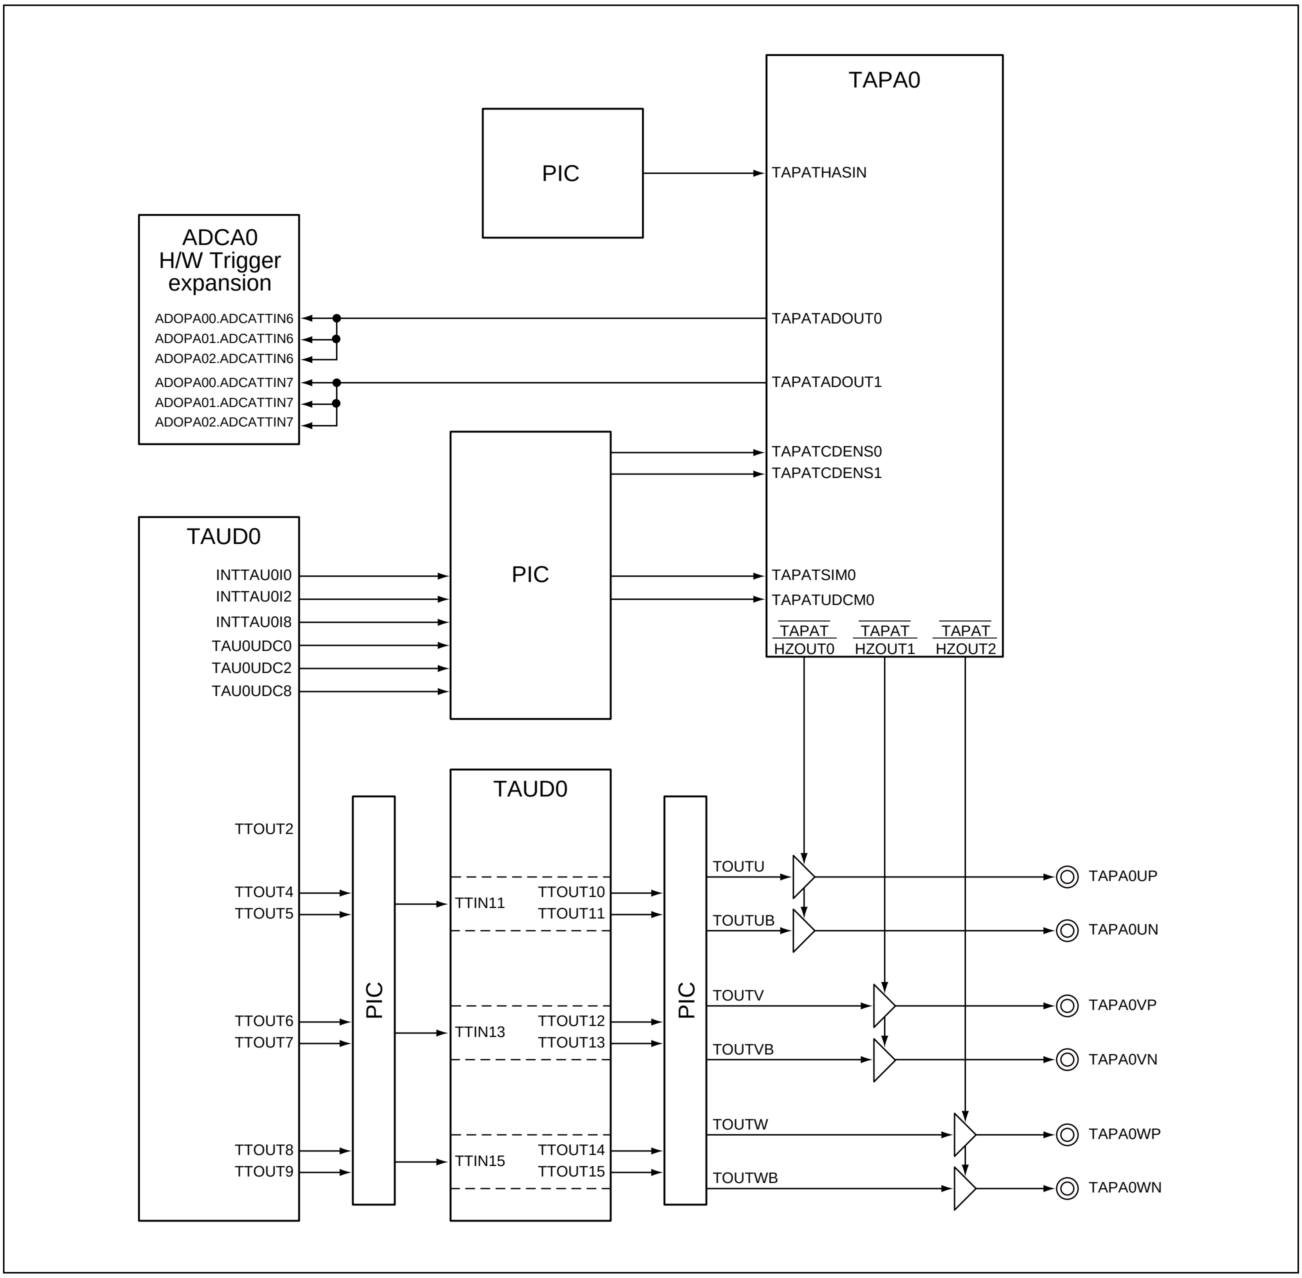

Figure 36.1 Configuration of Motor Control

TAUDn and PIC are used to generate the motor control output signals (three-phase PWM output signals with dead time).

The timer control unit (TAPA) performs Hi-Z control for the motor control output.

Additionally, PIC can provide functions specific to the motor by combining respective channels of TAUDn and TAUJ1, ENCAn, and TAPA.

36.2.3 Block Diagram

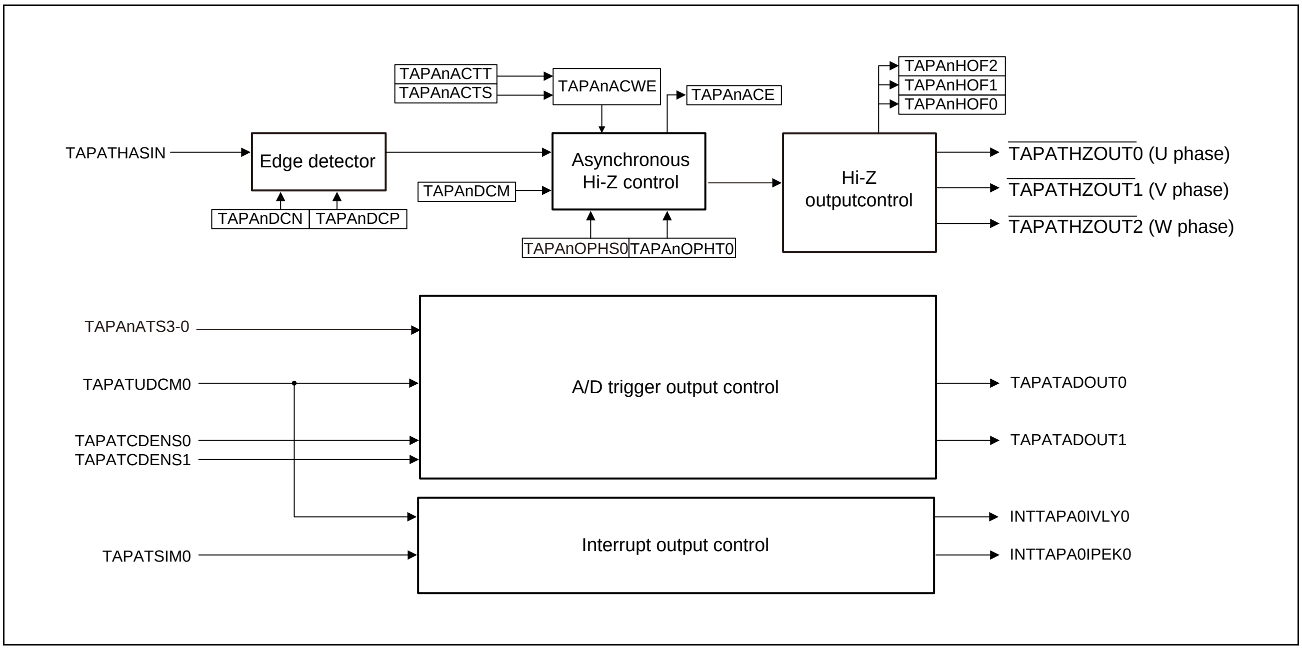

Figure 36.2 TAPA Peripheral Block Diagram

NOTE

For the PIC peripheral block diagram, see the respective section describing each function.

36.2.4 Definition of Terms

Peak and valley interrupts - Peak and valley of timer counter

In this document, the period from a TAUD counting-up status to generation of INT from the master channel is defined as a peak period, and this INT is defined as a peak interrupt.

In contrast, the period from a TAUD counting-down status to generation of INT from the master channel is defined as a valley period, and this INT is defined as a valley interrupt.

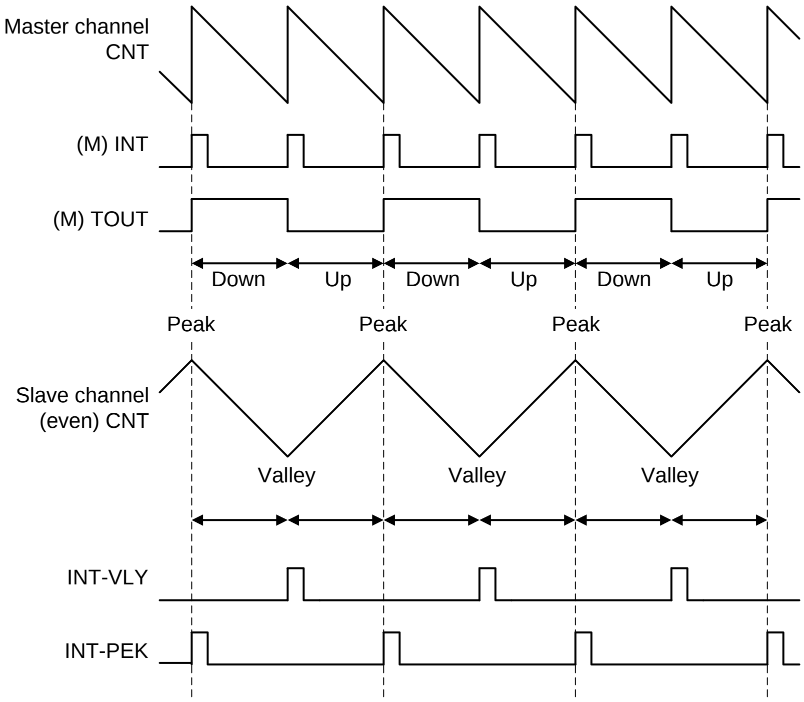

Figure 36.3 Peak and Valley Interrupts

36.3 Registers

36.3.1 List of Registers

The registers of TAPAn and PIC0 are listed in the following table.

For details about <TAPAn_base> and <PIC0_base>, see **Section 36.1.2, Register Base Addresses**.

Table 36.12 List of Registers

Module Name	Register Name	Symbol	Address
TAPAn	TAPA control register 0	TAPAnCTL0	<TAPAn_base> + 20_H
	TAPA control register 1	TAPAnCTL1	<TAPAn_base> + 24_H
	TAPA flag register	TAPAnFLG	<TAPAn_base> + 00_H
	TAPA asynchronous Hi-Z control write enable register	TAPAnACWE	<TAPAn_base> + 04_H
	TAPA asynchronous Hi-Z control start trigger register	TAPAnACTS	<TAPAn_base> + 08_H
	TAPA asynchronous Hi-Z control stop trigger register	TAPAnACTT	<TAPAn_base> + $0C_H$
	TAPA Hi-Z start trigger register	TAPAnOPHS	<TAPAn_base> + 14_H
	TAPA Hi-Z stop trigger register	TAPAnOPHT	<TAPAn_base> + 18_H
	TAPA emulation register	TAPAnEMU	<TAPAn_base> + 28_H
PIC0	Simultaneous start trigger control register	PIC0SST	<PIC0_base> + 04_H
	Simultaneous start control register 0	PIC0SSER0	<PIC0_base> + 10_H
	Simultaneous start control register 2	PIC0SSER2	<PIC0_base> + 18_H
	Hi-Z output control register 0	PIC0HIZCEN0	<PIC0_base> + 80_H
	A/D conversion trigger output control register 400	PIC0ADTEN400	<PIC0_base> + 90_H
	A/D conversion trigger output control register 401	PIC0ADTEN401	<PIC0_base> + 94_H
	A/D conversion trigger output control register 402	PIC0ADTEN402	<PIC0_base> + 98_H
	Timer I/O control register 200	PIC0REG200	<PIC0_base> + $C0_H$
	Timer I/O control register 201	PIC0REG201	<PIC0_base> + $C4_H$
	Timer I/O control register 202	PIC0REG202	<PIC0_base> + $C8_H$
	Timer I/O control register 203	PIC0REG203	<PIC0_base> + CC_H
	Timer I/O control register 30	PIC0REG30	<PIC0_base> + $E8_H$
	Timer I/O control register 31	PIC0REG31	<PIC0_base> + EC_H

NOTE

For details about PIC-related registers, see the respective section describing each function.

36.3.2 TAPAnCTL0 — TAPA Control Register 0

This register is used to set up the asynchronous Hi-Z control function.

The values of this register can be rewritten only when TAPAnFLG.TAPAnACE is 0 and TAUDnTEm for the corresponding TAUD's master channel is 0.

Access: This register can be read or written in 16-bit units.

Address: <TAPAn_base> + 20_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

36.3.3 TAPAnCTL1 — TAPA Control Register 1

This register is used to specify the A/D conversion trigger.

Access: This register can be read or written in 8-bit units.

Address: <TAPAn_base> + 24_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAPAnATS3	TAPAnATS2	TAPAnATS1	TAPAnATS0
Value after reset	0	0	0	0	0	0	0	0

Table 36.14 TAPAnCTL1 Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2	TAPAnATS3, TAPAnATS2	A/D Conversion Trigger 1 Selection These are control bits that specify A/D conversion trigger output 1 (TAPATADOUT1).

TAPAn ATS3	TAPAn ATS2	Description
0	0	INT signal while the triangle wave is falling (counting down)
0	1	INT signal while the triangle wave is rising (counting up)
1	0	INT signal while the triangle wave is rising (counting up) or falling (counting down)
1	1	INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt INTTAPA0IVLY0 signal

Bit Position	Bit Name	Function
1, 0	TAPAnATS1, TAPAnATS0	A/D Conversion Trigger 0 Selection These are control bits that specify the A/D conversion trigger output 0 (TAPATADOUT0).

TAPAn ATS1	TAPAn ATS0	Description
0	0	INT signal while the triangle wave is falling (counting down)
0	1	INT signal while the triangle wave is rising (counting up)
1	0	INT signal while the triangle wave is rising (counting up) or falling (counting down)
1	1	INT signal and valley interrupt INTTAPA0IVLY0 signal while the triangle wave is rising (counting up) or falling (counting down)

36.3.4 TAPAnFLG — TAPA Flag Register

This flag register is for asynchronous Hi-Z control.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAPAn_base> + 00_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TAPAn HOF2	TAPAn HOF1	TAPAn HOF0	—	—	—	—	—	—	—	TAPAn ACE

Table 36.15 TAPAnFLG Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned.
10	TAPAnHOF2	W phase Hi-Z Control Monitor This bit is used to monitor the Hi-Z control status. 0: The present output of TAPAnTHZOUT2 is high level 1: The present output TAPAnTHZOUT2 is low level.
9	TAPAnHOF1	V phase Hi-Z Control Monitor This bit is used to monitor the Hi-Z control status. 0: The present output of TAPAnTHZOUT1 is high level 1: The present output TAPAnTHZOUT1 is low level.
8	TAPAnHOF0	U phase Hi-Z Control Monitor This bit is used to monitor the Hi-Z control status. 0: The present output of TAPAnTHZOUT0 is high level 1: The present output TAPAnTHZOUT0 is low level.
7 to 1	Reserved	When read, the value after reset is returned.
0	TAPAnACE	Asynchronous Hi-Z Control Enable 0: Indicates that the asynchronous Hi-Z control is stopped. 1: Indicates that the asynchronous Hi-Z control is enabled. The conditions for setting or clearing this bit are as follows: Clear condition: Writing 1 to TAPAnACTT while TAPAnACWE = 1 Set condition: Writing 1 to TAPAnACTS while TAPAnACWE = 1

36.3.5 TAPAnACWE — TAPA Asynchronous Hi-Z Control Write Enable Register

This register is used to enable writing for asynchronous Hi-Z control.

Access: This register can be read or written in 8-bit units.

Address: <TAPAn_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnACWE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 36.16 TAPAnACWE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TAPAnACWE	Asynchronous Control Write Enable This is a write enable bit for asynchronous Hi-Z control. After 1 is written, this bit is automatically cleared to 0 by writing 1 to TAPAnACTS and TAPAnACTT. 0: Disables writing to TAPAnACTS and TAPAnACTT. 1: Enables writing to TAPAnACTS and TAPAnACTT.

36.3.6 TAPAnACTS — TAPA Asynchronous Hi-Z Control Start Trigger Register

This register is used to enable the start trigger for asynchronous Hi-Z control.

Access: This register is a write-only register that can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnACTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.17 TAPAnACTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnACTS	Asynchronous Hi-Z Control Start Trigger This bit enables the start trigger for asynchronous Hi-Z control. The setting of this bit is valid only when TAPAnACWE = 1. 0: Writing 0 is ignored (no function). 1: Enables asynchronous Hi-Z control when TAPAnACWE is 1.

36.3.7 TAPAnACTT — TAPA Asynchronous Hi-Z Control Stop Trigger Register

This bit enables the stop trigger for asynchronous Hi-Z control.

Access: This register is a write-only register that can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnACTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.18 TAPAnACTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnACTT	Asynchronous Hi-Z Control Stop Trigger This bit enables the stop trigger for asynchronous Hi-Z control. The setting of this bit is valid only when TAPAnACWE = 1. 0: Writing 0 is ignored (no function). 1: Disables asynchronous Hi-Z control when TAPAnACWE is 1.

36.3.8 TAPAnOPHS — TAPA Hi-Z Start Trigger Register

This software trigger register is used to start Hi-Z control for motor control output pins.

Access: This register is a write-only register that can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnOPHS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.19 TAPAnOPHS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnOPHS0	Hi-Z Control Start Trigger This bit starts Hi-Z control for motor control output pins. 0: Writing 0 is ignored (no function). 1: Starts Hi-Z control.

36.3.9 TAPAnOPHT — TAPA Hi-Z Stop Trigger Register

This software trigger register is used to stop Hi-Z control for motor control output pins.

Access: This register is a write-only register that can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnOPHT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.20 TAPAnOPHT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnOPHT0	Hi-Z Control Stop Trigger This bit stops Hi-Z control for motor control output pins. 0: Writing 0 is ignored (no function). 1: Stops Hi-Z control. Whether the setting of this bit is valid or invalid depends on the setting of TAPAnCTL0.TAPAnDCM.

36.3.10 TAPAnEMU — TAPA Emulation Register

This register controls SVSTOP for emulation.

Access: This register can be read or written in 8-bit units. (when EPC.SVSTOP = 0, rewritten only)

Address: <TAPAn_base> + 28_H

Value after reset: Reading this register returns always 00_H.

Bit	7	6	5	4	3	2	1	0
	TAPAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 36.21 TAPAnEMU Register Contents

Bit Position	Bit Name	Function
7	TAPAnSVSDIS	This bit is used to control disabling of SVSTOP. 0: SVSTOP is valid. (Sets Hi-Z control output to low level when SVSTOP = 1 is input). 1: SVSTOP is invalid. (Hi-Z control output level does not change according to the level of SVSTOP input).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

36.4 Asynchronous Hi-Z Control Function

If the operation of the timer motor control function controlled by the MCU becomes abnormal, the rotation of the external motor also becomes abnormal. This function can forcibly set the motor control output to the Hi-Z state upon detection of abnormal motor operation, independent of MCU control.

36.4.1 Overview

This function forcibly stops TAPAn output through asynchronous Hi-Z control.

- When the TAPATHASIN signal becomes active, the levels of the motor control output pins are set to Hi-Z, and motor control output is forcibly stopped.
- Motor control output in a Hi-Z state can be resumed by writing the Hi-Z stop trigger register (TAPAnOPHT0).
- The Hi-Z state of motor control output can also be specified by writing the Hi-Z control start trigger register (TAPAnOPHS).
- Setting PIC can enable or disable Hi-Z control input when an error occurs.

36.4.2 System Configuration Example

A system configuration example is shown below, where an external error detection signal (the TAPA0ESO signal) is used for Hi-Z control of the motor control outputs (TAPA0UP / TAPA0UN / TAPA0VP / TAPA0VN / TAPA0WP / TAPA0WN).

When valid edges of the external error detection signal are detected, the level of the motor control outputs is set to Hi-Z.

Because the microcontroller might freeze when an error occurs, external error detection signals are continuously processed so that the motor control timer outputs can be set to Hi-Z even if no clock is supplied.

Note that an error is detected only when the valid edge of the error detection signal is detected. Therefore, no error is detected if the output level is fixed and the signal level does not change.

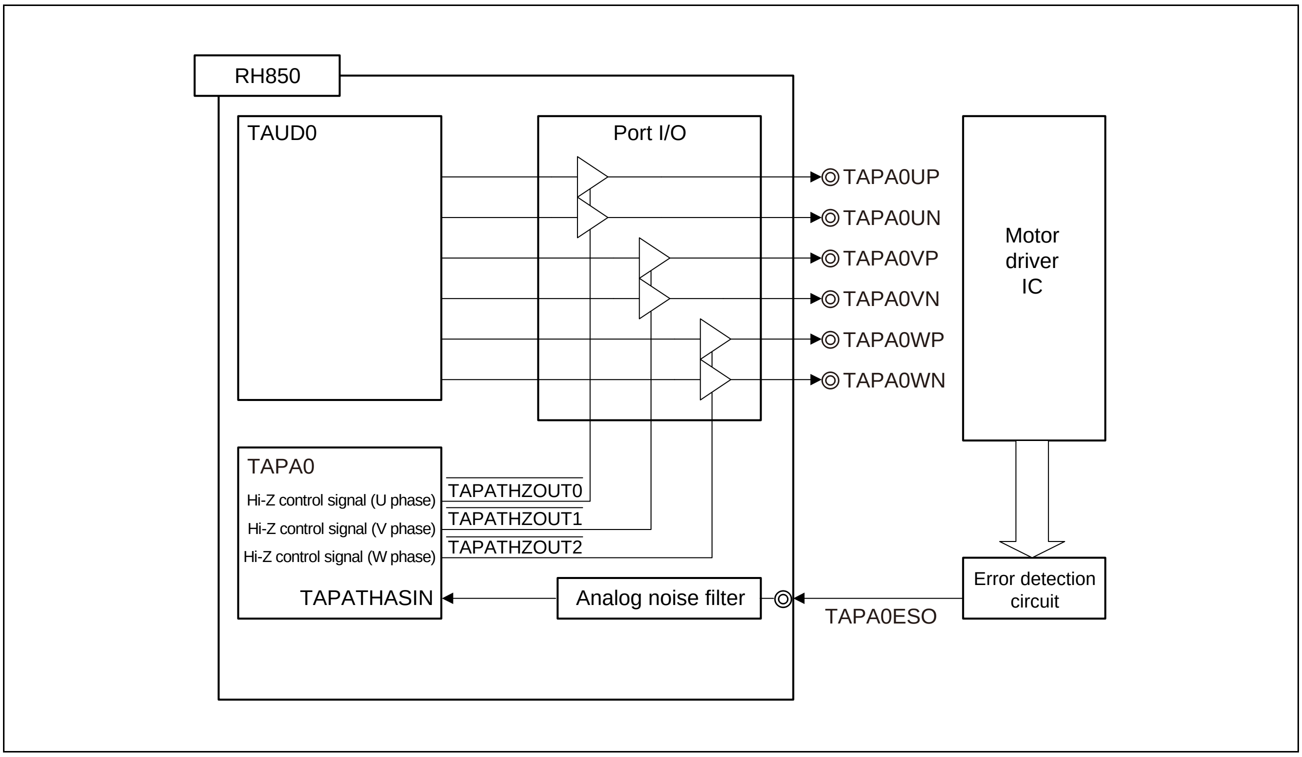

Figure 36.4 System Configuration Example of Asynchronous Hi-Z Control for Pin Input

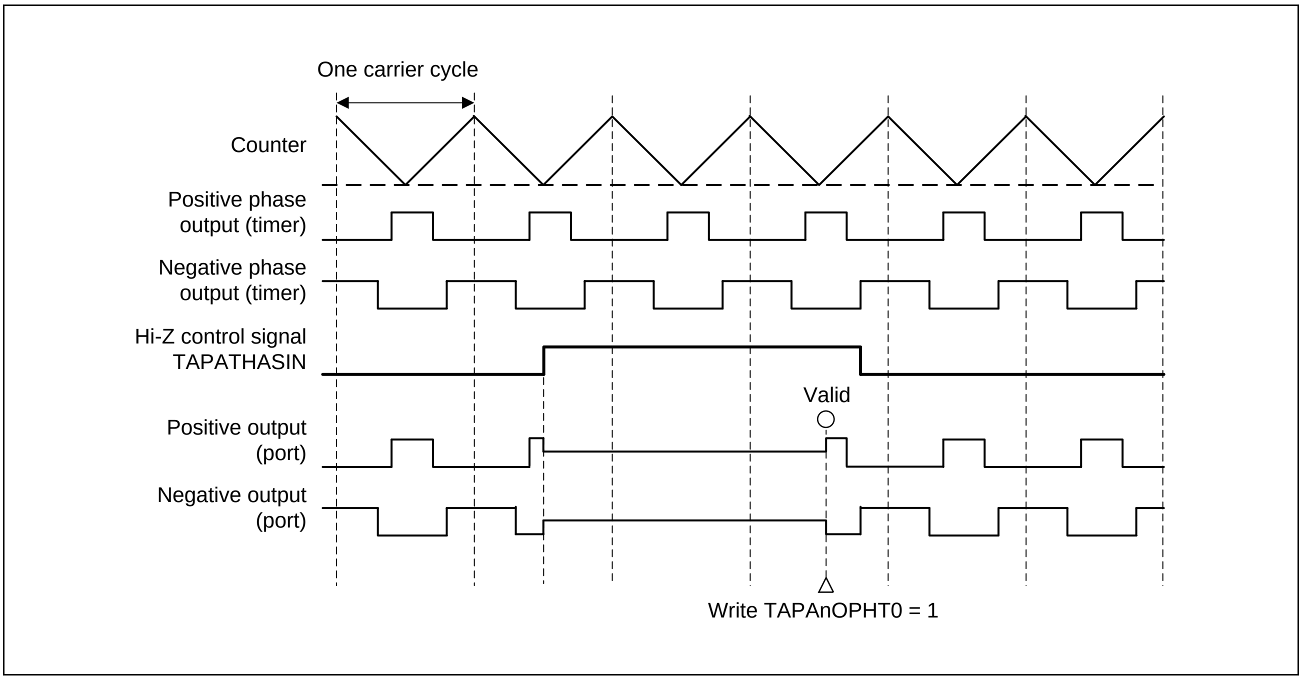
36.4.3 Basic Operation

Hi-Z control for motor control output pins can be started as follows:

- Detecting the valid edge of asynchronous Hi-Z control signal (TAPATHASIN)
- Setting the start trigger bit TAPAnOPHS.TAPAnOPHS0 of the Hi-Z control signal

The levels of the motor control output pins are set to Hi-Z until the stop trigger bit of the Hi-Z control signal (TAPAnOPHT.TAPAnOPHT0) is set. Note that whether the setting of TAPAnOPTH0 is valid or invalid depends on the setting of TAPAnCTL0.TAPAnDCM.

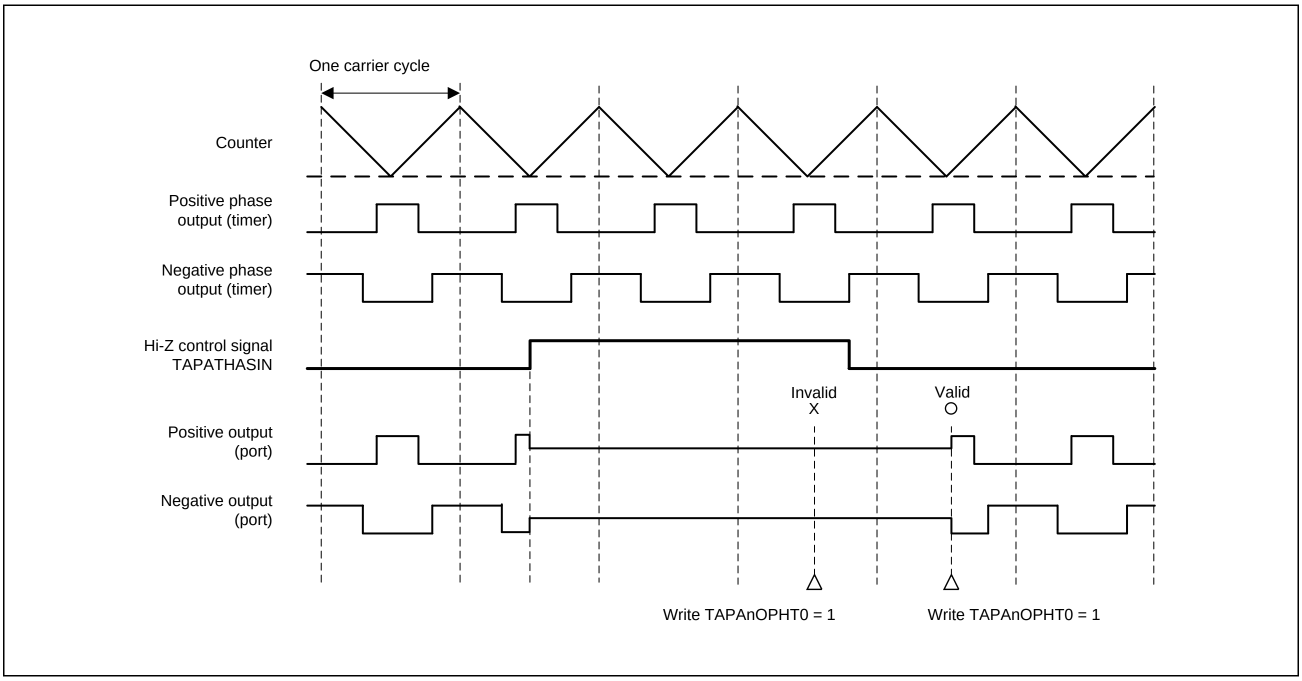
(1) Operation when TAPAnCTL0.TAPAnDCM = 0, TAPAnDCP = 1, and TAPAnDCN = 0



The motor control outputs are forcibly stopped (Hi-Z output) when the valid edge of TAPATHASIN is detected.

The motor control outputs restart when 1 is written to TAPAnOPHT.TAPAnOPHT0, regardless of the level of TAPATHASIN.

(2) Operation when TAPAnCTL0.TAPAnDCM = 1, TAPAnDCP = 1, and TAPAnDCN = 0



The motor control outputs are forcibly stopped (Hi-Z output) when the valid edge of TAPATHASIN is detected.

Writing 1 to the stop trigger bit (TAPAnOPHT.TAPAnOPHT0) of the Hi-Z control signal is ignored while TAPATHASIN is active (high level because TAPAnCTL0.TAPAnDCP is 1).

The motor control outputs restart when 1 is written to TAPAnOPHT.TAPAnOPHT0 after TAPATHASIN becomes inactive (low level because TAPAnCTL0.TAPAnDCP is 1).

36.4.4 Asynchronous Hi-Z Control Using Software Trigger

Hi-Z control for motor control output is possible by using the Hi-Z control start trigger bit TAPAnOPHS.TAPAnOPHS0 and Hi-Z control stop trigger bit TAPAnOPHT.TAPAnOPHT0.

(1) Function of Hi-Z control start trigger bit TAPAnOPHS.TAPAnOPHS0

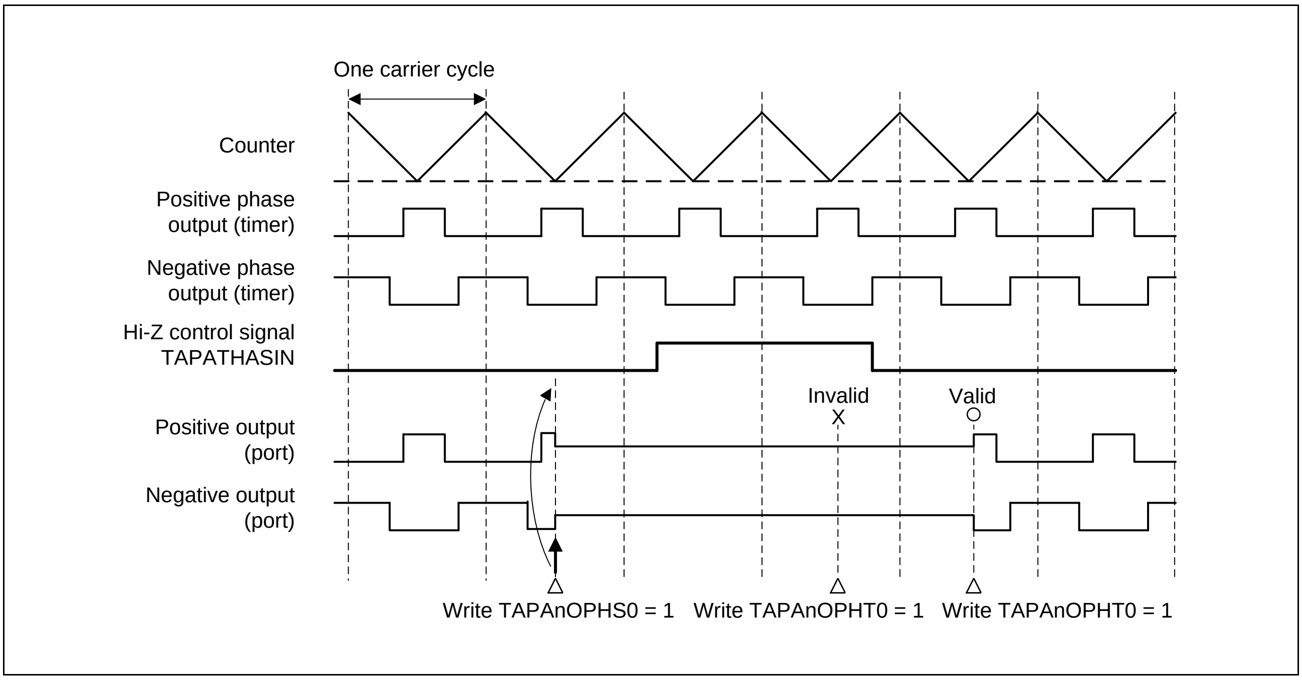
TAPAnDCM	Function
0/1	Writing 1 to TAPAnOPHS0 starts Hi-Z control and forcibly stops the motor control output (Hi-Z output).

(2) Function of Hi-Z control stop trigger bit TAPAnOPHT.TAPAnOPHT0

Whether the Hi-Z control stop trigger is valid or invalid depends on the conditions below:

TAPAnDCM	Function
0	Writing 1 to TAPAnOPHT0 stops Hi-Z control and restarts motor control output.
1	If TAPATHASIN is inactive, writing 1 to TAPAnOPHT0 stops Hi-Z control and restarts motor control output. If TAPATHASIN is active, writing 1 to TAPAnOPHT0 is ignored.

(3) Operation when TAPAnCTL0.TAPAnDCM = 1, TAPAnDCP = 1, and TAPAnDCN = 0



The motor control output (Hi-Z output) is forcibly stopped when 1 is written to TAPAnOPHS0.

After that, the level of the motor control output remains Hi-Z even if the rising edge of TAPATHASIN is detected.

Writing to TAPAnOPHT0 is ignored while TAPATHASIN is active (high level because TAPAnDCN is 0 and TAPAnDCP is 1).

After detection of the falling edge of TAPATHASIN, the motor control output restarts when 1 is written to TAPAnOPHT0 while TAPATHASIN is inactive (low level because TAPAnDCN is 0 and TAPAnDCP is 1).

36.4.5 Operating Procedure

The operating procedure for the asynchronous input Hi-Z control function is shown below:

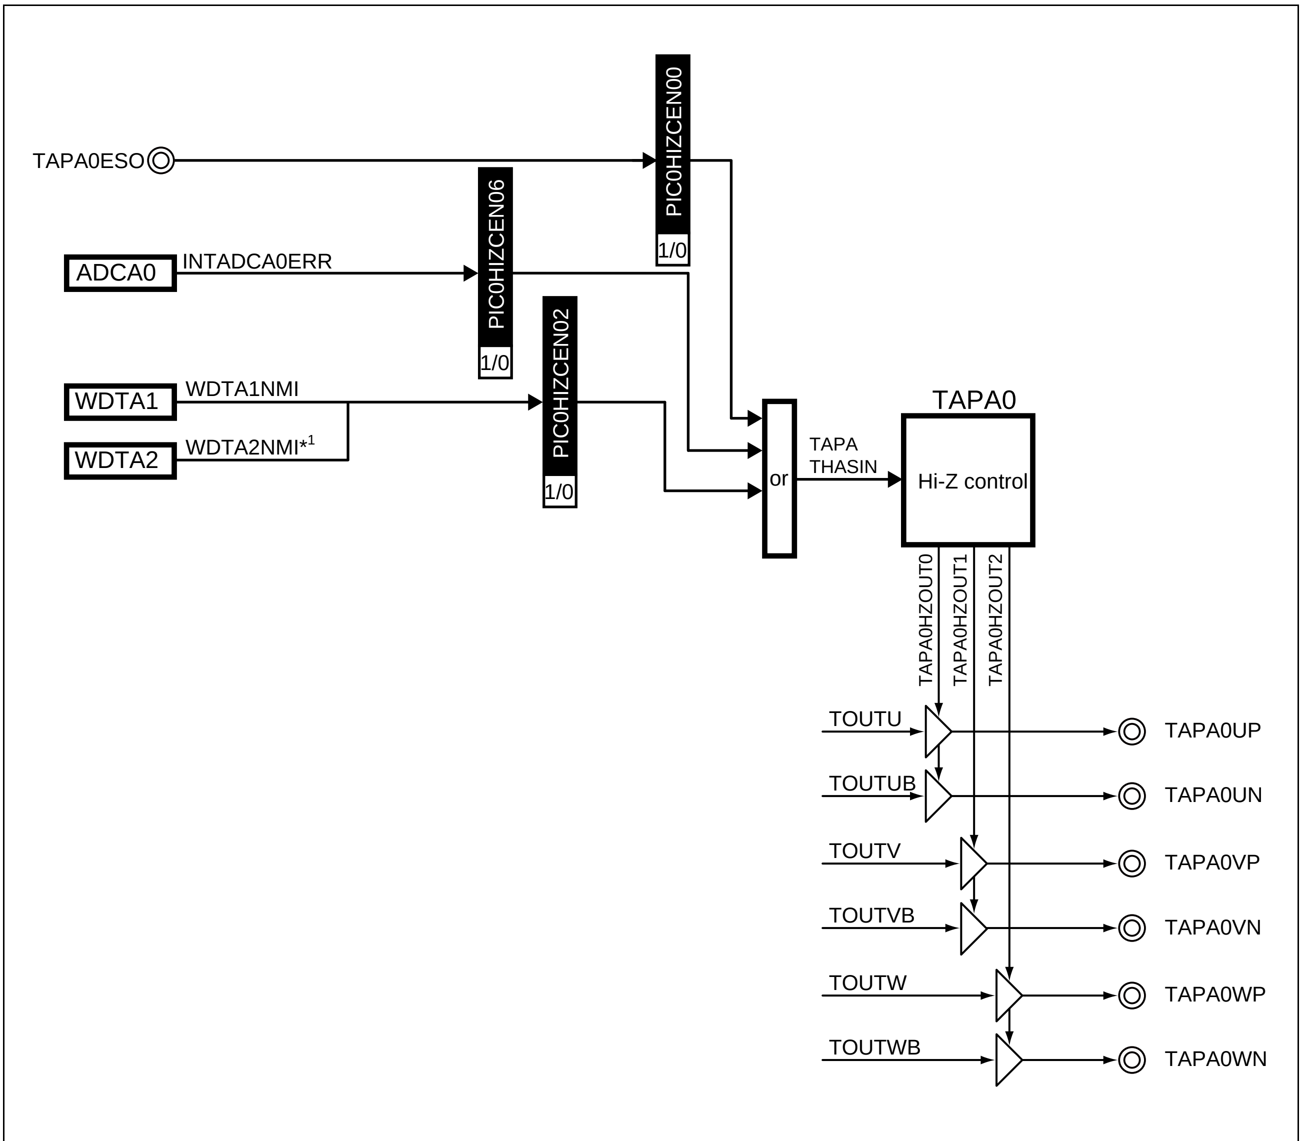
	Operation	Status of TAPA
Initial setup	Set up the TAPAnCTL0 register. Specify TAPAnDCP and TAPAnDCN to select the input edge. Specify TAPAnDCM to select the clear mode.	Asynchronous Hi-Z control stopped (TAPAnFLG.TAPAnACE = 0)
Start operation	Set up the TAPAnACWE register. Set TAPAnACWE to 1.	Writing to TAPAnACTS is enabled.
	Set up the TAPAnACTS register. Set TAPAnACTS to 1.	Asynchronous Hi-Z control enabled (TAPAnFLG.TAPAnACE = 1)
During operation	Hi-Z control for the timer function outputs can be started by controlling the following: ● TAPAnOPHS register ● Asynchronous Hi-Z control signal (TAPATHASIN) Hi-Z control for the timer function outputs can be stopped by controlling the following: ● TAPAnOPHT register (If TAPAnDCM is 1, control by the TAPAnOPHT register is enabled only while TAPATHASIN is inactive.) The TAPA operating status can always be read using the TAPAnFLG register.	Hi-Z control for the motor control output pins is started by detecting the valid edge of the asynchronous Hi-Z control signal (TAPATHASIN) or by setting the Hi-Z control start trigger bit TAPAnOPHS0 to 1. Hi-Z control for the motor control output pins is stopped by setting the Hi-Z control stop trigger bit TAPAnOPHT0 to 1 according to the operation mode specified by the TAPAnDCM bit.
Stop operation	Set up the TAPAnACWE register. Set TAPAnACWE to 1.	Writing to TAPAnACTT is enabled.
	Set up the TAPAnACTT register. Set TAPAnACTT to 1.	Asynchronous Hi-Z control stopped (TAPAnFLG.TAPAnACE = 0)

Restart

36.4.6 TAPA0 Hi-Z Control Input Selection

In order to stop the motor control output in case of errors, error events are selected in PIC and the level of the motor control output is set to Hi-Z in TAPA0, as shown in the diagram below.

The TAPA function can be stopped by setting TAPA0ACTT = 01_H after setting PIC0HIZCEN0 = 00_H or TAPA0ACWE = 01_H.



Note 1. This function is supported in RH850/F1KH-D8.

Figure 36.5 Hi-Z Control Block Diagram

Switching into a Hi-Z state can be performed by the following:

- TAPA0ESO pin input
- A/D converter ADCA0 error signal ADCA0ERR

- RH850/F1KH-D8
  Window Watchdog Timer WDTA1 non maskable interrupt WDTA1NMI and Window Watchdog Timer WDTA2 non maskable interrupt WDTA2NMI

  RH850/F1KM-S4, RH850/F1KM-S1
  Window Watchdog Timer WDTA1 non maskable interrupt WDTA1NMI

For details about these signals, see the respective descriptions.

36.4.7 Registers

36.4.7.1 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0)

The PIC0HIZCENn register selects the Hi-Z output control signal of TAPAn.

Access:	This register can be read or written in 8-bit units.
Address:	<PIC0_base> + 80_H
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	PIC0HIZCENn6	—	—	—	PIC0HIZCENn2	—	PIC0HIZCENn0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R	R	R	R/W	R	R/W

Table 36.22 PIC0HIZCENn Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	PIC0HIZCENn6	Selects whether to enable or disable Hi-Z output control by the INTADCA0ERR interrupt signal. 0: Disable 1: Enable
5 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PIC0HIZCENn2	RH850/F1KH-D8 Selects whether to enable or disable Hi-Z output control by the WDTA1NMI and the WDTA2NMI interrupt signal. 0: Disable 1: Enable RH850/F1KM-S4, RH850/F1KM-S1 Selects whether to enable or disable Hi-Z output control by the WDTA1NMI interrupt signal. 0: Disable 1: Enable
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC0HIZCENn0	Selects whether to enable or disable Hi-Z output control by the TAPA0ESO pin input. 0: Disable 1: Enable

36.5 INT Signal Output Selection Function

36.5.1 Configuration of the INT Signal Output Selection Function

This function generates the peak interrupt INTTAPA0IPEK0 and valley interrupt INTTAPA0IVLY0 by using the TAPATSIM0 signal, which is connected to the INT signal on the TAUD's triangular carrier cycle generation channel (master) and TAPATUDCM0 signal, which is connected to the counter up/down signal.

For the connection destination of TAPATSIM0, see **Section 36.1.7, Internal Output Signal**.

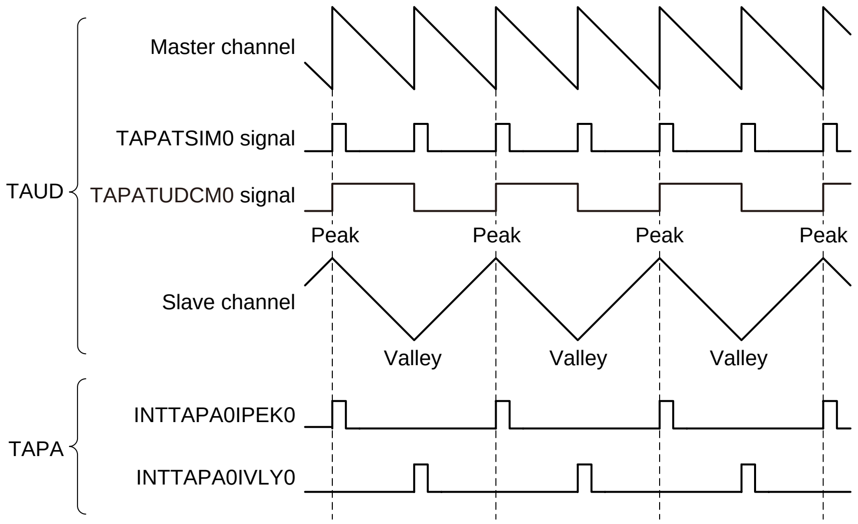


Figure 36.6 Basic Timing of Signals for the INT Signal Output Selection Function

Triangular carrier cycles are generated on the master channel.

The INT signal generated on the master channel in each half triangular carrier cycle is input to TAPAn as the TAPATSIM0 signal. TAPAn generates the INTTAPA0IPEK0 signal (peak interrupt) during high level of the TAPATUDCM0 signal and the INTTAPA0IVLY0 signal (valley interrupt) during low level of the TAPATUDCM0 signal by using the TAPATSIM0 and TAPATUDCM0 input signals.

CAUTION

The peak interrupt INTTAPA0IPEK0 and valley interrupt INTTAPA0IVLY0 are generated regardless of the function of the master channel of TAUD.

When not using these peak and valley interrupts, mask them by using the ICTAPAnIPEK0 and ICTAPAnIVLY0 registers, respectively.

36.5.2 Block Diagram

TAUDn and TAPAn are connected in the registers shown below by the INT signal output selection function.

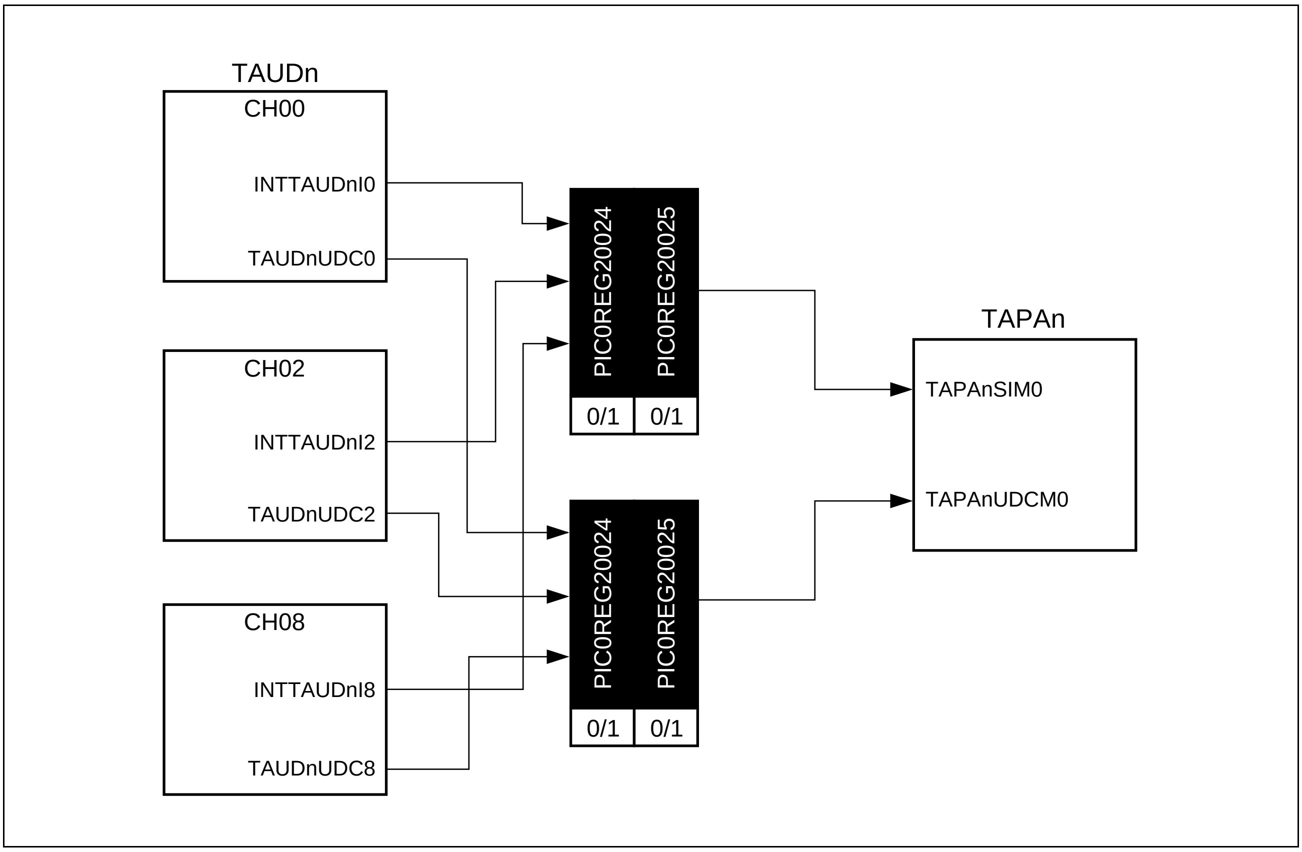

Figure 36.7 Connection of the INT Signals

36.5.3 Registers

36.5.3.1 PIC0REG2n0 — Timer I/O Control Register 2n0 (n = 0)

This register selects the TAPA0 input.

Access: This register can be read or written in 32-bit units.

Address: PIC0REG200: FFDD 00C0$_H$

Value after reset: 0000 0000$_H$

Table 36.23 PIC0REG2n0 Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	*[1]
25, 24	PIC0REG2n025 PIC0REG2n024	Select the TAUDn channel used by TAPATSIM0 and TAPATUDCM0. 00: Not selected 01: TAUD0 channel 0 selected 10: TAUD0 channel 2 selected 11: TAUD0 channel 8 selected
23 to 0	Reserved	*[1]

Note 1. Some of the bits defined as 0 in the PIC0REG2n0 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

36.6 A/D Converter Conversion Trigger Selection Function

This function outputs the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1 from the TAPATCDENS0 and TAPATCDENS1 signals, which are connected to a compare match interrupt based on the triangular carrier cycle of TAUD, or a valley interrupt signal (INTTAPA0IVLY0).

36.6.1 Configuration of A/D Converter Conversion Trigger Selection Function

Table 36.24 Signals Used for TAPATADOUT Generation

Output Signal	Slave Match Detection Signal	Valley Interrupt Signal
TAPATADOUT0	TAPATCDENS0	INTTAPA0IVLY0
TAPATADOUT1	TAPATCDENS1	INTTAPA0IVLY0

Table 36.25 Operation of TAPATADOUT1 According to the Setting of TAPAnCTL1.TAPAnATS[3:2]

TAPAnATS3	TAPAnATS2	Description
0	0	Outputs the INT signal from TAPATADOUT1 while the triangle wave is falling (counting down).
0	1	Outputs the INT signal from TAPATADOUT1 while the triangle wave is rising (counting up).
1	0	Outputs the INT signal from TAPATADOUT1 while the triangle wave is rising (counting up) or falling (counting down).
1	1	Outputs the INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt INTTAPA0IVLY0 from TAPATADOUT1.

Table 36.26 Operation of TAPATADOUT0 According to the Setting of TAPAnCTL1.TAPAnATS[1:0]

TAPAnATS1	TAPAnATS0	Description
0	0	Outputs the INT signal from TAPATADOUT0 while the triangle wave is falling (counting down).
0	1	Outputs the INT signal from TAPATADOUT0 while the triangle wave is rising (counting up).
1	0	Outputs the INT signal from TAPATADOUT0 while the triangle wave is rising (counting up) or falling (counting down).
1	1	Outputs the INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt INTTAPA0IVLY0 from TAPATADOUT0.

36.6.2 Block Diagram

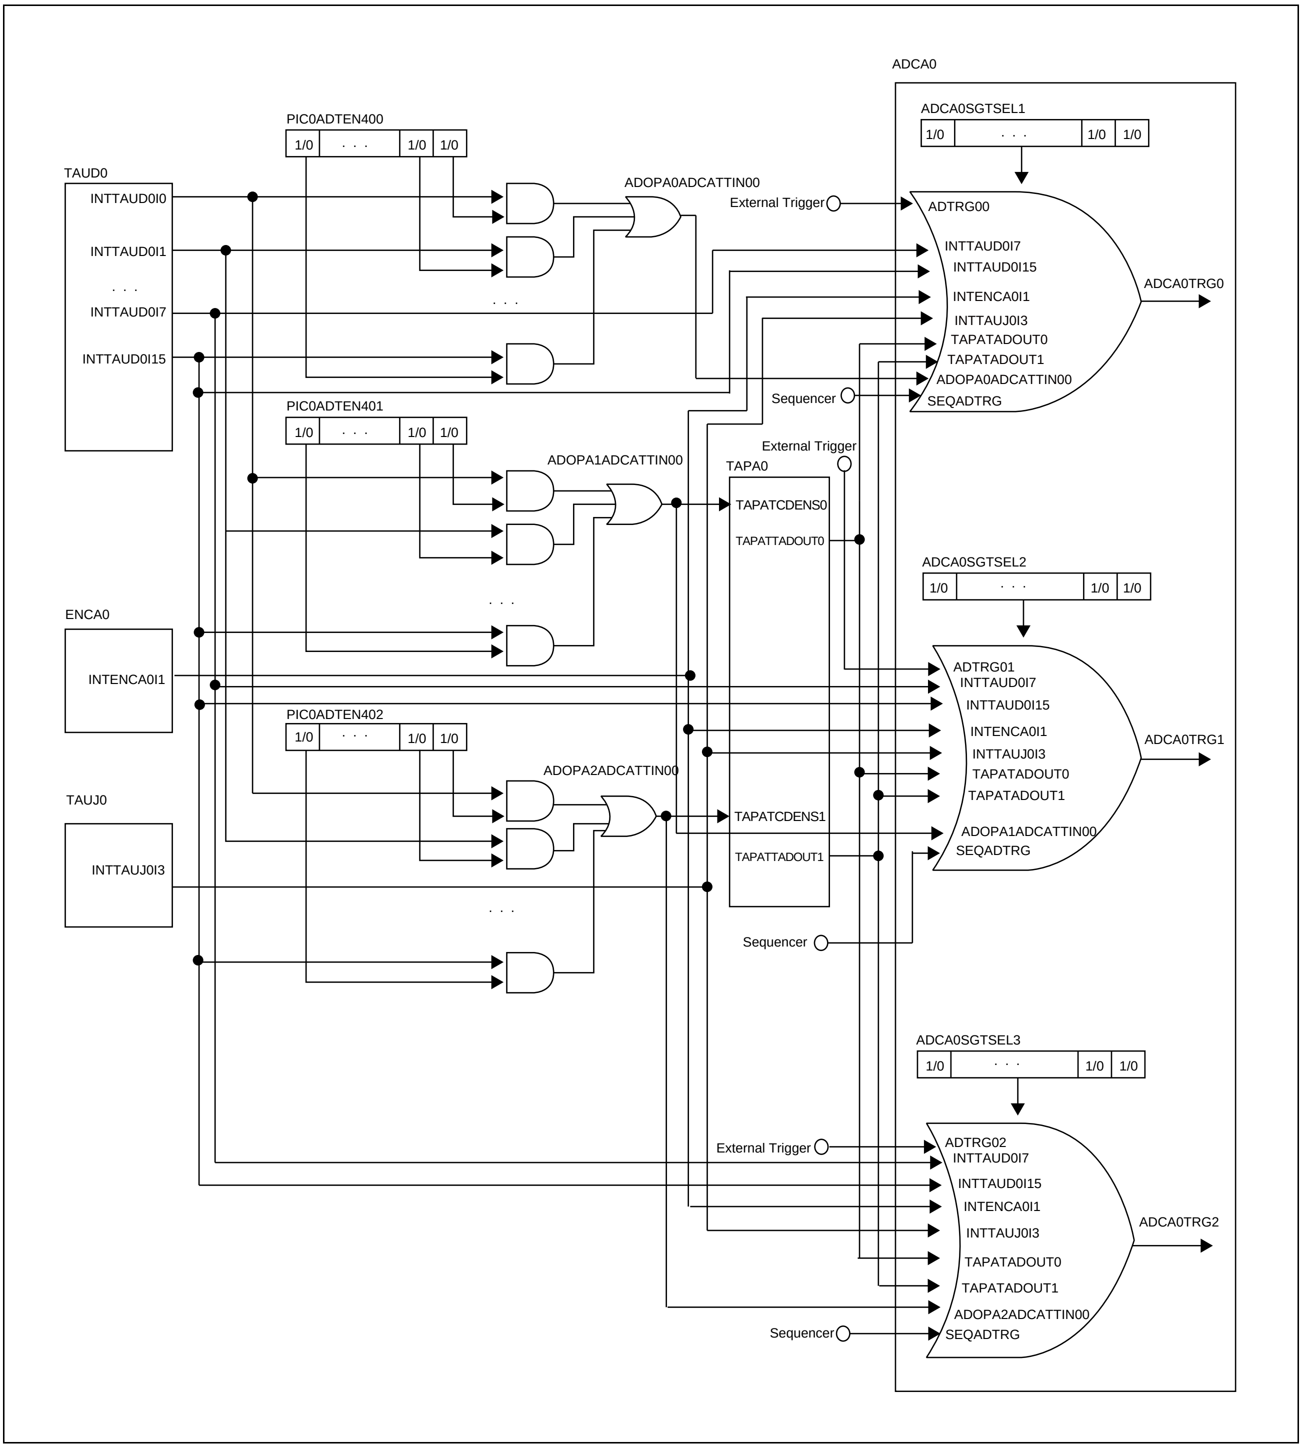

Figure 36.8 Block Diagram of A/D Conversion Trigger Selection Function

NOTE

See **Section 38.3.4.1, ADCAnSGTSELx — Scan Group x Start Trigger Control Register** for details on the settings of the ADCA0SGTSEL register.

36.6.3 Waveforms of A/D Converter Conversion Trigger Output Control Operation in Triangle PWM Mode

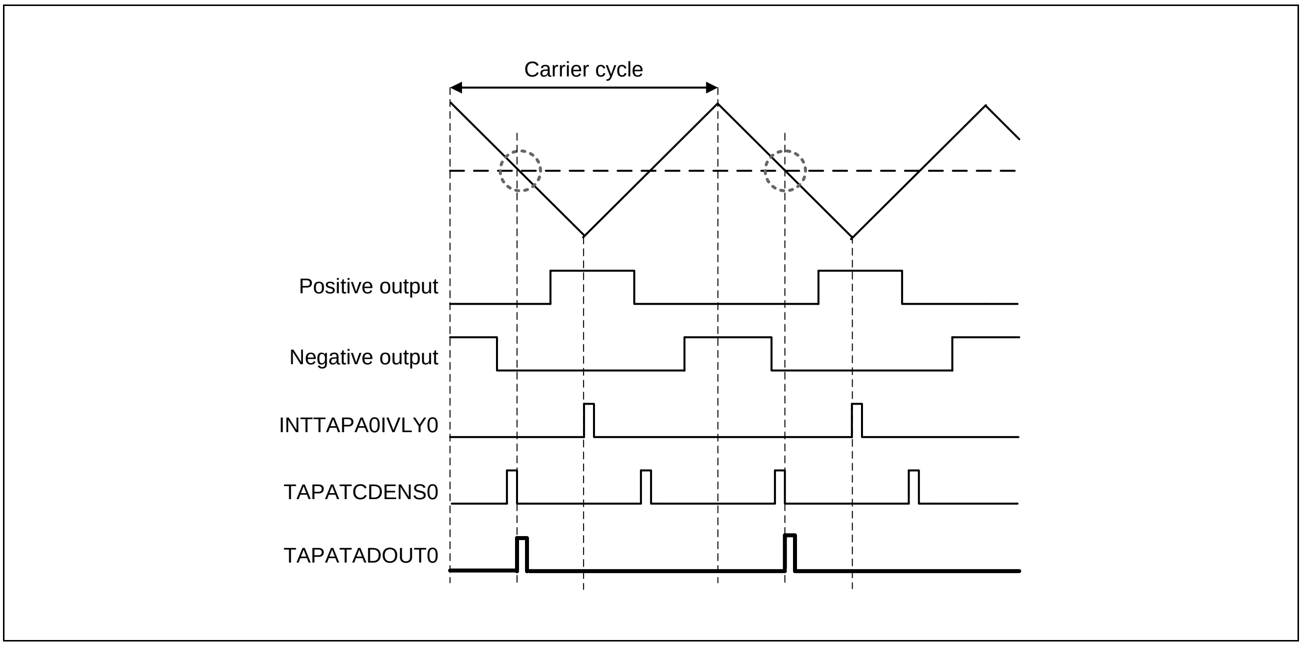

Figure 36.9 TAPAnATS[1:0] bits = 00_B: Output INT Signal while the Triangle Wave is Falling (Counting Down)

While the triangle wave is falling (counting down), the signals TAPATCDENS0 and TAPATCDENS1 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

In this case, no A/D converter conversion trigger signal is output while the triangle wave is rising (counting up).

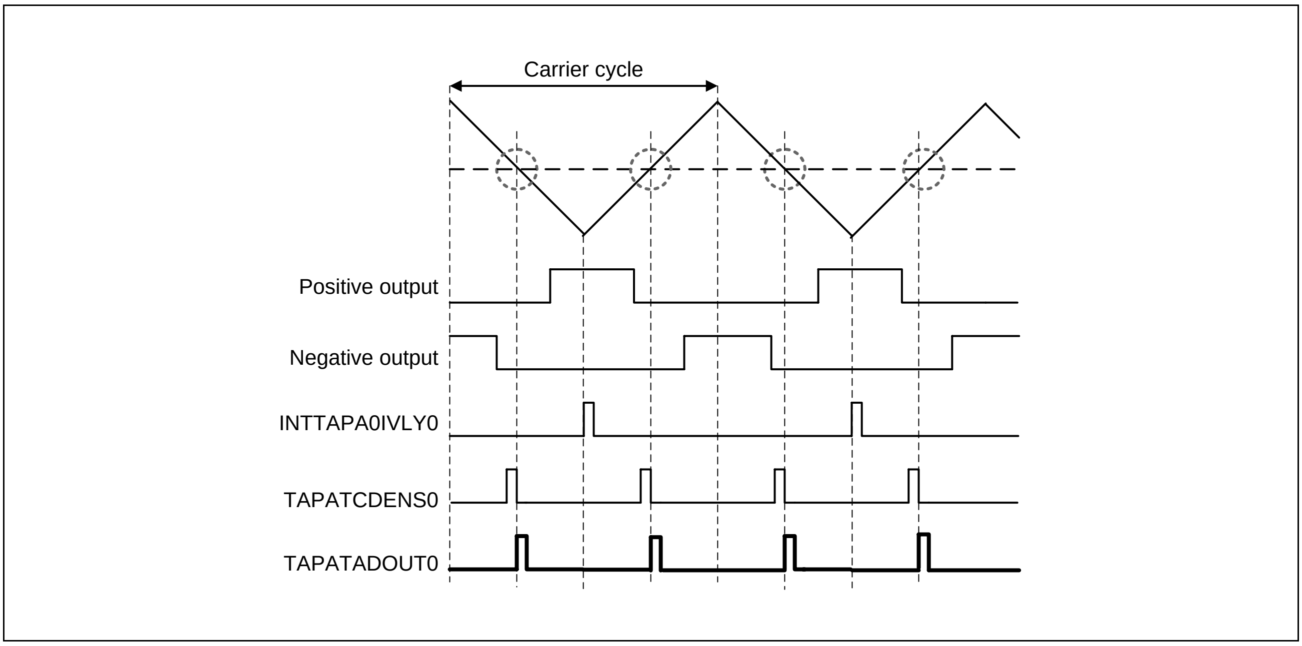

Figure 36.10 TAPAnATS[1:0] bits = 10_B: Output INT Signal while the Triangle Wave is Rising (Counting Up) or Falling (Counting Down)

The signals TAPATCDENS0 and TAPATCDENS1 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

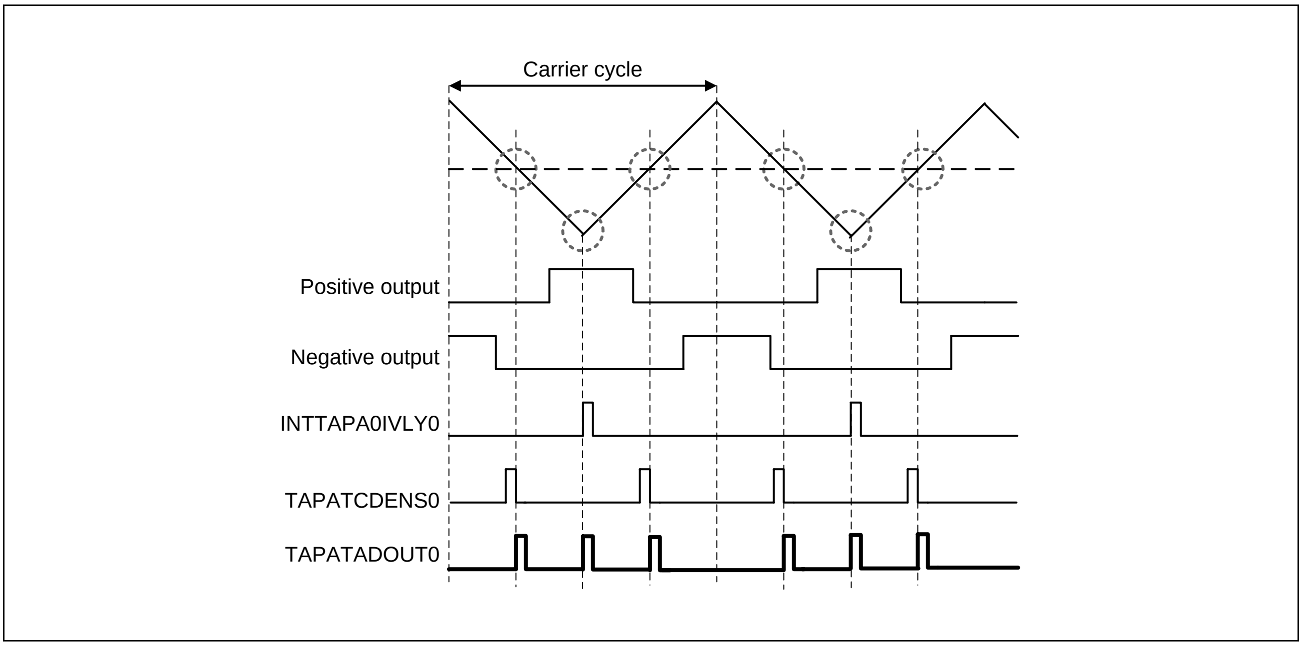

Figure 36.11 TAPAnATS[1:0] bits = 11_B: Output of INT Signal and Valley Interrupt while the Triangle Wave is Rising (Counting Up) or Falling (Counting Down)

The signals TAPATCDENS0 and TAPATCDENS1 and valley interrupt INTTAPA0IVLY0 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

36.6.4 Operating Procedure for A/D Converter Conversion Trigger Selection Function

The operating procedure for the A/D converter conversion trigger selection function is shown below.

	Operation	Status of TAUD and TAPA
Initial setup	Initialize TAUD. Specify the timer operation mode. Set up the TAPAnCTL1 register. Specify TAPAnATS[1:0] (TAPATADOUT0 setting). Specify TAPAnATS[3:2] (TAPATADOUT1 setting). Set up the PIC0ADTEN4nj and PIC0REG2n0 registers according to the signal to be used. Specify PIC0ADTEN4nj (TAPATCDENS0 or TAPATCDENS1 setting). Specify PIC0REG2n0 (INTTAPA0IVLY0 setting).	TAUD and TAPA stop the operation.
Start operation	Start the TAUD operation.	TAUD starts the count operation.
During operation	TAUD operates according to the setting of each function.	The A/D conversion trigger selection function outputs either TAPATADOUT0 according to the setting of TAPAnATS[1:0] or TAPATADOUT1 according to the setting of TAPAnATS[3:2], based on the interrupt TAPATCDENS1 or TAPATCDENS0, which is input from TAUD, and the valley interrupt INTTAPA0IVLY0, which is generated by TAPA.
Stop operation	Stop the TAUD operation.	TAUD stops the count operation.

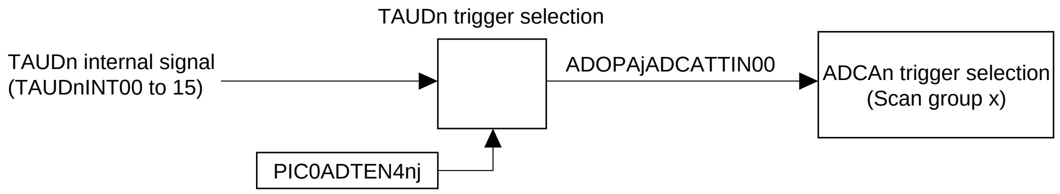
Restart

36.7 ADCA Trigger Selection Function

36.7.1 Functional Overview

This function generates ADCA hardware trigger signals by using TAUDn channel output.

36.7.2 Configuration



Note: For details, see **Figure 36.8, Block Diagram of A/D Conversion Trigger Selection Function**.

Figure 36.12 Block Diagram of ADCA Trigger Selection Function

36.7.3 Registers

36.7.3.1 PIC0ADTEN4nj — A/D Conversion Trigger Output Control Register 4nj (n = 0, j = 0 to 2)

This register selects an ADCA0 start trigger source from TAUDn channel m. (m = 0 to 15)

Access: This register can be read or written in 16-bit units.

Address: <PIC0_base> + 90_H + 4 × j

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 36.27 PIC0ADTEN4nj Register Contents

Bit Position	Bit Name	Function
15 to 0	PIC0ADTEN4nj15 to PIC0ADTEN4nj00	Sets a trigger source of CHm (m = 0 to 15) in the TAUDn timer. 0: A/D trigger source of CHm in the TAUDn timer is disabled. 1: A/D trigger source of CHm in the TAUDn timer is enabled.

36.7.4 Example of Operation

(1) Initial setting: Set the function of each channel of the TAUD0 to be used.

(2) Setting of the A/D conversion trigger output control register 4nj (PIC0ADTEN4nj):
Setting the bits of A/D conversion trigger output control register 4nj ((PIC0ADTEN4nj) to 1 enables selection of an interrupt request signal from each channel of the TAUD0 as the trigger of the A/D conversion scan group.

– Register setting should be performed when A/D conversion is stopped.

(3) Setting of the A/D conversion trigger selection control register (ADCA0SGTSELx):
Setting the bits corresponding to each trigger to 1 enables to use the signal generated by executing the logical OR of each trigger as the start trigger of the A/D conversion scan group.

– Register setting should be performed when the A/D conversion is stopped.

(4) Enabling of TAUD0 timer operation
Each channel of the TAUD0 timer set in (1) starts.

Table 36.30 PIC0SSER2 Register Contents

Bit Position	Bit Name	Function
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	PIC0SSER214	Enables a simultaneous start trigger for the ENCA0 timer. 0: Simultaneous start trigger is disabled. 1: Simultaneous start trigger is enabled.
13 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	PIC0SSER203 to PIC0SSER200	Set a simultaneous start trigger for the CHm in the TAUJ1 timer. 0: Simultaneous start trigger is disabled. 1: Simultaneous start trigger is enabled.

36.8.3.3 PIC0SST — Simultaneous Start Trigger Control Register

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PIC0_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SYNCTRG
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 36.31 PIC0SST Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	SYNCTRG	Generates a start trigger for the timer whose simultaneous start is enabled. When read, this bit is always read as 0. 0: Disabled. 1: Simultaneous start trigger is generated (the pulse in the width of 1PCLK is output).

36.8.4 Example of Operation

(1) Operation example of timer configuration:
The timers that operates in operation mode to be selected can be simultaneously started in any combinations.

(2) Simultaneous start enable:
Setting the relevant bits in the PIC0SSER0 and PIC0SSER2 registers of the target timers to be simultaneously started to 1 enables these timers to simultaneously start.

(3) Start trigger output:
Writing 1 to the SYNCTRG bit in the PIC0SST register enables the target timers set in (2) to simultaneously start.

(4) Repeating (2) and (3) for the channels that have not started yet enables the different target timers to simultaneously start in multiple batches.

Table 36.34 PIC0REG31 Register Contents

Bit Position	Bit Name	Function
1	PIC0REG3101	Selects a TIN input signal to CH1 of TAUJ1. 0: CH1 of TAUJ1 is not used for trigger width measurement. 1: DT output signal of ENCAT0IEC
0	PIC0REG3100	Selects a TIN input signal to CH0 of TAUJ1. 0: CH0 of TAUJ1 is not used for trigger width measurement. 1: DT output signal of ENCAT0IEC

36.9.4 Example of Operation

The trigger and pulse width measurement function is achieved by combining the ENCA0 trigger signals (ENCAT0IEC, ENCAT0EQ0, ENCAT0EQ1) and the following functions of TAUD0 and TAUJ1.

- TAUDTTINm input pulse interval measurement function (TAUD0)
- TAUJTTINm input pulse interval measurement function (TAUJ1)

Also, the following function of PIC is used to convert the trigger signal input to TINm into a level-sensitive toggle signal.

- DT circuit

The trigger and pulse width measurement function implements measurement of the ENCA0 output trigger signal interval using the TAUDTTINm input pulse interval measurement function of TAUD0 and the TAUJTTINm input pulse interval measurement function of TAUJ1.

(1) TAUDTTINm Input Pulse Interval Measurement Function, TAUJTTINm Input Pulse Interval Measurement Function

When the valid TINm edge of TAUD0 or TAUJ1 is detected, the CNTm value is captured into CDRm and CNTm is cleared.

CAUTION

Set both edges (rising and falling edges) of TINm to be detected as valid (TAUD0CMURm.TAUD0TIS[1:0] = 10_B, TAUJ1CMURm.TAUJ1TIS[1:0] = 10_B) for this function.

For details of the TAUD and TAUJ functions, see the corresponding sections.

(2) DT Circuit

The DT circuit is used to convert the trigger signal output from ENCA0 into a level-sensitive toggle signal.

As shown in **Figure 36.17, Operation of DT Circuit**, the output signal is toggled upon each input trigger signal generation.

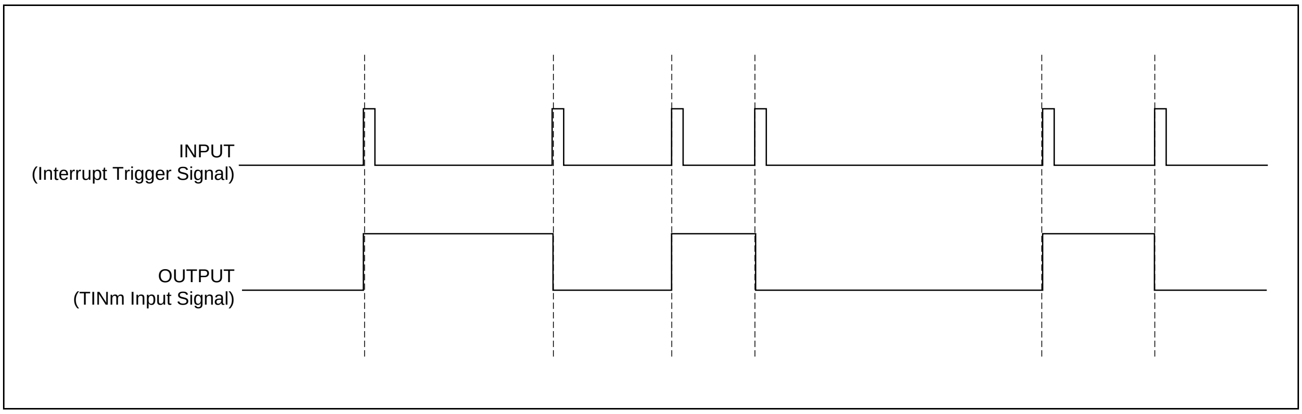

Figure 36.17 Operation of DT Circuit

PIC provides input signal conversion and signal connection to TAUD0 and TAUJ1 to measure the generation interval of trigger signals from ENCA0.

The timing chart of the trigger and pulse width measurement function is shown below.

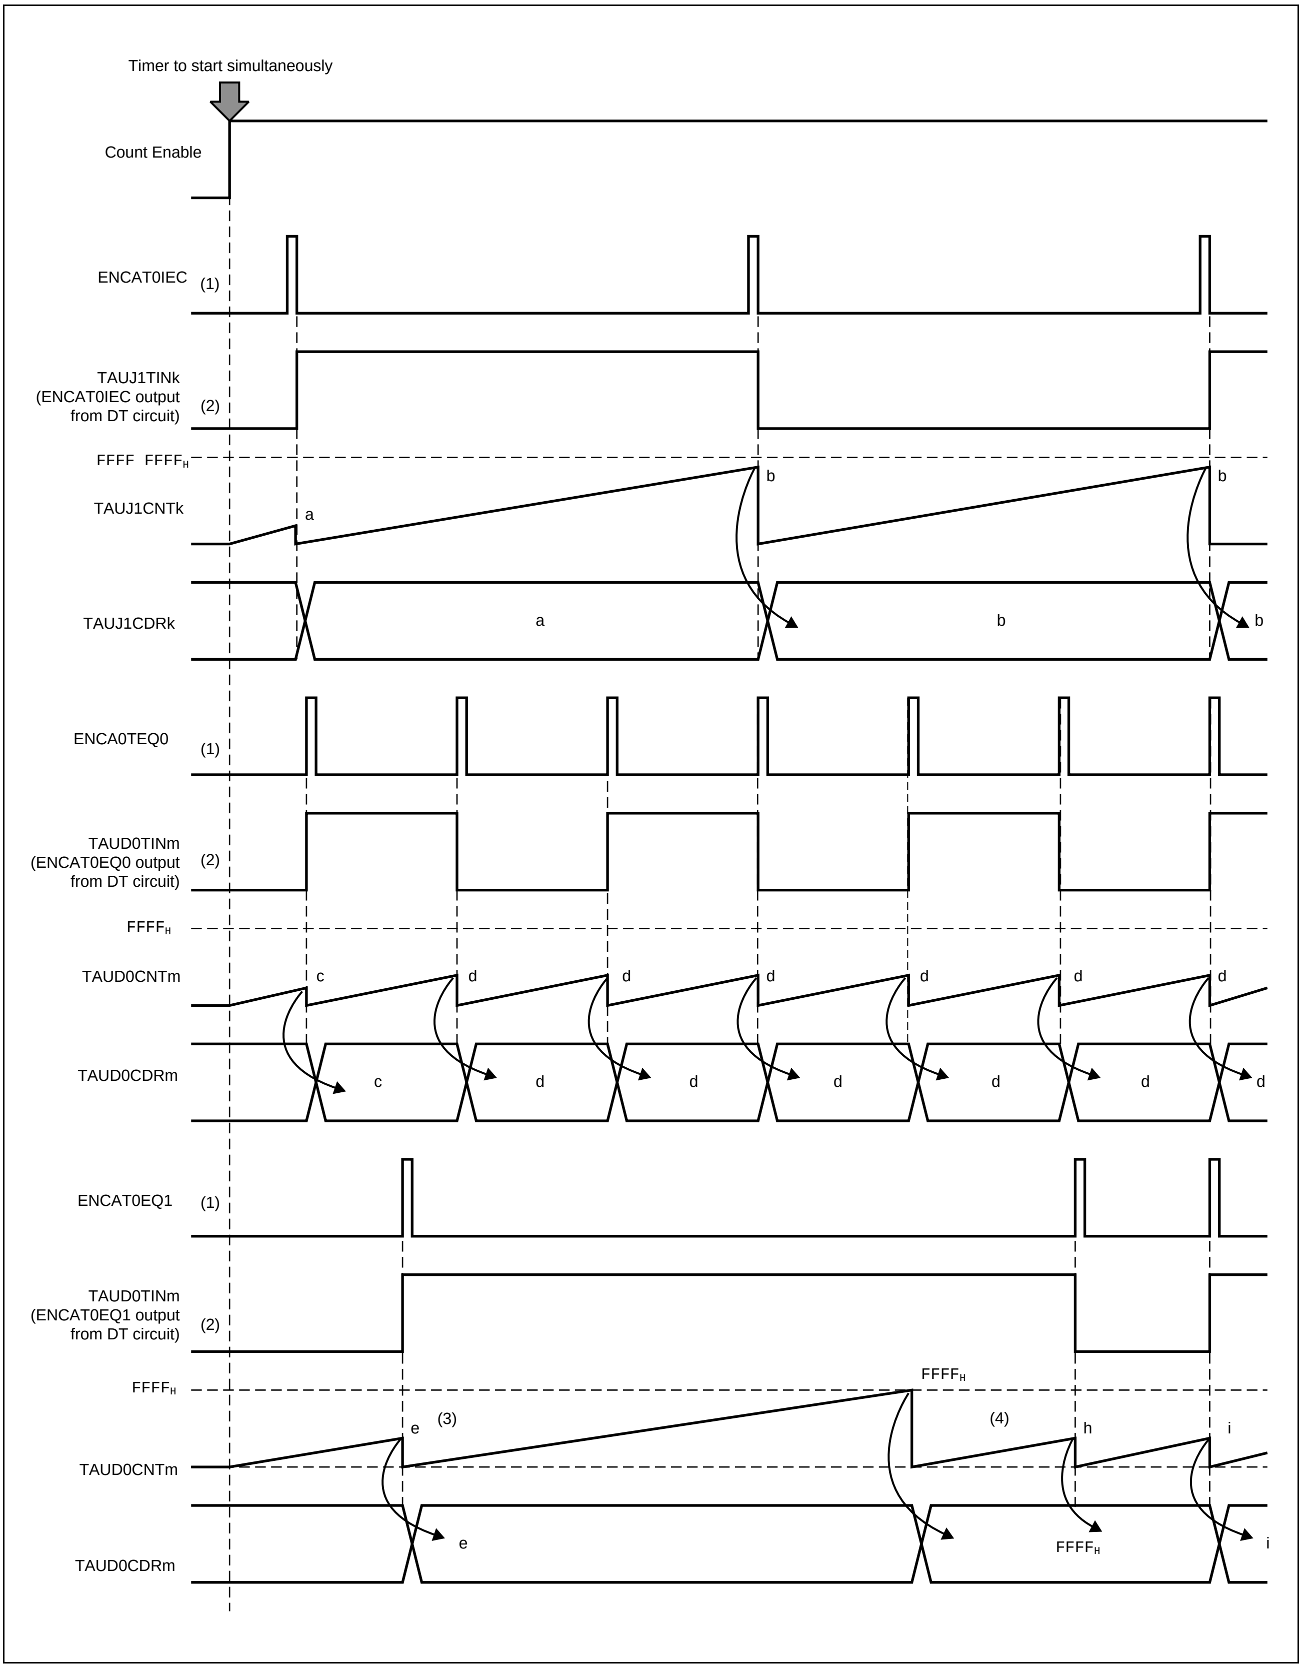

Figure 36.18 Operation Example of the Function of Trigger and Pulse Width Measurement (m = 0 to 2, k = 0, 1)

(1) The following signals are output from ENCA0 as triggers:

- ENCAT0IEC (interrupt trigger signal output when timer counter value is cleared by ENCA0EC input)
- ENCAT0EQ0 (trigger signal output according to timing of a match of timer counter value and value of compare register 0)
- ENCAT0EQ1 (trigger signal output according to timing of a match of timer counter value and value of compare register 1)

(2) The trigger signal output from ENCA0 is converted to a level-sensitive toggle signal by the DT circuit and is output to TINm of TAUD0 and TAUJ1.

(3) By setting both TINm edges (rising and falling edges) of TAUD0 and TAUJ1 as valid, the CNTm value is captured into CDRm at the TINm toggle timing and cleared to 0000_H. This operation is repeated.
The first captured value (shown as “a” in the figure) from the start of operation indicates the interval from the start of TAUJ operation until trigger input.

(4) When an overflow occurs, the count value $FFFF_H$ (FFFF FFFF_H for TAUJ) is captured but the count value is not captured at the first trigger after the overflow.

With the above operation, the trigger generation interval can be measured.

The following table shows the combinations of the trigger signals and measurement timers, and the bit settings of the pertinent PIC registers for setting the signal paths and the I/O selection registers. Appropriately set these bits according to the trigger signal to be measured and the measurement timer to be used.

Table 36.35 Combinations of Trigger Signals and Measurement Timers

Interrupt Trigger Signal	Measurement Timer	PIC Register Bit Setting	
ENCAT0IEC	TAUJ1 CH0	PIC0REG3100 = 1	
	TAUJ1 CH1	PIC0REG3101 = 1	
ENCAT0EQ0	TAUD0 CH0	PIC0REG3109 = 0 PIC0REG3110 = 1	
	TAUD0 CH2	PIC0REG3112 = 1 PIC0REG3113 = 0	
ENCAT0EQ1	TAUD0 CH0	PIC0REG3106 = 1 PIC0REG3107 = 0 PIC0REG3108 = 0	PIC0REG3109 = 0 PIC0REG3110 = 0
	TAUD0 CH1		PIC0REG3111 = 1

36.9.5 Setup Flow

The setup flow in this section shows the general setup flow to measure the pulse interval, which applies to all the following combinations. For the combinations of the trigger signals and measurement timers, see **Table 36.35, Combinations of Trigger Signals and Measurement Timers**.

Encoder Timer	Trigger Signal	Measurement Timer

	4	ENCA0ACL	Don't care	Selects the clear level of A phase for a encoder special-clear
	3, 2	ENCA0ECS[1:0]	Don't care	Selects encoder clear input (Z phase) edge
	1, 0	ENCA0EIS[1:0]	Don't care	Selects encoder input (A or B phase) edge

Table 36.37 TAUJ1 Setting (k = 0, 1)
TAUJ1 (TAUJTTINm Input Pulse Interval Measurement Function)

Register	Bit Position	Bit Name	Setting Value	Note
TAUJ1CMORk	15,14	TAUJ1CKS[1:0]	Don’t care	Operation Clock Setting
	13,12	TAUJ1CCS[1:0]	00	
	11	TAUJ1MAS	0	
	10, 9, 8	TAUJ1STS[2:0]	001	
	7, 6	TAUJ1COS[1:0]	11	
	5		0	Fixed to 0
	4, 3, 2, 1	TAUJ1MD[4:1]	0010	
	0	TAUJ1MD0	Don’t care	
TAUJ1CMURk	1, 0	TAUJ1TIS[1:0]	10	

NOTE

When TAUJ1CMORk is used for the TAUDTTINm input pulse interval measurement function, the TAUJ1CKS[1:0] (operating clock selection) and TAUJ1MD0 (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUJ1COS[1:0] (overflow mode selection) bits can also be set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see **Section 33, Timer Array Unit J (TAUJ)**.

For TAUJ common registers (TAUJ1TOE, TAUJ1TO, TAUJ1TOM, TAUJ1TOC, TAUJ1TOL, TAUJ1RDE, and TAUJ1RDM), only set the bits corresponding to the used channels to 0.

Table 36.38 TAUD0 Setting (m = 0 to 2)
TAUD0 (TAUDTTINm Input Pulse Interval Measurement Function)

Register	Bit Position	Bit Name	Setting Value	Note
TAUD0CMORm	15, 14	TAUD0CKS[1:0]	Don’t care	Operation Clock Setting
	13, 12	TAUD0CCS[1:0]	00	
	11	TAUD0MAS	0	
	10 to 8	TAUD0STS[2:0]	001	
	7, 6	TAUD0COS[1:0]	11	
	5		0	Fixed to 0
	4 to 1	TAUD0MD[4:1]	0010	
	0	TAUD0MD0	Don’t care	
TAUD0CMURm	1, 0	TAUD0TIS[1:0]	10	

NOTE

When TAUD0CMORm is used for the TAUDTTINm input pulse interval measurement function, the TAUD0CKS[1:0] (operating clock selection) and TAUD0MD0 (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUD0COS[1:0] (overflow mode selection) bits can also be set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see **Section 32, Timer Array Unit D (TAUD)**.

For TAUD common registers (TAUD0TOE, TAUD0TO, TAUD0TOM, TAUD0TOC, TAUD0TOL, TAUD0TDE, TAUD0TDM, TAUD0TDL, TAUD0TRE, TAUD0TRO, TAUD0TRC, TAUD0TME, TAUD0RDE, TAUD0RDS, TAUD0RDM, and TAUD0RDC), only set the bits corresponding to the used channels to 0.

Table 36.39 PIC Setting

Register	Bit Position	Bit Name	Setting Value	Note
PIC0REG31	13, 12	PIC0REG3113 PIC0REG3112	0 1	Selects the DT output signal from ENCAT0EQ0 as TAUD0TTIN2 input signal
	11	PIC0REG3111	1	Selects the signal selected with PIC0REG3106 to PIC0REG3108 (DT output signal from ENCAT0EQ1) as TAUD0TTIN1 input signal
	10, 9	PIC0REG3110 PIC0REG3109	1 0	Selects the DT output signal from ENCAT0EQ0 as TAUD0TTIN0 input signal
	8 to 6	PIC0REG3108 PIC0REG3107 PIC0REG3106	0 0 1	Selects the DT output signal from ENCAT0EQ1 as TAUD0TTIN1 or TAUD0TTIN0 input signal
	1	PIC0REG3101	1	Selects the DT output signal from ENCAT0IEC as TAUJ1TTIN1 input signal
	0	PIC0REG3100	1	Selects the DT output signal from ENCAT0IEC as TAUJ1TTIN0 input signal

36.10 A/D Trigger Encoder Capture Function

36.10.1 Functional Overview

The value of the encoder counter synchronized with A/D conversion can be obtained by using an A/D conversion trigger signal as a capture signal of ENCA0.

36.10.2 Configuration

(1) Configuration

Table 36.40 Configuration of A/D Trigger Encoder Capture Function

A/D Converter	Encoder Timer
ADCA0	ENCA0

(2) Block Diagram

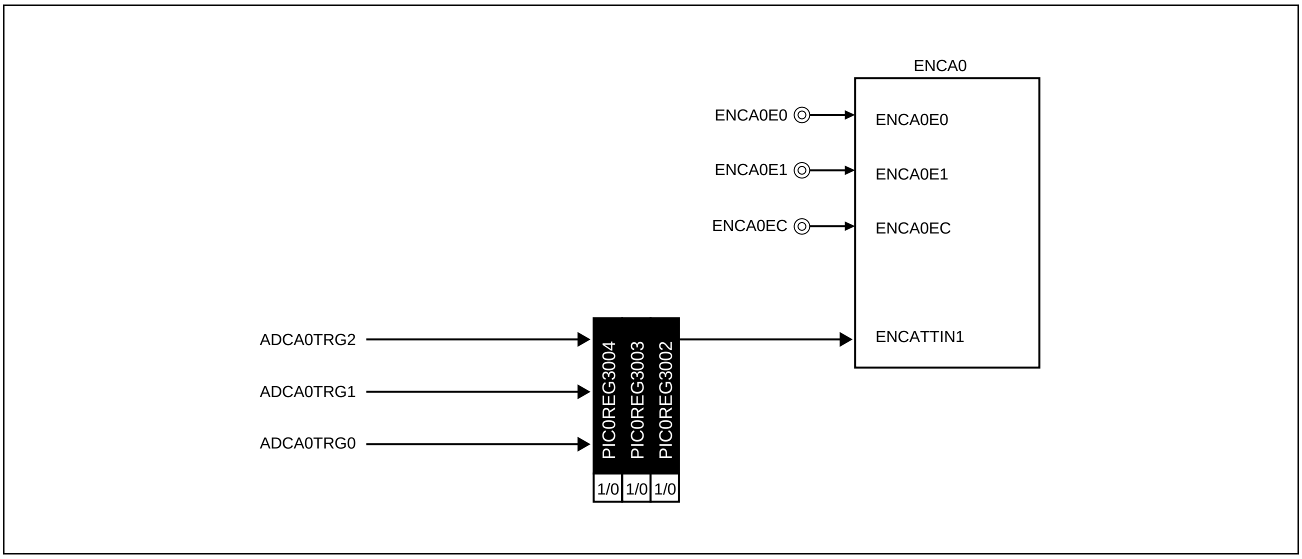

Figure 36.21 Block Diagram of A/D Trigger Encoder Capture Function

CAUTION

1. It takes ENCA0 one additional clock cycle to capture the input signal of the ADCA0TRG0, ADCA0TRG1, and ADCA0TRG2 pins compared with the number of clock cycles it takes to capture the input signal of the ENCA0TIN1 pin when using CKSCLK_IPERI1, and three additional clock cycles when using CKSCLK_AADCA. Be sure to take this into account when configuring your system.
2. Configure the edge detection function by using the edge detection function registers of the digital noise filter, which are FCLA0CTL0_ADC0,
FCLA0CTL1_ADC0, and FCLA0CTL2_ADC0 (see **Section 2A.12.1.4, Input Pins that Incorporate Digital Filter Type D, Section 2B.12.1.4, Input Pins that Incorporate Digital Filter Type D** and **Section 2C.12.1.4, Input Pins that Incorporate Digital Filter Type D** for details), and specify “rising edge” for edge detection of the ENCA0TIN1 capture trigger input of ENCA0 (ENCA0IOC0.ENCA0TIS [3:2] = 01_B). Do not set ENCA0IOC0.ENCA0TIS [3:2] to 10_B (falling edge) or 11_B (both edges).
3. ADCA0TRG0-2 are selected by ADCA0SGTSEL1-3 signal shown in **Figure 36.8, Block Diagram of A/D Conversion Trigger Selection Function**.

36.10.3 Registers

36.10.3.1 PIC0REG30 — Timer I/O Control Register 30

Access: This register can be read or written in 32-bit units.

Address: <PIC0_base> + E8$_H$

Value after reset: 0000 0000$_H$

</table>

36.10.4 Example of Operation

The A/D trigger encoder capture function is implemented by connecting A/D conversion trigger signal ADCAnTRGi (n = 0, i = 0 to 2) to ENCA0.

CAUTION

When using this function, the ENCA0 interrupt signal ENCATINT1 should not be selected as the A/D converter trigger. If selected, the correct operation cannot be performed because the following loop occurs: ADCAnTRG1 generation → ENCA0 capture operation → ENCATINT1 generation by capture operation → ADCAnTRG1 generation.

The following shows a timing chart of the A/D trigger encoder capture function using the ADCA0TRG1 as a trigger.

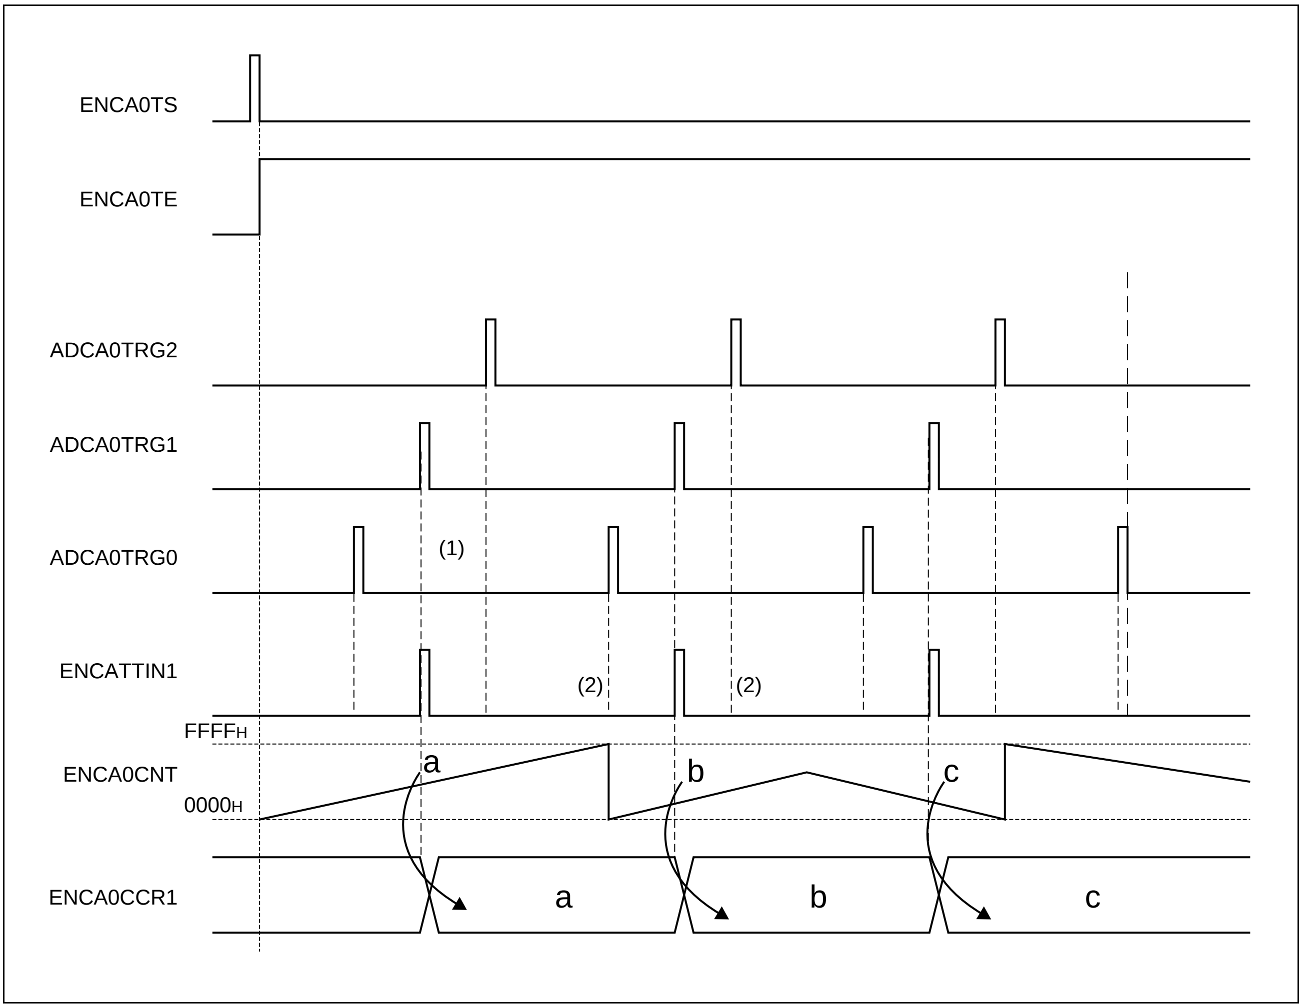

Figure 36.22 Operation Example of Trigger Encoder Capture Function

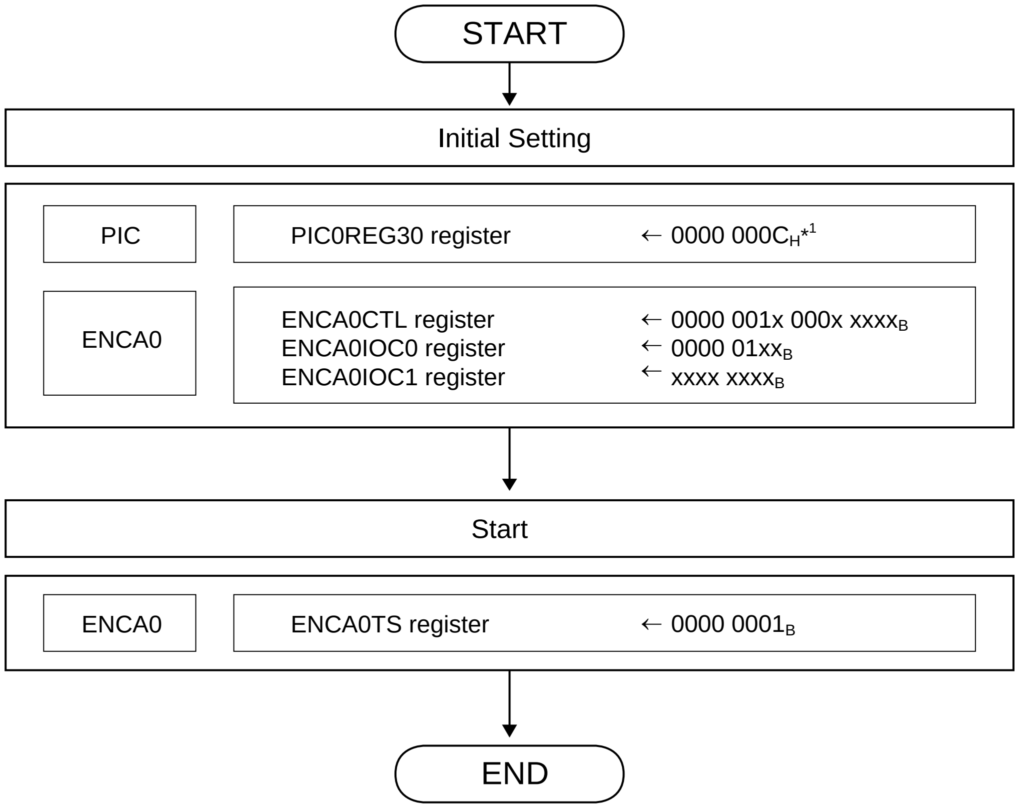
(1) When ADCA0TRG1 is selected as ENCA0 capture trigger 1 signal ENCATTIN1, the valid ADCA0TRG1 is input to ENCA0 as the ENCATTIN1 signal and ENCA0 is captured.

(2) When a hardware trigger signal (ADCA0TRG0, ADCA0TRG2) other than ADCA0TRG1 is generated, the ENCATTIN1 signal is not generated and ENCA0 is not captured.

36.10.5 Setup Flow

The setup flow in this section shows the general setup flow to perform the capture operation of encoder timer ENCA0 based on the ADCA0TRG1 signal.



Note 1. Change the settings depending on the hardware trigger to perform the capture operation.

Figure 36.23 Setup Flow

36.10.6 Setting Examples for Operation Functions

This section provides example settings for each register.

The setup example shown in this section describes how to set up capture operation of encoder timer ENCA0 based on the ADCA0TRG1 signal. Change the settings depending on the hardware trigger to perform the capture operation.

Table 36.42 ENCAn Setting

Register	Bit Position	Bit Name	Setting Value	Remark
ENCAnCTL	15	ENCAnCME	0	Disables compare match interrupt detection masking
	14	ENCAnMCS	0	Selects release trigger for compare match interrupt detection masking
	13 to 10		0	Fixed to 0
	9	ENCAnCRM1	1	Sets the ENCAnCCR1 register for capture operation
	8	ENCAnCRM0	Don’t care	Selects the function of ENCAnCCR0 register
	7	ENCAnCTS	0	Selects ENCATTIN1 as trigger for capture operation
	6, 5		0	Fixed to 0
	4	ENCAnLDE	Don’t care	Enables or disables reload operation when ENCAnCCR0 register underflow occurs
	3	ENCAnECM1	Don’t care	Enables or disables clearing of the counter on compare match of ENCAnCCR1 register
	2	ENCAnECM0	Don’t care	Enables or disables clearing of the counter on compare match of ENCAnCCR0 register
	1,0	ENCAnUDS[1:0]	Don’t care	Select the counter up/down control by ENCAnE0 and ENCAnE1
ENCAnIOC0	7 to 4		0	Fixed to 0
	3, 2	ENCAnTIS[3:2]	0[*1] 1[*1]	Select the valid edge of capture trigger 1 (ENCATTIN1) for the rising edge detection
	1, 0	ENCAnTIS[1:0]	Don’t care	Select the valid edge of capture trigger 0 (ENCATTIN0)
ENCAnIOC1	7	ENCAnSCE	Don’t care	Enables encoder special-clear
	6	ENCAnZCL	Don’t care	Selects the clear level (input level) of Z phase for encoder special-clear
	5	ENCAnBCL	Don’t care	Selects the clear level (input level) of B phase for encoder special-clear
	4	ENCAnACL	Don’t care	Selects the clear level (input level) of A phase for encoder special-clear
	3, 2	ENCAnECS[1:0]	Don’t care	Select encoder clear input (Z phase) edge
	1, 0	ENCAnEIS[1:0]	Don’t care	Select encoder input (A or B phase) edge
PIC0REG30	4	PIC0REG3004	Don’t care	Selects ADCA0 trigger signal of ENCATTIN1
	3	PIC0REG3003	Don’t care	
	2	PIC0REG3002	Don’t care	

Note 1. Change the setting depending on the hardware trigger to perform the capture operation.

NOTE

Bits ENCA0CRM1 and ENCA0CTS in ENCA0CTL are fixed: ENCA0CRM1 = 1 (ENCA0CCR1 register function) and ENCA0CTS = 0 (trigger source of capture to the ENCA0CCR1 register). All the other bits can be set arbitrarily.

36.11 Three-Phase PWM Output with Dead Time

36.11.1 Functional Overview

This feature generates each of the set signals (active level timing signals) and clear signals (inactive level timing signals) once or less per cycle and then uses the results to output a three-phase PWM waveform with dead time.

For the PWM output feature of TAUD, only the clear timing used during each cycle is specified by specifying the duty value, but for the feature described here, the set timing can also be specified, which makes more flexible PWM output with dead time possible.

36.11.2 Configuration

The unit and channel configuration for this feature is shown below. (n = 0)

Table 36.43 Configuration of Three-Phase PWM Output with Dead Time

Timer	Timer Motor Control Function
TAUD0 CH2, CH4 to CH15 (used channels fixed)	TAPA0

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm → INTTAUDnIm (TAUDn channel m interrupt)
- TINm → TAUDTTINm (TAUDn channel m input)
- TOUTm → TAUDTTOUTm (TAUDn channel m output)
- CDRm → TAUDnCDRm (TAUDn channel m data register)
- CNTm → TAUDnCNTm (TAUDn channel m counter register)

(1) TAUDn Configuration

Because CH10, CH12, and CH14 are only used for TOUTm, these channels can be used for features that do not use TOUTm (m = 10, 12, 14).

Table 36.44 TAUDn Configuration

CH	Function Name	M/S	CDR Setting	Description
2	PWM output (CH2 is the master channel for CH4 to CH9.)	M	Cycle	
4		S	Duty (U phase signal setting)	
5		S	Duty (U phase signal clearing)	
6		S	Duty (V phase signal setting)	
7		S	Duty (V phase signal clearing)	
8		S	Duty (W phase signal setting)	
9		S	Duty (W phase signal clearing)	
10	Any feature that does not use TOUT10	S		TOUT10: U phase output
11	One-phase PWM output	S	Dead time (U phase)	TOUT11: UB phase output
12	Any feature that does not use TOUT12	S		TOUT12: V phase output
13	One-phase PWM output	S	Dead time (V phase)	TOUT13: VB phase output
14	Any feature that does not use TOUT14	S		TOUT14: W phase output
15	One-phase PWM output	S	Dead time (W phase)	TOUT15: WB phase output

Note: M: Master channel, S: Slave channel

5 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PIC0HIZCENn2	RH850/F1KH-D8 Selects whether to enable or disable Hi-Z output control by the WDTA1NMI and the WDTA2NMI interrupt signal. 0: Disable 1: Enable RH850/F1KM-S4, RH850/F1KM-S1 Selects whether to enable or disable Hi-Z output control by the WDTA1NMI interrupt signal. 0: Disable 1: Enable
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC0HIZCENn0	Selects whether to enable or disable Hi-Z output control by the TAPAnESO pin input. 0: Disable 1: Enable

36.11.4 Operation Example

This example shows how to generate each of the set signals and clear signals once or less per cycle and then use the results to output a three-phase PWM waveform with dead time.

This is achieved by combining the following TAUD features:

- PWM output
- One-phase PWM output

In addition, the following peripheral interconnections are used to create the PWM waveform supplied from the set and clear signals generated during PWM output to the input TINm signal (m = 11, 13, or 15) of one-phase PWM output:

- SR flip-flop circuit

Three-phase PWM output is achieved by assigning the one-phase PWM output with dead time achieved using the above features to the U, V, and W phases. Therefore, the set and clear signals of PWM output can be freely specified for each PWM phase. Because the only difference among phases is the assigned channel, only one phase (the U phase) is described below.

36.11.4.1 Pwm Output

PWM output uses a combination of CH2, CH4, and CH5.

By specifying the cycle for CDR02, the U phase set value for CDR04, and the U phase clear value for CDR05, a set/clear signal is generated for the SR flip-flop circuit that generates the input TIN11 signal of one-phase PWM output from INT04 and INT05.

Instead of CH4 and CH5, which are used for the above described U phase set/clear signal generation, the V phase uses CH6 and CH7, and the W phase uses CH8 and CH9.

36.11.4.2 One-Phase PWM Output

One-phase PWM output is generated from TOUT10 and TOUT11 by using a combination of CH10 and CH11.

By specifying the dead time value for CDR11, a one-phase PWM signal with dead time is output for the TIN11 input.

Similarly, the V phase uses CH12 and CH13 to output a one-phase PWM signal with dead time, while the W phase uses CH14 and CH15.

CAUTION

Specify the same clock for each TAUDn channel that uses the PWM output and one-phase PWM output features.

For details about the TAUD functions, see **Section 32, Timer Array Unit D (TAUD)**.

36.11.4.3 SR Flip-Flop Circuit

The PWM waveform supplied to input TIN11 of one-phase PWM output is generated by using the U phase set signal generated by CH4 of TAUD and the U phase clear signal generated by CH5.

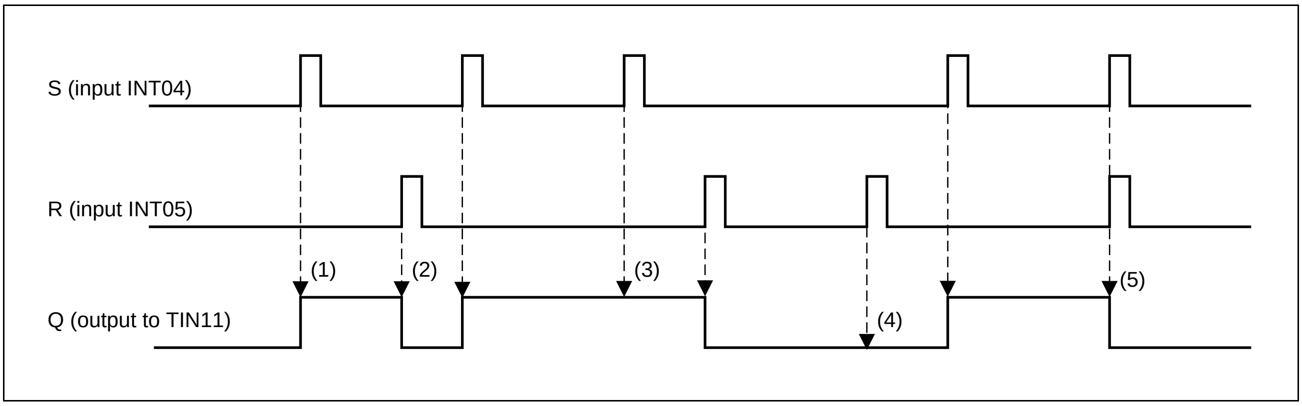

Figure 36.26 SR Flip-Flop Circuit Operation Timing Chart (U phase example)

(1) When a signal is input to input S, output Q goes to the high level at the rising edge of S.

(2) When a signal is input to input R, output Q goes to the low level at the rising edge of R.

(3) If a signal is input to input S while output Q is at the high level, output Q is not affected.

(4) If a signal is input to input R while output Q is at the low level, output Q is not affected.

(5) If a signal is input to input S and input R at the same time, input R is prioritized and output Q goes to the low level at the rising edge of R.

The V phase uses INT06 and INT07 as input to supply a PWM waveform to TIN13, and the W phase uses INT08 and INT09 as input to supply a PWM waveform to TIN15.

The output change timing of the PWM waveform generated during one-phase PWM output is based on PWM output.

The active level output timing set signal and inactive level output timing clear signal of PWM are generated during PWM output. By inputting these signals to the SR flip-flop circuit, a PWM signal that can be changed at any time is generated.

A one-phase PWM signal is output by generating a positive or negative PWM waveform and then adding dead time to it according to changes in the generated PWM signal.

PIC is used to set/clear signal generated during PWM output as the TIN input for one-phase PWM output through the SR flip-flop circuit.

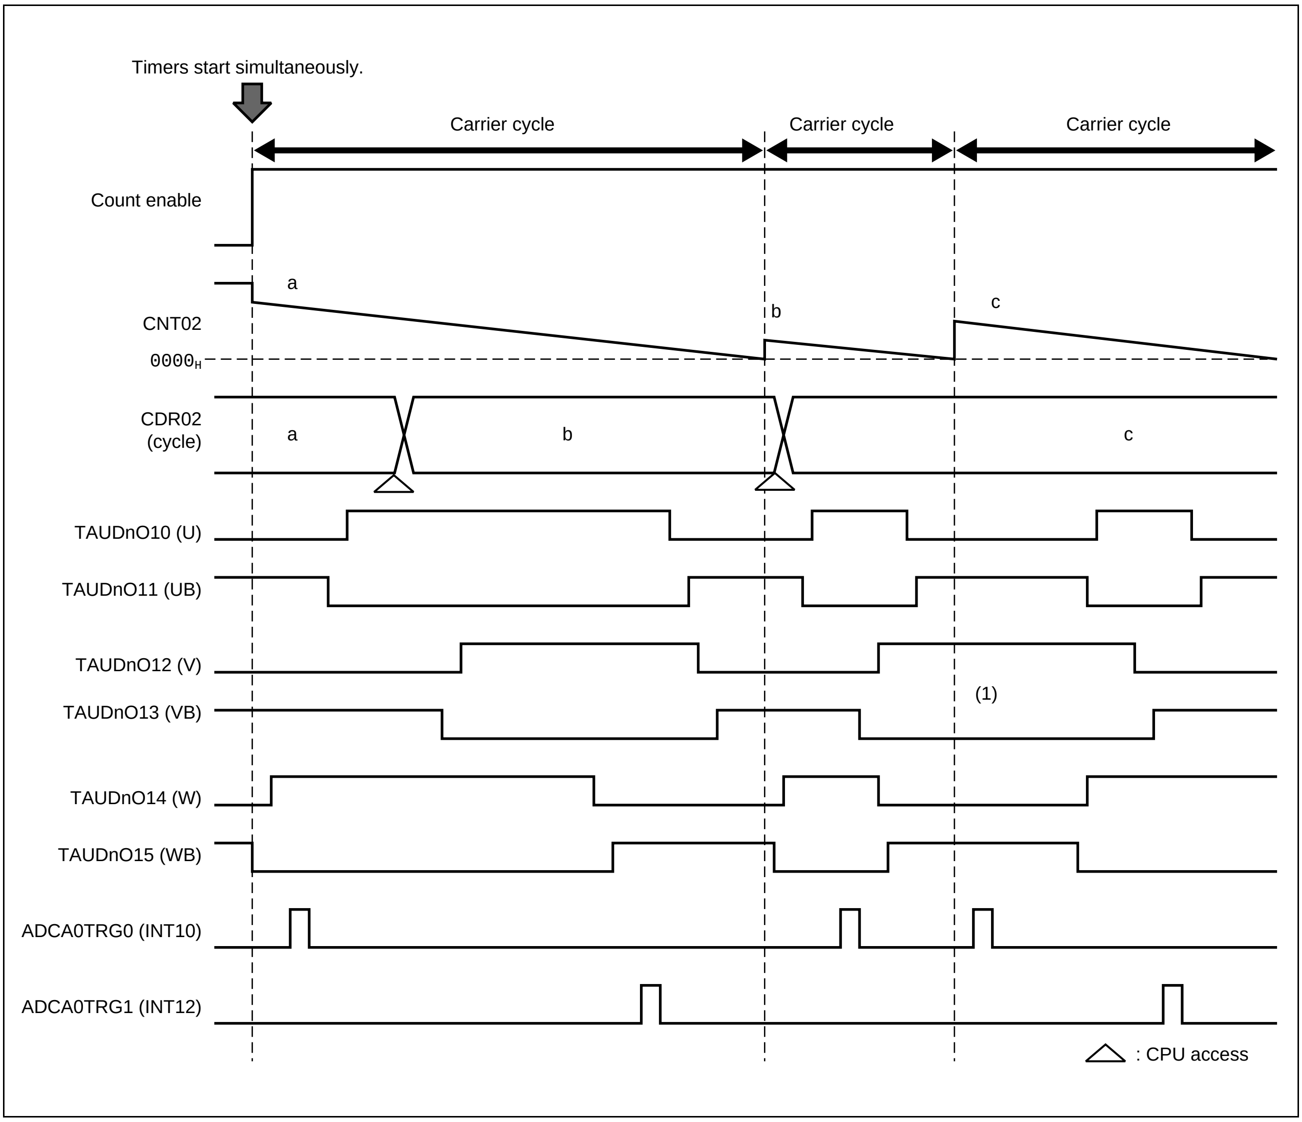

Figure 36.27 Example of Three-Phase PWM (U/UB, V/VB, W/WB) Output with Dead Time

Figure 36.27, Example of Three-Phase PWM (U/UB, V/VB, W/WB) Output with Dead Time shows a typical example of three-phase PWM output with dead time.

By appropriately setting up the set/clear signal output timing, PWM output that extends across carrier cycles (point (1)) and other types of output are also possible.

In this example, ADCA0TRG0 and ADCA0TRG1 (which are at the bottom) use the CNT and INT signals of CH10 and CH12, which are not used for one-phase PWM output, and the A/D trigger signal is output by performing type-1 A/D trigger output.

In this way, because only the TOUTm signal that performs signal output for the channel performing positive phase output is used during one-phase PWM output, any feature that uses CNTm, CDRm, or INTm can be specified. For details, see **Section 32, Timer Array Unit D (TAUD)** (m = 10, 12, or 14).

The following figures show timing charts for outputting a three-phase PWM signal with dead time.

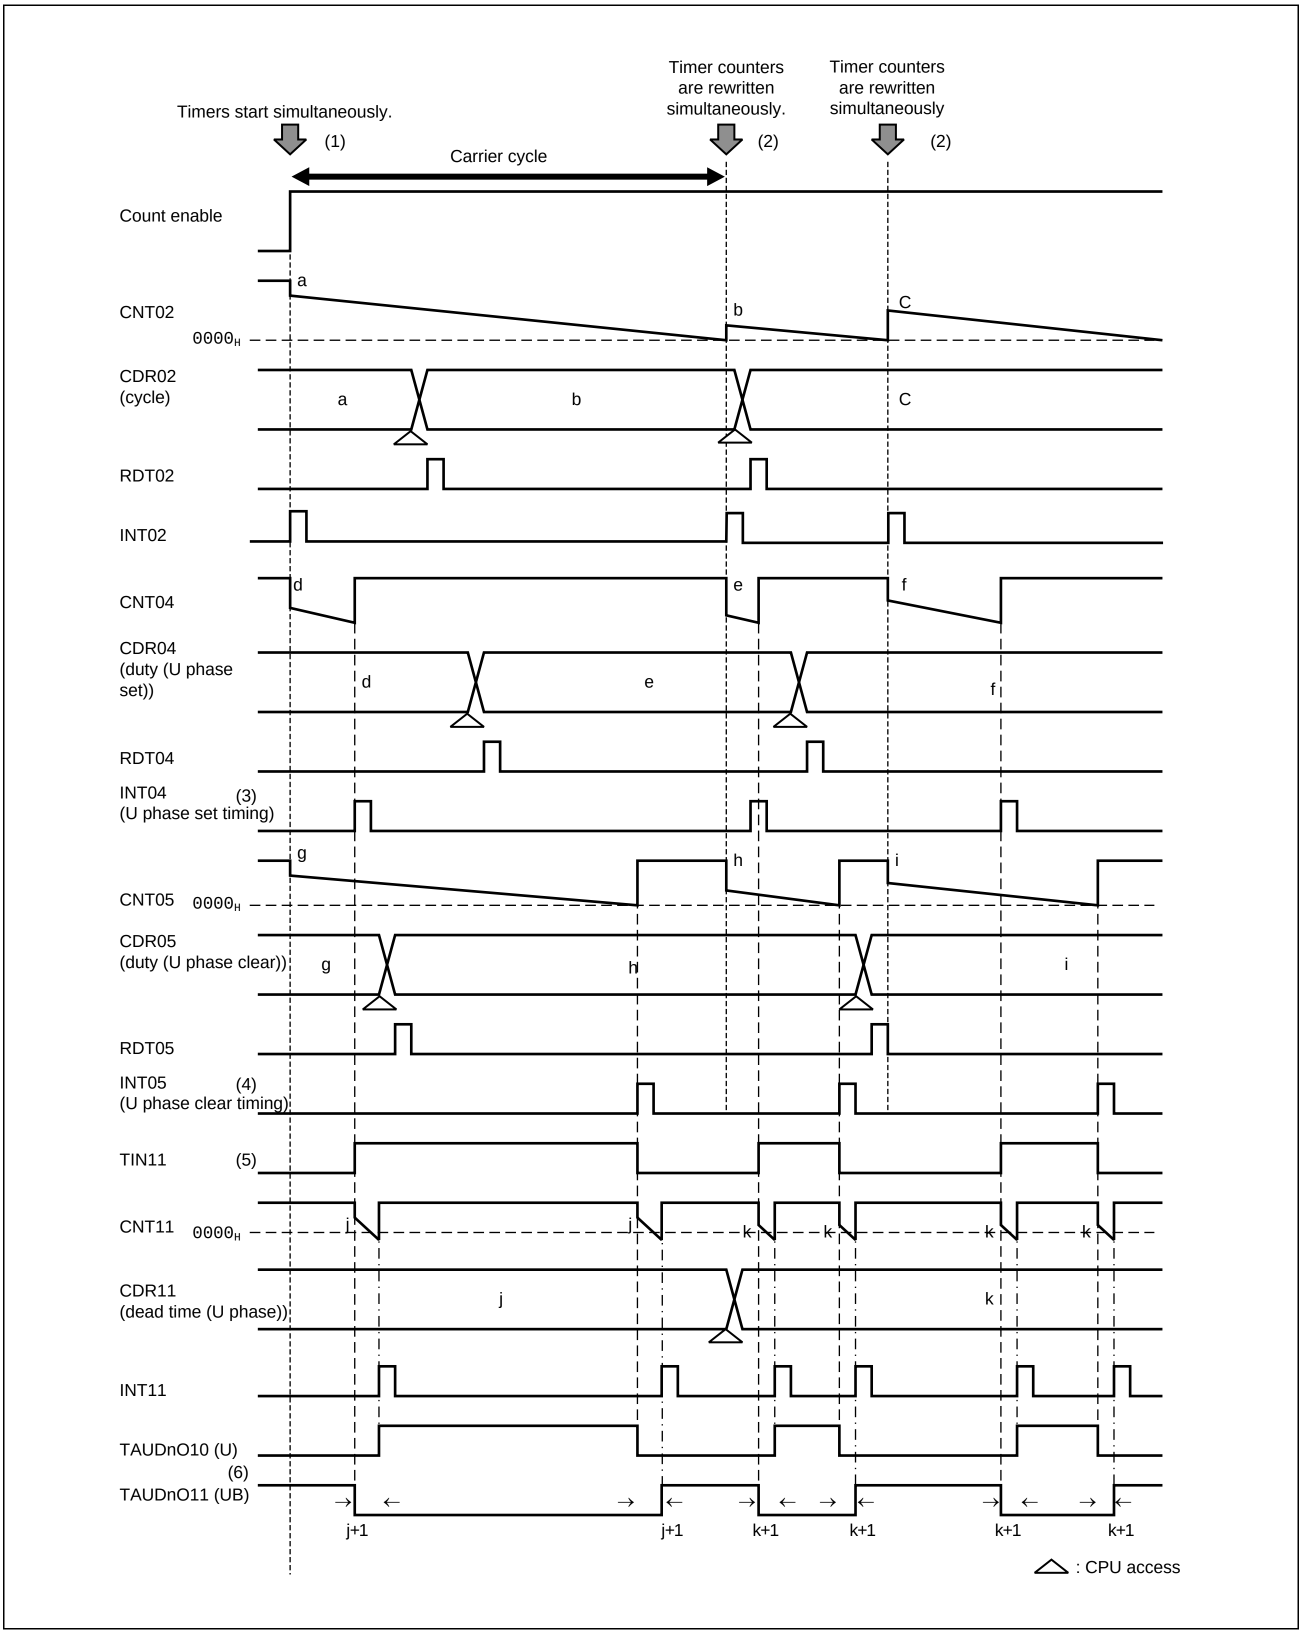

Figure 36.28 Example of One-Phase PWM (U phase, UB phase) Output with Dead Time

An operation example of the timer configuration for performing the U phase PWM output in **Figure 36.28, Example of One-Phase PWM (U phase, UB phase) Output with Dead Time** is provided below.

(1) By simultaneously starting timers, CH2 (the carrier cycle timer), CH4 (the U phase set signal output timing timer), and CH5 (the U phase clear signal output timing timer) are started simultaneously.
The CH11 timer is also enabled, but until a TIN11 edge is detected, which is the count start timing, counting is not performed.

(2) For CH4 and CH5, when there is a CH2 underflow, the settings from CDR04 and CDR05 are reloaded to CNT04 and CNT05.

(3) When there is a CH4 underflow, the U phase set timing signal (INT04) is generated.

(4) When there is a CH5 underflow, the U phase clear timing signal (INT05) is generated.

(5) The peripheral interconnections supply the output of the SR flip-flop circuit that uses INT04 (the set timing signal) and INT05 (the clear timing signal) as input to the input TIN11 signal of one-phase PWM output.

(6) During one-phase PWM output, a PWM waveform with dead time is output by detecting a TIN11 edge.

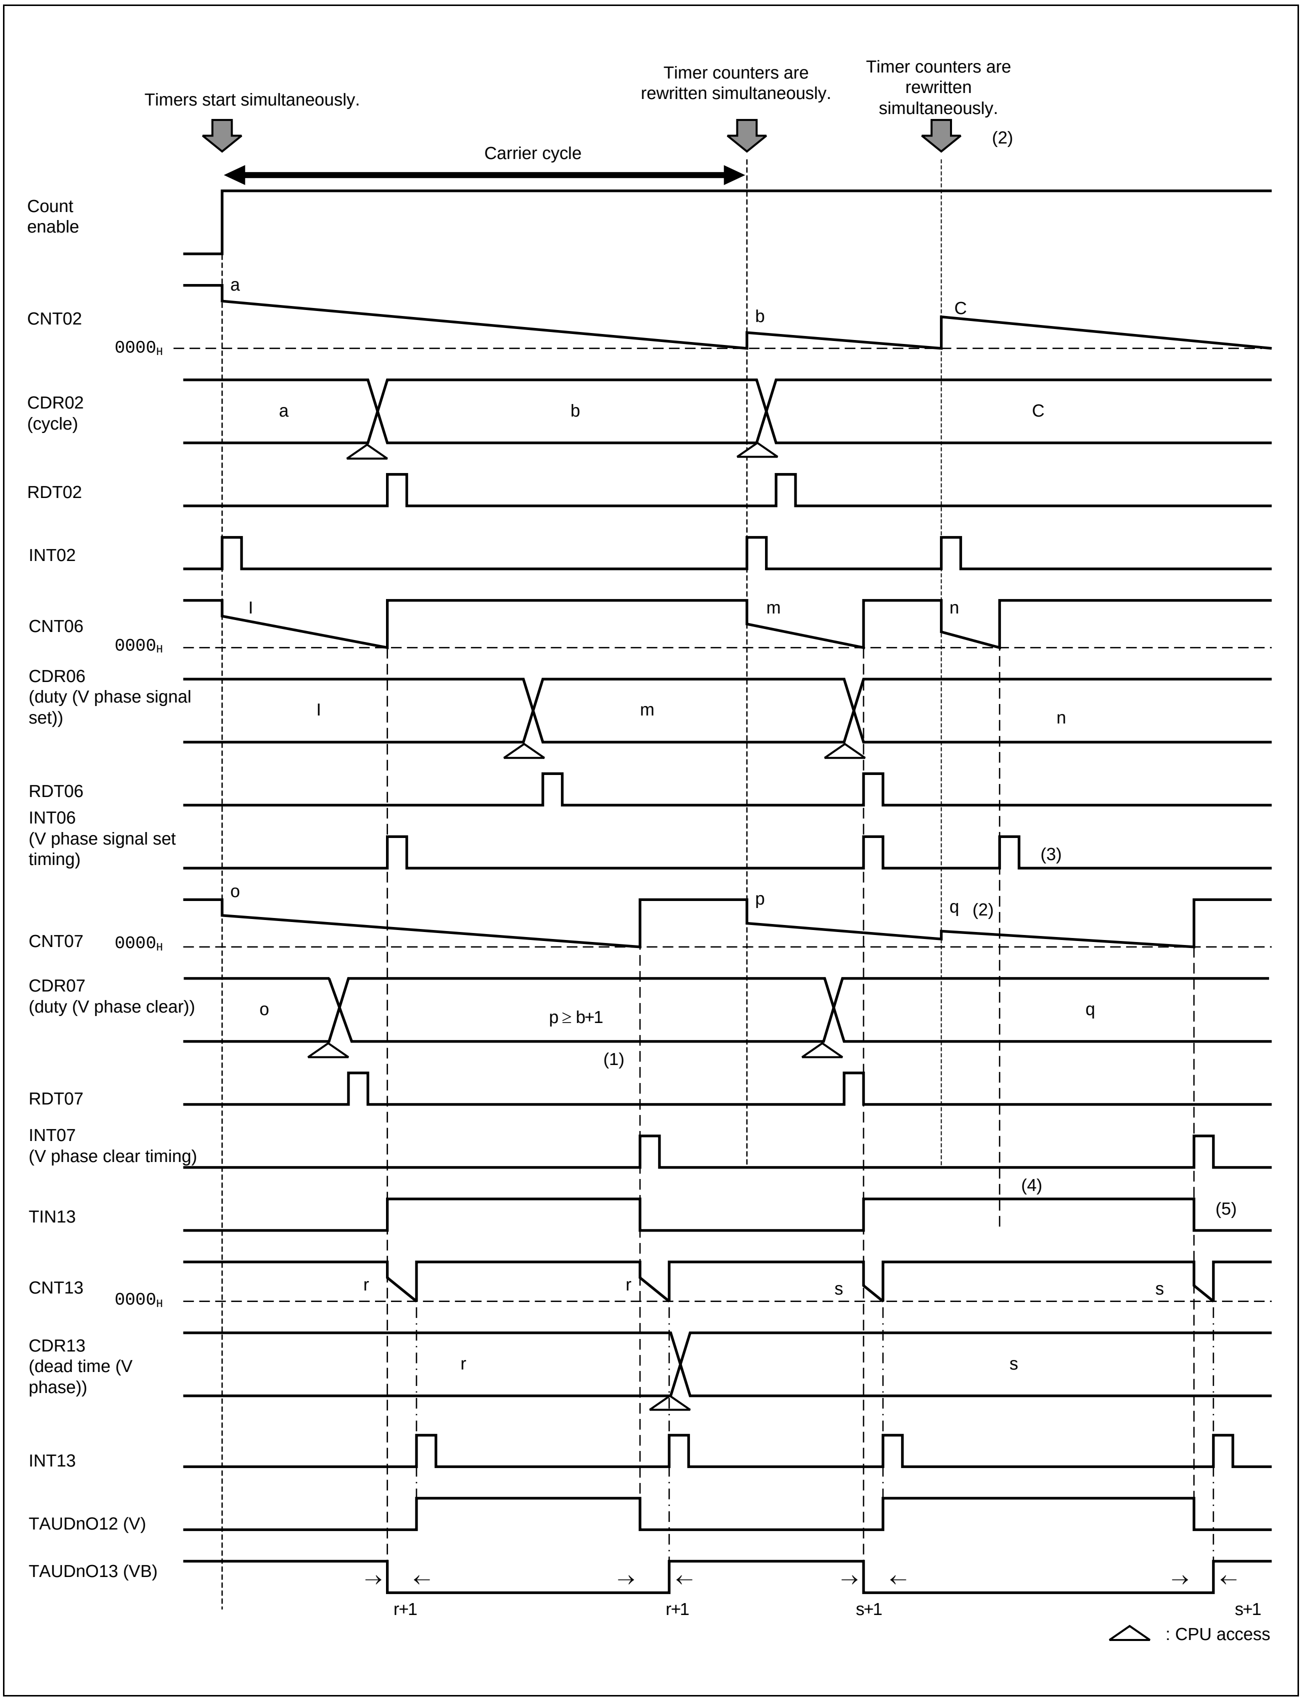

Figure 36.29 Example of One-Phase PWM (V phase, VB phase) Output with Dead Time

An operation example of the timer configuration for performing the V phase PWM output in **Figure 36.29, Example of One-Phase PWM (V phase, VB phase) Output with Dead Time** is provided below.

For details about the operations from when timers are simultaneously started until a one-phase PWM signal is output, see the U phase operation example.

(1) If the setting of CH7 (the V phase clear signal output timing timer), which generates the V phase clear timing signal (INT07), is greater than the CH2 (the carrier cycle timer) setting.

(2) Before a V phase clear timing signal (INT07) is generated by a CH7 underflow, a CH2 (carrier cycle timer) underflow occurs, and the CH7 setting is reloaded.

(3) It causes the V phase clear timing signal (INT07) not to be generated, resulting in consecutive generation of the V phase set timing signal (INT06).

(4) In this case, because the V phase set timing signal (INT06) is ignored by the SR flip-flop circuit, there is no effect on the PWM output waveform. Therefore, a PWM waveform that extends across carrier cycles is output.

(5) The PWM output is changed at the timing of the next V phase clear timing signal (INT07).

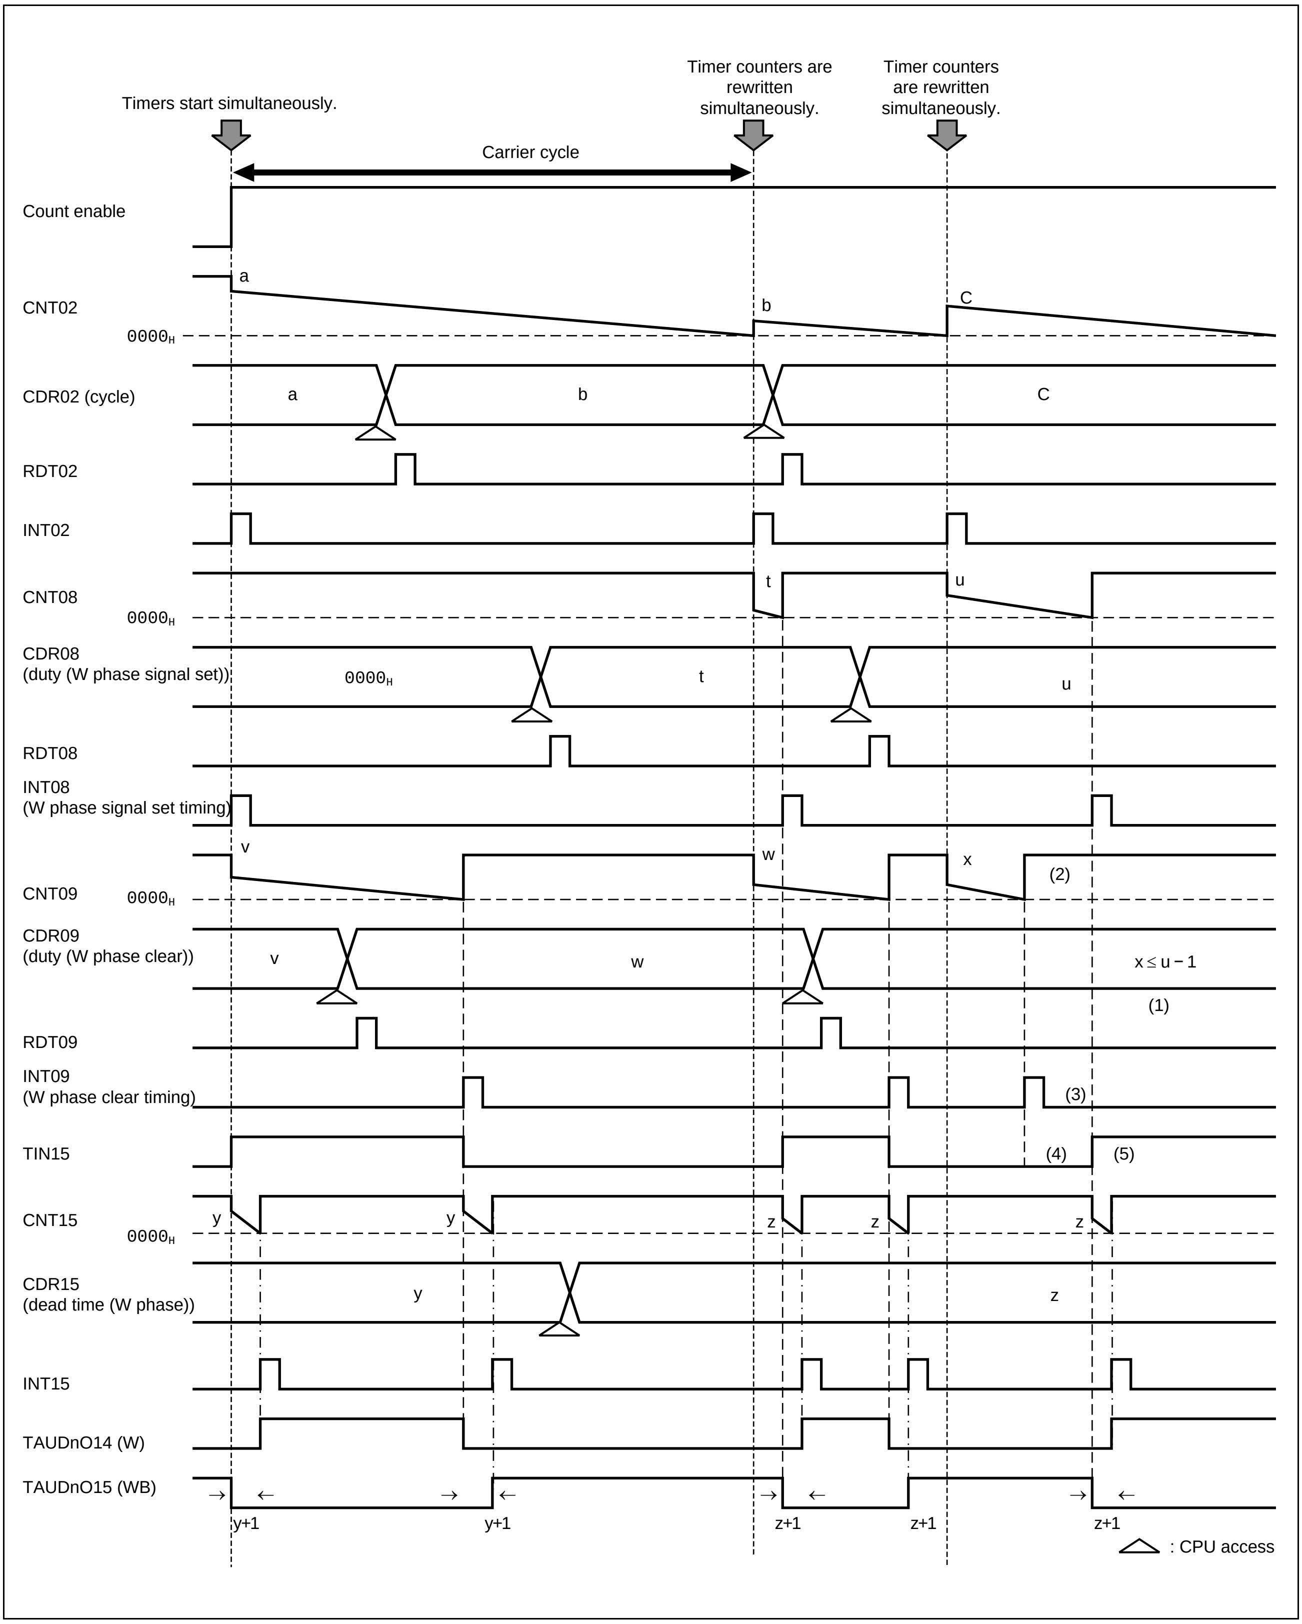

Figure 36.30 Example of One-Phase PWM (W phase, WB phase) Output with Dead Time

An operation example of the timer configuration for performing the W phase PWM output in **Figure 36.30, Example of One-Phase PWM (W phase, WB phase) Output with Dead Time** is provided below.

For details about the operations from when timers are simultaneously started until a one-phase PWM signal is output, see the U phase operation example.

(1) If the setting of CH9 (the W phase clear signal output timing timer), which generates the W phase clear timing signal (INT09), is less than the CH8 (the W phase set signal output timing timer) setting.

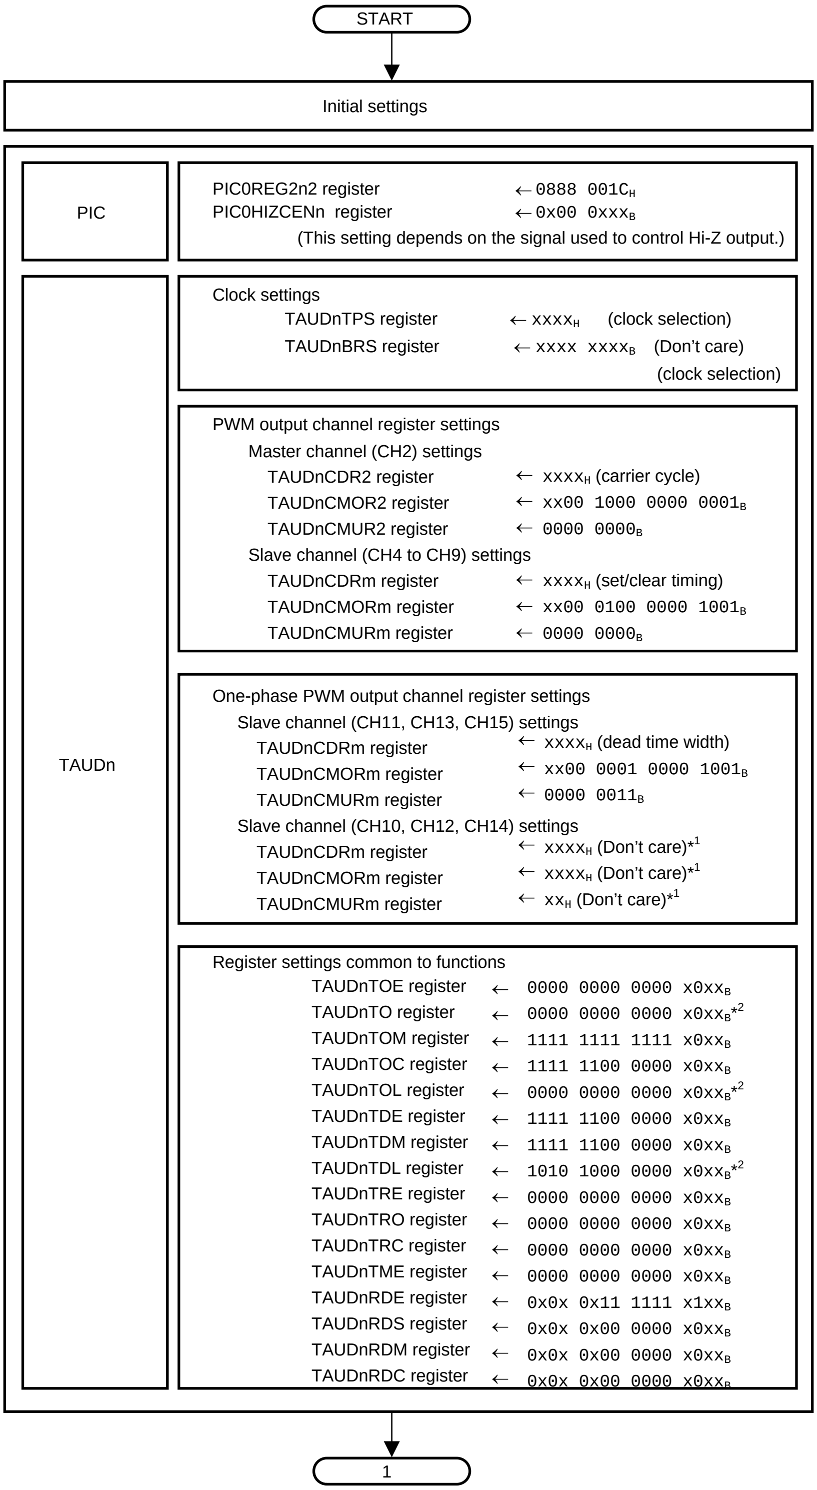
(2) Before a W phase set timing signal (INT08) is generated by a CH8 underflow, a CH9 (W phase clear signal output timing timer) underflow occurs, and the W phase clear timing signal (INT09) is generated.

(3) This results in consecutive W phase clear timing signals (INT09) being generated.

(4) In this case, because the consecutively generated W phase clear timing signals (INT09) are ignored by the SR flip-flop circuit, there is no effect on the PWM output waveform.

(5) The PWM output is changed at the timing of the next W phase set timing signal (INT08).

36.11.5 Setup Flow



PIC0REG2n2 register ← 0888 001C$_H$
PIC0HIZCENn register ← 0x00 0xxx$_B$

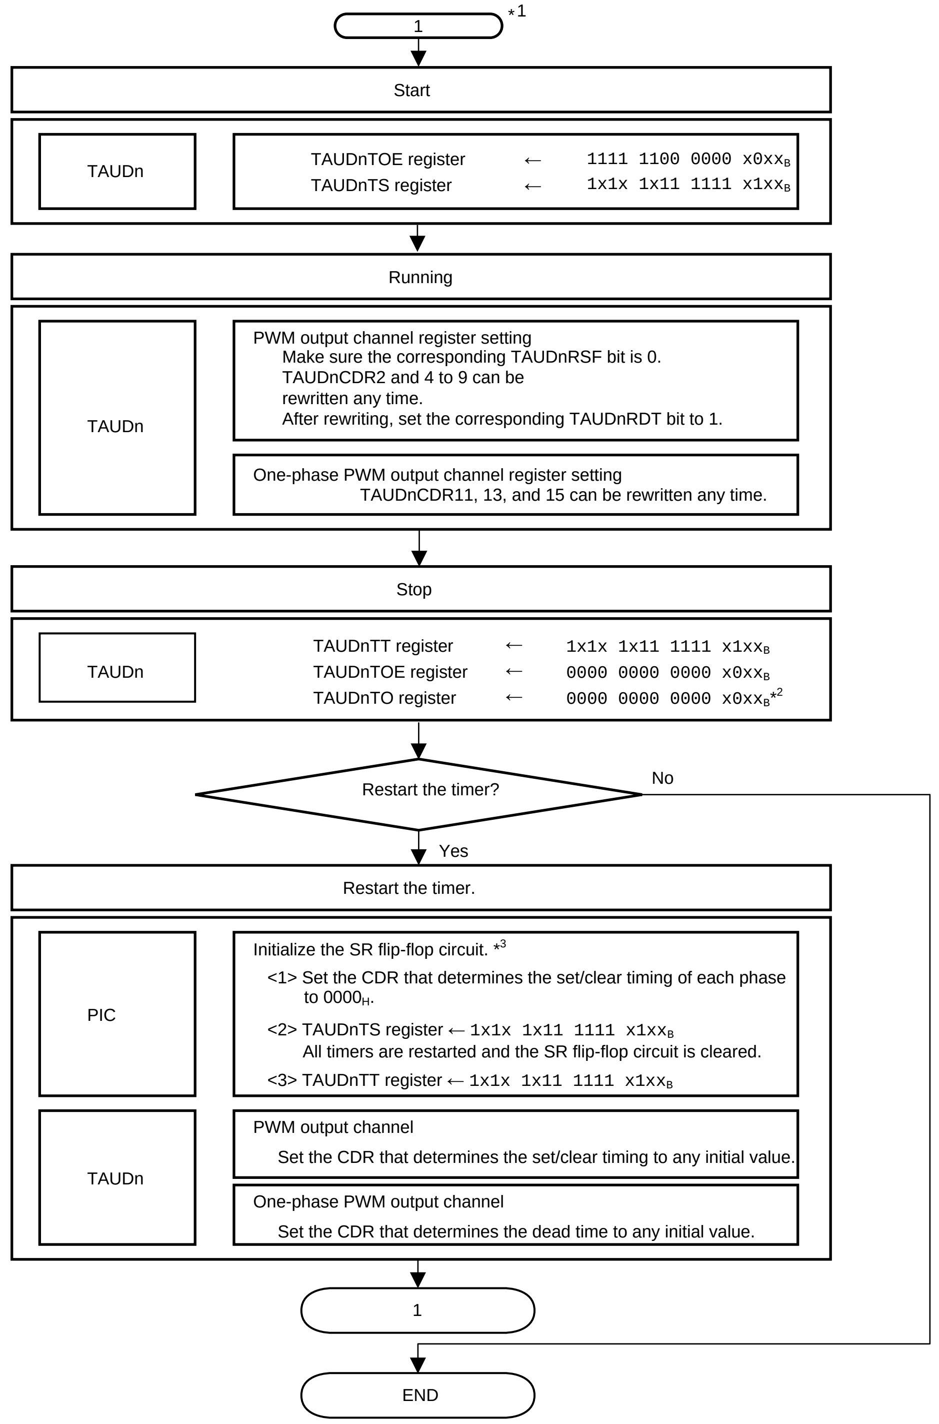
TAUDnRDC register ← 0x0x 0x00 0000 x0xx$_B$

Note 1. Specify a feature that does not use TOUTm.

Note 2. Change settings according to the active level of the PWM signal to be output.

Figure 36.31 Setup Flow (Active High Example)



Note 1. Specify the selection register and output port to use after specifying the initial settings for the peripheral interconnections and timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

Note 3. If initialization processing is not performed, the SR flip-flop circuit enters the timer-stopped state, and the timer restart output pulse might be output at an unintended level.

Figure 36.32 Setup Flow (Active High Example) (continued)

36.11.6 Setting Examples for Operation Functions

This section provides example settings for each register.

36.11.6.1 TAUDn Settings (Active High Example)

Table 36.47 TAUDn: CH2-related (PWM Output Master Channel*[1])

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMOR2	15, 14	TAUDnCKS[1:0]	Don’t care*[2]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	000	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0000	
	0	TAUDnMD0	1	
TAUDnCMUR2	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD PWM output. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 36.48 TAUDn: CH4 to CH9-related (PWM Output Slave Channel*[1]) (m = 4 to 9)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Any*[2]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD PWM output. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

NOTE

For the TAUDnCMORm register used during PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Table 36.49 TAUDn: CH11, CH13, and CH15-related (One-phase PWM Output) (m = 11, 13, or 15)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*[1]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	001	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	11	Both rising and falling TINm edges are detected as valid. (High width)

Note 1. Specify the same operation clock settings as for the PWM output master channel (CH2).

NOTE

For the TAUDnCMORm register used during one-phase PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. CH10, CH12, and CH14 can be used with any feature that does not use TOUTm output (such as A/D trigger output). For details, see **Section 32, Timer Array Unit D (TAUD)**.

Table 36.50 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOE	15 to 10	TAUDnTOE15 to TAUDnTOE10	0 1	Disable the timer. Enable the timer.
	9 to 4	TAUDnTOE09 to TAUDnTOE04	0	These are fixed to 0 because TOUT09 to TOUT04 are not used.
	3	TAUDnTOE03	Don't care	
	2	TAUDnTOE02	0	This is fixed to 0 because TOUT02 is not used.
	1, 0	TAUDnTOE01 TAUDnTOE00	Don't care	
TAUDnTO	15 to 10	TAUDnTO15 to TAUDnTO10	0*[1]	Output a low-level signal to TOUT15 to TOUT10.
	9 to 4	TAUDnTO09 to TAUDnTO04	0	Output a low-level signal to TOUT09 to TOUT04.
	3	TAUDnTO03	Don't care	
	2	TAUDnTO02	0	Output a low-level signal to TOUT02.
	1, 0	TAUDnTO01 TAUDnTO00	Don't care	
TAUDnTOM	15 to 4	TAUDnTOM15 to TAUDnTOM04	1	Synchronous operation mode
	3	TAUDnTOM03	Don't care	
	2	TAUDnTOM02	0	Independent operation mode
	1, 0	TAUDnTOM01 TAUDnTOM00	Don't care	

Table 36.50 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOC	15 to 10	TAUDnTOC15 to TAUDnTOC10	1	Synchronous operation mode 2
	9 to 4	TAUDnTOC09 to TAUDnTOC04	0	Synchronous operation mode 1
	3	TAUDnTOC03	Don’t care	
	2	TAUDnTOC02	0	Operation mode 1
	1, 0	TAUDnTOC01 TAUDnTOC00	Don’t care	
TAUDnTOL	15 to 4	TAUDnTOL15 to TAUDnTOL04	0*1	Positive logic output (active high)
	3	TAUDnTOL03	Don’t care	
	2	TAUDnTOL02	0	Positive logic output (active high)
	1, 0	TAUDnTOL01 TAUDnTOL00	Don’t care	
TAUDnTDE	15 to 10	TAUDnTDE15 to TAUDnTDE10	1	Enable dead time control.*2
	9 to 4	TAUDnTDE09 to TAUDnTDE04	0	Disable dead time control.
	3	TAUDnTDE03	Don’t care	
	2	TAUDnTDE02	0	Disable dead time control.
	1, 0	TAUDnTDE01 TAUDnTDE00	Don’t care	
TAUDnTDM	15 to 10	TAUDnTDM15 to TAUDnTDM10	1	Output dead time upon detecting a TINm input edge at a lower odd channel.
	9 to 4	TAUDnTDM09 to TAUDnTDM04	0	Invalid because dead time control is disabled.
	3	TAUDnTDM03	Don’t care	
	2	TAUDnTDM02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDM01 TAUDnTDM00	Don’t care	
TAUDnTDL	15	TAUDnTDL15	1*1	Dead time is in the negative segment of the W phase output
	14	TAUDnTDL14	0*1	Dead time is in the positive segment of the W phase output
	13	TAUDnTDL13	1*1	Dead time is in the negative segment of the V phase output
	12	TAUDnTDL12	0*1	Dead time is in the positive segment of the V phase output
	11	TAUDnTDL11	1*1	Dead time is in the negative segment of the U phase output
	10	TAUDnTDL10	0*1	Dead time is in the positive segment of the U phase output
	9 to 4	TAUDnTDL09 to TAUDnTDL04	0	Invalid because dead time control is disabled.
	3	TAUDnTDL03	Don’t care	
	2	TAUDnTDL02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDL01 TAUDnTDL00	Don’t care	
TAUDnTRE	15 to 4	TAUDnTRE15 to TAUDnTRE04	0	Stop real-time output.
	3	TAUDnTRE03	Don’t care	
	2	TAUDnTRE02	0	Stop real-time output.
	1, 0	TAUDnTRE01 TAUDnTRE00	Don’t care	

Table 36.50 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTRO	15 to 4	TAUDnTRO15 to TAUDnTRO04	0	Invalid because real-time output is disabled.
	3	TAUDnTRO03	Don't care	
	2	TAUDnTRO02	0	Invalid because real-time output is disabled.
	1, 0	TAUDnTRO01 TAUDnTRO00	Don't care	
TAUDnTRC	15 to 4	TAUDnTRC15 to TAUDnTRC04	0	Do not use this channel to generate the real-time output trigger.
	3	TAUDnTRC03	Don't care	
	2	TAUDnTRC02	0	Do not use this channel to generate the real-time output trigger.
	1, 0	TAUDnTRC01 TAUDnTRC00	Don't care	
TAUDnTME	15 to 4	TAUDnTME15 to TAUDnTME04	0	Disable modulation output for timer output and real-time output.
	3	TAUDnTME03	Don't care	
	2	TAUDnTME02	0	Disable modulation output for timer output and real-time output.
	1, 0	TAUDnTME01 TAUDnTME00	Don't care	
TAUDnRDE	15	TAUDnRDE15	0	Disable simultaneous rewriting.
	14	TAUDnRDE14	Don't care	
	13	TAUDnRDE13	0	Disable simultaneous rewriting.
	12	TAUDnRDE12	Don't care	
	11	TAUDnRDE11	0	Disable simultaneous rewriting.
	10	TAUDnRDE10	Don't care	
	9 to 4	TAUDnRDE09 to TAUDnRDE04	1	Enable simultaneous rewriting.
	3	TAUDnRDE03	Don't care	
	2	TAUDnRDE02	1	Enable simultaneous rewriting.
	1, 0	TAUDnRDE01 TAUDnRDE00	Don't care	
TAUDnRDS	15	TAUDnRDS15	0	Do not enable simultaneous rewriting by using another upper channel.
	14	TAUDnRDS14	Don't care	
	13	TAUDnRDS13	0	Do not enable simultaneous rewriting by using another upper channel.
	12	TAUDnRDS12	Don't care	
	11	TAUDnRDS11	0	Do not enable simultaneous rewriting by using another upper channel.
	10	TAUDnRDS10	Don't care	
	9 to 4	TAUDnRDS09 to TAUDnRDS04	0	Enable simultaneous rewriting by using a master channel.
	3	TAUDnRDS03	Don't care	
	2	TAUDnRDS02	0	Enable simultaneous rewriting by using a master channel.
	1, 0	TAUDnRDS01 TAUDnRDS00	Don't care	

Table 36.50 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnRDM	15	TAUDnRDM15	0	Invalid because simultaneous rewriting is not enabled.
	14	TAUDnRDM14	Don't care	
	13	TAUDnRDM13	0	Invalid because simultaneous rewriting is not enabled.
	12	TAUDnRDM12	Don't care	
	11	TAUDnRDM11	0	Invalid because simultaneous rewriting is not enabled.
	10	TAUDnRDM10	Don't care	
	9 to 4	TAUDnRDM09 to TAUDnRDM04	0	Load the signal when the master channel starts counting.
	3	TAUDnRDM03	Don't care	
	2	TAUDnRDM02	0	Load the signal when the master channel starts counting.
	1, 0	TAUDnRDM01 TAUDnRDM00	Don't care	
TAUDnRDC	15	TAUDnRDC15	0	Invalid because simultaneous rewriting is not enabled.
	14	TAUDnRDC14	Don't care	
	13	TAUDnRDC13	0	Invalid because simultaneous rewriting is not enabled.
	12	TAUDnRDC12	Don't care	
	11	TAUDnRDC11	0	Invalid because simultaneous rewriting is not enabled.
	10	TAUDnRDC10	Don't care	
	9 to 4	TAUDnRDC09 to TAUDnRDC04	0	Do not use this channel to generate the simultaneous rewrite trigger.
	3	TAUDnRDC03	Don't care	
	2	TAUDnRDC02	1	Do not use this channel to generate the simultaneous rewrite trigger.
	1, 0	TAUDnRDC01 TAUDnRDC00	Don't care	

Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see **Section 32, Timer Array Unit D (TAUD)**.

36.11.6.2 PIC Settings

Table 36.51 PIC Settings

Register	Bit Position	Bit Name	Setting	Remark
PIC0REG2n2	27	PIC0REG2n227	1	Select the input selected by the PIC0REG2n204 bit.
	23	PIC0REG2n223	1	Select the input selected by the PIC0REG2n203 bit.
	19	PIC0REG2n219	1	Select the input selected by the PIC0REG2n202 bit.
	4	PIC0REG2n204	1	Select the set/clear output according to INTTAUDnI8 and INTTAUDnI9.
	3	PIC0REG2n203	1	Select the set/clear output according to INTTAUDnI6 and INTTAUDnI7.
	2	PIC0REG2n202	1	Select the set/clear output according to INTTAUDnI4 and INTTAUDnI5.

36.12 High-accuracy Triangle PWM Output with Dead Time

36.12.1 Functional Overview

Compared to the triangle PWM output with dead time of TAUD, this makes it possible to control the variable dead time areas near duties of 100% and 0%. This makes more accurate triangle PWM output possible.

For the triangle PWM output with dead time feature of TAUD, it is not possible to output a UB phase dead time pulse, such as when transitioning to U phase 0% triangular wave output. (See **Figure 36.33, Timing of Dead Time Output by the TAUD Feature for Outputting a Triangle PWM Signal with Dead Time**)

For this feature, a pulse is generated in combination with the TAUD timer output, and a pseudo dead time pulse is added.

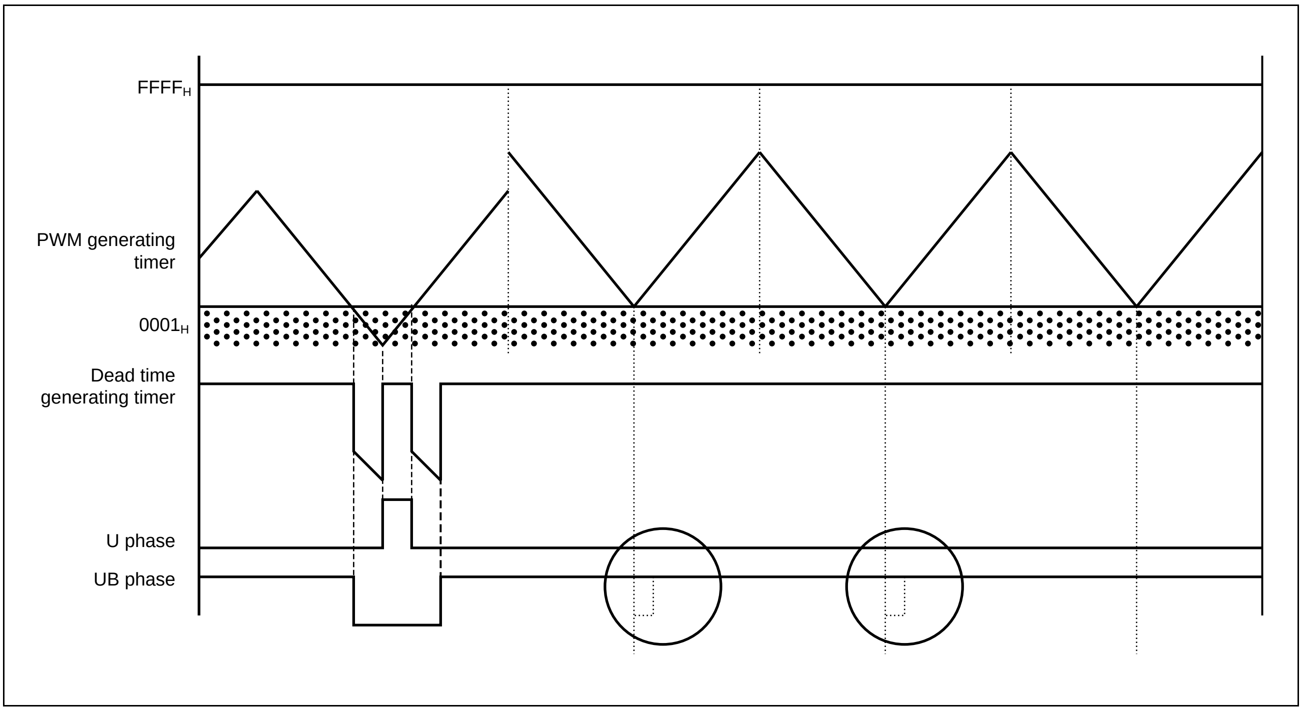


Figure 36.33 Timing of Dead Time Output by the TAUD Feature for Outputting a Triangle PWM Signal with Dead Time

36.12.2 Configuration

The unit and channel configuration for this feature is shown below. (n = 0)

Table 36.52 Configuration of Delay Pulse Output with Dead Time

Timer	Timer Motor Control Function
TAUD0 CH2, CH4 to CH15 (used channels fixed)	TAPA0

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm → INTTAUDnIm (TAUDn channel m interrupt)
- TINm → TAUDTTINm (TAUDn channel m input)
- TOUTm → TAUDTTOUTm (TAUDn channel m output)
- CDRm → TAUDnCDRm (TAUDn channel m data register)
- CNTm → TAUDnCNTm (TAUDn channel m counter register)

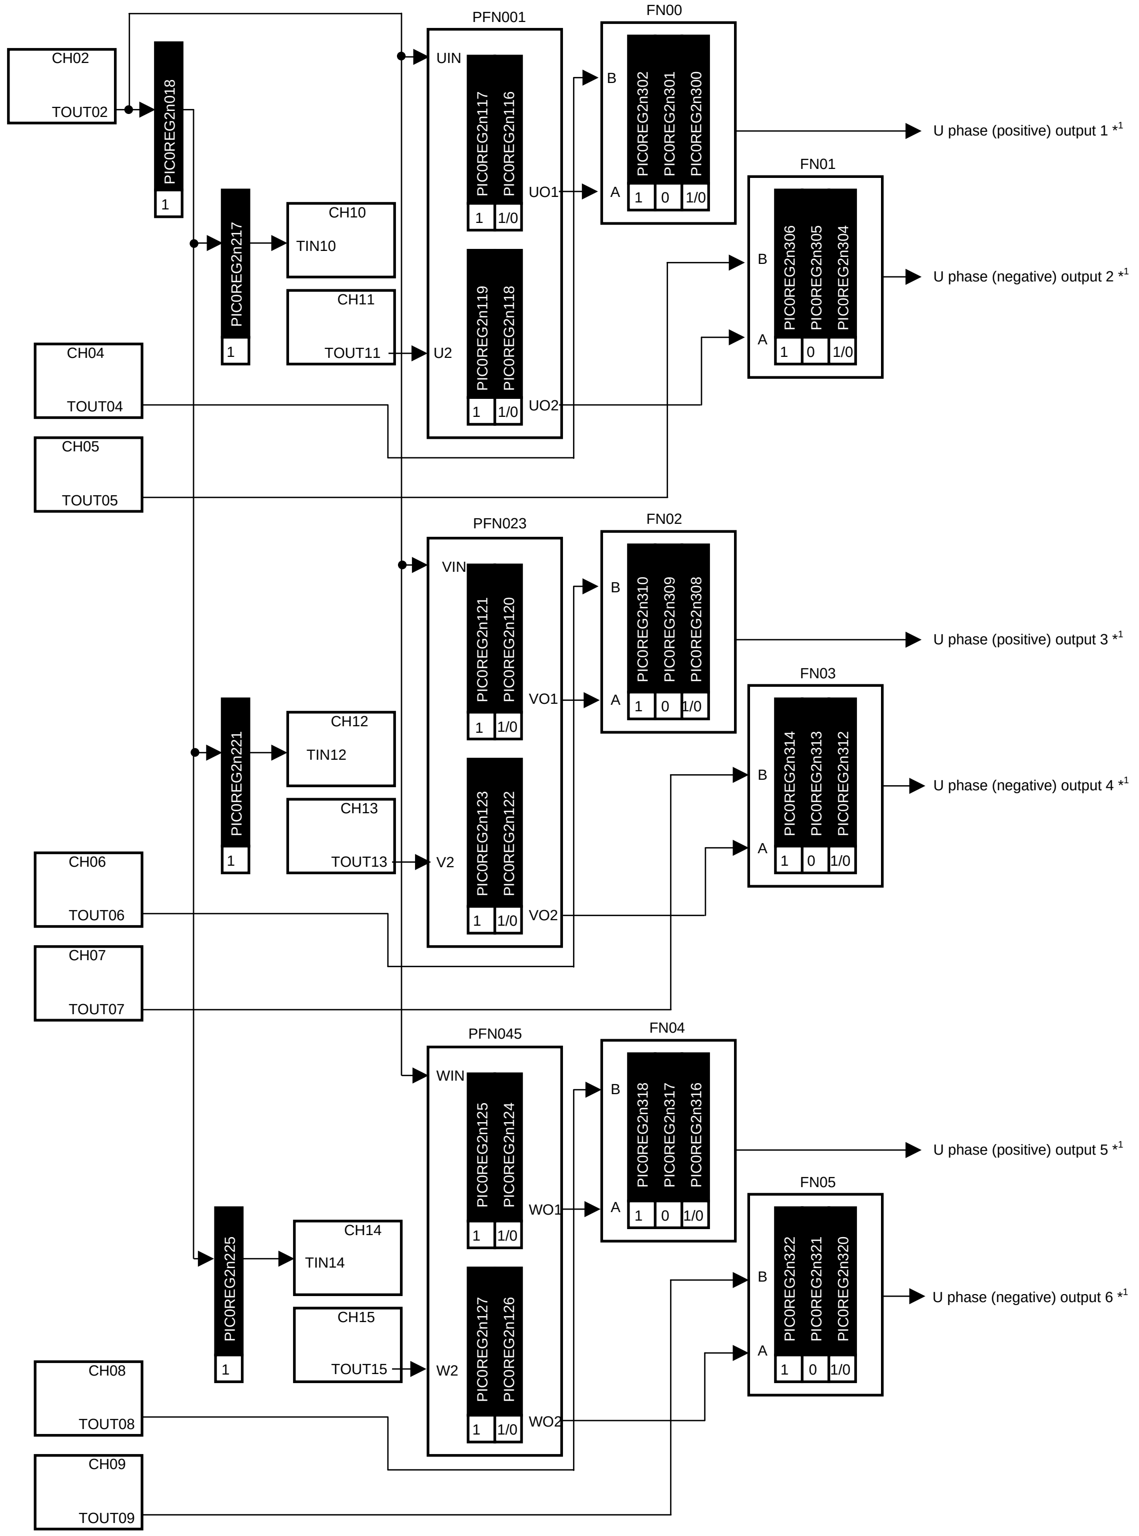
(1) TAUDn Configuration

Table 36.53 TAUD Configuration

CH	Function Name	M/S*1	CDR Setting	Description
2	Triangle PWM output with dead time (CH2 is the master channel for CH4 to CH9.)	M	Cycle	
4		S	Duty (U phase)	
5		S	Dead time (U phase)	
6		S	Duty (V phase)	
7		S	Dead time (V phase)	
8		S	Duty (W phase)	
9		S	Dead time (W phase)	
10	One-shot pulse output	M	Delay	Generate the pulse to be inserted into the variable dead time area for U phase PWM.
11		S	Pulse width	
12	One-shot pulse output	M	Delay	Generate the pulse to be inserted into the variable dead time area for V phase PWM.
13		S	Pulse width	
14	One-shot pulse output	M	Delay	Generate the pulse to be inserted into the variable dead time area for W phase PWM.
15		S	Pulse width	

Note 1. M: Master channel, S: Slave channel

(2) Block Diagram



Note 1. For the connection destination, see **Figure 36.25, Block Diagram: Motor Output Buffer Control**.

Figure 36.34 Block Diagram: High-Accuracy Triangle PWM Output with Dead Time

36.12.3 Registers

36.12.3.1 PIC0REG2n0 — Timer I/O Control Register 2n0 (n = 0)

This register selects TAUDn input.

Access: This register can be read or written in 32-bit units.

Address: PIC0REG200: FFDD 00C0$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	PIC0REG2n018	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 36.54 PIC0REG2n0 Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	*[1]
18	PIC0REG2n018	Select the TIN input signal to TAUDTTIN10, TAUDTTIN12, and TAUDTTIN14. 0: Setting prohibited 1: Select TAUDTTOUT2.
17 to 0	Reserved	*[1]

Note 1. Some of the bits defined as 0 in the PIC0REG2n0 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

36.12.3.2 PIC0REG2n1 — Timer I/O Control Register 2n1 (n = 0)

This register selects the logic of a combination circuit.

Access: This register can be read or written in 32-bit units.

Address: PIC0REG201: FFDD 00C4$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	PIC0HIZCENn0	Select whether to enable or disable Hi-Z output control by the TAPAnESO pin input. 0: Disable 1: Enable

36.12.4 Operation Example

This is achieved by combining the following TAUD features:

- Triangle PWM output with dead time
- One-shot pulse output

In addition, the following PIC is also used because the pulse to be inserted into the variable dead time area is generated for the positive or negative phase:

- Combination circuit (PFN001, PFN023, and PFN045)

In addition, the following peripheral interconnections are also used because the pulse to be inserted into the variable dead time area is combined with the triangle PWM output waveform:

- Logical operation circuit (FN0i) (i = 0 to 5)

A high-accuracy triangle PWM signal with dead time is output by assigning the PWM output achieved using the above features to the U, V, and W phases. Therefore, the PWM output dead time can be freely specified for the PWM signal of each phase. Because the only difference among phases is the assigned channel, only one phase (the U phase) is described below.

36.12.4.1 Triangle PWM Output with Dead Time

A triangle PWM signal with dead time is output from TOUT04 and TOUT05 by using CH2, CH4, and CH5 in combination.

36.12.4.2 One-shot Pulse Output

A CDR11 pulse for which the width is delayed by the delay time (CDR10) from the valid edge of the TIN10 (TOUT02) signal of CH10 is output as TOUT11 by using CH10 and CH11 in combination.

This pulse is used as the variable dead time area pulse used near duties of 100% and 0%.

CAUTION

Specify each CDR setting for one-shot pulse output such that the following condition is satisfied: CDR05 ≥ (CDR10 + CDR11)

If a value that does not satisfy the above condition is specified, the output waveform might be affected. To minimize this effect, in addition to satisfying the above setting condition, leave CDR11 set to 0000_H until the variable dead time area pulse is required.
Detect both rising and falling edges as the valid TIN10 (TOUT02) edge, and set TAUDnTOL11 to 1 (active low).
Specify the same operation clock for each TAUDn channel used for outputting a triangle PWM signal with dead time or a one-shot pulse.

For details about the TAUD functions, see **Section 32, Timer Array Unit D (TAUD)**.

36.12.4.3 U phase Combination Circuit (PFN001)

This circuit generates a variable dead time area pulse (FN00 A, FN01 A) for adding a generated one-shot pulse to a generated triangle PWM signal with dead time.

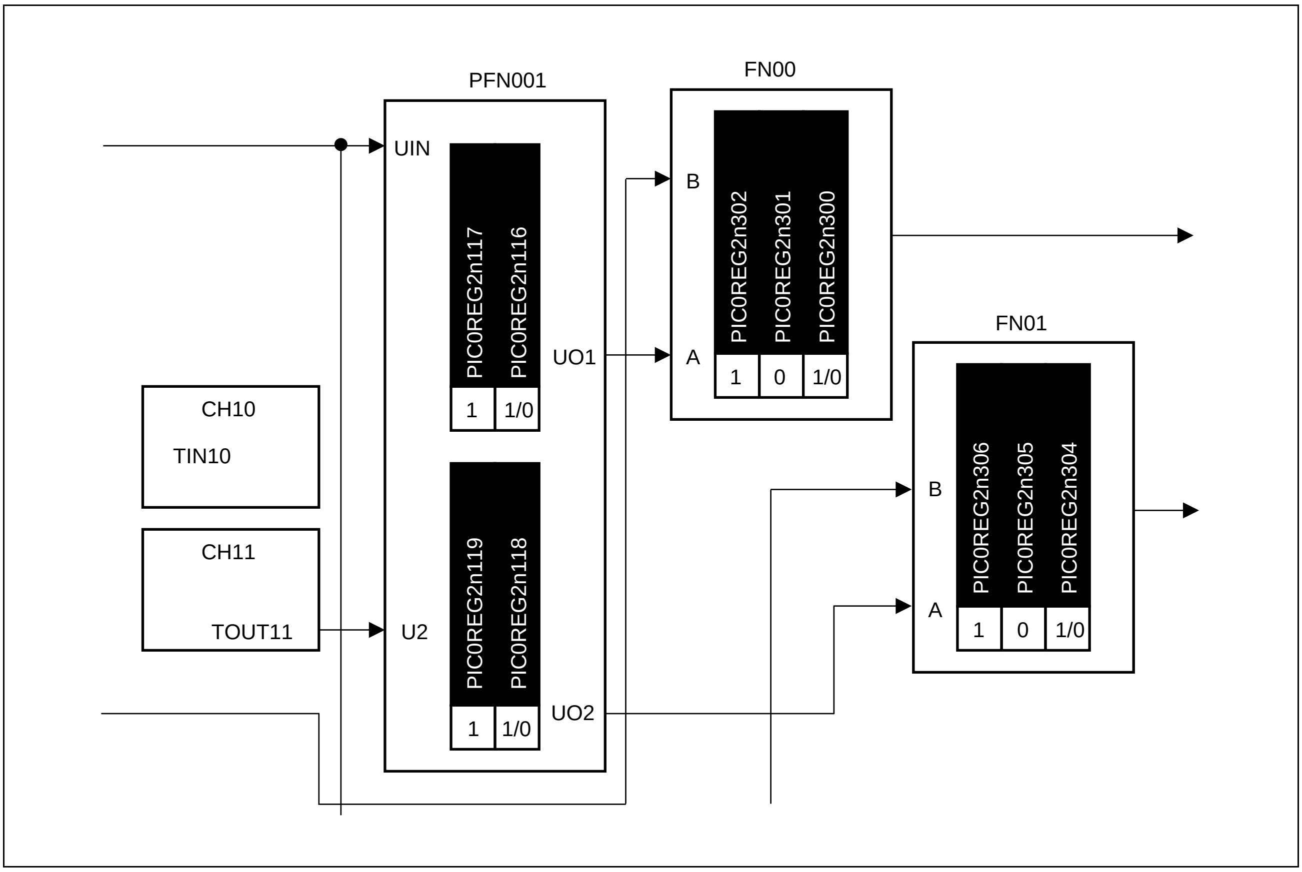

Figure 36.35 Block Diagram Excerpt (PFN001, FN00, and FN01)

The table below shows the relationships between combination circuit input (UIN, U2) and output (UO1, UO2).

Table 36.59 U and UB Phase Combination Circuit (PFN001) I/O Table

- UO1 (U phase variable dead time area pulse) output

UIN (TOUT02)	U2 (TOUT11)	UO1	
		PIC0REG2n117, 16 = 10_B U phase output active high (TAUDnTOL04 = 0)	PIC0REG2n117, 16 = 11_B U phase output active low (TAUDnTOL04 = 1)
0	0	1	0
0	1	1	0
1	0	0	1
1	1	1	0

- UO2 (UB phase variable dead time area pulse) output

UIN (TOUT02)	U2 (TOUT11)	UO2	
		PIC0REG2n119, 18 = 10_B UB phase output active high (TAUDnTOL05 = 0)	PIC0REG2n119, 18 = 11_B UB phase output active low (TAUDnTOL05 = 1)
0	0	0	1
0	1	1	0
1	0	1	0
1	1	1	0

NOTE

The PIC0REG2n116, PIC0REG2n117, PIC0REG2n118, and PIC0REG2n119 settings change depending on the active U phase and UB phase levels of the generated triangle PWM signal with dead time.

36.12.4.4 Logical Operation Circuit (FN0i) (i = 0 or 1)

This circuit combines an output triangle PWM signal with dead time (TOUT04, TOUT05) with combination circuit output (UO1 and UO2 of PFN001) and generates a PWM signal to which a variable dead time area pulse has been added.

The combination logic for the logical operation circuit is switched according to the PIC0REG2n3 register setting. (Bits 0 to 2 are specified for U phase output, and bits 4 to 6 are specified for UB phase output.)

Set up the logical operation circuit as shown in the table below. The combined signal is output from the TAPAnUP and TAPAnUM pins according to the specified combination logic.

Table 36.60 Logical Operation Circuit (FN0i) (i = 0 or 1) Settings and TAPAnUP and TAPAnUM Pin Output

- U phase output (TOUT04)

Active Level	PIC0REG2n302 to 00	TAPAnUP Pin Output Waveform
Active high (TAUDnTOL04 = 0)	100_B	AND of FN00 B (TOUT04) and FN00 A (UO1)
Active low (TAUDnTOL04 = 1)	101_B	OR of FN00 B (TOUT04) and FN00 A (UO1)

- UB phase output (TOUT05)

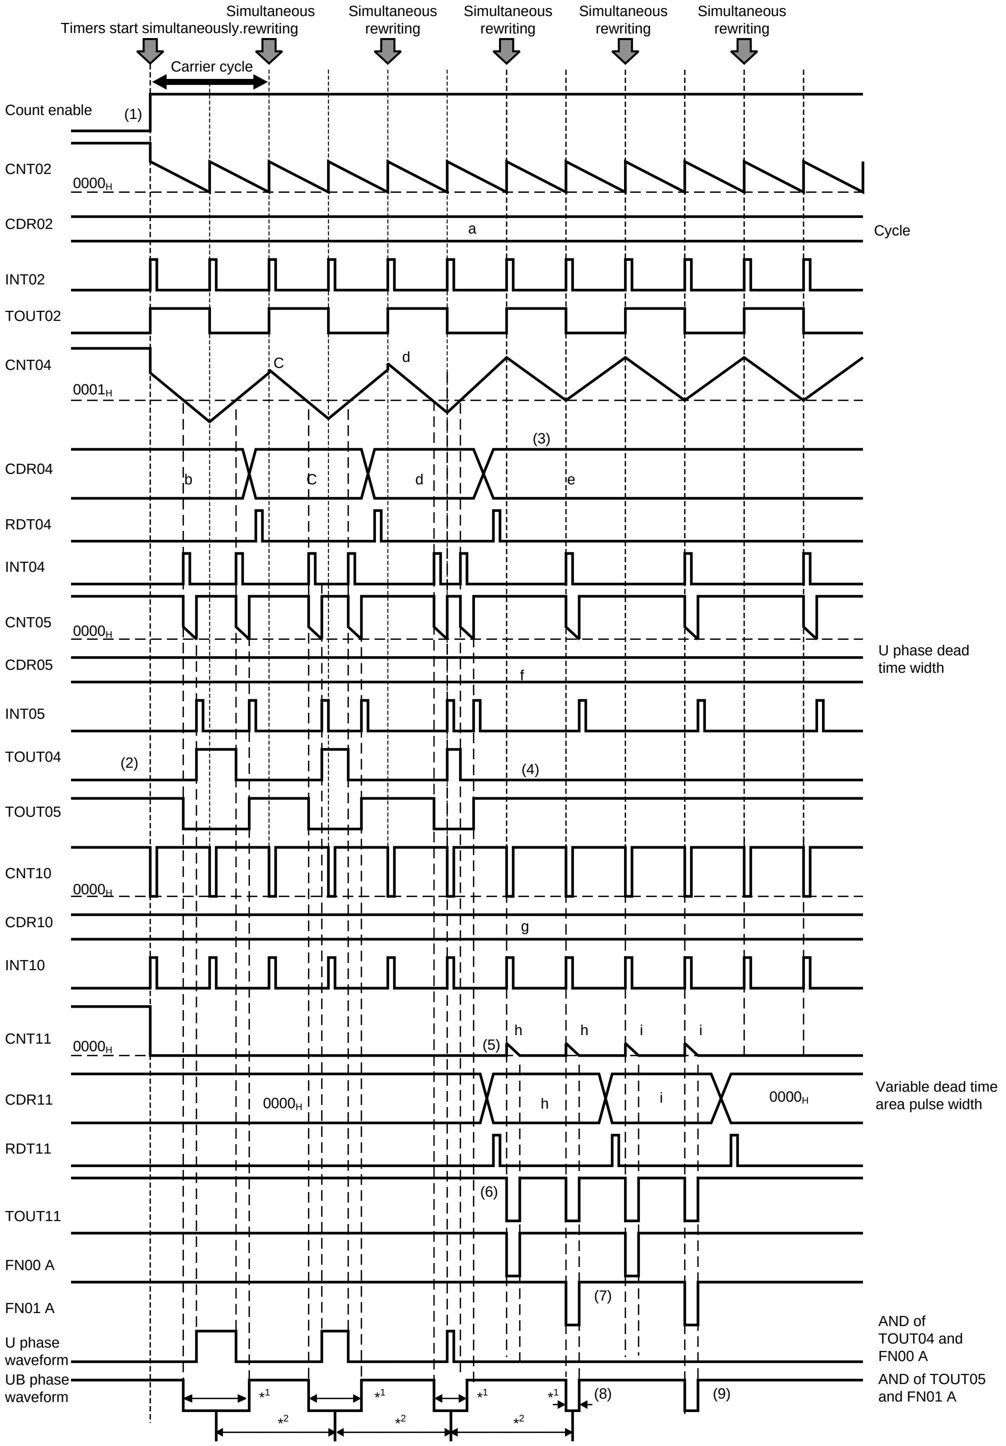
Active Level	PIC0REG2n306 to 04	TAPAnUM Pin Output
Active high (TAUDnTOL05 = 0)	100_B	AND of FN01 B (TOUT05) and FN01 A (UO2)
Active low (TAUDnTOL05 = 1)	101_B	OR of FN01 B (TOUT05) and FN01 A (UO2)

Because the above makes variable dead time control possible to ensure output accuracy near duties of 0% and 100% even for TAUD, a more accurate triangle PWM signal can be output than that output using the TAUD feature for outputting a triangle PWM signal with dead time.

For the V/VB phase and W/WB phase, the used channels and register bits differ, but the settings are the same, as shown in **Figure 36.34, Block Diagram: High-Accuracy Triangle PWM Output with Dead Time.**

The peripheral interconnections provide a connection for adding the pulse generated during one-shot pulse output to the PWM signal generated during output of a triangle PWM signal with dead time by using the combination circuit and logical operation circuit of the peripheral interconnections.

The following figures show timing charts for outputting a high-accuracy triangle PWM signal with dead time.



Note 1. The variable dead time area pulse uses a sawtooth wave and is therefore expanded on one side, unlike a pulse that uses a triangle wave, which is expanded on both sides.

Note 2. Because the variable dead time area pulse is expanded on one side, the length of the one-phase PWM output cycle for the variable dead time area increases by 1/2 the added variable dead time area pulse width.

Figure 36.36 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))

An operation example in which the system transitions to a U phase of 0% and UB phase of 100% in the timer configuration for performing the U phase PWM output shown in **Figure 36.36, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))** is provided below. Output of a triangle PWM signal with dead time is active high.

(1) When timer operation is started, output of a triangle PWM with dead time is started by the CH2, CH4, and CH5 channels of TAUDn.

(2) A triangle PWM waveform with dead time is generated from TOUT04 and TOUT05.

(3) A U phase duty output value of 0% is specified for CDR04.

(4) Due to the setting in (3), TOUT04 output is the inactive level, and TOUT05 output is the active level. However, no variable dead time area pulse is output during this operation.

(5) To create a variable dead time area pulse, the value to be used as the pulse width is specified for CDR11 when specifying the 0% U phase duty in (3).
For this example, the CDR11 setting is fixed to 0000_H until the system enters the variable dead time area to prevent adverse effects on the output PWM signal.

(6) The variable dead time area pulse is output as a pulse that has the width specified for CDR11 after the delay time specified for CDR10 elapses, starting at the TOUT02 edge.

(7) The pulse output in (6) is converted to a variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A) by the combination circuit (PFN001).

(8) The pulse generated in (7) is combined with the TOUT04 and TOUT05 output waveforms by using the logical operation circuits (FN00, FN01), and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output).

(9) By later changing the CDR11 setting, which specifies the width of the variable dead time area pulse, the desired variable dead time area pulse can be added.

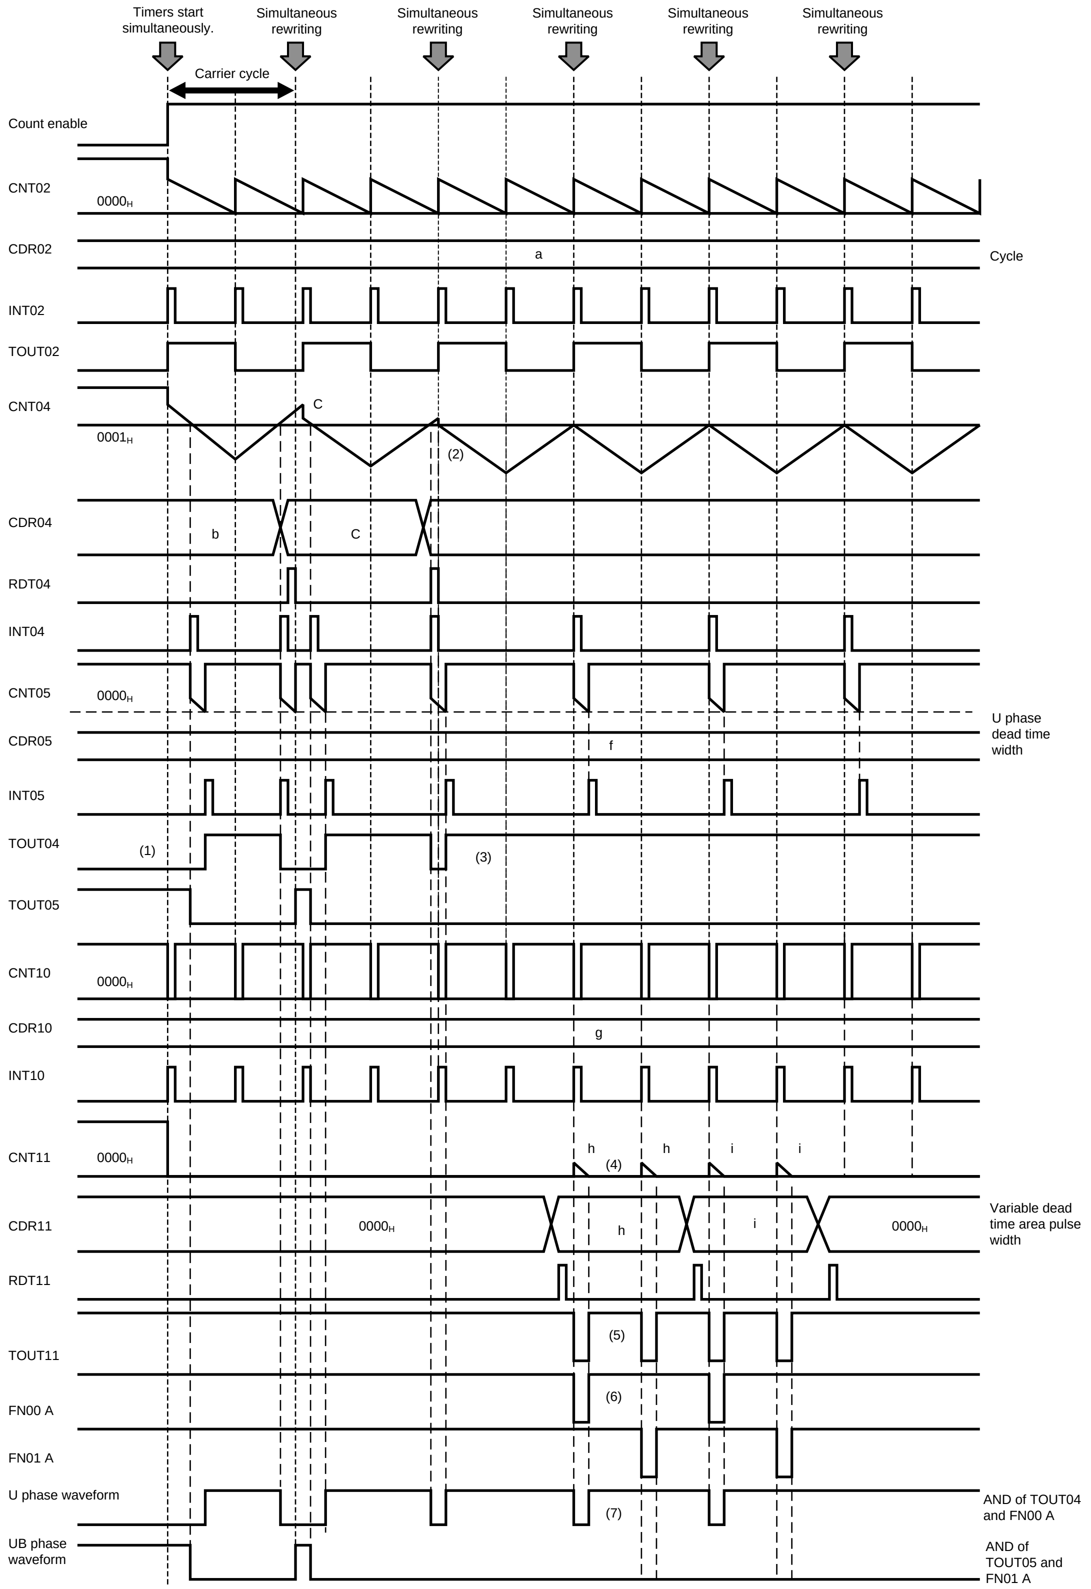


Figure 36.37 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))

An operation example in which the system transitions to a U phase of 100% and UB phase of 0% in the timer configuration for performing the U phase PWM output shown in **Figure 36.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))** is provided below. Output of a triangle PWM signal with dead time is active high.

(1) The timer operation from the start of timer operation until the output of a triangle PWM signal with dead time is the same.

(2) A U phase duty output value of 100% (CDR04 = 0000_H) is specified for CDR04.

(3) Due to the setting in (2), TOUT04 output is the active level, and TOUT05 output is the inactive level. However, no variable dead time area pulse is output during this operation.

(4) To create a variable dead time area pulse, the value to be used as the pulse width is specified for CDR11 one cycle after specifying the 100% U phase duty setting in (2).
For this example, the CDR11 setting is fixed to 0000_H until the system enters the variable dead time area to prevent adverse effects on the output PWM signal.

(5) The variable dead time area pulse is output as a pulse that has the width specified for CDR11 after the delay time specified for CDR10 elapses, starting at the TOUT02 edge.

(6) The pulse output in (5) is converted to a variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A) by the combination circuit (PFN001).

(7) The pulse generated in (6) is combined with the TOUT04 and TOUT05 output waveforms by using the logical operation circuits (FN00, FN01), and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output).

CAUTION

If the 100% U phase duty setting for CDR04 and the variable dead time area pulse width for CDR11 are specified at the same time, the variable dead time area pulse is affected by the amount shown by (2) for the last PWM signal output from TOUT04 and shown by feature specification (1), as shown in **Figure 36.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**.
To cancel this effect, the CDR11 setting is delayed one cycle.

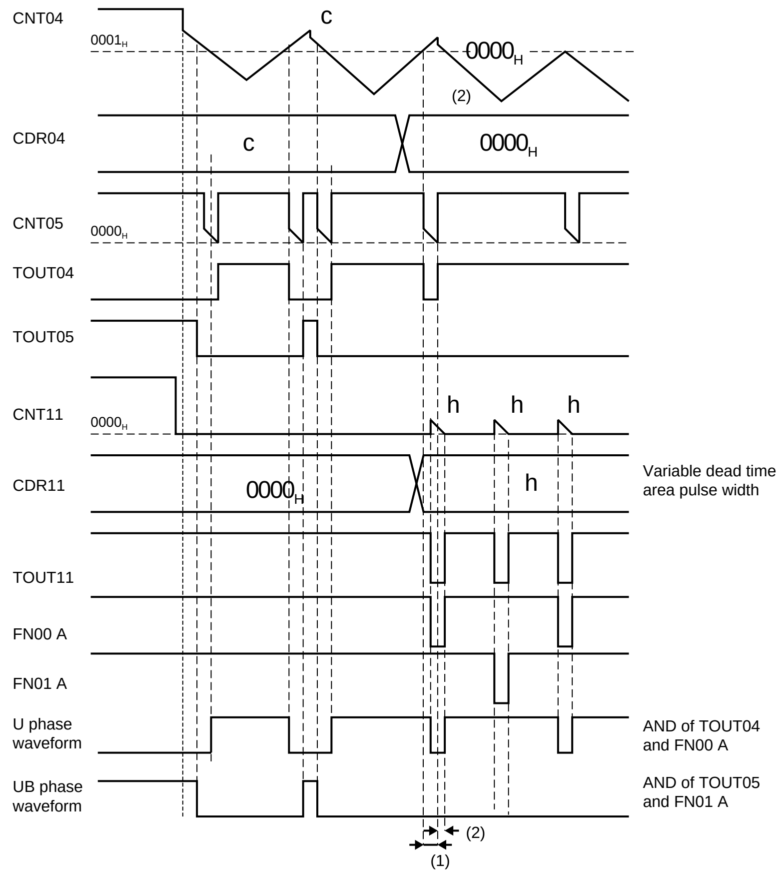

Figure 36.38 Effect on the Output Triangle PWM Wave with Dead Time by the Variable Dead Time Area Pulse

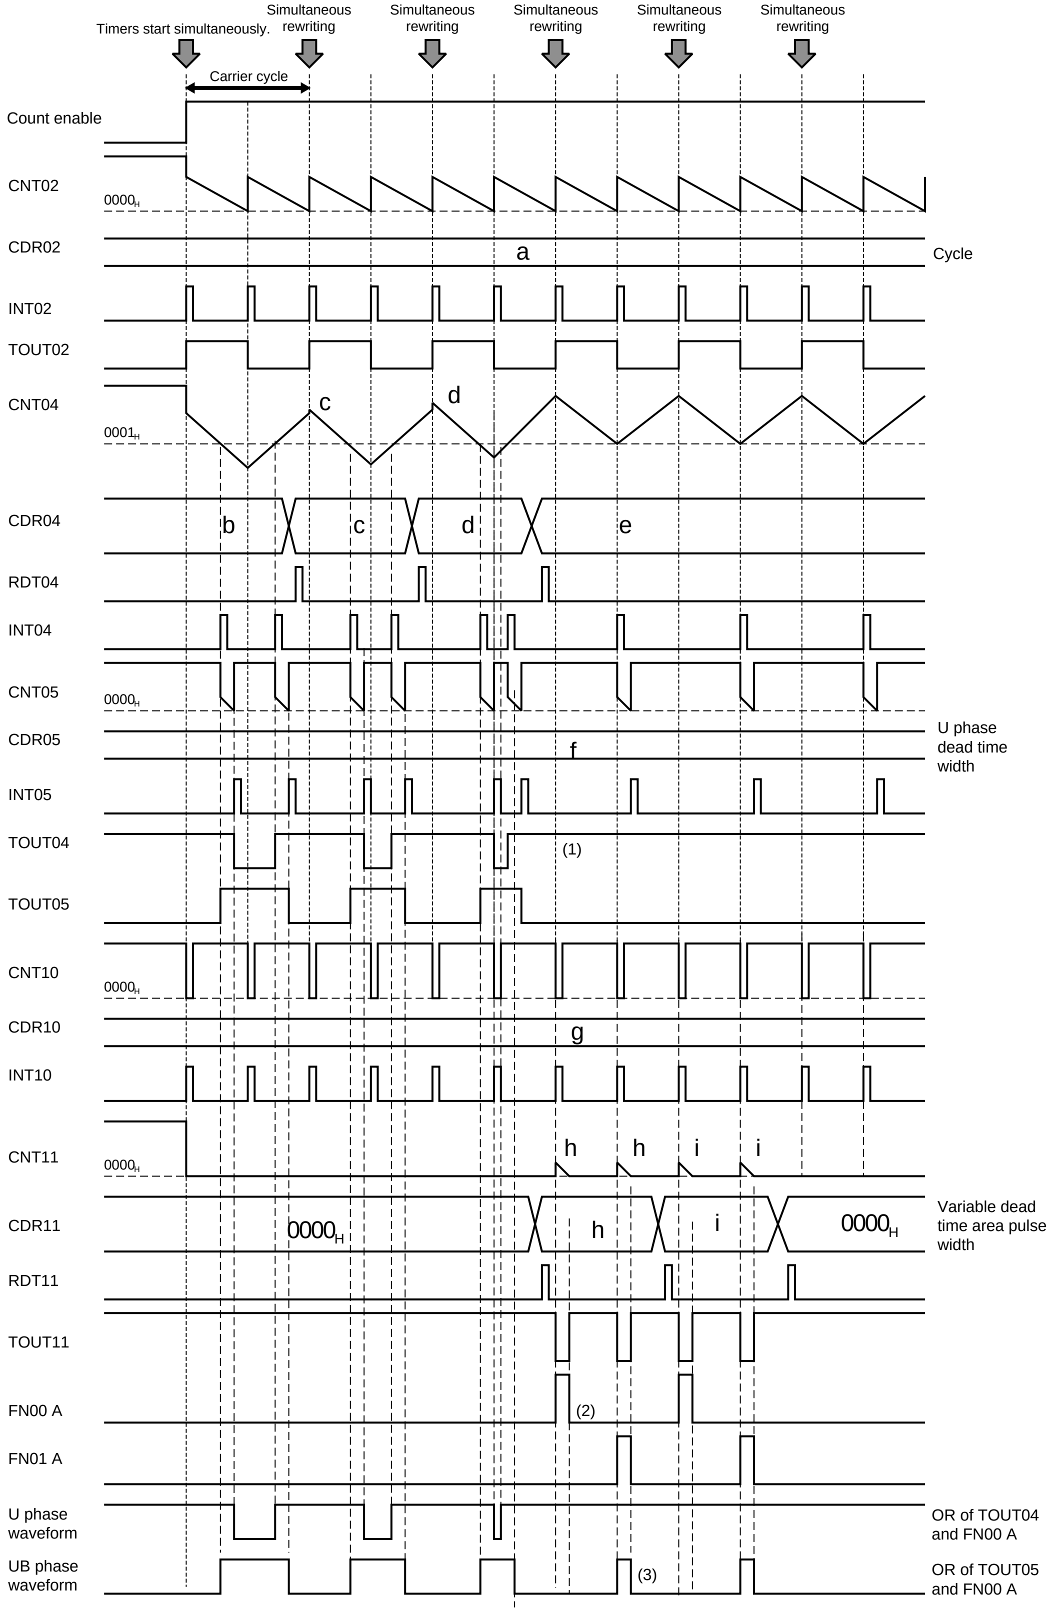

Figure 36.39 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (TAUDnTOL04 = 1 (Active Low), TAUDnTOL05 = 1 (Active Low))

An operation example in which the system transitions to a U phase of 100% and UB phase of 0% in the timer configuration for performing the U phase PWM output shown in **Figure 36.39, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (TAUDnTOL04 = 1 (Active Low), TAUDnTOL05 = 1 (Active Low))** is provided below. Output of a triangle PWM signal with dead time is active low.

(1) The timer operation from the start of timer operation until the output of a triangle PWM with dead time is the same as in **Figure 36.36, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**. However, an active low PWM signal is output from TOUT04 and TOUT05.

(2) Therefore, active low output that corresponds with PWM output is specified as the combination circuit setting (PIC0REG2n116 and PIC0REG2n117, and PIC0REG2n118 and PIC0REG2n119). This results in the output of an active low variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A).

(3) In addition, active low output that corresponds with PWM output is also specified as the logical operation circuit setting (PIC0REG2n302 to PIC0REG2n300 and PIC0REG2n306 to PIC0REG2n304). The pulse generated in (2) is combined with the TOUT04 and TOUT05 output waveforms, and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output) as an active low PWM signal.

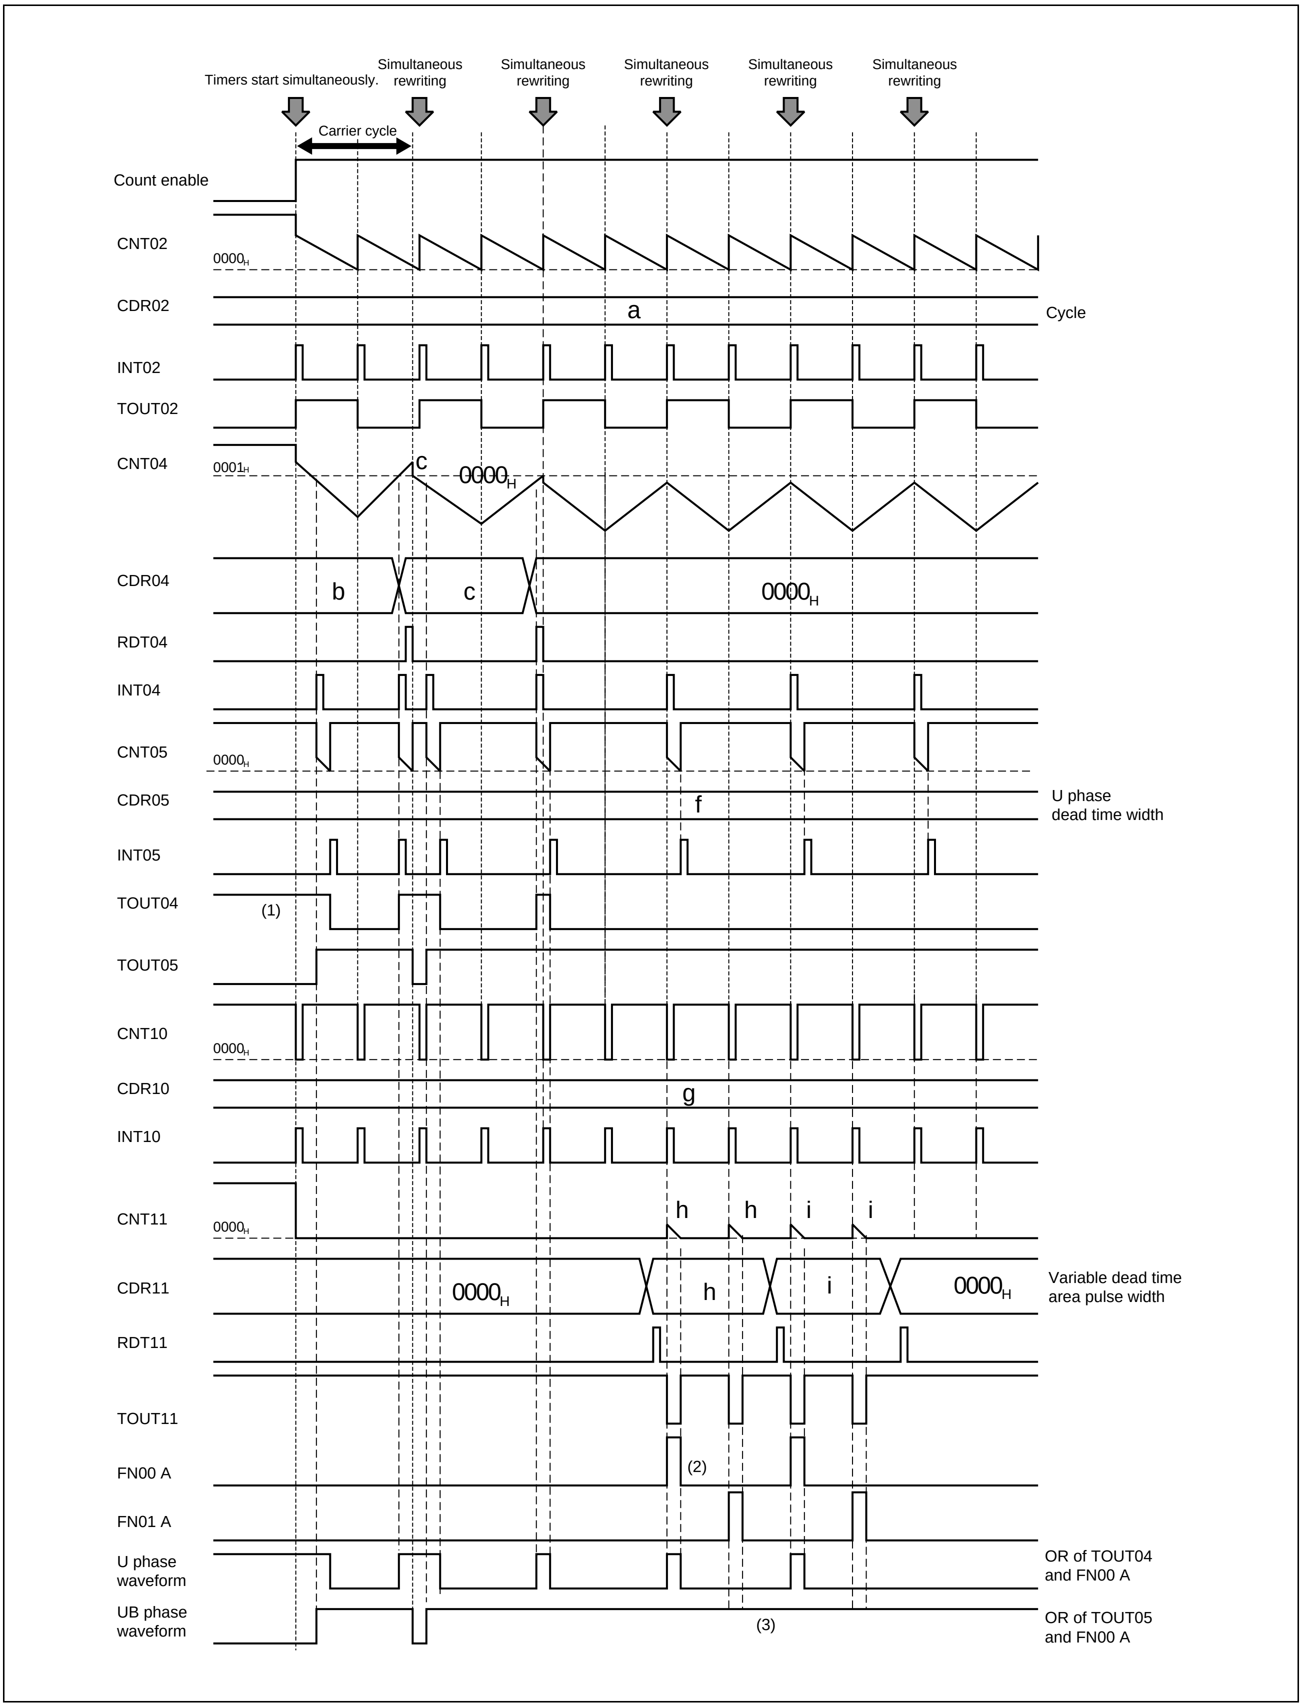

Figure 36.40 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active Low) and TAUDnTOL05 = 0 (Active Low))

An operation example in which the system transitions to a U phase of 0% and UB phase of 100% in the timer configuration for performing the U phase PWM output shown in **Figure 36.40, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active Low) and TAUDnTOL05 = 0 (Active Low))** is provided below. Output of a triangle PWM signal with dead time is active low.

(1) The timer operation from the start of timer operation until the output of a triangle PWM signal with dead time is the same as in **Figure 36.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**. However, an active low PWM signal is output.

(2) Therefore, active low output that corresponds with PWM output is specified as the combination circuit setting (PIC0REG2n116 and PIC0REG2n117, and PIC0REG2n118 and PIC0REG2n119). This results in the output of an active low variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A).

(3) In addition, active low output that corresponds with PWM output is also specified as the logical operation circuit setting (PIC0REG2n302 to PIC0REG2n300 and PIC0REG2n306 to PIC0REG2n304). The pulse generated in (2) is combined with the TOUT04 and TOUT05 output waveforms, and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output) as an active low PWM signal.

CAUTION

If the 100% U phase duty setting for CDR04 and the variable dead time area pulse width for CDR11 are specified at the same time, the last PWM signal output from TOUT04 is adversely affected due to the feature specifications.
To cancel this effect, the CDR11 setting is delayed one cycle.
For details, see **Figure 36.38, Effect on the Output Triangle PWM Wave with Dead Time by the Variable Dead Time Area Pulse**.

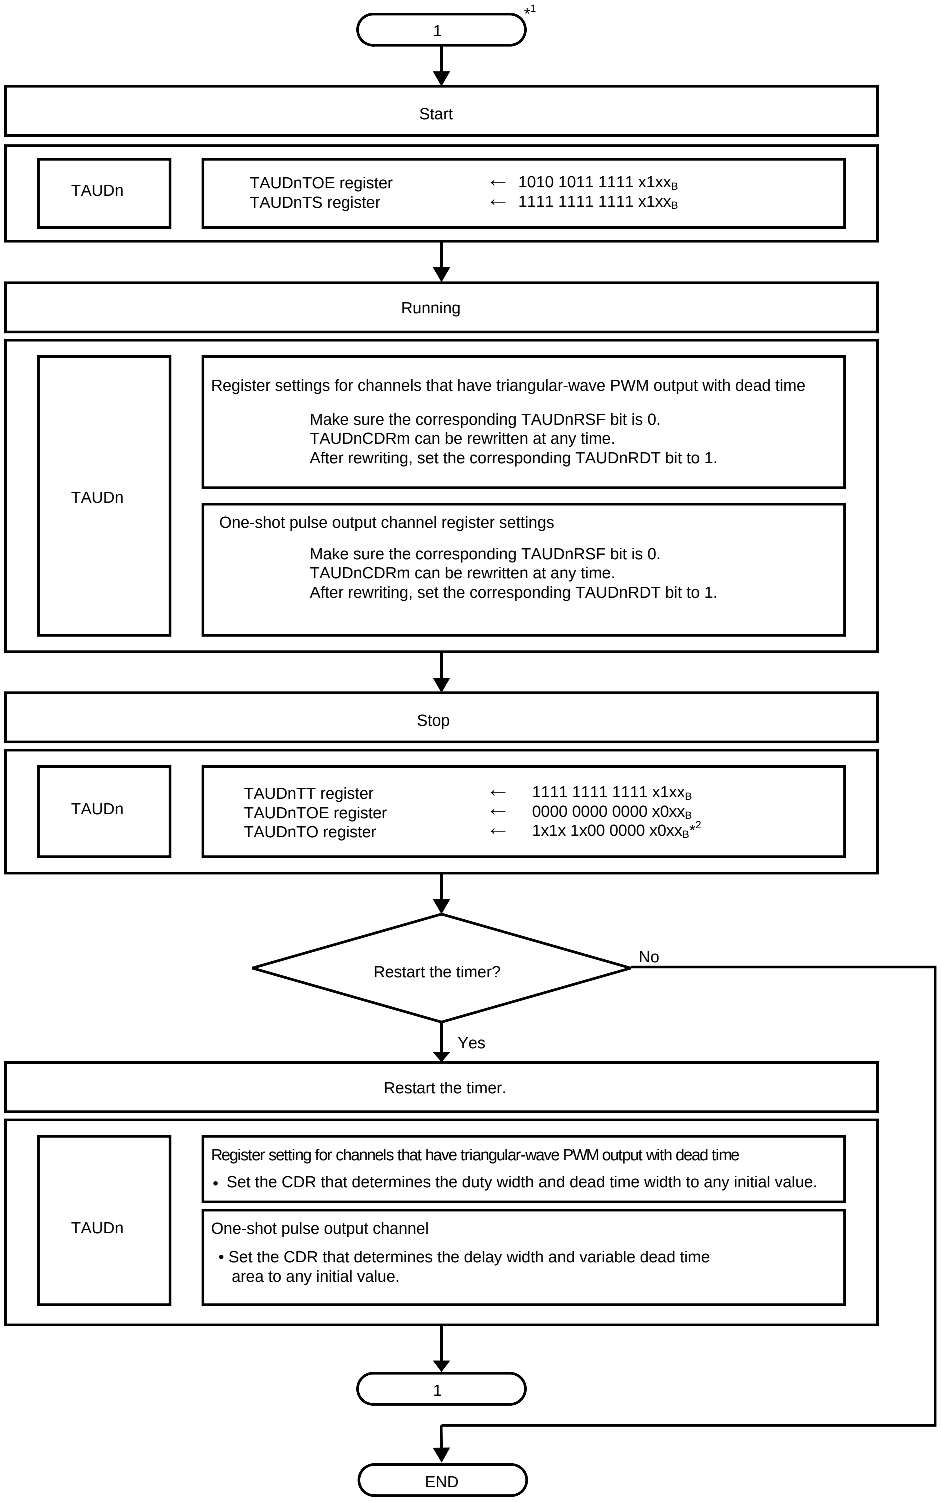
Note 1. Change settings according to the active level of the PWM signal to be output.

Figure 36.41 Setup Flow (Active High Example)



Note 1. Specify the selection register and output port to use after specifying the initial settings for the peripheral interconnections and timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

Figure 36.42 Setup Flow (Active High Example) (continued)

36.12.6 Setting Examples for Operation Functions

This section provides example settings for each register.

36.12.6.1 TAUDn Settings (active high example)

Table 36.61 TAUDn: CH2-related (Master Channel Used To Output A Triangle PWM Signal with Dead Time*[1])

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMOR2	15, 14	TAUDnCKS[1:0]	Don’t care*[2]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	000	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	0000	
	0	TAUDnMD0	1	At the start of operation, output INTm and toggle TOUTm.
TAUDnCMUR2	1, 0	TAUDnTIS[1:0]	00	Fixed

Note 1. The master channel and slave channel names are defined for TAUD triangle PWM output with dead time. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

NOTE

For the TAUDnCMORm register of the master channel used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.
For this feature, set TAUDnMD0 to 1.

Table 36.62 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Triangle PWM Signal with Dead Time*[1]) (m = 4, 6, or 8)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don’t care*[2]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	111	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	1001	
	0	TAUDnMD0	0	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The same operation clock must be specified for the master channel and slave channel.
For the TAUDnCMORm register of slave channels 2 and 3, which is used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 36.63 TAUDn: CH5, CH7, and CH9-related (Slave Channel 3 used to Output a Triangle PWM Signal with Dead Time*[1]) (m = 5, 7, or 9)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don’t care*[2]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	110	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The same operation clock must be specified for the master channel and slave channel.
For the TAUDnCMORm register of slave channels 2 and 3, which is used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 36.64 TAUDn: CH10, CH12, and CH14-related (Master Channel used to Output a One-shot Pulse*[1]) (m = 10, 12, or 14)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don’t care*[2]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	001	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	0	Disable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	10	Detect both rising and falling edges as valid.

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 36.65 TAUDn: CH11, CH13, and CH15-related (Slave Channel used to Output a One-Shot Pulse*[1]) (m = 11, 13, or 15)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don’t care*[2]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	1010	
	0	TAUDnMD0	0	Disable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel. Specify the same clock setting as for the master channel (CH2) used to output a triangle PWM signal with dead time.

NOTE

For the TAUDnCMORm register used during one-shot pulse output, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.
For this feature clear TAUDnMD0 to 0.

Table 36.66 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOE	15	TAUDnTOE15	0 1	Disable the timer. Enable the timer.
	14	TAUDnTOE14	0	
	13	TAUDnTOE13	0 1	Disable the timer. Enable the timer.
	12	TAUDnTOE12	0	
	11	TAUDnTOE11	0 1	Disable the timer. Enable the timer.
	10	TAUDnTOE10	0	
	9 to 4	TAUDnTOE09 to TAUDnTOE04	0 1	Disable the timer. Enable the timer.
	3	TAUDnTOE03	Don’t care	
	2	TAUDnTOE02	0 1	Disable the timer. Enable the timer.
	1, 0	TAUDnTOE01 TAUDnTOE00	Don’t care	

Table 36.66 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTO	15	TAUDnTO15	1*1	Output a high-level signal to TOUT15.
	14	TAUDnTO14	Don’t care	
	13	TAUDnTO13	1*1	Output a high-level signal to TOUT13.
	12	TAUDnTO12	Don’t care	
	11	TAUDnTO11	1*1	Output a high-level signal to TOUT11.
	10	TAUDnTO10	Don’t care	
	9 to 4	TAUDnTO09 to TAUDnTO04	0*1	Output a low-level signal to TOUT09 to TOUT04.
	3	TAUDnTO03	Don’t care	
	2	TAUDnTO02	0	Output a low-level signal to TOUT02.
	1, 0	TAUDnTO01 TAUDnTO00	Don’t care	
TAUDnTOM	15 to 10	TAUDnTOM15 to TAUDnTOM10	0	Independent operation mode
	9 to 4	TAUDnTOM09 to TAUDnTOM04	1	Synchronous operation mode
	3	TAUDnTOM03	Don’t care	
	2	TAUDnTOM02	0	Independent operation mode
	1, 0	TAUDnTOM01 TAUDnTOM00	Don’t care	
TAUDnTOC	15	TAUDnTOC15	1	Operation mode 2

	11	TAUDnTOC11	1	Operation mode 2
	10	TAUDnTOC10	0	Operation mode 1
	9 to 4	TAUDnTOC09 to TAUDnTOC04	1	Operation mode 2
	3	TAUDnTOC03	Don’t care	
	2	TAUDnTOC02	0	Operation mode 1
	1, 0	TAUDnTOC01 TAUDnTOC00	Don’t care	
TAUDnTOL	15	TAUDnTOL15	1*1	Inverted logic output (active low)
	14	TAUDnTOL14	Don’t care	
	13	TAUDnTOL13	1*1	Inverted logic output (active low)
	12	TAUDnTOL12	Don’t care	
	11	TAUDnTOL11	1*1	Inverted logic output (active low)
	10	TAUDnTOL10	Don’t care	
	9 to 4	TAUDnTOL09 to TAUDnTOL04	0*1	Positive logic output (active high)
	3	TAUDnTOL03	Don’t care	
	2	TAUDnTOL02	0	Positive logic output (active high)
	1, 0	TAUDnTOL01 TAUDnTOL00	Don’t care	

Table 36.66 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTDE	15 to 10	TAUDnTDE15 to TAUDnTDE10	0	Disable dead time control.
	9 to 4	TAUDnTDE09 to TAUDnTDE04	1	Enable dead time control.[*2]
	3	TAUDnTDE03	Don’t care	
	2	TAUDnTDE02	0	Disable dead time control.
	1, 0	TAUDnTDE01 TAUDnTDE00	Don’t care	
TAUDnTDM	15 to 9	TAUDnTDM15 to TAUDnTDM09	0	
	3	TAUDnTDM03	Don’t care	
	2	TAUDnTDM02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDM01 TAUDnTDM00	Don’t care	
TAUDnTDL	15 to 10	TAUDnTDL15 to TAUDnTDL10	0	Invalid because dead time control is disabled.
	9	TAUDnTDL09	1[*1]	Dead time is in the negative segment of the W phase output
	8	TAUDnTDL08	0[*1]	Dead time is in the positive segment of the W phase output
	7	TAUDnTDL07	1[*1]	Dead time is in the negative segment of the V phase output
	6	TAUDnTDL06	0[*1]	Dead time is in the positive segment of the V phase output
	5	TAUDnTDL05	1[*1]	Dead time is in the negative segment of the U phase output
	4	TAUDnTDL04	0[*1]	Dead time is in the positive segment of the U phase output
	3	TAUDnTDL03	Don’t care	
	2	TAUDnTDL02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDL01 TAUDnTDL00	Don’t care	
TAUDnTRE	15 to 4	TAUDnTRE15 to TAUDnTRE04	0	Disable real-time output.
	3	TAUDnTRE03	Don’t care	
	2	TAUDnTRE02	0	Disable real-time output.
	1, 0	TAUDnTRE01 TAUDnTRE00	Don’t care	
TAUDnTRO	15 to 4	TAUDnTRO15 to TAUDnTRO04	0	Invalid because real-time output is disabled.
	3	TAUDnTRO03	Don’t care	
	2	TAUDnTRO02	0	Invalid because real-time output is disabled.
	1, 0	TAUDnTRO01 TAUDnTRO00	Don’t care	

Table 36.66 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTRC	15 to 4	TAUDnTRC15 to TAUDnTRC04	0	Do not use this channel to generate the real-time output trigger.
	3	TAUDnTRC03	Don't care	
	2	TAUDnTRC02	0	Do not use this channel to generate the real-time output trigger.
	1, 0	TAUDnTRC01 TAUDnTRC00	Don't care	
TAUDnTME	15 to 4	TAUDnTME15 to TAUDnTME04	0	Disable modulation output for timer output and real-time output.
	3	TAUDnTME03	Don't care	
	2	TAUDnTME02	0	Disable modulation output for timer output and real-time output.
	1, 0	TAUDnTME01 TAUDnTME00	Don't care	
TAUDnRDE	15 to 4	TAUDnRDE15 to TAUDnRDE04	1	Enable simultaneous rewriting.
	3	TAUDnRDE03	Don't care	
	2	TAUDnRDE02	1	Enable simultaneous rewriting.
	1, 0	TAUDnRDE01 TAUDnRDE00	Don't care	
TAUDnRDS	15 to 4	TAUDnRDS15 to TAUDnRDS04	0	Do not enable simultaneous rewriting by using another upper channel.
	3	TAUDnRDS03	Don't care	
	2	TAUDnRDS02	0	Do not enable simultaneous rewriting by using another upper channel.
	1, 0	TAUDnRDS01 TAUDnRDS00	Don't care	
TAUDnRDM	15 to 10	TAUDnRDM15 to TAUDnRDM10	0	Perform simultaneous rewriting when the master channel starts counting.
	9 to 4	TAUDnRDM09 to TAUDnRDM04	1	Perform simultaneous rewriting after the master channel starts counting when there is a peak in the triangle wave on the corresponding slave channel.
	3	TAUDnRDM03	Don't care	
	2	TAUDnRDM02	1	Perform simultaneous rewriting after the master channel starts counting when there is a peak in the triangle wave on the corresponding slave channel.
	1, 0	TAUDnRDM01 TAUDnRDM00	Don't care	
TAUDnRDC	15 to 4	TAUDnRDC15 to TAUDnRDC04	0	Do not use this channel to generate the simultaneous rewrite trigger.
	3	TAUDnRDC03	Don't care	
	2	TAUDnRDC02	0	Do not use this channel to generate the simultaneous rewrite trigger.
	1, 0	TAUDnRDC01 TAUDnRDC00	Don't care	

Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see **Section 32, Timer Array Unit D (TAUD)**.

36.12.6.2 PIC Settings (Active High Example)

Table 36.67 PIC Settings

Register	Bit Position	Bit Name	Setting	Remark
PIC0REG2n0	18	PIC0REG2n018	1	Select the TOUT signal of CH2 of TAUDn.
PIC0REG2n1	27, 26	PIC0REG2n127 PIC0REG2n126	1 0	Negative W phase active high combination circuit output
	25, 24	PIC0REG2n125 PIC0REG2n124	1 0	Positive W phase active high combination circuit output
	23, 22	PIC0REG2n123 PIC0REG2n122	1 0	Negative V phase active high combination circuit output
	21, 20	PIC0REG2n121 PIC0REG2n120	1 0	Positive V phase active high combination circuit output
	19, 18	PIC0REG2n119 PIC0REG2n118	1 0	Negative U phase active high combination circuit output
	17, 16	PIC0REG2n117 PIC0REG2n116	1 0	Positive U phase active high combination circuit output
PIC0REG2n2	25	PIC0REG2n225	1	Select the input selected by the PIC0REG2n018 bit.
	21	PIC0REG2n221	1	Select the input selected by the PIC0REG2n018 bit.
	17	PIC0REG2n217	1	Select the input selected by the PIC0REG2n018 bit.
PIC0REG2n3	22, 21, 20	PIC0REG2n322 PIC0REG2n321 PIC0REG2n320	1 0 0	Negative W phase active high logical operation circuit output
	18, 17, 16	PIC0REG2n318 PIC0REG2n317 PIC0REG2n316	1 0 0	Positive W phase active high logical operation circuit output
	14, 13, 12	PIC0REG2n314 PIC0REG2n313 PIC0REG2n312	1 0 0	Negative V phase active high logical operation circuit output
	10, 9, 8	PIC0REG2n310 PIC0REG2n309 PIC0REG2n308	1 0 0	Positive V phase active high logical operation circuit output
	6, 5, 4	PIC0REG2n306 PIC0REG2n305 PIC0REG2n304	1 0 0	Negative U phase active high logical operation circuit output
	2, 1, 0	PIC0REG2n302 PIC0REG2n301 PIC0REG2n300	1 0 0	Positive U phase active high logical operation circuit output

36.13 Delay Pulse Output with Dead Time

36.13.1 Functional Overview

This feature outputs a three-phase PWM with dead time that is later than the cycle timing by an amount equal to the delay amount.

Unlike the function of three-phase PWM output with dead time, a PWM signal that has a reset in the next cycle can be output.

36.13.2 Configuration

The unit and channel configuration for this feature is shown below. (n = 0, m = 0 to 15)

Table 36.68 Configuration of Delay Pulse Output with Dead Time

Timer	Timer Motor Control Function
TAUD0 CH2 to CH15 (used channels fixed)	TAPA0

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm → INTTAUDnIm (TAUDn channel m interrupt)
- TINm → TAUDTTINm (TAUDn channel m input)
- TOUTm → TAUDTTOUTm (TAUDn channel m output)
- CDRm → TAUDnCDRm (TAUDn channel m data register)
- CNTm → TAUDnCNTm (TAUDn channel m counter register)

36.13.2.1 TAUDn Configuration

Because the CDRm value of CH3 does not affect TOUT0 to TOUT15, the INTm signal of CH3 can also be used for other purposes such as A/D conversion trigger generation.

Table 36.69 TAUDn configuration

CH	Function Name	M/S*[1]	CDR Setting	Description
2	Delay pulse output function (CH2 is the master channel for CH3 to CH9.)	M	Cycle	
3		S		Reserved
4		S	Delay (U phase)	
5		S	Pulse width (U phase)	
6		S	Delay (V phase)	
7		S	Pulse width (V phase)	
8		S	Delay (W phase)	
9		S	Pulse width (W phase)	
10	Any feature that does not use TOUTm	S		TOUT: U phase output

36.13.3 Registers

36.13.3.1 PIC0REG2n2 — Timer I/O Control Register 2n2 (n = 0)

This register selects CHm input signals of the TAUDn timer. This section describes the bits to be used in the delay pulse output with dead time.

Access: This register can be read or written in 32-bit units.

Address: PIC0REG202: FFDD 00C8$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 36.71 PIC0HIZCENn Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	PIC0HIZCENn6	Select whether to enable or disable Hi-Z output control by the INTADCA0ERR interrupt signal. 0: Disable 1: Enable
5 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PIC0HIZCENn2	RH850/F1KH-D8 Selects whether to enable or disable Hi-Z output control by the WDTA1NMI and the WDTA2NMI interrupt signal. 0: Disable 1: Enable RH850/F1KM-S4, RH850/F1KM-S1 Select whether to enable or disable Hi-Z output control by the WDTA1NMI interrupt signal. 0: Disable 1: Enable
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC0HIZCENn0	Select whether to enable or disable Hi-Z output control by the TAPAnESO pin input. 0: Disable 1: Enable

36.13.4 Operation Example

This is achieved by combining the following TAUD features:

- Delay pulse output function
- One-phase PWM output

The delay pulse output feature generates a PWM signal that is later than the cycle timing by an amount equal to the delay amount. Next, a one-phase PWM signal to which dead time has been added is output for the delayed PWM signal by one-phase PWM output feature.

A delay pulse with dead time is output by assigning the PWM output achieved using the above features to the U, V, and W phases. Therefore, the PWM output dead time can be freely specified for the PWM signal of each phase. Because the only difference between phases is the assigned channel, only one phase (the U phase) is described below.

36.13.4.1 Delay Pulse Output Function

By using a combination of CH2, CH4, and CH5, a basic PWM signal for one-phase PWM is output from TOUT05 delayed by the amount specified by CH4 with respect to the cycle specified by CH2.

Note that CH3 is a reserved timer for achieving this feature, so do not use it for other features.

CAUTION

Do not specify a delay amount that exceeds the cycle.

36.13.4.2 One-phase PWM Output

One-phase PWM output is generated from TOUT10 and TOUT11 by using a combination of CH10 and CH11.

By specifying the dead time value for CDR11, a one-phase PWM with dead time is output for the TIN11 input.

Similarly, the V phase uses CH12 and CH13 to output a one-phase PWM with dead time, while the W phase uses CH14 and CH15.

CAUTION

Specify the same clock for each TAUDn channel that uses the delay pulse output and one-phase PWM output features.

For details about the TAUD functions, see **Section 32, Timer Array Unit D (TAUD)**.

The differences between the delay pulse output with dead time and the three-phase PWM output with dead time are described below.

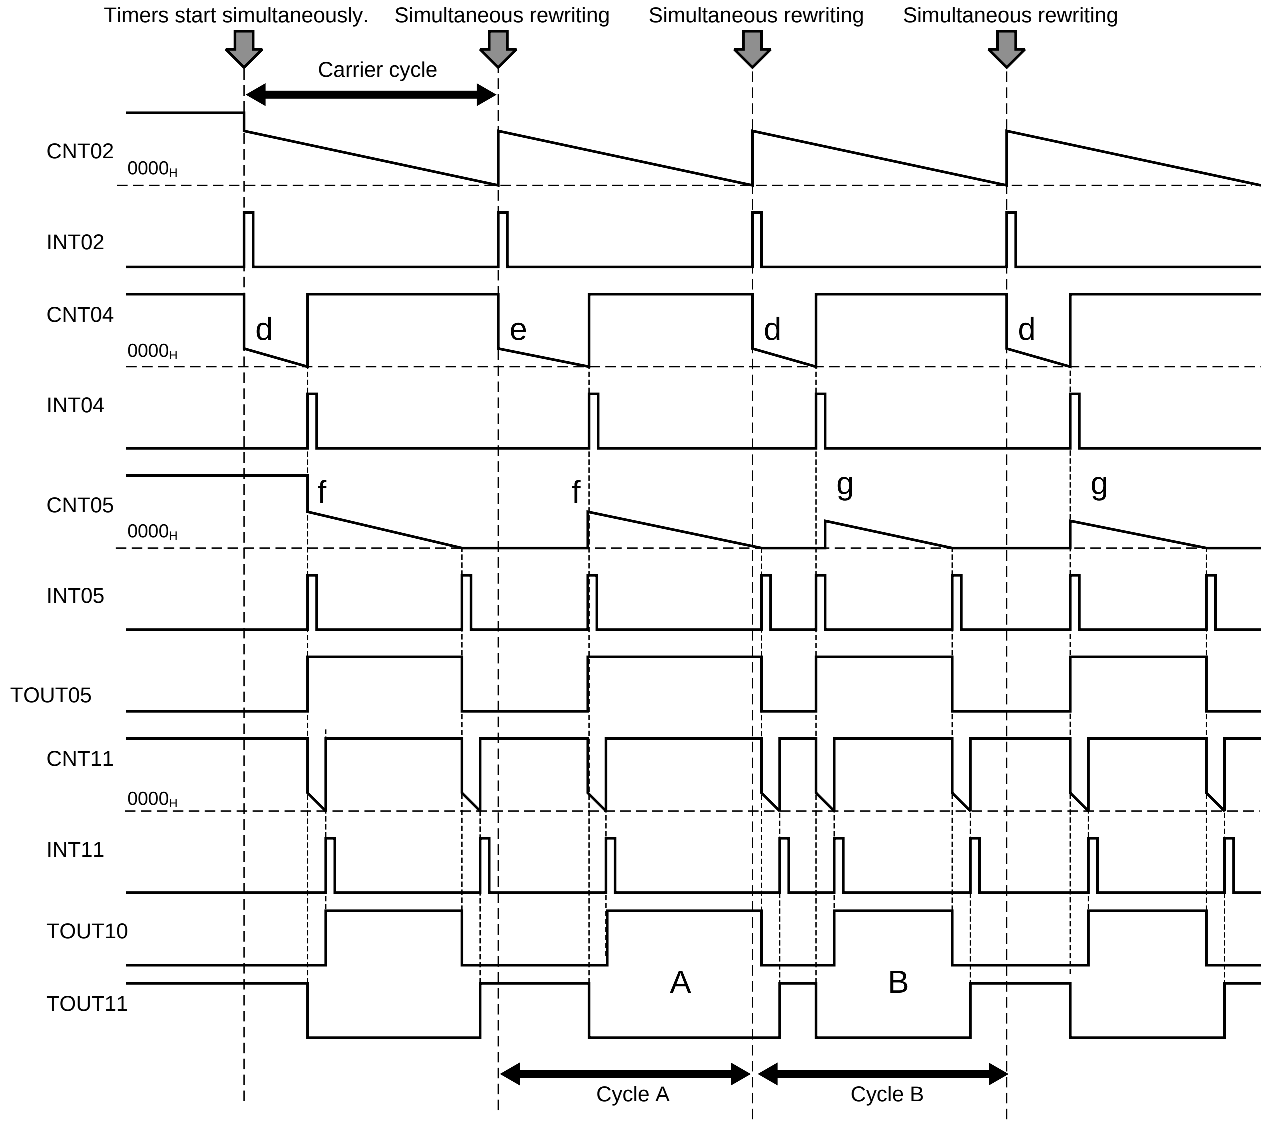

Figure 36.44 PWM Output by Outputting a Delay Pulse with Dead Time

In **Figure 36.44, PWM Output by Outputting a Delay Pulse with Dead Time**, PWM waveform A is supposed to be output before cycle A ends, but because the delay timing is too long, the PWM clear position is after the end of cycle A. Next, PWM waveform B, which is for cycle B, is output.

The operations shown below occur when an attempt is made to achieve the operations shown in **Figure 36.44, PWM Output by Outputting a Delay Pulse with Dead Time** by the three-phase PWM output with dead time.

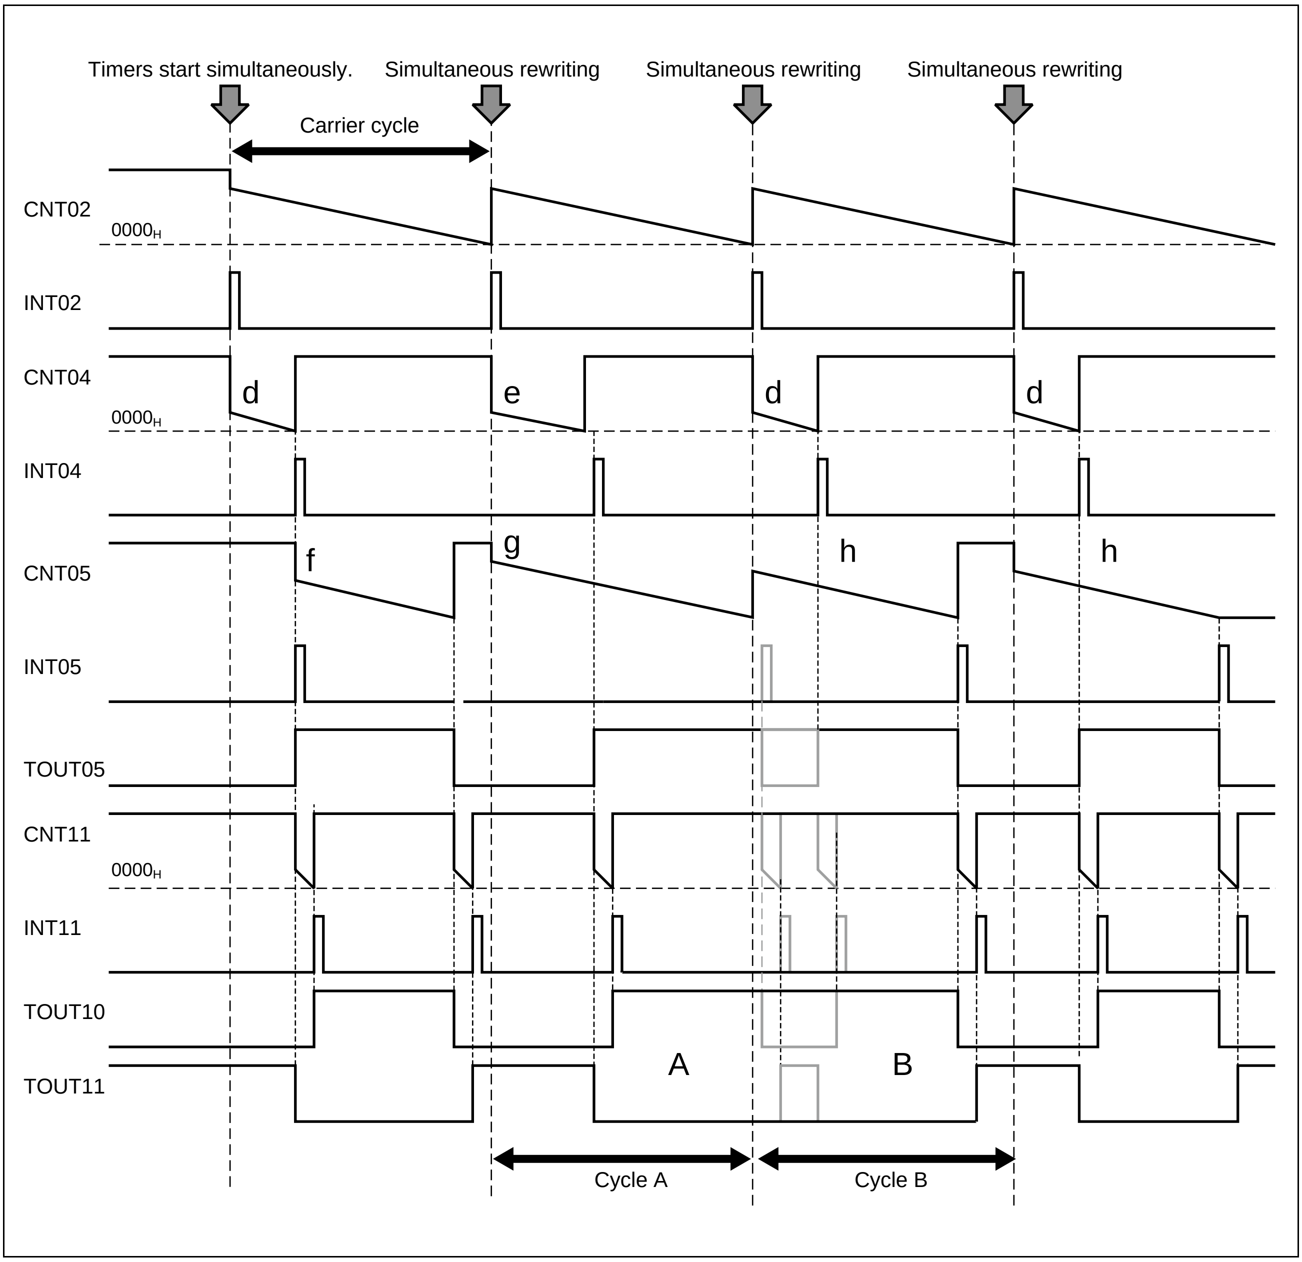

Figure 36.45 Output of a Three-Phase PWM Signal with Dead Time (1)

Figure 36.45, Output of a Three-Phase PWM Signal with Dead Time (1) shows an example in which the output PWM signal does not end before carrier cycle A because the set timing for outputting a three-phase PWM signal with dead time is delayed and the clear timing is after the end of the carrier cycle.

For cycle A, the set timing of PWM waveform A is the same as that in the figure on the previous page, but because the clear timing is after the end of cycle A, a reload operation occurs in cycle A before PWM waveform A is cleared, and the clear timing for PWM waveform A does not occur.

In addition, the set timing of PWM waveform B for cycle B is ignored because a PWM waveform is already set. The result is that there is no PWM waveform change until the clear timing of cycle B, and a waveform that combines PWM waveform A and PWM waveform B is output.

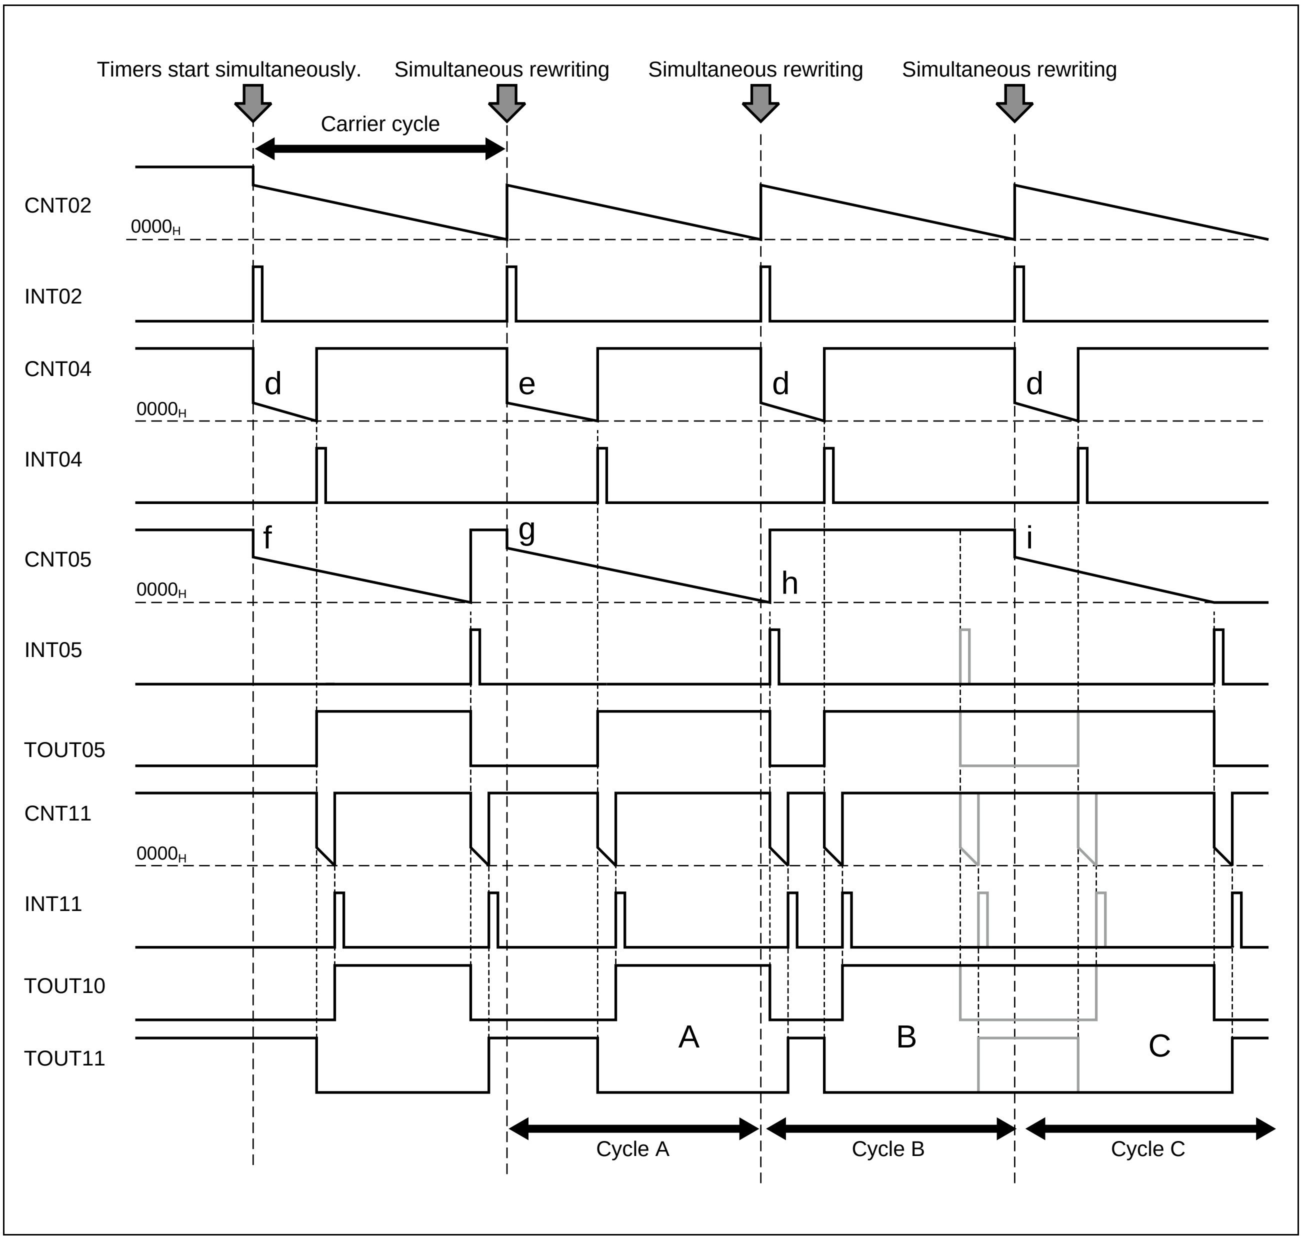

Figure 36.46 Output of a Three-Phase PWM Signal with Dead Time (2)

Figure 36.46, Output of a Three-Phase PWM Signal with Dead Time (2) shows an example of outputting a three-phase PWM signal with dead time in which counter operation for which the clear timing is longer than cycle A is continued in cycle B, and PWM output A is cleared at the beginning of cycle B.

The output of PWM waveform A for cycle A is the same as the output of a delay pulse with dead time, but because the clear timing is used at the beginning of cycle B, the clear timing of PWM output B, which is supposed to be output during cycle B, does not occur.

In addition, the set timing of PWM waveform C for cycle C is ignored because a PWM waveform is already set. The result is that there is no PWM waveform change until the clear timing of cycle C, and a waveform that combines PWM waveform B and PWM waveform C is output.

In this way, it is possible to achieve freer PWM output timing when outputting a delay pulse with dead time than when outputting a three-phase PWM signal with dead time.

The peripheral interconnections provide a connection for using the PWM output timing of delay pulse output as input for one-phase PWM output.

Figure 36.47, Output of a Delay Pulse with Dead Time shows a timing chart for outputting a delay pulse with dead time.

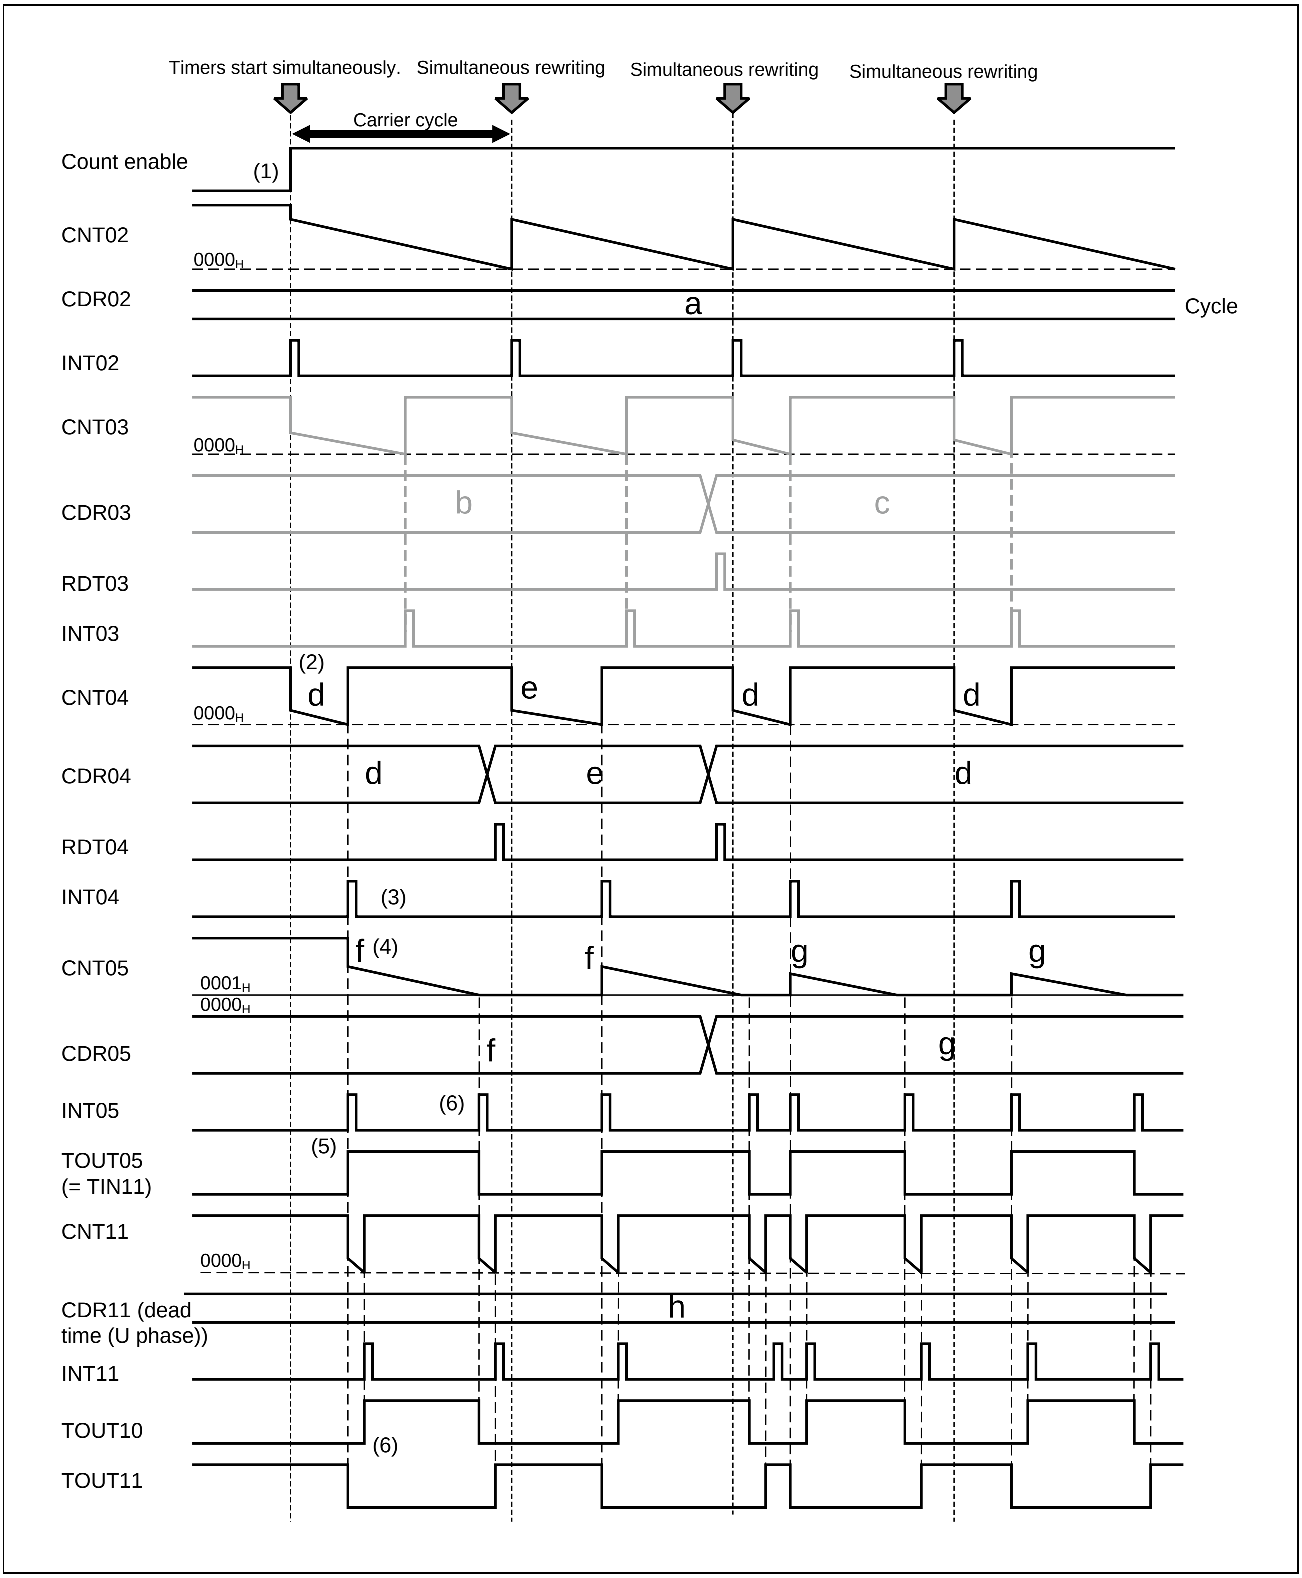

Figure 36.47 Output of a Delay Pulse with Dead Time

The output of a delay pulse with dead time shown in **Figure 36.47, Output of a Delay Pulse with Dead Time** is described below.

(1) CH2 (the carrier cycle timer) and CH4 (the delay timing timer) are started simultaneously by starting timers simultaneously.
CH5 (the PWM duty timer) and CH11 (the dead time timer) are also enabled, but no counting operations are performed until the edges of INT04, which indicates the count start timing for CH5, and TIN11, which indicates the count start timing for CH11, are detected.
Because CH3 does not affect PWM output for this function, the channel is not described.

(2) For CH4, when there is a CH2 underflow, the settings from CDR04 are reloaded to CNT04.

(3) The CH4 underflow generates the delay timing signal (INT04).

(4) When INT04 is generated, the settings from CDR05 are reloaded to CNT05, and then the CH5 (the PWM duty timer) operation starts.

(5) At this time, INT05 is generated and the TOUT05 output level changes to the active level.

(6) Due to the CH5 underflow, INT05 is generated again, and TOUT05 changes to the inactive level. TOUT05, which is changed by the CH4 and CH5 underflow, is supplied to the TIN11 input of one-phase PWM output.

(7) During one-phase PWM output, a PWM waveform with dead time is output by detecting a TIN11 edge.

36.13.5 Setup Flow

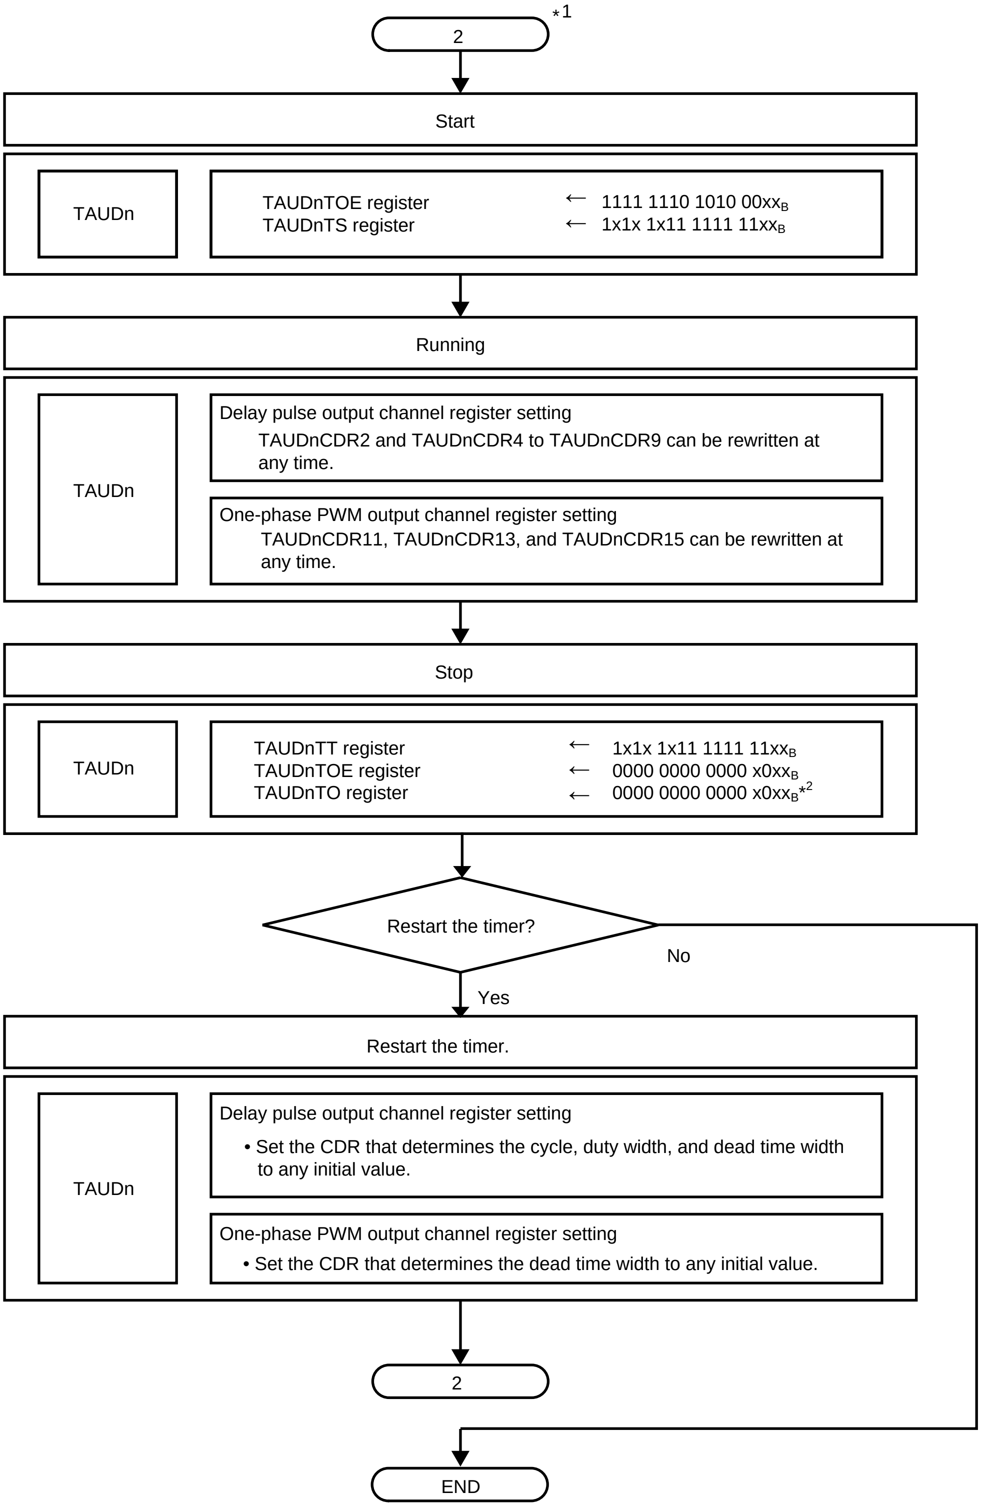
Figure 36.49 Setup Flow (Active High Example) (continued)



Note 1. Specify the selection register and output port to use after specifying the initial settings for PIC and the timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

Figure 36.50 Setup Flow (Active High Example) (continued)

36.13.6 Setting Examples for Operation Functions

This section provides example settings for each register.

36.13.6.1 TAUDn Settings

Table 36.72 TAUDn: CH2-related (Master Channel used to Output a Delay Pulse*1)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMOR2	15, 14	TAUDnCKS[1:0]	Don’t care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	000	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0000	
	0	TAUDnMD0	1	Output INTm at the start of operation.
TAUDnCMUR2	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 36.73 TAUDn: CH3-related (Slave Channel used to Output a Delay Pulse*1,*2)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMOR3	15, 14	TAUDnCKS[1:0]	Don’t care*3	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	Start trigger: INTm detection on the master channel
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMUR3	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Note 3. For this feature, the channel does not affect operation, but it is set up because it is a configuration channel for delay pulse output.

NOTE

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Table 36.74 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Delay Pulse*[1]) (m = 4, 6, or 8)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*[2]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	Start trigger: INTm detection on the master channel
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the slave channel and master channel.

NOTE

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Table 36.75 TAUDn: CH5, CH7, and CH9-related (Slave Channel 3 used to Output a Delay Pulse*[1]) (m = 5, 7, or 9)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*[2]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	101	Start trigger: INTm detection on an upper channel
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	1010	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the slave channel and master channel.

NOTE

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.

Table 36.76 TAUDn: CH11, CH13, and CH15-related (One-Phase PWM Output) (m = 11, 13, or 15)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*[1]	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	001	Start trigger: Detection of a TINm-input valid edge
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	11	Both rising and falling TINm edges are detected as valid. (High width)

Note 1. Specify the same operation clock settings as for the PWM output master channel (CH2).

NOTE

For the TAUDnCMORm register used during one-phase PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 32, Timer Array Unit D (TAUD)**.

CH10, CH12, and CH14 can be used with any feature that does not use TOUTm output (such as A/D trigger output).

Table 36.77 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOE	15 to 10	TAUDnTOE15 to TAUDnTOE10	0 1	Disable the timer. Enable the timer.
	9	TAUDnTOE09	0 1	Disable the timer. Enable the timer.
	8	TAUDnTOE08	0	This is fixed to 0 because TOUT08 is not used.
	7	TAUDnTOE07	0 1	Disable the timer. Enable the timer.
	6	TAUDnTOE06	0	This is fixed to 0 because TOUT06 is not used
	5	TAUDnTOE05	0 1	Disable the timer. Enable the timer.
	4	TAUDnTOE04	0	This is fixed to 0 because TOUT04 is not used
	3	TAUDnTOE03	0	This is fixed to 0 because TOUT03 is not used
	2	TAUDnTOE02	0	This is fixed to 0 because TOUT02 is not used.
	1, 0	TAUDnTOE01 TAUDnTOE00	Don't care	
TAUDnTO	15 to 10	TAUDnTO15 to TAUDnTO10	0*[1]	Output a low-level signal to TOUT15 to TOUT10.
	9 to 2	TAUDnTO09 to TAUDnTO02	0	Output a low-level signal to TOUT09 to TOUT02.
	1, 0	TAUDnTO01 TAUDnTO00	Don't care	

Table 36.77 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOM	15 to 10	TAUDnTOM15 to TAUDnTOM10	1	Synchronous operation mode
	9 to 4	TAUDnTOM09 to TAUDnTOM04	0	Independent operation mode
	3	TAUDnTOM03	1	Synchronous operation mode
	2	TAUDnTOM02	0	Independent operation mode
	1, 0	TAUDnTOM01 TAUDnTOM00	Don’t care	
TAUDnTOC	15 to 10	TAUDnTOC15 to TAUDnTOC10	1	Synchronous operation mode 2
	9 to 4	TAUDnTOC09 to TAUDnTOC04	1, 0, 1, 0, 1, 0	CH5, CH7, CH9: Operation mode 2 CH4, CH6, CH8: Operation mode 1
	3	TAUDnTOC03	0	Operation mode 1
	2	TAUDnTOC02	0	Operation mode 1
	1, 0	TAUDnTOC01 TAUDnTOC00	Don’t care	
TAUDnTOL	15 to 10	TAUDnTOL15 to TAUDnTOL10	0*1	Positive logic output (active high)
	9 to 2	TAUDnTOL09 to TAUDnTOL02	0	Positive logic output (active high)
	1, 0	TAUDnTOL01 TAUDnTOL00	Don’t care	
TAUDnTDE	15 to 10	TAUDnTDE15 to TAUDnTDE10	1	Enable dead time control.*2
	9 to 2	TAUDnTDE09 to TAUDnTDE02	0	Disable dead time control.
	1, 0	TAUDnTDE01 TAUDnTDE00	Don’t care	
TAUDnTDM	15 to 10	TAUDnTDM15 to TAUDnTDM10	1	Output dead time upon detecting a TINm input edge at a lower odd channel.
	9 to 2	TAUDnTDM09 to TAUDnTDM02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDM01 TAUDnTDM00	Don’t care	
TAUDnTDL	15	TAUDnTDL15	1*1	Add dead time to the negative W phase period.
	14	TAUDnTDL14	0*1	Add dead time to the positive W phase period.
	13	TAUDnTDL13	1*1	Add dead time to the negative V phase period.
	12	TAUDnTDL12	0*1	Add dead time to the positive V phase period.
	11	TAUDnTDL11	1*1	Add dead time to the negative U phase period.
	10	TAUDnTDL10	0*1	Add dead time to the positive U phase period.
	9 to 2	TAUDnTDL09 to TAUDnTDL02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDL01 TAUDnTDL00	Don’t care	
TAUDnTRE	15 to 2	TAUDnTRE15 to TAUDnTRE02	0	Disable real-time output.
	1, 0	TAUDnTRE01 TAUDnTRE00	Don’t care	

Table 36.77 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTRO	15 to 2	TAUDnTRO15 to TAUDnTRO02	0	Invalid because real-time output is disabled.
	1, 0	TAUDnTRO01 TAUDnTRO00	Don't care	
TAUDnTRC	15 to 2	TAUDnTRC15 to TAUDnTRC02	0	Do not use this channel to generate the real-time output trigger.
	1, 0	TAUDnTRC01 TAUDnTRC00	Don't care	
TAUDnTME	15 to 2	TAUDnTME15 to TAUDnTME02	0	Disable modulation output for timer output and real-time output.
	1, 0	TAUDnTME01 TAUDnTME00	Don't care	
TAUDnRDE	15	TAUDnRDE15	0	Disable simultaneous rewriting.
	14	TAUDnRDE14	Don't care	
	13	TAUDnRDE13	0	Disable simultaneous rewriting.
	12	TAUDnRDE12	Don't care	
	11	TAUDnRDE11	0	Disable simultaneous rewriting.
	10	TAUDnRDE10	Don't care	
	9 to 2	TAUDnRDE09 to TAUDnRDE02	1	Enable simultaneous rewriting.
	1, 0	TAUDnRDE01 TAUDnRDE00	Don't care	
TAUDnRDS	15	TAUDnRDS15	0	Do not enable simultaneous rewriting by using another upper channel.
	14	TAUDnRDS14	Don't care	
	13	TAUDnRDS13	0	Do not enable simultaneous rewriting by using another upper channel.
	12	TAUDnRDS12	Don't care	
	11	TAUDnRDS11	0	Do not enable simultaneous rewriting by using another upper channel.
	10	TAUDnRDS10	Don't care	
	9 to 2	TAUDnRDS09 to TAUDnRDS02	0	Enable simultaneous rewriting by using a master channel.
	1, 0	TAUDnRDS01 TAUDnRDS00	Don't care	
TAUDnRDM	15	TAUDnRDM15	0	Invalid because simultaneous rewriting is not enabled.
	14	TAUDnRDM14	Don't care	
	13	TAUDnRDM13	0	Invalid because simultaneous rewriting is not enabled.
	12	TAUDnRDM12	Don't care	
	11	TAUDnRDM11	0	Invalid because simultaneous rewriting is not enabled.
	10	TAUDnRDM10	Don't care	
	9 to 2	TAUDnRDM09 to TAUDnRDM02	0	Load the signal when the master channel starts counting.
	1, 0	TAUDnRDM01 TAUDnRDM00	Don't care	

Table 36.77 Common TAUDn Channel Settings

Register	Bit Position	Bit Name	Setting	Remark
TAUDnRDC	15	TAUDnRDC15	0	Invalid because simultaneous rewriting is not enabled.
	14	TAUDnRDC14	Don't care	
	13	TAUDnRDC13	0	Invalid because simultaneous rewriting is not enabled.
	12	TAUDnRDC12	Don't care	
	11	TAUDnRDC11	0	Invalid because simultaneous rewriting is not enabled.
	10	TAUDnRDC10	Don't care	
	9 to 2	TAUDnRDC09 to TAUDnRDC02	0	Do not use this channel to generate the simultaneous rewrite trigger.
	1, 0	TAUDnRDC01 TAUDnRDC00	Don't care	

Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see **Section 32, Timer Array Unit D (TAUD)**.

36.13.6.2 Peripheral Interconnections Settings

Table 36.78 Peripheral Interconnections Settings

Register	Bit Position	Bit Name	Setting	Remark
PIC0REG2n2	27	PIC0REG2n227	1	Select the input selected by the PIC0REG2n204 bit.
	23	PIC0REG2n223	1	Select the input selected by the PIC0REG2n203 bit.
	19	PIC0REG2n219	1	Select the input selected by the PIC0REG2n202 bit.
	4	PIC0REG2n204	0	Select TAUDTTOUT9.
	3	PIC0REG2n203	0	Select TAUDTTOUT7.
	2	PIC0REG2n202	0	Select TAUDTTOUT5.

Section 37 PWM Output/Diagnostic (PWM-Diag)

This section contains a generic description of the PWM output/diagnostic function (PWM-Diag).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of PWM-Diag.

37.1 Features of RH850/F1KH, RH850/F1KM PWM-Diag

37.1.1 Number of Units

The PWM-Diag unit consists of a PWBA block for generating clock signals, PWGA blocks that generate PWM signals, and a PWSA block for generating triggers for A/D conversion. The numbers of individual units are listed below.

Each PWGA unit has single PWM channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 37.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
PWBA			
Number of Units	1	1	1
Name	PWBAn (n = 0)	PWBAn (n = 0)	PWBAn (n = 0)
PWGA			
Number of Units	72	80	96
Name	PWGAn (n = 0 to 71)	PWGAn (n = 0 to 79)	PWGAn (n = 0 to 95)
PWSA			
Number of Units	1	1	1
Name	PWSAn (n = 0)	PWSAn (n = 0)	PWSAn (n = 0)

Table 37.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
PWBA					
Number of Units	1	1	1	1	1
Name	PWBAn (n = 0)	PWBAn (n = 0)	PWBAn (n = 0)	PWBAn (n = 0)	PWBAn (n = 0)
PWGA					
Number of Units	44	64	72	80	96
Name	PWGAn (n = 0 to 13, 16 to 23, 26 to 47)	PWGAn (n = 0 to 63)	PWGAn (n = 0 to 71)	PWGAn (n = 0 to 79)	PWGAn (n = 0 to 95)
PWSA					
Number of Units	1	1	1	1	1
Name	PWSAn (n = 0)	PWSAn (n = 0)	PWSAn (n = 0)	PWSAn (n = 0)	PWSAn (n = 0)

Table 37.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
PWBA				
Number of Units	1	1	1	1
Name	PWBAn (n = 0)	PWBAn (n = 0)	PWBAn (n = 0)	PWBAn (n = 0)
PWGA				
Number of Units	13	24	24	48
Name	PWGAn (n = 0 to 12)	PWGAn (n = 0 to 23)	PWGAn (n = 0 to 23)	PWGAn (n = 0 to 47)
PWSA				
Number of Units	1	1	1	1
Name	PWSAn (n = 0)	PWSAn (n = 0)	PWSAn (n = 0)	PWSAn (n = 0)

Table 37.4 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, individual units constituting the PWM-Diag function are identified by the index “n”; for example, PWBAnTE indicates the PWBAn status register.
m	The PWBA generation clock is identified by the index “m”; for example, PWBAnBRSm (m = 0 to 3) indicates the PWMCLKm clock cycle configuration register.
x, y	An A/D converter configuration register number corresponding to a PWM-Diag channel is identified by the index “x, y”; for example, PWSAnPVCRx_y (x_y = 00_01, 02_03, ..., 94_95).
j	Registers storing trigger channel numbers (encoded value) from PWGAn are identified by the index “j”; for example, the PWSAnQUEj (j = 0 to 7) register.
k	Sets of registers where each has the same function are identified by the index “k”; for example, the SLPWGAk (k = 0 to 2) register.
z	An A/D conversion result correspond to PWSAnPVCRx_y register is identified by the index “z”; for example, PWSAnPWDDIRz (z = 00, 01, ..., 95).
h	Sets of registers where each has the same function are identified by the index “h”; for example, the PWGAINTFhk (h = 0, 1) register.

Table 37.5 Indices (RH850/F1KM-S4)

Index	Description
n	Throughout this section, individual units constituting the PWM-Diag function are identified by the index “n”; for example, PWBAnTE indicates the PWBAn status register.
m	The PWBA generation clock is identified by the index “m”; for example, PWBAnBRSm (m = 0 to 3) indicates the PWMCLKm clock cycle configuration register.
x, y	An A/D converter configuration register number corresponding to a PWM-Diag channel is identified by the index “x, y”; for example, PWSAnPVCRx_y (x_y = 00_01, 02_03, ..., 94_95).
j	Registers storing trigger channel numbers (encoded value) from PWGAn are identified by the index “j”; for example, the PWSAnQUEj (j = 0 to 7) register.
k	Sets of registers where each has the same function are identified by the index “k”; for example, the SLPWGAk (k = 0 to 2) register.
z	An A/D conversion result correspond to PWSAnPVCRx_y register is identified by the index “z”; for example, PWSAnPWDDIRz (z = 00, 01, ..., 95).
h	Sets of registers where each has the same function are identified by the index “h”; for example, the PWGAINTFhk (h = 0) register.

Table 37.6 Indices (RH850/F1KM-S1)

Index	Description
n	Throughout this section, individual units constituting the PWM-Diag function are identified by the index “n”; for example, PWBAnTE indicates the PWBAn status register.
m	The PWBA generation clock is identified by the index “m”; for example, PWBAnBRSm (m = 0 to 3) indicates the PWMCLKm clock cycle configuration register.
x, y	An A/D converter configuration register number corresponding to a PWM-Diag channel is identified by the index “x, y”; for example, PWSAnPVCRx_y (x_y = 00_01, 02_03, ..., 46_47).
j	Registers storing trigger channel numbers (encoded value) from PWGAn are identified by the index “j”; for example, the PWSAnQUEj (j = 0 to 7) register.
k	Sets of registers where each has the same function are identified by the index “k”; for example, the SLPWGAk (k = 0, 1) register.
z	An A/D conversion result correspond to PWSAnPVCRx_y register is identified by the index “z”; for example, PWSAnPWDDIRz (z = 00, 01, ..., 47).
h	Sets of registers where each has the same function are identified by the index “h”; for example, the PWGAINTFhk (h = 0) register.

The following table shows values indicated by the indices of each product.

Table 37.7 Indices of Products (RH850/F1KH-D8)

Indices of each product		
176 Pins	233 Pins	324 Pins
x = 00, 02, ,,, 70 y = 01, 03, ,,, 71 z = 00, 01, ,,, 71	x = 00, 02, ,,, 78 y = 01, 03, ,,, 79 z = 00, 01, ,,, 79	x = 00, 02, ,,, 94 y = 01, 03, ,,, 95 z = 00, 01, ,,, 95
j = 0 to 7	j = 0 to 7	j = 0 to 7
k = 0 to 2	k = 0 to 2	k = 0 to 2
h = 0, 1	h = 0, 1	h = 0, 1

h = 0	h = 0	h = 0	h = 0	h = 0

Table 37.9 Indices of Products (RH850/F1KM-S1)

Indices of each Product			
48 Pins	64 Pins	80 Pins	100 Pins
x = 00, 02, ,,, 12 y = 01, 03, ,,, 13*[1] z = 00, 01, ,,, 12	x = 00, 02, ,,, 22 y = 01, 03, ,,, 23 z = 00, 01, ,,, 23	x = 00, 02, ,,, 22 y = 01, 03, ,,, 23 z = 00, 01, ,,, 23	x = 00, 02, ,,, 46 y = 01, 03, ,,, 47 z = 00, 01, ,,, 47
j = 0 to 7	j = 0 to 7	j = 0 to 7	j = 0 to 7
k = 0	k = 0	k = 0	k = 0, 1
h = 0	h = 0	h = 0	h = 0

Note 1. Channels 0 to 12 are provided in PWM-Diag.

37.1.2 Register Base Addresses

PWM-Diag base addresses are listed in the following table.

PWM-Diag register addresses are given as offsets from the base addresses.

Table 37.10 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<PWBAn_base>	FFE7 2800_H
<PWGAn_base>	FFE7 1000_H + 40_H × n
<PWSAn_base>	FFE7 0000_H
<SLPW_base>	FFE7 3000_H
<PWGAINTF_base>	FFE7 3100_H

37.1.3 Clock Supply

The PWM-Diag clock supply is shown in the following table.

Table 37.11 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
PWBAn	PCLK	CKSCLK_IPERI2	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI2	Bus clock
PWGAn	PCLK	CKSCLK_IPERI2	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI2	Bus clock
PWSAn	PCLK	CKSCLK_IPERI2	Module clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI2	Bus clock

37.1.4 Interrupt Requests

PWM-Diag interrupt requests are listed in the following table.
Regarding interrupt connection image, refer to **Figure 37.1, PWGA Interrupt Connection Image (PWGA 96 Channels Embedded)**.

Table 37.12 Interrupt Requests (RH850/F1KH-D8)

37.1.5 Reset Sources

PWM-Diag reset sources are listed in the following table. The individual PWM-Diag units are initialized by these reset sources.

Table 37.15 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
PWBAn	All reset sources (ISORES)
PWGAn	
PWSAn	

37.1.6 External Input/Output Signals

External input/output signals of the PWM-Diag are listed below.

Table 37.16 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
PWGA_TOUTn (Unit: PWGA)	PWGA unit n output	PWGAnO

CAUTION

When port P8_6 is used as PWGA38O, port P8_6 pin outputs a low-level $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is deasserted.

For details, see **Section 2A.11.1.1, P8_6: $\overline{\text{RESETOUT}}$, Section 2B.11.1.1, P8_6: $\overline{\text{RESETOUT}}$** and **Section 2C.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

37.1.7 Internal Output Signals

The I/O signals for connecting two PWM-Diag channels or a PWM-Diag and another function are listed below.

Table 37.17 Internal Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Connected to
PWBA0		
PWMCLK0	PWGA count clock 0	PWGAn
PWMCLK1	PWGA count clock 1	PWGAn
PWMCLK2	PWGA count clock 2	PWGAn
PWMCLK3	PWGA count clock 3	PWGAn

ADCAn		
ADC_CONV_ENDn	A/D conversion completion signal	PWSA0
ADC_PWDDRn[15:0]	A/D conversion result signal	PWSA0

37.1.8 Functional Overview

This function is comprised of four types of units: clock divider (PWBA), PWM generator (PWGA), A/D conversion trigger select function (PWSA), and A/D converter (ADCA).

PWBA

- Clock divider

  PWBA generates a PWMCLKm count clock signal by frequency division of PCLK and supplies it to the PWM generator PWGA.
  The cycle of the PWMCLKm count clock signal can be calculated from the setting of the PWBAnBRSm register by the equation below.

  (When the PWBAnBRSm = 1 to 2047)
  PWMCLKm count clock cycle = (PWBAnBRSm value × 2) × PCLK cycle

  (When the PWBAnBRSm = 0)
  PWMCLKm count clock cycle = PCLK cycle

  In addition, PWBA can control operation when the on-chip debugger is in use by using the PWBAnEMU register.

PWGA

PWGA outputs PWM waveforms and A/D conversion trigger to PWSA by using the clock PWMCLKm input from PWBA.

- PWM waveform output PWGA_TOUTn

  This generator outputs PWM waveforms from the PWGA_TOUTn pin. The PWM cycle is controlled by the match timing of PWGAnCNT register value and the PWGA_PERIOD input value. PWGA_PERIOD input value can be set by PWGAPRD and PWGAPRDSLk register setting. Set the high-level period of PWM output in the PWGAnCSDR and PWGAnCRDR registers.

  The PWM waveform cycle and duty can be calculated by the equations below.

  PWM waveform cycle = (PWGA_PERIOD + 1) × PWMCLKm count clock cycle

  When PWGAnCRDR[11:0] > PWGAnCSDR[11:0],

  High-level period of PWM waveform =
  (PWGAnCRDR register value – PWGAnCSDR register value) × PWMCLKm count clock cycle

  PWM waveform duty (%) = High-level period of PWM waveform/PWM waveform cycle × 100 = (PWGAnCRDR register value – PWGAnCSDR register value)/(PWGA_PERIOD + 1) × 100

  Note that the PWM output is fixed to the low level when the PWGAnCRDR register value is equal to the PWGAnCSDR register value.

  When $1xxx_H$ or the value higher than PWGA_PERIOD is set in the PWGAnCRDR register (i.e. bit 12 is set to 1), the PWM output is fixed to the high level.

- A/D conversion trigger output PWGA_TRGOUTn

  The A/D conversion trigger signal PWGA_TRGOUTn for PWSA is generated when the PWGAnCTDR register value and the PWGAnCNT register value match and its timing can be set by PWGAnOCL.
  The output enable/disable of PWGA_TRGOUTn is controlled by PWGAnTCR register. The timing can be calculated by the equation below.
  A/D conversion trigger signal generation timing = PWGAnCTDR register value × PWMCLKm count clock cycle

- PWGA interrupt request signal PWGA_INTn

  PWGA generates the interrupt request signal PWGA_INTn at the falling edge of the PWM output PWGA_TOUTn. When the PWM output is fixed to the low level, PWGA_INTn is generated when the PWGAnCRDR register value and the PWGAnCNT register value match; when the PWM output is fixed to the high level, it is generated when the PWGAnCNT register value and the PWGA_PERIOD input value match.

PWSA

PWSA transmits the required setting information to the A/D converter and outputs the A/D conversion start trigger, based on the A/D conversion trigger signal PWGA_TRGOUTn from the PWM generator (PWGA).

- A/D conversion control by PWSA

  PWSA outputs the information required for the A/D conversion, which is set in the corresponding PWSAnPVCRx_y register for the channel number of the trigger input from PWGAn, (i.e., information on ADC physical channel, external MPX control, and error detection level selection) to the A/D converter.
  At the same timing, A/D conversion trigger (PWSA_ADTRG) is output to ADCA0 or ADCA1. (A maximum of eight input trigger signal PWGA_TRGOUTn data received during A/D conversion are stored and kept in PWSAnQUE.)
  The setting information to be output to the A/D converter is kept until the next trigger is generated.
  When the A/D conversion triggered by the PWM-Diag function is completed in the A/D converter, PWSA triggers the next A/D conversion based on the data stored in the PWSAnQUE register.

- Queuing of A/D conversion triggers from PWGA

  The A/D conversion trigger signal (PWGA_TRGOUTn) input from PWGAn is stored in the PWSAnQUEj register as a channel number. The PWSAnQUEj register stores a maximum of eight channel numbers of the A/D conversion trigger signal PWGA_TRGOUTn received during A/D conversion in a queue structure.
  A PWSA queue full interrupt occurs in the following states, when the queue of the PWSAnQUEj register becomes full

  - A trigger number is written to PWSAnQUE7
  - A trigger number has already been written to PWSAnQUE7 and cannot be written when PWGA_TRGOUTn is input.

- Storing A/D conversion result

  The A/D conversion result is stored in PWSAnPWDDIRz register.

ADCA

A/D conversion is executed upon receipt of information required for A/D conversion and A/D conversion trigger from PWSA.

A/D conversion is executed using the PWM-Diag-dedicated scan group; on completion of the A/D conversion, it is reported to the PWSA.

For the basic operation of the A/D converter, see **Section 38, A/D Converter (ADCA)**.

For the A/D converter operation with the PWM-Diag function, see **Section 38.4.7.1, A/D Conversion with PWM-Diag Enabled**.

37.1.9 Block Diagram

The following figure shows an example of connecting the LED control circuit combining the PWM-Diag and the A/D converter.

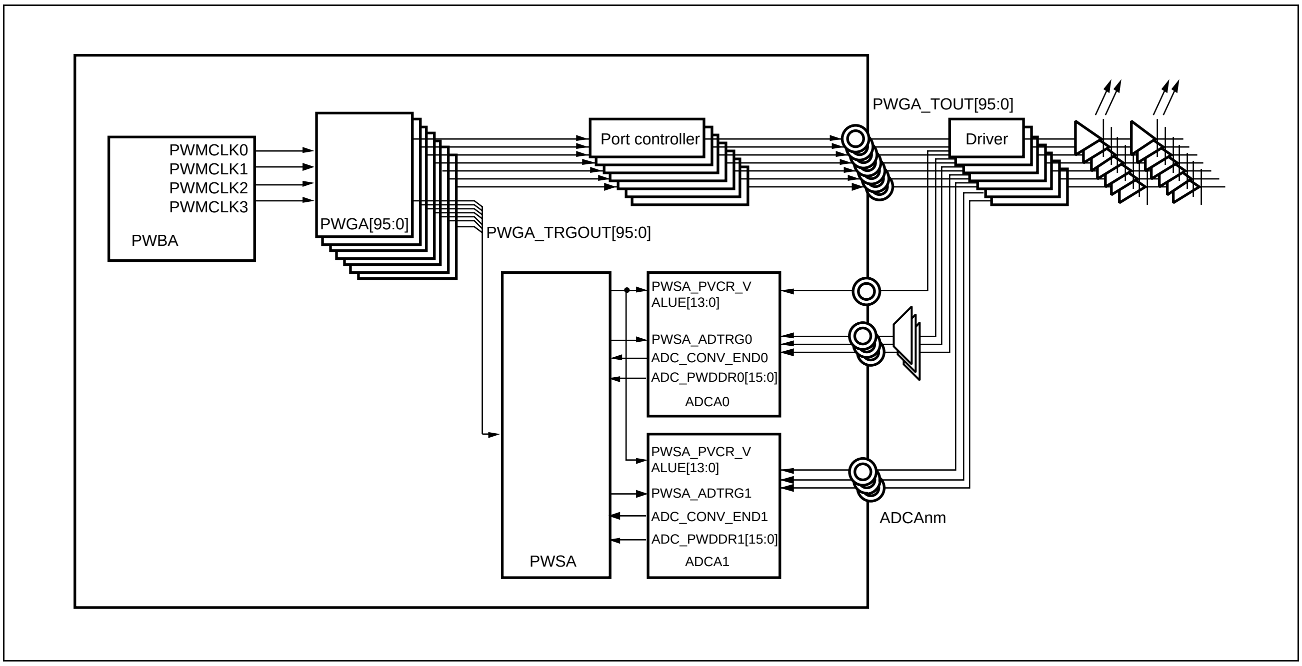

Figure 37.2 Example of Connecting the LED Control Circuit using the PWM-Diag and the A/D Converter

37.2 Registers

37.2.1 List of Registers

PWM Output/Diagnostic registers are listed in the following table.

<PWBAn_base>, <PWSAn_base>, and <PWGAn_base> are defined in **Section 37.1.2, Register Base Addresses**.

Table 37.20 List of Registers

Module Name	Register Name	Symbol	Address
PWBAn	PWMCLKm cycle configuration register	PWBAnBRSm	<PWBAn_base> + 0004_H × m
	PWMCLKm enable status register	PWBAnTE	<PWBAn_base> + 0010_H
	PWMCLKm start trigger register	PWBAnTS	<PWBAn_base> + 0014_H
	PWMCLKm stop trigger register	PWBAnTT	<PWBAn_base> + 0018_H
	PWBA emulation register	PWBAnEMU	<PWBAn_base> + $001C_H$
PWGAn	PWM output set condition register	PWGAnCSDR	<PWGAn_base> + 0000_H
	PWM output reset condition register	PWGAnCRDR	<PWGAn_base> + 0004_H
	PWGA_TRGOUTn generation condition register	PWGAnCTDR	<PWGAn_base> + 0008_H
	Buffer register reload trigger register	PWGAnRDT	<PWGAn_base> + $000C_H$
	Buffer register reload status register	PWGAnRSF	<PWGAn_base> + 0010_H
	PWM cycle count register	PWGAnCNT	<PWGAn_base> + 0014_H
	PWGA_TRGOUTn control register	PWGAnTCR	<PWGAn_base> + 0018_H
	PWGAnTCR buffer register	PWGAnTCBR	<PWGAn_base> + $001C_H$
	PWGA control register	PWGAnCTL	<PWGAn_base> + 0020_H
	PWGAnCSDR buffer register	PWGAnCSBR	<PWGAn_base> + 0024_H
	PWGAnCRDR buffer register	PWGAnCRBR	<PWGAn_base> + 0028_H
	PWGAnCTDR buffer register	PWGAnCTBR	<PWGAn_base> + $002C_H$
SLPWG	PWGA synchronous trigger register	SLPWGAk	<SLPW_base> + k × 4_H
	PWGA period setting register	PWGAPRD	<SLPW_base> + $000C_H$
	PWGA period selection register	PWGAPRDSLk	<SLPW_base> + 0010_H + k × 4_H
PWSAn	PWSA control register	PWSAnCTL	<PWSAn_base> + 0000_H
	Trigger queue status register	PWSAnSTR	<PWSAn_base> + 0004_H
	Trigger queue status clear register	PWSAnSTC	<PWSAn_base> + 0008_H
	Trigger queue register	PWSAnQUEj	<PWSAn_base> + 0020_H + j × 4_H
	PWM-Diag mode A/D setting register	PWSAnPVCRx_y	<PWSAn_base> + 0040_H + x × 2_H
	PWM-Diag data supplementary information register	PWSAnPWDDIRz	<PWSAn_base> + 0200_H + z × 4_H
	PWSA emulation control register	PWSAnEMU	<PWSAn_base> + $000C_H$
PWGA_INTF	PWGA interrupt factor register	PWGAINTFhk	<PWGAINTF_base> + h × 30_H + k × 10_H
	PWGA interrupt mask register	PWGAINTMSKhk	<PWGAINTF_base> + h × 30_H + k × 10_H + 4_H
	PWGA interrupt factor clear register	PWGAINTFChk	<PWGAINTF_base> + h × 30_H + k × 10_H + 8_H

37.2.1.1 PWBAnBRSm — PWMCLKm Cycle Configuration Register

This register sets the clock cycle of PWMCLKm.

Access: This register can be read or written in 16-bit units.

Address: <PWBAn_base> + 0004_H × m

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PWBAnBRSm[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.21 PWBAnBRSm Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	PWBAnBRSm[10:0]	Register for setting the clock cycle of PWMCLKm. – PWBAnBRSm = 0: PWMCLKm = PCLK – PWBAnBRSm = 1: PWMCLKm = PCLK / (2 × 1) – PWBAnBRSm = 2: PWMCLKm = PCLK / (2 × 2) ... – PWBAnBRSm = n: PWMCLKm = PCLK / (2 × n) (n = 1 to 2047) These bits can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0).

37.2.1.2 PWBAnTE — PWMCLKm Enable Status Register

This is a status register that indicates the output status of PWMCLKm (m = 0 to 3).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWBAn_base> + 0010_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTE3	PWBAnTE2	PWBAnTE1	PWBAnTE0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 37.22 PWBAnTE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3	PWBAnTE3	A status flag indicating the operation status of PWMCLK3 0: Not operating 1: Operating
2	PWBAnTE2	A status flag indicating the operation status of PWMCLK2 0: Not operating 1: Operating
1	PWBAnTE1	A status flag indicating the operation status of PWMCLK1 0: Not operating 1: Operating
0	PWBAnTE0	A status flag indicating the operation status of PWMCLK0 0: Not operating 1: Operating

37.2.1.3 PWBAnTS — PWMCLKm Start Trigger Register

This register is a start trigger register for PWMCLKm (m = 0 to 3).

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWBAn_base> + 0014_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTS3	PWBAnTS2	PWBAnTS1	PWBAnTS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 37.23 PWBAnTS Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3	PWBAnTS3	Start Trigger for PWMCLK3 0: Writing 0 has no effect. 1: Starts the output of PWMCLK3.
2	PWBAnTS2	Start Trigger for PWMCLK2 0: Writing 0 has no effect. 1: Starts the output of PWMCLK2.
1	PWBAnTS1	Start Trigger for PWMCLK1 0: Writing 0 has no effect. 1: Starts the output of PWMCLK1.
0	PWBAnTS0	Start Trigger for PWMCLK0 0: Writing 0 has no effect. 1: Starts the output of PWMCLK0.

37.2.1.4 PWBAnTT — PWMCLKm Stop Trigger Register

This register is a stop trigger register for PWMCLKm (m = 0 to 3).

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWBAn_base> + 0018_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTT3	PWBAnTT2	PWBAnTT1	PWBAnTT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 37.24 PWBAnTT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3	PWBAnTT3	Stop Trigger for PWMCLK3 0: Writing 0 has no effect. 1: Stops the output of PWMCLK3.
2	PWBAnTT2	Stop Trigger for PWMCLK2 0: Writing 0 has no effect. 1: Stops the output of PWMCLK2.
1	PWBAnTT1	Stop Trigger for PWMCLK1 0: Writing 0 has no effect. 1: Stops the output of PWMCLK1.
0	PWBAnTT0	Stop Trigger for PWMCLK0 0: Writing 0 has no effect. 1: Stops the output of PWMCLK0.

37.2.1.5 PWBAnEMU — PWBA Emulation Register

This register sets the operation during emulation.

Access: This register can be read or written in 8-bit units.

Address: <PWBAn_base> + $001C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PWBAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 37.25 PWBAnEMU Register Contents

Bit Position	Bit Name	Function
7	PWBAnSVSDIS	(When the EPC.SVSTOP bit = 0) The count clock is provided continuously when the debugger is controlling the microcontroller (by using break points, etc.), regardless of the value of this bit (1 or 0). (When the EPC.SVSTOP bit = 1) 0: The count clock is stopped when the debugger is controlling the microcontroller (by using break points, etc.). 1: The count clock is provided continuously when the debugger is controlling the microcontroller (by using break points, etc.). This bit can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

37.2.1.6 PWGAnCTL — PWGA Control Register

PWGAnCTL is used to select the count clock from PWBA and setting output condition of PWGA_TRGOUTn.

Access: This register can be read or written in 8-bit units.

Address: <PWGAn_base> + 0020$_{\text{H}}$

Value after reset: 00$_{\text{H}}$

Bit	7	6	5	4	3	2	1	0
	PWGAnOCL	—	PWGAnTCUT[1:0]		—	—	PWGAnCKS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R	R	R/W	R/W

Table 37.26 PWGAnCTL Register Contents

Bit Position	Bit Name	Function
7	PWGAnOCL	This bit select the PWGA_TRGOUTn output condition related with PWGA_TOUTn. 0: PWGA_TRGOUTn output at the condition of high level of PWGA_TOUTn 1: PWGA_TRGOUTn output at the condition of both high and low level of PWGA_TOUTn
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	PWGAnTCUT[1:0]	These bits select the update timing of PWGAnTCBR register. 00: No update 01: Update at rising edge of PWGA_TOUTn at the condition of PWGAnTCBR rewrite in progress (PWGAnRSFT = 1) 10: Update at falling edge of PWGA_TOUTn at the condition of PWGAnTCBR rewrite in progress (PWGAnRSFT = 1) 11: Update immediately (PWGAnTCBR rewrite request trigger of PWGAnRDTT = 1 setting is invalid)
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PWGAnCKS[1:0]	Count Clock Enable Input PWMCLK3 to PWMCLK0 Select 00: Uses PWMCLK0 as count clock 01: Uses PWMCLK1 as count clock 10: Uses PWMCLK2 as count clock 11: Uses PWMCLK3 as count clock These bits can only be rewritten when the PWGAn operation is stopped (SLPWGAk.SLPWGA[31:0] = 0).

37.2.1.7 PWGAnCNT — PWM Cycle Count Register

This is a count register.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGAn_base> + 0014_H

Value after reset: $0FFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCNT[11:0]											
Value after reset	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.27 PWGAnCNT Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned.
11 to 0	PWGAnCNT[11:0]	12-bit counter value

37.2.1.8 PWGAnCSDR — PWM Output Set Condition Register

This register sets the setting condition for PWGA_TOUTn output.

Access: This register can be read or written in 16-bit units.

Address: <PWGAn_base> + 0000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCSDR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.28 PWGAnCSDR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	PWGAnCSDR[11:0]	These bits set the setting condition for PWM output. The set value is reflected to the PWGAnCSBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

NOTE

In case of changing PWM period by PWGAPRD and PWGAPRDSLk registers, the setting of PWGAnCSDR > PWGA_PERIOD is prohibited.

37.2.1.9 PWGAnCRDR — PWM Output Reset Condition Register

This register sets the reset condition for PWGA_TOUTn output.

Access: This register can be read or written in 16-bit units.

Address: <PWGAn_base> + 0004_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PWGAnCRDR[12:0]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.29 PWGAnCRDR Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 0	PWGAnCRDR[12:0]	These bits set the reset condition for PWM output. The set value is reflected to the PWGAnCRBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

37.2.1.10 PWGAnCTDR — PWGA_TRGOUTn Generation Condition Register

This register sets the generation condition for PWGA_TRGOUTn.

Access: This register can be read or written in 16-bit units.

Address: <PWGAn_base> + 0008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCTDR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.30 PWGAnCTDR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	PWGAnCTDR[11:0]	These bits set the A/D conversion trigger generation condition for PWSAn. The set value is reflected to the PWGAnCTBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

37.2.1.11 PWGAnTCR — PWGA_TRGOUTn Control Register

This register controls enable/disable of PWGA_TRGOUTn.

Access: This register can be read or written in 8-bit units.

Address: <PWGAn_base> + 0018$_H$

Value after reset: 01$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWGAnTOE
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R/W

Table 37.31 PWGAnTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWGAnTOE	This bit set the output enable/disable of PWGA_TRGOUTn 0: Output disable of PWGA_TRGOUTn. 1: Output enable of PWGA_TRGOUTn. This register value is reflected to the PWGAnTCBR at the update timing selected by PWGAnTCUT[1:0].

NOTE

PWGAnTOE bit has to be set before count operation. In addition, in case of PWGAnTCUT=01B or 10B, PWGAnTOE bit has to be set before PWGAnTCBR rewrite request.

37.2.1.12 PWGAnCSBR — PWGAnCSDR Buffer Register

This is a buffer register for the PWGAnCSDR register.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGAn_base> + 0024$_H$

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCSBR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.32 PWGAnCSBR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned.
11 to 0	PWGAnCSBR[11:0]	The PWGAnCSDR register value is reflected to this register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, the pin output is driven high.

37.2.1.13 PWGAnCRBR — PWGAnCRDR Buffer Register

This is a buffer register for the PWGA_TOUTn reset condition.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGAn_base> + 0028_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PWGAnCRBR[12:0]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.33 PWGAnCRBR Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12 to 0	PWGAnCRBR[12:0]	The PWGAnCRDR register value is reflected to this register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, the pin output is driven low.

37.2.1.14 PWGAnCTBR — PWGAnCTDR Buffer Register

This is a buffer register for the PWGA_TRGOUTn generation condition.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGAn_base> + $002C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCTBR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.34 PWGAnCTBR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned.
11 to 0	PWGAnCTBR[11:0]	The PWGAnCTDR register value is reflected to this register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, a trigger is transmitted to PWSAn.

37.2.1.15 PWGAnTCBR — PWGAnTCR Buffer Register

This is a buffer register for the PWGAnTCR register.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWGAn_base> + $001C_H$

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWGAnTOBE
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 37.35 PWGAnTCBR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	PWGAnTOBE	The PWGAnTCR register value is reflected to this register at the update timing selected by PWGAnCTRL.TCUT[1:0]. 0: Output disable of PWGA_TRGOUTn. 1: Output enable of PWGA_TRGOUTn.

37.2.1.16 PWGAnRSF — Buffer Register Reload Status Register

This register is a status register for simultaneous rewrite control.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWGAn_base> + 0010_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWGAnRSFT	PWGAnRSF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 37.36 PWGAnRSF Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	PWGAnRSFT	PWGAnTCBR Rewrite Control Status 0: PWGAnTCBR rewrite is enabled. This value indicates the completion of PWGAnTCBR rewrite after the generation of a PWGAnTCBR rewrite trigger signal. In case of PWGAnTCUT = 00_B or 11_B, this bit shows always “0”. 1: PWGAnTCBR rewrite is in progress. This value indicates the waiting state for completion.
0	PWGAnRSF	Compare Buffer Register Simultaneous Rewrite Control Status 0: Compare buffer register simultaneous rewrite is enabled. This value indicates the completion of compare buffer register simultaneous rewrite after the generation of a compare buffer register simultaneous rewrite trigger signal. 1: Compare buffer register simultaneous rewrite is in progress. This value indicates the waiting state for completion.

37.2.1.17 PWGAnRDT — Buffer Register Reload Trigger Register

This is a simultaneous rewrite request trigger register.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWGAn_base> + $000C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWGAnRDTT	PWGAnRDT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 37.37 PWGAnRDT Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	PWGAnRDTT	PWGAnTCBR Rewrite Request Trigger 0: Writing 0 does not work as a function. 1: Triggers the rewrite request for PWGAnTCBR, and sets PWGA0RSF.PWGA0RSFT to 1. In case of PWGAnTCUT = 00_B or 11_B, write to this bit “1” is invalid.
0	PWGAnRDT	Compare Buffer Register Simultaneous Rewrite Request Trigger 0: Writing 0 does not work as a function. 1: Triggers the simultaneous rewrite request for the compare registers (PWGAnCSDR, PWGAnCRDR, and PWGAnCTDR), and sets PWGAnRSF.PWGAnRSF to 1.

37.2.1.18 SLPWGAk — PWGA Synchronous Trigger Register (k = 0 to 2)

This register triggers start and stop for multiple channels simultaneously.

Access: This register can be read or written in 32-bit units.

Address: <SLPW_base> + k × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SLPWGA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SLPWGA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 37.38 SLPWGAk Register Contents

Bit Position	Bit Name	Function
31 to 0	SLPWGA[31:0]	Trigger start and stop to multiple channels simultaneously. 0: Stops the corresponding channels. 1: Starts the corresponding channels. The bits correspond to the following channels. SLPWGA0.SLPWGA[31:0]: PWGA31 - PWGA0 SLPWGA1.SLPWGA[31:0]: PWGA63 - PWGA32 SLPWGA2.SLPWGA[31:0]: PWGA95 - PWGA64

37.2.1.19 PWGAPRD — PWGA Period Setting Register

This register is used to set the PWGA counter period.

Access: This register can be read or written in 16-bit units.

Address: <SLPW_base> + $000C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAPRD[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.39 PWGAPRD Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	PWGAPRD[11:0]	These bits set the PWGA counter period. (= PWGA_PERIOD) The period of PWGA_TOUTn can be flexible changed by setting this register when PWGAPRDSLk is set to 1. If PWGAPRDSLk is set to 0, PWGA_PERIOD value is FFF_H.

NOTE

PWGAPRD register setting change is prohibited during count operation.

37.2.1.20 PWGAPRDSLk — PWGA Period Selection Register (k = 0 to 2)

This register is used to select the PWGA counter period either 12bit free-running or PWGAPRD register setting.

Access: This register can be read or written in 32-bit units.

Address: <SLPW_base> + 0010_H + k × 4_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PWGAPRDSL[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWGAPRDSL[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 37.40 PWGAPRDSLk Register Contents

Bit Position	Bit Name	Function
31 to 0	PWGAPRDSL[31:0]	Select the PWGA counter period either 12 bit free-running or PWGAPRD register setting. 0: Select the 12 bit free-running 1: Select the PWGAPRD register setting The bits correspond to the following channels. PWGAPRDSL0.SLPWGA[31:0]: PWGA31 - PWGA0 PWGAPRDSL1.SLPWGA[31:0]: PWGA63 - PWGA32 PWGAPRDSL2.SLPWGA[31:0]: PWGA95 - PWGA64

37.2.1.21 PWSAnCTL — PWSA Control Register

This register is used to control operations of PWSA.

Access: This register can be read or written in 8-bit units.

Address: <PWSAn_base> + 0000$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	PWSAnARSE	—	—	—	—	—	—	PWSAnENBL
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R/W

Table 37.41 PWSAnCTL Register Contents

Bit Position	Bit Name	Function
7	PWSAnARSE	A/D conversion result storing control 0: Storing the ADCAnPWDDIR register to PWSAnPWDDIRz register is disabled 1: Storing the ADCAnPWDDIR register to PWSAnPWDDIRz register is enabled.
6 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWSAnENBL	Operation Permission Control 0: Operation is prohibited (initial state). Writing 0 initializes PWSAnSTR, PWSAnQUEj, PWSAnOWE and PWSAnWFLG. 1: Operation is enabled.

NOTE

PWSAnARSE setting has to be changed during the state of trigger has not been input (PWSAnQUE0 = 7F$_H$) and condition of not input the trigger from PWGA.

37.2.1.22 PWSAnSTR — Trigger Queue Status Register

This is a status register that indicates whether the number of a channel for which an A/D conversion trigger has been generated is stored in a PWSAnQUEj register.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWSAn_base> + 0004$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWSAnQFL	PWSAnQNE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 37.42 PWSAnSTR Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	PWSAnQFL	Indicates the queuing state of the A/D conversion trigger. 0: Some PWSAnQUEj registers do not store a channel number. 1: All of the PWSAnQUEj registers store a channel number.
0	PWSAnQNE	Bit indicating that there is a trigger in the trigger queue 0: A channel number is not stored in a PWSAnQUEj register, or A/D conversion is in progress while only PWSAnQUE0 stores a channel number. 1: The number of the channel waiting for conversion is stored in j = 1 and subsequent PWSAnQUEj registers.

37.2.1.23 PWSAnSTC — Trigger Queue Status Clear Register

This register clears the status of the PWSAnSTR register.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWSAn_base> + 0008$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWSAnCLFL	PWSAnCLNE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 37.43 PWSAnSTC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	PWSAnCLFL	PWSAnQFL Clear 0: PWSAnQFL retains the status (Writing 0 has no effect). 1: PWSAnQFL is cleared to 0.
0	PWSAnCLNE	PWSAnQNE Clear 0: PWSAnQNE retains the status (Writing 0 has no effect). 1: PWSAnQNE is cleared to 0.

37.2.1.24 PWSAnQUEj — Trigger Queue Register (j = 0 to 7)

This register stores the channel number that received the trigger from PWGAn.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWSAn_base> + 0020_H + j × 4_H

Value after reset: $7F_H$

Bit	7	6	5	4	3	2	1	0
	—	PWSAnQUEj[6:0]						
Value after reset	0	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R

Table 37.44 PWSAnQUEj Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	PWSAnQUEj[6:0]	These bits hold the channel number (0 to 95) of the PWGA for which a trigger was generated in order from PWSAnQUE0 to PWSAnQUE7. After the A/D conversion of PWSAnQUE0 is completed, the values in PWSAnQUE1 to PWSAnQUE7 shift to PWSAnQUE0 to PWSAnQUE6.

NOTE

If a trigger occurs simultaneously for multiple channels, the trigger with the smaller channel number has priority.

37.2.1.25 PWSAnPVCRx_y — PWM-Diag Mode A/D Setting Register

This register is used to set the corresponding A/D converter for each channel.

Two consecutive channels are set such as PWSA0PVCR02_03, and the 16 higher-order bits of each register correspond to an odd-numbered channel while the 16 lower-order bits correspond to an even- numbered channel.

At the generation of a trigger, the set value is transmitted to the ADCAnPWDVCR register of the A/D converter.

For the ADCAnPWDVCR register, see **Section 38, A/D Converter (ADCA)**.

Access:	PWSAnPVCRx_y register can be read or written in 32-bit units. PWSAnPVCRx_yL, PWSAnPVCRx_yH registers can be read or written in 16-bit units.
Address:	PWSAnPVCRx_y: <PWSAn_base> + 0040_H + x × 2_H PWSAnPVCRx_yL: <PWSAn_base> + 0040_H + x × 2_H PWSAnPVCRx_yH: <PWSAn_base> + 0040_H + x × 2_H + 2_H
Value after reset:	0000 0000_H

Table 37.45 PWSAnPVCRx_y Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30, 29	PWSAnVRDTy[29:28]	These bits indicate the set value of the ADCAnPWDVCR.ULS[3:2] bits (odd-numbered channel).
28	PWSAnSLADy	RH850/F1KM-S4 100-pin products: RH850/F1KM-S1 all products: When writing, write the value after reset. RH850/F1KH-D8 all products, RH850/F1KM-S4 144/176/233/272-pin products: ADCA Select (odd-numbered channel) 0: Output to ADCA0. 1: Output to ADCA1.
27	PWSAnVRDTy[27]	This bit indicates the set value of the ADCAnPWDVCR.MPXE bit[*1] (odd-numbered channel).
26 to 24	PWSAnVRDTy[26:24]	These bits indicate the set value of the ADCAnPWDVCR.MPXV[2:0] bits[*1] (odd-numbered channel).
23, 22	PWSAnVRDTy[23:22]	These bits indicate the set value of the ADCAnPWDVCR.ULS[1:0] bits (odd-numbered channel).
21 to 16	PWSAnVRDTy[21:16]	These bits indicate the set value of the ADCAnPWDVCR.GCTRL[5:0] bits (odd-numbered channel).
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14, 13	PWSAnVRDTx[13:12]	These bits indicate the set value of the ADCAnPWDVCR.ULS[3:2] bits. (even-numbered channel)

Table 37.45 PWSAnPVCRx_y Register Contents

Bit Position	Bit Name	Function
12	PWSAnSLADx	RH850/F1KM-S4 100-pin products: RH850/F1KM-S1 all products: When writing, write the value after reset. RH850/F1KH-D8 all products, RH850/F1KM-S4 144/176/233/272-pin products: ADCA Select (even-numbered channel) 0: Output to ADCA0. 1: Output to ADCA1.
11	PWSAnVRDTx[11]	This bit indicates the set value of the ADCAnPWDVCR.MPXE bit*[1]. (even-numbered channel)
10 to 8	PWSAnVRDTx[10:8]	These bits indicate the set value of the ADCAnPWDVCR.MPXV[2:0] bits*[1]. (even-numbered channel)
7, 6	PWSAnVRDTx[7:6]	These bits indicate the set value of the ADCAnPWDVCR.ULS[1:0] bits. (even-numbered channel)
5 to 0	PWSAnVRDTx[5:0]	These bits indicate the set value of the ADCAnPWDVCR.GCTRL[5:0] bits. (even-numbered channel)

Note 1. These bits are only supported for ADCA0.

37.2.1.26 PWSAnPWDDIRz — PWM-Diag Data Supplementary Information Register

This register stores the A/D conversion result correspond to PWSAnPVCRx_y register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <PWSAn_base> + 0200_H + z × 4_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PWSAn MPXE	PWSAnMPXV[2:0]			—	PWSAn OWE	PWSAn WFLG	—	—	—	PWSAnID[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.46 PWSAnPWDDIRz Register Contents

Bit Position	Bit Name	Function
31	PWSAnMPXE	This bit mirrors PWSAnVRDTx[11] or PWSAnVRDTy[27]
30 to 28	PWSAnMPXV[2:0]	These bits mirror PWSAnVRDTx[10:8] or PWSAnVRDTy[26:24]
27	Reserved	When read, the value after reset is returned.
26	PWSAnOWE	This bit indicates overwrite error flag of the A/D conversion result storing. Set timing is same as PWSAnPWDDR stored timing at the condition of PWSAnWFLG = 1. 0: An overwrite error is not detected. 1: An overwrite error is detected Setting condition: PWSAnWFLG = 1, and new A/D conversion result is written to PWSAnPWDDR[15:0] Clearing condition: Reading this register, or clearing the PWSAnENBL bit.
25	PWSAnWFLG	This bit indicates write flag of the A/D conversion result storing. Set timing is same as PWSAnPWDDR stored timing. 0: This register is read, or A/D conversion is not finished. 1: The A/D conversion result is stored (not read yet). Setting condition: The A/D conversion result is written to PWSAnPWDDR[15:0] Clearing condition: Reading this register, or clearing the PWSAnENBL bit.
24 to 22	Reserved	When read, the value after reset is returned.
21 to 16	PWSAnID[5:0]	These bits mirror PWSAnVRDTx[5:0] or PWSAnVRDTy[21:16]
15 to 0	PWSAnPWDDR[15:0]	These bits indicate the A/D conversion result which is sent by ADC_PWDDRn[15:0] pins from ADCAn. The data format is same as ADCAnPWDTSNDR.PWDDR[15:0].

37.2.1.27 PWSAnEMU — PWSA Emulation Control Register

This register is used to set the operation for emulation.

Access: This register can be read or written in 8-bit units.

Address: <PWSAn_base> + 000C$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWSAnSVSDIS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 37.47 PWSAnEMU Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWSAnSVSDIS	(When the EPC.SVSTOP bit = 0) The operation continues when the debugger is controlling the microcontroller (by using break points, etc.), regardless of the value of this bit (1 or 0). (When the EPC.SVSTOP bit = 1) 0: When the debugger is controlling the microcontroller (by using break points, etc.); – The output state to A/D is retained, the ADC_CONV_ENDn input at a break point is internally retained, and PWSAnQUEj is updated after break release. – The PWGA_TRGOUTn input is accepted even at a break, and INTQFULL is also output. – Reading and writing to the register is possible. 1: The operation continues when the debugger is controlling the microcontroller (by using break points, etc.). The above bit can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0), the operation of all channels PWGAn has stopped (SLPWGAk.SLPWGA), and no trigger has been generated from any of the channels PWGAn (PWSAnQUE0 is the value after reset).

37.2.1.28 PWGAINTFhk — PWGA Interrupt Factor Register (k = 0 to 2)

These registers contain information about which PWGAn interrupt (PWGA_INTn) has been generated without depending on PWGAINTMSKhk setting. Regarding block diagram image, see **Figure 37.1, PWGA Interrupt Connection Image**.

Access:	These registers are read-only registers that can be read in 32-bit units.
Address:	<PWGAINTF_base> + h × 30_H + k × 10_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

37.3 Operating Procedure

Procedures for setting when starting and stopping operation of PWM-Diag are illustrated below.

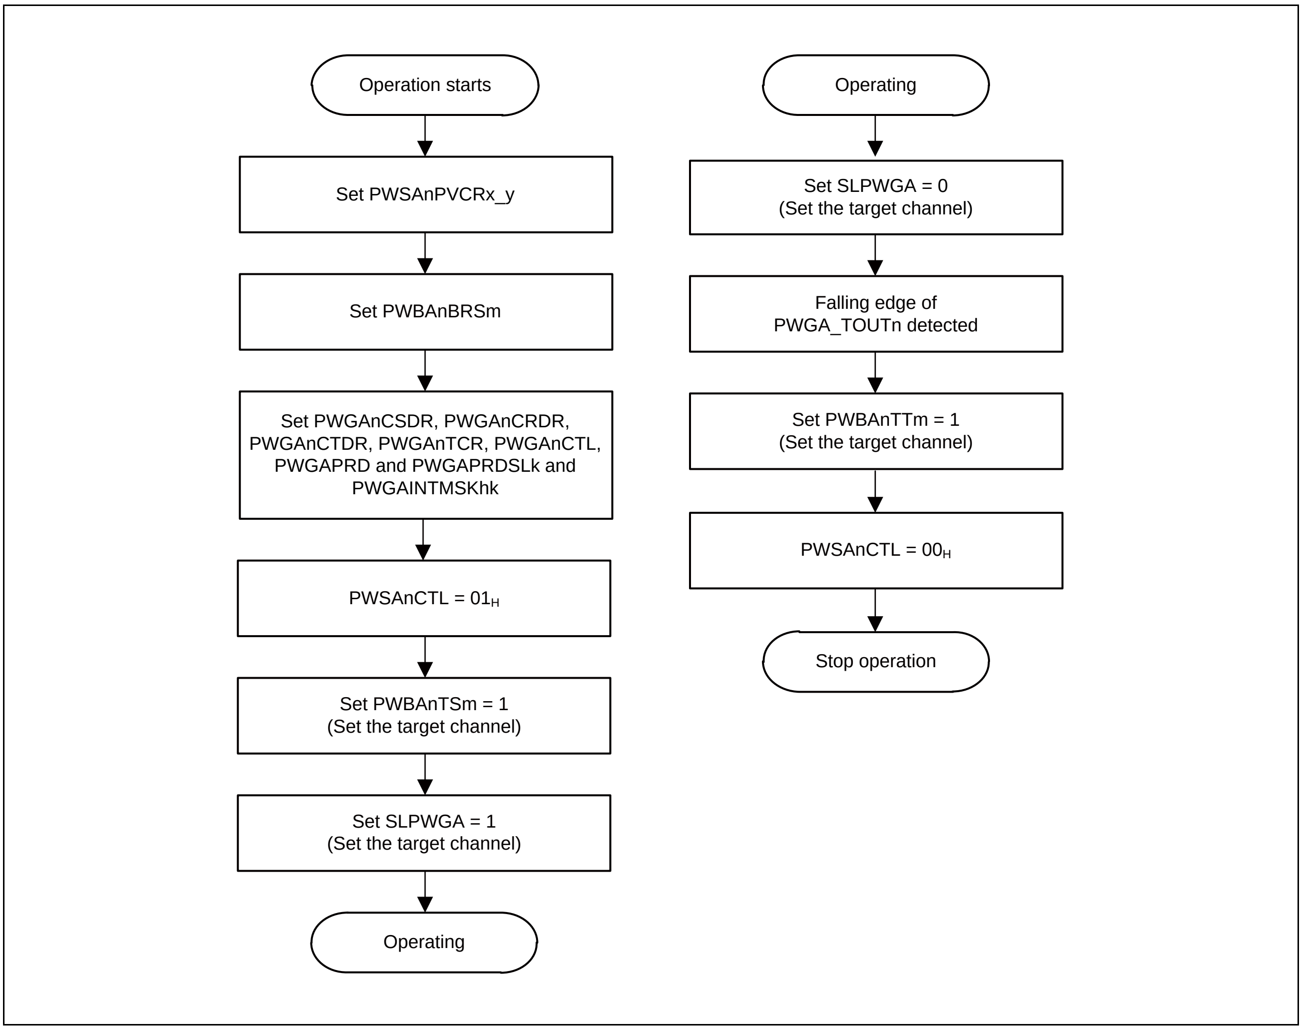

Figure 37.3 PWM-Diag Operating Procedure

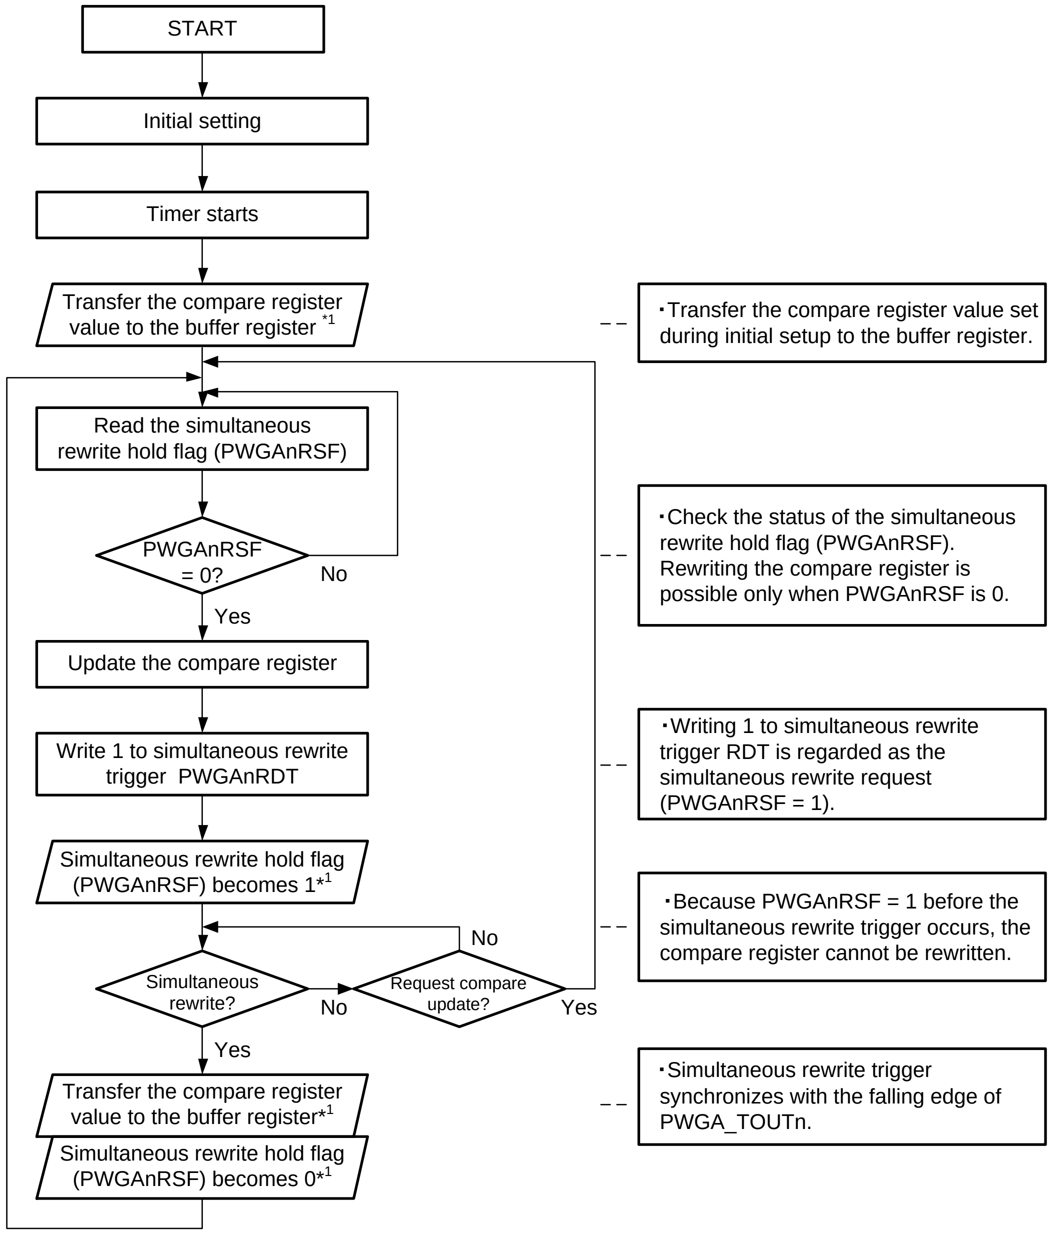
Procedures for compare buffer register simultaneous rewrite of PWGA are illustrated below.

The described term “compare register” indicates PWGAnCSDR, PWGAnCRDR, or PWGAnCTDR.

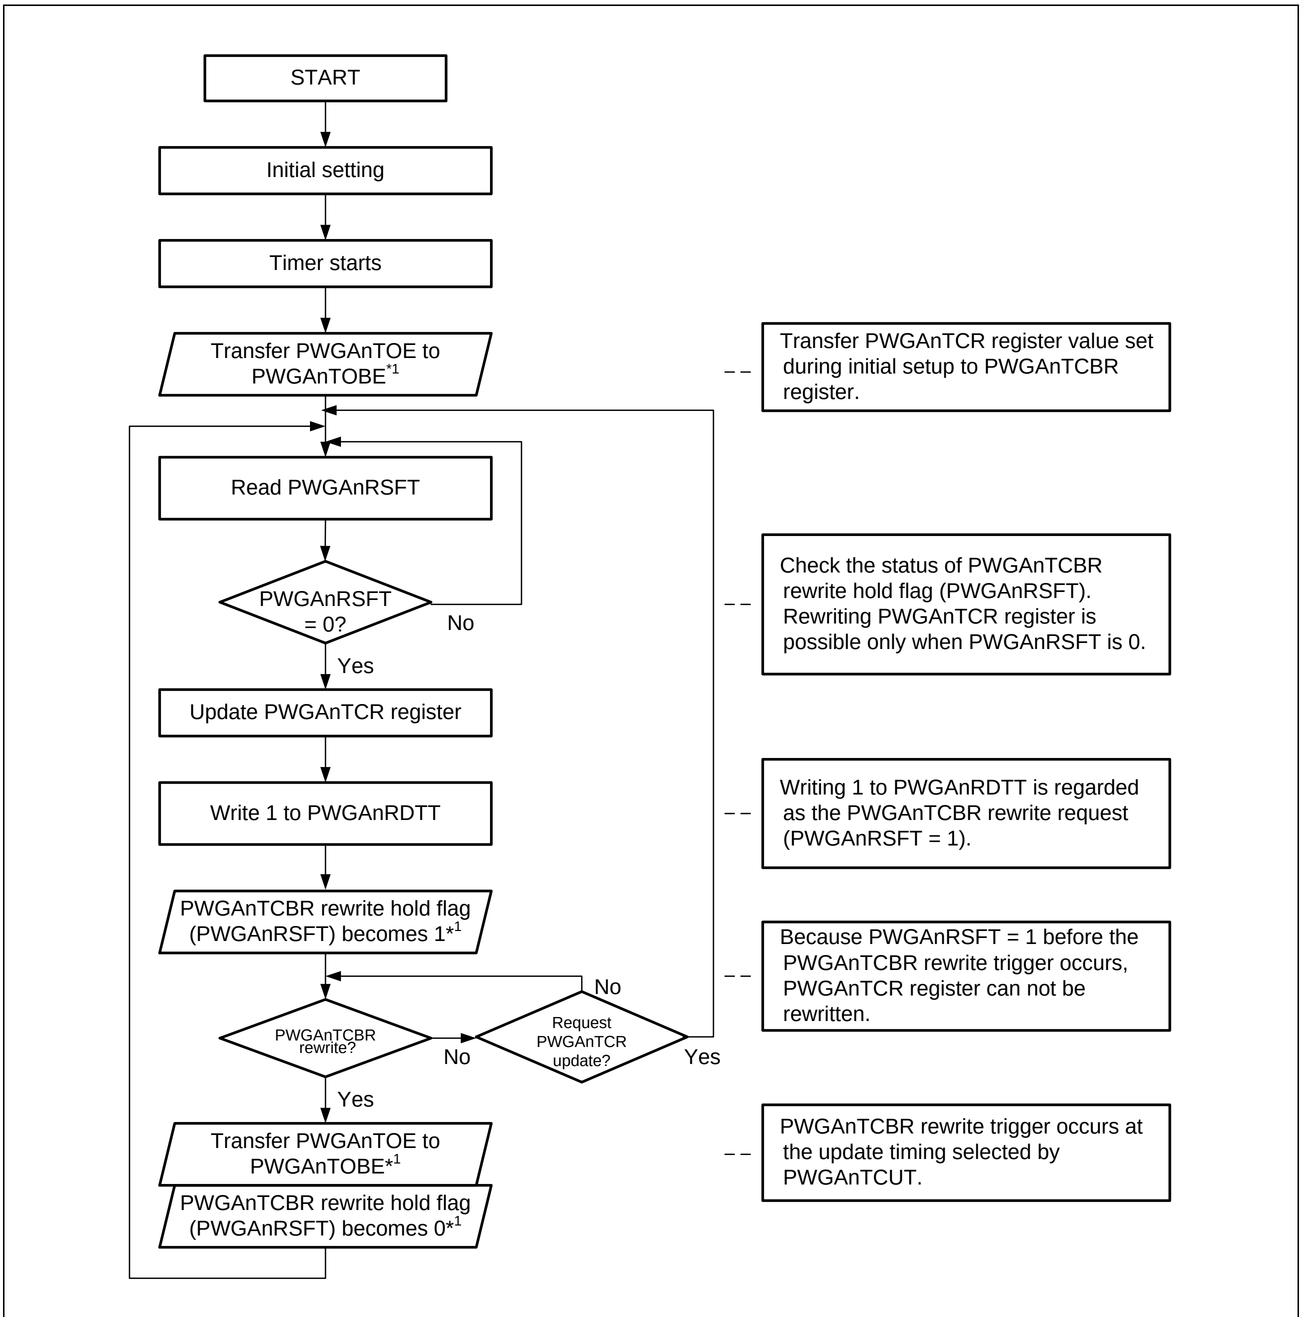
In addition, the described term “buffer register” indicates PWGAnCSBR, PWGAnCRBR, or PWGAnCTBR.



Note 1. Indicates the transition by hardware.

Figure 37.4 Compare Buffer Register Simultaneous Rewrite Procedure

Procedures for PWGAnTCBR register rewrite of PWGA are illustrated below.



Note 1. Indicates the transition by hardware.

Figure 37.5 PWGAnTCBR Register Rewrite Procedure

37.4 Operation Waveform of PWM-Diag

37.4.1 PWM Waveform Output by PWGA and Operation Waveform for A/D Conversion Trigger Output

37.4.1.1 Basic Operation Waveform of PWGA

The basic operation waveforms of PWGA are illustrated below.

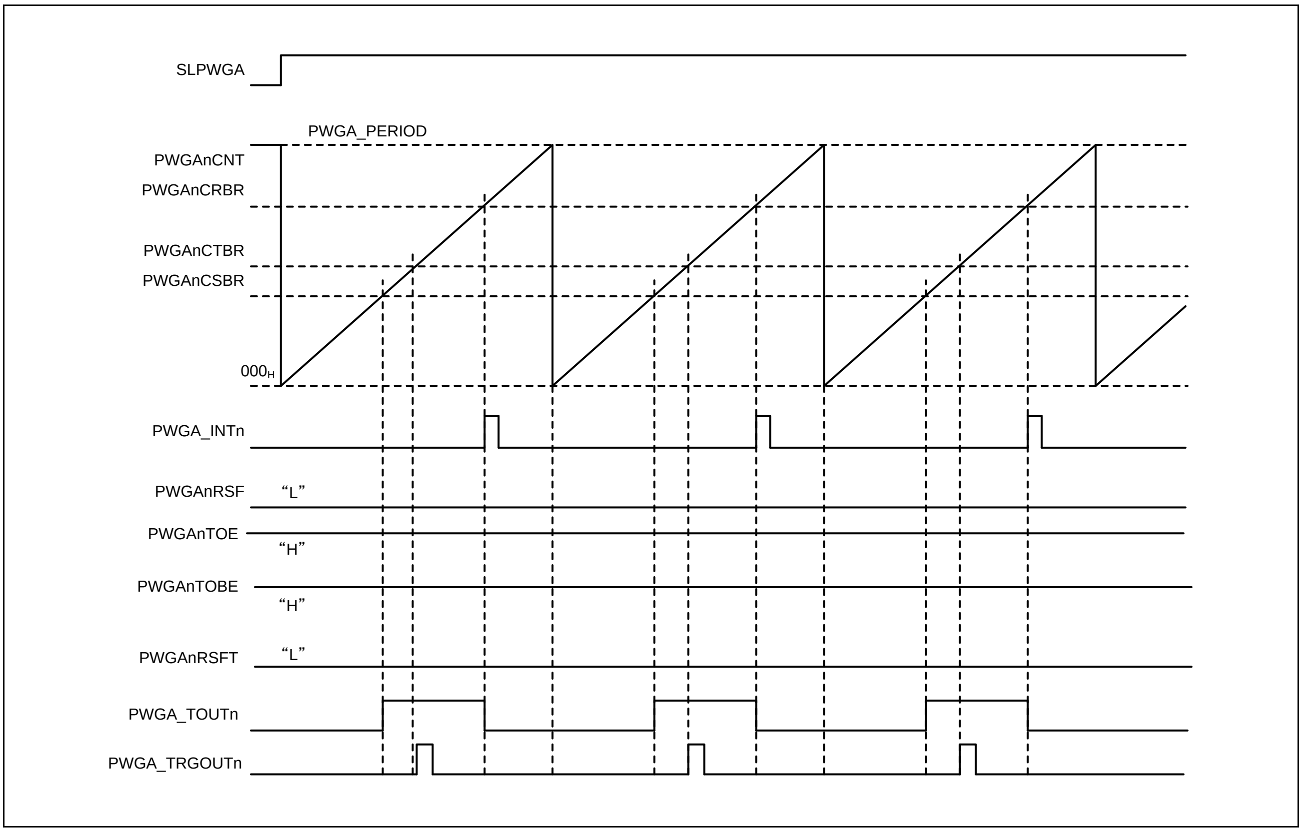


Figure 37.6 Basic Waveform

37.4.1.2 Operation Waveform when Compare Buffer Register Simultaneous Rewrite for PWGA is Executed

The following figure illustrates the operation waveforms when compare buffer register simultaneous rewrite for PWGA is executed.

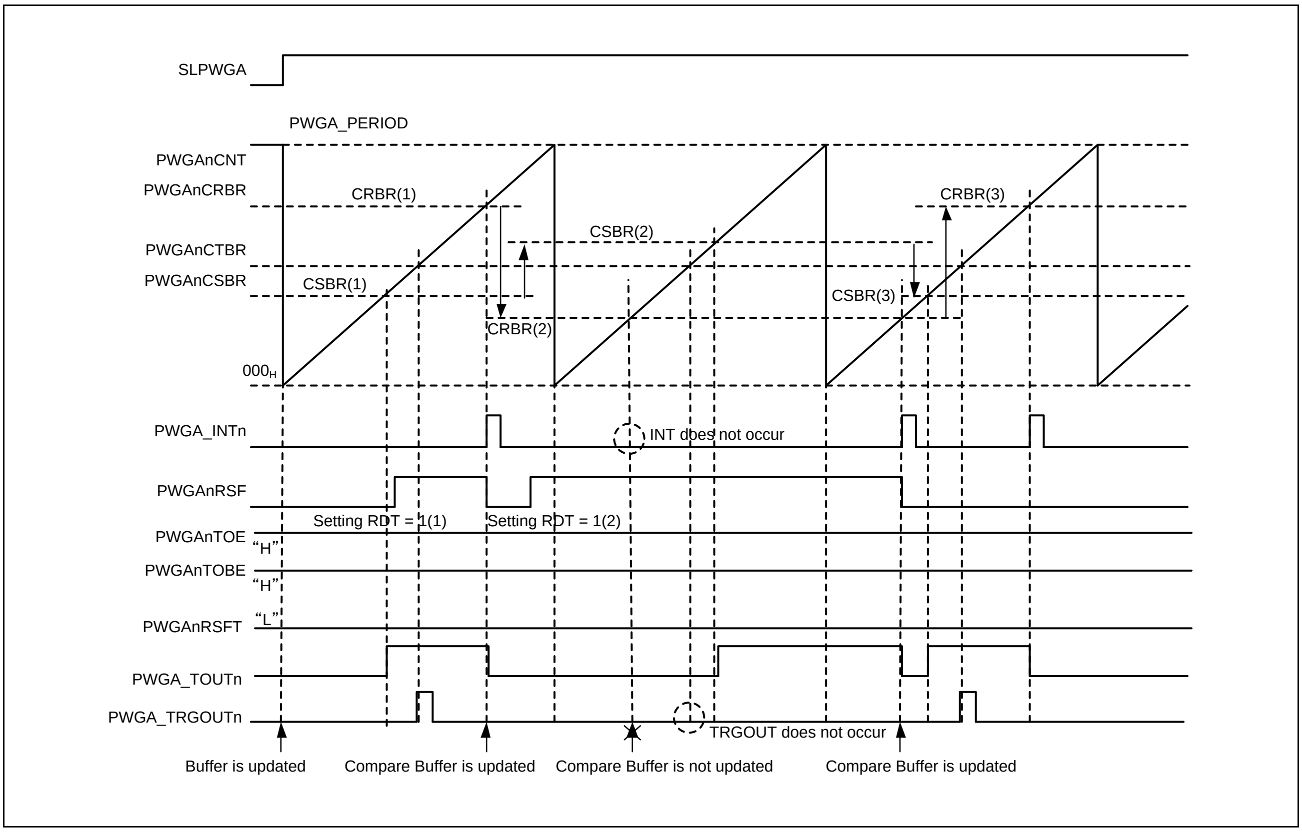

Figure 37.7 Waveform when Compare Buffer Register Simultaneous Rewrite is Executed (PWGAnOCL = 0)

Compare buffer register simultaneous rewrite is executed by re-setting the PWGAnCSDR and PWGAnCRDR registers, then setting either the PWGAnRDT or SLPWGAk register.

Moreover, if the relationship between set values in one interval is PWGAnCSDR > PWGAnCRDR, a falling edge in that interval is meaningless, and the falling edge in the next interval is valid.

In case of PWGAnOCL = 1, PWGAn_TRGOUTn is also occurred at the timing of "TRGOUT does not occur" in **Figure 37.7, Waveform when Compare Buffer Register Simultaneous Rewrite is Executed (PWGAnOCL = 0)**.

37.4.1.3 Operation Waveform when PWGAnTCBR Register Rewrite for PWGA is Executed

The following figure illustrates the operation waveforms when PWGAnTCBR register rewrite for PWGA is executed.

PWGAnTCBR register rewrite is executed by re-setting the PWGAnTCR register after setting of PWGAnRDTT.

The update timing of PWGAnTCBR register requested by PWGAnRDTT is depended on PWGAnTCUT setting.

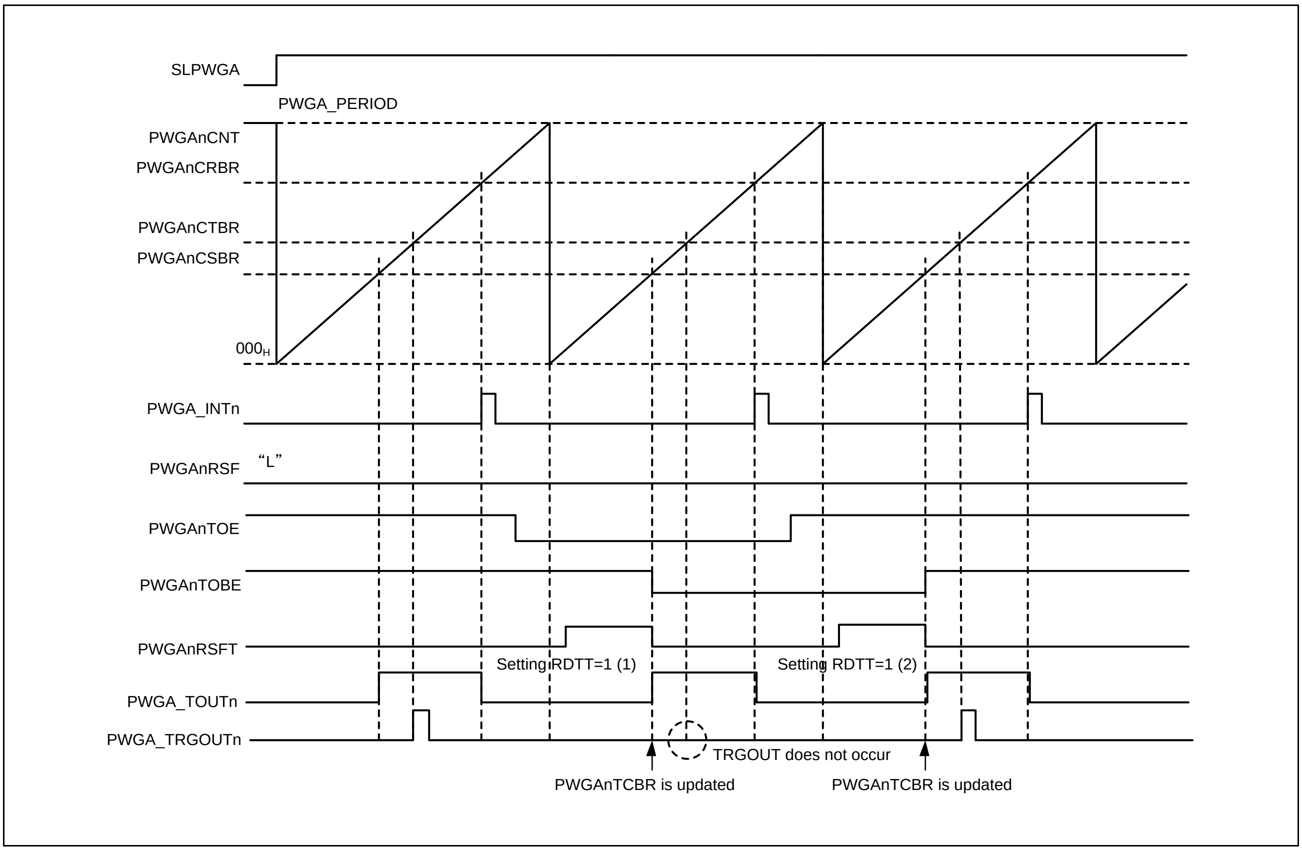

Figure 37.8 Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 01_B)

PWGAn_TRGOUTn is not occurred at the timing of "TRGOUT does not occur" in **Figure 37.8, Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 01B)** because PWGAnTOBE = 0 even if PWGAnOCL = 1.

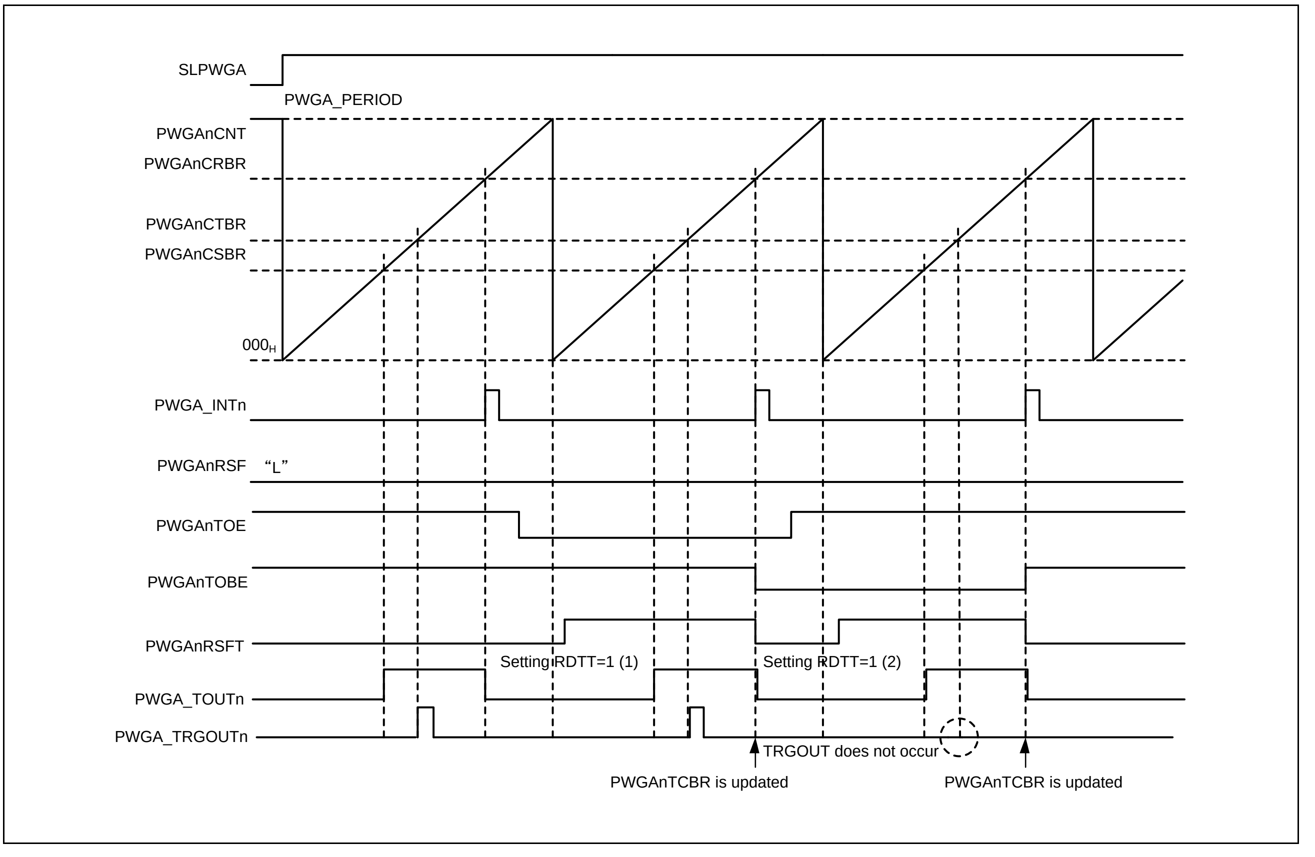

Figure 37.9 Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 10_B)

PWGAn_TRGOUTn is not occurred at the timing of “TRGOUT does not occur” in **Figure 37.9, Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 10B)** because PWGAnTOBE = 0 even if PWGAnOCL = 1.

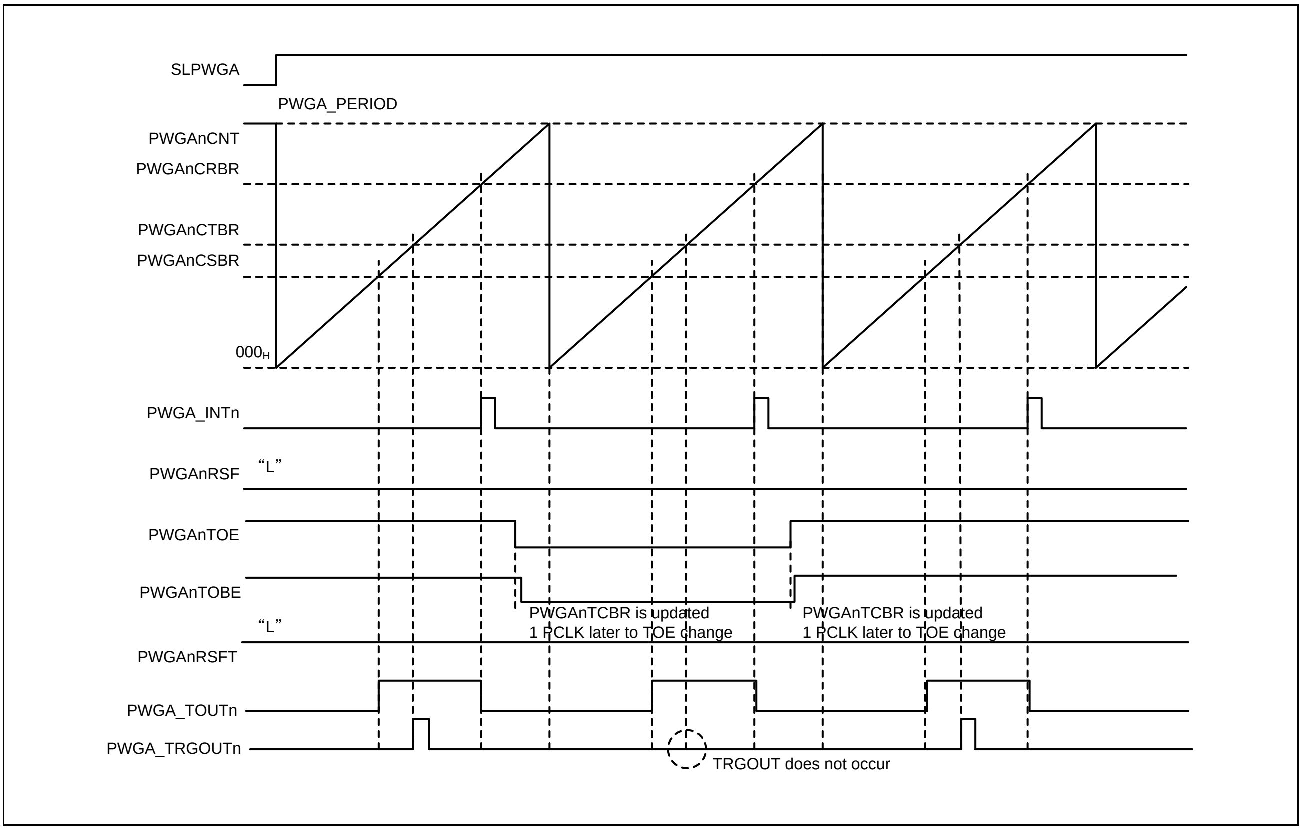

Figure 37.10 Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 11_B)

PWGAn_TRGOUTn is not occurred at the timing of "TRGOUT does not occur" in **Figure 37.10, Waveform when PWGAnTCBR Register Rewrite is Executed (PWGAnOCL = 0, PWGAnTCUT = 11B)** because PWGAnTOBE = 0 even if PWGAnOCL = 1.

37.4.1.4 Operation Waveform when Stopping and Restarting PWGA Operation

The following figure illustrates the operation waveforms when stopping and restarting PWGA operation.

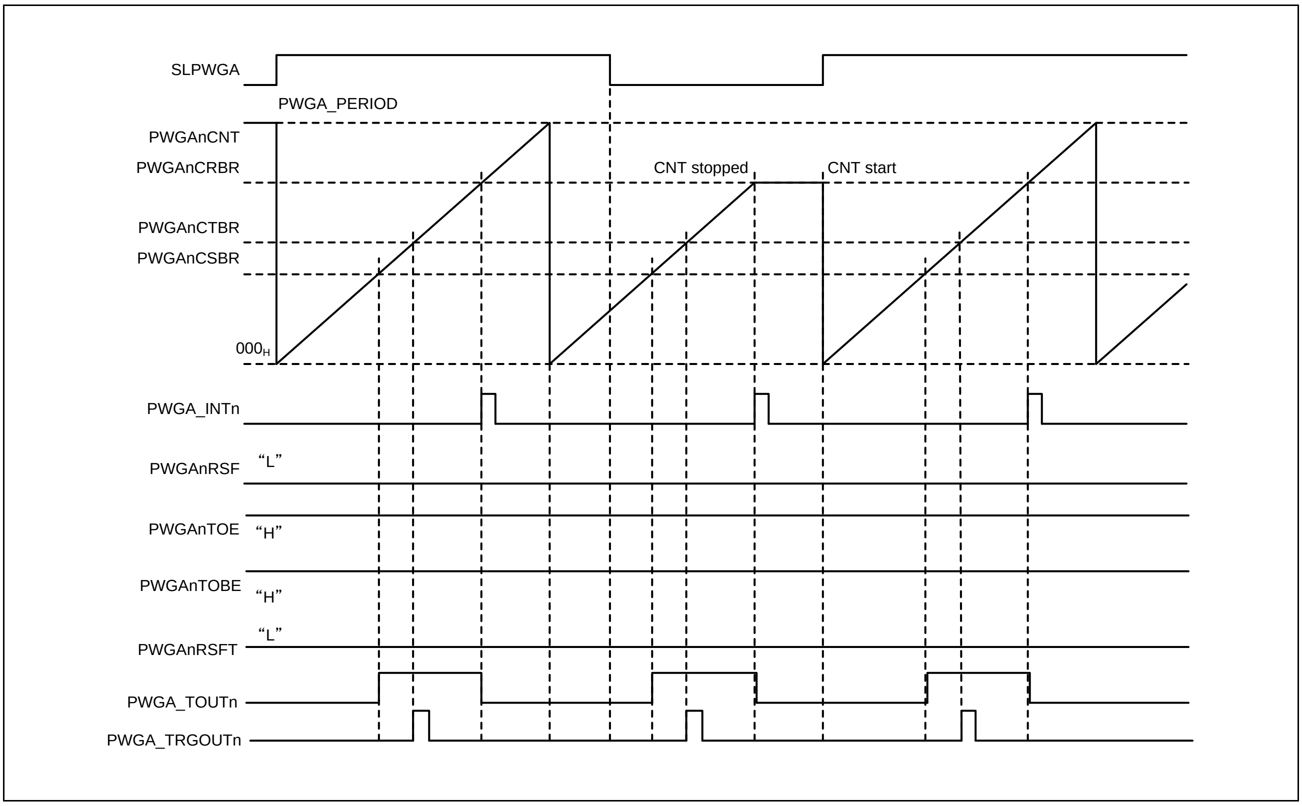

Figure 37.11 Stopping and Resuming Operation (1)

After the setting of SLPWGA has been changed from 1 to 0, PWGAnCNT stops operation because PWGA_INTn is generated.

After PWGA_INTn has been generated, by changing the setting of SLPWGA from 0 to 1, PWGAnCNT resumes counting from 000_H.

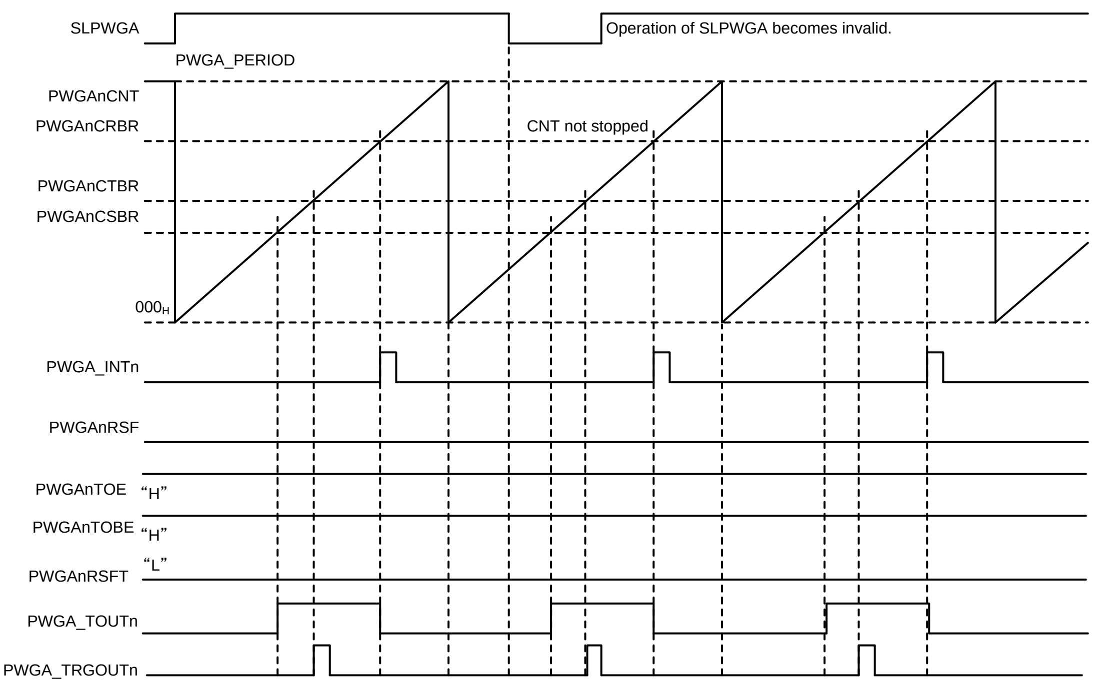

Figure 37.12 Stopping and Resuming Operation (2)

After the setting of SLPWGA has been changed from 1 to 0, if the setting of SLPWGA is changed from 0 to 1 before PWGA_INTn is generated, operations of SLPWGA become invalid, and PWGAnCNT continues counting.

37.4.1.5 Waveforms of PWGA Operation with Specific Settings

The following figures illustrate the waveforms of PWGA operation with specific settings.

When PWGAnOCL is set to 0 and PWGAnCSBR is equal to PWGAnCRBR, PWGA_TOUTn is fixed to the low level and PWGA_TRGOUTn does not become valid as illustrated.

When PWGAnOCL is set to 1, PWGA_TRGOUTn occurs at the timing PWGAnCNT matches PWGAnCTBR regardless of PWGA_TOUTn level.

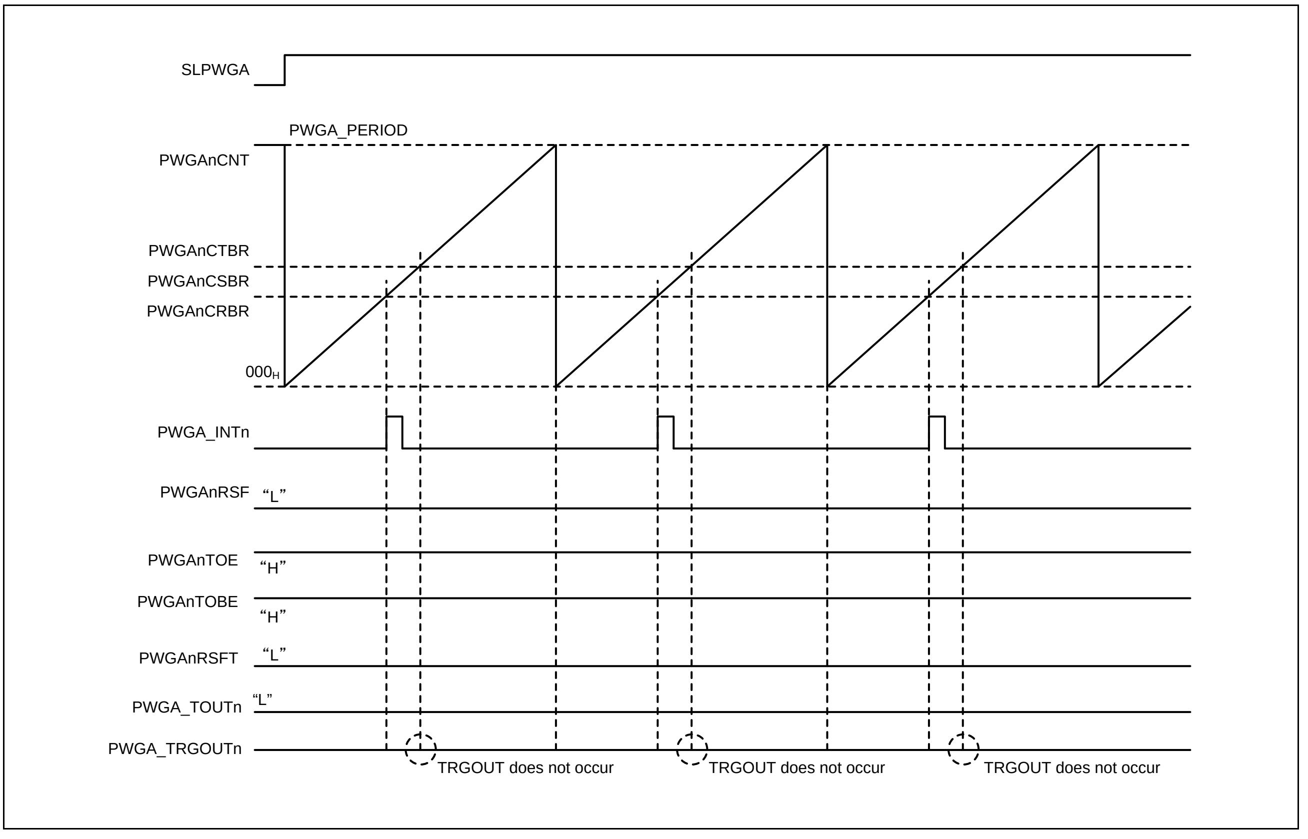

Figure 37.13 PWGA_TOUTn = 0% Output Waveform

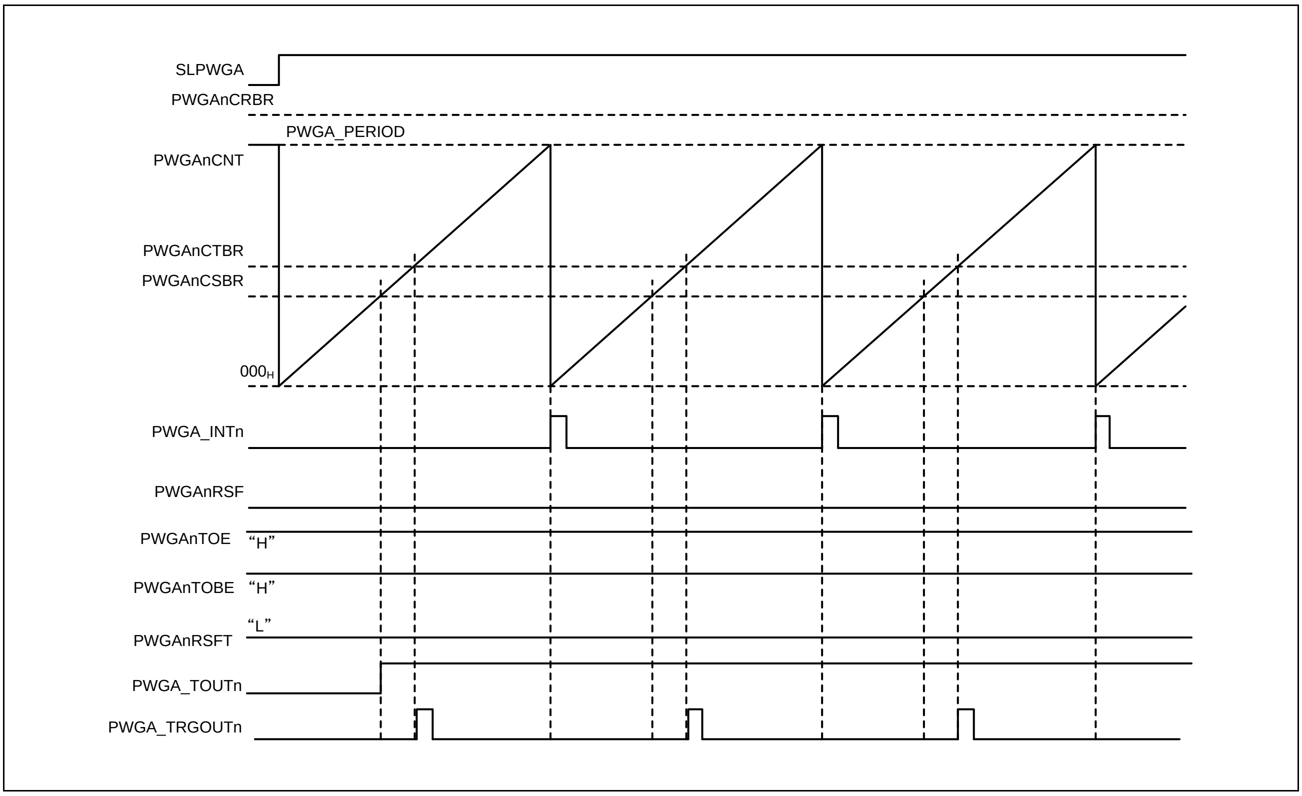

Figure 37.14 PWGA_TOUTn = 100% Output Waveform

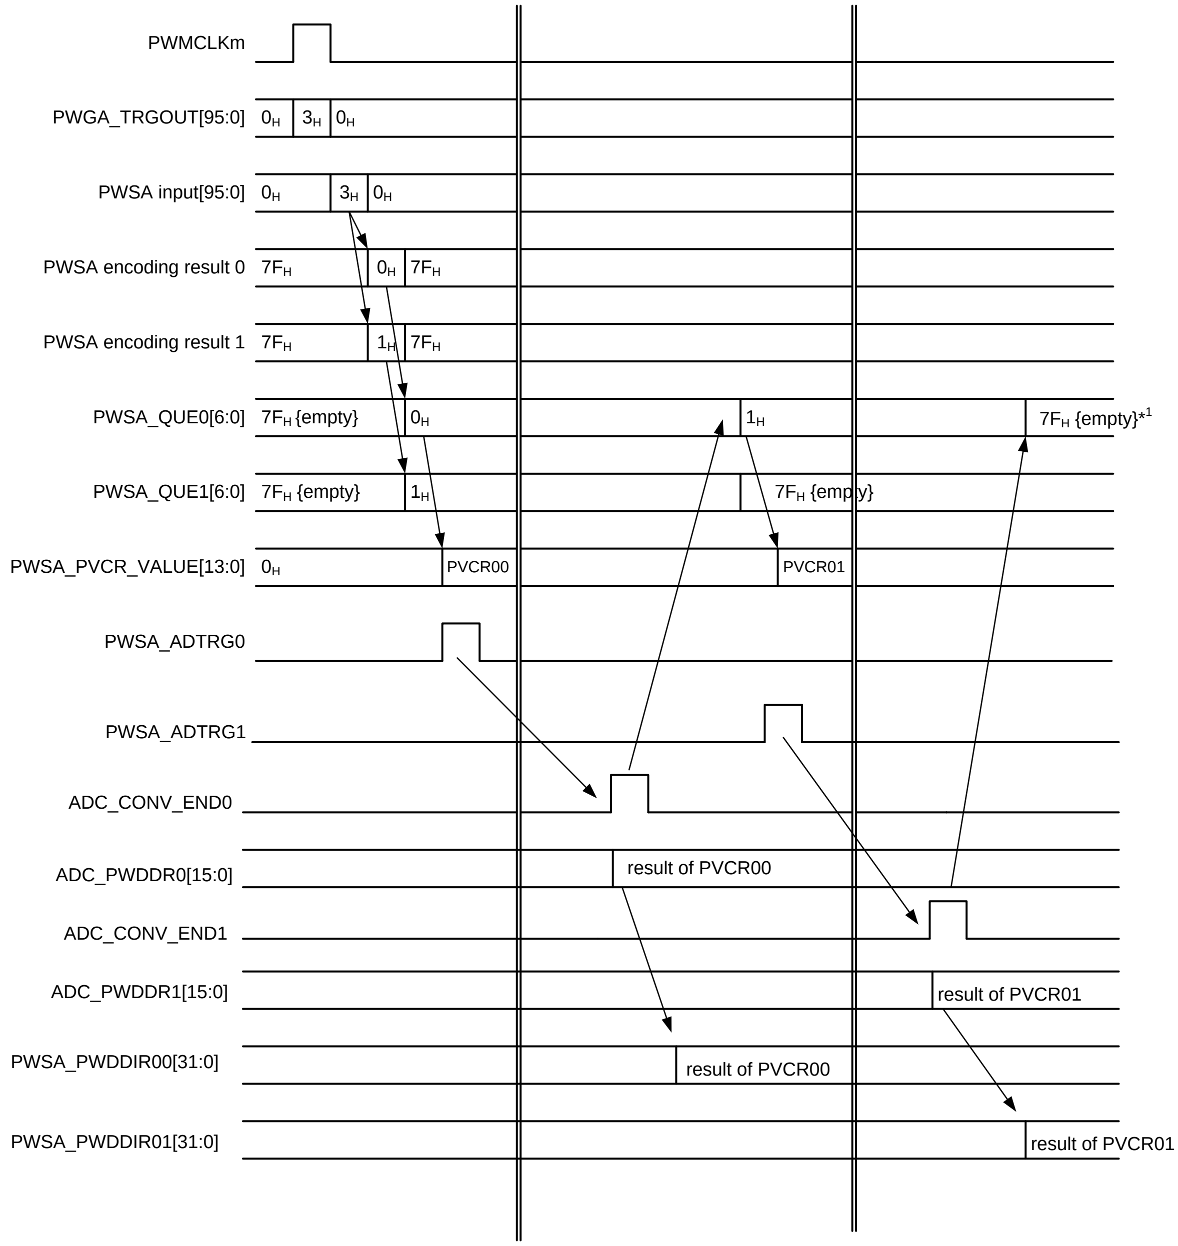
37.4.2 Operation Waveform when A/D Conversion Trigger Occurs in PWSA

An example of the PWSA operation is shown below.



Note 1. QUE0 indicates the PWGA_TRG number while the A/D conversion is executed. The initial value (while the A/D conversion is not executed) is $7F_H$.

Figure 37.15 Example of PWSA Operation

(1) Triggers occur simultaneously in channels 0 and 1 of PWGA. Channel 0 with the smaller channel number is stored in PWSAnQUE0, and channel 1 with the larger channel number is stored in PWSAnQUE1. The lower 16 bits data of PWSAnPVCR00_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter.
The A/D converter whether ADCA0 or ADCA1 is selected by PWSAnSLAD00 bit of PWSAnPVCR00_01. This example shows that ADCA0 is selected when PWSAnSLAD00 is 0.
At this time, as the A/D conversion for channel 1 is in the waiting state, the PWSAnSTR.PWSAnQNE bit is set.

(2) On completion of A/D conversion executed in step (1), the result of A/D conversion is stored in the lower 16 bits of PWSAnPWDDIR00. The higher 16 bits of PWSAnPWDDIR00 mirrors the information of PWSAnPVCR00_01[15:0]. The channel number of PWSAnQUE1 shifts to PWSAnQUE0 and PWSAnQUE1 enters the empty state.
After that, as similar to step (1), the upper 16-bit data of PWSAnPVCR00_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter. This example shows that ADCA1 is selected when PWSAnSLAD01 is 1.

(3) On completion of A/D conversion executed in step (2), the result of A/D conversion is stored in the lower 16 bits of PWSAnPWDDIR01. The higher 16 bits of PWSAnPWDDIR01 mirrors the information of PWSAnPVCR00_01[31:16]. PWSAnQUE0 enters the empty state.

37.5 PWM-Diag Related Function in A/D Converter (ADCA)

This section describes the A/D converter used in the PWM-Diag function.

37.6 ADCA Registers when the PWM-Diag Function is Used

- Before starting PWSA operation, the A/D converter must be set using the following register.
  - PWM-Diag scan group control register (ADCAnPWDSGCR)
- When the PWM-Diag is running, the PWSAnPVCRx_y value corresponding to the channel under conversion is set in the following register of the A/D converter.
  - PWM-Diag virtual channel register (ADCAnPWDVCR)
- After completion of A/D conversion, the conversion result can be checked by reading the following registers.
  - PWM-Diag data register (ADCAnPWDTSNDR)
  - PWM-Diag data supplementary information register (ADCAnPWDDIR, PWSAnPWDDIRz*[1])
- When A/D conversion result is outside the expected range, it can be confirmed using the upper/lower limit error detection function. The upper/lower limit error detection function is set by the following register.
  - Upper limit/lower limit error register (ADCAnULER)
- The scan end flag of the PWM-Diag scan group can be cleared using the following register.
  - PWM-Diag scan end flag clear register (ADCAnPWDSGSEFCR)

Note 1. PWSAnPWDDIRz register is in PWSA.

Section 38 A/D Converter (ADCA)

This section contains a generic description of the A/D Converter (ADCA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of ADCA.

38.1 Features of RH850/F1KH, RH850/F1KM ADCA

38.1.1 Number of Units and Channels

This microcontroller has the following number of ADCA units.

Table 38.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	2	2	2
Name	ADCAn (n = 0, 1)	ADCAn (n = 0, 1)	ADCAn (n = 0, 1)

Table 38.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	2	2	2	2
Name	ADCAn (n = 0)	ADCAn (n = 0, 1)	ADCAn (n = 0, 1)	ADCAn (n = 0, 1)	ADCAn (n = 0, 1)

Table 38.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	ADCAn (n = 0)	ADCAn (n = 0)	ADCAn (n = 0)	ADCAn (n = 0)

An ADCAn unit has the same number of physical channels as the number of A/D input pins and the same number of virtual channels as the number of addresses where the results of A/D conversion will be stored. The numbers of channels on individual products are as listed below.

Table 38.4 Unit Configurations and Physical Channels (RH850/F1KH-D8)

Unit Name ADCAn		RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
ADCA0	12-bit pins for conversion*[1]	16	16	16
	10-bit pins for conversion*[2]	18	18	18
ADCA1	12-bit pins for conversion*[1]	16	16	16
	10-bit pins for conversion*[2]	8	20	20

Note 1. When 10-bit mode is selected, this pin can be used for 10-bit conversion.

Note 2. When 12-bit mode is selected but a pin is for 10-bit conversion, the 2 low-order bits of the result of conversion must be masked before use.

Table 38.5 Unit Configurations and Physical Channels (RH850/F1KM-S4)

Unit Name ADCAn		RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
ADCA0	12-bit pins for conversion*[1]	16	16	16	16	16
	10-bit pins for conversion*[2]	16	18	18	18	18
ADCA1	12-bit pins for conversion*[1]	—	8	16	16	16
	10-bit pins for conversion*[2]	—	4	8	20	20

Note 1. When 10-bit mode is selected, this pin can be used for 10-bit conversion.

Note 2. When 12-bit mode is selected but a pin is for 10-bit conversion, the 2 low-order bits of the result of conversion must be masked before use.

Table 38.6 Unit Configurations and Physical Channels (RH850/F1KM-S1)

Unit Name ADCAn		RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
ADCA0	12-bit pins for conversion*[1]	8	10	11	16
	10-bit pins for conversion*[2]	4	11	14	20

Note 1. When 10-bit mode is selected, this pin can be used for 10-bit conversion.

Note 2. When 12-bit mode is selected but a pin is for 10-bit conversion, the 2 low-order bits of the result of conversion must be masked before use.

Table 38.10 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual ADCA units are identified by the index “n”; for example, ADCAnPWDVCR (n = 0, 1) indicates the PWM-Diag virtual channel register.
m	Throughout this section, the individual physical channels (channels in the unit) of ADCAn are identified by the index “m”; for example, ANInm.
j	Throughout this section, the individual virtual channels of ADCAn are identified by the index “j”; for example, ADCAnVCRj indicates the virtual channel register.
x	Throughout this section, the individual scan groups (SG) of ADCAn are identified by the index “x”; for example, ADCAnSGSTCRx indicates the scan group x start control register (x = 1 to 3).
k	Throughout this section, the individual physical channel numbers for T&H are identified by the index “k”; for example, THkE (k = 0 to 5) is T&H enable bit of the T&H enable register (ADCAnTHER).

Table 38.11 Indices (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual ADCA units are identified by the index “n”; for example, ADCAnPWDVCR (n = 0, 1) indicates the PWM-Diag virtual channel register.
m	Throughout this section, the individual physical channels (channels in the unit) of ADCAn are identified by the index “m”; for example, ANInm.
j	Throughout this section, the individual virtual channels of ADCAn are identified by the index “j”; for example, ADCAnVCRj indicates the virtual channel register.
x	Throughout this section, the individual scan groups (SG) of ADCAn are identified by the index “x”; for example, ADCAnSGSTCRx (x = 1 to 3) indicates the scan group x start control register.
k	Throughout this section, the individual physical channel numbers for T&H are identified by the index “k”; for example, THkE (k = 0 to 5) is T&H enable bit of the T&H enable register (ADCAnTHER).

Table 38.12 Indices (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual ADCA units are identified by the index “n”; for example, ADCAnPWDVCR (n = 0) indicates the PWM-Diag virtual channel register.
m	Throughout this section, the individual physical channels (channels in the unit) of ADCAn are identified by the index “m”; for example, ANInm.
j	Throughout this section, the individual virtual channels of ADCAn are identified by the index “j”; for example, ADCAnVCRj indicates the virtual channel register.
x	Throughout this section, the individual scan groups (SG) of ADCAn are identified by the index “x”; for example, ADCAnSGSTCRx (x = 1 to 3) indicates the scan group x start control register.
k	Throughout this section, the individual physical channel numbers for T&H are identified by the index “k”; for example, THkE (k = 0 to 5) is T&H enable bit of the T&H enable register (ADCAnTHER).

The following table shows values indicated by the indices of each product.

Table 38.13 Indices of Products (RH850/F1KH-D8)

Indices of Each Product		
RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
m = 0 to 27, 30 to 35 (ADCA0) m = 0 to 23 (ADCA1)	m = 0 to 27, 30 to 35 (ADCA0) m = 0 to 35 (ADCA1)	m = 0 to 27, 30 to 35 (ADCA0) m = 0 to 35 (ADCA1)

k = 0 to 5 (ADCA0)	k = 0 to 5 (ADCA0)	k = 0 to 5 (ADCA0)	k = 0 to 5 (ADCA0)	k = 0 to 5 (ADCA0)

Table 38.15 Indices of Products (RH850/F1KM-S1)

Indices of Each Product			
RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
m = 0 to 7, 16 to 19 (ADCA0)	m = 0 to 9, 16 to 26(ADCA0)	m = 0 to 10, 16 to 29 (ADCA0)	m = 0 to 35 (ADCA0)
j = 00 to 19*[1] (ADCA0)	j = 00 to 28*[1] (ADCA0)	j = 00 to 36 (ADCA0)	j = 00 to 49 (ADCA0)
x = 1 to 3 (ADCA0)	x = 1 to 3 (ADCA0)	x = 1 to 3 (ADCA0)	x = 1 to 3 (ADCA0)
k = 0, 2, 4 (ADCA0)	k = 0, 2, 4 (ADCA0)	k = 0, 2, 4 (ADCA0)	k = 0 to 5 (ADCA0)

Note 1. j = 33 to 35 are supported only in diagnosis of T&H circuit.

38.1.2 Register Base Addresses

ADCAn base addresses are listed in the following table.

ADCAn register addresses are given as offsets from the base addresses.

Table 38.16 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<ADCA0_base>	FFF2 0000$_{H}$
<ADCA1_base>	FFD6 D000$_{H}$

Table 38.17 Register Base Addresses (RH850/F1KM-S4)

Base Address Name	Base Address
<ADCA0_base>	FFF2 0000$_{H}$
<ADCA1_base>	FFD6 D000$_{H}$

Table 38.18 Register Base Address (RH850/F1KM-S1)

Base Address Name	Base Address
<ADCA0_base>	FFF2 0000$_{H}$

38.1.3 Clock Supply

The ADCAn clock supply is shown in the following table.

Table 38.19 Clock Supply (RH850/F1KH-D8)

Unit Name	Unit Clock Name	Supply Clock Name	Description
ADCA0	ADCLK	CKSCLK_AADCA	Module clock
	Register access clock	CPUCLK_L, CKSCLK_AADCA	Bus clock
ADCA1	ADCLK	CKSCLK_IADCA	Module clock
	Register access clock	CPUCLK_L	Bus clock

Table 38.20 Clock Supply (RH850/F1KM-S4)

Unit Name	Unit Clock Name	Supply Clock Name	Description
ADCA0	ADCLK	CKSCLK_AADCA	Module clock
	Register access clock	CPUCLK_L, CKSCLK_AADCA	Bus clock
ADCA1	ADCLK	CKSCLK_IADCA	Module clock
	Register access clock	CPUCLK_L	Bus clock

Table 38.21 Clock Supply (RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
ADCA0	ADCLK	CKSCLK_AADCA	Module clock
	Register access clock	CPUCLK_L	Bus clock
		CKSCLK_AADCA	

38.1.4 Interrupt Requests

ADCAn interrupt requests are listed in the following table.

Table 38.22 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number	Other Trigger Signals
ADCA0				
INT_ADE	A/D error interrupt	56	—	Motor control
INT_SG1	Scan group 1 (SG1) end interrupt	18	4	LPS
INT_SG2	Scan group 2 (SG2) end interrupt	19	5	LPS
INT_SG3	Scan group 3 (SG3) end interrupt	20, 32	6	LPS
ADC_CONV_END0	Scan group 4 (SG4) A/D conversion end signal	—	7	—
ADCA1				
INT_ADE	A/D error interrupt	212	—	—
INT_SG1	Scan group 1 (SG1) end interrupt	213	115	—
INT_SG2	Scan group 2 (SG2) end interrupt	214	116	—
INT_SG3	Scan group 3 (SG3) end interrupt	215	117	—
ADC_CONV_END1	Scan group 4 (SG4) A/D conversion end signal	—	118	—

Table 38.23 Interrupt Requests (RH850/F1KM-S4)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number	Other Trigger Signals
ADCA0				
INT_ADE	A/D error interrupt	56	—	Motor control
INT_SG1	Scan group 1 (SG1) end interrupt	18	4	LPS
INT_SG2	Scan group 2 (SG2) end interrupt	19	5	LPS
INT_SG3	Scan group 3 (SG3) end interrupt	20, 32	6	LPS
ADC_CONV_END0	Scan group 4 (SG4) A/D conversion end signal	—	7	—
ADCA1				
INT_ADE	A/D error interrupt	212	—	—
INT_SG1	Scan group 1 (SG1) end interrupt	213	115	—
INT_SG2	Scan group 2 (SG2) end interrupt	214	116	—
INT_SG3	Scan group 3 (SG3) end interrupt	215	117	—
ADC_CONV_END1	Scan group 4 (SG4) A/D conversion end signal	—	118	—

Table 38.24 Interrupt Requests (RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number	Other Trigger Signals
ADCA0				
INT_ADE	A/D error interrupt	56	—	Motor control
INT_SG1	Scan group 1 (SG1) end interrupt	18	4	LPS
INT_SG2	Scan group 2 (SG2) end interrupt	19	5	LPS
INT_SG3	Scan group 3 (SG3) end interrupt	20, 32	6	LPS
ADC_CONV_END0	Scan group 4 (SG4) A/D conversion end signal	—	7	—

38.1.5 Reset Sources

ADCAn reset sources are listed in the following table. ADCAn is initialized by these reset sources.

Table 38.25 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
ADCA0	Reset sources other than transition to DeepSTOP mode (AWORES)
ADCA1	All reset sources (ISORES)

Table 38.26 Reset Sources (RH850/F1KM-S4)

Unit Name	Reset Source
ADCA0	Reset sources other than transition to DeepSTOP mode (AWORES)
ADCA1	All reset sources (ISORES)

Table 38.27 Reset Sources (RH850/F1KM-S1)

Unit Name	Reset Source
ADCA0	Reset sources other than transition to DeepSTOP mode (AWORES)

38.1.6 External Input/Output Signals

External input/output signals of ADCAn are listed below.

Table 38.28 ADCA0 Analog Input Signals (RH850/F1KH-D8)

Unit Signal Name	Alternative Port Pin Signal	Resolution	T&H	RH850/ F1KH-D8 176 Pins	RH850/ F1KH-D8 233 Pins	RH850/ F1KH-D8 272 Pins	RH850/ F1KH-D8 324 Pins

Note 1. The track and hold circuit (T&H) for ANI0m (m = 01, 03, 05) is only included on RH850/F1KM-S1 devices with 100 pins.

Table 38.31 ADCA0 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
ADCA0		
ADCA0TRG0	External trigger pin (scan group 1)*1	ADCA0TRG0
ADCA0TRG1	External trigger pin (scan group 2)*1	ADCA0TRG1
ADCA0TRG2	External trigger pin (scan group 3)*1	ADCA0TRG2
ADCA0SEL0	External analog multiplexer (MPX) output pin 0	ADCA0SEL0
ADCA0SEL1	External analog multiplexer (MPX) output pin 1	ADCA0SEL1
ADCA0SEL2	External analog multiplexer (MPX) output pin 2	ADCA0SEL2

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector** and **Section 2C.12, Noise Filter & Edge/Level Detector**.

CAUTION

- When port P8_6 is used as ADCA0I8S, port P8_6 pin outputs a low-level $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is deasserted.
  For details, see **Section 2A.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**, **Section 2B.11.1.1, P8_6: $\overline{\text{RESETOUT}}$** and **Section 2C.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.
- The RH850/F1KH-D8 and RH850/F1KM-S4 do not have ANI028 (ADCA0I12S) and ANI029 (ADCA0I13S) pins, so do not attempt writing to the corresponding bits or controlling the signals.
  For descriptions in this section that mention ANI028 (ADCA0I12S) and ANI029 (ADCA0I13S), read them as stating that ANI028 (ADCA0I12S) and ANI029 (ADCA0I13S) are not supported.

Table 38.34 ADCA1 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
ADCA1		
ADCA1TRG0	External trigger pin (scan group 1)*[1]	ADCA1TRG0
ADCA1TRG1	External trigger pin (scan group 2)*[1]	ADCA1TRG1
ADCA1TRG2	External trigger pin (scan group 3)*[1]	ADCA1TRG2

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**.

Table 38.35 ADCA1 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
ADCA1		
ADCA1TRG0	External trigger pin (scan group 1)*[1]	ADCA1TRG0
ADCA1TRG1	External trigger pin (scan group 2)*[1]	ADCA1TRG1
ADCA1TRG2	External trigger pin (scan group 3)*[1]	ADCA1TRG2

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see **Section 2B.12, Noise Filter & Edge/Level Detector**

38.2 Overview

38.2.1 Functional Overview

ADCA has the following features.

- 10-bit/12-bit resolution
- Successive approximation conversion method
- Number of A/D input channels
  A/D conversion is available for a maximum of 34 ADCA0 channels and 36 ADCA1 channels. Additionally, ADCA0 supports the connection of an external analog multiplexer (MPX) to extend the number of analog input channels.
- Internal track and hold (T&H) circuit
  ANI000 to ANI005 (ADCA0I0 to ADCA0I5) of ADCA0 include the track and hold circuit. The track and hold circuit can sample up to 6 channels of analog input simultaneously.
- A/D conversion control by scan groups
  The A/D conversion channel or conversion mode (scan mode) can be set for each scan group.
- Two scan modes
  Multi-cycle scan mode: Specified number of scans are executed.
  Continuous scan mode: Scans are executed repeatedly and continuously.
- Asynchronous/synchronous suspend and resume function
  A processing for a scan group can be interrupted to run the processing for another scan group.
- Start/Stop trigger for each scan group
  Software, hardware, and external trigger can start processing of each scan group.
  Software can stop processing of each scan group.
- Scan end interrupt and DMA transfer are supported.
  For each scan group, an interrupt request to INTC can be issued or DMA transfer can be started, each time a processing for the virtual channel indicated by the end virtual channel pointer ends, or a virtual channel ends.
- A/D conversion channel repeat function
  A/D conversion is performed for the same channel two or four times sequentially, and the result is stored in the data register.
- Abundant safety functions
  Abundant safety functions are provided, such as A/D converter diagnosis, diagnosis of the channel multiplexer, diagnosis of open pins, diagnosis of the T&H circuit, 8 pairs of upper limit/lower limit check for the A/D converter and have error flag register for each virtual channel, overwrite check for data registers, and read and clear function for data registers.
- Shortest A/D conversion time per channel
  1.15 µs (when MPX is not used)
  2.30 µs (when MPX is used)
- Configurable stabilization time for MPX analog input
  Stabilization time can be selected by 8 patterns of counter setting for each physical channel.
  Min. 1us
  Max. 250us

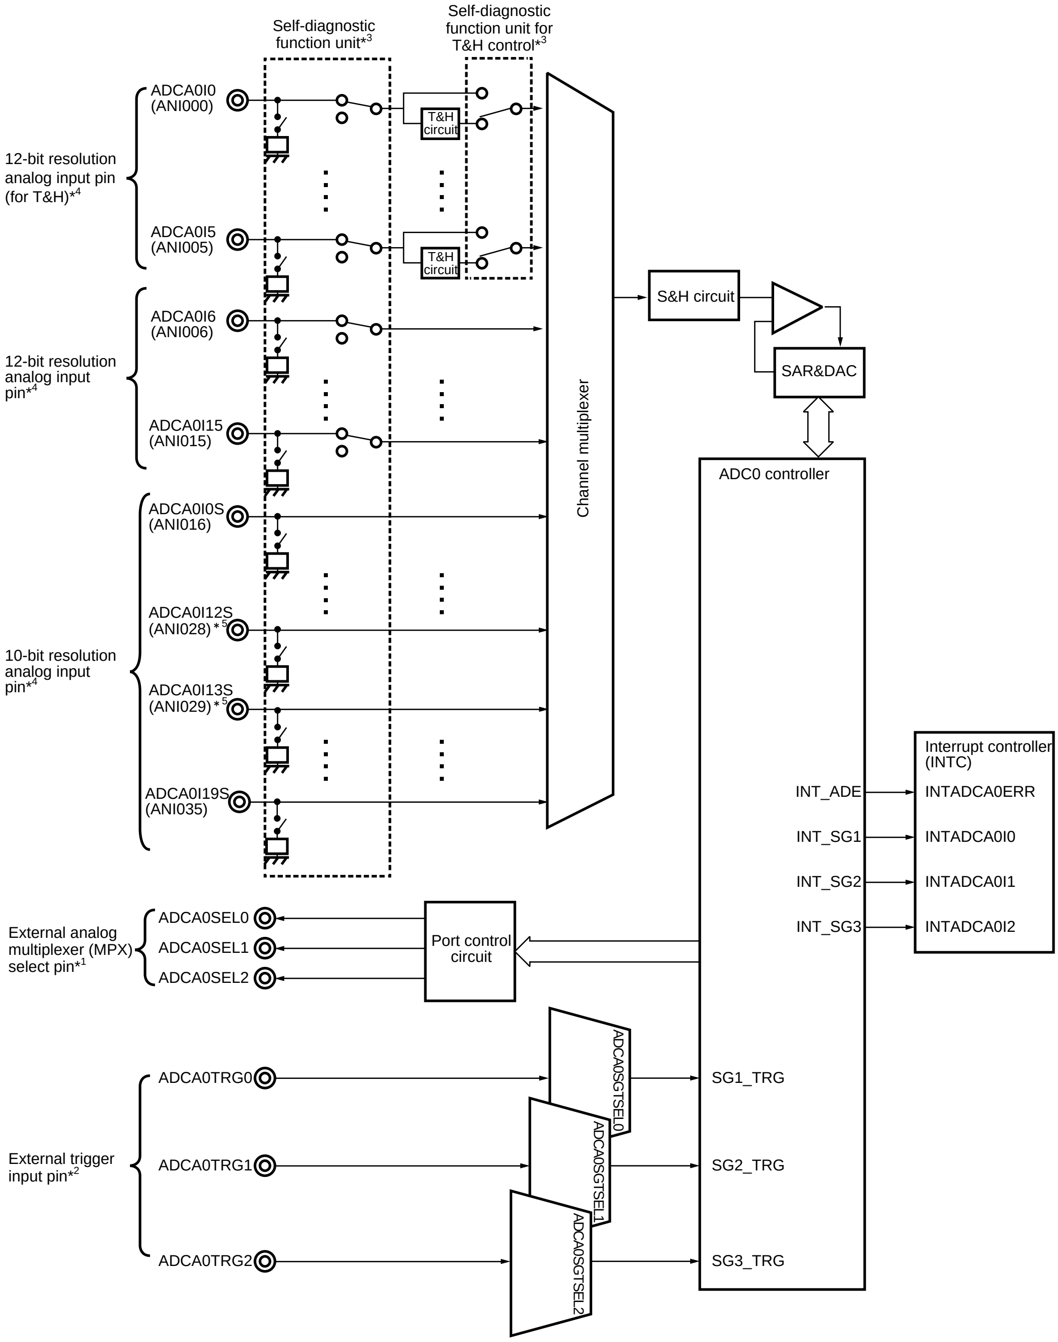
NOTE

- Physical channel (ANInm)
  Each A/D input channel of ADCA0 and ADCA1 units is called a physical channel. The physical channel of each unit is represented as ANI0m (m = 0 to 27, 30 to 35) for ADCA0 and ANI1m (m = 0 to 35) for ADCA1.
  In RH850/F1KH, RH850/F1KM, the alternative port pins for 12-bit resolution A/D input channel and 10-bit resolution A/D input channel are represented as ADCAnIm and ADCAnImS, respectively. In this section, the physical channels and the corresponding alternative port pins are listed together.
- Virtual channel (ADCAnVCRj)
  ADCA0 has a maximum of 50 virtual channels, and ADCA1 has a maximum of 36 virtual channels. The virtual channel specifies the physical channel to be scanned.
  Scans are executed in sequence from the smallest virtual channel number. The scan order can be arbitrarily-specified by using virtual channels. In addition, the scanned result is stored in the data register (ADCAnDRj) corresponding to the virtual channel.
- Scan group (SGx)
  ADCA has three scan groups (SG1, SG2, SG3) and one PWM-Diag group (SG4). A/D conversion is executed in scan group unit. The channel to be scanned can be selected for each group by specifying the scan range, that is, the conversion start virtual channel and the conversion end virtual channel.

38.2.2 Block Diagram

The block diagram of ADCA0 is shown in **Figure 38.1, ADCA0 Block Diagram**. The block diagram of ADCA1 is shown in **Figure 38.2, ADCA1 Block Diagram**.

(1) Configuration of ADCA0



Note 1. For an example of external analog multiplexer connection, see **Figure 38.4, Example of External Analog Multiplexer Connection**.

Note 2. For details, see **Figure 38.3, Internal Connection Diagram of External Trigger Input Pins**.

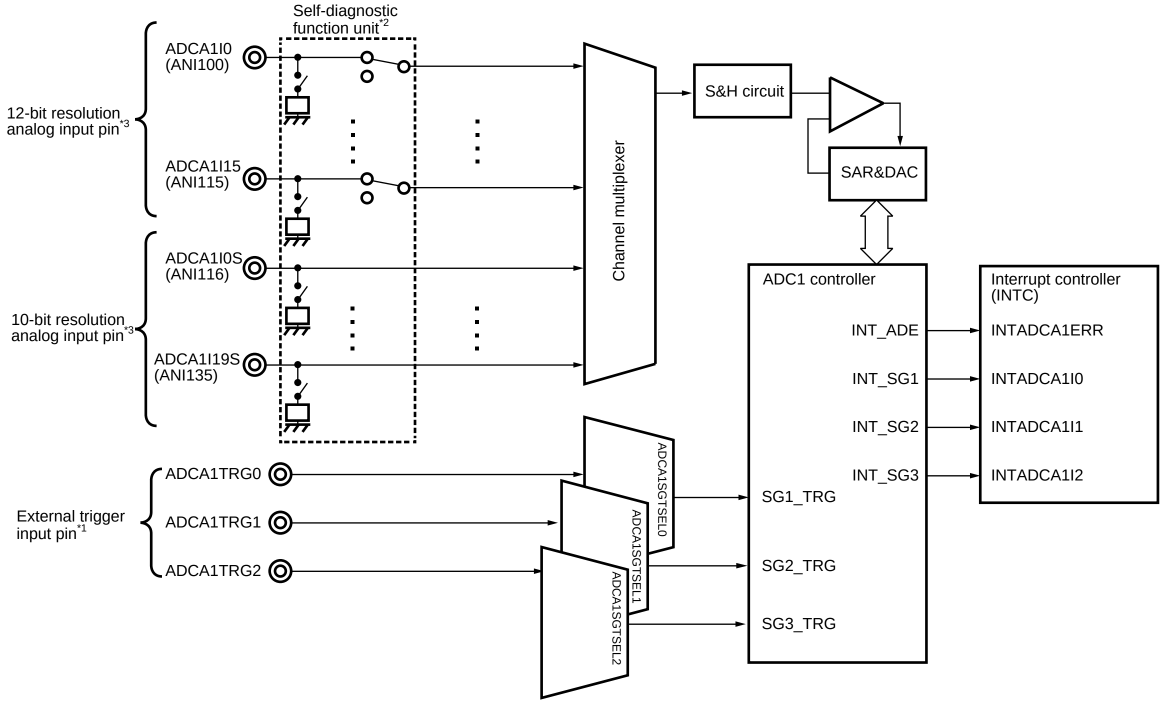
Note 3. For the self-diagnostic function unit, see **Section 38.5, Self-Diagnostic Function**.

Note 4. For the analog input of each product, see **Table 38.28, ADCA0 Analog Input Signals (RH850/F1KH-D8)**, **Table 38.29, ADCA0 Analog Input Signals (RH850/F1KM-S4)**, **Table 38.30, ADCA0 Analog Input Signals (RH850/F1KM-S1)**.

Note 5. The RH850/F1KH-D8 and RH850/F1KM-S4 do not have ADCA0I12S (ANI028) and ADCA0I13S (ANI029) pins.

Figure 38.1 ADCA0 Block Diagram

(2) Configuration of ADCA1



Note 1. For details, see **Figure 38.3, Internal Connection Diagram of External Trigger Input Pins**.

Note 2. For the self-diagnostic function unit, see **Section 38.5, Self-Diagnostic Function**.

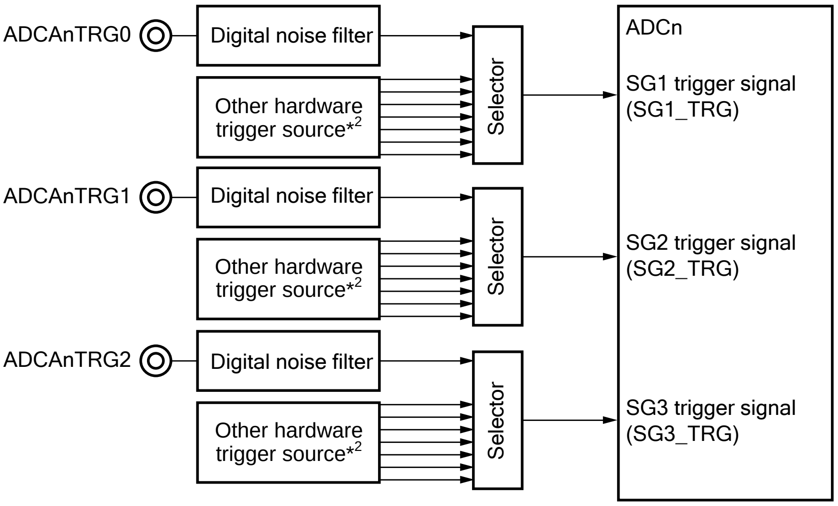
Note 3. For the analog input of each product, see **Table 38.32, ADCA1 Analog Input Signals (RH850/F1KH-D8)**, **Table 38.33, ADCA1 Analog Input Signals (RH850/F1KM-S4)**.

Figure 38.2 ADCA1 Block Diagram

(3) Configuration of External Trigger Input Pins

An external trigger input pin is a hardware trigger source to activate ADCAn.

The configuration of external trigger input pins is shown below.



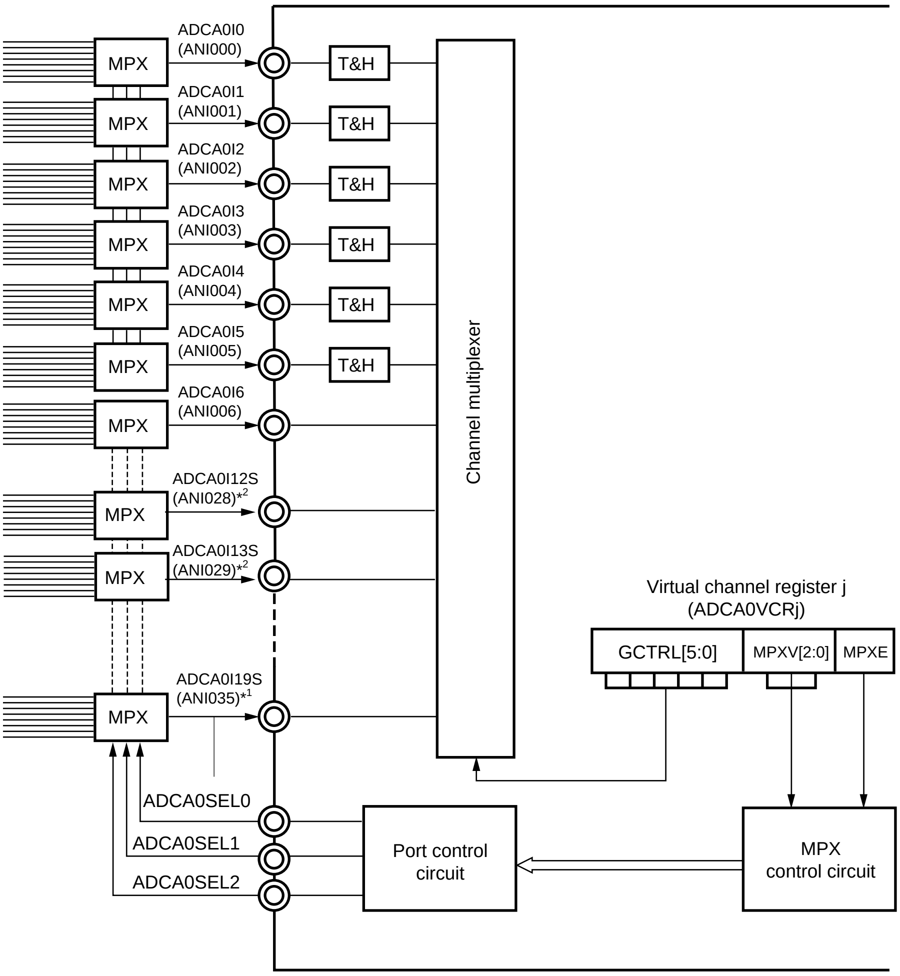
Note 1. For the condition setting to accept a trigger from an external trigger input pin, see **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector** and **Section 2C.12, Noise Filter & Edge/Level Detector**.

Note 2. For the hardware trigger sources, see **Table 38.78, List of A/D Conversion Hardware Triggers**.

Figure 38.3 Internal Connection Diagram of External Trigger Input Pins

(4) Configuration of External Analog Multiplexer (MPX)

The external analog multiplexer (MPX) can be connected to any input signal pins ADCA0I0 to ADCA0I19S. An example of the external analog multiplexer connection is shown below.



Note: The T&H function is disabled when the external analog multiplexer (MPX) is used

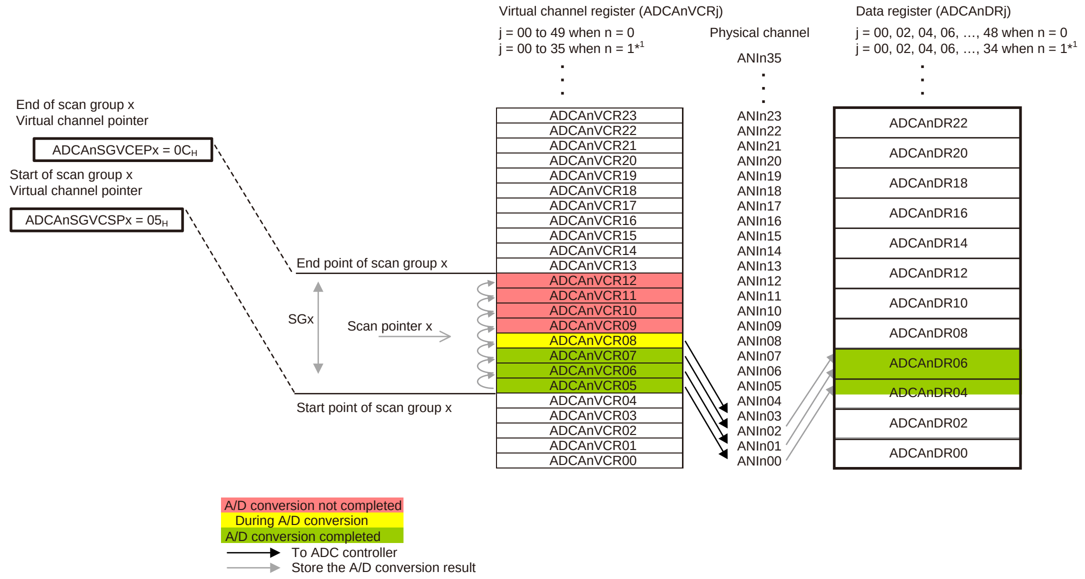
Note 1. For the analog input of each product, see **Table 38.28**, **ADCA0 Analog Input Signals (RH850/F1KH-D8)**, **Table 38.29, ADCA0 Analog Input Signals (RH850/F1KM-S4)**, **Table 38.30, ADCA0 Analog Input Signals (RH850/F1KM-S1)**.

Note 2. The RH850/F1KH-D8 and RH850/F1KM-S4 do not have ADCA0I12S (ANI028) and ADCA0I13S (ANI029) pins.

Figure 38.4 Example of External Analog Multiplexer Connection

(5) Virtual Channel

The virtual channel specifies the physical address to be scanned.
The virtual channel is controlled by the ADCAnVCRj register.
A usage example of the virtual channel is shown below.



Note 1. This is not supported in RH850/F1KM-S4 with 100 pins and RH850/F1KM-S1.

Example) When scan group x starts scanning 5th to 12th virtual channels

1. The ADCAnVCRj register specifies the physical channel (ANInm) for which virtual channel j executes the A/D conversion. The A/D conversion pins can be set in any order. (The figure above shows an example when ANIn0 to ANIn7 are selected.)
2. The scan pointer x sequentially reads the physical channels specified in the ADCAnVCRj register from “start point of scan group x” to “end point of scan group x”, and starts the A/D conversion for the read physical address.
3. The scanned result of virtual channel j is stored in data register j.

Figure 38.5 Usage Example of Virtual Register

38.3 Registers

38.3.1 List of Registers

The ADCA registers are listed in the following table.

For details about <ADCAn_base>, see **Section 38.1.2, Register Base Addresses**.

Table 38.36 List of Registers

Module Name	Register Name	Symbol	Address
ADCA specific registers (virtual channel)			
ADCAn	Virtual channel register j	ADCAnVCRj	<ADCAn_base> + j × 4_H
	PWM-Diag virtual channel register	ADCAnPWDVCR	<ADCAn_base> + $0F4_H$
	Data register j	ADCAnDRj	<ADCAn_base> + 100_H + j × 2_H
	Data supplementary information register j	ADCAnDIRj	<ADCAn_base> + 200_H + j × 4_H
	PWM-Diag data register	ADCAnPWDTSNDR	<ADCAn_base> + 178_H
	PWM-Diag data supplementary information register	ADCAnPWDDIR	<ADCAn_base> + $2F4_H$
ADCA specific registers (control)			
ADCAn	A/D force halt register	ADCAnADHALTR	<ADCAn_base> + 300_H
	A/D control register	ADCAnADCR	<ADCAn_base> + 304_H
	MPX current register	ADCAnMPXCURR	<ADCAn_base> + $30C_H$
	T&H sampling start control register	ADCAnTHSMPSTCR	<ADCAn_base> + 314_H
	T&H control register	ADCAnTHCR	<ADCAn_base> + 318_H
	T&H group A hold start control register	ADCAnTHAHLDSTCR	<ADCAn_base> + $31C_H$
	T&H group B hold start control register	ADCAnTHBHLDSTCR	<ADCAn_base> + 320_H
	T&H group A control register	ADCAnTHACR	<ADCAn_base> + 324_H
	T&H group B control register	ADCAnTHBCR	<ADCAn_base> + 328_H
	T&H enable register	ADCAnTHER	<ADCAn_base> + $32C_H$
	T&H group select register	ADCAnTHGSR	<ADCAn_base> + 330_H
	Sampling control register	ADCAnSMPCR	<ADCAn_base> + 380_H
	MPX stabilization time selection register 0	ADCAnMPXSTBTSELR0	<ADCAn_base> + $5F0_H$
	MPX stabilization time selection register 1	ADCAnMPXSTBTSELR1	<ADCAn_base> + $5F4_H$
	MPX stabilization time selection register 2	ADCAnMPXSTBTSELR2	<ADCAn_base> + $5F8_H$
	MPX stabilization time selection register 3	ADCAnMPXSTBTSELR3	<ADCAn_base> + $5FC_H$
	MPX stabilization time selection register 4	ADCAnMPXSTBTSELR4	<ADCAn_base> + 600_H
	MPX stabilization time setting register 0	ADCAnMPXSTBTR0	<ADCAn_base> + 610_H
	MPX stabilization time setting register 1	ADCAnMPXSTBTR1	<ADCAn_base> + 614_H
	MPX stabilization time setting register 2	ADCAnMPXSTBTR2	<ADCAn_base> + 618_H
	MPX stabilization time setting register 3	ADCAnMPXSTBTR3	<ADCAn_base> + $61C_H$
	MPX stabilization time setting register 4	ADCAnMPXSTBTR4	<ADCAn_base> + 620_H
	MPX stabilization time setting register 5	ADCAnMPXSTBTR5	<ADCAn_base> + 624_H
	MPX stabilization time setting register 6	ADCAnMPXSTBTR6	<ADCAn_base> + 628_H
	MPX stabilization time setting register 7	ADCAnMPXSTBTR7	<ADCAn_base> + $62C_H$

Table 38.36 List of Registers

Module Name	Register Name	Symbol	Address
ADCA specific registers (safety-related)			
ADCAn	Safety control register	ADCAnSFTCR	<ADCAn_base> + 334_H
	Upper limit/lower limit table register 0	ADCAnULLMTBR0	<ADCAn_base> + 338_H
	Upper limit/lower limit table register 1	ADCAnULLMTBR1	<ADCAn_base> + $33C_H$
	Upper limit/lower limit table register 2	ADCAnULLMTBR2	<ADCAn_base> + 340_H
	Error clear register	ADCAnECR	<ADCAn_base> + 344_H
	Upper limit/lower limit error register	ADCAnULER	<ADCAn_base> + 348_H
	Overwrite error register	ADCAnOWER	<ADCAn_base> + $34C_H$
	Upper limit/lower limit error VC flag register 0	ADCAnULEVCFR0	<ADCAn_base> + 540_H
	Upper limit/lower limit error VC flag register 1	ADCAnULEVCFR1	<ADCAn_base> + 544_H
	Upper limit/lower limit table register 3	ADCAnULLMTBR3	<ADCAn_base> + 564_H
	Upper limit/lower limit table register 4	ADCAnULLMTBR4	<ADCAn_base> + 568_H
	Upper limit/lower limit table register 5	ADCAnULLMTBR5	<ADCAn_base> + $56C_H$
	Upper limit/lower limit table register 6	ADCAnULLMTBR6	<ADCAn_base> + 570_H
	Upper limit/lower limit table register 7	ADCAnULLMTBR7	<ADCAn_base> + 574_H
Scan group (SG) specific registers			
ADCAn	Scan group x start control register	ADCAnSGSTCRx	<ADCAn_base> + x × 40_H + 400_H
	PWM-Diag scan stop control register	ADCAnPWDSGSTPCR	<ADCAn_base> + 504_H
	PWM-Diag scan group control register	ADCAnPWDSGCR	<ADCAn_base> + 508_H
	Scan group x control register	ADCAnSGCRx	<ADCAn_base> + x × 40_H + 408_H
	Scan group x start virtual channel pointer	ADCAnSGVCSPx	<ADCAn_base> + x × 40_H + $40C_H$
	Scan group x end virtual channel pointer	ADCAnSGVCEPx	<ADCAn_base> + x × 40_H + 410_H
	Scan group x multicycle register	ADCAnSGMCYCRx	<ADCAn_base> + x × 40_H + 414_H
	PWM-Diag scan end flag clear register	ADCAnPWDSGSEFCR	<ADCAn_base> + 518_H
	Scan group x scan end flag clear register	ADCAnSGSEFCRx	<ADCAn_base> + x × 40_H + 418_H
	Scan group status register	ADCAnSGSTR	<ADCAn_base> + 308_H
	Scan group x stop control register	ADCAnSGSTPCRx	<ADCAn_base> + x × 40_H + 404_H
Hardware trigger specific register			
ADCAn	Scan group x start trigger control register	ADCAnSGTSELx	<ADCAn_base> + x × 40_H + $41C_H$
Self-diagnosis specific registers			
ADCAn	Self-diagnosis control register 0	ADCAnDGCTL0	<ADCAn_base> + 350_H
	Self-diagnosis control register 1	ADCAnDGCTL1	<ADCAn_base> + 354_H
	Pull down control register 1	ADCAnPDCTL1	<ADCAn_base> + 358_H
	Pull down control register 2	ADCAnPDCTL2	<ADCAn_base> + $35C_H$
Emulation specific register			
ADCAn	Emulation control register	ADCAnEMU	<ADCAn_base> + 388_H

38.3.2 ADCA Specific Registers

This section describes the registers that are equipped in each of ADCA0 and ADCA1.

38.3.2.1 ADCAnVCRj — Virtual Channel Register j

This register is used to control the virtual channel.

Access: ADCAnVCRj register can be read or written in 32-bit units.
ADCAnVCRjL register can be read or written in 16-bit units.
ADCAnVCRjLL and ADCAnVCRjLH registers can be read or written in 8-bit units.

Address: ADCAnVCRj: <ADCAn_base> + j × 4_H
ADCAnVCRjL: <ADCAn_base> + j × 4_H
ADCAnVCRjLL: <ADCAn_base> + j × 4_H
ADCAnVCRjLH: <ADCAn_base> + j × 4_H + 1_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MPXE*1,*2	MPXV[2:0]*1			ULS[3:2]		CNVCLS*1,*3	ADIE	ULS[1:0]		GCTRL[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 38.37 ADCAnVCRj Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	MPXE*1,*2	MPX Enable 0: The use of MPX is prohibited. No wait is inserted before A/D conversion is performed. 1: The use of MPX is permitted. The MPXV[2:0] bits are output from ADCAnSEL0 to ADCAnSEL2 when the virtual channel starts, and a wait of one A/D-conversion time is inserted before A/D conversion is performed.
14 to 12	MPXV[2:0]*1	These bits are used to set the MPX value to be transferred to an external analog multiplexer.
11, 10	ULS[3:2]	Upper Limit/Lower Limit Table Select*4
9	CNVCLS*1,*3	A/D Conversion Type Select for Self-Diagnosis 0: A/D conversion of the hold value is performed during a self-diagnosis. 1: Normal A/D conversion is performed during a self-diagnosis. When normal A/D conversion is performed during a self-diagnosis and MPX is in use (MPXE is set), however, a wait of one A/D conversion time is inserted before A/D conversion is performed. On the other hand, MPX cannot be used when A/D conversion of the hold value is performed during a self-diagnosis.
8	ADIE	A/D Conversion End Interrupt Enable 0: A scan group x end interrupt (INT_SGx) is not generated when A/D conversion for virtual channel j ends in SGx. 1: A scan group x end interrupt (INT_SGx) is generated when A/D conversion for virtual channel j ends in SGx.

Table 38.37 ADCAnVCRj Register Contents

Bit Position	Bit Name	Function
7, 6	ULS[1:0]	Upper Limit/Lower Limit Table Select*4
5 to 0	GCTRL[5:0]	Physical Channel Select 0_H to 23_H: Corresponding ANInm is selected. 24_H: Diagnosis channel for A/D converter is selected. Others: Setting prohibit **NOTE:** These bits shall set the physical channel which is supported. See **Table 38.13, Indices of Products (RH850/F1KH-D8)**, **Table 38.14, Indices of Products (RH850/F1KM-S4)**, **Table 38.15, Indices of Products (RH850/F1KM-S1)**, **Table 38.28, ADCA0 Analog Input Signals (RH850/F1KH-D8)**, **Table 38.29, ADCA0 Analog Input Signals (RH850/F1KM-S4)**, **Table 38.30, ADCA0 Analog Input Signals (RH850/F1KM-S1)**, **Table 38.32, ADCA1 Analog Input Signals (RH850/F1KH-D8)** and **Table 38.33, ADCA1 Analog Input Signals (RH850/F1KM-S4)**.

Note 1. These bits are only supported for ADCA0. For ADCA1, when writing, write the value after reset.

Note 2. When GCTRL[5:0] is set to 24_H (Self-Diagnosis channel), set MPXE to 0.

Note 3. This bit is only supported when j = 33 to 35. Otherwise, when writing, write the value after reset.

Note 4. ULS[3:0] =
0000: Upper limit and lower limit are not checked
0001: Upper limit and lower limit are checked for ADCAnULLMTBR0.
0010: Upper limit and lower limit are checked for ADCAnULLMTBR1.
0011: Upper limit and lower limit are checked for ADCAnULLMTBR2.
0100: Upper limit and lower limit are checked for ADCAnULLMTBR3.
0101: Upper limit and lower limit are checked for ADCAnULLMTBR4.
0110: Upper limit and lower limit are checked for ADCAnULLMTBR5.
0111: Upper limit and lower limit are checked for ADCAnULLMTBR6.
1000: Upper limit and lower limit are checked for ADCAnULLMTBR7.
Other than above : Setting prohibited (Upper limit and lower limit are not checked when set)

CAUTION

To prevent malfunction, ADCAnVCRj should be set (except ADIE = 0 setting when stop procedure of scan group) when SGACT of applicable scan groups is 0 (before scan groups are started) and TRGMD of applicable scan groups is 0.

38.3.2.2 ADCAnPWDVCR — PWM-Diag Virtual Channel Register

This register is used to indicate virtual channel setting (PWSAnPVCRx_y register setting) of the PWM-Diag (SG4).

Access:	ADCAnPWDVCR register is a read-only register that can be read in 32-bit units. ADCAnPWDVCRL register is a read-only register that can be read in 16-bit units. ADCAnPWDVCRLL register is a read-only register that can be read in 8-bit units. ADCAnPWDVCRLH register is a read-only register that can be read in 8-bit units.
Address:	ADCAnPWDVCR: <ADCAn_base> + 0F4$_{\text{H}}$ ADCAnPWDVCRL: <ADCAn_base> + 0F4$_{\text{H}}$ ADCAnPWDVCRLL: <ADCAn_base> + 0F4$_{\text{H}}$ ADCAnPWDVCRLH: <ADCAn_base> + 0F4$_{\text{H}}$ + 1$_{\text{H}}$
Value after reset:	0000 0000$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 38.39 ADCAnPWDVCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15	MPXE*1	The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[27] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[11] (even channel) bit. MPX Enable Set this bit to 1 when an external analog multiplexer is used. 0: The use of MPX is prohibited. 1: The use of MPX is permitted. The MPXV[2:0] bits are output from ADCAnSEL0 to ADCAnSEL2 when the virtual channel starts, and a wait of one A/D-conversion time is inserted before A/D conversion is performed.
14 to 12	MPXV[2:0]*1	These bits are used to set the MPX value to be transferred to an external analog multiplexer by using the PWSAnPVCRx_y.PWSAnVRDTy[26:24] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[10:8] (even channel) bit.
11, 10	ULS[3:2]	The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[29:28] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[13:12] (even channel) bit. Upper Limit/Lower Limit Table Select*2
9, 8	Reserved	When read, the value after reset is returned.
7, 6	ULS[1:0]	The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[23:22] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[7:6] (even channel) bit. Upper Limit/Lower Limit Table Select*2
5 to 0	GCTRL[5:0]	The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[21:16] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[5:0] (even channel) bit. Physical Channel Select These bits are used to specify a physical channel to be assigned to virtual channel j. For the selection of the channel, see **Table 38.38, Selection of Physical Channels**.

Note 1. These bits are only supported for ADCA0. For ADCA1, when read, the value after reset is returned.

Note 2. ULS[3:0] =
0000: Upper limit and lower limit are not checked.
0001: Upper limit and lower limit are checked for ADCAnULLMTBR0.
0010: Upper limit and lower limit are checked for ADCAnULLMTBR1.
0011: Upper limit and lower limit are checked for ADCAnULLMTBR2.
0100: Upper limit and lower limit are checked for ADCAnULLMTBR3.
0101: Upper limit and lower limit are checked for ADCAnULLMTBR4.
0110: Upper limit and lower limit are checked for ADCAnULLMTBR5.
0111: Upper limit and lower limit are checked for ADCAnULLMTBR6.
1000: Upper limit and lower limit are checked for ADCAnULLMTBR7.
Other than above : Setting prohibited (Upper limit and lower limit are not checked when set)

38.3.2.3 ADCAnDRj — Data Register j

This register is a 32-/16-bit read-only register that stores the A/D conversion results corresponding to ADCAnVCRj and ADCAnVCR(j+1). As the A/D conversion results, the conversion result for ADCAnVCR(j+1) is stored in the upper bits (ADCAnDR(j+1)), and the conversion result for ADCAnVCRj is stored in the lower bits (ADCAnDRj).

Access:	ADCAnDRj register is a read-only register that can be read in 32-bit units. ADCAnDRjL and ADCAnDRjH registers are read-only registers that can be read in 16-bit units.
Address:	ADCAnDRj: <ADCAn_base> + 100_H + j × 2_H ADCAnDRjL: <ADCAn_base> + 100_H + j × 2_H ADCAnDRjH: <ADCAn_base> + 100_H + j × 2_H + 2_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DR(j+1)[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRj[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.40 ADCAnDRj Register Contents

Bit Position	Bit Name	Function
31 to 16	DR(j+1)[15:0]	These bits are used to store the A/D conversion result data. (The A/D conversion result for the channel set in ADCAnVCR(j+1) are transferred.)
15 to 0	DRj[15:0]	These bits are used to store the A/D conversion result data. (The A/D conversion result for the channel set in ADCAnVCRj are transferred.)

CAUTION

ADCAnDIRj.WFLG and ADCAnDIR(j+1).WFLG are cleared by reading ADCAnDRjL or ADCAnDRjH in 16-bit units at this time. If virtual channels 33, 34, and 35 are used exclusively for self-diagnosis, the lower-order bits (DRj[15:0]) for channel 32 cannot be used.

NOTES

1. j = 00, 02, …, 46, 48 (for ADCA0)
   j = 00, 02, …, 32, 34 (for ADCA1)
2. By controlling ADCAnADCR.CRAC and ADCAnADCR.CTYP, the data format of this register becomes as follows:
   - ADCAnADCR.CTYP = 0 and ADCAnADCR.CRAC = 0 → Right alignment is used.
     →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 27 to 16, and the A/D conversion result for ADCAnVCRj is transferred to bits 11 to 0.
   - ADCAnADCR.CTYP = 0 and ADCAnADCR.CRAC = 1 → Left alignment is used.
     →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 31 to 20, and the A/D conversion result for ADCAnVCRj is transferred to bits 15 to 4.

- ADCAnADCR.CTYP = 1 and ADCAnADCR.CRAC = 0 → Right alignment is used.
  →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 25 to 16, and the A/D conversion result for ADCAnVCRj is transferred to bits 9 to 0.
- ADCAnADCR.CTYP = 1 and ADCAnADCR.CRAC = 1 → Left alignment is used.
  →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 31 to 22, and the A/D conversion result for ADCAnVCRj is transferred to bits 15 to 6.

38.3.2.4 ADCAnDIRj — Data Supplementary Information Register j

This register is a 32-bit read-only register that stores the A/D conversion result for ADCAnDRj and information incidental to the A/D converted value.

As the A/D conversion result, the ADCAnDRj value is transferred. As information incidental to the A/D converted value, information about the write flag (WFLG), the MPX value (MPXV[2:0]), and the physical channel (ID[5:0]) is transferred. The data format of the A/D conversion result stored in ADCAnDIRj is the same as that for the ADCAnDRj register.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	<ADCAn_base> + 200_H + j × 4_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MPXE *1	MPXV[2:0]*1			—	—	WFLG	—	—	—	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.41 ADCAnDIRj Register Contents

Bit Position	Bit Name	Function
31	MPXE*1	MPX Enable Flag 0: MPX function is not used. 1: MPX function is used.
30 to 28	MPXV[2:0]*1	These bits are used to store the MPX value. The MPX value to be stored is the MPX value of the most recent conversion result.
27, 26	Reserved	When read, the value after reset is returned.
25	WFLG	Write Flag 0: ADCAnDRj or ADCAnDIRj is read (cleared when read). 1: A/D converted value is stored in ADCAnDRj (set when the value is stored).
24 to 22	Reserved	When read, the value after reset is returned.
21 to 16	ID[5:0]	These bits store the physical channel number (GCTRL) corresponding to the conversion result. The physical channel number to be stored is the number corresponding to the most recent conversion result.
15 to 0	DR[15:0]	These bits are used to store the A/D conversion result.

Note 1. These bits are only supported by ADCA0.
For ADCA1, when read, the value after reset is returned.

38.3.2.5 ADCAnPWDTSNDR — PWM-Diag Data Register

This register is a 32-/16-bit read-only register that stores the A/D conversion results corresponding to the PWM-Diag. As the A/D conversion results, the conversion result for the PWM-Diag (PWDDR) is stored in the upper bits.

Access:	ADCAnPWDTSNDR register is a read-only register that can be read in 32-bit units. ADCAnPWDTSNDRH register is a read-only register that can be read in 16-bit units.
Address:	ADCAnPWDTSNDR: <ADCAn_base> + 178_H ADCAnPWDTSNDRH: <ADCAn_base> + $17A_H$
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PWDDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.42 ADCAnPWDTSNDR Register Contents

Bit Position	Bit Name	Function
31 to 16	PWDDR[15:0]	These bits are used to store the A/D conversion result data for the PWM-Diag.
15 to 0	Reserved	When read, the value after reset is returned.

NOTE

The data format of this register is controlled by ADCAnADCR.CRAC and ADCAnADCR.CTYP, as shown below.

- ADCAnADCR.CTYP = 0, ADCAnADCR.CRAC = 0 → Right alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 27 to 16.
- ADCAnADCR.CTYP = 0, ADCAnADCR.CRAC = 1 → Left alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 31 to 20.
- ADCAnADCR.CTYP = 1, ADCAnADCR.CRAC = 0 → Right alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 25 to 16.
- ADCAnADCR.CTYP = 1, ADCAnADCR.CRAC = 1 → Left alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 31 to 22.

38.3.2.6 ADCAnPWDDIR — PWM-Diag Data Supplementary Information Register

This register is a 32-bit read-only register that stores the A/D conversion result when PWM-Diag is used, and information incidental to the A/D converted value.

As the A/D conversion result, the ADCAnPWDSNDR.PWDDR[15:0] value is transferred. As supplementary information to the A/D converted value, the write flag (WFLG), MPX value (MPXV[2:0]), and physical channel (ID[5:0]) are transferred. The data format of the A/D conversion result stored in ADCAnPWDDIR is the same as that for the ADCAnPWDTSNDR register. In addition, PWDDR[15:0] can be read with corresponded PWGA channel by PWSAnPWDDIRz register. For details, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ADCAn_base> + 2F4$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MPXE*1	MPXV[2:0]*1			—	—	WFLG	—	—	—	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWDDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.43 ADCAnPWDDIR Register Contents

Bit Position	Bit Name	Function
31	MPXE*1	MPX Enable Flag 0: The MPX function is not used. 1: The MPX function is used.
30 to 28	MPXV[2:0]*1	These bits are used to store the MPX value. The MPX value to be stored is the MPX value of the most recent conversion result.
27, 26	Reserved	When read, the value after reset is returned.
25	WFLG	Write Flag 0: ADCAnPWDTSNDR or ADCAnPWDDIR is read (cleared when read). 1: The A/D converted value is stored in ADCAnPWDTSNDR (set when the value is stored).
24 to 22	Reserved	When read, the value after reset is returned.
21 to 16	ID[5:0]	These bits are used to store the physical channel number (GCTRL) corresponding to the conversion result. The physical channel number to be stored is the physical channel number corresponding to the most recent conversion result.
15 to 0	PWDDR[15:0]	These bits are used to store the A/D conversion result for PWM-Diag.

Note 1. These bits are only supported for ADCA0.
For ADCA1, when read, the value after reset is returned.

38.3.2.7 ADCAnADHALTR — A/D Force Halt Register

This register is used to halt conversion for all SGs of ADCAn. The read value is always 0.

Access:	ADCAnADHALTR register is a write-only register that can be written in 32-bit units. ADCAnADHALTRL register is a write-only register that can be written in 16-bit units. ADCAnADHALTRLL register is a write-only register that can be written in 8-bit units.
Address:	ADCAnADHALTR:<ADCAn_base> + 300_H ADCAnADHALTRL:<ADCAn_base> + 300_H ADCAnADHALTRLL:<ADCAn_base> + 300_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 38.44 ADCAnADHALTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	HALT	ADCA Force Halt Trigger All scan groups are halted and initialized, and ADCA becomes idle state. Writing of 0: No effect Writing of 1: Scan groups are halted.

38.3.2.8 ADCAnADCR — A/D Control Register

This register is used for ADCAn common control.

Access: ADCAnADCR register can be read or written in 32-bit units.
ADCAnADCRL register can be read or written in 16-bit units.
ADCAnADCRLL register can be read or written in 8-bit units.

Address: ADCAnADCR: <ADCAn_base> + 304_H
ADCAnADCRL: <ADCAn_base> + 304_H
ADCAnADCRLL: <ADCAn_base> + 304_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 38.45 ADCAnADCR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	DGON	Self-Diagnostic Voltage Standby Control 0: The self-diagnostic voltage circuit is turned off. 1: The self-diagnostic voltage circuit is turned on, or the reference voltage is updated.
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CRAC	Alignment Control 0: The results of conversion to PWDDR and ADCAnDRj are stored right-aligned. 1: The results of conversion to PWDDR and ADCAnDRj are stored left-aligned.
4	CTYP	12/10 Bit Select Mode 0: 12-bit mode 1: 10-bit mode
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	SUSMTD [1:0]	Suspend Mode Select These bits are used to select the suspend method when a higher-priority scan group interrupts a lower-priority scan group. 00: Synchronous suspend when a higher-priority SG or SVSTOP interrupts. 01: Asynchronous suspend when a higher-priority SG (SG2, SG3, SG4) and SVSTOP interrupt SG1, and synchronous suspend when a higher-priority SG (SG3, SG4) and SVSTOP interrupt SG2, or when a higher-priority SG (SG4) and SVSTOP interrupt SG3. 10: Asynchronous suspend when a higher-priority SG or SVSTOP interrupts. 11: Setting prohibited

CAUTION

To prevent malfunction, ADCAnADCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

- Synchronous suspend:
  If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the A/D conversion for the higher-priority SG is performed after the on-going A/D conversion of a channel is completed. After processing for the higher-priority SG is completed, the suspended A/D channel processing for the lower-priority SG is resumed.
- Asynchronous suspend:
  If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the on-going channel processing is suspended, and then the A/D conversion for the higher-priority SG is performed. After processing for the higher-priority SG is completed, the suspended A/D channel conversion for the lower-priority SG is resumed.

For details, see **Figure 38.25, Example of Synchronous Suspend and Resume Operation** and **Figure 38.26, Example of Asynchronous Suspend and Resume Operation**.

38.3.2.9 ADCAnMPXCURR — MPX Current Register

This register is used to store the MPX value for an external analog multiplexer.

Access:	ADCAnMPXCURR register is a read-only register that can be read in 32-bit units. ADCAnMPXCURRL register is a read-only register that can be read in 16-bit units. ADCAnMPXCURRLL register is a read-only register that can be read in 8-bit units.
Address:	ADCAnMPXCURR: <ADCAn_base> + 30C$_{H}$ ADCAnMPXCURRL: <ADCAn_base> + 30C$_{H}$ ADCAnMPXCURRLL: <ADCAn_base> + 30C$_{H}$
Value after reset:	0000 0000$_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.46 ADCAnMPXCURR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2 to 0	MPXCUR[2:0]	These bits are used to store the current MPX value. If conversion of a virtual channel starts after setting ADCAnVCRj.MPXE to 1, the setting of ADCAnVCRj.MPXV[2:0] is stored. If conversion of a virtual channel starts after setting ADCAnPWDVCR.MPXE to 1, the setting of ADCAnPWDVCR.MPXV[2:0] is stored.

NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

38.3.2.10 ADCAnTHSMPSTCR — T&H Sampling Start Control Register

This register is used to control the start of sampling for all T&Hk (k = 0 to 5). The bits are always read as 0.

Access:	ADCAnTHSMPSTCR register is a write-only register that can be written in 32-bit units. ADCAnTHSMPSTCRL register is a write-only register that can be written in 16-bit units. ADCAnTHSMPSTCRLL register is a write-only register that can be written in 8-bit units.
Address:	ADCAnTHSMPSTCR: <ADCAn_base> + 314_H ADCAnTHSMPSTCRL: <ADCAn_base> + 314_H ADCAnTHSMPSTCRLL: <ADCAn_base> + 314_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SMPST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 38.47 ADCAnTHSMPSTCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SMPST	T&H Sampling Start Control Trigger 0: No effect 1: Sampling for all T&H is started. The conditions to place the T&H circuit in the sampling state are as follows: ● Condition to start sampling while T&H is stopped: 1 being written to ADCAnTHSMPSTCR.SMPST while ADCAnTHER.THkE = 1 (k = 0 to 5). ● Condition to start continuous sampling in automatic sampling: A/D conversion of the hold value for T&Hk being completed while ADCAnTHER.THkE = 1 (k = 0 to 5) and ADCAnTHCR.ASMPMSK = 1.

NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

38.3.2.11 ADCAnTHCR — T&H Control Register

This register controls the sampling transition after A/D conversion of the hold value for T&H is completed.

Automatic start of sampling on the T&H circuit after A/D conversion of the hold value for T&H is completed shortens the time required for the generation of succeeding hold completion triggers.

Access:	ADCAnTHCR register can be read or written in 32-bit units. ADCAnTHCRL register can be read or written in 16-bit units. ADCAnTHCRLL register can be read or written in 8-bit units.
Address:	ADCAnTHCR: <ADCAn_base> + 318$_H$ ADCAnTHCRL: <ADCAn_base> + 318$_H$ ADCAnTHCRLL: <ADCAn_base> + 318$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ASMPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 38.48 ADCAnTHCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ASMPMSK	Automatic Sampling Mask Control 0: Automatic sampling is not performed. 1: Automatic sampling is performed.

CAUTION

To prevent malfunction, ADCAnTHCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

38.3.2.12 ADCAnTHAHLDSTCR — T&H Group A Hold Start Control Register

This register is used to control the start of the hold for T&H group A. The bits are always read as 0.

Access: ADCAnTHAHLDSTCR register is a write-only register that can be written in 32-bit units.
ADCAnTHAHLDSTCRL register is a write-only register that can be written in 16-bit units.
ADCAnTHAHLDSTCRLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnTHAHLDSTCR: <ADCAn_base> + $31C_H$
ADCAnTHAHLDSTCRL: <ADCAn_base> + $31C_H$
ADCAnTHAHLDSTCRLL: <ADCAn_base> + $31C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HLDST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 38.49 ADCAnTHAHLDSTCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	HLDST	T&H Group A Hold Start Control Trigger 0: No effect 1: Hold for T&H group A is started. The condition to place T&H group A in the hold state is as follows: 1 being written to ADCAnTHAHLDSTCR.HLDST while ADCAnTHER.THkE = 1 (k = 0 to 5) and ADCAnTHGSR.THkGS = 0 (k = 0 to 5).

NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

38.3.2.13 ADCAnTHBHLDSTCR — T&H Group B Hold Start Control Register

This register is used to control the start of the hold for T&H group B. The bits are always read as 0.

Access:	ADCAnTHBHLDSTCR register is a write-only register that can be written in 32-bit units. ADCAnTHBHLDSTCRL register is a write-only register that can be written in 16-bit units. ADCAnTHBHLDSTCRLL register is a write-only register that can be written in 8-bit units.
Address:	ADCAnTHBHLDSTCR: <ADCAn_base> + 320_H ADCAnTHBHLDSTCRL: <ADCAn_base> + 320_H ADCAnTHBHLDSTCRLL: <ADCAn_base> + 320_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HLDST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 38.50 ADCAnTHBHLDSTCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	HLDST	T&H Group B Hold Start Control Trigger 0: No effect 1: Hold for T&H group B is started. The condition to place T&H group B in the hold state is as follows: 1 being written to ADCAnTHBHLDSTCR.HLDST while ADCAnTHER.THkE = 1 (k = 0 to 5) and ADCAnTHGSR.THkGS = 1 (k = 0 to 5).

NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

38.3.2.14 ADCAnTHACR — T&H Group A Control Register

This register is used to control T&H group A.

Access:	ADCAnTHACR register can be read or written in 32-bit units. ADCAnTHACRL register can be read or written in 16-bit units. ADCAnTHACRLL register can be read or written in 8-bit units.
Address:	ADCAnTHACR: <ADCAn_base> + 324_H ADCAnTHACRL: <ADCAn_base> + 324_H ADCAnTHACRLL: <ADCAn_base> + 324_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	HLDCTE	HLDTE	—	—	SGS[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Table 38.51 ADCAnTHACR Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	HLDCTE	T&H Group A Hold Completion Trigger Enable This bit is used when self-diagnosis of the T&H circuit is to proceed. 0: Self-diagnosis does not proceed. 1: Self-diagnosis proceeds. **NOTE:** The SGx_TRG (x = 1 to 3) trigger is selected for the trigger input of the scan group that is not selected in SGS[1:0] of ADCAnTHACR and SGS[1:0] of ADCAnTHBCR.
4	HLDTE	T&H Group A Hold Trigger Enable 0: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is selected for the hold start trigger of T&H group A. 1: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is not selected for the hold start trigger of T&H group A. **NOTE:** ADCAnTHAHLDSTCR.HLDST becomes a hold start trigger regardless of the ADCAnTHACR.HLDTE setting. Set this bit to 0 when self-diagnosis of the T&H circuit is to proceed.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	SGS[1:0]	T&H Group A Scan Group Select 00: No scan group is selected for T&H group A. 01: SG1 is selected for T&H group A. 10: SG2 is selected for T&H group A. 11: SG3 is selected for T&H group A. **NOTES:** 1. If ADCAnTHACR.SGS[1:0] is set to 0_H, T&H does not operate. When you enable T&Hk in ADCAnTHER.THkE, make sure that a scan group is specified in SGS[1:0]. 2. Selecting the same scan group as T&H group B is prohibited.

CAUTION

To prevent malfunction, ADCAnTHACR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

38.3.2.15 ADCAnTHBCR — T&H Group B Control Register

This register is used to control T&H group B.

Access: ADCAnTHBCR register can be read or written in 32-bit units.
ADCAnTHBCRL register can be read or written in 16-bit units.
ADCAnTHBCRLL register can be read or written in 8-bit units.

Address: ADCAnTHBCR: <ADCAn_base> + 328_H
ADCAnTHBCRL: <ADCAn_base> + 328_H
ADCAnTHBCRLL: <ADCAn_base> + 328_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	HLDCTE	HLDTE	—	—	SGS[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Table 38.52 ADCAnTHBCR Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	HLDCTE	T&H Group B Hold Completion Trigger Enable This bit is used when self-diagnosis of the T&H circuit is to proceed. 0: Self-diagnosis does not proceed. 1: Self-diagnosis proceeds. **NOTE:** The SGx_TRG (x = 1 to 3) trigger is selected for the trigger input of the scan group that is not selected in SGS[1:0] of ADCAnTHACR and SGS[1:0] of ADCAnTHBCR.
4	HLDTE	T&H Group B Hold Trigger Enable 0: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is selected for the hold start trigger of T&H group B. 1: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is not selected for the hold start trigger of T&H group B. **NOTE:** ADCAnTHBHLDSTCR.HLDST becomes a hold start trigger regardless of the ADCAnTHBCR.HLDTE setting. Set this bit to 0 when self-diagnosis of the T&H circuit is to proceed.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	SGS[1:0]	T&H Group B Scan Group Select 00: No scan group is selected for T&H group B. 01: SG1 is selected for T&H group B. 10: SG2 is selected for T&H group B. 11: SG3 is selected for T&H group B. **NOTES:** 1. If ADCAnTHBCR.SGS[1:0] is set to 0_H, T&H does not operate. When you enable T&Hk in ADCAnTHER.THkE, make sure that a scan group is specified in SGS[1:0]. 2. Selecting the same scan group as T&H group A is prohibited.

CAUTION

To prevent malfunction, ADCAnTHBCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

38.3.2.16 ADCAnTHER — T&H Enable Register

This register controls enabling and disabling of each T&H.

Access: ADCAnTHER register can be read or written in 32-bit units.
ADCAnTHERL register can be read or written in 16-bit units.
ADCAnTHERLL register can be read or written in 8-bit units.

Address: ADCAnTHER: <ADCAn_base> + 32C$_H$
ADCAnTHERL: <ADCAn_base> + 32C$_H$
ADCAnTHERLL: <ADCAn_base> + 32C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TH5E	TH4E	TH3E	TH2E	TH1E	TH0E
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 38.53 ADCAnTHER Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	TH5E	T&H5 Enable 0: T&H5 is disabled. 1: T&H5 is enabled. **NOTE:** If TH5E is set to 0, T&H5 is always stopped.
4	TH4E	T&H4 Enable 0: T&H4 is disabled. 1: T&H4 is enabled. **NOTE:** If TH4E is set to 0, T&H4 is always stopped.
3	TH3E	T&H3 Enable 0: T&H3 is disabled. 1: T&H3 is enabled. **NOTE:** If TH3E is set to 0, T&H3 is always stopped.
2	TH2E	T&H2 Enable 0: T&H2 is disabled. 1: T&H2 is enabled **NOTE:** If TH2E is set to 0, T&H2 is always stopped.
1	TH1E	T&H1 Enable 0: T&H1 is disabled. 1: T&H1 is enabled. **NOTE:** If TH1E is set to 0, T&H1 is always stopped.
0	TH0E	T&H0 Enable 0: T&H0 is disabled. 1: T&H0 is enabled **NOTE:** If TH0E is set to 0, T&H0 is always stopped.

CAUTION

To prevent malfunction, ADCAnTHER should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

38.3.2.17 ADCAnTHGSR — T&H Group Select Register

This register is used to select a T&H group for each T&H.

Access:	ADCAnTHGSR register can be read or written in 32-bit units. ADCAnTHGSRL register can be read or written in 16-bit units. ADCAnTHGSRLL register can be read or written in 8-bit units.
Address:	ADCAnTHGSR: <ADCAn_base> + 330$_H$ ADCAnTHGSRL: <ADCAn_base> + 330$_H$ ADCAnTHGSRLL: <ADCAn_base> + 330$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TH5GS	TH4GS	TH3GS	TH2GS	TH1GS	TH0GS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 38.54 ADCAnTHGSR Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	TH5GS	T&H5 Group Select 0: T&H5 is selected to group A. 1: T&H5 is selected to group B.
4	TH4GS	T&H4 Group Select 0: T&H4 is selected to group A. 1: T&H4 is selected to group B.
3	TH3GS	T&H3 Group Select 0: T&H3 is selected to group A. 1: T&H3 is selected to group B.
2	TH2GS	T&H2 Group Select 0: T&H2 is selected to group A. 1: T&H2 is selected to group B.
1	TH1GS	T&H1 Group Select 0: T&H1 is selected to group A. 1: T&H1 is selected to group B.
0	TH0GS	T&H0 Group Select 0: T&H0 is selected to group A. 1: T&H0 is selected to group B.

CAUTION

- Do not set T&H0 to T&H2 to the same group as T&H3 to T&H5.
  Example
  - Group A: 0ch, 1ch, 2ch
    Group B: 3ch, 4ch, 5ch → Setting allowed
  - Group A: 0ch
    Group B: 1ch, 2ch → Setting allowed
  - Group A: 0ch, 1ch, 3ch
    Group B: 2ch, 4ch → Setting prohibited
- To prevent malfunction, ADCAnTHGSR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

38.3.2.18 ADCAnSMPCR — Sampling Control Register

This register controls sampling.

ADCAnSMPCR controls the sampling time for SG4 (PWM-Diag) and SG1 to SG3.

Access:	ADCAnSMPCR register can be read or written in 32-bit units. ADCAnSMPCRL register can be read or written in 16-bit units. ADCAnSMPCRLL register can be read or written in 8-bit units.
Address:	ADCAnSMPCR: <ADCAn_base> + 380_H ADCAnSMPCRL: <ADCAn_base> + 380_H ADCAnSMPCRLL: <ADCAn_base> + 380_H
Value after reset:	0000 0018_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	SMPT[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 38.55 ADCAnSMPCR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	SMPT[7:0]	These bits are used to set the sampling time (the number of cycles). 12_H: 18 cycles (ADCLK = 8 MHz to 32 MHz) 18_H: 24 cycles (ADCLK = 8 MHz to 40 MHz) Settings other than above are prohibited.

CAUTION

- To prevent malfunction, ADCAnSMPCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
- When SMPT is changed, the A/D conversion wait time is also changed when MPX is used by virtual channel register j (ADCAnVCRj) or PWM-Diag virtual channel register (ADCAnPWDVCR).

38.3.2.19 ADCAnMPXSTBTSELR0 to 4 — MPX Stabilization Time Selection Register 0 to 4

This register is used to select the stabilization time for respective physical channels when external multiplexer is used. ADCAnMPXSTBTSELR0 corresponds to physical channels ANIn00 to ANIn07, ADCAnMPXSTBTSELR1 corresponds to physical channels of ANIn08 to ANIn15, ADCAnMPXSTBTSELR2 corresponds to physical channels of ANIn16 to ANIn23, and ADCAnMPXSTBTSELR3 corresponds to physical channels of ANIn24 to ANIn31, and ADCAnMPXSTBTSELR4 corresponds to physical channels of ANIn32 to ANIn35.

Access: ADCAnMPXSTBTSELR0 to 4 registers can be read or written in 32-bit units.
ADCAnMPXSTBTSELR0L to 4L registers can be read or written in 16-bit units.
ADCAnMPXSTBTSELR0H to 3H registers can be read or written in 16-bit units.

Address: ADCAnMPXSTBTSELR0: <ADCAn_base> + 5F0$_{H}$
ADCAnMPXSTBTSELR1: <ADCAn_base> + 5F4$_{H}$
ADCAnMPXSTBTSELR2: <ADCAn_base> + 5F8$_{H}$
ADCAnMPXSTBTSELR3: <ADCAn_base> + 5FC$_{H}$
ADCAnMPXSTBTSELR4: <ADCAn_base> + 600$_{H}$

ADCAnMPXSTBTSELR0L: <ADCAn_base> + 5F0$_{H}$
ADCAnMPXSTBTSELR1L: <ADCAn_base> + 5F4$_{H}$
ADCAnMPXSTBTSELR2L: <ADCAn_base> + 5F8$_{H}$
ADCAnMPXSTBTSELR3L: <ADCAn_base> + 5FC$_{H}$
ADCAnMPXSTBTSELR4L: <ADCAn_base> + 600$_{H}$

ADCAnMPXSTBTSELR0H: <ADCAn_base> + 5F0$_{H}$ + 2$_{H}$
ADCAnMPXSTBTSELR1H: <ADCAn_base> + 5F4$_{H}$ + 2$_{H}$
ADCAnMPXSTBTSELR2H: <ADCAn_base> + 5F8$_{H}$ + 2$_{H}$
ADCAnMPXSTBTSELR3H: <ADCAn_base> + 5FC$_{H}$ + 2$_{H}$

Value after reset: 0000 0000$_{H}$

Table 38.56 ADCAnMPXSTBTSELR0 to 4 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write value after reset.
30 to 28	STBTCHhh[2:0]*[1]	Select the value from ADCAnMPXSTBTR0 to 7 for MPX stabilization time*[2].
27	Reserved	When read, the value after reset is returned. When writing, write value after reset.
26 to 24	STBTCHgg[2:0]*[1]	Select the value from ADCAnMPXSTBTR0 to 7 for MPX stabilization time*[2].
23	Reserved	When read, the value after reset is returned. When writing, write value after reset.
22 to 20	STBTCHff[2:0]*[1]	Select the value from ADCAnMPXSTBTR0 to 7 for MPX stabilization time*[2].
19	Reserved	When read, the value after reset is returned. When writing, write value after reset.
18 to 16	STBTCHee[2:0]*[1]	Select the value from ADCAnMPXSTBTR0 to 7 for MPX stabilization time*[2].
15	Reserved	When read, the value after reset is returned. When writing, write value after reset.
14 to 12	STBTCHdd[2:0]*[1]	Select the value from ADCAnMPXSTBTR0 to 7 for MPX stabilization time*[2].
11	Reserved	When read, the value after reset is returned. When writing, write value after reset.
10 to 8	STBTCHcc[2:0]*[1]	Select the value from ADCAnMPXSTBTR0 to 7 for MPX stabilization time*[2].
7	Reserved	When read, the value after reset is returned. When writing, write value after reset.
6 to 4	STBTCHbb[2:0]*[1]	Select the value from ADCAnMPXSTBTR0 to 7 for MPX stabilization time*[2].
3	Reserved	When read, the value after reset is returned. When writing, write value after reset.
2 to 0	STBTCHaa[2:0]*[1]	Select the value from ADCAnMPXSTBTR0 to 7 for MPX stabilization time*[2].

Note 1. The relationship between physical channel and register symbol is shown below table. ADCAn012S and ADCA0I13S are not supported on RH850/F1KH-D8, RH850/F1KM-S4. When writing corresponding bits (STBTCH28[2:0] and STBTCH29[2:0] of ADCA0MPXSTBTSELR3 register), write value after reset.

Note 2. STBTCH00[2:0] to STBTCH35[2:0]=
000: The set value of ADCAnMPXSTBTR0 is used for MPX stabilization time
001: The set value of ADCAnMPXSTBTR1 is used for MPX stabilization time
010: The set value of ADCAnMPXSTBTR2 is used for MPX stabilization time
011: The set value of ADCAnMPXSTBTR3 is used for MPX stabilization time
100: The set value of ADCAnMPXSTBTR4 is used for MPX stabilization time
101: The set value of ADCAnMPXSTBTR5 is used for MPX stabilization time
110: The set value of ADCAnMPXSTBTR6 is used for MPX stabilization time
111: The set value of ADCAnMPXSTBTR7 is used for MPX stabilization time

Physical Channel		Selection Register	Symbol	
ANIn00	ADCAnI0	ADCAnMPXSTBTSELR0	aa	00
ANIn08	ADCAnI8	ADCAnMPXSTBTSELR1		08

ANIn07	ADCAnI7	ADCAnMPXSTBTSELR0	hh	07
ANIn15	ADCAnI15	ADCAnMPXSTBTSELR1		15
ANIn23	ADCAnI7S	ADCAnMPXSTBTSELR2		23
ANIn31	ADCAnI15S	ADCAnMPXSTBTSELR3		31

NOTE

- STBTCH00[2:0] to STBTCH35[2:0] are enabled when the MPXE bit of the ADCAnVCRj or ADCAnPWDVCR register is set to 1.
- In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

CAUTION

To prevent malfunction, ADCAnMPXSTBTSELR0 to ADCAnMPXSTBTSELR4 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

38.3.2.20 ADCAnMPXSTBTR0 to 7 — MPX Stabilization Time Setting Register 0 to 7

This register is used to set the stabilization time when external multiplexer is used.

Stabilization time of corresponded physical channels which is selected by ADCAnMPXSTBTSEL0 to 4 register is set by setting this register.

Access: ADCAnMPXSTBTR0 to 7 registers can be read or written in 32-bit units.
ADCAnMPXSTBTR0L to 7L registers can be read or written in 16-bit units.

Address:
ADCAnMPXSTBTR0: <ADCAn_base> + 610_H
ADCAnMPXSTBTR1: <ADCAn_base> + 614_H
ADCAnMPXSTBTR2: <ADCAn_base> + 618_H
ADCAnMPXSTBTR3: <ADCAn_base> + $61C_H$
ADCAnMPXSTBTR4: <ADCAn_base> + 620_H
ADCAnMPXSTBTR5: <ADCAn_base> + 624_H
ADCAnMPXSTBTR6: <ADCAn_base> + 628_H
ADCAnMPXSTBTR7: <ADCAn_base> + $62C_H$

ADCAnMPXSTBTR0L: <ADCAn_base> + 610_H
ADCAnMPXSTBTR1L: <ADCAn_base> + 614_H
ADCAnMPXSTBTR2L: <ADCAn_base> + 618_H
ADCAnMPXSTBTR3L: <ADCAn_base> + $61C_H$
ADCAnMPXSTBTR4L: <ADCAn_base> + 620_H
ADCAnMPXSTBTR5L: <ADCAn_base> + 624_H
ADCAnMPXSTBTR6L: <ADCAn_base> + 628_H
ADCAnMPXSTBTR7L: <ADCAn_base> + $62C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 38.57 ADCAnMPXSTBR0 to 7 Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing, write value after reset.
13 to 0	STBTIME[13:0]	Specify the analog input stabilization time when an external analog multiplexer is used only. When these bits are all “0” (reset value), wait time of one A/D conversion is inserted. Other than all “0”, wait time is inserted before A/D conversion according to the calculation below. Calculation formula: STBTIME[13:0] / ADCLK Refer to **Table 38.58, Setting Example of ADCAnMPXSTBR0 to 7 Register** below for as example. Stabilization time has to be set within from 1μs to 250μs.

Table 38.58 Setting Example of ADCAnMPXSTBR0 to 7 Register

Stabilization Time (µs)	ADCLK (MHz)						
	8	10	12	16	20	24	40
1	0008_H	$000A_H$	$000C_H$	0010_H	0014_H	0018_H	0028_H
100	0320_H	$03E8_H$	$04B0_H$	0640_H	$07D0_H$	0960_H	$0FA0_H$
250	$07D0_H$	$09C4_H$	$0BB8_H$	$0FA0_H$	1388_H	1770_H	2710_H

Note 1. This setting should be changed in accordance with A/D conversion clock selection.

CAUTION

To prevent malfunction, ADCAnMPXSTBTR0 to ADCAnMPXSTBTR7 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1KH, RH850/F1KM, only ADCA0 supports this function.

38.3.2.21 ADCAnSFTCR — Safety Control Register

This is a register for safety control.

Access:	ADCAnSFTCR register can be read or written in 32-bit units. ADCAnSFTCRL register can be read or written in 16-bit units. ADCAnSFTCRLL register can be read or written in 8-bit units.
Address:	ADCAnSFTCR: <ADCAn_base> + 334_{H} ADCAnSFTCRL: <ADCAn_base> + 334_{H} ADCAnSFTCRLL: <ADCAn_base> + 334_{H}
Value after reset:	0000 0000_{H}

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	RDCLRE	ULEIE	OWEIE	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R

Table 38.59 ADCAnSFTCR Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	RDCLRE	Read & Clear Enable When the A/D conversion result is read, this bit selects whether the A/D conversion result is cleared by hardware. 0: ADCAnPWDTSNDR/ADCAnDRj and ADCAnPWDDIR/ADCAnDIRj are not cleared when ADCAnPWDTSNDR/ADCAnDRj or ADCAnPWDDIR/ADCAnDIRj is read. 1: ADCAnPWDTSNDR/ADCAnDRj and ADCAnPWDDIR/ADCAnDIRj are cleared when ADCAnPWDTSNDR/ADCAnDRj or ADCAnPWDDIR/ADCAnDIRj is read. WFLG of ADCAnDIRj is cleared regardless of the RDCLRE setting when ADCAnDRj or ADCAnDIRj is read. Even when reading with 16-bit access to ADCAnDRj or ADCAnPWDTSNDR is performed with the setting of RDCLRE = 1, all 32-bit data will be cleared.
3	ULEIE	A/D Error Interrupt (INT_ADE) Enable on Upper/Lower Limit Error Detection 0: Disabled 1: Enabled
2	OWEIE	A/D Error Interrupt (INT_ADE) Enable on Overwrite Error Detection 0: Disabled 1: Enabled
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

To prevent malfunction, ADCAnSFTCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

38.3.2.22 ADCAnULLMTBR0 to 7 — Upper Limit/Lower Limit Table Register 0 to 7

These registers are used to set the threshold for detection of an upper limit or lower limit error in the A/D converted value. Any of ADCAnULLMTBR0 to ADCAnULLMTBR7 is specified by setting ADCAnPWDVCR.ULS[3:0] and ADCAnVCRj.ULS[3:0] and compared with ADCAnPWDTSNDR and ADCAnDRj.

Access: ADCAnULLMTBR0 to 7 registers can be read or written in 32-bit units.
ADCAnULLMTBR0L to 7L and ADCAnULLMTBR0H to 7H registers can be read or written in 16-bit units.

Address: ADCAnULLMTBR0: <ADCAn_base> + 338_{H}
ADCAnULLMTBR1: <ADCAn_base> + $33C_{H}$
ADCAnULLMTBR2: <ADCAn_base> + 340_{H}
ADCAnULLMTBR3: <ADCAn_base> + 564_{H}
ADCAnULLMTBR4: <ADCAn_base> + 568_{H}
ADCAnULLMTBR5: <ADCAn_base> + $56C_{H}$
ADCAnULLMTBR6: <ADCAn_base> + 570_{H}
ADCAnULLMTBR7: <ADCAn_base> + 574_{H}

ADCAnULLMTBR0L: <ADCAn_base> + 338_{H}
ADCAnULLMTBR1L: <ADCAn_base> + $33C_{H}$
ADCAnULLMTBR2L: <ADCAn_base> + 340_{H}
ADCAnULLMTBR3L: <ADCAn_base> + 564_{H}
ADCAnULLMTBR4L: <ADCAn_base> + 568_{H}
ADCAnULLMTBR5L: <ADCAn_base> + $56C_{H}$
ADCAnULLMTBR6L: <ADCAn_base> + 570_{H}
ADCAnULLMTBR7L: <ADCAn_base> + 574_{H}

ADCAnULLMTBR0H: <ADCAn_base> + 338_{H} + 2_{H}
ADCAnULLMTBR1H: <ADCAn_base> + $33C_{H}$+ 2_{H}
ADCAnULLMTBR2H: <ADCAn_base> + 340_{H} + 2_{H}
ADCAnULLMTBR3H: <ADCAn_base> + 564_{H} + 2_{H}
ADCAnULLMTBR4H: <ADCAn_base> + 568_{H} + 2_{H}
ADCAnULLMTBR5H: <ADCAn_base> + $56C_{H}$ + 2_{H}
ADCAnULLMTBR6H: <ADCAn_base> + 570_{H} + 2_{H}
ADCAnULLMTBR7H: <ADCAn_base> + 574_{H} + 2_{H}

Value after reset: FFF0 0000_{H}

Table 38.60 ADCAnULLMTBR0 to 7 Registers Contents

Bit Position	Bit Name	Function
31 to 20	ULMTB[11:0]	Upper Limit Table Specify the threshold for detection of an upper limit error in the A/D converted value. The upper limit error (ADCAnULER.UE) is set when the following condition is met: ULMTB[11:0] < A/D converted value
19 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 4	LLMTB[11:0]	Lower Limit Table Specify the threshold for detection of a lower limit error in the A/D converted value. The lower limit error (ADCAnULER.LE) is set when the following condition is met: LLMTB[11:0] > A/D converted value
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

- When A/D conversion is executed in 10-bit mode (ADCAnADCR.CTYP = 1), ULMTB[1:0] and LLMTB[1:0] should be set to 11B and 00B, respectively.
- To prevent malfunction, ADCAnULLMTBR0 to ADCAnULLMTBR7 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
- The upper-limit table (ULMTB[11:0]) must be greater than the lower-limit table (LLMTB[11:0]).

38.3.2.23 ADCAnECR — Error Clear Register

This register is used to control clearing of an error. The read value is always 0.

Access: ADCAnECR register is a write-only register that can be written in 32-bit units.
ADCAnECRL register is a write-only register that can be written in 16-bit units.
ADCAnECRLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnECR: <ADCAn_base> + 344_H
ADCAnECRL: <ADCAn_base> + 344_H
ADCAnECRLL: <ADCAn_base> + 344_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	ULEC	OWEC	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	R	R

Table 38.61 ADCAnECR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When writing, write the value after reset.
3	ULEC	Upper Limit Error Flag (ADCAnULER.UE) / Lower Limit Error Flag (ADCAnULER.LE) Clear, Upper/Lower Limit Error Capture (ADCAnULER.ULECAP[5:0]), Scan Group Bit (ULSG[1:0]) When Upper/Lower Limit Error Occurs, MPX Usage Bit (MPXE), and the MPX Value Storing Bit (MPXV[2:0]) Clear When Upper/Lower Limit Error Occurs Upper Limit/Lower Limit Error VC Flag (ADCAnULEVCFR0-1.ULEVC[49:0], ADCAnULEVCFR1.ULEPWDVC) Clear 0: No effect. 1: Clears the flag.
2	OWEC	Overwrite Error Flag (ADCAnOWER.OWE) and Overwrite Error Capture (ADCAnOWER.OWECAP[5:0]) Clear 0: No effect. 1: Clears the flag.
1, 0	Reserved	When writing, write the value after reset.

38.3.2.24 ADCAnULER — Upper Limit/Lower Limit Error Register

This register is a read-only register that indicates information regarding the upper limit/lower limit errors.

Access:	ADCAnULER register is a read-only register that can be read in 32-bit units. ADCAnULERL register is a read-only register that can be read in 16-bit units. ADCAnULERLH register is a read-only register that can be read in 8-bit units. ADCAnULERLL register is a read-only register that can be read in 8-bit units.
Address:	ADCAnULER: <ADCAn_base> + 348_H ADCAnULERL: <ADCAn_base> + 348_H ADCAnULERLL: <ADCAn_base> + 348_H ADCAnULERLH: <ADCAn_base> + 348_H + 1_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UE	LE	ULSG[1:0]		MPXE	MPXV[2:0]			—	—	ULECAP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.62 ADCAnULER Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15	UE	Upper Limit Error Flag 0: An upper limit error is not detected. 1: An upper limit error is detected. Setting condition: The A/D converted value exceeds the upper limit threshold specified by the upper limit/lower limit table registers 0 to 7 (ADCAnULLMTBR0 to 7). If a subsequent upper limit error is detected in A/D conversion while this bit is set to 1, the ADCAnULER register is not updated. Clearing condition: 1 is written to ADCAnECR.ULEC.
14	LE	Lower Limit Error Flag 0: A lower limit error is not detected. 1: A lower limit error is detected. Setting condition: The A/D converted value is lower than the lower limit threshold specified by the upper limit/lower limit table registers 0 to 7 (ADCAnULLMTBR0 to 7). If a subsequent lower limit error is detected in A/D conversion while this bit is set to 1, the ADCAnULER register is not updated. Clearing condition: 1 is written to ADCAnECR.ULEC.

Table 38.62 ADCAnULER Register Contents

Bit Position	Bit Name	Function
13, 12	ULSG[1:0]	Scan Group where an Upper Limit/Lower Limit Error Occurs 00: No upper limit/lower limit error occurred. 01: The scan group where an upper limit/lower limit error occurred is SG1 to SG3. 10: The scan group where an upper limit/lower limit error occurred is PWM-Diag. Capture condition: When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0. Clearing condition: When 1 is written to ADCAnECR.ULEC.
11	MPXE*[1]	MPX Usage 0: The MPX function was not used when an upper limit/lower limit error occurred. 1: The MPX function was used when an upper limit/lower limit error occurred. Capture condition: When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0 Clearing condition: When 1 is written to ADCAnECR.ULEC.
10 to 8	MPXV[2:0]*[1]	The value of MPX is stored when the errors of the upper and lower limit occurred Capture condition: When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0. Clearing condition: When 1 is written to ADCAnECR.ULEC.
7	Reserved	When read, an undefined value is read.
6	Reserved	When read, the value after reset is returned.
5 to 0	ULECAP[5:0]	Upper Limit/Lower Limit Error Capture The physical channel is captured when an upper limit/lower limit error occurred. Capturing condition: When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0. Clearing condition: 1 is written to ADCAnECR.ULEC.

Note 1. These bits are only supported for ADCA0.
For ADCA1, when read, the value after reset is returned.

NOTE

ADCAnULER is updated when the A/D converted value is set in ADCAnDRj or ADCAnPWDTSNDR.

38.3.2.25 ADCAnOWER — Overwrite Error Register

This register is a 32/16/8-bit read-only register that indicates an overwrite error. The target for overwrite errors is SG1 to SG3, and not PWM-Diag.

Access: ADCAnOWER register is a read-only register that can be read in 32-bit units.
ADCAnOWERL register is a read-only register that can be read in 16-bit units.
ADCAnOWERLL register is a read-only register that can be read in 8-bit units.

Address: ADCAnOWER: <ADCAn_base> + 34C$_H$
ADCAnOWERL: <ADCAn_base> + 34C$_H$
ADCAnOWERLL: <ADCAn_base> + 34C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	OWE	—	OWECAP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.63 ADCAnOWER Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	OWE	Overwrite Error Flag 0: An overwrite error is not detected. 1: An overwrite error is detected. Setting condition: ADCAnDIRj.WFLG = 1, and the A/D converted value is written to ADCAnDRj. If a subsequent overwrite error is detected in A/D conversion while this bit is set to 1, the ADCAnOWER register is not updated. Clearing condition: 1 is written to ADCAnECR.OWEC.
6	Reserved	When read, the value after reset is returned.
5 to 0	OWECAP[5:0]	Overwrite Error Capture The virtual channel number is captured when an overwrite error occurs. Capturing condition: OWE = 0 and ADCAnDIRj.WFLG = 1, and the A/D converted value is written to ADCAnDRj Clearing condition: 1 is written to ADCAnECR.OWEC.

NOTE

ADCAnOWER is updated when the A/D converted value is set in ADCAnDRj.

38.3.2.26 ADCAnULEVCFR0 — Upper Limit/Lower Limit Error VC Flag Register 0

This is a flag register for each virtual channel indicating an upper or lower limit error. ADCAnULEVCFR0 corresponds to ADCAnVCRj (j = 0 to 31).

Access: ADCAnULEVCFR0 register is a read-only register that can be read in 32-bit units.

Address: ADCAnULEVCFR0: <ADCAn_base> + 540_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ULEVC[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ULEVC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.64 ADCAnULEVCFR0 Register Contents

Bit Position	Bit Name	Function
31 to 0	ULEVC[31:0]	ADCAnVCRj (j = 0 to 31) Upper Limit/Lower Limit Error Flag 0: An Upper Limit/lower Limit error is not detected. 1: An Upper Limit/lower Limit error is detected. Setting condition: The A/D converted value exceeds or lowers the upper/lower limit threshold specified by the upper limit/lower limit table registers 0 to 7 (ADCAnULLMTBR0 to ADCAnULLMTBR7). Clearing condition: 1 is written to ADCAnECR.ULEC.

38.3.2.27 ADCAnULEVCFR1 — Upper Limit/Lower Limit Error VC Flag Register 1

This is a flag register for each virtual channel indicating an upper or lower limit error. ADCAnULEVCFR1 corresponds to ADCAnVCRj (j = 32 to 49) and ADCAnPWDVCR.

Access: ADCAnULEVCFR1 register is a read-only register that can be read in 32-bit units.

Address: ADCAnULEVCFR1: <ADCAn_base> + 544_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ULEPWDVC	—	—	—	—	—	—	—	—	—	—	—	—	—	ULEVC[49:48]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.65 ADCAnULEVCFR1 Register Contents

Bit Position	Bit Name	Function
31	ULEPWDVC	ADCAnPWDVCR Upper Limit/Lower Limit Error Flag 0: An Upper Limit/lower Limit error is not detected. 1: An Upper Limit/lower Limit error is detected. Setting condition: The A/D converted value exceeds or lowers the upper/lower limit threshold specified by the upper limit/lower limit table registers 0 to 7 (ADCAnULLMTBR0 to ADCAnULLMTBR7). Clearing condition: 1 is written to ADCAnECR.ULEC.
30 to 18	Reserved	When read, the value after reset is returned.
17 to 0	ULEVC[49:32]	ADCAnVCRj (j=32-49) Upper Limit/Lower Limit Error Flag 0: An Upper Limit/lower Limit error is not detected. 1: An Upper Limit/lower Limit error is detected. Setting condition: The A/D converted value exceeds or lowers the upper/lower limit threshold specified by the upper limit/lower limit table registers 0 to 7 (ADCAnULLMTBR0 to ADCAnULLMTBR7). Clearing condition: 1 is written to ADCAnECR.ULEC.

38.3.3 Scan Group (SG) Specific Registers

This section describes the registers provided for each scan group.

38.3.3.1 ADCAnSGSTCRx — Scan Group x Start Control Register

This register is used to control the start of scan group x. The read value is always 0.

Access:	ADCAnSGSTCRx is a write-only register that can be written in 32-bit units. ADCAnSGSTCRxL is a write-only register that can be written in 16-bit units. ADCAnSGSTCRxLL is a write-only register that can be written in 8-bit units.
Address:	ADCAnSGSTCRx: <ADCAn_base> + x × 40_H + 400_H ADCAnSGSTCRxL: <ADCAn_base> + x × 40_H + 400_H ADCAnSGSTCRxLL: <ADCAn_base> + x × 40_H + 400_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SGST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 38.66 ADCAnSGSTCRx Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SGST	Scan Group Start Trigger Writing 1 to SGST while ADCAnSGSTR.SGACT[3:1] = 0 starts the target SGx.

38.3.3.2 ADCAnPWDSGSTPCR — PWM-Diag Scan Stop Control Register

This is a control register to stop scan group for PWM-Diag. The read value is always 0.

Access:	ADCAnPWDSGSTPCR register is a write-only register that can be written in 32-bit units. ADCAnPWDSGSTPCRL register is a write-only register that can be written in 16-bit units. ADCAnPWDSGSTPCRLL register is a write-only register that can be written in 8-bit units.
Address:	ADCAnPWDSGSTPCR: <ADCAn_base> + 504_H ADCAnPWDSGSTPCRL: <ADCAn_base> + 504_H ADCAnPWDSGSTPCRLL: <ADCAn_base> + 504_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWDS GSTP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 38.67 ADCAnPWDSGSTPCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	PWDSGSTP	Scan Group for PWM-Diag Stop Trigger Writing 1 to PWDSGSTP while ADCAnSGSTR.SGACT[4] = 1.

38.3.3.3 ADCAnPWDSGCR — PWM-Diag Scan Group Control Register

This register is used to control PWM-Diag.

Access: ADCAnPWDSGCR register can be read or written in 32-bit units.
ADCAnPWDSGCRL register can be read or written in 16-bit units.
ADCAnPWDSGCRLL register can be read or written in 8-bit units.

Address: ADCAnPWDSGCR: <ADCAn_base> + 508$_H$
ADCAnPWDSGCRL: <ADCAn_base> + 508$_H$
ADCAnPWDSGCRLL: <ADCAn_base> + 508$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWDTRGMD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 38.68 ADCAnPWDSGCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWDTRGMD	PWM-Diag Trigger Mode Select 0: PWSA_ADTRG trigger input is disabled. 1: PWSA_ADTRG is selected for the trigger input to the PWM-Diag scan group.

CAUTION

To prevent malfunction, ADCAnPWDSGCR should be set (except clearing PWDTRGMD upon completion of A/D conversion) when SGACT of the PWM-Diag scan group (SG4) is 0 (before the scan group is started).

38.3.3.4 ADCAnSGCRx — Scan Group x Control Register

This register controls scan group x.

Access:	ADCAnSGCRx register can be read or written in 32-bit units. ADCAnSGCRxL register can be read or written in 16-bit units. ADCAnSGCRxLL register can be read or written in 8-bit units.
Address:	ADCAnSGCRx: <ADCAn_base> + x × 40_H + 408_H ADCAnSGCRxL: <ADCAn_base> + x × 40_H + 408_H ADCAnSGCRxLL: <ADCAn_base> + x × 40_H + 408_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	SCANMD	ADIE	SCT[1:0]		—	TRGMD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W

Table 38.69 ADCAnSGCRx Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	SCANMD	Scan Mode 0: Multicycle scan mode 1: Continuous scan mode Write 0 to this bit for SG2 and SG3.
4	ADIE	Scan End Interrupt Enable 0: INT_SGx is not output when the scan for SGx ends. 1: INT_SGx is output when the scan for SGx ends.
3, 2	SCT[1:0]	Channel Repeat Times Select 00: The selected number of channel repeat times is one. 01: The selected number of channel repeat times is two. 10: The selected number of channel repeat times is four. 11: Setting prohibited
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TRGMD	Trigger Mode 0: Trigger input to SGx_TRG is disabled (Hardware trigger disabled). 1: SGx_TRG start trigger or hold complete trigger A/B is selected for the trigger input to SGx. The software trigger is valid regardless of the TRGMD bit setting.

CAUTION

To prevent malfunction, ADCAnSGCRx should be set (except clearing TRGMD upon completion of A/D conversion and ADIE = 0 setting when stop procedure of scan group) when SGACT of all scan groups is 0 (before the scan group is started) and TRGMD of all scan groups is 0.

38.3.3.5 ADCAnSGVCSPx — Scan Group x Start Virtual Channel Pointer

This register specifies the start pointer of a virtual channel.

Access: ADCAnSGVCSPx register can be read or written in 32-bit units.
ADCAnSGVCSPxL register can be read or written in 16-bit units.
ADCAnSGVCSPxLL register can be read or written in 8-bit units.

Address: ADCAnSGVCSPx: <ADCAn_base> + x × 40_H + $40C_H$
ADCAnSGVCSPxL: <ADCAn_base> + x × 40_H + $40C_H$
ADCAnSGVCSPxLL: <ADCAn_base> + x × 40_H + $40C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	VCSP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 38.70 ADCAnSGVCSPx Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	VCSP[5:0]	Start Virtual Channel Pointer These bits are used to specify the virtual channel from which the SGx scan is to be started.

CAUTION

- ADCAnSGVCSPx must be equal to or smaller than ADCAnSGVCEPx.
- When writing to the channel pointers, be sure to write in the following order: ADCAnSGVCSPx → ADCAnSGVCEPx. When SGx is started, the A/D conversion for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is executed.
- Though ADCAnSGVCSPx can be written during the A/D conversion, the register is updated at the time when ADCAnSGVCEPx is written. The new setting is applied when SGx is started next time.
- When the hardware trigger is used, writing to this register during operation is prohibited.

38.3.3.6 ADCAnSGVCEPx — Scan Group x End Virtual Channel Pointer

This register specifies the end pointer of a virtual channel.

Access:	ADCAnSGVCEPx register can be read or written in 32-bit units. ADCAnSGVCEPxL register can be read or written in 16-bit units. ADCAnSGVCEPxLL register can be read or written in 8-bit units.
Address:	ADCAnSGVCEPx: <ADCAn_base> + x × 40_H + 410_H ADCAnSGVCEPxL: <ADCAn_base> + x × 40_H + 410_H ADCAnSGVCEPxLL: <ADCAn_base> + x × 40_H + 410_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	VCEP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 38.71 ADCAnSGVCEPx Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	VCEP[5:0]	End Virtual Channel Pointer These bits are used to specify the virtual channel at which the SGx scan is to be ended.

CAUTION

- ADCAnSGVCSPx must be equal to or smaller than ADCAnSGVCEPx.
- When SGx is started, processing for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is executed.
  ADCAnSGVCEPx can be rewritten even when SGx is being processed. The new setting is applied when SGx is started next time.

38.3.3.7 ADCAnSGMCYCRx — Scan Group x Multicycle Register

This register is a 32/16/8-bit read/write register that indicates the number of scan times in multicycle scan mode.

Access:	ADCAnSGMCYCRx register can be read or written in 32-bit units. ADCAnSGMCYCRxL register can be read or written in 16-bit units. ADCAnSGMCYCRxLL register can be read or written in 8-bit units.
Address:	ADCAnSGMCYCRx: <ADCAn_base> + x × 40_H + 414_H ADCAnSGMCYCRxL: <ADCAn_base> + x × 40_H + 414_H ADCAnSGMCYCRxLL: <ADCAn_base> + x × 40_H + 414_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 38.72 ADCAnSGMCYCRx Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	MCYC[1:0]	Multicycle Number Specification These bits are used to specify the number of scan times in multicycle scan mode. 00_B: Number of scans = 1 01_B: Number of scans = 2 10_B: Setting prohibited 11_B: Number of scans = 4

CAUTION

- To prevent malfunction, ADCAnSGMCYCRx should be set when SGACT of scan group x is 0 (before the scan group is started) and TRGMD is 0.
- When SGx is started, the scan for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is repeatedly executed as many times as specified in ADCAnSGMCYCRx.

38.3.3.8 ADCAnPWDSGSEFCR — PWM-Diag Scan End Flag Clear Register

This register is used to control the clearing of PWM-Diag scan end flag (SEF). The bits are always read as 0.

Access:	ADCAnPWDSGSEFCR register is a write-only register that can be written in 32-bit units. ADCAnPWDSGSEFCRL register is a write-only register that can be written in 16-bit units. ADCAnPWDSGSEFCRLL register is a write-only register that can be written in 8-bit units.
Address:	ADCAnPWDSGSEFCR: <ADCAn_base> + 518_H ADCAnPWDSGSEFCRL: <ADCAn_base> + 518_H ADCAnPWDSGSEFCRLL: <ADCAn_base> + 518_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWDSEFC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 38.73 ADCAnPWDSGSEFCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	PWDSEFC	PWM-Diag Scan End Flag Clear Trigger 0: No effect. 1: Clears the PWM-Diag scan end flag (ADCAnSGSTR.SEF[4]).

38.3.3.9 ADCAnSGSEFCRx — Scan Group x Scan End Flag Clear Register

This register is a write-only register that clears the scan end flag (ADCAnSGSTR.SEFx). The read value is always 0.

Access:	ADCAnSGSEFCRx register is a write-only register that can be written in 32-bit units. ADCAnSGSEFCRxL register is a write-only register that can be written in 16-bit units. ADCAnSGSEFCRxLL register is a write-only register that can be written in 8-bit units.
Address:	ADCAnSGSEFCRx: <ADCAn_base> + x × 40_H + 418_H ADCAnSGSEFCRxL: <ADCAn_base> + x × 40_H + 418_H ADCAnSGSEFCRxLL: <ADCAn_base> + x × 40_H + 418_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 38.74 ADCAnSGSEFCRx Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SEFC	Scan End Flag Clear Trigger 0: No effect. 1: Clears the target SG scan end flag (ADCAnSGSTR.SEFx).

38.3.3.10 ADCAnSGSTR — Scan Group Status Register

This register indicates the state of T&H, SVSTOP, scan group x, and PWM-Diag scan group. The SHACT and SGACT bits are cleared when HALT is executed.

Access:	ADCAnSGSTR register is a read-only register that can be read in 32-bit units. ADCAnSGSTRL register is a read-only register that can be read in 16-bit units.
Address:	ADCAnSGSTR: <ADCAn_base> + 308_H ADCAnSGSTRL: <ADCAn_base> + 308_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	SHACT	SGACT[5:1]					—	—	—	—	SEF[4:1]				—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.75 ADCAnSGSTR Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	When read, the value after reset is returned.
14	SHACT	T&H Status Flag 0: T&H is stopped. 1: T&H conversion or sampling is in progress.
13	SGACT[5]	SVSTOP Status Flag 0: SVSTOP is canceled. 1: SVSTOP is accepted.
12	SGACT[4]	PWM-Diag Scan Group (SG4) Status Flag 0: A/D conversion for PWM-Diag (SG4) is completed. 1: A/D conversion for PWM-Diag (SG4) is in processing or suspension.
11	SGACT[3]	Scan Group 3 (SG3) Status Flag 0: A/D conversion for SG3 is completed. 1: A/D conversion for SG3 is in processing or suspension.
10	SGACT[2]	Scan Group 2 (SG2) Status Flag 0: A/D conversion for SG2 is completed. 1: A/D conversion for SG2 is in processing or suspension.
9	SGACT[1]	Scan Group 1 (SG1) Status Flag 0: A/D conversion for SG1 is completed. 1: A/D conversion for SG1 is in processing or suspension.
8 to 5	Reserved	When read, the value after reset is returned.
4	SEF[4]	PWM-Diag Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: ● ADCAnPWDTSNDR for PWM-Diag is read. ● ADCAnPWDDIR for PWM-Diag is read. ● ADCAnPWDSGSEFCR.PWDSEFC is written as 1. 1: The A/D conversion result is written to ADCAnPWDTSNDR for PWM-Diag.

Table 38.75 ADCAnSGSTR Register Contents

Bit Position	Bit Name	Function
3	SEF[3]	SG3 Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: ● ADCAnDRj for the virtual channel which ADCAnSGVCEP3 indicates is read. ● ADCAnDIRj for the virtual channel which ADCAnSGVCEP3 indicates is read. ● ADCAnSGSEFCRx.SEFC is written as 1. 1: The A/D conversion result is written to ADCAnDRj for the virtual channel which ADCAnSGVCEP3 indicates.
2	SEF[2]	SG2 Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: ● ADCAnDRj for the virtual channel which ADCAnSGVCEP2 indicates is read. ● ADCAnDIRj for the virtual channel which ADCAnSGVCEP2 indicates is read. ● ADCAnSGSEFCRx.SEFC is written as 1. 1: The A/D conversion result is written to ADCAnDRj for the virtual channel which ADCAnSGVCEP2 indicates.
1	SEF[1]	SG1 Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: ● ADCAnDRj for the virtual channel which ADCAnSGVCEP1 indicates is read. ● ADCAnDIRj for the virtual channel which ADCAnSGVCEP1 indicates is read. ● ADCAnSGSEFCRx.SEFC is written as 1. 1: The A/D conversion result is written to ADCAnDRj for the virtual channel which ADCAnSGVCEP1 indicates.
0	Reserved	When read, the value after reset is returned.

38.3.3.11 ADCAnSGSTPCRx — Scan Group x Stop Control Register

This is a control register to stop scan group x. The read value is always 0.

Access: ADCAnSGSTPCRx register is a write-only register that can be written in 32-bit units.
ADCAnSGSTPCRxL register is a write-only register that can be written in 16-bit units.
ADCAnSGSTPCRxLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnSGSTPCRx: <ADCAn_base> + x × 40_H + 404_H
ADCAnSGSTPCRxL: <ADCAn_base> + x × 40_H + 404_H
ADCAnSGSTPCRxLL: <ADCAn_base> + x × 40_H + 404_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SGSTP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 38.76 ADCAnSGSTPCRx Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SGSTP	Scan Group x Stop Trigger Writing 1 to SGSTP while ADCAnSGSTR.SGACT[3:1] = 1 stops the target SGx.

38.3.4 Hardware Trigger Specific Register

38.3.4.1 ADCAnSGTSELx — Scan Group x Start Trigger Control Register

This register is used to select the A/D conversion trigger (hardware trigger) for SGx.

Access:	ADCAnSGTSELx register can be read or written in 32-bit units. ADCAnSGTSELxL register can be read or written in 16-bit units.
Address:	ADCAnSGTSELx: <ADCAn_base> + x × 40_H + $41C_H$ ADCAnSGTSELxL: <ADCAn_base> + x × 40_H + $41C_H$
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

		T3SEL1	INTTAUJ1I3	TAUJ1
		T3SEL2	INTTAUB0I7	TAUB0
		T3SEL3	INTTAUB0I15	TAUB0
		T3SEL4	INTTAUJ3I3	TAUJ3

CAUTIONS

1. When enabling the LPS trigger factor (SEQADTRG), select and enable only one of ADCA0SGTSEL1.T1SEL4, ADCA0SGTSEL2.T2SEL4, and ADCA0SGTSEL3.T3SEL4.
2. To prevent malfunction, ADCAnSGTSELx should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

38.3.5 Self-Diagnosis Specific Registers

38.3.5.1 ADCAnDGCTL0 — Self-Diagnosis Control Register 0

This register controls the self-diagnostic voltage level.

Access:	ADCAnDGCTL0 register can be read or written in 32-bit units. ADCAnDGCTL0L register can be read or written in 16-bit units. ADCAnDGCTL0LL register can be read or written in 8-bit units.
Address:	ADCAnDGCTL0: <ADCAn_base> + 350_{H} ADCAnDGCTL0L: <ADCAn_base> + 350_{H} ADCAnDGCTL0LL: <ADCAn_base> + 350_{H}
Value after reset:	$0000\ 0000_{H}$

Table 38.79 ADCAnDGCTL0 Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	PSEL[2:0]	Self-Diagnostic Voltage Level Select

ADCAnDGCTL0			Output Signal			
PSEL2	PSEL1	PSEL0	ADDIAGOUT	DIAGOUT2	DIAGOUT1	DIAGOUT0
0	0	0	Hi-z	Hi-z	Hi-z	Hi-z
0	0	1	AnVSS	2/3AnV$_{REF}$	1/2AnV$_{REF}$	1/3AnV$_{REF}$
0	1	0	1/3AnV$_{REF}$	1/3AnV$_{REF}$	2/3AnV$_{REF}$	1/2AnV$_{REF}$
0	1	1	1/2AnV$_{REF}$	1/2AnV$_{REF}$	1/3AnV$_{REF}$	2/3AnV$_{REF}$
1	0	0	2/3AnV$_{REF}$	Hi-z	Hi-z	Hi-z
1	0	1	AnV$_{REF}$	1/3AnV$_{REF}$	1/3AnV$_{REF}$	1/3AnV$_{REF}$
1	1	0	AnV$_{REF}$	1/2AnV$_{REF}$	1/2AnV$_{REF}$	1/2AnV$_{REF}$
1	1	1	AnV$_{REF}$	2/3AnV$_{REF}$	2/3AnV$_{REF}$	2/3AnV$_{REF}$

NOTE

The value of the ADCAnDGCTL0.PSEL[2:0] bits are updated after the following condition occurs.

- ADCAnADCR.DGON = 1
- Sampling completion

38.3.5.2 ADCAnDGCTL1 — Self-Diagnosis Control Register 1

This register controls the self-diagnostic channel.

Access: ADCAnDGCTL1 register can be read or written in 32-bit units.
ADCAnDGCTL1L register can be read or written in 16-bit units.

Address: ADCAnDGCTL1: <ADCAn_base> + 354_H
ADCAnDGCTL1L: <ADCAn_base> + 354_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 38.80 ADCAnDGCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15, 12, 9, 6, 3, 0	CDG [15, 12, 9, 6, 3, 0]	Self-Diagnostic Channel Select 0: ANInm is selected. 1: DIAGOUT0 is selected.
13, 10, 7, 4, 1	CDG [13, 10, 7, 4, 1]	Self-Diagnostic Channel Select 0: ANInm is selected. 1: DIAGOUT1 is selected.
14, 11, 8, 5, 2	CDG [14, 11, 8, 5, 2]	Self-Diagnostic Channel Select 0: ANInm is selected. 1: DIAGOUT2 is selected.

CAUTION

To prevent malfunction, ADCAnDGCTL1 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

38.3.5.3 ADCAnPDCTL1 — Pull Down Control Register 1

This register specifies the channel to which the pull down resistor is connected.

For details, see **Section 38.5.3, Diagnosis of Open Pins**.

Access:	ADCAnPDCTL1 register can be read or written in 32-bit units. ADCAnPDCTL1L register can be read or written in 16-bit units.
Address:	ADCAnPDCTL1: <ADCAn_base> + 358_H ADCAnPDCTL1L: <ADCAn_base> + 358_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. ADCAnPDCTL1.PDNA [15:0] corresponds to ANInI15 to ANInI0. For details, see **Table 38.28, ADCA0 Analog Input Signals (RH850/F1KH-D8)**, **Table 38.29, ADCA0 Analog Input Signals (RH850/F1KM-S4)**, **Table 38.30, ADCA0 Analog Input Signals (RH850/F1KM-S1)**, **Table 38.32, ADCA1 Analog Input Signals (RH850/F1KH-D8)**, and **Table 38.33, ADCA1 Analog Input Signals (RH850/F1KM-S4)**. When writing to the bits of unused ANIn signals, write the value after reset.

Table 38.81 ADCAnPDCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PDNA[15:0]	Pull Down Enable Control These bits set whether an on-chip pull-down resistor is to be connected to the corresponding physical channel (ANIn[00:15]). 0: An on-chip pull-down resistor is not connected. 1: An on-chip pull-down resistor is connected.

CAUTION

To prevent malfunction, ADCAnPDCTL1 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

For on-chip pull-down resistor values, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.

38.3.5.4 ADCAnPDCTL2 — Pull Down Control Register 2

This register specifies the channel to which the pull down resistor is connected.

For details, see **Section 38.5.3, Diagnosis of Open Pins**.

Access:	ADCAnPDCTL2 register can be read or written in 32-bit units. ADCAnPDCTL2H and ADCAnPDCTL2L registers can be read or written in 16-bit units. ADCAnPDCTL2HL, ADCAnPDCTL2LH, and ADCAnPDCTL2LL registers can be read or written in 8-bit units.
Address:	ADCAnPDCTL2: <ADCAn_base> + 35C$_H$ ADCAnPDCTL2L: <ADCAn_base> + 35C$_H$ ADCAnPDCTL2H: <ADCAn_base> + 35C$_H$ + 2$_H$ ADCAnPDCTL2HL: <ADCAn_base> + 35C$_H$ +2$_H$ ADCAnPDCTL2LL: <ADCAn_base> + 35C$_H$ ADCAnPDCTL2LH: <ADCAn_base> + 35C$_H$ + 1$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	PDNB[19:16]*1			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

	PDNB[15:0]*1															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. ADCAnPDCTL2.PDNB [19:0] corresponds to ANInI19S to ANInI0S. For details, see **Table 38.28, ADCA0 Analog Input Signals (RH850/F1KH-D8)**, **Table 38.29, ADCA0 Analog Input Signals (RH850/F1KM-S4)**, **Table 38.30, ADCA0 Analog Input Signals (RH850/F1KM-S1)**, **Table 38.32, ADCA1 Analog Input Signals (RH850/F1KH-D8)**, and **Table 38.33, ADCA1 Analog Input Signals (RH850/F1KM-S4)**. When writing to the bits of unused ANIn signals, write the value after reset.

Table 38.82 ADCAnPDCTL2 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 0	PDNB[19:0]	Pull Down Enable Control These bits set whether the on-chip pull-down resistor is to be connected with the corresponding physical channel (ANIn[16:35]). 0: The on-chip pull-down resistor is not connected. 1: The on-chip pull-down resistor is connected.

CAUTION

To prevent malfunction, ADCAnPDCTL2 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

For on-chip pull-down resistor values, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.

38.3.6 Emulation Specific Register

38.3.6.1 ADCAnEMU — Emulation Control Register

This register controls the SVSTOP disable signal.

Access: This register can be read or written in 8-bit units.

Address: <ADCAn_base> + 388_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	SVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 38.83 ADCAnEMU Register Contents

Bit Position	Bit Name	Function
7	SVSDIS	SVSTOP Disable 0: SVSTOP is enabled 1: SVSTOP is disabled For the A/D conversion when SVSTOP is enabled, see **Section 38.4.10.3, SVSTOP Operation**.
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

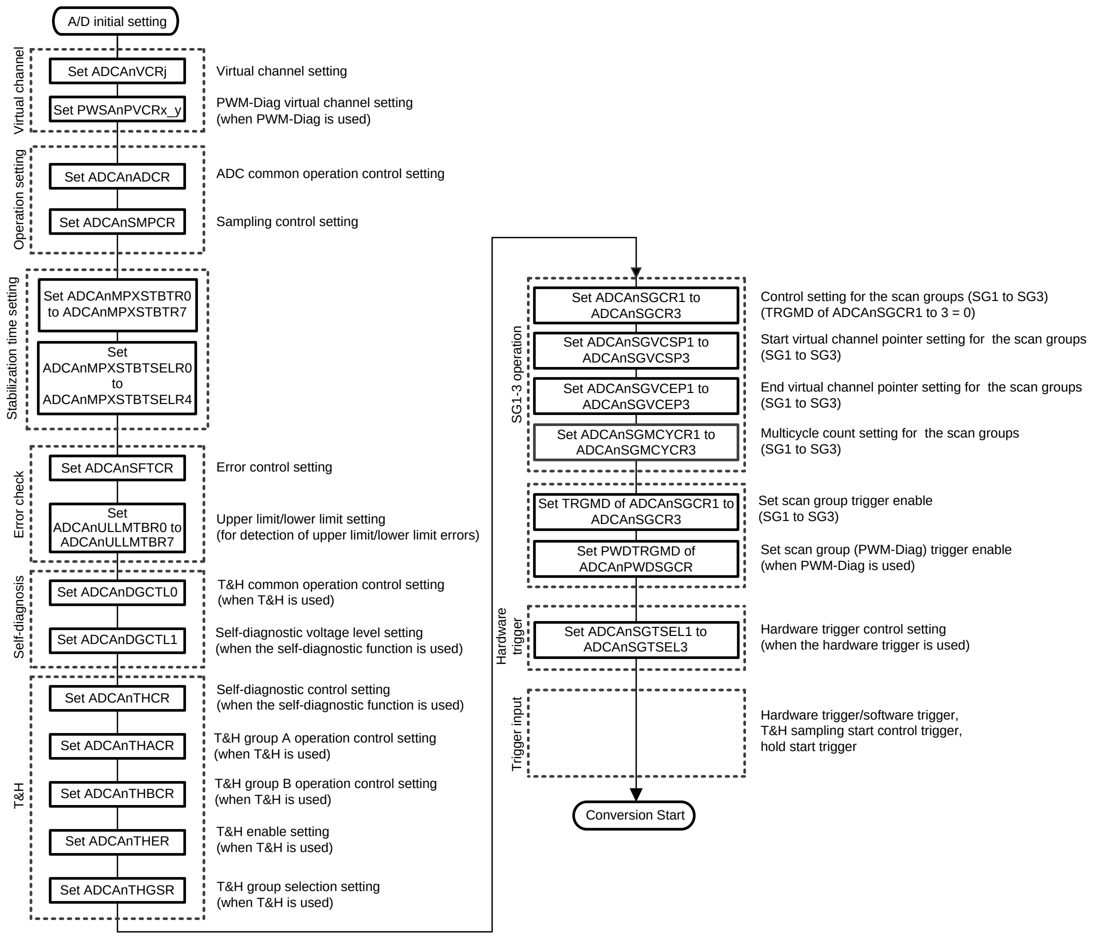
CAUTION

To prevent malfunction, SVSDIS should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

38.4 Operation

38.4.1 Initial Setting

Figure 38.6, Flowchart for Initial Setting shows an initial setting example of the A/D conversion. For trigger input, see **Figure 38.7, Flowchart for Trigger Input** in the next section. For interrupt request signals, see **Section 38.4.12, Scan End Interrupt Request**.



Note: Set these registers as necessary.

Figure 38.6 Flowchart for Initial Setting

38.4.2 Trigger Input

The following figure shows the flowchart for trigger input.

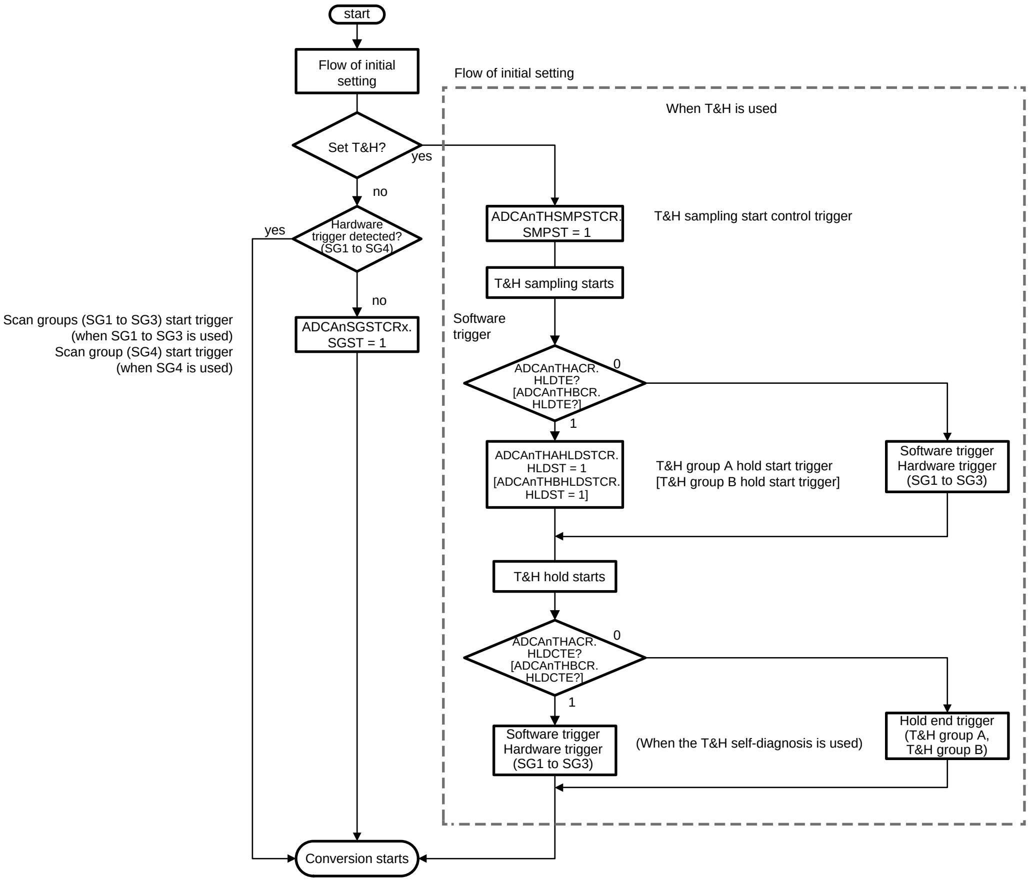


Figure 38.7 Flowchart for Trigger Input

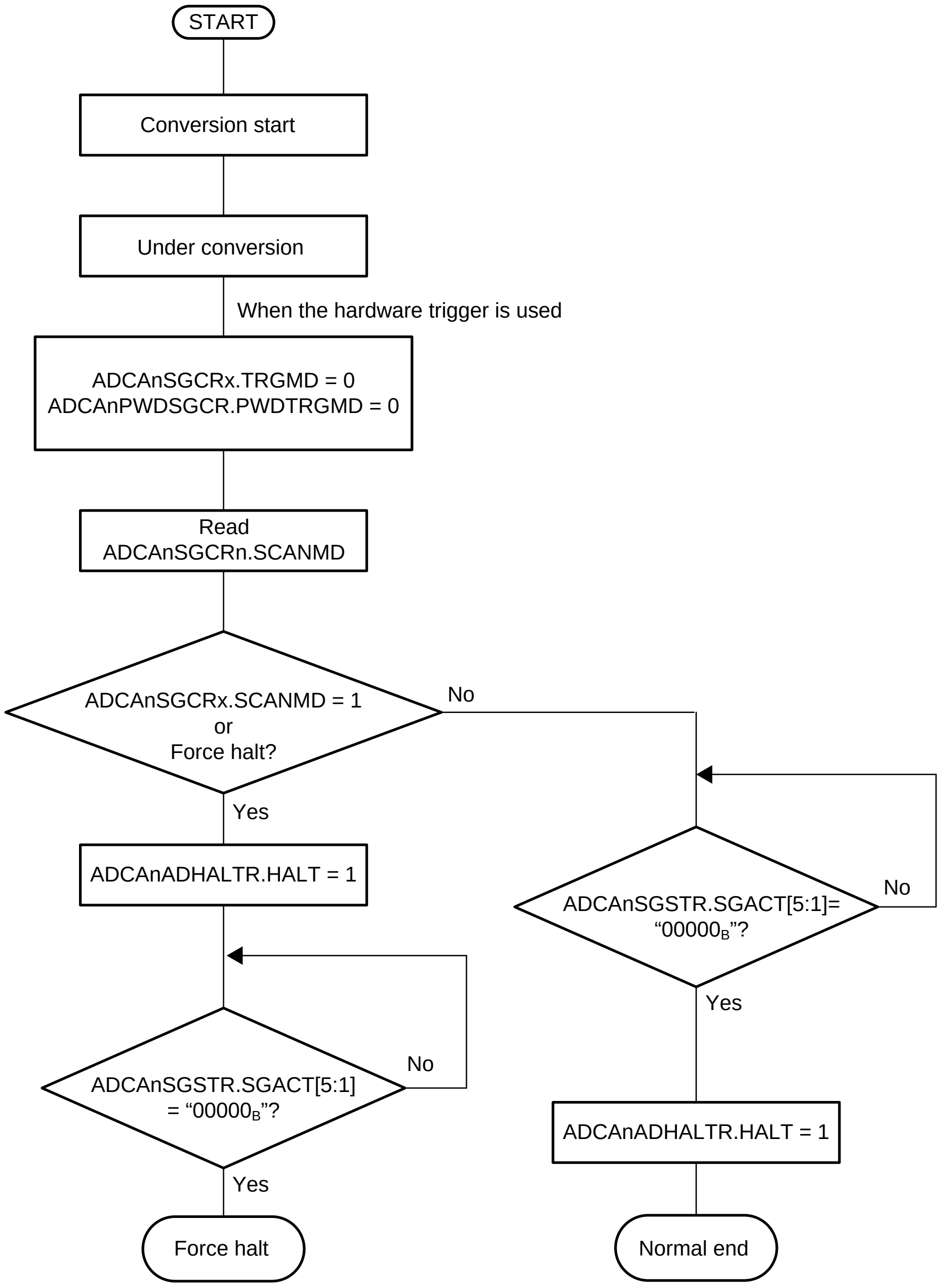
NOTE

When an SG start trigger is generated during scanning, the SG start trigger is ignored.

38.4.3 Ending/Stopping A/D Conversion

38.4.3.1 Ending by ADHALT

The flow for ending A/D conversion is shown below.



Note: The final setting of HALT when A/D conversion ends normally is done to clarify whether the status is "Conversion" or "IDLE". Whether HALT is set or not when A/D conversion ends normally does not affect the A/D conversion accuracy.

Figure 38.8 Flowchart for Ending A/D Conversion by ADHALT

38.4.3.2 Stopping by SGSTP (for Each Scan Group)

The flow for stopping A/D conversion for each scan group is shown below with SG1 as an example. Scan group which is selected in T&H group (Group A or Group B) has to be stopped after stopping of T&H (Group A or Group B).

Other scan group can be also controlled by its corresponding bit (ADCAnSGSTPCR2.SGSTP, ADCAnSGSTPCR3.SGSTP and ADCAnPWDSGSTPCR.PWDSGSTP). In case of SGSTP = 1 is set, it is necessary to confirm the clearing of corresponded scan group of SGACT.

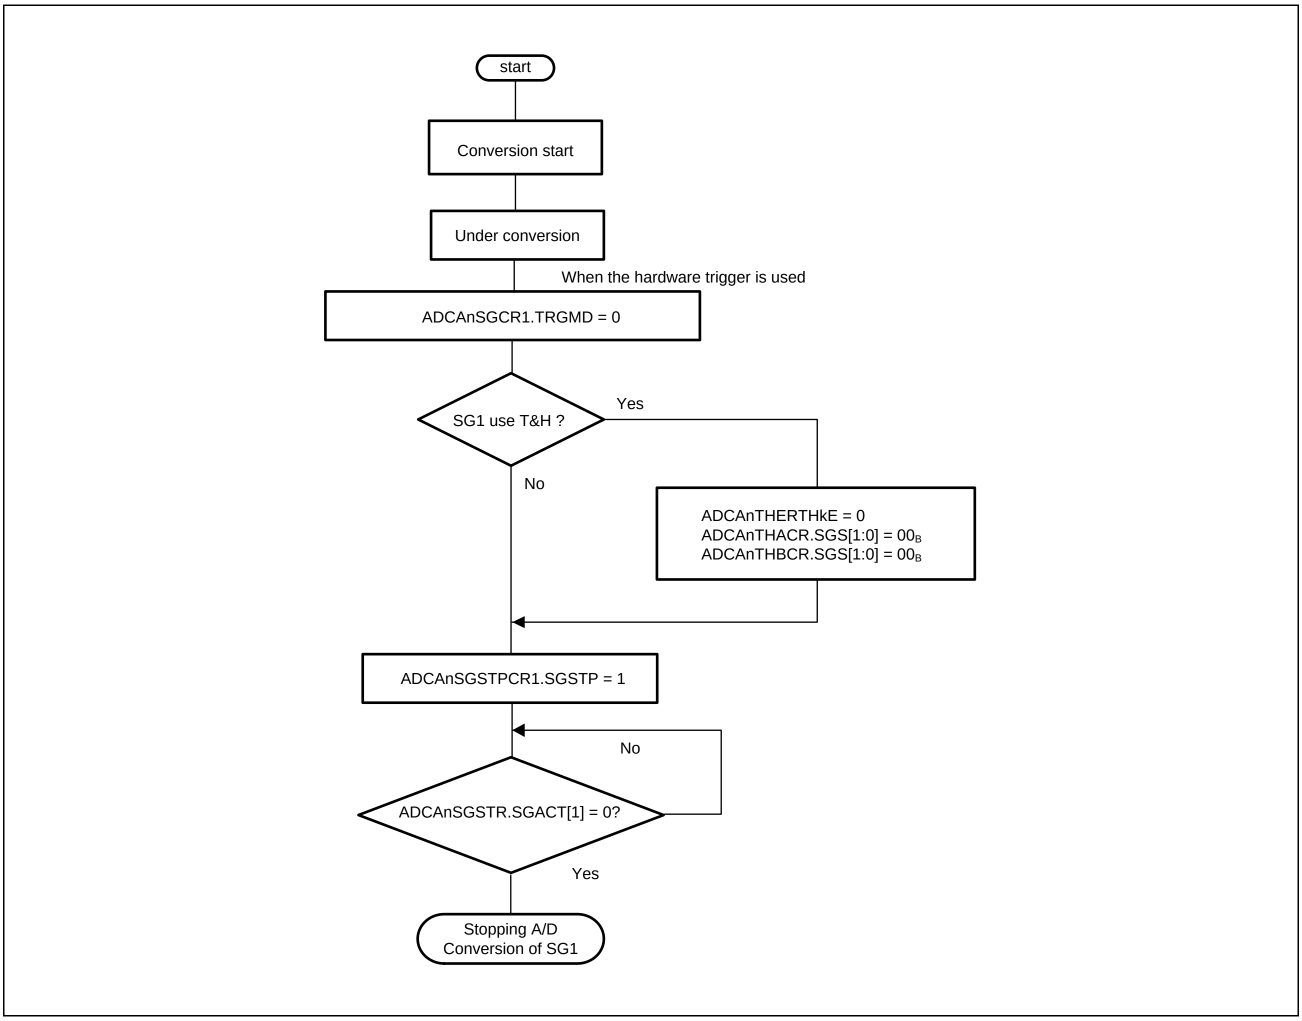


Figure 38.9 Flowchart for Stopping A/D Conversion for Each Scan Group (SG1)

CAUTION

In order to treat the A/D conversion results and re-set registers correctly after scan group stop setting, more than 14-bus clock (7-times of dummy read) has to be waited. In case of using the interrupt, this procedure is not necessary.

NOTE

When the scan group stop bit is set right before A/D conversion is completed, the corresponding scan group makes a transition to the IDLE state, but an A/D conversion end interrupt or scan end interrupt may be output. If it has any system inconvenience, disable the interrupt and then set the stop bit.

When the scan group stop bit (ADCAnSGSTPCRx.SGSTP, ADCAnPWDSGSTPCR.PWDSGST) is set, the corresponding scan group enters the IDLE state and SGACT is cleared to 0 after finishing of the virtual channel in progress. An example of the operation is shown below.

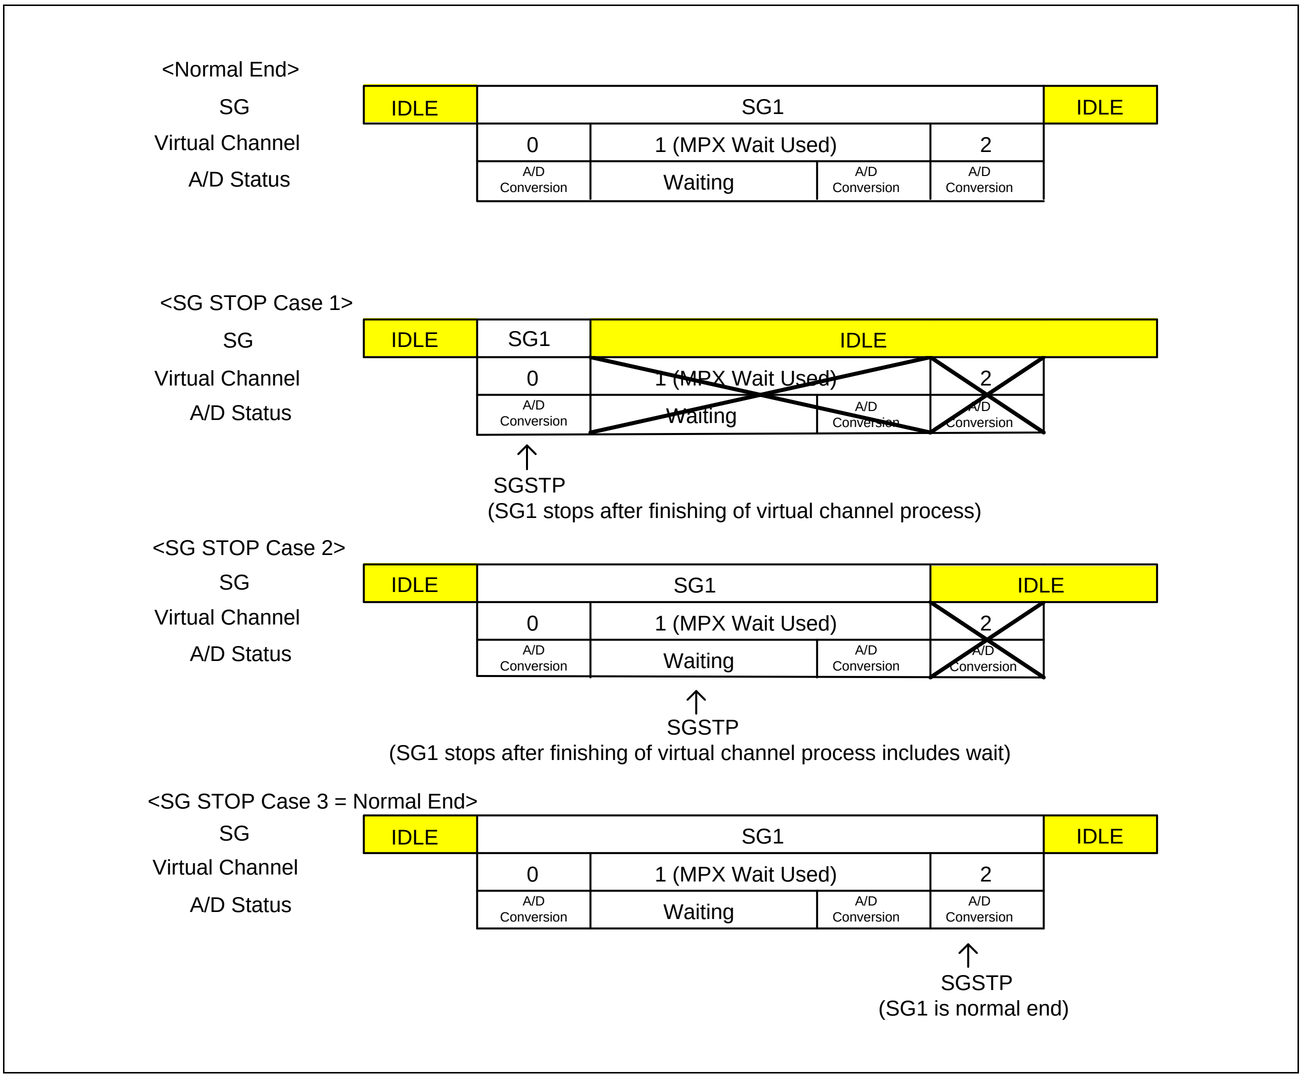

Figure 38.10 Example of Scan Group Stop Operation (SG1)

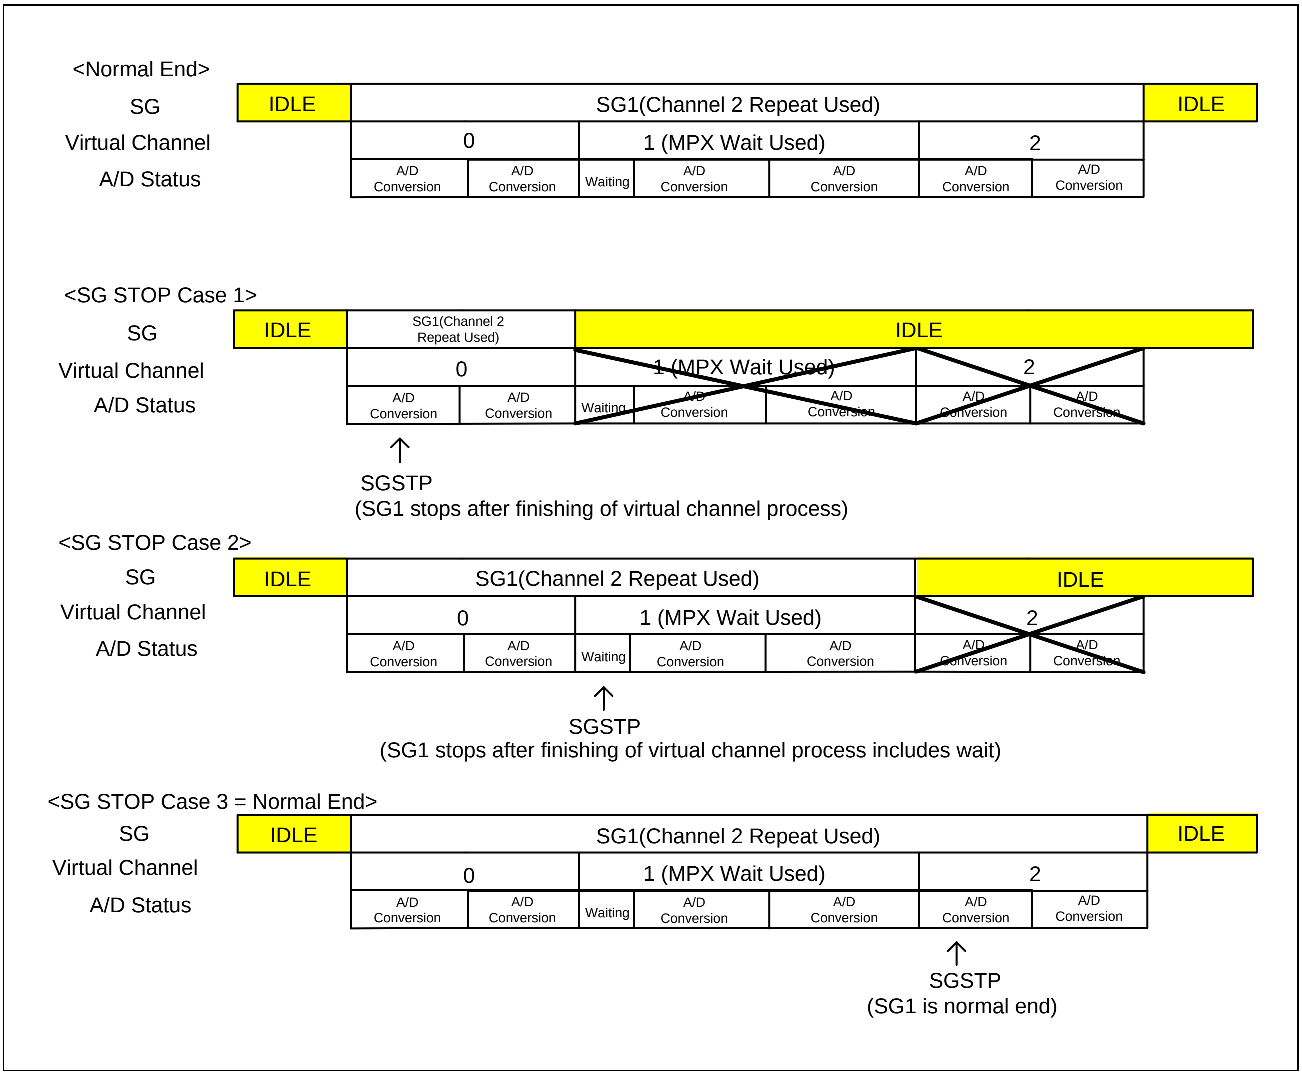

Figure 38.11 Example of Scan Group Stop Operation (SG1 channel repeat)

When the stop bit of the scan group that has been suspended due to synchronous/asynchronous suspend is set, the corresponding scan group enters the IDLE state and SGACT is cleared to 0 without resuming the processing.

When the scan group stop bit is set and asynchronous suspend occurs due to interruption by a scan group with a higher priority during processing by a virtual channel, the processing of the virtual channel is stopped as shown in **Figure 38.12, Example of Scan Group Stop Operation (Asynchronous suspend of SG1)**, the virtual channel enters the IDLE state and SGACT is cleared to 0.

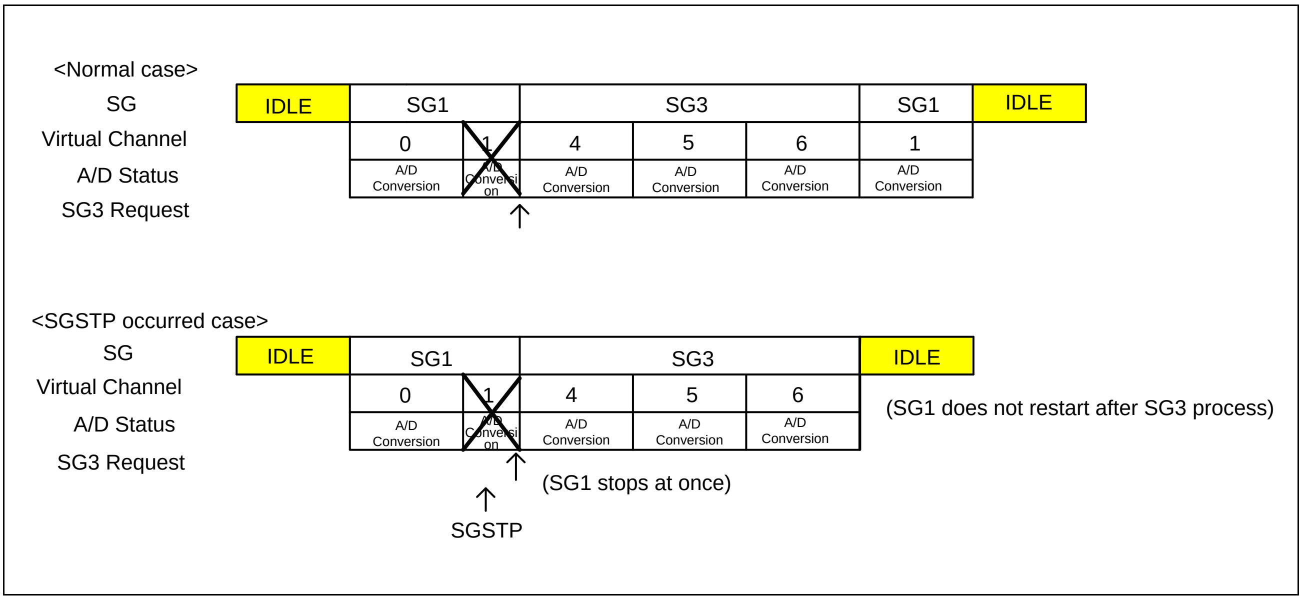

Figure 38.12 Example of Scan Group Stop Operation (Asynchronous suspend of SG1)

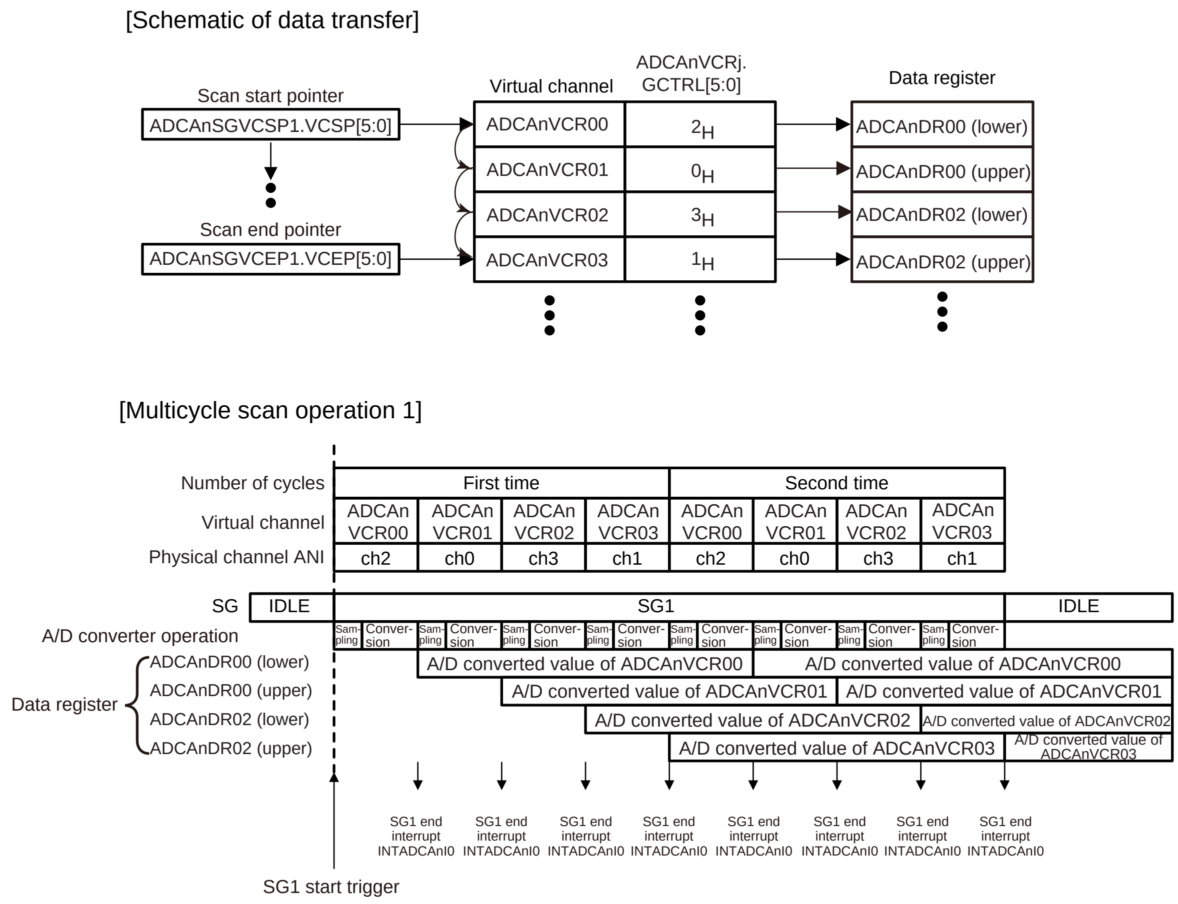
38.4.4 Example of Scan Group Operation

(1) Multicycle Scan Mode

The following figure illustrates an operation example where four virtual channels of scan group 1 are converted using the two-cycle scan in multicycle scan mode.

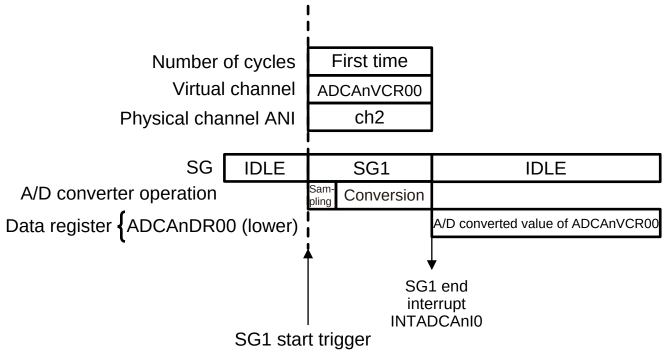


Conditions

Scan group 1: A/D conversion of virtual channels 0 to 3 using the two-cycle scan in multicycle scan mode

Figure 38.13 Example of Multicycle Scan Operation 1

The following figure illustrates an operation example where a pin is scanned once in multicycle scan mode.



Conditions

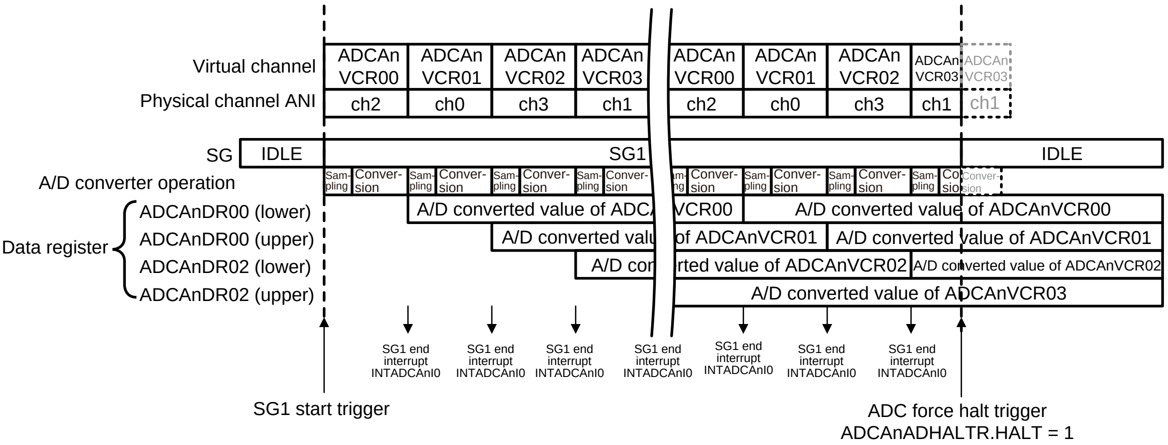
Scan group 1: A/D conversion of virtual channel 0 in which a pin is scanned once in multicycle scan mode

Figure 38.14 Example of Multicycle Scan Operation 2

(2) Continuous Scan Mode

Continuous scan mode allows A/D conversion of the SG channels indicated by the pointers specified by ADCAnSGVCSPx.VCSP[5:0] to ADCAnSGVCEPx.VCEP[5:0] to continue until ADCAnADHALTR.HALT or ADCAnSGSTPCRx.SGSTP is asserted. This mode can be used only with SG1.

The following figure shows an example of operation in continuous scan mode.



Conditions

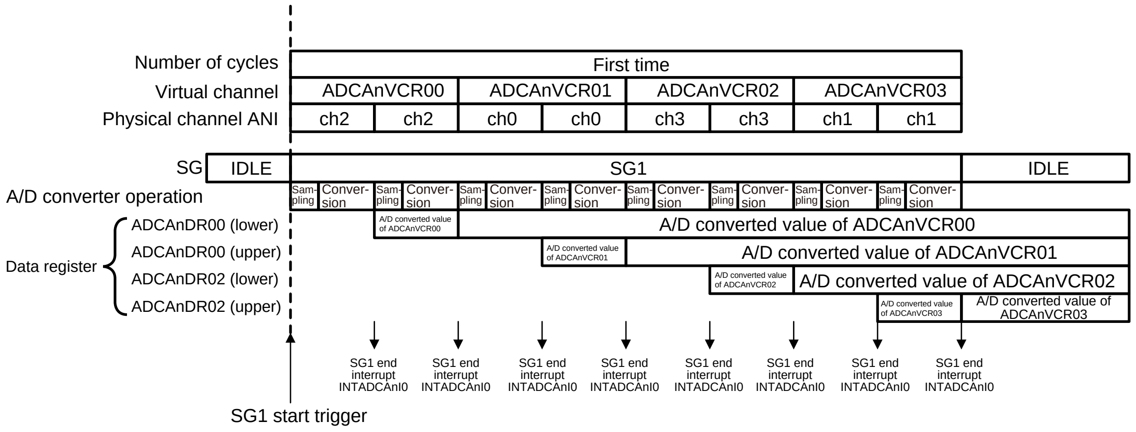
Scan group 1: A/D conversion of virtual channels 0 to 3 in continuous scan mode

Figure 38.15 Example of Continuous Scan Operation

38.4.5 Channel Repeat Mode

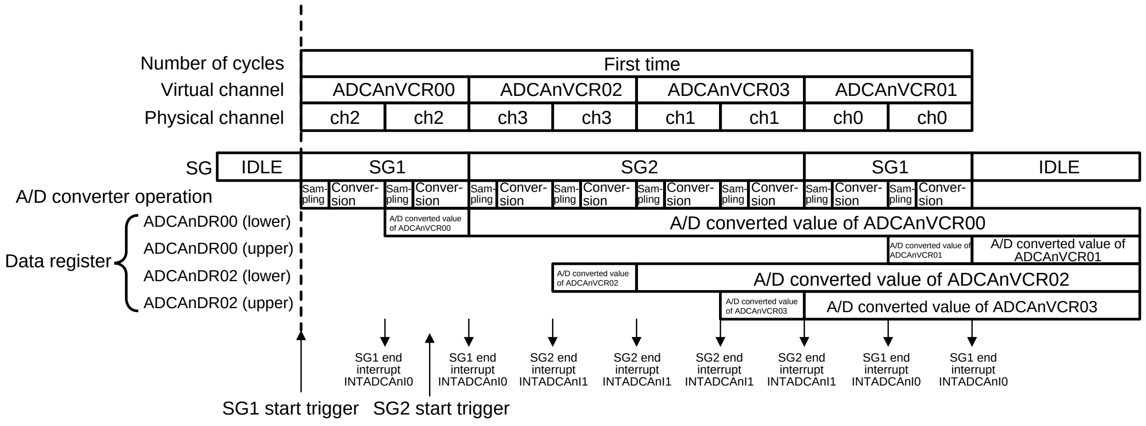
Channel repeat mode allows A/D conversion of the SG channel indicated by the pointer specified by ADCAnSGVCSPx.VCSP[5:0] to ADCAnSGVCEPx.VCEP[5:0] to repeat number of channel repeat times specified by ADCAnSGCRx.SCT[1:0]. This mode operates exclusively in each SG. The number of channel repeat times is selectable from 1, 2, and 4.

The following figures show examples of operation under respective conditions.



Conditions

Scan group 1: A/D conversion of virtual channels 0 to 3 in which the channels are repeated twice and a pin is scanned once in multicycle scan mode

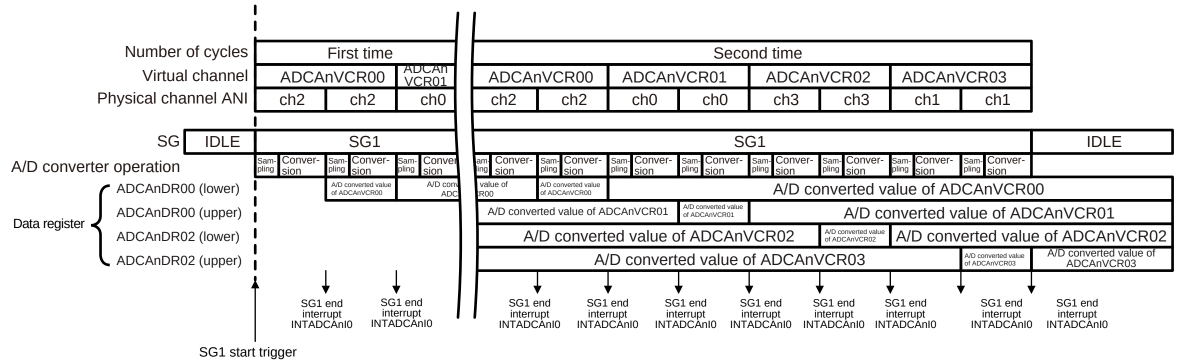


Conditions

Scan group 1: A/D conversion of virtual channels 0 and 1 in which the channels are repeated twice and a pin is scanned once in multicycle scan mode

Scan group 2: A/D conversion of virtual channels 2 and 3 in which the channels are repeated twice and a pin is scanned once in multicycle scan mode

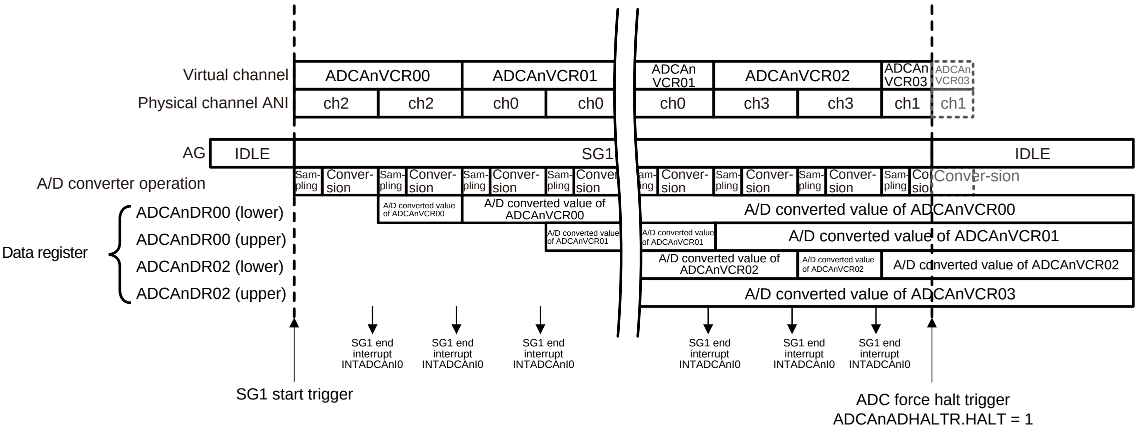
Figure 38.16 Example of Channel Repeat Operation 1



Conditions

Scan group 1: A/D conversion of virtual channels 0 to 3 in which the channels are repeated twice and the two-cycle scan is used in multicycle scan mode

Figure 38.17 Example of Channel Repeat Operation 2



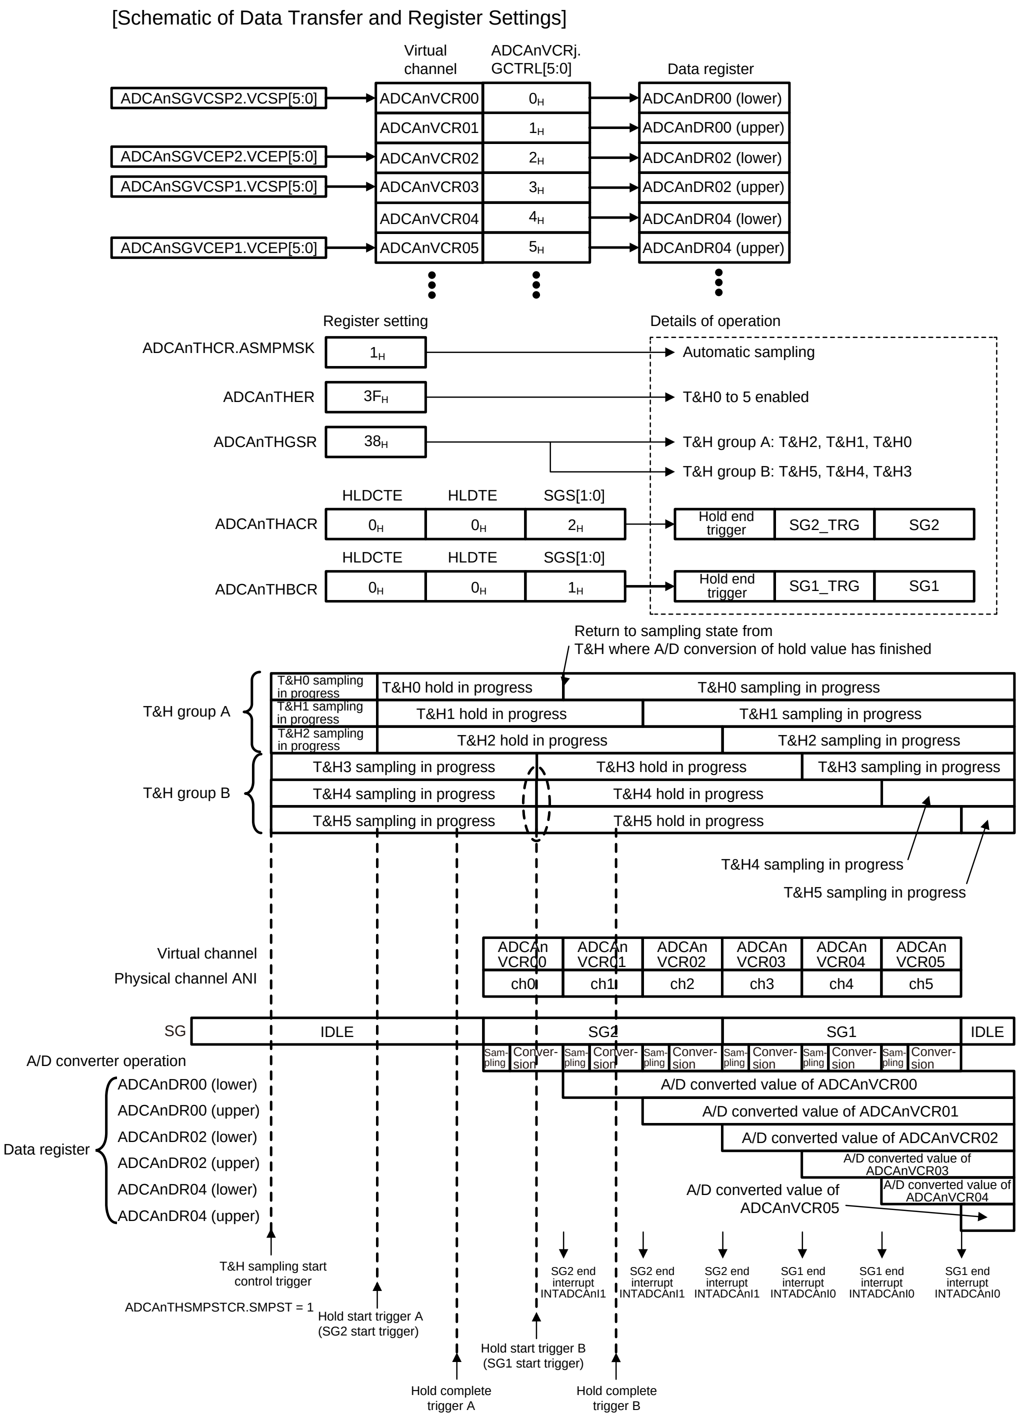
Conditions

Scan group 1: A/D conversion of virtual channels 0 to 3 in which the channels are repeated twice in continuous scan mode

Figure 38.18 Example of Channel Repeat Operation 3

38.4.6 Example of Simultaneous Track and Hold Operation

Figure 38.19, Example of Simultaneous Track & Hold Operation 1 shows an operation example of simultaneous track and hold.



Conditions

Scan group 1: A/D conversion of virtual channels 3 to 5 in which a pin is scanned once in multicycle scan mode

Scan group 2: A/D conversion of virtual channels 0 to 2 in which a pin is scanned once in multicycle scan mode

Figure 38.19 Example of Simultaneous Track & Hold Operation 1

CAUTION

- Do not specify the same physical channel in different groups.
- Two-cycle (or more) scan in multicycle scan mode and track & hold operation using continuous scan mode are prohibited.
- Because ADCAnTHSMPSTCR.SMPST is common to group A and group B, set SMPST after T&H operation for both group A and group B has been completed.
- If the hardware trigger is asserted before HLDCTE = 1 and HLDTE = 1 of ADCAnTHACR register or ADCAnTHBCR register are set and HLDST of ADCAnTHAHLDSTCR register or ADCAnTHBHLDSTCR register is written to hold T&H, scan operation starts. In that case, the channel switch opens with T&H staying in the sampling state. Therefore, all scan results are undefined. Do not assert the hardware trigger by setting HLDCTE = 1 and HLDTE = 1 before writing HLDST.
- Setting any channel from among 0 to 2 and any channel from among 3 to 5 in the same scan group is prohibited.
- Set the interval between T&H sampling start control trigger and hold start trigger to be 450 ns or more.
- Set the interval between hold start trigger and completion of the group A/D conversion to be 10 μs or less.
  In suspend mode, do not use T&H for the channel of a scan group with low priority setting, if suspend time exceeds 10 μs.

38.4.7 A/D Conversion with External Analog Multiplexer

The following figures show examples of A/D conversion in each case.

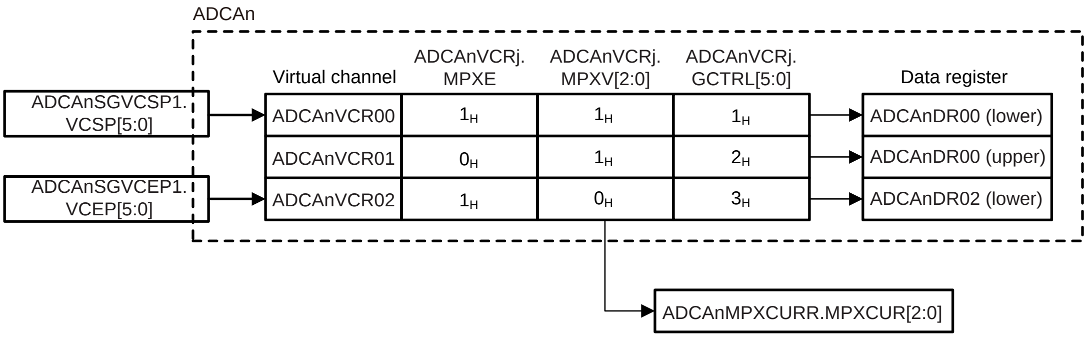


Figure 38.20 Schematic of Data Transfer and Register Settings

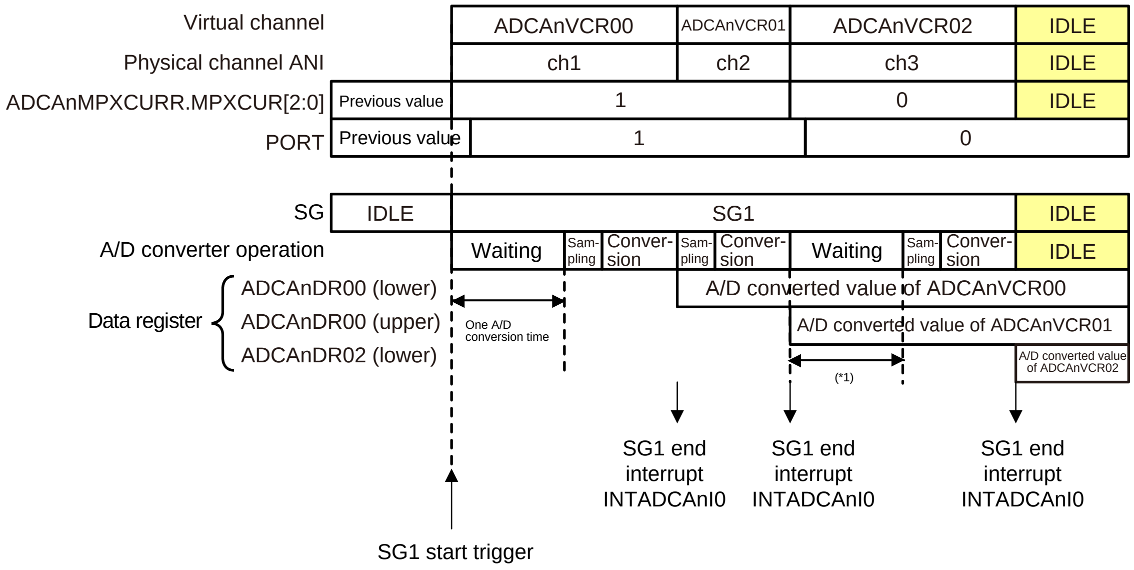


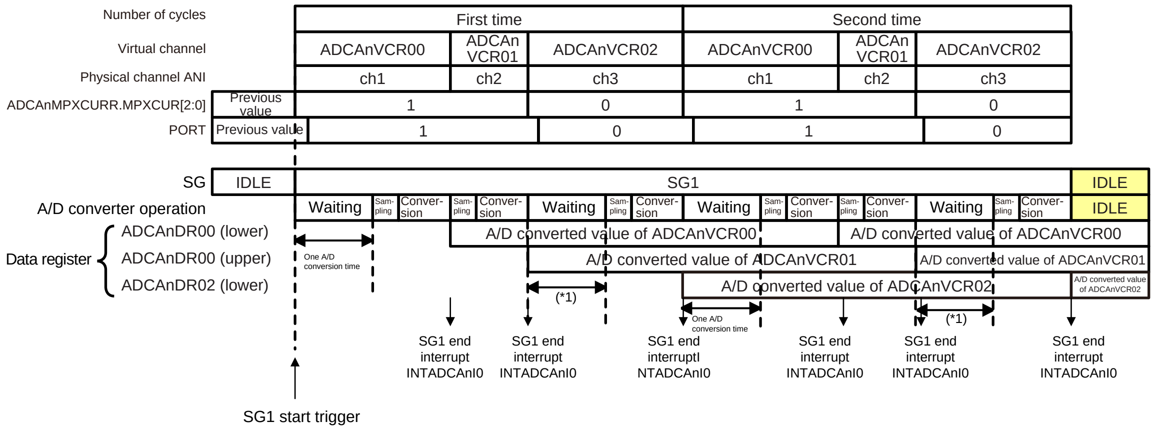
Conditions

Scan group 1: A/D conversion of virtual channels 0 to 2 in which a pin is scanned once in multicycle scan mode

Configurable stabilization time for MPX analog input is selected for physical channel ANI 3. (ADCAnMPXSTBTSELR.STBTCH03=7_H)

Note 1. Waiting time is depended on the setting of ADCAnMPXSTBTR7 register.

Figure 38.21 A/D Conversion 1 at an External Analog Multiplexer



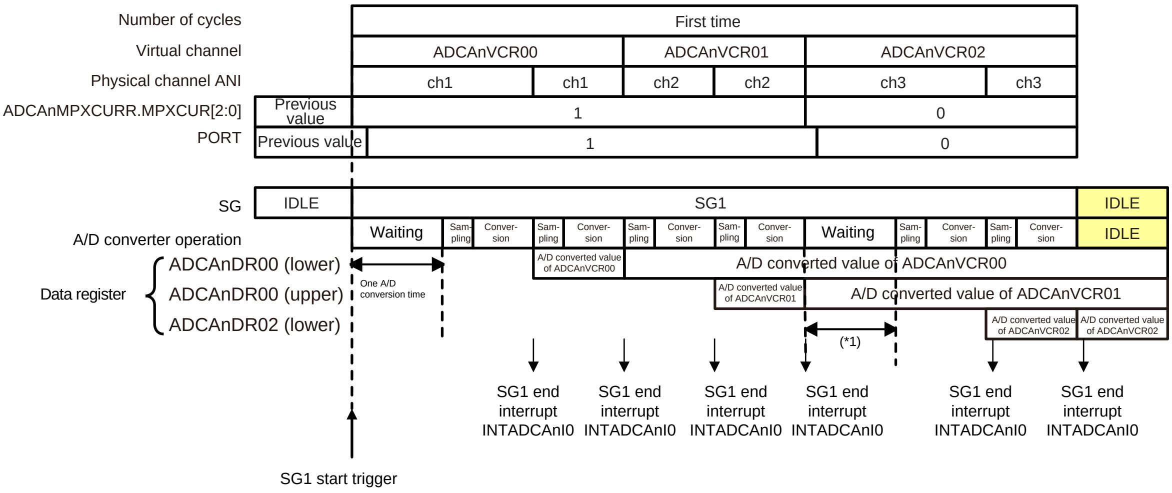
Conditions

Scan group 1: A/D conversion of virtual channels 0 to 2 using the two-cycle scan in multicycle scan mode

Configurable stabilization time for MPX analog input is selected for physical channel ANI 3. (ADCAnMPXSTBTSELR.STBTCH03=7_H)

Note 1. Waiting time is depended on the setting of ADCAnMPXSTBTR7 register.

Figure 38.22 A/D Conversion 2 at an External Analog Multiplexer



Conditions

Scan group 1: A/D conversion of virtual channels 0 to 2 in which the channels are repeated twice and a pin is scanned once in multicycle scan mode

Configurable stabilization time for MPX analog input is selected for physical channel ANI 3. (ADCAnMPXSTBTSELR.STBTCH03=7_H)

Note 1. Waiting time is depended on the setting of ADCAnMPXSTBTR7 register.

Figure 38.23 A/D Conversion 3 at an External Analog Multiplexer

38.4.7.1 A/D Conversion with PWM-Diag Enabled

With the PWM-Diag function enabled, A/D conversion is performed by the signal from the PWM-Diag.

For details on the PWM-Diag function, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.

To control the A/D conversion, the A/D converter receives the setting information on the MPX by the A/D conversion trigger select (PWSA) signal. The flow of A/D conversion with PWM-Diag is as follows.

(1) Set the channel MPX value of the MPX to ADCAnPWDVCR.MPXV[2:0]. Up to 8 channels can be specified to the MPX.

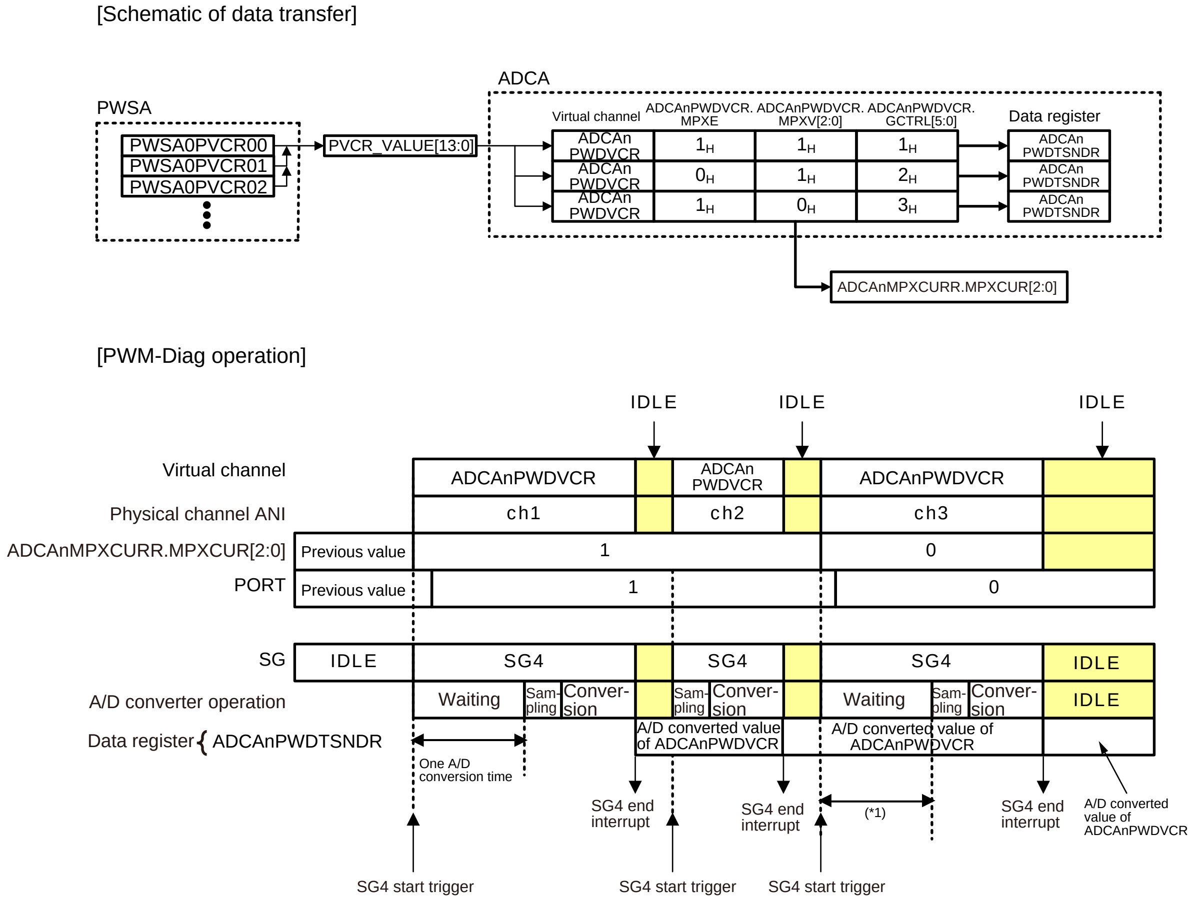
(2) The A/D conversion is started by the trigger signal PWSA_ADTRG from the PWM-Diag. In addition, when the MPX enable bit (ADCAnPWDVCR.MPXE) is 1, a wait of one A/D-conversion time or configured wait time which is set by ADCAnSTBTR0 to ADCAnSTBTR7 and ADCAnSTBTSELR0 to ADCAnSTBTSELR4 is inserted before A/D conversion is performed.

(3) At the end of A/D conversion, the scan end is notified to the PWM-Diag.

CAUTION

As the trigger signal PWSA_ADTRG of PWM-Diag function has a higher-priority than SGx_TRG (x = 1 to 3), the operation of other scan groups may be kept waiting until the PWM-Diag function is ended.

Figure 38.24, PWM-Diag Operation shows an example of PWM-Diag operation using an MPX.



Configurable stabilization time for MPX analog input is selected for physical channel ANI 3. (ADCAnMPXSTBTSELR.STBTCH03 = 7_H)

Note 1. Waiting time is depended on the setting of ADCAnMPXSTBTR7 register.

Figure 38.24 PWM-Diag Operation

38.4.8 Example of Synchronous Suspend and Resume Operation

Figure 38.25, Example of Synchronous Suspend and Resume Operation shows an example of synchronous suspend and resume operation. In this example, a higher-priority SG interrupts a lower-priority SG.

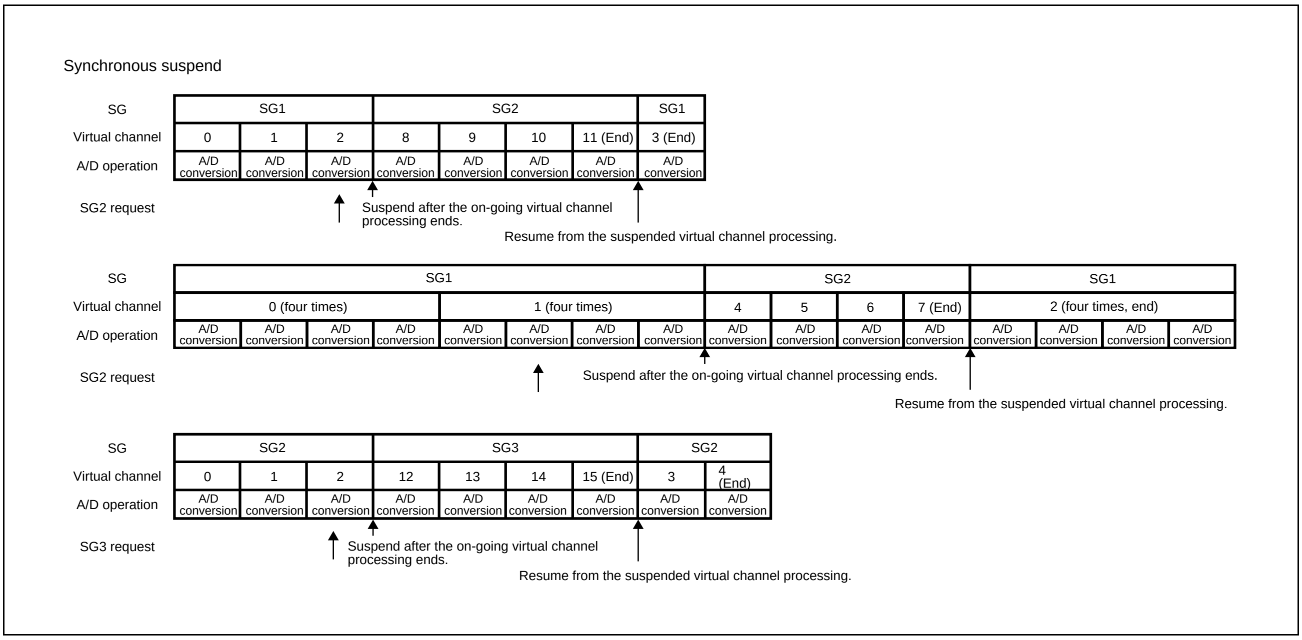


Figure 38.25 Example of Synchronous Suspend and Resume Operation

NOTE

Priority of scan groups is as follows.

Lower Higher

SG1 < SG2 < SG3 < PWM-Diag (SG4)

38.4.9 Example of Asynchronous Suspend and Resume Operation

Figure 38.26, Example of Asynchronous Suspend and Resume Operation shows an example of asynchronous suspend and resume operation. In this example, a higher-priority SG interrupts a lower-priority SG.

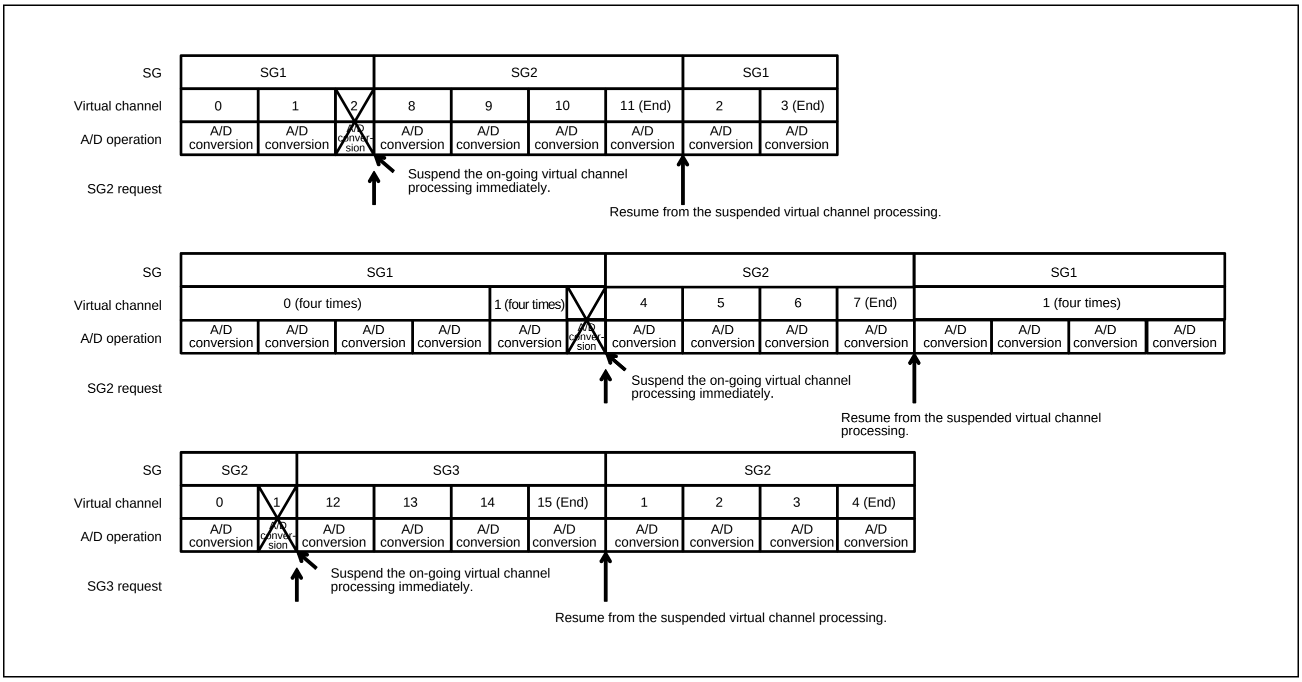

Figure 38.26 Example of Asynchronous Suspend and Resume Operation

NOTE

Priority of scan groups is as follows.

Lower Higher

SG1 < SG2 < SG3 < PWM-Diag (SG4)

38.4.10 Error Detecting Functions

ADCAn covers upper-limit error, lower-limit error, and overwrite error.

38.4.10.1 Upper-Limit/Lower-Limit Error Detecting Function

The upper-limit/lower-limit error detecting function determines whether the A/D converted data is larger than the upper-limit table ADCAnULLMTBR0.ULMTB[11:0] to ADCAnULLMTBR7. ULMTB[11:0] or smaller than the lower-limit table ADCAnULLMTBR0.LLMTB[11:0] to ADCAnULLMTBR7.LLMTB[11:0] at the end of A/D conversion.

38.4.10.2 Overwrite Error Detecting Function

If the ADCAnDIRj register or ADCAnDRj register of a virtual channel is not read while ADCAnDIRj.WFLG = 1 (A/D converted value is stored) and the next A/D converted value is written in the ADCAnDRj register, an overwrite error is detected.

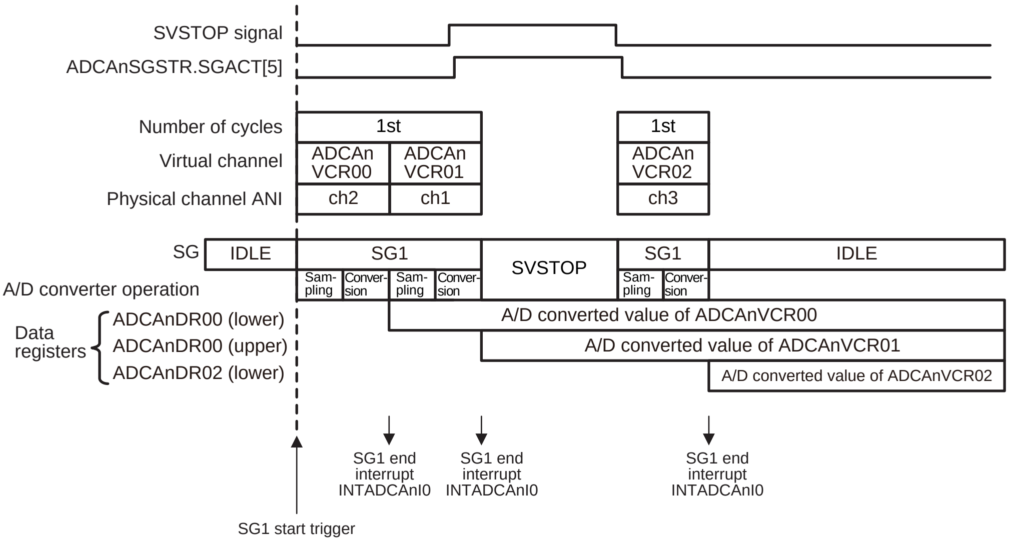
38.4.10.3 SVSTOP Operation

The SVSTOP function is supported by the SVSTOP signal sent from the on-chip debugger control unit. The SVSTOP function stops conversion of the A/D converter when the SVSTOP signal is input during an emulation break. While the SVSTOP signal is high, reading registers ADCAnDRj, ADCAnDIRj, ADCAnSGSTR, ADCAnULER, ADCAnOWER, ADCAnPWDTSNDR, ADCAnPWDDIR, ADCAnULEVCFR0, and ADCAnULEVCFR1 by the external access does not affect these registers.

When the high level is input to SVSTOP while ADCAnEMU.SVSDIS = 0, ADCAnSGSTR.SGACT[5] is set to 1 to make a transition to the SVSTOP state. Hardware triggers and software triggers are valid in the SVSTOP state. When the high level is input to SVSTOP while ADCAnEMU.SVSDIS = 1, the ADCA does not make a transition to the SVSTOP state. ADHALT (forced termination of A/D conversion) and scan group stop by ADCAnSGSTPCRx should not be performed in the SVSTOP state.

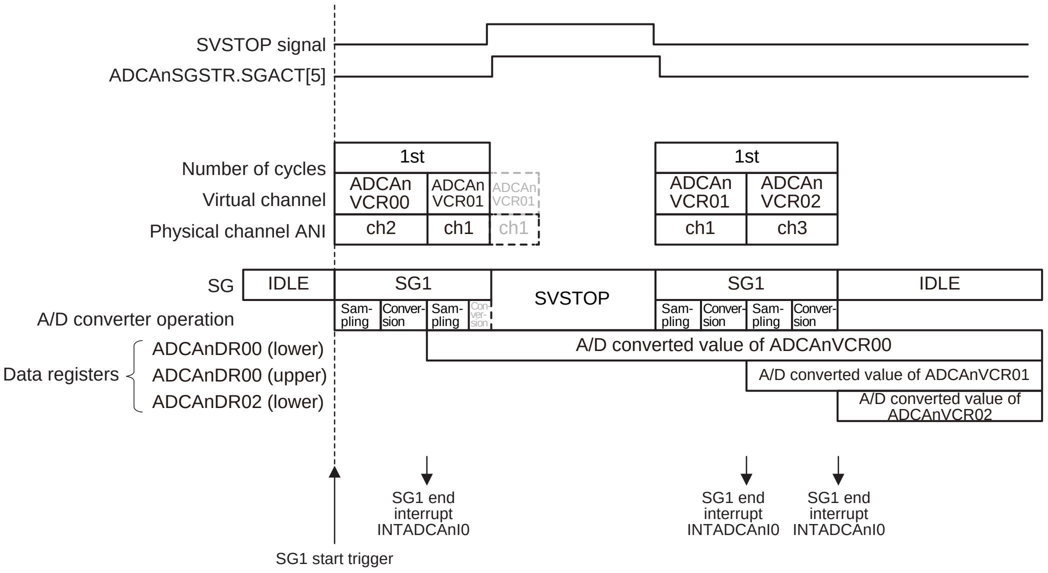
In operations for synchronous suspension, a new start trigger cannot be accepted over the time from when the high level is input to SVSTOP to the completion of conversion on the channel where conversion is currently proceeding. This time can be up to the time taken for one A/D conversion.

The following example illustrates a SVSTOP operation example.



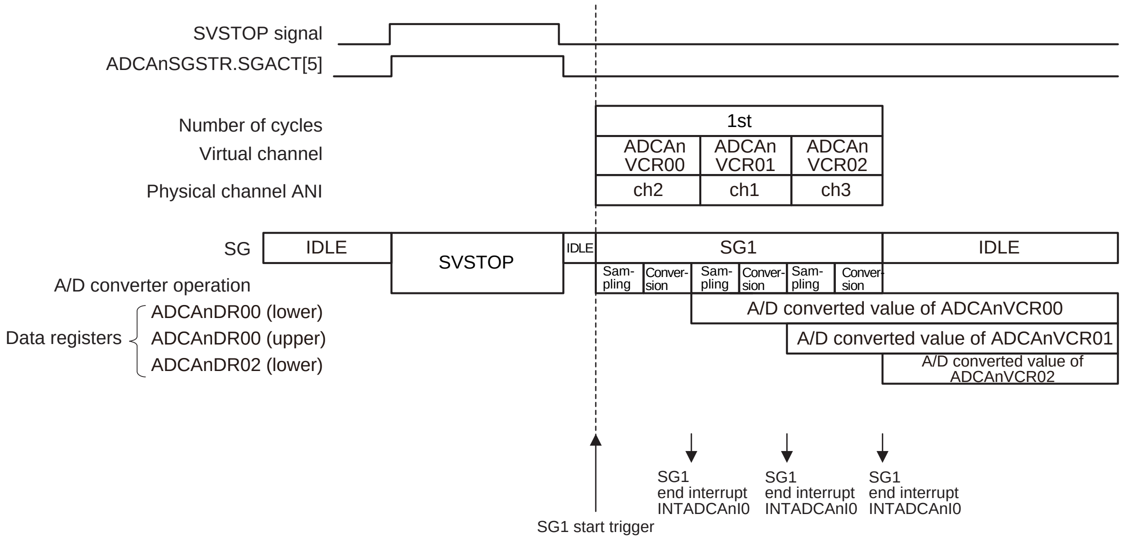
Note: An SG start trigger is accepted even during SVSTOP after the completion of conversion.

Figure 38.27 Example of SVSTOP Operation (ADCAnADCR.SUSMTD = 00 and ADCAnEMU.SVSDIS = 0)



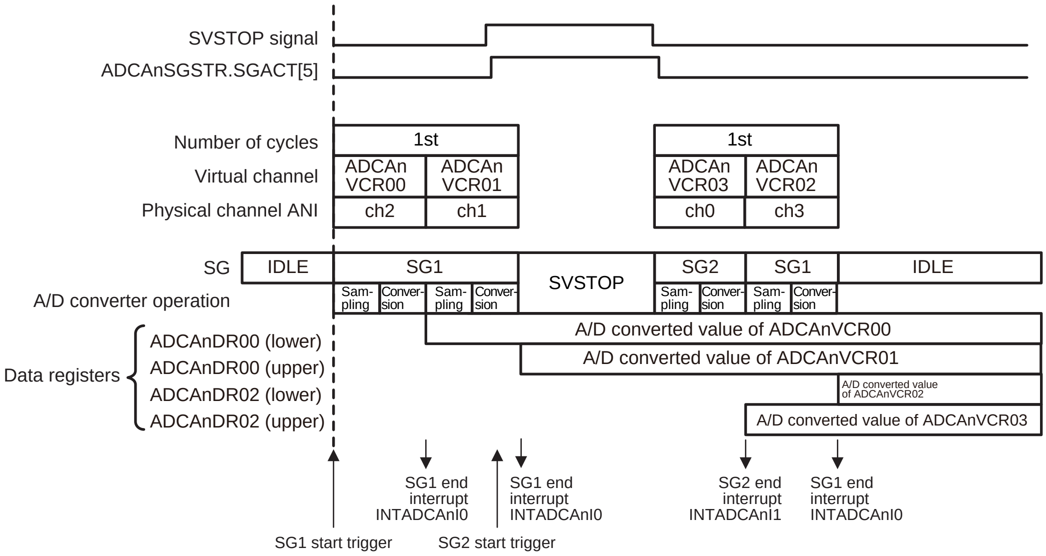
Note: An SG start trigger is accepted even during SVSTOP.

Figure 38.28 Example of SVSTOP Operation (ADCAnADCR.SUSMTD = 10 and ADCAnEMU.SVSDIS = 0)



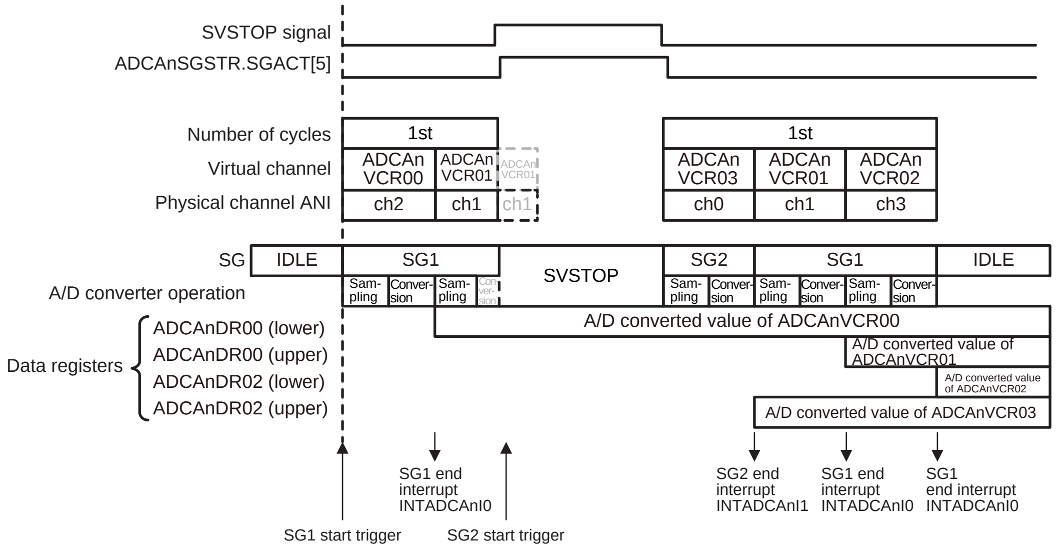
Note: An SG start trigger is accepted even during SVSTOP.

Figure 38.29 Example of SVSTOP Operation in the IDLE State (ADCAnADCR.SUSMTD = 00 and ADCAnEMU.SVSDIS = 0)



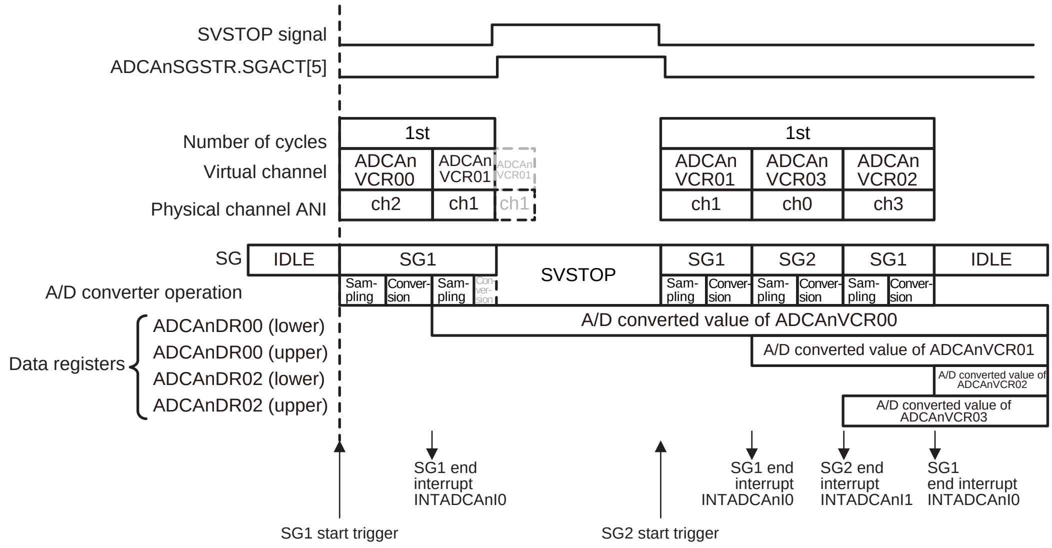
Note: After the completion of conversion, the SG start trigger is accepted even during SVSTOP.

Figure 38.30 Conflict of SVSTOP Start and High-Priority SG Start Trigger (ADCAnADCR.SUSMTD = 00, ADCAnEMU.SVSDIS = 0)



Note: An SG start trigger is accepted even during SVSTOP.

Figure 38.31 Conflict of SVSTOP Start and High-Priority SG Start Trigger (ADCAnADCR.SUSMTD = 10, ADCAnEMU.SVSDIS = 0)



Note: An SG start trigger is accepted even during SVSTOP.
In cases of conflict between clearing of SVSTOP and setting of the scan group start trigger bit, conversion of the suspended scan group is resumed regardless of its priority.

Figure 38.32 Conflict of SVSTOP Clear and High-Priority SG Start Trigger (ADCAnADCR.SUSMTD = 10, ADCAnEMU.SVSDIS = 0)

38.4.11 Activating Scan Group by a Hardware Trigger

Scan group x can be activated by the hardware trigger input to SGx_TRG. As for the hardware trigger sources to be used, see **Table 38.78, List of A/D Conversion Hardware Triggers**. When activating SGx_TRG by the hardware trigger, set the peripheral function to be used by the trigger and set the start trigger in the A/D conversion trigger select control register (ADCAnSGTSELx).
A hardware trigger from external trigger input pin requires digital filter setting. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**, **Section 2B.12, Noise Filter & Edge/Level Detector** and **Section 2C.12, Noise Filter & Edge/Level Detector**. More than one start trigger can be specified.

38.4.11.1 Stopping Scan Group by ADHALT

Setting ADCAnADHALTR.HALT (A/D force halt trigger) to 1 forcibly halts the A/D conversion and clears the scan group status register (ADCAnSGSTR). The error flag of ADCAnULER, ADCAnULEVCFR0, and ADCAnULEVCFR1 (upper limit/lower limit error register) is not cleared. When ADCAnADHALTR.HALT is set, make sure that ADCAnSGSTR.SGACT has been cleared.

38.4.12 Scan End Interrupt Request

Scan group x can issue a scan end interrupt request (INT_SGx) to INTC. If ADIE of ADCAnSGCRx is set to 1, INT_SGx can be output after the SGx scan ends. If ADIE of ADCAnSGCRx is set to 0, the INT_SGx output when the SGx scan ends can be disabled. If ADIE of ADCAnVCRj is set to 1, INT_SGx can be output when A/D conversion for virtual channel j in SGx ends. If ADIE of ADCAnVCRj is set to 0, the INT_SGx output when A/D conversion for virtual channel j in SGx ends can be disabled. Since SGx scan ending is simultaneous with A/D conversion ending for virtual channel j in SGx when ADIEs of both ADCAnSGCRx and ADCAnVCRj are set to 1, INT_SGx occurs only once.

Example 1: A scan is executed for virtual channel 0 or 1 in SG1 when ADIE of ADCAnSGCR1 is 0, ADIE of VCR0 is 1, and ADIE of VCR1 is 0.
INT_SG1 is output when A/D conversion ends for virtual channel 0.

Example 2: A scan is executed for virtual channel 0 or 1 in SG2 when ADIE of ADCAnSGCR2 is 0, ADIE of VCR0 is 1, and ADIE of VCR1 is 1.
INT_SG2 is output when A/D conversion ends for virtual channel 0 and virtual channel 1.

Example 3: A scan is executed for virtual channel 0 or 1 in SG3 when ADIE of ADCAnSGCR3 is 1, ADIE of VCR0 is 0, and ADIE of VCR1 is 0.
INT_SG3 is output when a scan ends (when A/D conversion for virtual channel 1 ends).

Furthermore, the DMA can be started when scan ends.

For the setting of DMA, see **Section 8, DMA Controller**.

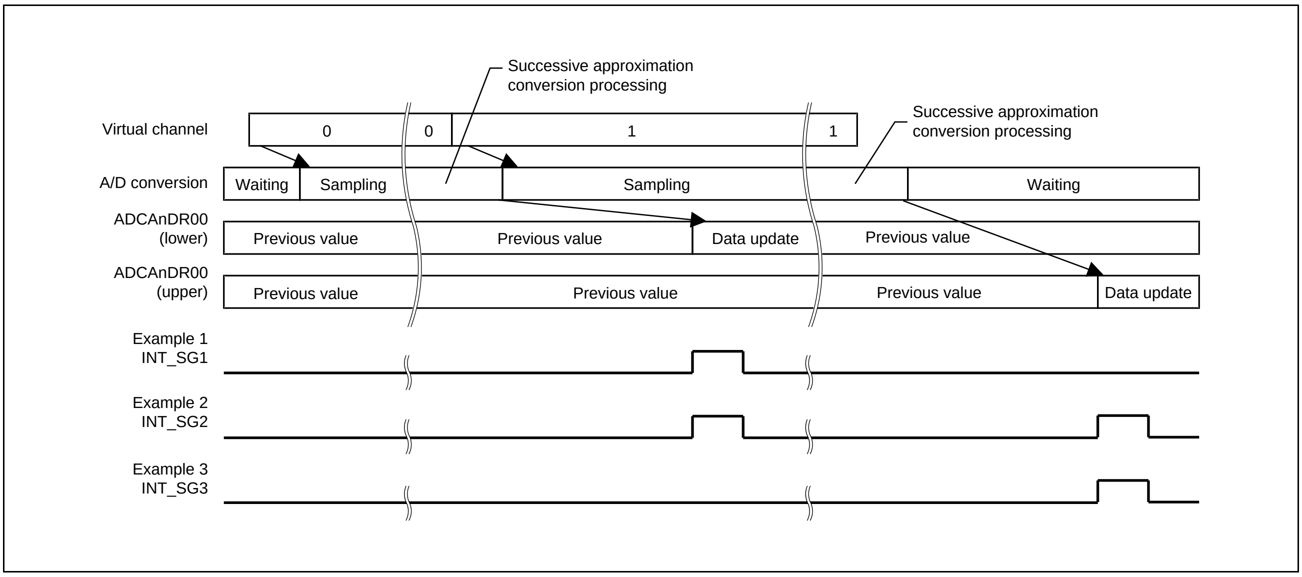


Figure 38.33 Example of a Scan Conversion End Interrupt Occurrence

38.4.13 A/D Error Interrupt Request

ADCA can issue an A/D error interrupt request (INT_ADE) to INTC. For an error source for which ULEIE and OWEIE of ADCAnSFTCR are set to 1, the OR condition of the error source is issued as INT_ADE. For an error source for which ULEIE and OWEIE of ADCAnSFTCR are set to 0, INT_ADE does not output an interrupt.

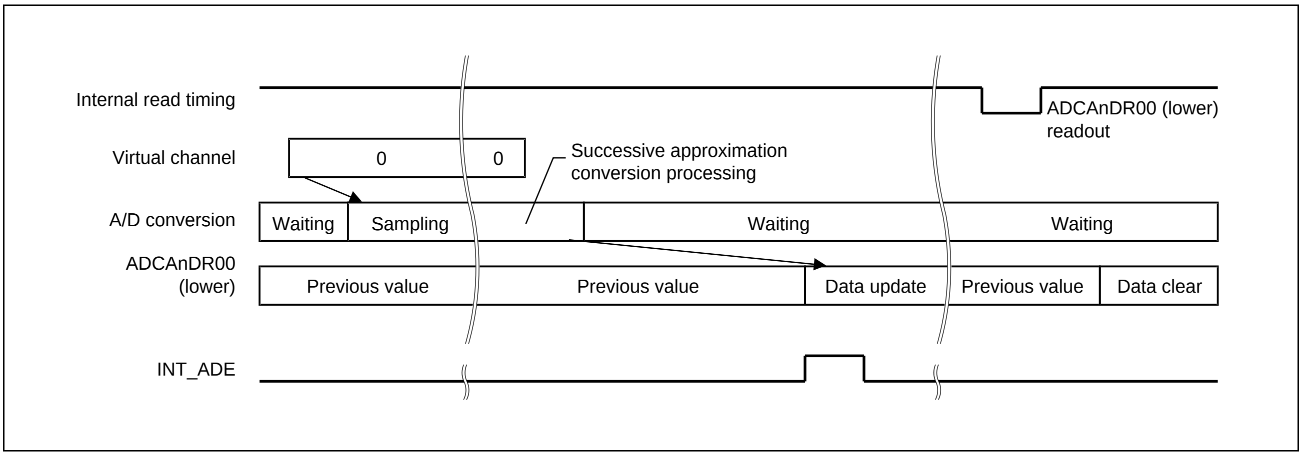

Figure 38.34 A/D Error Interrupt (Example: Overwrite Error)

38.5 Self-Diagnostic Function

To check the ADCAn function, the following self-diagnostic functions are available.

Section 38.5.1, Diagnosis of A/D Conversion Circuit

Section 38.5.2, Diagnosis of Channel Multiplexer

Section 38.5.3, Diagnosis of Open Pins

Section 38.5.4, Diagnosis of T&H Circuit

The overview of the self-diagnostic functions is shown in the figure below. A detailed description is given in the following sections.

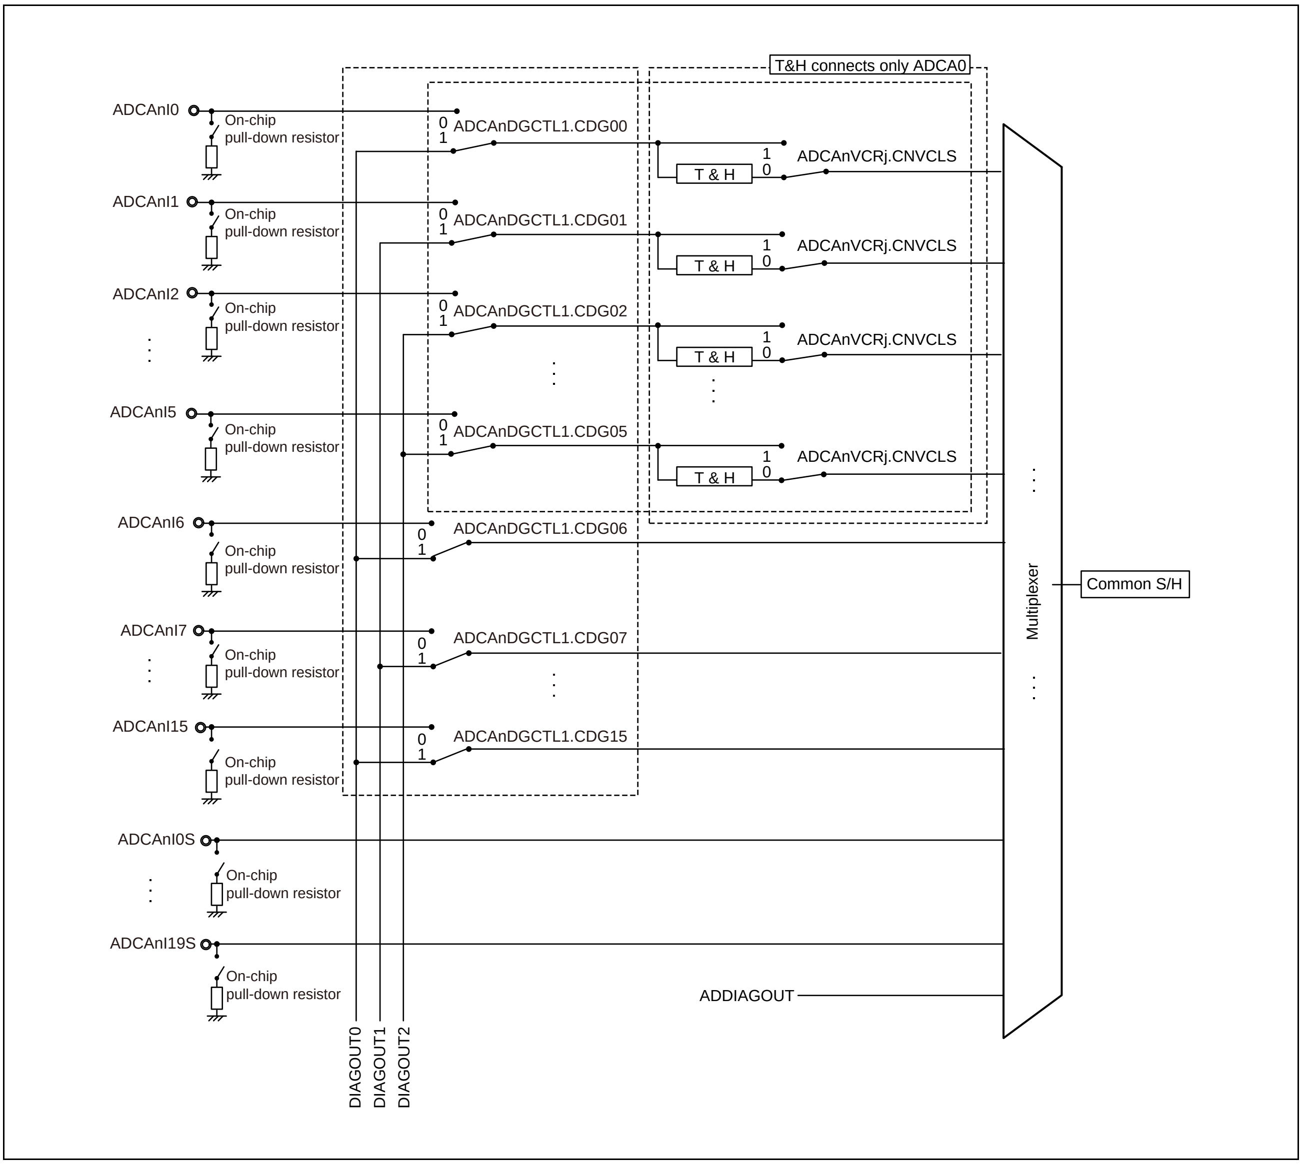

Figure 38.35 Overview of Self-Diagnostic Functions

NOTE

The functions in the dashed-line frames depend on the product.

38.5.1 Diagnosis of A/D Conversion Circuit

This function checks whether the A/D converter is operating normally by verifying the A/D conversion for self-diagnostic voltage (ADDIAGOUT) and the result of conversion. If the result of A/D conversion differs from the expected value, an internal circuit may be broken. The features of self-diagnosis of the A/D converter are as follows:

- As the self-diagnostic voltage (ADDIAGOUT) level, AnV_{REF}, $2/3AnV_{REF}$, $1/3AnV_{REF}$, $1/2AnV_{REF}$, and AnVSS are selectable by the PSEL[2:0] bits in the ADCAnDGCTL0 register.
- Self-diagnosis of the A/D converter is enabled by performing A/D conversion on one of SG1 to SG3.

38.5.1.1 Diagnostic Procedure

The diagnostic procedures are shown below.

Common settings for ADC should be made before self-diagnosis is to proceed.

1. Set ADCAnADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCAnDGCTL0.PSEL[2:0] to select a self-diagnostic voltage level.
4. Set ADCAnADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Set an arbitrary bit of ADCAnVCRj.GCTRL[5:0] to 100100_B to select the diagnosis channel.
7. Set ADCAnVCRj.ADIE = 1 to enable the A/D conversion end interrupt.
8. Set ADCAnSGVCSPx to specify the start pointer of virtual channel.
9. Set ADCAnSGVCEPx to specify the end pointer of virtual channel.
10. Generate the start trigger of scan group to perform the A/D conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the A/D conversion was performed successfully.

NOTE

- During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCAnDGCTL0.PSEL[2:0]. However, the value of ADCAnDGCTL0.PSEL[2:0] becomes effective from the next A/D conversion.
- To clear ADCAnADCR.DGON, follow the procedure below:
    1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
    2. Clear ADCAnDGCTL0.PSEL[2:0].
    3. Clear ADCAnADCR.DGON.

38.5.2 Diagnosis of Channel Multiplexer

This function checks whether the path from the analog input to the A/D converter is normal.
Set the A/D conversion reference voltage (DIAGOUT0, DIAGOUT1, DIAGOUT2) by ADCAnDGCTL0.PSEL[2:0] and the channels to be connected by the ADCAnDGCTL1 register to perform A/D conversion using multiple analog channels.
If the result of A/D conversion differs from the expected value, an internal circuit may be broken. The features of self-diagnosis of the channel multiplexer are as follows:

- Channels for diagnosis can be arbitrarily selected from among ADCA0I0 to ADCA0I15 and ADCA1I0 to ADCA1I15.
- As the self-diagnostic voltage level, 2/3AnV$_{REF}$, 1/3AnV$_{REF}$, and 1/2AnV$_{REF}$ are selectable and one of the three reference voltage levels can be allocated to each channel.

Table 38.84 Selection of Channel to be Diagnosed

Connection	Select Channel
DIAGOUT0	Channels 0, 3, 6, 9, 12, and 15
DIAGOUT1	Channels 1, 4, 7, 10, and 13
DIAGOUT2	Channels 2, 5, 8, 11, and 14

- Self-diagnosis of the channel multiplexer is enabled by performing A/D conversion on one of SG1 to SG3 by using multiple channels.

38.5.2.1 Diagnostic Procedure

The diagnostic procedure is shown below.

Common settings for ADC should be made before self-diagnosis is to proceed.

1. Set ADCAnADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCAnDGCTL0.PSEL[2:0] to select a self-diagnostic voltage level.
4. Set ADCAnADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Use two or more ADCAnVCRj registers.
   Set ADCAnVCRj.GCTRL[5:0] bits to select physical channels.
   Set ADCAnVCRj.ADIE bit to enable the A/D conversion end interrupt.
7. Set ADCAnSGVCSPx register to specify the start pointer of virtual channel.
8. Set ADCAnSGVCEPx register to specify the end pointer of virtual channel.
9. Set ADCAnDGCTL1 register to specify the physical channel to the self-diagnostic channel.
10. Generate the start trigger of scan group to perform the A/D conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the A/D conversion was performed successfully.

NOTE

- During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCAnDGCTL0.PSEL[2:0]. However, the value of ADCAnDGCTL0.PSEL[2:0] becomes effective from the next A/D conversion.
- To clear ADCAnADCR.DGON, follow the procedure below:
  1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
  2. Clear ADCAnDGCTL0.PSEL[2:0].
  3. Clear ADCAnADCR.DGON.

38.5.3 Diagnosis of Open Pins

This function detects whether the analog input pin (ADCAnIm, ADCAnImS) is open due to disconnection, etc. An internal pull-down resistor can be connected to diagnose the analog input pin.
Connect the analog input pin (ADCAnIm, ADCAnImS) with the pull-down resistor for self-diagnosis for A/D conversion of the target channels.

Figure 38.36 Setting of On-chip Pull Down Resistor

When there is a disconnection, the conversion result is almost 0 V and it indicates an open detection.

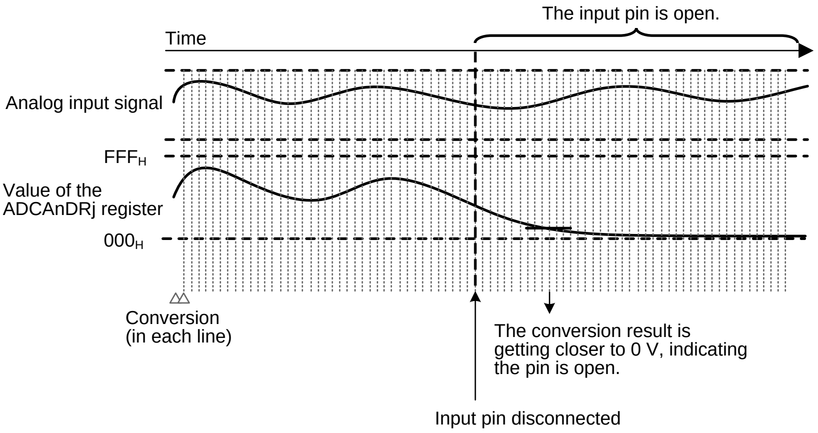

Figure 38.37 Analog Input Signal Disconnection Detection

CAUTIONS

1. The pull-down resistors must not be connected during normal A/D conversion operation. Connected pull-down resistors may lead to a drop in the input voltage and result in erroneous A/D conversion results.
2. When the analog input voltage is nearly equal to the voltage level which is pulled down, a disconnection cannot be detected by this function.

38.5.3.1 Diagnostic Procedure

1. Set the ADCAnPDCTL1.PDNA or ADCAnPDCTL2.PDNB bit which correspond to analog input pins (ADCAnIm, ADCAnImS) to be diagnosed to enable the pull down resistor.
2. Generate the start trigger of scan group to perform the A/D conversion.
3. Perform the A/D conversion multiple times on the same analog input.
4. Monitor the channel's A/D conversion results and check if any result declines to almost 0 V.

38.5.4 Diagnosis of T&H Circuit

This function is used to diagnose proper operation of the T&H0 to T&H5 circuits for ADCA0I0 to ADCA0I5.

Virtual channel registers 33 to 35 (ADCA0VCR33 to ADCA0VCR35) are used exclusively for comparison of the potential conversion result using the T&H circuit and that obtained without using the T&H circuit to detect a failure of the T&H circuit.

For this diagnosis, the ADCA0THACR.HLDCTE is set to 1 (ADCA0THBCR.HLDCTE = 1) and ADCA0THACR.HLDTE to 0 (ADCA0THBCR.HLDTE = 0) and the A/D conversion trigger is used as the hold start/end trigger. Connect the reference voltage signal (DIAGOUT0, DIAGOUT1, or DIAGOUT2) selected by ADCAnDGCTL0.PSEL[2:0] to the target channels for diagnosis by using the ADCAnDGCTL1 register.

38.5.4.1 Diagnostic Procedure (in case of T&H circuit ch0 diagnosis)

1. Set ADCA0ADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCA0DGCTL0.PSEL[2:0] = 001_B to select 1/3AnV$_{REF}$ voltage level.
4. Set ADCA0ADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Set ADCA0DGCTL1.CDG0 = 1 to enable DIAGOUT0.
7. Set ADCA0VCR33.GCTRL[5:0] to ADCAVCR35.GCTRL[5:0] to 000000_B to select physical ch0.
8. Set ADCA0VCR33.CNVCLS and ADCA0VCR34.CNVCLS to1 to select normal conversion.
9. Set ADCA0VCR35.CNVCLS = 0 to select hold value conversion.
10. Set ADCA0THACR.SGS[1:0] = 01_B to select SG1 to “T&H group A”.
11. Set ADCA0THER.TH0E = 1 to enable T&H circuit ch0.
12. Set ADCA0THGSR.TH0GS = 0 to select T&H circuit ch0 to “T&H group A”.
13. Set ADCA0SGVCSP1.VCSP[5:0] =100001_B to select SG1 start pointer to VCR33.
14. Set ADCA0SGVCEP1.VCEP[5:0] = 100011_B to select SG1 end pointer to VCR35.
15. Set ADCA0DGCTL0.PSEL[2:0] = 011_B to select 2/3AnV$_{REF}$ voltage level.
16. Set ADCA0THSMPSTCR.SMPST = 1 to execute T&H sampling.
17. Wait for 500 ns.
18. Set ADCA0SGSTCR1.SGST = 1 to execute SG1 A/D conversion.
19. Read ADCA0DIR33 to ADCA0DIR35, and check A/D conversion result to see if SG1 A/D conversion has finished.

NOTES

To clear ADCAnADCR.DGON, follow the procedure below:

1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
2. Use the ADCAnTHER register to disable the diagnosed T&Hk.
3. Clear ADCAnDGCTL0.PSEL[2:0].
4. Clear ADCAnADCR.DGON.

38.5.4.2 Diagnosis Mechanism

(1) A reference voltage “A” is applied to one of the reference voltage signals DIAGOUT0 to DIAGOUT2. The T&H circuit holds the voltage “A” and an A/D conversion is performed without using the T&H circuit.

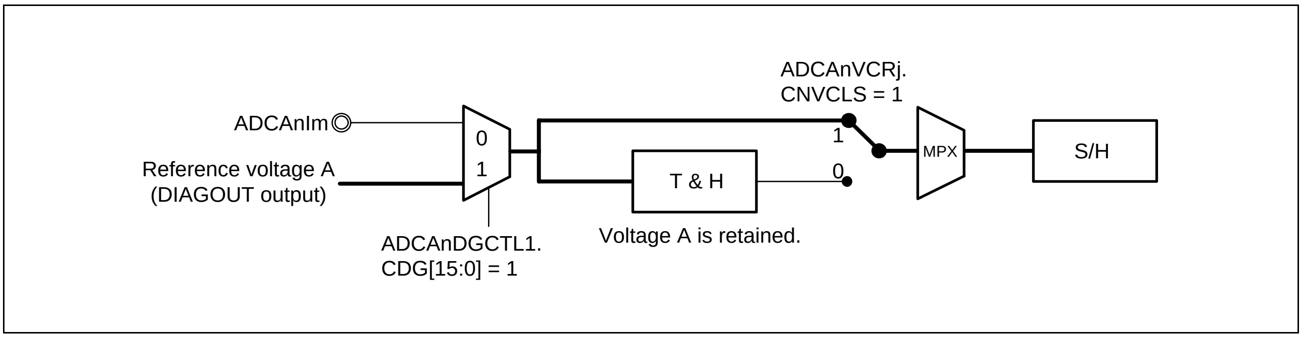

Figure 38.38 T&H Circuit Diagnostic Mechanisms (1)

(2) A reference voltage “B” is applied to one of the reference voltage signals DIAGOUT0 to DIAGOUT2. The T&H circuit still holds the voltage “A” and an A/D conversion is performed without using the T&H circuit.
Note that since reference voltage “A” is being held, reference voltage “B” is not held.

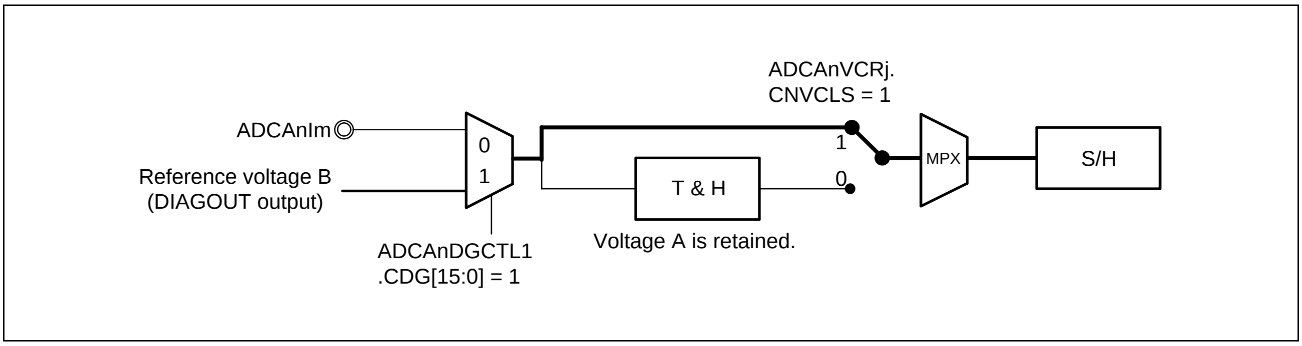

Figure 38.39 T&H Circuit Diagnostic Mechanisms (2)

(3) An A/D conversion is performed using the T&H circuit. The T&H circuit continues to hold the voltage A.

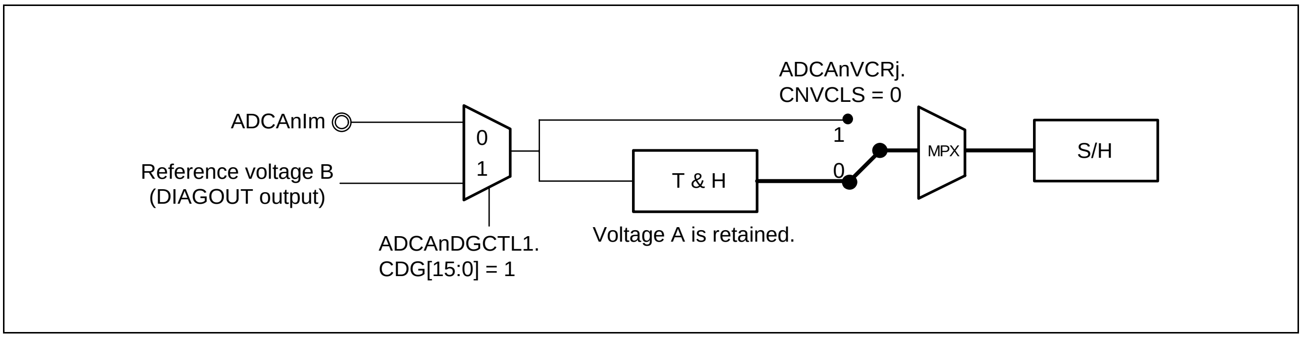

Figure 38.40 T&H Circuit Diagnostic Mechanisms (3)

(4) The diagnosis of T&H circuit is successful if the following results are obtained:

1. The first result (step 1) is voltage “A”.
2. The second result (step 2) is voltage “B”.
3. The last result (step 3) is voltage “A” again.

38.6 Definition of A/D Conversion Accuracy

A/D conversion accuracy is defined as follows:

- Resolution
  Digital output code value from the A/D converter
- Quantization error
  An error essentially contained in the A/D converter, which is assumed as 1/2 LSB (**Figure 38.41, Definition of A/D Conversion Accuracy**).
- Offset error
  Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from the minimum voltage value 000_H to 001_H. However, the quantization error is not included.
- Full scale error
  Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from FFE_H to FFF_H. However, the quantization error is not included.
- DNL (Differential nonlinear error)
  Deviation between the ideal digital output code width (Vq) and the actual digital output code width (Va), which is assumed as (Va – Vq)/Vq. However, the offset error, the full scale error, and the quantization error are not included.
- INL (Integral nonlinear error)
  Deviation of the actual value from the ideal A/D conversion characteristics between the zero voltage and the full scale voltage, which is assumed as an integral of DNL from 000_H to a digital output code. However, the offset error, the full scale error, and the quantization error are not included.
- Absolute accuracy
  Deviation between the digital value and the analog input value. The offset error, the full scale error, the quantization error, DNL, and INL are included.
- Overall error
  Deviation between the digital value and the analog input value. The offset error, the full scale error, DNL, and INL are included, but the quantization error isn't included.

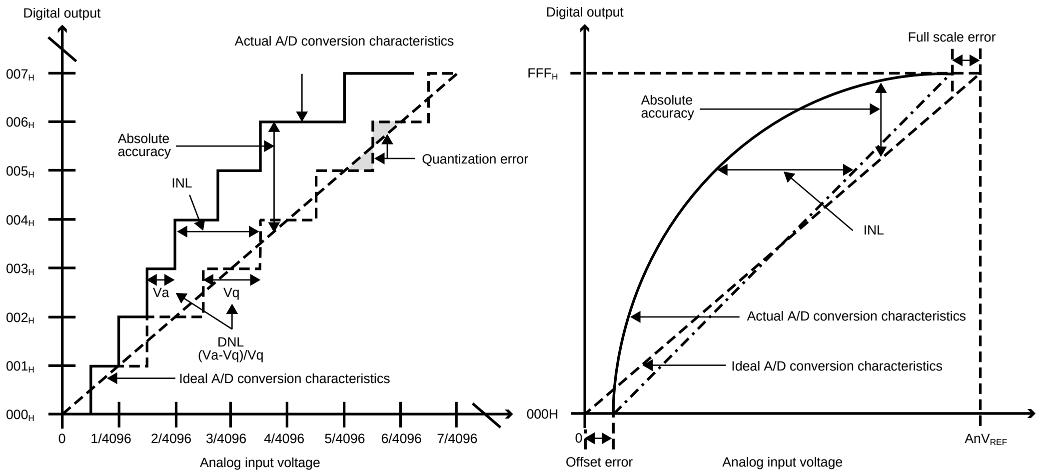

Figure 38.41 Definition of A/D Conversion Accuracy

38.7 Usage Notes

38.7.1 Range of Channel Input Voltage

CAUTION

ADCAnIm and ADCAnImS input voltages should be used within the specification range. When the channel input voltage exceeds AnVREF or falls below AnVSS, an over-voltage/injected current condition applies.

1. When an over-voltage is applied to ADCAnIm pins (within the specified injected current range) and at the same pins the ADC self-diagnosis (diagnosis of channel multiplexer) is executed an offset voltage to the diagnosis voltage will be measured.
2. When an over-voltage is applied to ADCAnIm pins (within the specified injected current range) and at adjacent pins the ADC self-diagnosis (diagnosis of channel multiplexer) is executed an AD conversion result within the range of TESH0SN will be measured.

Case: Injected current is applied at only two pins (ADCA0I0 and ADCA0I1 in the example below) where the ADC self-diagnosis is executed.

- ADCA0I0 and ADCA0I1 with applied injected current, but ADC self-diagnosis executed (CDG0-15 = 1 set to DIAGOUTn selected).
  → Conversion result of TESH0SN with offset voltage
- ADCA0I2-15 without applied injected current, but ADC self-diagnosis executed (CDG0-15 = 1 set to DIAGOUTn selected).
  → Conversion result of TESH0SN without offset voltage

38.7.2 Notes on Application Design

(1) Analog Input Pins (ADCAnIm, ADCAnImS)

- Ensure that the input voltages on the ADCAnIm and ADCAnImS pins are within the specified ranges. We recommend using diodes with VF of 0.3V or below to form a clamp to avoid the input of voltages at or above AnVREF and at or below AnVSS. The results of conversion for input voltages at or above AnVREF and at or below AnVSS are undefined and so are not guaranteed. Input of such voltages can also affect the results of conversion on other channels.
- Reduce noise on the analog input pins (ADCAnIm and ADCAnImS) by connecting a resistor Re between the pins and the external sources of analog input signals for conversion and capacitor Ce to the AnVSS pins.
- Avoid analog signal lines crossing digital signal lines and vice versa, since this can introduce noise and reduce performance in A/D conversion.
- We recommend avoiding the driving of large currents through input and output pins near the ADCAnIm and ADCAnImS pins and toggled signals in particular should be kept away from these pins.
- If you are using the standby functions, confirm the Force halt or the Normal end with the flow for **Section 38.4.3, Ending/Stopping A/D Conversion**. Then, set the ADCAnTHER.THkE bits, which are to be effective on standby, to 0.
- If you are using the LPS on ADCA0 (also when standby function is used), set the ADCA0SGCRx.TRGMD bit to 1 and the ADCA0SGTSELx.TxSEL bits to SEQTRG (LPS). For details, see **Section 15, Low-Power Sampler (LPS)**.
- Do not connect a channel to be used with the T&H function to an external analog multiplexer.

- Changes to physical and virtual channels during operation while the T&H function is in use is prohibited.
- Writing to PWM-Diag-related registers while PWM-Diag is not in use is prohibited.

(2) Power Wiring

The following methods are recommended to minimize the influence of switching noise from digital circuits on A/D converter accuracy.

- Connect markedly thick wiring patterns to the mesh pattern or connect solid patterns to the power-supply lines.
- Insert bypass capacitors between power-supply pins (EVCC, BVCC, and AnVREF) and ground pins (EVSS, BVCC, and AnVSS).
- We recommend separating the analog power supply (AnVREF) from the digital power supplies (EVCC, BVCC) and providing the voltages from a series regulator. If the analog power supply is to come from the same source as that of the digital power supplies, wire the analog and digital power supplies to an electrolytic capacitor, and provide separate wiring patterns on the board.
  We also recommend inserting a chip inductor in the input for the analog power supply. Furthermore, earth the analog and digital grounds to the same point on an electrolytic capacitor, and provide separate wiring patterns for the grounds on the board.
  The analog power supply also serves as the analog reference voltage for this product.

(3) Variation in A/D Converted Data

The effects of noise and variations in the power supply voltages lead to dispersal of the results of A/D conversion. Furthermore, noise on the analog input pins (ADCAnIm and ADCAnImS) or on the reference voltage input pins (AnVREF and AnVSS) can lead to the results of A/D conversion being incorrect.

Apply software processing to avoid ill effects on the system of fluctuations in or incorrectness of the results of A/D conversion.

Examples of software handling are described below.

- Use averaged values from several rounds of A/D conversion
- Execute A/D conversion for several time and omit extreme results
- Repeat the processing for abnormalities to check for repeated abnormalities in the case of results of A/D conversion which will cause malfunctions of the system.

There is a possibility that A/D conversion accuracy of high priority SG become worse when following both conditions are applicable.

(1) During the A/D conversion of low priority SG (e.g. SG1), conversion trigger of the high priority SG (e.g. SG3) occur.

(2) The channel T&H function of high priority SG (e.g. SG3) is enabled.

The above case is one of an example of SG combination. The SG priority is SG4 > SG3 > SG2 > SG1. The fluctuation of conversion error depends on the external circuit and devices mounted on the customer board.

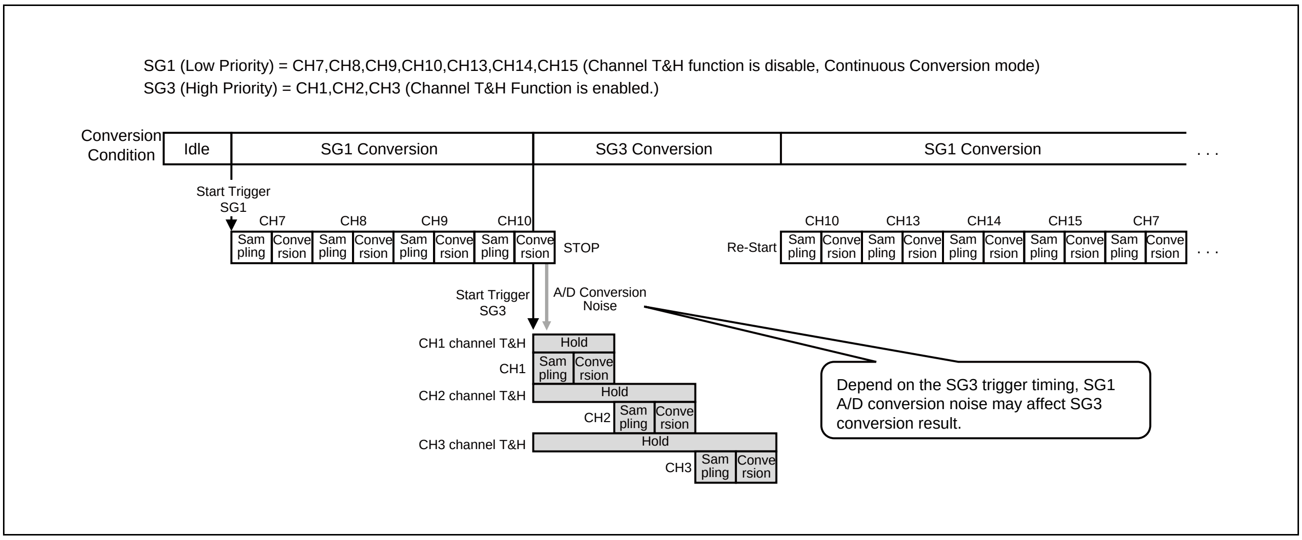

Figure 38.42 SG priority

Examples of software handling are described below.

- Low priority SG (e.g. SG1) A/D conversion have to be finished 3 ADCLK before the conversion trigger of high priority SG (e.g. SG3), if the SG3 contains the channels which channel T&H is available.
- If there is a case that high priority SG (e.g. SG3) conversion trigger occur during the conversion of low priority SG (e.g. SG1), disable the high priority SG channel T&H function.
- If the both conditions mentioned in previous page need to be used, adjust high priority SG (e.g. SG3) conversion trigger timing to synchronize with the following timing (the period shown by arrowed line in the following figure) during A/D conversion of low priority SG (e.g. SG1).

Even if trigger timing is adjusted above recommendation time, conversion error specified in **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1** cannot be removed.

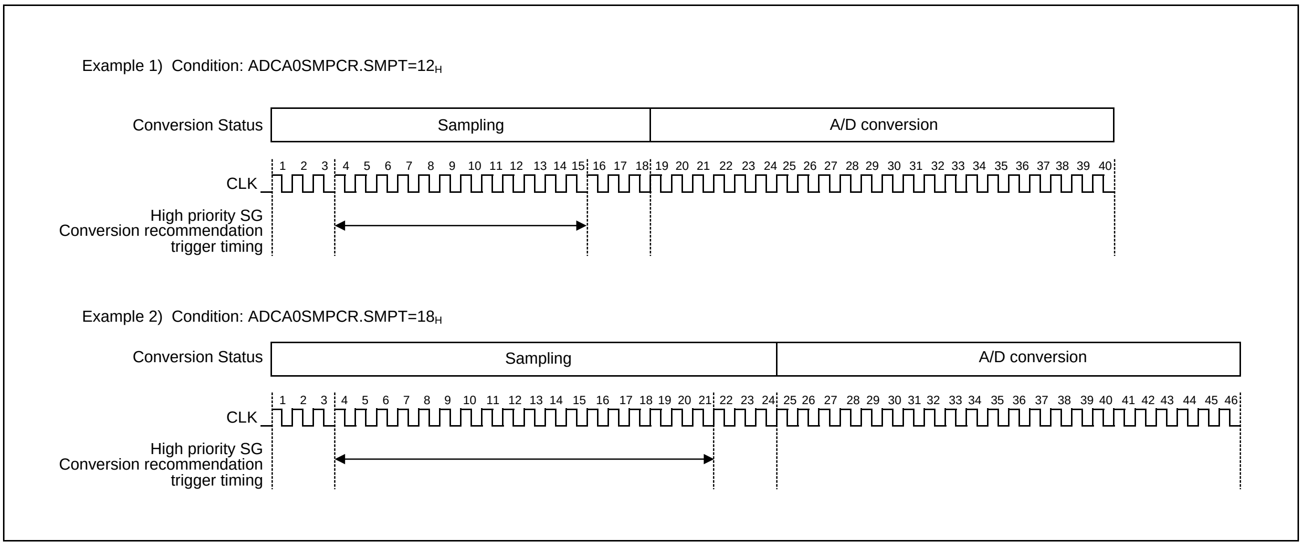

Figure 38.43 SG conversion trigger timing

When it is not possible to use the above 3 software handlings, following process is recommended.

- Doing A/D conversion several times and using average of several A/D conversion results.
- Doing continuous A/D conversion several times, remove abnormal conversion result and use only the other results.
- When abnormal A/D conversion result is detected, not to proceed abnormal operation immediately, doing one more A/D conversion before proceeding abnormal operation.

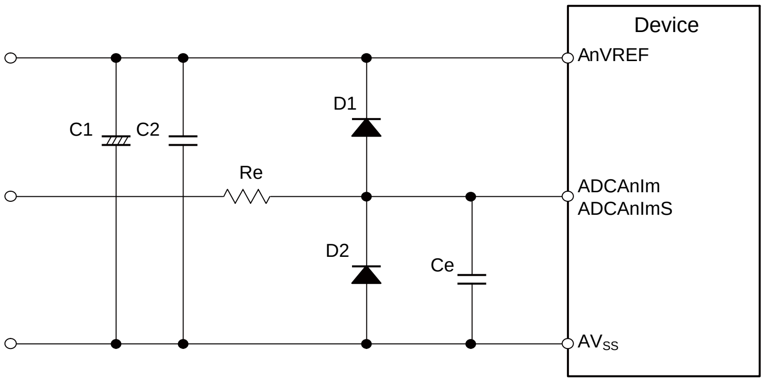
The effect of above process is depend on the external circuit and devices mounted on the customer board. Sufficient evaluation of the system is recommended.

(4) Alternative Input/Output

Analog input (ADCAnIm, ADCAnImS) pins can be used as port pins.

Do not read from input port pins or write to output port pins while an ADCAnIm or ADCAnImS pin function is selected and handling A/D conversion. Doing so may reduce the accuracy of conversion.

Fluctuations in output current from output port pins due to the effects of an external circuit connected to a port pin while A/D conversion is in progress may also reduce the accuracy of conversion. If digital pulses are applied to or digital pulses are output through a pin adjacent to a pin for which A/D conversion is in progress, the A/D converted value may not be as expected due to coupling noise. Accordingly, do not apply pulses to or output pulses from a pin adjacent to a pin for which A/D conversion is in progress.

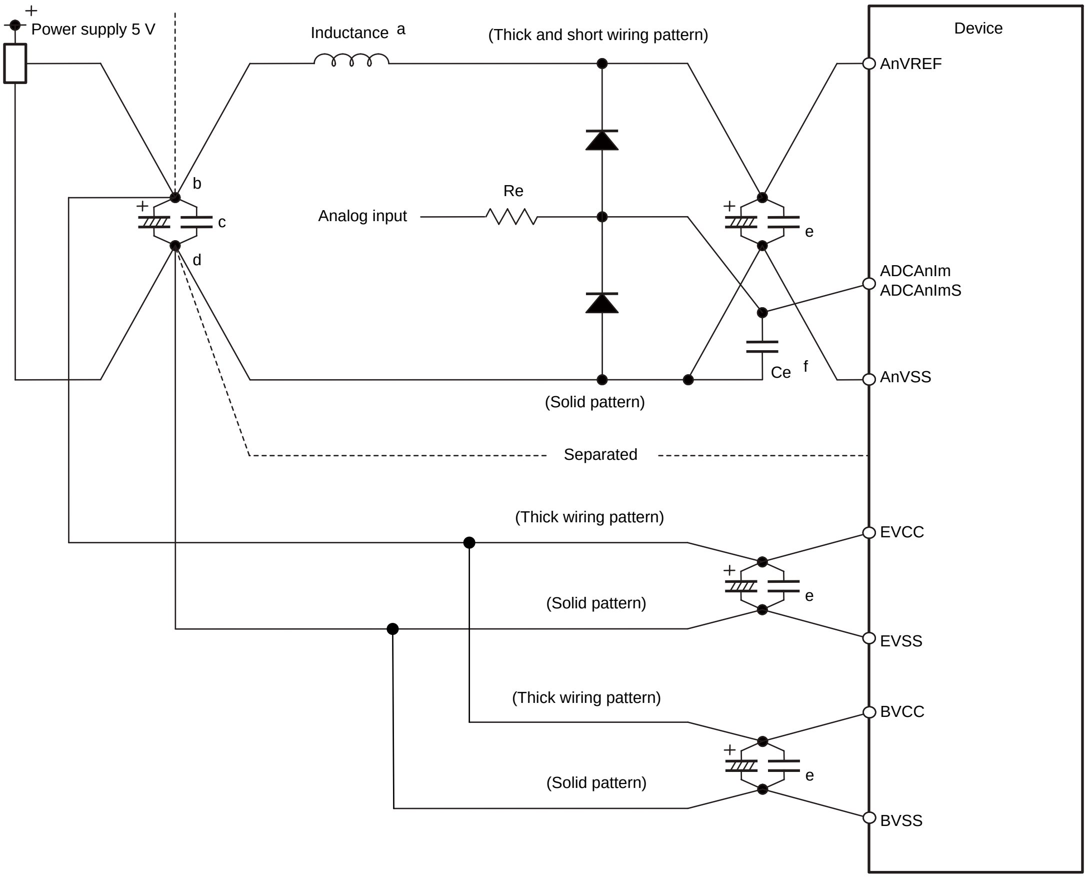


Note: C1: 4.7 µF to 10 µF
C2: 0.01 µF to 0.1 µF
Ce: 5 to 10 nF
Re: 0 to 1 kΩ
The values above are for reference.
D1, D2: VF ≤ 0.3 V

Figure 38.44 Example of Noise Protection for Analog Input Circuit

Capacitor C1 is effective for low-frequency noise, and capacitors C2 and Ce are effective for high-frequency noise.

The voltage on an AnVREF pin is undefined immediately after switching from the stopped state to the start of conversion operations, and this may have the effect of reducing the accuracy of conversion. As a countermeasure for this situation, connect capacitors C1 and C2 to the AnVREF pins.



a) Insert an inductor for the analog power input.

b) Wire the analog and digital supplies to a single point near the 5V power supply and provide separate wiring patterns on the board.

c) Place a bypass capacitor (electrolytic or laminated ceramic) near the common power supply.

d) Wire the analog and digital grounds to a single point near the power supplies, and provide separate wiring patterns for each on the board.

e) Place bypass capacitors (electrolytic or laminated ceramic) near the respective power supply pins.

f) Place capacitor Ce near the analog input pins of the device.

Figure 38.45 Example of Power Wiring

Section 39 Key Return (KR)

This section contains a generic description of the Key Return (KR).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of KR.

39.1 Features of RH850/F1KH, RH850/F1KM KR

39.1.1 Number of Units and Channels

This microcontroller has the following number of KR units and channels.

Table 39.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	KRn (n = 0)	KRn (n = 0)	KRn (n = 0)

Table 39.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins

Table 39.7 Indices (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual KR units are identified by the index “n”; for example, KRnKRM (n = 0) indicates the key return mode register.
m	Throughout this section, the individual KR channels are identified by the index “m”; for example, KRnKRMm (m = 0 to 7) indicates the key input enable bit of KRnKRM (key return mode register).

39.1.2 Register Base Address

KRn base address is listed in the following table.

KRn register addresses are given as an offset from the base address.

Table 39.8 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<KR0_base>	FFF7 8000_H

39.1.3 Clock Supply

The KRn clock supply is shown in the following table.

Table 39.9 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
KRn	PCLK	CPUCLK_UL	Module clock
	Register access clock	CPUCLK_UL	Bus clock

39.1.4 Interrupt Requests

KRn interrupt requests are listed in the following table:

Table 39.10 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
KR0			
INTKRn	Key interrupt	90	—

39.1.5 Reset Sources

KRn reset sources are listed in the following table. KRn is initialized by these reset sources.

Table 39.11 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
KRn	All reset sources (ISORES)

39.1.6 External Input/Output Signals

External input/output signals of KRn are listed below.

Table 39.12 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
KR0		
KRnTPKR7 to KRnTPKR0	Key input signal	KR0I7 to KR0I0

39.2 Overview

39.2.1 Functional Overview

The Key Return function has the following features:

A key interrupt request signal (INTKRn) can be generated by inputting a falling signal, that goes from high to low, to any of the eight key input pins (KRnTPKR7 to KRnTPKR0).

39.2.2 Block Diagram

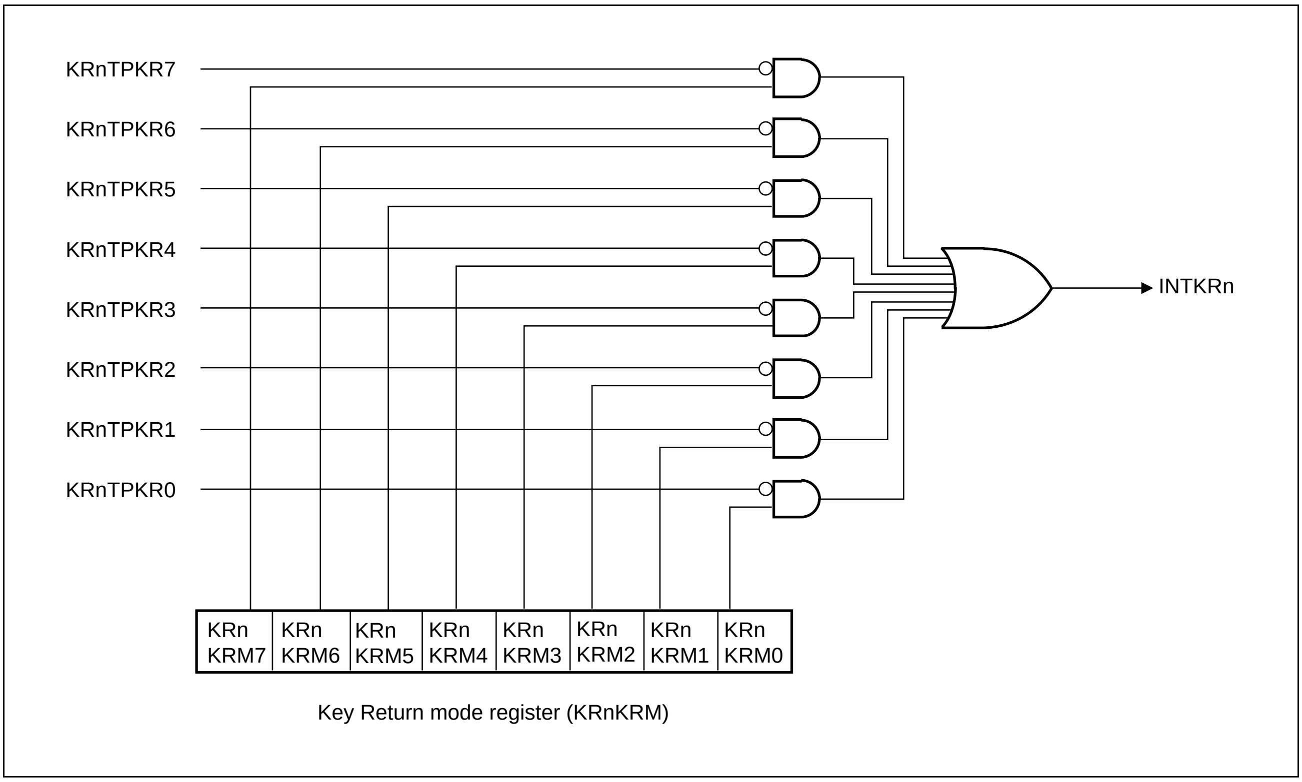

Figure 39.1 Block Diagram of the Key Return Function

39.3 Registers

39.3.1 List of Registers

KR register is listed in the following table.

For details about <KRn_base>, see **Section 39.1.2, Register Base Address**.

Table 39.13 List of Register

Module Name	Register Name	Symbol	Address
KRn	Key return mode register	KRnKRM	<KRn_base>

39.3.2 KRnKRM — Key Return Mode Register

This register enables/disables the key input signal detection.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: <KRn_base>

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	KRnKRM7	KRnKRM6	KRnKRM5	KRnKRM4	KRnKRM3	KRnKRM2	KRnKRM1	KRnKRM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 39.14 KRnKRM Register Contents

Bit Position	Bit Name	Function
7 to 0	KRnKRMm	Enables/disables the key input signal detection. 0: Disabled 1: Enabled

39.4 Operation

39.4.1 Interrupt Request INTKRn

The interrupt request INTKRn is generated when the level of the corresponding key input pin (KRnTPKRm) is changed from high to low while input to the key input pin (KRnTPKRm) is enabled (KRnKRM.KRnKRMm = 1).

Figure 39.2, Interrupt Request Generation shows how the interrupt request is generated:

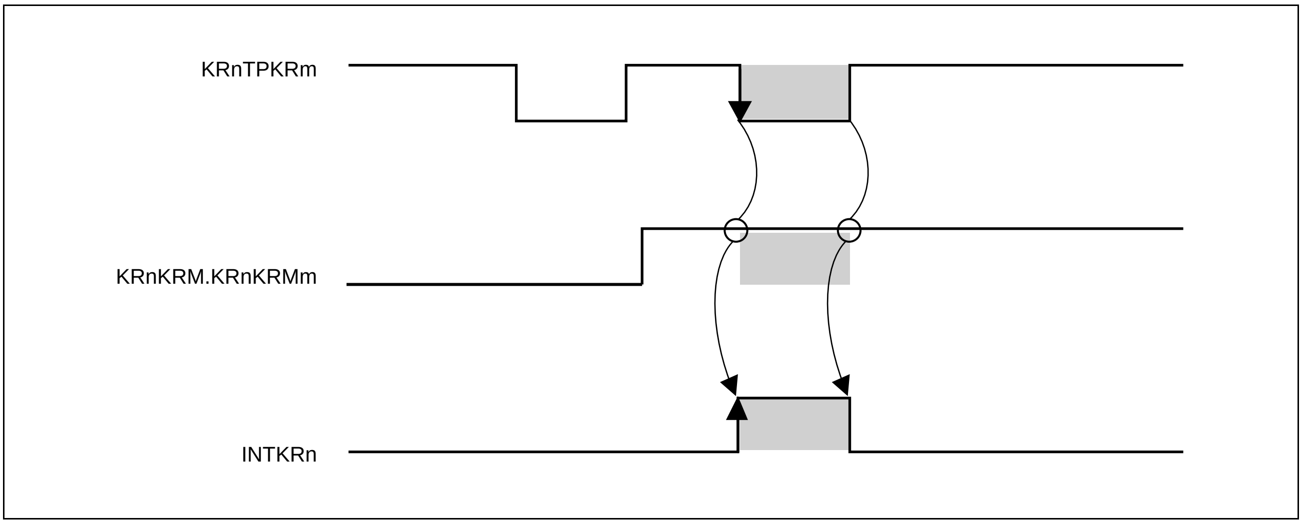

Figure 39.2 Interrupt Request Generation

CAUTIONS

1. The change of a key input pin (KRnTPKRm) level from high to low does not trigger another INTKRn if any of the key return input pins are already low. The next INTKRn is only triggered by a key input pin level changing from high to low if all other key input pins are high.
2. If the key input value changes at the same time the setting of KRnKRM.KRnKRMm is changed, an unintended key interrupt request INTKRn might be generated.
   Therefore, mask (disable) INTKRn of the interrupt controller before changing KRnKRM.KRnKRMm from 0 to 1, or from 1 to 0.

Section 40A Functional Safety of RH850/F1KH-D8

This section provides an overview of the safety mechanisms included in the RH850/F1KH Series.

This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.

For more information about the development process and safety mechanisms, please contact our sales office.

The following are the failure detection functions provided by this microcontroller.

40A.1 Overview

ECC

Detects failures of memories and data transfer paths and corrects some types of failures.

Memory Protection

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

Clock Monitor

Monitors the clock operation to detect abnormal operations.

For details, see **Section 13, Clock Monitor (CLMA)**.

Data CRC

Generates CRC to detect data errors.

For details, see **Section 41, Data CRC (DCRA)**.

Write-Protected Registers

The write-protected registers are protected from inadvertent write access due to erroneous program execution.

For details, see **Section 5, Write-Protected Registers**.

40A.2 ECC

40A.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

Table 40A.1 ECC Overview

Applicable Memory		Applicable Data Width [bits]	Operation upon Error Detection					Failure Insertion
			Detection/ Correction	SYSERR	Interrupt Notice	Error Status	Address Capture	
Code flash		128	SEC-DED	SED/DED*[2]	SEC-DED	Possible	Possible	Possible
Data flash		32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
Local RAM (CPU1/CPU2/Self)		32	SEC-DED	SED/DED*[2]	SEC-DED	Possible	Possible	Possible
Global RAM Retention RAM		32	SEC-DED	SED/DED*[2]	SEC-DED	Possible	Possible	Possible
Peripheral RAM*[1]	CSIH	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	RS-CANFD	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	FlexRay	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	Ethernet	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	MMCA	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible

Note 1. For details of ECC for each peripheral IP, see **Section 40A.2.6, ECC for Peripheral RAM**.

Note 2. For details, see **Section 40A.2.2.2, Interrupt Requests, Section 40A.2.4.2, Interrupt Requests**, and **Section 40A.2.5.2, Interrupt Requests**.

Applicable Data Width

This is the data width to be ECC encoded.

To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).

(1) Reading data to be ECC-encoded including data to be rewritten

(2) Replacing data to be rewritten

(3) Writing back data generated in (2)

Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected.

SED-DED: 1-bit errors and 2-bit errors can only be detected.

SYSERR

SYSERR can be generated upon error detection.

Interrupt Notice

An interrupt can be generated upon error detection.

Error Status

The status of a detected error is retained.

Address Capture

The address of a detected error is retained.

Failure Insertion

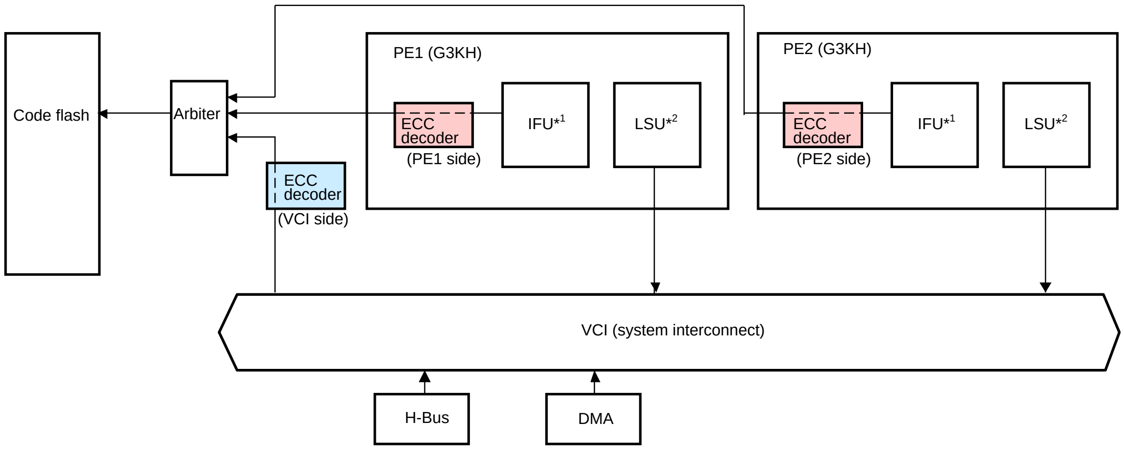
Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

40A.2.2 Code Flash ECC

40A.2.2.1 Overview

RH850/F1KH has three code flash ECC decoder circuits implemented, two inside the Processor Element (PE1/PE2) and one on the VCI (system interconnect).

Figure 40A.1, Block Diagram of Code Flash ECC shows the location of three ECC decoders for the code flash.



Note 1. Instruction Fetch Unit

Note 2. Load Store Unit

Figure 40A.1 Block Diagram of Code Flash ECC

The code flash ECC is summarized in the table below.

Table 40A.2 Summary of Code Flash ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction. ● 2-bit error detection and 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. (This is not supported in CFERRINT_PE1 register.) Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see **Section 3A, CPU System of RH850/F1KH-D8**. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.

Table 40A.2 Summary of Code Flash ECC

Item	Description
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The ECC 1-bit error status is set only when no error status has been set. The ECC 2-bit error status is set even when the ECC 1-bit error status is set. A register for clearing the error status is provided.
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also captured.
Self-diagnosis	The ECC bit can be read directly.
Inhibiting instruction execution	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching avoids the execution of incorrect instructions.

40A.2.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.

Table 40A.3 Code Flash ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0*[1] (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR	—

Note 1. ECCFLI0FEIF flag set can be read (not jump to handler address of FEINT) in SYSERR processing because return from SYSERR is not possible.

Table 40A.4 Code Flash ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0 (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR, INTECCFLI0	—

Table 40A.5 Code Flash ECC Interrupt Requests (During Bus Master Data Access except CPU Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	INTECCFLI0	—
—	ECC 2-bit error interrupt of code flash	INTECCFLI0	—

40A.2.2.3 List of Registers

Table 40A.6 List of Registers

Module Name	Register Name	Symbol*[1]	Address
CFECC_VCI	Code flash ECC control register (VCI)	CFECCCTL_VCI	FFC6 2200_H
	Code flash error information control register (VCI)	CFERRINT_VCI	FFC6 2204_H
	Code flash status clear register (VCI)	CFSTCLR_VCI	FFC6 2208_H
	Code flash error count overflow status register (VCI)	CFOVFSTR_VCI	FFC6 $220C_H$
	Code flash 1st error status register (VCI)	CF1STERSTR_VCI	FFC6 2210_H
	Code flash 1st error address register (VCI)	CF1STEADR0_VCI	FFC6 2250_H
CFECC_CPU1	Code flash ECC control register (PE1)	CFECCCTL_PE1	FFC6 2400_H
	Code flash error information control register (PE1)	CFERRINT_PE1	FFC6 2404_H
	Code flash status clear register (PE1)	CFSTCLR_PE1	FFC6 2408_H
	Code flash error count overflow status register (PE1)	CFOVFSTR_PE1	FFC6 $240C_H$
	Code flash 1st error status register (PE1)	CF1STERSTR_PE1	FFC6 2410_H
	Code flash 1st error address register (PE1)	CF1STEADR0_PE1	FFC6 2450_H
CFECC_CPU2	Code flash ECC control register (PE2)	CFECCCTL_PE2	FFC6 2600_H
	Code flash error information control register (PE2)	CFERRINT_PE2	FFC6 2604_H
	Code flash status clear register (PE2)	CFSTCLR_PE2	FFC6 2608_H
	Code flash error count overflow status register (PE2)	CFOVFSTR_PE2	FFC6 $260C_H$
	Code flash 1st error status register (PE2)	CF1STERSTR_PE2	FFC6 2610_H
	Code flash 1st error address register (PE2)	CF1STEADR0_PE2	FFC6 2650_H
CFECC_VCI	Code flash sub-test control register (VCI)	CFSTSTCTL_VCI	FFC6 2350_H

Note 1. The registers suffixed with symbols “_VCI”, “_PE1” and “_PE2” are provided to ECC controllers corresponding to each access port: registers with “_VCI” are provided to the ECC controller for data access from the system interconnect to the code flash, registers with “_PE1” are provided to the ECC controller for fetch access from the CPU1 and registers with “_PE2” are provided to the ECC controller for fetch access from the CPU2.

40A.2.2.4 Details of Registers

(1) CFECCCTL_VCI/PE1/PE2 — Code Flash ECC Control Register

CFECCCTL_VCI/PE1/PE2 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFECCCTL_VCI/PE1/PE2, PROT1 and PROT0 need to be 01_B.

Access: CFECCCTL_VCI, CFECCCTL_PE1 and CFECCCTL_PE2 can be read or written in 32-bit units.
CFECCCTL_VCIL, CFECCCTL_PE1L and CFECCCTL_PE2L can be read or written in 16-bit units.

Address: CFECCCTL_VCI: FFC6 2200$_H$
CFECCCTL_VCIL: FFC6 2200$_H$
CFECCCTL_PE1: FFC6 2400$_H$
CFECCCTL_PE1L: FFC6 2400$_H$
CFECCCTL_PE2: FFC6 2600$_H$
CFECCCTL_PE2L: FFC6 2600$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40A.7 CFECCCTL_VCI/PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFECCCTL_VCI/PE1/PE2.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) CFERRINT_VCI/PE1/PE2 — Code Flash Error Information Control Register

CFERRINT_VCI/PE1/PE2 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access:	CFERRINT_VCI, CFERRINT_PE1 and CFERRINT_PE2 can be read or written in 32-bit units. CFERRINT_VCIL, CFERRINT_PE1L and CFERRINT_PE2L can be read or written in 16-bit units. CFERRINT_VCILL, CFERRINT_PE1LL and CFERRINT_PE2LL can be read or written in 8-bit units.
Address:	CFERRINT_VCI: FFC6 2204$_H$ CFERRINT_VCIL: FFC6 2204$_H$ CFERRINT_VCILL: FFC6 2204$_H$ CFERRINT_PE1: FFC6 2404$_H$ CFERRINT_PE1L: FFC6 2404$_H$ CFERRINT_PE1LL: FFC6 2404$_H$ CFERRINT_PE2: FFC6 2604$_H$ CFERRINT_PE2L: FFC6 2604$_H$ CFERRINT_PE2LL: FFC6 2604$_H$
Value after reset:	0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE *1	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40A.8 CFERRINT_VCI/PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE*1	ECC 2-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

Note 1. This bit is not supported in CFERRINT_PE1/PE2. When writing to this bit in CFERRINT_PE1/PE2, always write 1.

Note 2. Regarding the interrupt request, see **Section 40A.2.2.2, Interrupt Requests**.

(3) CFSTCLR_VCI/PE1/PE2 — Code Flash Status Clear Register

CFSTCLR_VCI/PE1/PE2 clears the error flags in the error status register (CF1STERSTR_VCI/PE1/PE2), the overflow flag in the error overflow status register (CFOVFSTR_VCI/PE1/PE2), and the error address register (CF1STEADR0_VCI/PE1/PE2).

Access: CFSTCLR_VCI, CFSTCLR_PE1 and CFSTCLR_PE2 are write-only registers that can be written in 32-bit units.
CFSTCLR_VCIL, CFSTCLR_PE1L and CFSTCLR_PE2L are write-only registers that can be written in 16-bit units.
CFSTCLR_VCILL, CFSTCLR_PE1LL and CFSTCLR_PE2LL are write-only registers that can be written in 8-bit units.

Address: CFSTCLR_VCI: FFC6 2208$_H$
CFSTCLR_VCIL: FFC6 2208$_H$
CFSTCLR_VCILL: FFC6 2208$_H$
CFSTCLR_PE1: FFC6 2408$_H$
CFSTCLR_PE1L: FFC6 2408$_H$
CFSTCLR_PE1LL: FFC6 2408$_H$
CFSTCLR_PE2: FFC6 2608$_H$
CFSTCLR_PE2L: FFC6 2608$_H$
CFSTCLR_PE2LL: FFC6 2608$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCLR 0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 40A.9 CFSTCLR_VCI/PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	STCLR0	Error Status Clear 0: No effect (Setting 0 does not affect the DEDF0 and SEDF0 flags in CF1STERSTR_VCI/PE1/PE2; ERROVF0 flag in CFOVFSTR_VCI/PE1/PE2; and CF1STEADR0_VCI/PE1/PE2.) 1: Writing 1 to this bit clears the DEDF0 and SEDF0 flags in CF1STERSTR_VCI/PE1/PE2; ERROVF0 flag in CFOVFSTR_VCI/PE1/PE2; and CF1STEADR0_VCI/PE1/PE2.

(4) CFOVFSTR_VCI/PE1/PE2 — Code Flash Error Count Overflow Status Register

CFOVFSTR_VCI/PE1/PE2 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

Access: CFOVFSTR_VCI, CFOVFSTR_PE1 and CFOVFSTR_PE2 are read-only registers that can be read in 32-bit units.
CFOVFSTR_VCIL, CFOVFSTR_PE1L and CFOVFSTR_PE2L are read-only registers that can be read in 16-bit units.
CFOVFSTR_VCILL, CFOVFSTR_PE1LL and CFOVFSTR_PE2LL are read-only registers that can be read in 8-bit units.

Address: CFOVFSTR_VCI: FFC6 220C$_H$
CFOVFSTR_VCIL: FFC6 220C$_H$
CFOVFSTR_VCILL: FFC6 220C$_H$
CFOVFSTR_PE1: FFC6 240C$_H$
CFOVFSTR_PE1L: FFC6 240C$_H$
CFOVFSTR_PE1LL: FFC6 240C$_H$
CFOVFSTR_PE2: FFC6 260C$_H$
CFOVFSTR_PE2L: FFC6 260C$_H$
CFOVFSTR_PE2LL: FFC6 260C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.10 CFOVFSTR_VCI/PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF0	Error Overflow Flag ERROVF0 shows whether a second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register has occurred, except when both of the error address and source of the second error are the same as those of the first error. 0: Did not occur. 1: Occurred. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1/PE2 to 1.

(5) CF1STERSTR_VCI/PE1/PE2 — Code Flash 1st Error Status Register

CF1STERSTR_VCI/PE1/PE2 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0. If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

Access:	CF1STERSTR_VCI, CF1STERSTR_PE1 and CF1STERSTR_PE2 are read-only registers that can be read in 32-bit units. CF1STERSTR_VCIL, CF1STERSTR_PE1L and CF1STERSTR_PE2L are read-only registers that can be read in 16-bit units. CF1STERSTR_VCILL, CF1STERSTR_PE1LL and CF1STERSTR_PE2LL are read-only registers that can be read in 8-bit units.
Address:	CF1STERSTR_VCI: FFC6 2210$_H$ CF1STERSTR_VCIL: FFC6 2210$_H$ CF1STERSTR_VCILL: FFC6 2210$_H$ CF1STERSTR_PE1: FFC6 2410$_H$ CF1STERSTR_PE1L: FFC6 2410$_H$ CF1STERSTR_PE1LL: FFC6 2410$_H$ CF1STERSTR_PE2: FFC6 2610$_H$ CF1STERSTR_PE2L: FFC6 2610$_H$ CF1STERSTR_PE2LL: FFC6 2610$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF0	SEDF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.11 CF1STERSTR_VCI/PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF0	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1/PE2 to 1. [Setting condition] ECC 2-bit error is detected when DEDF0 is 0.
0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected when DEDF0 flag is 0. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1/PE2 to 1. [Setting condition] ECC 1-bit error is detected when DEDF0, SEDF0 are 0.

(6) CF1STEADR0_VCI/PE1/PE2 — Code Flash 1st Error Address Register

CF1STEADR0_VCI/PE1/PE2 holds the address at which an error has occurred.

The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1/PE2. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STEADR0_VCI/PE1/PE2 register is cleared by an internal reset, the external reset, or by setting the STCLR bit in the CFSTCLR_VCI/PE1/PE2 register to 1.

Access: CF1STEADR0_VCI, CF1STEADR0_PE1 and CF1STEADR0_PE2 are read-only registers that can be read in 32-bit units.

CF1STEADR0_VCIL, CF1STEADR0_VCIH, CF1STEADR0_PE1L, CF1STEADR0_PE1H, CF1STEADR0_PE2L and CF1STEADR0_PE2H are read-only registers that can be read in 16-bit units.

CF1STEADR0_VCILL, CF1STEADR0_VCILH, CF1STEADR0_VCIHL, CF1STEADR0_VCIHH, CF1STEADR0_PE1LL, CF1STEADR0_PE1LH, CF1STEADR0_PE1HL, CF1STEADR0_PE1HH, CF1STEADR0_PE2LL, CF1STEADR0_PE2LH, CF1STEADR0_PE2HL and CF1STEADR0_PE2HH are read-only registers that can be read in 8-bit units.

Address:
CF1STEADR0_VCI: FFC6 2250$_H$
CF1STEADR0_VCIL: FFC6 2250$_H$
CF1STEADR0_VCIH: FFC6 2252$_H$
CF1STEADR0_VCILL: FFC6 2250$_H$
CF1STEADR0_VCILH: FFC6 2251$_H$
CF1STEADR0_VCIHL: FFC6 2252$_H$
CF1STEADR0_VCIHH: FFC6 2253$_H$
CF1STEADR0_PE1: FFC6 2450$_H$
CF1STEADR0_PE1L: FFC6 2450$_H$
CF1STEADR0_PE1H: FFC6 2452$_H$
CF1STEADR0_PE1LL: FFC6 2450$_H$

Table 40A.12 CF1STEADR0_VCI/PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned.
24 to 4	EADR[24:4]	1st Error Address Monitors the address of the first error. The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1/PE2. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1/PE2 to 1.
3 to 0	Reserved	When read, the value after reset is returned.

(7) CFSTSTCTL_VCI — Code Flash Sub-Test Control Register

CFSTSTCTL_VCI is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read directly.

When writing to CFSTSTCTL_VCI, PROT1 and PROT0 need to be 01_B.

Access:	CFSTSTCTL_VCI can be read or written in 32-bit units. CFSTSTCTL_VCIL can be read or written in 16-bit units.
Address:	CFSTSTCTL_VCI: FFC6 2350_H CFSTSTCTL_VCIL: FFC6 2350_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 40A.13 CFSTSTCTL_VCI Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST bit. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFSTSTCTL_VCI.
14	PROT0	
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, ECC bits can be read directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see **Section 3A, CPU System of RH850/F1KH-D8**.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16n address. The results of reading code flash are as follows:

Table 40A.14 Results of Reading Code Flash

Bit Number	Meaning	Bit Position	Description
bit[31:10]	all-0	31 to 10	These bits are always 0.
bit[9]	reserved	9	Unknown
bit[8:0]	ECC bits	8 to 0	ECC bits

40A.2.3 Data Flash ECC

40A.2.3.1 Overview

The data flash ECC is summarized in the table below.

Table 40A.15 Summary of Data Flash ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection / correction. ● 2-bit error detection and 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 2-bit errors is selectable. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is disabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the Interrupt Controller, an interrupt processing is not executed.
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The function is set only while no error status is set. A register for clearing the error status is provided.
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. ECC error address is captured when both SEDF and DEDF of DFERSTR are 0.
Self-diagnosis	ROM data and the ECC bit can be read directly. Arbitrary data can be written to ROM data and the ECC bit.

40A.2.3.2 Interrupt Requests

The interrupt requests for data flash ECC are shown below.

Table 40A.16 Data Flash ECC Interrupt Requests (During Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of data flash	INTECCEEP0	—
—	ECC 2-bit error interrupt of data flash	INTECCEEP0	—

40A.2.3.3 List of Registers

Table 40A.17 List of Registers

Module Name	Register Name	Symbol	Address
DFECC	Data flash ECC control register	DFECCCTL	FFC6 2A00$_H$
	Data flash error status register	DFERSTR	FFC6 2A04$_H$
	Data flash error status clear register	DFERSTC	FFC6 2A08$_H$
	Data flash error overflow status register	DFOVFSTR	FFC6 2A0C$_H$
	Data flash error overflow status clear register	DFOVFSTC	FFC6 2A10$_H$
	Data flash error notification control register	DFERRINT	FFC6 2A14$_H$
	Data flash 1st error address register	DFEADR	FFC6 2A18$_H$
	Data flash test control register	DFTSTCTL	FFC6 2A1C$_H$

40A.2.3.4 Details of Registers

(1) DFECCCTL — Data Flash ECC Control Register

DFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCCTL, PROT1 and PROT0 need to be 01_B.

Access: DFECCCTL can be read or written in 16-bit units.

Address: DFECCCTL: FFC6 $2A00_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40A.18 DFECCCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFECCCTL.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.

The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

Access:	DFERSTR is a read-only register that can be read in 8-bit units.
Address:	DFERSTR: FFC6 $2A04_H$
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDF	SEDF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40A.19 DFERSTR Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	DEDF	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 2-bit error is detected when both SEDF and DEDF are 0.
0	SEDF	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 1-bit error is detected when both SEDF and DEDF are 0.

(3) DFERSTC — Data Flash Error Status Clear Register

DFERSTC clears the error flags in the data flash error status register.

Access: DFERSTC is a write-only register that can be written in 8-bit units.

Address: DFERSTC: FFC6 2A08$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERRCLR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 40A.20 DFERSTC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ERRCLR	SEDF/DEDF Flag Clear 0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF and SEDF flags in DFERSTR.) 1: The SEDF/DEDF flag in DFERSTR is cleared.

(4) DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of data flash error overflow.

Access: DFOVFSTR is a read-only register that can be read in 8-bit units.

Address: DFOVFSTR: FFC6 2A0C$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40A.21 DFOVFSTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF	Error Overflow Flag ERROVF is set if an ECC error occurs while the error address register is full. 0: Did not occurred. 1: Occurred. [Clearing condition] Set the ERROVFCLR bit is set in data flash error overflow status clear register.

(5) DFOVFSTC — Data Flash Error Overflow Status Clear Register

DFOVFSTC clears the data flash error overflow flag.

Access: DFOVFSTC is a write-only register that can be written in 8-bit units.

Address: DFOVFSTC: FFC6 2A10$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVFCLR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 40A.22 DFOVFSTC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ERROVFCLR	Error Overflow Flag Clear 0: No effect (Setting the ERROVFCLR bit to 0 does not affect the ERROVF flag in DFOVFSTR.) 1: The ERROVF flag in DFOVFSTR is cleared.

(6) DFERRINT — Data Flash Error Notification Control Register

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: DFERRINT can be read or written in 8-bit units.

Address: DFERRINT: FFC6 2A14$_H$

Value after reset: 02$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 40A.23 DFERRINT Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	ECC 2-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(7) DFEADR — Data Flash 1st Error Address Register

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0.

Access: DFEADR is a read-only register that can be read in 32-bit units.

Address: DFEADR: FFC6 2A18$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	DFEADR[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DFEADR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.24 DFEADR Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned.
20 to 2	DFEADR[20:2]	ECC Error Address DFEADR is read-only field to monitor the address at which an ECC error has occurred. This register holds an internal address. Convert it to the actual address by adding the data flash base address FF20 0000$_H$.
1, 0	Reserved	When read, the value after reset is returned.

(8) DFTSTCTL — Data Flash Test Control Register

DFTSTCTL is used for the ECC test.

After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read.

When writing to DFTSTCTL, PROT1 and PROT0 need to be 01_B.

Access: DFTSTCTL can be read or written in 16-bit units.

Address: DFTSTCTL: FFC6 $2A1C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 40A.25 DFTSTCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCTST bit. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFTSTCTL.
14	PROT0	
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test Sets ECC test mode. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

40A.2.4 Local RAM ECC

40A.2.4.1 Overview

The local RAM ECC of CPU1/CPU2 is summarized in the table below.

Table 40A.26 Summary of Local RAM ECC (CPU1/CPU2)

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction. ● 2-bit error detection and 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see **Section 3A, CPU System of RH850/F1KH-D8**. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The function is set only while no error status is set. A register for clearing the error status is provided.
Address capture	When no error status has been set, the address at which the first error occurred is captured. In addition, when the retained address source is an ECC 1-bit error or ECC 2-bit error, the address is also captured.
Self-diagnosis	Arbitrary data can be written to RAM data and the ECC bit. RAM data and the ECC bit can be read directly.
Others	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.

CAUTION

When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16-bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

40A.2.4.2 Interrupt Requests

The local RAM ECC interrupt requests are listed below.

Table 40A.27 Local RAM ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	SYSERR, INTECCRAM (SED & SECDIS = 1)	—
		INTECCRAM (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of RAM	SYSERR, INTECCRAM	—

Table 40A.28 Local RAM ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	SYSERR, INTECCRAM (SED & SECDIS = 1)	—
		INTECCRAM (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of RAM	SYSERR, INTECCRAM	—

Table 40A.29 Local RAM ECC Interrupt Requests (During Data Access except CPU Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	INTECCRAM	—
—	ECC 2-bit error interrupt of RAM	INTECCRAM	—

40A.2.4.3 List of Registers

Table 40A.30 List of Registers

Module Name	Address	Symbol	Register Name	R/W	Value after Reset	Access Size
LRTST	FFC6 5004$_H$	LRTSTCTL_PE1	Local RAM test control register (PE1)	R/W	0000 0000$_H$	16/32

40A.2.4.4 Details of Registers

(1) LRTSTCTL_PE1/PE2 — Local RAM Test Control Register

LRTSTCTL_PE1/PE2 is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits.

When writing to LRTSTCTL_PE1/PE2, PROT1 and PROT0 need to be 01$_B$.

Access:	LRTSTCTL_PE1 and LRTSTCTL_PE2 registers can be read or written in 32-bit units. LRTSTCTL_PE1L and LRTSTCTL_PE2L registers can be read or written in 16-bit units.
Address:	LRTSTCTL_PE1: FFC6 5004$_H$ LRTSTCTL_PE1L: FFC6 5004$_H$ LRTSTCTL_PE2: FFC6 5024$_H$ LRTSTCTL_PE2L: FFC6 5024$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 40A.31 LRTSTCTL_PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST and DATSEL bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRTSTCTL_PE1/PE2.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read by reading LRTDATBF0_PE1/PE2 register or written directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).
0	DATSEL	Data Select This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: RAM data is selected. 1: The ECC bits are selected.

CAUTION

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

(2) LRTDATBF0_PE1/PE2 — Local RAM Test Data Read Buffer 0

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL_PE1/PE2, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

Access:	LRTDATBF0_PE1 and LRTDATBF0_PE2 registers are read-only registers that can be read in 32-bit units.
Address:	LRTDATBF0_PE1: FFC6 5008$_H$ LRTDATBF0_PE2: FFC6 5028$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	LRTDATBF[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.32 LRTDATBF0_PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned.
6 to 0	LRTDATBF[6:0]	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the local RAM, the ECC bits for the local RAM are stored in LRTDATBF[6:0].

(3) LRECCCTL_PE1/PE2 — Local RAM ECC Control Register

LRECCCTL_PE1/PE2 enables or disables ECC error detection and correction and 1-bit error correction.

When writing to LRECCCTL_PE1/PE2, PROT1 and PROT0 need to be 01_B.

Access: LRECCCTL_PE1 and LRECCCTL_PE2 registers can be read or written in 32-bit units.
LRECCCTL_PE1L and LRECCCTL_PE2L registers can be read or written in 16-bit units.

Address: LRECCCTL_PE1: FFC6 5400_H
LRECCCTL_PE1L: FFC6 5400_H
LRECCCTL_PE2: FFC6 5600_H
LRECCCTL_PE2L: FFC6 5600_H

Value after reset: 0000 0000_H

Table 40A.33 LRECCCTL_PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRECCCTL_PE1/PE2.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(4) LRERRINT_PE1/PE2 — Local RAM Error Information Control Register

LRERRINT_PE1/PE2 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: LRERRINT_PE1 and LRERRINT_PE2 registers can be read or written in 32-bit units.
LRERRINT_PE1L and LRERRINT_PE2L registers can be read or written in 16-bit units.
LRERRINT_PE1LL and LRERRINT_PE2LL registers can be read or written in 8-bit units.

Address: LRERRINT_PE1: FFC6 5404$_H$
LRERRINT_PE1L: FFC6 5404$_H$
LRERRINT_PE1LL: FFC6 5404$_H$
LRERRINT_PE2: FFC6 5604$_H$
LRERRINT_PE2L: FFC6 5604$_H$
LRERRINT_PE2LL: FFC6 5604$_H$

Value after reset: 0000 0003$_H$

Table 40A.34 LRERRINT_PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	ECC 2-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(5) LRSTCLR_PE1/PE2 — Local RAM Status Clear Register

LRSTCLR_PE1/PE2 clears the error flags in the error status register (LR1STERSTR_PE1/PE2), the overflow flag in the error overflow status register (LROVFSTR_PE1/PE2), and the error address register (LR1STEADR0_PE1/PE2). LRSTCLR_PE1/PE2 is a write-only register and is always read as 0.

Access: LRSTCLR_PE1 and LRSTCLR_PE2 registers are write-only registers that can be written in 32-bit units.
LRSTCLR_PE1L and LRSTCLR_PE2L registers are write-only registers that can be written in 16-bit units.
LRSTCLR_PE1LL and LRSTCLR_PE2LL registers are write-only registers that can be written in 8-bit units.

Address: LRSTCLR_PE1: FFC6 5408$_{\text{H}}$
LRSTCLR_PE1L: FFC6 5408$_{\text{H}}$
LRSTCLR_PE1LL: FFC6 5408$_{\text{H}}$
LRSTCLR_PE2: FFC6 5608$_{\text{H}}$
LRSTCLR_PE2L: FFC6 5608$_{\text{H}}$
LRSTCLR_PE2LL: FFC6 5608$_{\text{H}}$

Value after reset: 0000 0000$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.35 LRSTCLR_PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	STCLR0	Error Status Flag Clear Writing 1 to this bit clears the DEDF0 and SEDF0 flags in LR1STERSTR_PE1/PE2; ERROVF0 flag in LROVFSTR_PE1/PE2; and LR1STEADR0_PE1/PE2.

(6) LROVFSTR_PE1/PE2 — Local RAM Error Count Overflow Status Register

LROVFSTR_PE1/PE2 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1/PE2.

Access: LROVFSTR_PE1 and LROVFSTR_PE2 registers are read-only registers that can be read in 32-bit units.
LROVFSTR_PE1L and LROVFSTR_PE2L registers are read-only registers that can be read in 16-bit units.
LROVFSTR_PE1LL and LROVFSTR_PE2LL registers are read-only registers that can be read in 8-bit units.

Address: LROVFSTR_PE1: FFC6 540C$_H$
LROVFSTR_PE1L: FFC6 540C$_H$
LROVFSTR_PE1LL: FFC6 540C$_H$
LROVFSTR_PE2: FFC6 560C$_H$
LROVFSTR_PE2L: FFC6 560C$_H$
LROVFSTR_PE2LL: FFC6 560C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.36 LROVFSTR_PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF0	Error Overflow Flag ERROVF0 is set if a second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(7) LR1STERSTR_PE1/PE2 — Local RAM 1st Error Status Register

LR1STERSTR_PE1/PE2 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0.

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR_PE1/PE2 is cleared by an internal reset, the external reset, or setting 1 to the STCLR0 bit in LRSTCLR_PE1/PE2.

Access:	LR1STERSTR_PE1 and LR1STERSTR_PE2 registers are read-only registers that can be read in 32-bit units. LR1STERSTR_PE1L and LR1STERSTR_PE2L registers are read-only registers that can be read in 16-bit units. LR1STERSTR_PE1LL and LR1STERSTR_PE2LL registers are read-only registers that can be read in 8-bit units.
Address:	LR1STERSTR_PE1: FFC6 5410$_{\text{H}}$ LR1STERSTR_PE1L: FFC6 5410$_{\text{H}}$ LR1STERSTR_PE1LL: FFC6 5410$_{\text{H}}$ LR1STERSTR_PE2: FFC6 5610$_{\text{H}}$ LR1STERSTR_PE2L: FFC6 5610$_{\text{H}}$ LR1STERSTR_PE2LL: FFC6 5610$_{\text{H}}$
Value after reset:	0000 0000$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF0	SEDF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.37 LR1STERSTR_PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF0	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the STCLR0 bit in LRSTCLR_PE1/PE2 to 1. [Setting condition] ECC 2-bit error is detected with DEDF0 being 0.
0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the STCLR0 bit in LRSTCLR_PE1/PE2 to 1. [Setting condition] ECC 1-bit error is detected with both SEDF0 and DEDF0 being 0.

(8) LR1STEADR0_PE1/PE2 — Local RAM 1st Error Address Register 0

LR1STEADR0_PE1/PE2 holds the address at which an error has occurred.

The error address is set if an error occurs while error flags are 0 in LR1STERSTR_PE1/PE2. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set in LR1STERSTR_PE1/PE2. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address[31:19] bits of the associated memory to transform the internal address to the real address. LR1STEADR0_PE1/PE2 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1/PE2.

Access: LR1STEADR0_PE1 and LR1STEADR0_PE2 registers are read-only registers that can be read in 32-bit units.
LR1STEADR0_PE1L, LR1STEADR0_PE1H, LR1STEADR0_PE2L and LR1STEADR0_PE2H registers are read-only registers that can be read in 16-bit units.
LR1STEADR0_PE1LL, LR1STEADR0_PE1LH, LR1STEADR0_PE1HL, LR1STEADR0_PE2LL, LR1STEADR0_PE2LH and LR1STEADR0_PE2HL registers are read-only registers that can be read in 8-bit units.

Address:
LR1STEADR0_PE1: FFC6 5450$_H$
LR1STEADR0_PE1L: FFC6 5450$_H$,
LR1STEADR0_PE1H: FFC6 5452$_H$
LR1STEADR0_PE1LL: FFC6 5450$_H$,
LR1STEADR0_PE1LH: FFC6 5451$_H$,
LR1STEADR0_PE1HL: FFC6 5452$_H$
LR1STEADR0_PE2: FFC6 5650$_H$
LR1STEADR0_PE2L: FFC6 5650$_H$,
LR1STEADR0_PE2H: FFC6 5652$_H$
LR1STEADR0_PE2LL: FFC6 5650$_H$,
LR1STEADR0_PE2LH: FFC6 5651$_H$,
LR1STEADR0_PE2HL: FFC6 5652$_H$

Value after reset: 0000 0000$_H$

Table 40A.38 LR1STEADR0_PE1/PE2 Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned.
18 to 2	EADR[18:2]	1st Error Address Monitors the address of the first error. The error address is held if an error occurs while all the error flags are 0 in LR1STERSTR_PE1/PE2. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.
1, 0	Reserved	When read, the value after reset is returned.

40A.2.5 Global RAM (Including the Retention RAM) ECC

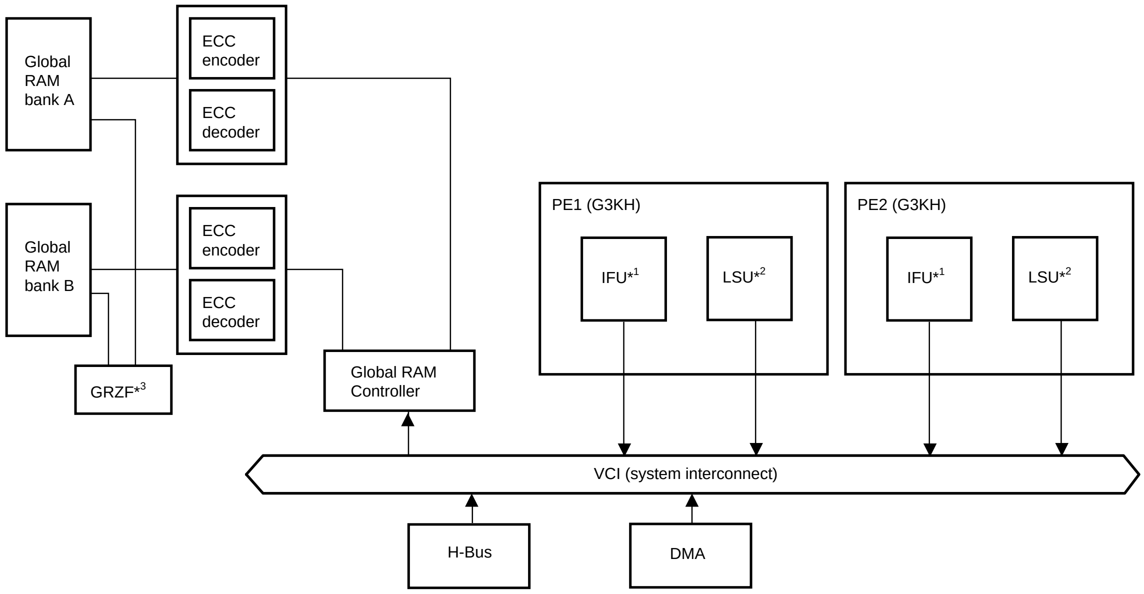
40A.2.5.1 Overview

CAUTION

The retention RAM is a part of the global RAM. The ECC for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

In RH850/F1KH, an ECC encoder and an ECC decoder are provided for each bank (bank A and bank B).

Figure 40A.2, Block Diagram of Global RAM ECC shows the location of two ECC decoders and two ECC encoders for the global RAM.



Note 1. Instruction Fetch Unit

Note 2. Load Store Unit

Note 3. GRZF accesses RAM directly. For details, see **Section 45.3, Global RAM Zero Fill (GRZF)**.

Figure 40A.2 Block Diagram of Global RAM ECC

The global RAM ECC is summarized in the table below.

Table 40A.39 Summary of Global RAM ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction ● 2-bit error detection and 1-bit error detection When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see **Section 3A, CPU System of RH850/F1KH-D8**. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.
Error status	A status register is provided to indicate the statuses of 2-bit ECC error detection and 1-bit ECC error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	If an ECC error occurs while no error status is set, the address at which the associated error has occurred is captured. In addition, if the address source retained is 1-bit ECC error, it is captured when a 2-bit ECC error is detected
Self-diagnosis	Arbitrary data can be written to RAM data and the ECC bit. RAM data can be read directly
Others	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.

40A.2.5.2 Interrupt Requests

Global RAM ECC interrupt requests are listed below.

Table 40A.40 Global RAM ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	SYSERR, INTECCRAM (SED & SECDIS = 1)	—
		INTECCRAM (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of RAM	SYSERR, INTECCRAM	—

Table 40A.41 Global RAM ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	SYSERR, INTECCRAM (SED & SECDIS = 1)	—
		INTECCRAM (SED & SECDIS = 0)	—

Table 40A.43 List of Registers

Module Name	Address	Symbol	Register Name	R/W	Value after Reset	Access Size
GRECC	FFC6 4000_H	GRECCCTL_BKA	Global RAM ECC control register (Bank A)	R/W	0000 0000_H	16/32
	FFC6 4004_H	GRERRINT_BKA	Global RAM error information control register (Bank A)	R/W	0000 0001_H	8/16/32
	FFC6 4010_H	GRSTCLR_BKA	Global RAM status clear register (Bank A)	W	0000 0000_H	8/16/32
	FFC6 4014_H	GROVFSTR_BKA	Global RAM error count overflow status register (Bank A)	R	0000 0000_H	8/16/32
	FFC6 4018_H	GR1STERSTR_BKA	Global RAM 1st error status register (Bank A)	R	0000 0000_H	8/16/32
	FFC6 $401C_H$	GR1STEADR_BKA	Global RAM 1st error address register (Bank A)	R	FEE0 0000_H	8/16/32
	FFC6 4020_H	GRTSTCTL_BKA	Global RAM test control register (Bank A)	R/W	0000 0000_H	16/32
	FFC6 4024_H	GRDECINBF1_BKA	Global RAM ECC decoder input data buffer 1 (Bank A)	R/W	0000 0000_H	8/16/32
	FFC6 4200_H	GRECCCTL_BKB	Global RAM ECC control register (Bank B)	R/W	0000 0000_H	16/32
	FFC6 4204_H	GRERRINT_BKB	Global RAM error information control register (Bank B)	R/W	0000 0001_H	8/16/32
	FFC6 4210_H	GRSTCLR_BKB	Global RAM status clear register (Bank B)	W	0000 0000_H	8/16/32
	FFC6 4214_H	GROVFSTR_BKB	Global RAM error count overflow status register (Bank B)	R	0000 0000_H	8/16/32
	FFC6 4218_H	GR1STERSTR_BKB	Global RAM 1st error status register (Bank B)	R	0000 0000_H	8/16/32
	FFC6 $421C_H$	GR1STEADR_BKB	Global RAM 1st error address register (Bank B)	R	FEF0 0000_H	8/16/32
	FFC6 4220_H	GRTSTCTL_BKB	Global RAM test control register (Bank B)	R/W	0000 0000_H	16/32
	FFC6 4224_H	GRDECINBF1_BKB	Global RAM ECC decoder input data buffer 1 (Bank B)	R/W	0000 0000_H	8/16/32

Note: _BKA and _BKB in Symbol indicate on each bank. “BKA” represents for bank A and “BKB” represents for bank B.

40A.2.5.4 Details of Registers

(1) GRECCCTL_BKA/BKB — Global RAM ECC Control Register

GRECCCTL_BKA/BKB enables or disables ECC error detection and correction and 1-bit error correction. Set the PROT1 and PROT0 bits to 01_B when writing to GRECCCTL_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

Access:	GRECCCTL_BKA and GRECCCTL_BKB can be read or written in 32-bit units GRECCCTL_BKAL and GRECCCTL_BKBL can be read or written in 16-bit units
Address:	GRECCCTL_BKA: FFC6 4000_H GRECCCTL_BKAL: FFC6 4000_H GRECCCTL_BKB: FFC6 4200_H GRECCCTL_BKBL: FFC6 4200_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40A.44 GRECCCTL_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0.Set PROT1 to 0 and PROT0 to 1 when writing to this register.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. When writing, write 01 to PROT1 and PROT0 at the same time. 0: 1-bit error correction is performed when a 1-bit error is detected. 1: 1-bit error correction is not performed when a 1-bit error is detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. When writing, write 01 to PROT1 and PROT0 at the same time. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) GRERRINT_BKA/BKB— Global RAM Error Information Control Register

GRERRINT_BKA/BKB enables or disables generation of the error notification signal upon detection of an ECC 1-bit error.

The setting of this register is used for accesses through the respective access port.

Access: GRERRINT_BKA and GRERRINT_BKB can be read or written in 32-bit units
GRERRINT_BKAL and GRERRINT_BKBL can be read or written in 16-bit units
GRERRINT_BKALL and GRERRINT_BKBLL can be read or written in 8-bit units

Address: GRERRINT_BKA: FFC6 4004$_H$
GRERRINT_BKAL: FFC6 4004$_H$
GRERRINT_BKALL: FFC6 4004$_H$
GRERRINT_BKB: FFC6 4204$_H$
GRERRINT_BKBL: FFC6 4204$_H$
GRERRINT_BKBLL: FFC6 4204$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 40A.45 GRERRINT_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, these bits are always read as 0. When writing, always write 0.
0	SEDIE	ECC 1-bit error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(3) GRSTCLR_BKA/BKB — Global RAM Status Clear Register

GRSTCLR_BKA/BKB clears the error flags in the error status register (GR1STERSTR_BKA/BKB), the overflow flag in the error count overflow status register (GROVFSTR_BKA/BKB), and the error address register (GR1STEADR_BKA/BKB). GRSTCLR_BKA/BKB is a write-only register and is always read as 0.

The setting of this register is used for accesses through the respective access port.

Access: GRSTCLR_BKA and GRSTCLR_BKB are write-only registers that can be written in 32-bit units.
GRSTCLR_BKAL and GRSTCLR_BKBL are write-only registers that can be written in 16-bit units.
GRSTCLR_BKALL and GRSTCLR_BKBLL are write-only registers that can be written in 8-bit units

Address: GRSTCLR_BKA: FFC6 4010$_H$
GRSTCLR_BKAL: FFC6 4010$_H$
GRSTCLR_BKALL: FFC6 4010$_H$
GRSTCLR_BKB: FFC6 4210$_H$
GRSTCLR_BKBL: FFC6 4210$_H$
GRSTCLR_BKBLL: FFC6 4210$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCLR 0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 40A.46 GRSTCLR_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, always write 0.
0	STCLR0	Error Status Flag Clear Writing 1 to this bit clears the DEDF and SEDF flags in GR1STERSTR_BKA/BKB, ERROVF0 flag in GROVFSTR_BKA/BKB, and EADR[19:0] in GR1STEADR_BKA/BKB.

(4) GROVFSTR_BKA/BKB— Global RAM Error Count Overflow Status Register

GROVFSTR_BKA/BKB monitors occurrence of error overflow. If a second error occurs after the first error (while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

The setting of this register is used for accesses through the respective access port.

Access: GROVFSTR_BKA and GROVFSTR_BKB are read-only registers that can be read in 32-bit units
GROVFSTR_BKAL and GROVFSTR_BKBL are read-only registers that can be read in 16-bit units
GROVFSTR_BKALL and GROVFSTR_BKBLL are read-only registers that can be read in 8-bit units

Address: GROVFSTR_BKA: FFC6 4014$_H$
GROVFSTR_BKAL: FFC6 4014$_H$
GROVFSTR_BKALL: FFC6 4014$_H$
GROVFSTR_BKB: FFC6 4214$_H$
GROVFSTR_BKBL: FFC6 4214$_H$
GROVFSTR_BKBLL: FFC6 4214$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.47 GROVFSTR_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF0	Error Overflow Flag ERROVF0 is set if a second error occurs while any of the error flags (DEDF and SEDF) in the error status register is set. ERROVF0 is not set when the second error occurs at the same address or source like the first error.

(5) GR1STERSTR_BKA/BKB— Global RAM 1st Error Status Register

GR1STERSTR_BKA/BKB monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. However, the corresponding error flag is set if an ECC 2-bit error occurs only when SEDF bit is set. GR1STERSTR_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

Access: GR1STERSTR_BKA and GR1STERSTR_BKB are read-only registers that can be read in 32-bit units.
GR1STERSTR_BKAL and GR1STERSTR_BKBL are read-only registers that can be read in 16-bit units.
GR1STERSTR_BKALL and GR1STERSTR_BKBLL are read-only registers that can be read in 8-bit units.

Address: GR1STERSTR_BKA: FFC6 4018_H
GR1STERSTR_BKAL: FFC6 4018_H
GR1STERSTR_BKALL: FFC6 4018_H
GR1STERSTR_BKB: FFC6 4218_H
GR1STERSTR_BKBL: FFC6 4218_H
GR1STERSTR_BKBLL: FFC6 4218_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF	SEDF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.48 GR1STERSTR_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF	ECC 2-bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the STCLR0 bit in GRSTCLR_BKA/BKB to 1. [Setting condition] ECC 2-bit error is detected when DEDF is 0.
0	SEDF	ECC 1-bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the STCLR0 bit in GRSTCLR_BKA/BKB to 1. [Setting condition] ECC 1-bit error is detected when DEDF and SEDF are 0.

(6) GR1STEADR_BKA/BKB— Global RAM 1st Error Address Register

GR1STEADR_BKA/BKB holds the address at which an error has occurred.
The error address is updated if an error occurs while all the error flags are 0 in GR1STERSTR_BKA/BKB. The address

is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error occurs, the address is not updated.
GR1STEADR_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

Access: GR1STEADR_BKA and GR1STEADR_BKB are read-only registers that can be read in 32-bit units.
GR1STEADR_BKAL, GR1STEADR_BKBL, GR1STEADR_BKAH and GR1STEADR_BKBH are read-only registers that can be read in 16-bit units.
GR1STEADR_BKALL, GR1STEADR_BKALH, GR1STEADR_BKAHL, GR1STEADR_BKBLL, GR1STEADR_BKBLH and GR1STEADR_BKBHL are read-only registers that can be read in 8-bit unit.

Address:
GR1STEADR_BKA: FFC6 401C$_H$
GR1STEADR_BKAL: FFC6 401C$_H$
GR1STEADR_BKALL: FFC6 401C$_H$

Table 40A.49 GR1STEADR_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	EADR[19:0]	1st Error Address Monitors the address of the first error. The error address is updated if an error occurs while all the error flags are 0 in GR1STERSTR_BKA/BKB. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

Note 1. The value after reset differs depending on bank A or bank B.

(7) GRTSTCTL_BKA/BKB — Global RAM Test Control Register

This register is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST to 1, any data can be written to the ECC bits.
Also, input and output by the ECC decoder in the global RAM controller can be controlled for testing (self-diagnosis).

Set PROT1 to 0 and PROT0 to 1 when writing to this register.

Access: GRTSTCTL_BKA and GRTSTCTL_BKB can be read or written in 32-bit units
GRTSTCTL_BKAL and GRTSTCTL_BKBL can be read or written in 16-bit units

Address: GRTSTCTL_BKA: FFC6 4020_H
GRTSTCTL_BKAL: FFC6 4020_H
GRTSTCTL_BKB: FFC6 4220_H
GRTSTCTL_BKBL: FFC6 4220_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 40A.50 GRTSTCTL_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, these bits are always read as 0. When writing, always write 0.
15	PROT1	Enables or disables modification of the ECCTST. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to GRTSTCTL_BKA/BKB.
14	PROT0	
13 to 1	Reserved	When read, these bits are always read as 0. When writing, always write 0.
0	ECCTST	ECC test bit. This bit permits to switch the ECC data for writing into RAM. Assert (PROT1, PROT0) = (0, 1) to write to this register. 0: Output of ECC encoder is used for ECC data to RAM 1: Register output is used for ECC data to RAM.

(8) GRDECINBF1_BKA/BKB— Global RAM ECC Decoder Input Data Buffer 1

7-bit ECC of global RAM is replaced to this register value by write access to global RAM during GRTSTCTL_BKA/BKB.ECCTST = 1 (test mode).

Access:	GRDECINBF1_BKA and GRDECINBF1_BKB can be read or written in 32-bit units. GRDECINBF1_BKAL and GRDECINBF1_BKBL can be read or written in 16-bit units. GRDECINBF1_BKALL and GRDECINBF1_BKBLL can be read or written in 8-bit units.
Address:	GRDECINBF1_BKA: FFC6 4024_H GRDECINBF1_BKAL: FFC6 4024_H GRDECINBF1_BKALL: FFC6 4024_H GRDECINBF1_BKB: FFC6 4224_H GRDECINBF1_BKBL: FFC6 4224_H GRDECINBF1_BKBLL: FFC6 4224_H

Table 40A.51 GRDECINBF1_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, these bits are always read as 0. When writing, always write 0.
6 to 0	GRDECINBF1[6:0]	This field is valid ECCTST = 1 (test mode). When the write operation is executed, the data in this register is used for writing to 7-bit ECC field RAM.

40A.2.6 ECC for Peripheral RAM

40A.2.6.1 Overview

This is an ECC module for the RAM of the following peripheral modules.

MMCA, CSIH, RS-CANFD, FlexRay and Ethernet AVB.

Table 40A.52 List of the ECC Functions for the peripheral RAM

Item	Description
ECC error detection/correction	ECC error detection and correction can be enabled or disabled. Either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction ● 2-bit error detection and 1-bit error detection The ECC error detection/correction can be disabled by using through mode. In the initial state, 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Error notification can be enabled or disabled when an ECC 2-bit error is detected. ● Error notification can be enabled or disabled when an ECC 1-bit error is detected. In the initial state of ECC controller, 2-bit error notification is enabled and 1-bit error notification is disabled. However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed.
Error status	Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available. A bit for clearing the error status is provided.
Address capture	Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).

CAUTION

When ECC error detection/correction is performed about RS-CANFD or FlexRay, initialize the RAM area before it is used.

40A.2.6.2 Interrupt Requests

ECC of peripheral interrupt requests are listed below.

Table 40A.53 MMCA ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	MMCA0 ECC 1-bit error or 2-bit error interrupt	INTECCMMCA0RAM	—

Table 40A.54 CSIHn ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
INTECCCSIHn	CSIHn ECC 1-bit error or 2-bit error interrupt	INTECCCSIH0	—
		INTECCCSIH1	
		INTECCCSIH2	
		INTECCCSIH3	
		INTECCCSIH4	

Table 40A.55 RCFDCn ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
ECCCNFDRAMFEIF	RCFDCn ECC 1-bit error or 2-bit error interrupt	INTECCCNFDRAM0	—
		INTECCCNFDRAM1	

Table 40A.56 FlexRay ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	FLXA0 ECC 1-bit error or 2-bit error interrupt	INTECCFLRAM	—

Table 40A.57 Ethernet AVB ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ETNBn ECC 1-bit error or 2-bit error interrupt	INTECCETH0	—
		INTECCETH1	

40A.2.6.3 List of Registers

(1) List of ECC Modules

The RAMs of the multiple peripheral functions are provided with the ECC modules. The following table shows the peripheral functions provided with the ECC modules, the corresponding ECC module names, and base addresses of the ECC modules.

Table 40A.58 List of ECC Modules

Peripheral Functions		Module Name	ECC Module Names and Register	
			Base Address Name	Base Address <base_addr>
MMCA0	Transfer buffer A (TBFA)	ECCMMCA0A	<ECCMMCA0A_base>	FFED A000$_H$
	Transfer buffer B (TBFB)	ECCMMCA0B	<ECCMMCA0B_base>	FFED A100$_H$
CSIHn	Buffered I/O (CSIH RAM)	ECCCSIH0	<ECCCSIH0_base>	FFC7 0100$_H$
		ECCCSIH1	<ECCCSIH1_base>	FFC7 0200$_H$
		ECCCSIH2	<ECCCSIH2_base>	FFC7 0300$_H$
		ECCCSIH3	<ECCCSIH3_base>	FFC7 0400$_H$
		ECCCSIH4	<ECCCSIH4_base>	FFC7 0500$_H$
RCFDC0	Message bufferRAM (MB RAM)	ECCCFD0MB	<ECCCFD0MB_base>	FFC7 1300$_H$
	Acceptance filter list RAM0 (AFL0 RAM)	ECCCFD0AFL0	<ECCCFD0AFL0_base>	FFC7 1400$_H$
	Acceptance filter list RAM1 (AFL1 RAM)	ECCCFD0AFL1	<ECCCFD0AFL1_base>	FFC7 1500$_H$
RCFDC1	Message bufferRAM (MB RAM)	ECCCFD1MB	<ECCCFD1MB_base>	FFC7 1A00$_H$
	Acceptance filter list RAM0 (AFL0 RAM)	ECCCFD1AFL0	<ECCCFD1AFL0_base>	FFC7 1B00$_H$
	Acceptance filter list RAM1 (AFL1 RAM)	ECCCFD1AFL1	<ECCCFD1AFL1_base>	FFC7 1C00$_H$
FLXA0	Message RAM (MRAM)	ECCFLXA0	<ECCFLXA0_base>	FFC7 3100$_H$
	Temporary buffer (TBFA)	ECCFLXA0T0	<ECCFLXA0T0_base>	FFC7 3200$_H$
	Temporary buffer (TBFB)	ECCFLXA0T1	<ECCFLXA0T1_base>	FFC7 3300$_H$
ETNB0	Transmit FIFO RAM.(TXRAM)	ECCETNB0TX	<ECCETNB0TX_base>	FFC7 4100$_H$
	Receive FIFO RAM.(RXRAM)	ECCETNB0RX	<ECCETNB0RX_base>	FFC7 4200$_H$
ETNB1	Transmit FIFO RAM.(TXRAM)	ECCETNB1TX	<ECCETNB1TX_base>	FFC7 4300$_H$
	Receive FIFO RAM.(RXRAM)	ECCETNB1RX	<ECCETNB1RX_base>	FFC7 4400$_H$

(2) List of Registers

Each ECC module has the registers shown in the following table.

Table 40A.59 List of Registers

Module Name	Register Name	Symbol	Address
See (1) List of ECC Modules.	ECC control register	<Module_Name>CTL	<base_addr> + 00_H
	ECC test mode control register	<Module_Name>TMC	<base_addr> + 04_H
	ECC encode/decode input/output replacement test register	<Module_Name>TED	<base_addr> + $0C_H$
	ECC redundant bit data control test register	<Module_Name>TRC	<base_addr> + 08_H
	ECC decode syndrome data register	<Module_Name>SYND	<base_addr> + $0B_H$
	ECC 7-bit redundant bit data hold test register	<Module_Name>HORD	<base_addr> + $0A_H$
	ECC encode test register	<Module_Name>ECRD	<base_addr> + 09_H
	ECC redundant bit input/output replacement register	<Module_Name>ERDB	<base_addr> + 08_H
	ECC error address register 0	<Module_Name>AD0	<base_addr> + 10_H
SL_READTEST	ECCREAD test select register	SELB_READTEST	FFC7 8000H

40A.2.6.4 Details of Registers

(1) <Module_Name>CTL — ECC Control Register

The <Module_Name>CTL register controls the mode of the ECC and the status for target peripheral modules.

Bits 7, 5, 4 and 3 should be set (written) while the target peripheral module’s operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01_B.

Access: This register can be read or written in 16-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

Value after reset: $001X_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	ECCOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	—
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R	R

Note 1. These bits are always read as 0.

Table 40A.60 <Module_Name>CTL Register Contents

Bit Position	Bit Name	Function
15	EMCA1	Access Control Bits 1 and 0 to ECC Mode Selection These bits specify whether updating the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 01_B, writing to bit 7 is enabled.
14	EMCA0	
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	ECCOVFF	By detecting an error while the error status is set and the new error has another address than the already latched (not cleared or reset is not issued), this bit is set. 0: Overflow is not occurred after reset of clearing ECER2F and ECER1F. 1: Error address register overflowed **NOTE:** This bit clear condition is as follows. (1) Reset (2) Writing ECER2C = 1 when ECER2F = 1 or ECER1C = 1 when ECER1F = 1 (3) Selecting through mode enable (ECTHM = 1)
10	ECER2C	2-Bit ECC Error Detection Flag Clear This bit clears 2-bit error detection flags of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. ECER2C = 1 also clears the ECCOVFF bit while ECER2F bit is set.
9	ECER1C	1-Bit ECC Error Detection Correction Accumulation Flag Clear This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. ECER1C = 1 also clears the ECCOVFF bit while ECER1F bit is set.
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40A.60 <Module_Name>CTL Register Contents

Bit Position	Bit Name	Function
7	ECTHM	ECC Function through Mode Selection Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 disables the ECC function. When writing to this bit, write 01_B to the EMCA1 and EMCA0 bits at the same time. Set this bit to 1 to disable the ECC function. 0: Passing through mode is disabled (normal operation mode). 1: Passing through mode is enabled. (ECC function disable)
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	EC1ECP	1-Bit Error Correction Enable This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. 0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.
4	EC2EDIC	2-Bit Error Detection Interrupt Control This bit controls whether to generate an interrupt when 2-bit error is detected. 0: When 2-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 2-bit error is detected, a target peripheral module's interrupt will be generated.
3	EC1EDIC	1-Bit Error Detection Interrupt Control This bit controls whether to generate an interrupt when 1-bit error is detected. 0: When 1-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 1-bit error is detected, a target peripheral module's interrupt will be generated.
2	ECER2F	2-Bit Error Detection Flag This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (a target peripheral module's interrupt) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. When through mode is enable (ECTHM = 1), this bit is cleared. If 2-bit error is detected again while this bit is set, an interrupt will not be generated. 0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred. This bit is read-only. Writing 0 or 1 does not change internal state.
1	ECER1F	1-Bit Error Detection/Correction Flag This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. When through mode is enabled (ECTHM = 1), this bit is cleared. 0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred. This bit is read-only. Writing 0 or 1 does not change internal state.
0	ECEMF	ECC Error Message Flag This flag indicates whether an error exists in the current read data bus. This bit is updated whenever the RAM outputs data. This bit is also cleared when through mode is enabled (ECTHM = 1) and there is no 1-bit error in decode circuit input data. 0: The current RAM output data does not have bit errors. 1: The current RAM output data have bit errors.

CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

(2) <Module_Name>TMC — ECC Test Mode Control Register

The <Module_Name>TMC register is used to switch to the test mode, and this register is for test mode control.

This register can be used when a target peripheral module is not accessed to RAM.

When writing to bit 7, ETMA1 and ETMA0 need to be 10_B.

Access: This register can be read or written in 16-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA1	ETMA0	—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*[1]	R/W*[1]	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. These bits are always read as 0.

Table 40A.61 <Module_Name>TMC Register Contents

Bit Position	Bit Name	Function
15	ETMA1	Access Control Bits 1 and 0 to ECC Test Mode These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.
14	ETMA0	
13 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTMCE	ECC Test Mode Enable This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write 10_B to the ETMA1 and ETMA0 bits at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: <Module_Name>TED, <Module_Name>TRC, <Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, <Module_Name>ERDB Register test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECTRRS	ECC RAM Read Test Mode Selection This bit selects the targets for reading when the <Module_Name>TED and <Module_Name>ERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Read value of the <Module_Name>TED register will be the write value of the <Module_Name>TED register. Read value of the <Module_Name>ERDB register will be the write value of the <Module_Name>ERDB register. 1: Read value of the <Module_Name>TED register can read RAM data. Read value of the <Module_Name>ERDB register will be the ECC Data to be written to RAM.
3	ECREOS	ECC Redundant Bit Output Data Selection This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the <Module_Name>ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated for write data is stored in RAM. 1: The value of <Module_Name>ERDB Register is stored in RAM.

Table 40A.61 <Module_Name>TMC Register Contents

Bit Position	Bit Name	Function
2	ECENS	ECC Encoder Input Selection This bit specifies data written to RAM or the value of the <Module_Name>TED register as the input to the ECC encoder. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated from write data to RAM 1: ECC data is generated from register value of the <Module_Name>TED.
1	ECDCS	ECC Decoder Input Selection This bit specifies which data is for generation of syndrome code and error detection, RAM data or the value of <Module_Name>TED. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Syndrome code generation and error detection are performed from RAM Data. 1: Syndrome code generation and error detection are performed from <Module_Name>TED register value.
0	ECREIS	ECC Redundant Bit Input Data Selection This bit specifies which ECC data is for generation of syndrome code and error detection, ECC data stored in RAM or the value of the <Module_Name>ERDB. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Syndrome code generation and error detection are performed from ECC data stored in RAM. 1: Syndrome code generation and error detection are performed from <Module_Name>ERDB register value.

(3) <Module_Name>TED — ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

This register value is used to generate ECC data or syndrome code.

This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE = 1). When <Module_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when a target peripheral module is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEDB[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEDB[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40A.62 <Module_Name>TED Register Contents

Bit Position	Bit Name	Function
31 to 0	ECEDB[31:0]	When <Module_Name>TMC.ECENS = 1, the value of this register is used to generate ECC data and that is stored to RAM. When <Module_Name>TMC.ECDCS = 1, the value of this register is used to generate syndrome code that is stored in ECC decode syndrome data register (<Module_Name>SYND). In addition, when <Module_Name>TMC.ECTRRS = 1, RAM data [31:0] instead of written data is read for the value of this register.

(4) <Module_Name>TRC — ECC Redundant Bit Data Control Test Register

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers, <Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, and <Module_Name>ERDB.

This register can be accessed when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When <Module_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when a target peripheral module is not accessed to RAM.

Access:	This register can be read or written in 32-bit units.
Address:	See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	<Module_Name>SYND (see **Section (6)**)								<Module_Name>HORD (see **Section (7)**)

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(5) <Module_Name>AD0 — Target ECC Error Address Register 0

This is read only register to hold the ECC error occurred address.

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	ECEAD[30:16]														
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.63 <Module_Name>AD0 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned.
30 to 0	ECEAD[30:0]	ECEAD0 is a read-only register to hold the address at which an ECC error has occurred. If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECEAD0 as the address at which the ECC error has occurred. The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. Only one address can be held in ECEAD0

(6) <Module_Name>SYND — ECC Decode Syndrome Data Register

This register is a read-only register for storing generated syndrome data in ECC test mode.

Writing to this register is ignored.

This register is read-only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SYND6	SYND5	SYND4	SYND3	SYND2	SYND1	SYND0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40A.64 <Module_Name>SYND Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	SYND[6:0]	These bits store generated syndrome code as needed.

(7) <Module_Name>HORD — ECC 7-Bit Redundant Bit Data Hold Test Register

This register is for storing ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	HORD6	HORD5	HORD4	HORD3	HORD2	HORD1	HORD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40A.65 <Module_Name>HORD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	HORD[6:0]	These bits store ECC code for read RAM data as needed. When <Module_Name>TMC.ECTRRS =1 and if <Module_Name>TED register is read, ECC code is stored.

(8) <Module_Name>ECRD — ECC Encode Test Register

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ECRD6	ECRD5	ECRD4	ECRD3	ECRD2	ECRD1	ECRD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40A.66 <Module_Name>ECRD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing and can read ECC data for data written in the <Module_Name>TED register when <Module_Name>MC.ECENS =1.

(9) <Module_Name>ERDB — ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles test data.

This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE = 1). When <Module_Name>TMC.ECTMCE = 0, writing to this register is ignored and 00_H is read.

Access:	This register can be read or written in 8-bit units.
Address:	See **Table 40A.58, List of ECC Modules** and **Table 40A.59, List of Registers**.
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	ERDB6	ERDB5	ERDB4	ERDB3	ERDB2	ERDB1	ERDB0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40A.67 <Module_Name>ERDB Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ERDB[6:0]	These bits can store this register value as ECC data when <Module_Name>TMC.ECREOS = 1. When the register is read while <Module_Name>TMC.ECREIS =1, the value read from these bits is ECC data read from the RAM. When <Module_Name>TMC.ECTRRS = 1, ECC data to be stored in RAM will be read for this register value instated of written data.

(10) SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the target peripheral module's RAM ECC registers.

Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

Access: SELB_READTESTW can be read or written in 32-bit units.
SELB_READTEST and SELB_READTESTH can be read or written in 16-bit units.

Address: SELB_READTESTW: FFC7 8000_H
SELB_READTEST: FFC7 8000_H
SELB_READTESTH: FFC7 8002_H

Value after reset: 0000 0000_H

3	RTCSIHE7A3	CSIH3 ECC Register Write Access for Testing Purpose Enable/Disable 0: Write access for testing purpose is disabled. 1: Write access for testing purpose is enabled (CSIH3 ECC read-only bit can be written).
2	RTCSIHE7A2	CSIH2 ECC Register Write Access for Testing Purpose Enable/Disable 0: Write access for testing purpose is disabled. 1: Write access for testing purpose is enabled (CSIH2 ECC read-only bit can be written).
1	RTCSIHE7A1	CSIH1 ECC Register Write Access for Testing Purpose Enable/Disable 0: Write access for testing purpose is disabled. 1: Write access for testing purpose is enabled (CSIH1 ECC read-only bit can be written).
0	RTCSIHE7A0	CSIH0 ECC Register Write Access for Testing Purpose Enable/Disable 0: Write access for testing purpose is disabled. 1: Write access for testing purpose is enabled (CSIH0 ECC read-only bit can be written).

40A.3 Memory Protection

40A.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU
  The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see *the RH850 Family User's Manual: Software*.
- Slave Guard
  A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.
  - PEG
    The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see **Section 3A, CPU System of RH850/F1KH-D8**.
  - IPG
    The CPU Peripheral is protected against illegal accesses.
    For details, see **Section 3A, CPU System of RH850/F1KH-D8**.
  - GRG
    The global RAM is protected against illegal accesses.
  - PBG/HBG
    The control registers in the peripheral circuits are protected against illegal accesses. For details, see **Section 40A.3.3, PBG/HBG**.
  - PBGC
    The CPU system has its dedicated PBG function which is called PBG for CPU system. For details, see **Section 40A.3.4, PBG for CPU System**.

40A.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.

Table 40A.69 Identifiers for Slave Guard

Identifier	Function
UM	When the CPU makes an access, this indicates the operating mode of the CPU. 0: Supervisor mode 1: User mode When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 0.
SPID	When the CPU makes an access, this indicates the system protection identifier SPID that is assigned to the CPU. When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 00_B.
PEID	This indicates the access source bus master. 001_B: CPU1 010_B: CPU2 100_B: Other bus master (H-Bus bus master) When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.

40A.3.2 GRG (Global RAM Guard)

This product is provided with 4-channel GRG, which is described in detail in the following sections.

CAUTION

The retention RAM is a part of the global RAM. The Guard for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

40A.3.2.1 List of Registers

Table 40A.70 List of Registers

Module Name	Address	Symbol	Register Name	R/W	Value after Reset	Access Size
MGDGR	FFC4 9000$_H$	MGDGRPROT0_BKA	GRG protection setting register0 (Bank A)	R/W	03FE 01F0$_H$	8/16/32
	FFC4 9004$_H$	MGDGRBAD0_BKA	GRG compare base address register0 (Bank A)	R/W	0000 0000$_H$	8/16/32

	FFC4 9044$_H$	MGDGRSSTAT_BKA	GRG error status register (Bank A)	R	0000 0000$_H$	8/16/32
	FFC4 9048$_H$	MGDGRSTYPE_BKA	GRG error access type register (Bank A)	R	0000 0000$_H$	8/16/32
	FFC4 904C$_H$	MGDGRSAD_BKA	GRG error address register (Bank A)	R	FEE0 0000$_H$	8/16/32
	FFC4 9200$_H$	MGDGRPROT0_BKB	GRG protection setting register0 (Bank B)	R/W	03FE 01F0$_H$	8/16/32
	FFC4 9204$_H$	MGDGRBAD0_BKB	GRG compare base address register0 (Bank B)	R/W	0000 0000$_H$	8/16/32
	FFC4 9208$_H$	MGDGRADV0_BKB	GRG compare address valid register0 (Bank B)	R/W	0000 0000$_H$	8/16/32
	FFC4 9210$_H$	MGDGRPROT1_BKB	GRG protection setting register1 (Bank B)	R/W	03FE 01F0$_H$	8/16/32
	FFC4 9214$_H$	MGDGRBAD1_BKB	GRG compare base address register1 (Bank B)	R/W	0000 0000$_H$	8/16/32
	FFC4 9218$_H$	MGDGRADV1_BKB	GRG compare address valid register1 (Bank B)	R/W	0000 0000$_H$	8/16/32
	FFC4 9220$_H$	MGDGRPROT2_BKB	GRG protection setting register2 (Bank B)	R/W	03FE 01F0$_H$	8/16/32
	FFC4 9224$_H$	MGDGRBAD2_BKB	GRG compare base address register2 (Bank B)	R/W	0000 0000$_H$	8/16/32
	FFC4 9228$_H$	MGDGRADV2_BKB	GRG compare address valid register2 (Bank B)	R/W	0000 0000$_H$	8/16/32
	FFC4 9230$_H$	MGDGRPROT3_BKB	GRG protection setting register3 (Bank B)	R/W	03FE 01F0$_H$	8/16/32
	FFC4 9234$_H$	MGDGRBAD3_BKB	GRG compare base address register3 (Bank B)	R/W	0000 0000$_H$	8/16/32
	FFC4 9238$_H$	MGDGRADV3_BKB	GRG compare address valid register3 (Bank B)	R/W	0000 0000$_H$	8/16/32
	FFC4 9240$_H$	MGDGRSCTL_BKB	GRG control register (Bank B)	W	0000 0000$_H$	8/16/32
	FFC4 9244$_H$	MGDGRSSTAT_BKB	GRG error status register (Bank B)	R	0000 0000$_H$	8/16/32
	FFC4 9248$_H$	MGDGRSTYPE_BKB	GRG error access type register (Bank B)	R	0000 0000$_H$	8/16/32
	FFC4 924C$_H$	MGDGRSAD_BKB	GRG error address register (Bank B)	R	FEF0 0000$_H$	8/16/32

Note: MGDGRPROTn_BKA/BKB, MGDGRBADn_BKA/BKB, and MGDGRADVn_BKA/BKB set the protection specifications for each channel (n = 0 to 3).
MGDGRSCTL_*, MGDGRSSTAT_*, MGDGRSTYPE_* and MGDGRSAD_* indicate error information on each bank.
“BKA” represents for Bank A and “BKB” represents for Bank B.

40A.3.2.2 Details of Registers

(1) MGDGRPROTn_BKA/BKB — GRG Protection Setting Register n (n = 0 to 3)

Access: MGDGRPROTn_BKA and MGDGRPROTn_BKB can be read or written in 32-bit units
MGDGRPROTn_BKAL, MGDGRPROTn_BKBL, MGDGRPROTn_BKAH and MGDGRPROTn_BKBH can be read or written in 16-bit units
MGDGRPROTn_BKALL, MGDGRPROTn_BKAHL, MGDGRPROTn_BKAHH, MGDGRPROTn_BKBLL, MGDGRPROTn_BKBHL and MGDGRPROTn_BKBHH can be read or written in 8-bit units.

Address: MGDGRPROTn_BKA: FFC4 9000$_H$ + n × 10$_H$
MGDGRPROTn_BKAL: FFC4 9000$_H$ + n × 10$_H$
MGDGRPROTn_BKALL: FFC4 9000$_H$ + n × 10$_H$
MGDGRPROTn_BKAH: FFC4 9002$_H$ + n × 10$_H$
MGDGRPROTn_BKAHL: FFC4 9002$_H$ + n × 10$_H$
MGDGRPROTn_BKAHH: FFC4 9003$_H$ + n × 10$_H$
MGDGRPROTn_BKB: FFC4 9200$_H$ + n × 10$_H$
MGDGRPROTn_BKBL: FFC4 9200$_H$ + n × 10$_H$
MGDGRPROTn_BKBLL: FFC4 9200$_H$ + n × 10$_H$
MGDGRPROTn_BKBH: FFC4 9202$_H$ + n × 10$_H$
MGDGRPROTn_BKBHL: FFC4 9202$_H$ + n × 10$_H$
MGDGRPROTn_BKBHH: FFC4 9203$_H$ + n × 10$_H$

Value after reset: 03FE 01F0$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 40A.71 MGDGRPROTn_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30	EN	Protection Enable 0: Disables protection. 1: Enables protection. Only access permitted by this register is possible.
29 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	UM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	PEID4	Access with PEID = 4 (peripheral device connected to H-BUS)*1 0: Disables access with PEID4. 1: Enables access with PEID4.
20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40A.71 MGDGRPROTn_BKA/BKB Register Contents

Bit Position	Bit Name	Function
19	PEID2	Access with PEID = 2 (CPU2)*[1] 0: Disables access with PEID2. 1: Enables access with PEID2.
18	PEID1	Access with PEID = 1 (CPU1)*[1] 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	SPID3	Access with SPID = 3*[2] 0: Disables access with SPID3. 1: Enables access with SPID3.
7	SPID2	Access with SPID = 2 (CPU2*[3])*[2] 0: Disables access with SPID2. 1: Enables access with SPID2.
6	SPID1	Access with SPID = 1 (CPU1*[3])*[2] 0: Disables access with SPID1. 1: Enables access with SPID1.
5	SPID0	Access with SPID = 0 (peripheral device connected to H-BUS)*[2] 0: Disables access with SPID0. 1: Enables access with SPID0.
4 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. Access with PEID
PEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
SPID is a bit list with each bit corresponding to a SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. Setting value of MCFG0.SPID

CAUTION

Global RAM Guard (GRG) only supports write accesses. The guard setting is not enabled for read accesses.

(2) MGDGRBADn_BKA/BKB — GRG Compare Base Address Register n (n = 0 to 3)

Access: MGDGRBADn_BKA and MGDGRBADn_BKB can be read or written in 32-bit units.
MGDGRBADn_BKAL, MGDGRBADn_BKAH, MGDGRBADn_BKBL and MGDGRBADn_BKBH can be read or written in 16-bit units.
MGDGRBADn_BKALH, MGDGRBADn_BKAHL, MGDGRBADn_BKBLH and MGDGRBADn_BKBHL can be read or written in 8-bit units.

Address:
MGDGRBADn_BKA: FFC4 9004_H + n × 10_H
MGDGRBADn_BKAL: FFC4 9004_H + n × 10_H
MGDGRBADn_BKALH: FFC4 9005_H + n × 10_H
MGDGRBADn_BKAH: FFC4 9006_H + n × 10_H
MGDGRBADn_BKAHL: FFC4 9006_H + n × 10_H
MGDGRBADn_BKB: FFC4 9204_H + n × 10_H
MGDGRBADn_BKBL: FFC4 9204_H + n × 10_H
MGDGRBADn_BKBLH: FFC4 9205_H + n × 10_H
MGDGRBADn_BKBH: FFC4 9206_H + n × 10_H
MGDGRBADn_BKBHL: FFC4 9206_H + n × 10_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 40A.72 MGDGRBADn_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 11	AD[19:11]	Compare Base Address*[1] These bits set the base address of protection setting domain specified by the GRG protection setting register n (MGDGRPROTn_BKA/BKB).
10 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. For details, see **Section 40A.3.2.2(3), MGDGRADVn_BKA/BKB — GRG Compare Address Valid Register n (n = 0 to 3)**.

(3) MGDGRADVn_BKA/BKB — GRG Compare Address Valid Register n (n = 0 to 3)

Access: MGDGRADVn_BKA and MGDGRADVn_BKB can be read or written in 32-bit units.

MGDGRADVn_BKAL, MGDGRADVn_BKAH, MGDGRADVn_BKBL and MGDGRADVn_BKBH can be read or written in 16-bit units.

MGDGRADVn_BKALH, MGDGRADVn_BKAHL, MGDGRADVn_BKBLH and MGDGRADVn_BKBHL can be read or written in 8-bit units.

Address:
MGDGRADVn_BKA: FFC4 9008_H + n × 10_H
MGDGRADVn_BKAL: FFC4 9008_H + n × 10_H
MGDGRADVn_BKALH: FFC4 9009_H + n × 10_H
MGDGRADVn_BKAH: FFC4 $900A_H$ + n × 10_H
MGDGRADVn_BKAHL: FFC4 $900A_H$ + n × 10_H
MGDGRADVn_BKB: FFC4 9208_H + n × 10_H
MGDGRADVn_BKBL: FFC4 9208_H + n × 10_H
MGDGRADVn_BKBLH: FFC4 9209_H + n × 10_H
MGDGRADVn_BKBH: FFC4 $920A_H$ + n × 10_H
MGDGRADVn_BKBHL: FFC4 $920A_H$ + n × 10_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 40A.73 MGDGRADVn_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 11	ADV[19:11]	Valid Compare Address Setting MGDGRADVn_BKA/BKB[19:11] to 1 executes address compare. If all the bits of MGDGRADVn_BKA/BKB[19:11] are 1, 2 Kbytes, which is the minimum unit based on the address specified by MGDGRBADn_BKA/BKB, are protected. However, if all the bits of MGDGRADVn_BKA/BKB[19:11] are 0, all the areas of global RAM are protected.
10 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Setting example

If MGDGRBADn_BKA.AD[19:11] is 170$_H$ and MGDGRADVn_BKA.ADV[19:11] is 1FD$_H$, global RAM guard protection area n is from FEEB 8000$_H$ to FEEB 87FF$_H$ and FEEB 9000$_H$ to FEEB 97FF$_H$.

If MGDGRBADn_BKB.AD[19:11] is 170$_H$ and MGDGRADVn_BKB.ADV[19:11] is 1FD$_H$, global RAM guard protection area n is from FEFB 8000$_H$ to FEFB 87FF$_H$ and FEFB 9000$_H$ to FEFB 97FF$_H$.

Concept (e.g. bank A)

When MGDGRBADn_BKA.AD[19:11] is 170$_H$, the base address is FEEB 8000$_H$.
The settable range is shown by an underline as follows:

1 1 1 1	1 1 1 0	1 1 1 0	1 0 1 1	1 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	B
F	E	E	B	8	0	0	0	H

The settable range is as follows when MGDGRADVn_BKA.ADV[19:11] is 1FD$_H$:

0 0 0 0	0 0 0 0	0 0 0 0	1 1 1 1	1 1 1 0	1 0 0 0	0 0 0 0	0 0 0 0	B

The area to which protection applies is as shown below because the bits set to 0 and the lower eleven bits are not applicable:

0 0 0 0	0 0 0 0	0 0 0 0	1 0 1 1	1 0 0 x	0 x x x	x x x x	x x x x	B

Therefore the protection range is as follows:

1 1 1 1	1 1 1 0	1 1 1 0	1 0 1 1	1 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	B
F	E	E	B	8	0	0	0	H

to

1 1 1 1	1 1 1 0	1 1 1 0	1 0 1 1	1 0 0 0	0 1 1 1	1 1 1 1	1 1 1 1	B
F	E	E	B	8	7	F	F	H

and

1 1 1 1	1 1 1 0	1 1 1 0	1 0 1 1	1 0 0 1	0 0 0 0	0 0 0 0	0 0 0 0	B
F	E	E	B	9	0	0	0	H

to

1 1 1 1	1 1 1 0	1 1 1 0	1 0 1 1	1 0 0 1	0 1 1 1	1 1 1 1	1 1 1 1	B
F	E	E	B	9	7	F	F	H

The following 2 Kbytes each (a total of 4 Kbytes) are protected (in hexadecimal):

- FEEB 8000$_H$ to FEEB 87FF$_H$
- FEEB 9000$_H$ to FEEB 97FF$_H$

(4) MGDGRSCTL_BKA/BKB — GRG Control Register

Access: MGDGRSCTL_BKA and MGDGRSCTL_BKB registers are write-only registers that can be written in 32-bit units.
MGDGRSCTL_BKAL and MGDGRSCTL_BKBL registers are write-only registers that can be written in 16-bit units.
MGDGRSCTL_BKALL and MGDGRSCTL_BKBLL registers are write-only registers that can be written in 8-bit units.

Address: MGDGRSCTL_BKA: FFC4 9040$_{\text{H}}$
MGDGRSCTL_BKAL: FFC4 9040$_{\text{H}}$
MGDGRSCTL_BKALL: FFC4 9040$_{\text{H}}$
MGDGRSCTL_BKB: FFC4 9240$_{\text{H}}$
MGDGRSCTL_BKBL: FFC4 9240$_{\text{H}}$
MGDGRSCTL_BKBLL: FFC4 9240$_{\text{H}}$

Value after reset: 0000 0000$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 40A.74 MGDGRSCTL_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	ERRCLO	Error Entry Overflow Flag Clear 0: No operation 1: Clears the overflow flag.
0	ERRCLE	GRG Protection Violation Flag Clear 0: No operation 1: Clears the error flag. Set this bit at the same time as ERRCLO as shown in **Table 40A.75, Combinations of ERRCLO and ERRCLE**.

Table 40A.75 Combinations of ERRCLO and ERRCLE

ERRCLO	ERRCLE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

(5) MGDGRSSTAT_BKA/BKB— GRG Error Status Register

Access:	MGDGRSSTAT_BKA and MGDGRSSTAT_BKB are read-only registers that can be read in 32-bit units. MGDGRSSTAT_BKAL and MGDGRSSTAT_BKBL are read-only registers that can be read in 16-bit units. MGDGRSSTAT_BKALL and MGDGRSSTAT_BKBLL are read-only registers that can be read in 8-bit units.
Address:	MGDGRSSTAT_BKA: FFC4 9044_H MGDGRSSTAT_BKAL: FFC4 9044_H MGDGRSSTAT_BKALL: FFC4 9044_H MGDGRSSTAT_BKB: FFC4 9244_H MGDGRSSTAT_BKBL: FFC4 9244_H MGDGRSSTAT_BKBLL: FFC4 9244_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.76 MGDGRSSTAT_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred. If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of GRG error entry stages is 1. Note that this overflow is notified to INTGUARD. In addition, it is not possible to determine whether overflow has occurred in INTGUARD. Check the value of this bit. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	GRG protection violation Error Flag 0: No GRG protection violation has occurred. 1: A GRG protection violation has occurred.

(6) MGDGRSTYPE_BKA/BKB — GRG Error Access Type Register

Access: MGDGRSTYPE_BKA and MGDGRSTYPE_BKB are read-only registers that can be read in 32-bit units.
MGDGRSTYPE_BKAL and MGDGRSTYPE_BKBL are read-only registers that can be read in 16-bit units.
MGDGRSTYPE_BKALL, MGDGRSTYPE_BKALH, MGDGRSTYPE_BKBLL and MGDGRSTYPE_BKBLH are read-only registers that can be read in 8-bit units.

Address:
MGDGRSTYPE_BKA: FFC4 9048$_H$
MGDGRSTYPE_BKAL: FFC4 9048$_H$
MGDGRSTYPE_BKALL: FFC4 9048$_H$
MGDGRSTYPE_BKALH: FFC4 9049$_H$
MGDGRSTYPE_BKB: FFC4 9248$_H$
MGDGRSTYPE_BKBL: FFC4 9248$_H$
MGDGRSTYPE_BKBLL: FFC4 9248$_H$
MGDGRSTYPE_BKBLH: FFC4 9249$_H$

Value after reset: 0000 0000$_H$

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.77 MGDGRSTYPE_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	The PEID of the originator of the access which led to a GRG protection violation
12 to 10	Reserved	When read, the value after reset is returned.
9 to 8	SPID[1:0]	The SPID of the originator of the access which led to a GRG protection violation
7	Reserved	When read, the value after reset is returned.
6	UM	The UM of the originator of the access which led to a GRG protection violation
5 to 0	Reserved	When read, the value after reset is returned.

(7) MGDGRSAD_BKA/BKB — GRG Error Address Register

Access: MGDGRSAD_BKA and MGDGRSAD_BKB are read-only registers that can be read in 32-bit units.
MGDGRSAD_BKAL, MGDGRSAD_BKAH, MGDGRSAD_BKBL and MGDGRSAD_BKBH are read-only registers that can be read in 16-bit units.
MGDGRSAD_BKALL, MGDGRSAD_BKALH, MGDGRSAD_BKAHL, MGDGRSAD_BKBLL, MGDGRSAD_BKBLH and MGDGRSAD_BKBHL are read-only registers that can be read in 8-bit units.

Address:
MGDGRSAD_BKA: FFC4 904C$_H$
MGDGRSAD_BKAL: FFC4 904C$_H$
MGDGRSAD_BKALL: FFC4 904C$_H$

Table 40A.78 MGDGRSAD_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	SAD[19:0]	Address at GRG violation was occurred.

Note 1. The value after reset differs depending on bank A or bank B.

40A.3.3 PBG/HBG

The PBG/HBG module is divided into several PBG/HBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG/HBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG/HBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG/HBG group names, and the PBG/HBG channel numbers.

Table 40A.79 PBG/HBG Groups and Channels and Target Modules

PBG/HBG Group	Group No. (Register Name index)*3	PBG/HBG Channel Number	Protection Target Module	Target Register
PBG10	00	0	ECON_NMI	WDTNMIF WDTNMIFC

		4	RCFDC0 (channel 4)	All registers in RCFDC0 Ch4 group*4
		5	RCFDC0 (channel 5)	All registers in RCFDC0 Ch5 group*4
		6	RCFDC0 (channel 6)	All registers in RCFDC0 Ch6 group*4
		7	RCFDC0 (channel 7)	All registers in RCFDC0 Ch7 group*4
		8	RCFDC0 (Global)	All registers in RCFDC0 Global group*4
		9	ECCCFD0MB	All registers in ECCCFD0MB
		10	ECCCFD0AFL0	All registers in ECCCFD0AFL0
		11	ECCCFD0AFL1	All registers in ECCCFD0AFL1
PBG61	14	0	RCFDC1_CAN0	All registers in RCFDC1 Ch0 group
		1	RCFDC1_CAN1	All registers in RCFDC1 Ch1 group
		2	RCFDC1_CAN2	All registers in RCFDC1 Ch2 group
		3	RCFDC1_CAN3	All registers in RCFDC1 Ch3 group
		4	RCFDC1_Global	All registers in RCFDC1 Global group
		5	ECCCFD1MB	All registers in ECCCFD1MB
		6	ECCCFD1AFL0	All registers in ECCCFD1AFL0
		7	ECCCFD1AFL1	All registers in ECCCFD1AFL1
HBG00	00	0	MEMC0	All registers in MEMC0
		1	MEMC0_CS0	External Memory Area(CS0)
		2	MEMC0_CS1	External Memory Area(CS1)
		3	MEMC0_CS2	External Memory Area(CS2)
		4	MEMC0_CS3	External Memory Area(CS3)
HBG01	01	0	SFMA0	All registers in SFMA0
		1	SFMA0_MEM	External Serial Flash Memory Area
HBG02	02	0	FLXA0	All registers in FLXA0

Note 1. For details, see **Section 5, Write-Protected Registers**, **Section 9A, Reset Controller of RH850/F1KH-D8**, **Section 10A, Power Supply Circuit of RH850/F1KH-D8**, **Section 11A, Supply Voltage Monitor of RH850/F1KH-D8**, **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4**, **Section 13, Clock Monitor (CLMA)**, **Section 14, Stand-By Controller (STBC)**, and **Section 15, Low-Power Sampler (LPS)**.

Note 2. Regarding the PBG registers for the flash memory, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

Note 3. Regarding the PBG register addresses, see **Table 40A.80, List of PBG/HBG Protection Registers**.

Note 4. Regarding the RS-CANFD guard group, see **Section 24, CANFD Interface (RS-CANFD)**.

NOTE

Be sure to enable PBG/HBG before disabling register access clock of each clock domain.

40A.3.3.1 List of Registers

The following table lists the registers provided for each PBG/HBG group. And PBG/HBG group is equal to module name.

Table 40A.80 List of PBG/HBG Protection Registers

PBG/ HBG Group^{*1}	Group No.^{*2}	Symbol	Register Name	R/W	Value after Reset	Address	Access Size	Power Domain
PBG10	00	FSGD00PROT0	PBG00 protection register 0	R/W	066F FFF7$_H$	FFC4 0000$_H$	8/16/32	ISO
		FSGD00PROT1	PBG00 protection register 1	R/W	066F FFF7$_H$	FFC4 0004$_H$	8/16/32	
		FSGD00PROT2	PBG00 protection register 2	R/W	066F FFF7$_H$	FFC4 0008$_H$	8/16/32	
		FSGD00PROT3	PBG00 protection register 3	R/W	066F FFF7$_H$	FFC4 000C$_H$	8/16/32	
		FSGD00PROT4	PBG00 protection register 4	R/W	066F FFF7$_H$	FFC4 0010$_H$	8/16/32	
		FSGD00PROT5	PBG00 protection register 5	R/W	066F FFF7$_H$	FFC4 0014$_H$	8/16/32	
		FSGD00PROT6	PBG00 protection register 6	R/W	066F FFF7$_H$	FFC4 0018$_H$	8/16/32	
		FSGD00PROT7	PBG00 protection register 7	R/W	066F FFF7$_H$	FFC4 001C$_H$	8/16/32	
		FSGD00PROT8	PBG00 protection register 8	R/W	066F FFF7$_H$	FFC4 0020$_H$	8/16/32

Note 1. The Group indicates the module name.

Note 2. Register name index.

The following table lists the registers provided for each PBG/HBG group.

Table 40A.81 List of PBG/HBG Error Registers

Module Name	Symbol	Register Name	R/W	Value after Reset	Address	Access Size
PBGxx	ERRSLVxxCTL	PBGxx error control register	W	0000 0000_H	<base_addr0> + 0_H	8/16/32
	ERRSLVxxSTAT	PBGxx error status register	R	0000 0000_H	<base_addr0> + 4_H	8/16/32
	ERRSLVxxADDR	PBGxx error address register	R	0000 0000_H	<base_addr0> + 8_H	32
	ERRSLVxxTYPE	PBGxx error type register	R	0000 0000_H	<base_addr0> + C_H	16/32
HBGxx	HERRSLVxxCTL	HBGxx error control register	W	0000 0000_H	<base_addr1> + 0_H	8/16/32
	HERRSLVxxSTAT	HBGxx error status register	R	0000 0000_H	<base_addr1> + 4_H	8/16/32
	HERRSLVxxADDR	HBGxx error address register	R	0000 0000_H	<base_addr1> + 8_H	32
	HERRSLVxxTYPE	HBGxx error type register	R	0000 0000_H	<base_addr1> + C_H	16/32

In the above table, "xx" in the register names and symbols represents the PBG group numbers. The table below shows the base address values <base_addr0>, which correspond to each of the PBG group numbers and channel numbers as well as base address values <base_addr1>, which correspond to each of the HBG group numbers and channel numbers.

Table 40A.82 PBG Group Numbers and Error Base Addresses

PBG Group	PBG Group Number	<base_addr0>
PBG10	00	FFC4 0040_H
PBG11	01	FFC4 0140_H
PBG12	07	FFC4 0440_H
PBG13	08	FFC4 0540_H
PBG14	12	FFC4 0640_H
PBG20	02	FFDD $D040_H$
PBG21	09	FFDD $D140_H$
PBG30	03	FFF9 4040_H
PBG31	04	FFF9 4140_H
PBG32	05	FFF9 4240_H
PBG33	13	FFF9 4340_H
PBG40	10	FFC5 $9C40_H$
PBG50	06	FFF9 0040_H
PBG60	11	FFC7 1840_H
PBG61	14	FFC7 1940_H

Table 40A.83 HBG Group Numbers and Error Base Addresses

HBG Group	HBG Group Number	<base_addr1>
HBG00	00	FFF9 $C040_H$
HBG01	01	FFF9 $C140_H$
HBG02	02	FFF9 $C240_H$

40A.3.3.2 Details of Registers

(1) FSGDxxPROTn — PBGxx Protection Register n HFSGDxxPROTn — HBGxx Protection Register n

FSGDxxPROTn and HFSGDxxPROTn specify the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. "n" in the register names and symbols represents the PBG/HBG channel number.

Access:	FSGDxxPROTn and HFSGDxxPROTn can be read or written in 32-bit units. FSGDxxPROTnL, FSGDxxPROTnH, HFSGDxxPROTnL, and HFSGDxxPROTnH can be read or written in 16-bit units. FSGDxxPROTnLL, FSGDxxPROTnHL, FSGDxxPROTnHH, HFSGDxxPROTnLL, HFSGDxxPROTnHL, and HFSGDxxPROTnHH can be read or written in 8-bit units.
Address:	See **Table 40A.80, List of PBG/HBG Protection Registers**.
Value after reset:	See **Table 40A.80, List of PBG/HBG Protection Registers**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROTLOCK	—	—	—	—	—	PROTUM	—	—	—	PROTPEID4	—	PROTPEID2	PROTPEID1	—	—
Value after reset	0	0	0	0	0	1	1	*1	*1	*1	*1	*1	*1	*1	*1	1
R/W	R/W	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PROTSPID3	PROTSPID2	PROTSPID1	PROTSPID0	—	PROTRDPDEF	PROTWRPDEF	PROTRD	PROTWR
Value after reset	1	1	1	1	1	1	1	*1	*1	*1	*1	1	0	1	1	1
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Note 1. It varies depending on each register. See **Section 40A.3.3.1, List of Registers**.

Table 40A.84 FSGDxxPROTn/HFSGxxPROTn Register Contents

Bit Position	Bit Name	Function
31	PROTLOCK	Register Lock 0: Enables FSGDxxPROTn/HFSGDxxPROTn rewrite. 1: Disables FSGDxxPROTn/HFSGDxxPROTn rewrite. When PROTLOCK is set to 1, the value is held until reset is asserted.
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	PROTPEID4	Access with PEID = 4 (peripheral device connected to H-BUS)*1 0: Disables access with PEID4. 1: Enables access with PEID4.
20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19	PROTPEID2	Access with PEID = 2 (CPU2)*1 0: Disables access with PEID2. 1: Enables access with PEID2.
18	PROTPEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40A.84 FSGDxxPROTn/HFSGxxPROTn Register Contents

Bit Position	Bit Name	Function
8	PROTSPID3	Access with SPID = 3*2 0: Disables access with SPID3. 1: Enables access with SPID3.
7	PROTSPID2	Access with SPID = 2 (CPU2*3)*2 0: Disables access with SPID2. 1: Enables access with SPID2.
6	PROTSPID1	Access with SPID = 1 (CPU1*3)*2 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0 (peripheral device connected to H-BUS)*2 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. Setting value of MCFG0.SPID

(2) ERRSLVxxCTL — PBGxx Error Control Register HERRSLVxxCTL — HBGxx Error Control Register

ERRSLVxxCTL and HERRSLVxxCTL clear the status in the error status register with the PBGxx/HBGxx.

Access: ERRSLVxxCTL and HERRSLVxxCTL are write-only registers that can be written in 32-bit units.
ERRSLVxxCTLL and HERRSLVxxCTLL are write-only registers that can be written in 16-bit units.
ERRSLVxxCTLLL and HERRSLVxxCTLLL are write-only registers that can be written in 8-bit units.

Address: ERRSLVxxCTL: <base_addr0> + 0_H
ERRSLVxxCTLL: <base_addr0> + 0_H
ERRSLVxxCTLLL: <base_addr0> + 0_H
HERRSLVxxCTL: <base_addr1> + 0_H
HERRSLVxxCTLL: <base_addr1> + 0_H
HERRSLVxxCTLLL: <base_addr1> + 0_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 40A.85 ERRSLVxxCTL/HERRSLVxxCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears the overflow flag. 0: Does not clear the overflow flag. 1: Clears the overflow flag.
0	CLRE	Clears the error flag. 0: Does not clear the error flag. 1: Clears the error flag.

Table 40A.86 CLRO and CLRE in ERRSLVxxCTL Register

CLRO	CLRE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

(3) ERRSLVxxSTAT — PBGxx Error Status Register
HERRSLVxxSTAT — HBGxx Error Status Register

ERRSLVxxSTAT and HERRSLVxxSTAT hold the status of the illegal access rejected with the PBGxx/HBGxx.

Access: ERRSLVxxSTAT and HERRSLVxxSTAT are read-only registers that can be read in 32-bit units.
ERRSLVxxSTATL and HERRSLVxxSTATL are read-only registers that can be read in 16-bit units.
ERRSLVxxSTATLL and HERRSLVxxSTATLL are read-only registers that can be read in 8-bit units.

Address: ERRSLVxxSTAT: <base_addr0> + 4_H
ERRSLVxxSTATL: <base_addr0> + 4_H
ERRSLVxxSTATLL: <base_addr0> + 4_H
HERRSLVxxSTAT: <base_addr1> + 4_H
HERRSLVxxSTATL: <base_addr1> + 4_H
HERRSLVxxSTATLL: <base_addr1> + 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.87 ERRSLVxxSTAT/HERRSLVxxSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred. If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBG/HBG error entry stages is 1. Note that this overflow is notified to INTGUARD. In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	Error Status Flag 0: No PBG/HBG protection violation 1: PBG/HBG protection violation occurred.

CAUTION

After writing HERRSLVxxCTL, the value of HERRSLVxxSTAT takes the following procedure for a reflection:

- Execute SYNCM
- Wait for 24 × CPU clock*1 cycles

Note 1. CPU clock: Clock selected by CKSC_CPUCLKS_CTRL and CKSC_CPUCLKD_CTL

(4) ERRSLVxxADDR — PBGxx Error Address Register
HERRSLVxxADDR — HBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.
HERRSLVxxADDR holds the address of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.

Access:	ERRSLVxxADDR and HERRSLVxxADDR are read-only registers that can be read in 32-bit units.
Address:	ERRSLVxxADDR: <base_addr0> + 8_H HERRSLVxxADDR: <base_addr1> + 8_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.88 ERRSLVxxADDR/HERRSLVxxADDR Register Contents

Bit Position	Bit Name	Function
31 to 2	ADDR[31:2]	Address in which the PBG/HBG protection violation is generated.
1, 0	Reserved	ERRSLVxxADDR: When read, the value after reset is returned. HERRSLVxxADDR: When read, an undefined value is returned.

(5) ERRSLVxxTYPE — PBGxx Error Type Register
HERRSLVxxTYPE — HBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

HERRSLVxxTYPE holds the type of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.

Access: ERRSLVxxTYPE and HERRSLVxxTYPE are read-only registers that can be read in 32-bit units.
ERRSLVxxTYPEL and HERRSLVxxTYPEL are read-only registers that can be read in 16-bit units.

Address: ERRSLVxxTYPE: <base_addr0> + C_H
ERRSLVxxTYPEL: <base_addr0> + C_H
HERRSLVxxTYPE: <base_addr1> + C_H
HERRSLVxxTYPEL: <base_addr1> + C_H

Value after reset: 0000 0000_H

Table 40A.89 ERRSLVxxTYPE/HERRSLVxxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	PEID of the access source from which the PBG/HBG protection violation is generated.
12 to 10	Reserved	When read, the value after reset is returned.
9, 8	SPID[1:0]	SPID of the access source from which the PBG/HBG protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBG/HBG protection violation is generated.
5	Reserved	When read, the value after reset is returned.
4 to 1	Reserved	These bits are read as an undefined value.
0	WRITE	This bit is set to 1 when the access that has generated the PBG/HBG protection violation is a write access.

40A.3.4 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.

Table 40A.90 Target Registers of PBG for CPU Subsystem

PBGC Group	Group No.	Channel Number	Protection Target Module	Target Register
PBGC0	C0 (PBC group 0 for CPU system)	0	INTC2	ICxxx, IBDxxx (xxx =32 to 381) IMRm (m = 1 to 11) (described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8**)
		1	PDMA0	All registers inside DMA controller (described in **Section 8, DMA Controller**)
		2	PDMA1	All registers inside DMA controller (described in **Section 8, DMA Controller**)

Table 40A.90 Target Registers of PBG for CPU Subsystem

PBGC Group	Group No.	Channel Number	Protection Target Module	Target Register
PBGC1	C1 (PBC group 1 for CPU system)	0	Flash memory (Programing function)	BFASELR*1
		1	Code flash ECC control register (VCI)	CFECCCTL_VCI CFERRINT_VCI CFSTCLR_VCI CFOVFSTR_VCI CF1STERSTR_VCI CF1STEADR0_VCI CFSTSTCTL_VCI
		2	Code flash ECC control register (PE1)	CFECCCTL_PE1 CFERRINT_PE1 CFSTCLR_PE1 CFOVFSTR_PE1 CF1STERSTR_PE1 CF1STEADR0_PE1
		3	Local RAM ECC control register (PE1)	LRTSTCTL_PE1 LRTDATBF0_PE1 LRECCCTL_PE1 LRERRINT_PE1 LRSTCLR_PE1 LROVFSTR_PE1 LR1STERSTR_PE1 LR1STEADR0_PE1
		4	System control module	BOOTCTRL (described in **Section 3A, CPU System of RH850/F1KH-D8**) EPC (described in **Section 43, On-Chip Debug Unit (OCD)**)
		5	Buffer controller	FBUFCCTL (described in **Section 3A, CPU System of RH850/F1KH-D8**)
		6	Global RAM ECC Control register (bank A)	GRECCCTL_BKA GRERRINT_BKA GRSTCLR_BKA GROVFSTR_BKA GR1STERSTR_BKA GR1STEADR_BKA GRTSTCTL_BKA GRDECINBF1_BKA
		7	Global RAM ECC Control register (bank B)	GRECCCTL_BKB GRERRINT_BKB GRSTCLR_BKB GROVFSTR_BKB GR1STERSTR_BKB GR1STEADR_BKB GRTSTCTL_BKB GRDECINBF1_BKB
		8	Code flash ECC control register (PE2)	CFECCCTL_PE2 CFERRINT_PE2 CFSTCLR_PE2 CFOVFSTR_PE2 CF1STERSTR_PE2 CF1STEADR0_PE2
		9	Local RAM ECC control register (PE2)	LRTSTCTL_PE2 LRTDATBF0_PE2 LRECCCTL_PE2 LRERRINT_PE2 LRSTCLR_PE2 LROVFSTR_PE2 LR1STERSTR_PE2 LR1STEADR0_PE2

Note 1. Regarding the PBGC registers for the flash memory, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

40A.3.4.1 List of Registers

The following table lists the registers provided for each PBGC group. And PBG group is equal to module name.

Table 40A.91 List of PBGC Protection Registers

PBG Group*1	Group No.	Symbol	Register Name	R/W	Value after Reset	Address	Access Size	Power Domain
PBGC0	C0	FSGDC0PROT0	PBGC0 protection register 0	R/W	07FF FFFF$_H$	FFC4 C000$_H$	8/16/32	ISO
		FSGDC0PROT1	PBGC0 protection register 1	R/W	07FF FFFF$_H$	FFC4 C004$_H$	8/16/32	
		FSGDC0PROT2	PBGC0 protection register 2	R/W	07FF FFFF$_H$	FFC4 C008$_H$	8/16/32	
PBGC1	C1	FSGDC1PROT0	PBGC1 protection register 0	R/W	07FF FFFF$_H$	FFC4 C120$_H$	8/16/32	ISO
		FSGDC1PROT1	PBGC1 protection register 1	R/W	07FF FFFF$_H$	FFC4 C124$_H$	8/16/32	
		FSGDC1PROT2	PBGC1 protection register 2	R/W	07FF FFFF$_H$	FFC4 C128$_H$	8/16/32	
		FSGDC1PROT3	PBGC1 protection register 3	R/W	07FF FFFF$_H$	FFC4 C12C$_H$	8/16/32	
		FSGDC1PROT4	PBGC1 protection register 4	R/W	07FF FFFF$_H$	FFC4 C130$_H$	8/16/32	
		FSGDC1PROT5	PBGC1 protection register 5	R/W	07FF FFFF$_H$	FFC4 C134$_H$	8/16/32	
		FSGDC1PROT6	PBGC1 protection register 6	R/W	07FF FFFF$_H$	FFC4 C118$_H$	8/16/32	
		FSGDC1PROT7	PBGC1 protection register 7	R/W	07FF FFFF$_H$	FFC4 C11C$_H$	8/16/32	
		FSGDC1PROT8	PBGC1 protection register 8	R/W	07FF FFFF$_H$	FFC4 C138$_H$	8/16/32	
		FSGDC1PROT9	PBGC1 protection register 9	R/W	07FF FFFF$_H$	FFC4 C13C$_H$	8/16/32	

Note 1. The Group indicates the module name.

Table 40A.92 List of PBGC Error Registers

Module Name	Symbol	Register Name	R/W	Value after Reset	Address	Access Size
PBGC0	ERRSLVC0CTL	PBGC0 error control register	W	0000 0000$_H$	FFC4 C800$_H$	8/16/32
	ERRSLVC0STAT	PBGC0 error status register	R	0000 0000$_H$	FFC4 C804$_H$	8/16/32
	ERRSLVC0ADDR	PBGC0 error address register	R	0000 0000$_H$	FFC4 C808$_H$	32
	ERRSLVC0TYPE	PBGC0 error type register	R	0000 0000$_H$	FFC4 C80C$_H$	16/32
PBGC1	ERRSLVC1CTL	PBGC1 error control register	W	0000 0000$_H$	FFC4 C900$_H$	8/16/32
	ERRSLVC1STAT	PBGC1 error status register	R	0000 0000$_H$	FFC4 C904$_H$	8/16/32
	ERRSLVC1ADDR	PBGC1 error address register	R	0000 0000$_H$	FFC4 C908$_H$	32
	ERRSLVC1TYPE	PBGC1 error type register	R	0000 0000$_H$	FFC4 C90C$_H$	16/32

40A.3.4.2 Details of Registers

(1) FSGDCxPROTn — PBGCx Protection Register n (x = 0, 1)

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.

"n" in the register names and symbols represents the PBGC channel number.

Access: FSGDCxPROTn register can be read or written in 32-bit units.
FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16-bit units.
FSGDCxPROTnLL, FSGDCxPROTnHL, and FSGDCxPROTnHH registers can be read or written in 8-bit units.

Address: See **Table 40A.91, List of PBGC Protection Registers**.

Value after reset: See **Table 40A.91, List of PBGC Protection Registers**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROTLOCK	—	—	—	—	—	PROTUM	—	—	—	PROTPEID4	—	PROTPEID2	PROTPEID1	—	—
Value after reset	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1

Table 40A.93 FSGDCxPROTn Register Contents

Bit Position	Bit Name	Function
31	PROTLOCK	Lock of write to this register 0: Register can be re-written. 1: Any further write to this register is ignored. This bit can be cleared by RESET.
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	PROTPEID4	Access with PEID = 4 (peripheral device connected to H-BUS)*1 0: Disables access with PEID4. 1: Enables access with PEID4.
20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19	PROTPEID2	Access with PEID = 2 (CPU2)*1 0: Disables access with PEID2. 1: Enables access with PEID2.
18	PROTPEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PROTSPID3	Access with SPID = 3*2 0: Disables access with SPID3. 1: Enables access with SPID3.

Table 40A.93 FSGDCxPROTn Register Contents

Bit Position	Bit Name	Function
7	PROTSPID2	Access with SPID = 2 (CPU2*[3])*[2] 0: Disables access with SPID2. 1: Enables access with SPID2.
6	PROTSPID1	Access with SPID = 1 (CPU1*[3])*[2] 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0 (peripheral device connected to H-BUS)*[2] 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. Setting value of MCFG0.SPID

(2) ERRSLVCxCTL — PBGCx Error Control Register (x = 0, 1)

ERRSLVCxCTL clears the status in error status register PBGCx.

Access:	ERRSLVCxCTL register is a write-only register that can be written in 32-bit units. ERRSLVCxCTLL register is a write-only register that can be written in 16-bit units. ERRSLVCxCTLLL register is a write-only register that can be written in 8-bit units.
Address:	ERRSLVCxCTL: FFC4 C800$_H$ + (100$_H$ × x) ERRSLVCxCTLL: FFC4 C800$_H$ + (100$_H$ × x) ERRSLVCxCTLLL: FFC4 C800$_H$ + (100$_H$ × x)
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 40A.94 ERRSLVCxCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears the overflow flag. 0: Does not clear the overflow flag. 1: Clears the overflow flag.
0	CLRE	Clears the error flag. 0: Does not clear the error flag. 1: Clears the error flag.

Table 40A.95 CLRO and CLRE in ERRSLVCxxCTL Register

CLRO	CLRE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

(3) ERRSLVCxSTAT — PBGCx Error Status Register (x = 0, 1)

ERRSLVCxSTAT holds the status of the illegal access rejected with the PBGCx.

Access: ERRSLVCxSTAT register is a read-only register that can be read in 32-bit units.
ERRSLVCxSTATL register is a read-only register that can be read in 16-bit units.
ERRSLVCxSTATLL register is a read-only register that can be read in 8-bit units.

Address: ERRSLVCxSTAT: FFC4 C804$_H$ + (100$_H$ × x)
ERRSLVCxSTATL: FFC4 C804$_H$ + (100$_H$ × x)
ERRSLVCxSTATLL: FFC4 C804$_H$ + (100$_H$ × x)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.96 ERRSLVCxSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred. If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBGC error entry stages is 1. Note that this overflow is notified to INTGUARD. In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	Error Status Flag 0: No PBGC protection violation 1: A PBGC protection violation occurred.

(4) ERRSLVCxADDR — PBGCx Error Address Register (x = 0, 1)

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Access: ERRSLVCxADDR register is a read-only register that can be read in 32-bit units.

Address: FFC4 C808$_H$ + (100$_H$ × x)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.97 ERRSLVCxADDR Register Contents

Bit Position	Bit Name	Function
31 to 2	ADDR[31:2]	Address in which the PBGC protection violation is generated.
1, 0	Reserved	When read, the value after reset is returned.

(5) ERRSLVCxTYPE — PBGCx Error Type Register (x = 0, 1)

ERRSLVCxTYPE holds the type of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Access: ERRSLVCxTYPE register is a read-only register that can be read in 32-bit units.
ERRSLVCxTYPEL register is a read-only register that can be read in 16-bit units.

Address: ERRSLVCxTYPE: FFC4 C80C_H + (100_H × x)
ERRSLVCxTYPEL: FFC4 C80C_H + (100_H × x)

Value after reset: $\text{0000 0000}_\text{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40A.98 ERRSLVCxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	PEID of the access source from which the PBGC protection violation is generated.
12 to 10	Reserved	When read, the value after reset is returned.
9, 8	SPID[1:0]	SPID of the access source from which the PBGC protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBGC protection violation is generated.
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	This bit is set to 1 when an access that has generated the PBGC protection violation is the write.

Section 40B Functional Safety of RH850/F1KM-S4

This section provides an overview of the safety mechanisms included in the RH850/F1KM Series.

This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.

For more information about the development process and safety mechanisms, please contact our sales office.

The following are the failure detection functions provided by this microcontroller.

40B.1 Overview

ECC

Detects failures of memories and data transfer paths and corrects some types of failures.

Memory Protection

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

Clock Monitor

Monitors the clock operation to detect abnormal operations.

For details, see **Section 13, Clock Monitor (CLMA)**.

Data CRC

Generates CRC to detect data errors.

For details, see **Section 41, Data CRC (DCRA)**.

Write-Protected Registers

The write-protected registers are protected from inadvertent write access due to erroneous program execution.

For details, see **Section 5, Write-Protected Registers**.

40B.2 ECC

40B.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

Table 40B.1 ECC Overview

Applicable Memory		Applicable Data Width [bits]	Operation upon Error Detection					Failure Insertion
			Detection/ Correction	SYSERR	Interrupt Notice	Error Status	Address Capture	
Code flash		128	SEC-DED	SED/DED*[2]	SEC-DED	Possible	Possible	Possible
Data flash		32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
Local RAM (CPU1/Self)		32	SEC-DED	SED/DED*[2]	SEC-DED	Possible	Possible	Possible
Global RAM Retention RAM		32	SEC-DED	SED/DED*[2]	SEC-DED	Possible	Possible	Possible
Peripheral RAM*[1]	CSIH	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	RS-CANFD	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	FlexRay	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	Ethernet	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible

Note 1. For details of ECC for each peripheral IP, see **Section 40B.2.6, ECC for Peripheral RAM**.

Note 2. For details, see **Section 40B.2.2.2, Interrupt Requests, Section 40B.2.4.2, Interrupt Requests**, and **Section 40B.2.5.2, Interrupt Requests**.

Applicable Data Width

This is the data width to be ECC encoded.

To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).

(1) Reading data to be ECC-encoded including data to be rewritten

(2) Replacing data to be rewritten

(3) Writing back data generated in (2)

Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected.

SED-DED: 1-bit errors and 2-bit errors can only be detected.

SYSERR

SYSERR can be generated upon error detection.

Interrupt Notice

An interrupt can be generated upon error detection.

Error Status

The status of a detected error is retained.

Address Capture

The address of a detected error is retained.

Failure Insertion

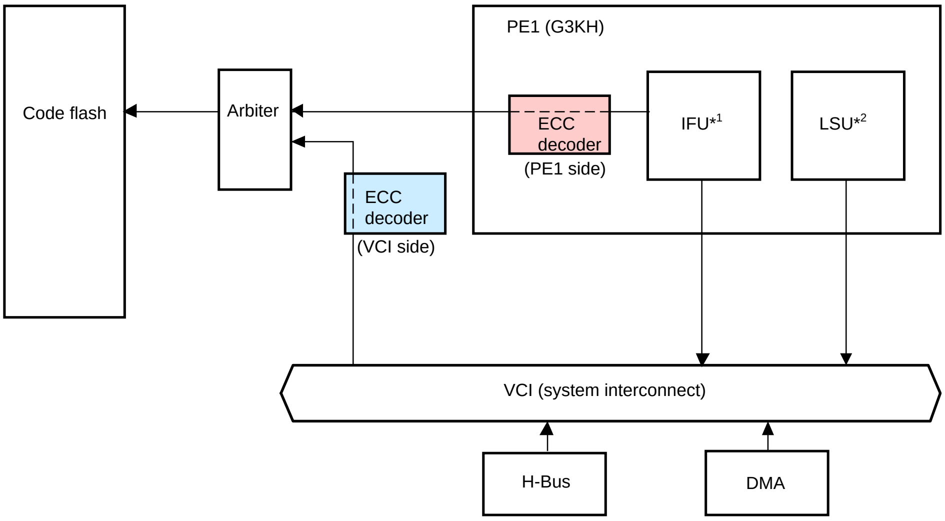
Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

40B.2.2 Code Flash ECC

40B.2.2.1 Overview

RH850/F1KM has two code flash ECC decoder circuits implemented, one inside the Processor Element (PE1) and one on the VCI (system interconnect).

Figure 40B.1, Block Diagram of Code Flash ECC shows the location of two ECC decoders for the code flash.



Note 1. Instruction Fetch Unit

Note 2. Load Store Unit

Figure 40B.1 Block Diagram of Code Flash ECC

The code flash ECC is summarized in the table below.

Table 40B.2 Summary of Code Flash ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction. ● 2-bit error detection and 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. (This is not supported in CFERRINT_PE1 register.) Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see **Section 3BC, CPU System of RH850/F1KM**. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.

Table 40B.2 Summary of Code Flash ECC

Item	Description
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The ECC 1-bit error status is set only when no error status has been set. The ECC 2-bit error status is set even when the ECC 1-bit error status is set. A register for clearing the error status is provided.
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also captured.
Self-diagnosis	The ECC bit can be read directly.
Inhibiting instruction execution	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching avoids the execution of incorrect instructions.

40B.2.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.

Table 40B.3 Code Flash ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0*[1] (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR	—

Note 1. ECCFLI0FEIF flag set can be read (not jump to handler address of FEINT) in SYSERR processing because return from SYSERR is not possible.

Table 40B.4 Code Flash ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0 (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR, INTECCFLI0	—

Table 40B.5 Code Flash ECC Interrupt Requests (During Bus Master Data Access except CPU Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	INTECCFLI0	—
—	ECC 2-bit error interrupt of code flash	INTECCFLI0	—

40B.2.2.3 List of Registers

Table 40B.6 List of Registers

Module Name	Register Name	Symbol*1	Address
CFECC_VCI	Code flash ECC control register (VCI)	CFECCCTL_VCI	FFC6 2200$_H$
	Code flash error information control register (VCI)	CFERRINT_VCI	FFC6 2204$_H$
	Code flash status clear register (VCI)	CFSTCLR_VCI	FFC6 2208$_H$
	Code flash error count overflow status register (VCI)	CFOVFSTR_VCI	FFC6 220C$_H$
	Code flash 1st error status register (VCI)	CF1STERSTR_VCI	FFC6 2210$_H$
	Code flash 1st error address register (VCI)	CF1STEADR0_VCI	FFC6 2250$_H$
CFECC_CPU1	Code flash ECC control register (PE1)	CFECCCTL_PE1	FFC6 2400$_H$
	Code flash error information control register (PE1)	CFERRINT_PE1	FFC6 2404$_H$
	Code flash status clear register (PE1)	CFSTCLR_PE1	FFC6 2408$_H$
	Code flash error count overflow status register (PE1)	CFOVFSTR_PE1	FFC6 240C$_H$
	Code flash 1st error status register (PE1)	CF1STERSTR_PE1	FFC6 2410$_H$
	Code flash 1st error address register (PE1)	CF1STEADR0_PE1	FFC6 2450$_H$
CFECC_VCI	Code flash sub-test control register (VCI)	CFSTSTCTL_VCI	FFC6 2350$_H$

Note 1. The registers suffixed with symbols "_VCI" and "_PE1" are provided to ECC controllers corresponding to each access port: registers with "_VCI" are provided to the ECC controller for data access from the system interconnect to the code flash and registers with "_PE1" are provided to the ECC controller for fetch access from the CPU1.

40B.2.2.4 Details of Registers

(1) CFECCCTL_VCI/PE1 — Code Flash ECC Control Register

CFECCCTL_VCI/PE1 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFECCCTL_VCI/PE1, PROT1 and PROT0 need to be 01_B.

Access: CFECCCTL_VCI and CFECCCTL_PE1 can be read or written in 32-bit units.
CFECCCTL_VCIL and CFECCCTL_PE1L can be read or written in 16-bit units.

Address: CFECCCTL_VCI: FFC6 2200_H
CFECCCTL_VCIL: FFC6 2200_H
CFECCCTL_PE1: FFC6 2400_H
CFECCCTL_PE1L: FFC6 2400_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40B.7 CFECCCTL_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFECCCTL_VCI/PE1.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) CFERRINT_VCI/PE1 — Code Flash Error Information Control Register

CFERRINT_VCI/PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: CFERRINT_VCI and CFERRINT_PE1 can be read or written in 32-bit units.
CFERRINT_VCIL and CFERRINT_PE1L can be read or written in 16-bit units.
CFERRINT_VCILL and CFERRINT_PE1LL can be read or written in 8-bit units.

Address: CFERRINT_VCI: FFC6 2204$_H$
CFERRINT_VCIL: FFC6 2204$_H$
CFERRINT_VCILL: FFC6 2204$_H$
CFERRINT_PE1: FFC6 2404$_H$
CFERRINT_PE1L: FFC6 2404$_H$
CFERRINT_PE1LL: FFC6 2404$_H$

Value after reset: 0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE *1	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40B.8 CFERRINT_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE*[1]	ECC 2-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

Note 1. This bit is not supported in CFERRINT_PE1. When writing to this bit in CFERRINT_PE1, always write 1.

Note 2. Regarding the interrupt request, see **Section 40B.2.2.2, Interrupt Requests**.

(3) CFSTCLR_VCI/PE1 — Code Flash Status Clear Register

CFSTCLR_VCI/PE1 clears the error flags in the error status register (CF1STERSTR_VCI/PE1), the overflow flag in the error overflow status register (CFOVFSTR_VCI/PE1), and the error address register (CF1STEADR0_VCI/PE1).

Access: CFSTCLR_VCI and CFSTCLR_PE1 are write-only registers that can be written in 32-bit units.
CFSTCLR_VCIL and CFSTCLR_PE1L are write-only registers that can be written in 16-bit units.
CFSTCLR_VCILL and CFSTCLR_PE1LL are write-only registers that can be written in 8-bit units.

Address: CFSTCLR_VCI: FFC6 2208$_H$
CFSTCLR_VCIL: FFC6 2208$_H$
CFSTCLR_VCILL: FFC6 2208$_H$
CFSTCLR_PE1: FFC6 2408$_H$
CFSTCLR_PE1L: FFC6 2408$_H$
CFSTCLR_PE1LL: FFC6 2408$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCLR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 40B.9 CFSTCLR_VCI/_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	STCLR0	Error Status Clear 0: No effect (Setting 0 does not affect the DEDF0 and SEDF0 flags in CF1STERSTR_VCI/PE1; ERROVF0 flag in CFOVFSTR_VCI/PE1; and CF1STEADR0_VCI/PE1.) 1: Writing 1 to this bit clears the DEDF0 and SEDF0 flags in CF1STERSTR_VCI/PE1; ERROVF0 flag in CFOVFSTR_VCI/PE1; and CF1STEADR0_VCI/PE1.

(4) CFOVFSTR_VCI/PE1 — Code Flash Error Count Overflow Status Register

CFOVFSTR_VCI/PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

Access:	CFOVFSTR_VCI and CFOVFSTR_PE1 are read-only registers that can be read in 32-bit units. CFOVFSTR_VCIL and CFOVFSTR_PE1L are read-only registers that can be read in 16-bit units. CFOVFSTR_VCILL and CFOVFSTR_PE1LL are read-only registers that can be read in 8-bit units.
Address:	CFOVFSTR_VCI: FFC6 220C$_H$ CFOVFSTR_VCIL: FFC6 220C$_H$ CFOVFSTR_VCILL: FFC6 220C$_H$ CFOVFSTR_PE1: FFC6 240C$_H$ CFOVFSTR_PE1L: FFC6 240C$_H$ CFOVFSTR_PE1LL: FFC6 240C$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.10 CFOVFSTR_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF0	Error Overflow Flag ERROVF0 shows whether a second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register has occurred, except when both of the error address and source of the second error are the same as those of the first error. 0: Did not occur. 1: Occurred. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1 to 1.

(5) CF1STERSTR_VCI/PE1 — Code Flash 1st Error Status Register

CF1STERSTR_VCI/PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0. If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

Access: CF1STERSTR_VCI and CF1STERSTR_PE1 are read-only registers that can be read in 32-bit units.
CF1STERSTR_VCIL and CF1STERSTR_PE1L are read-only registers that can be read in 16-bit units.
CF1STERSTR_VCILL and CF1STERSTR_PE1LL are read-only registers that can be read in 8-bit units.

Address: CF1STERSTR_VCI: FFC6 2210$_H$
CF1STERSTR_VCIL: FFC6 2210$_H$
CF1STERSTR_VCILL: FFC6 2210$_H$
CF1STERSTR_PE1: FFC6 2410$_H$
CF1STERSTR_PE1L: FFC6 2410$_H$
CF1STERSTR_PE1LL: FFC6 2410$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF0	SEDF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.11 CF1STERSTR_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF0	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1 to 1. [Setting condition] ECC 2-bit error is detected when DEDF0 is 0.
0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected when DEDF0 flag is 0. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1 to 1. [Setting condition] ECC 1-bit error is detected when DEDF0, SEDF0 are 0.

(6) CF1STEADR0_VCI/PE1 — Code Flash 1st Error Address Register

CF1STEADR0_VCI/PE1 holds the address at which an error has occurred.

The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STEADR0_VCI/PE1 register is cleared by an internal reset, the external reset, or by setting the STCLR bit in the CFSTCLR_VCI/PE1 register to 1.

Access: CF1STEADR0_VCI and CF1STEADR0_PE1 are read-only registers that can be read in 32-bit units.
CF1STEADR0_VCIL, CF1STEADR0_VCIH, CF1STEADR0_PE1L and CF1STEADR0_PE1H are read-only registers that can be read in 16-bit units.
CF1STEADR0_VCILL, CF1STEADR0_VCILH, CF1STEADR0_VCIHL, CF1STEADR0_VCIHH, CF1STEADR0_PE1LL, CF1STEADR0_PE1LH, CF1STEADR0_PE1HL and CF1STEADR0_PE1HH are read-only registers that can be read in 8-bit units.

Address: CF1STEADR0_VCI: FFC6 2250$_H$
CF1STEADR0_VCIL: FFC6 2250$_H$
CF1STEADR0_VCIH: FFC6 2252$_H$
CF1STEADR0_VCILL: FFC6 2250$_H$
CF1STEADR0_VCILH: FFC6 2251$_H$
CF1STEADR0_VCIHL: FFC6 2252$_H$
CF1STEADR0_VCIHH: FFC6 2253$_H$
CF1STEADR0_PE1: FFC6 2450$_H$
CF1STEADR0_PE1L: FFC6 2450$_H$
CF1STEADR0_PE1H: FFC6 2452$_H$
CF1STEADR0_PE1LL: FFC6 2450$_H$
CF1STEADR0_PE1LH: FFC6 2451$_H$
CF1STEADR0_PE1HL: FFC6 2452$_H$
CF1STEADR0_PE1HH: FFC6 2453$_H$

Value after reset: 0000 0000$_H$

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned.
24 to 4	EADR[24:4]	1st Error Address Monitors the address of the first error. The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1 to 1.
3 to 0	Reserved	When read, the value after reset is returned.

(7) CFSTSTCTL_VCI — Code Flash Sub-Test Control Register

CFSTSTCTL_VCI is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read directly.

When writing to CFSTSTCTL_VCI, PROT1 and PROT0 need to be 01_B.

Access:	CFSTSTCTL_VCI can be read or written in 32-bit units. CFSTSTCTL_VCIL can be read or written in 16-bit units.
Address:	CFSTSTCTL_VCI: FFC6 2350_H CFSTSTCTL_VCIL: FFC6 2350_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 40B.13 CFSTSTCTL_VCI Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST bit. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFSTSTCTL_VCI.
14	PROT0	
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, ECC bits can be read directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see **Section 3BC, CPU System of RH850/F1KM**.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16n address. The results of reading code flash are as follows:

Table 40B.14 Results of Reading Code Flash

Bit Number	Meaning	Bit Position	Description
bit[31:10]	all-0	31 to 10	These bits are always 0.
bit[9]	reserved	9	Unknown
bit[8:0]	ECC bits	8 to 0	ECC bits

40B.2.3 Data Flash ECC

40B.2.3.1 Overview

The data flash ECC is summarized in the table below.

Table 40B.15 Summary of Data Flash ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection / correction. ● 2-bit error detection and 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 2-bit errors is selectable. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is disabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the Interrupt Controller, an interrupt processing is not executed.
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The function is set only while no error status is set. A register for clearing the error status is provided.
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. ECC error address is captured when both SEDF and DEDF of DFERSTR are 0.
Self-diagnosis	ROM data and the ECC bit can be read directly. Arbitrary data can be written to ROM data and the ECC bit.

40B.2.3.2 Interrupt Requests

The interrupt requests for data flash ECC are shown below.

Table 40B.16 Data Flash ECC Interrupt Requests (During Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of data flash	INTECCEEP0	—
—	ECC 2-bit error interrupt of data flash	INTECCEEP0	—

40B.2.3.3 List of Registers

Table 40B.17 List of Registers

Module Name	Register Name	Symbol	Address
DFECC	Data flash ECC control register	DFECCCTL	FFC6 2A00$_H$
	Data flash error status register	DFERSTR	FFC6 2A04$_H$
	Data flash error status clear register	DFERSTC	FFC6 2A08$_H$
	Data flash error overflow status register	DFOVFSTR	FFC6 2A0C$_H$
	Data flash error overflow status clear register	DFOVFSTC	FFC6 2A10$_H$
	Data flash error notification control register	DFERRINT	FFC6 2A14$_H$
	Data flash 1st error address register	DFEADR	FFC6 2A18$_H$
	Data flash test control register	DFTSTCTL	FFC6 2A1C$_H$

40B.2.3.4 Details of Registers

(1) DFECCCTL — Data Flash ECC Control Register

DFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCCTL, PROT1 and PROT0 need to be 01_B.

Access: DFECCCTL can be read or written in 16-bit units.

Address: DFECCCTL: FFC6 $2A00_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40B.18 DFECCCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFECCCTL.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.

The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

Access: DFERSTR is a read-only register that can be read in 8-bit units.

Address: DFERSTR: FFC6 2A04$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDF	SEDF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40B.19 DFERSTR Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	DEDF	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 2-bit error is detected when both SEDF and DEDF are 0.
0	SEDF	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 1-bit error is detected when both SEDF and DEDF are 0.

(3) DFERSTC — Data Flash Error Status Clear Register

DFERSTC clears the error flags in the data flash error status register.

Access: DFERSTC is a write-only register that can be written in 8-bit units.

Address: DFERSTC: FFC6 2A08$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERRCLR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 40B.20 DFERSTC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ERRCLR	SEDF/DEDF Flag Clear 0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF and SEDF flags in DFERSTR.) 1: The SEDF/DEDF flag in DFERSTR is cleared.

(4) DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of data flash error overflow.

Access: DFOVFSTR is a read-only register that can be read in 8-bit units.

Address: DFOVFSTR: FFC6 2A0C$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40B.21 DFOVFSTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF	Error Overflow Flag ERROVF is set if an ECC error occurs while the error address register is full. 0: Did not occurred. 1: Occurred. [Clearing condition] Set the ERROVFCLR bit is set in data flash error overflow status clear register.

(5) DFOVFSTC — Data Flash Error Overflow Status Clear Register

DFOVFSTC clears the data flash error overflow flag.

Access: DFOVFSTC is a write-only register that can be written in 8-bit units.

Address: DFOVFSTC: FFC6 2A10$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVFCLR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 40B.22 DFOVFSTC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ERROVFCLR	Error Overflow Flag Clear 0: No effect (Setting the ERROVFCLR bit to 0 does not affect the ERROVF flag in DFOVFSTR.) 1: The ERROVF flag in DFOVFSTR is cleared.

(6) DFERRINT — Data Flash Error Notification Control Register

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: DFERRINT can be read or written in 8-bit units.

Address: DFERRINT: FFC6 2A14$_H$

Value after reset: 02$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 40B.23 DFERRINT Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	ECC 2-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(7) DFEADR — Data Flash 1st Error Address Register

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0.

Access: DFEADR is a read-only register that can be read in 32-bit units.

Address: DFEADR: FFC6 2A18$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	DFEADR[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DFEADR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.24 DFEADR Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned.
20 to 2	DFEADR[20:2]	ECC Error Address DFEADR is read-only field to monitor the address at which an ECC error has occurred. This register holds an internal address. Convert it to the actual address by adding the data flash base address FF20 0000$_H$.
1, 0	Reserved	When read, the value after reset is returned.

(8) DFTSTCTL — Data Flash Test Control Register

DFTSTCTL is used for the ECC test.

After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read.

When writing to DFTSTCTL, PROT1 and PROT0 need to be 01_B.

Access: DFTSTCTL can be read or written in 16-bit units.

Address: DFTSTCTL: FFC6 2A1C$_H$

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 40B.25 DFTSTCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCTST bit. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFTSTCTL.
14	PROT0	
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test Sets ECC test mode. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

40B.2.4 Local RAM ECC

40B.2.4.1 Overview

The local RAM ECC of CPU1 is summarized in the table below.

Table 40B.26 Summary of Local RAM ECC (CPU1)

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction. ● 2-bit error detection and 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see **Section 3BC, CPU System of RH850/F1KM**. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The function is set only while no error status is set. A register for clearing the error status is provided.
Address capture	When no error status has been set, the address at which the first error occurred is captured. In addition, when the retained address source is an ECC 1-bit error or ECC 2-bit error, the address is also captured.
Self-diagnosis	Arbitrary data can be written to RAM data and the ECC bit. RAM data and the ECC bit can be read directly.
Others	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.

CAUTION

When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16-bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

40B.2.4.2 Interrupt Requests

The local RAM ECC interrupt requests are listed below.

Table 40B.27 Local RAM ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	SYSERR, INTECCRAM (SED & SECDIS = 1)	—
		INTECCRAM (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of RAM	SYSERR, INTECCRAM	—

Table 40B.28 Local RAM ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	SYSERR, INTECCRAM (SED & SECDIS = 1)	—
		INTECCRAM (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of RAM	SYSERR, INTECCRAM	—

Table 40B.29 Local RAM ECC Interrupt Requests (During Data Access except CPU Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	INTECCRAM	—
—	ECC 2-bit error interrupt of RAM	INTECCRAM	—

40B.2.4.3 List of Registers

Table 40B.30 List of Registers

Module Name	Address	Symbol	Register Name	R/W	Value after Reset	Access Size
LRTST	FFC6 5004_H	LRTSTCTL_PE1	Local RAM test control register (PE1)	R/W	0000 0000_H	16/32
	FFC6 5008_H	LRTDATBF0_PE1	Local RAM test data read buffer 0 (PE1)	R	0000 0000_H	32
LRECC	FFC6 5400_H	LRECCCTL_PE1	Local RAM ECC control register (PE1)	R/W	0000 0000_H	16/32
	FFC6 5404_H	LRERRINT_PE1	Local RAM error information control register (PE1)	R/W	0000 0003_H	8/16/32
	FFC6 5408_H	LRSTCLR_PE1	Local RAM status clear register (PE1)	W	0000 0000_H	8/16/32
	FFC6 $540C_H$	LROVFSTR_PE1	Local RAM error count overflow status register (PE1)	R	0000 0000_H	8/16/32
	FFC6 5410_H	LR1STERSTR_PE1	Local RAM 1st error status register (PE1)	R	0000 0000_H	8/16/32
	FFC6 5450_H	LR1STEADR0_PE1	Local RAM 1st error address register 0 (PE1)	R	0000 0000_H	8/16/32

40B.2.4.4 Details of Registers

(1) LRTSTCTL_PE1 — Local RAM Test Control Register

LRTSTCTL_PE1 is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits.

When writing to LRTSTCTL_PE1, PROT1 and PROT0 need to be 01_B.

Access: LRTSTCTL_PE1 register can be read or written in 32-bit units.
LRTSTCTL_PE1L register can be read or written in 16-bit units.

Address: LRTSTCTL_PE1: FFC6 5004_H
LRTSTCTL_PE1L: FFC6 5004_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST	DATSEL
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40B.31 LRTSTCTL_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST and DATSEL bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRTSTCTL_PE1.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read by reading LRTDATBF0_PE1 register or written directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).
0	DATSEL	Data Select This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: RAM data is selected. 1: The ECC bits are selected.

CAUTION

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

(2) LRTDATBF0_PE1 — Local RAM Test Data Read Buffer 0

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL_PE1, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

Access:	LRTDATBF0_PE1 register is a read-only register that can be read in 32-bit units.
Address:	LRTDATBF0_PE1: FFC6 5008$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	LRTDATBF[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.32 LRTDATBF0_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned.
6 to 0	LRTDATBF[6:0]	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the local RAM, the ECC bits for the local RAM are stored in LRTDATBF[6:0].

(3) LRECCCTL_PE1 — Local RAM ECC Control Register

LRECCCTL_PE1 enables or disables ECC error detection and correction and 1-bit error correction.

When writing to LRECCCTL_PE1, PROT1 and PROT0 need to be 01$_B$.

Access: LRECCCTL_PE1 register can be read or written in 32-bit units.
LRECCCTL_PE1L register can be read or written in 16-bit units.

Address: LRECCCTL_PE1: FFC6 5400$_H$
LRECCCTL_PE1L: FFC6 5400$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 40B.33 LRECCCTL_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRECCCTL_PE1.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(4) LRERRINT_PE1 — Local RAM Error Information Control Register

LRERRINT_PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access:	LRERRINT_PE1 register can be read or written in 32-bit units. LRERRINT_PE1L register can be read or written in 16-bit units. LRERRINT_PE1LL register can be read or written in 8-bit units.
Address:	LRERRINT_PE1: FFC6 5404$_H$ LRERRINT_PE1L: FFC6 5404$_H$ LRERRINT_PE1LL: FFC6 5404$_H$
Value after reset:	0000 0003$_H$

Table 40B.34 LRERRINT_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	ECC 2-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(5) LRSTCLR_PE1 — Local RAM Status Clear Register

LRSTCLR_PE1 clears the error flags in the error status register (LR1STERSTR_PE1), the overflow flag in the error overflow status register (LROVFSTR_PE1), and the error address register (LR1STEADR0_PE1). LRSTCLR_PE1 is a write-only register and is always read as 0.

Access:	LRSTCLR_PE1 register is a write-only register that can be written in 32-bit units. LRSTCLR_PE1L register is a write-only register that can be written in 16-bit units. LRSTCLR_PE1LL register is a write-only register that can be written in 8-bit units.
Address:	LRSTCLR_PE1: FFC6 5408_{H} LRSTCLR_PE1L: FFC6 5408_{H} LRSTCLR_PE1LL: FFC6 5408_{H}
Value after reset:	0000 0000_{H}

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 40B.35 LRSTCLR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	STCLR0	Error Status Flag Clear Writing 1 to this bit clears the DEDF0 and SEDF0 flags in LR1STERSTR_PE1; ERROVF0 flag in LROVFSTR_PE1; and LR1STEADR0_PE1.

(6) LROVFSTR_PE1 — Local RAM Error Count Overflow Status Register

LROVFSTR_PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1.

Access:	LROVFSTR_PE1 register is a read-only register that can be read in 32-bit units. LROVFSTR_PE1L register is a read-only register that can be read in 16-bit units. LROVFSTR_PE1LL register is a read-only register that can be read in 8-bit units.
Address:	LROVFSTR_PE1: FFC6 540C$_H$ LROVFSTR_PE1L: FFC6 540C$_H$ LROVFSTR_PE1LL: FFC6 540C$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.36 LROVFSTR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF0	Error Overflow Flag ERROVF0 is set if a second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(7) LR1STERSTR_PE1 — Local RAM 1st Error Status Register

LR1STERSTR_PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0.

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR_PE1 is cleared by an internal reset, the external reset, or setting 1 to the STCLR0 bit in LRSTCLR_PE1.

Access: LR1STERSTR_PE1 register is a read-only register that can be read in 32-bit units.
LR1STERSTR_PE1L register is a read-only register that can be read in 16-bit units.
LR1STERSTR_PE1LL register is a read-only register that can be read in 8-bit units.

Address: LR1STERSTR_PE1: FFC6 5410$_H$
LR1STERSTR_PE1L: FFC6 5410$_H$
LR1STERSTR_PE1LL: FFC6 5410$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF0	SEDF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.37 LR1STERSTR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF0	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the STCLR0 bit in LRSTCLR_PE1 to 1. [Setting condition] ECC 2-bit error is detected with DEDF0 being 0.
0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the STCLR0 bit in LRSTCLR_PE1 to 1. [Setting condition] ECC 1-bit error is detected with both SEDF0 and DEDF0 being 0.

(8) LR1STEADR0_PE1 — Local RAM 1st Error Address Register 0

LR1STEADR0_PE1 holds the address at which an error has occurred.

The error address is set if an error occurs while error flags are 0 in LR1STERSTR_PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set in LR1STERSTR_PE1. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address[31:19] bits of the associated memory to transform the internal address to the real address. LR1STEADR0_PE1 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1.

Access:	LR1STEADR0_PE1 register is a read-only register that can be read in 32-bit units. LR1STEADR0_PE1L and LR1STEADR0_PE1H registers are read-only registers that can be read in 16-bit units. LR1STEADR0_PE1LL, LR1STEADR0_PE1LH, and LR1STEADR0_PE1HL registers are read-only registers that can be read in 8-bit units.
Address:	LR1STEADR0_PE1: FFC6 5450$_H$ LR1STEADR0_PE1L: FFC6 5450$_H$, LR1STEADR0_PE1H: FFC6 5452$_H$ LR1STEADR0_PE1LL: FFC6 5450$_H$, LR1STEADR0_PE1LH: FFC6 5451$_H$, LR1STEADR0_PE1HL: FFC6 5452$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	EADR[18:16]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.38 LR1STEADR0_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned.
18 to 2	EADR[18:2]	1st Error Address Monitors the address of the first error. The error address is held if an error occurs while all the error flags are 0 in LR1STERSTR_PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.
1, 0	Reserved	When read, the value after reset is returned.

40B.2.5 Global RAM (Including the Retention RAM) ECC

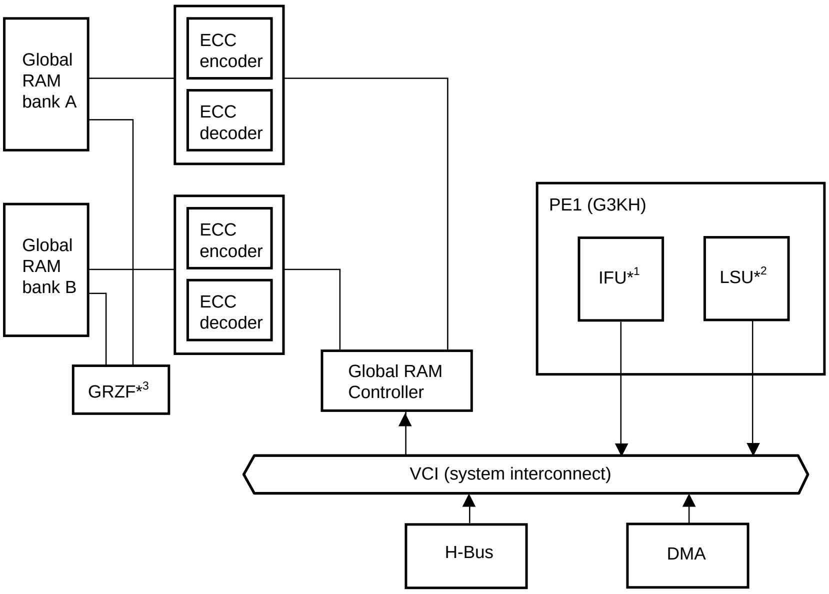
40B.2.5.1 Overview

CAUTION

The retention RAM is a part of the global RAM. The ECC for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

In RH850/F1KM-S4, an ECC encoder and an ECC decoder are provided for each bank (bank A and bank B).

Figure 40B.2, Block Diagram of Global RAM ECC shows the location of two ECC decoders and two ECC encoders for the global RAM.



Note 1. Instruction Fetch Unit

Note 2. Load Store Unit

Note 3. GRZF accesses RAM directly. For details, see **Section 45.3, Global RAM Zero Fill (GRZF)**.

Figure 40B.2 Block Diagram of Global RAM ECC

The global RAM ECC is summarized in the table below.

Table 40B.39 Summary of Global RAM ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction ● 2-bit error detection and 1-bit error detection When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see **Section 3BC, CPU System of RH850/F1KM**. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.
Error status	A status register is provided to indicate the statuses of 2-bit ECC error detection and 1-bit ECC error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	If an ECC error occurs while no error status is set, the address at which the associated error has occurred is captured. In addition, if the address source retained is 1-bit ECC error, it is captured when a 2-bit ECC error is detected
Self-diagnosis	Arbitrary data can be written to RAM data and the ECC bit. RAM data can be read directly
Others	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.

40B.2.5.2 Interrupt Requests

Global RAM ECC interrupt requests are listed below.

Table 40B.40 Global RAM ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	SYSERR, INTECCRAM (SED & SECDIS = 1)	—
		INTECCRAM (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of RAM	SYSERR, INTECCRAM	—

Table 40B.41 Global RAM ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	SYSERR, INTECCRAM (SED & SECDIS = 1)	—
		INTECCRAM (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of RAM	SYSERR, INTECCRAM	—

Table 40B.42 Global RAM ECC Interrupt Requests (During Data Access except CPU Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	INTECCRAM	—
—	ECC 2-bit error interrupt of RAM	INTECCRAM	—

40B.2.5.3 List of Registers

Table 40B.43 List of Registers

Module Name	Address	Symbol	Register Name	R/W	Value after Reset	Access Size
GRECC	FFC6 4000_H	GRECCCTL_BKA	Global RAM ECC control register (Bank A)	R/W	0000 0000_H	16/32
	FFC6 4004_H	GRERRINT_BKA	Global RAM error information control register (Bank A)	R/W	0000 0001_H	8/16/32
	FFC6 4010_H	GRSTCLR_BKA	Global RAM status clear register (Bank A)	W	0000 0000_H	8/16/32
	FFC6 4014_H	GROVFSTR_BKA	Global RAM error count overflow status register (Bank A)	R	0000 0000_H	8/16/32
	FFC6 4018_H	GR1STERSTR_BKA	Global RAM 1st error status register (Bank A)	R	0000 0000_H	8/16/32
	FFC6 $401C_H$	GR1STEADR_BKA	Global RAM 1st error address register (Bank A)	R	FEE0 0000_H	8/16/32
	FFC6 4020_H	GRTSTCTL_BKA	Global RAM test control register (Bank A)	R/W	0000 0000_H	16/32
	FFC6 4024_H	GRDECINBF1_BKA	Global RAM ECC decoder input data buffer 1 (Bank A)	R/W	0000 0000_H	8/16/32
	FFC6 4200_H	GRECCCTL_BKB	Global RAM ECC control register (Bank B)	R/W	0000 0000_H	16/32
	FFC6 4204_H	GRERRINT_BKB	Global RAM error information control register (Bank B)	R/W	0000 0001_H	8/16/32
	FFC6 4210_H	GRSTCLR_BKB	Global RAM status clear register (Bank B)	W	0000 0000_H	8/16/32
	FFC6 4214_H	GROVFSTR_BKB	Global RAM error count overflow status register (Bank B)	R	0000 0000_H	8/16/32
	FFC6 4218_H	GR1STERSTR_BKB	Global RAM 1st error status register (Bank B)	R	0000 0000_H	8/16/32
	FFC6 $421C_H$	GR1STEADR_BKB	Global RAM 1st error address register (Bank B)	R	FEF0 0000_H	8/16/32
	FFC6 4220_H	GRTSTCTL_BKB	Global RAM test control register (Bank B)	R/W	0000 0000_H	16/32
	FFC6 4224_H	GRDECINBF1_BKB	Global RAM ECC decoder input data buffer 1 (Bank B)	R/W	0000 0000_H	8/16/32

Note: _BKA and _BKB in Symbol indicate on each bank. “BKA” represents for bank A and “BKB” represents for bank B.

40B.2.5.4 Details of Registers

(1) GRECCCTL_BKA/BKB — Global RAM ECC Control Register

GRECCCTL_BKA/BKB enables or disables ECC error detection and correction and 1-bit error correction. Set the PROT1 and PROT0 bits to 01$_B$ when writing to GRECCCTL_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

Access:	GRECCCTL_BKA and GRECCCTL_BKB can be read or written in 32-bit units GRECCCTL_BKAL and GRECCCTL_BKBL can be read or written in 16-bit units
Address:	GRECCCTL_BKA: FFC6 4000$_H$ GRECCCTL_BKAL: FFC6 4000$_H$ GRECCCTL_BKB: FFC6 4200$_H$ GRECCCTL_BKBL: FFC6 4200$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40B.44 GRECCCTL_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0.Set PROT1 to 0 and PROT0 to 1 when writing to this register.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. When writing, write 01 to PROT1 and PROT0 at the same time. 0: 1-bit error correction is performed when a 1-bit error is detected. 1: 1-bit error correction is not performed when a 1-bit error is detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. When writing, write 01 to PROT1 and PROT0 at the same time. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) GRERRINT_BKA/BKB— Global RAM Error Information Control Register

GRERRINT_BKA/BKB enables or disables generation of the error notification signal upon detection of an ECC 1-bit error.

The setting of this register is used for accesses through the respective access port.

Access: GRERRINT_BKA and GRERRINT_BKB can be read or written in 32-bit units
GRERRINT_BKAL and GRERRINT_BKBL can be read or written in 16-bit units
GRERRINT_BKALL and GRERRINT_BKBLL can be read or written in 8-bit units

Address: GRERRINT_BKA: FFC6 4004$_H$
GRERRINT_BKAL: FFC6 4004$_H$
GRERRINT_BKALL: FFC6 4004$_H$
GRERRINT_BKB: FFC6 4204$_H$
GRERRINT_BKBL: FFC6 4204$_H$
GRERRINT_BKBLL: FFC6 4204$_H$

Value after reset: 0000 0001$_H$

Table 40B.45 GRERRINT_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, these bits are always read as 0. When writing, always write 0.
0	SEDIE	ECC 1-bit error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(3) GRSTCLR_BKA/BKB — Global RAM Status Clear Register

GRSTCLR_BKA/BKB clears the error flags in the error status register (GR1STERSTR_BKA/BKB), the overflow flag in the error count overflow status register (GROVFSTR_BKA/BKB), and the error address register (GR1STEADR_BKA/BKB). GRSTCLR_BKA/BKB is a write-only register and is always read as 0.

The setting of this register is used for accesses through the respective access port.

Access:	GRSTCLR_BKA and GRSTCLR_BKB are write-only registers that can be written in 32-bit units. GRSTCLR_BKAL and GRSTCLR_BKBL are write-only registers that can be written in 16-bit units. GRSTCLR_BKALL and GRSTCLR_BKBLL are write-only registers that can be written in 8-bit units
Address:	GRSTCLR_BKA: FFC6 4010_H GRSTCLR_BKAL: FFC6 4010_H GRSTCLR_BKALL: FFC6 4010_H GRSTCLR_BKB: FFC6 4210_H GRSTCLR_BKBL: FFC6 4210_H GRSTCLR_BKBLL: FFC6 4210_H
Value after reset:	0000 0000_H

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 40B.46 GRSTCLR_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, always write 0.
0	STCLR0	Error Status Flag Clear Writing 1 to this bit clears the DEDF and SEDF flags in GR1STERSTR_BKA/BKB, ERROVF0 flag in GROVFSTR_BKA/BKB, and EADR[19:0] in GR1STEADR_BKA/BKB.

(4) GROVFSTR_BKA/BKB— Global RAM Error Count Overflow Status Register

GROVFSTR_BKA/BKB monitors occurrence of error overflow. If a second error occurs after the first error (while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

The setting of this register is used for accesses through the respective access port.

Access: GROVFSTR_BKA and GROVFSTR_BKB are read-only registers that can be read in 32-bit units
GROVFSTR_BKAL and GROVFSTR_BKBL are read-only registers that can be read in 16-bit units
GROVFSTR_BKALL and GROVFSTR_BKBLL are read-only registers that can be read in 8-bit units

Address: GROVFSTR_BKA: FFC6 4014$_H$
GROVFSTR_BKAL: FFC6 4014$_H$
GROVFSTR_BKALL: FFC6 4014$_H$
GROVFSTR_BKB: FFC6 4214$_H$
GROVFSTR_BKBL: FFC6 4214$_H$
GROVFSTR_BKBLL: FFC6 4214$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.47 GROVFSTR_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF0	Error Overflow Flag ERROVF0 is set if a second error occurs while any of the error flags (DEDF and SEDF) in the error status register is set. ERROVF0 is not set when the second error occurs at the same address or source like the first error.

(5) GR1STERSTR_BKA/BKB— Global RAM 1st Error Status Register

GR1STERSTR_BKA/BKB monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. However, the corresponding error flag is set if an ECC 2-bit error occurs only when SEDF bit is set. GR1STERSTR_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

Access: GR1STERSTR_BKA and GR1STERSTR_BKB are read-only registers that can be read in 32-bit units.
GR1STERSTR_BKAL and GR1STERSTR_BKBL are read-only registers that can be read in 16-bit units.
GR1STERSTR_BKALL and GR1STERSTR_BKBLL are read-only registers that can be read in 8-bit units.

Address: GR1STERSTR_BKA: FFC6 4018$_{\text{H}}$
GR1STERSTR_BKAL: FFC6 4018$_{\text{H}}$
GR1STERSTR_BKALL: FFC6 4018$_{\text{H}}$
GR1STERSTR_BKB: FFC6 4218$_{\text{H}}$
GR1STERSTR_BKBL: FFC6 4218$_{\text{H}}$
GR1STERSTR_BKBLL: FFC6 4218$_{\text{H}}$

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.48 GR1STERSTR_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF	ECC 2-bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the STCLR0 bit in GRSTCLR_BKA/BKB to 1. [Setting condition] ECC 2-bit error is detected when DEDF is 0.
0	SEDF	ECC 1-bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the STCLR0 bit in GRSTCLR_BKA/BKB to 1. [Setting condition] ECC 1-bit error is detected when DEDF and SEDF are 0.

(6) GR1STEADR_BKA/BKB— Global RAM 1st Error Address Register

GR1STEADR_BKA/BKB holds the address at which an error has occurred.
The error address is updated if an error occurs while all the error flags are 0 in GR1STERSTR_BKA/BKB. The address

is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error occurs, the address is not updated.
GR1STEADR_BKA/BKB is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in GRSTCLR_BKA/BKB.

The setting of this register is used for accesses through the respective access port.

Access: GR1STEADR_BKA and GR1STEADR_BKB are read-only registers that can be read in 32-bit units.
GR1STEADR_BKAL, GR1STEADR_BKBL, GR1STEADR_BKAH and GR1STEADR_BKBH are read-only registers that can be read in 16-bit units.
GR1STEADR_BKALL, GR1STEADR_BKALH, GR1STEADR_BKAHL, GR1STEADR_BKBLL, GR1STEADR_BKBLH and GR1STEADR_BKBHL are read-only registers that can be read in 8-bit units.

Address: GR1STEADR_BKA: FFC6 401C$_H$
GR1STEADR_BKAL: FFC6 401C$_H$
GR1STEADR_BKALL: FFC6 401C$_H$
GR1STEADR_BKALH: FFC6 401D$_H$
GR1STEADR_BKAH: FFC6 401E$_H$
GR1STEADR_BKAHL: FFC6 401E$_H$
GR1STEADR_BKB: FFC6 421C$_H$
GR1STEADR_BKBL: FFC6 421C$_H$
GR1STEADR_BKBLL: FFC6 421C$_H$
GR1STEADR_BKBLH: FFC6 421D$_H$
GR1STEADR_BKBH: FFC6 421E$_H$
GR1STEADR_BKBHL: FFC6 421E$_H$

Value after reset: GR1STEADR_BKA: FEE0 0000$_H$, GR1STEADR_BKB: FEF0 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 40B.49 GR1STEADR_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	EADR[19:0]	1st Error Address Monitors the address of the first error. The error address is updated if an error occurs while all the error flags are 0 in GR1STERSTR_BKA/BKB. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

Note 1. The value after reset differs depending on bank A or bank B.

(7) GRTSTCTL_BKA/BKB — Global RAM Test Control Register

This register is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST to 1, any data can be written to the ECC bits.
Also, input and output by the ECC decoder in the global RAM controller can be controlled for testing (self-diagnosis).

Set PROT1 to 0 and PROT0 to 1 when writing to this register.

Access:	GRTSTCTL_BKA and GRTSTCTL_BKB can be read or written in 32-bit units GRTSTCTL_BKAL and GRTSTCTL_BKBL can be read or written in 16-bit units
Address:	GRTSTCTL_BKA: FFC6 4020_H GRTSTCTL_BKAL: FFC6 4020_H GRTSTCTL_BKB: FFC6 4220_H GRTSTCTL_BKBL: FFC6 4220_H
Value after reset:	0000 0000_H

Table 40B.50 GRTSTCTL_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, these bits are always read as 0. When writing, always write 0.
15	PROT1	Enables or disables modification of the ECCTST. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to GRTSTCTL_BKA/BKB.
14	PROT0	
13 to 1	Reserved	When read, these bits are always read as 0. When writing, always write 0.
0	ECCTST	ECC test bit. This bit permits to switch the ECC data for writing into RAM. Assert (PROT1, PROT0) = (0, 1) to write to this register. 0: Output of ECC encoder is used for ECC data to RAM 1: Register output is used for ECC data to RAM.

(8) GRDECINBF1_BKA/BKB— Global RAM ECC Decoder Input Data Buffer 1

7-bit ECC of global RAM is replaced to this register value by write access to global RAM during GRTSTCTL_BKA/BKB.ECCTST = 1 (test mode).

Access: GRDECINBF1_BKA and GRDECINBF1_BKB can be read or written in 32-bit units.
GRDECINBF1_BKAL and GRDECINBF1_BKBL can be read or written in 16-bit units.
GRDECINBF1_BKALL and GRDECINBF1_BKBLL can be read or written in 8-bit units.

Address: GRDECINBF1_BKA: FFC6 4024_H
GRDECINBF1_BKAL: FFC6 4024_H
GRDECINBF1_BKALL: FFC6 4024_H
GRDECINBF1_BKB: FFC6 4224_H
GRDECINBF1_BKBL: FFC6 4224_H
GRDECINBF1_BKBLL: FFC6 4224_H

Table 40B.51 GRDECINBF1_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, these bits are always read as 0. When writing, always write 0.
6 to 0	GRDECINBF1[6:0]	This field is valid ECCTST = 1 (test mode). When the write operation is executed, the data in this register is used for writing to 7-bit ECC field RAM.

40B.2.6 ECC for Peripheral RAM

40B.2.6.1 Overview

This is an ECC module for the RAM of the following peripheral modules.

CSIH, RS-CANFD, FlexRay and Ethernet AVB.

Table 40B.52 List of the ECC Functions for the peripheral RAM

Item	Description
ECC error detection/correction	ECC error detection and correction can be enabled or disabled. Either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction ● 2-bit error detection and 1-bit error detection The ECC error detection/correction can be disabled by using through mode. In the initial state, 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Error notification can be enabled or disabled when an ECC 2-bit error is detected. ● Error notification can be enabled or disabled when an ECC 1-bit error is detected. In the initial state of ECC controller, 2-bit error notification is enabled and 1-bit error notification is disabled. However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed.
Error status	Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available. A bit for clearing the error status is provided.
Address capture	Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).

CAUTION

When ECC error detection/correction is performed about RS-CANFD or FlexRay, initialize the RAM area before it is used.

40B.2.6.2 Interrupt Requests

ECC of peripheral interrupt requests are listed below.

Table 40B.53 CSIHn ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
INTECCCSIHn	CSIHn ECC 1-bit error or 2-bit error interrupt	INTECCCSIH0	—
		INTECCCSIH1	
		INTECCCSIH2	
		INTECCCSIH3	

Table 40B.54 RCFDCn ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
ECCCNFDRAMFEIF	RCFDC0 ECC 1-bit error or 2-bit error interrupt	INTECCCNFDRAM	—

Table 40B.55 FlexRay ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	FLXA0 ECC 1-bit error or 2-bit error interrupt	INTECCFLRAM	—

Table 40B.56 Ethernet AVB ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ETNB0 ECC 1-bit error or 2-bit error interrupt	INTECCETH	—

40B.2.6.3 List of Registers

(1) List of ECC Modules

The RAMs of the multiple peripheral functions are provided with the ECC modules. The following table shows the peripheral functions provided with the ECC modules, the corresponding ECC module names, and base addresses of the ECC modules.

Table 40B.57 List of ECC Modules

Peripheral Functions		Module Name	ECC Module Names and Register	
			Base Address Name	Base Address <base_addr>
CSIHn	Buffered I/O (CSIH RAM)	ECCCSIH0	<ECCCSIH0_base>	FFC7 0100_H
		ECCCSIH1	<ECCCSIH1_base>	FFC7 0200_H
		ECCCSIH2	<ECCCSIH2_base>	FFC7 0300_H
		ECCCSIH3	<ECCCSIH3_base>	FFC7 0400_H
RCFDC0	Message bufferRAM (MB RAM)	ECCCFD0MB	<ECCCFD0MB_base>	FFC7 1300_H
	Acceptance filter list RAM0 (AFL0 RAM)	ECCCFD0AFL0	<ECCCFD0AFL0_base>	FFC7 1400_H
	Acceptance filter list RAM1 (AFL1 RAM)	ECCCFD0AFL1	<ECCCFD0AFL1_base>	FFC7 1500_H
FLXA0	Message RAM (MRAM)	ECCFLXA0	<ECCFLXA0_base>	FFC7 3100_H
	Temporary buffer (TBFA)	ECCFLXA0T0	<ECCFLXA0T0_base>	FFC7 3200_H
	Temporary buffer (TBFB)	ECCFLXA0T1	<ECCFLXA0T1_base>	FFC7 3300_H
ETNB0	Transmit FIFO RAM.(TXRAM)	ECCETNB0TX	<ECCETNB0TX_base>	FFC7 4100_H
	Receive FIFO RAM.(RXRAM)	ECCETNB0RX	<ECCETNB0RX_base>	FFC7 4200_H

(2) List of Registers

Each ECC module has the registers shown in the following table.

Table 40B.58 List of Registers

Module Name	Register Name	Symbol	Address
See (1) List of ECC Modules.	ECC control register	<Module_Name>CTL	<base_addr> + 00_H
	ECC test mode control register	<Module_Name>TMC	<base_addr> + 04_H
	ECC encode/decode input/output replacement test register	<Module_Name>TED	<base_addr> + $0C_H$
	ECC redundant bit data control test register	<Module_Name>TRC	<base_addr> + 08_H
	ECC decode syndrome data register	<Module_Name>SYND	<base_addr> + $0B_H$
	ECC 7-bit redundant bit data hold test register	<Module_Name>HORD	<base_addr> + $0A_H$
	ECC encode test register	<Module_Name>ECRD	<base_addr> + 09_H
	ECC redundant bit input/output replacement register	<Module_Name>ERDB	<base_addr> + 08_H
	ECC error address register 0	<Module_Name>AD0	<base_addr> + 10_H
SL_READTEST	ECCREAD test select register	SELB_READTEST	FFC7 8000H

40B.2.6.4 Details of Registers

(1) <Module_Name>CTL — ECC Control Register

The <Module_Name>CTL register controls the mode of the ECC and the status for target peripheral modules.

Bits 7, 5, 4 and 3 should be set (written) while the target peripheral module’s operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01_B.

Access: This register can be read or written in 16-bit units.

Address: See **Table 40B.57, List of ECC Modules** and **Table 40B.58, List of Registers**.

Value after reset: $001X_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	ECCOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	—
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R	R

Note 1. These bits are always read as 0.

Table 40B.59 <Module_Name>CTL Register Contents

Bit Position	Bit Name	Function
15	EMCA1	Access Control Bits 1 and 0 to ECC Mode Selection These bits specify whether updating the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 01_B, writing to bit 7 is enabled.
14	EMCA0	
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	ECCOVFF	By detecting an error while the error status is set and the new error has another address than the already latched (not cleared or reset is not issued), this bit is set. 0: Overflow is not occurred after reset of clearing ECER2F and ECER1F. 1: Error address register overflowed **NOTE:** This bit clear condition is as follows. (1) Reset (2) Writing ECER2C = 1 when ECER2F = 1 or ECER1C = 1 when ECER1F = 1 (3) Selecting through mode enable (ECTHM = 1)
10	ECER2C	2-Bit ECC Error Detection Flag Clear This bit clears 2-bit error detection flags of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. ECER2C = 1 also clears the ECCOVFF bit while ECER2F bit is set.
9	ECER1C	1-Bit ECC Error Detection Correction Accumulation Flag Clear This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. ECER1C = 1 also clears the ECCOVFF bit while ECER1F bit is set.
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40B.59 <Module_Name>CTL Register Contents

Bit Position	Bit Name	Function
7	ECTHM	ECC Function through Mode Selection Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 disables the ECC function. When writing to this bit, write 01_B to the EMCA1 and EMCA0 bits at the same time. Set this bit to 1 to disable the ECC function. 0: Passing through mode is disabled (normal operation mode). 1: Passing through mode is enabled. (ECC function disable)
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	EC1ECP	1-Bit Error Correction Enable This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. 0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.
4	EC2EDIC	2-Bit Error Detection Interrupt Control This bit controls whether to generate an interrupt when 2-bit error is detected. 0: When 2-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 2-bit error is detected, a target peripheral module's interrupt will be generated.
3	EC1EDIC	1-Bit Error Detection Interrupt Control This bit controls whether to generate an interrupt when 1-bit error is detected. 0: When 1-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 1-bit error is detected, a target peripheral module's interrupt will be generated.
2	ECER2F	2-Bit Error Detection Flag This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (a target peripheral module's interrupt) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. When through mode is enable (ECTHM = 1), this bit is cleared. If 2-bit error is detected again while this bit is set, an interrupt will not be generated. 0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred. This bit is read-only. Writing 0 or 1 does not change internal state.
1	ECER1F	1-Bit Error Detection/Correction Flag This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. When through mode is enabled (ECTHM = 1), this bit is cleared. 0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred. This bit is read-only. Writing 0 or 1 does not change internal state.
0	ECEMF	ECC Error Message Flag This flag indicates whether an error exists in the current read data bus. This bit is updated whenever the RAM outputs data. This bit is also cleared when through mode is enabled (ECTHM = 1) and there is no 1-bit error in decode circuit input data. 0: The current RAM output data does not have bit errors. 1: The current RAM output data have bit errors.

CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

(2) <Module_Name>TMC — ECC Test Mode Control Register

The <Module_Name>TMC register is used to switch to the test mode, and this register is for test mode control.

This register can be used when a target peripheral module is not accessed to RAM.

When writing to bit 7, ETMA1 and ETMA0 need to be 10_B.

Access: This register can be read or written in 16-bit units.

Address: See **Table 40B.57, List of ECC Modules** and **Table 40B.58, List of Registers**.

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA1	ETMA0	—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. These bits are always read as 0.

Table 40B.60 <Module_Name>TMC Register Contents

Bit Position	Bit Name	Function
15	ETMA1	Access Control Bits 1 and 0 to ECC Test Mode These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.
14	ETMA0	
13 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTMCE	ECC Test Mode Enable This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write 10_B to the ETMA1 and ETMA0 bits at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: <Module_Name>TED, <Module_Name>TRC, <Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, <Module_Name>ERDB Register test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECTRRS	ECC RAM Read Test Mode Selection This bit selects the targets for reading when the <Module_Name>TED and <Module_Name>ERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Read value of the <Module_Name>TED register will be the write value of the <Module_Name>TED register. Read value of the <Module_Name>ERDB register will be the write value of the <Module_Name>ERDB register. 1: Read value of the <Module_Name>TED register can read RAM data. Read value of the <Module_Name>ERDB register will be the ECC Data to be written to RAM.
3	ECREOS	ECC Redundant Bit Output Data Selection This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the <Module_Name>ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated for write data is stored in RAM. 1: The value of <Module_Name>ERDB Register is stored in RAM.

Table 40B.60 <Module_Name>TMC Register Contents

Bit Position	Bit Name	Function
2	ECENS	ECC Encoder Input Selection This bit specifies data written to RAM or the value of the <Module_Name>TED register as the input to the ECC encoder. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated from write data to RAM 1: ECC data is generated from register value of the <Module_Name>TED.
1	ECDCS	ECC Decoder Input Selection This bit specifies which data is for generation of syndrome code and error detection, RAM data or the value of <Module_Name>TED. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Syndrome code generation and error detection are performed from RAM Data. 1: Syndrome code generation and error detection are performed from <Module_Name>TED register value.
0	ECREIS	ECC Redundant Bit Input Data Selection This bit specifies which ECC data is for generation of syndrome code and error detection, ECC data stored in RAM or the value of the <Module_Name>ERDB. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Syndrome code generation and error detection are performed from ECC data stored in RAM. 1: Syndrome code generation and error detection are performed from <Module_Name>ERDB register value.

(3) <Module_Name>TED — ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

This register value is used to generate ECC data or syndrome code.

This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE = 1). When <Module_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000$_H$ is read.

This register can be used when a target peripheral module is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See **Table 40B.57, List of ECC Modules** and **Table 40B.58, List of Registers**.

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEDB[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEDB[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40B.61 <Module_Name>TED Register Contents

Bit Position	Bit Name	Function
31 to 0	ECEDB[31:0]	When <Module_Name>TMC.ECENS = 1, the value of this register is used to generate ECC data and that is stored to RAM. When <Module_Name>TMC.ECDCS = 1, the value of this register is used to generate syndrome code that is stored in ECC decode syndrome data register (<Module_Name>SYND). In addition, when <Module_Name>TMC.ECTRRS = 1, RAM data [31:0] instead of written data is read for the value of this register.

(4) <Module_Name>TRC — ECC Redundant Bit Data Control Test Register

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers, <Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, and <Module_Name>ERDB.

This register can be accessed when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When <Module_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when a target peripheral module is not accessed to RAM.

Access:	This register can be read or written in 32-bit units.
Address:	See **Table 40B.57, List of ECC Modules** and **Table 40B.58, List of Registers**.
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	<Module_Name>SYND (see **Section (6)**)								<Module_Name>HORD (see **Section (7)**)

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(5) <Module_Name>AD0 — Target ECC Error Address Register 0

This is read only register to hold the ECC error occurred address.

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	See **Table 40B.57, List of ECC Modules** and **Table 40B.58, List of Registers**.
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	ECEAD[30:16]														
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.62 <Module_Name>AD0 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned.
30 to 0	ECEAD[30:0]	ECEAD0 is a read-only register to hold the address at which an ECC error has occurred. If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECEAD0 as the address at which the ECC error has occurred. The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. Only one address can be held in ECEAD0

(6) <Module_Name>SYND — ECC Decode Syndrome Data Register

This register is a read-only register for storing generated syndrome data in ECC test mode.

Writing to this register is ignored.

This register is read-only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 40B.57, List of ECC Modules** and **Table 40B.58, List of Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SYND6	SYND5	SYND4	SYND3	SYND2	SYND1	SYND0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40B.63 <Module_Name>SYND Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	SYND[6:0]	These bits store generated syndrome code as needed.

(7) <Module_Name>HORD — ECC 7-Bit Redundant Bit Data Hold Test Register

This register is for storing ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 40B.57, List of ECC Modules** and **Table 40B.58, List of Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	HORD6	HORD5	HORD4	HORD3	HORD2	HORD1	HORD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40B.64 <Module_Name>HORD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	HORD[6:0]	These bits store ECC code for read RAM data as needed. When <Module_Name>TMC.ECTRRS =1 and if <Module_Name>TED register is read, ECC code is stored.

(8) <Module_Name>ECRD — ECC Encode Test Register

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 40B.57, List of ECC Modules** and **Table 40B.58, List of Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ECRD6	ECRD5	ECRD4	ECRD3	ECRD2	ECRD1	ECRD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40B.65 <Module_Name>ECRD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing and can read ECC data for data written in the <Module_Name>TED register when <Module_Name>MC.ECENS =1.

(9) <Module_Name>ERDB — ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles test data.

This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE = 1). When <Module_Name>TMC.ECTMCE = 0, writing to this register is ignored and 00_H is read.

Access:	This register can be read or written in 8-bit units.
Address:	See **Table 40B.57, List of ECC Modules** and **Table 40B.58, List of Registers**.
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	ERDB6	ERDB5	ERDB4	ERDB3	ERDB2	ERDB1	ERDB0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40B.66 <Module_Name>ERDB Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ERDB[6:0]	These bits can store this register value as ECC data when <Module_Name>TMC.ECREOS = 1. When the register is read while <Module_Name>TMC.ECREIS =1, the value read from these bits is ECC data read from the RAM. When <Module_Name>TMC.ECTRRS = 1, ECC data to be stored in RAM will be read for this register value instated of written data.

(10) SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the target peripheral module's RAM ECC registers.

Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

Access:	This register can be read or written in 16-bit units.
Address:	See **Table 40B.57, List of ECC Modules** and **Table 40B.58, List of Registers**.
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0	RTCSIHE7A0	CSIH0 ECC Register Write Access for Testing Purpose Enable/Disable 0: Write access for testing purpose is disabled. 1: Write access for testing purpose is enabled (CSIH0 ECC read-only bit can be written).

40B.3 Memory Protection

40B.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU
  The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see *the RH850 Family User's Manual: Software*.
- Slave Guard
  A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.
  - PEG
    The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see **Section 3BC, CPU System of RH850/F1KM**.
  - IPG
    The CPU Peripheral is protected against illegal accesses.
    For details, see **Section 3BC, CPU System of RH850/F1KM**.
  - GRG
    The global RAM is protected against illegal accesses.
  - PBG/HBG
    The control registers in the peripheral circuits are protected against illegal accesses. For details, see **Section 40B.3.3, PBG/HBG**.
  - PBGC
    The CPU system has its dedicated PBG function which is called PBG for CPU system. For details, see **Section 40B.3.4, PBG for CPU System**.

40B.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.

Table 40B.68 Identifiers for Slave Guard

Identifier	Function
UM	When the CPU makes an access, this indicates the operating mode of the CPU. 0: Supervisor mode 1: User mode When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 0.
SPID	When the CPU makes an access, this indicates the system protection identifier SPID that is assigned to the CPU. When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 00_B.
PEID	This indicates the access source bus master. 001_B: CPU1 100_B: Other bus master (H-Bus bus master) When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.

40B.3.2 GRG (Global RAM Guard)

This product is provided with 4-channel GRG, which is described in detail in the following sections.

CAUTION

The retention RAM is a part of the global RAM. The Guard for the retention RAM is shared with the global RAM's. Therefore, use the same register as the global RAM's in case of the retention RAM.

40B.3.2.1 List of Registers

Table 40B.69 List of Registers

Module Name	Address	Symbol	Register Name	R/W	Value after Reset	Access Size
MGDGR	FFC4 9000$_H$	MGDGRPROT0_BKA	GRG protection setting register0 (Bank A)	R/W	03FE 01F0$_H$	8/16/32
	FFC4 9004$_H$	MGDGRBAD0_BKA	GRG compare base address register0 (Bank A)	R/W	0000 0000$_H$	8/16/32
	FFC4 9008$_H$	MGDGRADV0_BKA	GRG compare address valid register0 (Bank A)	R/W	0000 0000$_H$	8/16/32
	FFC4 9010$_H$	MGDGRPROT1_BKA	GRG protection setting register1 (Bank A)	R/W	03FE 01F0$_H$	8/16/32
	FFC4 9014$_H$	MGDGRBAD1_BKA	GRG compare base address register1 (Bank A)	R/W	0000 0000$_H$	8/16/32
	FFC4 9018$_H$	MGDGRADV1_BKA	GRG compare address valid register1 (Bank A)	R/W	0000 0000$_H$	8/16/32

	FFC4 9248$_H$	MGDGRSTYPE_BKB	GRG error access type register (Bank B)	R	0000 0000$_H$	8/16/32
	FFC4 924C$_H$	MGDGRSAD_BKB	GRG error address register (Bank B)	R	FEF0 0000$_H$	8/16/32

Note: MGDGRPROTn_BKA/BKB, MGDGRBADn_BKA/BKB, and MGDGRADVn_BKA/BKB set the protection specifications for each channel (n = 0 to 3).
MGDGRSCTL_*, MGDGRSSTAT_*, MGDGRSTYPE_* and MGDGRSAD_* indicate error information on each bank.
“BKA” represents for Bank A and “BKB” represents for Bank B.

40B.3.2.2 Details of Registers

(1) MGDGRPROTn_BKA/BKB — GRG Protection Setting Register n (n = 0 to 3)

Access:	MGDGRPROTn_BKA and MGDGRPROTn_BKB can be read or written in 32-bit units MGDGRPROTn_BKAL, MGDGRPROTn_BKBL, MGDGRPROTn_BKAH and MGDGRPROTn_BKBH can be read or written in 16-bit units MGDGRPROTn_BKALL, MGDGRPROTn_BKAHL, MGDGRPROTn_BKAHH, MGDGRPROTn_BKBLL, MGDGRPROTn_BKBHL and MGDGRPROTn_BKBHH can be read or written in 8-bit units.
Address:	MGDGRPROTn_BKA: FFC4 9000_H + n × 10_H MGDGRPROTn_BKAL: FFC4 9000_H + n × 10_H MGDGRPROTn_BKALL: FFC4 9000_H + n × 10_H MGDGRPROTn_BKAH: FFC4 9002_H + n × 10_H MGDGRPROTn_BKAHL: FFC4 9002_H + n × 10_H MGDGRPROTn_BKAHH: FFC4 9003_H + n × 10_H MGDGRPROTn_BKB: FFC4 9200_H + n × 10_H MGDGRPROTn_BKBL: FFC4 9200_H + n × 10_H MGDGRPROTn_BKBLL: FFC4 9200_H + n × 10_H MGDGRPROTn_BKBH: FFC4 9202_H + n × 10_H MGDGRPROTn_BKBHL: FFC4 9202_H + n × 10_H MGDGRPROTn_BKBHH: FFC4 9203_H + n × 10_H
Value after reset:	03FE $01F0_H$

Table 40B.70 MGDGRPROTn_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30	EN	Protection Enable 0: Disables protection. 1: Enables protection. Only access permitted by this register is possible.
29 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	UM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	PEID4	Access with PEID = 4 (peripheral device connected to H-BUS)*1 0: Disables access with PEID4. 1: Enables access with PEID4.
20, 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.

Table 40B.70 MGDGRPROTn_BKA/BKB Register Contents

Bit Position	Bit Name	Function
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	SPID3	Access with SPID = 3*[2] 0: Disables access with SPID3. 1: Enables access with SPID3.
7	SPID2	Access with SPID = 2*[2] 0: Disables access with SPID2. 1: Enables access with SPID2.
6	SPID1	Access with SPID = 1 (CPU1*[3])*[2] 0: Disables access with SPID1. 1: Enables access with SPID1.
5	SPID0	Access with SPID = 0 (peripheral device connected to H-BUS)*[2] 0: Disables access with SPID0. 1: Enables access with SPID0.
4 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. Access with PEID
PEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
SPID is a bit list with each bit corresponding to a SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. Setting value of MCFG0.SPID

CAUTION

Global RAM Guard (GRG) only supports write accesses. The guard setting is not enabled for read accesses.

(2) MGDGRBADn_BKA/BKB — GRG Compare Base Address Register n (n = 0 to 3)

Access: MGDGRBADn_BKA and MGDGRBADn_BKB can be read or written in 32-bit units.
MGDGRBADn_BKAL, MGDGRBADn_BKAH, MGDGRBADn_BKBL and MGDGRBADn_BKBH can be read or written in 16-bit units.
MGDGRBADn_BKALH, MGDGRBADn_BKAHL, MGDGRBADn_BKBLH and MGDGRBADn_BKBHL can be read or written in 8-bit units.

Address:
MGDGRBADn_BKA: FFC4 9004_H + n × 10_H
MGDGRBADn_BKAL: FFC4 9004_H + n × 10_H
MGDGRBADn_BKALH: FFC4 9005_H + n × 10_H
MGDGRBADn_BKAH: FFC4 9006_H + n × 10_H
MGDGRBADn_BKAHL: FFC4 9006_H + n × 10_H
MGDGRBADn_BKB: FFC4 9204_H + n × 10_H
MGDGRBADn_BKBL: FFC4 9204_H + n × 10_H
MGDGRBADn_BKBLH: FFC4 9205_H + n × 10_H
MGDGRBADn_BKBH: FFC4 9206_H + n × 10_H
MGDGRBADn_BKBHL: FFC4 9206_H + n × 10_H

Value after reset: 0000 0000_H

Table 40B.71 MGDGRBADn_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 11	AD[19:11]	Compare Base Address*[1] These bits set the base address of protection setting domain specified by the GRG protection setting register n (MGDGRPROTn_BKA/BKB).
10 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. For details, see **Section 40B.3.2.2(3), MGDGRADVn_BKA/BKB — GRG Compare Address Valid Register n (n = 0 to 3)**.

(3) MGDGRADVn_BKA/BKB — GRG Compare Address Valid Register n (n = 0 to 3)

Access: MGDGRADVn_BKA and MGDGRADVn_BKB can be read or written in 32-bit units.

MGDGRADVn_BKAL, MGDGRADVn_BKAH, MGDGRADVn_BKBL and MGDGRADVn_BKBH can be read or written in 16-bit units.

MGDGRADVn_BKALH, MGDGRADVn_BKAHL, MGDGRADVn_BKBLH and MGDGRADVn_BKBHL can be read or written in 8-bit units.

Address:
MGDGRADVn_BKA: FFC4 9008$_H$ + n × 10$_H$
MGDGRADVn_BKAL: FFC4 9008$_H$ + n × 10$_H$
MGDGRADVn_BKALH: FFC4 9009$_H$ + n × 10$_H$
MGDGRADVn_BKAH: FFC4 900A$_H$ + n × 10$_H$
MGDGRADVn_BKAHL: FFC4 900A$_H$ + n × 10$_H$
MGDGRADVn_BKB: FFC4 9208$_H$ + n × 10$_H$
MGDGRADVn_BKBL: FFC4 9208$_H$ + n × 10$_H$
MGDGRADVn_BKBLH: FFC4 9209$_H$ + n × 10$_H$
MGDGRADVn_BKBH: FFC4 920A$_H$ + n × 10$_H$
MGDGRADVn_BKBHL: FFC4 920A$_H$ + n × 10$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 40B.72 MGDGRADVn_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 11	ADV[19:11]	Valid Compare Address Setting MGDGRADVn_BKA/BKB[19:11] to 1 executes address compare. If all the bits of MGDGRADVn_BKA/BKB[19:11] are 1, 2 Kbytes, which is the minimum unit based on the address specified by MGDGRBADn_BKA/BKB, are protected. However, if all the bits of MGDGRADVn_BKA/BKB[19:11] are 0, all the areas of global RAM are protected.
10 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Setting example

If MGDGRBADn_BKA.AD[19:11] is 1D0$_H$ and MGDGRADVn_BKA.ADV[19:11] is 1FD$_H$, global RAM guard protection area n is from FEEE 8000$_H$ to FEEE 87FF$_H$ and FEEE 9000$_H$ to FEEE 97FF$_H$.

If MGDGRBADn_BKB.AD[19:11] is 1D0$_H$ and MGDGRADVn_BKB.ADV[19:11] is 1FD$_H$, global RAM guard protection area n is from FEFE 8000$_H$ to FEFE 87FF$_H$ and FEFE 9000$_H$ to FEFE 97FF$_H$.

Concept (e.g. bank A)

When MGDGRBADn_BKA.AD[19:11] is 1D0$_H$, the base address is FEEE 8000$_H$.
The settable range is shown by an underline as follows:

1 1 1 1	1 1 1 0	1 1 1 0	1 1 1 0	1 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	B
F	E	E	E	8	0	0	0	H

The settable range is as follows when MGDGRADVn_BKA.ADV[19:11] is 1FD$_H$:

0 0 0 0	0 0 0 0	0 0 0 0	1 1 1 1	1 1 1 0	1 0 0 0	0 0 0 0	0 0 0 0	B

The area to which protection applies is as shown below because the bits set to 0 and the lower eleven bits are not applicable:

0 0 0 0	0 0 0 0	0 0 0 0	1 1 1 0	1 0 0 x	0 x x x	x x x x	x x x x	B

Therefore the protection range is as follows:

1 1 1 1	1 1 1 0	1 1 1 0	1 1 1 0	1 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	B
F	E	E	E	8	0	0	0	H

to

1 1 1 1	1 1 1 0	1 1 1 0	1 1 1 0	1 0 0 0	0 1 1 1	1 1 1 1	1 1 1 1	B
F	E	E	E	8	7	F	F	H

and

1 1 1 1	1 1 1 0	1 1 1 0	1 1 1 0	1 0 0 1	0 0 0 0	0 0 0 0	0 0 0 0	B
F	E	E	E	9	0	0	0	H

to

1 1 1 1	1 1 1 0	1 1 1 0	1 1 1 0	1 0 0 1	0 1 1 1	1 1 1 1	1 1 1 1	B
F	E	E	E	9	7	F	F	H

The following 2 Kbytes each (a total of 4 Kbytes) are protected (in hexadecimal):

- FEEE 8000$_H$ to FEEE 87FF$_H$
- FEEE 9000$_H$ to FEEE 97FF$_H$

(4) MGDGRSCTL_BKA/BKB — GRG Control Register

Access: MGDGRSCTL_BKA and MGDGRSCTL_BKB registers are write-only registers that can be written in 32-bit units.
MGDGRSCTL_BKAL and MGDGRSCTL_BKBL registers are write-only registers that can be written in 16-bit units.
MGDGRSCTL_BKALL and MGDGRSCTL_BKBLL registers are write-only registers that can be written in 8-bit units.

Address: MGDGRSCTL_BKA: FFC4 9040$_H$
MGDGRSCTL_BKAL: FFC4 9040$_H$
MGDGRSCTL_BKALL: FFC4 9040$_H$
MGDGRSCTL_BKB: FFC4 9240$_H$
MGDGRSCTL_BKBL: FFC4 9240$_H$
MGDGRSCTL_BKBLL: FFC4 9240$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERRCLO	ERRCLE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 40B.73 MGDGRSCTL_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	ERRCLO	Error Entry Overflow Flag Clear 0: No operation 1: Clears the overflow flag.
0	ERRCLE	GRG Protection Violation Flag Clear 0: No operation 1: Clears the error flag. Set this bit at the same time as ERRCLO as shown in **Table 40B.74, Combinations of ERRCLO and ERRCLE**.

Table 40B.74 Combinations of ERRCLO and ERRCLE

ERRCLO	ERRCLE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

(5) MGDGRSSTAT_BKA/BKB— GRG Error Status Register

Access: MGDGRSSTAT_BKA and MGDGRSSTAT_BKB are read-only registers that can be read in 32-bit units.
MGDGRSSTAT_BKAL and MGDGRSSTAT_BKBL are read-only registers that can be read in 16-bit units.
MGDGRSSTAT_BKALL and MGDGRSSTAT_BKBLL are read-only registers that can be read in 8-bit units.

Address: MGDGRSSTAT_BKA: FFC4 9044_H
MGDGRSSTAT_BKAL: FFC4 9044_H
MGDGRSSTAT_BKALL: FFC4 9044_H
MGDGRSSTAT_BKB: FFC4 9244_H
MGDGRSSTAT_BKBL: FFC4 9244_H
MGDGRSSTAT_BKBLL: FFC4 9244_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.75 MGDGRSSTAT_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred. If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of GRG error entry stages is 1. Note that this overflow is notified to INTGUARD. In addition, it is not possible to determine whether overflow has occurred in INTGUARD. Check the value of this bit. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	GRG protection violation Error Flag 0: No GRG protection violation has occurred. 1: A GRG protection violation has occurred.

(6) MGDGRSTYPE_BKA/BKB — GRG Error Access Type Register

Access: MGDGRSTYPE_BKA and MGDGRSTYPE_BKB are read-only registers that can be read in 32-bit units.
MGDGRSTYPE_BKAL and MGDGRSTYPE_BKBL are read-only registers that can be read in 16-bit units.
MGDGRSTYPE_BKALL, MGDGRSTYPE_BKALH, MGDGRSTYPE_BKBLL and MGDGRSTYPE_BKBLH are read-only registers that can be read in 8-bit units.

Address: MGDGRSTYPE_BKA: FFC4 9048$_H$
MGDGRSTYPE_BKAL: FFC4 9048$_H$
MGDGRSTYPE_BKALL: FFC4 9048$_H$
MGDGRSTYPE_BKALH: FFC4 9049$_H$

Table 40B.76 MGDGRSTYPE_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	The PEID of the originator of the access which led to a GRG protection violation
12 to 10	Reserved	When read, the value after reset is returned.
9 to 8	SPID[1:0]	The SPID of the originator of the access which led to a GRG protection violation
7	Reserved	When read, the value after reset is returned.
6	UM	The UM of the originator of the access which led to a GRG protection violation
5 to 0	Reserved	When read, the value after reset is returned.

(7) MGDGRSAD_BKA/BKB — GRG Error Address Register

Access: MGDGRSAD_BKA and MGDGRSAD_BKB are read-only registers that can be read in 32-bit units.

MGDGRSAD_BKAL, MGDGRSAD_BKAH, MGDGRSAD_BKBL and MGDGRSAD_BKBH are read-only registers that can be read in 16-bit units.

MGDGRSAD_BKALL, MGDGRSAD_BKALH, MGDGRSAD_BKAHL, MGDGRSAD_BKBLL, MGDGRSAD_BKBLH and MGDGRSAD_BKBHL are read-only registers that can be read in 8-bit units.

Address:
MGDGRSAD_BKA: FFC4 904C$_H$
MGDGRSAD_BKAL: FFC4 904C$_H$
MGDGRSAD_BKALL: FFC4 904C$_H$

Table 40B.77 MGDGRSAD_BKA/BKB Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19 to 0	SAD[19:0]	Address at GRG violation was occurred.

Note 1. The value after reset differs depending on bank A or bank B.

40B.3.3 PBG/HBG

The PBG/HBG module is divided into several PBG/HBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG/HBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG/HBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG/HBG group names, and the PBG/HBG channel numbers.

Table 40B.78 PBG/HBG Groups and Channels and Target Modules

PBG/HBG Group	Group No. (Register Name index)*3	PBG/HBG Channel Number	Protection Target Module	Target Register
PBG10	00	0	ECON_NMI	WDTNMIF WDTNMIFC
		1	ECON_FEINT	FEINTF FEINTFMSK FEINTFC
		2	SL_INTC	SELB_INTC1
		3	ADCA0	All registers in ADCA0
		4	KR0	KR0KRM
		5	PORT (Group A_ISO)	Registers of P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, and AP1 (except Pn, PSRn, PPRn, PNOTn, and PIBCn)
		6	PORT (Group A_AWO)	Registers of P0, P1, P2, P3, P8, AP0, and IP0 (except Pn, PSRn, PPRn, PNOTn, and PIBCn)
		7	JTAG (Group A)	JP0 register (except JP0, JPSR0, JPPR0, JPNOT0, and JPIBC0)
		8	RLN30	All registers in RLIN30

Note 1. For details, see **Section 5, Write-Protected Registers**, **Section 9BC, Reset Controller of RH850/F1KM**, **Section 10B, Power Supply Circuit of RH850/F1KM-S4**, **Section 11BC, Supply Voltage Monitor of RH850/F1KM**, **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4**, **Section 13, Clock Monitor (CLMA)**, **Section 14, Stand-By Controller (STBC)**, and **Section 15, Low-Power Sampler (LPS)**.

Note 2. Regarding the PBG registers for the flash memory, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

Note 3. Regarding the PBG register addresses, see **Table 40B.79, List of PBG/HBG Protection Registers**.

Note 4. Regarding the RS-CANFD guard group, see **Section 24, CANFD Interface (RS-CANFD)**.

NOTE

Be sure to enable PBG/HBG before disabling register access clock of each clock domain.

40B.3.3.1 List of Registers

The following table lists the registers provided for each PBG/HBG group. And PBG/HBG group is equal to module name.

Table 40B.79 List of PBG/HBG Protection Registers

PBG/ HBG Group[*1]	Group No.[*2]	Symbol	Register Name	R/W	Value after Reset	Address	Access Size	Power Domain
PBG10	00	FSGD00PROT0	PBG00 protection register 0	R/W	066F FFF7$_H$	FFC4 0000$_H$	8/16/32	ISO
		FSGD00PROT1	PBG00 protection register 1	R/W	066F FFF7$_H$	FFC4 0004$_H$	8/16/32	
		FSGD00PROT2	PBG00 protection register 2	R/W	066F FFF7$_H$	FFC4 0008$_H$	8/16/32	
		FSGD00PROT3	PBG00 protection register 3	R/W	066F FFF7$_H$	FFC4 000C$_H$	8/16/32

Note 1. The Group indicates the module name.

Note 2. Register name index.

The following table lists the registers provided for each PBG/HBG group.

Table 40B.80 List of PBG/HBG Error Registers

Module Name	Symbol	Register Name	R/W	Value after Reset	Address	Access Size
PBGxx	ERRSLVxxCTL	PBGxx error control register	W	0000 0000_H	<base_addr0> + 0_H	8/16/32
	ERRSLVxxSTAT	PBGxx error status register	R	0000 0000_H	<base_addr0> + 4_H	8/16/32
	ERRSLVxxADDR	PBGxx error address register	R	0000 0000_H	<base_addr0> + 8_H	32
	ERRSLVxxTYPE	PBGxx error type register	R	0000 0000_H	<base_addr0> + C_H	16/32
HBGxx	HERRSLVxxCTL	HBGxx error control register	W	0000 0000_H	<base_addr1> + 0_H	8/16/32
	HERRSLVxxSTAT	HBGxx error status register	R	0000 0000_H	<base_addr1> + 4_H	8/16/32
	HERRSLVxxADDR	HBGxx error address register	R	0000 0000_H	<base_addr1> + 8_H	32
	HERRSLVxxTYPE	HBGxx error type register	R	0000 0000_H	<base_addr1> + C_H	16/32

In the above table, “xx” in the register names and symbols represents the PBG group numbers. The table below shows the base address values <base_addr0>, which correspond to each of the PBG group numbers and channel numbers as well as base address values <base_addr1>, which correspond to each of the HBG group numbers and channel numbers.

Table 40B.81 PBG Group Numbers and Error Base Addresses

PBG Group	PBG Group Number	<base_addr0>
PBG10	00	FFC4 0040_H
PBG11	01	FFC4 0140_H
PBG12	07	FFC4 0440_H
PBG13	08	FFC4 0540_H
PBG20	02	FFDD $D040_H$
PBG21	09	FFDD $D140_H$
PBG30	03	FFF9 4040_H
PBG31	04	FFF9 4140_H
PBG32	05	FFF9 4240_H
PBG40	10	FFC5 $9C40_H$
PBG50	06	FFF9 0040_H
PBG60	11	FFC7 1840_H

Table 40B.82 HBG Group Numbers and Error Base Addresses

HBG Group	HBG Group Number	<base_addr1>
HBG00	00	FFF9 $C040_H$
HBG01	01	FFF9 $C140_H$
HBG02	02	FFF9 $C240_H$

40B.3.3.2 Details of Registers

(1) FSGDxxPROTn — PBGxx Protection Register n
HFSGDxxPROTn — HBGxx Protection Register n

FSGDxxPROTn and HFSGDxxPROTn specify the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. "n" in the register names and symbols represents the PBG/HBG channel number.

Access:	FSGDxxPROTn and HFSGDxxPROTn can be read or written in 32-bit units. FSGDxxPROTnL, FSGDxxPROTnH, HFSGDxxPROTnL, and HFSGDxxPROTnH can be read or written in 16-bit units. FSGDxxPROTnLL, FSGDxxPROTnHL, FSGDxxPROTnHH, HFSGDxxPROTnLL, HFSGDxxPROTnHL, and HFSGDxxPROTnHH can be read or written in 8-bit units.
Address:	See **Table 40B.79, List of PBG/HBG Protection Registers**.
Value after reset:	See **Table 40B.79, List of PBG/HBG Protection Registers**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. It varies depending on each register. See **Section 40B.3.3.1, List of Registers**.

Table 40B.83 FSGDxxPROTn/HFSGxxPROTn Register Contents

Bit Position	Bit Name	Function
31	PROTLOCK	Register Lock 0: Enables FSGDxxPROTn/HFSGDxxPROTn rewrite. 1: Disables FSGDxxPROTn/HFSGDxxPROTn rewrite. When PROTLOCK is set to 1, the value is held until reset is asserted.
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	PROTPEID4	Access with PEID = 4 (peripheral device connected to H-BUS)*1 0: Disables access with PEID4. 1: Enables access with PEID4.
20,19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PROTPEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PROTSPID3	Access with SPID = 3*2 0: Disables access with SPID3. 1: Enables access with SPID3.

Table 40B.83 FSGDxxPROTn/HFSGxxPROTn Register Contents

Bit Position	Bit Name	Function
7	PROTSPID2	Access with SPID = 2*[2] 0: Disables access with SPID2. 1: Enables access with SPID2.
6	PROTSPID1	Access with SPID = 1 (CPU1*[3])*[2] 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0 (peripheral device connected to H-BUS)*[2] 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. Setting value of MCFG0.SPID

(2) ERRSLVxxCTL — PBGxx Error Control Register
HERRSLVxxCTL — HBGxx Error Control Register

ERRSLVxxCTL and HERRSLVxxCTL clear the status in the error status register with the PBGxx/HBGxx.

Access: ERRSLVxxCTL and HERRSLVxxCTL are write-only registers that can be written in 32-bit units.
ERRSLVxxCTLL and HERRSLVxxCTLL are write-only registers that can be written in 16-bit units.
ERRSLVxxCTLLL and HERRSLVxxCTLLL are write-only registers that can be written in 8-bit units.

Address: ERRSLVxxCTL: <base_addr0> + 0_H
ERRSLVxxCTLL: <base_addr0> + 0_H
ERRSLVxxCTLLL: <base_addr0> + 0_H
HERRSLVxxCTL: <base_addr1> + 0_H
HERRSLVxxCTLL: <base_addr1> + 0_H
HERRSLVxxCTLLL: <base_addr1> + 0_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 40B.84 ERRSLVxxCTL/HERRSLVxxCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears the overflow flag. 0: Does not clear the overflow flag. 1: Clears the overflow flag.
0	CLRE	Clears the error flag. 0: Does not clear the error flag. 1: Clears the error flag.

Table 40B.85 CLRO and CLRE in ERRSLVxxCTL Register

CLRO	CLRE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

(3) ERRSLVxxSTAT — PBGxx Error Status Register HERRSLVxxSTAT — HBGxx Error Status Register

ERRSLVxxSTAT and HERRSLVxxSTAT hold the status of the illegal access rejected with the PBGxx/HBGxx.

Access: ERRSLVxxSTAT and HERRSLVxxSTAT are read-only registers that can be read in 32-bit units.
ERRSLVxxSTATL and HERRSLVxxSTATL are read-only registers that can be read in 16-bit units.
ERRSLVxxSTATLL and HERRSLVxxSTATLL are read-only registers that can be read in 8-bit units.

Address: ERRSLVxxSTAT: <base_addr0> + 4_H
ERRSLVxxSTATL: <base_addr0> + 4_H
ERRSLVxxSTATLL: <base_addr0> + 4_H
HERRSLVxxSTAT: <base_addr1> + 4_H
HERRSLVxxSTATL: <base_addr1> + 4_H
HERRSLVxxSTATLL: <base_addr1> + 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.86 ERRSLVxxSTAT/HERRSLVxxSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred. If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBG/HBG error entry stages is 1. Note that this overflow is notified to INTGUARD. In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	Error Status Flag 0: No PBG/HBG protection violation 1: PBG/HBG protection violation occurred.

CAUTION

After writing HERRSLVxxCTL, the value of HERRSLVxxSTAT takes the following procedure for a reflection:

- Execute SYNCM
- Wait for 24 × CPU clock*[1] cycles

Note 1. CPU clock: Clock selected by CKSC_CPUCLKS_CTRL and CKSC_CPUCLKD_CTL

(4) ERRSLVxxADDR — PBGxx Error Address Register
HERRSLVxxADDR — HBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.
HERRSLVxxADDR holds the address of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.

Access: ERRSLVxxADDR and HERRSLVxxADDR are read-only registers that can be read in 32-bit units.

Address: ERRSLVxxADDR: <base_addr0> + 8_H
HERRSLVxxADDR: <base_addr1> + 8_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[15:2]														—	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.87 ERRSLVxxADDR/HERRSLVxxADDR Register Contents

Bit Position	Bit Name	Function
31 to 2	ADDR[31:2]	Address in which the PBG/HBG protection violation is generated.
1, 0	Reserved	ERRSLVxxADDR: When read, the value after reset is returned. HERRSLVxxADDR: When read, an undefined value is returned.

(5) ERRSLVxxTYPE — PBGxx Error Type Register HERRSLVxxTYPE — HBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

HERRSLVxxTYPE holds the type of the illegal access rejected with the HBGxx. The register is not updated when corresponding HERRSLVxxSTAT.ERR is 1.

Access:	ERRSLVxxTYPE and HERRSLVxxTYPE are read-only registers that can be read in 32-bit units. ERRSLVxxTYPEL and HERRSLVxxTYPEL are read-only registers that can be read in 16-bit units.
Address:	ERRSLVxxTYPE: <base_addr0> + C$_H$ ERRSLVxxTYPEL: <base_addr0> + C$_H$ HERRSLVxxTYPE: <base_addr1> + C$_H$ HERRSLVxxTYPEL: <base_addr1> + C$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	PEID[2:0]			—	—	—	SPID[1:0]		—	UM	—	—	—	—	—	WRITE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.88 ERRSLVxxTYPE/HERRSLVxxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	PEID of the access source from which the PBG/HBG protection violation is generated.
12 to 10	Reserved	When read, the value after reset is returned.
9, 8	SPID[1:0]	SPID of the access source from which the PBG/HBG protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBG/HBG protection violation is generated.
5	Reserved	When read, the value after reset is returned.
4 to 1	Reserved	These bits are read as an undefined value.
0	WRITE	This bit is set to 1 when the access that has generated the PBG/HBG protection violation is a write access.

40B.3.4 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.

Table 40B.89 Target Registers of PBG for CPU Subsystem

PBGC Group	Group No.	Channel Number	Protection Target Module	Target Register
PBGC0	C0 (PBC group 0 for CPU system)	0	INTC2	ICxxx (xxx = 32 to 376) IMRm (m = 1 to 11) (described in **Section 7BC, Exception/Interrupt of RH850/F1KM**)
		1	PDMA0	All registers inside DMA controller (described in **Section 8, DMA Controller**)

Table 40B.89 Target Registers of PBG for CPU Subsystem

PBGC Group	Group No.	Channel Number	Protection Target Module	Target Register
PBGC1	C1 (PBC group 1 for CPU system)	0	Flash memory (Programing function)	BFASELR*[1]
		1	Code flash ECC control register (VCI)	CFECCCTL_VCI CFERRINT_VCI CFSTCLR_VCI CFOVFSTR_VCI CF1STERSTR_VCI CF1STEADR0_VCI CFSTSTCTL_VCI
		2	Code flash ECC control register (PE1)	CFECCCTL_PE1 CFERRINT_PE1 CFSTCLR_PE1 CFOVFSTR_PE1 CF1STERSTR_PE1 CF1STEADR0_PE1
		3	Local RAM ECC control register (PE1)	LRTSTCTL_PE1 LRTDATBF0_PE1 LRECCCTL_PE1 LRERRINT_PE1 LRSTCLR_PE1 LROVFSTR_PE1 LR1STERSTR_PE1 LR1STEADR0_PE1
		4	On-Chip Debug module	EPC (described in **Section 43, On-Chip Debug Unit (OCD)**)
		5	Buffer controller	FBUFCCTL (described in **Section 3BC, CPU System of RH850/F1KM**)
		6	Global RAM ECC Control register (bank A)	GRECCCTL_BKA GRERRINT_BKA GRSTCLR_BKA GROVFSTR_BKA GR1STERSTR_BKA GR1STEADR_BKA GRTSTCTL_BKA GRDECINBF1_BKA
		7	Global RAM ECC Control register (bank B)	GRECCCTL_BKB GRERRINT_BKB GRSTCLR_BKB GROVFSTR_BKB GR1STERSTR_BKB GR1STEADR_BKB GRTSTCTL_BKB GRDECINBF1_BKB

Note 1. Regarding the PBGC registers for the flash memory, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

40B.3.4.1 List of Registers

The following table lists the registers provided for each PBGC group. And PBG group is equal to module name.

Table 40B.90 List of PBGC Protection Registers

PBG Group*[1]	Group No.	Symbol	Register Name	R/W	Value after Reset	Address	Access Size	Power Domain
PBGC0	C0	FSGDC0PROT0	PBGC0 protection register 0	R/W	07FF FFFF$_H$	FFC4 C000$_H$	8/16/32	ISO
		FSGDC0PROT1	PBGC0 protection register 1	R/W	07FF FFFF$_H$	FFC4 C004$_H$	8/16/32	
PBGC1	C1	FSGDC1PROT0	PBGC1 protection register 0	R/W	07FF FFFF$_H$	FFC4 C120$_H$	8/16/32	ISO
		FSGDC1PROT1	PBGC1 protection register 1	R/W	07FF FFFF$_H$	FFC4 C124$_H$	8/16/32	
		FSGDC1PROT2	PBGC1 protection register 2	R/W	07FF FFFF$_H$	FFC4 C128$_H$	8/16/32	
		FSGDC1PROT3	PBGC1 protection register 3	R/W	07FF FFFF$_H$	FFC4 C12C$_H$	8/16/32	
		FSGDC1PROT4	PBGC1 protection register 4	R/W	07FF FFFF$_H$	FFC4 C130$_H$	8/16/32	
		FSGDC1PROT5	PBGC1 protection register 5	R/W	07FF FFFF$_H$	FFC4 C134$_H$	8/16/32	
		FSGDC1PROT6	PBGC1 protection register 6	R/W	07FF FFFF$_H$	FFC4 C118$_H$	8/16/32	
		FSGDC1PROT7	PBGC1 protection register 7	R/W	07FF FFFF$_H$	FFC4 C11C$_H$	8/16/32	

Note 1. The Group indicates the module name.

Table 40B.91 List of PBGC Error Registers

Module Name	Symbol	Register Name	R/W	Value after Reset	Address	Access Size
PBGC0	ERRSLVC0CTL	PBGC0 error control register	W	0000 0000$_H$	FFC4 C800$_H$	8/16/32
	ERRSLVC0STAT	PBGC0 error status register	R	0000 0000$_H$	FFC4 C804$_H$	8/16/32
	ERRSLVC0ADDR	PBGC0 error address register	R	0000 0000$_H$	FFC4 C808$_H$	32
	ERRSLVC0TYPE	PBGC0 error type register	R	0000 0000$_H$	FFC4 C80C$_H$	16/32
PBGC1	ERRSLVC1CTL	PBGC1 error control register	W	0000 0000$_H$	FFC4 C900$_H$	8/16/32
	ERRSLVC1STAT	PBGC1 error status register	R	0000 0000$_H$	FFC4 C904$_H$	8/16/32
	ERRSLVC1ADDR	PBGC1 error address register	R	0000 0000$_H$	FFC4 C908$_H$	32
	ERRSLVC1TYPE	PBGC1 error type register	R	0000 0000$_H$	FFC4 C90C$_H$	16/32

40B.3.4.2 Details of Registers

(1) FSGDCxPROTn — PBGCx Protection Register n (x = 0, 1)

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.

"n" in the register names and symbols represents the PBGC channel number.

Access:	FSGDCxPROTn register can be read or written in 32-bit units. FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16-bit units. FSGDCxPROTnLL, FSGDCxPROTnHL, and FSGDCxPROTnHH registers can be read or written in 8-bit units.
Address:	See **Table 40B.90, List of PBGC Protection Registers**.
Value after reset:	See **Table 40B.90, List of PBGC Protection Registers**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROTLOCK	—	—	—	—	—	PROTUM	—	—	—	PROTPEID4	—	—	PROTPEID1	—	—
Value after reset	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1

Table 40B.92 FSGDCxPROTn Register Contents

Bit Position	Bit Name	Function
31	PROTLOCK	Lock of write to this register 0: Register can be re-written. 1: Any further write to this register is ignored. This bit can be cleared by RESET.
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	PROTPEID4	Access with PEID = 4 (peripheral device connected to H-BUS)*1 0: Disables access with PEID4. 1: Enables access with PEID4.
20, 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PROTPEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PROTSPID3	Access with SPID = 3*2 0: Disables access with SPID3. 1: Enables access with SPID3.
7	PROTSPID2	Access with SPID = 2*2 0: Disables access with SPID2. 1: Enables access with SPID2.

Table 40B.92 FSGDCxPROTn Register Contents

Bit Position	Bit Name	Function
6	PROTSPID1	Access with SPID = 1 (CPU1*3)*2 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0 (peripheral device connected to H-BUS)*2 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. Setting value of MCFG0.SPID

(2) ERRSLVCxCTL — PBGCx Error Control Register (x = 0, 1)

ERRSLVCxCTL clears the status in error status register PBGCx.

Access: ERRSLVCxCTL register is a write-only register that can be written in 32-bit units.
ERRSLVCxCTLL register is a write-only register that can be written in 16-bit units.
ERRSLVCxCTLLL register is a write-only register that can be written in 8-bit units.

Address: ERRSLVCxCTL: FFC4 C800$_H$ + (100$_H$ × x)
ERRSLVCxCTLL: FFC4 C800$_H$ + (100$_H$ × x)
ERRSLVCxCTLLL: FFC4 C800$_H$ + (100$_H$ × x)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 40B.93 ERRSLVCxCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears the overflow flag. 0: Does not clear the overflow flag. 1: Clears the overflow flag.
0	CLRE	Clears the error flag. 0: Does not clear the error flag. 1: Clears the error flag.

Table 40B.94 CLRO and CLRE in ERRSLVCxxCTL Register

CLRO	CLRE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

(3) ERRSLVCxSTAT — PBGCx Error Status Register (x = 0, 1)

ERRSLVCxSTAT holds the status of the illegal access rejected with the PBGCx.

Access:	ERRSLVCxSTAT register is a read-only register that can be read in 32-bit units. ERRSLVCxSTATL register is a read-only register that can be read in 16-bit units. ERRSLVCxSTATLL register is a read-only register that can be read in 8-bit units.
Address:	ERRSLVCxSTAT: FFC4 C804$_H$ + (100$_H$ × x) ERRSLVCxSTATL: FFC4 C804$_H$ + (100$_H$ × x) ERRSLVCxSTATLL: FFC4 C804$_H$ + (100$_H$ × x)
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.95 ERRSLVCxSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred. If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBGC error entry stages is 1. Note that this overflow is notified to INTGUARD. In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	Error Status Flag 0: No PBGC protection violation 1: A PBGC protection violation occurred.

(4) ERRSLVCxADDR — PBGCx Error Address Register (x = 0, 1)

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Access: ERRSLVCxADDR register is a read-only register that can be read in 32-bit units.

Address: FFC4 C808$_H$ + (100$_H$ × x)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.96 ERRSLVCxADDR Register Contents

Bit Position	Bit Name	Function
31 to 2	ADDR[31:2]	Address in which the PBGC protection violation is generated.
1, 0	Reserved	When read, the value after reset is returned.

(5) ERRSLVCxTYPE — PBGCx Error Type Register (x = 0, 1)

ERRSLVCxTYPE holds the type of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Access:	ERRSLVCxTYPE register is a read-only register that can be read in 32-bit units. ERRSLVCxTYPEL register is a read-only register that can be read in 16-bit units.
Address:	ERRSLVCxTYPE: FFC4 C80C$_H$ + (100$_H$ × x) ERRSLVCxTYPEL: FFC4 C80C$_H$ + (100$_H$ × x)
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40B.97 ERRSLVCxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	PEID of the access source from which the PBGC protection violation is generated.
12 to 10	Reserved	When read, the value after reset is returned.
9, 8	SPID[1:0]	SPID of the access source from which the PBGC protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBGC protection violation is generated.
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	This bit is set to 1 when an access that has generated the PBGC protection violation is the write.

Section 40C Functional Safety of RH850/F1KM-S1

This section provides an overview of the safety mechanisms included in the RH850/F1KM Series.

This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.

For more information about the development process and safety mechanisms, please contact our sales office.

The following are the failure detection functions provided by this microcontroller.

40C.1 Overview

ECC

Detects failures of memories and data transfer paths and corrects some types of failures.

Memory Protection

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

Clock Monitor

Monitors the clock operation to detect abnormal operations. For details, see **Section 13, Clock Monitor (CLMA)**.

Data CRC

Generates CRC to detect data errors.

For details, see **Section 41, Data CRC (DCRA)**.

Write-Protected Registers

The write-protected registers are protected from inadvertent write access due to erroneous program execution.

For details, see **Section 5, Write-Protected Registers**.

40C.2 ECC

40C.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

Table 40C.1 ECC Overview

Applicable Memory		Applicable Data Width [bits]	Operation upon Error Detection					Failure Insertion
			Detection/ Correction	SYSERR	Interrupt Notice	Error Status	Address Capture	
Code flash		128	SEC-DED	SED/DED*2	SEC-DED	Possible	Possible	Possible
Data flash		32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
Local RAM (CPU1/Self) Retention RAM (CPU1/Self)		32	SEC-DED	SED/DED*2	SEC-DED	Possible	Possible	Possible
Peripheral RAM*1	CSIH	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	RS-CANFD	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible

Note 1. For details of ECC for each peripheral IP, see **Section 40C.2.5, ECC for Peripheral RAM**.

Note 2. For details, see **Section 40C.2.2.2, Interrupt Requests** and **Section 40C.2.4.2, Interrupt Requests**.

Applicable Data Width

This is the data width to be ECC encoded.

To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).

(1) Reading data to be ECC-encoded including data to be rewritten

(2) Replacing data to be rewritten

(3) Writing back data generated in (2)

Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected. SED-DED: 1-bit errors and 2-bit errors can only be detected.

SYSERR

SYSERR can be generated upon error detection.

Interrupt Notice

An interrupt can be generated upon error detection.

Error Status

The status of a detected error is retained.

Address Capture

The address of a detected error is retained.

Failure Insertion

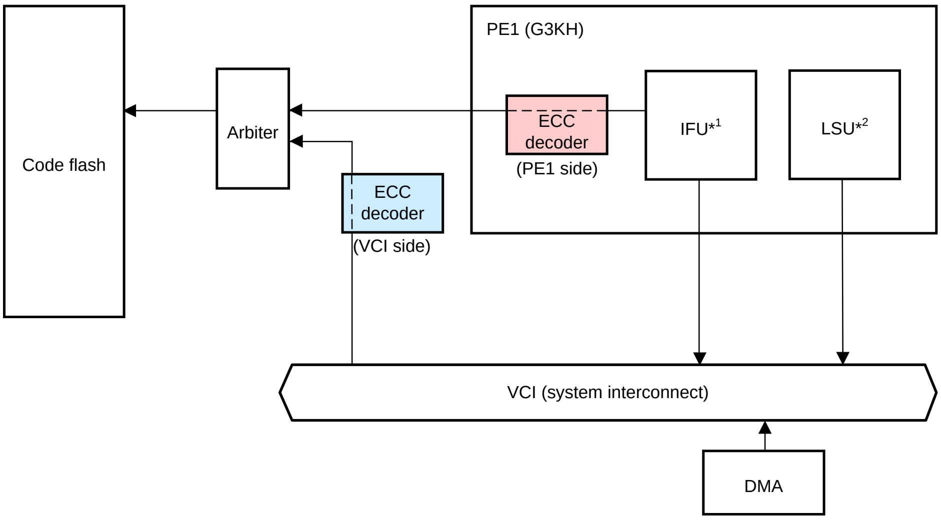
Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

40C.2.2 Code Flash ECC

40C.2.2.1 Overview

RH850/F1KM has two code flash ECC decoder circuits implemented, one inside the Processor Element (PE1) and one on the VCI (system interconnect).

Figure 40C.1, Block Diagram of Code Flash ECC shows the location of two ECC decoders for the code flash.



Note 1. Instruction Fetch Unit

Note 2. Load Store Unit

Figure 40C.1 Block Diagram of Code Flash ECC

The code flash ECC is summarized in the table below.

Table 40C.2 Summary of Code Flash ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction. ● 2-bit error detection and 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. (This is not supported in CFERRINT_PE1 register.) Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see **Section 3BC, CPU System of RH850/F1KM**. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.

Table 40C.2 Summary of Code Flash ECC

Item	Description
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The ECC 1-bit error status is set only when no error status has been set. The ECC 2-bit error status is set even when the ECC 1-bit error status is set. A register for clearing the error status is provided.
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also captured.
Self-diagnosis	The ECC bit can be read directly.
Inhibiting instruction execution	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching avoids the execution of incorrect instructions.

40C.2.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.

Table 40C.3 Code Flash ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0*[1] (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR	—

Note 1. ECCFLI0FEIF flag set can be read (not jump to handler address of FEINT) in SYSERR processing because return from SYSERR is not possible.

Table 40C.4 Code Flash ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	SYSERR, INTECCFLI0 (SED & SECDIS = 1)	—
		INTECCFLI0 (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of code flash	SYSERR, INTECCFLI0	—

Table 40C.5 Code Flash ECC Interrupt Requests (During Bus Master Data Access except CPU Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	INTECCFLI0	—
—	ECC 2-bit error interrupt of code flash	INTECCFLI0	—

40C.2.2.3 List of Registers

Table 40C.6 List of Registers

Module Name	Register Name	Symbol*[1]	Address
CFECC_VCI	Code flash ECC control register (VCI)	CFECCCTL_VCI	FFC6 2200_H
	Code flash error information control register (VCI)	CFERRINT_VCI	FFC6 2204_H
	Code flash status clear register (VCI)	CFSTCLR_VCI	FFC6 2208_H
	Code flash error count overflow status register (VCI)	CFOVFSTR_VCI	FFC6 $220C_H$
	Code flash 1st error status register (VCI)	CF1STERSTR_VCI	FFC6 2210_H
	Code flash 1st error address register (VCI)	CF1STEADR0_VCI	FFC6 2250_H
CFECC_CPU1	Code flash ECC control register (PE1)	CFECCCTL_PE1	FFC6 2400_H
	Code flash error information control register (PE1)	CFERRINT_PE1	FFC6 2404_H
	Code flash status clear register (PE1)	CFSTCLR_PE1	FFC6 2408_H
	Code flash error count overflow status register (PE1)	CFOVFSTR_PE1	FFC6 $240C_H$
	Code flash 1st error status register (PE1)	CF1STERSTR_PE1	FFC6 2410_H
	Code flash 1st error address register (PE1)	CF1STEADR0_PE1	FFC6 2450_H
CFECC_VCI	Code flash sub-test control register (VCI)	CFSTSTCTL_VCI	FFC6 2350_H

Note 1. The registers suffixed with symbols "_VCI" and "_PE1" are provided to ECC controllers corresponding to each access port: registers with "_VCI" are provided to the ECC controller for data access from the system interconnect to the code flash and registers with "_PE1" are provided to the ECC controller for fetch access from the CPU1.

40C.2.2.4 Details of Registers

(1) CFECCCTL_VCI/PE1 — Code Flash ECC Control Register

CFECCCTL_VCI/PE1 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFECCCTL_VCI/PE1, PROT1 and PROT0 need to be 01_{B}.

Access:	CFECCCTL_VCI and CFECCCTL_PE1 can be read or written in 32-bit units. CFECCCTL_VCIL and CFECCCTL_PE1L can be read or written in 16-bit units.
Address:	CFECCCTL_VCI: FFC6 2200_{H} CFECCCTL_VCIL: FFC6 2200_{H} CFECCCTL_PE1: FFC6 2400_{H} CFECCCTL_PE1L: FFC6 2400_{H}
Value after reset:	0000 0000_{H}

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40C.7 CFECCCTL_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFECCCTL_VCI/PE1.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) CFERRINT_VCI/PE1 — Code Flash Error Information Control Register

CFERRINT_VCI/PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access:	CFERRINT_VCI and CFERRINT_PE1 can be read or written in 32-bit units. CFERRINT_VCIL and CFERRINT_PE1L can be read or written in 16-bit units. CFERRINT_VCILL and CFERRINT_PE1LL can be read or written in 8-bit units.
Address:	CFERRINT_VCI: FFC6 2204$_H$ CFERRINT_VCIL: FFC6 2204$_H$ CFERRINT_VCILL: FFC6 2204$_H$ CFERRINT_PE1: FFC6 2404$_H$ CFERRINT_PE1L: FFC6 2404$_H$ CFERRINT_PE1LL: FFC6 2404$_H$
Value after reset:	0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE*[1]	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40C.8 CFERRINT_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE*[1]	ECC 2-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

Note 1. This bit is not supported in CFERRINT_PE1. When writing to this bit in CFERRINT_PE1, always write 1.

Note 2. Regarding the interrupt request, see **Section 40C.2.2.2, Interrupt Requests**.

(3) CFSTCLR_VCI/PE1 — Code Flash Status Clear Register

CFSTCLR_VCI/PE1 clears the error flags in the error status register (CF1STERSTR_VCI/PE1), the overflow flag in the error overflow status register (CFOVFSTR_VCI/PE1), and the error address register (CF1STEADR0_VCI/PE1).

Access: CFSTCLR_VCI and CFSTCLR_PE1 are write-only registers that can be written in 32-bit units.
CFSTCLR_VCIL and CFSTCLR_PE1L are write-only registers that can be written in 16-bit units.
CFSTCLR_VCILL and CFSTCLR_PE1LL are write-only registers that can be written in 8-bit units.

Address: CFSTCLR_VCI: FFC6 2208$_H$
CFSTCLR_VCIL: FFC6 2208$_H$
CFSTCLR_VCILL: FFC6 2208$_H$

CFSTCLR_PE1: FFC6 2408$_H$
CFSTCLR_PE1L: FFC6 2408$_H$
CFSTCLR_PE1LL: FFC6 2408$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCLR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 40C.9 CFSTCLR_VCI/_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	STCLR0	Error Status Clear 0: No effect (Setting 0 does not affect the DEDF0 and SEDF0 flags in CF1STERSTR_VCI/PE1; ERROVF0 flag in CFOVFSTR_VCI/PE1; and CF1STEADR0_VCI/PE1.) 1: Writing 1 to this bit clears the DEDF0 and SEDF0 flags in CF1STERSTR_VCI/PE1; ERROVF0 flag in CFOVFSTR_VCI/PE1; and CF1STEADR0_VCI/PE1.

(4) CFOVFSTR_VCI/PE1 — Code Flash Error Count Overflow Status Register

CFOVFSTR_VCI/PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

Access: CFOVFSTR_VCI and CFOVFSTR_PE1 are read-only registers that can be read in 32-bit units.
CFOVFSTR_VCIL and CFOVFSTR_PE1L are read-only registers that can be read in 16-bit units.
CFOVFSTR_VCILL and CFOVFSTR_PE1LL are read-only registers that can be read in 8-bit units.

Address: CFOVFSTR_VCI: FFC6 220C$_H$
CFOVFSTR_VCIL: FFC6 220C$_H$
CFOVFSTR_VCILL: FFC6 220C$_H$

CFOVFSTR_PE1: FFC6 240C$_H$
CFOVFSTR_PE1L: FFC6 240C$_H$
CFOVFSTR_PE1LL: FFC6 240C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.10 CFOVFSTR_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF0	Error Overflow Flag ERROVF0 shows whether a second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register has occurred, except when both of the error address and source of the second error are the same as those of the first error. 0: Did not occur. 1: Occurred. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1 to 1.

(5) CF1STERSTR_VCI/PE1 — Code Flash 1st Error Status Register

CF1STERSTR_VCI/PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0. If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

Access:	CF1STERSTR_VCI and CF1STERSTR_PE1 are read-only registers that can be read in 32-bit units. CF1STERSTR_VCIL and CF1STERSTR_PE1L are read-only registers that can be read in 16-bit units. CF1STERSTR_VCILL and CF1STERSTR_PE1LL are read-only registers that can be read in 8-bit units.
Address:	CF1STERSTR_VCI: FFC6 2210$_H$ CF1STERSTR_VCIL: FFC6 2210$_H$ CF1STERSTR_VCILL: FFC6 2210$_H$ CF1STERSTR_PE1: FFC6 2410$_H$ CF1STERSTR_PE1L: FFC6 2410$_H$ CF1STERSTR_PE1LL: FFC6 2410$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 40C.11 CF1STERSTR_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF0	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1 to 1. [Setting condition] ECC 2-bit error is detected when DEDF0 is 0.
0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected when DEDF0 flag is 0. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1 to 1. [Setting condition] ECC 1-bit error is detected when DEDF0, SEDF0 are 0.

(6) CF1STEADR0_VCI/PE1 — Code Flash 1st Error Address Register

CF1STEADR0_VCI/PE1 holds the address at which an error has occurred.

The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STEADR0_VCI/PE1 register is cleared by an internal reset, the external reset, or by setting the STCLR bit in the CFSTCLR_VCI/PE1 register to 1.

Access: CF1STEADR0_VCI and CF1STEADR0_PE1 are read-only registers that can be read in 32-bit units.
CF1STEADR0_VCIL, CF1STEADR0_VCIH, CF1STEADR0_PE1L and CF1STEADR0_PE1H are read-only registers that can be read in 16-bit units.
CF1STEADR0_VCILL, CF1STEADR0_VCILH, CF1STEADR0_VCIHL, CF1STEADR0_VCIHH, CF1STEADR0_PE1LL, CF1STEADR0_PE1LH, CF1STEADR0_PE1HL and CF1STEADR0_PE1HH are read-only registers that can be read in 8-bit units.

Address: CF1STEADR0_VCI: FFC6 2250$_H$
CF1STEADR0_VCIL: FFC6 2250$_H$
CF1STEADR0_VCIH: FFC6 2252$_H$
CF1STEADR0_VCILL: FFC6 2250$_H$
CF1STEADR0_VCILH: FFC6 2251$_H$
CF1STEADR0_VCIHL: FFC6 2252$_H$
CF1STEADR0_VCIHH: FFC6 2253$_H$
CF1STEADR0_PE1: FFC6 2450$_H$
CF1STEADR0_PE1L: FFC6 2450$_H$
CF1STEADR0_PE1H: FFC6 2452$_H$
CF1STEADR0_PE1LL: FFC6 2450$_H$
CF1STEADR0_PE1LH: FFC6 2451$_H$
CF1STEADR0_PE1HL: FFC6 2452$_H$
CF1STEADR0_PE1HH: FFC6 2453$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	EADR[24:16]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.12 CF1STEADR0_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned.
24 to 4	EADR[24:4]	1st Error Address Monitors the address of the first error. The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error has been already occurred, the address is not updated. [Clearing condition] Set the STCLR0 bit in CFSTCLR_VCI/PE1 to 1.
3 to 0	Reserved	When read, the value after reset is returned.

(7) CFSTSTCTL_VCI — Code Flash Sub-Test Control Register

CFSTSTCTL_VCI is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read directly.

When writing to CFSTSTCTL_VCI, PROT1 and PROT0 need to be 01_B.

Access: CFSTSTCTL_VCI can be read or written in 32-bit units.
CFSTSTCTL_VCIL can be read or written in 16-bit units.

Address: CFSTSTCTL_VCI: FFC6 2350_H
CFSTSTCTL_VCIL: FFC6 2350_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 40C.13 CFSTSTCTL_VCI Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST bit. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFSTSTCTL_VCI.
14	PROT0	
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, ECC bits can be read directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see **Section 3BC, CPU System of RH850/F1KM**.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16n address. The results of reading code flash are as follows:

Table 40C.14 Results of Reading Code Flash

Bit Number	Meaning	Bit Position	Description
bit[31:10]	all-0	31 to 10	These bits are always 0.
bit[9]	reserved	9	Unknown
bit[8:0]	ECC bits	8 to 0	ECC bits

40C.2.3 Data Flash ECC

40C.2.3.1 Overview

The data flash ECC is summarized in the table below.

Table 40C.15 Summary of Data Flash ECC

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection / correction. ● 2-bit error detection and 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 2-bit errors is selectable. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is disabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the Interrupt Controller, an interrupt processing is not executed.
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The function is set only while no error status is set. A register for clearing the error status is provided.
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. ECC error address is captured when both SEDF and DEDF of DFERSTR are 0.
Self-diagnosis	ROM data and the ECC bit can be read directly. Arbitrary data can be written to ROM data and the ECC bit.

40C.2.3.2 Interrupt Requests

The interrupt requests for data flash ECC are shown below.

Table 40C.16 Data Flash ECC Interrupt Requests (During Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of data flash	INTECCEEP0	—
—	ECC 2-bit error interrupt of data flash	INTECCEEP0	—

40C.2.3.3 List of Registers

Table 40C.17 List of Registers

Module Name	Register Name	Symbol	Address
DFECC	Data flash ECC control register	DFECCCTL	FFC6 2A00$_H$
	Data flash error status register	DFERSTR	FFC6 2A04$_H$
	Data flash error status clear register	DFERSTC	FFC6 2A08$_H$
	Data flash error overflow status register	DFOVFSTR	FFC6 2A0C$_H$
	Data flash error overflow status clear register	DFOVFSTC	FFC6 2A10$_H$
	Data flash error notification control register	DFERRINT	FFC6 2A14$_H$
	Data flash 1st error address register	DFEADR	FFC6 2A18$_H$
	Data flash test control register	DFTSTCTL	FFC6 2A1C$_H$

40C.2.3.4 Details of Registers

(1) DFECCCTL — Data Flash ECC Control Register

DFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCCTL, PROT1 and PROT0 need to be 01_B.

Access: DFECCCTL can be read or written in 16-bit units.

Address: DFECCCTL: FFC6 $2A00_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40C.18 DFECCCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFECCCTL.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.

The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

Access: DFERSTR is a read-only register that can be read in 8-bit units.

Address: DFERSTR: FFC6 2A04$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDF	SEDF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40C.19 DFERSTR Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	DEDF	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 2-bit error is detected when both SEDF and DEDF are 0.
0	SEDF	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the ERRCLR bit in DFERSTC to 1. [Setting condition] ECC 1-bit error is detected when both SEDF and DEDF are 0.

(3) DFERSTC — Data Flash Error Status Clear Register

DFERSTC clears the error flags in the data flash error status register.

Access: DFERSTC is a write-only register that can be written in 8-bit units.

Address: DFERSTC: FFC6 $2A08_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERRCLR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 40C.20 DFERSTC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ERRCLR	SEDF/DEDF Flag Clear 0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF and SEDF flags in DFERSTR.) 1: The SEDF/DEDF flag in DFERSTR is cleared.

(4) DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of data flash error overflow.

Access: DFOVFSTR is a read-only register that can be read in 8-bit units.

Address: DFOVFSTR: FFC6 $2A0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40C.21 DFOVFSTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF	Error Overflow Flag ERROVF is set if an ECC error occurs while the error address register is full. 0: Did not occurred. 1: Occurred. [Clearing condition] Set the ERROVFCLR bit is set in data flash error overflow status clear register.

(5) DFOVFSTC — Data Flash Error Overflow Status Clear Register

DFOVFSTC clears the data flash error overflow flag.

Access: DFOVFSTC is a write-only register that can be written in 8-bit units.

Address: DFOVFSTC: FFC6 2A10$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVFCLR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 40C.22 DFOVFSTC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ERROVFCLR	Error Overflow Flag Clear 0: No effect (Setting the ERROVFCLR bit to 0 does not affect the ERROVF flag in DFOVFSTR.) 1: The ERROVF flag in DFOVFSTR is cleared.

(6) DFERRINT — Data Flash Error Notification Control Register

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: DFERRINT can be read or written in 8-bit units.

Address: DFERRINT: FFC6 2A14$_H$

Value after reset: 02$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 40C.23 DFERRINT Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	ECC 2-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(7) DFEADR — Data Flash 1st Error Address Register

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0.

Access: DFEADR is a read-only register that can be read in 32-bit units.

Address: DFEADR: FFC6 2A18$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	DFEADR[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DFEADR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.24 DFEADR Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned.
20 to 2	DFEADR[20:2]	ECC Error Address DFEADR is read-only field to monitor the address at which an ECC error has occurred. This register holds an internal address. Convert it to the actual address by adding the data flash base address FF20 0000$_H$.
1, 0	Reserved	When read, the value after reset is returned.

(8) DFTSTCTL — Data Flash Test Control Register

DFTSTCTL is used for the ECC test.

After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read.

When writing to DFTSTCTL, PROT1 and PROT0 need to be 01_B.

Access:	DFTSTCTL can be read or written in 16-bit units.
Address:	DFTSTCTL: FFC6 $2A1C_H$
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 40C.25 DFTSTCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCTST bit. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFTSTCTL.
14	PROT0	
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test Sets ECC test mode. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

40C.2.4 Local RAM (Including the Retention RAM) ECC

40C.2.4.1 Overview

CAUTION

The retention RAM is a part of the local RAM. The ECC for the retention RAM is shared with the local RAM. Therefore, use for the retention RAM the same register as that for the local RAM.

The local RAM ECC of CPU1 is summarized in the table below.

Table 40C.26 Summary of Local RAM ECC (CPU1)

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction. ● 2-bit error detection and 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected.
Error notification	A notification is sent when an ECC error occurs. ● Enabling or disabling of error notification in the case of detection of ECC 2-bit error is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit error during data access and instruction fetch. ● Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 1-bit error (SECDIS = 1) during data access and instruction fetch. For details of the SYSERR, see **Section 3BC, CPU System of RH850/F1KM**. In the initial state of ECC controller, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The function is set only while no error status is set. A register for clearing the error status is provided.
Address capture	When no error status has been set, the address at which the first error occurred is captured. In addition, when the retained address source is an ECC 1-bit error or ECC 2-bit error, the address is also captured.
Self-diagnosis	Arbitrary data can be written to RAM data and the ECC bit. RAM data and the ECC bit can be read directly.
Others	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.

CAUTION

When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16-bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

40C.2.4.2 Interrupt Requests

The local RAM ECC interrupt requests are listed below.

Table 40C.27 Local RAM ECC Interrupt Requests (During CPU Fetch Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	SYSERR, INTECCRAM (SED & SECDIS = 1)	—
		INTECCRAM (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of RAM	SYSERR, INTECCRAM	—

Table 40C.28 Local RAM ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	SYSERR, INTECCRAM (SED & SECDIS = 1)	—
		INTECCRAM (SED & SECDIS = 0)	—
—	ECC 2-bit error interrupt of RAM	SYSERR, INTECCRAM	—

Table 40C.29 Local RAM ECC Interrupt Requests (During Data Access except CPU Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	INTECCRAM	—
—	ECC 2-bit error interrupt of RAM	INTECCRAM	—

40C.2.4.3 List of Registers

Table 40C.30 List of Registers

Module Name	Address	Symbol	Register Name	R/W	Value after Reset	Access Size
LRTST	FFC6 5004_H	LRTSTCTL_PE1	Local RAM test control register (PE1)	R/W	0000 0000_H	16/32
	FFC6 5008_H	LRTDATBF0_PE1	Local RAM test data read buffer 0 (PE1)	R	0000 0000_H	32
LRECC	FFC6 5400_H	LRECCCTL_PE1	Local RAM ECC control register (PE1)	R/W	0000 0000_H	16/32

40C.2.4.4 Details of Registers

(1) LRTSTCTL_PE1 — Local RAM Test Control Register

LRTSTCTL_PE1 is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits. When writing to LRTSTCTL_PE1, PROT1 and PROT0 need to be 01_B.

Access: LRTSTCTL_PE1 register can be read or written in 32-bit units.
LRTSTCTL_PE1L register can be read or written in 16-bit units.

Address: LRTSTCTL_PE1: FFC6 5004_H
LRTSTCTL_PE1L: FFC6 5004_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST	DATSEL
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40C.31 LRTSTCTL_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST and DATSEL bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRTSTCTL_PE1.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read by reading LRTDATBF0_PE1 register or written directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).
0	DATSEL	Data Select This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: RAM data is selected. 1: The ECC bits are selected.

CAUTION

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

(2) LRTDATBF0_PE1 — Local RAM Test Data Read Buffer 0

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL_PE1, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

Access: LRTDATBF0_PE1 register is a read-only register that can be read in 32-bit units.

Address: LRTDATBF0_PE1: FFC6 5008_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	LRTDATBF[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.32 LRTDATBF0_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned.
6 to 0	LRTDATBF[6:0]	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the local RAM, the ECC bits for the local RAM are stored in LRTDATBF[6:0].

(3) LRECCCTL_PE1 — Local RAM ECC Control Register

LRECCCTL_PE1 enables or disables ECC error detection and correction and 1-bit error correction.

When writing to LRECCCTL_PE1, PROT1 and PROT0 need to be 01_B.

Access: LRECCCTL_PE1 register can be read or written in 32-bit units.
LRECCCTL_PE1L register can be read or written in 16-bit units.

Address: LRECCCTL_PE1: FFC6 5400_H
LRECCCTL_PE1L: FFC6 5400_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40C.33 LRECCCTL_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRECCCTL_PE1.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(4) LRERRINT_PE1 — Local RAM Error Information Control Register

LRERRINT_PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access:	LRERRINT_PE1 register can be read or written in 32-bit units. LRERRINT_PE1L register can be read or written in 16-bit units. LRERRINT_PE1LL register can be read or written in 8-bit units.
Address:	LRERRINT_PE1: FFC6 5404$_H$ LRERRINT_PE1L: FFC6 5404$_H$ LRERRINT_PE1LL: FFC6 5404$_H$
Value after reset:	0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 40C.34 LRERRINT_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	ECC 2-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(5) LRSTCLR_PE1 — Local RAM Status Clear Register

LRSTCLR_PE1 clears the error flags in the error status register (LR1STERSTR_PE1), the overflow flag in the error overflow status register (LROVFSTR_PE1), and the error address register (LR1STEADR0_PE1). LRSTCLR_PE1 is a write-only register and is always read as 0.

Access: LRSTCLR_PE1 register is a write-only register that can be written in 32-bit units.
LRSTCLR_PE1L register is a write-only register that can be written in 16-bit units.
LRSTCLR_PE1LL register is a write-only register that can be written in 8-bit units.

Address: LRSTCLR_PE1: FFC6 5408$_H$
LRSTCLR_PE1L: FFC6 5408$_H$
LRSTCLR_PE1LL: FFC6 5408$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCLR 0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 40C.35 LRSTCLR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	STCLR0	Error Status Flag Clear Writing 1 to this bit clears the DEDF0 and SEDF0 flags in LR1STERSTR_PE1; ERROVF0 flag in LROVFSTR_PE1; and LR1STEADR0_PE1.

(6) LROVFSTR_PE1 — Local RAM Error Count Overflow Status Register

LROVFSTR_PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1.

Access: LROVFSTR_PE1 register is a read-only register that can be read in 32-bit units.
LROVFSTR_PE1L register is a read-only register that can be read in 16-bit units.
LROVFSTR_PE1LL register is a read-only register that can be read in 8-bit units.

Address: LROVFSTR_PE1: FFC6 540C$_{\text{H}}$
LROVFSTR_PE1L: FFC6 540C$_{\text{H}}$
LROVFSTR_PE1LL: FFC6 540C$_{\text{H}}$

Value after reset: 0000 0000$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.36 LROVFSTR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF0	Error Overflow Flag ERROVF0 is set if a second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(7) LR1STERSTR_PE1 — Local RAM 1st Error Status Register

LR1STERSTR_PE1 monitors occurrence of the first error when the ECC error detection/correction is enabled. The error status is set if an error occurs while the error flag is 0.

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR_PE1 is cleared by an internal reset, the external reset, or setting 1 to the STCLR0 bit in LRSTCLR_PE1.

Access:	LR1STERSTR_PE1 register is a read-only register that can be read in 32-bit units. LR1STERSTR_PE1L register is a read-only register that can be read in 16-bit units. LR1STERSTR_PE1LL register is a read-only register that can be read in 8-bit units.
Address:	LR1STERSTR_PE1: FFC6 5410$_H$ LR1STERSTR_PE1L: FFC6 5410$_H$ LR1STERSTR_PE1LL: FFC6 5410$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF0	SEDF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.37 LR1STERSTR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF0	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. [Clearing condition] Set the STCLR0 bit in LRSTCLR_PE1 to 1. [Setting condition] ECC 2-bit error is detected with DEDF0 being 0.
0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. [Clearing condition] Set the STCLR0 bit in LRSTCLR_PE1 to 1. [Setting condition] ECC 1-bit error is detected with both SEDF0 and DEDF0 being 0.

(8) LR1STEADR0_PE1 — Local RAM 1st Error Address Register 0

LR1STEADR0_PE1 holds the address at which an error has occurred.

The error address is set if an error occurs while error flags are 0 in LR1STERSTR_PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address[31:19] bits of the associated memory to transform the internal address to the real address. LR1STEADR0_PE1 is cleared by an internal reset, the external reset, or setting the STCLR0 bit to 1 in LRSTCLR_PE1.

Access: LR1STEADR0_PE1 register is a read-only register that can be read in 32-bit units.
LR1STEADR0_PE1L and LR1STEADR0_PE1H registers are read-only registers that can be read in 16-bit units.
LR1STEADR0_PE1LL, LR1STEADR0_PE1LH, and LR1STEADR0_PE1HL registers are read-only registers that can be read in 8-bit units.

Address: LR1STEADR0_PE1: FFC6 5450_H
LR1STEADR0_PE1L: FFC6 5450_H
LR1STEADR0_PE1H: FFC6 5452_H
LR1STEADR0_PE1LL: FFC6 5450_H
LR1STEADR0_PE1LH: FFC6 5451_H
LR1STEADR0_PE1HL: FFC6 5452_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.38 LR1STEADR0_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned.
18 to 2	EADR[18:2]	1st Error Address Monitors the address of the first error. The error address is held if an error occurs while all the error flags are 0 in LR1STERSTR_PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.
1, 0	Reserved	When read, the value after reset is returned.

40C.2.5 ECC for Peripheral RAM

40C.2.5.1 Overview

This is an ECC module for the RAM of the following peripheral modules.

CSIH and RS-CANFD.

Table 40C.39 List of the ECC Functions for the peripheral RAM

Item	Description
ECC error detection/correction	ECC error detection and correction can be enabled or disabled. Either of the following settings can be selected. ● 2-bit error detection and 1-bit error detection/correction ● 2-bit error detection and 1-bit error detection The ECC error detection/correction can be disabled by using through mode. In the initial state, 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. ● Error notification can be enabled or disabled when an ECC 2-bit error is detected. ● Error notification can be enabled or disabled when an ECC 1-bit error is detected. In the initial state of ECC controller, 2-bit error notification is enabled and 1-bit error notification is disabled. However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed.
Error status	Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available. A bit for clearing the error status is provided.
Address capture	Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).

CAUTION

When ECC error detection/correction is performed about RS-CANFD, initialize the RAM area before it is used.

40C.2.5.2 Interrupt Requests

ECC of peripheral interrupt requests are listed below.

Table 40C.40 CSIHn ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
INTECCCSIHn	CSIHn ECC 1-bit error or 2-bit error interrupt	INTECCCSIH0	—
		INTECCCSIH1	
		INTECCCSIH2	
		INTECCCSIH3	

Table 40C.41 RCFDCn ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
ECCCNFDRAMFEIF	RCFDC0 ECC 1-bit error or 2-bit error interrupt	INTECCCNFDRAM	—

40C.2.5.3 List of Registers

(1) List of ECC Modules

The RAMs of the multiple peripheral functions are provided with the ECC modules. The following table shows the peripheral functions provided with the ECC modules, the corresponding ECC module names, and base addresses of the ECC modules.

Table 40C.42 List of ECC Modules

Peripheral Functions		Module Name	ECC Module Names and Register	
			Base Address Name	Base Address <base_addr>
CSIHn	Buffered I/O (CSIH RAM)	ECCCSIH0	<ECCCSIH0_base>	FFC7 0100$_H$
		ECCCSIH1	<ECCCSIH1_base>	FFC7 0200$_H$
		ECCCSIH2	<ECCCSIH2_base>	FFC7 0300$_H$
		ECCCSIH3	<ECCCSIH3_base>	FFC7 0400$_H$
RCFDC0	Message bufferRAM (MB RAM)	ECCCFD0MB	<ECCCFD0MB_base>	FFC7 1300$_H$
	Acceptance filter list RAM0 (AFL0 RAM)	ECCCFD0AFL0	<ECCCFD0AFL0_base>	FFC7 1400$_H$
	Acceptance filter list RAM1 (AFL1 RAM)	ECCCFD0AFL1	<ECCCFD0AFL1_base>	FFC7 1500$_H$

(2) List of Registers

Each ECC module has the registers shown in the following table.

Table 40C.43 List of Registers

Module Name	Register Name	Symbol	Address
See (1) List of ECC Modules.	ECC control register	<Module_Name>CTL	<base_addr> + 00$_H$
	ECC test mode control register	<Module_Name>TMC	<base_addr> + 04$_H$
	ECC encode/decode input/output replacement test register	<Module_Name>TED	<base_addr> + 0C$_H$
	ECC redundant bit data control test register	<Module_Name>TRC	<base_addr> + 08$_H$
	ECC decode syndrome data register	<Module_Name>SYND	<base_addr> + 0B$_H$
	ECC 7-bit redundant bit data hold test register	<Module_Name>HORD	<base_addr> + 0A$_H$
	ECC encode test register	<Module_Name>ECRD	<base_addr> + 09$_H$
	ECC redundant bit input/output replacement register	<Module_Name>ERDB	<base_addr> + 08$_H$
	ECC error address register 0	<Module_Name>AD0	<base_addr> + 10$_H$
SL_READTEST	ECCREAD test select register	SELB_READTEST	FFC7 8000$_H$

40C.2.5.4 Details of Registers

(1) <Module_Name>CTL — ECC Control Register

The <Module_Name>CTL register controls the mode of the ECC and the status for target peripheral modules.

Bits 7, 5, 4 and 3 should be set (written) while the target peripheral module’s operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01_B.

Access:	This register can be read or written in 16-bit units.
Address:	See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.
Value after reset:	$001X_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	ECCOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	—
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R	R

Note 1. These bits are always read as 0.

Table 40C.44 <Module_Name>CTL Register Contents

Bit Position	Bit Name	Function
15	EMCA1	Access Control Bits 1 and 0 to ECC Mode Selection These bits specify whether updating the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 01_B, writing to bit 7 is enabled.
14	EMCA0	
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	ECCOVFF	By detecting an error while the error status is set and the new error has another address than the already latched (not cleared or reset is not issued), this bit is set. 0: Overflow is not occurred after reset of clearing ECER2F and ECER1F. 1: Error address register overflowed **NOTE:** This bit clear condition is as follows. (1) Reset (2) Writing ECER2C = 1 when ECER2F = 1 or ECER1C = 1 when ECER1F = 1 (3) Selecting through mode enable (ECTHM = 1)
10	ECER2C	2-Bit ECC Error Detection Flag Clear This bit clears 2-bit error detection flags of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority. ECER2C = 1 also clears the ECCOVFF bit while ECER2F bit is set.
9	ECER1C	1-Bit ECC Error Detection Correction Accumulation Flag Clear This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority. ECER1C = 1 also clears the ECCOVFF bit while ECER1F bit is set.
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40C.44 <Module_Name>CTL Register Contents

Bit Position	Bit Name	Function
7	ECTHM	ECC Function through Mode Selection Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 disables the ECC function. When writing to this bit, write 01_B to the EMCA1 and EMCA0 bits at the same time. Set this bit to 1 to disable the ECC function. 0: Passing through mode is disabled (normal operation mode). 1: Passing through mode is enabled. (ECC function disable)
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	EC1ECP	1-Bit Error Correction Enable This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. 0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.
4	EC2EDIC	2-Bit Error Detection Interrupt Control This bit controls whether to generate an interrupt when 2-bit error is detected. 0: When 2-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 2-bit error is detected, a target peripheral module's interrupt will be generated.
3	EC1EDIC	1-Bit Error Detection Interrupt Control This bit controls whether to generate an interrupt when 1-bit error is detected. 0: When 1-bit error is detected, a target peripheral module's interrupt will not be generated. 1: When 1-bit error is detected, a target peripheral module's interrupt will be generated.
2	ECER2F	2-Bit Error Detection Flag This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (a target peripheral module's interrupt) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. When through mode is enable (ECTHM = 1), this bit is cleared. If 2-bit error is detected again while this bit is set, an interrupt will not be generated. 0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred. This bit is read-only. Writing 0 or 1 does not change internal state.
1	ECER1F	1-Bit Error Detection/Correction Flag This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. When through mode is enabled (ECTHM = 1), this bit is cleared. 0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred. This bit is read-only. Writing 0 or 1 does not change internal state.
0	ECEMF	ECC Error Message Flag This flag indicates whether an error exists in the current read data bus. This bit is updated whenever the RAM outputs data. This bit is also cleared when through mode is enabled (ECTHM = 1) and there is no 1-bit error in decode circuit input data. 0: The current RAM output data does not have bit errors. 1: The current RAM output data have bit errors.

CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

(2) <Module_Name>TMC — ECC Test Mode Control Register

The <Module_Name>TMC register is used to switch to the test mode, and this register is for test mode control.

This register can be used when a target peripheral module is not accessed to RAM.

When writing to bit 7, ETMA1 and ETMA0 need to be 10_B.

Access:	This register can be read or written in 16-bit units.
Address:	See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA1	ETMA0	—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. These bits are always read as 0.

Table 40C.45 <Module_Name>TMC Register Contents

Bit Position	Bit Name	Function
15	ETMA1	Access Control Bits 1 and 0 to ECC Test Mode These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0.
14	ETMA0	
13 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTMCE	ECC Test Mode Enable This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write 10_B to the ETMA1 and ETMA0 bits at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: <Module_Name>TED, <Module_Name>TRC, <Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, <Module_Name>ERDB Register test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECTRRS	ECC RAM Read Test Mode Selection This bit selects the targets for reading when the <Module_Name>TED and <Module_Name>ERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Read value of the <Module_Name>TED register will be the write value of the <Module_Name>TED register. Read value of the <Module_Name>ERDB register will be the write value of the <Module_Name>ERDB register. 1: Read value of the <Module_Name>TED register can read RAM data. Read value of the <Module_Name>ERDB register will be the ECC Data to be written to RAM.
3	ECREOS	ECC Redundant Bit Output Data Selection This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the <Module_Name>ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated for write data is stored in RAM. 1: The value of <Module_Name>ERDB Register is stored in RAM.

Table 40C.45 <Module_Name>TMC Register Contents

Bit Position	Bit Name	Function
2	ECENS	ECC Encoder Input Selection This bit specifies data written to RAM or the value of the <Module_Name>TED register as the input to the ECC encoder. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated from write data to RAM 1: ECC data is generated from register value of the <Module_Name>TED.
1	ECDCS	ECC Decoder Input Selection This bit specifies which data is for generation of syndrome code and error detection, RAM data or the value of <Module_Name>TED. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Syndrome code generation and error detection are performed from RAM Data. 1: Syndrome code generation and error detection are performed from <Module_Name>TED register value.
0	ECREIS	ECC Redundant Bit Input Data Selection This bit specifies which ECC data is for generation of syndrome code and error detection, ECC data stored in RAM or the value of the <Module_Name>ERDB. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Syndrome code generation and error detection are performed from ECC data stored in RAM. 1: Syndrome code generation and error detection are performed from <Module_Name>ERDB register value.

(3) <Module_Name>TED — ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

This register value is used to generate ECC data or syndrome code.

This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE = 1). When <Module_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when a target peripheral module is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40C.46 <Module_Name>TED Register Contents

Bit Position	Bit Name	Function
31 to 0	ECEDB[31:0]	When <Module_Name>TMC.ECENS = 1, the value of this register is used to generate ECC data and that is stored to RAM. When <Module_Name>TMC.ECDCS = 1, the value of this register is used to generate syndrome code that is stored in ECC decode syndrome data register (<Module_Name>SYND). In addition, when <Module_Name>TMC.ECTRRS = 1, RAM data [31:0] instead of written data is read for the value of this register.

(4) <Module_Name>TRC — ECC Redundant Bit Data Control Test Register

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers, <Module_Name>SYND, <Module_Name>HORD, <Module_Name>ECRD, and <Module_Name>ERDB.

This register can be accessed when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When <Module_Name>TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when a target peripheral module is not accessed to RAM.

Access:	This register can be read or written in 32-bit units.
Address:	See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(5) <Module_Name>AD0 — Target ECC Error Address Register 0

This is read only register to hold the ECC error occurred address.

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	ECEAD[30:16]														
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	ECEAD[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.47 <Module_Name>AD0 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned.
30 to 0	ECEAD[30:0]	ECEAD0 is a read-only register to hold the address at which an ECC error has occurred. If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECEAD0 as the address at which the ECC error has occurred. The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. Only one address can be held in ECEAD0

(6) <Module_Name>SYND — ECC Decode Syndrome Data Register

This register is a read-only register for storing generated syndrome data in ECC test mode.

Writing to this register is ignored.

This register is read-only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE = 0), 00_H is read.

Access:	This register is a read-only register that can be read in 8-bit units.
Address:	See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	SYND6	SYND5	SYND4	SYND3	SYND2	SYND1	SYND0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40C.48 <Module_Name>SYND Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	SYND[6:0]	These bits store generated syndrome code as needed.

(7) <Module_Name>HORD — ECC 7-Bit Redundant Bit Data Hold Test Register

This register is for storing ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE = 0), 00_H is read.

Access:	This register is a read-only register that can be read in 8-bit units.
Address:	See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	HORD6	HORD5	HORD4	HORD3	HORD2	HORD1	HORD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40C.49 <Module_Name>HORD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	HORD[6:0]	These bits store ECC code for read RAM data as needed. When <Module_Name>TMC.ECTRRS =1 and if <Module_Name>TED register is read, ECC code is stored.

(8) <Module_Name>ECRD — ECC Encode Test Register

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (<Module_Name>TMC.ECTMCE = 1). When ECC test mode is disabled (<Module_Name>TMC.ECTMCE = 0), 00_H is read.

Access:	This register is a read-only register that can be read in 8-bit units.
Address:	See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	ECRD6	ECRD5	ECRD4	ECRD3	ECRD2	ECRD1	ECRD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 40C.50 <Module_Name>ECRD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing and can read ECC data for data written in the <Module_Name>TED register when <Module_Name>MC.ECENS =1.

(9) <Module_Name>ERDB — ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles test data.

This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode in enabled (<Module_Name>TMC.ECTMCE = 1). When <Module_Name>TMC.ECTMCE = 0, writing to this register is ignored and 00_H is read.

Access:	This register can be read or written in 8-bit units.
Address:	See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	ERDB6	ERDB5	ERDB4	ERDB3	ERDB2	ERDB1	ERDB0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40C.51 <Module_Name>ERDB Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ERDB[6:0]	These bits can store this register value as ECC data when <Module_Name>TMC.ECREOS = 1. When the register is read while <Module_Name>TMC.ECREIS =1, the value read from these bits is ECC data read from the RAM. When <Module_Name>TMC.ECTRRS = 1, ECC data to be stored in RAM will be read for this register value instated of written data.

(10) SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the target peripheral module's RAM ECC registers.

Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

Access:	This register can be read or written in 16-bit units.
Address:	See **Table 40C.42, List of ECC Modules** and **Table 40C.43, List of Registers**.
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

40C.3 Memory Protection

40C.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU

  The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see the *RH850 Family User's Manual: Software*.

- Slave Guard

  A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.

  - PEG
    The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see **Section 3BC, CPU System of RH850/F1KM**.
  - IPG
    The CPU Peripheral is protected against illegal accesses. For details, see **Section 3BC, CPU System of RH850/F1KM**.
  - PBG
    The control registers in the peripheral circuits are protected against illegal accesses. For details, see **Section 40C.3.2, PBG**.
  - PBGC
    The CPU system has its dedicated PBG function which is called a PBG for CPU system. For details, see **Section 40C.3.3, PBG for CPU System**.

40C.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.

Table 40C.53 Identifiers for Slave Guard

Identifier	Function
UM	When the CPU makes an access, this indicates the operating mode of the CPU. 0: Supervisor mode 1: User mode When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 0.
SPID	When the CPU makes an access, this indicates the system protection identifier SPID that is assigned to the CPU. When the PDMA makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 00_B.
PEID	This indicates the access source bus master. 001_B: CPU1 When the PDMA makes an access, the value of this identifier is the value in the channel master setting register.

40C.3.2 PBG

The PBG module is divided into several PBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG group names, and the PBG channel numbers.

Table 40C.54 PBG Groups and Channels and Target Modules

PBG Group	Group No.*3	PBG Channel Number	Protection Target Module	Target Register
PBG10	00	0	ECON_NMI	WDTNMIF WDTNMIFC
		1	ECON_FEINT	FEINTF FEINTFMSK FEINTFC
		2	SL_INTC	SELB_INTC1
		3	ADCA0	All registers in ADCA0
		4	KR0	KR0KRM
		5	PORT (Group A_ISO)	Registers of P9, P10, and P11 (except Pn, PSRn, PPRn, PNOTn, and PIBCn)
		6	PORT (Group A_AWO)	Registers of P0, P8, and AP0 (except Pn, PSRn, PPRn, PNOTn, and PIBCn)
		7	JTAG (Group A)	JP0 register (except JP0, JPSR0, JPPR0, JPNOT0, and JPIBC0)
		8	RLN30	All registers in RLIN30
		9	RLN31	All registers in RLIN31
		10	RLN32	All registers in RLIN32
		11	RLN33	All registers in RLIN33
PBG11	01	0	DNF (TAUD0)	DNFATAUD0ICTL DNFATAUD0IEN

		9	TAPA0	All registers in TAPA0
		10	ENCA0	All registers in ENCA0
		11	TAUJ1	All registers in TAUJ1

Table 40C.54 PBG Groups and Channels and Target Modules

PBG Group	Group No.*3	PBG Channel Number	Protection Target Module	Target Register
PBG20	02	12	TAUB0	All registers in TAUB0 (except SELB_TAUB0I)
		13	Reserved area	—
		14	PWBAn PWGAn PWSAn SLPWG PWGA_INTF	All registers in PWM-Diag
		15	SL_TAUJ2	SELB_TAUJ2I
PBG21	09	0	Flash memory (DCIB)	EEPRDCYCL
		1	DFECC	DFECCCTL, DFERSTR, DFERSTC, DFOVFSTR, DFOVFSTC, DFERRINT, DFEADR, DFTSTCTL
		5	SL_TAUB0	SELB_TAUB0I
		8	TAUJ2	All registers in TAUJ2 (except SELB_TAUJ2I)
		9	TAUJ3	All registers in TAUJ3
PBG30	03	0	RCFDC0 (channel 0)	All registers in RCFDC0 Ch0 group*4
		1	RCFDC0 (channel 1)	All registers in RCFDC0 Ch1 group*4
		2	RCFDC0 (channel 2)	All registers in RCFDC0 Ch2 group*4
		3	RCFDC0 (channel 3)	All registers in RCFDC0 Ch3 group*4
		4	RCFDC0 (channel 4)	All registers in RCFDC0 Ch4 group*4
		5	RCFDC0 (channel 5)	All registers in RCFDC0 Ch5 group*4
		8	RCFDC0 (Global)	All registers in RCFDC0 Global group*4
PBG31	04	0	OSTM0	All registers in OSTM0
		4	ECCCSIH0	All registers in ECC CSIH0
		5	ECCCSIH1	All registers in ECC CSIH1
		6	ECCCSIH2	All registers in ECC CSIH2
		7	ECCCSIH3	All registers in ECC CSIH3
		8	ECCCFD0MB	All registers in ECCCFD0MB
		9	ECCCFD0AFL0	All registers in ECCCFD0AFL0
		10	ECCCFD0AFL1	All registers in ECCCFD0AFL1

Table 40C.54 PBG Groups and Channels and Target Modules

PBG Group	Group No.*3	PBG Channel Number	Protection Target Module	Target Register
PBG32	05	0	CSIH0 (Group A)	CSIH0CTL0-2, CSIH0STR0, CSIH0STCR0, CSIH0EMU
		1	CSIH0 (Group B)	CSIH0 registers other than the above
		2	CSIH1 (Group A)	CSIH1CTL0-2, CSIH1STR0, CSIH1STCR0, CSIH1EMU
		3	CSIH1 (Group B)	CSIH1 registers other than the above
		4	CSIH2 (Group A)	CSIH2CTL0-2, CSIH2STR0, CSIH2STCR0, CSIH2EMU
		5	CSIH2 (Group B)	CSIH2 registers other than the above
		6	CSIH3 (Group A)	CSIH3CTL0-2, CSIH3STR0, CSIH3STCR0, CSIH3EMU
		7	CSIH3 (Group B)	CSIH3 registers other than the above
		8	CSIG0 (Group A)	CSIG0CTL0-2, CSIG0STR0, CSIG0STCR0, CSIG0EMU
		9	CSIG0 (Group B)	CSIG0 registers other than the above
PBG50	06	0	System control*1	All registers in Write-Protect Function, Reset Controller, Power Supply Circuit, Supply Voltage Monitor, Clock Controller, Clock Monitor, Stand-By Controller, and Low-Power Sampler*1 (except STBC0PSC, STBC0STPT, SWRESA, PROTCMD0, PROTS0, JPPCMD0, JPPROTS0, PPCMD0, PPCMD8-11, PPROTS0, PPROTS8-11, FLMDPCMD, FLMDPS)
		1	STBC0	STBC0PSC, STBC0STPT
		4	RESCTL	SWRESA
		5	Flash memory (Self Programming)	FLMD, *2
		6	Flash memory (Control)	— *2
		7	Flash memory (SCDS)	PRDNAME1-3, CHIPID1-2
		8	WPROTR	PROTCMD0 PROTS0

Note 1. For details, see **Section 5, Write-Protected Registers**, **Section 9BC, Reset Controller of RH850/F1KM**, **Section 10C, Power Supply Circuit of RH850/F1KM-S1**, **Section 11BC, Supply Voltage Monitor of RH850/F1KM**, **Section 12C, Clock Controller of RH850/F1KM-S1**, **Section 13, Clock Monitor (CLMA)**, **Section 14, Stand-By Controller (STBC)**, and **Section 15, Low-Power Sampler (LPS)**.

Note 2. Regarding the PBG registers for the flash memory, refer to *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

Note 3. Regarding the PBG register addresses, see the **Table 40C.55, List of PBG Protection Registers**.

Note 4. Regarding the RS-CANFD guard group, see **Section 24, CANFD Interface (RS-CANFD)**.

NOTE

Be sure to enable PBG before disabling register access clock of each clock domain.

40C.3.2.1 List of Registers

The following table lists the registers provided for each PBG group. And PBG group is equal to module name.

Table 40C.55 List of PBG Protection Registers

PBG Group*1	Group No.*2	Symbol	Register Name	R/W	Value after Reset	Address	Access Size	Power Domain
PBG10	00	FSGD00PROT0	PBG00 protection register 0	R/W	066F FFF7$_H$	FFC4 0000$_H$	8/16/32	ISO
		FSGD00PROT1	PBG00 protection register 1	R/W	066F FFF7$_H$	FFC4 0004$_H$	8/16/32	
		FSGD00PROT2	PBG00 protection register 2	R/W	066F FFF7$_H$	FFC4 0008$_H$	8/16/32	
		FSGD00PROT3	PBG00 protection register 3	R/W	066F FFF7$_H$	FFC4 000C$_H$	8/16/32	
		FSGD00PROT4	PBG00 protection register 4	R/W	066F FFF7$_H$	FFC4 0010$_H$	8/16/32	
		FSGD00PROT5	PBG00 protection register 5	R/W	066F FFF7$_H$	FFC4 0014$_H$	8/16/32	
		FSGD00PROT6	PBG00 protection register 6	R/W	066F FFF7$_H$	FFC4 0018$_H$	8/16/32	
		FSGD00PROT7	PBG00 protection register 7	R/W	066F FFF7$_H$	FFC4 001C$_H$	8/16/32	
		FSGD00PROT8	PBG00 protection register 8	R/W	066F FFF7$_H$	FFC4 0020$_H$	8/16/32	
		FSGD00PROT9	PBG00 protection register 9	R/W	066F FFF7$_H$	FFC4 0024$_H$	8/16/32	
		FSGD00PROT10	PBG00 protection register 10	R/W	066F FFF7$_H$	FFC4 0028$_H$	8/16/32

		FSGD06PROT4	PBG06 protection register 4	R/W	066F FFF7$_H$	FFF9 0010$_H$	8/16/32	
		FSGD06PROT5	PBG06 protection register 5	R/W	066F FFF7$_H$	FFF9 0014$_H$	8/16/32	
		—	Reserved	—	—	FFF9 0018$_H$	—	
		FSGD06PROT7	PBG06 protection register 7	R/W	066F FFF7$_H$	FFF9 001C$_H$	8/16/32	
		FSGD06PROT8	PBG06 protection register 8	R/W	066F FFF7$_H$	FFF9 0020$_H$	8/16/32	

Note 1. The Group indicates the module name.

Note 2. Register name index.

The following table lists the registers provided for each PBG group.

Table 40C.56 List of PBG Error Registers

Module Name	Symbol	Register Name	R/W	Value after Reset	Address	Access Size
PBGxx	ERRSLVxxCTL	PBGxx error control register	W	0000 0000_H	<base_addr0> + 0_H	8/16/32
	ERRSLVxxSTAT	PBGxx error status register	R	0000 0000_H	<base_addr0> + 4_H	8/16/32
	ERRSLVxxADDR	PBGxx error address register	R	0000 0000_H	<base_addr0> + 8_H	32
	ERRSLVxxTYPE	PBGxx error type register	R	0000 0000_H	<base_addr0> + C_H	16/32

In the above table, "xx" in the register names and symbols represents the PBG group numbers. The table below shows the base address values <base_addr0>, which correspond to each of the PBG group numbers.

Table 40C.57 PBG Group Numbers and Error Base Addresses

PBG Group	PBG Group Number	<base_addr0>
PBG10	00	FFC4 0040_H
PBG11	01	FFC4 0140_H
PBG12	07	FFC4 0440_H
PBG13	08	FFC4 0540_H
PBG20	02	FFDD $D040_H$
PBG21	09	FFDD $D140_H$
PBG30	03	FFF9 4040_H
PBG31	04	FFF9 4140_H
PBG32	05	FFF9 4240_H
PBG50	06	FFF9 0040_H

40C.3.2.2 Details of Registers

(1) FSGDxxPROTn — PBGxx Protection Register n

FSGDxxPROTn specifies the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. “n” in the register names and symbols represents the PBG channel number.

Access: FSGDxxPROTn register can be read or written in 32-bit units.
FSGDxxPROTnL and FSGDxxPROTnH registers can be read or written in 16-bit units.
FSGDxxPROTnLL, FSGDxxPROTnHL and FSGDxxPROTnHH registers can be read or written in 8-bit units.

Address: See **Table 40C.55, List of PBG Protection Registers**.

Value after reset: See **Table 40C.55, List of PBG Protection Registers**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROTLOCK	—	—	—	—	—	PROTUM	—	—	—	—	—	—	PROTPEID1	—	—
Value after reset	0	0	0	0	0	1	1	*1	*1	*1	*1	*1	*1	*1	*1	1
R/W	R/W	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PROTSPID3	PROTSPID2	PROTSPID1	PROTSPID0	—	PROTRDPDEF	PROTWRPDEF	PROTRD	PROTWR
Value after reset	1	1	1	1	1	1	1	*1	*1	*1	*1	1	0	1	1	1
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Note 1. It varies depending on each register. See **Section 40C.3.2.1, List of Registers**.

Table 40C.58 FSGDxxPROTn Register Contents

Bit Position	Bit Name	Function
31	PROTLOCK	Register Lock 0: Enables FSGDxxPROTn rewrite. 1: Disables FSGDxxPROTn rewrite. When PROTLOCK is set to 1, the value is held until reset is asserted.
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PROTPEID1	Access with PEID = 1 (CPU1)*1 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PROTSPID3	Access with SPID = 3*2 0: Disables access with SPID3. 1: Enables access with SPID3.
7	PROTSPID2	Access with SPID = 2*2 0: Disables access with SPID2. 1: Enables access with SPID2.

Table 40C.58 FSGDxxPROTn Register Contents

Bit Position	Bit Name	Function
6	PROTSPID1	Access with SPID = 1 (CPU1*3)*2 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0*2 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. Setting value of MCFG0.SPID

(2) ERRSLVxxCTL — PBGxx Error Control Register

ERRSLVxxCTL clears the status in the error status register with the PBGxx.

Access: ERRSLVxxCTL is write-only register that can be written in 32-bit units.
ERRSLVxxCTLL is write-only register that can be written in 16-bit units.
ERRSLVxxCTLLL is write-only register that can be written in 8-bit units.

Address: ERRSLVxxCTL: <base_addr0> + 0_H
ERRSLVxxCTLL: <base_addr0> + 0_H
ERRSLVxxCTLLL: <base_addr0> + 0_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 40C.59 ERRSLVxxCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears the overflow flag. 0: Does not clear the overflow flag. 1: Clears the overflow flag.
0	CLRE	Clears the error flag. 0: Does not clear the error flag. 1: Clears the error flag.

Table 40C.60 CLRO and CLRE in ERRSLVxxCTL Register

CLRO	CLRE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

(3) ERRSLVxxSTAT — PBGxx Error Status Register

ERRSLVxxSTAT holds the status of the illegal access rejected with the PBGxx.

Access: ERRSLVxxSTAT is read-only register that can be read in 32-bit units.
ERRSLVxxSTATL is read-only register that can be read in 16-bit units.
ERRSLVxxSTATLL is read-only register that can be read in 8-bit units.

Address: ERRSLVxxSTAT: <base_addr0> + 4_H
ERRSLVxxSTATL: <base_addr0> + 4_H
ERRSLVxxSTATLL: <base_addr0> + 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.61 ERRSLVxxSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred. If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBG error entry stages is 1. Note that this overflow is notified to INTGUARD. In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	Error Status Flag 0: No PBG protection violation 1: A PBG protection violation occurred.

(4) ERRSLVxxADDR — PBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

Access: ERRSLVxxADDR is read-only register that can be read in 32-bit units.

Address: ERRSLVxxADDR: <base_addr0> + 8_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.62 ERRSLVxxADDR Register Contents

Bit Position	Bit Name	Function
31 to 2	ADDR[31:2]	Address in which the PBG protection violation is generated.
1, 0	Reserved	When read, the value after reset is returned.

(5) ERRSLVxxTYPE — PBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

Access: ERRSLVxxTYPE is read-only register that can be read in 32-bit units.
ERRSLVxxTYPEL is read-only register that can be read in 16-bit units.

Address: ERRSLVxxTYPE: <base_addr0> + C_H
ERRSLVxxTYPEL: <base_addr0> + C_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEID[2:0]			—	—	—	SPID[1:0]		—	UM	—	—	—	—	—	WRITE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.63 ERRSLVxxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	PEID of the access source from which the PBG protection violation is generated.
12 to 10	Reserved	When read, the value after reset is returned.
9, 8	SPID[1:0]	SPID of the access source from which the PBG protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBG protection violation is generated.
5	Reserved	When read, the value after reset is returned.
4 to 1	Reserved	These bits are read as an undefined value.
0	WRITE	This bit is set to 1 when the access that has generated the PBG protection violation is a write access.

40C.3.3 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.

Table 40C.64 Target Registers of PBG for CPU Subsystem

PBGC Group	Group No.	Channel Number	Protection Target Module	Target Register
PBGC0	C0 (PBC group 0 for CPU system)	0	INTC2	ICxxx (xxx=32 to 357) IMRm (m=1 to 11) (described in **Section 7BC, Exception/Interrupts of RH850/F1KM**)
		1	PDMA0	All registers inside DMA controller (described in **Section 8, DMA Controller**)
PBGC1	C1 (PBC group 1 for CPU system)	0	Flash memory (Programing function)	BFASELR*[1]
		1	Code flash ECC control register (VCI)	CFECCCTL_VCI CFERRINT_VCI CFSTCLR_VCI CFOVFSTR_VCI CF1STERSTR_VCI CF1STEADR0_VCI CFSTSTCTL_VCI
		2	Code flash ECC control register (PE1)	CFECCCTL_PE1 CFERRINT_PE1 CFSTCLR_PE1 CFOVFSTR_PE1 CF1STERSTR_PE1 CF1STEADR0_PE1
		3	Local RAM ECC control register (PE1)	LRTSTCTL_PE1 LRTDATBF0_PE1 LRECCCTL_PE1 LRERRINT_PE1 LRSTCLR_PE1 LROVFSTR_PE1 LR1STERSTR_PE1 LR1STEADR0_PE1
		4	On-Chip Debug module	EPC (described in **Section 43, On-Chip Debug Unit (OCD)**)
		5	Buffer controller	FBUFCCTL (described in **Section 3BC, CPU System of RH850/F1KM**)

Note 1. Regarding the PBGC registers for the flash memory, refer to *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

40C.3.3.1 List of Registers

The following table lists the registers provided for each PBGC group. And PBG group is equal to module name.

Table 40C.65 List of PBGC Protection Registers

PBG Group*[1]	Group No.	Symbol	Register Name	R/W	Value after Reset	Address	Access Size	Power Domain
PBGC0	C0	FSGDC0PROT0	PBGC0 protection register 0	R/W	07FF $FFFF_H$	FFC4 $C000_H$	8/16/32	ISO
		FSGDC0PROT1	PBGC0 protection register 1	R/W	07FF $FFFF_H$	FFC4 $C004_H$	8/16/32	
PBGC1	C1	FSGDC1PROT0	PBGC1 protection register 0	R/W	07FF $FFFF_H$	FFC4 $C120_H$	8/16/32	ISO
		FSGDC1PROT1	PBGC1 protection register 1	R/W	07FF $FFFF_H$	FFC4 $C124_H$	8/16/32	
		FSGDC1PROT2	PBGC1 protection register 2	R/W	07FF $FFFF_H$	FFC4 $C128_H$	8/16/32	
		FSGDC1PROT3	PBGC1 protection register 3	R/W	07FF $FFFF_H$	FFC4 $C12C_H$	8/16/32	
		FSGDC1PROT4	PBGC1 protection register 4	R/W	07FF $FFFF_H$	FFC4 $C130_H$	8/16/32	
		FSGDC1PROT5	PBGC1 protection register 5	R/W	07FF $FFFF_H$	FFC4 $C134_H$	8/16/32	

Note 1. The Group indicates the module name.

Table 40C.66 List of PBGC Error Registers

Module Name	Symbol	Register Name	R/W	Value after Reset	Address	Access Size
PBGC0	ERRSLVC0CTL	PBGC0 error control register	W	0000 0000_H	FFC4 $C800_H$	8/16/32
	ERRSLVC0STAT	PBGC0 error status register	R	0000 0000_H	FFC4 $C804_H$	8/16/32
	ERRSLVC0ADDR	PBGC0 error address register	R	0000 0000_H	FFC4 $C808_H$	32
	ERRSLVC0TYPE	PBGC0 error type register	R	0000 0000_H	FFC4 $C80C_H$	16/32
PBGC1	ERRSLVC1CTL	PBGC1 error control register	W	0000 0000_H	FFC4 $C900_H$	8/16/32
	ERRSLVC1STAT	PBGC1 error status register	R	0000 0000_H	FFC4 $C904_H$	8/16/32
	ERRSLVC1ADDR	PBGC1 error address register	R	0000 0000_H	FFC4 $C908_H$	32
	ERRSLVC1TYPE	PBGC1 error type register	R	0000 0000_H	FFC4 $C90C_H$	16/32

40C.3.3.2 Details of Registers

(1) FSGDCxPROTn — PBGCx Protection Register n (x = 0, 1)

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.

"n" in the register names and symbols represents the PBGC channel number.

Access:	FSGDCxPROTn register can be read or written in 32-bit units. FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16-bit units. FSGDCxPROTnLL, FSGDCxPROTnHL and FSGDCxPROTnHH registers can be read or written in 8-bit units.
Address:	See **Table 40C.65, List of PBGC Protection Registers**.
Value after reset:	See **Table 40C.65, List of PBGC Protection Registers**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PROTUM	—	—	—	—	—	—	PROTPEID1	—	—
Value after reset	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PROTSPID3	PROTSPID2	PROTSPID1	PROTSPID0	—	PROTRDPDEF	PROTWRPDEF	PROTRD	PROTWR
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Table 40C.67 FSGDCxPROTn Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	PROTPEID1	Access with PEID = 1 (CPU1)[*1] 0: Disables access with PEID1. 1: Enables access with PEID1.
17 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PROTSPID3	Access with SPID = 3[*2] 0: Disables access with SPID3. 1: Enables access with SPID3.
7	PROTSPID2	Access with SPID = 2[*2] 0: Disables access with SPID2. 1: Enables access with SPID2.
6	PROTSPID1	Access with SPID = 1 (CPU1[*3])[*2] 0: Disables access with SPID1. 1: Enables access with SPID1.
5	PROTSPID0	Access with SPID = 0[*2] 0: Disables access with SPID0. 1: Enables access with SPID0.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 40C.67 FSGDCxPROTn Register Contents

Bit Position	Bit Name	Function
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master regardless of other setting in this register. 1: The setting of PROTRD is effective.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master regardless of other setting in this register. 1: The setting of PROTWR is effective.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

Note 3. Setting value of MCFG0.SPID

(2) ERRSLVCxCTL — PBGCx Error Control Register (x = 0, 1)

ERRSLVCxCTL clears the status in error status register PBGCx.

Access: ERRSLVCxCTL is a write-only register that can be written in 32-bit units.
ERRSLVCxCTLL is a write-only register that can be written in 16-bit units.
ERRSLVCxCTLLL is a write-only register that can be written in 8-bit units.

Address: ERRSLVCxCTL: FFC4 C800$_H$ + (100$_H$ × x)
ERRSLVCxCTLL: FFC4 C800$_H$ + (100$_H$ × x)
ERRSLVCxCTLLL: FFC4 C800$_H$ + (100$_H$ × x)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 40C.68 ERRSLVCxCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears the overflow flag. 0: Does not clear the overflow flag. 1: Clears the overflow flag.
0	CLRE	Clears the error flag. 0: Does not clear the error flag. 1: Clears the error flag.

Table 40C.69 CLRO and CLRE in ERRSLVCxxCTL Register

CLRO	CLRE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

(3) ERRSLVCxSTAT — PBGCx Error Status Register (x = 0, 1)

ERRSLVCxSTAT holds the status of the illegal access rejected with the PBGCx.

Access: ERRSLVCxSTAT is a read-only register that can be read in 32-bit units.
ERRSLVCxSTATL is a read-only register that can be read in 16-bit units.
ERRSLVCxSTATLL is a read-only register that can be read in 8-bit units.

Address: ERRSLVCxSTAT: FFC4 $C804_H$ + (100_H × x)
ERRSLVCxSTATL: FFC4 $C804_H$ + (100_H × x)
ERRSLVCxSTATLL: FFC4 $C804_H$ + (100_H × x)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.70 ERRSLVCxSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred. If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBGC error entry stages is 1. Note that this overflow is notified to INTGUARD. In addition, it is not possible to determine whether an overflow has occurred by INTGUARD. For an overflow check the OVF bit should be checked. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	Error Status Flag 0: No PBGC protection violation 1: A PBGC protection violation occurred.

(4) ERRSLVCxADDR — PBGCx Error Address Register (x = 0, 1)

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx. The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Access: ERRSLVCxADDR is read-only register that can be read in 32-bit units.

Address: FFC4 C808$_H$ + (100$_H$ × x)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.71 ERRSLVCxADDR Register Contents

Bit Position	Bit Name	Function
31 to 2	ADDR[31:2]	Address in which the PBGC protection violation is generated.
1,0	Reserved	When read, the value after reset is returned.

(5) ERRSLVCxTYPE — PBGCx Error Type Register (x = 0, 1)

ERRSLVCxTYPE holds the type of the illegal access rejected with the PBGCx. The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Access: ERRSLVCxTYPE is read-only register that can be read in 32-bit units.
ERRSLVCxTYPEL is read-only register that can be read in 16-bit units.

Address: ERRSLVCxTYPE: FFC4 C80C$_H$ + (100$_H$ × x)
ERRSLVCxTYPEL: FFC4 C80C$_H$ + (100$_H$ × x)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40C.72 ERRSLVCxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	PEID of the access source from which the PBGC protection violation is generated.
12 to 10	Reserved	When read, the value after reset is returned.
9, 8	SPID[1:0]	SPID of the access source from which the PBGC protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBGC protection violation is generated.
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	This bit is set to 1 when an access that has generated the PBGC protection violation is the write.

Section 41 Data CRC (DCRA)

This section contains a generic description of the data CRC function A (DCRA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of DCRA.

41.1 Features of RH850/F1KH, RH850/F1KM DCRA

41.1.1 Number of Units

This microcontroller has the following number of DCRA units.

Each DCRA unit has single channel interface.

Table 41.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	4	4	4
Name	DCRAn (n = 0 to 3)	DCRAn (n = 0 to 3)	DCRAn (n = 0 to 3)

Table 41.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	4	4	4	4	4
Name	DCRAn (n = 0 to 3)	DCRAn (n = 0 to 3)	DCRAn (n = 0 to 3)	DCRAn (n = 0 to 3)	DCRAn (n = 0 to 3)

Table 41.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	4	4
Name	DCRAn (n = 0)	DCRAn (n = 0)	DCRAn (n = 0 to 3)	DCRAn (n = 0 to 3)

Table 41.4 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual data CRC function A units are identified by the index “n”; for example, DCRAnCTL (n = 0 to 3) indicates the DCRAn control register.

41.1.2 Register Base Addresses

DCRAn base addresses are listed in the following table.

DCRAn register addresses are given as offsets from the base addresses.

Table 41.5 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<DCRA0_base>	FFF7 0000_H
<DCRA1_base>	FFF7 1000_H
<DCRA2_base>	FFF7 2000_H
<DCRA3_base>	FFF7 3000_H

41.1.3 Clock Supply

The DCRAn clock supply is shown in the following table.

Table 41.6 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
DCRAn	PCLK	CPUCLK_UL	Module clock
	Register access clock	CPUCLK_UL	Bus clock

41.1.4 Reset Sources

DCRAn reset sources are listed in the following table. DCRAn is initialized by these reset sources.

Table 41.7 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
DCRAn	All reset sources (ISORES)

41.2 Overview

41.2.1 Functional Overview

The data CRC function A can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- 32-bit Ethernet CRC
  (X32+X26+X23+X22+X16+X12+X11+X10+X8+X7+X5+X4+X2 +X1+1)
- 16-bit CCITT CRC
  (X16+X12+X5+1)
- CRC of an arbitrary data block length can be generated.
- After initialization of the CRC data register, every write access to the CRC input register generates a new CRC according to the selected polynomial, and the result is stored in the CRC data register.

41.2.2 Block Diagram

The following picture shows the block diagram of the data CRC function A.

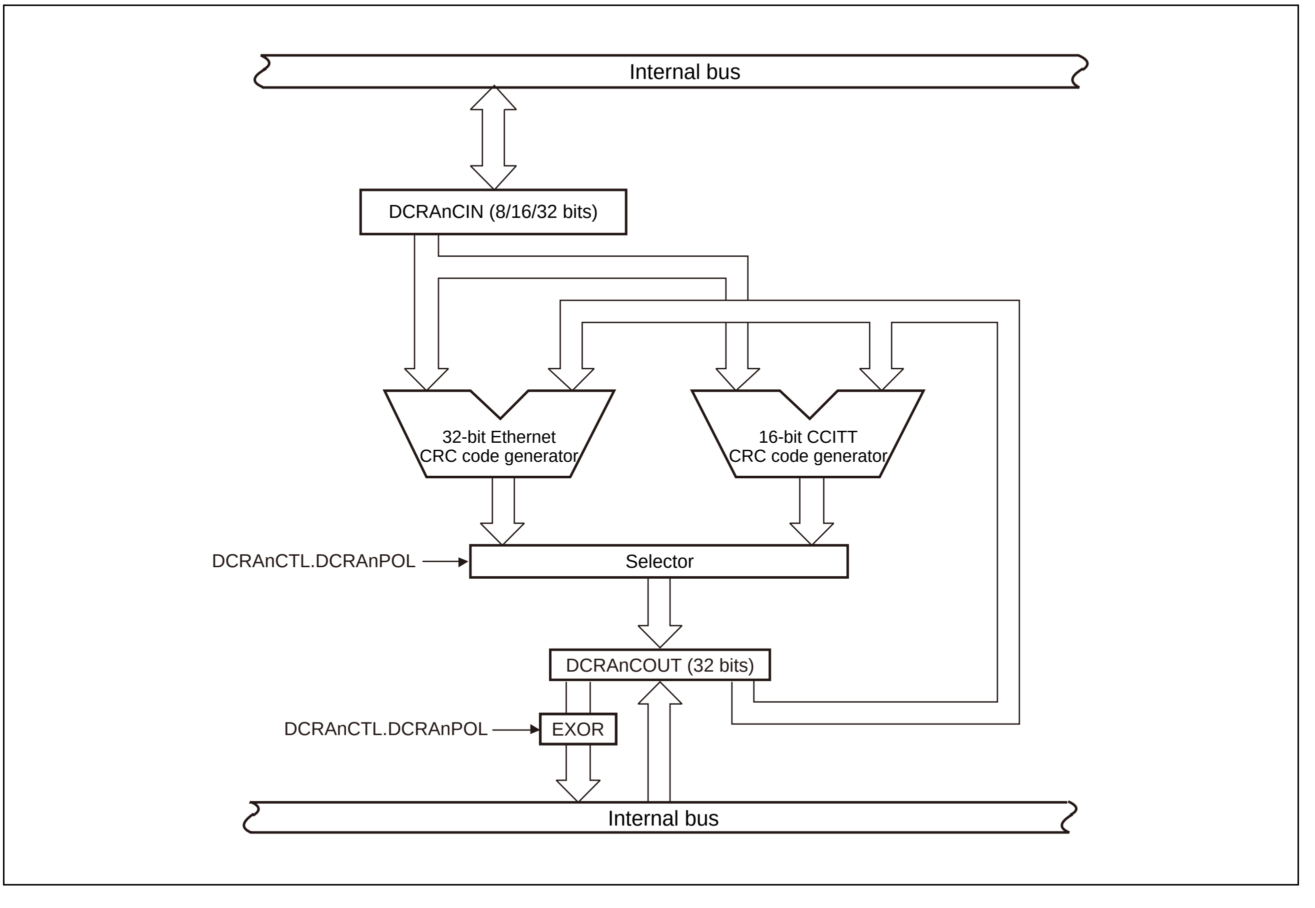

Figure 41.1 Block Diagram of Data CRC Function A

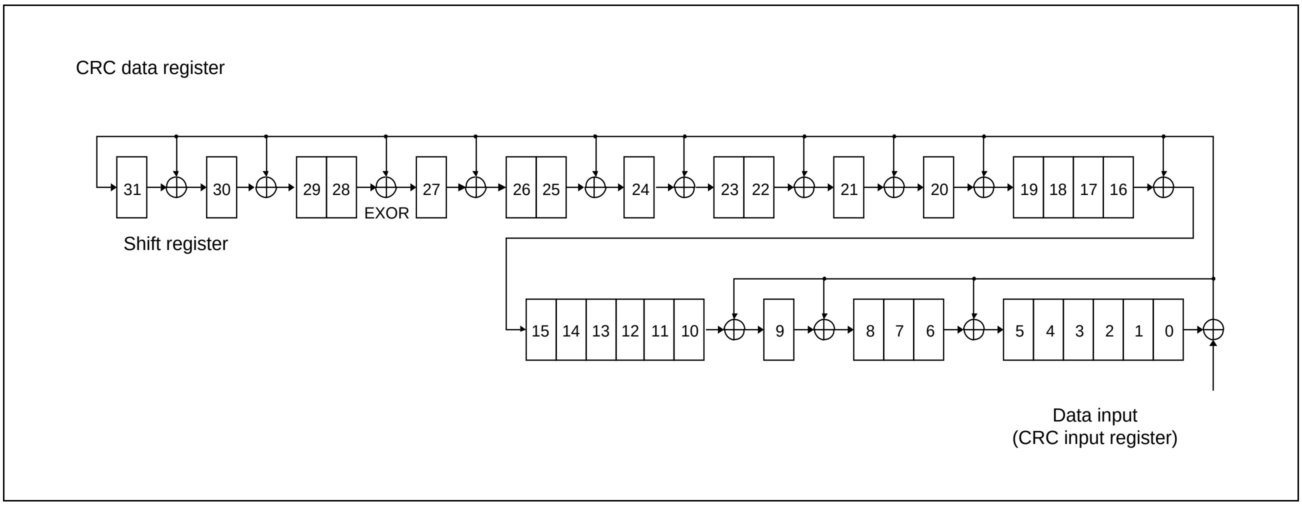
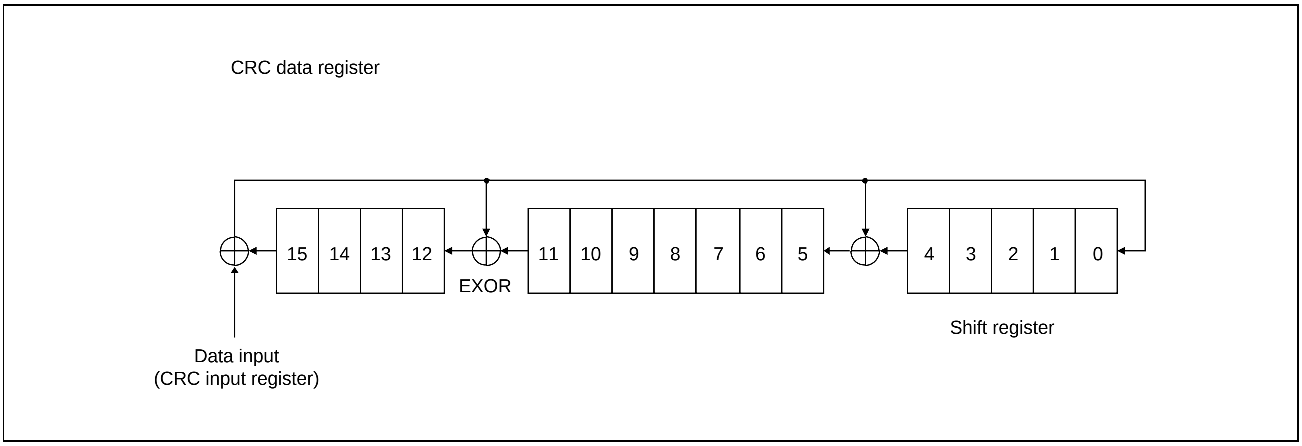
41.2.3 Operational Circuit

- **32-bit Ethernet**



- **16-bit CCITT**



41.3 Registers

41.3.1 List of Registers

DCRA registers are listed in the following table.

For details about <DCRAn_base>, **Section 41.1.2, Register Base Addresses**.

Table 41.8 List of Registers

Module Name	Register Name	Symbol	Address
DCRAn	CRC input register	DCRAnCIN	<DCRAn_base> + 00_H
	CRC data register	DCRAnCOUT	<DCRAn_base> + 04_H
	CRC control register	DCRAnCTL	<DCRAn_base> + 20_H

41.3.2 DCRAnCIN — CRC Input Register

This register holds the input data for CRC calculation. The effective bit width used for CRC calculation must be set by DCRAnCTL.DCRAnISZ[1:0].

When data is written to this register, the CRC code is generated.

The CRC calculation is immediately started after the DCRAnCIN register is written. The DCRAnCOUT register must be initialized with the initial starting value, before the first data of the data block is written to DCRAnCIN register.

Access: This register can be read or written in 32-bit units

Address: <DCRAn_base>

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRAnCIN[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRAnCIN[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 41.9 DCRAnCIN Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRAnCIN[31:0]	Input Data for CRC Calculation The valid bits are: ● For 32 bit effective bit width: DCRAnCIN[31:0] ● For 16 bit effective bit width: DCRAnCIN[15:0] ● For 8 bit effective bit width: DCRAnCIN[7:0]

41.3.3 DCRAnCOUT — CRC Data Register

This register stores the result of the CRC code generated by the 32-bit Ethernet polynomial or the 16-bit CCITT polynomial.

Access:	This register can be read or written in 32-bit units.
Address:	<DCRAn_base> + 4_H
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRAnCOUT[31:16]															
Value after reset *1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRAnCOUT[15:0]															
Value after reset *1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The read value after reset is 0000 0000$_H$ since the 32-bit Ethernet CRC polynomial is selected as the CRC generating function after reset.

Table 41.10 DCRAnCOUT Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRAnCOUT	Result of the CRC Code Generation When the 16-bit CCITT polynomial is enabled, the bits 15 to 0 show the CRC result. The bits 31 to 16 are undefined. The read value of this register is a value obtained by performing EXOR calculation for the following value: • For 32-bit Ethernet polynomial: FFFF FFFF$_H$ • For 16-bit CCITT polynomial: 0000$_H$ For example, when DCRAnCOUT = 5555 5555$_H$ for the 32-bit Ethernet polynomial, AAAA AAAA$_H$ is read.

CAUTION

This register must be initialized by setting the initial start value before the first data of the data block is written to DCRAnCIN register.

41.3.4 DCRAnCTL — CRC Control Register

This register controls the CRC generation process.

Access: This register can be read or written in 8-bit units.

Address: <DCRAn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	DCRAnISZ[1:0]		DCRAnPOL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 41.11 DCRAnCTL Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2, 1	DCRAnISZ[1:0]	Specify the CRC input bit width. 00: 32 bits (DCRAnCIN[31:0]) 01: 16 bits (DCRAnCIN[15:0]) 10: 8 bits (DCRAnCIN[7:0]) 11: Setting prohibited
0	DCRAnPOL	Specifies the CRC generation method. 0: 32-bit Ethernet CRC polynomial generation. The byte order of the DCRAnCIN register is LSB (least significant bit) first. This means that, if the CRC input bit width is 8 bits (DCRAnISZ[1:0] = 10_B), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 0 (LSB) is the start bit of the input data. 1: 16-bit CCITT CRC polynomial generation. The byte order of the DCRAnCIN register is MSB (most significant bit) first. This means that, if the CRC input bit width is 8 bits (DCRAnISZ[1:0] = 10_B), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 7 (MSB) is the start bit of the input data.

CAUTION

- If the CRC generation method (DCRAnCTL.DCRAnPOL) is changed, the DCRAnCOUT register must be initialized by setting the initial start value.
- The CRC input bit width (DCRAnCTL.DCRAnISZ[1:0]) must be set according to the data block bit width. Changing the CRC input bit width is not allowed during processing of a data block (a data block consists of N bytes, half-words or one word). After the final CRC result is read from DCRAnCOUT register, the bit width can be changed. In that case, the DCRAnCOUT register must be initialized with the initial start value.

41.4 Operation

The data CRC function A generates a CRC (cyclic redundancy check) of an arbitrary data block length. The data is forwarded to the data CRC function in 8-, 16- or 32-bit units. The CRC polynomial can either be selected for 32-bit Ethernet or 16-bit CCITT. The initial starting value must be set at the DCRAnCOUT register before the first write access to the CRC input register (DCRAnCIN) is performed.

The flowchart below shows the CRC generating procedure.

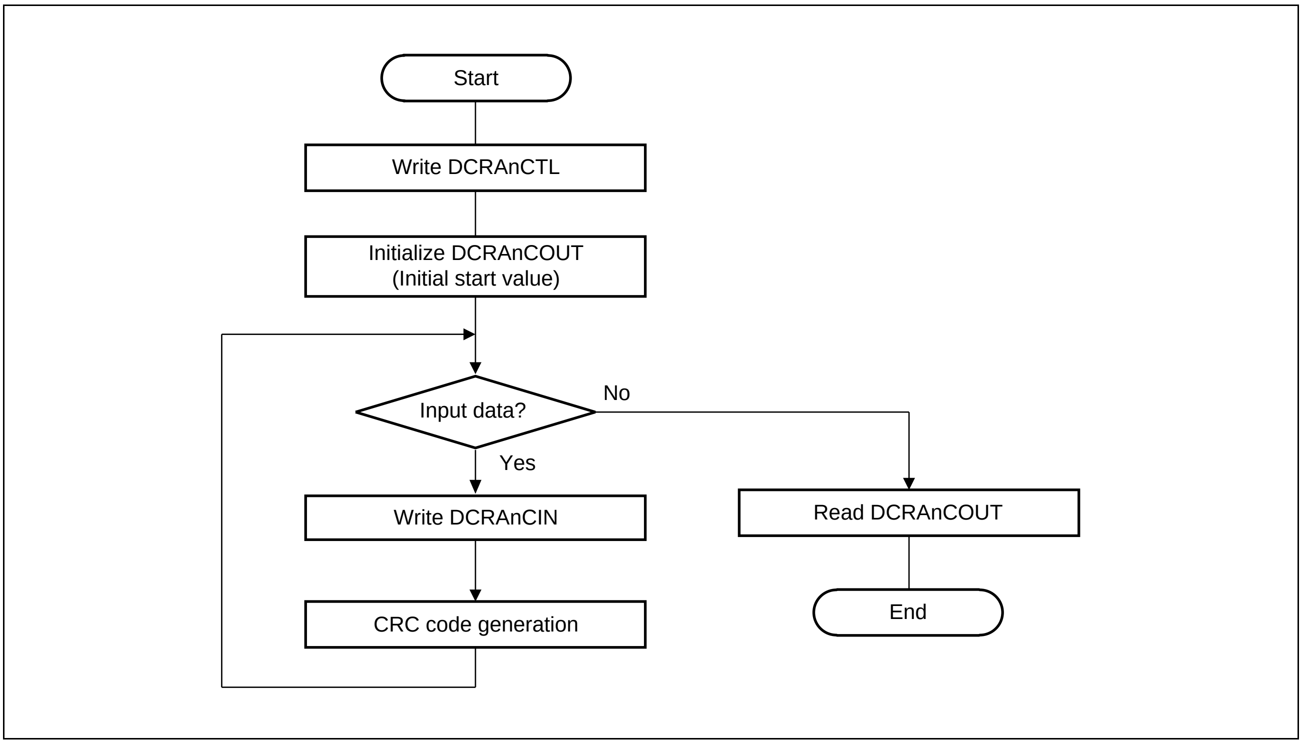


Figure 41.2 Flowchart of Data CRC Function A

NOTES

1. Before writing the first data to DCRAnCIN, the CRC output register DCRAnCOUT must be initialized with the initial start value.
2. DCRAnCOUT must be re-initialized by setting the initial start value when the polynomial is changed by changing DCRAnCTL.DCRAnPOL.
3. Setting example of the initial start values of the respective polynomials
The following is the example of setting values.

Table 41.12 Setting Example of Initial Start Values (When Read at a Reset)

	Initial Start Value	EXOR Value	DCRAnCOUT Read Value
16-bit CCITT	XXXX $FFFF_H$	XXXX 0000_H	XXXX $FFFF_H$
32-bit Ethernet	FFFF $FFFF_H$	FFFF $FFFF_H$	0000 0000_H

Note: X: Undefined

Section 42 Security Function

Please refer to separate documents about security function which describes the two functions as shown below.

- ICUMD for RH850/F1KH-D8, RH850/F1KM-S4
- ICUSE for RH850/F1KM-S1

Section 43 On-Chip Debug Unit (OCD)

This microcontroller has an on-chip debug function. By using the on-chip debug emulator, programs can be debugged with the microcontroller mounted in the target system.

The debug functions incorporated in this microcontroller conform to IEEE-ISTO 5001™-2003 Class 3*[1], a Nexus debug interface standard.

Note 1. This function is supported only by products with an $\overline{\text{EVTO}}$ pin.

CAUTION

The debug functions described in this section are supported by the microcontroller but whether they are usable depends on the debugger. For details on debugging, see the user's manual of the debugger.

43.1 Overview of RH850/F1KH, RH850/F1KM OCD

43.1.1 Functional Overview

The on-chip debug functions described below are supported by the microcontroller.

(1) Debug Interface

This microcontroller supports the following as debug interfaces: Nexus Interface, Low Pin Debug Interface (1 pin) - hereinafter called "LPD (1 pin)", and Low Pin Debug Interface (4 pins) - hereinafter called "LPD (4 pins)".

On-chip debug can be performed using these debug interfaces.

NOTE

When LPD (1 pin) is used, LPD is operating by the clock of MainOSC.

(2) Debug Monitoring Function

Debug-dedicated monitor program space is mounted and is used during debugging.

The basic debug functions below can be used by running a monitoring program.

- Downloading the user-created program
- Reading and writing the memory and registers
- Running the user-created program starting at any address

(3) On-chip Break

A maximum of 12 breakpoints can be specified at any execution address. Of the 12 breakpoints, a maximum of four breakpoints can be specified for any access (access address, access data).

(4) Software Break

Software break points can be specified at any execution address.

(5) Peripheral Break

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the user-created program is stopped, for instance upon a breakpoint hit.

(6) Forced Break

Execution of the user-created program can be interrupted forcibly.

(7) Forced Reset

This device (microcontroller) can be forcibly reset.

(8) Real Time RAM Monitoring (RRM)

The memory can be read during program execution. Because this read access uses debug-dedicated DMA, it has minimal effect on program execution.

(9) Dynamic Memory Modification (DMM)

The memory can be written during program execution. Because this write access uses debug-dedicated DMA, it has minimal effect on program execution.

(10) Timer Function

Using a 32-bit counter, the time for running the user-created program can be measured based on the clock for debug.

For the measurement accuracy, see the user’s manual of the debugger.

(11) Mask Function

Masking the following factors is possible.

- All reset sources except for a POC reset and a wakeup reset
- $\overline{\text{MEMC0WAIT}}$ *[1]

Note 1. This function is supported only by products with MEMC.

(12) Hot Plug-in Function

Debugging can be started in normal operating mode without the external reset input.

NOTE

When the hot plug-in function is used in power save mode, the INTDCUTDI interrupt is required to return from power save mode as the wake-up process. About the INTDCUTDI interrupt, see **Table 7A.4, EI Level Maskable Interrupt Sources**, **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)** and **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)** (Channel No.21).

(13) Security Function

To prevent the contents of the flash memory from being read by an unauthorized person, a 128-bit ID code can be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code written to the microcontroller, the flash memory cannot be accessed.

For details on how to set the ID code, see the user’s manual of the debugger.

(14) Trace Function

Execution history, data changes, etc. of the user-created program can be obtained.

NOTE

The trace function is only available in devices with 8-MB memory in RH850/F1KH-D8.

The trace function is only available in devices with 4-MB memory in RH850/F1KM-S4.

The trace function is only available in devices with 1-MB memory in RH850/F1KM-S1.

43.2 Peripheral Break Control

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the user-created program is stopped, for instance upon a breakpoint hit.

During peripheral break, the peripheral modules operate as follows.

a. Modules that stop unconditionally regardless of the EPC.SVSTOP setting

Table 43.4 Modules that Stop Unconditionally Regardless of the EPC.SVSTOP Setting (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Module
Window watchdog timer (WDTA)

CAUTION

RH850/F1KH-D8:
Do not write to the WDTAn when using the individual break function.
In order for the WDTAn of a CPUn for which break points have not been configured to receive clear commands, writing to the WDTAn by using SVACCESS is not disabled.
If WDTA0MD or a trigger register is written on the debugger GUI or by some other means, it might cause an unintentional reset.
To prevent this, be sure to configure synchronous breaks for all CPUs. (SVACCESS is enabled by a tool.)

b. Modules that continue to operate by the setting of emulation registers even when EPC.SVSTOP = 1

Table 43.5 Modules that Continue to Operate by the Setting of Emulation Registers even when EPC.SVSTOP = 1 (RH850/F1KH-D8)

Module	Emulation Register	n
OS timer (OSTM)	OSTMnEMU.OSTMnSVSDIS 0: Stops during break 1: Continues during break	0 to 9
Timer array unit D (TAUD)	TAUDnEMU.TAUDnSVSDIS 0: Stops during break 1: Continues during break	0
Timer array unit B (TAUB)	TAUBnEMU.TAUBnSVSDIS 0: Stops during break 1: Continues during break	0, 1
Timer array unit J (TAUJ)	TAUJnEMU.TAUJnSVSDIS 0: Stops during break 1: Continues during break	0 to 3
Real-time clock (RTCA)	RTCAnEMU.RTCAnSVSDIS 0: Stops during break 1: Continues during break	0
Clocked serial interface G (CSIG)	CSIGnEMU.CSIGnSVSDIS 0: Stops during break 1: Continues during break	0 to 4
Clocked serial interface H (CSIH)	CSIHnEMU.CSIHnSVSDIS 0: Stops during break 1: Continues during break	0 to 4
Timer motor control function (TAPA)	TAPAnEMU.TAPAnSVSDIS 0: Stops during break 1: Continues during break	0
Encoder timer (ENCA)	ENCAnEMU.ENCAnSVSDIS 0: Stops during break 1: Continues during break	0
PWM output/diagnostic (PWM-Diag)	PWBAnEMU.PWBAnSVSDIS 0: Stops during break 1: Continues during break	0
	PWSAnEMU.PWSAnSVSDIS 0: Stops during break 1: Continues during break	0
A/D converter (ADCA)	ADCAnEMU.ADCAnSVSDIS 0: Stops during break 1: Continues during break	0, 1

Table 43.6 Modules that Continue to Operate by the Setting of Emulation Registers even when EPC.SVSTOP = 1 (RH850/F1KM-S4)

Module	Emulation Register	n
OS timer (OSTM)	OSTMnEMU.OSTMnSVSDIS 0: Stops during break 1: Continues during break	0 to 4
Timer array unit D (TAUD)	TAUDnEMU.TAUDnSVSDIS 0: Stops during break 1: Continues during break	0
Timer array unit B (TAUB)	TAUBnEMU.TAUBnSVSDIS 0: Stops during break 1: Continues during break	0, 1
Timer array unit J (TAUJ)	TAUJnEMU.TAUJnSVSDIS 0: Stops during break 1: Continues during break	0 to 3
Real-time clock (RTCA)	RTCAnEMU.RTCAnSVSDIS 0: Stops during break 1: Continues during break	0
Clocked serial interface G (CSIG)	CSIGnEMU.CSIGnSVSDIS 0: Stops during break 1: Continues during break	0 to 3
Clocked serial interface H (CSIH)	CSIHnEMU.CSIHnSVSDIS 0: Stops during break 1: Continues during break	0 to 3
Timer motor control function (TAPA)	TAPAnEMU.TAPAnSVSDIS 0: Stops during break 1: Continues during break	0
Encoder timer (ENCA)	ENCAnEMU.ENCAnSVSDIS 0: Stops during break 1: Continues during break	0
PWM output/diagnostic (PWM-Diag)	PWBAnEMU.PWBAnSVSDIS 0: Stops during break 1: Continues during break	0
	PWSAnEMU.PWSAnSVSDIS 0: Stops during break 1: Continues during break	0
A/D converter (ADCA)	ADCAnEMU.ADCAnSVSDIS 0: Stops during break 1: Continues during break	0, 1

Table 43.7 Modules that Continue to Operate by the Setting of Emulation Registers even when EPC.SVSTOP = 1 (RH850/F1KM-S1)

Module	Emulation Register	n
OS timer (OSTM)	OSTMnEMU.OSTMnSVSDIS 0: Stops during break 1: Continues during break	0
Timer array unit D (TAUD)	TAUDnEMU.TAUDnSVSDIS 0: Stops during break 1: Continues during break	0
Timer array unit B (TAUB)	TAUBnEMU.TAUBnSVSDIS 0: Stops during break 1: Continues during break	0
Timer array unit J (TAUJ)	TAUJnEMU.TAUJnSVSDIS 0: Stops during break 1: Continues during break	0 to 3
Real-time clock (RTCA)	RTCAnEMU.RTCAnSVSDIS 0: Stops during break 1: Continues during break	0

Clocked serial interface H (CSIH)	CSIHnEMU.CSIHnSVSDIS 0: Stops during break 1: Continues during break	0 to 3
Timer motor control function (TAPA)	TAPAnEMU.TAPAnSVSDIS 0: Stops during break 1: Continues during break	0
Encoder timer (ENCA)	ENCAnEMU.ENCAnSVSDIS 0: Stops during break 1: Continues during break	0
PWM output/diagnostic (PWM-Diag)	PWBAnEMU.PWBAnSVSDIS 0: Stops during break 1: Continues during break	0
	PWSAnEMU.PWSAnSVSDIS 0: Stops during break 1: Continues during break	0
A/D converter (ADCA)	ADCAnEMU.ADCAnSVSDIS 0: Stops during break 1: Continues during break	0

CAUTION

For details on the registers, see the register description of the corresponding section.

c. Modules that stop when EPC.SVSTOP = 1

Table 43.8 Modules that Stop when EPC.SVSTOP = 1 (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Module
LIN/UART interface (RLIN3)
Low-power sampler (LPS)

43.3 Hot Plug-in in Each Mode

43.3.1 RUN Mode

When Hot Plug-in has occurred in RUN mode, it is necessary to maintain the current state.

43.3.2 STOP/DeepSTOP Mode

When Hot Plug-in has occurred in STOP/DeepSTOP mode, it is necessary to transfer in RUN mode.

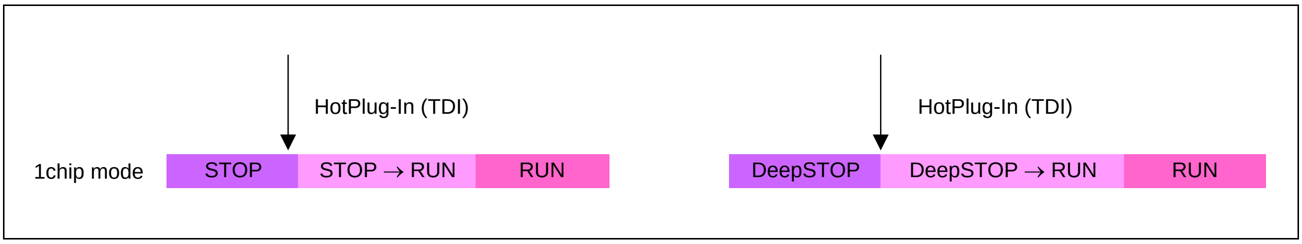

Figure 43.1 Hot Plug-in in STOP/DeepSTOP Mode

43.3.3 Cyclic RUN Mode

When Hot Plug-in has occurred in Cyclic RUN mode, it is necessary to transfer in DeepSTOP mode and wakeup to RUN mode.

All regulators in ISO are made operating state in OCD mode.

Then, on the occurrence of interrupt of “DCUTDI Low level Detection interrupt (INTDCUTDI)”, it is necessary for a transfer order to be executed to DeepSTOP mode by user (software) if on-chip debugging is performed.

The sequence of the time when to enter to OCD mode in Cyclic RUN mode is mentioned below.

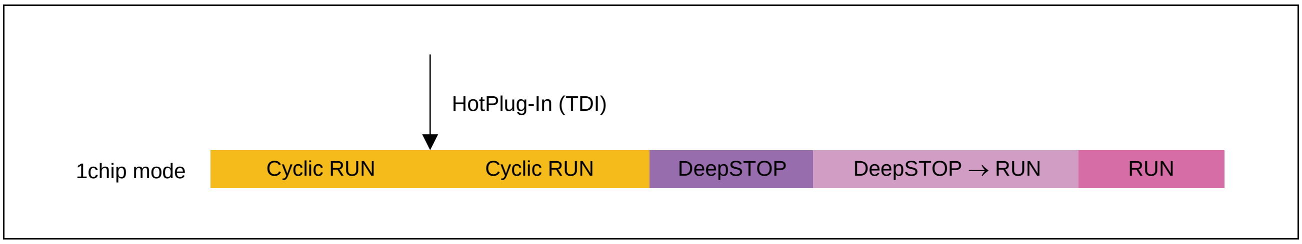

Figure 43.2 Hot Plug-in in Cyclic RUN Mode

43.3.4 Cyclic STOP Mode

When Hot Plug-in has occurred in Cyclic STOP mode, it is necessary to transfer in Cyclic RUN mode.

Then, on the occurrence of wakeup factor of DCUTDI, it is necessary for a transfer to be executed as the same case of Cyclic RUN mode.
The sequence of the time when to enter to OCD mode in Cyclic STOP mode is mentioned below.

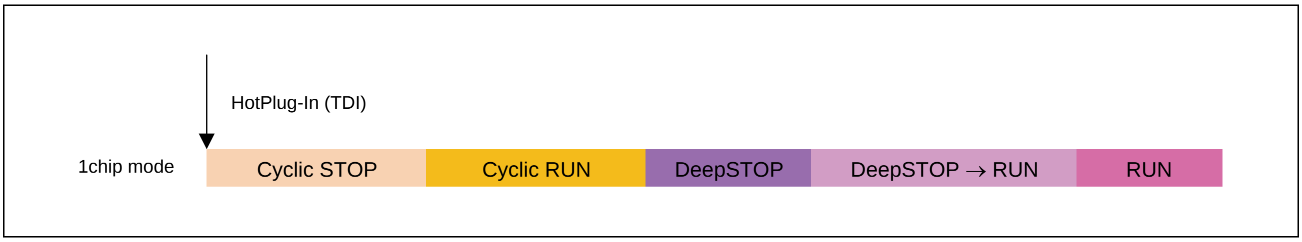

Figure 43.3 Hot Plug-in in Cyclic STOP Mode

43.4 Registers

43.4.1 List of Registers

OCD register is listed in the following table.

Table 43.9 List of Register

Module Name	Register Name	Symbol	Address
—	Emulation peripheral control register	EPC	—

43.4.2 EPC — Emulation Peripheral Control Register

This register stops operation of peripheral functions (timer, serial interface, and A/D converter) in debug mode (SVSTOP).

Access: Accessing from the user program is prohibited.

Address: —

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SVSTOP	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	—	—	—	—	—	—	—	—

Table 43.10 EPC Register Contents

Bit Position	Bit Name	Function
7	Reserved	—
6	SVSTOP	Stops operation of peripheral functions (timer, serial interface, and A/D converter) during debugging. 0: Does not stop operation 1: Stops operation
5 to 0	Reserved	—

NOTE

EPC is set by the debugger. Setting by the user program is prohibited. As for the setting of the debugger, see the user's manual of the debugger.

43.5 Cautions on Using On-Chip Debugging

43.5.1 Treatment of Devices Used for Debugging

Do not install a device that was used for debugging on a mass-produced product, because the flash memory was rewritten during system debugging and thus the write/erase endurance of the flash memory cannot be guaranteed.

43.5.2 Reset Assertion when a Debugger is Connected

If a program in which a reset is asserted at the start of program execution is executed when a debugger is being used, the microcontroller is reset before preparation for communications between the OCD emulator and microcontroller is complete. For this reason, communications may not proceed correctly.

The period of preparation for communications depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer. To ensure that the debugger operates properly when debugging a program in which a reset is asserted at the start of program execution, insert a wait between the start of program and reset assertion.

43.5.3 Restrictions when HS IntOSC is Used as the Main Clock Source Instead of MainOSC

Need to change the debug interface configuration (OPJTAG) to LPD (4 pins) in advance if E1 Emulator is used for debug.

LPD (1 pin) mode cannot be used.

43.5.4 Restrictions when the Writing of OCD_MD and Reset are Occur at the Same Time, or Restrictions when the Writing of MTR (DBG_CTRLP) and Reset are Occur at the Same Time

When the writing of OCD_MD and reset are occur at the same time, or the writing of MTR (DBG_CTRLP) and reset are occur at the same time, it is a possibility of terminal hazard.

If the debugger was disconnected, please reconnect the debugger.

43.5.5 Transition to DeepSTOP Mode when a Debugger is Connected

When a debugger is in use, when a program to transition to DeepSTOP mode is executed immediately following the start of the program, the microcomputer stops power supply to the Isolated area (ISO area) before preparation for communications between the OCD emulator and microcomputer is complete. For this reason, communications may not proceed correctly.

The period of preparation for communications depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer. A wait must be inserted during the period from release from the reset state and transition to DeepSTOP mode by the emulator for correct operation of the debugger when debugging a program to transition to DeepSTOP mode immediately after the program starts.

Section 44 Flash Memory

This section describes the flash memory mounted on RH850/F1KH, RH850/F1KM.

The first part in this section describes the characteristics of the mounted flash memory and the characteristics specific to RH850/F1KH, RH850/F1KM, such as the memory map, flash memory programming, and ECC.

44.1 Features of RH850/F1KH, RH850/F1KM Flash Memory

- Includes code flash memory and data flash memory

  The code flash memory can store program codes and data and has the user area and the extended user area.

  The data flash memory is used for storing data.

- Method of flash memory programming

  Flash memory programming via a serial interface and programming of flash memory by a user program (self-programming) are supported.

- Support for BGO (Back Ground Operation)

  RH850/F1KH-D8, RH850/F1KM-S4:

  - The BGO function allows programs to be executed in the code flash memory while the data flash memory is being programmed/erased.
  - The BGO function allows programs to be executed in the code flash memory while the code flash memory is being programmed/erased. (There are restrictions of programming/erasing area and reading area combination. See **Table 44.6, Conditions under which Background Operation is Usable (RH850/F1KH-D8)** and **Table 44.7, Conditions under which Background Operation is Usable (RH850/F1KM-S4)**).

  RH850/F1KM-S1:

  - The BGO function allows programs to be executed in the code flash memory while the data flash memory is being programmed/erased.

- Flash memory data security
  - Support for security functions to protect against illicit tampering with or reading out of data in the flash memory
  - Support for protection functions to protect against erroneous overwriting of the flash memory

- Option byte function

  RH850/F1KH-D8, RH850/F1KM-S4:

  - Sets the operation after releasing reset for ports, WDTA, CVM, clock divider mode for CPUCLK, FlexRay, Ethernet AVB and $\overline{\text{RESETOUT}}$.

  RH850/F1KM-S1:

  - Sets the operation after releasing reset for ports, WDTA, CVM and $\overline{\text{RESETOUT}}$.

- Support for the error detection/correction function (ECC) in the code flash memory and data flash memory

  Built-in ECC function can detect 2-bit errors and detect/correct 1-bit errors.

- Interrupts can be acknowledged in self-programming mode.

For code flash sizes and data flash sizes of each product, see the following sections.

- **Section 4A.1, Address Space**
- **Section 4B.1, Address Space**
- **Section 4C.1, Address Space**

44.2 Structure of Memory

44.2.1 Mapping of Code Flash Memory

Figure 44.1, Mapping of the Code Flash Memory (RH850/F1KH-D8), **Figure 44.2, Mapping of the Code Flash Memory (RH850/F1KM-S4)**, **Figure 44.3, Mapping of the Code Flash Memory (RH850/F1KM-S1)**, illustrates the mapping of the code flash memory.

The user area of the code flash memory is divided into 8 and 32 KB blocks, which serve as the units of erasure. A single 32 KB block is also incorporated as the extended user area. The user area and extended user area are available as areas for storing the user program.

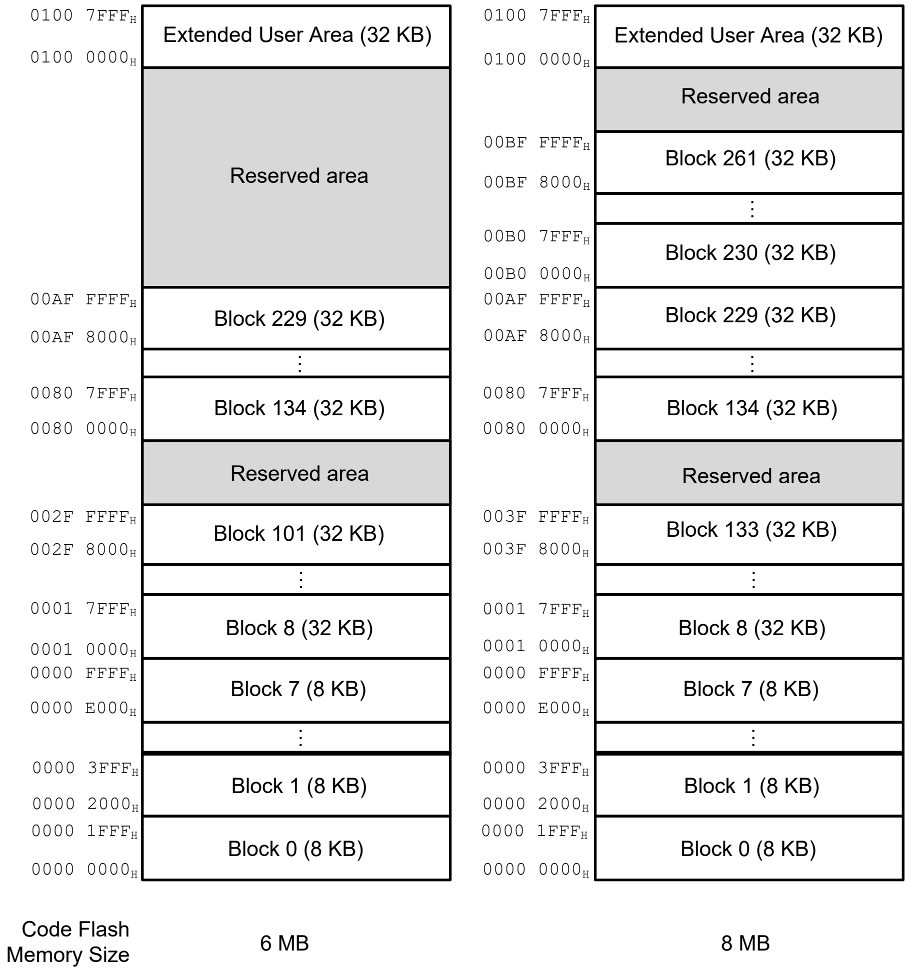

Figure 44.1 Mapping of the Code Flash Memory (RH850/F1KH-D8)

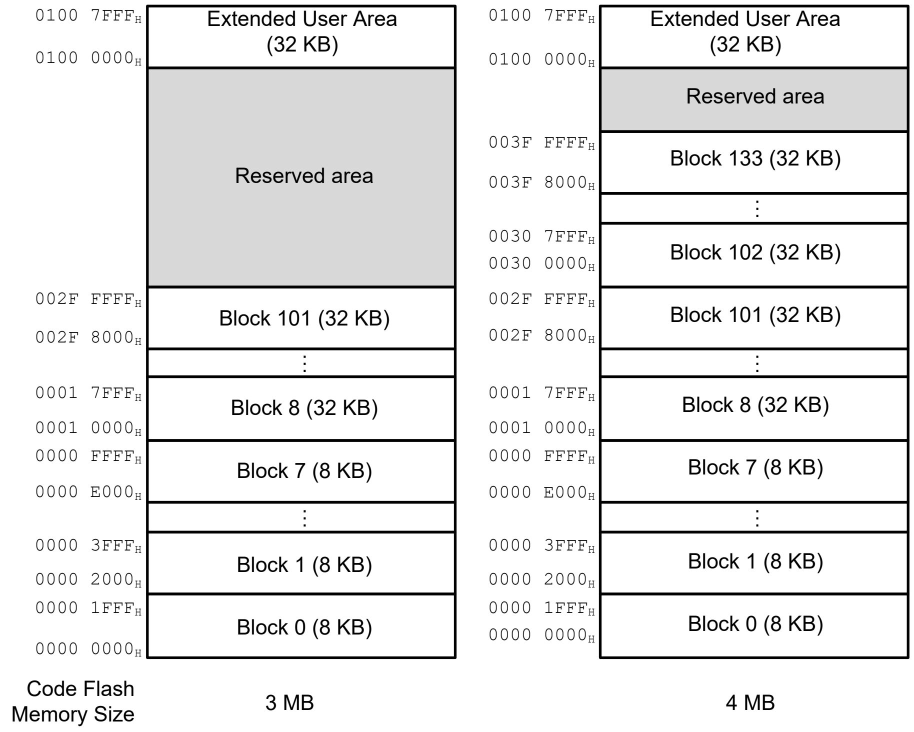

Figure 44.2 Mapping of the Code Flash Memory (RH850/F1KM-S4)

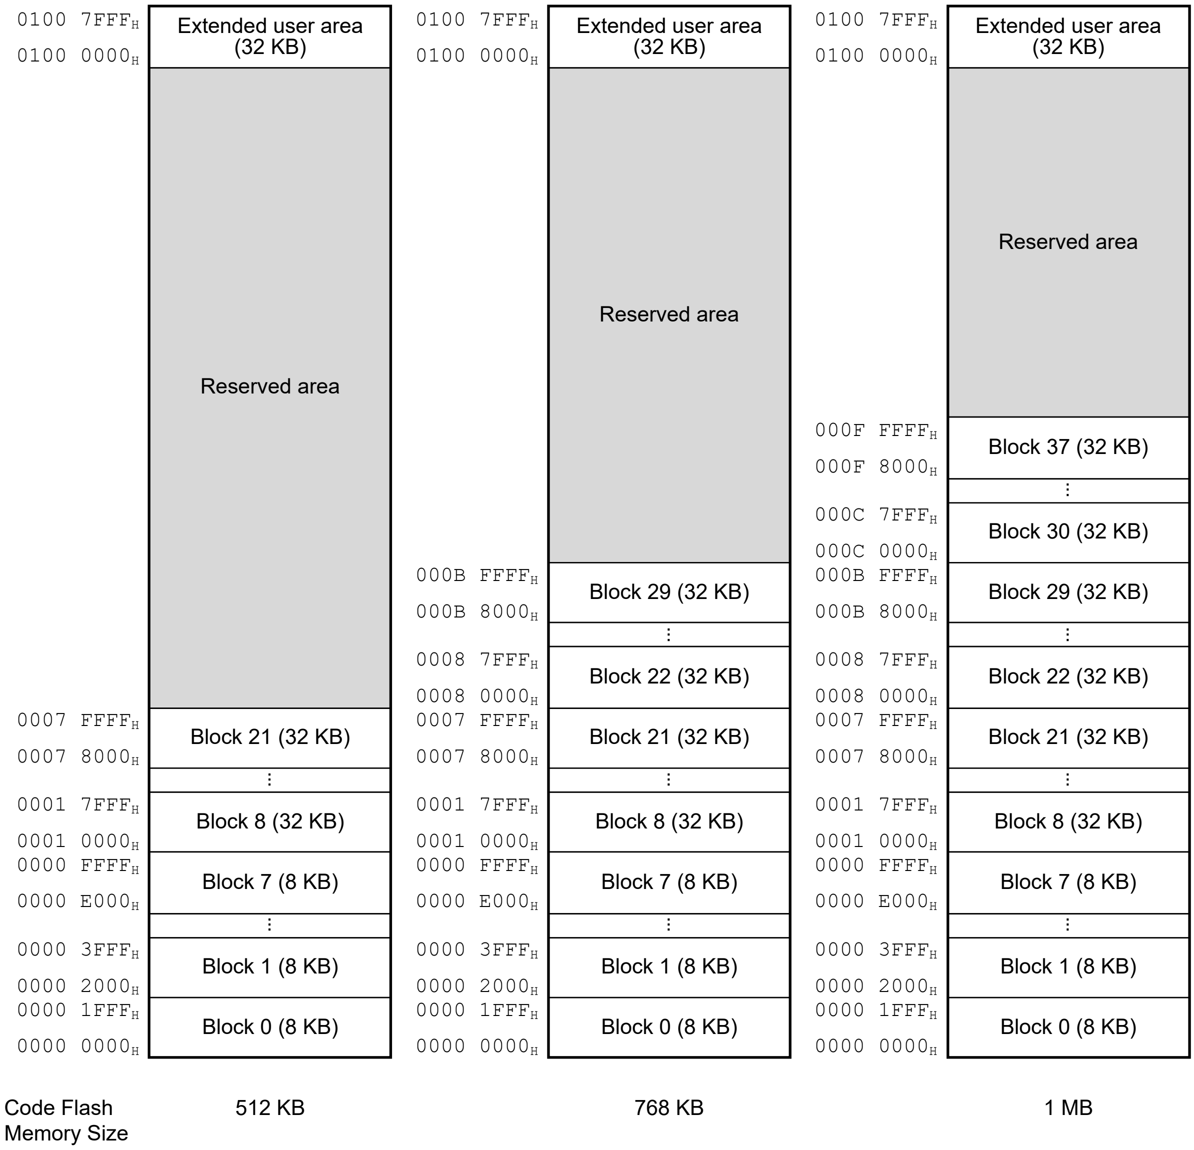

Figure 44.3 Mapping of the Code Flash Memory (RH850/F1KM-S1)

44.2.2 Mapping of Data Flash Memory

The data area of the data flash memory is divided into 64-byte blocks, with each being a unit for erasure. **Figure 44.4, Mapping of the Data Flash Memory (RH850/F1KH-D8)**, **Figure 44.5, Mapping of the Data Flash Memory (RH850/F1KM-S4)**, **Figure 44.6, Mapping of the Data Flash Memory (RH850/F1KM-S1)** shows the mapping of the data flash memory.

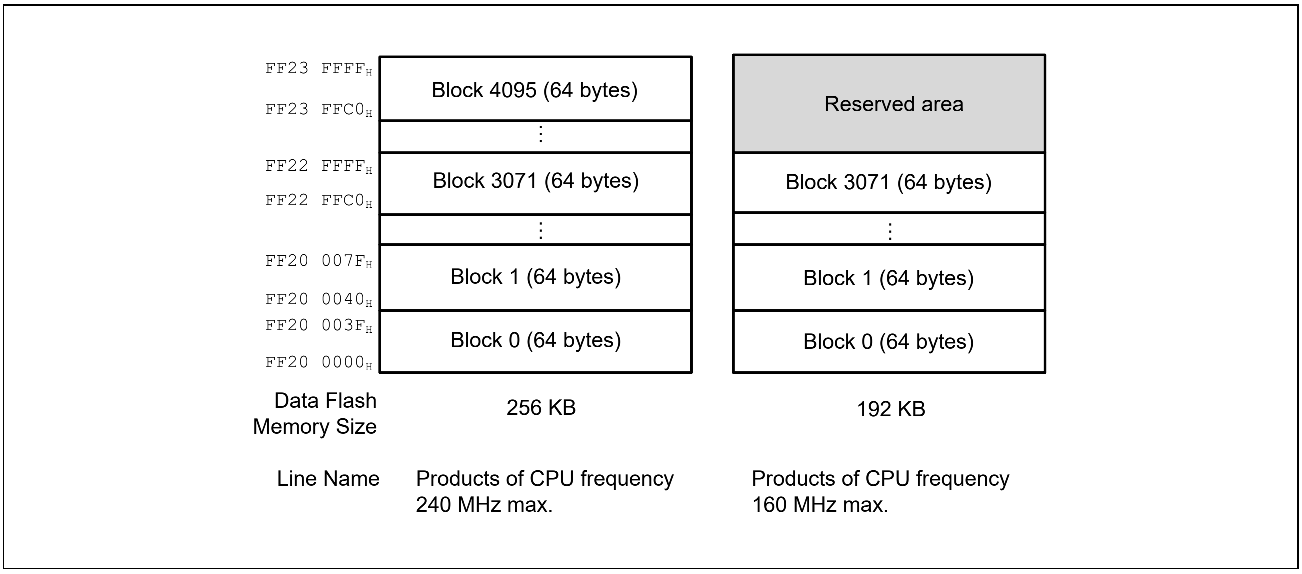

Figure 44.4 Mapping of the Data Flash Memory (RH850/F1KH-D8)

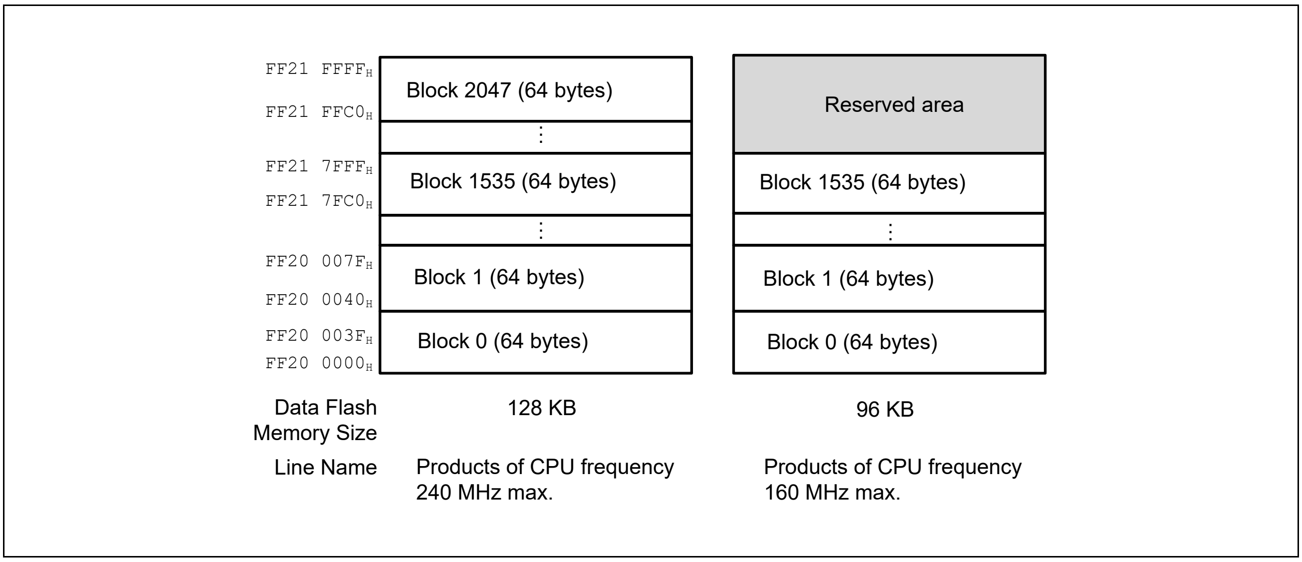

Figure 44.5 Mapping of the Data Flash Memory (RH850/F1KM-S4)

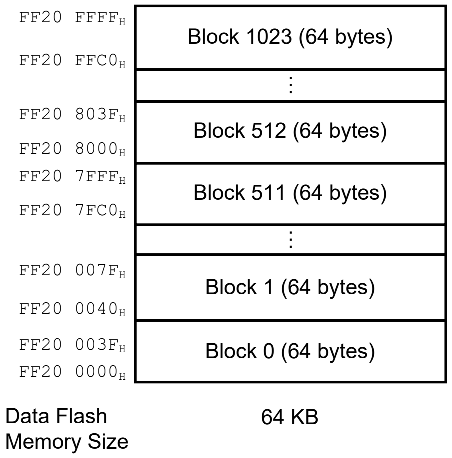

Figure 44.6 Mapping of the Data Flash Memory (RH850/F1KM-S1)

44.3 Operating Modes Associated with Flash Memory

Figure 44.7, Mode Transition Associated with Flash Memory is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, see **Section 6, Operating Mode**.

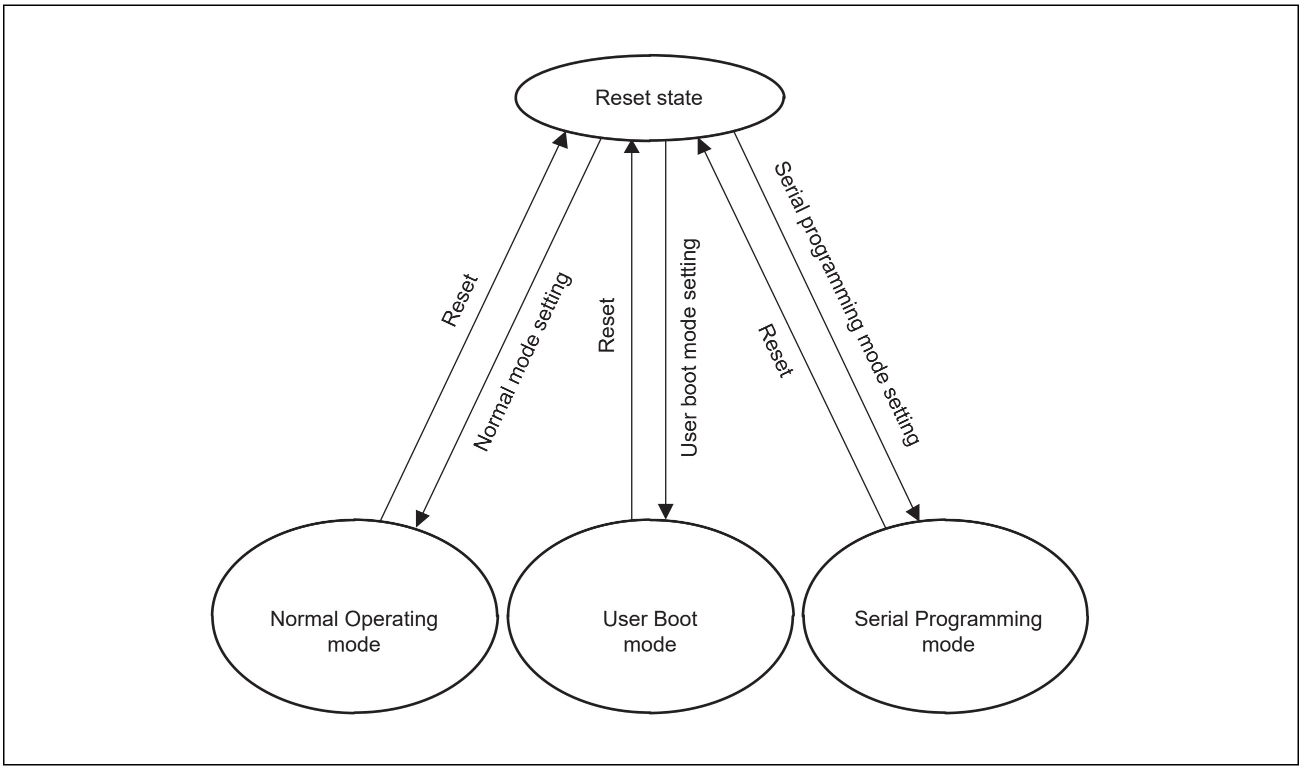

Figure 44.7 Mode Transition Associated with Flash Memory

Table 44.1, Programmable and Erasable Area in Each Mode and the Boot Program after Reset Release shows the flash memory area which is programmable and erasable in each mode and the boot program after reset release.

Table 44.1 Programmable and Erasable Area in Each Mode and the Boot Program after Reset Release

Item	Normal Operating Mode	User Boot Mode	Serial Programming Mode
Programmable and erasable area	• User area • Extended user area • Data area	• User area • Data area	• User area • Extended user area • Data area
Boot program after reset release	Program in user area or extended user area (Changeable by using the variable reset vector)	Program in extended user area. (Reset vector is 0100 0000_H)	Firmware program for serial programming

44.4 Functions

44.4.1 Functional Overview

The flash memory can be updated via a serial interface by a dedicated flash memory programmer (serial programming), before being mounted on the target system or on a flash adapter system.

Furthermore, security functions to prohibit updating of the user program written in the flash memory are incorporated, and this can prevent tampering by third parties.

Programming by the user program (self-programming) is suited for applications where the target system program may require updating after deployed to the end user. Protection features for the safe rewriting of the flash memory are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as external communications, etc., and this allows programming under various conditions. **Table 44.2, Methods of Programming** gives an overview of the methods of programming and the corresponding operating modes.

Table 44.2 Methods of Programming

Method of Programming	Description	Operating Mode
Serial programming	A dedicated flash memory programmer allows on-board programming of the flash memory after the device is mounted on the target system.	Serial programming mode
	A dedicated flash memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system.	
Self-programming	The user program that is written to code flash memory in advance by serial programming also allows updating the flash memory. The background operation capability makes it possible to fetch instructions or otherwise read data in code flash memory while the data flash memory is self-programming. For this reason, it is possible to update the data flash memory by executing a program written to the code flash memory. RH850/F1KH-D8, RH850/F1KM-S4: In addition, when the specific conditions of the code flash memory range for updating and the code flash memory range for reading are satisfied, the background operation can be used. (see **Table 44.6, Conditions under which Background Operation is Usable (RH850/F1KH-D8)**, **Table 44.7, Conditions under which Background Operation is Usable (RH850/F1KM-S4)**). In this case, the code flash memory can be update using the instructions for programming in the code flash memory by self-programming. When background operation cannot be used, instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being updated by self-programming. In such cases, a program for updating must be transferred to the internal RAM in advance and executed. RH850/F1KM-S1: Instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being updated by self-programming. In such cases, a program for updating must be transferred to the local RAM in advance and executed.	Normal operating mode User boot mode

Renesas provides a library for self-programming. For details on this library, see the user's manuals for the code flash library and data flash library of this device.

Table 44.3, Basic Functions at a Glance lists the functions of the flash memory. Dedicated flash memory programmer commands enable serial programming, while reading of the flash memory by a library function or the user program enables self-programming.

Table 44.3 Basic Functions at a Glance

Function	Description	Level of Support (✓: Supported, Δ: Conditionally Supported, —: Not Supported)	
		Serial Programming	Self-Programming
Blank checking	This is used to check a specified block to ensure that writing to it has not already proceeded. Results of reading from code flash memory and data flash memory to which nothing has been written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	✓	Δ (Only data flash is supported)
Block erasure	This is for erasing the contents of a specified block of memory.	✓	✓
Programming	This is for writing to a specified address.	✓	✓
Verification and checksum	Data that are read out from flash memory are compared with data transferred from the flash memory programmer.	✓	— (Reading of data by the user program is possible)
Reading	Data that have been written to the flash memory are read out.	✓	✓
Setting for OTP (one-time programming)	A specified block of code flash memory is set for OTP (OTP can only be set, that is, it is not possible to release a block's OTP setting).	✓	✓
Setting an ID	An ID setting is made for use in controlling the connection of a dedicated flash memory programmer for serial programming, controlling of the on-chip debugger, and programming of the code flash memory by self-programming. In the initial state of the product at shipment, the ID codes are FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF$_H$.	✓	✓
Security settings	Security settings are for use in serial programming.	✓	Δ (Only when setting is prohibited after being permitted)
Protection settings	Settings for block protection of code flash memory and variable reset vector are provided.	Δ (Setting of the reset vector values for variable reset vector function is not supported.)	✓
Setting of option bytes	Option bytes are set to change them from the initial values.	✓	✓
Clearing the configuration	ID setting, security settings, protection settings, and option byte settings are initialized. Execution of the configuration clear command is prohibited in the following cases: ● The lock bit is set to one of blocks. ● One block of a code flash and a data flash is not blank. ● Prohibited by security function (**Table 44.4, Summary of Security Functions**)	✓	—

For details on serial programming, see the user's manual of the flash programmer.

For details on self-programming, see the user's manuals for the code flash library and data flash library of this device.

The flash memory supports various security functions.

The OTP setting and authentication of the ID code are security functions for use with serial programming and self-programming.

In serial programming, authentication of the ID code, prohibiting connection of a dedicated flash memory programmer, and prohibition of commands (for block erasure, programming, and reading) are available for use as security functions.

The security functions supported by the flash memory are listed in **Table 44.4, Summary of Security Functions**.

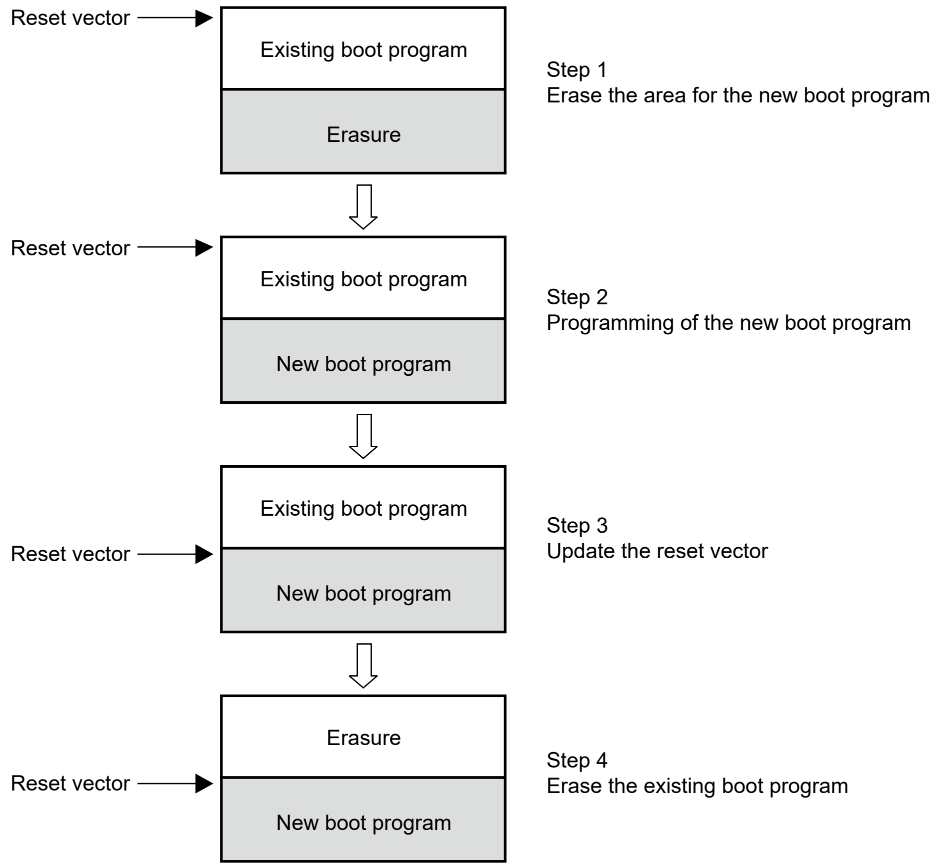
Table 44.4 Summary of Security Functions

Function	Description
OTP	OTP can be individually set for each block of the user area and the extended user area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self-programming is prohibited. Once set, the OTP setting cannot be released. Furthermore, since execution of the configuration clearing command is prohibited for any area for which OTP has been set, changing a security setting from “prohibited” to “permitted” is not possible.
ID authentication	The result of ID authentication can be used to control the connection of a dedicated flash memory programmer for serial programming. The result of ID authentication can also be used to control enabling of self-programming.
Prohibition of connection of a dedicated flash memory programmer	The connection of a dedicated flash memory programmer for serial programming is prohibited. Since execution of the configuration clearing command is also prohibited when the connection of a dedicated flash memory programmer is prohibited, changing a security setting from “prohibited” to “permitted” is not possible.
Prohibition of block erasure commands	Block erasure commands at the time of serial programming are prohibited. Since execution of the configuration clearing command is also prohibited when block erasure commands are prohibited, changing a security setting from “prohibited” to “permitted” is not possible.
Prohibition of programming commands	Block erasure commands and programming commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.
Prohibition of read commands	Read commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.

The flash memory supports various protection functions. The protection functions supported by the flash memory are listed in **Table 44.5, Summary of Protection Functions**.

Table 44.5 Summary of Protection Functions

Function	Description
Block protection	Lock bit settings can be individually made to enable or disable programming and erasure of each block of the user area and the extended user area of code flash memory. Programming and erasure by self-programming of an area for which the lock bit is set and the lock bit function is enabled are prohibited. Programming or erasure can proceed again when the lock bit function is disabled after having been enabled. When a block of code flash memory is erased, the lock bit for that block is also erased.
Hardware protection	The level on the FLMD0 pin can be set to prohibit programming and erasure of the code flash memory. – FLMD0 = 0: Programming prohibited – FLMD0 = 1: Programming permitted
Variable reset vector	The protection settings include control of the reset vector. As shown in **Figure 44.8, Utilizing the Variable Reset Vector Function to Update the Boot Program**, after programming of a new boot program while leaving the existing boot program in place, changing the reset vector is a safe way to change to the area holding the new boot program. The areas that can be specified by using the reset vector are the user area and extended user area.



Note: After step 4, a reset leads to updating of the reset vectors for which RBASE is changed.

Figure 44.8 Utilizing the Variable Reset Vector Function to Update the Boot Program

44.5 Serial Programming

A dedicated flash memory programmer can be used to handle flash memory in serial programming mode.

Serial Programming

The microcontroller is mounted on the system board at the time of serial programming. Providing a connector to the board enables handling of the microcontroller by the flash memory programmer to proceed.

44.5.1 Environments for Programming

The recommended environments for handling the flash memory of the microcontroller with data are described below.

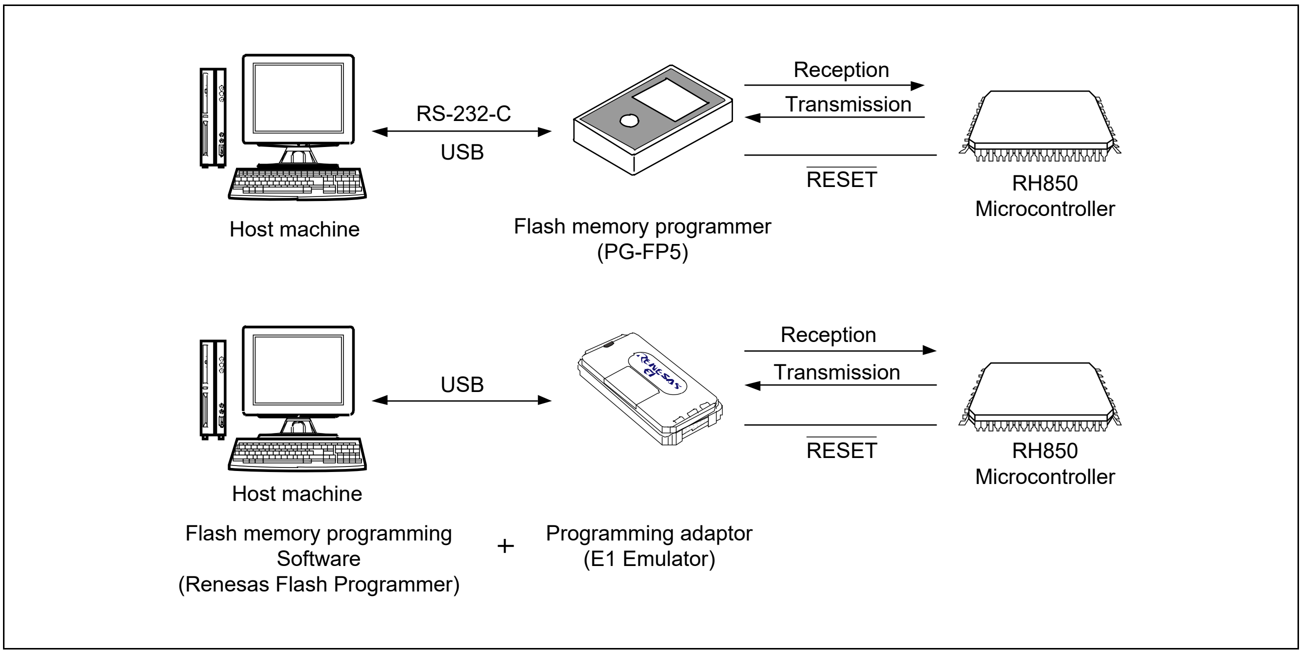


Figure 44.9 Environments for Handling Programs of the Flash Memory

By using the PG-FP5 flash memory programmer or the combination of the Renesas Flash Programmer (software for writing to flash memory) running on the host machine and the E1 emulator as an programming adaptor, the user is easily able to erase, program, and verify the contents of the on-chip memory of flash-memory-equipped microcontrollers from Renesas Electronics.

The PG-FP5 flash memory programmer handles programming from a host machine or programming in stand-alone mode while the Renesas Flash Programmer only handles programming from a host machine.

NOTE

For details on the PG-FP5, see *the PG-FP5 Flash Memory Programmer User's Manual*. For details on the Renesas Flash Programmer of flash programming software, see *the Renesas Flash Programmer Flash Programming Software User's Manual*.

44.6 Communication Modes

44.6.1 Asynchronous Flash Programming Interface — 1-Wire UART

The single-wire asynchronous serial programming interface, 1-wire UART is connected to the flash memory programmer with the following port.

- FPDR (JP0_0): Receive data input/transmit data output

44.6.2 Asynchronous Flash Programming Interface — 2-Wire UART

The double-wire asynchronous serial programming interface, 2-wire UART is connected to the flash memory programmer with the following ports.

- FPDR (JP0_0): Receive data input
- FPDT (JP0_1): Transmit data output

44.6.3 Synchronous Flash Programming Interface CSI

The synchronous serial programming interface CSI is connected to the flash memory programmer with the following ports.

- FPDR (JP0_0): Receive data input
- FPDT (JP0_1): Transmit data output
- FPCK (JP0_2): Serial clock input

The flash memory programmer outputs the serial data clock SCK, and the microcontroller operates as a slave.

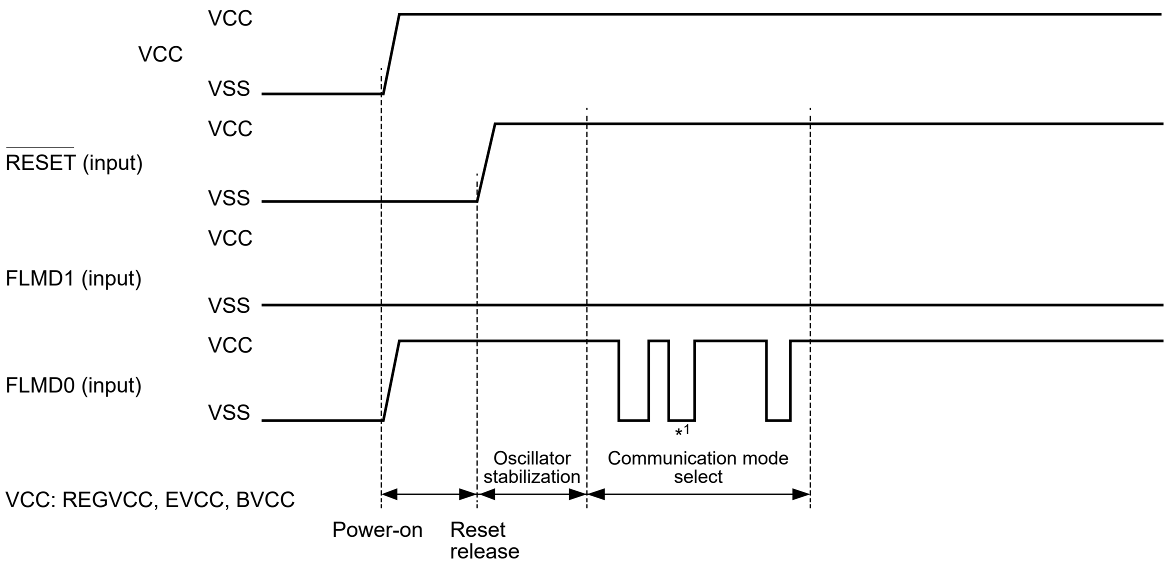
NOTE

For details on Renesas Flash Programmer, see *the Renesas Flash Programmer Flash Programming Software User's Manual*.

44.6.4 Selection of Communication Method

The communication method can be selected by pulse input to the FLMD0 pin (up to 7 pulses) after transition to the flash memory programming mode. The FLMD0 pulse is generated by a dedicated flash memory programmer.

Figure 44.10, Selection of Communication Method shows the relation between the number of pulses and communication method.



Note 1. The number of clock cycles to be inserted depends on the communication method as in the following table.

FLMD0 Pulse	Communication Method
0	2-wire UART
7	1-wire UART
3	CSI
Other than above	Setting prohibited

Figure 44.10 Selection of Communication Method

44.7 Self-Programming

44.7.1 Outline

The RH850/F1KH and RH850/F1KM supports programming of the flash memory by the user program itself. Renesas Electronics provides a code flash library and a data flash library for use with user programs. These libraries can be used for writing to the code flash memory and to the data flash memory.

When the data flash memory is programmed, the background operation facility makes it possible to execute a programming program from the code flash memory to program the data flash memory. Furthermore, the programming program can be copied to internal RAM in advance of the programming operation, and executed from the given destination to perform the programming.

In addition, when the specific conditions of the code flash memory range for updating and the code flash memory range for reading are satisfied, the background operation can be used. (see **Table 44.6, Conditions under which Background Operation is Usable (RH850/F1KH-D8)**, **Table 44.7, Conditions under which Background Operation is Usable (RH850/F1KM-S4)**, **Table 44.8, Conditions under which Background Operation is Usable (RH850/F1KM-S1)**). In this case, the code flash memory can be update using the instructions for programming in the code flash memory by self-programming. The programming program can also be copied to the internal RAM in advance and executed to program the code flash memory.

When background operation cannot be used, the programming program can be copied to the internal RAM in advance and executed to program the code flash memory.

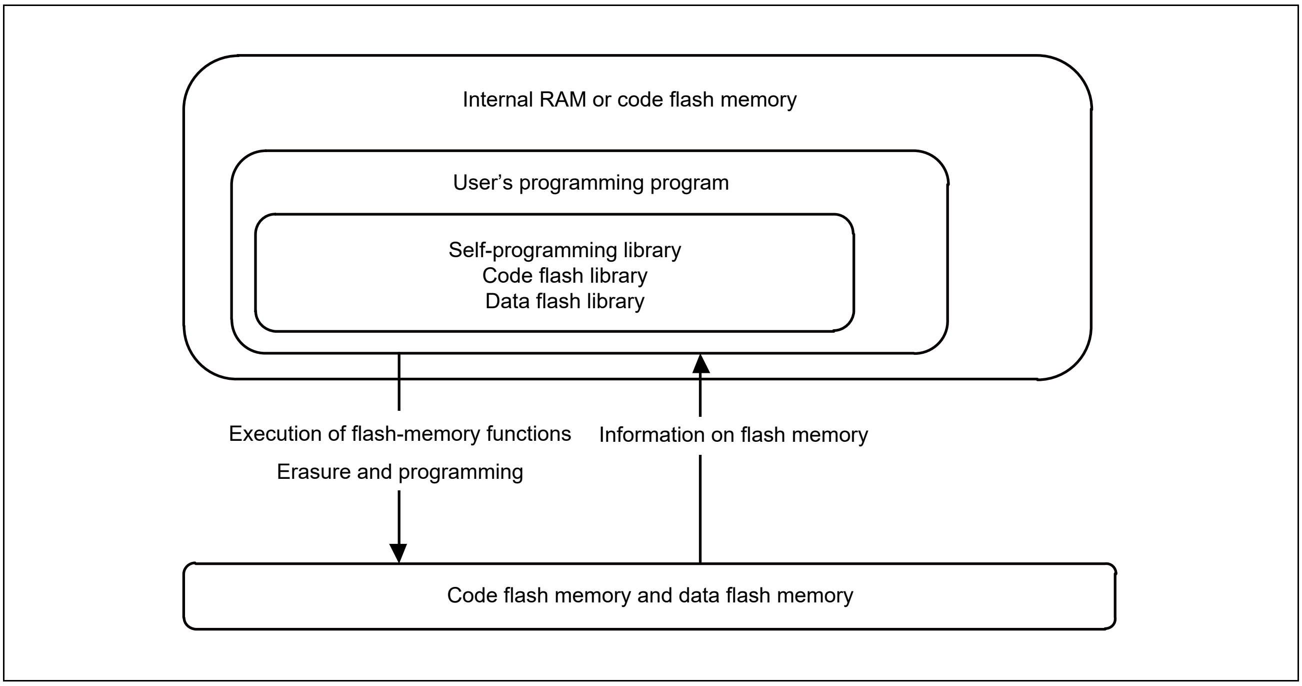


Figure 44.11 Schematic View of Self-Programming

For details on the self-programming of flash memory, see the user's manuals for the code flash and data flash libraries for this device.

44.7.2 Background Operation

Background operations can be used when the combination of the flash memory for writing and the flash memory for reading is any of those listed below.

Table 44.6 Conditions under which Background Operation is Usable (RH850/F1KH-D8)

		Writing					
		[FLI0] Address: 0000 0000$_H$ to 001F FFFF$_H$	[FLI1] Address: 0020 0000$_H$ to 003F FFFF$_H$ (Code Flash 8 MB), 0020 0000$_H$ to 002F FFFF$_H$ (Code Flash 6 MB)	[FLI2] Address: 0080 0000$_H$ to 009F FFFF$_H$	[FLI3] Address: 00A0 0000$_H$ to 00BF FFFF$_H$ (Code Flash 8 MB), 00A0 0000$_H$ to 00AF FFFF$_H$ (Code Flash 6 MB)	Extended User Area*[1]	Data Flash Memory
Reading	[FLI0] Address: 0000 0000$_H$ to 001F FFFF$_H$	—	✓	✓	✓	—	✓
	[FLI1] Address: 0020 0000$_H$ to 003F FFFF$_H$ (Code Flash 8 MB), 0020 0000$_H$ to 002F FFFF$_H$ (Code Flash 6 MB)	✓	—	✓	✓	✓	✓
	[FLI2] Address: 0080 0000$_H$ to 009F FFFF$_H$	✓	✓	—	✓	✓	✓
	[FLI3] Address: 00A0 0000$_H$ to 00BF FFFF$_H$ (Code Flash 8MB), 00A0 0000$_H$ to 00A0 FFFF$_H$ (Code Flash 6MB)	✓	✓	✓	—	✓	✓
	Extended User Area	—	✓	✓	✓	—	✓
	Data Flash Memory	—	—	—	—	—	—

Note: ✓: possible, —: not possible

Note 1. Extended user area cannot be written in User Boot mode.

Range for Writing	Range for Reading
Data flash memory	Code flash memory

44.7.3 Enabling Self-Programming

The self-programming function can be activated in normal operating mode and user boot mode.

Erasure and programming of the code flash memory by the self-programming function is enabled by making the FLMD0 pin high level.

This prevents unnecessary overwriting of the program if the device operates incorrectly.

The FLMD0 pin is made high level by using one of the following methods.

- The FLMD0 pin is externally pulled up.
- The FLMD0 pin is pulled up by the FLMDCNT register.

The outline of the FLMDCNT register is described in **Section 44.7.3.1, FLMDCNT Register**.

Table 44.9 List of Register

Module Name	Register Name	Symbol	Address
FLMD	FLMDCNT register	FLMDCNT	FFA0 0000_H

44.7.3.1 FLMDCNT Register

This register specifies the internal pull-up or pull-down of the FLMD0 pin.

The correct write sequence using the FLMDPCMD register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFA0 0000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	FLMDPUP	FLMD0 Pin Software Control 0: Pull-down selected 1: Pull-up selected

44.8 Reading Flash Memory

44.8.1 Reading Code Flash Memory

Special settings are not required to read code flash memory in normal mode. Data can simply be read out through access to addresses in the code flash memory.

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception.

44.8.2 Reading Data Flash Memory

Configure the number of read cycles in the EEPRDCYCL register prior to reading data from data flash memory in normal mode. Once this register is properly configured, data can be read by simply accessing addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programmed again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

Table 44.11 List of Registers

Module Name	Register Name	Symbol	Address
DCIB	Data flash wait cycle control register	EEPRDCYCL	FFC5 9810_H

44.8.2.1 EEPRDCYCL — Data Flash Wait Cycle Control Register

This register is used to specify the number of wait cycles to be inserted when reading the data in the data flash.

Set the number of wait cycles to be inserted in the clock cycle when reading the data flash according to the operating clock frequency of the CPU (f_{CPUCLK}).

Access:	This register can be read or written in 8-bit units.
Address:	FFC5 9810_H
Value after reset:	$0F_H$

Bit	7	6	5	4	3	2	1	0

NOTES

1. The read access time to the data flash is calculated by the number of wait cycles.
   RH850/F1KH-D8, RH850/F1KM-S4:
   Read access time to the data flash = {20 + (Number of wait cycles × 8)} / CPU operating frequency
   (CKDIVMD = 1, including products of CPU frequency 160 MHz max.)
   Read access time to the data flash = {20 + (Number of wait cycles × 4)} / CPU operating frequency
   (CKDIVMD = 0)
   RH850/F1KM-S1:
   Read access time to the data flash = {17 + (Number of wait cycles × 4)} / CPU operating frequency
   However, the time may be changed depending on the combination of instructions before and after the execution.
2. ✓ indicates the number of wait cycles that can be set.

44.8.2.2 PRDNAMEn — Product Name Storage Register (n = 1 to 3)

This register stores the product name. The product part name is stored in 16-byte ASCII code, and PRDNAME1, PRDNAME2, and PRDNAME3 correspond to the fourth to first bytes, eighth to fifth bytes, and twelfth to ninth bytes of the product part name respectively.

Access: These registers are read-only registers that can be read in 32-bit units.

Address: PRDNAME1: FFCD 00D0$_H$

PRDNAME2: FFCD 00D4$_H$

PRDNAME3: FFCD 00D8$_H$

Value after reset: See **Table 44.14, List of Registers Related to Product Information (Products of CPU frequency 240 MHz max.) (RH850/F1KH-D8)**, **Table 44.16, List of Registers Related to Product Information (Products of CPU frequency 240 MHz max.) (RH850/F1KM-S4)**, and **Table 44.18, List of Registers Related to Product Information (RH850/F1KM-S1)**.

44.8.2.3 CHIPIDnXX — Chip ID Register (n = 1, 2, XX = LL, LH, HL, HH)

The RH850/F1KH and RH850/F1KM provides the option of a unique chip ID of the device.

Access: These registers are read-only registers that can be read in 32-bit units.

Address: CHIPID1LL: FFCD $00E0_H$
CHIPID1LH: FFCD $00E4_H$
CHIPID1HL: FFCD $00E8_H$
CHIPID1HH: FFCD $00EC_H$
CHIPID2LL: FFCD $00F0_H$
CHIPID2LH: FFCD $00F4_H$
CHIPID2HL: FFCD $00F8_H$
CHIPID2HH: FFCD $00FC_H$

Value after reset: Unique value

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. n = 1, 2
XX = LL, LH, HL, HH

44.9 Option Bytes

The option bytes of the flash memory are an expansion area and hold data specified by the user for a variety of purposes. Initial settings for peripheral modules and so on as specified by the option bytes become effective on release from the reset state. **Table 44.19, Value of Shipping (RH850/F1KH-D8)**, **Table 44.20, Value of Shipping (RH850/F1KM-S4, RH850/F1KM-S1)** shows the value of shipping.

Table 44.19 Value of Shipping (RH850/F1KH-D8)

Option Byte	Value
Option byte 0	FA27 FFCF$_H$
Option byte 1	FFFF FDF4$_H$

Table 44.20 Value of Shipping (RH850/F1KM-S4, RH850/F1KM-S1)

Option Byte	Value
Option byte 0	FA27 FFCF$_H$
Option byte 1	FFFF FDFF$_H$

44.9.1 Option Byte Setting

Be sure to set the option byte area that corresponds to the optional functions listed below, before writing a program to the flash memory.

The optional functions specified by the option bytes are as follows.

- Function of port group JP0
- Activation code method of WDTA2*[2]
- Start mode of WDTA2*[2]
- Enabling or disabling WDTA2*[2]
- Activation code method of WDTA1
- Start mode of WDTA1
- Enabling or disabling WDTA1
- Activation code method of WDTA0
- Start mode of WDTA0
- Enabling or disabling WDTA0
- Initial value of the overflow interval time for WDTA2*[2], WDTA1 and WDTA0
- Enabling or disabling of $\overline{\text{RESETOUT}}$
- Enabling the high voltage monitor
- Enabling the low voltage monitor
- Clock divider mode for CPUCLK*[1]
- Enabling or disabling FlexRay*[1]
- Enabling or disabling Ethernet AVB 0*[1]
- Enabling or disabling Ethernet AVB 1*[2]
- Enabling or disabling PE2*[2]
- Enabling or disabling PE2 Boot*[2]

Note 1. This function is not supported in RH850/F1KM-S1.

Note 2. This function is supported in RH850/F1KH-D8.

44.9.2 OPBT0 — Option Byte 0

The settings and bit positions of the option bytes are listed below.

For details on how to set an option byte, see the user’s manual of the flash programmer for serial programming as well as the code flash library for self-programming.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	OPJTAG[1:0]		—	—	WDT 1_3	—	WDT 1_1	WDT 1_0	WDT 0_3	—	WDT 0_1	WDT 0_0	WDT_2	WDT_1	WDT_0

	—	—	—	—	—	—	—	—	—	—	—	SIDAM	WDT2_3	—	WDT2_1	WDT2_0

Table 44.22 Option Byte 1 Settings

Bit Position	Bit Name	Function
31 to 10	Reserved	When writing, write "1".
9	Reserved	When writing, write "0".
8 to 5	Reserved	When writing, write "1".
4	SIDAM	Self-Programming ID Authentication Mode 0: Self-Programming ID Authentication is NOT necessary for code flash memory programming and configuration setting for reset vector. 1: Self-Programming ID Authentication is necessary for code flash memory programming and configuration setting for reset vector.
3	WDT2_3	RH850/F1KH-D8: Specifies the activation code method of WDTA2. 0: Fixed activation code 1: Variable activation code RH850/F1KM-S4, RH850/F1KM-S1: When writing, write "1".
2	Reserved	When writing, write "1".
1	WDT2_1	RH850/F1KH-D8: Specifies the start mode of WDTA2. 0: Software trigger start mode 1: Default start mode RH850/F1KM-S4, RH850/F1KM-S1: When writing, write "1".
0	WDT2_0	RH850/F1KH-D8: Enables or disables WDTA2. 0: WDTA2 is disabled 1: WDTA2 is enabled RH850/F1KM-S4, RH850/F1KM-S1: When writing, write "1".

44.10 Usage Notes

(1) Reading areas where Programming or Erasure was Interrupted

When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid the reading out of undefined data, which might cause a malfunction, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.

(2) Reading the Code Flash Memory that has been Erased but Not yet been Programmed Again

Note that reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.

(3) Prohibition of Additional Writing

Writing to a given area two or more times is not possible. When overwriting data in an area of flash memory after writing to the area has been completed, erase the area first.

(4) Resets During Programming and Erasure

In the case of the external reset during programming and erasure, wait for at least the minimum value of $\overline{\text{RESET}}$ input low level width once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.

(5) Allocation of Vectors for Interrupts and Other Exceptions During Programming and Erasure

Generation of an interrupt or other exception during programming or erasure may lead to fetching of the vector from the code flash memory. If this does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.

(6) Abnormal Termination of Programming and Erasure

Even if programming/erasure ends abnormally due to the assertion of a reset by the $\overline{\text{RESET}}$ pin, the programming/erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming/erasure ends abnormally, the blank check function cannot judge whether the area is erased successfully or not. Erase the area again to ensure that the corresponding area is completely erased before using.

If programming and erasure of code flash memory are not completed normally, the lock bit for the target area may be enabled (locked). In such cases, erase the block to erase the lock bit while the lock bit is in the disabled state (the area is not locked).

(7) Items Prohibited During Programming, Erasure and Blank check.

Do not perform the following operations during programming, erasure, and blank check.

- Set the operating voltage from the power supply outside the allowed range.

RH850/F1KH-D8, RH850/F1KM-S4:

- Change the frequency of the peripheral clock.

RH850/F1KM-S1:

- Change of all clock register described in **Section 12C, Clock Controller**.

The following steps have to be applied during writing and/or erasing:

(a) Please do not select the HS IntOSC and EMCLK as clock source when writing and/or erasing the code/data flash. This is also applicable when the HS IntOSC is set as PLL1 source clock.

(b) Please disable CLMA0, and CLMA3. (Set CLMA0CTL0.CLMA0CLME = 0, CLMA3CTL0.CLMA3CLME = 0)

(c) Please disable the LPS (DPEN = 0, ADEN = 0) when writing and/or erasing the code/data flash.

If (a) to (c) above are difficult to apply, please contact your local sales representative.

(8) Erasure of all flash memory before clearing the configuration

Erase the user area of code flash and all of the data area of data flash before clearing the configuration.

(9) Restriction on Serial Programming when HS IntOSC is Used

RH850/F1KH-D8, RH850/F1KM-S4:

- 1-wire/2-wire UART mode cannot be used.
- The E1 emulator cannot be used.

RH850/F1KM-S1:

Please do not select the HS IntOSC and EMCLK as clock source during serial programming mode.

When the HS IntOSC and EMCLK are set, there is a possibility that a failure occurs during flash write or flash erase. In case the flash write and flash erase process are finished successfully, the write and erase can be guaranteed.

Section 45 RAM

This section describes the RAM mounted on RH850/F1KH, RH850/F1KM.

45.1 Features of RH850/F1KH, RH850/F1KM RAM

- RH850/F1KH and RH850/F1KM includes the following RAMs:
  - Local RAM (LRAM)
    The local RAM is accessible at high speed. Values in the local RAM are not retained in DeepSTOP mode.
  - Global RAM (GRAM)
    RH850/F1KH-D8:
    The global RAM is used for serving as a source or destination for DMA transfer. The global RAM is divided into banks A and B and parallel access to both banks is possible. Values in global RAM are not retained in DeepSTOP mode.
    RH850/F1KM-S4:
    The global RAM is used for serving as a source or destination for DMA transfer. The global RAM is divided into banks A and B and parallel access to both banks is possible. Values in global RAM are not retained in DeepSTOP mode.
    RH850/F1KM-S1:
    There is no global RAM in RH850/F1KM-S1
  - Retention RAM (RRAM)
    RH850/F1KH-D8:
    The retention RAM is a part of the global RAM (Bank B). Values in the retention RAM are retained in DeepSTOP mode.
    In addition, even if the power-supply voltage (REG0VCC / REG1VCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage (VVLVI).
    RH850/F1KM-S4:
    The retention RAM is a part of the global RAM (Bank B). Values in the retention RAM are retained in DeepSTOP mode.
    In addition, even if the power-supply voltage (REGVCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage (VVLVI).
    RH850/F1KM-S1:
    The retention RAM is a part of the local RAM and is also accessible at high speed. Values in the retention RAM are retained in DeepSTOP mode.
    In addition, even if the power-supply voltage (REGVCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage (VVLVI).

Access time for each RAM is shown in the table below.

Table 45.1 RAM Access Time (RH850/F1KH-D8)

Type of Access	RAM	1st Access (CPUCLK_H)	Continuous Access (CPUCLK_H)
Instruction fetch	Local RAM (own PE)	6	6
	Global RAM	6	6
	Retention RAM	6	6
Read access	Local RAM (own PE)	1	1
	Local RAM (other PE)	6	4
	Global RAM	6	2
	Retention RAM	6	2
Write access	Local RAM (own PE)	1	1
	Local RAM (other PE)	1 (Posted)	3
	Global RAM	1 (Posted)	2 (Posted)
	Retention RAM	1 (Posted)	2 (Posted)

Table 45.2 RAM Access Time (RH850/F1KM-S4)

Type of Access	RAM	1st Access (CPUCLK_H)	Continuous Access (CPUCLK_H)
Instruction fetch	Local RAM	6	6
	Global RAM	6	6
	Retention RAM	6	6
Read access	Local RAM	1	1
	Global RAM	6	2
	Retention RAM	6	2
Write access	Local RAM	1	1
	Global RAM	1 (Posted)	2 (Posted)
	Retention RAM	1 (Posted)	2 (Posted)

Table 45.3 RAM Access Time (RH850/F1KM-S1)

Type of Access	RAM	1st Access (CPUCLK_M)	Continuous Access (CPUCLK_M)
Instruction fetch	Local RAM	5	5
	Retention RAM	5	5
Read access	Local RAM	1	1
	Retention RAM	1	1
Write access	Local RAM	1	1
	Retention RAM	1	1

NOTE

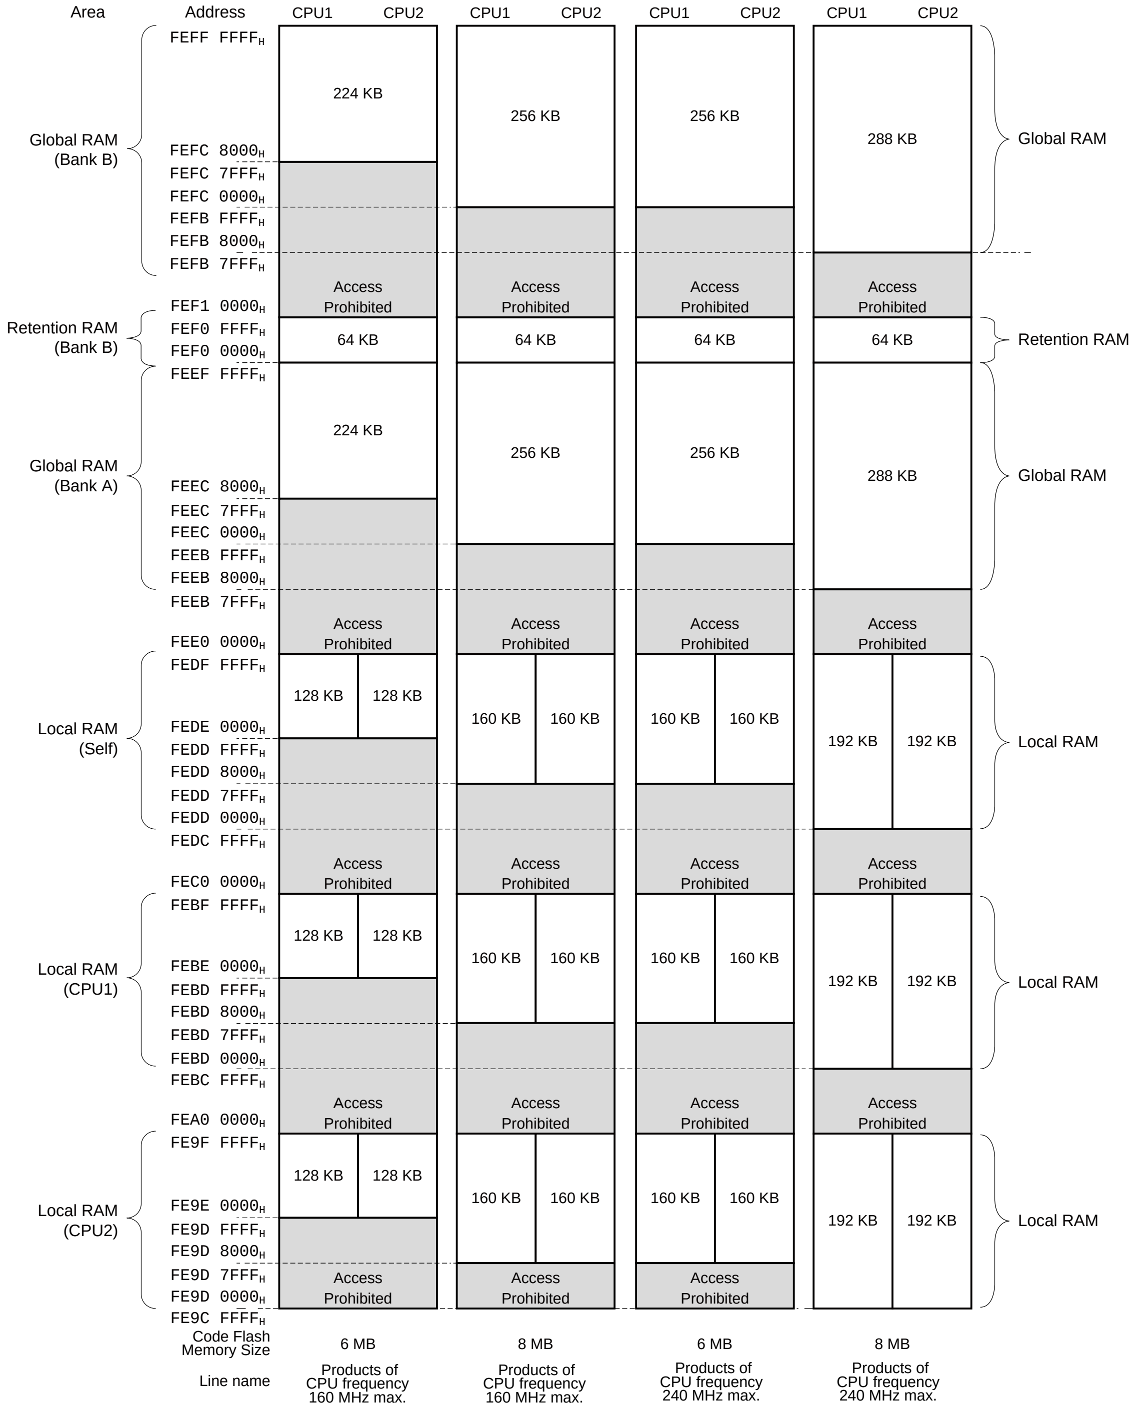
There is possibility that number of access clock of above table is changed depending on the combination before and after instructions.
When RAM access is misaligned, these number is increased.

- Error detection/correction function (ECC) in the local RAM, global RAM and retention RAM

  The ECC function is included, which can detect 2-bit errors and detect/correct 1-bit errors. For details, see **Section 40A, Functional Safety of RH850/F1KH-D8**, **Section 40B, Functional Safety of RH850/F1KM-S4** and **Section 40C, Functional Safety of RH850/F1KM-S1**.

45.2 Memory Configuration

Figure 45.1, Memory Map of the Local RAM, the Global RAM and the Retention RAM (RH850/F1KH-D8), **Figure 45.2, Memory Map of the Local RAM, the Global RAM and the Retention RAM (RH850/F1KM-S4)** and **Figure 45.3, Memory Map of the Local RAM and the Retention RAM (RH850/F1KM-S1)** show the memory map of the local RAM, global RAM and the retention RAM.



Note: Access prohibited area is prohibited, operation is not guaranteed.

45.3 Global RAM Zero Fill (GRZF)

45.3.1 Number of Units

This microcontroller has the following number of GRZF units.

Table 45.4 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	GRZF	GRZF	GRZF

Table 45.5 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	GRZF	GRZF	GRZF	GRZF	GRZF

Table 45.6 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	—	—
Name	—	—	—	—

45.3.2 Register Base Address

GRZF base address is listed in the following table.

GRZF register addresses are given as an offset from the base address in general.

Table 45.7 Register Base Address (RH850/F1KH-D8)

Base Address Name	Base Address
<GRZF_base>	FFC0 3000_H

Table 45.8 Register Base Address (RH850/F1KM-S4)

Base Address Name	Base Address
<GRZF_base>	FFC0 3000_H

45.3.3 Clock Supply

The GRZF clock supply is shown in following table.

Table 45.9 Clock Supply (RH850/F1KH-D8)

Unit Name	Unit Clock Name	Supply Clock Name
GRZF	Unit clock	CPUCLK_H
	Register access	CPUCLK_UL

Table 45.10 Clock Supply (RH850/F1KM-S4)

Unit Name	Unit Clock Name	Supply Clock Name
GRZF	Unit clock	CPUCLK_H
	Register access	CPUCLK_UL

45.3.4 Interrupt Requests

GRZF interrupt requests are listed in the following table:

Table 45.11 Interrupt Request (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number
INTGRZF	Interrupt for GRZF	376

Table 45.12 Interrupt Request (RH850/F1KM-S4)

Unit Interrupt Signal	Description	Interrupt Number
INTGRZF	Interrupt for GRZF	376

45.3.5 Reset Sources

GRZF reset sources are listed in the following table. GRZF is initialized by these reset sources the All reset sources.

Table 45.13 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Sources
GRZF	All reset sources (ISORES)

Table 45.14 Reset Sources (RH850/F1KM-S4)

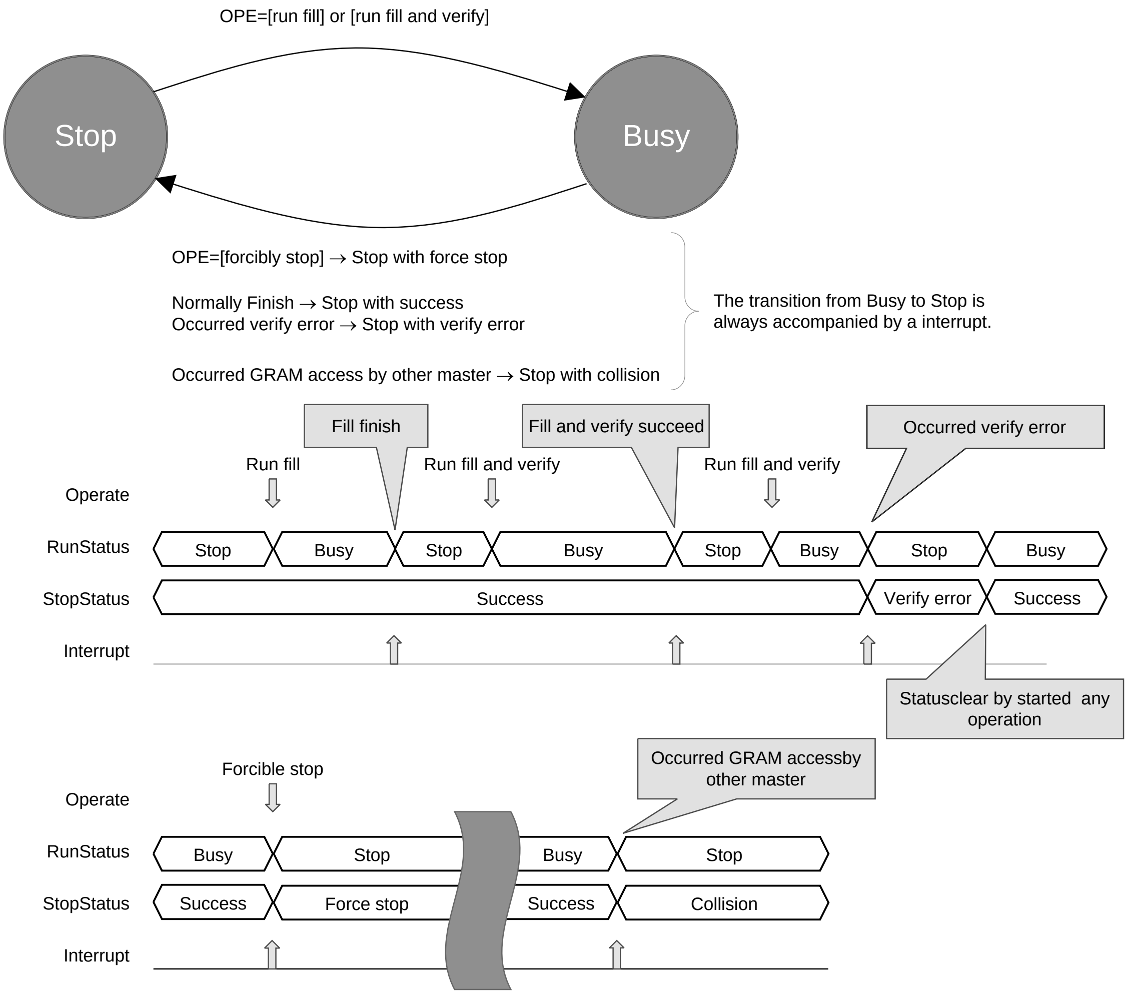
Unit Name	Reset Sources
GRZF	All reset sources (ISORES)

45.3.6 Functional Overview

This function is memory ZERO fill and verify check for GRAM area (including RRAM)

GRZF cannot arbitrate access from other bus-master. So, when GRZF is in busy status, do not access the same bank on GRAM that GRZF is accessing. If other bus-master accesses to the same bank that GRZF is accessing, the operation of GRZF is terminated and INTGRZF occurs with error status. Also, the access of other bus master will not be fulfilled (Writing is ignored, and read data cannot be guaranteed).

Other bus-master can access to the bank that GRZF is not accessing.



Note: ● Necessary cycle@CPUCLK_H base

RH850/F1KH-D8:
- Only fill: size (word) × (2 + WAIT^{*1})
- Fill and verify: size (word) × (4 + 2 x WAIT^{*1})

Note 1. WAIT value depends on GRZFCTL.OPE[5:4] setting with operation start trigger.

RH850/F1KM-S4:
- Only fill: size (word) × 2
- Fill and verify: size (word) × 4

Figure 45.4 The Memory ZERO Fill and Verify Check for GRAM Area (including RRAM) Function

45.3.7 Registers

45.3.7.1 List of Registers

GRZF registers are listed in the following table.

For details about <GRZF_base>, see **Section 45.3.2, Register Base Address**.

Table 45.15 List of Registers

Module Name	Register Name	Symbol	Address
GRZF	GRZF control register	GRZFCTL	<GRZF_base> + 00_H
	GRZF status register	GRZFSTS	<GRZF_base> + 04_H
	GRZF start address setting register	GRZFSA	<GRZF_base> + 08_H
	GRZF fill size setting register	GRZFSZ	<GRZF_base> + $0C_H$

45.3.7.2 GRZFCTL — GRZF Control Register

This register is used to configure various operation settings of the global RAM Zero Fill.

Access: This register is a write-only register that can be written in 32-bit units in RH850/F1KM-S4.

This register can be read or written in 32-bit units in RH850/F1KH-D8.

Address: <GRZF_base> + 00$_\text{H}$

Value after reset: 0000 0000$_\text{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KEY2[7:0]								KEY1[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KEY0[7:0]								OPE[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	R^{*1}/W	R^{*1}/W	W	W	W	W

Note 1. These bits can read in RH850/F1KH-D8.

Table 45.16 GRZFCTL Register Contents

Bit Position	Bit Name	Function
31 to 24	KEY2[7:0]	Must be write fix value(C0$_\text{H}$) if any operation.
23 to 16	KEY1[7:0]	Must be write fix value(FF$_\text{H}$) if any operation.
15 to 8	KEY0[7:0]	Must be write fix value(EE$_\text{H}$) if any operation.
7 to 0	OPE[7:0]	Operation type. 0000 0000$_\text{B}$: forcibly stop 0000 0001$_\text{B}$: run zero fill 0000 0010$_\text{B}$: run zero fill and verify 0001 0001$_\text{B}$: run zero fill wait 1 cycle^{*1} 0001 0010$_\text{B}$: run zero fill and verify wait 1 cycle^{*1} 0010 0001$_\text{B}$: run zero fill wait 2 cycles^{*1} 0010 0010$_\text{B}$: run zero fill and verify wait 2 cycles^{*1} 0011 0001$_\text{B}$: run zero fill wait 3 cycles^{*1} 0011 0010$_\text{B}$: run zero fill and verify wait 3 cycles^{*1} other than above: setting prohibited Execution of these operations, you must write the KEY0-2 at the same time.

Note 1. Bits [5:4] are used to set up the WAIT function in RH850/F1KH-D8.
01$_\text{B}$: Wait 1 cycle CPUCLK_H
10$_\text{B}$: Wait 2 cycles CPUCLK_H
11$_\text{B}$: Wait 3 cycles CPUCLK_H

45.3.7.3 GRZFSTS — GRZF Status Register

This register is the status of the memory ZERO fill performed.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <GRZF_base> + 04_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSTS	—	—	—	—	—	SSTS[1:0]		—	—	—	PSTS[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PSTS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.17 GRZFSTS Register Contents

Bit Position	Bit Name	Function
31	RSTS	Run status 0: Stop 1: Busy
30 to 26	Reserved	When read, the value after reset is returned.
25, 24	SSTS[1:0]	Stop status 00_B: No error 01_B: Forcibly stop 10_B: Stop with verify error 11_B: Stop with collision other bus-master SSTS will be cleared at the next startup
23 to 21	Reserved	When read, the value after reset is returned.
20 to 0	PSTS[20:0]	Progress status (executed address)

NOTE

The value of progress address indicated by the PSTS is not guaranteed, if stopped by the forcibly stop or contention access of other bus master. Please restart without changing value of the start address and size.

45.3.7.4 GRZFSA — GRZF Start Address Setting Register

This register is used to set start address of the memory ZERO fill performed.

Access: This register can be read or written in 32-bit units.

Address: <GRZF_base> + 08_H

Value after reset: FEE0 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFST[10:0]											BANK	START[19:16]			
Value after reset	1	1	1	1	1	1	1	0	1	1	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	START[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Table 45.18 GRZFSA Register Contents

Bit Position	Bit Name	Function
31 to 21	OFST[10:0]	These bits are fixed to $7F7_H$ to indicate the GRAM start address configured when this register is read in 32-bit units.
20	BANK	Target Bank of global RAM 0: BankA 1: BankB (Including retention RAM)
19 to 0	START[19:0]	Target Start Address (bits 9 to 0 is fixed to 0) 1 KB unit

NOTE

This register can be rewritten only when the Stop state. Writing in operation will be ignored.

45.3.7.5 GRZFSZ — GRZF Fill Size Setting Register

This register is used to set fill size of the memory ZERO fill performed

Access: This register can be read or written in 32-bit units.

Address: <GRZF_base> + 0C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	SIZE[19:16]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SIZE[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Table 45.19 GRZFSZ Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 0	SIZE[19:0]	Memory fill size setting (bits 9 to 0 is fixed to 0). Size the actual initialization will be the SIZE + 1 KB.

CAUTIONS

1. This register can be rewritten only when the Stop state. Writing in operation will be ignored.
2. The size setting across BankA and BankB is prohibited.

45.3.8 Operation

This module effects only global RAM bank A and global RAM bank B. The RRAM area belong to global RAM bank B. So this module also effects the RRAM area.

Global RAM Zero Fill (GRZF) consists of the following function:

- FILL function

  Write zero to GRAM

- VERI function
  Write zero to GRAM and verify the data GRAM have been zero

The transition state from Busy state to Stop state always generate the Interrupt request.

The cause for transition from Busy state to Stop state are shown below:

- Success in FILL function to all the target banks.
- Conflict occur when the other master accesses the target bank while running.
- Verify error occur when the RAM area is not zero at VERI function.
- Forcibly stop by GRZFCTL.OPE[7:0] = 0000 $0000_{B.}$

45.3.8.1 Procedure for FILL and VERI Function

The procedure for FILL and VERI function is shown below.

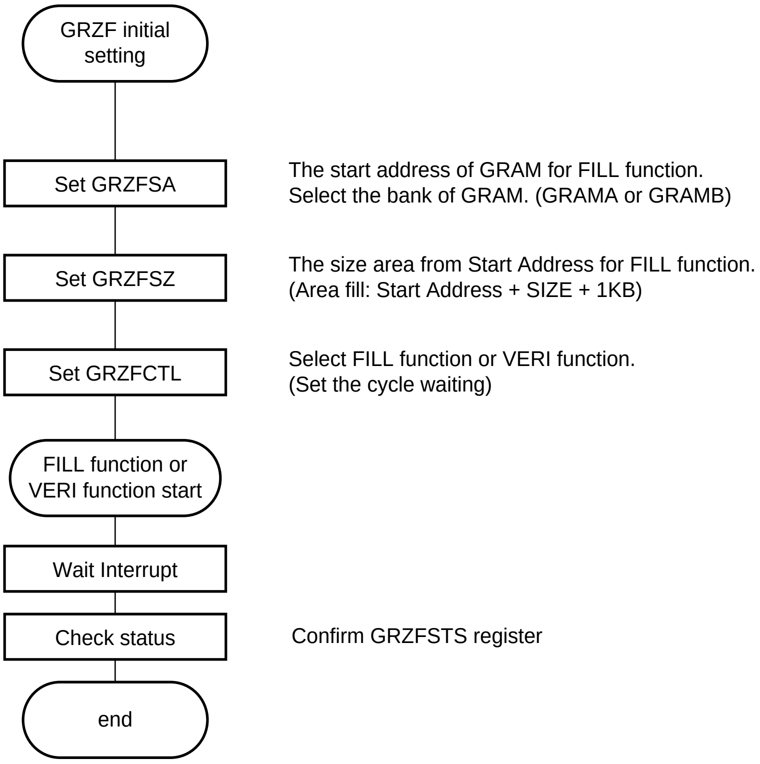


Figure 45.5 FILL and VERI Flow

45.3.8.2 Interrupt Sources

GRZF can generate the following interrupt requests:

- The interrupt occurs when transition from Busy to Stop in both FILL function and VERI function.
- When an interrupt occurred, the source of the interrupt is identified by checking GRZFSTS.SSTS. This status flag holds the value until the next startup (accordingly, does not change when the GRZF module transition from Busy to Stop).

45.4 Usage Notes

- Before accessing the global, local or retention RAM with ECC error detection and correction enabled, initialize the RAM by setting the access size to the largest bit length.
- Accessing the RAM before initializing it may lead to the detection of ECC errors. ECC errors may be detected if initialization is not handled in the maximum unit of access, for example, when 32-bit word RAM is accessed in 8- or 16-bit units.

The following notes apply to the GRZF. See **Figure 40A.2, Block Diagram of Global RAM ECC** and **Figure 40B.2, Block Diagram of Global RAM ECC**.

- When GRZF accesses to GRAM, GRZF does not use ECC encoder or decoder. When there is any differences between the read value and the write value in 39 bits including GRZF 32 bits (all 0) and ECC code 7 bits, a verify error is occurred in GRZF. The verify error can be checked by the GRZFSTS.SSTS[1:0].
- Global RAM Guard (GRG) cannot guard the access from GRZF to GRAM.

Section 46 Boundary Scan

This section contains a generic description of boundary scan.

The RH850/F1KH, RH850/F1KM has a JTAG interface and provides a boundary scan function.

46.1 Overview

Boundary scan is a test method defined in the IEEE standard 1149.1 that is used to test the connection between the devices mounted on the printed-circuit board. The boundary scan of the RH850/F1KH, RH850/F1KM conforms to IEEE Std 1149.1-2001.

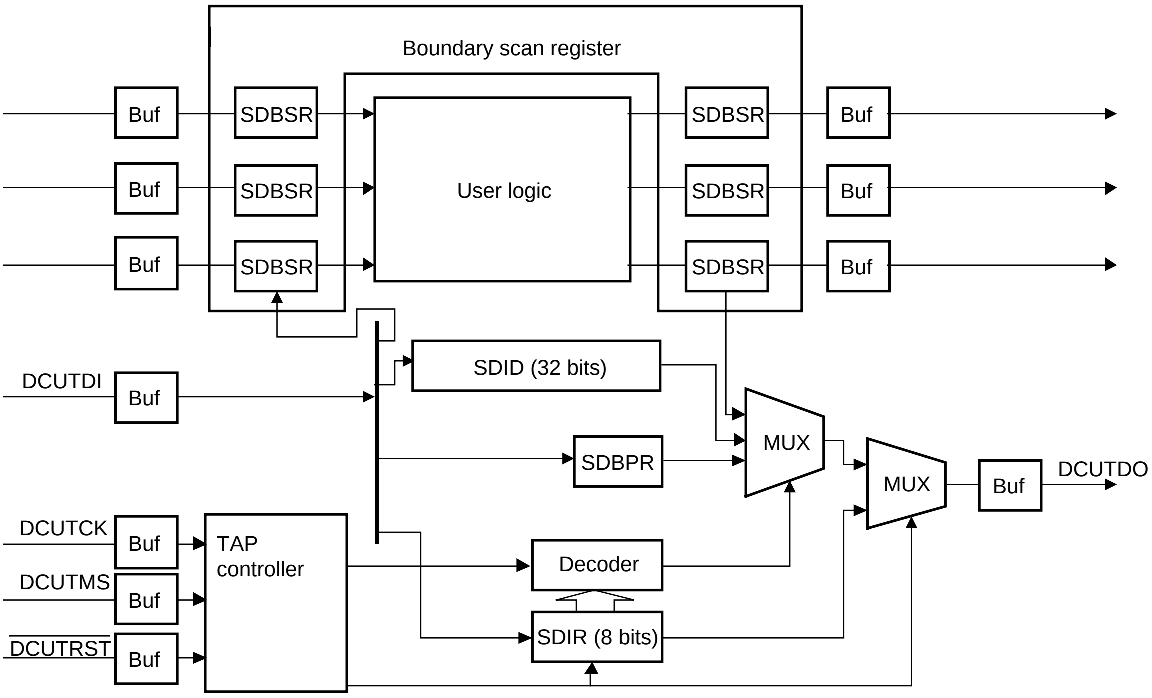
46.2 Features of RH850/F1KH, RH850/F1KM Boundary Scan

- Five control signals (DCUTCK, DCUTDI, DCUTDO, DCUTMS, and $\overline{\text{DCUTRST}}$)
- TAP controller
- Instruction register
- Bypass register
- Boundary scan register

The JTAG interface has four instructions.

- BYPASS
  Test mode conforming to the IEEE 1149.1
- EXTEST
  Test mode conforming to the IEEE 1149.1
- SAMPLE/PRELOAD
  Test mode conforming to the IEEE 1149.1
- IDCODE
  Test mode conforming to the IEEE 1149.1

Figure 46.1, Block Diagram of JTAG Interface shows a block diagram of the JTAG interface.



Note: SDBSR: Boundary scan register
SDBPR: Bypass register
Buf: I/O buffer
SDIR: Instruction register
SDID: ID register
MUX: Multiplexer

Figure 46.1 Block Diagram of JTAG Interface

46.3 External Input/Output Pins

There are five JTAG control signals: DCUTCK, DCUTDI, DCUTMS, DCUTDO, and $\overline{\text{DCUTRST}}$.

Table 46.1, Pin Configuration shows the pin configuration.

Table 46.1 Pin Configuration

Pin Name	Description
DCUTCK	Serial data input/output clock pin Data is input to DCUTDI and is output from DCUTDO in synchronization with this clock signal.
DCUTMS	Mode select input pin Changing the level of this signal in synchronization with DCUTCK changes the state of the TAP controller. For the protocol, see **Figure 46.2, TAP Controller State Transition Diagram**.
$\overline{\text{DCUTRST}}$	Reset input pin A low-level input of this signal resets the JTAG interface. This signal is accepted asynchronously with DCUTCK.
DCUTDI	Serial data input pin Data is input in synchronization with DCUTCK and sent to the JTAG interface.
DCUTDO	Serial data output pin Data to be read from the JTAG interface is output in synchronization with DCUTCK.

46.4 Registers

The JTAG interface has the following registers. None of the registers can be accessed by the CPU.

- SDIR: Instruction register
- SDID: ID register
- SDBPR: Bypass register
- SDBSR: Boundary scan register

Table 46.2 Register Configuration

Register Name	Symbol	Access Size	Value After Reset*[1]
Instruction register	SDIR	8	55_H
ID register	SDID	32	See **Table 46.5, ID Register Codes (RH850/F1KH-D8)**, **Table 46.6, ID Register Codes (RH850/F1KM-S4)**, **Table 46.7, ID Register Codes (RH850/F1KM-S1)**.
Bypass register	SDBPR	1	Undefined
Boundary scan register	SDBSR	—	Undefined

Note 1. Registers are initialized when $\overline{\text{DCUTRST}}$ pin is 0 or when TAP is in the Test-Logic-Reset state.

Instructions can be serially transferred from the serial data input pin (DCUTDI) and input to the instruction register (SDIR). The bypass register (SDBPR) is a 1-bit register, to which DCUTDI and DCUTDO are connected in BYPASS mode. The boundary scan register (SDBSR) is connected to DCUTDI and DCUTDO in SAMPLE/PRELOAD mode and EXTEST mode. The ID register (SDID) is a 32-bit register, from which the fixed code is output via DCUTDO in IDCODE mode.

Table 46.3, Serial Transfer Types shows the serial transfer types possible with the JTAG interface registers.

Table 46.3 Serial Transfer Types

Register	Serial Input	Serial Output
SDIR	Possible	Impossible*[1]
SDBPR	Possible	Possible
SDBSR	Possible	Possible
SDID	Impossible	Possible

Note 1. A fixed value is read out.

46.4.1 Instruction Register (SDIR)

The instruction register (SDIR) is an 8-bit register that holds a boundary scan instruction. SDIR is initialized by a low-level input of $\overline{\text{DCUTRST}}$ or in the TAP Test-Logic-Reset state. Operation is not guaranteed if a reserved instruction is set in this register.

Table 46.4 Boundary Scan Instructions

Instruction Code								Description
0	0	0	0	0	0	0	0	JTAG EXTEST
0	1	0	0	0	0	0	0	JTAG SAMPLE/PRELOAD
0	1	0	1	0	1	0	1	JTAG IDCODE (initial value)
1	1	1	1	1	1	1	1	JTAG BYPASS
Other than above								Reserved

46.4.2 ID Register (SDID)

The ID register (SDID) is a 32-bit register with a device specific ID.

SDID can be read from the JTAG interface when the IDCODE instruction is set, but cannot be accessed from the CPU.

For the read values, see **Table 46.5, ID Register Codes (RH850/F1KH-D8)**, **Table 46.6, ID Register Codes (RH850/F1KM-S4)**, **Table 46.7, ID Register Codes (RH850/F1KM-S1)** and **Table 46.2, Register Configuration**.

Table 46.5 ID Register Codes (RH850/F1KH-D8)

PKG	ID Register Codes			
	31 to 28	27 to 12	11 to 1	0
324 pins	0001	1000 0011 1100 1010	0100 0100 011	1
233 pins	0001	1000 0011 1100 1100	0100 0100 011	1
176 pins	0001	1000 0011 1100 1101	0100 0100 011	1

Table 46.6 ID Register Codes (RH850/F1KM-S4)

PKG	ID Register Codes			
	31 to 28	27 to 12	11 to 1	0
272 pins	0001	1000 0011 1000 1111	0100 0100 011	1
233 pins	0001	1000 0011 1001 0000	0100 0100 011	1
176 pins	0001	1000 0011 1001 0001	0100 0100 011	1
144 pins	0001	1000 0011 1001 0010	0100 0100 011	1
100 pins	0001	1000 0011 1001 0011	0100 0100 011	1

Table 46.7 ID Register Codes (RH850/F1KM-S1)

PKG	ID Register Codes			
	31 to 28	27 to 12	11 to 1	0
100 pins	0001	1000 0011 1001 0100	0100 0100 011	1
80 pins	0001	1000 0011 1001 0101	0100 0100 011	1
64 pins	0001	1000 0011 1001 0110	0100 0100 011	1
48 pins	0001	1000 0011 1001 0111	0100 0100 011	1

46.4.3 Bypass Register (SDBPR)

The bypass register (SDBPR) is a 1-bit register. When SDIR is set to BYPASS mode, SDBPR is connected to the position between DCUTDI and DCUTDO. The value after reset is undefined. SDBPR is not initialized by a power-on reset or by a low-level input of $\overline{\text{DCUTRST}}$.

46.4.4 Boundary Scan Register (SDBSR)

The boundary scan register (SDBSR) is a shift register for controlling the external I/O pins. When SDIR is set to SAMPLE/PRELOAD or EXTEST mode, SDBSR is connected to the position between DCUTDI and DCUTDO. The value after reset is undefined. SDBSR is not initialized by a power-on reset or a low-level input of $\overline{\text{DCUTRST}}$.

46.5 Operation

46.5.1 TAP Controller

Figure 46.2, TAP Controller State Transition Diagram shows the state transition of the TAP controller. The transition condition is the DCUTMS value at the rising edge of DCUTCK.

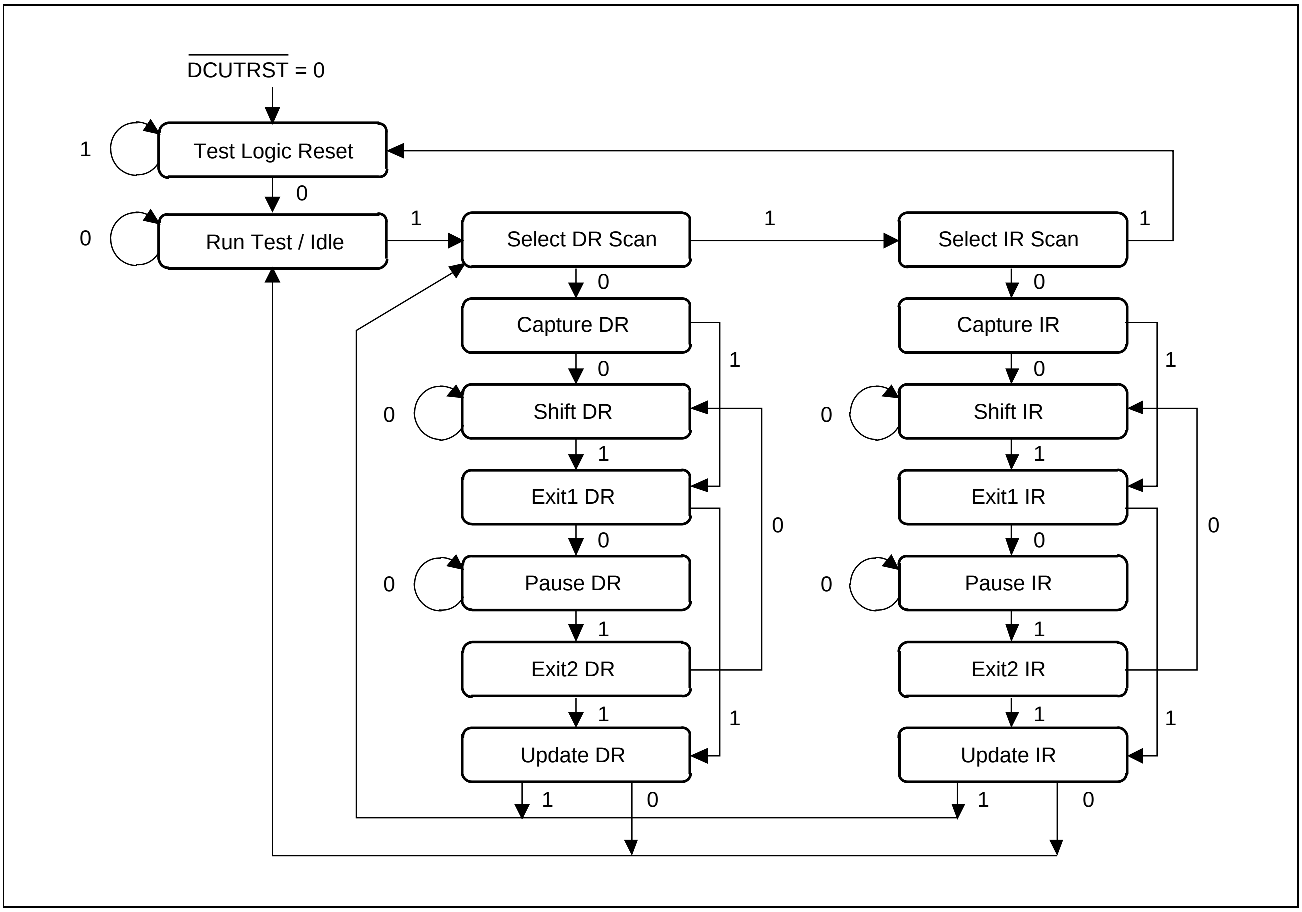


Figure 46.2 TAP Controller State Transition Diagram

NOTE

The DCUTDI value is sampled at the rising edge of DCUTCK and is shifted at the falling edge. DCUTDO is in the high-impedance state in the states other than Shift-DR and Shift-IR. A low-level input of $\overline{\text{DCUTRST}}$ causes transition to Test-Logic-Reset state asynchronously with DCUTCK.

46.5.2 Supported Instructions

46.5.2.1 BYPASS

The BYPASS instruction is a required standard instruction to operate the bypass register. This instruction shortens the shift path to achieve high-speed serial data transfer of other devices on the printed-circuit board. During execution of this instruction, the test circuit has no effect on the system circuit.

46.5.2.2 SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input the value to the boundary scan register from the internal circuits of this device; to output the value from the scan path; and to load data onto the scan path. During execution of this instruction, the level of the input pin of this device is sent to the internal circuits as is, and the value of the internal circuits is output to the outside via the output pin as is. Executing this instruction has no effect on the system circuit of this device.

The SAMPLE operation allows taking in the snapshots of the value to be transferred to the internal circuits from the input pin or the value to be transferred to the output pin from the internal circuits to the boundary scan register and allows reading the snapshots from the scan path. Snapshots can be taken in without preventing the normal operation of this device.

The PRELOAD operation allows setting the initial value to the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. If the EXTEST instruction is executed without PRELOAD operation, an undefined value is output from the output pin until the first scan sequence is completed (transfer to the output latch) because the parallel output latch value is always output to the output pin by the EXTEST instruction.

46.5.2.3 EXTEST

The EXTEST instruction is used to test the external circuits when this device is mounted on the printed-circuit board. When this instruction is executed, the output pin is used to output the test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed-circuit board; whereas the input pin is used to take in the test result from the printed-circuit board to the boundary scan register. When the EXTEST instruction is executed N times for testing, the test data for the Nth execution is scanned in at the (N - 1)th scan-out.

If the data is loaded onto the boundary scan register of the output pin in the Capture-DR state of this instruction, it is not used for testing the external circuits (replaced through shift operation).

46.5.2.4 IDCODE

The IDCODE instruction sets the JTAG interface pins to IDCODE mode, which is defined by the JTAG standard. When the JTAG interface is initialized (by a low-level input of $\overline{\text{DCUTRST}}$ or placing TAP in the Test-Logic-Reset state), IDCODE mode is set.

46.5.3 Pins Subject to Boundary Scan

All pins, excluding pins such as external clock input pins or power supply pins, are subject to boundary scan.

The pins which are not subjected to boundary scan are listed in **Table 46.8, Pins not Subject to Boundary Scan (RH850/F1KH-D8)** and **Table 46.9, Pins not Subject to Boundary Scan (RH850/F1KM-S4, RH850/F1KM-S1)**.

Table 46.8 Pins not Subject to Boundary Scan (RH850/F1KH-D8)

Type	Pin Name
JTAG interface	DCUTCK, DCUTDI, DCUTDO, DCUTMS, $\overline{\text{DCUTRST}}$
Power supply pins	REG0VCC, REG1VCC, AWOVCL, AWOVSS, ISOVCL, ISOVSS EVCC, EVSS, BVCC, BVSS
Power supply pins (A/D converter)	A0VREF, A1VREF, A0VSS, A1VSS
Clock	X1, X2, XT1, IP0_0/XT2
Mode setting	P10_8/FLMD1, P10_1/MODE0, P10_2/MODE1

Table 46.9 Pins not Subject to Boundary Scan (RH850/F1KM-S4, RH850/F1KM-S1)

Type	Pin Name
JTAG interface	DCUTCK, DCUTDI, DCUTDO, DCUTMS, $\overline{\text{DCUTRST}}$
Power supply pins	REGVCC, AWOVCL, AWOVSS, ISOVCL, ISOVSS EVCC, EVSS, BVCC[*1], BVSS[*1]
Power supply pins (A/D converter)	A0VREF, A1VREF[*1], A0VSS, A1VSS[*1]
Clock	X1, X2, XT1[*1], IP0_0/XT2[*1]
Mode setting	P10_8/FLMD1, P10_1/MODE0, P10_2/MODE1

Note 1. Only available for 272/233/176/144-pin versions.

The following signals are only sampled in boundary scan mode.

Table 46.10 Pins Subject to Boundary Scan (Sampling Only)

Function	Pin Name
Reset	$\overline{\text{RESET}}$
Mode setting	FLMD0

The following pins are shared by the analog buffer. Accordingly, boundary scan only applies to general I/O pins.

Table 46.11 Pins Subject to Boundary Scan (Only General I/O Pins)

Function	Pin Name
ADCA0 input	P8_0-12, P9_0-4, AP0_0-15
ADCA1 input	P18_0-15, P19_0-3, AP1_0-15

NOTE

In boundary scan mode, the level of the following pins must be fixed:
P10_1 = Low, P10_2 = High, and P10_8 = High

46.6 Usage Notes

1. Once an instruction is set, it is not modified until another instruction is issued. To issue the same instruction twice in a row, insert an instruction that has no effect on chip operation (such as BYPASS) between the instructions.
2. To start the system in boundary scan mode, de-assert $\overline{\text{DCUTRST}}$ while $\overline{\text{RESET}}$ is high. Also be sure to set DCUTMS to high before de-asserting $\overline{\text{DCUTRST}}$ and ensure that DCUTMS remains high for 600 ns + five DCUTCK clock cycles after de-asserting $\overline{\text{DCUTRST}}$.
3. For the maximum clock frequency that can be input to DCUTCK, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.
4. If serial transfer is performed exceeding the number of bits of the register connected between DCUTDI and DCUTDO, the data that is input from DCUTDI is output from DCUTDO as is.
5. If the serial transfer sequence is corrupted, be sure to assert $\overline{\text{DCUTRST}}$. In this case, transfer starts again from the beginning regardless of the point of transfer corruption.
6. Data is output via DCUTDO at the falling edge of DCUTCK.
7. To facilitate debugging, route $\overline{\text{DCUTRST}}$ on the board in such a way that patterns can be easily cut.

Section 47A Electrical Characteristics of RH850/F1KH-D8

47A.1 Overview

The electrical spec of this device is guaranteed by the following operational condition. But, this condition is different depends on each characteristics, so refer to each chapter for more detail.

47A.1.1 Pin Groups

47A.1.1.1 324-Pin Version

Symbol	Pin Group Supplied by	Related Pins/Ports
PgR0	REG0VCC, AWOVSS	X1, X2, XT1, XT2/IP0_0
PgE	EVCC, EVSS	Related ports: JP0, P0, P1, P2, P3, P8, P9, P20, P23 Related pins: $\overline{\text{RESET}}$, FLMD0
PgB	BVCC, BVSS	Related ports: P10, P11, P12, P13, P18, P19, P21, P22, P24
PgA0	A0VREF, A0VSS	Related port: AP0
PgA1	A1VREF, A1VSS	Related port: AP1

47A.1.2 General Measurement Conditions

47A.1.2.1 Common Conditions

- Power supply
  - REG0VCC = EVCC = VPOC*[1] to 5.5 V
  - REG1VCC = VPOC*[1] to 3.6 V, REG1VCC ≤ REG0VCC
  - BVCC = VPOC*[1] to REG0VCC
  - A0VREF = 3.0 V to 5.5 V
  - A1VREF = 3.0 V to 5.5 V
  - AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V
- Capacitance of the internal regulator
  - CAWOVCL: 0.1 µF ±30%
  - CISOVCL: 0.1 µF ±30% per pin
- Operating temperature
  - Tj = –40 to +130°C @R7F7017xx3ABG*[2]
  - Tj = –40 to +150°C @R7F7017xx4ABG*[2]
    @R7F7017yy3AFP*[2]

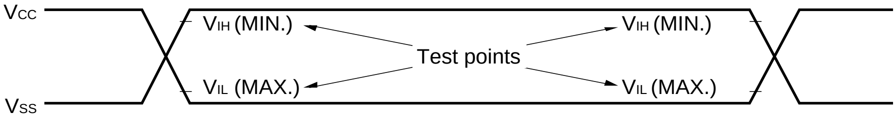
  xx = 10, 11, 14, 15
  yy = 08, 09
- Load conditions
  - CL = 30 pF

Note 1. “VPOC” means POC (power-on clear) detection voltage. For more detail, see **Section 47A.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

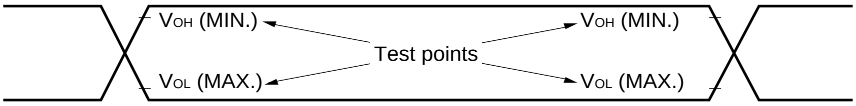
Note 2. Regarding operation temperature of each product, see **Section 1A.3, RH850/F1KH Product Lineup**.

47A.1.2.2 AC Characteristic Measurement Condition

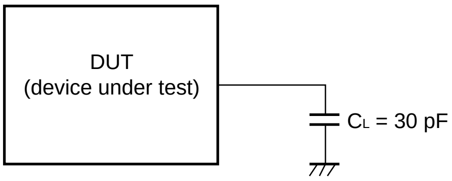
(1) AC Test Input Measurement Points



(2) AC Test Output Measurement Points



(3) Load Conditions



CAUTION

If the load capacitance exceeds 30pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30pF.

47A.2 Absolute Maximum Ratings

CAUTIONS

1. Do not directly connect outputs (or input/outputs) to each other, power supply and ground.
2. Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.
3. When designing an external circuit ensure that the connections don’t conflict with the port state of this device.

47A.2.1 Supply Voltages

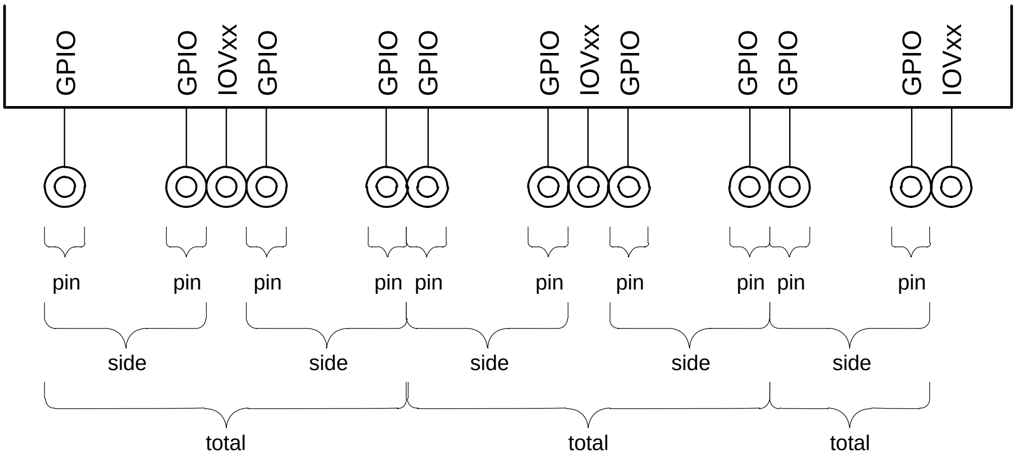
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
System supply voltage	REG0VCC		–0.5		6.5	V
	REG1VCC		–0.5		6.5	V
	AWOVSS		–0.5		0.5	V
	ISOVSS		–0.5		0.5	V
Port supply voltage	EVCC		–0.5		6.5	V
	BVCC		–0.5		6.5	V
	EVSS		–0.5		0.5	V
	BVSS		–0.5		0.5	V
A/D-converter supply voltage	A0VREF		–0.5		6.5	V
	A1VREF		–0.5		6.5	V
	A0VSS		–0.5		0.5	V
	A1VSS		–0.5		0.5	V

47A.2.2 Port Voltages

Item	Pin Group*[1]	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	PgR0	VI		–0.5		REG0VCC + 0.5 (Do not exceed 6.5 V)	V
	PgE			–0.5		EVCC + 0.5 (Do not exceed 6.5 V)	V
	PgB			–0.5		BVCC + 0.5 (Do not exceed 6.5 V)	V
	PgA0			–0.5		A0VREF + 0.5 (Do not exceed 6.5 V)	V
	PgA1			–0.5		A1VREF + 0.5 (Do not exceed 6.5 V)	V

Note 1. The characteristics of the alternative-function pins are the same as those of the port pins unless otherwise specified.

47A.2.3 Port Current



Definition of the condition:

- Per pin: Output current of one GPIO
- Per side: Total output current of all GPIO pins on one side of one IOVxx
- Total: Total output current of both sides of one IOVxx

Note:

- GPIO: General-purpose I/O pin (JP0, P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, P23, P24, AP0, AP1)
- IOVxx: Power supply pin for I/O pins (EVCC/EVSS, BVCC/BVSS, A0VREF/A0VSS, A1VREF/A1VSS)

47A.2.3.1 324-Pin Version

Item	Symbol	Pin Group	Condition	MIN.	TYP.	MAX.	Unit

47A.2.4 Temperature Condition

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Storage temperature	Tstg		–55		150	°C
Junction temperature	Tj	R7F7017xx3ABG	–40		130	°C
		R7F7017xx4ABG R7F7017yy3AFP	–40		150	°C

Note: xx = 02, 03, 04, 05, 06, 07, 10, 11, 12, 13, 15
yy = 00, 01, 08, 09

Regarding operation temperature of each product, see **Section 1A.3, RH850/F1KH Product Lineup**.

47A.3 Operational Condition

47A.3.1 Recommended Operating Conditions

Products of CPU frequency 240 MHz max.

(1/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CPU clock frequency	f_{CPUCLK_H}	CKDIVMD = 1			240	MHz
		CKDIVMD = 0			120	MHz
	f_{CPUCLK_M}				120	MHz
	f_{CPUCLK_L}	for OSTMn			60	MHz
		for MEMC[*5]				
	f_{CPUCLK_UL}				30	MHz
Peripheral clock (clock domain) frequency[*1]	f_{CKSCLK_AWDTA}	for WDTA0			240[*2]	kHz
	f_{CKSCLK_ATAUJ}	for TAUJ0			40	MHz
		for TAUJ2				
	f_{CKSCLK_ARTCA}	for RTCA0			4	MHz
	f_{CKSCLK_AADCA}	for ADCA0			40	MHz
	f_{CKSCLK_AFOUT}	for FOUT			24	MHz
	$f_{CKSCLK\_ICPUCLK}$	for CPU subsystem			240 / 120	MHz
	f_{CKSCLK_IPERI1}	for TAUD0			80	MHz
		for TAUJ1				
		for TAUJ3				
		for ENCA0				
		for TAPA0				
		for PIC0				
		for SFMA0				
	f_{CKSCLK_IPERI2}	for TAUBn			40	MHz
		for RCFDCn (clkc)				
		for RSENTn				
		for PWBAn				
		for PWGAn				
		for PWSAn				
		for MMCA0				
	f_{CKSCLK_ILIN}	for RLIN24n			40	MHz
		for RLIN3n				
	f_{CKSCLK_IADCA}	for ADCA1			40	MHz
	f_{CKSCLK_ICAN}	for RCFDCn (PCLK)			80	MHz
	$f_{CKSCLK\_ICANOSC}$	for RCFDCn (clk_xincan)			24	MHz
	f_{CKSCLK_ICSI}	for CSIGn			80	MHz
		for CSIHn				
	f_{CKSCLK_IIIC}	for RIICn			40	MHz
	$f_{LS\ IntOSC}$	for WDTA1			240[*2]	kHz
		for WDTA2				
	f_{EMCLK}	for LPSn			8	MHz

(2/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Power supply	REG0VCC	REG0VCC = EVCC	VPOC*[3]		5.5	V
	EVCC					
	REG1VCC	REG1VCC ≤ REG0VCC	VPOC*[3]		3.6	V
	BVCC		VPOC*[3]		REG0VCC	V
	A0VREF		3.0		5.5	V
	A1VREF					
Normal operation voltage	AWOVCL		1.1	1.25	1.35	V
	ISOVCL					
Limited operation voltage*[4]	AWOVCL		1.35		1.43	V
	ISOVCL					

Note 1. For clock specification of peripherals, see **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4**.

Note 2. This frequency depends on the internal oscillator (LS IntOSC).

Note 3. “VPOC” means POC (power-on clear) detection voltage (TYP. 2.85 V). For detail, see **Section 47A.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.
In addition, the guaranteed operation in DC characteristic.
And AC characteristic is guaranteed when more than 3.0 V.
When the power supply voltage is VPOC to 3.0 V, the device does not malfunction.

Note 4. Reliability restrictions from 1.35 V to 1.43 V.

Note 5. Devided by 2 on MEMC internal.

Products of CPU frequency 160 MHz max.

(1/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CPU clock frequency	f_{CPUCLK_H}				160	MHz
	f_{CPUCLK_M}				80	MHz
	f_{CPUCLK_L}	for OSTMn			40	MHz
		for MEMC*5				
	f_{CPUCLK_UL}				20	MHz
Peripheral clock (clock domain) frequency*1	f_{CKSCLK_AWDTA}	for WDTA0			240*2	kHz

	f_{EMCLK}	for LPSn			8	MHz
Power supply	REG0VCC	REG0VCC = EVCC	VPOC*3		5.5	V
	EVCC					
	REG1VCC	REG1VCC ≤ REG0VCC	VPOC*3		3.6	V
	BVCC		VPOC*3		REG0VCC	V
	A0VREF		3.0		5.5	V
	A1VREF					

(2/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Normal operation voltage	AWOVCL ISOVCL		1.1	1.25	1.35	V
Limited operation voltage*4	AWOVCL		1.35		1.43	V

Note 1. For clock specification of peripherals, see **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4**.

Note 2. This frequency depends on the internal oscillator (LS IntOSC).

Note 3. “VPOC” means POC (power-on clear) detection voltage (TYP. 2.85 V). For detail, see **Section 47A.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.
In addition, the guaranteed operation in DC characteristic.
And AC characteristic is guaranteed when more than 3.0 V.
When the power supply voltage is VPOC to 3.0 V, the device does not malfunction.

Note 4. Reliability restrictions from 1.35 V to 1.43 V.

Note 5. Devided by 2 on MEMC internal.

47A.3.2 Oscillator Characteristics

Condition: REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC, BVCC = VPOC to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C

(1) MainOSC (In Case of Using a Crystal/Ceramic)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MainOSC frequency*[3]	f_{MOSC}		8		24	MHz
MainOSC current consumption	I_{MOSC}	After stabilization		1.9*[2]	2.3*[2]	mA
MainOSC oscillation start point	V_{MOSCSP}		VPOC			V
MainOSC oscillation operating point	V_{MOSCOP}			0.5 × REG0VCC *[2]		V
MainOSC oscillation amplitude	$V_{MOSCAMP}$		0.4 × REG0VCC – 0.2*[2]			V
MainOSC oscillation stabilization time	t_{MSTB}			2*[1],*[2]		ms
MainOSC transconductance	g_{m_MOSC}	MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 00		11.1*[1]		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 01		10.6*[1]		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 10		9.3*[1]		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 11		7.8*[1]		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 00		8.6*[1]		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 01		7.8*[1]		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 10		6.1*[1]		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 11		4.0*[1]		mA/V

Note 1. Oscillator stabilization time is time until being set (“1”) in MOSCS.MOSCCLKACT bit after MOSCE.MOSCENTRG bit is written “1”, and depends on the setting value of MOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

Note 2. This is reference value.

Note 3. The following four crystal/ceramic resonator frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

(2) MainOSC (In Case of External Clock Input to X1)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
X1 clock Input frequency*[1]	f_{EX}		8		24	MHz
X1 clock Input cycle time	t_{EXCYC}		41.7		125	ns
X1 High level Input voltage	V_{IH}		0.7 × REG0VCC		REG0VCC + 0.5	V
		@Flash Programing Interface*[2]	0.8 × REG0VCC		REG0VCC + 0.5	V
X1 Low level Input voltage	V_{IL}		–0.5		0.3 × REG0VCC	V
		@Flash Programing Interface*[2]	–0.5		0.2 × REG0VCC	V
X1 Input leakage current	I_{LIH}	VI = REG0VCC			0.5	μA
	I_{LIL}	VI = 0 V			–0.5	μA
X1 clock Input low-level pulse width	t_{EXL}	f_{EX} = 8 MHz	58			ns
		f_{EX} = 16 MHz	26			ns
		f_{EX} = 20 MHz	20			ns
		f_{EX} = 24 MHz	16			ns
X1 clock Input high-level pulse width	t_{EXH}	f_{EX} = 8 MHz	58			ns
		f_{EX} = 16 MHz	26			ns
		f_{EX} = 20 MHz	20			ns
		f_{EX} = 24 MHz	16			ns
X1 clock Input period jitter			–0.3		0.3	ns

Note 1. The following four external clock input frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

Note 2. X2 should be open and its parasitic capacitance should be less than 5 pF.

(3) SubOSC

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
SubOSC frequency	f_{SOSC}	Crystal	30	32.768	38	kHz
SubOSC current consumption	I_{SOSC}	After stabilization		1.5*[2]	4*[2]	μA
SubOSC DC operating point	$V_{SOSCDCOP}$			0.65*[2]		V
SubOSC oscillation stabilization time	t_{SSTB}			*[1]		s

Note 1. Oscillator stabilization time is time until being set (“1”) in SOSCS.SOSCCLKACT bit after SOSCE.SOSCENTRG bit is written “1”, and depends on the setting value of SOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

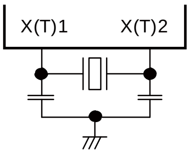
Note 2. This is reference value.

CAUTION

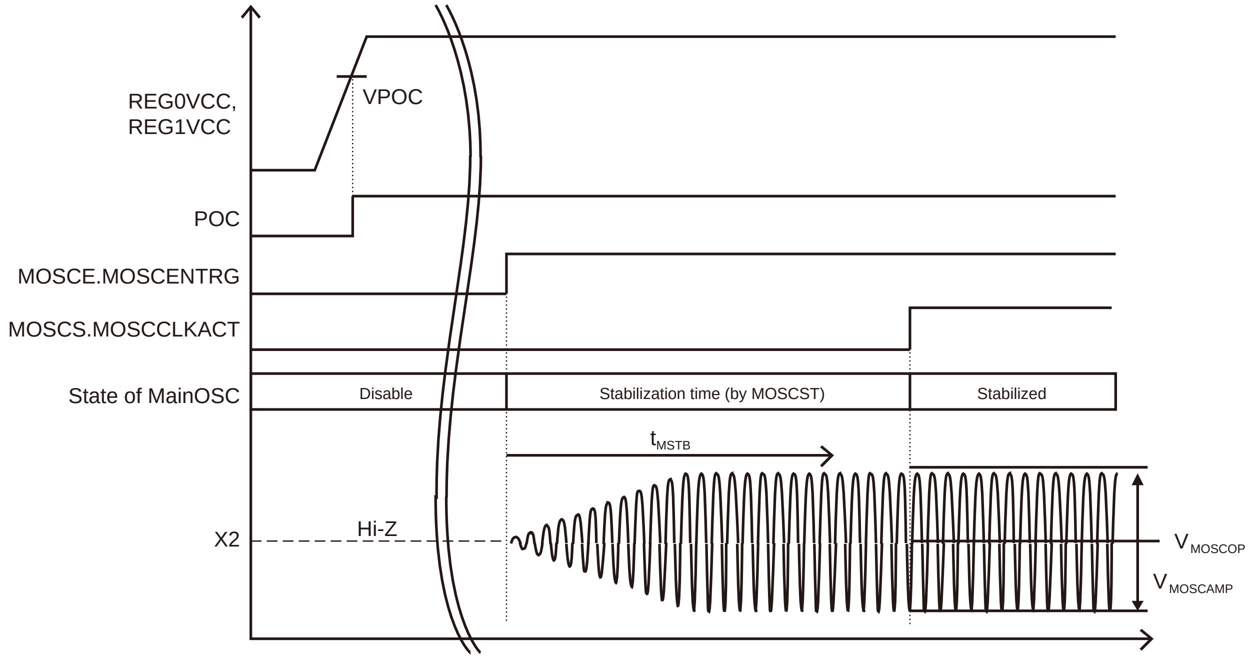
The oscillation stabilization time differs according the matching with the external resonator circuit. It is recommended to determine the oscillation stabilization time by an oscillator matching test.

NOTE

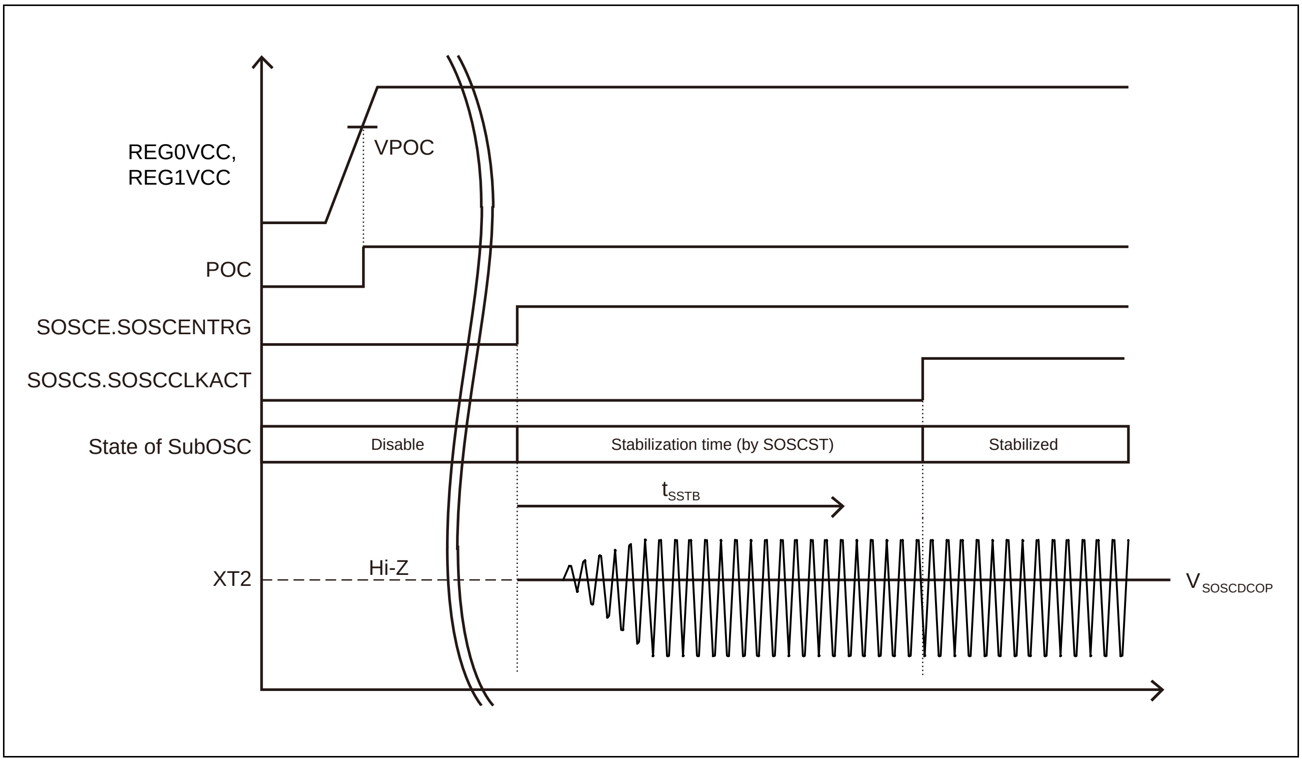
Recommended oscillator circuit is shown below.



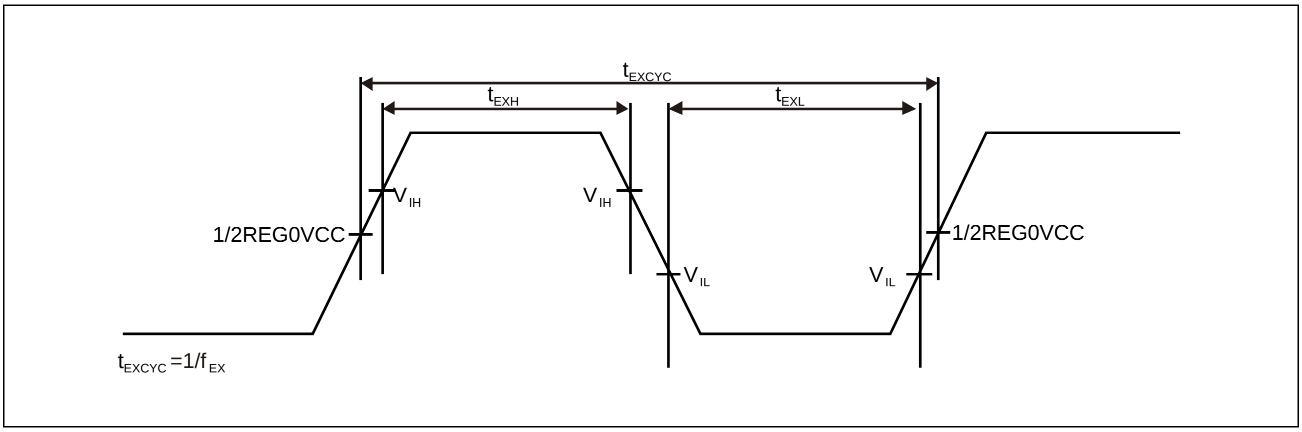
MainOSC



SubOSC



External clock



47A.3.3 Internal Oscillator Characteristics

Condition: REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = VPOC to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
LS IntOSC frequency	f_{RL}		220.8	240	259.2	kHz
HS IntOSC frequency*[3]	f_{RH}		7.6	8	8.4	MHz
		After user trimming @ trimming temp*[2]	7.92	8	8.08	MHz
HS IntOSC current consumption	I_{RH}	After stabilization			170*[1]	µA
HS IntOSC oscillation stabilization time	t_{RHSTB}				54.4	µs

Note 1. This is reference value.

Note 2. The HS IntOSC frequency may not meet the specification range (8.00 MHz ±0.08 MHz after user trimming @ trimming temp) in the while writing/erasing the code/data flash.

Note 3. The HS IntOSC frequency may not meet the specification range in the Cyclic STOP/Cyclic RUN mode.

47A.3.4 PLL Characteristics

47A.3.4.1 PLL0 (for CPU, with SSCG) Characteristics

Condition: REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = VPOC to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition			MIN.	TYP.	MAX.	Unit
Input frequency	$f_{\mathrm{PLL0CLKIN}}$	MainOSC			8		24	MHz
		HS IntOSC*3			7.6	8.0	8.4	MHz
		HS IntOSC After user trimming @ trimming temp*3			7.92	8.0	8.08	MHz
Output frequency	f_{CPLL0OUT}	SSCG mode	MainOSC	Products of CPU frequency 240 MHz max.	105.8		240	MHz
				Products of CPU frequency 160 MHz max.	105.8		160	MHz
			HS IntOSC*3		67		84	MHz
			HS IntOSC After user trimming @ trimming temp*3		69.8		80.8	MHz
Modulation frequency	f_{MOD}				20		100	kHz
Frequency dithering range*2	f_{DIT}				0.82	1.0	1.18	%
					1.64	2.0	2.36	%
					2.46	3.0	3.54	%
					3.28	4.0	4.72	%
					4.10	5.0	5.90	%
					4.92	6.0	7.08	%
					6.56	8.0	9.44	%
					8.20	10.0	11.80	%
Lock time*1	t_{LCK0}	SSCG mode	PLL0ST = 0000 $1B80_{\mathrm{H}}$		814.9	880	956.6	µs

Note 1. Lock time is time until being set (“1”) in PLL0S.PLL0CLKACT bit after PLL0E.PLL0ENTRG bit is written “1”.

Note 2. "Frequency dithering range” is set by PLL0ADJ[2:0] bits of PLL0C registers.

Note 3. The HS IntOSC has a frequency deviation. When the HSIntOSC is used the frequency deviation should be considered for the customer application as it affects peripheral functions (e.g. TAUx, ADCAn, etc.).

47A.3.4.2 PLL1 (for CPU/Peripheral) Characteristics

Condition: REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC, BVCC = VPOC to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input frequency	$f_{PLL1CLKIN}$	MainOSC	8		24	MHz
		HS IntOSC*[3]	7.6	8.0	8.4	MHz
		HS IntOSC After user trimming @ trimming temp*[3]	7.92	8.0	8.08	MHz
Output frequency	$f_{CPLL1OUT}$	MainOSC	80		120	MHz
		HS IntOSC*[3]	76	80	84	MHz
	$f_{PPLLOUT}$		76	80	84	MHz
Output period jitter*[1]	t_{CPJ1}		–100		100	ps
Long term jitter*[1]	t_{LTJ}	term = 1 μs	–500		500	ps
		term = 10 μs	–1		1	ns
		term = 20 μs	–2		2	ns
Lock time*[2]	t_{LCK1}		104	112.3	122.1	μs

Note 1. This is reference value.

Note 2. Lock time is time until being set (“1”) in PLL1S.PLL1CLKACT bit after PLL1E.PLL1ENTRG bit is written “1”.

Note 3. The HS IntOSC has a frequency deviation. When the HSIntOSC is used the frequency deviation should be considered for the customer application as it affects peripheral functions (e.g. TAUx, ADCAn, etc.).

47A.4 DC Characteristics

47A.4.1 Capacitance

Condition: REG0VCC = REG1VCC = EVCC = BVCC = A0VREF = A1VREF = AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, Ta = 25°C

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input capacitance	CI*[1]	f = 1 MHz 0 V for non measurement pins			10	pF
Input/output capacitance	CIO*[2]				10	pF

Note 1. CI: Capacitance between the input pin and ground

Note 2. CIO: Capacitance between the input/output pin and ground

47A.4.2 Pin Characteristics

Condition: Some of the conditions mentioned in this chapter can be selected by software and described in the hardware user's manual.

Note 1. Pull-down resistor for ADC diagnostic purpose. Control via ADC self-diagnostic register.

Note 2. Supports Cload: 100 pF

Note 3. Supports Cload: 50 pF

Note 4. Pull-down resistors for ADC diagnostic and internal pull-down purposes. For ADC diagnostic, control via ADC self-diagnostic register. For internal pull-down, control via PD register.

Note 5. TTL is selected for Boundary scan mode or Nexus in normal operating mode.

Note 6. Only available for 324-pin devices.

Condition: REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC,

		Slow mode*5	CL = 30 pF			37	ns
			CL = 50 pF			62	ns
			CL = 100 pF			124	ns
Output frequency	f_O	Fast mode	CL = 30 pF			40	MHz
		Slow mode	CL = 30 pF			10	MHz
			CL = 50 pF			6	MHz
			CL = 100 pF			3	MHz

Note 1. “IOVCC” means the pins are assigned to the power supply (EVCC, BVCC, A0VREF and A1VREF).

Note 2. Not select the analog input function of ADCn.

Note 3. When the internal pull-up resistor of FLMD0 pin is applied by FLMDCNT register, please connect 86 kΩ or more as external pull-down resistor.

Note 4. The number of pin indicates simultaneous ON.

Note 5. Measurement point: 0.1 × IOVCC to 0.9 × IOVCC

Note 6. Measurement point: 0.2 × IOVCC to 0.8 × IOVCC

47A.4.2.1 Output Current

47A.4.3 Power Supply Currents

Condition: REG0VCC, REG1VCC, EVCC, BVCC, A0VREF and A1VREF total current. But the I/O buffer is stopped.

Products of CPU frequency 240 MHz max.

Item	Symbol	Condition					MIN.	TYP.*1	MAX.	Unit
		CPU	PLL	Tj	Peripheral*2	Power supply				
RUN mode current	IDDR	Run (240 MHz)	Run	–40 to 150°C	Run (#1)	Total		113	330	mA
						REG1VCC		92	290	mA
				25°C	Stop (#1)	Total		107		mA
						REG1VCC		88		mA
RUN mode current (During data/code flash programming)	IDDR3	Run (240 MHz)	Run	–40 to 150°C	Run (#2)	Total		133	350	mA
						REG1VCC		92	290	mA
RUN mode current (With code flash background operation)	IDDRBGO	Run (240 MHz)	Run	–40 to 150°C	Run (#6)	Total		133	350	mA
						REG1VCC		92	290	mA
RUN mode current (HALT state)	IDDH	Run (240 MHz)	Run	–40 to 150°C	Run (#3)	Total		108	325	mA
						REG1VCC		88	286	mA

Products of CPU frequency 160 MHz max.

Item	Symbol	Condition					MIN.	TYP.*1	MAX.	Unit
		CPU	PLL	Tj	Peripheral*2	Power supply				
RUN mode current	IDDR	Run (160 MHz)	Run	–40 to 150°C	Run (#1)	Total		83	293	mA
						REG1VCC		62	253	mA
				25°C	Stop (#1)	Total		77		mA
						REG1VCC		58		mA
RUN mode current (During data/code flash programming)	IDDR3	Run (160 MHz)	Run	–40 to 150°C	Run (#2)	Total		103	313	mA
						REG1VCC		62	253	mA
RUN mode current (With code flash background operation)	IDDRBGO	Run (160 MHz)	Run	–40 to 150°C	Run (#6)	Total		103	313	mA
						REG1VCC		62	253	mA
RUN mode current (HALT state)	IDDH	Run (160 MHz)	Run	–40 to 150°C	Run (#3)	Total		78	288	mA
						REG1VCC		58	249	mA

Products of CPU frequency 240 MHz max, 160 MHz max.

		Condition								
Item	Symbol	CPU	PLL	Tj	Peripheral*2	Power supply	MIN.	TYP.*1	MAX.	Unit
STOP mode current	IDDS	Stop	Stop	–40 to 90°C	Stop (#2)	Total		2.2	48	mA
						REG1VCC		2	45	mA
				110°C	Stop (#2)	Total			88	mA
						REG1VCC			83	mA
				135°C	Stop (#2)	Total			138	mA
						REG1VCC			130	mA
DeepSTOP mode current	IDDDS	Power off	Power off	–40 to 85°C	Stop (#3)	Total		52	800	µA
						REG1VCC		1	10	µA
				105°C	Stop (#3)	Total			1480	µA
						REG1VCC			30	µA
				125°C	Stop (#3)	Total			2140	µA
						REG1VCC			60	µA
Cyclic RUN mode current	IDDCR	Run (HS IntOSC)	Stop	–40 to 90°C	Run (#4)	Total		9.8	58	mA
						REG1VCC		9.1	49	mA
				115°C	Run (#4)	Total			97	mA
						REG1VCC			86	mA
				135°C	Run (#4)	Total			146	mA
						REG1VCC			133	mA
Cyclic STOP mode current	IDDCS	Stop	Stop	–40 to 90°C	Run (#5)	Total		2.4	50	mA
						REG1VCC		2.2	47	mA
				110°C	Run (#5)	Total			88	mA
						REG1VCC			83	mA
				135°C	Run (#5)	Total			138	mA
						REG1VCC			130	mA

Note 1. The condition of “TYP.” shows the specification with the following conditions. Also, the value is just for reference only.
- Tj = 25°C
- REG0VCC = EVCC = BVCC = A0VREF = A1VREF = 5.0 V
- REG1VCC = 3.3 V
- AWOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V

Note 2. Operating condition of each peripheral function is shown in the table of next page.

Caution: It must be ensured that the junction temperature in the Ta range remains below Tj ≤ 150°C and does not exceed its limit under application conditions (thermal resistance, power supply current, peripheral current (if not included in power supply current), port output current and injection current).

47A.4.4 Injection Currents

Table 47A.1 Definition of Pin Group (324-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgR0	REG0VCC, AWOVSS	IP0_0
PgE	EVCC, EVSS	JP0, P0, P1, P2, P3, P20, P23
PgB	BVCC, BVSS	P10, P11, P12, P13, P21, P22, P24
PgE’	EVCC, EVSS	P8, P9
PgB’	BVCC, BVSS	P18, P19
PgA0	A0VREF, A0VSS	AP0
PgA1	A1VREF, A1VSS	AP1

Table 47A.2 Reserved

Table 47A.3 Definition of Pin Group (233-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgR0	REG0VCC, AWOVSS	IP0_0
PgE	EVCC, EVSS	JP0, P0, P1, P2, P3, P20
PgB	BVCC, BVSS	P10, P11, P12, P13
PgE’	EVCC, EVSS	P8, P9
PgB’	BVCC, BVSS	P18, P19
PgA0	A0VREF, A0VSS	AP0
PgA1	A1VREF, A1VSS	AP1

Table 47A.4 Definition of Pin Group (176-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgR0	REG0VCC, AWOVSS	IP0_0
PgE	EVCC, EVSS	JP0, P0, P1, P2, P20
PgB	BVCC, BVSS	P10, P11, P12
PgE’	EVCC, EVSS	P8, P9
PgB’	BVCC, BVSS	P18
PgA0	A0VREF, A0VSS	AP0
PgA1	A1VREF, A1VSS	AP1

47A.4.4.1 Absolute Maximum Ratings

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJPM}	PgE	Per pin			10	mA
			Total			60	mA
		PgB	Per pin			10	mA
			Total			60	mA
		PgE’	Per pin			10	mA
			Total			60	mA
		PgB’	Per pin			10	mA
			Total			60	mA
		PgA0	Per pin			10	mA
			Total			60	mA
		PgA1	Per pin			10	mA
			Total			60	mA
		PgR0	Per pin			10	mA
Negative overload current VIN < VSS	I_{INJNM}	PgE	Per pin			–10	mA
			Total			–60	mA
		PgB	Per pin			–10	mA
			Total			–60	mA
		PgE’	Per pin			–10	mA
			Total			–60	mA
		PgB’	Per pin			–10	mA
			Total			–60	mA
		PgA0	Per pin			–10	mA
			Total			–60	mA
		PgA1	Per pin			–10	mA
			Total			–60	mA
		PgR0	Per pin			–10	mA

CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgA0 and PgA1, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

47A.4.4.2 DC Characteristics for Overload Current

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJP}	PgE	Per pin			2	mA
			Total			50	mA
		PgB	Per pin			2	mA
			Total			50	mA
		PgE’	Per pin			3	mA
			Total			20	mA

			Total			20	mA
		PgA0	Per pin			3	mA
			Total			20	mA
		PgA1	Per pin			3	mA
			Total			20	mA
		PgR0	Per pin			2	mA
Negative overload current VIN < VSS	I_{INJN}	PgE	Per pin			–2	mA
			Total			–50	mA
		PgB	Per pin			–2	mA
			Total			–50	mA
		PgE’	Per pin			–3	mA
			Total			–20	mA
		PgB’	Per pin			–3	mA
			Total			–20	mA
		PgA0	Per pin			–3	mA
			Total			–20	mA
		PgA1	Per pin			–3	mA
			Total			–20	mA
		PgR0	Per pin			–2	mA

NOTE

These specifications are not tested on sorting and are specified based on the device characterization.

47A.4.5 Power Management Characteristics

47A.4.5.1 Regulator Characteristics

Condition: REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = VPOC to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	REG0VCC		VPOC*[1]		5.5	V
	REG1VCC	REG1VCC ≤ REG0VCC	VPOC*[1]		3.6	V
Output voltage	AWOVCL	AWOVCL pin	1.15	1.25	1.35	V
	ISOVCL	ISOVCL pin	1.15	1.25	1.35	V
Capacitance	CAWOVCL	AWOVCL pin	0.07	0.10	0.13	μF
	CISOVCL	ISOVCL pin	0.07	0.10	0.13	μF
Equivalent series resistance for load capacitance	RVRAWO	for CAWOVCL			40*[2]	mΩ
	RVRISO	for CISOVCL			40*[2]	mΩ
Inrush current during power-on	REG0VCC				200	mA
	REG1VCC				350	mA

Note 1. “VPOC” means POC (power-on clear) detection voltage (typ. 2.85 V). For detail, see **Section 47A.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

Note 2. This is reference value.

47A.4.5.2 Voltage Detector (POC, LVI, VLVI, CVM) Characteristics

Condition: REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC, BVCC = VPOC to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition			MIN.	TYP.	MAX.	Unit
Detection voltage (REG0VCC, REG1VCC)	VPOC	POC			2.7	2.85	3.0	V
Detection voltage (REG0VCC)	VLVI0	LVI	Rise		3.87	4.0	4.13	V
			Fall		3.9	4.0	4.1	V
	VLVI1		Rise		3.57	3.7	3.83	V
			Fall		3.6	3.7	3.8	V
	VLVI2		Rise		3.37	3.5	3.63	V
			Fall		3.4	3.5	3.6	V
	VVLVI	VLVI			1.8	1.9	2.0	V
Detection voltage (ISOVCL)	VCVMH	CVM	High voltage[Caution]		1.35	1.39	1.43	V
	VCVML*8		Low voltage[Caution]		1.10	1.15	1.20	V
Response time	t_{D_POC1}*6	POC	At power-on (Rise)	*1			2	ms
				*2			6.3	ms
			After power-on (Rise)	*3			2	ms
				*4			5	ms
	t_{D_POC2}*7		After power-on (Fall)	*5			5	μs
	t_{D_LVI}	LVI					2	ms
	t_{D_VLVI}	VLVI		*3			2	ms
				*4			5	ms
	t_{D_CVM}	CVM			0.2		10	μs
Setup time	t_{S_LVI}	LVI	LVICNT0,1 bits are set to 1 (except 00_B), then LVI is ready to operate				80	μs
REG0VCC, REG1VCC minimum width	t_{W_POC}	POC			0.2			ms
REG0VCC minimum width	t_{W_LVI}	LVI			0.2			ms
	t_{W_VLVI}	VLVI			0.2			ms

Note 1. Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms

Note 2. Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms

Note 3. Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 20 V/ms

Note 4. Voltage slope (t_{VS}): 20 V/ms < t_{VS} ≤ 500 V/ms

Note 5. Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 500 V/ms

Note 6. t_{D_POC1} is the time from detection voltage to release of reset signal.

Note 7. t_{D_POC2} is the time from detection voltage to occurrence of reset signal.

Note 8. The CVM monitors the internal voltage regulator output to ensure that ISOVCL is upper than specified minimum level.

Caution: A detection of the voltage ISOVCL outside the specified level of VCVMH and VCVML is not ensured by CVM.

$\overline{\text{DCUTRST}}$ input delay time (vs $\overline{\text{RESET}}$ ↑)	t_{DRTRST}		1			ms
$\overline{\text{RESET}}$ hold time (vs $\overline{\text{DCUTRST}}$ ↓)	t_{HRTRST}		0			ms

Note 1. IOVCC means EVCC, BVCC, A0VREF and A1VREF.

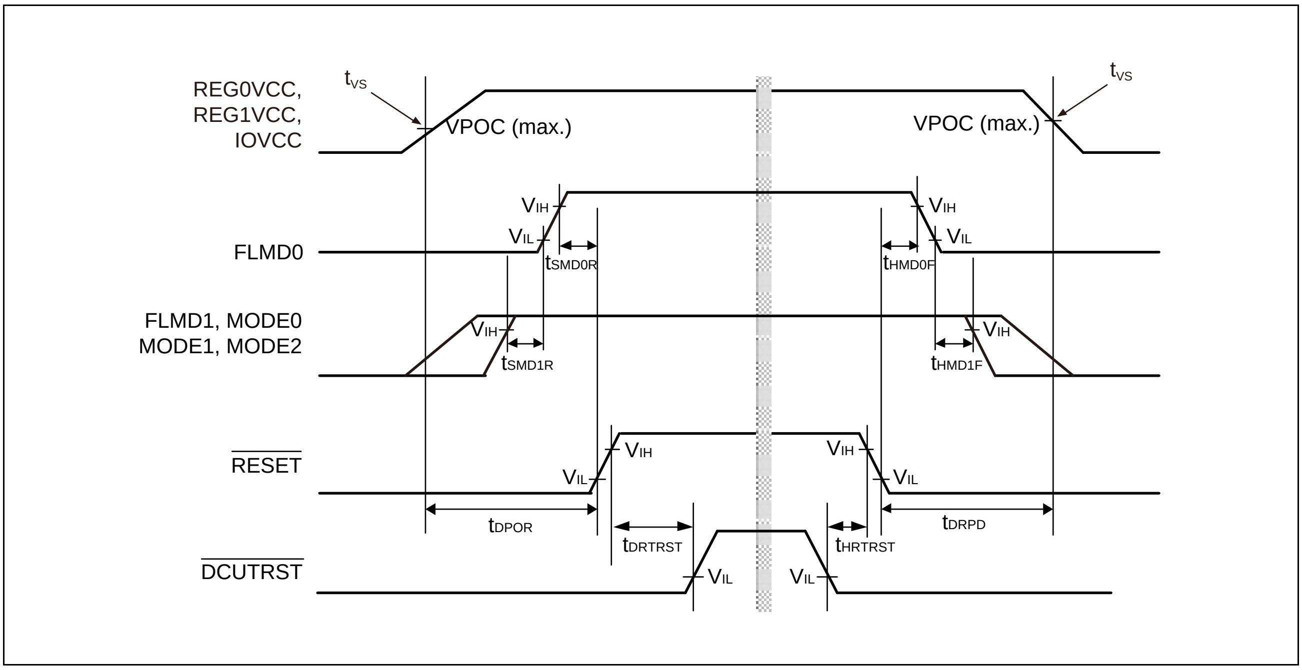

Table 47A.8 In Case the $\overline{\text{RESET}}$ Pin is Used (for User Boot Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REG0VCC, REG1VCC and IOVCC*1)	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 μs/V)	V/ms
REG0VCC ↑, REG1VCC ↑ and IOVCC*1 ↑ to $\overline{\text{RESET}}$ ↑ delay time	t_{DPOR}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 setup time (vs $\overline{\text{RESET}}$ ↑)	t_{SMD0R}		1			ms
FLMD1, MODE0, MODE1, MODE2 setup time (vs FLMD0 ↑)	t_{SMD1R}		1			μs
FLMD0 hold time (vs $\overline{\text{RESET}}$ ↓)	t_{HMD0F}		1			μs
FLMD1, MODE0, MODE1, MODE2 hold time (vs FLMD0 ↓)	t_{HMD1F}		1			μs
$\overline{\text{RESET}}$ ↓ to REG0VCC ↓, REG1VCC ↓ and IOVCC ↓ delay time	t_{DRPD}		0			ms

Note 1. IOVCC means EVCC, BVCC, A0VREF and A1VREF.

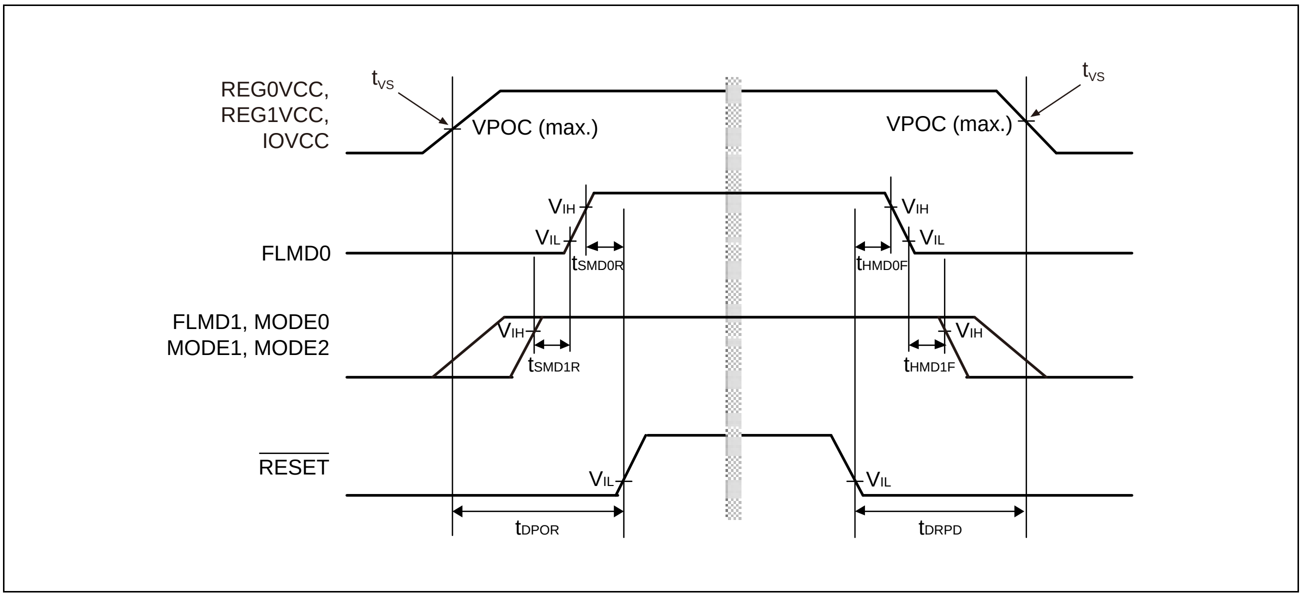

Table 47A.9 In Case the $\overline{\text{RESET}}$ Pin is Not Used and Fixed to High Level by Pull-up*1

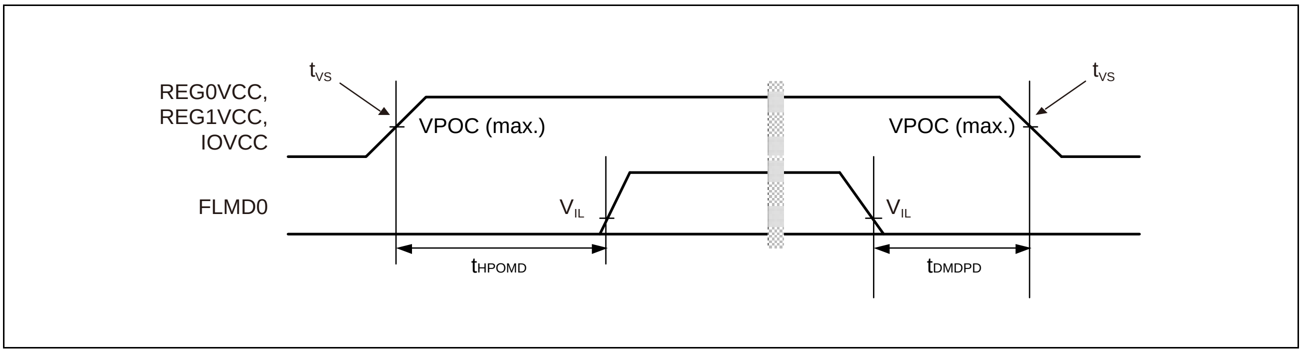
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REG0VCC, REG1VCC and IOVCC*2)	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 µs/V)	V/ms
REG0VCC ↑, REG1VCC ↑ and IOVCC*2 ↑ to FLMD0 hold time	t_{HPOMD}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 ↓ to REG0VCC ↓, REG1VCC ↓ and IOVCC*2 ↓ delay time	t_{DMDPD}		1			µs

Note 1. This operating condition is available only in normal operation mode (include self-programming mode). When the device is used in except normal operation mode, please use the $\overline{\text{RESET}}$ pin.

Note 2. IOVCC means EVCC, BVCC, A0VREF and A1VREF.



47A.4.5.4 CPU Reset Release Timing

Condition: REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC, BVCC = VPOC to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Table 47A.10 In Case the $\overline{\text{RESET}}$ Pin is Not Used

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
REG0VCC ↑ and REG1VCC ↑ to CPU reset release*[1]	t_{DPCRR}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms			2.58	ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms			8.3	ms

Note 1. This is reference value.

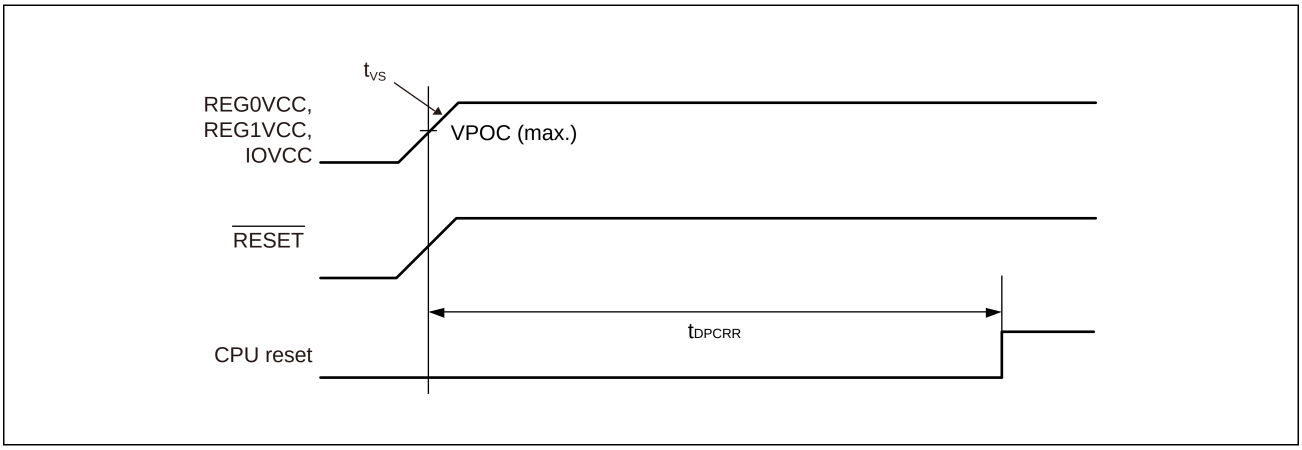


Table 47A.11 In Case the $\overline{\text{RESET}}$ Pin is Used

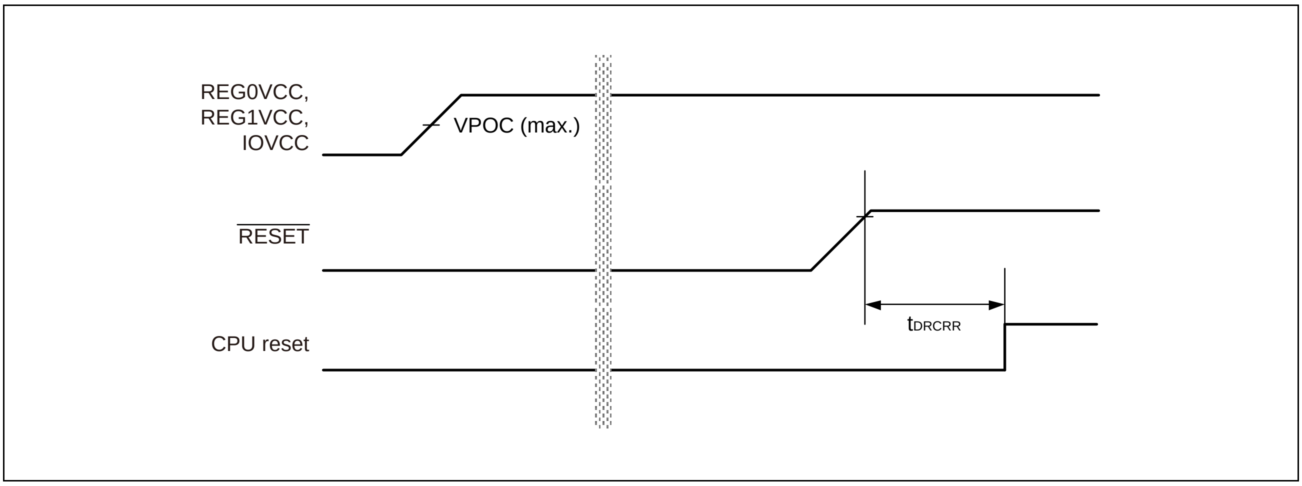
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ ↑ to CPU reset release*[1]	t_{DRCRR}				32*[2]	µs

Note 1. This is reference value.

Note 2. In case the time until releasing the $\overline{\text{RESET}}$ pin is longer than t_{DPCRR}.



47A.5 AC Characteristics

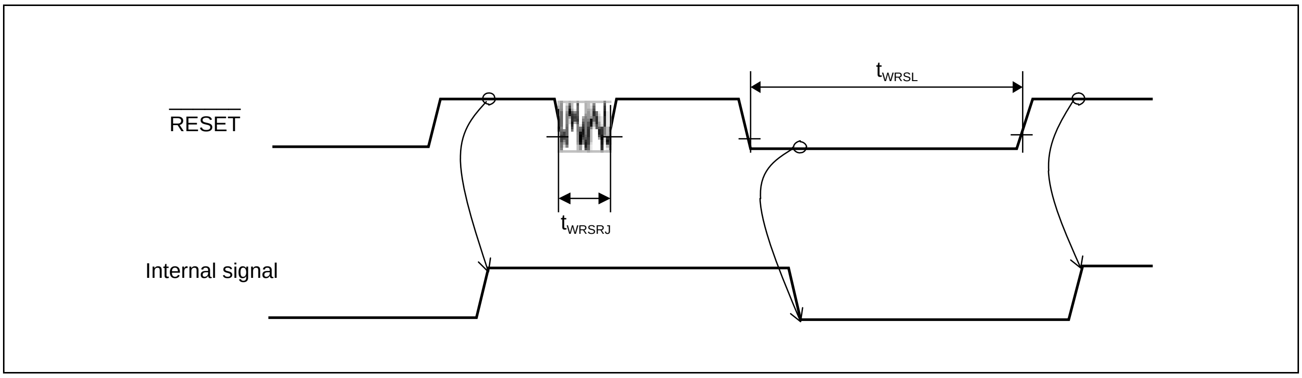
47A.5.1 $\overline{\text{RESET}}$ Timing

Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ input low level width*[1]	t_{WRSL}	Except power on	600			ns
$\overline{\text{RESET}}$ pulse rejection*[2]	t_{WRSRJ}		100			ns

Note 1. $\overline{\text{RESET}}$ input width is needed to ensure that the internal reset signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.



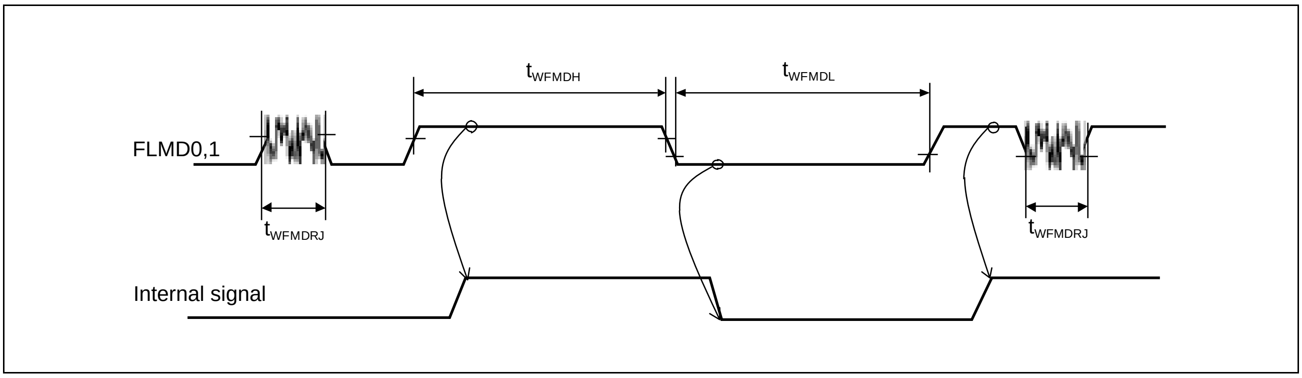
47A.5.2 Mode Timing

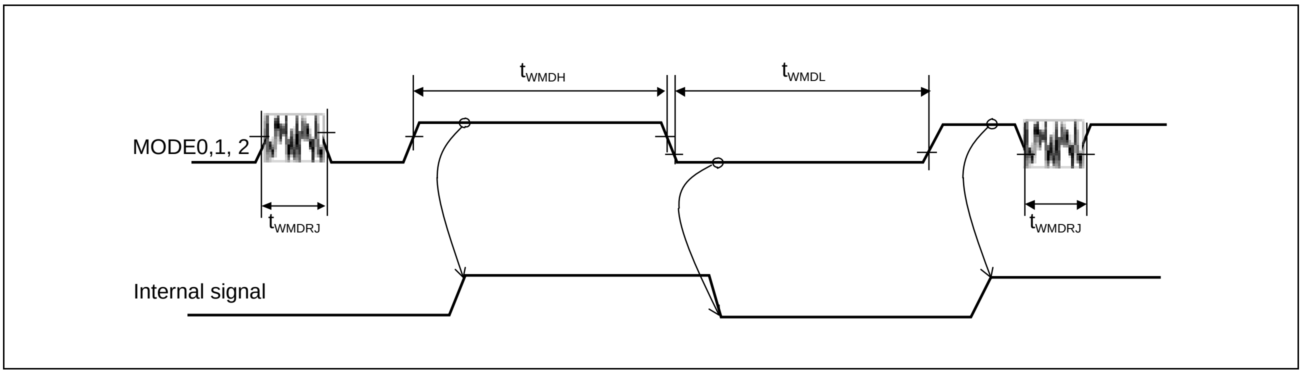
Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0, 1 input high/low level width*[1]	t_{WFMDH}/ t_{WFMDL}		600			ns
FLMD0, 1 pulse rejection*[2]	t_{WFMDRJ}		100			ns
MODE0, 1, 2 input high/low level width*[1]	t_{WMDH}/ t_{WMDL}		600			ns
MODE0, 1, 2 pulse rejection*[2]	t_{WMDRJ}		100			ns

Note 1. FLMD0, 1 and MODE0, 1, 2 input width is needed to ensure that the internal mode signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.





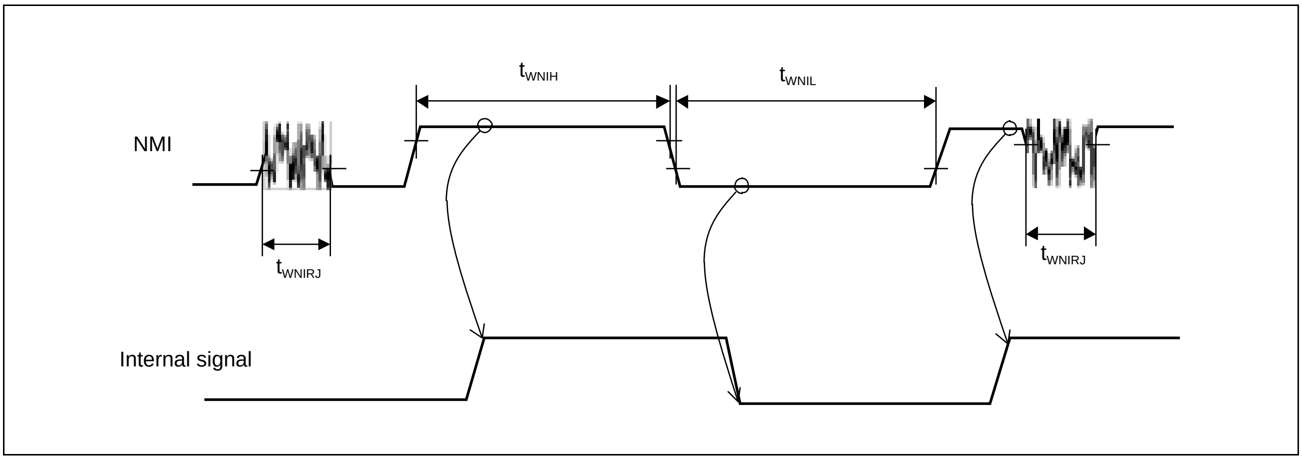
47A.5.3 Interrupt Timing

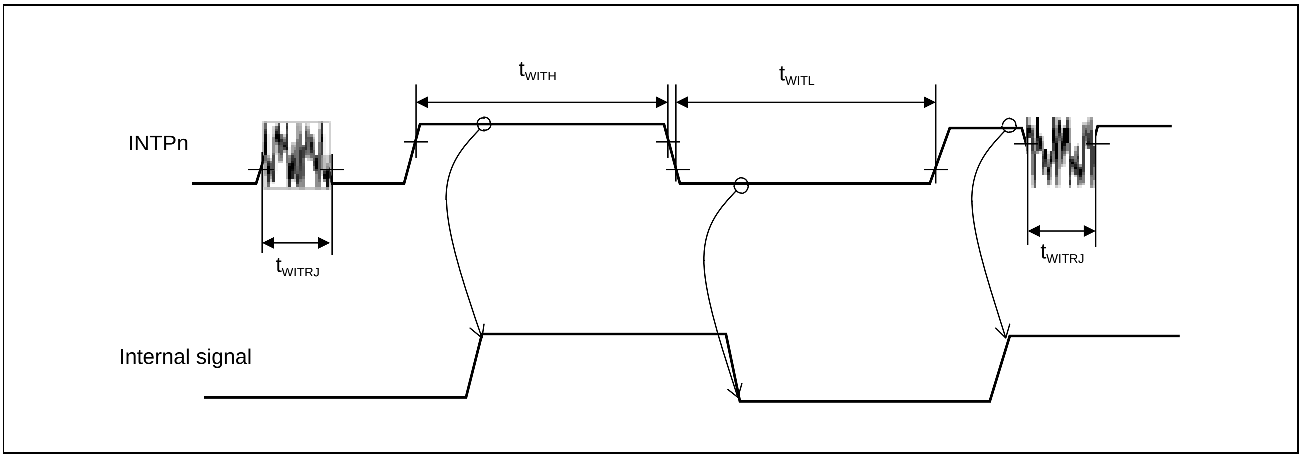
Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
NMI input high/low level width*1	t_{WNIH}/ t_{WNIL}	Edge detection mode	600			ns
		Level detection mode (EMCLK is operated by HS IntOSC)	756			ns
		Level detection mode (EMCLK is operated by LS IntOSC)	24			µs
NMI pulse rejection*2	t_{WNIRJ}		100			ns
INTPn input high/low level width*1	t_{WITH}/ t_{WITL}	Edge detection mode	600			ns
		Level detection mode (EMCLK is operated by HS IntOSC)	756			ns
		Level detection mode (EMCLK is operated by LS IntOSC)	24			µs
INTPn pulse rejection*2	t_{WITRJ}		100			ns

Note 1. NMI and INTPn input width is needed to ensure that the internal interrupt signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.



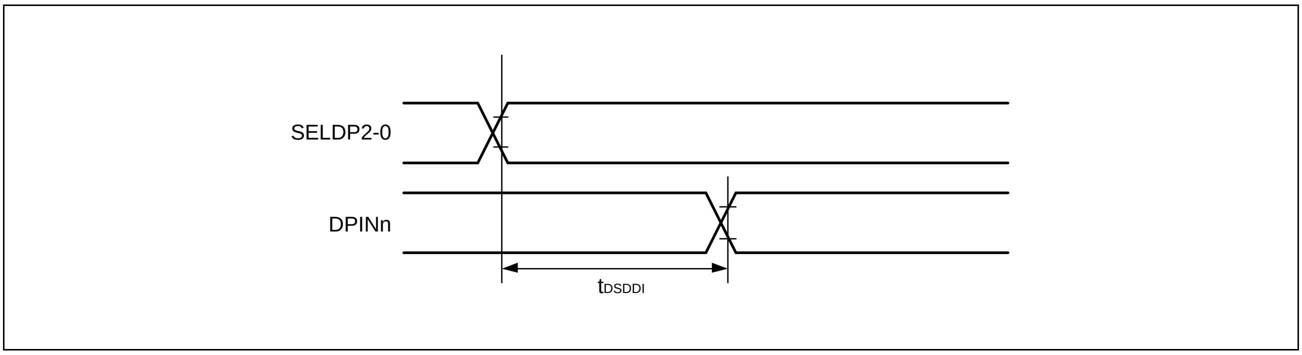


47A.5.4 Low Power Sampler (DPIN input) Timing

Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
DPINn input delay time (vs SELDP2-0)	t_{DSDDI}				150	ns

Note: n = 7 to 0



47A.5.5 CSCXFOUT Timing

Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

<Output driver strength>

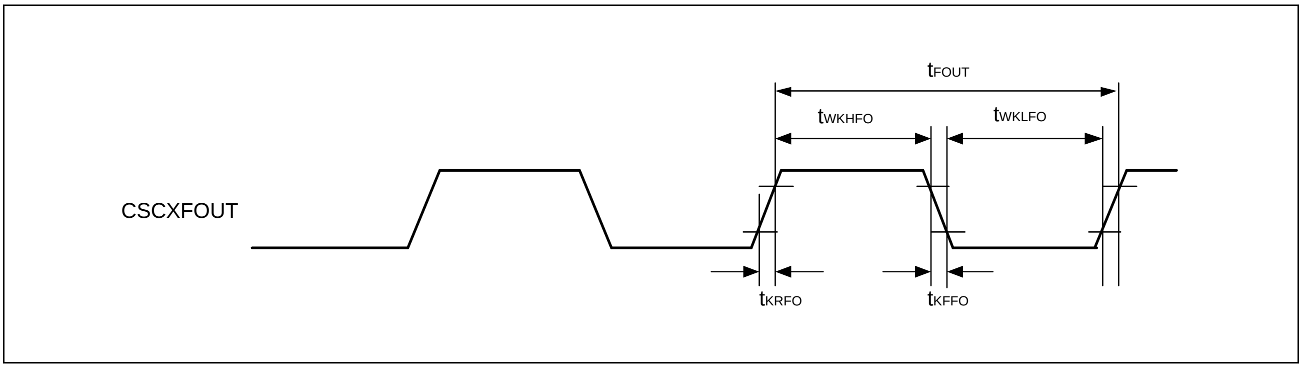
CSCXFOUT: Slow or fast mode (refer to the condition in the following table)

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
CSCXFOUT output cycle	t_{FOUT}	Slow mode		100 (max. 10 MHz)			ns
		Fast mode		41.6 (max. 24 MHz)			ns
CSCXFOUT high level width	t_{WKHFO}	Slow mode	N: 1[*1] or even value[*2]	t_{FOUT} / 2 – 37			ns
			N: Odd value (N ≥ 5)[*2,*3]	t_{FOUT} × (N+1) / 2N – 37			ns
		Fast mode	N: 1[*1] or even value[*2]	t_{FOUT} / 2 – 10			ns
			N: Odd value (N ≥ 3)[*2]	t_{FOUT} × (N+1) / 2N – 10			ns
CSCXFOUT low level width	t_{WKLFO}	Slow mode	N: 1[*1] or even value[*2]	t_{FOUT} / 2 – 37			ns
			N: Odd value (N ≥ 5)[*2,*3]	t_{FOUT} × (N–1) / 2N – 37			ns
		Fast mode	N: 1[*1] or even value[*2]	t_{FOUT} / 2 – 10			ns
			N: Odd value (N ≥ 3)[*2]	t_{FOUT} × (N–1) / 2N – 10			ns
CSCXFOUT rise/ fall time	t_{KRFO}/ t_{KFFO}	Slow mode				37	ns
		Fast mode				10	ns

Note 1. When MainOSC, HS IntOSC, LS IntOSC or SubOSC is selected as source clock with the condition of N = 1, the characteristics of output signal depends on the selected source clock. It is recommended to use output signal after evaluation on an actual environment.

Note 2. "N" is the value of "Clock divisor N" defined by FOUTDIV register.

Note 3. The selection of N = 3 is prohibited when slow mode is used.



47A.5.6 MEMC0CLK Timing

	t_{HSTWT2}	<17> DEW ≥ 1	(AHW + DPW + DEW) × T – 9			ns

Note 1. ASW means the number of address setup wait for multiplex bus.

Note 2. AHW means the number of address hold wait for multiplex bus.

Note 3. DPW means the number of programmable data wait for multiplex bus.
DEW means the number of external data wait for multiplex bus.
“w” means the sum of DPW and DEW.

Note 4. t_{CPUCLK}: CPU clock period.

Note 5. DHW means the number of data hold wait for multiplex bus.

Note 6. Address means MEMC0AD15-0, MEMC0A23-16, $\overline{\text{MEMC0CS3-0}}$, and $\overline{\text{MEMC0BEN1-0}}$.
324-pin products support 24-bit address. 233/176-pin products support 23-bit address.

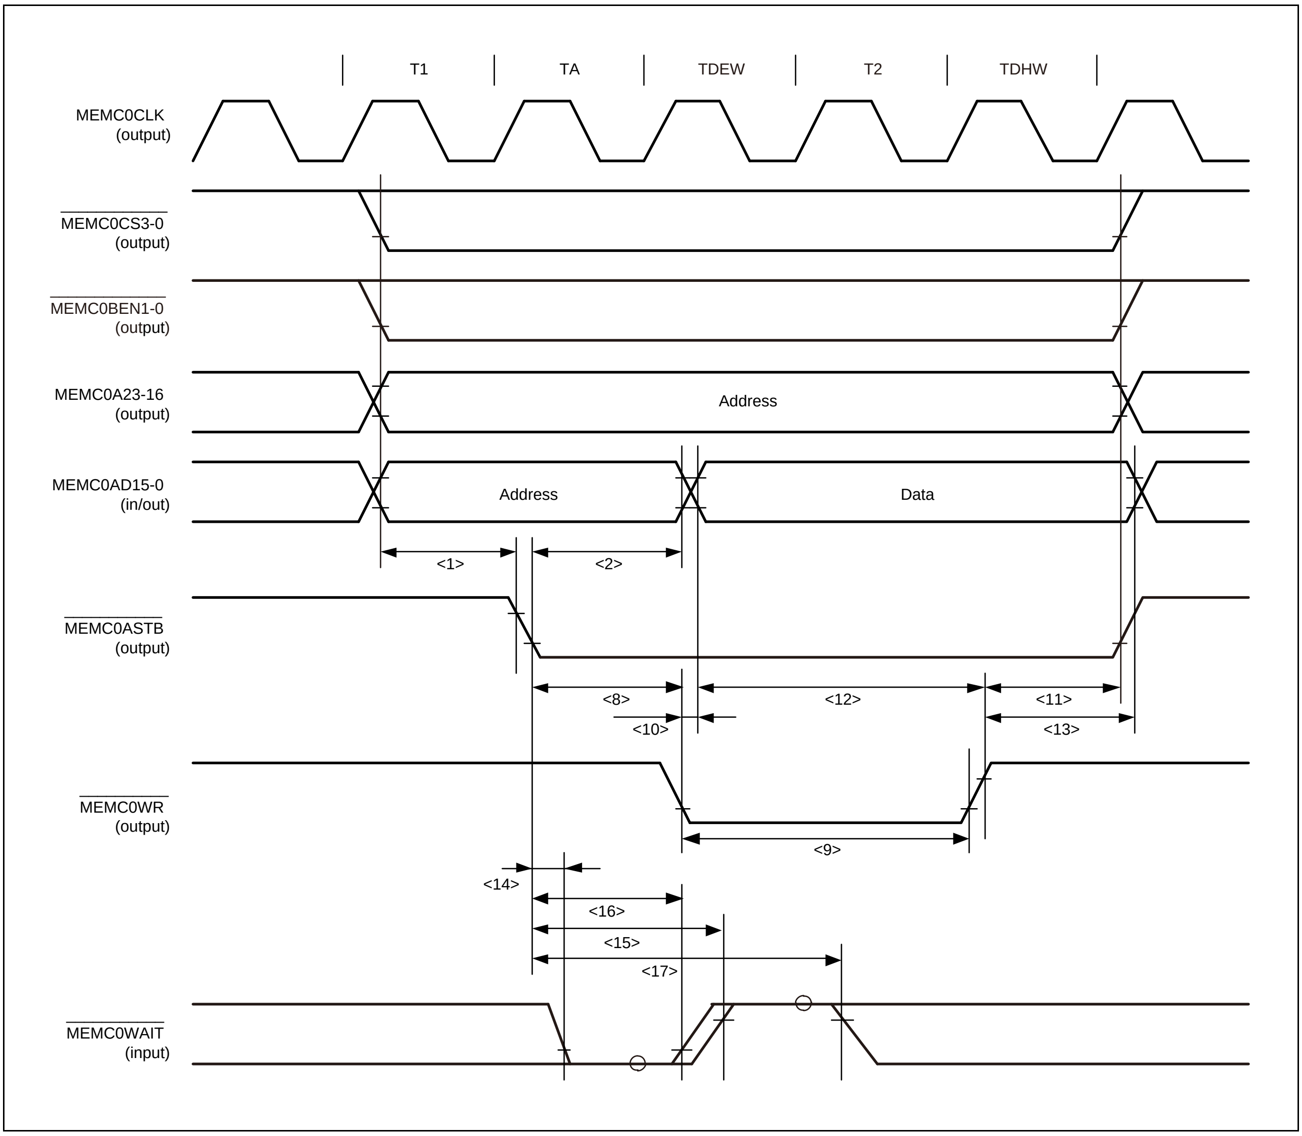
Note 7. Address means MEMC0A23-16, $\overline{\text{MEMC0CS3-0}}$, $\overline{\text{MEMC0BEN1-0}}$, and $\overline{\text{MEMC0ASTB}}$.
324-pin products support 24-bit address. 233/176-pin products support 23-bit address.

Note 8. t_{FRDA} means the period from output off to Hi-z for MEMC0AD15-0.

NOTE

When the bus period (T) is shorter than 44 ns, t_{DRDID} spec requires at least 1data wait. (w = 1)

(1) Multiplex Write Cycle (Asynchronous; 1 Data Wait)



(2) Multiplex Read Cycle (Asynchronous; 1 Data Wait)

47A.5.11 RLIN2/RLIN3 Timing

Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RLIN3 transfer rate		LIN specification	1		20	kbps
		LIN extended baud rate	1		115.2*[1]	kbps
		UART function			1.5	Mbps
RLIN2 transfer rate		LIN specification	1		20	kbps

Note 1. The LIN extended baud rate is not part of the LIN standard specification.

47A.5.12 RIIC Timing

Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C

Table 47A.17 RIIC Timing (Normal Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RIICnSCL clock period	f_{CLK}				100	kHz
Bus free time (between stop/start condition)	t_{BUF}		4.7			μs
Hold time*[1]	t_{HD}: STA		4.0			μs
RIICnSCL clock low-level width	t_{LOW}		4.7			μs
RIICnSCL clock high-level time	t_{HIGH}		4.0			μs
Setup time for start/restart condition	t_{SU}: STA		4.7			μs
Data hold time	t_{HD}: DAT	CBUS compatible master	5.0			μs
		I^{2}C mode	0*[2]			μs
Data setup time	t_{SU}: DAT		250			ns
Stop condition setup time	t_{SU}: STO		4.0			μs
Capacitance load of each bus line	Cb				400	pF

Remark: n = 0, 1

Note: If the system does not extend the RIICnSCL signal low hold time (t_{Low}), only the maximum data hold time (t_{HD}: DAT) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Table 47A.18 RIIC Timing (Fast Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RIICnSCL clock period	f_{CLK}				400	kHz
Bus free time (between stop/start condition)	t_{BUF}		1.3			µs
Hold time*1	t_{HD}: STA		0.6			µs
RIICnSCL clock low-level width	t_{LOW}		1.3			µs
RIICnSCL clock high-level time	t_{HIGH}		0.6			µs
Setup time for start/restart condition	t_{SU}: STA		0.6			µs
Data hold time	t_{HD}: DAT	I^{2}C mode	0*2			µs
Data setup time	t_{SU}: DAT		100*3			ns
Stop condition setup time	t_{SU}: STO		0.6			µs
Pulse width with spike suppressed by input filter	t_{SP}		0		50	ns
Capacitance load of each bus line	Cb				400	pF

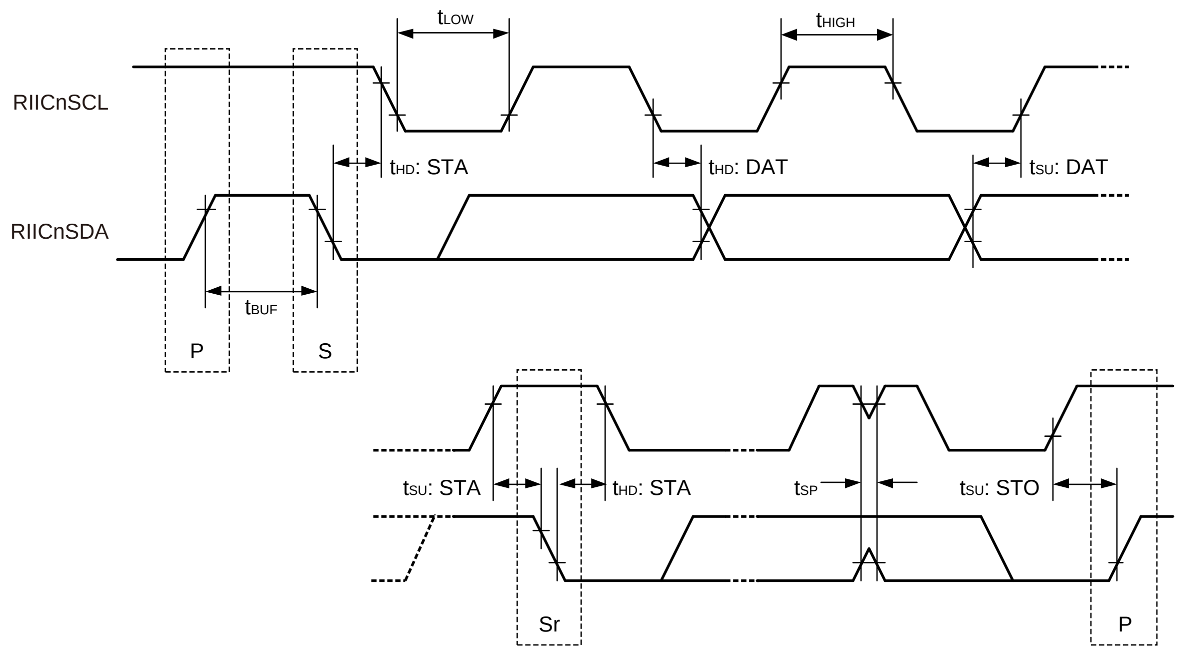
Remark: n = 0, 1

Note: If the system does not extend the RIICnSCL signal low hold time (t_{Low}), only the maximum data hold time (t_{HD}: DAT) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Note 3. The fast mode I^{2}C bus can be used in normal mode I^{2}C bus system. In this case, set the fast mode I^{2}C bus so that it meets the following conditions.
- If the system does not extend the RIICnSCL signal's low state hold time: t_{SU}: DAT ≥ 250 ns
- If the system extends the RIICnSCL signal's low state hold time:
Transmit the following data bit to the RIICnSDA line prior to releasing the RIICnSCL line
(1250 ns: Normal mode I^{2}C bus specification).



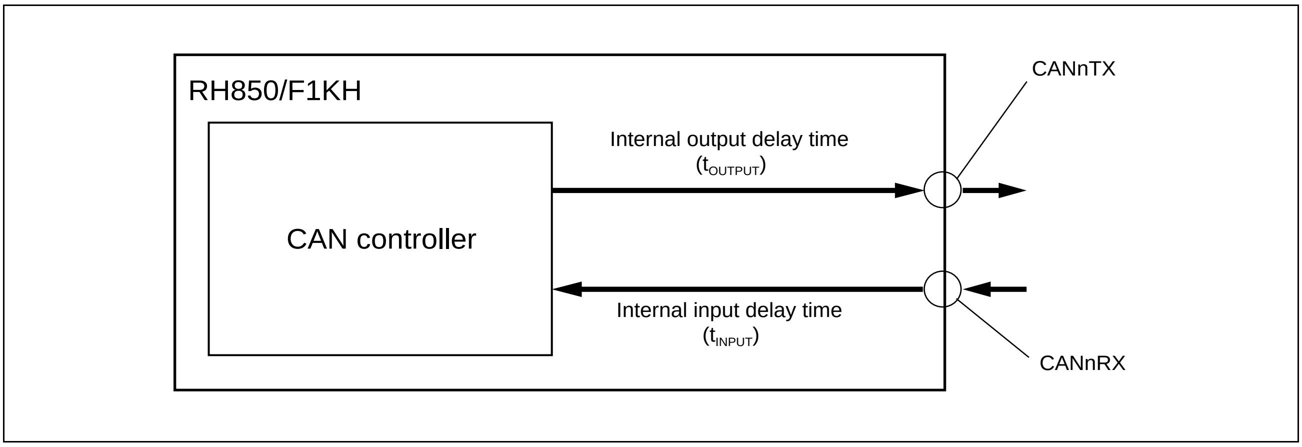
Note: P: Stop condition S: Start condition Sr: Restart condition

47A.5.13 RS-CANFD Timing

Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Transfer rate		Classical CAN mode			1	Mbps
Data bit rate (CAN FD mode)		Nominal bit rate ≤ 500 kbps			5	Mbps
		Nominal bit rate > 500 kbps			2	Mbps
Internal delay time*1	t_{NODE}				50	ns

Note 1. t_{NODE} = Internal input delay time (t_{INPUT}) + Internal output delay time (t_{OUTPUT})



47A.5.14 FlexRay Timing

Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC,

			AnVREF = 3.0 V to 4.5 V	ADCAnIm			±1.0	LSB
				ADCAnImS			±2.0	LSB

Note: Conversion accuracy when ADCA0ImS terminal is converted in 12-bit mode: Conversion accuracy can be applied if lower 2-bit is ignored from conversion result.

Note 1. This does not include quantization error.

Note 2. 3.0 + 1.3 × (the number of used T&H)

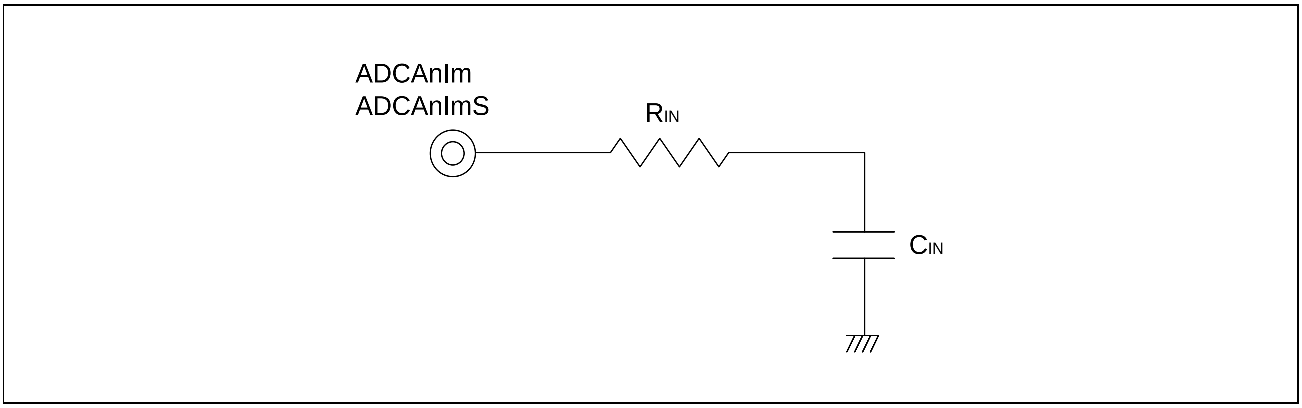
Note 3. Include the oscillation accuracy of HS IntOSC.

Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as “sampling time + successive approximation time”.

CAUTION

When an external digital pulse is applied to AP0, AP1, P8, P9, P18, and P19 pins during an A/D conversion this may lead to an A/D conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse.
The same behavior may apply when the digital buffer is used as an output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

47A.6.1 Equivalent Circuit of the Analog Input Block



Terminals	Condition	RIN (kΩ)	CIN (pF)
ADCA0I0 to 5	When T&H is used	14.1	2.1
	When T&H is not used	3.9	2.1
ADCA0I6 to 15	—	3.9	2.1
ADCA0I0S to 3S, 5S to 11S, 14S to 16S	—	5.7	9.2
ADCA0I4S, 17S to 19S	—	10.3	9.2
ADCA1I0 to 15	—	4	2.1
ADCA1I0S to 19S	—	5.5	7.9

CAUTION

This specification is not tested during outgoing inspection. Therefore RIN and CIN are reference values only and not guaranteed. In addition these values are specified as maximum values.

47A.7 Flash Programming Characteristics

47A.7.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Condition: REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = VPOC to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Table 47A.21 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{PCLK}*[3]		5*[4]		30	MHz
Number of rewrites*[1]	CWRT	Data retention of 20 years*[2]	1000			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 1000), the device can be erased “n” times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the code flash memory.

Note 3. f_{PCLK} = 1/8 f_{CPUCLK_H}: System operating frequency for internal flash.

Note 4. Only for program/erase operation.

Table 47A.22 Programming Characteristic

47A.7.2 Data Flash

The data flash memory is shipped in the erased state. If the data flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Condition: REG0VCC = EVCC = VPOC to 5.5 V, REG1VCC = VPOC to 3.6 V, REG1VCC ≤ REG0VCC,
BVCC = VPOC to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V,
AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Table 47A.23 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{PCLK}*[3]		5*[4]		30	MHz
Number of rewrites*[1]	CWRT	Data retention 20 years*[2]	125 k			times
		Data retention 3 years*[2]	250 k			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 125000), the device can be erased “n” times for each block. For example, when a block of 64 bytes is erased after 4 bytes of writing have been performed for different addresses 168 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the data flash memory.

Note 3. f_{PCLK} = 1/8 f_{CPUCLK_H}: System operating frequency for internal flash.

Note 4. Only for program/erase operation.

Table 47A.24 Programming Characteristics

Item	Symbol	Condition	Block Size	MIN.	TYP.	MAX.	Unit

			128 KB		3.48	20.48	s
			256 KB		6.95	40.94	s
Blank check time		f_{PCLK} ≥ 20 MHz	4 B			30*[1]	μs
			64 B			100*[1]	μs
			32 KB			35.2	ms
			64 KB			70.4	ms
			128 KB			140.8	ms
			256 KB			281.6	ms

Note 1. Only the processing time of the hardware. The overhead required by the software is not included.

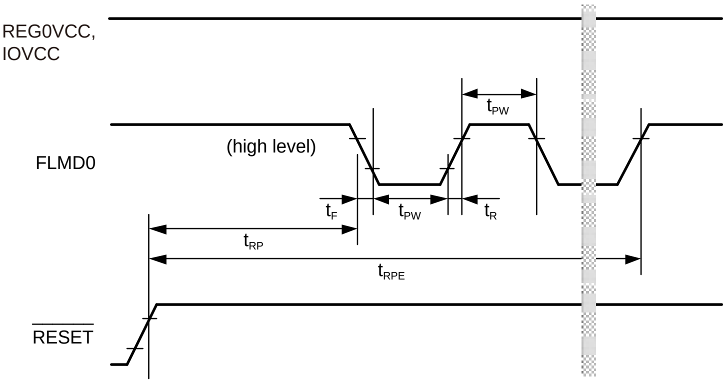
47A.7.3 Serial Programming Interface

47A.7.3.1 Serial Programmer Setup Timing

Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC, BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0 pulse input start time	t_{RP}		1.5			ms
FLMD0 pulse input end time	t_{RPE}				101.5	ms
FLMD0 low/high level width	t_{PW}		3.2			µs
FLMD0 rise time	t_R				20	ns
FLMD0 fall time	t_F				20	ns

Note: IOVCC: EVCC = BVCC = A0VREF = A1VREF



47A.7.3.2 Flash Programming Interface

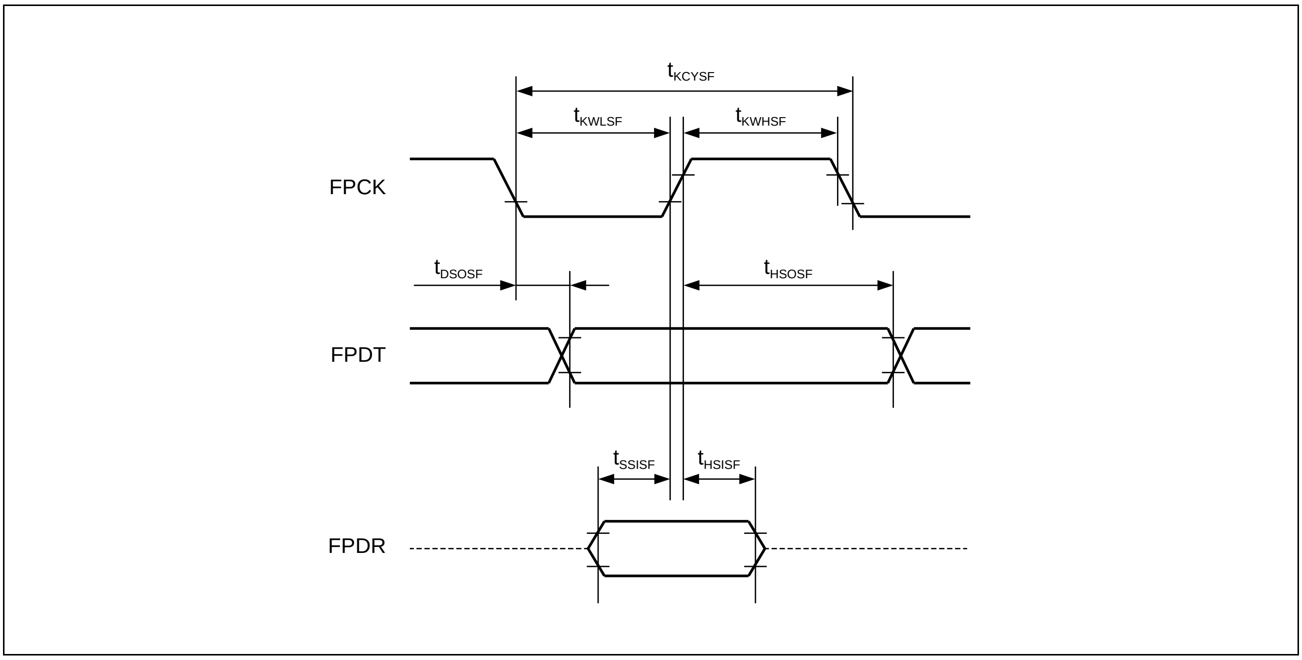
Condition: REG0VCC = EVCC = 3.0 V to 5.5 V, REG1VCC = 3.0 V to 3.6 V, REG1VCC ≤ REG0VCC, BVCC = 3.0 V to REG0VCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Flash Programming transfer rate		1-wired UART mode			1	Mbps
		2-wired UART mode (Products of CPU frequency 240 MHz max.)			1.5	Mbps
		2-wired UART mode (Products of CPU frequency 160 MHz max.)			1	Mbps
FPCK cycle time	t_{KCYSF}	3-wired clock sync mode	200*1			ns
FPCK high level width	t_{KWHSF}	3-wired clock sync mode	$t_{KCYSF} / 2 – 15$			ns
FPCK low level width	t_{KWLSF}	3-wired clock sync mode	$t_{KCYSF} / 2 – 15$			ns
FPDR setup time (vs. FPCK)	t_{SSISF}	3-wired clock sync mode	$t_{Pcyc} \times 2$			ns
FPDR hold time (vs. FPCK)	t_{HSISF}	3-wired clock sync mode	$t_{Pcyc} \times 2$			ns
FPDT output delay (vs. FPCK)	t_{DSOSF}	3-wired clock sync mode Not continuous transfer (data: 1st bit)			0	ns
		3-wired clock sync mode Not continuous transfer (data: except 1st bit)			$–t_{KWHSF} + 3 \times t_{Pcyc} + 36$	ns
FPDT hold time (vs. FPCK)	t_{HSOSF}	3-wired clock sync mode	$t_{Pcyc} \times 2$			ns

Note 1. Input an external clock that is more than 6 clocks of PCLK.

NOTE

t_{Pcyc} is period of PCLK.



47A.8 Thermal Characteristics

47A.8.1 Parameters

Package	Item	Symbol	Estimate	Unit	Note
324-pin FPBGA	Thermal Resistance	Θja	17.4	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	9.8		
233-pin FPBGA	Thermal Resistance	Θja	17.9	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	9.9		
176-pin LQFP	Thermal Resistance	Θja	31.9	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	23.8		

NOTE

The thermal resistance and characterization parameters depend on the usage environment.

47A.8.2 Board

Conforming to JESD51-7 (4 layers)

	Board Size (mm)		
	X	Y	Area (mm^2)
Board	76.2	114.3	8709.66
Remaining copper rates	Thickness of conductors		
50-95-95-50%	70-35-35-70 µm		

Section 47B Electrical Characteristics of RH850/F1KM-S4

47B.1 Overview

The electrical spec of this device is guaranteed by the following operational condition. But, this condition is different depends on each characteristics, so refer to each chapter for more detail.

47B.1.1 Pin Groups

47B.1.1.1 272-Pin Version

Symbol	Pin Group Supplied by	Related Pins/Ports
PgR	REGVCC, AWOVSS	X1, X2, XT1, XT2/IP0_0
PgE	EVCC, EVSS	Related ports: JP0, P0, P1, P2, P3, P8, P9, P20 Related pins: $\overline{\text{RESET}}$, FLMD0
PgB	BVCC, BVSS	Related ports: P10, P11, P12, P13, P18, P19, P21, P22
PgA0	A0VREF, A0VSS	Related port: AP0
PgA1	A1VREF, A1VSS	Related port: AP1

47B.1.1.2 233-Pin Version

Symbol	Pin Group Supplied by	Related Pins/Ports
PgR	REGVCC, AWOVSS	X1, X2, XT1, XT2/IP0_0
PgE	EVCC, EVSS	Related ports: JP0, P0, P1, P2, P3, P8, P9, P20 Related pins: $\overline{\text{RESET}}$, FLMD0
PgB	BVCC, BVSS	Related ports: P10, P11, P12, P13, P18, P19
PgA0	A0VREF, A0VSS	Related port: AP0
PgA1	A1VREF, A1VSS	Related port: AP1

47B.1.1.3 176-Pin Version

Symbol	Pin Group Supplied by	Related Pins/Ports
PgR	REGVCC, AWOVSS	X1, X2, XT1, XT2/IP0_0
PgE	EVCC, EVSS	Related ports: JP0, P0, P1, P2, P8, P9, P20 Related pins: $\overline{\text{RESET}}$, FLMD0
PgB	BVCC, BVSS	Related ports: P10, P11, P12, P18
PgA0	A0VREF, A0VSS	Related port: AP0
PgA1	A1VREF, A1VSS	Related port: AP1

47B.1.1.4 144-Pin Version

Symbol	Pin Group Supplied by	Related Pins/Ports

PgA0	A0VREF, A0VSS	Related port: AP0
PgA1	A1VREF, A1VSS	Related port: AP1

47B.1.1.5 100-Pin Version

Symbol	Pin Group Supplied by	Related Pins/Ports
PgR	REGVCC, AWOVSS	X1, X2
PgE	EVCC, EVSS	Related ports: JP0, P0, P8, P9, P10, P11 Related pins: $\overline{\text{RESET}}$, FLMD0
PgA0	A0VREF, A0VSS	Related port: AP0

47B.1.2 General Measurement Conditions

47B.1.2.1 Common Conditions

- Power supply
  - REGVCC = EVCC = VPOC*[1] to 5.5 V
  - BVCC = VPOC*[1] to REGVCC
  - A0VREF = 3.0 V to 5.5 V
  - A1VREF = 3.0 V to 5.5 V
  - AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V
- Capacitance of the internal regulator
  - CAWOVCL: 0.1 µF ±30%
  - CISOVCL: 0.1 µF ±30% per pin
- Operating temperature
  - Tj = –40 to +130°C@R7F7016xx3ABG*[2]
  - Tj = –40 to +150°C@R7F7016xx4ABG*[2]
    @R7F7016yy3AFP*[2]

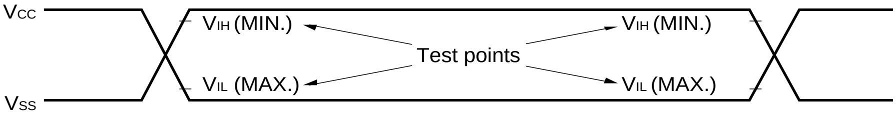
  xx = 50, 51, 52, 53
  yy = 44, 45, 46, 47, 48, 49
- Load conditions
  - CL = 30 pF

Note 1. “VPOC” means POC (power-on clear) detection voltage. For more detail, see **Section 47B.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

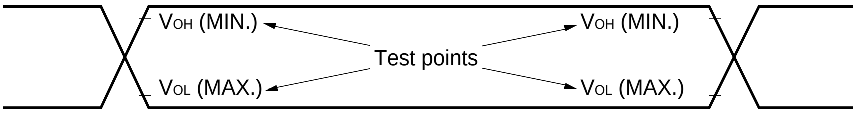
Note 2. Regarding operation temperature of each product, see **Section 1B.3, RH850/F1KM Product Lineup**.

47B.1.2.2 AC Characteristic Measurement Condition

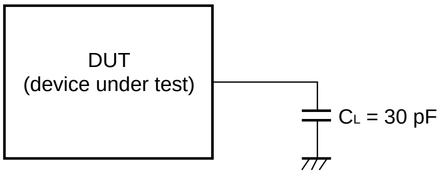
(1) AC Test Input Measurement Points



(2) AC Test Output Measurement Points



(3) Load Conditions



CAUTION

If the load capacitance exceeds 30pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30pF.

47B.2 Absolute Maximum Ratings

CAUTIONS

1. Do not directly connect outputs (or input/outputs) to each other, power supply and ground.
2. Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.
3. When designing an external circuit ensure that the connections don't conflict with the port state of this device.

47B.2.1 Supply Voltages

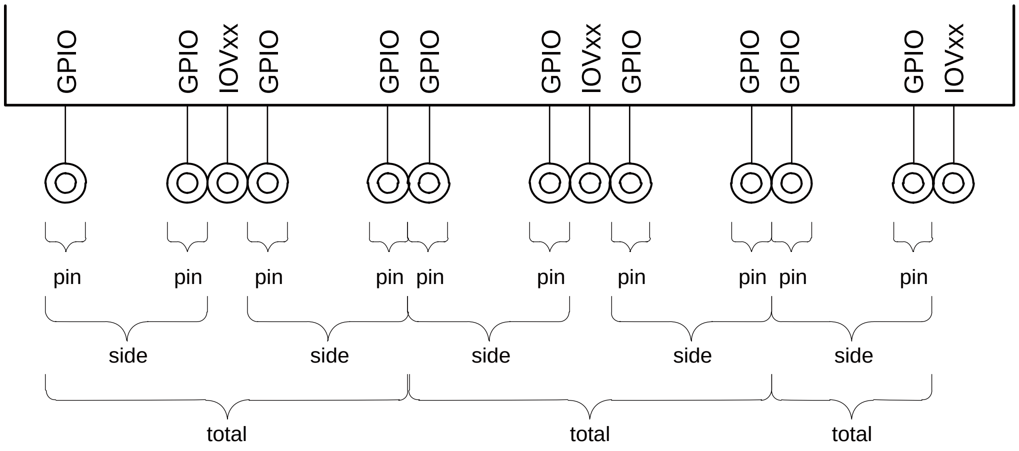
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
System supply voltage	REGVCC		–0.5		6.5	V
	AWOVSS		–0.5		0.5	V
	ISOVSS		–0.5		0.5	V
Port supply voltage	EVCC		–0.5		6.5	V
	BVCC		–0.5		6.5	V
	EVSS		–0.5		0.5	V
	BVSS		–0.5		0.5	V
A/D-converter supply voltage	A0VREF		–0.5		6.5	V
	A1VREF		–0.5		6.5	V
	A0VSS		–0.5		0.5	V
	A1VSS		–0.5		0.5	V

47B.2.2 Port Voltages

Item	Pin Group*[1]	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	PgR	VI		–0.5		REGVCC + 0.5 (Do not exceed 6.5 V)	V
	PgE			–0.5		EVCC + 0.5 (Do not exceed 6.5 V)	V
	PgB			–0.5		BVCC + 0.5 (Do not exceed 6.5 V)	V
	PgA0			–0.5		A0VREF + 0.5 (Do not exceed 6.5 V)	V
	PgA1			–0.5		A1VREF + 0.5 (Do not exceed 6.5 V)	V

Note 1. The characteristics of the alternative-function pins are the same as those of the port pins unless otherwise specified.

47B.2.3 Port Current



Definition of the condition:

- Per pin: Output current of one GPIO
- Per side: Total output current of all GPIO pins on one side of one IOVxx
- Total: Total output current of both sides of one IOVxx

Note:

- GPIO: General-purpose I/O pin (JP0, P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, AP0, AP1)
- IOVxx: Power supply pin for I/O pins (EVCC/EVSS, BVCC/BVSS, A0VREF/A0VSS, A1VREF/A1VSS)

47B.2.4 Temperature Condition

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Storage temperature	Tstg		–55		150	°C
Junction temperature	Tj	R7F7016xx3ABG	–40		130	°C
		R7F7016xx4ABG R7F7016yy3AFP	–40		150	°C

Note: xx = 40, 41, 42, 43, 50, 51, 52, 53
yy = 34, 35, 36, 37, 38, 39, 44, 45, 46, 47, 48, 49

Regarding operation temperature of each product, see **Section 1B.3, RH850/F1KM Product Lineup**.

47B.3 Operational Condition

47B.3.1 Recommended Operating Conditions

Products of CPU frequency 240 MHz max.

(1/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CPU clock frequency	f_{CPUCLK_H}	CKDIVMD = 1			240	MHz
		CKDIVMD = 0			120	MHz
	f_{CPUCLK_M}				120	MHz
	f_{CPUCLK_L}	for OSTMn			60	MHz
		for MEMC*5				
	f_{CPUCLK_UL}				30	MHz
Peripheral clock (clock domain) frequency*1	f_{CKSCLK_AWDTA}	for WDTA0			240*2	kHz
	f_{CKSCLK_ATAUJ}	for TAUJ0			40	MHz
		for TAUJ2				
	f_{CKSCLK_ARTCA}	for RTCA0			4	MHz
	f_{CKSCLK_AADCA}	for ADCA0			40	MHz
	f_{CKSCLK_AFOUT}	for FOUT			24	MHz
	$f_{CKSCLK\_ICPUCLK}$	for CPU subsystem			240 / 120	MHz
	f_{CKSCLK_IPERI1}	for TAUD0			80	MHz
		for TAUJ1				
		for TAUJ3				
		for ENCA0				
		for TAPA0				
		for PIC0				
		for SFMA0				
	f_{CKSCLK_IPERI2}	for TAUBn			40	MHz
		for RCFDCn (clkc)				
		for RSENTn				
		for PWBAn				
		for PWGAn				
		for PWSAn				
	f_{CKSCLK_ILIN}	for RLIN24n			40	MHz
		for RLIN3n				
	f_{CKSCLK_IADCA}	for ADCA1			40	MHz
	f_{CKSCLK_ICAN}	for RCFDCn (PCLK)			80	MHz
	$f_{CKSCLK\_ICANOSC}$	for RCFDCn (clk_xincan)			24	MHz
	f_{CKSCLK_ICSI}	for CSIGn			80	MHz
		for CSIHn				
	f_{CKSCLK_IIIC}	for RIICn			40	MHz
	$f_{LS\ IntOSC}$	for WDTA1			240*2	kHz
	f_{EMCLK}	for LPSn			8	MHz

(2/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Power supply	REGVCC	REGVCC = EVCC	VPOC*3		5.5	V
	EVCC					
	BVCC		VPOC*3		REGVCC	V
	A0VREF		3.0		5.5	V
	A1VREF					
Normal operation voltage	AWOVCL		1.1	1.25	1.35	V
	ISOVCL					
Limited operation voltage*4	AWOVCL		1.35		1.43	V
	ISOVCL					

Note 1. For clock specification of peripherals, see **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4**.

Note 2. This frequency depends on the internal oscillator (LS IntOSC).

Note 3. “VPOC” means POC (power-on clear) detection voltage (TYP. 2.85 V). For detail, see **Section 47B.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.
In addition, the guaranteed operation in DC characteristic.
And AC characteristic is guaranteed when more than 3.0 V.
When the power supply voltage is VPOC to 3.0 V, the device does not malfunction.

Note 4. Reliability restrictions from 1.35 V to 1.43 V.

Note 5. Devided by 2 on MEMC internal.

Products of CPU frequency 160 MHz max.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CPU clock frequency	f_{CPUCLK_H}				160	MHz

Power supply	REGVCC	REGVCC = EVCC	VPOC*3		5.5	V
	EVCC					
	BVCC		VPOC*3		REGVCC	V
	A0VREF		3.0		5.5	V
	A1VREF					
Normal operation voltage	AWOVCL		1.1	1.25	1.35	V
	ISOVCL					
Limited operation voltage*4	AWOVCL		1.35		1.43	V

Note 1. For clock specification of peripherals, see **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4**.

Note 2. This frequency depends on the internal oscillator (LS IntOSC).

Note 3. “VPOC” means POC (power-on clear) detection voltage (TYP. 2.85 V). For detail, see **Section 47B.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.
In addition, the guaranteed operation in DC characteristic.
And AC characteristic is guaranteed when more than 3.0 V.
When the power supply voltage is VPOC to 3.0 V, the device does not malfunction.

Note 4. Reliability restrictions from 1.35 V to 1.43 V.

Note 5. Devided by 2 on MEMC internal.

47B.3.2 Oscillator Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C

(1) MainOSC (In Case of Using a Crystal/Ceramic)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MainOSC frequency*[3]	f_{MOSC}		8		24	MHz
MainOSC current consumption	I_{MOSC}	After stabilization		1.9*[2]	2.3*[2]	mA
MainOSC oscillation start point	V_{MOSCSP}		VPOC			V
MainOSC oscillation operating point	V_{MOSCOP}			0.5 × REGVCC*[2]		V
MainOSC oscillation amplitude	$V_{MOSCAMP}$		0.4 × REGVCC – 0.2*[2]			V
MainOSC oscillation stabilization time	t_{MSTB}			2*[1],*[2]		ms
MainOSC transconductance	g_{m_MOSC}	MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 00		11.1*[1]		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 01		10.6*[1]		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 10		9.3*[1]		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 11		7.8*[1]		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 00		8.6*[1]		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 01		7.8*[1]		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 10		6.1*[1]		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 11		4.0*[1]		mA/V

Note 1. Oscillator stabilization time is time until being set (“1”) in MOSCS.MOSCCLKACT bit after MOSCE.MOSCENTRG bit is written “1”, and depends on the setting value of MOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

Note 2. This is reference value.

Note 3. The following four crystal/ceramic resonator frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

(2) MainOSC (In Case of External Clock Input to X1)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
X1 clock Input frequency*[1]	f_{EX}		8		24	MHz
X1 clock Input cycle time	t_{EXCYC}		41.7		125	ns
X1 High level Input voltage	V_{IH}		0.7 × REGVCC		REGVCC + 0.5	V
		@Flash Programing Interface*[2]	0.8 × REGVCC		REGVCC + 0.5	V
X1 Low level Input voltage	V_{IL}		–0.5		0.3 × REGVCC	V
		@Flash Programing Interface*[2]	–0.5		0.2 × REGVCC	V
X1 Input leakage current	I_{LIH}	VI = REGVCC			0.5	μA
	I_{LIL}	VI = 0 V			–0.5	μA
X1 clock Input low-level pulse width	t_{EXL}	f_{EX} = 8 MHz	58			ns
		f_{EX} = 16 MHz	26			ns
		f_{EX} = 20 MHz	20			ns
		f_{EX} = 24 MHz	16			ns
X1 clock Input high-level pulse width	t_{EXH}	f_{EX} = 8 MHz	58			ns
		f_{EX} = 16 MHz	26			ns
		f_{EX} = 20 MHz	20			ns
		f_{EX} = 24 MHz	16			ns
X1 clock Input period jitter			–0.3		0.3	ns

Note 1. The following four external clock input frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

Note 2. X2 should be open and its parasitic capacitance should be less than 5 pF.

(3) SubOSC

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
SubOSC frequency	f_{SOSC}	Crystal	30	32.768	38	kHz
SubOSC current consumption	I_{SOSC}	After stabilization		1.5*[2]	4*[2]	μA
SubOSC DC operating point	$V_{SOSCDCOP}$			0.65*[2]		V
SubOSC oscillation stabilization time	t_{SSTB}			*[1]		s

Note 1. Oscillator stabilization time is time until being set (“1”) in SOSCS.SOSCCLKACT bit after SOSCE.SOSCENTRG bit is written “1”, and depends on the setting value of SOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

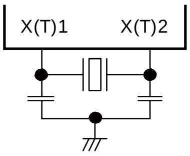
Note 2. This is reference value.

CAUTION

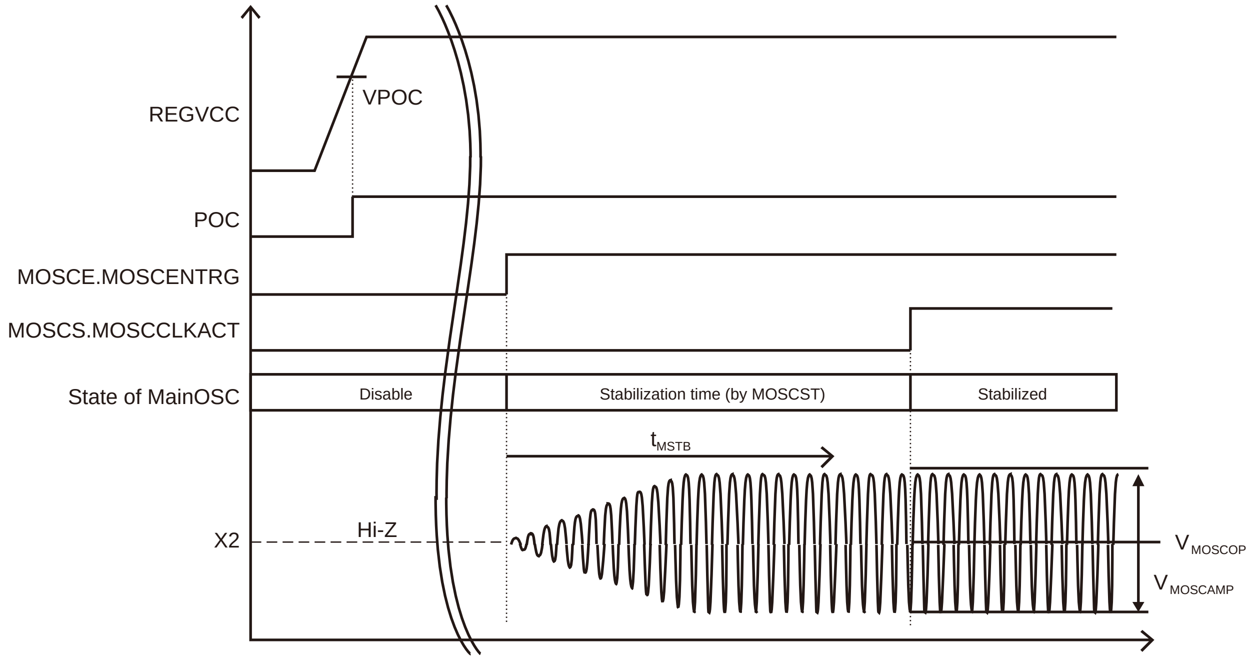
The oscillation stabilization time differs according the matching with the external resonator circuit. It is recommended to determine the oscillation stabilization time by an oscillator matching test.

NOTE

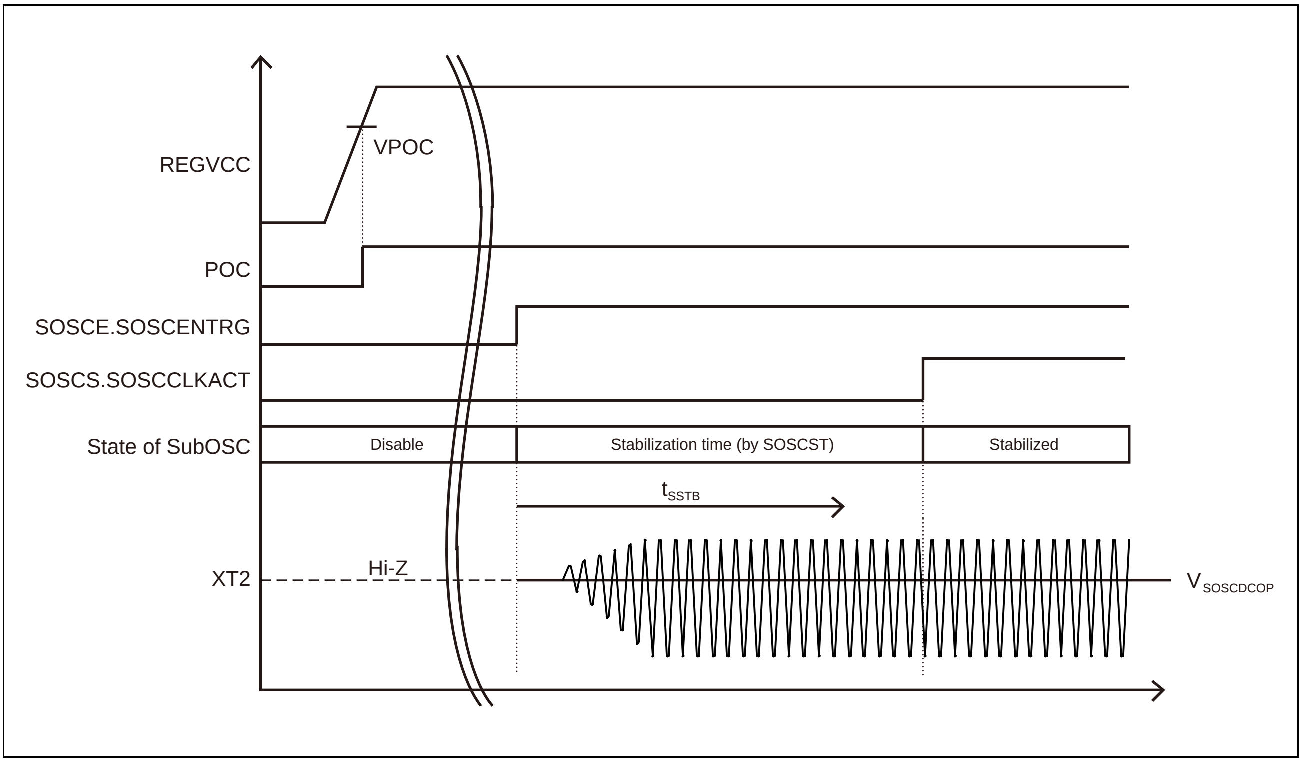
Recommended oscillator circuit is shown below.



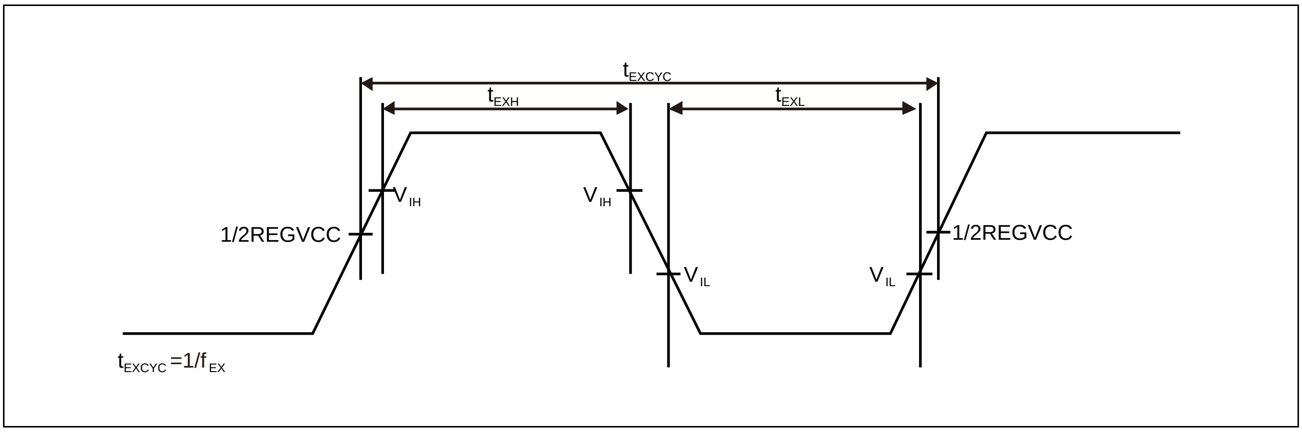
MainOSC



SubOSC



External clock



47B.3.3 Internal Oscillator Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
LS IntOSC frequency	f_{RL}		220.8	240	259.2	kHz
HS IntOSC frequency*[3]	f_{RH}		7.6	8	8.4	MHz
		After user trimming @ trimming temp*[2]	7.92	8	8.08	MHz
HS IntOSC current consumption	I_{RH}	After stabilization			170*[1]	μA
HS IntOSC oscillation stabilization time	t_{RHSTB}				54.4	μs

Note 1. This is reference value.

Note 2. The HS IntOSC frequency may not meet the specification range (8.00 MHz ±0.08 MHz after user trimming @ trimming temp) in the while writing/erasing the code/data flash.

Note 3. The HS IntOSC frequency may not meet the specification range in the Cyclic STOP/Cyclic RUN mode.

47B.3.4 PLL Characteristics

47B.3.4.1 PLL0 (for CPU, with SSCG) Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition			MIN.	TYP.	MAX.	Unit
Input frequency	$f_{PLL0CLKIN}$	MainOSC			8		24	MHz
		HS IntOSC*3			7.6	8.0	8.4	MHz
		HS IntOSC After user trimming @ trimming temp*3			7.92	8.0	8.08	MHz
Output frequency	$f_{CPLL0OUT}$	SSCG mode	MainOSC	Products of CPU frequency 240 MHz max.	105.8		240	MHz
				Products of CPU frequency 160 MHz max.	105.8		160	MHz
			HS IntOSC*3		67		84	MHz
			HS IntOSC After user trimming @ trimming temp*3		69.8		80.8	MHz
Modulation frequency	f_{MOD}				20		100	kHz
Frequency dithering range*2	f_{DIT}				0.82	1.0	1.18	%
					1.64	2.0	2.36	%
					2.46	3.0	3.54	%
					3.28	4.0	4.72	%
					4.10	5.0	5.90	%
					4.92	6.0	7.08	%
					6.56	8.0	9.44	%
					8.20	10.0	11.80	%
Lock time*1	t_{LCK0}	SSCG mode	PLL0ST = 0000 1B80$_H$		814.9	880	956.6	µs

Note 1. Lock time is time until being set (“1”) in PLL0S.PLL0CLKACT bit after PLL0E.PLL0ENTRG bit is written “1”.

Note 2. "Frequency dithering range” is set by PLL0ADJ[2:0] bits of PLL0C registers.

Note 3. The HS IntOSC has a frequency deviation. When the HSIntOSC is used the frequency deviation should be considered for the customer application as it affects peripheral functions (e.g. TAUx, ADCAn, etc.).

47B.3.4.2 PLL1 (for CPU/Peripheral) Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input frequency	$f_{PLL1CLKIN}$	MainOSC	8		24	MHz
		HS IntOSC*[3]	7.6	8.0	8.4	MHz
		HS IntOSC After user trimming @ trimming temp*[3]	7.92	8.0	8.08	MHz
Output frequency	$f_{CPLL1OUT}$	MainOSC	80		120	MHz
		HS IntOSC*[3]	76	80	84	MHz
	$f_{PPLLOUT}$		76	80	84	MHz
Output period jitter*[1]	t_{CPJ1}		–100		100	ps
Long term jitter*[1]	t_{LTJ}	term = 1 μs	–500		500	ps
		term = 10 μs	–1		1	ns
		term = 20 μs	–2		2	ns
Lock time*[2]	t_{LCK1}		104	112.3	122.1	μs

Note 1. This is reference value.

Note 2. Lock time is time until being set (“1”) in PLL1S.PLL1CLKACT bit after PLL1E.PLL1ENTRG bit is written “1”.

Note 3. The HS IntOSC has a frequency deviation. When the HSIntOSC is used the frequency deviation should be considered for the customer application as it affects peripheral functions (e.g. TAUx, ADCAn, etc.).

47B.4 DC Characteristics

47B.4.1 Capacitance

Condition: REGVCC = EVCC = BVCC = A0VREF = A1VREF = AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, Ta = 25°C

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input capacitance	CI*[1]	f = 1 MHz 0 V for non measurement pins			10	pF
Input/output capacitance	CIO*[2]				10	pF

Note 1. CI: Capacitance between the input pin and ground

Note 2. CIO: Capacitance between the input/output pin and ground

47B.4.2 Pin Characteristics

Condition: Some of the conditions mentioned in this chapter can be selected by software and described in the hardware user's manual.

Note 1. Pull-down resistor for ADC diagnostic purpose. Control via ADC self-diagnostic register.

Note 2. Supports Cload: 100 pF

Note 3. Supports Cload: 50 pF

Note 4. Pull-down resistors for ADC diagnostic and internal pull-down purposes. For ADC diagnostic, control via ADC self-diagnostic register. For internal pull-down, control via PD register.

Note 5. TTL is selected for Boundary scan mode or Nexus in normal operating mode.

Note 6. Only available for 176-pin, 233-pin and 272-pin devices.

Condition: REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
High level output voltage	VOH	Fast mode	IOH = –5 mA (6 pins)*4	IOVCC – 1.0			V
			IOH = –3 mA (10 pins)*4	IOVCC – 1.0			V
			IOH = –1 mA (16 pins)*4	IOVCC – 0.5			V
			IOH = –0.1 mA (16 pins)*4	IOVCC – 0.5			V
		Slow mode	IOH = –1 mA (16 pins)*4	IOVCC – 0.5			V
			IOH = –0.1 mA (16 pins)*4	IOVCC – 0.5			V
Low level output voltage	VOL	Fast mode	IOL = 5 mA (6 pins)*4			0.4	V
			IOL = 3 mA (10 pins)*4			0.4	V
			IOL = 1 mA (16 pins)*4			0.4	V
		Slow mode	IOL = 1 mA (16 pins)*4			0.4	V
Rise/Fall time	t_{KRP}/t_{KFP}	Fast mode (except below pins)*5	CL = 30 pF			7	ns
			CL = 50 pF			12	ns
			CL = 100 pF			24	ns
		Fast mode (P0_5, P0_6, P10_1, P10_2, P11_2, P11_3, P11_6, P11_7)*6	CL = 50 pF			6	ns
		Fast mode (P0_2, P0_3)*6	CL = 100 pF			6.15	ns
		Slow mode*5	CL = 30 pF			37	ns
			CL = 50 pF			62	ns
			CL = 100 pF			124	ns
Output frequency	f_O	Fast mode	CL = 30 pF			40	MHz
		Slow mode	CL = 30 pF			10	MHz
			CL = 50 pF			6	MHz
			CL = 100 pF			3	MHz

Note 1. “IOVCC” means the pins are assigned to the power supply (EVCC, BVCC, A0VREF and A1VREF).

Note 2. Not select the analog input function of ADCn.

Note 3. When the internal pull-up resistor of FLMD0 pin is applied by FLMDCNT register, please connect 86 kΩ or more as external pull-down resistor.

Note 4. The number of pin indicates simultaneous ON.

Note 5. Measurement point: 0.1 × IOVCC to 0.9 × IOVCC

Note 6. Measurement point: 0.2 × IOVCC to 0.8 × IOVCC

(4) 144-Pin Version

Item	Symbol	Pin Group	Condition		MIN.	TYP.	MAX.	Unit
High-level output current	IOH	PgE	Per side	P9_0 to P9_4, P20_4, P20_5			–15	mA
				P0_0 to P0_3			–20	mA
				JP0_3 to JP0_5, P0_4 to P0_6, P0_11 to P0_14, P1_0 to P1_3, P8_2, P8_10 to P8_12			–30	mA
				JP0_0 to JP0_2, P1_8 to P1_11			–30	mA
				JP0_6, P0_7 to P0_10, P1_4, P1_5, P8_0 to P8_1, P8_3 to P8_9			–30	mA
			Total (EVCC)				–60	mA
		PgB	Per side	P10_6 to P10_9, P18_0 to P18_3			–30	mA
				P10_10 to P10_14, P11_1 to P11_7, P11_15, P12_0 to P12_2			–30	mA
				P10_0 to P10_5, P10_15, P11_0, P11_8 to P11_12			–30	mA
			Total (BVCC)				–60	mA
		PgA0	Total (A0VREF)				–16	mA
		PgA1	Total (A1VREF)				–8	mA
Low-level output current	IOL	PgE	Per side	P9_0 to P9_4, P20_4 to P20_5			15	mA
				P0_0 to P0_6, P0_11 to P0_14, P1_0 to P1_3			30	mA
				JP0_0 to JP0_5, P1_8 to P1_11, P8_2, P8_10 to P8_12			30	mA
				JP0_6, P0_7 to P0_10			25	mA
				P1_4 to P1_5, P8_0, P8_1, P8_3 to P8_9			19	mA
			Total (EVCC)				60	mA
		PgB	Per side	P18_0 to P18_3			20	mA
				P10_6 to P10_14, P11_1, P11_2			30	mA
				P11_3 to P11_7, P11_15, P12_0 to P12_2			30	mA
				P10_0 to P10_5, P10_15, P11_0, P11_8 to P11_12			30	mA
			Total (BVCC)				60	mA
		PgA0	Total (A0VREF)				16	mA
		PgA1	Total (A1VREF)				8	mA

Note: For detail of the definition of “side” and “total”, see **Section 47B.2.3, Port Current**.

(5) 100-Pin Version

Item	Symbol	Pin Group	Condition		MIN.	TYP.	MAX.	Unit
High-level output current	IOH	PgE	Per side	P9_0 to P9_4			–5	mA
				P0_0 to P0_3, P10_3 to P10_5			–25	mA
				JP0_3 to JP0_5, P0_4 to P0_6, P0_11 to P0_14, P8_2, P8_10 to P8_12			–30	mA
				JP0_0 to JP0_2			–11	mA
				P0_7 to P0_10, P8_3 to P8_9			–27	mA
				P10_6 to P10_9			–20	mA
				P10_10 to P10_14, P11_1 to P11_7			–30	mA
				P10_0 to P10_2			–15	mA
			Total (EVCC)				–60	mA
		PgA0	Total (A0VREF)				–16	mA
Low-level output current	IOL	PgE	Per side	P9_0 to P9_4			5	mA
				P0_0 to P0_6, P0_11 to P0_14, P10_3 to P10_5			30	mA
				JP0_0 to JP0_5, P8_2, P8_10 to P8_12			26	mA
				P0_7 to P0_10			20	mA
				P8_3 to P8_9			7	mA
				P10_6 to P10_14, P11_1, P11_2			30	mA
				P11_3 to P11_7			25	mA
				P10_0 to P10_2			15	mA
			Total (EVCC)				60	mA
		PgA0	Total (A0VREF)				16	mA

Note: For detail of the definition of “side” and “total”, see **Section 47B.2.3, Port Current**.

47B.4.3 Power Supply Currents

Condition: REGVCC, EVCC, BVCC, A0VREF and A1VREF total current. But the I/O buffer is stopped.

Products of CPU frequency 240 MHz max.

Item	Symbol	Condition				MIN.	TYP.*1	MAX.	Unit
		CPU	PLL	Tj	Peripheral*2				
RUN mode current	IDDR	Run (240 MHz)	Run	–40 to 150°C	Run (#1)		70	185	mA
				25°C	Stop (#1)		64		mA
RUN mode current (During data/code flash programming)	IDDR3	Run (240 MHz)	Run	–40 to 150°C	Run (#2)		90	205	mA
RUN mode current (With code flash background operation)	IDDRBGO	Run (240 MHz)	Run	–40 to 150°C	Run (#6)		90	205	mA
RUN mode current (HALT state)	IDDH	Run (240 MHz)	Run	–40 to 150°C	Run (#3)		67	183	mA

Products of CPU frequency 160 MHz max.

Item	Symbol	Condition				MIN.	TYP.*1	MAX.	Unit
		CPU	PLL	Tj	Peripheral*2				
RUN mode current	IDDR	Run (160 MHz)	Run	–40 to 150°C	Run (#1)		60	173	mA
				25°C	Stop (#1)		54		mA
RUN mode current (During data/code flash programming)	IDDR3	Run (160 MHz)	Run	–40 to 150°C	Run (#2)		80	193	mA
RUN mode current (With code flash background operation)	IDDRBGO	Run (160 MHz)	Run	–40 to 150°C	Run (#6)		80	193	mA
RUN mode current (HALT state)	IDDH	Run (160 MHz)	Run	–40 to 150°C	Run (#3)		57	171	mA

Products of CPU frequency 240 MHz max, 160 MHz max.

Item	Symbol	Condition				MIN.	TYP.*1	MAX.	Unit
		CPU	PLL	Tj	Peripheral*2				
STOP mode current	IDDS	Stop	Stop	–40 to 90°C	Stop (#2)		1.3	22	mA
				110°C	Stop (#2)			42	mA
				135°C	Stop (#2)			66	mA
DeepSTOP mode current	IDDDS	Power off	Power off	–40 to 85°C	Stop (#3)		50	700	µA
				105°C	Stop (#3)			1280	µA
				125°C	Stop (#3)			1840	µA
Cyclic RUN mode current	IDDCR	Run (HS IntOSC)	Stop	–40 to 90°C	Run (#4)		6.1	28	mA
				115°C	Run (#4)			47	mA
				135°C	Run(#4)			71	mA
Cyclic STOP mode current	IDDCS	Stop	Stop	–40 to 90°C	Run (#5)		1.4	23	mA
				110°C	Run (#5)			42	mA
				135°C	Run (#5)			66	mA

Note 1. The condition of “TYP.” shows the specification with the following conditions. Also, the value is just for reference only.
- Tj = 25°C
- REGVCC = EVCC = BVCC = A0VREF = A1VREF = 5.0 V
- AWOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V

Note 2. Operating condition of each peripheral function is shown in the table of next page.

Caution: It must be ensured that the junction temperature in the Ta range remains below Tj ≤ 150°C and does not exceed its limit under application conditions (thermal resistance, power supply current, peripheral current (if not included in power supply current), port output current and injection current).

Function		Run						Stop		
		(#1)	(#2)	(#3)	(#4)	(#5)	(#6)	(#1)	(#2)	(#3)

47B.4.4 Injection Currents

Table 47B.1 Definition of Pin Group (272-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgR	REGVCC, AWOVSS	IP0_0
PgE	EVCC, EVSS	JP0, P0, P1, P2, P3, P20
PgB	BVCC, BVSS	P10, P11, P12, P13, P21, P22
PgE’	EVCC, EVSS	P8, P9
PgB’	BVCC, BVSS	P18, P19
PgA0	A0VREF, A0VSS	AP0
PgA1	A1VREF, A1VSS	AP1

Table 47B.2 Definition of Pin Group (233-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgR	REGVCC, AWOVSS	IP0_0
PgE	EVCC, EVSS	JP0, P0, P1, P2, P3, P20
PgB	BVCC, BVSS	P10, P11, P12, P13
PgE’	EVCC, EVSS	P8, P9
PgB’	BVCC, BVSS	P18, P19
PgA0	A0VREF, A0VSS	AP0
PgA1	A1VREF, A1VSS	AP1

Table 47B.3 Definition of Pin Group (176-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgR	REGVCC, AWOVSS	IP0_0
PgE	EVCC, EVSS	JP0, P0, P1, P2, P20
PgB	BVCC, BVSS	P10, P11, P12
PgE’	EVCC, EVSS	P8, P9
PgB’	BVCC, BVSS	P18
PgA0	A0VREF, A0VSS	AP0
PgA1	A1VREF, A1VSS	AP1

Table 47B.4 Definition of Pin Group (144-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgR	REGVCC, AWOVSS	IP0_0
PgE	EVCC, EVSS	JP0, P0, P1, P20
PgB	BVCC, BVSS	P10, P11, P12
PgE’	EVCC, EVSS	P8, P9
PgB’	BVCC, BVSS	P18
PgA0	A0VREF, A0VSS	AP0
PgA1	A1VREF, A1VSS	AP1

Table 47B.5 Definition of Pin Group (100-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgE	EVCC, EVSS	JP0, P0, P10, P11
PgE’	EVCC, EVSS	P8, P9
PgA0	A0VREF, A0VSS	AP0

47B.4.4.1 Absolute Maximum Ratings

(1) 272/233/176/144-Pin Versions

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJPM}	PgE	Per pin			10	mA
			Total			60	mA
		PgB	Per pin			10	mA
			Total			60	mA
		PgE’	Per pin			10	mA
			Total			60	mA
		PgB’	Per pin			10	mA
			Total			60	mA
		PgA0	Per pin			10	mA
			Total			60	mA
		PgA1	Per pin			10	mA
			Total			60	mA
		PgR	Per pin			10	mA
Negative overload current VIN < VSS	I_{INJNM}	PgE	Per pin			–10	mA
			Total			–60	mA
		PgB	Per pin			–10	mA
			Total			–60	mA
		PgE’	Per pin			–10	mA
			Total			–60	mA
		PgB’	Per pin			–10	mA
			Total			–60	mA
		PgA0	Per pin			–10	mA
			Total			–60	mA
		PgA1	Per pin			–10	mA
			Total			–60	mA
		PgR	Per pin			–10	mA

CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgA0 and PgA1, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

(2) 100-Pin Version

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJPM}	PgE	Per pin			10	mA
			Total			60	mA
		PgE’	Per pin			10	mA
			Total			60	mA
		PgA0	Per pin			10	mA
			Total			60	mA
Negative overload current VIN < VSS	I_{INJNM}	PgE	Per pin			–10	mA
			Total			–60	mA
		PgE’	Per pin			–10	mA
			Total			–60	mA
		PgA0	Per pin			–10	mA
			Total			–60	mA

CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgA0, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

47B.4.4.2 DC Characteristics for Overload Current

(1) 272/233/176/144-Pin Versions

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJP}	PgE	Per pin			2	mA
			Total			50	mA
		PgB	Per pin			2	mA
			Total			50	mA
		PgE’	Per pin			3	mA
			Total			20	mA
		PgB’	Per pin			3	mA
			Total			20	mA
		PgA0	Per pin			3	mA
			Total			20	mA
		PgA1	Per pin			3	mA
			Total			20	mA
		PgR	Per pin			2	mA
Negative overload current VIN < VSS	I_{INJN}	PgE	Per pin			–2	mA
			Total			–50	mA
		PgB	Per pin			–2	mA
			Total			–50	mA
		PgE’	Per pin			–3	mA
			Total			–20	mA
		PgB’	Per pin			–3	mA
			Total			–20	mA
		PgA0	Per pin			–3	mA
			Total			–20	mA
		PgA1	Per pin			–3	mA
			Total			–20	mA
		PgR	Per pin			–2	mA

NOTE

These specifications are not tested on sorting and are specified based on the device characterization.

(2) 100-Pin Version

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJP}	PgE	Per pin			2	mA
			Total			50	mA
		PgE'	Per pin			3	mA
			Total			20	mA
		PgA0	Per pin			3	mA
			Total			20	mA
Negative overload current VIN < VSS	I_{INJN}	PgE	Per pin			–2	mA
			Total			–50	mA
		PgE'	Per pin			–3	mA
			Total			–20	mA
		PgA0	Per pin			–3	mA
			Total			–20	mA

NOTE

These specifications are not tested on sorting and are specified based on the device characterization.

47B.4.5 Power Management Characteristics

47B.4.5.1 Regulator Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	REGVCC		VPOC*[1]		5.5	V
Output voltage	AWOVCL	AWOVCL pin	1.15	1.25	1.35	V
	ISOVCL	ISOVCL pin	1.15	1.25	1.35	V
Capacitance	CAWOVCL	AWOVCL pin	0.07	0.10	0.13	μF
	CISOVCL	ISOVCL pin	0.07	0.10	0.13	μF
Equivalent series resistance for load capacitance	RVRAWO	for CAWOVCL			40*[2]	mΩ
	RVRISO	for CISOVCL			40*[2]	mΩ
Inrush current during power-on					250	mA

Note 1. “VPOC” means POC (power-on clear) detection voltage (typ. 2.85 V). For detail, see **Section 47B.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

Note 2. This is reference value.

47B.4.5.2 Voltage Detector (POC, LVI, VLVI, CVM) Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition			MIN.	TYP.	MAX.	Unit
Detection voltage (REGVCC)	VPOC	POC			2.7	2.85	3.0	V
	VLVI0	LVI	Rise		3.87	4.0	4.13	V
			Fall		3.9	4.0	4.1	V
	VLVI1		Rise		3.57	3.7	3.83	V
			Fall		3.6	3.7	3.8	V
	VLVI2		Rise		3.37	3.5	3.63	V
			Fall		3.4	3.5	3.6	V
	VVLVI	VLVI			1.8	1.9	2.0	V
Detection voltage (ISOVCL)	VCVMH	CVM	High voltage$^{\text{Caution}}$		1.35	1.39	1.43	V
	VCVML*8		Low voltage$^{\text{Caution}}$		1.10	1.15	1.20	V
Response time	t_{D_POC1}*6	POC	At power-on (Rise)	*1			2	ms
				*2			6.3	ms
			After power-on (Rise)	*3			2	ms
				*4			5	ms
	t_{D_POC2}*7		After power-on (Fall)	*5			5	µs
	t_{D_LVI}	LVI					2	ms
	t_{D_VLVI}	VLVI		*3			2	ms
				*4			5	ms
	t_{D_CVM}	CVM			0.2		10	µs
Setup time	t_{S_LVI}	LVI	LVICNT0,1 bits are set to 1 (except 00_B), then LVI is ready to operate				80	µs
REGVCC minimum width	t_{W_POC}	POC			0.2			ms
	t_{W_LVI}	LVI			0.2			ms
	t_{W_VLVI}	VLVI			0.2			ms

Note 1. Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms

Note 2. Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms

Note 3. Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 20 V/ms

Note 4. Voltage slope (t_{VS}): 20 V/ms < t_{VS} ≤ 500 V/ms

Note 5. Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 500 V/ms

Note 6. t_{D_POC1} is the time from detection voltage to release of reset signal.

Note 7. t_{D_POC2} is the time from detection voltage to occurrence of reset signal.

Note 8. The CVM monitors the internal voltage regulator output to ensure that ISOVCL is upper than specified minimum level.

Caution: A detection of the voltage ISOVCL outside the specified level of VCVMH and VCVML is not ensured by CVM.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REGVCC and IOVCC*1)	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 µs/V)	V/ms
REGVCC ↑ and IOVCC*1 ↑ to $\overline{\text{RESET}}$ ↑ delay time	t_{DPOR}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 hold time (vs $\overline{\text{RESET}}$ ↑)	t_{HMDR}		1			ms
FLMD0 setup time (vs $\overline{\text{RESET}}$ ↓)	t_{SMDF}		0			µs
$\overline{\text{RESET}}$ ↓ to REGVCC ↓ and IOVCC*1 ↓ delay time	t_{DRPD}		0			ms

Note 1. IOVCC means EVCC, BVCC, A0VREF and A1VREF.

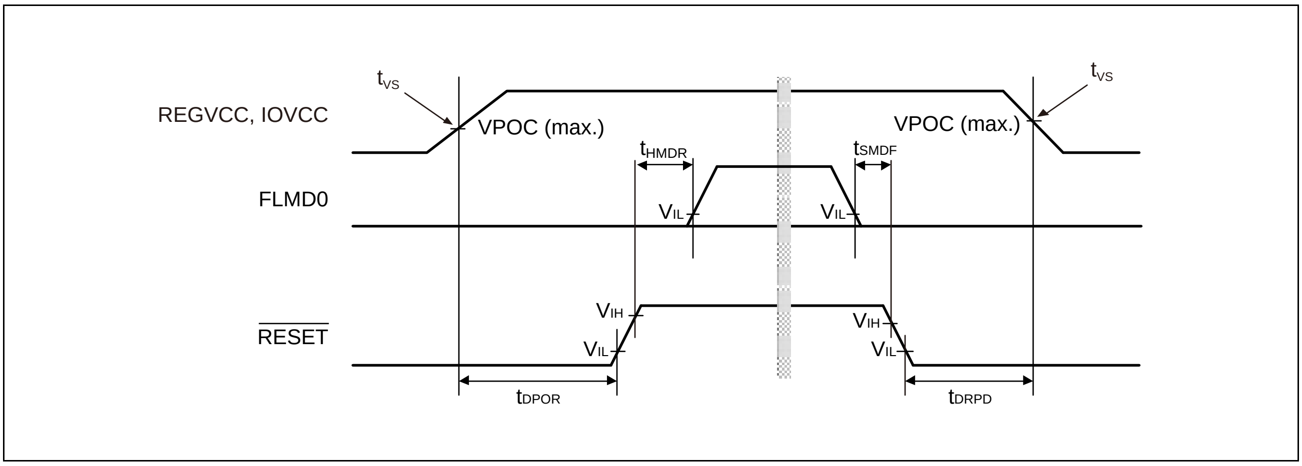

Table 47B.7 In Case the $\overline{\text{RESET}}$ Pin is Used (for Serial Programming Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REGVCC and IOVCC*1)	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 μs/V)	V/ms
REGVCC ↑ and IOVCC*1 ↑ to $\overline{\text{RESET}}$ ↑ delay time	t_{DPOR}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 setup time (vs $\overline{\text{RESET}}$ ↑)	t_{SMD0R}		1			ms
$\overline{\text{RESET}}$ ↓ to REGVCC ↓ and IOVCC*1 ↓ delay time	t_{DRPD}		0			ms

Note 1. IOVCC means EVCC, BVCC, A0VREF and A1VREF.

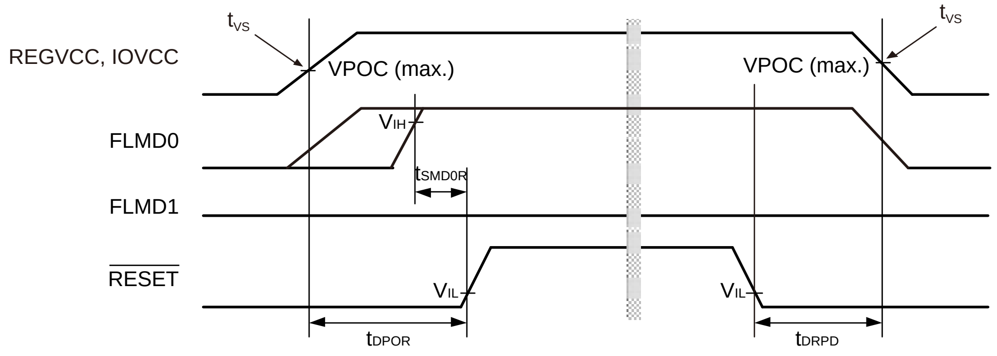

Table 47B.8 In Case the $\overline{\text{RESET}}$ Pin is Used (for Boundary Scan Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REGVCC and IOVCC*^{1})	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 µs/V)	V/ms
REGVCC ↑ and IOVCC*^{1} ↑ to $\overline{\text{RESET}}$ ↑ delay time	t_{DPOR}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 setup time (vs $\overline{\text{RESET}}$ ↑)	t_{SMD0R}		1			ms
FLMD1,MODE0,MODE1 setup time (vs FLMD0 ↑)	t_{SMD1R}		1			µs
FLMD0 hold time (vs $\overline{\text{RESET}}$ ↓)	t_{HMD0F}		1			µs
FLMD1, MODE0, MODE1, MODE2 hold time (vs FLMD0 ↓)	t_{HMD1F}		1			µs
$\overline{\text{RESET}}$ ↓ to REGVCC ↓ and IOVCC*^{1} ↓ delay time	t_{DRPD}		0			ms
$\overline{\text{DCUTRST}}$ input delay time (vs $\overline{\text{RESET}}$ ↑)	t_{DRTRST}		1			ms
$\overline{\text{RESET}}$ hold time (vs $\overline{\text{DCUTRST}}$ ↓)	t_{HRTRST}		0			ms

Note 1. IOVCC means EVCC, BVCC, A0VREF and A1VREF.

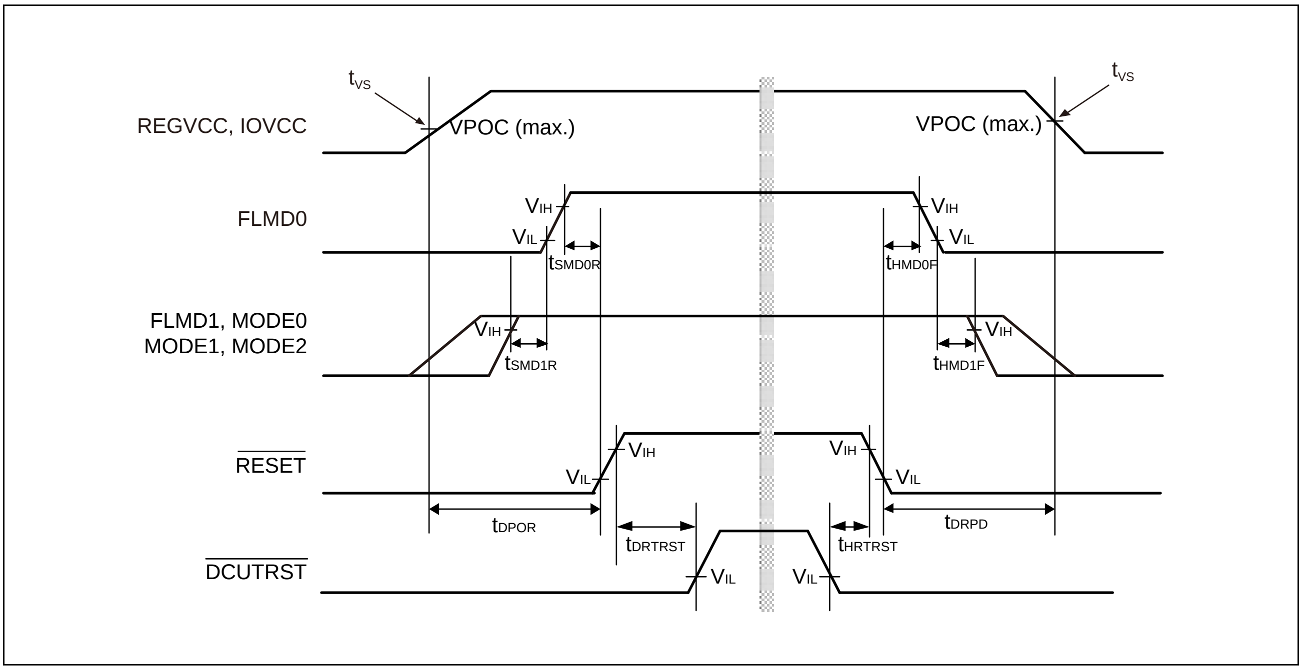

Table 47B.9 In Case the $\overline{\text{RESET}}$ Pin is Used (for User Boot Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REGVCC and IOVCC^{*1})	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 μs/V)	V/ms
REGVCC ↑ and IOVCC^{*1} ↑ to $\overline{\text{RESET}}$ ↑ delay time	t_{DPOR}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 setup time (vs $\overline{\text{RESET}}$ ↑)	t_{SMD0R}		1			ms
FLMD1, MODE0, MODE1, MODE2 setup time (vs FLMD0 ↑)	t_{SMD1R}		1			μs
FLMD0 hold time (vs $\overline{\text{RESET}}$ ↓)	t_{HMD0F}		1			μs
FLMD1, MODE0, MODE1, MODE2 hold time (vs FLMD0 ↓)	t_{HMD1F}		1			μs
$\overline{\text{RESET}}$ ↓ to REGVCC ↓ and IOVCC ↓ delay time	t_{DRPD}		0			ms

Note 1. IOVCC means EVCC, BVCC, A0VREF and A1VREF.

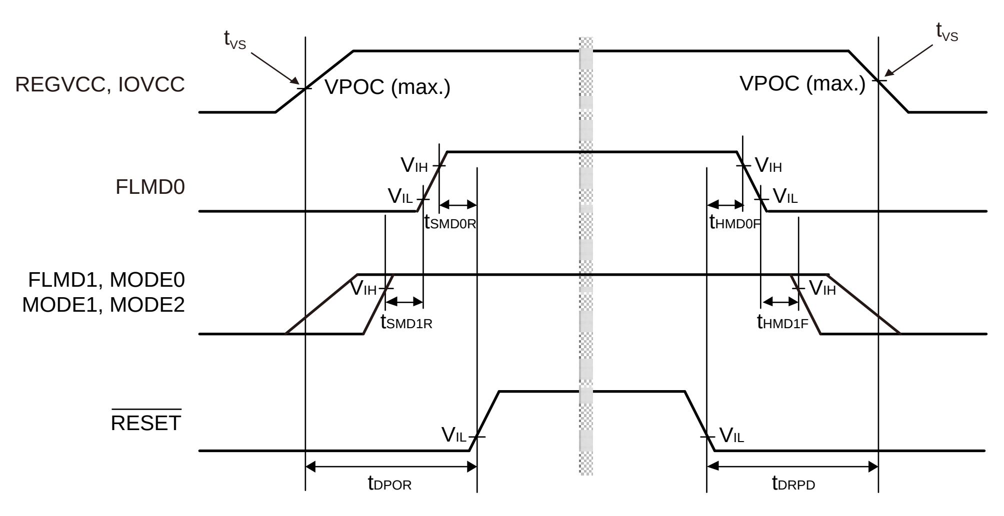

Table 47B.10 In Case the $\overline{\text{RESET}}$ Pin is Not Used and Fixed to High Level by Pull-up*[1]

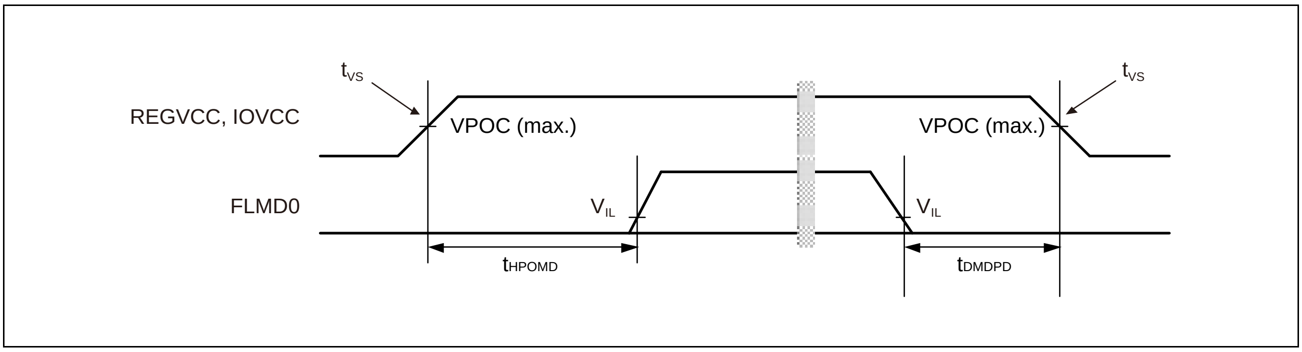
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REGVCC and IOVCC*[2])	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 μs/V)	V/ms
REGVCC ↑ and IOVCC*[2] ↑ to FLMD0 hold time	t_{HPOMD}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 ↓ to REGVCC ↓ and IOVCC*[2] ↓ delay time	t_{DMDPD}		1			μs

Note 1. This operating condition is available only in normal operation mode (include self-programming mode).
When the device is used in except normal operation mode, please use the $\overline{\text{RESET}}$ pin.

Note 2. IOVCC means EVCC, BVCC, A0VREF and A1VREF.



47B.4.5.4 CPU Reset Release Timing

Condition: REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Table 47B.11 In Case the $\overline{\text{RESET}}$ Pin is Not Used

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
REGVCC ↑ to CPU reset release*1	t_{DPCRR}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms			2.58	ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms			8.3	ms

Note 1. This is reference value.

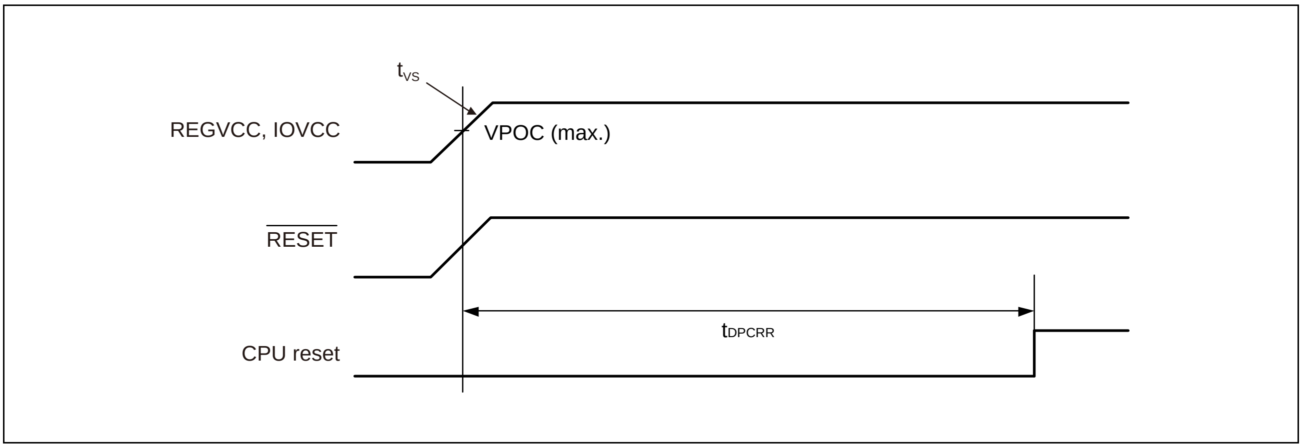


Table 47B.12 In Case the $\overline{\text{RESET}}$ Pin is Used

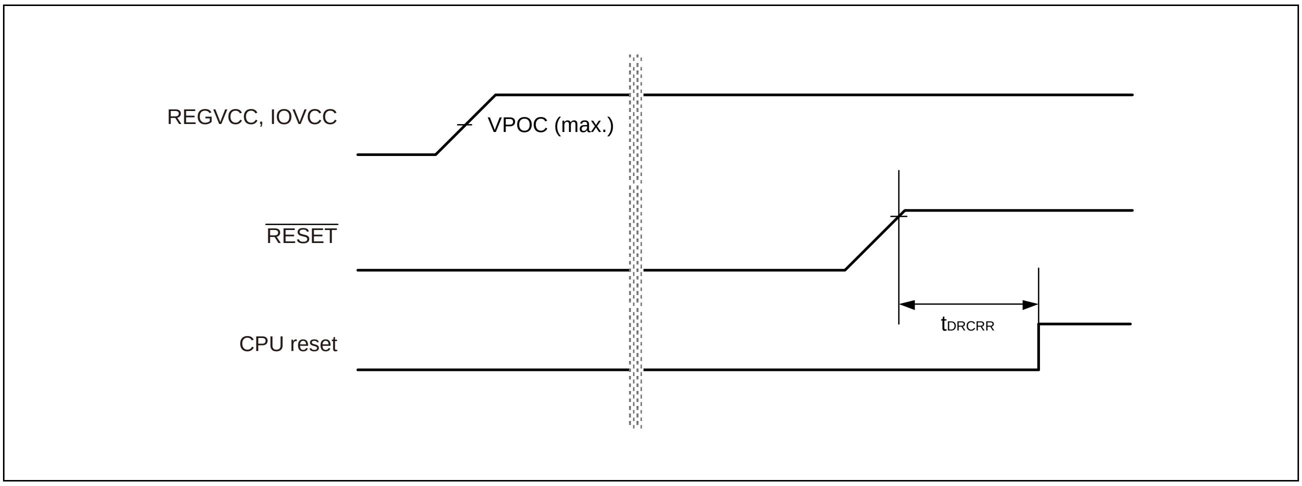
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ ↑ to CPU reset release*1	t_{DRCRR}				32*2	µs

Note 1. This is reference value.

Note 2. In case the time until releasing the $\overline{\text{RESET}}$ pin is longer than t_{DPCRR}.



47B.5 AC Characteristics

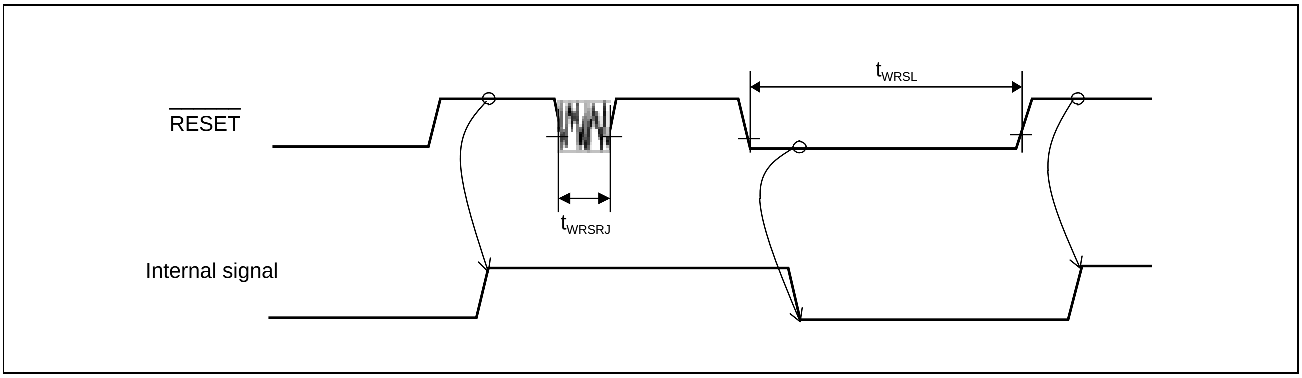
47B.5.1 $\overline{\text{RESET}}$ Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ input low level width*[1]	t_{WRSL}	Except power on	600			ns
$\overline{\text{RESET}}$ pulse rejection*[2]	t_{WRSRJ}		100			ns

Note 1. $\overline{\text{RESET}}$ input width is needed to ensure that the internal reset signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.



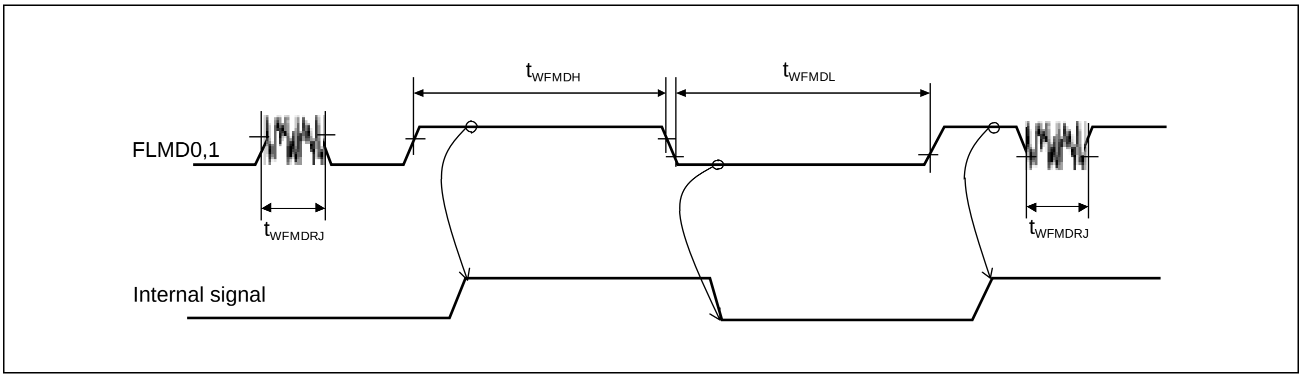
47B.5.2 Mode Timing

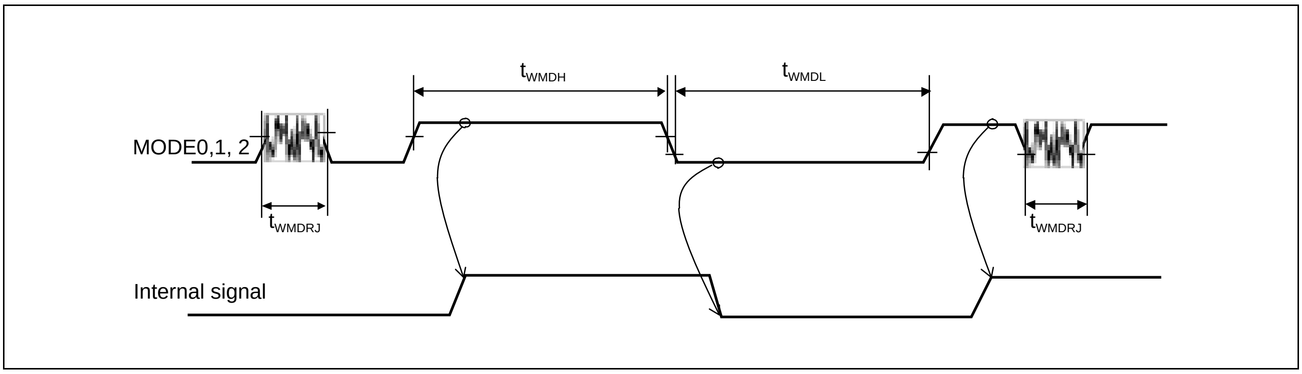
Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0, 1 input high/low level width*1	t_{WFMDH}/ t_{WFMDL}		600			ns
FLMD0, 1 pulse rejection*2	t_{WFMDRJ}		100			ns
MODE0, 1, 2 input high/low level width*1	t_{WMDH}/ t_{WMDL}		600			ns
MODE0, 1, 2 pulse rejection*2	t_{WMDRJ}		100			ns

Note 1. FLMD0, 1 and MODE0, 1, 2 input width is needed to ensure that the internal mode signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.





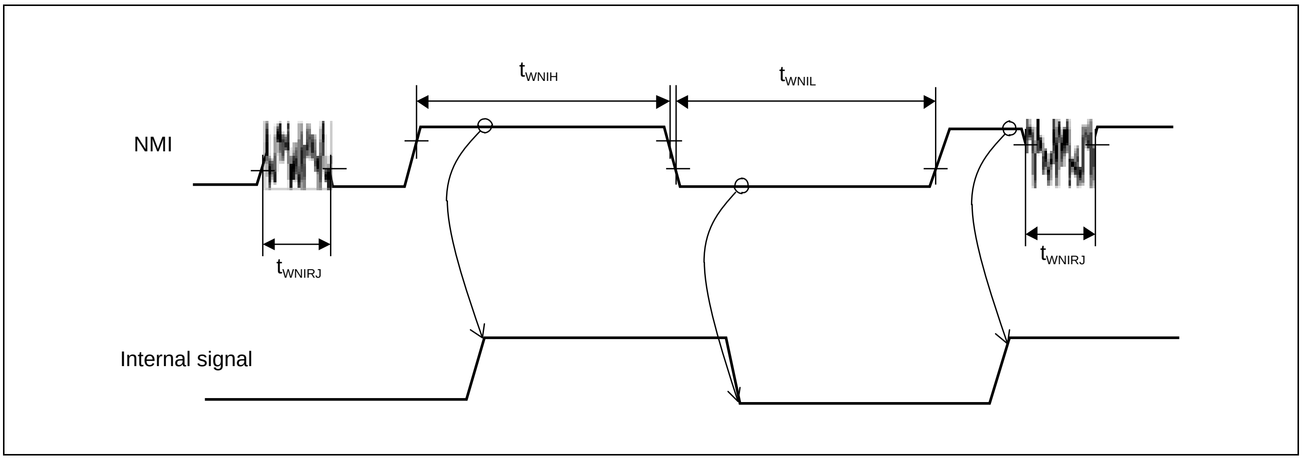
47B.5.3 Interrupt Timing

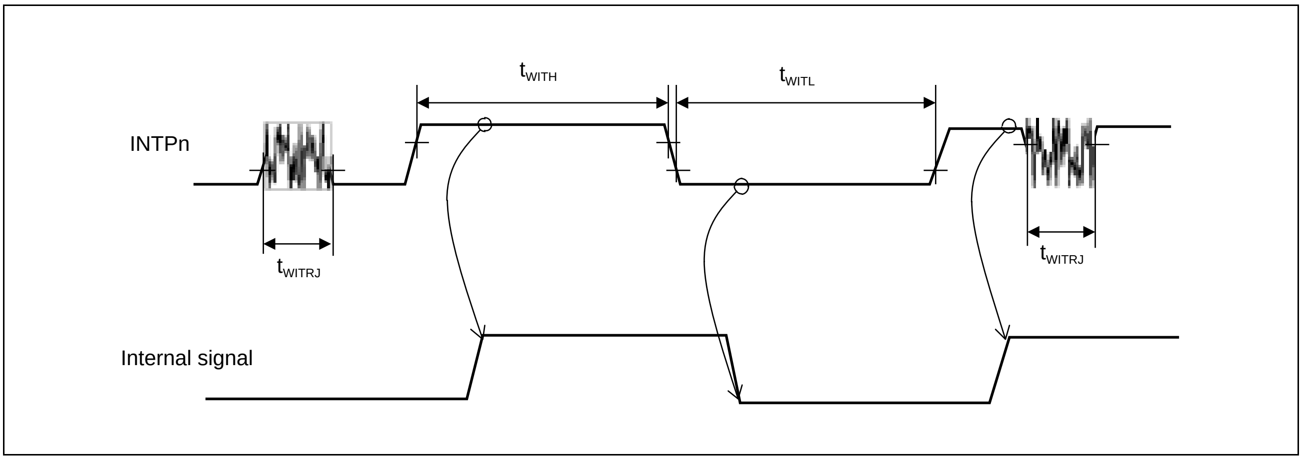
Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
NMI input high/low level width*[1]	t_{WNIH}/ t_{WNIL}	Edge detection mode	600			ns
		Level detection mode (EMCLK is operated by HS IntOSC)	756			ns
		Level detection mode (EMCLK is operated by LS IntOSC)	24			µs
NMI pulse rejection*[2]	t_{WNIRJ}		100			ns
INTPn input high/low level width*[1]	t_{WITH}/ t_{WITL}	Edge detection mode	600			ns
		Level detection mode (EMCLK is operated by HS IntOSC)	756			ns
		Level detection mode (EMCLK is operated by LS IntOSC)	24			µs
INTPn pulse rejection*[2]	t_{WITRJ}		100			ns

Note 1. NMI and INTPn input width is needed to ensure that the internal interrupt signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.



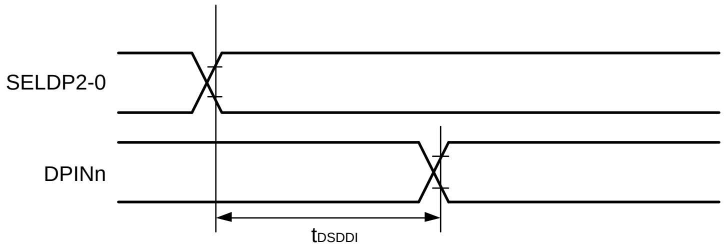


47B.5.4 Low Power Sampler (DPIN input) Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
DPINn input delay time (vs SELDP2-0)	t_{DSDDI}				150	ns

Note: n = 7 to 0



47B.5.5 CSCXFOUT Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

<Output driver strength>

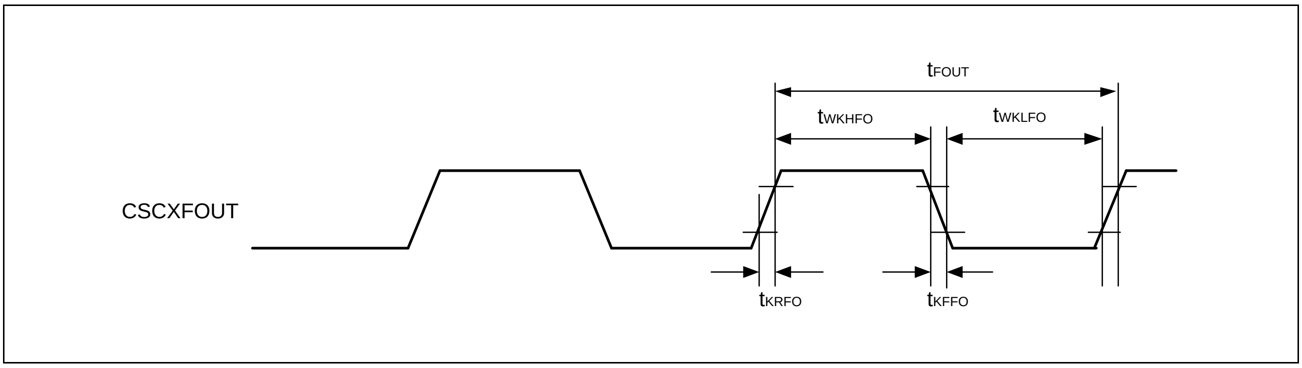
CSCXFOUT: Slow or fast mode (refer to the condition in the following table)

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
CSCXFOUT output cycle	t_{FOUT}	Slow mode		100 (max. 10 MHz)			ns
		Fast mode		41.6 (max. 24 MHz)			ns
CSCXFOUT high level width	t_{WKHFO}	Slow mode	N: 1*1 or even value*2	t_{FOUT} / 2 – 37			ns
			N: Odd value (N ≥ 5)*2,*3	t_{FOUT} × (N+1) / 2N – 37			ns
		Fast mode	N: 1*1 or even value*2	t_{FOUT} / 2 – 10			ns
			N: Odd value (N ≥ 3)*2	t_{FOUT} × (N+1) / 2N – 10			ns
CSCXFOUT low level width	t_{WKLFO}	Slow mode	N: 1*1 or even value*2	t_{FOUT} / 2 – 37			ns
			N: Odd value (N ≥ 5)*2,*3	t_{FOUT} × (N–1) / 2N – 37			ns
		Fast mode	N: 1*1 or even value*2	t_{FOUT} / 2 – 10			ns
			N: Odd value (N ≥ 3)*2	t_{FOUT} × (N–1) / 2N – 10			ns
CSCXFOUT rise/ fall time	t_{KRFO}/ t_{KFFO}	Slow mode				37	ns
		Fast mode				10	ns

Note 1. When MainOSC, HS IntOSC, LS IntOSC or SubOSC is selected as source clock with the condition of N=1, the characteristics of output signal depends on the selected source clock. It is recommended to use output signal after evaluation on an actual environment.

Note 2. “N” is the value of “Clock divisor N” defined by FOUTDIV register.

Note 3. The selection of N = 3 is prohibited when slow mode is used.



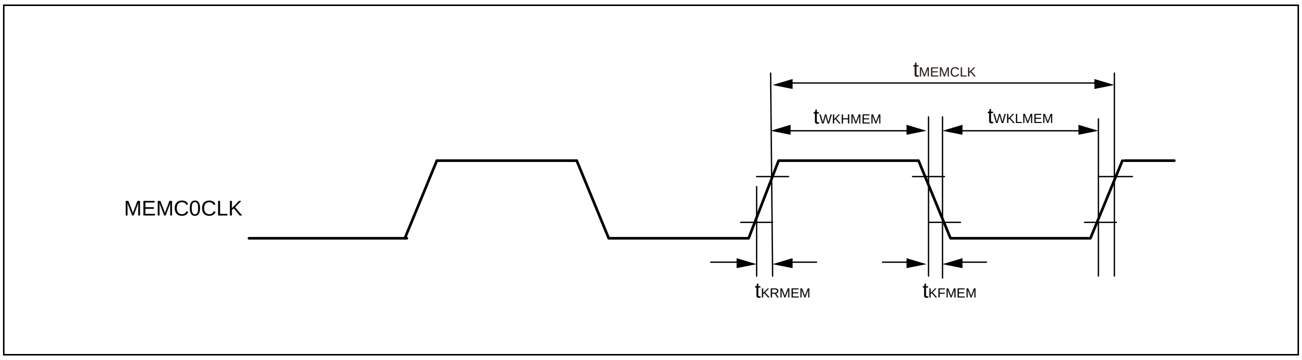
47B.5.6 MEMC0CLK Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

<Output driver strength>

MEMC0CLK pin: Fast mode

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MEMC0CLK output cycle	t_{MEMCLK}		33.4 (max.30 MHz)			ns
MEMC0CLK high / low level width	t_{WKHMEM} / t_{WKLMEM}		t_{MEMCLK} / 2 – 10			ns
MEMC0CLK rise / fall time	t_{KRMEM} / t_{KFMEM}				10	ns



47B.5.7 External Bus Timing

47B.5.7.1 MEMC0CLK Asynchronous

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

<Output driver strength>

MEMC0AD0-15, MEMC0A16-23, $\overline{\text{MEMC0CS3-0}}$, $\overline{\text{MEMC0BEN1-0}}$, $\overline{\text{MEMC0ASTB}}$, $\overline{\text{MEMC0WR}}$, and $\overline{\text{MEMC0RD}}$ pins: Fast mode

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Bus operational period	T		33.4 (max.30 MHz)			ns
Address[*4] setup time to $\overline{\text{MEMC0ASTB}}$ ↓	t_{SAST}	<1>	(1 + ASW) × T – 15			ns
Address (MEMC0AD15-0) hold time from $\overline{\text{MEMC0ASTB}}$ ↓	t_{HSTA}	<2>	(1 + AHW) × T – 15			ns
Address (MEMC0AD15-0) float delay time from $\overline{\text{MEMC0RD}}$ ↓	t_{FRDA}[*8]	<3>			9	ns
Address[*5] hold time from $\overline{\text{MEMC0RD}}$ ↑	t_{HRDA}	<4>	–1.5			ns
Data (MEMC0AD15-0) input delay time from $\overline{\text{MEMC0RD}}$ ↓	t_{DRDID}	<5>	9		(1 + w) × T – 35	ns
Data (MEMC0AD15-0) input hold time from $\overline{\text{MEMC0RD}}$ ↑	t_{HRDID}	<6>	0			ns
Delay time from $\overline{\text{MEMC0ASTB}}$ ↓ to $\overline{\text{MEMC0RD}}$ ↓	t_{DSTRD}	<7>	(1 + AHW) × T – 15			ns
Delay time from $\overline{\text{MEMC0ASTB}}$ ↓ to $\overline{\text{MEMC0WR}}$ ↓	t_{DSTWR}	<8>	(1 + AHW) × T – 15			ns
$\overline{\text{MEMC0RD}}$, $\overline{\text{MEMC0WR}}$ low level width	t_{WRDST}	<9>	(1 + w) × T – 10			ns
Data (MEMC0AD15-0) output delay time from $\overline{\text{MEMC0WR}}$ ↓	t_{DWROD}	<10>			11	ns
Address[*5] hold time from $\overline{\text{MEMC0WR}}$ ↑	t_{HWRA}	<11>	(1 + DHW) × T – 15			ns
Data (MEMC0AD15-0) output setup time to $\overline{\text{MEMC0WR}}$ ↑	t_{SODWR}	<12>	(1 + w) × T – 15			ns
Data (MEMC0AD15-0) output hold time from $\overline{\text{MEMC0WR}}$ ↑	t_{HWROD}	<13>	(1 + DHW) × T – 15			ns
$\overline{\text{MEMC0WAIT}}$ setting delay from $\overline{\text{MEMC0ASTB}}$ ↓	t_{SSTWT1}	<14>			(AHW + DPW) × T – 24	ns
	t_{SSTWT2}	<15> DEW ≥ 1			(AHW + DPW + DEW) × T – 24	ns
$\overline{\text{MEMC0WAIT}}$ hold time from $\overline{\text{MEMC0ASTB}}$ ↓	t_{HSTWT1}	<16>	(AHW + DPW + DEW – 1) × T – 9			ns
	t_{HSTWT2}	<17> DEW ≥ 1	(AHW + DPW + DEW) × T – 9			ns

Note 1. ASW means the number of address setup wait for multiplex bus.

Note 2. AHW means the number of address hold wait for multiplex bus.

Note 3. DPW means the number of programmable data wait for multiplex bus.
DEW means the number of external data wait for multiplex bus.
"w" means the sum of DPW and DEW.

Note 4. t_{CPUCLK}: CPU clock period.

Note 5. DHW means the number of data hold wait for multiplex bus.

Note 6. Address means MEMC0AD15-0, MEMC0A23-16, $\overline{\text{MEMC0CS3-0}}$, and $\overline{\text{MEMC0BEN1-0}}$.
272-pin product supports 24-bit address. 233/176-pin products support 23-bit address.

Note 7. Address means MEMC0A23-16, $\overline{\text{MEMC0CS3-0}}$, $\overline{\text{MEMC0BEN1-0}}$, and $\overline{\text{MEMC0ASTB}}$.
272-pin product supports 24-bit address. 233/176-pin products support 23-bit address.

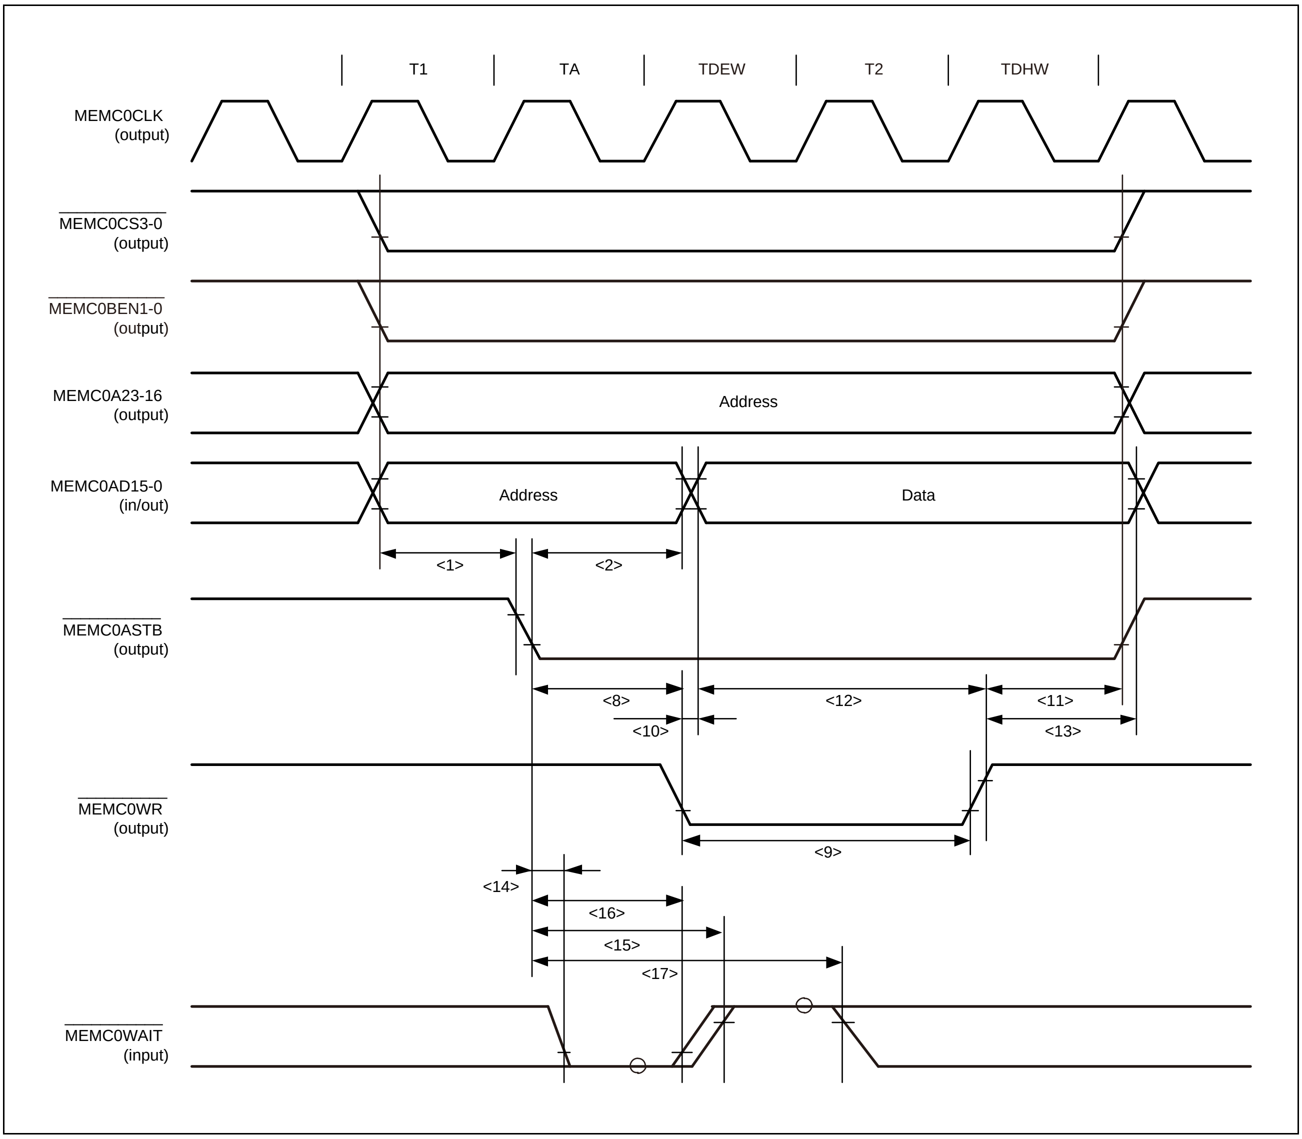
Note 8. t_{FRDA} means the period from output off to Hi-z for MEMC0AD15-0.

NOTE

When the bus period (T) is shorter than 44 ns, t_{DRDID} spec requires at least 1data wait. (w = 1)

---

(1) Multiplex Write Cycle (Asynchronous; 1 Data Wait)



(2) Multiplex Read Cycle (Asynchronous; 1 Data Wait)

Table 47B.14 CSIG Timing (Slave Mode)

<Output driver strength>

CSIGnSO: Fast mode

CSIGnRYO: Slow mode

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Macro operation clock cycle time	t_{KCYGn}		12.5 (max. 80 MHz)			ns
CSIGnSC cycle time	t_{KCYSGn}		200			ns
CSIGnSC high level width	t_{KWHSGn}		0.5 × t_{KCYSGn} – 10			ns
CSIGnSC low level width	t_{KWLSGn}		0.5 × t_{KCYSGn} – 10			ns
CSIGnSI setup time (vs. CSIGnSC)	t_{SSISGn}		20			ns
CSIGnSI hold time (vs. CSIGnSC)	t_{HSISGn}		t_{KCYGn} + 5			ns
CSIGnSO output delay (vs. CSIGnSC)	t_{DSOSGn}				30	ns
CSIGnRYO output delay	t_{SRYOGn}				38	ns
$\overline{\text{CSIGnSSI}}$ setup time (vs. CSIGnSC)	$t_{SSSISGn}$		0.5 × t_{KCYSGn} – 5			ns
$\overline{\text{CSIGnSSI}}$ hold time (vs. CSIGnSC)	$t_{HSSISGn}$		t_{KCYGn} + 5			ns

Note: n = 0 to 3

47B.5.10.2 CSIH Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Table 47B.15 CSIH Timing (Master Mode: 10 Mbps)

<Output driver strength>

CSIHnSO, CSIHnSC (output): Fast mode (CL = 100pF@n=0 / 50pF@n=1-3)

CSIHnCSSx: Slow mode

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Macro Operation clock cycle time	t_{KCYHn}		12.5 (max. 80 MHz)			ns
CSIHnSC cycle time	t_{KCYMHn}		100			ns
CSIHnSC high level width	t_{KWHMHn}		0.5 × t_{KCYMHn} – 10			ns
CSIHnSC low level width	t_{KWLMHn}		0.5 × t_{KCYMHn} – 10			ns
CSIHnSI setup time (vs. CSIHnSC)	t_{SSIMHn}	SI positive edge mode (CSIHnCTL1.CSIHnSLRS = 0)	19			ns
		SI negative edge mode (CSIHnCTL1.CSIHnSLRS = 1)	14			ns
CSIHnSI hold time (vs. CSIHnSC)	t_{HSIMHn}	SI positive edge mode (CSIHnCTL1.CSIHnSLRS = 0)	0			ns
		SI negative edge mode (CSIHnCTL1.CSIHnSLRS = 1)	$t_{KCYHn}/2$			ns
CSIHnSO output delay (vs. CSIHnSC)	t_{DSOMHn}				7	ns
CSIHnRYI setup time (vs. CSIHnSC)	t_{SRYIHn}	CSIHnCTL1.CSIHnSIT = x CSIHnCTL1.CSIHnHSE = 1	2 × t_{KCYHn} + 25			ns
CSIHnRYI high level width	t_{WRYIHn}	CSIHnCTL1.CSIHnHSE = 1	t_{KCYHn} + 5			ns
CSIHnCSS0-7 inactive width	$t_{WSCSBHn}$		CSIDLE × t_{KCYMHn} – 15			ns
CSIHnCSS0-7 setup time (vs. CSIHnSC)	$t_{SSCSBHn0}$	CSIHnCFGx.CSIHnDAP = 0	CSSETUP × t_{KCYMHn} – 23			ns
	$t_{SSCSBHn1}$	CSIHnCFGx.CSIHnDAP = 1	(CSSETUP + 0.5) × t_{KCYMHn} – 23			ns
CSIHnCSS0-7 hold time (vs. CSIHnSC)	$t_{HSCSBHn0}$	CSIHnCTL1.CSIHnSIT = 0	CSSHOLD × t_{KCYMHn} – 5			ns
	$t_{HSCSBHn1}$	CSIHnCTL1.CSIHnSIT = 1	(CSSHOLD + 0.5) × t_{KCYMHn} – 5			ns

Note: n = 0 to 3

NOTE

CSIDLE: Setting value of CSIHnCFGx.CSIHnIDx[2:0]

CSSETUP: Setting value of CSIHnCFGx.CSIHnSPx[3:0]

CSSHOLD: Setting value of CSIHnCFGx.CSIHnHDx[3:0]

x: Depends on number of the chip select signals.

CAUTION

When the serial clock level is changed during the communication (CSIHnCFGx.CSIHnCKPx) and the IDLE has a setting of 0.5 transmission clock cycles, an inactive width time $t_{WSCSBHn}$ of "0.5 × t_{KCYMHn}" is added.

Table 47B.16 CSIH Timing (Slave Mode: 5 Mbps)

<Output driver strength>
CSIHnSO: Fast mode
CSIHnRYO: Slow mode

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Macro Operation clock cycle time	t_{KCYHn}		12.5 (max. 80 MHz)			ns
CSIHnSC cycle time	t_{KCYSHn}		200			ns
CSIHnSC high level width	t_{KWHSHn}		$0.5 \times t_{KCYSHn} - 10$			ns
CSIHnSC low level width	t_{KWLSHn}		$0.5 \times t_{KCYSHn} - 10$			ns
CSIHnSI setup time (vs. CSIHnSC)	t_{SSISHn}		20			ns
CSIHnSI hold time (vs. CSIHnSC)	t_{HSISHn}		$t_{KCYHn} + 5$			ns
CSIHnSO output delay (vs. CSIHnSC)	t_{DSOSHn}				30	ns
CSIHnRYO output delay	t_{SRYOHn}	$t_{KCYSHn} \geq 8 \times t_{KCYHn}$			38	ns
		$t_{KCYSHn} < 8 \times t_{KCYHn}$			$38 + t_{KCYHn}$	ns
$\overline{\text{CSIHnSSI}}$ setup time (vs. CSIHnSC)	$t_{SSSISHn}$		$0.5 \times t_{KCYSHn} - 5$			ns
$\overline{\text{CSIHnSSI}}$ hold time (vs. CSIHnSC)	$t_{HSSISHn}$		$t_{KCYHn} + 5$			ns

Note: n = 0 to 3

Table 47B.17 CSIH Timing (Slave Mode: 8 Mbps)

<Output driver strength>
CSIHnSO: Fast mode
CSIHnRYO: Slow mode

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Macro Operation clock cycle time	t_{KCYHn}		12.5 (max. 80 MHz)			ns
CSIHnSC cycle time	t_{KCYSHn}		125			ns
CSIHnSC high level width	t_{KWHSHn}		$0.5 \times t_{KCYSHn} - 10$			ns
CSIHnSC low level width	t_{KWLSHn}		$0.5 \times t_{KCYSHn} - 10$			ns
CSIHnSI setup time (vs. CSIHnSC)	t_{SSISHn}		12.5			ns
CSIHnSI hold time (vs. CSIHnSC)	t_{HSISHn}		$t_{KCYHn} + 5$			ns
CSIHnSO output delay (vs. CSIHnSC)	t_{DSOSHn}				25	ns

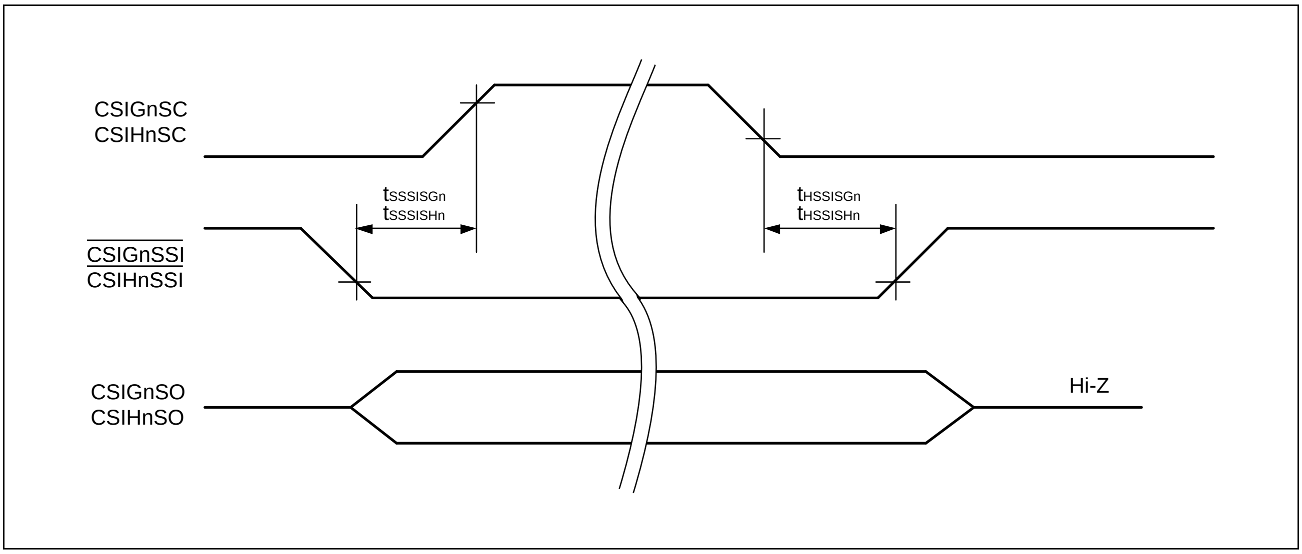
- CSIH (CSIHnCTL1: CSIHnSSE=1, CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 1/0 or 0/1)



47B.5.11 RLIN2/RLIN3 Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RLIN3 transfer rate		LIN specification	1		20	kbps
		LIN extended baud rate	1		115.2*[1]	kbps
		UART function			1.5	Mbps
RLIN2 transfer rate		LIN specification	1		20	kbps

Note 1. The LIN extended baud rate is not part of the LIN standard specification.

47B.5.12 RIIC Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C

Table 47B.18 RIIC Timing (Normal Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RIICnSCL clock period	f_{CLK}				100	kHz
Bus free time (between stop/start condition)	t_{BUF}		4.7			µs
Hold time*[1]	t_{HD}: STA		4.0			µs
RIICnSCL clock low-level width	t_{LOW}		4.7			µs
RIICnSCL clock high-level time	t_{HIGH}		4.0			µs
Setup time for start/restart condition	t_{SU}: STA		4.7			µs
Data hold time	t_{HD}: DAT	CBUS compatible master	5.0			µs
		I^2C mode	0*[2]			µs
Data setup time	t_{SU}: DAT		250			ns
Stop condition setup time	t_{SU}: STO		4.0			µs
Capacitance load of each bus line	Cb				400	pF

Remark: n = 0, 1

Note: If the system does not extend the RIICnSCL signal low hold time (t_{Low}), only the maximum data hold time (t_{HD}: DAT) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Table 47B.19 RIIC Timing (Fast Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RIICnSCL clock period	f_{CLK}				400	kHz
Bus free time (between stop/start condition)	t_{BUF}		1.3			μs
Hold time*[1]	t_{HD}: STA		0.6			μs
RIICnSCL clock low-level width	t_{LOW}		1.3			μs
RIICnSCL clock high-level time	t_{HIGH}		0.6			μs
Setup time for start/restart condition	t_{SU}: STA		0.6			μs
Data hold time	t_{HD}: DAT	I^2C mode	0*[2]			μs
Data setup time	t_{SU}: DAT		100*[3]			ns
Stop condition setup time	t_{SU}: STO		0.6			μs
Pulse width with spike suppressed by input filter	t_{SP}		0		50	ns
Capacitance load of each bus line	Cb				400	pF

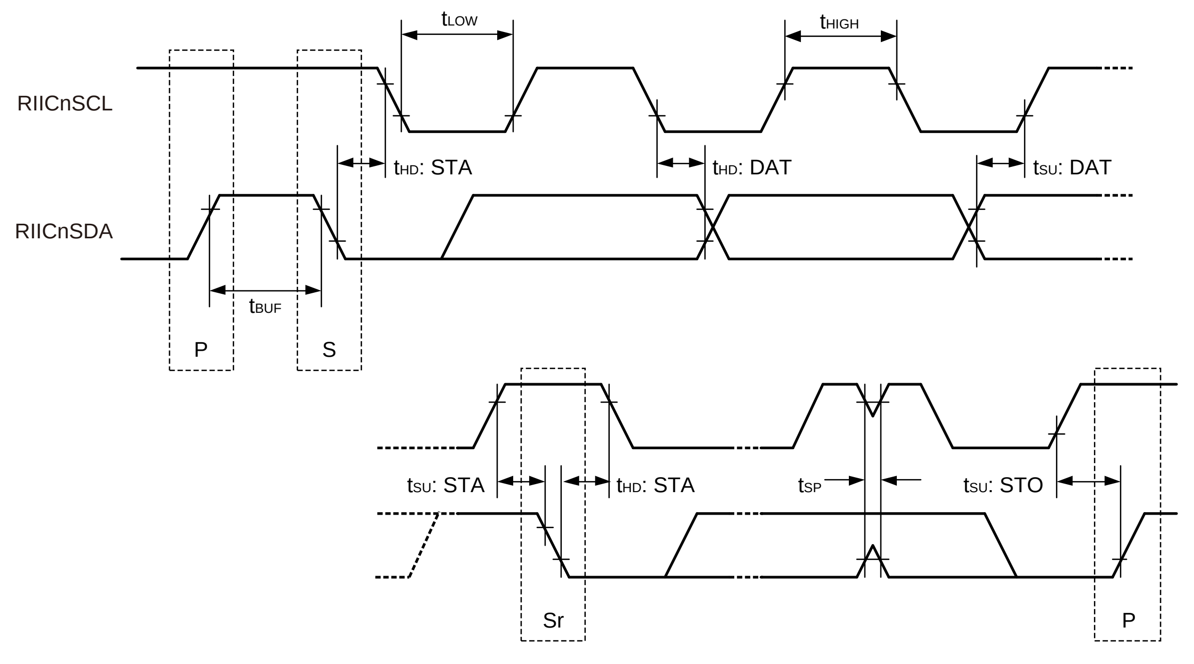
Remark: n = 0, 1

Note: If the system does not extend the RIICnSCL signal low hold time (t_{Low}), only the maximum data hold time (t_{HD}: DAT) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Note 3. The fast mode I^2C bus can be used in normal mode I^2C bus system. In this case, set the fast mode I^2C bus so that it meets the following conditions.
- If the system does not extend the RIICnSCL signal's low state hold time: t_{SU}: DAT ≥ 250 ns
- If the system extends the RIICnSCL signal's low state hold time:
Transmit the following data bit to the RIICnSDA line prior to releasing the RIICnSCL line
(1250 ns: Normal mode I^2C bus specification).



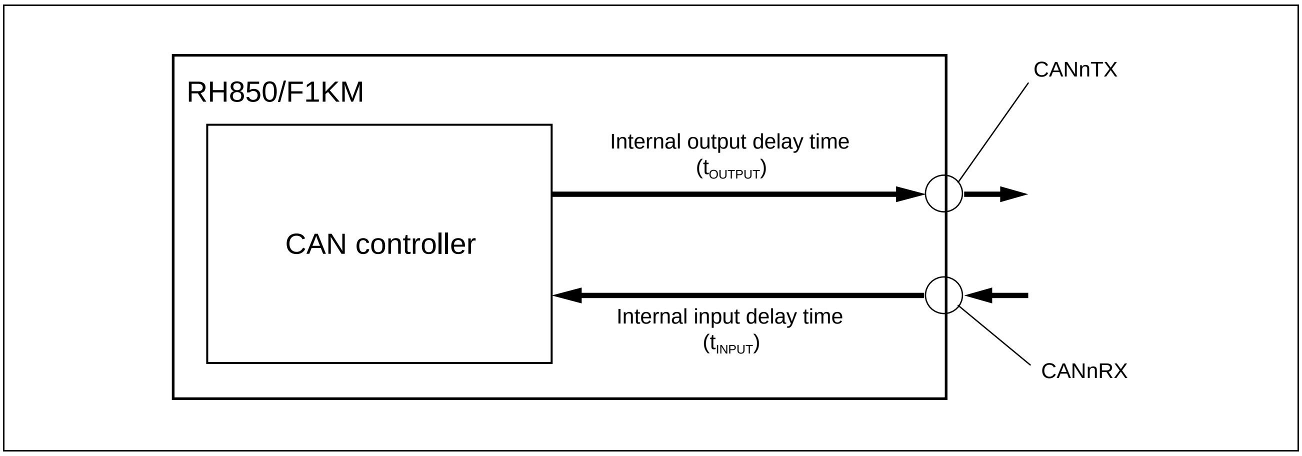
Note: P: Stop condition S: Start condition Sr: Restart condition

47B.5.13 RS-CANFD Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Transfer rate		Classical CAN mode			1	Mbps
Data bit rate (CAN FD mode)		Nominal bit rate ≤ 500 kbps			5	Mbps
		Nominal bit rate > 500 kbps			2	Mbps
Internal delay time*[1]	t_{NODE}				50	ns

Note 1. t_{NODE} = Internal input delay time (t_{INPUT}) + Internal output delay time (t_{OUTPUT})



47B.5.14 FlexRay Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Products of CPU frequency 240 MHz max.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Transfer rate					10	Mbps

Products of CPU frequency 160 MHz max.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Transfer rate					5	Mbps

47B.5.15 Ethernet Timing

47B.5.15.1 MII Interface

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to 3.6 V, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 15 pF

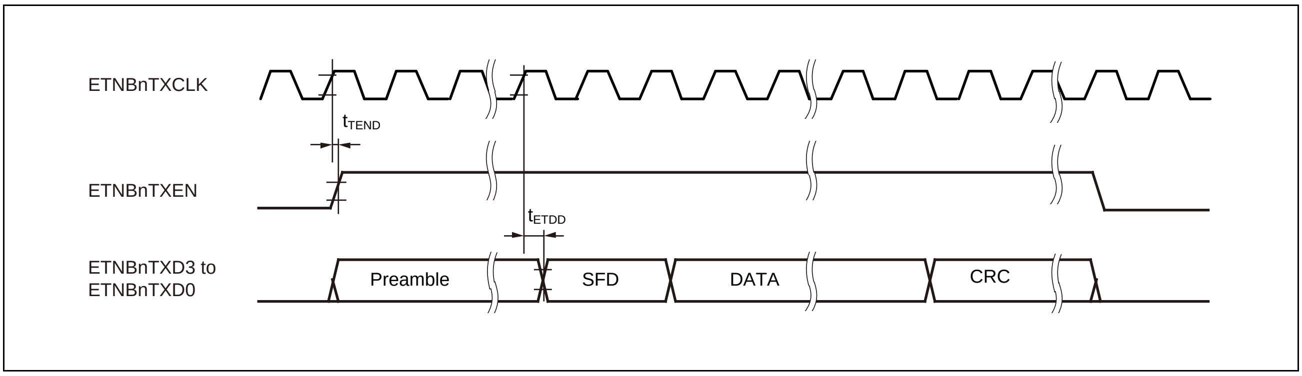
<Output driver strength>

ETNB0TXD3-0 and ETNB0TXEN pins: Fast mode

ETNB0TXCLK pin: TTL type

Table 47B.20 MII Interface (Transmission Interface)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
ETNB0TXCLK clock period	t_{Tcyc}	100 Mbps	40 – 100 ppm	40	40 + 100 ppm	ns
		10 Mbps	400 – 100 ppm	400	400 + 100 ppm	ns
ETNB0TXEN delay vs ETNB0TXCLK ↑	t_{TEND}	CL = 15 pF			18	ns
ETNB0TXD[3:0] delay vs ETNB0TXCLK ↑	t_{ETDD}	CL = 15 pF			18	ns

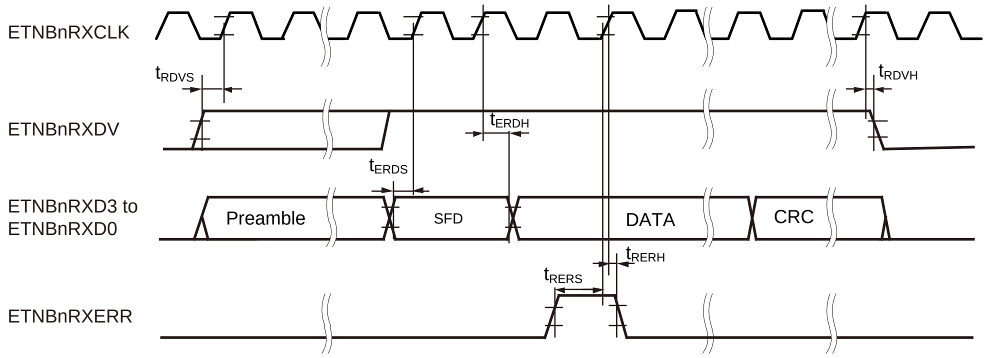


<Input buffer>

ETNB0RXCLK, ETNB0RXDV, ETNB0RXD[3:0], and ETNB0RXER pins: TTL type

Table 47B.21 MII Interface (Reception Interface)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
ETNB0RXCLK clock period	t_{Rcyc}	100 Mbps	40 – 100 ppm	40	40 + 100 ppm	ns
		10 Mbps	400 – 100 ppm	400	400 + 100 ppm	ns
ETNB0RXDV hold time vs ETNB0RXCLK ↑	t_{RDVH}		10			ns
ETNB0RXDV setup time vs ETNB0RXCLK ↑	t_{RDVS}		10			ns
ETNB0RXD[3:0] hold time vs ETNB0RXCLK ↑	t_{ERDH}		10			ns
ETNB0RXD[3:0] setup time vs ETNB0RXCLK ↑	t_{ERDS}		10			ns
ETNB0RXERR hold time vs ETNB0RXCLK ↑	t_{RERH}		10			ns
ETNB0RXERR setup time vs ETNB0RXCLK ↑	t_{RERS}		10			ns



47B.5.15.2 Management Interface

Timing of management interface (ETNB0MDC and ETNB0MDIO) depends on software. It is necessary to adjust wait time according to AC specification of PHY.

47B.5.16 RSENT Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Tick Time			1		90	µs

47B.5.17 Timer Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
TAUD0Iy input high/low level width (y = 0 to 15)	t_{WTDIH}/ t_{WTDIL}		n × Tsamp + 20[*1,*2]			ns
TAUD0Oy output cycle (y = 0 to 15)	t_{TDCYK}	Slow mode			10	MHz
TAUBxIy input high/low level width (x = 0, 1, y = 0 to 15)	t_{WTBIH}/ t_{WTBIL}		n × Tsamp + 20[*1,*2]			ns
TAUBxOy output cycle (x = 0, 1, y = 0 to 15)	t_{TBCYK}	Slow mode			10	MHz
TAUJxIy input high/low level width[*3] (x = 0 to 3, y = 0 to 3)	t_{WTJIH}/ t_{WTJIL}		600			ns
TAUJxIy pulse rejection[*4]	t_{WTIJRJ}		100			ns
TAUJxOy output cycle (x = 0 to 3, y = 0 to 3)	t_{TJCYK}	Slow mode			10	MHz
RTCA0OUT output cycle	t_{RTCYK}			1		Hz
TAPA0ESO input high/low level width[*3]	t_{WESIH}/ t_{WESIL}		600			ns
TAPA0ESO pulse rejection[*4]	t_{WESIRJ}		100			ns
TAPA0Uy/Vy/Wy output cycle (y = P, N)	t_{TPCYK}	Slow mode			10	MHz
ENCA0TINy input high/low level width (y = 0, 1)	t_{WENTIH}/ t_{WENTIL}		n × Tsamp + 20[*1]			ns
ENCA0Ey input high/low level width (y = 0,1,C)	t_{WENyIH}/ t_{WENyIL}		n × Tsamp + 20[*1]			ns
PWGAyO output cycle (y = 0 to 95)	t_{PWGCYK}	Slow mode			10	MHz

Note 1. n: Sampling number of the digital noise filter for each input.
Tsamp: Sampling time of the digital noise filter for each input.

Note 2. Input more than 1 count clock width of each timer counter channel.

Note 3. TAUJxIy and TAPA0ESO input width is needed to ensure that the internal timer input signal is activated.

Note 4. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.

			AnVREF = 3.0 V to 4.5 V	ADCAnIm			±1.0	LSB
				ADCAnImS			±2.0	LSB

Note: Conversion accuracy when ADCA0ImS terminal is converted in 12-bit mode: Conversion accuracy can be applied if lower 2-bit is ignored from conversion result.

Note 1. This does not include quantization error.

Note 2. 3.0 + 1.3 × (the number of used T&H)

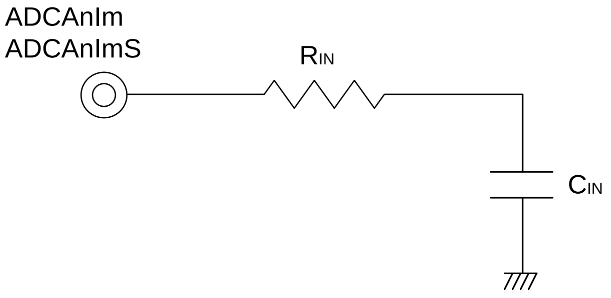
Note 3. Include the oscillation accuracy of HS IntOSC.

Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as “sampling time + successive approximation time”.

CAUTION

When an external digital pulse is applied to AP0, AP1, P8, P9, P18, and P19 pins during an A/D conversion this may lead to an A/D conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse.
The same behavior may apply when the digital buffer is used as an output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

47B.6.1 Equivalent Circuit of the Analog Input Block



Terminals	Condition	RIN (kΩ)	CIN (pF)
ADCA0I0 to 5	When T&H is used	14.1	2.2
	When T&H is not used	3.8	2.1
ADCA0I6 to 15	—	3.8	2.1
ADCA0I0S to 3S, 5S to 11S, 14S to 16S	—	5.3	9.3
ADCA0I4S, 17S to 19S	—	7.2	9.3
ADCA1I0 to 15	—	3.8	2
ADCA1I0S to 19S	—	5.2	7.4

CAUTION

This specification is not tested during outgoing inspection. Therefore RIN and CIN are reference values only and not guaranteed. In addition these values are specified as maximum values.

47B.7 Flash Programming Characteristics

47B.7.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Condition: REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Table 47B.22 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{PCLK}*[3]		5*[4]		30	MHz
Number of rewrites*[1]	CWRT	Data retention of 20 years*[2]	1000			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 1000), the device can be erased “n” times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the code flash memory.

Note 3. f_{PCLK} = 1/8 f_{CPUCLK_H}: System operating frequency for internal flash.

Note 4. Only for program/erase operation.

Table 47B.23 Programming Characteristic

Note 1. Only the processing time of the hardware. The overhead required by the software is not included.

47B.7.2 Data Flash

The data flash memory is shipped in the erased state. If the data flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Condition: REGVCC = EVCC = VPOC to 5.5 V, BVCC = VPOC to REGVCC, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Table 47B.24 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{PCLK}*[3]		5*[4]		30	MHz
Number of rewrites*[1]	CWRT	Data retention 20 years*[2]	125 k			times
		Data retention 3 years*[2]	250 k			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 125000), the device can be erased “n” times for each block. For example, when a block of 64 bytes is erased after 4 bytes of writing have been performed for different addresses 168 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the data flash memory.

Note 3. f_{PCLK} = 1/8 f_{CPUCLK_H}: System operating frequency for internal flash.

Note 4. Only for program/erase operation.

Table 47B.25 Programming Characteristics

Item	Symbol	Condition	Block Size	MIN.	TYP.	MAX.	Unit
Programming time		$f_{PCLK} \geq 20$ MHz	4 B		0.16*[1]	1.7*[1]	ms

			64 KB		1.74	10.24	s
			128 KB		3.48	20.48	s
Blank check time		$f_{PCLK} \geq 20$ MHz	4 B			30*[1]	µs
			64 B			100*[1]	µs
			32 KB			35.2	ms
			64 KB			70.4	ms
			128 KB			140.8	ms

Note 1. Only the processing time of the hardware. The overhead required by the software is not included.

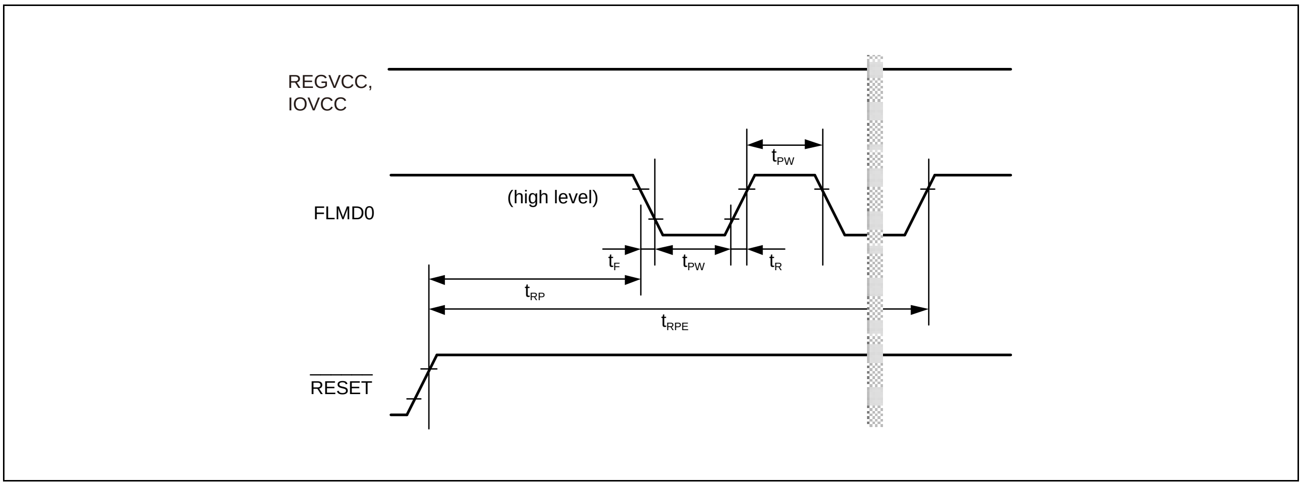
47B.7.3 Serial Programming Interface

47B.7.3.1 Serial Programmer Setup Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0 pulse input start time	t_{RP}		1.5			ms
FLMD0 pulse input end time	t_{RPE}				101.5	ms
FLMD0 low/high level width	t_{PW}		3.2			µs
FLMD0 rise time	t_R				20	ns
FLMD0 fall time	t_F				20	ns

Note: IOVCC: EVCC = BVCC = A0VREF = A1VREF



47B.7.3.2 Flash Programming Interface

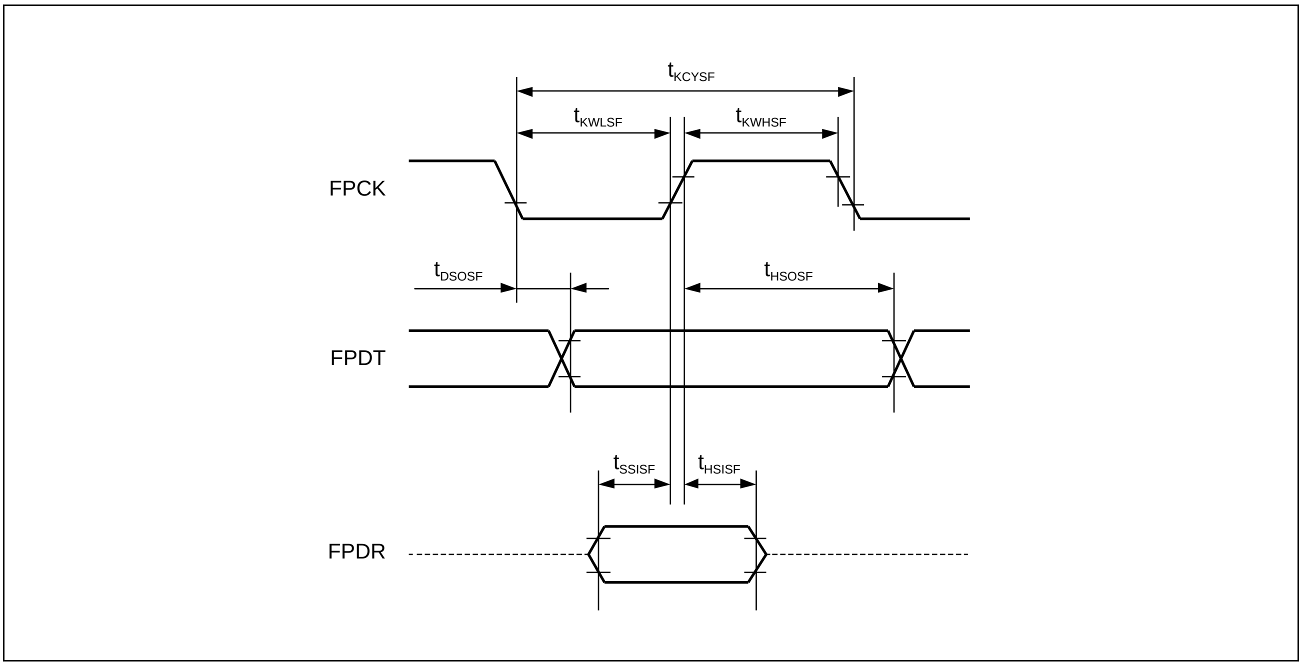
Condition: REGVCC = EVCC = 3.0 V to 5.5 V, BVCC = 3.0 V to REGVCC, A0VREF = 3.0 V to 5.5 V, A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = BVSS = A0VSS = A1VSS = 0 V, CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%, Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Flash Programming transfer rate		1-wired UART mode			1	Mbps
		2-wired UART mode (Products of CPU frequency 240 MHz max.)			1.5	Mbps
		2-wired UART mode (Products of CPU frequency 160 MHz max.)			1	Mbps
FPCK cycle time	t_{KCYSF}	3-wired clock sync mode	200*[1]			ns
FPCK high level width	t_{KWHSF}	3-wired clock sync mode	t_{KCYSF} / 2 – 15			ns
FPCK low level width	t_{KWLSF}	3-wired clock sync mode	t_{KCYSF} / 2 – 15			ns
FPDR setup time (vs. FPCK)	t_{SSISF}	3-wired clock sync mode	t_{Pcyc} × 2			ns
FPDR hold time (vs. FPCK)	t_{HSISF}	3-wired clock sync mode	t_{Pcyc} × 2			ns
FPDT output delay (vs. FPCK)	t_{DSOSF}	3-wired clock sync mode Not continuous transfer (data: 1st bit)			0	ns
		3-wired clock sync mode Not continuous transfer (data: except 1st bit)			$-t_{KWHSF} + 3 \times t_{Pcyc} + 36$	ns
FPDT hold time (vs. FPCK)	t_{HSOSF}	3-wired clock sync mode	t_{Pcyc} × 2			ns

Note 1. Input an external clock that is more than 6 clocks of PCLK.

NOTE

t_{Pcyc} is period of PCLK.



47B.8 Thermal Characteristics

47B.8.1 Parameters

Package	Item	Symbol	Estimate	Unit	Note
272-pin FPBGA	Thermal Resistance	Θja	21.1	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	11.8		
233-pin FPBGA	Thermal Resistance	Θja	21.2	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	11.8		
176-pin LQFP	Thermal Resistance	Θja	35.5	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	27.6		
144-pin LQFP	Thermal Resistance	Θja	35.5	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	26.9		
100-pin LQFP	Thermal Resistance	Θja	38.3	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	28.1		

NOTE

The thermal resistance and characterization parameters depend on the usage environment.

47B.8.2 Board

Conforming to JESD51-7 (4 layers)

	Board Size (mm)		Area (mm^2)
	X	Y	
Board	76.2	114.3	8709.66
Remaining copper rates	Thickness of conductors		
50-95-95-50%	70-35-35-70 µm		

Section 47C Electrical Characteristics of RH850/F1KM-S1

47C.1 Overview

The electrical spec of this device is guaranteed by the following operational condition. But, this condition is different depends on each characteristics, so refer to each chapter for more detail.

47C.1.1 Pin Groups

47C.1.1.1 100-Pin Version

Symbol	Pin Group Supplied by	Related Pins / Ports
PgR	REGVCC, AWOVSS	X1, X2
PgE	EVCC, EVSS	Related ports: JP0, P0, P8, P9, P10, P11
		Related pins: $\overline{\text{RESET}}$, FLMD0
PgA0	A0VREF, A0VSS	Related port: AP0

47C.1.1.2 80-Pin Version

Symbol	Pin Group Supplied by	Related Pins / Ports
PgR	REGVCC, AWOVSS	X1, X2
PgE	EVCC, EVSS	Related ports: JP0, P0, P8, P9, P10, P11
		Related pins: $\overline{\text{RESET}}$, FLMD0
PgA0	A0VREF, A0VSS	Related port: AP0

47C.1.1.3 64-Pin Version

Symbol	Pin Group Supplied by	Related Pins / Ports
PgR	REGVCC, AWOVSS	X1, X2
PgE	EVCC, EVSS	Related ports: JP0, P0, P8, P9, P10
		Related pins: $\overline{\text{RESET}}$, FLMD0
PgA0	A0VREF, A0VSS	Related port: AP0

47C.1.1.4 48-Pin Version

Symbol	Pin Group Supplied by	Related Pins / Ports
PgR	REGVCC, AWOVSS	X1, X2
PgE	EVCC, EVSS	Related ports: JP0, P0, P8, P9, P10
		Related pins: $\overline{\text{RESET}}$, FLMD0
PgA0	A0VREF, A0VSS	Related port: AP0

47C.1.2 General Measurement Conditions

47C.1.2.1 Common Conditions

- Power supply
  - REGVCC = EVCC = VPOC*[1] to 5.5 V
  - A0VREF = 3.0 V to 5.5 V
  - AWOVSS = ISOVSS = EVSS = A0VSS = 0 V
- Capacitance of the internal regulator
  - CAWOVCL: 0.1 µF ±30%
  - CISOVCL: 0.1 µF ±30%
- Operating temperature
  - Tj = –40 to +130°C @ R7F7016xx3AFP*[2]
  - Tj = –40 to +150°C @ R7F7016xx4AFP*[2]

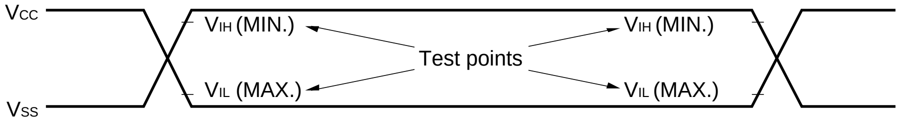
  xx = 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95
- Load conditions
  - CL = 30 pF

Note 1. “VPOC” means POC (power-on clear) detection voltage. For more detail, see **Section 47C.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

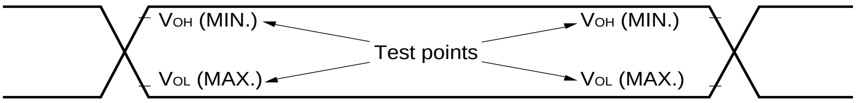
Note 2. Regarding operation temperature of each product, see **Section 1C.3, RH850/F1KM Product Lineup**.

47C.1.2.2 AC Characteristic Measurement Condition

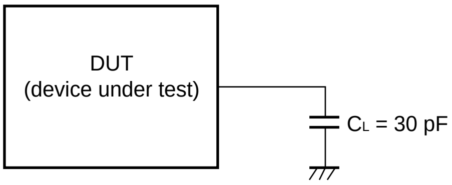
(1) AC Test Input Measurement Points



(2) AC Test Output Measurement Points



(3) Load Conditions



CAUTION

If the load capacitance exceeds 30 pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30 pF.

47C.2 Absolute Maximum Ratings

CAUTIONS

1. Do not directly connect outputs (or input/outputs) to each other, power supply and ground.
2. Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.
3. When designing an external circuit ensure that the connections don't conflict with the port state of this device.

47C.2.1 Supply Voltages

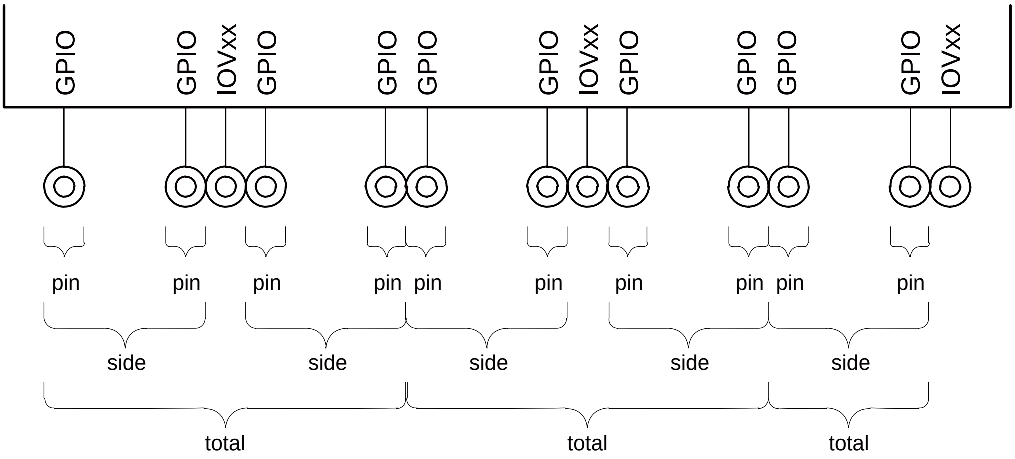
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
System supply voltage	REGVCC		–0.5		6.5	V
	AWOVSS		–0.5		0.5	V
	ISOVSS		–0.5		0.5	V
Port supply voltage	EVCC		–0.5		6.5	V
	EVSS		–0.5		0.5	V
A/D-converter supply voltage	A0VREF		–0.5		6.5	V
	A0VSS		–0.5		0.5	V

47C.2.2 Port Voltages

Item	Pin Group*[1]	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	PgR	VI		–0.5		REGVCC + 0.5 (Do not exceed 6.5 V)	V
	PgE			–0.5		EVCC + 0.5 (Do not exceed 6.5 V)	V
	PgA0			–0.5		A0VREF + 0.5 (Do not exceed 6.5 V)	V

Note 1. The characteristics of the alternative-function pins are the same as those of the port pins unless otherwise specified.

47C.2.3 Port Current



Definition of the condition:

- Per pin: Output current of one GPIO
- Per side: Total output current of all GPIO pins on one side of one IOVxx
- Total: Total output current of both sides of one IOVxx

Note:

- GPIO: General-purpose I/O pin (JP0, P0, P8, P9, P10, P11, AP0)
- IOVxx: Power supply pin for I/O pins (EVCC/EVSS, A0VREF/A0VSS)

47C.2.3.1 100-Pin Version

Item	Symbol	Pin Group	Condition	MIN.	TYP.	MAX.	Unit
High-level output current	IOH	PgE	Per pin			–10	mA
			Per side (Total of P9_0 to P9_6)			–48	mA
			Per side (Total of P0_0 to P0_3, P10_3 to P10_5, P10_15, P11_0)			–48	mA
			Per side (Total of JP0_3 to JP0_5, P0_4 to P0_6, P0_11 to P0_14, P8_2, P8_10 to P8_12)			–48	mA
			Per side (Total of JP0_0 to JP0_2)			–30	mA
			Per side (Total of P0_7 to P0_10, P8_0, P8_1, P8_3 to P8_9)			–48	mA
			Per side (Total of P10_6 to P10_9)			–40	mA
			Per side(Total of P10_10 to P10_14, P11_1 to P11_7)			–48	mA
			Per side (Total of P10_0 to P10_2)			–30	mA
			Total (EVCC)			–60	mA
		PgA0	Per pin			–10	mA
			Total (A0VREF)			–48	mA
Low-level output current	IOL	PgE	Per pin			10	mA
			Per side (Total of P9_0 to P9_6)			48	mA
			Per side (Total of P0_0 to P0_6, P0_11 to P0_14, P10_3 to P10_5, P10_15, P11_0)			48	mA
			Per side (Total of JP0_0 to JP0_5, P8_2, P8_10 to P8_12)			48	mA
			Per side (Total of P0_7 to P0_10)			40	mA
			Per side (Total of P8_0, P8_1, P8_3 to P8_9)			48	mA
			Per side(Total of P10_6 to P10_14, P11_1, P11_2)			48	mA
			Per side (Total of P11_3 to P11_7)			48	mA
			Per side (Total of P10_0 to P10_2)			30	mA
			Total (EVCC)			60	mA
		PgA0	Per pin			10	mA
			Total (A0VSS)			48	mA

47C.2.3.2 80-Pin Version

Item	Symbol	Pin Group	Condition	MIN.	TYP.	MAX.	Unit
High-level output current	IOH	PgE	Per pin			–10	mA
			Per side (Total of P9_0 to P9_6, P10_6 to P10_14, P11_1 to P11_4)			–48	mA
			Per side (Total of P10_0 to P10_2)			–30	mA
			Per side (Total of P0_0 to P0_3, P10_3 to P10_5, P10_15, P11_0)			–48	mA
			Per side (Total of JP0_0 to JP0_5, P0_4 to P0_12, P8_0 to P8_6)			–48	mA
			Total (EVCC)			–60	mA
		PgA0	Per pin			–10	mA
			Total (A0VREF)			–48	mA
Low-level output current	IOL	PgE	Per pin			10	mA
			Per side (Total of P9_0 to P9_6, P10_6 to P10_14, P11_1 to P11_4)			48	mA
			Per side (Total of P10_0 to P10_2)			30	mA
			Per side (Total of P0_0 to P0_6, P0_11, P0_12, P10_3 to P10_5, P10_15, P11_0)			48	mA
			Per side (Total of JP0_0 to JP0_5, P0_7 to P0_10, P8_0 to P8_6)			48	mA
			Total (EVSS)			60	mA
		PgA0	Per pin			10	mA
			Total (A0VSS)			48	mA

47C.2.3.3 64-Pin Version

Item	Symbol	Pin Group	Condition	MIN.	TYP.	MAX.	Unit
High-level output current	IOH	PgE	Per pin			–10	mA
			Per side (Total of P9_0 to P9_3, P10_6 to P10_14)			–48	mA
			Per side (Total of P10_0 to P10_2)			–30	mA
			Per side (Total of P0_0 to P0_3, P10_3 to P10_5)			–48	mA
			Per side (Total of JP0_0 to JP0_5, P0_4 to P0_6, P8_0 to P8_6)			–48	mA
			Total (EVCC)			–60	mA
		PgA0	Per pin			–10	mA
			Total (A0VREF)			–48	mA
Low-level output current	IOL	PgE	Per pin			10	mA
			Per side (Total of P9_0 to P9_3, P10_6 to P10_14)			48	mA
			Per side (Total of P10_0 to P10_2)			30	mA
			Per side (Total of P0_0 to P0_6, P10_3 to P10_5)			48	mA
			Per side (Total of JP0_0 to JP0_5, P8_0 to P8_6)			48	mA
			Total (EVSS)			60	mA
		PgA0	Per pin			10	mA
			Total (A0VSS)			48	mA

47C.2.3.4 48-Pin Version

Item	Symbol	Pin Group	Condition	MIN.	TYP.	MAX.	Unit
High-level output current	IOH	PgE	Per pin			–10	mA
			Per side (Total of P9_0, P9_1, P10_6 to P10_10)			–48	mA
			Per side (Total of P10_0 to P10_2)			–30	mA
			Per side (Total of P0_0 to P0_3, P10_3 to P10_5)			–48	mA
			Per side (Total of JP0_0 to JP0_5, P8_0, P8_1)			–48	mA
			Total (EVCC)			–60	mA
		PgA0	Per pin			–10	mA
			Total (A0VREF)			–48	mA
Low-level output current	IOL	PgE	Per pin			10	mA
			Per side (Total of P9_0, P9_1, P10_6 to P10_10)			48	mA
			Per side (Total of P10_0 to P10_2)			30	mA
			Per side (Total of P0_0 to P0_3, P10_3 to P10_5)			48	mA
			Per side (Total of JP0_0 to JP0_5, P8_0, P8_1)			48	mA
			Total (EVSS)			60	mA
		PgA0	Per pin			10	mA
			Total (A0VSS)			48	mA

47C.2.4 Temperature Condition

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Storage temperature	Tstg		–55		150	°C
Junction temperature	Tj	R7F7016xx3AFP	–40		130	°C
		R7F7016xx4AFP	–40		150	°C

Note: xx = 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95

Regarding operation temperature of each product, see **Section 1C.3, RH850/F1KM Product Lineup**.

47C.3 Operational Condition

47C.3.1 Recommended Operating Conditions

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CPU clock frequency	$f_{\mathrm{CPUCLK\_M}}$				120	MHz
	$f_{\mathrm{CPUCLK\_L}}$	for OSTMn			60	MHz
Peripheral clock (clock domain) frequency[*1]	$f_{\mathrm{CKSCLK\_AWDTA}}$	for WDTA0			240[*2]	kHz
	$f_{\mathrm{CKSCLK\_ATAUJ}}$	for TAUJ0			40	MHz
		for TAUJ2				
	$f_{\mathrm{CKSCLK\_ARTCA}}$	for RTCA0			4	MHz
	$f_{\mathrm{CKSCLK\_AADCA}}$	for ADCA0			40	MHz
	$f_{\mathrm{CKSCLK\_AFOUT}}$	for FOUT			24	MHz
	$f_{\mathrm{CKSCLK\_IPERI1}}$	for TAUD0			80	MHz
		for TAUJ1				
		for TAUJ3				
		for ENCA0				
		for TAPA0				
		for PIC0				
	$f_{\mathrm{CKSCLK\_IPERI2}}$	for TAUB0			40	MHz
		for RCFDCn (clkc)				
		for RSENTn				
		for PWBAn				
		for PWGAn				
		for PWSAn				
	$f_{\mathrm{CKSCLK\_ILIN}}$	for RLIN24n			40	MHz
		for RLIN3n				
	$f_{\mathrm{CKSCLK\_ICAN}}$	for RCFDCn (pclk)			80	MHz
	$f_{\mathrm{CKSCLK\_ICANOSC}}$	for RCFDCn (clk_xincan)			24	MHz
	$f_{\mathrm{CKSCLK\_ICSI}}$	for CSIGn			80	MHz
		for CSIHn				
	$f_{\mathrm{LS\ IntOSC}}$	for WDTA1			240[*2]	kHz
	$f_{\mathrm{CKSCLK\_IIIC}}$	for RIICn			40	MHz
	f_{EMCLK}	for LPSn			8	MHz
Power supply	REGVCC	REGVCC = EVCC	VPOC[*3]		5.5	V
	EVCC					
	A0VREF		3.0		5.5	V
Normal operation voltage	AWOVCL		1.1	1.25	1.35	V
	ISOVCL					
Limited operation voltage[*4]	AWOVCL		1.35		1.43	V
	ISOVCL					

Note 1. For clock specification of peripherals, see **Section 12C, Clock Controller of RH850/F1KM-S1**.

Note 2. This frequency depends on the internal oscillator (LS IntOSC).

Note 3. "VPOC" means POC (power-on clear) detection voltage (TYP. 2.85 V). For detail, see **Section 47C.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.
In addition, the guaranteed operation in DC characteristic.
And AC characteristic is guaranteed when more than 3.0 V.
When the power supply voltage is VPOC to 3.0 V, the device does not malfunction.

Note 4. Reliability restrictions from 1.35 V to 1.43 V.

47C.3.2 Oscillator Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%,
Tj = –40 to (depend on the product) °C

(1) MainOSC (In Case of Using a Crystal/Ceramic)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MainOSC frequency*3	f_{MOSC}		8		24	MHz
MainOSC current consumption	I_{MOSC}	After stabilization		1.9*2	2.3*2	mA
MainOSC oscillation start point	V_{MOSCSP}		VPOC			V
MainOSC oscillation operating point	V_{MOSCOP}			0.5 × REGVCC*2		V
MainOSC oscillation amplitude	$V_{MOSCAMP}$		0.4 × REGVCC − 0.2*2			V
MainOSC oscillation stabilization time	t_{MSTB}			2*1, *2		ms
MainOSC transconductance	g_{m_MOSC}	MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 00		11.1*1		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 01		10.6*1		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 10		9.3*1		mA/V
		MOSCS.MOSCCLKACT = 0, MOSCC.MOSCAMPSEL[1:0] = 11		7.8*1		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 00		8.6*1		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 01		7.8*1		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 10		6.1*1		mA/V
		MOSCS.MOSCCLKACT = 1, MOSCC.MOSCAMPSEL[1:0] = 11		4.0*1		mA/V

Note 1. Oscillator stabilization time is time until being set (“1”) in MOSCS.MOSCCLKACT bit after MOSCE.MOSCENTRG bit is written “1”, and depends on the setting value of MOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

Note 2. This is reference value.

Note 3. The following four crystal/ceramic resonator frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

(2) MainOSC (In Case of External Clock Input to X1)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
X1 clock Input frequency*[1]	f_{EX}		8		24	MHz
X1 clock Input cycle time	t_{EXCYC}		41.7		125	ns
X1 High level Input voltage	V_{IH}		0.7 × REGVCC		REGVCC + 0.5	V
		@Flash Programing Interface*[2]	0.8 × REGVCC		REGVCC + 0.5	V
X1 Low level Input voltage	V_{IL}		–0.5		0.3 × REGVCC	V
		@Flash Programing Interface*[2]	–0.5		0.2 × REGVCC	V
X1 Input leakage current	I_{LIH}	VI = REGVCC			0.5	μA
	I_{LIL}	VI = 0 V			–0.5	μA
X1 clock Input low-level pulse width	t_{EXL}	f_{EX} = 8 MHz	58			ns
		f_{EX} = 16 MHz	26			ns
		f_{EX} = 20 MHz	20			ns
		f_{EX} = 24 MHz	16			ns
X1 clock Input high-level pulse width	t_{EXH}	f_{EX} = 8 MHz	58			ns
		f_{EX} = 16 MHz	26			ns
		f_{EX} = 20 MHz	20			ns
		f_{EX} = 24 MHz	16			ns
X1 clock Input period jitter			–0.3		0.3	ns

Note 1. The following four external clock input frequencies are supported: 8 MHz, 16 MHz, 20 MHz and 24 MHz.

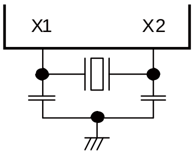
Note 2. X2 should be open and its parasitic capacitance should be less than 5 pF.

CAUTION

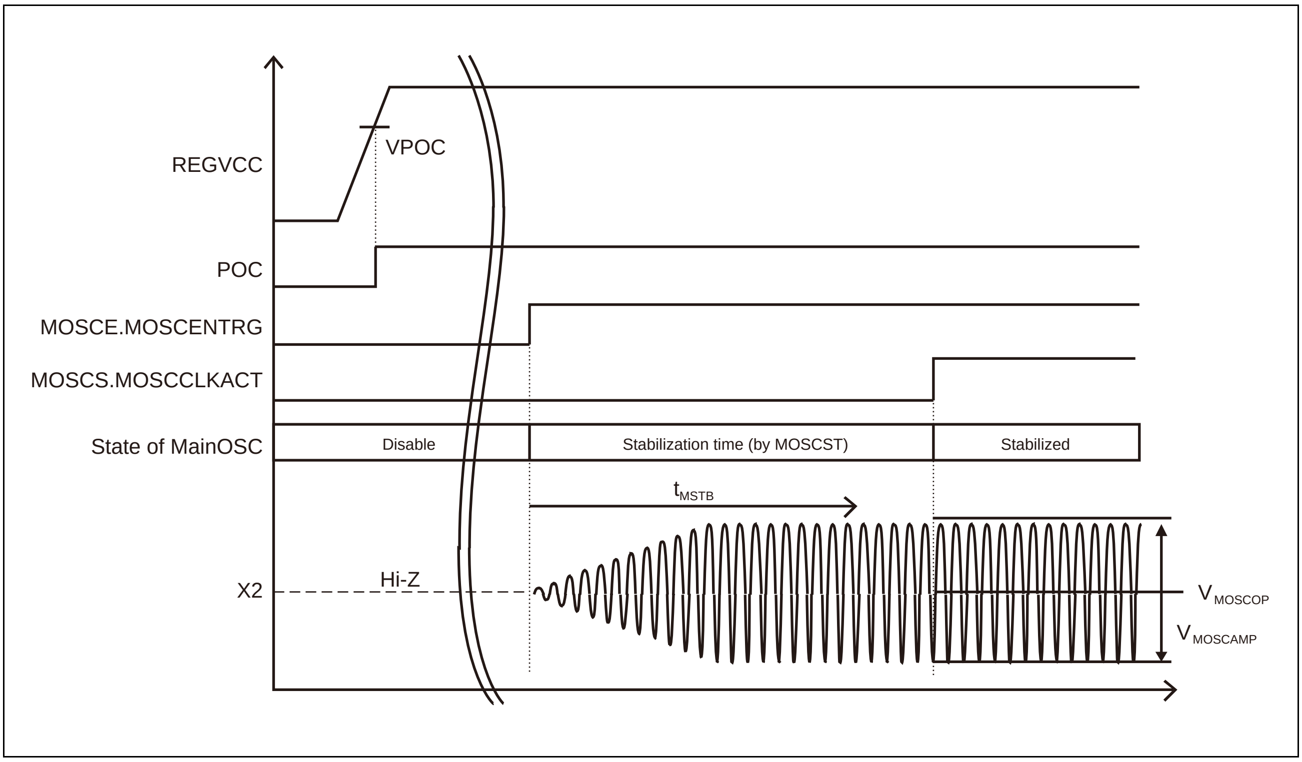
The oscillation stabilization time differs according the matching with the external resonator circuit. It is recommended to determine the oscillation stabilization time by an oscillator matching test.

NOTE

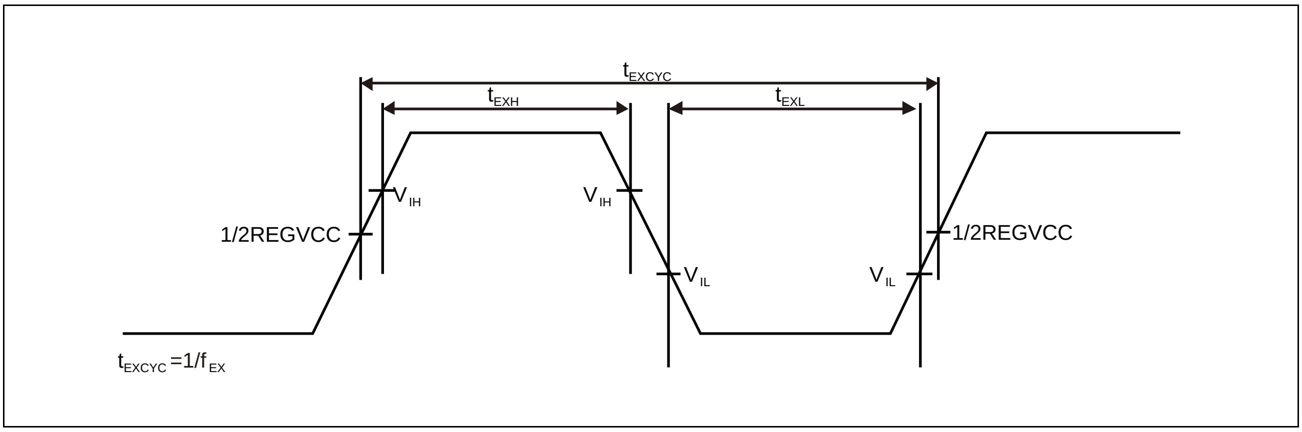
Recommended oscillator circuit is shown below.



MainOSC



External clock



47C.3.3 Internal Oscillator Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
LS IntOSC frequency	f_{RL}		220.8	240	259.2	kHz
HS IntOSC frequency*2, *3	f_{RH}		7.6	8	8.4	MHz
		After user trimming @ trimming temp	7.92	8	8.08	MHz
HS IntOSC current consumption	I_{RH}	After stabilization			170*1	µA
HS IntOSC oscillation stabilization time	t_{RHSTB}				54.4	µs

Note 1. This is reference value.

Note 2. The HS IntOSC frequency may not meet the specification range (8.00 MHz ±0.4 MHz, 8.00 MHz ±0.08 MHz after user trimming @ trimming temp) in the while writing/erasing the code/data flash.

Note 3. The HS IntOSC frequency may not meet the specification range in the Cyclic STOP/Cyclic RUN mode.

47C.3.4 PLL Characteristics

47C.3.4.1 PLL1 (for CPU/Peripheral) Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Input frequency	$f_{PLL1CLKIN}$	MainOSC		8		24	MHz
		HS IntOSC	After user trimming @ trimming temp*3, *4	7.92	8.0	8.08	MHz
Output frequency	$f_{CPLL1OUT}$	MainOSC		80		120	MHz
		HS IntOSC*3	After user trimming @ trimming temp*3	79.2	80	80.8	MHz
	$f_{PPLLOUT}$			79.2	80	80.8	MHz
Output period jitter*1	t_{CPJ1}			–100		100	ps
Long term jitter*1	t_{LTJ}	term = 1 µs		–500		500	ps
		term = 10 µs		–1		1	ns
		term = 20 µs		–2		2	ns
Lock time*2	t_{LCK1}			104	112.3	122.1	µs

Note 1. This is reference value.

Note 2. Lock time is time until being set (“1”) in PLL1S.PLL1CLKACT bit after PLL1E.PLL1ENTRG bit is written “1”.

Note 3. The HS IntOSC has a frequency deviation. When the HSIntOSC is used the frequency deviation should be considered for the customer application as it affects peripheral functions (e.g. TAUx, ADCAn, etc.).

Note 4. Do not select the PLL1 as clock source during the code/data flash write and/or erase.

47C.4 DC Characteristics

47C.4.1 Capacitance

Condition: REGVCC = EVCC = A0VREF = AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
Ta = 25°C

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input capacitance	CI*[1]	f = 1 MHz 0 V for non measurement pins			10	pF
Input/output capacitance	CIO*[2]				10	pF

Note 1. CI: Capacitance between the input pin and ground

Note 2. CIO: Capacitance between the input/output pin and ground

47C.4.2 Pin Characteristics

Condition: Some of the conditions mentioned in this chapter can be selected by software and described in the hardware user's manual.

Note 1. Pull-down resistor for ADC diagnostic purpose. Control via ADC self-diagnostic register.

Note 2. Supports Cload: 100 pF

Note 3. Supports Cload: 50 pF

Note 4. Pull-down resistors for ADC diagnostic and internal pull-down purposes. For ADC diagnostic, control via ADC self-diagnostic register. For internal pull-down, control via PD register.

Note 5. TTL is selected for Boundary scan mode or Nexus in normal operating mode.

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

				P0_0 to P0_6, P0_11, P0_12, P10_3 to P10_5, P10_15, P11_0			30	mA
				JP0_0 to JP0_5, P0_7 to P0_10, P8_0 to P8_6			21	mA
			Total (EVSS)				60	mA
		PgA0	Total (A0VSS)				11	mA

Note: For detail of the definition of “side” and “total”, see **Section 47C.2.3, Port Current**.

(3) 64-Pin Version

Item	Symbol	Pin Group	Condition		MIN.	TYP.	MAX.	Unit
High-level output current	IOH	PgE	Per side	P9_0 to P9_3, P10_6 to P10_14			–30	mA
				P10_0 to P10_2			–15	mA
				P0_0 to P0_3, P10_3 to P10_5			–27	mA
				JP0_0 to JP0_5, P0_4 to P0_6, P8_0 to P8_6			–24	mA
			Total (EVCC)				–60	mA
		PgA0	Total (A0VREF)				–10	mA
Low-level output current	IOL	PgE	Per side	P9_0 to P9_3, P10_6 to P10_14			30	mA
				P10_0 to P10_2			15	mA
				P0_0 to P0_6, P10_3 to P10_5			30	mA
				JP0_0 to JP0_5, P8_0 to P8_6			13	mA
			Total (EVSS)				60	mA
		PgA0	Total (A0VSS)				10	mA

Note: For detail of the definition of “side” and “total”, see **Section 47C.2.3, Port Current**.

(4) 48-Pin Version

Item	Symbol	Pin Group	Condition		MIN.	TYP.	MAX.	Unit
High-level output current	IOH	PgE	Per side	P9_0, P9_1, P10_6 to P10_10			–27	mA
				P10_0 to P10_2			–15	mA
				P0_0 to P0_3, P10_3 to P10_5			–27	mA
				JP0_0 to JP0_5, P8_0, P8_1			–8	mA
			Total (EVCC)				–60	mA
		PgA0	Total (A0VREF)				–8	mA
Low-level output current	IOL	PgE	Per side	P9_0, P9_1, P10_6 to P10_10			27	mA
				P10_0 to P10_2			15	mA
				P0_0 to P0_3, P10_3 to P10_5			27	mA
				JP0_0 to JP0_5, P8_0, P8_1			8	mA
			Total (EVSS)				60	mA
		PgA0	Total (A0VSS)				8	mA

Note: For detail of the definition of “side” and “total”, see **Section 47C.2.3, Port Current**.

47C.4.3 Power Supply Currents

Condition: REGVCC, EVCC, A0VREF total current. But the I/O buffer is stopped.

Item	Symbol	Condition				MIN.	TYP.*1	MAX.	Unit
		CPU	PLL	Tj	Peripheral*2				
RUN mode current	IDDR	Run (120 MHz)	Run	–40 to 150°C	Run(#1)		32	67	mA
				25°C	Stop(#1)		26		mA
RUN mode current (During data/code flash programming)	IDDR3	Run (120 MHz)	Run	–40 to 150°C	Run(#2)		43	82	mA
RUN mode current (HALT state)	IDDH	Run (120 MHz)	Run	–40 to 150°C	Run(#3)		29	63	mA

Item	Symbol	Condition				MIN.	TYP.*1	MAX.	Unit
		CPU	PLL	Tj	Peripheral*2				
STOP mode current	IDDS	Stop	Stop	–40 to 90°C	Stop(#2)		0.7	12	mA
				110°C	Stop(#2)			17	mA
				135°C	Stop(#2)			31	mA
DeepSTOP mode current	IDDDS	Power off	Power off	–40 to 85°C	Stop(#3)		50	470	μA
				105°C	Stop(#3)			830	μA
				125°C	Stop(#3)			1370	μA
Cyclic RUN mode current	IDDCR	Run (HS IntOSC)	Stop	–40 to 90°C	Run(#4)		3.6	21	mA
				115°C	Run(#4)			28	mA
				135°C	Run(#4)			40	mA
Cyclic STOP mode current	IDDCS	Stop	Stop	–40 to 90°C	Run(#5)		1.1	13	mA
				110°C	Run(#5)			18	mA
				135°C	Run(#5)			32	mA

Note 1. The condition of “TYP.” shows the specification with the following conditions. Also, the value is just for reference only.
- Tj = 25°C
- REGVCC = EVCC = A0VREF = 5.0 V
- AWOVSS = EVSS = A0VSS = 0 V

Note 2. Operating condition of each peripheral function is shown in the table of next page.

Caution: It must be ensured that the junction temperature in the Ta range remains below Tj ≤ 150°C and does not exceed its limit under application conditions (thermal resistance, power supply current, peripheral current (if not included in power supply current), port output current and injection current).

Note 1. T&H used.

47C.4.4 Injection Currents

Table 47C.1 Definition of Pin Group (100-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgE	EVCC, EVSS	JP0, P0, P10, P11
PgE’	EVCC, EVSS	P8, P9
PgA0	A0VREF, A0VSS	AP0

Table 47C.2 Definition of Pin Group (80-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgE	EVCC, EVSS	JP0, P0, P10, P11
PgE’	EVCC, EVSS	P8, P9
PgA0	A0VREF, A0VSS	AP0

Table 47C.3 Definition of Pin Group (64-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgE	EVCC, EVSS	JP0, P0, P10
PgE’	EVCC, EVSS	P8, P9
PgA0	A0VREF, A0VSS	AP0

Table 47C.4 Definition of Pin Group (48-Pin Version)

Symbol	Power Supply for Pin Group	Pin
PgE	EVCC, EVSS	JP0, P0, P10
PgE’	EVCC, EVSS	P8, P9
PgA0	A0VREF, A0VSS	AP0

47C.4.4.1 Absolute Maximum Ratings

(1) 100-Pin Version

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJPM}	PgE	Per pin			10	mA
			Total			60	mA
		PgE’	Per pin			10	mA
			Total			60	mA
		PgA0	Per pin			10	mA
			Total			60	mA
Negative overload current VIN < VSS	I_{INJNM}	PgE	Per pin			–10	mA
			Total			–60	mA
		PgE’	Per pin			–10	mA
			Total			–60	mA
		PgA0	Per pin			–10	mA
			Total			–60	mA

CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgA0, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

(2) 80-Pin Version

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJPM}	PgE	Per pin			10	mA
			Total			60	mA
		PgE’	Per pin			10	mA
			Total			60	mA
		PgA0	Per pin			10	mA
			Total			60	mA
Negative overload current VIN < VSS	I_{INJNM}	PgE	Per pin			–10	mA
			Total			–60	mA
		PgE’	Per pin			–10	mA
			Total			–60	mA
		PgA0	Per pin			–10	mA
			Total			–60	mA

CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgA0, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

(3) 64-Pin Version

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJPM}	PgE	Per pin			10	mA
			Total			60	mA
		PgE’	Per pin			10	mA
			Total			60	mA
		PgA0	Per pin			10	mA
			Total			60	mA
Negative overload current VIN < VSS	I_{INJNM}	PgE	Per pin			–10	mA
			Total			–60	mA
		PgE’	Per pin			–10	mA
			Total			–60	mA
		PgA0	Per pin			–10	mA
			Total			–60	mA

CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgA0, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

(4) 48-Pin Version

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJPM}	PgE	Per pin			10	mA
			Total			60	mA
		PgE’	Per pin			10	mA
			Total			60	mA
		PgA0	Per pin			10	mA
			Total			60	mA
Negative overload current VIN < VSS	I_{INJNM}	PgE	Per pin			–10	mA
			Total			–60	mA
		PgE’	Per pin			–10	mA
			Total			–60	mA
		PgA0	Per pin			–10	mA
			Total			–60	mA

CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of an injected current condition for PgA0, TESH0SN is kept when the injected current is applied to an adjacent pin where the ADC self-diagnosis is executed. When an injected current is applied to the same pin where the ADC self-diagnosis is executed the TESH0SN deviating value will increase sharply with increasing absolute value of injection current.

47C.4.4.2 DC Characteristics for Overload Current

(1) 100-Pin Version

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJP}	PgE	Per pin			2	mA
			Total			50	mA
		PgE’	Per pin			3	mA
			Total			20	mA
		PgA0	Per pin			3	mA
			Total			20	mA
Negative overload current VIN < VSS	I_{INJN}	PgE	Per pin			–2	mA
			Total			–50	mA
		PgE’	Per pin			–3	mA
			Total			–20	mA
		PgA0	Per pin			–3	mA
			Total			–20	mA

NOTE

These specifications are not tested on sorting and are specified based on the device characterization.

(2) 80-Pin Version

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJP}	PgE	Per pin			2	mA
			Total			50	mA
		PgE’	Per pin			3	mA
			Total			20	mA
		PgA0	Per pin			3	mA
			Total			20	mA
Negative overload current VIN < VSS	I_{INJN}	PgE	Per pin			–2	mA
			Total			–50	mA
		PgE’	Per pin			–3	mA
			Total			–20	mA
		PgA0	Per pin			–3	mA
			Total			–20	mA

NOTE

These specifications are not tested on sorting and are specified based on the device characterization.

(3) 64-Pin Version

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJP}	PgE	Per pin			2	mA
			Total			50	mA
		PgE'	Per pin			3	mA
			Total			20	mA
		PgA0	Per pin			3	mA
			Total			20	mA
Negative overload current VIN < VSS	I_{INJN}	PgE	Per pin			–2	mA
			Total			–50	mA
		PgE'	Per pin			–3	mA
			Total			–20	mA
		PgA0	Per pin			–3	mA
			Total			–20	mA

NOTE

These specifications are not tested on sorting and are specified based on the device characterization.

(4) 48-Pin Version

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJP}	PgE	Per pin			2	mA
			Total			50	mA
		PgE'	Per pin			3	mA
			Total			20	mA
		PgA0	Per pin			3	mA
			Total			20	mA
Negative overload current VIN < VSS	I_{INJN}	PgE	Per pin			–2	mA
			Total			–50	mA
		PgE'	Per pin			–3	mA
			Total			–20	mA
		PgA0	Per pin			–3	mA
			Total			–20	mA

NOTE

These specifications are not tested on sorting and are specified based on the device characterization.

47C.4.5 Power Management Characteristics

47C.4.5.1 Regulator Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	REGVCC		VPOC*[1]		5.5	V
Output voltage	AWOVCL	AWOVCL pin	1.15	1.25	1.35	V
	ISOVCL	ISOVCL pin	1.15	1.25	1.35	V
Capacitance	CAWOVCL	AWOVCL pin	0.07	0.10	0.13	μF
	CISOVCL	ISOVCL pin	0.07	0.10	0.13	μF
Equivalent series resistance for load capacitance	RVRAWO	for CAWOVCL			40*[2]	mΩ
	RVRISO	for CISOVCL			40*[2]	mΩ
Inrush current during power-on					120	mA

Note 1. “VPOC” means POC (power-on clear) detection voltage (typ. 2.85 V). For detail, see **Section 47C.4.5.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

Note 2. This is reference value.

47C.4.5.2 Voltage Detector (POC, LVI, VLVI, CVM) Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition			MIN.	TYP.	MAX.	Unit
Detection voltage (REGVCC)	VPOC	POC			2.7	2.85	3.0	V
	VLVI0	LVI	Rise		3.87	4.0	4.13	V
			Fall		3.9	4.0	4.1	V
	VLVI1		Rise		3.57	3.7	3.83	V
			Fall		3.6	3.7	3.8	V
	VLVI2		Rise		3.37	3.5	3.63	V
			Fall		3.4	3.5	3.6	V
	VVLVI	VLVI			1.8	1.9	2.0	V
Detection voltage (ISOVCL)	VCVMH	CVM	High voltage[Caution]		1.35	1.39	1.43	V
	VCVML*8		Low voltage[Caution]		1.10	1.15	1.20	V
Response time	t_{D_POC1}*6	POC	At power-on (Rise)	*1			2	ms
				*2			6.3	ms
			After power-on (Rise)	*3			2	ms
				*4			5	ms
	t_{D_POC2}*7		After power-on (Fall)	*5			5	μs
	t_{D_LVI}	LVI					2	ms
	t_{D_VLVI}	VLVI		*3			2	ms
				*4			5	ms
	t_{D_CVM}	CVM			0.2		10	μs
Setup time	t_{S_LVI}	LVI	LVICNT0,1 bits are set to 1 (except 00_B), then LVI is ready to operate				80	μs
REGVCC minimum width	t_{W_POC}	POC			0.2			ms
	t_{W_LVI}	LVI			0.2			ms
	t_{W_VLVI}	VLVI			0.2			ms

Note 1. Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms

Note 2. Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms

Note 3. Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 20 V/ms

Note 4. Voltage slope (t_{VS}): 20 V/ms < t_{VS} ≤ 500 V/ms

Note 5. Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 500 V/ms

Note 6. t_{D_POC1} is the time from detection voltage to release of reset signal.

Note 7. t_{D_POC2} is the time from detection voltage to occurrence of reset signal.

Note 8. The CVM monitors the internal voltage regulator output to ensure that ISOVCL is upper than specified minimum level.

Caution: A detection of the voltage ISOVCL outside the specified level of VCVMH and VCVML is not ensured by CVM.

FLMD1, MODE0, MODE1,MODE2 setup time (vs FLMD0 ↑)	t_{SMD1R}		1			μs
FLMD0 hold time (vs $\overline{\text{RESET}}$ ↓)	t_{HMD0F}		1			μs
FLMD1, MODE0, MODE1, MODE2 hold time (vs FLMD0 ↓)	t_{HMD1F}		1			μs
$\overline{\text{RESET}}$ ↓ to REGVCC ↓ and IOVCC ↓ delay time	t_{DRPD}		0			ms

Note 1. IOVCC means EVCC, A0VREF.

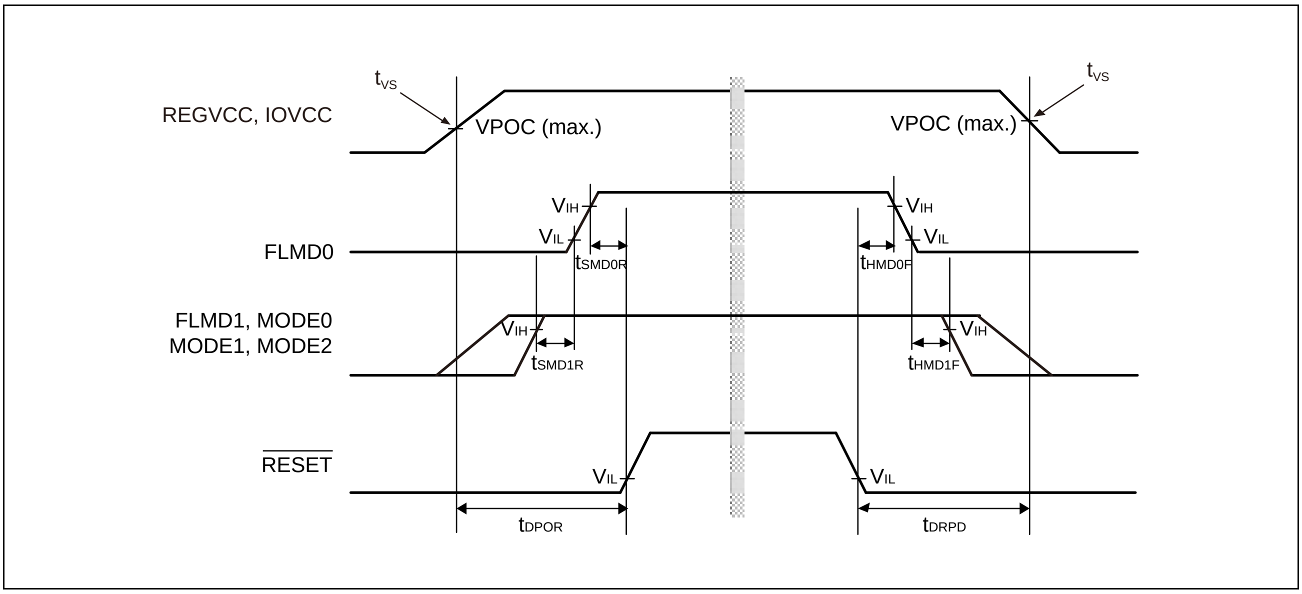

Table 47C.9 In Case the $\overline{\text{RESET}}$ Pin is Not Used and Fixed to High Level by Pull-up*1

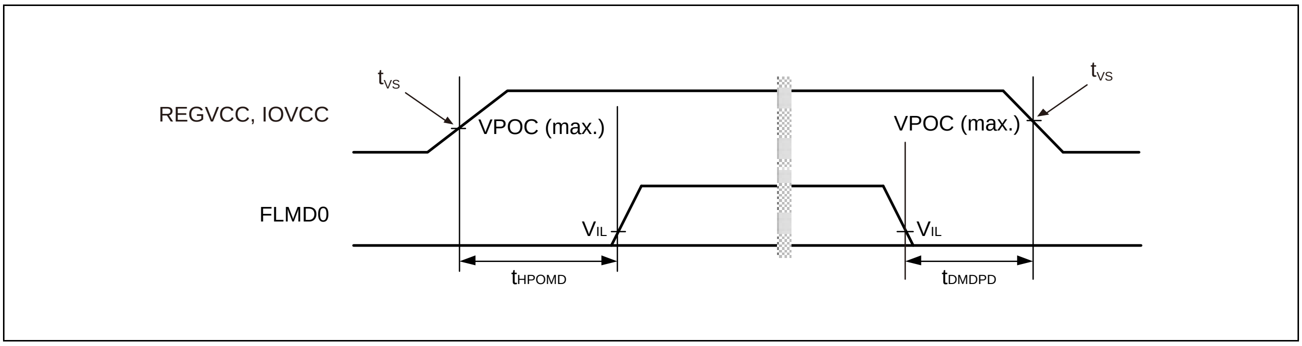
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REGVCC and IOVCC*2)	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 μs/V)	V/ms
REGVCC ↑ and IOVCC*2 ↑ to FLMD0 hold time	t_{HPOMD}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 ↓ to REGVCC ↓ and IOVCC*2 ↓ delay time	t_{DMDPD}		1			μs

Note 1. This operating condition is available only in normal operation mode (include self-programming mode).
When the device is used in except normal operation mode, please use the $\overline{\text{RESET}}$ pin.

Note 2. IOVCC means EVCC, and A0VREF.



47C.4.5.4 CPU Reset Release Timing

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Table 47C.10 In Case the $\overline{\text{RESET}}$ Pin is Not Used

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
REGVCC ↑ to CPU reset release*[1]	t_{DPCRR}	Voltage slope (t_{VS}): 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms			2.58	ms
		Voltage slope (t_{VS}): 0.5 V/ms < t_{VS} ≤ 500 V/ms			8.3	ms

Note 1. This is reference value.

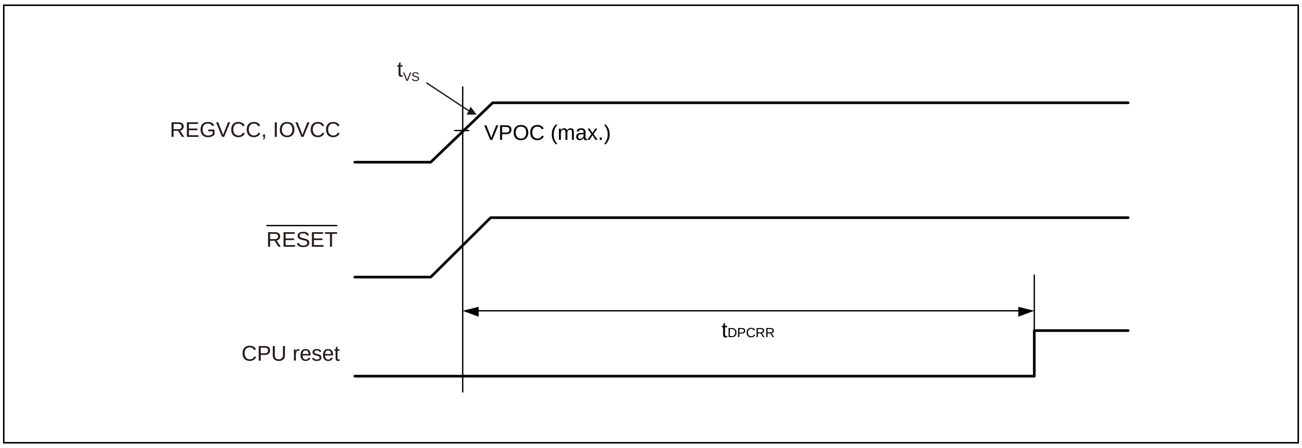


Table 47C.11 In Case the $\overline{\text{RESET}}$ Pin is Used

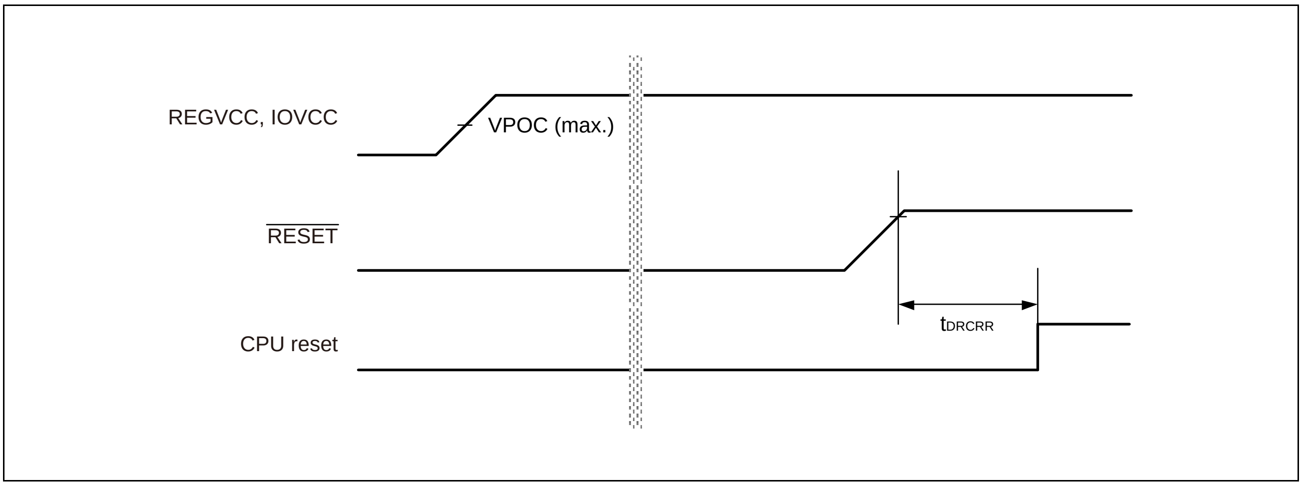
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ ↑ to CPU reset release*[1]	t_{DRCRR}				16*[2]	μs

Note 1. This is reference value.

Note 2. In case the time until releasing the $\overline{\text{RESET}}$ pin is longer than t_{DPCRR}.



47C.5 AC Characteristics

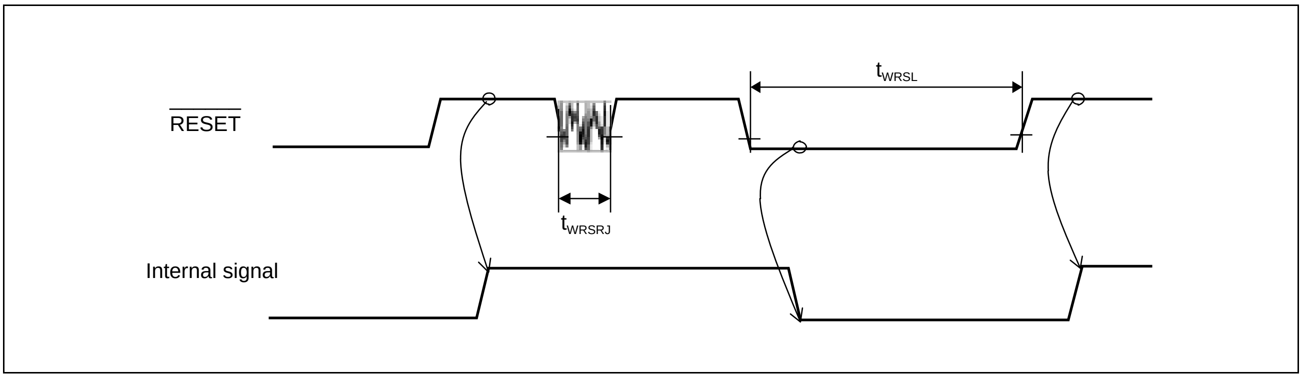
47C.5.1 $\overline{\text{RESET}}$ Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ input low level width*[1]	t_{WRSL}	Except power on	600			ns
$\overline{\text{RESET}}$ pulse rejection*[2]	t_{WRSRJ}		100			ns

Note 1. $\overline{\text{RESET}}$ input width is needed to ensure that the internal reset signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.



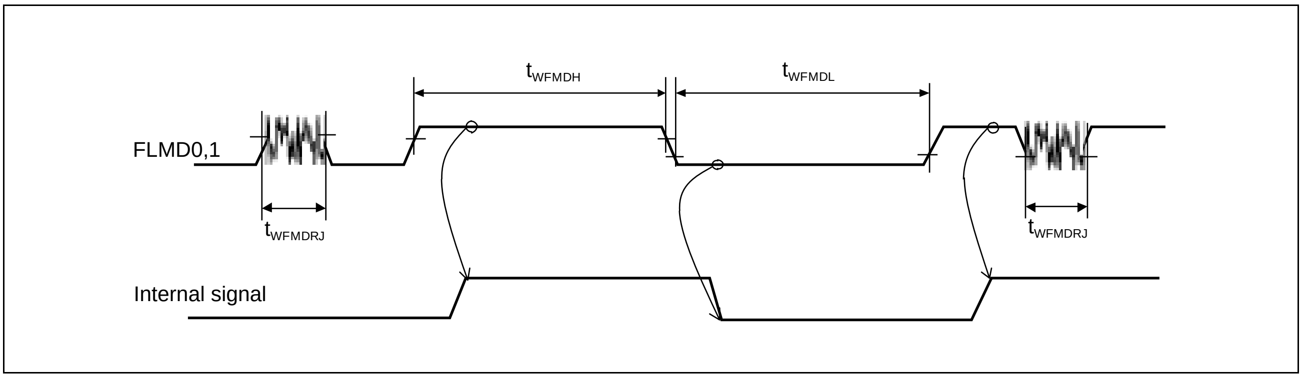
47C.5.2 Mode Timing

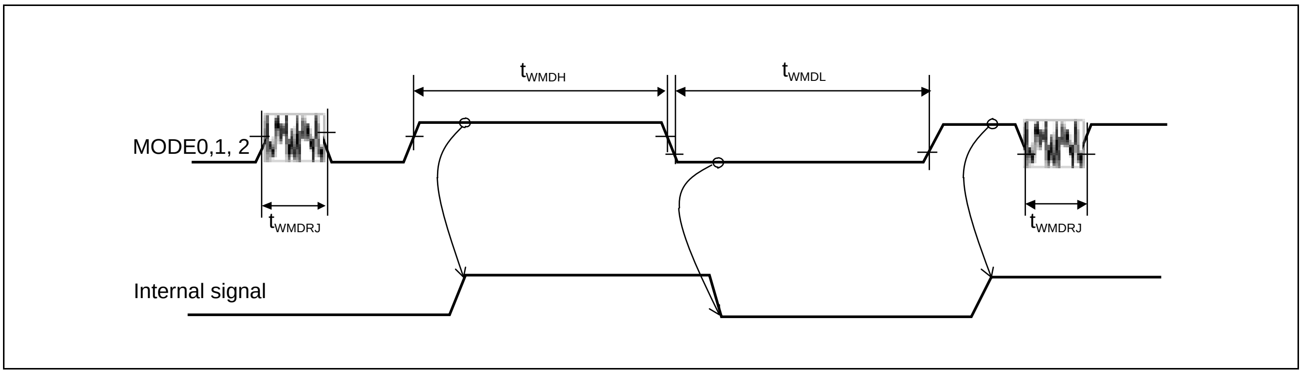
Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0, 1 input high/low level width*[1]	t_{WFMDH}/ t_{WFMDL}		600			ns
FLMD0, 1 pulse rejection*[2]	t_{WFMDRJ}		100			ns
MODE0, 1, 2 input high/low level width*[1]	t_{WMDH}/ t_{WMDL}		600			ns
MODE0, 1, 2 pulse rejection*[2]	t_{WMDRJ}		100			ns

Note 1. FLMD0,1 and MODE0, 1, 2 input width is needed to ensure that the internal mode signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.





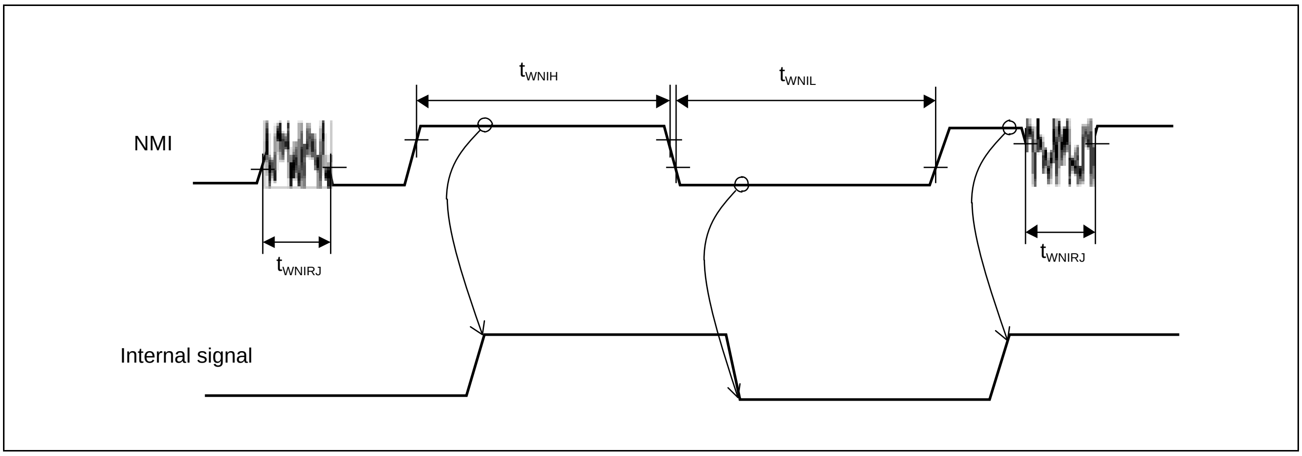
47C.5.3 Interrupt Timing

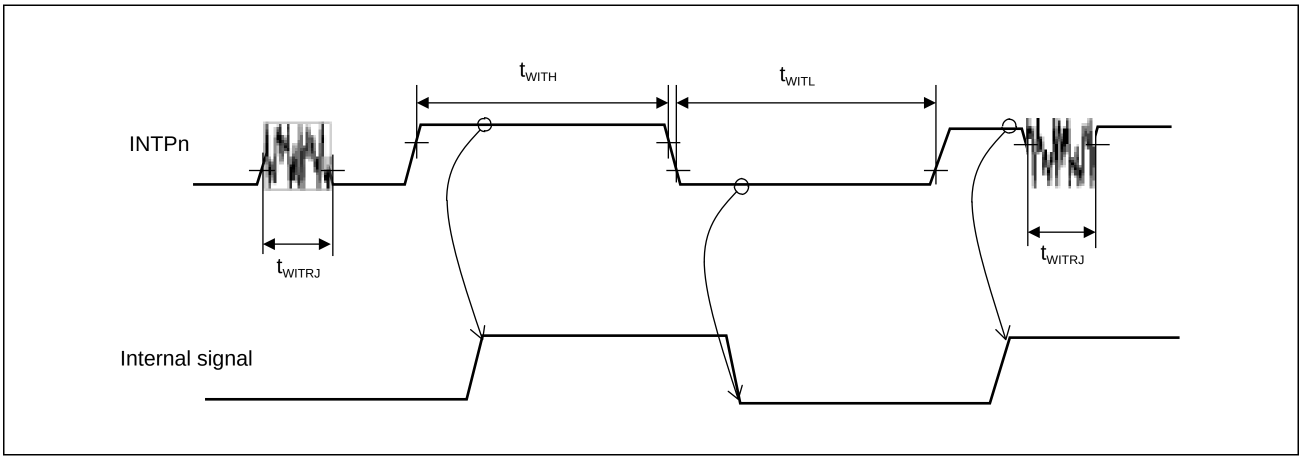
Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
NMI input high/low level width*[1]	t_{WNIH}/ t_{WNIL}	Edge detection mode	600			ns
		Level detection mode (EMCLK is operated by HS IntOSC)	756			ns
		Level detection mode (EMCLK is operated by LS IntOSC)	24			μs
NMI pulse rejection*[2]	t_{WNIRJ}		100			ns
INTPn input high/low level width*[1]	t_{WITH}/ t_{WITL}	Edge detection mode	600			ns
		Level detection mode (EMCLK is operated by HS IntOSC)	756			ns
		Level detection mode (EMCLK is operated by LS IntOSC)	24			μs
INTPn pulse rejection*[2]	t_{WITRJ}		100			ns

Note 1. NMI and INTPn input width is needed to ensure that the internal interrupt signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.



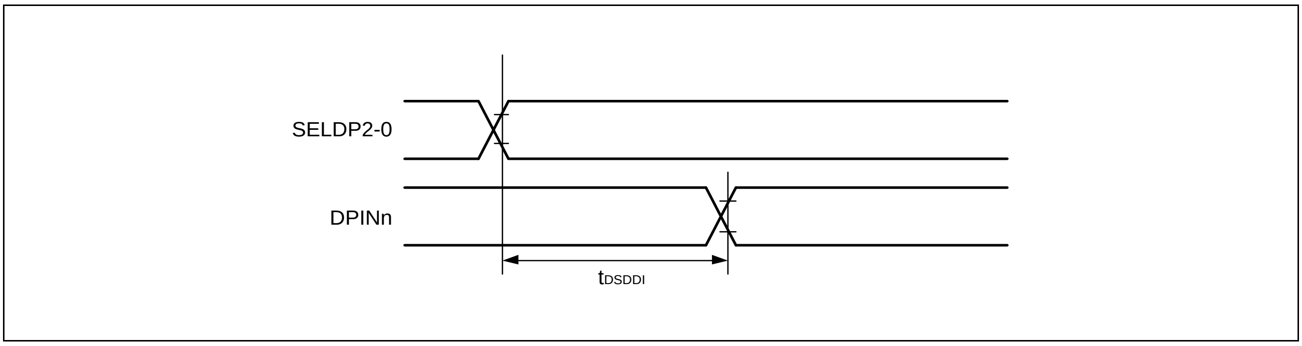


47C.5.4 Low Power Sampler (DPIN input) Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
DPINn input delay time (vs SELDP2-0)	t_{DSDDI}				150	ns

Note: n = 7 to 0



47C.5.5 CSCXFOUT Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

<Output driver strength>

CSCXFOUT: Slow or fast mode (refer to the condition in the following table)

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
CSCXFOUT output cycle	t_{FOUT}	Slow mode		100 (max. 10 MHz)			ns
		Fast mode		41.6 (max. 24 MHz)			ns
CSCXFOUT high level width	t_{WKHFO}	Slow mode	N: 1[*1] or even value[*2]	t_{FOUT} / 2 – 37			ns
			N: Odd value (N ≥ 5)[*2, *3]	t_{FOUT} × (N+1) / 2N – 37			ns
		Fast mode	N: 1[*1] or even value[*2]	t_{FOUT} / 2 – 10			ns
			N: Odd value (N ≥ 3)[*2]	t_{FOUT} × (N+1) / 2N – 10			ns
CSCXFOUT low level width	t_{WKLFO}	Slow mode	N: 1[*1] or even value[*2]	t_{FOUT} / 2 – 37			ns
			N: Odd value (N ≥ 5)[*2, *3]	t_{FOUT} × (N–1) / 2N – 37			ns
		Fast mode	N: 1[*1] or even value[*2]	t_{FOUT} / 2 – 10			ns
			N: Odd value (N ≥ 3)[*2]	t_{FOUT} × (N–1) / 2N – 10			ns
CSCXFOUT rise/ fall time	t_{KRFO}/ t_{KFFO}	Slow mode				37	ns
		Fast mode				10	ns

Note 1. When MainOSC, HS IntOSC, or LS IntOSC is selected as source clock with the condition of N = 1, the characteristics of output signal depends on the selected source clock. It is recommended to use output signal after evaluation on an actual environment.

Note 2. “N” is the value of “Clock divisor N” defined by FOUTDIV register.

Note 3. The selection of N = 3 is prohibited when slow mode is used.

47C.5.11 RLIN2/RLIN3 Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RLIN3 transfer rate		LIN specification	1		20	kbps
		LIN extended baud rate	1		115.2*[1]	kbps
		UART function			1.5	Mbps
RLIN2 transfer rate		LIN specification	1		20	kbps

Note 1. The LIN extended baud rate is not part of the LIN standard specification.

47C.5.12 RIIC Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C

Table 47C.17 RIIC Timing (Normal Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RIICnSCL clock period	f_{CLK}				100	kHz
Bus free time (between stop/start condition)	t_{BUF}		4.7			µs
Hold time*[1]	t_{HD}: STA		4.0			µs
RIICnSCL clock low-level width	t_{LOW}		4.7			µs
RIICnSCL clock high-level time	t_{HIGH}		4.0			µs
Setup time for start/restart condition	t_{SU}: STA		4.7			µs
Data hold time	t_{HD}: DAT	CBUS compatible master	5.0			µs
		I^{2}C mode	0*[2]			µs
Data setup time	t_{SU}: DAT		250			ns
Stop condition setup time	t_{SU}: STO		4.0			µs
Capacitance load of each bus line	Cb				400	pF

Remark: n = 0, 1

Note: If the system does not extend the RIICnSCL signal low hold time (t_{Low}), only the maximum data hold time (t_{HD}: DAT) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL.

Table 47C.18 RIIC Timing (Fast Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RIICnSCL clock period	f_{CLK}				400	kHz
Bus free time (between stop/start condition)	t_{BUF}		1.3			μs
Hold time[*1]	t_{HD}: STA		0.6			μs
RIICnSCL clock low-level width	t_{LOW}		1.3			μs
RIICnSCL clock high-level time	t_{HIGH}		0.6			μs
Setup time for start/restart condition	t_{SU}: STA		0.6			μs
Data hold time	t_{HD}: DAT	I^{2}C mode	0[*2]			μs
Data setup time	t_{SU}: DAT		100[*3]			ns
Stop condition setup time	t_{SU}: STO		0.6			μs
Pulse width with spike suppressed by input filter	t_{SP}		0		50	ns
Capacitance load of each bus line	Cb				400	pF

Remark: n = 0, 1

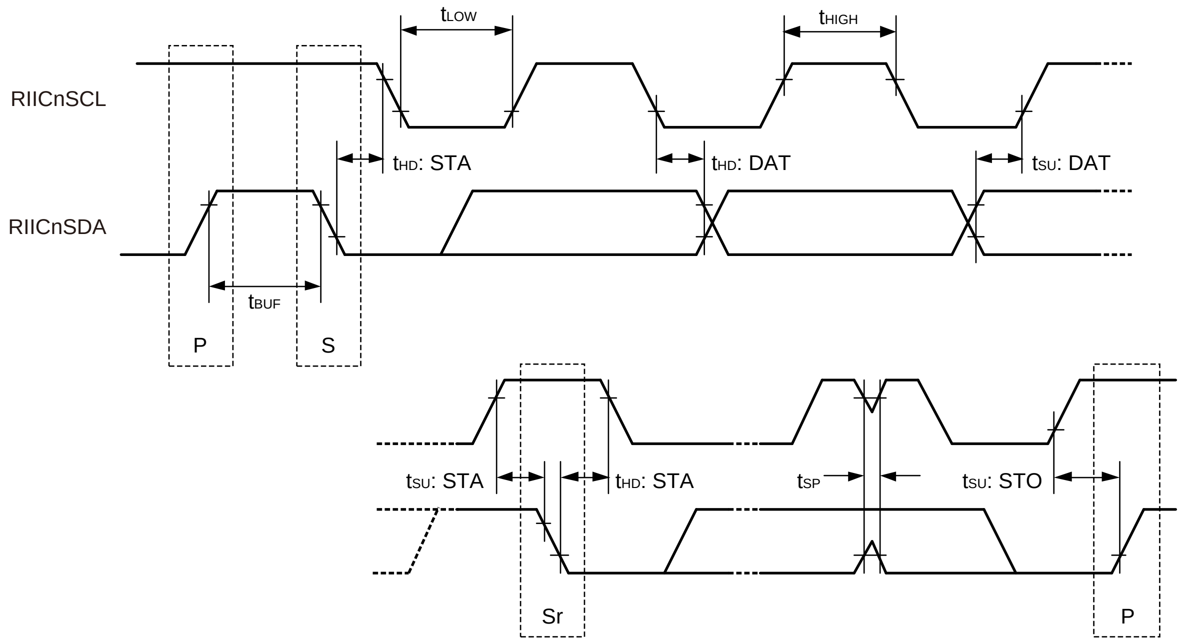
Note: If the system does not extend the RIICnSCL signal low hold time (t_{Low}), only the maximum data hold time (t_{HD}: DAT) needs to be satisfied.

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIICnSDA signal (at VIH min. of RIICnSCL signal). In order to occupy the undefined area at the falling edge of RIICnSCL

Note 3. The fast mode I^{2}C bus can be used in normal mode I^{2}C bus system. In this case, set the fast mode I^{2}C bus so that it meets the following conditions.

- If the system does not extend the RIICnSCL signal's low state hold time: t_{SU}: DAT ≥ 250 ns
- If the system extends the RIICnSCL signal's low state hold time:
  Transmit the following data bit to the RIICnSDA line prior to releasing the RIICnSCL line
  (1250 ns: Normal mode I^{2}C bus specification).



Note: P: Stop condition S: Start condition Sr: Restart condition

47C.5.13 RS-CANFD Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,

				ADCAnImS			±1.5	LSB
			AnVREF = 3.0 V to 4.5 V	ADCAnIm			±1.0	LSB
				ADCAnImS			±2.0	LSB

Note: Conversion accuracy when ADCA0ImS terminal is converted in 12-bit mode: Conversion accuracy can be applied if lower 2-bit is ignored from conversion result.

Note 1. This does not include quantization error.

Note 2. 3.0 + 1.3 × (the number of used T&H)

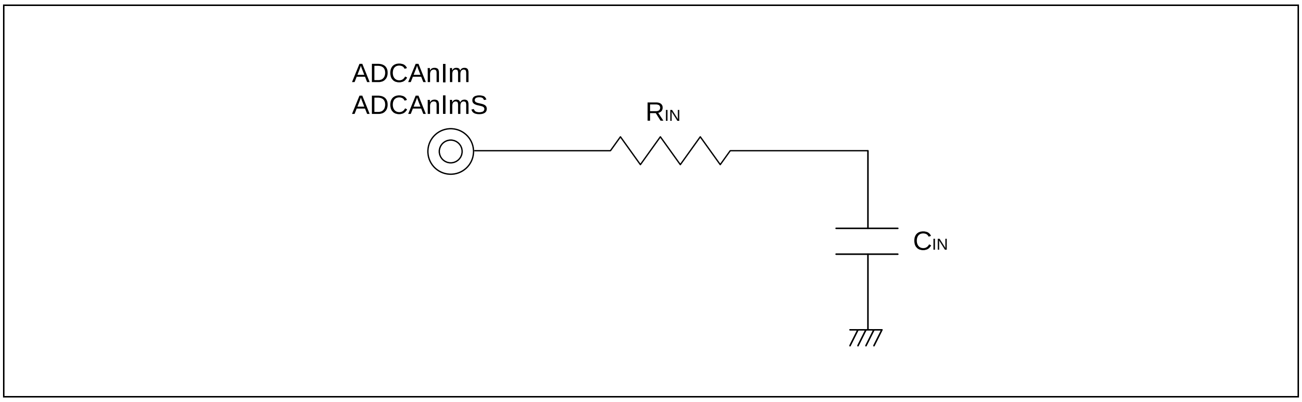
Note 3. Include the oscillation accuracy of HS IntOSC.

Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as “sampling time + successive approximation time”.

CAUTION

When an external digital pulse is applied to AP0, P8, and P9 pins during an A/D conversion this may lead to an A/D conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse.
The same behavior may apply when the digital buffer is used as an output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

47C.6.1 Equivalent Circuit of the Analog Input Block



Terminals	Condition	RIN (kΩ)	CIN (pF)
ADCA0I0 to 5	When T&H is used	14.2	2.1
	When T&H is not used	4.2	2.1
ADCA0I6 to 15	—	4.2	2.1
ADCA0I0S to 3S, 5S to 16S	—	5.6	9.5
ADCA0I4S, 17S to 19S	—	6.2	9.5

CAUTION

This specification is not tested during outgoing inspection. Therefore RIN and CIN are reference values only and not guaranteed. In addition these values are specified as maximum values.

47C.7 Flash Programming Characteristics

47C.7.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 μF ±30%, CISOVCL: 0.1 μF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Table 47C.19 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{PCLK}*[3]		4*[4]		30	MHz
Number of rewrites*[1]	CWRT	Data retention of 20 years*[2]	1000			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 1000), the device can be erased “n” times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the code flash memory.

Note 3. f_{PCLK} = 1/4 f_{CPUCLK_M}: System operating frequency for internal flash.

Note 4. Only for program/erase operation.

Table 47C.20 Programming Characteristic

Item	Symbol	Condition	Block Size	MIN.	TYP.	MAX.	Unit
Programming time		f_{PCLK} ≥ 20 MHz CWRT < 100 times	256 B		0.4*[1]	6*[1]	ms
			8 KB		20	90	ms
			32 KB		80	360	ms
			256 KB		0.6	2.7	s
			384 KB		0.9	4.1	s
			512 KB		1.2	5.4	s
			768 KB		1.7	8.1	s
			1 MB		2.3	10.8	s
		f_{PCLK} ≥ 20 MHz CWRT ≥ 100 times	256 B		0.5*[1]	7.2*[1]	ms
			8 KB		24	108	ms
			32 KB		96	432	ms
			256 KB		0.7	3.3	s
			384 KB		1.1	4.9	s
			512 KB		1.4	6.5	s
			768 KB		2.1	9.8	s
			1 MB		2.7	13	s
Erase time		f_{PCLK} ≥ 20 MHz CWRT < 100 times	8 KB		39	120	ms
			32 KB		141	480	ms
			256 KB		1.2	3.5	s
			384 KB		1.7	5.3	s
			512 KB		2.3	7	s
			768 KB		3.4	10.5	s
			1 MB		4.5	14	s
		f_{PCLK} ≥ 20 MHz CWRT ≥ 100 times	8 KB		47	144	ms
			32 KB		169	576	ms
			256 KB		1.4	4.2	s
			384 KB		2.1	6.3	s
			512 KB		2.7	8.4	s
			768 KB		4.1	12.6	s
			1 MB		5.4	16.8	s

Note 1. Only the processing time of the hardware. The overhead required by the software is not included.

47C.7.2 Data Flash

The data flash memory is shipped in the erased state. If the data flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Table 47C.21 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{PCLK}*3		4*4		30	MHz
Number of rewrites*1	CWRT	Data retention 20 years*2	125 k			times
		Data retention 3 years*2	250 k			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 125000), the device can be erased “n” times for each block. For example, when a block of 64 bytes is erased after 4 bytes of writing have been performed for different addresses 168 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the data flash memory.

Note 3. f_{PCLK} = 1/4 f_{CPUCLK_M}: System operating frequency for internal flash.

Note 4. Only for program/erase operation.

Table 47C.22 Programming Characteristics

Item	Symbol	Condition	Block Size	MIN.	TYP.	MAX.	Unit
Programming time		$f_{PCLK} \geq 20$ MHz	4 B		0.16*1	1.7*1	ms
			32 KB		1.4	6.8	s
			64 KB		2.79	13.44	s
Erase time		$f_{PCLK} \geq 20$ MHz	64 B		1.7*1	10*1	ms
			32 KB		0.9	5.2	s
			64 KB		1.74	10.24	s
Blank check time		$f_{PCLK} \geq 20$ MHz	4 B			30*1	µs
			64 B			100*1	µs
			32 KB			35.2	ms
			64 KB			70.4	ms

Note 1. Only the processing time of the hardware. The overhead required by the software is not included.

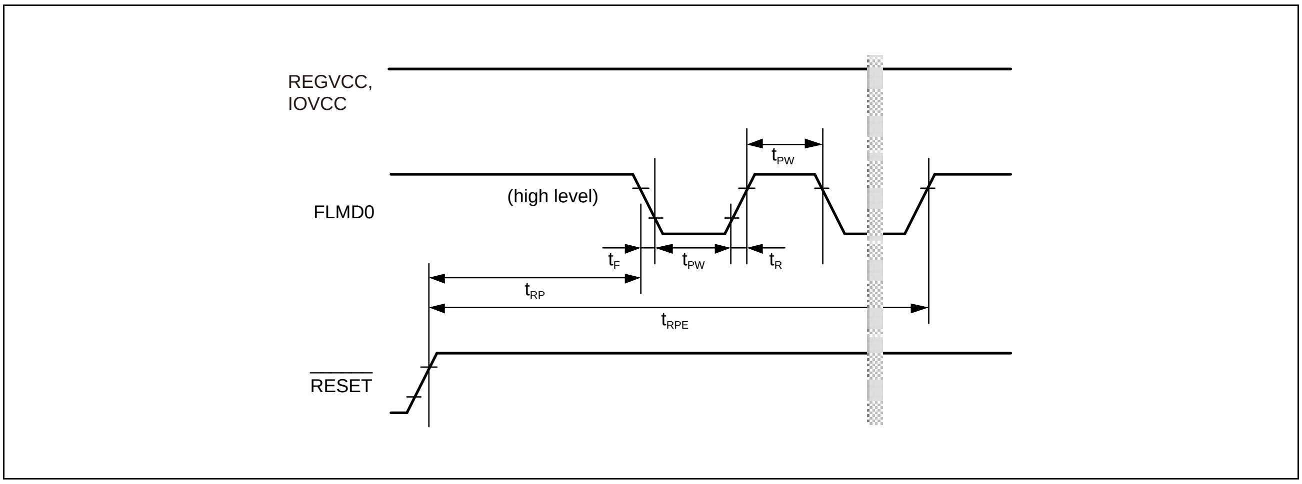
47C.7.3 Serial Programming Interface

47C.7.3.1 Serial Programmer Setup Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0 pulse input start time	t_{RP}		1.5			ms
FLMD0 pulse input end time	t_{RPE}				101.5	ms
FLMD0 low/high level width	t_{PW}		1.6			µs
FLMD0 rise time	t_R				20	ns
FLMD0 fall time	t_F				20	ns

Note: IOVCC: EVCC = A0VREF



47C.7.3.2 Flash Programming Interface

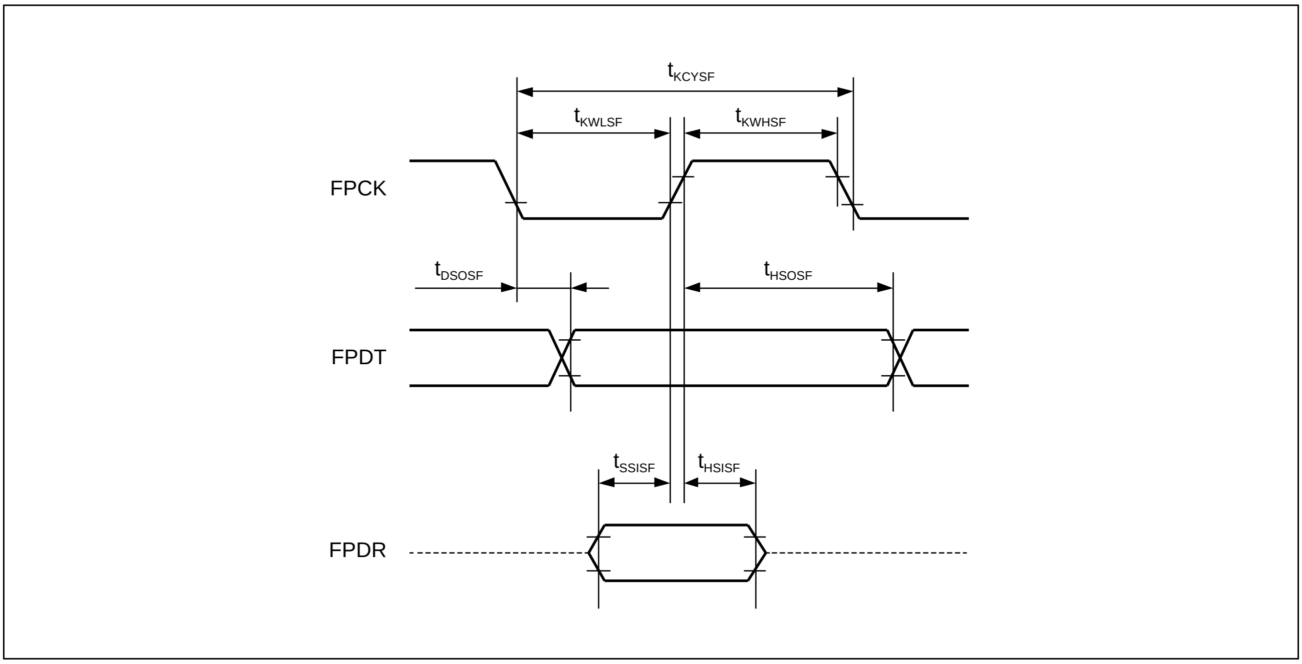
Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = 0 V,
CAWOVCL: 0.1 µF ±30%, CISOVCL: 0.1 µF ±30%,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Flash Programming transfer rate		1-wired UART mode			1	Mbps
		2-wired UART mode			1.5	Mbps
FPCK cycle time	t_{KCYSF}	3-wired clock sync mode	200*[1]			ns
FPCK high level width	t_{KWHSF}	3-wired clock sync mode	t_{KCYSF} / 2 – 15			ns
FPCK low level width	t_{KWLSF}	3-wired clock sync mode	t_{KCYSF} / 2 – 15			ns
FPDR setup time (vs. FPCK)	t_{SSISF}	3-wired clock sync mode	$t_{Pcyc} \times 2$			ns
FPDR hold time (vs. FPCK)	t_{HSISF}	3-wired clock sync mode	$t_{Pcyc} \times 2$			ns
FPDT output delay (vs. FPCK)	t_{DSOSF}	3-wired clock sync mode Not continuous transfer (data: 1st bit)			0	ns
		3-wired clock sync mode Not continuous transfer (data: except 1st bit)			$-t_{KWHSF} + 3 \times t_{Pcyc} + 36$	ns
FPDT hold time (vs. FPCK)	t_{HSOSF}	3-wired clock sync mode	$t_{Pcyc} \times 2$			ns

Note 1. Input an external clock that is more than 6 clocks of PCLK.

NOTE

t_{Pcyc} is period of PCLK.



47C.8 Thermal Characteristics

47C.8.1 Parameters

Package	Item	Symbol	Estimate	Unit	Note
100-pin LQFP	Thermal Resistance	Θja	44.3	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	34.7		
80-pin LQFP	Thermal Resistance	Θja	44.5	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	34.0		
64-pin LQFP	Thermal Resistance	Θja	45.3	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	33.8		
48-pin LQFP	Thermal Resistance	Θja	47.0	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	33.8		

NOTE

The thermal resistance and characterization parameters depend on the usage environment.

47C.8.2 Board

Conforming to JESD51-7 (4 layers)

	Board Size (mm)		Area (mm^2)
	X	Y	
Board	76.2	114.3	8709.66
Remaining copper rates	Thickness of conductors		
50-95-95-50%	70-35-35-70 μm
