16.3.4 DHC — Data Hold Wait Configuration Register

The DHC register is used to set the number of data hold waits for the external bus.

By setting this register, a data hold wait of “DHC register setting + one cycle” is inserted in a write cycle.

Access: This register can be read or written in 16-bit units.

Address: <MEMCn_base> + $0C_H$

Value after reset: 0000_H

16.3.5 DSC — Data Setup Wait Configuration Register

The DSC register is used to set the number of data setup wait states for the external bus.

This wait is inserted in a write cycle.

Access: This register can be read or written in 16-bit units.

Address: <MEMCn_base> + $0E_H$

Value after reset: 0000_H

CS0 area	ASW01, ASW00, AHW01, AHW00

16.3.7 ICC — Idle Cycle Configuration Register

The ICC register is used to set the number of idle cycles of the external bus. The number of idle cycles can be set for each chip select area.

Access:	This register can be read or written in 16-bit units.
Address:	<MEMCn_base> + 14_H
Value after reset:	3333_H

CAUTION

The Idle cycles set by the ICC register is invalid during bus sizing cycle. However, even in bus sizing cycle, idle cycles are valid during read cycle.
In this case, the number of idle cycles to be inserted depends on the ICC register setting. At least 1 clock cycle is inserted even when “no idle cycle” is selected.

16.3.8 EWC — External Wait Error Configuration Register

The EWC register is used to enable and disable the external wait error function.

Access: This register can be read or written in 16-bit units.

Address: <MEMCn_base> + $1A_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	EW3	—	EW2	—	EW1	—	EW0

Table 16.29 EWC Register Contents

Bit Position	Bit Name	Function
15 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6	EW3	External wait error setting These bits are used to enable and disable the external wait error in each chip select area. 0: External wait error disabled 1: External wait error enabled When this function is enabled, a wait state is forcibly released and SYSERR exception is occurred if an external wait request is detected continuously for 128 clock cycles.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4	EW2	External wait error setting These bits are used to enable and disable the external wait error in each chip select area. 0: External wait error disabled 1: External wait error enabled When this function is enabled, a wait state is forcibly released and SYSERR exception is occurred if an external wait request is detected continuously for 128 clock cycles.
3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2	EW1	External wait error setting These bits are used to enable and disable the external wait error in each chip select area. 0: External wait error disabled 1: External wait error enabled When this function is enabled, a wait state is forcibly released and SYSERR exception is occurred if an external wait request is detected continuously for 128 clock cycles.
1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	EW0	External wait error setting These bits are used to enable and disable the external wait error in each chip select area. 0: External wait error disabled 1: External wait error enabled When this function is enabled, a wait state is forcibly released and SYSERR exception is occurred if an external wait request is detected continuously for 128 clock cycles.

The relationship between each chip select area and the control bits is shown below.

Table 16.30 Relationship between EWx Bits and Chip Select Area

Chip Select Area	EWx
CS3 area	EW3
CS2 area	EW2
CS1 area	EW1
CS0 area	EW0

16.4 Functions

16.4.1 Bus Control Functions

16.4.1.1 Chip Select Output Function

The connected external memory area is divided into and managed in 4 chip select areas, as shown in **Figure 16.1, External Memory Map (RH850/F1KH-D8)**, **Figure 16.2, External Memory Map (RH850/F1KM-S4)**.

When a bus cycle is generated for the external bus, this microcontroller makes the $\overline{\text{MEMC0CS[3:0]}}$ output pin corresponding to the access target address active (low level), along with outputting the access target address from the MEMC0A[23:16] and MEMC0AD[15:0].

The various settings for the external bus, such as the number of wait/idle states, can all be made for each chip select area.

By using these functions, different types of memory can be connected to each chip select area.

The allocation of the chip select areas is fixed by the system and cannot be changed through programming.

The memory map is shown below.

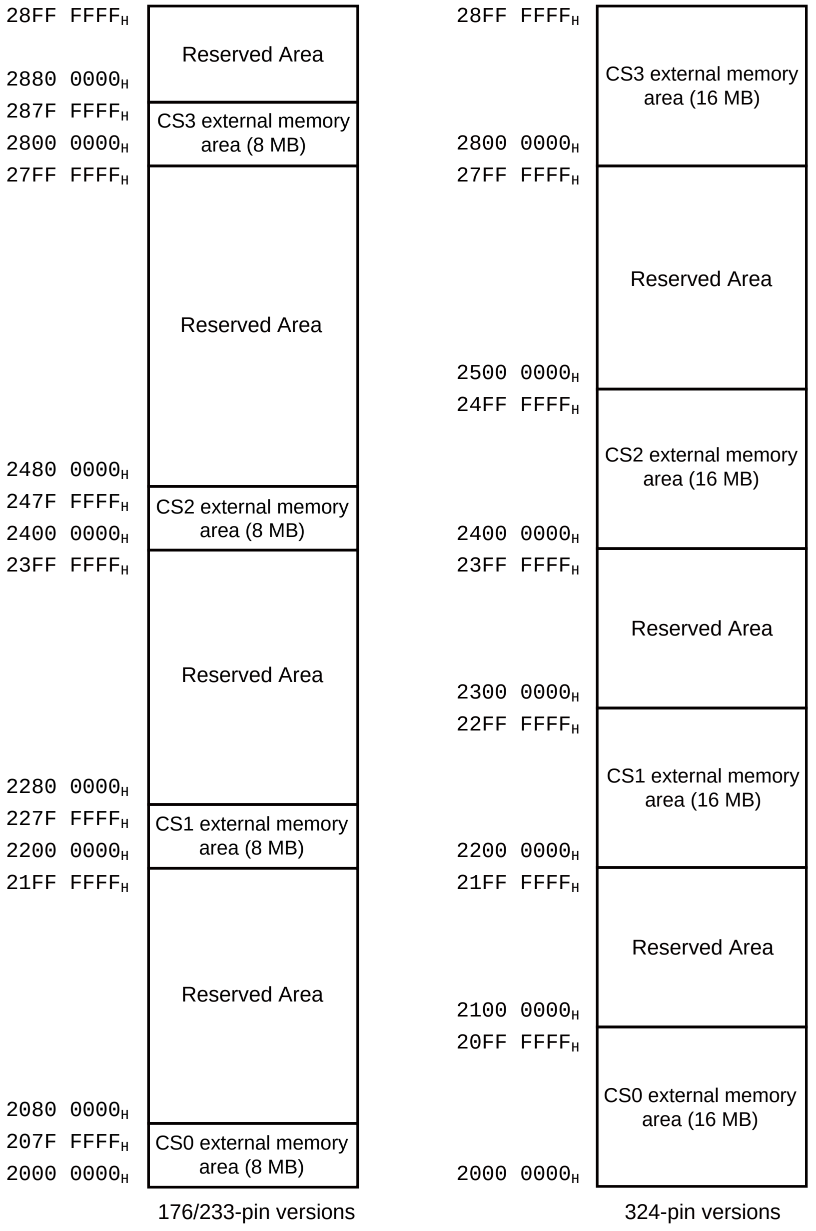

Figure 16.1 External Memory Map (RH850/F1KH-D8)

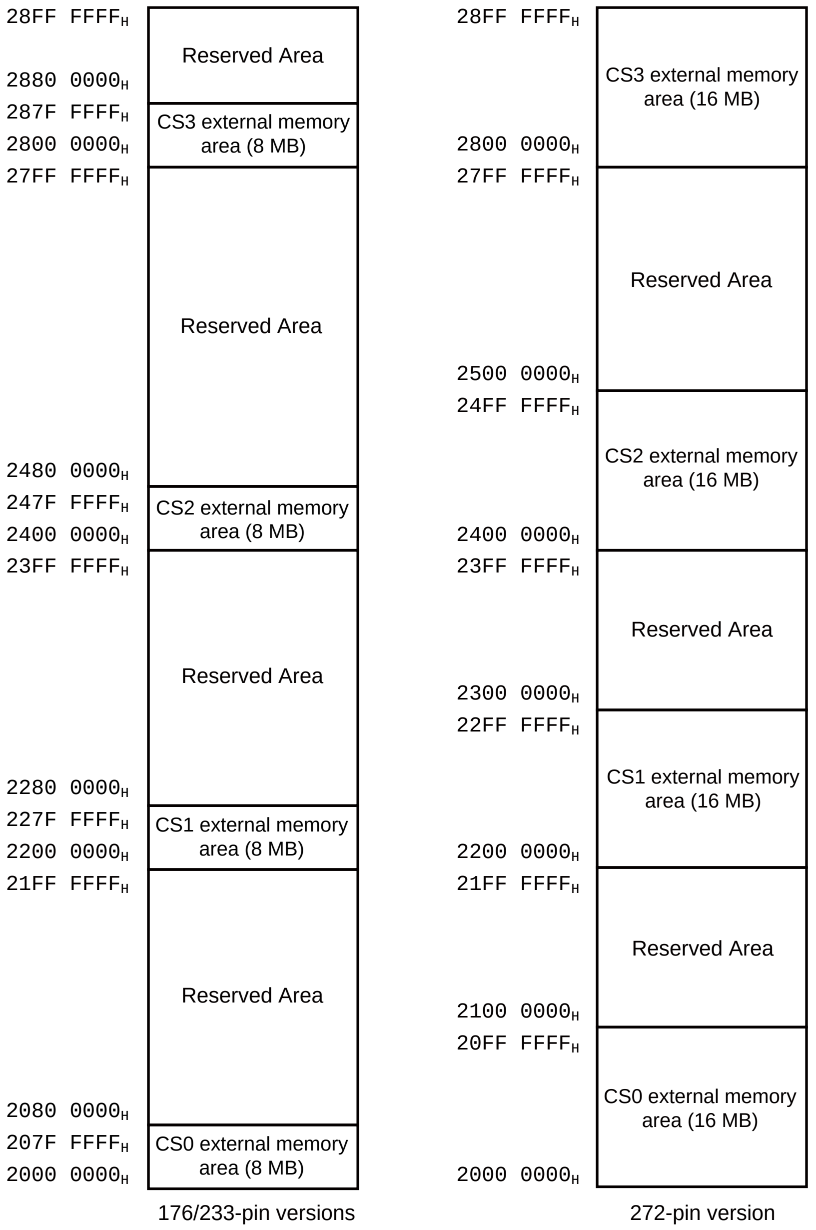

Figure 16.2 External Memory Map (RH850/F1KM-S4)

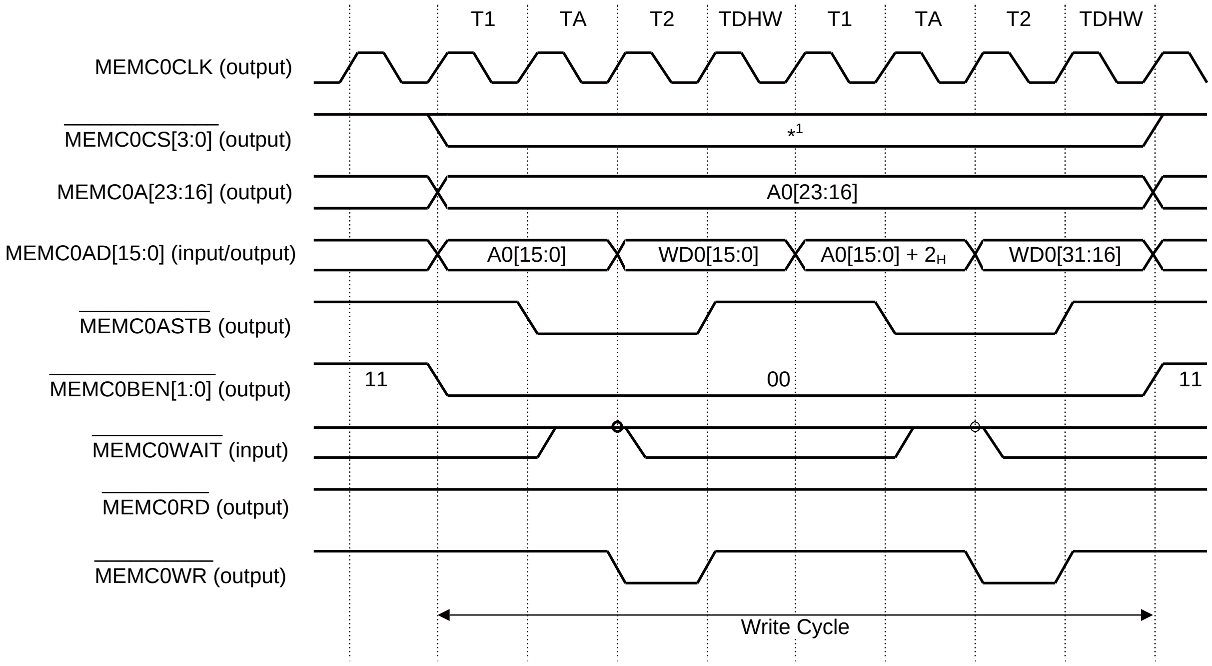
16.4.1.2 Bus Sizing Function

Access requests from the CPU (or DMA) are executed after being divided in accordance with the bit width of the external bus of the access destination.



Note: T_1: Address setup period
T_A: Address strobe period
T_2: Read (write) strobe period
T_{DHW}: Data hold wait period

Note 1. Indicates the chip select area to be accessed.

Figure 16.3 Bus Cycles when Making a 32-Bit Write Access to the External Bus

16.4.1.3 Data Endian Setting Function

Either little endian or big endian can be selected as the data endian of the external bus interface. This setting can be made for each chip select area with the DEC register.

CAUTIONS

1. In this microcontroller, instruction fetch operations in big endian are not supported. The assembler and debugger were designed for little endian operations.
2. Misaligned access in big endian format is not supported.

16.4.2 Wait Functions

Wait functions are listed below.

Table 16.31 Wait Functions

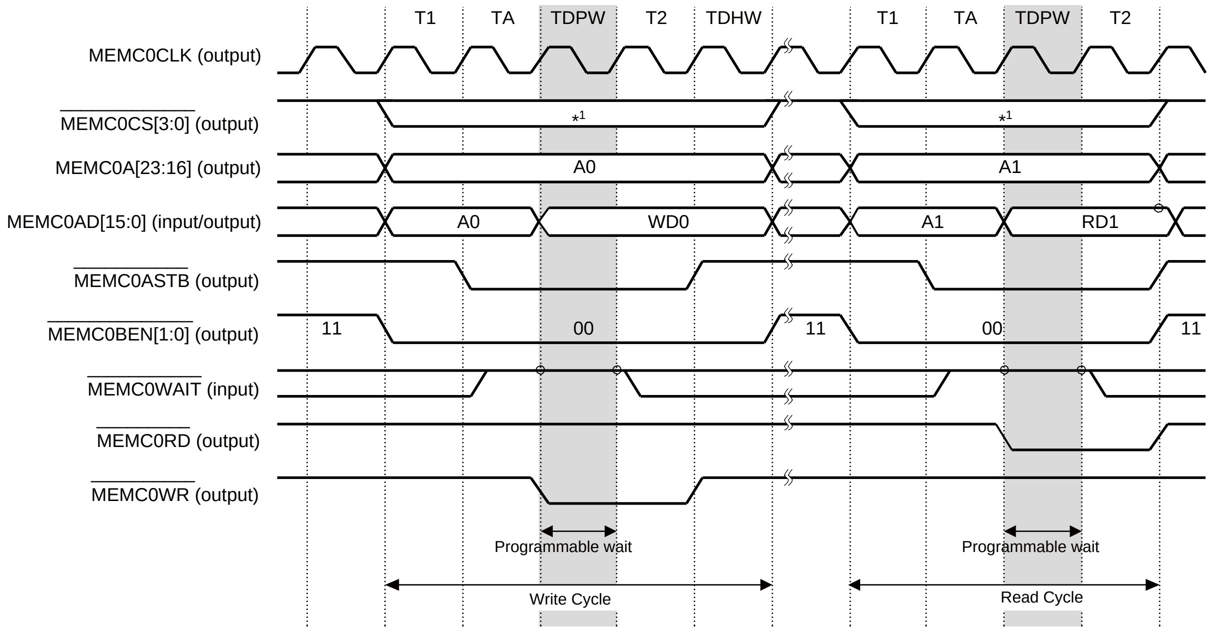
Wait Function	Data Wait		Data Hold Wait	Data Setup Wait	Address Wait	Idle State
	Programmable	External Pin				
Read access	✓	✓	—	—	✓	✓
Write access	✓	✓	✓	✓	✓	✓
Setting register	DWC	—	DHC	DSC	AWC	ICC
Max. number of waits	15	—	3	3	3	3

16.4.2.1 Programmable Data Wait Function

This wait function is used to delay the data latch timing by extending the read strobe and write strobe periods.

This function is enabled during data transfer. Up to 15 cycles can be inserted.

Data waits can be set for each chip select area using the DWC register.



Note: T_1: Address setup period

T_A: Address strobe period

T_2: Read (write) strobe period

T_{DPW}: Programmable data wait period

T_{DHW}: Data hold wait period

Note 1. Indicates the chip select area to be accessed.

Figure 16.4 Bus Cycles when Inserting Programmable Data Waits

16.4.2.2 External Wait Function

Data waits of any length can be inserted from the $\overline{\text{MEMC0WAIT}}$ pin.

The $\overline{\text{MEMC0WAIT}}$ pin input level is sampled immediately after completion of the TA cycle and the TDPW, TDEW cycles.

Data wait cycles obtained by ORing the programmable data wait set by the data wait control register (DWC register) and the external wait set by the $\overline{\text{MEMC0WAIT}}$ pin input, are inserted.

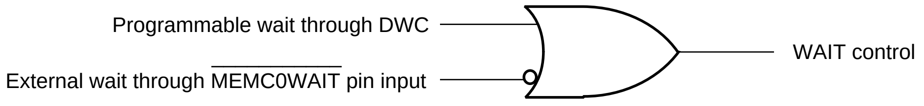


Figure 16.5 Internal Data Wait Generator

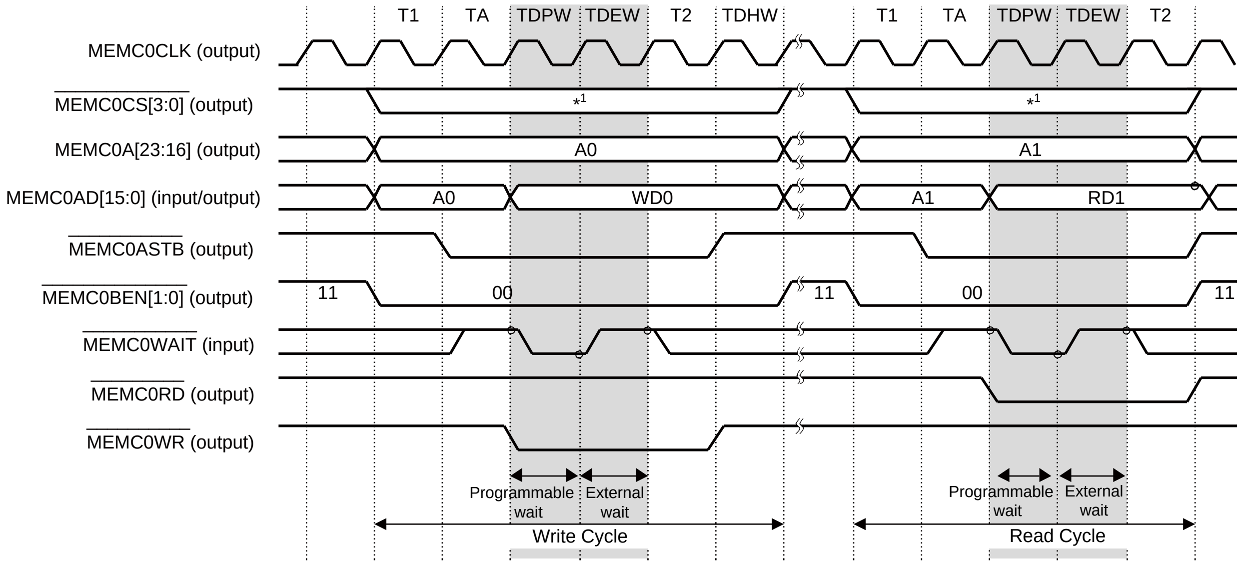


Note: T_1: Address setup period
T_A: Address strobe period
T_2: Read (write) strobe period
T_{DPW}: Programmable data wait period
T_{DEW}: External data wait period
T_{DHW}: Data hold wait period

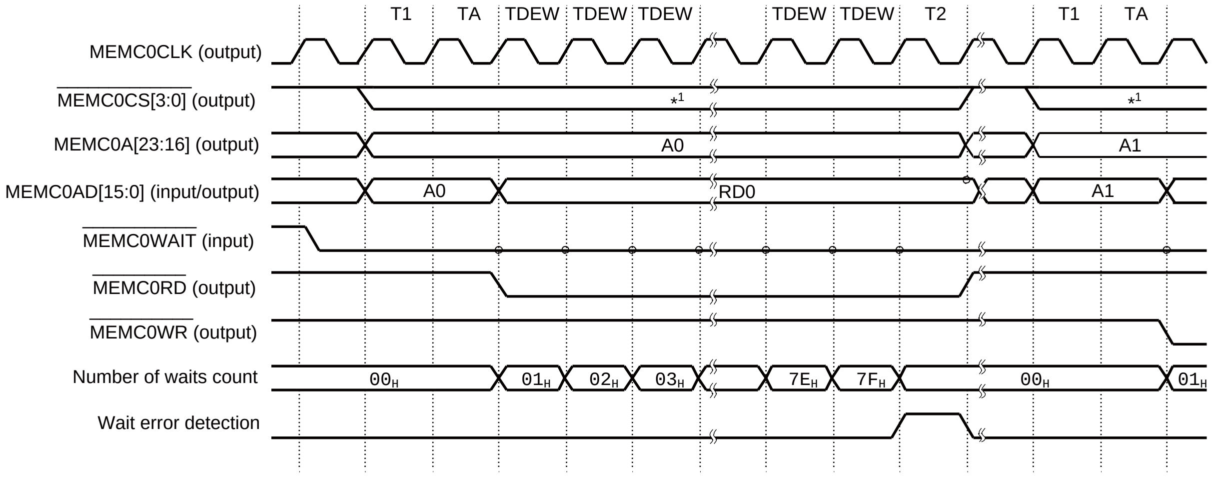
Note 1. Indicates the chip select area to be accessed.

Figure 16.6 Bus Cycles when Inserting Programmable Data Waits and External Waits (while DWC = 1)

16.4.2.3 External Wait Error Detection Function

By setting the EWx bit in the external wait error configuration register (EWC register) to 1, a wait state is forcibly canceled and SYSERR exception is generated if an external wait request is input continuously for 128 clock cycles.

This function prevents the system hanging up due to an unexpected failure of the $\overline{\text{MEMC0WAIT}}$ input pin.



Note: T_1: Address setup period
T_A: Address strobe period
T_{DEW}: External data wait period
T_2: Read (write) strobe period

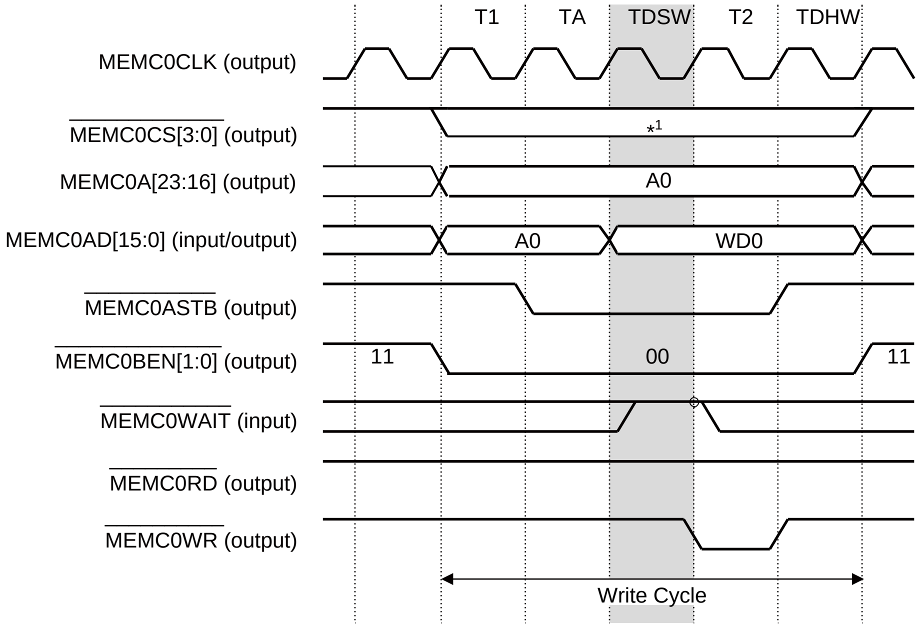
Note 1. Indicates the chip select area to be accessed.

Figure 16.7 Operation Timing during External Wait Error Detection

16.4.2.4 Data Setup Wait Function

This function inserts waits before a transfer state to secure setup time for data write strobe, and is only valid during a write cycle.

Waits of up to 3 cycles per chip select area can be inserted by setting the DSC register.



Note: T_1: Address setup period
T_A: Address strobe period
T_{DSW}: Data setup wait period
T_2: Read (write) strobe period
T_{DHW}: Data hold wait period

Note 1. Indicates the chip select area to be accessed.

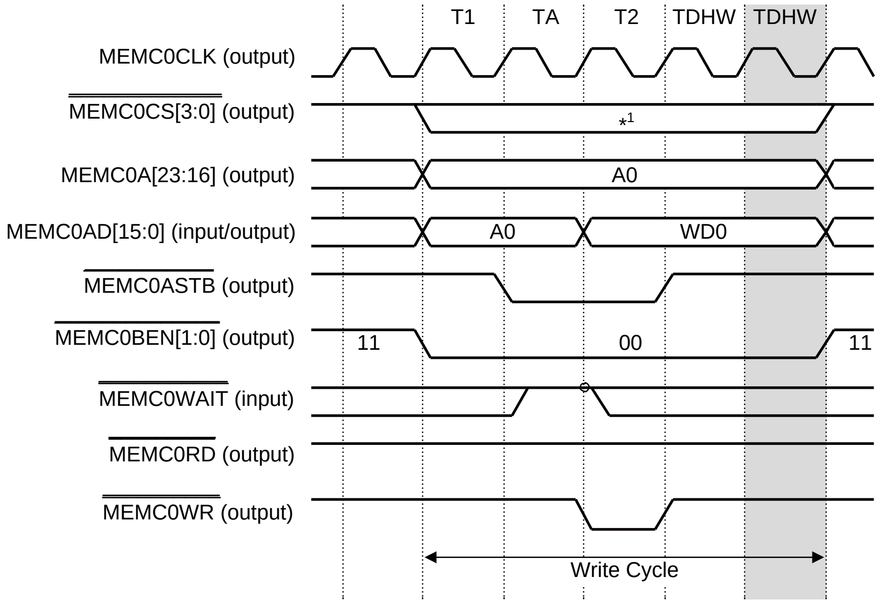
Figure 16.8 Bus Cycles when Inserting Data Setup Waits

16.4.2.5 Data Hold Wait Function

This function inserts a wait in the state following the rising edge of the write strobe signal in order to secure the hold time for the data write strobe.

This microcontroller always inserts 1 data hold wait state upon occurrence of a write cycle. This data hold wait can be extended by up to 3 cycles by setting the DHC register, allowing insertion of 4 cycles.

The number of cycles to extend the data hold wait can be set for each chip select area with the DHC register.



Note: T_1: Address setup period
T_A: Address strobe period
T_2: Read (write) strobe period
T_{DHW}: Data hold wait period

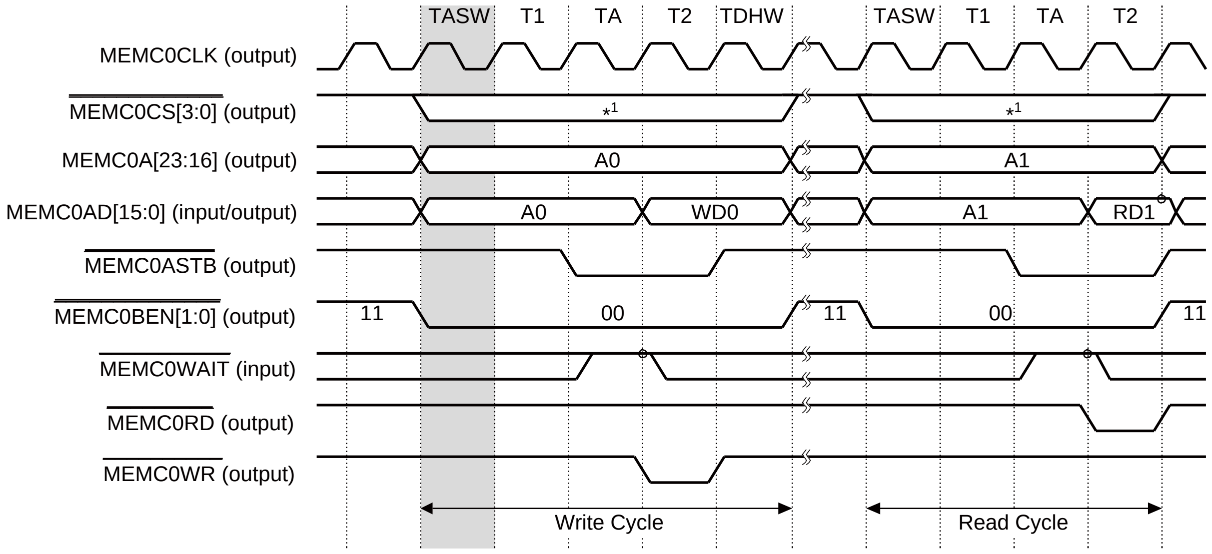
Note 1. Indicates the chip select area to be accessed.

Figure 16.9 Bus Cycles when Inserting Data Hold Waits

16.4.2.6 Address Setup Wait Function

The address setup wait function inserts a wait before the address transfer state in order to secure the setup time for the address strobe.

Up to 3 wait cycles can be inserted for each chip select area by setting the AWC register.



Note: T1: Address setup period
TASW: Address setup wait period
TA: Address strobe period
T2: Read (write) strobe period
TDHW: Data hold wait period

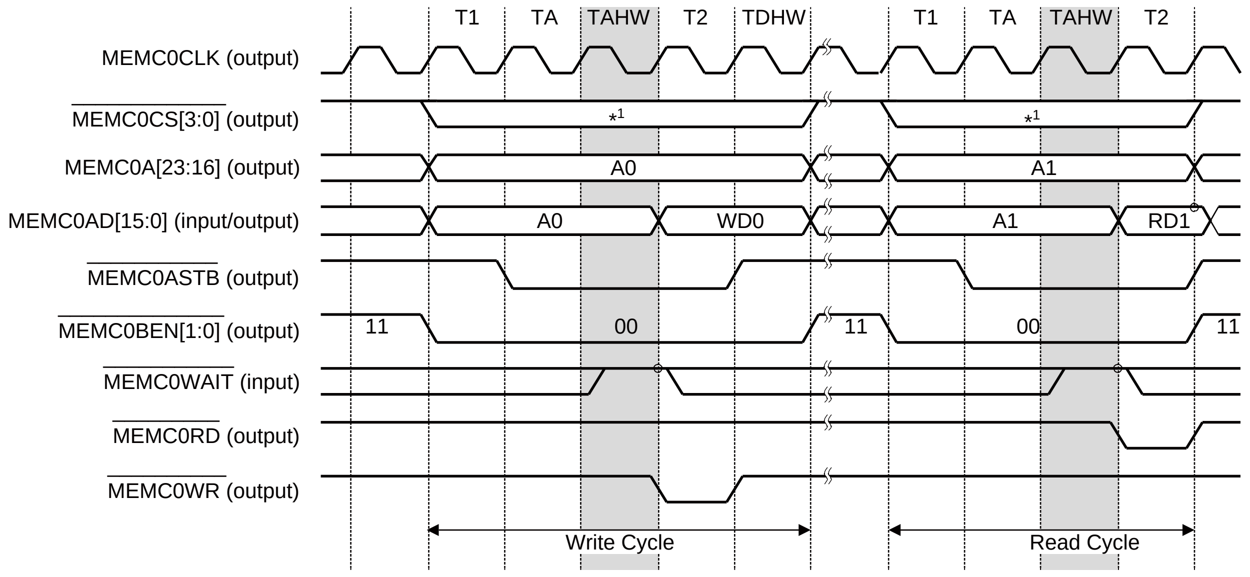
Note 1. Indicates the chip select area to be accessed.

Figure 16.10 Bus Cycles when Inserting Address Setup Waits

16.4.2.7 Address Hold Wait Function

The address hold wait function inserts waits after the address transfer state to secure hold time for address strobe.

Up to 3 wait cycles can be inserted for each chip select area by setting the AWC register.



Note: T_1: Address setup period
T_A: Address strobe period
T_{AHW}: Address hold wait period
T_2: Read (write) strobe period
T_{DHW}: Data hold wait period

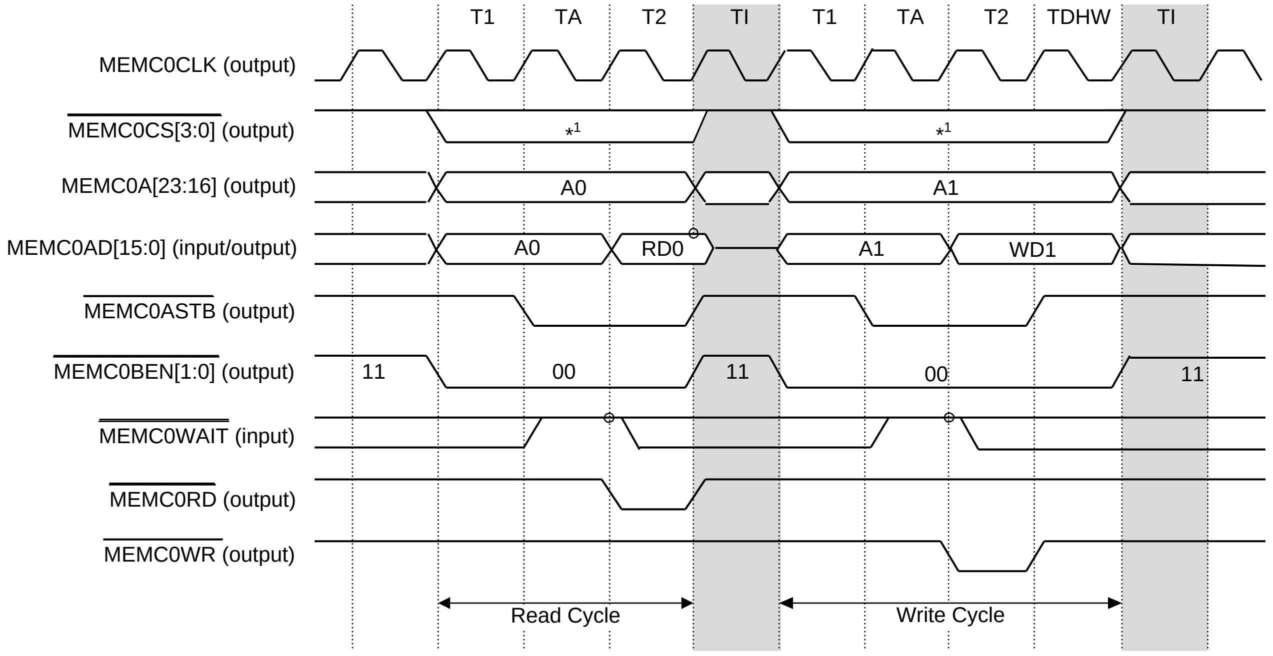
Note 1. Indicates the chip select area to be accessed.

Figure 16.11 Bus Cycles when Inserting Address Hold Waits

16.4.2.8 Idle Insertion Function

This function inserts an idle state after the last state of each cycle in order to prevent bus conflicts between cycles.

This function can be set independently after a read cycle/write cycle for each chip select area by setting the ICC register.



Note: T_1: Address setup period
T_A: Address strobe period
T_2: Read (write) strobe period
T_I: Idle state period
T_{DHW}: Data hold wait period

Note 1. Indicates the chip select area to be accessed.

16.4.3.1 SRAM Connection Example

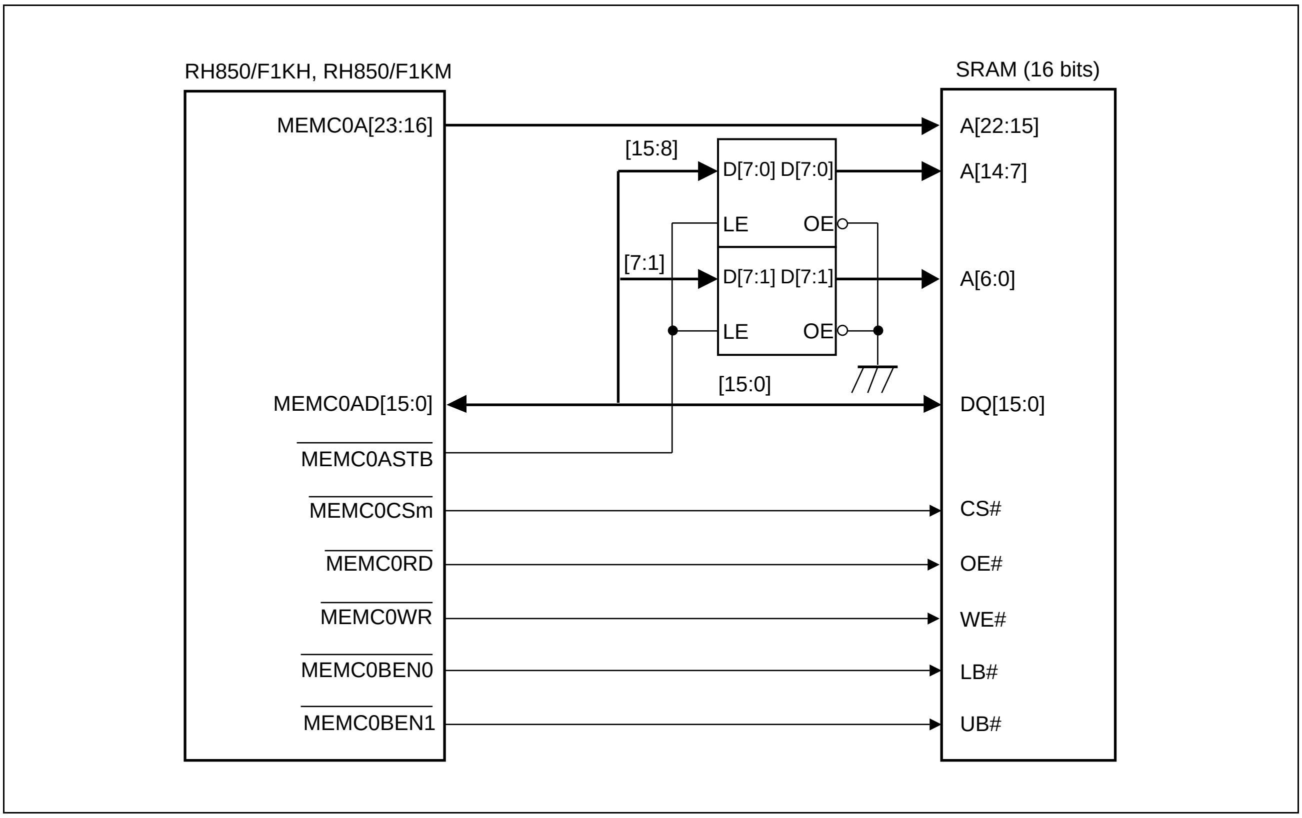

Figure 16.13 SRAM (16 Bits) Connection Example

16.4.4 Data Access Flow

The data transfer flow to the external memory differs according to the data width, specified endian, external bus width, and start address.

For misaligned access, the CPU performs the division and coupling of data. Whether the access is misaligned or not depends on the data width and start address.

Misaligned

As the accesses listed below are misaligned, the CPU divides the cycles.

- When half-word (16-bit) data is read from/written to an odd address
- When word (32-bit) data is read from/written to an address that is not a multiple of 4

Table 16.32 Misaligned Access Conditions

Access Conditions		Cycles Divided by the CPU		
Data Width	Address	1st	2nd	3rd
16 bits	2n + 1	8-bit access to 2n + 1	8-bit access to 2n + 2	—
32 bits	4n + 1	8-bit access to 4n + 1	16-bit access to 4n + 2	8-bit access to 4n + 4
32 bits	4n + 2	16-bit access to 4n + 2	16-bit access to 4n + 4	—
32 bits	4n + 3	8-bit access to 4n + 3	16-bit access to 4n + 4	8-bit access to 4n + 6

The data flows for each condition are shown on the following pages.

16.5 Notes on Use of MEMC

Stop MEMC before transitioning to standby mode.

Section 17 Serial Flash Memory Interface A (SFMA)

This section contains a generic description of the Serial Flash Memory Interface A (SFMA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of SFMA.

17.1 Features of RH850/F1KH, RH850/F1KM SFMA

17.1.1 Number of Units

This microcontroller has the following number of SFMA units.

Table 17.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	SFMAn (n = 0)	SFMAn (n = 0)	SFMAn (n = 0)

Table 17.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	—	1	1	1	1
Name	—	SFMAn (n = 0)	SFMAn (n = 0)	SFMAn (n = 0)	SFMAn (n = 0)

Table 17.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	—	—
Name	—	—	—	—

Table 17.4 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual SFMA units are identified by the index “n”; for example, SFMAnCMNCR (n = 0) is the SFMAn common control register.

Table 17.5 Index (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual SFMA units are identified by the index “n”; for example, SFMAnCMNCR (n = 0) is the SFMAn common control register.

17.1.2 Register Base Address

SFMAn base address is listed in the following table.

SFMAn register addresses are given as an offset from the base address in general.

Table 17.6 Register Base Address (RH850/F1KH-D8)

Base Address Name	Base Address
<SFMA0_base>	1004 0000_H

Table 17.7 Register Base Address (RH850/F1KM-S4)

Base Address Name	Base Address
<SFMA0_base>	1004 0000_H

17.1.3 Clock Supply

The SFMAn clock supply is shown in the following table.

Table 17.8 Clock Supply (RH850/F1KH-D8)

Unit Name	Unit Clock Name	Supply Clock Name	Description
SFMAn	Bϕ	CKSCLK_IPERI1	SFMA clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	SFMA clock

Table 17.9 Clock Supply (RH850/F1KM-S4)

Unit Name	Unit Clock Name	Supply Clock Name	Description
SFMAn	Bϕ	CKSCLK_IPERI1	SFMA clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI1	SFMA clock

17.1.4 Reset Sources

SFMAn reset sources are listed in the following table. SFMAn is initialized by these reset sources.

Table 17.10 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
SFMAn	All reset sources (ISORES)

Table 17.11 Reset Sources (RH850/F1KM-S4)

Unit Name	Reset Source
SFMAn	All reset sources (ISORES)

17.1.5 External Input/Output Signals

External input/output signals of SFMAn are listed below.

Table 17.12 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
SFMA0		
SPBCLK	Clock output	SFMA0CLK
SPBSSL	Slave select signal output	SFMA0SSL
SPBMO/SPBIO0	Master transmit data/data 0	SFMA0IO0
SPBMI/SPBIO1	Master input data/data 1	SFMA0IO1
SPBIO2	Data 2	SFMA0IO2
SPBIO3	Data 3	SFMA0IO3

Table 17.13 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
SFMA0		
SPBCLK	Clock output	SFMA0CLK
SPBSSL	Slave select signal output	SFMA0SSL
SPBMO/SPBIO0	Master transmit data/data 0	SFMA0IO0
SPBMI/SPBIO1	Master input data/data 1	SFMA0IO1
SPBIO2	Data 2	SFMA0IO2
SPBIO3	Data 3	SFMA0IO3

17.2 Overview

17.2.1 Functional Overview

The Serial Flash Memory Interface outputs control signals to the serial flash memory connected to the SPI multi I/O bus space, thus enabling direct connection of the serial flash memory.

This module allows the connected serial flash memory to be accessed by directly reading the SPI multi I/O bus space, or using SPI operating mode to transmit and receive data.

- Serial Flash Memory Interface

  One serial flash memory device can be connected.

  A data bus size of 1 bit, 2 bits, or 4 bits can be selected.

- External Address Space Read Mode

  A maximum of 4-Gbyte address space is supported

  The SPBSSL pin can be automatically controlled through access address monitoring

  Efficient data reception due to built-in read cache (64-bit line × 16 entries)

- SPI Operating Mode

  Desired read/write access to serial flash memory possible

- Bit rate

  SPBCLK is generated by frequency division of Bϕ by internal baud rate generator

  SPBCLK frequency division ratio can be set from 2 to 4080

- SPBSSL Pin Control

  Delay from SPBSSL signal assertion to SPBCLK operation (clock delay) can be set
    Range: 1 to 8 SPBCLK cycles (set in SPBCLK-cycle units)

  Delay from SPBCLK stop to SPBSSL output negation (SPBSSL negation delay) can be set
    Range: 1.5 to 8.5 SPBCLK cycles (set in SPBCLK-cycle units)

  SPBSSL output assertion wait before next access (next access delay) can be set
    Range: 1 to 8 SPBCLK cycles (set in SPBCLK-cycle units)

  SPBSSL polarity can be changed

17.2.2 Block Diagram

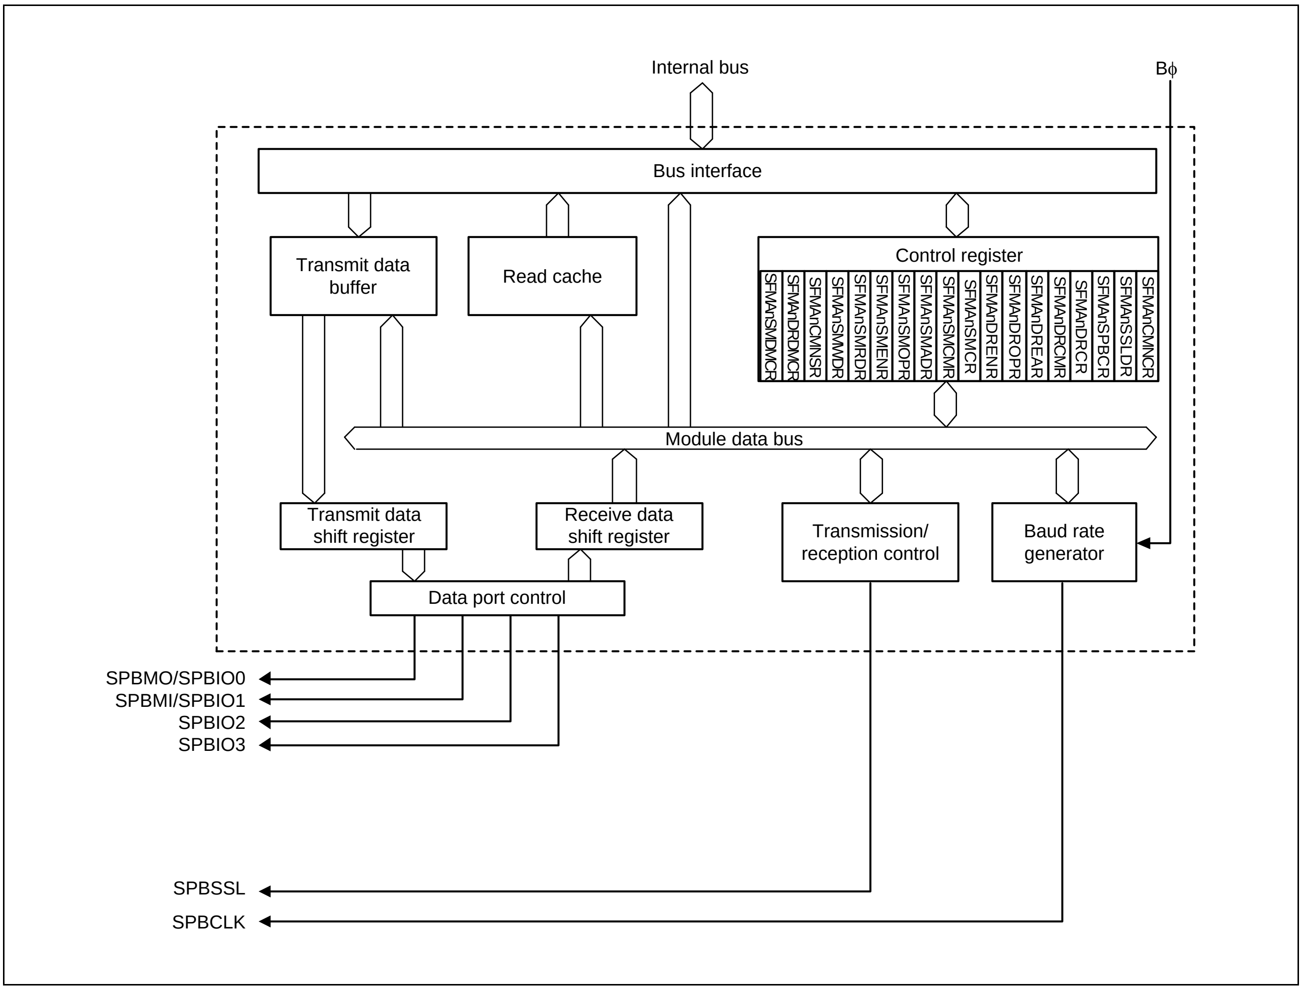

Figure 17.1 SFMA Block Diagram

17.3 Registers

17.3.1 List of Registers

SFMA registers are listed in the following table.

For details about <SFMAn_base>, see **Section 17.1.2, Register Base Address**.

Table 17.14 List of Registers

Module Name	Register Name	Symbol	Address
SFMAn	SFMAn common control register	SFMAnCMNCR	<SFMAn_base> + 00_H
	SFMAn SSL delay register	SFMAnSSLDR	<SFMAn_base> + 04_H
	SFMAn bit rate register	SFMAnSPBCR	<SFMAn_base> + 08_H
	SFMAn data read control register	SFMAnDRCR	<SFMAn_base> + $0C_H$
	SFMAn data read command setting register	SFMAnDRCMR	<SFMAn_base> + 10_H
	SFMAn data read extended address setting register	SFMAnDREAR	<SFMAn_base> + 14_H
	SFMAn data read option setting register	SFMAnDROPR	<SFMAn_base> + 18_H
	SFMAn data read enable setting register	SFMAnDRENR	<SFMAn_base> + $1C_H$
	SFMAn SPI mode control register	SFMAnSMCR	<SFMAn_base> + 20_H
	SFMAn SPI mode command setting register	SFMAnSMCMR	<SFMAn_base> + 24_H
	SFMAn SPI mode address setting register	SFMAnSMADR	<SFMAn_base> + 28_H
	SFMAn SPI mode option setting register	SFMAnSMOPR	<SFMAn_base> + $2C_H$
	SFMAn SPI mode enable setting register	SFMAnSMENR	<SFMAn_base> + 30_H
	SFMAn SPI mode read data register	SFMAnSMRDR	<SFMAn_base> + 38_H
	SFMAn SPI mode write data register	SFMAnSMWDR	<SFMAn_base> + 40_H
	SFMAn common status register	SFMAnCMNSR	<SFMAn_base> + 48_H
	SFMAn data read dummy cycle setting register	SFMAnDRDMCR	<SFMAn_base> + 58_H
	SFMAn SPI mode dummy cycle setting register	SFMAnSMDMCR	<SFMAn_base> + 60_H

17.3.2 SFMAnCMNCR — SFMAn Common Control Register

SFMAnCMNCR is a 32-bit register that controls the SPI multi I/O bus controller. The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 00$_H$

Value after reset: 01AA 4000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

17.3.3 SFMAnSSLDR — SFMAn SSL Delay Register

SFMAnSSLDR is a 32-bit register that adjusts the timing between the SPBSSL signal and the SPBCLK signal.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 04_H

Value after reset: $0007\ 0707_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SPNDL[2:0]

Table 17.16 SFMAnSSLDR Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18 to 16	SPNDL[2:0]	Next Access Delay Sets the period from transfer end to next transfer start (next access). 000: 1 SPBCLK cycle 001: 2 SPBCLK cycles 010: 3 SPBCLK cycles 011: 4 SPBCLK cycles 100: 5 SPBCLK cycles 101: 6 SPBCLK cycles 110: 7 SPBCLK cycles 111: 8 SPBCLK cycles
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	SLNDL[2:0]	SPBSSL Negation Delay Sets the period from the time the last SPBCLK edge is sent of a transfer to SPBSSL pin negation (SPBSSL negation delay). 000: 1.5 SPBCLK cycles 001: 2.5 SPBCLK cycles 010: 3.5 SPBCLK cycles 011: 4.5 SPBCLK cycles 100: 5.5 SPBCLK cycles 101: 6.5 SPBCLK cycles 110: 7.5 SPBCLK cycles 111: 8.5 SPBCLK cycles
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.16 SFMAnSSLDR Register Contents

Bit Position	Bit Name	Function
2 to 0	SCKDL[2:0]	Clock Delay Sets the period from SPBSSL pin assertion to SPBCLK oscillation (clock delay). 000: 1 SPBCLK cycle 001: 2 SPBCLK cycles 010: 3 SPBCLK cycles 011: 4 SPBCLK cycles 100: 5 SPBCLK cycles 101: 6 SPBCLK cycles 110: 7 SPBCLK cycles 111: 8 SPBCLK cycles

17.3.4 SFMAnSPBCR — SFMAn Bit Rate Register

SFMAnSPBCR is a 32-bit register that sets the bit rate.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 08_H

Value after reset: $0000\ 0003_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	SPBR[7:0]								—	—	—	—	—	—	BRDV[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Table 17.17 SFMAnSPBCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	SPBR[7:0]	Bit Rate Sets the bit rate. The bit rate is determined by a combination of these bits with the BRDV[1:0] bits. Setting SPBR[7:0] to 0 is prohibited. SPBR[7:0] needs to be changed to non-zero value before SPI communication starts.
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	BRDV[1:0]	Bit Rate Frequency Division Sets the bit rate. The bit rate is determined by a combination of these bits with the SPBR[7:0] bits. The SPBR value is used to set the base bit rate. The BRDV value is used to select a division ratio of the base bit rate from among no division, 2, 4, and 8. 00: Base bit rate 01: Base bit rate divided by 2 10: Base bit rate divided by 4 11: Base bit rate divided by 8

Bit Rate

SPBR[7:0] and BRDV[1:0] are used for setting the bit rate.

The following formula is used to calculate the bit rate when SPBR[7:0] $\neq 0$.

$$\text{Bit rate} = B\phi / (2 \times n \times 2^N)$$

n: SPBR[7:0] setting (1, …, 255)

N: BRDV[1:0] setting (0 to 3)

17.3.5 SFMAnDRCR — SFMAn Data Read Control Register

SFMAnDRCR is a 32-bit register that sets the operation in external address space read mode.

The bits except the SSLN bit should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 0C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SSLN	—	—	—	—	RBURST[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RCF	RBE	—	—	—	—	—	—	—	SSLE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	R/W	R	R	R	R	R	R	R	R/W

Table 17.18 SFMAnDRCR Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	SSLN	SPBSSL Negation Asserted SPBSSL can be negated by writing 1 to this bit when both the RBE and SSLE bits are 1. This bit is always read as 0. **NOTE:** To start next access after SPBSSL negation using this bit, read SSLF in SFMAnCMNSR = 0 to confirm that the SPBSSL has been negated.
23 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 16	RBURST[3:0]	Read Data Burst Length Sets the burst length (data unit count) when reading. This bit is enabled when the RBE bit is set to 1. 0000: 1 data unit 0001: 2 continuous data units : 1110: 15 continuous data units 1111: 16 continuous data units One data unit is 64 bits long.
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	RCF	Read cache Flush When 1 is written to this bit, all the entries in the read cache are cleared. This bit is always read as 0. **NOTE:** After flushing the read cache by writing 1 to the RCF bit, read the SFMAnDRCR before proceeding to read from the external address space.
8	RBE	Read Burst Turns burst ON or OFF when reading. 0: Data is read according to the access size. 1: Read cache is enabled, and as many data units as the burst count specified in RBURST[3:0] bits is read.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.18 SFMAnDRCR Register Contents

Bit Position	Bit Name	Function
0	SSLE	SPBSSL Negation Sets the conditions for SPBSSL negation during read burst. SPBSSL is negated for each access during normal read. 0: SPBSSL is negated after transfer of data set in burst length. 1: SPBSSL is negated when the accessed address is not continuous with the previously transferred address.

17.3.6 SFMAnDRCMR — SFMAn Data Read Command Setting Register

SFMAnDRCMR is a 32-bit register that sets the commands issued in external address space read mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access:	This register can be read or written in 32-bit units.
Address:	<SFMAn_base> + 10_H
Value after reset:	0003 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	CMD[7:0]	Command Sets the command.
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	OCMD[7:0]	Optional Command Sets the optional command.

17.3.7 SFMAnDREAR — SFMAn Data Read Extended Address Setting Register

SFMAnDREAR is a 32-bit register that sets the address when the serial flash address is output in 32-bit mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 14_H

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	EAV[5:0]						—

Table 17.20 SFMAnDREAR Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 17	EAV[5:0]	32-Bit Extended Upper Address Fixed Value Sets the serial flash address [31:26] fixed values to EAV[5:0]. This setting is valid when the ADE[3] bit in SFMAnDRENR is 1.
16 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

17.3.8 SFMAnDROPR — SFMAn Data Read Option Setting Register

SFMAnDROPR is a 32-bit register that sets the option data in external address space read mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 18_H

Value after reset: $0000\ 0000_H$

Table 17.21 SFMAnDROPR Register Contents

Bit Position	Bit Name	Function
31 to 24	OPD3[7:0]	Option Data 3 Sets the option data 3.
23 to 16	OPD2[7:0]	Option Data 2 Sets the option data 2.
15 to 8	OPD1[7:0]	Option Data 1 Sets the option data 1.
7 to 0	OPD0[7:0]	Option Data 0 Sets the option data 0.

Note: OPD3, OPD2, OPD1, and OPD0 are output in this order.

17.3.9 SFMAnDRENR — SFMAn Data Read Enable Setting Register

SFMAnDRENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and read data in external address space read mode and enables outputting them other than read data.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 1C$_H$

Value after reset: 0000 4700$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.22 SFMAnDRENR Register Contents

Bit Position	Bit Name	Function
31, 30	CDB[1:0]	Command Bit Size Sets the command size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
29, 28	OCDB[1:0]	Optional Command Bit Size Sets the optional command size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
27, 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25, 24	ADB[1:0]	Address Bit Size Sets the address size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21, 20	OPDB[1:0]	Option Data Bit Size Sets the option data size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.22 SFMAnDRENR Register Contents

Bit Position	Bit Name	Function
17, 16	DRDB[1:0]	Data Read Bit Size Sets the data read size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15	DME	Dummy Cycle Enable Enables insertion of the dummy cycle before the read data. **NOTE:** A setting is prohibited for a transfer starting with a dummy cycle. 0: Dummy cycle insertion disabled 1: Dummy cycle insertion enabled
14	CDE	Command Enable Sets the command to be output. 0: Command output disabled 1: Command output enabled
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	OCDE	Optional Command Enable Sets the optional command to be output. 0: Optional command output disabled 1: Optional command output enabled
11 to 8	ADE[3:0]	Address Enable Sets the address to be output. Be sure to use the following setting; otherwise, the operation is not guaranteed. 0000: Output disabled 0111: Address[23:0] 1111: Address[31:0] Other than above: Setting prohibited
7 to 4	OPDE[3:0]	Option Data Enable Sets the option data to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 1000: OPD3 1100: OPD3, OPD2 1110: OPD3, OPD2, OPD1 1111: OPD3, OPD2, OPD1, OPD0 Other than above: Setting prohibited
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

17.3.10 SFMAnSMCR — SFMAn SPI Mode Control Register

SFMAnSMCR is a 32-bit register that sets the operation in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access:	This register can be read or written in 32-bit units.
Address:	<SFMAn_base> + 20_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SSLKP	—	—	—	—	—	SPIRE	SPIWE	SPIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	W

Table 17.23 SFMAnSMCR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	SSLKP	SPBSSL Signal Level Determines the SPBSSL status after the end of transfer. 0: SPBSSL signal is negated at the end of transfer. 1: SPBSSL signal level is maintained from the end of transfer to the start of next access.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	SPIRE	Data Read Enable Enables reading in SPI operating mode. 0: Data reading disabled 1: Data reading enabled **NOTE:** When the transfer data bit size is set to 2 bits or 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time.
1	SPIWE	Data Write Enable Enables writing in SPI operating mode. 0: Data writing disabled 1: Data writing enabled **NOTE:** When the transfer data bit size is set to 2 bits or 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time.
0	SPIE	SPI Data Transfer Enable Data is transferred by setting this bit to 1. This bit is enabled only when the TEND bit in SFMAnCMNSR is set to 1. The operation cannot be guaranteed when this bit is set to 1 with the TEND bit set to 0. This bit is always read as 0. **NOTE:** When the SPBSSL pin is de-asserted, the command, optional command, address, and option data that are output enabled are output even if the SPIRE and SPIWE bits are set to 0. When the SPBSSL pin is asserted, follow the notes described in **Section 17.5.2, Notes on Starting Transfer from the SPBSSL Retained State in SPI Operating Mode**.

17.3.11 SFMAnSMCMR — SFMAn SPI Mode Command Setting Register

SFMAnSMCMR is a 32-bit register that sets the commands issued in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 24_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.24 SFMAnSMCMR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	CMD[7:0]	Command Sets the command.
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	OCMD[7:0]	Optional Command Sets the optional command.

17.3.12 SFMAnSMADR — SFMAn SPI Mode Address Setting Register

SFMAnSMADR is a 32-bit register that sets the addresses in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 28_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADR[31:24]								ADR[23:16]

Table 17.25 SFMAnSMADR Register Contents

Bit Position	Bit Name	Function
31 to 24	ADR[31:24]	Address Sets the value of bits 31 to 24 when the serial flash address is output in 32-bit units. This setting is valid when ADE[3] in SFMAnSMENR is 1.
23 to 0	ADR[23:0]	Address Sets the address.

17.3.13 SFMAnSMOPR — SFMAn SPI Mode Option Setting Register

SFMAnSMOPR is a 32-bit register that sets the option data in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + $2C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

23 to 16	OPD2[7:0]	Option Data 2 Sets the option data 2.
15 to 8	OPD1[7:0]	Option Data 1 Sets the option data 1.
7 to 0	OPD0[7:0]	Option Data 0 Sets the option data 0.

Note: OPD3, OPD2, OPD1, and OPD0 are output in this order.

17.3.14 SFMAnSMENR — SFMAn SPI Mode Enable Setting Register

SFMAnSMENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and transfer data in SPI operating mode and enables their output. SFMAnSMENR also enables dummy cycle insertion. Disabling all of the command, optional command, address, option data, dummy cycle, and transfer data is prohibited. At least one of them except dummy cycle must be enabled.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 30_H

Value after reset: $0000\ 4000_H$

Table 17.27 SFMAnSMENR Register Contents

Bit Position	Bit Name	Function
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	SPIDB[1:0]	Transfer Data Bit Size Sets the transfer data size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15	DME	Dummy Cycle Enable Enables insertion of the dummy cycle before the read data. **NOTE:** Dummy cycle insertion is prohibited for write in SPI operating mode including the case in which a transfer ends with a dummy cycle. **NOTE:** A setting is prohibited for a transfer starting with a dummy cycle. 0: Dummy cycle insertion disabled 1: Dummy cycle insertion enabled
14	CDE	Command Enable Sets the command to be output. 0: Command output disabled 1: Command output enabled
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	OCDE	Optional Command Enable Sets the optional command to be output. 0: Optional command output disabled 1: Optional command output enabled
11 to 8	ADE[3:0]	Address Enable Sets the address to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 0100: ADR[23:16] 0110: ADR[23:8] 0111: ADR[23:0] 1111: ADR[31:0] Other than above: Setting prohibited
7 to 4	OPDE[3:0]	Option Data Enable Sets the option data to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 1000: OPD3 1100: OPD3, OPD2 1110: OPD3, OPD2, OPD1 1111: OPD3, OPD2, OPD1, OPD0 Other than above: Setting prohibited
3 to 0	SPIDE[3:0]	Transfer Data Enable Sets valid transfer data. The following settings must be used. Otherwise, the operation is not guaranteed. 0000: Not transferred 1000: 8 bits transferred (enables data at address 0 of the SPI mode read/write data register) 1100: 16 bits transferred (enables data at addresses 0 and 1 of the SPI mode read/write data register) 1111: 32 bits transferred (enables data at addresses 0 to 3 of the SPI mode read/write data register) Other than above: Setting prohibited

17.3.15 SFMAnSMRDR — SFMAn SPI Mode Read Data Register

SFMAnSMRDR is a 32-bit register that stores the read data in SPI operating mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the SPI mode enable setting register (SFMAnSMENR). Be sure to access from address 0.

The settings of this register should be read when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: SFMAnSMRDR is a read-only register that can be read in 32-bit units.

SFMAnSMRDRL, SFMAnSMRDRH are read-only registers that can be read in 16-bit units.

SFMAnSMRDRLL, SFMAnSMRDRLH, SFMAnSMRDRHL, SFMAnSMRDRHH are read-only registers that can be read in 8-bit units.

Address: SFMAnSMRDR: <SFMAn_base> + 38_H

SFMAnSMRDRL: <SFMAn_base> + 38_H

SFMAnSMRDRLL: <SFMAn_base> + 38_H

SFMAnSMRDRLH: <SFMAn_base> + 39_H

SFMAnSMRDRH: <SFMAn_base> + $3A_H$

SFMAnSMRDRHL: <SFMAn_base> + $3A_H$

SFMAnSMRDRHH: <SFMAn_base> + $3B_H$

Value after reset: XXXX $XXXX_H$

Note: The contents of this register are modified upon completion of reception in SPI operating mode. Be sure to read data when reception in SPI operating mode is completed.

17.3.16 SFMAnSMWDR — SFMAn SPI Mode Write Data Register

SFMAnSMWDR is a 32-bit register that sets the write data in SPI operating mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the SPI mode enable setting register (SFMAnSMENR). Be sure to access from address 0.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access:	SFMAnSMWDR can be read or written in 32-bit units. SFMAnSMWDRL, SFMAnSMWDRH can be read or written in 16-bit units. SFMAnSMWDRLL, SFMAnSMWDRLH, SFMAnSMWDRHL, SFMAnSMWDRHH can be read or written in 8-bit units.

17.3.17 SFMAnCMNSR — SFMAn Common Status Register

SFMAnCMNSR is a 32-bit register that holds flags indicating the operating state.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	<SFMAn_base> + 48_H
Value after reset:	0000 0001_H

17.3.18 SFMAnDRDMCR — SFMAn Data Read Dummy Cycle Setting Register

SFMAnDRDMCR is a 32-bit register that sets the size and number of dummy cycles to be inserted in external address space read mode.

The settings of this register are enabled when the DME bit in the data read enable setting register (SFMAnDRENR) is 1.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access:	This register can be read or written in 32-bit units.
Address:	<SFMAn_base> + 58_H
Value after reset:	$0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	DMDB[1:0]	Dummy Cycle Bit Size Sets the dummy cycle size in bit units. The setting of these bits is combined with the setting of the IO0FV, IO2FV, and IO3FV bits in the common control register (SFMAnCMNCR) to determine the state of the unused pins during the dummy cycles. The state of the used pins is Hi-Z. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	DMCYC[2:0]	Number of Dummy Cycles Sets the number of dummy cycles to be inserted when the DME bit in the data read enable setting register (SFMAnDRENR) is 1. 000: 1 cycle 001: 2 cycles 010: 3 cycles 011: 4 cycles 100: 5 cycles 101: 6 cycles 110: 7 cycles 111: 8 cycles

17.3.19 SFMAnSMDMCR — SFMAn SPI Mode Dummy Cycle Setting Register

SFMAnSMDMCR is a 32-bit register that sets the size and number of dummy cycles to be inserted in SPI operating mode.

The settings of this register are enabled when the DME bit in the SPI mode enable setting register (SFMAnSMENR) is 1.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access:	This register can be read or written in 32-bit units.
Address:	<SFMAn_base> + 60_H
Value after reset:	$0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	DMDB[1:0]	Dummy Cycle Bit Size Sets the dummy cycle size in bit units. The setting of these bits is combined with the setting of the IO0FV, IO2FV, and IO3FV bits in the common control register (SFMAnCMNCR) to determine the state of the unused pins during the dummy cycles. The state of the used pins is Hi-Z. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	DMCYC[2:0]	Number of Dummy Cycles Sets the number of dummy cycles to be inserted when the DME bit in the SPI mode enable setting register (SFMAnSMENR) is 1. 000: 1 cycle 001: 2 cycles 010: 3 cycles 011: 4 cycles 100: 5 cycles 101: 6 cycles 110: 7 cycles 111: 8 cycles

17.4 Operation

17.4.1 System Configuration

With this module, one serial flash memory can be directly connected (data size of 1, 2, and 4 bits).

The example of system configuration is shown in **Figure 17.2, System Configuration Example with 4-Bit Data Size**.

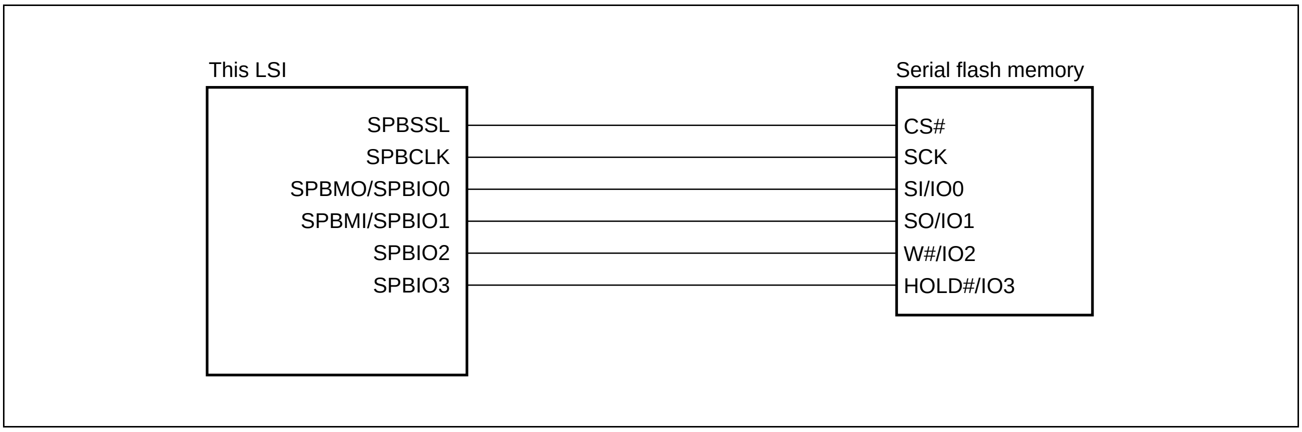

Figure 17.2 System Configuration Example with 4-Bit Data Size

17.4.2 Address Map

In external address space read mode, the serial flash connected is assigned in the SPI multi I/O bus space. In combination with DREAR, a maximum of 4 Gbytes can be accessed.

Table 17.33 Address Map

Internal Address	Max. Access Area
3000 0000$_H$ to 33FF FFFF$_H$	4 Gbytes

17.4.3 32-bit Serial Flash Addresses

Since the SPI multi I/O bus space is 64 Mbytes, only a part of the 32-bit serial flash address area can be directly accessed. Here, the fixed value set in the pertinent register is used as the upper bit value of a 32-bit address.

To output serial flash addresses in 32 bits, set the ADE[3] bit in SFMAnDRENR to 1, and set the serial flash address [31:26] fixed values to the EAV[5:0] bits in SFMAnDREAR.

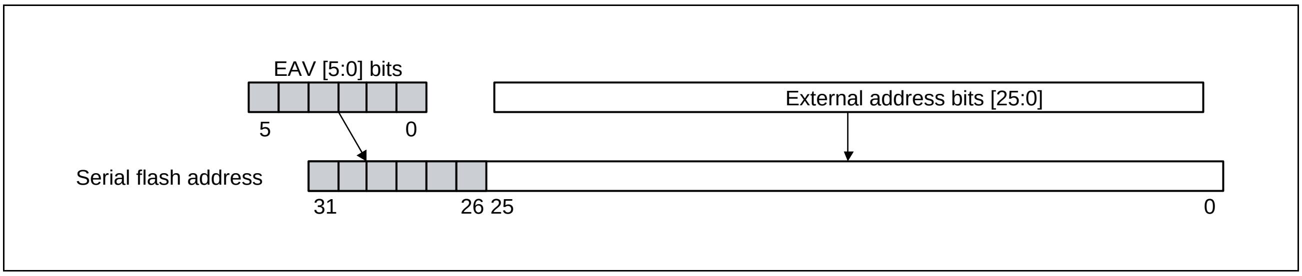

Figure 17.3 32-Bit Address Setting

17.4.4 Operating Modes

This module has two operating modes: external address space read mode and SPI operating mode.

In external address space read mode, a read access to the SPI multi I/O bus space is converted into SPI communication and data is received. After data acquisition, data is returned to the bus master that is the issuing source. For details, see **Section 17.4.5, External Address Space Read Mode**.

In SPI operating mode, arbitrary SPI communication is carried out using register settings. For details, see **Section 17.4.8, SPI Operating Mode**.

17.4.5 External Address Space Read Mode

A read access to the SPI multi I/O bus space can be converted into SPI communication in external address space read mode. Further, the commands, optional commands, option data, and dummy cycle issued for reading can be modified using registers.

In external address space read mode, either normal read operation or burst read operation can be selected. The transfer format is determined based on the common control register (SFMAnCMNCR), SSL delay register (SFMAnSSLDR), bit rate setting register (SFMAnSPBCR), data read control register (SFMAnDRCR), data read command setting register (SFMAnDRCMR), data read extended address setting register (SFMAnDREAR), data read option setting register (SFMAnDROPR), data read enable setting register (SFMAnDRENR), and data read dummy cycle setting register (SFMAnDRDMCR).

17.4.5.1 Normal Read Operation

When the RBE bit in SFMAnDRCR is set to 0, normal read operation is performed.

In the normal read operation, the data of 8 bits, 16 bits, and 32 bits are read for respectively a byte, a half-word, and a word read access. After reading, the SPBSSL pin is negated.

The normal read operation timing is shown in **Figure 17.4, Normal Read Operation Timing**.

t1 is the time period from SPBSSL pin assertion to SPBCLK oscillation (clock delay), t2 is the time period from transmission of the last SPBCLK edge of a transfer to SPBSSL pin negation (SPBSSL negation delay), and t3 is the time period from one transfer end to the next transfer start (next access). For details of t1, t2, and t3, see **Section 17.4.9, Transfer Format**.

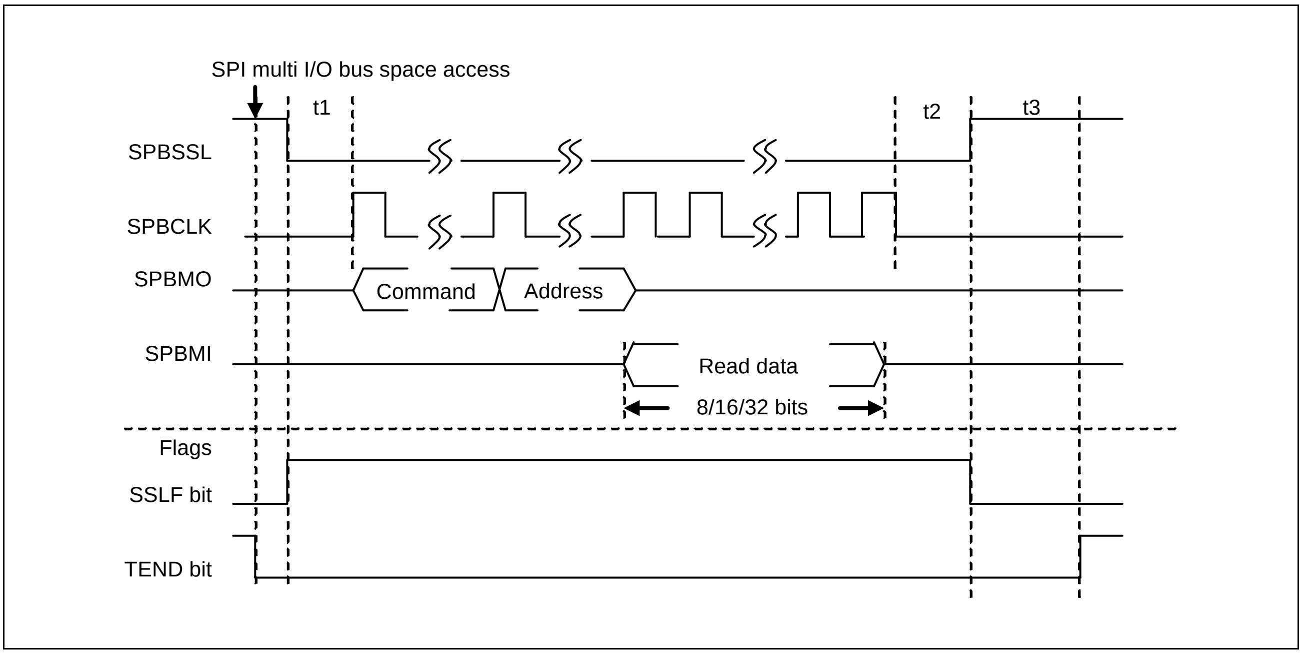

Figure 17.4 Normal Read Operation Timing

17.4.5.2 Burst Read Operation

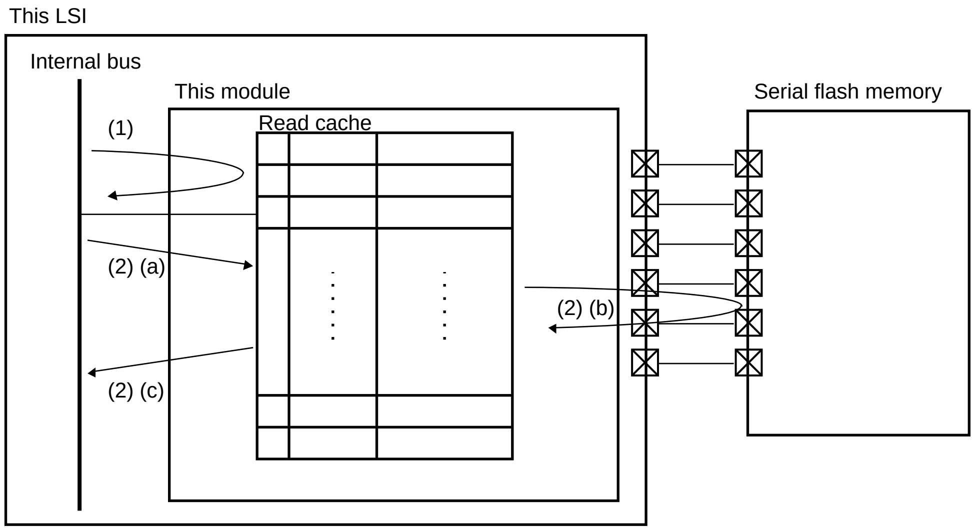
When the RBE bit in SFMAnDRCR is set to 1, burst read operation is performed.

Read cache is enabled in the burst read operation. For read cache operation, see **Section 17.4.7, Read Cache**.

For reading bytes, words, or longwords, the read cache is first referred to for the data. When the read cache contains the data, the data is read from the read cache without accessing the serial flash memory. When the read cache does not contain the data, burst read operation is performed in the serial flash memory and the read data is stored in the read cache. The data transfer length at that time is 64 bits × RBURST[3:0] bits and the data is always read from the 64-bit boundary.

The SPBSSL pin status after data transfer can be selected by using the SSLE bit in SFMAnDRCR. When the SSLE bit is set to 0, the SPBSSL pin is negated after data transfer. For an operation performed when the SSLE bit is set to 1, see **Section 17.4.5.3, Burst Read Operation with Automatic SPBSSL Negation**, just below.

A pattern diagram of this operation and a burst read operation timing diagram when SSLE bit is set to 0 are shown in **Figure 17.5, Burst Read Operation** and **Figure 17.6, Burst Read Operation Timing (SSLE Bit = 0)**.



(1) When the read cache contains the data

The data is read from the read cache without performing SPI communication.

(2) When the read cache does not contain the data

(a) The read cache is accessed to confirm that the data is not in the read cache.

(b) The data is read from the serial flash memory and the read data is stored in the read cache.

(c) The data is read from the read cache.

Figure 17.5 Burst Read Operation

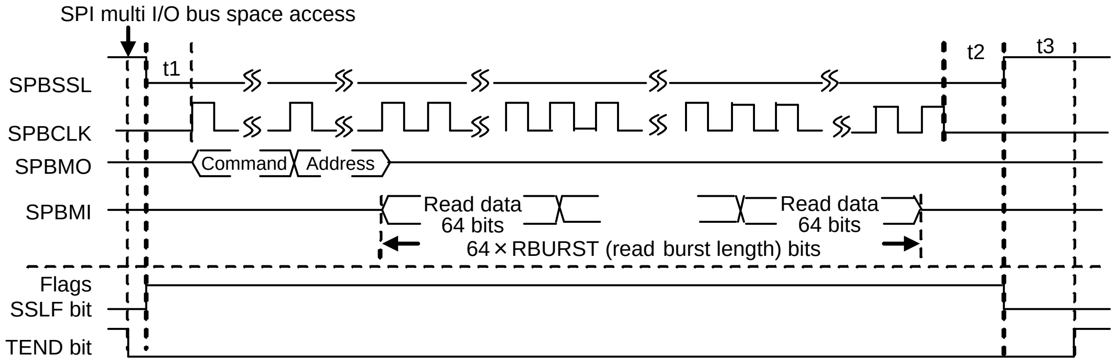


Figure 17.6 Burst Read Operation Timing (SSLE Bit = 0)

17.4.5.3 Burst Read Operation with Automatic SPBSSL Negation

When SSLE bit in SFMAnDRCR is set to 1, this module does not negate the SPBSSL pin after the burst read transfer. When accessing the next time, if the address is continuous with the previous read address, the burst read operation is performed without issuing the command, optional command, address, option data, or dummy cycle. If the address is not continuous with the previous read address, the SPBSSL pin is once negated and the burst read operation is performed after issuing the command, optional command, address, option data, or dummy cycle.

Burst read timing diagrams for continuous address and non-continuous address are shown in **Figure 17.7, Burst Read Timing for Continuous Address (SSLE Bit = 1)** and **Figure 17.8, Burst Read Timing for Non-Continuous Address (SSLE Bit = 1)**.

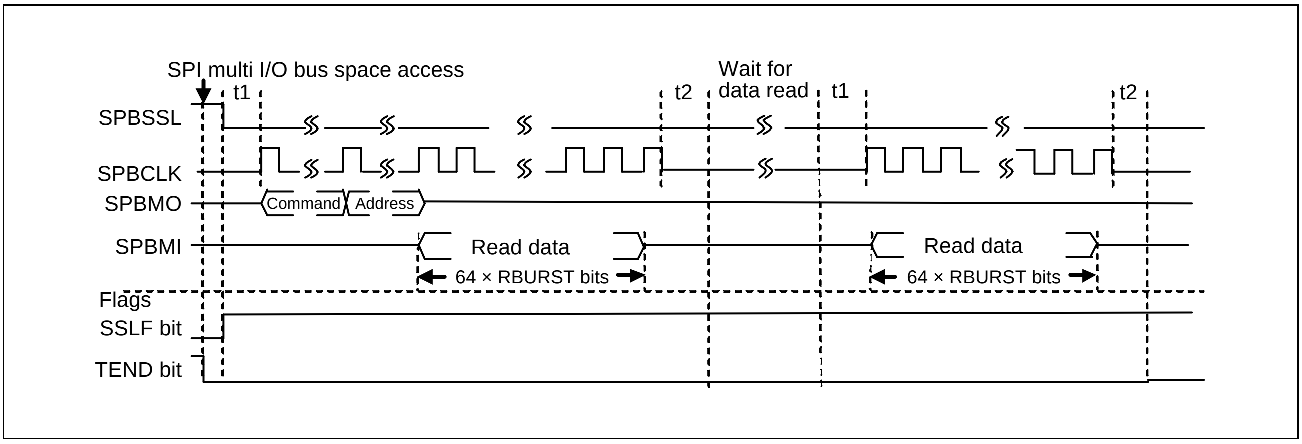

Figure 17.7 Burst Read Timing for Continuous Address (SSLE Bit = 1)

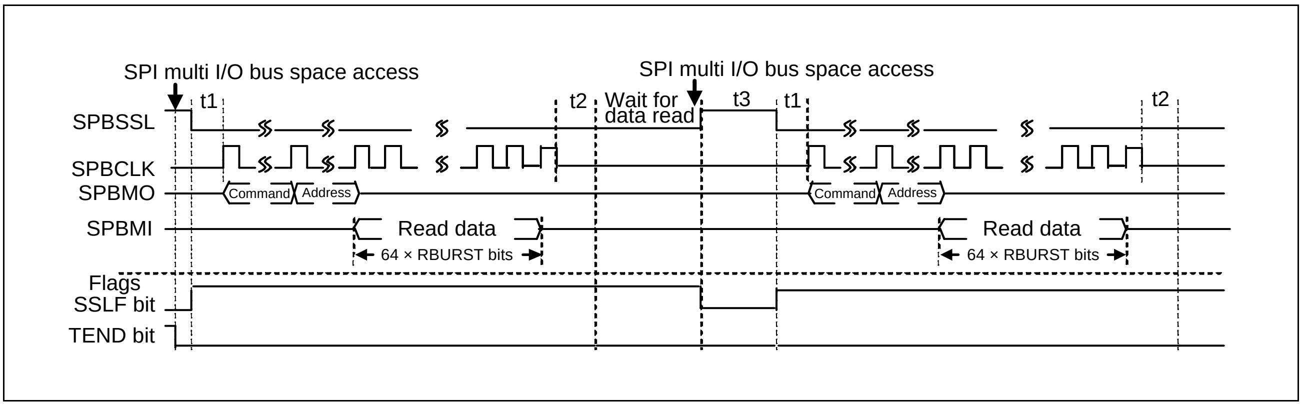

Figure 17.8 Burst Read Timing for Non-Continuous Address (SSLE Bit = 1)

For the next access after negation of the SPBSSL with the SSLN bit in SFMAnDRCR with this operation, read SSLF = 0 in SFMAnCMNSR to confirm that the SPBSSL has been negated.

17.4.6 Initial Setting Flow

An example of an initial setting flow in external address space read mode is shown in **Figure 17.9, Example of Initial Setting Flow in External Address Space Read Mode**.

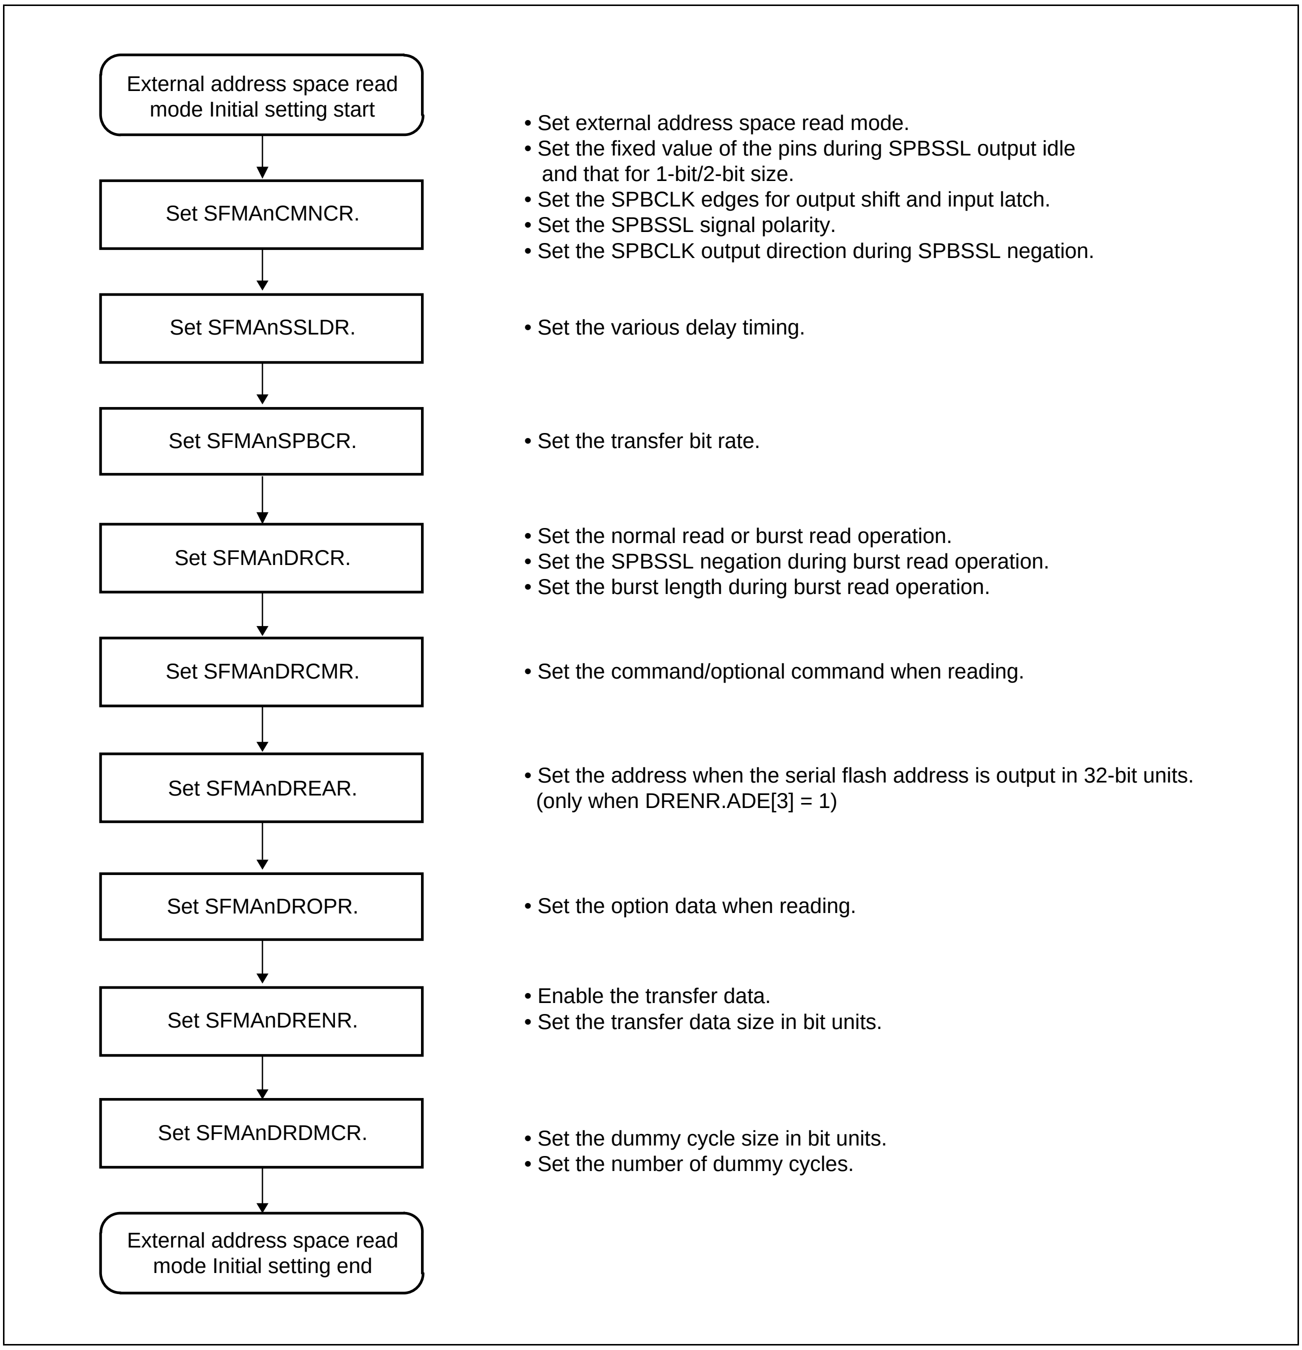

Figure 17.9 Example of Initial Setting Flow in External Address Space Read Mode

17.4.7 Read Cache

This module has a simple built-in read cache. The read cache can be used during external address space read mode and burst read operation. The read cache is configured with a line size of 64 bits and 16 entries.

Read cache configuration is shown in **Figure 17.10, Read Cache Configuration**.

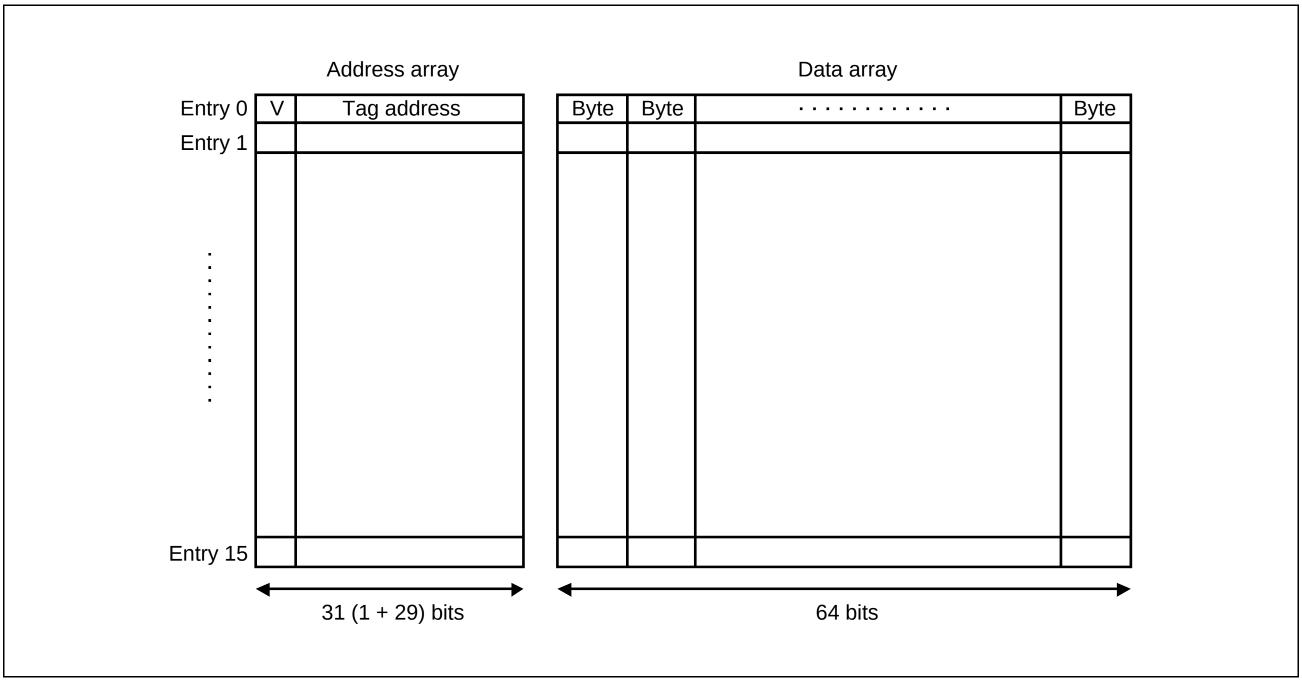

Figure 17.10 Read Cache Configuration

17.4.7.1 Address Array

The V bit indicates whether the entry data is valid. When the V bit is 1, the data is valid and when V bit is 0, the data is invalid.

The tag address bits hold the address used for the serial flash memory. Address bits 31 to 3 are used for the tag address.

Address bits 23 to 3 are enabled when address output is 24 bits.
Address bits 31 to 3 are enabled when address output is 32 bits.

17.4.7.2 Data Array

It retains the 64-bit read data. Registration in the read cache is performed in line units.

17.4.7.3 Read Operation

In case of read-hit, data is read from the read cache. In case of read-miss, after the 64 × RBURST (read burst length) data is read from the serial flash memory and the read cache is updated, the data is returned to the bus master.

17.4.7.4 Data Replacement

The write pointer is used to update data. In case of read-miss, the RBURST (read burst length) portion data is replaced starting at the entry specified by the write pointer. In other words, the data is replaced in the storage order of the data. Whether data is referred to or not will not affect the replacement order of data.

17.4.8 SPI Operating Mode

This module can carry out an arbitrary SPI operation by using the register settings.

The transfer format is determined based on the common control register (SFMAnCMNCR), SSL delay register (SFMAnSSLDR), bit rate setting register (SFMAnSPBCR), SPI mode control register (SFMAnSMCR), SPI mode command setting register (SFMAnSMCMR), SPI mode address setting register (SFMAnSMADR), SPI mode option setting register (SFMAnSMOPR), and SPI mode enable setting register (SFMAnSMENR), SPI mode read data register (SFMAnSMRDR), SPI mode write data register (SFMAnSMWDR), and SPI mode dummy cycle setting register (SFMAnSMDMCR).

SPI operating mode can be used for reading the status of the serial flash memory and writing to the serial flash memory.

In this mode, one transfer refers to the operation from when the SPIE bit in SFMAnSMCR is set to 1 when the TEND bit in SFMAnCMNSR is set to 1.

17.4.8.1 Transfer Start

The transfer of data is started in the set transfer format by setting the SPIE bit in SFMAnSMCR to 1. When write operation is enabled, the SPI mode write data register is transmitted to the serial flash memory. When read operation is enabled, data read from the serial flash memory is stored into the SPI mode read data register.

The SPI operation timing is shown in **Figure 17.11, SPI Operation Timing**.

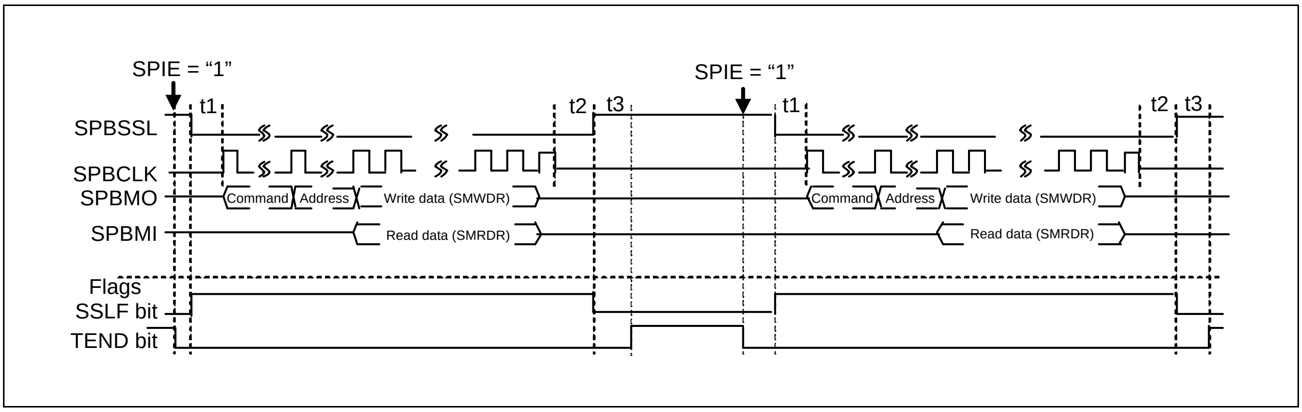

Figure 17.11 SPI Operation Timing

17.4.8.2 Read/Write Enable

- Read operation: Data can be read by setting the SPIRE bit in SFMAnSMCR to 1. The read data is stored into SFMAnSMRDR.
- Write operation: Data can be written by setting the SPIWE bit in SFMAnSMCR to 1. The data stored in SFMAnSMWDR is output.

When the data size is set to 1 bit using the SPIDB[1:0] bits in SFMAnSMENR, data can be transmitted and received by setting the SPIRE and SPIWE bits to 1. However, when the data size is set to 2 or 4 bits by using the SPIDB[1:0] bits, only one of the SPIRE and SPIWE bits should be enabled. The operation is not guaranteed if both the bits are enabled.

17.4.8.3 Retention of SPBSSL Pin Assertion

By setting the SSLKP bit in SFMAnSMCR to 1, assertion of the SPBSSL pin can be continued till the next transfer. With this function, the transfer can be carried out continuously with the SPBSSL kept in the asserted state.

The data transfer timing using the SSLKP bit is shown in **Figure 17.12, Data Transfer Timing using the SSLKP Bit**.

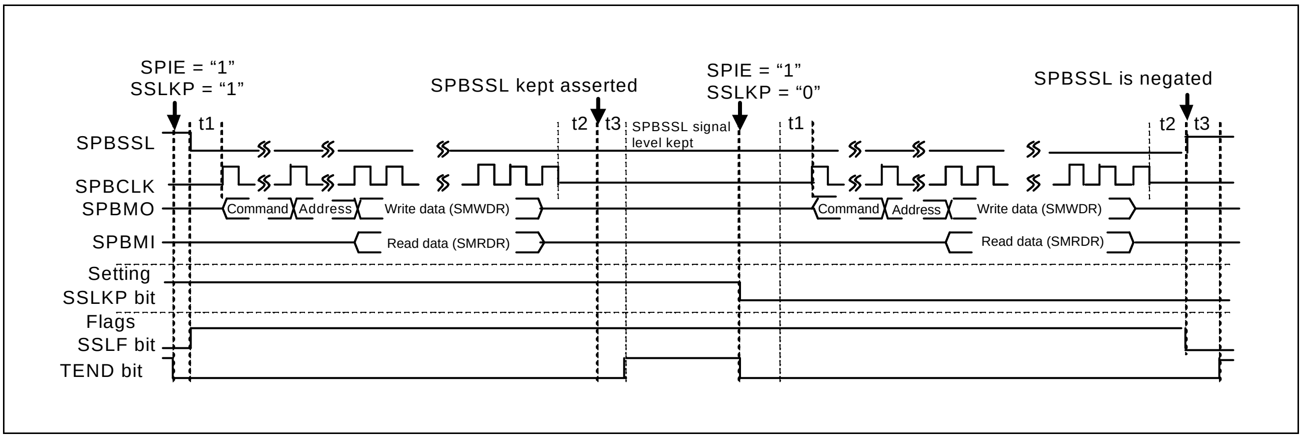

Figure 17.12 Data Transfer Timing using the SSLKP Bit

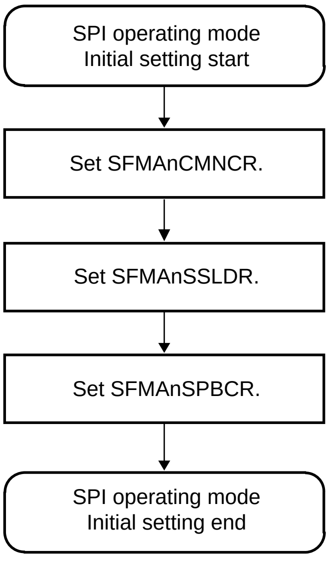
17.4.8.4 Initial Setting Flow

An example of an initial setting flow in SPI operating mode is shown in **Figure 17.13, Example of Initial Setting Flow in SPI Operating Mode**.



- Set SPI operating mode.
- Set the fixed value of the pins during SPBSSL output idle and that for 1-bit/2-bit size.
- Set the SPBCLK edges for output shift and input latch.
- Set the SPBSSL signal polarity.
- Set the SPBCLK output direction during SPBSSL negation.

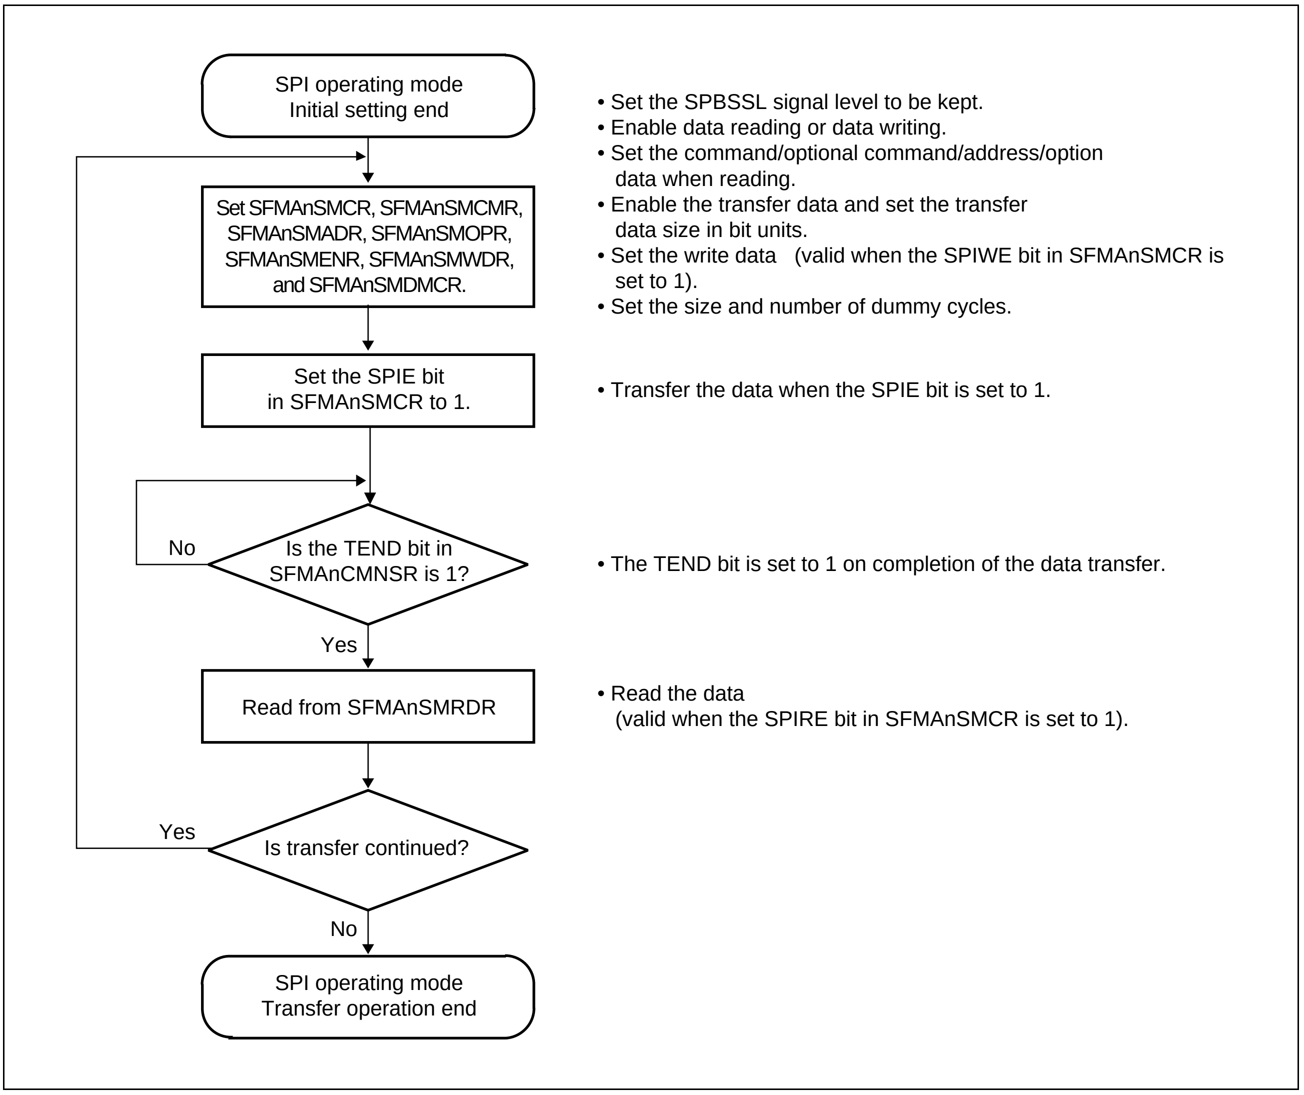
- Set the various delay timing.

- Set the transfer bit rate.

Figure 17.13 Example of Initial Setting Flow in SPI Operating Mode

17.4.8.5 Data Transfer Setting Flow

An example of a data transfer setting flow in SPI operating mode is shown in **Figure 17.14, Example of a Data Transfer Setting Flow in SPI Operating Mode**.



- Set the SPBSSL signal level to be kept.
- Enable data reading or data writing.
- Set the command/optional command/address/option data when reading.
- Enable the transfer data and set the transfer data size in bit units.
- Set the write data (valid when the SPIWE bit in SFMAnSMCR is set to 1).
- Set the size and number of dummy cycles.

- Transfer the data when the SPIE bit is set to 1.

- The TEND bit is set to 1 on completion of the data transfer.

- Read the data (valid when the SPIRE bit in SFMAnSMCR is set to 1).

Figure 17.14 Example of a Data Transfer Setting Flow in SPI Operating Mode

17.4.9 Transfer Format

17.4.9.1 SPBSSL Pin Enable Polarity Control

The enable polarity of the SPBSSL pin can be changed with the SSLP bit in SFMAnCMNCR.

17.4.9.2 SPBCLK Output

The SPBCLK output direction during SPBSSL negation can be set with the CPOL bit in SFMAnCMNCR.

17.4.9.3 Data Transmission and Reception Timing

Data is transmitted and received at either the odd or even edges. The data transmission timing can be set to the odd or even edge with the CPHAT bit in SFMAnCMNCR. Similarly, the data reception timing can be set to the odd or even edge with the CPHAR bit in SFMAnCMNCR.

17.4.9.4 Delay Settings

t1 is the time period from SPBSSL pin assertion to SPBCLK oscillation (clock delay). It can be set with the SCKDL[2:0] bits in SFMAnSSLDR. t2 is the time period till the SPBSSL signal negation after the SPBCLK oscillation is stopped (SPBSSL negation delay). It can be set with the SLNDL[2:0] bits in SFMAnSSLDR. t3 is the time period required to prevent SPBSSL signal assertion for the next transfer after the end of the previous transfer (next access delay). It can be set with the SPNDL[2:0] bits in SFMAnSSLDR.

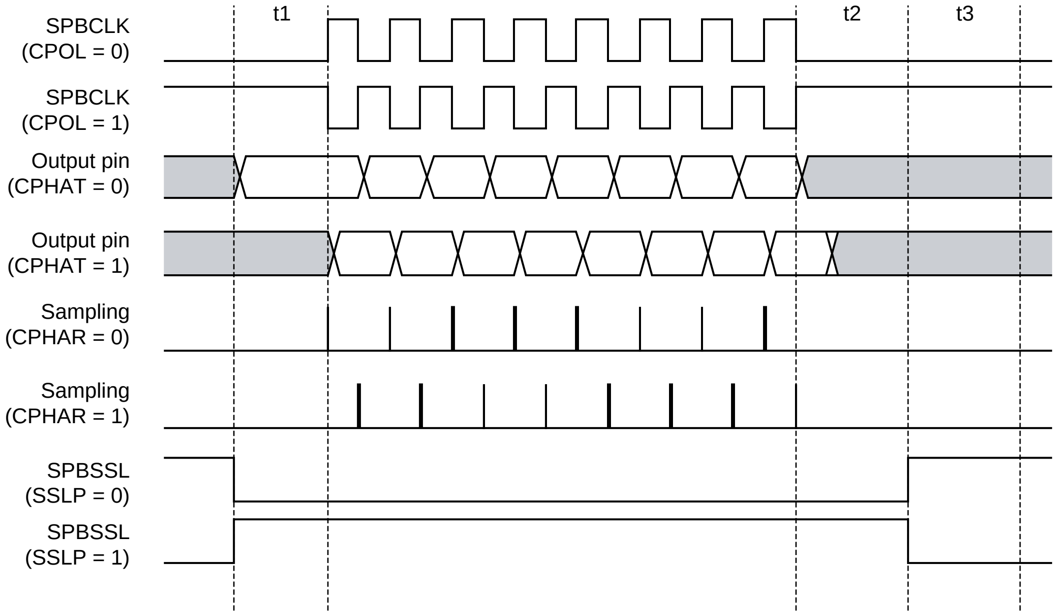


Figure 17.15 Transfer Format

17.4.10 Data Format

This module can input and output data in the order of command, optional command, address, option data, dummy cycle and data.

17.4.10.1 Data Registers

Table 17.34, Data Registers shows the input and output data.

Table 17.34 Data Registers

Data	External Address Space Read Operation	SPI Operation
Command (8 bits)	CMD[7:0] bits in SFMAnDRCMR	CMD[7:0] bits in SFMAnSMCMR
Optional command (8 bits)	OCMD[7:0] bits in SFMAnDRCMR	OCMD[7:0] bits in SFMAnSMCMR
Address (32/24 bits)	32 bits: SFMAnDREAR.EAV[5:0] + lower [25:0] bits of the read address. 24 bits: Lower [23:0] bits of the read address	32 bits: ADR[31:0] bits in SFMAnSMADR 24 bits: ADR[23:0] bits in SFMAnSMADR
Option data (8 bits × 4)	SFMAnDROPR	SFMAnSMOPR
Dummy cycle (1 to 8 cycles)	SFMAnDRDMCR	SFMAnSMDMCR (only when read)
Transfer data	Normal read: 8, 16, and 32 bits Burst read: 64 × RBURST bits	Read: SFMAnSMRDR Write: SFMAnSMWDR

17.4.10.2 Data Enable

In external address space read mode, transfer enable or disable of the command, optional command, address, option data, and dummy cycle can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], and DME bits in SFMAnDRENR, respectively. The size and number of dummy cycles can be controlled with the data read dummy cycle setting register (SFMAnDRDMCR).

Similarly, in SPI operating mode, enable or disable of the command, optional command, address, option data, dummy cycle, and transfer data can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], DME, and SPIDE[3:0] bits in SFMAnSMENR, respectively. However, disabling all the above parameters is prohibited in SPI operating mode. At least one of them except dummy cycle must be enabled. The size and number of dummy cycles can be controlled with the SPI mode dummy cycle setting register (SFMAnSMDMCR).

For the address and option data in external address space read mode; and the address, option data, and transfer data in SPI operating mode, the enable bit setting allowed is determined according to the transfer data size. For the allowed setting combinations of the enable bits and transfer data size, refer to the description of the pertinent registers.

If data is disabled, that data is skipped, and input and output of the next data is carried out. The command, optional command, address, and option data are always output. During dummy cycles, the state of the used pins is Hi-Z. In external address space read mode, data is always input; and in SPI operating mode, input and output of data is determined based on the settings of the SPIRE and SPIWE bits in SFMAnSMCR.

There are some restrictions on dummy cycle insertion; refer to the description of the DME bits in SFMAnDRENR and SFMAnSMENR for details.

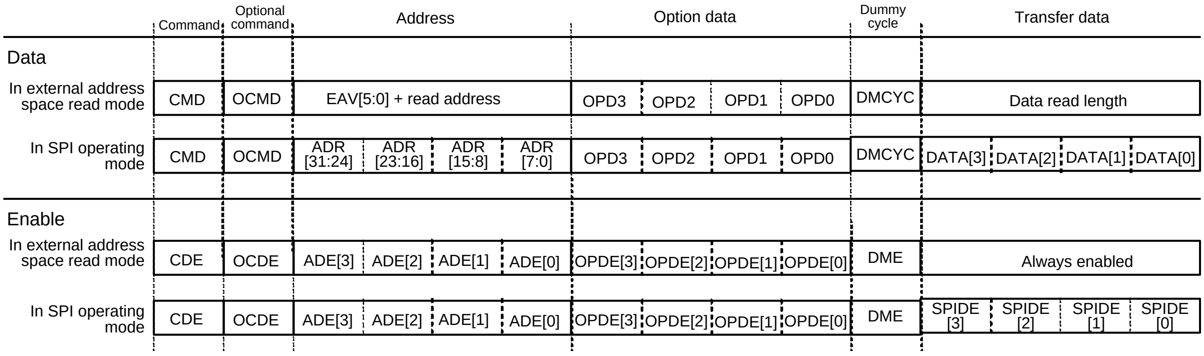

Figure 17.16 Data and Enable

17.4.10.3 Bit Size

In external address space read mode, the size of the command, optional command, address, option data, and the read data in bit units is respectively controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and DRDB[1:0] bits in SFMAnDRENR. The size of the dummy cycle in bit units is also controlled with the DMDB[1:0] bits in SFMAnDRDMCR.

Similarly, in SPI operating mode, the size of the command, optional command, address, option data, and read write data in bit units is controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and SPIDB[1:0] bits in SFMAnSMENR. The size of the dummy cycle in bit units is also controlled with the DMDB[1:0] bits in SFMAnSMDMCR.

(1) 1-bit Size

When the size is set to 1 bit, SPBMI pin will be the input pin and SPBMO pin will be the output pin. SPBIO2 and SPBIO3 pins are not used.

Figure 17.17, Transfer Format Example with 1-Bit Data Size shows the transfer format example.

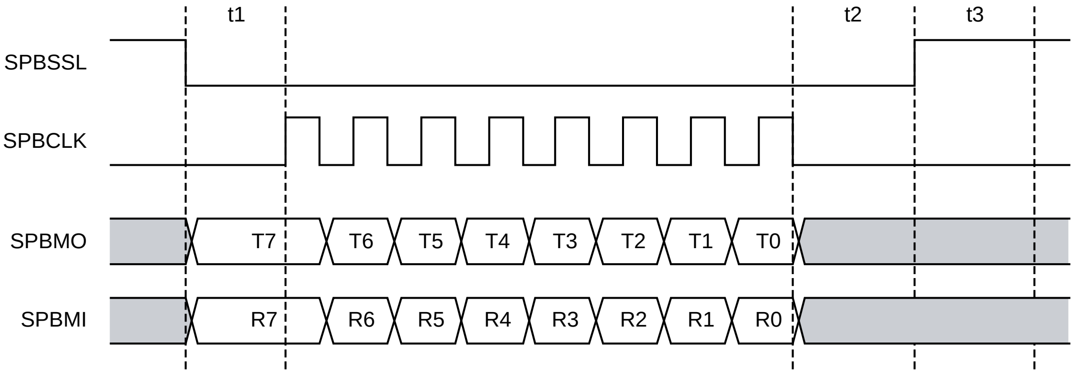

Figure 17.17 Transfer Format Example with 1-Bit Data Size

(2) 2-bit Size

When the size is set to 2 bits, SPBIO0 and SPBIO1 pins will be either the input pins or the output pins. SPBIO2 and SPBIO3 pins are not used.

Figure 17.18, Transfer Format Example with 2-Bit Data Size shows the transfer format example.

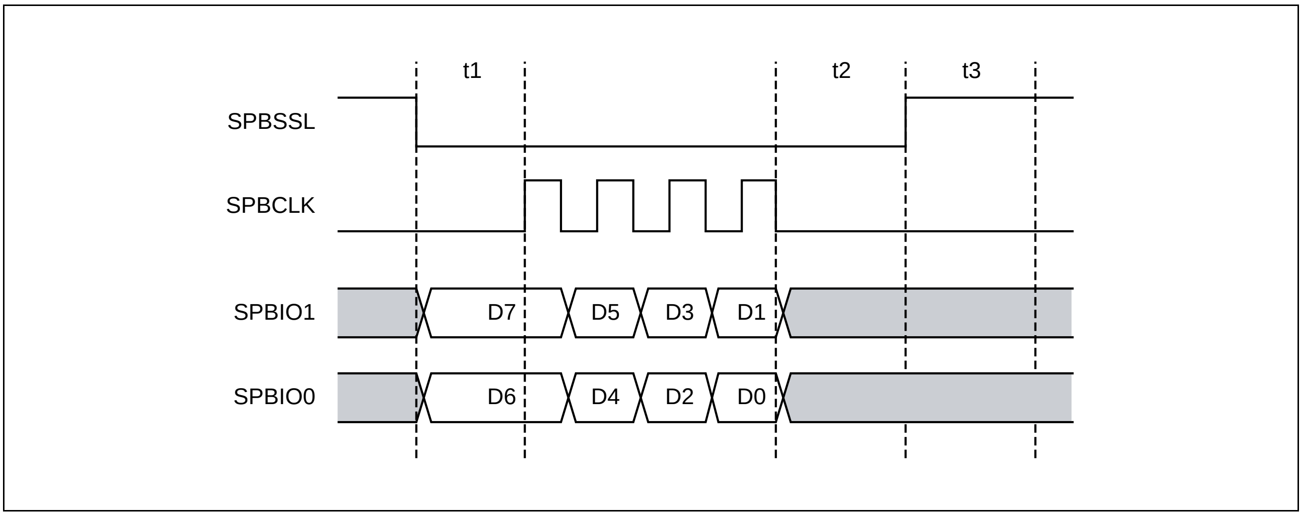

Figure 17.18 Transfer Format Example with 2-Bit Data Size

(3) 4-bit Size

When the size is set to 4 bits, SPBIO0, SPBIO1, SPBIO2, and SPBIO3 pins will be either the input pins or the output pins.

Figure 17.19, Transfer Format Example with 4-Bit Data Size shows the transfer format example.

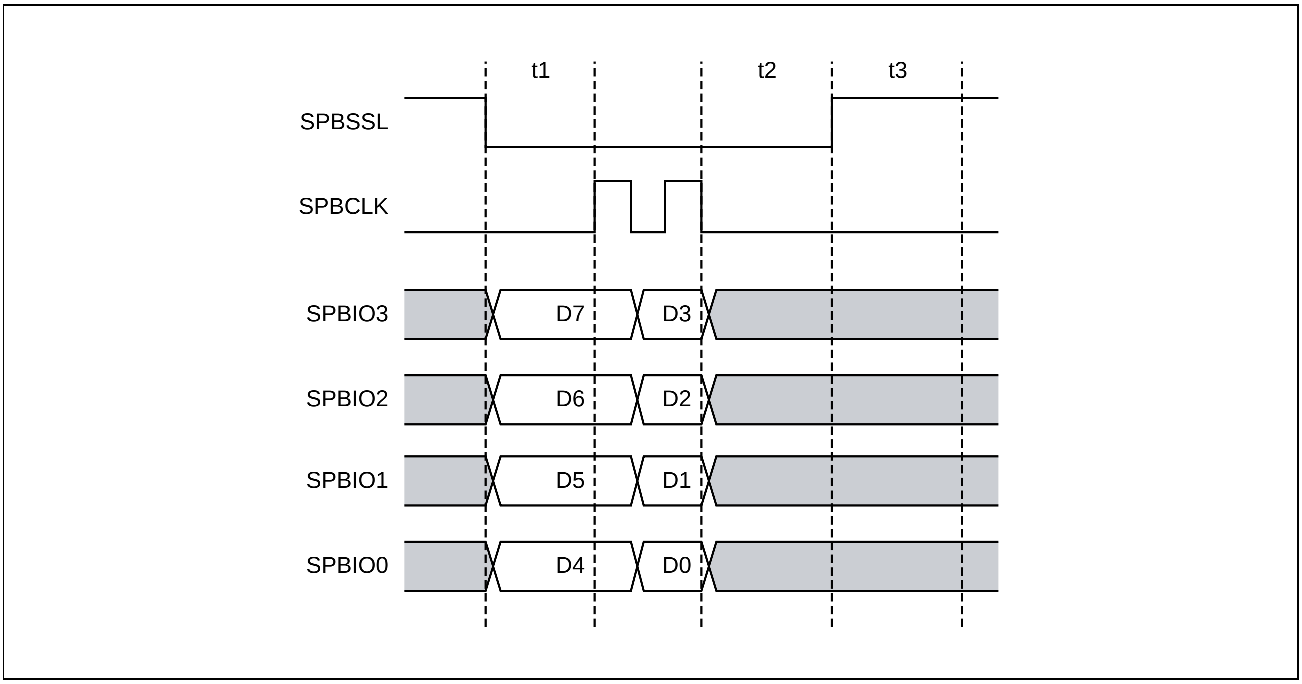

Figure 17.19 Transfer Format Example with 4-Bit Data Size

17.4.11 Data Pin Control

With this module, the status of pins can be automatically changed based on the data size to be used and the read/write settings. The pin status during the SPBSSL negation can be set with the MOIIO3, MOIIO2, MOIIO1, and MOIIO0 bits in SFMAnCMNCR. The SPBSSL and SPBCLK pins are always output pins. The status of respective pins is specified in **Table 17.35, Pin Status (1)** to **Table 17.38, Pin Status (4)**.

Table 17.35 Pin Status (1)

Pin	SPBSSL Negation	SPBSSL Assertion		
		Command, Optional Command, Address, Option Data		
		1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	MOIIO0 bit value	Output	Output	Output
SPBMI/SPBIO1	MOIIO1 bit value	Hi-Z	Output	Output
SPBIO2	MOIIO2 bit value	IO2FV bit value	IO2FV bit value	Output
SPBIO3	MOIIO3 bit value	IO3FV bit value	IO3FV bit value	Output

Table 17.36 Pin Status (2)

Pin	Transfer Data					
	External Address Space Read Operation			SPI Operation		
				SPIRE Bit = 1, SPIWE Bit = 0		
	1-bit Size	2-bit Size	4-bit Size	1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	IO0FV bit value	Input	Input	IO0FV bit value	Input	Input
SPBMI/SPBIO1	Input	Input	Input	Input	Input	Input
SPBIO2	IO2FV bit value	IO2FV bit value	Input	IO2FV bit value	IO2FV bit value	Input
SPBIO3	IO3FV bit value	IO3FV bit value	Input	IO3FV bit value	IO3FV bit value	Input

Table 17.37 Pin Status (3)

Pin	Transfer Data					
	SPI Operation					
	SPIRE Bit = 0, SPIWE Bit = 1			SPIRE Bit = 1, SPIWE Bit = 1		
	1-bit Size	2-bit Size	4-bit Size	1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	Output	Output	Output	Output	Setting prohibited	Setting prohibited
SPBMI/SPBIO1	Hi-Z	Output	Output	Input	Setting prohibited	Setting prohibited
SPBIO2	IO2FV bit value	IO2FV bit value	Output	IO2FV bit value	Setting prohibited	Setting prohibited
SPBIO3	IO3FV bit value	IO3FV bit value	Output	IO3FV bit value	Setting prohibited	Setting prohibited

Table 17.38 Pin Status (4)

Pin	Dummy Cycle		
	1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	IO0FV bit value	Hi-Z	Hi-Z
SPBMI/SPBIO1	Hi-Z	Hi-Z	Hi-Z
SPBIO2	IO2FV bit value	IO2FV bit value	Hi-Z
SPBIO3	IO3FV bit value	IO3FV bit value	Hi-Z

17.4.12 SPBSSL Pin Control

Negation conditions of the SPBSSL pin are as follows.

17.4.12.1 External Address Space Read Mode

(1) Normal read operation (RBE bit in SFMAnDRCR = 0)
SPBSSL negated after completing the data transfer and t2 cycle.

(2) Burst read without automatic SPBSSL negation (RBE bit in SFMAnDRCR = 1, SSLE bit in SFMAnDRCR = 0)
SPBSSL negated after completing the data transfer and t2 cycle.

(3) Burst read with automatic SPBSSL negation (RBE bit in SFMAnDRCR = 1, SSLE bit in SFMAnDRCR = 1)
- SPBSSL negated after t2 cycle when the read address is not continuous with the previously read address
- SPBSSL negated after the SSLN bit in SFMAnDRCR is set to 1

17.4.12.2 SPI Operating Mode

(1) SPBSSL pin assertion not retained (SSLKP bit in SFMAnSMCR = 0)
SPBSSL negated after completing the data transfer and t2 cycle.

(2) SPBSSL pin assertion retained (SSLKP bit in SFMAnSMCR = 1)
SPBSSL not negated.
When to be negated, data should be transferred after setting the SSLKP bit to 0.

17.4.13 Flags

This module has two flag bits SSLF and TEND in SFMAnCMNSR. These bits are read-only bits.

17.4.13.1 SSLF Bit

This bit indicates the SPBSSL pin status. The status is 1 when the SPBSSL is asserted, and the status is 0 when the SPBSSL is negated.

17.4.13.2 TEND Bit

This bit indicates whether transfer of data is in progress or the transfer of data has ended.

During t1 time period, data transfer, t2 time period, t3 time period, and waiting for read access by burst read and SPBSSL automatic negation, the TEND bit is read as 0 to indicate that the transfer of data is in progress.

When other than the above, the TEND bit is read as 1 to indicate that transfer of data has ended.

17.4.13.3 Register Re-writing Timing

The status of the TEND bit determines the rewritable registers.

The registers which can be written to, except the SSLN bit in SFMAnDRCR, should be modified when TEND = 1. Read SFMAnSMRDR when TEND = 1. SFMAnCMNSR can always be read.

17.5 Usage Notes

17.5.1 Notes on Transfer to Read Data in SPI Operating Mode

In SPI operating mode, take note of the following points for caution when setting the SPI mode enable setting register (SFMAnSMENR) to enable transfer only for reading data.

“Transfer only for reading data” indicates transfer to read data while the CDE, OCDE, ADE[3:0], and OPDE[3:0] bits in SFMAnSMENR are all 0.

17.5.1.1 Transfer to Read Data While the Signal on the SPBSSL Pin is De-asserted

Set the SFMAnSMENR.SPIDE[3:0] bits to 1100 or 1111 when transfer only for reading data is to proceed.

Transfer will not proceed normally if the setting of the SFMAnSMENR.SPIDE[3:0] bits is 1000.

17.5.1.2 Transfer to Read Data While the Signal on the SPBSSL Pin is Asserted

When transfer only for reading data is to proceed, set the SFMAnSMENR.SPIDE[3:0] bits to 1100 or 1111, or end the immediately preceding transfer with reading data.

When the immediately preceding transfer is of a command, optional command, address, or option data, or is transfer for writing data, the subsequent transfer only for reading data will not proceed normally if the setting of the SFMAnSMENR.SPIDE[3:0] bits is 1000.

17.5.2 Notes on Starting Transfer from the SPBSSL Retained State in SPI Operating Mode

Be sure to set the SPIWE bit in the SFMAnSMCR register to 1 when the transfer of a command, optional command, address, or option data is started while the SPBSSL pin is being asserted in SPI operating mode.

Section 18 Multi Media Card Interface A (MMCA)

This section contains a generic description of Multi Media Card Interface A (MMCA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of MMCA.

18.1 Features of RH850/F1KH, RH850/F1KM MMCA

18.1.1 Number of Units

This microcontroller has the following number of MMCA units.

Table 18.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	—	—	1
Name	—	—	MMCAn (n = 0)

Table 18.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	—	—	—	—	—
Name	—	—	—	—	—

Table 18.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of units	—	—	—	—
Name	—	—	—	—

Table 18.4 Index

Index	Description
n	Throughout this section, the individual MMCA units are identified by the index “n”; for example, MMCAnCE_CMD_SET (n = 0) is the MMCAn command setting register.

18.1.2 Register Base Address

MMCAn base address is listed in the following table.

MMCAn register addresses are given as an offset from the base address.

Table 18.5 Register Base Address

Base Address Name	Base Address
<MMCA0_base>	FFED 9000_H

18.1.3 Clock Supply

The MMCAn clock supply is listed in the following table.

Table 18.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
MMCAn	MMCA module clock	CKSCLK_IPERI2	MMCA module clock
	Register access clock	CPUCLK_L, CKSCLK_IPERI2	Bus clock

18.1.4 Interrupt Requests

The MMCAn interrupts are listed in the following table.

Table 18.7 Interrupt Requests

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
MMCA0			
INTMMCA0	MMCA interrupt	354	—
DMAMMCA0	MMCA DMA request	—	127

18.1.5 Reset Sources

MMCAn reset sources are listed in the following table. MMCAn is initialized by these reset sources.

Table 18.8 Reset Sources

Unit Name	Reset Source
MMCAn	All reset sources (ISORES)

18.1.6 External Input/Output Signals

External input/output signals of MMCAn are listed below.

Table 18.9 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
MMCA0		
MMCA0CLK	MMCA Clock	MMCA0CLK
MMCA0CMD	MMCA Command / Response	MMCA0CMD
MMCA0DAT[7:0]	MMCA Data[7:0]	MMCA0DAT[7:0]

18.2 Overview

18.2.1 Features

- Compliant with JEDEC STANDARD JESD84-A441 (neither DDR mode nor 1.8-V operation is supported)
- Supports 1-/4-/8-bit MMC bus width
- Supports Backward-compatible mode.
  High-speed mode is not supported.
- MMC Clock frequency = MMCA module clock frequency/2^k (k = 1 to 10)
- Supports block transfer
  Stream transfer is not supported.
- Supports boot operation
  The alternative boot operation is not supported.
- MMC clock frequency settings are adjustable in boot mode.
- Supports high priority interrupt (HPI)
  HPIs in the sequence of CMD6, CMD24, CMD25 (pre-defined), and CMD38 are supported.
- Supports background operation
- Interrupt requests: normal operation and error/timeout.
- DMA transfer requests: buffer write and buffer read

18.2.2 Block Diagram

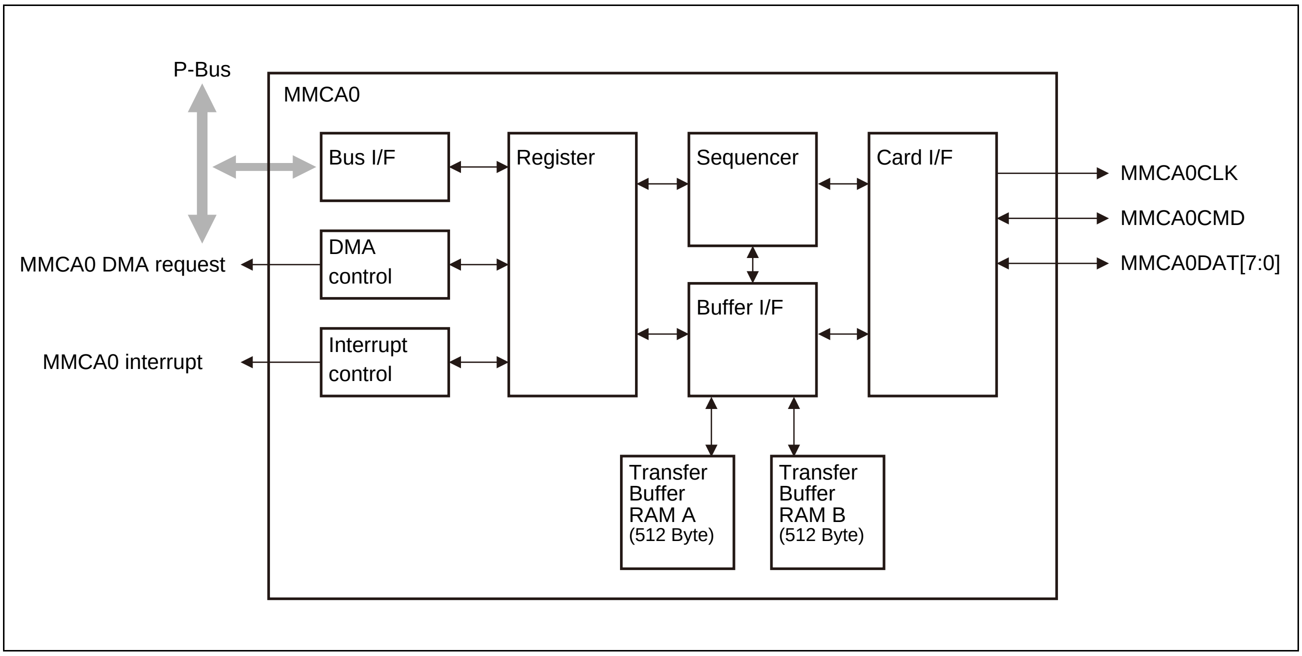

Figure 18.1 Block Diagram of MMCA

18.3 Registers

18.3.1 List of Registers

MMCA registers are listed in the following table.

For details on <MMCAn_base>, see **Section 18.1.2, Register Base Address**.

Table 18.10 List of Registers

Module Name	Register Name	Symbol	Address
MMCAn	MMCAn command setting register	MMCAnCE_CMD_SET	<MMCAn_base> + 00_H
	MMCAn argument register	MMCAnCE_ARG	<MMCAn_base> + 08_H
	MMCAn argument register for automatically-issued CMD12	MMCAnCE_ARG_CMD12	<MMCAn_base> + $0C_H$
	MMCAn command control register	MMCAnCE_CMD_CTRL	<MMCAn_base> + 10_H
	MMCAn transfer block setting register	MMCAnCE_BLOCK_SET	<MMCAn_base> + 14_H
	MMCAn clock control register	MMCAnCE_CLK_CTRL	<MMCAn_base> + 18_H
	MMCAn buffer access configuration register	MMCAnCE_BUF_ACC	<MMCAn_base> + $1C_H$
	MMCAn response register 3	MMCAnCE_RESP3	<MMCAn_base> + 20_H
	MMCAn response register 2	MMCAnCE_RESP2	<MMCAn_base> + 24_H
	MMCAn response register 1	MMCAnCE_RESP1	<MMCAn_base> + 28_H
	MMCAn response register 0	MMCAnCE_RESP0	<MMCAn_base> + $2C_H$
	MMCAn response register for automatically-issued CMD12	MMCAnCE_RESP_CMD12	<MMCAn_base> + 30_H
	MMCAn data register	MMCAnCE_DATA	<MMCAn_base> + 34_H
	MMCAn boot operation setting register	MMCAnCE_BOOT	<MMCAn_base> + $3C_H$
	MMCAn interrupt flag register	MMCAnCE_INT	<MMCAn_base> + 40_H
	MMCAn interrupt enable register	MMCAnCE_INT_EN	<MMCAn_base> + 44_H
	MMCAn status register 1	MMCAnCE_HOST_STS1	<MMCAn_base> + 48_H
	MMCAn status register 2	MMCAnCE_HOST_STS2	<MMCAn_base> + $4C_H$
	MMCAn software reset register	MMCAnCE_SWRESA	<MMCAn_base> + $7C_H$

18.3.2 MMCAnCE_CMD_SET — MMCAn Command Setting Register

MMCAnCE_CMD_SET sets a command sequence. For the setting values of MMCAnCE_CMD_SET, see **Section 18.4.4.13, Setting Values of MMCAnCE_CMD_SET**. The command sequence starts when the settings have been made in bits 31 to 16. Note that writing to MMCAnCE_CMD_SET is disabled while a command sequence is proceeding (the CMDSEQ bit in MMCAnCE_HOST_STS1 is 1).

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 00_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.11 MMCAnCE_CMD_SET Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30	BOOT	Boot Operation 0: Command sequence other than for boot operations 1: Command sequence for boot operations
29 to 24	CMD[5:0]	Command Index Set a command index ([45:40]).
23, 22	RTYP[1:0]	Response Type 00: No response 01: 6-byte response (R1, R1b, R3, R4, R5) 10: 17-byte response (R2) 11: Setting prohibited
21	RBSY	Response Busy Select Selects whether "busy" is involved in response reception. 0: No response busy 1: Response busy involved (R1b)
20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19	WDAT	Presence/Absence of Data 0: No data 1: With data
18	DWEN	Read/Write (valid when “with data” is selected) 0: Read from the card. 1: Write to the card.
17	CMLTE	Single/Multi Block Transfer Select (valid when “with data” is selected) 0: Single-block transfer 1: Multi-block transfer

Table 18.11 MMCAnCE_CMD_SET Register Contents

Bit Position	Bit Name	Function
16	CMD12EN	Automatic CMD12 Issuance (valid when multi-block transfer is selected)*[1] 0: Disables automatic CMD12 issuance. 1: Enables automatic CMD12 issuance. For details of automatic CMD12 issuance, see **Section 18.4.3.4, Automatic CMD12 Issuance.** **NOTE:** Set the transfer block size to 512 bytes. Set the RBSY bit to 0.
15, 14	RIDXC[1:0]	Response Index Check Specify the items to be checked in bits [45:40] of a 6-byte response or bits [133:128] of a 17-byte response. 00: Checks the response index (check whether matched with a command index). 01: Checks the check bits (check whether all the bits are set to 1). 10: No checking 11: Setting prohibited
13, 12	RCRC7C[1:0]	Response CRC7 Check Specify the items to be checked in bits [7:1] of a 6-byte response or of a 17-byte response. 00: Checks CRC7 (set the response type to 01). 01: Checks the check bits (check whether all the bits are set to 1) (set the response type to 01). 10: Checks internal CRC7 (R2 only) (set the response type to 10). 11: No checking
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	CRC16C	CRC16 Check in Reception (valid when "with data" and "read" are selected) 0: Checks CRC16 in reception. 1: Does not check CRC16 in reception (used when CMD14).
9	BOOTACK	Receive Boot Acknowledge (valid in boot mode) 0: Boot acknowledge is not received. 1: Boot acknowledge is received.
8	CRCSTE	CRC Status Reception (valid when "with data" and "write" are selected) 0: Receives CRC status. 1: Does not receive CRC status (used when CMD19).
7	TBIT	Transmission Bit Setting 0: Sets the transmission bit ([46]) to 1. 1: Sets the transmission bit ([46]) to 0.
6	OPDM	Open-Drain Output Mode 0: Normal output 1: Open-drain output This setting is only applied to the MMCAnCMD line.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SBIT	Read Data Start Bit Detection Setting (valid when "with data" and "read" are selected) 0: Detects a start bit when the valid MMCAnDAT signals specified by the DATW bits are all 0. 1: Detects a start bit when MMCAnDAT[0] is 0.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	DATW[1:0]	Data Bus Width Setting (valid when "with data" is selected) 00: 1 bit 01: 4 bits 10: 8 bits 11: Setting prohibited

Note 1. It is recommended to use the pre-defined multi-block transfer by setting this bit to 0 for a higher data transfer rate.

18.3.3 MMCAnCE_ARG — MMCAn Argument Register

MMCAnCE_ARG sets the argument for the command to be transmitted. Set this register before starting a command sequence.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARG[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ARG[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.12 MMCAnCE_ARG Register Contents

Bit Position	Bit Name	Function
31 to 0	ARG[31:0]	Set bits [39:8] of the command. **NOTE:** Set the argument of automatically-issued CMD12 by MMCAnCE_ARG_CMD12.

18.3.4 MMCAnCE_ARG_CMD12 — MMCAn Argument Register for Automatically-Issued CMD12

MMCAnCE_ARG_CMD12 is used to set the argument for the automatically-issued CMD12. This register is valid when issuing CMD12 automatically in multi-block transfer. For automatic issuance of CMD12, see **Section 18.4.3.4, Automatic CMD12 Issuance**. Set this register before starting a command sequence.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + $0C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	C12ARG[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 18.13 MMCAnCE_ARG_CMD12 Register Contents

Bit Position	Bit Name	Function
31 to 0	C12ARG[31:0]	Set bits [39:8] of the automatically-issued CMD12.

18.3.5 MMCAnCE_CMD_CTRL — MMCAn Command Control Register

MMCAnCE_CMD_CTRL is used to terminate a command sequence forcibly.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BREAK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 18.14 MMCAnCE_CMD_CTRL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BREAK	Forcible Termination of Command Sequence Writing 1 to this bit while it is 0 and then writing 0 to it discontinues the current command sequence. After this bit is set as described above, check if the value of the CMDSEQ bit in MMCAnCE_HOST_STS1 has become 0. If this is the case, execute software reset. **NOTE:** A software reset initializes the value of this register, so the setting in this register needs to be remade.

18.3.6 MMCAnCE_BLOCK_SET — MMCAn Transfer Block Setting Register

MMCAnCE_BLOCK_SET specifies the size of the block and the number of blocks for the data to be transferred. Set this register before starting a command sequence.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 14_H

Value after reset: $0000\ 0200_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BLKCNT[15:0]

Table 18.15 MMCAnCE_BLOCK_SET Register Contents

Bit Position	Bit Name	Function
31 to 16	BLKCNT[15:0]	Number of Blocks for Transfer **NOTE:** This setting is valid for multi-block transfer.
15 to 0	BLKSIZ[15:0]	Transfer Block Size **NOTE:** Transfer block size should be set as follows. Single-block transfer: 1 to 512 bytes Multi-block transfer: 512 bytes

18.3.7 MMCAnCE_CLK_CTRL — MMCAn Clock Control Register

MMCAnCE_CLK_CTRL controls the MMC clock and sets timeout values. Do not change the setting of this register while a command sequence is in progress.

Access:	This register can be read or written in 32-bit units.
Address:	<MMCAn_base> + 18_H
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.16 MMCAnCE_CLK_CTRL Register Contents

Bit Position	Bit Name	Function
31	MMCBUSBSY	MMC Clock Output control / Division setting prohibition 0: MMC bus is NOT busy (During the command sequence + 10 cycle) 1: MMC bus is busy (During the command sequence + 10 cycle) When a command sequence is started with MMCAnCE_CMD_SET register setting, MMCBUSBSY bit is set to 1 at the same time as CMDSEQ bit is set to 1. After CMDSEQ bit is set to 0 at the command sequence end, MMCBUSBSY bit becomes 0 after 10 cycle of MMC Clock. **NOTE:** When MMC bus is busy, do not set CLKEN bit and the CLKDIV bit of the MMCAnCE_CLK_CTRL register.
30 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	CLKEN	MMC Clock Output Control 0: Does not output the MMC clock (fixed to low level). 1: Outputs the MMC clock.
23 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 16	CLKDIV[3:0]	MMC Clock Frequency Setting 0000: MMCA module clock/2^{1} 0001: MMCA module clock/2^{2} : 0111: MMCA module clock/2^{8} 1000: MMCA module clock/2^{9} 1001: MMCA module clock/2^{10} 1010 to 1111: Setting prohibited For details of MMC clock frequency settings in boot operations, see **Section 18.4.3.5, MMC Clock Frequency in Boot Operations** and **Section 18.3.12, MMCAnCE_BOOT — MMCAn Boot Operation Setting Register**.
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13, 12	SRSPTO[1:0]	Response Timeout Setting 00: 64 MMC clock cycles 01: 128 MMC clock cycles 10: 256 MMC clock cycles 11: Setting prohibited

Table 18.16 MMCAnCE_CLK_CTRL Register Contents

Bit Position	Bit Name	Function
11 to 8	SRBSYTO[3:0]	Response Busy Timeout Setting 0000: 2^{14} × MMC clock cycles 0001: 2^{15} × MMC clock cycles : 1110: 2^{28} × MMC clock cycles 1111: 2^{29} × MMC clock cycles
7 to 4	SRWDTO[3:0]	Write Data/Read Data Timeout Setting 0000: 2^{14} × MMC clock cycles 0001: 2^{15} × MMC clock cycles : 1110: 2^{28} × MMC clock cycles 1111: 2^{29} × MMC clock cycles
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

18.3.8 MMCAnCE_BUF_ACC — MMCAn Buffer Access Configuration Register

MMCAnCE_BUF_ACC configures the method of accessing data registers and mode of DMA transfer. Do not set this register again during a command sequence. For explanation of the buffers, see **Section 18.4.3.3, Buffer Structure and Buffer Access**.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 1C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.17 MMCAnCE_BUF_ACC Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	DMATYP	DMA Transfer setting When DMAWEN or DMAREN is set to 1, set to 1
25	DMAWEN	Buffer Write DMA Transfer Request Enable 0: Disables DMA transfer request for buffer writing. 1: Enables DMA transfer request for buffer writing.
24	DMAREN	Buffer Read DMA Transfer Request Enable 0: Disables DMA transfer request for buffer reading. 1: Enables DMA transfer request for buffer reading.
23 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	ATYP	Buffer access selection 0: When not swapped byte-wise. 1: When swapped byte-wise. **NOTE:** For buffer access, see **Section 18.4.3.3, Buffer Structure and Buffer Access**.
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

18.3.9 MMCAnCE_RESP3 to MMCAnCE_RESP0 — MMCAn Response Registers 3 to 0

MMCAnCE_RESP3 to MMCAnCE_RESP0 are the registers in which the response that has been received is stored. For the formats of response values, see **Section 18.4.3.1, Command/Response Formats**.

Access:	These registers can be read only in 32-bit units.
Address:	MMCAnCE_RESP3: <MMCAn_base> + 20$_H$ MMCAnCE_RESP2: <MMCAn_base> + 24$_H$ MMCAnCE_RESP1: <MMCAn_base> + 28$_H$ MMCAnCE_RESP0: <MMCAn_base> + 2C$_H$
Value after reset:	0000 0000$_H$

Table 18.20 MMCAnCE_RESP1 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP[63:32]	Bits [63:32] of a 17-byte response are stored.

MMCAnCE_RESP0

Table 18.21 MMCAnCE_RESP0 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP[31:0]	Bits [39:8] of a 6-byte response or bits [31:0] of a 17-byte response are stored. **NOTE:** The response to an automatically issued CMD12 is stored in the MMCAnCE_RESP_CMD12 register.

18.3.10 MMCAnCE_RESP_CMD12 — MMCAn Response Register for Automatically-Issued CMD12

MMCAnCE_RESP_CMD12 is a register in which the response to the automatically-issued CMD12 is stored.

Access: This register can be read only in 32-bit units.

Address: <MMCAn_base> + 30_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.22 MMCAnCE_RESP_CMD12 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP12[31:0]	Bits [39:8] of the response to automatically-issued CMD12 are stored.

18.3.11 MMCAnCE_DATA — MMCAn Data Register

MMCAnCE_DATA is used to access the buffers of this module. For the write/read data formats, see **Section 18.4.3.2, Data Block Format**.

Access:	This register can be read or written in 32-bit units.
Address:	<MMCAn_base> + 34_H
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 0	DATA[31:0]	Buffer write/read data [31:0]

18.3.12 MMCAnCE_BOOT — MMCAn Boot Operation Setting Register

MMCAnCE_BOOT controls the MMC clock and sets timeout values in boot mode. Do not set this register again during a command sequence.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + $3C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.24 MMCAnCE_BOOT Register Contents

Bit Position	Bit Name	Function
31 to 28	BTCLKDIV[3:0]	MMC Clock Frequency Setting in Boot Mode 0000: MMCA module clock/2^{1} 0001: MMCA module clock/2^{2} 0010: MMCA module clock/2^{3} 0011: MMCA module clock/2^{4} 0100 to 1111: Settings prohibited Set these bits to a value lower than that in the CLKDIV bits of MMCAnCE_CLK_CTRL. For MMC clock frequency in boot mode, see **Section 18.4.3.5, MMC Clock Frequency in Boot Operations**.
27 to 24	SBTACKTO[3:0]	Boot Acknowledge Timeout Setting 0000: 2^{14} × MMC clock cycles 0001: 2^{15} × MMC clock cycles : 1110: 2^{28} × MMC clock cycles 1111: 2^{29} × MMC clock cycles
23 to 20	S1STBTDATTO [3:0]	1st Boot Data Timeout Setting 0000: 2^{14} × MMC clock cycles 0001: 2^{15} × MMC clock cycles : 1110: 2^{28} × MMC clock cycles 1111: 2^{29} × MMC clock cycles
19 to 16	SBTDATTO[3:0]	Interval Between Boot Data Timeout Setting 0000: 2^{14} × MMC clock cycles 0001: 2^{15} × MMC clock cycles : 1110: 2^{28} × MMC clock cycles 1111: 2^{29} × MMC clock cycles
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

18.3.13 MMCAnCE_INT — MMCAn Interrupt Flag Register

MMCAnCE_INT indicates various statuses during execution of a command sequence. Each bit is set when its setting condition has been met. To clear flag(s), write 0 only to the bit(s) to be cleared and write 1 to the other bits. For the handling of this module in the case of an error or timeout, see **Section 18.4.3.8, Handling of this Module in the Case of Error/Timeout**.

Access:	This register can be read or written in 32-bit units.
Address:	<MMCAn_base> + 40$_{H}$
Value after reset:	0000 0000$_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	CMD12 DRE	CMD12 RBE	CMD12 CRE	DTRAN E	BUF RE	BUF WEN	BUF REN	—	—	RBSYE	CRSPE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R	R	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMD VIO	BUF VIO	—	—	WDAT ERR	RDAT ERR	RIDX ERR	RSP ERR	—	—	—	CRCS TO	WDAT TO	RDAT TO	RBSY TO	RSP TO
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Note 1. Writing 0 initializes the bit. Writing 1 is ignored.

Table 18.25 MMCAnCE_INT Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write 1.
26	CMD12DRE	Automatic CMD12 Issuance & Buffer Read Complete [Setting condition] Response busy for automatically-issued CMD12 and buffer reading have been completed. [Clearing condition] Writing a 0 to this bit. **NOTE:** When CMD12DRE has been set, CMD12RBE, CMD12CRE, and BUFRE have also been set. So, these bits should be cleared as well.
25	CMD12RBE	Automatic CMD12 Issuance Response Busy Complete [Setting condition] Reception of the response and response busy for an automatically-issued CMD12 have been completed. [Clearing condition] Writing a 0 to this bit. **NOTE:** When CMD12RBE has been set, CMD12CRE has also been set. So, this bit should be cleared as well. When CMD12RBE is set during a multi-block write, DTRANE is also set. So clear the bit as well.
24	CMD12CRE	Automatic CMD12 Response Complete [Setting condition] The response to an automatically-issued CMD12 has been received. [Clearing condition] Writing a 0 to this bit.

Table 18.25 MMCAnCE_INT Register Contents

Bit Position	Bit Name	Function
23	DTRANE	Data Transmission Complete [Setting conditions] Transmission of all blocks of data has been completed. – When configured to receive CRC status: Completion of busy (data busy) after reception of CRC status – When configured not to receive CRC status: Completion of data transmission [Clearing condition] Writing a 0 to this bit.
22	BUFRE	Buffer Read Complete [Setting conditions] – Other than in boot operations All blocks of data have been received and the data have been read from the buffer. – In boot operations All blocks of data have been received and the data have been read from the buffer, MMCAnCMD has been modified from 0 to 1, and 48 MMC clock cycles have elapsed. [Clearing condition] Writing a 0 to this bit
21	BUFWEN	Buffer Write Ready [Setting conditions] The buffer has become empty and ready for writing. [Clearing condition] Writing a 0 to this bit. **NOTE:** When writing data to MMCAnCE_DATA by the CPU, this bit should be cleared first and the data corresponding to the block size set in MMCAnCE_BLOCK_SET should be written. Note that this bit is not set when DMA transfer request for buffer writing is enabled.
20	BUFREN	Buffer Read Ready [Setting conditions] Transfer block size of data have been stored in the buffer and it has become ready for reading. [Clearing condition] Writing a 0 to this bit. **NOTE:** When reading data from MMCAnCE_DATA by the CPU, this bit should be cleared first and the data corresponding to the block size set in MMCAnCE_BLOCK_SET should be read. Note that this bit is not set when DMA transfer request for buffer reading is enabled.
19, 18	Reserved	When read, the value after reset is returned. When writing, write 1.
17	RBSYE	Response Busy Complete [Setting condition] Reception of a response and response busy have been completed. [Clearing condition] Writing a 0 to this bit. **NOTE:** When RBSYE has been set, CRSPE has also been set. So, this bit should be cleared as well. Completion of reception of the response and response busy for automatically-issued CMD12 is reflected in CMD12RBE.

Table 18.25 MMCAnCE_INT Register Contents

Bit Position	Bit Name	Function
16	CRSPE	Command/Response Complete [Setting conditions] – Other than in boot operations When configured not to receive response: A command has been transmitted. When configured to receive 6- or 17-byte response: A response has been received. – In boot operations When reception of boot acknowledge has been selected: The boot acknowledge pattern has been received. [Clearing condition] Writing a 0 to this bit. **NOTE:** Completion of reception of the response to automatically-issued CMD12 is reflected in CMD12CRE.
15	CMDVIO	Command Issuance Error [Setting conditions] Illegal setting has been made in MMCAnCE_CMD_SET or MMCAnCE_BLOCK_SET. – During execution of a command sequence: Writing to CMD[5:0] in MMCAnCE_CMD_SET. (The command sequence is not stopped automatically.) – At the start of command sequence: ● Writing to CMD[5:0] in MMCAnCE_CMD_SET when the registers have been set for one of the following combinations of selection. ● No response + response busy ● No response + with data + not during boot operations ● No data + automatic CMD12 issuance ● With data + single-block transfer + automatic CMD12 issuance ● With data + response busy + automatic CMD12 issuance ● With data + transfer block size = 0 ● With data + transfer block size ≥ 513 ● With data + multi-block transfer + number of blocks for transfer = 0 ● Boot operations + no data ● Boot operations + write ● Boot operations + response busy ● Boot operations + automatic CMD12 issuance ● Boot acknowledge reception + not during boot operations [Clearing condition] Writing a 0 to this bit.
14	BUFVIO	Buffer Access Error [Setting conditions] Illegal buffer access has been attempted. – MMCAnCE_ DATA has been accessed exceeding the block size set in BLKSIZ[15:0] in MMCAnCE_BLOCK_SET. – While data is being read from the card: MMCAnCE_DATA has been accessed with BUFREN not set (when DMA is used, with no DMA transfer request asserted for buffer reading). – While data is being written to the card: MMCAnCE_DATA has been accessed with BUFWEN not set (when DMA is used, with no DMA transfer request asserted for buffer writing). [Clearing condition] Writing a 0 to this bit. **NOTE:** When BUFVIO has been set, the command sequence is not stopped automatically. If an error occurs, this bit will be set.
13, 12	Reserved	When read, the value after reset is returned. When writing, write 1.

Table 18.25 MMCAnCE_INT Register Contents

Bit Position	Bit Name	Function
11	WDATERR	Write Data Error [Setting conditions] Error is found in the data that has been written. – Error is in the status of the CRC status. – Error is in the end bits of the CRC status. [Clearing condition] Writing a 0 to this bit. **NOTE:** When WDATERR has been set, the command sequence is stopped automatically.
10	RDATERR	Read Data Error [Setting conditions] Error is found in the read data. – Error is in CRC16 of the read data. – Error is in the end bits of the read data. [Clearing condition] Writing a 0 to this bit. **NOTE:** When RDATERR has been set, the command sequence is stopped automatically.
9	RIDXERR	Response Index Error [Setting conditions] Error has been found in the index value of the response. – When an error has been found in bits [45:40] of a 6-byte response (including automatically-issued CMD12) or bits [133:128] of a 17-byte response. (The items to be checked are set by RIDXC in MMCAnCE_CMD_SET.) [Clearing condition] Writing a 0 to this bit. **NOTE:** When RIDXERR has been set, the command sequence is stopped automatically.
8	RSPERR	Response Error [Setting conditions] Error has been found in the response values of the response. – Transmission bit in the response is 1. – Error is in the end bits of the response. – When an error has been found in bits [7:1] of a 6-byte response (including automatically-issued CMD12) or a 17-byte response. (The items to be checked are set by RCRC7C in MMCAnCE_CMD_SET.) – Error in the boot acknowledge pattern – Error in the end bits of the boot acknowledge [Clearing condition] Writing a 0 to this bit. **NOTE:** When RSPERR has been set, the command sequence is stopped automatically.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write 1.
4	CRCSTO	CRC Status Timeout [Setting condition] CRC status could not be received. [Clearing condition] Writing a 0 to this bit. **NOTE:** The command sequence is not stopped even if CRCSTO is set.
3	WDATTO	Write Data Timeout [Setting condition] The busy status remains unchanged after the period set by SRWDTO in MMCAnCE_CLK_CTRL after the CRC status was received. [Clearing condition] Writing a 0 to this bit. **NOTE:** The command sequence is not stopped even if WDATTO is set.

Table 18.25 MMCAnCE_INT Register Contents

Bit Position	Bit Name	Function
2	RDATTO	Read Data Timeout [Setting conditions] – Other than in boot operations ● Read data could not be received within the period set by SRWDTO in MMCAnCE_CLK_CTRL after the read command was transmitted. ● Read data could not be received within the period set by SRWDTO in MMCAnCE_CLK_CTRL after the read data was received. – In boot operations ● The first read data could not be received within the period set by S1STBTDATTO in MMCAnCE_BOOT. ● Read data could not be received within the period set by SBTDATTO in MMCAnCE_BOOT after the read data was received. [Clearing condition] Writing a 0 to this bit. **NOTE:** The command sequence is not stopped even if RDATTO is set.
1	RBSYTO	Response Busy Timeout [Setting condition] The busy status remains unchanged after the period set by SRBSYTO in MMCAnCE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. [Clearing condition] Writing a 0 to this bit. **NOTE:** The command sequence is not stopped even if RBSYTO is set.
0	RSPTO	Response Timeout [Setting conditions] – Other than in boot operations Response could not be received within the period set by SRSPTO in MMCAnCE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. – In boot operations When reception of boot acknowledge has been selected: The boot acknowledge could not be received within the period set by SBTACKTO in MMCAnCE_BOOT. [Clearing condition] Writing a 0 to this bit. **NOTE:** The command sequence is not stopped even if RSPTO is set.

18.3.14 MMCAnCE_INT_EN — MMCAn Interrupt Enable Register

MMCAnCE_INT_EN controls output of the MMCAnCE_INT-related interrupt signals. For details on interrupt requests, see **Section 18.4.1, Interrupt Requests**.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 44_H

Value after reset: $0000\ 0000_H$

3	MWDATTO	WDATTO Interrupt Enable 0: Disables interrupt output by the WDATTO flag. 1: Enables interrupt output by the WDATTO flag.
2	MRDATTO	RDATTO Interrupt Enable 0: Disables interrupt output by the RDATTO flag. 1: Enables interrupt output by the RDATTO flag.
1	MRBSYTO	RBSYTO Interrupt Enable 0: Disables interrupt output by the RBSYTO flag. 1: Enables interrupt output by the RBSYTO flag.
0	MRSPTO	RSPTO Interrupt Enable 0: Disables interrupt output by the RSPTO flag. 1: Enables interrupt output by the RSPTO flag.

18.3.15 MMCAnCE_HOST_STS1 — MMCAn Status Register 1

MMCAnCE_HOST_STS1 indicates the number of blocks that have been transferred, the states of the MMCAnCMD line and MMCAnDAT lines, the index of the response that has been received, and whether a command sequence is in progress.

Access: This register can be read only in 32-bit units.

Address: <MMCAn_base> + 48_H

Value after reset: X0XX 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.27 MMCAnCE_HOST_STS1 Register Contents

Bit Position	Bit Name	Function
31	CMDSEQ	Command Sequence in Progress 0: Command sequence is in the initial state. 1: Command sequence is being executed.
30	CMDSIG	MMCAnCMD State Indicates the state on the MMCAnCMD line.
29 to 24	RSPIDX[5:0]	Response Index Indicate bits [45:40] of a 6-byte response or bits [133:128] of a 17-byte response.
23 to 16	DATSIG[7:0]	MMCAnDAT[7:0] State Indicate the state on the MMCAnDAT[7:0] lines. Note: When a communication error or a timeout error occurs, MMCAnDAT[0] may remain 0.
15 to 0	RCVBLK[15:0]	Number of Transferred Blocks Indicate the number of blocks that have been transferred. When the DWEN bit in MMCAnCE_CMD_SET is 0: Number of blocks read from the card When the DWEN bit in MMCAnCE_CMD_SET is 1: Number of blocks written to the card

18.3.16 MMCAnCE_HOST_STS2 — MMCAn Status Register 2

MMCAnCE_HOST_STS2 indicates timeout and error statuses.

Access: This register can be read only in 32-bit units.

Address: <MMCAn_base> + $4C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.28 MMCAnCE_HOST_STS2 Register Contents

Bit Position	Bit Name	Function
31	CRCSTE	CRC Status Error This bit is set to 1 when an error is found in the CRC status value.
30	CRC16E	Read Data CRC16 Error This bit is set to 1 when an error is found in CRC16 in the read data.
29	AC12CRCE	Automatic CMD12 Response CRC7 Error This bit is set to 1 when an error is found in bits [7:1] of the response to the automatically-issued CMD12. **NOTE:** The items to be checked are set by RCRC7C in MMCAnCE_CMD_SET.
28	RSPCRC7E	Command Response CRC7 Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in bits [7:1] of a 6-byte response or a 17-byte response. **NOTE:** The items to be checked are set by RCRC7C in MMCAnCE_CMD_SET.
27	CRCSTEBE	CRC Status End Bit Error This bit is set to 1 when an error is found in the end bits in CRC status.
26	RDATEBE	Read Data End Bit Error This bit is set to 1 when an error is found in the end bits in the read data.
25	AC12REBE	Automatic CMD12 Response End Bit Error This bit is set to 1 when an error is found in the end bits of the response to the automatically-issued CMD12.
24	RSPEBE	Command Response End Bit Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in the end bits of the response.
23	AC12IDXE	Automatic CMD12 Response Index Error This bit is set to 1 when an error is found in bits [45:40] of the response to the automatically-issued CMD12. **NOTE:** The items to be checked are set by RIDXC in MMCAnCE_CMD_SET.
22	RSPIDXE	Command Response Index Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in bits [45:40] of a 6-byte response or bits [133:128] of a 17-byte response. **NOTE:** The items to be checked are set by RIDXC in MMCAnCE_CMD_SET.

Table 18.28 MMCAnCE_HOST_STS2 Register Contents

Bit Position	Bit Name	Function
21	BTACKPATE	Boot Acknowledge Pattern Error This bit is set to 1 when an error is found in the boot acknowledge pattern.
20	BTACKEBE	Boot Acknowledge End Bit Error This bit is set to 1 when an error is found in the end bits of the boot acknowledge.
19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18 to 16	CRCST[2:0]	CRC Status/Boot Acknowledge Pattern Indication This bit indicates the value for CRC status that was received or the pattern value from the boot-acknowledge.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	STRDATTO	Read Data Timeout (valid other than in boot operations) This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in MMCAnCE_CLK_CTRL after a read command was transmitted. This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in MMCAnCE_CLK_CTRL after a read data was received.
13	DATBSYTO	Data Busy Timeout This bit is set to 1 if busy status remains unchanged after the period set by the SRWDTO bits in MMCAnCE_CLK_CTRL after the CRC status was received.
12	CRCSTTO	CRC Status Timeout This bit is set to 1 if CRC status could not be received.
11	AC12BSYTO	Automatic CMD12 Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in MMCAnCE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
10	RSPBSYTO	Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in MMCAnCE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
9	AC12RSPTO	Automatic CMD12 Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in MMCAnCE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
8	STRSPTO	Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in MMCAnCE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
7	BTACKTO	Boot Acknowledge Timeout In boot operations, this bit is set to 1 if boot acknowledge is not received within the period set by the SBTACKTO bits in MMCAnCE_BOOT.
6	1STBTDATTO	1st Boot Data Timeout In boot operations, this bit is set to 1 if the 1st read data is not received within the period set by the S1STBTDATTO bits in MMCAnCE_BOOT.
5	BTDATTO	Interval between Boot Data Timeout In boot operations, this bit is set to 1 if read data is not received within the period set by the SBTDATTO bits in MMCAnCE_BOOT after a read data was received.
4 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

18.3.17 MMCAnCE_SWRESA — MMCAn Software Reset Register

MMCAnCE_SWRESA controls software reset of this module.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + $7C_H$

Value after reset: $0000\ 0004_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SWRST	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.29 MMCAnCE_SWRESA Register Contents

Bit Position	Bit Name	Function
31	SWRST	Software Reset 0: Software reset cleared (normal operation). 1: Executes software reset. When this bit is set to 1, the values of all registers are initialized. (SWRST is not initialized.)
30 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

18.4 Operations

18.4.1 Interrupt Requests

The table below shows the specification of the interrupt requests. This module generates two types of interrupt requests: normal operation and error/timeout. When a bit in the flag register is set to 1 and also the corresponding bit in the interrupt enable register is set to 1 (enabled), an interrupt request is asserted.

Table 18.30 Specification of Interrupt Requests

Flag Register	Bit	Enable Register	Bit	Interrupt Request
MMCAnCE_INT	CMD12DRE	MMCAnCE_INT_EN	MCMD12DRE	Normal operation interrupt
	CMD12RBE		MCMD12RBE	
	CMD12CRE		MCMD12CRE	
	DTRANE		MDTRANE	
	BUFRE		MBUFRE	
	BUFWEN		MBUFWEN	
	BUFREN		MBUFREN	
	RBSYE		MRBSYE	
	CRSPE		MCRSPE	
	CMDVIO		MCMDVIO	Error/timeout interrupt
	BUFVIO		MBUFVIO	
	WDATERR		MWDATERR	
	RDATERR		MRDATERR	
	RIDXERR		MRIDXERR	
	RSPERR		MRSPERR	
	CRCSTO		MCRCSTO	
	WDATTO		MWDATTO	
	RDATTO		MRDATTO	
	RBSYTO		MRBSYTO	
	RSPTO		MRSPTO	

18.4.2 DMA Specifications

This module has two types of DMA transfer requests: for buffer reading and for buffer writing.

The method of DMA transfer is configured by MMCAnCE_BUF_ACC.

18.4.2.1 DMA for Buffer Writing

The DMA transfer request is asserted for buffer writing when the buffer has become empty while the DMAWEN bit in MMCAnCE_BUF_ACC is set to 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in MMCAnCE_BLOCK_SET) × BLKCNT (the number of blocks for transfer set in MMCAnCE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFWEN bit in MMCAnCE_INT will not be asserted during DMA transfer.

If an error has occurred during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

18.4.2.2 DMA for Buffer Reading

The DMA transfer request is asserted for buffer reading when the buffer stores data of the block size specified in MMCAnCE_BLOCK_SET while the DMAREN bit in MMCAnCE_BUF_ACC is set to 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in MMCAnCE_BLOCK_SET) × BLKCNT (the number of blocks for transfer set in MMCAnCE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFREN bit in MMCAnCE_INT will not be asserted during DMA transfer.

If an error has occurred during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

18.4.3 Operations

18.4.3.1 Command/Response Formats

The figure below shows the format of the command to be transferred. The command index that is set in the CMD[5:0] bits in MMCAnCE_CMD_SET and the argument set in the ARG[31:0] bits in MMCAnCE_ARG are reflected in the command.

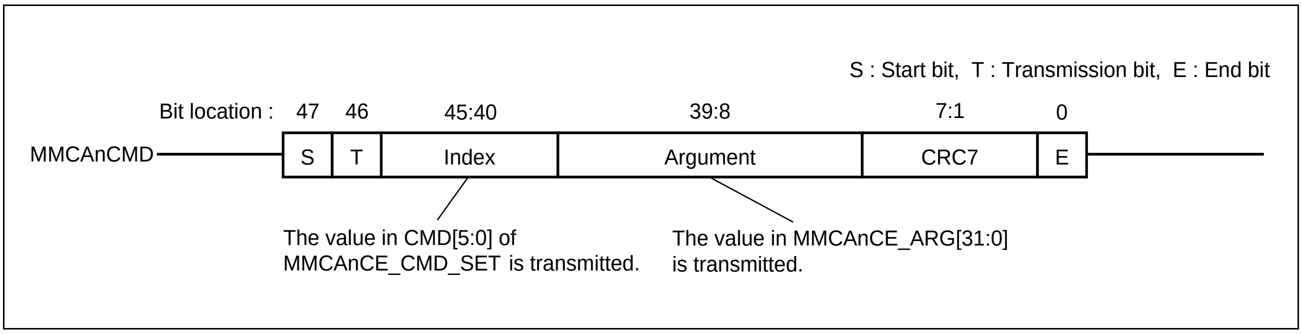

Figure 18.2 Command Format

Figure 18.3, Format of 6-Byte Response and **Figure 18.4, Format of 17-Byte Response (R2)** show the formats when a 6-byte response and 17-byte response (R2) are received, respectively. The received response is stored in MMCAnCE_RESP0 or MMCAnCE_RESP3 to MMCAnCE_RESP0. The items to be checked are set by the RIDXC bits and the RCRC7C bits in MMCAnCE_CMD_SET.

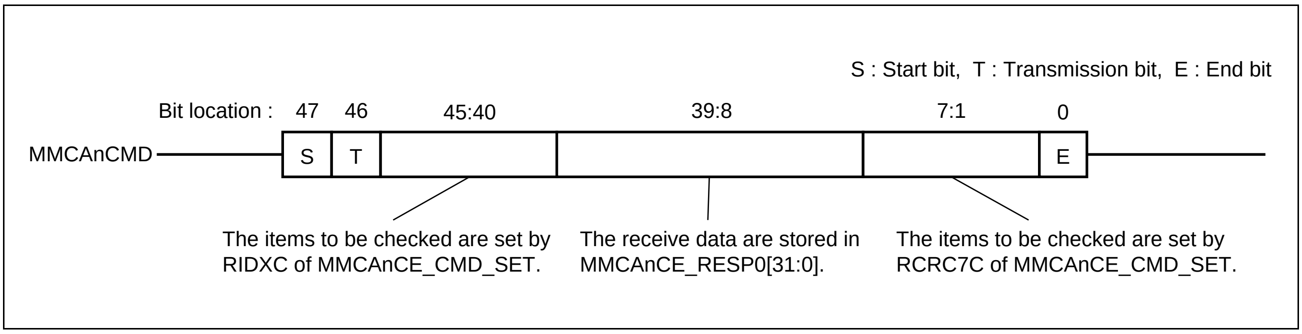

Figure 18.3 Format of 6-Byte Response

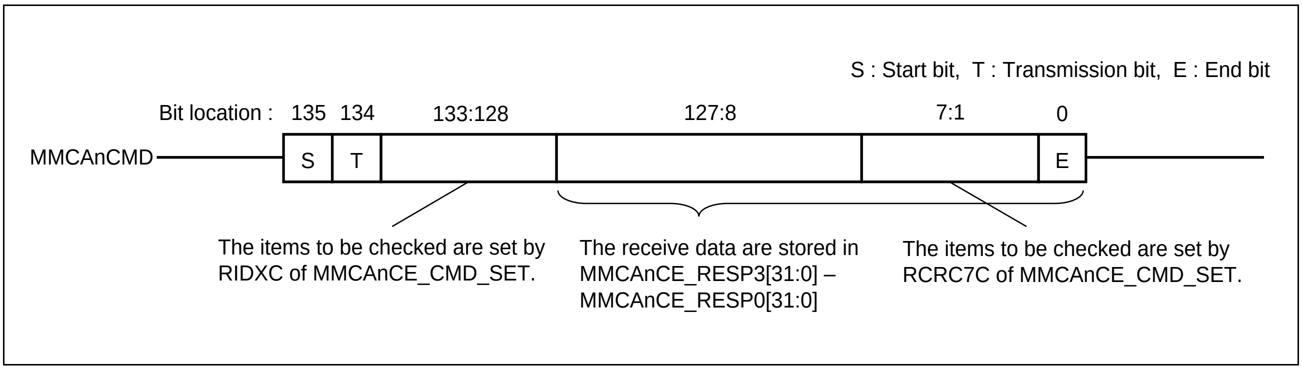

Figure 18.4 Format of 17-Byte Response (R2)

18.4.3.2 Data Block Format

The figure below shows the format of data blocks. For D0 to D3 in the figure, see **Section 18.4.3.3, Buffer Structure and Buffer Access**. When data are written to the card, the data stored in the buffer are transmitted. When data are read from the card, the received data are stored in the buffer.

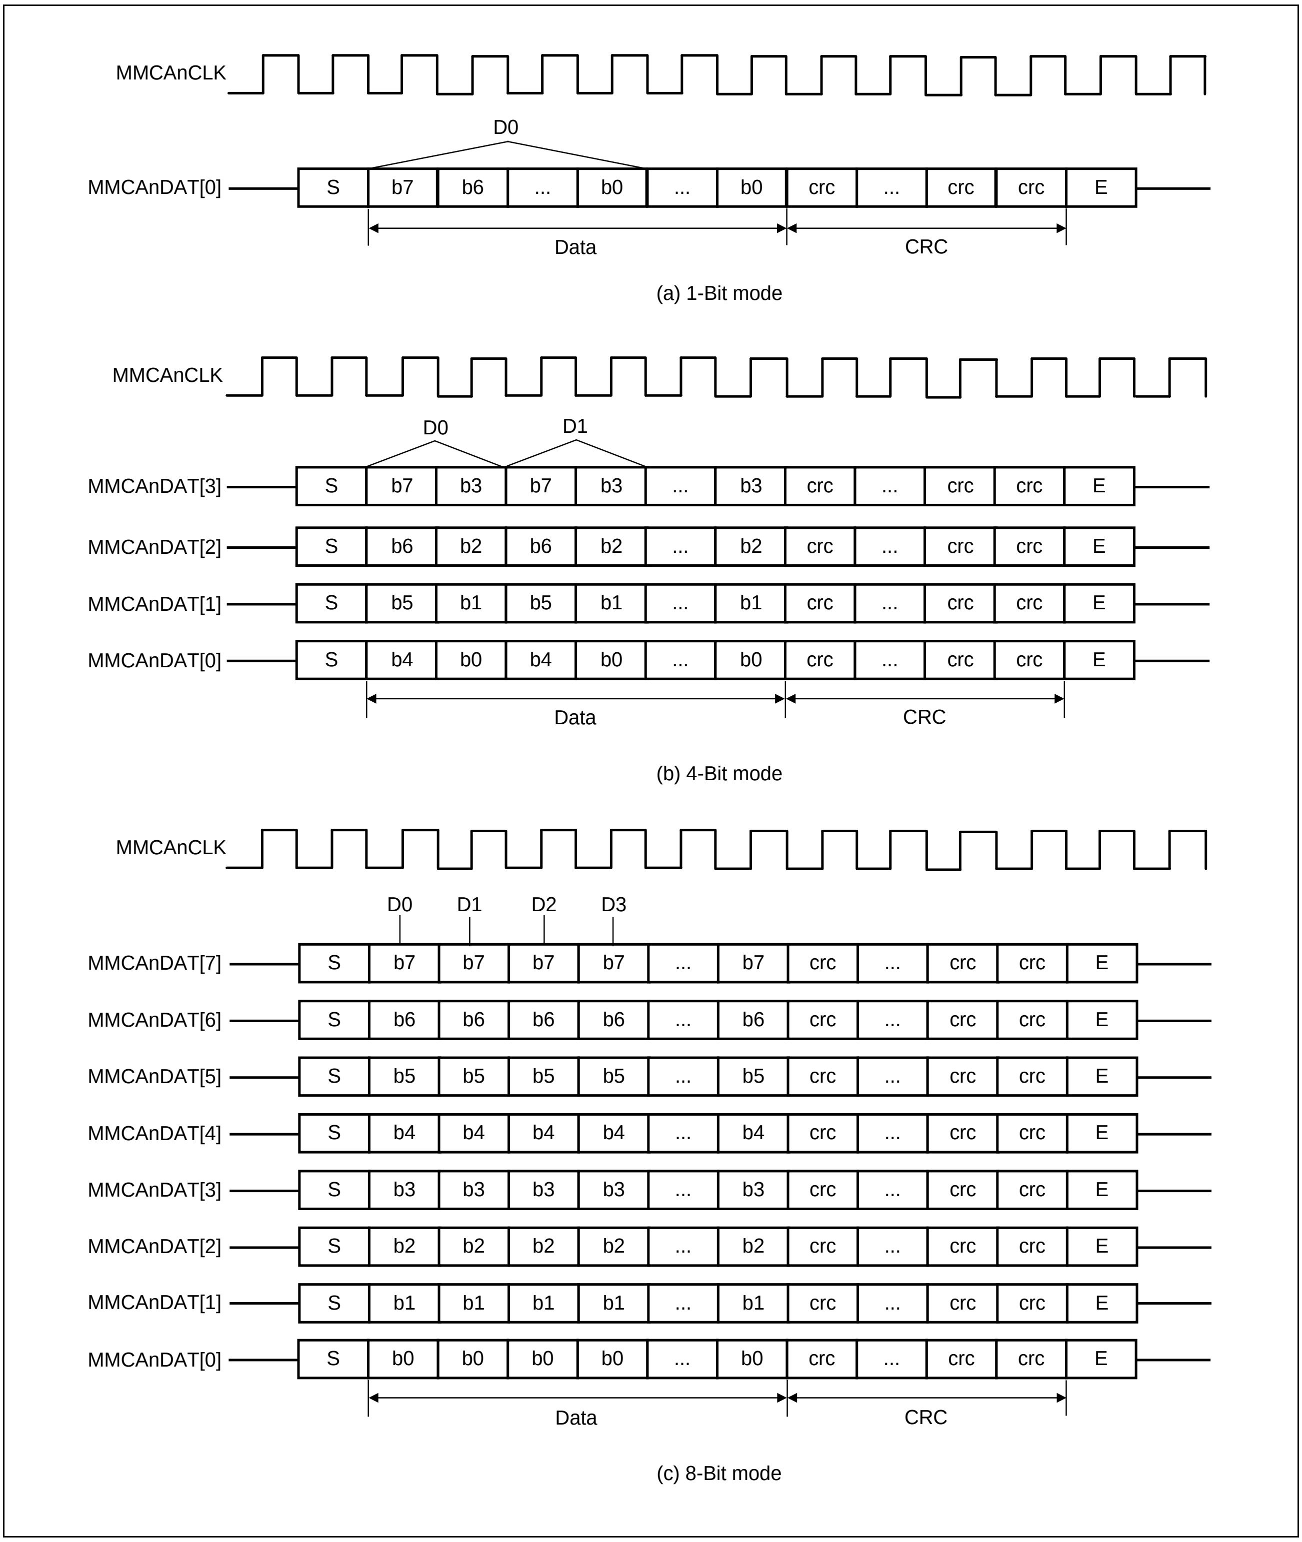

Figure 18.5 Data Block Format

18.4.3.3 Buffer Structure and Buffer Access

As shown in **Figure 18.6, Double Buffer Structure**, this module has two 512-byte RAM units for double buffering. If a block of data (512 bytes) stored in one buffer is transmitted during multi-block writing, the next block of data can be transmitted as soon as the other buffer is full. If a block of received data (512 bytes) is stored in one buffer during multi-block reading, the next block of received data can be stored in the other buffer once it is empty.

If neither buffer is empty during multi-block reading, the MMC clock is stopped, which in turn temporarily stops reception. Once either of the buffers becomes empty, supply of the MMC clock signal is re-started and data reception is resumed.

The buffers are accessed by MMCAnCE_DATA. If the transfer block size is set to 4 × n + 1 or 4 × n + 3, access should be made for 4 × (n + 1) bytes in 32-bit access. (n = 0, 1, 2, …, 127).

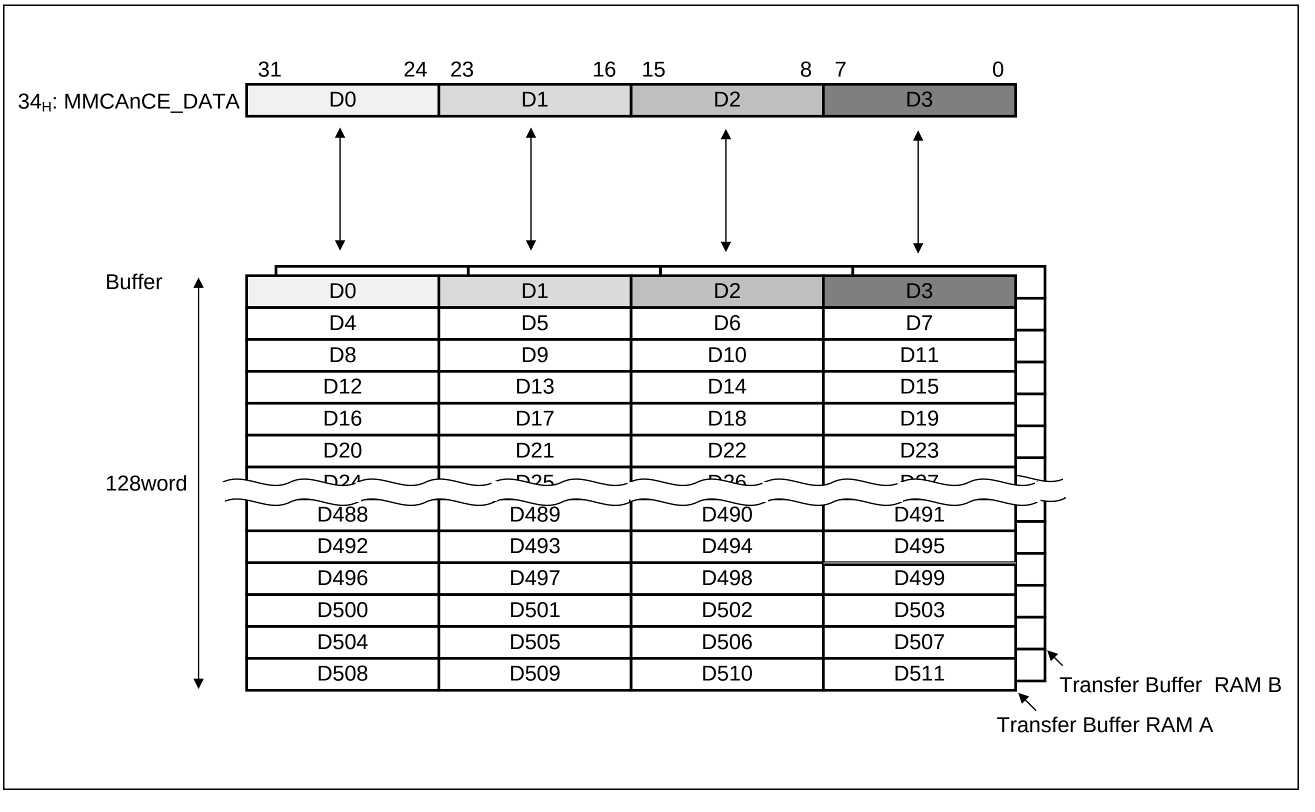

Figure 18.6 Double Buffer Structure

This module has the buffer access select function that allows byte-wise swapping of data when the buffer is accessed by writing to or reading from MMCAnCE_DATA. This function is enabled by the setting of MMCAnCE_BUFF_ACC. The figure below shows the specification of 32-bit accesses.

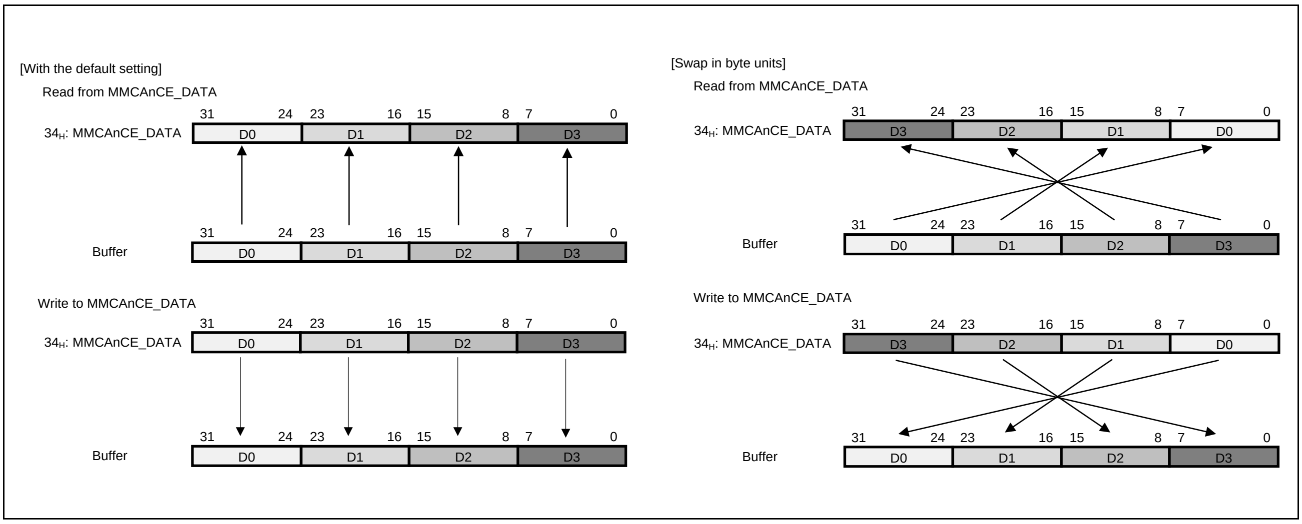

Figure 18.7 Specification of Byte-Swapping

18.4.3.4 Automatic CMD12 Issuance

This module has the function that automatically issues CMD12 when multi-block transfer is performed with the CMD12EN bit in MMCAnCE_CMD_SET set to 1.

The figure below shows the timing of automatic CMD12 issuance in multi-block read. CMD12 is issued such that the end bit of the command is sent two bits before the end bit of the data during reception of the last block.

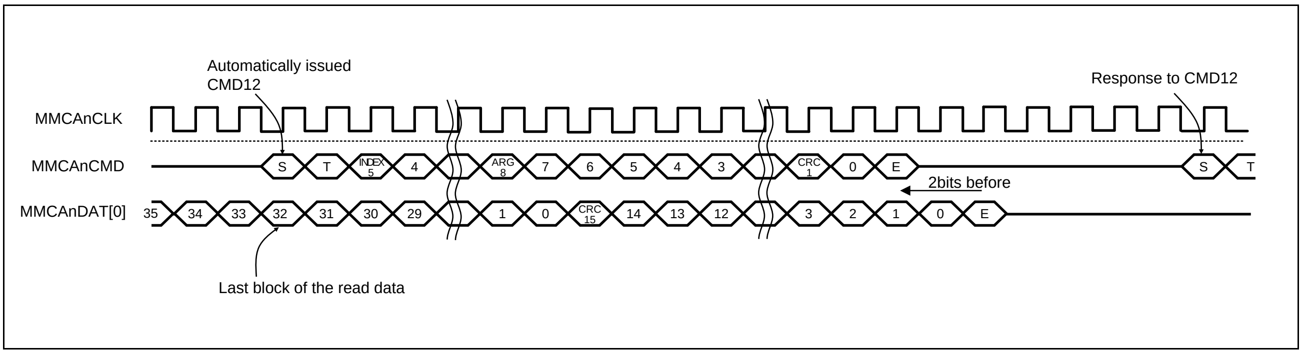

Figure 18.8 Timing of Automatically-Issued CMD12 in Multi-Block Read (1-Bit Mode)

The figure below shows the timing of automatic CMD12 issuance in multi-block write. CMD12 is issued after the data busy after transmission of the last block has ended.

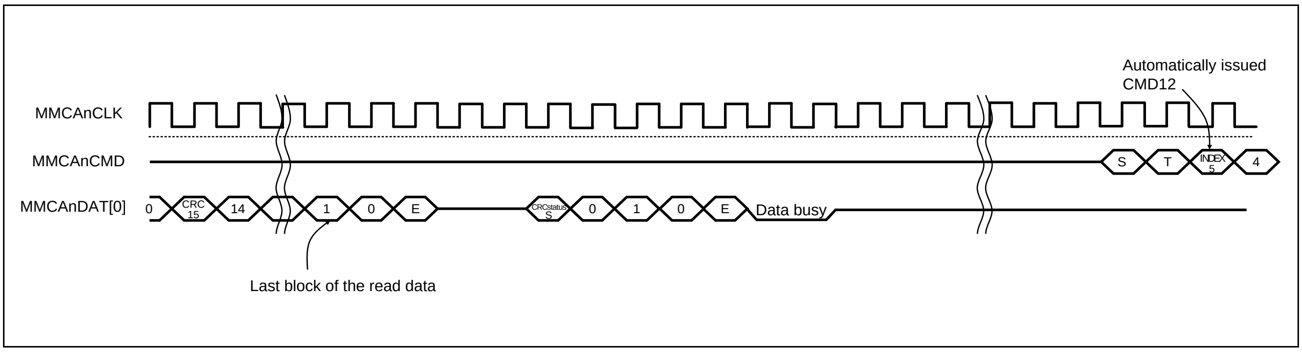

Figure 18.9 Timing of Automatically-Issued CMD12 in Multi-Block Write (1-Bit Mode)

The argument for the automatically-issued CMD12 is set in MMCAnCE_ARG_CMD12. Bits [39:8] of the response to the CMD12 is stored in MMCAnCE_RESP_CMD12. "Busy" is involved in response reception.

18.4.3.5 MMC Clock Frequency in Boot Operations

The figure below shows the timing for changing the MMC clock frequency in boot operations. In boot operations, the MMC clock frequency can be switched to the value corresponding to the setting of the BTCLKDIV bits of MMCAnCE_BOOT 74 MMC clock cycles after MMCAnCMD is modified from 1 to 0. Alternatively, it can be switched to the value corresponding to the setting of the CLKDIV bits of MMCAnCE_CLK_CTRL 48 MMC clock cycles after MMCAnCMD is modified from 0 to 1.

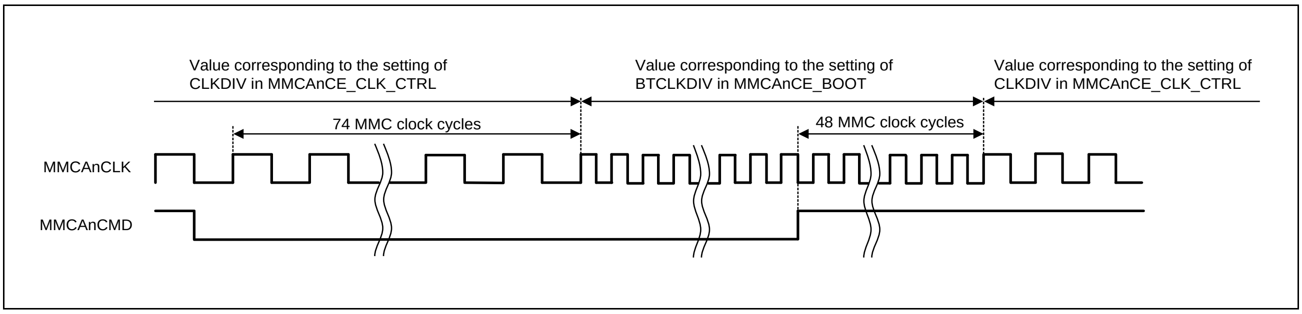

Figure 18.10 MMC Clock Frequency in Boot Operations

18.4.3.6 High Priority Interrupt (HPI)

The HPI should be processed according to the following procedure. See **Section 18.3, Registers**, and **Section 18.4.4, Examples of Setting**.

(a) To execute the HPI during a write to the device

- Terminate the command sequence forcibly.
- Wait until the CMDSEQ bit in MMCAnCE_HOST_STS1 becomes 1.
- Issue CMD12 (R1) to cause a device state transition from rcv to prg. If the device is already in the prg state here, the device does not output a response.
- Issue CMD13 (R1).
- Issue the HPI command.*[1]

(b) To execute the HPI in the response busy state not during a write to the device

- Terminate the command sequence forcibly.
- Wait until the CMDSEQ bit in MMCAnCE_HOST_STS1 turns 0.
- Issue CMD13 (R1).
- Issue the HPI command.*[1]

HPIs in the sequence of CMD6, CMD24, CMD25 (pre-defined), and CMD38 are supported.

Note 1. CMD12 (R1b) or CMD13 (R1b) differs depending on the e-MMC connected.

18.4.3.7 Background Operation

The background operation should be processed according to the following procedure. See **Section 18.3, Registers** and **Section 18.4.4, Examples of Setting**.

To execute background operation, issue CMD6 (R1) to write to the BKOPS_START byte in the EXT_CSD register of the device.

To confirm that background operation has been completed, issue CMD6 (R1) and then CMD13 (R1) to check the device state, or poll the MMCAnDAT[0]. If the device state is trans after issuing CMD13 (R1) or MMCAnDAT[0] is high, background operation has been completed.

To suspend background operation, use the HPI (see **Section 18.4.3.6, High Priority Interrupt (HPI)**).

18.4.3.8 Handling of this Module in the Case of Error/Timeout

This module may not be stopped when an error has occurred. If an error has occurred and the CMDSEQ bit in MMCAnCE_HOST_STS1 is still indicating that the command sequence is in progress, terminate the sequence forcibly and execute software reset. Note that the data for transmission or received data that had been stored in the buffers at the time of error occurrence are not guaranteed.

This module is not stopped when a timeout has occurred. Before issuing the next command after the timeout has occurred, terminate the sequence forcibly and execute software reset.

18.4.4 Examples of Setting

This section shows the procedures for executing typical command sequences.

18.4.4.1 Legends

The figure below shows the legends for the symbols used in the figures in the following subsections.

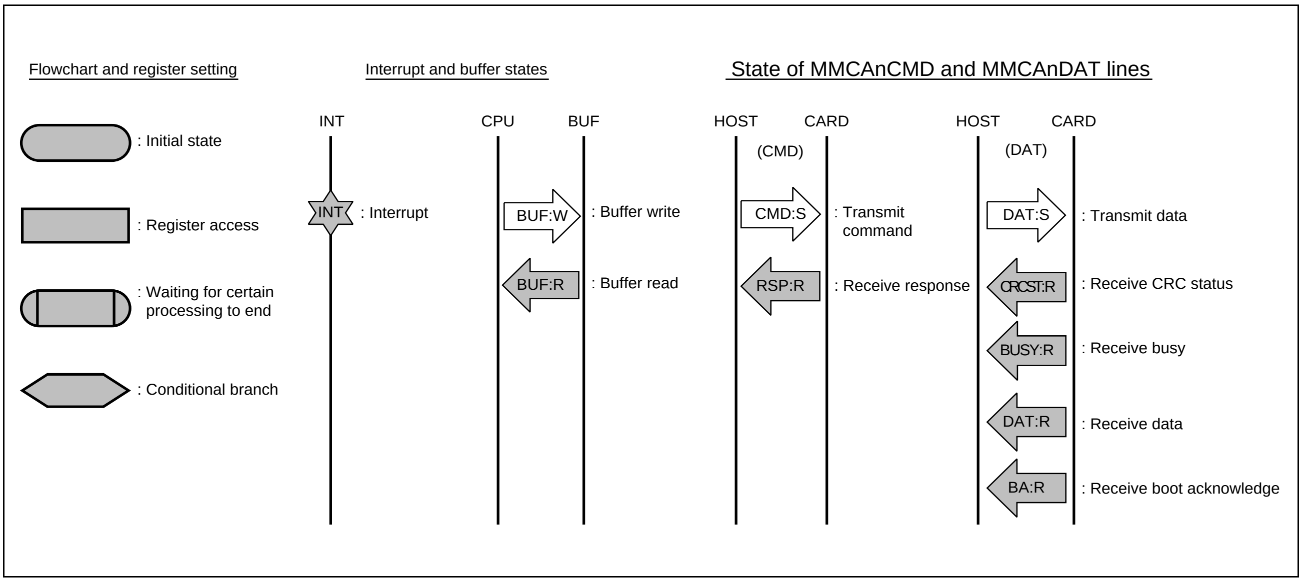

Figure 18.11 Legends for Symbols Used in Figures

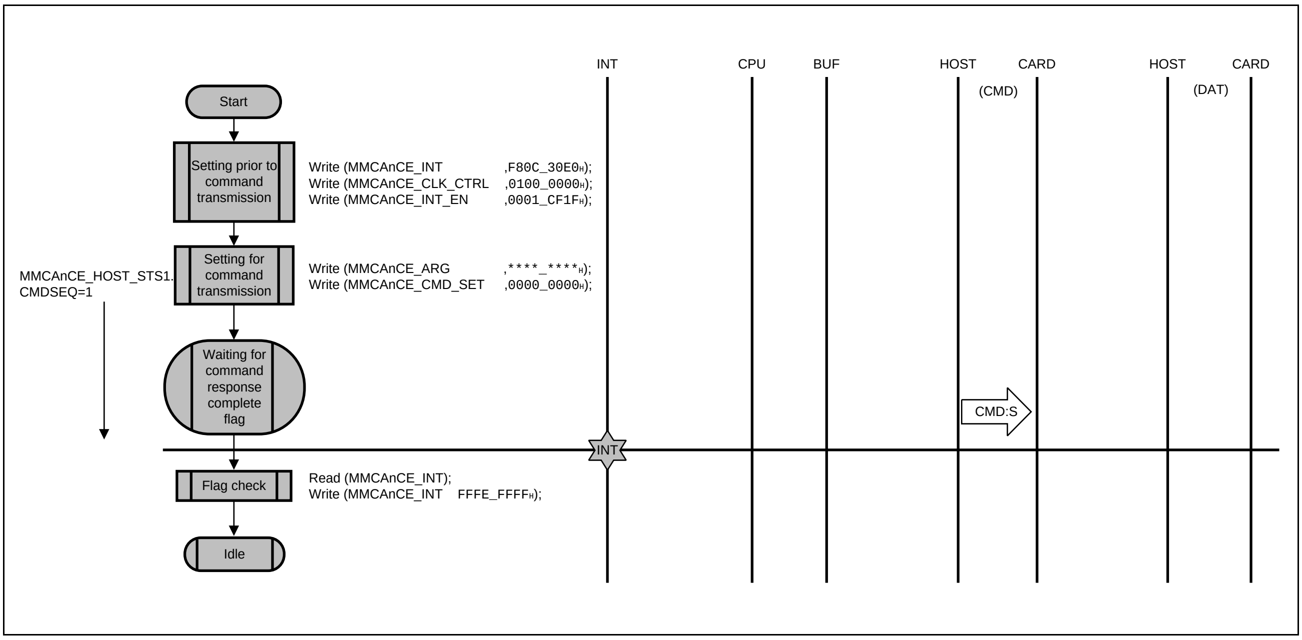
18.4.4.2 Command Transmission



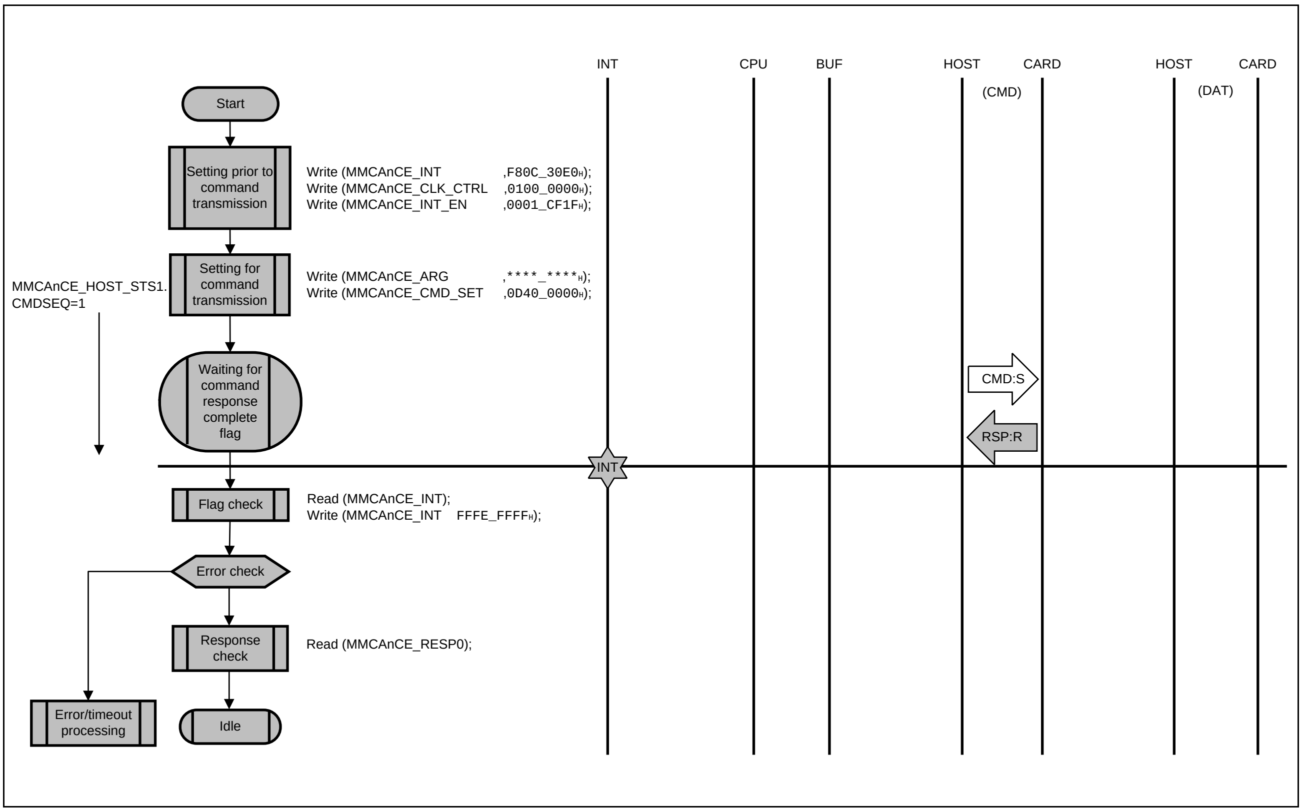
```
Write (MMCAnCE_INT          ,F80C_30E0H);
Write (MMCAnCE_CLK_CTRL     ,0100_0000H);
Write (MMCAnCE_INT_EN       ,0001_CF1FH);

Write (MMCAnCE_ARG          ,****_****H);
Write (MMCAnCE_CMD_SET      ,0000_0000H);

Read (MMCAnCE_INT);
Write (MMCAnCE_INT    FFFE_FFFFH);
```

Figure 18.12 Command Transmission (CMD0)

18.4.4.3 Command Transmission → Response Reception



```
Write (MMCAnCE_INT          ,F80C_30E0H);
Write (MMCAnCE_CLK_CTRL     ,0100_0000H);
Write (MMCAnCE_INT_EN       ,0001_CF1FH);
```

```
Write (MMCAnCE_ARG          ,****_****H);
Write (MMCAnCE_CMD_SET      ,0D40_0000H);
```

```
Read (MMCAnCE_INT);
Write (MMCAnCE_INT    FFFE_FFFFH);
```

```
Read (MMCAnCE_RESP0);
```

18.5 Detection and Correction of Errors in MMCA RAM

For details of this ECC function, see **Section 40A.2.6, ECC for Peripheral RAM**.

Section 19 Clocked Serial Interface G (CSIG)

This section contains a generic description of the Clocked Serial Interface G (CSIG).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of CSIG.

19.1 Features of RH850/F1KH, RH850/F1KM CSIG

19.1.1 Number of Units

This microcontroller has the following number of CSIG units.

Each CSIG unit has single channel interface.

Table 19.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	5	5	5
Name	CSIGn (n = 0 to 4)	CSIGn (n = 0 to 4)	CSIGn (n = 0 to 4)

Table 19.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	2	4	4	4
Name	CSIGn (n = 0)	CSIGn (n = 0, 1)	CSIGn (n = 0 to 3)	CSIGn (n = 0 to 3)	CSIGn (n = 0 to 3)

Table 19.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	CSIGn (n = 0)	CSIGn (n = 0)	CSIGn (n = 0)	CSIGn (n = 0)

Table 19.4 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual CSIG units are identified by the index “n”: for example, CSIGnCTL0 (n = 0 to 4) is the CSIGn control register 0.

Table 19.5 Index (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual CSIG units are identified by the index “n”: for example, CSIGnCTL0 (n = 0 to 3) is the CSIGn control register 0.

Table 19.6 Index (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual CSIG units are identified by the index “n”: for example, CSIGnCTL0 (n = 0) is the CSIGn control register 0.

19.1.2 Register Base Addresses

CSIG base addresses are listed in the following table.

CSIG register addresses are given as offsets from the base addresses.

Table 19.7 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<CSIG0_base>	FFD8 8000$_H$
<CSIG1_base>	FFD8 A000$_H$
<CSIG2_base>	FFD8 C000$_H$
<CSIG3_base>	FFD8 E000$_H$
<CSIG4_base>	FFD9 2000$_H$

Table 19.8 Register Base Addresses (RH850/F1KM-S4)

Base Address Name	Base Address
<CSIG0_base>	FFD8 8000$_H$
<CSIG1_base>	FFD8 A000$_H$
<CSIG2_base>	FFD8 C000$_H$
<CSIG3_base>	FFD8 E000$_H$

Table 19.9 Register Base Address (RH850/F1KM-S1)

Base Address Name	Base Address
<CSIG0_base>	FFD8 8000$_H$

19.1.3 Clock Supply

The CSIG clock supply is shown in the following table.

Table 19.10 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
CSIGn	PCLK	CKSCLK_ICSI	Communication clock
	Register access clock	CPUCLK_L, CKSCLK_ICSI	Bus clock

19.1.4 Interrupt Requests

CSIG interrupt requests are listed in the following table.

Table 19.11 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
CSIG0			
INTCSIGTIC	Communication status interrupt	27,118	8
INTCSIGTIR	Receive status interrupt	28,119	9
INTCSIGTIRE	Communication error interrupt	57	—
CSIG1			
INTCSIGTIC	Communication status interrupt	223	66
INTCSIGTIR	Receive status interrupt	224	67
INTCSIGTIRE	Communication error interrupt	225	—
CSIG2			
INTCSIGTIC	Communication status interrupt	326	78
INTCSIGTIR	Receive status interrupt	327	79
INTCSIGTIRE	Communication error interrupt	328	—
CSIG3

INTCSIGTIR	Receive status interrupt	330	126
INTCSIGTIRE	Communication error interrupt	331	—
CSIG4			
INTCSIGTIC	Communication status interrupt	98	39
INTCSIGTIR	Receive status interrupt	99	40
INTCSIGTIRE	Communication error interrupt	100	—

Table 19.12 Interrupt Requests (RH850/F1KM-S4)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
CSIG0			
INTCSIGTIC	Communication status interrupt	27,118	8
INTCSIGTIR	Receive status interrupt	28,119	9
INTCSIGTIRE	Communication error interrupt	57	—
CSIG1			
INTCSIGTIC	Communication status interrupt	223	66
INTCSIGTIR	Receive status interrupt	224	67
INTCSIGTIRE	Communication error interrupt	225	—
CSIG2			
INTCSIGTIC	Communication status interrupt	326	78
INTCSIGTIR	Receive status interrupt	327	79
INTCSIGTIRE	Communication error interrupt	328	—
CSIG3			
INTCSIGTIC	Communication status interrupt	329	125
INTCSIGTIR	Receive status interrupt	330	126
INTCSIGTIRE	Communication error interrupt	331	—

Table 19.13 Interrupt Requests (RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
CSIG0			
INTCSIGTIC	Communication status interrupt	27,118	8
INTCSIGTIR	Receive status interrupt	28,119	9
INTCSIGTIRE	Communication error interrupt	57	—

19.1.5 Reset Sources

CSIG reset sources are listed in the following table. CSIG is initialized by these reset sources.

Table 19.14 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
CSIGn	All reset sources (ISORES)

19.1.6 External Input/Output Signals

External input/output signals of CSIG are listed below.

Table 19.15 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
CSIG0		
CSIGTSCK	Serial clock signal	CSIG0SC[*1]
CSIGTSI	Serial data input signal	CSIG0SI
CSIGTSO	Serial data output signal	CSIG0SO[*1]
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG0SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG0RYI
CSIGTRYO	Ready / busy output signal	CSIG0RYO
CSIG1		
CSIGTSCK	Serial clock signal	CSIG1SC[*1]
CSIGTSI	Serial data input signal	CSIG1SI
CSIGTSO	Serial data output signal	CSIG1SO[*1]
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG1SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG1RYI
CSIGTRYO	Ready / busy output signal	CSIG1RYO
CSIG2		
CSIGTSCK	Serial clock signal	CSIG2SC[*1]
CSIGTSI	Serial data input signal	CSIG2SI
CSIGTSO	Serial data output signal	CSIG2SO[*1]
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG2SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG2RYI
CSIGTRYO	Ready / busy output signal	CSIG2RYO
CSIG3		
CSIGTSCK	Serial clock signal	CSIG3SC[*1]
CSIGTSI	Serial data input signal	CSIG3SI
CSIGTSO	Serial data output signal	CSIG3SO[*1]
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG3SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG3RYI
CSIGTRYO	Ready / busy output signal	CSIG3RYO
CSIG4		
CSIGTSCK	Serial clock signal	CSIG4SC[*1]
CSIGTSI	Serial data input signal	CSIG4SI
CSIGTSO	Serial data output signal	CSIG4SO[*1]
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG4SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG4RYI
CSIGTRYO	Ready / busy output signal	CSIG4RYO

Note 1. For the port pins that are used as CSIGnSO and CSIGnSC, set the output driver strength to high (PDSCn_m = 1).

Table 19.16 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
CSIG0		
CSIGTSCK	Serial clock signal	CSIG0SC*[1]
CSIGTSI	Serial data input signal	CSIG0SI
CSIGTSO	Serial data output signal	CSIG0SO*[1]
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG0SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG0RYI
CSIGTRYO	Ready / busy output signal	CSIG0RYO
CSIG1		
CSIGTSCK	Serial clock signal	CSIG1SC*[1]
CSIGTSI	Serial data input signal	CSIG1SI
CSIGTSO	Serial data output signal	CSIG1SO*[1]
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG1SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG1RYI
CSIGTRYO	Ready / busy output signal	CSIG1RYO
CSIG2		
CSIGTSCK	Serial clock signal	CSIG2SC*[1]
CSIGTSI	Serial data input signal	CSIG2SI
CSIGTSO	Serial data output signal	CSIG2SO*[1]
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG2SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG2RYI
CSIGTRYO	Ready / busy output signal	CSIG2RYO
CSIG3		
CSIGTSCK	Serial clock signal	CSIG3SC*[1]
CSIGTSI	Serial data input signal	CSIG3SI
CSIGTSO	Serial data output signal	CSIG3SO*[1]
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG3SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG3RYI
CSIGTRYO	Ready / busy output signal	CSIG3RYO

Note 1. For the port pins that are used as CSIGnSO and CSIGnSC, set the output driver strength to high (PDSCn_m = 1).

Table 19.17 External Input/Output Signals (RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
CSIG0		
CSIGTSCK	Serial clock signal	CSIG0SC*[1]
CSIGTSI	Serial data input signal	CSIG0SI
CSIGTSO	Serial data output signal	CSIG0SO*[1]
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG0SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG0RYI
CSIGTRYO	Ready / busy output signal	CSIG0RYO

Note 1. For the port pins that are used as CSIGnSO and CSIGnSC, set the output driver strength to high (PDSCn_m = 1).

19.1.7 Data Consistency Check

The port and the alternative function for data consistency check of CSIGnSO (CSIGTSO) output are shown in the following table. See **Section 19.5.10, Error Detection** for details on data consistency checking.

Table 19.18 Port Pins for Data Consistency Checking (RH850/F1KH-D8)

Unit Signal Name	Port Pin Name	Alternative Function

19.2 Overview

19.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode or slave mode is selectable.
- Slave select input signal ($\overline{\text{CSIGTSSI}}$) is available.
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, whereas it is determined by the input clock in slave mode.
- Maximum transfer clock frequency:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6)
- Clock phases and data phases are selectable.
- Data transfer with MSB first or LSB first is selectable.
- Transfer data length is selectable from 7 to 16 bits in 1-bit units
- Built-in EDL (extended data length) function for transferring more than 16 bits of data.
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Built-in handshake function
- Built-in error detection (data consistency check, parity, overrun)
- Three different interrupt request signals (INTCSIGTIC, INTCSIGTIR, INTCSIGTIRE)
- Built-in LBM (Loop Back Mode) function for self-test

19.2.2 Functional Overview Description

The CSIG uses three signals for communication:

- Transmission clock CSIGTSCK (output in master mode, input in slave mode)
- Serial data output signal CSIGTSO
- Serial data input signal CSIGTSI

The CSIGnCTL2 register is used to select whether the CSIG should be operated in master mode or slave mode.

Additional signals can be used for external control and monitoring:

- $\overline{\text{CSIGTSSI}}$: Slave select input signal
- CSIGTRYO: Ready/busy output signal (handshake signal)
- CSIGTRYI: Ready/busy input signal (handshake signal)

Data transmission is bit-wise and serial and synchronous to the transmission clock.

The following table shows the most important registers for setting up CSIG.

Table 19.21 Main Registers of CSIG

Register	Function
CSIGnCTL0	Provides and stops operating clock and enables/disables data transmission and data reception.
CSIGnCTL1	Controls options such as interrupt timing, extended data length, data consistency check, loop-back mode, handshake, etc.
CSIGnCTL2	Selects master or slave mode, and the transfer clock frequency of the built-in baud rate generator (BRG) in master mode.
CSIGnCFG0	Configures the communication protocol.

19.2.3 Block Diagram

The following block diagram shows the main components of the CSIG.

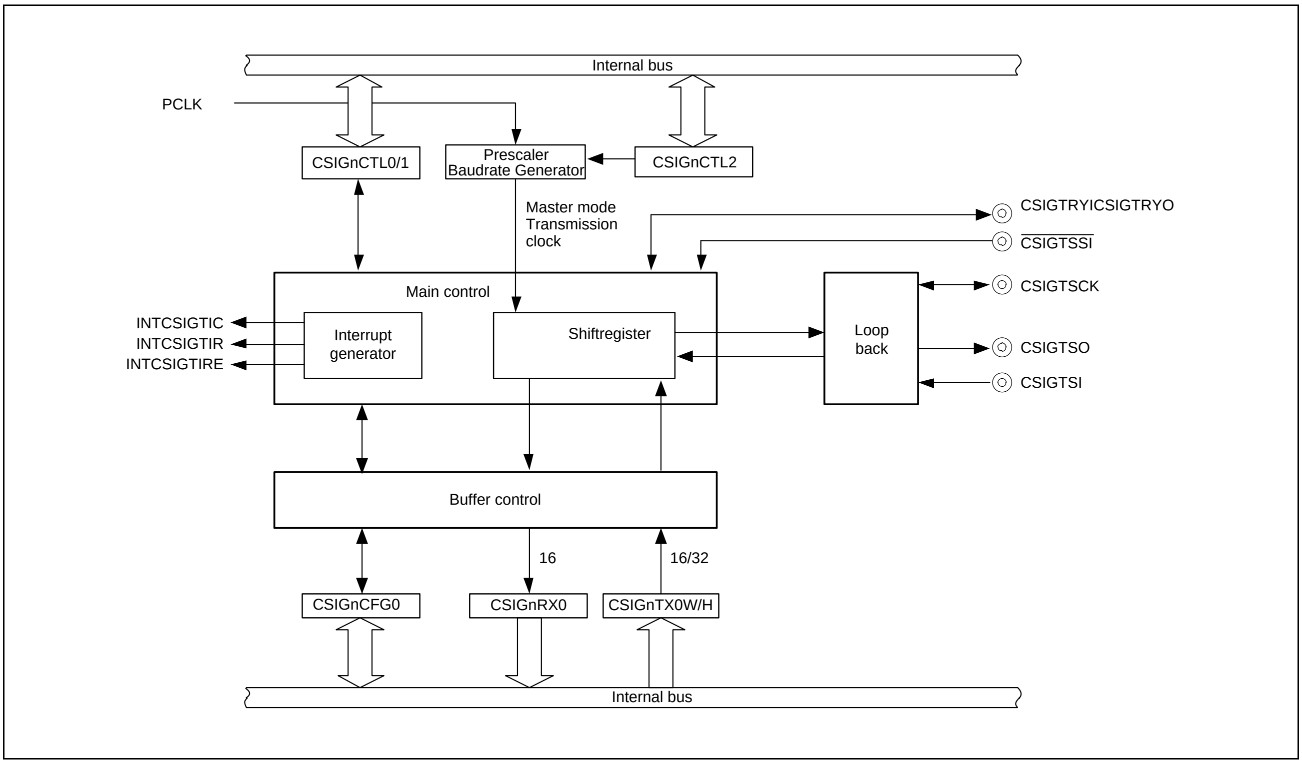

Figure 19.1 CSIG Block Diagram

In master mode, the transmission clock CSIGTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

19.3 Registers

19.3.1 List of Registers

CSIG registers are listed in the following table.

For details on <CSIGn_base>, see **Section 19.1.2, Register Base Addresses**.

Table 19.22 List of Registers

Module Name	Register Name	Symbol	Address
CSIGn	CSIGn control register 0	CSIGnCTL0	<CSIGn_base> + 0000_H
	CSIGn control register 1	CSIGnCTL1	<CSIGn_base> + 0010_H
	CSIGn control register 2	CSIGnCTL2	<CSIGn_base> + 0014_H
	CSIGn status register 0	CSIGnSTR0	<CSIGn_base> + 0004_H
	CSIGn status clear register 0	CSIGnSTCR0	<CSIGn_base> + 0008_H
	CSIGn Rx-only mode control register 0	CSIGnBCTL0	<CSIGn_base> + 1000_H
	CSIGn configuration register 0	CSIGnCFG0	<CSIGn_base> + 1010_H
	CSIGn transmission register 0 for word access	CSIGnTX0W	<CSIGn_base> + 1004_H
	CSIGn transmission register 0 for half word access	CSIGnTX0H	<CSIGn_base> + 1008_H
	CSIGn reception register 0	CSIGnRX0	<CSIGn_base> + $100C_H$
	CSIGn emulation register	CSIGnEMU	<CSIGn_base> + 0018_H

19.3.2 CSIGnCTL0 — CSIGn Control Register 0

This register controls the operation clock, and enables or disables transmission/reception.

Access: This register can be read or written in 8-bit units.

Address: <CSIGn_base> + 0000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CSIGnPWR	CSIGnTXE	CSIGnRXE	—	—	—	—	CSIGnMBS
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R/W

Table 19.23 CSIGnCTL0 Register Contents

Bit Position	Bit Name	Function
7	CSIGnPWR	Controls operation clock. 0: Stops operation clock. 1: Supplies operation clock. Clearing CSIGnPWR to 0 resets the internal circuits, stops operation, and sets the CSIG to standby state. Clock supply to internal circuits stops. If CSIGnPWR is cleared during communication, ongoing communication is aborted. In this case, communication setting must be started from the beginning.
6	CSIGnTXE	Enables/disables transmission. 0: Transmission disabled 1: Transmission enabled
5	CSIGnRXE	Enables/disables reception. 0: Reception disabled 1: Reception enabled
4 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CSIGnMBS	When setting CSIGnCTL0.CSIGnPWR = 1, be sure to set to this bit to 1. (The value after reset is “0”.)

CAUTION

When configuring this register, see **Table 19.36, List of Cautions when Configuring the Registers**.

19.3.3 CSIGnCTL1 — CSIGn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, handshake function, and slave select function.

Access: This register can be read or written in 32-bit units.

Address: <CSIGn_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CSIGn CKR	CSIGn SLIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CSIGn EDLE	—	CSIGn DCS	—	CSIGn LBM	CSIGn SIT	CSIGn HSE	CSIGn SSE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 19.24 CSIGnCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17	CSIGnCKR	CSIGTSCK clock inversion function 0: Default level of CSIGTSCK is high. 1: Default level of CSIGTSCK is low. The CSIGnCKR bit is used in combination with the CSIGnCFG0.CSIGnDAP bit. For details, see **Section 19.3.8, CSIGnCFG0 — CSIGn Configuration Register 0**.
16	CSIGnSLIT	Selects the timing of interrupt INTCSIGTIC. 0: Normal interrupt timing (interrupt is generated after the transfer) 1: Interrupt generation when CSIGnTX0W/H is empty and available for storing the next data. For details, see **Section 19.4.2, INTCSIGTIC (Communication Status Interrupt)**.
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	CSIGnEDLE	Enables/disables extended data length (EDL) mode. 0: Extended data length mode disabled 1: Extended data length mode enabled For details, see **Section 19.5.5.2, Data Length Selection with Extended Data Length**.
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CSIGnDCS	Enables/disables data consistency check. 0: Data consistency check disabled 1: Data consistency check enabled For details, see **Section 19.5.10.1, Data Consistency Check**.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	CSIGnLBM	Controls loop-back mode (LBM). 0: Loop-back mode deactivated 1: Loop-back mode activated Loop-back mode can be set only in master mode. Set this bit to 0 in slave mode. For details, see **Section 19.5.9, Loop-Back Mode**.

Table 19.24 CSIGnCTL1 Register Contents

Bit Position	Bit Name	Function
2	CSIGnSIT	Selects interrupt delay mode. 0: No delay 1: Half clock delay for all interrupts This bit is only valid in master mode. In slave mode, no delay is generated. For details, see **Section 19.4.1, Interrupt Delay**.
1	CSIGnHSE	Enables/disables handshake function. 0: Handshake function disabled 1: Handshake function enabled For details, see **Section 19.5.8, Handshake Function**.
0	CSIGnSSE	Enables/disables slave select function. 0: Input signal $\overline{\text{CSIGTSSI}}$ disabled. 1: Input signal $\overline{\text{CSIGTSSI}}$ enabled. If the slave select function is not used, this bit must be set to 0 (see also **Section 19.5.2, Master/Slave Connections**).

Details about CSIGnCTL1.CSIGnSSE:

Table 19.25 Operation of the Slave Select Function during Reception

CSIGnCTL0.CSIGnRXE	CSIGnCTL1.CSIGnSSE	$\overline{\text{CSIGTSSI}}$	Receive Operation
0	—	—	Reception disabled
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

Table 19.26 Operation of the Slave Select Function during Transmission

CSIGnCTL0.CSIGnTXE	CSIGnCTL1.CSIGnSSE	$\overline{\text{CSIGTSSI}}$	Transmit Operation
0	—	—	Transmission disabled
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

CAUTION

When configuring this register, see **Table 19.36, List of Cautions when Configuring the Registers**.

19.3.4 CSIGnCTL2 — CSIGn Control Register 2

This register selects the communication clock.

Access: This register can be read or written in 16-bit units.

Address: <CSIGn_base> + 0014_H

Value after reset: $E000_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIGnPRS[2:0]			—	CSIGnBRS[11:0]											
Value after reset	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

CAUTION

When configuring this register, see **Table 19.36, List of Cautions when Configuring the Registers**.

19.3.5 CSIGnSTR0 — CSIGn Status Register 0

This register indicates the status of the CSIG.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <CSIGn_base> + 0004_H

Value after reset: $0000\ 0010_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CSIGn TSF	—	—	—	CSIGn DCE	—	CSIGn PE	CSIGn OVE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.28 CSIGnSTR0 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	CSIGnTSF	Transfer Status Flag 0: Idle state 1: Communication is in progress or being prepared The timing to set or clear this bit is as follows:

Master Mode	Timing to Set	Timing to Clear
Tx-only mode	Writing to transmission register	Within a half clock cycle from the last serial clock edge
Tx/Rx mode		
Rx-only mode	Reading from reception register	

Slave Mode	Timing to Set	Timing to Clear
Tx-only mode	Writing to transmission register	Within a half clock cycle from the last serial clock edge
Tx/Rx mode		
Rx-only mode	CSIGTSCK input	

Bit Position	Bit Name	Function
6 to 4	Reserved	When read, the value after reset is returned.
3	CSIGnDCE	Data Consistency Check Error Flag 0: No data consistency check error detected 1: Data consistency check error detected This bit is cleared by writing 1 to CSIGnSTCR0.CSIGnDCEC. When setting to 1 due to data consistency check error detection and clearing to 0 by CSIGnSTCR0.CSIGnDCEC occur simultaneously, setting to 1 due to data consistency check error detection takes precedence. This bit is initialized when CSIGnCTL0.CSIGnPWR changes from 0 to 1, or from 1 to 0.
2	Reserved	When read, the value after reset is returned.

Table 19.28 CSIGnSTR0 Register Contents

Bit Position	Bit Name	Function
1	CSIGnPE	Parity Error Flag 0: No parity error detected 1: Parity error detected This bit is cleared by writing 1 to CSIGnSTCR0.CSIGnPEC. When setting to 1 due to parity error detection and clearing to 0 by writing to CSIGnSTCR0.CSIGnPEC occur simultaneously, setting to 1 due to parity error detection takes precedence. This bit is initialized when CSIGnCTL0.CSIGnPWR changes from 0 to 1, or from 1 to 0.
0	CSIGnOVE	Overrun Error Flag 0: No overrun error detected 1: Overrun error detected This bit is cleared by writing 1 to CSIGnSTCR0.CSIGnOVEC. When setting to 1 due to overrun error detection and clearing to 0 by writing to CSIGnSTCR0.CSIGnOVEC occur simultaneously, setting to 1 due to overrun error detection takes precedence. This bit is initialized by the value of CSIGnCTL0.CSIGnPWR changes from 0 to 1, or from 1 to 0.

CAUTION

When configuring this register, see **Table 19.36, List of Cautions when Configuring the Registers**.

19.3.6 CSIGnSTCR0 — CSIGn Status Clear Register 0

This register clears the status flags of the CSIGnSTR0 status register.

Access:	This register can be read or written in 16-bit units. When read, the value 0000$_H$ is always returned.
Address:	<CSIGn_base> + 0008$_H$
Value after reset:	0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CSIGn DCEC	—	CSIGn PEC	CSIGn OVEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W

Table 19.29 CSIGnSTCR0 Register Contents

Bit Position	Bit Name	Function
15 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	CSIGnDCEC	Controls the data consistency check error flag clear command. 0: No operation. Read value is always 0. 1: Clears the data consistency check error flag (CSIGnSTR0.CSIGnDCE).
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CSIGnPEC	Controls the parity error flag clear command. 0: No operation. Read value is always 0. 1: Clears the parity error flag (CSIGnSTR0.CSIGnPE).
0	CSIGnOVEC	Controls the overrun error flag clear command. 0: No operation. Read value is always 0. 1: Clears the overrun error flag (CSIGnSTR0.CSIGnOVE).

19.3.7 CSIGnBCTL0 — CSIGn Rx-Only Mode Control Register 0

This register enables/disables the data transfer in Rx-only mode.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: <CSIGn_base> + 1000_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CSIGnSCE
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R/W

Table 19.30 CSIGnBCTL0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CSIGnSCE	Disables/enables the start of the next data reception by reading CSIGnRX0. 0: Next reception disabled 1: Next reception enabled For details, see **Section 19.5.4.2, Receive-Only Mode**.

CAUTION

When configuring this register, see **Table 19.36, List of Cautions when Configuring the Registers**.

19.3.8 CSIGnCFG0 — CSIGn Configuration Register 0

This register configures the communication protocols such as data length, parity, transfer direction, clock phase, and data phase.

Access: This register can be read or written in 32-bit units.

Address: <CSIGn_base> + 1010$_H$

Value after reset: 0000 0000$_H$

CAUTION

When configuring this register, see **Table 19.36, List of Cautions when Configuring the Registers**.

19.3.9 CSIGnTX0W — CSIGn Transmission Register 0 for Word Access

This register stores the transmission data and specifies the extended data length.

Access:	This register can be read or written in 32-bit units.
Address:	<CSIGn_base> + 1004_H
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CSIGn EDL	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 19.32 CSIGnTX0W Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29	CSIGnEDL	Specifies the extended data length. 0: Normal operation 1: Extended data length enabled The associated data is transmitted as 16-bit data. This bit can only be set if CSIGnCTL1.CSIGnEDLE = 1.
28 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	CSIGnTX[15:0]	Data to be transmitted

CAUTION

When configuring this register, see **Table 19.36, List of Cautions when Configuring the Registers**.

19.3.10 CSIGnTX0H — CSIGn Transmission Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of CSIGnTX0W register.

The settings specified by the upper 16 bits of CSIGnTX0W are applied to the transmission.

Access: This register can be read or written in 16-bit units.

Address: <CSIGn_base> + 1008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.33 CSIGnTX0H Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIGnTX[15:0]	Data to be transmitted

CAUTION

When configuring this register, see **Table 19.36, List of Cautions when Configuring the Registers**.

19.3.11 CSIGnRX0 — CSIGn Reception Register 0

This register stores the received data.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <CSIGn_base> + $100C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIGnRX[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.34 CSIGnRX0 Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIGnRX[15:0]	Received Data These bits are initialized when CSIGnCTL0.CSIGnPWR changes from 0 to 1 or from 1 to 0. When reading, the values of these bits must be read at least 1 clock before the generation of CSIGTIR interrupt.

CAUTION

When configuring this register, see **Table 19.36, List of Cautions when Configuring the Registers**.

19.3.12 CSIGnEMU — CSIGn Emulation Register

This register controls operation by SVSTOP.

Access: This register can be read or written in 8-bit or 1-bit units.
Write to this register when EPC.SVSTOP = 0.

Address: <CSIGn_base> + 0018_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CSIGnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 19.35 CSIGnEMU Register Contents

Bit Position	Bit Name	Function
7	CSIGnSVSDIS	Selects whether to continue or stop transmit/receive operation during debugging. ● When the EPC.SVSTOP bit is set to 0: Continues transmit/receive operation regardless of the setting of this bit. ● When the EPC.SVSTOP bit is set to 1: 0: Stops transmit/receive operation. 1: Continues transmit/receive operation.
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

When configuring this register, see **Table 19.36, List of Cautions when Configuring the Registers**.

19.3.13 List of Cautions

Table 19.36 List of Cautions when Configuring the Registers

Register Name	Bit Name	Cautions
CSIGnCTL0	CSIGnPWR	If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, it is necessary to restart the communication.
CSIGnCTL0	CSIGnTXE CSIGnRXE	Do not modify any of these bits while CSIGnCTL0.CSIGnPWR = 0. (These bits can be modified simultaneously with the CSIGnCTL0.CSIGnPWR bit.) Do not modify these bits while CSIGnSTR0.CSIGnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted.
CSIGnCTL0	CSIGnMBS	When setting CSIGnCTL0.CSIGnPWR = 1, be sure to set to this bit to 1. (The value after reset is “0”.) This bit must be modified simultaneously with CSIGnCTL0.CSIGnPWR bit.
CSIGnCTL1	CSIGnCKR	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnCTL1	CSIGnSLIT CSIGnEDLE CSIGnDCS CSIGnHSE	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnCTL1	CSIGnLBM	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting this bit to 1 is prohibited in slave mode.
CSIGnCTL1	CSIGnSSE	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting this bit to 1 is prohibited in master mode.
CSIGnCTL1	CSIGnSIT	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated.
CSIGnCTL2	CSIGnPRS[2:0] CSIGnBRS[11:0]	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting of the maximum transfer clock frequency is as follows. ● Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4) ● Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6)
CSIGnSTR0	CSIGnTSF	Writing to this bit is prohibited, and only reading is permitted.
CSIGnSTR0	CSIGnDCE CSIGnPE CSIGnOVE	Writing to these bits is prohibited, and only reading is permitted. These bits are initialized when CSIGnCTL0.CSIGnPWR = 0 → 1 or CSIGnCTL0.CSIGnPWR = 1 → 0.
CSIGnBCTL0	CSIGnSCE	Write to this bit before CSIGnRX0 is read. Fix the CSIGnSCE bit to 0 when the transfer mode is transmit mode or transmit/receive mode.
CSIGnCFG0	CSIGnPS[1:0] CSIGnDLS[3:0] CSIGnDIR CSIGnDAP	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnTX0W	CSIGnEDL	This bit is valid only when CSIGnCTL1.CSIGnEDLE = 1.
CSIGnTX0W CSIGnTX0H		Write access to these bits are prohibited when CSIGnCTL0.CSIGnTXE = CSIGnCTL0.CSIGnRXE = 0.
CSIGnRX0		These bits are initialized when CSIGnCTL0.CSIGnPWR = 0 → 1 or CSIGnCTL0.CSIGnPWR = 1 → 0. Read access to this bit is prohibited when CSIGnCTL0.CSIGnTXE = CSIGnCTL0.CSIGnRXE = 0.
CSIGnEMU	CSIGnSVSDIS	Modification of this bit is prohibited while SVSTOP = 1.

19.4 Interrupt Sources

CSIG can generate the following interrupts:

- INTCSIGTIC (communication status interrupt)
- INTCSIGTIR (reception status interrupt)
- INTCSIGTIRE (communication error interrupt)

19.4.1 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half cycle of the transmission clock CSIGTSCK. This function is not available in slave mode.

The delay is specified by setting CSIGnCTL1.CSIGnSIT = 1. (The setting of the CSIGnSIT bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of CSIGnCTL1.CSIGnSIT = 1 (interrupt delay enabled), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), and CSIGnCFG0.CSIGnDLS[3:0] = 1000_B (data length 8 bits).

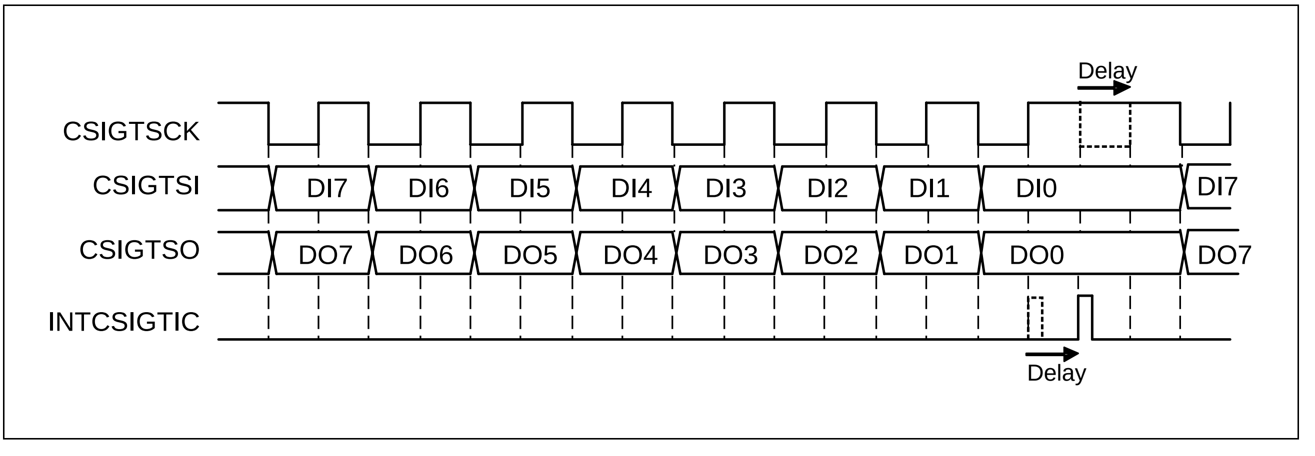

Figure 19.2 Interrupt Delay Function (CSIGnCTL1.CSIGnSIT = 1)

19.4.2 INTCSIGTIC (Communication Status Interrupt)

This interrupt is normally generated after every data transfer. It can be used to trigger a DMA for writing new transmission data to register CSIGnTX0W or CSIGnTX0H.

The following example assumes master mode and a setting of CSIGnCTL1.CSIGnSIT = 0 (no interrupt delay), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), CSIGnCFG0.CSIGnDLS[3:0] = 1000_B (data length 8 bits), and CSIGnCTL1.CSIGnSLIT = 0 (normal interrupt timing).

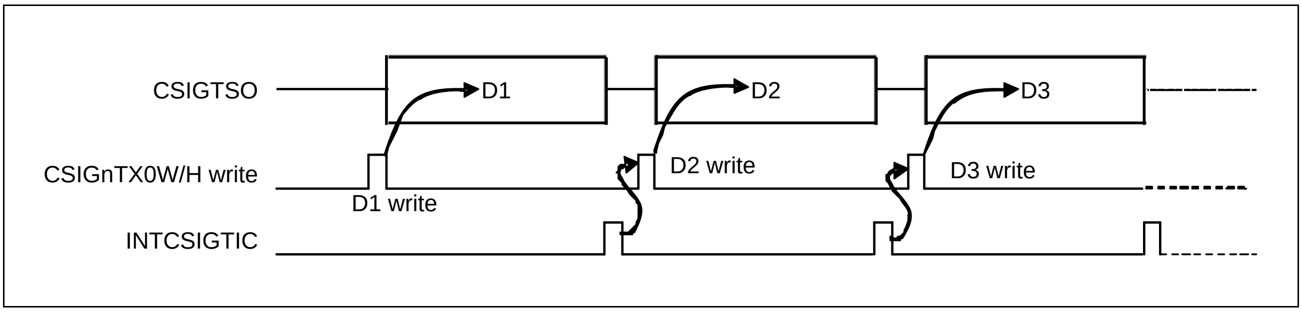

Figure 19.3 Generation of INTCSIGTIC after Communication (CSIGnCTL1.CSIGnSLIT = 0)

However, INTCSIGTIC can also be set up to occur when the CSIGnTX0W/H register is empty and available for receiving the next data. This is specified by setting CSIGnCTL1.CSIGnSLIT = 1.

This mode allows more efficient data transfers.

The effect is illustrated in the figure below.

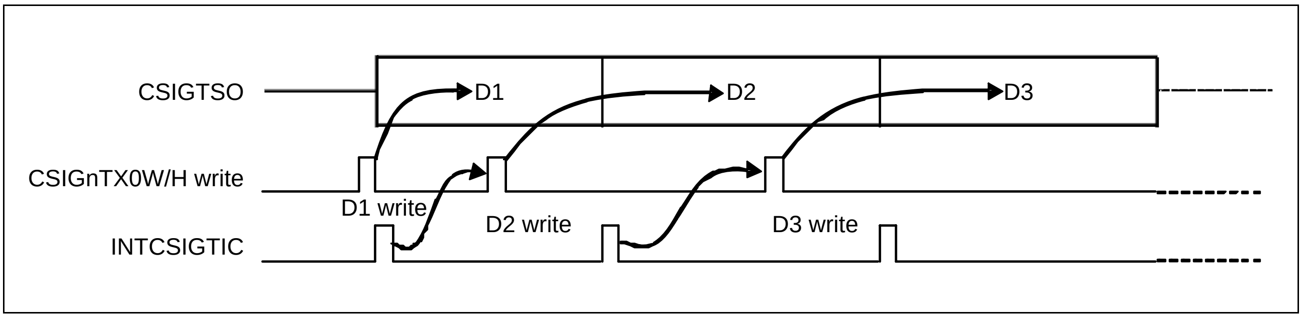

Figure 19.4 Generation of INTCSIGTIC at the Beginning of Communication

19.4.3 INTCSIGTIR (Reception Status Interrupt)

This interrupt is generated in receive-only and transmit/receive mode after data has been received and is available in the reception register. It can be used to trigger a DMA for reading the received data from CSIGnRX0 register.

The following example assumes master mode and a setting of CSIGnCTL1.CSIGnSIT = 0 (no interrupt delay), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), and CSIGnCFG0.CSIGnDLS[3:0] = 1000_B (data length 8 bits).

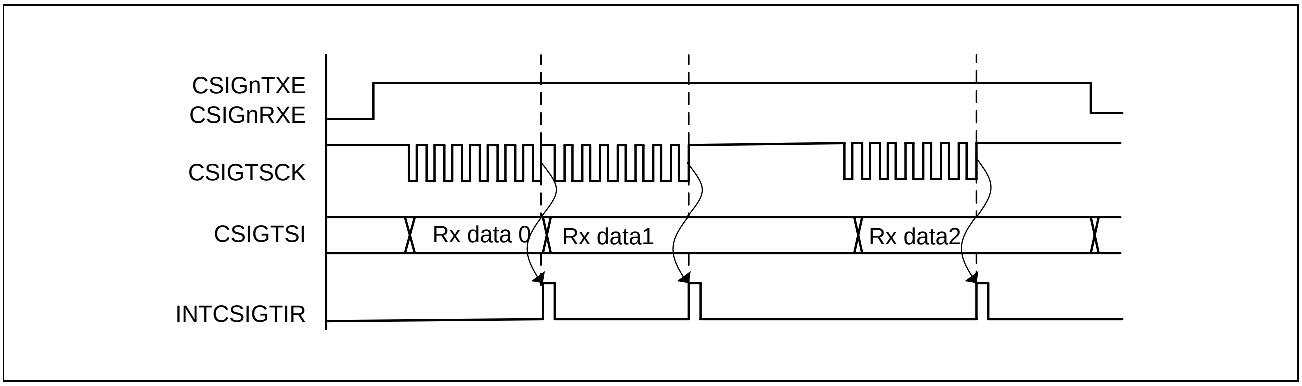

Figure 19.5 Generation of INTCSIGTIR

19.4.4 INTCSIGTIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

Table 19.37 Data Error Types

Error Type	Communication Status After Error Interrupt	Note
Parity error	Interrupt is generated and communication continues.	—
Data consistency check error	Interrupt is generated and communication continues.	—
Overrun error*1	When CSIGnCTL1.CSIGnHSE = 0 (handshake function disabled) in slave mode, interrupt is generated and communication continues.	When CSIGnCTL1.CSIGnHSE = 1 (handshake function enabled) in slave mode, communication stops due to the handshake. An interrupt is not generated and an overrun error does not occur.

Note 1. In master mode, overrun errors do not occur.
In slave mode, communication cannot be stopped.

The type of error that caused the generation of INTCSIGTIRE is indicated in register CSIGnSTR0.

For details about the various error types, see **Section 19.5.10, Error Detection**.

19.5 Operation

19.5.1 Master/Slave Mode

Whether CSIG operates in master mode or in slave mode depends on the setting of bits CSIGnCTL2.CSIGnPRS[2:0]. If master mode is selected, the source of the transmission clock must be selected as well.

19.5.1.1 Master Mode

In master mode, the serial transmission clock is generated by the built-in baud rate generator (BRG) and supplied to the slave via signal CSIGTSCK.

Master mode is enabled by setting bits CSIGnCTL2.CSIGnPRS[2:0] to values other than 111_B. In master mode, the frequency of BRG can be configured by setting bits CSIGnCTL2. CSIGnPRS[2:0] and bits CSIGnCTL2.CSIGnBRS[11:0].

The default level of CSIGTSCK depends on the CSIGTSCK clock inversion function bit; it is high when CSIGnCTL1.CSIGnCKR = 0, and is low when CSIGnCTL1.CSIGnCKR = 1.

The example below shows the communication in master mode for 8-bit data, CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0, and MSB first:

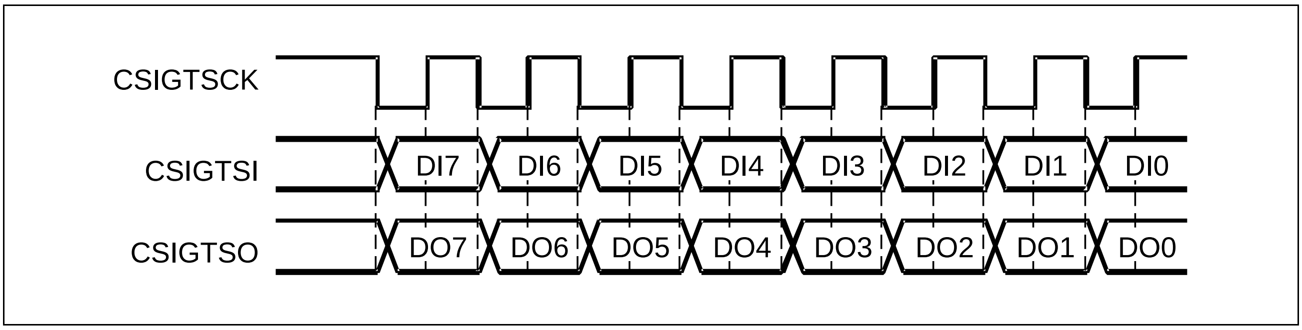

Figure 19.6 Transmission/Reception in Master Mode

19.5.1.2 Slave Mode

In slave mode, another device is the communication master. The external clock is supplied via the signal CSIGTSCK. Transmit/receive operation starts as soon as a clock signal is detected.

Slave mode is selected by setting CSIGnCTL2.CSIGnPRS[2:0] to 111_B.

NOTE

When using slave mode, disable the baud rate generator (BRG) by setting bits CSIGnCTL2.CSIGnBRS[11:0] to 000_H.

The example below shows the communication in slave mode for 8-bit data, CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0, and MSB first:

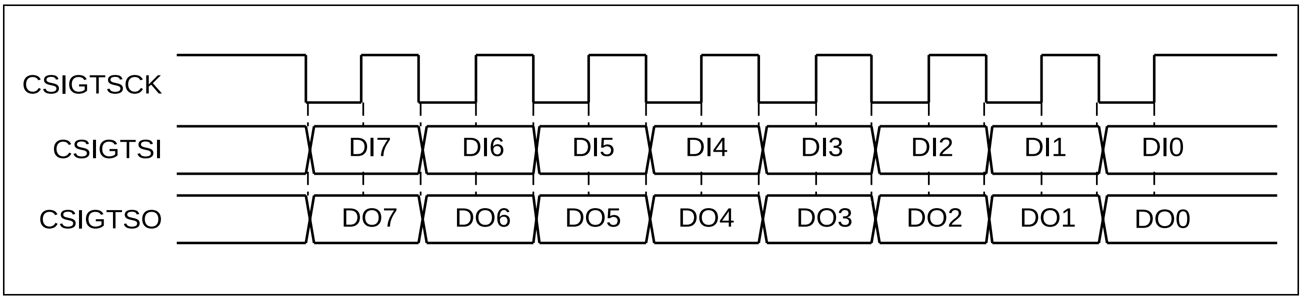

Figure 19.7 Transmission/Reception in Slave Mode

19.5.2 Master/Slave Connections

19.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

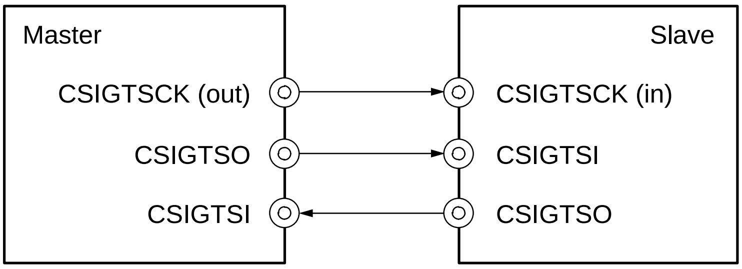

Figure 19.8 Direct Master/Slave Connection

19.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this case, the master must provide one slave select (SS) signal to each of the slaves. This signal is connected to the slave select input $\overline{\text{CSIGTSSI}}$ of the slave.

The $\overline{\text{CSIGTSSI}}$ signal can be enabled or disabled by the CSIGnCTL1.CSIGnSSE bit.

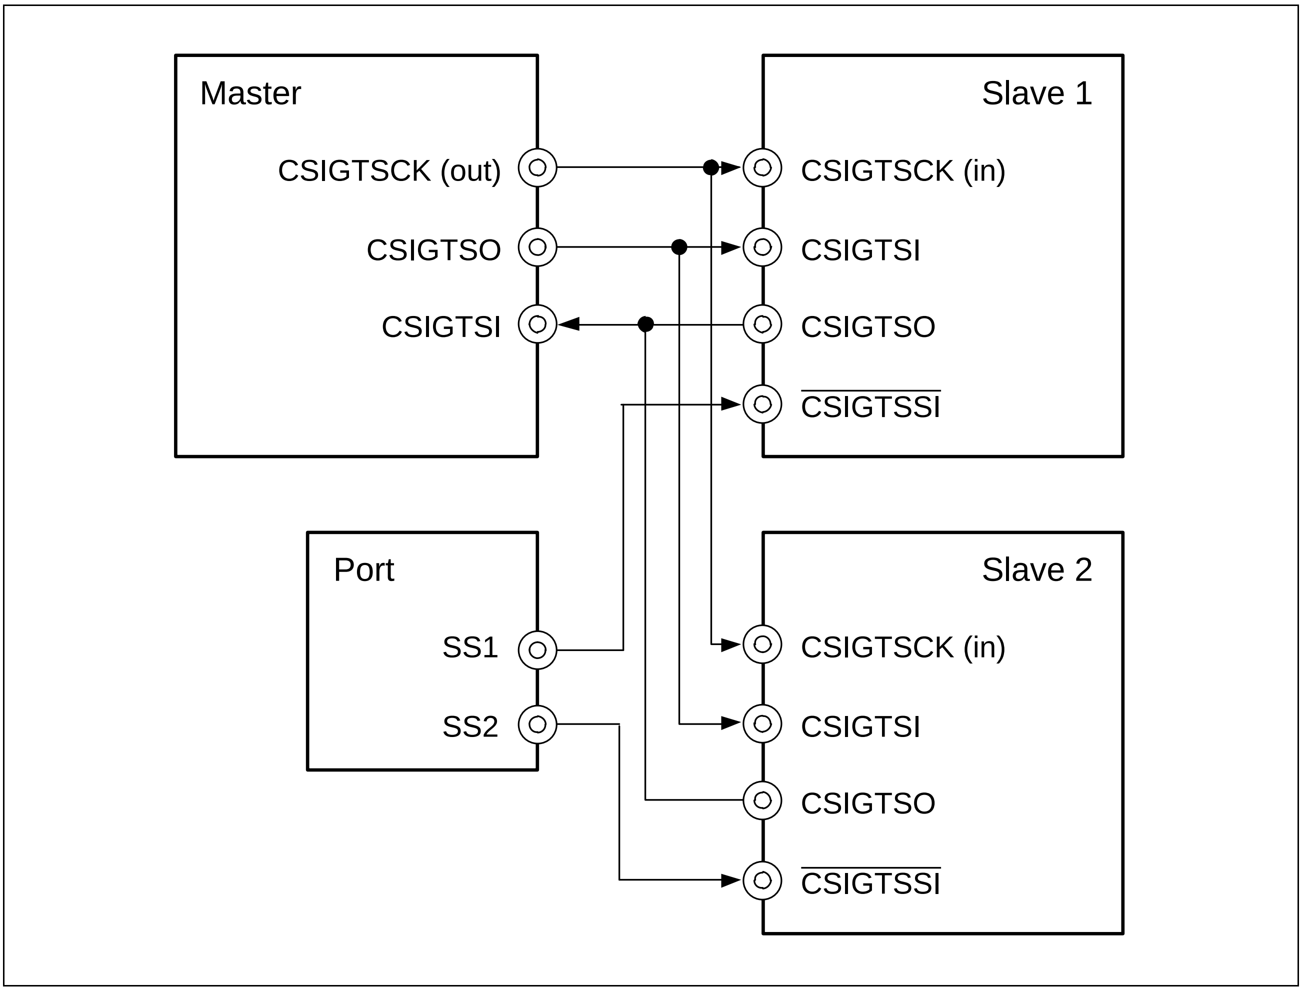

Figure 19.9 Master to Multiple Slaves Connection

A slave is selected (enabled) when its $\overline{\text{CSIGTSSI}}$ signal is low.

If it is not selected, the slave will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set (CSIGnCTL0.CSIGnTXE = 1), the CSIGTSO output buffer of the slave which is not selected is disabled and set to input mode in order to avoid interference with the outputs of other selected slaves.

19.5.3 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the CSIGnPRS[2:0] and CSIGnBRS[11:0] bits in the CSIGnCTL2 register.

The following figure shows a block diagram of the BRG.

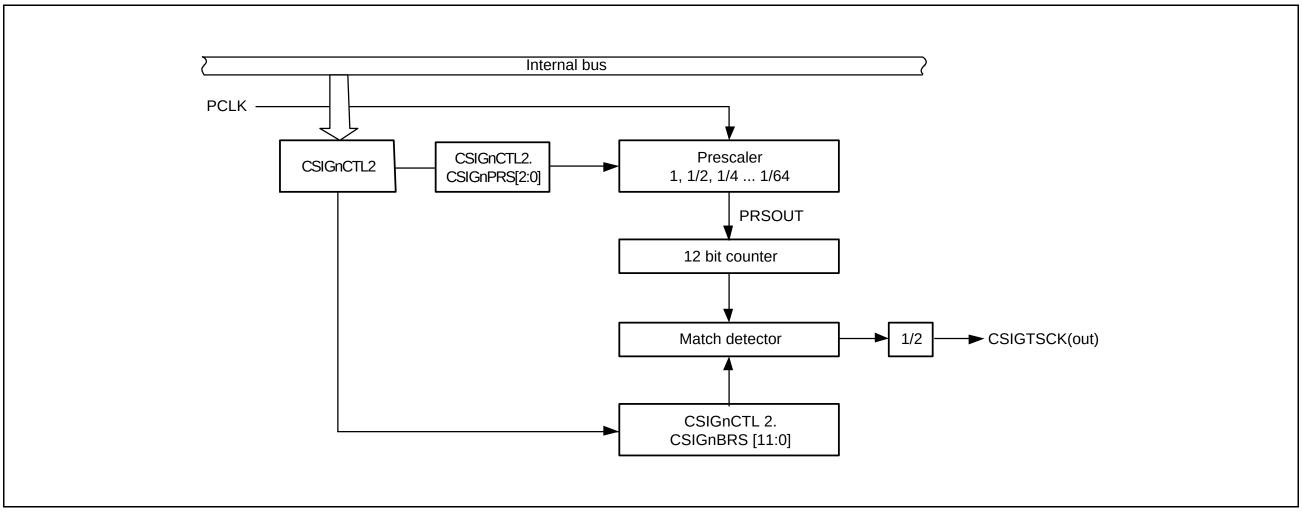

Figure 19.10 BRG Block Diagram

Setting CSIGnCTL2.CSIGnBRS[11:0] to 000_H disables the BRG.

Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated as:

Transfer clock frequency (CSIGTSCK) = PCLK / (division ratio of PCLK) = PCLK / ($2^{\alpha} \times k \times 2$) where:

α = CSIGnCTL2.CSIGnPRS[2:0] = 0 to 6

k = CSIGnCTL2.CSIGnBRS[11:0] = 1 to 4095

Transfer clock frequency upper and lower limits

When specifying the transfer clock frequency, please note the following:

- For the maximum transfer clock frequency of this product in master mode or slave mode, refer to the CSIG timing shown in the electrical characteristics. In addition, in either mode, specify a frequency within the defined range.
- The minimum transfer clock frequency in master mode and slave mode is PCLK/524160.
- The maximum transfer clock frequency is as follows:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6)

19.5.4 Data Transfer Modes

19.5.4.1 Transmit-Only Mode

Setting CSIGnCTL0.CSIGnTXE = 1 and CSIGnCTL0.CSIGnRXE = 0 places CSIG in transmit-only mode.
Transmission starts when data to be transmitted is written in the CSIGnTX0W or CSIGnTX0H register.

CAUTION

When the mode transitions from one of the receive modes to transmit-only mode, the data in the CSIGnRX0 buffer becomes undefined after completion of the first transmission.
Therefore, the reception register CSIGnRX0 has to be read before switching to transmit-only mode.

19.5.4.2 Receive-Only Mode

Setting CSIGnCTL0.CSIGnTXE = 0 and CSIGnCTL0.CSIGnRXE = 1 puts the CSIG in receive-only mode.

In master mode, reception starts when dummy data is read from the CSIGnRX0 register.
All subsequent receptions are triggered by reads from the CSIGnRX0 register, as long as CSIGnBCTL0.CSIGnSCE = 1.

Moreover, CSIGnBCTL0.CSIGnSCE has to be set to 0 before reading the last received data from CSIGnRX0.

The recommended procedure is:

1. Set CSIGnBCTL0.CSIGnSCE = 1.
2. Read CSIGnRX0 (dummy data).
3. Wait for the reception interrupt INTCSIGTIR.
4. Read CSIGnRX0 (received data).
   In case more data receptions follow at step 3, continue to read until all data is received.
   Before reading the last received data from CSIGnRX0, set CSIGnBCTL0.CSIGnSCE = 0.

In slave mode, reception starts when the communication clock CSIGTSCK is received from the master. In this case, it is not necessary to read data from the CSIGnRX0 register of the slave.

NOTE

In slave mode, any previously received data must be read from the reception register CSIGnRX0 in order to avoid any overwrite situation.

19.5.4.3 Transmit/Receive Mode

Setting CSIGnCTL0.CSIGnTXE = 1 and CSIGnCTL0.CSIGnRXE = 1 puts the CSIG in transmit/receive mode.

Data transfer (transmission and reception) starts when the data to be transmitted is written to the CSIGnTX0W or CSIGnTX0H register.

19.5.5 Data Length Selection

19.5.5.1 Data Length Selection without Extended Length

Transmission data length is selectable from 7 to 16 bits using the CSIGnDLS[3:0] bits in the CSIGnCFG0 register. The examples below show the communication with MSB first (CSIGnCFG0.CSIGnDIR = 0):

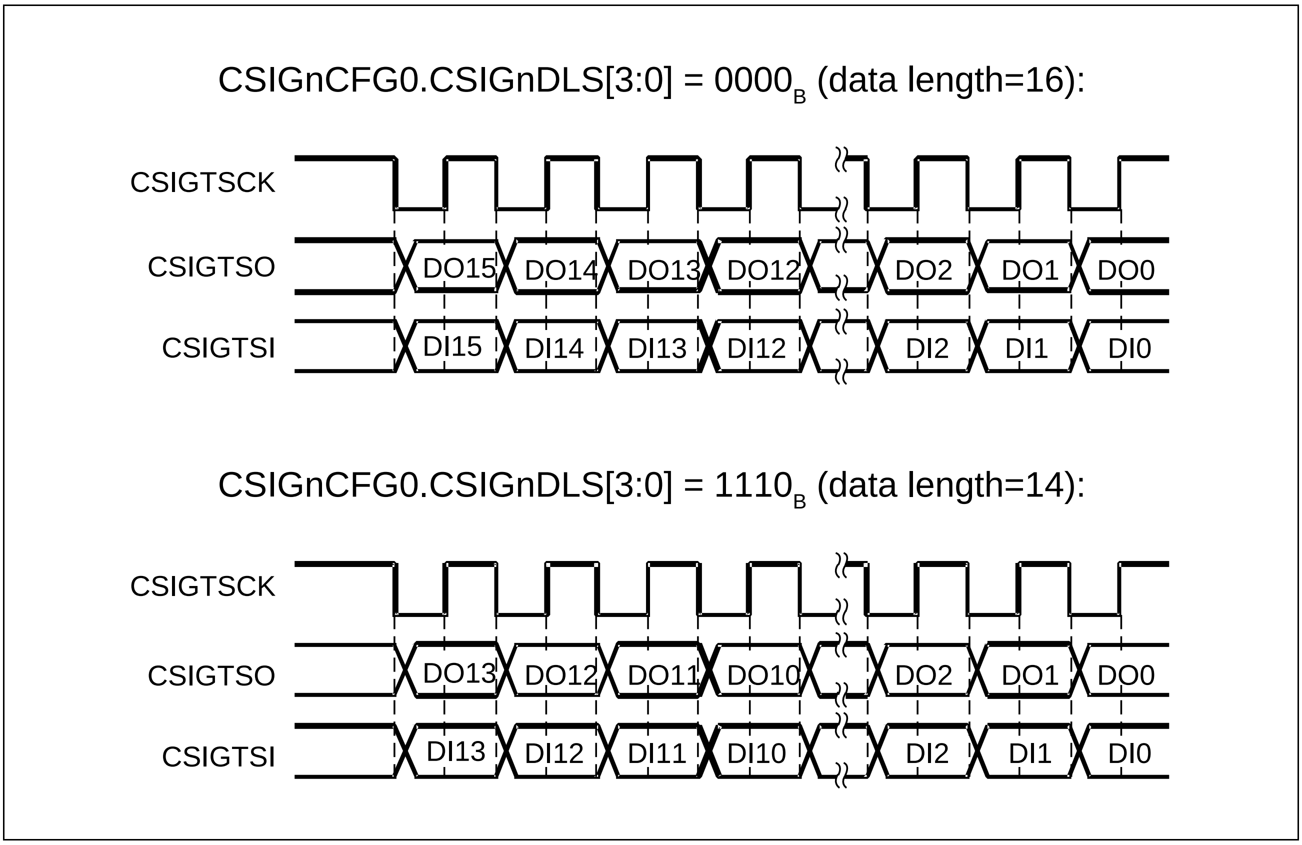

Figure 19.11 Data Length Selection Function

19.5.5.2 Data Length Selection with Extended Data Length

If the data to be transmitted/received exceeds 16 bits, the extended data length (EDL) function can be used.

The EDL function is enabled by setting the CSIGnCTL1.CSIGnEDLE bit to 1.

The following describes how the EDL function works and how to specify the EDL setting.

- The data has to be broken into 16-bit blocks plus remainder. For example, data of 42 bits would be broken into two 16-bit blocks plus 10 bits.
- The bit length of the remainder is set as “data length” in CSIGnCFG0.CSIGnDLS[3:0] bits.
- Set the CSIGnTX0W.CSIGnEDL bit to 1 to transmit the 16-bit blocks. In this case, the data written to the CSIGnTX0W register is sent as 16-bit data regardless of the setting of the CSIGnCFG0.CSIGnDLS[3:0] bits.
- The transfer completes after the data with the specified data length (the remainder when CSIGnTX0W.CSIGnEDL = 0) has been sent.

Example

Example of sending 40 bits of data, 123456789A$_H$:

40 bits are split into 2 × 16 bits plus 8 bits.

- Initialize CSIGnCFG0.CSIGnDLS[3:0] = 8D.
- To transmit the data 123456789A$_H$ with MSB first, write the following sequence to CSIGnTX0W:
  - 2000 1234$_H$ (CSIGnTX0W.CSIGnEDL = 1)
  - 2000 5678$_H$ (CSIGnTX0W.CSIGnEDL = 1)
  - 0000 009A$_H$ (CSIGnTX0W.CSIGnEDL = 0)

The following figure illustrates the timing.

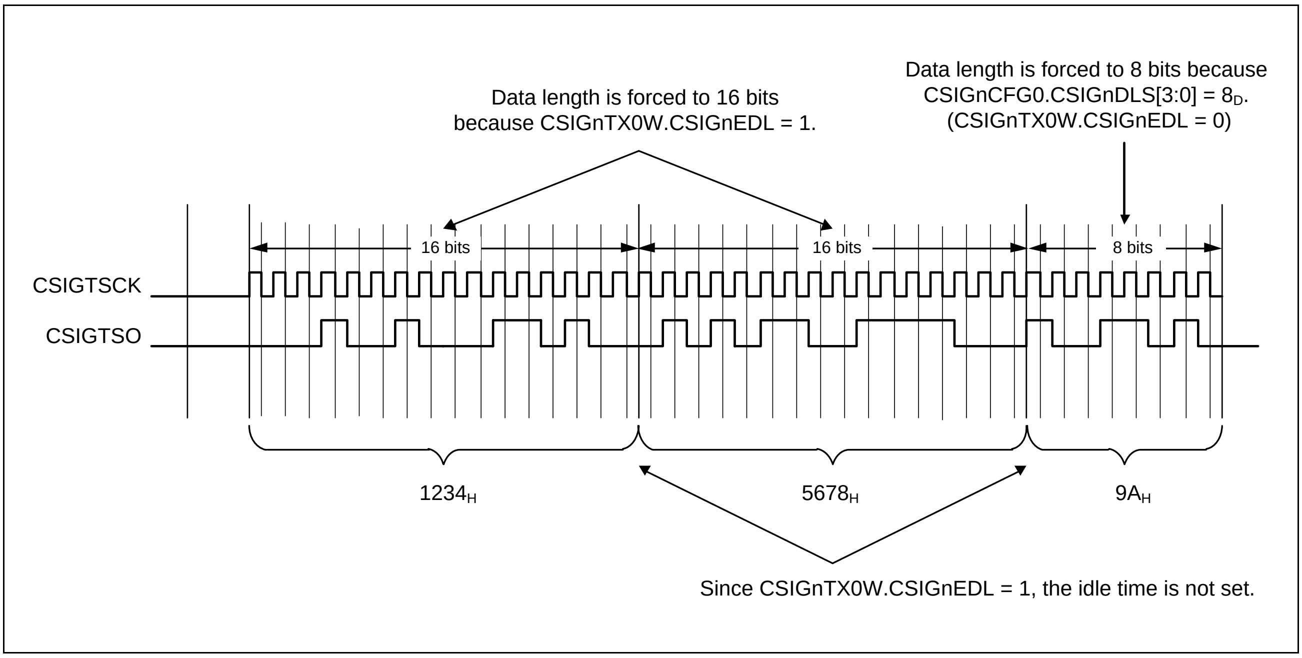

Figure 19.12 EDL Timing Diagram

NOTES

1. Data length with less than 7 bits can be set only when EDL mode is used.
2. It is not possible to transmit two consecutive data with a data length of less than 7 bits.
3. If parity is enabled, the parity bit is added after the last bit.
4. Example for setting the data direction:
    - Data to be transmitted: 123456_H
    - MSB first:
      Set CSIGnCFG0.CSIGnDIR to 0.
      Write 2000 1234_H to CSIGnTX0W (EDL bit = 1).
      Write 0000 0056_H to CSIGnTX0W (EDL bit = 0).
    - LSB first:
      Set CSIGnCFG0.CSIGnDIR to 1.
      Write 2000 3456_H to CSIGnTX0W (EDL bit = 1).
      Write 0000 0012_H to CSIGnTX0W (EDL bit = 0).
5. EDL mode cannot be used in the slave mode configured for receive-only mode.
   (CSIGnCTL2.CSIGnPRS[2:0] = 111_B, CSIGnCTL0.CSIGnTXE = 0, CSIGnCTL0.CSIGnRXE = 1)

19.5.6 Serial Data Direction Selection Function

The serial data direction is selectable using the CSIGnDIR bit in the CSIGnCFG0 register. The examples below show the communication for 8-bit data (CSIGnCFG0.CSIGnDLS[3:0] = 1000_B):

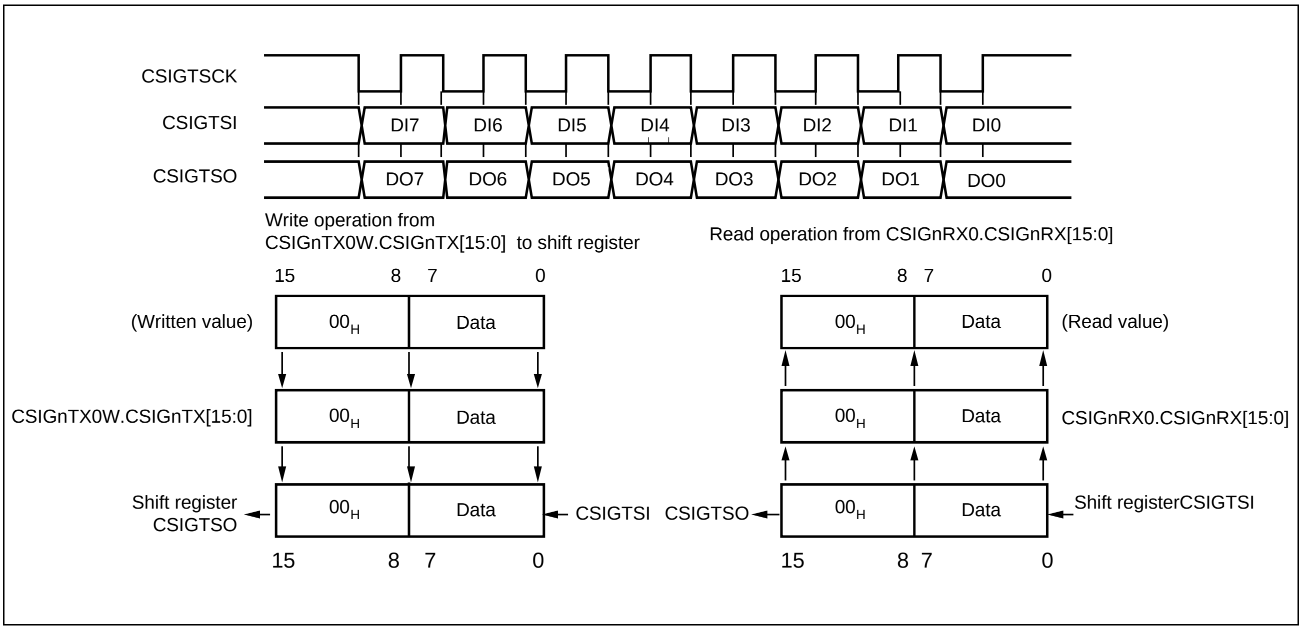

Figure 19.13 Serial Data Direction Select Function — MSB First (CSIGnDIR = 0)

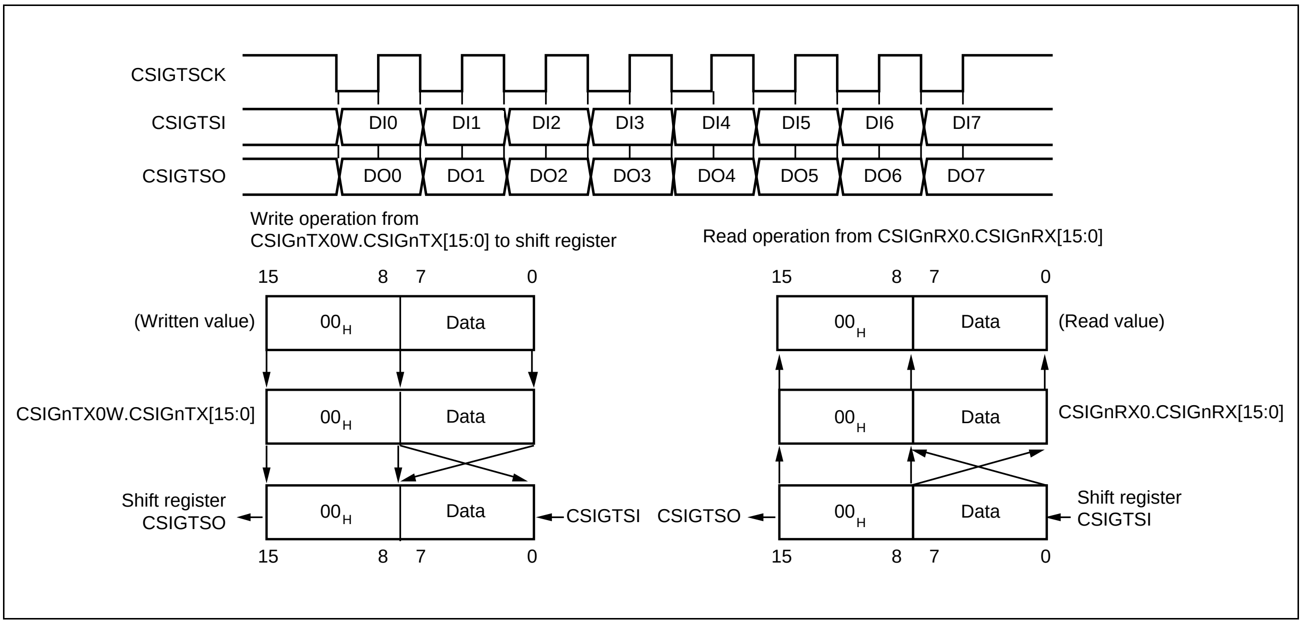

Figure 19.14 Serial Data Direction Select Function — LSB First (CSIGnDIR = 1)

19.5.7 Communication in Slave Mode

The following figure illustrates the communication signals and timing in slave mode.

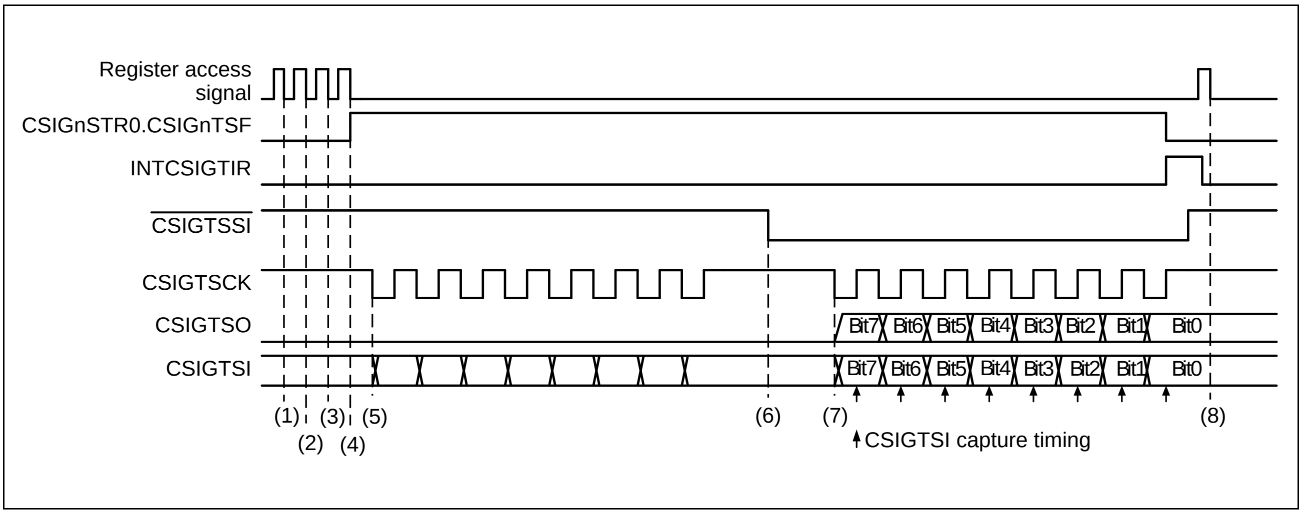

Figure 19.15 Rx/Tx Communication Timing in Slave Mode

1. Slave mode is selected (CSIGnCTL2.CSIGnPRS[2:0] = 111_{B}), the $\overline{\text{CSIGTSSI}}$ signal is enabled (CSIGnCTL1.CSIGnSSE = 1) and the clock phase is set to the high level (CSIGnCTL1.CSIGnCKR = 0).
2. Data length is 8 bits (CSIGnCFG0.CSIGnDLS[3:0] = 1000_{B}).
   Data direction is set to MSB first (CSIGnCFG0.CSIGnDIR = 0).
3. CSIG is set to transmit/receive mode (CSIGnCTL0.CSIGnPWR = 1, CSIGnCTL0.CSIGnTXE = 1, CSIGnCTL0.CSIGnRXE = 1).
4. When transfer data is written to the transmission register CSIGnTX0H, the transfer status flag CSIGnSTR0.CSIGnTSF is automatically set and the CSIG waits until signal $\overline{\text{CSIGTSSI}}$ goes low.
5. While signal $\overline{\text{CSIGTSSI}}$ is high, transmission/reception is not started even if the serial clock is input. CSIGTSO retains the values and input at CSIGTSI is ignored.
6. As soon as $\overline{\text{CSIGTSSI}}$ falls to low level, CSIGTSO is enabled.
7. If the serial clock is input to the CSIG while $\overline{\text{CSIGTSSI}}$ is low, transfer data is sent to CSIGTSO in synchronization with the serial clock, and simultaneously data is received from CSIGTSI.
8. The register CSIGnRX0 is read.

19.5.8 Handshake Function

CSIG features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by the CSIGnCTL1.CSIGnHSE bit. For handshake, the signals CSIGTRYI and CSIGTRYO are used.

The busy timing depends on the setting of the data phase selection bit CSIGnCFG0.CSIGnDAP.

19.5.8.1 Slave Mode

If CSIGnCTL1.CSIGnHSE = 1, a low-level CSIGTRYO signal is output when the slave becomes busy. This happens when previously received data is still in the CSIGnRX0 register, and the new data cannot be copied from the shift register to CSIGnRX0 (CSIGnRX0 full condition).

The following examples assume a data length of 8 bits.

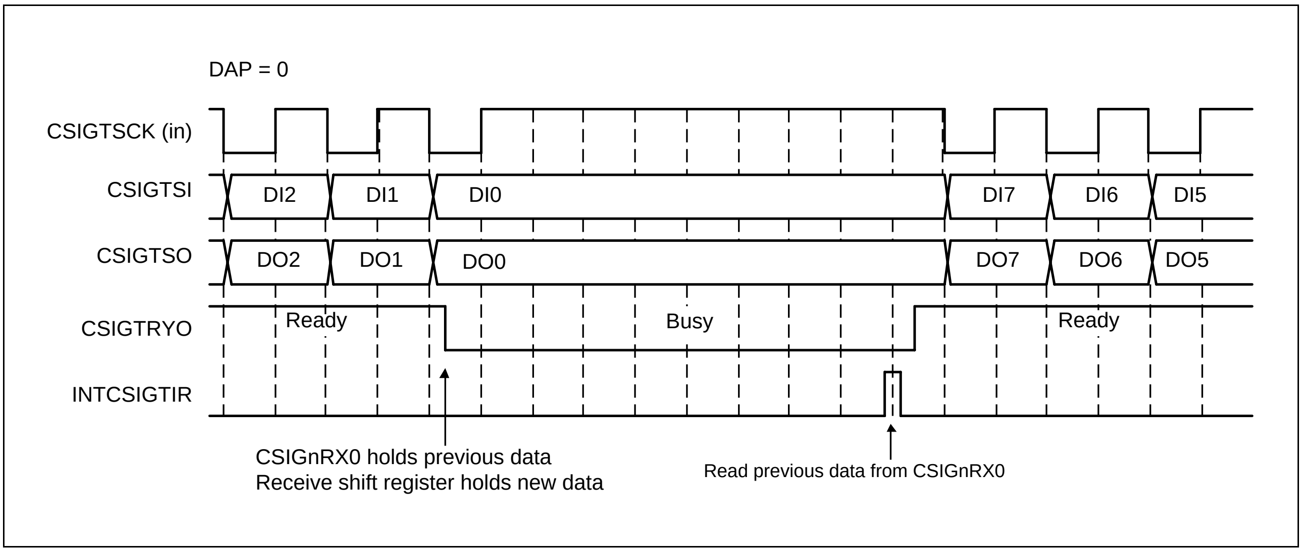

Figure 19.16 Ready/Busy Signal from Slave (CSIGnCFG0.CSIGnDAP = 0)

While the slave is busy, the master has to wait (i.e. suspend the transmission clock). The slave sets CSIGTRYO to high (“ready”) as soon as the read from the reception register CSIGnRX0 completes.

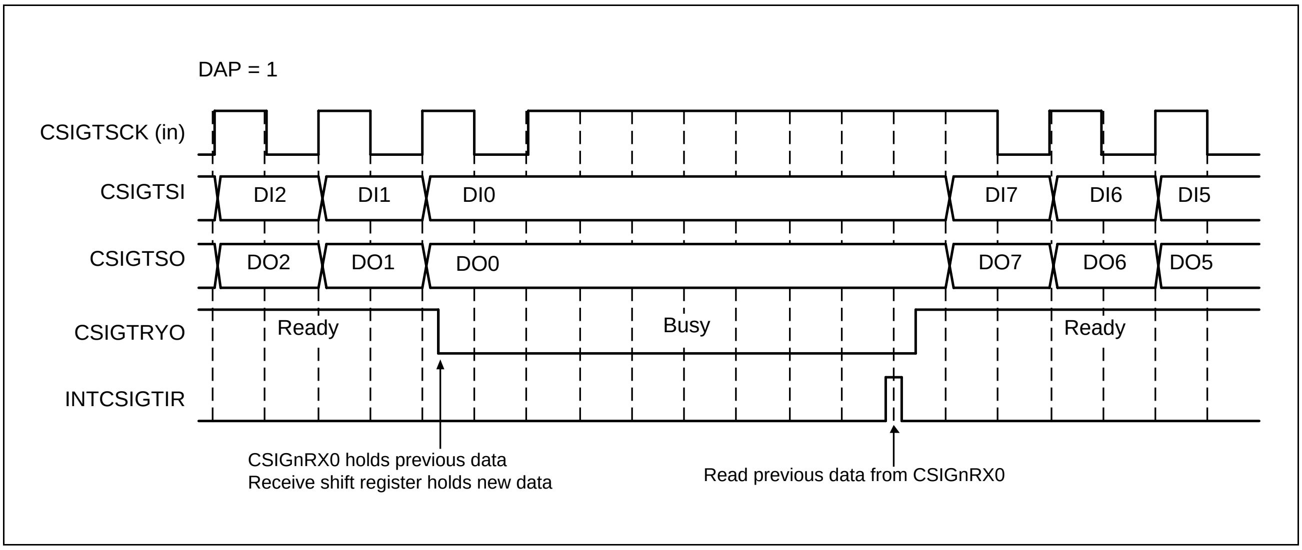

Figure 19.17 Ready/Busy Signal from Slave (CSIGnCFG0.CSIGnDAP = 1)

19.5.8.2 Master Mode

When the master detects low level of the CSIGTRYI while CSIGnCTL1.CSIGnHSE = 1, subsequent transfers are put on hold, the master goes into wait state and suspends the CSIGTSCK clock.

The CSIGTRYI level is checked at each half clock cycle of CSIGTSCK.

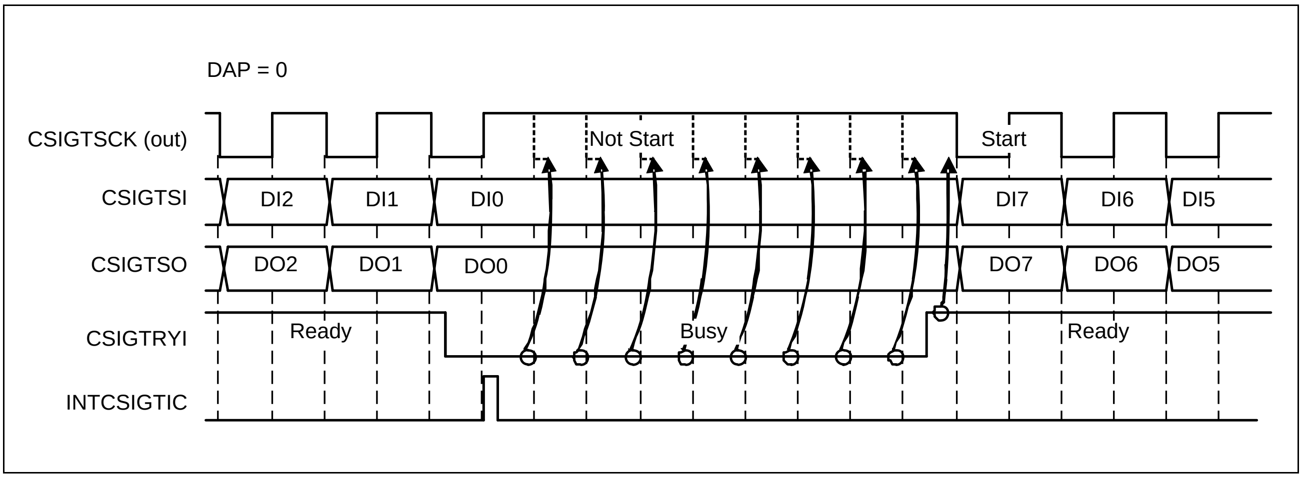

Figure 19.18 Master’s Reaction to CSIGTRYI (CSIGnCFG0.CSIGnDAP = 0)

If the CSIGTRYI low signal from the slave is received while data transfer is in progress, the serial clock is suspended after the transfer is complete.

The master resumes the communication as soon as CSIGTRYI becomes high (slave is "ready").

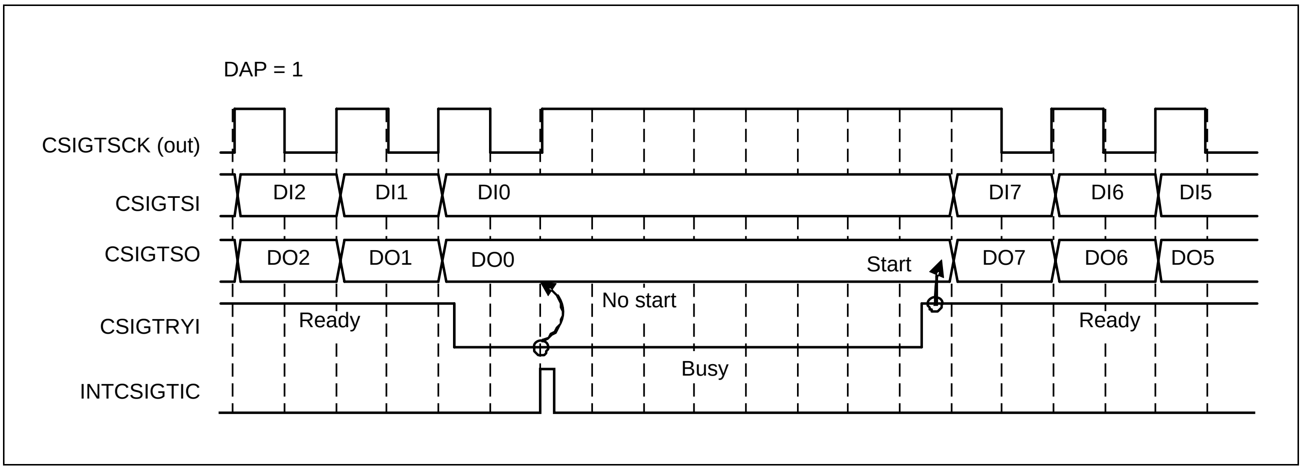

Figure 19.19 Master's Reaction to CSIGTRYI (CSIGnCFG0.CSIGnDAP = 1)

CAUTION

If multiple slaves are connected, the master must only detect the CSIGTRYI signal of the slave it has selected for communication.

CSIGTRYI of the master must be pulled down by the slave before the next transfer starts. Even if the signal is pulled down by the slave during the transfer, the transfer will continue until it completes.

19.5.9 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active (CSIGnCTL1.CSIGnLBM = 1), the transmit and receive signals are internally connected, as shown in the figures below. The signals CSIGTSCK, CSIGTSO, and CSIGTSI are disconnected from the ports. In addition, the CSIGTSO output level is fixed to low, and CSIGTSCK is set to reset level (High). The rest of CSIG works as in normal operation.

In order to test the CSIG, set the loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data.

Table 19.38 Output Level of Pins

Pin	Output Level
CSIGTSCK(out)	High level
CSIGTSO	Low level (not dependent on the previous value)
Interrupt	Normal function
CSIGTRYO	Normal function (Low level)

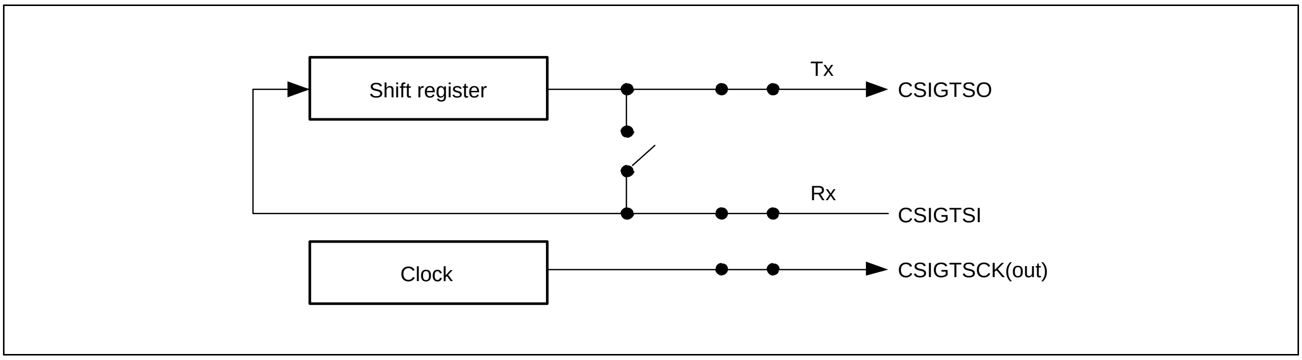

Figure 19.20 Normal Operation

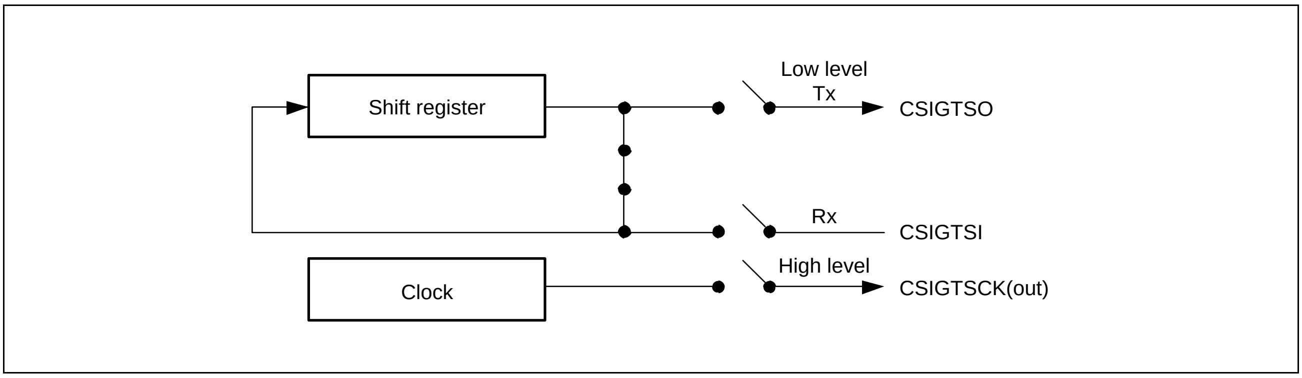

Figure 19.21 Operation in Loop-Back Mode

19.5.10 Error Detection

CSIG can detect three error types:

- Data consistency check error (transmission data)
- Parity error (received data)
- Overrun error (received data)

Data consistency check error and parity error check functions can be individually enabled or disabled.

If one of these errors is detected, the interrupt INTCSIGTIRE is generated.

19.5.10.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent as an output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIGnCTL1.CSIGnDCS bit (when checking data consistency, make sure that PIPCn.PIPCn_m = 1 for CSIGTSO). It will not be enabled if data transmission is disabled (CSIGnCTL0.CSIGnTXE = 0).

When the data consistency check is enabled, the data transferred from CSIGnTX0W or CSIGnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIGTSO are captured and their logical interpretation is written to the corresponding shift register.

After completion of the transmission, the data sent is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIGTIRE is generated.
- The CSIGnSTR0.CSIGnDCE bit is set.

The data consistency check function is illustrated in the following block diagram.

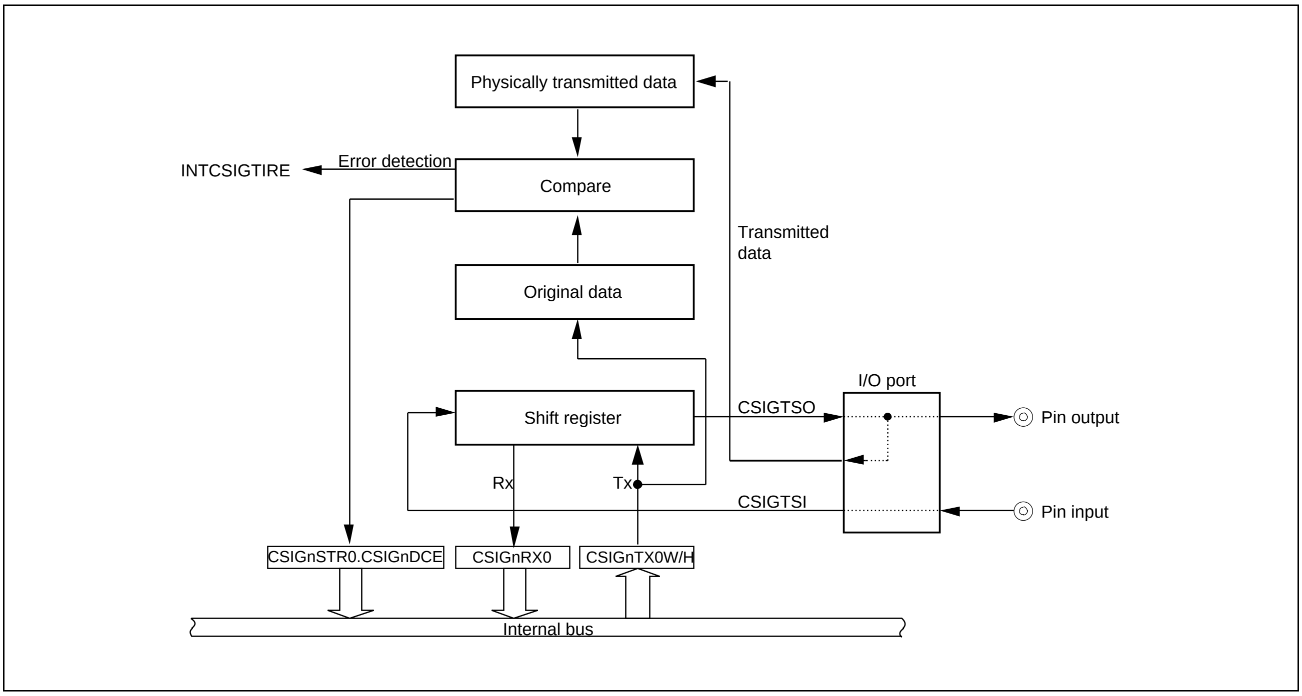

Figure 19.22 Functional Block Diagram of the Data Consistency Check

19.5.10.2 Parity Check

Parity is a common mean to detect a single bit error during data transmission. CSIG can append a parity bit after the last data bit (even if extended data length is used).

The use and type of parity is specified by CSIGnCFG0.CSIGnPS[1:0].

Parity check is enabled if CSIGnCFG0.CSIGnPS[1] = 1.

The parity bit is checked after reception is complete. If a parity error occurs:

- Interrupt INTCSIGTIRE is generated.
- The CSIGnSTR0.CSIGnPE bit is set.

The following figure shows an example.

Data length is 8 bits. The data transmitted is 05_H and 35_H. Parity type is odd.

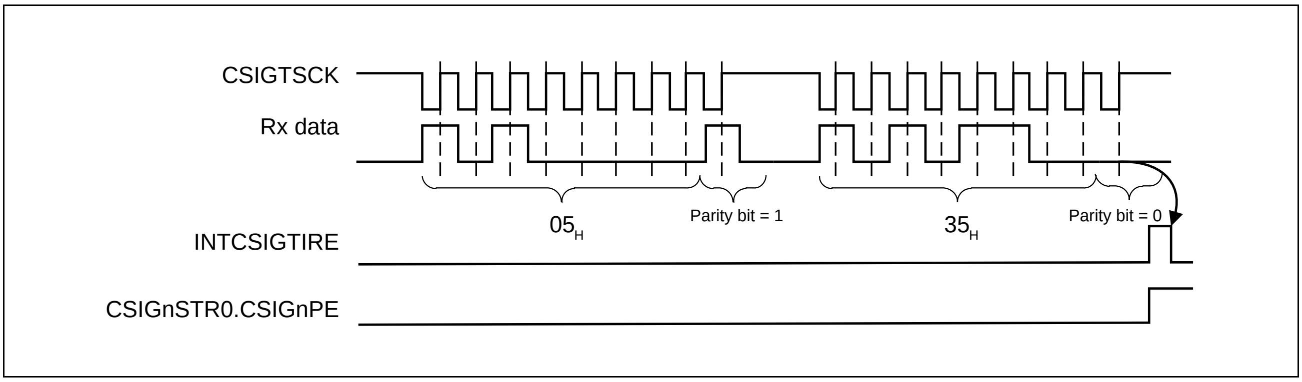

Figure 19.23 Parity Check Example

For the first 8 bits, the parity bit is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

For the second 8 bits, the parity bit is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last data bit.

19.5.10.3 Overrun Error

This error occurs when previously received data still resides in the reception register CSIGnRX0 because it has not been read, and new data is received.

The overrun error is not generated if data reception is disabled (CSIGnCTL0.CSIGnRXE = 0).

If overrun occurs:

- Interrupt INTCSIGTIRE is generated
- The CSIGnSTR0.CSIGnOVE bit is set
- Data in the CSIGnRX0 register is overwritten and communication continues.

The following figure illustrates the overrun error detection function.

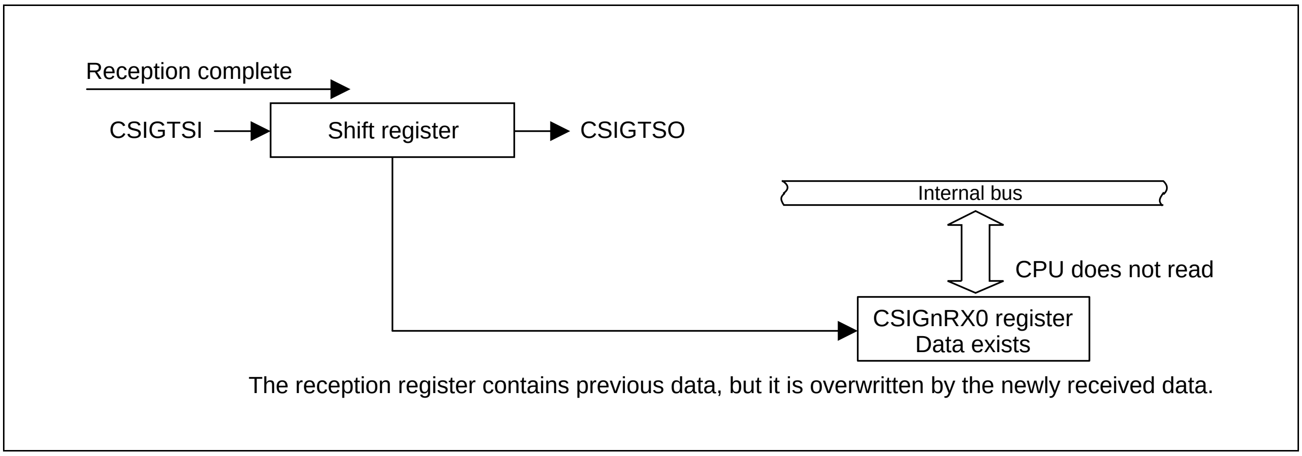

Figure 19.24 Overrun Error Detection

The following figure illustrates an example where:

- Rx data 3 is not read
- Rx data 4 is received, and data is overwritten.

Thus an overrun error occurs.

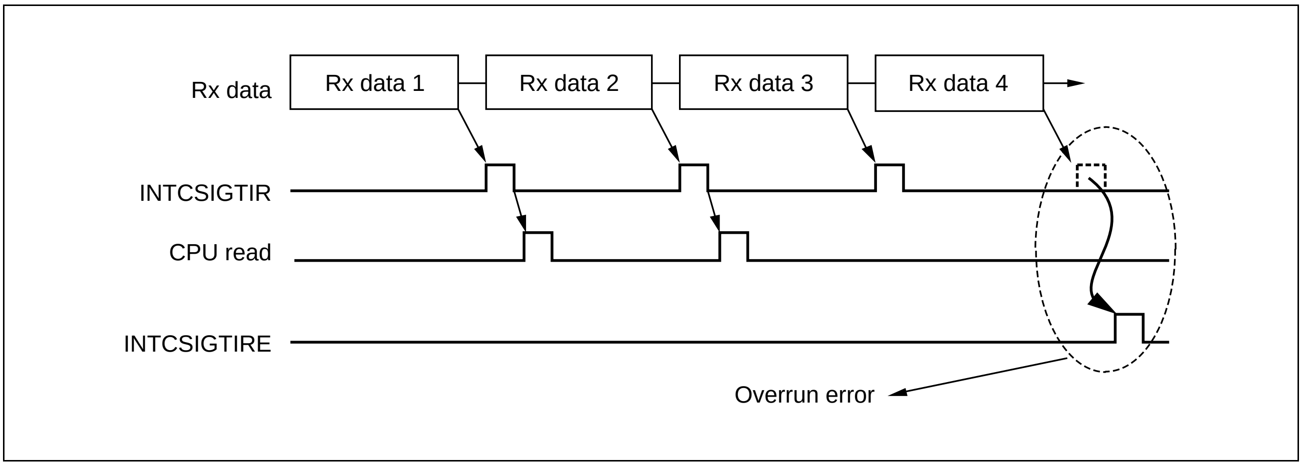

Figure 19.25 Overrun Error Detection — Example

NOTE

An overrun error can be avoided by using the handshake.

When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

For details see **Section 19.5.8, Handshake Function**.

19.6 Operating Procedures

19.6.1 Master Mode Transmission/Reception by DMA

This section describes an example of performing the transmission/reception in master mode in combination with a DMA.

The following instructions are based on the assumption that:

- Transmission data length is 8 bits (CSIGnCFG0.CSIGnDLS[3:0] = 1000_B)
- MSB is transmitted first (CSIGnCFG0.CSIGnDIR = 0)
- INTCSIGTIC interrupt is generated at the end of the transfer (CSIGnCTL1.CSIGnSLIT = 0)
- Normal clock and data phase (CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0)
- The number of data is 10 (0 to 9)

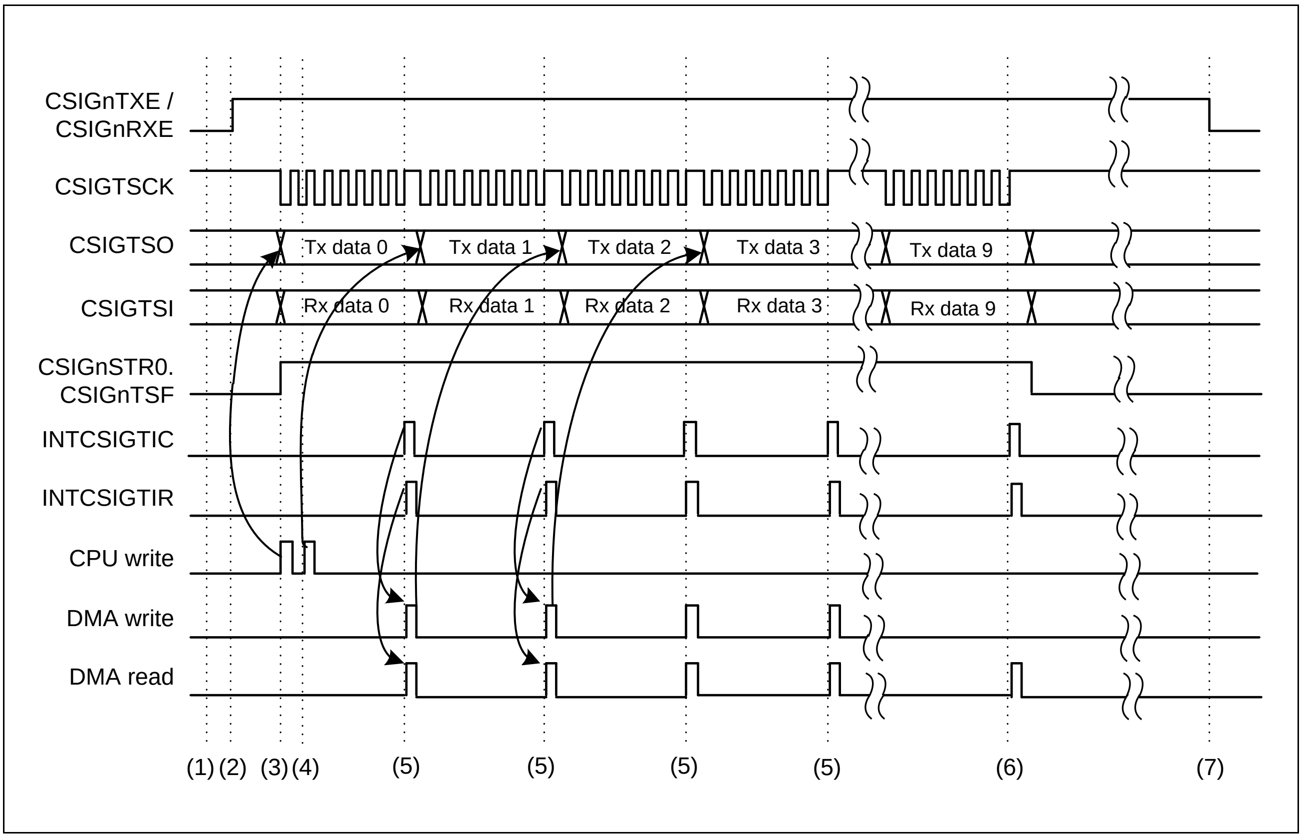

Figure 19.26 Communication in Master Mode

Procedure:

1. Configure the communication protocol in register CSIGnCFG0. Specify the interrupt timing and operation mode by setting the corresponding bits of the CSIGnCTL1 register and CSIGnCTL2 register.
2. In the CSIGnCTL0 register, set CSIGnPWR = 1 (enable clock), CSIGnTXE = 1 (enable transmission), and CSIGnRXE = 1 (enable reception).
3. Write the first data to be sent to the transmission register CSIGnTX0H. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIGnTX0H. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After the transmission or reception of each data, INTCSIGTIC or INTCSIGTIR interrupt is generated. INTCSIGTIC indicates that the next data can be written to CSIGnTX0H. INTCSIGTIR indicates that the reception register CSIGnRX0 must be read.
   In this example, CPU write and DMA write are assumed as equivalent.
6. No more write action is required after the transmission of data 8 completes. Data 9 (the last data) has been written after the transmission of data 7. However, the reception register CSIGnRX0 must be read after the reception of data 8 and 9 completes.
7. Finally, to disable the transmit/receive operation, clear CSIGnCTL0.CSIGnTXE and CSIGnCTL0.CSIGnRXE. When no communication is taking place, set CSIGnCTL0.CSIGnPWR to “0” to minimize the power consumption of the CSIGn.

Section 20 Clocked Serial Interface H (CSIH)

This section contains a generic description of the Clocked Serial Interface H (CSIH).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of CSIH.

20.1 Features of RH850/F1KH, RH850/F1KM CSIH

20.1.1 Number of Units

This microcontroller has the following number of CSIH units.

Each CSIH unit has single channel interface.

Table 20.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of units	5	5	5
Name	CSIHn (n = 0 to 4)	CSIHn (n = 0 to 4)	CSIHn (n = 0 to 4)

Table 20.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of units	4	4	4	4	4
Name	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)

Table 20.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of units	1	1	3	4
Name	CSIHn (n = 0)	CSIHn (n = 0)	CSIHn (n = 0 to 2)	CSIHn (n = 0 to 3)

Table 20.4 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual CSIH units are identified by the index “n”: for example, CSIHnCTL0 (n = 0 to 4) is the CSIHn control register 0.
x	CSIHn has a maximum of 8 chip select signals. Throughout this section, the individual chip select signals are identified by the index “x”: that is, CSx denotes a non-specified chip select signal.
y	A variable used for explanation is identified by the index “y”: for example, CSIHnBRSy is the baud rate setting register of CSIHn.

Table 20.5 Indices (RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual CSIH units are identified by the index “n”: for example, CSIHnCTL0 (n = 0 to 3) is the CSIHn control register 0.
x	CSIHn has a maximum of 8 chip select signals. Throughout this section, the individual chip select signals are identified by the index “x”: that is, CSx denotes a non-specified chip select signal.
y	A variable used for explanation is identified by the index “y”: for example, CSIHnBRSy is the baud rate setting register of CSIHn.

The following table shows values indicated by the indices of each product.

Table 20.6 Indices of Products (RH850/F1KH-D8)

Indices of Each Product		
176 Pins	233 Pins	324 Pins
For the value of x, see **Table 20.9, Number of Chip Select Signals (RH850/F1KH-D8)**.		
y = 0 to 3		

Table 20.7 Indices of Products (RH850/F1KM-S4)

Indices of Each Product				
100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
For the value of x, see **Table 20.10, Number of Chip Select Signals (RH850/F1KM-S4)**.				
y = 0 to 3				

Table 20.8 Indices of Products (RH850/F1KM-S1)

Indices of Each Product			
48 Pins	64 Pins	80 Pins	100 Pins
For the value of x, see **Table 20.11, Number of Chip Select Signals (RH850/F1KM-S1)**.			
y = 0 to 3			

The numbers of chip select signals for each of the CSIH units are listed in the following table.

Table 20.9 Number of Chip Select Signals (RH850/F1KH-D8)

	Chip Select Index		
Unit Name	176 Pins	233 Pins	324 Pins
CSIH0	CSx (x = 0 to 7)	CSx (x = 0 to 7)	CSx (x = 0 to 7)
CSIH1	CSx (x = 0 to 5)	CSx (x = 0 to 5)	CSx (x = 0 to 5)
CSIH2	CSx (x = 0 to 5)	CSx (x = 0 to 5)	CSx (x = 0 to 5)
CSIH3	CSx (x = 0 to 3)	CSx (x = 0 to 3)	CSx (x = 0 to 3)
CSIH4	CSx (x = 0,1)	CSx (x = 0,1)	CSx (x = 0,1)

Table 20.10 Number of Chip Select Signals (RH850/F1KM-S4)

	Chip Select Index				
Unit Name	100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
CSIH0	CSx (x = 0 to 7)	CSx (x = 0 to 7)	CSx (x = 0 to 7)	CSx (x = 0 to 7)	CSx (x = 0 to 7)
CSIH1	CSx (x = 0 to 2, 4, 5)	CSx (x = 0 to 5)	CSx (x = 0 to 5)	CSx (x = 0 to 5)	CSx (x = 0 to 5)
CSIH2	CSx (x = 0 to 3)	CSx (x = 0 to 5)	CSx (x = 0 to 5)	CSx (x = 0 to 5)	CSx (x = 0 to 5)
CSIH3	CSx (x = 0 to 3)	CSx (x = 0 to 3)	CSx (x = 0 to 3)	CSx (x = 0 to 3)	CSx (x = 0 to 3)

Table 20.11 Number of Chip Select Signals (RH850/F1KM-S1)

	Chip Select Index			
Unit Name	48 Pins	64 Pins	80 Pins	100 Pins
CSIH0	CSx (x = 0, 1)	CSx (x = 0 to 3)	CSx (x = 0 to 7)	CSx (x = 0 to 7)
CSIH1	—	—	CSx (x = 0 to 3)	CSx (x = 0 to 5)
CSIH2	—	—	CSx (x = 0 to 3)	CSx (x = 0 to 3)
CSIH3	—	—	—	CSx (x = 0 to 3)

20.1.2 Register Base Addresses

CSIH base addresses are listed in the following table.

CSIH register addresses are given as offsets from the base addresses.

Table 20.12 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<CSIH0_base>	FFD8 0000_H
<CSIH1_base>	FFD8 2000_H
<CSIH2_base>	FFD8 4000_H
<CSIH3_base>	FFD8 6000_H
<CSIH4_base>	FFD9 0000_H

Table 20.13 Register Base Addresses (RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<CSIH0_base>	FFD8 0000_H
<CSIH1_base>	FFD8 2000_H
<CSIH2_base>	FFD8 4000_H
<CSIH3_base>	FFD8 6000_H

20.1.3 Clock Supply

The CSIH clock supply is shown in the following table.

Table 20.14 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
CSIHn	PCLK	CKSCLK_ICSI	Communication clock
	Register access clock	CPUCLK_L, CKSCLK_ICSI	Bus clock

20.1.4 Interrupt Requests

CSIH interrupt requests are listed in the following table.

Table 20.15 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
CSIH0			
INTCSIHTIC	Communication status interrupt	29	70
INTCSIHTIR	Receive status interrupt	30	71
INTCSIHTIRE	Communication error interrupt	31	—
INTCSIHTIJC	Job completion interrupt	20, 32	72
CSIH1			
INTCSIHTIC	Communication status interrupt	16, 116	28
INTCSIHTIR	Receive status interrupt	17, 117	29
INTCSIHTIRE	Communication error interrupt	27, 118	—
INTCSIHTIJC	Job completion interrupt	28, 119	30
CSIH2			
INTCSIHTIC	Communication status interrupt	8, 132	89
INTCSIHTIR	Receive status interrupt	10, 133	90
INTCSIHTIRE	Communication error interrupt	11, 134	—
INTCSIHTIJC	Job completion interrupt	12, 135	91
CSIH3			
INTCSIHTIC	Communication status interrupt	9, 158	41
INTCSIHTIR	Receive status interrupt	13, 159	42
INTCSIHTIRE	Communication error interrupt	14, 160	—
INTCSIHTIJC	Job completion interrupt	15, 161	43
CSIH4			
INTCSIHTIC	Communication status interrupt	124	58
INTCSIHTIR	Receive status interrupt	125	59
INTCSIHTIRE	Communication error interrupt	126	—
INTCSIHTIJC	Job completion interrupt	127	76

Table 20.16 Interrupt Requests (RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
CSIH0			
INTCSIHTIC	Communication status interrupt	29	70
INTCSIHTIR	Receive status interrupt	30	71
INTCSIHTIRE	Communication error interrupt	31	—
INTCSIHTIJC	Job completion interrupt	20, 32	72
CSIH1			
INTCSIHTIC	Communication status interrupt	16, 116	28
INTCSIHTIR	Receive status interrupt	17, 117	29
INTCSIHTIRE	Communication error interrupt	27, 118	—
INTCSIHTIJC	Job completion interrupt	28, 119	30
CSIH2			
INTCSIHTIC	Communication status interrupt	8, 132	89
INTCSIHTIR	Receive status interrupt	10, 133	90
INTCSIHTIRE	Communication error interrupt	11, 134	—
INTCSIHTIJC	Job completion interrupt	12, 135	91
CSIH3			
INTCSIHTIC	Communication status interrupt	9, 158	41
INTCSIHTIR	Receive status interrupt	13, 159	42
INTCSIHTIRE	Communication error interrupt	14, 160	—
INTCSIHTIJC	Job completion interrupt	15, 161	43

20.1.5 Reset Sources

CSIH reset sources are listed in the following table. CSIH is initialized by these reset sources.

Table 20.17 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
CSIHn	All reset sources (ISORES)

20.1.6 External Input/Output Signals

External input/output signals of CSIH are listed below.

Table 20.18 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
CSIH0		
CSIHTSCK	Serial clock signal	CSIH0SC*2
CSIHTSI	Serial data input signal	CSIH0SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH0SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH0RYI
CSIHTSO	Serial data output signal	CSIH0SO*2
CSIHTRYO	Ready/busy output signal	CSIH0RYO
CSIHTCSS[7:0]*1	Chip select signal	CSIH0CSS[7:0]*1
CSIH1		
CSIHTSCK	Serial clock signal	CSIH1SC*2
CSIHTSI	Serial data input signal	CSIH1SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH1SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH1RYI
CSIHTSO	Serial data output signal	CSIH1SO*2
CSIHTRYO	Ready/busy output signal	CSIH1RYO
CSIHTCSS[5:0]*1	Chip select signal	CSIH1CSS[5:0]*1
CSIH2		
CSIHTSCK	Serial clock signal	CSIH2SC*2
CSIHTSI	Serial data input signal	CSIH2SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH2SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH2RYI
CSIHTSO	Serial data output signal	CSIH2SO*2
CSIHTRYO	Ready/busy output signal	CSIH2RYO
CSIHTCSS[5:0]*1	Chip select signal	CSIH2CSS[5:0]*1
CSIH3		
CSIHTSCK	Serial clock signal	CSIH3SC*2
CSIHTSI	Serial data input signal	CSIH3SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH3SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH3RYI
CSIHTSO	Serial data output signal	CSIH3SO*2
CSIHTRYO	Ready/busy output signal	CSIH3RYO
CSIHTCSS[3:0]*1	Chip select signal	CSIH3CSS[3:0]*1
CSIH4		
CSIHTSCK	Serial clock signal	CSIH4SC*2
CSIHTSI	Serial data input signal	CSIH4SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH4SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH4RYI
CSIHTSO	Serial data output signal	CSIH4SO*2
CSIHTRYO	Ready/busy output signal	CSIH4RYO
CSIHTCSS[1:0]*1	Chip select signal	CSIH4CSS[1:0]*1

Note 1. For the number of chip select signals, see **Table 20.9, Number of Chip Select Signals (RH850/F1KH-D8)**.

Note 2. For the port pins that are used as CSIHnSO and CSIHnSC, set the output driver strength to high (PDSCn_m = 1).

Table 20.19 External Input/Output Signals (RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
CSIH0		
CSIHTSCK	Serial clock signal	CSIH0SC*2
CSIHTSI	Serial data input signal	CSIH0SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH0SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH0RYI
CSIHTSO	Serial data output signal	CSIH0SO*2
CSIHTRYO	Ready/busy output signal	CSIH0RYO
CSIHTCSS[7:0]*1	Chip select signal	CSIH0CSS[7:0]*1
CSIH1		
CSIHTSCK	Serial clock signal	CSIH1SC*2
CSIHTSI	Serial data input signal	CSIH1SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH1SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH1RYI
CSIHTSO	Serial data output signal	CSIH1SO*2
CSIHTRYO	Ready/busy output signal	CSIH1RYO
CSIHTCSS[5:0]*1	Chip select signal	CSIH1CSS[5:0]*1
CSIH2		
CSIHTSCK	Serial clock signal	CSIH2SC*2
CSIHTSI	Serial data input signal	CSIH2SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH2SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH2RYI
CSIHTSO	Serial data output signal	CSIH2SO*2
CSIHTRYO	Ready/busy output signal	CSIH2RYO
CSIHTCSS[5:0]*1	Chip select signal	CSIH2CSS[5:0]*1
CSIH3		
CSIHTSCK	Serial clock signal	CSIH3SC*2
CSIHTSI	Serial data input signal	CSIH3SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH3SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH3RYI
CSIHTSO	Serial data output signal	CSIH3SO*2
CSIHTRYO	Ready/busy output signal	CSIH3RYO
CSIHTCSS[3:0]*1	Chip select signal	CSIH3CSS[3:0]*1

Note 1. For the number of chip select signals, see **Table 20.10, Number of Chip Select Signals (RH850/F1KM-S4)**, **Table 20.11, Number of Chip Select Signals (RH850/F1KM-S1)**.

Note 2. For the port pins that are used as CSIHnSO and CSIHnSC, set the output driver strength to high (PDSCn_m = 1).

CAUTION

When port P8_6 is used as CSIH0CSS4, port P8_6 pin outputs a low-level $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is deasserted.

For details, see **Section 2A.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**, **Section 2B.11.1.1, P8_6: $\overline{\text{RESETOUT}}$** and **Section 2C.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

20.1.7 Data Consistency Check

The port and the alternative function for data consistency check of CSIHnSO (CSIHTSO) output are shown in the following table. See **Section 20.5.12, Error Detection** for details on data consistency checking.

Table 20.20 Port Pins for Data Consistency Checking (RH850/F1KH-D8)

Unit Signal Name	Port Pin Name	Alternative Function
CSIH0		
CSIHTSO	P0_3	ALT_OUT4
CSIH1		
CSIHTSO	P0_5	ALT_OUT3
	P10_2	ALT_OUT5
CSIH2

20.2 Overview

20.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode or slave mode is selectable
- Multiple slaves configuration and RCB (Recessive Configuration for Broadcasting) are possible since there are to eight configurable chip select output signals
- Slave select input signal ($\overline{\text{CSIHTSSI}}$) is usable
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, whereas it is determined by the input clock in slave mode.
- Maximum transfer clock frequency:
  - Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6) for all products
  - Slave mode: 8.0 MHz (however, it must be equal to or lower than PCLK/6) for CSIH0 in RH850/F1KM-S1 48- and 64-pin products, CSIH2 for other products
- Clock phases and data phases are selectable
- Data transfer with MSB first or LSB first is selectable
- Transfer data length is selectable from 2 to 16 bits in 1-bit units
- Built-in EDL (extended data length) function for transferring more than 16 bits of data
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Built-in handshake function
- Built-in error detection (data consistency check, parity, time-out, overflow, and overrun)
- Support of job concept
- 128 words I/O buffer memory
- Direct access mode or memory mode (FIFO, dual buffer, and transmit-only buffer) is selectable
- Four different interrupt request signals (INTCSIHTIC, INTCSIHTIR, INTCSIHTIRE, INTCSIHTIJC)
- Built-in LBM (Loop Back Mode) function for self-test
- CPU-controlled high-priority communication function
- Enforced chip select idle setting
- Built-in RCB (Recessive Configuration for Broadcasting) bit
- Built-in JOB enable control bit for AUTOSAR

20.2.2 Functional Overview Description

The CSIH uses three signals for communication:

- Transmission clock CSIHTSCK (output in master mode, input in slave mode)
- Data output signal CSIHTSO
- Data input signal CSIHTSI

Additional signals are available for external control and monitoring:

- $\overline{\text{CSIHTSSI}}$: Slave select input signal
- CSIHTRYO: Ready/busy output signal (handshake signal)
- CSIHTRYI: Ready/busy input signal (handshake signal)
- CSIHTCSS[7:0]: Chip select signals

Data transmission is bit-wise and serial, and performed synchronously with the transmission clock.

The following table shows the most important registers for setting up the CSIH.

Table 20.23 Main Registers of CSIH

Register	Function
CSIHnCTL0	Enables/disables serial clock, and permits/ prohibits data transmission and data reception. Defines end-of-job behavior and enables/disables (bypasses) buffering.
CSIHnCTL1	Controls options such as interrupt timing, extended data length, job feature, data consistency check, loop-back mode, handshake, etc.
CSIHnCTL2	Selects master or slave mode, and the transfer clock frequency of the built-in baud rate generator (BRG) in master mode.
CSIHnBRSy	Specifies the transfer clock frequency for each chip select signal.
CSIHnMCTL0	Selects memory mode and specifies the time-out value.
CSIHnMCTL1	Controls the memory in FIFO mode.
CSIHnMCTL2	Controls the memory in dual buffer mode.
CSIHnCFGx	Configures the communication protocol for each chip select signal.

20.2.3 Block Diagram

The following block diagram shows the main components of the CSIH.

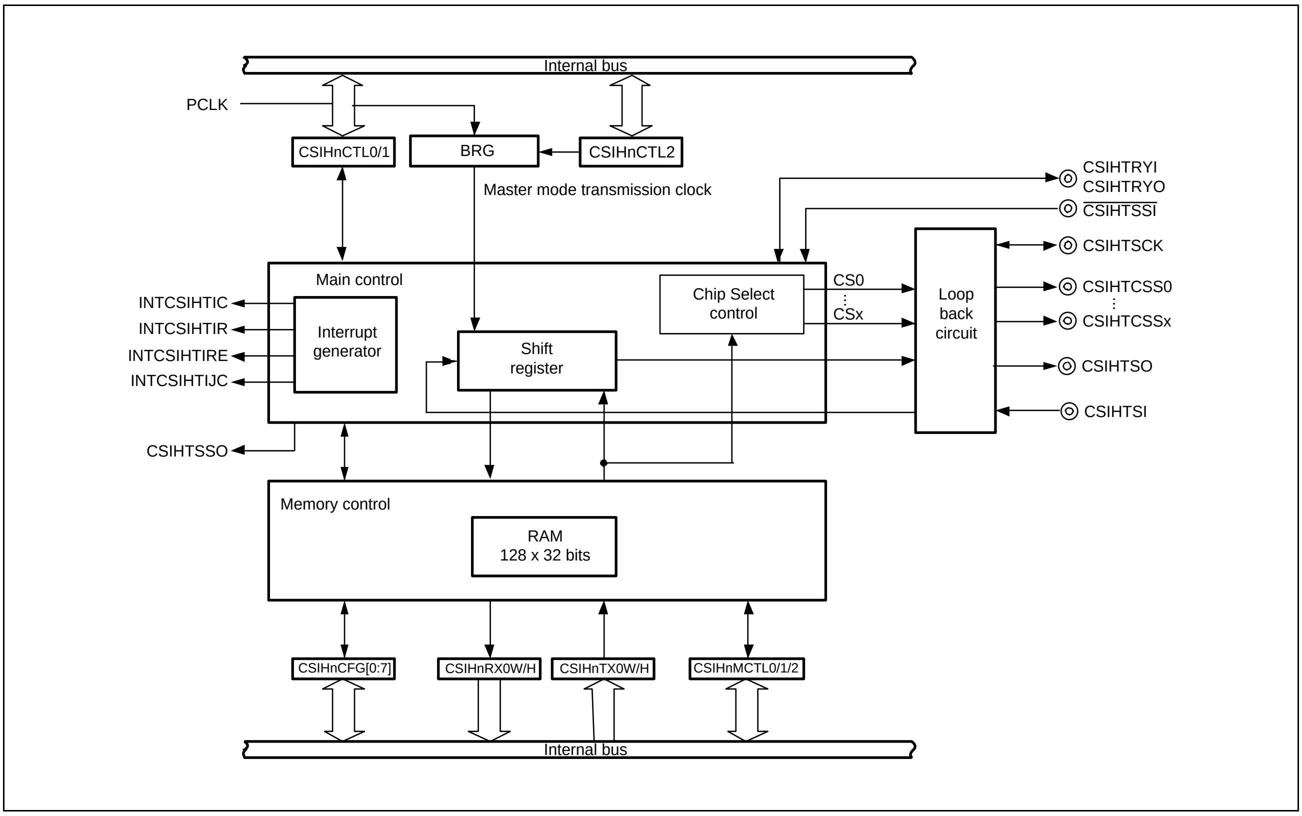

Figure 20.1 CSIH Block Diagram

In master mode, the transmission clock CSIHTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

The built-in memory can be configured as FIFO, dual buffer (separate transmit and receive buffers), or transmit-only buffer. It can also be bypassed for data transmission and reception without buffering.

The loop back circuit disconnects the CSIH completely from the ports and supports internal self-test.

NOTE

This section describes the following modes:

- The “operating mode” is either master mode or slave mode. The master can control and communicate with several slaves only in master mode (for details, see **Section 20.5.1, Operating Modes (Master/Slave)).**
- The “job mode” is related to the AUTOSAR job concept (for details, see **Section 20.5.3.3, Job Concept**).
- The “memory mode” accords with the various configurations of the associated buffer memory (for details, see **Section 20.5.6, CSIH Buffer Memory**).
- The “data transfer mode” specifies the type of communication – transmit-only, receive-only, or transmit/receive (for details, see **Section 20.5.7, Data Transfer Modes**).

20.3 Registers

20.3.1 List of Registers

CSIH registers are listed in the following table.

For details about <CSIHn_base>, see **Section 20.1.2, Register Base Addresses**.

Table 20.24 List of Registers

Module Name	Register Name	Symbol	Address
CSIHn	CSIHn control register 0	CSIHnCTL0	<CSIHn_base> + 0000_H
	CSIHn control register 1	CSIHnCTL1	<CSIHn_base> + 0010_H
	CSIHn control register 2	CSIHnCTL2	<CSIHn_base> + 0014_H
	CSIHn status register 0	CSIHnSTR0	<CSIHn_base> + 0004_H
	CSIHn status clear register 0	CSIHnSTCR0	<CSIHn_base> + 0008_H
	CSIHn memory control register 0	CSIHnMCTL0	<CSIHn_base> + 1040_H
	CSIHn memory control register 1	CSIHnMCTL1	<CSIHn_base> + 1000_H
	CSIHn memory control register 2	CSIHnMCTL2	<CSIHn_base> + 1004_H
	CSIHn memory read/write pointer register 0	CSIHnMRWP0	<CSIHn_base> + 1018_H
	CSIHn configuration register 0	CSIHnCFG0	<CSIHn_base> + 1044_H
	CSIHn configuration register 1	CSIHnCFG1	<CSIHn_base> + 1048_H
	CSIHn configuration register 2	CSIHnCFG2	<CSIHn_base> + $104C_H$
	CSIHn configuration register 3	CSIHnCFG3	<CSIHn_base> + 1050_H
	CSIHn configuration register 4	CSIHnCFG4	<CSIHn_base> + 1054_H
	CSIHn configuration register 5	CSIHnCFG5	<CSIHn_base> + 1058_H
	CSIHn configuration register 6	CSIHnCFG6	<CSIHn_base> + $105C_H$
	CSIHn configuration register 7	CSIHnCFG7	<CSIHn_base> + 1060_H
	CSIHn transmit data register 0 for word access	CSIHnTX0W	<CSIHn_base> + 1008_H
	CSIHn transmit data register 0 for half word access	CSIHnTX0H	<CSIHn_base> + $100C_H$
	CSIHn receive data register 0 for word access	CSIHnRX0W	<CSIHn_base> + 1010_H
	CSIHn receive data register 0 for half word access	CSIHnRX0H	<CSIHn_base> + 1014_H
	CSIHn emulation register	CSIHnEMU	<CSIHn_base> + 0018_H
	CSIHn baud rate setting register 0	CSIHnBRS0	<CSIHn_base> + 1068_H
	CSIHn baud rate setting register 1	CSIHnBRS1	<CSIHn_base> + $106C_H$
	CSIHn baud rate setting register 2	CSIHnBRS2	<CSIHn_base> + 1070_H
	CSIHn baud rate setting register 3	CSIHnBRS3	<CSIHn_base> + 1074_H

20.3.2 CSIHnCTL0 — CSIHn Control Register 0

This register controls the operation clock, enables/disables transmission/reception, and enables/disables the memory allocated for transmission and/or reception. It forces the stop of communication at the end of the current job.

Access: This register can be read or written in 8-bit units.

Address: <CSIHn_base> + 0000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CSIHnPWR	CSIHnTXE	CSIHnRXE	—	—	—	CSIHnJOBE	CSIHnMBS
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R/W	R/W

Table 20.25 CSIHnCTL0 Register Contents

Bit Position	Bit Name	Function
7	CSIHnPWR	Controls the operation clock. 0: Stops operation clock. 1: Supplies operation clock. Clearing CSIHnPWR to 0 resets the internal circuits, stops operation, and sets CSIH to standby state. Clock supply to internal circuits stops. If CSIHnPWR is cleared (to 0) during communication, ongoing communication is immediately aborted. In this case, the communication setting must be reconfigured.
6	CSIHnTXE	Enables/disables transmission. 0: Disables transmission. 1: Enables transmission.
5	CSIHnRXE	Enables/disables reception. 0: Disables reception. 1: Enables reception.
4 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CSIHnJOBE	Stops communication at the end of the current job (communication ends if data is written to the transmission buffer when CSIHnTX0W.CSIHnEOJ = 1 (job completion)). 0: Communication stop is not requested. 1: Stops communication. This bit can be used to abort an ongoing job. This bit is cleared to 0 automatically. Even if this bit is set to 1, the read value is always 0. In FIFO mode, the pointer must be cleared by setting CSIHnSTCR0.CSIHnPCT = 1 before the next communication is started
0	CSIHnMBS	Bypasses the memory for transmission and/or reception data. 0: Memory mode CSIH memory is used for transmission and/or reception data. 1: Direct access mode CSIH memory is bypassed.

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.3 CSIHnCTL1 — CSIHn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, handshake functionality, and job mode. It selects the active output level of each chip select signal and the behavior of the chip select signals after the transfer of the final data.

Access: This register can be read or written in 32-bit units.

Address: <CSIHn_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CSIHn SLRS	—	—	—	—	—	CSIHn PHE	CSIHn CKR	CSIHn SLIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn CSL7	CSIHn CSL6	CSIHn CSL5	CSIHn CSL4	CSIHn CSL3	CSIHn CSL2	CSIHn CSL1	CSIHn CSL0	CSIHn EDLE	CSIHn JE	CSIHn DCS	CSIHn CSRI	CSIHn LBM	CSIHn SIT	CSIHn HSE	CSIHn SSE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 20.26 CSIHnCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	CSIHnSLRS	Sets the internal synchronization timing for receive data input. 0: Rising edge of PCLK 1: Falling edge of PCLK For differences by the setting, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.
23 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	CSIHnPHE	Sets the CPU-controlled priority-based communication function. 0: The CPU-controlled high-priority communication function is disabled. 1: The CPU-controlled high-priority communication function is enabled. To enable the CPU-controlled high-priority communication function, set this bit to 1 and set CSIHnJE = 1. This bit can only be set in transmit-only buffer mode.
17	CSIHnCKR	CSIHTSCK Clock Inversion Function 0: The default level of CSIHTSCK is high 1: The default level of CSIHTSCK is low For details, see **Section 20.3.11, CSIHnCFGx — CSIHn Configuration Register x (x = 0 to 7)**.
16	CSIHnSLIT	Selects the timing of interrupt INTCSIHTIC. 0: Normal interrupt timing (interrupt is generated after the transfer) 1: As soon as the contents of the CSIHnTX0W/H register are transferred to the shift register, an interrupt is generated (this function is activated only in direct access mode/transmit-only buffer mode). For details, see **Section 20.4.3, INTCSIHTIC (Communication Status Interrupt)**.
15 to 8	CSIHnCSLx	Selects the active output level of chip select signal x (CSIHTCSSx). 0: Chip select is active low. 1: Chip select is active high. For details, see **Section 20.5.3, Chip Selection (CS) Features**.

Table 20.26 CSIHnCTL1 Register Contents

Bit Position	Bit Name	Function
7	CSIHnEDLE	Enables/disables extended data length (EDL) mode. 0: Disables extended data length mode. 1: Enables extended data length mode. For details, see **Section 20.5.8.2, Data Length Greater than 16 Bits**.
6	CSIHnJE	Enables/disables job mode. 0: Disables job mode. 1: Enables job mode. For details, see **Section 20.5.3.3, Job Concept**. The CSIHnCTL0.CSIHnJOBE, CSIHnTX0W.CSIHnEOJ, and CSIHnTX0W. CSIHnCIRE bits are enabled only when CSIHnJE = 1. Setting this bit in slave mode is prohibited. In addition, to enable the CPU-controlled high-priority communication function, set this bit to 1 as well as CSIHnPHE = 1.
5	CSIHnDCS	Enables/disables data consistency check. 0: Disables data consistency check. 1: Enables data consistency check. For details, see **Section 20.5.12.1, Data Consistency Check**.
4	CSIHnCSRI	Defines chip select signal behavior after last data transfer. 0: Chip select signal retains the active level. 1: Chip select signal returns to the inactive level. The last data is determined at the interrupt timing in direct access mode or FIFO mode. When CSIHnCTL1.CSIHnSLIT = 1, the last data is determined in direct access mode.
3	CSIHnLBM	Controls loop-back mode (LBM). 0: Deactivates loop-back mode. 1: Activates loop-back mode. For details, see **Section 20.5.13, Loop-Back Mode**.
2	CSIHnSIT	Selects interrupt delay mode. 0: No delay is generated. 1: Half clock delay is generated for all interrupts. This bit is only valid in master mode. In slave mode, no delay is generated. For details, see **Section 20.4.2, Interrupt Delay**.
1	CSIHnHSE	Enables/disables the handshake function. 0: Disables the handshake function. 1: Enables the handshake function. For details see **Section 20.5.11, Handshake Function**.
0	CSIHnSSE	Enables/disables the slave select function. 0: Input signal $\overline{\text{CSIHTSSI}}$ is disabled. 1: Input signal $\overline{\text{CSIHTSSI}}$ is recognized. If the slave select function is not used, this bit must be set to 0 (see also **Section 20.5.2, Master/Slave Connections**).

Details about CSIHnCTL1.CSIHnSSE are shown in the following tables.

Table 20.27 Operation of the Slave Select Function during Reception

CSIHnCTL0. CSIHnRXE	CSIHnCTL1. CSIHnSSE	$\overline{\text{CSIHTSSI}}$	Receive Operation
0	—	—	Reception is prohibited
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

Table 20.28 Operation of the Slave Select Function during Transmission

CSIHnCTL0.CSIHnTXE	CSIHnCTL1.CSIHnSSE	$\overline{\text{CSIHTSSI}}$	Transmit Operation
0	—	—	Transmission is prohibited
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.4 CSIHnCTL2 — CSIHn Control Register 2

This register selects operating mode and the reference clock value, and specifies the transfer clock frequency.

For details see **Section 20.5.5, Transmission Clock Selection**.

Access: This register can be read or written in 16-bit units.

Address: <CSIHn_base> + 0014$_H$

Value after reset: E000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnPRS[2:0]			—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 20.29 CSIHnCTL2 Register Contents

Bit Position	Bit Name	Function
15 to 13	CSIHnPRS[2:0]	These bits select the operation mode and the reference clock value.
12 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CSIHnPRS2	CSIHnPRS1	CSIHnPRS0	Selection of Reference Clock (PRSOUT)
0	0	0	PCLK (Master mode)
0	0	1	PCLK/2 (Master mode)
0	1	0	PCLK/4 (Master mode)
0	1	1	PCLK/8 (Master mode)
1	0	0	PCLK/16 (Master mode)
1	0	1	PCLK/32 (Master mode)
1	1	0	PCLK/64 (Master mode)
1	1	1	External clock via CSIHTSCK(in) (Slave mode)

In master mode, the following bits are used to set the transfer clock frequency:

CSIHnCTL2.CSIHnPRS[2:0], CSIHnCFGx.CSIHnBRSS[1:0], CSIHnBRSy.CSIHnBRS[11:0]

In addition, any of the four different transfer clock frequency settings that are specified by the CSIHnBRSy.CSIHnBRS[11:0] bits is selected for each chip select signal. To select the transfer clock frequency setting for each chip select signal, use the CSIHnCFGx.CSIHnBRSS[1:0] bits.

The following table shows the relationship between CSIHnCFGx.CSIHnBRSS[1:0] and CSIHnBRSy.CSIHnBRS[11:0].

CSIHnCFGx.CSIHnBRSS[1:0]	Transfer Clock Frequency Setting Bit to be Selected
00	CSIHnBRS0.CSIHnBRS[11:0]
01	CSIHnBRS1.CSIHnBRS[11:0]
10	CSIHnBRS2.CSIHnBRS[11:0]
11	CSIHnBRS3.CSIHnBRS[11:0]

The following table shows the relationship between the transfer clock frequency and the transfer clock frequency setting (CSIHnBRSy[11:0]) selected by the CSIHnBRSS[1:0] bits when the bit value of the CSIHnPRS[2:0] bits is α.

CSIHnBRSy[11:0]	Transfer Clock Frequency
0	BRG stopped
1	PCLK / (2^{α} × 1 × 2)
2	PCLK / (2^{α} × 2 × 2)
3	PCLK / (2^{α} × 3 × 2)
4	PCLK / (2^{α} × 4 × 2)
...	…
4095	PCLK / (2^{α} × 4095× 2)

When a time-out error is used in slave mode, the clock selected by this setting is used. In slave mode, the CSIHnPRS[2:0] bits are set to 111_B. In this case, the prescaler has the same setting as when the CSIHnPRS[2:0] bits are set to 000_B. When using a time-out error, set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000_H.

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.5 CSIHnSTR0 — CSIHn Status Register 0

This register indicates the status of CSIH.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <CSIHn_base> + 0004_H

Value after reset: $0000\ 0010_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

<tr><th rowspan="2">Slave Mode</th><th colspan="2">Timing to Set</th><th rowspan="2">Timing to Clear</th></tr>
<tr><th>Direct Access Mode, FIFO Mode</th><th>Dual Buffer Mode, Transmit-Only Buffer Mode</th></tr>
<tr><td>Transmit-only mode</td><td rowspan="2">Data is written to a transmit register (CSIHnTX0W/ CSIHnTX0H)</td><td rowspan="3">CSIHnMCTL2.CSIHnBTST bit is set</td><td rowspan="3">Within a half clock cycle the last serial clock edge</td></tr>
<tr><td>Transmit/receive mode</td></tr>
<tr><td>Receive-only mode</td><td>Input timing of CSIHTSCK</td></tr>
</table>
</td></tr>
<tr><td>6</td><td>Reserved</td><td>When read, the value after reset is returned.</td></tr>
<tr><td>5</td><td>CSIHnFLF</td><td>A flag indicating that the buffer is full in FIFO mode.
0: FIFO buffer is not full.
1: FIFO buffer is full.
This bit is cleared by CSIHnSTCR0.CSIHnPCT.
The FIFO buffer might be filled with unsent data or received data.</td></tr>
</table>

Table 20.30 CSIHnSTR0 Register Contents

Bit Position	Bit Name	Function
4	CSIHnEMF	A flag indicating that the buffer is empty in FIFO mode. 0: FIFO buffer is not empty. 1: FIFO buffer is empty. This bit is set to 1 by CSIHnSTCR0.CSIHnPCT. This bit is set to 1 when CSIHnSTR0.CSIHnSRP[7:0] + CSIHnSTR0.CSIHnSPF[7:0] = 00_H. The FIFO buffer might be filled with unsent data or received data.
3	CSIHnDCE	Data Consistency Check Error Flag 0: No data consistency check error is detected. 1: Data consistency check error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnDCEC. When setting to 1 by data consistency check error detection and clearing to 0 by CSIHnSTCR0.CSIHnDCEC occur simultaneously, setting to 1 takes precedence over clearing to 0. This bit is initialized when CSIHnCTL0.CSIHnPWR is changed from 0 to 1 or from 1 to 0.
2	Reserved	When read, the value after reset is returned.
1	CSIHnPE	Parity Error Flag 0: No parity error is detected. 1: Parity error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnPEC. When setting to 1 due to parity error detection and clearing to 0 by CSIHnSTCR0.CSIHnPEC occur simultaneously, setting to 1 by parity error detection takes precedence over clearing to 0. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.
0	CSIHnOVE	Overrun Error Flag (Fixed to 0 in dual buffer mode) 0: No overrun error is detected. 1: Overrun error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnOVEC. When setting to 1 due to overrun error detection and clearing to 0 by writing to CSIHnSTCR0.CSIHnOVEC occur simultaneously, setting to 1 by overrun error detection takes precedence over clearing to 0. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.

Table 20.31 Behaviors in Various Memory Modes

Bit Name	Bit Position	Direct Access Mode	FIFO Mode	Transmit-Only Buffer Mode	Dual Buffer Mode
CSIHnSRP[7:0]	31 to 24	Fixed to 0	Number of received data	Fixed to 0	Fixed to 0
CSIHnSPF[7:0]	23 to 16	Fixed to 0	Number of untransmitted data packets	Fixed to 0	Fixed to 0
CSIHnTMOE	15	Fixed to 0	0: No error is detected. 1: An error is detected.	Fixed to 0	Fixed to 0
CSIHnOFE	14	Fixed to 0	0: No error is detected. 1: An error is detected.	Fixed to 0	Fixed to 0
CSIHnTSF	7	0: Idle state 1: Communication is in progress or being prepared			
CSIHnFLF	5	Fixed to 0	0: FIFO is not full 1: FIFO is full	Fixed to 0	Fixed to 0
CSIHnEMF	4	Fixed to 1	0: FIFO is not empty 1: FIFO is empty	Fixed to 1	Fixed to 1
CSIHnDCE	3	0: No error is detected. 1: An error is detected.			
CSIHnPE	1	0: No error is detected. 1: An error is detected.			
CSIHnOVE	0	0: No error is detected. 1: An error is detected.	0: No error is detected. 1: An error is detected.	0: No error is detected. 1: An error is detected.	Fixed to 0

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.6 CSIHnSTCR0 — CSIHn Status Clear Register 0

This register clears the status flags of the CSIHnSTR0 status register.

Access:	This register can be read or written in 16-bit units. When read, the value 0000$_H$ is always returned.
Address:	<CSIHn_base> + 0008$_H$
Value after reset:	0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<tr><td>…</td><td>…</td></tr>
<tr><td>11111_B</td><td>Time-out is (31 × 8 × BRG output clocks)</td></tr>
</table>
CAUTION: Changing the time-out setting is only permitted when CSIHnCTL0.CSIHnPWR = 0.
Set the CSIHnTO[4:0] bits to 00000_B in direct access mode, dual buffer mode, or transmit-only buffer mode (except FIFO mode).
For details about time-out detection, see also **Section 20.5.12.3, Time-Out Error**.</td></tr>
</table>

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.8 CSIHnMCTL1 — CSIHn Memory Control Register 1

This register selects the conditions to generate the interrupt requests INTCSIHTIC and INTCSIHTIR in FIFO mode.

Access: This register can be read or written in 32-bit units.

Address: <CSIHn_base> + 1000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CSIHnFES[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnFFS[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 20.34 CSIHnMCTL1 Register Contents

Bit Position	Bit name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	CSIHnFES[6:0]	Selects the conditions to generate the INTCSIHTIC interrupt (transmit data empty) in FIFO mode. When the number of unsent data to be transmitted in FIFO (checked by the CSIHnSTR0.CSIHnSPF[7:0] bit) and CSIHnMCTL1.CSIHnFES[6:0] match, the FIFO empty flag (CSIHnSTR0.CSIHnEMF bit) is set to 1, and the INTCSIHTIC interrupt request is generated.
15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	CSIHnFFS[6:0]	Selects the conditions to generate the INTCSIHTIR interrupt (receive data full) in FIFO mode. When the number of received data in FIFO (checked by the CSIHnSTR0.CSIHnSRP[7:0] bit) and (128 - CSIHnMCTL1.CSIHnFFS[6:0]) match, the INTCSIHTIR interrupt request is generated.

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.9 CSIHnMCTL2 — CSIHn Memory Control Register 2

This register controls the operation of the memory in dual buffer or transmit-only buffer mode and triggers to start communication.

Access: This register can be read or written in 32-bit units.

Address: <CSIHn_base> + 1004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

These bits are automatically incremented when the transmission data is written or read.
These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.
In direct access mode, these bits are not incremented.
In FIFO mode, these bits indicate the read/write address of transmission data.</td></tr>
</table>

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.11 CSIHnCFGx — CSIHn Configuration Register x (x = 0 to 7)

These eight registers configure the prescaler, parity, data length, recessive configuration for broadcasting, serial data direction, clock phase and data phase, idle enforcement configuration, idle time, hold time, inter-data time, and setup for each chip select signal, CSIHTCSSx.

Slave mode

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is effective.

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock phase and data phase

In slave mode, set all bits other than above in the CSIHnCFG0 register, and the CSIHnCFG1 to CSIHnCFG7 registers to 0.

Access: This register can be read or written in 32-bit units.

Address: CSIHnCFG0: <CSIHn_base> + 1044$_{H}$
CSIHnCFG1: <CSIHn_base> + 1048$_{H}$
CSIHnCFG2: <CSIHn_base> + 104C$_{H}$
CSIHnCFG3: <CSIHn_base> + 1050$_{H}$
CSIHnCFG4: <CSIHn_base> + 1054$_{H}$
CSIHnCFG5: <CSIHn_base> + 1058$_{H}$
CSIHnCFG6: <CSIHn_base> + 105C$_{H}$
CSIHnCFG7: <CSIHn_base> + 1060$_{H}$

Value after reset: 0000 0000$_{H}$

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.12 CSIHnTX0W — CSIHn Transmit Data Register 0 for Word Access

This register stores transmission data. In addition, it specifies the communication interrupt request, the end-of-job, the extended data length, and the chip select activation.

Access: This register can be read or written in 32-bit units.

Address: <CSIHn_base> + 1008_H

Value after reset: $XXXX\ XXXX_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHn CIRE	CSIHn EOJ	CSIHn EDL	—	—	—	—	—	CSIHnC S7	CSIHnC S6	CSIHnC S5	CSIHnC S4	CSIHnC S3	CSIHnC S2	CSIHnC S1	CSIHnC S0
Value after reset	—	—	—	0	0	0	0	0	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnTX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 20.38 CSIHnTX0W Register Contents

Bit Position	Bit Name	Function
31	CSIHnCIRE	Enables the communication interrupt request INTCSIHTIC in dual buffer or transmit-only buffer mode, or the job completion interrupt request INTCSIHTIJC in FIFO mode. 0: No interrupt is requested. 1: An interrupt is requested. Generates interrupt INTCSIHTIC or INTCSIHTIJC after transmission. For details, see **Section 20.4.3, INTCSIHTIC (Communication Status Interrupt)** and **Section 20.4.6, INTCSIHTIJC (Job Completion Interrupt)**. **CAUTION:** This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
30	CSIHnEOJ	Specifies the end of a job. 0: Indicates that it is not end-of-job data. The job continues. 1: Indicates end-of-job data. **CAUTION:** This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). This bit must be set to 0 in slave mode.
29	CSIHnEDL	Specifies whether the associated data requires the extended data length (EDL) option. 0: Normal operation 1: Enables the extended data length. The associated data is transmitted as a 16-bit packet. No inter-data time or idle time will be inserted after the data is transmitted. If CSIHnCTL1.CSIHnEDLE = 1 and CSIHnTX0W.CSIHnEDL = 1, the subsequent data must have the same CS selection. If CS is modified for the subsequent data, the correct operation is not assured. **CAUTION:** This bit is only available if CSIHnCTL1.CSIHnEDLE = 1.
28 to 24	Reserved	When read, an undefined value is returned. When writing to these bits, write 0.

Table 20.38 CSIHnTX0W Register Contents

Bit Position	Bit Name	Function
23 to 16	CSIHnCS[7:0]	Activates one or more chip select signals. 0: Activates chip select signals x for the associated transmission. 1: Deactivates chip select signals x for the associated transmission. Setting CSIHnTX0W.CSIHnCS[7:0] = FF$_H$ is prohibited. **CAUTION:** If several chip select signals are enabled for broadcasting, the configuration of one with CSIHnCFGx.CSIHnRCBx = 0 (dominant) is used. In this case, all dominant chip select signals must be set to precisely the same value. In slave mode, set the CSIHnCS[7:0] bit to FE$_H$.
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.13 CSIHnTX0H — CSIHn Transmit Data Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of register CSIHnTX0W.

The settings specified by the upper 16 bits of CSIHnTX0W are applied to the transmission. Set transmit data to CSIHnTX0W before using this register because the value of CSIHnTX0W is undefined after the reset.

Access: This register can be read or written in 16-bit units.

Address: <CSIHn_base> + 100C$_H$

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnTX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 20.39 CSIHnTX0H Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.14 CSIHnRX0W — CSIHn Receive Data Register 0 for Word Access

This register stores the received data.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <CSIHn_base> + 1010_H

Value after reset: $0XXX\ XXXX_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	CSIHn RPE	CSIHn TDCE	CSIHn CS7	CSIHn CS6	CSIHn CS5	CSIHn CS4	CSIHn CS3	CSIHn CS2	CSIHn CS1	CSIHn CS0
Value after reset	0	0	0	0	0	0	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnRX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 20.40 CSIHnRX0W Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned.
25	CSIHnRPE	Indicates whether a reception data parity error was detected. 0: No parity error was detected on the associated reception data. 1: A parity error was detected on the associated reception data.
24	CSIHnTDCE	Indicates whether a transmission data consistency check error was detected. 0: No consistency error was detected on the associated transmission data. 1: A consistency error was detected on the associated transmission data.
23 to 16	CSIHnCSx (x = 7 to 0)	Indicates which chip select signal was activated. 0: Chip select x was activated for the associated reception. 1: Chip select x was deactivated for the associated reception.
15 to 0	CSIHnRX[15:0]	Stores the received data.

NOTE

This register stores the received data when an INTCSIHTIR interrupt is generated. Read the received data stored in this register before generation of an INTCSIHTIR interrupt. Otherwise the data is rewritten with the next received data.

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.15 CSIHnRX0H — CSIHn Receive Data Register 0 for Half Word Access

This register stores the received data. This register is the same as bits 15 to 0 of register CSIHnRX0W.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <CSIHn_base> + 1014_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnRX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 20.41 CSIHnRX0H Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIHnRX[15:0]	Stores the received data.

NOTE

This register stores the received data when an INTCSIHTIR interrupt is generated. Read the received data stored in this register before generation of an INTCSIHTIR interrupt. Otherwise the data is rewritten with the next received data.

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.16 CSIHnEMU — CSIHn Emulation Register

This register controls operation of SVSTOP.

Access: This register can be read or written in 8-bit or 1-bit units.
Perform write operation when (EPC.SVSTOP = 0).

Address: <CSIHn_base> + 0018_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CSIHnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 20.42 CSIHnEMU Register Contents

Bit Position	Bit Name	Function
7	CSIHnSVSDIS	Selects whether to continue or stop transmit/receive operation during debugging. ● When the EPC.SVSTOP bit is set to 0 Continues transmit/receive operation regardless of the setting of this bit. ● When the EPC.SVSTOP bit is set to 1 0: Stops transmit/receive operation. 1: Continues transmit/receive operation.
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.17 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y = 0 to 3)

This register sets the transfer clock frequency for each chip select signal.

With CSIHnCFG0 to 7.CSIHnBRSSx[1:0] bits, one of the four types of transfer clock frequency settings can be selected for each chip select signal. For details of transfer clock frequency setting, see **Section 20.5.5, Transmission Clock Selection**.

Access:	This register can be read or written in 16-bit units.
Address:	CSIHnBRS0: <CSIHn_base> + 1068_H CSIHnBRS1: <CSIHn_base> + $106C_H$ CSIHnBRS2: <CSIHn_base> + 1070_H CSIHnBRS3: <CSIHn_base> + 1074_H
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CSIHnBRS[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 20.43 CSIHnBRSy Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CSIHnBRS[11:0]	0: BRG stopped 1: PCLK / (2^{α} × 1 × 2) 2: PCLK / (2^{α} × 2 × 2) 3: PCLK / (2^{α} × 3 × 2) 4: PCLK / (2^{α} × 4 × 2) . . . 4095: PCLK / (2^{α} × 4095 × 2) α is the value of CSIHnCTL2.CSIHnPRS[2:0].

CAUTION

When setting this register, see **Table 20.44, Notes on Setting Registers**.

20.3.18 List of Cautions

Table 20.44 Notes on Setting Registers

Register Name	Bit Name	Cautions
CSIHnCTL0	CSIHnPWR	If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, it is necessary to restart the communication.
CSIHnCTL0	CSIHnTXE CSIHnRXE	Do not modify any of these bits while CSIHnCTL0.CSIHnPWR = 0. (These bits can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Do not modify these bits while CSIHnSTR0.CSIHnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted.
CSIHnCTL0	CSIHnJOBE	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid when CSIHnCTL1.CSIHnJE = 1. Setting this bit is prohibited in slave mode.
CSIHnCTL0	CSIHnMBS	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. (This bit can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Modification of this bit is only permitted while CSIHnSTR0.CSIHnTSF = 0. Do not change the mode between FIFO mode and direct access mode while CSIHnCTL0.CSIHnPWR = 1. When the CPU-controlled high-priority communication is enabled, the operation is the same as that in direct access mode regardless of the CSIHnMBS bit setting.
CSIHnCTL1	CSIHnCKR	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. When CS is not used, use this bit instead of CSIHnCFGx.CSIHnCKPx and set CSIHnCFGx.CSIHnCKPx to 0. This bit must be used in slave mode.
CSIHnCTL1	CSIHnSLIT CSIHnCSL[7:0] CSIHnEDLE CSIHnDCS CSIHnCSRI CSIHnHSE	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.
CSIHnCTL1	CSIHnPHE CSIHnJE CSIHnLBM	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting this bit to 1 is prohibited in slave mode.
CSIHnCTL1	CSIHnSSE	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting this bit to 1 is prohibited in master mode.
CSIHnCTL1	CSIHnSIT	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated.
CSIHnCTL2	CSIHnPRS[2:0]	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of the maximum transfer clock frequency is as follows. ● Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4) ● Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6)
CSIHnSTR0	CSIHnSRP[7:0] CSIHnSPF[7:0] CSIHnHPST CSIHnFLF CSIHnEMF CSIHnTSF	Writing to these bits is prohibited, and only reading is permitted.
CSIHnSTR0	CSIHnTMOE CSIHnOFE CSIHnDCE CSIHnPE CSIHnOVE	Writing to these bits is prohibited, and only reading is permitted. These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0.
CSIHnSTCR0	CSIHnPCT	If this bit is set to 1 during communication, ongoing communication is aborted.
CSIHnMCTL0	CSIHnMMS[1:0]	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0 and CSIHnCTL0.CSIHnMBS = 0.

Table 20.44 Notes on Setting Registers

Register Name	Bit Name	Cautions
CSIHnMCTL0	CSIHnTO[4:0]	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Set these bits to 0 in master mode. Set these bits to 0 in direct access, dual buffer, and transmit-only buffer mode.
CSIHnMCTL1	CSIHnFES[6:0] CSIHnFFS[6:0]	Writing to these bits while communication is ongoing is permitted.
CSIHnMCTL2	CSIHnBTST CSIHnND[7:0] CSIHnSOP[6:0]	Writing to these bits is prohibited when CSIHnCTL0.CSIHnPWR = 0. Writing to these bits is prohibited when CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0. Writing to these bits is prohibited when CSIHnSTR0.CSIHnTSF = 1. Writing to these bits is prohibited in direct access or FIFO mode.
CSIHnMRWP0	CSIHnRRA[6:0]	Writing to these bits while communication is ongoing is permitted. Writing to these bits is prohibited in direct access or FIFO mode. When writing is required, set "00_H" to these bits in transmit-only buffer mode.
CSIHnMRWP0	CSIHnTRWA[6:0]	Writing to these bits while communication is ongoing is permitted. Writing to these bits is prohibited in direct access or FIFO mode.
CSIHnCFGx x = 0 to 7	CSIHnBRSSx[1:0] CSIHnRCBx CSIHnIDLx CSIHnIDx[2:0] CSIHnHDx[3:0] CSIHnINx[3:0] CSIHnSPx[3:0]	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. These bits must be set to 0 in slave mode.
CSIHnCFGx x = 0 to 7	CSIHnPSx[1:0] CSIHnDLSx[3:0] CSIHnDIRx CSIHnDAPx	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. In slave mode, the CSIHnCFG0 setting is used for the configuration. Therefore, all the bits in CSIHnCFG1 to CSIHnCFG7 must be set to 0.
CSIHnCFGx x = 0 to 7	CSIHnCKPx	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. This bit must be set to 0 in slave mode as CSIHnCTL1.CSIHnCKR must be used in slave mode. If CS is not used, the CSIHnCTL1.CSIHnCKR bit instead of this bit, and clear this bit to 0.
CSIHnTX0W	CSIHnEOJ CSIHnCIRE	These bits are only valid when CSIHnCTL1.CSIHnJE = 1. While CSIHnCTL1.CSIHnJE = 0, the values of these bits are ignored even if 1 is read. Set these bits to 0 in slave mode.
CSIHnTX0W	CSIHnEDL	This bit is only valid when CSIHnCTL1.CSIHnEDLE = 1. While CSIHnCTL1.CSIHnEDLE = 0, the value of this bit is ignored even if 1 is read.
CSIHnTX0W	CSIHnCS[7:0]	In master mode, setting this bit to "FF_H" is prohibited. In slave mode, set this bit to "FE_H".
CSIHnTX0W CSIHnTX0H		Reading these bits while communication is ongoing is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0, reading and writing to these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0, writing to these bits are prohibited in direct access mode.
CSIHnRX0W		These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is permitted in the mode (Transmit-only buffer, Dual buffer and Direct access modes) except FIFO mode. While CSIHnCTL0.CSIHnPWR = 1, reading these bits is permitted.

Table 20.44 Notes on Setting Registers

Register Name	Bit Name	Cautions
CSIHnRX0H		These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 1, reading these bits is permitted in the FIFO mode. In spite of CSIHnCTL0.CSIHnPWR value, reading is permitted of these bits in the mode (Transmit-only buffer, Dual buffer and Direct access modes) except FIFO mode.
CSIHnEMU	CSIHnSVSDIS	Modification of this bit is only permitted while SVSTOP = 0.
CSIHnBRSy y = 0 to 3		Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.

20.4 Interrupt Sources

CSIH can generate the following interrupt requests:

- INTCSIHTIC (communication status interrupt)
- INTCSIHTIR (reception status interrupt)
- INTCSIHTIRE (communication error interrupt)
- INTCSIHTIJC (job completion interrupt)

20.4.1 Overview

The communication error interrupt INTCSIHTIRE is generated when an error is detected. The generation of the other interrupts depends on the memory mode, the job mode, and – in case of the job completion interrupt INTCSIHTIJC – also the operating mode.

The job completion interrupt INTCSIHTIJC is only generated when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). It is not available in slave mode.

The following table gives an overview.

Table 20.45 Interrupt Generation

Memory Mode	Interrupt	Interrupt Source	
		Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	INTCSIHTIC	Tx data empty*[1]	Tx data empty*[1] except job abort*[4]
	INTCSIHTIR	Rx data full*[2] *and* CSIHnCTL0.CSIHnRXE = 1	Rx data full*[2] *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC*[3]	Not applicable	CSIHnTX0W.CSIHnCIRE = 1 (except Tx data empty), or job abort*[4]
Transmit-only buffer	INTCSIHTIC	End of communication	CSIHnTX0W.CSIHnCIRE = 1 *and* (CSIHnCTL0.CSIHnJOBE = 0 *or* CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHTIR	Data received *and* CSIHnCTL0.CSIHnRXE = 1	Data received *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC*[3]	Not applicable	Job abort*[4]
Dual buffer	INTCSIHTIC	End of communication	CSIHnTX0W.CSIHnCIRE = 1 *and* (CSIHnCTL0.CSIHnJOBE = 0 *or* CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHTIR	End of communication *and* CSIHnCTL0.CSIHnRXE = 1	Data received *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC*[3]	Not applicable	Job abort*[4]
Direct access	INTCSIHTIC	One data transfer	One data transfer except the state of job abort*[4]
	INTCSIHTIR	Data received *and* CSIHnCTL0.CSIHnRXE = 1	Data received *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC*[3]	Not applicable	Job abort*[4]

Note 1. “Tx data empty” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFES[6:0].

Note 2. “Rx data full” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFFS[6:0].

Note 3. INTCSIHTIJC is not available in slave mode.

Note 4. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1
During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

20.4.2 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half a cycle of the transmission clock, CSIHTSCK. This is not possible in slave mode.

The delay is specified by setting CSIHnCTL1.CSIHnSIT = 1. (The setting of the CSIHnSIT bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of CSIHnCTL1.CSIHnSIT = 1 (interrupt delay enabled), CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0 (clock phase and data phase), and CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B (data length 8 bits).

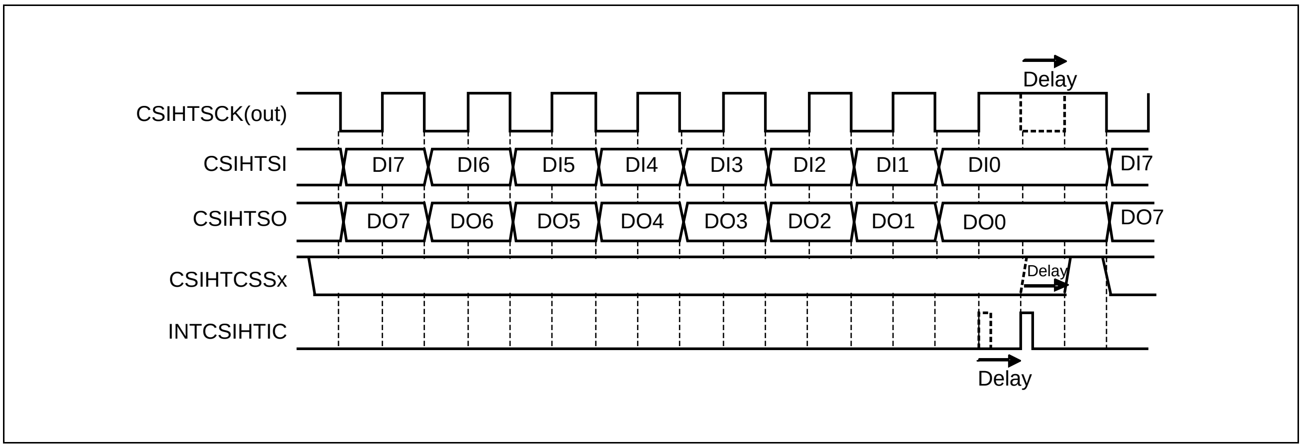

Figure 20.2 Interrupt Delay Function (CSIHnCTL1.CSIHnSIT = 1)

Setting CSIHnCTL1.CSIHnSIT = 1 adds a half cycle delay to the transmission clock. This also delays the end of the current chip select signal (CSIHTCSSx).

20.4.3 INTCSIHTIC (Communication Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions shown in the following table.

Table 20.46 INTCSIHTIC Interrupt Generation

Memory Mode	Interrupt Source	
	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	This interrupt is generated just before transmission data in the FIFO runs out, notifying the application that new data should be added. INTCSIHTIC is generated if the number of transmit data remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMTCL1.CSIHnFES[6:0].	Similar to “when JE is 0”, an interrupt is generated when the number of transmit data remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMCTL1.CSIHnFES[6:0]. However, it is not generated if a job is aborted.
Transmit-only buffer, dual buffer	An interrupt is generated at the end of communication. (specified by the CSIHnMTLC2.CSIHnND[7:0] bit)	Generated when data is transmitted while CSIHnTX0W.CSIHnCIRE = 1. Note that if data and job abort*[1] are transmitted while CSIHnTX0W.CSIHnCIRE = 1, the INTCSIHTIJC interrupt is generated instead of INTCSIHTIC.
Direct access	Generated after every data transfer.	Generated after every data transfer, except when the communication was aborted.

Note 1. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1.
During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

20.4.3.1 INTCSIHTIC in Direct Access Mode

The examples below show the INTCSIHTIC behavior in direct access mode.

The examples assume:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase
  (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

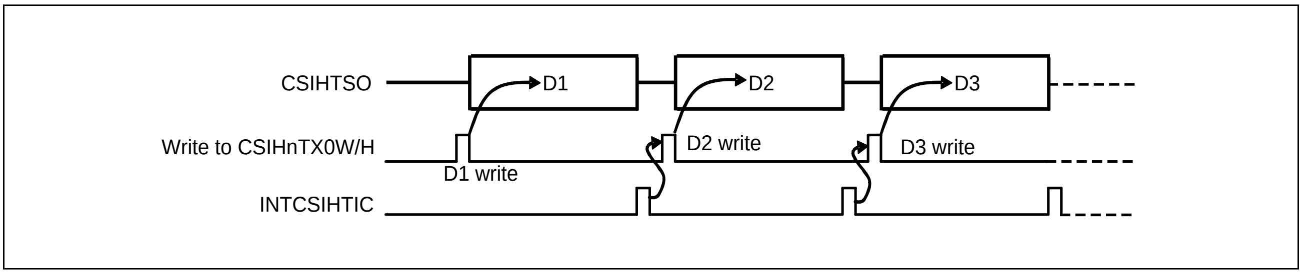

Figure 20.3 Generation of INTCSIHTIC after Transfer (CSIHnCTL1.CSIHnSLIT = 0)

If job mode is enabled (CSIHnCTL1.CSIHnJE = 1) and a job ends because data is sent with CSIHnTXOW.CSIHnEOJ = 1 and communication stop is requested (CSIHnCTL0.CSIHnJOBE = 1), then INTCSIHTIC is replaced by the job completion interrupt INTCSIHTIJC.

INTCSIHTIC can also be set up to occur as soon as the CSIHnTX0W/H register becomes empty and available for storing the next data. This is specified by setting CSIHnCTL1.CSIHnSLIT = 1.

The effect is illustrated in the figure below.

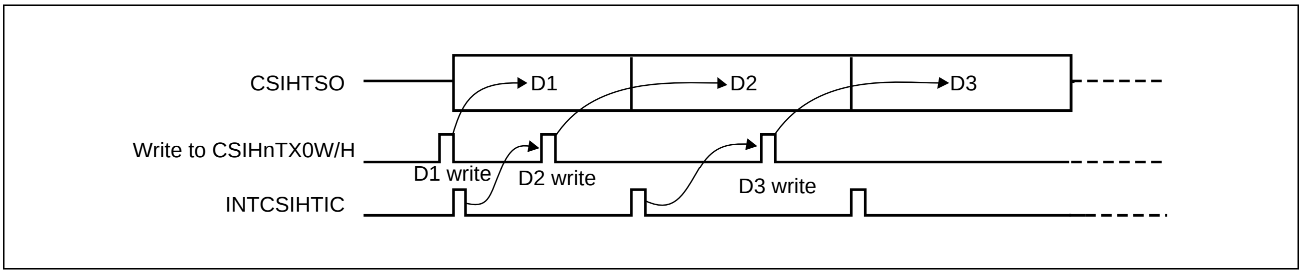

Figure 20.4 Immediate Generation of INTCSIHTIC (CSIHnCTL1.CSIHnSLIT = 1)

Thus, the new data can be written in advance.

NOTE

During high priority communication in transmit-only buffer mode, the operation is in the same as that in direct access mode.

20.4.3.2 INTCSIHTIC in FIFO Mode

The example below shows the INTCSIHTIC behavior in FIFO mode.

The example assumes:

- Master mode
- FIFO mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

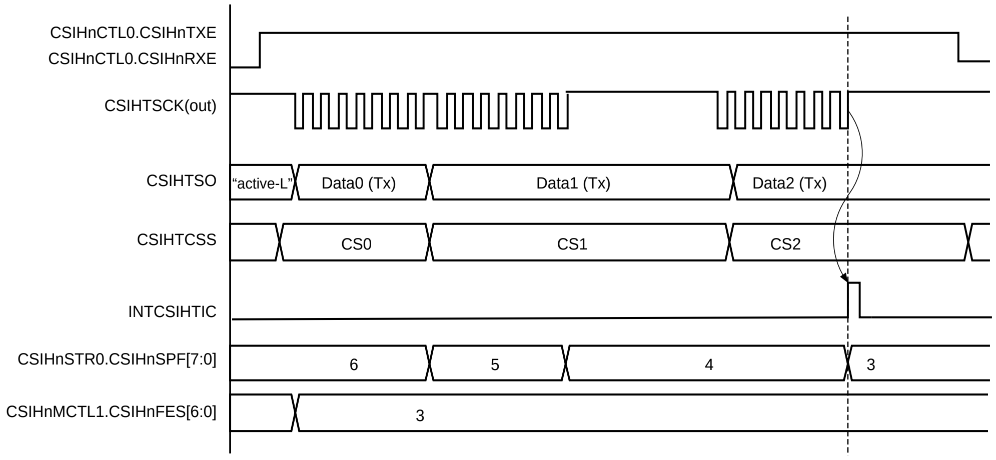

Figure 20.5 Generation of INTCSIHTIC in FIFO Memory Mode

The condition for "FIFO empty" is specified in CSIHnMCTL1.CSIHnFES[6:0]. In the example of the diagram above, the number of unsent data in FIFO is set to 3.

CSIHnSTR0.CSIHnSPF[7:0] indicates the number of unsent data. When both match, the interrupt INTCSIHTIC occurs.

20.4.3.3 INTCSIHTIC in Job Mode

The example below shows the INTCSIHTIC behavior in job mode.

The example assumes:

- Master mode
- Job mode enabled (CSIHnCTL1.CSIHnJE = 1)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

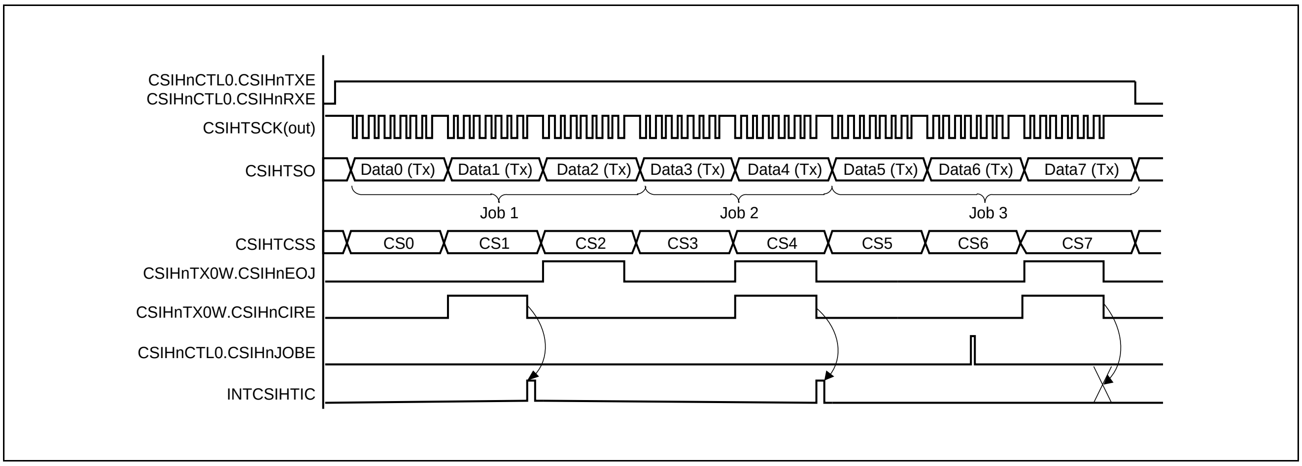

Figure 20.6 Generation of INTCSIHTIC in Job Mode

The rules for generating INTCSIHTIC in job mode are shown in the following table.

Table 20.47 Generation of INTCSIHTIC in Job Mode

CSIHnTX0W. CSIHnEOJ	CSIHnTX0W. CSIHnCIRE	INTCSIHTIC
0	0	Not generated
0	1	Generated
1	0	Not generated
1	1	CSIHnCTL0.CSIHnJOBE = 0: Generated
		CSIHnCTL0.CSIHnJOBE = 1: Not generated, replaced by interrupt INTCSIHTIJC

20.4.4 INTCSIHTIR (Reception Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions below.

Table 20.48 INTCSIHTIR Interrupt Generation

	Interrupt Source	
Memory Mode	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	This interrupt occurs when CSIHnCTL0.CSIHnRXE is 1 and the FIFO buffer is almost full with received data, notifying the application that the FIFO must be emptied. INTCSIHTIR is generated, if the number of received data in the FIFO (CSIHnSTR0.CSIHnSRP[7:0]) equals (128 – CSIHnMCTL1.CSIHnFFS[6:0]).	
Dual buffer	An interrupt is generated when the communication has finished (as specified by the CSIHnMCTL2.CSIHnND[7:0] bits) and CSIHnCTL0.CSIHnRXE = 1.	An interrupt is generated after every data transfer.
Transmit-only buffer, Direct access	An interrupt is generated after every data transfer.	

20.4.4.1 INTCSIHTIR in Direct Access Mode

The example below shows the INTCSIHTIR behavior in direct access mode.

The example below assumes:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase
  (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

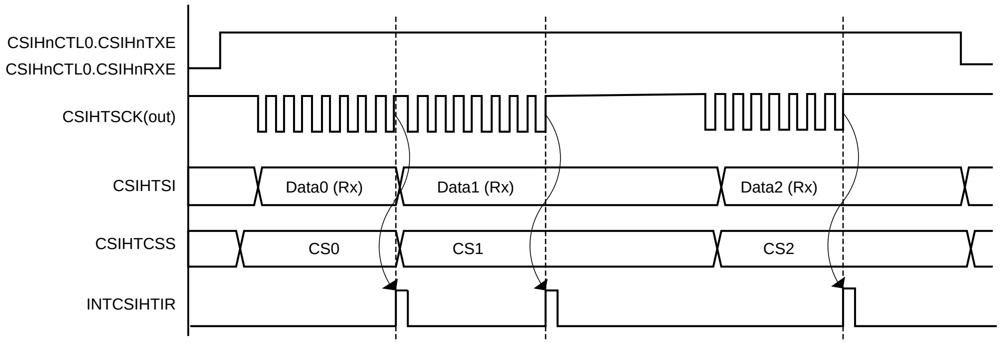

Figure 20.7 Generation of INTCSIHTIR in Direct Access Mode

20.4.4.2 INTCSIHTIR in Dual Buffer Mode

The example below shows the INTCSIHTIR behavior in dual buffer mode.

The example assumes:

- Master mode
- Dual buffer mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Default clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

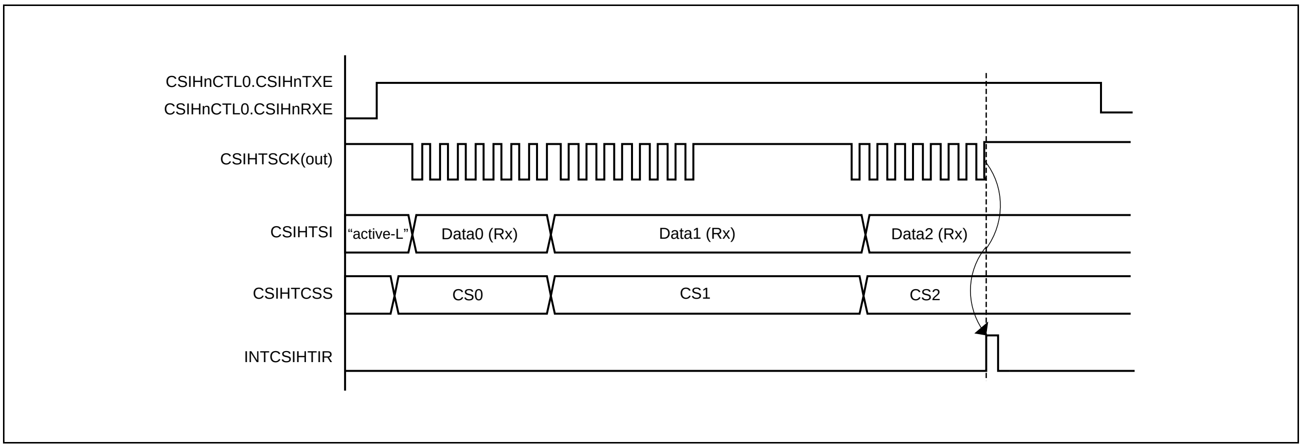

Figure 20.8 Generation of INTCSIHTIR in Dual Buffer Mode

20.4.5 INTCSIHTIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

For details about interrupt generation timing, see **Section 20.5.12, Error Detection**.

Table 20.49 Data Error Types

Error Type	Communication Status after Error Interrupt	Note
FIFO overflow error	Communication continues even if an interrupt is generated.	The data is not written to the FIFO buffer and the data that overflowed is lost, but communications started before the error continue.
Parity error	Communication continues even if an interrupt is generated.	—
Data consistency check error	Communication continues even if an interrupt is generated.	—
Time-out error	Communication continues even if an interrupt is generated.	—
Overrun error	Condition for errors 1: In FIFO mode, when the number of received data is 0 and CPU reads the CSIHnRX0W/H register, an interrupt is generated and communication continues.	—
	Condition for errors 2: In slave mode, when CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled): [1] In direct access mode or transmit-only buffer mode, when reception is completed while the previous received data is retained in the CSIHnRX0W/H register, an interrupt is generated, and communication continues. [2] In FIFO mode, when reception by the FIFO buffer is completed and the buffer is in the full state, an interrupt is generated. Communication continues.	In slave mode, when CSIHnCTL1.CSIHnHSE = 1 (handshake function enabled), communication is suspended due to handshake, an overrun error is not generated.

The type of error that caused the generation of INTCSIHTIRE is flagged in register CSIHnSTR0.

Additionally a parity error flag and a data consistency check error flag are attached to the received data in CSIHnRX0W.

For details about the various error types, see **Section 20.5.12, Error Detection**.

20.4.6 INTCSIHTIJC (Job Completion Interrupt)

This interrupt supports the handling of jobs. See **Section 20.5.3.3, Job Concept**. This interrupt is only available in master mode.

Job mode is enabled by setting CSIHnCTL1.CSIHnJE = 1. When CSIHnCTL1.CSIHnJE = 0, INTCSIHTIJC is not generated.

Depending on the memory mode, this interrupt is generated according to the condition shown in the following table.

Table 20.50 INTCSIHTIJC Interrupt Generation

Memory Mode	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	Not applicable	Indicates that the communication stopped at the end of a job after a job abort*[1] was triggered If FIFO empty is not detected, INTCSIHTIJC is generated when CSIHnCIRE is 1.
Transmit-only buffer		Indicates that the communication stopped at the end of a job after a job abort*[1] was triggered.
Dual buffer		
Direct access		

Note 1. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1

20.5 Operation

20.5.1 Operating Modes (Master/Slave)

Whether CSIH operates in the master or slave mode determines the source of the serial clock.

20.5.1.1 Master Mode

In master mode, the serial transmission clock is generated by the internal baud rate generator (BRG) and supplied to the slave(s) by signal CSIHTSCK.

Master mode is enabled by setting CSIHnCTL2.CSIHnPRS[2:0] to values other than 111_B. In master mode, the BRG frequency can be specified by setting the CSIHnCTL2.CSIHnPRS[2:0] bits in combination with the CSIHnBRSy.CSIHnBRS[11:0] bits.

(1) Chip select signals

In master mode, one or more chip select signals can be used. If several slaves are connected to the master, the chip select signals can be used to select one or more slaves. Only the selected slave is then enabled for communication.

The communication protocol as well as additional parameters are stored separately for each chip select signal. This makes it possible to adapt the data transfer individually to the requirements of each slave. For details, see **Section 20.5.3, Chip Selection (CS) Features**.

(2) Clock defaults

The default level of CSIHTSCK depends on the clock phase inversion function bit of the CSIHTSCK, and is high when CSIHnCTL1.CSIHnCKR = 0 and is low when CSIHnCTL1.CSIHnCKR = 1.

The example below shows the communication in master mode for 8-bit data, CSIHnCTL1.CSIHnCKR = 0, CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0, and MSB first.

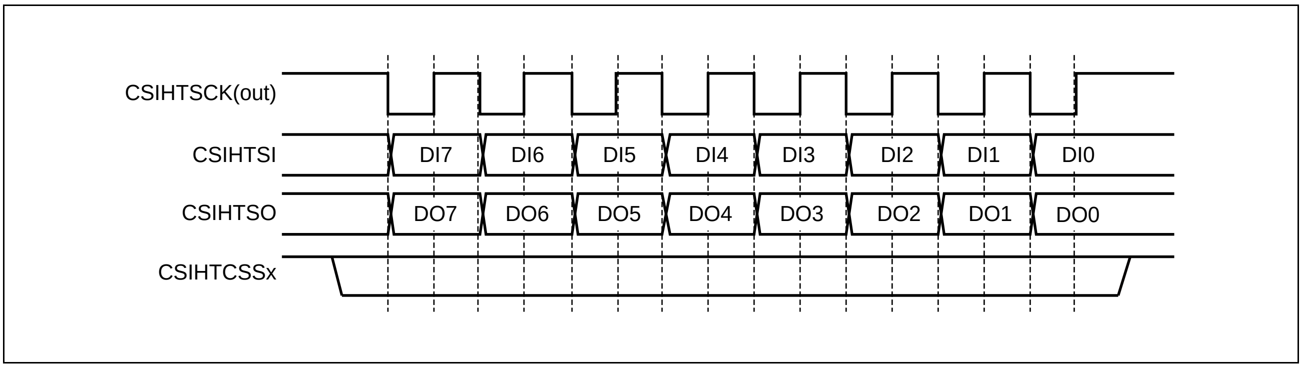

Figure 20.9 Transmission/Reception in Master Mode

20.5.1.2 Slave Mode

In slave mode, another device is the communication master and supplies the transmission clock. Normal transmit/receive operation is started as soon as a clock signal is detected.

Slave mode is selected by setting the CSIHnCTL2.CSIHnPRS[2:0] bits to 111_B.

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is enabled (settings of the CSIHnCFG1 - CSIHnCFG7 registers are disabled).

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock phase and data phase

NOTE

When using slave mode, disable the baud rate generator (BRG) by setting the CSIHnBRSy.CSIHnBRS[11:0] bits to 000_H. However, if you are using a time-out error, set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000_H.

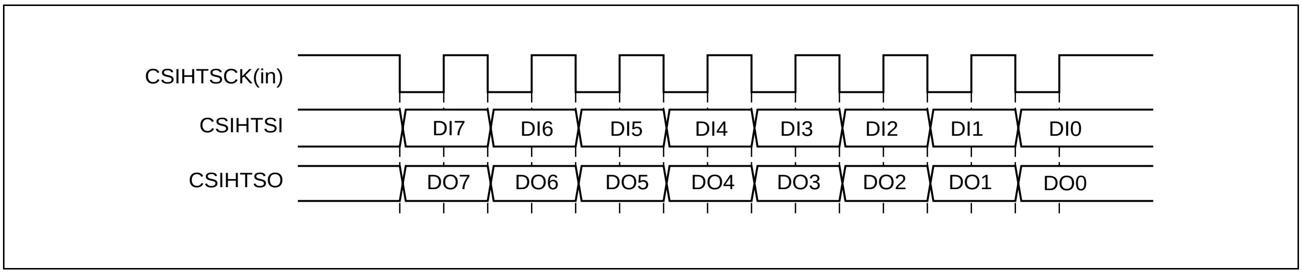

Figure 20.10 Transmission/Reception in Slave Mode

20.5.2 Master/Slave Connections

20.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

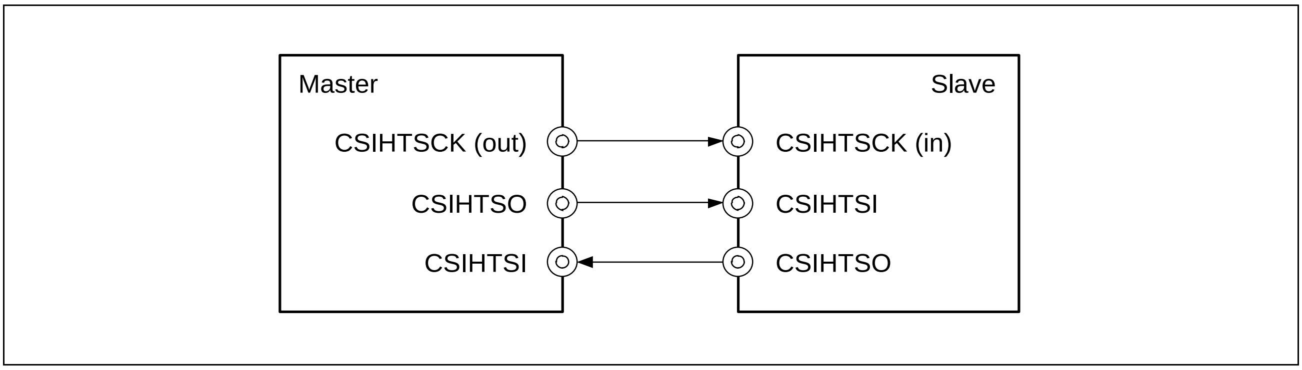

Figure 20.11 Direct Master/Slave Connection

20.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this example, the master supplies one chip select (CS) signal to each of the slaves. This signal is connected to the slave select input $\overline{\text{CSIHTSSI}}$ of the slave.

The $\overline{\text{CSIHTSSI}}$ signal can be enabled/disabled by using the CSIHnCTL1.CSIHnSSE bit.

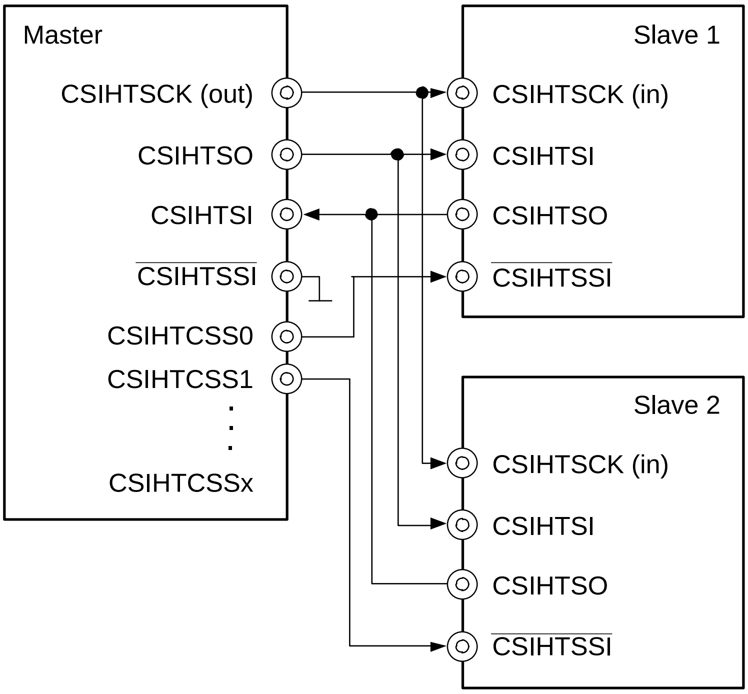

Figure 20.12 Connections between One Master and Multiple Slaves

By default, the chip select level is active low. That means, a slave is selected (enabled) as a CSIH slave when its $\overline{\text{CSIHTSSI}}$ signal is low level. However, to adapt the CS to other devices, the output level of each chip select signal can also be programmed to be active high.

If a slave is not selected, it will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set (CSIHnCTL0.CSIHnTXE = 1), the CSIHTSO output of the slaves that are not selected is disabled and set to input mode in order to avoid interference with the output of the selected slave.

20.5.3 Chip Selection (CS) Features

The chip select signal, CSIHTCSSx can be used by the master to select one or more slaves for communication.

20.5.3.1 Configuration Registers

The parameters for each chip select signal CSIHTCSSx are defined in the corresponding configuration register CSIHnCFGx. The parameters include the communication protocol and additional CS parameters.

The communication protocol specifies:

- Data length: The number of bits to be sent or received.
  (CSIHnCFGx.CSIHnDLSx[3:0])
- Transfer direction: MSB or LSB first.
  (CSIHnCFGx.CSIHnDIRx)
- Parity usage: Odd, even, 0 parity or none.
  (CSIHnCFGx.CSIHnPSx[1:0])
- Clock phase and data phase.
  (CSIHnCFGx.CSIHnCKPx, CSIHnCFGx.CSIHnDAPx)

Additional parameters for each chip select signal that are only available in master mode are:

- Individual selection of the baud rate generator prescaler for each chip select signal
  (CSIHnCFGx.CSIHnBRSSx[1:0])
- Chip select priority: Categorizes chip select signals into “dominant” and “recessive”. The priority applies if two or more chip selects signals with different configurations are simultaneously activated for message broadcasting. In this case, the configuration specified for dominant chip select signals is used. (CSIHnCFGx.CSIHnRCBx)

The principle is also called “Recessive Configuration for Broadcasting” (RCB).

CAUTION

When specifying multiple chip select signals as dominant, be sure to configure the same settings for all dominant signals.

- Chip select timing:
  - Setup time Tsetup: The time from when the CS signal becomes active to the start of data output.
    (CSIHnCFGx.CSIHnSPx[3:0])
  - Inter-data time Tinter: The time between one data and the next data while the same CS signal is active.
    (CSIHnCFGx.CSIHnINx[3:0])
  - Hold time Thold: The time during which the CS signal remains active until CS is switched.
    (CSIHnCFGx.CSIHnHDx[3:0])
  - Idle time Tidle: Inactive time after terminating a CS signal or after every data transfer to the same CSx.
    (CSIHnCFGx.CSIHnIDx[2:0])

The CS timings of the setup time, the inter-data time, the hold time, and the idle time are illustrated in the figure below. When CSIHnCFGx.CSIHnIDLx bit is set to 1, IDLE time is inserted for every transfer regardless of CS signal.

Figure 20.13, Chip Select Timings provides an example of when the default active low setting is specified for the CSIHTCSS1 and CSIHTCSS2 signals (CSIHnCTL1.CSIHnCSL1 bit = 0, CSIHnCTL1.CSIHnCSL2 bit = 0). The active level can be specified individually for each CS.

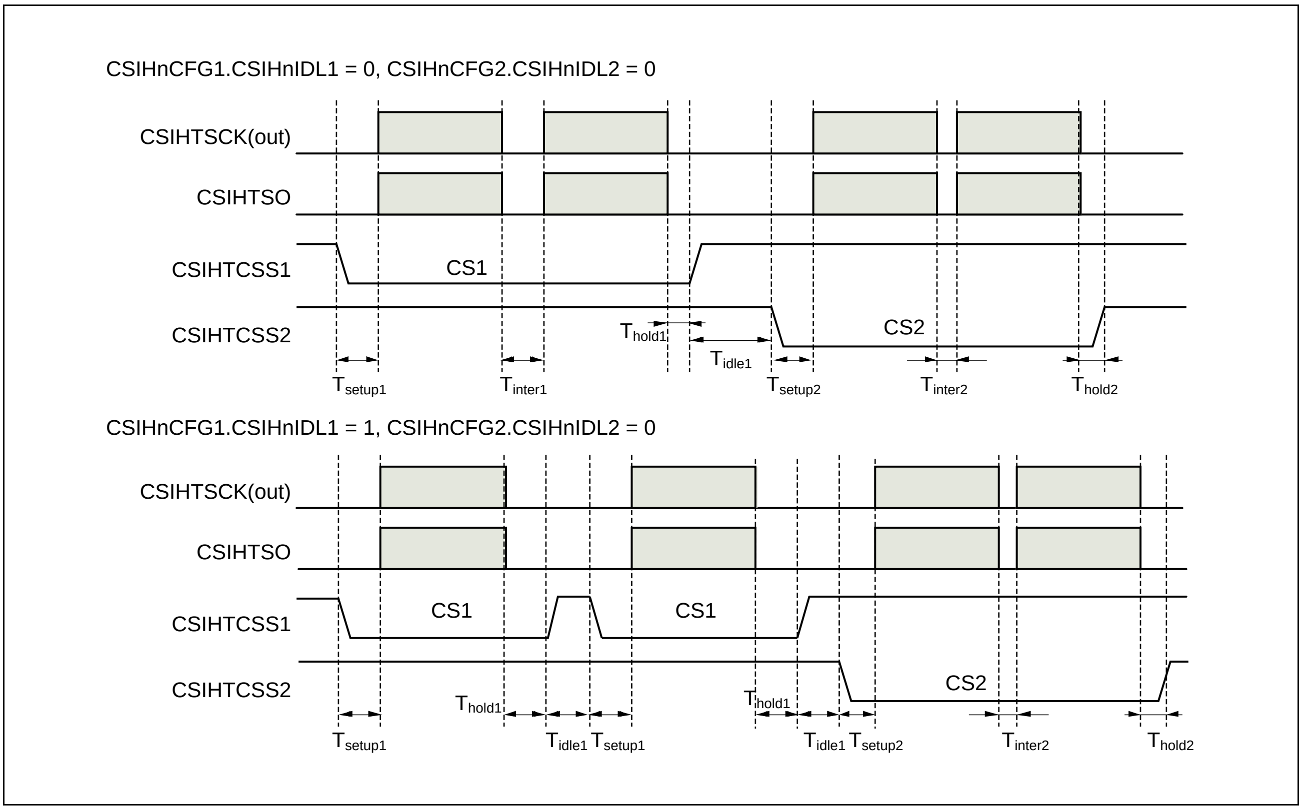

Figure 20.13 Chip Select Timings

Note that each CS signal can have a different value for the setup time, inter-data time, hold time, and idle time.

A particular chip select signal is activated by setting the appropriate bit in the transmission register CSIHnTX0W.CSIHnCSx.

CSIHnRX0W.CSIHnCSx in the reception register indicates the chip select signal associated with the received data.

CAUTION

When high priority communication function by CPU control is enabled (CSIHnCTL1.CSIHnPHE = 1), IDLE state is inserted regardless of IDLn bit settings when priority communication mode is changed from low to high and from high to low.

20.5.3.2 CS Example

The following figure shows an example of two consecutive data transmissions.

The first communication uses CS0 to communicate with a single slave. The second enables CS0 and CS1 to broadcast a message to two slaves. The priority of CS0 is set to “recessive: low priority” and the priority of CS1 to “dominant: high priority”. Consequently, the second communication is conducted using the CS1 settings, which are set as dominant.

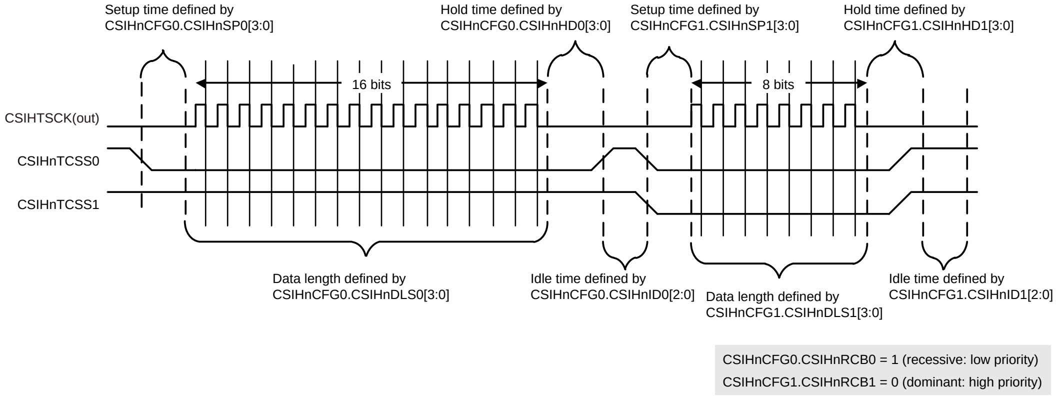

Figure 20.14 Chip Select and RCB Example

20.5.3.3 Job Concept

In CSIH, a job consists of the number of data targeted for transfer.

Job mode enable

The job mode can only be enabled in master mode. The job mode is enabled or disabled by CSIHnCTL1.CSIHnJE, while the CSIH is disabled by CSIHnCTL0.CSIHnPWR = 0.

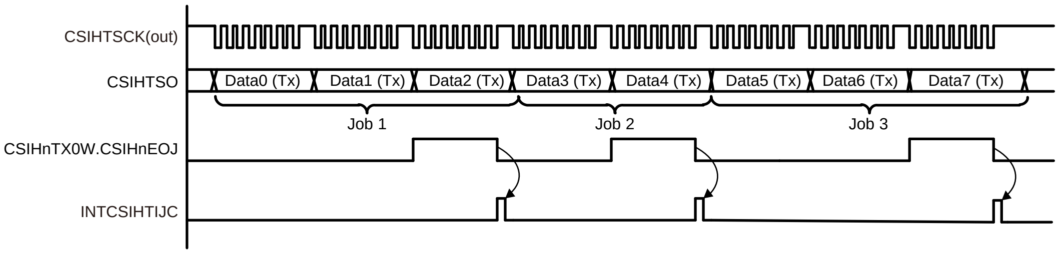

Figure 20.15 Job Examples

A job ends by transmitting data with CSIHnTX0W.CSIHnEOJ = 1.

Communication can be specified to stop when a job is finished. This is done by setting CSIHnCTL0.CSIHnJOBE. When CSIHnJOBE is set, the communication continues until the data for which the CSIHnEOJ bit is set is transmitted. After this data is sent, the communication is stopped and the job completion interrupt INTCSIHTIJC is generated.

20.5.4 Details of Chip Select Timing

20.5.4.1 Changing the Clock Phase

The serial clock level specified by CSIHnCFGx.CSIHnCKPx can be changed while communication is stopped. The minimum value of an idle time is one transmission clock (CSIHTSCK(out)) cycle.

If the idle time is set to 0.5 transmission clock cycles (in CSIHnCFGx.CSIHnIDx[2:0]) and two consecutive data is sent with different CSIHnCFGx.CSIHnCKPx configurations, the idle time is automatically extended to one CSIHTSCK(out) cycle.

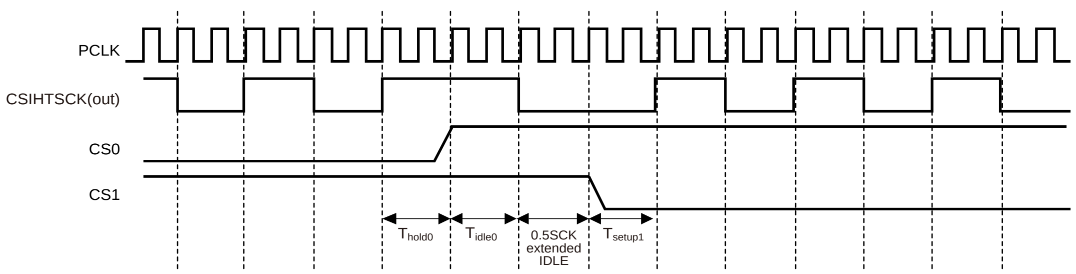

Figure 20.16 Clock Phase Timing with PCLK/4, $T_{hold}0$ = T_{setup1} = 0.5CSIHTSCK, T_{idle0} = 0.5CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)

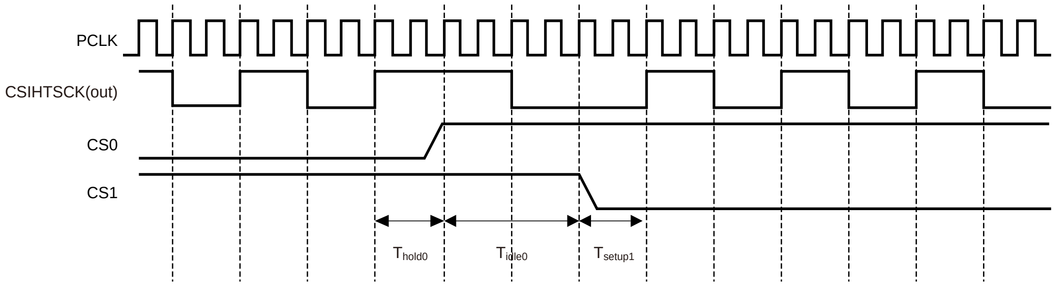

Figure 20.17 Clock Phase Timing with PCLK/4, $T_{hold}0$ = T_{setup1} = 0.5CSIHTSCK, T_{idle0} = 1CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)

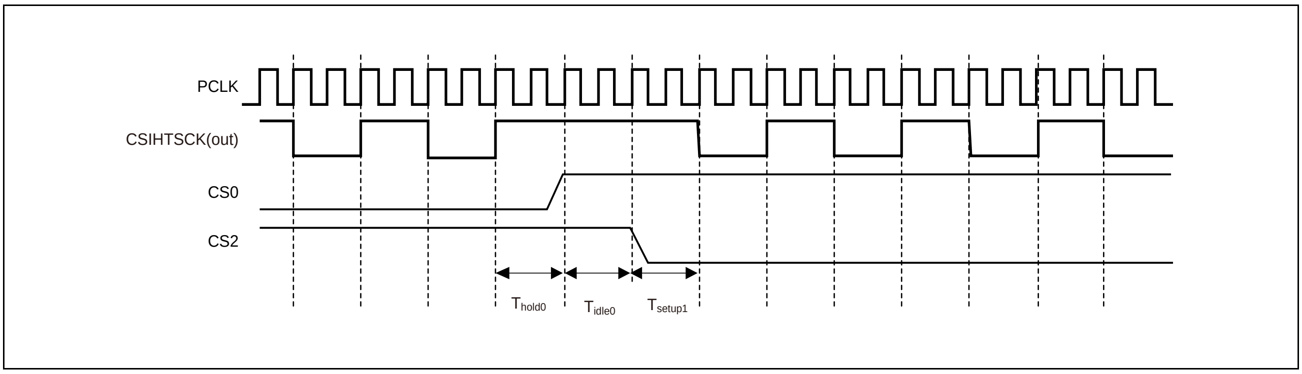

Figure 20.18 Clock Phase Timing with PCLK/4, $T_{hold}0 = T_{setup1}$ = 0.5CSIHTSCK, T_{idle0} = 0.5CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG2.CSIHnCKP2 = 0 (CSIHTCSS2)

20.5.4.2 Changing the Data Phase

The CSIHnCFGx.CSIHnDAPx bit defines the phase of the data bits relative to the clock.

The relation between the setting of the CSIHnCFGx.CSIHnDAPx bit and the hold and setup times is as follows:

Hold time is the period from the last edge of the serial clock (CSIHTSCK) until the signals on CSIHTCSS[7:0] change to the inactive level.

Setup time is the period from when the signals on CSIHTCSS[7:0] change to the active level until to when the transmission data (CSIHTSO) is output.

Therefore, there is a gap of 0.5 CSIHTSCK cycles until the edge of the serial clock signal (CSIHTSCK) is output according to the CSIHnCFGx.CSIHnDAPx setting.

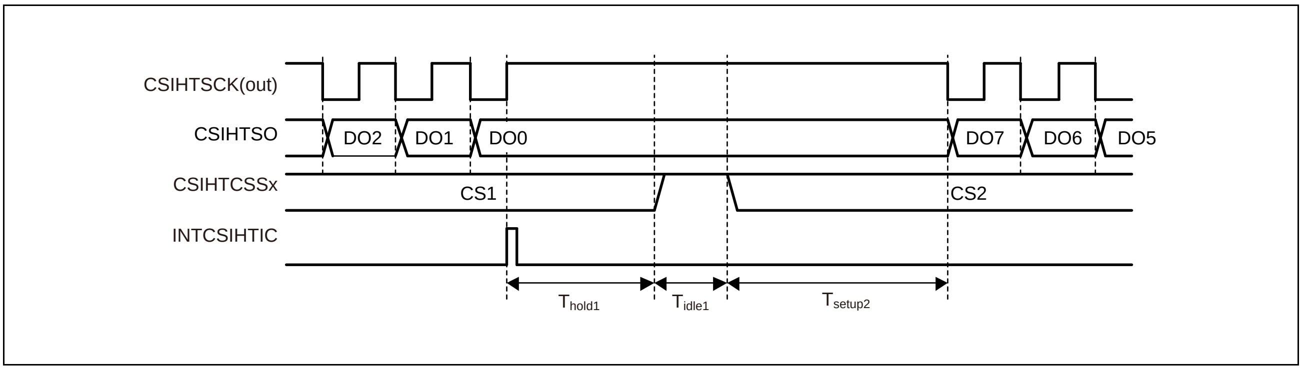

Figure 20.19 Data Phase Timing with
CSIHnCFG1.CSIHnCKP1 = 0, CSIHnCFG1.CSIHnDAP1 = 0 and
CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 0

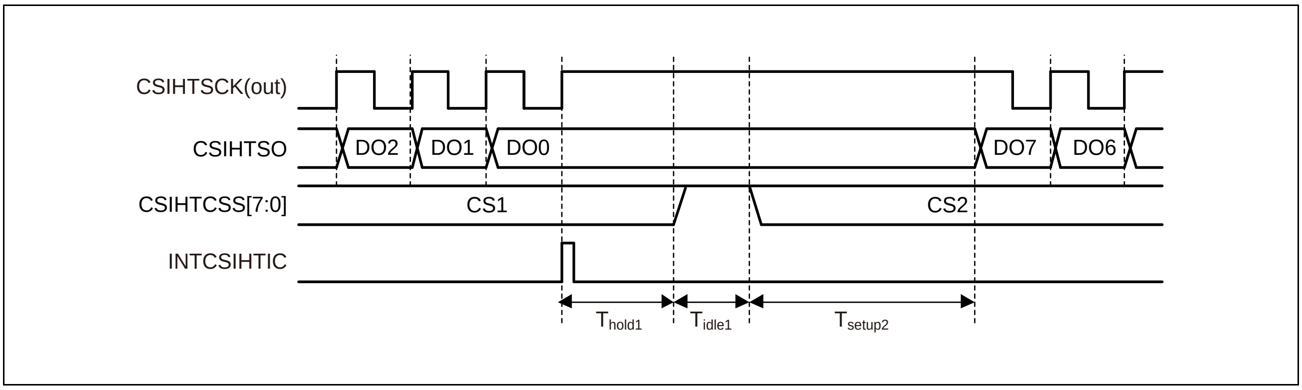

Figure 20.20 Data Phase Timing with
CSIHnCFG1.CSIHnCKP1 = 1, CSIHnCFG1.CSIHnDAP1 = 0 and
CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 1

20.5.5 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the following bits:

- CSIHnCTL2.CSIHnPRS[2:0]
- CSIHnBRSy.CSIHnBRS[11:0]
- CSIHnCFGx.CSIHnBRSSx[1:0]

The transfer clock frequency of transmission clock CSIHTSCK is determined by the setting of the CSIHnCTL2.CSIHnPRS[2:0] bits and the setting of the CSIHnBRSy.CSIHnBRS[11:0] bits, but any one of CSIHnBRS3 to CSIHnBRS0 can be selected for each chip select signal by using the CSIHnCFGx.CSIHnBRSSx[1:0] bits.

The following figure shows a block diagram of the baud rate generator.

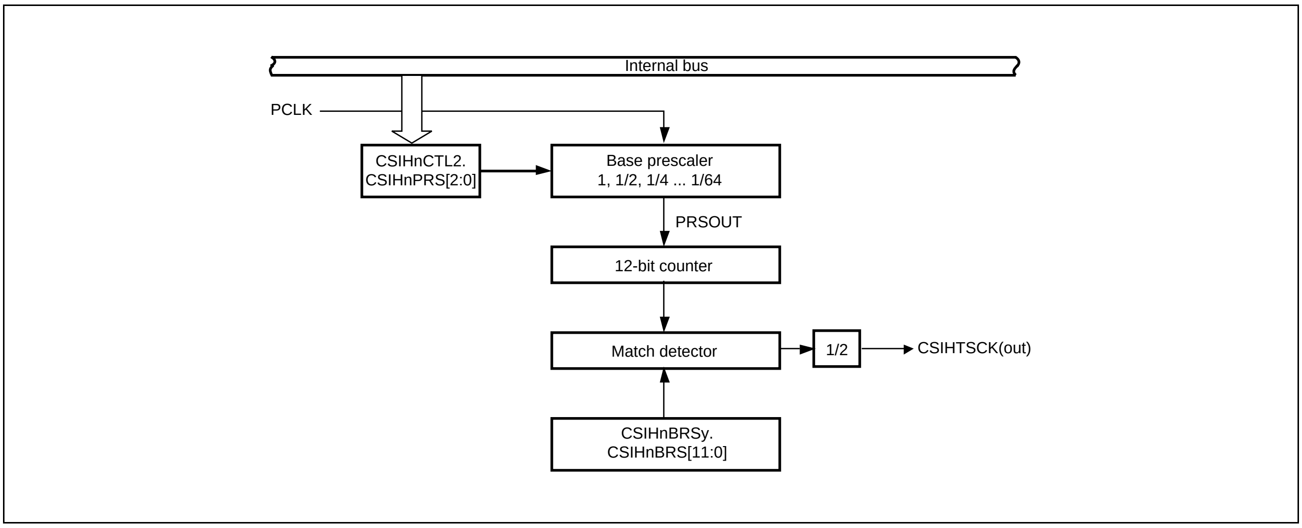

Figure 20.21 Baud Rate Generator Block Diagram

By setting CSIHnBRSy.CSIHnBRS[11:0] to 000_H, the baud rate generator is disabled and CSIHTSCK of the corresponding channels are stopped.

Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated as:

Transfer clock frequency (CSIHTSCK) = PCLK / (division ratio of PCLK) = PCLK / ($2^\alpha \times k \times 2$),

where:

α = CSIHnCTL2.CSIHnPRS[2:0] = 0 to 6

k = CSIHnBRS0.CSIHnBRS0[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 0)
CSIHnBRS1.CSIHnBRS1[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 1)
CSIHnBRS2.CSIHnBRS2[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 2)
CSIHnBRS3.CSIHnBRS3[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 3)

Transfer clock frequency upper and lower limits

When setting the transfer clock frequency, please note the following:

- The minimum transfer clock frequency in master mode and slave mode is PCLK/524160.
- The maximum transfer clock frequency is as follows:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/6)

20.5.6 CSIH Buffer Memory

The CSIH has a configurable RAM that can be used for buffered I/O. The size is 128 words. One word is comprised of 32-bit data and 7-bit ECC.

The following configurations are available:

Table 20.51 Configurations of CSIH buffer

Mode	CSIHnCTL0.CSIHnMBS	CSIHnMCTL0.CSIHnMMS[1:0]
FIFO mode	0	00_B
Dual buffer mode		01_B
Transmit-only buffer mode		10_B
Direct access mode	1	X

20.5.6.1 FIFO Mode

In FIFO mode, data can be written to the CSIHnTX0W register without waiting for completion of the transmission, and data can be received without reading the CSIHnRX0W register immediately, provided the FIFO is not full.

Data to be transmitted is stored in the FIFO memory. Transmission and reception occur simultaneously – one data is received as one data is transmitted. That means, received data overwrites the transmitted data in the FIFO.

The CSIH automatically updates the respective FIFO memory pointers when data is written to or read from the FIFO memory, or data is transmitted to or received from the FIFO memory.

Table 20.52 FIFO Mode

Pointer Description	Pointer*[1]	Range
Number of untransmitted words	CSIHnSTR0.CSIHnSPF[7:0]	0 to 128
Number of words received and stored in the FIFO	CSIHnSTR0.CSIHnSRP[7:0]	0 to 128
Address for write/read of transmit data	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $01FC_H$
Address for read of received data	CSIHnMRWP0.CSIHnRRA[6:0]	0000_H to $01FC_H$
Address to be sent	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $01FC_H$

Note 1. The values are automatically updated after each read/write or data transmit/receive operation.

The CSIH status register contains two FIFO status flags:

- CSIHnSTR0.CSIHnFLF: FIFO full
- CSIHnSTR0.CSIHnEMF: FIFO empty

When this mode is started, bit CSIHnSTCR0.CSIHnPCT must be set. By doing this, CSIHnSTR0.CSIHnEMF is not reset, but set.

All FIFO pointers and FIFO flags except CSIHnSTR0.CSIHnEMF are reset and CSIHnSTR0.CSIHnEMF is set.

20.5.6.2 Dual Buffer Mode

In this mode, the memory is divided into two parts of equal size; 64 words are allocated to transmission data and 64 words to received data. In dual buffer mode, the respective buffer pointers indicate the values shown in the following table.

Table 20.53 Dual Buffer Mode

Pointer Description	Pointer*1	Range
Address of data written to and read from transmit buffer	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $00FC_H$
Address of data read from receive buffer	CSIHnMRWP0.CSIHnRRA[6:0]	0000_H to $00FC_H$
The number of transmit data remaining in the transmit buffer	CSIHnMCTL2.CSIHnND[6:0]	0 to 64
Address to which data is transmitted	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $00FC_H$

Note 1. Pointers are automatically incremented after each read/write.

20.5.6.3 Transmit-Only Buffer Mode

In this mode, the entire memory is used to save transmission data.

Received data must be read directly from CSIHnRX0W/H.

In transmit-only buffer mode, the respective buffer pointer indicates the values shown in the following table.

Table 20.54 Transmit-Only Buffer Mode

Pointer Description	Pointer*1	Range
Address of data written to and read from transmit buffer	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $01FC_H$
The number of transmit data remained in the transmit buffer	CSIHnMCTL2.CSIHnND[6:0]	0 to 128
Address to which data is transmitted	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $01FC_H$

Note 1. Pointers are automatically incremented after each read/write.

20.5.6.4 Direct Access Mode

In direct access mode, the CSIH memory is completely bypassed:

- Transmission data provided by the CPU to the transmission register CSIHnTX0W or CSIHnTX0H is directly copied to the shift register.
- Reception data is directly copied from the shift register to the reception register CSIHnRX0W or CSIHnRX0H.

20.5.7 Data Transfer Modes

The following table summarizes this section. It shows how data transfer is started in the various memory, operating, and transfer modes.

Table 20.55 Start of Data Transfer

Memory and Operating Mode		Transfer Mode	
		Transmit-Only Transmit/Receive	Receive-Only
FIFO, direct access	Master	Writing to the CSIHnTX0W register or the CSIHnTX0H register	Writing to the CSIHnTX0W register or the CSIHnTX0H register
	Slave	Clock reception from master	Incoming clock from the master
Transmit-only buffer, dual buffer	Master	CSIHnMCTL2.CSIHnBTST = 1	CSIHnMCTL2.CSIHnBTST = 1
	Slave	Clock reception from master	Clock reception from master

20.5.7.1 Transmit-Only Mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 0 puts the CSIH in transmit-only mode. Start of transmission depends on the memory mode:

- In case of FIFO or direct access mode, transmission starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, transmission starts when the CSIHnMCTL2.CSIHnBTST bit is set.

20.5.7.2 Transmit/Receive Mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in transmit/receive mode.

Start of communication (transmission and reception) depends on the memory mode:

- In case of FIFO or direct access mode, communication starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, communication starts when the CSIHnMCTL2.CSIHnBTST bit is set.

20.5.7.3 Receive-Only Mode

Setting CSIHnCTL0.CSIHnTXE = 0 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in receive-only mode.

In master mode, start of reception depends on the memory mode:

- In case of FIFO or direct access mode, reception starts when dummy data is written to the CSIHnTX0W or CSIHnTX0H register.

In slave mode, reception starts as soon as the CSIHTSCK transmission clock is received from the master. It is not necessary to write data to the CSIHnTX0W or CSIHnTX0H register of the slave.

- In case of dual buffer mode or transmit-only buffer mode, reception starts when the CSIHnMCTL2.CSIHnBTST bit is set.

20.5.8 Data Length Selection

20.5.8.1 Data Length from 2 to 16 Bits

The length of a data packet is selectable for each chip select signal from 2 to 16 bits using CSIHnCFGx.CSIHnDLSx[3:0]. The examples below show the communication with MSB first (CSIHnCFGx.CSIHnDIRx = 0).

Data length = 16 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 0000_B):

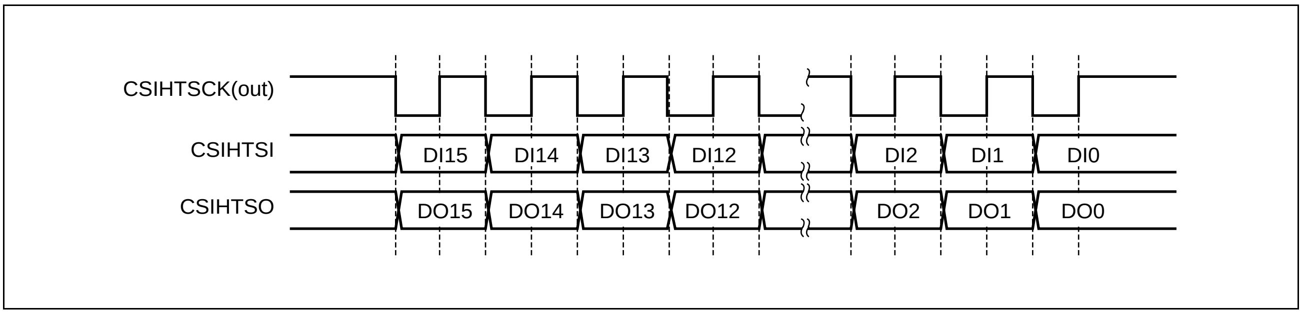

Figure 20.22 16 Bit Data Length, MSB First

Data length = 14 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1110_B):

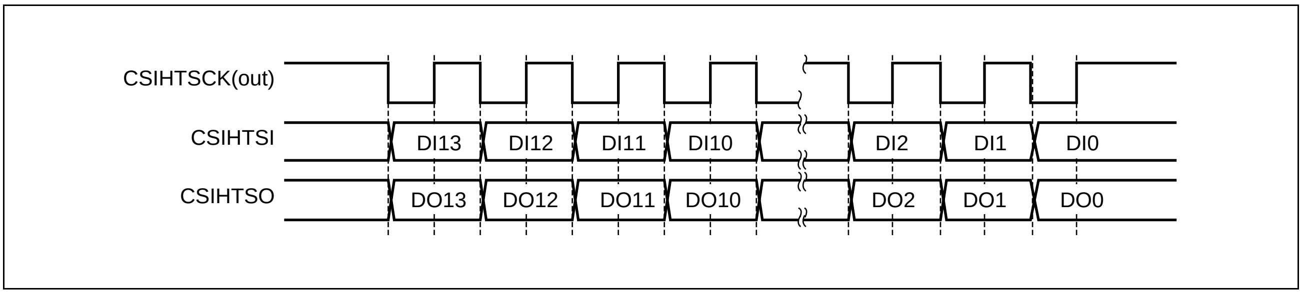

Figure 20.23 14 Bit Data Length, MSB First

20.5.8.2 Data Length Greater than 16 Bits

If the data to be sent/received exceeds 16 bits, the extended data length (EDL) function can be used.

EDL function is enabled by setting the CSIHnCTL1.CSIHnEDLE bit to 1.

EDL function works as follows:

- The data has to be broken into 16-bit blocks plus remainder. For example, data of 42 bits would be broken into two 16-bit blocks plus 10 bits.
- The bit length of the remainder is set as “data length” in CSIHnCFGx.CSIHnDLSx[3:0].
- For transmitting the 16-bit blocks, CSIHnTX0W.CSIHnEDL must be set to 1. In this case, the data written to CSIHnTX0W is sent as a 16-bit data length regardless of the CSIHnCFGx.CSIHnDLSx[3:0] bit setting.
- The transfer is complete after a block with the specified data length (the remainder of data specified with CSIHnTX0W.CSIHnEDL = 0) has been sent.

Example

Example for sending 40-bit data (123456789A$_H$) to CS0:

40 bits are split into two 16-bit blocks plus 8 bits.

- Initialize CSIHnCFG0.CSIHnDLS0[3:0] = 8.
- To transmit 123456789A$_H$ with MSB first, write the following sequence to CSIHnTX0W:
  - 20FE 1234$_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - 20FE 5678$_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - 00FE 009A$_H$ (CSIHnTX0W.CSIHnEDL = 0)

The following figure illustrates the timing.

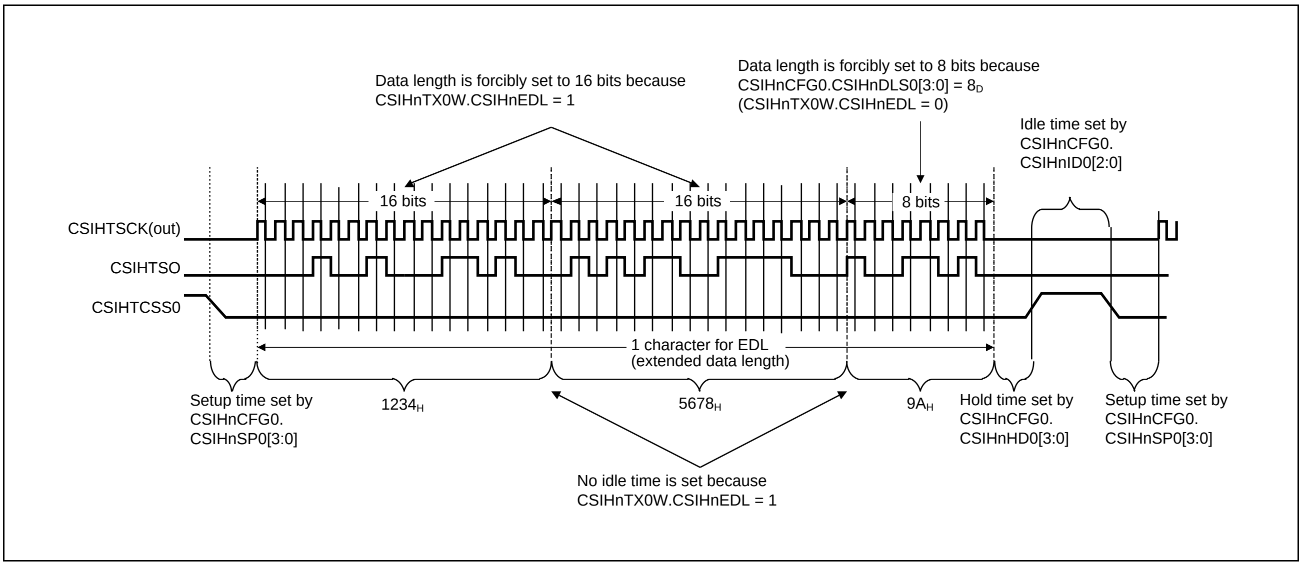

Figure 20.24 EDL Timing Diagram

NOTES

1. 1-bit data length is allowed only when using the EDL mode.
2. If parity is enabled, the parity bit is added after the last bit.
3. When data is sent using extended data length (EDL) function, use the same chip select signal.
4. Example for configuring the data direction:
   - Data to be sent: 123456_H
   - MSB first:
     Set CSIHnCFGx.CSIHnDIRx = 0
     Write CSIHnTX0W = 20FE 1234_H (EDL bit = 1)
     Write CSIHnTX0W = 00FE 0056_H (EDL bit = 0)
   - LSB first:
     Set CSIHnCFGx.CSIHnDIRx = 1
     Write CSIHnTX0W = 20FE 3456_H (EDL bit = 1)
     Write CSIHnTX0W = 00FE 0012_H (EDL bit = 0)
5. Operation is not guaranteed if CSIHnTX0W.CSIHnEOJ and CSIHnTX0W.CSIHnEDL are simultaneously set to “1” while CSIHnCTL1.CSIHnJE = 1 and CSIHnCTL1.CSIHnEDLE = 1.
6. EDL mode cannot be used in receive-only mode of slave mode.
   (CSIHnCTL2.CSIHnPRS[2:0] = 111_B, CSIHnCTL0.CSIHnTXE = 0, CSIHnCTL0.CSIHnRXE = 1)

20.5.9 Serial Data Direction Selection

The serial data direction is selectable for each chip select signal using the CSIHnDIRx bit in the CSIHnCFGx register.

The examples below show communication for a data length of 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).

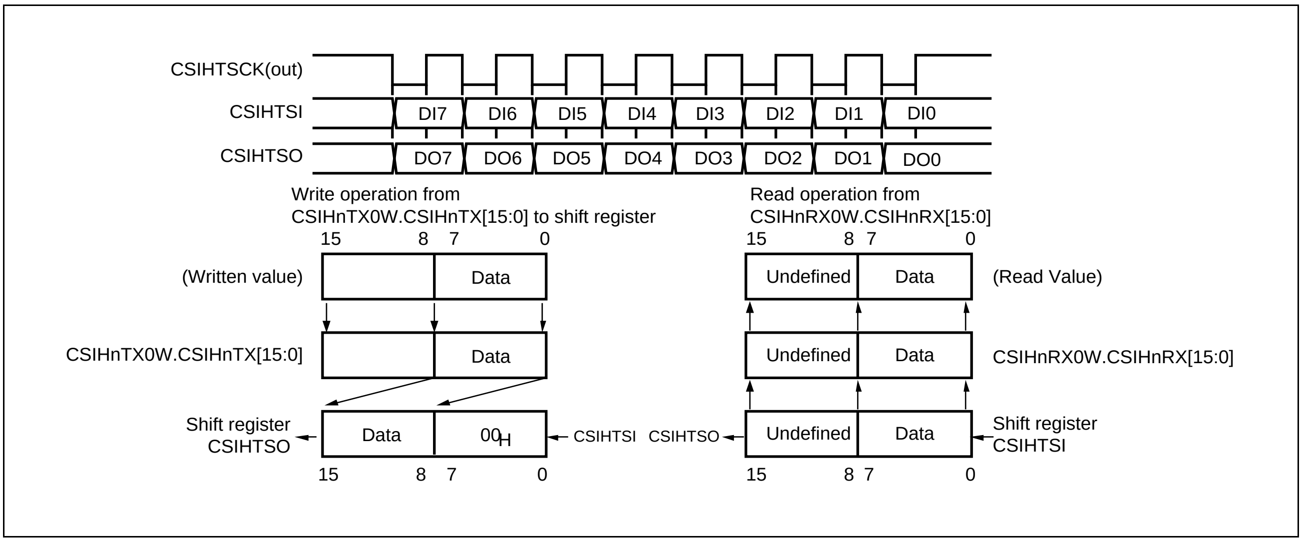

Figure 20.25 Serial Data Direction Select Function — MSB First (CSIHnDIRx = 0)

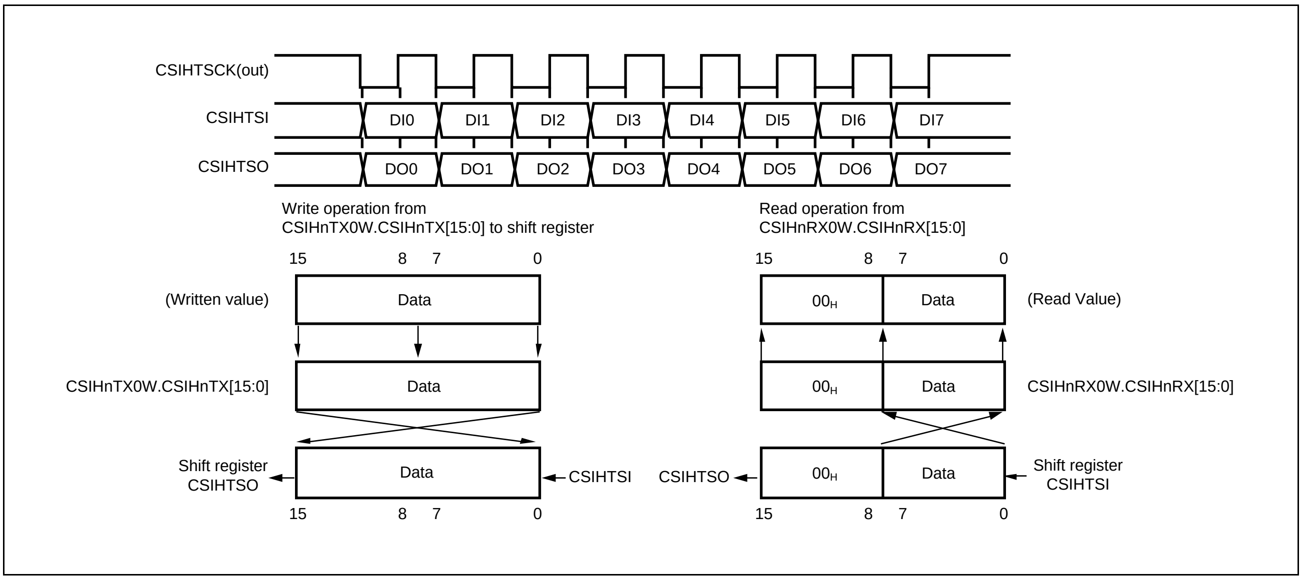

Figure 20.26 Serial Data Direction Select Function — LSB First (CSIHnDIRx = 1)

20.5.10 Slave Select (SS) Function

The Slave Select (SS) function enables communication between one master and multiple slaves (SPI communications).

In master mode, the master device outputs the slave select signal (CSIHTCSSx) to a slave. Communication by a device in slave mode is enabled when the slave input select signal (CSIHTSSI) is at the low level.

See **Section 20.5.2, Master/Slave Connections**, for examples of connections using the SS function.

20.5.10.1 Communication Timing Using SS Function

The following figure illustrates the communication signal and timings using the SS function.

In slave mode, the data transfer configuration is determined by the CSIHnCFG0 register.

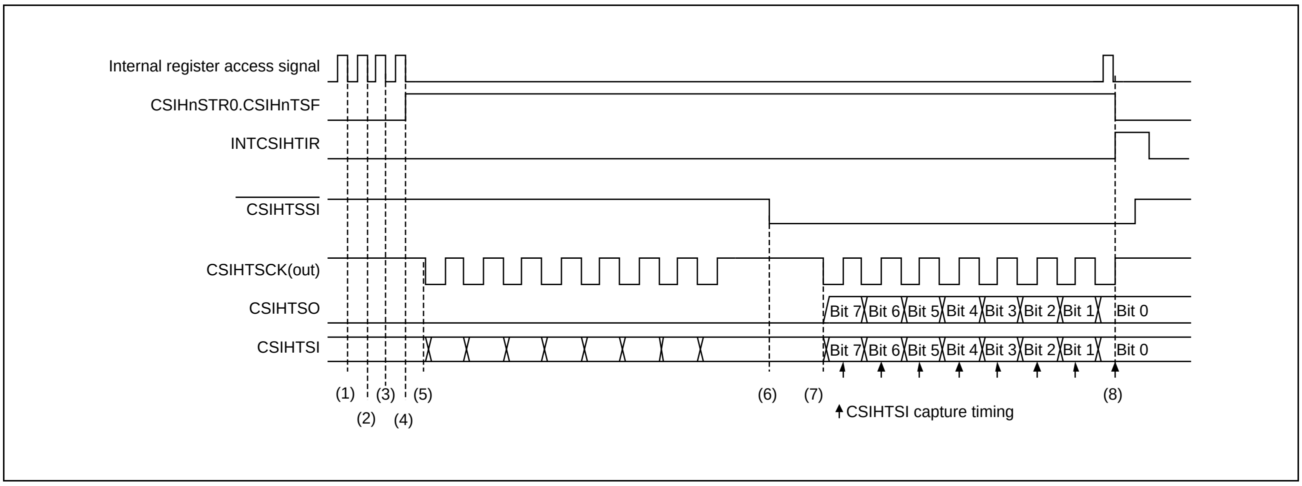

Figure 20.27 Tx/Rx Timing of Communication Using SS Function

(1) CSIH enters slave mode by setting CSIHnCTL2.CSIHnPRS[2:0] = 111_B. CSIHnCFG0.CSIHnCKP0 and CSIHnCFG0.CSIHnDAP0 are 0.

(2) The data length is 8 bits (CSIHnCFG0.CSIHnDLS0[3:0] = 1000_B). The data direction is MSB first (CSIHnCFG0.CSIHnDIR0 = 0).

(3) The transmit/receive mode is set (CSIHnCTL0.CSIHnTXE = 1, CSIHnCTL0.CSIHnRXE = 1, and CSIHnCTL0.CSIHnPWR = 1). Communication start is permitted.

(4) The transfer status flag CSIHnSTR0.CSIHnTSF is automatically set when transfer data is written to the CSIHnTX0W or CSIHnTX0H transmission register during direct access mode or FIFO mode.

(5) While the signal $\overline{\text{CSIHTSSI}}$ is at high level, transmission/reception is not started, even if an external transmission clock CSIHTSCK is input. Input to CSIHTSI is ignored.

(6) $\overline{\text{CSIHTSSI}}$ falling to low level indicates that CSIHTSO is enabled and ready for transmission.

(7) As soon as the external clock signal CSIHTSCK is detected, the slave transmits data to CSIHTSO and simultaneously captures data from CSIHTSI.

(8) Interrupt INTCSIHTIR indicates that the reception is complete. The CSIHnRX0W/H register can be read.

20.5.10.2 CSIHTSSO Operation

CSIHnPWR	CSIHnTXE	CSIHnRXE	CSIHnSSE	CSIHTSSO
0	—	—	—	H
1	—	—	0	H
	0		1	H
	1		1	Inverse value of $\overline{\text{CSIHTSSI}}$ level

The CSIHTSSO pin is a signal to control the I/O function of the chip’s SO pin when using the SS function.

The CSIHTSO pin is enabled when the CSIHTSSO pin is “High” (the chip’s SO pin is being driven).

The CSIHTSO pin is disabled when the CSIHTSSO pin is “Low” (the chip’s SO pin is not being driven).

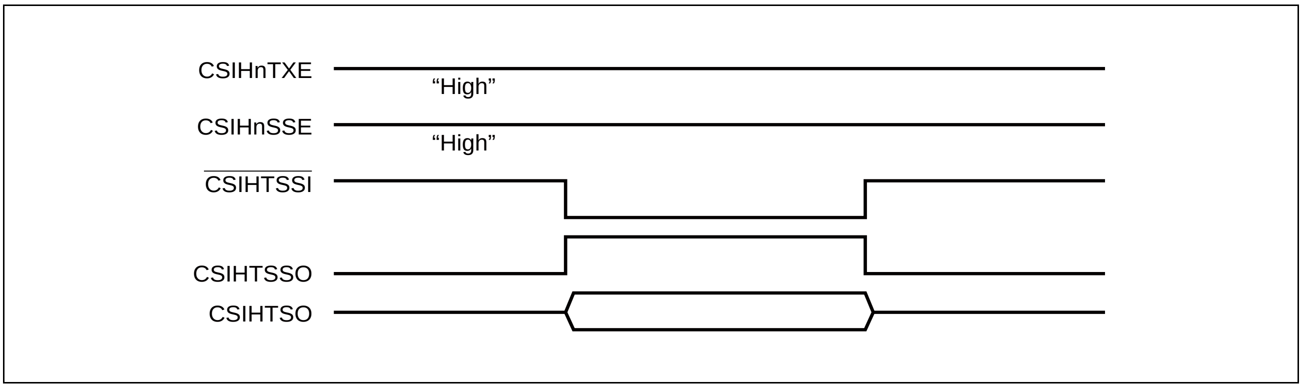

Figure 20.28 Operation of CSIHTSSO

CAUTION

If $\overline{\text{CSIHTSSI}}$ pin is changed during communication (CSIHnSTR0.CSIHnTSF = 1), current communication is not guaranteed.

20.5.11 Handshake Function

CSIH features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by the CSIHnCTL1.CSIHnHSE bit. For handshake, the signals CSIHTRYI and CSIHTRYO are used.

The busy timing depends on the data phase selection bit CSIHnCFGx.CSIHnDAPx.

20.5.11.1 Slave Mode

If CSIHnCTL1.CSIHnHSE = 1, a low-level CSIHTRYO signal is output when the slave becomes busy. This can happen in two cases:

1. When the next data to be sent is not ready:
   When the slave is in transmit-only mode or transmit/receive mode (CSIHnCTL0.CSIHnTXE = 1) and is in any of the states listed below, the CSIHTRYO outputs the busy state (low level).

Table 20.56 Memory Mode and Slave Transfer State

Memory Mode	Slave Transfer State
Direct access mode	When there is no more data to be sent
FIFO mode	When there is no more data to be sent (CSIHnSTR0.CSIHnEMF = 1)
Dual buffer mode	When CSIHnMCTL2.CSIHnBTST is not set to 1
Transmit-only buffer mode	

The following examples assume an eight-bit data length.

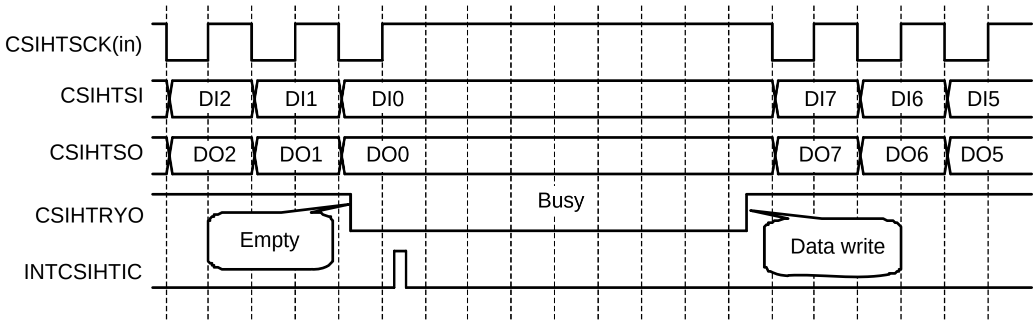

Figure 20.29 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 0)

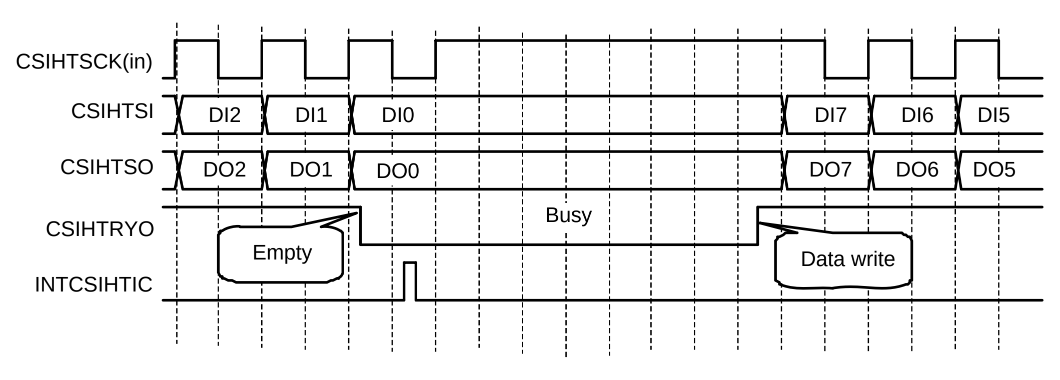

Figure 20.30 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 1)

2. When receive register is full:
   When slave is configured in receive-only mode or transmit/receive mode (CSIHnCTL0.CSIHnRXE = 1), and new data cannot be copied from a shift register to CSIHnRX0W/H because the previously received data is still in the CSIHnRX0W/H register (CSIHnRX0W/H is full).
   When CSIHnCTL0.CSIHnRXE is 1 and is in any of the following states, CSIHTRYO outputs busy state (low level).

Table 20.57 Memory Mode and Slave Reception State

Memory Mode	Slave Reception State
Direct access mode	When CSIHnRX0W or CSIHnRX0H is full
FIFO mode	When received data is remaining in buffer (CSIHnSTR0.CSIHnFLF = 1)
Dual buffer mode	No applicable case
Transmit-only buffer mode	When CSIHnRX0W or CSIHnRX0H is full

The following examples assume an eight-bit data length.

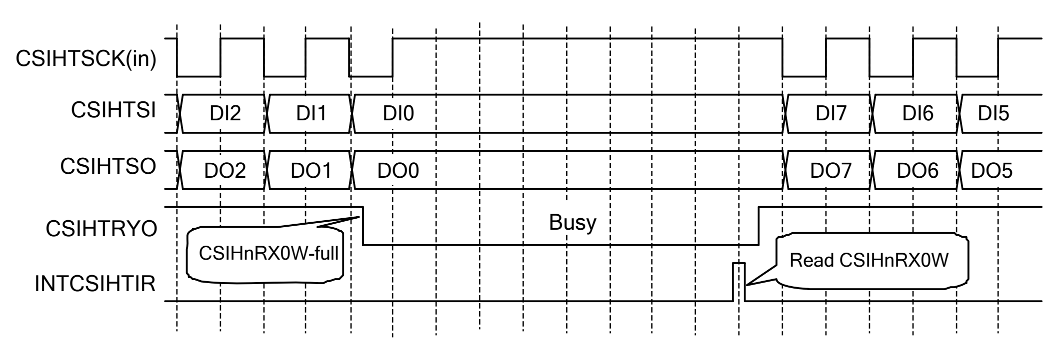

Figure 20.31 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 0)

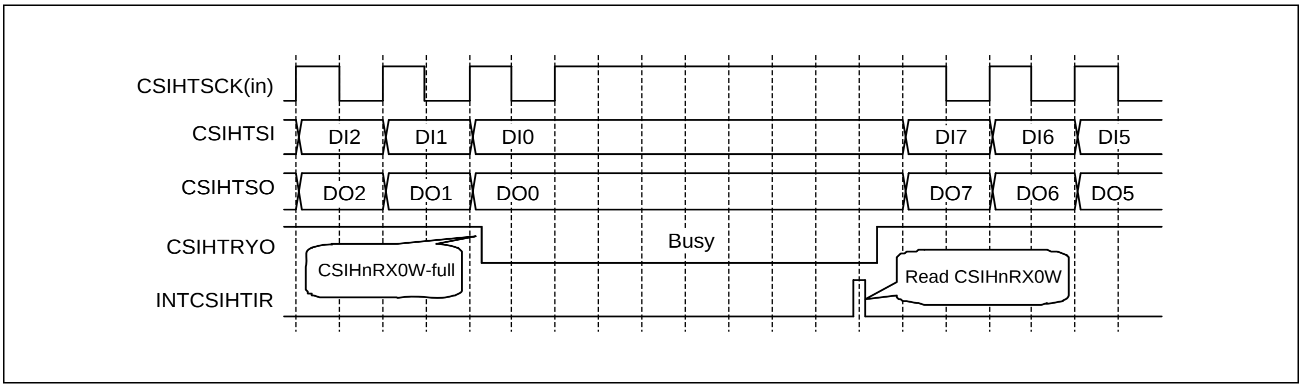

Figure 20.32 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 1)

20.5.11.2 Master Mode

When the master detects CSIHTRYI = 0 while CSIHnCTL1.CSIHnHSE = 1, the subsequent transfers are put on hold, the master goes into wait state and suspends the CSIHTSCK clock.

The CSIHTRYI level is checked at each half clock cycle of CSIHTSCK.

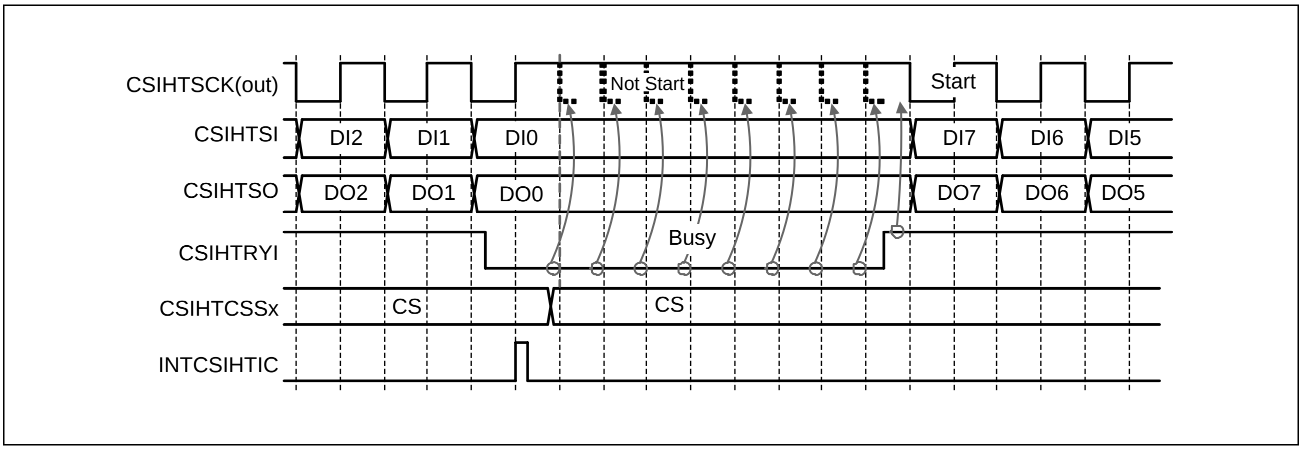

Figure 20.33 Master’s Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 0)

The CSIHTRYI signal must be pulled down by the slave before the next transfer starts. If this is done while data transfer is in progress, the serial clock from the master is suspended after the transfer is complete.

The master resumes the communication as soon as CSIHTRYI becomes high (the slave is “ready”).

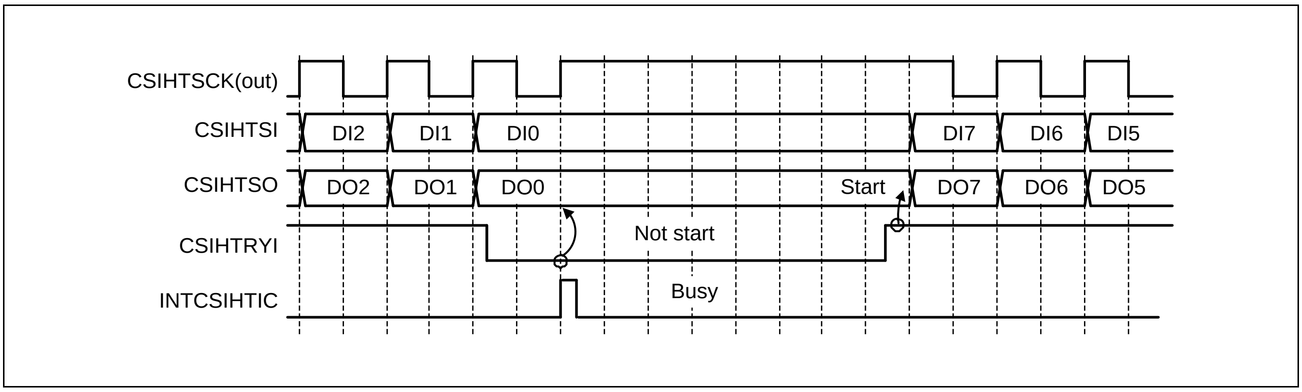

Figure 20.34 Master’s Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 1)

CAUTIONS

1. If multiple slaves are connected, the master must only detect the CSIHTRYI signal of the slave it has selected for communication.
2. Even when the CSIHTRYI pin of the master detects a CSIHTRYO signal from the slave during data transfer, the communication is not put on hold but continues until the data transfer is completed.

20.5.12 Error Detection

CSIH can detect five error types:

- Data consistency check error (transmission data)
- Parity error (received data)
- Overrun error (received data)
- Time-out error (in FIFO mode)
- Overflow error (in FIFO mode)

Check for parity, data consistency and time-out errors can be enabled/disabled individually.

If any of these errors is detected, the interrupt request INTCSIHTIRE is generated and the corresponding flags are set.

20.5.12.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent as output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIHnCTL1.CSIHnDCS bit (when checking data consistency, make sure that PIPCn.PIPCn_m = 1). It will not be enabled if data transmission is disabled (CSIHnCTL0.CSIHnTXE = 0).

When the data consistency check is active, the data transferred from CSIHnTX0W or CSIHnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIHTSO are read back via the CSIHTDCS signal into the corresponding shift register.

After completion of the transmission, the sent data is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnDCE bit is set.

Additionally, CSIHnRX0W.CSIHnTDCE of data that contains the error is set.

The data consistency check function is illustrated in the following block diagram.

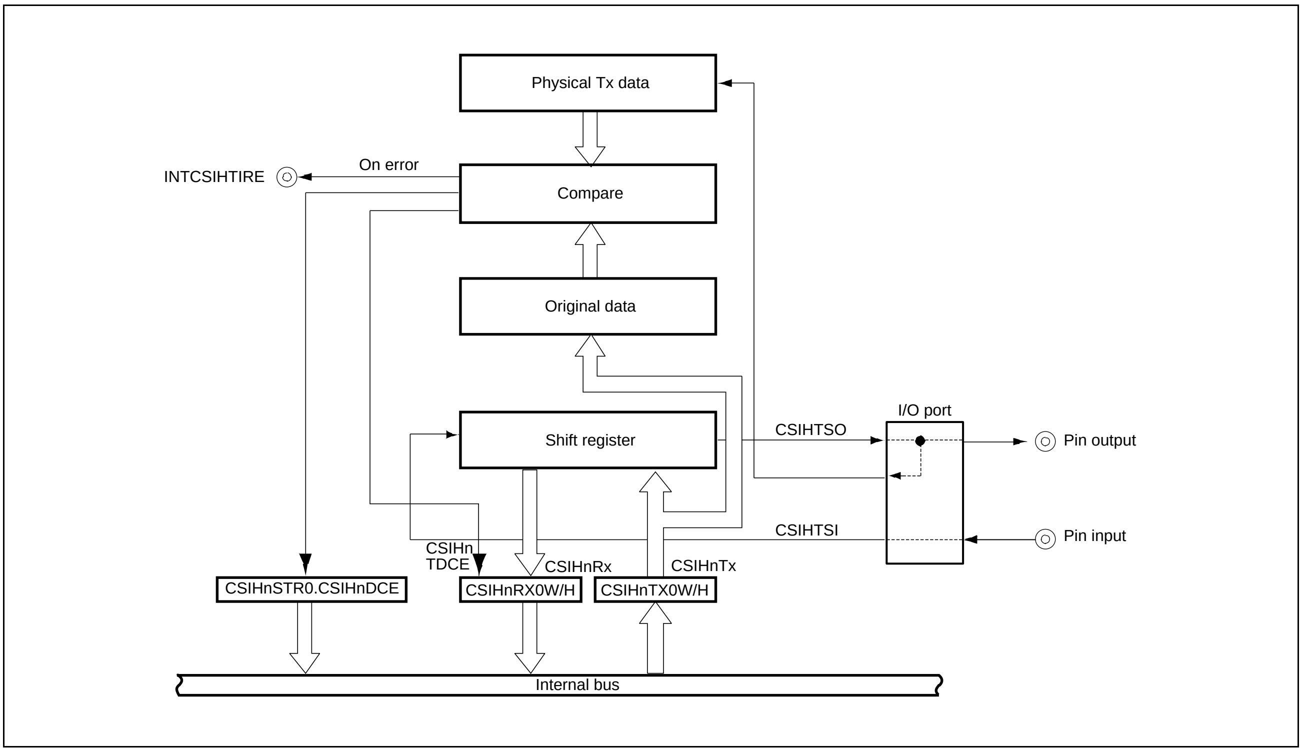

Figure 20.35 Data Consistency Check Functional Block Diagram

20.5.12.2 Parity Check

CSIH can append a parity bit to the last data bit (even if extended data length is used).

The use and type of parity is specified in CSIHnCFGx.CSIHnPSx[1:0].

Parity check is enabled if CSIHnCFGx.CSIHnPSx[1] = 1.

The parity bit is checked after a reception is complete. In case of parity error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnPE bit is set.

Additionally, CSIHnRX0W.CSIHnRPE of data that contains the error is set.

The figure below shows an example.

- Data length is 8 bits.
- The data to be transmitted is 05_H and 35_H.
- Data direction is LSB first.
- Parity type is odd.

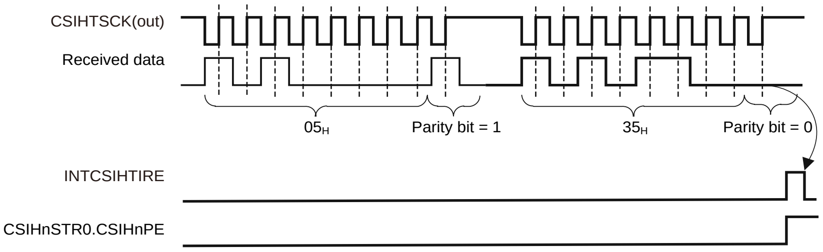

Figure 20.36 Parity Check Example

The parity bit of the first data is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

The parity bit of the second data is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last bit of the data.

20.5.12.3 Time-Out Error

Time-out errors can be checked only in slave FIFO mode.

This error occurs if neither of the following occurred within a certain period of time:

- Received data in FIFO is read
- FIFO receives data from CSIHTSI

The time-out time is defined in CSIHnMCTL0.CSIHnTO[4:0] in units of “8 x transmission clock CSIHTSCK”. A time-out error occurs when the specified time is exceeded (the time-out time is not detected when CSIHnMCTL0.CSIHnTO[4:0] = 00000_B).

The dedicated time-out counter is set by the CSIHnCTL2.CSIHnPRS[2:0] and CSIHnBRSy.CSIHnBRS[11:0] bits.

If the value of the CSIHnBRSy.CSIHnBRS[11:0] bits is left as 000_H, the dedicated time-out counter does not operate.

The dedicated time-out counter measures the time between the last and the next read operation.

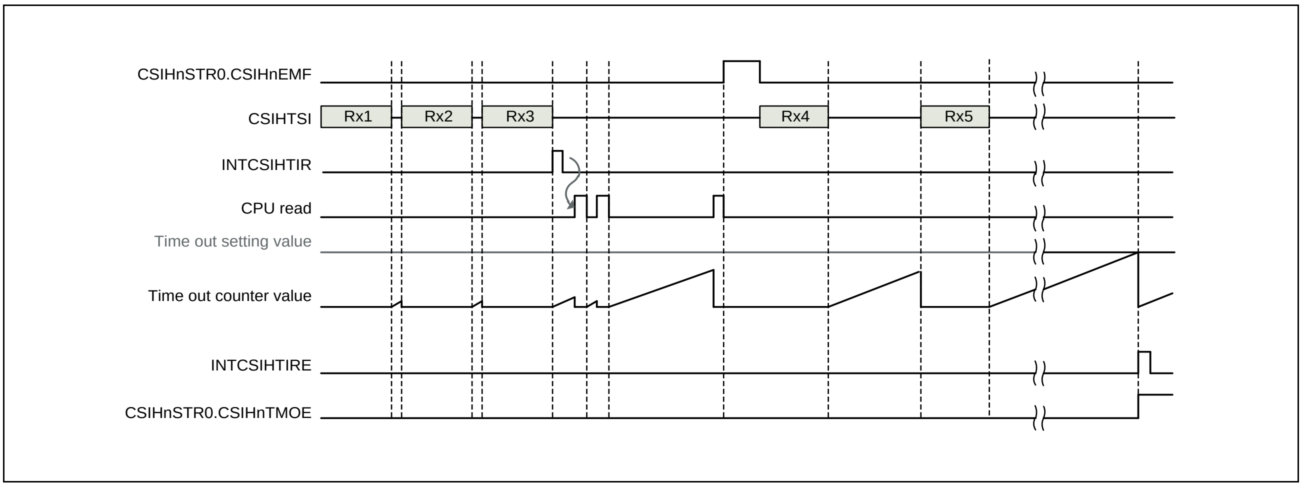

Figure 20.37 Time-Out Check Functional Timing Diagram

The start timing of the time-out counter is as follows:

- When reception is completed
- When data read from the CPU is completed
  (The counter does not start if the buffer is empty.)
- When a time-out error is detected

After a time-out error is detected, if data is still available in FIFO, the time-out counter restarts.

If the value set by bits CSIHnMCTL0.CSIHnTO[4:0] is reached again, the INTCSIHTIRE interrupt is output again.

The timeout counter continues to count until received data is read. To stop the counter, read all received data or set CSIHnSTCR0.CSIHnPCT to 1. Note that the pointer is cleared if you perform the latter.

The counter is reset at the following timing:

- Data is read once.
- A new data item is received.
- A timeout error is detected.
- The CSIHnSTCR0.CSIHnPCT bit is set to 1.

If a timeout error occurs, the following occur:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnTMOE bit is set.

20.5.12.4 Overflow Error

An overflow error can occur in FIFO mode. It occurs when transmission data is written to the CSIHnTX0W register while the FIFO buffer is filled with received data.

Example

100 data packets have been transmitted. That means, the FIFO contains 100 received data packets. The application starts to read the received data.

While the read operation is in progress, the application begins to write another set of 50 transmission data packets to the FIFO. However, only 10 received data packets have been read up to now, and 90 are still in the FIFO.

In this case, only 38 buffers are available for new transmission data. When the CPU tries to write the 39th data, an overflow error occurs.

This is illustrated in the following figure.

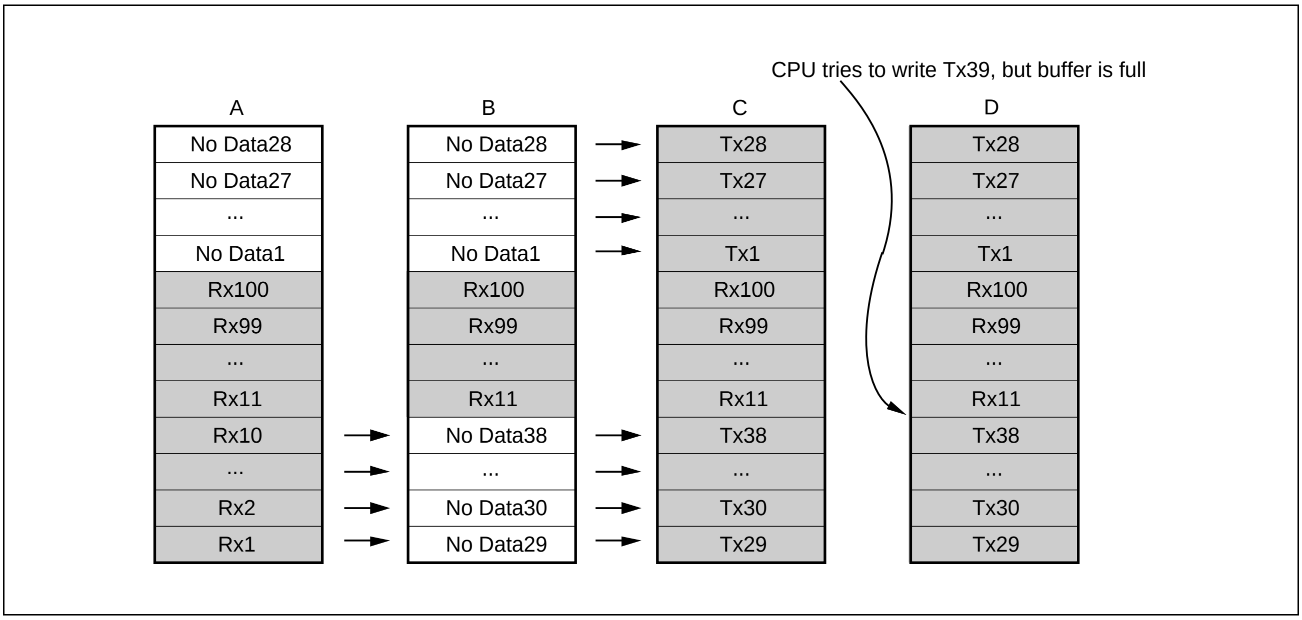

Figure 20.38 FIFO Overview

The 39th and subsequent data packets are discarded. The figure below shows the overflow timing.

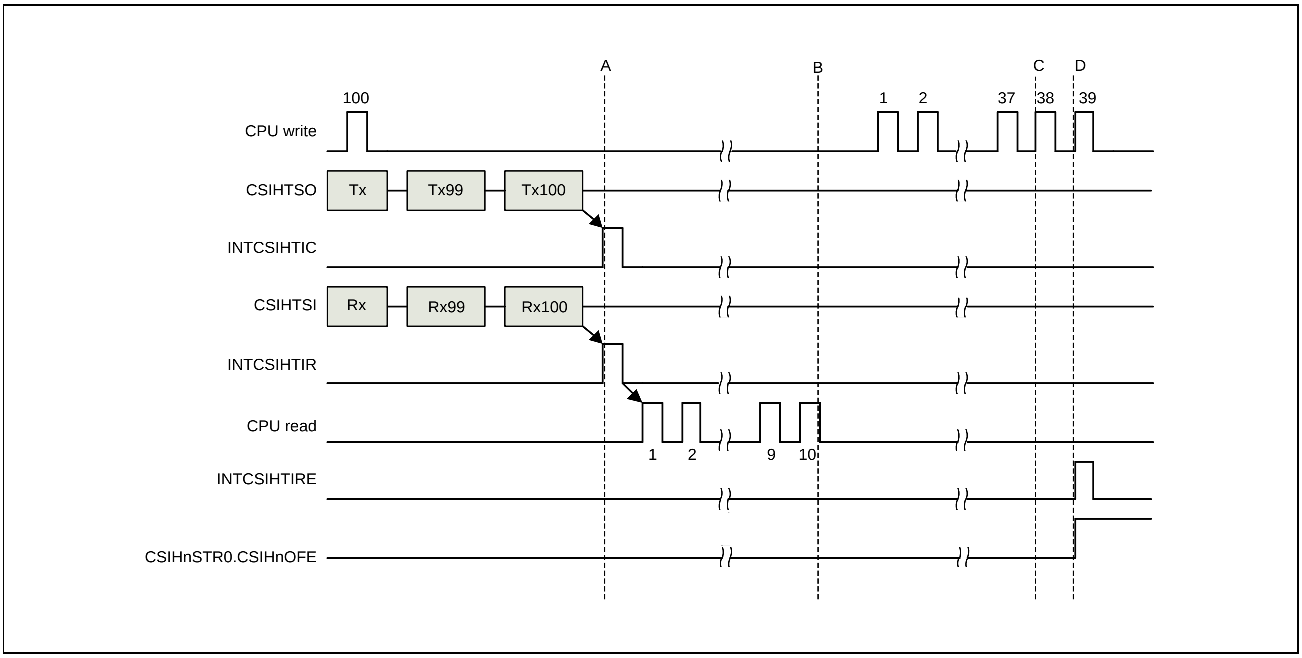

Figure 20.39 FIFO Overflow Timing

In case of overflow error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnOFE bit is set.

20.5.12.5 Overrun Error

An overrun error can occur in direct access, transmit-only buffer, and FIFO modes. It does not occur in dual buffer mode. The overrun error does not occur if data reception is disabled (CSIHnCTL0.CSIHnRXE = 0).

There are two conditions for overrun errors.

Condition for errors 1

- In FIFO mode, if the CPU reads the CSIHnRX0W/H register when the number of received data is 0.

Condition for errors 2

- In slave mode, when CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled):
  - In direct access mode or transmit-only buffer mode, when reception is completed while the previous received data remains in the CSIHnRX0W/H register.
  - In FIFO mode, when reception is completed while the FIFO buffer is still full of receive data.

(1) Direct access/transmit-only buffer

In direct access and transmit-only buffer modes, this error occurs when newly received data cannot be transferred from the shift register to the reception register CSIHnRX0W/H. This happens when CSIHnRX0W/H was not read and therefore contains previously received data.

The following figure illustrates the overrun error detection function.

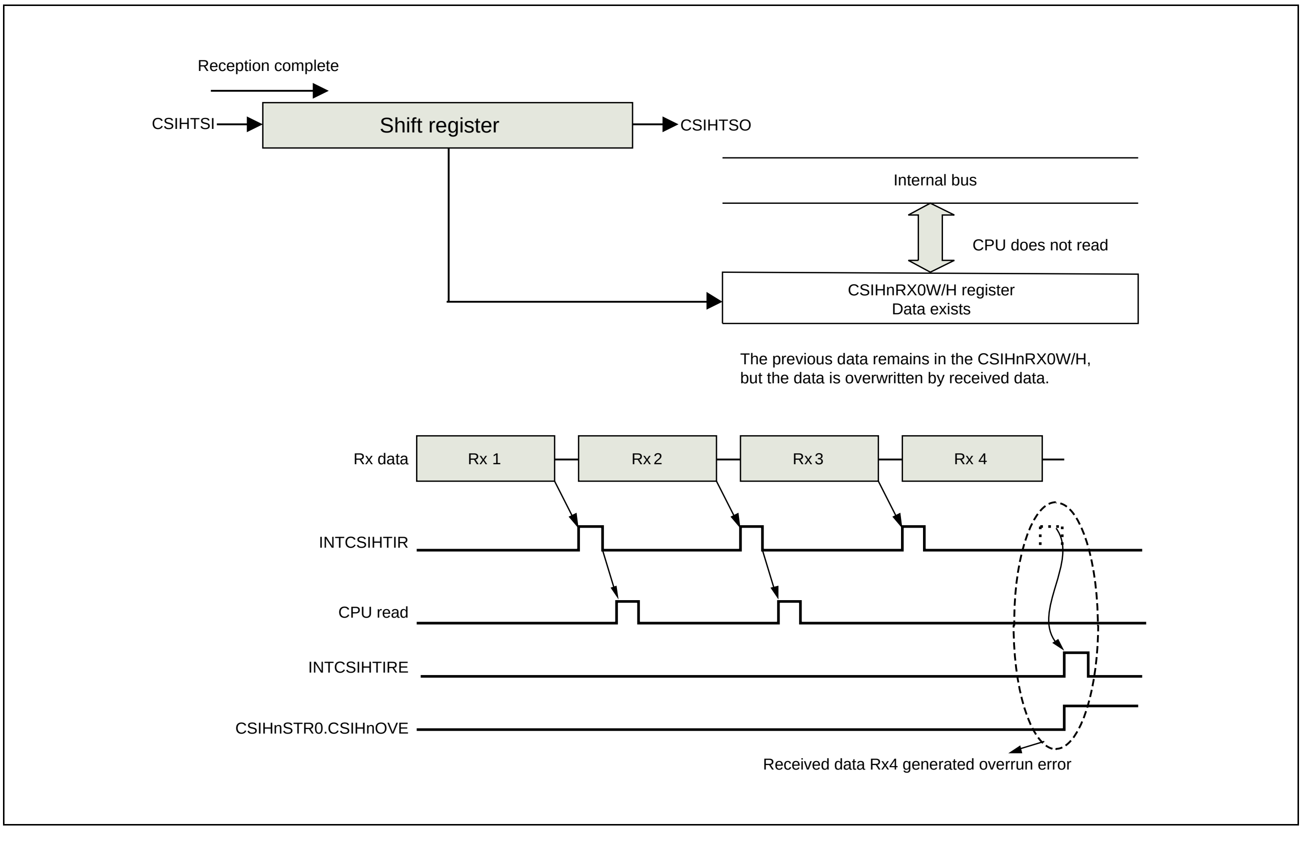

Figure 20.40 Overrun Error Detection in Direct Access and Transmit-Only Buffer Modes

NOTE

An overrun error can be avoided in slave mode by using handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

(2) FIFO mode

In FIFO mode, this error occurs if:

1. Newly received data cannot be transferred from the shift register to the FIFO because the FIFO is full.

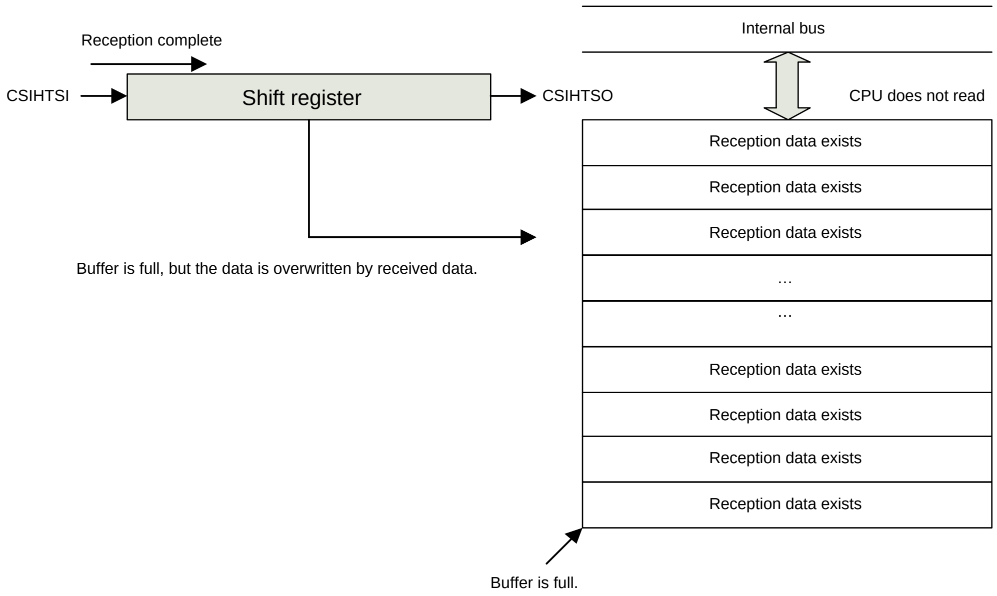

Figure 20.41 Overrun Error Detection in FIFO Mode (FIFO Full)

NOTE

An overrun error can be avoided in slave mode by using the handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

2. The CPU attempts to read non-existent receive data.

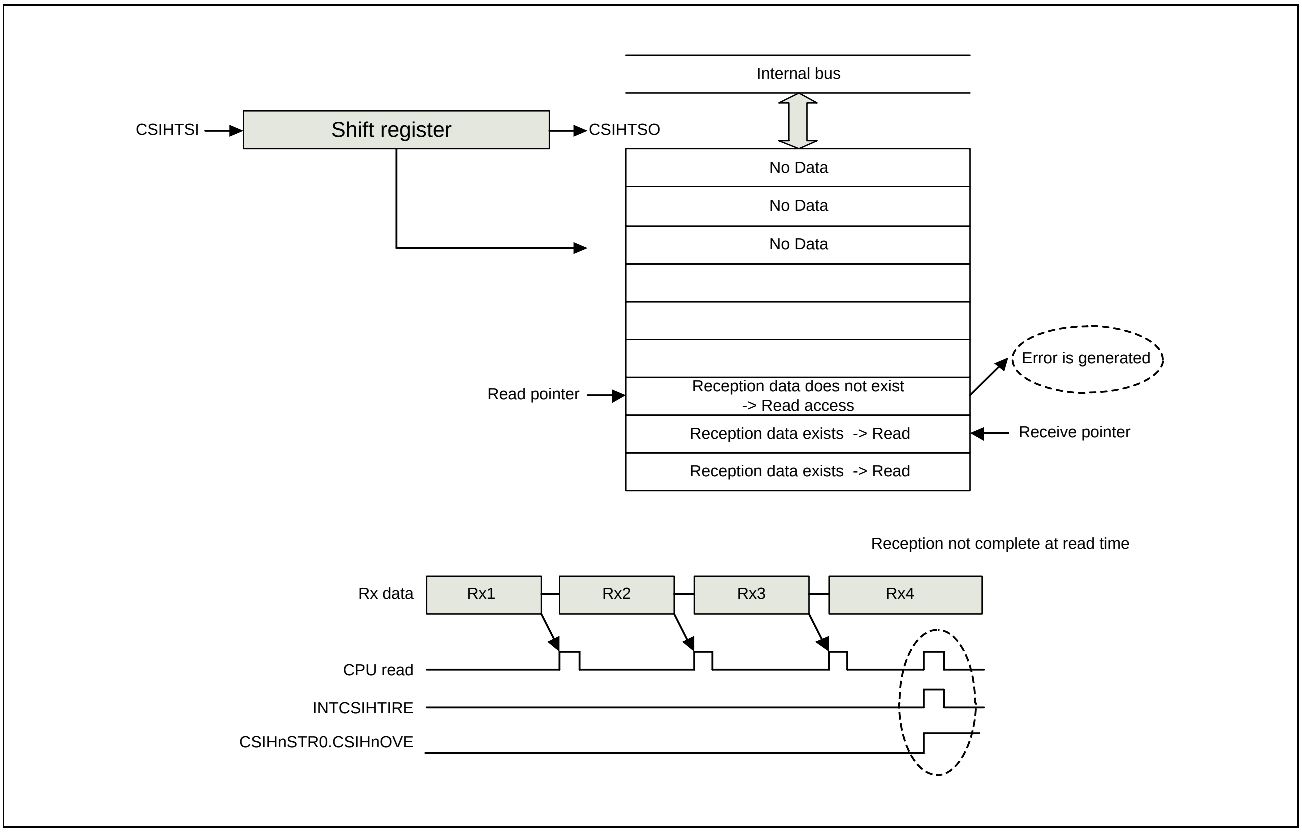

Figure 20.42 Overrun Error Detection in FIFO Mode (No Data)

In case of overrun error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnOVE bit is set.
- Received data is overwritten and the communication continues.
  (When the CPU tries to read non-existent data, it waits until reception is completed and then resumes reading.)

For details see **Section 20.5.11, Handshake Function**.

20.5.13 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active (CSIHnCTL1.CSIHnLBM = 1), CSIHTCSSx is fixed to the inactive level (the active level is defined by the CSIHnCTL1.CSIHnCSLx value). The transmit and receive signals are internally connected, as shown in the figures below. The signals CSIHTSCK, CSIHTSO, CSIHTSI, and CSIHTCSSx are disconnected from the ports. In addition, the CSIHTSO output level is fixed to low, and CSIHTSCK is set to reset level (High) regardless of the value of the CSIHnCFGx.CSIHnCKPx. The rest of CSIH works as in normal operation.

In order to test CSIH, put it in loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data. Any connected device remains unaffected by the loop-back test.

Table 20.58 Pin Output Level in Loop-Back Mode

Pin Name	Output Level
CSIHTSCK(out)	High level
CSIHTCSS[7:0]	Inactive level
CSIHTSO	Low level (not dependent on the previous value)
Interrupt	Normal function
CSIHTRYO	Normal function (Low level)

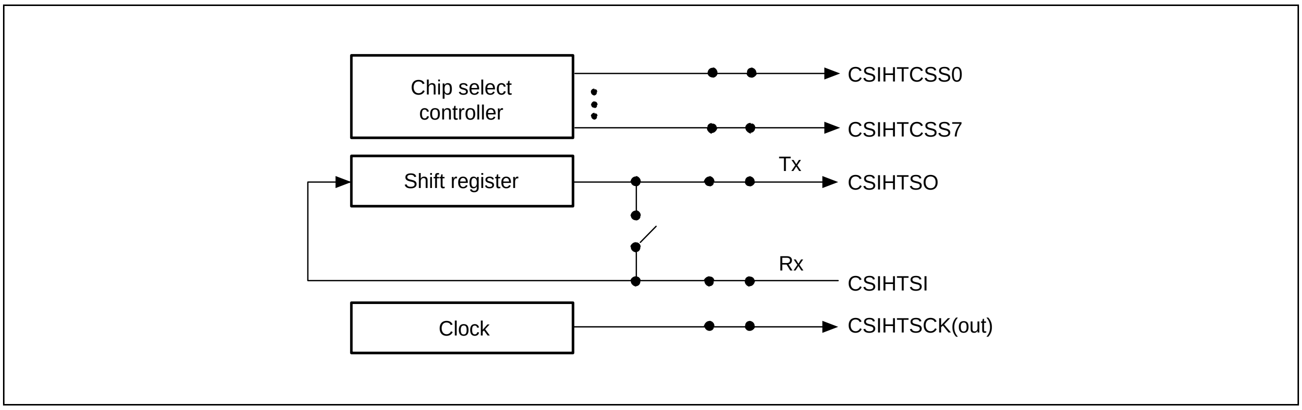

Figure 20.43 Normal Operation

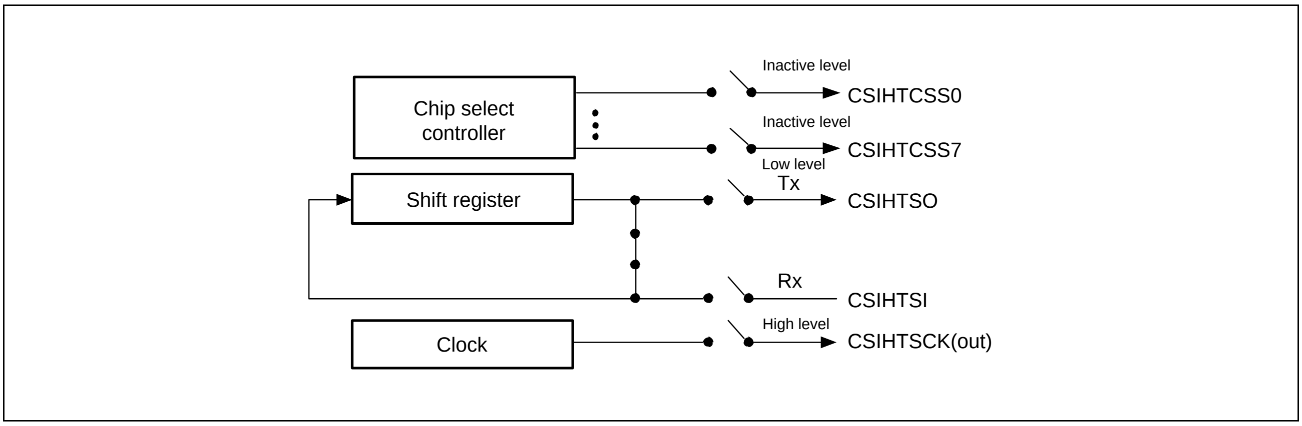

Figure 20.44 Loop-Back Mode Operation

20.5.14 CPU-Controlled High Priority Communication Function

CSIH has a function to abort low priority communication to perform high priority communication if it receives a high-priority communication request from the CPU while low-priority communication is being used. This function supports transmit-only buffer mode as low priority communication and only direct access mode as high-priority communication. To enable this function, CSIHnCTL1.CSIHnPHE and CSIHnCTL1.CSIHnJE must be set to 1.

The following figure illustrates CPU-controlled high-priority communication.

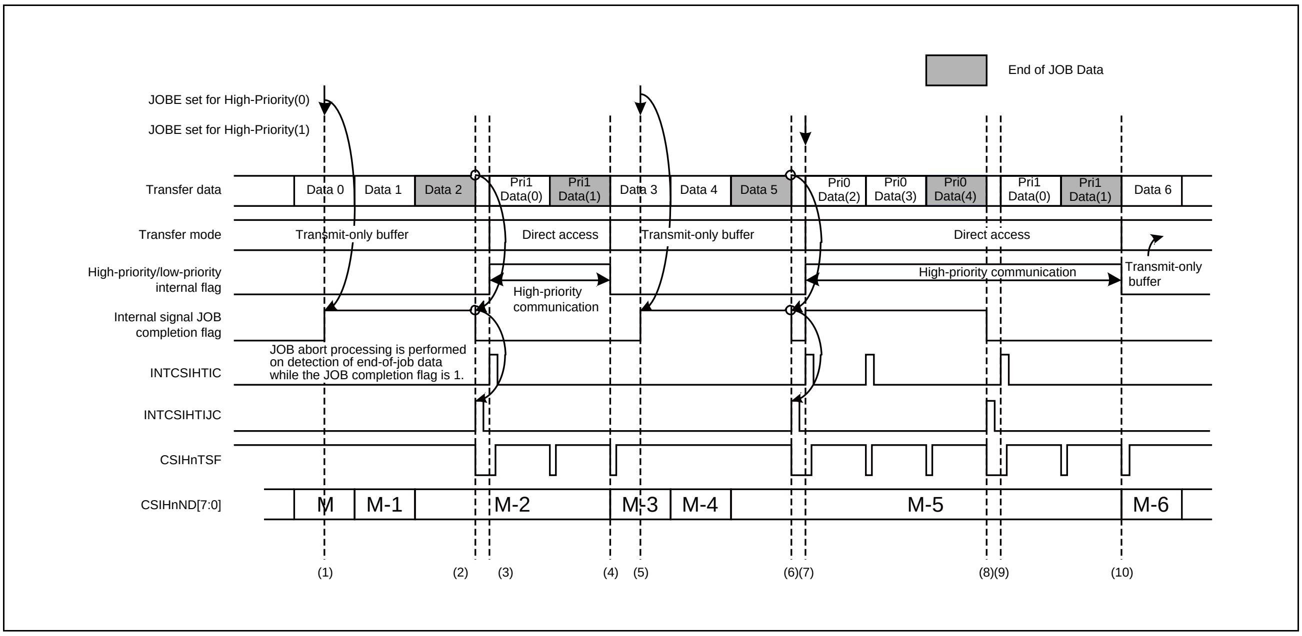

Figure 20.45 Example of CPU-Controlled High-Priority Communication

(1) By setting CSIHnCTL0.CSIHnJOBE = 1 during low-priority communication, start of high-priority communication following end-of-job data is notified, and the internal signal flag is set.

(2) When end-of-job data is detected, the current low-priority communication is aborted and the INTCSIHTIJC interrupt occurs. The internal signal job completion flag is cleared due to the communication abort, and memory mode is automatically switched to direct access mode for the subsequent high-priority communication.

(3) The CPU detects the interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H.

(4) When end-of-job data is detected, communication is aborted. At this time, because the internal signal end-of-job flag is set to 0, the CSIH determines that the next communication is low-priority, automatically switches memory mode to transmit-only buffer mode, and then resumes the aborted low-priority communication.

(5) Same as (1) above.

(6) Same as (2) above.

(7) The CPU detects an interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H. The CPU sets CSIHnCTL0.CSIHnJOBE = 1 again to notify that the next communication is high-priority.

(8) When end-of-job data is detected, communication is aborted and the INTCSIHTIJC interrupt is generated. At this time, the CPU determines that the subsequent communication is also high-priority because the internal signal JOB completion flag is 1, and waits for communication to start.

(9) Same as (3) above.

(10) Same as (4) above.

CAUTION

Memory mode is switched automatically when communication is changed from low priority to high priority (from transmit-only buffer mode to direct access mode) and from high priority to low priority (from direct access mode to transmit-only buffer mode).

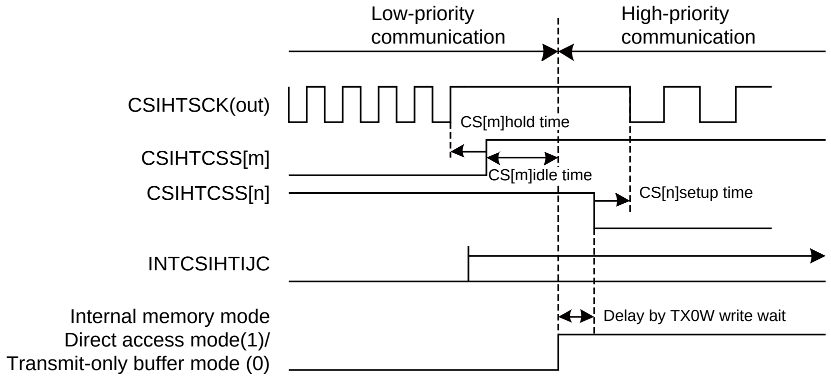

Figure 20.46 Transition from Low-Priority Mode to High-Priority Mode

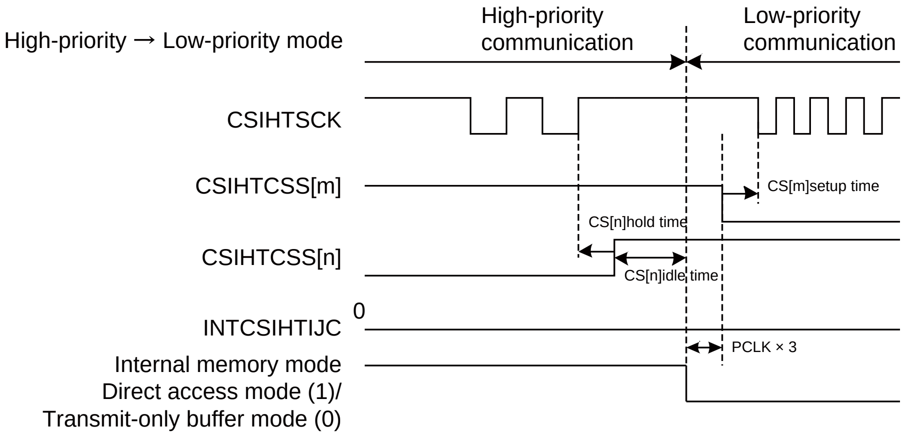

Figure 20.47 Transition from High-Priority Mode to Low-Priority Mode

Do not conduct write operation of communication data or CSIHnCTL0.CSIHnJOBE bit operation during setting inhibited period to switch low and high priority communication mode correctly.

CSIHnTX0W register write inhibited period:

- Period from when CSIHnJOBE bit is set for switching to high priority communication mode to when INTCSIHTIJC interrupt is detected.
- Period from when the last data of high priority communication (End of JOB data) is written to when the CSIHnHPST state = 0 is detected.

CSIHnJOBE register write inhibited period:

- Period from when CSIHnJOBE bit is set for switching to high priority communication mode to when INTCSIHTIJC interrupt is detected.

During high communication mode period, there is no setting inhibited period for CSIHnJOBE bit. It is possible to set CSIHnJOBE bit before writing communication data. For example, to communicate multiple JOB data in high priority mode, it is possible to set CSIHnJOBE bit before writing the first communication data.

CAUTION

When CSIHnJOBE bit is set right before the last communication of high priority communication ends, different operations are required depending on the timing at which setting of CSIHnJOBE bit is internally detected.

If the setting of the CSIHnJOBE bit is detected before the transfer of the last bit is completed, high priority communication mode continues.

When setting of the CSIHnJOBE bit is detected after the transfer of the last bit is completed, the mode temporarily returns to low priority communication. After detection of End of JOB data in low priority communication, the mode changes back to high priority communication.

20.5.15 Enforced Chip Select Idle Setting

It is possible to insert an idle state between two consecutive data transfers by setting CSIHnCFGx.CSIHnIDLx.

1. When CSIHnCFGx.CSIHnIDLx = 0
   If the next CSIHTCSSx is the same as the previous one, an idle state is not inserted, but an inter-data time is inserted instead.
   If the next CSIHTCSSx is different from the previous one, an idle state is inserted.
2. When CSIHnCFGx.CSIHnIDLx = 1
   An idle state is always inserted even if a next CSIHTCSSx is not different from the previous one.

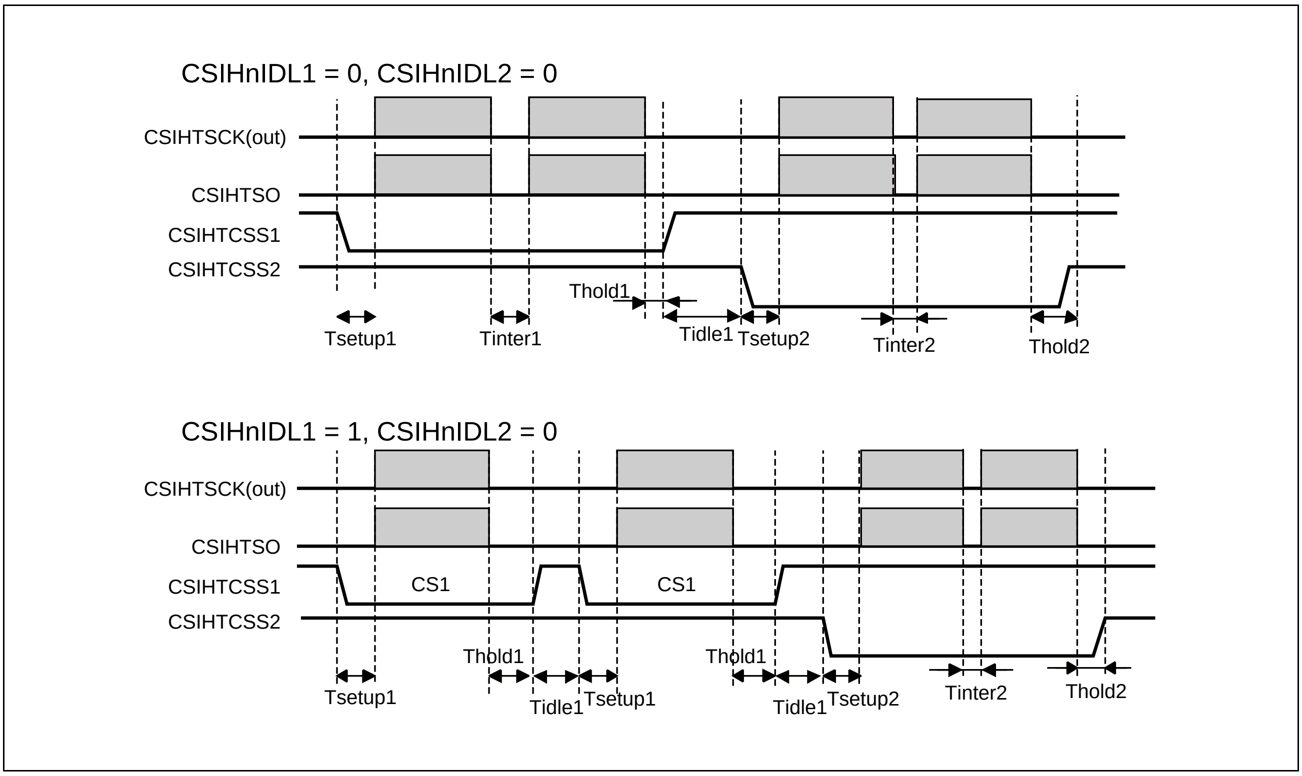

Figure 20.48 Enforced Chip Select Idle Setting Example

CAUTION

If the CPU-controlled high priority communication function is enabled

(CSIHnCTL1.CSIHnPHE = 1), when the mode is switched from low priority communication to high priority communication or from high priority communication to low priority communication, an IDLE state is inserted regardless of the setting of CSIHnCFGx.CSIHnIDLx bit.

20.6 Operating Procedures

The examples and procedures below are described according to the memory mode in the following order:

- Direct access mode
- Transmit-only buffer mode
- Dual buffer mode
- FIFO mode

20.6.1 Procedures in Direct Access Mode

Two examples for a master are provided, one with job mode disabled, and the other with job mode enabled.

20.6.1.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below assumes the following conditions:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)

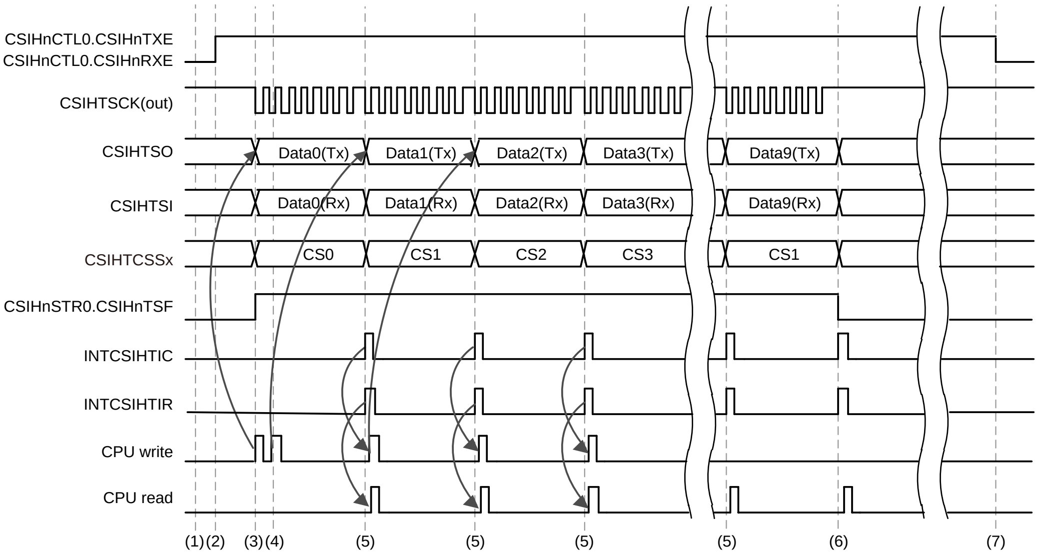

Figure 20.49 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first data to be sent to the transmission register, CSIHnTX0W. Within the same write operation, activate CS0. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIHnTX0W. If required, you can change the CS to address a different device. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every data transmission/reception, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated:
   - INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
   - INTCSIHTIR indicates that the reception register CSIHnRX0W must be read.
6. No more write action is required after completion of data 8. Data 9 (the last data) has been written in advance. However, reception register CSIHnRX0W must be read after completion of writing data 8 and 9.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

20.6.1.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)
- Two jobs, each transmitting three data.

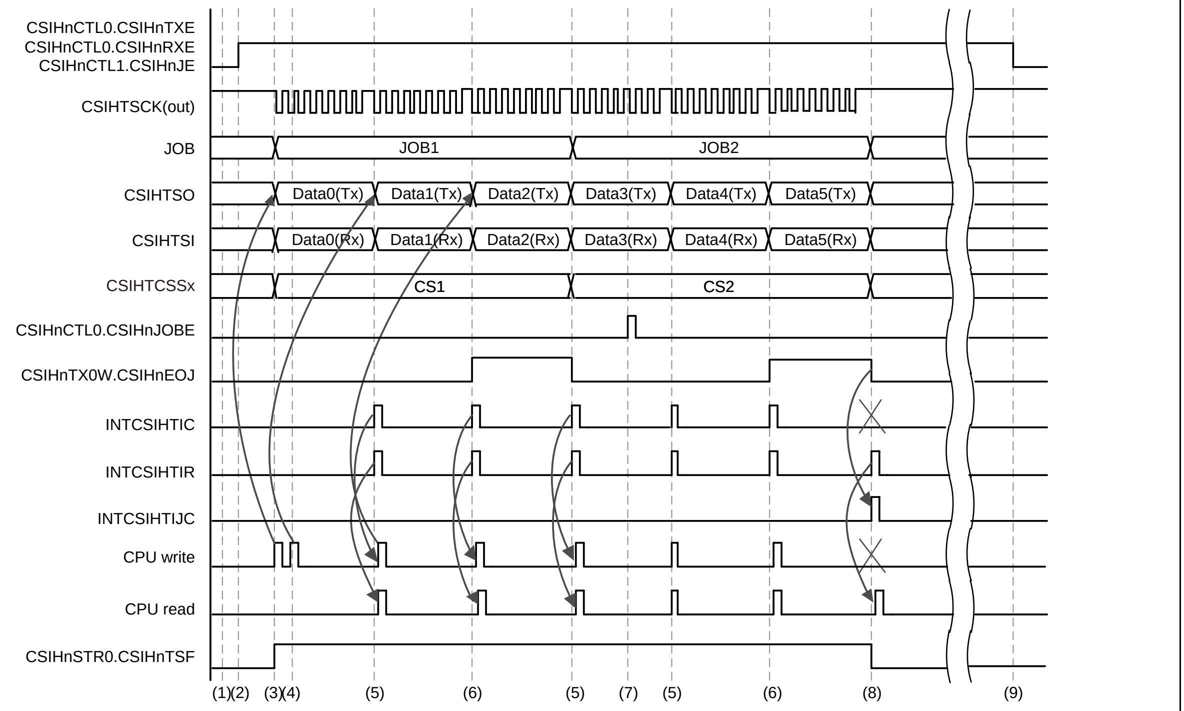

Figure 20.50 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 1

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1 and CS2. Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits the reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first data to be sent to the transmission register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
   The CSIHnSTR0.CSIHnTSF flag indicates that communication is in progress.
4. Write the second data to CSIHnTX0W. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every data transmission/reception, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.
   - INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
   - INTCSIHTIR indicates that the reception register, CSIHnRX0W must be read.
6. Setting CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is sent. After that, the next job may begin.
7. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of the current job (JOB2).
8. After the forced stop of communication, the interrupt request, INTCSIHTIC is replaced by INTCSIHTIJC. INTCSIHTIR is generated as usual.
   The interrupt request, INTCSIHTIJC indicates that the communication was forcibly stopped at the end of the current job. The interrupt request, INTCSIHTIC is not generated. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
9. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.
   To start another transmission without stopping communication, perform steps 3 and later.

20.6.2 Procedures in Transmit-Only Buffer Mode

Two examples for a master is provided, one with job mode disabled, and the other one with job mode enabled.

20.6.2.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 10_B)

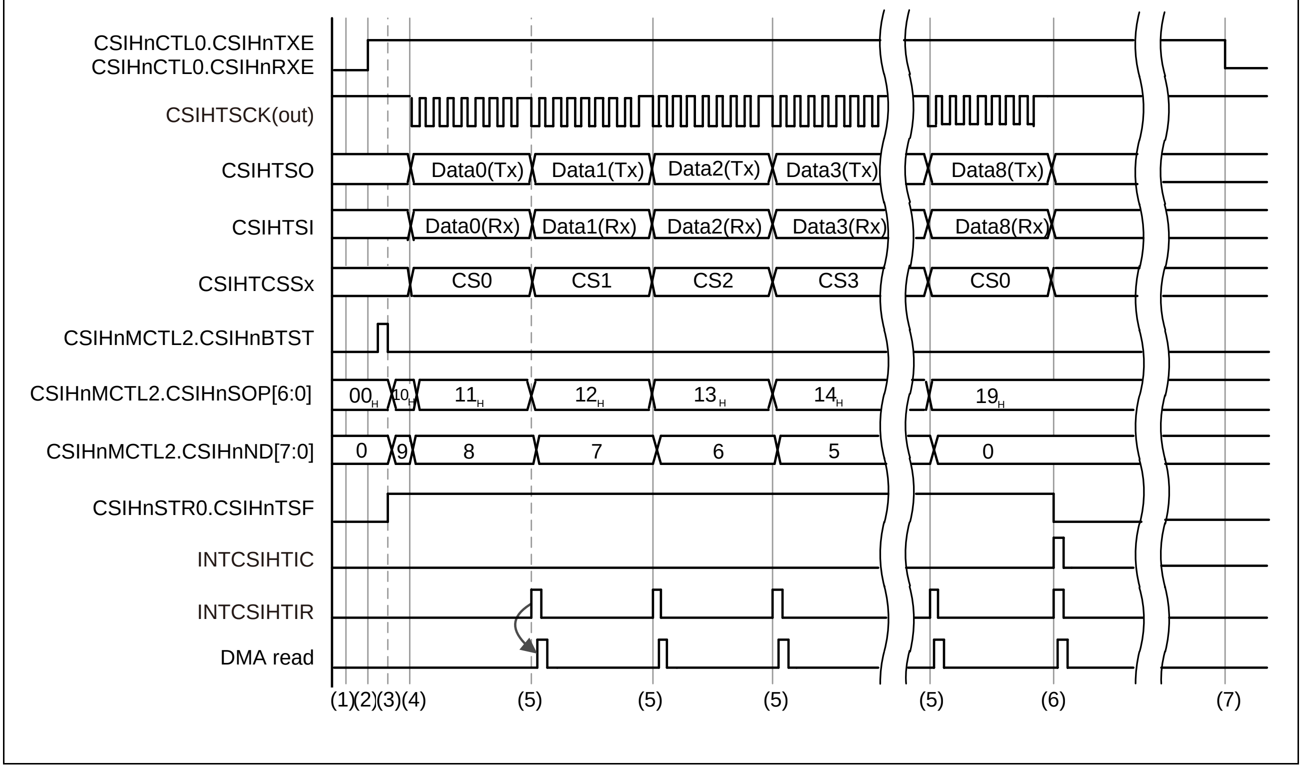

Figure 20.51 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 10_B (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission/reception is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. After every data reception, the interrupt request, INTCSIHTIR is generated. INTCSIHTIR indicates that the receive register CSIHnRX0W must be read.
6. When all transmissions are complete, the interrupt request, INTCSIHTIC is generated.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

20.6.2.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data is 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 10_B)

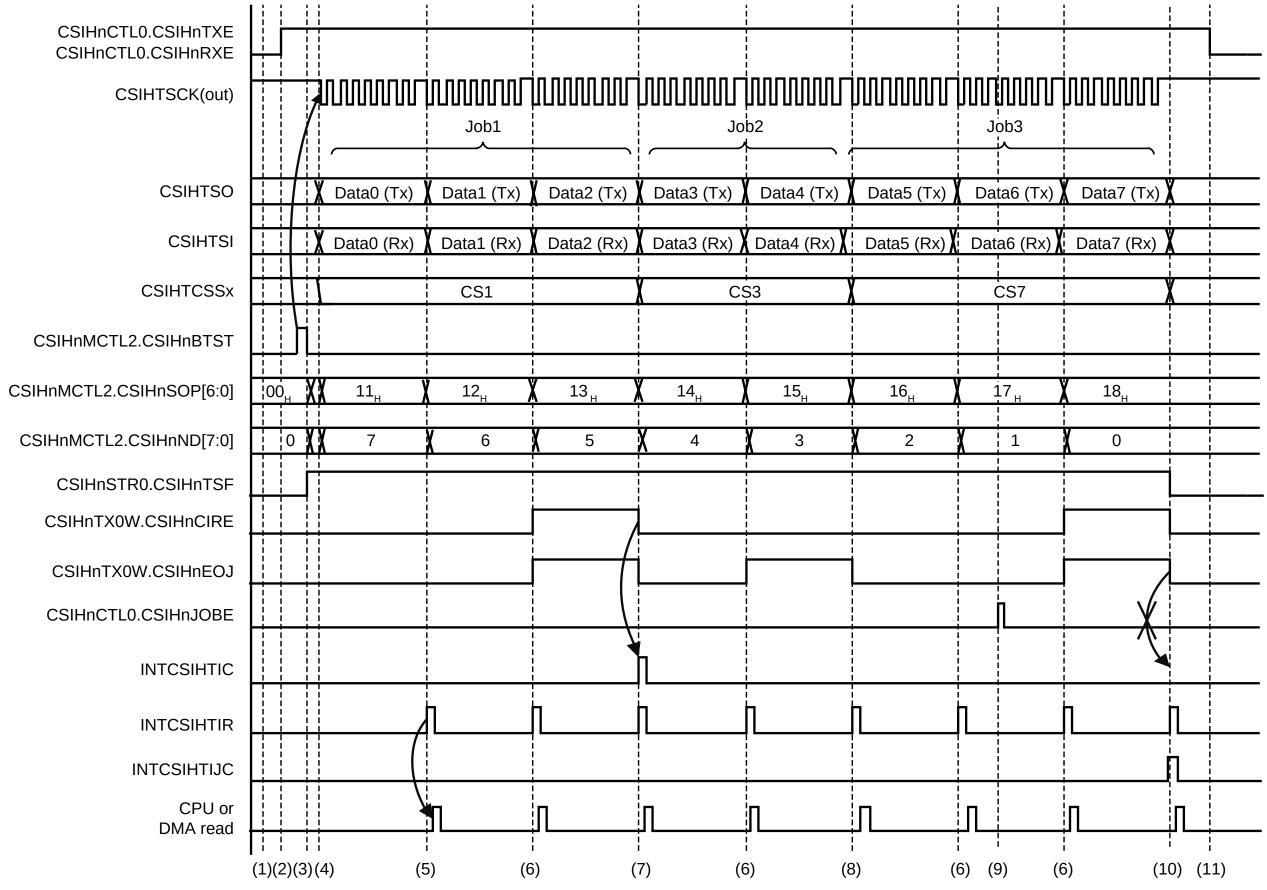

Figure 20.52 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 1

NOTE

The process of writing the data into the buffer is not described.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1, CS3, and CS7.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 10_B (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. After every data reception, the interrupt request, INTCSIHTIR is generated. INTCSIHTIR indicates that the receive register CSIHnRX0W must be read.
6. The CSIHnTX0W.CSIHnEOJ = 1 setting indicates that the last data of the current job is sent.
7. The interrupt request INTCSIHTIC is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
8. The INTCSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CHABnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
10. After the forced stop of communication, interrupt requests INTCSIHTIJC and INTCSIHTIR are generated at the end of job3.
    The INTCSIHTIJC interrupt request indicates that the communication was forcibly stopped at the end of the current job.
    The INTCSIHTIC interrupt request is not generated because the INTCSIHTIJC interrupt request is generated instead of the INTCSIHTIC interrupt request. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.
    When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

20.6.3 Procedures in Dual Buffer Mode

Examples when job mode is enabled in master mode, disabled in master mode, and disabled in slave mode are provided below.

20.6.3.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CHABnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)

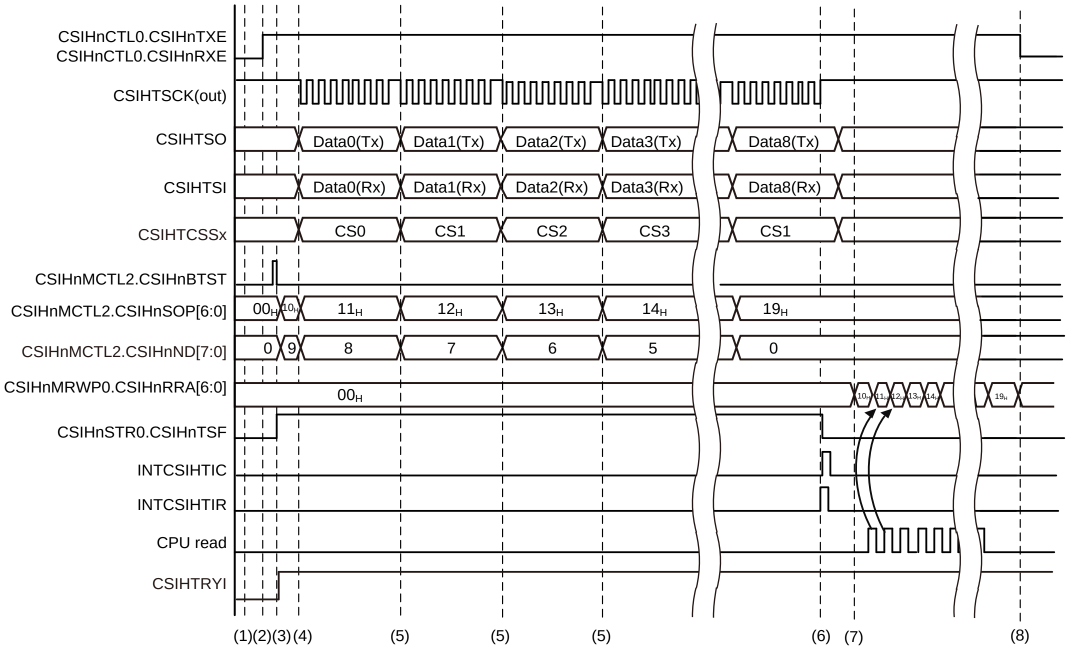

Figure 20.53 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The process of writing the data into the buffer is not described.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0]. Set CSIHnMCTL0.CSIHnMMS[1:0] = 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits the reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Permit buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.
   The interrupt requests INTCSIHTIC and INTCSIHTIR are not generated.
6. When the last data is transmitted/received, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.
   The CPU starts to read the received data from the receive buffer.
7. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0]. These bits are incremented after each data is read.
8. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.
   When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

20.6.3.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data is 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 00_H (CSIHnMCTL2.CSIHnSOP[6:0] = 00_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)

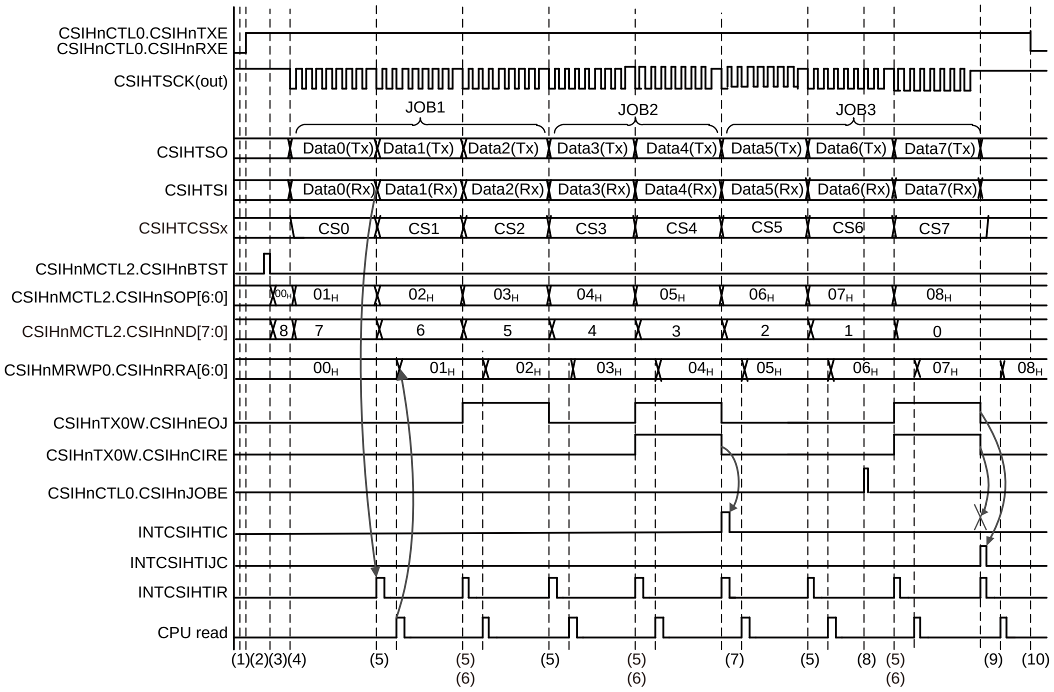

Figure 20.54 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 1

NOTE

The process of writing the data into the buffer is not described.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS0 to CS7.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits.
   Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented, and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission. This is repeated until the last data is transmitted/received.
5. The INTCSIHTIR interrupt request is generated everytime data is received.
   The INTCSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
6. CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is sent.
7. The INTCSIHTIC interrupt request is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
8. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
9. After the forced stop of communication, interrupt requests INTCSIHTIJC and INTCSIHTIR are generated at the end of JOB3.
   The INTCSIHTIJC interrupt request indicates that the communication was forcibly stopped at the end of the current job.
   The INTCSIHTIC interrupt request is not generated because the INTCSIHTIJC interrupt request is generated instead of the INTCSIHTIC interrupt request. Additionally, the transmission data available in register CSIHnTX0W is not sent.
10. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.
    When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

20.6.3.3 Transmit/Receive in Slave Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCTL1.CSIHnCKR = 0, CSIHnCFG0.CSIHnDAP0 = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)
- Handshake function is enabled (CSIHnCTL1.CSIHnHSE = 1)

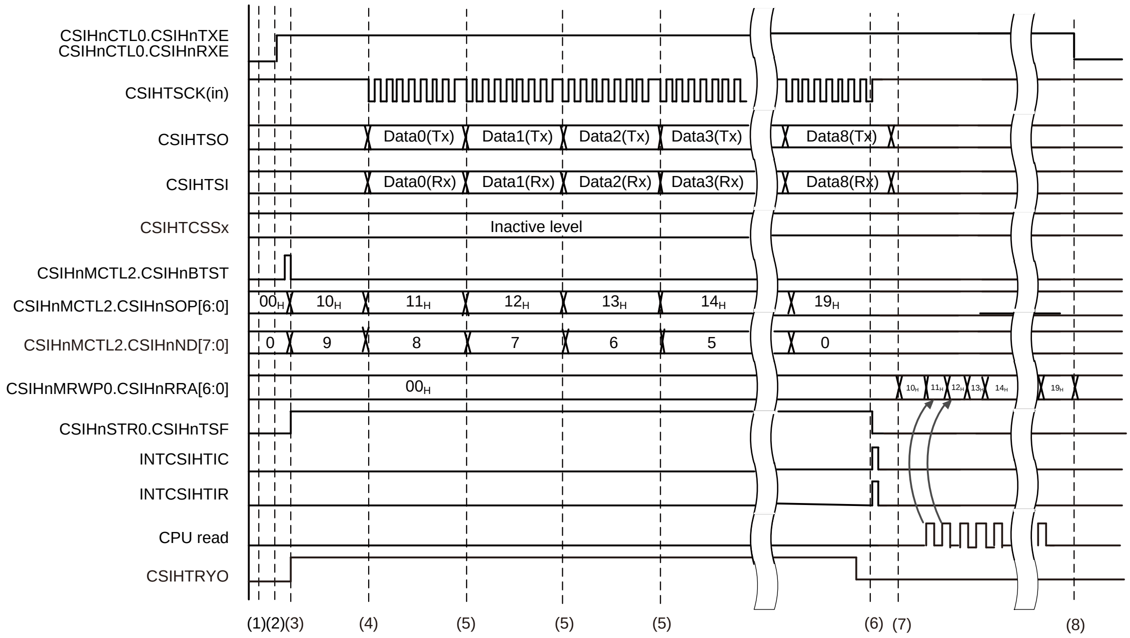

Figure 20.55 Slave in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The process of writing the data into the buffer is not described.

Procedure:

1. Configure the communication protocol in register CSIHnCFG0.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Specify the transfer start address by setting the CSIHnMCTL2.CSIHnSOP[6:0] bits and the number of data by setting the CSIHnMCTL2.CSIHnND[7:0] bits. Permit the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started when the input clock is received from the master. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.
   The interrupt requests INTCSIHTIC and INTCSIHTIR are not generated because transmission data is sent from the buffer, and received data is stored in the buffer.
6. When the last data is transmitted/received, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.
   The CPU starts to read the received data that is stored in the receive buffer.
7. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0]. These bits are incremented after each data is read.
8. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.
   When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

20.6.4 Procedures in FIFO Mode

Two examples for a master is provided, one with job mode disabled, the other one with job mode enabled.

20.6.4.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00_B)

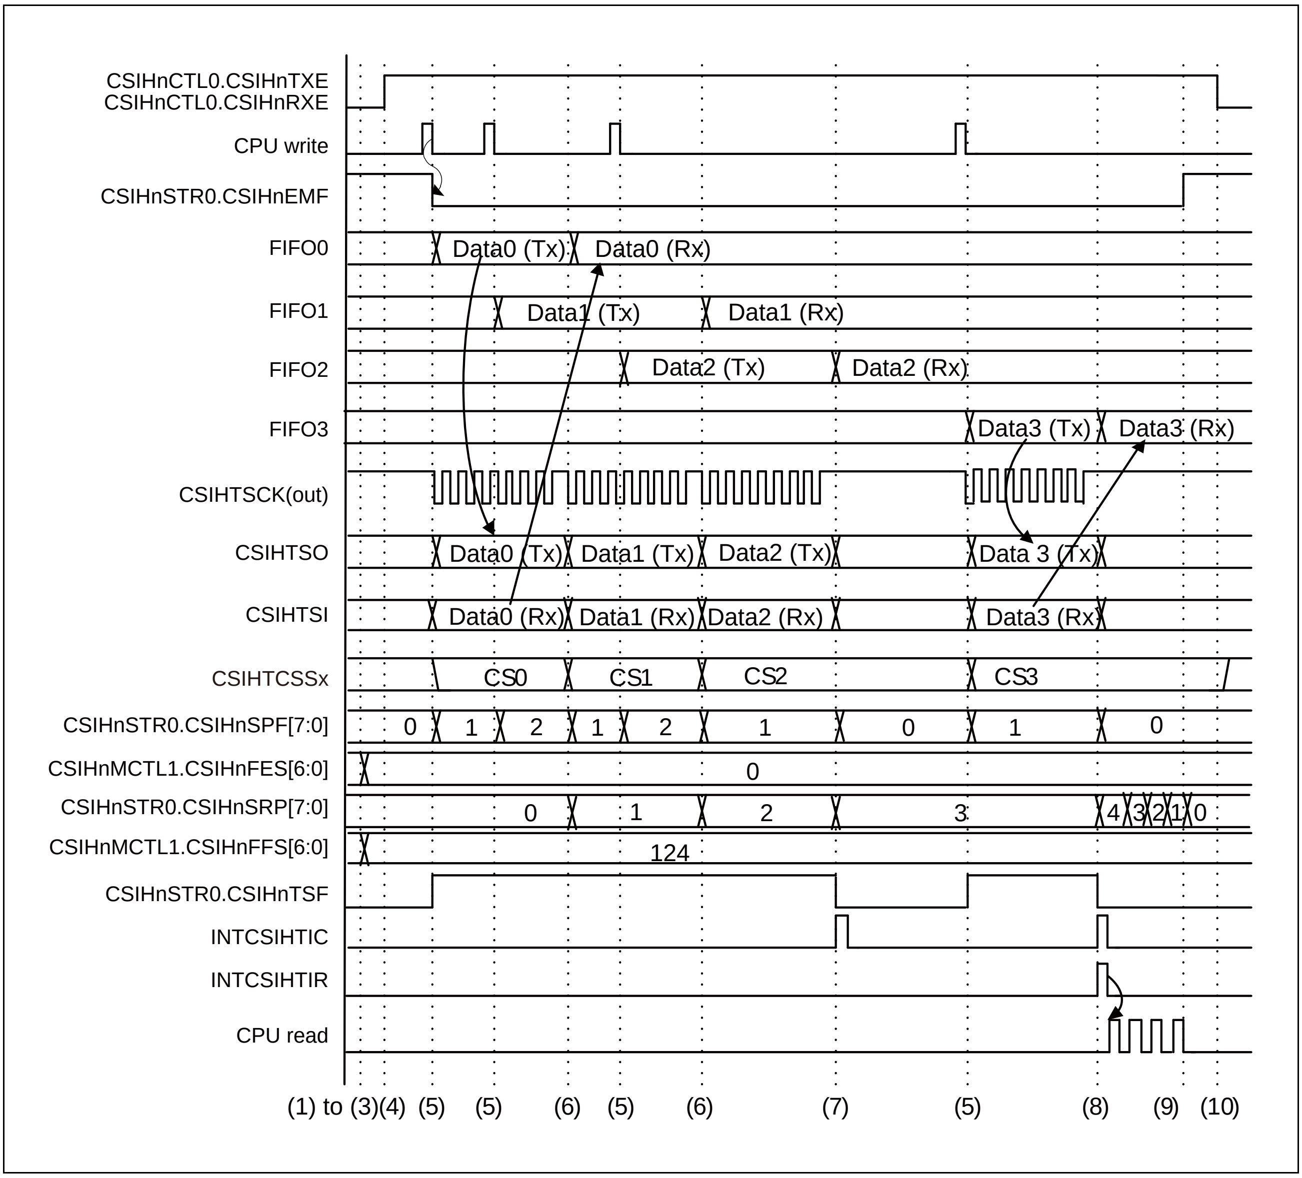

Figure 20.56 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. Specify the job mode disable and master mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2. Specify the FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] = 00_B. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
2. Set CSIHnSTCR0.CSIHnPCT = 1 to clear all buffer pointers.
   (CSIHnSTR0.CSIHnFLF = 0, CSIHnSTR0.CSIHnEMF = 1, and CSIHnSTR0.CSIHnSPF[7:0] = 00_H.)
3. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating the INTCSIHTIC interrupt output. Specify the conditions for generating the INTCSIHTIR interrupt request in the CSIHnMCTL1.CSIHnFFS[6:0] bits.
4. Set CSIHnCTL0.CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
5. Write the first transmit data to the transmit register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
   Check that CSIHnSTR0.CSIHnEMF = 0.
6. The current transmission is completed. As the CSIHnFES[6:0] bits are not the same as the CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is not generated.
7. As the CSIHnFES[6:0] bits are the same as the CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is generated.
8. When CSIHnFFS[6:0] = 128 - CSIHnSRP[7:0], the interrupt request INTCSIHTIR is generated. Since CSIHnFES[6:0] = CSIHnSPF[7:0], the interrupt request INTCSIHTIC is generated.
   After the generation of an interrupt, the CPU starts reading received data that is stored in the receive buffer.
9. When the CPU completes reading the received data that is stored in the receive buffer, CSIHnSTR0.CSIHnEMF is set to 1 and the FIFO buffer becomes empty.
10. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. In addition, if communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

20.6.4.2 Transmit/Receive Mode when Job Mode is Enabled in Master Mode

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- JOB1 consists of four data, JOB2 consists of three data, and JOB3 consists of five data.
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00_B)

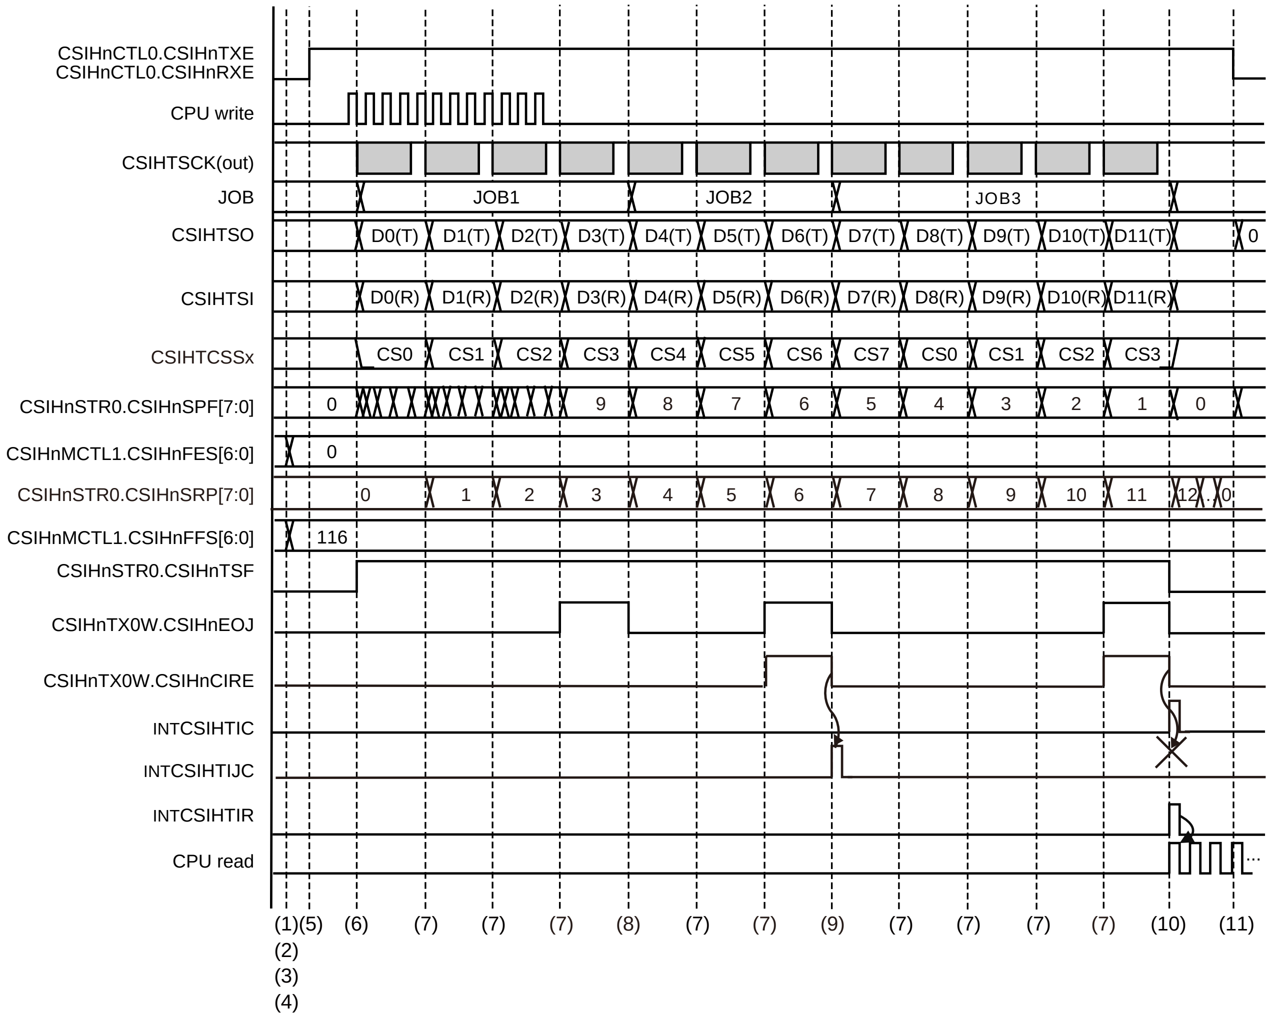

Figure 20.57 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 1

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. Set job mode disable and master mode in the corresponding bits of the CSIHnCTL1 and CSIHnCTL2 registers. Set FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] to 00_B. This example uses chip select signals CS0 to CS7.
2. Set CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
3. Make sure that CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to 00_H.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating the INTCSIHTIC interrupt request. With CSIHnMCTL1.CSIHnFFS[6:0], specify the conditions for generating the INTCSIHTIR interrupt request.
5. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the first data to be sent to the CSIHnTX0W transmission register. Transmission starts automatically when the first data becomes available.
   Make sure CSIHnSTR0.CSIHnEMF is set to 0.
7. The current transmission is completed. Since CSIHnFES[6:0] is not the same as CSIHnSPF[7:0], the interrupt request INTCSIHTIC is not generated.
8. The INTCSIHTIJC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. The INTCSIHTIJC interrupt request is generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
10. The INTCSIHTIC interrupt request is generated because CSIHnFES[6:0] = CSIHnSPF[7:0]. INTCSIHTIC is generated so that INTCSIHTIJC is not generated.
    When CSIHnFFS[6:0] = 128 - CSIHnSRP[7:0], the interrupt request INTCSIHTIR is generated. After the generation of the INTCSIHTIR interrupt, CPU starts reading the received data stored in received buffer.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

20.7 Detection and Correction of Errors in CSIHn RAM

For details of ECC, see **Section 40A.2.6, ECC for Peripheral RAM**, **Section 40B.2.6, ECC for Peripheral RAM**, **Section 40C.2.5, ECC for Peripheral RAM**.

Section 21 LIN Master Interface (RLIN2)

This section contains a generic description of the LIN master interface (RLIN2).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RLIN2.

21.1 Features of RH850/F1KH, RH850/F1KM RLIN2

21.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN2 units and channels.

Table 21.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	3	3	4
Name	RLIN24n (n = 0 to 2)	RLIN24n (n = 0 to 2)	RLIN24n (n = 0 to 3)

Table 21.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	2	3	3	3
Name	RLIN24n (n = 0)	RLIN24n (n = 0, 1)	RLIN24n (n = 0 to 2)	RLIN24n (n = 0 to 2)	RLIN24n (n = 0 to 2)

Table 21.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	RLIN24n (n = 0)	RLIN24n (n = 0)	RLIN24n (n = 0)	RLIN24n (n = 0)

Table 21.7 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual RLIN2 units are identified by the index “n” (n = 0 to 3).
m	Throughout this section, the individual channels are identified by the index “m” (m = 0 to 15).
i	Throughout this section, the individual channels of units that compose RLIN2 are identified by the index “i” (i = 0 to 3).
b	Throughout this section, the individual data buffers implemented in RLIN2 are identified by the index “b” (b = 1 to 8).

Table 21.8 Indices (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual RLIN2 units are identified by the index “n” (n = 0 to 2).
m	Throughout this section, the individual channels are identified by the index “m” (m = 0 to 11).
i	Throughout this section, the individual channels of units that compose RLIN2 are identified by the index “i” (i = 0 to 3).
b	Throughout this section, the individual data buffers implemented in RLIN2 are identified by the index “b” (b = 1 to 8).

Table 21.9 Indices (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RLIN2 units are identified by the index “n” (n = 0).
m	Throughout this section, the individual channels are identified by the index “m” (m = 0 to 2).
i	Throughout this section, the individual channels of units that compose RLIN2 are identified by the index “i” (i = 0 to 2).
b	Throughout this section, the individual data buffers implemented in RLIN2 are identified by the index “b” (b = 1 to 8).

For example, RLN24nGLWBR are the LIN wake-up baud rate select registers, which are the global registers of RLIN2. RLN24nmLiMD are the LIN mode registers, which are the channel registers.

The following lists the indices corresponding to each product.

Table 21.10 Indices Correspondence of Each Product (RH850/F1KH-D8)

Indices Correspondence of Each Product		
176 Pins	233 Pins	324 Pins
i = 0 to 3 (RLIN240, 1) i = 0, 1 (RLIN242)	i = 0 to 3 (RLIN240, 1, 2)	i = 0 to 3 (RLIN240, 1, 2, 3)
b = 1 to 8	b = 1 to 8	b = 1 to 8

Table 21.11 Indices Correspondence of Each Product (RH850/F1KM-S4)

Indices Correspondence of Each Product				
100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
i = 0 to 2 (RLIN240)	i = 0 to 3 (RLIN240) i = 0, 1 (RLIN241)	i = 0 to 3 (RLIN240, 1) i = 0, 1 (RLIN242)	i = 0 to 3 (RLIN240, 1, 2)	i = 0 to 3 (RLIN240, 1, 2)
b = 1 to 8	b = 1 to 8	b = 1 to 8	b = 1 to 8	b = 1 to 8

Table 21.12 Indices Correspondence of Each Product (RH850/F1KM-S1)

Indices Correspondence of Each Product			
48 Pins	64 Pins	80 Pins	100 Pins
i = 0, 1 (RLIN240)	i = 0, 1 (RLIN240)	i = 0, 1 (RLIN240)	i = 0 to 2 (RLIN240)
b = 1 to 8	b = 1 to 8	b = 1 to 8	b = 1 to 8

21.1.2 Register Base Addresses

RLIN2 base addresses are listed in the following table.

RLIN2 register addresses are given as offsets from the base addresses.

Table 21.13 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<RLIN240_base>	FFCE 0000_H
<RLIN241_base>	FFCE 0080_H
<RLIN242_base>	FFCE 0100_H
<RLIN243_base>	FFCE 0180_H

Table 21.14 Register Base Addresses (RH850/F1KM-S4)

Base Address Name	Base Address
<RLIN240_base>	FFCE 0000_H
<RLIN241_base>	FFCE 0080_H
<RLIN242_base>	FFCE 0100_H

Table 21.15 Register Base Address (RH850/F1KM-S1)

Base Address Name	Base Address
<RLIN240_base>	FFCE 0000_H

21.1.3 Clock Supply

The RLIN2 clock supply is shown in the following table.

Table 21.16 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RLIN24n	LIN communication clock sources	CKSCLK_ILIN	Communication clock
	Register access clock	CPUCLK_L, CKSCLK_ILIN	Bus clock

21.1.4 Interrupt Requests

RLIN2 interrupt requests are listed in the following table.

Table 21.17 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number
RLIN240		
INTRLIN20	RLIN20 interrupt	58
INTRLIN21	RLIN21 interrupt	59
INTRLIN22	RLIN22 interrupt	162
INTRLIN23	RLIN23 interrupt	163
RLIN241		
INTRLIN24	RLIN24 interrupt	226
INTRLIN25	RLIN25 interrupt	227
INTRLIN26	RLIN26 interrupt	275
INTRLIN27	RLIN27 interrupt	276
RLIN242		
INTRLIN28	RLIN28 interrupt	285
INTRLIN29	RLIN29 interrupt	286
INTRLIN210	RLIN210 interrupt	324
INTRLIN211	RLIN211 interrupt	325
RLIN243		
INTRLIN212	RLIN212 interrupt	184
INTRLIN213	RLIN213 interrupt	185
INTRLIN214	RLIN214 interrupt	186
INTRLIN215	RLIN215 interrupt	187

Table 21.18 Interrupt Requests (RH850/F1KM-S4)

Unit Interrupt Signal	Description	Interrupt Number
RLIN240		
INTRLIN20	RLIN20 interrupt	58
INTRLIN21	RLIN21 interrupt	59
INTRLIN22	RLIN22 interrupt	162
INTRLIN23	RLIN23 interrupt	163
RLIN241		
INTRLIN24	RLIN24 interrupt	226
INTRLIN25	RLIN25 interrupt	227
INTRLIN26	RLIN26 interrupt	275
INTRLIN27	RLIN27 interrupt	276
RLIN242		
INTRLIN28	RLIN28 interrupt	285
INTRLIN29	RLIN29 interrupt	286
INTRLIN210	RLIN210 interrupt	324
INTRLIN211	RLIN211 interrupt	325

Table 21.19 Interrupt Requests (RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number
RLIN240		
INTRLIN20	RLIN20 interrupt	58
INTRLIN21	RLIN21 interrupt	59
INTRLIN22	RLIN22 interrupt	162

21.1.5 Reset Sources

RLIN2 reset sources are listed in the following table. RLIN2 is initialized by these reset sources.

Table 21.20 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
RLIN24n	All reset sources (ISORES)

21.1.6 External Input/Output Signals

External input/output signals of RLIN2 are listed in the following table.

Table 21.21 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN240		
RLIN2mRX (m = 0 to 3)	RLIN240 receive data input	RLIN2mRX (m = 0 to 3)
RLIN2mTX (m = 0 to 3)	RLIN240 transmit data output	RLIN2mTX (m = 0 to 3)
RLIN241		
RLIN2mRX (m = 4 to 7)	RLIN241 receive data input	RLIN2mRX (m = 4 to 7)
RLIN2mTX (m = 4 to 7)	RLIN241 transmit data output	RLIN2mTX (m = 4 to 7)
RLIN242		
RLIN2mRX (m = 8 to 11)	RLIN242 receive data input	RLIN2mRX (m = 8 to 11)
RLIN2mTX (m = 8 to 11)	RLIN242 transmit data output	RLIN2mTX (m = 8 to 11)
RLIN243		
RLIN2mRX (m = 12 to 15)	RLIN243 receive data input	RLIN2mRX (m = 12 to 15)
RLIN2mTX (m = 12 to 15)	RLIN243 transmit data output	RLIN2mTX (m = 12 to 15)

Table 21.22 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN240		
RLIN2mRX (m = 0 to 3)	RLIN240 receive data input	RLIN2mRX (m = 0 to 3)
RLIN2mTX (m = 0 to 3)	RLIN240 transmit data output	RLIN2mTX (m = 0 to 3)
RLIN241		
RLIN2mRX (m = 4 to 7)	RLIN241 receive data input	RLIN2mRX (m = 4 to 7)
RLIN2mTX (m = 4 to 7)	RLIN241 transmit data output	RLIN2mTX (m = 4 to 7)
RLIN242		
RLIN2mRX (m = 8 to 11)	RLIN242 receive data input	RLIN2mRX (m = 8 to 11)
RLIN2mTX (m = 8 to 11)	RLIN242 transmit data output	RLIN2mTX (m = 8 to 11)

Table 21.23 External Input/Output Signals (RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN240		
RLIN2mRX (m = 0 to 2)	RLIN240 receive data input	RLIN2mRX (m = 0 to 2)
RLIN2mTX (m = 0 to 2)	RLIN240 transmit data output	RLIN2mTX (m = 0 to 2)

21.2 Overview

21.2.1 Functional Overview

The LIN Master Interface is a hardware LIN communication controller that complies with LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602 (SEP 2005), and automatically performs frame communication and error determination.

Table 21.24, LIN Master Interface Specifications shows the LIN Master Interface specifications.

Table 21.24 LIN Master Interface Specifications

Item		Specifications
Channel count		16 channels (In this product, 4-channel version of RLIN2 is included.)
LIN communication function	Protocol	LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602 (SEP 2005)
	Variable frame structure	• Transmission break width: 13 to 28 Tbits • Transmission break delimiter width: 1 to 4 Tbits • Inter-byte space (header): 0 to 7 Tbits (space between Sync field and ID field)*1 • Response space: 0 to 7 Tbits*1 • Inter-byte space: 0 to 3 Tbits (space between data bytes in response area) • Transmit wake-up: 1 to 16 Tbits
	Checksum	• Automatic operation for both transmission and reception • Classic or enhanced selectable (for each frame)
	Response field data byte count	Variable from 0 to 8 bytes
	Frame communication modes	• Mode in which header transmission and response transmission/reception are started with a single transmission start request • Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode)
	Wake-up transmission and reception	Available in LIN wake-up mode • Wake-up transmission (1 to 16 Tbits) • Wake-up reception Low-level width of input signals measured
	Status	• Successful frame/wake-up transmission • Successful header transmission • Successful frame/wake-up reception*2 • Successful data 1 reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)
	Error status	• Bit error • Checksum error • Frame timeout error • Physical bus error • Framing error
	Baud rate selection	Baud rate conforming to the LIN specifications generated using baud rate generator
	Test mode	Self-test mode for user evaluation
	Interrupt function	• Successful frame/wake-up transmission • Successful frame/wake-up reception*2 • Error detection The logical OR of these three events is the interrupt source (INTRLIN2m) for each channel.

Note 1. Since the same register is used for configuration, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the input signal low-level width count is indicated.

21.2.2 Block Diagram

Figure 21.1, LIN Master Interface Block Diagram (324 Pins, RLIN2 16 Channels Embedded) shows a block diagram of the LIN master interface.

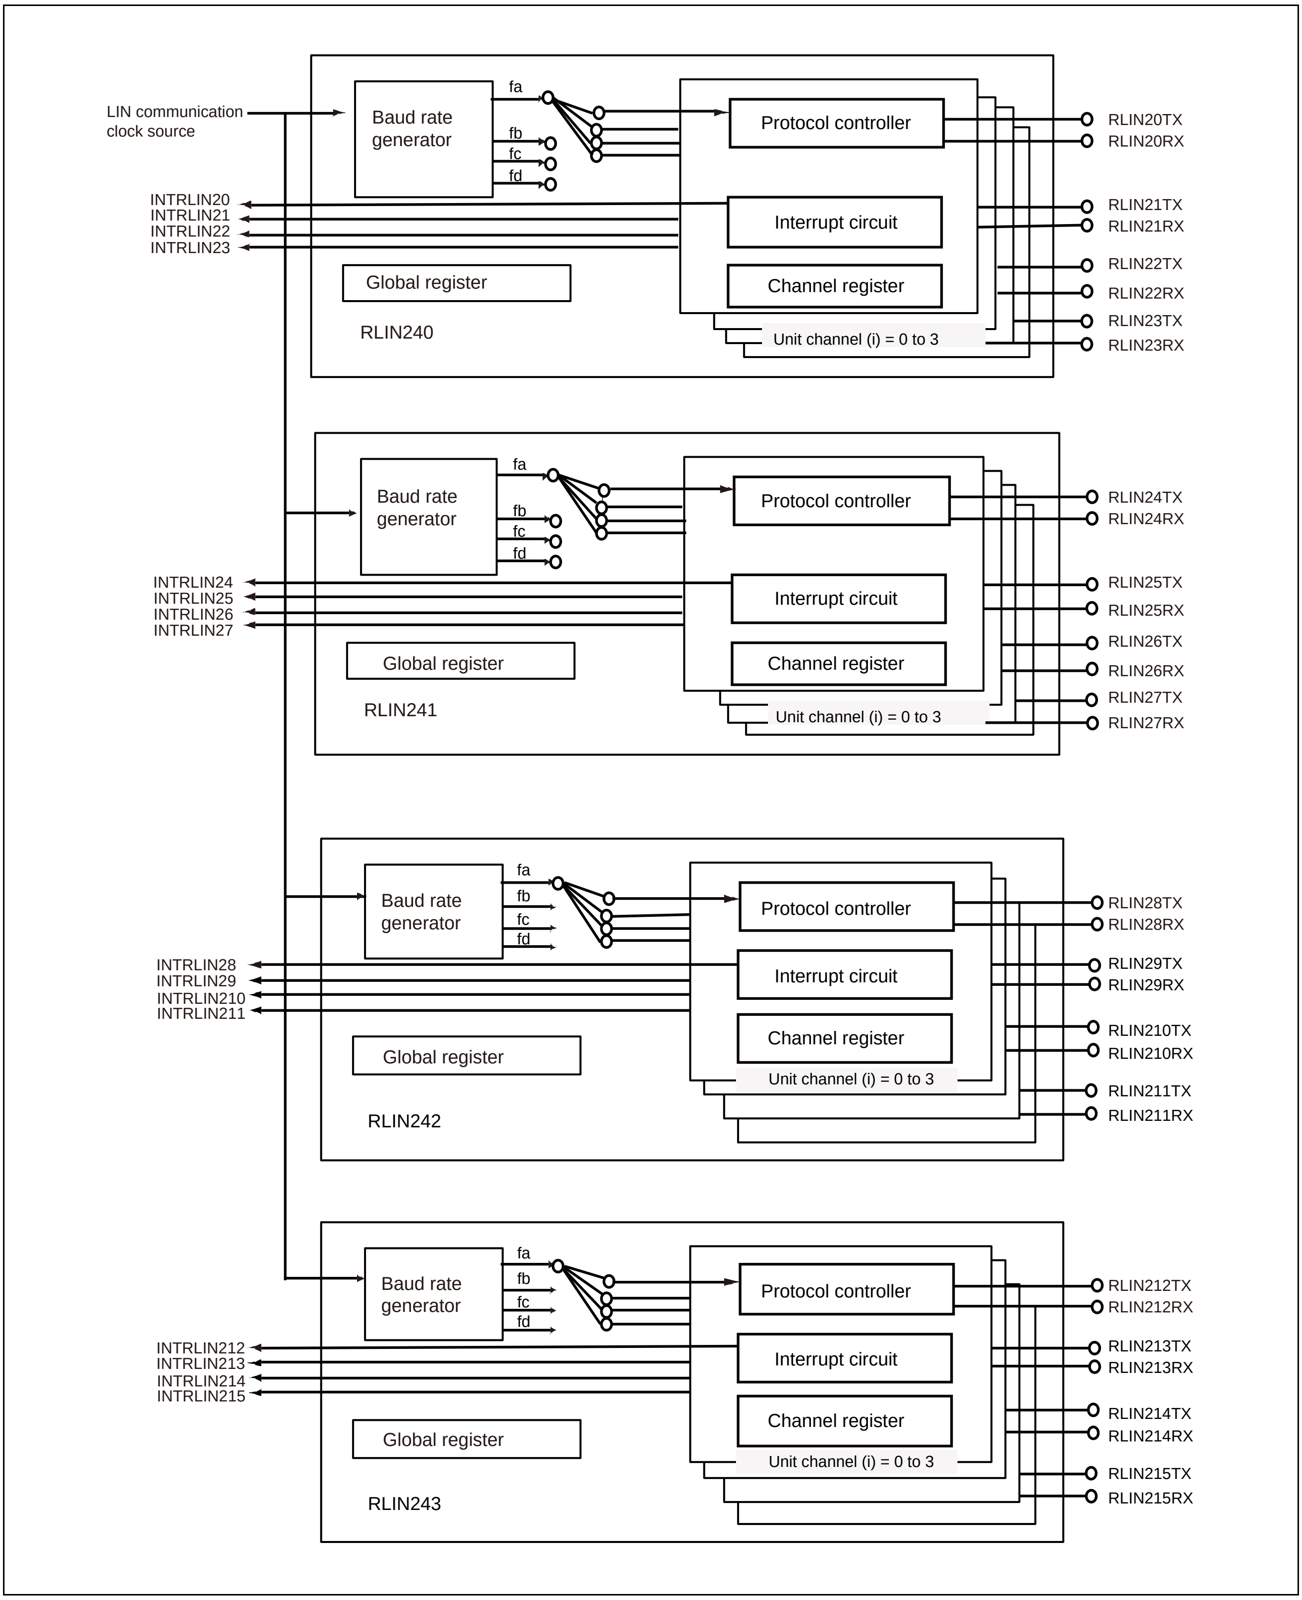

Figure 21.1 LIN Master Interface Block Diagram (324 Pins, RLIN2 16 Channels Embedded)

21.3 Registers

The registers of the LIN master interface include global registers and channel registers. As the global registers are allocated for each unit, they can be individually set for each unit. As the channel registers are allocated for each channel, they can individually control each channel.

21.3.1 List of Registers

RLIN2 registers are listed in the following table.

For details about <RLIN24n_base>, see **Section 21.1.2, Register Base Addresses**.

Table 21.25 List of Registers

Module Name	Register Name	Symbol	Address
Global registers			
RLN24n	LIN wake-up baud rate select register	RLN24nGLWBR	<RLIN24n_base> + 01_H
	LIN baud rate prescaler 0 register	RLN24nGLBRP0	<RLIN24n_base> + 02_H
	LIN baud rate prescaler 1 register	RLN24nGLBRP1	<RLIN24n_base> + 03_H
	LIN self-test control register	RLN24nGLSTC	<RLIN24n_base> + 04_H
Channel registers			
RLN24nm	LIN mode register	RLN24nmLiMD	<RLIN24n_base> + $08_H + i \times 20_H$
	LIN break field configuration register	RLN24nmLiBFC	<RLIN24n_base> + $09_H + i \times 20_H$
	LIN space configuration register	RLN24nmLiSC	<RLIN24n_base> + $0A_H + i \times 20_H$
	LIN wake-up configuration register	RLN24nmLiWUP	<RLIN24n_base> + $0B_H + i \times 20_H$
	LIN interrupt enable register	RLN24nmLiIE	<RLIN24n_base> + $0C_H + i \times 20_H$
	LIN error detection enable register	RLN24nmLiEDE	<RLIN24n_base> + $0D_H + i \times 20_H$
	LIN control register	RLN24nmLiCUC	<RLIN24n_base> + $0E_H + i \times 20_H$
	LIN transmission control register	RLN24nmLiTRC	<RLIN24n_base> + $10_H + i \times 20_H$
	LIN mode status register	RLN24nmLiMST	<RLIN24n_base> + $11_H + i \times 20_H$
	LIN status register	RLN24nmLiST	<RLIN24n_base> + $12_H + i \times 20_H$
	LIN error status register	RLN24nmLiEST	<RLIN24n_base> + $13_H + i \times 20_H$
	LIN data field configuration register	RLN24nmLiDFC	<RLIN24n_base> + $14_H + i \times 20_H$
	LIN ID buffer register	RLN24nmLiIDB	<RLIN24n_base> + $15_H + i \times 20_H$
	LIN checksum buffer register	RLN24nmLiCBR	<RLIN24n_base> + $16_H + i \times 20_H$
	LIN data buffer 1 register	RLN24nmLiDBR1	<RLIN24n_base> + $18_H + i \times 20_H$
	LIN data buffer 2 register	RLN24nmLiDBR2	<RLIN24n_base> + $19_H + i \times 20_H$
	LIN data buffer 3 register	RLN24nmLiDBR3	<RLIN24n_base> + $1A_H + i \times 20_H$
	LIN data buffer 4 register	RLN24nmLiDBR4	<RLIN24n_base> + $1B_H + i \times 20_H$
	LIN data buffer 5 register	RLN24nmLiDBR5	<RLIN24n_base> + $1C_H + i \times 20_H$
	LIN data buffer 6 register	RLN24nmLiDBR6	<RLIN24n_base> + $1D_H + i \times 20_H$
	LIN data buffer 7 register	RLN24nmLiDBR7	<RLIN24n_base> + $1E_H + i \times 20_H$
	LIN data buffer 8 register	RLN24nmLiDBR8	<RLIN24n_base> + $1F_H + i \times 20_H$

Note: When writing to a register not used, write the value after reset.

21.3.2 Global Registers

21.3.2.1 RLN24nGLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nGLWBR: <RLIN24n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LWBR0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 21.26 RLN24nGLWBR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified by the LCKS bit setting in the RLN24nmLiMD registers is used (when LIN 1.3 is used). 1: In LIN wake-up mode, the clock fa is used regardless of the setting of the LCKS bit in the RLN24nmLiMD registers (when LIN 2.X is used).

Set the RLN24nGLWBR register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

LWBR0 Bit (Wake-Up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN24nGLWBR register to 0. This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.

When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. With this setting, fa is selected as the LIN system clock (f_{LIN}) during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register (the LCKS bit is not changed) and the 2.5-Tbit or longer low-level width of the input signal can be measured. Setting the baud rate to 19200 bps while fa is selected allows the 130 µs or longer low-level width of the input signal to be detected during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register.

21.3.2.2 RLN24nGLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nGLBRP0: <RLIN24n_base> + 02_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.27 RLN24nGLBRP0 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the LIN communication clock source by N+1. Setting range: 00_H to FF_H

Set the RLN24nGLBRP0 register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

The value set in this register is used to control the frequency of baud rate clock source fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the LIN communication clock source by N+1.

21.3.2.3 RLN24nGLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nGLBRP1: <RLIN24n_base> + 03_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.28 RLN24nGLBRP1 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the LIN communication clock source by M+1. Setting range: 00_H to FF_H

Set the RLN24nGLBRP1 register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the LIN communication clock source by M+1.

21.3.2.4 RLN24nGLSTC — LIN Self-Test Control Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nGLSTC: <RLIN24n_base> + 04$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.29 RLN24nGLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	—	Writing A7$_H$, 58$_H$, and 01$_H$ successively to the RLN24nGLSTC register places the module in LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN24nGLSTC register cancels protection of LIN self-test mode.

Set the RLN24nGLSTC register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

Writing A7$_H$, 58$_H$, and 01$_H$ successively to the RLN24nGLSTC register places the module into LIN self-test mode.

When successive writing is completed and the module is placed in LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For details about transitioning to LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

When read, bits 6 to 1 return “000000$_B$”, and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.

For details about exiting LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

Writing 1 to this bit does not affect the value of the RLN24nGLSTC register if it is not a part of successive writing of A7$_H$, 58$_H$, and 01$_H$.

21.3.3 Channel Registers

21.3.3.1 RLN24nmLiMD — LIN Mode Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiMD: <RLIN24n_base> + 08_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	LCKS[1:0]		—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R

Table 21.30 RLN24nmLiMD Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Set the RLN24nmLiMD register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.
With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).
With 01_B set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).
With 10_B set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).
With 11_B set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

When the LWBR0 bit in the RLN24nGLWBR is 1 (when LIN 2.x is used) and the RLN24nmLiMST register is 01_H (LIN wake-up mode), regardless of the setting of the LCKS bit, fa is input to the protocol controller (LCKS bit is not changed).

21.3.3.2 RLN24nmLiBFC — LIN Break Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiBFC: <RLIN24n_base> + 09_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.31 RLN24nmLiBFC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	BDT[1:0]	Transmission Break Delimiter (High Level) Width Select b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmission Break (Low Level) Width Select b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN24nmLiBFC register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header.
1 Tbit to 4 Tbits can be specified.

BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header.
13 Tbits to 28 Tbits can be specified.

21.3.3.3 RLN24nmLiSC — LIN Space Configuration Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiSC: <RLIN24n_base> + $0A_H$ + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 21.32 RLN24nmLiSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN24nmLiSC register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.

0 Tbit to 3 Tbits can be specified.

These bits are enabled only during response transmission; they are disabled during response reception.

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.

0 Tbit to 7 Tbits can be specified.

The response space setting is enabled only during response transmission; the setting is disabled during response reception.

The inter-byte space (header) value is equal to the response space value.

21.3.3.4 RLN24nmLiWUP — LIN Wake-Up Configuration Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiWUP: <RLIN24n_base> + $0B_H$ + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 21.33 RLN24nmLiWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low Level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Set the RLN24nmLiWUP register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

WUTL[3:0] Bits (Wake-Up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.

1 Tbit to 16 Tbits can be specified.

When the LWBR0 bit in the RLN24nGLWBR is 1 (when LIN 2.x is used), regardless of the setting of the LCKS bit in the RLN24nmLiMD register, fa is selected as the LIN system clock (f_{LIN}) (LCKS bit is not changed).

21.3.3.5 RLN24nmLiIE — LIN Interrupt Enable Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiIE: <RLIN24n_base> + $0C_H$ + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 21.34 RLN24nmLiIE Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Request Enable 0: Disables successful frame/wake-up reception interrupt request. 1: Enables successful frame/wake-up reception interrupt request.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Request Enable 0: Disables successful frame/wake-up transmission interrupt request. 1: Enables successful frame/wake-up transmission interrupt request.

Set the RLN24nmLiIE register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables interrupt request upon detection of an error.

With 0 set, the interrupt request is not generated when the ERR flag in the RLN24nmLiST register is set to 1.

With 1 set, the interrupt request is generated when the ERR flag in the RLN24nmLiST register is set to 1.

Errors that constitute interrupt sources are bit errors, physical bus errors, frame timeout errors, framing errors, and checksum errors.

Detection of a bit error, physical bus error, frame timeout error, and framing error can be enabled or disabled using the RLN24nmLiEDE register.

FRCIE Bit (Successful Frame/Wake-Up Reception Interrupt Request Enable)

The FRCIE bit enables or disables interrupt request upon successful reception of a frame or a wake-up signal (counting of low level width of the input signal).

With 0 set, the interrupt request is not generated when the FRC flag in the RLN24nmLiST register is set to 1.

With 1 set, the interrupt request is generated when the FRC flag in the RLN24nmLiST register is set to 1.

FTCIE Bit (Successful Frame/Wake-Up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables interrupt request upon successful transmission of a frame or a wake-up signal.

With 0 set, the interrupt request is not generated when the FTC flag in the RLN24nmLiST register is set to 1.

With 1 set, the interrupt request is generated when the FTC flag in the RLN24nmLiST register is set to 1.

21.3.3.6 RLN24nmLiEDE — LIN Error Detection Enable Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiEDE: <RLIN24n_base> + $0D_H$ + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FERE	FTERE	PBERE	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 21.35 RLN24nmLiEDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Frame Timeout Error Detection Enable 0: Disables frame timeout error detection. 1: Enables frame timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN24nmLiEDE register while the OMM0 bit in the RLN24nmLiMST register is 0_B (LIN reset mode).

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

When this bit is set to 1, the detection result is indicated in the FER flag in the RLN24nmLiEST register.

For details on the framing error, see **Section 21.14, Error Status**.

FTERE Bit (Frame Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error.

With 0 set, the frame timeout error is not detected.

With 1 set, the frame timeout error is detected.

When this bit is set to 1, the detection result is indicated in the FTER flag in the RLN24nmLiEST register.

For details on the frame timeout error, see **Section 21.14, Error Status**.

PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.

With 0 set, the physical bus error is not detected.

With 1 set, the physical bus error is detected.

When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN24nmLiEST register.

For details on the physical bus error, see **Section 21.14, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

When this bit is set to 1, the detection result is indicated in the BER flag in the RLN24nmLiEST register.

For details on the bit error, see **Section 21.14, Error Status**.

21.3.3.7 RLN24nmLiCUC — LIN Control Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiCUC: <RLIN24n_base> + $0E_H$ + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 21.36 RLN24nmLiCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode. 1: LIN operation mode.
0	OM0	LIN Reset 0: Transition to LIN reset mode. 1: Exit LIN reset mode.

Set the RLN24nmLiCUC register to 01_H to transition to LIN wake-up mode or to 03_H to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN24nmLiCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN24nmLiMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the operating mode (LIN wake-up mode or LIN operation mode) that is entered after exiting LIN reset mode.

Setting this bit to 0 selects LIN wake-up mode.

Setting this bit to 1 selects LIN operation mode.

This bit is enabled only when the OMM0 bit in the RLN24nmLiMST register is 1.

Writing a value to this bit is disabled while the FTS bit in the RLN24nmLiTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects whether to transition to or exit LIN reset mode.

Setting this bit to 0 causes RLIN2 to enter LIN reset mode.

Setting this bit to 1 causes RLIN2 to exit LIN reset mode.

21.3.3.8 RLN24nmLiTRC — LIN Transmission Control Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiTRC: <RLIN24n_base> + 10_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 21.37 RLN24nmLiTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RTS	Response Transmission Start 0: Response transmission is stopped in frame separate mode. 1: Response transmission is started in frame separate mode.
0	FTS	Frame Transmission/Wake-up Transmission/Reception Start 0: Frame Transmission/wake-up transmission/reception is stopped. 1: Frame Transmission/wake-up transmission/reception is started.

RTS Bit (Response Transmission Start)

Set the RTS bit (response transmit start bit) to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame transmission and transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write 02_H to the RLN24nmLiTRC register using the store instruction.

Writing a value to this bit is disabled when the OMM0 bit is 0 (LIN reset mode). When the OMM1 bit is 0 (LIN wake-up mode), do not write 1.

Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is stopped).

FTS Bit (Frame Transmission/Wake-Up Transmission/Reception Start)

Set the FTS bit to 1 to start frame/wake-up transmission.

Also set this bit to 1 to allow wake-up reception (counting of the low level width of the input signal).

Only 1 can be written to this bit; 0 cannot be written.

Writing a value to this bit is disabled when the OMM0 bit is 0 (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

21.3.3.9 RLN24nmLiMST — LIN Mode Status Register

Access: This register is a read-only register that can be read in 8-bit units.

Address: RLN24nmLiMST: <RLIN24n_base> + 11_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 21.38 RLN24nmLiMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

When the OMM0 bit is 0_B (LIN reset mode), the value of this bit is disabled.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

21.3.3.10 RLN24nmLiST — LIN Status Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiST: <RLIN24n_base> + 12_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 21.39 RLN24nmLiST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN24nmLiST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

Writing to this register is prohibited while the FTS bit in the RLN24nmLiTRC register is 1 (frame transmission or wake-up transmission/reception is started)

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value from before 1 was written.

"1" is set upon completion of header transmission, but an interrupt request is not generated.

To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value from before 1 is written.

“1” is set upon completion of Data 1 reception, but an interrupt request is not generated.

To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when the value of any of the flags of the RLN24nmLiEST registers is 1). Here, an interrupt request is generated if the ERRIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN24nmLiEST register while in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC Flag (Successful Frame/Wake-Up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value from before 1 is written.

The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request is generated if the FRCIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled).

To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

FTC Flag (Successful Frame/Wake-Up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value from before 1 is written.

The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request is generated if the FTCIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled).

To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

21.3.3.11 RLN24nmLiEST — LIN Error Status Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiEST: <RLIN24n_base> + 13_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	CSER	—	FER	FTER	PBER	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 21.40 RLN24nmLiEST Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Frame Timeout Error Flag 0: Frame timeout error has not been detected. 1: Frame timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN24nmLiEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN24nmLiTRC register is 1 (frame transmission or wake-up transmission/reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value from before 1 is written.

The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value from before 1 is written.

The FER flag is set to 1 upon framing error detection when the FERE bit of the RLN24nmLiEST register is 1 (framing error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

FTER Flag (Frame Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value from before 1 is written.

The FTER flag is set to 1 upon frame timeout error detection when the FTERE bit of the RLN24nmLiEDE register is 1 (frame timeout error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value from before 1 is written.

The PBER flag is set to 1 upon physical bus error detection when the PBERE bit of the RLN24nmLiEDE register is 1 (physical bus error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value from before 1 is written.

The BER flag is set to 1 upon bit error detection when the BERE bit of the RLN24nmLiEDE register is 1 (bit error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

21.3.3.12 RLN24nmLiDFC — LIN Data Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiDFC: <RLIN24n_base> + 14_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	FSM	CSM	RFT	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.41 RLN24nmLiDFC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 bytes + checksum 0 0 0 1: 1 byte + checksum 0 0 1 0: 2 bytes + checksum : 0 1 1 1: 7 bytes + checksum 1 0 0 0: 8 bytes + checksum Settings other than the above are prohibited.

Set the RLN24nmLiDFC register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

FSM Bit (Frame Separate Mode Select)

The FSM bit sets the response transmission mode.

With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN24nmLiTRC register is 1), response is transmitted/received without the RTS bit in the RLN24nmLiTRC register being set.

With 1 set, frame separate mode is selected. When the RTS bit of the RLN24nmLiTRC register is set to 1 during header transmission, response transmission is executed after header transmission has ended.

For response reception (the RFT bit is 0), set the FSM bit to 0.

When transitioning to LIN self-test mode, set this bit to 0 before transition.

For details on frame separate mode, see **Section 21.11.1, Transmission of LIN Frames**.

CSM Bit (Checksum Select)

The CSM bit sets checksum mode.

With 0 set, classic checksum mode is selected.

With 1 set, enhanced checksum mode is selected.

When frame timeout error detection is enabled (the FTERE bit in the RLN24nmLiEDE register is 1), the timeout time depends on the setting of this bit. For details, see **Section 21.14, Error Status**.

RFT Bit (Response Field Communication Direction Select)

The RFT bit sets the direction of the response field/wake-up signal communication.

With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low level width of the input signal is counted).

With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.

The data length can be 0 to 8 bytes excluding the checksum size.

21.3.3.13 RLN24nmLiIDB — LIN ID Buffer Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiIDB: <RLIN24n_base> + 15_H + i × 20_H

Value after reset: Undefined

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.42 RLN24nmLiIDB Register Contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bit (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bit (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN24nmLiIDB register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted prior to communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 sets P0 and IDP1 sets P1.

Since parity is not automatically calculated, set the calculation value. Note that even if the specified calculation result is incorrect, it is transmitted as is.

ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

21.3.3.14 RLN24nmLiCBR — LIN Checksum Buffer Register

Access: This register is a read-only register that can be read in 8-bit units. In LIN self-test mode, this register can be read or written in 8-bit units.

Address: RLN24nmLiCBR: <RLIN24n_base> + 16_H + i × 20_H

Value after reset: Undefined

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.43 RLN24nmLiCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

while in LIN operation mode, this register operates as follows:

- When the RFT bit in the RLN24nmLiDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN24nmLiDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN24nmLiDFC register is 1 (transmission):
  After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.
  Writing to this register is invalid.
- When the RFT bit in the RLN24nmLiDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

Set the RLN24nmLiCBR register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

21.3.3.15 RLN24nmLiDBRb — LIN Data Buffer b Register

Access: This register can be read or written in 8-bit units.

Address:
RLN24nmLiDBR1: <RLIN24n_base> + 18_H + i × 20_H
RLN24nmLiDBR2: <RLIN24n_base> + 19_H + i × 20_H
RLN24nmLiDBR3: <RLIN24n_base> + $1A_H$ + i × 20_H
RLN24nmLiDBR4: <RLIN24n_base> + $1B_H$ + i × 20_H
RLN24nmLiDBR5: <RLIN24n_base> + $1C_H$ + i × 20_H
RLN24nmLiDBR6: <RLIN24n_base> + $1D_H$ + i × 20_H
RLN24nmLiDBR7: <RLIN24n_base> + $1E_H$ + i × 20_H
RLN24nmLiDBR8: <RLIN24n_base> + $1F_H$ + i × 20_H

Value after reset: Undefined

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.44 RLN24nmLiDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or allows the received data to be read. Setting range: 00_H to FF_H

- For response transmission:

  The LiDBRb registers specify the data to be transmitted in the response field.
  Configure these registers when:

  - The RFT bit in RLN24nmLiDFC register is 1 (transmission).
  - The FSM bit in RLN24nmLiDFC register is 0 (not frame separate mode).
  - The FTS bit in RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

  or

  - The RFT bit in RLN24nmLiDFC register is 1 (transmission).
  - The FSM bit in RLN24nmLiDFC register is 1 (frame separate mode).
  - The RTS bit in RLN24nmLiTRC register is 0 (response transmission is stopped).

- For response reception:

  The LiDBRb registers hold the data received in the response field.
  The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.
  Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started).

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted prior to communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

21.4 Interrupt Sources

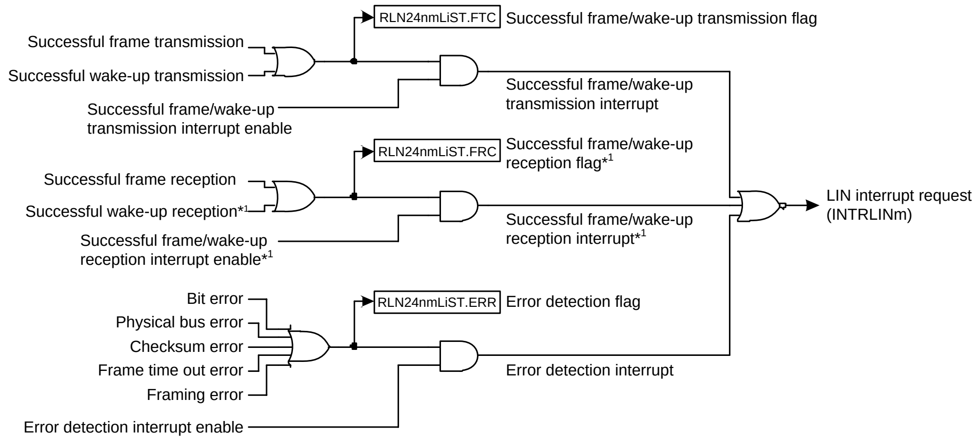
The LIN interrupts are interrupt requests generated by the LIN master interface.

There are three interrupt sources for each channel; successful frame/wake-up transmission, successful frame/wakeup reception, and error detection.

Interrupt requests from these three sources are ORed to generate one interrupt request “LIN interrupt”.

The respective interrupt request is output when the corresponding flag in the RLN24nmLiST register is set to 1 while the corresponding bit in the RLN24nmLiIE register is 1 (interrupt enabled). However, if an interrupt is requested when the corresponding flag in the RLN24nmLiST register has been set to 1, it is ignored. Therefore, clear the corresponding flag to 0 to enable the interrupt again.

Figure 21.2, LIN Interrupt Block Diagram shows a block diagram of the LIN interrupt.



Note 1. The wake-up receive signal indicates the input signal low level width count.

Figure 21.2 LIN Interrupt Block Diagram

21.5 Modes

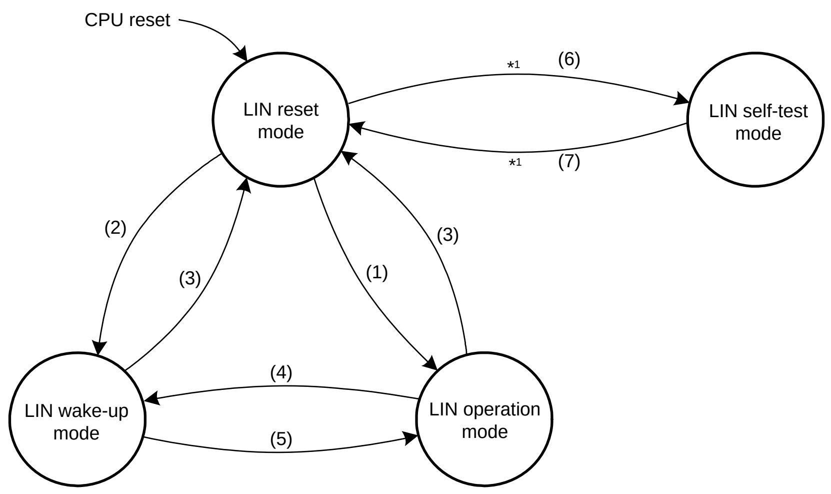
The LIN master interface provides the following four modes:

- LIN reset mode
- LIN operation mode
- LIN wake-up mode
- LIN self-test mode

The mode transitions except LIN self-test mode is controlled independently for respective channels.

Figure 21.3, Mode Transitions shows mode transitions. **Table 21.45, Transition Condition of Each Mode** describes mode transition conditions.

Table 21.46, Operations Available in Each Mode lists operations available in each mode.



Note 1. See **Section 21.15, LIN Self-Test Mode** for the details.

Figure 21.3 Mode Transitions

Table 21.45 Transition Condition of Each Mode

	Mode Transition			Transition Condition
(1)	LIN reset mode	→	LIN operation mode	RLN24nmLiCUC.OM1,OM0 = 11_B
(2)	LIN reset mode	→	LIN wake-up mode	RLN24nmLiCUC.OM1,OM0 = 01_B
(3)	LIN wake-up mode LIN operation mode	→	LIN reset mode	RLN24nmLiCUC.OM0 = 0_B
(4)	LIN operation mode	→	LIN wake-up mode	RLN24nmLiCUC.OM1,OM0 = 01_B
(5)	LIN wake-up mode	→	LIN operation mode	RLN24nmLiCUC.OM1,OM0 = 11_B
(6)	LIN reset mode	→	LIN self-test mode	See **Section 21.15, LIN Self-Test Mode**.
(7)	LIN self-test mode	→	LIN reset mode	See **Section 21.15, LIN Self-Test Mode**.

Table 21.46 Operations Available in Each Mode

LIN Operation Mode	LIN Wake-Up Mode	LIN Self-Test Mode
Header transmission Response transmission Response reception Error detection	Wake-up transmission Wake-up reception Error detection	self-test

Whether a transition has been made to LIN reset mode, LIN operation mode, or LIN wake-up mode can be verified by reading the OMM1 and OMM0 bits in the RLN24nmLiMST register.

For a description of LIN self-test mode, see **Section 21.15, LIN Self-Test Mode**.

21.6 LIN Reset Mode

Setting the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The transition to LIN reset mode can be verified by determining that the OMM0 bit in the RLN24nmLiMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication stops.

From LIN reset mode, transitions to LIN operation mode, LIN wake-up mode, and LIN self-test mode can be made.

When the mode transitions to LIN reset mode, the following registers are initialized to their reset values and retain their initial values while in LIN reset mode:

- RLN24nmLiTRC register
- RLN24nmLiST register
- RLN24nmLiEST register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN24nGLWBR register
- RLN24nGLBRP0 register
- RLN24nGLBRP1 register
- RLN24nmLiMD register
- RLN24nmLiBFC register
- RLN24nmLiSC register
- RLN24nmLiWUP register
- RLN24nmLiIE register
- RLN24nmLiEDE register
- RLN24nmLiDFC register
- RLN24nmLiIDB register
- RLN24nmLiCBR register
- RLN24nmLiDBRb register

21.7 LIN Operation Mode

While in LIN operation mode, frame processing (header transmission, response transmission, response reception, and error detection) is performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN24nmLiCUC register to 11_B changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN24nmLiMST register to 11_B. Communication settings should be performed after the RLN24nmLiMST register has become 11_B.

21.8 LIN Wake-Up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) is performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN24nmLiCUC register to 01_B changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN24nmLiMST register to 01_B. Communication settings should be performed after the RLN24nmLiMST register has become 01_B.

21.9 Header Transmission/Response Transmission/Response Reception

21.9.1 Header Transmission

Figure 21.4, Operation in Header Transmission shows the operation of the LIN master interface in header transmission. **Table 21.47, Processing in Header Transmission** shows processing in header transmission.

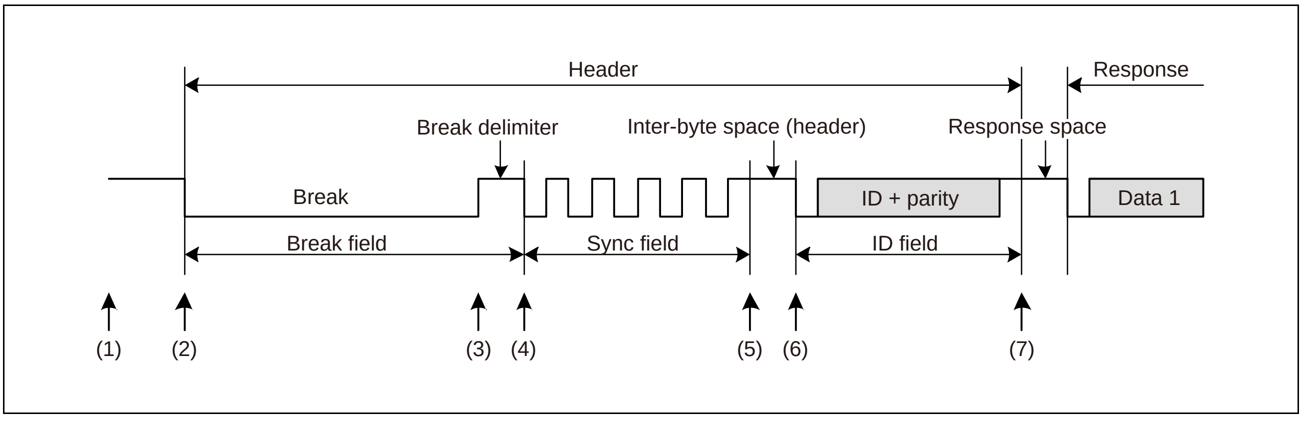


Figure 21.4 Operation in Header Transmission

Table 21.47 Processing in Header Transmission

	Software Processing	LIN Master Interface Processing
(1)	● Sets a baud rate ● Enables interrupts ● Enables error detection ● Sets frame configuration parameters ● Transitions to LIN operation mode ● Sets information on the frame to be transmitted (ID, parity, data length, response direction, checksum method, and transmission data)	Waits for the FTS bit in the RLN24nmLiTRC register to be set by software (idle).
(2)	Sets the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3)	Waits for an interrupt request	Transmits a break delimiter.
(4)		Transmits a sync field (55_H).
(5)		Transmits an inter-byte space (header).
(6)		Transmits an ID field.
(7)		Sets the successful header transmission flag.

NOTE

For information about error detection, see **Section 21.14, Error Status**.

21.9.2 Response Transmission

Figure 21.5, Operation in Response Transmission shows the operation of the LIN master interface in response transmission. **Table 21.48, Processing in Response Transmission** shows the processing in response transmission.

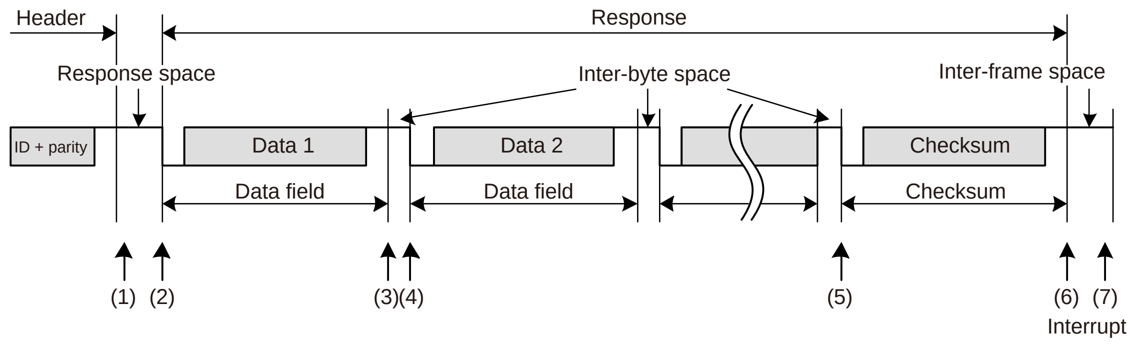

Figure 21.5 Operation in Response Transmission

Table 21.48 Processing in Response Transmission

	Software Processing	LIN Master Interface Processing
(1)	(When in frame separate mode) ● Sets the RTS bit in the RLN24nmLiTRC register to 1 (response transmission started) (When not in frame separate mode) ● Waits for an interrupt request	(When in frame separate mode) ● Waits for the RTS bit in the RLN24nmLiTRC register to be set to 1 by software. (During this time, “1” is output.) ● When the bit is set to 1, sends a response space. (When not in frame separate mode) ● Sends a response space.
(2)	Waits for an interrupt request	Transmits data 1.
(3)		Transmits an inter-byte space.
(4)		● Transmits data 2. ● Transmits an inter-byte space ● Transmits data 3. ● Transmits an inter-byte space (Repeats the transmission of data and inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN24nmLiDFC register.) : :
(5)		Transmits the checksum.
(6)		● Sets the successful frame/wake-up transmission flag. ● Sets the FTS bit in the RLN24nmLiTRC register to 0 (frame transmission or wake-up transmission/reception stopped) (When in frame separate mode) ● Sets the RTS bit in the RLN24nmLiTRC register to 0 (response transmission stopped).
(7)	● Processing after communication Checks the RLN24nmLiST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 21.14, Error Status**.

21.9.3 Response Reception

Figure 21.6, Operation in Response Reception shows the operation of the LIN master interface in response reception. **Table 21.49, Processing in Response Reception** shows the processing in response reception.

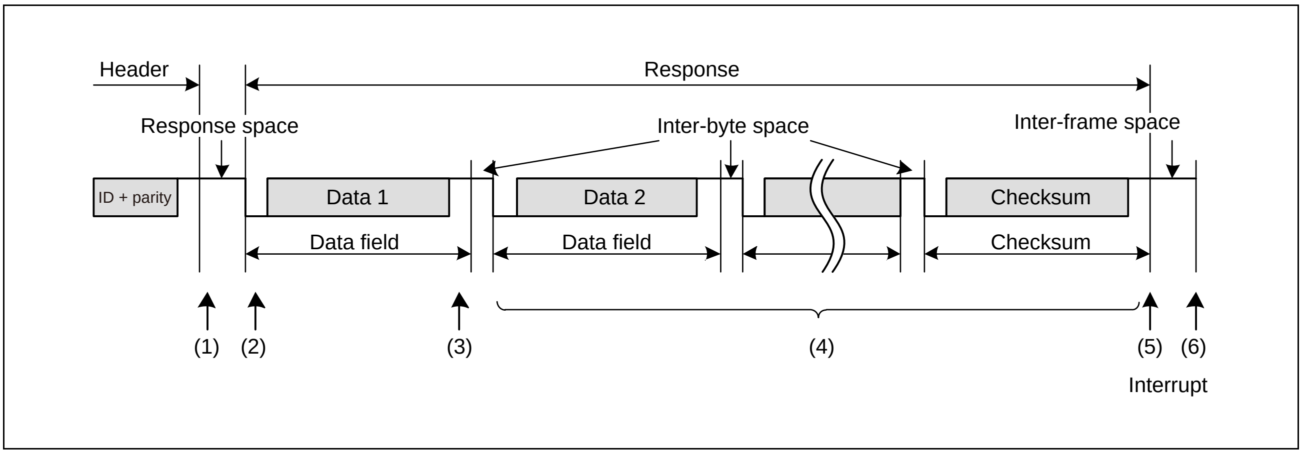

Figure 21.6 Operation in Response Reception

Table 21.49 Processing in Response Reception

	Software Processing	LIN Master Interface Processing
(1)	Waits for an interrupt request (no processing).	Waits for detection of a start bit.
(2)	Waits for an interrupt request.	Receives data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		● Receives data 2 when the start bit is detected. ● Receives data 3 when the start bit is detected. (Repeats the reception of data as many times as the data length specified in bits RFDL[3:0] in the RLN24nmLiDFC register.) : : ● Receives the checksum when the start bit is detected.
(5)		● Evaluates the checksum. ● Sets the successful frame/wake-up reception flag. ● Sets the FTS bit in the RLN24nmLiTRC register to 0 (frame transmission or wake-up transmission/reception stopped).
(6)	● Processing after communication Reads the received data. Checks the RLN24nmLiST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 21.14, Error Status**.

21.10 Data Transmission/Reception

21.10.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag of the RLN24nmLiEST register (see **Section 21.14, Error Status**).

In the LIN master interface, because data is generated every 1 Tbit = $16f_{LIN}$, the sampling point for received data is the 13th clock cycle (81.25% position).

Figure 21.7, Example of Data Transmission Timing shows an example of data transmission timing.

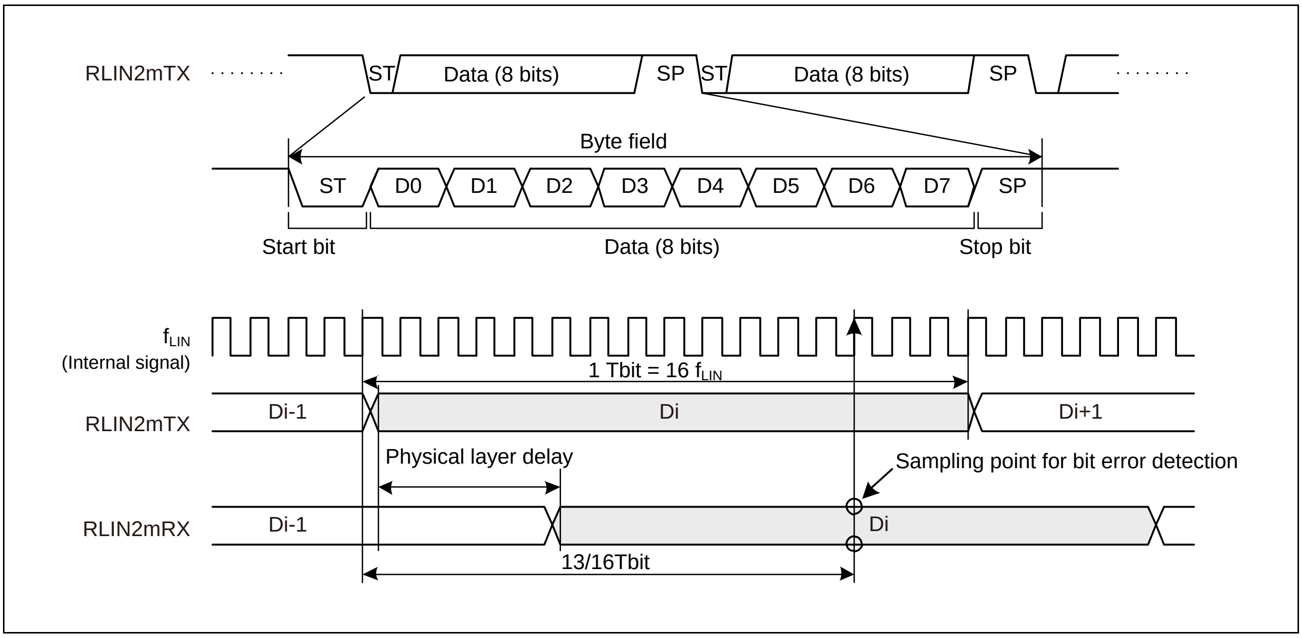

Figure 21.7 Example of Data Transmission Timing

21.10.2 Data Reception

Data reception is performed by using the synchronized RLIN2mRX signal (an internal signal) that is the input from the RLIN2mRX pin synchronized with the LIN system clock (f_{LIN}).

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN2mRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN2mRX signal is low level. The falling edge is not recognized as a start bit if the RLIN2mRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

The bit sampling period after detection of the start bit is one Tbit.

Figure 21.8, Example of Data Reception Timing shows an example of data reception timing.

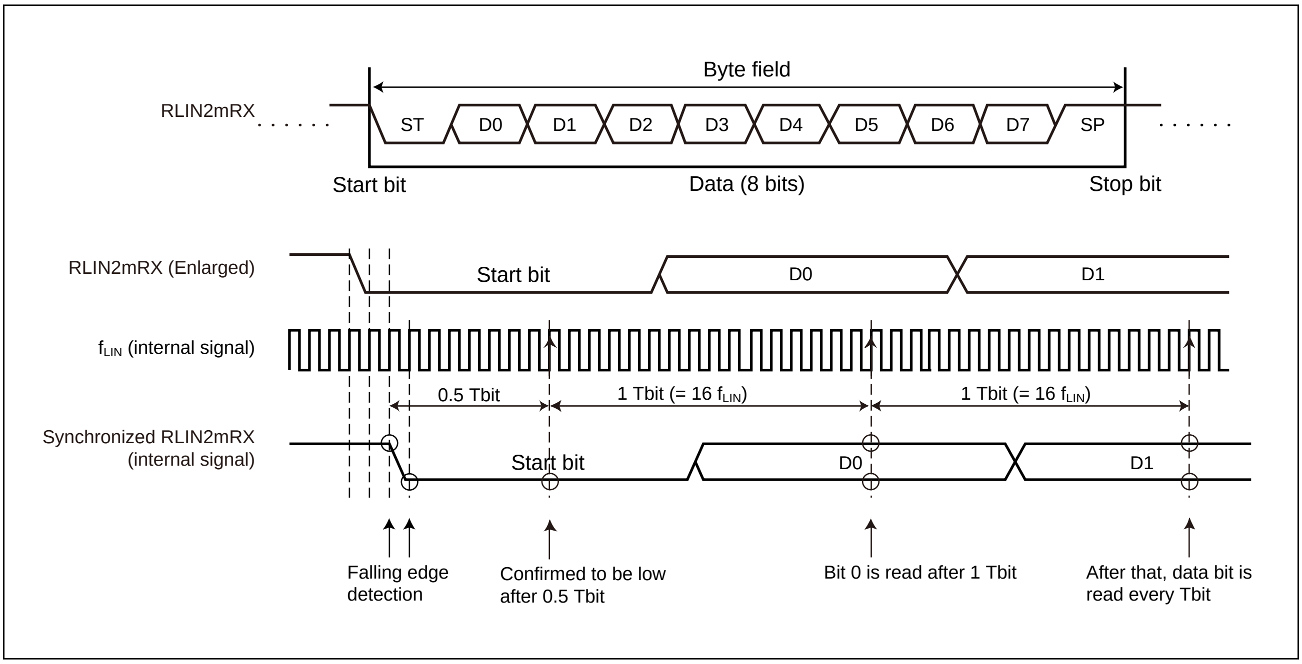

Figure 21.8 Example of Data Reception Timing

21.11 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN master interface sends or receives data continuously.

21.11.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-byte transmission, the contents stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN24nmLiDBR5 to RLN24nmLiDBR8 are not transmitted. The transmitted checksum data is stored in the RLN24nmLiCBR register.

Figure 21.9, LIN Transmission Processing and Corresponding Buffers shows the LIN transmission processing and the corresponding buffers.

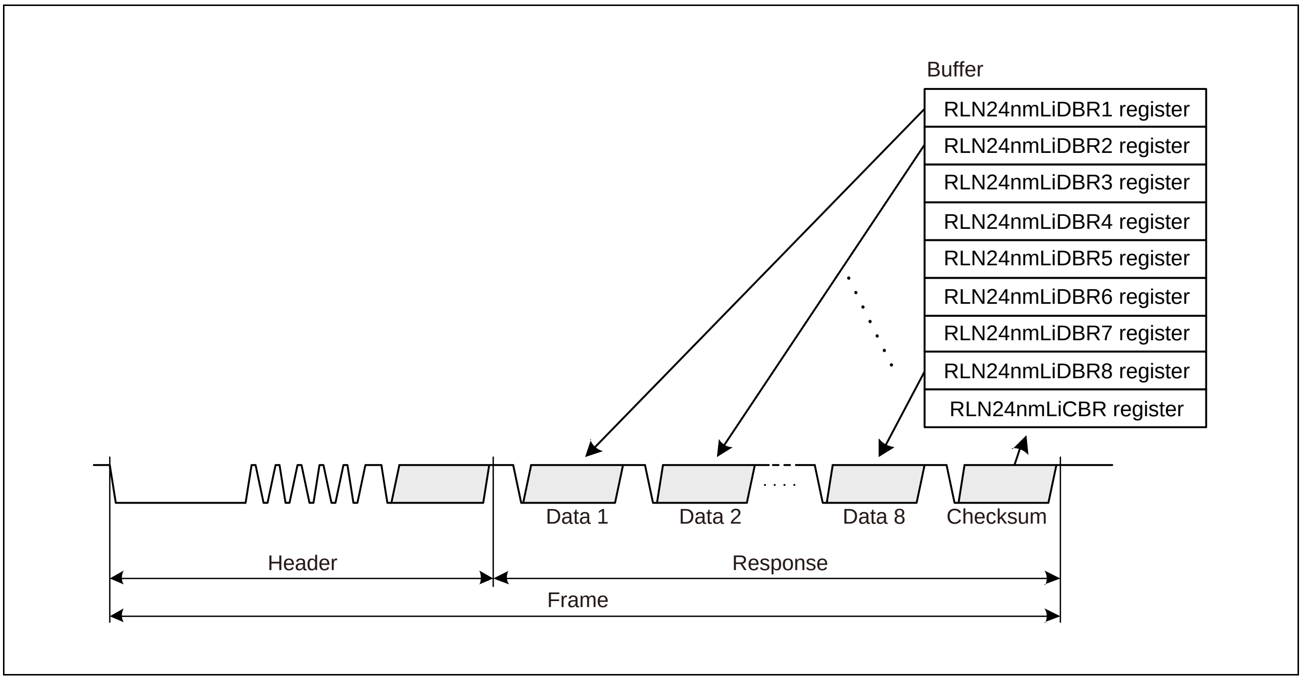

Figure 21.9 LIN Transmission Processing and Corresponding Buffers

(1) Frame Separate Mode

Setting the FSM bit in the RLN24nmLiDFC register to 1 sets the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN24nmLiST register is set to 1 (successful header transmission).

21.11.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame are stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR4, respectively; no data is stored in registers RLN24nmLiDBR5 to RLN24nmLiDBR8. The received checksum data is stored in the RLN24nmLiCBR register.

Figure 21.10, LIN Reception Processing and Corresponding Buffers shows the LIN reception processing and the corresponding buffers.

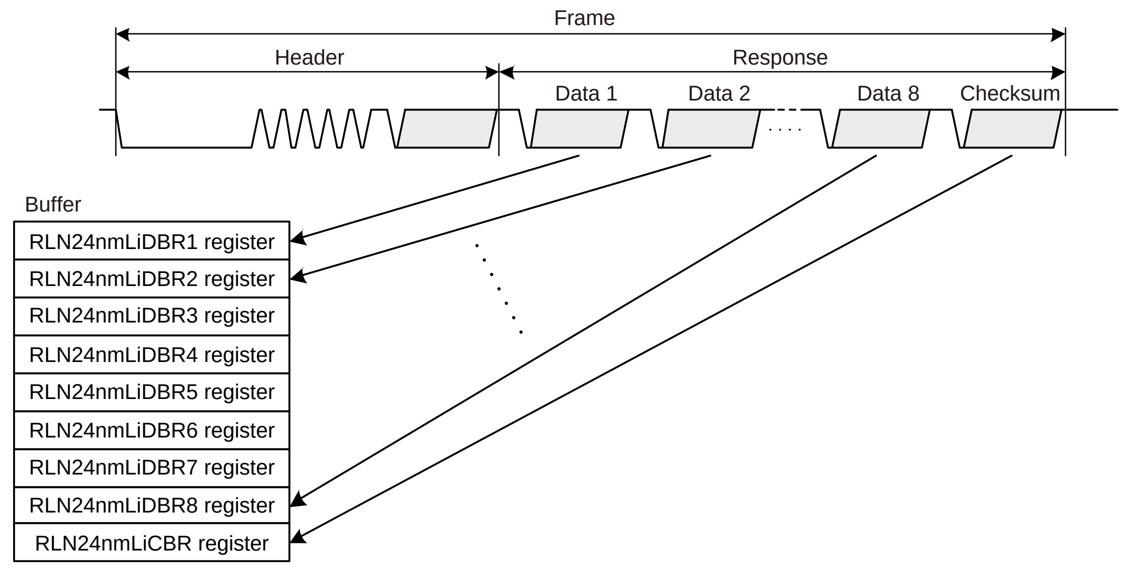

Figure 21.10 LIN Reception Processing and Corresponding Buffers

(1) Reception of Data 1

When the reception of the first byte of data is finished, the D1RC flag in the RLN24nmLiST register is set to 1 (successful data 1 reception).

21.12 Wake-Up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

21.12.1 Wake-Up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN24nmLiDFC register to 1 (transmission) and the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal is set using the WUTL[3:0] bits in the RLN24nmLiWUP register. However, if the value of the LWBR0 bit of the RLN24nGLWBR register is 1 (when LIN 2.x is used), the LIN system clock (f_{LIN}) has the low-level width of fa (JW) regardless of the setting of the LCKS bit of the RLN24nmLiMD register. By setting the baud rate to 19200 bps when fa is selected and setting the WUTL[3:0] bits of the RLN24nmLiWUP register to 0100_B (5 Tbits), 260 µs low level width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN24nmLiMD register.

If a wake-up low level is output without any error, the FTC flag in the RLN24nmLiST register is set to 1 (successful frame or wake-up transmission); when the FTCIE bit in the RLN24nmLiIE register is 1 (successful frame/wake-up transmission interrupt enabled), an interrupt request is generated.

If an error is detected, wake-up transmission is aborted and the error flag for the error detected (the PBER flag or BER flag in the RLN24nmLiEST register) is set to 1 (physical bus error detection / bit error detection).

Figure 21.11, Wake-Up Transmission Timing shows the wake-up transmission timing.

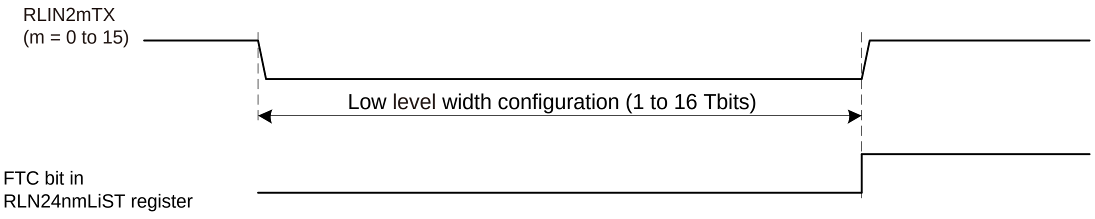

Figure 21.11 Wake-Up Transmission Timing

21.12.2 Wake-Up Reception

The detection of a wake-up signal involves the use of an input signal low level width count function.

The input signal low level width count function measures the low level width of the input signal to the RLIN2mRX pin, using the same sampling point as data reception. This allows an input signal of f_{LIN} with a low-level width of 2.5-Tbit or longer to be measured.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN24nGLWBR register to 0. When LIN Specification Package Revision 2.x is used, set LWBR0 bit to 1.

When LWBR0 bit is set to 1, regardless of the setting of the LCKS bit in the RLN24nmLiMD register, fa is selected as the LIN system clock (f_{LIN}) (the LCKS bit is not changed).

Setting the baud rate to 19200 bps while fa is selected allows an input signal with a low-level width of 130 µs or longer to be detected during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register.

When using this function, in LIN wake-up mode set the RFT bit in the RLN24nmLiDFC register to 0 (reception), and the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN24nmLiST register is set to 1 (successful frame or wake-up reception) and if the FRCIE bit in the RLN24nmLiIE register is 1 (successful frame or wake-up reception interrupt enabled), an interrupt request is generated.

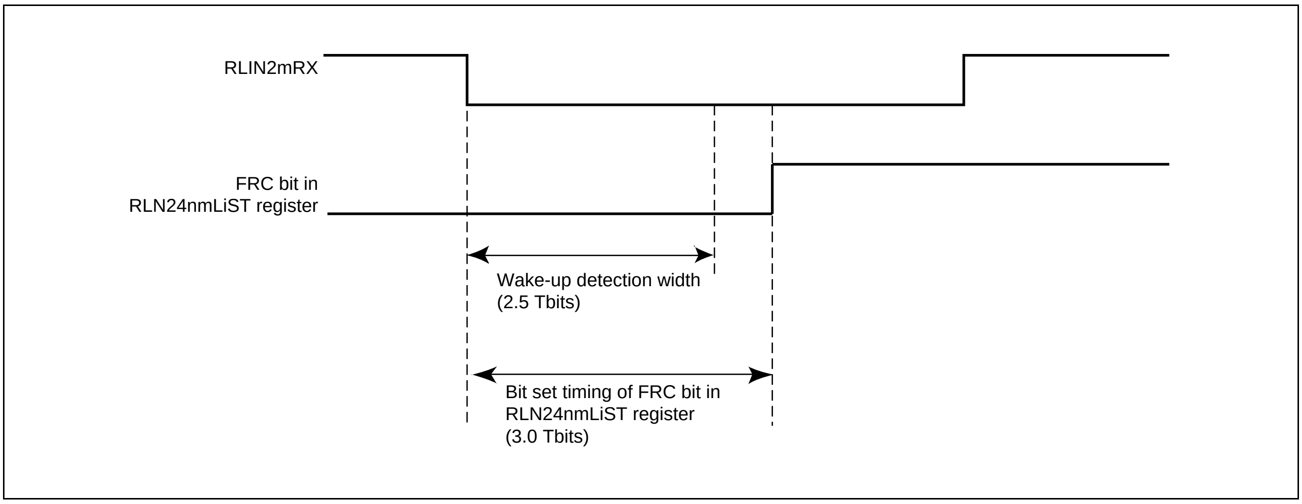

Figure 21.12 Input Signal Low Level Count Function

21.12.3 Wake-Up Collision

If the master node and the slave node transmit wake-up signals simultaneously, a collision will occur on the LIN bus; however the a collision of wake-up signals is not detected in the LIN master interface.

21.13 Status

During LIN mode operation, the LIN master interface can detect seven types of statuses.

Three of these statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, can generate interrupt requests.

Table 21.50, Types of Statuses shows the types of statuses.

Table 21.50 Types of Statuses

Status	Status Set Condition	Status Clear Condition	Operation Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN24nmLiCUC register is set to not-LIN-reset-mode, if the LIN master interface actually exits LIN reset mode.	After the OM0 bit in the RLN24nmLiCUC register is set to LIN reset mode, if the LIN master interface enters LIN reset mode.	All modes	OMM0 bit in the RLN24nmLiMST register	—
Operation mode	After the OM1 bit in the RLN24nmLiCUC register is set to LIN operation mode, if the LIN master interface actually enters LIN operation mode.	After the OM1 bit in the RLN24nmLiCUC register is set to LIN wake-up mode, if the LIN master interface enters LIN wake-up mode.	● LIN operation mode ● LIN wake-up mode	OMM1 bit in the RLN24nmLiMST register	—
Successful frame/wake-up transmission	When a frame (header transmission + response transmission) or a wake-up signal is transmitted successfully.	● When the next communication is started ● When cleared by software ● After transition to LIN reset mode	● LIN operation mode ● LIN wake-up mode	FTC flag in the RLN24nmLiST register	✓
Successful frame/wake-up reception	When a frame (header transmission + response reception) or a wake-up signal is received successfully.	● When the next communication is started ● When cleared by software ● After transition to LIN reset mode	● LIN operation mode ● LIN wake-up mode	FRC flag in the RLN24nmLiST register	✓
Error detection	If any of the CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN24nmLiEST register is set to 1 (error detected).	● When the next communication is started ● When cleared by software*[1] ● After transition to LIN reset mode	● LIN operation mode ● LIN wake-up mode	ERR flag in the RLN24nmLiST register	✓
Successful data 1 reception	When the RFT bit in the RLN24nmLiDFC register is 0 (reception) and the first byte of the response field is received successfully.*[2]	● When the next communication is started ● When cleared by software ● After transition to LIN reset mode	LIN operation mode	D1RC flag in the RLN24nmLiST register	—
Successful header transmission	When a header field is transmitted successfully.	● When the next communication is started ● When cleared by software ● After transition to LIN reset mode	LIN operation mode	HTRC flag in the RLN24nmLiST register	—

Note 1. While in LIN operation mode, the ERR flag in the RLN24nmLiST register is cleared to 0 by writing 0 to the CSER flag, FER flag, FTER flag, PBER flag, or BER flag in the RLN24nmLiEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN24nmLiDFC register are 0000_B (0 bytes + checksum).

21.14 Error Status

21.14.1 Types of Error Statuses

The LIN master interface can detect five types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN24nmLiEST register.

All error statuses represent interrupt sources.

Table 21.51, Types of Error Statuses shows the types of error statuses.

Table 21.51 Types of Error Statuses

Status	Error Detection Condition	Operating Mode Capable of Error Detection	Communication	Selection of Detection Enable/Disable	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1	● LIN operation mode ● LIN wake-up mode	Aborted	✓	BER flag in the RLN24nmLiEST register
Physical bus error	● LIN bus is detected to be high level when sending a break ● LIN bus is detected to be low level when sending a break delimiter ● LIN bus is detected to be high level when sending a wake-up	● LIN operation mode ● LIN wake-up mode	Aborted	✓	PBER flag in the RLN24nmLiEST register
Frame timeout error	A frame transmission/reception does not complete within a given time*2	LIN operation mode	Aborted	✓	FTER flag in the RLN24nmLiEST register
Framing error	In response field reception, the stop bit of each data byte is low level	LIN operation mode	Aborted	✓	FER flag in the RLN24nmLiEST register
Checksum error	In response field reception, checksum test results in an error	LIN operation mode	—	×	CSER flag in the RLN24nmLiEST register

Note 1. If a bit error is detected, the process is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. The timeout time depends on the response field data length (the RFDL[3:0] bits in the RLN24nmLiDFC register) and the checksum selection (the CSM bit in the RLN24nmLiDFC register), and this can be calculated according to the following formula:
When classic checksum is selected (when the CSM bit in the RLN24nmLiDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
When enhanced checksum is selected (when the CSM bit in the RLN24nmLiDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.

The error status is cleared when the next communication is started, when it is cleared by software, or at a transition to LIN reset mode.

21.14.2 Target Time Domain for Error Detection

Figure 21.13, Target Time Domain for Error Detection shows the time domain in which the LIN master interface monitors for error detection.

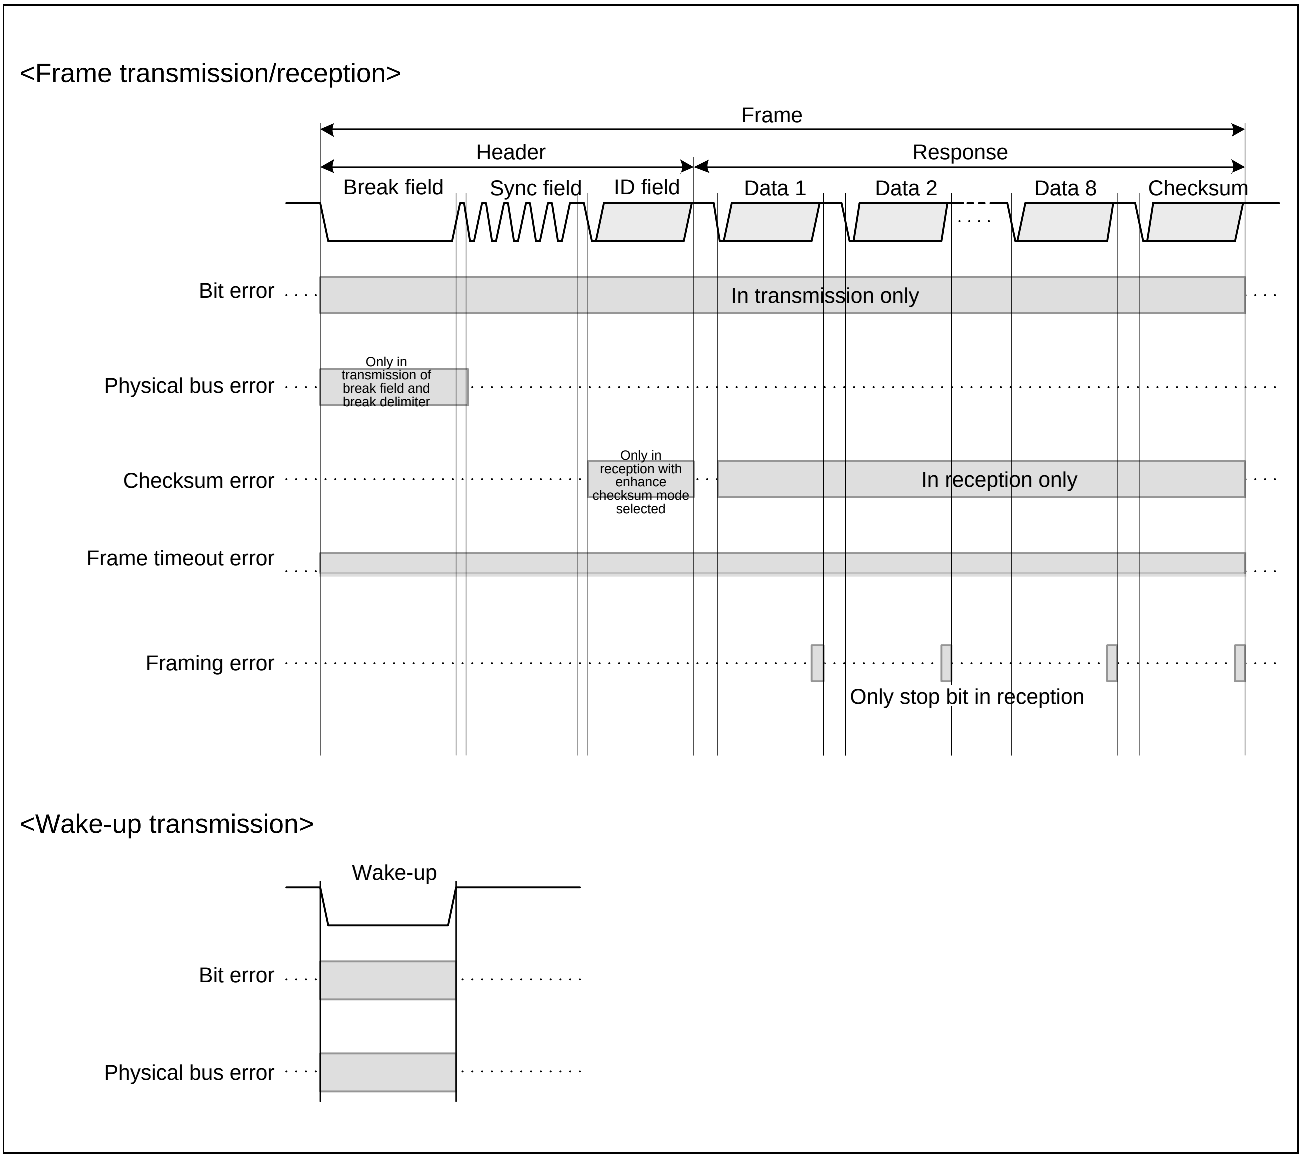

Figure 21.13 Target Time Domain for Error Detection

21.15 LIN Self-Test Mode

The LIN master interface provides LIN self-test mode. When the LIN master interface enters LIN self-test mode, RLIN2mTX and RLIN2mRX are disconnected from the external pins, and are internally connected in the LIN master interface. Thus, the frame transmitted from RLIN2mTX is looped back to RLIN2mRX.

Two types of self-test can be performed:

- LIN self-test mode (transmission): header transmission and response transmission
- LIN self-test mode (reception): header transmission and response reception

In LIN self-test mode, the operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator. Regardless of the setting of the baud rate related registers, the baud rate operates at the LIN communication clock source/16 [bps].

In LIN self-test mode, the following functions are not supported:

- LIN wake-up mode
- Frame separate mode

Do not use these functions.

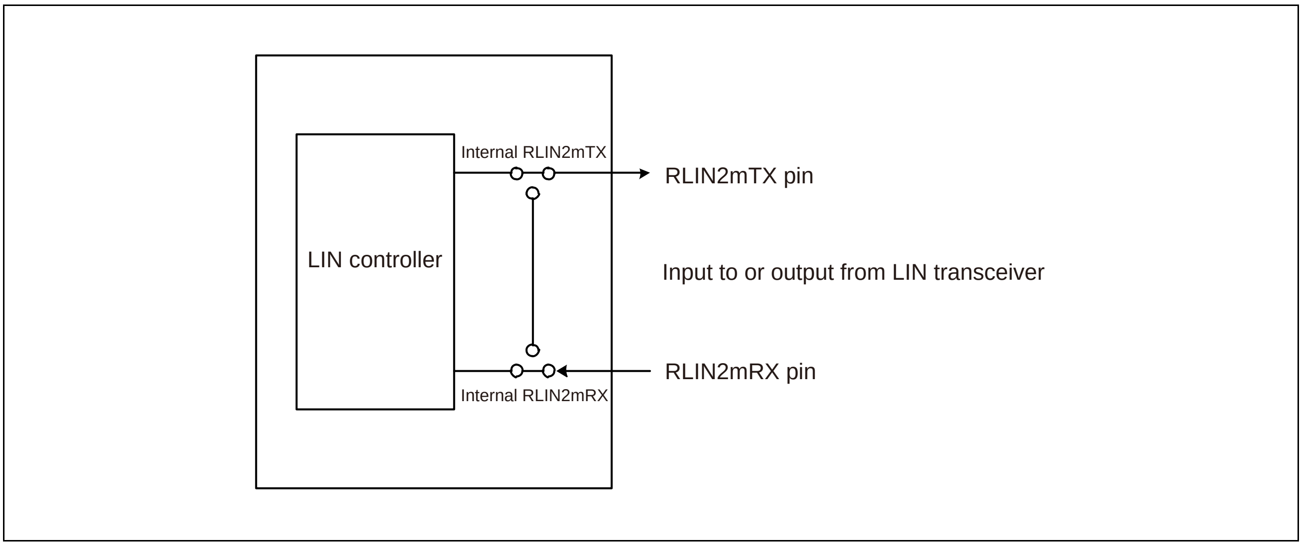

Figure 21.14 Connection in LIN Reset Mode, LIN Wake-Up Mode, and LIN Operation Mode

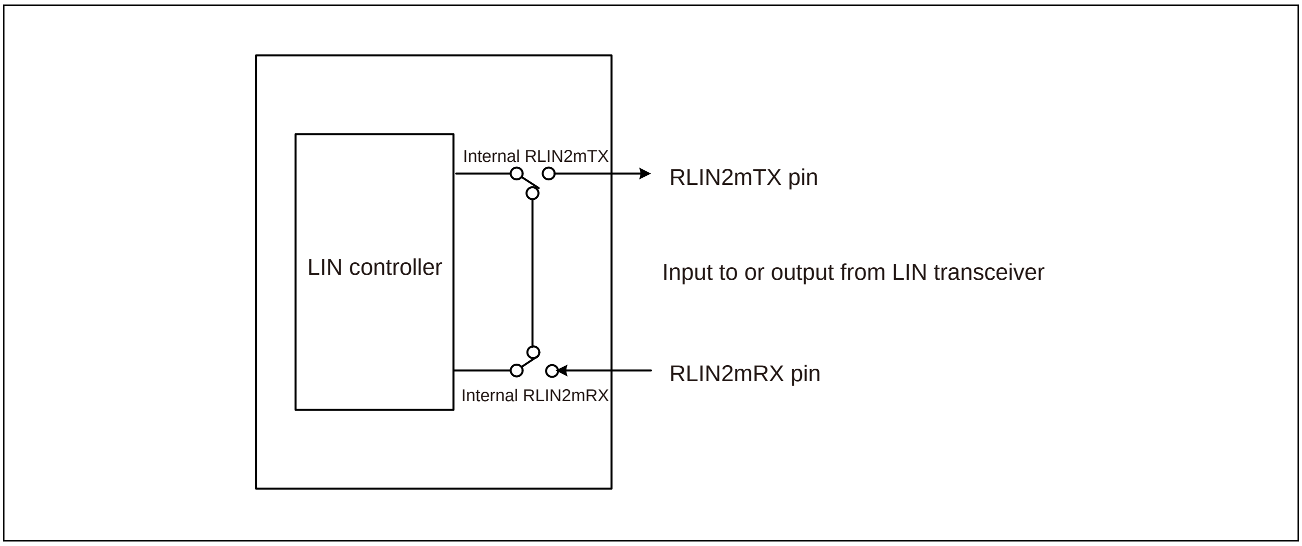

Figure 21.15 Connection in LIN Self-Test Mode

21.15.1 Transition to LIN Self-Test Mode

Writing to the RLN24nGLSTC register enables LIN self-test mode.

The LSTM bit in the RLN24nGLSTC register being set to 1 indicates that the mode has transitioned to LIN self-test mode.

A specific sequence is required to transition to LIN self-test mode. In this sequence, information must be written three times consecutively to the LIN self-test control register, as follows:

- Switch all channels of the unit to LIN reset mode.
  Set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN24nmLiMST register and confirm that it is 0 (LIN reset mode).
- 1st write: RLN24nGLSTC register = $1010\ 0111_B$ ($A7_H$)
- 2nd write: RLN24nGLSTC register = $0101\ 1000_B$ (58_H)
- 3rd write: RLN24nGLSTC register = $0000\ 0001_B$ (01_H)
- Confirm that all channels have transitioned to LIN self-test mode
  Read the LSTM bit in the RLN24nGLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the 1st write step. In addition, if a write to another LIN-related register in the same unit is performed during transition to LIN self-test mode (three consecutive write operations to the RLN24nGLSTC register), the transition is also canceled.

21.15.2 Transmission in LIN Self-Test Mode

To execute a self-test on transmission, perform the procedure below:

- Set the baud rate related registers.
  RLN24nGLBRP0 register = xxxx $xxxx_B$*[1]
  RLN24nGLBRP1 register = xxxx $xxxx_B$*[1]
  RLN24nmLiMD register = 0000 $xx00_B$*[1]
- Set interrupt enable register and error enable related registers.
  RLN24nmLiIE register = 0000 $0xxx_B$*[2]
  RLN24nmLiEDE register = 0000 $xxxx_B$
- Set the break field and space related registers.
  RLN24nmLiBFC register = 00xx $xxxx_B$
  RLN24nmLiSC register = 00xx $0xxx_B$
- Exit the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN24nmLiCUC register, and check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are 11_B.
- Set the transmit frame related registers.
  RLN24nmLiDFC register = 00x1 $xxxx_B$
  RLN24nmLiIDB register = xxxx $xxxx_B$
  RLN24nmLiDBR1 to RLN24nmLiDBR8 registers = xxxx $xxxx_B$
- Start header transmission → response transmission
  Set the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started).
  The LIN self-test mode (transmission) is executed, interrupts are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN master interface.
  To suspend the LIN self-test mode (transmission) while it is running, set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode), which causes a transition to the LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN24nmLiIDB, RLN24nmLiDBRb, and RLN24nmLiCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN24nmLiTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN24nmLiTRC register is cleared.

NOTE

x: Don't care

Note 1. The settings of the following registers are not reflected in the operation of the LIN self-test mode: the RLN24nGLBRP0 register, the RLN24nGLBRP1 register, and the LCKS bit in the RLN24nmLiMD register. Therefore, setting these registers is not necessary.

Note 2. If necessary, set the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8**, **Section 7BC, Exception/Interrupts of RH850/F1KM**.

21.15.3 Reception in LIN Self-Test Mode

To execute a self-test on reception, perform the procedure below:

- Set the baud rate related registers.
  RLN24nGLBRP0 register = xxxx xxxx_B*[1]
  RLN24nGLBRP1 register = xxxx xxxx_B*[1]
  RLN24nmLiMD register = 0000 xx00_B*[1]
- Set the interrupt enable and error enable related registers.
  RLN24nmLiIE register = 0000 0xxx_B*[2]
  RLN24nmLiEDE register = 0000 x0xx_B
- Set the break field and space related registers.
  RLN24nmLiBFC register = 00xx xxxx_B
  RLN24nmLiSC register = 00xx 0xxx_B*[1]
- Exit the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN24nmLiCUC register, and check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are 11_B.
- Set the receive frame related registers.
  RLN24nmLiDFC register = 00x0 xxxx_B
  RLN24nmLiIDB register = xxxx xxxx_B
  RLN24nmLiDBR1 to RLN24nmLiDBR8 registers = xxxx xxxx_B
  RLN24nmLiCBR register = xxxx xxxx_B
  Since the checksum value to be transmitted is not automatically calculated, perform the calculation and specify the calculated value in the RLN24nmLiCBR register. By specifying an incorrect checksum, the checksum error can be tested.
- Start header transmission → response reception
  Set the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started). The LIN self-test mode (reception) is executed, interrupts are generated, and status and error status are also updated. To suspend the LIN self-test mode (reception) while it is running, set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode), which causes a transition to the LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN24nmLiIDB, RLN24nmLiDBRb, and RLN24nmLiCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN24nmLiTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN24nmLiTRC register is cleared.

NOTE

x: Don’t care

Note 1. The settings of the following registers are not reflected to the operation of the LIN self-test mode: the RLN24nGLBRP0 register, the RLN24nGLBRP1 register, the LCKS bit in the RLN24nmLiMD register, and the IBS bit and IBHS bit (response space only) in the RLN24nmLiSC register. Therefore, setting these registers is not necessary.

Note 2. If necessary, set the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8**, **Section 7BC, Exception/Interrupts of RH850/F1KM**.

21.15.4 Exiting LIN Self-Test Mode

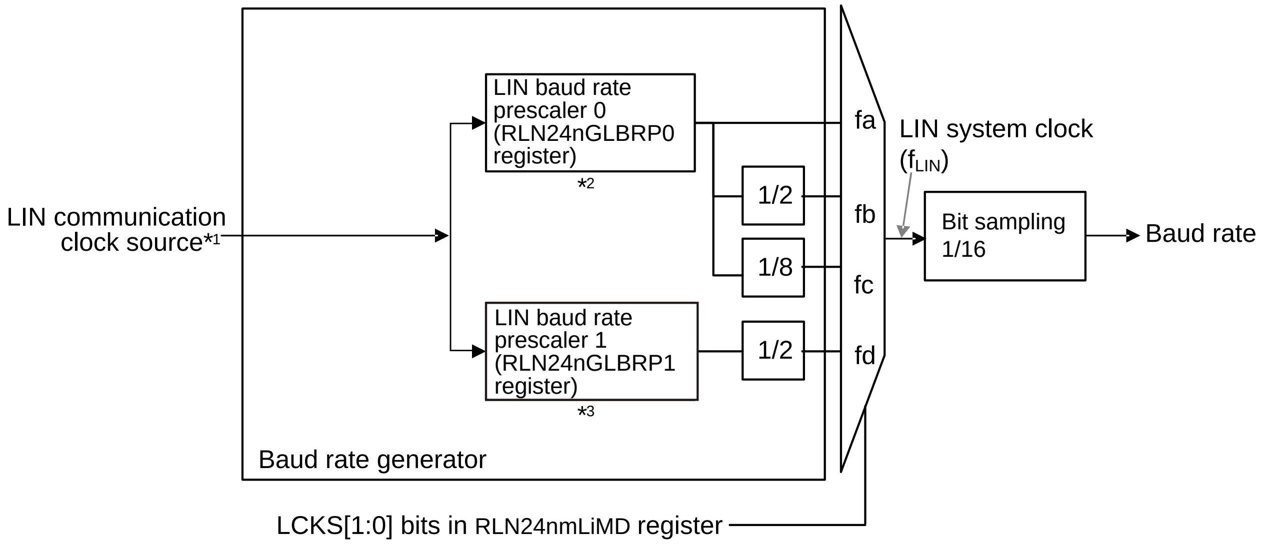
To exit LIN self-test mode, perform the procedure below:

- Switch all channels of the unit to LIN reset mode.
  Write 0 to the OM0 bit in the RLN24nmLiCUC register to make a transition to LIN reset mode. However, if the OMM1 and OMM0 bits in the RLN24nmLiMST register are not 11_B in any channels of the unit after the transition to LIN self-test mode, write 11_B to the OM1 and OM0 bits in the RLN24nmLiCUC register in any one channel. Check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are set to 11_B, and then make a transition to LIN reset mode.
- Verify that the LIN master interface has exited LIN self-test mode.
  Read the LSTM bit in the RLN24nGLSTC register and confirm that it is not 0 (not in LIN self-test mode)
- Verify the transition to LIN reset mode.
  Read the OMM0 bit in the RLN24nmLiMST register and confirm that it is 0 (LIN reset mode).

21.16 Baud Rate Generator

The LIN system clock (f_{LIN}) is obtained by dividing the LIN communication clock source frequency by the baud rate generator, and the baud rate is obtained by dividing that clock by 16. The inverse of this baud rate is called the bit time (Tbit).

Figure 21.16, Block Diagram of Baud Rate Generation shows a block diagram of baud rate generation.



Note 1. For the LIN communication clock source, see **Section 12AB.5.3, Clock Domain Settings**, **12C.5.3, Clock Domain Settings**.

Note 2. According to the RLN24nGLBRP0 register, the clock frequency is divided by N + 1 (N = 0 to 255).

Note 3. According to the RLN24nGLBRP1 register, the clock frequency is divided by M + 1 (M = 0 to 255).

Figure 21.16 Block Diagram of Baud Rate Generation

Set the LIN communication clock source in a range from 4 MHz to 40 MHz.

By setting the RLN24nGLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting system clock frequencies are fa = 19200 × 16, fb = 9600 × 16, and fc = 2400 × 16. These system clock frequencies are divided by 16 in the bit timing generator, enabling baud rates of 19200 bps, 9600 bps, and 2400 bps to be generated. Also, by setting the RLN24nGLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting system clock frequency is fd = 10417 × 16. This system clock frequency is divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

The formula for calculating baud rate is shown below.

Baud rate:

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP0 + 1) ÷ 16 [bps] (When fa is selected)

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP0 + 1) ÷ 2 ÷ 16 [bps] (When fb is selected)

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP0 + 1) ÷ 8 ÷ 16 [bps] (When fc is selected)

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP1 + 1) ÷ 2 ÷ 16 [bps] (When fd is selected)

Section 22 LIN/UART Interface (RLIN3)

This section contains a generic description of the LIN/UART interface (RLIN3).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RLIN3.

22.1 Features of RH850/F1KH, RH850/F1KM RLIN3

22.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN3 units.

Each RLIN3 unit has a single channel interface.

Table 22.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins

Table 22.7 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual RLIN3 units are identified by the index “n”: for example, RLN3nLCUC (n = 0 to 7) is the LIN control register.
b	Throughout this section, the individual transmit/received data buffers of RLIN3n are identified by the index “b”: for example, RLN3nLDBRb (b = 1 to 8) is the data buffer register.

Table 22.8 Indices (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual RLIN3 units are identified by the index “n”: for example, RLN3nLCUC (n = 0 to 7) is the LIN control register.
b	Throughout this section, the individual transmit/received data buffers of RLIN3n are identified by the index “b”: for example, RLN3nLDBRb (b = 1 to 8) is the data buffer register.

Table 22.9 Indices (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RLIN3 units are identified by the index “n”: for example, RLN3nLCUC (n = 0 to 3) is the LIN control register.
b	Throughout this section, the individual transmit/received data buffers of RLIN3n are identified by the index “b”: for example, RLN3nLDBRb (b = 1 to 8) is the data buffer register.

The following lists the index value corresponding to each product.

Table 22.10 Index Correspondence of Each Product (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index Correspondence to Product
All Products
b = 1 to 8

22.1.2 Register Base Addresses

RLIN3 base addresses are listed in the following table.

RLIN3 register addresses are given as offsets from the base addresses.

Table 22.11 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<RLIN30_base>	FFCE 2000$_H$
<RLIN31_base>	FFCE 2040$_H$
<RLIN32_base>	FFCE 2080$_H$
<RLIN33_base>	FFCE 20C0$_H$
<RLIN34_base>	FFCE 2100$_H$
<RLIN35_base>	FFCE 2140$_H$
<RLIN36_base>	FFCE 2180$_H$
<RLIN37_base>	FFCE 21C0$_H$

Table 22.12 Register Base Addresses (RH850/F1KM-S4)

Base Address Name	Base Address
<RLIN30_base>	FFCE 2000$_H$
<RLIN31_base>	FFCE 2040$_H$
<RLIN32_base>	FFCE 2080$_H$
<RLIN33_base>	FFCE 20C0$_H$
<RLIN34_base>	FFCE 2100$_H$
<RLIN35_base>	FFCE 2140$_H$
<RLIN36_base>	FFCE 2180$_H$
<RLIN37_base>	FFCE 21C0$_H$

Table 22.13 Register Base Addresses (RH850/F1KM-S1)

Base Address Name	Base Address
<RLIN30_base>	FFCE 2000$_H$
<RLIN31_base>	FFCE 2040$_H$
<RLIN32_base>	FFCE 2080$_H$
<RLIN33_base>	FFCE 20C0$_H$

22.1.3 Clock Supply

The RLIN3 clock supply is shown in the following table.

Table 22.14 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RLIN3n	LIN communication clock sources	CKSCLK_ILIN*1,*2	Communication clock
	Register access clock	CPUCLK_L, CKSCLK_ILIN	Bus clock

Note 1. The clock domain CKSCLK_ILIN divided clock can be supplied only to RLIN30 channel.

Note 2. Set the LIN communication clock source in the range of 4 MHz to 40 MHz.

22.1.4 Interrupt Requests

RLIN3 interrupt requests are listed in the following table.

Table 22.15 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RLIN30			
INTRLIN3n (n = 0)	RLIN30 interrupt	33	—
INTRLIN3nUR0 (n = 0)	RLIN30 transmit interrupt	34	10
INTRLIN3nUR1 (n = 0)	RLIN30 receive completion interrupt	35	11
INTRLIN3nUR2 (n = 0)	RLIN30 status interrupt	36	—
RLIN31			
INTRLIN3n (n = 1)	RLIN31 interrupt	120	—
INTRLIN3nUR0 (n = 1)	RLIN31 transmit interrupt	121	86
INTRLIN3nUR1 (n = 1)	RLIN31 receive completion interrupt	122	87
INTRLIN3nUR2 (n = 1)	RLIN31 status interrupt	123	—
RLIN32			
INTRLIN3n (n = 2)	RLIN32 interrupt	164	—
INTRLIN3nUR0 (n = 2)	RLIN32 transmit interrupt	165	44
INTRLIN3nUR1 (n = 2)	RLIN32 receive completion interrupt	166	45
INTRLIN3nUR2 (n = 2)	RLIN32 status interrupt	167	—
RLIN33			
INTRLIN3n (n = 3)	RLIN33 interrupt	228	—
INTRLIN3nUR0 (n = 3)	RLIN33 transmit interrupt	229	111
INTRLIN3nUR1 (n = 3)	RLIN33 receive completion interrupt	230	112
INTRLIN3nUR2 (n = 3)	RLIN33 status interrupt	231	—
RLIN34			
INTRLIN3n (n = 4)	RLIN34 interrupt	232	—
INTRLIN3nUR0 (n = 4)	RLIN34 transmit interrupt	233	50
INTRLIN3nUR1 (n = 4)	RLIN34 receive completion interrupt	234	51
INTRLIN3nUR2 (n = 4)	RLIN34 status interrupt	235	—
RLIN35			
INTRLIN3n (n = 5)	RLIN35 interrupt	236	—
INTRLIN3nUR0 (n = 5)	RLIN35 transmit interrupt	237	121
INTRLIN3nUR1 (n = 5)	RLIN35 receive completion interrupt	238	122
INTRLIN3nUR2 (n = 5)	RLIN35 status interrupt	239	—
RLIN36			
INTRLIN3n (n = 6)	RLIN36 interrupt	360	—
INTRLIN3nUR0 (n = 6)	RLIN36 transmit interrupt	361	119
INTRLIN3nUR1 (n = 6)	RLIN36 receive completion interrupt	362	120
INTRLIN3nUR2 (n = 6)	RLIN36 status interrupt	363	—
RLIN37			
INTRLIN3n (n = 7)	RLIN37 interrupt	364	—
INTRLIN3nUR0 (n = 7)	RLIN37 transmit interrupt	365	16
INTRLIN3nUR1 (n = 7)	RLIN37 receive completion interrupt	366	77
INTRLIN3nUR2 (n = 7)	RLIN37 status interrupt	367	—

Table 22.16 Interrupt Requests (RH850/F1KM-S4)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RLIN30			
INTRLIN3n (n = 0)	RLIN30 interrupt	33	—
INTRLIN3nUR0 (n = 0)	RLIN30 transmit interrupt	34	10
INTRLIN3nUR1 (n = 0)	RLIN30 receive completion interrupt	35	11
INTRLIN3nUR2 (n = 0)	RLIN30 status interrupt	36	—
RLIN31			
INTRLIN3n (n = 1)	RLIN31 interrupt	120	—
INTRLIN3nUR0 (n = 1)	RLIN31 transmit interrupt	121	86
INTRLIN3nUR1 (n = 1)	RLIN31 receive completion interrupt	122	87
INTRLIN3nUR2 (n = 1)	RLIN31 status interrupt	123	—
RLIN32			
INTRLIN3n (n = 2)	RLIN32 interrupt	164	—
INTRLIN3nUR0 (n = 2)	RLIN32 transmit interrupt	165	44
INTRLIN3nUR1 (n = 2)	RLIN32 receive completion interrupt	166	45
INTRLIN3nUR2 (n = 2)	RLIN32 status interrupt	167	—
RLIN33			
INTRLIN3n (n = 3)	RLIN33 interrupt	228	—
INTRLIN3nUR0 (n = 3)	RLIN33 transmit interrupt	229	111
INTRLIN3nUR1 (n = 3)	RLIN33 receive completion interrupt	230	112
INTRLIN3nUR2 (n = 3)	RLIN33 status interrupt	231	—
RLIN34			
INTRLIN3n (n = 4)	RLIN34 interrupt	232	—
INTRLIN3nUR0 (n = 4)	RLIN34 transmit interrupt	233	50

RLIN36			
INTRLIN3n (n = 6)	RLIN36 interrupt	360	—
INTRLIN3nUR0 (n = 6)	RLIN36 transmit interrupt	361	119
INTRLIN3nUR1 (n = 6)	RLIN36 receive completion interrupt	362	120
INTRLIN3nUR2 (n = 6)	RLIN36 status interrupt	363	—
RLIN37			
INTRLIN3n (n = 7)	RLIN37 interrupt	364	—
INTRLIN3nUR0 (n = 7)	RLIN37 transmit interrupt	365	16
INTRLIN3nUR1 (n = 7)	RLIN37 receive completion interrupt	366	77
INTRLIN3nUR2 (n = 7)	RLIN37 status interrupt	367	—

Table 22.17 Interrupt Requests (RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RLIN30			
INTRLIN3n (n = 0)	RLIN30 interrupt	33	—
INTRLIN3nUR0 (n = 0)	RLIN30 transmit interrupt	34	10
INTRLIN3nUR1 (n = 0)	RLIN30 receive completion interrupt	35	11
INTRLIN3nUR2 (n = 0)	RLIN30 status interrupt	36	—
RLIN31			
INTRLIN3n (n = 1)	RLIN31 interrupt	120	—
INTRLIN3nUR0 (n = 1)	RLIN31 transmit interrupt	121	86
INTRLIN3nUR1 (n = 1)	RLIN31 receive completion interrupt	122	87
INTRLIN3nUR2 (n = 1)	RLIN31 status interrupt	123	—
RLIN32			
INTRLIN3n (n = 2)	RLIN32 interrupt	164	—
INTRLIN3nUR0 (n = 2)	RLIN32 transmit interrupt	165	44
INTRLIN3nUR1 (n = 2)	RLIN32 receive completion interrupt	166	45
INTRLIN3nUR2 (n = 2)	RLIN32 status interrupt	167	—
RLIN33			
INTRLIN3n (n = 3)	RLIN33 interrupt	228	—
INTRLIN3nUR0 (n = 3)	RLIN33 transmit interrupt	229	111
INTRLIN3nUR1 (n = 3)	RLIN33 receive completion interrupt	230	112
INTRLIN3nUR2 (n = 3)	RLIN33 status interrupt	231	—

22.1.5 Reset Sources

RLIN3 reset sources are listed in the following table. RLIN3 is initialized by these reset sources.

Table 22.18 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
RLIN3n	All reset sources (ISORES)

22.1.6 External Input/output Signals

External input/output signals of RLIN3 are listed below.

Table 22.19 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN30		
RLIN3nRX (n = 0)	RLIN30 receive data input	RLIN30RX
RLIN3nTX (n = 0)	RLIN30 transmit data output	RLIN30TX
RLIN31		
RLIN3nRX (n = 1)	RLIN31 receive data input	RLIN31RX
RLIN3nTX (n = 1)	RLIN31 transmit data output	RLIN31TX
RLIN32		
RLIN3nRX (n = 2)	RLIN32 receive data input	RLIN32RX
RLIN3nTX (n = 2)	RLIN32 transmit data output	RLIN32TX
RLIN33		
RLIN3nRX (n = 3)	RLIN33 receive data input	RLIN33RX
RLIN3nTX (n = 3)	RLIN33 transmit data output	RLIN33TX
RLIN34		
RLIN3nRX (n = 4)	RLIN34 receive data input	RLIN34RX
RLIN3nTX (n = 4)	RLIN34 transmit data output	RLIN34TX
RLIN35		
RLIN3nRX (n = 5)	RLIN35 receive data input	RLIN35RX
RLIN3nTX (n = 5)	RLIN35 transmit data output	RLIN35TX
RLIN36		
RLIN3nRX (n = 6)	RLIN36 receive data input	RLIN36RX
RLIN3nTX (n = 6)	RLIN36 transmit data output	RLIN36TX
RLIN37		
RLIN3nRX (n = 7)	RLIN37 receive data input	RLIN37RX
RLIN3nTX (n = 7)	RLIN37 transmit data output	RLIN37TX

Table 22.20 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN30		
RLIN3nRX (n = 0)	RLIN30 receive data input	RLIN30RX
RLIN3nTX (n = 0)	RLIN30 transmit data output	RLIN30TX
RLIN31		
RLIN3nRX (n = 1)	RLIN31 receive data input	RLIN31RX
RLIN3nTX (n = 1)	RLIN31 transmit data output	RLIN31TX
RLIN32		
RLIN3nRX (n = 2)	RLIN32 receive data input	RLIN32RX
RLIN3nTX (n = 2)	RLIN32 transmit data output	RLIN32TX
RLIN33		
RLIN3nRX (n = 3)	RLIN33 receive data input	RLIN33RX
RLIN3nTX (n = 3)	RLIN33 transmit data output	RLIN33TX
RLIN34		
RLIN3nRX (n = 4)	RLIN34 receive data input	RLIN34RX
RLIN3nTX (n = 4)	RLIN34 transmit data output	RLIN34TX
RLIN35		
RLIN3nRX (n = 5)	RLIN35 receive data input	RLIN35RX
RLIN3nTX (n = 5)	RLIN35 transmit data output	RLIN35TX
RLIN36		
RLIN3nRX (n = 6)	RLIN36 receive data input	RLIN36RX
RLIN3nTX (n = 6)	RLIN36 transmit data output	RLIN36TX
RLIN37		
RLIN3nRX (n = 7)	RLIN37 receive data input	RLIN37RX
RLIN3nTX (n = 7)	RLIN37 transmit data output	RLIN37TX

Table 22.21 External Input/Output Signals (RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN30		
RLIN3nRX (n = 0)	RLIN30 receive data input	RLIN30RX
RLIN3nTX (n = 0)	RLIN30 transmit data output	RLIN30TX
RLIN31		
RLIN3nRX (n = 1)	RLIN31 receive data input	RLIN31RX
RLIN3nTX (n = 1)	RLIN31 transmit data output	RLIN31TX
RLIN32		
RLIN3nRX (n = 2)	RLIN32 receive data input	RLIN32RX
RLIN3nTX (n = 2)	RLIN32 transmit data output	RLIN32TX
RLIN33		
RLIN3nRX (n = 3)	RLIN33 receive data input	RLIN33RX
RLIN3nTX (n = 3)	RLIN33 transmit data output	RLIN33TX

22.2 Overview

22.2.1 Functional Overview

The LIN/UART interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602, and automatically performs frame communication and error determination.

The LIN/UART interface is provided with UART mode and can also be used as a UART.

The appropriate mode should be used for the LIN/UART interface according to the application: LIN master, LIN slave, or UART.

LIN master

- LIN reset mode
- LIN mode (LIN master mode)
    - LIN wake-up mode
    - LIN operation mode
- LIN self-test mode

LIN slave

- LIN reset mode
- LIN mode (LIN slave mode [auto baud rate] or LIN slave mode [fixed baud rate])
    - LIN wake-up mode
    - LIN operation mode
- LIN self-test mode

UART

- LIN reset mode
- UART mode

Table 22.22, LIN/UART Interface Specifications shows the LIN/UART interface specifications.

Table 22.22 LIN/UART Interface Specifications

Item		Specifications	
	Channel count	Up to 8 channels	
LIN communication function	Protocol	LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602	
	Variable frame structure	Master	• Break transmission width: 13 to 28 Tbits • Break delimiter transmission width: 1 to 4 Tbits • Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*1 • Transmission response space width: 0 to 7 Tbits*1 • Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) • Transmission wake-up width: 1 to 16 Tbits
		Slave	• Break reception width: 9.5 or 10.5 Tbits [for fixed baud rate] : 10 or 11 Tbits [for auto baud rate] • Transmission response space width: 0 to 7 Tbits • Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) • Transmission wake-up width: 1 to 16 Tbits
	Checksum	• Automatic operation for both transmission and reception • Classic or enhanced selectable (for each frame)	
	Response field data byte count	Variable from 0 to 8 bytes Multi-byte (9 or more bytes) response transmission and reception also possible	
	Frame communication modes	Master	• Mode in which header transmission and response transmission/reception are started with a single transmission start request • Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode)
		Slave	• Mode in which header is automatically received with fixed baud rate • Mode in which header is automatically received with the baud rate set according to the sync field measurement result of the sync field and break field detected
	Wake-up transmission and reception	LIN wake-up mode provided • Wake-up transmission (1 to 16 Tbits) • Wake-up reception Low-level width of input signals measured	
	Status	Master	• Successful frame/wake-up transmission • Successful header transmission • Successful frame/wake-up reception*2 • Successful data 1 reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)
		Slave	• Successful response/wake-up transmission • Successful response/wake-up reception*2 • Successful header reception • Successful data 1 reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)

Table 22.22 LIN/UART Interface Specifications

Item		Specifications	
LIN communication function	Error status	Master	● Bit error ● Checksum error ● Frame timeout error/response timeout error ● Physical bus error ● Framing error ● Response preparation error
		Slave	● Bit error ● Checksum error ● Frame timeout error/response timeout error ● Sync field error ● ID parity error ● Framing error ● Response preparation error
	Baud rate selection	Baud rates conforming to the LIN specifications generated using baud rate generator	
	Test mode	Self-test mode for user evaluation	
	Interrupt function	Master	● Successful header/frame/wake-up transmission ● Successful frame/wake-up reception*2 ● Error detection
		Slave	● Successful response/wake-up transmission ● Successful Header/response/wake-up reception*2 ● Error detection
UART communication function	Data buffer	● Transmission data buffer/transmission data buffer for wait (exclusively for transmission; data length of 1. Character length of 7, 8, and 9 bits supported) ● UART buffer (exclusively for transmission; variable data length from 1 to 9. Character length of 7 and 8 bits supported) ● Reception data buffer (exclusively for reception; data length of 1. Character length of 7, 8, and 9 bits supported)	
	Data format	Character length: 7 or 8 bits Length of 9 bits supported by using the expansion bit.	
		Transmission stop bit: 1 or 2 bits	
		Parity function: odd, even, 0, or none	
		LSB- or MSB-first transfer selectable	
		Reverse input/output of transmission/reception data possible	
	Status	● Transmission status ● Reception status ● Successful UART buffer transmission ● Error detection ● Expansion bit detection ● ID match ● Reset mode status	
	Error status	● Bit error ● Framing error ● Parity error ● Overrun error	
	Baud rate selection	With the built-in baud rate generator, any baud rate can be set.	
	When a certain expansion bit is at the expected level, the data received can be compared to the 8-bit data preset in the register.		

Table 22.22 LIN/UART Interface Specifications

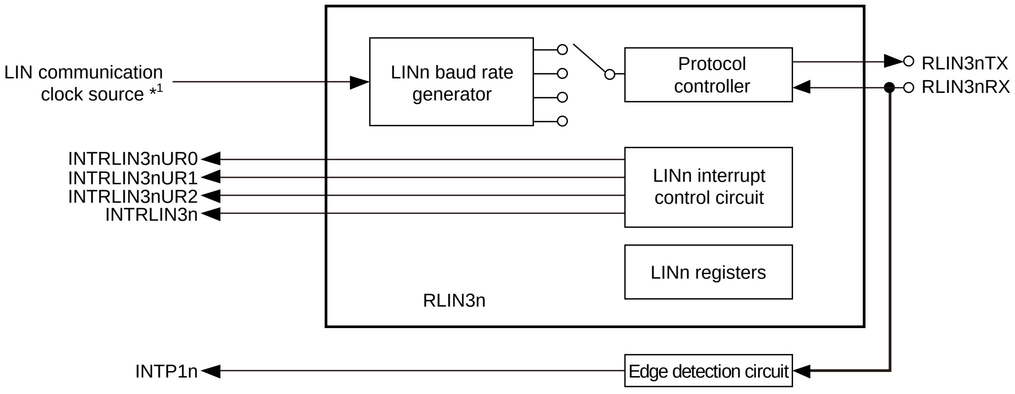
Item	Specifications	
UART communication function	Reception of the stop bit is guaranteed. (Start of transmission can be delayed when start of transmission is attempted during reception of the stop bit).	
	Interrupt function	• Transmission start/complete • Reception complete • Status/error detection

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the input signal low-level width count is indicated.

22.2.2 Block Diagram

Figure 22.1, LIN/UART Interface Block Diagram shows a block diagram of the LIN/UART interface.



Note 1. For the LIN communication clock source, see **Section 12AB.5.3, Clock Domain Settings**, **12C.5.3, Clock Domain Settings**.

Figure 22.1 LIN/UART Interface Block Diagram

22.2.3 Terms Used in Block Diagram

• RLIN3nTX, RLIN3nRX:	LIN/UART interface I/O pins
• LINn baud rate generator:	Generates the LIN/UART interface communication clock
• LINn registers:	LIN/UART interface registers
• LINn interrupt control circuit:	Controls interrupt requests generated by the LIN/UART interface

22.3 Registers

22.3.1 List of Registers

RLIN3 registers are listed in the following table.

For details about <RLIN3n_base>, see **Section 22.1.2, Register Base Addresses**.

Table 22.23 List of Registers

Module Name	Register Name	Symbol	Address	LIN Master	LIN Slave	UART
RLN3n	LIN wake-up baud rate select register	RLN3nLWBR	<RLIN3n_base> + 01_H	✓	✓	✓
	LIN / UART baud rate prescaler 01 register	RLN3nLBRP01	<RLIN3n_base> + 02_H	—	✓	✓
	LIN / UART baud rate prescaler 0 register	RLN3nLBRP0	<RLIN3n_base> + 02_H	✓	✓	✓
	LIN / UART baud rate prescaler 1 register	RLN3nLBRP1	<RLIN3n_base> + 03_H	✓	✓	✓
	LIN self-test control register	RLN3nLSTC	<RLIN3n_base> + 04_H	✓	✓	—
	LIN / UART mode register	RLN3nLMD	<RLIN3n_base> + 08_H	✓	✓	✓
	LIN break field configuration register/ UART configuration register	RLN3nLBFC	<RLIN3n_base> + 09_H	✓	✓	✓
	LIN / UART space configuration register	RLN3nLSC	<RLIN3n_base> + $0A_H$	✓	✓	✓
	LIN wake-up configuration register	RLN3nLWUP	<RLIN3n_base> + $0B_H$	✓	✓	—
	LIN interrupt enable register	RLN3nLIE	<RLIN3n_base> + $0C_H$	✓	✓	—
	LIN / UART error detection enable register	RLN3nLEDE	<RLIN3n_base> + $0D_H$	✓	✓	✓
	LIN / UART control register	RLN3nLCUC	<RLIN3n_base> + $0E_H$	✓	✓	✓
	LIN / UART transmission control register	RLN3nLTRC	<RLIN3n_base> + 10_H	✓	✓	✓
	LIN / UART mode status register	RLN3nLMST	<RLIN3n_base> + 11_H	✓	✓	✓
	LIN / UART status register	RLN3nLST	<RLIN3n_base> + 12_H	✓	✓	✓
	LIN / UART error status register	RLN3nLEST	<RLIN3n_base> + 13_H	✓	✓	✓
	LIN / UART data field configuration register	RLN3nLDFC	<RLIN3n_base> + 14_H	✓	✓	✓
	LIN / UART ID buffer register	RLN3nLIDB	<RLIN3n_base> + 15_H	✓	✓	✓
	LIN checksum buffer register	RLN3nLCBR	<RLIN3n_base> + 16_H	✓	✓	—
	UART data buffer 0 register	RLN3nLUDB0	<RLIN3n_base> + 17_H	—	—	✓
	LIN / UART data buffer 1 register	RLN3nLDBR1	<RLIN3n_base> + 18_H	✓	✓	✓
	LIN / UART data buffer 2 register	RLN3nLDBR2	<RLIN3n_base> + 19_H	✓	✓	✓
	LIN / UART data buffer 3 register	RLN3nLDBR3	<RLIN3n_base> + $1A_H$	✓	✓	✓
	LIN / UART data buffer 4 register	RLN3nLDBR4	<RLIN3n_base> + $1B_H$	✓	✓	✓
	LIN / UART data buffer 5 register	RLN3nLDBR5	<RLIN3n_base> + $1C_H$	✓	✓	✓
	LIN / UART data buffer 6 register	RLN3nLDBR6	<RLIN3n_base> + $1D_H$	✓	✓	✓
	LIN / UART data buffer 7 register	RLN3nLDBR7	<RLIN3n_base> + $1E_H$	✓	✓	✓
	LIN / UART data buffer 8 register	RLN3nLDBR8	<RLIN3n_base> + $1F_H$	✓	✓	✓
	UART operation enable register	RLN3nLUOER	<RLIN3n_base> + 20_H	—	—	✓
	UART option register 1	RLN3nLUOR1	<RLIN3n_base> + 21_H	—	—	✓
	UART transmission data register	RLN3nLUTDR	<RLIN3n_base> + 24_H	—	—	✓
	UART transmission data register L	RLN3nLUTDRL	<RLIN3n_base> + 24_H	—	—	✓
	UART transmission data register H	RLN3nLUTDRH	<RLIN3n_base> + 25_H	—	—	✓

Table 22.23 List of Registers

Module Name	Register Name	Symbol	Address	LIN Master	LIN Slave	UART
RLN3n	UART reception data register	RLN3nLURDR	<RLIN3n_base> + 26_H	—	—	✓
	UART reception data register L	RLN3nLURDRL	<RLIN3n_base> + 26_H	—	—	✓
	UART reception data register H	RLN3nLURDRH	<RLIN3n_base> + 27_H	—	—	✓
	UART wait transmission data register	RLN3nLUWTDR	<RLIN3n_base> + 28_H	—	—	✓
	UART wait transmission data register L	RLN3nLUWTDRL	<RLIN3n_base> + 28_H	—	—	✓
	UART wait transmission data register H	RLN3nLUWTDRH	<RLIN3n_base> + 29_H	—	—	✓

Remark: ✓: Used, —: Not used

Note: When writing to an unused register, write the value after reset.

22.3.2 LIN Master Related Registers

22.3.2.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			LWBR0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.24 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 samplings 1 1 1 1: 16 samplings Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified in the LCKS bit of the RLN3nLMD register is used. (LIN1.3) 1: In LIN wake-up mode, the clock fa is used regardless of the setting in the LCKS bit of the RLN3nLMD register. (LIN2.x)

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In LIN master mode (LIN/UART mode select bits in LIN mode register = 00_B), set these bits to 0000_B or 1111_B (16 sampling).

LPRS[2:0] Bits (Prescaler Clock Select)

These bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

LWBR0 Bit (Wake-up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.
When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects fa as the LIN system clock (f_{LIN}) during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.

Setting the baud rate to 19200 bps while fa is selected allows an input signal with a low-level width of 130 us or longer to be detected in the LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

22.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 02_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.25 RLN3nLBRP0 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1. Setting range: 00_H to FF_H

Configure the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by N + 1.

22.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 03_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.26 RLN3nLBRP1 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1. Setting range: 00_H to FF_H

Configure the RLN3nLBRP1 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M + 1.

22.3.2.4 RLN3nLSTC — LIN Self-Test Control Register

Access:	This register can be read or written in 8-bit units.
Address:	<RLIN3n_base> + 04_H
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.27 RLN3nLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	—	Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Configure the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed and the mode is changed to LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return “000000_B”, and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For exiting LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

22.3.2.5 RLN3nLMD — LIN Mode Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base>+ 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	LCKS[1:0]		LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.28 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: RLIN3n interrupt is used. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are used.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 0: LIN master mode

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, the RLIN3 interrupt is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are generated from the LIN/UART interface.
For each interrupt source, see **Section 22.4, Interrupt Sources**.

LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.
With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).
With 01_B set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).
With 10_B set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).
With 11_B set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

When 1_B is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x), and the RLN3nLMST register is 01_H (LIN wake-up mode), the protocol controller is supplied with fa regardless of the setting of this bit (the LCKS bit is not changed).

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an LIN master, set these bits to 00_B.

22.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.29 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	BDT[1:0]	Transmission Break Delimiter (High Level) Width Select b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmission Break (Low Level) Width Select b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Some combinations of the specified values result in a frame length exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header.
1 Tbit to 4 Tbits can be set.

BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header.
13 Tbits to 28 Tbits can be set.

22.3.2.7 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 22.30 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Specify the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.
0 Tbit to 3 Tbits can be set.
These bits are enabled only during response transmission; these are disabled during response reception.

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.
0 Tbit to 7 Tbits can be set.
The response space setting is enabled only during response transmission; setting is disabled during response reception.
The inter-byte space (header) is equal to the response space.

22.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 22.31 RLN3nLWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low Level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.
1 Tbit to 16 Tbits can be set.

With 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x), fa is selected as the LIN system clock (f_{LIN}) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

22.3.2.9 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 22.32 RLN3nLIE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SHIE	Successful Header Transmission Interrupt Request Enable 0: Disables successful header transmission interrupt request. 1: Enables successful header transmission interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Request Enable 0: Disables successful frame/wake-up reception interrupt request. 1: Enables successful frame/wake-up reception interrupt request.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Request Enable 0: Disables successful frame/wake-up transmission interrupt request. 1: Enables successful frame/wake-up transmission interrupt request.

Configure the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

SHIE Bit (Successful Header Transmission Interrupt Request Enable)

The SHIE bit enables or disables interrupt request upon successful transmission of a header.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n transmission is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.
Occurrence factors are bit errors, physical bus errors, frame/response timeout errors, framing errors, checksum errors, and response preparation errors. Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE Bit (Successful Frame/Wake-up Reception Interrupt Request Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a frame or a wake-up signal (input signal low-level width count).
With 0 set, the interrupt request for RLIN3n successful reception is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for successful RLIN3n reception is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE Bit (Successful Frame/Wake-up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a frame or a wake-up signal.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

22.3.2.10 RLN3nLEDE —LIN Error Detection Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	—	—	—	FERE	FTERE	PBERE	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 22.33 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable*[1] 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable*[1] 0: Disables bit error detection. 1: Enables bit error detection.

Note 1. Set FERE bit and BERE bit to 1.

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function applies to frame timeout.
With 1 set, the timeout function applies to response timeout.
For details on the timeout error, see **Section 22.7.7, Error Statuses**.

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
Set this bit to 1. The detection result of the framing error is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 22.7.7, Error Statuses**.

FTERE Bit (Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.
When this bit is set to 1, the detection result is reflected in the FTER flag of the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected.
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see **Section 22.7.7, Error Statuses**.

PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.
With 0 set, the physical bus error is not detected.
With 1 set, the physical bus error is detected.
When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN3nLEST register.
For details on the physical bus error, see **Section 22.7.7, Error Statuses**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
Set this bit to 1. The detection result is indicated in the BER flag in the RLN3nLEST register.
For details on the bit error, see **Section 22.7.7, Error Statuses**.

22.3.2.11 RLN3nLCUC — LIN Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 22.34 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode 1: LIN operation mode
0	OM0	LIN Reset 0: LIN reset mode 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to transition to LIN wake-up mode or to 03_H to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN3nLCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
With 0 set, LIN wake-up mode.
With 1 set, LIN operation mode.
This bit is enabled only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
With 0 set, LIN reset mode.
With 1 set, LIN reset mode is canceled.

22.3.2.12 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 22.35 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped in frame separate mode. 1: Response transmission/reception is started in frame separate mode.
0	FTS	Frame Transmission/Wake-up Transmission/Reception Start 0: Frame Transmission/wake-up transmission/reception is stopped. 1: Frame Transmission/wake-up transmission/reception is started.

RTS Bit (Response Transmission/Reception Start)

In frame separate mode, set the RTS bit to 1 after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.
Writing a value to this bit is disabled when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).
Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 at the end of data group communication or transition to LIN reset mode.

FTS Bit (Frame Transmission/Wake-up Transmission/Reception Start)

Set the FTS bit to 1 to start frame transmission and reception.
Also set this bit to 1 to allow wake-up transmission and reception (input signal low-level width count).
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication (including error detection) and transition to LIN reset mode.

22.3.2.13 RLN3nLMST — LIN Mode Status Register

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.36 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

22.3.2.14 RLN3nLST — LIN Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 22.37 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value it had before 1 is written.
The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt request for RLN3n transmission is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value it had before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register while in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC Flag (Successful Frame/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for RLN3n successful reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC Flag (Successful Frame/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for RLN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

22.3.2.15 RLN3nLEST — LIN Error Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RPER	—	CSER	—	FER	FTER	PBER	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 22.38 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value it had before 1 is written.
The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value it had before 1 is written.
The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the value of the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

FTER Flag (Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), the FTER flag is set to 1 upon frame timeout error or response timeout error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled), the PBER flag is set to 1 upon physical bus error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

22.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	FSM	CSM	RFT	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.39 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received.

With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

FSM Bit (Frame Separate Mode Select)

The FSM bit selects the response communication mode.
With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without setting the RTS bit in the RLN3nLTRC register.
With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception which is 8 bytes or less (the RFT bit is 0), set the FSM bit to 0.
When transitioning to LIN self-test mode, set this bit to 0 before transition.
For details on frame separate mode, see **Section 22.7.4.1, Transmission of LIN Frames**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

CSM Bit (Checksum Select)

The CSM bit selects the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error detection is enabled (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details, see **Section 22.7.7, Error Statuses**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.
During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

RFT Bit (Response Field Communication Direction Select)

The RFT bit sets the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the RTS bit in the RLN3nLTRC register is 0).
To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).
Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

22.3.2.17 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.40 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bits (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bits (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

In LIN self-test mode, this register operates as described below.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 is for P0 and IDP1 is for P1.

Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

22.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register is a read-only register that can be read in 8-bit units. In LIN self-test mode, this register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.41 RLN3nLCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Stores the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

22.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

Access: This register can be read or written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.42 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or reads the received data. Setting range: 00_H to FF_H

- For response transmission:
  These registers set the data to be transmitted in the response field.
  Use these registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 0 (not frame separate mode)
  - FTS in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped)

  or
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is stopped)
- For response reception:
  These registers store the data received in the response field.
  The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.
  Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started).
- For transmission of response data of 9 bytes or more:
  Use these registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is stopped)
- For reception of response data of 9 bytes or more:
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as described below.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

22.3.3 LIN Slave Related Registers

22.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 22.43 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 samplings 0 0 1 1: 4 samplings 0 1 1 1: 8 samplings 1 1 1 1: 16 samplings Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
When the frame communication is performed in LIN slave mode (fixed baud rate) (LMD[1:0] bits in the RLN3nLMD register = 11_B), set these bits to “0000_B” or “1111_B” (16 samplings).
When the frame communication is performed in LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10_B), set these bits to “0011_B” (4 samplings) or “0111_B” (8 samplings).

LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler. The LIN communication clock source is divided by this prescaler.

In LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10_B), set these bits so that the prescaler clock becomes as follows according to the target baud rate.

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4 MHz*[1]
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

Note 1. Use the clock with NSPB bits set to “0011_B” (4 samplings).

22.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register

Access: RLN3nLBRP01 can be read or written in 16-bit units.
RLN3nLBRP0 can be read or written in 8-bit units.
RLN3nLBRP1 can be read or written in 8-bit units.

Address: RLN3nLBRP01: <RLIN3n_base> + 02_H
RLN3nLBRP0: <RLIN3n_base> + 02_H
RLN3nLBRP1: <RLIN3n_base> + 03_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 22.44 RLN3nLBRP01 Register Contents

Bit Position	Bit Name	Function
15 to 0	BRP[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting range: 0000_H to $FFFF_H$

Configure the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units using registers RLN3nLBRP0 and RLN3nLBRP1.

NOTE

In LIN slave mode [auto baud rate], the system automatically sets the result of baud rate correction to the RLN3nLBRP01 register on successful reception of the sync field.

22.3.3.3 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 04$_{H}$

Value after reset: 00$_{H}$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.45 RLN3nLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	—	Writing A7$_{H}$, 58$_{H}$, and 01$_{H}$ successively to the RLN3nLSTC register places the module into LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Configure the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0$_{B}$ (LIN reset mode).

Writing A7$_{H}$, 58$_{H}$, and 01$_{H}$ successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed and the module is placed in LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return "000000$_{B}$", and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For exiting LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of A7$_{H}$, 58$_{H}$, and 01$_{H}$.

22.3.3.4 RLN3nLMD — LIN Mode Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 22.46 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: RLIN3 interrupt is used. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are used.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 1 0: LIN Slave mode (auto baud rate) 1 1: LIN Slave mode (fixed baud rate)

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, the RLIN3 interrupt is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are generated from the LIN/UART interface.
For each interrupt source, see **Section 22.4, Interrupt Sources**.

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use this module as an LIN slave, set these bits to “10_B” (auto baud rate) or “11_B” (fixed baud rate).

22.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LBLT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 22.47 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LBLT	Reception Break (Low-Level) Detection Width Setting 0: A break (low-level) is detected in 9.5 or 10 Tbits 1: A break (low-level) is detected in 10.5 or 11 Tbits

Configure the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LBLT Bit (Reception Break (Low-Level) Detection Width Setting)

- When RLN3nLMD.LMD is “10_B” (LIN slave mode (auto baud rate))

  0: Low-level width of 10 Tbits or longer is detected.

  1: Low-level width of 11 Tbits or longer is detected.

- When RLN3nLMD.LMD is “11_B” (LIN slave mode (fixed baud rate))

  0: Low-level width of 9.5 Tbits or longer is detected.

  1: Low-level width of 10.5 Tbits or longer is detected.

22.3.3.6 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 22.48 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	IBHS[2:0]	Response Space Setting b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

This register is enabled only during response transmission, and disabled during response reception.

Some combinations of the specified values result in a frame or response length exceeding the timeout time. Specify the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the inter-byte space width of the response transmission.
0 Tbit to 3 Tbits can be set.

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the transmission width of the response space.
0 Tbit to 7 Tbits can be set.

22.3.3.7 RLN3nLWUP — LIN Wake-Up Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 22.49 RLN3nLWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low-level width of the wake-up frame transmission.
1 Tbit to 16 Tbits can be set.

22.3.3.8 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 22.50 RLN3nLIE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SHIE	Successful Header Reception Interrupt Request Enable 0: Disables successful header reception interrupt request. 1: Enables successful header reception interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Response/Wake-up Reception Interrupt Request Enable 0: Disables successful Response/wake-up reception interrupt request. 1: Enables successful Response/wake-up reception interrupt request.
0	FTCIE	Successful Response/Wake-up Transmission Interrupt Request Enable 0: Disables successful Response/wake-up transmission interrupt request. 1: Enables successful Response/wake-up transmission interrupt request.

Configure the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

SHIE Bit (Successful Header Reception Interrupt Request Enable)

The SHIE bit enables or disables an interrupt request upon successful reception of a header.
With 0 set, the interrupt request for RLIN3n successful reception is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n successful reception is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.
Error types that are interrupt sources are the bit error, frame/response timeout error, framing error, sync filed error, ID parity error, checksum error, and response preparation error.
Detection of the bit error, frame/response timeout error, sync filed error, ID parity error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE Bit (Successful Response/Wake-up Reception Interrupt Request Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a response or a wake-up frame (input signal low-level width count).
With 0 set, the interrupt request for RLIN3n successful reception is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n successful reception is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE Bit (Successful Response/Wake-up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a response or a wake-up frame.
With 0 set, the interrupt request for RLIN3n successful transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n successful transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

22.3.3.9 RLN3nLEDE — LIN Error Detection Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 0D$_{\text{H}}$

Value after reset: 00$_{\text{H}}$

Bit	7	6	5	4	3	2	1	0
	LTES	IPERE	—	SFERE	FERE	TERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W

Table 22.51 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6	IPERE	ID Parity Error Detection Enable 0: Disables ID Parity error detection. 1: Enables ID Parity error detection.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	SFERE	Sync Field Error Detection Enable 0: Disables Sync Field error detection. 1: Enables Sync Field error detection.
3	FERE	Framing Error Detection Enable*1 0: Disables framing error detection. 1: Enables framing error detection.
2	TERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BERE	Bit Error Detection Enable*1 0: Disables bit error detection. 1: Enables bit error detection.

Note 1. Set FERE bit and BERE bit to 1

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0$_{\text{B}}$ (LIN reset mode).

LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function applies to frame timeout.
With 1 set, the timeout function applies to response timeout.
For details on the timeout error, see **Section 22.7.7, Error Statuses**.

IPERE Bit (ID Parity Error Detection Enable)

This bit enables or disables detection of the ID parity error.
With 0 set, the ID parity error is not detected.
With 1 set, the ID parity error is detected.
When this bit is set to 1, the detection result is reflected in the IPER flag of the RLN3nLEST register.
For details on the ID parity error, see **Section 22.7.7, Error Statuses**.

SFERE Bit (Sync Field Error Detection Enable)

This bit enables or disables detection of the sync field error.
With 0 set, the sync field error is not detected.
With 1 set, the sync field error is detected.
Regardless of the setting of this bit, when a sync field error is detected, this module waits for the next header.
When this bit is set to 1, the detection result is reflected in the SFER flag of the RLN3nLEST register.
For details on the sync filed error, see **Section 22.7.7, Error Statuses**.

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
Set this bit to 1. The detection result of the framing error is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 22.7.7, Error Statuses**.

TERE Bit (Timeout Error Detection Enable)

The TERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.
When this bit is set to 1, the detection result is reflected in the TER flag of the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected.
The timeout error should not be used in LIN slave mode [auto baud rate] (when the LMD[1:0] bits in the RLN3nLMD register are “10_B”).
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see **Section 22.7.7, Error Statuses**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
Set this bit to 1. The detection result is indicated in the BER flag in the RLN3nLEST register.
For details on the bit error, see **Section 22.7.7, Error Statuses**.

22.3.3.10 RLN3nLCUC — LIN Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 22.52 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode 1: LIN operation mode
0	OM0	LIN Reset 0: LIN reset mode 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to transition to LIN wake-up mode or to 03_H to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN3nLCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific LIN operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
With 0 set, LIN/UART interface enters LIN wake-up mode.
With 1 set, LIN/UART interface enters LIN operation mode.
This bit is enabled only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
With 0 set, LIN/UART interface enters LIN reset mode.
With 1 set, LIN reset mode of LIN/UART interface is canceled.

22.3.3.11 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	LNRR	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 22.53 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LNRR	No LIN Response Request 0: Response for the reception ID 1: No response for the reception ID
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped. 1: Response transmission/reception is started.
0	FTS	LIN Communication Start 0: Header reception/wake-up transmission/reception is stopped. 1: Header reception/wake-up transmission/reception is started.

LNRR Bit (No LIN Response Request)

Set this bit to 1 if no response is to be transmitted/received after receiving the header and checking the received ID. Once set, this bit is automatically cleared to 0 upon detection of new sync field or transition to LIN reset mode. Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write 04_H using the store instruction.
Do not set this bit and the RTS bit to 1 simultaneously.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, use this bit only after the completion of the header. (Do not use this bit for the second or later data group.)

RTS Bit (Response Transmission/Reception Start)

Set this bit to 1 to start response transmission or reception after receiving the header and checking the received ID.
Once set, this bit is automatically cleared to 0 upon completion of response transmission or reception (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.
Do not set this bit and the LNRR bit to 1 simultaneously
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group transmission/reception or transition to LIN reset mode.

FTS Bit (LIN Communication Start)

Set this bit to 1 to start header reception or wake-up transmission/reception.
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

22.3.3.12 RLN3nLMST — LIN Mode Status Register

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RLIN3n_base> +11$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.54 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

22.3.3.13 RLN3nLST — LIN Status Register

Access:	This register can be read or written in 8-bit units.
Address:	<RLIN3n_base> + 12_H
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 22.55 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Reception Flag 0: Header reception has not been completed. 1: Header reception has been completed.
6	D1RC	Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	FRC	Successful Response/Wake-up Reception Flag 0: Response or wake-up reception has not been completed. 1: Response or wake-up reception has been completed.
0	FTC	Successful Response/Wake-up Transmission Flag 0: Response or wake-up transmission has not been completed. 1: Response or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, writing a value to this register is disabled. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC Flag (Successful Header Reception Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value before 1 is written.
The HTRC flag is set to 1 upon completion of header reception. Here, an interrupt request for RLIN3n successful reception is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if header reception is completed while this bit is 1, an interrupt is not generated. To clear this bit to 0, write 0 to the bit.
To detect a new header in the response field upon completion of header reception, clear this bit after it is set to 1.

D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value it had before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLIN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if an error is detected while this bit is 1, an interrupt is not generated. To clear the bit to 0, write 0 to the RPER, IPER, CSER, SFER, FER, TER, and BER flags in the RLN3nLEST register. This clears the ERR flag to 0.

FRC Flag (Successful Response/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FRC flag is set to 1 upon completion of response or wake-up reception. Here, an interrupt request for RLIN3n successful reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if response reception or wake-up reception is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC Flag (Successful Response/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FTC flag is set to 1 upon completion of response or wake-up transmission. Here, an interrupt request for RLIN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if response transmission or wake-up transmission is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

22.3.3.14 RLN3nLEST — LIN Error Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RPER	IPER	CSER	SFER	FER	TER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 22.56 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	IPER	ID Parity Error Flag 0: ID parity error has not been detected. 1: ID parity error has been detected.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	SFER	Sync Field Error Flag 0: Sync field error has not been detected. 1: Sync field error has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	TER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value it had before 1 is written.
The RPER flag is set to 1 upon response preparation error detection. Write 0 to clear this bit.

IPER Flag (ID Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
When the IPERE bit of the RLN3nLEDE register is 1 (ID parity error detection enabled), this bit is set to 1 upon ID parity error detection. Write 0 to clear this bit.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value it had before 1 is written.
The CSER flag is set to 1 upon checksum error detection. Write 0 to clear this bit.

SFER Flag (Sync Field Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
When the SFERE bit of the RLN3nLEDE register is 1 (sync field error detection enabled), this bit is set to 1 upon sync field error detection. Write 0 to clear this bit.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. Write 0 to clear this bit.

TER Flag (Timeout Error Flag)

Only 0 can be written to the TER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the TERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), this flag is set to 1 upon frame timeout error or response timeout error detection. Write 0 to clear this bit.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. Write 0 to clear this bit.

22.3.3.15 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	—	LCS	RCDS	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.57 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Data transmission/reception continues without waiting for reception of the next header.)
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LCS	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RCDS	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

When multi-byte response transmission/reception function is not used, set it to “0”.

Set this bit when the RTS bit is 0 (response transmission/reception stopped).

LCS Bit (Checksum Select)

The LCS bit selects the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error detection is enabled (the TERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details on the bit error, see **Section 22.7.7, Error Statuses**.
When the length of the response field data is 0 bytes (the RFDL bit is 0), do not set this bit to “1” (enhanced).
When response data of 9 bytes or more is to be transmitted or received, do not change the LCS bit setting after the first data group through the last data group.
During transmission or reception of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.
Set this bit when the RTS bit is 0 (response transmission/reception stopped).

RCDS Bit (Response Field Communication Direction Select)

This bit selects the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped) in LIN operation mode or when the FTS bit is 0 (header reception or wake-up transmission/reception stopped) in LIN wake-up mode).
When response data of 9 bytes or more is to be transmitted or received, do not change this bit setting after the first data group through the last data group.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
Set these bits when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped).
When response data of 9 bytes or more is to be transmitted or received, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit in the RLN3nLDFC register is 1) include the checksum.

22.3.3.16 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.58 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7, 6	IDP[1:0]	Parity Setting Stores the parity bits (P0 and P1) received in the ID field.
5 to 0	ID[5:0]	ID Setting Stores the 6-bit ID value received in the ID field.

The value in the RLN3nLIDB register is enabled after the completion of header reception. In LIN mode (LIN operation mode, LIN wake-up mode), writing to this register is disabled.

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits store the parity bits (P0 and P1) received in the ID field of the LIN frame. IDP0 is for P0 and IDP1 is for P1.

When the IPERE bit in the RLN3nLEDE register is 1 (ID parity detection enabled), the received value and the value calculated internally are compared. If they do not match, IPER (ID parity error flag) is set.

ID[5:0] Bits (ID Setting)

The ID bits store the 6-bit ID value received in the ID field of the LIN frame.

22.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register is a read-only register that can be read in 8-bit units.
However, in LIN self-test mode, this register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.59 RLN3nLCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Stores the checksum value transmitted or received.

In LIN operation mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN self-test mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

22.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

Access: This register can be read or written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.60 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or holds the received data. Setting range: 00_H to FF_H

- For response transmission:
  The RLN3nLDBRb registers set the data to be transmitted in the response field.
  These registers should be set when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stop).
- For response reception:
  The RLN3nLDBRb registers store the data received in the response field.
  The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

22.3.4 UART Related Registers

22.3.4.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 22.61 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 samplings 0 1 0 1: 6 samplings 0 1 1 0: 7 samplings 0 1 1 1: 8 samplings 1 0 0 0: 9 samplings 1 0 0 1: 10 samplings 1 0 1 0: 11 samplings 1 0 1 1: 12 samplings 1 1 0 0: 13 samplings 1 1 0 1: 14 samplings 1 1 1 0: 15 samplings 1 1 1 1: 16 samplings Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In UART mode, it is possible to set the NSPB bits from 6 samplings to 16 samplings.

LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

22.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register

Access: RLN3nLBRP01 register can be read or written in 16-bit units.

RLN3nLBRP0 register can be read or written in 8-bit units.

RLN3nLBRP1 register can be read or written in 8-bit units.

Address: RLN3nLBRP01: <RLIN3n_base> + 02_H

RLN3nLBRP0: <RLIN3n_base> + 02_H

RLN3nLBRP1: <RLIN3n_base> + 03_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.62 RLN3nLBRP01 Register Contents

Bit Position	Bit Name	Function
15 to 0	BRP[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting range: 0000_H to $FFFF_H$

Configure the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units using the registers RLN3nLBRP0 and RLN3nLBRP1.

22.3.4.3 RLN3nLMD — UART Mode Register

Access:	This register can be read or written in 8-bit units.
Address:	<RLIN3n_base> + 08_H
Value after reset:	00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	—	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R	R/W	R/W

Table 22.63 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LRDNFS	UART Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 1: UART mode

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LRDNFS Bit (UART Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an UART, set these bits to 01_B.

22.3.4.4 RLN3nLBFC — UART Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	UTPS	URPS	UPS[1:0]		USBLS	UBOS	UBLS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.64 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	UTPS	UART Output Polarity Switch 0: Transmission data normal output 1: Transmission data with inverted output
5	URPS	UART Input Polarity Switch 0: Reception data normal output 1: Reception data with inverted output
4, 3	UPS[1:0]	UART Parity Select 00: Parity disabled 01: Even parity 10: 0 Parity 11: Odd parity
2	USBLS	UART Stop Bit length Select 0: Stop bit:1 bit 1: Stop bit: 2 bits
1	UBOS	UART Transfer Format Order Select 0: LSB First 1: MSB First
0	UBLS	UART Character Length Select 0: UART 8 bits communication 1: UART 7 bits communication

Configure the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

UTPS Bit (UART Output Polarity Switch)

Sets the output polarity for UART communication.
With 0 set, transmit data is output without inversion.
With 1 set, inverted transmit data is output.
The setting of this bit is valid in all the bits of the UART frame.
In half-duplex communication, this setting should match the setting of URPS bit.

URPS Bit (UART Input Polarity Switch)

This bit specifies the input polarity for UART communication.
With 0 set, received data is input without inversion.
With 1 set, received data is input with inversion.
The setting of this bit is valid in all the bits of the UART frame.
In half-duplex communication, this setting should match the setting of UTPS bit.

When setting this bit to “1” and expansion bit reception ((with expansion bit comparison) or (with data comparison)) is performed, set the inverse of the expected value to the UEBDL bit in the RLN3nLUOR1 register and RLN3nLIDB register to enable comparison of the inverted values of the received values.

UPS[1:0] Bits (UART Parity Select)

Sets the UART parity.

- When these bits are set to “00_B”, data is communicated without the parity.

  [Transmission]
  A parity bit is not added to transmit data.

  [Reception]
  Data is received without parity processing. Therefore, a parity error does not occur.

- When these bits are set to “01_B”, data is communicated with the even parity.

  [Transmission]
  If the number of 1s in transmit data is odd, “1” is added to the parity bit. If the number of 1s in transmit data is even, “0” is added to the parity bit.

  [Reception]
  If the number of 1s in receive data including the parity bit is odd, a parity error occurs.

- When these bits are set to “10_B”, data is communicated with 0 parity.

  [Transmission]
  Regardless of the number of 1s in transmit data, “0” is added to the parity bit.

  [Reception]
  The value of the parity bit is not evaluated. Therefore, no parity error occurs.

- When these bits are set to “11_B”, data is communicated with the odd parity.

  [Transmission]
  If the number of 1s in transmit data is odd, “0” is added to the parity bit. If the number of 1s in transmit data is even, “1” is added to the parity bit.

  [Reception]
  If the number of 1s in receive data including the parity bit is even, a parity error occurs.

USBLS Bit (UART Stop Bit Length Select)

Sets the stop bit length of data for UART communication.
With 0 set, stop bit length of 1 bit is selected.
With 1 set, stop bit length of 2 bits is selected.

UBOS Bit (UART Transfer Format Select)

Sets the bit order of data for UART communication.
With 0 set, LSB first is selected.
With 1 set, MSB first is selected.

UBLS Bit (UART Character Length Select)

Sets the character length of one frame for UART communication.
With 0 set, the character length is 8 bits.
With 1 set, the character length is 7 bits.
When the character length of one frame is 9 bits (the UEBE bit in the RLN3nLUOR1 register is 1), the setting of this bit is ignored.

22.3.4.5 RLN3nLSC — UART Space Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 22.65 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the space between the UART frames when transmitting data from the UART buffer. 0 to 3 Tbits can be set.

Set IBS[1:0] bits to “00_B” when UART buffer is not used.

When data is transferred from the UART transmission data register (RLN3nLUTDR) and the UART wait transmission data register (RLN3nLUWTDR), the setting of these bits is ignored.Set these bits to “00_B”.

22.3.4.6 RLN3nLEDE —UART Error Detection Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FERE	OERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R/W

Table 22.66 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	OERE	Overrun Error Detection Enable 0: Disables overrun error detection. 1: Enables overrun error detection.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is reflected in the FER flag of the RLN3nLEST register.
For details on the framing error, see **Section 22.8.5, Error Statuses**.

OERE Bit (Overrun Error Detection Enable)

This bit enables or disables detection of the overrun error.
With 0 set, the overrun error is not detected.
With 1 set, the overrun error is detected.
When this bit is set to 1, the detection result is reflected in the OER flag of the RLN3nLEST register.
For details on the overrun error, see **Section 22.8.5, Error Statuses**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is reflected in the BER flag of the RLN3nLEST register.
In full-duplex communication, do not set this bit to “1”.
Do not set this register when the NSPB bits in the RLN3nLWBR register are 0101_B (6 samplings) and the LRDNFS bit in the RLN3nLMD register is 0 (noise filtering is enabled).

For details on the bit error, see **Section 22.8.5, Error Statuses**.

22.3.4.7 RLN3nLCUC — UART Control Register

Access: This register can be read or written in 8-bit units.
Address: <RLIN3n_base> + $0E_H$
Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 22.67 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	OM0	LIN Reset 0: LIN reset mode 1: LIN reset mode is canceled.

After a value is written to this register, confirm that the value written is reflected in the RLN3nLMST register before writing another value.

OM0 Bit (LIN Reset)

The OM0 bit selects whether to transition to or exit LIN reset mode.
With 0 set, LIN reset mode.
With 1 set, LIN reset mode is canceled.

22.3.4.8 RLN3nLTRC — UART Transmission Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R

Table 22.68 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RTS	UART Buffer Transmission Start 0: UART Buffer transmission is stopped. 1: UART Buffer transmission is started.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

RTS Bit (UART Buffer Transmission Start)

When transmitting data from the UART buffer, set this bit to “1”.

Only 1 can be written to this bit; 0 cannot be written.

Write to this bit when the UTOE bit in the RLN3nLUOER register is 1 (transmission enable) and the UTS bit in the RLN3nLST register is 0 (transmission is not in progress).

Once set, regardless of errors, this bit is automatically cleared to 0 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDFC register. This bit is also automatically cleared to 0 upon transition to LIN reset mode.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

When writing 1 to this bit while the UTSW bit in the RLN3nLDFC register is 1 (when UART buffer transmission is requested, the start of transmission is delayed until the reception of stop bit is completed), write only during the reception of stop bit.

22.3.4.9 RLN3nLMST — UART Mode Status Register

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.69 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

22.3.4.10 RLN3nLST — UART Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	URS	UTS	ERR	—	—	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 22.70 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	URS	Reception Status Flag 0: Reception is stopped. 1: Reception is started.
4	UTS	Transmission Status Flag 0: Transmission is stopped. 1: Transmission is started.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	FTC	Successful UART Buffer Transmission Flag 0: UART buffer transmission has not been completed. 1: UART buffer transmission has been completed.

The RLN3nLST register is automatically cleared to “00_H” upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains “00_H”. To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

URS Flag (Reception Status Flag)

At the start of the reception, this flag is set to 1.
The reception is started under the following condition.

- When the start bit is detected

At the end of reception, this flag is cleared to 0. While reception is stopped, this flag retains 0.
The reception is ended under the following conditions.

- Sampling point of the first bit of the stop bits

UTS Flag (Transmission Status Flag)

At the start of the transmission, this flag is set to 1. During the transmission, this flag retains 1.
The transmission is started under the following conditions.

- When transmission data is specified in the RLN3nLUTDR or RLN3nLUWTDR register
- When the RTS bit in the RLN3nLTRC register is set to 1

This flag is cleared to 0 at the completion of transmission.
The transmission is ended under the following conditions.

- When transmission of data specified in the RLN3nLUTDR or RLN3nLUWTDR register is completed and next data is not specified
- When transmission from UART buffer is completed (when the RTS bit in the RLN3nLTRC register is cleared to 0)

ERR Flag (Error Detection Flag)

This flag is set to 1 upon detection of an error, detection of an expansion bit, or when ID's match (when at least one of the flags of the RLN3nLEST register is 1). Here, an interrupt request for RLIN3n status is generated. However, if an error or expansion bit is detected or ID's match while this bit is 1, an interrupt is not generated. To clear the bit to 0, write 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register.

FTC Flag (Successful UART Buffer Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that it was before 1 was written.
Regardless of errors, this bit is set to 1 upon completion of transmission of the number of data specified by the MDL bit in the RLN3nLDFC register from the UART buffer. Here, an interrupt request for RLIN3n transmission is generated.
Write 0 to clear this flag.

22.3.4.11 RLN3nLEST — UART Error Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	UPER	IDMT	EXBT	FER	OER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 22.71 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	UPER	Parity Error Flag 0: Parity error has not been detected. 1: Parity error has been detected.
5	IDMT	ID Match Flag 0: The received data does not match the ID value. 1: The received data matches the ID value.
4	EXBT	Expansion Bit Detection Flag 0: Expansion bit has not been detected. 1: Expansion bit has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	OER	Overrun Error Flag 0: Overrun error has not been detected. 1: Overrun error has been detected.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to, and the value of 00_H is retained. To clear certain bits in this register, write 0 to those bits, and write 1 to the bits not to be cleared by using the store instruction.

UPER Flag (Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.

This flag is set to 1 upon parity error detection. Write 0 to clear this flag.

IDMT Flag (ID Match Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.

The IDMT flag is set to 1 when all the following conditions are met:

- The UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enabled)
- The UECD bit in the RLN3nLUOR1 register is 0 (expansion bit comparison enabled)
- The UEBDCE bit in the RLN3nLUOR1 register is 1 (expansion bit/data comparison enabled)
  - The received expansion bit and the value of the UEBDL bit of the RLN3nLUOR1 register match.
  - The 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register match.

Write 0 to clear this flag.

EXBT Flag (Expansion Bit Detection Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
When the UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enable), if the received expansion bit matches with the UEBDL bit in the RLN3nLUOR1 register, this flag is set to 1.
Write 0 to clear this flag.

FER Flag (Framing Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
The FER flag is set to 1 upon framing error detection while the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled). Write 0 to clear this flag.

OER Flag (Overrun Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
The OER flag is set to 1 upon overrun error detection while the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). Write 0 to clear this flag.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written.
The BER flag is set to 1 when the transmitted data and the data monitored by the receive pin do not match while the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled).
Write 0 to clear this flag.

22.3.4.12 RLN3nLDFC — UART Data Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	UTSW	—	MDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 22.72 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	UTSW	Transmission Start Wait 0: When UART buffer transmission is requested, transmission is started immediately. 1: When UART buffer transmission is requested, transmission is not started until reception of the stop bit is completed.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	MDL[3:0]	UART Buffer Data Length Select b3 b0 0 0 0 0: 9 data 0 0 0 1: 1 data 0 0 1 0: 2 data 0 0 1 1: 3 data 0 1 0 0: 4 data 0 1 0 1: 5 data 0 1 1 0: 6 data 0 1 1 1: 7 data 1 0 0 0: 8 data 1 0 0 1: 9 data Settings other than the above are prohibited.

UTSW Bit (Transmission Start Wait)

This bit controls the transmission start timing of UART buffer.
With 0 set, transmission is started as soon as the start of UART buffer transmission is requested.
With 1 set, transmission is started after the completion of the stop bit reception.
Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.
This bit is enabled when the RTS bit in the RLN3nLTRC register is set to 1. In addition, writing a value to this bit is disabled when the RTS bit is 1 (UART buffer transmission started).
Set this bit to 1 only to switch from reception to transmission in half-duplex communication.

MDL[3:0] Bits (UART Buffer Data Length Select)

These bits specify the data length of the UART buffer.
Writing a value to these bits is disabled when the RTS bit in the RLN3nLTRC register is 1 (UART buffer transmission started).

22.3.4.13 RLN3nLIDB — UART ID Buffer Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ID[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.73 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7 to 0	ID[7:0]	Specifies the ID value that is referred in expansion bit data comparison

ID Bit (ID Bit)

When the UEBE bit in the RLN3nLUOR1 register is set to 1 (expansion bit enabled), the UECD bit is set to 0 (expansion bit comparison enabled), and the UEBDCE bit is set to 1 (data comparison after expansion bit is detected), set the value to be compared with the received data. Write to the RLN3nLIDB register when the URS bit in the RLN3nLST register is 0 (reception is stopped).

22.3.4.14 RLN3nLUDB0 — UART Data Buffer 0 Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 17_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	UDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.74 RLN3nLUDB0 Register Contents

Bit Position	Bit Name	Function
7 to 0	UDB[7:0]	Sets the data to be transmitted. Setting range: 00_H to FF_H

If the data length selection corresponds to 9 data bytes (RLN3nLDFC.MDL bit is “0_H” or “9_H”) for multi-byte UART transmission, then the first data value for UART communication is present in this buffer.

Write to the RLN3nLUDB0 register when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

Table 22.75, Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see **Section 22.8.1.2, UART Buffer Transmission**, **22.8.1.2(1), UART Buffer Transmission**.

Table 22.75 Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format

	RLN3nLUDB0							
	b7	b6	b5	b4	b3	b2	b1	b0
7-bit; LSB first	—*1	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
7-bit; MSB first	—*1	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6
8-bit; LSB first	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
8-bit; MSB first	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7

Note 1. In the case of 7-bit data length, write the value after reset.

22.3.4.15 RLN3nLDBRb — UART Data Buffer b Register (b = 1 to 8)

Access: This register can be read or written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H

RLN3nLDBR2: <RLIN3n_base> + 19_H

RLN3nLDBR3: <RLIN3n_base> + $1A_H$

RLN3nLDBR4: <RLIN3n_base> + $1B_H$

RLN3nLDBR5: <RLIN3n_base> + $1C_H$

RLN3nLDBR6: <RLIN3n_base> + $1D_H$

RLN3nLDBR7: <RLIN3n_base> + $1E_H$

RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.76 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Specifies the data to be transmitted. Setting range: 00_H to FF_H

These registers specify the data transmitted from the UART buffer.

Write to these registers when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

Table 22.77, Bit Arrangement of the RLN3nLDBRb Register According to Each Communication Format, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see **Section 22.8.1.2, UART Buffer Transmission**, **22.8.1.2(1), UART Buffer Transmission**.

Table 22.77 Bit Arrangement of the RLN3nLDBRb Register According to Each Communication Format

	RLN3nLDBRb							
	b7	b6	b5	b4	b3	b2	b1	b0
7-bit; LSB first	—*1	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
7-bit; MSB first	—*1	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6
8-bit; LSB first	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
8-bit; MSB first	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7

Note 1. In the case of 7-bit data length, write the value after reset.

22.3.4.16 RLN3nLUOER — UART Operation Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	UROE	UTOE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 22.78 RLN3nLUOER Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	UROE	Reception Enable 0: Disables reception. 1: Enables reception.
0	UTOE	Transmission Enable 0: Disables transmission. 1: Enables transmission.

The RLN3nLUOER register is automatically cleared to 00_H upon transition to LIN reset mode.
In LIN reset mode, this register cannot be written to.
In LIN reset mode, the register retains 00_H.

UROE Bit (Reception Enable)

The UROE bit enables or disables reception.
With 0 set, reception is disabled.
With 1 set, reception is enabled.
Do not clear this bit during reception. If the communication is suspended during reception, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to transition to the LIN reset mode. Note that transmission is also aborted.

Do not set this bit to 1 when data transmission from the UART buffer is in progress.

UTOE Bit (Transmission Enable)

The UTOE bit enables or disables transmission.
With 0 set, transmission is disabled.
With 1 set, transmission is enabled.
Do not clear this bit during transmission. If the communication is suspended during transmission, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to transition to the LIN reset mode. Note that reception is also aborted.

22.3.4.17 RLN3nLUOR1 — UART Option Register 1

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 21_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	UECD	UTIGTS	UEBDCE	UEBDL	UEBE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 22.79 RLN3nLUOR1 Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UECD	Expansion Bit Comparison Disable 0: Enables expansion bit comparison. 1: Disables expansion bit comparison.
3	UTIGTS	Transmission Interrupt Generation Timing Select 0: Transmission interrupt is generated at the start of transmission. 1: Transmission interrupt is generated at the completion of transmission.
2	UEBDCE	Expansion Bit Data Comparison Enable 0: Disables data comparison after an expansion bit is detected. 1: Enables data comparison after an expansion bit is detected.
1	UEBDL	Expansion Bit Detection Level Select 0: Selects expansion bit value 0 as the expansion bit detection level. 1: Selects expansion bit value 1 as the expansion bit detection level.
0	UEBE	Expansion Bit Enable 0: Disables expansion bit operation. 1: Enables expansion bit operation.

UECD Bit (Expansion Bit Comparison Disable)

The UECD bit enables or disables comparison between the received expansion bit and the UEBDL bit value when the UEBE bit is 1 (expansion bit operation is enabled).

With 0 set, comparison between the received expansion bit and the UEBDL bit value is enabled when the expansion bit is received.

With 1 set, comparison between the received expansion bit and the UEBDL bit value is disabled when the expansion bit is received.

Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Do not set this bit to 1 when the UART buffer is used.

Do not set this bit to 1 when the UEBDCE bit is 1 (expansion bit/data comparison enable).

UTIGTS Bit (Transmission Interrupt Generation Timing Select)

The UTIGTS bit selects the generation timing of the transmission interrupt.
With 0 set, the transmission interrupt is generated at the start of transmission.
With 1 set, the transmission interrupt is generated at the completion of transmission.
When transmission from the UART buffer is performed with 0 set, the transmission interrupt is generated only at the start of the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register).
When transmission from the UART buffer is performed with 1 set, the transmission interrupt is generated only at the completion of the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register).

UEBDCE Bit (Expansion Bit Data Comparison Enable)

After an expansion bit is detected, this bit enables or disables the comparison between the 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register.
With 0 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is disabled.
With 1 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UEBE bit is 0 (expansion bit operation disabled).
Do not set this bit to 1 when the UECD bit is 1 (expansion bit comparison disabled).
Do not set this bit to 1 when the UART buffer is used.

UEBDL Bit (Expansion Bit Detection Level Select)

The UEBDL bit selects the level to be detected as the expansion bit when the UEBE bit is 1 (expansion bit operation is enabled) and the UECD bit is 0 (expansion bit comparison enabled).
With 0 set, expansion bit value 0 is the level to be detected as the expansion bit.
With 1 set, expansion bit value 1 is the level to be detected as the expansion bit.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

UEBE Bit (Expansion Bit Enable Bit)

The UEBE bit enables or disables expansion bit operation.
With 0 set, expansion bit operation is disabled.
With 1 set, expansion bit operation is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

22.3.4.18 RLN3nLUTDR — UART Transmission Data Register

Access: RLN3nLUTDR register can be read or written in 16-bit units.
RLN3nLUTDRL register can be read or written in 8-bit units.
RLN3nLUTDRH register can be read or written in 8-bit units.

Address: RLN3nLUTDR: <RLIN3n_base> + 24_H
RLN3nLUTDRL: <RLIN3n_base> + 24_H
RLN3nLUTDRH: <RLIN3n_base> + 25_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	UTD[8:0]

Table 22.80 RLN3nLUTDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	UTD[8:0]	Specifies the data to be transmitted. Setting range: 000_H to $1FF_H$

The RLN3nLUTDR register specifies the data to be transmitted from the transmission data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

This register can be accessed in 8 bits.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

Also, do not write data to this register when a transmission request is being generated due to write access to the RLN3nLUWTDR register.

When transmitting data continuously, do not set another piece of transmission data in this register before the generation of transmission interrupt.

The table below shows the bit arrangement according to the set communication format.

Table 22.81 Bit Arrangement of the RLN3nLUTDR Register According to Each Communication Format

	RLN3nLUTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0

22.3.4.19 RLN3nLURDR — UART Reception Data Register

Access: RLN3nLURDR register is a read-only register that can be read in 16-bit units.

RLN3nLURDRL register is a read-only register that can be read in 8-bit units.

RLN3nLURDRH register is a read-only register that can be read in 8-bit units.

Address: RLN3nLURDR: <RLIN3n_base> + 26_H

RLN3nLURDRL: <RLIN3n_base> + 26_H

RLN3nLURDRH: <RLIN3n_base> + 27_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	URD [8:0]

Table 22.82 RLN3nLURDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned.
8 to 0	URD [8:0]	Store the received data

The RLN3nLURDR allows the reception data to be read from the receive data register.

When the UROE bit in the RLN3nLUOER register is 1, the received data is stored in this register and can be read out.

This register is updated upon reception of stop bit in the received data.

This register is also updated even when an error is caused by the parity or stop bit.

However, the value of this register is not updated if an overrun error occurs when the OERE bit of the RLN3nLEDE register is 1 (overrun detection enabled). The value of this register is updated even if an overrun error occurs when the OERE bit is 0 (overrun detection disabled).

Read this register upon occurrence of a reception error (overrun error, framing error, parity error) when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). If the next data is received without reading this register, an overrun error occurs.

This register can be accessed in 8-bit units.

However, when expansion bit is used (UEBE bit of the RLN3nLUOR1 register is 1 (expansion bit operation enabled), do not attempt 8-bit access.

The table below shows the bit arrangement according to the set communication format.

Table 22.83 Bit Arrangement of the RLN3nLURDR Register According to Each Communication Format

	RLN3nLURDR

Table 22.84 RLN3nLUWTDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	UWTD[8:0]	Sets the data to be transmitted from the wait transmit data register after waiting for the stop bit reception to be completed. Setting range: 000_H to $1FF_H$

The RLN3nLUWTDR register sets the data to be transmitted from the UART wait transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

Use this register only to switch from reception to transmission in half-duplex communication.

Also, write to this register only while the stop bit is being received.

Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.

When this register is read, the value of the RLN3nLUTDR register is actually read.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

The table below shows the bit arrangement according to the set communication format.

Table 22.85 Bit Arrangement of the RLN3nLUWTDR Register According to Each Communication Format

	RLN3nLUWTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0

22.4 Interrupt Sources

The LIN/UART interface generates four types of interrupt requests.

- RLIN3n transmission interrupt
- RLIN3n successful reception interrupt
- RLIN3n status interrupt
- RLIN3n interrupt

Setting the LIOS bit in the RLN3nLMD register to 0 allows to perform logical OR operation on all of the interrupt sources, outputting the interrupt request from the RLIN3n interrupt.

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, or RLIN3n status interrupt depending on the interrupt request.

Table 22.86, Interrupt Sources lists the sources for each interrupt.

Table 22.86 Interrupt Sources

		LIOS Bit in RLN3nLMD Register is 0	LIOS Bit in RLN3nLMD Register is 1*1		
		RLIN3n Interrupt	RLIN3n Transmission Interrupt	RLIN3n Successful Reception Interrupt	RLIN3n Status Interrupt
LIN mode	LIN master mode	• Successful frame transmission • Successful frame reception • Successful wake-up transmission • Successful wake-up reception • Successful header transmission • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error	• Successful frame transmission • Successful wake-up transmission • Successful header transmission	• Successful frame reception • Successful wake-up reception	• Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error
	LIN slave mode	• Successful response transmission • Successful response reception • Successful wake-up transmission • Successful wake-up reception • Successful header reception • Bit error • Frame/response timeout error • Framing error • Sync field error • Checksum error • ID parity error • Response preparation error	• Successful response transmission • Successful wake-up transmission	• Successful response reception • Successful wake-up reception • Successful header reception	• Bit error • Frame/response timeout error • Framing error • Sync field error • Checksum error • ID parity error • Response preparation error
UART mode		—	• Transmission start/successful transmission	• Successful reception • Expansion bit mismatch	• Bit error • Overrun error • Framing error • Expansion bit match • ID match • Parity error

Note 1. The LIOS bit setting is valid in LIN Mode. In UART mode, setting the LIOS bit is not required.

In LIN mode, each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is set to 1.

22.5 Modes

The LIN/UART interface provides the following four modes, depending on the specific function to be performed:

- LIN reset mode
- LIN mode
  - LIN master mode
  - LIN slave mode [auto baud rate]
  - LIN slave mode [fixed baud rate]
- UART mode
- LIN self-test mode

Figure 22.2, Mode Transitions shows mode transitions. **Table 22.87, Transition Condition of Each Mode** describes mode transition conditions. **Table 22.88, Operations Available in Each Mode** lists operations available in each mode.

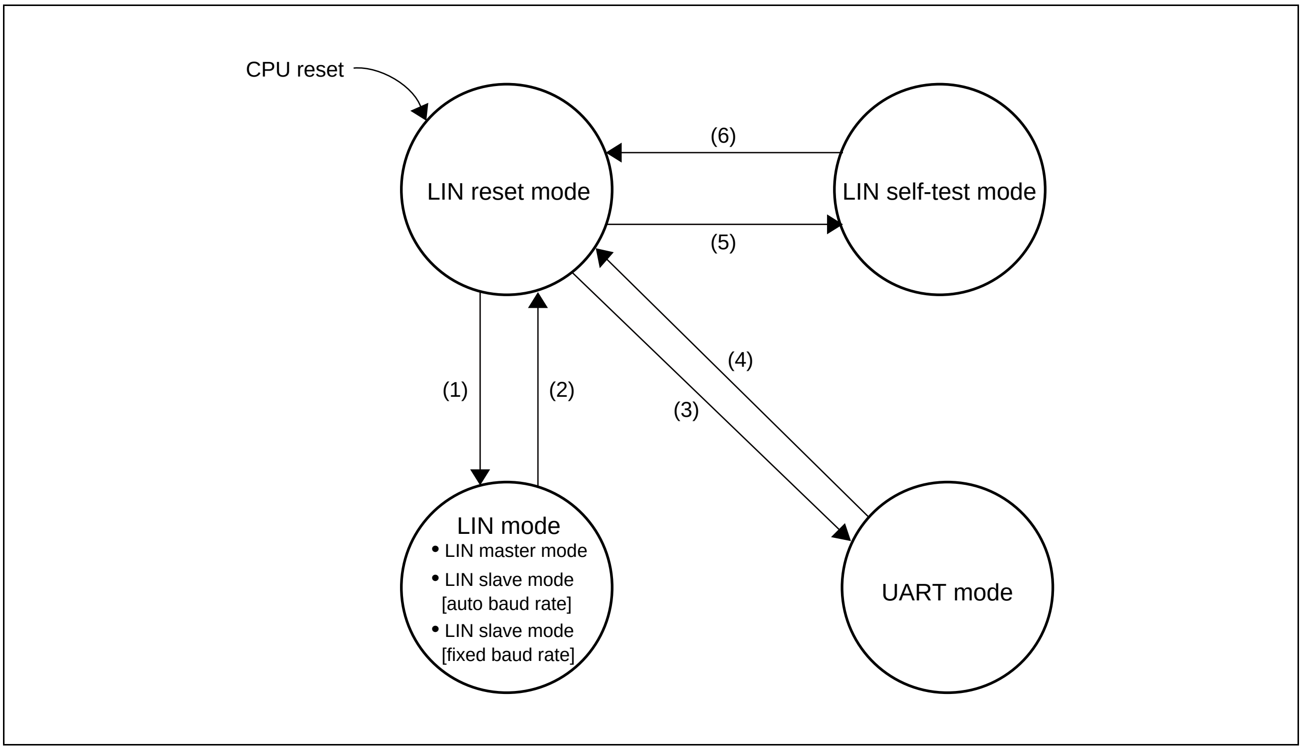

Figure 22.2 Mode Transitions

Table 22.87 Transition Condition of Each Mode

	Mode Transition			Transition Condition
(1)	LIN reset mode	→	LIN mode	
			- LIN master mode	- LMD bits in RLN3nLMD register = 00_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B or 11_B
			- LIN slave mode [auto baud rate]	- LMD bits in RLN3nLMD register = 11_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B or 11_B
			- LIN slave mode [fixed baud rate]	- LMD bits in RLN3nLMD register = 10_B and OM1 and OM0 bits of RLN3nLCUC register = 01_B or 11_B
(2)	LIN mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
(3)	LIN reset mode	→	UART mode	LMD bits in RLN3nLMD register = 01_B and OM0 bit in RLN3nLCUC register = 1_B
(4)	UART mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
(5)	LIN reset mode	→	LIN self-test mode	See **Section 22.9, LIN Self-Test Mode**.
(6)	LIN self-test mode	→	LIN reset mode	See **Section 22.9, LIN Self-Test Mode**.

Table 22.88 Operations Available in Each Mode

LIN Mode			
LIN Master Mode	LIN Slave Mode [auto baud rate] LIN Slave Mode [fixed baud rate]	UART Mode	LIN Self-Test Mode
Header transmission Response transmission Response reception Wake-up transmission Wake-up reception Error detection	Header reception Response transmission Response reception Wake-up transmission Wake-up reception Error detection	UART transmission UART reception Error detection	Self-test

Whether mode has transitioned to LIN reset mode, the LIN mode, or the UART mode can be verified by reading the LMD bits in the RLN3nLMD register and the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see **Section 22.9, LIN Self-Test Mode**.

22.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The transition to LIN reset mode can be verified by checking that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication and the UART communication functions are halted.

From LIN reset mode, transitions to LIN mode, UART mode, and LIN self-test mode can be made.

When the mode transitions to LIN reset mode, the following registers are initialized to their reset values and they retain their initial values while in LIN reset mode:

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register
- RLN3nLUOER register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLUDB0 register
- RLN3nLDBRb register (b = 1 to 8)
- RLN3nLUOR1 register
- RLN3nLUTDR register
- RLN3nLURDR register
- RLN3nLUWTDR register

22.7 LIN Mode

LIN mode can operate in the following submodes: LIN master mode, LIN slave mode [auto baud rate], and LIN slave mode [fixed baud rate].

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00_B (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01_B or 11_B causes the transition to LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01_B to 11_B.

In LIN slave mode [auto baud rate] and LIN slave mode [fixed baud rate], header reception, response transmission, response reception, wake-up transmission, wake-up reception, and error detection can be performed.

The LIN slave mode [auto baud rate] allows automatic detection of the break field and the sync field, and sets a baud rate based on the results of measurement of a sync field. The baud rate can be set to 1 kbps to 20 kbps.

Set the LPRS[2:0] bits in the RLN3nLWBR register so that the prescaler clock (the clock obtained by dividing the frequency of the LIN communication clock source by the prescaler) is configured as follows according to the target baud rate.

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4 MHz*[1]
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

Note 1. Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to “0011_B” (4 samplings).

LIN slave mode [fixed baud rate] allows automatic detection of the break field, the sync field, and the ID field at a baud rate that is preset by the baud rate generator.

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 10_B (LIN slave mode [auto baud rate]) and setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B or 11_B causes the transition to LIN slave mode [auto baud rate]; and setting the LMD bits in the RLN3nLMD register to 11_B (LIN slave mode [fixed baud rate]), and setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B or 11_B causes the transition to LIN slave mode [fixed baud rate], turning the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B or 11_B.

When transitioning form one submode to another submode within LIN mode, transition to LIN reset mode first and change the LMD bits in the RLN3nLMD register.

The LIN mode provides the following two operating modes:

- LIN operation mode
- LIN wake-up mode

Figure 22.3, Transition of Operating Modes shows the transition of operating modes. **Table 22.89, Transition Conditions for Operating Modes** describes the transition conditions of operating modes.

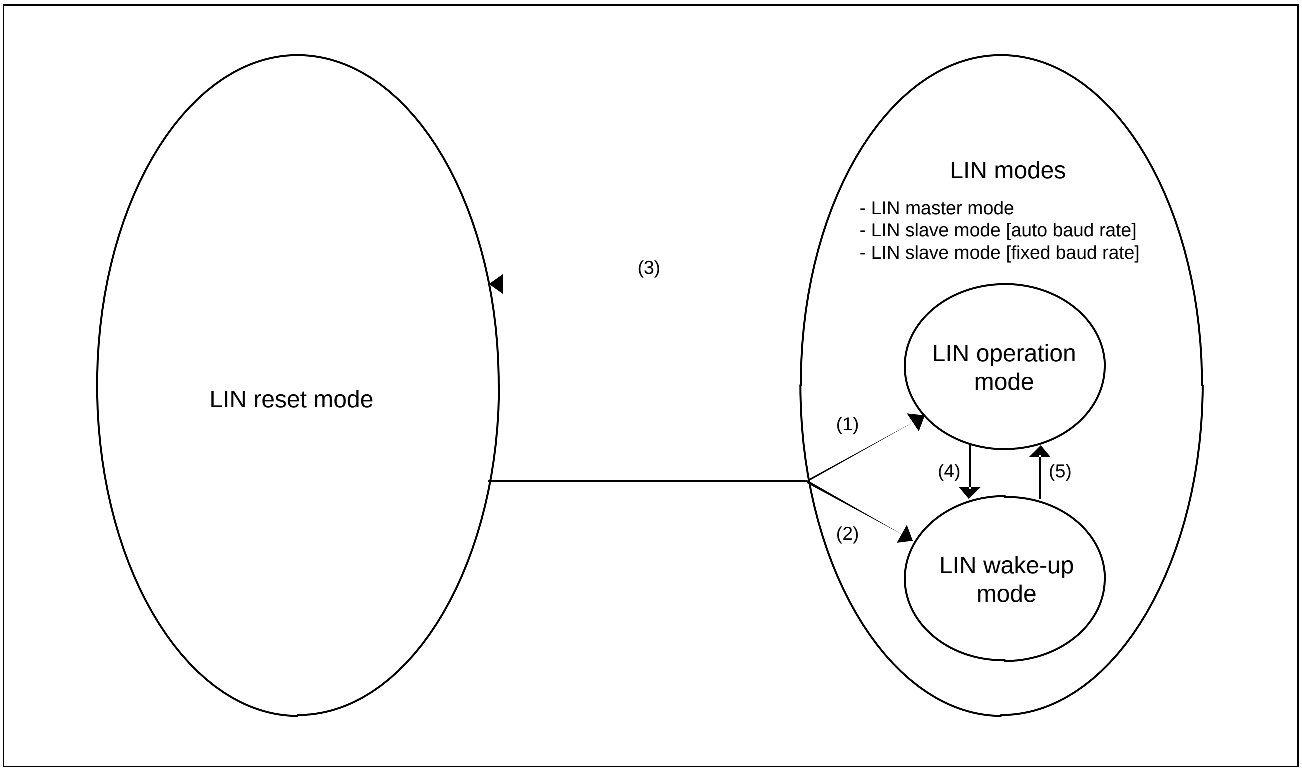

Figure 22.3 Transition of Operating Modes

Table 22.89 Transition Conditions for Operating Modes

	Operation Mode Transition			Transition Condition
(1)	LIN reset mode	→	LIN mode ● LIN operation mode	LMD bits in RLN3nLMD register = 00_B or 10_B or 11_B and OM1 and OM0 bits in RLN3nLCUC register = 11_B
(2)	LIN reset mode	→	LIN mode ● LIN wake-up mode	LMD bits in RLN3nLMD register = 00_B or 10_B or 11_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B
(3)	LIN mode ● LIN operation mode ● LIN wake-up mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
(4)*[1]	LIN mode ● LIN operation mode	→	LIN mode ● LIN wake-up mode	OM1 and OM0 bits in RLN3nLCUC register = 01_B
(5)*[1]	LIN mode ● LIN wake-up mode	→	LIN mode ● LIN operation mode	OM1 and OM0 bits in RLN3nLCUC register = 11_B

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is in progress (when the FTS bit in the RLN3nLTRC register is 1).

(1) LIN Operation Mode

While in LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11_B switches the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11_B. Communication settings should be configured after the OMM1 and OMM0 bits have become 11_B.

(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B switches the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B. Communication settings should be configured after the OMM1 and OMM0 bits have become 01_B.

22.7.1 LIN Master Mode

22.7.1.1 Header Transmission

Figure 22.4, Operation in Header Transmission shows the operation of the LIN/UART interface (LIN master mode) in header transmission. **Table 22.90, Processing in Header Transmission** provides processing in header transmission.

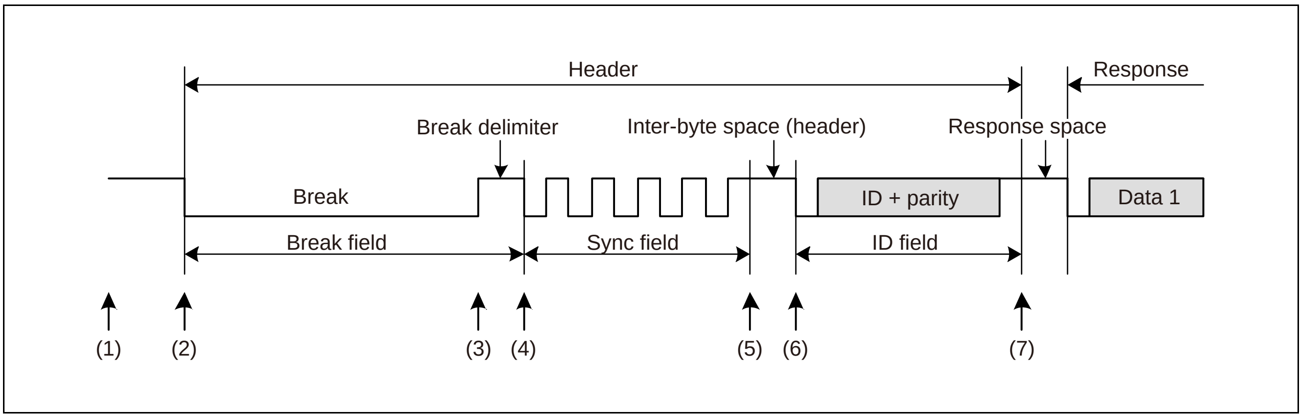

Figure 22.4 Operation in Header Transmission

Table 22.90 Processing in Header Transmission

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Transitions to LIN master mode: LIN operation mode • Configures frame information to be transmitted (ID, parity, data length, response direction, Checksum method, and transmission data)	Waits for the FTS bit in the RLN3nLTRC register to be set by software (idle)
(2)	Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3)	Waits for an interrupt request	Transmits a break delimiter.
(4)		Transmits a sync field (55_H).
(5)		Transmits an inter-byte space (header).
(6)		Transmits an ID field.
(7)		Sets the successful header transmission flag.

NOTE

For information about error detection conditions, see **Section 22.7.7, Error Statuses**.

22.7.1.2 Response Transmission

Figure 22.5, Operation in Response Transmission shows the operation of the LIN/UART interface (LIN master mode) in response transmission.
Table 22.91, Processing in Response Transmission provides processing in response transmission.

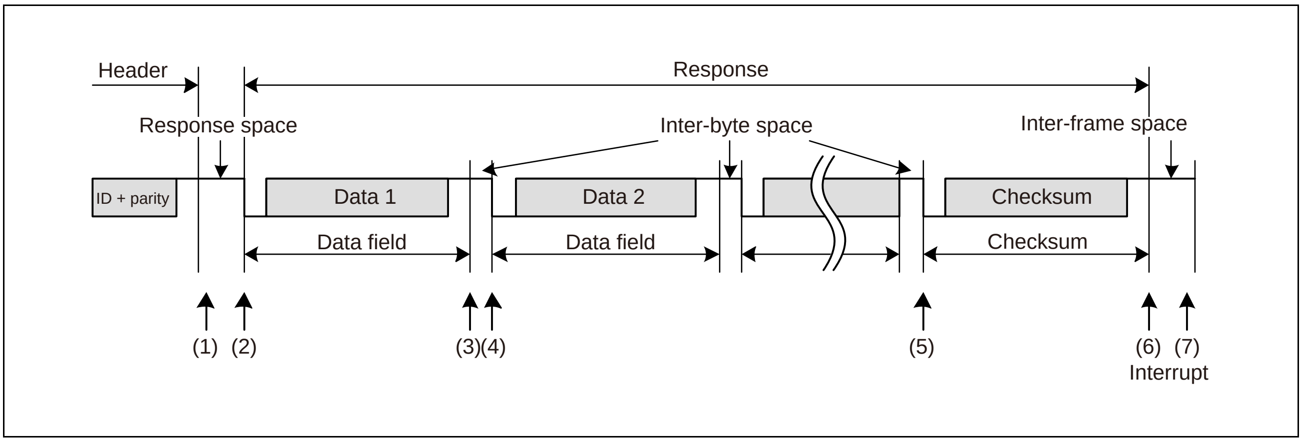

Figure 22.5 Operation in Response Transmission

Table 22.91 Processing in Response Transmission

	Software Processing	LIN/UART Interface Processing
(1)	[When in frame separate mode] • Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/reception started) [When not in frame separate mode] • Waits for an interrupt request	[When in frame separate mode] • Waits for the RTS bit in the RLN3nLTRC register to be set to 1 by software. • When the bit is set to 1, transmits a response space. [When not in frame separate mode] • Transmits a response space.
(2)	Waits for an interrupt request	Transmits data 1.
(3)		Transmits an inter-byte space.
(4)		• Transmits data 2. • Transmits an inter-byte space • Transmits data 3. • Transmits an inter-byte space (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register). : :
(5)		Transmits the checksum.
(6)		• Sets the successful frame/wake-up transmission flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped) [When in frame separate mode] • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception is stopped).
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	Idle

NOTE

For information about error detection conditions, see **Section 22.7.7, Error Statuses**.

22.7.1.3 Response Reception

Figure 22.6, Operation in Response Reception shows the operation of the LIN/UART interface (LIN master mode) in response reception. **Table 22.92, Processing in Response Reception** provides processing in response reception.

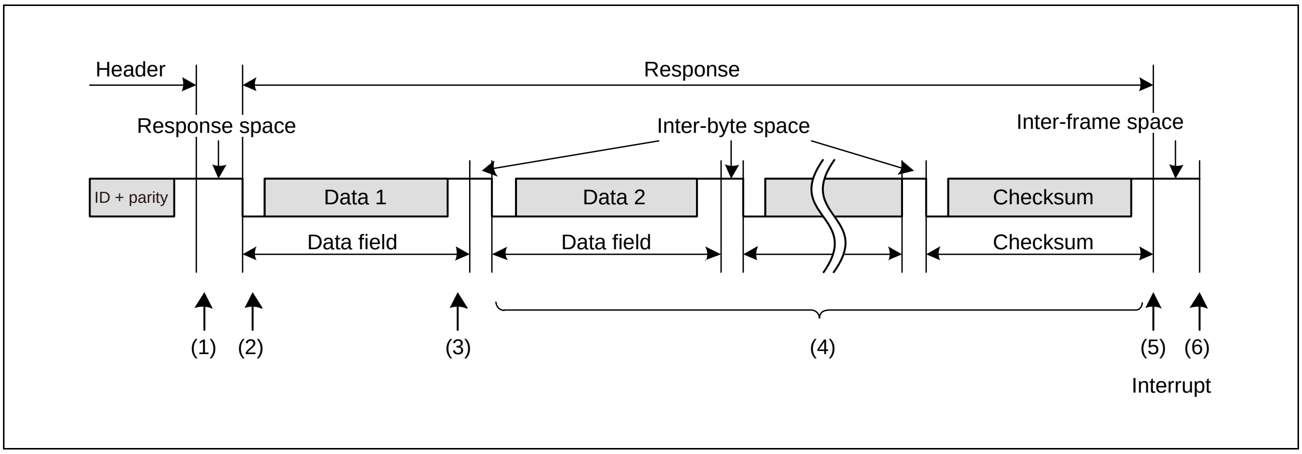

Figure 22.6 Operation in Response Reception

Table 22.92 Processing in Response Reception

	Software Processing	LIN/UART Interface Processing
(1)	Waits for an interrupt request (no processing)	Waits for detection of a start bit.
(2)		Receives data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		● Receives data 2 when the start bit is detected. ● Receives data 3 when the start bit is detected. (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register). : : ● Receives the checksum when the start bit is detected.
(5)		● Determines the checksum. ● Sets the successful frame/wake-up reception flag. ● Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped).
(6)	● Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 22.7.7, Error Statuses**.

22.7.2 LIN Slave Mode

22.7.2.1 Header Reception

Figure 22.7, Operation in Header Reception shows the operation of the LIN/UART interface (LIN slave mode) in header reception. **Table 22.93, Processing in Header Reception** provides processing in header reception.

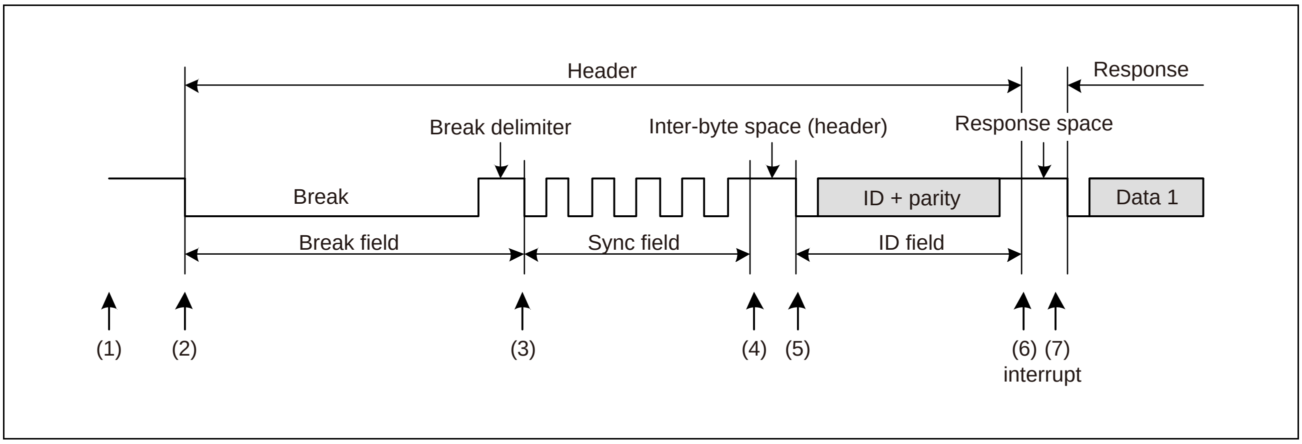

Figure 22.7 Operation in Header Reception

Table 22.93 Processing in Header Reception

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Transitions to the LIN slave mode: LIN operation mode • Sets the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started)	Waits for the FTS bit in the RLN3nLTRC register to be set by software.
(2)	Waits for an interrupt request.	Waits for detection of break field
(3)		Detects a break field (LIN slave mode [fixed baud rate]. For details about the break field detection timing in the case of LIN slave mode [auto baud rate], see [Auto Baud Rate Correction Function].)
(4)		• Detects a sync field (55_H) • Sets the baud rate generator (in the case of LIN slave mode [auto baud rate]) • Clears the no-response request bit (LNRR bit).
(5)		• Receives an ID field. • Checks the ID parity bit
(6)		Sets the header reception complete flag.
(7)	• Checks the RLN3nLST register, and clears flags. • Checks the RLN3nLIDB register, and prepares a response.	• Completes a header reception process. • Waits for a response request.

NOTE

The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred. For information about error detection conditions, see **Section 22.7.7, Error Statuses**.

[Auto Baud Rate Correction Function]

In LIN slave mode [auto baud rate], the system always measures the low-level widths that are received. If the first "Low level" width is 10 times (if the BLT bit of the RLN3nLBFC register is "0") or 11 times (if the BLT bit of the RLN3nLBFC register is "1") or greater than the bit width calculated from the average of the starting 2 bits (the period of the consecutive falling edges from the beginning of the sync field) of the sync field, the system concludes that the detection of break field was successful and verifies that the data in the sync field is 55_H. If the data in the sync field is indeed 55_H and the system determines that sync field reception was successful, the system automatically sets the baud rate correction result to the RLN3nLBRP01 register.

If data is received up to the ID field without error, a successful header reception interrupt is generated at the stop bit position.

On the other hand, if the data in the sync field is not 55_H and the system determines that sync field reception failed, the system sets the sync field error flag and an error interrupt is generated. In that case, baud rate correction is not performed and the LIN/UART interface waits for the detection of the next break field (low level).

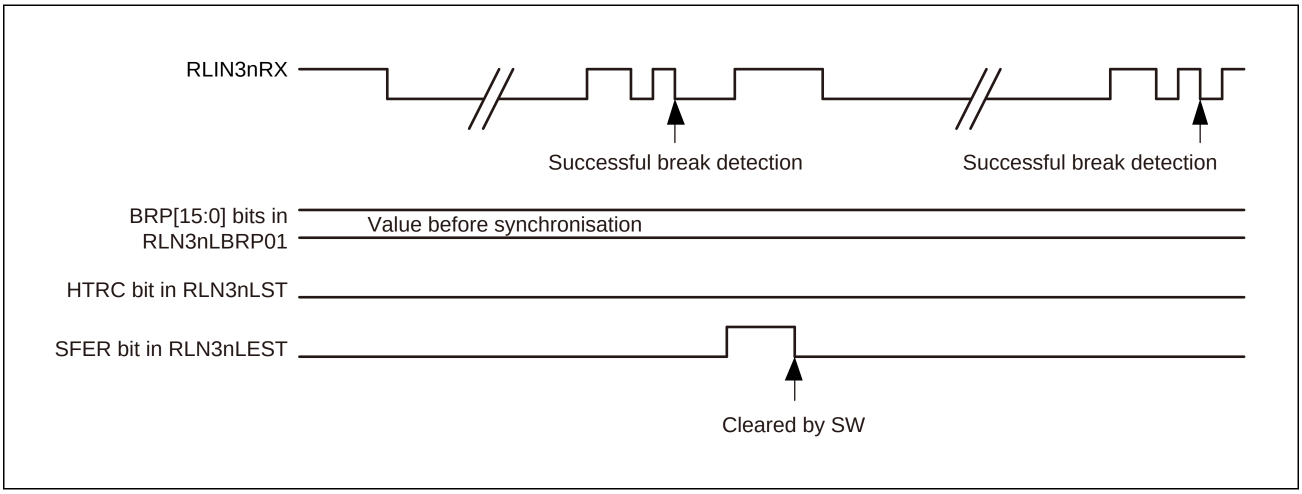

Figure 22.9 Header Reception in LIN Slave Mode [Auto Baud Rate] (Sync Field Error)

22.7.2.2 Response Transmission

Figure 22.10, Operation in Response Transmission shows the operation of the LIN/UART interface (LIN slave mode) in response transmission. **Table 22.94, Processing in Response Transmission** provides processing in response transmission.

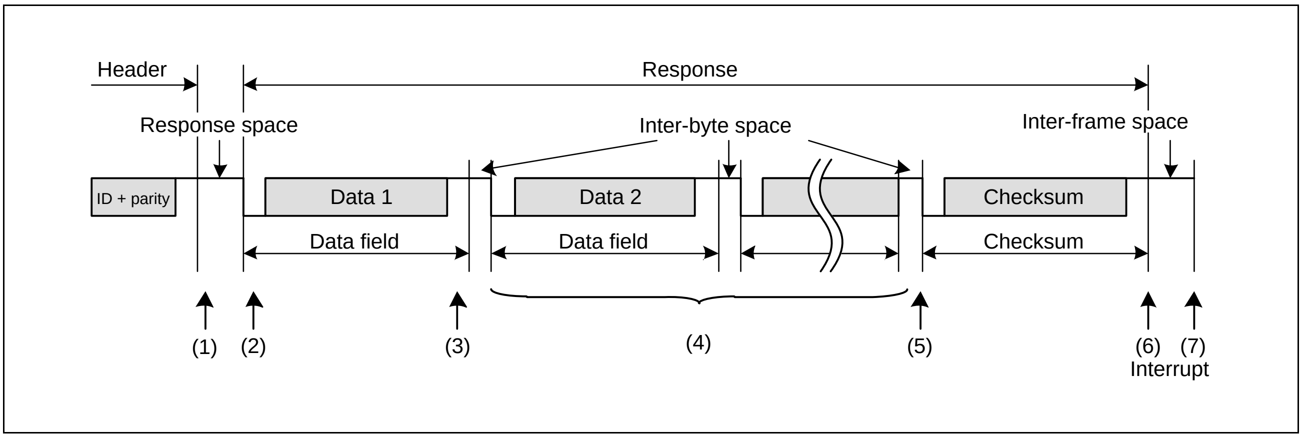

Figure 22.10 Operation in Response Transmission

Table 22.94 Processing in Response Transmission

	Software Processing	LIN/UART Interface Processing
(1)	• Configures the RLN3nLDFC register. • Configures the RLN3nLDBRb registers.(b = 1 to 8) • Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/reception started)	• Waits for the RTS or LNRR bit in the RLN3nLTRC register to be set by software • Transmits the response space after the RTS bit of the RLN3nLTRC register is set to 1
(2)	Waits for an interrupt request.	Transmits data 1.
(3)		Transmits an inter-byte space.
(4)		• Transmits data 2. • Transmits an inter-byte space • Transmits data 3. • Transmits an inter-byte space (Repeats as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register). : :
(5)		Transmits the checksum.
(6)		• Sets the successful response/wake-up transmission flag. • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	• Completes the response transmission process. • Waits for a new break.

NOTE

- For information about error detection, see **Section 22.7.7, Error Statuses**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred.

22.7.2.3 Response Reception

Figure 22.11, Operation in Response Reception shows the operation of the LIN/UART interface (LIN slave mode) in response reception. **Table 22.95, Processing in Response Reception** provides processing in response reception.

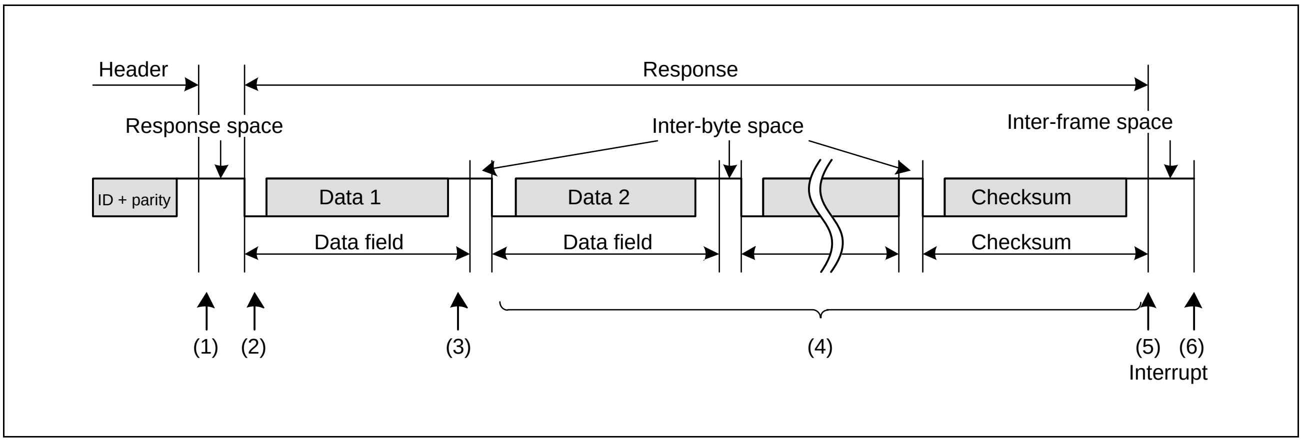

Figure 22.11 Operation in Response Reception

Table 22.95 Processing in Response Reception

	Software Processing	LIN/UART Interface Processing
(1)	• Sets the RLN3nLDFC register. • Sets the response transmission/reception start bit (RTS bit) to 1.	• Waits for the RTS (response transmission/reception start) or LNRR (no-response request) bit to be set by software. • Waits for detection of the start bit.
(2)	Waits for an interrupt request.	Receives data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		• Receives data 2 when the start bit is detected. • Receives data 3 when the start bit is detected. (Repeats as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register). : : • Receives the checksum when the start bit is detected.
(5)		• Determines the checksum. • Sets the successful response/wake-up reception flag or error flag. • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	• Completes the response process. • Waits for a new break.

NOTE

- For information about error detection conditions, see **Section 22.7.7, Error Statuses**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred.

22.7.2.4 No-response Request

Figure 22.12, Operation when No Response is Requested shows the operation of the LIN/UART interface (LIN slave mode) when no response is requested. **Table 22.96, Processing when No Response is Requested** shows the processing that occurs when no response is requested.

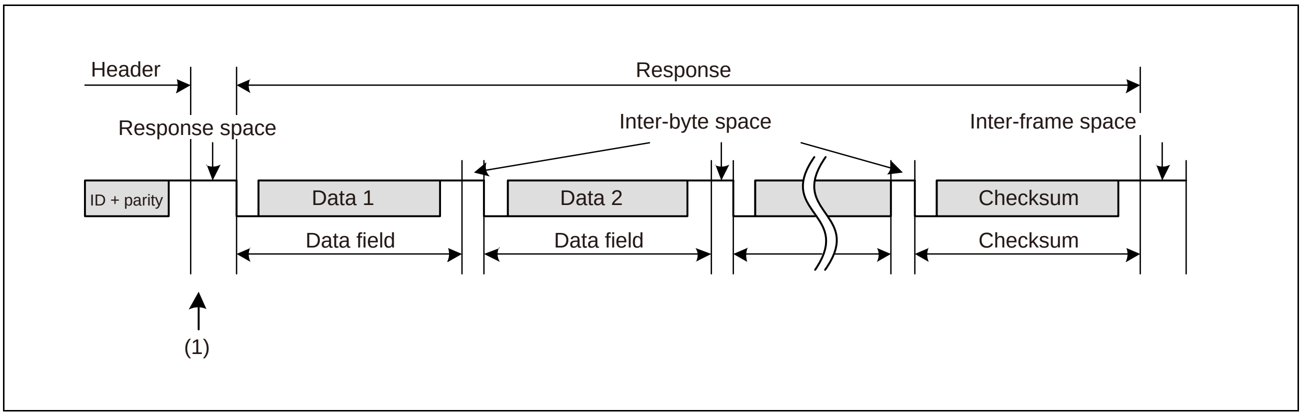

Figure 22.12 Operation when No Response is Requested

Table 22.96 Processing when No Response is Requested

	Software Processing	LIN/UART Interface Processing
(1)	• Sets the no-response request bit (LNRR bit) to 1.	• Waits for the LNRR (no-response request) bit to be set by software • Completes the frame reception process • Waits for a new break

22.7.3 Data Transmission/Reception

22.7.3.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag of the RLN3nLEST register (see **Section 22.7.7, Error Statuses**).

In LIN master mode and LIN slave mode [fixed baud rate], 1 Tbit is generated to be $16f_{LIN}$, and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

In LIN slave mode [auto baud rate], if 1 Tbit is generated to be $4f_{LIN}$, the sampling point for received data is at the third clock cycle (75% position). If 1 Tbit is generated to be $8f_{LIN}$, the sampling point for received data is at the 7th clock cycle (87.5% position).

Figure 22.13, Example of Data Transmission Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate]) shows an example of data transmission timing.

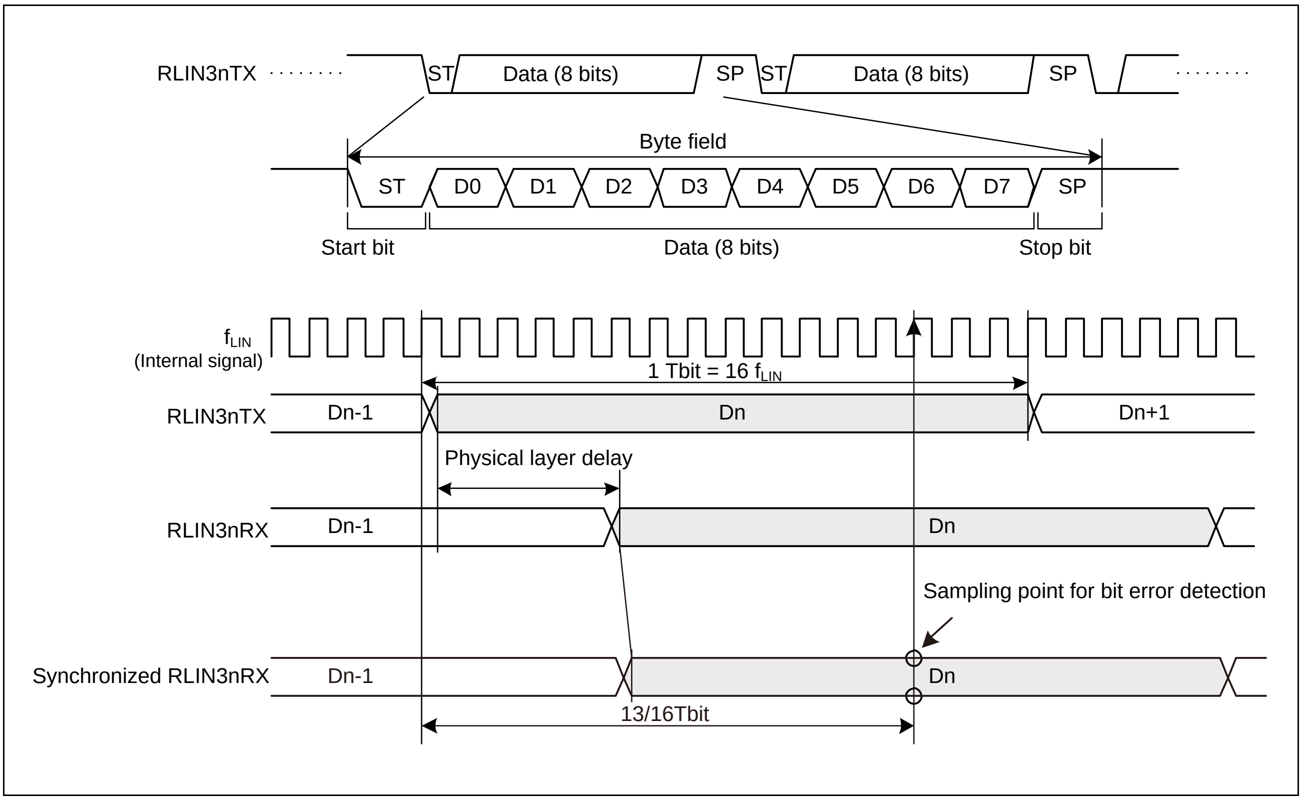

Figure 22.13 Example of Data Transmission Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

22.7.3.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN/UART interface has a noise filter function with respect to reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN/UART interface uses a noise filter, and the value determined by a 3-sampling majority rule on prescaler clocks is used as the sampling value. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN/UART interface does not use a noise filter, and the value of the synchronized RLIN3nRX value at the sampling position is used as the sampling value.

Figure 22.14, Example of Data Reception Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate]) shows an example of data reception timing.

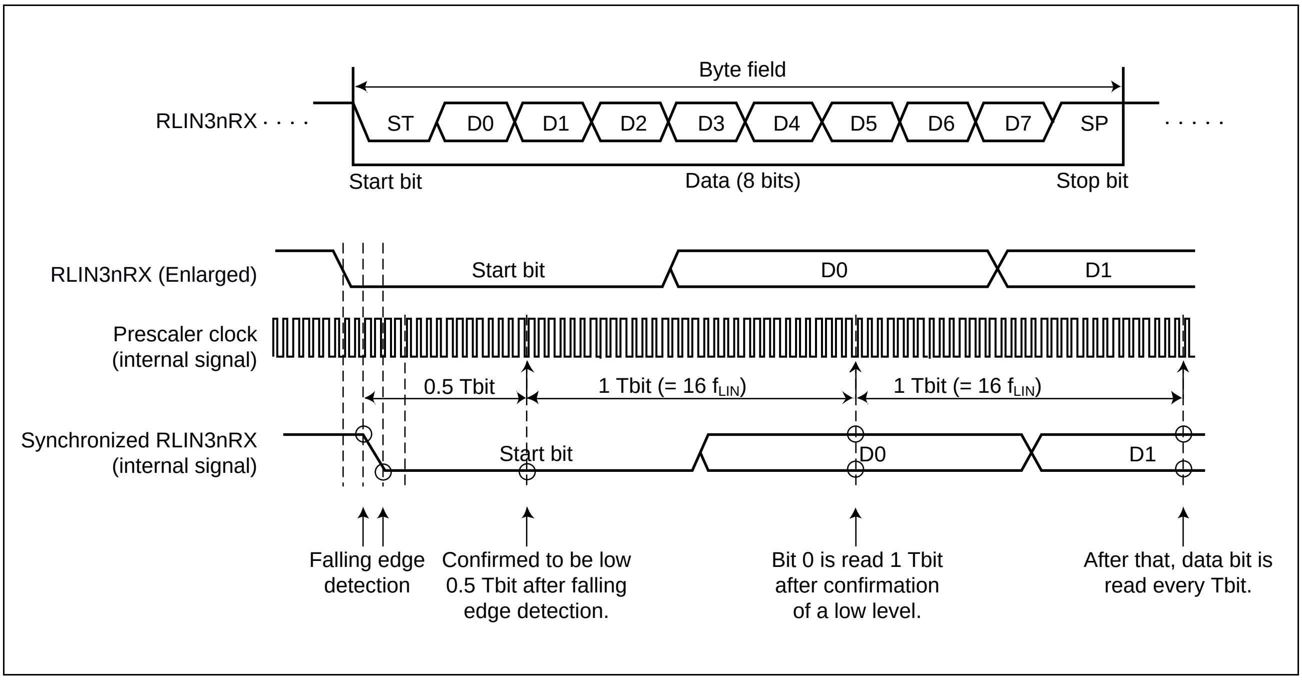

Figure 22.14 Example of Data Reception Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

22.7.4 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN/UART interface transmits or receives data continuously.

22.7.4.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data regions 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data regions 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

Figure 22.15, LIN Transmission Processing and Corresponding Buffers shows the LIN transmission processing and the corresponding buffers.

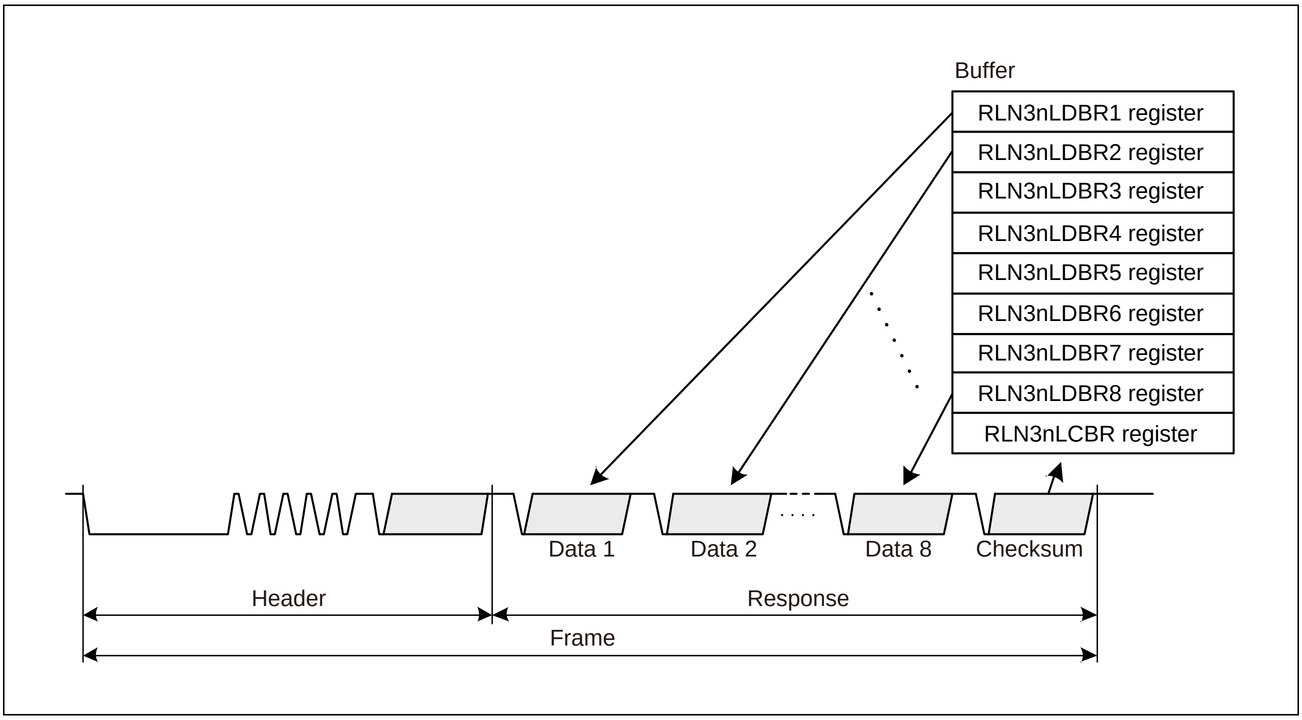

Figure 22.15 LIN Transmission Processing and Corresponding Buffers

[Frame Separate Mode]

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, the header and response are separately transmitted when prompted by respective transmission start requests.

When the transmission of the header is completed, the HTRC flag in the RLN3nLST register is set to 1 (successful header transmission).

Use frame separate mode when transmitting or receiving response data of 9 bytes or greater in LIN master mode.

22.7.4.2 Reception of LIN Frames

For an 8-byte reception, the contents of data regions 1 to 8 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data regions 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

Figure 22.16, LIN Reception Processing and Corresponding Buffers depicts the LIN reception processing and the corresponding buffers.

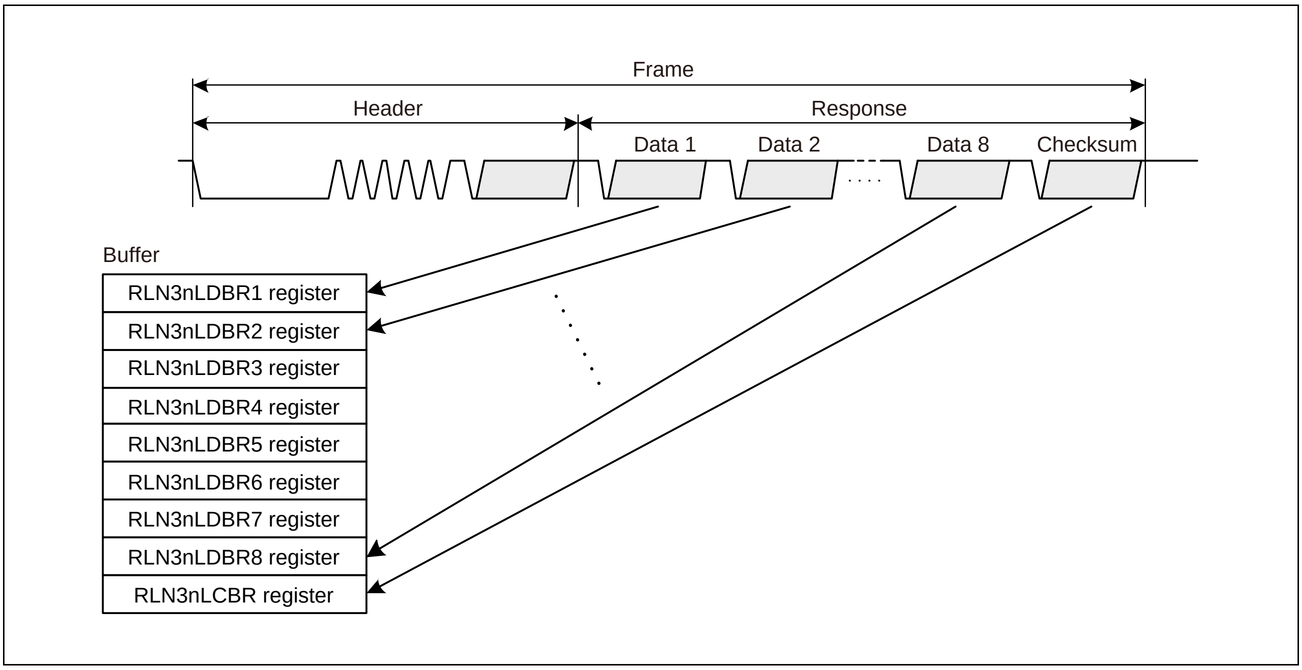

Figure 22.16 LIN Reception Processing and Corresponding Buffers

[Reception of Data 1]

When the reception of the first byte of data is completed, the D1RC flag in the RLN3nLST register is set to 1 (successful data 1 reception).

22.7.4.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses of 10 bytes or greater can also be transmitted and received.

In such case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is greater than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be transmitted or received is not the final data group) in the first data group (variable from 0 to 8 bytes) before transmitting or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the final data group. If it is the final data group, the LSS bit in the RLN3nLDFC register should be set to 0 (indicating that the next data group to be transmitted or received is the final data group) before transmitting or receiving the data group, and a checksum should be appended to the final data group.

By changing the RFDL bit setting in RLN3nLDFC register when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register to 1 (frame separate mode).

NOTE

In LIN slave mode, the LIN/UART interface can detect a new break field during the transmission or reception of a response.

22.7.5 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

22.7.5.1 Wake-up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN3nLDFC register to 1 (LIN master mode: response transmission), or setting the RCDS bit in the RLN3nLDFC register to 1 (LIN slave mode: response transmission), and then the FTS bit in the RLN3nLTRC register to 1 (frame transmission, header reception or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal is set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register in LIN master mode is 1 (LIN2.x), the LIN system clock (f_{LIN}) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register. By setting the WUTL[3:0] bits of the RLN3nLWUP register to 0100_B (5 Tbits), 260 µs low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low-level width is output without any bit error, the FTC flag in the RLN3nLST register is set to 1 (successful frame response or wake-up transmission) and when the FTCIE bit in the RLN3nLIE register is 1 (successful frame response/wake-up transmission interrupt enabled), an interrupt request for RLIN3n transmission is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is aborted and the BER flag of the RLN3nLEST register is set to 1 (bit error detected).
When RLN3nLEDE.PBERE is set in LIN master mode, set RLN3nLEST.PBER flag to 1 (physical bus error detection) at the same time of a bit error.

Figure 22.17, Wake-up Transmission Timing shows the wake-up transmission timing.

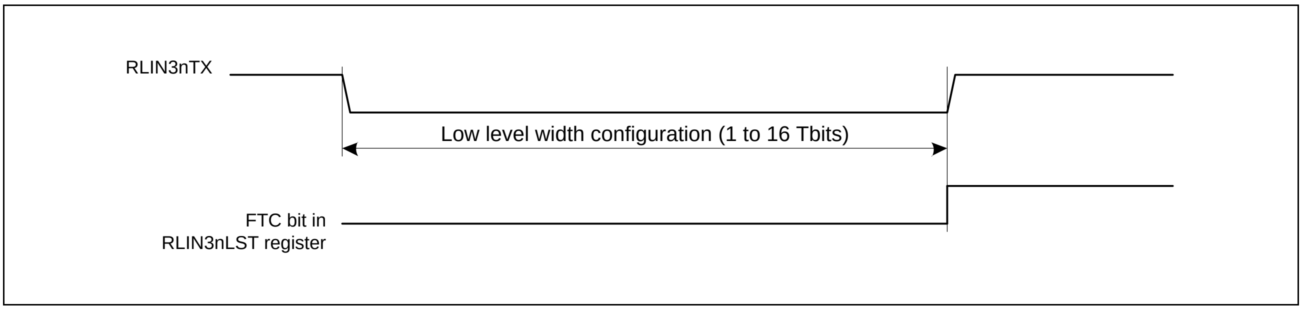

Figure 22.17 Wake-up Transmission Timing

22.7.5.2 Wake-up Reception

To detect a wake-up signal, use the input signal low-level width count function. The input signal low level width count function measures the low level width of the input signal to the RLIN3nRX pin, using the same sampling point as data reception. This allows the 2.5-Tbit or longer low-level width of the input signal of f_{LIN} to be measured.

In LIN master mode, by setting the LWBR0 bit in the RLN3nLWBR register, operation is executed without changing the baud rate generator setting at a transition between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects the LIN system clock (f_{LIN}) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200 bps while fa is selected, an input signal with a low-level width of 130 us or longer regardless of the setting of the LCKS bit in the RLN3nLMD register.

To used the wake-up reception function, in LIN wake-up mode, set the RFT bit in the RLN3nLDFC register to 0 (LIN master mode: response reception) or the RCDS bit in the RLN3nLDFC register to 0 (LIN slave mode: response reception), and then set the FTS bit in the RLN3nLTRC register to 1 (frame transmission (header reception) or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register is set to 1 (successful frame response/wake-up reception) and if the FRCIE bit in the RLN3nLIE register is 1 (successful frame response or wake-up reception interrupt enabled), an interrupt request for RLIN3n successful reception is generated.

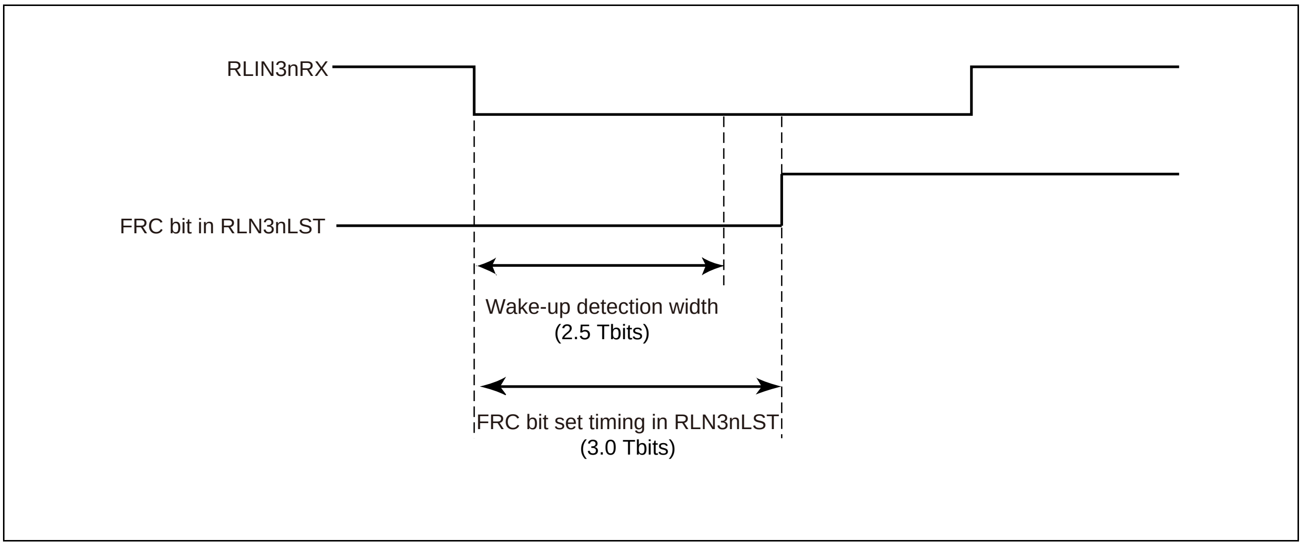

Figure 22.18 Input Signal Low level Count Function

22.7.5.3 Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, however the collision of wakeup signals is not detected in the LIN/UART interface.

22.7.6 Statuses

During LIN mode operation, the LIN/UART interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, successful header transmission/reception, can generate interrupt requests.

Table 22.97, Types of Statuses in LIN Master Mode shows the types of statuses available in LIN master mode. **Table 22.98, Types of Statuses in LIN Slave Mode** lists the types of statuses available in LIN slave mode [auto baud rate] and in LIN slave mode [fixed baud rate].

Table 22.97 Types of Statuses in LIN Master Mode

Status	Status Set Condition	Status Clear Condition	Operating Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if the LIN/UART interface actually enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if the LIN/UART interface actually enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Successful frame/wake-up transmission	When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully.	• When the next communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in RLN3nLST register	✓
Successful frame/wake-up reception	When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully.	• When the next communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in RLN3nLST register	✓
Error detection	If any of the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected).	• When the next communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software*1 • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in RLN3nLST register	✓
Successful data 1 reception	When the RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte of each data group is received successfully.*2	• When the next communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Successful header transmission	When a header field is transmitted successfully.	• When the next communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	✓

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, or BER flag in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

Table 22.98 Types of Statuses in LIN Slave Mode

Status	Status Set Condition	Status Clear Condition	Operating Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode.	After the OM0 bit of the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if the LIN/UART interface actually enters LIN operation mode.	● After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if the LIN/UART interface actually enters LIN wake-up mode.	● LIN operation mode ● LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Successful response/wake-up transmission	When a response field, a wake-up signal, or a data group is transmitted successfully.	● When cleared by software ● After transition to LIN reset mode	● LIN operation mode ● LIN wake-up mode	FTC flag in RLN3nLST register	✓
Successful response/wake-up reception	When a response field, a wake-up signal, or a data group is received successfully.	● When cleared by software ● After transition to LIN reset mode	● LIN operation mode ● LIN wake-up mode	FRC flag in RLN3nLST register	✓
Error detection	If any of the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, and BER flag of the RLN3nLEST register is set to 1 (error detected).	● When cleared by software*[1] ● After transition to LIN reset mode	● LIN operation mode ● LIN wake-up mode	ERR flag in RLN3nLST register	✓
Successful data 1 reception	When the RCDS bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte for each data group is received successfully.*[2]	● When cleared by software ● After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Successful header reception	When a header field is received successfully.	● When cleared by software ● After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	✓

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, or BER flag of the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

22.7.7 Error Statuses

22.7.7.1 LIN Master Mode

(1) Types of Error Statuses

The LIN/UART interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

All error statuses represent interrupt events.

Table 22.99, Types of Error Statuses in LIN Master Mode shows the types of error statuses.

Table 22.99 Types of Error Statuses in LIN Master Mode

Status	Error Detection Condition	Operating Mode Capable of Error Detection	Communication	Enable/ Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1,*2	• LIN operation mode • LIN wake-up mode	Aborted	Enabled	BER flag in RLN3nLEST register
Physical bus error	• LIN bus is detected to be high level when transmitting a break • LIN bus is detected to be low level when transmitting a break delimiter • LIN bus is detected to be high level when transmitting a wake-up	• LIN operation mode • LIN wake-up mode	Aborted	Enabled	PBER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Aborted	Enabled	FTER flag in RLN3nLEST register
Framing error	In response field reception, the stop bit of each data byte is low level	LIN operation mode	Aborted	Enabled	FER flag in RLN3nLEST register
Checksum error	In response field reception, checksum test results in an error	LIN operation mode	—	Disabled	CSER flag in RLN3nLEST register
Response preparation error	One of the following conditions occurs in frame separate mode during a multi-byte response reception: • The first reception data byte is received after completion of header transmission but before a response transmission/reception request is specified • The first reception data byte is received after the completion of previous data group reception but before a transmission/reception request for the next data group is specified.	LIN operation mode	Aborted	Disabled	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, processing is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately after the bit that caused the error is transmitted. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. In a multi-byte response transmission, bit errors are also detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and can be calculated using the following formula.
When the FSM bit in the RLN3nLDFC register is set to 1 (frame separate mode), the timeout time is that of the 8 data bytes until the RTS bit of the RLN3nLTRC register is set. Once the RTS bit is set, the timeout time is changed to the time based on the response field data length (the RFDL[3:0] bits in the RLN3nLDFC register).

[Frame timeout]
When classic checksum is selected (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
When enhanced checksum is selected (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]
The aforementioned timeout time is longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.
[Response timeout]
Timeout time = (number of data bytes + 1) × 14 [Tbit]
When an error is detected, time-out error detection function stops.

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), when it is cleared by software, or at a transition to LIN reset mode.

(2) Target Time Domain for LIN Error Detection

Figure 22.19, Target Time Domain for LIN Error Detection (LIN Master Mode) shows the time domain in which the LIN/UART interface in LIN master mode performs monitoring for error detection.

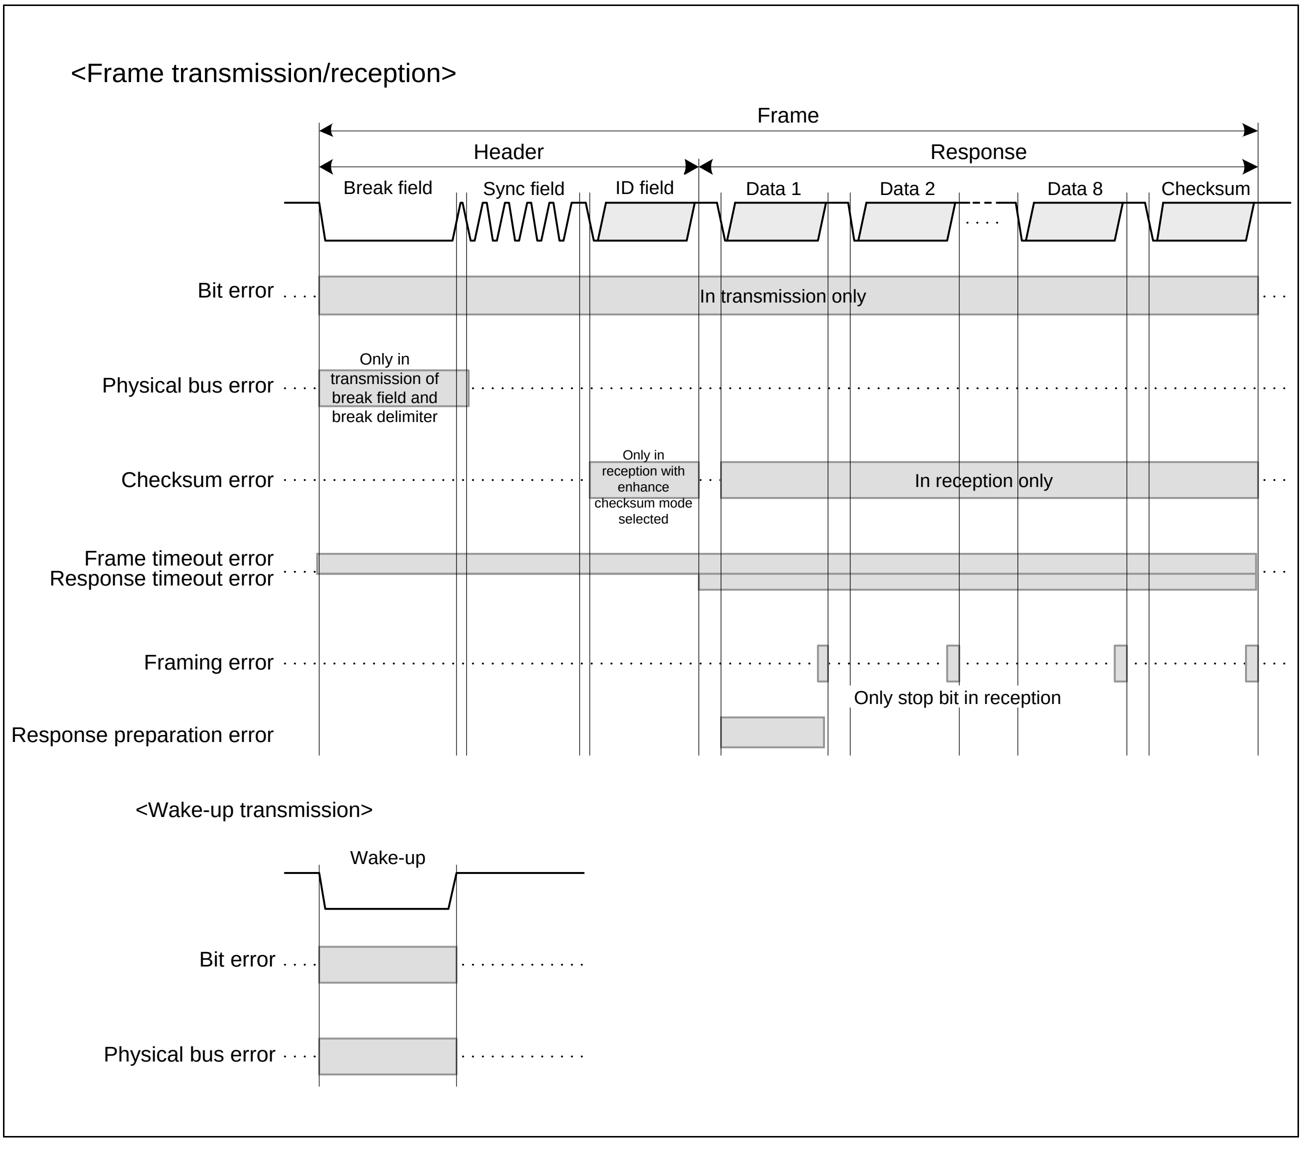

Figure 22.19 Target Time Domain for LIN Error Detection (LIN Master Mode)

22.7.7.2 LIN Slave Mode

(1) Types of Error Statuses

The LIN/UART interface can detect seven types of error statuses in LIN slave mode [auto baud rate] or in LIN slave mode [fixed baud rate]. These error statuses can be verified by checking the corresponding bits in the RLN3nLEST register.

Table 22.100, Types of Error Statuses in LIN Slave Mode shows the types of error statuses.

Table 22.100 Types of Error Statuses in LIN Slave Mode

Status	Error Detection Condition	Operating Mode Capable of Error Detection	Communication	Enable/Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match*1 *2	● LIN operation mode ● LIN wake-up mode	Aborted	Enabled	BER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Aborted	Enabled	TER flag in RLN3nLEST register
Framing error	In frame reception, the stop bit of each data byte is low level	LIN operation mode	Aborted	Enabled	FER flag in RLN3nLEST register
Sync field error	If the width of the break low level is greater than the width set by the LBLT bit in the RLN3nLBFC register and the sync field is not 55_H	LIN operation mode	Aborted	Enabled*4	SFER flag in RLN3nLEST register
Checksum error	In response field reception, the checksum test results in an error	LIN operation mode	—*5	Disabled	CSER flag in RLN3nLEST register
ID parity error	If the received ID parity bit does not match the value that is automatically calculated by the LIN/UART interface	LIN operation mode	Aborted	Enabled	IPER flag in RLN3nLEST register
Response preparation error	● After the reception of a header, if the response is not prepared before the first reception data byte is received ● In a multi-byte response reception, if the preparation for the reception of next data group does not complete before the first reception data byte for the next data group is received	LIN operation mode	Aborted	Disabled	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, processing is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately after the bit that caused the error is transmitted. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. In a multi-byte response transmission, bit errors are also detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the LCS bit in the RLN3nLDFC register), and this can be calculated according to the following formula. The timeout time is that of 8 data bytes until the RTS bit or the LNRR bit of the RLN3nLTRC register is set. When the RTS bit is set, the timeout time is changed to the time based on the response field data length (RFDL[3:0] bit of the RLN3nLDFC register). When the LNRR bit is set, the timeout function stops.

[Frame timeout]
When classic checksum is selected (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
When enhanced checksum is selected (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.

[Response timeout]
Timeout time = (number of data bytes + 1) × 14 [Tbit]
When en error is detected, time-out error detection function stops.

Note 4. Only reflection of the result to the SFER flag can be enabled/disabled. Error detection cannot be enabled/disabled.

Note 5. Checksum determination is performed upon completion of response frame reception. In case of an error, the successful reception flag is not set to 1.

The error status is cleared by software or at a transition to LIN reset mode.

(2) Target Time Domain for LIN Error Detection

Figure 22.20, Target Time Domain for LIN Error Detection (LIN Slave Mode) shows the time domain in which the LIN/UART interface in slave mode performs monitoring for error detection.

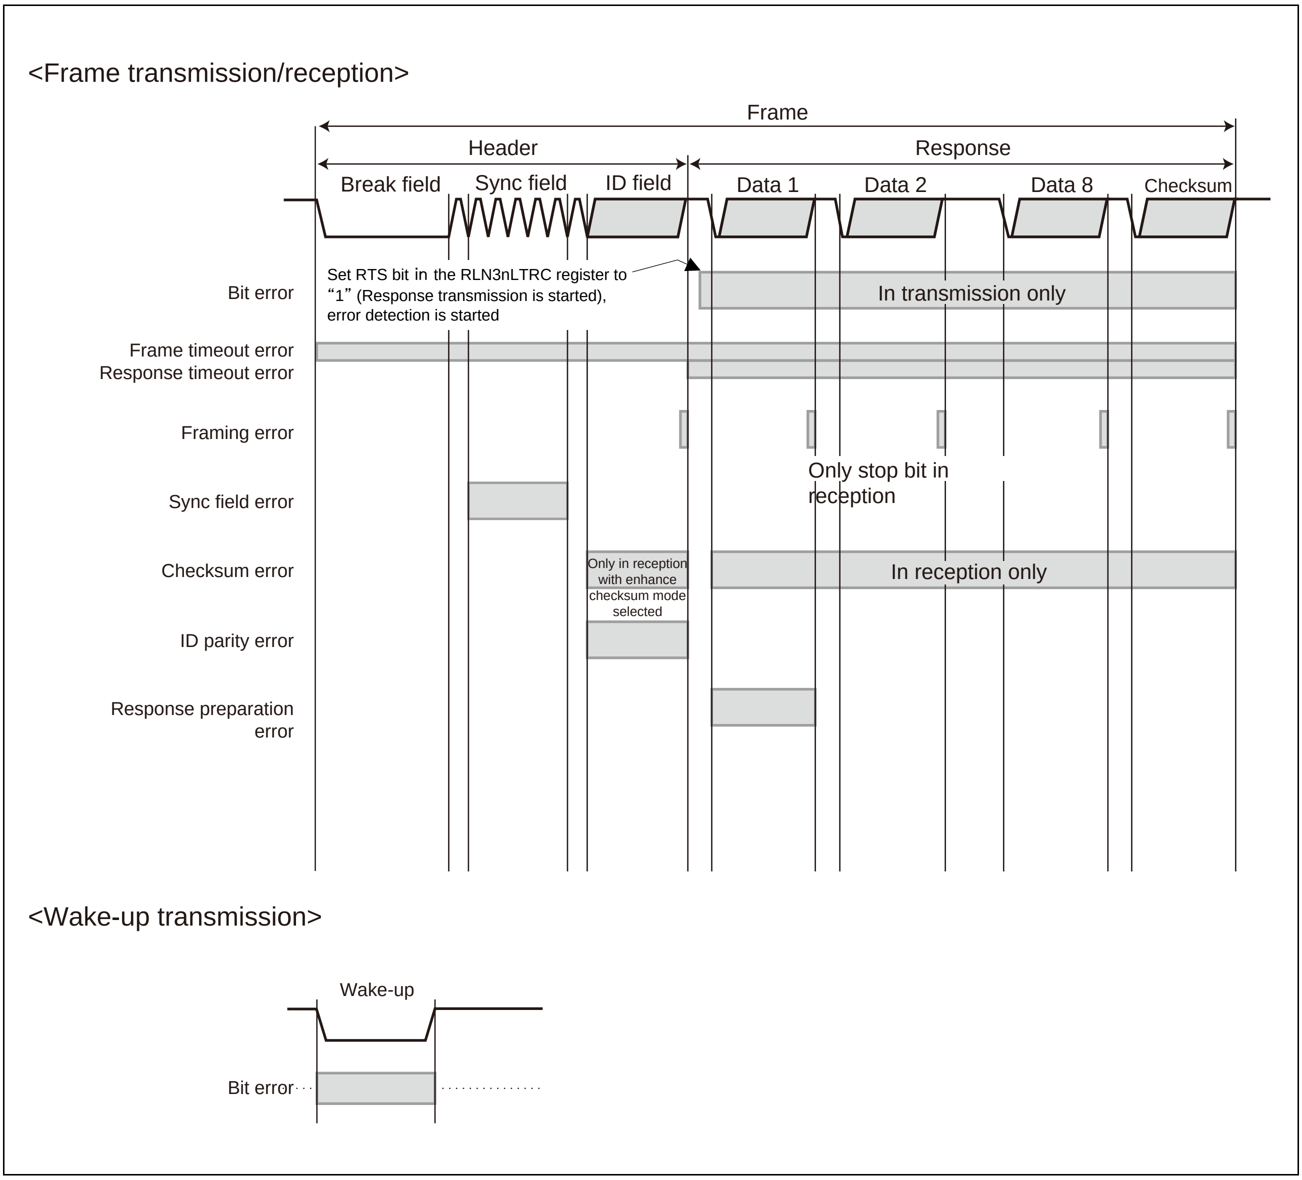

Figure 22.20 Target Time Domain for LIN Error Detection (LIN Slave Mode)

22.8 UART Mode

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 01_B (UART mode) and the OM0 bit in the RLN3nLCUC register to 1 changes the mode to UART mode, turning the OMM0 bit in the RLN3nLMST register to 1.

22.8.1 Transmission

Figure 22.21, LIN/UART Interface (in UART Mode) Transmission Operation shows the operation of the LIN/UART interface (in UART mode) during transmission. **Table 22.101, LIN/UART Interface (UART Mode) Transmission Processing** provides processing of the LIN/UART interface (in UART mode) during transmission.

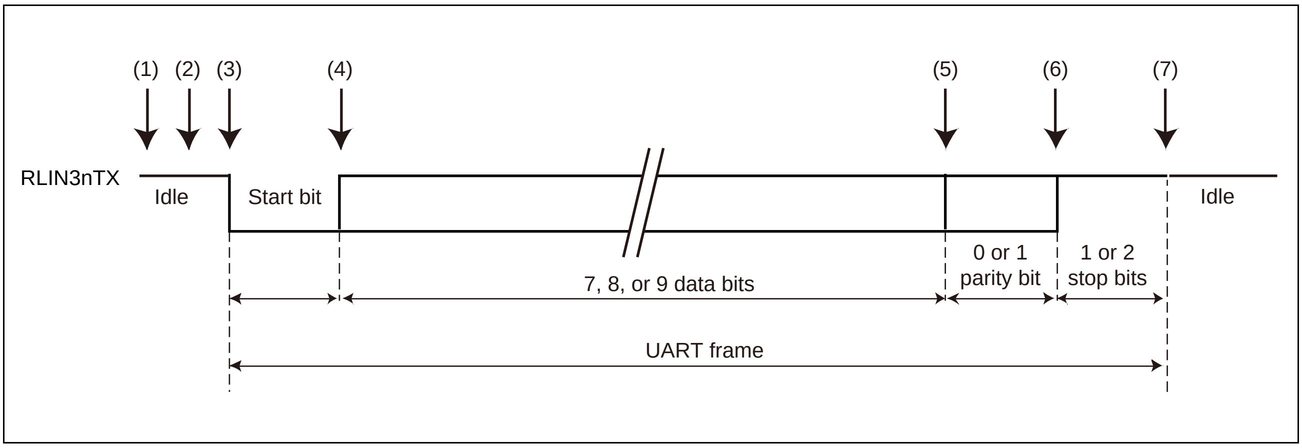

Figure 22.21 LIN/UART Interface (in UART Mode) Transmission Operation

Table 22.101 LIN/UART Interface (UART Mode) Transmission Processing

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate. • Sets noise filter ON/OFF. • Enables error detection. • Configures data format. • Sets an interrupt generation timing. • Exits from LIN reset mode. • Sets the transmission enable bit (UTOE bit) to 1.	• Waits for a transmission trigger (RLN3nLUTDR register) by software.
(2)	• Specifies the data to be transmitted in the UART transmit data register (RLN3nLUTDR) or UART wait transmit data register (RLN3nLUWTDR).	• Sets the transmission status flag.
(3)	• Waits for an interrupt request.	• Transmits a start bit (for switching from reception to transmission in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see **Section 22.8.1.4, Transmission Start Wait Function**.) [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • Outputs a transmission interrupt.
(4)	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • When transmitting data continuously, specifies the next data to be transmitted in the UART transmission data register (RLN3nLUTDR) and waits for the generation of an interrupt request.	Transmits the data specified in the UART (wait) transmission data register.
(5)		Transmits a parity bit when parity is used.
(6)		Transmits 1 or 2 stop bits.

Table 22.101 LIN/UART Interface (UART Mode) Transmission Processing

	Software Processing	LIN/UART Interface Processing
(7)	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] ● If another item of transmission data is set, goes to step (3).	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] ● If another piece of transmission data is set, goes to step (3). ● If the next data to be transmitted is not specified, clears the transmission status flag.
	[When the UTIGTS bit is 1 (a transmission interrupt is output upon completion of transmission)] ● When transmitting data continuously, goes to step (2).	[When the UTIGTS bit is 1 (a transmission interrupt is output upon completion of transmission)] ● Generates RLIN3n transmission interrupt request. ● Clears the transmission status flag.

22.8.1.1 Continuous Transmission

The LIN/UART interface (in UART mode) can transmit multiple sets of data continuously by using the RLN3nLUTDR register. **Figure 22.22, Operation Examples of LIN/UART Interface (UART Mode) Continuous Transmission** shows an operation example where the transmission interrupt generation timing is the start of transmission and an operation example where the transmission interrupt generation timing is the completion of transmission.

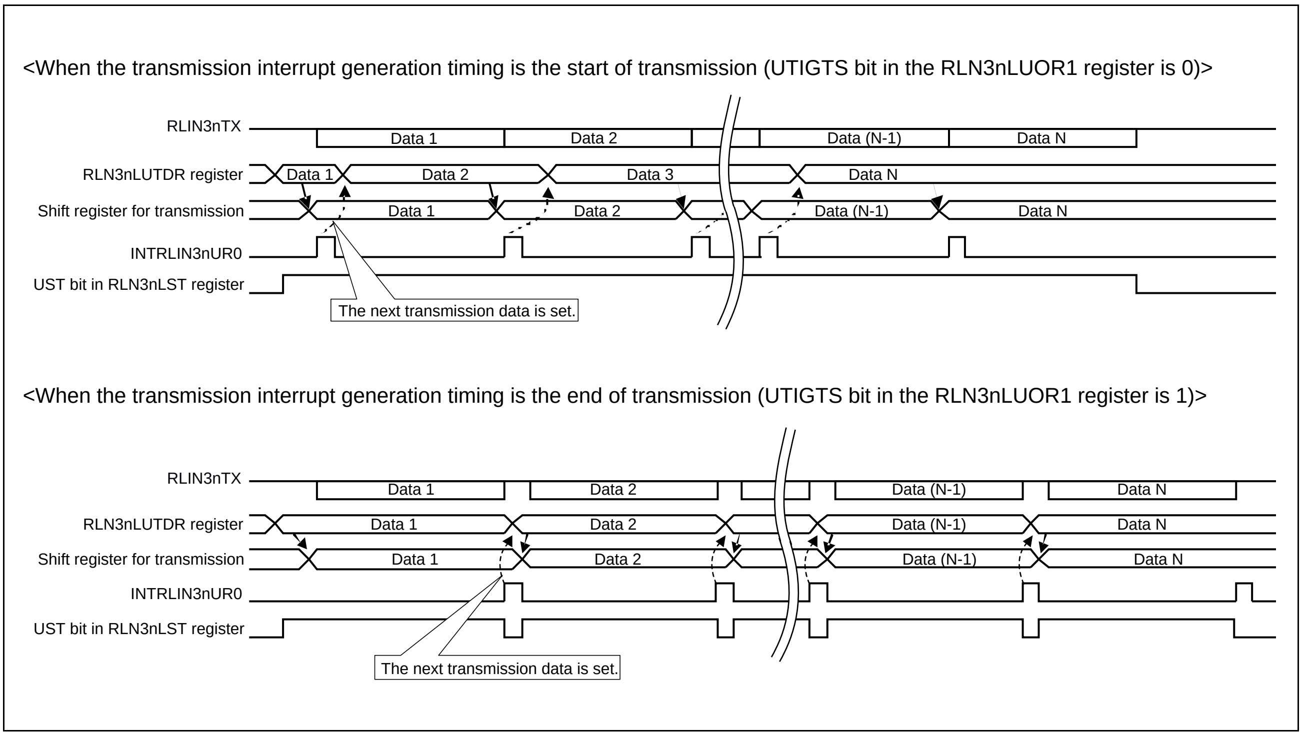

Figure 22.22 Operation Examples of LIN/UART Interface (UART Mode) Continuous Transmission

An interrupt can be generated at the completion of a transmission by changing the UTIGTS bit in the RLN3nLUOR1 register from 0 to 1 after the start of transmission of final data, provided that the transmission interrupt generation timing is the start of transmission and the completion of transmission of final data needs to be known.

22.8.1.2 UART Buffer Transmission

The LIN/UART interface (in UART mode) has a maximum of nine bytes of UART buffers and it is capable of performing continuous transmissions through the use of UART buffers.

Figure 22.23, UART Buffer Transmission in LIN/UART Interface (in UART Mode) shows the UART buffer transmission operation of the LIN/UART interface (in UART mode).
Table 22.102, UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode) shows the UART buffer transmission processing.

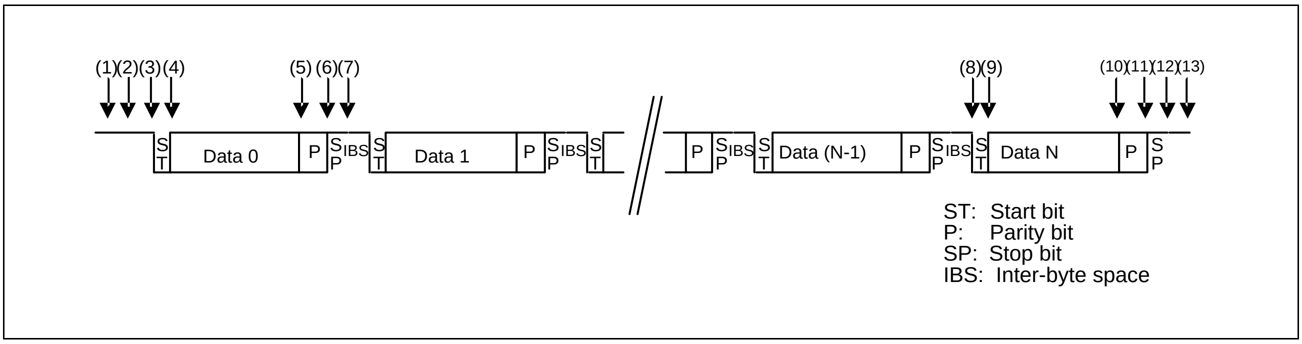

Figure 22.23 UART Buffer Transmission in LIN/UART Interface (in UART Mode)

Table 22.102 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode)

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables error detection • Configures data format • Sets the interrupt generation timing to the completion of transmission. • Exits from LIN reset mode. • Sets the transmission enable bit (UTOE bit) to 1	• Waits for a transmission trigger (RTS bit) by software
(2)	• Sets the UART buffer data length and whether the start of transmission must be waited. • Specifies the data to be transmitted in the UART data 0 buffer register (RLN3nLUDB0) and the LIN data buffer b register (RLN3nLDBRb). (b =1 to 8) • Sets the UART buffer transmission start bit (RTS).	• Sets the transmission status flag.
(3)	Waits for an interrupt request.	Transmits a start bit. (For switching from reception to transmission in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see **Section 22.8.1.4, Transmission Start Wait Function**.)
(4)		Transmits the data specified in the UART data buffer 0 register (RLN3nLUDB0) or the LIN/UART data buffer b register (RLN3nLDBRb).
(5)		Transmits a parity bit when parity is used.
(6)		Transmits 1 or 2 stop bits (When the number of data set in UART buffer data length select bits is 1, proceeds to (12).)
(7)		Transmits an inter-byte space (idle).
		Repeats steps (3) to (7) until the number of data set in the UART buffer data length select bits -1 is reached.

Table 22.103 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode)

	Software Processing	LIN/UART Interface Processing
(8)	Waits for an interrupt request.	Transmits a start bit.
(9)		Transmits the data specified in the LIN/UART data buffer b register (RLN3nLDBRb).
(10)		Transmits a parity bit when parity is used.
(11)		Transmits 1 or 2 stop bits.
(12)		● Sets the successful buffer transmission flag. ● Clears the UART buffer transmission start bit (RTS). ● Generates a transmission interrupt request signal. ● Clears the transmission status flag.
(13)	● Checks the RLN3nLST register, and clears flags ● When continuously transmitting data, goes to step (2).	

(1) UART Buffer Transmission

For a 9-byte transmission, the contents stored in the RLN3nLUDB0 and RLN3nLDBR1 to RLN3nLDBR8 registers are transmitted to data regions 0 to 8. The RLN3nLUDB0 register is used only if 9-byte transmission is specified. In other cases, the RLN3nLDBR1 to RLN3nLDBR8 registers are selected depending on the data length. For a 4-byte transmission, the contents stored in the RLN3nLDBR1 to RLN3nLDBR4 registers are transmitted to data regions 1 to 4, but the contents of the RLN3nLDBR5 to RLN3nLDBR8 registers are not transmitted. An RLIN3n transmission interrupt is generated after the number of data specified in the MDL [3:0] bits of the RLN3nLDFC register is transmitted. The spaces between each transmitted data can be specified in the IBS bit of the RLN3nLSC register.

Figure 22.24, UART Buffer and Transmission Processing (for 9-Byte Transmission) shows a 9-byte UART buffer and the transmission processing.

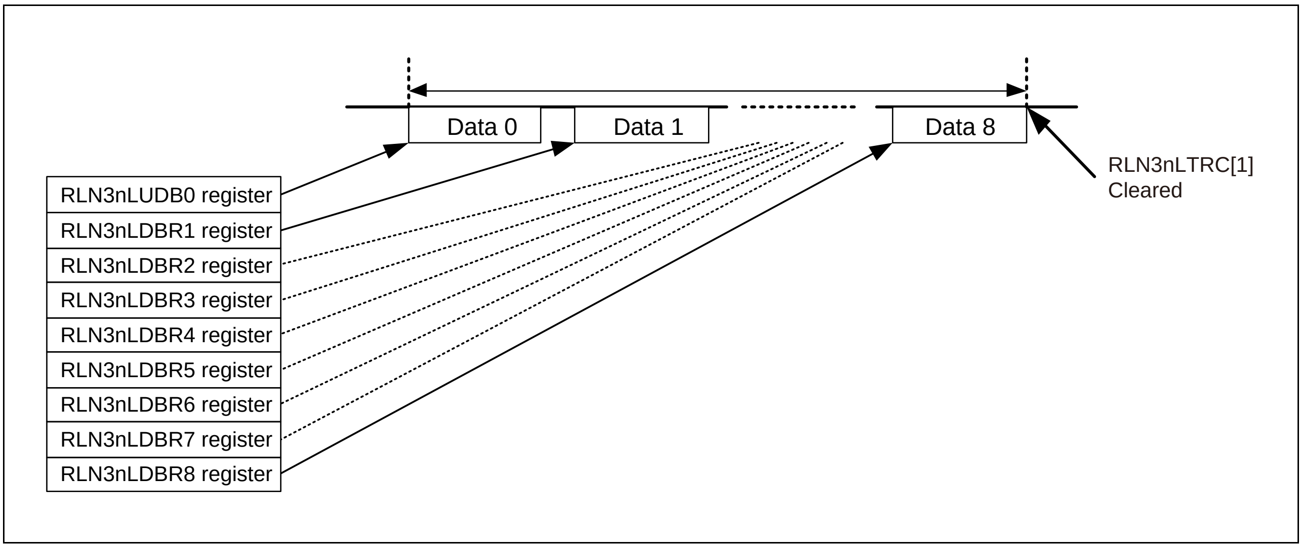

Figure 22.24 UART Buffer and Transmission Processing (for 9-Byte Transmission)

22.8.1.3 Data Transmission

One bit of data is transmitted per Tbit.

In half-duplex communication, if the BERE bit in the RLN3nLEDE register is 1 (bit error detection enabled), the transmission data and the input pin level are compared bit by bit during data transmission, and the results are stored in the BER flag of the RLN3nLEST register (see **Section 22.7.7, Error Statuses**). The timing at which the input pin is sampled during data transmission can vary depending on the settings of the LPRS[2:0] and NSPB[3:0] bits in the RLN3nLWBR register.

The bit error detection timing in UART mode is shown in **Table 22.104, Error Detection Timing in UART Mode**.

Table 22.104 Error Detection Timing in UART Mode

Sampling Count Per Bit	Bit Error Detection Timing
6 samples	3rd clock cycle + 1 prescaler clock
7 samples	4th clock cycle + 1 prescaler clock
8 samples	4th clock cycle + 1 prescaler clock
9 samples	5th clock cycle + 1 prescaler clock
10 samples	5th clock cycle + 1 prescaler clock
11 samples	6th clock cycle + 1 prescaler clock
12 samples	6th clock cycle + 1 prescaler clock
13 samples	7th clock cycle + 1 prescaler clock
14 samples	7th clock cycle + 1 prescaler clock
15 samples	8th clock cycle + 1 prescaler clock
16 samples	8th clock cycle + 1 prescaler clock

Example of Data Transmission Timing (when 1 Tbit = 16 samplings) is shown in **Figure 22.25, Example of Data Transmission Timing (When 1 Tbit = 16 samplings).**

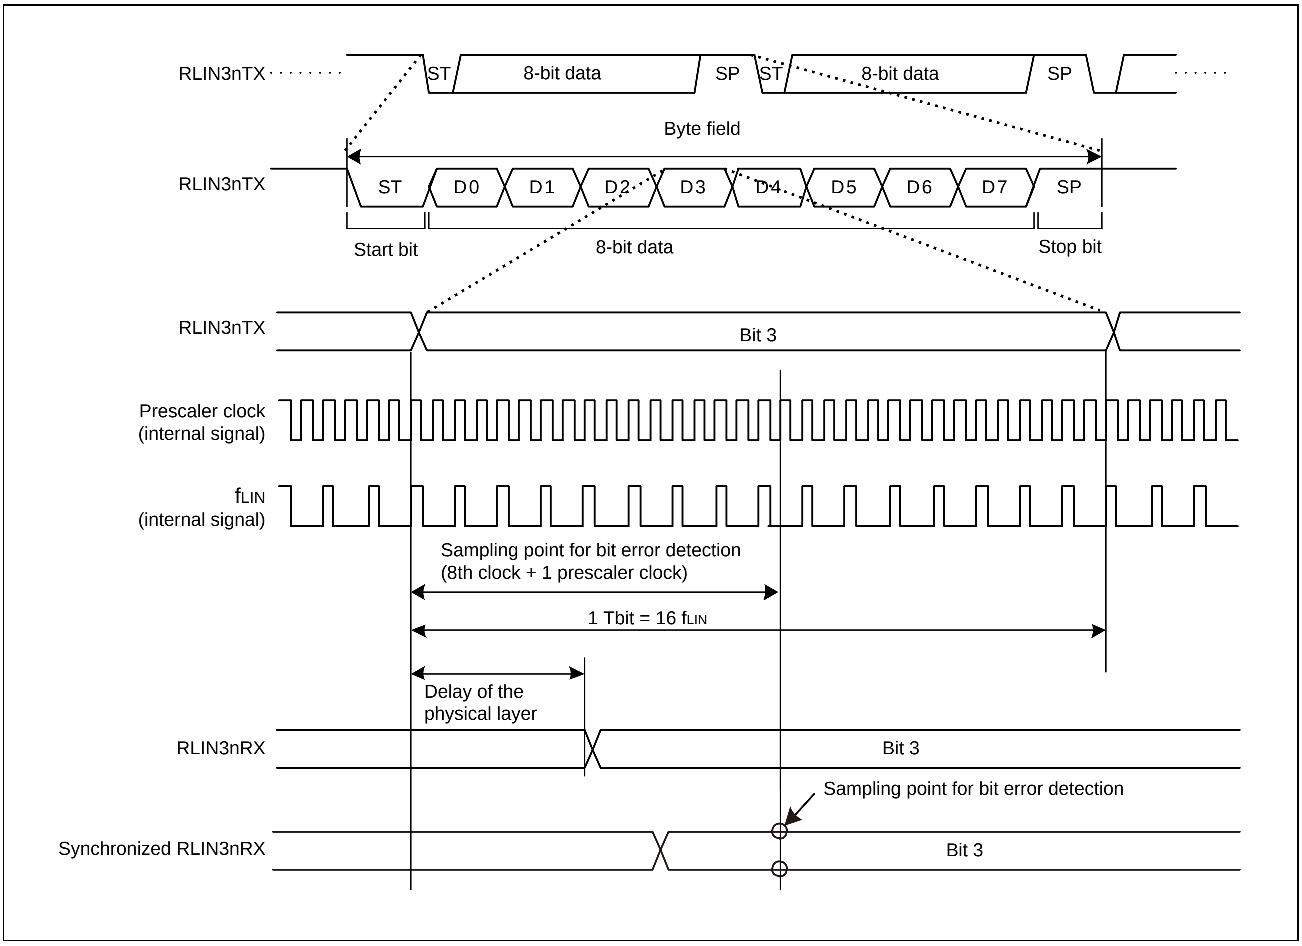

Figure 22.25 Example of Data Transmission Timing (When 1 Tbit = 16 samplings)

22.8.1.4 Transmission Start Wait Function

For performing half-duplex communication, the LIN/UART interface (in UART mode) has the function of securing the reception stop bit length when switching from reception to transmission.

If it is desired to delay the start of transmission until the stop bits for the reception are completed, specify the transmission data in the RLN3nLUWTDR register, which is used only for the wait function, instead of specifying it in the RLN3nLUTDR register as a transmission start request. When transmitting from the UART buffer, set the RTS bit in the RLN3nLTRC register to 1 (UART buffer transmission start) while the UTSW bit in the RLN3nLDFC register is set to 1.

In this case, the LIN/UART interface delays the start of transmission until the stop bits of reception data are completed.

It should be noted that even if the UART stop bit length select bit (USBLS) in RLN3nLBFC register is 1 (stop bits = 2 bits), there is only a 1-bit delay.

Figure 22.26, Transmission Wait Function (Case When Transmit Data Is Set While Stop Bits Are Being Received) shows the operation of transmission wait function.

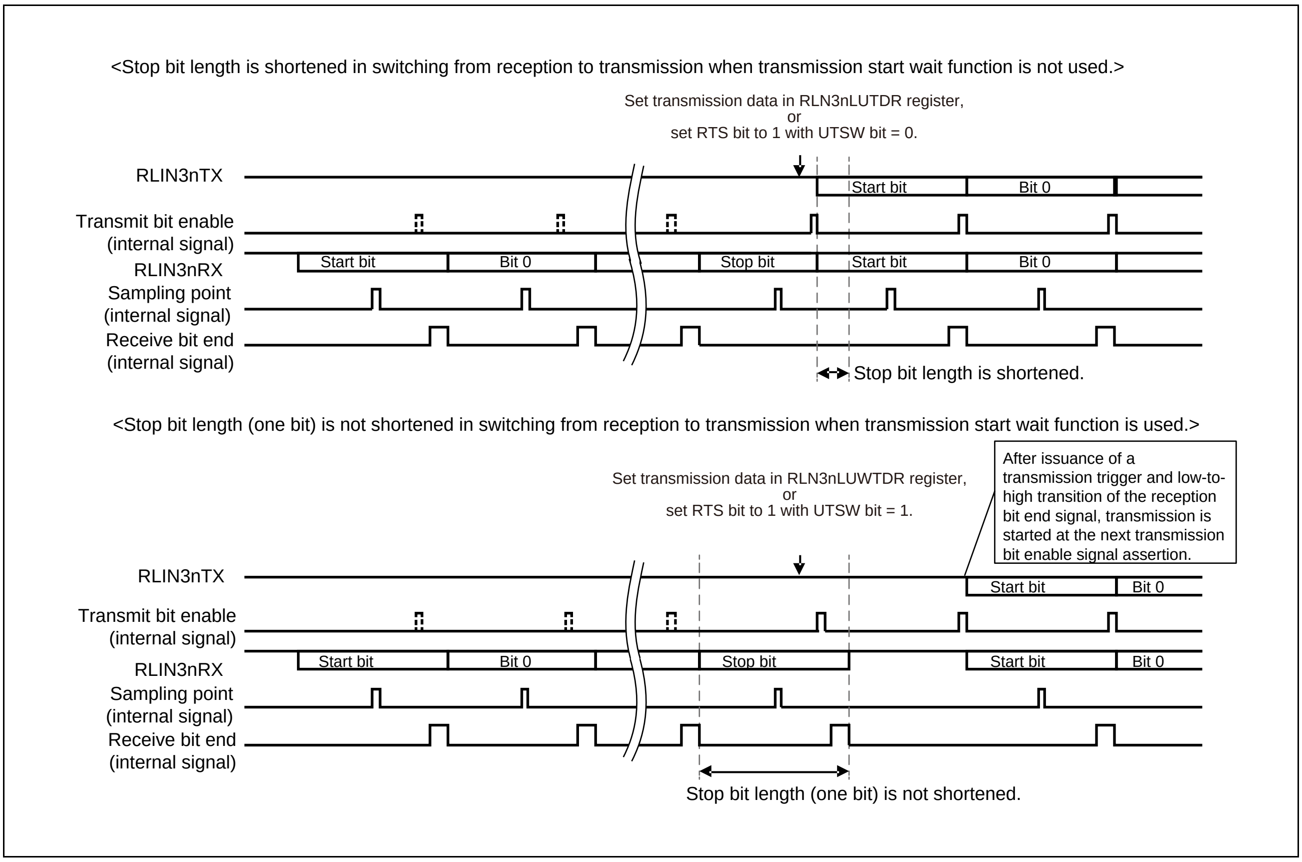

Figure 22.26 Transmission Wait Function (Case When Transmit Data Is Set While Stop Bits Are Being Received)

22.8.2 Reception

Figure 22.27, LIN/UART Interface (in UART Mode) Reception Operation shows the LIN/UART interface (in UART mode) reception operation. **Table 22.105, LIN/UART Interface (in UART Mode) Reception Processing** shows the LIN/UART interface (in UART mode) reception processing.

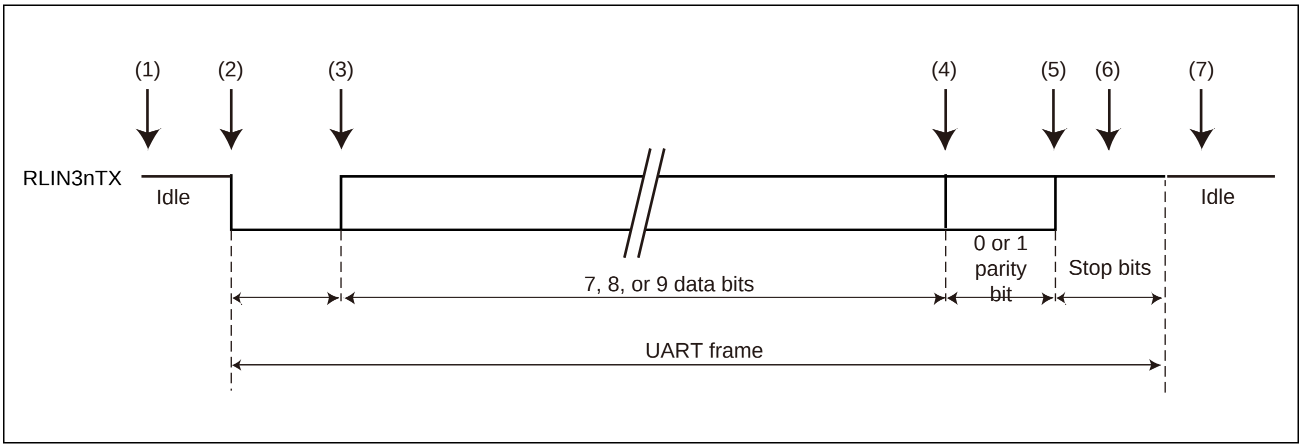

Figure 22.27 LIN/UART Interface (in UART Mode) Reception Operation

Table 22.105 LIN/UART Interface (in UART Mode) Reception Processing

	Software Processing	LIN/UART Interface Processing
(1)	● Sets a baud rate. ● Sets noise filter ON/OFF. ● Enables error detection. ● Configures data format. ● Exits from LIN reset mode. ● Sets the reception enable bit (UROE bit) to 1.	● Waits for the reception to be enabled by software. ● Waits for detection of a start bit.
(2)	Waits for an interrupt request.	● Waits for a falling edge from the reception pin, and detects a start bit. ● Sets the reception status flag.
(3)		Receives data.
(4)		Receives a parity bit when parity is used.
(5)		Receives only 1 stop bit.
(6)		● Generates a RLIN3n successful reception interrupt request. ● Clears the reception status flag.
(7)	Checks the RLN3nLST register, and clears flags	Waits for a falling edge from the reception pin.

22.8.2.1 Data Reception

Data reception is performed by using the synchronized RLIN3nRX (an internal signal) that is the input from the RLIN3nRX pin synchronized with the prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, resampling is performed 0.5 Tbits later when the number of sampling per 1 Tbit is even and {(the number of sampling + 1) / 2} / (the number of sampling) Tbits later when the number is odd. If the synchronized RLIN3nRX signal is low level, the bit is recognized as a start bit. The bit is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected during the resampling.

After the start bit is detected, 1 bit is sampled per Tbit.

However, when the BERE bit in the RLN3nLEDE register is 1, the sampling point is the same as the bit error detection timing.

The LIN/UART interface has a noise filter function for received data. If the LRDNFS bit in the RLN3nLMD register is 0, the noise filter is used. For a sampling value, the value determined by a 3-sampling majority rule by the prescaler clock is used. If the LRDNFS bit in the RLN3nLMD register is 1, the noise filter is not used. In this case, for a sampling value, the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 22.28, Example of Data Reception Timing (When 1 Tbit = 16 samplings) shows an example of data reception timing.

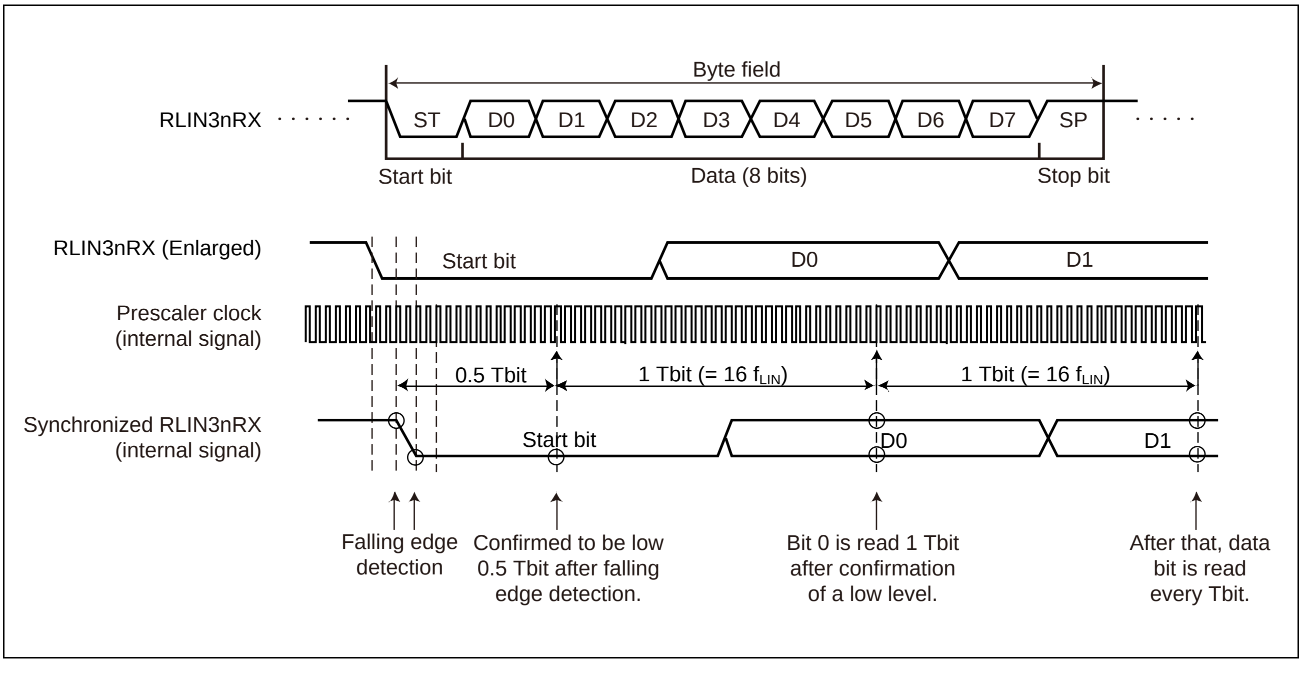

Figure 22.28 Example of Data Reception Timing (When 1 Tbit = 16 samplings)

22.8.3 Expansion Bits

The LIN/UART interface (in UART mode) can transmit and receive 9-bit long data by setting the UEBE bit in the RLN3nLUOR1 register to 1.

22.8.3.1 Expansion Bit Transmission

The LIN/UART interface (in UART mode) can transmit 9-bit long data by writing the 9-bit data to either the UART transmission data register (RLN3nLUTDR) or the UART wait transmission data register (RLN3nLUWTDR) when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1.

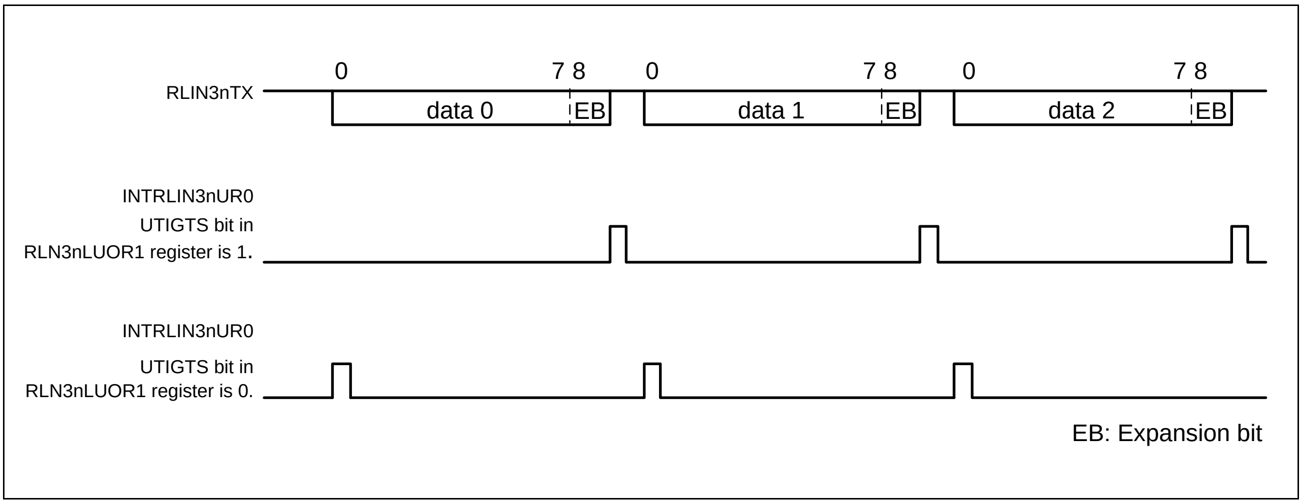

Figure 22.29 Transmission Example When Expansion Bit is Enabled (LSB First)

22.8.3.2 Expansion Bit Reception

The LIN/UART interface (in UART mode) can always receive 9-bit data without comparing the expansion bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 1, and the expansion bit data comparison enable bit (UEBDCE) is 0. Regardless of the expansion bit detection level select bit (UEBDL) setting in the UART option register 1 (RLN3nLUOR1), a RLIN3n successful reception interrupt is generated when 9-bit data is received.

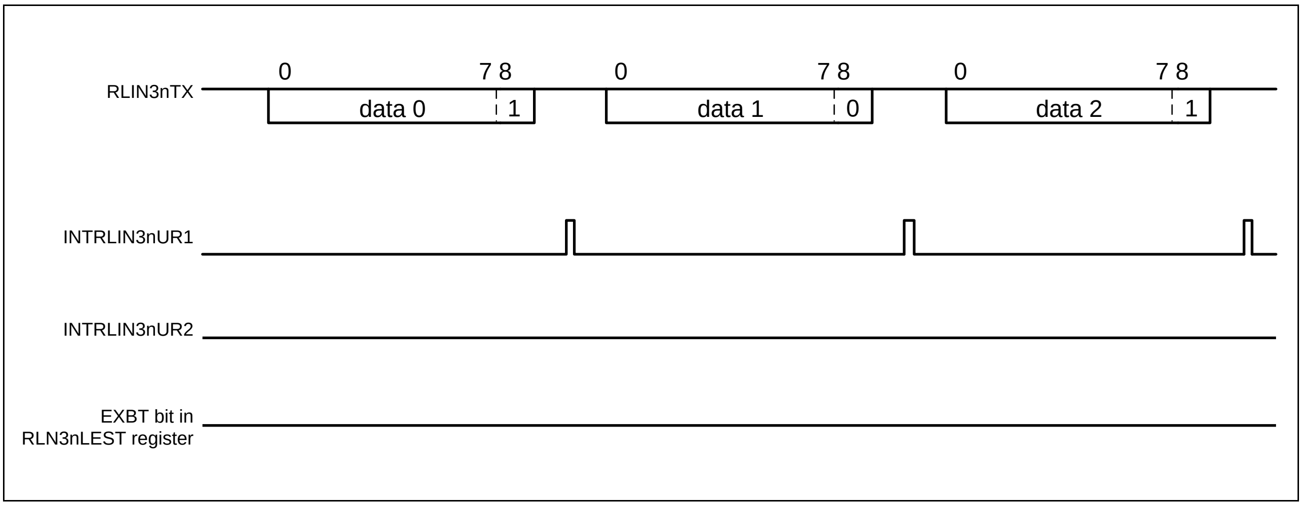

Figure 22.30 Expansion Bit Reception Example (LSB First)

22.8.3.3 Expansion Bit Reception (with Expansion Bit Comparison)

The LIN/UART interface (in UART mode) can compare received expansion bits and the UEBDL bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 0.

If the level that was set in the expansion bit detection level select bit (UEBDL) is detected, an RLIN3n status interrupt request is generated upon completion of data reception, and the expansion bit detection flag (EXBT) in the LIN error status register (RLN3nLEST) is set. If the reversed value of an expansion bit detection level is detected, RLIN3n successful reception interrupt request is generated. In either case, the received data is stored in the UART reception data register (RLN3nLURDR), unless there was an overrun error.

Figure 22.31, Expansion Bit Reception Example (with Expansion Bit Comparison) (LSB First, UEBDL = 0) shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

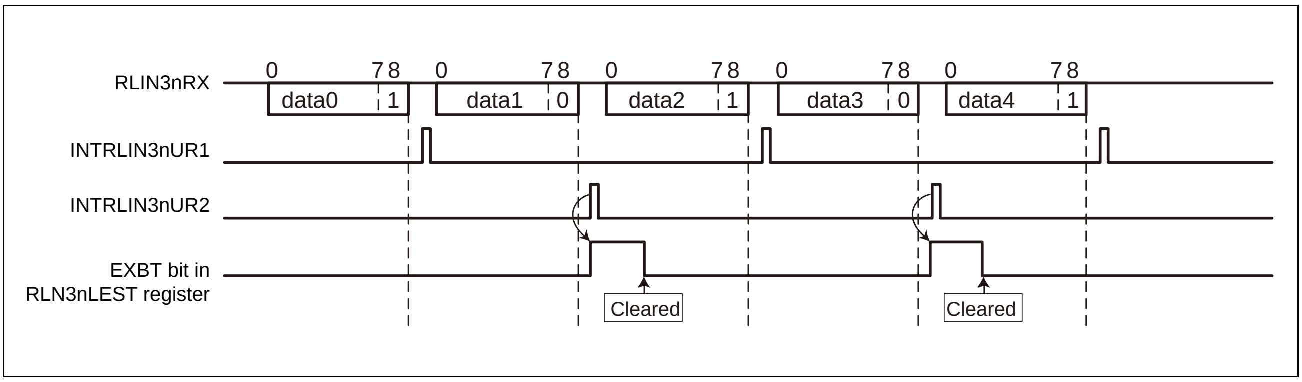

Figure 22.31 Expansion Bit Reception Example (with Expansion Bit Comparison) (LSB First, UEBDL = 0)

NOTE

- If a reception error (parity error, framing error, or overrun error) occurs in received data 0, 2, or 4 (if a reversed value of an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. In this case, a RLIN3n successful reception interrupt is not generated.
- If a reception error (parity error, framing error, or overrun error) occurs in received data 1 or 3 (if an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs, the expansion bit detection flag (EXBT) is also set.

22.8.3.4 Expansion Bit Reception (with Data Comparison)

If the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 1, when the level that was set by the expansion bit detection level select bit (UEBDL) is detected, the LIN/UART interface (in UART mode) compares the 8 bits of the received data excluding the expansion bit, with the a preset RLN3nLIDB register value.

If the result of the comparison is a match, the LIN/UART interface performs the following operations:

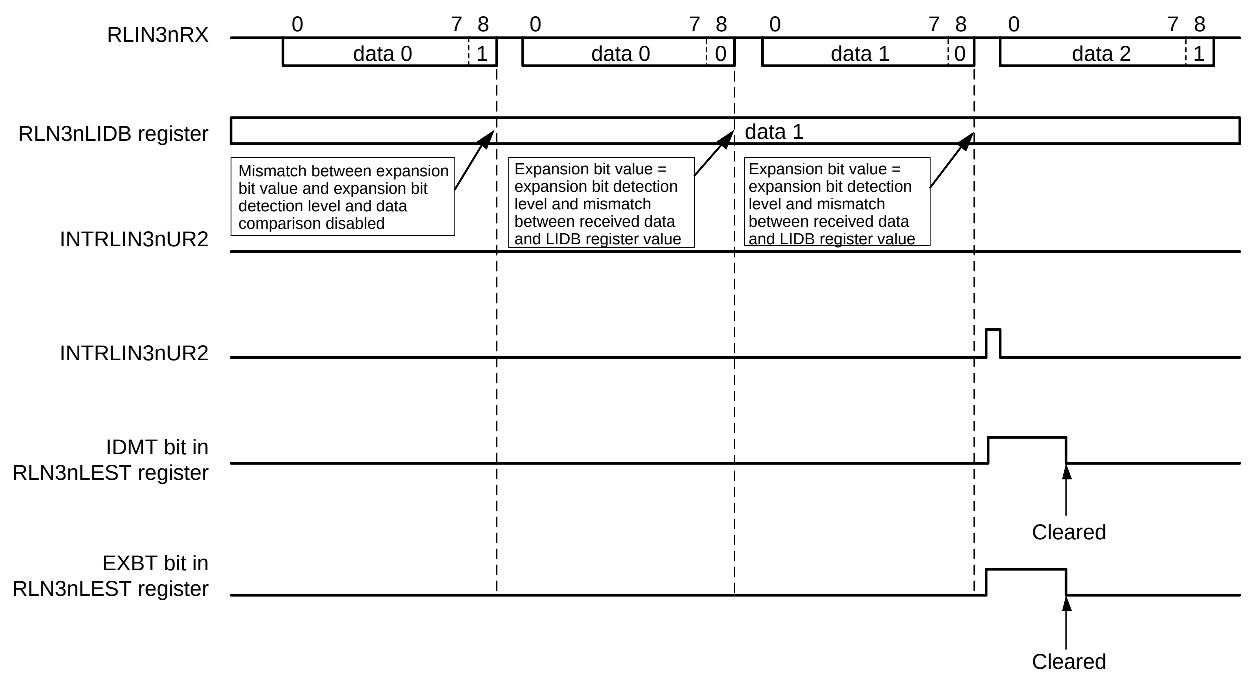
- Generates an RLIN3n status interrupt
- Sets the expansion bit detection flag (EXBT)
- Sets the ID match flag (IDMT)
- Stores the received data in the UART reception data register (RLN3nLURDR)

Even when the result of the comparison is a match, successful RLIN3n successful reception interrupt is not generated.

If the result of the comparison is not a match, no RLIN3n successful reception interrupt or RLIN3n status interrupt is generated, and the EXBT and IDMT flags are not set to 1. The received data is not stored in the UART reception data register (RLN3nLURDR).

When changing the UEBDCE bit to 0, make the change before the reception of the next data is completed.

Figure 22.32, Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL = 0) shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.



Note: If a reception error (parity error, framing error, or overrun error) occurs, an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs and the result of comparison is a match, the EXBT and IDMT are also set to 1.

Figure 22.32 Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL = 0)

22.8.4 Statuses

In UART mode, the LIN/UART interface can detect five types of statuses.

Two statuses, successful UART buffer transmission and error detection, can generate interrupt requests.

Table 22.106, Types of Statuses in UART Mode shows the types of statuses available in UART mode.

Table 22.106 Types of Statuses in UART Mode

Status	Status Set Condition	Status Clear Condition	Corresponding Bit	Interrupt
LIN reset mode	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode.	OMM0 bit in RLN3nLMST register	—
Successful UART buffer transmission	• When the UTIGTS bit in the RLN3nLUOR1 register is 0 (transmission interrupt request is generated upon start of transmission), if the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register) is started. • When the UTIGTS bit in the RLN3nLUOR1 register is 1 (transmission interrupt request is generated upon completion of transmission), if the transmission of the data length specified by the MDL bit in the RLN3nLDFC register is completed.	• When cleared by software • After transition to LIN reset mode	FTC flag in RLN3nLST register	✓
Error detection	If any of the UPER flag, IDMT flag, EXBT flag, FER flag, OER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected).	• When cleared by software*[1] • After transition to LIN reset mode	ERR flag in RLN3nLST register	✓
Transmission status	• When data is written to the RLN3nLUTDR or RLN3nLUWTDR register. • When 1 is written to the RTS bit in the RLN3nLTRC register.	• When the transmission of the data specified in the RLN3nLUTDR or RLN3nLUWTDR register is completed, but the next transmission data is not specified. • When the transmission of the data in the UART buffer is completed and the RTS bit in the RLN3nLTRC register is cleared. • After transition to LIN reset mode	UTS flag in RLN3nLST register	—
Reception status	When a start bit is detected.	• When a sampling point for stop bits is detected • After transition to LIN reset mode	URS flag in RLN3nLST register	—

Note 1. Writing a 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register when not in the LIN reset mode sets the ERR flag in the RLN3nLST register to 0.

22.8.5 Error Statuses

Types of Error Statuses

In UART mode, the LIN/UART interface can detect four types of errors and two types of statuses. The condition of these statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

Table 22.107, Types of Statuses in UART Mode lists applicable status types.

Table 22.107 Types of Statuses in UART Mode

Status	Error Detection Condition	Communication	Enable/Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data monitored on the reception pin do not match*[1]	Continues until the transmission of the specified transmission data is completed.	Enabled	BER flag in RLN3nLEST register
Overrun error	After received data is stored in the RLN3nLURDR register, the next data is received before the previous data is read. (In this case, no data is stored in the RLN3nLURDR register).	— (Reception is completed by the time this error is detected)	Enabled	OER flag in RLN3nLEST register
Framing error	When the first stop bit is low level in the reception processing.	— (Reception is completed by the time this error is detected)	Enabled	FER flag in RLN3nLEST register
Parity error	The received parity value fails to match the parity value calculated from the received data	Continues until the data reception is completed.	Disabled*[2]	UPER flag in RLN3nLEST register
Expansion bit detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register.	—	Enabled	EXBT flag in RLN3nLEST register
ID match detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register and the 8-bit received data excluding the expansion bit matches the value of the RLN3nLIDB register.	—	Enabled	IDMT flag in RLN3nLEST register

Note 1. In the case of transmission from the UART buffer, bit errors are detected even in the space between UART frames (inter-byte space).

Note 2. Setting the UPS[1:0] bits in the RLN3nLBFC register to 10_B (0 parity) disables the checking of parity bit values. In this case, no parity error is generated.

The error status is cleared by software or at a transition to LIN reset mode.

22.9 LIN Self-Test Mode

The LIN/UART interface provides a LIN self-test mode. When the LIN/UART interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and they are internally connected within the LIN/UART interface. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX. The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following four modes:

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception
- LIN slave self-test mode (transmission): Header reception and response transmission
- LIN slave self-test mode (reception): Header reception and response reception

In LIN self-test mode, the operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator.

Regardless of the setting of the baud rate related registers, the baud rate setting is the LIN communication clock source/16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to 0000_B or 1111_B.)

In addition, in LIN self-test mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- LIN slave mode (Auto baud rate)
- Frame/response timeout error

Do not use these functions.

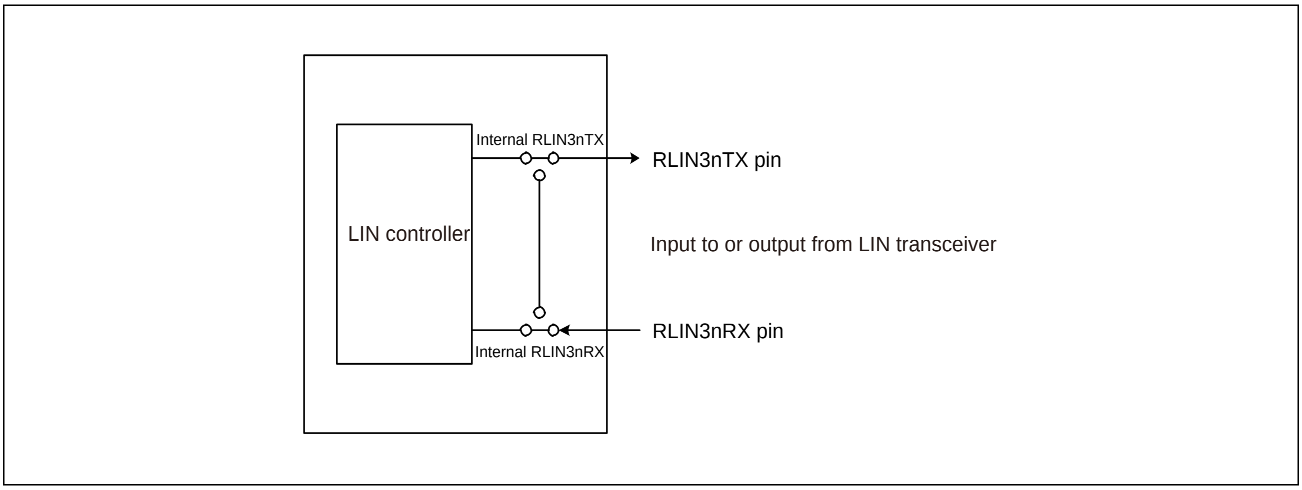


Figure 22.33 Connection in LIN Reset Mode, LIN Mode, and UART Mode

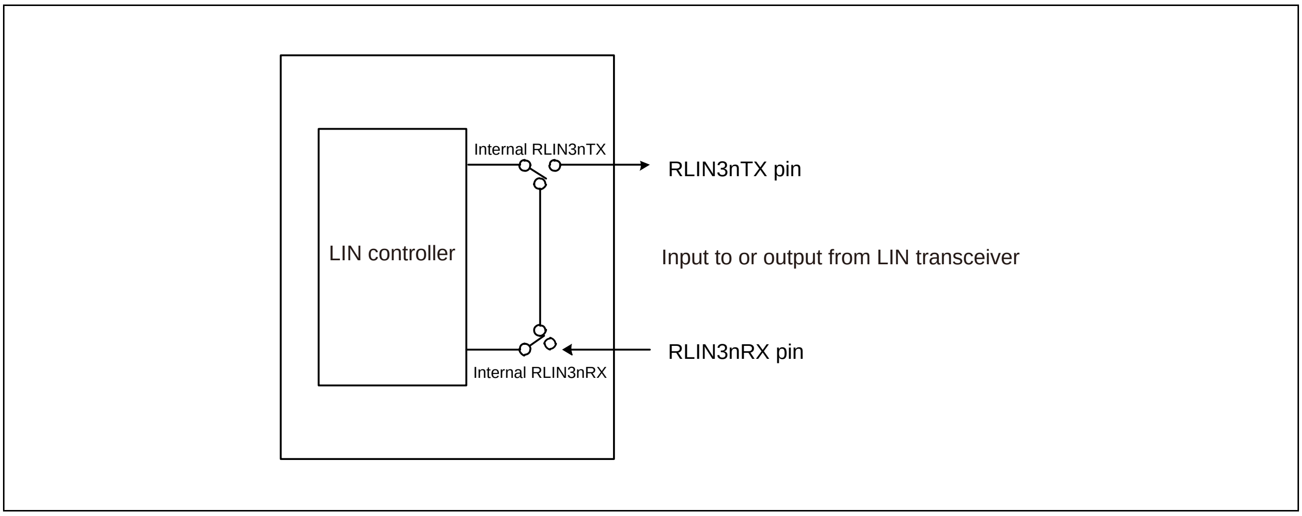

Figure 22.34 Connection in LIN Self-Test Mode

22.9.1 Transition to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.
The LSTM bit in the RLN3nLSTC register set to 1 indicates that the mode has transitioned to the LIN self-test mode.

When transitioning to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be consecutively written three times to the LIN self-test control register, as follows:

- Transition to LIN reset mode
  Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
  LMD bits in RLN3nLMD = 00_B (LIN master mode) or 11_B (LIN slave mode [fixed baud rate])
- 1st write: RLN3nLSTC register = $1010\ 0111_B$ ($A7_H$)
- 2nd write: RLN3nLSTC register = $0101\ 1000_B$ (58_H)
- 3rd write: RLN3nLSTC register = $0000\ 0001_B$ (01_H)
- Verify the transition to LIN self-test mode
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the 1st write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is aborted. The above sequence should be retried from the 1st write step. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also aborted.

22.9.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 xxxx_B*1
  RLN3nLBRP0 register = xxxx xxxx_B*1
  RLN3nLBRP1 register = xxxx xxxx_B*1
  RLN3nLMD register = 00xx xx00_B*1
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 xxxx_B*2
  RLN3nLEDE register = x000 x0xx_B
- Configure the break field and space related registers.
  RLN3nLBFC register = 00xx xxxx_B
  RLN3nLSC register = 00xx 0xxx_B
- Exit the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11_B.
- Configure the transmission frame related registers.
  RLN3nLDFC register = 00x1 xxxx_B
  RLN3nLIDB register = xxxx xxxx_B
  RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx xxxx_B
- Start header transmission → response transmission
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started). The LIN master self-test mode (transmission) is executed, interrupt is generated, and status and error status are also updated. The checksum is automatically calculated by the LIN/UART interface. To abort the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Arbitrary value can be specified.

Note 1. The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register and the LCKS bit in the RLN3nLMD register. Therefore, configuration of these registers is not necessary.

Note 2. If necessary, configure the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8**, **Section 7BC, Exception/Interrupts of RH850/F1KM**.

Note 3. When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).
The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up transmission flag is calculated by the following formula.

$$10 \times (\text{number of data bytes} + 1)\ [\text{Tbit}]$$

1 Tbit = 1/frequency of LIN communication clock source × 16

22.9.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxxx_B$*[1]
  RLN3nLBRP0 register = xxxx $xxxx_B$*[1]
  RLN3nLBRP1 register = xxxx $xxxx_B$*[1]
  RLN3nLMD register = 00xx $xx00_B$*[1]
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*[2]
  RLN3nLEDE register = x000 $x0xx_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 00xx $xxxx_B$
  RLN3nLSC register = 00xx $0xxx_B$*[1]
- Exit the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11_B.
- Configure the reception frame related registers.
  RLN3nLDFC register = 00x0 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx $xxxx_B$
  RLN3nCBR register = xxxx $xxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, perform the calculation and specify the calculated value in the RLN3nLCBR register.
- Start header transmission → response reception
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started). The LIN master self-test mode (reception) is executed, interrupt is generated, and status and error status are also updated. To abort the LIN master self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the specified value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Arbitrary value can be specified.

Note 1. The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, configuration of these registers is not necessary.

Note 2. If necessary, configure the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8**, **Section 7BC, Exception/Interrupts of RH850/F1KM**.

Note 3. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not

completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).
The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

22.9.4 Transmission in LIN Slave Self-Test Mode

To execute a self-test on LIN slave transmission, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 xxx0$_B$*1
  RLN3nLBRP0 register = xxxx xxxx$_B$*1
  RLN3nLBRP1 register = xxxx xxxx$_B$*1
  RLN3nLMD register = 00x x0011$_B$
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 xxxx$_B$*2
  RLN3nLEDE register = xx0x x00x$_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 0000 000x$_B$*3
  RLN3nLSC register = 00xx 0001$_B$
- Exit the LIN reset mode.
  Write 11$_B$ to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11$_B$.
- Configure the transmission frame related registers.
  RLN3nLDFC register = 00x1 xxxx$_B$
  RLN3nLIDB register = xxxx xxxx$_B$
  RLN3nLDBR1 to RLN3nLDBR8 registers = xxxx xxxx$_B$
- Header reception → response transmission started
  Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started).
  (The header reception and the response transmission are executed in this order, without manipulating the RTS bit in the RLN3nLTRC register.)
  The LIN slave self-test mode (transmission) is executed, interrupt is generated, and status and error status are also updated.
  The checksum is automatically calculated by the LIN/UART interface. To abort the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Arbitrary value can be specified.

Note 1. The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, and the RLN3nLBRP1 register. Therefore, configuration of these registers is not necessary.

Note 2. If necessary, configure the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8**, **Section 7BC, Exception/Interrupts of RH850/F1KM**.

Note 3. According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

Note 4. When the successful header reception interrupt and the successful response transmission interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).

The time from setting of the successful header reception flag to setting of the successful response/wake-up transmission flag is calculated by using the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

22.9.5 Reception in LIN Slave Self-Test Mode

To execute a self-test on LIN slave reception, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 xxx0$_B$*[1]
  RLN3nLBRP0 register = xxxx xxxx$_B$*[1]
  RLN3nLBRP1 register = xxxx xxxx$_B$*[1]
  RLN3nLMD register = 00xx 0011$_B$
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 xxxx$_B$*[2]
  RLN3nLEDE register = xx0x x00x$_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 0000 000x$_B$*[3]
  RLN3nLSC register = 00xx 0001$_B$*[1]
- Exit the LIN reset mode.
  Write 11$_B$ to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11$_B$.
- Configure the reception frame related registers.
  RLN3nLDFC register = 00x0 xxxx$_B$
  RLN3nLIDB register = xxxx xxxx$_B$
  RLN3nLDBR1 to RLN3nLDBR8 registers = xxxx xxxx$_B$
  RLN3nCBR register = xxxx xxxx$_B$
  Since the checksum value to be transmitted is not automatically calculated, users must calculate it and set it to the RLN3nLCBR register. A checksum test can be performed by setting an incorrect checksum value here.
- Header reception → response reception started
  Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started).
  (Without any setting of the RTS bit in the RLN3nLTRC register, the header reception and the response reception are executed in this order.)
  The LIN slave self-test mode (reception) is executed, interrupt is generated, and status and error status are also updated. To abort the LIN slave self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the specified value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Arbitrary value can be specified.

Note 1. The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, and the IBS bit in the RLN3nLSC register.
Therefore, configuration of these registers is not necessary.

Note 2. If necessary, configure the related registers described in **Section 7A, Exception/Interrupts of RH850/F1KH-D8**, **Section 7BC, Exception/Interrupts of RH850/F1KM**.

Note 3. According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

Note 4. When the successful header reception interrupt and the successful response reception interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).
The time required from the set of the successful header reception flag to the set of the successful response/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

22.9.6 Exiting LIN Self-Test Mode

To exit LIN self-test mode, perform the following procedure:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
  If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11_B, write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11_B, transition to LIN reset mode.
- Verify that LIN/UART interface has exited LIN self-test mode.
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 0 (not in LIN self-test mode)
- Verify the transition to LIN reset mode.
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).

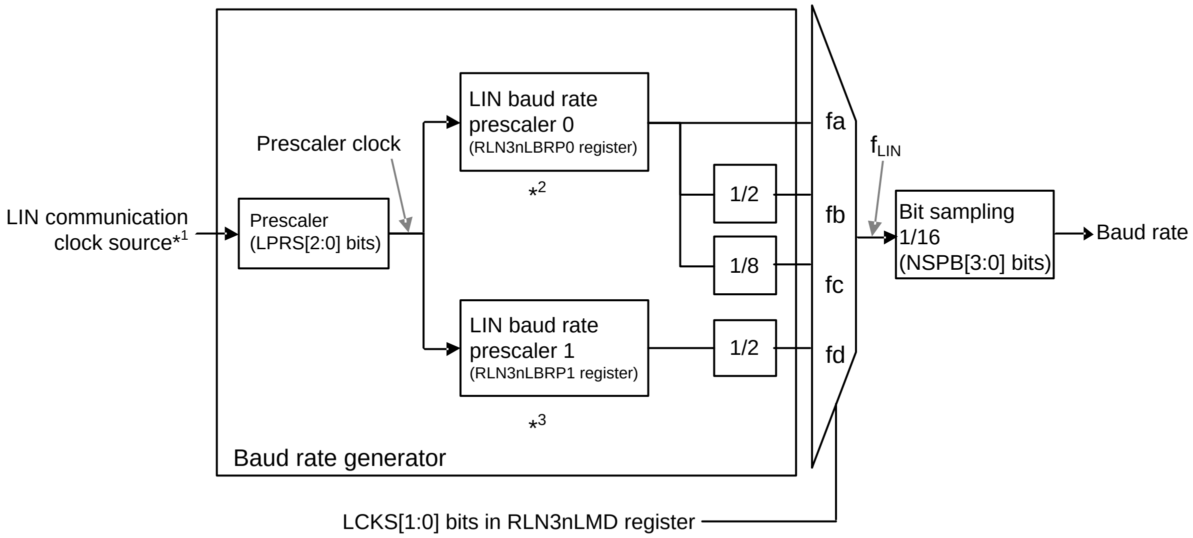
22.10 Baud Rate Generator

The prescaler clock is obtained by dividing the LIN communication clock source frequency by the prescaler, and the LIN system clock (f_{LIN}) is obtained by dividing the prescaler clock frequency by the baud rate generator. The clock obtained by dividing the LIN system clock frequency (f_{LIN}) by the number of samples is the baud rate. The inverse of this baud rate is called the bit time (Tbit).

The LIN/UART interface has two types of baud rate generators. The baud rate generators are switched according to the mode used.

22.10.1 LIN Master Mode

Figure 22.35, Block Diagram of Baud Rate Generation in LIN Master Mode shows a block diagram of baud rate generation in LIN master mode.



Note 1. For the LIN communication clock source, see **Section 12AB.5.3, Clock Domain Settings**, **12C.5.3, Clock Domain Settings**.

Note 2. When the value in RLN3nLBRP0 register is N (N = 0 to 255), the clock frequency is divided by N + 1.

Note 3. When the value in RLN3nLBRP1 register is M (M = 0 to 255), the clock frequency is divided by M + 1.

Figure 22.35 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLN3nLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting bit rates are fa = 19200 × 16, fb = 9600 × 16, and fc = 2400 × 16. These bit rates are frequency-divided by 16 in the bit timing generator, enabling baud rates of 19200 bps, 9600 bps and 2400 bps, to be generated. Also, by configuring the RLN3nLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting bit rate is fd = 10417 × 16. This bit rate is frequency-divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

Baud rate of LIN master

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)

÷ (RLN3nLBRP0+ 1) ÷ 16 [bps] (When fa is selected for f_{LIN})

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)

÷ (RLN3nLBRP0 + 1) ÷ 2 ÷ 16 [bps] (When fb is selected for f_{LIN})

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)

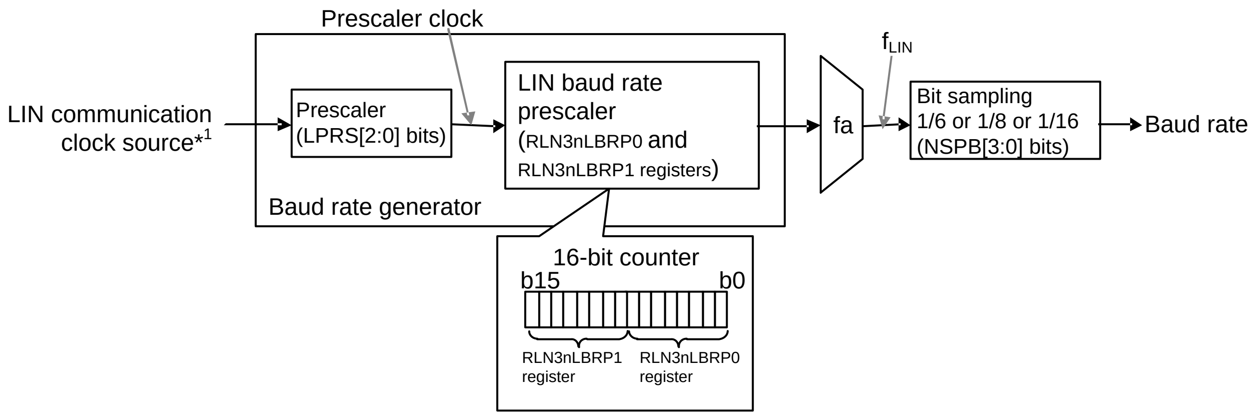
÷ (RLN3nLBRP0 + 1) ÷ 8 ÷ 16 [bps] (When fc is selected for f_{LIN})

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)

÷ (RLN3nLBRP1 + 1) ÷ 2 ÷ 16 [bps] (When fd is selected for f_{LIN})

22.10.2 LIN Slave Mode

Figure 22.36, Block Diagram of Baud Rate Generation in LIN Slave Mode shows a block diagram of baud rate generation in LIN slave mode.



Note 1. For the LIN communication clock source, see **Section 12AB.5.3, Clock Domain Settings**, **12C.5.3, Clock Domain Settings**.

Figure 22.36 Block Diagram of Baud Rate Generation in LIN Slave Mode

In LIN slave mode (auto baud rate), the baud rate can be specified in the range of 1 kbps to 20 kbps. Configure the prescaler clock as follows according to the target baud rate:

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4 MHz*1
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

Note 1. Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to “0011_B” (4 samplings).

The formula for baud rate is described below.
Baud rate of LIN slave

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)

÷ (RLN3nLBRP01 + 1) ÷ 16 [bps] ([Fixed baud rate])

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)

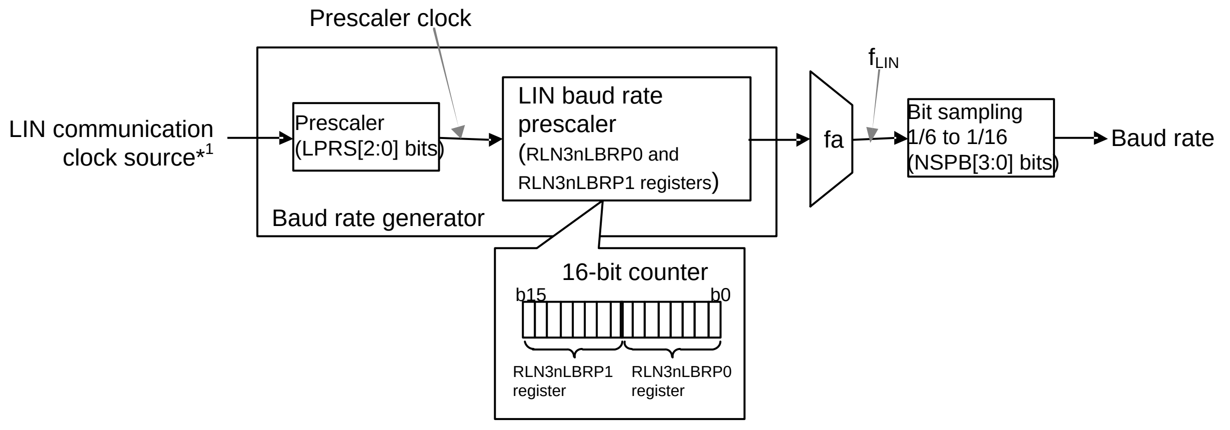
÷ (RLN3nLBRP01 + 1) ÷ 4 or 8 [bps] ([Auto baud rate])

NOTE

For a LIN slave with fixed baud rate, set the NSPB[3:0] bit to “0000$_B$” (16 samplings) or “1111$_B$” (16 samplings). For a LIN slave with auto baud rate, set the NSPB[3:0] bits to “0011$_B$” (4 samplings) or “0100$_B$” (8 samplings).

22.10.3 UART Mode

Figure 22.37, Block Diagram of Baud Rate Generation in UART Mode shows a block diagram of baud rate generation in UART mode.



Note 1. For the LIN communication clock source, see **Section 12AB.5.3, Clock Domain Settings**, **12C.5.3, Clock Domain Settings**.

Figure 22.37 Block Diagram of Baud Rate Generation in UART Mode

UART baud rate is calculated with the following formula:

UART baud rate

= {LIN communication clock source frequency} × (RLN3nLWBR.LPRS[2:0] selected clock) ÷ (RLN3nLBRP01 + 1) ÷ {RLN3nLWBR.NSPB[3:0] selected count} [bps]

22.11 Noise Filter

The LIN/UART interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLN3nLMD register to 0 (use the noise filter), the noise filter is activated. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

Figure 22.38, Configuration of Noise Filter shows the configuration of the noise filter, **Figure 22.39, Example of Noise Filter Circuit** shows an example of a noise filter circuit, and **Figure 22.40, Determination of Received Data when Noise Filter is Used** shows the determination of the received data when the noise filter is used.

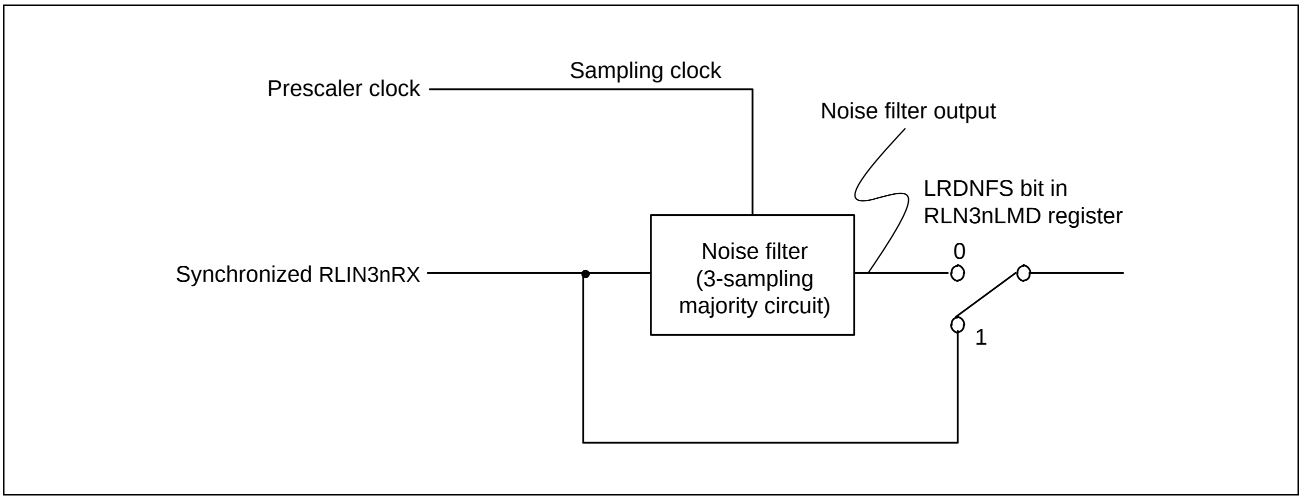


Figure 22.38 Configuration of Noise Filter

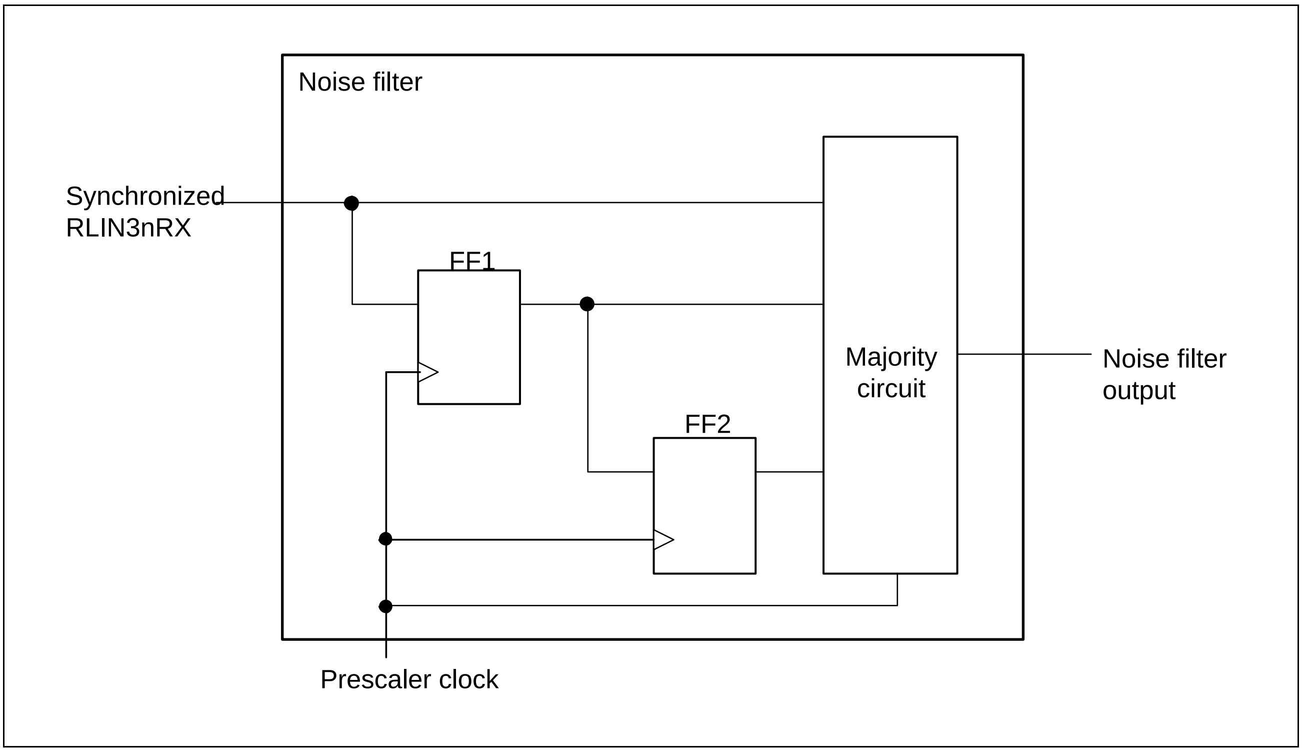

Figure 22.39 Example of Noise Filter Circuit

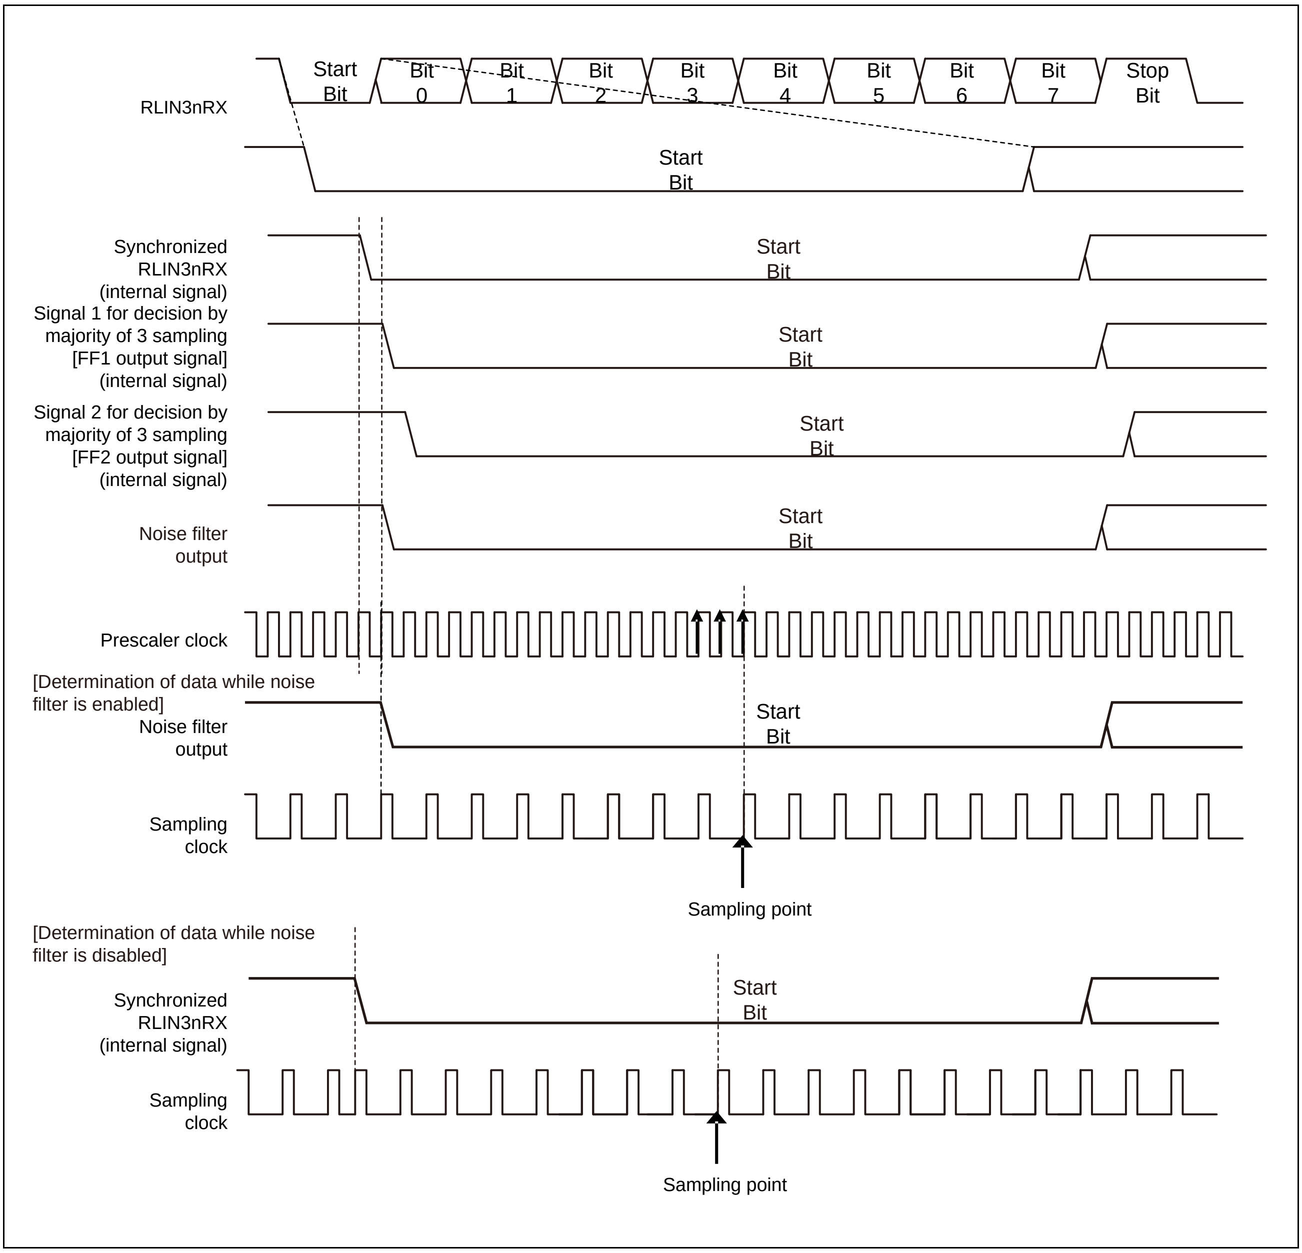

Figure 22.40 Determination of Received Data when Noise Filter is Used

Section 23 I²C Bus Interface (RIIC)

This section contains a generic description of the I²C Bus Interface (RIIC).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RIIC.

23.1 Features of RH850/F1KH, RH850/F1KM RIIC

23.1.1 Number of Units

This microcontroller has the following number of RIIC units.

Each RIIC unit has single channel interface.

Table 23.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	2	2	2
Name	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)

Table 23.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	2	2	2	2	2
Name	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)

Table 23.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	2	2	2	2
Name	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)	RIICn (n = 0, 1)

Table 23.4 Index (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RIIC units are identified by the index “n”: for example, RIICnCR1 (n = 0, 1) is the I²C bus control register 1.

23.1.2 Register Base Addresses

RIIC base addresses are listed in the following table.

RIIC register addresses are given as offsets from the base addresses.

Table 23.5 Register Base Addresses (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<RIIC0_base>	FFCA 0000_H
<RIIC1_base>	FFCA 0080_H

23.1.3 Clock Supply

The RIIC clock supply is shown in the following table.

Table 23.6 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RIICn	PCLK*[1]	CKSCLK_IIIC	Communication clock
	Register access clock	CPUCLK_L, CKSCLK_IIIC	Bus clock

Note 1. Set the period of PCLK no greater than 1/2 of the width at high level of the SCL clock.

23.1.4 Interrupt Requests

RIIC interrupt requests are listed in the following table.

Table 23.7 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RIIC0			
INTRIICnEE	RIIC communication error / event generation interrupt	77	—
INTRIICnRI	RIIC receive end interrupt	78	20
INTRIICnTI	RIIC transmit data empty interrupt	76	19
INTRIICnTEI	RIIC transmit end interrupt	79	—
RIIC1			
INTRIICnEE	RIIC communication error / event generation interrupt	241	—
INTRIICnRI	RIIC receive end interrupt	242	114
INTRIICnTI	RIIC transmit data empty interrupt	240	113
INTRIICnTEI	RIIC transmit end interrupt	243	—

23.1.5 Reset Sources

RIIC reset sources are listed in the following table. RIIC is initialized by these reset sources.

Table 23.8 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
RIICn	All reset sources (ISORES)

23.1.6 External Input/Output Signals

External input/output signals of RIIC are listed below.

Table 23.9 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RIIC0		
RIICnSCL	Serial clock I/O pin	RIIC0SCL
RIICnSDA	Serial data I/O pin	RIIC0SDA
RIIC1		
RIICnSCL	Serial clock I/O pin	RIIC1SCL
RIICnSDA	Serial data I/O pin	RIIC1SDA

When using these ports, the PBDCn register for the corresponding port and the corresponding bit in the PODCn register must be set to 1.

23.2 Overview

23.2.1 Functional Overview

Communications format

- I^{2}C bus format
- Master mode or slave mode selectable
- Automatic securing of the various set-up times, hold times, and bus-free times according to the specified transfer rate

Transfer rate

Up to 400 kbps

SCL clock

- For master operation, the duty cycle of the SCL clock is selectable in the following range:
  - 0% < Duty < 100%

Issuing and detecting conditions

Start, restart, and stop conditions are automatically generated. Start conditions (including restart conditions) and stop conditions are detectable.

Slave address

- Up to three slave-address settings can be made.
- Seven- and ten-bit address formats are supported (along with the use of both at once).
- General call addresses and device ID addresses are detectable.

Acknowledgement

- For transmission, the acknowledge bit is automatically loaded
  - Transfer of the next data for transmission can be automatically suspended on detection of a not-acknowledge bit.
- For reception, the acknowledge bit is automatically transmitted
  - If a wait between the eighth and ninth clock cycles has been selected, software control of the value in the acknowledge field in response to the received value is possible.

Wait function

- In reception, the following periods of waiting can be obtained by holding the clock signal (SCL) at the low level:
  - Waiting between the eighth and ninth clock cycles
  - Waiting between the ninth clock cycle and the first clock cycle of the next transfer (WAIT function)

SDA output delay function

Timing of the output of transmitted data, including the acknowledge bit, can be delayed.

Arbitration

- For multi-master operation
  - Operation to synchronize the SCL (clock) signal in cases of conflict with the SCL signal from another master is possible.
  - When issuing the start condition would create conflict on the bus, loss of arbitration is detected by testing for non-matching between the internal signal for the SDA line and the level on the SDA line.
  - In master operation, loss of arbitration is detected by testing for non-matching of internal and line levels for transmit data.
- Loss of arbitration due to detection of the start condition while the bus is busy can be detected (to prevent the issuing of double start conditions).
- Loss of arbitration in transfer of a not-acknowledge bit due to the internal signal for the SDA line and the level on the SDA line not matching can be detected.
- Loss of arbitration due to non-matching of internal and line levels for data can be detected in slave transmission.

Timeout function

The internal time-out function is capable of detecting long-interval stop of the SCL (clock signal).

Noise removal

The interface incorporates digital noise filters for both the SCL and SDA signals, and the width for noise cancellation by the filters is adjustable by software.

Interrupt sources

- Four sources:
  - Error in transfer or occurrence of events (detection of arbitration loss, NACK, time-out, a start condition including a restart condition, or a stop condition)
  - Reception complete (including matching with a slave address)
  - Transmit-data-empty (including matching with a slave address)
  - Transmission complete

23.2.2 Block Diagram

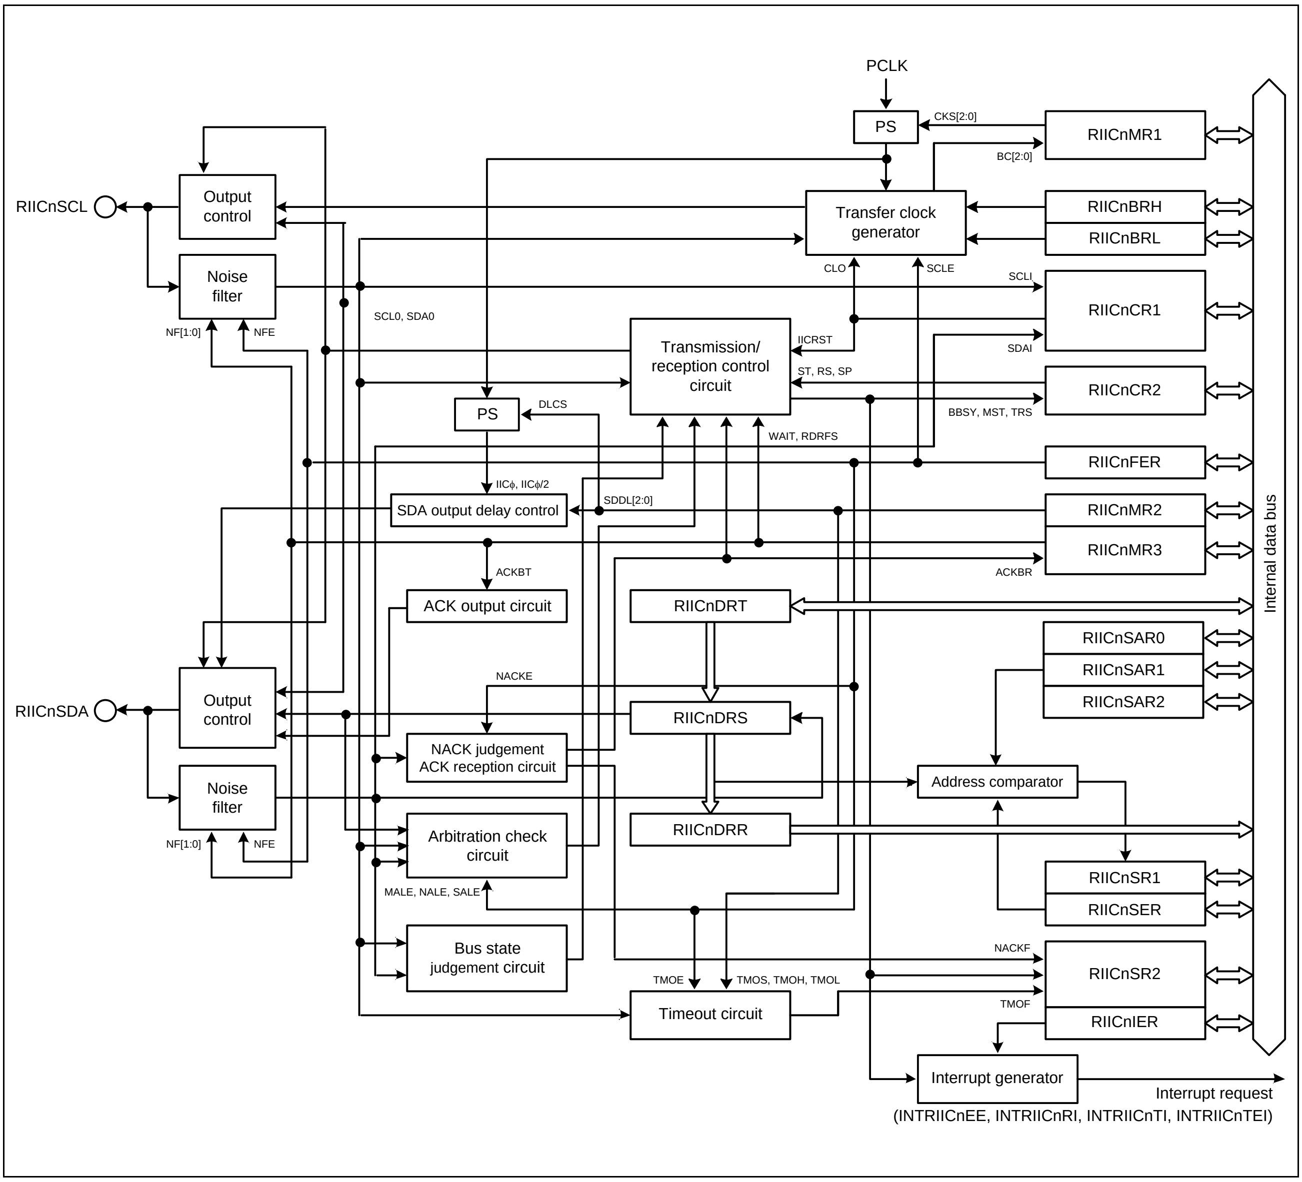

Figure 23.1 Block Diagram of RIIC

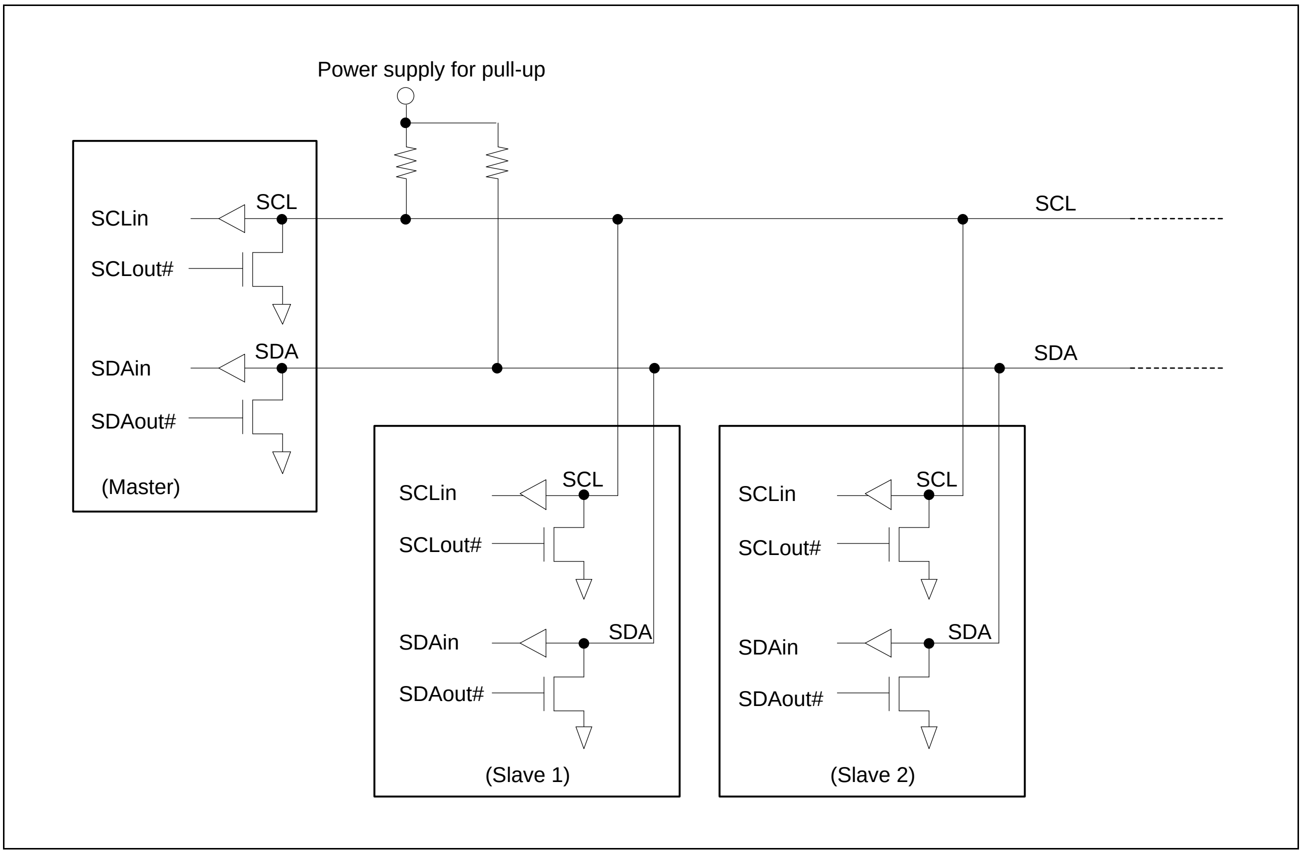

Figure 23.2 Connections to the External Circuit by the I/O Pins (I^{2}C Bus Configuration Example)

23.3 Registers

23.3.1 List of Registers

RIIC registers are listed in the table below.

For details about <RIICn_base>, see **Section 23.1.2, Register Base Addresses**.

Table 23.10 List of Registers

Module Name	Register Name	Symbol	Address
RIICn	I^{2}C bus control register 1	RIICnCR1	<RIICn_base> + 0000_H
	I^{2}C bus control register 2	RIICnCR2	<RIICn_base> + 0004_H
	I^{2}C bus mode register 1	RIICnMR1	<RIICn_base> + 0008_H
	I^{2}C bus mode register 2	RIICnMR2	<RIICn_base> + $000C_H$
	I^{2}C bus mode register 3	RIICnMR3	<RIICn_base> + 0010_H
	I^{2}C bus function enable register	RIICnFER	<RIICn_base> + 0014_H
	I^{2}C bus status enable register	RIICnSER	<RIICn_base> + 0018_H
	I^{2}C bus interrupt enable register	RIICnIER	<RIICn_base> + $001C_H$
	I^{2}C bus status register 1	RIICnSR1	<RIICn_base> + 0020_H
	I^{2}C bus status register 2	RIICnSR2	<RIICn_base> + 0024_H
	I^{2}C slave address register 0	RIICnSAR0	<RIICn_base> + 0028_H
	I^{2}C slave address register 1	RIICnSAR1	<RIICn_base> + $002C_H$
	I^{2}C slave address register 2	RIICnSAR2	<RIICn_base> + 0030_H
	I^{2}C bus bit rate low-level register	RIICnBRL	<RIICn_base> + 0034_H
	I^{2}C bus bit rate high-level register	RIICnBRH	<RIICn_base> + 0038_H
	I^{2}C bus transmit data register	RIICnDRT	<RIICn_base> + $003C_H$
	I^{2}C bus receive data register	RIICnDRR	<RIICn_base> + 0040_H
	I^{2}C bus shift register	RIICnDRS	—

23.3.2 RIICnCR1 — I²C Bus Control Register 1

Access: RIICnCR1 register can be read or written in 32-bit units.

RIICnCR1L register can be read or written in 16-bit units.

RIICnCR1LL register can be read or written in 8-bit units.

Address: RIICnCR1: <RIICn_base> + 0000_H

RIICnCR1L: <RIICn_base> + 0000_H

RIICnCR1LL: <RIICn_base> + 0000_H

Value after reset: $0000\ 001F_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 23.11 RIICnCR1 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ICE	I²C Bus Interface Enable 0: Disabled (the RIICnSCL and RIICnSDA pins are not driven). 1: Enabled (the RIICnSCL and RIICnSDA pins are driven). (This bit selects an RIIC reset or internal reset in combination with the IICRST bit.)
6	IICRST	I²C Bus Internal Reset 0: Clears the RIIC reset or internal reset. 1: Initiates the RIIC reset or internal reset. (Clears the bit counter and the SCL/SDA output latch)
5	CLO	Extra SCL Clock Cycle Output 0: Does not output an extra SCL clock cycle (default). 1: Outputs an extra SCL clock cycle. (The CLO bit is cleared automatically after one clock cycle is output.)
4	SOWP	SCLO/SDAO Write Protect 0: Bits SCLO and SDAO can be written. 1: Bits SCLO and SDAO are protected. (This bit is read as 1.)
3	SCLO	SCL Output Control/Monitor ● Read: 0: The RIIC has driven the RIICnSCL pin low. 1: The RIIC has released the RIICnSCL pin. ● Write: 0: The RIIC drives the RIICnSCL pin low. 1: The RIIC releases the RIICnSCL pin.

Table 23.11 RIICnCR1 Register Contents

Bit Position	Bit Name	Function
2	SDAO	SDA Output Control/Monitor ● Read: 0: The RIIC has driven the RIICnSDA pin low. 1: The RIIC has released the RIICnSDA pin. ● Write: 0: The RIIC drives the RIICnSDA pin low. 1: The RIIC releases the RIICnSDA pin.
1	SCLI	SCL Line Monitor 0: RIICnSCL line is low. 1: RIICnSCL line is high.
0	SDAI	SDA Line Monitor 0: RIICnSDA line is low. 1: RIICnSDA line is high.

SDAO Bit (SDA Output Control/Monitor) and SCLO Bit (SCL Output Control/Monitor)

These bits are used to directly control the RIICnSDA and RIICnSCL signals output from the RIIC.

When writing to these bits, also write 0 to the SOWP bit.

The result of setting these bits is input to the RIIC via the input buffer. When slave mode is selected, a START condition may be detected and the bus may be released depending on the bit settings.

Do not rewrite these bits during a START condition, STOP condition, repeated START condition, or during transmission or reception. Operation after rewriting under the above conditions is not guaranteed.

When reading these bits, the state of signals output from the RIIC can be read.

CLO Bit (Extra SCL Clock Cycle Output)

This bit is used to output an extra SCL clock cycle for debugging or error processing.

Normally, set the bit to 0. Setting the bit to 1 in a normal communication state causes a communication error.

For details on this function, see **Section 23.13.2, Extra SCL Clock Cycle Output Function**.

IICRST Bit (I^{2}C Bus Internal Reset)

This bit is used to reset the internal states of the RIIC.

Setting this bit to 1 initiates an RIIC reset or internal reset.

Whether an RIIC reset or internal reset is initiated is determined according to the combination with the ICE bit. **Table 23.12, RIIC Resets** lists the types of RIIC reset.

The RIIC reset resets all registers (except ICE and IICRST) including the RIICnCR2.BBSY flag and internal states of the RIIC, and the internal reset resets the bit counter (RIICnMR1.BC[2:0] bits), the I^{2}C bus shift register (RIICnDRS), and the I^{2}C bus status registers (RIICnSR1 and RIICnSR2) as well as the internal states of the RIIC. For the reset conditions for each register, see **Section 23.14, Reset Function of RIIC**.

An internal reset initiated with the IICRST bit set to 1 during operation (with the ICE bit set to 1) resets the internal states of the RIIC without initializing the port settings and the control and setting registers of the RIIC when the bus or RIIC hangs up due to a communication error, etc.

If the RIIC hangs up in a low level output state, resetting the internal states cancels the low level output state and releases the bus with the RIICnSCL pin and RIICnSDA pin at a high impedance.

CAUTION

If an internal reset is initiated using the IICRST bit for a bus hang-up occurred during communication with the master device in slave mode, the states may become different between the slave device and the master device (due to the difference in the bit counter information). For this reason, do not initiate an internal reset in slave mode, but initiate restoration processing from the master device. If an internal reset is necessary because the RIIC hangs up with the SCL line in a low level output state in slave mode, initiate an internal reset and then issue a restart condition from the master device or resume communication from the start condition issuance after issuing a stop condition. If communication is restarted by initiating a reset solely in the slave device without issuing a start condition or restart condition from the master device, synchronization will be lost because the master and slave devices operate asynchronously.

Table 23.12 RIIC Resets

IICRST	ICE	State	Specifications
1	0	RIIC reset	Resets all registers (except ICE and IICRST) and internal states of the RIIC.
	1	Internal reset	Reset the RIICnMR1.BC[2:0] bits, and the RIICnSR1, RIICnSR2, RIICnDRS registers and the internal states of the RIIC.

ICE Bit (I^{2}C Bus Interface Enable)

The ICE bit selects driving or non-driving of the RIICnSCL and RIICnSDA pins. Moreover, this bit can perform two types of reset in combination with the IICRST bit. For the types of reset, see **Table 23.12, RIIC Resets**.

Set the ICE bit to 1 when using RIIC. Setting the ICE bit to 1 selects driving of the RIICnSCL and RIICnSDA pins.

Set the ICE bit to 0 when RIIC is not to be used. Clearing the ICE bit to 0 stops driving of the RIICnSCL and RIICnSDA pins.

CAUTION

Though the output from RIICnSDA or RIICnSCL is disabled while the ICE bit is 0, the input to RIICnSDA or RIICnSCL is enabled. The RIICnSCL and RIICnSDA pin functions should not be assigned to the RIIC. If assigned, it causes the slave addresses to be compared.

23.3.3 RIICnCR2 — I^{2}C Bus Control Register 2

Access: RIICnCR2 register can be read or written in 32-bit units.
RIICnCR2L register can be read or written in 16-bit units.
RIICnCR2LL register can be read or written in 8-bit units.

Address: RIICnCR2: <RIICn_base> + 0004$_H$
RIICnCR2L: <RIICn_base> + 0004$_H$
RIICnCR2LL: <RIICn_base> + 0004$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	BBSY	MST	TRS	—	SP	RS	ST	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R

Table 23.13 RIICnCR2 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	BBSY	Bus Busy Detection Flag 0: The I^{2}C bus is released (the bus is free). 1: The I^{2}C bus is occupied (the bus is busy).
6	MST*[1]	Master/Slave Mode 0: Slave mode 1: Master mode
5	TRS*[1]	Transmit/Receive Mode 0: Receive mode 1: Transmit mode
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SP	Stop Condition Issuance Request 0: Does not request to issue a stop condition. 1: Requests to issue a stop condition.
2	RS	Restart Condition Issuance Request 0: Does not request to issue a restart condition. 1: Requests to issue a restart condition.
1	ST	Start Condition Issuance Request 0: Does not request to issue a start condition. 1: Requests to issue a start condition.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. When the RIICnMR1.MTWP bit is set to 1, the MST and TRS bits can be written to.

ST Bit (Start Condition Issuance Request)

This bit is used to request transition to master mode and issuance of a start condition.

When this bit is set to 1 to request to issue a start condition, a start condition is issued when the BBSY flag is set to 0 (bus free).

For details on the start condition issuance, see **Section 23.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the ST bit

[Clearing conditions]

- When 0 is written to the ST bit
- When a start condition has been issued
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTION

Set the ST bit to 1 (start condition issuance request) when the BBSY flag is set to 0 (bus free).

Note that arbitration may be lost as the start condition issuance error if the ST bit is set to 1 (start condition issuance request) when the BBSY flag is set to 1 (bus busy).

RS Bit (Restart Condition Issuance Request)

This bit is used to request that a restart condition be issued in master mode.

When this bit is set to 1 to request to issue a restart condition, a restart condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the restart condition issuance, see **Section 23.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the RS bit with the RIICnCR2.BBSY flag set to 1

[Clearing conditions]

- When 0 is written to the RS bit
- When a restart condition has been issued or a start condition is detected
- When a stop condition is detected
- When the RIICnCR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTIONS

1. Do not set the RS bit to 1 while issuing a stop condition.
2. It is commended to issue a restart condition in master transmit mode. If the RS bit is set to 1 (restart condition issuance request) in mode other than master mode, the restart condition is not issued in this mode but the RS bit remains set. If the operating mode changes to master mode with the bit not being cleared, the restart condition may be issued.

SP Bit (Stop Condition Issuance Request)

This bit is used to request that a stop condition be issued in master mode.

When this bit is set to 1 to request to issue a stop condition, a stop condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the stop condition issuance, see **Section 23.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the SP bit with both the RIICnCR2.BBSY flag and the RIICnCR2.MST bit set to 1

[Clearing conditions]

- When 0 is written to the SP bit
- When a stop condition has been issued or a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When a start condition and a restart condition are detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTIONS

1. Writing to the SP bit is not possible while the setting of the BBSY flag is 0 (bus free).
2. Do not set the SP bit to 1 while a restart condition is being issued.

TRS Bit (Transmit/Receive Mode)

This bit indicates transmit or receive mode.

The RIIC is in receive mode when the TRS bit is set to 0 and is in transmit mode when the bit is set to 1. Combination of this bit and the MST bit indicates the operating mode of the RIIC.

The value of the TRS bit is automatically changed to the value for transmission mode or reception mode (1 or 0) by the following conditions.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When the address received in slave mode matches the address enabled in RIICnSER, with the R/W# bit set to 1
- When 1 is written to the TRS bit with the RIICnMR1.MTWP bit set to 1

[Clearing conditions]

- When a stop condition is detected
- The RIICnSR2.AL (arbitration-lost) flag being set to 1
- In master mode, reception of a slave address to which an R/W# bit with the value 1 is appended
- In slave transmit mode, a restart condition is detected (a restart condition is detected with RIICnCR2.BBSY = 1 and RIICnCR2.MST = 0)
- When 0 is written to the TRS bit with the RIICnMR1.MTWP bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

MST Bit (Master/Slave Mode)

This bit indicates master or slave mode.

The RIIC is in slave mode when the MST bit is set to 0 and is in master mode when the bit is set to 1. Combination of this bit and the TRS bit indicates the operating mode of the RIIC.

The value of the MST bit is automatically changed to the value for master mode or slave mode (1 or 0) by the following conditions.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When 1 is written to the MST bit with the RIICnMR1.MTWP bit set to 1

[Clearing conditions]

- When a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 0 is written to the MST bit with the RIICnMR1.MTWP bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

BBSY Flag (Bus Busy Detection)

The BBSY flag indicates whether the I^{2}C bus is occupied (bus busy) or released (bus free).

This bit is set to 1 when the SDA line changes from high to low under the condition of SCL = high, assuming that a start condition has been issued.

When the SDA line changes from low to high under the condition of SCL = high, this bit is cleared to 0 after the bus free time (specified in RIICnBRL) start condition is not detected, assuming that a stop condition has been issued.

[Setting condition]

When a start condition is detected

[Clearing conditions]

- When the bus free time (specified in RIICnBRL) start condition is not detected after detecting a stop condition
- When 1 is written to the RIICnCR1.IICRST bit with the RIICnCR1.ICE bit set to 0 (RIIC reset)

CAUTION

- When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
- When an internal reset is applied while the bus is not free, the BBSY flag is not cleared.

23.3.4 RIICnMR1 — I^{2}C Bus Mode Register 1

Access:	RIICnMR1 register can be read or written in 32-bit units. RIICnMR1L register can be read or written in 16-bit units. RIICnMR1LL register can be read or written in 8-bit units.
Address:	RIICnMR1: <RIICn_base> + 0008$_H$ RIICnMR1L: <RIICn_base> + 0008$_H$ RIICnMR1LL: <RIICn_base> + 0008$_H$
Value after reset:	0000 0008$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MTWP	CKS[2:0]			BCWP	BC[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	W	R/W	R/W	R/W

Table 23.14 RIICnMR1 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	MTWP	MST/TRS Write Protect 0: Disables writing to the RIICnCR2.MST and TRS bits. 1: Enables writing to the RIICnCR2.MST and TRS bits.
6 to 4	CKS[2:0]	Internal Reference Clock Selection (IICϕ) b6 b4 0 0 0: PCLK/1 clock 0 0 1: PCLK/2 clock 0 1 0: PCLK/4 clock 0 1 1: PCLK/8 clock 1 0 0: PCLK/16 clock 1 0 1: PCLK/32 clock 1 1 0: PCLK/64 clock 1 1 1: PCLK/128 clock
3	BCWP*1	BC Write Protect 0: Enables a value to be written in the BC[2:0] bits. (This bit is read as 1.) 1: Protects the BC[2:0] bits.
2 to 0	BC[2:0]	Bit Counter b2 b0 0 0 0: 9 bits 0 0 1: 2 bits 0 1 0: 3 bits 0 1 1: 4 bits 1 0 0: 5 bits 1 0 1: 6 bits 1 1 0: 7 bits 1 1 1: 8 bits

Note 1. When rewriting the BC[2:0] bits, write 0 to the BCWP bit simultaneously.

BC[2:0] Bits (Bit Counter)

These bits function as a counter that indicates the number of bits remaining to be transferred at the detection of a rising edge on the SCL line. Although these bits are writable and readable, it is not necessary to access these bits under normal conditions.

To write to these bits, specify the number of bits to be transferred plus one (data is transferred with an additional acknowledge bit) between transferred frames. When setting any value other than 000_B, set the value while the SCL line is at a low level.

[Clearing conditions]

- When 1 is written to the RIICnCR1.IICRST bit and a RIIC reset or internal reset is initiated.
- Data transfer including the acknowledge bit being completed.
- A start condition including a restart condition being detected.

23.3.5 RIICnMR2 — I^{2}C Bus Mode Register 2

Access: RIICnMR2 register can be read or written in 32-bit units.

RIICnMR2L register can be read or written in 16-bit units.

RIICnMR2LL register can be read or written in 8-bit units.

Address: RIICnMR2: <RIICn_base> + 000C$_H$

RIICnMR2L: <RIICn_base> + 000C$_H$

RIICnMR2LL: <RIICn_base> + 000C$_H$

Value after reset: 0000 0006$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 23.15 RIICnMR2 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	DLCS	SDA Output Delay Clock Source Selection 0: The internal reference clock (IICϕ) is selected as the clock source of the SDA output delay counter. 1: The internal reference clock divided by 2 (IICϕ/2) is selected as the clock source of the SDA output delay counter.*1
6 to 4	SDDL[2:0]	SDA Output Delay Counter ● When RIICnMR2.DLCS = 0 (IICϕ) b6 b4 0 0 0: No output delay 0 0 1: 1 IICϕ cycle 0 1 0: 2 IICϕ cycles 0 1 1: 3 IICϕ cycles 1 0 0: 4 IICϕ cycles 1 0 1: 5 IICϕ cycles 1 1 0: 6 IICϕ cycles 1 1 1: 7 IICϕ cycles ● When RIICnMR2.DLCS = 1 (IICϕ/2) b6 b4 0 0 0: No output delay 0 0 1: 1 or 2 IICϕ cycles 0 1 0: 3 or 4 IICϕ cycles 0 1 1: 5 or 6 IICϕ cycles 1 0 0: 7 or 8 IICϕ cycles 1 0 1: 9 or 10 IICϕ cycles 1 1 0: 11 or 12 IICϕ cycles 1 1 1: 13 or 14 IICϕ cycles

Table 23.15 RIICnMR2 Register Contents

Bit Position	Bit Name	Function
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TMOH	Timeout H Count Control 0: Disables counting while the SCL line is at a high level. 1: Enables counting while the SCL line is at a high level.
1	TMOL	Timeout L Count Control 0: Disables counting while the SCL line is at a low level. 1: Enables counting while the SCL line is at a low level.
0	TMOS	Timeout Detection Time Selection 0: Long mode is selected. 1: Short mode is selected.

Note 1. The setting DLCS = 1 (IICϕ/2) only becomes valid when SCL is at the low level. When SCL is at the high level, the setting DLCS = 1 becomes invalid and the clock source becomes the internal reference clock (IICϕ).

TMOS Bit (Timeout Detection Time Selection)

This bit is used to select long mode or short mode for the timeout detection time when the timeout function is enabled (RIICnFER.TMOE bit = 1). When this bit is set to 0, long mode is selected. When this bit is set to 1, short mode is selected. In long mode, the timeout detection internal counter functions as a 16 bit-counter. In short mode, the counter functions as a 14 bit-counter. While the SCL line is in the state that enables this counter as specified by bits TMOH and TMOL, the counter counts up in synchronization with the internal reference clock (IICϕ) as a count source.

For details on the timeout function, see **Section 23.13.1, Timeout Function**.

TMOL Bit (Timeout L Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held low when the timeout function is enabled (RIICnFER.TMOE bit = 1).

TMOH Bit (Timeout H Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held high when the timeout function is enabled (RIICnFER.TMOE bit = 1).

SDDL[2:0] Bits (SDA Output Delay Setup Counter)

The SDA output can be delayed by the SDDL[2:0] setting. This counter works with the clock source selected by the DLCS bit. The setting of this function can be used for all types of SDA output, including the transmission of the acknowledge bit.

For details on this function, see **Section 23.7, Facility for Delaying SDA Output**.

CAUTION

Set the SDA output delay time to meet the I^{2}C bus standard (within the data enable time/acknowledge enable time*[1]). Note that, if a value outside the standard is set, communication with communication devices may malfunction or it may seemingly become a start condition or stop condition depending on the bus state.

Note 1. Data enable time/acknowledge enable time
3,450 ns (up to 100 kbps: standard mode [Sm])
900 ns (up to 400 kbps: fast mode [Fm])

23.3.6 RIICnMR3 — I^{2}C Bus Mode Register 3

Access: RIICnMR3 register can be read or written in 32-bit units.

RIICnMR3L register can be read or written in 16-bit units.

RIICnMR3LL register can be read or written in 8-bit units.

Address: RIICnMR3: <RIICn_base> + 0010$_H$

RIICnMR3L: <RIICn_base> + 0010$_H$

RIICnMR3LL: <RIICn_base> + 0010$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.16 RIICnMR3 Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	WAIT*2	WAIT 0: No WAIT (The period between ninth clock cycle and first clock cycle is not held low.) 1: WAIT (The period between ninth clock cycle and first clock cycle is held low.) Low-hold is released by reading RIICnDRR.
5	RDRFS*2	RDRF Flag Set Timing Selection 0: The RDRF flag is set at the rising edge of the ninth SCL clock cycle. (The SCL line is not held low at the falling edge of the eighth clock cycle.) 1: The RDRF flag is set at the rising edge of the eighth SCL clock cycle. (The SCL line is held low at the falling edge of the eighth clock cycle.) Low-hold is released by writing a value to the ACKBT bit.
4	ACKWP*1	ACKBT Write Protect 0: Modification of the ACKBT bit is disabled. 1: Modification of the ACKBT bit is enabled.
3	ACKBT*1	Transmit Acknowledge 0: A 0 is sent as the acknowledge bit (ACK transmission). 1: A 1 is sent as the acknowledge bit (NACK transmission).
2	ACKBR	Receive Acknowledge 0: A 0 is received as the acknowledge bit (ACK reception). 1: A 1 is received as the acknowledge bit (NACK reception).
1, 0	NF[1:0]	Digital noise Filter Stage Selection b1 b0 0 0: Noise of up to one IICϕ cycle is filtered out (single-stage filter). 0 1: Noise of up to two IICϕ cycles is filtered out (2-stage filter). 1 0: Noise of up to three IICϕ cycles is filtered out (3-stage filter). 1 1: Noise of up to four IICϕ cycles is filtered out (4-stage filter).

Note 1. If it is attempted to write 1 to both ACKWP and ACKBT bits, the ACKBT bit cannot be set to 1.

Note 2. The WAIT and RDRFS bits are valid only in receive mode (invalid in transmit mode).

NF[1:0] Bits (Digital noise Filter Stage Selection)

These bits are used to select the number of stages of the digital noise filter.

CAUTION

Set the noise range to be filtered out by the noise filter within a range less than the SCL line high-level period or low-level period. If the noise range is set to a value of (SCL clock width: high-level period or low-level period, whichever is shorter) - [1.5 internal reference clock synchronized (IICϕ) cycles] or more, the SCL clock is regarded as noise by the noise filter function of the RIIC, which may prevent the RIIC from operating normally.

ACKBR Bit (Receive Acknowledge)

This bit is used to store the acknowledge bit information received from the receive device in transmit mode.

[Setting condition]

When 1 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When 0 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

ACKBT Bit (Transmit Acknowledge)

This bit is used to set the bit to be sent at the acknowledge timing in receive mode.

[Setting condition]

When 1 is written to this bit with the ACKWP bit set to 1

[Clearing conditions]

- When 0 is written to this bit after ACKWP reading while the ACKWP bit is set to 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

CAUTION

The ACKBT bit must be written to while the ACKWP bit is 1. If the ACKBT bit is written to with the ACKWP bit cleared to 0, writing to the ACKBT bit is disabled.

ACKWP Bit (ACKBT Write Protect)

This bit is used to control the modification of the ACKBT bit.

RDRFS Bit (RDRF Flag Set Timing Selection)

This bit is used to select the RDRF flag set timing in receive mode and also to select whether to hold the SCL line low at the falling edge of the eighth SCL clock cycle.

When the RDRFS bit is 0, the SCL line is not held low at the falling edge of the eighth SCL clock cycle, and the RDRF flag is set to 1 at the rising edge of the ninth SCL clock cycle.

When the RDRFS bit is 1, the RDRF flag is set to 1 at the rising edge of the eighth SCL clock cycle and the SCL line is held low at the falling edge of the eighth SCL clock cycle. The low-hold of the SCL line is released by writing a value to the ACKBT bit.

After data is received with this setting, the SCL line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKBT = 0) or NACK (ACKBT = 1) according to receive data.

WAIT Bit (WAIT)

This bit is used to control whether to hold the period between the ninth SCL clock cycle and the first SCL clock cycle low until the receive data buffer (RIICnDRR) is completely read each time single-byte data is received in receive mode.

When the WAIT bit is 0, the receive operation is continued without holding the period between the ninth and the first SCL clock cycle low. When both the RDRFS and WAIT bits are 0, continuous receive operation is enabled with the double buffer.

When the WAIT bit is 1, the SCL line is held low from the falling edge of the ninth clock cycle until the RIICnDRR value is read each time single-byte data is received. This enables receive operation in byte units.

CAUTION

When the value of the WAIT bit is cleared to 0, be sure to read the RIICnDRR beforehand.

23.3.7 RIICnFER — I^{2}C Bus Function Enable Register

Access:	RIICnFER register can be read or written in 32-bit units. RIICnFERL register can be read or written in 16-bit units. RIICnFERLL register can be read or written in 8-bit units.
Address:	RIICnFER: <RIICn_base> + 0014$_H$ RIICnFERL: <RIICn_base> + 0014$_H$ RIICnFERLL: <RIICn_base> + 0014$_H$
Value after reset:	0000 0072$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.17 RIICnFER Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	SCLE	SCL Synchronous Circuit Enable 0: No SCL synchronous circuit is used. 1: An SCL synchronous circuit is used.
5	NFE	Digital Noise Filter Circuit Enable 0: No digital noise filter circuit is used. 1: A digital noise filter circuit is used.
4	NACKE	NACK Reception Transfer Suspension Enable 0: Transfer operation is not suspended during NACK reception (transfer suspension disabled). 1: Transfer operation is suspended during NACK reception (transfer suspension enabled).
3	SALE	Slave Arbitration-Lost Detection Enable 0: Slave arbitration-lost detection is disabled. 1: Slave arbitration-lost detection is enabled.
2	NALE	NACK Transmission Arbitration-Lost Detection Enable 0: NACK transmission arbitration-lost detection is disabled. 1: NACK transmission arbitration-lost detection is enabled.
1	MALE	Master Arbitration-Lost Detection Enable 0: Master arbitration-lost detection is disabled. (Disables the arbitration-lost detection function and does not clear the RIICnCR2.MST and TRS bits automatically when arbitration is lost.) 1: Master arbitration-lost detection is enabled. (Enables the arbitration-lost detection function and clears the RIICnCR2.MST and TRS bits automatically when arbitration is lost.) If 1 is written to the ST bit while the BBSY flag is 1 in slave transmit mode, the TRS bit is not cleared.
0	TMOE	Timeout Function Enable 0: The timeout function is disabled. 1: The timeout function is enabled.

TMOE Bit (Timeout Function Enable)

This bit is used to enable or disable the timeout function.

For details on the timeout function, see **Section 23.13.1, Timeout Function**.

MALE Bit (Master Arbitration-Lost Detection Enable)

This bit is used to select enabling or disabling of the arbitration-lost detection function. Normally, set this bit to 1.

NALE Bit (NACK Transmission Arbitration-Lost Detection Enable)

This bit is used to specify whether the detection of ACK during transmission of NACK in reception (such as when slaves with the same address are present on the bus and each is transmitting different data, or when two or more masters select the same slave device simultaneously with different numbers of bytes for reception) is judged to represent a loss in arbitration.

SALE Bit (Slave Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when a value different from the value being transmitted is detected on the bus in slave transmit mode (such as when slaves with the same address exist on the bus or when a mismatch with the transmit data occurs due to noise).

NACKE Bit (NACK Reception Transfer Suspension Enable)

This bit is used to specify whether to continue or discontinue the transfer operation when NACK is received in transmit mode. Normally, set this bit to 1.

When NACK is received with the NACKE bit set to 1, the next transfer operation is suspended.

When the NACKE bit is 0, the next transfer operation is continued regardless of the received acknowledge content.

SCLE Bit (SCL Synchronous Circuit Enable)

This bit is used to specify whether to synchronize the SCL clock with a rising or falling edge on the SCL line. Normally, set this bit to 1.

When the SCLE bit is cleared to 0 (SCL synchronous circuit not used), the RIIC does not synchronize the SCL clock with the SCL input clock. In this setting, the RIIC outputs the SCL clock with the transfer rate set in RIICnBRH and RIICnBRL regardless of the SCL line state. For this reason, if the bus load of the I^2C bus line is much larger than the specification value or if the SCL clock output overlaps in multiple masters, the short-cycle SCL clock that does not meet the specification may be output. When no SCL synchronous circuit is used, it also affects the issuance of a start condition, restart condition, and stop condition, and the continuous output of extra SCL clock cycles.

This bit must not be cleared to 0 except for checking the output of the transfer rate.

23.3.8 RIICnSER — I^{2}C Bus Status Enable Register

Access:	RIICnSER register can be read or written in 32-bit units. RIICnSERL register can be read or written in 16-bit units. RIICnSERLL register can be read or written in 8-bit units.
Address:	RIICnSER: <RIICn_base> + 0018_H RIICnSERL: <RIICn_base> + 0018_H RIICnSERLL: <RIICn_base> + 0018_H
Value after reset:	0000 0009_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 23.18 RIICnSER Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	DIDE	Device-ID Address Detection Enable 0: Device-ID address detection is disabled. 1: Device-ID address detection is enabled.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	GCE	General Call Address Enable 0: General call address detection is disabled. 1: General call address detection is enabled.
2	SAR2	Slave Address Register 2 Enable 0: Slave address in RIICnSAR2 is disabled. 1: Slave address in RIICnSAR2 is enabled.
1	SAR1	Slave Address Register 1 Enable 0: Slave address in RIICnSAR1 is disabled. 1: Slave address in RIICnSAR1 is enabled.
0	SAR0	Slave Address Register 0 Enable 0: Slave address in RIICnSAR0 is disabled. 1: Slave address in RIICnSAR0 is enabled.

SARy Bit (Slave Address Register y Enable) (y = 0 to 2)

This bit is used to enable or disable the slave address set in RIICnSARy.

When this bit is set to 1, the slave address set in RIICnSARy is enabled and is compared with the received slave address.

When this bit is cleared to 0, the slave address set in RIICnSARy is disabled and is ignored even if it matches the received slave address.

GCAE Bit (General Call Address Enable)

This bit is used to specify whether to ignore the general call address (0000 000$_B$ + 0 [W]: All 0) when it is received.

When this bit is set to 1, if the received slave address matches the general call address, the RIIC recognizes the received slave address as the general call address independently of the slave addresses set in RIICnSARy (y = 0 to 2) and performs data receive operation.

When this bit is cleared to 0, the received slave address is ignored even if it matches the general call address.

DIDE Bit (Device-ID Address Detection Enable)

This bit is used to specify whether to recognize and execute the Device-ID address when a device ID (1111 100$_B$) is received in the first frame after a start condition or restart condition is detected.

When this bit is set to 1, if the received first frame matches the device ID, the RIIC recognizes that the Device-ID address has been received. When the following R/W# bit is 0 [W], the RIIC recognizes the second and the following frames as slave addresses and continues the receive operation.

When this bit is cleared to 0, the RIIC ignores the received first frame even if it matches the device ID address and recognizes the first frame as a normal slave address.

For details on the device-ID address detection, see **Section 23.9.3, Device-ID Address Detection**.

23.3.9 RIICnIER — I^{2}C Bus Interrupt Enable Register

Access: RIICnIER register can be read or written in 32-bit units.
RIICnIERL register can be read or written in 16-bit units.
RIICnIERLL register can be read or written in 8-bit units.

Address: RIICnIER: <RIICn_base> + 001C$_H$
RIICnIERL: <RIICn_base> + 001C$_H$
RIICnIERLL: <RIICn_base> + 001C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.19 RIICnIER Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	TIE	Transmit Data Empty Interrupt Enable 0: Transmit data empty interrupt request (INTRIICnTI) is disabled. 1: Transmit data empty interrupt request (INTRIICnTI) is enabled.
6	TEIE	Transmit End Interrupt Enable 0: Transmit end interrupt request (INTRIICnTEI) is disabled. 1: Transmit end interrupt request (INTRIICnTEI) is enabled.
5	RIE	Receive Complete Interrupt Enable 0: Receive complete interrupt request (INTRIICnRI) is disabled. 1: Receive complete interrupt request (INTRIICnRI) is enabled.
4	NAKIE	NACK Reception Interrupt Enable 0: NACK reception interrupt request (NAKI) is disabled. 1: NACK reception interrupt request (NAKI) is enabled.
3	SPIE	Stop Condition Detection Interrupt Enable 0: Stop condition detection interrupt request (SPI) is disabled. 1: Stop condition detection interrupt request (SPI) is enabled.
2	STIE	Start Condition Detection Interrupt Enable 0: Start condition detection interrupt request (STI) is disabled. 1: Start condition detection interrupt request (STI) is enabled.
1	ALIE	Arbitration-Lost Interrupt Enable 0: Arbitration-lost interrupt request (ALI) is disabled. 1: Arbitration-lost interrupt request (ALI) is enabled.
0	TMOIE	Timeout Interrupt Enable 0: Timeout interrupt request (TMOI) is disabled. 1: Timeout interrupt request (TMOI) is enabled.

TMOIE Bit (Timeout Interrupt Enable)

This bit is used to enable or disable timeout interrupt requests (TMOI) when the RIICnSR2.TMOF flag is set to 1. A TMOI interrupt request is canceled by clearing the TMOF flag or the TMOIE bit to 0.

ALIE Bit (Arbitration-Lost Interrupt Enable)

This bit is used to enable or disable arbitration-lost interrupt requests (ALI) when the RIICnSR2.AL flag is set to 1. An ALI interrupt request is canceled by clearing the AL flag or the ALIE bit to 0.

STIE Bit (Start Condition Detection Interrupt Enable)

This bit is used to enable or disable start condition detection interrupt requests (STI) when the RIICnSR2.START flag is set to 1. An STI interrupt request is canceled by clearing the START flag or the STIE bit to 0.

SPIE Bit (Stop Condition Detection Interrupt Enable)

This bit is used to enable or disable stop condition detection interrupt requests (SPI) when the RIICnSR2.STOP flag is set to 1. An SPI interrupt request is canceled by clearing the STOP flag or the SPIE bit to 0.

NAKIE Bit (NACK Reception Interrupt Enable)

This bit is used to enable or disable NACK reception interrupt requests (NAKI) when the RIICnSR2.NACKF flag is set to 1. An NAKI interrupt request is canceled by clearing the NACKF flag or the NAKIE bit to 0.

RIE Bit (Receive Complete Interrupt Enable)

This bit is used to enable or disable receive complete interrupt requests (INTRIICnRI) when the RIICnSR2.RDRF flag is set to 1.

TEIE Bit (Transmit End Interrupt Enable)

This bit is used to enable or disable transmit end interrupts (INTRIICnTEI) when the RIICnSR2.TEND flag is set to 1. An INTRIICnTEI interrupt request is canceled by clearing the TEND flag or the TEIE bit to 0.

TIE Bit (Transmit Data Empty Interrupt Enable)

This bit is used to enable or disable transmit data empty interrupts (INTRIICnTI) when the RIICnSR2.TDRE flag is set to 1.

23.3.10 RIICnSR1 — I^{2}C Bus Status Register 1

Access: RIICnSR1 register can be read or written in 32-bit units.
RIICnSR1L register can be read or written in 16-bit units.
RIICnSR1LL register can be read or written in 8-bit units.

Address: RIICnSR1: <RIICn_base> + 0020$_H$
RIICnSR1L: <RIICn_base> + 0020$_H$
RIICnSR1LL: <RIICn_base> + 0020$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	DID	—	GCA	AAS2	AAS1	AAS0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R(/W)*1	R	R(/W)*1	R(/W)*1	R(/W)*1	R(/W)*1

Note 1. Only 0 can be written to this bit.

Table 23.20 RIICnSR1 Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	DID	Device-ID Address Detection Flag 0: Device-ID address is not detected. 1: Device-ID address is detected.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	GCA	General Call Address Detection Flag 0: General call address is not detected. 1: General call address is detected.
2	AAS2	Slave Address 2 Detection Flag 0: Slave address 2 is not detected. 1: Slave address 2 is detected.
1	AAS1	Slave Address 1 Detection Flag 0: Slave address 1 is not detected. 1: Slave address 1 is detected.
0	AAS0	Slave Address 0 Detection Flag 0: Slave address 0 is not detected. 1: Slave address 0 is detected.

AASy Flag (Slave Address y Detection) (y = 0 to 2)

[Setting conditions]

<For 7-bit address format: RIICnSARy.FSy = 0>

When the received slave address matches the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

When the received slave address matches a value of (1111 0_B + RIICnSARy.SVA[9:8]) and the following address matches the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the AASy bit after reading AASy = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

<For 7-bit address format: RIICnSARy.FSy = 0>

- When the received slave address does not match the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

- When the received slave address does not match a value of (1111 0_B + RIICnSARy.SVA[9:8]) with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the received slave address matches a value of (1111 0_B + RIICnSARy.SVA[9:8]) and the following address does not match the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

GCA Flag (General Call Address Detection)

[Setting condition]

- When the received slave address matches the general call address (0000 000_B + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
  This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the GCA bit after reading GCA = 1
- When a stop condition is detected
- When the received slave address does not match the general call address (0000 000_B + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

DID Flag (Device-ID Address Detection)

[Setting condition]

- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID (1111 100_B) + 0 [W]) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled). This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.
- When a restart condition is detected after a match with the device ID address and the device ID address (1111 100_B) plus 1[R] has matched while the setting of the RIICnSER.DIDE bit is 1 (device ID address detection enabled). This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the DID bit after reading DID = 1
- When a stop condition is detected
- When the first frame received immediately after a start condition or restart condition is detected does not match a value of (device ID (1111 100_B)) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID (1111 100_B) + 0 [W]) and the second frame does not match any of slave addresses 0 to 2 with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

23.3.11 RIICnSR2 — I^{2}C Bus Status Register 2

Access: RIICnSR2 register can be read or written in 32-bit units.
RIICnSR2L register can be read or written in 16-bit units.
RIICnSR2LL register can be read or written in 8-bit units.

Address: RIICnSR2: <RIICn_base> + 0024_H
RIICnSR2L: <RIICn_base> + 0024_H
RIICnSR2LL: <RIICn_base> + 0024_H

Value after reset: $0000\ 0000_H$

Note 1. Only 0 can be written to this bit.

Table 23.21 RIICnSR2 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	TDRE	Transmit Data Empty Flag 0: RIICnDRT contains transmit data. 1: RIICnDRT contains no transmit data.
6	TEND	Transmit End Flag 0: Data is being transmitted. 1: Data has been transmitted.
5	RDRF	Receive Complete Flag 0: RIICnDRR contains no receive data. 1: RIICnDRR contains receive data.
4	NACKF	NACK Detection Flag 0: NACK is not detected. 1: NACK is detected.
3	STOP	Stop Condition Detection Flag 0: Stop condition is not detected. 1: Stop condition is detected.
2	START	Start Condition Detection Flag 0: Start condition is not detected. 1: Start condition is detected.
1	AL	Arbitration-Lost Flag 0: Arbitration is not lost. 1: Arbitration is lost.
0	TMOF	Timeout Detection Flag 0: Timeout is not detected. 1: Timeout is detected.

TMOF Flag (Timeout Detection)

This flag is set to 1 when the RIIC recognizes timeout after the SCL line state remains unchanged for a certain period.

[Setting condition]

The timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is stuck low or high during the following conditions:

- The bus is busy (the RIICnCR2.BBSY flag is 1) in master mode (the RIICnCR2.MST bit is 1).
- The RIIC's own slave address matches (the RIICnSR1 register is not 00_H) and the bus is busy (the RIICnCR2.BBSY bit is 1) in slave mode (the RIICnCR2.MST bit is 0).
- The bus is free (the RIICnCR2.BBSY flag is 0) while generation of a start condition is requested (the RIICnCR2.ST bit is 1).

[Clearing conditions]

- When 0 is written to the TMOF bit after reading TMOF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

AL Flag (Arbitration-Lost)

This flag shows that bus mastership has been lost (loss in arbitration) due to a bus conflict or some other reason when a start condition is issued or an address and data are transmitted. The RIIC monitors the level on the SDA line during transmission and, if the level on the line does not match the value of the bit being output, sets the value of the AL bit to 1 to indicate that the bus is occupied by another device.

The RIIC can also set the flag to indicate the detection of loss of arbitration during NACK transmission in receive mode or during data transmission in slave mode.

[Setting conditions]

<When master arbitration-lost detection is enabled: RIICnFER.MALE = 1>

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data (including slave address) transmission in master transmit mode (when the SDA line is driven low while the internal SDA output is at a high level (the SDA pin is in the high-impedance state))
- When a start condition is detected while the RIICnCR2.ST bit is 1 (start condition issuance request) or the internal SDA output state does not match the SDA line level
- When the RIICnCR2.ST bit is set to 1 (start condition issuance request) with the RIICnCR2.BBSY flag set to 1.

<When NACK arbitration-lost detection is enabled: RIICnFER.NALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock in the ACK period during NACK transmission in receive mode

<When slave arbitration-lost detection is enabled: RIICnFER.SALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data transmission in slave transmit mode

[Clearing conditions]

- When 0 is written to the AL bit after reading AL = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Table 23.22 Relationship between Arbitration-Lost Generation Sources and Arbitration-Lost Enable Functions

RIICnFER			RIICnSR2	Error	Arbitration-Lost Generation Source
MALE	NALE	SALE	AL		
1	—	—	1	Start condition issuance error	When internal SDA output state does not match SDA line level when a start condition is detected while the RIICnCR2.ST bit is 1
					When RIICnCR2.ST is set to 1 with RIICnCR2.BBSY set to 1
			1	Transmit data mismatch	When transmit data (including slave address) does not match the bus state in master transmit mode
—	1	—	1	NACK transmission mismatch	When ACK is detected during transmission of NACK in master receive mode or slave receive mode
—	—	1	1	Transmit data mismatch	When transmit data does not match the bus state in slave transmit mode

Remark: —: Don’t care

START Flag (Start Condition Detection)

[Setting condition]

When a start condition (or a restart condition) is detected

[Clearing conditions]

- When 0 is written to the START bit after reading START = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

STOP Flag (Stop Condition Detection)

[Setting condition]

When a stop condition is detected

[Clearing conditions]

- When 0 is written to the STOP bit after reading STOP = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

NACKF Flag (NACK Detection)

[Setting condition]

When acknowledge is not received (NACK is received) from the receive device in transmit mode with the RIICnFER.NACKE bit set to 1 (transfer suspension enabled)

[Clearing conditions]

- When 0 is written to the NACKF bit after reading NACKF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTION

When the NACKF flag is set to 1, the RIIC suspends data transmission/reception. Writing to RIICnDRT in transmit mode or reading from RIICnDRR in receive mode with the NACKF flag set to 1 does not enable data transmit/receive operation. To restart data transmission/reception, clear the NACKF flag to 0.

RDRF Flag (Receive Complete)

[Setting conditions]

- When receive data has been transferred from RIICnDRS to RIICnDRR
  At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit)
- When the received slave address matches the address enabled in RIICnSER after a start condition (or a restart condition) is detected with the RIICnCR2.TRS bit cleared to 0
- In master mode, transition to master reception while the R/W# bit appended to the slave address is set to 1

[Clearing conditions]

- When 0 is written to the RDRF bit after reading RDRF = 1
- When data is read from RIICnDRR
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

TEND Flag (Transmit End)

[Setting condition]

At the rising edge of the ninth SCL clock cycle while the TDRE flag is 1

[Clearing conditions]

- When 0 is written to the TEND bit after reading TEND = 1
- When data is written to RIICnDRT
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

TDRE Flag (Transmit Data Empty)

[Setting conditions]

- When data has been transferred from RIICnDRT to RIICnDRS and RIICnDRT becomes empty
- When the RIICnCR2.TRS bit is set to 1
  - When the RIICnCR2.MST bit is set to 1 after a start condition is detected
  - When 1 is written to the RIICnCR2.TRS bit while the RIICnMR1.MTWP bit is 1
- When the received slave address matches the address enabled in RIICnSER after a start condition including a restart condition is detected with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When data is written to RIICnDRT
- When the RIICnCR2.TRS bit is cleared to 0
  - When a stop condition is detected
  - When the RIIC enters receive mode from transmit mode
  - When 0 is written to the RIICnCR2.TRS bit while the RIICnMR1.MTWP bit is 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTION

When the NACKF flag is set to 1 while the RIICnFER.NACKE bit is 1, the RIIC suspends data transmission/reception. Here, if the TDRE flag is 0 (next transmit data has been written), data is transferred to the RIICnDRS register and the RIICnDRT register becomes empty at the rising edge of the ninth clock cycle, but the TDRE flag is not set to 1.

23.3.12 RIICnSARy — I^{2}C Slave Address Register y (y = 0 to 2)

Access: RIICnSARy register can be read or written in 32-bit units.

RIICnSARyL register can be read or written in 16-bit units.

RIICnSARyLL and RIICnSARyLH registers can be read or written in 8-bit units.

Address: RIICnSAR0: <RIICn_base> + 0028$_H$

RIICnSAR0L: <RIICn_base> + 0028$_H$

RIICnSAR0LL: <RIICn_base> + 0028$_H$,
RIICnSAR0LH: <RIICn_base> + 0029$_H$

RIICnSAR1: <RIICn_base> + 002C$_H$

RIICnSAR1L: <RIICn_base> + 002C$_H$

RIICnSAR1LL: <RIICn_base> + 002C$_H$,
RIICnSAR1LH: <RIICn_base> + 002D$_H$

RIICnSAR2: <RIICn_base> + 0030$_H$

RIICnSAR2L: <RIICn_base> + 0030$_H$

RIICnSAR2LL: <RIICn_base> + 0030$_H$,
RIICnSAR2LH: <RIICn_base> + 0031$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FSy	—	—	—	—	—	SVA[9:1]									SVA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.23 RIICnSARy Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	FSy	7-Bit/10-Bit Address Format Selection 0: The 7-bit address format is selected. 1: The 10-bit address format is selected.
14 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 1	SVA[9:1]	7-Bit Address/10-Bit Address Upper Bits A slave address is set. ● When the FSy bit is 0 (7-bit address format), the SVA[7:1] bits are valid and form a 7-bit slave address. ● When the FSy bit is 1 (10-bit address format), SVA[9:1] bits form a 10-bit slave address (combined with the SVA0 bit).
0	SVA0	10-Bit Address LSB The least significant bit (LSB) of a 10-bit slave address is set. ● When the FSy bit is 0 (7-bit address format), this bit is invalid. ● When the FSy bit is 1 (10-bit address format), this bit is a 10-bit slave address (combined with the SVA[9:1] bits).

SVA0 Bit (10-Bit Address LSB)

When the 10-bit address format is selected (RIICnSARy.FSy = 1), this bit functions as the LSB of a 10-bit address and forms a 10-bit address in combination with the SVA[9:1] bits.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, this bit is valid. While the RIICnSARy.FSy bit or SARy bit is 0, the setting of this bit is ignored.

SVA[9:1] Bits (7-Bit Address/10-Bit Address Upper Bits)

When the 7-bit address format is selected (RIICnSARy.FSy = 0), these bits function as a 7-bit address. When the 10-bit address format is selected (RIICnSARy.FSy = 1), these bits function as a 10-bit address in combination with the SVA0 bit.

While the RIICnSER.SARy bit is 0, the setting of these bits is ignored.

FSy Bit (7-Bit/10-Bit Address Format Selection)

This bit is used to select 7-bit address or 10-bit address for slave address y (in RIICnSARy).

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 0, the 7-bit address format is selected for slave address y, the RIICnSARy.SVA[7:1] setting is valid, and the settings of the SVA[9:8] bits and the RIICnSARy.SVA0 bit are ignored.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, the 10-bit address format is selected for slave address y and the settings of the SVA[9:1] bits and the SVA0 bit are valid.

While the RIICnSER.SARy bit is 0 (RIICnSARy disabled), the setting of the RIICnSARy.FSy bit is invalid.

23.3.13 RIICnBRL — I^{2}C Bus Bit Rate Low-Level Register

Access:	RIICnBRL register can be read or written in 32-bit units. RIICnBRLL register can be read or written in 16-bit units. RIICnBRLLL register can be read or written in 8-bit units.
Address:	RIICnBRL: <RIICn_base> + 0034_H RIICnBRLL: <RIICn_base> + 0034_H RIICnBRLLL: <RIICn_base> + 0034_H

Table 23.24 RIICnBRL Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	BRL[4:0]	Bit Rate Low-Level Period Low-level period of SCL clock

The RIICnBRL register is a 5-bit register that is used to set the width at low level for the SCL clock.

It also works to generate the data setup time for automatic SCL low-hold operation (see **Section 23.10, Automatic Low-Hold Function for SCL**); when the RIIC is used only in slave mode, this register needs to be set to a value longer than the data setup time*1.

RIICnBRL counts the low-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits.

Note 1. Data setup time (t_{SU}: DAT)
250 ns (up to 100 kbps: standard mode [Sm])
100 ns (up to 400 kbps: fast mode [Fm])

23.3.14 RIICnBRH — I^{2}C Bus Bit Rate High-Level Register

Access: RIICnBRH register can be read or written in 32-bit units.

RIICnBRHL register can be read or written in 16-bit units.

RIICnBRHLL register can be read or written in 8-bit units.

Address: RIICnBRH: <RIICn_base> + 0038$_H$

RIICnBRHL: <RIICn_base> + 0038$_H$

Table 23.25 RIICnBRH Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	BRH[4:0]	Bit Rate High-Level Period High-level period of SCL clock

RIICnBRH is a 5-bit register to set the high-level period of SCL clock. RIICnBRH is valid in master mode. If the RIIC is used only in slave mode, this register need not to set the high-level period.

RIICnBRH counts the high-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits.

The I^{2}C transfer rate and the SCL clock duty are calculated using the following expression.

(1) When RIICnFER.SCLE = 0
Transfer rate = $1/\{[(\text{RIICnBRH} + 1) + (\text{RIICnBRL} + 1)]/\text{IIC}\phi^{*1} + tr + tf\}$
Duty cycle = $\{tr + [(\text{RIICnBRH} + 1)/\text{IIC}\phi]\}/\{tr + tf + [(\text{RIICnBRH} + 1) + (\text{RIICnBRL} + 1)]/\text{IIC}\phi\}$

(2) When RIICnFER.SCLE = 1, RIICnFER.NFE = 0, IICϕ = PCLK
Transfer rate = $1/\{[(\text{RIICnBRH} + 3) + (\text{RIICnBRL} + 3)]/\text{IIC}\phi^{*1} + tr + tf\}$
Duty cycle = $\{tr + [(\text{RIICnBRH} + 3)/\text{IIC}\phi]\}/\{tr + tf + [(\text{RIICnBRH} + 3) + (\text{RIICnBRL} + 3)]/\text{IIC}\phi\}$

(3) When RIICnFER.SCLE = 1, RIICnFER.NFE = 1, IICϕ = PCLK
Transfer rate = $1/\{[(\text{RIICnBRH} + 3 + nf) + (\text{RIICnBRL} + 3 + nf)]/\text{IIC}\phi^{*1} + tr + tf\}$
Duty cycle = $\{tr + [(\text{RIICnBRH} + 3 + nf)/\text{IIC}\phi]\}/\{tr + tf + [(\text{RIICnBRH} + 3 + nf) + (\text{RIICnBRL} + 3 + nf)]/\text{IIC}\phi\}$

(4) RIICnFER.SCLE = 1, RIICnFER.NFE = 0, IICϕ < PCLK
Transfer rate = $1/\{[(\text{RIICnBRH} + 2) + (\text{RIICnBRL} + 2)]/\text{IIC}\phi^{*1} + tr + tf\}$
Duty cycle = $\{tr + [(\text{RIICnBRH} + 2)/\text{IIC}\phi]\}/\{tr + tf + [(\text{RIICnBRH} + 2) + (\text{RIICnBRL} + 2)]/\text{IIC}\phi\}$

(5) When RIICnFER.SCLE = 1, RIICnFER.NFE = 1, $\mathrm{IIC}\phi < \mathrm{PCLK}$

$\text{Transfer rate} = 1/\{[(\mathrm{RIICnBRH} + 2 + nf) + (\mathrm{RIICnBRL} + 2 + nf)\ ]/\mathrm{IIC}\phi^{*1} + tr + tf\}$

$\text{Duty cycle} = \{tr + [(\mathrm{RIICnBRH} + 2 + nf)/\ \mathrm{IIC}\phi]\}/\{\ tr + tf + [(\mathrm{RIICnBRH} + 2 + nf) + (\mathrm{RIICnBRL} + 2 + nf)]/\mathrm{IIC}\phi\}$

tf: SCL line falling time [ns]*2

tr: SCL line rising time [ns]*2

nf: Digital noise filter stage

Duty cycle: 0% < Duty < 100%

Note 1. As for IICϕ, see CKS[2:0] in **Section 23.3.4, RIICnMR1 — I2C Bus Mode Register 1**.

Note 2. The SCL line rising time [tr] and SCL line falling time [tf] depend on the total bus line capacitance [Cb] and the pull-up resistor [Rp]. For details, see the I²C bus standard from NXP Semiconductors.

Table 23.26, Examples of RIICnBRH/RIICnBRLSettings for Transfer Rate lists examples of the RIICnBRH and RIICnBRL register settings when the SCL synchronization circuit is not used.

CAUTION

CBRH/ICBRL settings in these tables are calculated using the following values:
SCL line rising time (tr): 100 kbps or less, [Sm]: 1000 ns, 400 kbps or less, [Fm]: 300 ns
SCL line falling time (tf): 400 kbps or less, [Sm/Fm]: 300 ns
For the specified values of SCL line rising time (tr) and SCL line falling time (tf), see the I^{2}C bus standard from NXP Semiconductors.

23.3.15 RIICnDRT — I^{2}C Bus Transmit Data Register

Access: RIICnDRT register can be read or written in 32-bit units.
RIICnDRTL register can be read or written in 16-bit units.
RIICnDRTLL register can be read or written in 8-bit units.

Address: RIICnDRT: <RIICn_base> + 003C$_H$
RIICnDRTL: <RIICn_base> + 003C$_H$
RIICnDRTLL: <RIICn_base> + 003C$_H$

When RIICnDRT detects a space in the I^{2}C bus shift register (RIICnDRS), it transfers the transmit data that has been written to RIICnDRT to RIICnDRS and starts transmitting data in transmit mode.

The double-buffer structure of RIICnDRT and RIICnDRS allows continuous transmit operation if the next transmit data has been written to RIICnDRT while the RIICnDRS data is being transmitted.

RIICnDRT can always be read and written. Write transmit data to RIICnDRT once when a transmit data empty interrupt (INTRIICnTI) request is generated. When writing to bit 31 to 8, write the value after reset.

23.3.16 RIICnDRR — I^{2}C Bus Receive Data Register

Access: RIICnDRR register is a read-only register that can be read in 32-bit units.

RIICnDRRL register is a read-only register that can be read in 16-bit units.

RIICnDRRLL register is a read-only register that can be read in 8-bit units.

Address: RIICnDRR: <RIICn_base> + 0040$_H$

RIICnDRRL: <RIICn_base> + 0040$_H$

RIICnDRRLL: <RIICn_base> + 0040$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

When 1 byte of data has been received, the received data is transferred from the I^{2}C bus shift register (RIICnDRS) to RIICnDRR to enable the next data to be received.

The double-buffer structure of RIICnDRS and RIICnDRR allows continuous receive operation if the received data has been read from RIICnDRR while RIICnDRS is receiving data.

RIICnDRR cannot be written. Read data from RIICnDRR once when a receive complete interrupt (INTRIICnRI) request is generated.

If RIIC receives the next receive data before the current data is read from RIICnDRR (while the RIICnSR2.RDRF flag is 1), the RIIC automatically holds the SCL clock low one cycle before the RDRF flag is set to 1 next.

23.3.17 RIICnDRS — I^{2}C Bus Shift Register

Access: This register is not accessible.

Address: —

Value after reset: 0000 00FF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RIICnDRS is a shift register to transmit and receive data.

During transmission, transmit data is transferred from RIICnDRT to RIICnDRS and is sent from the SDA pin. During reception, data is transferred from RIICnDRS to RIICnDRR after 1 byte of data has been received.

RIICnDRS cannot be accessed directly.

23.4 Interrupt Sources

The RIIC issues four types of interrupt request: transfer error or event generation (arbitration-lost detection, NACK detection, timeout detection, start condition detection, and stop condition detection), receive complete, transmit data empty, and transmit end.

Table 23.27, Interrupt Sources lists details of the several interrupt requests. The receive complete and transmit data empty interrupt request are both capable of launching data transfer by the DMA.

Table 23.27 Interrupt Sources

Symbol	Interrupt Source	Interrupt Flag	DMA Launching	Interrupt Condition
INTRIICnTI	Transmit Data Empty	TDRE	Possible	TDRE = 1 and TIE = 1
INTRIICnTEI	Transmit End	TEND	Not possible	TEND = 1 and TEIE = 1
INTRIICnRI	Receive Complete	RDRF	Possible	RDRF = 1 and RIE = 1
INTRIICnEE	Transfer Error/Event Generation	AL	Not possible	AL = 1 and ALIE = 1
		NACKF		NACKF = 1 and NAKIE = 1
		TMOF		TMOF = 1 and TMOIE = 1
		START		START = 1 and STIE = 1
		STOP		STOP = 1 and SPIE = 1

Clear or mask the each flag during interrupt handling.

CAUTIONS

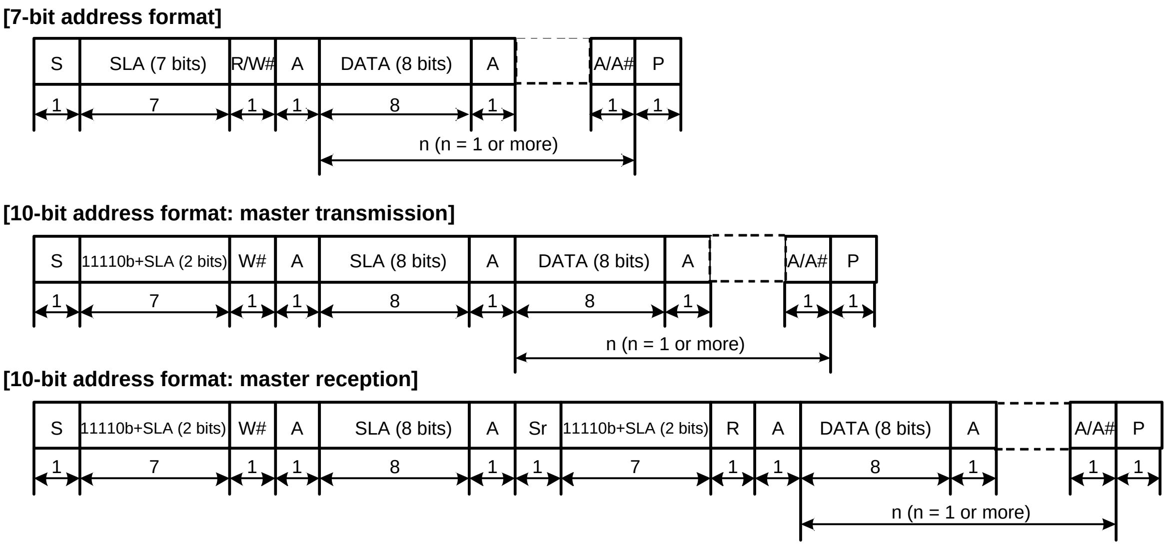
1. There is a latency (delay) between the execution of a write instruction for a peripheral module by the CPU and actual writing to the module. Thus, when an interrupt flag has been cleared or masked, read the relevant flag again to check whether clearing or masking has been completed, and then return from interrupt processing. Returning from interrupt processing without checking that writing to the module has been completed creates a possibility of repeated processing of the same interrupt.
2. Since INTRIICnTI is an edge-detected interrupt, it does not require clearing. Furthermore, the RIICnSR2.TDRE flag (a condition for INTRIICnTI) is automatically cleared to 0 when data for transmission are written to RIICnDRT or a stop condition is detected (RIICnSR2.STOP flag = 1).
3. Since INTRIICnRI is an edge-detected interrupt, it does not require clearing. Furthermore, the RIICnSR2.RDRF flag (a condition for INTRIICnRI) is automatically cleared to 0 when data are read from RIICnDRR.
4. When using the INTRIICnTEI interrupt, clear the RIICnSR2.TEND flag in the INTRIICnTEI interrupt processing. Note that the RIICnSR2.TEND flag is automatically cleared to 0 when data for transmission are written to RIICnDRT or a stop condition is detected (RIICnSR2.STOP flag = 1).

23.5 Operation

23.5.1 Communication Data Format

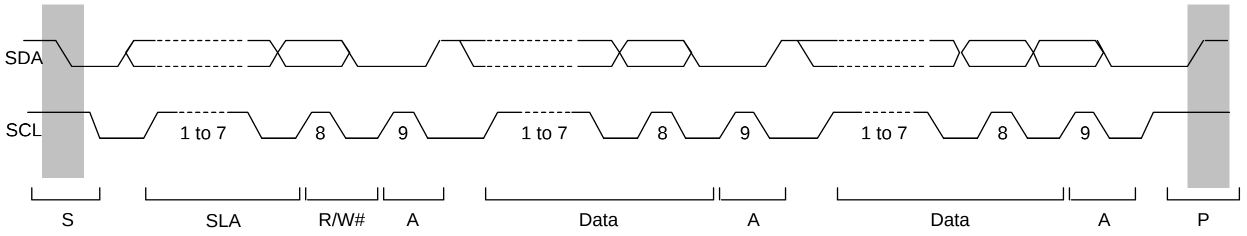
The I²C bus format consists of 8-bit data and 1-bit acknowledge. The frame following a start condition or restart condition is an address frame used to specify a slave device with which the master device communicates. The specified slave is valid until a new slave is specified or a stop condition is issued.

Figure 23.3, I2C Bus Format shows the I²C bus format, and **Figure 23.4, I2C Bus Timing (SLA = 7 Bits)** shows the I²C bus timing.



Note: n: Number of transfer frames

Figure 23.3 I²C Bus Format



Note: S: Start condition. The master device drives the SDA line low from high level while the SCL line is at a high level.

SLA: Slave address, by which the master device selects a slave device.

R/W#: Indicates the direction of data transfer: from the slave device to the master device when R/W is 1, or from the master device to the slave device when R/W is 0.

A: Acknowledge. The receive device drives the SDA line low. (In master transmit mode, the slave device returns acknowledge. In master receive mode, the master device returns acknowledge.)

A#: Not-acknowledge. The receiving device has not returned a response or is not present so the SDA line has remained at the high level.

Sr: Restart condition. The master device drives the SDA line low from the high level after the setup time has elapsed with the SCL line at the high level.

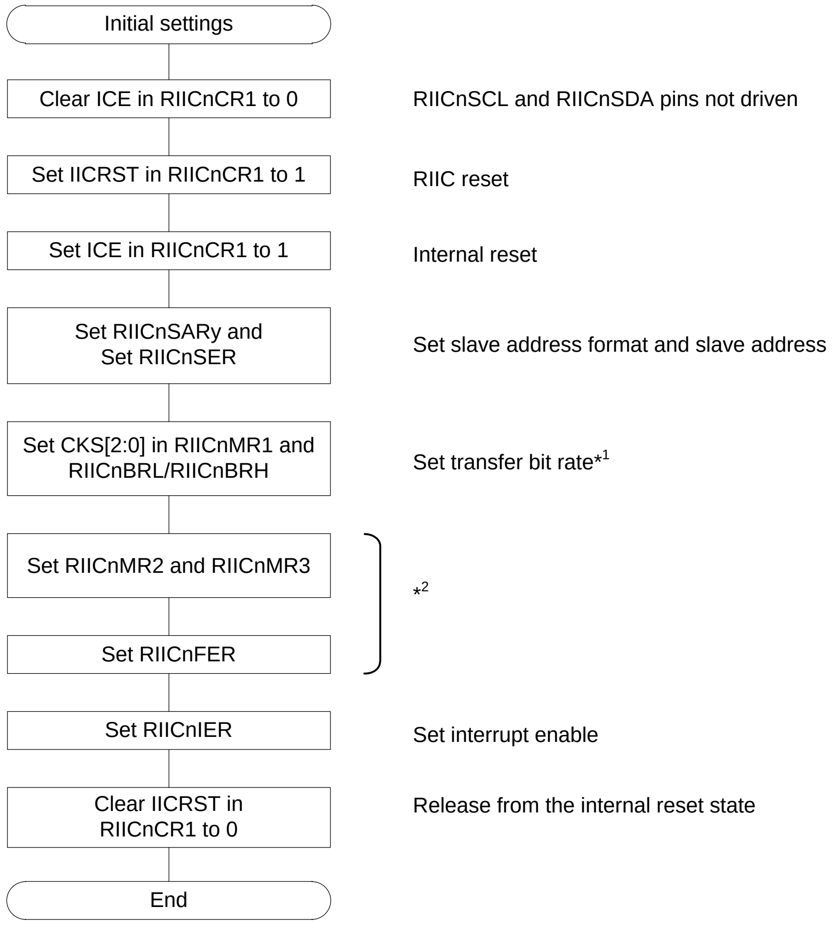
DATA: Transmitted or received data

P: Stop condition. The master device drives the SDA line high from low level while the SCL line is at a high level.

Figure 23.4 I²C Bus Timing (SLA = 7 Bits)

23.5.2 Initial Settings

Before starting data transmission and reception, initialize the RIIC according to the procedure in **Figure 23.5, Example of RIIC Initialization Flowchart**. Make initial settings for the RIIC once when starting the RIIC.



Note: y = 0 to 2

Note 1. When the RIIC is used only in slave mode, set the RIICnBRL register to a value longer than the data setup time.

Note 2. Set these registers as necessary.

Figure 23.5 Example of RIIC Initialization Flowchart

23.5.3 Master Transmit Operation

In master transmit operation, the RIIC outputs the SCL (clock) and transmitted data signals as the master device, and the slave device returns acknowledgements. **Figure 23.6, Example of Master Transmission Flowchart** shows an example of usage of master transmission and **Figure 23.7, Master Transmit Operation Timing (1) (7-Bit Address Format)** to **Figure 23.9, Master Transmit Operation Timing (3)** show the timing of operations in master transmission.

The following describes the procedure and operations for master transmission.

(1) Set the RIICnCR1.IICRST bit 1 to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 23.5, Example of RIIC Initialization Flowchart**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. At the same time, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the internal levels for the SDA output state and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS and MST bits to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the slave address including the R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, the RIIC continues in master transmit mode.
Since the RIICnSR2.NACKF flag being 1 at this time indicates that the slave address has not been recognized or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.
For data transmission with an address in the 10-bit format, start by writing 1111 0_B, the two higher-order bits of the slave address, and W# to RIICnDRT as the first address transmission. Then, as the second address transmission, write the eight lower-order bits of the slave address to RIICnDRT.

(4) After confirming that the RIICnSR2.TDRE flag is 1, write the data for transmission to the RIICnDRT register. The RIIC automatically holds the SCL line low until the data for transmission are ready or a stop condition is issued.

(5) After all bytes of data for transmission have been written to the RIICnDRT register, wait until the value of the RIICnSR2.TEND flag returns to 1, and then set the RIICnCR2.SP bit to 1 (stop condition issuance request). Upon receiving a stop condition issuance request, the RIIC issues the stop condition.

(6) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00_B and enters slave receive mode. Furthermore, it automatically clears the RIICnSR2.TDRE and TEND flags to 0, and sets the RIICnSR2.STOP flag in to 1.

(7) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

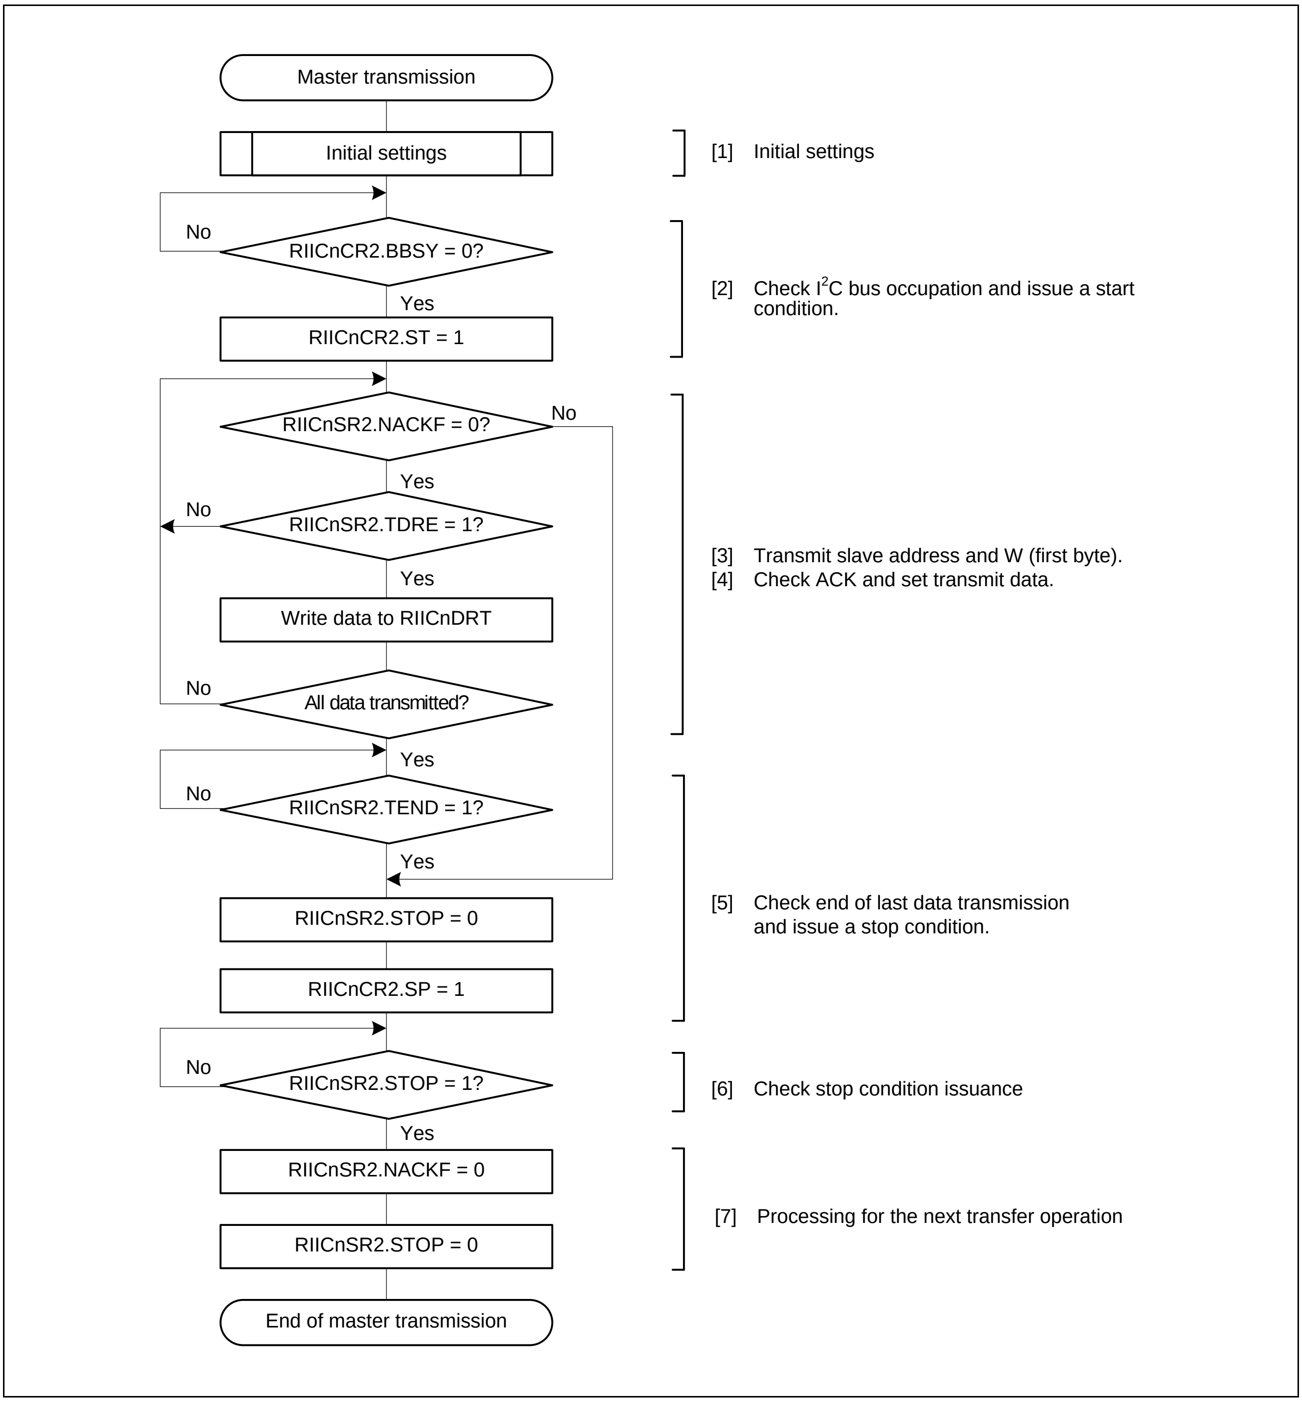


Figure 23.6 Example of Master Transmission Flowchart

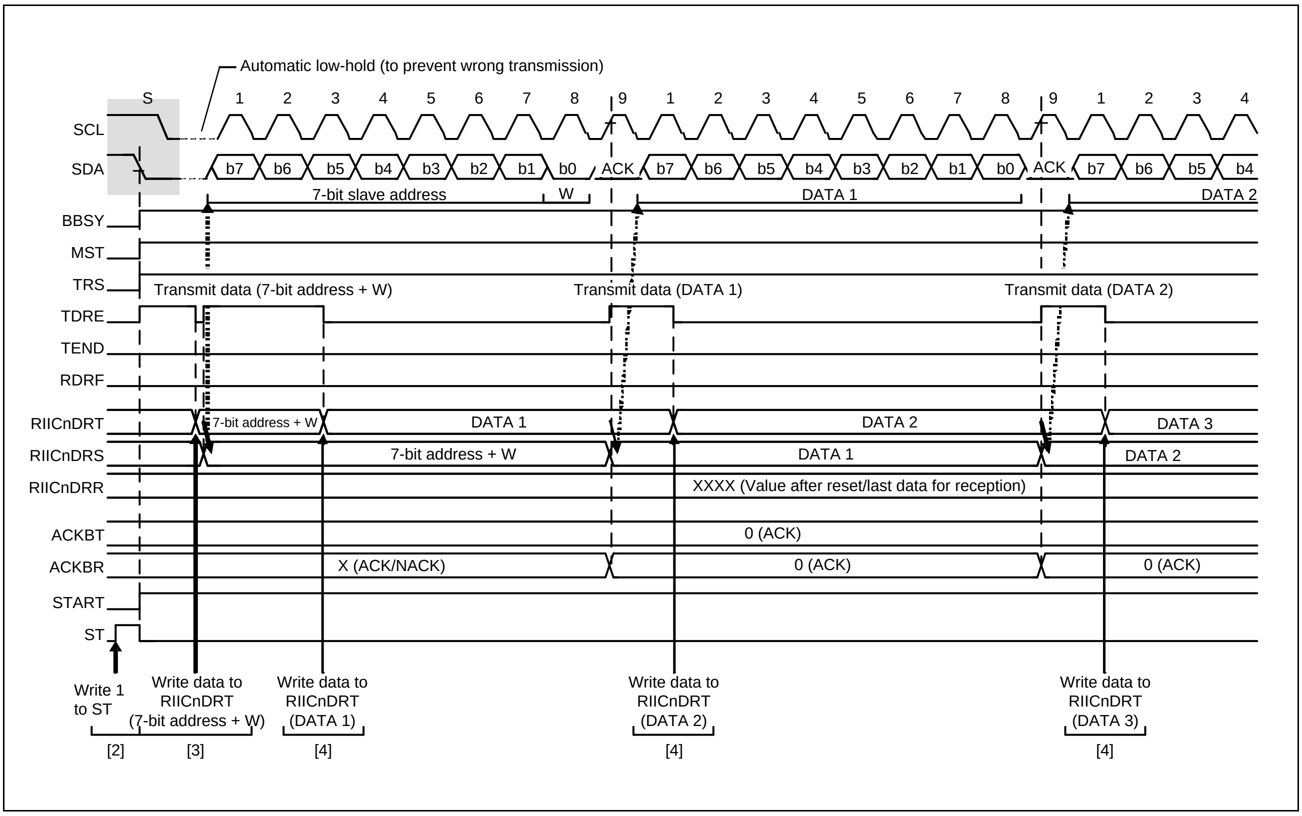

Figure 23.7 Master Transmit Operation Timing (1) (7-Bit Address Format)

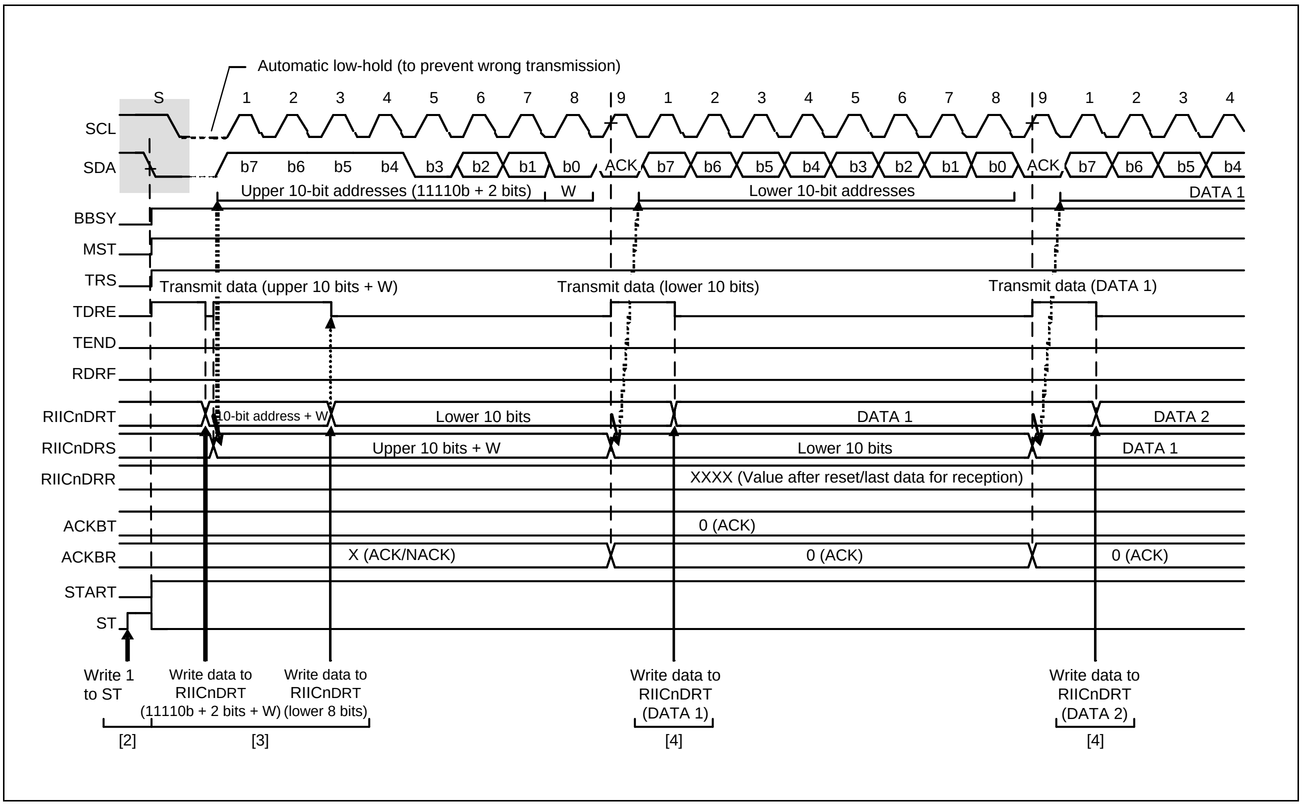

Figure 23.8 Master Transmit Operation Timing (2) (10-Bit Address Format)

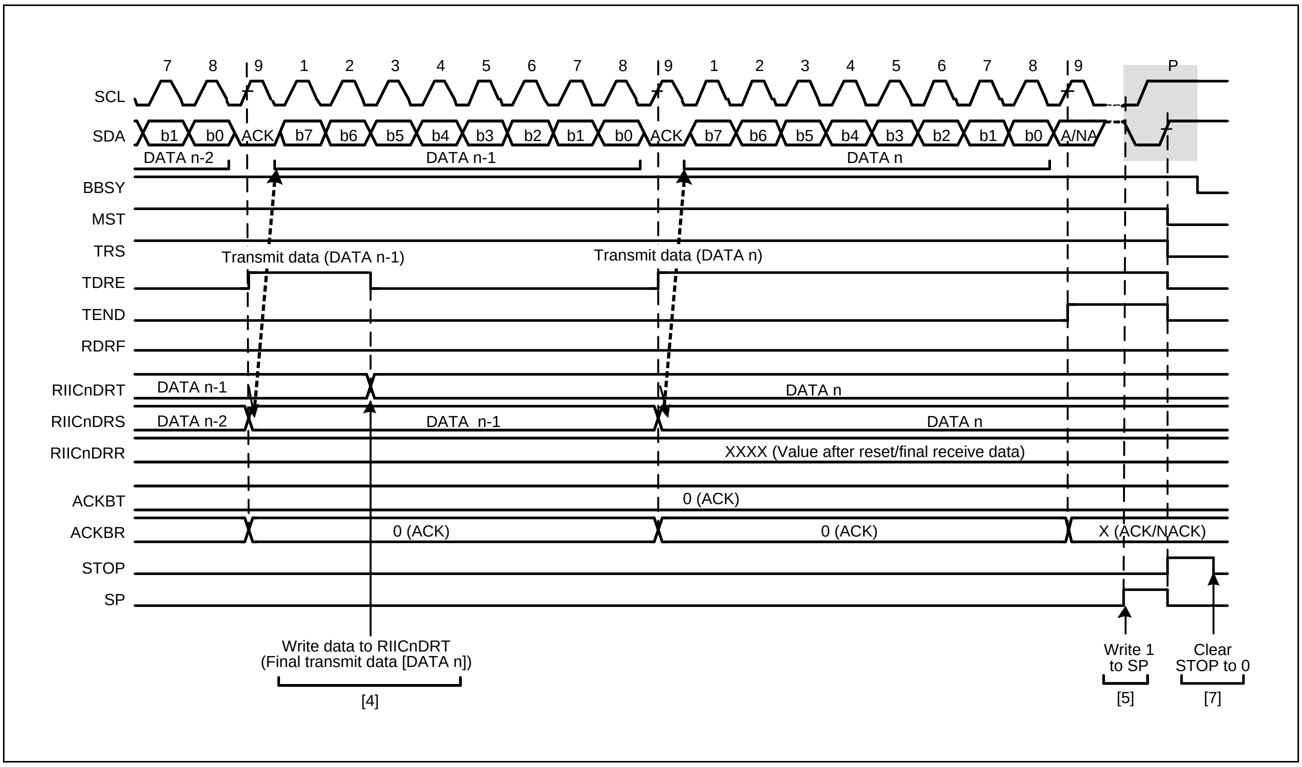

Figure 23.9 Master Transmit Operation Timing (3)

23.5.4 Master Receive Operation

In master receive operation, the RIIC as a master device outputs the SCL (clock) signal, receives data from the slave device, and returns acknowledgements. Since the RIIC must start by sending a slave address to the corresponding slave device, this part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

Figure 23.10, Example of Master Reception Flowchart (7-Bit Address Format, 1 or 2 Bytes) shows an example of master reception flowchart (7-bit address format, 1 or 2 bytes), **Figure 23.11, Example of Master Reception Flowchart (7-Bit Address Format, 3 Bytes or More)** shows an example of master reception flowchart (7-bit address format, 3 bytes or more), and **Figure 23.12, Master Receive Operation Timing (1) (7-Bit Address Format, when RDRFS = 0)** to **Figure 23.14, Master Receive Operation Timing (3) (when RDRFS = 0)** show the timing of operations in master reception.

The following describes the procedure and operations for master reception.

(1) Set the RIICnCR1.IICRST bit to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 23.5, Example of RIIC Initialization Flowchart**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. When the RIIC detects the start condition, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the levels for the SDA output and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and value of the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the slave address including the R/W# bit has been transmitted, the value of the RIICnCR2.TRS bit is automatically updated to select transmit or receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 1, the RIICnCR2.TRS bit is cleared to 0 on the rising edge of the ninth cycle of SCL (the clock signal), placing the RIIC in master receive mode. At this time, the TDRE flag is automatically cleared to 0 and the RIICnSR2.RDRF flag is automatically set to 1.
Since the RIICnSR2.NACKF flag being 1 at this time indicates that the slave address has not been recognized or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.
For master reception from a device with a 10-bit address, start by using master transmission to transmit the two higher-order bits of the slave address and then the eight lower-order bits of the slave address, and issue a restart condition following generation of the transmission end interrupt (or after TEND = 1) (see **Figure 23.13, Master Receive Operation Timing (2) (10-Bit Address Format, when RDRFS = 0)** for operation timing). After that, transmitting 1111 0_B plus the two higher-order bits of the slave address, and the R bit places the RIIC in master receive mode.

(4) Dummy read RIICnDRR after confirming that the RIICnSR2.RDRF flag is 1; this makes the RIIC start output of the SCL (clock) signal and start data reception.

(5) After 1 byte of data has been received, the RIICnSR2.RDRF flag is set to 1 on the rising edge of the eighth or ninth cycle of SCL clock (the clock signal) as selected by the RIICnMR3.RDRFS bit. Reading out RIICnDRR at this time will produce the received data, and the RDRF flag is automatically cleared to 0 at the same time. Furthermore, the value of the acknowledgement field received during the ninth cycle of SCL clock is returned as the value set in the RIICnMR3.ACKBT bit. Furthermore, if the next byte to be received is the next to last byte, set the RIICnMR3.WAIT bit to 1 (for wait insertion) before reading the RIICnDRR (containing the second byte from last). As well as enabling NACK output even in the case of delays in processing to set the RIICnMR3.ACKBT bit to 1 (NACK) in step (6), due to other interrupts, etc., this fixes the SCL line to the low level on the rising edge of the ninth clock cycle in reception of the last byte, so the state is such that issuing a stop condition is possible.

(6) When the RIICnMR3.RDRFS bit is 0 and the slave device must be notified that it is to end transfer for data reception after transfer of the next (final) byte, set the RIICnMR3.ACKBT bit to 1 (NACK).

(7) After reading out the byte before last from the RIICnDRR register, if the value of the RIICnSR2.RDRF flag is confirmed to be 1, write 1 to the RIICnCR2.SP bit (stop condition issuance request) and then read the last byte from RIICnDRR. When RIICnDRR is read, the RIIC is released from the wait state and issues the stop condition after low-level output in the ninth clock cycle is completed or the SCL line is released from the low-hold state.

(8) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00_B and enters slave receive mode. Furthermore, detection of the stop condition leads to setting of the RIICnSR2.STOP flag to 1.

(9) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

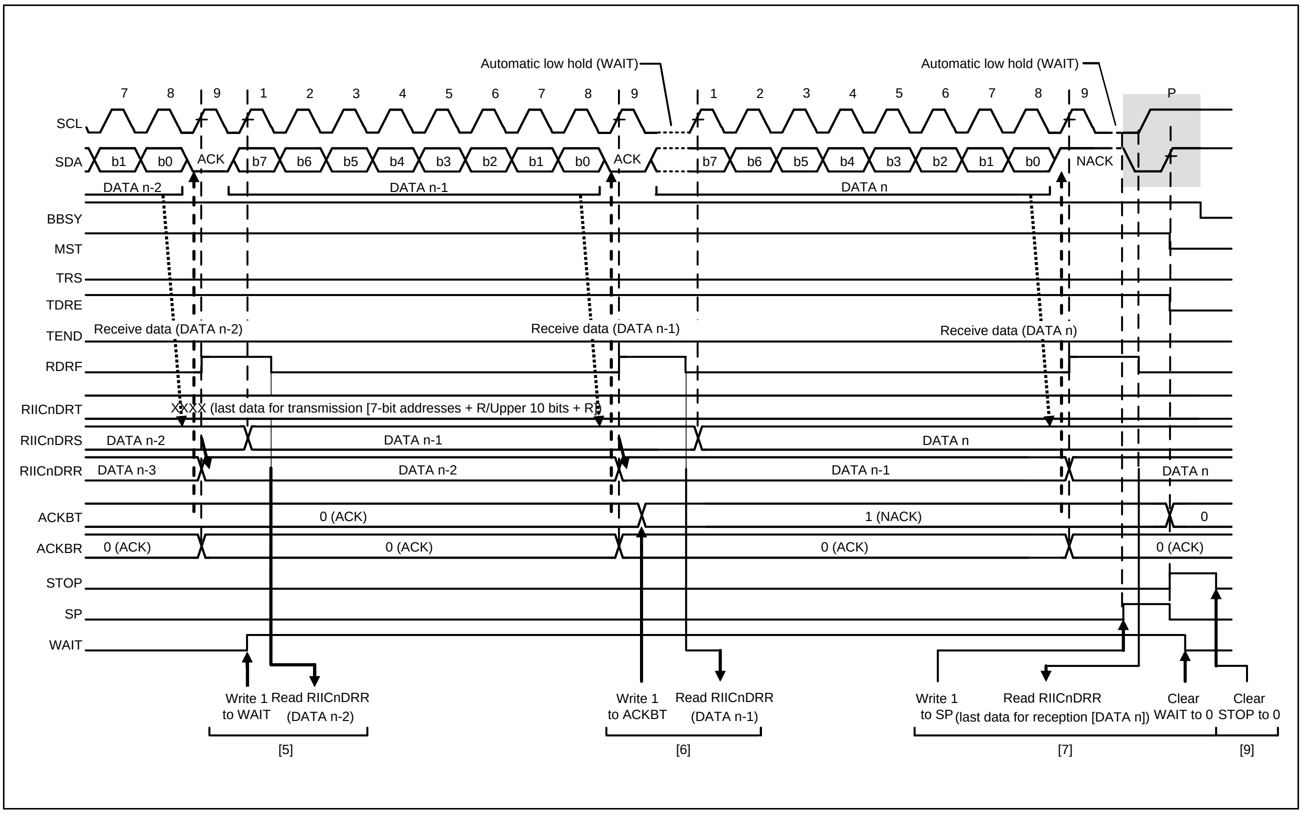

Figure 23.14 Master Receive Operation Timing (3) (when RDRFS = 0)

23.5.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL (clock) signal, the RIIC transmits data as a slave device, and the master device returns acknowledgements.

Figure 23.15, Example of Slave Transmission Flowchart shows an example of usage of slave transmission and **Figure 23.16, Slave Transmit Operation Timing (1) (7-Bit Address Format)** and **Figure 23.17, Slave Transmit Operation Timing (2)** show the timing of operations in slave transmission.

The following describes the procedure and operations for slave transmission.

(1) Follow the procedure in **Figure 23.5, Example of RIIC Initialization Flowchart** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC automatically sets the BBSY and RIICnSR2.START flags to 1 and automatically clears the ST bit to 0 on detection of a start condition.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 1, the RIIC automatically places itself in slave transmit mode by setting both the RIICnCR2.TRS bit and the RIICnSR2.TDRE flag to 1.

(3) After the RIICnSR2.TDRE flag is confirmed to be 1, write the data for transmission to the RIICnDRT register. At this time, if the RIIC receives no acknowledge from the master device (receives an NACK signal) while the RIICnFER.NACKE bit is 1, the RIIC suspends transfer of the next data.

(4) Wait until the RIICnSR2.TEND flag is set to 1 while the RIICnSR2.TDRE flag is 1, after the RIICnSR2.NACKF flag is set to 1 or the last byte for transmission is written to the RIICnDRT register. When the RIICnSR2.NACKF flag or the TEND flag is 1, the RIIC drives the SCL line low on the ninth falling edge of SCL clock.

(5) When the RIICnSR2.NACKF flag or the RIICnSR2.TEND flag is 1, dummy read RIICnDRR to complete the processing. This releases the SCL line.

(6) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.GCA, and AASy (y = 0 to 2), flags RIICnSR2.TDRE and TEND, and the RIICnCR2.TRS bit to 0, and enters slave receive mode. Furthermore, it automatically sets the RIICnSR2.STOP flag to 1.

(7) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

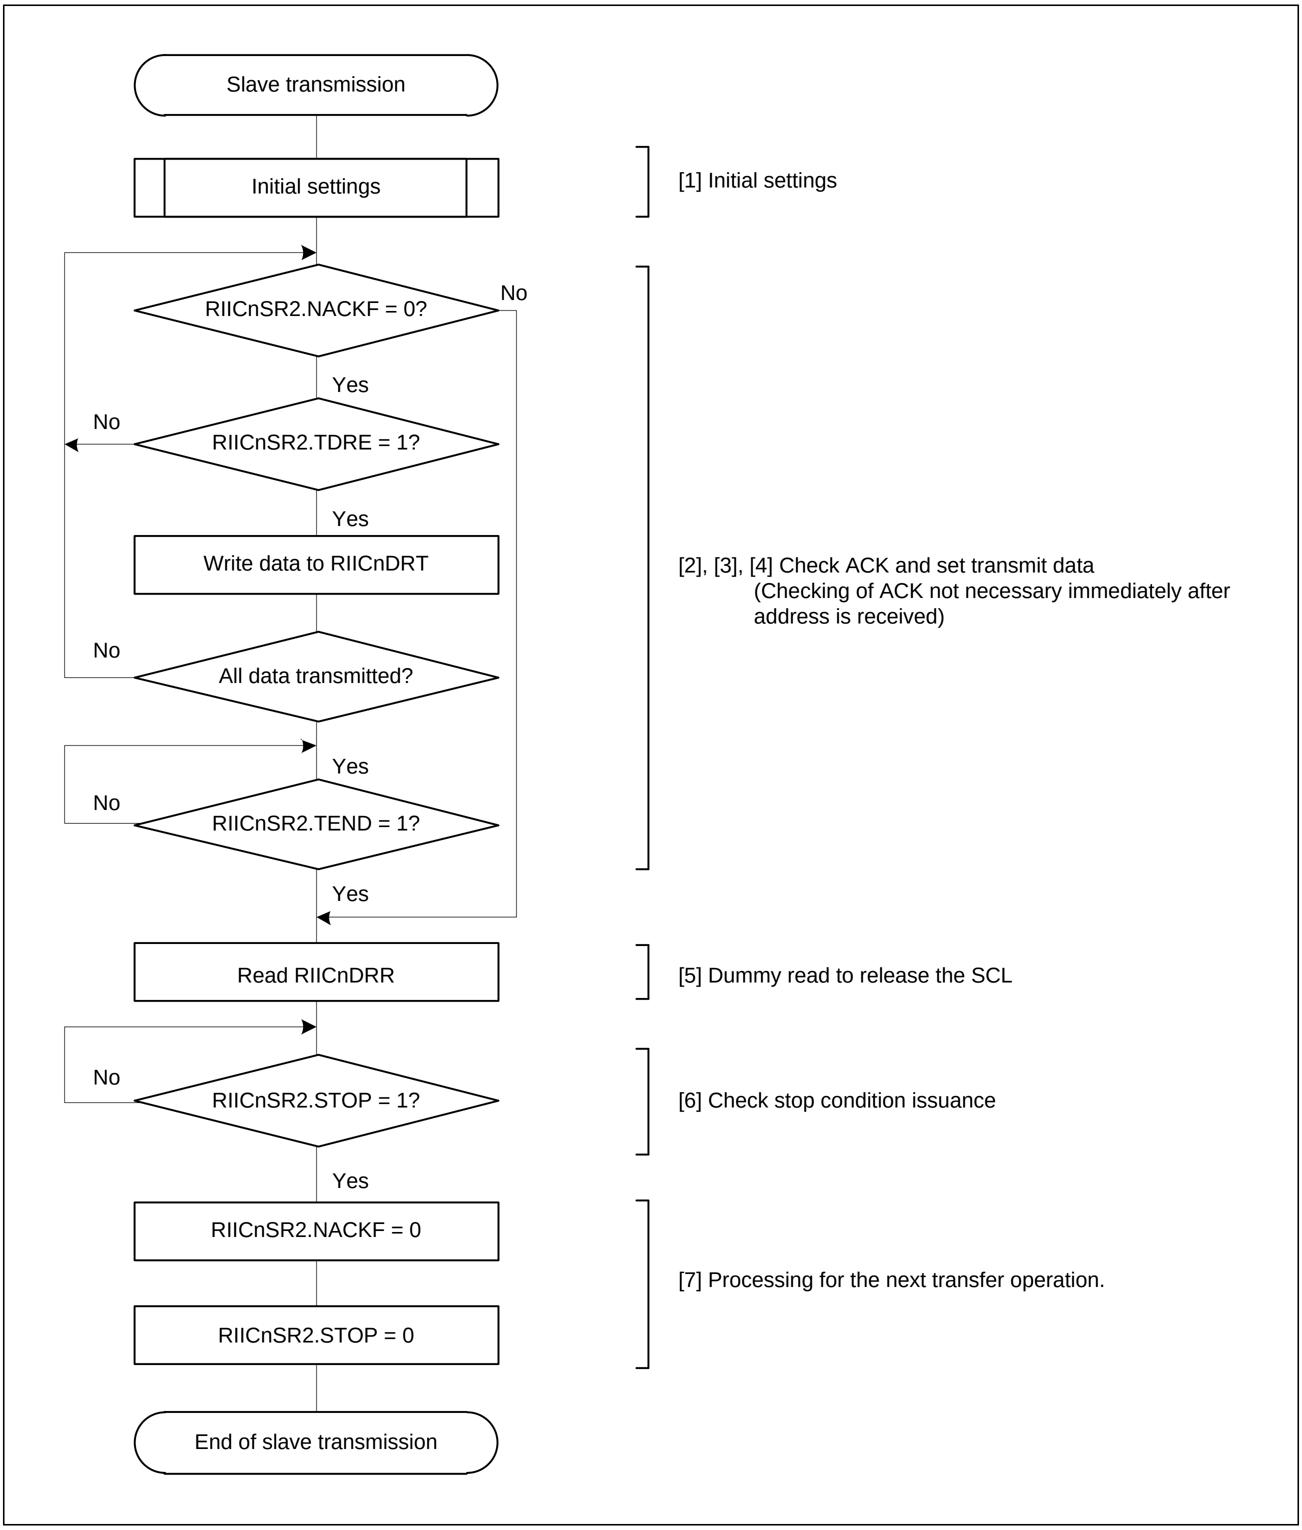

Figure 23.15 Example of Slave Transmission Flowchart

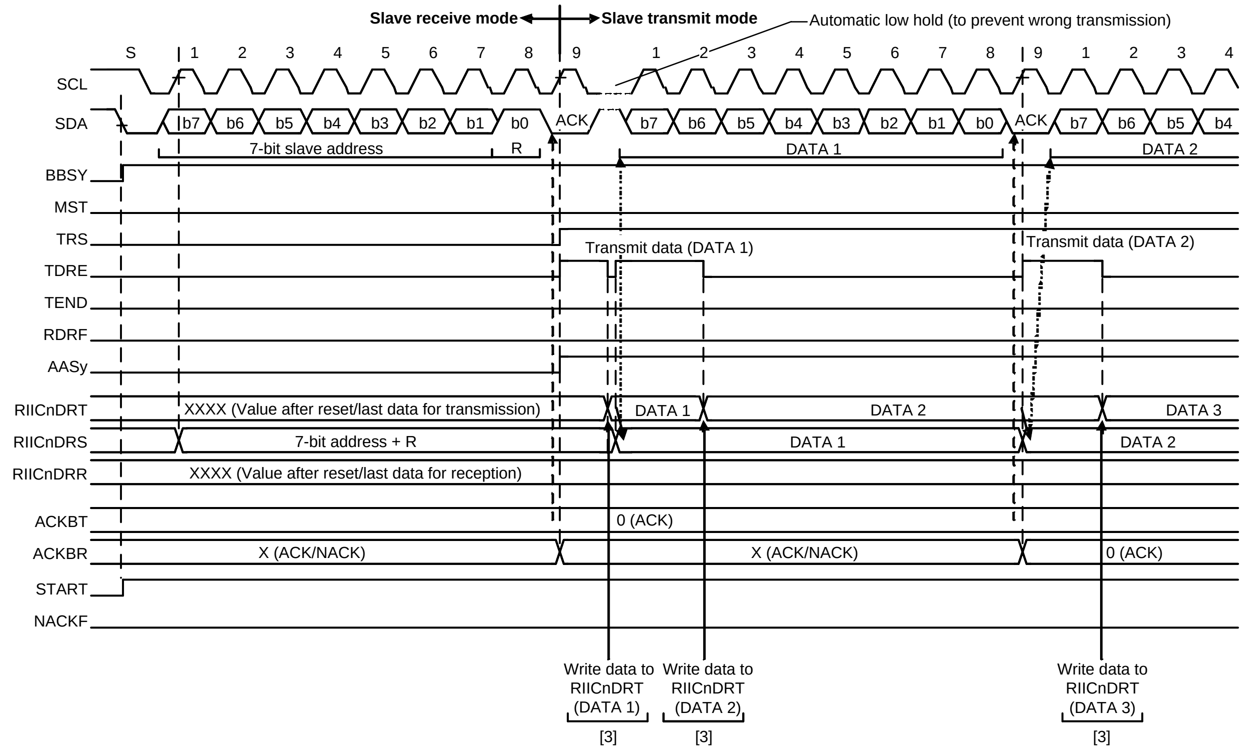

Figure 23.16 Slave Transmit Operation Timing (1) (7-Bit Address Format)

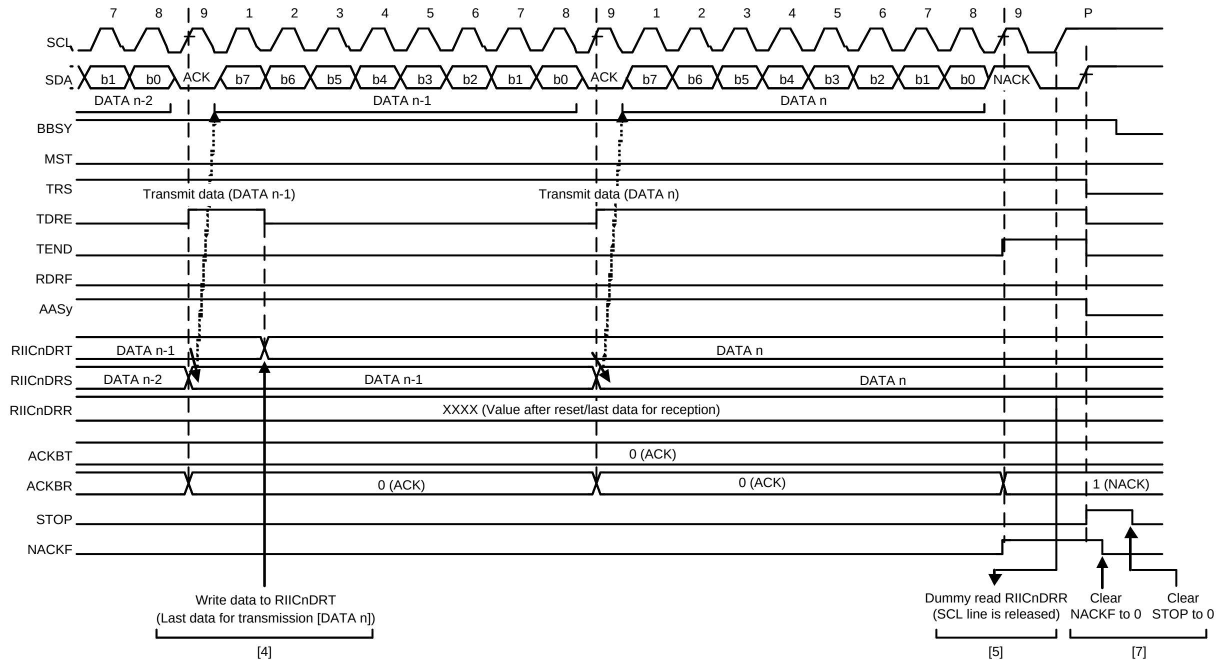

Figure 23.17 Slave Transmit Operation Timing (2)

23.5.6 Slave Receive Operation

In slave receive operation, the master device outputs the SCL clock and transmit data, and the RIIC returns acknowledgements as a slave device.

Figure 23.18, Example of Slave Reception Flowchart shows an example of usage of slave reception and **Figure 23.19, Slave Receive Operation Timing (1) (7-Bit Address Format, when RDRFS = 0)** and **Figure 23.20, Slave Receive Operation Timing (2) (when RDRFS = 0)** show the timing of operations in slave reception.

The following describes the procedure and operations for slave reception.

(1) Follow the procedure in **Figure 23.5, Example of RIIC Initialization Flowchart** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC automatically sets the BBSY and RIICnSR2.START flags to 1 and automatically clears the ST bit to 0 on detection of a start condition.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1. GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 0, the RIIC continues to place itself in slave receive mode and sets the RIICnSR2.RDRF flag to 1.

(3) After the RIICnSR2.STOP flag is confirmed to be 0 and the RIICnSR2.RDRF flag to be 1, dummy read RIICnDRR as the first read operation (the dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower eight bits when the 10-bit address format is selected).

(4) When RIICnDRR is read, the RIIC automatically clears the RIICnSR2.RDRF flag to 0. If reading of RIICnDRR is delayed and a next byte is received while the RDRF flag is still set to 1, the RIIC holds the SCL line low from one SCL cycle before the timing with which RDRF should be set. In this case, reading RIICnDRR releases the SCL line from being held at the low level.
When the RIICnSR2.STOP flag is 1 and the RIICnSR2.RDRF flag is also 1, read RIICnDRR until all the data is completely received.

(5) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 0. Furthermore, it automatically sets the RIICnSR2.STOP flag to 1.

(6) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.STOP flag to 0 for the next transfer operation.

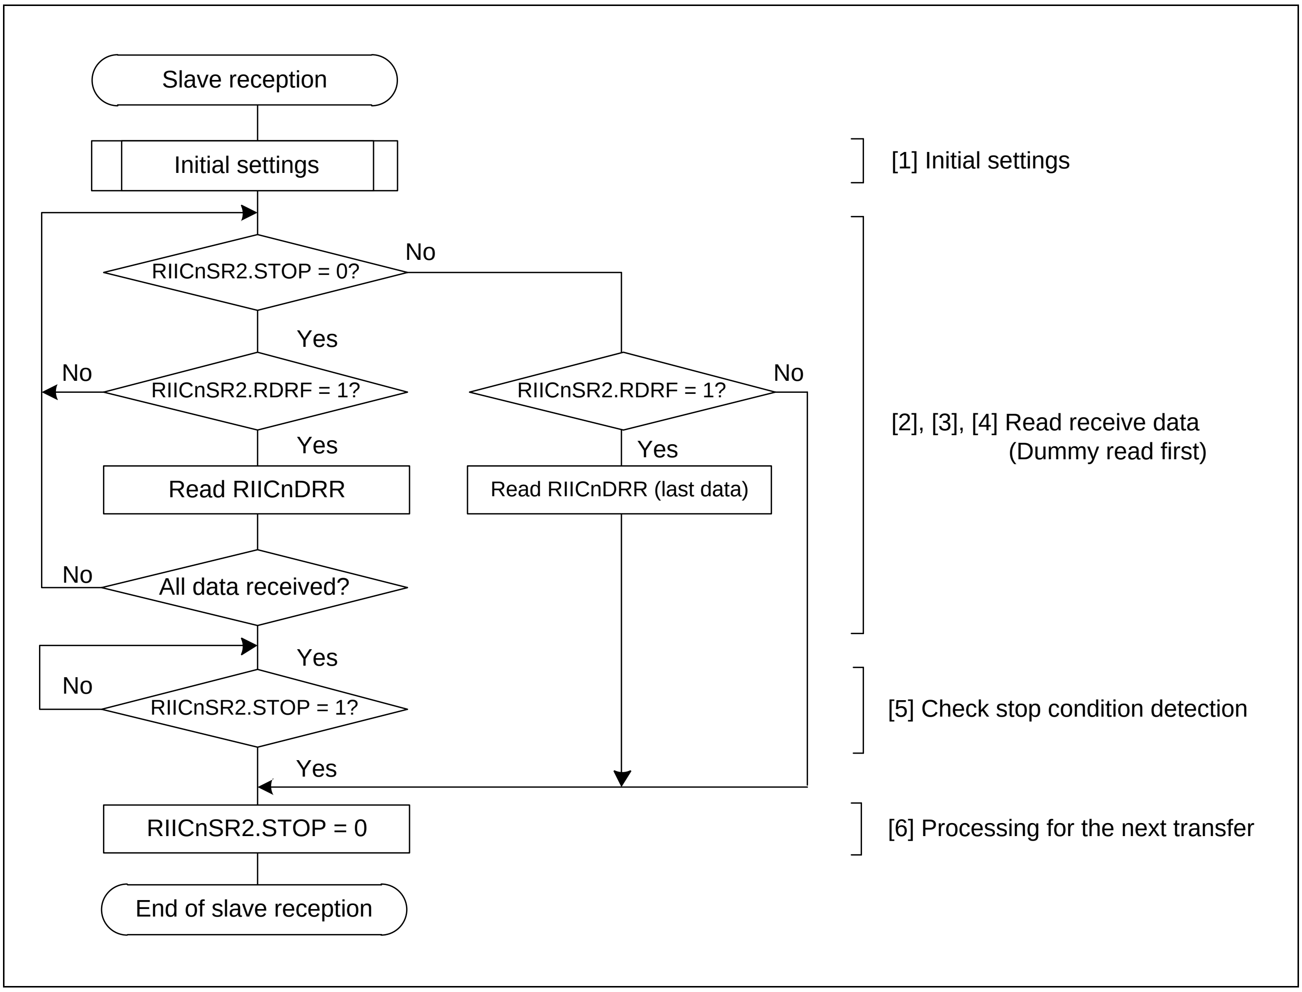

Figure 23.18 Example of Slave Reception Flowchart

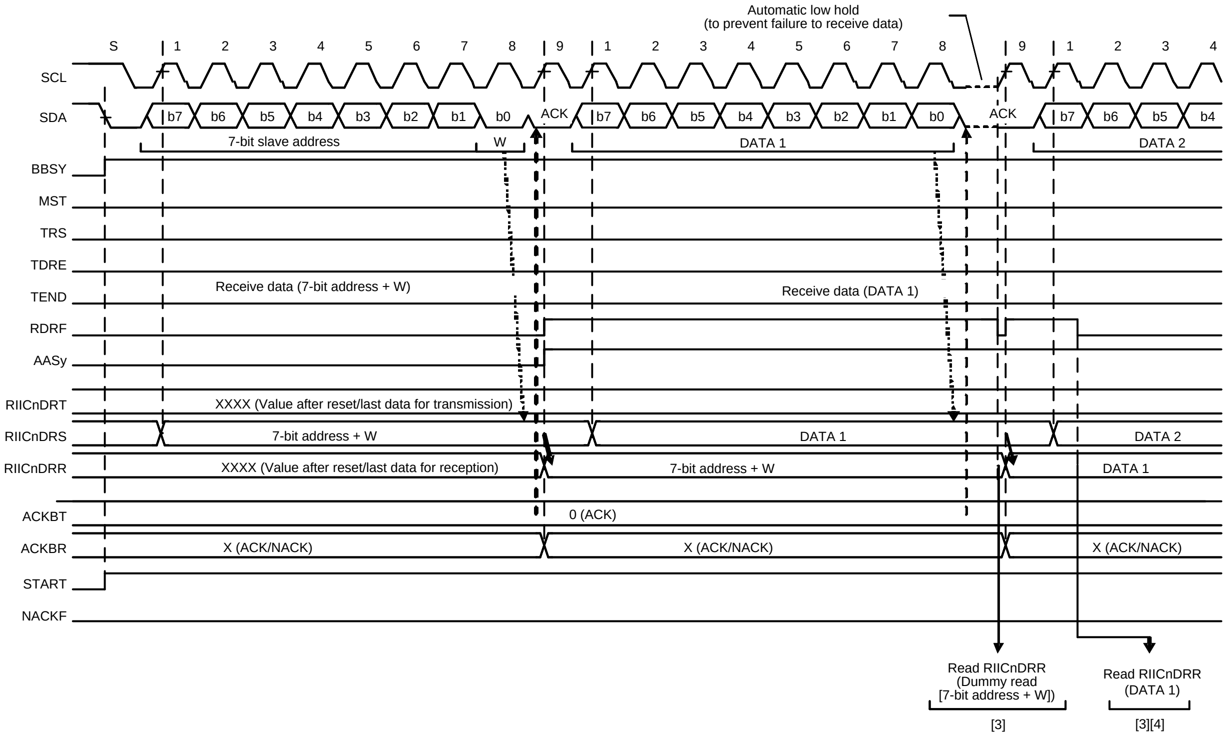

Figure 23.19 Slave Receive Operation Timing (1) (7-Bit Address Format, when RDRFS = 0)

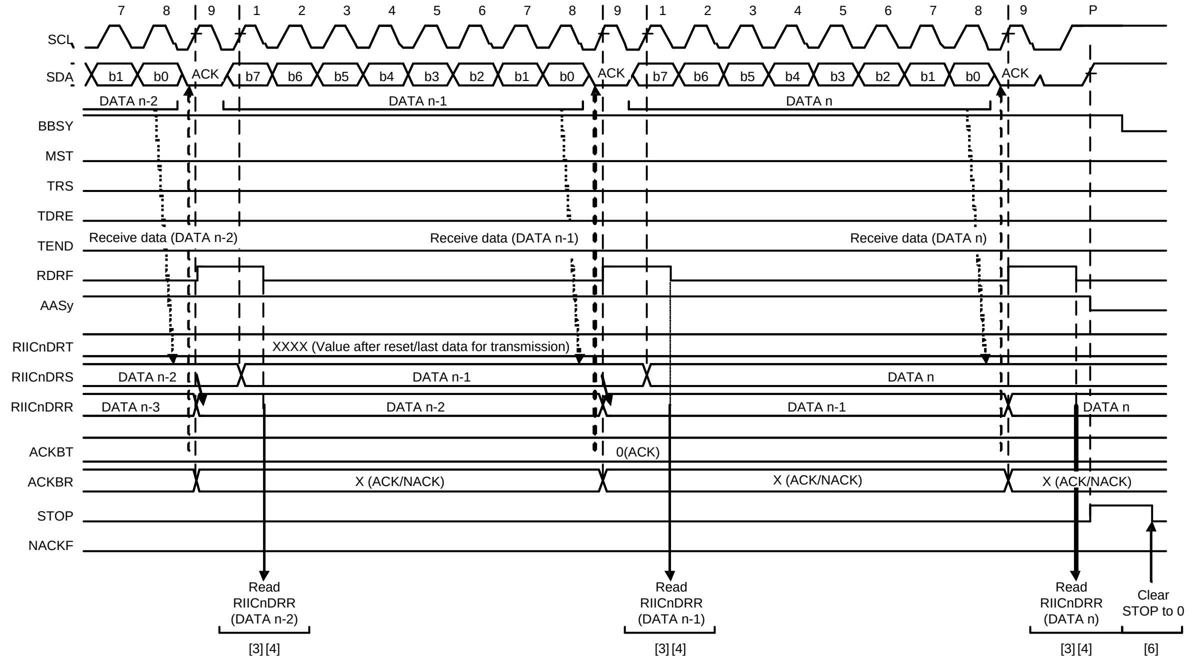

Figure 23.20 Slave Receive Operation Timing (2) (when RDRFS = 0)

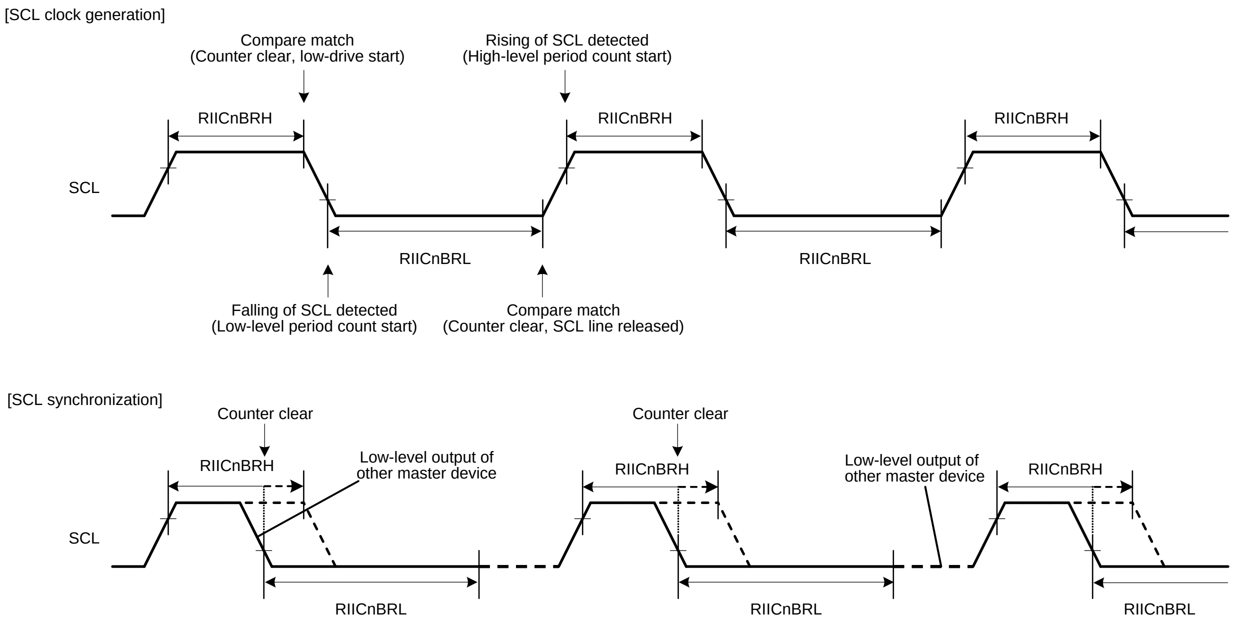
23.6 SCL Synchronization Circuit

In generation of the SCL (clock) signal, the RIIC starts counting out the value for width at high level specified in RIICnBRH when it detects a rising edge on the SCL line and drives the SCL line low once counting of the width at high level is complete. When the RIIC detects the falling edge of the SCL line, it starts counting out the width at low level period specified in RIICnBRL, and then stops driving the SCL line (releases the line) once counting of the width at low level is complete. The SCL (clock) signal is thus generated.

If multiple master devices are connected to the I^{2}C bus, a collision of SCL signals may arise due to contention with another master device. In such cases, the master devices have to synchronize their SCL signals. Since this synchronization of SCL signals must be bit by bit, the RIIC is equipped with a facility (the SCL synchronization circuit) to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCL line during communication.

When the RIIC has detected a rising edge on the SCL line and thus started counting out the width at high level specified in RIICnBRH, and the level on the SCL line falls because an SCL signal is being generated by another master device, the RIIC stops counting when it detects the falling edge, drives the level on the SCL line low, and starts counting out the width at low level specified in RIICnBRL. When the RIIC finishes counting out the width at low level, it stops driving the SCL line to the low level (i.e. releases the line). At this time, if the width at low level of the SCL clock signal from the other master device is longer than the width at low level set in the RIIC, the width at low level of the SCL signal will be extended. Once the width at low level for the other master device has ended, the SCL signal rises because the SCL line has been released. That is, in cases of contention of SCL signals from more than one master, the width at high level of the SCL signal is synchronized with that of the clock having the narrower width, and the width at low level of the SCL signal is synchronized with that of the clock having the broader width. However, such synchronization of the SCL signal is only enabled when the RIICnFER.SCLE bit is set to 1.



Note: RIICnBRH: I^{2}C bus bit rate high-level register (SCL clock high-level period counter)
RIICnBRL: I^{2}C bus bit rate low-level register (SCL clock low-level period counter)

Figure 23.21 Generation and Synchronization of the SCL Signal from the RIIC

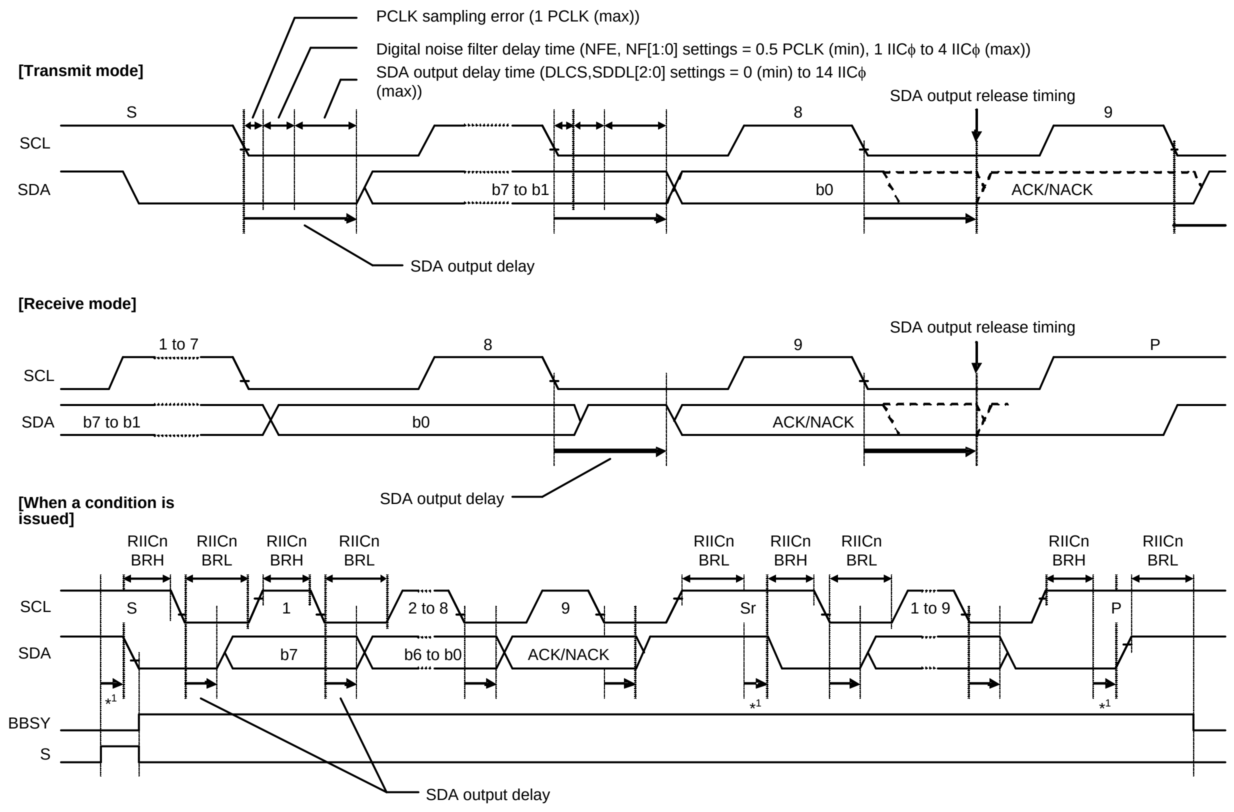
23.7 Facility for Delaying SDA Output

The RIIC module incorporates a facility for delaying output on the SDA line. The delay can be applied to all output (issuing of the start, restart, and stop conditions, data, and the ACK and NACK signals) on the SDA line.

With the SDA output delay facility, SDA output is delayed from detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval over which the SCL (clock) signal is at the low level. Doing this leads to usage with the aim of preventing erroneous operation of communications devices.

The output delay facility is enabled by setting the RIICnMR2.SDDL[2:0] bits to any value other than 000_B, and disabled by setting the same bits to 000_B.

While the SDA output delay facility is enabled (i.e. while the SDDL[2:0] bits are set to any value other than 000_B), the RIICnMR2.DLCS bit selects the clock source for counting by the SDA output delay counter as the internal base clock (IICϕ) for the RIIC module or as a clock signal derived by dividing the frequency of the internal base clock by two (IICϕ/2). The counter counts the number of cycles set in the SDDL[2:0] bits. After counting of the set number of cycles of delay is completed, the RIIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.



Note 1. The output delay facility is set by the SDDL[2:0] bits when a start (S), restart (Sr), or stop (P) condition is issued.

Figure 23.22 SDA Output Delay Facility

23.8 Digital Noise-Filter Circuits

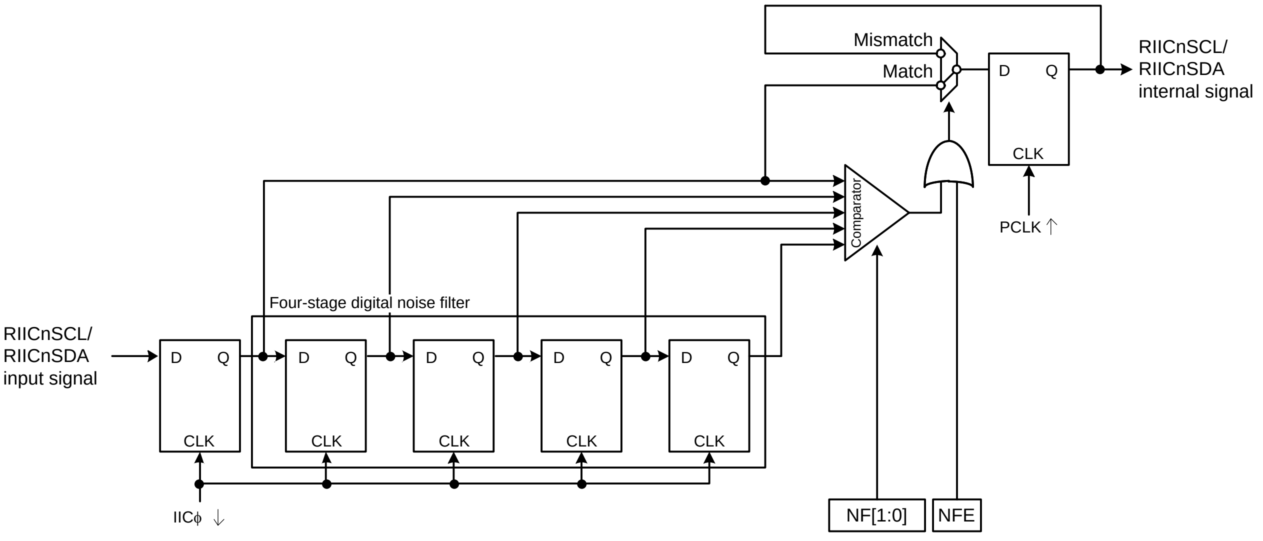
The states of the RIICnSCL and RIICnSDA pins are conveyed to the internal circuitry through the digital noise-filter circuit. **Figure 23.23, Block Diagram of Digital Noise Filter Circuit** is a block diagram of the digital noise-filter circuit.

The on-chip digital noise-filter circuit of the RIIC consists of four flip-flop circuit stages connected in series and a match-detection circuit.

The number of effective stages in the digital noise filter is selected by the RIICnMR3.NF[1:0] bits. The selected number of effective stages determines the noise-filtering capability as a period from one to four IICϕ cycles.

The input signal to the RIICnSCL pin (or RIICnSDA pin) is sampled on falling edges of the IICϕ signal. When the input signal level matches the output level of the number of effective flip-flop circuit stages as selected by the RIICnMR3.NF[1:0] bits, the signal level is conveyed as an internal signal. If the signal levels do not match, the previous value is retained.

If the ratio between the frequency of the internal operating clock (PCLK) and the transfer rate is small, the characteristics of the digital noise filter may lead to the elimination of needed signals as noise. In such cases, it is possible to disable the digital noise-filter circuit (by clearing the RIICnFER.NFE bit to 0).



Note: NFE: Digital noise filter circuit enable bit
NF[1:0]: Digital noise filter stage selection bit

Figure 23.23 Block Diagram of Digital Noise Filter Circuit

23.9 Address Match Detection

The RIIC can set three unique slave addresses in addition to the general call address and device ID address, and also can set 7-bit or 10-bit slave addresses.

23.9.1 Slave-Address Match Detection

The RIIC can set three unique slave addresses, and has a slave address detection function for each unique slave address. When the RIICnSER.SARy bit (y = 0 to 2) is set to 1, the slave addresses set in RIICnSARy (y = 0 to 2) can be detected.

When the RIIC detects a match of the set slave address, the corresponding RIICnSR1.AASy flag (y = 0 to 2) is set to 1 at the rising edge of the ninth SCL clock cycle and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. The RIICnSR2.RDRF flag or the RIICnSR2.TDRE flag is set to 1 by the following R/W# bit. This causes a receive complete interrupt (INTRIICnRI) or transmit data empty interrupt (INTRIICnTI) to be generated. The AASy flag is used to identify which slave address has been specified.

Figure 23.24, AASy Flag Set Timing with 7-Bit Address Format Selected to **Figure 23.26, AASy Flag Set/Clear Timing with 7-Bit/10-Bit Address Formats Mixed** show the AASy flag set timing in three cases.

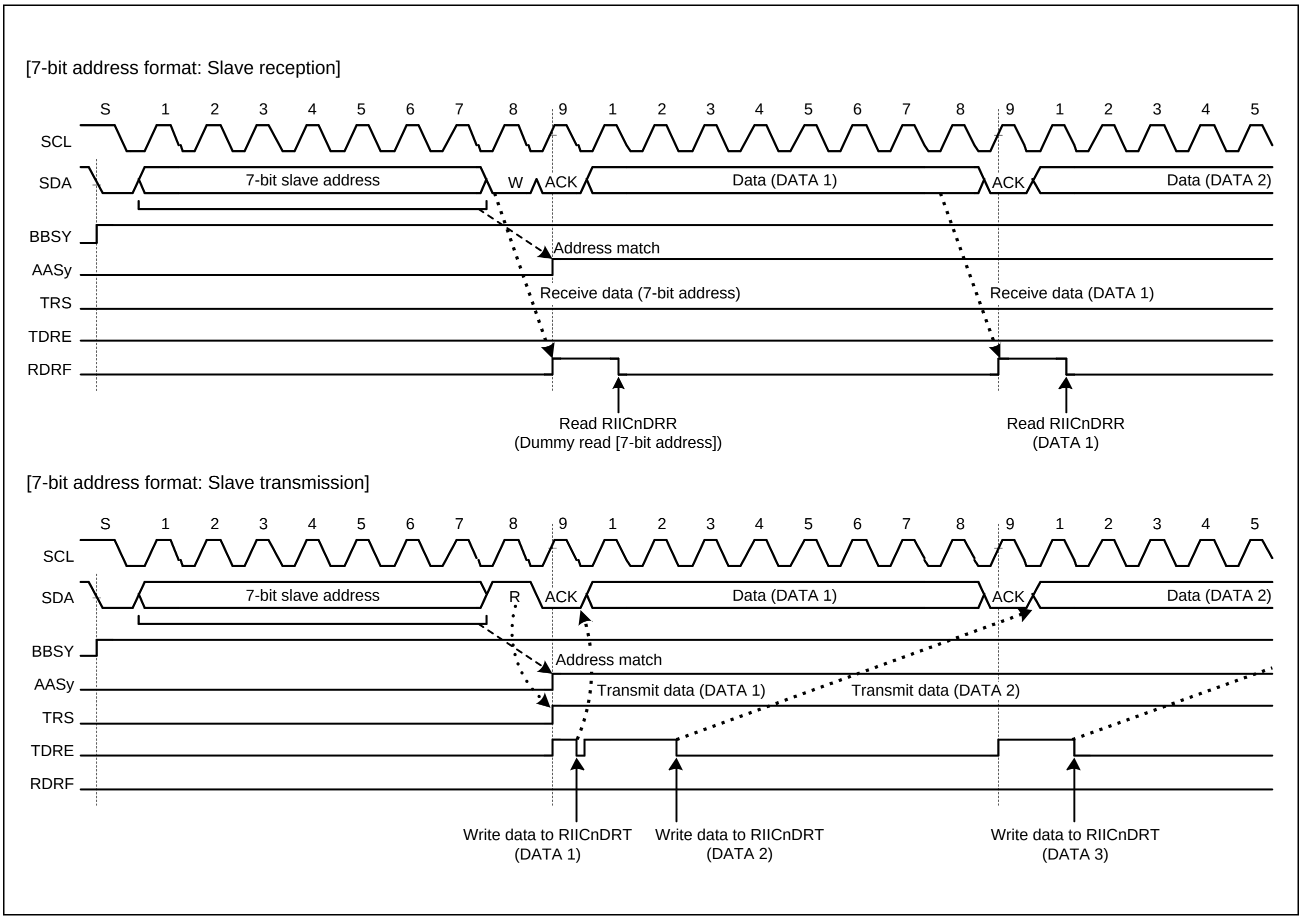


Figure 23.24 AASy Flag Set Timing with 7-Bit Address Format Selected

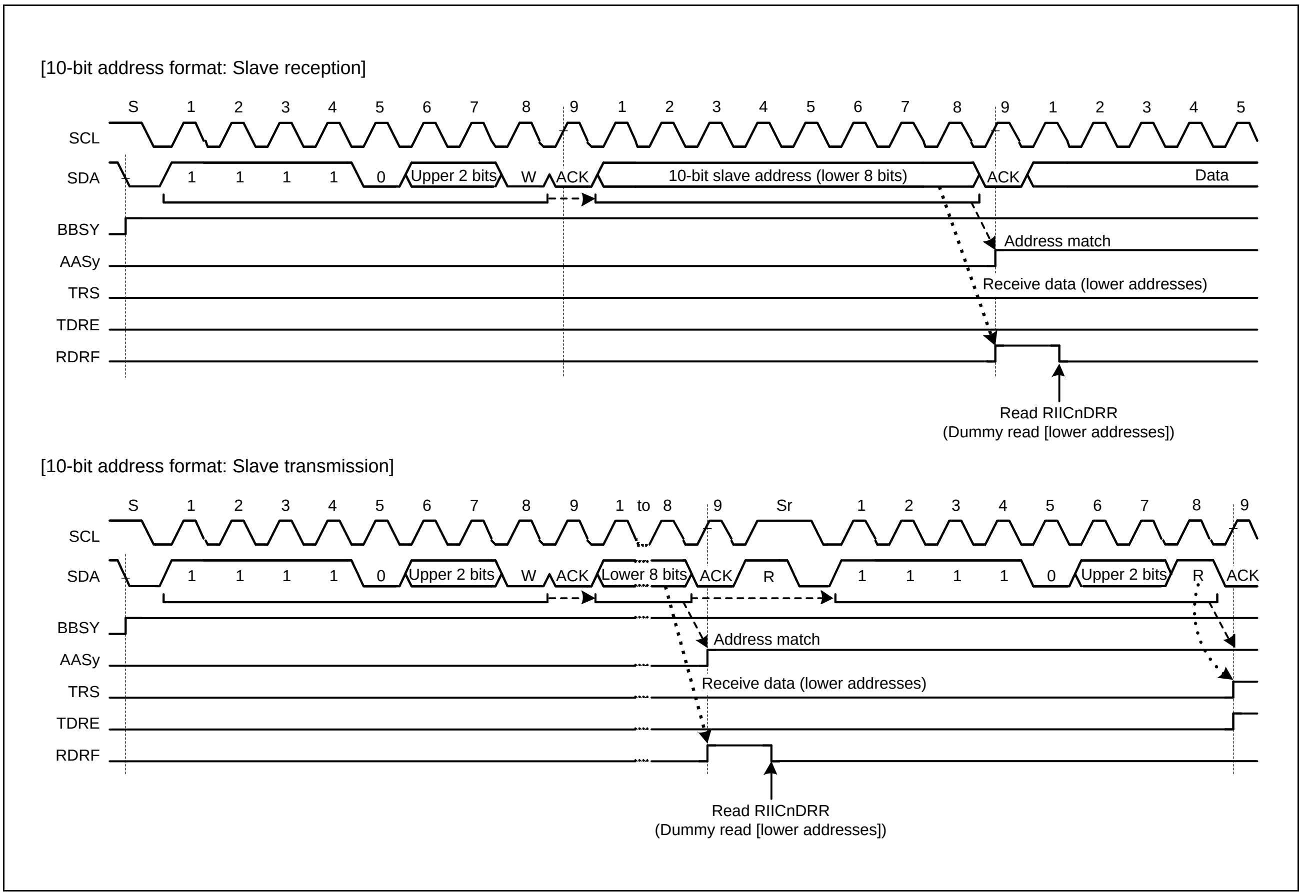

Figure 23.25 AASy Flag Set Timing with 10-Bit Address Format Selected

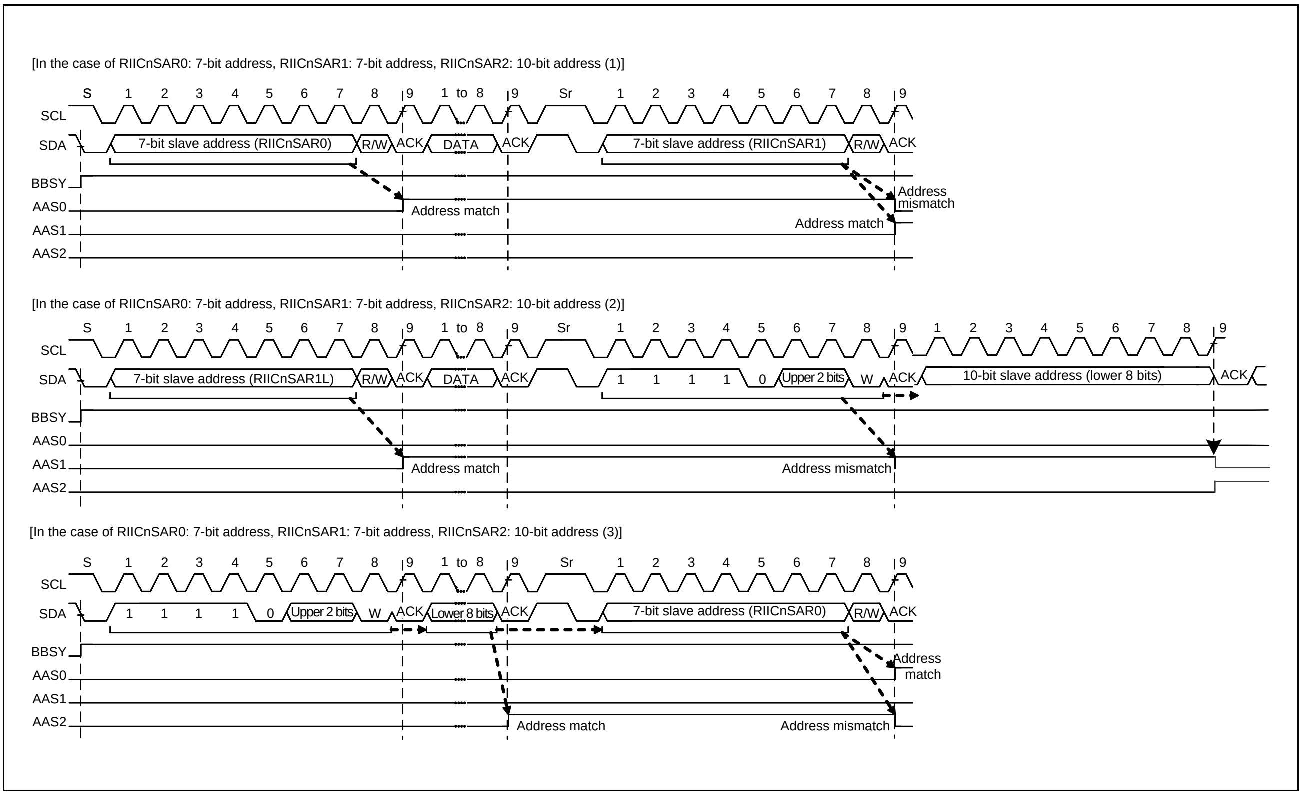

Figure 23.26 AASy Flag Set/Clear Timing with 7-Bit/10-Bit Address Formats Mixed

23.9.2 Detection of the General Call Address

The RIIC has a facility for detecting the general call address ($0000\ 000_B$ + 0 [W]). This is enabled by setting the RIICnSER.GCAE bit to 1.

If the address received after a start or restart condition is issued is $0000\ 000_B$ + 1[R] (start byte), the RIIC recognizes this as the address of a slave device with an “all-zero” address but not as the general call address.

When the RIIC detects the general call address, both the RIICnSR1.GCA flag and the RIICnSR2.RDRF flag are set to 1 on the rising edge of the ninth cycle of SCL clock. This leads to the generation of a receive complete interrupt (INTRIICnRI). The value of the GCA flag can be confirmed to recognize that the general call address has been transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

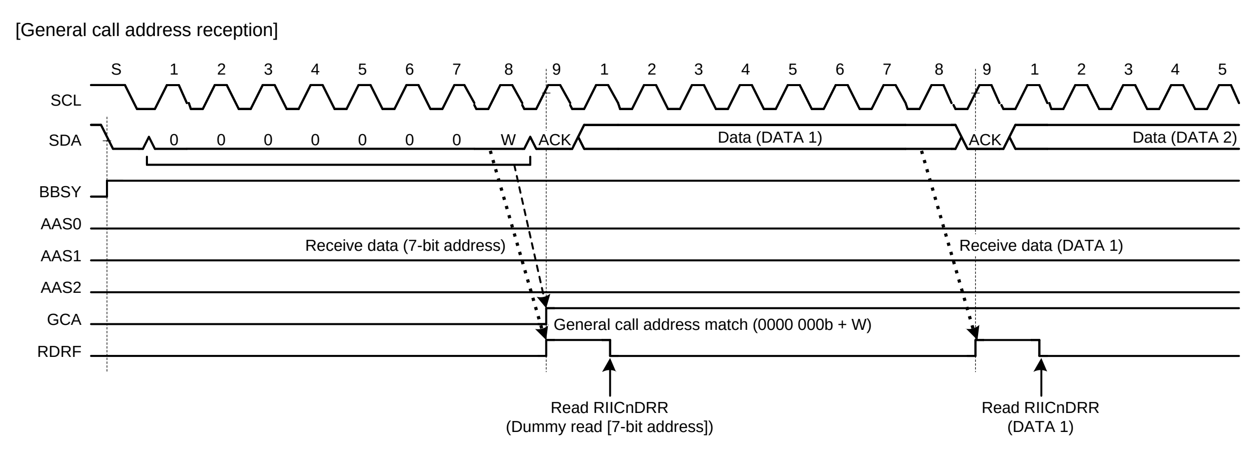

Figure 23.27 Timing of GCA Flag Setting during Reception of General Call Address

23.9.3 Device-ID Address Detection

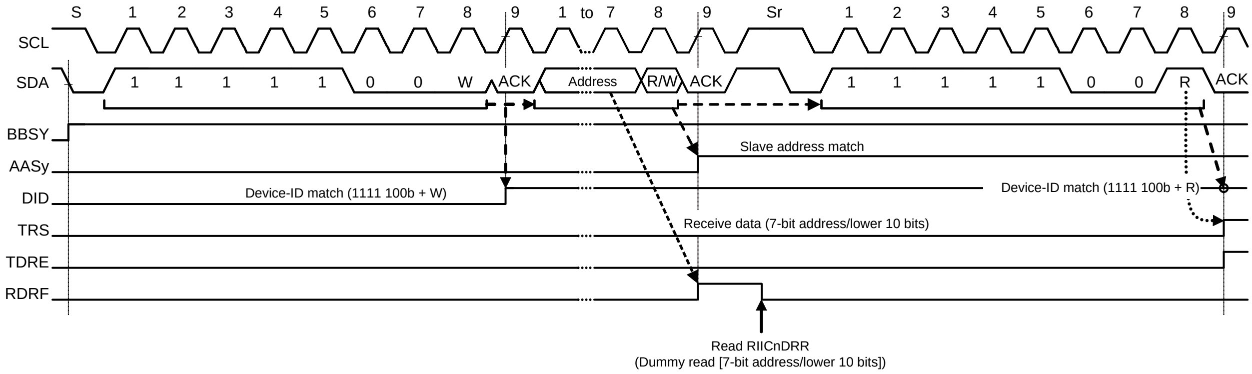
The RIIC module has a facility for detecting device-ID addresses conforming with the I^{2}C bus specification (Rev. 03). When the RIIC receives 1111 100_B as the first byte after a start condition or restart condition was issued with the RIICnSER.DIDE bit set to 1, the RIIC recognizes the address as a device ID, sets the RIICnSR1.DID flag to 1 on the rising edge of the ninth SCL clock cycle when the following R/W# bit is 0, and then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the RIIC sets the corresponding RIICnSR1.AASy flag (y = 0 to 2) to 1.

After that, when the first byte received after a start or restart condition is issued matches the device ID address (1111 100_B) again and the following R/W# bit is 1, the RIIC does not compare the second and subsequent bytes and sets the RIICnSR2.TDRE flag to 1.

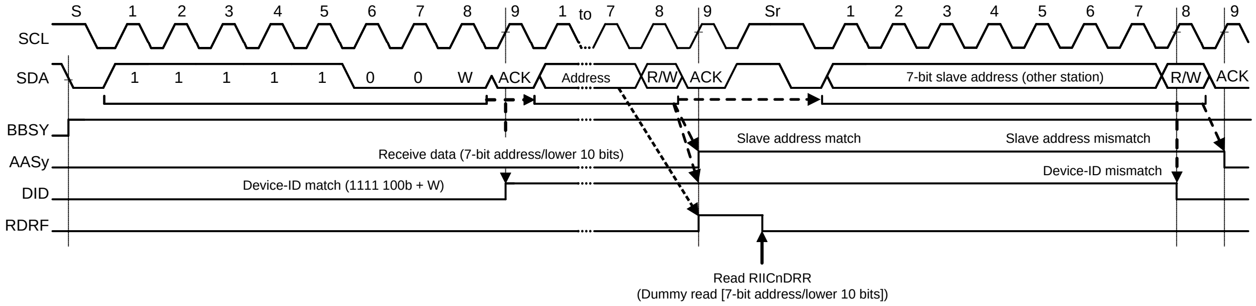
In the device-ID address detection function, the RIIC clears the DID flag to 0 if a match with the RIIC’s own slave address is not obtained or a match with the device ID address is not obtained after a match with the RIIC’s own slave address and the detection of a restart condition. If the first byte after detection of a start or restart condition matches the device ID address (1111 100_B) and the R/W# bit is 0, the RIIC sets the DID flag to 1 and compares the second and subsequent bytes with the RIIC’s slave address. If the R/W# bit is 1, the DID flag holds the previous value and the RIIC does not compare the second and subsequent bytes. Therefore, the reception of a device-ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Furthermore, prepare the device-ID fields (three bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal data for transmission. For details, see I^{2}C Bus Standard from NXP Semiconductors.

[Device-ID reception]



[When address received after a restart condition is detected does not match the Device-ID]



[When address before the Device-ID + R does not match the slave address]

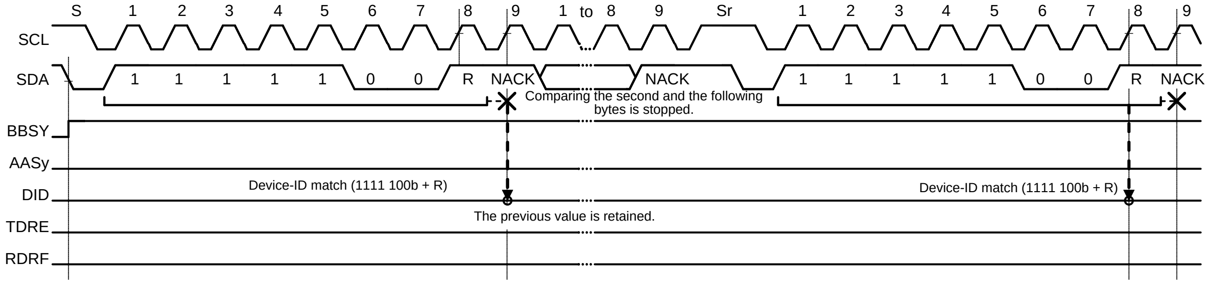


Figure 23.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID

23.10 Automatic Low-Hold Function for SCL

23.10.1 Function to Prevent Wrong Transmission of Transmit Data

To prevent the unintended transmission of erroneous data, this low-hold period is extended until data for transmission have been written. In addition, the RIIC holds the SCL line low over the period until a stop condition is issued and also over the period until the RIICnDRR register is dummy read.

<Master transmit mode>

- Low-level interval after a start condition or restart condition is issued
- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next
- Low-level interval from the ninth clock cycle until a stop condition is issued

<Slave transmit mode>

- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next
- Low-level interval from the ninth clock cycle and the RIICnDRR register is dummy read

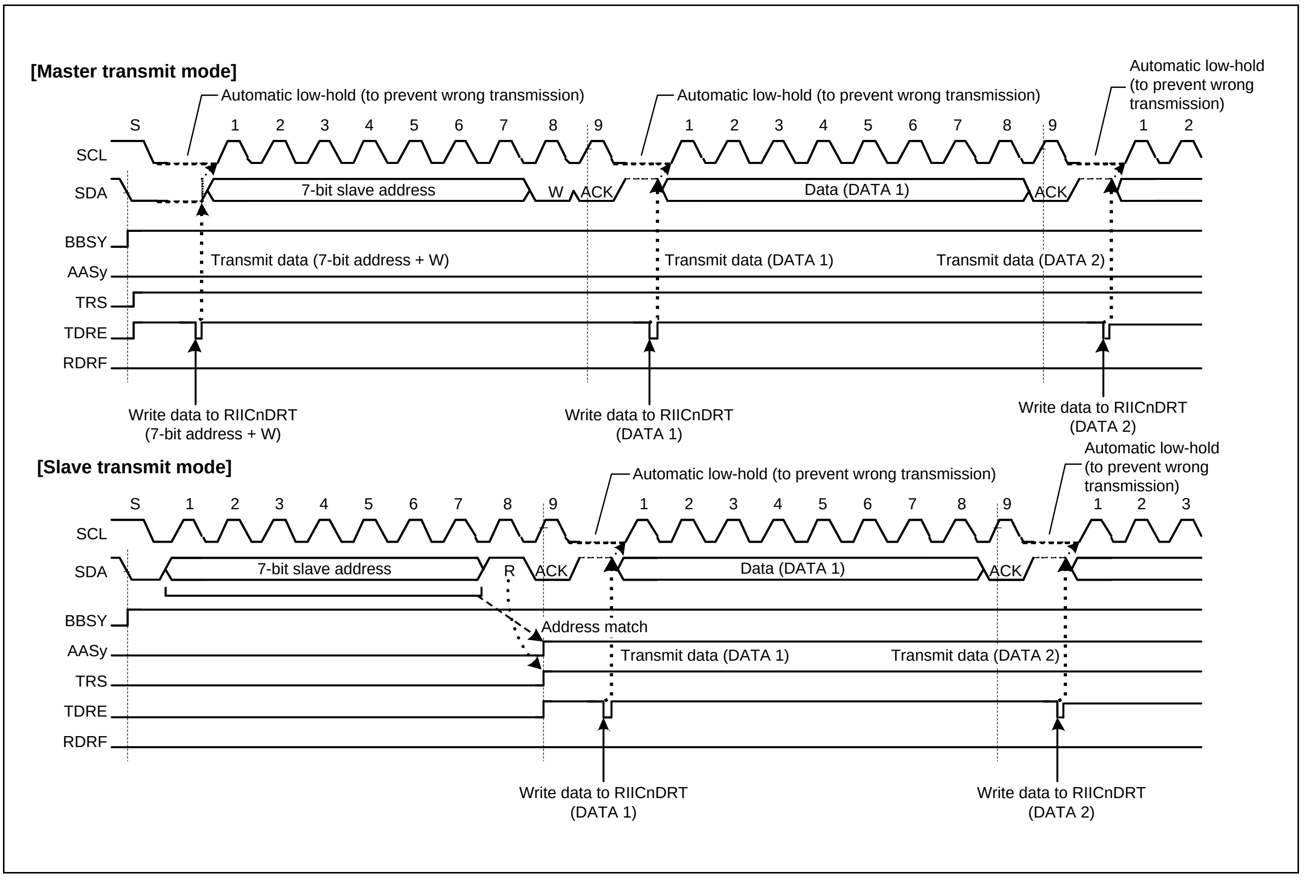

Figure 23.29 Automatic Low-Hold Operation in Transmit Mode

23.10.2 NACK Reception Transfer Suspension Function

The RIIC has a function to suspend transfer operation when NACK is received in transmit mode (RIICnCR2.TRS bit = 1). This function is enabled when the RIICnFER.NACKE bit is set to 1 (transfer suspension enabled). If the next transmit data has already been written (RIICnSR2.TDRE flag = 0) when NACK is received, next data transmission at the falling edge of the ninth SCL clock cycle is automatically suspended. This prevents the SDA line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (RIICnSR2.NACKF flag = 1), transmit operation and receive operation are discontinued. To restore transmit/receive operation, be sure to clear the NACKF flag to 0. In master transmit mode, clear the NACKF flag to 0, issue a restart or stop condition, and then issue a start condition again.

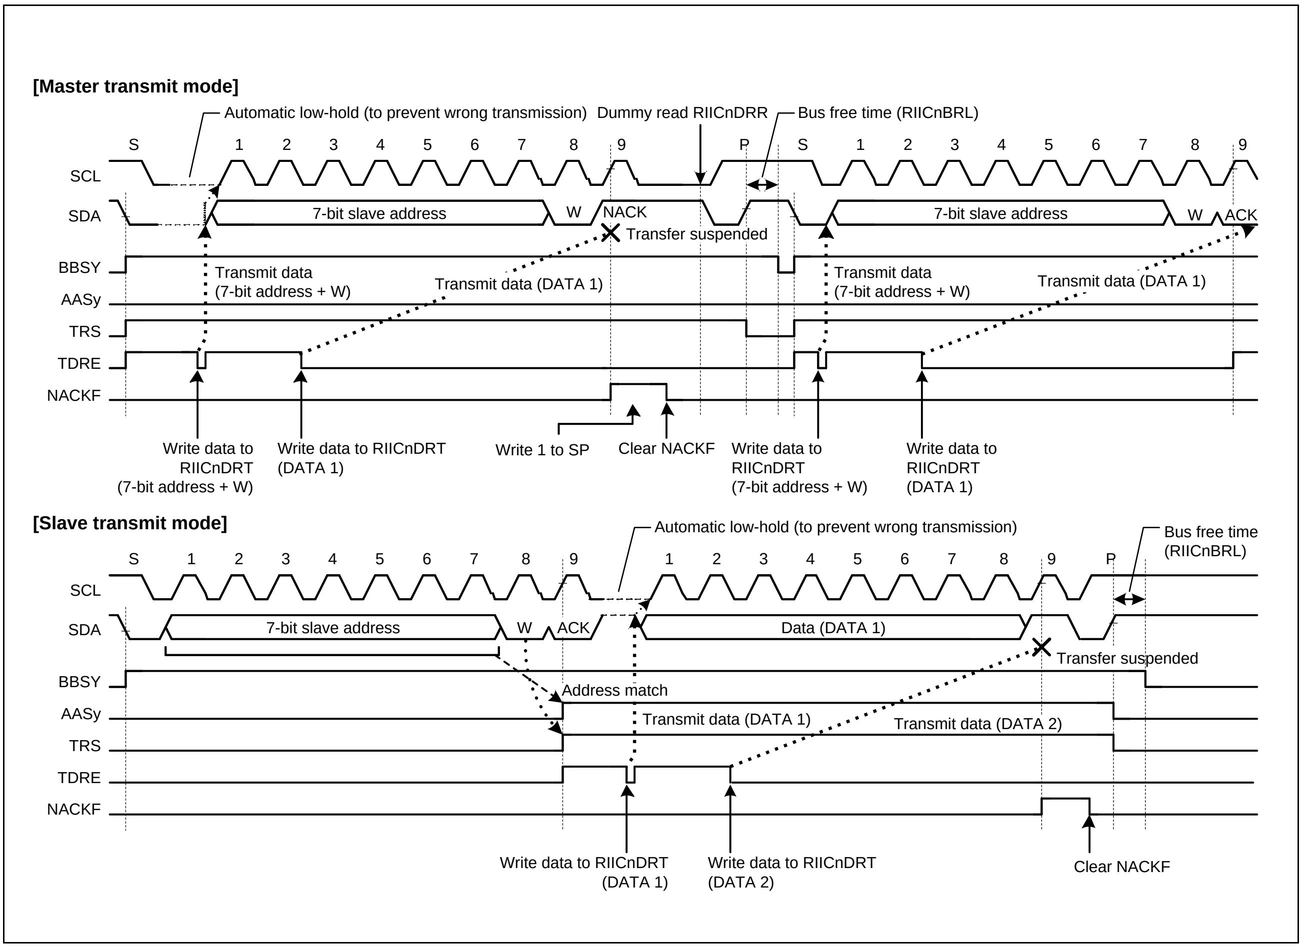

Figure 23.30 Suspension of Data Transfer when NACK is Received (NACKE = 1)

23.10.3 Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (RIICnDRR) read is delayed for a period of one transfer frame or more with receive complete (RIICnSR2.RDRF flag = 1) in receive mode (RIICnCR2.TRS = 0), the RIIC holds the SCL line low automatically immediately before the next data is received to prevent failure to receive data.

This function to prevent failure to receive data using the automatic low-hold function is also enabled even if the read processing of the final receive data is delayed and, in the meantime, the RIIC's own slave address is designated after a stop condition is issued. This function does not disturb other communication because the RIIC does not hold the SCL line low when a mismatch with its own slave address occurs after a stop condition is issued.

Sections in which the SCL line is held low can be selected with a combination of the RIICnMR3.WAIT and RDRFS bits.

(1) One-Byte Receive Operation and Automatic Low-Hold Function Using the WAIT Bit

When the RIICnMR3.WAIT bit is set to 1, the RIIC performs one-byte receive operation using the WAIT bit function.
Furthermore, when the RIICnMR3.RDRFS bit is 0, the RIIC automatically sends the RIICnMR3.ACKBT bit value for the acknowledge bit in the period from the falling edge of the eighth SCL clock cycle to the falling edge of the ninth SCL clock cycle, and automatically holds the SCL line low at the falling edge of the ninth SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from RIICnDRR, which enables bytewise receive operation.

The WAIT bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and device ID address) is obtained in master receive mode or slave receive mode.

(2) One-Byte Receive Operation (ACK/NACK Transmission Control) and Automatic Low-Hold Function Using the RDRFS Bit

When the RIICnMR3.RDRFS bit is set to 1, the RIIC performs one-byte receive operation using the RDRFS bit function.
When the RIICnSR2.RDRFS bit is set to 1, the RDRF flag (receive complete) in RIICnSR2 is set to 1 at the rising edge of the eighth SCL clock cycle, and the SCL line is automatically held low at the falling edge of the eighth SCL clock cycle. This lowhold is released by writing a value to the RIICnMR3.ACKBT bit, but cannot be released by reading data from RIICnDRR, which enables receive operation by the ACK/NACK transmission control according to the data received in byte units.

The RDRFS bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and device ID address) is obtained in master receive mode or slave receive mode.

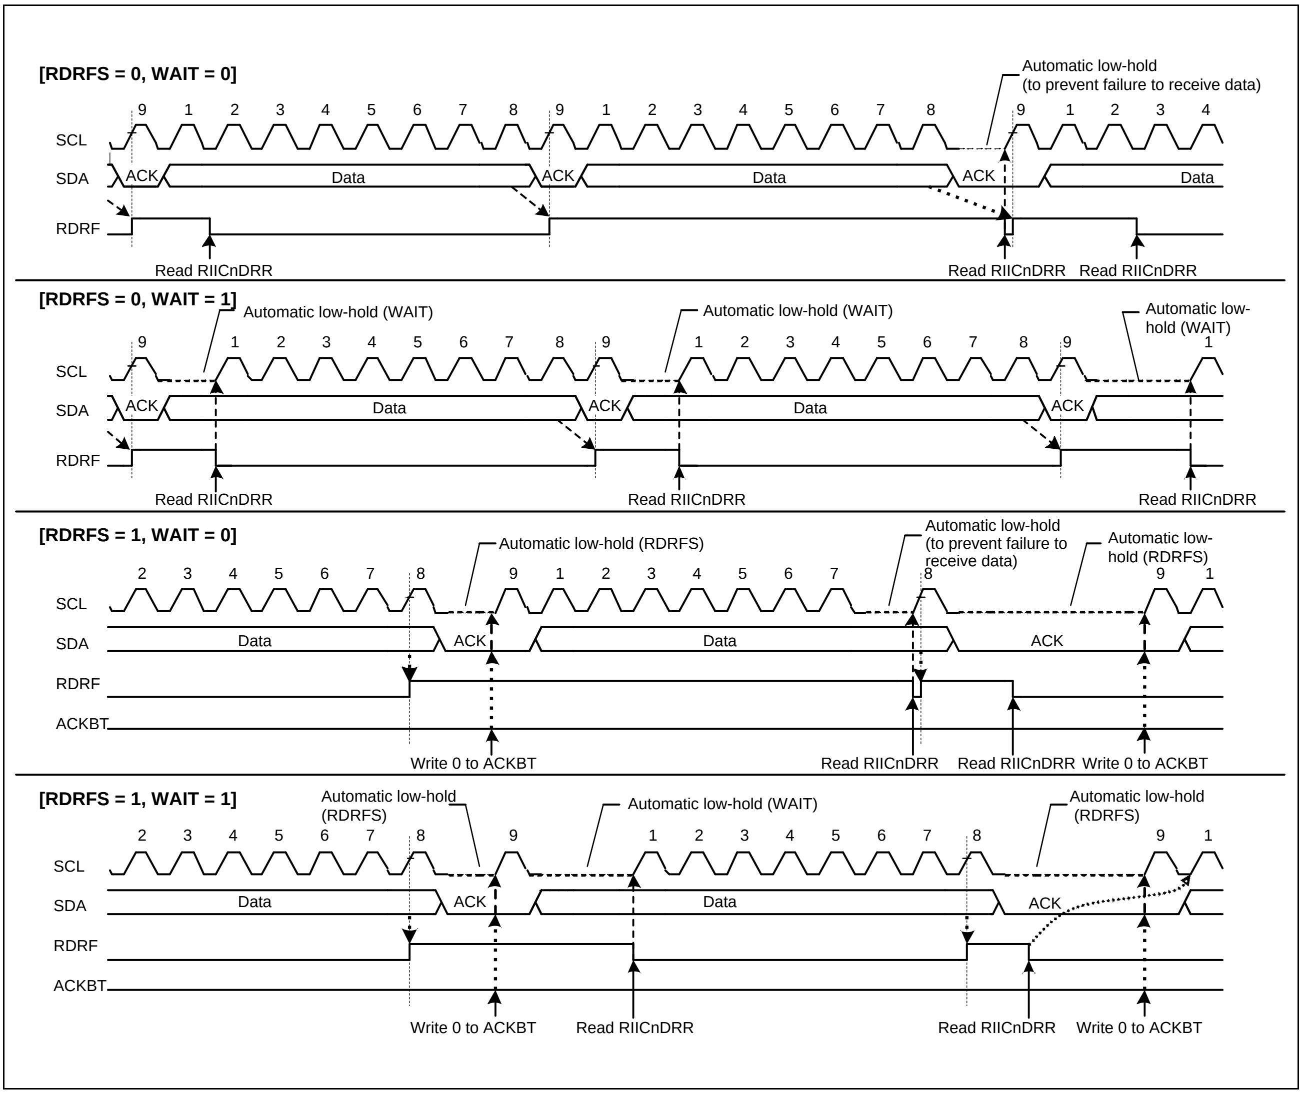

Figure 23.31 Automatic Low-Hold Operation in Receive Mode (Using RDRFS and WAIT Bits)

23.11 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the I^{2}C bus standard, the RIIC has functions to prevent double-issue of a start condition, to detect arbitration-lost during transmission of NACK, and to detect arbitration-lost in slave transmit mode.

23.11.1 Master Arbitration-Lost Detection (MALE Bit)

The RIIC drives the SDA line low to issue a start condition. However, if the SDA line has already been driven low by another master device issuing a start condition, the RIIC considers this a loss in arbitration, so priority is given to transfer by the other master device. Similarly, if the RIICnCR2.ST bit is set to 1 while the bus is busy (RIICnCR2.BBSY flag = 1), the RIIC considers itself to have lost in arbitration, so priority is given to transfer by the other master device and no start condition is generated.

When a start condition is issued successfully, if the data for transmission including the address bits (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state, and the low level is detected on the SDA line), the RIIC loses in arbitration.

After a loss in arbitration of mastership, the RIIC immediately enters slave receive mode. If a slave address (including the general call address) matches its own address at this time, the RIIC continues in slave operation.

A loss in arbitration of mastership is detected when the following conditions are met while the RIICnFER.MALE bit is 1 (master arbitration-lost detection enabled).

[Master arbitration-lost conditions]

- Non-matching of the internal level for output on SDA and the level on the SDA line after a start condition was issued by setting the RIICnCR2.ST bit to 1 while the RIICnCR2.BBSY flag was cleared to 0 (erroneous issuing of a start condition)
- Setting of the RIICnCR2.ST bit to 1 (start condition double-issue error) while the RIICnCR2.BBSY flag is set to 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDA line in master transmit mode (RIICnCR2.MST and TRS bits = 11_B)

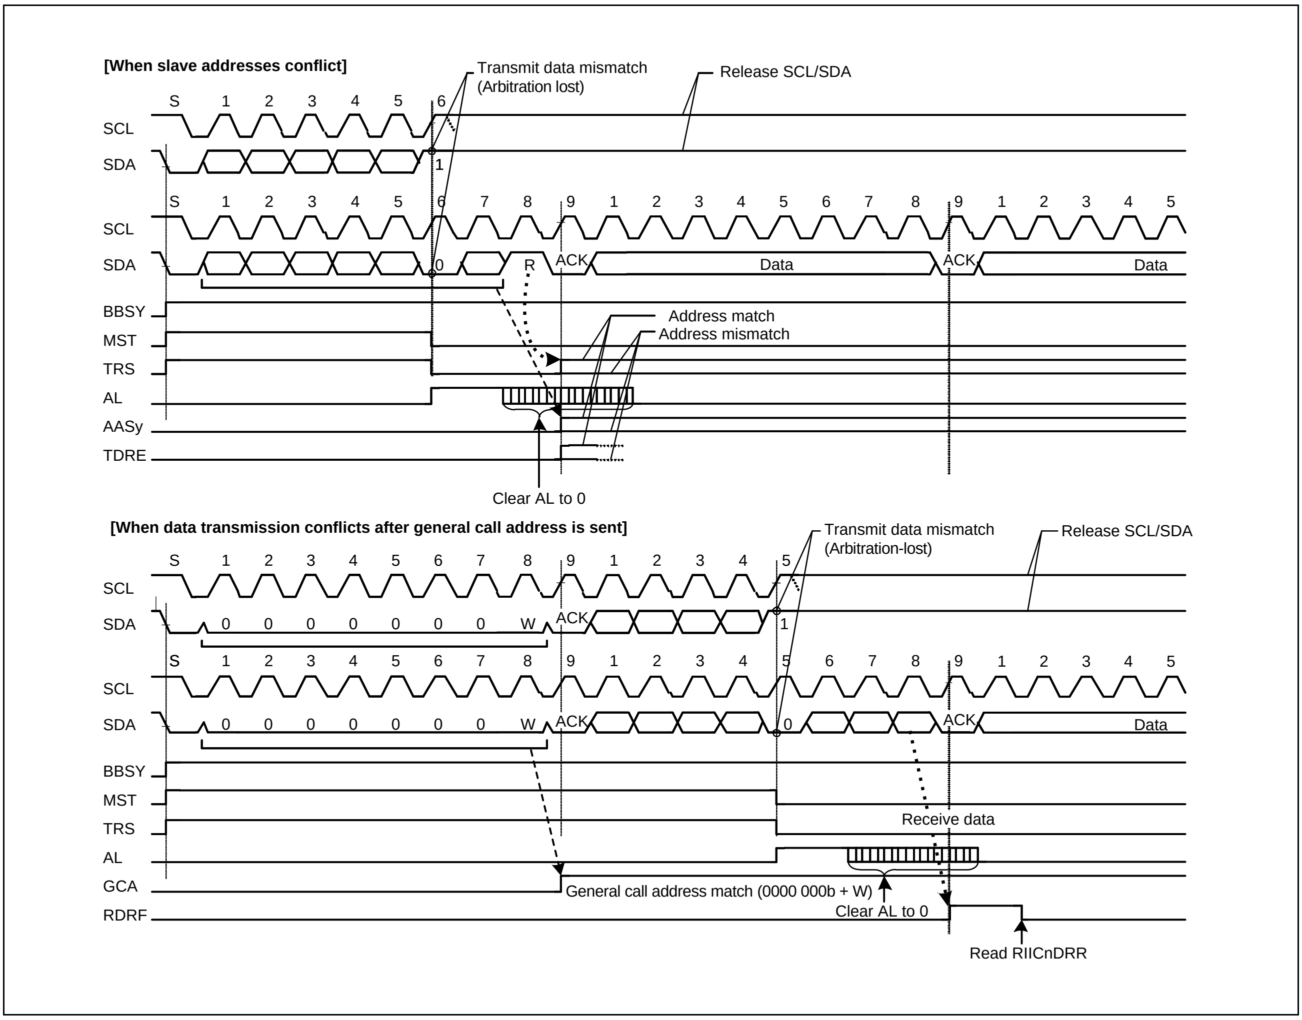

Figure 23.32 Examples of Master Arbitration-Lost Detection (MALE = 1)

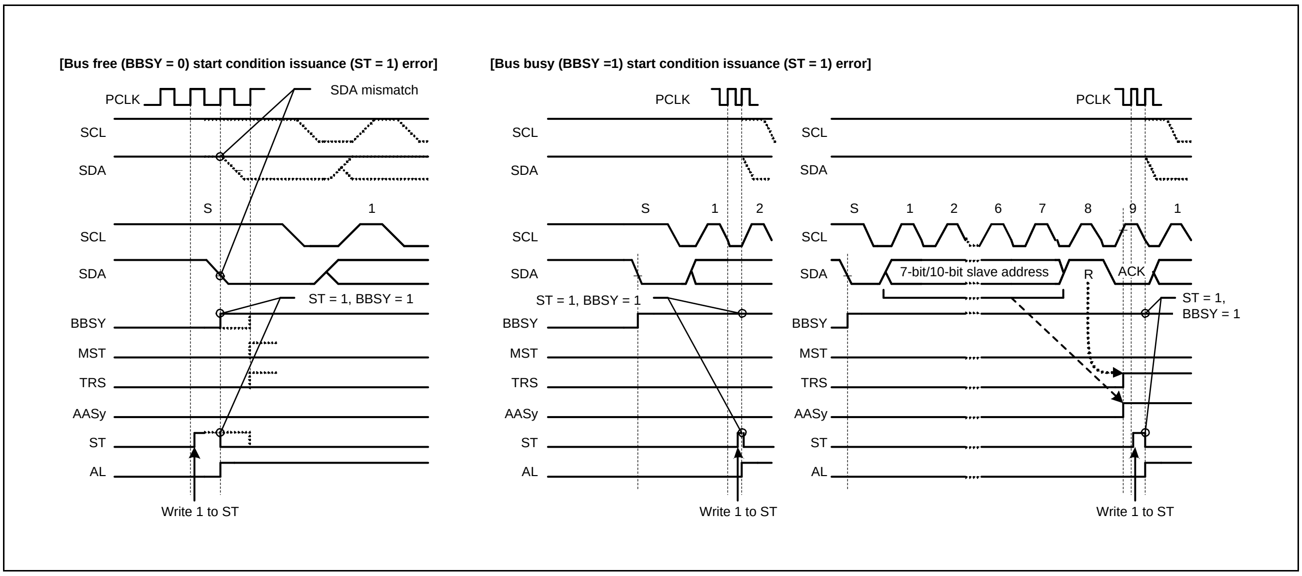

Figure 23.33 Arbitration-Lost when a Start Condition is Issued (MALE = 1)

The TRS bit is not cleared if 1 is written to the ST bit while the BBSY flag is 1 in slave transmit mode.

23.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

The RIIC has a function to cause arbitration to be lost if the internal SDA output level does not match the level on the SDA line (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state, and the low level is detected on the SDA line) during transmission of NACK in receive mode. Arbitration is lost due to a conflict of NACK transmission and ACK transmission when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send/receive the same information through a single slave device. **Figure 23.34, Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)** shows an example of arbitration-lost detection during transmission of NACK.

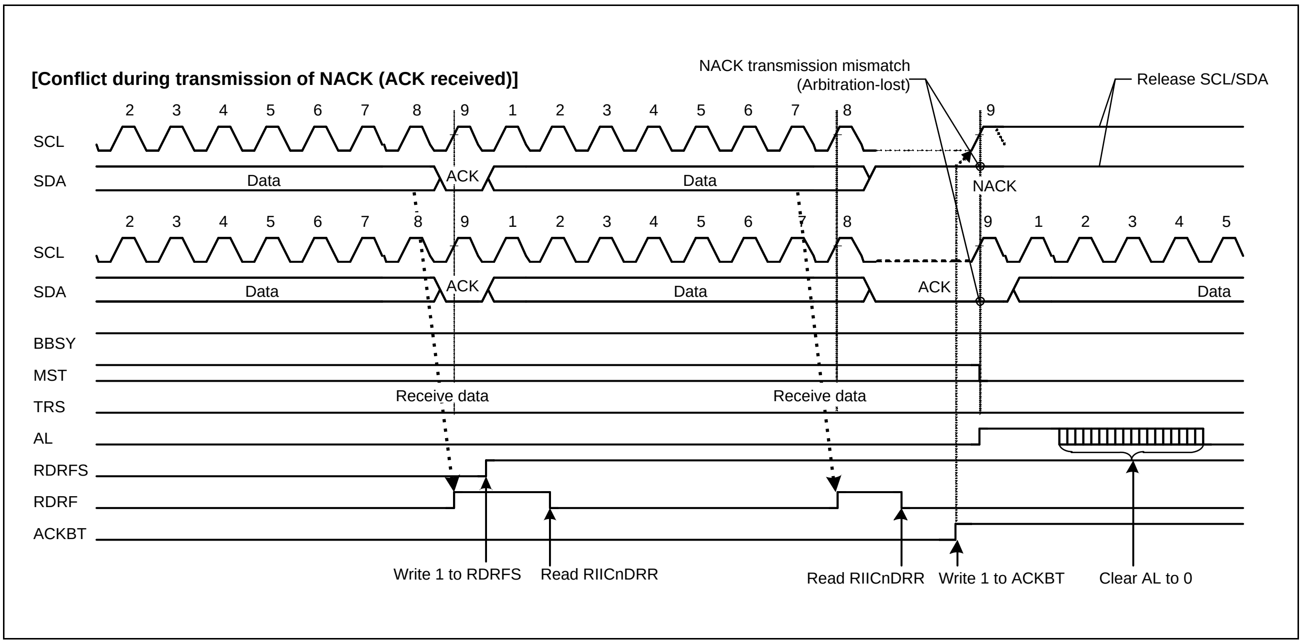

Figure 23.34 Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)

The following explains arbitration-lost detection using an example where two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives two bytes of data from the slave device, and master B receives four bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in both master A and master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Here, master A sends NACK when it has received two final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received necessary four bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like this occurs, master A cannot detect ACK transmitted by master B and issues a stop condition.

Therefore, the issuance of the stop condition conflicts with the SCL clock output of master B, which disturbs communication.

When the RIIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost.

If arbitration is lost during transmission of NACK, the RIIC enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

The RIIC detects arbitration-lost during transmission of NACK when the following condition is met with the RIICnFER.NALE bit set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

When the internal SDA output level does not match the SDA line (ACK is received) during transmission of NACK (RIICnMR3.ACKBT bit = 1)

23.11.3 Slave Arbitration-Lost Detection (SALE Bit)

The RIIC has a function to cause arbitration to be lost if the data for transmission (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the highimpedance state, and the low level is detected on the SDA line) in slave transmit mode.

When it loses slave arbitration, the RIIC enters slave receive mode.

The RIIC detects slave arbitration-lost when the following condition is met with the RIICnFER.SALE bit set to 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

When transmit data excluding acknowledge (internal SDA output level) does not match the SDA line in slave transmit mode (RIICnCR2.MST and TRS bits = 01_B)

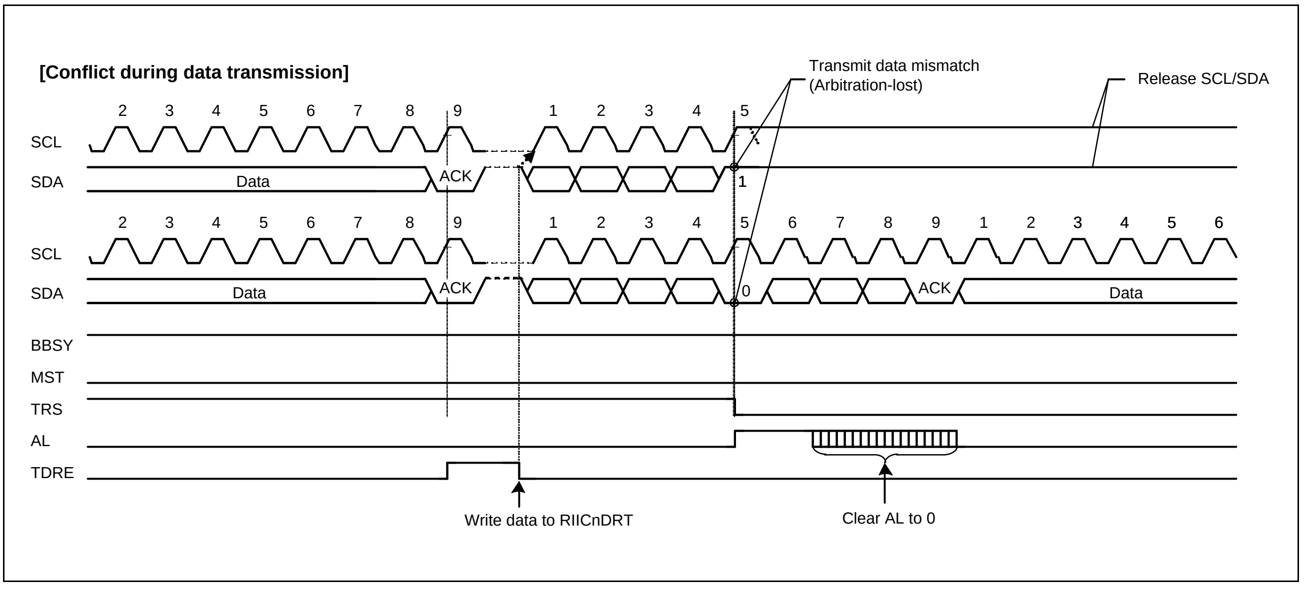

Figure 23.35 Example of Slave Arbitration-Lost Detection (SALE = 1)

23.12 Start Condition/Restart Condition/Stop Condition Issuing Function

23.12.1 Issuing a Start Condition

The RIIC issues a start condition when the RIICnCR2.ST bit is set to 1.

When the ST bit is set to 1, a start condition issuance request is made and the RIIC issues a start condition when the RIICnCR2.BBSY flag is 0 (bus free). When a start condition is issued normally, the RIIC automatically shifts to the master transmit mode.

A start condition is issued in the following sequence.

[Start condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the start condition hold time.
- Drive the SCL line low (high level to low level).
- Detect low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

23.12.2 Issuing a Restart Condition

The RIIC issues a restart condition when the RIICnCR2.RS bit is set to 1.

When the RS bit is set to 1, a restart condition issuance request is made even during communication and the RIIC issues a restart condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

(To detect the issuance of a restart condition, clear the RIICnSR2.START flag before a restart condition is issued.)

A restart condition is issued in the following sequence.

[Restart condition issuance]

- Release the SDA line.
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRL and the restart condition setup time.
- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the restart condition hold time.
- Drive the SCL line low (high level to low level).
- Detect a low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

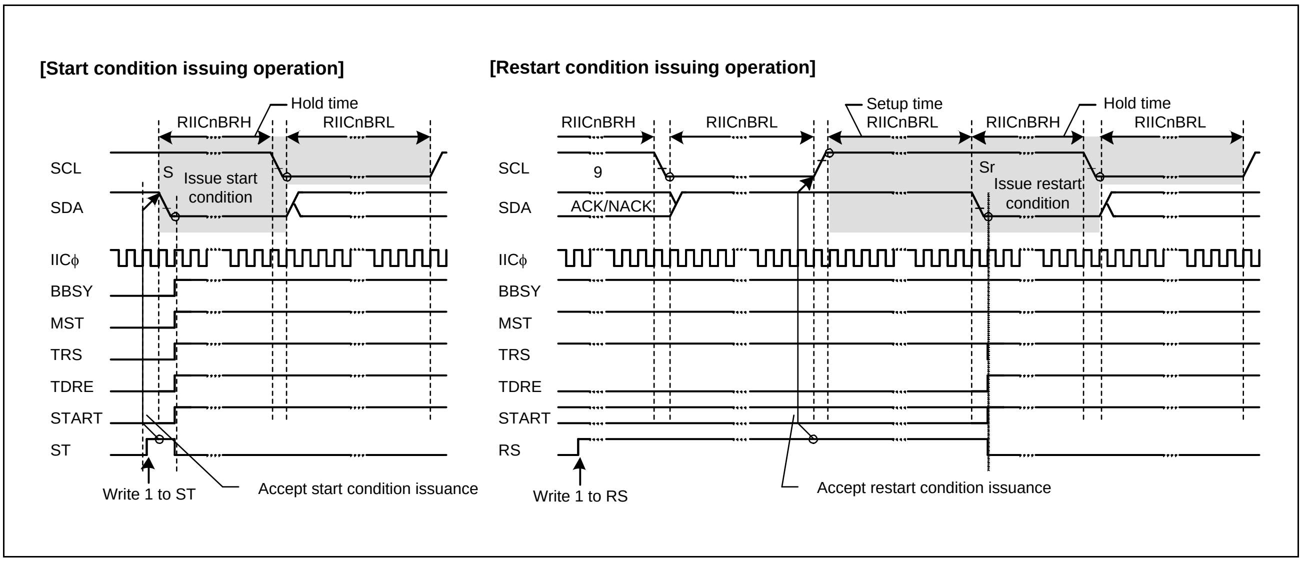

Figure 23.36 Start Condition/Restart Condition Issue Timing (ST and RS Bits)

23.12.3 Issuing a Stop Condition

The RIIC issues a stop condition when the RIICnCR2.SP bit is set to 1.

When the SP bit is set to 1, a stop condition issuance request is made and the RIIC issues a stop condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

A stop condition is issued in the following sequence.

[Stop condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRH and the stop condition setup time.
- Release the SDA line (low level to high level).
- Ensure the time set in RIICnBRL and the bus free time.
- Clear the BBSY flag to 0 (to release the bus mastership).

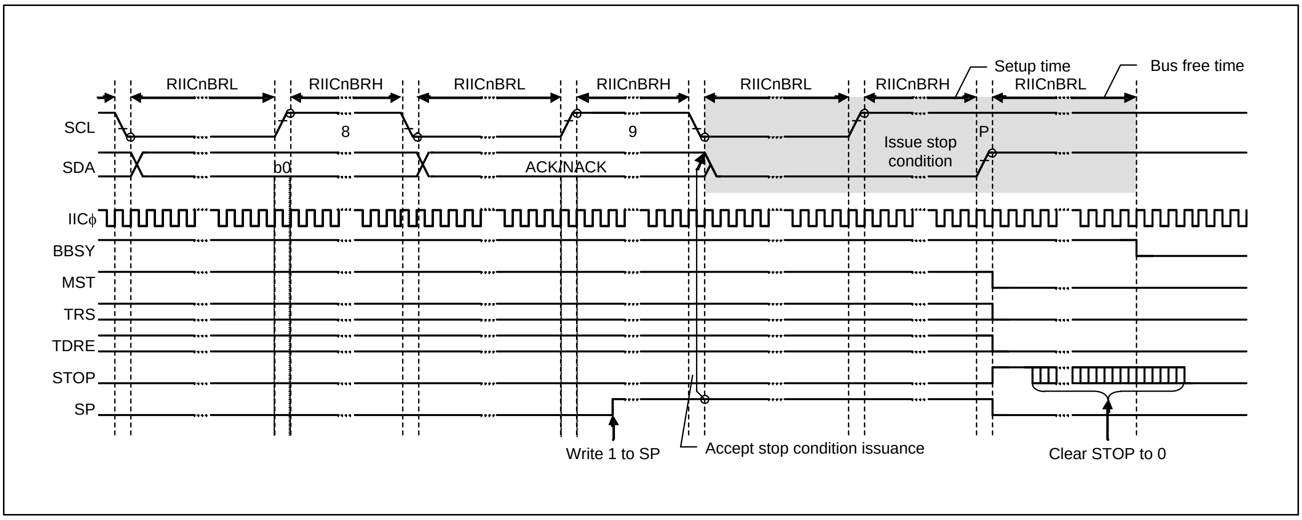

Figure 23.37 Stop Condition Issue Timing (SP Bit)

23.13 Bus Hanging

If the clock signals from the master and slave devices go out of synchronization due to noise or other factors, the I^{2}C bus might hang with a fixed level on the SCL line and/or SDA line.

As measures against the bus hanging, the RIIC has a timeout function to detect hanging by monitoring the SCL line, a function for the output of an extra SCL clock cycle to release the bus from a hung state due to clock signals being out of synchronization, and the RIIC/internal reset function.

By checking the RIICnCR1.SCLO, SDAO, SCLI, and SDAI bits, it is possible to see whether the RIIC or its partner in communications is placing the low level on the SCL or SDA lines.

23.13.1 Timeout Function

The RIIC has the timeout function to detect an abnormality that the SCL line is held for a certain period of time. The RIIC can detect an abnormal bus state by monitoring that the SCL line is held low or high for a predetermined time.

The timeout function monitors the SCL line state and counts the low-level period or high-level period using the internal counter. The timeout function resets the internal counter each time the SCL line changes (rising or falling), but continues to count unless the SCL line changes. If the internal counter overflows due to no SCL line change, the RIIC can detect the timeout and report the bus abnormality.

The internal counter is cleared when one of the conditions is met.

(1) When RIICnMR2.TMOH=0, and RIICnMR2.TMOL=1:
The internal counter is cleared by SCL rising

(2) When RIICnMR2.TMOH=1, and RIICnMR2.TMOL=0:
The internal counter is cleared by SCL falling

(3) When RIICnMR2.TMOH=RIICnMR2.TMOL=1:
The internal counter is cleared by SCL rising or falling

This timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is stuck low or high during the following conditions:

- The bus is busy (RIICnCR2.BBSY flag is 1) in master mode (RIICnCR2.MST bit is 1).
- The RIIC’s own slave address matches (RIICnSR1 register is not 00_H) and the bus is busy (RIICnCR2.BBSY flag is 1) in slave mode (RIICnCR2.MST bit is 0).
- The bus is free (RIICnCR2.BBSY flag is 0) while generation of a START condition is requested (RIICnCR2.ST bit is 1).

The internal counter of the timeout function works using the internal reference clock (IICϕ) set by the RIICnMR1.CKS[2:0] bits as a count source. It functions as a 16-bit counter when long mode is selected (RIICnMR2.TMOS bit = 0) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCL line level (low/high or both levels) during which this counter is activated can be selected by the setting of the RIICnMR2.TMOH and TMOL bits. If both TMOL and TMOH bits are cleared to 0, the internal counter does not work.

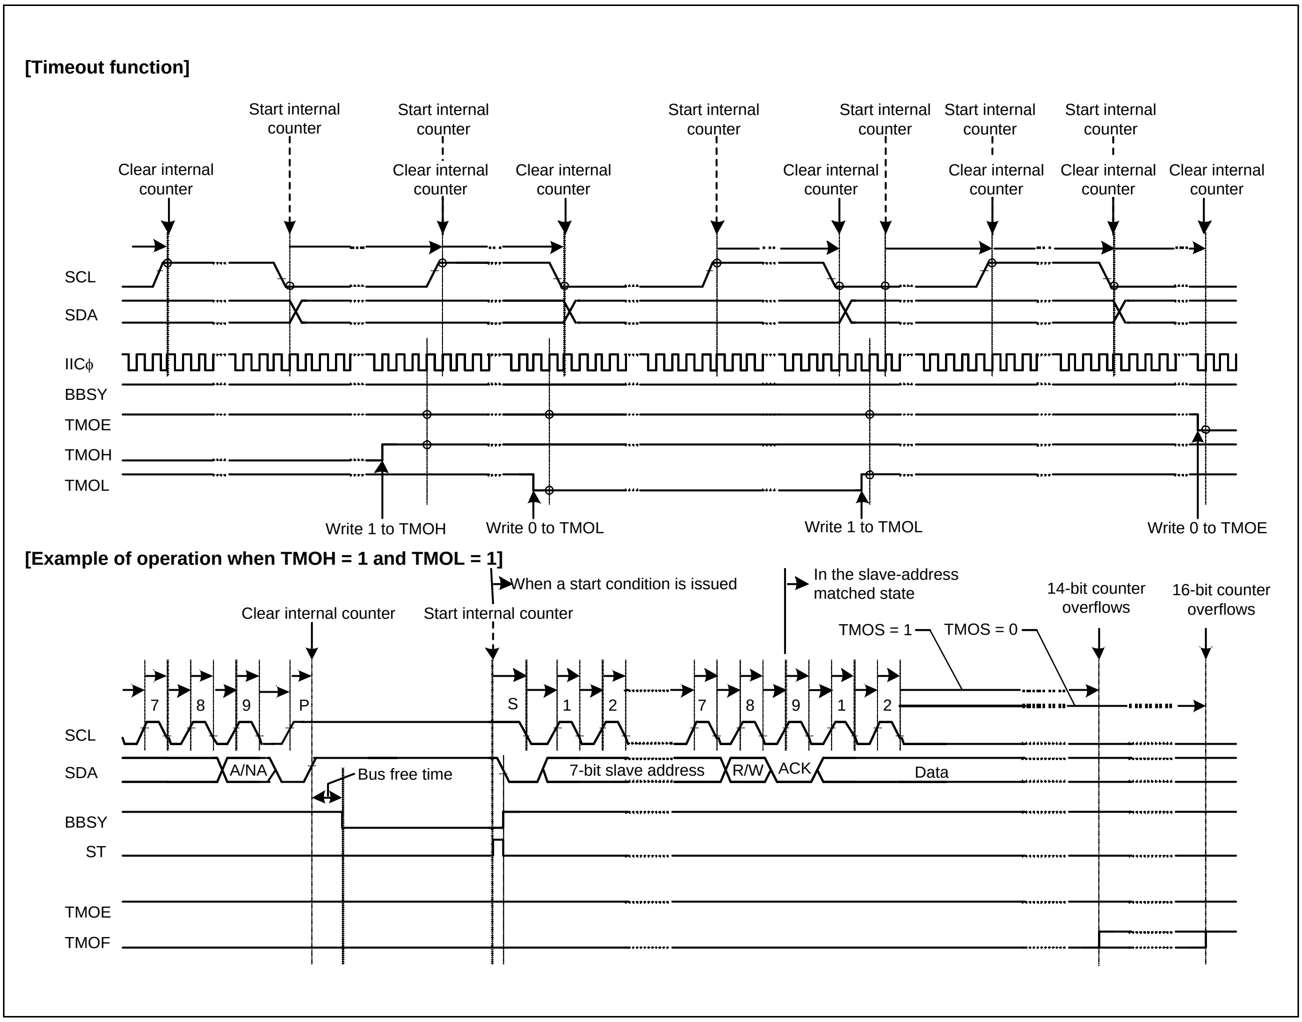

Figure 23.38 Timeout Function (TMOE, TMOS, TMOH, and TMOL Bits)

23.13.2 Extra SCL Clock Cycle Output Function

In master mode, the RIIC module has a facility for the output of extra SCL (clock) cycles to release the SDA line of the slave device from being held at the low level due to the master being out of synchronization with the slave device.

This function is mainly used in master mode to release the SDA line of the slave device from the state of being fixed to the low level by including extra cycles of SCL output from the RIIC with single cycles of the SCL (clock) signal as the unit in the case of a bus error where the RIIC cannot issue a stop condition because the slave device is holding the SDA line at the low level. Do not use this facility in normal situations. Using it when communications are proceeding correctly will lead to malfunctions.

When the RIICnCR1.CLO bit is set to 1 in master mode, a single cycle of the SCL clock at the frequency corresponding to the transfer rate settings (settings of the RIICnMR1.CKS[2:0] bits, and of the RIICnBRH and RIICnBRL registers) is output as an extra clock cycle. After output of this single cycle of the SCL clock, the CLO bit is automatically cleared to 0. Therefore, further extra clock cycles can be output consecutively by the software program writing 1 to the CLO bit after having read CLO = 0.

When the RIIC module is in master mode and the slave device is holding the SDA line at the low level because synchronization with the slave device has been lost due to the effects of noise, etc., the output of a stop condition is not possible. The facility for output of an extra cycle of the SCL (clock) signal can be used to output extra cycles of SCL one by one to make the slave device release the SDA line from being held at the low level, thus recovering the bus from an unusable state. Release of the SDA line by the slave device can be monitored by reading the RIICnCR1.SDAI bit. After confirming release of the SDA line by the slave device, complete communications by reissuing the stop condition.

Use this facility with the RIICnFER.MALE bit (master arbitration-lost detection disabled) cleared to 0. If the MALE bit is set to 1 (master arbitration-lost detection enabled), arbitration is lost when the value of the RIICnCR1.SDAO bit does not match the state of the SDA line, so take care on this point.

[Additional output conditions for the SCL clock]

- In master mode and when the bus is free
- In master mode and the SCL line is not held low (the bus is busy)

Figure 23.39, Extra SCL Clock Cycle Output Function (CLO Bit) shows the operation timing of the extra SCL clock cycle output function (CLO bit).

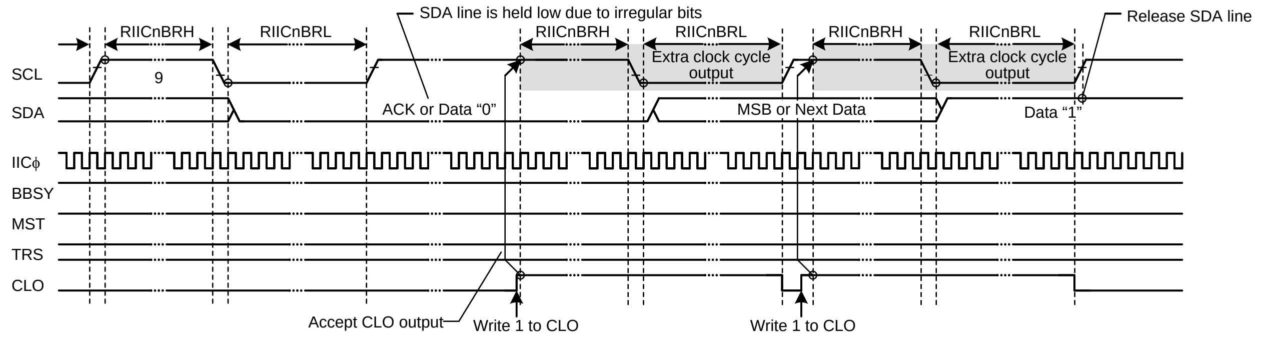

Figure 23.39 Extra SCL Clock Cycle Output Function (CLO Bit)

23.13.3 RIIC Reset and Internal Reset

The RIIC module incorporates a function for resetting itself. There are two types of reset. One is referred to as an RIIC reset; this initializes all registers including the RIICnCR2.BBSY flag. The other is referred to as an internal reset; this releases the RIIC from the slave-address matched state and initializes the internal counter while retaining other settings.

After issuing a reset, be sure to clear the RIICnCR1.IICRST bit to 0.

Both types of reset are effective for release from bus-hung states since both restore the output state of the SCL and SDA pins to the high impedance state.

Issuing a reset during slave operation may lead to a loss of synchronization between the master device clock and the slave device clock, so avoid this where possible. Note that monitoring of the bus state, such as for the presence of a start condition, is not possible during an RIIC reset (RIICnCR1.ICE and IICRST bits = 01_B).

For a detailed description of the RIIC and internal resets, see **Section 23.14, Reset Function of RIIC**.

23.14 Reset Function of RIIC

The RIIC has RIIC reset, and internal reset functions. In addition RIIC is cleared by ISORES.
Table 23.28, RIIC Reset Functions lists the scope of each reset and reset conditions.

Note 1. When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
When an internal reset is applied while the bus is not free, the BBSY flag is not cleared to 0.

Section 24 CANFD Interface (RS-CANFD)

This section contains a generic description of the CAN Interface (RS-CANFD).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RS-CANFD.

24.1 Features of RH850/F1KH, RH850/F1KM RS-CANFD

24.1.1 Number of Units and Channels

This microcontroller has the following number of RS-CANFD units and channels.

Table 24.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	2
Name	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0, 1)

Table 24.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0)

Table 24.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0)	RCFDCn (n = 0)

Table 24.7 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index “n”; for example, RCFDCnCFDGCTR is the global control register of the RCFDCn unit (n = 0, 1).
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index “m”; for example, RCFDCnCFDCmSTS is the channel m status register (m = 0 to 7 with n = 0, or m = 0 to 3 with n = 1).
z	Throughout this section, the total number of channels of RS-CANFD units is generically indicated by the index “z” (z = 0 to 11).
j	The individual registers associated with receive rule table are generically indicated by the index “j”; for example, RCFDCnCFDGAFLIDj (j = 0 to 15 with both value of index “n” (n = 0, 1)) is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index “k”; for example, RCFDCnCFDCFCCk (k = 0 to [channel m × 3 + 2] with both value of index “n” (n = 0, 1)) is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index “x”; for example, RCFDCnCFDRFSTSx (x = 0 to 7 with both value of index “n” (n = 0, 1)) is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by “d”; for example, the transmit/receive FIFO buffer data field register is described as RCFDCnCFDCFDFd_k (d = 0 to 15).
q	The individual receive buffers are generically indicated by the index “q”; for example, RCFDCnCFDRMIDq (q = 0 to [channel m × 16 + 15] with both value of index “n” (n = 0, 1)) is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index “p”; for example, RCFDCnCFDTMCp (p = 0 to [channel m × 32 + 31] with both value of index “n” (n = 0, 1)) is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by “b”; for example, the receive buffer data field register is described as RCFDCnCFDRMDFb_q (b = 0 to 15 with both value of index “n” (n = 0, 1)).
r	The individual RAM tests for CAN are generically indicated by the index “r”; for example, RCFDCnCFDRPGACCr (r = 0 to 63 with both value of index “n” (n = 0, 1)) is the RAM test page access register.
y	The registers not covered above are indicated by the index “y”; for example, RCFDCnCFDRMNDy (y = 0 to 3 with n = 0 or (y= 0, 1)) with n = 1 is a receive buffer new data register.

Note: The functions and descriptions of registers in this section are for the RS-CANFDn that has 8 channels (m = 0 to 7) for unit 0 (n = 0) and 4 channels (m = 0 to 3) for unit 1 (n = 1). When referring to information with indices, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

Table 24.8 Indices (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index “n”; for example, RCFDCnCFDGCTR is the global control register of the RCFDCn unit (n = 0).
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index “m”; for example, RCFDCnCFDCmSTS is the channel m status register (m = 0 to 7).
z	Throughout this section, the total number of channels of RS-CANFD units is generically indicated by the index “z” (z = 0 to 7).
j	The individual registers associated with receive rule table are generically indicated by the index “j”; for example, RCFDCnCFDGAFLIDj (j = 0 to 15) is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index “k”; for example, RCFDCnCFDCFCCk (k = 0 to [channel m × 3 + 2]) is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index “x”; for example, RCFDCnCFDRFSTSx (x = 0 to 7) is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by “d”; for example, the transmit/receive FIFO buffer data field register is described as RCFDCnCFDCFDFd_k (d = 0 to 15).
q	The individual receive buffers are generically indicated by the index “q”; for example, RCFDCnCFDRMIDq (q = 0 to [channel m × 16 + 15]) is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index “p”; for example, RCFDCnCFDTMCp (p = 0 to [channel m × 32 + 31]) is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by “b”; for example, the receive buffer data field register is described as RCFDCnCFDRMDFb_q (b = 0 to 15).
r	The individual RAM tests for CAN are generically indicated by the index “r”; for example, RCFDCnCFDRPGACCr (r = 0 to 63) is the RAM test page access register.
y	The registers not covered above are indicated by the index “y”; for example, RCFDCnCFDRMNDy (y = 0 to 3 with n = 0, or y= 0, 1 with n = 1) is a receive buffer new data register.

Note: The functions and descriptions of registers in this section are for the RS-CANFD that has 8 channels (m = 0 to 7). When referring to information with indices, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

Table 24.9 Indices (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index “n”; for example, RCFDCnCFDGCTR is the global control register of the RCFDCn unit (n = 0).
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index “m”; for example, RCFDCnCFDCmSTS is the channel m status register (m = 0 to 5).
z	Throughout this section, the total number of channels of RS-CANFD units is generically indicated by the index “z” (z = 0 to 5).
j	The individual registers associated with receive rule table are generically indicated by the index “j”; for example, RCFDCnCFDGAFLIDj (j = 0 to 15) is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index “k”; for example, RCFDCnCFDCFCCk (k = 0 to [channel m × 3 + 2]) is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index “x”; for example, RCFDCnCFDRFSTSx (x = 0 to 7)*[1] is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by “d”; for example, the transmit/receive FIFO buffer data field register is described as RCFDCnCFDCFDFd_k (d = 0 to 15).
q	The individual receive buffers are generically indicated by the index “q”; for example, RCFDCnCFDRMIDq (q = 0 to [channel m × 16 + 15]) is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index “p”; for example, RCFDCnCFDTMCp (p = 0 to [channel m × 32 + 31]) is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by “b”; for example, the receive buffer data field register is described as RCFDCnCFDRMDFb_q (b = 0 to 15).
r	The individual RAM tests for CAN are generically indicated by the index “r”; for example, RCFDCnCFDRPGACCr (r = 0 to 63) is the RAM test page access register.
y	The registers not covered above are indicated by the index “y”; for example, RCFDCnCFDRMNDy (y = 0 to 2 with n = 0, or y = 0, 1 with n = 1) is a receive buffer new data register.

Note: The functions and descriptions of registers in this section are for the RS-CANFD that has 6 channels (m = 0 to 5). When referring to information with indices, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

Note 1. Only the index “x” of RCFDCnCFDCDTCT regisiter and RCFDCnCFDCDTSTS register for RH850/F1KM-S1 are x = 0 to 5.

The following table lists the values of indices for individual products.

Table 24.10 Indices for Individual Products (RH850/F1KH-D8)

	Indices for Individual Products		
Unit Name	176 Pins	233 Pins	324 Pins

Table 24.12 Indices for Individual Products (RH850/F1KM-S1)

Unit Name	Indices for Individual Products			
	48 Pins	64 Pins	80 Pins	100 Pins
RCFDC0	m = 0	m = 0 to 2	m = 0 to 2	m = 0 to 5
	z = 0	z = 0 to 2	z = 0 to 2	z = 0 to 5
	j = 0 to 15	j = 0 to 15	j = 0 to 15	j = 0 to 15
	k = 0 to 2	k = 0 to 8	k = 0 to 8	k = 0 to 17
	x = 0 to 7*[1]	x = 0 to 7*[1]	x = 0 to 7*[1]	x = 0 to 7*[1]
	d = 0 to 15	d = 0 to 15	d = 0 to 15	d = 0 to 15
	q = 0 to 15	q = 0 to 47	q = 0 to 47	q = 0 to 95
	p = 0 to 31	p = 0 to 95	p = 0 to 95	p = 0 to 191
	b = 0 to 15	b = 0 to 15	b = 0 to 15	b = 0 to 15
	r = 0 to 63	r = 0 to 63	r = 0 to 63	r = 0 to 63
	y = 0	y = 0, 1	y = 0, 1	y = 0 to 2

Note 1. Only the index “x” of RCFDCnCFDCDTCT regisiter and RCFDCnCFDCDTSTS register for RH850/F1KM-S1 are x = 0 to 5.

24.1.2 Register Base Addresses

RCFDCn base addresses are listed in the following table.

RCFDCn register addresses are given as offsets from the base addresses.

Table 24.13 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<RCFDC0_base>	FFD0 0000_H
<RCFDC1_base>	FFD2 0000_H

Table 24.14 Register Base Address (RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<RCFDC0_base>	FFD0 0000_H

24.1.3 Clock Supply

The RCFDCn clock supply is shown in the following table.

Table 24.15 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name	Description
RCFDCn	clk_xincan	CKSCLK_ICANOSC	Communication clock from OSC clock
	clkc	CKSCLK_IPERI2	Communication clock
	pclk	CKSCLK_ICAN	Module clock
	Register access clock	CPUCLK_M, CKSCLK_ICAN	Bus clock

The operating frequency of the RCFDCn depends on the transfer rate and the number of channels in use. **Table 24.16, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM** shows the range of the frequency.

Table 24.16 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM

Condition			Range of Operating Frequency		
Nominal Bit Rate	Data Bit Rate	No. of Channels in Use (max.)	pclk	clk_xincan*[1]	clkc*[1]
500 kbps	5 Mbps	8 ch	pclk = 80 MHz	Not applicable	clkc = 40 MHz
1 Mbps	2 Mbps	8 ch	pclk = 80 MHz	Not applicable	clkc = 40 MHz
500 kbps	2 Mbps	2 ch	pclk = 24 MHz	clk_xincan = 12 MHz	Not applicable
500 kbps	2 Mbps	8 ch	pclk = 80 MHz	Not applicable	clkc = 40 MHz

Note 1. Setting the DCS bit in the RCFDCnCFDGCFG register enables to select either clk_xincan or clkc. Set clocks less than or equal to pclk/2.

CAUTION

When the RS-CANFD module is used in stop mode, set the MainOSC as the clock source of the RS-CANFD module. For details about how to set the clock source, see **Section 12AB.4.3.10, RS-CANFD Clock Domains C_ISO_CAN and C_ISO_CANOSC** and **Section 12C.4.3.9, RS-CANFD Clock Domains C_ISO_CAN and C_ISO_CANOSC**.

24.1.4 Interrupt Requests

RCFDCn interrupt requests are listed in the following table.

Table 24.17 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal		Description	Interrupt Number	DMA Trigger Number
RCFDC0				
Global	INTRCANGERR0	CAN global error interrupt	22	—
	INTRCANGRECC0	CAN receive FIFO interrupt	23	—
	RSCANFDRF0	Reception FIFO access message buffers0	—	60
	RSCANFDRF1	Reception FIFO access message buffers1	—	61
	RSCANFDRF2	Reception FIFO access message buffers2	—	62
	RSCANFDRF3	Reception FIFO access message buffers3	—	63
	RSCANFDRF4	Reception FIFO access message buffers4	—	68
	RSCANFDRF5	Reception FIFO access message buffers5	—	69
	RSCANFDRF6	Reception FIFO access message buffers6	—	82
	RSCANFDRF7	Reception FIFO access message buffers7	—	83
CAN0	INTRCAN0ERR	CAN0 error interrupt	24	—
	INTRCAN0REC	CAN0 transmit/receive FIFO receive completion interrupt	25	—
	INTRCAN0TRX	CAN0 transmit interrupt	26	—
	RSCANFDCF0	CAN0 common FIFO access message buffers	—	23
CAN1	INTRCAN1ERR	CAN1 error interrupt	113	—
	INTRCAN1REC	CAN1 transmit/receive FIFO receive completion interrupt	114	—
	INTRCAN1TRX	CAN1 transmit interrupt	115	—
	RSCANFDCF1	CAN1 common FIFO access message buffers	—	24
CAN2	INTRCAN2ERR	CAN2 error interrupt	217	—
	INTRCAN2REC	CAN2 transmit/receive FIFO receive completion interrupt	218	—
	INTRCAN2TRX	CAN2 transmit interrupt	219	—
	RSCANFDCF2	CAN2 common FIFO access message buffers	—	26
CAN3	INTRCAN3ERR	CAN3 error interrupt	220	—
	INTRCAN3REC	CAN3 transmit/receive FIFO receive completion interrupt	221	—
	INTRCAN3TRX	CAN3 transmit interrupt	222	—
	RSCANFDCF3	CAN3 common FIFO access message buffers	—	27
CAN4	INTRCAN4ERR	CAN4 error interrupt	272	—
	INTRCAN4REC	CAN4 transmit/receive FIFO receive completion interrupt	273	—
	INTRCAN4TRX	CAN4 transmit interrupt	274	—
	RSCANFDCF4	CAN4 common FIFO access message buffers	—	48
CAN5	INTRCAN5ERR	CAN5 error interrupt	287	—
	INTRCAN5REC	CAN5 transmit/receive FIFO receive completion interrupt	288	—
	INTRCAN5TRX	CAN5 transmit interrupt	289	—
	RSCANFDCF5	CAN5 common FIFO access message buffers	—	49
CAN6	INTRCAN6ERR	CAN6 error interrupt	321	—
	INTRCAN6REC	CAN6 transmit/receive FIFO receive completion interrupt	322	—
	INTRCAN6TRX	CAN6 transmit interrupt	323	—
	RSCANFDCF6	CAN6 common FIFO access message buffers	—	64

Table 24.17 Interrupt Requests (RH850/F1KH-D8)

Unit	Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
CAN7	INTRCAN7ERR	CAN7 error interrupt	332	—
	INTRCAN7REC	CAN7 transmit/receive FIFO receive completion interrupt	333	—
	INTRCAN7TRX	CAN7 transmit interrupt	334	—
	RSCANFDCF7	CAN7 common FIFO access message buffers	—	65
RCFDC1				
Global	INTRCANGERR1	CAN global error interrupt	319	—
	INTRCANGRECC1	CAN receive FIFO interrupt	320	—

NOTE

For the wake-up factors from standby mode, see **Section 14.1.2.1, Wake-Up Factors for Stand-By Modes**.

24.1.5 Reset Sources

RCFDCn reset sources are listed in the following table. RCFDCn is initialized by these reset sources.

Table 24.20 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
RCFDCn	All reset sources (ISORES)

24.1.6 External Input/Output Signals

External input/output signals of RCFDCn are listed below.

Table 24.21 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
RCFDC0		
CANzRX (z = 0 to 7)	CANm receive data input	CANzRX (z = 0 to 7)
CANzTX (z = 0 to 7)	CANm transmit data output	CANzTX (z = 0 to 7)
RCFDC1		
CANzRX (z = 8 to 11)	CANm receive data input	CANzRX (z = 8 to 11)
CANzTX (z = 8 to 11)	CANm transmit data output	CANzTX (z = 8 to 11)

Table 24.22 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
RCFDC0		
CANzRX (z = 0 to 7)	CANm receive data input	CANzRX (z = 0 to 7)
CANzTX (z = 0 to 7)	CANm transmit data output	CANzTX (z = 0 to 7)

Table 24.23 External Input/Output Signals (RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
RCFDC0		
CANzRX (z = 0 to 5)	CANm receive data input	CANzRX (z = 0 to 5)
CANzTX (z = 0 to 5)	CANm transmit data output	CANzTX (z = 0 to 5)

24.2 Overview

24.2.1 Functional Overview

Table 24.24, RS-CANFD Module Specifications shows the RS-CANFD module specifications that has 8 channels (m = 0 to 7) for unit 0 (n = 0) and 4 channels (m = 0 to 3) for unit 1 (n = 1). **Figure 24.1, RS-CANFD Module Block Diagram** shows the RS-CANFD module block diagram.

Table 24.24 RS-CANFD Module Specifications

Item	Specification
Number of channels	8 (n = 0), 4 (n = 1)
Protocol	ISO11898-1 compliant Using CAN FD frames is selectable by switching interface modes.
Communication speed	Classical CAN only mode : • Maximum 1 Mbps $\text{Communication speed (CANm bit time clock)} = \frac{1}{\text{CANm bit time}}$ CANm bit time = CANmTq × Tq count per bit $\text{CANmTq} = \frac{\text{(NBRP[9: 0] bits in the RCFDCnCFDCmNCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RCFDCnCFDGCFG register) CAN FD mode and CAN FD only mode: • Data bit rate: max.5 Mbps (Nominal bit rate ≤ 500 Kbps) • Data bit rate: max.2 Mbps (1Mbps ≥ Nominal bit rate > 500 Kbps) Note : fCAN = 40 MHz $\text{Transmission rate (CANm nominal bit time clock)} = \frac{1}{\text{CANm nominal bit time}}$ $\text{Transmission rate (CANm data bit time clock)} = \frac{1}{\text{CANm data bit time}}$ CANm nominal bit time = CANmTq(N) × Tq count per nominal bit CANm data bit time = CANmTq(D) × Tq count per data bit $\text{CANmTq(N)} = \frac{\text{(NBRP[9: 0] bits in the RCFDCnCFDCmNCFG register + 1)}}{\text{fCAN}}$ $\text{CANmTq(D)} = \frac{\text{(DBRP[7: 0] bits in the RCFDCnCFDCmDCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RCFDCnCFDGCFG register) m = 0 to 7 (n = 0), m = 0 to 3 with (n = 1) Tq: Time quantum

Table 24.24 RS-CANFD Module Specifications

Item	Specification
Buffer	RCFDC0: 1280 buffers in total ● Individual buffers: 256 buffers (32 buffers × 8 channels) Transmit buffer: 32 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 32 buffers allocatable) ● Shared buffers: 1024 buffers for all channels Receive buffer: 0 to 128 buffers Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) ● ECC included RCFDC1: 640 buffers in total ● Individual buffers: 128 buffers (32 buffers × 4 channels) Transmit buffer: 32 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 32 buffers allocatable) ● Shared buffers: 512 buffers for all channels Receive buffer: 0 to 64 buffers Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) ● ECC included
Reception function	● Receives data frames and remote frames. ● Selects ID format (standard ID, extended ID, or both IDs) to be received. ● Sets interrupt enable/disable for each FIFO. ● Mirror function (reception of messages transmitted from the own CAN node) ● Timestamp function (to record message reception time as a 16-bit timer value)
Reception filter function	● Selects receive messages according to 1024 receive rules. ● Sets the number of receive rules (0 to 255) for each channel. ● Acceptance filter processing: Sets ID and mask for each receive rule. ● DLC filter processing: Enables DLC filter check for each acceptance rule.
Receive message transfer function	● Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer ● Label addition function Stores label information together with a message in a receive buffer and FIFO buffer.
Transmission function	● Transmits data frames and remote frames. ● Selects ID format (standard ID, extended ID, or both IDs) to be transmitted. ● Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer. ● Selects ID priority transmission or transmit buffer number priority transmission. ● Transmit request can be aborted (possible to confirm with a flag) ● One-shot transmission function
Interval transmission function	Transmits messages at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers)
Transmit queue function	Transmits all stored messages according to the ID priority.
Transmit history function	Stores the history information of transmission-completed messages
Gateway function	Transmits a received message automatically.
Bus off recovery mode selection	Selects the method for returning from bus off state. ● ISO11898-1 compliant ● Automatic entry to channel halt mode at bus-off entry ● Automatic entry to channel halt mode at bus-off end ● Transition to channel halt mode by program request ● Transition to the error-active state by program request (forcible return from the bus off state)

Table 24.24 RS-CANFD Module Specifications

Item	Specification
Error status monitoring	● Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus lock). ● Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery) ● Reads the error counter. ● Monitors DLC errors.
Interrupt source	RCFDC0: 26 sources, RCFDC1: 14 sources ● Global interrupts (2 sources/unit) (n = 0, 1) Receive FIFO interrupt (1 source/unit) (n = 0, 1) Global error interrupt (1 source/unit) (n = 0, 1) ● Channel interrupts (3 sources/channel) CANm transmit interrupt (m = 0 to 7 (n = 0), m = 0 to 3 (n = 1)) 1. CANm transmit interrupt – CANm transmit complete interrupt – CANm transmit abort interrupt – CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode) – CANm transmit history interrupt – CANm transmit queue interrupt 2. CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) 3. CANm error interrupt
CAN stop mode	Reduces power consumption by stopping clock supply to the RS-CANFD module.
CAN clock source	Selects the clkc or the clk_xincan. As for the range of operating frequency, see **Table 24.16, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM**.
Test function	Test function for user evaluation ● Listen-only mode ● Self-test mode 0 (external loopback) ● Self-test mode 1 (internal loopback) ● Restricted operation mode ● RAM test (read/write test) ● Inter-channel communication test [CRC error test enabled]

24.2.2 Interface Modes

The RS-CANFD has three interface modes.

- Classical CAN only mode: Handles only classical CAN frames.
- CAN FD mode: Handles classical CAN frames and CAN FD frames.
- CAN FD only mode: Handles only CAN FD frames.

Interface modes are switched by the CLOE bit and the FDOE in the RCFDCnCFDCmFDCFG register.

Set interface modes for each channel.

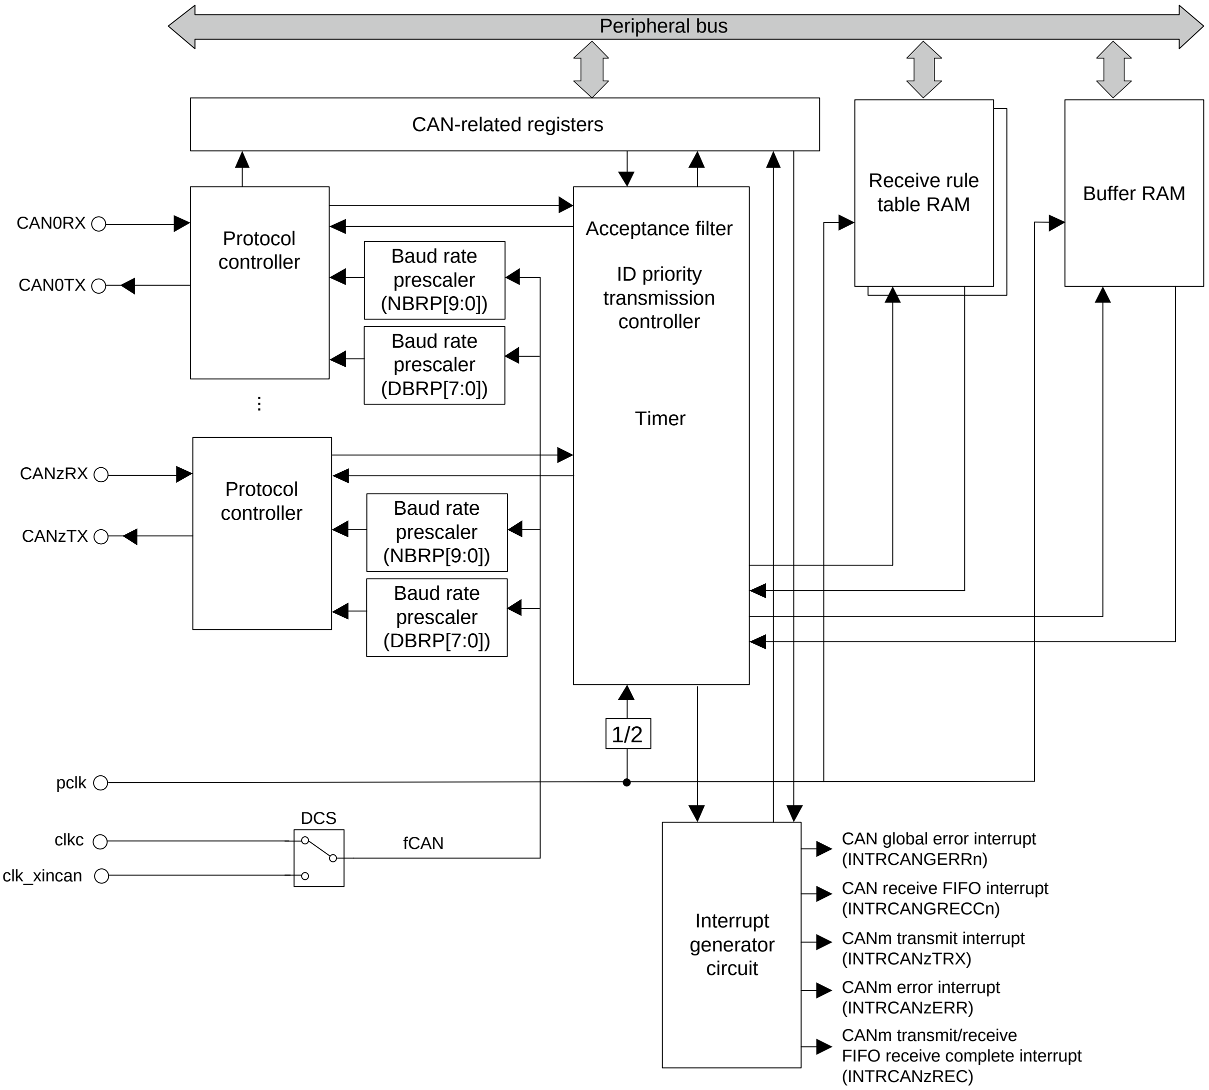
Table 24.25 Description and Configuration of Interface Mode

Interface Mode	Description	Configuration
CAN-FD mode	Classical and CAN-FD frames can be transmitted and received	RCFDCnCFDCmFDCFG.CLOE = 0 RCFDCnCFDCmFDCFG.FDOE = 0
CAN-FD only mode	Only CAN-FD frames can be transmitted and received. Classical frames will cause the detection of an error	RCFDCnCFDCmFDCFG.CLOE = 0 RCFDCnCFDCmFDCFG.FDOE = 1
Classical CAN only mode	Only Classical Frame can be transmitted and received. FD frames will cause the detection of an error	RCFDCnCFDCmFDCFG.CLOE = 1 RCFDCnCFDCmFDCFG.FDOE = 0

24.2.3 CAN FD Protocol

This product supports CAN FD according to the ISO/DIS 11898-1 protocol that specifies the new CRC field including stuff counters.

24.2.4 Block Diagram



Note: n = 0, 1
z = 0 to 11
m = 0 to 7 (n = 0) and m = 0 to 3 (n = 1)
NBRP[9:0]: Bits in the RCFDCnCFDCmNCFG register
DBRP[7:0]: Bits in the RCFDCnCFDCmDCFG register
DCS: Bits in the RCFDCnCFDGCFG register
fCAN: CAN clock

Figure 24.1 RS-CANFD Module Block Diagram

24.3 Registers

This section describes all registers to be used when the RS-CANFD is used.

24.3.1 List of Registers

The following tables list RS-CANFD registers to be used.

For details about <RCFDCn_base>, see **Section 24.1.2, Register Base Addresses**.

For details about registers initialized in Global reset mode or Channel reset mode, see following.

- **Table 24.118, Registers Initialized in Global Reset Mode or Channel Reset Mode**
- **Table 24.119, Registers Initialized Only in Global Reset Mode**

Table 24.26 List of Registers

Module Name	Register Name	Symbol	Address	Guard Group
Channel-related registers				
RCFDCn	Channel nominal bit rate configuration register	RCFDCnCFDCmNCFG	<RCFDCn_base> + 0000_H + (10_H × m)	RCFDCn Chm
RCFDCn	Channel control register	RCFDCnCFDCmCTR	<RCFDCn_base> + 0004_H + (10_H × m)	RCFDCn Chm
RCFDCn	Channel status register	RCFDCnCFDCmSTS	<RCFDCn_base> + 0008_H + (10_H × m)	RCFDCn Chm
RCFDCn	Channel error flag register	RCFDCnCFDCmERFL	<RCFDCn_base> + $000C_H$ + (10_H × m)	RCFDCn Chm
RCFDCn	Channel data bit rate configuration register	RCFDCnCFDCmDCFG	<RCFDCn_base> + 0700_H + (20_H × m)	RCFDCn Chm
RCFDCn	Channel CAN FD configuration register	RCFDCnCFDCmFDCFG	<RCFDCn_base> + 0704_H + (20_H × m)	RCFDCn Chm
RCFDCn	Channel CAN FD control register	RCFDCnCFDCmFDCTR	<RCFDCn_base> + 0708_H + (20_H × m)	RCFDCn Chm
RCFDCn	Channel CAN FD status register	RCFDCnCFDCmFDSTS	<RCFDCn_base> + $070C_H$ + (20_H × m)	RCFDCn Chm
RCFDCn	Channel CAN FD CRC register	RCFDCnCFDCmFDCRC	<RCFDCn_base> + 0710_H + (20_H × m)	RCFDCn Chm
Global-related registers				
RCFDCn	Global configuration register	RCFDCnCFDGCFG	<RCFDCn_base> + 0084_H	RCFDCn global
RCFDCn	Global control register	RCFDCnCFDGCTR	<RCFDCn_base> + 0088_H	RCFDCn global
RCFDCn	Global status register	RCFDCnCFDGSTS	<RCFDCn_base> + $008C_H$	RCFDCn global
RCFDCn	Global error flag register	RCFDCnCFDGERFL	<RCFDCn_base> + 0090_H	RCFDCn global
RCFDCn	Global timestamp counter register	RCFDCnCFDGTSC	<RCFDCn_base> + 0094_H	RCFDCn global
RCFDCn	Global TX interrupt status register 0	RCFDCnCFDGTINTSTS0	<RCFDCn_base> + 0610_H	RCFDCn global
RCFDCn	Global TX interrupt status register 1	RCFDCnCFDGTINTSTS1	<RCFDCn_base> + 0614_H	RCFDCn global
RCFDCn	Global FD configuration register	RCFDCnCFDGFDCFG	<RCFDCn_base> + 0624_H	RCFDCn global
Receive rule-related registers				
RCFDCn	Receive rule entry control register	RCFDCnCFDGAFLECTR	<RCFDCn_base> + 0098_H	RCFDCn global
RCFDCn	Receive rule configuration register 0	RCFDCnCFDGAFLCFG0	<RCFDCn_base> + $009C_H$	RCFDCn global
RCFDCn	Receive rule configuration register 1	RCFDCnCFDGAFLCFG1	<RCFDCn_base> + $00A0_H$	RCFDCn global
RCFDCn	Receive rule ID register	RCFDCnCFDGAFLIDj	<RCFDCn_base> + 1000_H + (10_H × j)	RCFDCn global
RCFDCn	Receive rule mask register	RCFDCnCFDGAFLMj	<RCFDCn_base> + 1004_H + (10_H × j)	RCFDCn global
RCFDCn	Receive rule pointer 0 register	RCFDCnCFDGAFLP0_j	<RCFDCn_base> + 1008_H + (10_H × j)	RCFDCn global
RCFDCn	Receive rule pointer 1 register	RCFDCnCFDGAFLP1_j	<RCFDCn_base> + $100C_H$ + (10_H × j)	RCFDCn global
Receive buffer-related registers				
RCFDCn	Receive buffer number register	RCFDCnCFDRMNB	<RCFDCn_base> + $00A4_H$	RCFDCn global
RCFDCn	Receive buffer new data register	RCFDCnCFDRMNDy	<RCFDCn_base> + $00A8_H$ + (04_H × y)	RCFDCn global
RCFDCn	Receive buffer ID register	RCFDCnCFDRMIDq	<RCFDCn_base> + 2000_H + (80_H × q)	RCFDCn global
RCFDCn	Receive buffer pointer register	RCFDCnCFDRMPTRq	<RCFDCn_base> + 2004_H + (80_H × q)	RCFDCn global
RCFDCn	Receive buffer CAN FD status register	RCFDCnCFDRMFDSTSq	<RCFDCn_base> + 2008_H + (80_H × q)	RCFDCn global
RCFDCn	Receive buffer data field register	RCFDCnCFDRMDFb_q	<RCFDCn_base> + $200C_H$ + (04_H × b) + (80_H × q)	RCFDCn global

Table 24.26 List of Registers

Module Name	Register Name	Symbol	Address	Guard Group
Receive FIFO buffer-related registers				
RCFDCn	Receive FIFO buffer configuration and control register	RCFDCnCFDRFCCx	<RCFDCn_base> + 00B8$_H$ + (04$_H$ × x)	RCFDCn global
RCFDCn	Receive FIFO buffer status register	RCFDCnCFDRFSTSx	<RCFDCn_base> + 00D8$_H$ + (04$_H$ × x)	RCFDCn global
RCFDCn	Receive FIFO buffer pointer control register	RCFDCnCFDRFPCTRx	<RCFDCn_base> + 00F8$_H$ + (04$_H$ × x)	RCFDCn global
RCFDCn	Receive FIFO buffer access id register	RCFDCnCFDRFIDx	<RCFDCn_base> + 6000$_H$ + (80$_H$ × x)	RCFDCn global
RCFDCn	Receive FIFO buffer access pointer register	RCFDCnCFDRFPTRx	<RCFDCn_base> + 6004$_H$ + (80$_H$ × x)	RCFDCn global
RCFDCn	Receive FIFO CAN FD status register	RCFDCnCFDRFFDSTSx	<RCFDCn_base> + 6008$_H$ + (80$_H$ × x)	RCFDCn global
RCFDCn	Receive FIFO buffer access data field register	RCFDCnCFDRFDFd_x	<RCFDCn_base> + 600C$_H$ + (04$_H$ × d) + (80$_H$ × x)	RCFDCn global
Transmit/receive FIFO buffer-related registers				
RCFDCn	Transmit/receive FIFO buffer configuration and control register	RCFDCnCFDCFCCk	<RCFDCn_base> + 0118$_H$ + (04$_H$ × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer status register	RCFDCnCFDCFSTSk	<RCFDCn_base> + 0178$_H$ + (04$_H$ × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer pointer control register	RCFDCnCFDCFPCTRk	<RCFDCn_base> + 01D8$_H$ + (04$_H$ × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer access id register	RCFDCnCFDCFIDk	<RCFDCn_base> + 6400$_H$ + (80$_H$ × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer access pointer register	RCFDCnCFDCFPTRk	<RCFDCn_base> + 6404$_H$ + (80$_H$ × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO CAN FD configuration/status register	RCFDCnCFDCFFDCSTSk	<RCFDCn_base> + 6408$_H$ + (80$_H$ × k)	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer access data field register	RCFDCnCFDCFDFd_k	<RCFDCn_base> + 640C$_H$ + (04$_H$ × d) + (80$_H$ × k)	RCFDCn global
FIFO status-related registers				
RCFDCn	FIFO empty status register	RCFDCnCFDFESTS	<RCFDCn_base> + 0238$_H$	RCFDCn global
RCFDCn	FIFO full status register	RCFDCnCFDFFSTS	<RCFDCn_base> + 023C$_H$	RCFDCn global
RCFDCn	FIFO message lost status register	RCFDCnCFDFMSTS	<RCFDCn_base> + 0240$_H$	RCFDCn global
RCFDCn	Receive FIFO buffer interrupt flag status register	RCFDCnCFDRFISTS	<RCFDCn_base> + 0244$_H$	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer receive interrupt flag status register	RCFDCnCFDCFRISTS	<RCFDCn_base> + 0248$_H$	RCFDCn global
RCFDCn	Transmit/receive FIFO buffer transmit interrupt flag status register	RCFDCnCFDCFTISTS	<RCFDCn_base> + 024C$_H$	RCFDCn global
FIFO DMA-related registers				
RCFDCn	DMA enable register	RCFDCnCFDCDTCT	<RCFDCn_base> + 0640$_H$	RCFDCn global
RCFDCn	DMA status register	RCFDCnCFDCDTSTS	<RCFDCn_base> + 0644$_H$	RCFDCn global
Transmit buffer-related registers				
RCFDCn	Transmit buffer control register	RCFDCnCFDTMCp	<RCFDCn_base> + 0250$_H$ + (01$_H$ × p)	RCFDCn global
RCFDCn	Transmit buffer status register	RCFDCnCFDTMSTSp	<RCFDCn_base> + 0350$_H$ + (01$_H$ × p)	RCFDCn global
RCFDCn	Transmit buffer ID register	RCFDCnCFDTMIDp	<RCFDCn_base> + 8000$_H$ + (80$_H$ × p)	RCFDCn global
RCFDCn	Transmit buffer pointer register	RCFDCnCFDTMPTRp	<RCFDCn_base> + 8004$_H$ + (80$_H$ × p)	RCFDCn global
RCFDCn	Transmit buffer CAN FD configuration register	RCFDCnCFDTMFDCTRp	<RCFDCn_base> + 8008$_H$ + (80$_H$ × p)	RCFDCn global
RCFDCn	Transmit buffer data field register	RCFDCnCFDTMDFb_p	<RCFDCn_base> + 800C$_H$ + (04$_H$ × b) + (80$_H$ × p)	RCFDCn global
RCFDCn	Transmit buffer interrupt enable configuration register	RCFDCnCFDTMIECm	<RCFDCn_base> + 04D0$_H$ + (04$_H$ × m)	RCFDCn global
Transmit buffer status-related registers				
RCFDCn	Transmit buffer transmit request status register	RCFDCnCFDTMTRSTSm	<RCFDCn_base> + 0450$_H$ + (04$_H$ × m)	RCFDCn global

Table 24.31 RCFDCnCFDCmNCFG Register Contents

Bit Position	Bit Name	Function
15 to 11	NSJW[4:0]	Nominal Bit Rate Resynchronization Jump Width Control b15 b14 b13 b12 b11 0 0 0 0 0: 1 Tq 0 0 0 0 1: 2 Tq 0 0 0 1 0: 3 Tq : : 1 1 1 1 0: 31 Tq 1 1 1 1 1: 32 Tq
10	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
9 to 0	NBRP[9:0]	Nominal Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1).

Modify the RCFDCnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings for bit timing parameters, see **Section 24.10.1, Initial Settings**.

NTSEG2[4:0] Bits

These bits specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.

Possible values are 2 Tq to 32 Tq, inclusive.

Set a value smaller than the value of the NTSEG1[6:0] bits.

NTSEG1[6:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.

Possible values are 4 to 128 Tq.

NSJW[4:0] Bits

These bits specify the resynchronization jump width of nominal bit rate as a Tq value. Possible values are 1 to 32 Tq. Specify a value equal to or smaller than the NTSEG2[4:0] value.

NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

The NBRP[9:0] value and the DBRP[7:0] value should be equal and the two corresponding bit rate values are different according to the respective segment values.

24.3.2.2 RCFDCnCFDCmCTR — Channel Control Register (m = 0 to 7)

Access: RCFDCnCFDCmCTR register can be read or written in 32-bit units

RCFDCnCFDCmCTRL, RCFDCnCFDCmCTRH registers can be read or written in 16-bit units

RCFDCnCFDCmCTRLL, RCFDCnCFDCmCTRLH, RCFDCnCFDCmCTRHL, RCFDCnCFDCmCTRHH registers can be read or written in 8-bit units

Address: RCFDCnCFDCmCTR: <RCFDCn_base> + 0004_H + (10_H × m)

RCFDCnCFDCmCTRL: <RCFDCn_base> + 0004_H + (10_H × m),

RCFDCnCFDCmCTRH: <RCFDCn_base> + 0006_H + (10_H × m)

RCFDCnCFDCmCTRLL: <RCFDCn_base> + 0004_H + (10_H × m),

RCFDCnCFDCmCTRLH: <RCFDCn_base> + 0005_H + (10_H × m),

RCFDCnCFDCmCTRHL: <RCFDCn_base> + 0006_H + (10_H × m),

RCFDCnCFDCmCTRHH: <RCFDCn_base> + 0007_H + (10_H × m)

Bit Position	Bit Name	Function
31	ROM	Restricted Operation Mode Enable 0: Restricted operation mode is disabled. 1: Restricted operation mode is enabled.
30	CRCT	CRC Error Test Enable 0: The first bit of the reception ID field is not inverted. 1: The first bit of the reception ID field is inverted.
29 to 27	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
26, 25	CTMS[1:0]	Communication Test Mode Select b26 b25 0 0: Standard test mode 0 1: Listen-only mode 1 0: Self-test mode 0 (external loopback mode) 1 1: Self-test mode 1 (internal loopback mode)
24	CTME	Communication Test Mode Enable 0: Communication test mode is disabled. 1: Communication test mode is enabled.
23	ERRD	Error Display Mode Select 0: Error flags are displayed only for the first error information after bits 14 to 8 in the RCFDCnCFDCmERFL register are all cleared. 1: Error flags for all error information are displayed.

Table 24.32 RCFDCnCFDCmCTR Register Contents

Bit Position	Bit Name	Function
22, 21	BOM[1:0]	Bus Off Recovery Mode Select b22 b21 0 0: ISO11898-1 compliant 0 1: Entry to channel halt mode automatically at bus-off entry 1 0: Entry to channel halt mode automatically at bus-off end 1 1: Entry to channel halt mode (in bus-off state) by program request
20	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
19	TDCVFIE	Transmitter Delay Compensation Violation Interrupt Enable 0: A transmitter delay compensation violation interrupt is disabled. 1: A transmitter delay compensation violation interrupt is enabled.
18	SOCOIE	Successful Occurrence Counter Overflow Interrupt Enable 0: A successful occurrence counter overflow interrupt is disabled. 1: A successful occurrence counter overflow interrupt is enabled.
17	EOCOIE	Error Occurrence Counter Overflow Interrupt Enable 0: An error occurrence counter overflow interrupt is disabled. 1: An error occurrence counter overflow interrupt is enabled.
16	TAIE	Transmit Abort Interrupt Enable 0: Transmit abort interrupt is disabled. 1: Transmit abort interrupt is enabled.
15	ALIE	Arbitration Lost Interrupt Enable 0: Arbitration lost interrupt is disabled. 1: Arbitration lost interrupt is enabled.
14	BLIE	Bus Lock Interrupt Enable 0: Bus lock interrupt is disabled. 1: Bus lock interrupt is enabled.
13	OLIE	Overload Frame Transmit Interrupt Enable 0: Overload frame transmit interrupt is disabled. 1: Overload frame transmit interrupt is enabled.
12	BORIE	Bus Off Recovery Interrupt Enable 0: Bus off recovery interrupt is disabled. 1: Bus off recovery interrupt is enabled.
11	BOEIE	Bus Off Entry Interrupt Enable 0: Bus off entry interrupt is disabled. 1: Bus off entry interrupt is enabled.
10	EPIE	Error Passive Interrupt Enable 0: Error passive interrupt is disabled. 1: Error passive interrupt is enabled.
9	EWIE	Error Warning Interrupt Enable 0: Error warning interrupt is disabled. 1: Error warning interrupt is enabled.
8	BEIE	Bus Error Interrupt Enable 0: Bus error interrupt is disabled. 1: Bus error interrupt is enabled.
7 to 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
3	RTBO	Forcible Return from Bus-off When this bit is set to 1, forcible return from the bus off state is made. This bit is always read as 0.

Table 24.32 RCFDCnCFDCmCTR Register Contents

Bit Position	Bit Name	Function
2	CSLPR	Channel Stop Mode 0: Other than channel stop mode 1: Channel stop mode
1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

ROM Bit

When the ROM bit and the CTME bit in the RCFDCnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RCFDCnCFDCmCTR register is 00_B (standard test mode). Modify this bit only in channel halt mode.

This bit is always 0 in channel reset mode.

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RCFDCnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RCFDCnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RCFDCnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is set to 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RCFDCnCFDCmERFL register. When this bit is clear to 0, if any error is detected while the flags of bits 14 to 8 in the RCFDCnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RCFDCnCFDCmCTR register (m = 0 to 7) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RCFDCnCFDCmSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01_B or at bus off end when the BOM[1:0] bits are 10_B), the program’s writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TDCVFIE Bit

When the TDCVF flag in the RCFDCnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

SOCOIE Bit

When the SOCO flag in the RCFDCnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

EOCOIE Bit

When the EOCO flag in the RCFDCnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RCFDCnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RCFDCnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RCFDCnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RCFDCnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RCFDCnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RCFDCnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RCFDCnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RCFDCnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RCFDCnCFDCmSTS register to 00_H and also clears the BOSTS flag in the RCFDCnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RCFDCnCFDCmCTR register are 00_B (ISO11898-1 compliant). A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RS-CANFD module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode. Clearing this bit to 0 makes the channel exit channel stop mode.

This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 24.5.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B.

When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits are automatically set to 10_B.

24.3.2.3 RCFDCnCFDCmSTS — Channel Status Register (m = 0 to 7)

Access: RCFDCnCFDCmSTS register can be read or written in 32-bit units

RCFDCnCFDCmSTSL register can be read or written in 16-bit units

RCFDCnCFDCmSTSH register is a read-only register that can be read in 16-bit units

RCFDCnCFDCmSTSLL register is a read-only register that can be read in 8-bit units

RCFDCnCFDCmSTSLH register can be read or written in 8-bit units

RCFDCnCFDCmSTSHL, RCFDCnCFDCmSTSHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDCmSTS: <RCFDCn_base> + 0008_{H} + (10_{H} × m)

RCFDCnCFDCmSTSL: <RCFDCn_base> + 0008_{H} + (10_{H} × m),

RCFDCnCFDCmSTSH: <RCFDCn_base> + $000A_{H}$ + (10_{H} × m)

RCFDCnCFDCmSTSLL: <RCFDCn_base> + 0008_{H} + (10_{H} × m),

RCFDCnCFDCmSTSLH: <RCFDCn_base> + 0009_{H} + (10_{H} × m),

RCFDCnCFDCmSTSHL: <RCFDCn_base> + $000A_{H}$ + (10_{H} × m),

RCFDCnCFDCmSTSHH: <RCFDCn_base> + $000B_{H}$ + (10_{H} × m)

Value after reset: $0000\ 0005_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TEC[7:0]								REC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ESIF	COMSTS	RECSTS	TRMSTS	BOSTS	EPSTS	CSLPSTS	CHLTSTS	CRSTSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1
R/W	R	R	R	R	R	R	R	R/W*[1]	R	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.33 RCFDCnCFDCmSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	ESIF	Error State Indication Flag 0: No CAN FD message whose ESI bit is recessive has been received. 1: At least one CAN FD message whose ESI bit is recessive has been received.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state

Table 24.33 RCFDCnCFDCmSTS Register Contents

Bit Position	Bit Name	Function
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.

This flag is set to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag is set to 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

24.3.2.4 RCFDCnCFDCmERFL — Channel Error Flag Register (m = 0 to 7)

Access:	RCFDCnCFDCmERFL register can be read or written in 32-bit units
	RCFDCnCFDCmERFLL register can be read or written in 16-bit units
	RCFDCnCFDCmERFLH register is a read-only register that can be read in 16-bit units
	RCFDCnCFDCmERFLLL, RCFDCnCFDCmERFLLH registers can be read or written in 8-bit units
	RCFDCnCFDCmERFLHL, RCFDCnCFDCmERFLHH registers are read-only registers that can be read in 8-bit units
Address:	RCFDCnCFDCmERFL: <RCFDCn_base> + 000C$_H$ + (10$_H$ × m)
	RCFDCnCFDCmERFLL: <RCFDCn_base> + 000C$_H$ + (10$_H$ × m),
	RCFDCnCFDCmERFLH: <RCFDCn_base> + 000E$_H$ + (10$_H$ × m)
	RCFDCnCFDCmERFLLL: <RCFDCn_base> + 000C$_H$ + (10$_H$ × m),
	RCFDCnCFDCmERFLLH: <RCFDCn_base> + 000D$_H$ + (10$_H$ × m),
	RCFDCnCFDCmERFLHL: <RCFDCn_base> + 000E$_H$ + (10$_H$ × m),
	RCFDCnCFDCmERFLHH: <RCFDCn_base> + 000F$_H$ + (10$_H$ × m)
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	CRCREG[14:0]														
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	ADERR	B0ERR	B1ERR	CERR	AERR	FERR	SERR	ALF	BLF	OVLF	BORF	BOEF	EPF	EWF	BEF

R/W	R	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]	R/W[*1]

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.34 RCFDCnCFDCmERFL Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data (CRC length:15 bits) A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.

Table 24.34 RCFDCnCFDCmERFL Register Contents

Bit Position	Bit Name	Function
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is set to 1. Transition to channel reset mode resets these flags to 0.

If the ERRD bit in the RCFDCnCFDCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RCFDCnCFDCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RCFDCnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CAN FD frame is sent or received, the value of CRCREG[20:0] bits in the RCFDCnCFDCmFDCRC register is updated. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

This bit is always 0 in channel reset mode.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected even though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected even though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of bus lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RCFDCnCFDCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RCFDCnCFDCmCTR register is set to 1 (forcible return from the bus off state).
- The BOM[1:0] bits in the RCFDCnCFDCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).

- The CHMDC[1:0] bits in the RCFDCnCFDCmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is entered (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is entered when the BOM[1:0] bits in the RCFDCnCFDCmCTR register (m = 0 to 7) are set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag is set to 1 when the error passive state is entered ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])). This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RCFDCnCFDCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

24.3.2.5 RCFDCnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0 to 7)

Access: RCFDCnCFDCmDCFG register can be read or written in 32-bit units

RCFDCnCFDCmDCFGL, RCFDCnCFDCmDCFGH registers can be read or written in 16-bit units

RCFDCnCFDCmDCFGLL, RCFDCnCFDCmDCFGHL, RCFDCnCFDCmDCFGHH registers can be read or written in 8-bit units

Address: RCFDCnCFDCmDCFG: <RCFDCn_base> + 0700_H + (20_H × m)
RCFDCnCFDCmDCFGL: <RCFDCn_base> + 0700_H + (20_H × m),
RCFDCnCFDCmDCFGH: <RCFDCn_base> + 0702_H + (20_H × m)
RCFDCnCFDCmDCFGLL: <RCFDCn_base> + 0700_H + (20_H × m),
RCFDCnCFDCmDCFGHL: <RCFDCn_base> + 0702_H + (20_H × m),
RCFDCnCFDCmDCFGHH: <RCFDCn_base> + 0703_H + (20_H × m)

Value after reset: 0000 0000_H

Table 24.35 RCFDCnCFDCmDCFG Register Contents

Bit Position	Bit Name	Function
19 to 16	DTSEG1[3:0]	Data Bit Rate Time Segment 1 Control b19 b18 b17 b16 0 0 0 0: Setting prohibited 0 0 0 1: 2 Tq 0 0 1 0: 3 Tq 0 0 1 1: 4 Tq 0 1 0 0: 5 Tq 0 1 0 1: 6 Tq 0 1 1 0: 7 Tq 0 1 1 1: 8 Tq 1 0 0 0: 9 Tq 1 0 0 1: 10 Tq 1 0 1 0: 11 Tq 1 0 1 1: 12 Tq 1 1 0 0: 13 Tq 1 1 0 1: 14 Tq 1 1 1 0: 15 Tq 1 1 1 1: 16 Tq
15 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
7 to 0	DBRP[7:0]	Data Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1).

Modify the RCFDCnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CAN FD mode, set the RCFDCnCFDCmDCFG register to the value equal to the set RCFDCnCFDCmNCFG register value. For the description and settings of bit timing parameters, see **Section 24.10.1, Initial Settings**.

The channel of Classical only mode does not have to perform the configuration of this register.

DSJW[2:0] Bits

These bits specify the resynchronization jump width of data bit rate as a Tq value. Possible values are 1 to 8 Tq. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.

Possible values are 2 to 8 Tq.

Set a value less than or equal to the value of the DTSEG1[3:0] bits.

DTSEG1[3:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.

Possible values are 2 to 16 Tq.

DBRP[7:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the data bit rate prescaler ((DBRP[7:0]) + 1) becomes CANmTq(D) clock (fCANTQ(D)m). One clock of the CANmTq(D) clock becomes one Time Quantum (Tq).

Be sure to specify the same value for both NBRP[9:0] and DBRP[7:0].

To specify different values for the nominal bit rate and the data bit rate, change the values of the RCFDCnCFDCmNCFG.NTSEG1 and NTSEG2 bits and RCFDCnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

When the TDCE bit is set to 1(Transmitter delay compensation is enabled) in the RCFDCnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

24.3.2.6 RCFDCnCFDCmFDCFG — Channel CAN FD Configuration Register (m = 0 to 7)

Access: RCFDCnCFDCmFDCFG register can be read or written in 32-bit units

RCFDCnCFDCmFDCFGL, RCFDCnCFDCmFDCFGH registers can be read or written in 16-bit units

RCFDCnCFDCmFDCFGLL, RCFDCnCFDCmFDCFGLH, RCFDCnCFDCmFDCFGHL, RCFDCnCFDCmFDCFGHH registers can be read or written in 8-bit units

Address: RCFDCnCFDCmFDCFG: <RCFDCn_base> + 0704_H + (20_H × m)

RCFDCnCFDCmFDCFGL: <RCFDCn_base> + 0704_H + (20_H × m),

RCFDCnCFDCmFDCFGH: <RCFDCn_base> + 0706_H + (20_H × m)

RCFDCnCFDCmFDCFGLL: <RCFDCn_base> + 0704_H + (20_H × m),

RCFDCnCFDCmFDCFGLH: <RCFDCn_base> + 0705_H + (20_H × m),

RCFDCnCFDCmFDCFGHL: <RCFDCn_base> + 0706_H + (20_H × m),

RCFDCnCFDCmFDCFGHH: <RCFDCn_base> + 0707_H + (20_H × m)

Value after reset: 0000 0000_H

Table 24.36 RCFDCnCFDCmFDCFG Register Contents

Bit Position	Bit Name	Function
31	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
30	CLOE	Classical CAN only mode enable bit 0: Classical CAN only mode is disabled 1: Classical CAN only mode is enabled
29	REFE	Reception data edge filter enable bit 0: Reception data edge filter is disabled 1: Reception data edge filter is enabled
28	FDOE	FD-only mode enable bit 0: FD-only mode is disabled 1: FD-only mode is enabled
27	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
26	GWBRS	Gateway BRS 0: A frame is transmitted with the BRS bit in the received frame set to 0. 1: A frame is transmitted with the BRS bit in the received frame set to 1.
25	GWFDF	Gateway FDF 0: A frame is transmitted regarding the received frame as a classical CAN frame. 1: A frame is transmitted regarding the received frame as a CAN FD frame.
24	GWEN	CAN-CAN FD Gateway Enable 0: The CAN-CAN FD gateway is disabled. 1: The CAN-CAN FD gateway is enabled.
23	Reserved	This bit is read as the value after reset. The write value should be the value after reset.

Table 24.36 RCFDCnCFDCmFDCFG Register Contents

Bit Position	Bit Name	Function
22 to 16	TDCO[6:0]	Transmitter Delay Compensation Offset These bits are set to the transmitter delay compensation offset value.
15 to 11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10	ESIC	Error State Display Mode Select 0: Always displays the node error state. 1: When the node is not in the error passive state: Displays the message buffer error state. When the node is in the error passive state: Displays the node error state.
9	TDCE	Transmitter Delay Compensation Enable 0: Transmitter delay compensation is disabled. 1: Transmitter delay compensation is enabled.
8	TDCOC	Transmitter Delay Compensation Measurement Select 0: Measurement and offset 1: Only offset
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2 to 0	EOCCFG[2:0]	Error Occurrence Counting Method Select b2 b1 b0 0 0 0: All transmit messages and receive messages 0 0 1: All transmit messages 0 1 0: All receive messages 0 1 1: Setting prohibited 1 0 0: Only data phase of transmitted or received CAN FD message 1 0 1: Only data phase of transmitted CAN FD message 1 1 0: Only data phase of received CAN FD message 1 1 1: Setting prohibited

CLOE Bit

Setting this bit to 1 enables Classical CAN only mode. When data is transmitted, a classical CAN frame will be sent. When a CAN FD frame is received, a form error or a CRC error is detected.

Modify this bit only in channel reset mode.

Do not set RCFDCnCFDCmFDCFG.CLOE and RCFDCnCFDCmFDCFG.FDOE simultaneously.

CLOE Bit	FDOE Bit	Interface Mode
0	0	CAN-FD mode
0	1	FD only mode
1	0	Classical CAN only mode
1	1	Reserved

REFE Bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge. Modify this bit only in channel reset mode.

Setting this bit to 0 when using in Classical CAN only mode.

FDOE Bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CAN FD frame will be sent regardless of the settings to the CFFDF bit in the RCFDCnCFDCFFDCSTSk register or the TMFDF bit in the RCFDCnCFDTMFDCTRp register. When a classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

In case a Classical frame is confiured for transmitting, the FDF bit is sent as recessive, so a FD frame is sent.

If the DLC is configured bigger than 8, the remaining data bytes are padded with CCh.

Do not set RCFDCnCFDCmFDCFG.CLOE and RCFDCnCFDCmFDCFG.FDOE simultaneously.

GWBRS Bit

When the GWEN bit is 1, the BRS bit in a CAN FD frame to be transmitted by the gateway function is set.

When the GWFDF bit is set to 0, write 0 to this bit. Modify this bit only in channel reset mode.

GWFDF Bit

When the GWEN bit is 1, the FDF bit in a CAN FD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RCFDCnCFDCFCCk register set to 10_B (gateway mode).

Setting this bit to 1 enables the CAN-CAN FD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWFDF bit and the GWBRS bit. When the DLC value in the received classical CAN frame is 1001_B or more and the GWFDF bit is set to 1 (CAN FD frame), the DLC value is replaced with 1000_B.

While this bit is set to 1, do not perform routing the following frames by using the gateway function.

- Remote frames

Modify this bit only in channel reset mode.

Table 24.37, Operation when the CAN-CAN FD Gateway is Enabled shows the settings and formats of transmit frame and receive frame while the CAN- CAN FD gateway is enabled.

Table 24.37 Operation when the CAN-CAN FD Gateway is Enabled

Receive Frame			GWFDF Bit	Transmit Frame		
Format	BRS Bit	Received DLC Value		Format	BRS Bit	DLC Value to be Transmitted
Classical CAN	None	DLC ≤ 1000_B	0	Classical CAN	None	Not replaced
		DLC > 1000_B				
CAN FD	Arbitrary	DLC ≤ 1000_B				
		DLC > 1000_B				Replaced with 1000_B
Classical CAN	None	DLC ≤ 1000_B	1	CAN FD	According to GWBRS bit setting	Not replaced
		DLC >1000_B				Replaced with 1000_B
CAN FD	Arbitrary	DLC ≤ 1000_B				Not replaced
		DLC > 1000_B				

TDCO[6:0] Bits

These bits set the SSP offset value. How to use this value depends on the TDCOC bit in the RCFDCnCFDCmFDCFG register.

These bits are based on CAN clock frequency(fCAN).

When the TDCOC bit is set to 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded down to the nearest integer Tq).

When the TDCOC bit is set to 1, the transmitter delay compensation result equals to the TDCO[6:0] value. The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

ESIC Bit

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RCFDCnCFDCFFDCSTSk register or TMESI bit in the RCFDCnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is set to 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode

Table 24.38 ESI Value to Be Transmitted

ESIC Bit	Channel Status	ESI Value to be Transmitted
0	Error active	0 (error active node)
	Error passive	1 (error passive node)
1	Error active	ESI value set in the transmit/receive FIFO buffer or transmit buffer (CFESI bit in the RCFDCnCFDCFFDCSTSk register or TMESI bit in the RCFDCnCFDTMFDCTRp register)
	Error passive	1 (error passive node)

TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

TDCOC Bit

When this bit is set to 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is set to 1, the SSP position is defined only by the SSP offset value. Modify this bit only in channel reset mode or channel halt mode.

EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

24.3.2.7 RCFDCnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 to 7)

Access: RCFDCnCFDCmFDCTR register can be read or written in 32-bit units
RCFDCnCFDCmFDCTRL register can be read or written in 16-bit units
RCFDCnCFDCmFDCTRLL register can be read or written in 8-bit units

Address: RCFDCnCFDCmFDCTR: <RCFDCn_base> + 0708_H + (20_H × m)
RCFDCnCFDCmFDCTRL: <RCFDCn_base> + 0708_H + (20_H × m)
RCFDCnCFDCmFDCTRLL: <RCFDCn_base> + 0708_H + (20_H × m)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.39 RCFDCnCFDCmFDCTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	SOCCLR	Successful Occurrence Counter Clear Setting the SOCCLR bit to 1 clears the successful occurrence counter. This bit is always read as 0.
0	EOCCLR	Error Occurrence Counter Clear Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0.

SOCCLR Bit

Setting this bit to 1 clears the successful occurrence counter (SOC[7:0] bits in the RCFDCnCFDCmFDSTS register). This bit is automatically cleared to 0.

EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RCFDCnCFDCmFDSTS register). This bit is automatically cleared to 0.

24.3.2.8 RCFDCnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 7)

Access: RCFDCnCFDCmFDSTS register can be read or written in 32-bit units
RCFDCnCFDCmFDSTSL register can be read or written in 16-bit units
RCFDCnCFDCmFDSTSH register is a read-only register that can be read in 16-bit units
RCFDCnCFDCmFDSTSLL, RCFDCnCFDCmFDSTSLH registers can be read or written in 8-bit units
RCFDCnCFDCmFDSTSHL, RCFDCnCFDCmFDSTSHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDCmFDSTS: <RCFDCn_base> + 070C$_H$ + (20$_H$ × m)
RCFDCnCFDCmFDSTSL: <RCFDCn_base> + 070C$_H$ + (20$_H$ × m),
RCFDCnCFDCmFDSTSH: <RCFDCn_base> + 070E$_H$ + (20$_H$ × m)
RCFDCnCFDCmFDSTSLL: <RCFDCn_base> + 070C$_H$ + (20$_H$ × m),
RCFDCnCFDCmFDSTSLH: <RCFDCn_base> + 070D$_H$ + (20$_H$ × m),
RCFDCnCFDCmFDSTSHL: <RCFDCn_base> + 070E$_H$ + (20$_H$ × m),
RCFDCnCFDCmFDSTSHH: <RCFDCn_base> + 070F$_H$ + (20$_H$ × m)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SOC[7:0]								EOC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SOCO	EOCO	TDCVF	TDCR[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W^{*1}	R/W^{*1}	R/W^{*1}	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.40 RCFDCnCFDCmFDSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	SOC[7:0]	Successful Occurrence Counter The successful occurrence counter value can be read.
23 to 16	EOC[7:0]	Error Occurrence Counter The error occurrence counter value can be read.
15 to 10	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
9	SOCO	Successful Occurrence Counter Overflow Flag 0: The successful occurrence counter does not overflow. 1: The successful occurrence counter has overflowed.
8	EOCO	Error Occurrence Counter Overflow Flag 0: The error occurrence counter does not overflow. 1: The error occurrence counter has overflowed.
7	TDCVF	Transmitter Delay Compensation Violation Flag 0: No transmitter delay compensation violation is present. 1: A transmitter delay compensation violation is present.
6 to 0	TDCR[6:0]	Transmitter Delay Compensation Result Status The transmitter delay compensation result can be read.

SOC[7:0] Bits

These bits show the successful occurrence counter value. The successful occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches FF_H. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RCFDCnCFDCmFDCTR register. These bits are set to 0 in channel reset mode.

EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RCFDCnCFDCmFDCFG register. This counter stops counting when it reaches FF_H.

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RCFDCnCFDCmFDCTR register. These bits are set to 0 in channel reset mode.

SOCO Flag

This bit indicates that successful occurrence counter overflow has occurred.

This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached FF_H. This flag is set to 0 in channel reset mode.

EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.

This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RCFDCnCFDCmFDCFG register when the EOC[7:0] value has reached FF_H. This flag is set to 0 in channel reset mode.

TDCVF Flag

This bit indicates violation of transmitter delay compensation.

The transmit data is compared with the reception CAN bus level delayed due to the transceiver’s loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CANm bit times - 2 fCAN (CANm bit time is the value of data bit rate). This flag is set to 0 in channel reset mode.

TDCR[6:0] Flags

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).

This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RCFDCnCFDCmFDCFG register.

These flags are updated at a falling edge between the FDF bit and res bit when the TDCE bit in the RCFDCnCFDCmFDCFG register is set to 1(transmitter delay compensation enable) and also the TDCOC bit in the RCFDCnCFDCmFDCFG register is set to 0(measurement and offset).

This flag is set to 0 in channel reset mode.

24.3.2.9 RCFDCnCFDCmFDCRC — Channel CAN FD CRC Register (m = 0 to 7)

Access: RCFDCnCFDCmFDCRC register is a read-only register that can be read in 32-bit units

RCFDCnCFDCmFDCRCL, RCFDCnCFDCmFDCRCH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDCmFDCRCLL, RCFDCnCFDCmFDCRCLH, RCFDCnCFDCmFDCRCHL, RCFDCnCFDCmFDCRCHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDCmFDCRC: <RCFDCn_base> + 0710_H + (20_H × m)

RCFDCnCFDCmFDCRCL: <RCFDCn_base> + 0710_H + (20_H × m),

RCFDCnCFDCmFDCRCH: <RCFDCn_base> + 0712_H + (20_H × m)

RCFDCnCFDCmFDCRCLL: <RCFDCn_base> + 0710_H + (20_H × m),

RCFDCnCFDCmFDCRCLH: <RCFDCn_base> + 0711_H + (20_H × m),

RCFDCnCFDCmFDCRCHL: <RCFDCn_base> + 0712_H + (20_H × m),

RCFDCnCFDCmFDCRCHH: <RCFDCn_base> + 0713_H + (20_H × m)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	SCNT[3:0]				—	—	—	CRCREG[20:16]

	CRCREG[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.41 RCFDCnCFDCmFDCRC Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	These bits are read as the value after reset.
27 to 24	SCNT[3:0]	Stuff count bit Indicate a value of the stuff count in a CAN FD frame. Bits 25 to 27 indicates the Gray-coded value of the stuff bit count modulo 8 in the transmitted/received frames. Bit 24 indicates an even parity value of bits 25 to 27.
23 to 21	Reserved	These bits are read as the value after reset.
20 to 0	CRCREG[20:0]	CRC Calculation Data (CRC Length:17 Bit or 21 Bit) These bits show the CRC value calculated based on the transmit message or receive message. When the CRC length is 17 bits, bits b20 to b17 are read as 0.

SCNT[3:0] Flags

When the CTME bit in the RCFDCnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CAN FD frame can be read if a message transmitted/received is a CAN FD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. These flags are updated at the first bit in the CRC field of the CAN FD frame. These bits are cleared to 0 in channel reset mode.

CRCREG[20:0] Flags

When the CTME bit in the RCFDCnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CAN FD frame (CRC length = 17 or 21 bits), these flags are updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received the CRCREG[14:0] value in the RCFDCnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0.

These bits are cleared to 0 in channel reset mode.

24.3.3 Details of Global-related Registers

24.3.3.1 RCFDCnCFDGCFG — Global Configuration Register

Access: RCFDCnCFDGCFG register can be read or written in 32-bit units

RCFDCnCFDGCFGL, RCFDCnCFDGCFGH registers can be read or written in 16-bit units

RCFDCnCFDGCFGLL, RCFDCnCFDGCFGLH, RCFDCnCFDGCFGHL, RCFDCnCFDGCFGHH registers can be read or written in 8-bit units

Address: RCFDCnCFDGCFG: <RCFDCn_base> + 0084_H

RCFDCnCFDGCFGL: <RCFDCn_base> + 0084_H,

RCFDCnCFDGCFGH: <RCFDCn_base> + 0086_H

Table 24.42 RCFDCnCFDGCFG Register Contents

Bit Position	Bit Name	Function
11 to 8	TSP[3:0]	Timestamp Clock Source Division b11 b10 b9 b8 0 0 0 0: Not divided 0 0 0 1: Divided by 2 0 0 1 0: Divided by 4 0 0 1 1: Divided by 8 0 1 0 0: Divided by 16 0 1 0 1: Divided by 32 0 1 1 0: Divided by 64 0 1 1 1: Divided by 128 1 0 0 0: Divided by 256 1 0 0 1: Divided by 512 1 0 1 0: Divided by 1024 1 0 1 1: Divided by 2048 1 1 0 0: Divided by 4096 1 1 0 1: Divided by 8192 1 1 1 0: Divided by 16384 1 1 1 1: Divided by 32768
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	CMPOC	Payload Overflow Mode Select 0: No message is stored. 1: Messages are stored and payloads exceeding the buffer size are discarded.
4	DCS	CAN Clock Source Select[*2] 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Note 2. For the CAN clock frequency settings, see **Table 24.16, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM**.

Modify the RCFDCnCFDGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 24.7.3.1, Interval Transmission Function**.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CAN FD frames.

TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.

When this bit is 0, the received message in which the payload overflows is not stored in the buffer.

When this bit is 1, the received message in which the payload overflows is stored in the buffer, and depending on the DRE bit the received DLC value or the DLC value of the receive rule is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.

The buffer's payload storage size is set by the following bits.

- Receive buffer: RMPLS[2:0] bits in the RCFDCnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RCFDCnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RCFDCnCFDCFCCk register

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN). For the CAN clock frequency settings, see **Table 24.16, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM**.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte that exceeds the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RCFDCnCFDGAFLP0_j register to 0000_B before clearing the DCE bit in the RCFDCnCFDGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the transmit buffer with the smallest number has the highest priority.

When using the transmit queue, this bit should be set to 0.

24.3.3.2 RCFDCnCFDGCTR — Global Control Register

Access: RCFDCnCFDGCTR register can be read or written in 32-bit units

RCFDCnCFDGCTRL, RCFDCnCFDGCTRH registers can be read or written in 16-bit units

RCFDCnCFDGCTRLL, RCFDCnCFDGCTRLH, RCFDCnCFDGCTRHL registers can be read or written in 8-bit units

Address: RCFDCnCFDGCTR: <RCFDCn_base> + 0088$_H$

RCFDCnCFDGCTRL: <RCFDCn_base> + 0088$_H$,

RCFDCnCFDGCTRH: <RCFDCn_base> + 008A$_H$

RCFDCnCFDGCTRLL: <RCFDCn_base> + 0088$_H$,

RCFDCnCFDGCTRLH: <RCFDCn_base> + 0089$_H$,

RCFDCnCFDGCTRHL: <RCFDCn_base> + 008A$_H$

Value after reset: 0000 0005$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSRST

Table 24.43 RCFDCnCFDGCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 12	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
11	CMPOFIE	Payload Overflow Interrupt Enable 0: A payload overflow interrupt is disabled. 1: A payload overflow interrupt is enabled.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode

Table 24.43 RCFDCnCFDGCTR Register Contents

Bit Position	Bit Name	Function
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RCFDCnCFDGTSC register is cleared to 0000_H.

CMPOFIE Bit

When the CMPOF flag in the RCFDCnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request occurs. Modify this bit only in global reset mode.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RCFDCnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RCFDCnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RCFDCnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RS-CANFD module into global stop mode.

Clearing this bit to 0 makes the RS-CANFD module leave from global stop mode. This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 24.5.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module in global stop mode.

24.3.3.3 RCFDCnCFDGSTS — Global Status Register

Access: RCFDCnCFDGSTS register is a read-only register that can be read in 32-bit units
RCFDCnCFDGSTSL register is a read-only register that can be read in 16-bit units
RCFDCnCFDGSTSLL register is a read-only register that can be read in 8-bit units

Address: RCFDCnCFDGSTS: <RCFDCn_base> + 008C$_H$
RCFDCnCFDGSTSL: <RCFDCn_base> + 008C$_H$
RCFDCnCFDGSTSLL: <RCFDCn_base> + 008C$_H$

Value after reset: 0000 000D$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	GRAMINIT	GSLPSTS	GHLTSTS	GRSTSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.44 RCFDCnCFDGSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

24.3.3.4 RCFDCnCFDGERFL — Global Error Flag Register

Access: RCFDCnCFDGERFL register can be read or written in 32-bit units
RCFDCnCFDGERFLL, RCFDCnCFDGERFLH registers can be read or written in 16-bit units
RCFDCnCFDGERFLLL, RCFDCnCFDGERFLHL registers can be read or written in 8-bit units

Address: RCFDCnCFDGERFL: <RCFDCn_base> + 0090$_H$
RCFDCnCFDGERFLL: <RCFDCn_base> + 0090$_H$,
RCFDCnCFDGERFLH: <RCFDCn_base> + 0092$_H$
RCFDCnCFDGERFLLL: <RCFDCn_base> + 0090$_H$,
RCFDCnCFDGERFLHL: <RCFDCn_base> + 0092$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	EEF7	EEF6	EEF5	EEF4	EEF3	EEF2	EEF1	EEF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CMPOF	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.45 RCFDCnCFDGERFL Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
23	EEF7	ECC Error Flag for Channel 7 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
22	EEF6	ECC Error Flag for Channel 6 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
21	EEF5	ECC Error Flag for Channel 5 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
20	EEF4	ECC Error Flag for Channel 4 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
19	EEF3	ECC Error Flag for Channel 3 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
18	EEF2	ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
17	EEF1	ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority

Table 24.45 RCFDCnCFDGERFL Register Contents

Bit Position	Bit Name	Function
16	EEF0	ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
15 to 4	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset.
3	CMPOF	Payload Overflow Flag 0: No payload overflow has occurred. 1: A payload overflow has occurred.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RCFDCnCFDGERFL register are cleared to 0 in global reset mode.

EEFm Flag

When a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 7), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

CMPOF Flag

When a payload overflow occurs in any of channel m (m = 0 to 7), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RCFDCnCFDTHLSTSm register (m = 0 to 7) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RCFDCnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RCFDCnCFDCFSTSk register (k = 0 to 17) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

NOTE

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

24.3.3.5 RCFDCnCFDGTSC — Global Timestamp Counter Register

Access:	RCFDCnCFDGTSC register is a read-only register that can be read in 32-bit units. RCFDCnCFDGTSCL register is a read-only register that can be read in 16-bit units.
Address:	RCFDCnCFDGTSC: <RCFDCn_base> + 0094_H RCFDCnCFDGTSCL: <RCFDCn_base> + 0094_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.46 RCFDCnCFDGTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RCFDCnCFDGCFG register is 0 (pclk):

  The timestamp counter starts counting when the RS-CANFD module has transitioned to global operating mode.

  This counter stops counting when the RS-CANFD module has transitioned to global stop mode or global test mode.

- When the TSSS bit is 1 (CANm nominal bit time clock):

  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.

  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

24.3.3.6 RCFDCnCFDGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RCFDCnCFDGTINTSTS0 register is a read-only register that can be read in 32-bit units

RCFDCnCFDGTINTSTS0L, RCFDCnCFDGTINTSTS0H registers are read-only registers that can be read in 16-bit units

RCFDCnCFDGTINTSTS0LL, RCFDCnCFDGTINTSTS0LH, RCFDCnCFDGTINTSTS0HL, RCFDCnCFDGTINTSTS0HH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDGTINTSTS0: <RCFDCn_base> + 0610_H
RCFDCnCFDGTINTSTS0L: <RCFDCn_base> + 0610_H,
RCFDCnCFDGTINTSTS0H: <RCFDCn_base> + 0612_H
RCFDCnCFDGTINTSTS0LL: <RCFDCn_base> + 0610_H,
RCFDCnCFDGTINTSTS0LH: <RCFDCn_base> + 0611_H,
RCFDCnCFDGTINTSTS0HL: <RCFDCn_base> + 0612_H,
RCFDCnCFDGTINTSTS0HH: <RCFDCn_base> + 0613_H

Value after reset: $0000\ 0000_H$

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 24.47 RCFDCnCFDGTINTSTS0 Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	These bits are read as the value after reset.
28	THIF3	Channel 3 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
27	CFTIF3	Channel 3 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
26	TQIF3	Channel 3 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
25	TAIF3	Channel 3 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested
24	TSIF3	Channel 3 Transmit Buffer Transmit Complete Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
23 to 21	Reserved	These bits are read as the value after reset.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.

Table 24.47 RCFDCnCFDGTINTSTS0 Register Contents

Bit Position	Bit Name	Function
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	These bits are read as the value after reset.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RCFDCnCFDTMIECm register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the corresponding RCFDCnCFDTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RCFDCnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RCFDCnCFDTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQTXIE bit in the RCFDCnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQTXIF bit in the RCFDCnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQTXIF bit (transmit queue interrupt request) in the RCFDCnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQTXIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RCFDCnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RCFDCnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RCFDCnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RCFDCnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RCFDCnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

24.3.3.7 RCFDCnCFDGTINTSTS1 — Global TX Interrupt Status Register 1

Access: RCFDCnCFDGTINTSTS1 register is a read-only register that can be read in 32-bit units

RCFDCnCFDGTINTSTS1L, RCFDCnCFDGTINTSTS1H registers are read-only registers that can be read in 16-bit units

RCFDCnCFDGTINTSTS1LL, RCFDCnCFDGTINTSTS1LH, RCFDCnCFDGTINTSTS1HL, RCFDCnCFDGTINTSTS1HH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDGTINTSTS1: <RCFDCn_base> + 0614$_H$
RCFDCnCFDGTINTSTS1L: <RCFDCn_base> + 0614$_H$,
RCFDCnCFDGTINTSTS1H: <RCFDCn_base> + 0616$_H$
RCFDCnCFDGTINTSTS1LL: <RCFDCn_base> + 0614$_H$,
RCFDCnCFDGTINTSTS1LH: <RCFDCn_base> + 0615$_H$,
RCFDCnCFDGTINTSTS1HL: <RCFDCn_base> + 0616$_H$,
RCFDCnCFDGTINTSTS1HH: <RCFDCn_base> + 0617$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 24.48 RCFDCnCFDGTINTSTS1 Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	These bits are read as the value after reset.
28	THIF7	Channel 7 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
27	CFTIF7	Channel 7 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
26	TQIF7	Channel 7 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
25	TAIF7	Channel 7 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
24	TSIF7	Channel 7 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested
23 to 21	Reserved	These bits are read as the value after reset.
20	THIF6	Channel 6 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.

Table 24.48 RCFDCnCFDGTINTSTS1 Register Contents

Bit Position	Bit Name	Function
19	CFTIF6	Channel 6 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF6	Channel 6 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF6	Channel 6 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF6	Channel 6 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested
15 to 13	Reserved	These bits are read as the value after reset.
12	THIF5	Channel 5 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF5	Channel 5 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF5	Channel 5 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF5	Channel 5 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF5	Channel 5 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF4	Channel 4 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF4	Channel 4 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF4	Channel 4 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF4	Channel 4 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF4	Channel 4 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RCFDCnCFDTMIECm register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the corresponding RCFDCnCFDTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RCFDCnCFDCmCTR register is set to 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RCFDCnCFDTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQTXIE bit in the RCFDCnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQTXIF bit in the RCFDCnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQTXIF bit (transmit queue interrupt request) in the RCFDCnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. Clearing the TXQTXIE bit to 0 also clears this flag to 0.

CFTIFm Bits

When the CFTXIE bit in the RCFDCnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RCFDCnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RCFDCnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RCFDCnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RCFDCnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

24.3.3.8 RCFDCnCFDGFDCFG — Global FD Configuration Register

Access: RCFDCnCFDGFDCFG register can be read or written in 32-bit units
RCFDCnCFDGFDCFGL register can be read or written in 16-bit units
RCFDCnCFDGFDCFGLL, RCFDCnCFDGFDCFGLH registers can be read or written in 8-bit units

Address: RCFDCnCFDGFDCFG: <RCFDCn_base> + 0624_H
RCFDCnCFDGFDCFGL: <RCFDCn_base> + 0624_H
RCFDCnCFDGFDCFGLL: <RCFDCn_base> + 0624_H,
RCFDCnCFDGFDCFGLH: <RCFDCn_base> + 0625_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSCCFG[1:0]		—	—	—	—	—	—	—	RPED
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Table 24.49 RCFDCnCFDGFDCFG register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9, 8	TSCCFG[1:0]	Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Captured at a sample point of the res bit.*1 1 1: Setting prohibited.
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RPED	Protocol exception event detection disabled bit 0: Protocol exception event detection is enabled 1: Protocol exception event detection is disabled

Note 1. When a classical CAN frame is transmitted/received, a time-stamp value will be captured at the sample point in the SOF bit.

TSCCFG bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

RPED bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame will be output. Modify this bit only in global reset mode.

24.3.4 Details of Receive Rule-related Registers

24.3.4.1 RCFDCnCFDGAFLECTR — Receive Rule Entry Control Register

Access:	RCFDCnCFDGAFLECTR register can be read or written in 32-bit units RCFDCnCFDGAFLECTRL register can be read or written in 16-bit units RCFDCnCFDGAFLECTRLL, RCFDCnCFDGAFLECTRLH registers can be read or written in 8-bit units
Address:	RCFDCnCFDGAFLECTR: <RCFDCn_base> + 0098_H RCFDCnCFDGAFLECTRL: <RCFDCn_base> + 0098_H RCFDCnCFDGAFLECTRLL: <RCFDCn_base> + 0098_H, RCFDCnCFDGAFLECTRLH: <RCFDCn_base> + 0099_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.50 RCFDCnCFDGAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7, 6	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
5 to 0	AFLPN[5:0]	Receive Rule Table Page Number Configuration A page number can be selected in the range of page 0 (000000_B) to page 63 (111111_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[5:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 000000_B to 111111_B.

For details about the receive rule table, see **Section 24.6.1, Data Processing Using the Receive Rule Table**.

24.3.4.2 RCFDCnCFDGAFLCFG0 — Receive Rule Configuration Register 0

Access: RCFDCnCFDGAFLCFG0 register can be read or written in 32-bit units

RCFDCnCFDGAFLCFG0L, RCFDCnCFDGAFLCFG0H registers can be read or written in 16-bit units

RCFDCnCFDGAFLCFG0LL, RCFDCnCFDGAFLCFG0LH, RCFDCnCFDGAFLCFG0HL, RCFDCnCFDGAFLCFG0HH registers can be read or written in 8-bit units

Address: RCFDCnCFDGAFLCFG0: <RCFDCn_base> + 009C$_H$
RCFDCnCFDGAFLCFG0L: <RCFDCn_base> + 009C$_H$,
RCFDCnCFDGAFLCFG0H: <RCFDCn_base> + 009E$_H$
RCFDCnCFDGAFLCFG0LL: <RCFDCn_base> + 009C$_H$,
RCFDCnCFDGAFLCFG0LH: <RCFDCn_base> + 009D$_H$,
RCFDCnCFDGAFLCFG0HL: <RCFDCn_base> + 009E$_H$,
RCFDCnCFDGAFLCFG0HH: <RCFDCn_base> + 009F$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RNC0[7:0]								RNC1[7:0]

Table 24.51 RCFDCnCFDGAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules exclusively used for channel 2.
7 to 0	RNC3[7:0]	Number of Rules for Channel 3 Set the number of receive rules exclusively used for channel 3.

Modify the RCFDCnCFDGAFLCFG0 register only in global reset mode.

Up to 128 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 255.
- The total number of rules allocated to each channel does not exceed the number of rules that can be registered for the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table. Set these bits to a value within the range of 00$_H$ to FF$_H$.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table. Set these bits to a value within the range of 00_H to FF_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table. Set these bits to a value within the range of 00_H to FF_H.

RNC3[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 3 receive rule table. Set these bits to a value within the range of 00_H to FF_H.

24.3.4.3 RCFDCnCFDGAFLCFG1 — Receive Rule Configuration Register 1

Access: RCFDCnCFDGAFLCFG1 register can be read or written in 32-bit units

RCFDCnCFDGAFLCFG1L, RCFDCnCFDGAFLCFG1H registers can be read or written in 16-bit units

RCFDCnCFDGAFLCFG1LL, RCFDCnCFDGAFLCFG1LH, RCFDCnCFDGAFLCFG1HL, RCFDCnCFDGAFLCFG1HH registers can be read or written in 8-bit units

Address: RCFDCnCFDGAFLCFG1: <RCFDCn_base> + 00A0$_H$

RCFDCnCFDGAFLCFG1L: <RCFDCn_base> + 00A0$_H$,

RCFDCnCFDGAFLCFG1H: <RCFDCn_base> + 00A2$_H$

RCFDCnCFDGAFLCFG1LL: <RCFDCn_base> + 00A0$_H$,

RCFDCnCFDGAFLCFG1LH: <RCFDCn_base> + 00A1$_H$,

RCFDCnCFDGAFLCFG1HL: <RCFDCn_base> + 00A2$_H$,

RCFDCnCFDGAFLCFG1HH: <RCFDCn_base> + 00A3$_H$

Value after reset: 0000 0000$_H$

Table 24.52 RCFDCnCFDGAFLCFG1 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC4[7:0]	Number of Rules for Channel 4 Set the number of receive rules exclusively used for channel 4.
23 to 16	RNC5[7:0]	Number of Rules for Channel 5 Set the number of receive rules exclusively used for channel 5.
15 to 8	RNC6[7:0]	Number of Rules for Channel 6 Set the number of receive rules exclusively used for channel 6.
7 to 0	RNC7[7:0]	Number of Rules for Channel 7 Set the number of receive rules exclusively used for channel 7.

Modify the RCFDCnCFDGAFLCFG1 register only in global reset mode.

Up to 128 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 255.
- The total number of rules allocated to each channel does not exceed the number of rules that can be registered for the entire unit.

RNC4[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 4 receive rule table. Set these bits to a value within the range of 00$_H$ to FF$_H$.

RNC5[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 5 receive rule table. Set these bits to a value within the range of 00_H to FF_H.

RNC6[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 6 receive rule table. Set these bits to a value within the range of 00_H to FF_H.

RNC7[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 7 receive rule table. Set these bits to a value within the range of 00_H to FF_H.

24.3.4.4 RCFDCnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access: RCFDCnCFDGAFLIDj register can be read or written in 32-bit units

RCFDCnCFDGAFLIDjL, RCFDCnCFDGAFLIDjH registers can be read or written in 16-bit units

RCFDCnCFDGAFLIDjLL, RCFDCnCFDGAFLIDjLH, RCFDCnCFDGAFLIDjHL, RCFDCnCFDGAFLIDjHH registers can be read or written in 8-bit units

Address: RCFDCnCFDGAFLIDj: <RCFDCn_base> + 1000_H + (10_H × j)

RCFDCnCFDGAFLIDjL: <RCFDCn_base> + 1000_H + (10_H × j),

RCFDCnCFDGAFLIDjH: <RCFDCn_base> + 1002_H + (10_H × j)

RCFDCnCFDGAFLIDjLL: <RCFDCn_base> + 1000_H + (10_H × j),

RCFDCnCFDGAFLIDjLH: <RCFDCn_base> + 1001_H + (10_H × j),

RCFDCnCFDGAFLIDjHL: <RCFDCn_base> + 1002_H + (10_H × j),

RCFDCnCFDGAFLIDjHH: <RCFDCn_base> + 1003_H + (10_H × j)

Value after reset: 0000 0000_H

Table 24.53 RCFDCnCFDGAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RCFDCnCFDGAFLIDj register when the AFLDAE bit in the RCFDCnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

24.3.4.5 RCFDCnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access: RCFDCnCFDGAFLMj register can be read or written in 32-bit units

RCFDCnCFDGAFLMjL, RCFDCnCFDGAFLMjH registers can be read or written in 16-bit units

RCFDCnCFDGAFLMjLL, RCFDCnCFDGAFLMjLH, RCFDCnCFDGAFLMjHL, RCFDCnCFDGAFLMjHH registers can be read or written in 8-bit units

Address: RCFDCnCFDGAFLMj: <RCFDCn_base> + 1004_H + (10_H × j)

RCFDCnCFDGAFLMjL: <RCFDCn_base> + 1004_H + (10_H × j),

RCFDCnCFDGAFLMjH: <RCFDCn_base> + 1006_H + (10_H × j)

RCFDCnCFDGAFLMjLL: <RCFDCn_base> + 1004_H + (10_H × j),

RCFDCnCFDGAFLMjLH: <RCFDCn_base> + 1005_H + (10_H × j),

RCFDCnCFDGAFLMjHL: <RCFDCn_base> + 1006_H + (10_H × j),

RCFDCnCFDGAFLMjHH: <RCFDCn_base> + 1007_H + (10_H × j)

Value after reset: 0000 0000_H

Table 24.54 RCFDCnCFDGAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared.
29	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RCFDCnCFDGAFLMj register when the AFLDAE bit in the RCFDCnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RCFDCnCFDGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set all the GAFLIDM[28:0] bits to 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

24.3.4.6 RCFDCnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RCFDCnCFDGAFLP0_j register can be read or written in 32-bit units

RCFDCnCFDGAFLP0_jL, RCFDCnCFDGAFLP0_jH registers can be read or written in 16-bit units

RCFDCnCFDGAFLP0_jLL, RCFDCnCFDGAFLP0_jLH, RCFDCnCFDGAFLP0_jHL, RCFDCnCFDGAFLP0_jHH registers can be read or written in 8-bit units

Address: RCFDCnCFDGAFLP0_j: <RCFDCn_base> + 1008_H + $(10_H \times j)$

RCFDCnCFDGAFLP0_jL: <RCFDCn_base> + 1008_H + $(10_H \times j)$,

RCFDCnCFDGAFLP0_jH: <RCFDCn_base> + $100A_H$ + $(10_H \times j)$

RCFDCnCFDGAFLP0_jLL: <RCFDCn_base> + 1008_H + $(10_H \times j)$,

RCFDCnCFDGAFLP0_jLH: <RCFDCn_base> + 1009_H + $(10_H \times j)$,

RCFDCnCFDGAFLP0_jHL: <RCFDCn_base> + $100A_H$ + $(10_H \times j)$,

RCFDCnCFDGAFLP0_jHH: <RCFDCn_base> + $100B_H$ + $(10_H \times j)$

1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

Modify the RCFDCnCFDGAFLP0_j register when the AFLDAE bit in the RCFDCnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLPTR[15:0] Bits

These bits are used to set a 16-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the setting value by the NRXMB[7:0] bits in the RCFDCnCFDRMNB register.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

24.3.4.7 RCFDCnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15)

Access: RCFDCnCFDGAFLP1_j register can be read or written in 32-bit units

RCFDCnCFDGAFLP1_jL, RCFDCnCFDGAFLP1_jH registers can be read or written in 16-bit units

RCFDCnCFDGAFLP1_jLL, RCFDCnCFDGAFLP1_jLH, RCFDCnCFDGAFLP1_jHL, RCFDCnCFDGAFLP1_jHH registers can be read or written in 8-bit units

Address:
RCFDCnCFDGAFLP1_j: <RCFDCn_base> + $100C_H$ + (10_H × j)
RCFDCnCFDGAFLP1_jL: <RCFDCn_base> +$100C_H$ + (10_H × j),
RCFDCnCFDGAFLP1_jH: <RCFDCn_base> + $100E_H$ + (10_H × j)
RCFDCnCFDGAFLP1_jLL: <RCFDCn_base> + $100C_H$ + (10_H × j),
RCFDCnCFDGAFLP1_jLH: <RCFDCn_base> + $100D_H$ + (10_H × j),
RCFDCnCFDGAFLP1_jHL: <RCFDCn_base> + $100E_H$ + (10_H × j),
RCFDCnCFDGAFLP1_jHH: <RCFDCn_base> + $100F_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Table 24.56 RCFDCnCFDGAFLP1_j Register Contents

Bit Position	Bit Name	Function
31 to 8	GAFLFDP[31:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RCFDCnCFDGAFLP1_j register when the AFLDAE bit in the RCFDCnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[31:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RCFDCnCFDGAFLP0_j register is set to 1 (messages are stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RCFDCnCFDCFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) can be selected.

24.3.5 Details of Receive Buffer-related Registers

24.3.5.1 RCFDCnCFDRMNB — Receive Buffer Number Register

Access: RCFDCnCFDRMNB register can be read or written in 32-bit units

RCFDCnCFDRMNBL register can be read or written in 16-bit units

RCFDCnCFDRMNBLL, RCFDCnCFDRMNBLH registers can be read or written in 8-bit units

Address: RCFDCnCFDRMNB: <RCFDCn_base> + 00A4$_\text{H}$

RCFDCnCFDRMNBL: <RCFDCn_base> + 00A4$_\text{H}$

RCFDCnCFDRMNBLL: <RCFDCn_base> + 00A4$_\text{H}$,

RCFDCnCFDRMNBLH: <RCFDCn_base> + 00A5$_\text{H}$

Value after reset: 0000 0000$_\text{H}$

Table 24.57 RCFDCnCFDRMNB Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10 to 8	RMPLS[2:0]	Receive Buffer Payload Storage Size Select b10 b9 b8 0 0 0: 8byte 0 0 1: 12byte 0 1 0: 16byte 0 1 1: 20byte 1 0 0: 24byte 1 0 1: 32byte 1 1 0: 48byte 1 1 1: 64byte
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 128.

Modify the RCFDCnCFDRMNB register only in global reset mode.

RMPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

24.3.5.2 RCFDCnCFDRMNDy — Receive Buffer New Data Register (y = 0 to 3)

Access:	RCFDCnCFDRMNDy register can be read or written in 32-bit units RCFDCnCFDRMNDyL, RCFDCnCFDRMNDyH registers can be read or written in 16-bit units RCFDCnCFDRMNDyLL, RCFDCnCFDRMNDyLH, RCFDCnCFDRMNDyHL, RCFDCnCFDRMNDyHH registers can be read or written in 8-bit units
Address:	RCFDCnCFDRMNDy: <RCFDCn_base> + $00A8_H$ + (04_H × y) RCFDCnCFDRMNDyL: <RCFDCn_base> + $00A8_H$ + (04_H × y), RCFDCnCFDRMNDyH: <RCFDCn_base> + $00AA_H$ + (04_H × y) RCFDCnCFDRMNDyLL: <RCFDCn_base> + $00A8_H$ + (04_H × y), RCFDCnCFDRMNDyLH: <RCFDCn_base> + $00A9_H$ + (04_H × y), RCFDCnCFDRMNDyHL: <RCFDCn_base> + $00AA_H$ + (04_H × y), RCFDCnCFDRMNDyHH: <RCFDCn_base> + $00AB_H$ + (04_H × y)

Table 24.58 RCFDCnCFDRMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RCFDCnCFDRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 127)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[2:0] value in the RCFDCnCFDRMNB register is 000_B (8 bytes), the message storing time is 12 pclk clock cycles.

When the RMPLS[2:0] value is 111_B (64 bytes), the message storing time is 40 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size). These flags are cleared to 0 in global reset mode.

24.3.5.3 RCFDCnCFDRMIDq — Receive Buffer ID Register (q = 0 to 127)

Access: RCFDCnCFDRMIDq register is a read-only register that can be read in 32-bit units

RCFDCnCFDRMIDqL, RCFDCnCFDRMIDqH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRMIDqLL, RCFDCnCFDRMIDqLH, RCFDCnCFDRMIDqHL, RCFDCnCFDRMIDqHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDRMIDq: <RCFDCn_base> + 2000_H + (80_H × q)

RCFDCnCFDRMIDqL: <RCFDCn_base> + 2000_H + (80_H × q),

Table 24.59 RCFDCnCFDRMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR/RRS ● When the received message is a classical CAN frame 0: Data frame 1: Remote frame ● When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	Reserved	This bit is read as the value after reset.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

24.3.5.4 RCFDCnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 127)

Access: RCFDCnCFDRMPTRq register is a read-only register that can be read in 32-bit units

RCFDCnCFDRMPTRqL, RCFDCnCFDRMPTRqH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRMPTRqLL, RCFDCnCFDRMPTRqLH, RCFDCnCFDRMPTRqHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDRMPTRq: <RCFDCn_base> + 2004$_H$ + (80$_H$ × q)
RCFDCnCFDRMPTRqL: <RCFDCn_base> + 2004$_H$ + (80$_H$ × q),
RCFDCnCFDRMPTRqH: <RCFDCn_base> + 2006$_H$ + (80$_H$ × q)
RCFDCnCFDRMPTRqLL: <RCFDCn_base> + 2004$_H$ + (80$_H$ × q),

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[2:0] bits in the RCFDCnCFDRMNB register.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

24.3.5.5 RCFDCnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 127)

Access: RCFDCnCFDRMFDSTSq register is a read-only register that can be read in 32-bit units

RCFDCnCFDRMFDSTSqL, RCFDCnCFDRMFDSTSqH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRMFDSTSqLL, RCFDCnCFDRMFDSTSqHL, RCFDCnCFDRMFDSTSqHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDRMFDSTSq: <RCFDCn_base> + 2008_H + (80_H × q)
RCFDCnCFDRMFDSTSqL: <RCFDCn_base> + 2008_H + (80_H × q),

0	RMESI	ESI 0: Error active node 1: Error passive node

RMPTR[15:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive buffer.

RMBRS Bit

When the RMFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is set to 0, this bit is always read as 0.

RMESI Bit

When the RMFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is set to 0, this bit is always read as 0.

24.3.5.6 RCFDCnCFDRMDFb_q — Receive Buffer Data Field Register (b = 0 to 15, q = 0 to 127)

Access: RCFDCnCFDRMDFb_q register is a read-only register that can be read in 32-bit units

RCFDCnCFDRMDFb_qL, RCFDCnCFDRMDFb_qH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRMDFb_qLL, RCFDCnCFDRMDFb_qLH, RCFDCnCFDRMDFb_qHL, RCFDCnCFDRMDFb_qHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDRMDFb_q: <RCFDCn_base> + 200C$_H$ + (04$_H$ × b) + (80$_H$ × q)
RCFDCnCFDRMDFb_qL: <RCFDCn_base> + 200C$_H$ + (04$_H$ × b) + (80$_H$ × q),
RCFDCnCFDRMDFb_qH: <RCFDCn_base> + 200E$_H$ + (04$_H$ × b) + (80$_H$ × q)
RCFDCnCFDRMDFb_qLL: <RCFDCn_base> + 200C$_H$ + (04$_H$ × b) + (80$_H$ × q),
RCFDCnCFDRMDFb_qLH: <RCFDCn_base> + 200D$_H$ + (04$_H$ × b) + (80$_H$ × q),
RCFDCnCFDRMDFb_qHL: <RCFDCn_base> + 200E$_H$ + (04$_H$ × b) + (80$_H$ × q),
RCFDCnCFDRMDFb_qHH: <RCFDCn_base> + 200F$_H$ + (04$_H$ × b) + (80$_H$ × q)

Value after reset: 0000 0000$_H$

Table 24.62 RCFDCnCFDRMDFb_q Register Contents

Bit Position	Bit Name	Function
31 to 24	RMDB4 × b + 3 [7:0]	Receive Buffer Data Byte 4 × b + 3 Receive Buffer Data Byte 4 × b + 2 Receive Buffer Data Byte 4 × b + 1 Receive Buffer Data Byte 4 × b + 0 Data for a message stored in the receive buffer can be read.
23 to 16	RMDB4 × b + 2 [7:0]	
15 to 8	RMDB4 × b + 1 [7:0]	
7 to 0	RMDB4 × b + 0 [7:0]	

When the RMDLC[3:0] value in the RCFDCnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as 00$_H$.

Specify the payload storage size of the receive buffer by the RMPLS[2:0] bits in the RCFDCnCFDRMNB register. Do not read or write the RCFDCnCFDRMDFb_q register corresponding to an area that exceeds the specified size.

24.3.6 Details of Receive FIFO Buffer-related Registers

24.3.6.1 RCFDCnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access: RCFDCnCFDRFCCx register can be read or written in 32-bit units

RCFDCnCFDRFCCxL register can be read or written in 16-bit units

RCFDCnCFDRFCCxLL, RCFDCnCFDRFCCxLH registers can be read or written in 8-bit units

Address: RCFDCnCFDRFCCx: <RCFDCn_base> + $00B8_H$ + (04_H × x)

RCFDCnCFDRFCCxL: <RCFDCn_base> + $00B8_H$ + (04_H × x)

RCFDCnCFDRFCCxLL: <RCFDCn_base> + $00B8_H$ + (04_H × x),

RCFDCnCFDRFCCxLH: <RCFDCn_base> + $00B9_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

3, 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit is set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 enables the use of FIFO buffers. Clearing this bit to 0 sets the RFEMP flag in the RCFDCnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RCFDCnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

24.3.6.2 RCFDCnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RCFDCnCFDRFSTSx register can be read or written in 32-bit units
RCFDCnCFDRFSTSxL register can be read or written in 16-bit units
RCFDCnCFDRFSTSxLL register can be read or written in 8-bit units
RCFDCnCFDRFSTSxLH register is a read-only register that can be read in 8-bit units

Address: RCFDCnCFDRFSTSx: <RCFDCn_base> + $00D8_H$ + (04_H × x)
RCFDCnCFDRFSTSxL: <RCFDCn_base> + $00D8_H$ + (04_H × x)
RCFDCnCFDRFSTSxLL: <RCFDCn_base> + $00D8_H$ + (04_H × x),
RCFDCnCFDRFSTSxLH: <RCFDCn_base> + $00D9_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.64 RCFDCnCFDRFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RCFDCnCFDRFCCx register is set to 0. This flag is 00_H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RCFDCnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RCFDCnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RCFDCnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RCFDCnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when a received message is in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

24.3.6.3 RCFDCnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RCFDCnCFDRFPCTRx register is a write-only register that can be written in 32-bit units

RCFDCnCFDRFPCTRxL register is a write-only register that can be written in 16-bit units

RCFDCnCFDRFPCTRxLL register is a write-only register that can be written in 8-bit units

Address: RCFDCnCFDRFPCTRx: <RCFDCn_base> + $00F8_H$ + (04_H × x)

RCFDCnCFDRFPCTRxL: <RCFDCn_base> + $00F8_H$ + (04_H × x)

RCFDCnCFDRFPCTRxLL: <RCFDCn_base> + $00F8_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 24.65 RCFDCnCFDRFPCTRx Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

When the RFDMAEx value in the RCFDCnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RCFDCnCFDRFSTSx register is decremented by 1. Read the RCFDCnCFDRFIDx, RCFDCnCFDRFPTRx, RCFDCnCFDRFFDSTSx, and RCFDCnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RCFDCnCFDRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RCFDCnCFDRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

24.3.6.4 RCFDCnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RCFDCnCFDRFIDx register is a read-only register that can be read in 32-bit units

RCFDCnCFDRFIDxL, RCFDCnCFDRFIDxH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRFIDxLL, RCFDCnCFDRFIDxLH, RCFDCnCFDRFIDxHL, RCFDCnCFDRFIDxHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDRFIDx: <RCFDCn_base> + 6000$_H$ + (80$_H$ × x)
RCFDCnCFDRFIDxL: <RCFDCn_base> + 6000$_H$ + (80$_H$ × x),

Bit Position	Bit Name	Function
31	RFIDE	Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	RFRTR	Receive FIFO Buffer RTR/RRS ● When the received message is a classical CAN frame 0: Data frame 1: Remote frame ● When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	Reserved	This bit is read as the value after reset.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

24.3.6.5 RCFDCnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RCFDCnCFDRFPTRx register is a read-only register that can be read in 32-bit units

RCFDCnCFDRFPTRxL, RCFDCnCFDRFPTRxH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRFPTRxLL, RCFDCnCFDRFPTRxLH, RCFDCnCFDRFPTRxHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDRFPTRx: <RCFDCn_base> + 6004_H + (80_H × x)
RCFDCnCFDRFPTRxL: <RCFDCn_base> + 6004_H + (80_H × x),
RCFDCnCFDRFPTRxH: <RCFDCn_base> + 6006_H + (80_H × x)
RCFDCnCFDRFPTRxLL: <RCFDCn_base> + 6004_H + (80_H × x),
RCFDCnCFDRFPTRxLH: <RCFDCn_base> + 6005_H + (80_H × x),
RCFDCnCFDRFPTRxHH: <RCFDCn_base> + 6007_H + (80_H × x)

0	RFESI	ESI 0: Error active node 1: Error passive node

RFPTR[15:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

RFFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive FIFO buffer.

RFBRS Bit

When the RFFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is set to 0, this bit is always read as 0.

RFESI Bit

When the RFFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is set to 0, this bit is always read as 0.

24.3.6.7 RCFDCnCFDRFDFd_x — Receive FIFO Buffer Access Data Field Register (d = 0 to 15, x = 0 to 7)

Access: RCFDCnCFDRFDFd_x register is a read-only register that can be read in 32-bit units

RCFDCnCFDRFDFd_xL, RCFDCnCFDRFDFd_xH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDRFDFd_xLL, RCFDCnCFDRFDFd_xLH, RCFDCnCFDRFDFd_xHL, RCFDCnCFDRFDFd_xHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDRFDFd_x: <RCFDCn_base> + 600C$_H$ + (04$_H$ × d) + (80$_H$ × x)

Table 24.69 RCFDCnCFDRFDFd_x Register Contents

Bit Position	Bit Name	Function
31 to 24	RFDB4 × d + 3 [7:0]	Receive Buffer Data Byte 4 × d + 3 Receive Buffer Data Byte 4 × d + 2 Receive Buffer Data Byte 4 × d + 1 Receive Buffer Data Byte 4 × d + 0 Data for a message stored in the receive buffer can be read.
23 to 16	RFDB4 × d + 2 [7:0]	
15 to 8	RFDB4 × d + 1 [7:0]	
7 to 0	RFDB4 × d + 0 [7:0]	

When the RFDLC[3:0] value in the RCFDCnCFDRFPTRx register is smaller than the payload storage size of the receive FIFO buffer, data bytes for which no data is set are read as 00$_H$.

Specify the payload storage size of the receive FIFO buffer by the RFPLS[2:0] bits in the RCFDCnCFDRFCCx register. Do not read or write the RCFDCnCFDRFDFd_x register corresponding to an area that exceeds the specified size.

24.3.7 Transmit/Receive FIFO Buffer-related Registers

24.3.7.1 RCFDCnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register (k = 0 to 23)

Access: RCFDCnCFDCFCCk register can be read or written in 32-bit units

RCFDCnCFDCFCCkL, RCFDCnCFDCFCCkH registers can be read or written in 16-bit units

RCFDCnCFDCFCCkLL, RCFDCnCFDCFCCkLH, RCFDCnCFDCFCCkHL, RCFDCnCFDCFCCkHH registers can be read or written in 8-bit units

Address: RCFDCnCFDCFCCk: <RCFDCn_base> + 0118_H + (04_H × k)

RCFDCnCFDCFCCkL: <RCFDCn_base> + 0118_H + (04_H × k),

3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.

Table 24.70 RCFDCnCFDCFCCk Register Contents

Bit Position	Bit Name	Function
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTML[4:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/ receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[4:0]) (See **Table 24.29, Transmit Buffer p Linked to the Transmit/Receive FIFO Buffer by the Setting of Bits CFTML[4:0]**).

See **Table 24.27, Transmit Buffer p Allocated to Each Channel** and **Table 24.28, Transmit/Receive FIFO Buffer k Allocated to Each Channel**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[4:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the same channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RCFDCnCFDGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RCFDCnCFDGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer. When this bit is 1, the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel which does not handle the CAN FD frames.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RCFDCnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RCFDCnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 enables the transmit/receive FIFO buffers.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration- lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RCFDCnCFDCFCCk register have been set, set this bit to 1 by using another instruction.

24.3.7.2 RCFDCnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 23)

Access:	RCFDCnCFDCFSTSk register can be read or written in 32-bit units RCFDCnCFDCFSTSkL register can be read or written in 16-bit units RCFDCnCFDCFSTSkLL register can be read or written in 8-bit units RCFDCnCFDCFSTSkLH register is a read-only register that can be read in 8-bit units
Address:	RCFDCnCFDCFSTSk: <RCFDCn_base> + 0178_H + (04_H × k) RCFDCnCFDCFSTSkL: <RCFDCn_base> + 0178_H + (04_H × k) RCFDCnCFDCFSTSkLL: <RCFDCn_base> + 0178_H + (04_H × k), RCFDCnCFDCFSTSkLH: <RCFDCn_base> + 0179_H + (04_H × k)
Value after reset:	0000 0001_H

0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values according to the setting of the CFM[1:0] bits in the RCFDCnCFDCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RCFDCnCFDCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the interrupt source selected by the CFIM bit in the RCFDCnCFDCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RCFDCnCFDCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RCFDCnCFDCFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RCFDCnCFDCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RCFDCnCFDCFPCTRk register after data was written to the RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDFd_k register

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

24.3.7.3 RCFDCnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 23)

Access:	RCFDCnCFDCFPCTRk register is a write-only register that can be written in 32-bit units RCFDCnCFDCFPCTRkL register is a write-only register that can be written in 16-bit units RCFDCnCFDCFPCTRkLL register is a write-only register that can be written in 8-bit units
Address:	RCFDCnCFDCFPCTRk: <RCFDCn_base> + $01D8_H$ + (04_H × k) RCFDCnCFDCFPCTRkL: <RCFDCn_base> + $01D8_H$ + (04_H × k) RCFDCnCFDCFPCTRkLL: <RCFDCn_base> + $01D8_H$ + (04_H × k)
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 24.72 RCFDCnCFDCFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control ● Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. ● Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. ● Gateway mode: Setting prohibited

When the corresponding transmit/receive FIFO buffer is the first transmit/receive FIFO buffer (k = 3 × m) allocated to channel m and when the CFDMAEm bit in the RCFDCnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RCFDCnCFDCFCCk register is 00_B):

  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RCFDCnCFDCFSTSk register is decremented by 1. Read the RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDFd_k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.

  When writing FF_H to these bits, make sure that the CFE bit in the RCFDCnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RCFDCnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RCFDCnCFDCFCCk register is 01_B):

  Writing FF_H to the CFPC[7:0] bits stores the data written to the RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDFd_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented by 1. Write transmit messages to the RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDFd_k registers before writing FF_H to the CFPC[7:0] bits.

  When writing FF_H to these bits, make sure that the CFE bit in the RCFDCnCFDCFCCk register is set to 1 and the CFFLL flag in the RCFDCnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).

- Gateway mode (CFM[1:0] value in the RCFDCnCFDCFCCk register is 10_B): Setting prohibited

24.3.7.4 RCFDCnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 23)

Access: RCFDCnCFDCFIDk register can be read or written in 32-bit units

RCFDCnCFDCFIDkL, RCFDCnCFDCFIDkH registers can be read or written in 16-bit units

RCFDCnCFDCFIDkLL, RCFDCnCFDCFIDkLH, RCFDCnCFDCFIDkHL, RCFDCnCFDCFIDkHH registers can be read or written in 8-bit units

Address: RCFDCnCFDCFIDk: <RCFDCn_base> + 6400_H + (80_H × k)

RCFDCnCFDCFIDkL: <RCFDCn_base> + 6400_H + (80_H × k),

Table 24.73 RCFDCnCFDCFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR/RRS ● When the CFM[1:0] value is 01_B (transmit mode) – When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame – When the transmit message is a CAN FD frame Write 0 to this bit. ● When the CFM[1:0] value is 00_B (receive mode) – When the received message is a classical CAN frame 0: Data frame 1: Remote frame – When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.

Table 24.73 RCFDCnCFDCFIDk Register Contents

Bit Position	Bit Name	Function
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data ● When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. ● When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register can be written only when the CFM[1:0] value in the RCFDCnCFDCFCCk register is 01_B (transmit mode). This register can be read only when the CFM[1:0] value is 00_B (receive mode). This RCFDCnCFDCFIDk register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

If the received message is a classical CAN frame, this bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. If the received message is a CAN FD frame, this bit indicates the RRS bit value of the received message.

When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFFDF bit in the RCFDCnCFDCFFDCSTSk register is 1 (CAN FD frame), set this bit to 0.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, these bits are used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

24.3.7.5 RCFDCnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 23)

Access: RCFDCnCFDCFPTRk register can be read or written in 32-bit units

RCFDCnCFDCFPTRkL, RCFDCnCFDCFPTRkH registers can be read or written in 16-bit units

RCFDCnCFDCFPTRkLL, RCFDCnCFDCFPTRkLH, RCFDCnCFDCFPTRkHH registers can be read or written in 8-bit units

Address: RCFDCnCFDCFPTRk: <RCFDCn_base> + 6404_H + (80_H × k)

RCFDCnCFDCFPTRkL: <RCFDCn_base> + 6404_H + (80_H × k),

RCFDCnCFDCFPTRkH: <RCFDCn_base> + 6406_H + (80_H × k)

RCFDCnCFDCFPTRkLL: <RCFDCn_base> + 6404_H + (80_H × k),

RCFDCnCFDCFPTRkLH: <RCFDCn_base> + 6405_H + (80_H × k),

RCFDCnCFDCFPTRkHH: <RCFDCn_base> + 6407_H + (80_H × k)

<tr><td>15 to 0</td><td>CFTS[15:0]</td><td>Transmit/Receive FIFO Buffer Timestamp Data
These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.</td></tr>
</table>

This register can be written only when the CFM[1:0] value in the RCFDCnCFDCFCCk register is 01_B (transmit mode). This register can be read only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFDLC[3:0] bits are set to 1001_B or more while the CFFDF bit in the RCFDCnCFDCFFDCSTSk register is 0 (classical CAN frame), 8-byte data is transmitted actually.

A value of 0000_B to 1111_B is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by CC_H.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer. These bits are valid when the CFM[1:0] value is 00_B.

24.3.7.6 RCFDCnCFDCFFDCSTSk — Transmit/receive FIFO CAN FD Configuration/status Register (k = 0 to 23)

Access: RCFDCnCFDCFFDCSTSk register can be read or written in 32-bit units

RCFDCnCFDCFFDCSTSkL register can be read or written in 16-bit units

RCFDCnCFDCFFDCSTSkH register is a read-only register that can be read in 16-bit units

RCFDCnCFDCFFDCSTSkLL register can be read or written in 8-bit units

RCFDCnCFDCFFDCSTSkHL, RCFDCnCFDCFFDCSTSkHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDCFFDCSTSk: <RCFDCn_base> + 6408_H + (80_H × k)

Table 24.75 RCFDCnCFDCFFDCSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	CFPTR[15:0]	Transmit/Receive FIFO Buffer Label Data ● When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[15:0] are valid. ● When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	CFFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	CFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	CFESI	ESI 0: Error active node 1: Error passive node

This register can be written only when the CFM[1:0] value in the RCFDCnCFDCFCCk register is 01_B (transmit mode). This register can be read only when the CFM[1:0] value is 00_B (receive mode). Do not read or write this register when the CFM[1:0] value is 10_B (gateway mode).

CFPTR[15:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[15:0] value is stored in the transmit history buffer when message transmission has been completed.

CFFDF Bit

When the CFM[1:0] value is 00_B, this bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] value is 01_B, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.

CFBRS Bit

When the CFM[1:0] value is 00_B, if the CFFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is set to 0, this bit is always read as 0.

When the CFM[1:0] value is 01_B, if the CFFDF bit is set to 1, this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is set to 0, write 0 to this bit.

CFESI Bit

When the CFM[1:0] value is 00_B, if the CFFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is set to 0, this bit is always read as 0.

When the CFM[1:0] value is 01_B, if the CFFDF bit is set to 1, this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RCFDCnCFDCmFDCFG register is set to 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is set to 0, write 0 to this bit.

24.3.7.7 RCFDCnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field Register (d = 0 to 15, k = 0 to 23)

Access:	RCFDCnCFDCFDFd_k register can be read or written in 32-bit units RCFDCnCFDCFDFd_kL, RCFDCnCFDCFDFd_kH registers can be read or written in 16-bit units RCFDCnCFDCFDFd_kLL, RCFDCnCFDCFDFd_kLH, RCFDCnCFDCFDFd_kHL, RCFDCnCFDCFDFd_kHH registers can be read or written in 8-bit units
Address:	RCFDCnCFDCFDFd_k: <RCFDCn_base> + $640C_H + (04_H \times d) + (80_H \times k)$ RCFDCnCFDCFDFd_kL: <RCFDCn_base> + $640C_H + (04_H \times d) + (80_H \times k)$, RCFDCnCFDCFDFd_kH: <RCFDCn_base> + $640E_H + (04_H \times d) + (80_H \times k)$ RCFDCnCFDCFDFd_kLL: <RCFDCn_base> + $640C_H + (04_H \times d) + (80_H \times k)$, RCFDCnCFDCFDFd_kLH: <RCFDCn_base> + $640D_H + (04_H \times d) + (80_H \times k)$, RCFDCnCFDCFDFd_kHL: <RCFDCn_base> + $640E_H + (04_H \times d) + (80_H \times k)$, RCFDCnCFDCFDFd_kHH: <RCFDCn_base> + $640F_H + (04_H \times d) + (80_H \times k)$
Value after reset:	$0000\ 0000_H$

Table 24.76 RCFDCnCFDCFDFd_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB4 × d + 3 [7:0]	Transmit/Receive FIFO Buffer Data Byte 4 × d + 3 Transmit/Receive FIFO Buffer Data Byte 4 × d + 2 Transmit/Receive FIFO Buffer Data Byte 4 × d + 1 Transmit/Receive FIFO Buffer Data Byte 4 × d + 0 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.
23 to 16	CFDB4 × d + 2 [7:0]	
15 to 8	CFDB4 × d + 1 [7:0]	
7 to 0	CFDB4 × d + 0 [7:0]	

This register can be written only when the CFM[1:0] value in the RCFDCnCFDCFCCk register is 01_B (transmit mode).

This register can be read only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RCFDCnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RCFDCnCFDCFCCk register. Do not read or write the RCFDCnCFDCFDFd_k register corresponding to an area that exceeds the specified size.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

24.3.8 Details of FIFO Status-related Registers

24.3.8.1 RCFDCnCFDFESTS — FIFO Empty Status Register

Access: RCFDCnCFDFESTS register is a read-only register that can be read in 32-bit units

RCFDCnCFDFESTSL, RCFDCnCFDFESTSH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDFESTSLL, RCFDCnCFDFESTSLH, RCFDCnCFDFESTSHL, RCFDCnCFDFESTSHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDFESTS: <RCFDCn_base> + 0238_H
RCFDCnCFDFESTSL: <RCFDCn_base> + 0238_H,
RCFDCnCFDFESTSH: <RCFDCn_base> + $023A_H$
RCFDCnCFDFESTSLL: <RCFDCn_base> + 0238_H,
RCFDCnCFDFESTSLH: <RCFDCn_base> + 0239_H,
RCFDCnCFDFESTSHL: <RCFDCn_base> + $023A_H$,
RCFDCnCFDFESTSHH: <RCFDCn_base> + $023B_H$

Value after reset: FFFF $FFFF_H$

Table 24.77 RCFDCnCFDFESTS Register Contents

Bit Position	Bit Name	Function
13	CF5EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 23)
12	CF4EMP	
11	CF3EMP	
10	CF2EMP	
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message . (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RCFDCnCFDFESTS register is set to FFFF FFFF_H in global reset mode.

CFkEMP Flag (k = 0 to 23)

The CFkEMP flag is set to 1 when the CFEMP flag in the RCFDCnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RCFDCnCFDRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

24.3.8.2 RCFDCnCFDFFSTS — FIFO Full Status Register

Access: RCFDCnCFDFFSTS register is a read-only register that can be read in 32-bit units

RCFDCnCFDFFSTSL, RCFDCnCFDFFSTSH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDFFSTSLL, RCFDCnCFDFFSTSLH, RCFDCnCFDFFSTSHL, RCFDCnCFDFFSTSHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDFFSTS: <RCFDCn_base> + $023C_H$
RCFDCnCFDFFSTSL: <RCFDCn_base> + $023C_H$,
RCFDCnCFDFFSTSH: <RCFDCn_base> + $023E_H$
RCFDCnCFDFFSTSLL: <RCFDCn_base> + $023C_H$,
RCFDCnCFDFFSTSLH: <RCFDCn_base> + $023D_H$,
RCFDCnCFDFFSTSHL: <RCFDCn_base> + $023E_H$,
RCFDCnCFDFFSTSHH: <RCFDCn_base> + $023F_H$

Value after reset: $0000\ 0000_H$

5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RCFDCnCFDFFSTS register is cleared to 0000 0000$_H$ in global reset mode.

CFkFLL Flag (k = 0 to 23)

The CFkFLL flag is set to 1 when the CFFLL flag in the RCFDCnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).

When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RCFDCnCFDRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

24.3.8.3 RCFDCnCFDFMSTS — FIFO Message Lost Status Register

Access: RCFDCnCFDFMSTS register is a read-only register that can be read in 32-bit units

RCFDCnCFDFMSTSL, RCFDCnCFDFMSTSH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDFMSTSLL, RCFDCnCFDFMSTSLH, RCFDCnCFDFMSTSHL, RCFDCnCFDFMSTSHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDFMSTS: <RCFDCn_base> + 0240_H

RCFDCnCFDFMSTSL: <RCFDCn_base> + 0240_H,

RCFDCnCFDFMSTSH: <RCFDCn_base> + 0242_H

RCFDCnCFDFMSTSLL: <RCFDCn_base> + 0240_H,

RCFDCnCFDFMSTSLH: <RCFDCn_base> + 0241_H,

RCFDCnCFDFMSTSHL: <RCFDCn_base> + 0242_H,

RCFDCnCFDFMSTSHH: <RCFDCn_base> + 0243_H

Value after reset: 0000 0000_H

6	RF6MLT	
5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RCFDCnCFDFMSTS register is cleared to 0000 0000_H in global reset mode.

CFkMLT Flag (k = 0 to 23)

The CFkMLT flag is set to 1 when the CFMLT flag in the RCFDCnCFDCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RCFDCnCFDRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

24.3.8.4 RCFDCnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access:	RCFDCnCFDRFISTS register is a read-only register that can be read in 32-bit units RCFDCnCFDRFISTSL register is a read-only register that can be read in 16-bit units RCFDCnCFDRFISTSLL register is a read-only register that can be read in 8-bit units
Address:	RCFDCnCFDRFISTS: <RCFDCn_base> + 0244$_H$ RCFDCnCFDRFISTSL: <RCFDCn_base> + 0244$_H$ RCFDCnCFDRFISTSLL: <RCFDCn_base> + 0244$_H$
Value after reset:	0000 0000$_H$

Modify the RCFDCnCFDCDTCT register in global operating mode or global test mode.

CFDMAEm Bit

This bit is used to enable DMA transfer for transmit/receive FIFO buffer 3 × m (the first transmit/ receive FIFO buffer allocated to channel m). DMA transfer is enabled only for transmit/receive FIFO buffers for which the CFM[1:0] bits in the RCFDCnCFDCFCCk register is set to 00_B (receive mode).

Set this bit to 0 when the CFM[1:0] value is 01_B (transmit mode) or 10_B (gateway mode).

RFDMAEx Bit

This bit is used to enable DMA transfer for receive FIFO buffer x.

24.3.9.2 RCFDCnCFDCDTSTS — DMA Status Register

Access: RCFDCnCFDCDTSTS register is a read-only register that can be read in 32-bit units

RCFDCnCFDCDTSTSL register is a read-only register that can be read in 16-bit units

RCFDCnCFDCDTSTSLL, RCFDCnCFDCDTSTSLH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDCDTSTS: <RCFDCn_base> + 0644_H

RCFDCnCFDCDTSTSL: <RCFDCn_base> + 0644_H

RCFDCnCFDCDTSTSLL: <RCFDCn_base> + 0644_H,

RCFDCnCFDCDTSTSLH: <RCFDCn_base> + 0645_H

Value after reset: 0000 0000_H

5	RFDMASTS5	
4	RFDMASTS4	
3	RFDMASTS3	
2	RFDMASTS2	
1	RFDMASTS1	
0	RFDMASTS0	

CFDMASTSm Bit

When DMA transfer is enabled (CFDMAEm bit in the RCFDCnCFDCDTCT register is 1) for the transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m) while the transmit/receive FIFO buffer contains one of more messages, the CFDMASTSm bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the transmit/receive FIFO buffer have been transferred or DMA transfer is disabled (CFDMAEm bit is 0), the CFDMASTSm bit is cleared to 0 indicating that DMA transfer has been completed. If the CFDMAEm bit is set to 0 during DMA transfer, the CFDMASTSm bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

RFDMASTSx Bit

When DMA transfer is enabled (corresponding RFDMAEx bit in the RCFDCnCFDCDTCT register is 1) for the receive FIFO buffer x and the receive FIFO buffer contains one of more messages, the RFDMASTSx bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the receive FIFO buffer x have been transferred or DMA transfer is disabled (RFDMAEx bit = 0), the RFDMASTSx bit is cleared to 0 indicating that DMA transfer has been completed. If the RFDMAEx bit is set to 0 during DMA transfer, the RFDMASTSx bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area) These bits are cleared to 0 in global reset mode.

24.3.10 Details of Transmit Buffer-related Registers

24.3.10.1 RCFDCnCFDTMCp — Transmit Buffer Control Register (p = 0 to 255)

Access: RCFDCnCFDTMCp register can be read or written in 8-bit units

Address: RCFDCnCFDTMCp: <RCFDCn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*[1]	R/W*[1]

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 24.85 RCFDCnCFDTMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RCFDCnCFDTMCp register meets any of the following conditions, set it to 00_H.

- The RCFDCnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[4:0] bits in the RCFDCnCFDCFCCk register (p = m × 32 + the value of CFTML[4:0] bits).
- The RCFDCnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[4:0] bits in the RCFDCnCFDTXQCCm (m = 0 to 7) register (p = (m × 32 + 31) to (m × 32 + 31 – the value of TXQDC[4:0] bits)).

All of the bits in the RCFDCnCFDTMCp register are cleared to 0 in channel reset mode. Modify the RCFDCnCFDTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. If transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RCFDCnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RCFDCnCFDTMSTSp register is 00_B.

24.3.10.2 RCFDCnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 255)

Access: RCFDCnCFDTMSTSp register can be read or written in 8-bit units

Address: RCFDCnCFDTMSTSp: <RCFDCn_base> + 0350_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 24.86 RCFDCnCFDTMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

All of the bits in the RCFDCnCFDTMSTSp register are cleared to 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RCFDCnCFDTMCp register is set to 1. The TMTARM flag is set to 0 when the TMTAR bit in the RCFDCnCFDTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RCFDCnCFDTMCp register is set to 1. The TMTRM flag is set to 0 when the TMTR bit in the RCFDCnCFDTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RCFDCnCFDTMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RCFDCnCFDTMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

24.3.10.3 RCFDCnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 255)

Access:	RCFDCnCFDTMIDp register can be read or written in 32-bit units RCFDCnCFDTMIDpL, RCFDCnCFDTMIDpH registers can be read or written in 16-bit units RCFDCnCFDTMIDpLL, RCFDCnCFDTMIDpLH, RCFDCnCFDTMIDpHL, RCFDCnCFDTMIDpHH registers can be read or written in 8-bit units
Address:	RCFDCnCFDTMIDp: <RCFDCn_base> + 8000_H + (80_H × p) RCFDCnCFDTMIDpL: <RCFDCn_base> + 8000_H + (80_H × p), RCFDCnCFDTMIDpH: <RCFDCn_base> + 8002_H + (80_H × p) RCFDCnCFDTMIDpLL: <RCFDCn_base> + 8000_H + (80_H × p), RCFDCnCFDTMIDpLH: <RCFDCn_base> + 8001_H + (80_H × p), RCFDCnCFDTMIDpHL: <RCFDCn_base> + 8002_H + (80_H × p), RCFDCnCFDTMIDpHH: <RCFDCn_base> + 8003_H + (80_H × p)
Value after reset:	0000 0000_H

Table 24.87 RCFDCnCFDTMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR/RRS ● When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame ● When the transmit message is a CAN FD frame Write 0 to this bit.
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RCFDCnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 32 + 31) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

Set this bit to 0 when the TMFDF bit in the RCFDCnCFDTMFDCTRp register is 1 (CAN FD frame).

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

24.3.10.4 RCFDCnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 255)

Access: RCFDCnCFDTMPTRp register can be read or written in 32-bit units

RCFDCnCFDTMPTRpH register can be read or written in 16-bit units

RCFDCnCFDTMPTRpHH register can be read or written in 8-bit units

Address: RCFDCnCFDTMPTRp: <RCFDCn_base> + 8004_H + (80_H × p)

RCFDCnCFDTMPTRpH: <RCFDCn_base> + 8006_H + (80_H × p)

RCFDCnCFDTMPTRpHH: <RCFDCn_base> + 8007_H + (80_H × p)

</table>

Modify this register when the TMTRM bit in the corresponding RCFDCnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 32 + 31) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RCFDCnCFDTMIDp register is set to 0 (data frame).

When the TMDLC[3:0] bits are set to 1001_B or more while the TMFDF bit in the RCFDCnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the TMRTR bit is 1 (remote frame), these bits set the length of the message to be requested.

24.3.10.5 RCFDCnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register (p = 0 to 255)

Access:	RCFDCnCFDTMFDCTRp register can be read or written in 32-bit units RCFDCnCFDTMFDCTRpL, RCFDCnCFDTMFDCTRpH registers can be read or written in 16-bit units RCFDCnCFDTMFDCTRpLL, RCFDCnCFDTMFDCTRpHL, RCFDCnCFDTMFDCTRpHH registers can be read or written in 8-bit units
Address:	RCFDCnCFDTMFDCTRp: <RCFDCn_base> + 8008_H + (80_H × p) RCFDCnCFDTMFDCTRpL: <RCFDCn_base> + 8008_H + (80_H × p), RCFDCnCFDTMFDCTRpH: <RCFDCn_base> + $800A_H$ + (80_H × p) RCFDCnCFDTMFDCTRpLL: <RCFDCn_base> + 8008_H + (80_H × p), RCFDCnCFDTMFDCTRpHL: <RCFDCn_base> + $800A_H$ + (80_H × p), RCFDCnCFDTMFDCTRpHH: <RCFDCn_base> + $800B_H$ + (80_H × p)

Table 24.89 RCFDCnCFDTMFDCTRp Register Contents

Bit Position	Bit Name	Function
31 to 16	TMPTR[15:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	TMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	TMESI	ESI 0: Error active node 1: Error passive node

Modify this register when the TMTRM bit in the corresponding RCFDCnCFDTMSTSp register is set to 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer p (p = m × 32 + 31) of the corresponding channel.

TMPTR[15:0] Bits

When message transmission has been completed, the TMPTR[15:0] value is stored in the transmit history buffer.

TMFDF Bit

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.

TMBRS Bit

When this bit is set to 1 while the TMFDF bit is set to 1, the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is set to 0, write 0 to this bit.

TMESI Bit

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is set to 1. The set value is transmitted when the ESIC bit in the RCFDCnCFDCmFDCFG register is set to 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is set to 0, write 0 to this bit.

24.3.10.6 RCFDCnCFDTMDFb_p — Transmit Buffer Data Field Register (b = 0 to 15, p = 0 to 255)

Access: RCFDCnCFDTMDFb_p register can be read or written in 32-bit units

RCFDCnCFDTMDFb_pL, RCFDCnCFDTMDFb_pH registers can be read or written in 16-bit units

RCFDCnCFDTMDFb_pLL, RCFDCnCFDTMDFb_pLH, RCFDCnCFDTMDFb_pHL, RCFDCnCFDTMDFb_pHH registers can be read or written in 8-bit units

Address: RCFDCnCFDTMDFb_p: <RCFDCn_base> + $800C_H$ + (04_H × b) + (80_H × p)

Table 24.91 RCFDCnCFDTMIECm Register Contents

Bit Position	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = m × 32 + 31 to m × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = m × 32 + 15 to m × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 255)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RCFDCnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

Table 24.92, TMIEp Bit Assignment shows the bit assignment.

Bit Position	Bit Name	Function
31 to 16	TMTCSTSp	Transmit Buffer Transmit Complete Status Flag p (p = m × 32 + 31 to m × 32 + 16) 0: Transmission has not been completed. 1: Transmission has been completed.
15 to 0	TMTCSTSp	Transmit Buffer Transmit Complete Status Flag p (p = m × 32 + 15 to m × 32 + 0) 0: Transmission has not been completed. 1: Transmission has been completed.

TMTCSTSp Flags (p = 0 to 255)

When the TMTRF[1:0] flag in the RCFDCnCFDTMSTSp register is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)), the corresponding TMTCSTSp flag is set to 1.

To clear the TMTCSTSp flag to 0, set the corresponding TMTRF[1:0] flag to 00_B. This flag is cleared to 0 in channel reset mode.

Table 24.98, TMTCSTSp Bit Assignment shows the bit assignment.

24.3.11.4 RCFDCnCFDTMTASTSm — Transmit Buffer Transmit Abort Status Register (m = 0 to 7)

Access: RCFDCnCFDTMTASTSm register is a read-only register that can be read in 32-bit units

RCFDCnCFDTMTASTSmL, RCFDCnCFDTMTASTSmH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDTMTASTSmLL, RCFDCnCFDTMTASTSmLH, RCFDCnCFDTMTASTSmHL, RCFDCnCFDTMTASTSmHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDTMTASTSm: <RCFDCn_base> + $04B0_H$ + (04_H × m)
RCFDCnCFDTMTASTSmL: <RCFDCn_base> + $04B0_H$ + (04_H × m),
RCFDCnCFDTMTASTSmH: <RCFDCn_base> + $04B2_H$ + (04_H × m)
RCFDCnCFDTMTASTSmLL: <RCFDCn_base> + $04B0_H$ + (04_H × m),
RCFDCnCFDTMTASTSmLH: <RCFDCn_base> + $04B1_H$ + (04_H × m),

Table 24.101 RCFDCnCFDTXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	TXQDC[4:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 31) makes the (g + 1) transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited.
7	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	TXQTXIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
4 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQDC[4:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 32 + 31) to (m × 32 + 0) (See **Table 24.30, Transmit Buffer p Allocated to the Transmit Queue of Each Channel**). For examples of how buffer allocation is done, see **Figure 24.9, Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links**.

Modify these bits only in channel reset mode.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQTXIE Bit

When the TXQTXIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQTXIE bit.

TXQE Bit

Setting this bit to 1 enables the transmit queue. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[4:0] bits to 00010_B or more.

24.3.12.2 RCFDCnCFDTXQSTSm — Transmit Queue Status Register (m = 0 to 7)

Access: RCFDCnCFDTXQSTSm register can be read or written in 32-bit units

RCFDCnCFDTXQSTSmL register can be read or written in 16-bit units

RCFDCnCFDTXQSTSmLL register can be read or written in 8-bit units

Address: RCFDCnCFDTXQSTSm: <RCFDCn_base> + 0570_H + (04_H × m)

RCFDCnCFDTXQSTSmL: <RCFDCn_base> + 0570_H + (04_H × m)

RCFDCnCFDTXQSTSmLL: <RCFDCn_base> + 0570_H + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQTXIF	TXQFLL	TXQEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W^{*1}	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.102 RCFDCnCFDTXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
13 to 8	Reserved	When read, the undefined value is returned. When writing to these bits, write the value after reset.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	TXQTXIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQTXIF Flag

The TXQTXIF flag is set to 1 when the interrupt source specified by the TXQIM bit in the RCFDCnCFDTXQCCm register has occurred.

The TXQTXIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RCFDCnCFDTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages stored in the transmit queue matches the transmit queue depth set by the TXQDC[4:0] bits in the RCFDCnCFDTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[4:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is stored in the transmit queue. This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

24.3.12.3 RCFDCnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 7)

Access: RCFDCnCFDTXQPCTRm register is a write-only register that can be written in 32-bit units
RCFDCnCFDTXQPCTRmL register is a write-only register that can be written in 16-bit units
RCFDCnCFDTXQPCTRmLL register is a write-only register that can be written in 8-bit units

Address: RCFDCnCFDTXQPCTRm: <RCFDCn_base> + 0590_H + (04_H × m)
RCFDCnCFDTXQPCTRmL: <RCFDCn_base> + 0590_H + (04_H × m)
RCFDCnCFDTXQPCTRmLL: <RCFDCn_base> + 0590_H + (04_H × m)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 24.103 RCFDCnCFDTXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request for the message. Write transmit messages to the RCFDCnCFDTMIDp, RCFDCnCFDTMPTRp, RCFDCnCFDTMFDCTRp, and RCFDCnCFDTMDFb_p registers (p = 31, 63, 95, 127, 159, 191, 223 and 255) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RCFDCnCFDTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RCFDCnCFDTXQSTSm register is 0 (he transmit queue is not full).

24.3.13 Details of Transmit History-related Registers

24.3.13.1 RCFDCnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 to 7)

Access:	RCFDCnCFDTHLCCm register can be read or written in 32-bit units RCFDCnCFDTHLCCmL register can be read or written in 16-bit units RCFDCnCFDTHLCCmLL, RCFDCnCFDTHLCCmLH registers can be read or written in 8-bit units
Address:	RCFDCnCFDTHLCCm: <RCFDCn_base> + $05B0_H$ + (04_H × m) RCFDCnCFDTHLCCmL: <RCFDCn_base> + $05B0_H$ + (04_H × m) RCFDCnCFDTHLCCmLL: <RCFDCn_base> + $05B0_H$ + (04_H × m), RCFDCnCFDTHLCCmLH: <RCFDCn_base> + $05B1_H$ + (04_H × m)

Table 24.104 RCFDCnCFDTHLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entries from transmit/receive FIFO buffers and transmit queue 1: Entries from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 24 items of data have been stored in the transmit history buffer 1: Each time transmit history data is stored in the transmit history buffer
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source. Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit is set to 0.

THLE Bit

Setting this bit to 1 enables the transmit history buffer. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

24.3.13.2 RCFDCnCFDTHLSTSm — Transmit History Status Register (m = 0 to 7)

Access: RCFDCnCFDTHLSTSm register can be read or written in 32-bit units
RCFDCnCFDTHLSTSmL register can be read or written in 16-bit units
RCFDCnCFDTHLSTSmLL register can be read or written in 8-bit units
RCFDCnCFDTHLSTSmLH register is a read-only register that can be read in 8-bit units

Address: RCFDCnCFDTHLSTSm: <RCFDCn_base> + $05D0_H + (04_H \times m)$
RCFDCnCFDTHLSTSmL: <RCFDCn_base> + $05D0_H + (04_H \times m)$
RCFDCnCFDTHLSTSmLL: <RCFDCn_base> + $05D0_H + (04_H \times m)$,
RCFDCnCFDTHLSTSmLH: <RCFDCn_base> + $05D1_H + (04_H \times m)$

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 24.105 RCFDCnCFDTHLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
13 to 8	THLMC[5:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[5:0] Bits

These bits indicate the number of unread data stored in the transmit history buffer. These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RCFDCnCFDTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 32 items of data have been stored in the transmit history buffer, and is cleared to 0 when the number of data stored in the transmit history buffer has decreased to less than 32. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RCFDCnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single item of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RCFDCnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

24.3.13.3 RCFDCnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 7)

Access: RCFDCnCFDTHLPCTRm register is a write-only register that can be written in 32-bit units

RCFDCnCFDTHLPCTRmL register is a write-only register that can be written in 16-bit units

RCFDCnCFDTHLPCTRmLL register is a write-only register that can be written in 8-bit units

Address: RCFDCnCFDTHLPCTRm: <RCFDCn_base> + 05F0$_H$ + (04$_H$ × m)

RCFDCnCFDTHLPCTRmL: <RCFDCn_base> + 05F0$_H$ + (04$_H$ × m)

RCFDCnCFDTHLPCTRmLL: <RCFDCn_base> + 05F0$_H$ + (04$_H$ × m)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 24.106 RCFDCnCFDTHLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF$_H$ to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF$_H$, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[5:0] (transmit history buffer unread data counter) value in the RCFDCnCFDTHLSTSm register is decremented by 1. Write FF$_H$ to the THLPC[7:0] bits after reading from the RCFDCnCFDTHLACC0m register and the RCFDCnCFDTHLACC1m register.

When writing FF$_H$ to these bits, make sure that the THLE bit in the RCFDCnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RCFDCnCFDTHLSTSm register is 0.

24.3.13.4 RCFDCnCFDTHLACC0m — Transmit History Access Register 0 (m = 0 to 7)

Access: RCFDCnCFDTHLACC0m register is a read-only register that can be read in 32-bit units

RCFDCnCFDTHLACC0mL, RCFDCnCFDTHLACC0mH registers are read-only registers that can be read in 16-bit units

RCFDCnCFDTHLACC0mLL, RCFDCnCFDTHLACC0mHL, RCFDCnCFDTHLACC0mHH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDTHLACC0m: <RCFDCn_base> + 10000_H + (08_H × m)

RCFDCnCFDTHLACC0mL: <RCFDCn_base> + 10000_H + (08_H × m),

RCFDCnCFDTHLACC0mH: <RCFDCn_base> + 10002_H + (08_H × m)

RCFDCnCFDTHLACC0mLL: <RCFDCn_base> + 10000_H + (08_H × m),

RCFDCnCFDTHLACC0mHL: <RCFDCn_base> + 10002_H + (08_H × m),

RCFDCnCFDTHLACC0mHH: <RCFDCn_base> + 10003_H + (08_H × m)

Value after reset: $0000\ 0000_H$

Table 24.107 RCFDCnCFDTHLACC0m Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTS[15:0]	Timestamp Data The timestamp data of stored data can be read.
15 to 8	Reserved	When read, the value after reset is returned.
7 to 3	BN[4:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

Timestamp values in transmit history data stored in the transmit history buffer are displayed.

BN[4:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

24.3.13.5 RCFDCnCFDTHLACC1m — Transmit History Access Register 1 (m = 0 to 7)

Access: RCFDCnCFDTHLACC1m register is a read-only register that can be read in 32-bit units

RCFDCnCFDTHLACC1mL register is a read-only register that can be read in 16-bit units

RCFDCnCFDTHLACC1mLL, RCFDCnCFDTHLACC1mLH registers are read-only registers that can be read in 8-bit units

Address: RCFDCnCFDTHLACC1m: <RCFDCn_base> + 10004_H + (08_H × m)

RCFDCnCFDTHLACC1mL: <RCFDCn_base> + 10004_H + (08_H × m)

5	C5ICBCE	CAN5 Inter-channel Communication Test Enable 0: CAN5 inter-channel communication test is disabled. 1: CAN5 inter-channel communication test is enabled.
4	C4ICBCE	CAN4 Inter-channel Communication Test Enable 0: CAN4 inter-channel communication test is disabled. 1: CAN4 inter-channel communication test is enabled.

Table 24.109 RCFDCnCFDGTSTCFG Register Contents

Bit Position	Bit Name	Function
3	C3ICBCE	CAN3 Inter-channel Communication Test Enable 0: CAN3 inter-channel communication test is disabled. 1: CAN3 inter-channel communication test is enabled.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled. 1: CAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RCFDCnCFDGTSTCFG register only in global test mode.

RTMPS[8:0] Bits

- RCFDC0 with 8 channels

  These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to 108_H, inclusive.

- RCFDC0 with 6 channels

  These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to $C6_H$, inclusive. Should not access more than 192 Bytes in the last page.

- RCFDC1 with 4 channels

  These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to 84_H, inclusive. Should not access more than 128 Bytes in the last page.

C7ICBCE Bit

Setting this bit to 1 enables the channel 7 inter-channel communication test. This bit is cleared to 0 in global reset mode.

C6ICBCE Bit

Setting this bit to 1 enables the channel 6 inter-channel communication test. This bit is cleared to 0 in global reset mode.

C5ICBCE Bit

Setting this bit to 1 enables the channel 5 inter-channel communication test. This bit is cleared to 0 in global reset mode.

C4ICBCE Bit

Setting this bit to 1 enables the channel 4 inter-channel communication test. This bit is cleared to 0 in global reset mode.

C3ICBCE Bit

Setting this bit to 1 enables the channel 3 inter-channel communication test. This bit is cleared to 0 in global reset mode.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test. This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test. This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test. This bit is cleared to 0 in global reset mode.

24.3.14.2 RCFDCnCFDGTSTCTR — Global Test Control Register

Access: RCFDCnCFDGTSTCTR register can be read or written in 32-bit units
RCFDCnCFDGTSTCTRL register can be read or written in 16-bit units
RCFDCnCFDGTSTCTRLL register can be read or written in 8-bit units

Address: RCFDCnCFDGTSTCTR: <RCFDCn_base> + $061C_H$
RCFDCnCFDGTSTCTRL: <RCFDCn_base> + $061C_H$
RCFDCnCFDGTSTCTRLL: <RCFDCn_base> + $061C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	RTME	—	ICBCTME
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 24.110 RCFDCnCFDGTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	ICBCTME	Inter-channel Communication Test Enable 0: Inter-channel communication test is disabled 1: Inter-channel communication test is enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode (See **Figure 24.37, RAM Test Setting Procedure**).

1. Set the GMDC[1:0] bits in the RCFDCnCFDGCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 7) in the RCFDCnCFDGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

24.3.14.3 RCFDCnCFDGLOCKK — Global Lock Key Register

Access: RCFDCnCFDGLOCKK register is a write-only register that can be written in 32-bit units.

RCFDCnCFDGLOCKKL register is a write-only register that can be written in 16-bit units.

Address: RCFDCnCFDGLOCKK: <RCFDCn_base> + $062C_H$

RCFDCnCFDGLOCKKL: <RCFDCn_base> + $062C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCK[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}	W^{*1}

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 24.111 RCFDCnCFDGLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RCFDCnCFDGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 24.10.4.2, Procedure for Releasing the Protection**.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RCFDCnCFDGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RCFDCn_base> + 0000_H to <RCFDCn_base> + $07FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

24.3.14.4 RCFDCnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access:	RCFDCnCFDRPGACCr register can be read or written in 32-bit units RCFDCnCFDRPGACCrL, RCFDCnCFDRPGACCrH registers can be read or written in 16-bit units RCFDCnCFDRPGACCrLL, RCFDCnCFDRPGACCrLH, RCFDCnCFDRPGACCrHL, RCFDCnCFDRPGACCrHH registers can be read or written in 8-bit units
Address:	RCFDCnCFDRPGACCr: <RCFDCn_base> + 10400_H + (04_H × r) RCFDCnCFDRPGACCrL: <RCFDCn_base> + 10400_H + (04_H × r), RCFDCnCFDRPGACCrH: <RCFDCn_base> + 10402_H + (04_H × r) RCFDCnCFDRPGACCrLL: <RCFDCn_base> + 10400_H + (04_H × r), RCFDCnCFDRPGACCrLH: <RCFDCn_base> + 10401_H + (04_H × r), RCFDCnCFDRPGACCrHL: <RCFDCn_base> + 10402_H + (04_H × r), RCFDCnCFDRPGACCrHH: <RCFDCn_base> + 10403_H + (04_H × r)
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDTA[31:16]

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDTA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.112 RCFDCnCFDRPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA[31:0]	RAM Data Test Access RAM data for CAN can be read and written.

Modify the RCFDCnCFDRPGACCr register in global test mode with the RTME bit in the RCFDCnCFDGTSTCTR register set to 1 (RAM test is enabled).

The RCFDCnCFDRPGACCr register can be read and written when the RTME bit is set to 1.

24.4 Interrupt Sources and DMA Trigger

24.4.1 Interrupt Sources

The RS-CANFD module has 26 interrupts for unit 0 and 14 interrupts for unit 1 are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources/unit): Receive FIFO interrupt Global error interrupt
- Channel interrupts (3 sources/channel): (m = 0 to 7 (n = 0), m = 0 to 3 (n = 1))

1. CANm transmit interrupt
    - CANm transmit complete interrupt
    - CANm transmit abort interrupt
    - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
    - CANm transmit history interrupt
    - CANm transmit queue Interrupt
2. CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)
3. CANm error interrupt

CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In this case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

Table 24.113, List of CAN Interrupt Sources lists the CAN interrupt sources. **Figure 24.2, CAN Global Interrupt Block Diagram** shows the CAN global interrupt block diagram. **Figure 24.3, CAN Channel Interrupt Block Diagram** shows the CAN channel interrupt block diagram.

Table 24.113 List of CAN Interrupt Sources

	Interrupt Source		Corresponding Interrupt Request Flag	Corresponding Interrupt Enable Bit
Global interrupts	Receive FIFO	Receive FIFO 0	RFIF in the RCFDCnCFDRFSTS0 register	RFIE in the RCFDCnCFDRFCC0 register
		Receive FIFO 1	RFIF in the RCFDCnCFDRFSTS1 register	RFIE in the RCFDCnCFDRFCC1 register
		Receive FIFO 2	RFIF in the RCFDCnCFDRFSTS2 register	RFIE in the RCFDCnCFDRFCC2 register
		Receive FIFO 3	RFIF in the RCFDCnCFDRFSTS3 register	RFIE in the RCFDCnCFDRFCC3 register
		Receive FIFO 4	RFIF in the RCFDCnCFDRFSTS4 register	RFIE in the RCFDCnCFDRFCC4 register
		Receive FIFO 5	RFIF in the RCFDCnCFDRFSTS5 register	RFIE in the RCFDCnCFDRFCC5 register
		Receive FIFO 6	RFIF in the RCFDCnCFDRFSTS6 register	RFIE in the RCFDCnCFDRFCC6 register
		Receive FIFO 7	RFIF in the RCFDCnCFDRFSTS7 register	RFIE in the RCFDCnCFDRFCC7 register
	Global error		DEF in the RCFDCnCFDGERFL register	DEIE in the RCFDCnCFDGCTR register

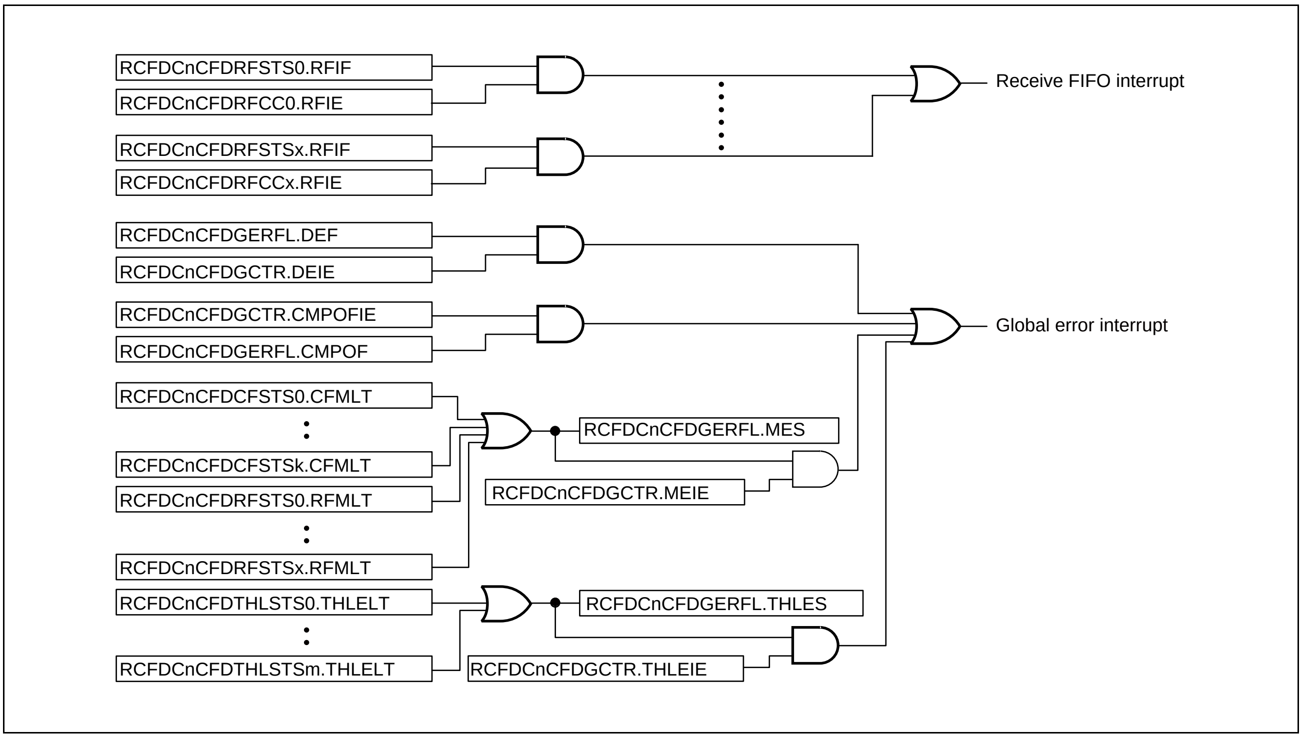

Figure 24.2 CAN Global Interrupt Block Diagram

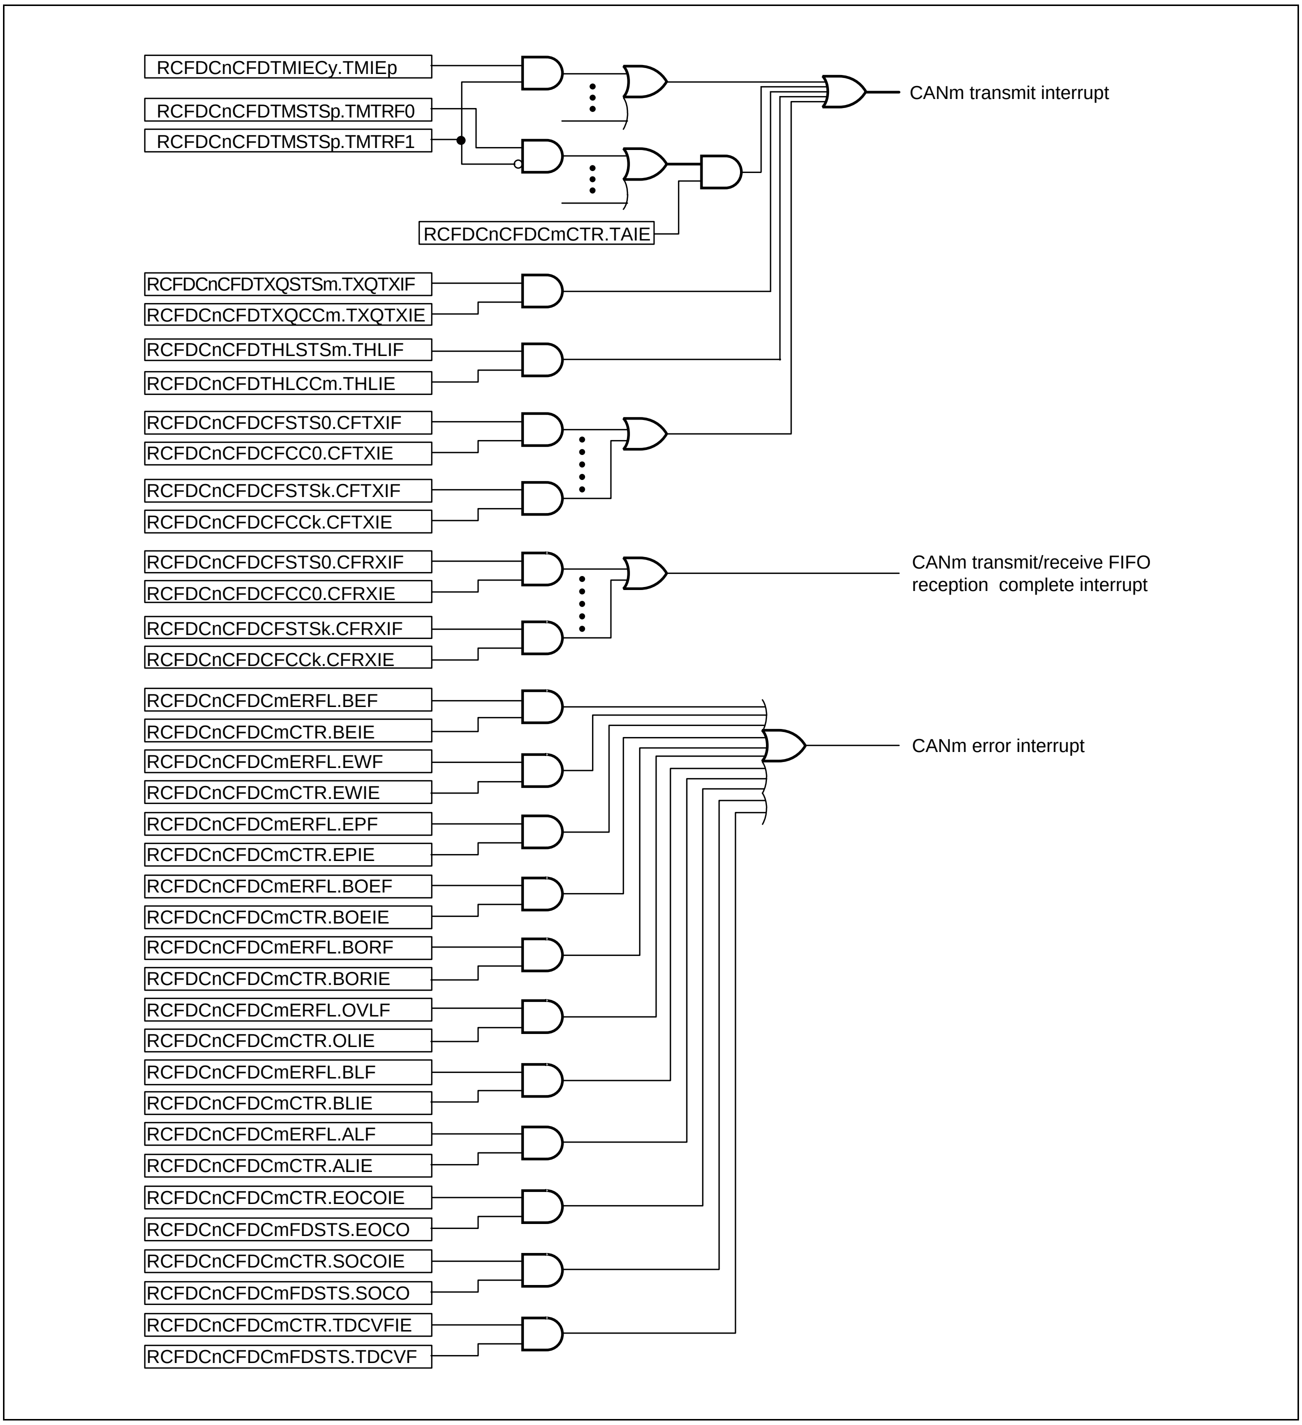

Figure 24.3 CAN Channel Interrupt Block Diagram

24.4.2 DMA Trigger

FIFO buffers used for reception can be related to DMA channels. The following 16 FIFO buffers can be related.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k (k = 3 × m, m = 0 to 7) allocated to channel m

When the DMA enable bit (RFDMAEx or CFDMAEm bit in the RCFDCnCFDCDTCT register) is set to 1 and an unread message is remaining in the related FIFO, a DMA transfer request trigger is generated.

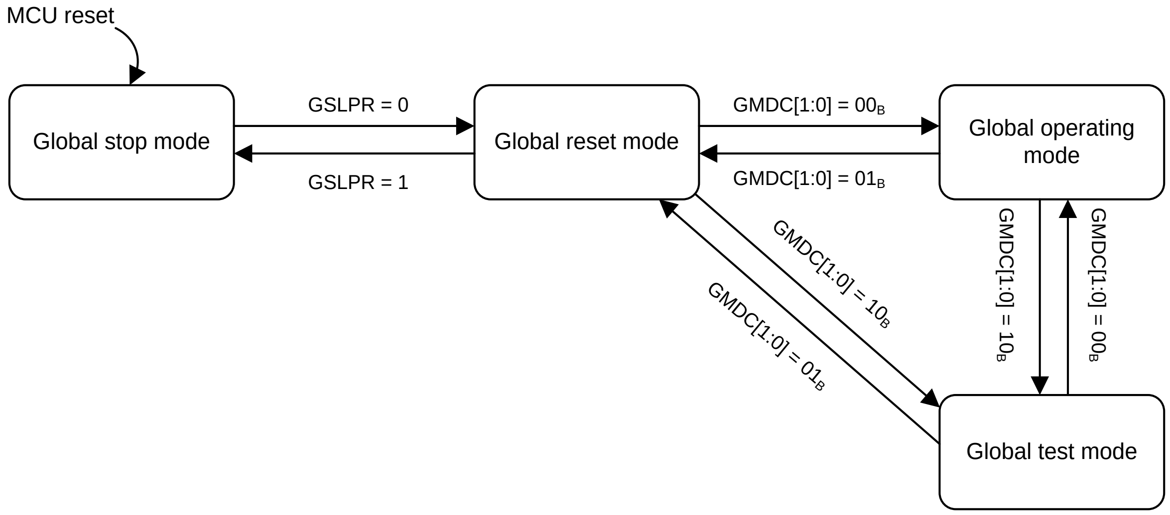
24.5 CAN Modes

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in **Section 24.5.1, Global Modes**, and details of channel modes are described in **Section 24.5.2, Channel Modes**.

- Global stop mode: Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs the RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channels.
- Channel halt mode: Stops CAN communication and allows channel testing.
- Channel communication mode: Performs CAN communication.

24.5.1 Global Modes

Figure 24.4, Transitions of Global Modes shows the transitions of global modes.



Note: GSLPR, GMDC[1:0]: Bits in the RCFDCnCFDGCTR register

Figure 24.4 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. **Table 24.114, Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 24.114 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

	Channel Mode after Setting			
Channel Mode before Setting	GMDC[1:0] = 00_B GSLPR = 0 (Global Operation)	GMDC[1:0] = 10_B GSLPR = 0 (Global Test)	GMDC[1:0] = 01_B GSLPR = 0 (Global Reset)	GMDC[1:0] = 01_B GSLPR = 1 (Global Stop)
Channel communication	Channel communication	Channel halt	Channel reset	Transition prohibited
Channel halt	Channel halt	Channel halt	Channel reset	Transition prohibited
Channel reset	Channel reset	Channel reset	Channel reset	Channel stop
Channel stop	Channel stop	Channel stop	Channel stop	Channel stop

Note: GMDC[1:0], GSLPR: Bits in the RCFDCnCFDGCTR register

Table 24.115, Global Mode Transition Time shows the global mode transition time.

Table 24.115 Global Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Global stop	Global reset	Three pclk cycles
Global reset	Global stop	Three pclk cycles
Global reset	Global test	Ten pclk cycles
Global reset	Global operating	Ten pclk cycles
Global test	Global reset	Two CAN bit times*1,*2
Global test	Global operating	Three pclk cycles
Global operating	Global reset	Two CAN bit times*1,*2
Global operating	Global test	Three CAN frames*1

Note 1. CAN frame time and CAN bit time of the lowest communication speed of the channels in use

Note 2. This time value is the CAN bit time of the nominal bit rate.

24.5.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the CAN module transitions to global stop mode. Setting the GSLPR bit in the RCFDCnCFDGCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each RCFDCnCFDCmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the CAN module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

24.5.1.2 Global Reset Mode

In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. For registers to be initialized, see **Table 24.118, Registers Initialized in Global Reset Mode or Channel Reset Mode** and **Table 24.119, Registers Initialized Only in Global Reset Mode**.

Setting the GMDC[1:0] bits in the RCFDCnCFDGCTR register to 01_B sets the CHMDC[1:0] bits in each RCFDCnCFDCmCTR registers (m = 0 to 7) to 01_B (channel reset mode). If all channels are forced to transition to channel reset mode, the CAN module transitions to global reset mode.

Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01_B).

24.5.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RCFDCnCFDGCTR register to 10_B sets the CHMDC[1:0] bits in each RCFDCnCFDCmCTR register to 10_B (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

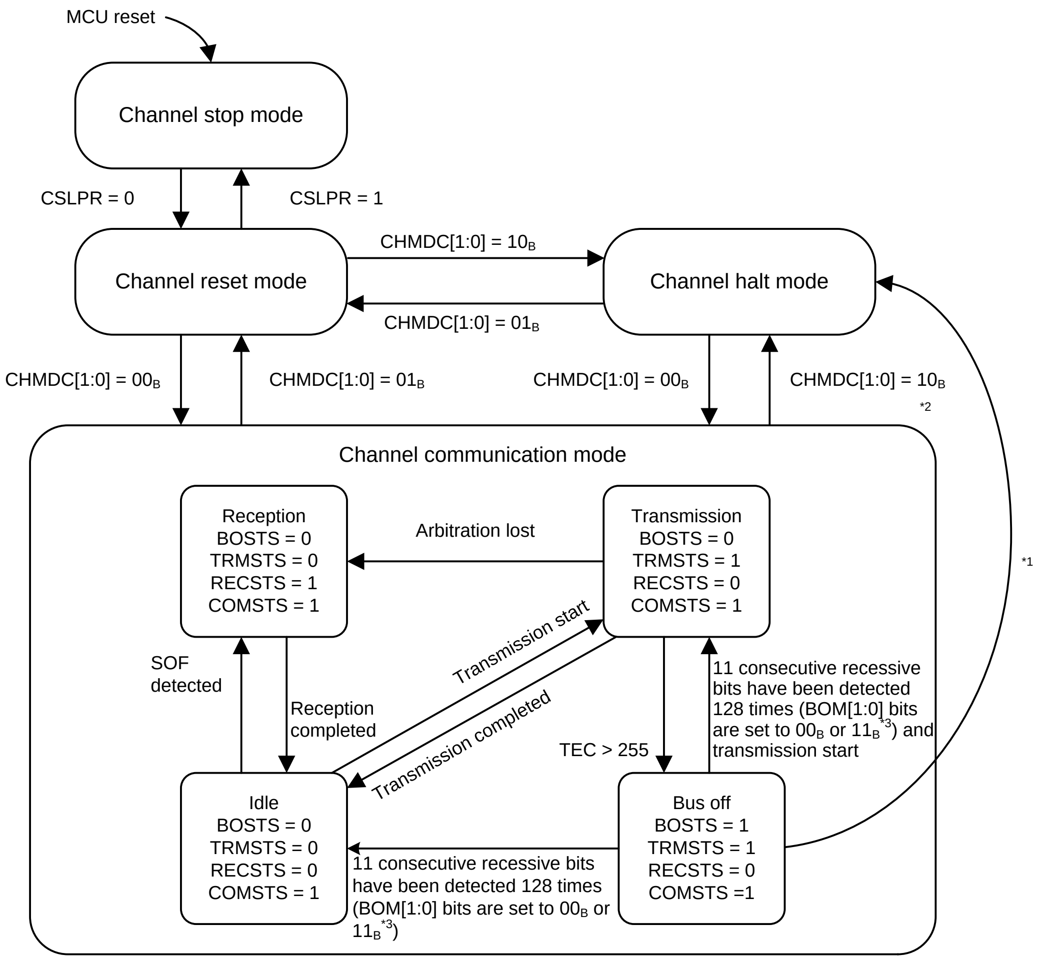
24.5.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.

When the GMDC[1:0] bits in the RCFDCnCFDGCTR register are set to 00_B, the RS-CANFD module transitions to global operating mode.

24.5.2 Channel Modes

Figure 24.5, Channel Mode State Transition Chart shows a channel mode state transition chart. **Table 24.116, Channel Mode Transition Time** shows the channel mode transition time.



Note: CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RCFDCnCFDCmCTR register (m = 0 to 7) BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RCFDCnCFDCmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = 01_B: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = 10_B: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = 11_B: Transition to channel halt mode when the CHMDC[1:0] bits are set to 10_B

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Note 3. When 11 consecutive recessive bits are detected 128 times before the CHMDC[1:0] bits are set to 10_B.

Figure 24.5 Channel Mode State Transition Chart

Table 24.116 Channel Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel stop	Channel reset	Three pclk cycles
Channel reset	Channel stop	Three pclk cycles
Channel reset	Channel halt	Three CANm bit times*1
Channel reset	Channel communication	Four CANm bit times*1
Channel halt	Channel reset	Two CANm bit times*1
Channel halt	Channel communication	Four CANm bit times*1
Channel communication	Channel reset	Two CANm bit times*1
Channel communication	Channel halt	Two CANm frames

Note 1. This time value is the CANm bit time of the nominal bit rate.

24.5.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. Channel-related registers can be read, but writing data to them is prohibited (except write to CSLPR bit). Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RCFDCnCFDCmCTR register (m = 0 to 7) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

24.5.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. For registers to be initialized, see **Table 24.118, Registers Initialized in Global Reset Mode or Channel Reset Mode**.

When the CHMDC[1:0] bits in the RCFDCnCFDCmCTR register are set to 01_B (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 24.117, Operation when a Channel Transitions to Channel Reset Mode/Channel Halt Mode** shows the operation when the CHMDC[1:0] bits are set to 01_B (channel reset mode) during CAN communication.

24.5.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

Table 24.117, Operation when a Channel Transitions to Channel Reset Mode/Channel Halt Mode shows operation when the CHMDC[1:0] bits are set to 10_B (channel halt mode) during CAN communication.

Table 24.117 Operation when a Channel Transitions to Channel Reset Mode/Channel Halt Mode

Mode	During Reception	During Transmission	Bus Off State
Channel reset (CHMDC[1:0] = 01_B)	Transitions to channel reset mode before reception is completed.*[1]	Transitions to channel reset mode before transmission is completed.*[1]	Transitions to channel reset mode before bus off recovery.
Channel halt*[3] (CHMDC[1:0] = 10_B)	Transitions to channel halt mode after reception is completed.*[2]	Transitions to channel halt mode after transmission is completed.	[When BOM[1:0] = 00_B] Transitions to channel halt mode (CHMDC[1:0] = 10_B) only after bus off recovery. [When BOM[1:0] = 01_B] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = 10_B] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = 11_B] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10_B before bus off recovery.

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10_B and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01_B.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RCFDCnCFDCmERFL register that becomes 1 when dominant lock is detected.

Note 3. When the transition from channel reset mode to channel halt mode is to be made, set the RCFDCnCFDCmNCFG register and the RCFDCnCFDCmDCFG register, and then make a transition.

24.5.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RCFDCnCFDCmCTR register are set to 00_B, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RCFDCnCFDCmSTS register (m = 0 to 7) is set to 1

(communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

24.5.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RCFDCnCFDCmCTR register.

- When BOM[1:0] = 00_B:

  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RCFDCnCFDCmSTS register are initialized to 00_H, the BORF flag in the

  RCFDCnCFDCmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RCFDCnCFDCmCTR register are set to 10_B (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).

- When BOM[1:0] = 01_B:

  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10_B and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.

- When BOM[1:0] = 10_B:

  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10_B. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.

- When BOM[1:0] = 11_B:

  When the CHMDC[1:0] bits are set to 10_B in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.

  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 11 consecutive recessive bits 128 times) before CHMDC[1:0] bits are set to 10_B.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01_B or 10_B is made only when the CHMDC[1:0] bits are 00_B (channel communication mode).

Furthermore, setting the RTBO bit in the RCFDCnCFDCmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to 00_H. Write 1 to the RTBO bit only when the BOM[1:0] value is 00_B. Writing 1 to the RTBO bit in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

24.5.3 Initializing Registers by Transition to CAN Mode

Table 24.118, Registers Initialized in Global Reset Mode or Channel Reset Mode lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, **Table 24.119, Registers Initialized Only in Global Reset Mode** lists bits and flags to be initialized only by a transition to global reset mode.

Table 24.118 Registers Initialized in Global Reset Mode or Channel Reset Mode

Register	Bit / Flag
RCFDCnCFDCmCTR register	ROM, CRCT, CTMS[1:0], CTME, CHMDC[1:0]

RCFDCnCFDGTSTCTR register	RTME, ICBCTME

24.6 Reception Functions

There are two reception types.

- Reception by receive buffers:

  Zero to 128 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.

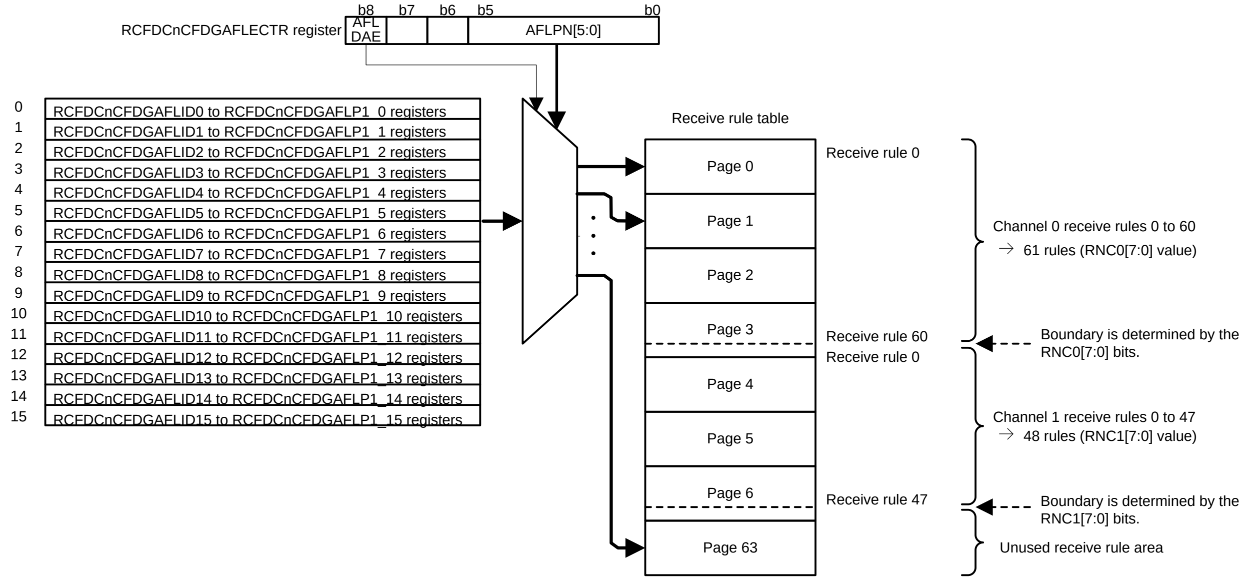
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):

  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

24.6.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 255 receive rules can be registered per channel and up to (128 × number of channels) total receive rules can be registered in the entire module. (Up to 1024 receive rules can be registered in this module that has eight channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 24.6, Registration of Receive Rules (for Setting Channel 0 and 1)** illustrates how receive rules are registered.



Note: RNC0[7:0], RNC1[7:0]: Bits in the RCFDCnCFDGAFLCFG0 register

Figure 24.6 Registration of Receive Rules (for Setting Channel 0 and 1)

CAUTION

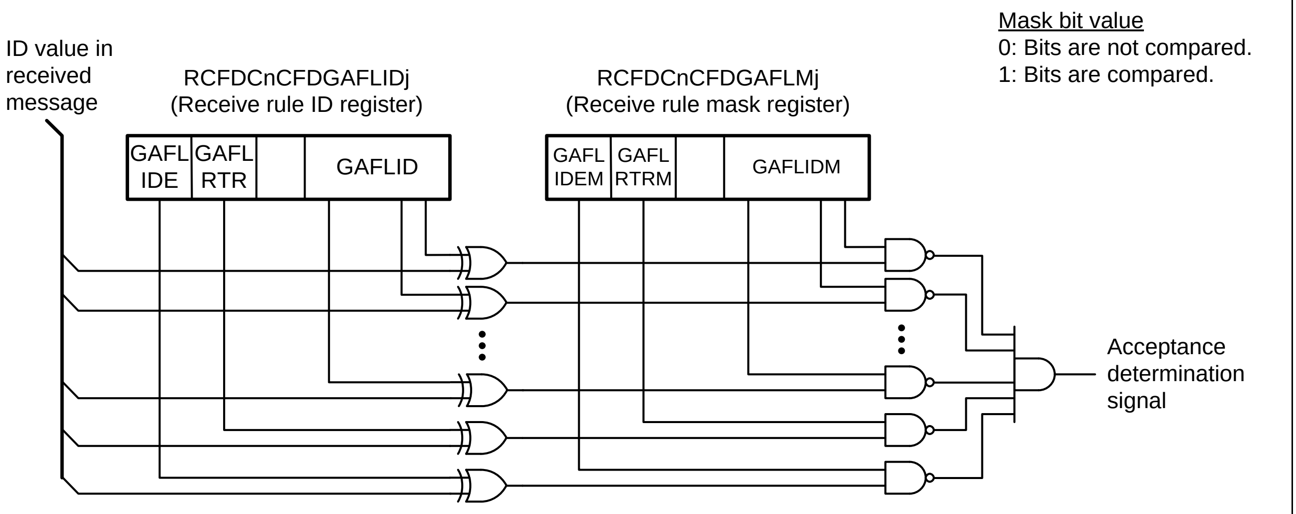
Receive rules for each channel must be set in contiguous blocks. Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RCFDCnCFDGAFLIDj, RCFDCnCFDGAFLMj, RCFDCnCFDGAFLP0_j, and RCFDCnCFDGAFLP1_j registers (j = 0 to 15). The RCFDCnCFDGAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RCFDCnCFDGAFLMj register is used to set mask, the RCFDCnCFDGAFLP0_j register is used to set label information to be added, DLC value, and storage receive buffer, and the RCFDCnCFDGAFLP1_j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

24.6.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RCFDCnCFDGAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule with the smallest number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.



j = 0 to 15

GAFLIDE, GAFLRTR, GAFLID: Bits in the RCFDCnCFDGAFLIDj register
GAFLIDEM, GAFLRTRM, GAFLIDM: Bits (mask bits) in the RCFDCnCFDGAFLMj register

Acceptance determination signal
0: Does not pass the acceptance filter processing.
(Not stored in the buffer)
1: Passes the acceptance filter processing.

Figure 24.7 Acceptance Filter Function

24.6.1.2 DLC Filter Processing

When the DCE bit in the RCFDCnCFDGCFG register is set to 1 (DLC check is enabled), DLC filter processing is performed for messages that pass through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RCFDCnCFDGCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RCFDCnCFDGCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of 00_H is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RCFDCnCFDGERFL register is set to 1 (a DLC error is present).

24.6.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, and/or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RCFDCnCFDGAFLP0_j register (j = 0 to 15) and by the RCFDCnCFDGAFLP1_j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

If the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RCFDCnCFDGERFL register is set to 1 (payload overflow) and the processing is handled according to the CMPOC bit in the RCFDCnCFDGCFG register. When the CMPOC bit is 0, the received message which exceeds the payload storage size is not stored in the buffer. When the CMPOC bit is 1, the received message is stored in the buffer with payloads exceeding the storage size being discarded, and depending on the DRE bit in the RCFDCnCFDGCFG register the received DLC value or the DLC value of the receive rule is stored in the buffer.

24.6.1.4 Label Addition Processing

It is possible to add 16-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[15:0] bits in the RCFDCnCFDGAFLP0_j register.

24.6.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is enabled by setting the MME bit in the RCFDCnCFDGCFG register to 1 (mirror function is enabled).

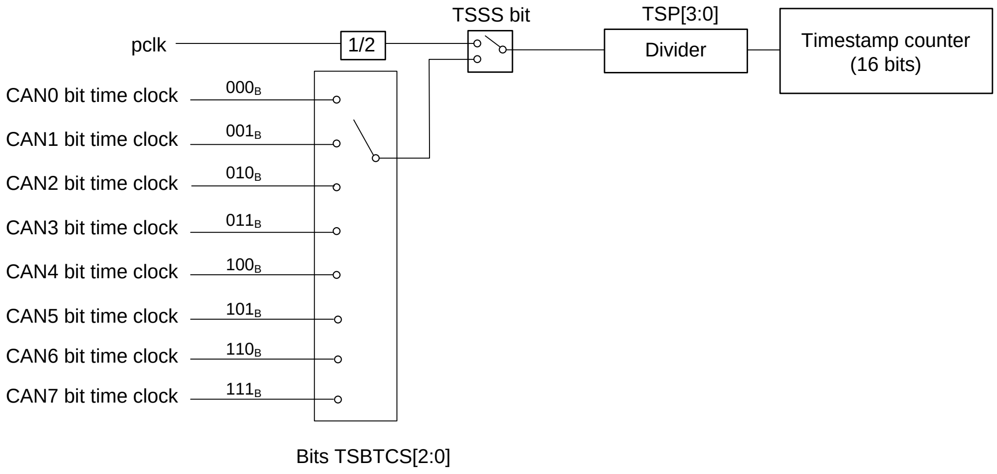
When the mirror function is in use, receive rules for which the GAFLLB bit in the RCFDCnCFDGAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

24.6.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time and transmission time. The timestamp counter value is fetched at the timing set with the TSCCFG[1:0] bits in the RCFDCnCFDGCFG register and is then stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RCFDCnCFDGCFG register. The clock source is selectable from pclk/2 or nominal CANm bit time clock(m = 0 to 7). However, do not select the nominal CANm bit time clock of channels that handle CAN FD frames. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RCFDCnCFDGCFG register.

When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to 0000_H by setting the TSRST bit in the RCFDCnCFDGCTR register to 1.



Note: TSBTCS[2:0], TSSS, TSP[3:0]: Bits in the RCFDCnCFDGCFG register
When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B

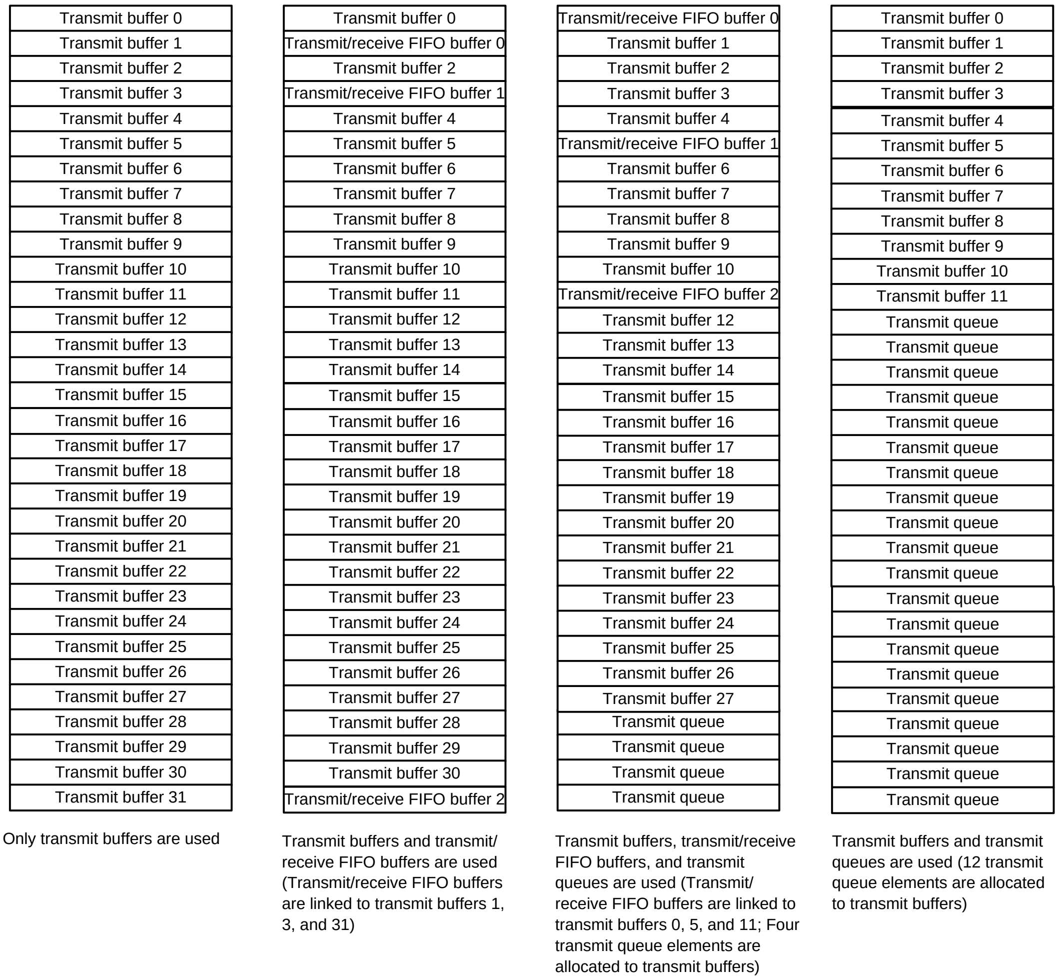
Figure 24.8 Timestamp Function Block Diagram

24.7 Transmission Functions

There are three types of transmission. The transmittable payload length is 64 bytes in every transmission types.

- Transmission using transmit buffers:
  Each channel has 32 buffers.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first- out basis.
- Transmission using transmit queues:
  Up to 32 transmit buffers per channel can be allocated to the transmit queues. Transmit buffer ((32 × m) + 31) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

Figure 24.9, Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links shows the allocation of transmit queues and transmit/receive FIFO buffer link.



Transmit buffer 0	Transmit buffer 0	Transmit/receive FIFO buffer 0	Transmit buffer 0
Transmit buffer 1	Transmit/receive FIFO buffer 0	Transmit buffer 1	Transmit buffer 1
Transmit buffer 2	Transmit buffer 2	Transmit buffer 2	Transmit buffer 2

Figure 24.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

24.7.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RCFDCnCFDGCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the smallest buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit setting. When a 2-bit ECC error is detected in the priority determination processing, no message is transmitted.

24.7.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RCFDCnCFDTMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RCFDCnCFDTMSTSp register (p = 0 to 255). When transmit completes successfully, the TMTRF[1:0] flag is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)).

24.7.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RCFDCnCFDTMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RCFDCnCFDTMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RCFDCnCFDTMSTSp register is set to 01_B (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

24.7.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RCFDCnCFDTMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RCFDCnCFDTMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10_B or 11_B. When an arbitration-lost or an error occurs, the TMTRF[1:0] lag is set to 01_B (transmit abort has been completed).

24.7.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffer, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RCFDCnCFDCFCCk register (k = 0 to 23). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[4:0] bits in the RCFDCnCFDCFCCk register. When the CFE bit in the RCFDCnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, arbitration-lost or the transition to channel halt mode in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

24.7.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RCFDCnCFDCFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RCFDCnCFDCFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to 00_H.

Select an interval timer count source using the CFITR and CFITSS bits in the RCFDCnCFDCFCCk register. When the CFITR and CFITSS bits are set to 00_B, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to 10_B, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits × 10). When the CFITR and CFITSS bits are set to $x1_B$, the CANm bit time clock becomes a count source in Classical CAN only mode and the nominal CANm bit time clock becomes a count source in CAN FD mode. (Use this count source only for the channel which does not handle the CAN FD frames in CAN FD mode.)

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00_B

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times N$$

- When CFITR and CFITSS = 10_B:

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = $x1_B$:

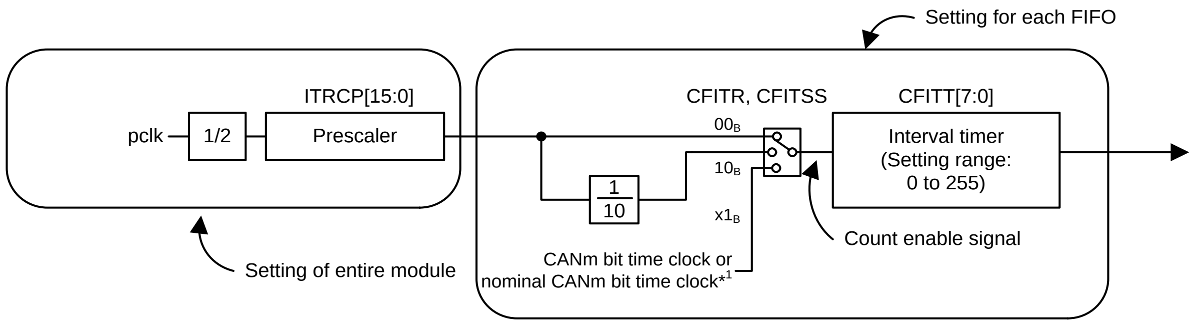
  Classical CAN only mode:

$$\frac{1}{\text{CANm bit time clock frequency}} \times N$$

  CAN FD mode and CAN FD only mode:

$$\frac{1}{\text{Nominal CANm bit time clock frequency}} \times N$$

Figure 24.10, Interval Timer Block Diagram shows the interval timer block diagram.

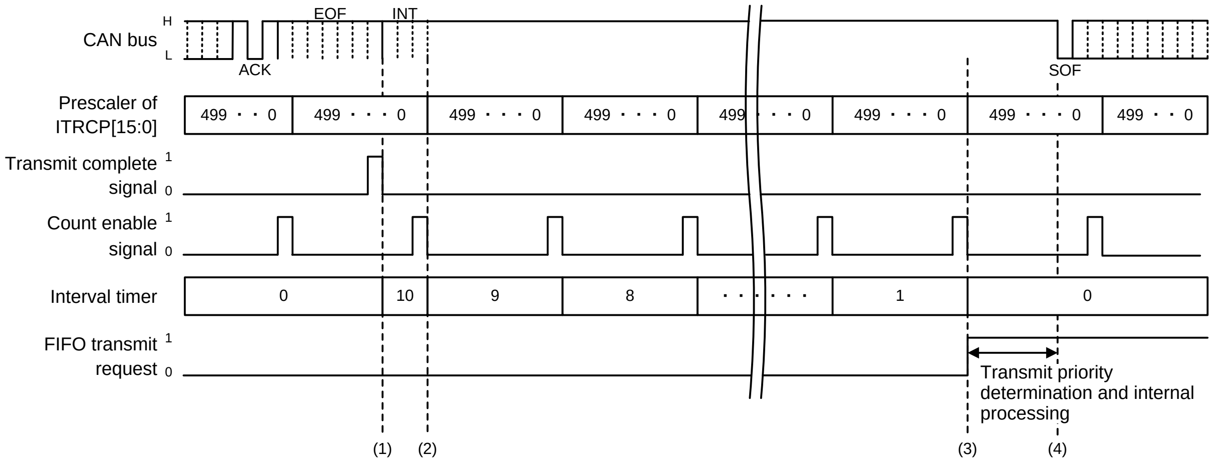


Note: ITRCP[15:0]: Bits in the RCFDCnCFDGCFG register
CFITR, CFITSS, CFITT[7:0]: Bits in the RCFDCnCFDCFCCk register
m = 0 to 7, k = 0 to 23

Note 1. Use this count source only for the channel does not handle the CAN FD frames in CAN FD mode.

Figure 24.10 Interval Timer Block Diagram

Figure 24.11, Interval Timer Timing Chart shows the interval timer timing diagram.



$$\text{Interval time (theoretical value)} = \frac{2}{\text{pclk frequency}} \times \text{(set ITRCP[15:0] value)} \times \text{set CFITT[7:0] value}$$

Note: ITRCP[15:0]: Bits in the RCFDCnCFDGCFG register (The set value is 500 in this figure.)
CFITT[7:0]: Bits in the RCFDCnCFDCFCCk register (The set value is 10 in this figure.)

Figure 24.11 Interval Timer Timing Chart

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by 1 upon the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 1164 pclk cycles may be generated.

24.7.4 Transmission Using Transmit Queues

3 to 32 buffers are allocated to a transmit queue for each channel, and transmit buffer ((32 × m) + 31) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RCFDCnCFDTXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RCFDCnCFDTXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, arbitration-lost, or the transition to channel halt mode when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

24.7.5 Transmit Data Padding (in CAN FD Mode and in CAN FD only Mode)

When the payload length indicated by the set DLC value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by CC_H.

This processing is performed in the following cases.

- Transmit/receive FIFO set to transmission or gateway mode:

When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RCFDCnCFDCFCCk register.

This processing is also performed in FD only mode, if a Classical Frame is configured with a DLC bigger than 8.

24.7.6 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 32 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RCFDCnCFDTHLCCm register. The THLEN bit in the RCFDCnCFDCFIDk register (k = 0 to 23) and the RCFDCnCFDTMIDp register (p = 0 to 255)determines whether transmit history data is stored for each message.

A timestamp value is always included in the transmit history data..

The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.

Storage of the transmit history data after the successful completion of transmission may take up to 448 pclk cycles.

- Buffer type

  001_B: Transmit buffer

  010_B: Transmit/receive FIFO buffer

  100_B: Transmit queue

- Buffer number:

  Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See **Table 24.120, Transmit History Data Buffer Numbers**.
- Label data: Label information of the transmit message
- Timestamp: Timestamp value of the transmit message

Table 24.120 Transmit History Data Buffer Numbers

Buffer Type / Buffer No.	001_B	010_B	100_B
00000_B	Transmit buffer 16 × m + 0	Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[4:0] bits in the RCFDCnCFDCFCCk register (k = 0 to 23)	Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission
00001_B	Transmit buffer 16 × m + 1		
00010_B	Transmit buffer 16 × m + 2		
00011_B	Transmit buffer 16 × m + 3		
00100_B	Transmit buffer 16 × m + 4		
00101_B	Transmit buffer 16 × m + 5		
00110_B	Transmit buffer 16 × m + 6		
00111_B	Transmit buffer 16 × m + 7		
01000_B	Transmit buffer 16 × m + 8		
01001_B	Transmit buffer 16 × m + 9		
01010_B	Transmit buffer 16 × m + 10		
01011_B	Transmit buffer 16 × m + 11		
01100_B	Transmit buffer 16 × m + 12		
01101_B	Transmit buffer 16 × m + 13		
01110_B	Transmit buffer 16 × m + 14		
01111_B	Transmit buffer 16 × m + 15		
10000_B	Transmit buffer 16 × m + 16		
10001_B	Transmit buffer 16 × m + 17		
10010_B	Transmit buffer 16 × m + 18		
10011_B	Transmit buffer 16 × m + 19		
10100_B	Transmit buffer 16 × m + 20		
10101_B	Transmit buffer 16 × m + 21		
10110_B	Transmit buffer 16 × m + 22		
10111_B	Transmit buffer 16 × m + 23		
11000_B	Transmit buffer 16 × m + 24		
11001_B	Transmit buffer 16 × m + 25		
11010_B	Transmit buffer 16 × m + 26		
11011_B	Transmit buffer 16 × m + 27		
11100_B	Transmit buffer 16 × m + 28		
11101_B	Transmit buffer 16 × m + 29		
11110_B	Transmit buffer 16 × m + 30		
11111_B	Transmit buffer 16 × m + 31		

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see **Section 24.6.1.6, Timestamp**.

Transmit history data can be read from the RCFDCnCFDTHLACC0m register and the RCFDCnCFDTHLACC1m register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

24.8 Gateway Function

When a transmit/receive FIFO buffer is set to gateway mode, receive messages can be transmitted from an arbitrary channel without CPU intervention.

When the CFM[1:0] bits in the RCFDCnCFDCFCCk register are set to 10_B (gateway mode) for the transmit/receive FIFO buffer selected by the RCFDCnCFDGAFLP1_j register of a channel being used for transmission, messages that pass through filter processing according to the receive rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.

Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes the target of transmit priority determination.

Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the

RCFDCnCFDCFCCk register to 0 and the CFEMP flag becomes 1 according to the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted and will not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when the message in it is being transmitted or will be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

24.8.1 CAN-CAN FD Gateway

When the gateway function is used, a frame to be transmitted can be replaced with a classical CAN frame or a CAN FD frame.

Setting the GWEN bit in the RCFDCnCFDCmFDCFG register to 1 enables the CAN-CAN FD gateway. The FDF and BRS bits in the transmit frame can be selected by the GWFDF and GWBRS bits in the RCFDCnCFDCmFDCFG register. When the DLC value of the received CAN frame is 1001_B or more and the GWFDF bit is 1 (CAN FD frame), the DLC value is replaced with 1000_B.

When the CAN-CAN FD gateway is enabled, do not perform routing for the following frames.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

24.9 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
  - Restricted operation mode
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test [CRC error test enabled]

24.9.1 Standard Test Mode

CRC tests are enabled in standard test mode. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RCFDCnCFDCmERFL register when the message is a classical CAN frame (CRC length = 15 bits) or in the CRCREG[20:0] bits in the RCFDCnCFDCmFDCRC register when the message is a CAN FD frame (CRC length = 17 or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see **Section 24.9.6.1, CRC Error Test**.

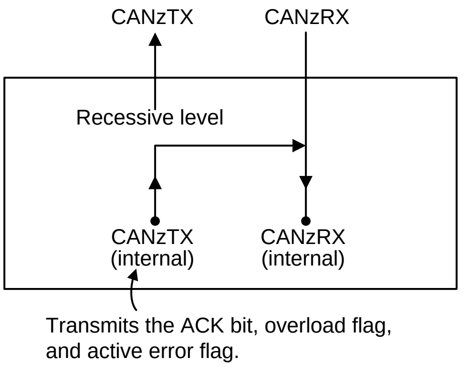
24.9.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

Figure 24.12, Connection when Listen-Only Mode is Selected shows the connection when listen-only mode is selected.



Note: z = 0 to 11

Figure 24.12 Connection when Listen-Only Mode is Selected

24.9.3 Self-Test Mode (Loopback Mode)

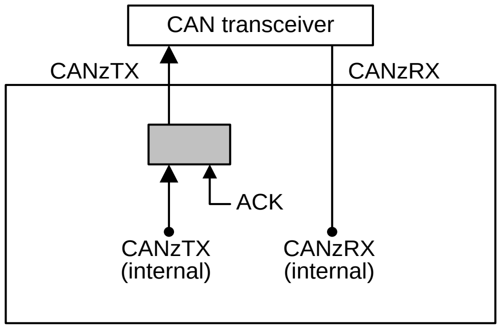
In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RCFDCnCFDGAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).

If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

24.9.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver. In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

Figure 24.13, Connection when Self-Test Mode 0 is Selected shows the connection when self-test mode 0 is selected.



Note: z = 0 to 11

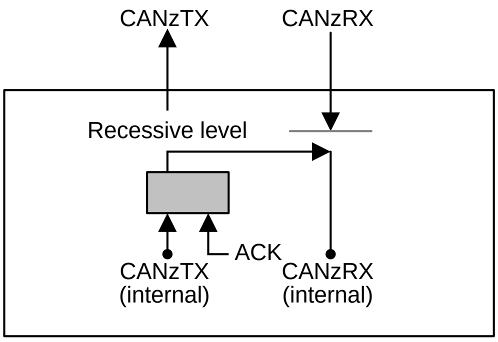
Figure 24.13 Connection when Self-Test Mode 0 is Selected

24.9.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANzTX pin (z = 0 to 11) to the internal CANzRX pin is performed. The external CANzRX pin input is isolated. The external CANzTX pin outputs only recessive bits.

Figure 24.14, Connection when Self-Test Mode 1 is Selected shows the connection when self-test mode 1 is selected.



Note: z = 0 to 11

Figure 24.14 Connection when Self-Test Mode 1 is Selected

24.9.4 Restricted Operation Mode (CAN FD Mode and CAN FD Only Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the bus idle state comes for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error.

A desired transmission request can be made for transmission without restrictions.

24.9.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page are set by the RTMPS[8:0] bits in the RCFDCnCFDGTSTCFG register. Data in the set page can be read from and written to the RCFDCnCFDRPGACCr register (r = 0 to 63).

The available total RAM size:

- RCFDC0 with 8 channels: 67840 bytes (10900_H).
- RCFDC0 with 6 channels: 50880 bytes ($C6C0_H$).
- RCFDC1 with 4 channels: 33920 bytes (8480_H).

24.9.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.

Set the channels not participating in test to Channel halt mode.

Figure 24.15, Connection for Inter-Channel Communication Test shows the connection for inter-channel communication test.

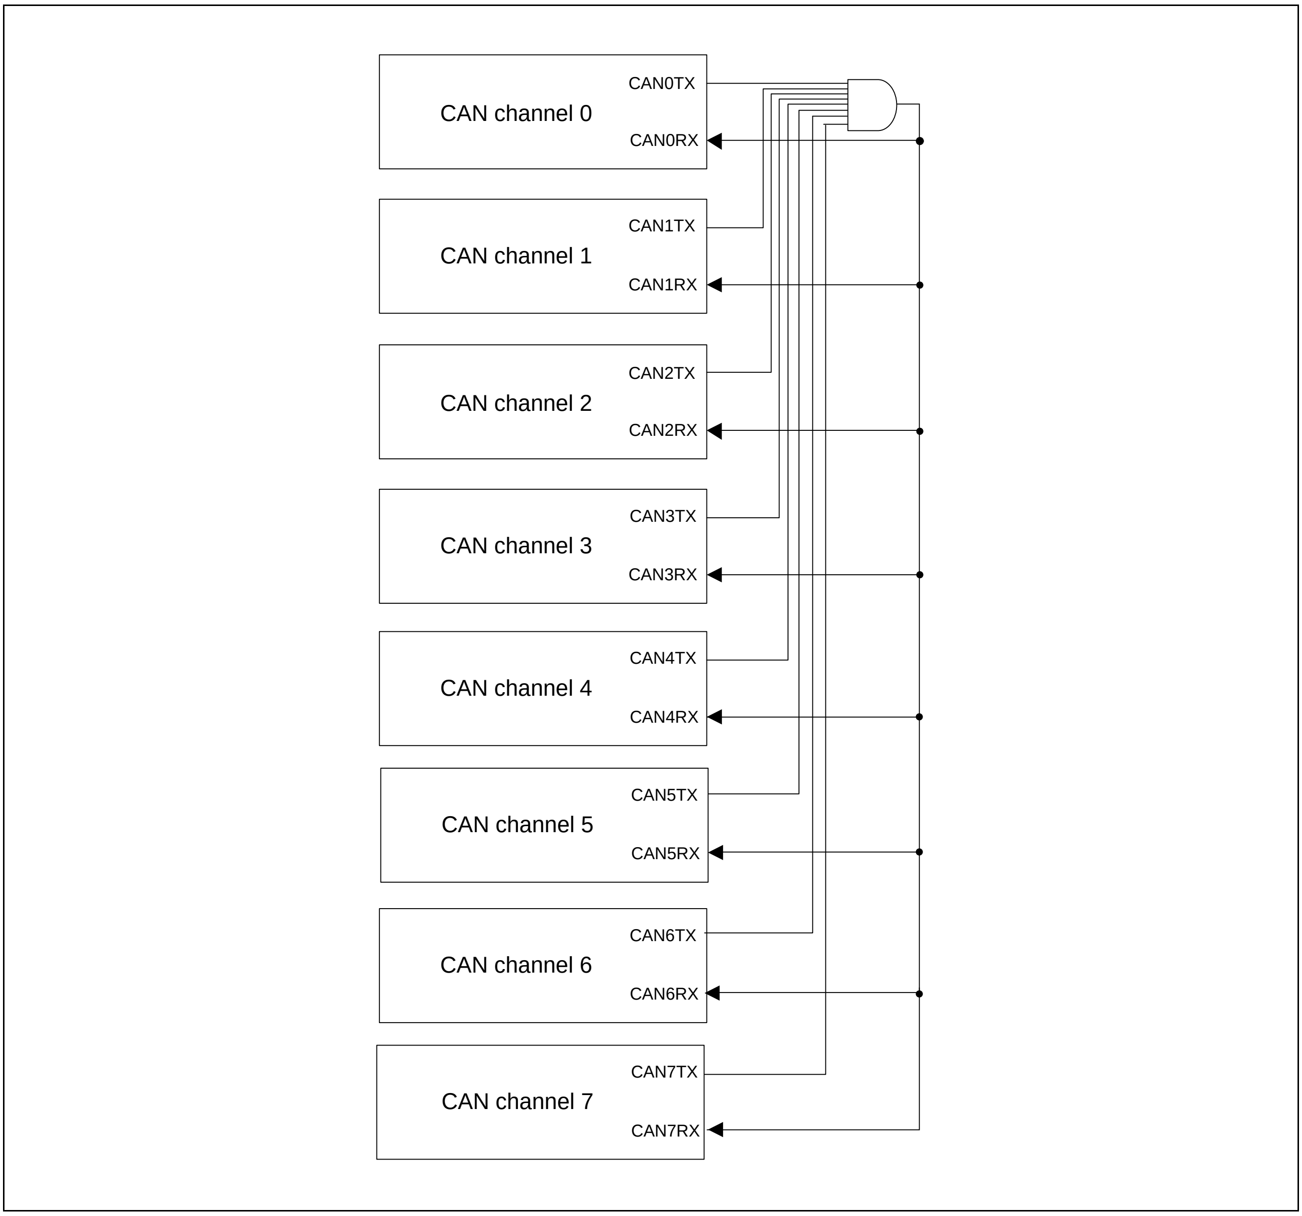


Figure 24.15 Connection for Inter-Channel Communication Test

24.9.6.1 CRC Error Test

A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

Preconditions

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

Procedure

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RCFDCnCFDC0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RCFDCnCFDTMCp register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RCFDCnCFDCmERFL register or the CRCREG[20:0] bits in the RCFDCnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RCFDCnCFDC0ERFL is 1 (CRC error detected).

The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID’s upper 5-bit value is 10000_B or ID’s upper 6-bit value is 011111_B is received.

The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

24.10 RS-CANFD Setting Procedure

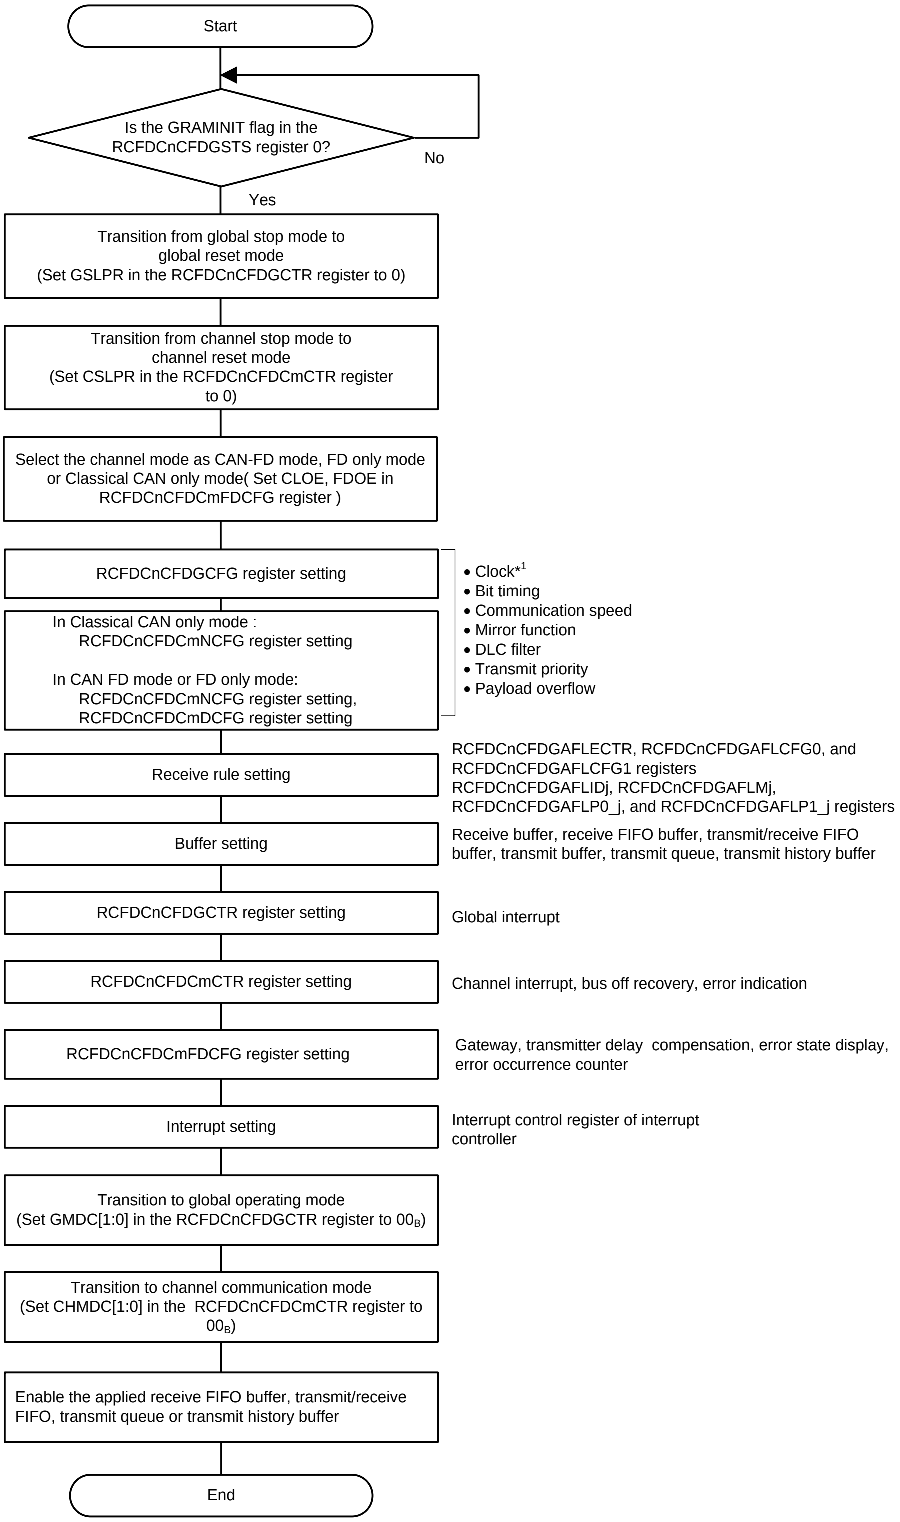
24.10.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset.

The RAM initialization time:

- RCFDC0 with 8 channels: 25730 pclk cycles.
- RCFDC0 with 6 channels: 19298 pclk cycles.
- RCFDC1 with 4 channels: 12866 pclk cycles.

The GRAMINIT flag in the RCFDCnCFDGSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 24.16, CAN Setting Procedure after the MCU is Reset** shows the CAN setting procedure after the MCU is reset.



Note: m = 0 to 7, j = 0 to 15

Note 1. For the setting of CAN clock frequency, see **Table 24.16, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1KH and RH850/F1KM**.

Figure 24.16 CAN Setting Procedure after the MCU is Reset

24.10.1.1 Clock Setting

Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk_xincan or clkc using the DCS bit in the RCFDCnCFDGCFG register.

24.10.1.2 Bit Timing Setting

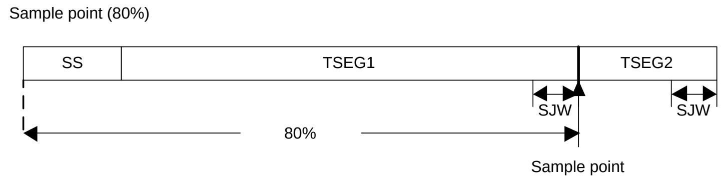
In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding registers for each channel. Two bit rates (nominal bit rate and data bit rate) are provided. Set the nominal bit rate in the RCFDCnCFDCmNCFG register and set the data bit rate in the RCFDCnCFDCmDCFG register. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RCFDCnCFDGCFG register. Set a division ratio by the NBRP[9:0] bits in the RCFDCnCFDCmNCFG register and the DBRP[7:0] bits in the RCFDCnCFDCmDCFG register (CANmTq(N) clock and CANmTq(D) clock).

Be sure to specify the same values for both NBRP[9:0] and DBRP[7:0].

To specify different values for the nominal bit rate and the data bit rate, change the values of the RCFDCnCFDCmNCFG.NTSEG1 and NTSEG2 bits and RCFDCnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

When the TDCE bit is set to 1(Transmitter delay compensation is enabled) in the RCFDCnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0] .

Figure 24.17, Bit Timing Chart shows the bit timing chart. **Table 24.121, Example of Bit Timing Settings** shows an example of bit timing setting.



Classical CAN only mode :

SS = 1 Tq fixed
Set TSEG1 to a range of 4 Tq to 128 Tq
Set TSEG2 to a range of 2 Tq to 32 Tq
Set SJW to a range of 1 Tq to 32 Tq
Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 161 Tq
TSEG1 > TSEG2 > SJW

CAN FD mode and CAN FD only mode :
<Nominal bit rate>
SS = 1 Tq fixed
Set TSEG1 to a range of 4 Tq to 128 Tq
Set TSEG2 to a range of 2 Tq to 32 Tq
Set SJW to a range of 1 Tq to 32 Tq
Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 161 Tq
TSEG1 > TSEG2 ≥ SJW

<Data bit rate>
SS = 1 Tq fixed
Set TSEG1 to a range of 2 Tq to 16 Tq
Set TSEG2 to a range of 2 Tq to 8 Tq
Set SJW to a range of 1 Tq to 8 Tq
Set SS + TSEG1 + TSEG2 to a range of 5 Tq to 25 Tq
TSEG1 ≥ TSEG2 ≥ SJW

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space. Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (Time segment 1):
  TSEG1 is a segment that absorbs physical delay on the CAN network. The physical delay on the CAN network is twice the total of the delay on the CAN bus, the delay in the input comparator, and the delay in the output driver.
- TSEG2 (Time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (Resynchronization jump width)
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

Figure 24.17 Bit Timing Chart

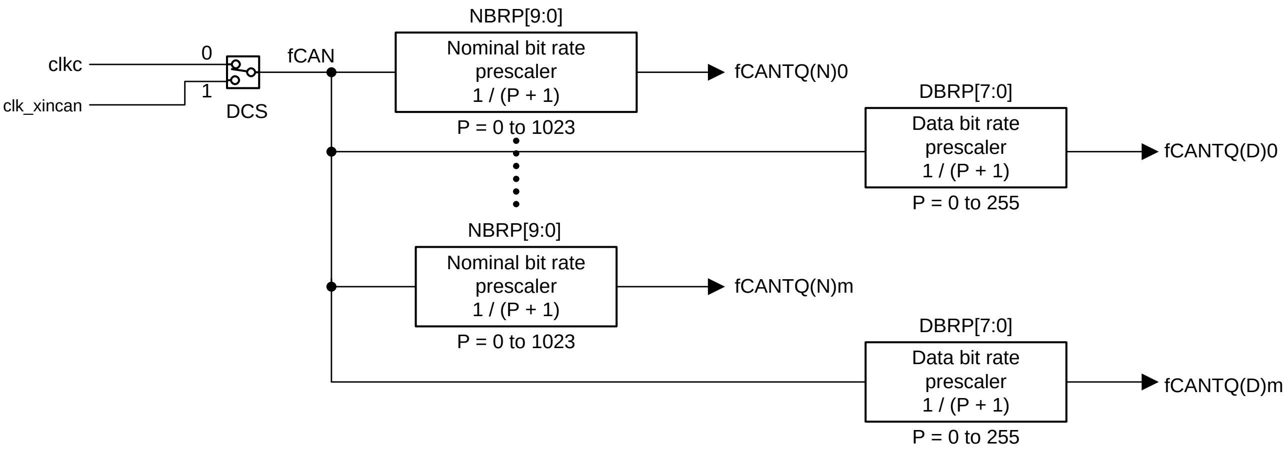
Table 24.121 Example of Bit Timing Settings

1 Bit	Set Value (Tq)				Sample Point (%) Note: See **Table 24.24, RS-CANFD Module Specifications**.
	SS	TSEG1	TSEG2	SJW	
8 Tq	1	4	3	1	62.50
	1	5	2	1	75.00
10 Tq	1	6	3	1	70.00
	1	7	2	1	80.00
16 Tq	1	10	5	1	68.75
	1	11	4	1	75.00
20 Tq	1	12	7	1	65.00
	1	13	6	1	70.00
50 Tq	1	39	10	4	80.00

24.10.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. Set two types of transmission rate (arbitration phase and data phase) for each channel.

Figure 24.18, CAN Clock Control Block Diagram shows the CAN clock control block diagram, and **Table 24.122, Example of Communication Speed Setting (Classical CAN only mode)** shows an example of the communication speed setting.



$$\text{Nominal bit rate} = \frac{\text{fCAN}}{\text{Nominal bit rate prescaler division value} \times (\text{Tq count of 1 nominal bit time})}$$

$$\text{Data bit rate} = \frac{\text{fCAN}}{\text{Data bit rate prescaler division value} \times (\text{Tq count of 1 data bit time})}$$

Note: m = 0 to 7
DCS: Bit in the RCFDCnCFDGCFG register
NBRP[9:0]: Bits in the RCFDCnCFDCmNCFG register
DBRP[7:0]: Bits in the RCFDCnCFDCmDCFG register

125 Kbps	8 Tq (40) 20 Tq (16)	8 Tq (32) 16 Tq (16)	8 Tq (24) 12 Tq (16) 24 Tq (8)	10 Tq (16) 20 Tq (8)	8 Tq (16) 16 Tq (8)	8 Tq (8) 16 Tq (4)

Table 24.123 Example of Transmission Rate Setting (Nominal Bit Rate and Data Bit Rate in CAN FD mode and CAN FD only mode)

fCAN / Communication Rate	40 MHz	20 MHz
Nominal bit rate 500 kbps Data bit rate 5 Mbps	Nominal bit rate 80 Tq (1) Data bit rate 8Tq (1)	None
Nominal bit rate 1M bps Data bit rate 2 Mbps	Nominal bit rate 40 Tq (1) Data bit rate 20Tq (1)	Nominal bit rate 20 Tq (1) Data bit rate 10 Tq (1)

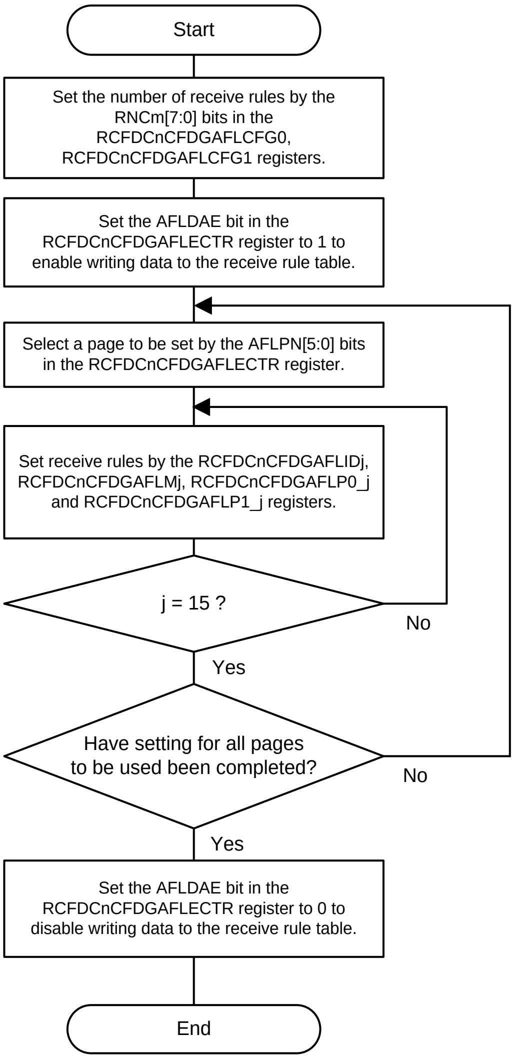
Note: Values in ( ) are baud rate prescaler division values.

24.10.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 63 (for 8-channel unit) by the AFLPN[5:0] bits in the RCFDCnCFDGAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.

Figure 24.19, Receive Rule Setting Procedure shows the receive rule setting procedure.



Note: m = 0 to 7, j = 0 to 15

Figure 24.19 Receive Rule Setting Procedure

24.10.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. And also set the payload storage size. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

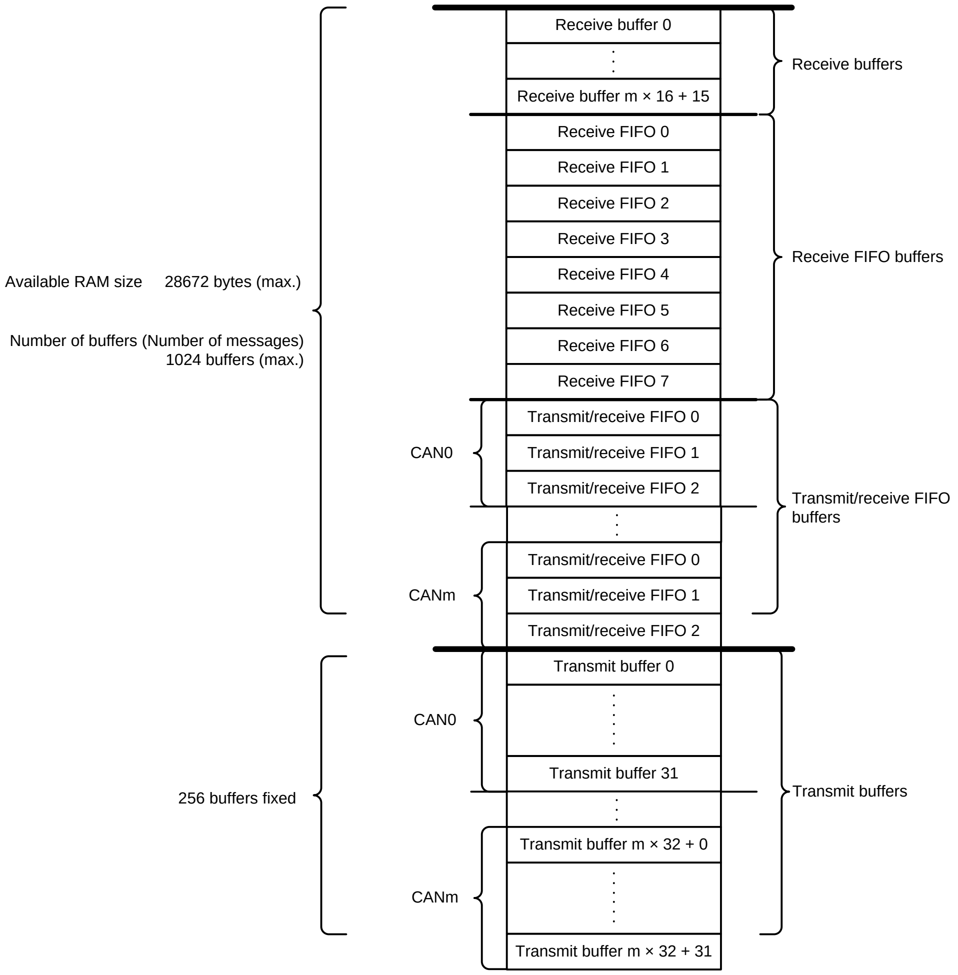
Up to 28672 bytes of the RAM can be used in receive buffers and FIFO buffers. Configure the buffers so that the following conditions are met.

Number of receive buffers × (12 + payload storage size) + total of (number of depth × (12 + payload storage size)) of receive FIFO buffers x + total of (number of depth × (12 + payload storage size)) of transmit/receive FIFO buffers k ≤ 28672 bytes

NOTE

The size of the RAM is for the RS-CANFDs that has 8 channels (m = 0 to 7) of IP design logic.
Regard the size of the RAM as the ones corresponding to your target product (3584 × (m+1) bytes).

Figure 24.20, Buffer Configuration shows the buffer configuration. **Figure 24.21, Buffer Setting Procedure** shows the buffer setting procedure.

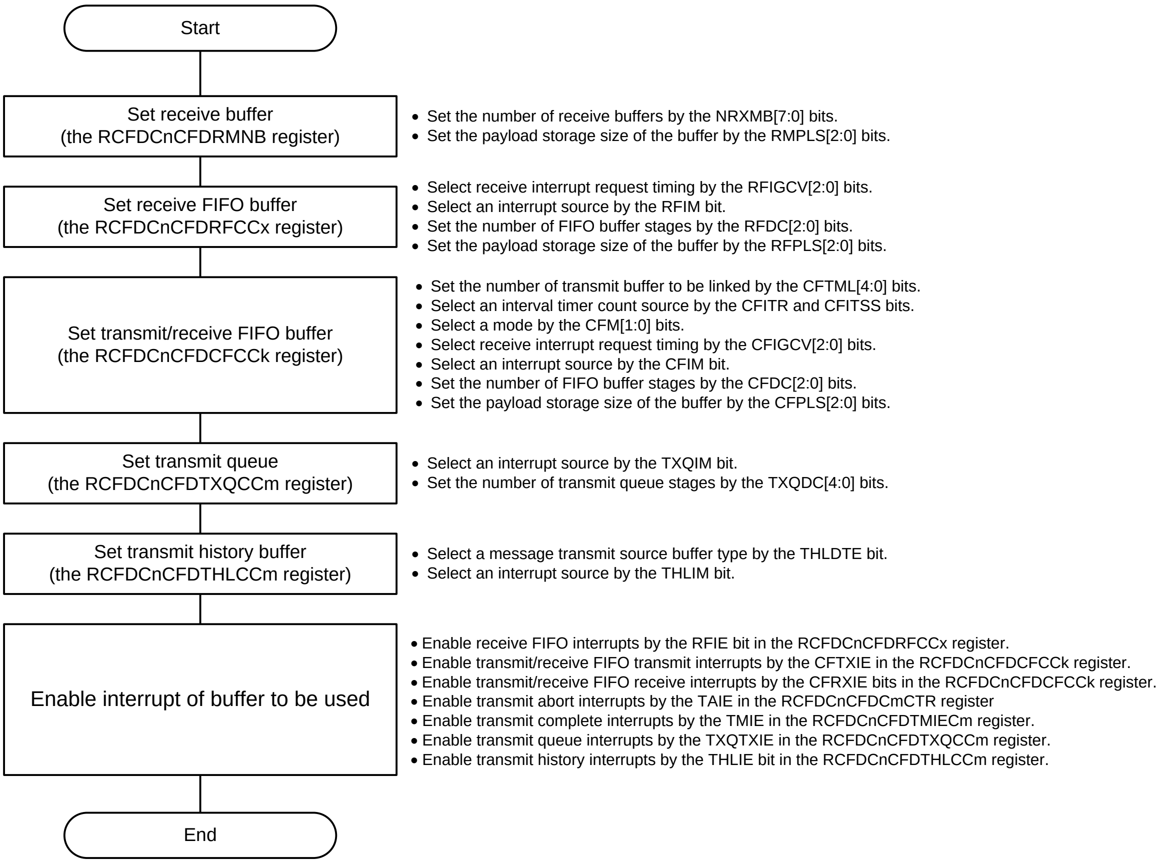


Note: m = 0 to 7

Figure 24.20 Buffer Configuration

CAUTION

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.



Note: k = 0 to 23, x = 0 to 7

Figure 24.21 Buffer Setting Procedure

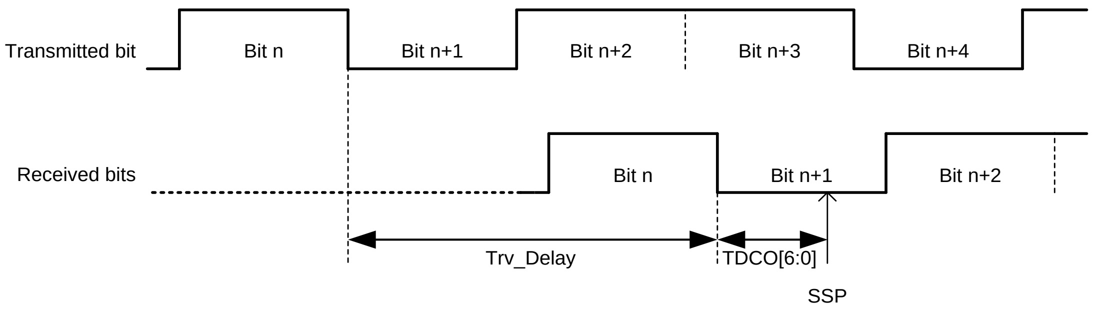
24.10.1.6 Transmitter Delay Compensation

A high baud rate is used in the data phase in CAN FD mode and CAN FD only mode. Transmitter delay compensation is provided as a function to accept propagation delay in data phase.

To use this function, set the TDCE bit in the RCFDCnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RCFDCnCFDCmFDCFG register.

When the TDCOC bit is 0, the SSP timing equals the total value of the delay measured by the RS- CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of Tq.)

Usually, the TDCO[6:0] value must be equal to SS + TSEG1, the sample point timing



Note: Bit n: Bit in the data phase
TDCO[6:0]: Bits in the RCFDCnCFDCmFDCFG register

Figure 24.22 SSP timing

When the TDCOC bit is 1, the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RCFDCnCFDCmDCFG register is larger than 0, the TDCO[6:0] value is also rounded off to the nearest integer of Tq.)

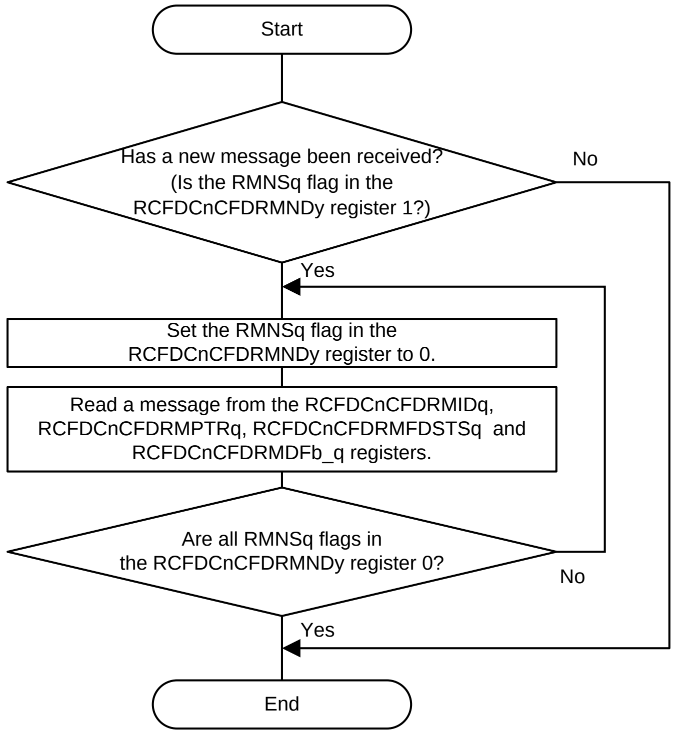
The RS-CANFD module compensates a delay up to (3 CANm bit time - 2 fCAN). (CANm bit time is data bit rate value.)

When the TDCE bit is set to 1(Transmitter delay compensation is enabled) in the RCFDCnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

24.10.2 Reception Procedure

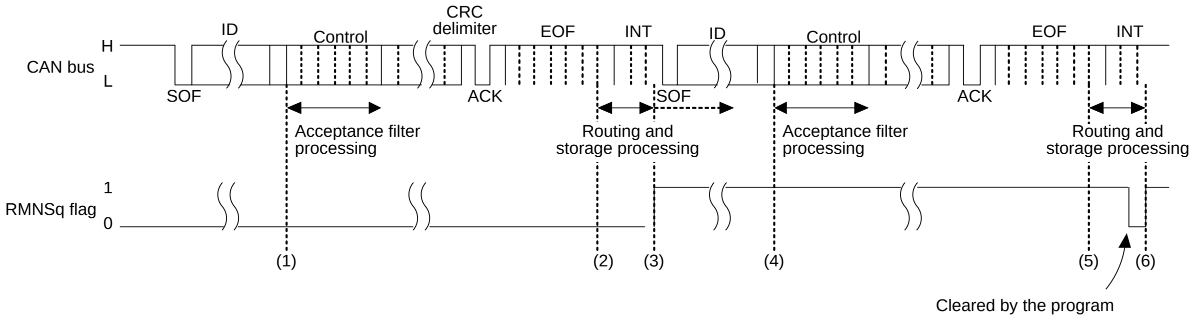
24.10.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RCFDCnCFDRMNDy register (y = 0 to 3, q = 0 to 127) is set to 1 (receive buffer q contains a new message). Messages can be read from registers RCFDCnCFDRMIDq, RCFDCnCFDRMPTRq, RCFDCnCFDRMFDSTSq, and RCFDCnCFDRMDFb_q (b = 0 to 15). If the next message is received before reading the message out of buffer, the message will be overwritten. **Figure 24.23, Receive Buffer Reading Procedure** shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RCFDCnCFDRMIDq, RCFDCnCFDRMPTRq, RCFDCnCFDRMFDSTSq, and RCFDCnCFDRMDFb_q.



Note: y = 0 to 3, q = 0 to 127, b = 0 to 15

Figure 24.23 Receive Buffer Reading Procedure



Note: y = 0 to 3, q = 0 to 127
RMNSq: Flag in the RCFDCnCFDRMNDy register

Figure 24.24 Receive Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RCFDCnCFDGCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RCFDCnCFDRMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RCFDCnCFDGCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag can not be cleared to 0 during storage of messages.

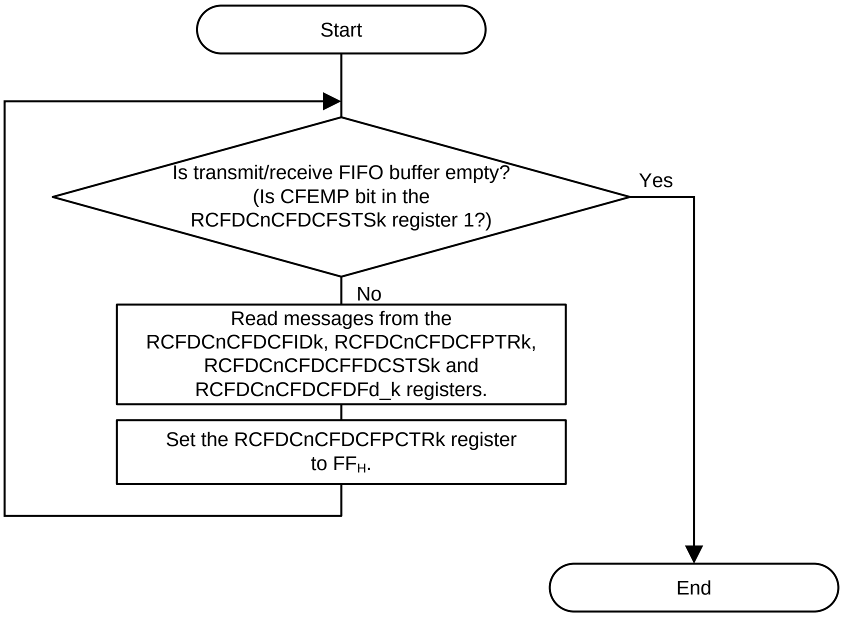
24.10.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message counter (RFMC[7:0] bits in the RCFDCnCFDRFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RCFDCnCFDCFSTSk register (k = 0 to 23)) is incremented by 1. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RCFDCnCFDRFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RCFDCnCFDCFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RCFDCnCFDRFIDx, RCFDCnCFDRFPTRx, RCFDCnCFDRFFDSTSx, and RCFDCnCFDRFDFd_x (d = 0 to 15) registers for receive FIFO buffers, or from the RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk and RCFDCnCFDCFDFd_k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RCFDCnCFDRFCCx register or the CFDC[2:0] bits in the RCFDCnCFDCFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RCFDCnCFDRFSTSx register or the CFEMP flag in the RCFDCnCFDCFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RCFDCnCFDRFSTSx register or CFRXIF flag in the RCFDCnCFDCFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.



Note: k = 0 to 23, d = 0 to 15

Figure 24.25 Transmit/Receive FIFO Buffer Reading Procedure

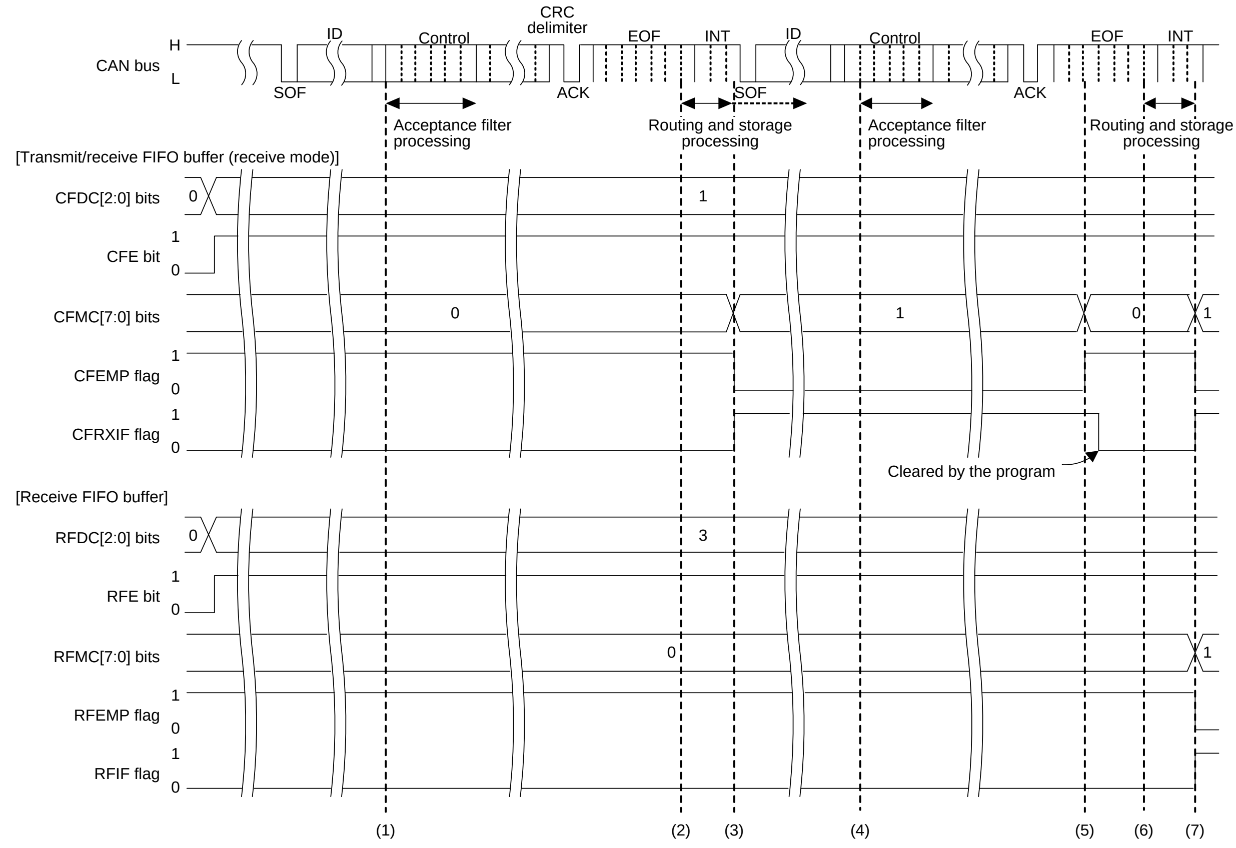
When reading a message, do not read the RCFDCnCFDRFDFd_x or RCFDCnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RCFDCnCFDRFCCx register or the CFPLS[2:0] bits in the RCFDCnCFDCFCCk register.

Table 24.124 Payload Storage Area of Receive FIFO Buffer

Set RFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF1_x
001_B	12 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF2_x
010_B	16 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF3_x
011_B	20 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF4_x
100_B	24 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF5_x
101_B	32 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF7_x
110_B	48 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF11_x
111_B	64 bytes	RCFDCnCFDRFDF0_x to RCFDCnCFDRFDF15_x

Table 24.125 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF1_k
001_B	12 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF2_k
010_B	16 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF3_k
011_B	20 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF4_k
100_B	24 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF5_k
101_B	32 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF7_k
110_B	48 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF11_k
111_B	64 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF15_k



Note: CFDC[2:0], CFE: Bits in the RCFDCnCFDCFCCk register
CFMC[7:0], CFEMP, CFRXIF: Flags in the RCFDCnCFDCFSTSk register
RFDC[2:0], RFE: Bits in the RCFDCnCFDRFCCx register
RFMC[7:0], RFEMP, RFIF: Flags in the RCFDCnCFDRFSTSx register
k = 0 to 23, x = 0 to 7

Figure 24.26 FIFO Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RCFDCnCFDGCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RCFDCnCFDCFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RCFDCnCFDCFCCk register is 001_B or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RCFDCnCFDCFSTSk register is incremented and becomes 01_H. When the CFIM bit in the RCFDCnCFDCFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RCFDCnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, and RCFDCnCFDCFDFd_k registers and write FF_H to the RCFDCnCFDCFPCTRk register. This causes the CFMC[7:0] bits in the

RCFDCnCFDCFSTSk register to be decremented. When CFMC[7:0] becomes 00_H, the CFEMP flag in the RCFDCnCFDCFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RCFDCnCFDGCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001_B or more. The CFMC[7:0] bit value is incremented by 1 to be 01_H. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RCFDCnCFDRFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RCFDCnCFDRFCCx register are set to 001_B or more. The RFMC[7:0] bits in the RCFDCnCFDRFSTSx register are set to 01_H by being incremented by 1. When the RFIM bit in the RCFDCnCFDRFCCx register is set to 1 (an interrupt request occurs each time a message has been received), the RFIF flag in the RCFDCnCFDRFSTSx register is set to 1 (a receive FIFO interrupt request is present).

24.10.2.3 FIFO Buffer Reading Procedure by DMA Transfer

The following FIFO buffers can be read by DMA transfer.

- RH850/F1KH-D8, RH850/F1KM-S4:
  All receive FIFO buffers x (x = 0 to 7)
  RH850/F1KM-S1:
  The receive FIFO buffers x except for the following (x = 0 to 7)
  The receive FIFO buffer x DMA enable (RCFDCnCFDCDTCT) and the receive FIFO buffer x
  DMA status (RCFDCnCFDCDTSTS) (x = 0 to 5)
- The first transmit/receive FIFO buffer k allocated to channel m (k = 3 × m, m = 0 to 7)

The DMA enable bit (RFDMAEx or CFDMAEm bit in the RCFDCnCFDCDTCT register) can be set at any time. However, before setting the DMA enable bit to 1 (to enable DMA transfer requests), set the receive interrupt enable bit (RFIE bit in the RCFDCnCFDRFCCx register or CFRXIE bit in the RCFDCnCFDCFCCk register) of related FIFO buffers to 0 (to disable interrupts). When DMA transfer requests are enabled, do not write a value to the FIFO control register (RCFDCnCFDRFCCx register or RCFDCnCFDCFCCk register).

When an unread message is remaining in a DMA transfer-enabled FIFO buffer, a DMA transfer request trigger is generated. Specify the address of the FIFO access register address*[1] for the transfer source address, and adjust the transfer size so that data can be read to the end of the payload storage area with a single trigger. The end of the payload storage area depends on the payload storage size specified by the RFPLS[2:0] bits in the RCFDCnCFDRFCCx register or the CFPLS[2:0] bits in the RCFDCnCFDCFCCk register.

After the end of the payload stored in the FIFO buffer has been read, the RFMC[7:0] value in the RCFDCnCFDRFSTSx register or the CFMC[7:0] value in the RCFDCnCFDCFSTSk register is automatically decremented by 1. After that, if an unread message is remaining in the FIFO buffer, a trigger is generated again.

When the RFDMAEx or CFDMAEm bit is set to 0 (to disable DMA transfer requests) during DMA transfer, wait until the DMA transfer status (RFDMASTSx or CFDMASTSm bit in the RCFDCnCFDCDTSTS register) is cleared to 0 (DMA transfer disabled), and then start the next processing (enabling DMA transfer again etc.). When disabling DMA transfer, examine how to process a message remaining in the FIFO buffer and a newly arriving message. When the FIFO buffer is enabled, it continues to receive messages.

Note 1.

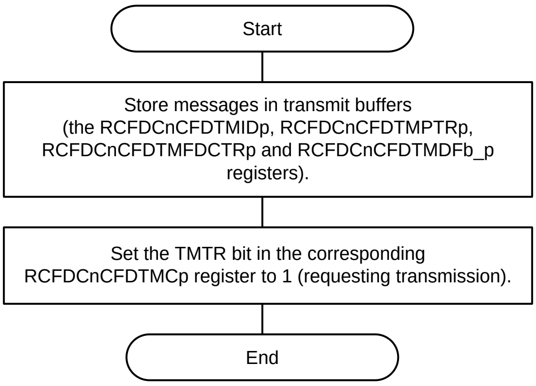
24.10.3 Transmission Procedure

24.10.3.1 Procedure for Transmission from Transmit Buffers

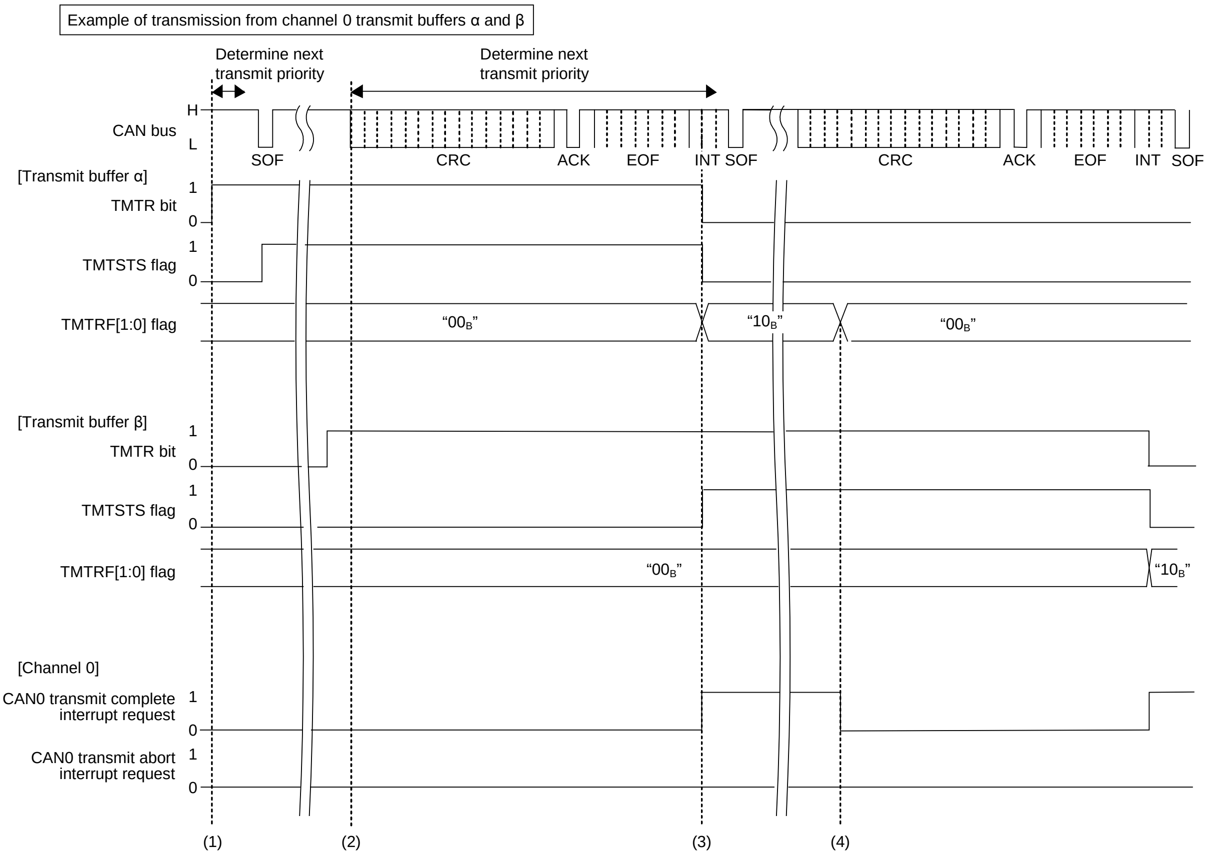
Figure 24.27, Procedure for Transmission from Transmit Buffers shows the procedure for transmission from transmit buffers.

Figure 24.28, Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully) shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 24.29, Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.



Note: p = 0 to 255, b = 0 to 15

Figure 24.27 Procedure for Transmission from Transmit Buffers



Note: α = 0 to 31, β = 0 to 31

TMTR: Bit in the RCFDCnCFDTMCp register

TMTSTS, TMTRF[1:0]: Flags in the RCFDCnCFDTMSTSp register

Figure 24.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) When the TMTR bit in the RCFDCnCFDTMCα register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer α is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RCFDCnCFDTMSTSα register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

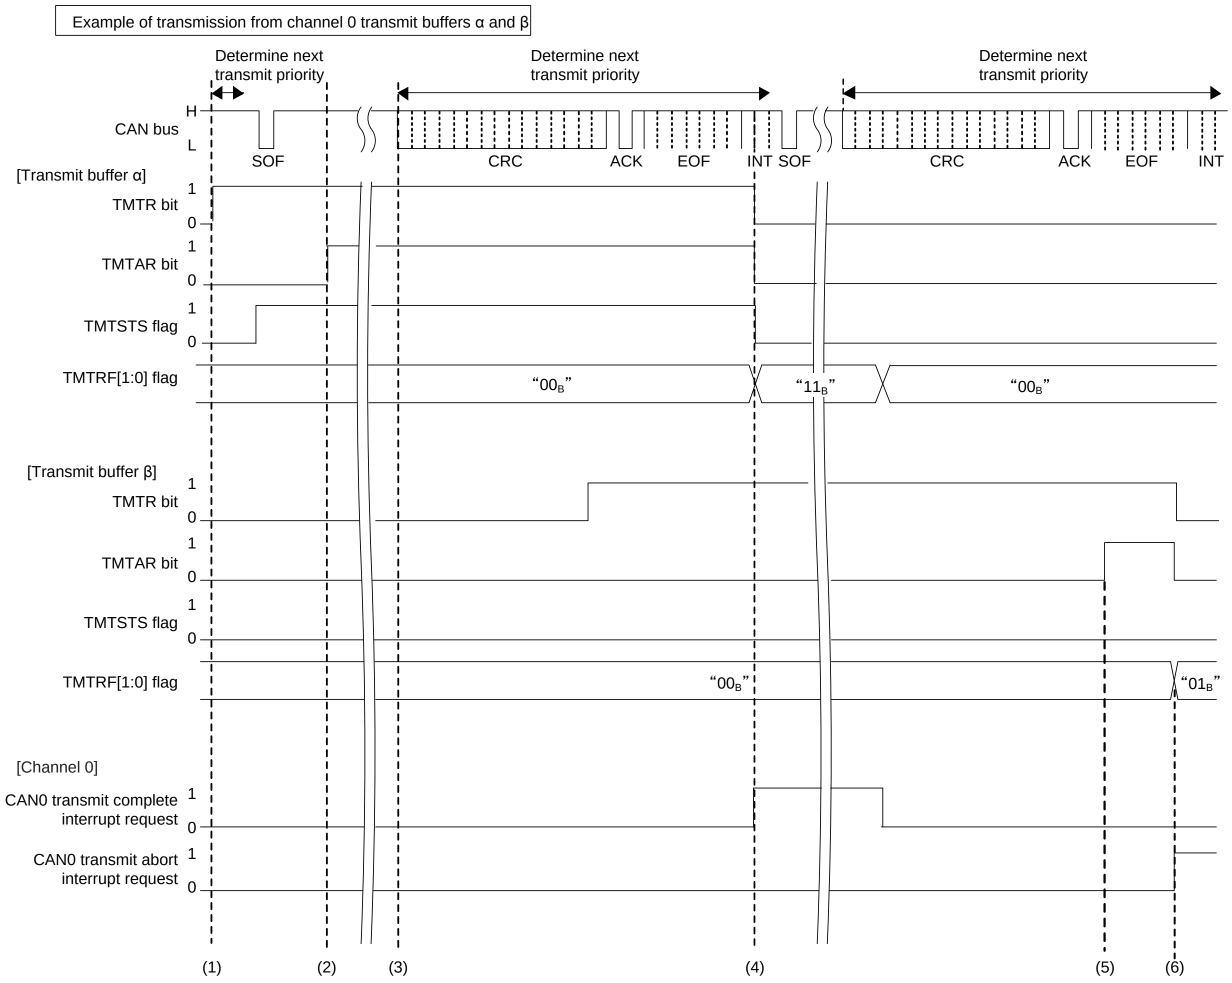
(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur between transmissions because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RCFDCnCFDTMSTSα register is set to 10_B (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RCFDCnCFDTMCα register are cleared to 0. When the TMIEα bit in the RCFDCnCFDTMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to 00_B. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00_B.

If an arbitration-lost occurs after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest- priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted.



Note: α = 0 to 31, β = 0 to 31

TMTR, TMTAR: Bits in the RCFDCnCFDTMCp register

TMTSTS, TMTRF[1:0]: Flags in the RCFDCnCFDTMSTSp register

Figure 24.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) When the TMTR bit in the RCFDCnCFDTMCα register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer α is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RCFDCnCFDTMSTSα register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts at the first bit of the CRC field for the next transmission. In this timing chart, buffer β is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RCFDCnCFDTMSTSα register is set to 11_B (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RCFDCnCFDTMCα register are cleared to 0. When the TMIEα value in the RCFDCnCFDTMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01_B. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01_B. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RCFDCnCFDCmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B.

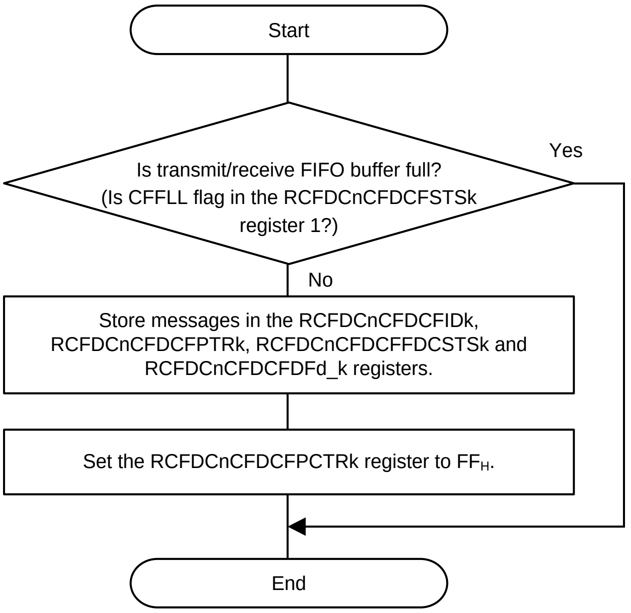
If an arbitration loss occurs after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted.

24.10.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure 24.30, Procedure for Transmission from Transmit/Receive FIFO Buffers shows the procedure for transmission from transmit/receive FIFO buffers.

Figure 24.31, Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully) shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 24.32, Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.



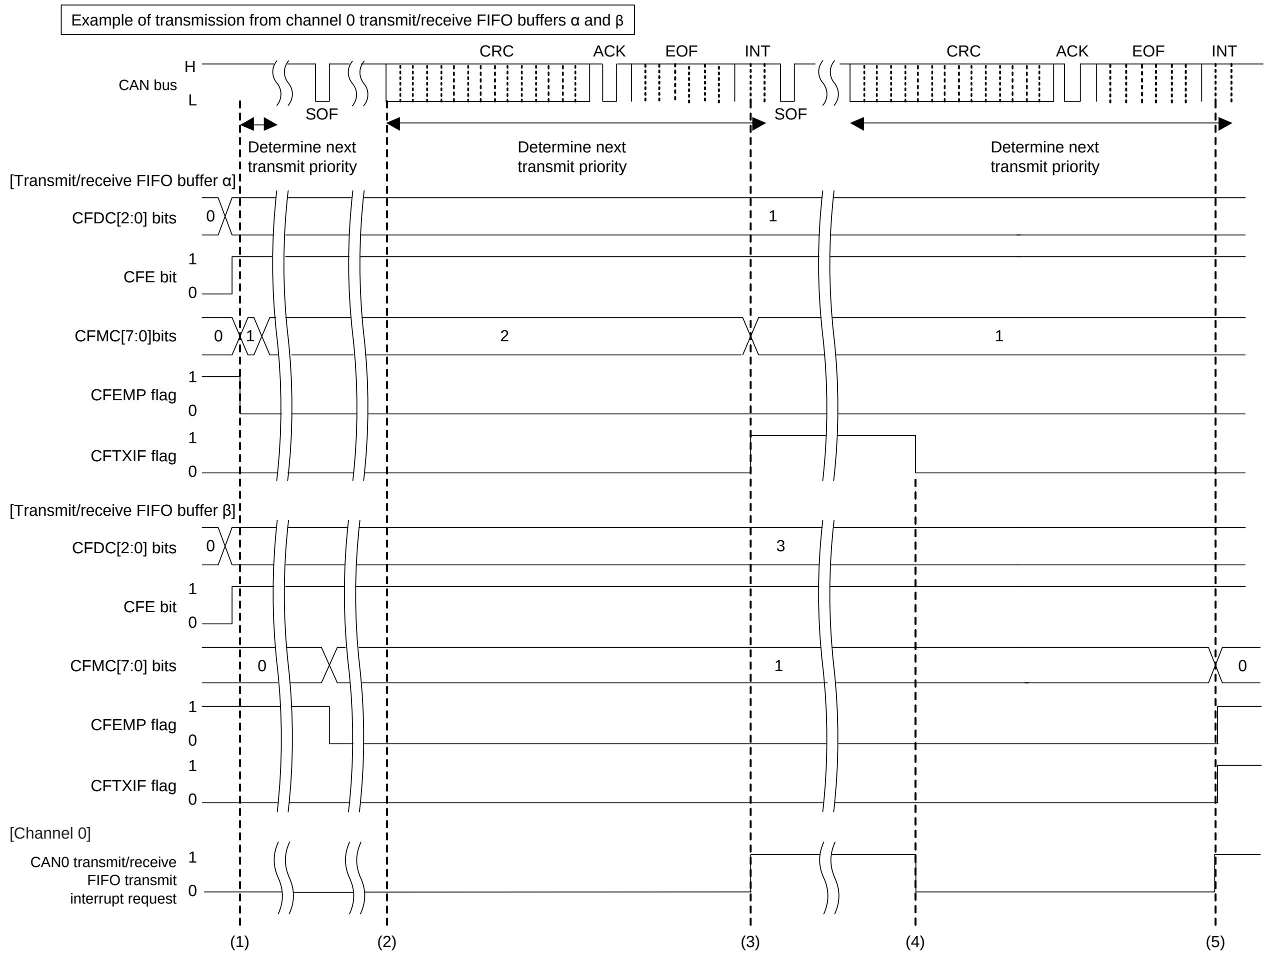
Note: k = 0 to 23, d = 0 to 15

Figure 24.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

When storing a message, do not write a value to the RCFDCnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RCFDCnCFDCFCCk register.

Table 24.126 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF1_k
001_B	12 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF2_k
010_B	16 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF3_k
011_B	20 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF4_k
100_B	24 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF5_k
101_B	32 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF7_k
110_B	48 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF11_k
111_B	64 bytes	RCFDCnCFDCFDF0_k to RCFDCnCFDCFDF15_k



Note: α = 0 to 2, β = 0 to 2

CFDC[2:0],CFE: Bits in the RCFDCnCFDCFCCk register

CFMC[7:0], CFEMP, CFTXIF: Flags in the RCFDCnCFDCFSTSk register

Figure 24.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RCFDCnCFDCFCCα register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RCFDCnCFDCFCCα register is 001_B (4 messages) or more and the CFMC[7:0] value in the RCFDCnCFDCFSTSα register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer α of channel 0.

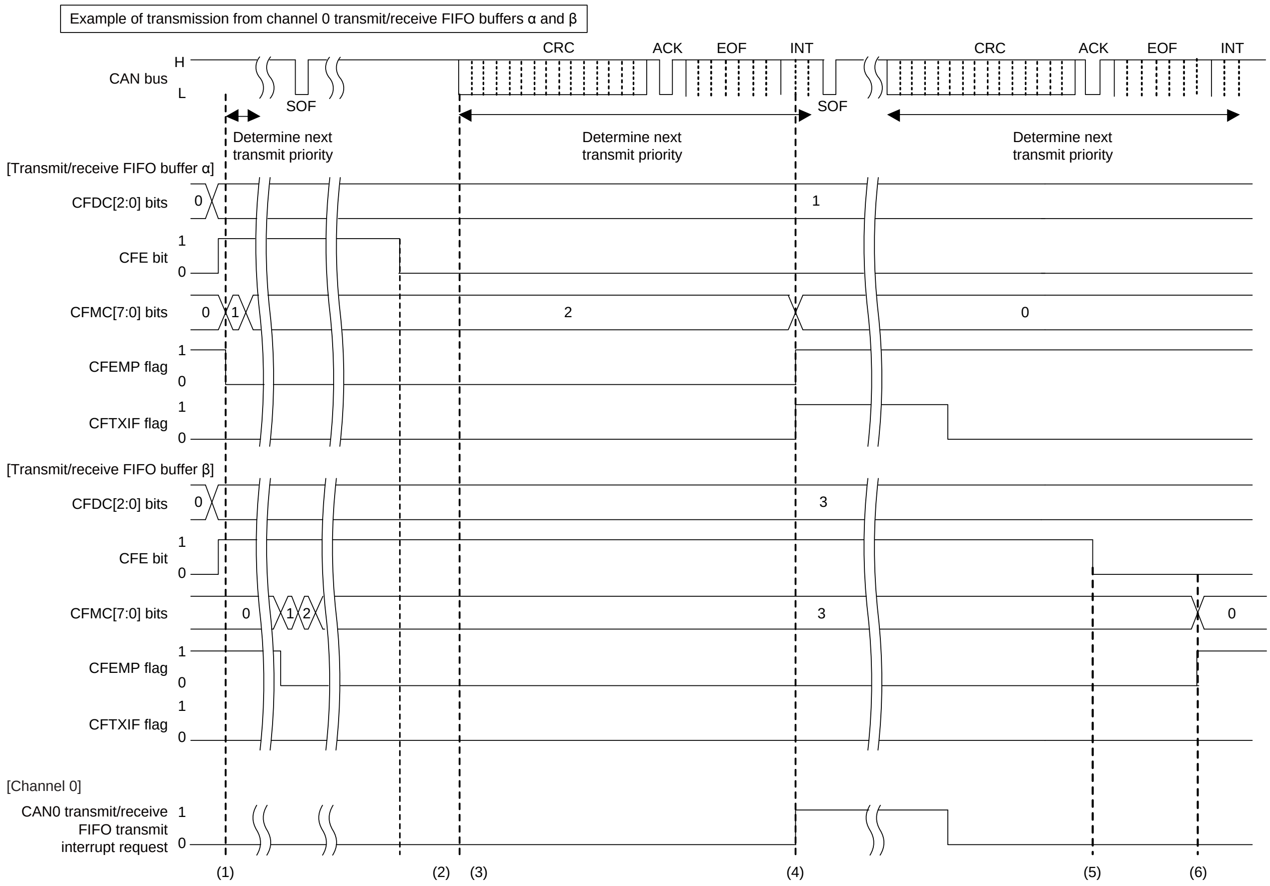
(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the CFMC[7:0] value in the RCFDCnCFDCFSTSα register is decremented by 1. Setting the CFIM bit in the RCFDCnCFDCFCCα register to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RCFDCnCFDCFSTSα register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer β of channel 0 completes and the CFMC[7:0] value in the RCFDCnCFDCFSTSβ register is decremented by 1. The CFMC[7:0] bits are cleared to 00_H and therefore the CFEMP flag in the RCFDCnCFDCFSTSβ register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RCFDCnCFDCFSTSα and RCFDCnCFDCFSTSβ registers is set to 1 (the transmit/receive FIFO buffer is full).



Note: α = 0 to 2, β = 0 to 2
CFDC[2:0], CFE: Bits in the RCFDCnCFDCFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RCFDCnCFDCFSTSk register

Figure 24.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) While the CAN bus is idle, when the CFE bit in the RCFDCnCFDCFCCα register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RCFDCnCFDCFCCα register is 001_B (4 messages) or more and the CFMC[7:0] value in the RCFDCnCFDCFSTSα register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer α of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer β is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

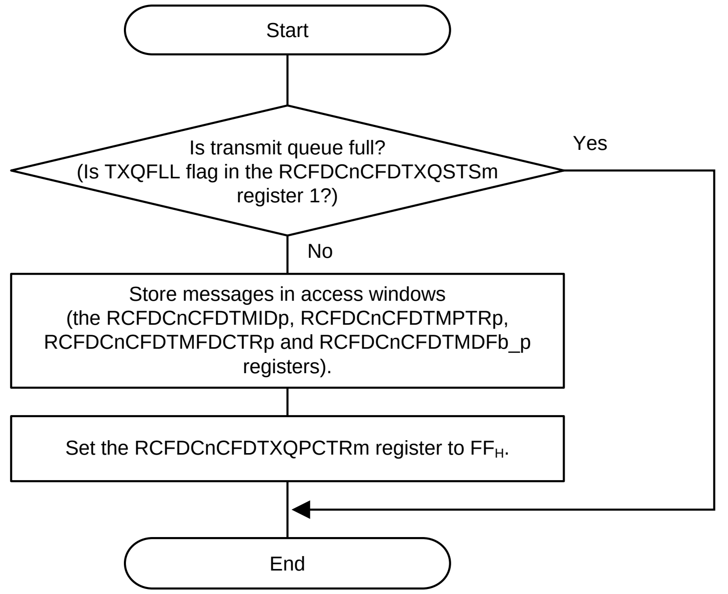
(4) When transmit completes successfully, the CFMC[7:0] value is cleared to 00_H. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RCFDCnCFDCFSTSα register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer β), transmit/receive FIFO buffers β cannot be disabled immediately even if the CFE bit in the RCFDCnCFDCFCCβ register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RCFDCnCFDCFSTSβ register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffers β are disabled and the CFMC[7:0] bits in the RCFDCnCFDCFSTSβ register are cleared to 00_H and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer β is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer β is immediately disabled. (The CFMC[7:0] bits are cleared to 00_H and the CFEMP flag is set to 1.)

24.10.3.3 Procedure for Transmission from the Transmit Queue

Figure 24.33, Procedure for Transmission from the Transmit Queue shows the procedure for transmission from the transmit queue.



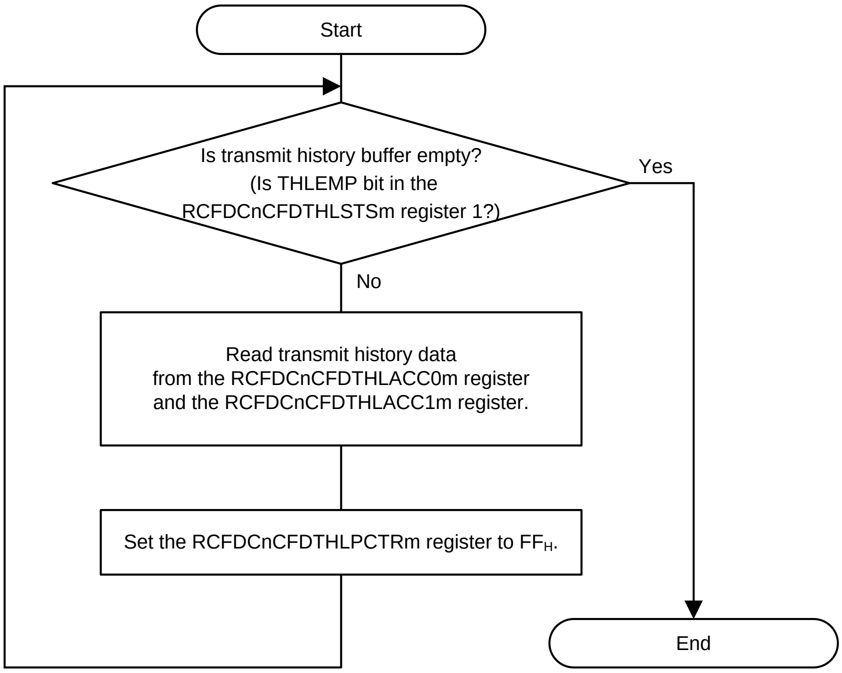
Note: p = m × 32 + 31, m = 0 to 7

Figure 24.33 Procedure for Transmission from the Transmit Queue

24.10.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RCFDCnCFDTHLACC0m register and the RCFDCnCFDTHLACC1m register.

The next data can be accessed by writing FF_H to the corresponding RCFDCnCFDTHLPCTRm register (m = 0 to 7) after reading a set of data. **Figure 24.34, Transmit History Buffer Reading Procedure** shows the transmit history buffer reading procedure.



Note: m = 0 to 7

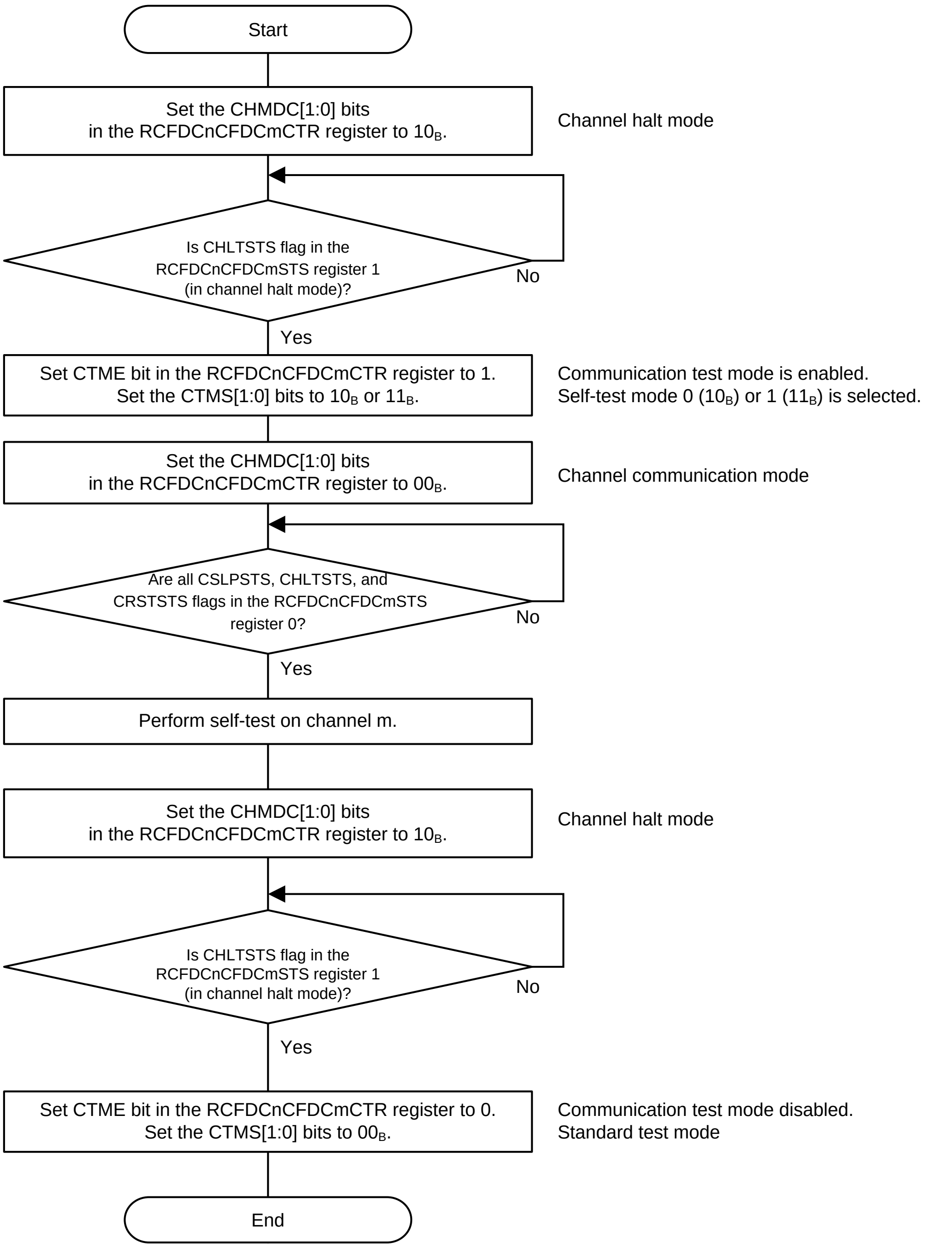
Figure 24.34 Transmit History Buffer Reading Procedure

24.10.4 Test Settings

24.10.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

Figure 24.35, Self-Test Mode Setting Procedure shows the self-test mode setting procedure.



Note: m = 0 to 7

Figure 24.35 Self-Test Mode Setting Procedure

24.10.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 24.127, Protection Release Data for Test Function** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RCFDCnCFDGLOCKK register, then set the target test bit to 1.

Table 24.127 Protection Release Data for Test Function

Test Function	Protection Release Data 1	Protection Release Data 2	Target Bit
RAM test	7575_H	$8A8A_H$	RTME bit in the RCFDCnCFDGTSTCTR register

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data1.
Figure 24.36, Protection Release Procedure shows the procedure for releasing the protection.

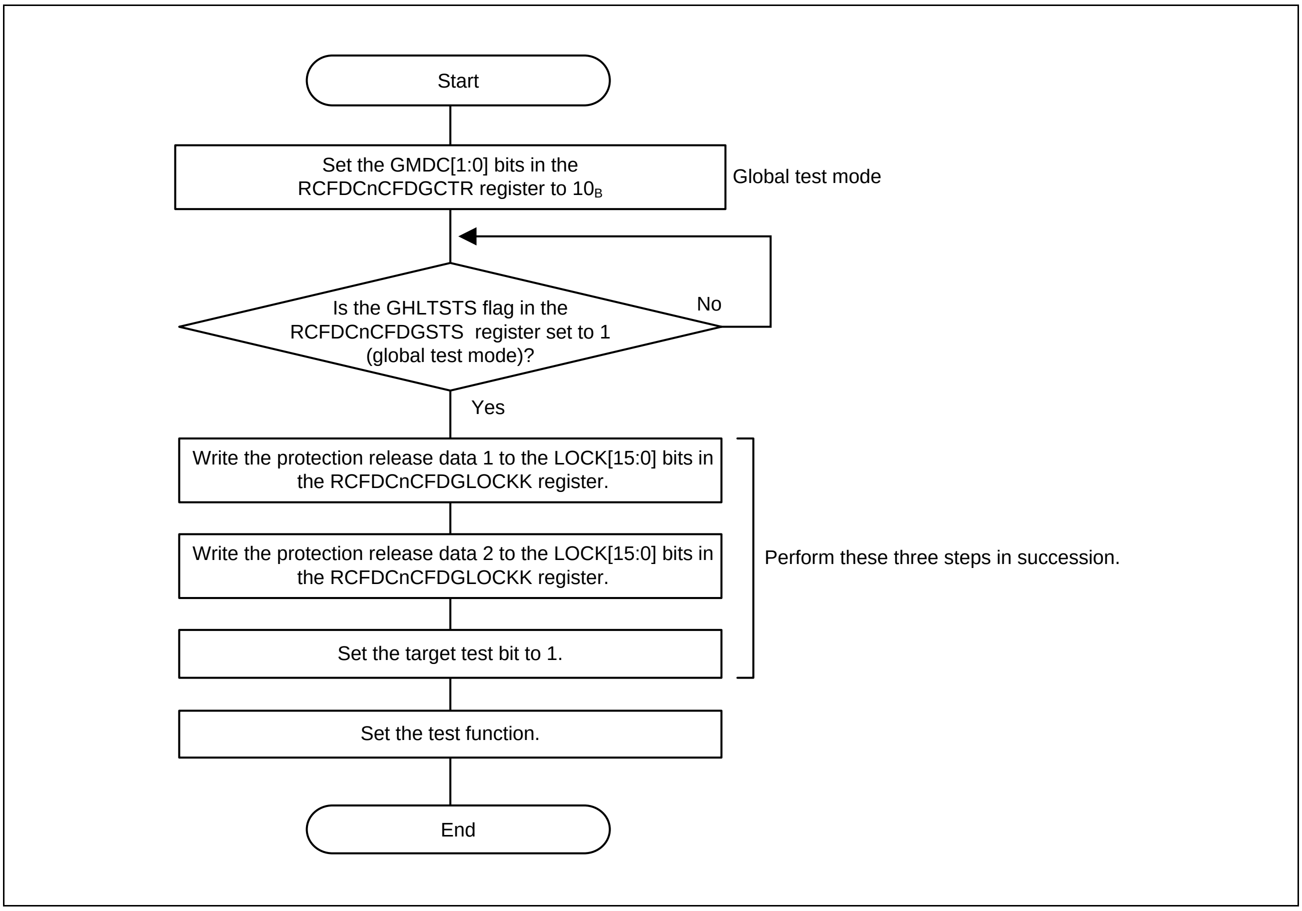


Figure 24.36 Protection Release Procedure

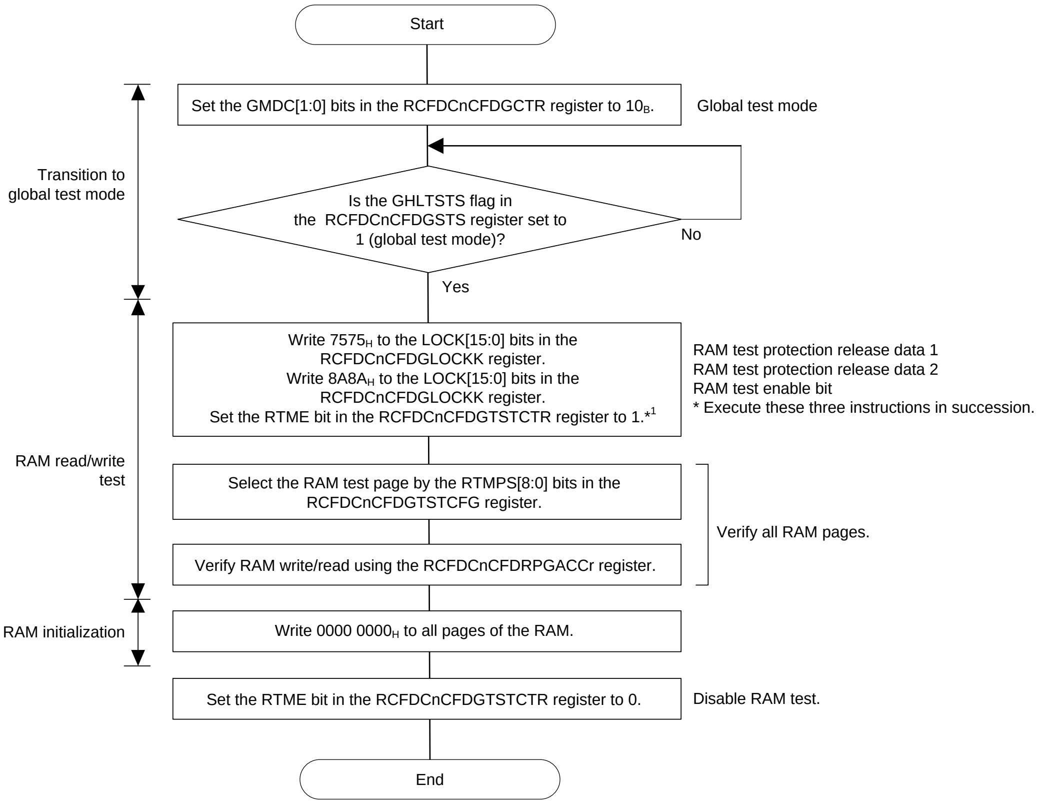
24.10.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before ending the RAM test, write 0000 0000_H to all pages of the CAN RAM.

Figure 24.37, RAM Test Setting Procedure shows the RAM test setting procedure.



Note: r = 0 to 63

Note 1. Before changing to the RAMTEST mode, make sure to:
- Cancel transmission request(s), if any,
- Disable all the FIFO and Transmit Queues, and,
- Clear the receiving flags of receiving buffers.

Figure 24.37 RAM Test Setting Procedure

24.10.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

Figure 24.38, Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1) shows the inter-channel communication test setting procedure.

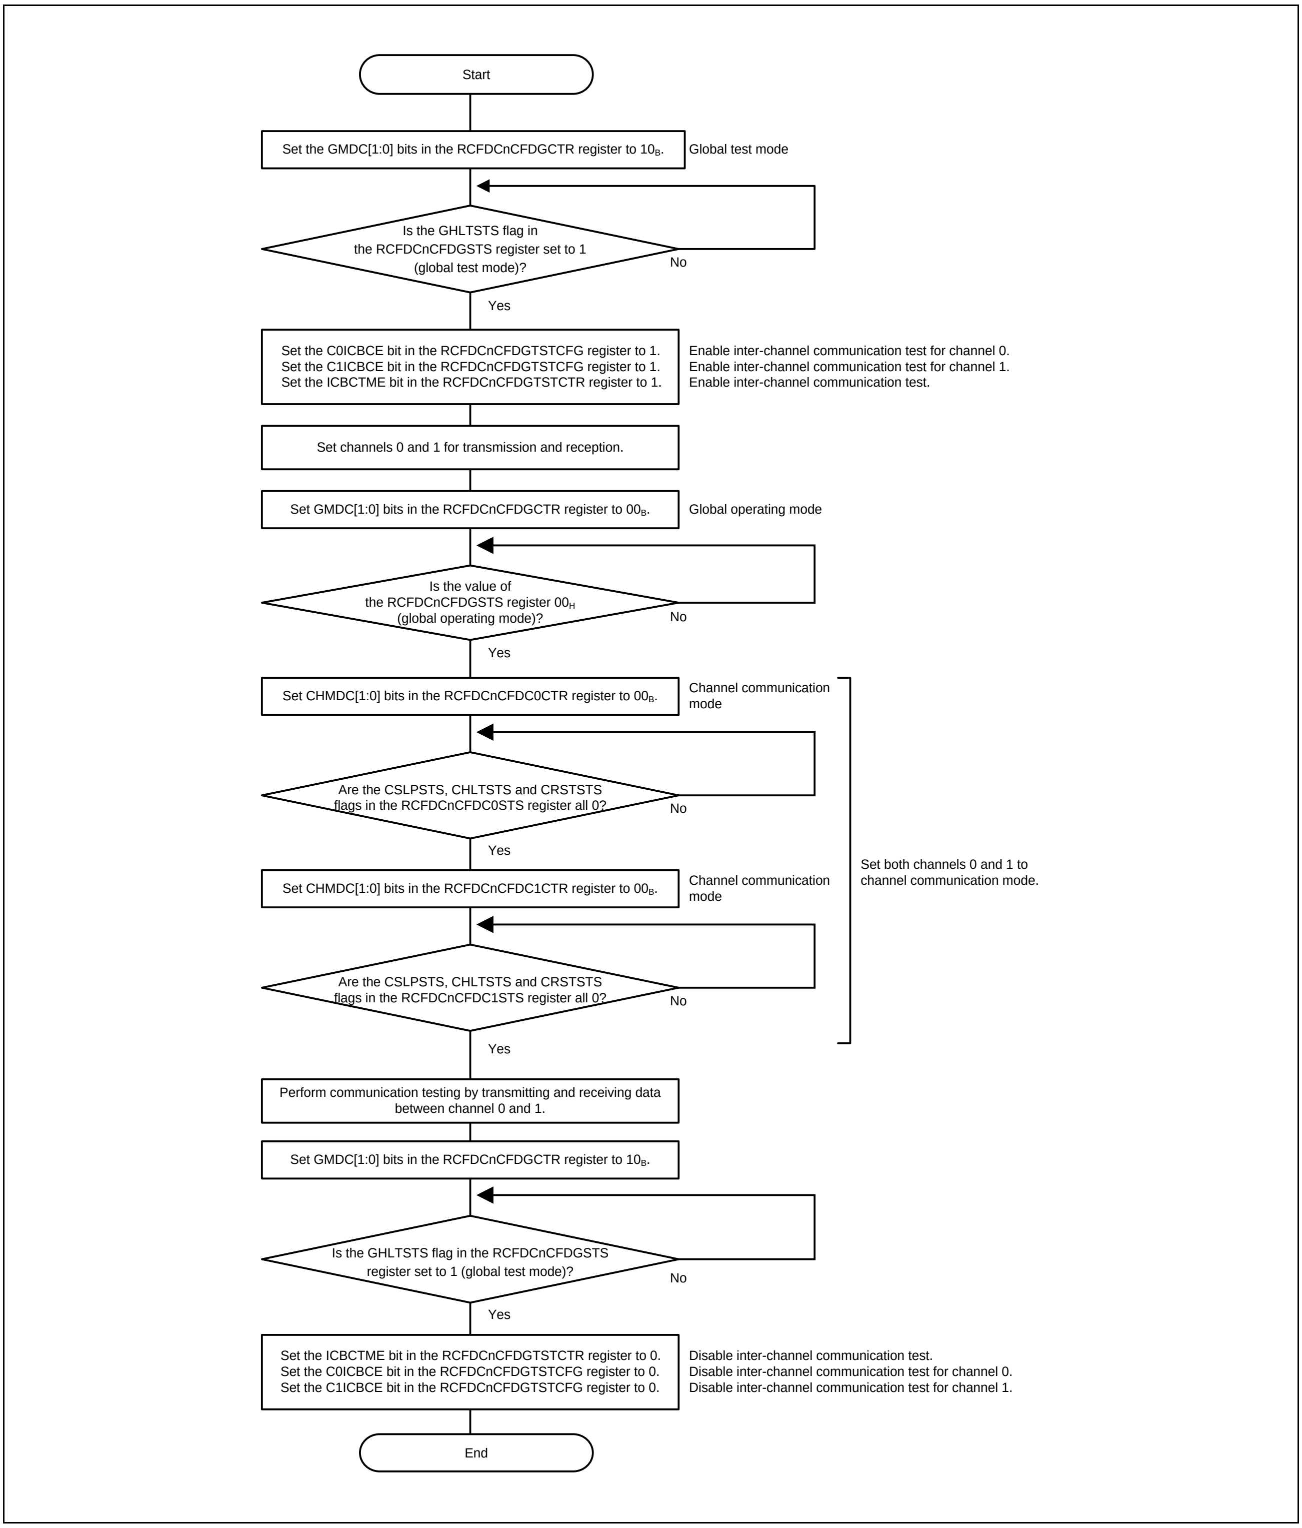


Figure 24.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

24.11 Notes on the RS-CANFD Module

- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RCFDCnCFDGSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RCFDCnCFDCmSTS register (m = 0 to 7) for transitions.
- When only classical CAN frames are used in CAN FD mode, set the RCFDCnCFDCmDCFG register to the value equal to the set RCFDCnCFDCmNCFG register value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the smallest rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the smallest number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RCFDCnCFDTMCp) of the corresponding transmit buffer to 00_H. The status register (RCFDCnCFDTMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RCFDCnCFDTMTRSTS0 to RCFDCnCFDTMTRSTS7, RCFDCnCFDTMTARSTS0 to RCFDCnCFDTMTARSTS7, RCFDCnCFDTMTCSTS0 to RCFDCnCFDTMTCSTS7, and RCFDCnCFDTMTASTS0 to RCFDCnCFDTMTASTS7), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RCFDCnCFDTMIEC0 to RCFDCnCFDTMIEC7) to 0 (transmit buffer interrupt is disabled).
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a newly received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- In the case of registers that access the RAM, the value after reset shown in **Section 24.3, Registers** indicate the values cleared by initialization of the CAN RAM. Values before clear are undefined. The following registers apply.
  - Receive rule (RCFDCnCFDGAFLIDj, RCFDCnCFDGAFLMj, RCFDCnCFDGAFLP0_j, RCFDCnCFDGAFLP1_j registers)
  - Receive buffers (RCFDCnCFDRMIDq, RCFDCnCFDRMPTRq, RCFDCnCFDRMFDSTSq, RCFDCnCFDRMDFb_q registers)
  - Receive FIFO buffer access registers (RCFDCnCFDRFIDx, RCFDCnCFDRFPTRx, RCFDCnCFDRFFDSTSx, and RCFDCnCFDRFDFd_x registers)
  - Transmit/receive FIFO buffer access registers (RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDFd_k registers)
  - Transmit buffers (RCFDCnCFDTMIDp, RCFDCnCFDTMPTRp, RCFDCnCFDTMFDCTRp, and RCFDCnCFDTMDFb_p registers)
  - Transmit history access registers (RCFDCnCFDTHLACC0m, RCFDCnCFDTHLACC1m registers)
  - RAM test page access register (RCFDCnCFDRPGACCr register)

- The values of unused receive buffers (RCFDCnCFDRMIDq, RCFDCnCFDRMPTRq, RCFDCnCFDRMFDSTSq, and RCFDCnCFDRMDFb_q registers), receive FIFO buffer access registers (RCFDCnCFDRFIDx, RCFDCnCFDRFPTRx, RCFDCnCFDRFFDSTSx, and RCFDCnCFDRFDFd_x registers) and transmit/receive FIFO buffer access registers (RCFDCnCFDCFIDk, RCFDCnCFDCFPTRk, RCFDCnCFDCFFDCSTSk, and RCFDCnCFDCFDFd_k registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

24.12 Detection and Correction of Errors in RS-CANFD RAM

For details of ECC, see **Section 40A.2.6, ECC for Peripheral RAM**, **Section 40B.2.6, ECC for Peripheral RAM**, **Section 40C.2.5, ECC for Peripheral RAM**.

Section 25 FlexRay (FLXA)

This section contains a generic description of the FlexRay (FLXA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of FLXA.

CAUTION

Please read “global RAM” described in this section as “global RAM/retention RAM”.

NOTE

The POC described in this section is an abbreviated form of Protocol Operation Control and differs from the POC (power-on clear) described in **Section 10A, Power Supply Circuit of RH850/F1KH-D8, Section 10B, Power Supply Circuit of RH850/F1KM-S4** and **Section 10C, Power Supply Circuit of RH850/F1KM-S1**.

25.1 Features of RH850/F1KH, RH850/F1KM FLXA

25.1.1 Number of Units and Channels

This microcontroller has the following number of FLXA units and channels.

Table 25.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	FLXAn (n = 0)	FLXAn (n = 0)	FLXAn (n = 0)

Table 25.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	FLXAn (n = 0)	FLXAn (n = 0)	FLXAn (n = 0)	FLXAn (n = 0)	FLXAn (n = 0)

Table 25.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	—	—
Name	—	—	—	—

Table 25.4 FLXA Unit Configurations and Channels (RH850/F1KH-D8)

Unit Name	Number of Channels per Unit	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
FLXA0	2 (A ch, B ch)	✓	✓	✓

Table 25.5 FLXA Unit Configurations and Channels (RH850/F1KM-S4)

Unit Name	Number of Channels per Unit	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
FLXA0	2 (A ch, B ch)	✓	✓	✓	✓	✓

Table 25.6 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual FLXA units are identified by the index “n”; for example, FLXAnFROC is the FlexRay control register.

Table 25.7 Index (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual FLXA units are identified by the index “n”; for example, FLXAnFROC is the FlexRay control register.

25.1.2 Register Base Address

FLXAn base address is listed in the following table.

FLXAn register addresses are given as an offset from the base address in general.

Table 25.8 Register Base Address (RH850/F1KH-D8)

Base Address Name	Base Address
<FLXA0_base>	1002 0000_H

Table 25.9 Register Base Address (RH850/F1KM-S4)

Base Address Name	Base Address
<FLXA0_base>	1002 0000_H

25.1.3 Clock Supply

The FLXAn clock supply is shown in the following table.

Table 25.10 Clock Supply (RH850/F1KH-D8)

Unit Name	Clock Name for the Unit	Supply Clock Name
FLXAn	hclk	CPUCLK_L
	clkc	CKSCLK_PPLLCLK*[1]
	Register access clock	CPUCLK_L

Note 1. FLXA0 clock can stop by OPBT0. FLXA0EN, refer to **Section 44.9.2, OPBT0 — Option Byte 0**.

Table 25.11 Clock Supply (RH850/F1KM-S4)

Unit Name	Clock Name for the Unit	Supply Clock Name
FLXAn	hclk	CPUCLK_L
	clkc	CKSCLK_PPLLCLK*[1]
	Register access clock	CPUCLK_L

Note 1. FLXA0 clock can stop by OPBT0. FLXA0EN, refer to **Section 44.9.2, OPBT0 — Option Byte 0**.

Table 25.12 Range of Operating Frequency Depending on the Transfer Rate

	Range of Operating Frequency	
Data Transfer Rate	hclk	clkc
10 Mbps	45 ≤ hclk ≤ 60 MHz	80 MHz
5 Mbps	27 ≤ hclk ≤ 60 MHz	80 MHz
2.5 Mbps	27 ≤ hclk ≤ 60 MHz	80 MHz

25.1.4 Interrupt Requests

The FLXAn interrupt requests are listed in the following table.

Table 25.13 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
FLXA0			
INTFLXA0LINE0	FlexRay0 interrupt	179	—
INTFLXA0LINE1	FlexRay1 interrupt	180	—
INTFLXA0TIM0	Timer 0 interrupt	181	—
INTFLXA0TIM1	Timer 1 interrupt	182	—
INTFLXA0TIM2	Timer 2 interrupt	183	—
INTFLXA0FDA	FIFO transfer interrupt	173	—
INTFLXA0FW	FIFO transfer warning interrupt	174	—
INTFLXA0OW	Output transfer warning interrupt	178	—
INTFLXA0OT	Output transfer end interrupt	177	—
INTFLXA0IQF	Input queue full interrupt	176	—
INTFLXA0IQE	Input queue empty interrupt	175	—

Table 25.14 Interrupt Requests (RH850/F1KM-S4)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
FLXA0			
INTFLXA0LINE0	FlexRay0 interrupt	179	—
INTFLXA0LINE1	FlexRay1 interrupt	180	—
INTFLXA0TIM0	Timer 0 interrupt	181	—
INTFLXA0TIM1	Timer 1 interrupt	182	—
INTFLXA0TIM2	Timer 2 interrupt	183	—
INTFLXA0FDA	FIFO transfer interrupt	173	—
INTFLXA0FW	FIFO transfer warning interrupt	174	—
INTFLXA0OW	Output transfer warning interrupt	178	—
INTFLXA0OT	Output transfer end interrupt	177	—
INTFLXA0IQF	Input queue full interrupt	176	—
INTFLXA0IQE	Input queue empty interrupt	175	—

25.1.5 Reset Sources

FLXAn reset sources are listed in the following table. FLXAn is initialized by the following reset signal:

Table 25.15 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
FLXAn	All reset sources (ISORES)

Table 25.16 Reset Sources (RH850/F1KM-S4)

Unit Name	Reset Source
FLXAn	All reset sources (ISORES)

25.1.6 External Input/Output Signals

External input/output signals of FLXAn are listed below.

Table 25.17 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal Name
FLXA0		
rxda_extfxr	Channel A receive data input	FLXA0RXDA
fxr_txda	Channel A transmit data output	FLXA0TXDA
fxr_txena_n	Channel A transmit data enable	FLXA0TXENA
rxdb_extfxr	Channel B receive data input	FLXA0RXDB
fxr_txdb	Channel B transmit data output	FLXA0TXDB
fxr_txenb_n	Channel B transmit data enable	FLXA0TXENB
stpwt_extfxr	Stop watch trigger input	FLXA0STPWT

Table 25.18 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal Name
FLXA0		
rxda_extfxr	Channel A receive data input	FLXA0RXDA
fxr_txda	Channel A transmit data output	FLXA0TXDA
fxr_txena_n	Channel A transmit data enable	FLXA0TXENA
rxdb_extfxr	Channel B receive data input	FLXA0RXDB
fxr_txdb	Channel B transmit data output	FLXA0TXDB
fxr_txenb_n	Channel B transmit data enable	FLXA0TXENB
stpwt_extfxr	Stop watch trigger input	FLXA0STPWT

25.1.7 Functions

For communication on a FlexRay network, individual message buffers that can hold up to 254 bytes of data can be configured. Up to 128 message buffers can be configured in the message RAM. All functions concerning the handling of messages are implemented in the Message Handler. These functions include acceptance filtering, the transfer of messages between the two FlexRay Channel Protocol Controllers and the Message RAM, maintaining the transmission schedule, and providing message status information.

The register set of the FlexRay IP-module can be accessed directly by an external Host via the module’s Host interface. These registers are used to control/configure/monitor the FlexRay Channel Protocol Controllers, Message Handler, Global Time Unit, System Universal Control, Frame and Symbol Processing, Network Management, Interrupt Control, to access the Message RAM via Input/Output Buffer; and to control the data transfer between the Message RAM and the local RAM/global RAM.

The FlexRay IP-module supports the following features:

Item	Specification
Communication	Conformance with FlexRay protocol specification v2.1
Data transfer rate	Up to 10 Mbit/s on each channel
Input/Output pins per channel	TxD, RxD, TxEN
FlexRay channels	2 (channels A and B)
Message buffers	Up to 128 message buffers configurable Configuration of message buffers with different payload lengths possible Each message buffer can be configured as a receive buffer, transmit buffer, part of a receive FIFO buffer. Filtering for slot counter, cycle counter, and channel
Message RAM	8 Kbyte of Message RAM for storage can be configured 128 message buffers with a data section of up to 48 bytes or up to 30 message buffers with a data section of 254 bytes
FIFO	One configurable receive FIFO
Message buffer access	By host CPU via input and output buffers Input Buffer: Holds message to be transferred to the Message RAM Output Buffer: Holds message read from the Message RAM
	By data transfer function Input transfer: Message buffer content is transferred from local RAM/global RAM to Message RAM on CPU request Output transfer: Message buffer content is transferred from Message RAM to local RAM/global RAM automatically
Network management	Supported
Interrupts	Maskable module interrupts
Timer	Two absolute timers One relative timer One stop watch timer

25.1.8 Block Diagram

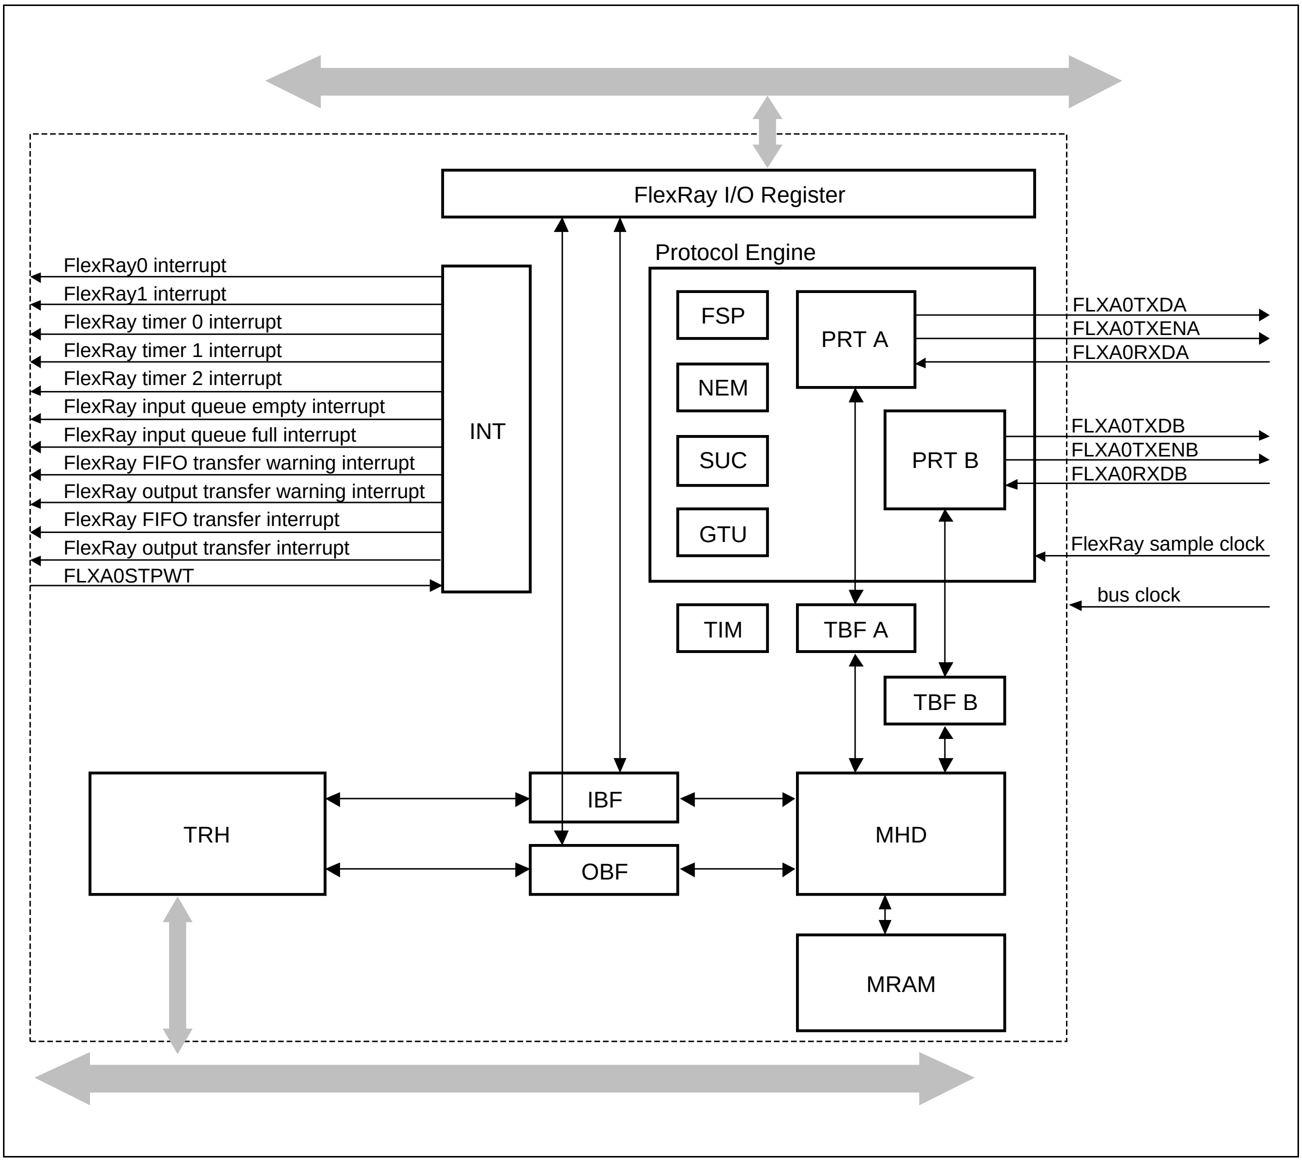

Figure 25.1 FlexRay IP Block Diagram

Input Buffer (IBF)

For write access to the message buffers configured in the Message RAM, the Host can write the header and data section for a specific message buffer to the Input Buffer. The Message Handler then transfers the data from the Input Buffer to the selected message buffer in the Message RAM.

Output Buffer (OBF)

For read access to a message buffer configured in the Message RAM the Message Handler transfers the selected message buffer to the Output Buffer. After the transfer has completed, the Host can read the header and data section of the transferred message buffer from the Output Buffer.

Message Handler (MHD)

The FlexRay Message Handler controls data transfers between the following components:

- Input/Output Buffer and Message RAM

- Temporary buffer RAMs of the two FlexRay Protocol Controllers and Message RAM

Message RAM (MRAM)

The Message RAM consists of a single-ported RAM that stores up to 128 FlexRay message buffers together with the related configuration data (header and data partition).

Temporary buffer RAM (TBF A/B)

Stores the data section of two complete messages.

FlexRay Channel Protocol Controller (PRT A/B)

The FlexRay Channel Protocol Controllers consist of shift register and FlexRay protocol FSM. They are connected to the Temporary buffer RAMs for intermediate message storage and to the physical layer via bus driver (BD).

This controller has the following functionality:

- Control and check of bit timing
- Reception/transmission of FlexRay frames and symbols
- Check of header CRC
- Generation/check of frame CRC
- Interfacing with bus driver

Global Time Unit (GTU)

The Global Time Unit performs the following functions:

- Generation of microtick (µT)
- Generation of macrotick (MT)
- Fault tolerant clock synchronization, by FTM algorithm, for:
  - rate correction
  - offset correction
- Cycle counter
- Timing control of static segment
- Timing control of dynamic segment (minislotting)
- Support of external clock correction

System Universal Control (SUC)

The System Universal Controller has the following functions:

- Configuration
- Wakeup
- Startup
- Normal Operation
- Passive Operation

Frame and Symbol Processing (FSP)

The Frame and Symbol Processing has the following functions:

- Checks whether the timing of frames and symbols is correct or not
- Checks whether the syntax and semantics of the received frame are correct or not
- Sets the slot status flags

Network Management (NEM)

Handles the network management vector.

Interrupt Control (INT)

The Interrupt Controller has the following functions:

- Provides error and status interrupt flags
- Enables and disables interrupt sources
- Assignment of interrupt sources to one of the two general module interrupt lines
- Enables and disables module interrupt lines

Timer (TIM)

The Timer module includes the following macrotick timer:

- Two absolute timers
- One relative timer
- One stop watch timer

Transfer Handler (TRH)

Handles the data transfer between local RAM/global RAM and FlexRay module. The Transfer Handler supports the following transfer types:

- Transfer of buffer configuration data from the local RAM/global RAM to the Message RAM
- Transfer of payload data for temporary buffers from the local RAM/global RAM to the Message RAM
- Transfer of buffer configuration data and payload data for temporary buffer from the local RAM/global RAM to the Message RAM
- Automatic transfer of payload data from receive buffer to the local RAM/global RAM upon frame reception
- Automatic transfer of payload data, buffer configuration data and message buffer status data from receive buffer to the local RAM/global RAM upon frame reception
- Automatic transfer of buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the local RAM/global RAM in response to slot status update
- Manual transfer of payload data, buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the local RAM/global RAM

25.2 Registers

25.2.1 List of Registers

The FLXAn registers are listed in the following table.

For details on <FLXAn_base>, see **Section 25.1.2, Register Base Address**.

Table 25.19 List of Registers

Module Name	Register Name	Symbol	Address
FLXAn	FlexRay operation control register	FLXAnFROC	<FLXAn_base> + 0004_H
	FlexRay operation status register	FLXAnFROS	<FLXAn_base> + $000C_H$
	FlexRay test register 1	FLXAnFRTEST1	<FLXAn_base> + 0010_H
	FlexRay test register 2	FLXAnFRTEST2	<FLXAn_base> + 0014_H
	FlexRay lock register	FLXAnFRLCK	<FLXAn_base> + $001C_H$
	FlexRay error interrupt register	FLXAnFREIR	<FLXAn_base> + 0020_H
	FlexRay status interrupt register	FLXAnFRSIR	<FLXAn_base> + 0024_H
	FlexRay error interrupt line select register	FLXAnFREILS	<FLXAn_base> + 0028_H
	FlexRay status interrupt line select register	FLXAnFRSILS	<FLXAn_base> + $002C_H$
	FlexRay error interrupt enable set register	FLXAnFREIES	<FLXAn_base> + 0030_H
	FlexRay error interrupt enable reset register	FLXAnFREIER	<FLXAn_base> + 0034_H
	FlexRay status interrupt enable set register	FLXAnFRSIES	<FLXAn_base> + 0038_H
	FlexRay status interrupt disable register	FLXAnFRSIER	<FLXAn_base> + $003C_H$
	FlexRay interrupt line enable register	FLXAnFRILE	<FLXAn_base> + 0040_H
	FlexRay timer 0 configuration register	FLXAnFRT0C	<FLXAn_base> + 0044_H
	FlexRay timer 1 configuration register	FLXAnFRT1C	<FLXAn_base> + 0048_H
	FlexRay stop watch register 1	FLXAnFRSTPW1	<FLXAn_base> + $004C_H$
	FlexRay stop watch register 2	FLXAnFRSTPW2	<FLXAn_base> + 0050_H
	FlexRay SUC configuration register 1	FLXAnFRSUCC1	<FLXAn_base> + 0080_H
	FlexRay SUC configuration register 2	FLXAnFRSUCC2	<FLXAn_base> + 0084_H
	FlexRay SUC configuration register 3	FLXAnFRSUCC3	<FLXAn_base> + 0088_H
	FlexRay NEM configuration register	FLXAnFRNEMC	<FLXAn_base> + $008C_H$
	FlexRay PRT configuration register 1	FLXAnFRPRTC1	<FLXAn_base> + 0090_H
	FlexRay PRT configuration register 2	FLXAnFRPRTC2	<FLXAn_base> + 0094_H
	FlexRay MHD configuration register	FLXAnFRMHDC	<FLXAn_base> + 0098_H
	FlexRay GTU configuration register 1	FLXAnFRGTUC1	<FLXAn_base> + $00A0_H$
	FlexRay GTU configuration register 2	FLXAnFRGTUC2	<FLXAn_base> + $00A4_H$
	FlexRay GTU configuration register 3	FLXAnFRGTUC3	<FLXAn_base> + $00A8_H$
	FlexRay GTU configuration register 4	FLXAnFRGTUC4	<FLXAn_base> + $00AC_H$
	FlexRay GTU configuration register 5	FLXAnFRGTUC5	<FLXAn_base> + $00B0_H$
	FlexRay GTU configuration register 6	FLXAnFRGTUC6	<FLXAn_base> + $00B4_H$
	FlexRay GTU configuration register 7	FLXAnFRGTUC7	<FLXAn_base> + $00B8_H$
	FlexRay GTU configuration register 8	FLXAnFRGTUC8	<FLXAn_base> + $00BC_H$
	FlexRay GTU configuration register 9	FLXAnFRGTUC9	<FLXAn_base> + $00C0_H$
	FlexRay GTU configuration register 10	FLXAnFRGTUC10	<FLXAn_base> + $00C4_H$
	FlexRay GTU configuration register 11	FLXAnFRGTUC11	<FLXAn_base> + $00C8_H$
	FlexRay CC status vector register	FLXAnFRCCSV	<FLXAn_base> + 0100_H
	FlexRay CC error vector register	FLXAnFRCCEV	<FLXAn_base> + 0104_H

Table 25.19 List of Registers

Module Name	Register Name	Symbol	Address
FLXAn	FlexRay slot counter value register	FLXAnFRSCV	<FLXAn_base> + 0110_H
	FlexRay macrotick and cycle counter value register	FLXAnFRMTCCV	<FLXAn_base> + 0114_H
	FlexRay rate correction value register	FLXAnFRRCV	<FLXAn_base> + 0118_H
	FlexRay offset correction value register	FLXAnFROCV	<FLXAn_base> + $011C_H$
	FlexRay sync frame status register	FLXAnFRSFS	<FLXAn_base> + 0120_H
	FlexRay symbol window and NIT status register	FLXAnFRSWNIT	<FLXAn_base> + 0124_H
	FlexRay aggregated channel status register	FLXAnFRACS	<FLXAn_base> + 0128_H
	FlexRay even sync ID register m (m = 1 to 15)	FLXAnFRESIDm (m = 1 to 15)	<FLXAn_base> + 0130_H to <FLXAn_base> + 0168_H (<FLXAn_base> + 0130_H + (m – 1) × 4_H)
	FlexRay odd sync ID register m (m = 1 to 15)	FLXAnFROSIDm (m = 1 to 15)	<FLXAn_base> + 0170_H to <FLXAn_base> + $01A8_H$ (<FLXAn_base> + 0170_H + (m – 1) × 4_H)
	FlexRay network management vector register m (m = 1 to 3)	FLXAnFRNMVm (m = 1 to 3)	<FLXAn_base> + $01B0_H$ to <FLXAn_base> + $01B8_H$ (<FLXAn_base> + $01B0_H$ + (m – 1) × 4_H)
	FlexRay message RAM configuration register	FLXAnFRMRC	<FLXAn_base> + 0300_H
	FlexRay FIFO rejection filter register	FLXAnFRFRF	<FLXAn_base> + 0304_H
	FlexRay FIFO rejection filter mask register	FLXAnFRFRFM	<FLXAn_base> + 0308_H
	FlexRay FIFO critical level register	FLXAnFRFCL	<FLXAn_base> + $030C_H$
	FlexRay message handler status register	FLXAnFRMHDS	<FLXAn_base> + 0310_H
	FlexRay last dynamic transmit slot register	FLXAnFRLDTS	<FLXAn_base> + 0314_H
	FlexRay FIFO status register	FLXAnFRFSR	<FLXAn_base> + 0318_H
	FlexRay message handler constraints flags register	FLXAnFRMHDF	<FLXAn_base> + $031C_H$
	FlexRay transmission request register i (i = 1 to 4)	FLXAnFRTXRQi (i = 1 to 4)	<FLXAn_base> + 0320_H to <FLXAn_base> + $032C_H$ (<FLXAn_base> + 0320_H + (i – 1) × 4_H)
	FlexRay new data register i (i = 1 to 4)	FLXAnFRNDATi (i = 1 to 4)	<FLXAn_base> + 0330_H to <FLXAn_base> + $033C_H$ (<FLXAn_base> + 0330_H + (i – 1) × 4_H)
	FlexRay message buffer status changed register i (i = 1 to 4)	FLXAnFRMBSCi (i = 1 to 4)	<FLXAn_base> + 0340_H to <FLXAn_base> + $034C_H$ (<FLXAn_base> + 0340_H + (i – 1) × 4_H)
	FlexRay write data section register x (x = 1 to 64)	FLXAnFRWRDSx (x = 1 to 64)	<FLXAn_base> + 0400_H to <FLXAn_base> + $04FC_H$ (<FLXAn_base> + 0400_H + (x – 1) × 4_H)
	FlexRay write header section register 1	FLXAnFRWRHS1	<FLXAn_base> + 0500_H
	FlexRay write header section register 2	FLXAnFRWRHS2	<FLXAn_base> + 0504_H
	FlexRay write header section register 3	FLXAnFRWRHS3	<FLXAn_base> + 0508_H
	FlexRay input buffer command mask register	FLXAnFRIBCM	<FLXAn_base> + 0510_H
	FlexRay input buffer command request register	FLXAnFRIBCR	<FLXAn_base> + 0514_H
	FlexRay read data section register x (x = 1 to 64)	FLXAnFRRDDSx (x = 1 to 64)	<FLXAn_base> + 0600_H to <FLXAn_base> + $06FC_H$ (<FLXAn_base> + 0600_H + (x – 1) × 4_H)
	FlexRay read header section register 1	FLXAnFRRDHS1	<FLXAn_base> + 0700_H
	FlexRay read header section register 2	FLXAnFRRDHS2	<FLXAn_base> + 0704_H
	FlexRay read header section register 3	FLXAnFRRDHS3	<FLXAn_base> + 0708_H
	FlexRay message buffer status register	FLXAnFRMBS	<FLXAn_base> + $070C_H$
	FlexRay output buffer command mask register	FLXAnFROBCM	<FLXAn_base> + 0710_H

Table 25.19 List of Registers

Module Name	Register Name	Symbol	Address
FLXAn	FlexRay output buffer command request register	FLXAnFROBCR	<FLXAn_base> + 0714_H
	FlexRay input transfer configuration register	FLXAnFRITC	<FLXAn_base> + 0800_H
	FlexRay output transfer configuration register	FLXAnFROTC	<FLXAn_base> + 0804_H
	FlexRay input pointer table base address register	FLXAnFRIBA	<FLXAn_base> + 0808_H
	FlexRay FIFO pointer table base address register	FLXAnFRFBA	<FLXAn_base> + $080C_H$
	FlexRay output pointer table base address register	FLXAnFROBA	<FLXAn_base> + 0810_H
	FlexRay input queue control register	FLXAnFRIQC	<FLXAn_base> + 0814_H
	FlexRay user input transfer request register	FLXAnFRUIR	<FLXAn_base> + 0818_H
	FlexRay user output transfer request register	FLXAnFRUOR	<FLXAn_base> + $081C_H$
	FlexRay Input Transfer Status Register	FLXAnFRITS	<FLXAn_base> + 0820_H
	FlexRay output transfer status register	FLXAnFROTS	<FLXAn_base> + 0824_H
	FlexRay access error status register	FLXAnFRAES	<FLXAn_base> + 0828_H
	FlexRay access error address register	FLXAnFRAEA	<FLXAn_base> + $082C_H$
	FlexRay message data available register i (i = 0 to 3)	FLXAnFRDAi (i = 0 to 3)	<FLXAn_base> + 0830_H to <FLXAn_base> + $083C_H$ (<FLXAn_base> + 0830_H + i × 4_H)
	FlexRay H-Bus configuration register	FLXAnFRAHBC	<FLXAn_base> + 0840_H
	FlexRay timer 2 configuration register	FLXAnFRT2C	<FLXAn_base> + 0844_H

25.2.2 FlexRay Operation Register

25.2.2.1 FLXAnFROC — FlexRay Operation Control Register

Access:	FLXAnFROC can be read or written in 32-bit units. FLXAnFROCL and FLXAnFROCH can be read or written in 16-bit units. FLXAnFROCLL and FLXAnFROCHL can be read or written in 8-bit units.
Address:	FLXAnFROC: <FLXAn_base> + 0004$_H$ FLXAnFROCL: <FLXAn_base> + 0004$_H$, FLXAnFROCH: <FLXAn_base> + 0006$_H$ FLXAnFROCLL: <FLXAn_base> + 0004$_H$, FLXAnFROCHL: <FLXAn_base> + 0006$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	T2IE	T1IE	T0IE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 25.20 FLXAnFROC Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	T2IE	Timer 2 interrupt enable Bit 0: Disabled 1: Enabled
17	T1IE	Timer 1 interrupt enable Bit 0: Disabled 1: Enabled
16	T0IE	Timer 0 interrupt enable Bit 0: Disabled 1: Enabled
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	OEP	Operation Enable bit Protection Bit 0: OE is unprotected 1: OE is protected
6 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	BEC	Byte Endian Control Bit 0: Little endian 1: Big endian
0	OE	Operation Enable Bit 0: Operation disabled, SW reset 1: Operation Enabled

(1) FLXAnFROC.T2IE

Timer 2 interrupt enable bit

This bit controls the timer 2 interrupt.

0: Disabled
No interrupt will be requested and the timer 2 interrupt line will be released if pending.

1: Enabled
Timer 2 interrupt will be asserted when FLXAnFROTS.T2IS is 1.

(2) FLXAnFROC.T1IE

Timer 1 interrupt enable bit

The user can only set this bit to 1 when timer 1 interrupt is not enabled in the FlexRay Status interrupt enable register (FLXAnFRSIES.TI1E is 0).
This bit controls the timer 1 interrupt.

0: Disabled
No interrupt will be requested and the timer 1 interrupt line will be released if pending.

1: Enabled
Timer 1 interrupt will be asserted when FLXAnFROTS.T1IS is 1.

(3) FLXAnFROC.T0IE

Timer 0 interrupt enable bit

The user can only set this bit to 1 when timer 0 interrupt is not enabled in the FlexRay Status interrupt enable register (FLXAnFRSIES.TI0E is 0).
This bit controls the timer 0 interrupt.

0: Disabled
No interrupt will be requested and the timer 0 interrupt line will be released if pending.

1: Enabled
Timer 0 interrupt will be asserted when FLXAnFROTS.T0IS is 1.

(4) FLXAnFROC.OEP

Operation Enable bit Protection bit

This bit protects against unintended write access to the OE bit.

0: OE is unprotected
Write access to the OE bit is enabled

1: OE is protected
Write access to the OE bit is disabled

(5) FLXAnFROC.BEC

Byte Endian Control bit

The user can only change this bit when FLXAnFROS.OS is 1.
This bit controls the byte order on reading and writing the FlexRay Network Management Vector register (FLXAnFRNMVm), FlexRay Write Data Section (FLXAnFRWRDSx) and FlexRay Read Data Section (FLXAnFRRDDSx). This bit also controls the byte order when reading or writing FlexRay payload data using the data transfer function.
For details about the byte alignment please refer to **Section 25.3.17, Byte Alignment**.

0: Little endian
Byte alignment in FLXAnFRNMVm, FLXAnFRWRDSx and FLXAnFRRDDSx is in little endian style.

1: Big endian
Byte alignment in FLXAnFRNMVm, FLXAnFRWRDSx and FLXAnFRRDDSx is in big endian style.

(6) FLXAnFROC.OE

Operation Enable bit

The user can only write to this bit when FLXAnFROC.OEP is 0.
The user should only write this bit with 0 when FLXAnFROS.OS is 1.
The user should only write this bit with 1 when FLXAnFROS.OS is 0 and the FlexRay sample clock is enabled.
This bit controls the operation state and executes the software reset of the FlexRay module. The operation status bit (FLXAnFROS.OS) indicates whether the FlexRay module is in reset state or not.

0: Operation disabled, SW reset
Forcibly moves the FlexRay module to its reset state, whatever the state of the FlexRay module is.

1: Operation Enabled
Reset state of the FlexRay module is released.

25.2.2.2 FLXAnFROS — FlexRay Operation Status Register

Access:	FLXAnFROS can be read or written in 32-bit units. FLXAnFROSL is a read-only register that can be read in 16-bit units. FLXAnFROSH can be read or written in 16-bit units. FLXAnFROSLL is a read-only register that can be read in 8-bit units. FLXAnFROSHL can be read or written in 8-bit units.
Address:	FLXAnFROS: <FLXAn_base> + 000C$_H$ FLXAnFROSL: <FLXAn_base> + 000C$_H$, FLXAnFROSH: <FLXAn_base> + 000E$_H$, FLXAnFROSLL: <FLXAn_base> + 000C$_H$, FLXAnFROSHL: <FLXAn_base> + 000E$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	T2IS	T1IS	T0IS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.21 FLXAnFROS Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	T2IS	Timer 2 Interrupt Status Bit 0: Timer 2 has not matched the conditions configured in the FLXAnFRT2C register 1: Timer 2 matched the conditions configured in the FLXAnFRT2C register
17	T1IS	Timer 1 Interrupt Status Bit 0: Timer 1 has not matched the conditions configured in the FLXAnFRT1C register 1: Timer 1 matched the conditions configured in the FLXAnFRT1C register
16	T0IS	Timer 0 Interrupt Status Bit 0: Timer 0 has not matched the conditions configured in the FLXAnFRT0C register 1: Timer 0 matched the conditions configured in the FLXAnFRT0C register
15 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	OS	Operation Status Bit 0: Operation disabled, reset state 1: Operation enabled

(1) FLXAnFROS.T2IS

Timer 2 Interrupt Status Bit

Writing 0 has no effect on the bit value.
This bit indicates that the expiration criteria configured in FLXAnFRT2C register has matched the FlexRay local time.
If enabled in FLXAnFROC.T2IE the timer 2 interrupt is generated when FLXAnFROS.T2IS is 1.

[Clearing condition]
This bit is cleared by writing 1 to FLXAnFROS.T2IS.
This bit is cleared when FLXAnFROS.OS changes from 1 to 0.

[Setting condition]
This bit is set when the expiration criteria configured in FLXAnFRT2C matches the FlexRay local time.

(2) FLXAnFROS.T1IS

Timer 1 Interrupt Status Bit

Writing 0 has no effect on the bit value.
This bit indicates that the expiration criteria configured in FLXAnFRT1C register has matched the FlexRay local time.
If enabled in FLXAnFROC.T1IE the timer 1 interrupt is generated when FLXAnFROS.T1IS is 1.

[Clearing condition]
This bit is cleared by writing 1 to FLXAnFROS.T1IS.
This bit is cleared when FLXAnFROS.OS changes from 1 to 0.

[Setting condition]
This bit is set when the expiration criteria configured in FLXAnFRT1C matches the FlexRay local time.

(3) FLXAnFROS.T0IS

Timer 0 Interrupt Status Bit

Writing 0 has no effect on the bit value.
This bit indicates that the expiration criteria configured in FLXAnFRT0C register has matched the FlexRay local time.
If enabled in FLXAnFROC.T0IE the timer 0 interrupt is generated when FLXAnFROS.T0IS is 1.

[Clearing condition]
This bit is cleared by writing 1 to FLXAnFROS.T0IS.
This bit is cleared when FLXAnFROS.OS changes from 1 to 0.

[Setting condition]
This bit is set when the expiration criteria configured in FLXAnFRT0C matches the FlexRay local time.

(4) FLXAnFROS.OS

Operation Status Bit

This bit indicates if the FlexRay module is in the reset or the operation state.
When FLXAnFROS.OS is 0 the FlexRay module gets initialized and registers mapped to the address area <FLXAn_base> + 0010_H to <FLXAn_base> + $0FFF_H$ cannot be accessed; read access from these registers will return undefined data.
When FLXAnFROS.OS is 1 it is possible to access to the address area <FLXAn_base> + 0010_H to <FLXAn_base> + $0FFF_H$ and to perform FlexRay communication.
When FLXAnFROS.OS changes from 0 to 1 all registers in the address range <FLXAn_base> + 0010_H to <FLXAn_base> + $0FFF_H$ are set to the “Values after reset”.

[Clearing condition]
When FLXAnFROC.OE is set to 0. It takes up to two peripheral bus clock cycles until FLXAnFROS.OS is set to 0.

[Setting condition]
When FLXAnFROC.OE is set to 1 it takes up to four peripheral clock cycles of the clock with the lower frequency out of the FlexRay sample clock and peripheral bus clock until FLXAnFROS.OS is set to 1.

25.2.3 Special Registers

25.2.3.1 FLXAnFRTEST1 — FlexRay Test Register 1

The FlexRay Test Register 1 holds the control bits to configure the test modes of the FlexRay module.

When the FlexRay is operated in one of its test modes that requires FLXAnFRTEST1.WRTEN to be set (RAM Test Mode, I/O Test Mode, Asynchronous Transmit Mode, and Loop Back Mode) only the selected test mode functionality is available.

To return from test mode operation to regular FlexRay operation we strongly recommend to apply a reset using FLXAnFROC.OE to reset all FlexRay internal state machines to their initial state.

The test functions are not available in addition to the normal operational mode functions, they change the functions of parts of the FlexRay module. Therefore normal operation as specified outside this chapter and as required by the FlexRay protocol specification and the FlexRay conformance test is not possible. Test mode functions may not be combined with each other or with FlexRay protocol functions.

The test mode features are intended for hardware testing or for FlexRay bus analyzer tools. They are not intended to be used in FlexRay applications.

Access: FLXAnFRTEST1 can be read or written in 32-bit units.

Address: FLXAnFRTEST1: <FLXAn_base> + 0010$_H$

Value after reset: 0000 0000$_H$

(1) FLXAnFRTEST1.CERB

Coding Error Report Channel B

Set when a coding error is detected on channel B.
Reset to zero when register FLXAnFRTEST1 is read or written. Once the FLXAnFRTEST1.CERB is set it will remain unchanged until FLXAnFRTEST1 register is accessed.

NOTES

1. Coding errors are signalled in all states where frame decoding is possible.
   FLXAnFRTEST1.CERB should be ignored in all other states.
2. The error codes regarding CAS/MTS symbols concern only the monitored bit pattern, irrelevant whether those bit patterns are seen in the symbol window or elsewhere.

(2) FLXAnFRTEST1.CERA

Coding Error Report Channel A

Set when a coding error is detected on channel A.
Reset to zero when register FLXAnFRTEST1 is read or written. Once the FLXAnFRTEST1.CERA is set it will remain unchanged until FLXAnFRTEST1 register is accessed.

NOTES

1. Coding errors are signalled in all states where frame decoding is possible.
   FLXAnFRTEST1.CERA should be ignored in all other states.
2. The error codes regarding CAS/MTS symbols concern only the monitored bit pattern, irrelevant whether those bit patterns are seen in the symbol window or elsewhere.

(3) FLXAnFRTEST1.TXENB

Control of Channel B Transmit Enable Pin

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.
This bit is used to test the interface to the physical layer (connectivity test) by driving the FLXAnTENB pin.

(4) FLXAnFRTEST1.TXENA

Control of Channel A Transmit Enable Pin

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.
This bit is used to test the interface to the physical layer (connectivity test) by driving the FLXAnTENA pin.

(5) FLXAnFRTEST1.TXB

Control of Channel B Transmit Pin

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.
This bit is used to test the interface to the physical layer (connectivity test) by driving the FLXAnTXDB pin.

(6) FLXAnFRTEST1.TXA

Control of Channel A Transmit Pin

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.
This bit is used to test the interface to the physical layer (connectivity test) by driving the FLXAnTXDA pin.

(7) FLXAnFRTEST1.RXB

Monitor Channel B Receive Pin

This bit is used to test the interface to the physical layer (connectivity test) by reading the FLXAnRXDB pin.

(8) FLXAnFRTEST1.RXA

Monitor Channel A Receive Pin

This bit is used to test the interface to the physical layer (connectivity test) by reading the FLXAnRXDA pin.

(9) FLXAnFRTEST1.AOB

Activity on B

FLXAnFRTEST1.AOB is set when there is activity on channel B or if the POC state is in DEFAULT_CONFIG or CONFIG state.
During STARTUP, NORMAL_ACTIVE or NORMAL_PASSIVE the function of FLXAnFRTEST1.AOB is inverse of zChannelIdle as specified in *the FlexRay protocol specification V2.1, Section 3, BITSTRB process*.
FLXAnFRTEST1.AOB should be ignored in all other POC states.

(10) FLXAnFRTEST1.AOA

Activity on A

FLXAnFRTEST1.AOA is set when there is activity on channel A or if the POC state is in DEFAULT_CONFIG or CONFIG state.
During STARTUP, NORMAL_ACTIVE or NORMAL_PASSIVE the function of FLXAnFRTEST1.AOA is inverse of zChannelIdle as specified in *the FlexRay protocol specification V2.1, Section 3, BITSTRB process*.
FLXAnFRTEST1.AOA should be ignored in all other POC states.

(11) FLXAnFRTEST1.TMC

Test Multiplexer Control

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.
00_B = Normal signal path
01_B = RAM Test Mode

Internal busses are multiplexed to make the Message RAM, Transient buffer RAM A and Transient buffer RAM B of the FlexRay module directly accessible by the Host. This mode is intended to enable testing of the FlexRay RAM during product testing.
10_B = I/O Test Mode

Output pins FLXAnTXDA, FLXAnTXDB, FLXAnTENA, FLXAnTENB, are driven to the values defined by bits FLXAnFRTEST1.TXA, FLXAnFRTEST1.TXB, FLXAnFRTEST1.TXENA, FLXAnFRTEST1.TXENB. The values applied to the input pins FLXAnRXDA, FLXAnRXDB can be read from register bits FLXAnFRTEST1.RXA, FLXAnFRTEST1.RXB.
11_B = Normal signal path

(12) FLXAnFRTEST1.ELBE

External Loop Back Enable

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to 1.
There are two possibilities to perform a Loop Back test. External Loop Back via physical layer or internal Loop Back for in-system self-test.
In case of an internal Loop Back the FlexRay IP module pins FLXAnTENA, FLXAnTENB are in their inactive state, pins FLXAnTXDA, FLXAnTXDB are set to HIGH, pins FLXAnRXDA, FLXAnRXDB are not evaluated. Bit FLXAnFRTEST1.ELBE is evaluated only when POC is in Loop Back Mode and test multiplexer control is in non-multiplexing mode FLXAnFRTEST1.TMC = 00_B.

(13) FLXAnFRTEST1.WRTEN

Write Test Register Enable

To set the bit from 0 to 1 the test mode key has to be written as defined in **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**. Enables write access to the test registers. The unlock sequence is not required when FLXAnFRTEST1.WRTEN is kept at 1 while other bits of the register are changed.
The bit can be reset to 0 at any time.

25.2.3.2 FLXAnFRTEST2 — FlexRay Test Register 2

The FlexRay Test Register 2 holds all bits required for the RAM test of the Message RAM, Transient buffer RAM A and Transient buffer RAM B of the FlexRay module.

Access: FLXAnFRTEST2 can be read or written in 32-bit units.

Address: FLXAnFRTEST2: <FLXAn_base> + 0014$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 25.23 FLXAnFRTEST2 Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	These bits are always read as 0. The write value should be always 0.
6 to 4	SSEL[2:0]	Segment Select 000$_B$: Access to RAM bytes 0000$_H$ to 03FF$_H$ enabled 001$_B$: Access to RAM bytes 0400$_H$ to 07FF$_H$ enabled 010$_B$: Access to RAM bytes 0800$_H$ to 0BFF$_H$ enabled 011$_B$: Access to RAM bytes 0C00$_H$ to 0FFF$_H$ enabled 100$_B$: Access to RAM bytes 1000$_H$ to 13FF$_H$ enabled 101$_B$: Access to RAM bytes 1400$_H$ to 17FF$_H$ enabled 110$_B$: Access to RAM bytes 1800$_H$ to 1BFF$_H$ enabled 111$_B$: Access to RAM bytes 1C00$_H$ to 1FFF$_H$ enabled
3	Reserved	This bit is always read as 0. The write value should be always 0.
2 to 0	RS[2:0]	RAM Select 000$_B$ = Unused 001$_B$ = Unused 010$_B$ = Unused 011$_B$ = Unused 100$_B$ = Transient buffer RAM A (TBF1) 101$_B$ = Transient buffer RAM B (TBF2) 110$_B$ = Message RAM (MBF) 111$_B$ = Unused

(1) FLXAnFRTEST2.SSEL

Segment Select

Write access to these bits is only possible if bit FLXAnFRTEST1.WRTEN is set to “1”.
To enable access to the complete Message RAM (8192 byte addresses) the Message RAM is segmented into portions of 1024 bytes.

(2) FLXAnFRTEST2.RS

RAM Select

Write access to this register is only possible when FLXAnFRTEST1.WRTEN is set to “1”.
In RAM Test mode the RAM blocks selected by FLXAnFRTEST2.RS are mapped to module address <FLXAn_base> + 0400_H to ERAY + $07FF_H$ (1024 byte addresses).

25.2.3.3 FLXAnFRLCK — FlexRay Lock Register

Access: FLXAnFRLCK can be read or written in 32-bit units.
FLXAnFRLCKL can be read or written in 16-bit units.
FLXAnFRLCKLL can be read or written in 8-bit units.

Address: FLXAnFRLCK: <FLXAn_base> + $001C_H$,
FLXAnFRLCKL: <FLXAn_base> + $001C_H$,
FLXAnFRLCKLL: <FLXAn_base> + $001C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CLK[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.24 FLXAnFRLCK Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	CLK[7:0]	Configuration Lock Key Bit

(1) FLXAnFRLCK.CLK

Configuration Lock Key Bit

The Lock Register is write-only. Reading the register will return $0000\ 0000_H$.
To leave CONFIG state by writing FLXAnFRSUCC1.CMD (command READY), the write operation has to be directly preceded by two write accesses to the Configuration Lock Key (unlock sequence). If the write sequence below is interrupted by other write accesses between the second write to the Configuration Lock Key and the write access to the FLXAnFRSUCC1 register, the CC remains in CONFIG state and the sequence has to be repeated.

First write: FLXAnFRLCK.CLK = “$1100\ 1110_B$” (CE_H)
Second write: FLXAnFRLCK.CLK = “$0011\ 0001_B$” (31_H)
Third write: FLXAnFRSUCC1.CMD

CAUTION

If the Host uses 8/16-bit accesses to write the listed bit fields, the user has to ensure that no dummy accesses to the remaining register bytes/words are inserted by the compiler.

25.2.4 Interrupt Registers

25.2.4.1 FLXAnFREIR — FlexRay Error Interrupt Register

The flags are set when the CC detects one of the listed error conditions. The flags remain set until cleared.

Access: FLXAnFREIR can be read or written in 32-bit units.
FLXAnFREIRL and FLXAnFREIRH can be read or written in 16-bit units.
FLXAnFREIRLL, FLXAnFREIRLH, FLXAnFREIRHL, and FLXAnFREIRHH can be read or written in 8-bit units.

Address: FLXAnFREIR: <FLXAn_base> + 0020_H,
FLXAnFREIRL: <FLXAn_base> + 0020_H, FLXAnFREIRH: <FLXAn_base> + 0022_H,
FLXAnFREIRLL: <FLXAn_base> + 0020_H, FLXAnFREIRLH: <FLXAn_base> + 0021_H,
FLXAnFREIRHL: <FLXAn_base> + 0022_H, FLXAnFREIRHH: <FLXAn_base> + 0023_H

Value after reset: $0000\ 0000_H$

Table 25.25 FLXAnFREIR Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	TABB	Transmission Across Boundary Channel B Flag 0: No transmission across slot boundary detected on channel B 1: Transmission across slot boundary detected on channel B
25	LTVB	Latest Transmit Violation Channel B Flag 0: No latest transmit violation detected on channel B 1: Latest transmit violation detected on channel B
24	EDB	Error Detected on Channel B Flag 0: No error detected on channel B 1: Error detected on channel B
23 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	TABA	Transmission Across Boundary Channel A Flag 0: No transmission across slot boundary detected on channel A 1: Transmission across slot boundary detected on channel A
17	LTVA	Latest Transmit Violation Channel A Flag 0: No latest transmit violation detected on channel A 1: Latest transmit violation detected on channel A
16	EDA	Error Detected on Channel A Flag 0: No error detected on channel A 1: Error detected on channel A
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 25.25 FLXAnFREIR Register Contents

Bit Position	Bit Name	Function
11	MHF	Message Handler Constraints Flag 0: No message handler constraint violation detected 1: Message handler constraint violation detected
10	IOBA	Illegal Output buffer Access Flag 0: No illegal Host access to Output Buffer occurred 1: Illegal Host access to Output Buffer occurred
9	IIBA	Illegal Input Buffer Access Flag 0: No illegal Host access to Input Buffer occurred 1: Illegal Host access to Input Buffer occurred
8	EFA	Empty FIFO Access Flag 0: No access to empty FIFO occurred 1: Access to empty FIFO occurred
7	RFO	Receive FIFO Overrun Flag 0: No receive FIFO overrun detected 1: A receive FIFO overrun has been detected
6	AERR	Access error Flag 0: Access error is not detected. 1: Access error is detected.
5	CCL	CHI Command Locked Flag 0: CHI command not accepted 1: CHI command accepted
4	CCF	Clock Correction Failure Flag 0: No clock correction error 1: Clock correction failed
3	SFO	Sync Frame Overflow Flag 0: Number of received sync frames ≤ FLXAnFRGTUC2 1: More sync frames received than configured by FLXAnFRGTUC2
2	SFBM	Sync Frames Below Minimum Flag 0: Sync node: 1 or more sync frames received, non-sync node: 2 or more sync frames received 1: Less than the required minimum of sync frames received
1	CNA	Command Not Accepted Flag 0: CHI command accepted 1: CHI command not accepted
0	PEMC	POC Error Mode Changed Flag 0: Error mode has not changed 1: Error mode has changed

(1) FLXAnFREIR.TABB

Transmission Across Boundary Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
The flag indicates that a transmission across a slot boundary occurred for channel B.

(2) FLXAnFREIR.LTVB

Latest Transmit Violation Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
The flag indicates to the CPU that a latest transmission violation occurred on channel B.

(3) FLXAnFREIR.EDB

Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This bit is set whenever one of the flags FLXAnFRACS.SEDB, FLXAnFRACS.CEDB, FLXAnFRACS.CIB, FLXAnFRACS.SBVB changes from 0 to 1.

(4) FLXAnFREIR.TABA

Transmission Across Boundary Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
The flag indicates that a transmission across a slot boundary occurred for channel A.

(5) FLXAnFREIR.LTVA

Latest Transmit Violation Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
The flag indicates to the CPU that a latest transmit violation occurred on channel A.

(6) FLXAnFREIR.EDA

Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This bit is set whenever one of the flags FLXAnFRACS.SEDA, FLXAnFRACS.CEDA, FLXAnFRACS.CIA, FLXAnFRACS.SBVA changes from 0 to 1.

(7) FLXAnFREIR.MHF

Message Handler Constraints Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
The flag indicates a Message Handler constraint violation condition. It is set whenever one of the flags FLXAnFRMHDF.SNUA, FLXAnFRMHDF.SNUB, FLXAnFRMHDF.FNFA, FLXAnFRMHDF.FNFB, FLXAnFRMHDF.TBFA, FLXAnFRMHDF.TBFB, FLXAnFRMHDF.WAHP changes from 0 to 1.

(8) FLXAnFREIR.IOBA

Illegal Output buffer Access Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC when the Host requests the transfer of a message buffer from the Message RAM to the Output Buffer while FLXAnFROBCR.OBSYS is set to 1.

(9) FLXAnFREIR.IIBA

Illegal Input Buffer Access Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC when the Host wants to modify a message buffer via Input Buffer and one of the following conditions applies:

1. The CC is not in CONFIG or DEFAULT_CONFIG state and the Host writes to the Input Buffer Command Request register to modify the
    - Header section of message buffer 0 or 1 configured as a key slot
    - Header section of static message buffers with buffer number < FLXAnFRMRC.FDB while FLXAnFRMRC.SEC = “01_B”
    - Header section of any static or dynamic message buffer while FLXAnFRMRC.SEC = “$1x_B$”
    - Header and/or data section of any message buffer belonging to the receive FIFO
2. The Host writes to any register of the Input Buffer while FLXAnFRIBCR.IBSYH is set to 1.

(10) FLXAnFREIR.EFA

Empty FIFO Access Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set when the Host requests the transfer of a message from the receive FIFO via Output Buffer while the receive FIFO is empty.

(11) FLXAnFREIR.RFO

Receive FIFO Overrun Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
The flag is set by the CC when a receive FIFO overrun is detected. When a receive FIFO overrun occurs, the oldest message is overwritten with a new message. The current state of the FIFO is monitored in register FLXAnFRFSR.

(12) FLXAnFREIR.AERR

Access error flag Flag

Writing 0 in this bit has no effect.
This bit is cleared when writing 1 to it.
Notifies of an access error.
When the AMR, ATBF1, or ATBF2 bit in the FLXAnFRMHDS register changes from 0 to 1, this bit is set to 1.

(13) FLXAnFREIR.CCL

CHI Command Locked Flag

Writing 0 has no effect on the bit value. This bit is cleared by writing 1 to it.
The flag indicates that the write access to the CHI command vector FLXAnFRSUCC1.CMD was not successful because the execution of the previous CHI command has not yet completed. In this case bit FLXAnFREIR.CNA is also set to 1.

(14) FLXAnFREIR.CCF

Clock Correction Failure Flag

Writing 0 has no effect on the bit value. This bit is cleared by writing 1 to it.
This flag is set at the end of the communication cycle whenever one of the following errors occurs:

- Offset and/or rate correction incomplete
- Clock correction limit exceeded

The clock correction status is monitored in registers FLXAnFRCCEV and FLXAnFRSFS. A failure may occur during startup, therefore bit FLXAnFREIR.CCF should be set to 0 after the CC entered NORMAL_ACTIVE state.

(15) FLXAnFREIR.SFO

Sync Frame Overflow Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
It is set to 1 when either the number of sync frames received during the last communication cycle or the total number of different sync frame IDs received during the last two cycles exceeds the maximum number of sync frames as defined by FLXAnFRGTUC2.SNM.

(16) FLXAnFREIR.SFBM

Sync Frames Below Minimum Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 at the end of a cycle if the number of sync frames received during the last communication cycle was below the limit required for rate or offset correction term calculation (i.e. offset and/or rate correction incomplete). The clock correction status is monitored in FLXAnFRCCEV and FLXAnFRSFS.
This flag may be set to 1 during startup. Therefore this flag should be set to 0 by the Host after the CC entered NORMAL_ACTIVE state.

(17) FLXAnFREIR.CNA

Command Not Accepted Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
The flag indicates that the write access to the CHI command vector FLXAnFRSUCC1.CMD was not successful because the requested command was not valid in the actual POC state, or because the CHI command was locked (FLXAnFREIR.CCL = 1).

(18) FLXAnFREIR.PEMC

POC Error Mode Changed Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 whenever the error mode signaled by FLXAnFRCCEV.ERRM changes.

25.2.4.2 FLXAnFRSIR — FlexRay Status Interrupt Register

The flags are set when the CC detects one of the listed events. The flags remain set until cleared.

Access:	FLXAnFRSIR can be read or written in 32-bit units. FLXAnFRSIRL and FLXAnFRSIRH can be read or written in 16-bit units. FLXAnFRSIRLL, FLXAnFRSIRLH, FLXAnFRSIRHL, and FLXAnFRSIRHH can be read or written in 8-bit units.
Address:	FLXAnFRSIR: <FLXAn_base> + 0024_H, FLXAnFRSIRL: <FLXAn_base> + 0024_H, FLXAnFRSIRH: <FLXAn_base> + 0026_H, FLXAnFRSIRLL: <FLXAn_base> + 0024_H, FLXAnFRSIRLH: <FLXAn_base> + 0025_H, FLXAnFRSIRHL: <FLXAn_base> + 0026_H, FLXAnFRSIRHH: <FLXAn_base> + 0027_H
Value after reset:	0000 0000_H

Table 25.26 FLXAnFRSIR Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	MTSB	MTS Received on Channel B Flag (vSS!ValidMTSB) 0: No MTS symbol received on channel B 1: MTS symbol received on channel B
24	WUPB	Wakeup Pattern Channel B Flag 0: No wakeup pattern received on channel B 1: Wakeup pattern received on channel B
23 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17	MTSA	MTS Received on Channel A Flag (vSS!ValidMTSA) 0: No MTS symbol received on channel A 1: MTS symbol received on channel A
16	WUPA	Wakeup Pattern Channel A Flag 0: No wakeup pattern received on channel A 1: Wakeup pattern received on channel A
15	SDS	Start of Dynamic Segment Flag 0: Dynamic segment not yet started 1: Dynamic segment started
14	MBSI	Message Buffer Status Interrupt Flag 0: No message buffer status change of message buffer with MBI = 1 1: Message buffer status of at least one message buffer with MBI = 1 has changed
13	SUCS	Startup Completed Successfully Flag 0: No startup completed successfully 1: Startup completed successfully
12	SWE	Stop Watch Event Flag 0: No Stop Watch Event 1: Stop Watch Event occurred

Table 25.26 FLXAnFRSIR Register Contents

Bit Position	Bit Name	Function
11	TOBC	OBF Transfer Complete Flag 0: No transfer completed 1: Transfer between Message RAM and Output Buffer completed
10	TIBC	IBF Transfer Complete Flag 0: No transfer completed 1: Transfer between Input Buffer and Message RAM completed
9	TI1	Timer Interrupt 1 Flag 0: No timer interrupt 1 1: Timer interrupt 1 occurred
8	TI0	Timer Interrupt 0 Flag 0: No timer interrupt 0 1: Timer interrupt 0 occurred
7	NMVC	Network Management Vector Changed Flag 0: No change in the network management vector 1: Network management vector changed
6	RFCL	Receive FIFO Critical Level Flag 0: Receive FIFO below critical level 1: Receive FIFO critical level reached
5	RFNE	Receive FIFO Not Empty Flag 0: Receive FIFO is empty 1: Receive FIFO is not empty
4	RXI	Receive Interrupt Flag 0: No ND flag of a receive buffer with MBI = 1 has been set to 1 1: At least one ND flag of a receive buffer with MBI = 1 has been set to 1
3	TXI	Transmit Interrupt Flag 0: No frame transmitted from a transmit buffer with MBI = 1 1: At least one frame was transmitted from a transmit buffer with MBI = 1
2	CYCS	Cycle Start Interrupt Flag 0: No communication cycle started 1: Communication cycle started
1	CAS	Collision Avoidance Symbol Flag 0: No bit pattern matching the CAS symbol received 1: Bit pattern matching the CAS symbol received
0	WST	Wakeup Status Flag 0: Wakeup status unchanged 1: Wakeup status changed

(1) FLXAnFRSIR.MTSB

MTS Received on Channel B Flag (vSS!ValidMTSB)

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
Indicates that a Media Access Test Symbol was received on channel B during the preceding symbol window.
Updated by the CC for each channel at the end of the symbol window.

(2) FLXAnFRSIR.WUPB

Wakeup Pattern Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 when a wakeup pattern was received on channel B in either of the following states:

- WAKEUP
- READY
- STARTUP state

(3) FLXAnFRSIR.MTSA

MTS Received on Channel A Flag (vSS!ValidMTSA)

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
Indicates that a Media Access Test Symbol was received on channel A during the preceding symbol window.
Updated by the CC for each channel at the end of the symbol window.

(4) FLXAnFRSIR.WUPA

Wakeup Pattern Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 when a wakeup pattern was received on channel A in either of the following states:

- WAKEUP
- READY
- STARTUP state

(5) FLXAnFRSIR.SDS

Start of Dynamic Segment Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC when the dynamic segment starts.

(6) FLXAnFRSIR.MBSI

Message Buffer Status Interrupt Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC when the message buffer status FLXAnFRMBS has changed and if bit MBI of that message buffer is 1 (see **Table 25.119, Header Section of a Message Buffer in the Message RAM**).

(7) FLXAnFRSIR.SUCS

Startup Completed Successfully Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set whenever a startup completed successfully and the CC entered NORMAL_ACTIVE state.

(8) FLXAnFRSIR.SWE

Stop Watch Event Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set after a stop watch activation when the current cycle counter and macrotick value are stored in the Stop Watch register (see **Section 25.2.5.4, FLXAnFRSTPW1 — FlexRay Stop Watch Register 1**).

(9) FLXAnFRSIR.TOBC

Transfer Output Buffer Completed Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set whenever a transfer from the Message RAM to the Output Buffer has completed and FLXAnFROBCR.OBSYS has been cleared by the Message Handler.

(10) FLXAnFRSIR.TIBC

Transfer Input Buffer Completed Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set whenever a transfer from the message RAM to the input buffer has completed and FLXAnFRIBCR.IBSYS has been cleared by the Message Handler.

(11) FLXAnFRSIR.TI1

Timer 1 Interrupt Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set whenever timer 1 matches the conditions configured in register FLXAnFRT1C. FlexRay timer 1 interrupt is generated when the T1IE bit in the FLXAnFROC register is effective.

(12) FLXAnFRSIR.TI0

Timer 0 Interrupt Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set whenever timer 0 matches the conditions configured in register FLXAnFRT0C. FlexRay timer 0 interrupt is generated when the T0IE bit in the FLXAnFROC register is effective.

(13) FLXAnFRSIR.NMVC

Network Management Vector Changed Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This is set when a change in the Network Management Vector occurs.

(14) FLXAnFRSIR.RFCL

Receive FIFO Critical Level Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set when the receive FIFO fill level FLXAnFRFSR.RFFL is equal to or greater than the critical level as configured by FLXAnFRFCL.CL.

(15) FLXAnFRSIR.RFNE

Receive FIFO Not Empty Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC when a received valid frame was stored into the empty receive FIFO. The current state of the receive FIFO is monitored in register FLXAnFRFSR.

(16) FLXAnFRSIR.RXI

Receive Interrupt Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC whenever the set condition of a message buffers ND flag is fulfilled (see **Section 25.2.9.6, FLXAnFRNDATi — FlexRay New Data Register i (i = 1 to 4)**), and if bit MBI of that message buffer is set to 1 (see **Table 25.119, Header Section of a Message Buffer in the Message RAM**)

(17) FLXAnFRSIR.TXI

Transmit Interrupt Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC at the end of frame transmission if bit MBI in the respective message buffer is set to 1 (see **Table 25.119, Header Section of a Message Buffer in the Message RAM**).

(18) FLXAnFRSIR.CYCS

Cycle Start Interrupt Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC when a communication cycle starts.

(19) FLXAnFRSIR.CAS

Collision Avoidance Symbol Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC during STARTUP state when a CAS or a potential CAS was received.

(20) FLXAnFRSIR.WST

Wakeup Status Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set when FLXAnFRCCSV.WSV changes to a value other than UNDEFINED.

25.2.4.3 FLXAnFREILS — FlexRay Error Interrupt Line Select Register

The FlexRay Error Interrupt Line Select register assigns an interrupt generated by a specific error interrupt flag from register FLXAnFREIR to one of the two modules interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt).

Access:	FLXAnFREILS can be read or written in 32-bit units. FLXAnFREILSL and FLXAnFREILSH can be read or written in 16-bit units. FLXAnFREILSLL, FLXAnFREILSLH, FLXAnFREILSHL, and FLXAnFREILSHH can be read or written in 8-bit units.
Address:	FLXAnFREILS: <FLXAn_base> + 0028$_H$, FLXAnFREILSL: <FLXAn_base> + 0028$_H$, FLXAnFREILSH: <FLXAn_base> + 002A$_H$, FLXAnFREILSLL: <FLXAn_base> + 0028$_H$, FLXAnFREILSLH: <FLXAn_base> + 0029$_H$, FLXAnFREILSHL: <FLXAn_base> + 002A$_H$, FLXAnFREILSHH: <FLXAn_base> + 002B$_H$
Value after reset:	0000 0000$_H$

25.2.4.4 FLXAnFRSILS — FlexRay Status Interrupt Line Select Register

The FlexRay Status Interrupt Line Select register assign an interrupt generated by a specific status interrupt flag from register FLXAnFRSIR to one of the two module interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt).

Access:	FLXAnFRSILS can be read or written in 32-bit units. FLXAnFRSILSL and FLXAnFRSILSH can be read or written in 16-bit units. FLXAnFRSILSLL, FLXAnFRSILSLH, FLXAnFRSILSHL, and FLXAnFRSILSHH can be read or written in 8-bit units.
Address:	FLXAnFRSILS: <FLXAn_base> + $002C_H$, FLXAnFRSILSL: <FLXAn_base> + $002C_H$, FLXAnFRSILSH: <FLXAn_base> + $002E_H$, FLXAnFRSILSLL: <FLXAn_base> + $002C_H$, FLXAnFRSILSLH: <FLXAn_base> + $002D_H$, FLXAnFRSILSHL: <FLXAn_base> + $002E_H$, FLXAnFRSILSHH: <FLXAn_base> + $002F_H$

25.2.4.5 FLXAnFREIES — FlexRay Error Interrupt Enable Set Register

The settings in the FlexRay Error Interrupt Enable Set register (FLXAnFREIES) and FlexRay Error Interrupt Enable Reset (FLXAnFREIER) register determine which status changes in the FlexRay Error Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFREIES and reset by writing to FLXAnFREIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value. Writing a 1 sets the interrupt enable bit.

Access: FLXAnFREIES can be read or written in 32-bit units.
FLXAnFREIESL and FLXAnFREIESH can be read or written in 16-bit units.
FLXAnFREIESLL, FLXAnFREIESLH, FLXAnFREIESHL, and FLXAnFREIESHH can be read or written in 8-bit units.

Address: FLXAnFREIES: <FLXAn_base> + 0030$_H$,
FLXAnFREIESL: <FLXAn_base> + 0030$_H$, FLXAnFREIESH: <FLXAn_base> + 0032$_H$,
FLXAnFREIESLL: <FLXAn_base> + 0030$_H$, FLXAnFREIESLH: <FLXAn_base> + 0031$_H$,
FLXAnFREIESHL: <FLXAn_base> + 0032$_H$, FLXAnFREIESHH: <FLXAn_base> + 0033$_H$

Value after reset: 0000 0000$_H$

25.2.4.6 FLXAnFREIER — FlexRay Error Interrupt Enable Reset Register

The settings in the FlexRay Error Interrupt Enable Set register (FLXAnFREIES) and FlexRay Error Interrupt Enable Reset (FLXAnFREIER) register determine which status changes in the FlexRay Error Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFREIES and reset by writing to FLXAnFREIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value. Writing a 1 clears the interrupt enable bit.

Access: FLXAnFREIER can be read or written in 32-bit units.
FLXAnFREIERL and FLXAnFREIERH can be read or written in 16-bit units.
FLXAnFREIERLL, FLXAnFREIERLH, FLXAnFREIERHL, and FLXAnFREIERHH can be read or written in 8- bit units.

Address: FLXAnFREIER: <FLXAn_base> + 0034$_H$,
FLXAnFREIERL: <FLXAn_base> + 0034$_H$, FLXAnFREIERH: <FLXAn_base> + 0036$_H$,
FLXAnFREIERLL: <FLXAn_base> + 0034$_H$, FLXAnFREIERLH: <FLXAn_base> + 0035$_H$,
FLXAnFREIERHL: <FLXAn_base> + 0036$_H$, FLXAnFREIERHH: <FLXAn_base> + 0037$_H$

Value after reset: 0000 0000$_H$

25.2.4.7 FLXAnFRSIES — FlexRay Status Interrupt Enable Set Register

The settings in the FlexRay Status Interrupt Enable Set register (FLXAnFRSIES) and FlexRay Status Interrupt Enable Reset (FLXAnFRSIER) register determine which status changes in the FlexRay Status Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFRSIES and reset by writing to FLXAnFRSIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value. Writing a 1 sets the interrupt enable bit.

Access: FLXAnFRSIES can be read or written in 32-bit units.
FLXAnFRSIESL and FLXAnFRSIESH and can be read or written in 16-bit units.
FLXAnFRSIESLL, FLXAnFRSIESLH, FLXAnFRSIESHL, and FLXAnFRSIESHH can be read or written in 8-bit units.

Address: FLXAnFRSIES: <FLXAn_base> + 0038_H,
FLXAnFRSIESL: <FLXAn_base> + 0038_H, FLXAnFRSIESH: <FLXAn_base> + $003A_H$,

25.2.4.8 FLXAnFRSIER — FlexRay Status Interrupt Disable Register

The settings in the FlexRay Status Interrupt Enable Set register (FLXAnFRSIES) and FlexRay Status Interrupt Disable (FLXAnFRSIER) register determine which status changes in the FlexRay Status Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFRSIES and reset by writing to FLXAnFRSIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value. Writing a 1 clears the interrupt enable bit.

Access:	FLXAnFRSIER can be read or written in 32-bit units. FLXAnFRSIERL and FLXAnFRSIERH can be read or written in 16-bit units. FLXAnFRSIERLL, FLXAnFRSIERLH, FLXAnFRSIERHL, and FLXAnFRSIERHH can be read or written in 8- bit units.
Address:	FLXAnFRSIER: <FLXAn_base> + 003C$_{H}$, FLXAnFRSIERL: <FLXAn_base> + 003C$_{H}$, FLXAnFRSIERH: <FLXAn_base> + 003E$_{H}$, FLXAnFRSIERLL: <FLXAn_base> + 003C$_{H}$, FLXAnFRSIERLH: <FLXAn_base> + 003D$_{H}$, FLXAnFRSIERHL: <FLXAn_base> + 003E$_{H}$, FLXAnFRSIERHH: <FLXAn_base> + 003F$_{H}$
Value after reset:	0000 0000$_{H}$

25.2.4.9 FLXAnFRILE — FlexRay Interrupt Line Enable Register

Each of the two module interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt) can be enabled/disabled separately by programming bit FLXAnFRILE.EINT0 and FLXAnFRILE.EINT1.

Access:	FLXAnFRILE can be read or written in 32-bit units. FLXAnFRILEL can be read or written in 16-bit units. FLXAnFRILELL can be read or written in 8-bit units.
Address:	FLXAnFRILE: <FLXAn_base> + 0040$_H$, FLXAnFRILEL: <FLXAn_base> + 0040$_H$, FLXAnFRILELL: <FLXAn_base> + 0040$_H$

25.2.5 FlexRay Timer Registers

25.2.5.1 FLXAnFRT0C — FlexRay Timer 0 Configuration Register

This register is an absolute timer. It specifies the point in time when a FlexRay timer 0 interrupt occurs as the values of cycle count and macrotick (MT). When the FlexRay timer 0 passes, FLXAnFRSIR.TI0 and FLXAnFROS.T0IS are set to 1. A timer 0 interrupt then occurs while the FLXAnFROC.T0IE bit is effective.

CAUTION

The configuration of timer 0 is compared against the macrotick counter value, there is no separate counter for timer 0.

Access: FLXAnFRT0C can be read or written in 32-bit units.
FLXAnFRT0CL and FLXAnFRT0CH can be read or written in 16-bit units.
FLXAnFRT0CLL, FLXAnFRT0CLH, FLXAnFRT0CHL, and FLXAnFRT0CHH can be read or written in 8-bit units.

Address: FLXAnFRT0C: <FLXAn_base> + 0044$_H$,
FLXAnFRT0CL: <FLXAn_base> + 0044$_H$, FLXAnFRT0CH: <FLXAn_base> + 0046$_H$,
FLXAnFRT0CLL: <FLXAn_base> + 0044$_H$, FLXAnFRT0CLH: <FLXAn_base> + 0045$_H$,
FLXAnFRT0CHL: <FLXAn_base> + 0046$_H$, FLXAnFRT0CHH: <FLXAn_base> + 0047$_H$

Value after reset: 0000 0000$_H$

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 16	T0MO[13:0]	Timer 0 Macrotick Offset Bit Timer 0 Macrotick Offset
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14 to 8	T0CC[6:0]	Timer 0 Cycle Code Bit Timer 0 Cycle Code
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	T0MS	Timer 0 Mode Select Bit 0: Single-shot mode 1: Continuous mode
0	T0RC	Timer 0 Run Control Bit 0: Timer 0 halted 1: Timer 0 running

(1) FLXAnFRT0C.T0MO

Timer 0 Macrotick Offset Bit

Before reconfiguration of the timer, the timer has to be halted first by clearing FLXAnFRT0C.T0RC to 0.
Configures the macrotick offset from the beginning of the communication cycle where the interrupt is to occur. The FlexRay timer 0 interrupt occurs at this offset for each cycle of the cycle set.

(2) FLXAnFRT0C.T0CC

Timer 0 Cycle Code Bit

Before reconfiguration of the timer, the timer has to be halted first by clearing FLXAnFRT0C.T0RC to 0.
The 7-bit timer 0 cycle code determines the cycle set used for generation of the FlexRay timer 0 interrupt. For details about the configuration of the cycle code see **Section 25.3.8.2, Cycle Counter Filtering**.

(3) FLXAnFRT0C.T0MS

Timer 0 Mode Select Bit

Before reconfiguration of the timer, the timer has to be halted first by clearing FLXAnFRT0C.T0RC to 0.
Configures the timer run mode. In Single-shot mode the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

(4) FLXAnFRT0C.T0RC

Timer 0 Run Control Bit

Timer 0 can be activated (set FLXAnFRT0C.T0RC to 1) when the POC is either in NORMAL_ACTIVE state or in NORMAL_PASSIVE state.
Timer 0 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

25.2.5.2 FLXAnFRT1C — FlexRay Timer 1 Configuration Register

This register is a relative timer. After the specified number of macroticks (MT) has expired, a FlexRay timer 1 interrupt is asserted. When the FlexRay timer 1 passes, FLXAnFRSIR.TI1 and FLXAnFROS.T1IS are set to 1. A timer 1 interrupt then occurs while the FLXAnFROC.T1IE bit is effective.

Access: FLXAnFRT1C can be read or written in 32-bit units.
FLXAnFRT1CL and FLXAnFRT1CH can be read or written in 16-bit units.
FLXAnFRT1CLL, FLXAnFRT1CHL, and FLXAnFRT1CHH can be read or written in 8-bit units.

Address: FLXAnFRT1C: <FLXAn_base> + 0048$_H$,
FLXAnFRT1CL: <FLXAn_base> + 0048$_H$, FLXAnFRT1CH: <FLXAn_base> + 004A$_H$,
FLXAnFRT1CLL: <FLXAn_base> + 0048$_H$, FLXAnFRT1CHL: <FLXAn_base> + 004A$_H$,
FLXAnFRT1CHH: <FLXAn_base> + 004B$_H$

Value after reset: 0002 0000$_H$

31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 16	T1MC[13:0]	Timer 1 Macrotick Count Bit
15 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	T1MS	Timer 1 Mode Select Bit 0: Single-shot mode 1: Continuous mode
0	T1RC	Timer 1 Run Control Bit 0: Timer 1 halted 1: Timer 1 running

(1) FLXAnFRT1C.T1MC

Timer 1 Macrotick Count Bit

Before reconfiguration of the timer, the timer has to be halted first by writing 0 to FLXAnFRT1C.T1RC.

- Valid values are 2 to 16383 MT in continuous mode
- Valid values are 1 to 16383 MT in single-shot mode

When the configured macrotick count is reached the FlexRay timer 1 interrupt is generated.

(2) FLXAnFRT1C.T1MS

Timer 1 Mode Select Bit

Before reconfiguration of the timer, the timer has to be halted first by writing 0 to FLXAnFRT1C.T1RC.
Configures the timer run mode. In Single-shot mode the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

(3) FLXAnFRT1C.T1RC

Timer 1 Run Control Bit

Timer 1 can be activated (set FLXAnFRT1C.T1RC to 1) as long as the POC is either in NORMAL_ACTIVE state or in NORMAL_PASSIVE state.
Timer 1 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

25.2.5.3 FLXAnFRT2C — FlexRay Timer 2 Configuration Register

This register is an absolute timer. Timer 2 has the same absolute timer features as timer 0.

Access: FLXAnFRT2C can be read or written in 32-bit units.
FLXAnFRT2CL and FLXAnFRT2CH can be read or written in 16-bit units.
FLXAnFRT2CLL, FLXAnFRT2CLH, FLXAnFRT2CHL, and FLXAnFRT2CHH can be read or written in 8-bit units.

Address: FLXAnFRT2C: <FLXAn_base> + 0844$_H$
FLXAnFRT2CL: <FLXAn_base> + 0844$_H$, FLXAnFRT2CH: <FLXAn_base> + 0846$_H$,

0	T2RC	Timer 2 Run Control Bit 0: Timer 2 halted 1: Timer 2 running

(1) FLXAnFRT2C.T2MO

Timer 2 Macrotick Offset Bit

The user can only write to these bits when FLXAnFRT2C.T2RC is 0.
Allowed range is 0 to FLXAnFRGTUC2.MPC.
These bits indicate the timer macrotick value defining the timer expiration condition.

(2) FLXAnFRT2C.T2CC

Timer 2 Cycle Code Bit

The user can only write to these bits when FLXAnFRT2C.T2RC is 0.
This bit indicates the cycle counter filter code defining the timer expiration condition.
See **Section 25.3.8.2, Cycle Counter Filtering**.

(3) FLXAnFRT2C.T2MS

Timer 2 Mode Select Bit

The user can only write to these bits when FLXAnFRT2C.T2RC is 0.
This bit indicates the operation mode of the Timer 2.

0: Single-shot mode
The timer is operating in the non-repetitive (single shot) mode. Once the configured expiration criteria are matching the timer will be automatically halted.

1: Continuous mode
The timer is operating in the repetitive (continuous) mode. The timer will expire every time the configured expiration criteria are matching. The timer is not halted.

(4) FLXAnFRT2C.T2RC

Timer 2 Run Control Bit

The user can only set this bit to 1 when the POC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.
This bit indicates the activation state of the Timer 2.
When the expiration criteria are matching for a single shot timer, then this bit is cleared automatically and the Timer 2 is halted.

[Setting condition]
This bit is set by writing 1 to it when the POC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.

[Clearing condition]
This bit is cleared when the POC state leaves the NORMAL_ACTIVE or NORMAL_PASSIVE state except for transitions between the two states.
This bit is cleared when the timer is operating in the non-repetitive (single shot) mode (FLXAnFRT2C.T2MS is 0) and the expiration criteria are matching.
This bit is cleared by writing 0 to it.

25.2.5.4 FLXAnFRSTPW1 — FlexRay Stop Watch Register 1

The stop watch is activated by the following trigger events.

- FlexRay 0 interrupt or FlexRay 1 interrupt
- Writing bit FLXAnFRSTPW1.SSWT to 1

At the first MT counter increment after the stop watch starts, the actual cycle counter and macrotick values are captured in register FLXAnFRSTPW1 while the slot counter values for channel A and B are captured in register FLXAnFRSTPW2.

Access: FLXAnFRSTPW1 can be read or written in 32-bit units.
FLXAnFRSTPW1L can be read or written in 16-bit units.
FLXAnFRSTPW1H is a read-only register that can be read in 16-bit units.
FLXAnFRSTPW1LL can be read or written in 8-bit units.
FLXAnFRSTPW1LH, FLXAnFRSTPW1HL, and FLXAnFRSTPW1HH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRSTPW1: <FLXAn_base> + 004C$_H$,
FLXAnFRSTPW1L: <FLXAn_base> + 004C$_H$, FLXAnFRSTPW1H: <FLXAn_base> + 004E$_H$,
FLXAnFRSTPW1LL: <FLXAn_base> + 004C$_H$, FLXAnFRSTPW1LH: <FLXAn_base> + 004D$_H$,
FLXAnFRSTPW1HL: <FLXAn_base> + 004E$_H$, FLXAnFRSTPW1HH: <FLXAn_base> + 004F$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.37 FLXAnFRSTPW1 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 16	SMTV[13:0]	Stop Watch Captured Macrotick Value
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	SCCV[5:0]	Stop Watch Captured Cycle Counter Value
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	EINT1	Enable FlexRay Interrupt 1 Trigger Bit 0: Stop watch trigger by FlexRay 1 interrupt disabled 1: FlexRay 1 interrupt event triggers stop watch
5	EINT0	Enable FlexRay 0 Interrupt Trigger Bit 0: Stop watch trigger by FlexRay 0 interrupt disabled 1: FlexRay interrupt 0 event triggers stop watch
4	EETP	Enable External Trigger Pin 0: Stop watch trigger via MCU input pin (FLXA0STPWT) disabled 1: A rising or falling edge on MCU input pin (FLXA0STPWT) trigger stop watch

Table 25.37 FLXAnFRSTPW1 Register Contents

Bit Position	Bit Name	Function
3	SSWT	Software Stop Watch Trigger Bit 0: Software trigger reset 1: Stop watch activated by software trigger
2	EDGE	Stop Watch Trigger Edge Select Bit 0: Falling edge 1: Rising edge
1	SWMS	Stop Watch Mode Select Bit 0: Single-shot mode 1: Continuous mode
0	ESWT	Enable Hardware Stop Watch Trigger Bit 0: Stop watch trigger disabled 1: Stop watch trigger enabled

(1) FLXAnFRSTPW1.SMTV

Stop Watch Captured Macrotick Value

Indicates the state of the macrotick counter when the stop watch event occurred.

(2) FLXAnFRSTPW1.SCCV

Stop Watch Captured Cycle Counter Value

Indicates the state of the cycle counter when the stop watch event occurred.

(3) FLXAnFRSTPW1.EINT1

Enable FlexRay 1 Interrupt Trigger Bit

Enables stop watch trigger by FlexRay 1 interrupt when FLXAnFRSTPW1.ESWT = 1.

(4) FLXAnFRSTPW1.EINT0

Enable FlexRay 0 Interrupt Trigger Bit

Enables stop watch trigger by FlexRay 0 interrupt when FLXAnFRSTPW1.ESWT = 1.

(5) FLXAnFRSTPW1.EETP

Enable External Trigger Pin

Enables stop watch trigger event via MCU pin FLXAnSTPWT if FLXAnFRSTPW1.ESWT = ‘1’.

(6) FLXAnFRSTPW1.SSWT

Software Stop Watch Trigger Bit

Bits FLXAnFRSTPW1.ESWT and FLXAnFRSTPW1.SSWT cannot be set to 1 simultaneously. In this case the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.
Writing 1 in this bit activates the stop watch. This bit is reset to 0 after the cycle count and slot count, and macrotick (MT) value are stored in the FlexRay stop watch register.

(7) FLXAnFRSTPW1.EDGE

Stop Watch Trigger Edge Select Bit

(8) FLXAnFRSTPW1.SWMS

Stop Watch Mode Select Bit

(9) FLXAnFRSTPW1.ESWT

Enable Stop Watch Trigger Bit

Bits FLXAnFRSTPW1.ESWT and FLXAnFRSTPW1.SSWT cannot be set to 1 simultaneously. In this case the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.
If enabled, a FlexRay 0 interrupt event or a FlexRay 1 interrupt event activates the stop watch.
In single-shot mode, this bit is reset to 0 after the cycle count and slot count, and macrotick (MT) value are stored in the FlexRay stop watch register.

25.2.5.5 FLXAnFRSTPW2 — FlexRay Stop Watch Register 2

Access: FLXAnFRSTPW2 is a read-only register that can be read in 32-bit units.
FLXAnFRSTPW2L and FLXAnFRSTPW2H are the read-only registers that can be read in 16-bit units.
FLXAnFRSTPW2LL, FLXAnFRSTPW2LH, FLXAnFRSTPW2HL, and FLXAnFRSTPW2HH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRSTPW2: <FLXAn_base> + 0050_H,
FLXAnFRSTPW2L: <FLXAn_base> + 0050_H, FLXAnFRSTPW2H: <FLXAn_base> + 0052_H,
FLXAnFRSTPW2LL: <FLXAn_base> + 0050_H, FLXAnFRSTPW2LH: <FLXAn_base> + 0051_H,
FLXAnFRSTPW2HL: <FLXAn_base> + 0052_H, FLXAnFRSTPW2HH: <FLXAn_base> + 0053_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SSCVB[10:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.38 FLXAnFRSTPW2 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned.
26 to 16	SSCVB[10:0]	Stop Watch Captured Slot Counter Value Channel B
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	SSCVA[10:0]	Stop Watch Captured Slot Counter Value Channel A

(1) FLXAnFRSTPW2.SSCVB

Stop Watch Captured Slot Counter Value Channel B

Indicates the state of the slot counter value for channel B when the stop watch event occurred.

(2) FLXAnFRSTPW2.SSCVA

Stop Watch Captured Slot Counter Value Channel A

Indicates the state of the slot counter value for channel A when the stop watch event occurred.

25.2.6 CC Control Registers

This section describes the registers provided by the CC (Communication Controller) to allow the Host to control the operation of the CC. The FlexRay protocol specification requires the Host to write application configuration data in CONFIG state only. Please consider that the configuration registers are not locked for writing in DEFAULT_CONFIG state.

The configuration data is reset when DEFAULT_CONFIG state is entered after reset. To change POC state from DEFAULT_CONFIG to CONFIG state the Host has to apply CHI command CONFIG. If the Host wants the CC to leave CONFIG state, the Host has to execute the lock release sequence as described in **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**.

25.2.6.1 FLXAnFRSUCC1 — FlexRay SUC Configuration Register 1

Access: FLXAnFRSUCC1 can be read or written in 32-bit units.
FLXAnFRSUCC1L and FLXAnFRSUCC1H can be read or written in 16-bit units.
FLXAnFRSUCC1LL, FLXAnFRSUCC1LH, FLXAnFRSUCC1HL, and FLXAnFRSUCC1HH can be read or written in 8-bit units.

Address: FLXAnFRSUCC1: <FLXAn_base> + 0080$_H$,
FLXAnFRSUCC1L: <FLXAn_base> + 0080$_H$, FLXAnFRSUCC1H: <FLXAn_base> + 0082$_H$,
FLXAnFRSUCC1LL: <FLXAn_base> + 0080$_H$, FLXAnFRSUCC1LH: <FLXAn_base> + 0081$_H$,
FLXAnFRSUCC1HL: <FLXAn_base> + 0082$_H$, FLXAnFRSUCC1HH: <FLXAn_base> + 0083$_H$

Value after reset: 0C40 1080$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	CCHB	CCHA	MTSB	MTSA	HCSE	TSM	WUCS	PTA[4:0]				
Value after reset	0	0	0	0	1	1	0	0	0	1	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSA[4:0]					—	TXSY	TXST	PBSY	—	—	—	CMD[3:0]			
Value after reset	0	0	0	1	0	0	0	0	1	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.39 FLXAnFRSUCC1 Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27	CCHB	Connected to Channel B Bit Configures pChannels 0: Not connected to channel B 1: Node connected to channel B (default after reset)
26	CCHA	Connected to Channel A Bit Configures pChannels 0: Not connected to channel A 1: Node connected to channel A (default after reset)
25	MTSB	Select Channel B for MTS Transmission Bit 0: Channel B disabled for MTS transmission 1: Channel B selected for MTS transmission
24	MTSA	Select Channel A for MTS Transmission Bit 0: Channel A disabled for MTS transmission 1: Channel A selected for MTS transmission

Table 25.39 FLXAnFRSUCC1 Register Contents

Bit Position	Bit Name	Function
23	HCSE	Halt due to Clock Sync Error Bit Configures pAllowHaltDueToClock 0: CC will enter/remain in NORMAL_PASSIVE 1: CC will enter HALT state
22	TSM	Transmission Slot Mode Bit Configures pSingleSlotEnabled 0: ALL Slot Mode 1: SINGLE Slot Mode (value after hard reset)
21	WUCS	Wakeup Channel Select Bit Configures pWakeupChannel 0: Send wakeup pattern on channel A 1: Send wakeup pattern on channel B
20 to 16	PTA[4:0]	Passive to Active Bit Configures pAllowPassiveToActive
15 to 11	CSA[4:0]	Cold Start Attempts Bit Configures gColdStartAttempts
10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	TXSY	Transmit Sync Frame in Key Slot Bit Configures pKeySlotUsedForSync 0: No sync frame transmission in key slot, node is neither sync nor coldstart node 1: Key slot used to transmit sync frame, node is sync node
8	TXST	Transmit Startup Frame in Key Slot Bit Configures pKeySlotUsedForStartup 0: No startup frame transmission in key slot, node is non-coldstarter 1: Key slot used to transmit startup frame, node is leading or following coldstarter
7	PBSY	POC Busy Flag 0: POC not busy, FLXAnFRSUCC1.CMD writeable 1: POC is busy, FLXAnFRSUCC1.CMD locked
6 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	CMD[3:0]	CHI Command Vector Bit 0000_B: command_not_accepted 0001_B: CONFIG 0010_B: READY 0011_B: WAKEUP 0100_B: RUN 0101_B: ALL_SLOTS 0110_B: HALT 0111_B: FREEZE 1000_B: SEND_MTS 1001_B: ALLOW_COLDSTART 1010_B: RESET_STATUS_INDICATORS 1011_B: MONITOR_MODE 1100_B: CLEAR_RAMS others: reserved

(1) FLXAnFRSUCC1.CCHB

Connected to Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Configures whether the node is connected to channel B (pChannels).

(2) FLXAnFRSUCC1.CCHA

Connected to Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Configures whether the node is connected to channel A (pChannels).

(3) FLXAnFRSUCC1.MTSB

Select Channel B for MTS Transmission Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
FLXAnFRSUCC1.MTSB may also be changed outside DEFAULT_CONFIG or CONFIG state when the write to FLXAnFRSUCC1 register is directly preceded by the unlock sequence for the Configuration Lock Key as described in **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**. This may be combined with CHI command SEND_MTS. If both bits FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB are set to 1, an MTS symbol will be transmitted on both channels when requested by writing FLXAnFRSUCC1.CMD = “1000_B”.
The bit selects channel B for MTS symbol transmission.

(4) FLXAnFRSUCC1.MTSA

Select Channel A for MTS Transmission Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
FLXAnFRSUCC1.MTSA may also be changed outside DEFAULT_CONFIG or CONFIG state when the write to FLXAnFRSUCC1 register is directly preceded by the unlock sequence for the Configuration Lock Key as described in **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**. This may be combined with CHI command SEND_MTS. If both bits FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB are set to 1, an MTS symbol will be transmitted on both channels when requested by writing FLXAnFRSUCC1.CMD = “1000_B”.
The bit selects channel A for MTS symbol transmission.

(5) FLXAnFRSUCC1.HCSE

Halt due to Clock Sync Error Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Controls the transition to HALT state due to a clock synchronization error (pAllowHaltDueToClock).

(6) FLXAnFRSUCC1.TSM

Transmission Slot Mode Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Sets the value after transmission slot mode reset (pSingleSlotEnabled).
In SINGLE slot mode the CC may only transmit in the preconfigured key slot. The key slot ID is configured in the header section of message buffer 0 or message buffers 0 and 1 depending on bit FLXAnFRMRC.SPLM.
If FLXAnFRSUCC1.TSM = 1, message buffer 0 or message buffers 0 and 1 can be (re)configured in DEFAULT_CONFIG or CONFIG state only. In ALL slot mode the CC may transmit in all slots.
FLXAnFRSUCC1.TSM is a configuration bit which can only be set/reset by the Host.

The CC changes to ALL slot mode when the Host successfully applied the ALL_SLOTS command by writing FLXAnFRSUCC1.CMD = “0101_B” in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. The actual slot mode is monitored by FLXAnFRCCSV.SLM.

(7) FLXAnFRSUCC1.WUCS

Wakeup Channel Select Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
With this bit the Host selects the channel on which the CC sends the Wakeup pattern (pWakeupChannel).

(8) FLXAnFRSUCC1.PTA

Passive to Active Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 31 even/odd cycle pairs.
Defines the number of consecutive even/odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state (pAllowPassiveToActive).
If set to “00000_B” the CC is not allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state.

(9) FLXAnFRSUCC1.CSA

Cold Start Attempts Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Must be identical in all nodes of a cluster. Valid values are 2 to 31.
Configures the maximum number of attempts that a cold starting node is permitted to try to start up the network without receiving any valid response from another node (gColdStartAttempts).

(10) FLXAnFRSUCC1.TXSY

Transmit Sync Frame in Key Slot Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Defines whether the key slot is used to transmit sync frames (pKeySlotUsedForSync).

CAUTION

The protocol requires that both bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set for coldstart nodes.

---

(11) FLXAnFRSUCC1.TXST

Transmit Startup Frame in Key Slot Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Defines whether the key slot is used to transmit startup frames (pKeySlotUsedForStartup).

CAUTION

The protocol requires that both bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set for coldstart nodes.

---

(12) FLXAnFRSUCC1.PBSY

POC Busy Flag

Signals that the POC is busy and cannot accept a command from the Host. FLXAnFRSUCC1.CMD is locked against write accesses.
Set to 1 after reset during initialization of internal RAM blocks.

(13) FLXAnFRSUCC1.CMD

CHI Command Vector Bit

The Host may write any CHI command at any time, but certain commands are enabled only in certain POC states. If a command is not enabled, it will not be executed, the CHI command vector FLXAnFRSUCC1.CMD will be reset to "0000_B" = command_not_accepted, and flag FLXAnFREIR.CNA will be set to 1.
In general the Host must check FLXAnFRSUCC1.PBSY before writing a new CHI command.
In case the previous CHI command has not yet completed, FLXAnFREIR.CCL is set to 1 together with FLXAnFREIR.CNA; the CHI command needs to be repeated.
Except for HALT state, a POC state change command applied while the CC is already in the requested POC state neither causes a state change nor will FLXAnFREIR.CNA be set.
Reading FLXAnFRSUCC1.CMD shows whether the last CHI command was accepted. The actual POC state is monitored by FLXAnFRCCSV.POCS.

- command_not_accepted
  FLXAnFRSUCC1.CMD is reset to "0000_B" due to one of the following conditions:
  - Illegal command applied by the Host
  - Host applied command to leave CONFIG state without preceding config lock key
  - Host applied new command while execution of the previous Host command has not completed
  - Host writes command_not_accepted

When FLXAnFRSUCC1.CMD is cleared to "0000_B", FLXAnFREIR.CNA is set to 1, and if enabled an interrupt is generated.
Commands which are not accepted are not executed.

CONFIG Command

Go to POC state CONFIG when called in POC states DEFAULT_CONFIG, or READY. When called in HALT state the CC transits to POC state DEFAULT_CONFIG. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to "0000_B" = command_not_accepted.

READY Command

Go to POC state READY when called in POC states CONFIG, NORMAL_ACTIVE, NORMAL_PASSIVE, STARTUP, or WAKEUP. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to "0000_B" = command_not_accepted.

WAKEUP Command

Go to POC state WAKEUP when called in POC state READY. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to "0000_B" = command_not_accepted.

RUN Command

Go to POC state STARTUP when called in POC state READY. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to “0000_B” = command_not_accepted.

ALL_SLOTS Command

Leave SINGLE slot mode and go to ALL-SLOTS mode after successful startup/integration at the next end of cycle when called in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to “0000_B” = command_not_accepted.

HALT Command

Set halt request FLXAnFRCCSV.HRQ to 1 and go to POC state HALT at the next end of cycle when called in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. When called in any other state, FLXAnFRSUCC1.CMD will be cleared to “0000_B” = command_not_accepted.

FREEZE Command

Set the freeze status indicator FLXAnFRCCSV.FSI to 1 and go to POC state HALT immediately. Can be called from any state.

SEND_MTS Command

Send single MTS symbol during the next following symbol window on the channel configured by FLXAnFRSUCC1.MTSA, FLXAnFRSUCC1.MTSB, when called in POC state NORMAL_ACTIVE after CC entered ALL slot mode (FLXAnFRCCSV.SLM = “11_B”). When called in any other state, or when called while a previously requested MTS has not yet been transmitted, FLXAnFRSUCC1.CMD will be reset to “0000_B” = command_not_accepted.

ALLOW_COLDSTART Command

The command clears FLXAnFRCCSV.CSI to enable the coldstart of the node. When called in states DEFAULT_CONFIG, CONFIG, or HALT, FLXAnFRSUCC1.CMD will be cleared to “0000_B” = command_not_accepted. To enable the coldstart it is also required that both FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set.

RESET_STATUS_INDICATORS Command

Clears status flags FLXAnFRCCSV.CSNI, FLXAnFRCCSV.CSAI, and FLXAnFRCCSV.WSV to their values after reset. May be called in POC states READY and STARTUP. When called in any other state, FLXAnFRSUCC1.CMD will be reset to “0000_B” = command_not_accepted.

CLEAR_RAMS Command

Sets FLXAnFRMHDS.CRAM to 1 when called in DEFAULT_CONFIG or CONFIG state. When called in any other state, FLXAnFRSUCC1.CMD will be reset to “0000_B” = command_not_accepted. FLXAnFRMHDS.CRAM is also set to 1 after reset. By setting FLXAnFRMHDS.CRAM all internal RAM blocks are initialized to zero. During the initialization of the RAMs, FLXAnFRSUCC1.PBSY will show POC busy. Access to the configuration and status registers is possible during execution of CHI command CLEAR_RAMS.

The initialization of the internal message RAM requires 2048 peripheral bus clock cycles. There should be no Host access to IBF or OBF during initialization of the internal RAM blocks after reset or after assertion of CHI command CLEAR_RAMS.

Before asserting CHI command CLEAR_RAMS, make sure that no transfer between Message RAM and IBF/OBF or Message RAM and Temporary Buffer RAM is ongoing and that the data transfer handler has no effect (FLXAnFRITS.ITS = 0 and FLXAnFROTS.OTS = 0). This command also clears the Message Buffer Status registers FLXAnFRMHDS, FLXAnFRLDTS, FLXAnFRFSR, FLXAnFRMHDF, FLXAnFRTXRQ1/2/3/4, FLXAnFRNDAT1/2/3/4, and FLXAnFRMBSC1/2/3/4.

CAUTIONS

1. All accepted commands with exception of CLEAR_RAMS and SEND_MTS will cause a change of the POC state in the FlexRay sample clock domain after at most 8 cycles of the slower of the two clocks “bus clock” and “FlexRay sample clock”, assuming that POC was not busy when the command was applied and that no POC state change was forced by bus activity in that time frame. Reading register FLXAnFRCCSV will show data that is additionally delayed by synchronization from the FlexRay sample clock domain to the bus clock domain. The maximum additional delay is 12 cycles of the slower of the two clocks “bus clock” and “FlexRay sample clock”.
2. When the communication is stopped by the FREEZE or READY command and the communication is restarted as Leading Coldstart node, the startup frame may not be transmitted on cycle 0 depending on the internal condition of the FlexRay module. This case occurs when the Startup frame is set in one of slot 1 to slot 7.
   This does not occur in ColdStart after a hardware reset.
   Even if this occurs, the second trial of ColdStart will succeed. ColdStart time becomes longer, but ColdStart will not be affected by the occurrence.
   To avoid this, allocate the Startup/Sync frame in the static slot 8 or higher.

Table 25.40, Reference to CHI Host Command Summary from FlexRay Protocol Specification below references the CHI commands from *the FlexRay Protocol Specification (Section 2.1.1.1, Table 2.2)* to the FlexRay CHI command vector FLXAnFRSUCC1.CMD.

Table 25.40 Reference to CHI Host Command Summary from FlexRay Protocol Specification

CHI Command	Where Processed (POC States)	CHI Command Vector CMD
ALL_SLOTS	POC: normal active, POC: normal passive	ALL_SLOTS
ALLOW_COLDSTART	All except POC: default config, POC: config, POC: halt	ALLOW_COLDSTART
CONFIG	POC: default config, POC: ready	CONFIG
CONFIG_COMPLETE	POC: config	Unlock sequence & READY
DEFAULT_CONFIG	POC: halt	CONFIG
FREEZE	All	FREEZE
HALT	POC: normal active, POC: normal passive	HALT
READY	All except POC: default config, POC: config, POC: ready, POC: halt	READY
RUN	POC: ready	RUN
WAKEUP	POC: ready	WAKEUP

25.2.6.2 FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2

Access: FLXAnFRSUCC2 can be read or written in 32-bit units.
FLXAnFRSUCC2L and FLXAnFRSUCC2H can be read or written in 16-bit units.
FLXAnFRSUCC2LL, FLXAnFRSUCC2LH, FLXAnFRSUCC2HL, and FLXAnFRSUCC2HH can be read or written in 8-bit units.

Address: FLXAnFRSUCC2: <FLXAn_base> + 0084_H
FLXAnFRSUCC2L: <FLXAn_base> + 0084_H, FLXAnFRSUCC2H: <FLXAn_base> + 0086_H,
FLXAnFRSUCC2LL: <FLXAn_base> + 0084_H, FLXAnFRSUCC2LH: <FLXAn_base> + 0085_H,
FLXAnFRSUCC2HL: <FLXAn_base> + 0086_H, FLXAnFRSUCC2HH: <FLXAn_base> + 0087_H

Value after reset: 0100 0504_H

Table 25.41 FLXAnFRSUCC2 Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27 to 24	LTN[3:0]	Listen Timeout Noise Bit Configures (gListenNoise – 1)
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 0	LT[20:0]	Listen Timeout Bit Configures pdListenTimeout

(1) FLXAnFRSUCC2.LTN

Listen Timeout Noise Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
The range for gListenNoise is 2 to 16.
FLXAnFRSUCC2.LTN must be configured identical in all nodes of a cluster.
Configures the upper limit for startup and wakeup listen timeout in the presence of noise expressed as a multiple of pdListenTimeout.

CAUTION

The wakeup/startup noise timeout is calculated as follows:
pdListenTimeout × gListenNoise = FLXAnFRSUCC2.LT × (FLXAnFRSUCC2.LTN + 1)

(2) FLXAnFRSUCC2.LT

Listen Timeout Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
The range for pdListenTimeout is 1284 to 1283846 µT. Configures wakeup/startup listen time out in µT.

25.2.6.3 FLXAnFRSUCC3 — FlexRay SUC Configuration Register 3

Access: FLXAnFRSUCC3 can be read or written in 32-bit units.
FLXAnFRSUCC3L can be read or written in 16-bit units.
FLXAnFRSUCC3LL can be read or written in 8-bit units.

Address: FLXAnFRSUCC3: <FLXAn_base> + 0088$_H$,
FLXAnFRSUCC3L: <FLXAn_base> + 0088$_H$,
FLXAnFRSUCC3LL: <FLXAn_base> + 0088$_H$

Value after reset: 0000 0011$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.42 FLXAnFRSUCC3 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 4	WCF[3:0]	Maximum Without Clock Correction Fatal Bit (transition to HALT state) Configures gMaxWithoutClockCorrectionFatal
3 to 0	WCP[3:0]	Maximum Without Clock Correction Passive Bit (transition to NORMAL_PASSIVE state) Configures gMaxWithoutClockCorrectionPassive

(1) FLXAnFRSUCC3.WCF

Maximum Without Clock Correction Fatal Bit (transition to HALT state)

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 1 to 15.
Must be identical in all nodes of a cluster.
Defines the number of consecutive even/odd cycle pairs with missing clock correction conditions that will cause a transition from NORMAL_ACTIVE or NORMAL_PASSIVE to HALT state.

CAUTION

The transition to HALT state is prevented if FLXAnFRSUCC1.HCSE is not set.

(2) FLXAnFRSUCC3.WCP

Maximum Without Clock Correction Passive Bit (transition to NORMAL_PASSIVE state)

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 1 to 15.
Must be identical in all nodes of a cluster.
Defines the number of consecutive even/odd cycle pairs with missing clock correction conditions that will cause a transition from NORMAL_ACTIVE to NORMAL_PASSIVE state.

25.2.6.4 FLXAnFRNEMC — FlexRay NEM Configuration Register

Access:	FLXAnFRNEMC can be read or written in 32-bit units. FLXAnFRNEMCL can be read or written in 16-bit units. FLXAnFRNEMCLL can be read or written in 8-bit units.
Address:	FLXAnFRNEMC: <FLXAn_base> + 008C$_H$, FLXAnFRNEMCL: <FLXAn_base> + 008C$_H$, FLXAnFRNEMCLL: <FLXAn_base> + 008C$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.43 FLXAnFRNEMC Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	NML[3:0]	Network Management Vector Length Bit Configures gNetworkManagementVectorLength

(1) FLXAnFRNEMC.NML

Network Management Vector Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 12 bytes.
The configured length must be identical in all nodes of a cluster. These bits configure the length of the NM vector in bytes.

25.2.6.5 FLXAnFRPRTC1 — FlexRay PRT Configuration Register 1

Access:	FLXAnFRPRTC1 can be read or written in 32-bit units. FLXAnFRPRTC1L and FLXAnFRPRTC1H can be read or written in 16-bit units. FLXAnFRPRTC1LL, FLXAnFRPRTC1LH, FLXAnFRPRTC1HL, and FLXAnFRPRTC1HH can be read or written in 8-bit units.
Address:	FLXAnFRPRTC1: <FLXAn_base> + 0090_H, FLXAnFRPRTC1L: <FLXAn_base> + 0090_H, FLXAnFRPRTC1H: <FLXAn_base> + 0092_H, FLXAnFRPRTC1LL: <FLXAn_base> + 0090_H, FLXAnFRPRTC1LH: <FLXAn_base> + 0091_H, FLXAnFRPRTC1HL: <FLXAn_base> + 0092_H, FLXAnFRPRTC1HH: <FLXAn_base> + 0093_H
Value after reset:	084C 0633_H

R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.44 FLXAnFRPRTC1 Register Contents

Bit Position	Bit Name	Function
31 to 26	RWP[5:0]	Repetitions of Tx Wakeup Pattern Bit Configures pWakeupPattern
25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24 to 16	RXW[8:0]	Wakeup Symbol Receive Window Length Bit Configures gdWakeupSymbolRxWindow
15, 14	BRP[1:0]	Baud Rate Prescaler Bit Configures gdSampleClockPeriod and pSamplesPerMicrotick 00_B = 10 Mbps 01_B = 5 Mbps 10_B = 2.5 Mbps 11_B = 2.5 Mbps
13, 12	SPP[1:0]	Strobe Point Position Bit Configures Strobe point position 00_B = Sample 5 01_B = Sample 4 10_B = Sample 6 11_B = Sample 5
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 4	CASM[6:0]	Collision Avoidance Symbol Max Bit Configures gdCASRxLowMax
3 to 0	TSST[3:0]	Transmission Start Sequence Transmitter Bit Configures gdTSSTransmitter

(1) FLXAnFRPRTC1.RWP

Repetitions of Tx Wakeup Pattern Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 63.
Configures the number of repetitions (sequences) of the Tx wakeup symbol.

(2) FLXAnFRPRTC1.RXW

Wakeup Symbol Receive Window Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 76 to 301.
Must be identical in all nodes of a cluster.
Configures the number of bit times used by the node to test the duration of the received wakeup pattern.

(3) FLXAnFRPRTC1.BRP

Baud Rate Prescaler Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
The Baud Rate Prescaler configures the baud rate on the FlexRay bus. The baud rates listed below are valid with a sample clock set to 80 MHz. One bit time always consists of 8 samples independent of the configured baud rate.

- 00_B = 10 MBit/s
  gdSampleClockPeriod = 12.5 ns = 1 × “sample clock”
  pSamplesPerMicrotick = 2 (1 µT = 25 ns)
- 01_B = 5 MBit/s
  gdSampleClockPeriod = 25 ns = 2 × “sample clock”
  pSamplesPerMicrotick = 1 (1 µT = 25 ns)
- 10_B, 11_B = 2.5 MBit/s
  gdSampleClockPeriod = 50 ns = 4 × “sample clock”
  pSamplesPerMicrotick = 1 (1 µT = 50 ns)

(4) FLXAnFRPRTC1.SPP

Strobe Point Position Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Defines the sample count value for strobing. The strobed bit value is set to the voted value when the sample count is incremented to the value configured by FLXAnFRPRTC1.SPP.

CAUTION

The current revision 2.1 of the FlexRay protocol requires that FLXAnFRPRTC1.SPP = “00_B”.
The alternate strobe point positions could be used to compensate for asymmetries in the physical layer.

(5) FLXAnFRPRTC1.CASM

Collision Avoidance Symbol Max Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
CASM[6] is fixed to 1. Valid values are 67 to 99.
Configures the upper limit of the acceptance window for a collision avoidance symbol (CAS).

(6) FLXAnFRPRTC1.TSST

Transmission Start Sequence Transmitter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 3 to 15.
Must be identical in all nodes of a cluster.
Configures the duration of the Transmission Start Sequence (TSS) in terms of bit times (1 bit time = 4 µT = 100ns @ 10 Mbps).

25.2.6.6 FLXAnFRPRTC2 — FlexRay PRT Configuration Register 2

Access: FLXAnFRPRTC2 can be read or written in 32-bit units.
FLXAnFRPRTC2L and FLXAnFRPRTC2H can be read or written in 16-bit units.
FLXAnFRPRTC2LL, FLXAnFRPRTC2LH, FLXAnFRPRTC2HL, and FLXAnFRPRTC2HH can be read or written in 8-bit units.

Address: FLXAnFRPRTC2:<FLXAn_base> + 0094_H,
FLXAnFRPRTC2L: <FLXAn_base> + 0094_H, FLXAnFRPRTC2H: <FLXAn_base> + 0096_H,
FLXAnFRPRTC2LL: <FLXAn_base> + 0094_H, FLXAnFRPRTC2LH: <FLXAn_base> + 0095_H,
FLXAnFRPRTC2HL: <FLXAn_base> + 0096_H, FLXAnFRPRTC2HH: <FLXAn_base> + 0097_H

Value after reset: $0F2D\ 0A0E_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.45 FLXAnFRPRTC2 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 24	TXL[5:0]	Wakeup Symbol Transmit Low Bit Configures gdWakeupSymbolTxLow
23 to 16	TXI[7:0]	Wakeup Symbol Transmit Idle Bit Configures gdWakeupSymbolTxIdle
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	RXL[5:0]	Wakeup Symbol Receive Low Bit Configures gdWakeupSymbolRxLow
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RXI[5:0]	Wakeup Symbol Rx Idle Bit Configures gdWakeupSymbolRxIdle

(1) FLXAnFRPRTC2.TXL

Wakeup Symbol Transmit Low Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 15 to 60.
Must be identical in all nodes of a cluster.
Configures the number of bit times used by the node to transmit the low phase of the wakeup symbol.

(2) FLXAnFRPRTC2.TXI

Wakeup Symbol Transmit Idle Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 45 to 180.
Must be identical in all nodes of a cluster.
Configures the number of bit times used by the node to transmit the idle phase of the wakeup symbol.

(3) FLXAnFRPRTC2.RXL

Wakeup Symbol Receive Low Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 10 to 55.
Must be identical in all nodes of a cluster.
Configures the number of bit times used by the node to test the duration of the low phase of the received wakeup symbol.

(4) FLXAnFRPRTC2.RXI

Wakeup Symbol Rx Idle Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 14 to 59.
Must be identical in all nodes of a cluster.
Configures the number of bit times used by the node to test the duration of the idle phase of the received wakeup symbol.

25.2.6.7 FLXAnFRMHDC — FlexRay MHD Configuration Register

Access: FLXAnFRMHDC can be read or written in 32-bit units.
FLXAnFRMHDCL and FLXAnFRMHDCH can be read or written in 16-bit units.
FLXAnFRMHDCLL, FLXAnFRMHDCHL, and FLXAnFRMHDCHH can be read or written in 8-bit units.

Address: FLXAnFRMHDC: <FLXAn_base> + 0098$_H$,
FLXAnFRMHDCL: <FLXAn_base> + 0098$_H$, FLXAnFRMHDCH: <FLXAn_base> + 009A$_H$,
FLXAnFRMHDCLL: <FLXAn_base> + 0098$_H$, FLXAnFRMHDCHL: <FLXAn_base> + 009A$_H$,
FLXAnFRMHDCHH: <FLXAn_base> + 009B$_H$

Value after reset: 0000 0000$_H$

Table 25.46 FLXAnFRMHDC Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28 to 16	SLT[12:0]	Start of Latest Transmit Bit Configures pLatestTx
15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	SFDL[6:0]	Static Frame Data Length Bit Configures gPayloadLengthStatic

(1) FLXAnFRMHDC.SLT

Start of Latest Transmit Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 7981.
Configures the latest maximum minislot value allowed before inhibiting frame transmission in the dynamic segment of the cycle. There is no transmission in dynamic segment if FLXAnFRMHDC.SLT is set to zero.

(2) FLXAnFRMHDC.SFDL

Static Frame Data Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 127.
The payload length must be identical in all nodes of a cluster.
Configures the cluster-wide payload length for all frames sent in the static segment in double bytes.

25.2.6.8 FLXAnFRGTUC1 — FlexRay GTU Configuration Register 1

Access:	FLXAnFRGTUC1 can be read or written in 32-bit units. FLXAnFRGTUC1L and FLXAnFRGTUC1H can be read or written in 16-bit units. FLXAnFRGTUC1LL, FLXAnFRGTUC1LH, and FLXAnFRGTUC1HL can be read or written in 8-bit units.
Address:	FLXAnFRGTUC1: <FLXAn_base> + $00A0_H$, FLXAnFRGTUC1L: <FLXAn_base> + $00A0_H$, FLXAnFRGTUC1H: <FLXAn_base> + $00A2_H$, FLXAnFRGTUC1LL: <FLXAn_base> + $00A0_H$, FLXAnFRGTUC1LH: <FLXAn_base> + $00A1_H$, FLXAnFRGTUC1HL: <FLXAn_base> + $00A2_H$

Table 25.47 FLXAnFRGTUC1 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 0	UT[19:0]	Setting of Communication Cycle in Microticks Bit Configures pMicroPerCycle

(1) FLXAnFRGTUC1.UT

Setting of Communication Cycle in Microticks Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 640 to 640000 µT.
Configures the duration of the communication cycle in microticks.

25.2.6.9 FLXAnFRGTUC2 — FlexRay GTU Configuration Register 2

Access: FLXAnFRGTUC2 can be read or written in 32-bit units.
FLXAnFRGTUC2L and FLXAnFRGTUC2H can be read or written in 16-bit units.
FLXAnFRGTUC2LL, FLXAnFRGTUC2LH, and FLXAnFRGTUC2HL can be read or written in 8-bit units.

Address: FLXAnFRGTUC2: <FLXAn_base> + 00A4$_H$,
FLXAnFRGTUC2L: <FLXAn_base> + 00A4$_H$, FLXAnFRGTUC2H: <FLXAn_base> + 00A6$_H$,
FLXAnFRGTUC2LL: <FLXAn_base> + 00A4$_H$, FLXAnFRGTUC2LH: <FLXAn_base> + 00A5$_H$,
FLXAnFRGTUC2HL: <FLXAn_base> + 00A6$_H$

Table 25.48 FLXAnFRGTUC2 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 16	SNM[3:0]	Sync Node Max Bit
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 0	MPC[13:0]	Setting of Communication Cycle in Macrotick Bit Configures gMacroPerCycle

(1) FLXAnFRGTUC2.SNM

Sync Node Max Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 15.
Must be identical in all nodes of a cluster.
Indicates the maximum number of frames with sync frame indicator bit SYN set to 1.

(2) FLXAnFRGTUC2.MPC

Setting of Communication Cycle in Macrotick Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 10 to 16000 MT.
The cycle length must be identical in all nodes of a cluster. Configures the duration of one communication cycle in macroticks.

25.2.6.10 FLXAnFRGTUC3 — FlexRay GTU Configuration Register 3

Access: FLXAnFRGTUC3 can be read or written in 32-bit units.
FLXAnFRGTUC3L and FLXAnFRGTUC3H can be read or written in 16-bit units.
FLXAnFRGTUC3LL, FLXAnFRGTUC3LH, FLXAnFRGTUC3HL, and FLXAnFRGTUC3HH can be read or written in 8-bit units.

Address: FLXAnFRGTUC3: <FLXAn_base> + 00A8$_H$,
FLXAnFRGTUC3L: <FLXAn_base> + 00A8$_H$, FLXAnFRGTUC3H: <FLXAn_base> + 00AA$_H$,
FLXAnFRGTUC3LL: <FLXAn_base> + 00A8$_H$, FLXAnFRGTUC3LH: <FLXAn_base> + 00A9$_H$,
FLXAnFRGTUC3HL: <FLXAn_base> + 00AA$_H$, FLXAnFRGTUC3HH: <FLXAn_base> + 00AB$_H$

Value after reset: 0202 0000$_H$

Table 25.49 FLXAnFRGTUC3 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30 to 24	MIOB[6:0]	Macrotick Initial Offset Channel B Bit Configures pMacroInitialOffset[B]
23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	MIOA[6:0]	Macrotick Initial Offset Channel A Bit Configures pMacroInitialOffset[A]
15 to 8	UIOB[7:0]	Microtick Initial Offset Channel B Bit Configures pMicroInitialOffset[B]
7 to 0	UIOA[7:0]	Microtick Initial Offset Channel A Bit Configures pMicroInitialOffset[A]

(1) FLXAnFRGTUC3.MIOB

Macrotick Initial Offset Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 72 MT.
Must be identical in all nodes of a cluster.
Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration.

(2) FLXAnFRGTUC3.MIOA

Macrotick Initial Offset Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 72 MT.
Must be identical in all nodes of a cluster.
Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration.

(3) FLXAnFRGTUC3.UIOB

Microtick Initial Offset Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 240 µT.
Configures the number of microticks between the actual time reference point on channel B and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation [B] and therefore has to be set for each channel independently.

(4) FLXAnFRGTUC3.UIOA

Microtick Initial Offset Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 240 µT.
Configures the number of microticks between the actual time reference point on channel A and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation [A] and therefore has to be set for each channel independently.

25.2.6.11 FLXAnFRGTUC4 — FlexRay GTU Configuration Register 4

For details about configuration of FLXAnFRGTUC4.NIT and FLXAnFRGTUC4.OCS see **Section 25.3.2.5, Configuration of NIT Start and Offset Correction Start**.

Access:	FLXAnFRGTUC4 can be read or written in 32-bit units. FLXAnFRGTUC4L and FLXAnFRGTUC4H can be read or written in 16-bit units. FLXAnFRGTUC4LL, FLXAnFRGTUC4LH, FLXAnFRGTUC4HL, and FLXAnFRGTUC4HH can be read or written in 8-bit units.
Address:	FLXAnFRGTUC4: <FLXAn_base> + 00AC$_H$, FLXAnFRGTUC4L: <FLXAn_base> + 00AC$_H$, FLXAnFRGTUC4H: <FLXAn_base> + 00AE$_H$, FLXAnFRGTUC4LL: <FLXAn_base> + 00AC$_H$, FLXAnFRGTUC4LH: <FLXAn_base> + 00AD$_H$, FLXAnFRGTUC4HL: <FLXAn_base> + 00AE$_H$, FLXAnFRGTUC4HH: <FLXAn_base> + 00AF$_H$
Value after reset:	0008 0007$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.50 FLXAnFRGTUC4 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 16	OCS[13:0]	Offset Correction Start Bit Configures (gOffsetCorrectionStart – 1)
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 0	NIT[13:0]	Network Idle Time Start Bit Configures (gMacroPerCycle -gdNIT – 1)

(1) FLXAnFRGTUC4.OCS

Offset Correction Start Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 8 to 15998 MT.
For cluster consisting of E-Ray implementations only, it is sufficient to program FLXAnFRGTUC4.OCS = FLXAnFRGTUC4.NIT + 1.
Must be identical in all nodes of a cluster.
Determines the start position of the offset correction within the NIT phase, calculated from start of cycle.

(2) FLXAnFRGTUC4.NIT

Network Idle Time Start Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 7 to 15997 MT.
Must be identical in all nodes of a cluster.
Configures the starting point of the Network Idle Time NIT from the beginning of the communication cycle expressed in terms of macroticks from the beginning of the cycle. The start of NIT is recognized if Macrotick = gMacroPerCycle –gdNIT –1 and the increment pulse of Macrotick is set.

25.2.6.12 FLXAnFRGTUC5 — FlexRay GTU Configuration Register 5

Access: FLXAnFRGTUC5 can be read or written in 32-bit units.
FLXAnFRGTUC5L and FLXAnFRGTUC5H can be read or written in 16-bit units.
FLXAnFRGTUC5LL, FLXAnFRGTUC5LH, FLXAnFRGTUC5HL, and FLXAnFRGTUC5HH can be read or written in 8-bit units.

Address: FLXAnFRGTUC5: <FLXAn_base> + 00B0$_H$,
FLXAnFRGTUC5L: <FLXAn_base> + 00B0$_H$, FLXAnFRGTUC5H: <FLXAn_base> + 00B2$_H$,
FLXAnFRGTUC5LL: <FLXAn_base> + 00B0$_H$, FLXAnFRGTUC5LH: <FLXAn_base> + 00B1$_H$,
FLXAnFRGTUC5HL: <FLXAn_base> + 00B2$_H$, FLXAnFRGTUC5HH: <FLXAn_base> + 00B3$_H$

Value after reset: 0E00 0000$_H$

Table 25.51 FLXAnFRGTUC5 Register Contents

Bit Position	Bit Name	Function
31 to 24	DEC[7:0]	Decoding Correction Bit Configures pDecodingCorrection
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 16	CDD[4:0]	Cluster Drift Damping Bit Configures pClusterDriftDamping
15 to 8	DCB[7:0]	Delay Compensation Channel B Bit Configures pDelayCompensation[B]
7 to 0	DCA[7:0]	Delay Compensation Channel A Bit Configures pDelayCompensation[A]

(1) FLXAnFRGTUC5.DEC

Decoding Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 14 to 143 µT.
Configures the decoding correction value in microticks used to determine the primary time reference point.

(2) FLXAnFRGTUC5.CDD

Cluster Drift Damping Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 20 µT.
Configures the cluster drift damping value in microticks used in clock synchronization to minimize accumulation of rounding errors.

(3) FLXAnFRGTUC5.DCB

Delay Compensation Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 200 µT.
Used to compensate for reception delays on channel B. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to 0.05 µs. In practice, the minimum of the propagation delays of all sync nodes should be applied.

(4) FLXAnFRGTUC5.DCA

Delay Compensation Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 200 µT.
Used to compensate for reception delays on channel A. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to 0.05 µs. In practice, the minimum of the propagation delays of all sync nodes should be applied.

25.2.6.13 FLXAnFRGTUC6 — FlexRay GTU Configuration Register 6

Access: FLXAnFRGTUC6 can be read or written in 32-bit units.
FLXAnFRGTUC6L and FLXAnFRGTUC6H can be read or written in 16-bit units.
FLXAnFRGTUC6LL, FLXAnFRGTUC6LH, FLXAnFRGTUC6HL, and FLXAnFRGTUC6HH can be read or written in 8-bit units.

Address: FLXAnFRGTUC6: <FLXAn_base> + 00B4$_H$,
FLXAnFRGTUC6L: <FLXAn_base> + 00B4$_H$, FLXAnFRGTUC6H: <FLXAn_base> + 00B6$_H$,
FLXAnFRGTUC6LL: <FLXAn_base> + 00B4$_H$, FLXAnFRGTUC6LH: <FLXAn_base> + 00B5$_H$,
FLXAnFRGTUC6HL: <FLXAn_base> + 00B6$_H$, FLXAnFRGTUC6HH: <FLXAn_base> + 00B7$_H$

Value after reset: 0002 0000$_H$

R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.52 FLXAnFRGTUC6 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26 to 16	MOD[10:0]	Maximum Oscillator Drift Bit Configures pdMaxDrift
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	ASR[10:0]	Accepted Startup Range Bit Configures pdAcceptedStartupRange

(1) FLXAnFRGTUC6.MOD

Maximum Oscillator Drift Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 1923 µT.
Configures the maximum drift offset between two nodes that operate with unsynchronized clocks over one communication cycle in µT.

(2) FLXAnFRGTUC6.ASR

Accepted Startup Range Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 1875 µT.
Configures the number of microticks constituting the expanded range of measured deviation for startup frames during integration.

25.2.6.14 FLXAnFRGTUC7 — FlexRay GTU Configuration Register 7

Access: FLXAnFRGTUC7 can be read or written in 32-bit units.
FLXAnFRGTUC7L and FLXAnFRGTUC7H can be read or written in 16-bit units.
FLXAnFRGTUC7LL, FLXAnFRGTUC7LH, FLXAnFRGTUC7HL, and FLXAnFRGTUC7HH can be read or written in 8-bit units.

Address: FLXAnFRGTUC7: <FLXAn_base> + 00B8$_{H}$,
FLXAnFRGTUC7L: <FLXAn_base> + 00B8$_{H}$, FLXAnFRGTUC7H: <FLXAn_base> + 00BA$_{H}$,
FLXAnFRGTUC7LL: <FLXAn_base> + 00B8$_{H}$, FLXAnFRGTUC7LH: <FLXAn_base> + 00B9$_{H}$,
FLXAnFRGTUC7HL: <FLXAn_base> + 00BA$_{H}$, FLXAnFRGTUC7HH: <FLXAn_base> + 00BB$_{H}$

Value after reset: 0002 0004$_{H}$

Table 25.53 FLXAnFRGTUC7 Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25 to 16	NSS[9:0]	Number of Static Slots Bit Configures gNumberOfStaticSlots
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 0	SSL[9:0]	Static Slot Length Bit Configures gdStaticSlot

(1) FLXAnFRGTUC7.NSS

Number of Static Slots Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 1023.
The number of static slots must be identical in all nodes of a cluster. Configures the number of static slots in a cycle.

(2) FLXAnFRGTUC7.SSL

Static Slot Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 4 to 659 MT.
The static slot length must be identical in all nodes of a cluster. Configures the length of a static slot in macroticks.

25.2.6.15 FLXAnFRGTUC8 — FlexRay GTU Configuration Register 8

Access: FLXAnFRGTUC8 can be read or written in 32-bit units.
FLXAnFRGTUC8L and FLXAnFRGTUC8H can be read or written in 16-bit units.
FLXAnFRGTUC8LL, FLXAnFRGTUC8HL, and FLXAnFRGTUC8HH can be read or written in 8-bit units.

Address: FLXAnFRGTUC8: <FLXAn_base> + 00BC$_H$,
FLXAnFRGTUC8L: <FLXAn_base> + 00BC$_H$, FLXAnFRGTUC8H: <FLXAn_base> + 00BE$_H$,
FLXAnFRGTUC8LL: <FLXAn_base> + 00BC$_H$, FLXAnFRGTUC8HL: <FLXAn_base> + 00BE$_H$,
FLXAnFRGTUC8HH: <FLXAn_base> + 00BF$_H$

Value after reset: 0000 0002$_H$

Table 25.54 FLXAnFRGTUC8 Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28 to 16	NMS[12:0]	Number of Minislots Bit Configures gNumberOfMinislots
15 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	MSL[5:0]	Minislot Length Bit Configures gdMinislot

(1) FLXAnFRGTUC8.NMS

Number of Minislots Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 7986.
The number of minislots must be identical in all nodes of a cluster. Configures the number of minislots within the dynamic segment of a cycle.

(2) FLXAnFRGTUC8.MSL

Minislot Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 63 MT.
The minislot length must be identical in all nodes of a cluster. Configures the length of a minislot in macroticks.

25.2.6.16 FLXAnFRGTUC9 — FlexRay GTU Configuration Register 9

Access:	FLXAnFRGTUC9 can be read or written in 32-bit units. FLXAnFRGTUC9L and FLXAnFRGTUC9H can be read or written in 16-bit units. FLXAnFRGTUC9LL, FLXAnFRGTUC9LH, and FLXAnFRGTUC9HL can be read or written in 8-bit units.
Address:	FLXAnFRGTUC9: <FLXAn_base> + 00C0$_H$, FLXAnFRGTUC9L: <FLXAn_base> + 00C0$_H$, FLXAnFRGTUC9H: <FLXAn_base> + 00C2$_H$, FLXAnFRGTUC9LL: <FLXAn_base> + 00C0$_H$, FLXAnFRGTUC9LH: <FLXAn_base> + 00C1$_H$, FLXAnFRGTUC9HL: <FLXAn_base> + 00C2$_H$

Table 25.55 FLXAnFRGTUC9 Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	DSI[1:0]	Dynamic Slot Idle Phase Bit Configures gdDynamicSlotIdlePhase
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	MAPO[4:0]	Minislot Action Point Offset Bit Configures gdMinislotActionPointOffset
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	APO[5:0]	Action Point Offset Bit Configures gdActionPointOffset

(1) FLXAnFRGTUC9.DSI

Dynamic Slot Idle Phase Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 2.
Must be identical in all nodes of a cluster.
Configures the duration of the dynamic slot idle phase in the number of minislots. The duration has to be greater or equal than the idle detection time.

(2) FLXAnFRGTUC9.MAPO

Minislot Action Point Offset Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 1 to 31 MT.
Must be identical in all nodes of a cluster.
Configures the action point offset in macroticks within the minislots of the dynamic segment.

(3) FLXAnFRGTUC9.APO

Action Point Offset Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 1 to 63 MT.
Must be identical in all nodes of a cluster.
Configures the action point offset in macroticks within static slots and symbol window.

25.2.6.17 FLXAnFRGTUC10 — FlexRay GTU Configuration Register 10

Access: FLXAnFRGTUC10 can be read or written in 32-bit units.
FLXAnFRGTUC10L and FLXAnFRGTUC10H can be read or written in 16-bit units.
FLXAnFRGTUC10LL, FLXAnFRGTUC10LH, FLXAnFRGTUC10HL, and FLXAnFRGTUC10HH can be read or written in 8-bit units.

Address: FLXAnFRGTUC10: <FLXAn_base> + 00C4$_{\text{H}}$,
FLXAnFRGTUC10L: <FLXAn_base> + 00C4$_{\text{H}}$, FLXAnFRGTUC10$_{\text{H}}$: <FLXAn_base> + 00C6$_{\text{H}}$,
FLXAnFRGTUC10LL: <FLXAn_base> + 00C4$_{\text{H}}$, FLXAnFRGTUC10L$_{\text{H}}$: <FLXAn_base> + 00C5$_{\text{H}}$,
FLXAnFRGTUC10HL: <FLXAn_base> + 00C6$_{\text{H}}$, FLXAnFRGTUC10H$_{\text{H}}$: <FLXAn_base> + 00C7$_{\text{H}}$

Value after reset: 0002 0005$_{\text{H}}$

Table 25.56 FLXAnFRGTUC10 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26 to 16	MRC[10:0]	Maximum Rate Correction Bit Configures pRateCorrectionOut
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 0	MOC[13:0]	Maximum Offset Correction Bit Configures pOffsetCorrectionOut

(1) FLXAnFRGTUC10.MRC

Maximum Rate Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 1923 µT.
Configures the maximum permitted rate correction value to be applied by the internal clock synchronization algorithm. The CC checks the internal rate correction value against the maximum rate correction value (absolute value).

(2) FLXAnFRGTUC10.MOC

Maximum Offset Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 5 to 15266 µT.
Configures the maximum permitted offset correction value (absolute value) to be applied by the internal clock synchronization algorithm (absolute value). The CC checks the internal offset correction value against the maximum offset correction value.

25.2.6.18 FLXAnFRGTUC11 — FlexRay GTU Configuration Register 11

Access: FLXAnFRGTUC11 can be read or written in 32-bit units.
FLXAnFRGTUC11L and FLXAnFRGTUC11H can be read or written in 16-bit units.
FLXAnFRGTUC11LL, FLXAnFRGTUC11LH, FLXAnFRGTUC11HL, and FLXAnFRGTUC11HH can be read or written in 8-bit units.

Address: FLXAnFRGTUC11: <FLXAn_base> + 00C8$_H$,
FLXAnFRGTUC11L: <FLXAn_base> + 00C8$_H$, FLXAnFRGTUC11H: <FLXAn_base> + 00CA$_H$,
FLXAnFRGTUC11LL: <FLXAn_base> + 00C8$_H$, FLXAnFRGTUC11LH: <FLXAn_base> + 00C9$_H$,
FLXAnFRGTUC11HL: <FLXAn_base> + 00CA$_H$, FLXAnFRGTUC11HH: <FLXAn_base> + 00CB$_H$

Table 25.57 FLXAnFRGTUC11 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26 to 24	ERC[2:0]	External Rate Correction Bit Configures pExternRateCorrection
23 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18 to 16	EOC[2:0]	External Offset Correction Bit Configures pExternOffsetCorrection
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	ERCC[1:0]	External Rate Correction Control Bit Configures vExternRateControl 00$_B$: External rate correction is prohibited. 01$_B$: External rate correction is prohibited. 10$_B$: Subtract 11$_B$: Add
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	EOCC[1:0]	External Offset Correction Control Bit Configures vExternOffsetControl 00$_B$: External offset correction is prohibited. 01$_B$: External offset correction is prohibited. 10$_B$: Subtract 11$_B$: Add

(1) FLXAnFRGTUC11.ERC

External Rate Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 7 µT.
Configures the external rate correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted/added from/to the calculated rate correction value. The value is applied during NIT.

(2) FLXAnFRGTUC11.EOC

External Offset Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 7 µT.
Configures the external offset correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted/added from/to the calculated offset correction value. The value is applied during NIT.

(3) FLXAnFRGTUC11.ERCC

External Rate Correction Control Bit

Should be modified only outside NIT (Network Idle Time).
By writing to FLXAnFRGTUC11.ERCC the external rate correction is enabled as specified below.

- 00_B = External rate correction is prohibited.
- 01_B = External rate correction is prohibited.
- 10_B = Subtract
  External rate correction value subtracted from calculated rate correction value
- 11_B = Add
  External rate correction value added to calculated rate correction value

(4) FLXAnFRGTUC11.EOCC

External Offset Correction Control Bit

Should be modified only outside NIT (Network Idle Time).
By writing to FLXAnFRGTUC11.EOCC the external offset correction is enabled as specified below.

- 00_B = External offset correction is prohibited.
- 01_B = External offset correction is prohibited.
- 10_B = Subtract
  External offset correction value subtracted from calculated offset correction value
- 11_B = Add
  External offset correction value added to calculated offset correction value

25.2.7 CC Status Registers

During 8/16-bit accesses to status variables coded with more than 8/16-bit, the variable might be updated by the CC between two accesses (non-atomic read accesses).

25.2.7.1 FLXAnFRCCSV — FlexRay CC Status Vector Register

Access: FLXAnFRCCSV is a read-only register that can be read in 32-bit units.
FLXAnFRCCSVL and FLXAnFRCCSVH are the read-only registers that can be read in 16-bit units.
FLXAnFRCCSVLL, FLXAnFRCCSVLH, FLXAnFRCCSVHL, and FLXAnFRCCSVHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRCCSV: <FLXAn_base> + 0100$_H$,
FLXAnFRCCSVL: <FLXAn_base> + 0100$_H$, FLXAnFRCCSVH: <FLXAn_base> + 0102$_H$,
FLXAnFRCCSVLL: <FLXAn_base> + 0100$_H$, FLXAnFRCCSVLH: <FLXAn_base> + 0101$_H$,
FLXAnFRCCSVHL: <FLXAn_base> + 0102$_H$, FLXAnFRCCSVHH: <FLXAn_base> + 0103$_H$

Value after reset: 0010 4000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.58 FLXAnFRCCSV Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned.
29 to 24	PSL[5:0]	POC Status Log Flag Status of FLXAnFRCCSV.POCS immediately before entering HALT state.
23 to 19	RCA[4:0]	Remaining Coldstart Attempts Flag Indicates vRemainingColdstartAttempts
18 to 16	WSV[2:0]	Wakeup Status Flag Indicates vPOC!WakeupStatus 000$_B$: UNDEFINED 001$_B$: RECEIVED_HEADER 010$_B$: RECEIVED_WUP 011$_B$: COLLISION_HEADER 100$_B$: COLLISION_WUP 101$_B$: COLLISION_UNKNOWN 110$_B$: TRANSMITTED 111$_B$: Reserved
15	Reserved	When read, the value after reset is returned.
14	CSI	Cold Start Inhibit Flag Indicates vColdStartInhibit 0: Cold starting of node enabled 1: Cold starting of node disabled
13	CSAI	Coldstart Abort Indicator Flag

Table 25.58 FLXAnFRCCSV Register Contents

Bit Position	Bit Name	Function
12	CSNI	Coldstart Noise Indicator Flag Indicates vPOC!ColdstartNoise
11, 10	Reserved	When read, the value after reset is returned.
9, 8	SLM[1:0]	Slot Mode Flag Indicates vPOC!SlotMode 00_B: SINGLE 01_B: reserved 10_B: ALL_PENDING 11_B: ALL
7	HRQ	Halt Request Flag Indicates vPOC!CHIHaltRequest
6	FSI	Freeze Status Indicator Flag Indicates vPOC!Freeze
5 to 0	POCS[5:0]	Protocol Operation Control Status Flag

(1) FLXAnFRCCSV.PSL

POC Status Log Flag

Set the value of FLXAnFRCCSV.POCS immediately before entering HALT state.
Set to HALT when FREEZE command is applied during HALT state and FLXAnFRCCSV.FSI is not already set i.e. the HALT state was not reached by FREEZE command.
Reset to “000000_B” when leaving HALT state.

(2) FLXAnFRCCSV.RCA

Remaining Coldstart Attempts Flag

Indicates the number of remaining coldstart attempts (vRemainingColdstartAttempts).
The value after a reset of FLXAnFRCCSV.RCA during CONFIG and DEFAULT_CONFIG state is also FLXAnFRSUCC1.CSA.
The RUN command resets this counter to the maximum number of coldstart attempts as configured by FLXAnFRSUCC1.CSA.

(3) FLXAnFRCCSV.WSV

Wakeup Status Flag

Indicates the status of the current wakeup attempt (vPOC!WakeupStatus).
Reset to 0 when entering Wakeup state, by CHI command RESET_STATUS_INDICATORS, or by transition from DEFAULT_CONFIG to CONFIG state.

- 000_B = UNDEFINED
  Wakeup not yet executed by the CC.
- 001_B = RECEIVED_HEADER
  Set when the CC finishes wakeup due to the reception of a frame header without coding violation on either channel in WAKEUP_LISTEN state.
- 010_B = RECEIVED_WUP
  Set when the CC finishes wakeup due to the reception of a valid wakeup pattern on the configured wakeup channel in WAKEUP_LISTEN state.

- 011_B = COLLISION_HEADER
  Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid header on either channel.
- 100_B = COLLISION_WUP
  Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid wakeup pattern on the configured wakeup channel.
- 101_B = COLLISION_UNKNOWN
  Set when the CC stops wakeup by leaving WAKEUP_DETECT state after expiration of the wakeup timer without receiving a valid wakeup pattern or a valid frame header.
- 110_B = TRANSMITTED
  Set when the CC has successfully completed the transmission of the wakeup pattern.
- 111_B = reserved

(4) FLXAnFRCCSV.CSI

Cold Start Inhibit Flag

Indicates whether the node is disabled from cold starting (vColdStartInhibit).
The flag is set to 1 whenever the POC enters READY state due to CHI command READY.
The flag has to be cleared under control of the Host by CHI command ALLOW_COLDSTART (FLXAnFRSUCC1.CMD = “1001_B”).

(5) FLXAnFRCCSV.CSAI

Coldstart Abort Indicator Flag

Indicates that coldstart was aborted.
Cleared by CHI command RESET_STATUS_INDICATORS or by transition from HALT to DEFAULT_CONFIG state or from READY to STARTUP state.

(6) FLXAnFRCCSV.CSNI

Coldstart Noise Indicator Flag

Indicates that the cold start procedure occurred under noisy conditions (vPOC!ColdstartNoise).
Cleared by CHI command RESET_STATUS_INDICATORS or by transition from HALT to DEFAULT_CONFIG state or from READY to STARTUP state.

(7) FLXAnFRCCSV.SLM

Slot Mode Flag

Indicates the actual slot mode of the POC (vPOC!SlotMode) in states READY, WAKEUP, STARTUP, NORMAL_ACTIVE, and NORMAL_PASSIVE.
Default value is SINGLE. Changes to ALL, depending on FLXAnFRSUCC1.TSM.
In NORMAL_ACTIVE or NORMAL_PASSIVE state the CHI command ALL_SLOTS will change the slot mode from SINGLE over ALL_PENDING to ALL.
Set FLXAnFRSUCC1.TSM to SINGLE except for NORMAL_ACTIVE or NORMAL_PASSIVE.

(8) FLXAnFRCCSV.HRQ

Halt Request Flag

Indicates that a request from the Host has been received to halt the POC at the end of the communication cycle (vPOC!CHIHaltRequest).
Cleared by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

(9) FLXAnFRCCSV.FSI

Freeze Status Indicator Flag

Indicates that the POC has entered the HALT state due to CHI command FREEZE (CMD = 0111_B) or due to an error condition requiring an immediate POC halt (vPOC!Freeze).
Reset by transition from HALT to DEFAULT_CONFIG state.

(10) FLXAnFRCCSV.POCS

Protocol Operation Control Status Flag

Indicates the current state of operation of the CC Protocol Operation Control
00 0000_B = DEFAULT_CONFIG state
00 0001_B = READY state
00 0010_B = NORMAL_ACTIVE state
00 0011_B = NORMAL_PASSIVE state
00 0100_B = HALT state
00 1111_B = CONFIG state

Indicates the current state of operation of the POC in the wakeup path
01 0000_B = WAKEUP_STANDBY state
01 0001_B = WAKEUP_LISTEN state
01 0010_B = WAKEUP_SEND state
01 0011_B = WAKEUP_DETECT state

Indicates the current state of operation of the POC in the startup path
10 0000_B = STARTUP_PREPARE state
10 0001_B = COLDSTART_LISTEN state
10 0010_B = COLDSTART_COLLISION_RESOLUTION state
10 0011_B = COLDSTART_CONSISTENCY_CHECK state
10 0100_B = COLDSTART_GAP state
10 0101_B = COLDSTART_JOIN State
10 0110_B = INTEGRATION_COLDSTART_CHECK state
10 0111_B = INTEGRATION_LISTEN state
10 1000_B = INTEGRATION_CONSISTENCY_CHECK state
10 1001_B = INITIALIZE_SCHEDULE state
10 1010_B = ABORT_STARTUP state
10 1011_B = STARTUP_SUCCESS state

Others = reserved

25.2.7.2 FLXAnFRCCEV — FlexRay CC Error Vector Register

Access:	FLXAnFRCCEV is a read-only register that can be read in 32-bit units. FLXAnFRCCEVL is a read-only register that can be read in 16-bit units. FLXAnFRCCEVLL and FLXAnFRCCEVLH are the read-only registers that can be read in 8-bit units.
Address:	FLXAnFRCCEV: <FLXAn_base> + 0104_H, FLXAnFRCCEVL: <FLXAn_base> + 0104_H, FLXAnFRCCEVLL: <FLXAn_base> + 0104_H, FLXAnFRCCEVLH: <FLXAn_base> + 0105_H
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 25.59 FLXAnFRCCEV Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned.
12 to 8	PTAC[4:0]	Passive to Active Count Flag Indicates vAllowPassiveToActive
7, 6	ERRM[1:0]	Error Mode Flag Indicates vPOC!ErrorMode 00_B: ACTIVE 01_B: PASSIVE 10_B: COMM_HALT 11_B: reserved
5, 4	Reserved	When read, the value after reset is returned.
3 to 0	CCFC[3:0]	Clock Correction Failed Counter Indicates vClockCorrectionFailed

(1) FLXAnFRCCEV.PTAC

Passive to Active Count Flag

Indicates the number of consecutive even/odd cycle pairs that have passed with valid rate and offset correction terms, while the node is waiting to transit from NORMAL_PASSIVE state to NORMAL_ACTIVE state. The transition takes place when FLXAnFRCCEV.PTAC equals FLXAnFRSUCC1.PTA -1.
Cleared by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

(2) FLXAnFRCCEV.ERRM

Error Mode Flag

Indicates the current error mode of the POC (vPOC!ErrorMode).
Cleared by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

(3) FLXAnFRCCEV.CCFC

Clock Correction Failed Counter

Indicates the clock correction failed counter value of the POC (vClockCorrectionFailed).
The Clock Correction Failed Counter is incremented by one at the end of any odd communication cycle where either the missing offset correction error or missing rate correction error are active.
The Clock Correction Failed Counter is reset to 0 at the end of an odd communication cycle if neither the offset correction failed nor the rate correction failed errors are active.
The Clock Correction Failed Counter stops at 15.
Cleared by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

25.2.7.3 FLXAnFRSCV — FlexRay Slot Counter Value Register

Access: FLXAnFRSCV is a read-only register that can be read in 32-bit units.
FLXAnFRSCVL and FLXAnFRSCVH are the read-only registers that can be read in 16-bit units.
FLXAnFRSCVLL, FLXAnFRSCVLH, FLXAnFRSCVHL, and FLXAnFRSCVHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRSCV: <FLXAn_base> + 0110$_H$,
FLXAnFRSCVL: <FLXAn_base> + 0110$_H$, FLXAnFRSCVH: <FLXAn_base> + 0112$_H$,
FLXAnFRSCVLL: <FLXAn_base> + 0110$_H$, FLXAnFRSCVLH: <FLXAn_base> + 0111$_H$,
FLXAnFRSCVHL: <FLXAn_base> + 0112$_H$, FLXAnFRSCVHH: <FLXAn_base> + 0113$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.60 FLXAnFRSCV Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned.
26 to 16	SCCB[10:0]	Slot Counter Channel B Indicates vSlotCounter[B]
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	SCCA[10:0]	Slot Counter Channel A Indicates vSlotCounter[A]

(1) FLXAnFRSCV.SCCB

Slot Counter Channel B

Indicates the current slot counter value on channel B (vSlotCounter[B]). The value is incremented by the CC and initialized at the start of a communication cycle.
Cleared when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFRSCV.SCCA

Slot Counter Channel A

Indicates the current slot counter value on channel A (vSlotCounter[A]). The value is incremented by the CC and initialized at the start of a communication cycle.
Cleared when leaving CONFIG state or when entering STARTUP state.

25.2.7.4 FLXAnFRMTCCV — FlexRay Macrotick and Cycle Counter Value Register

Access: FLXAnFRMTCCV is a read-only register that can be read in 32-bit units.
FLXAnFRMTCCVL and FLXAnFRMTCCVH are the read-only registers that can be read in 16-bit units.
FLXAnFRMTCCVLL, FLXAnFRMTCCVLH, and FLXAnFRMTCCVHL are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRMTCCV: <FLXAn_base> + 0114$_H$,
FLXAnFRMTCCVL: <FLXAn_base> + 0114$_H$, FLXAnFRMTCCVH: <FLXAn_base> + 0116$_H$,
FLXAnFRMTCCVLL: <FLXAn_base> + 0114$_H$,FLXAnFRMTCCVLH: <FLXAn_base> + 0115$_H$,
FLXAnFRMTCCVHL: <FLXAn_base> + 0116$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.61 FLXAnFRMTCCV Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 16	CCV[5:0]	Cycle Counter Value Indicates vCycleCounter
15, 14	Reserved	When read, the value after reset is returned.
13 to 0	MTV[13:0]	Macrotick Value Indicates vMacrotick

(1) FLXAnFRMTCCV.CCV

Cycle Counter Value

Indicates the current cycle counter value (vCycleCounter). The value is incremented by the CC at the start of a communication cycle.
Cleared when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFRMTCCV.MTV

Macrotick Value

Indicates the current macrotick value (vMacrotick). The value is incremented by the CC and reset at the start of a communication cycle.
Cleared when leaving CONFIG state or when entering STARTUP state.

25.2.7.5 FLXAnFRRCV — FlexRay Rate Correction Value Register

Access: FLXAnFRRCV is a read-only register that can be read in 32-bit units.
FLXAnFRRCVL is a read-only register that can be read in 16-bit units.
FLXAnFRRCVLL and FLXAnFRRCVLH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRRCV: <FLXAn_base> + 0118_H,
FLXAnFRRCVL: <FLXAn_base> + 0118_H,
FLXAnFRRCVLL: <FLXAn_base> + 0118_H, FLXAnFRRCVLH: <FLXAn_base> + 0119_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	RCV[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.62 FLXAnFRRCV Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned.
11 to 0	RCV[11:0]	Rate Correction Value Flag Indicates vRateCorrection

(1) FLXAnFRRCV.RCV

Rate Correction Value Flag

Indicates internal rate correction value (vRateCorrection/ two’s complement) before limitation. If the FLXAnFRRCV.RCV value exceeds the limits defined by FLXAnFRGTUC10.MRC, flag FLXAnFRSFS.RCLR is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.

CAUTION

The amount by which this value exceeded the limits is added to the external rate correction value.

25.2.7.6 FLXAnFROCV — FlexRay Offset Correction Value Register

Access: FLXAnFROCV is a read-only register that can be read in 32-bit units.
FLXAnFROCVL and FLXAnFROCVH are the read-only registers that can be read in 16-bit units.
FLXAnFROCVLL, FLXAnFROCVLH, and FLXAnFROCVHL are the read-only registers that can be read in 8- bit units.

Address: FLXAnFROCV: <FLXAn_base> + $011C_H$,
FLXAnFROCVL: <FLXAn_base> + $011C_H$, FLXAnFROCVH: <FLXAn_base> + $011E_H$,
FLXAnFROCVLL: <FLXAn_base> + $011C_H$, FLXAnFROCVLH: <FLXAn_base> + $011D_H$,
FLXAnFROCVHL: <FLXAn_base> + $011E_H$,

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	OCV[18:16]

	OCV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.63 FLXAnFROCV Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned.
18 to 0	OCV[18:0]	Offset Correction Value Flag Indicates vOffsetCorrection

(1) FLXAnFROCV.OCV

Offset Correction Value Flag

Indicates the internal offset correction value (vOffsetCorrection/ two’s complement) before limitation. If the FLXAnFROCV.OCV value exceeds the limits defined by FLXAnFRGTUC10.MOC, flag FLXAnFRSFS.OCLR is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.

CAUTION

The amount by which this value exceeded the limits is added to the external offset correction value.

25.2.7.7 FLXAnFRSFS — FlexRay Sync Frame Status Register

Access: FLXAnFRSFS is a read-only register that can be read in 32-bit units.
FLXAnFRSFSL and FLXAnFRSFSH are the read-only registers that can be read in 16-bit units.
FLXAnFRSFSLL, FLXAnFRSFSLH, and FLXAnFRSFSHL are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRSFS: <FLXAn_base> + 0120$_H$
FLXAnFRSFSL: <FLXAn_base> + 0120$_H$, FLXAnFRSFSH: <FLXAn_base> + 0122$_H$
FLXAnFRSFSLL: <FLXAn_base> + 0120$_H$, FLXAnFRSFSLH: <FLXAn_base> + 0121$_H$,
FLXAnFRSFSHL: <FLXAn_base> + 0122$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	RCLR	MRCS	OCLR	MOCS

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.64 FLXAnFRSFS Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned.
19	RCLR	Rate Correction Limit Reached Flag 0: Rate correction below limit 1: Rate correction limit reached
18	MRCS	Missing Rate Correction Signal Flag 0: Rate correction signal valid 1: Missing rate correction signal
17	OCLR	Offset Correction Limit Reached Flag 0: Offset correction below limit 1: Offset correction limit reached
16	MOCS	Missing Offset Correction Signal Flag 0: Offset correction signal valid 1: Missing offset correction signal
15 to 12	VSBO[3:0]	Valid Sync Frames Channel B, odd communication cycle
11 to 8	VSBE[3:0]	Valid Sync Frames Channel B, even communication cycle
7 to 4	VSAO[3:0]	Valid Sync Frames Channel A, odd communication cycle
3 to 0	VSAE[3:0]	Valid Sync Frames Channel A, even communication cycle

(1) FLXAnFRSFS.RCLR

Rate Correction Limit Reached Flag

The Rate Correction Limit Reached flag indicates that the rate correction value has exceeded its limit as defined by FLXAnFRGTUC10.MRC10 - MRC0. The flag is updated by the CC at start of offset correction phase.
Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(2) FLXAnFRSFS.MRCS

Missing Rate Correction Signal Flag

The Missing Rate Correction flag indicates that no rate correction calculation can be performed because no pairs of even/odd sync frames were received. The flag is updated by the CC at start of offset correction phase.
Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(3) FLXAnFRSFS.OCLR

Offset Correction Limit Reached Flag

The Offset Correction Limit Reached flag indicates that the offset correction value has exceeded its limit as defined by FLXAnFRGTUC10.MOC. The flag is updated by the CC at start of offset correction phase.
Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(4) FLXAnFRSFS.MOCS

Missing Offset Correction Signal Flag

The Missing Offset Correction flag indicates that no offset correction calculation can be performed because no sync frames were received. The flag is updated by the CC at start of offset correction phase.
Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(5) FLXAnFRSFS.VSBO

Valid Sync Frames Channel B, odd communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHB is 1.
Indicates the number of valid sync frames received on channel B in the odd communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each odd communication cycle.
Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(6) FLXAnFRSFS.VSBE

Valid Sync Frames Channel B, even communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHB is 1.
Indicates the number of valid sync frames received on channel B in the even communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each even communication cycle.
Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(7) FLXAnFRSFS.VSAO

Valid Sync Frames Channel A, odd communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHA is 1.
Indicates the number of valid sync frames received on channel A in the odd communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each odd communication cycle.
Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(8) FLXAnFRSFS.VSAE

Valid Sync Frames Channel A, even communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHA is 1.
Indicates the number of valid sync frames received on channel A in the even communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each even communication cycle.
Cleared when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

25.2.7.8 FLXAnFRSWNIT — FlexRay Symbol Window and NIT Status Register

Indicates the symbol windows related status. Symbol window related status information is updated by the CC at the end of the symbol window for each channel. NIT related status information is updated by the CC at the end of the NIT for each channel.

During startup the status data is not updated.

Access: FLXAnFRSWNIT is a read-only register that can be read in 32-bit units.
FLXAnFRSWNITL is a read-only register that can be read in 16-bit units.
FLXAnFRSWNITLL and FLXAnFRSWNITLH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRSWNIT: <FLXAn_base> + 0124_{H},
FLXAnFRSWNITL: <FLXAn_base> + 0124_{H},
FLXAnFRSWNITLL: <FLXAn_base> + 0124_{H}, FLXAnFRSWNITLH: <FLXAn_base> + 0125_{H}

Value after reset: 0000 0000_{H}

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 25.65 FLXAnFRSWNIT Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned.
11	SBNB	Slot Boundary Violation during NIT Channel B Flag 0: No slot boundary violation detected 1: Slot boundary violation during NIT detected on channel B
10	SENB	Syntax Error during NIT Channel B Flag 0: No syntax error detected 1: Syntax error during NIT detected on channel B
9	SBNA	Slot Boundary Violation during NIT Channel A Flag 0: No slot boundary violation detected 1: Slot boundary violation during NIT detected on channel A
8	SENA	Syntax Error during NIT Channel A Flag 0: No syntax error detected 1: Syntax error during NIT detected on channel A
7	MTSB	MTS Received on Channel B Flag 0: No MTS symbol received on channel B 1: MTS symbol received on channel B
6	MTSA	MTS Received on Channel A Flag 0: No MTS symbol received on channel A 1: MTS symbol received on channel A
5	TCSB	Transmission Conflict in Symbol Window Channel B Flag 0: No transmission conflict detected 1: Transmission conflict in symbol window detected on channel B

Table 25.65 FLXAnFRSWNIT Register Contents

Bit Position	Bit Name	Function
4	SBSB	Slot Boundary Violation in Symbol Window Channel B Flag 0: No slot boundary violation detected 1: Slot boundary violation during symbol window detected on channel B
3	SESB	Syntax Error in Symbol Window Channel B Flag 0: No syntax error detected 1: Syntax error during symbol window detected on channel B
2	TCSA	Transmission Conflict in Symbol Window Channel A Flag 0: No transmission conflict detected 1: Transmission conflict in symbol window detected on channel A
1	SBSA	Slot Boundary Violation in Symbol Window Channel A Flag 0: No slot boundary violation detected 1: Slot boundary violation during symbol window detected on channel A
0	SESA	Syntax Error in Symbol Window Channel A Flag 0: No syntax error detected 1: Syntax error during symbol window detected on channel A

(1) FLXAnFRSWNIT.SBNB

Indicates a Slot Boundary Violation during NIT Channel B Flag (vSS!BViolationB).

Cleared when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFRSWNIT.SENB

Indicates a Syntax Error during NIT Channel B Flag (vSS!SyntaxErrorB).

Cleared when leaving CONFIG state or when entering STARTUP state.

(3) FLXAnFRSWNIT.SBNA

Indicates a Slot Boundary Violation during NIT Channel A Flag (vSS!BViolationA).

Cleared when leaving CONFIG state or when entering STARTUP state.

(4) FLXAnFRSWNIT.SENA

Indicates a Syntax Error during NIT Channel A Flag (vSS!SyntaxErrorA).

Cleared when leaving CONFIG state or when entering STARTUP state.

(5) FLXAnFRSWNIT.MTSB

Indicates a MTS Received on Channel B Flag (vSS!ValidMTSB).

Media Access Test Symbol received on channel B during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.
When this bit is set to 1, also interrupt flag FLXAnFRSIR.MTSB is set to 1. Cleared when leaving CONFIG state or when entering STARTUP state.

(6) FLXAnFRSWNIT.MTSA

Indicates a MTS Received on Channel A Flag (vSS!ValidMTSA).

Media Access Test Symbol received on channel A during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.
When this bit is set to 1, also interrupt flag FLXAnFRSIR.MTSA is set to 1. Cleared when leaving CONFIG state or when entering STARTUP state.

(7) FLXAnFRSWNIT.TCSB

Indicates a Transmission Conflict in Symbol Window Channel B Flag (vSS!TxConflictB).

Cleared when leaving CONFIG state or when entering STARTUP state.

(8) FLXAnFRSWNIT.SBSB

Indicates a Slot Boundary Violation in Symbol Window Channel B Flag (vSS!BViolationB).

Cleared when leaving CONFIG state or when entering STARTUP state.

(9) FLXAnFRSWNIT.SESB

Indicates a Syntax Error in Symbol Window Channel B Flag (vSS!SyntaxErrorB).

Cleared when leaving CONFIG state or when entering STARTUP state.

(10) FLXAnFRSWNIT.TCSA

Indicates a Transmission Conflict in Symbol Window Channel A Flag (vSS!TxConflictA).

Cleared when leaving CONFIG state or when entering STARTUP state.

(11) FLXAnFRSWNIT.SBSA

Indicates a Slot Boundary Violation in Symbol Window Channel A Flag (vSS!BViolationA).

Cleared when leaving CONFIG state or when entering STARTUP state.

(12) FLXAnFRSWNIT.SESA

Indicates a Syntax Error in Symbol Window Channel A Flag (vSS!SyntaxErrorA).

Cleared when leaving CONFIG state or when entering STARTUP state.

25.2.7.9 FLXAnFRACS — FlexRay Aggregated Channel Status Register

The aggregated channel status provides the Host with an accrued status of channel activity for all communication slots regardless of whether they are assigned for transmission or subscribed for reception.

The aggregated channel status also includes status data from the symbol window and the network idle time.

The status data is updated (set) after each slot and aggregated until it is cleared by the Host. During startup the status data is not updated.

Access: FLXAnFRACS can be read or written in 32-bit units.
FLXAnFRACSL can be read or written in 16-bit units.
FLXAnFRACSLL and FLXAnFRACSLH can be read or written in 8-bit units.

Address: FLXAnFRACS: <FLXAn_base> + 0128_{H},
FLXAnFRACSL: <FLXAn_base> + 0128_{H},
FLXAnFRACSLL: <FLXAn_base> + 0128_{H}, FLXAnFRACSLH: <FLXAn_base> + 0129_{H}

Value after reset: 0000 0000_{H}

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.66 FLXAnFRACS Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	SBVB	Slot Boundary Violation on Channel B Flag 0: No slot boundary violation observed 1: Slot boundary violation(s) observed on channel B
11	CIB	Communication Indicator Channel B Flag 0: No valid frame(s) received in slots containing any additional communication 1: Valid frame(s) received on channel B in slots containing any additional communication
10	CEDB	Content Error Detected on Channel B Flag 0: No frame with content error received 1: Frame(s) with content error received on channel B
9	SEDB	Syntax Error Detected on Channel B Flag 0: No syntax error observed 1: Syntax error(s) observed on channel B
8	VFRB	Valid Frame Received on Channel B Flag 0: No valid frame received 1: Valid frame(s) received on channel B
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	SBVA	Slot Boundary Violation on Channel A Flag 0: No slot boundary violation observed 1: Slot boundary violation(s) observed on channel A

Table 25.66 FLXAnFRACS Register Contents

Bit Position	Bit Name	Function
3	CIA	Communication Indicator Channel A Flag 0: No valid frame(s) received in slots containing any additional communication 1: Valid frame(s) received on channel A in slots containing any additional communication
2	CEDA	Content Error Detected on Channel A Flag 0: No frame with content error received 1: Frame(s) with content error received on channel A
1	SEDA	Syntax Error Detected on Channel A Flag 0: No syntax error observed 1: Syntax error(s) observed on channel A
0	VFRA	Valid Frame Received on Channel A Flag 0: No valid frame received 1: Valid frame(s) received on channel A

(1) FLXAnFRACS.SBVB

Slot Boundary Violation on Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
One or more slot boundary violations were observed on channel B at any time during the observation period (static or dynamic slots, symbol window, and NIT).
When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFRACS.CIB

Communication Indicator Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
Indicates that one or more valid frames were received on channel B in slots that also contained additional communication during the observation period, i.e. one or more slots received a valid frame AND had any combination of either syntax error OR content error OR slot boundary violation.

CAUTION

The set condition of the flag FLXAnFRACS.CIB is also fulfilled if there is only one single frame in the slot and the slot boundary at the end of the slot is reached during the frames channel idle recognition phase.
When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.

(3) FLXAnFRACS.CEDB

Content Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
Indicates that one or more frames with a content error were received on channel B in any static or dynamic slot during the observation period.
When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.

(4) FLXAnFRACS.SEDB

Syntax Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel B.
When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.

(5) FLXAnFRACS.VFRB

Valid Frame Received on Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
One or more valid frames were received on channel B in any static or dynamic slot during the observation period.
Cleared when leaving CONFIG state or when entering STARTUP state.

(6) FLXAnFRACS.SBVA

Slot Boundary Violation on Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
Slot boundary violations were observed on channel A at any time during the observation period (static or dynamic slots, symbol window, and NIT).
When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.

(7) FLXAnFRACS.CIA

Communication Indicator Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
One or more valid frames were received on channel A in slots that also contained any additional communication during the observation period, i.e. one or more slots received a valid frame AND had any combination of either syntax error OR content error OR slot boundary violation.

CAUTION

The set condition of the flag FLXAnFRACS.CIA is also fulfilled if there is only one single frame in the slot and the slot boundary at the end of the slot is reached during the frames channel idle recognition phase.
When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.

(8) FLXAnFRACS.CEDA

Content Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
One or more frames with a content error were received on channel A in any static or dynamic slot during the observation period.
When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.

(9) FLXAnFRACS.SEDA

Syntax Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel A.
When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.

(10) FLXAnFRACS.VFRA

Valid Frame Received on Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
One or more valid frames were received on channel A in any static or dynamic slot during the observation period.
Cleared when leaving CONFIG state or when entering STARTUP state.

25.2.7.10 FLXAnFRESIDm — FlexRay Even Sync ID Register m (m = 1 to 15)

Registers FLXAnFRESID1 to FLXAnFRESID15 hold the frame IDs of the sync frames received in even communication cycles used for clock synchronization up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register FLXAnFRESID1 holding the lowest received sync frame ID. If the node itself transmits a sync frame in an even communication cycle, register FLXAnFRESID1 holds the respective sync frame ID as configured in message buffer 0 and flags FLXAnFRESID1.RXEA, FLXAnFRESID1.RXEB are set. The value is updated during the NIT of each even communication cycle.

Access: FLXAnFRESIDm is a read-only register that can be read in 32-bit units.
FLXAnFRESIDmL is a read-only register that can be read in 16-bit units.
FLXAnFRESIDmLL and FLXAnFRESIDmLH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRESIDm: <FLXAn_base> + 0130_H + (m – 1) × 4_H,
FLXAnFRESIDmL: <FLXAn_base> + 0130_H + (m – 1) × 4_H,
FLXAnFRESIDmLL: <FLXAn_base> + 0130_H + (m – 1) × 4_H,
FLXAnFRESIDmLH: <FLXAn_base> + 0130_H + (m – 1) × 4_H + 1_H

Value after reset: 0000 0000_H

Table 25.67 FLXAnFRESIDm Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15	RXEB	Received/Configured Even Sync ID on Channel B Flag 0: No sync frame received on channel B/node not configured to transmit sync frames 1: Sync frame received on channel B/node configured to transmit sync frames
14	RXEA	Received/Configured Even Sync ID on Channel A Flag 0: No sync frame received on channel A/node not configured to transmit sync frames 1: Sync frame received on channel A/node configured to transmit sync frames
13 to 10	Reserved	When read, the value after reset is returned.
9 to 0	EID[9:0]	Even Sync ID (vsSyncIDListA,B even Flag)

(1) FLXAnFRESIDm.RXEB

Received/Configured Even Sync ID on Channel B Flag

Signals that a sync frame corresponding to the stored even sync ID was received on channel B or that the node is configured to be a sync node with key slot = FLXAnFRESID1.EID.
Cleared when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFRESIDm.RXEA

Received/Configured Even Sync ID on Channel A Flag

Signals that a sync frame corresponding to the stored even sync ID was received on channel A or that the node is configured to be a sync node with key slot = FLXAnFRESID1.EID.
Cleared when leaving CONFIG state or when entering STARTUP state.

(3) FLXAnFRESIDm.EID

Even Sync ID Flag (vsSyncIDListA,B even)

Indicates the sync frame ID received in an even communication cycle. Cleared when leaving CONFIG state or when entering STARTUP state.

25.2.7.11 FLXAnFROSIDm — FlexRay Odd Sync ID Register m (m = 1 to 15)

Registers FLXAnFROSID1 to FLXAnFROSID15 hold the frame IDs of the sync frames received in odd communication cycles used for clock synchronization up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register FLXAnFROSID1 holding the lowest received sync frame ID. If the node itself transmits a sync frame in an odd communication cycle, register FLXAnFROSID1 holds the respective sync frame ID as configured in message buffer 0 and flags FLXAnFROSID1.RXOA, FLXAnFROSID1.RXOB are set. The value is updated during the NIT of each odd communication cycle.

Access: FLXAnFROSIDm is a read-only register that can be read in 32-bit units.
FLXAnFROSIDmL is a read-only register that can be read in 16-bit units.
FLXAnFROSIDmLL and FLXAnFROSIDmLH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFROSIDm: <FLXAn_base> + 0170_H + (m – 1) × $4_{H,}$
FLXAnFROSIDmL: <FLXAn_base> + 0170_H + (m – 1) × $4_{H,}$
FLXAnFROSIDmLL: <FLXAn_base> + 0170_H + (m – 1) × $4_{H,}$
FLXAnFROSIDmLH: <FLXAn_base> + 0170_H + (m – 1) × 4_H + 1_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.68 FLXAnFROSIDm Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15	RXOB	Received/Configured Odd Sync ID on Channel B Flag 0: No sync frame received on channel B/node not configured to transmit sync frames 1: Sync frame received on channel B/node configured to transmit sync frames
14	RXOA	Received/Configured Odd Sync ID on Channel A Flag 0: No sync frame received on channel A/node not configured to transmit sync frames 1: Sync frame received on channel A/node configured to transmit sync frames
13 to 10	Reserved	When read, the value after reset is returned.
9 to 0	OID[9:0]	Odd Sync ID Flag (vsSyncIDListA,B odd)

(1) FLXAnFROSIDm.RXOB

Received/Configured Odd Sync ID on Channel B Flag

Signals that a sync frame corresponding to the stored odd sync ID was received on channel B or that the node is configured to be a sync node with key slot = FLXAnFROSID1.OID.
Cleared when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFROSIDm.RXOA

Received/Configured Odd Sync ID on Channel A Flag

Signals that a sync frame corresponding to the stored odd sync ID was received on channel A or that the node is configured to be a sync node with key slot = FLXAnFROSID1.OID.
Cleared when leaving CONFIG state or when entering STARTUP state.

(3) FLXAnFROSIDm.OID

Odd Sync ID Flag (vsSyncIDListA,B odd)

Indicates the sync frame ID odd communication cycle.
Cleared when leaving CONFIG state or when entering STARTUP state.

25.2.7.12 FLXAnFRNMVm — FlexRay Network Management Vector Register m (m = 1 to 3)

The three network management registers hold the accrued NM vector (see **Section 25.3.7, Network Management**).

The CC updates the NM vector at the end of each communication cycle as long as the CC is either in NORMAL_ACTIVE or NORMAL_PASSIVE state.

NMVn-bytes exceeding the configured NM vector length are not valid.

For information about the byte alignment of the received NM vector in this register see **Section 25.3.17, Byte Alignment**.

Access: FLXAnFRNMVm is a read-only register that can be read in 32-bit units.
FLXAnFRNMVmL and FLXAnFRNMVmH are the read-only registers that can be read in 16-bit units.
FLXAnFRNMVmLL, FLXAnFRNMVmLH, FLXAnFRNMVmHL, and FLXAnFRNMVmHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRNMVm: <FLXAn_base> + $01B0_H$ + (m – 1) × 4_H,
FLXAnFRNMVmL: <FLXAn_base> + $01B0_H$ + (m – 1) × 4_H,
FLXAnFRNMVmH: <FLXAn_base> + $01B0_H$ + (m – 1) × 4_H + 2_H,
FLXAnFRNMVmLL: <FLXAn_base> + $01B0_H$ + (m – 1) × 4_H,
FLXAnFRNMVmLH: <FLXAn_base> + $01B0_H$ + (m – 1) × 4_H + 1_H,
FLXAnFRNMVmHL: <FLXAn_base> + $01B0_H$ + (m – 1) × 4_H + 2_H,
FLXAnFRNMVmHH: <FLXAn_base> + $01B0_H$ + (m – 1) × 4_H + 3_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NM[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.69 FLXAnFRNMVm Register Contents

Bit Position	Bit Name	Function
31 to 0	NM[31:0]	NM Vector The three network management vector registers hold the accrued NM vector (configurable 0 to 12 bytes). The NM vector to be held is generated by bit-wise logic OR for each NM vector received on each channel (valid static frames with PPI = 1) (see **Section 25.3.7, Network Management**). For information about the byte alignment of the received NM vector in this register see **Section 25.3.17, Byte Alignment**. NMVn-bytes exceeding the configured NM vector length are not valid. The Register Contents are updated at the end of each communication cycle as long as the CC is either in NORMAL_ACTIVE or NORMAL_PASSIVE state. These bits are cleared when leaving CONFIG state or when entering STARTUP state.

25.2.8 Message Buffer Control Registers

25.2.8.1 FLXAnFRMRC — FlexRay Message RAM Configuration Register

The Message RAM Configuration register defines the number of message buffers assigned to the static segment, dynamic segment, and FIFO.

The Message RAM can be divided into up three different areas; Static Buffer area, Static and Dynamic Buffer area, FIFO area. If present, the Static Buffer area is starting at Message Buffer 0.

The start of the Static and Dynamic Buffer area is configured by FLXAnFRMRC.FDB. FLXAnFRMRC.FDB defines the end of the Static Buffer area. If no Static Buffer area is present, the Static and Dynamic Buffer area starts at Message Buffer 0.

The start of the FIFO area is configured by FLXAnFRMRC.FFB. FLXAnFRMRC.FFB defines the end of the previous area, which can be either the Static Buffer area or the Static and Dynamic Buffer area. If no Static Buffer area and no Static and Dynamic Buffer area is present, the FIFO area starts at Message Buffer 0.

The end of the last configured area, which can be the Static Buffer area, the Static and Dynamic buffer area, or the FIFO area, is configured by FLXAnFRMRC.LCB.

Figure 25.2, Message RAM Organization shows an example configuration of the Message RAM where all there area are configured.

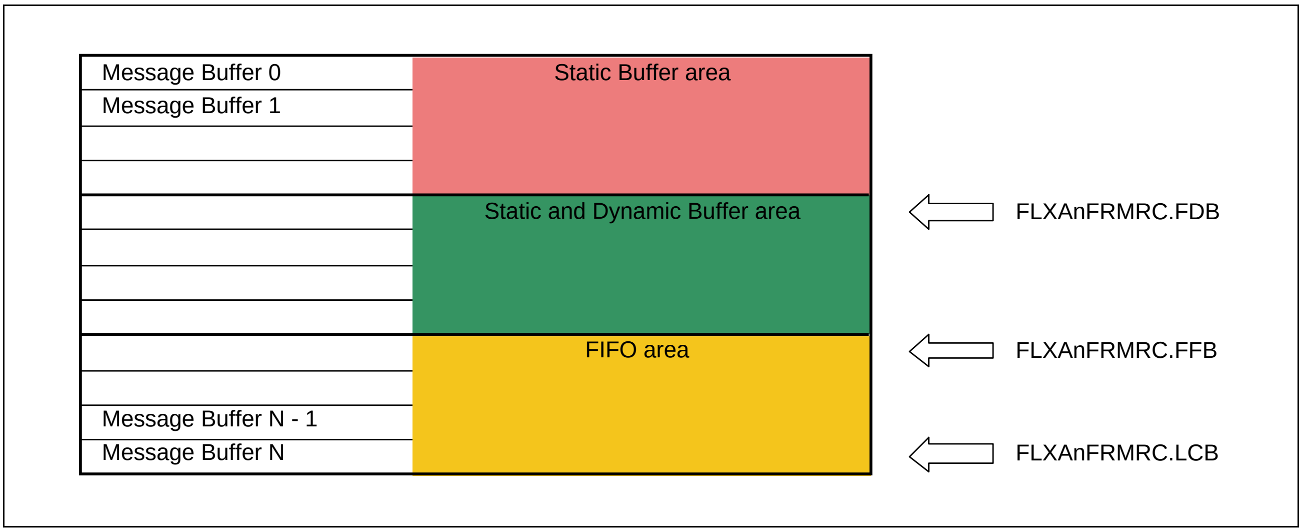

Figure 25.2 Message RAM Organization

CAUTIONS

1. If the node is configured as sync node (FLXAnFRSUCC1.TXSY = 1) or for single slot mode operation (FLXAnFRSUCC1.TSM = 1), message buffer 0 or 1 is reserved for sync frames or single slot frames and have to be configured with the node- specific key slot ID. In case the node is neither configured as sync node nor for single slot operation message buffer 0 or 1 is treated like all other message buffers.
2. The maximum number of header sections is 128. This means a maximum of 128 message buffers can be configured. The maximum length of a data section is 254 bytes. The length of the data section may be configured differently for each message buffer. For details see **Section 25.3.13, Message RAM**.
3. If two or more message buffers are assigned to slot 1 by use of cycle filtering, all of them must be located either in the “Static Buffers” or at the beginning of the “Static + Dynamic Buffers” section.

4. The FlexRay protocol specification requires that each node has to send a frame in its key slot. Therefore at least message buffer 0 is reserved for transmission in the key slot. Due to this requirement a maximum number of 127 message buffers can be assigned to the FIFO. Nevertheless, a non protocol conform configuration without a transmission slot in the static segment would still be operational.
5. The payload length configured and the length of the data section need to be configured identical for all message buffers belonging to the FIFO via FLXAnFRWRHS2.PL and FLXAnFRWRHS3.DP. When the CC is not in DEFAULT_CONFIG or CONFIG state reconfiguration of message buffers belonging to the FIFO is locked.

Access: FLXAnFRMRC can be read or written in 32-bit units.
FLXAnFRMRCL and FLXAnFRMRCH can be read or written in 16-bit units.
FLXAnFRMRCLL, FLXAnFRMRCLH, FLXAnFRMRCHL and FLXAnFRMRCHH can be read or written in 8-bit units.

Address: FLXAnFRMRC: <FLXAn_base> + 0300_H,
FLXAnFRMRCL: <FLXAn_base> + 0300_H, FLXAnFRMRCH: <FLXAn_base> + 0302_H,
FLXAnFRMRCLL: <FLXAn_base> + 0300_H, FLXAnFRMRCLH: <FLXAn_base> + 0301_H,
FLXAnFRMRCHL: <FLXAn_base> + 0302_H, FLXAnFRMRCHH: <FLXAn_base> + 0303_H

Value after reset: 0180 0000_H

Table 25.70 FLXAnFRMRC Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	SPLM	Sync Frame Payload Multiplex Bit 0: Only message buffer 0 locked against reconfiguration 1: Both message buffers 0 and 1 are locked against reconfiguration
25, 24	SEC[1:0]	Secure Buffers Bit 00_B: all buffers unlocked 01_B: static buffers locked, FIFO locked, limited transmission 10_B: all buffers locked 11_B: all buffers locked, limited transmission
23 to 16	LCB[7:0]	Last Configured Buffer Bit 0 to 127: Number of message buffers is FLXAnFRMRF.LCB + 1 128: No message buffer assigned to the FIFO
15 to 8	FFB[7:0]	First Buffer of FIFO Bit 0: All message buffers assigned to the FIFO 1 to 127: Message buffers from FLXAnFRMRC.FFB to FLXAnFRMRC.LCB assigned to the FIFO 128: No message buffer configured
7 to 0	FDB[7:0]	First Dynamic Buffer Bit 0: No group of message buffers exclusively for the static segment configured 1 to 127: Message buffers 0 to FLXAnFRMRC.FDB - 1 reserved for static segment 128: No dynamic message buffers configured

(1) FLXAnFRMRC.SPLM

Sync Frame Payload Multiplex Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
This bit is only evaluated if the node is configured as sync node (FLXAnFRSUCC1.TXSY = 1) or for single slot mode operation (FLXAnFRSUCC1.TSM = 1).
When this bit is set to 1 message buffers 0 and 1 are dedicated for sync frame transmission with different payload data on channel A and B.
When this bit is set to 0, sync frames are transmitted from message buffer 0 with the same payload data on all channels configured. Note that the channel filter configuration for message buffer 0 or message buffer 1 has to be chosen accordingly.

(2) FLXAnFRMRC.SEC

Secure Buffers Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Not evaluated when the CC is in DEFAULT_CONFIG or CONFIG state.
For temporary unlocking, see **Section 25.3.13.4, Host Handling of Access Errors**.

- 00_B = all buffers unlocked
  Reconfiguration of message buffers enabled with numbers < FLXAnFRMRC.FFB enabled
  - Exception: In nodes configured for sync frame transmission or for single slot mode operation message buffer 0 (and if FLXAnFRMRC.SPLM = 1, also message buffer 1) is always locked
- 01_B = static buffers locked, FIFO locked, limited transmission
  Reconfiguration of message buffers with numbers < FLXAnFRMRC.FDB and with numbers ≥ FLXAnFRMRC.FFB locked and transmission of message buffers for static segment with numbers ≥ FLXAnFRMRC.FDB disabled
- 10_B = all buffers locked
  Reconfiguration of all message buffers locked
- 11_B = all buffers locked, limited transmission
  Reconfiguration of all message buffers locked and transmission of message buffers for static segment with numbers ≥ FLXAnFRMRC.FDB disabled

(3) FLXAnFRMRC.LCB

Last Configured Buffer Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
When a Static and Dynamic Buffer area is configured (FLXAnFRMRC.FDB < 128), the user should configure FLXAnFRMRC.LCB ≥ FLXAnFRMRC.FDB.
When a FIFO area is configured (FLXAnFRMRC.FFB < 128), the user should configure FLXAnFRMRC.LCB ≥ FLXAnFRMRC.FFB.

(4) FLXAnFRMRC.FFB

First Buffer of FIFO Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
When a Static and Dynamic Buffer area is configured (FLXAnFRMRC.FDB < 128), the user should configure FLXAnFRMRC.FFB > FLXAnFRMRC.FDB.

(5) FLXAnFRMRC.FDB

First Dynamic Buffer Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

25.2.8.2 FLXAnFRFRF — FlexRay FIFO Rejection Filter Register

The FIFO Rejection Filter defines a user specified sequence of bits to which channel, frame ID, and cycle count of the incoming frames are compared. Together with the FIFO Rejection Filter Mask this register determines whether a message is rejected by the FIFO.

Access: FLXAnFRFRF can be read or written in 32-bit units.
FLXAnFRFRFL and FLXAnFRFRFH can be read or written in 16-bit units.
FLXAnFRFRFLL, FLXAnFRFRFLH, FLXAnFRFRFLH, FLXAnFRFRFHL, and FLXAnFRFRFHH can be read or written in 8-bit units.

Address: FLXAnFRFRF: <FLXAn_base> + 0304_H,
FLXAnFRFRFL: <FLXAn_base> + 0304_H, FLXAnFRFRFH: <FLXAn_base> + 0306_H,
FLXAnFRFRFLL: <FLXAn_base> + 0304_H, FLXAnFRFRFLH: <FLXAn_base> + 0305_H,
FLXAnFRFRFHL: <FLXAn_base> + 0306_H, FLXAnFRFRFHH: <FLXAn_base> + 0307_H

Value after reset: 0180 0000_H

Table 25.71 FLXAnFRFRF Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	RNF	Reject Null Frames Bit 0: Null frames are stored in the FIFO 1: Reject all null frames
23	RSS	Reject in Static Segment Bit 0: FIFO also used for static segment 1: Reject messages in static segment
22 to 16	CYF[6:0]	Cycle Counter Filter Bit Cycle Counter Filter
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 2	FID[10:0]	Frame ID Filter Bit 0 to 2047: Frame ID filter values
1, 0	CH[1:0]	Channel Filter Bit 00_B: receive on both channels 01_B: receive only on channel B 10_B: receive only on channel A 11_B: no reception

(1) FLXAnFRFRF.RNF

Reject Null Frames Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
If this bit is set to 1, received null frames are not stored in the FIFO.

(2) FLXAnFRFRF.RSS

Reject in Static Segment Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
If this bit is set to 1, the FIFO is used only for the dynamic segment.

(3) FLXAnFRFRF.CYF

Cycle Counter Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by FLXAnFRFRF.CYF, all frames are rejected. For details about the configuration of the cycle counter filter see **Section 25.3.8.2, Cycle Counter Filtering**.

(4) FLXAnFRFRF.FID

Frame ID Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Determines the frame ID to be rejected by the FIFO. With the additional configuration of register FLXAnFRFRFM, the corresponding frame ID filter bits are ignored, which results in further rejected frame IDs. When FLXAnFRFRFM.MFID is zero, a frame ID filter value of zero means that no frame ID is rejected.

(5) FLXAnFRFRF.CH

Channel Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
If reception on both channels is configured, also in static segment always both frames (from channel A and B) are stored in the FIFO, even if they are identical.

25.2.8.3 FLXAnFRFRFM — FlexRay FIFO Rejection Filter Mask Register

The FlexRay FIFO Rejection Filter Mask specifies which of the corresponding frame ID filter bits are relevant for rejection filtering. If a bit is set to 1, it indicates that the corresponding bit in the FLXAnFRFRF register will not be considered for rejection filtering.

Access: FLXAnFRFRFM can be read or written in 32-bit units.
FLXAnFRFRFML can be read or written in 16-bit units.
FLXAnFRFRFMLL and FLXAnFRFRFMLH can be read or written in 8-bit units.

Address: FLXAnFRFRFM: <FLXAn_base> + 0308$_{\text{H}}$,
FLXAnFRFRFML: <FLXAn_base> + 0308$_{\text{H}}$,
FLXAnFRFRFMLL: <FLXAn_base> + 0308$_{\text{H}}$, FLXAnFRFRFMLH: <FLXAn_base> + 0309$_{\text{H}}$

Value after reset: 0000 0000$_{\text{H}}$

Table 25.72 FLXAnFRFRFM Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 2	MFID[10:0]	Mask Frame ID Filter Bit 0: Corresponding frame ID filter bit is used for rejection filtering 1: Ignore corresponding frame ID filter bit.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

(1) FLXAnFRFRFM.MFID

Mask Frame ID Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

25.2.8.4 FLXAnFRFCL — FlexRay FIFO Critical Level Register

Access:	FLXAnFRFCL can be read or written in 32-bit units. FLXAnFRFCLL can be read or written in 16-bit units. FLXAnFRFCLLL can be read or written in 8-bit units.
Address:	FLXAnFRFCL: <FLXAn_base> + $030C_H$, FLXAnFRFCLL: <FLXAn_base> + $030C_H$, FLXAnFRFCLLL: <FLXAn_base> + $030C_H$
Value after reset:	$0000\ 0080_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 25.73 FLXAnFRFCL Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	CL[7:0]	Critical Level Bit Critical Level

(1) FLXAnFRFCL.CL

Critical Level Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
When the receive FIFO fill level (FLXAnFRFSR.RFFL) is equal or greater than the critical level configured by FLXAnFRFCL.CL, the receive FIFO critical level flag FLXAnFRFSR.RFCL is set to 1.
If FLXAnFRFCL.CL is programmed to values > 128, bit FLXAnFRFSR.RFCL is never set to 1.

25.2.9 Message Buffer Status Registers

25.2.9.1 FLXAnFRMHDS — FlexRay Message Handler Status Register

Access: FLXAnFRMHDS can be read or written in 32-bit units.
FLXAnFRMHDSL can be read or written in 16-bit units.
FLXAnFRMHDSH is a read-only register that can be read in 16-bit units.
FLXAnFRMHDSLL can be read or written in 8-bit units.
FLXAnFRMHDSLH, FLXAnFRMHDSHL, and FLXAnFRMHDSHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRMHDS: <FLXAn_base> + 0310$_H$,
FLXAnFRMHDSL: <FLXAn_base> + 0310$_H$, FLXAnFRMHDSH: <FLXAn_base> + 0312$_H$,
FLXAnFRMHDSLL: <FLXAn_base> + 0310$_H$, FLXAnFRMHDSLH: <FLXAn_base> + 0311$_H$,
FLXAnFRMHDSHL: <FLXAn_base> + 0312$_H$, FLXAnFRMHDSHH: <FLXAn_base> + 0313$_H$

Value after reset: 0000 0080$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.74 FLXAnFRMHDS Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30 to 24	MBU[6:0]	Message Buffer Updated Flag
23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	MBT[6:0]	Message Buffer Transmitted Flag
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14 to 8	FMB[6:0]	Faulty Message Buffer Number Flag
7	CRAM	Clear all internal RAM's Flag 0: No execution of the CHI command CLEAR_RAMS 1: Execution of the CHI command CLEAR_RAMS ongoing
6	MFMB	Multiple Faulty Message Buffer Detection Flag 0: No additional faulty message buffer. 1: Additional faulty message buffer was detected while the FLXAnFRMHDS.FMBD flag is set to 1.
5	FMBD	Faulty Message Buffer Detection Flag 0: No faulty message buffer. 1: Message buffer referenced by FLXAnFRMHDS.FMBD holds faulty data with a parity error.
4	ATBF2	Nonresident Buffer RAM B Access Error Flag 0: No access error 1: Access error occurred when reading the RAM B.

Table 25.74 FLXAnFRMHDS Register Contents

Bit Position	Bit Name	Function
3	ATBF1	Nonresident Buffer RAM A Access Error Flag 0: No access error. 1: Access error occurred when reading the RAM A.
2	AMR	Message RAM Access Error Flag 0 = No access error 1 = Access error occurred when reading the Message RAM.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

(1) FLXAnFRMHDS.MBU

Message Buffer Updated Flag

Number of message buffer that was updated last by the CC. For this message buffer the respective ND and/or MBC flag in the FLXAnFRNDAT1/2/3/4 registers and the FLXAnFRMBSC1/2/3/4 registers are also set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(2) FLXAnFRMHDS.MBT

Message Buffer Transmitted Flag

Number of last successfully transmitted message buffer.
If the message buffer is configured for single-shot mode, the respective TXR flag in the FLXAnFRTXRQ1/2/3/4 registers was reset to 0.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(3) FLXAnFRMHDS.FMB

Faulty Message Buffer Number Flag

This flag indicates that an access error occurred when reading from the message buffer referenced by FLXAnFRMHDS.FMB.
The value of this flag is only valid when FLXAnFRMHDS.AMR and flag FLXAnFRMHDS.FMBD are set to 1.
This flag is not updated while the FLXAnFRMHDS.FMBD flag is 1.
This flag is cleared by the CHI command CLEAR_RAMS.

(4) FLXAnFRMHDS.CRAM

Internal RAM Clear Flag

This flag indicates that the CHI command CLEAR_RAMS is ongoing (all bits of the message RAM, input buffer, output buffer and nonresident buffer are written to 0).
This flag is set by the CHI command CLEAR_RAMS.

(5) FLXAnFRMHDS.MFMB

Multiple Faulty Message Buffer Detection Flag

Writing 0 has no effect on the bit value.
This bit is cleared when writing 1 to it.
This bit indicates that an additional faulty message buffer was detected while the FMBD flag is set.
This bit is cleared by the CHI command CLEAR_RAMS.

(6) FLXAnFRMHDS.FMBD

Faulty Message Buffer Detection Flag

Writing 0 has no effect on the bit value.
This bit is cleared when writing 1 to it.
This bit indicates that the message buffer holds faulty data due to an access error.
This bit is cleared by the CHI command CLEAR_RAMS.

(7) FLXAnFRMHD.ATBF2

Nonresident Buffer RAM B Access Error Flag

Writing 0 has no effect on the bit value.
This bit is cleared when writing 1 to it.
This flag indicates that an access error occurred when reading the RAM B.

CAUTION

When this flag changes from 0 to 1, the AERR bit in the FLXAnFREIR register is set to 1.
This flag can be reset by the CHI command CLEAR_RAMS.

(8) FLXAnFRMHD.ATBF1

Nonresident Buffer RAM A Access Error Flag

Writing 0 has no effect on the bit value.
This bit is cleared when writing 1 to it.
This flag indicates that an access error occurred when reading the RAM A.

CAUTION

When this flag changes from 0 to 1, the AERR bit in the FLXAnFREIR register is set to 1.
This flag can be reset by the CHI command CLEAR_RAMS.

(9) FLXAnFRMHDS.AMR

Message RAM Access Error Flag

Writing 0 has no effect on the bit value.
This bit is cleared when writing 1 to it.
This flag indicates that an access error occurred when reading the Message RAM.

CAUTION

When this flag changes from 0 to 1, the AERR bit in the FLXAnFREIR register is set to 1.
This flag can be reset by the CHI command CLEAR_RAMS.

25.2.9.2 FLXAnFRLDTS — FlexRay Last Dynamic Transmit Slot Register

Access: FLXAnFRLDTS is a read-only register that can be read in 32-bit units.
FLXAnFRLDTSL and FLXAnFRLDTSH are the read-only registers that can be read in 16-bit units.
FLXAnFRLDTSLL, FLXAnFRLDTSLH, FLXAnFRLDTSHL, and FLXAnFRLDTSHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRLDTS: <FLXAn_base> + 0314_H,
FLXAnFRLDTSL: <FLXAn_base> + 0314_H, FLXAnFRLDTSH: <FLXAn_base> + 0316_H,
FLXAnFRLDTSLL: <FLXAn_base> + 0314_H, FLXAnFRLDTSLH: <FLXAn_base> + 0315_H,
FLXAnFRLDTSHL: <FLXAn_base> + 0316_H, FLXAnFRLDTSHH: <FLXAn_base> + 0317_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	LDTB[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	LDTA[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.75 FLXAnFRLDTS Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned.
26 to 16	LDTB[10:0]	Last Dynamic Transmission Channel B Flag
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	LDTA[10:0]	Last Dynamic Transmission Channel A Flag

(1) FLXAnFRLDTS.LDTB

Last Dynamic Transmission Channel B Flag

Stores the value of vSlotCounter[B] at the time of the last frame transmission on channel B in the dynamic segment of this node.
It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS of channel B.

(2) FLXAnFRLDTS.LDTA

Last Dynamic Transmission Channel A Flag

Stores the value of vSlotCounter[A] at the time of the last frame transmission on channel A in the dynamic segment of this node.
It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS of channel A.

25.2.9.3 FLXAnFRFSR — FlexRay FIFO Status Register

Access: FLXAnFRFSR is a read-only register that can be read in 32-bit units.
FLXAnFRFSRL is a read-only register that can be read in 16-bit units.
FLXAnFRFSRLL and FLXAnFRFSRLH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRFSR: <FLXAn_base> + 0318$_H$,
FLXAnFRFSRL: <FLXAn_base> + 0318$_H$,
FLXAnFRFSRLL: <FLXAn_base> + 0318$_H$, FLXAnFRFSRLH: <FLXAn_base> + 0319$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFFL[7:0]								—	—	—	—	—	RFO	RFCL	RFNE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.76 FLXAnFRFSR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 8	RFFL[7:0]	Receive FIFO Fill Level Flag
7 to 3	Reserved	When read, the value after reset is returned.
2	RFO	Receive FIFO Overrun Flag 0: No receive FIFO overrun detected 1: A receive FIFO overrun has been detected
1	RFCL	Receive FIFO Critical Level Flag 0: Receive FIFO below critical level 1: Receive FIFO critical level reached
0	RFNE	Receive FIFO Not Empty Flag 0: Receive FIFO is empty 1: Receive FIFO is not empty

(1) FLXAnFRFSR.RFFL

Receive FIFO Fill Level Flag

Indicates the number of FIFO buffers filled with new data not yet read by the Host. Maximum value is 128.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(2) FLXAnFRFSR.RFO

Receive FIFO Overrun Flag

The flag is set to 1 by the CC when a receive FIFO overrun is detected.
When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. In addition, interrupt flag FLXAnFREIR.RFO is set to 1.
The flag is cleared by the next FIFO read access issued by the Host.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(3) FLXAnFRFSR.RFCL

Receive FIFO Critical Level Flag

This flag is set to 1 when the receive FIFO fill level FLXAnFRFSR.RFFL is equal or greater than the critical level as configured by FLXAnFRFCL.CL.
When FLXAnFRFSR.RFCL changes from 0 to 1 bit FLXAnFRSIR.RFCL is set to 1, and if enabled, an interrupt is generated.
The flag is cleared by the CC as soon as FLXAnFRFSR.RFFL drops below FLXAnFRFCL.CL.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(4) FLXAnFRFSR.RFNE

Receive FIFO Not Empty Flag

This flag is set to 1 by the CC when a received valid frame (data or null frame depending on rejection mask) was stored in the FIFO. In addition, interrupt flag FLXAnFRSIR.RFNE is set to 1.
The bit is reset to 0 after the Host has read all messages from the FIFO.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

25.2.9.4 FLXAnFRMHDF — FlexRay Message Handler Constraints Flags Register

Some constraints exist for the Message Handler regarding bus clock frequency, Message RAM configuration, and FlexRay bus traffic. To simplify software development, constraints violations are reported by setting flags in the FLXAnFRMHDF.

Access:	FLXAnFRMHDF can be read or written in 32-bit units. FLXAnFRMHDFL can be read or written in 16-bit units. FLXAnFRMHDFLL and FLXAnFRMHDFLH can be read or written in 8-bit units.
Address:	FLXAnFRMHDF: <FLXAn_base> + $031C_H$, FLXAnFRMHDFL: <FLXAn_base> + $031C_H$, FLXAnFRMHDFLL: <FLXAn_base> + $031C_H$, FLXAnFRMHDFLH: <FLXAn_base> + $031D_H$
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.77 FLXAnFRMHDF Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	WAHP	Write Attempt to Header Partition Flag 0: No write attempt to header partition 1: Write attempt to header partition
7	TNSB	Transmission Not Started Channel B Flag 0: No transmission not started on channel B 1: Transmission not started on channel B
6	TNSA	Transmission Not Started Channel A Flag 0: No transmission not started on channel A 1: Transmission not started on channel A
5	TBFB	Temporary buffer Access Failure B Flag 0: No TBF B access failure 1: TBF B access failure
4	TBFA	Temporary buffer Access Failure A Flag 0: No TBF A access failure 1: TBF A access failure
3	FNFB	Find Sequence Not Finished Channel B Flag 0: No find sequence not finished for channel B 1: Find sequence not finished for channel B
2	FNFA	Find Sequence Not Finished Channel A Flag 0: No find sequence not finished for channel A 1: Find sequence not finished for channel A
1	SNUB	Status Not Updated Channel B Flag 0: No overload condition occurred when updating MBS for channel B 1: MBS for channel B not updated

Table 25.77 FLXAnFRMHDF Register Contents

Bit Position	Bit Name	Function
0	SNUA	Status Not Updated Channel A Flag 0: No overload condition occurred when updating MBS for channel A 1: MBS for channel A not updated

(1) FLXAnFRMHDF.WAHP

Write Attempt to Header Partition Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
Outside DEFAULT_CONFIG and CONFIG state this flag is set to 1 by the CC when the message handler tries to write message data into the header partition of the Message RAM due to faulty configuration of a message buffer. The write attempt is not executed, to protect the header partition from unintended write accesses.
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(2) FLXAnFRMHDF.TNSB

Transmission Not Started Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when the Message Handler was not ready to start a scheduled transmission on channel B at the action point of the configured slot.
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(3) FLXAnFRMHDF.TNSA

Transmission Not Started Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set by the CC when the Message Handler was not ready to start a scheduled transmission on channel A at the action point of the configured slot.
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(4) FLXAnFRMHDF.TBFB

Temporary buffer Access Failure B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when a read or write access to TBF B requested by PRT (Protocol controller) B could not complete within the available time.
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(5) FLXAnFRMHDF.TBFA

Temporary buffer Access Failure A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when a read or write access to TBF A requested by PRT A could not complete within the available time.
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(6) FLXAnFRMHDF.FNFB

Find Sequence Not Finished Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer).
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(7) FLXAnFRMHDF.FNFA

Find Sequence Not Finished Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer).
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(8) FLXAnFRMHDF.SNUB

Status Not Updated Channel B Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to update a message buffer’s status (FLXAnFRMBS).
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

(9) FLXAnFRMHDF.SNUA

Status Not Updated Channel A Flag

Writing 0 has no effect on the bit value.
This bit is cleared by writing 1 to it.
This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to update a message buffer’s status (FLXAnFRMBS).
When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.
Cleared when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

25.2.9.5 FLXAnFRTXRQi — FlexRay Transmission Request i (i = 1 to 4)

The four registers reflect the state of the TXR flags of all configured message buffers. The flags are valid for transmit buffers only. If the number of configured message buffers is less than 128, the unused TXR flags are invalid.

Access: FLXAnFRTXRQi is a read-only register that can be read in 32-bit units.
FLXAnFRTXRQiL and FLXAnFRTXRQiH are the read-only registers that can be read in 16-bit units.
FLXAnFRTXRQiLL, FLXAnFRTXRQiLH, FLXAnFRTXRQiHL, and FLXAnFRTXRQiHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRTXRQi: <FLXAn_base> + 0320_H + (i – 1) × 4_H,
FLXAnFRTXRQiL: <FLXAn_base> + 0320_H + (i – 1) × 4_H,
FLXAnFRTXRQiH: <FLXAn_base> + 0320_H + (i – 1) × 4_H + 2_H,
FLXAnFRTXRQiLL: <FLXAn_base> + 0320_H + (i – 1) × 4_H,
FLXAnFRTXRQiLH: <FLXAn_base> + 0320_H + (i – 1) × 4_H + 1_H,
FLXAnFRTXRQiHL: <FLXAn_base> + 0320_H + (i – 1) × 4_H + 2_H,
FLXAnFRTXRQiHH: <FLXAn_base> + 0320_H + (i – 1) × 4_H + 3_H,

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(1) FLXAnFRTXRQi.TXRo (o = (i – 1) × 32 to i × 32 – 1)

Transmission Request Flag o

If the flag is set to 1, the respective message buffer is ready for transmission or transmission of this message buffer is in progress.
In single-shot mode the flags are reset to 0 after transmission has completed.
This bit is cleared by the CHI command CLEAR_RAMS.

25.2.9.6 FLXAnFRNDATi — FlexRay New Data Register i (i = 1 to 4)

The four registers reflect the state of the ND flags of all configured message buffers. ND flags belonging to transmit buffers have no meaning. If the number of configured message buffers is less than 128, unused ND flags are invalid.

Access: FLXAnFRNDATi is a read-only register that can be read in 32-bit units.
FLXAnFRNDATiL and FLXAnFRNDATiH are the read-only registers that can be read in 16-bit units.
FLXAnFRNDATiLL, FLXAnFRNDATiLH, FLXAnFRNDATiHL, and FLXAnFRNDATiHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRNDATi: <FLXAn_base> + 0330_H + (i – 1) × 4_H,
FLXAnFRNDATiL: <FLXAn_base> + 0330_H + (i – 1) × 4_H,
FLXAnFRNDATiH: <FLXAn_base> + 0330_H + (i – 1) × 4_H + 2_H,
FLXAnFRNDATiLL: <FLXAn_base> + 0330_H + (i – 1) × 4_H,
FLXAnFRNDATiLH: <FLXAn_base> + 0330_H + (i – 1) × 4_H + 1_H,
FLXAnFRNDATiHL: <FLXAn_base> + 0330_H + (i – 1) × 4_H + 2_H,
FLXAnFRNDATiHH: <FLXAn_base> + 0330_H + (i – 1) × 4_H + 3_H

Value after reset: 0000 0000_H

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.79 FLXAnFRNDATi Register Contents

Bit Position	Bit Name	Function
31 to 0	NDm	New Data Flag m

(1) FLXAnFRNDATi.NDm (m = (i – 1) × 32 to i × 32 – 1)

New Data Flag m

The flags are set to 1 when a valid received data frame matches the message buffer’s filter configuration, independent of the payload length received or the payload length configured for that message buffer.
The flags are not set to 1 after reception of null frames except for message buffers belonging to the receive FIFO.
An ND flag is reset to 0 when the header section of the corresponding message buffer is reconfigured or when the data section has been transferred to the Output Buffer.
Cleared when leaving CONFIG state or when entering STARTUP state.
This bit is cleared by the CHI command CLEAR_RAMS.

25.2.9.7 FLXAnFRMBSCi — FlexRay Message Buffer Status Changed Register i (i = 1 to 4)

The four registers reflect the state of the MBC flags of all configured message buffers. If the number of configured message buffers is less than 128, unused MBC flags are invalid.

Access: FLXAnFRMBSCi is a read-only register that can be read in 32-bit units.
FLXAnFRMBSCiL and FLXAnFRMBSCiH are the read-only registers that can be read in 16-bit units.
FLXAnFRMBSCiLL, FLXAnFRMBSCiLH, FLXAnFRMBSCiHL, and FLXAnFRMBSCiHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRMBSCi: <FLXAn_base> + 0340$_H$ + (i – 1) × 4$_H$,
FLXAnFRMBSCiL: <FLXAn_base> + 0340$_H$ + (i – 1) × 4$_H$,
FLXAnFRMBSCiH: <FLXAn_base> + 0340$_H$ + (i – 1) × 4$_H$ + 2$_H$,
FLXAnFRMBSCiLL: <FLXAn_base> + 0340$_H$ + (i – 1) × 4$_H$,
FLXAnFRMBSCiLH: <FLXAn_base> + 0340$_H$+ (i – 1) × 4$_H$ + 1$_H$,
FLXAnFRMBSCiHL: <FLXAn_base> + 0340$_H$ + (i – 1) × 4$_H$ + 2$_H$,
FLXAnFRMBSCiHH: <FLXAn_base> + 0340$_H$ + (i – 1) × 4$_H$ + 3$_H$

Value after reset: 0000 0000$_H$

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.80 FLXAnFRMBSCi Register Contents

Bit Position	Bit Name	Function
31 to 0	MBCm	Message Buffer Status Changed Flag m

(1) FLXAnFRMBSCi.MBCm (m = (i – 1) × 32 to i × 32 – 1)

Message Buffer Status Changed Flag m

Indicates whether the Message Handler has changed one of the status flags VFRA, VFRB, SEOA, SEOB, CEOA, CEOB, SVOA, SVOB, TCIA, TCIB, ESA, ESB, MLST, FTA, FTB in the header section (see **Section 25.2.11.5, FLXAnFRMBS — FlexRay Message Buffer Status Register** and **Section 25.3.13.1, Header Partition**) of the respective message buffer.
An MBC flag is reset to 0 when the header section of the corresponding message buffer is reconfigured or when it has been transferred to the Output Buffer.
Cleared when leaving CONFIG state or when entering STARTUP state.
This bit is cleared by the CHI command CLEAR_RAMS.

25.2.10 Input Buffer

Double buffer structure consisting of Input Buffer Host and Input Buffer Shadow. While the Host can write to Input Buffer Host, the transfer to the Message RAM is done from Input Buffer Shadow. The Input Buffer holds the header and data sections to be transferred to the selected message buffer in the Message RAM. It is used to configure the message buffers in the Message RAM and to update the data sections of transmit buffers.

When updating the header section of a message buffer in the Message RAM from the Input Buffer, the Message Buffer Status as described in **Section 25.2.11.5, FLXAnFRMBS — FlexRay Message Buffer Status Register** is automatically reset to zero.

The header sections of message buffers belonging to the receive FIFO can only be (re)configured when the CC is in DEFAULT_CONFIG or CONFIG state. For those message buffers only the payload length configured and the data pointer need to be configured via FLXAnFRWRHS2.PLC and FLXAnFRWRHS3.DP. All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask.

The data transfer between Input Buffer (IBF) and Message RAM is described in detail in **Section 25.3.12.1, Reconfiguration of Message Buffers**.

These registers cannot be written when the input data transfer function shown in **Section 25.3.16.1, Input Data Transfer** is used and the FLXAnFRITS.ITS bit is 1.

25.2.10.1 FLXAnFRWRDSx — FlexRay Write Data Section Register x (x = 1 to 64)

This register holds the data wards to be transferred to the data section of the specified message buffer. The number of data words written to the Message RAM is defined by the payload length configured in FLXAnFRWRHS2.PLC bit.

Access: FLXAnFRWRDSx can be read or written in 32-bit units.
FLXAnFRWRDSxL and FLXAnFRWRDSxH can be read or written in 16-bit units.
FLXAnFRWRDSxLL, FLXAnFRWRDSxLH, FLXAnFRWRDSxHL, and FLXAnFRWRDSxHH can be read or written in 8-bit units.

Address: FLXAnFRWRDSx: <FLXAn_base> + 0400_H + (x – 1) × 4_H,
FLXAnFRWRDSxL: <FLXAn_base> + 0400_H + (x – 1) × 4_H,
FLXAnFRWRDSxH: <FLXAn_base> + 0400_H + (x – 1) × 4_H + 2_H,
FLXAnFRWRDSxLL: <FLXAn_base> + 0400_H + (x – 1) × 4_H,
FLXAnFRWRDSxLH: <FLXAn_base> + 0400_H + (x – 1) × 4_H + 1_H,
FLXAnFRWRDSxHL: <FLXAn_base> + 0400_H + (x – 1) × 4_H + 2_H,
FLXAnFRWRDSxHH: <FLXAn_base> + 0400_H + (x – 1) × 4_H + 3_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.81 FLXAnFRWRDSx Register Contents

Bit Position	Bit Name	Function
31 to 0	MD[31:0]	Message Data Bit

(1) FLXAnFRWRDSx.MD

Message Data Bit

For information about the byte alignment of the message data in this register see **Section 25.3.17, Byte Alignment**.

CAUTIONS

1. In case FLXAnFRWRHS2.PLC specifies an odd payload length, the remaining message data bytes are unused.
2. When writing to FLXAnFRWRDSx, each 32-bit word has to be filled up by one 32-bit access OR two consecutive 16-bit accesses OR four consecutive 8- bit accesses before the transfer from the Input Buffer to the Message RAM is started. If not all bytes of a 32- bit word have been written by the Host (8/16-bit access only), FLXAnFRWRDSx holds partly undefined data.
Reset by the CHI command CLEAR_RAMS.

25.2.10.2 FLXAnFRWRHS1 — FlexRay Write Header Section Register 1

Access: FLXAnFRWRHS1 can be read or written in 32-bit units.
FLXAnFRWRHS1L and FLXAnFRWRHS1H can be read or written in 16-bit units.
FLXAnFRWRHS1LL, FLXAnFRWRHS1LH, FLXAnFRWRHS1HL, and FLXAnFRWRHS1HH can be read or written in 8-bit units.

Address: FLXAnFRWRHS1: <FLXAn_base> + 0500_H,
FLXAnFRWRHS1L: <FLXAn_base> + 0500_H, FLXAnFRWRHS1H: <FLXAn_base> + 0502_H,
FLXAnFRWRHS1LL: <FLXAn_base> + 0500_H, FLXAnFRWRHS1LH: <FLXAn_base> + 0501_H,
FLXAnFRWRHS1HL: <FLXAn_base> + 0502_H, FLXAnFRWRHS1HH: <FLXAn_base> + 0503_H

Value after reset: 0000 0000_H

Table 25.82 FLXAnFRWRHS1 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29	MBI	Message Buffer Interrupt Bit 0: The corresponding message buffer interrupt is disabled 1: The corresponding message buffer interrupt is enabled
28	TXM	Transmission Mode Setting Bit 0: Continuous mode 1: Single-shot mode
27	PPIT	Payload Preamble Indicator Transmit Bit 0: Payload Preamble Indicator is set to 0 1: Payload Preamble Indicator is set to 1
26	CFG	Message Buffer Direction Configuration Bit 0: The corresponding buffer is configured as Receive Buffer 1: The corresponding buffer is configured as Transmit Buffer
25, 24	CH[1:0]	Channel Filter Control Bit
23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	CYC[6:0]	Cycle Code Bit
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	FID[10:0]	Frame ID Bit

(1) FLXAnFRWRHS1.MBI

Message Buffer Interrupt Enable Bit

This bit enables the message buffer interrupt.
After a dedicated receive buffer has been updated by the Message Handler, flag FLXAnFRSIR.RXI and /or FLXAnFRSIR.MBSI are set to 1. After a transmission has completed flag FLXAnFRSIR.TXI is set to 1.

(2) FLXAnFRWRHS1.TXM

Transmission Mode Setting Bit

This bit selects transmit mode of the corresponding message buffer. For transmit mode, see **Section 25.3.9.3, Transmit Buffers**.

(3) FLXAnFRWRHS1.PPIT

Payload Preamble Indicator Transmit Bit

This bit is used to control the state of the Payload Preamble Indicator in transmit frames in transmit frames of the corresponding message buffer.
If the bit is set to 1 in a static message buffer, the respective message buffer holds network management information.
If the bit is set to 1 in a dynamic message buffer the first two bytes of the payload segment may be used for message ID filtering by the receiver. Message ID filtering of received FlexRay frames is not supported by the FlexRay module, but can be done by the Host.

(4) FLXAnFRWRHS1.CFG

Message Buffer Direction Configuration Bit

This bit is used to configure the corresponding buffer as transmit buffer or as receive buffer. For message buffers belonging to the receive FIFO the bit is not evaluated.
When not allocating an unused area of at least 32 bits at the start of the data partition, set this bit to 1 in the data section of the message buffer allocated immediately after the (last buffer of the) header partition so that the message buffer is specified as a transmit buffer.

(5) FLXAnFRWRHS1.CH

Channel Filter Control Bit

The 2-bit channel filtering field associated with each buffer serves as a filter for receive buffers, and as a control field for transmit buffers.

CH[1:0]	Transmit Buffer Transmit Frame on	Receive Buffer Store Frame Received from
00_B	No transmission	Ignore frame
01_B	Channel A	Channel A
10_B	Channel B	Channel B
11_B	Both channels (static segment only)	Channel A or B (store first semantically valid frame; static segment only)

CAUTION

If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to 1, no frames are transmitted and received frames are ignored (same function as CH = “00_B”)

(6) FLXAnFRWRHS1.CYC

Cycle Code Bit

The 7-bit cycle code determines the cycle set used for cycle counter filtering.
For details about the configuration of the cycle code **Section 25.3.8.2, Cycle Counter Filtering**.

(7) FLXAnFRWRHS1.FID

Frame ID Bit

Configures the frame ID of the selected message buffer. The frame ID defines the slot number for transmission/reception of the respective message.
Message buffers with frame ID = 0 are considered as not valid.

25.2.10.3 FLXAnFRWRHS2 — FlexRay Write Header Section Register 2

Access:	FLXAnFRWRHS2 can be read or written in 32-bit units. FLXAnFRWRHS2L and FLXAnFRWRHS2H can be read or written in 16-bit units. FLXAnFRWRHS2LL, FLXAnFRWRHS2LH, and FLXAnFRWRHS2HL can be read or written in 8-bit units.
Address:	FLXAnFRWRHS2: <FLXAn_base> + 0504_H, FLXAnFRWRHS2L: <FLXAn_base> + 0504_H, FLXAnFRWRHS2H: <FLXAn_base> + 0506_H, FLXAnFRWRHS2LL: <FLXAn_base> + 0504_H, FLXAnFRWRHS2LH: <FLXAn_base> + 0505_H, FLXAnFRWRHS2HL: <FLXAn_base> + 0506_H
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.83 FLXAnFRWRHS2 Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	PLC[6:0]	Payload Length Configured Bit
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	CRC[10:0]	Header CRC Bit (vRF!Header!HeaderCRC) Receive Buffer: Configuration not required Transmit Buffer: Header CRC is configured

(1) FLXAnFRWRHS2.PLC

Payload Length Configured Bit

Length of data section (number of 2-byte words) as configured by the Host.
During static segment the static frame payload length as configured by FLXAnFRMHDC.SFDL defines the payload length for all static frames. If the payload length configured by FLXAnFRWRHS2.PLC is shorter than this value padding bytes are inserted to ensure that frames have proper physical length. The padding pattern is “0000_H” (see **Section 25.3.9.3, Transmit Buffers**).

(2) FLXAnFRWRHS2.CRC

Header CRC Bit (vRF!Header!HeaderCRC)

Setting of the receive buffer is not required.
Transmitting of the message buffer needs the header CRC calculation and setting.
For calculation of the header CRC the payload length of the frame send on the bus has to be considered. In static segment the payload length of all frames is configured by FLXAnFRMHDC.SFDL.

25.2.10.4 FLXAnFRWRHS3 — FlexRay Write Header Section Register 3

Access: FLXAnFRWRHS3 can be read or written in 32-bit units.
FLXAnFRWRHS3L can be read or written in 16-bit units.
FLXAnFRWRHS3LL and FLXAnFRWRHS3LH can be read or written in 8-bit units.

Address: FLXAnFRWRHS3: <FLXAn_base> + 0508$_{H}$,
FLXAnFRWRHS3L: <FLXAn_base> + 0508$_{H}$,
FLXAnFRWRHS3LL: <FLXAn_base> + 0508$_{H}$, FLXAnFRWRHS3LH: <FLXAn_base> + 0509$_{H}$

Value after reset: 0000 0000$_{H}$

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	DP[10:0]	Data Pointer Bit

(1) FLXAnFRWRHS3.DP

Data Pointer Bit

Configures the pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.

25.2.10.5 FLXAnFRIBCM — FlexRay Input Buffer Command Mask Register

Configures how the message buffer in the Message RAM selected by register FLXAnFRIBCR is updated. When IBF Host and IBF Shadow are swapped, also mask bits FLXAnFRIBCM.LHSH, FLXAnFRIBCM.LDSH, and FLXAnFRIBCM.STXRH are swapped with bits FLXAnFRIBCM.LHSS, FLXAnFRIBCM.LDSS, and FLXAnFRIBCM.STXRS.

Access: FLXAnFRIBCM can be read or written in 32-bit units.
FLXAnFRIBCML can be read or written in 16-bit units.
FLXAnFRIBCMH is a read-only register that can be read in 16-bit units.
FLXAnFRIBCMLL can be read or written in 8-bit units.
FLXAnFRIBCMHL is a read-only register that can be read in 8-bit units.

Address: FLXAnFRIBCM: <FLXAn_base> + 0510_H,
FLXAnFRIBCML: <FLXAn_base> + 0510_H, FLXAnFRIBCMH: <FLXAn_base> + 0512_H,
FLXAnFRIBCMLL: <FLXAn_base> + 0510_H, FLXAnFRIBCMHL: <FLXAn_base> + 0512_H

Value after reset: 0000 0000_H

Table 25.85 FLXAnFRIBCM Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	STXRS	Set Transmission Request Shadow Flag 0: Reset TXR flag 1: Set TXR flag, transmit buffer released for transmission (operation ongoing or finished)
17	LDSS	Load Data Section Shadow Flag 0: Data section is not updated 1: Data section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished)
16	LHSS	Load Header Section Shadow Flag 0: Header section is not updated 1: Header section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished)
15 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	STXRH	Set Transmission Request Host Bit 0: Reset TXR flag 1: Set TXR flag, transmit buffer released for transmission
1	LDSH	Load Data Section Host Bit 0: Data section is not updated 1: Data section selected for transfer from Input Buffer to the Message RAM
0	LHSH	Load Header Section Host Bit 0: Header section is not updated 1: Header section selected for transfer from Input Buffer to the Message RAM

(1) FLXAnFRIBCM.STXRS

Set Transmission Request Shadow Flag

(2) FLXAnFRIBCM.LDSS

Load Data Section Shadow Flag

(3) FLXAnFRIBCM.LHSS

Load Header Section Shadow Flag

(4) FLXAnFRIBCM.STXRH

Set Transmission Request Host Bit

If this bit is set to 1, the TXR flag for the selected message buffer is set in the FLXAnFRTXRQ1/2/3/4 registers to release the message buffer for transmission. In single-shot mode the flag is cleared by the CC after transmission has completed.
TXR is evaluated for transmit buffers only.

(5) FLXAnFRIBCM.LDSH

Set Load Data Section Host Bit

(6) FLXAnFRIBCM.LHSH

Set Load Header Section Host Bit

25.2.10.6 FLXAnFRIBCR — FlexRay Input Buffer Command Request Register

When the Host writes the number of the target message buffer in the Message RAM to FLXAnFRIBCR.IBRH, IBF Host and IBF Shadow are swapped. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS are also swapped (see **Section 25.3.12.2(1), Data Transfer from Input Buffer to Message RAM**).

With this write operation the FLXAnFRIBCR.IBSYS is set to 1. The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by FLXAnFRIBCR.IBRS.

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message into the IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, FLXAnFRIBCR.IBSYS is set back to 0 and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to FLXAnFRIBCR.IBRH.

If a write access to FLXAnFRIBCR.IBRH occurs while FLXAnFRIBCR.IBSYS is 1, FLXAnFRIBCR.IBSYH is set to 1. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, FLXAnFRIBCR.IBSYH is reset to 0.

FLXAnFRIBCR.IBSYS remains set to 1, and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS are also swapped.

Any write access to an Input Buffer register while both FLXAnFRIBCR.IBSYS and FLXAnFRIBCR.IBSYH are set to 1 will cause the error flag FLXAnFREIR.IIBA to be set to 1.

Access: FLXAnFRIBCR can be read or written in 32-bit units.
FLXAnFRIBCRL can be read or written in 16-bit units.
FLXAnFRIBCRH is a read-only register that can be read in 16-bit units.
FLXAnFRIBCRLL can be read or written in 8-bit units.
FLXAnFRIBCRLH, FLXAnFRIBCRHL, and FLXAnFRIBCRHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRIBCR: <FLXAn_base> + 0514_H,
FLXAnFRIBCRL: <FLXAn_base> + 0514_H, FLXAnFRIBCRH: <FLXAn_base> + 0516_H,
FLXAnFRIBCRLL: <FLXAn_base> + 0514_H, FLXAnFRIBCRLH: <FLXAn_base> + 0515_H,
FLXAnFRIBCRHL: <FLXAn_base> + 0516_H, FLXAnFRIBCRHH: <FLXAn_base> + 0517_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.86 FLXAnFRIBCR Register Contents

Bit Position	Bit Name	Function
31	IBSYS	Input Buffer Busy Shadow Flag 0: Transfer between IBF Shadow and Message RAM completed 1: Transfer between IBF Shadow and Message RAM in progress
30 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	IBRS[6:0]	Input Buffer Request Shadow Flag
15	IBSYH	Input Buffer Busy Host Flag 0: No request pending 1: Request while transfer between IBF Shadow and Message RAM in progress
14 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	IBRH[6:0]	Input Buffer Request Host Bit

(1) FLXAnFRIBCR.IBSYS

Input Buffer Busy Shadow Flag

Set to 1 after writing FLXAnFRIBCR.IBRH.
This bit indicates transmitting between the IBF Shadow and the Message RAM is ongoing.
When the transfer between IBF Shadow and the Message RAM has completed, FLXAnFRIBCR.IBSYS is set back to 0.

(2) FLXAnFRIBCR.IBRS

Input Buffer Request Shadow Flag

Number of the target message buffer actually updated/lately updated.

(3) FLXAnFRIBCR.IBSYH

Input Buffer Busy Host Flag

Set to 1 by writing FLXAnFRIBCR.IBRH while FLXAnFRIBCR.IBSYS is still 1.
This bit indicates transmitting between the IBF Shadow and the Message RAM is ongoing.
After the ongoing transfer between IBF Shadow and the Message RAM has completed, the FLXAnFRIBCR.IBSYH is set back to 0.

(4) FLXAnFRIBCR.IBRH

Input Buffer Request Host Bit

Selects the target message buffer in the Message RAM for data transfer from Input Buffer.

25.2.11 Output Buffer

Double buffer structure consisting of Output Buffer Host and Output Buffer Shadow. Used to read out message buffers from the Message RAM. While the Host can read from Output Buffer Host, the Message Handler transfers the selected message buffer from Message RAM to Output Buffer Shadow. The data transfer between Message RAM and Output Buffer (OBF) is described in **Section 25.3.12.2(2), Data Transfer from Message RAM to Output Buffer**.

These registers cannot be written when the output data transfer function shown in **Section 25.3.16.2, Output Data Transfer**, in Output Data Transfer is used and the FLXAnFROTS.OTS bit is 1.

25.2.11.1 FLXAnFRRDDSx — FlexRay Read Data Section Register x (x = 1 to 64)

Holds the data words read from the data section of the addressed message buffer. This register holds the data wards to be transferred to the data section of the specified message buffer. The number of data words (DWn) read from the Message RAM is defined by the payload length configured in FLXAnFRRDHS2.PLC bit.

Access: FLXAnFRRDDSx is a read-only register that can be read in 32-bit units.
FLXAnFRRDDSxL and FLXAnFRRDDSxH are the read-only registers that can be read in 16-bit units.
FLXAnFRRDDSxLL, FLXAnFRRDDSxLH, FLXAnFRRDDSxHL, and FLXAnFRRDDSxHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRRDDSx: <FLXAn_base> + 0600_H + (x – 1) × 4_H,
FLXAnFRRDDSxL: <FLXAn_base> + 0600_H + (x – 1) × 4_H,
FLXAnFRRDDSxH: <FLXAn_base> + 0600_H + (x – 1) × 4_H + 2_H,
FLXAnFRRDDSxLL: <FLXAn_base> + 0600_H + (x – 1) × 4_H,
FLXAnFRRDDSxLH: <FLXAn_base> + 0600_H + (x – 1) × 4_H + 1_H,
FLXAnFRRDDSxHL: <FLXAn_base> + 0600_H + (x – 1) × 4_H + 2_H,
FLXAnFRRDDSxHH: <FLXAn_base> + 0600_H + (x – 1) × 4_H + 3_H,

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.87 FLXAnFRRDDSx Register Contents

Bit Position	Bit Name	Function
31 to 0	MD[31:0]	Message Data

(1) FLXAnFRRDDSx.MD

Message Data Flag

For information about the byte alignment of the data words in this register see **Section 25.3.17, Byte Alignment**.

CAUTION

In case FLXAnFRWRHS2.PLC specifies an odd payload length, the remaining message data bytes are unused.
Reset by the CHI command CLEAR_RAMS.

25.2.11.2 FLXAnFRRDHS1 — FlexRay Read Header Section Register 1

Access: FLXAnFRRDHS1 is a read-only register that can be read in 32-bit units.
FLXAnFRRDHS1L and FLXAnFRRDHS1H are the read-only registers that can be read in 16-bit units.
FLXAnFRRDHS1LL, FLXAnFRRDHS1LH, FLXAnFRRDHS1HL, and FLXAnFRRDHS1HH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRRDHS1: <FLXAn_base> + 0700_H,
FLXAnFRRDHS1L: <FLXAn_base> + 0700_H, FLXAnFRRDHS1H: <FLXAn_base> + 0702_H,
FLXAnFRRDHS1LL: <FLXAn_base> + 0700_H, FLXAnFRRDHS1LH: <FLXAn_base> + 0701_H,
FLXAnFRRDHS1HL: <FLXAn_base> + 0702_H, FLXAnFRRDHS1HH: <FLXAn_base> + 0703_H

Value after reset: 0000 0000_H

Table 25.88 FLXAnFRRDHS1 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned.
29	MBI	Message Buffer Interrupt Flag
28	TXM	Transmission Mode Flag
27	PPIT	Payload Preamble Indicator Transmit Flag
26	CFG	Message Buffer Direction Configuration Flag
25, 24	CH[1:0]	Channel Filter Control Flag
23	Reserved	When read, the value after reset is returned.
22 to 16	CYC[6:0]	Cycle Code
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	FID[10:0]	Frame ID

(1) FLXAnFRRDHS1.MBI

Message Buffer Interrupt Flag

Values as configured by the Host via FLXAnFRWRHS1.MBI.
In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

(2) FLXAnFRRDHS1.TXM

Transmission Mode Flag

Values as configured by the Host via FLXAnFRWRHS1.TXM.
In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

(3) FLXAnFRRDHS1.PPIT

Payload Preamble Indicator Transmit Flag

Values as configured by the Host via FLXAnFRWRHS1.PPIT.
In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

(4) FLXAnFRRDHS1.CFG

Message Buffer Direction Configuration Flag

Values as configured by the Host via FLXAnFRWRHS1.CFG.
In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

(5) FLXAnFRRDHS1.CH

Channel Filter Control Flag

Values as configured by the Host via FLXAnFRWRHS1.CH.
In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to 0.

(6) FLXAnFRRDHS1.CYC

Cycle Code

Values as configured by the Host via FLXAnFRWRHS1.CYC.
In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to 0.

(7) FLXAnFRRDHS1.FID

Frame ID

Values as configured by the Host via FLXAnFRWRHS1.FID
In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are holding the received frame ID.

25.2.11.3 FLXAnFRRDHS2 — FlexRay Read Header Section Register 2

CAUTION

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRRDHS2 is updated from data frames only.

Access: FLXAnFRRDHS2 is a read-only register that can be read in 32-bit units.
FLXAnFRRDHS2L and FLXAnFRRDHS2H are the read-only registers that can be read in 16-bit units.
FLXAnFRRDHS2LL, FLXAnFRRDHS2LH, FLXAnFRRDHS2HL, and FLXAnFRRDHS2HH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRRDHS2: <FLXAn_base> + 0704$_H$,
FLXAnFRRDHS2L: <FLXAn_base> + 0704$_H$, FLXAnFRRDHS2H: <FLXAn_base> + 0706$_H$,
FLXAnFRRDHS2LL: <FLXAn_base> + 0704$_H$, FLXAnFRRDHS2LH: <FLXAn_base> + 0705$_H$,
FLXAnFRRDHS2HL: <FLXAn_base> + 0706$_H$, FLXAnFRRDHS2HH: <FLXAn_base> + 0707$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	PLR[6:0]							—	PLC[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	CRC[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.89 FLXAnFRRDHS2 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned.
30 to 24	PLR[6:0]	Payload Length Received Flag (vRF!Header!Length)
23	Reserved	When read, the value after reset is returned.
22 to 16	PLC[6:0]	Payload Length Configured Flag
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	CRC[10:0]	Header CRC Flag (vRF!Header!HeaderCRC)

(1) FLXAnFRRDHS2.PLR

Payload Length Received Flag (vRF!Header!Length)

Payload length (vRF!Header!Length) value updated from received data frames (exception: if message buffer belongs to the receive FIFO FLXAnFRRDSH2.PLR is also updated from received null frames).

(2) FLXAnFRRDHS2.PLC

Payload Length Configured Flag

Length of data section (number of 2-byte words) as configured by the Host.

(3) FLXAnFRRDHS2.CRC

Header CRC Flag (vRF!Header!HeaderCRC)

Receive Buffer: Header CRC (vRF!Header!HeaderCRC) updated from received data frames
Transmit Buffer: Header CRC configured by the Host

(4) Data Storage

When a message is stored into a message buffer the following behavior with respect to payload length received and payload length configured is implemented:

- FLXAnFRRDHS2.PLR > FLXAnFRRDHS2.PLC:
  The payload data stored in the message buffer is truncated to the payload length configured if FLXAnFRRDHS2.PLC even or else truncated to FLXAnFRRDHS2.PLC + 1.
- FLXAnFRRDHS2.PLR ≤ FLXAnFRRDHS2.PLC:
  The received payload data is stored into the message buffers data section. The remaining data bytes of the data section as configured by FLXAnFRRDHS2.PLC are filled with undefined data.
- FLXAnFRRDHS2.PLR = zero:
  The message buffer’s data section is filled with undefined data
- FLXAnFRRDHS2.PLC = zero:
  Message buffer has no data section configured. No data is stored into the message buffer’s data section.

CAUTIONS

1. The Message RAM is organized in 4-byte words. When received data is stored into a message buffer’s data section, the number of 2-byte data words written into the message buffer is FLXAnFRRDHS2.PLC rounded to the next even value.
2. FLXAnFRRDHS2.PLC should be configured identical for all message buffers belonging to the receive FIFO. Header 2 is updated from data frames only.
   For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRRDHS2 is updated from data frames only.

25.2.11.4 FLXAnFRRDHS3 — FlexRay Read Header Section Register 3

CAUTION

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRRDHS3 is updated from data frames only.

Access:	FLXAnFRRDHS3 is a read-only register that can be read in 32-bit units. FLXAnFRRDHS3L and FLXAnFRRDHS3H are the read-only registers that can be read in 16-bit units. FLXAnFRRDHS3LL, FLXAnFRRDHS3LH, FLXAnFRRDHS3HL, and FLXAnFRRDHS3HH are the read-only registers that can be read in 8-bit units.
Address:	FLXAnFRRDHS3: <FLXAn_base> + 0708$_H$, FLXAnFRRDHS3L: <FLXAn_base> + 0708$_H$, FLXAnFRRDHS3H: <FLXAn_base> + 070A$_H$, FLXAnFRRDHS3LL: <FLXAn_base> + 0708$_H$, FLXAnFRRDHS3LH: <FLXAn_base> + 0709$_H$, FLXAnFRRDHS3HL: <FLXAn_base> + 070A$_H$, FLXAnFRRDHS3HH: <FLXAn_base> + 070B$_H$
Value after reset:	0000 0000$_H$

Table 25.90 FLXAnFRRDHS3 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned.
29	RES	Reserved Bit Indicator Flag (vRF!Header!Reserved)
28	PPI	Payload Preamble Indicator (vRF!Header!PPIndicator)
27	NFI	Null Frame Indicator Flag (vRF!Header!NFIndicator) 0: Up to now no data frame has been stored into the respective message buffer 1: At least one data frame has been stored into the respective message buffer
26	SYN	Sync Frame Indicator Flag (vRF!Header!SyFIndicator) 0: The received frame is not a sync frame 1: The received frame is a sync frame
25	SFI	Startup Frame Indicator Flag (vRF!Header!SuFIndicator) 0: The received frame is not a startup frame 1: The received frame is a startup frame
24	RCI	Received on Channel Indicator Flag (vSS!Channel) 0: Frame received on channel B 1: Frame received on channel A
23, 22	Reserved	When read, the value after reset is returned.
21 to 16	RCC[5:0]	Receive Cycle Counter (vRF!Header!CycleCount)
15 to 11	Reserved	When read, the value after reset is returned.
10 to 0	DP[10:0]	Data Pointer Flag

(1) FLXAnFRRDHS3.RES

Reserved Bit Flag (vRF!Header!Reserved)

Reflects the state of the received reserved bit. The reserved bit is transmitted as 0.

(2) FLXAnFRRDHS3.PPI

Payload Preamble Indicator Flag (vRF!Header!PPIndicator)

The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.

- 0 = The payload segment of the received frame does not contain a network management vector nor a message ID
- 1 = Static segment: Network management vector in the first part of the payload
  Dynamic segment: Message ID in the first part of the payload

(3) FLXAnFRRDHS3.NFI

Null Frame Indicator Flag (vRF!Header!NFIndicator)

Is set to 1 after storage of the first received data frame.

(4) FLXAnFRRDHS3.SYN

Sync Frame Indicator Flag (vRF!Header!SyFIndicator)

A sync frame is marked by the sync frame indicator.

(5) FLXAnFRRDHS3.SFI

Startup Frame Indicator Flag (vRF!Header!SuFIndicator)

A startup frame is marked by the startup frame indicator.

(6) FLXAnFRRDHS3.RCI

Received on Channel Indicator Flag (vSS!Channel)

Indicates the channel from which the received data frame was taken to update the respective receive buffer.

(7) FLXAnFRRDHS3.RCC

Receive Cycle Counter (vRF!Header!CycleCount)

Cycle counter value updated from received data frame.

(8) FLXAnFRRDHS3.DP

Data Pointer Flag

Pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.
The bit value is the same as that set in the FLXAnFRWRHS3.DP bit.

25.2.11.5 FLXAnFRMBS — FlexRay Message Buffer Status Register

The message buffer status is updated by the CC with respect to the assigned channel(s) latest at the end of the slot following the slot assigned to the message buffer.

The flags are updated only when the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.

If only one channel (A or B) is assigned to a message buffer, the channel-specific status flags of the other channel are written to zero. If both channels are assigned to a message buffer, the channel- specific status flags of both channels are updated.

The message buffer status is updated only when the slot counter reached the configured frame ID and when the cycle counter filter matched. When the Host updates a message buffer via Input Buffer, all FLXAnFRMBS flags are reset to zero independent of which FLXAnFRIBCM bits are set or not.

For details about receive/transmit filtering see **Section 25.3.8, Filtering and Masking**, **Section 25.3.9, Transmit Process** and **Section 25.3.10, Receive Process**.

Whenever the Message Handler changes one of the flags FLXAnFRMBS.VFRA, FLXAnFRMBS.VFRB, FLXAnFRMBS.SEOA, FLXAnFRMBS.SEOB, FLXAnFRMBS.CEOA, FLXAnFRMBS.CEOB, FLXAnFRMBS.SVOA, FLXAnFRMBS.SVOB, FLXAnFRMBS.TCIA, FLXAnFRMBS.TCIB, FLXAnFRMBS.ESA, FLXAnFRMBS.ESB, FLXAnFRMBS.MLST, FLXAnFRMBS.FTA, FLXAnFRMBS.FTB the respective message buffer’s MBC flag in registers FLXAnFRMBSC1/2/3/4 is set.

Access: FLXAnFRMBS is a read-only register that can be read in 32-bit units.
FLXAnFRMBSL and FLXAnFRMBSH are the read-only registers that can be read in 16-bit units.
FLXAnFRMBSLL, FLXAnFRMBSLH, FLXAnFRMBSHL, and FLXAnFRMBSHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRMBS: <FLXAn_base> + 070C$_H$,
FLXAnFRMBSL: <FLXAn_base> + 070C$_H$, FLXAnFRMBSH: <FLXAn_base> + 070E$_H$,
FLXAnFRMBSLL: <FLXAn_base> + 070C$_H$, FLXAnFRMBSLH: <FLXAn_base> + 070D$_H$,
FLXAnFRMBSHL: <FLXAn_base> + 070E$_H$, FLXAnFRMBSHH: <FLXAn_base> + 070F$_H$

Value after reset: 0000 0000$_H$

31, 30	Reserved	When read, the value after reset is returned.
29	RESS	Reserved Bit Status Flag (vRF!Header!Reserved)
28	PPIS	Payload Preamble Indicator Status Flag (vRF!Header!PPIndicator) 0: PPI indicator set to 0 1: PPI indicator set to 1

Table 25.91 FLXAnFRMBS Register Contents

Bit Position	Bit Name	Function
27	NFIS	Null Frame Indicator Status Flag (vRF!Header!NFIndicator) 0: Received frame is a null frame 1: Received frame is not a null frame
26	SYNS	Sync Frame Indicator Status Flag (vRF!Header!SyFIndicator) 0: No sync frame received 1: The received frame is a sync frame
25	SFIS	Startup Frame Indicator Status Flag (vRF!Header!SuFIndicator) 0: No startup frame received 1: The received frame is a startup frame
24	RCIS	Received on Channel Indicator Status Flag (vSS!Channel) 0: Frame received on channel B 1: Frame received on channel A
23, 22	Reserved	When read, the value after reset is returned.
21 to 16	CCS[5:0]	Cycle Count Status Flag
15	FTB	Frame Transmitted on Channel B Flag 0: No data frame transmitted on channel B 1: Data frame transmitted on channel B
14	FTA	Frame Transmitted on Channel A Flag 0: No data frame transmitted on channel A 1: Data frame transmitted on channel A
13	Reserved	When read, the value after reset is returned.
12	MLST	Message Lost Flag 0: No message lost 1: Unprocessed message was overwritten
11	ESB	Empty Slot Channel B Flag 0: Bus activity detected in the assigned slot on channel B 1: No bus activity detected in the assigned slot on channel B
10	ESA	Empty Slot Channel A Flag 0: Bus activity detected in the assigned slot on channel A 1: No bus activity detected in the assigned slot on channel A
9	TCIB	Transmission Conflict Indication Channel B Flag (vSS!TxConflictB) 0: No transmission conflict occurred on channel B 1: Transmission conflict occurred on channel B
8	TCIA	Transmission Conflict Indication Channel A Flag (vSS!TxConflictA) 0: No transmission conflict occurred on channel A 1: Transmission conflict occurred on channel A
7	SVOB	Slot Boundary Violation Observed on Channel B Flag (vSS!BViolationB) 0: No slot boundary violation observed on channel B 1: Slot boundary violation observed on channel B
6	SVOA	Slot Boundary Violation Observed on Channel A Flag (vSS!BViolationA) 0: No slot boundary violation observed on channel A 1: Slot boundary violation observed on channel A
5	CEOB	Content Error Observed on Channel B Flag (vSS!ContentErrorB) 0: No content error observed on channel B 1: Content error observed on channel B
4	CEOA	Content Error Observed on Channel A Flag (vSS!ContentErrorA) 0: No content error observed on channel A 1: Content error observed on channel A
3	SEOB	Syntax Error Observed on Channel B Flag (vSS!SyntaxErrorB) 0: No syntax error observed on channel B 1: Syntax error observed on channel B

Table 25.91 FLXAnFRMBS Register Contents

Bit Position	Bit Name	Function
2	SEOA	Syntax Error Observed on Channel A Flag (vSS!SyntaxErrorA) 0: No syntax error observed on channel A 1: Syntax error observed on channel A
1	VFRB	Valid Frame Received on Channel B (vSS!ValidFrameB) 0: No valid frame received on channel B 1: Valid frame received on channel B
0	VFRA	Valid Frame Received on Channel A Flag (vSS!ValidFrameA) 0: No valid frame received on channel A 1: Valid frame received on channel A

(1) FLXAnFRMBS.RESS

Reserved Bit Status Flag (vRF!Header!Reserved)

Reflects the state of the received reserved bit.
The reserved bit is transmitted as 0.
For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(2) FLXAnFRMBS.PPIS

Payload Preamble Indicator Status Flag (vRF!Header!PPIndicator)

The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.
For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

- 0 = PPI indicator set to 0
  The payload segment of the received frame does not contain a network management vector or a message ID
- 1 = PPI indicator set to 1
  Static segment: Network management vector at the beginning of the payload
  Dynamic segment: Message ID at the beginning of the payload

(3) FLXAnFRMBS.NFIS

Null Frame Indicator Status Flag (vRF!Header!NFIndicator)

If set to 0 the payload segment of the received frame contains no usable data.
For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(4) FLXAnFRMBS.SYNS

Sync Frame Indicator Status Flag (vRF!Header!SyFIndicator)

A sync frame is marked by the sync frame indicator.
For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(5) FLXAnFRMBS.SFIS

Startup Frame Indicator Status Flag (vRF!Header!SuFIndicator)

The startup frame indicator specifies a startup frame.
For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(6) FLXAnFRMBS.RCIS

Received on Channel Indicator Status Flag (vSS!Channel)

Indicates the channel on which the frame was received.
For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(7) FLXAnFRMBS.CCS

Cycle Count Status Flag

Actual cycle count when status was updated.

(8) FLXAnFRMBS.FTB

Frame Transmitted on Channel B Flag

Indicates that this node has transmitted a data frame in the configured slot on channel B.

CAUTION

The FlexRay protocol specification requires that FLXAnFRMBS.FTB can only be reset by the Host.
Therefore the Cycle Count Status FLXAnFRMBS.CCS for this bit is only valid for the cycle where the bit is set to 1.

---

(9) FLXAnFRMBS.FTA

Frame Transmitted on Channel A Flag

Indicates that this node has transmitted a data frame in the configured slot on channel A.

CAUTION

The FlexRay protocol specification requires that FLXAnFRMBS.FTA can only be reset by the Host.
Therefore the Cycle Count Status FLXAnFRMBS.CCS for this bit is only valid for the cycle where this bit is set to 1.

---

(10) FLXAnFRMBS.MLST

Message Lost Flag

The flag is set in case the Host did not read the message before the message buffer was updated from a received data frame.
Not affected by reception of null frames except for message buffers belonging to the receive FIFO. The flag is reset to 0 by a Host write to the message buffer via IBF or when a new message is stored into the message buffer after the message buffers ND flag was reset to 0 by reading out the message buffer via OBF.

(11) FLXAnFRMBS.ESB

Empty Slot Channel B Flag

In an empty slot, there is no activity on the bus. This means that any frame transmission is not detected. This state can be checked in static and dynamic slots.

(12) FLXAnFRMBS.ESA

Empty Slot Channel A Flag

In an empty slot, there is no activity on the bus. This means that any frame transmission is not detected. This state can be checked in static and dynamic slots.

(13) FLXAnFRMBS.TCIB

Transmission Conflict Indication Channel B Flag (vSS!TxConflictB)

A transmission conflict indication is set to 1 if a transmission conflict has occurred on channel B.

(14) FLXAnFRMBS.TCIA

Transmission Conflict Indication Channel A Flag (vSS!TxConflictA)

A transmission conflict indication is set if a transmission conflict has occurred on channel A.

(15) FLXAnFRMBS.SVOB

Slot Boundary Violation Observed on Channel B Flag (vSS!BViolationB)

A slot boundary violation (channel active at the start or at the end of the assigned slot) was observed on the slot assigned to channel B.

(16) FLXAnFRMBS.SVOA

Slot Boundary Violation Observed on Channel A Flag (vSS!BViolationA)

A slot boundary violation (channel active at the start or at the end of the assigned slot) was observed on the slot assigned to channel A.

(17) FLXAnFRMBS.CEOB

Content Error Observed on Channel B Flag (vSS!ContentErrorB)

A content error was observed in the slot assigned to channel B.

(18) FLXAnFRMBS.CEOA

Content Error Observed on Channel A Flag (vSS!ContentErrorA)

A content error was observed in the slot assigned to channel A.

(19) FLXAnFRMBS.SEOB

Syntax Error Observed on Channel B Flag (vSS!SyntaxErrorB)

A syntax error was observed in the assigned slot on channel B.

(20) FLXAnFRMBS.SEOA

Syntax Error Observed on Channel A Flag (vSS!SyntaxErrorA)

A syntax error was observed in the assigned slot on channel A.

(21) FLXAnFRMBS.VFRB

Valid Frame Received on Channel B Flag (vSS!ValidFrameB)

A valid frame indication is set if a valid frame was received on channel B.

(22) FLXAnFRMBS.VFRA

Valid Frame Received on Channel A Flag (vSS!ValidFrameA)

A valid frame indication is set if a valid frame was received on channel A.

25.2.11.6 FLXAnFROBCM — FlexRay Output Buffer Command Mask Register

Configures how the Output Buffer is updated from the message buffer in the Message RAM selected by FLXAnFROBCR.OBRS.

Mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to the register internal storage when a Message RAM transfer is requested by FLXAnFROBCR.REQ.

When OBF Host and OBF Shadow are swapped, mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the register internal storage to keep them attached to the respective Output Buffer transfer.

The data transfer between Output Buffer and Message RAM is described in detail in **Section 25.3.12.2(2), Data Transfer from Message RAM to Output Buffer**.

CAUTION

After the transfer of the header section from the Message RAM to OBF Shadow has completed, the message buffer status changed flag MBC of the selected message buffer in the FLXAnFRMBSC1/2/3/4 registers is cleared. After the transfer of the data section from the Message RAM to OBF Shadow has completed, the new data flag ND of the selected message buffer in the FLXAnFRNDAT1/2/3/4 registers is cleared.

Access: FLXAnFROBCM can be read or written in 32-bit units.
FLXAnFROBCML can be read or written in 16-bit units.
FLXAnFROBCMH is a read-only register that can be read in 16-bit units.
FLXAnFROBCMLL can be read or written in 8-bit units.
FLXAnFROBCMHL is a read-only register that can be read in 8-bit units.

Address: FLXAnFROBCM: <FLXAn_base> + 0710$_H$,
FLXAnFROBCML: <FLXAn_base> + 0710$_H$, FLXAnFROBCMH: <FLXAn_base> + 0712$_H$,
FLXAnFROBCMLL: <FLXAn_base> + 0710$_H$, FLXAnFROBCMHL: <FLXAn_base> + 0712$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDSH	RHSH

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 25.92 FLXAnFROBCM Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17	RDSH	Read Data Section Host Flag 0: Data section is not read 1: Data section selected for transfer from Message RAM to Output Buffer
16	RHSH	Read Header Section Host Flag 0: Header section is not read 1: Header section selected for transfer from Message RAM to Output Buffer
15 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 25.92 FLXAnFROBCM Register Contents

Bit Position	Bit Name	Function
1	RDSS	Read Data Section Shadow Bit 0: Data section is not read 1: Data section selected for transfer from Message RAM to Output Buffer
0	RHSS	Read Header Section Shadow Bit 0: Header section is not read 1: Header section selected for transfer from Message RAM to Output Buffer

(1) FLXAnFROBCM.RDSH

Read Data Section Host Flag

(2) FLXAnFROBCM.RHSH

Read Header Section Host Flag

(3) FLXAnFROBCM.RDSS

Read Data Section Shadow Bit

(4) FLXAnFROBCM.RHSS

Read Header Section Shadow Bit

25.2.11.7 FLXAnFROBCR — FlexRay Output Buffer Command Request Register

After setting bit FLXAnFROBCR.REQ to 1 while FLXAnFROBCR.OBSYS is 0, FLXAnFROBCR.OBSYS is automatically set to 1, FLXAnFROBCR.OBRS is copied to the register internal storage, mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to register FLXAnFROBCM internal storage, and the transfer of the message buffer selected by FLXAnFROBCR.OBRS from the Message RAM to OBF Shadow is started. When the transfer between the Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCM.OBSYS back to 0.

By setting bit FLXAnFROBCR.VIEW to 1 while FLXAnFROBCR.OBSYS is 0, OBF Host and OBF Shadow are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the register FLXAnFROBCM internal storage to keep them attached to the respective Output Buffer transfer. FLXAnFROBCR.OBRH signals the number of the message buffer currently accessible by the Host.

If bits FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW are set to 1 with the same write access while FLXAnFROBCR.OBSYS is 0, FLXAnFROBCR.OBSYS is automatically set to 1 and OBF Shadow and OBF Host are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the registers internal storage to keep them attached to the respective Output Buffer transfer. Afterwards FLXAnFROBCR.OBRS is copied to the register internal storage, and the transfer of the selected message buffer from the Message RAM to OBF Shadow is started. While the transfer is ongoing the Host can read the message buffer transferred by the previous transfer from OBF Host. When the current transfer between Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCR.OBSYS back to 0.

Any write access to FLXAnFROBCR[15:8] while FLXAnFROBCR.OBSYS is set to 1 will cause the error flag FLXAnFREIR.IOBA to be set to 1. n this case, this write access has no effect and the Output Buffer will not be changed.

The data transfer between Output Buffer and Message RAM is described in detail in **Section 25.3.12.2(2), Data Transfer from Message RAM to Output Buffer**.

Access:	FLXAnFROBCR can be read or written in 32-bit units. FLXAnFROBCRL can be read or written in 16-bit units. FLXAnFROBCRH is a read-only register that can be read in 16-bit units. FLXAnFROBCRLL and FLXAnFROBCRLH can be read or written in 8-bit units. FLXAnFROBCRHL is a read-only register that can be read in 8-bit units.
Address:	FLXAnFROBCR: <FLXAn_base> + 0714$_H$, FLXAnFROBCRL: <FLXAn_base> + 0714$_H$, FLXAnFROBCRH: <FLXAn_base> + 0716$_H$, FLXAnFROBCRLL: <FLXAn_base> + 0714$_H$, FLXAnFROBCRLH: <FLXAn_base> + 0715$_H$, FLXAnFROBCRHL: <FLXAn_base> + 0716$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	OBRH[6:0]

Table 25.93 FLXAnFROBCR Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	OBRH[6:0]	Output Buffer Request Host Flag
15	OBSYS	Output Buffer Busy Shadow Flag 0: No transfer in progress 1: Transfer between Message RAM and OBF Shadow in progress
14 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	REQ	Request Message RAM Transfer Bit 0: No request 1: Transfer to OBF Shadow requested
8	VIEW	View Shadow Buffer Bit 0: No action 1: Swap OBF Shadow and OBF Host
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	OBRS[6:0]	Output Buffer Request Shadow Bit

(1) FLXAnFROBCR.OBRH

Output Buffer Request Host Flag

Number of message buffer currently accessible by the Host via FLXAnFRRDHS1 to FLXAnFRRDHS3, FLXAnFRMBS, and FLXAnFRRDDS1 to FLXAnFRRDDS64.
By writing FLXAnFROBCR.VIEW to 1 OBF Shadow and OBF Host are swapped and the transferred message buffer is accessible by the Host.

(2) FLXAnFROBCR.OBSYS

Output Buffer Busy Shadow Flag

Set to 1 after setting bit FLXAnFROBCR.REQ. When the transfer between the Message RAM and OBF Shadow has completed, FLXAnFROBCR.OBSYS is set back to 0.

(3) FLXAnFROBCR.REQ

Request Message RAM Transfer Bit

Only writeable while FLXAnFROBCR.OBSYS = 0.
Requests transfer of message buffer addressed by FLXAnFROBCR.OBRS from Message RAM to OBF Shadow.

(4) FLXAnFROBCR.VIEW

View Shadow Buffer Bit

Only writeable while FLXAnFROBCR.OBSYS = 0.
Toggles between OBF Shadow and OBF Host.

(5) FLXAnFROBCR.OBRS

Output Buffer Request Shadow Bit

Only writeable while FLXAnFROBCR.OBSYS = 0.
Number of source message buffer to be transferred from the Message RAM to OBF Shadow.
If the number of the first message buffer of the receive FIFO is written to this register the Message Handler transfers the message buffer addressed by the GET Index (GIDX, see **Section 25.3.11, FIFO Function**) to OBF Shadow.

25.2.12 Data Transfer Control Register

25.2.12.1 FLXAnFRITC — FlexRay Input Transfer Configuration Register

Access: FLXAnFRITC can be read or written in 32-bit units.
FLXAnFRITCL and FLXAnFRITCH can be read or written in 16-bit units.
FLXAnFRITCLL, FLXAnFRITCLH, and FLXAnFRITCHL can be read or written in 8-bit units.

Address: FLXAnFRITC: <FLXAn_base> + 0800_H,
FLXAnFRITCL: <FLXAn_base> + 0800_H, FLXAnFRITCH: <FLXAn_base> + 0802_H,
FLXAnFRITCLL: <FLXAn_base> + 0800_H, FLXAnFRITCLH: <FLXAn_base> + 0801_H,
FLXAnFRITCHL: <FLXAn_base> + 0802_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	ITM[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IQEIE	IQFIE	—	—	—	—	—	—	IQHR	ITE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Table 25.94 FLXAnFRITC Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	ITM[6:0]	Input queue Table Max Bit These bits configure the number of entries in the input pointer table the input buffer handler is capable to maintain in the input queue.
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	IQEIE	Input Queue Empty Interrupt Enable Bit 0: Disabled 1: Enabled
8	IQFIE	Input Queue Full Interrupt Enable Bit 0: Disabled 1: Enabled
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	IQHR	Input Queue Halt Request Bit 0: Input queue run request 1: Input queue halt request
0	ITE	Input Transfer Enable Bit 0: Operation Disable request 1: Operation Enable request

(1) FLXAnFRITC.ITM

Input queue Table Max Bit

The user can only write to this bit when FLXAnFRITS.ITS is 0.
These bits configure the number of entries in the input pointer table the input buffer handler is capable to maintain in the input queue.
Valid values are 00_H (1 queue entry) to $7F_H$ (128 queue entries).
Note that each entry requires two long words in the input pointer table.

(2) FLXAnFRITC.IQEIE

Input Queue Empty Interrupt Enable Bit

This bit controls the input queue empty interrupt.

- 0: Disabled
  No interrupt will be requested and the input queue empty interrupt line will be released.
- 1: Enabled
  Input queue empty interrupt will be asserted when FLXAnFRITS.IQEIS is 1.

(3) FLXAnFRITC.IQFIE

Input Queue Full Interrupt Enable Bit

This bit controls the input queue full interrupt.

- 0: Disabled
  No interrupt will be requested and the input queue full interrupt line will be released.
- 1: Enabled
  Input queue full interrupt will be asserted when FLXAnFRITS.IQFIS is 1.

(4) FLXAnFRITC.IQHR

Input Queue Halt Request Bit

The IQHR bit should not be set to 1 when FLXAnFRITS.ITS is 0.
This bit requests a halt of the input queue.
The status of the halt request is shown in the FLXAnFRITS.IQH register.
Refer to **Section 25.3.16.1(5), Halting the Input Queue** about usage of this bit.

- 0: Input queue run request
  The input queue resumes their operation.
- 1: Input queue halt request
  The input queue gets halted. An active input transfer will be completed but no further transfer request will start.

(5) FLXAnFRITC.ITE

Input Transfer Enable Bit

The user should only set this bit to 1 when FLXAnFRIBCR.IBSYS is 0.
The user should only set this bit to 0 when FLXAnFRITC.IQHR 0. Otherwise committed input transfers get lost.
This bit controls the operation mode of the input transfer queue.
The operation status of the input transfer queue function is shown in FLXAnFRITS.ITS.
Refer to **Section 25.3.16.1(1), Activation and Deactivation** about usage of this bit.

- 0: Operation Disable request
  The input transfer queue gets disabled when it becomes empty.
- 1: Operation Enable request
  The input transfer queue gets enabled. Input data structures are transferred to the FlexRay internal message RAM.

25.2.12.2 FLXAnFROTC — FlexRay Output Transfer Configuration Register

Access: FLXAnFROTC can be read or written in 32-bit units.
FLXAnFROTCL and FLXAnFROTCH can be read or written in 16-bit units.
FLXAnFROTCLL, FLXAnFROTCLH, and FLXAnFROTCHL can be read or written in 8-bit units.

Address: FLXAnFROTC: <FLXAn_base> + 0804_H,
FLXAnFROTCL: <FLXAn_base> + 0804_H, FLXAnFROTCH: <FLXAn_base> + 0806_H
FLXAnFROTCLL: <FLXAn_base> + 0804_H, FLXAnFROTCLH: <FLXAn_base> + 0805_H,
FLXAnFROTCHL: <FLXAn_base> + 0806_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Table 25.95 FLXAnFROTC Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 16	FTM[4:0]	FIFO Table Max Bit Configures the number of FIFO entries the output transfer handler is capable to maintain in the local RAM/global RAM.
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	FWIE	FIFO transfer Warning Interrupt Enable Bit 0: Disabled 1: Enabled
10	OWIE	Output transfer Warning Interrupt Enable Bit 0: Disabled 1: Enabled
9	FIE	FIFO transfer Interrupt Enable Bit 0: Disabled 1: Enabled
8	OIE	Output transfer Interrupt Enable Bit 0: Disabled 1: Enabled
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OTCS	Output Transfer Condition Select Bit 0: New data only mode 1: New data and status changed mode
0	OTE	Output Transfer Enable Bit 0: Operation Disable request 1: Operation Enable request

(1) FLXAnFROTC.FTM

FIFO Table Max Bit

The user can only write to these bits when FLXAnFROTS.OTS is 0.
Configures the number of FIFO entries the output transfer handler is capable to maintain in the local RAM/global RAM.
Valid values are 00_H (1 FIFO entry) to $1F_H$ (32 FIFO entries).

(2) FLXAnFROTC.FWIE

FIFO transfer Warning Interrupt Enable Bit

This bit controls the FIFO transfer warning interrupt.

- 0: Disabled
  No interrupt will be requested and the FIFO transfer warning interrupt line will be released.
- 1: Enabled
  FIFO transfer warning interrupt will be asserted when FLXAnFROTS.FWIS is 1.

(3) FLXAnFROTC.OWIE

Output transfer Warning Interrupt Enable Bit

This bit controls the output transfer warning interrupt.

- 0: Disabled
  No interrupt will be requested and the output transfer warning interrupt line will be released.
- 1: Enabled
  Output transfer warning interrupt will be asserted when FLXAnFROTS.OWIS is 1.

(4) FLXAnFROTC.FIE

FIFO transfer Interrupt Enable Bit

This bit controls the FIFO transfer interrupt.

- 0: Disabled
  No interrupt will be requested and the FIFO transfer interrupt line will be released.
- 1: Enabled
  FIFO transfer interrupt will be asserted when FLXAnFROTS.FIS is 1.

(5) FLXAnFROTC.OIE

Output transfer Interrupt Enable Bit

This bit controls the output transfer interrupt.

- 0: Disabled
  No interrupt will be requested and the output transfer interrupt line will be released.
- 1: Enabled
  Output transfer interrupt will be asserted when FLXAnFROTS.OTIS is 1.

(6) FLXAnFROTC.OTCS

Output Transfer Condition Select Bit

The user can only write to this bit when FLXAnFROTS.OTS is 0. This bit controls the output transfer condition.

- 0: New data only mode
  The ND bits in the FLXAnFRNDATi registers are used to detect a transfer condition for dedicated receive buffer
- 1: New data and status changed mode
  The ND bits in the FLXAnFRNDATi registers and the MBC bits in the FLXAnFRMBSCi register are used to detect a transfer condition for dedicated transmit and receive buffer

(7) FLXAnFROTC.OTE

Output Transfer Enable Bit

The user should only set this bit to 1 when FLXAnFROBCR.OBSYS is 0.
This bit controls the operation mode of the output transfer function.
The operation status of the output buffer transfer function is shown in FLXAnFROTS.OTS.
Refer to **Section 25.3.16.2(2), Output Transfer Data Structure** about usage of this bit.

- 0: Operation Disable request
  The output buffer transfer gets disabled.
  An active message buffer transfer will be completed but no further transfer will start.
- 1: Operation Enable request
  The output buffer transfer gets enabled. Message buffers are transferred from the FlexRay internal message RAM to output data structures.

The user cannot change the E-Ray message RAM configuration by writing to the FLXAnFRMRC register.

25.2.12.3 FLXAnFRIBA — FlexRay Input Pointer Table Base Address Register

Access:	FLXAnFRIBA can be read or written in 32-bit units. FLXAnFRIBAL and FLXAnFRIBAH can be read or written in 16-bit units. FLXAnFRIBALL, FLXAnFRIBALH, FLXAnFRIBAHL, and FLXAnFRIBAHH can be read or written in 8-bit units.
Address:	FLXAnFRIBA: <FLXAn_base> + 0808_H, FLXAnFRIBAL: <FLXAn_base> + 0808_H, FLXAnFRIBAH: <FLXAn_base> + $080A_H$, FLXAnFRIBALL: <FLXAn_base> + 0808_H, FLXAnFRIBALH: <FLXAn_base> + 0809_H, FLXAnFRIBAHL: <FLXAn_base> + $080A_H$, FLXAnFRIBAHH: <FLXAn_base> + $080B_H$
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.96 FLXAnFRIBA Register Contents

Bit Position	Bit Name	Function
31 to 0	ITA[31:0]	Input Table Address Bit These bits configure the base address of the input pointer table.

(1) FLXAnFRIBA.ITA

Input Table Address Bit

The user can only write to this bit when FLXAnFRITS.ITS is 0.
The address should be 32 bit aligned, thus the bits FLXAnFRIBA.ITA[1:0] are always 0.
These bits configure the base address of the input pointer table.
The table is used for the input transfer queue transferring message buffers from the local RAM/global RAM into the FlexRay internal message RAM.
The size of the input queue is configured in FLXAnFRITC.ITM.
Note that each entry requires two long words in the input pointer table.

25.2.12.4 FLXAnFRFBA — FlexRay FIFO Pointer Table Base Address Register

Access: FLXAnFRFBA can be read or written in 32-bit units.
FLXAnFRFBAL and FLXAnFRFBAH can be read or written in 16-bit units.
FLXAnFRFBALL, FLXAnFRFBALH, FLXAnFRFBAHL, and FLXAnFRFBAHH can be read or written in 8-bit units.

Address: FLXAnFRFBA: <FLXAn_base> + 080C$_H$,
FLXAnFRFBAL: <FLXAn_base> + 080C$_H$, FLXAnFRFBAH: <FLXAn_base> + 080E$_H$,
FLXAnFRFBALL: <FLXAn_base> + 080C$_H$, FLXAnFRFBALH: <FLXAn_base> + 080D$_H$,
FLXAnFRFBAHL: <FLXAn_base> + 080E$_H$, FLXAnFRFBAHH: <FLXAn_base> + 080F$_H$

Value after reset: 0000 0000$_H$

Table 25.97 FLXAnFRFBA Register Contents

Bit Position	Bit Name	Function
31 to 0	FTA[31:0]	FIFO pointer Table Address Bit These bits configure the base address of the FIFO pointer table.

(1) FLXAnFRFBA.FTA

FIFO pointer Table Address Bit

The user can only write to this bit when FLXAnFROTS.OTS is 0.
The address should be 32 bit aligned, thus the bits FLXAnFRFBA.FTA[1:0] are always 0.
These bits configure the base address of the FIFO pointer table.
The table is used for message buffers transferred from the FlexRay internal FIFO to the local RAM/global RAM.
The size of the FIFO is configured in FLXAnFROTC.FTM.

25.2.12.5 FLXAnFROBA — FlexRay Output Pointer Table Base Address Register

Access: FLXAnFROBA can be read or written in 32-bit units.
FLXAnFROBAL and FLXAnFROBAH can be read or written in 16-bit units.
FLXAnFROBALL, FLXAnFROBALH, FLXAnFROBAHL, and FLXAnFROBAHH can be read or written in 8-bit units.

Address: FLXAnFROBA: <FLXAn_base> + 0810_H,
FLXAnFROBAL: <FLXAn_base> + 0810_H, FLXAnFROBAH: <FLXAn_base> + 0812_H,
FLXAnFROBALL: <FLXAn_base> + 0810_H, FLXAnFROBALH: <FLXAn_base> + 0811_H,
FLXAnFROBAHL: <FLXAn_base> + 0812_H, FLXAnFROBAHH: <FLXAn_base> + 0813_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.98 FLXAnFROBA Register Contents

Bit Position	Bit Name	Function
31 to 0	OTA[31:0]	Output pointer Table Address Bit These bits configure the base address of the output pointer table.

(1) FLXAnFROBA.OTA

Output pointer Table Address Bit

The user can only write to this bit when FLXAnFROTS.OTS is 0.
The address should be 32 bit aligned, thus the bits FLXAnFROBA.OTA[1:0] are always 0.
These bits configure the base address of the output pointer table.
The table is used for message buffers transferred from the FlexRay internal message RAM to the local RAM/global RAM.
The size of the table depends on the utilization of the FlexRay internal message RAM and can have up to 128 entries.

25.2.12.6 FLXAnFRIQC — FlexRay Input Queue Control Register

Access: FLXAnFRIQC is a write-only register that can be written in 32-bit units.
FLXAnFRIQCL is a write-only register that can be written in 16-bit units.
FLXAnFRIQCLL is a write-only register that can be written in 8-bit units.

Address: FLXAnFRIQC: <FLXAn_base> + 0814_H,
FLXAnFRIQCL: <FLXAn_base> + 0814_H,
FLXAnFRIQCLL: <FLXAn_base> + 0814_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W

Table 25.99 FLXAnFRIQC Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When writing, write the value after reset.
6 to 0	IMBNR[6:0]	Input Message Buffer NumbeR Bit Message buffer number added to the input queue

(1) FLXAnFRIQC.IMBNR

Input Message Buffer NumbeR Bit

The user can only write to this bit when FLXAnFRITS.IQFP is 0.
The user cannot write to this register when FLXAnFRITS.ITS is 0 or when FLXAnFRITC.ITE is 0.
These bits are read as 0.
This value specifies the message buffer added to the input queue.
The number has to be identical to FLXAnFRWRHS4.IMBNR (see **Section 25.3.16.1(3), Input Pointer Table**) of the input pointer table.
The address to the input data structure has to be provided in the input pointer table at the put index (FLXAnFRITS.IPIDX) before writing to this register.
Writing to this register increments the input put index (FLXAnFRITS.IPIDX).

25.2.12.7 FLXAnFRUIR — FlexRay User Input Transfer Request Register

Access:	FLXAnFRUIR can be read or written in 32-bit units. FLXAnFRUIRL can be read or written in 16-bit units. FLXAnFRUIRLL can be read or written in 8-bit units.
Address:	FLXAnFRUIR: <FLXAn_base> + 0818_H, FLXAnFRUIRL: <FLXAn_base> + 0818_H, FLXAnFRUIRLL: <FLXAn_base> + 0818_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	UIDX[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.100 FLXAnFRUIR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	UIDX[7:0]	User requested Input index Bit Input pointer table index requested for input transfer

(1) FLXAnFRUIR.UIDX

User requested Input index Bit

The user can only write to this bit when FLXAnFRITS.UIRP is 0.
The user should not write to this register when FLXAnFRITS.ITS is 0.
The user should not write to this register when FLXAnFRITS.UIRP is 1.
The user should not write to this register when FLXAnFRITS.IQH is 1.
The user should only write FLXAnFRITC.ITM + 1 to this register.
This value specifies the input pointer table index for the user requested input transfer.
The address to the input data structure has to be provided in the input pointer table at the index UIDX before writing to this register.
When writing to this register, the requested input data structure will be transferred from input data structure position to the FlexRay internal message RAM.
In opposite to queued input transfers the related DA flag in the FLXAnFRDA register is not influenced by the user input transfer.

25.2.12.8 FLXAnFRUOR — FlexRay User Output Transfer Request Register

Access: FLXAnFRUOR can be read or written in 32-bit units.
FLXAnFRUORL can be read or written in 16-bit units.
FLXAnFRUORLL and FLXAnFRUORLH can be read or written in 8-bit units.

Address: FLXAnFRUOR: <FLXAn_base> + 081C$_H$,
FLXAnFRUORL: <FLXAn_base> + 081C$_H$,
FLXAnFRUORLL: <FLXAn_base> + 081C$_H$, FLXAnFRUORLH: <FLXAn_base> + 081D$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	URDS	—	—	UMBNR[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.101 FLXAnFRUOR Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	URDS	User request Read Data Section Bit 0: Data section is not transferred 1: Data section is transferred
8, 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	UMBNR[6:0]	User requested output Message Buffer NumbeR Bit Message buffer number requested for output transfer

(1) FLXAnFRUOR.URDS

User request Read Data Section Bit

The user can only write to this bit when FLXAnFROTS.UORP is 0.
The user should not write to this register when FLXAnFROTS.OTS is 0.
The user should not write to this register when FLXAnFROTS.UORP is 1.

- 0: Data section is not transferred
  The data section of the message buffer selected by the bits UMBNR is not requested
- 1: Data section is transferred
  The data section of the message buffer selected by the bits UMBNR is requested

(2) FLXAnFRUOR.UMBNR

User requested output Message Buffer NumbeR Bit

The user can only write to this bit when FLXAnFROTS.UORP is 0.
The user should not write to this register when FLXAnFROTS.OTS is 0.
The user should not write to this register when FLXAnFROTS.UORP is 1.
The user should restrict UMBNR to dedicated receive and transmit buffers when the FlexRay module is not in the CONFIG state.
When writing to this register, the header sections and optionally the data section (configurable by URDS) of the requested message buffer will be transferred from the FlexRay internal message RAM to the output data structure position defined by the output structure data pointer in the output pointer table.

25.2.12.9 FLXAnFRAHBC — FlexRay H-Bus Configuration Register

In this product, this register is not used because FLXAnFRAHBC.HPROT[3:0] has no function.

Access:	FLXAnFRAHBC can be read or written in 32-bit units. FLXAnFRAHBCL can be read or written in 16-bit units. FLXAnFRAHBCLL can be read or written in 8-bit units.
Address:	FLXAnFRAHBC: <FLXAn_base> + 0840_H, FLXAnFRAHBCL: <FLXAn_base> + 0840_H, FLXAnFRAHBCLL: <FLXAn_base> + 0840_H
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	HPROT[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.102 FLXAnFRAHBC Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	HPROT[3:0]	No function

25.2.13 Data Transfer Status Register

25.2.13.1 FLXAnFRITS — FlexRay Input Transfer Status Register

Access:	FLXAnFRITS can be read or written in 32-bit units. FLXAnFRITSL can be read or written in 16-bit units. FLXAnFRITSH is a read-only register that can be read in 16-bit units. FLXAnFRITSLL, FLXAnFRITSHL, and FLXAnFRITSHH are the read-only registers that can be read in 8-bit units. FLXAnFRITSLH can be read or written in 8-bit units.
Address:	FLXAnFRITS: <FLXAn_base> + 0820_H, FLXAnFRITSL: <FLXAn_base> + 0820_H, FLXAnFRITSH: <FLXAn_base> + 0822_H, FLXAnFRITSLL: <FLXAn_base> + 0820_H, FLXAnFRITSLH: <FLXAn_base> + 0821_H, FLXAnFRITSHL: <FLXAn_base> + 0822_H, FLXAnFRITSHH: <FLXAn_base> + 0823_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	IGIDX[6:0]							—	IPIDX[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Table 25.103 FLXAnFRITS Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30 to 24	IGIDX[6:0]	Input queue Get Index Bit Represents the get index of the input pointer table
23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	IPIDX[6:0]	Input queue Put Index Bit Represents the put index of the input pointer table
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	IQFP	Input Queue Full condition Pending Bit 0: Entries in the input queue are available 1: All entries in the input queue are occupied
11, 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	IQEIS	Input Queue Empty Interrupt Status Bit 0: No input queue empty condition detected 1: Input queue empty condition detected
8	IQFIS	Input Queue Full Interrupt Status Bit 0: No input queue full condition detected 1: Input queue full condition detected
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	UIRP	User Input transfer Request Pending Bit 0: No user input transfer request pending 1: User input transfer request pending

Table 25.103 FLXAnFRITS Register Contents

Bit Position	Bit Name	Function
1	IQH	Input Queue Halted Bit 0: Input queue not halted 1: Input queue halted
0	ITS	Input Transfer Status Bit 0: Disabled 1: Enabled

(1) FLXAnFRITS.IGIDX

Input queue Get Index Bit

These bits are only valid when FLXAnFRITS.IQH is 1.
These bits indicate the input pointer index the input queue handler will transfer next.
Valid values are 00_H to FLXAnFRITC.ITM.
The get index is incremented when the input data structure has been transferred from the local RAM/global RAM and the related DA flag in the FLXAnFRDA register is cleared.
The index is set to 00_H when FLXAnFRITS.ITS changes from 0 to 1.

(2) FLXAnFRITS.IPIDX

Input queue Put Index Bit

These bits indicate the index where the next input data structure pointer in the input pointer table should be stored.
Valid values are 00_H to FLXAnFRITC.ITM.
After reaching the maximum value the put index continues from 00_H.
The index is incremented when writing to FLXAnFRIQC.IMBNR.
The index is set to 00_H when FLXAnFRITS.ITS changes from 0 to 1.

(3) FLXAnFRITS.IQFP

Input Queue Full condition Pending Bit

This bit indicates that the input queue is full.
There should be no further input transfer requests, by writing to FLXAnFRIQC.IMBNR, as long as FLXAnFRITS.IQFP is 1.

[Clearing condition]
This bit is cleared when there is one free entry in the input queue.

[Setting condition]
This bit is set when all entries in the input queue are occupied.

(4) FLXAnFRITS.IQEIS

Input Queue Empty Interrupt Status Bit

Writing 0 has no effect on the bit value.
If enabled in FLXAnFRITC.IQEIE the input queue empty interrupt is generated when FLXAnFRITS.IQEIS is 1.

[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRITS.IQEIS.
This bit is cleared when FLXAnFRITS.ITS changes from 0 to 1.

[Setting condition]
This bit is set when all pending input transfers have been processed and consequently the input queue becomes empty.

(5) FLXAnFRITS.IQFIS

Input Queue Full Interrupt Status Bit

Writing 0 has no effect on the bit value.
If enabled in FLXAnFRITC.IQFIE the input queue full interrupt is generated when FLXAnFRITS.IQFIS is 1.
This flag is intended as interrupt status flag. It does not indicate the current input queue status; for this status refer to FLXAnFRITS.IQFP.

[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRITS.IQFIS.
This bit is cleared when FLXAnFRITS.ITS changes from 0 to 1.

[Setting condition]
This bit is set when all entries in the input queue are occupied.

(6) FLXAnFRITS.UIRP

User Input transfer Request Pending Bit

This bit indicates that a user input transfer is still pending.
There should be no further write access to FLXAnFRUIR.UIDX when this bit is 1.

[Clearing condition]
This bit is cleared when the user input transfer request is processed by the input transfer handler.

[Setting condition]
This bit is set when writing to FLXAnFRUIR.UIDX.

(7) FLXAnFRITS.IQH

Input Queue Halted Bit

This bit indicates the status of the input queue.
There should be no further write access to FLXAnFRUIR.UIDX when this bit is 1.

[Clearing condition]
This bit is cleared when FLXAnFRITC.IQHR is set to 0.

[Setting condition]
This bit is set immediately when the FLXAnFRITC.IQHR is set to 1 and there is no ongoing input transfer.
This bit is set only after an ongoing input transfer has been completed and FLXAnFRITC.IQHR is set to 1.

(8) FLXAnFRITS.ITS

Input Transfer Status Bit

This bit indicates the status of the input queue handler.
While this bit is 1, there can be no read or write access to the address area <FLXAn_base> + 0400_H to <FLXAn_base> + $05FF_H$ and there should be no CLEAR_RAMS command applied to FLXAnFRSUCC1.CMD register.
The input transfer queue indices and related status flags are set to 0 when FLXAnFRITS.ITS changes from 0 to 1.

[Clearing condition]
This bit is cleared immediately when FLXAnFRITC.ITE is set to 0 and there are no pending input transfers.
This bit is cleared after all pending requests have been processed and FLXAnFRITC.ITE is 0.

[Setting condition]
This bit is set when FLXAnFRITC.ITE is set to 1.

25.2.13.2 FLXAnFROTS — FlexRay Output Transfer Status Register

Access: FLXAnFROTS can be read or written in 32-bit units.
FLXAnFROTSL can be read or written in 16-bit units.
FLXAnFROTSH is a read-only register that can be read in 16-bit units.
FLXAnFROTSLL, FLXAnFROTSHL, and FLXAnFROTSHH are the read-only registers that can be read in 8- bit units.
FLXAnFROTSLH can be read or written in 8-bit units.

Address: FLXAnFROTS: <FLXAn_base> + 0824_H,
FLXAnFROTSL: <FLXAn_base> + 0824_H, FLXAnFROTSH: <FLXAn_base> + 0826_H,
FLXAnFROTSLL: <FLXAn_base> + 0824_H, FLXAnFROTSLH: <FLXAn_base> + 0825_H,
FLXAnFROTSHL: <FLXAn_base> + 0826_H, FLXAnFROTSHH: <FLXAn_base> + 0827_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.104 FLXAnFROTS Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 24	FFL[5:0]	FIFO Fill Level Bit Represent the number of unprocessed output FIFO structures
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 16	FGIDX[4:0]	FIFO Get Index Bit Represent the get index in the FIFO pointer table
15	FWP	FIFO transfer Warning condition Pending Bit 0: No FIFO transfer warning condition pending 1: FIFO transfer warning condition pending
14	OWP	Output transfer Warning condition Pending 0: No output transfer warning condition pending 1: Output transfer warning condition pending
13	FDA	FIFO Data Available Bit 0: No available FIFO structures 1: FIFO structures available at current FLXAnFROTS.FGIDX index
12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	FWIS	FIFO transfer Warning Interrupt Status Bit 0: No FIFO transfer warning condition detected 1: FIFO transfer warning condition detected
10	OWIS	Output transfer Warning Interrupt Status Bit 0: No output transfer warning condition detected 1: Output transfer warning condition detected
9	FIS	FIFO transfer Interrupt Status Bit 0: No FIFO structure updated in local RAM/global RAM 1: FIFO structure updated in local RAM/global RAM

Table 25.104 FLXAnFROTS Register Contents

Bit Position	Bit Name	Function
8	OTIS	Output transfer Interrupt Status Bit 0: No output structure updated in local RAM/global RAM 1: Output structure updated in local RAM/global RAM
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	UORP	User Output transfer Request Pending Bit 0: No user output transfer request pending 1: User output transfer request pending
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	OTS	Output Transfer Status Bit 0: Disabled 1: Enabled

(1) FLXAnFROTS.FFL

FIFO Fill Level Bit

These bits indicate the number of available output FIFO structures in the local RAM/global RAM. Valid values are 00_H to FLXAnFROTC.FTM + 1.
The value 00_H indicates that the FIFO is empty.
The value FLXAnFROTC.FTM + 1 indicates that the FIFO is full and no further FIFO transfers will be done.
The FIFO fill level is incremented when a FIFO data structure has been transferred from the FlexRay internal FIFO into the local RAM/global RAM.
The FIFO fill level is decremented when the user releases a FIFO data structure in the local RAM/global RAM by writing 1 to FLXAnFROTS.FDA.
The FIFO fill level is set to 00_H when the bit FLXAnFROTS.OTS changes from 0 to 1.

(2) FLXAnFROTS.FGIDX

FIFO Get Index Bit

These bits indicate the index where the current output data structure pointer in the FIFO pointer table is available for reading.
Valid values are 00_H to FLXAnFROTC.FTM.
After reaching the maximum value the get index continues from 00_H.
The index is incremented when a FIFO data structure is released by writing 1 to FLXAnFROTS.FDA.
The index is set to 00_H when FLXAnFROTS.OTS changes from 0 to 1.

(3) FLXAnFROTS.FWP

FIFO transfer Warning condition Pending Bit

This bit indicates the FIFO transfer warning condition.

[Clearing condition]
This bit is cleared when there are free output data structures (FLXAnFROTS.FFL ≤ FLXAnFROTC.FTM).
This bit is cleared when the FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]
This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1).

(4) FLXAnFROTS.OWP

Output transfer Warning condition Pending Bit

This bit indicates the output transfer warning condition.

[Clearing condition]
This bit is cleared, when all output structure pointers that have a pending output handler transfer condition detected are released (for dedicated transmit and receive message buffers or a user output transfer request).

[Setting condition]
This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or a user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to 1).

This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to 1 due to the input transfer request).

(5) FLXAnFROTS.FDA

FIFO Data Available Bit

Writing 0 has no effect on the bit value.
When this bit is 1, the next valid output data structure is available.
The related data structure pointer is in the FIFO pointer table at FLXAnFROTS.FGIDX.
Writing 1 to FLXAnFROTS.FDA

- increments FLXAnFROTS.FGIDX and
- decrements the FIFO fill level (FLXAnFROTS.FFL)

If there are still unprocessed data structures FLXAnFROTS.FDA remains 1.

[Clearing condition]
This bit is cleared when writing 1 to FLXAnFROTS.FDA and the FIFO fill level becomes 00_H.
This bit is cleared when the FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]
This bit is set when there is at least one FIFO data structure available in the local RAM/global RAM.

(6) FLXAnFROTS.FWIS

FIFO transfer Warning Interrupt Status Bit

Writing 0 has no effect on the bit value.
If enabled in FLXAnFROTC.FWIE the FIFO transfer warning interrupt is generated when FLXAnFROTS.FWIS is 1.

[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFROTS.FWIS.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]
This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1).

(7) FLXAnFROTS.OWIS

Output transfer Warning Interrupt Status Bit

Writing 0 has no effect on the bit value.
If enabled in FLXAnFROTC.OWIE the FIFO transfer warning interrupt is generated when FLXAnFROTS.OWIS is 1.

[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFROTS.OWIS.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]
This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or a user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to 1).

This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to 1 due to the input transfer request).

(8) FLXAnFROTS.FIS

FIFO transfer Interrupt Status Bit

Writing 0 has no effect on the bit value.
If enabled in FLXAnFROTC.FIE the FIFO transfer interrupt is generated when FLXAnFROTS.FIS is 1.

[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFROTS.FIS.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]
This bit is set when a FIFO data structure is updated by the transfer handler or the FFL bit changes from 00_H to 01_H.

(9) FLXAnFROTS.OTIS

Output transfer Interrupt Status Bit

Writing 0 has no effect on the bit value.
If enabled in FLXAnFROTC.OIE the output transfer interrupt is generated when FLXAnFROTS.OTIS is 1.

[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFROTS.OTIS.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]
This bit is set when an output data structure is updated by the transfer handler (from a dedicated transmit or receive message buffer or by a user output transfer request).

(10) FLXAnFROTS.UORP

User Output transfer Request Pending Bit

This bit indicates that a user output transfer is still pending.
There should be no further write access to FLXAnFRUOR.UMBNR when this bit is 1.

[Clearing condition]
This bit is cleared when the user output transfer request is processed by the output transfer handler.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]
This bit is set when writing to FLXAnFRUOR.UMBNR.

(11) FLXAnFROTS.OTS

Output Transfer Status Bit

This bit indicates the status of the output transfer handler.
While this bit is 1, there should be no read or write access to the address area <FLXAn_base> + 0600_H to <FLXAn_base> + $07FF_H$ and there should be no CLEAR_RAMS command applied to FLXAnFRSUCC1.CMD register.
While this bit is 1, the user cannot change the E-Ray message RAM configuration by writing to the FLXAnFRMRC register.
The output hander transfer indices and related status flags are set to 0 when FLXAnFROTS.OTS changes from 0 to 1.

[Clearing condition]
This bit is cleared immediately when FLXAnFROTC.OTE is set to 0 and there are no ongoing output transfers.
This bit is cleared after an ongoing transfer has been completed and FLXAnFROTC.OTE is 0.

[Setting condition]
This bit is set when FLXAnFROTC.OTE is set to 1.

25.2.13.3 FLXAnFRAES — FlexRay Access Error Status Register

Access: FLXAnFRAES can be read or written in 32-bit units.
FLXAnFRAESL can be read or written in 16-bit units.
FLXAnFRAESLL is a read-only register that can be read in 8-bit units.
FLXAnFRAESLH can be read or written in 8-bit units.

Address: FLXAnFRAES: <FLXAn_base> + 0828$_{H}$,
FLXAnFRAESL: <FLXAn_base> + 0828$_{H}$,
FLXAnFRAESLL: <FLXAn_base> + 0828$_{H}$, FLXAnFRAESLH: <FLXAn_base> + 0829$_{H}$

Value after reset: 0000 0000$_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	MAE	FAE	OAE	IAE	EIDX[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 25.105 FLXAnFRAES Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	MAE	Multiple Access Errors Bit 0: No multiple access errors occurred 1: Multiple access errors occurred
10	FAE	FIFO transfer Access Error Bit 0: No access error occurred during FIFO transfer 1: Access error occurred during FIFO transfer
9	OAE	Output transfer Access Error Bit 0: No access error occurred during output transfer 1: Access error occurred during output transfer
8	IAE	Input transfer Access Error Bit 0: No access error occurred during input transfer 1: Access error occurred during input transfer
7 to 0	EIDX[7:0]	Error Index Bit Data structure pointer index number

(1) FLXAnFRAES.MAE

Multiple Access Errors Bit

Writing 0 has no effect on the bit value.
This bit indicates that there were multiple access errors during a data transfer.

[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRAES.MAE.

[Setting condition]
This bit is set when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE are set and

- an access to an protected address occurred during a FIFO data transfer or
- an access to an protected address occurred during an output data transfer or
- an access to an protected address occurred during an input data transfer

(2) FLXAnFRAES.FAE

FIFO transfer Access Error Bit

Writing 0 has no effect on the bit value.
This bit indicates that there was an access error during a FIFO data transfer.

[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRAES.FAE.

[Setting condition]
This bit is set when a local RAM/global RAM access error was detected during a FIFO transfer and the bits FLXAnFRAES.OAE, FLXAnFRAES.IAE and FLXAnFRAES.MAE are 0.

(3) FLXAnFRAES.OAE

Output transfer Access Error Bit

Writing 0 has no effect on the bit value.
This bit indicates that there was an access error during a output data transfer.

[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRAES.OAE.

[Setting condition]
This bit is set when a local RAM/global RAM access error was detected during an output transfer and the bits FLXAnFRAES.FAE, FLXAnFRAES.IAE and FLXAnFRAES.MAE are 0.

(4) FLXAnFRAES.IAE

Input transfer Access Error Bit

Writing 0 has no effect on the bit value.
This bit indicates that there was an access error during an input data transfer.

[Clearing condition]
This bit is cleared when writing a 1 to FLXAnFRAES.IAE.

[Setting condition]
This bit is set when a local RAM/global RAM access error was detected during an output transfer and the bits FLXAnFRAES.OAE, FLXAnFRAES.FAE and FLXAnFRAES.MAE are 0.

(5) FLXAnFRAES.EIDX

Error Index Bit

This value is only valid when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is 1.
When the bit FLXAnFRAES.FAE is 1, FLXAnFRAES.EIDX holds the used FIFO put index when the access error has occurred.
When the bit FLXAnFRAES.OAE is 1, FLXAnFRAES.EIDX holds the input pointer table get index used when an access error occurred during an input transfer or when the user request an input transfer.
When the bit FLXAnFRAES.IAE is 1, FLXAnFRAES.EIDX holds the used input pointer table get index when the access error has occurred.
These bits are updated when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is changed from 0 to 1.

25.2.13.4 FLXAnFRAEA — FlexRay Access Error Address Register

Access: FLXAnFRAEA is a read-only register that can be read in 32-bit units.
FLXAnFRAEAL and FLXAnFRAEAH are the read-only registers that can be read in 16-bit units.
FLXAnFRAEALL, FLXAnFRAEALH, FLXAnFRAEAHL, and FLXAnFRAEAHH are the read-only registers that can be read in 8-bit units.

Address: FLXAnFRAEA: <FLXAn_base> + $082C_H$,
FLXAnFRAEAL: <FLXAn_base> + $082C_H$, FLXAnFRAEAH: <FLXAn_base> + $082E_H$,
FLXAnFRAEALL: <FLXAn_base> + $082C_H$, FLXAnFRAEALH: <FLXAn_base> + $082D_H$,
FLXAnFRAEAHL: <FLXAn_base> + $082E_H$, FLXAnFRAEAHH: <FLXAn_base> + $082F_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.106 FLXAnFRAEA Register Contents

Bit Position	Bit Name	Function
31 to 0	AEA[31:0]	Access Error Address Bit Address in the local RAM/global RAM when an access error has occurred

(1) FLXAnFRAEA.AEA

Access Error Address Bit

This value is only valid when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is 1.
These bits indicate the address of the access error indicated in the FLXAnFRAES register.
These bits are updated when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is changed from 0 to 1.

25.2.13.5 FLXAnFRDAi — FlexRay Message Data Available Register i (i = 0 to 3)

Access: FLXAnFRDAi can be read or written in 32-bit units.
FLXAnFRDAiL and FLXAnFRDAiH can be read or written in 16-bit units.
FLXAnFRDAiLL, FLXAnFRDAiLH, FLXAnFRDAiHL, and FLXAnFRDAiHH can be read or written in 8-bit units.

Address: FLXAnFRDAx: <FLXAn_base> + 0830_H + i × 4_H,
FLXAnFRDAxL: <FLXAn_base> + 0830_H + i × 4_H,
FLXAnFRDAxH: <FLXAn_base> + 0830_H + i × 4_H + 2_H,
FLXAnFRDAxLL: <FLXAn_base> + 0830_H + i × 4_H,
FLXAnFRDAxLH: <FLXAn_base> + 0830_H + i × 4_H + 1_H,
FLXAnFRDAxHL: <FLXAn_base> + 0830_H + i × 4_H + 2_H,
FLXAnFRDAxHH: <FLXAn_base> + 0830_H + i × 4_H + 3_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 25.107 FLXAnFRDAi Register Contents

Bit Position	Bit Name	Function
31 to 0	DAb	Data Available Bit 0: No data available for destination 1: Data available for destination

(1) FLXAnFRDAi.DAb (b = i × 32 to (i + 1) × 32 – 1)

Data Available Bit b

The user should not write a 1 to bits that are 0.
To maintain the status of input transfers, the user cannot clear bits related to input transfers.
This register is used for input and output transfers.
Each flag corresponds to a FlexRay message buffer.

[Clearing condition]
Input transfer:
This bit is cleared when the input data structure has been transferred from the local RAM/global RAM. The data structure and the data structure pointer can be changed when the related flag is 0.

Output transfer:
This bit is cleared by writing 1 to it.

[Setting condition]
Input transfer:
This bit is set when the corresponding message buffer number has been written to FLXAnFRIQC.IMBNR.
As long as this bit is 1, the input data structure and the data structure pointer corresponding to this input transfer request cannot be changed.

Output transfer:
This bit is set when the output data structure corresponding to this message buffer has been updated. As long as this bit is 1, the data structure is stable; no further update of the data structure will be done by the output handler. While this bit is 1, the application is allowed to change the output data structure pointer in the output pointer table for this message buffer number.

25.3 Functional Description

This chapter describes the FlexRay implementation together with the related FlexRay protocol features. More information about the FlexRay protocol itself can be found in the FlexRay protocol specification.

25.3.1 FlexRay Module Operation Control

25.3.1.1 FlexRay Module Enable

After hardware reset or after the FlexRay module has been disabled (following **Section 25.3.1.2, FlexRay Module Disable**) the FlexRay module is in the reset state (FLXAnFROS.OS is 0) and the clocks of the FlexRay core module are disabled.

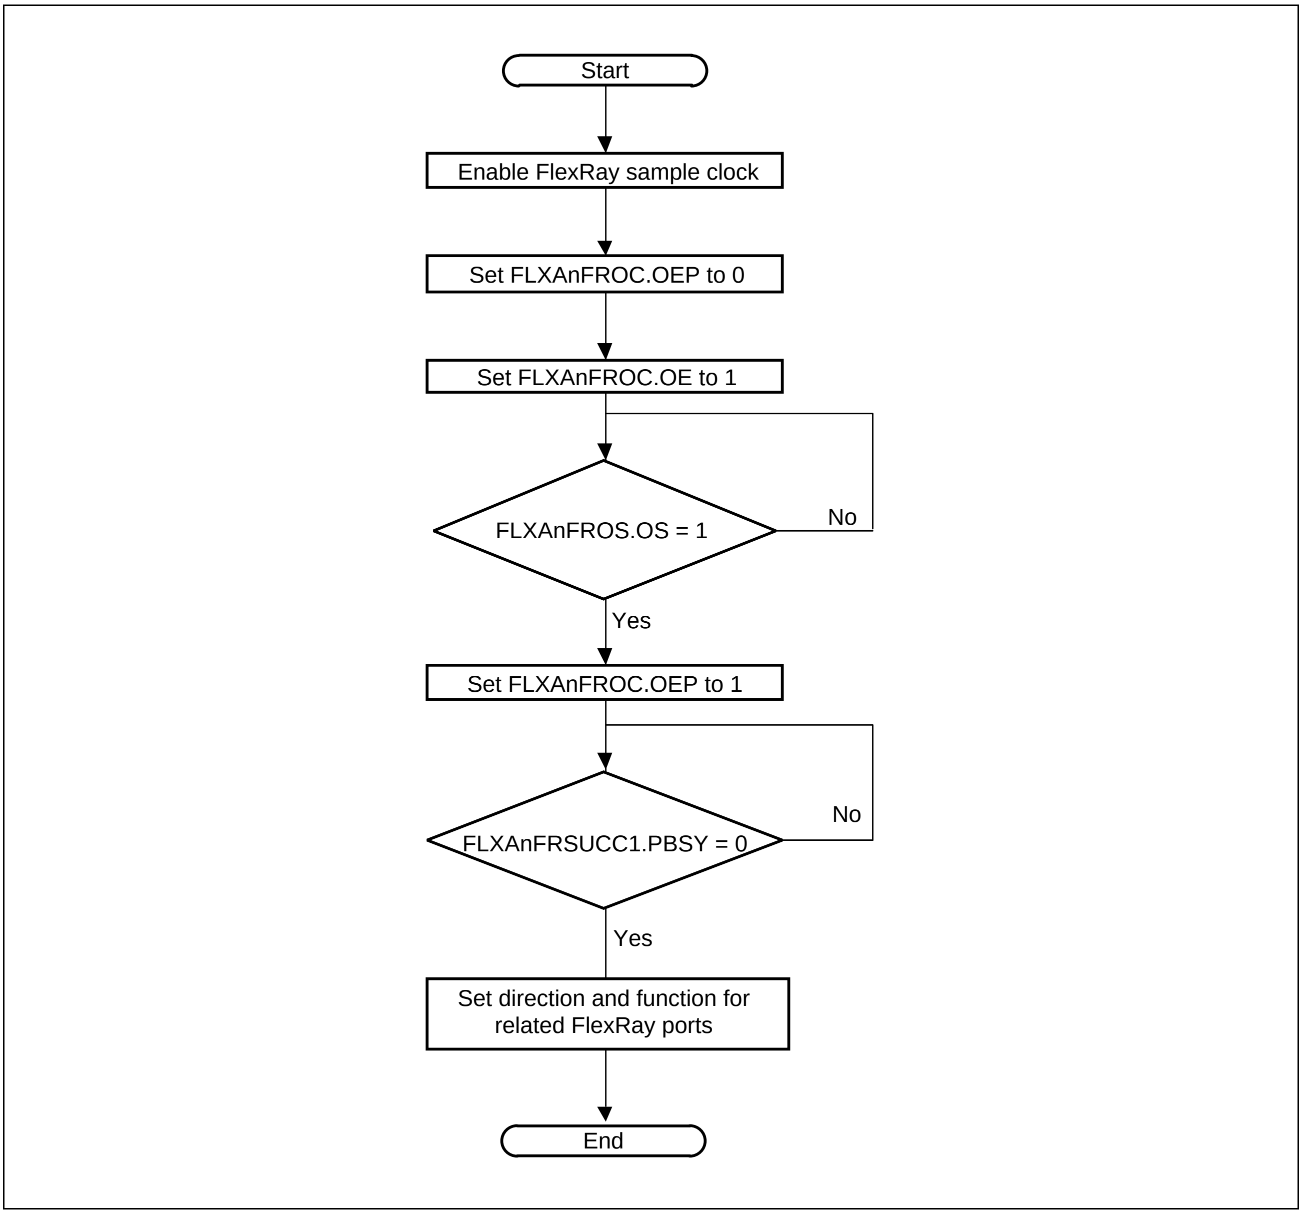

Figure 25.3 FlexRay Enable Flow

25.3.1.2 FlexRay Module Disable

The FlexRay module can be disabled at any time. However, it is recommended to disable the FlexRay module using the FLXAnFROC.OE register only when the FlexRay module is in HALT, CONFIG or DEFAULT_CONFIG state. Resetting the FlexRay module in any other state will terminate any ongoing FlexRay communication.

If the data transfer function is used, it is also required to disable this function before disabling the FlexRay module (see **Section 25.3.16.1(1), Activation and Deactivation** for suspending input transfer function and **Section 25.3.16.2(2), Output Transfer Data Structure** for suspending output transfer).

The following flow should be executed to disable the FlexRay module.

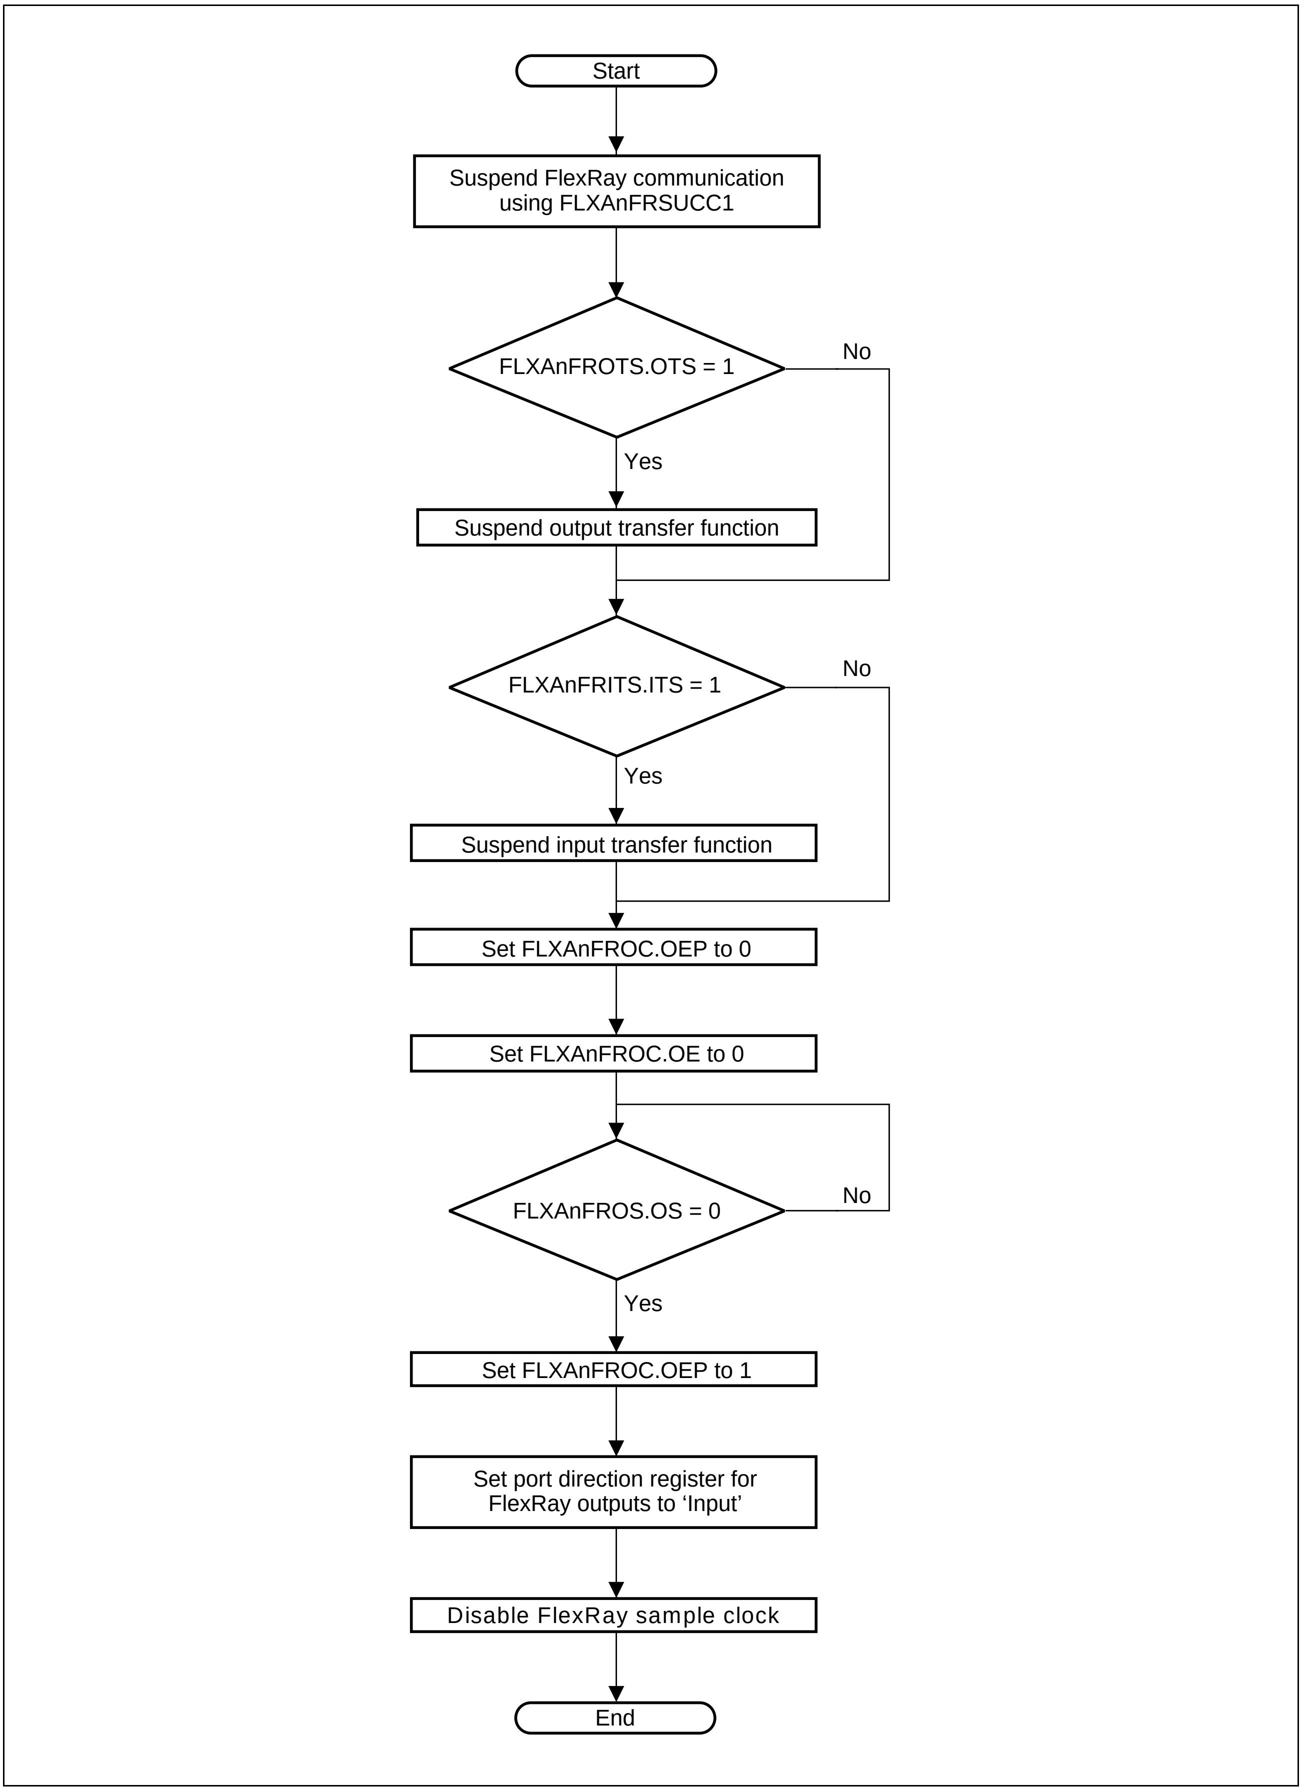

Figure 25.4 FlexRay Disable Flow

25.3.2 Communication Cycle

Communication on FlexRay networks is based on frames and symbols. The wakeup symbol (WUS) and the collision avoidance symbol (CAS) are transmitted outside the communication cycle to setup the time schedule. Frames and media access test symbols (MTS) are transmitted inside the communication cycle.

A FlexRay communication cycle consists of the following elements:

- Static Segment
- Dynamic Segment (optional)
- Symbol Window (optional)
- Network Idle Time (NIT)

Static segment, dynamic segment, and symbol window form the Network Communication Time (NCT). For each communication channel the slot counter starts at 1 and counts up until the end of the dynamic segment is reached. Both channels share the same arbitration grid which means that they use the same synchronized macrotick.

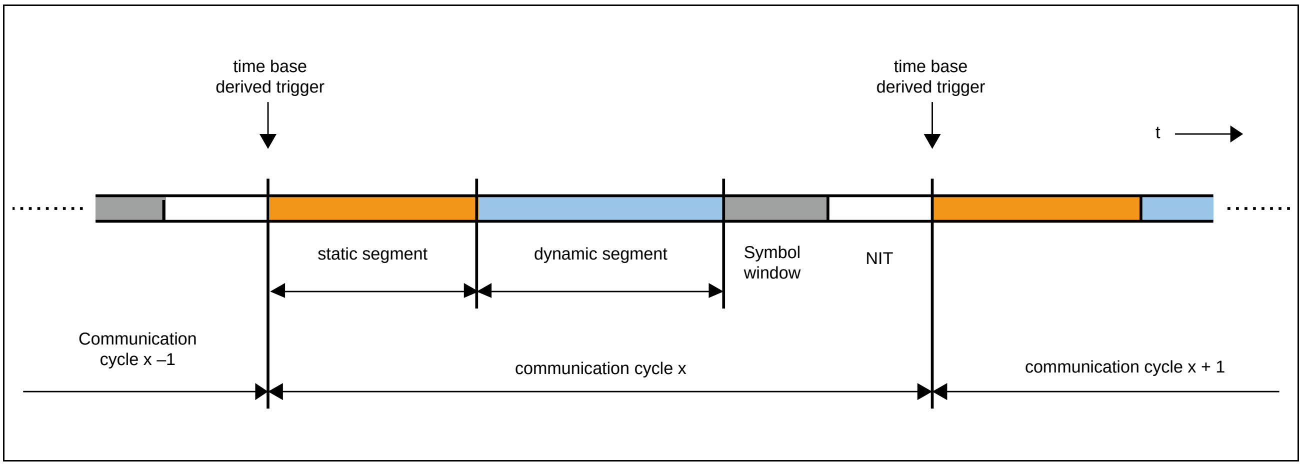

Figure 25.5 Structure of Communication Cycle

25.3.2.1 Static Segment

The Static Segment is characterized by the following features:

- Time slots of fixed length (optionally protected by bus guardian)
- Start of frame transmission at action point of the respective static slot
- Payload length same for all frames on both channels

Parameters:

Number of Static Slots (FLXAnFRGTUC7.NSS)

Static Slot Length (FLXAnFRGTUC7.SSL)

Payload Length Static (FLXAnFRMHDC.SFDL)

Action Point Offset (FLXAnFRGTUC9.APO)

25.3.2.2 Dynamic Segment

The Dynamic Segment is characterized by the following features:

- All controllers have bus access (no bus guardian protection possible)
- Variable payload length and duration of slots, different for both channels
- Start of transmission at minislot action point

Parameters:

Number of Minislots (FLXAnFRGTUC8.NMS) Minislot Length (FLXAnFRGTUC8.MSL)

Minislot Action Point Offset (FLXAnFRGTUC9.MAPO)

Start of Latest Transmit (last minislot) (FLXAnFRMHDC.SLT)

25.3.2.3 Symbol Window

During the symbol window only one media access test symbol (MTS) may be transmitted per channel. MTS symbols are send in NORMAL_ACTIVE state to test the bus guardian.

The symbol window is characterized by the following features:

- Send single symbol
- Transmission of the MTS symbol starts at the symbol windows action point

Parameters:

Symbol Window Action Point Offset (FLXAnFRGTUC9.APO) (same as for static slots)

Network Idle Time Start Position (FLXAnFRGTUC4.NIT)

25.3.2.4 Network Idle Time (NIT)

During network idle time the CC performs the following tasks:

- Calculate clock correction terms (offset and rate)
- Distribute offset correction over multiple macroticks after offset correction start
- Perform cluster cycle related tasks

Parameters:

Network idle time start position configuration bit (FLXAnFRGTUC4.NIT)

Offset correction start position configuration bit (FLXAnFRGTUC4.OCS)

25.3.2.5 Configuration of NIT Start and Offset Correction Start

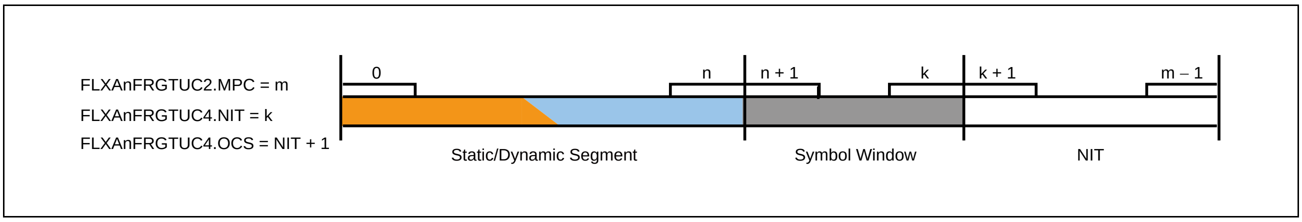

Figure 25.6 Configuration of NIT Start and Offset Correction Start

The number of macroticks per cycle gMacroPerCycle is assumed to be m. It is configured by programming FLXAnFRGTUC2.MPC = m.

The static/dynamic segment starts with macrotick 0 and ends with macrotick n:

n = static segment length + dynamic segment offset + dynamic segment length – 1MT

n = gNumberOfStaticSlots o gdStaticSlot + dynamic segment offset + gNumberOfMinislots o gdMinislot – 1 MT

The static segment length is configured by FLXAnFRGTUC7.SSL and FLXAnFRGTUC7.NSS.

The dynamic segment length is configured by FLXAnFRGTUC8.MSL and FLXAnFRGTUC8.NMS. The dynamic segment offset is:

If gdActionPointOffset ≤ gdMinislotActionPointOffset: dynamic segment offset = 0 MT

Else if gdActionPointOffset > gdMinislotActionPointOffset:

dynamic segment offset = gdActionPointOffset – gdMinislotActionPointOffset

The NIT starts with macrotick k + 1 and ends with the last macrotick of cycle m – 1. It has to be configured by setting FLXAnFRGTUC4.NIT = k.

For the FlexRay module the offset correction start is required to be FLXAnFRGTUC4.OCS ≥ FLXAnFRGTUC4.NIT + 1 = k + 1.

The length of symbol window results from the number of macroticks between the end of the static/dynamic segment and the beginning of the NIT. It can be calculated by the number of macroticks (k – n).

25.3.3 Communication Modes

The FlexRay Protocol Specification defines the Time-Triggered Distributed (TT-D) mode.

25.3.3.1 Time-Triggered Distributed (TT-D)

In TT-D mode the following configurations are possible:

- Pure static: Minimum 2 static slots + symbol window (optional)
- Mixed static/dynamic: Minimum 2 static slots + dynamic segment + symbol window (optional)

A minimum of two coldstart nodes needs to be configured for distributed time-triggered operation. Two fault-free coldstart nodes are necessary for the cluster startup. Each startup frame must be a sync frame, therefore all coldstart nodes are sync nodes.

25.3.4 Clock Synchronization

In TT-D mode, distributed clock synchronization is used. Each node individually synchronizes itself to the cluster by observing the timing of received sync frames from other nodes.

25.3.4.1 Global Time

Activities in a FlexRay node, including communication, are based on the concept of a global time. It is the clock synchronization mechanism that differentiates the FlexRay cluster from other node collections with independent clock mechanisms. The global time is a vector of two values: the cycle (cycle counter) and the cycle time (macrotick counter).

Cluster definitions:

- Macrotick (MT) = basic unit of time measurement in a FlexRay network, a macrotick consists of an integer number of microticks (µT)
- Cycle length = duration of a communication cycle in units of macroticks (MT)

25.3.4.2 Local Time

Internally, nodes time their behavior with microtick resolution. Microticks are time units derived from the oscillator clock tick of the specific node. Therefore microticks are controller-specific units. They may have different duration in different controllers. The precision of a node’s local time difference measurements is a microtick (µT).

Node definitions:

- Oscillator clock → prescaler → microtick (µT)
- µT = basic unit of time measurement in a CC, clock correction is done in units of → µT
- Cycle counter + macrotick counter = nodes local view of the global time

25.3.4.3 Synchronization Process

Clock synchronization is performed by means of sync frames. Only preconfigured nodes (sync nodes) are allowed to send sync frames. In a two-channel cluster a sync node has to send its sync frame on both channels.

For synchronization in FlexRay the following constraints have to be considered:

- Max. one sync frame per node in one communication cycle
- Max. 15 sync frames per cluster in one communication cycle
- Every node has to use a preconfigured number of sync frames (FLXAnFRGTUC2.SNM) for clock synchronization
- Minimum of two sync nodes required for clock synchronization and startup

For clock synchronization the time difference between expected and observed arrival time of sync frames received during the static segment is measured. In a two channel cluster the sync node has to be configured to send sync frames on both channels. The calculation of correction terms is done during NIT (offset: every cycle, rate: every odd cycle) by using an FTM algorithm. For details see *the FlexRay protocol specification v2.1, chapter 8*.

(1) Offset (Phase) Correction

- Only deviation values measured and stored in the current cycle used
- For a two channel node the smaller value will be taken
- Calculation during NIT of every communication cycle
- Offset correction value calculated in even cycles used for error checking only
- Checked against limit values
- Correction value is a signed integer number of µTs
- Correction done in odd numbered cycles, distributed over the macroticks beginning at offset correction start up to cycle end (end of NIT) to shift nodes next start of cycle (MTs lengthened/shortened)

(2) Rate (Frequency) Correction

- Pairs of deviation values measured and stored in even/odd cycle pair used
- For a two channel node the average of the differences from the two channels is used
- Calculated during NIT of odd numbered cycles
- Cluster drift damping is performed using global damping value
- Checked against limit values
- Correction value is a signed integer number of µTs
- Distributed over macroticks comprising the next even/odd cycle pair (MTs lengthened/shortened)

(3) Sync Frame Transmission

Sync frame transmission is only possible from buffer 0 and 1. Message buffer 1 may be used for sync frame transmission in case that sync frames should have different payloads on the two channels. In this case bit FLXAnFRMRC.SPLM has to be programmed to 1.

Message buffers used for sync frame transmission have to be configured with the key slot ID and can be (re)configured in DEFAULT_CONFIG or CONFIG state only. For nodes transmitting sync frames FLXAnFRSUCC1.TXSY must be set to 1.

(4) External Clock Synchronization

During normal operation, independent clusters can drift significantly. If synchronous operation across independent clusters is desired, external synchronization is necessary; even though the nodes within each cluster are synchronized. This can be accomplished with synchronous application of host-deduced rate and offset correction terms to the clusters.

- External offset/rate correction value is a signed integer
- External offset/rate correction value is added to calculated offset/rate correction value
- Aggregated offset/rate correction term (external + internal) is not checked against configured limits

25.3.5 Error Handling

The implemented error handling concept is intended to ensure that, in case of a lower layer protocol error in one single node, communication between non-affected nodes can be maintained. In some cases, higher layer program activity is required for the CC to resume normal operation. A change of the error handling state will set FLXAnFREIR.PEMC to 1 and may trigger an interrupt to the Host if enabled. The actual error mode is signaled by FLXAnFRCCEV.ERRM.

Table 25.108 Error Modes of the POC (Degradation Model)

Error Mode	Activity
ACTIVE	Full operation, State: NORMAL_ACTIVE The CC is fully synchronized and supports the cluster wide clock synchronization. The host is informed of any error condition(s) or status change by interrupt (if enabled) or by reading the error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR.
PASSIVE	Reduced operation, State: NORMAL_PASSIVE, CC self rescue allowed The CC stops transmitting frames and symbols, but received frames are still processed. Clock synchronization mechanisms are continued based on received frames. No active contribution to the cluster wide clock synchronization. The host is informed of any error condition(s) or status change by interrupt (if enabled) or by reading the error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR.
COMM_HALT	Operation halted, State: HALT, CC self rescue not allowed The CC stops frame and symbol processing, clock synchronization processing, and the macrotick generation. The host has still access to error and status information by reading the error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR. The bus drivers are disabled.

25.3.5.1 Clock Correction Failed Counter

When the Clock Correction Failed Counter reaches the “maximum without clock correction passive” limit defined by FLXAnFRSUCC3.WCP, the POC transits from NORMAL_ACTIVE to NORMAL_PASSIVE state. When it reaches the “maximum without clock correction fatal” limit defined by FLXAnFRSUCC3.WCF, it transits from NORMAL_ACTIVE or NORMAL_PASSIVE to HALT state.

The Clock Correction Failed Counter FLXAnFRCCEV.CCFC allows the Host to monitor the duration of the inability of a node to compute clock correction terms after the CC passed protocol startup phase. It will be incremented by one at the end of any odd communication cycle during which either the missing offset correction FLXAnFRSFS.MOCS or the missing rate correction FLXAnFRSFS.MRCS flag is set to 1.

The Clock Correction Failed Counter is reset to zero at the end of an odd communication cycle if neither the missing offset correction FLXAnFRSFS.MOCS nor the missing rate correction FLXAnFRSFS.MRCS flag is set to 1.

The Clock Correction Failed Counter stops incrementing when the “maximum without clock correction fatal” value FLXAnFRSUCC3.WCF is reached (i.e. incrementing the counter at its maximum value will not cause it to wrap around back to zero). The Clock Correction Failed Counter is initialized to zero when the CC enters READY state or when NORMAL_ACTIVE state is entered.

CAUTION

The transition to HALT state is prevented if FLXAnFRSUCC1.HCSE is not set to 1.

25.3.5.2 Passive to Active Counter

The passive to active counter controls the transition of the POC from NORMAL_PASSIVE to NORMAL_ACTIVE state. FLXAnFRSUCC1.PTA defines the number of consecutive even/odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state. If FLXAnFRSUCC1.PTA is set to zero the CC is not allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state.

25.3.5.3 HALT Command

If the Host wants to stop FlexRay communication of the local node it can bring the CC into HALT state by asserting the HALT command. This can be done by writing FLXAnFRSUCC1.CMD = “0110_B”. In order to shut down communication on an entire FlexRay network, a higher layer protocol is required to confirm that all nodes apply the HALT command at the same time.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

When called in NORMAL_ACTIVE or NORMAL_PASSIVE state the POC transits to HALT state at the end of the current cycle. When called in any other state FLXAnFRSUCC1.CMD will be reset to “0000_B” = command_not_accepted and bit FLXAnFREIR.CNA is set to 1. If enabled an interrupt to the Host is generated.

25.3.5.4 FREEZE Command

In case the Host detects a severe error condition it can bring the CC into HALT state by asserting the FREEZE command. This can be done by writing FLXAnFRSUCC1.CMD = “0111_B”. The FREEZE command triggers the entry of the HALT state immediately regardless of the actual POC state.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

CAUTION

When the communication is stopped by the FREEZE or READY command and the communication is restarted as Leading ColdStart, the startup frame is not transmitted on cycle0 depending on the internal condition of the FlexRay module. This case occurs when the Startup frame is set in one of the slot 1 to slot 7.

This does not occur in ColdStart after a hardware reset.

Even if this occurs, the second trial of ColdStart will succeed. ColdStart time becomes longer, but ColdStart will not be affected by the occurrence.

To avoid this, allocate the Startup/Sync frame in the static slot 8 or higher.

25.3.6 Communication Controller States

25.3.6.1 Communication Controller State Diagram

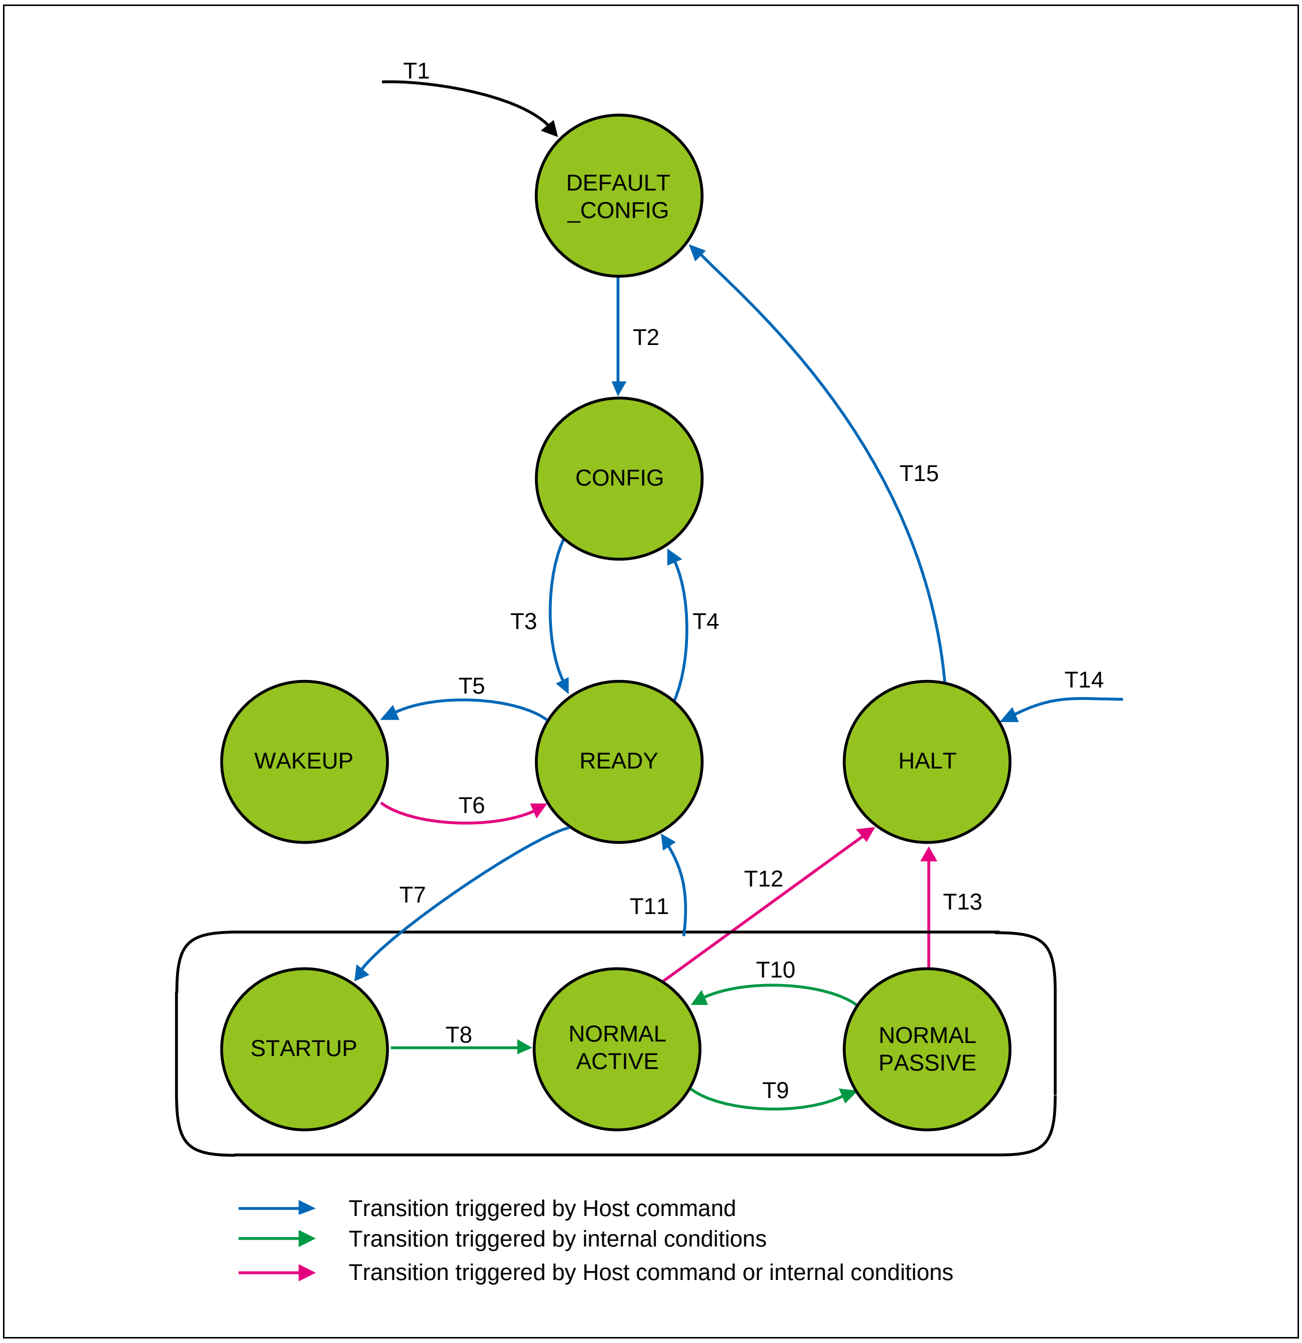

Figure 25.7 Overall State Diagram of FlexRay Communication Controller

State transitions are controlled by reset, FLXAnFR0RXDA, FLXAnFR0RXDB, by the POC state machine, and by the CHI Command Vector FLXAnFRSUCC1.CMD.

The CC transits from all states to HALT state after application of the FREEZE command (FLXAnFRSUCC1.CMD = “0111_B”).

Table 25.109 State Transitions of FlexRay Overall State Machine

T#	Condition	From	To
1	Reset	All States	DEFAULT_CONFIG
2	Command CONFIG, FLXAnFRSUCC1.CMD = “0001_B”	DEFAULT_CONFIG	CONFIG
3	Unlock sequence followed by command READY, FLXAnFRSUCC1.CMD = “0010_B”	CONFIG	READY
4	Command CONFIG, FLXAnFRSUCC1.CMD = “0001_B”	READY	CONFIG
5	Command WAKEUP, FLXAnFRSUCC1.CMD = “0011_B”	READY	WAKEUP
6	Complete transmission of wakeup pattern or received WUP or received frame header or wakeup collision detection or command READY, FLXAnFRSUCC1.CMD = “0010_B”	WAKEUP	READY
7	Command RUN, FLXAnFRSUCC1.CMD = “0100_B”	READY	STARTUP
8	Successful STARTUP	STARTUP	NORMAL_ACTIVE
9	Clock Correction Failed counter reached Maximum Without Clock Correction Passive limit configured by FLXAnFRSUCC3.WCP	NORMAL_ACTIVE	NORMAL_PASSIVE
10	Number of valid correction terms reached the Passive to Active limit configured by FLXAnFRSUCC1.PTA	NORMAL_PASSIVE	NORMAL_ACTIVE
11	Command READY, FLXAnFRSUCC1.CMD = “0010_B”	STARTUP, NORMAL_ACTIVE, NORMAL_PASSIVE	READY
12	Clock Correction Failed counter reached Maximum Without Clock Correction Fatal limit configured by FLXAnFRSUCC3.WCF when bit FLXAnFRSUCC1.HCSE set to 1 or command HALT, FLXAnFRSUCC1.CMD = “0110_B”	NORMAL_ACTIVE	HALT
13	Clock Correction Failed counter reached Maximum Without Clock Correction Fatal limit configured by FLXAnFRSUCC3.WCF when bit FLXAnFRSUCC1.HCSE set to 1 or command HALT, FLXAnFRSUCC1.CMD = “0110_B”	NORMAL_PASSIVE	HALT
14	Command FREEZE, FLXAnFRSUCC1.CMD = “0111_B”	All States	HALT
15	Command CONFIG, FLXAnFRSUCC1.CMD = “0001_B”	HALT	DEFAULT_CONFIG

25.3.6.2 DEFAULT_CONFIG State

In DEFAULT_CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state.

The CC enters this state

- When the reset is applied (HW reset or SW reset)
- When exiting from HALT state

To leave DEFAULT_CONFIG state the Host has to write FLXAnFRSUCC1.CMD = “0001_B”. The CC then transits to CONFIG state.

25.3.6.3 CONFIG State

In CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state. This state is used to initialize the CC configuration.

The CC enters this state

- When exiting from DEFAULT_CONFIG state
- When exiting from READY state

When the state has been entered via HALT and DEFAULT_CONFIG state, the Host can analyze status information and configuration. Before leaving CONFIG state the Host has to confirm that the configuration is fault-free.

To leave CONFIG state, the Host has to perform the unlock sequence as described is **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**. Directly after unlocking the CONFIG state the Host has to write FLXAnFRSUCC1.CMD to enter the next state.

CAUTION

Status bits FLXAnFRMHDS[14:0], registers FLXAnFRTXRQ1/2/3/4, and status data stored in the Message RAM are not affected by the transition of the POC from CONFIG to READY state.

When the CC is in CONFIG state it is also possible to bring the CC into a power saving mode by halting the module clocks (bus clock and sample clock). To do this the Host has to confirm that all Message RAM transfers have finished before turning off the clocks.

25.3.6.4 READY State

After unlocking CONFIG state and writing FLXAnFRSUCC1.CMD = “0010_B”, the CC enters READY state. From this state the CC can transit to WAKEUP state and perform a cluster wakeup or to STARTUP state to perform a coldstart or to integrate into a running cluster.

The CC enters this state

- When exiting from CONFIG, WAKEUP, STARTUP, NORMAL_ACTIVE, or NORMAL_PASSIVE state by writing FLXAnFRSUCC1.CMD = “0010_B” (READY command).

The CC exits from this state

- To CONFIG state by writing FLXAnFRSUCC1.CMD = “0001_B” (CONFIG command)
- To WAKEUP state by writing FLXAnFRSUCC1.CMD = “0011_B” (WAKEUP command)
- To STARTUP state by writing FLXAnFRSUCC1.CMD = “0100_B” (RUN command)

Internal counters and the CC status flags are reset when the CC enters STARTUP state.

CAUTION

Status bits FLXAnFRMHDS[14:0], registers FLXAnFRTXRQ1/2/3/4, and status data stored in the Message RAM are not affected by the transition of the POC from READY to STARTUP state.

25.3.6.5 WAKEUP State

The description below is intended to help configuring wakeup for the FlexRay IP-module. A detailed description of the wakeup procedure together with the respective SDL diagrams can be found in *the FlexRay protocol specification v2.1, section 7.1*.

The CC enters this state

- When exiting from READY state by writing FLXAnFRSUCC1.CMD = “0011_B” (WAKEUP command).

The CC exits from this state to READY state

- After complete non-aborted transmission of wakeup pattern (WUP)
- After WUP reception
- After detecting a WUP collision
- After reception of a frame header
- By writing FLXAnFRSUCC1.CMD = “0010_B” (READY command)

The cluster wakeup must precede the communication startup in order to ensure that all nodes in a cluster are awake. The minimum requirement for a cluster wakeup is that all bus drivers are supplied with power. A bus driver has the ability to wake up the other components of its node when it receives a wakeup pattern on its channel. At least one node in the cluster needs an external wakeup source.

The Host completely controls the wakeup procedure. It is informed about the state of the cluster by the bus driver and the CC and configures bus guardian (if available) and CC to perform the cluster wakeup. The CC provides to the Host the ability to transmit a special wakeup pattern on each of its available channels separately. The CC needs to recognize the wakeup pattern only during WAKEUP state.

Wakeup may be performed on only one channel at a time. The Host has to configure the wakeup channel while the CC is in CONFIG state by writing FLXAnFRSUCC1.WUCS. The CC ensures that ongoing communication on this channel is not disturbed. The CC cannot guarantee that all nodes connected to the configured channel awake upon the transmission of the wakeup pattern, since these nodes cannot give feedback until the startup phase. The wakeup procedure enables single-channel devices in a two-channel system to trigger the wakeup, by only transmitting the wakeup pattern on the single channel to which they are connected. Any coldstart node that deems a system startup necessary will then wake the remaining channel before initiating communication startup.

The wakeup procedure tolerates any number of nodes simultaneously trying to wakeup a single channel and resolves this situation such that only one node transmits the pattern. Additionally the wakeup pattern is collision resilient, so even in the presence of a fault causing two nodes to simultaneously transmit a wakeup pattern, the resulting collided signal can still wake the other nodes.

After wakeup the CC returns to READY state and signals the change of the wakeup status to the Host by setting flag FLXAnFRSIR.WST. The wakeup status vector can be read from FLXAnFRCCSV.WSV. If a valid wakeup pattern was received also either flag FLXAnFRSIR.WUPA or flag FLXAnFRSIR.WUPB is set to 1.

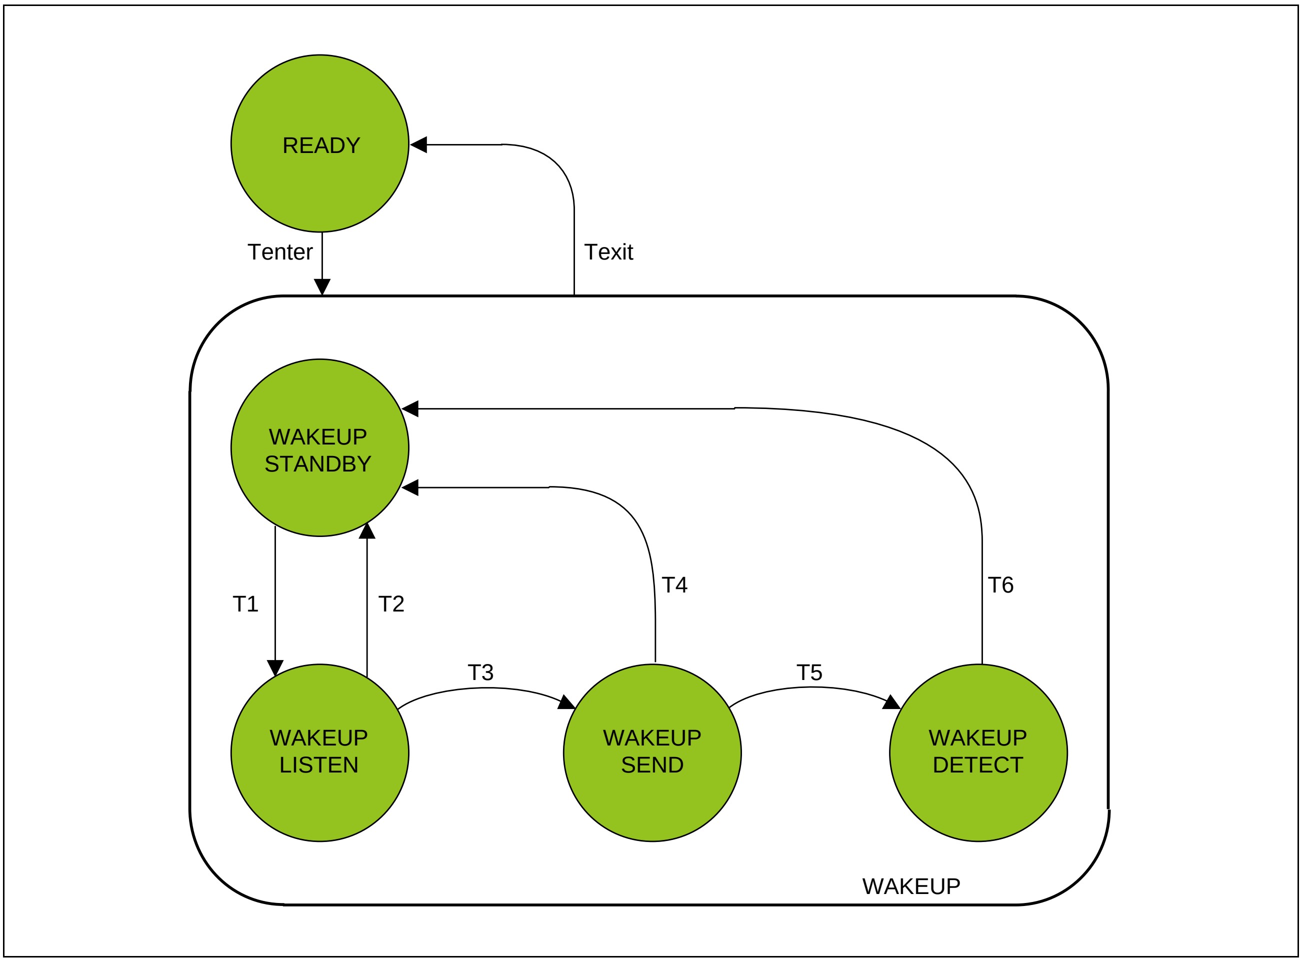

Figure 25.8 Structure of POC State WAKEUP

Table 25.110 State Transitions WAKEUP

T#	Condition	From	To
enter	Host commands change to WAKEUP state by writing FLXAnFRSUCC1.CMD = “0011_B” (WAKEUP command)	READY	WAKEUP
1	CHI command WAKEUP triggers wakeup FSM to transit to WAKEUP_LISTEN state	WAKEUP_STANDBY	WAKEUP_LISTEN
2	Received WUP on wakeup channel selected by bit FLXAnFRSUCC1.WUCS or frame header on either available channel	WAKEUP_LISTEN	WAKEUP_STANDBY
3	Timer event	WAKEUP_LISTEN	WAKEUP_SEND
4	Complete, non-aborted transmission of wakeup pattern	WAKEUP_SEND	WAKEUP_STANDBY
5	Collision detected	WAKEUP_SEND	WAKEUP_DETECT
6	Wakeup timer expired or WUP detected on wakeup channel selected by bit FLXAnFRSUCC1.WUCS or frame header received on either available	WAKEUP_DETECT	WAKEUP_STANDBY
exit	Wakeup completed (after T2 or T4 or T6) or Host commands change to READY state by writing FLXAnFRSUCC1.CMD = “0010_B” (READY command). This command also resets the wakeup FSM to WAKEUP_STANDBY state	WAKEUP	READY

The WAKEUP_LISTEN state is controlled by the wakeup timer and the wakeup noise timer. The two timers are controlled by the ListenTimeout (FLXAnFRSUCC2.LT bit) and ListenTimeoutNoise (FLXAnFRSUCC2.LTN bit) values. ListenTimeout enables a fast cluster wakeup in case of a noise free environment, while ListenTimeoutNoise enables wakeup under more difficult conditions regarding noise interference.

In WAKEUP_SEND state the CC transmits the wakeup pattern on the configured channel and checks for collisions. After return from wakeup the Host has to bring the CC into STARTUP state by CHI command RUN.

In WAKEUP_DETECT state the CC attempts to identify the reason for the wakeup collision detected in WAKEUP_SEND state. The monitoring is bounded by the expiration of listen timeout as configured by FLXAnFRSUCC2.LT. Either the detection of a wakeup pattern indicating a wakeup attempt by another node or the reception of a frame header indicating ongoing communication, causes the direct transition to READY state. Otherwise WAKEUP_DETECT is left after expiration of listen timeout; in this case the reason for wakeup collision is unknown.

The Host has to be aware of possible failures of the wakeup and act accordingly. It is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal time it takes another coldstart node to become awake and to be configured.

The FlexRay Protocol Specification recommends that two different CCs shall awake the two channels.

(1) Host Activities

The host must coordinate the wakeup of the two channels and must decide whether, or not, to wake a specific channel. The sending of the wakeup pattern is initiated by the Host. The wakeup pattern is detected by the remote BDs and signaled to their local Host.

Wakeup procedure controlled by Host (single-channel wakeup):

- Configure the CC in CONFIG state
  - Select wakeup channel by programming FLXAnFRSUCC1.WUCS
- Check local BDs whether a WUP was received
- Activate BD of selected wakeup channel
- Command CC to enter READY state
- Command CC to start wakeup on the configured channel by writing FLXAnFRSUCC1.CMD = “0011_B”
  - CC enters WAKEUP
  - CC returns to READY state and signals status of wakeup attempt to the Host
- Wait predefined time to allow the other nodes to wakeup and configure themselves
- Coldstart node:
  - In a dual channel cluster wait for WUP on the other channel
  - Reset coldstart inhibit flag FLXAnFRCCSV.CSI by writing FLXAnFRSUCC1.CMD = “1001_B” (ALLOW_COLDSTART command)
- Command CC to enter startup by writing FLXAnFRSUCC1.CMD = “0100_B” (RUN command)

Wakeup procedure triggered by BD:

- Wakeup recognized by BD
- BD triggers power-up of Host (if required)
- BD signals wakeup event to Host
- Host configures its local CC
- If necessary, Host commands wakeup of second channel and waits predefined time to allow the other nodes to wakeup and configure themselves
- Host commands CC to enter STARTUP state by writing FLXAnFRSUCC1.CMD = “0100_B” (RUN command)

(2) Wakeup Pattern (WUP)

The wakeup pattern (WUP) is composed of at least two wakeup symbols (WUS). Wakeup symbol and wakeup pattern are configured by registers FLXAnFRPRTC1 and FLXAnFRPRTC2.

- Single channel wakeup, wakeup symbol may not be sent on both channels at the same time
- Wakeup symbol collision resilient for at least two sending nodes (two overlapping wakeup symbols always recognizable)
- Wakeup symbol must be configured identical in all nodes of a cluster
- Wakeup symbol transmit low time configured by FLXAnFRPRTC2.TXL
- Wakeup symbol idle time used to listen for activity on the bus, configured by FLXAnFRPRTC2.TXI
- A wakeup pattern composed of at least two Tx-wakeup symbols needed for wakeup
- Number of repetitions configurable by FLXAnFRPRTC1.RWP (2 to 63 repetitions)
- Wakeup symbol receive window length configured by FLXAnFRPRTC1.RXW
- Wakeup symbol receive low time configured by FLXAnFRPRTC2.RXL
- Wakeup symbol receive idle time configured by FLXAnFRPRTC2.RXI

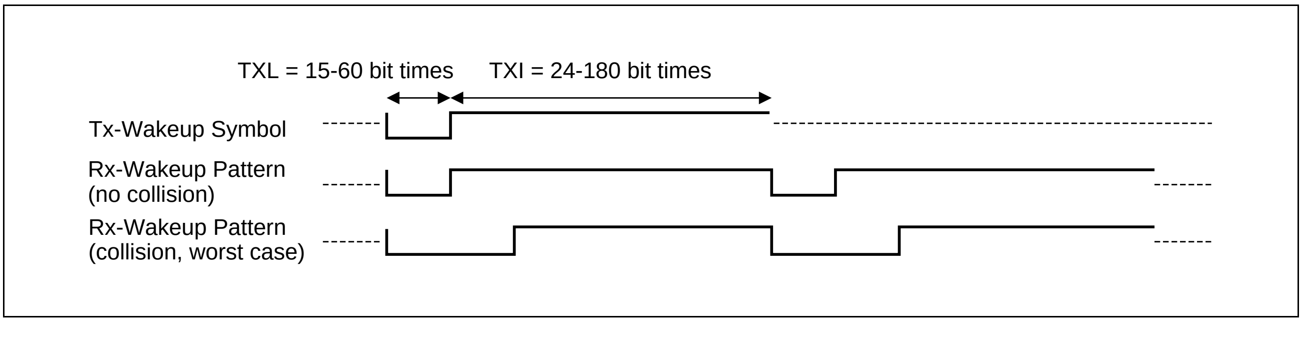

Figure 25.9 Timing of Wakeup Pattern

25.3.6.6 STARTUP State

The description below is intended to help configuring startup for the FlexRay module. A detailed description of the startup procedure together with the respective SDL diagrams can be found in *the FlexRay protocol specification v2.1, section 7.2*.

Any node entering STARTUP state that has coldstart capability should confirm that both channels attached have been awakened before initiating coldstart.

It cannot be assumed that all nodes and stars need the same amount of time to become completely awake and to be configured. Since at least two nodes are necessary to start up the cluster communication, it is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal amount of time it takes another coldstart node to become awake, to be configured and to enter startup. It may require several hundred milliseconds (depending on the hardware used) before all nodes and stars are completely awakened and configured.

Startup is performed on all channels synchronously. During startup, a node only transmits startup frames. Startup frames are both sync frames and null frames during startup.

A fault-tolerant, distributed startup strategy is used to ensure that all nodes are synchronized initially. In general, a node may enter NORMAL_ACTIVE state via (see **Figure 25.10, State Diagram Time — Triggered Startup**):

- Coldstart path initiating the schedule synchronization (LeadingColdstart node)
- Coldstart path joining other coldstart nodes (FollowingColdstart node)
- Integration path integrating into an existing communication schedule (all other nodes)

A coldstart attempt begins with the transmission of a collision avoidance symbol (CAS). Only a coldstart node that had transmitted the CAS transmits frames in the first four cycles after the CAS, it is then joined firstly by the other coldstart nodes and afterwards by all other nodes.

A coldstart node has bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY set to 1. Message buffer 0 holds the key slot ID which defines the slot number where the startup frame is send. In the frame header of the startup frame the startup frame indicator bit is set to 1.

In clusters consisting of three or more nodes, at least three nodes shall be configured to be coldstart nodes. In clusters consisting of two nodes, both nodes must be coldstart nodes. At least two fault-free coldstart nodes are necessary for the cluster to startup.

Each startup frame must also be a sync frame; therefore each coldstart node will also be a sync node. The number of coldstart attempts is configured by FLXAnFRSUCC1.CSA.

A non-coldstart node requires at least two startup frames from distinct nodes for integration. It may start integration before the coldstart nodes have finished their startup. It will not finish its startup until at least two coldstart nodes have finished their startup.

Both non-coldstart nodes and coldstart nodes start passive integration via the integration path as soon as they receive sync frames from which to derive the TDMA schedule information. During integration, the node has to adapt its own clock to the global clock (rate and offset) and has to make its cycle time consistent with the global schedule observable at the network. Afterwards, these settings are checked for consistency with all available network nodes. The node can only leave the integration phase and actively participate in communication when these checks are passed.

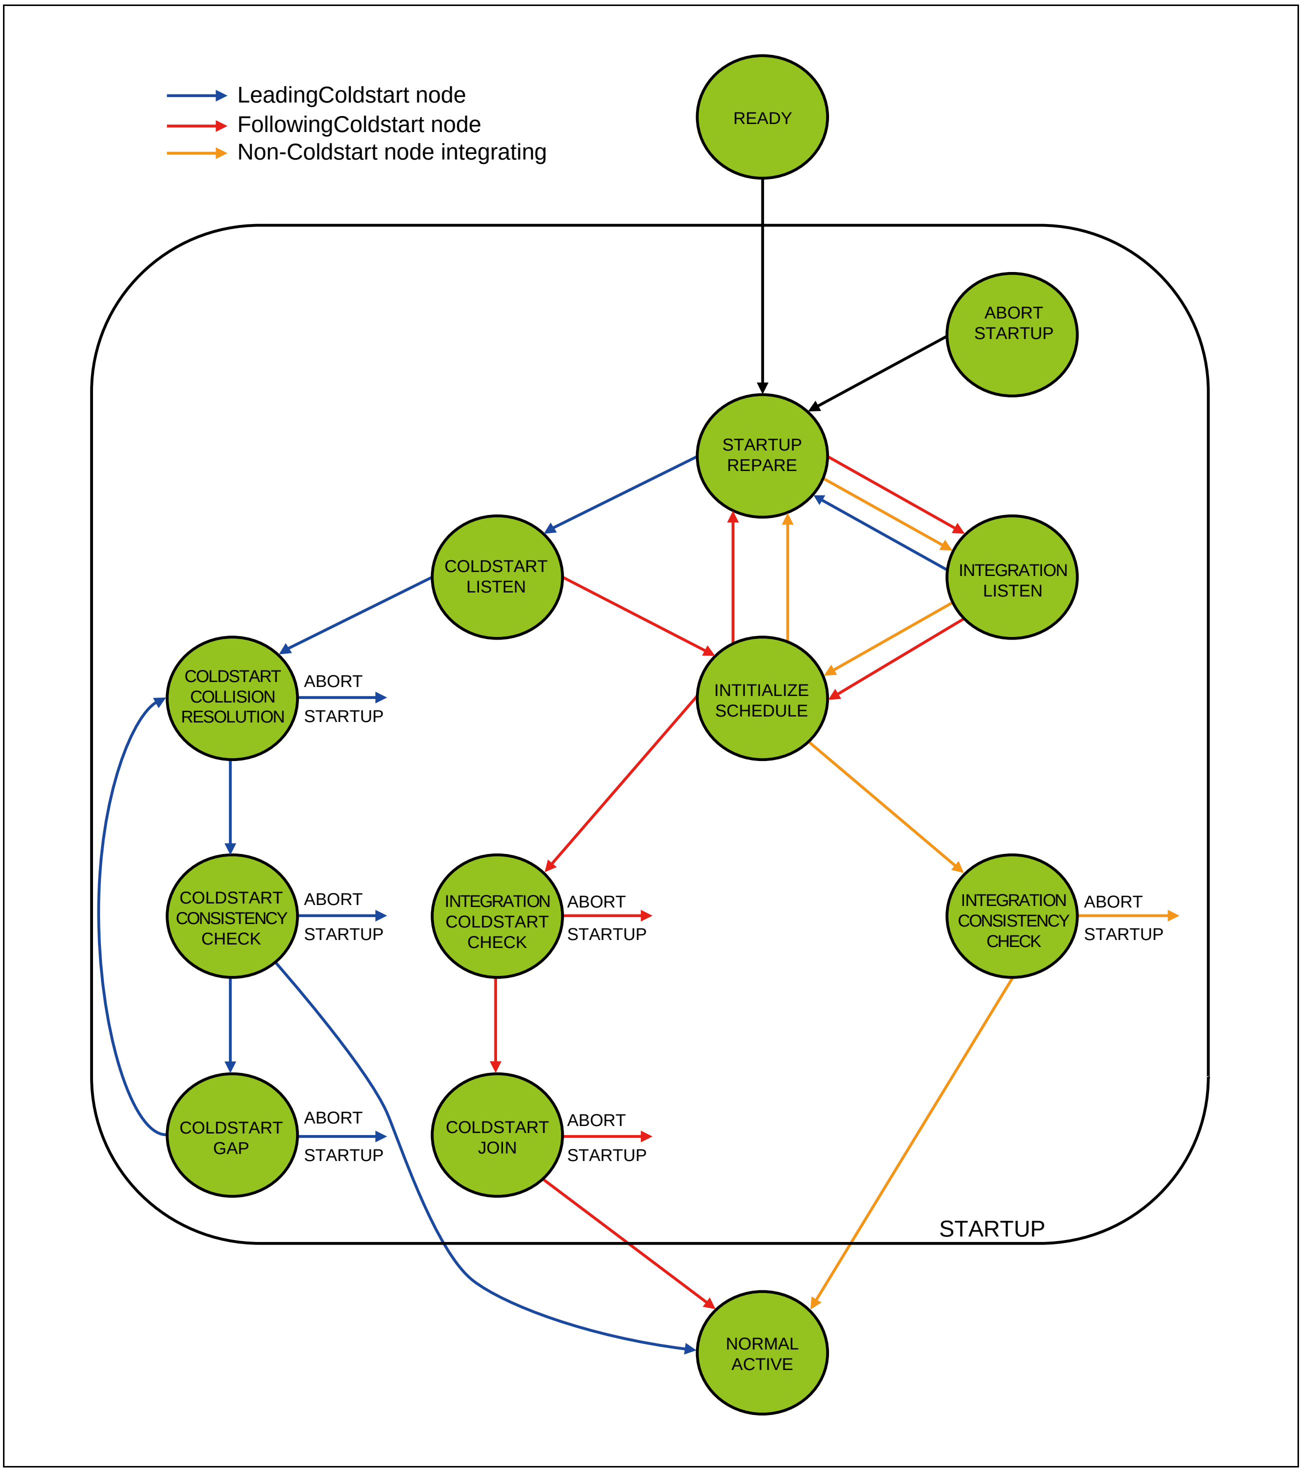

Figure 25.10 State Diagram Time — Triggered Startup

(1) Coldstart Inhibit Mode

In coldstart inhibit mode the node is prevented from initializing the TDMA communication schedule. If bit FLXAnFRCCSV.CSI is set to 1, the node is not allowed to initialize the cluster communication, i.e. entering the coldstart path is prohibited. The node is allowed to integrate to a running cluster or to transmit startup frames after another coldstart node started the initialization of the cluster communication.

The coldstart inhibit bit FLXAnFRCCSV.CSI is set to 1 whenever the POC enters READY state. The bit has to be cleared under control of the Host by CHI command ALLOW_COLDSTART (FLXAnFRSUCC1.CMD = “1001_B”)

(2) Startup Timeouts

The CC supplies two different µT timers supporting two timeout values, startup timeout and startup noise timeout. The two timers are started when the CC enters the COLDSTART_LISTEN state. The expiration of either of these timers causes the node to leave the initial sensing phase (COLDSTART_LISTEN state) with the intention of starting up communication.

CAUTION

The startup and startup noise timers are identical with the wakeup and wakeup noise timers and use the same configuration values FLXAnFRSUCC2.LT and FLXAnFRSUCC2.LTN.

(a) Startup Timeout

The startup timeout limits the listen time used by a node to determine if there is already communication between other nodes or at least one coldstart node actively requesting the integration of others. The startup timer is configured by programming FLXAnFRSUCC2.LT (see **Section 25.2.6.2, FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2**).

The startup timeout is:

pdListenTimeout = FLXAnFRSUCC2.LT

The startup timer is restarted upon:

- Entering the COLDSTART_LISTEN state
- Both channels reaching idle state while in COLDSTART_LISTEN state

The startup timer is stopped:

- If communication channel activity is detected on one of the configured channels while the node is in the COLDSTART_LISTEN state
- When the COLDSTART_LISTEN state is left

Once the startup timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The timer status is kept for further processing by the startup state machine.

(b) Startup Noise Timeout

At the same time the startup timer is started for the first time (transition from STARTUP_PREPARE state to COLDSTART_LISTEN state), the startup noise timer is started. This additional timeout is used to improve reliability of the startup procedure in the presence of noise. The startup noise timeout is configured by programming FLXAnFRSUCC2.LTN
(see **Section 25.2.6.2, FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2**).

The startup noise timeout is:

pdListenTimeout × gListenNoise = FLXAnFRSUCC2.LT × (FLXAnFRSUCC2.LTN + 1)

The startup noise timer is restarted upon:

- Entering the COLDSTART_LISTEN state
- Reception of correctly decoded headers or CAS symbols while the node is in COLDSTART_LISTEN state

The startup noise timer is stopped when the COLDSTART_LISTEN state is left.

Once the startup noise timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The status is kept for further processing by the startup state machine. Since the startup noise timer won’t be restarted when random channel activity is sensed, this timeout defines the fall-back solution that guarantees that a node will try to start up the communication cluster even in the presence of noise.

(3) Path of Leading Coldstart Node (Initiating Coldstart)

When a coldstart node enters COLDSTART_LISTEN, it listens to its attached channels.

If no communication is detected, the node enters the COLDSTART_COLLISION_RESOLUTION state and commences a coldstart attempt. The initial transmission of a CAS symbol is succeeded by the first regular cycle. This cycle has the number zero.

From cycle zero on, the node transmits its startup frame. Since each coldstart node may perform a coldstart attempt, it may occur that several nodes simultaneously transmit the CAS symbol and enter the coldstart path. This situation is resolved during the first four cycles after CAS transmission.

As soon as a node that initiates a coldstart attempt receives a CAS symbol or a frame header during these four cycles, it re-enters the COLDSTART_LISTEN state. Thereby, only one node remains in this path. In cycle four, other coldstart nodes begin to transmit their startup frames.

After four cycles in COLDSTART_COLLISION_RESOLUTION state, the node that initiated the coldstart enters the COLDSTART_CONSISTENCY_CHECK state. It collects all startup frames from cycle four and five and performs the clock correction. If the clock correction does not deliver any errors and it has received at least one valid startup frame pair, the node leaves COLDSTART_CONSISTENCY_CHECK and enters NORMAL_ACTIVE state.

The number of coldstart attempts that a node is allowed to perform is configured by FLXAnFRSUCC1.CSA. The number of remaining coldstarts attempts can be read from FLXAnFRCCSV.RCA. The number of remaining coldstart attempts is reduced by one for each attempted coldstart. A node may enter the COLDSTART_LISTEN state only if this value is larger than one and it may enter the COLDSTART_COLLISION_RESOLUTION state only if this value is larger than zero. If the number of coldstart attempts is one, coldstart is inhibited but integration is still possible.

(4) Path of Following Coldstart Node (Responding to Leading Coldstart Node)

When a coldstart node enters the COLDSTART_LISTEN state, it tries to receive a valid pair of startup frames to derive its schedule and clock correction from the leading coldstart node.

As soon as a valid startup frame has been received the INITIALIZE_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION_COLDSTART_CHECK state is entered.

In INTEGRATION_COLDSTART_CHECK state it is confirmed that the clock correction can be performed correctly and that the coldstart node from which this node has initialized its schedule is still valid. The node collects all sync frames and performs clock correction in the following double-cycle. If clock correction does not signal any errors and if the node continues to receive sufficient frames from the same node it has integrated on, the COLDSTART_JOIN state is entered.

In COLDSTART_JOIN state following coldstart nodes begin to transmit their own startup frames and continue to do so in subsequent cycles. Thereby, the leading coldstart node and the nodes joining it can check if their schedules agree with each other. If the clock correction signals any error, the node aborts the integration attempt. If a node in this state sees at least one valid startup frame during all even cycles in this state and at least one valid startup frame pair during all double cycles in this state, the node leaves COLDSTART_JOIN state and enters NORMAL_ACTIVE state. Thereby it leaves STARTUP at least one cycle after the node that initiated the coldstart.

(5) Path of Non-Coldstart Node

When a non-coldstart node enters the INTEGRATION_LISTEN state, it listens to its attached channels.

As soon as a valid startup frame has been received, the INITIALIZE_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION_CONSISTENCY_CHECK state is entered.

In INTEGRATION_CONSISTENCY_CHECK state the node verifies that the clock correction can be performed correctly and that enough coldstart nodes (at least 2) are sending startup frames that agree with the node’s own schedule. Clock correction is activated, and if any errors are signaled, the integration attempt is aborted.

During the first even cycle in this state, either two valid startup frames or the startup frame of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

During the first double-cycle in this state, either two valid startup frame pairs or the startup frame pair of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

If after the first double-cycle less than two valid startup frames are received within an even cycle, or less than two valid startup frame pairs are received within a double-cycle, the startup attempt is aborted.

Nodes in this state need to see two valid startup frame pairs for two consecutive double-cycles each to be allowed to leave STARTUP and enter NORMAL_OPERATION. Consequently, they leave startup at least one double-cycle after the node that initiated the coldstart and only at the end of a cycle with an odd cycle number.

25.3.6.7 NORMAL_ACTIVE State

As soon as the node that transmitted the first CAS symbol (resolving the potential access conflict and entering STARTUP via coldstart path) and one additional node have entered the NORMAL_ACTIVE state, the startup phase for the cluster has finished. In the NORMAL_ACTIVE state, all configured messages are scheduled for transmission. This includes all data frames as well as the sync frames. Rate and offset measurement is started in all even cycles (even/odd cycle pairs required).

In NORMAL_ACTIVE state the CC supports regular communication functions

- The CC performs transmissions and reception on the FlexRay bus as configured
- Clock synchronization is running
- The Host interface is operational

The CC exits from that state to

- HALT state by writing FLXAnFRSUCC1.CMD = “0110_B” (HALT command, at the end of the current cycle)
- HALT state by writing FLXAnFRSUCC1.CMD = “0111_B” (FREEZE command, immediately)
- HALT state due to change of the error state from ACTIVE to COMM_HALT
- NORMAL_PASSIVE state due to change of the error state from ACTIVE to PASSIVE
- READY state by writing FLXAnFRSUCC1.CMD = “0010_B” (READY command)

25.3.6.8 NORMAL_PASSIVE State

NORMAL_PASSIVE state is entered from NORMAL_ACTIVE state when the error state changes from ACTIVE to PASSIVE.

In NORMAL_PASSIVE state, the node is able to receive all frames (node is fully synchronized and performs clock synchronization). Contrary to the NORMAL_ACTIVE state, the node does not actively participate in communication, i.e. neither symbols nor frames are transmitted.

In NORMAL_PASSIVE state

- The CC performs reception on the FlexRay bus
- The CC does not transmit any frames or symbols on the FlexRay bus
- Clock synchronization is running
- The Host interface is operational

The CC exits from this state to

- HALT state by writing FLXAnFRSUCC1.CMD = “0110_B” (HALT command, at the end of the current cycle)
- HALT state by writing FLXAnFRSUCC1.CMD = “0111_B” (FREEZE command, immediately)
- HALT state due to change of the error state from PASSIVE to COMM_HALT
- NORMAL_ACTIVE state due to change of the error state from PASSIVE to ACTIVE. The transition takes place when FLXAnFRCCEV.PTAC equals FLXAnFRSUCC1.PTA – 1
- To READY state by writing FLXAnFRSUCC1.CMD = “0010_B” (READY command)

25.3.6.9 HALT State

In this state all communication (reception and transmission) is stopped.

The CC enters this state

- By writing FLXAnFRSUCC1.CMD = “0110_B” (HALT command) while the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state
- By writing FLXAnFRSUCC1.CMD = “0111_B” (FREEZE command) from all states
- When exiting from NORMAL_ACTIVE state because the clock correction failed counter reached the “maximum without clock correction fatal” limit and FLXAnFRSUCC1.HCSE is set to 1
- When exiting from NORMAL_PASSIVE state because the clock correction failed counter reached the “maximum without clock correction fatal” limit and FLXAnFRSUCC1.HCSE is set to 1

The CC exits from this state to DEFAULT_CONFIG state

- By writing FLXAnFRSUCC1.CMD = “0001_B” (CONFIG command)

When the CC enters HALT state, all configuration and status data is maintained for analyzing purposes.

When the Host writes FLXAnFRSUCC1.CMD = “0110_B” (HALT command), the CC sets bit FLXAnFRCCSV.HRQ to 1 and enters HALT state at the next end of cycle.

When the Host writes FLXAnFRSUCC1.CMD = “0111_B” (FREEZE command), the CC enters HALT state immediately and sets bit FLXAnFRCCSV.FSI to 1.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

25.3.7 Network Management

The accrued Network Management (NM) vector can be read from registers FLXAnFRNMV1 to FLXAnFRNMV3. The CC performs a bit-wise OR operation over all NM vectors out of all received valid NM frames with the Payload Preamble Indicator (PPI) bit set. Only static frames may be configured to hold NM information. The CC updates the NM vector at the end of each cycle.

The length of the NM vector can be configured from 0 to 12 bytes by FLXAnFRNEMC.NML. The NM vector length must be configured identically in all nodes of a cluster.

To configure a transmit buffer to send FlexRay frames with the PPI bit set as 1, bit PPIT in the header section of the respective transmit buffer has to be set to 1 via FLXAnFRWRHS1.PPIT. In addition the Host has to write the NM information to the data section of the respective transmit buffer.

The evaluation of the NM vector has to be done by the application running on the Host.

Section 25.3.17, Byte Alignment, for byte alignment of the received NM vector in registers FLXAnFRNMV1 to FLXAnFRNMV3.

CAUTIONS

1. In case a message buffer is configured for transmission/reception of network management frames, the payload length configured in header 2 of that message buffer should be equal or greater than the length of the NM vector configured by FLXAnFRNEMC.NML.
2. When the CC transits to HALT state, the cycle count is not incremented and therefore the NM vector is not updated. In this case FLXAnFRNMV1 to FLXAnFRNMV3 holds the value from the cycle before.

25.3.8 Filtering and Masking

Filtering is done by comparison of the configuration of assigned message buffers against actual slot and cycle counter values and channel ID (channel A, B). A message buffer is only updated/transmitted if the required matches occur.

Filtering is done on:

- Slot Counter
- Cycle Counter
- Channel ID

The following filter combinations for acceptance/transmit filtering are allowed:

- Slot Counter + Channel ID
- Slot Counter + Cycle Counter + Channel ID

All configured filters must match in order to store a received message in a message buffer.

CAUTION

For the FIFO the acceptance filter is configured by the FIFO Rejection Filter (FLXAnFRFRF) and the FIFO Rejection Filter Mask (FLXAnFRFRFM).

A message will be transmitted in the time slot corresponding to the configured frame ID on the configured channel(s). If cycle counter filtering is enabled the configured cycle filter value must also match.

25.3.8.1 Slot Counter Filtering

Every transmit and receive buffer contains a frame ID stored in the header section. This frame ID is compared against the actual slot counter value in order to assign receive and transmit buffers to the corresponding slot.

If two or more message buffers are configured with the same frame ID and channel ID, and if they have a matching cycle counter filter value for the same slot, then the message buffer with the lowest message buffer number is used.

25.3.8.2 Cycle Counter Filtering

Cycle counter filtering is based on the notion of a cycle set. For filtering purposes, a match is detected if any one of the elements of the cycle set is matched. The cycle set is defined by the cycle code field in header section 1 of each message buffer.

If message buffer 0 or 1 is configured to hold the startup/sync frame or the single slot frame by bits FLXAnFRSUCC1.TXST, FLXAnFRSUCC1.TXSY, and FLXAnFRSUCC1.TSM, cycle counter filtering for message buffer 0 or 1 shall be disabled.

CAUTION

Sharing of a static time slot via cycle counter filtering between different nodes of a FlexRay network is not allowed.

The set of cycle numbers belonging to a cycle set is determined as described in **Table 25.111, Definition of Cycle Set**.

Table 25.111 Definition of Cycle Set

Cycle Code	Matching Cycle Counter Values
0b000000x	all Cycles
0b000001c	every second Cycle at (Cycle Count) mod2 = c
0b00001cc	every fourth Cycle at (Cycle Count) mod4 = cc
0b0001ccc	every eighth Cycle at (Cycle Count) mod8 = ccc
0b001cccc	every sixteenth Cycle at (Cycle Count) mod16 = cccc
0b01ccccc	every thirty-second Cycle at (Cycle Count) mod32 = ccccc
0b1cccccc	every sixty-fourth Cycle at (Cycle Count) mod64 = cccccc

Table 25.112, Examples for Valid Cycle Sets below gives some examples for valid cycle sets to be used for cycle counter filtering.

Table 25.112 Examples for Valid Cycle Sets

Cycle Code	Matching Cycle Counter Values
0b0000011	1-3-5-7-….-63
0b0000100	0-4-8-12-….-60
0b0001110	6-14-22-30-….-62
0b0011000	8-24-40-56
0b0100011	3-35
0b1001001	9

The received message is stored only if the cycle counter value of the cycle during which the message is received matches an element of the receive buffer’s cycle set. Channel ID and frame ID must also be met.

The content of a transmit buffer is transmitted on the configured channel(s) when an element of the cycle set matches the current cycle counter value. Channel ID and frame ID must also match.

25.3.8.3 Channel ID Filtering

There is a 2-bit channel filtering field (CH) located in the header section of each message buffer in the Message RAM. It serves as a filter for receive buffers, and as a control field for transmit buffers (see **Table 25.113, Channel Filtering Configuration**).

Table 25.113 Channel Filtering Configuration

CH[1:0]	Transmit Buffer Transmit Frame	Receive Buffer Store Valid Receive Frame
00_B	no transmission	ignore frame
01_B	on channel A	received on channel A
10_B	on channel B	received on channel B
11_B	on both channels (static segment only)	received on channel A or B (store first semantically valid frame, static segment only)

The contents of a transmit buffer is transmitted on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a transmit buffer may be set up for transmission on both channels (CH = “11_B”).

Valid received frames are stored if they are received on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a receive buffer may be setup for reception on both channels (CH = “11_B”).

CAUTION

If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to 1, no frames are transmitted and received frames are ignored (same function as CH = “00_B”).

25.3.8.4 FIFO Filtering

For FIFO filtering registers FLXAnFRFRF and FLXAnFRFRFM are used. The FIFO filter consists of channel filter FLXAnFRFRF.CH, frame ID filter FLXAnFRFRF.FID, and cycle counter filter FLXAnFRFRF.CYF. Registers FLXAnFRFRF and FLXAnFRFRFM can be configured in DEFAULT_CONFIG or CONFIG state only. The filter configuration in the header section of message buffers belonging to the FIFO is ignored.

The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by FLXAnFRFRF.CYF, all frames are rejected.

A valid received frame is stored in the FIFO if channel ID, frame ID, and cycle counter are not rejected by the configured rejection filter and rejection filter mask, and if there is no matching dedicated receive buffer.

25.3.9 Transmit Process

25.3.9.1 Static Segment

For the static segment, if there are several messages pending for transmission, the message with the frame ID corresponding to the next sending slot is selected for transmission.

The data section of transmit buffers assigned to the static segment can be updated until the end of the preceding time slot. This means that a transfer from the Input Buffer has to be started by writing to the Input Buffer Command Request register latest at this time.

25.3.9.2 Dynamic Segment

In the dynamic segment, if several messages are pending, the message with the highest priority (lowest frame ID) is selected next. In the dynamic segment different slot counter sequences on channel A and channel B are possible (concurrent sending of different frame IDs on both channels).

The data section of transmit buffers assigned to the dynamic segment can be updated until the end of the preceding slot. This means that a transfer from the Input Buffer has to be started by writing to the Input Buffer Command Request register latest at this time.

The start of latest transmit configured by FLXAnFRMHDC.SLT defines the maximum minislot value allowed before inhibiting new frame transmission in the dynamic segment of the current cycle.

25.3.9.3 Transmit Buffers

FlexRay message buffers can be configured as transmit buffers by programming bit CFG in the header section of the respective message buffer to 1 via FLXAnFRWRHS1.

There exist the following possibilities to assign a transmit buffer to the CC channels:

- Static segment: channel A or channel B,
  channel A and channel B
- Dynamic segment: channel A or channel B

Message buffers 0 and 1 are dedicated to holding the startup frame, the sync frame, or the designated single slot frame as configured by FLXAnFRSUCC1.TXST, FLXAnFRSUCC1.TXSY, and FLXAnFRSUCC1.TSM. In this case, it can be reconfigured in DEFAULT_CONFIG or CONFIG state only. This ensures that any node transmits at most one startup/sync frame per communication cycle. Transmission of startup/sync frames from other message buffers is not possible.

All other message buffers configured for transmission in static or dynamic segment are reconfigurable during runtime depending on the configuration of FLXAnFRMRC.SEC (see **Section 25.3.12.1, Reconfiguration of Message Buffers**). Due to the organization of the data partition in the Message RAM (reference by data pointer), reconfiguration of the configured payload length and the data pointer in the header section of a message buffer may lead to erroneous configurations.

If a message buffer is reconfigured (header section updated) during runtime, it may happen that this message buffer is not send out in the respective communication cycle.

The CC does not have the capability to calculate the header CRC. The Host is supposed to provide the header CRCs for all transmit buffers. If network management is required, the Host has to set the PPIT bit in the header section of the respective message buffer to 1 and write the network management information to the data section of the message buffer (see **Section 25.3.7, Network Management**).

The payload length field configures the payload length in 2-byte words. If the configured payload length of a static transmit buffer is shorter than the payload length configured for the static segment by FLXAnFRMHDC.SFDL, the CC generates padding bytes to ensure that frames have proper physical length. The padding pattern is “0000_H”.

CAUTION

In case of an odd payload length (PLC = 1, 3, 5, ...) the application has to write zero to the last 16 bit of the message buffers data section to ensure that the padding pattern is “0000_H”.

Each transmit buffer provides a transmission mode flag TXM that allows the Host to configure the transmission mode for the transmit buffer. If this bit is set, the transmitter operates in the single-shot mode. If this bit is cleared, the transmitter operates in the continuous mode.

In single-shot mode the CC resets the respective TXR flag to 0 after transmission has completed. Now the Host may update the transmit buffer.

In continuous mode, the CC does not reset the respective transmission request flag TXR to 0 after successful transmission. In this case a frame is sent out each time the filter criteria match. The TXR flag can be reset to 0 by the Host by writing the respective message buffer number to the FLXAnFRIBCR register while bit FLXAnFRIBCM.STXRH is set to 0.

If two or more transmit buffers meet the filter criteria simultaneously, the transmit buffer with the lowest message buffer number will be transmitted in the respective slot.

25.3.9.4 Frame Transmission

The following steps are required to prepare a message buffer for transmission:

- Configure the transmit buffer in the Message RAM via FLXAnFRWRHS1, FLXAnFRWRHS2, and FLXAnFRWRHS3
- Write the data section of the transmit buffer via FLXAnFRWRDSx
- Transfer the configuration and message data from Input Buffer to the Message RAM by writing the number of the target message buffer to register FLXAnFRIBCR
- If configured in register FLXAnFRIBCM, the transmission request flag TXR for the respective message buffer will be set as soon as the transfer has completed, and the message buffer is ready for transmission.
- Check whether the message buffer has been transmitted by checking the respective TXR bit (TXR = 0) in the FLXAnFRTXRQ1/2/3/4 registers (single-shot mode only).

After transmission has completed, the respective TXR flag in the FLXAnFRTXRQ1/2/3/4 register is reset to 0 (single-shot mode), and, if bit MBI in the header section of the message buffer is set to 1, flag FLXAnFRSIR.TXI is set to 1. If enabled, an interrupt is generated.

25.3.9.5 Null Frame Transmission

If in static segment the Host does not set the transmission request flag to 1 before transmit time, the CC transmits a null frame with the null frame indication bit set to 0 and the payload data set to zero.

In the following cases the CC transmits a null frame:

- If the message buffer with the lowest message buffer number matching the filter criteria does not have its transmission request flag set (TXR = 0) to 1.
- No transmit buffer configured for the slot has a cycle counter filter that matches the current cycle. In this case, no message buffer status FLXAnFRMBS is updated.

Null frames are not transmitted in the dynamic segment.

25.3.10 Receive Process

25.3.10.1 Dedicated Receive Buffers

A portion of the FlexRay message buffers can be configured as dedicated receive buffers by programming bit CFG in the header section of the respective message buffer to 0 via FLXAnFRWRHS1.

The following possibilities exist to assign a receive buffer to the CC channels:

- Static segment: channel A or channel B,
  channel A and channel B (the CC stores the first semantically valid frame)
- Dynamic segment: channel A or channel B

The CC transfers the payload data of valid received messages from the shift register of the FlexRay channel protocol controller (channel A or B) to the receive buffer with the matching filter configuration. A receive buffer stores all frame elements except the frame CRC.

All message buffers configured for reception in static or dynamic segment are reconfigurable during runtime depending on the configuration of FLXAnFRMRC.SEC (see **Section 25.3.12.1, Reconfiguration of Message Buffers**). If a message buffer is reconfigured (header section updated) during runtime it may happen that in the respective communication cycle a received message is lost.

If two or more receive buffers meet the filter criteria simultaneously, the receive buffer with the lowest message buffer number is updated with the received message.

25.3.10.2 Frame Reception

The following steps are required to prepare a dedicated message buffer for reception:

- Configure the receive buffer in the Message RAM via FLXAnFRWRHS1, FLXAnFRWRHS2, and FLXAnFRWRHS3
- Transfer the configuration from Input Buffer to the Message RAM by writing the number of the target message buffer to register FLXAnFRIBCR

Once these steps are performed, the message buffer functions as an active receive buffer and participates in the internal acceptance filtering process which takes place every time the CC receives a message. The first matching receive buffer is updated from the received message.

If a valid payload segment was stored in the data section of a message buffer, the respective ND flag in the FLXAnFRNDAT1/2/3/4 registers is set to 1, and, if bit MBI in the header section of that message buffer is set to 1, flag FLXAnFRSIR.RXI is set to 1. If enabled, an interrupt is generated.

In case that bit ND was already set to 1 when the Message Handler updates the message buffer, bit FLXAnFRMBS.MLST of the respective message buffer is set to 1 and the unprocessed message data is lost.

If no frame, a null frame, or a corrupted frame was received in a slot, the data section of the message buffer configured for this slot is not updated. In this case only the respective message buffer status FLXAnFRMBS is updated.

When the Message Handler changed the message buffer status FLXAnFRMBS in the header section of a message buffer, the respective MBC flag in the FLXAnFRMBSC1/2/3/4 registers is set to 1, and if bit MBI in the header section of that message buffer is set, flag FLXAnFRSIR.MBSI is set to 1. If enabled an interrupt is generated.

If the payload length of a received frame PLR is longer than the value programmed by PLC in the header section of the respective message buffer, the data field stored in the message buffer is truncated to that length.

To read a receive buffer from the Message RAM via the Output Buffer, proceed as described in **Section 25.3.12.2(2), Data Transfer from Message RAM to Output Buffer**.

CAUTION

The ND and MBC flags are automatically cleared by the Message Handler when the payload data and the header of a received message have been transferred to the Output Buffer, respectively.

25.3.10.3 Null Frame Reception

The payload segment of a received null frame is not copied into the matching dedicated receive buffer. If a null frame has been received, only the message buffer status FLXAnFRMBS of the matching message buffer is updated from the received null frame. All bits in header 2 and 3 of the matching message buffer remain unchanged. They are updated from received data frames only.

When the Message Handler changed the message buffer status FLXAnFRMBS in the header section of a message buffer, the respective MBC flag in the FLXAnFRMBSC1/2/3/4 register is set to 1, and if bit MBI in the header section of that message buffer is set to 1, flag FLXAnFRSIR.MBSI is set to 1. If enabled, an interrupt is generated.

25.3.11 FIFO Function

25.3.11.1 Description

A portion of the message buffers can be configured as a cyclic First-In-First-Out (FIFO) buffer. The group of message buffers belonging to the FIFO is contiguous in the register map starting with the message buffer referenced by FLXAnFRMRC.FFB and ending with the message buffer referenced by FLXAnFRMRC.LCB. Up to 127 message buffers can be assigned to the FIFO.

Every valid incoming message not matching with any dedicated receive buffer but passing the programmable FIFO filter is stored into the FIFO. In this case frame ID, payload length, receive cycle count, and the message buffer status FLXAnFRMBS of the addressed FIFO message buffer are overwritten with frame ID, payload length, receive cycle count, and the status from the received frame. Bit FLXAnFRSIR.RFNE shows that the FIFO is not empty, bit FLXAnFRSIR.RFCL is set to 1 when the receive FIFO fill level FLXAnFRFSR.RFFL is equal or greater than the critical level as configured by FLXAnFRSIR.RFCL, bit FLXAnFREIR.RFO shows that a FIFO overrun has been detected. If enabled, interrupts are generated.

If null frames are not rejected by the FIFO rejection filter, the null frames will be treated like data frames when they are stored into the FIFO.

There are two index registers associated with the FIFO. The PUT Index Register (PIDX) is an index to the next available location in the FIFO. When a new message has been received it is written into the message buffer addressed by the PIDX register. The PIDX register is then incremented and addresses the next available message buffer. If the PIDX register is incremented past the highest numbered message buffer of the FIFO, the PIDX register is loaded with the number of the first (lowest numbered) message buffer in the FIFO chain. The GET Index Register (GIDX) is used to address the next message buffer of the FIFO to be read. The GIDX register is incremented after transfer of the contents of a message buffer belonging to the FIFO to the Output Buffer. The PUT Index Register and the GET Index Register are not accessible by the Host.

The FIFO is completely filled when the PUT index (PIDX) reaches the value of the GET index (GIDX). When the next message is written to the FIFO before the oldest message has been read, both PUT index and GET index are incremented and the new message overwrites the oldest message in the FIFO. This will set FIFO overrun flag FLXAnFREIR.RFO to 1.

A FIFO non empty status is detected when the PUT index (PIDX) differs from the GET index (GIDX). In this case flag FLXAnFRSIR.RFNE is set to 1. This indicates that there is at least one received message in the FIFO. The FIFO empty, FIFO not empty, and the FIFO overrun states are explained in **Figure 25.11, FIFO Status: Empty, Not Empty, Overrun** for a three message buffer FIFO.

The programmable FlexRay FIFO Rejection Filter (FLXAnFRFRF) defines a filter pattern for messages to be rejected. The FIFO filter consists of channel filter, frame ID filter, and cycle counter filter. If bit FLXAnFRFRF.RSS is set to 1, all messages received in the static segment are rejected by the FIFO. If bit FLXAnFRFRF.RNF is set to 1, received null frames are not stored in the FIFO.

The FlexRay FIFO Rejection Filter Mask (FLXAnFRFRFM) specifies which bits of the frame ID filter in the FIFO Rejection Filter register are marked “don’t care” for rejection filtering.

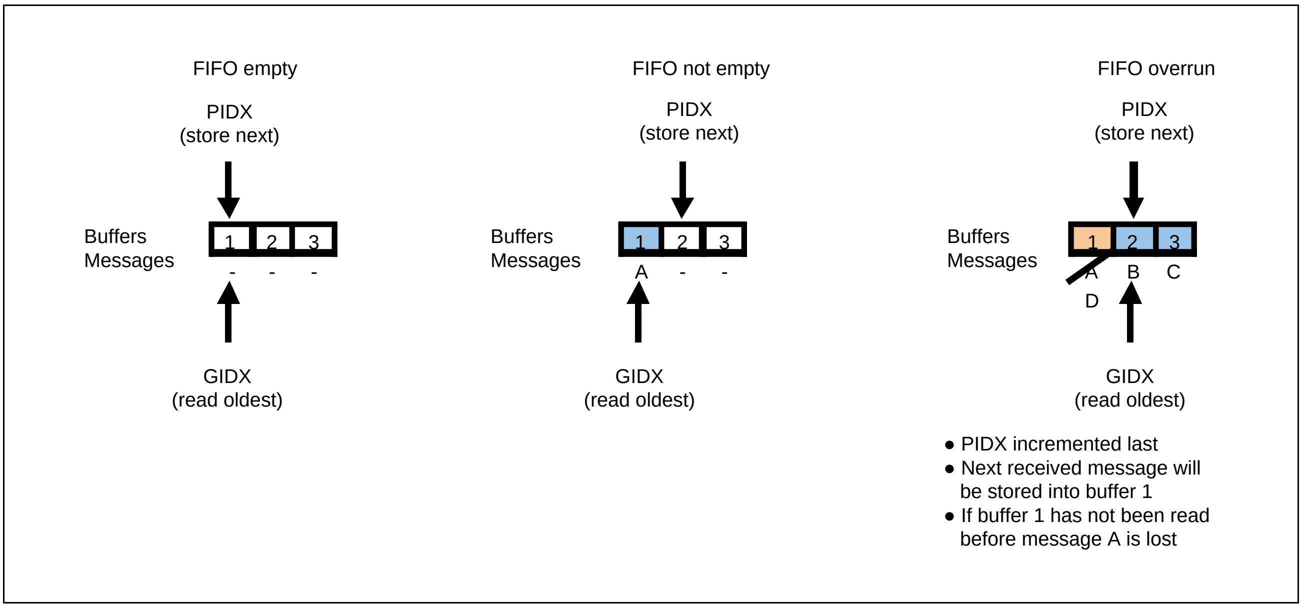

Figure 25.11 FIFO Status: Empty, Not Empty, Overrun

25.3.11.2 Configuration of the FIFO

(Re)configuration of message buffers belonging to the FIFO is only possible when the CC is in DEFAULT_CONFIG or CONFIG state. While the CC is in DEFAULT_CONFIG or CONFIG state, the FIFO function is not available.

For all message buffers belonging to the FIFO the payload length configured should be programmed to the same value via FLXAnFRWRHS2.PLC. The data pointer to the first 32-bit word of the data section of the respective message buffer in the Message RAM has to be configured via FLXAnFRWRHS3.DP.

All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask. The values configured in the header sections of the message buffers belonging to the FIFO are, with exception of DP and PLC, irrelevant.

CAUTIONS

1. It is recommended to program the MBI bits of the message buffers belonging to the FIFO to 0 via FLXAnFRWRHS1.MBI to avoid generation of interrupts.
2. If the payload length of a received frame is longer than the value programmed by FLXAnFRWRHS2.PLC in the header section of the respective message buffer, the data field stored in a message buffer of the FIFO is truncated to that length.

25.3.11.3 Access to the FIFO

(1) When the Output Buffer is Used:

For FIFO access outside DEFAULT_CONFIG and CONFIG state, the Host has to trigger a transfer from the Message RAM to the Output Buffer by writing the number of the first message buffer of the FIFO (referenced by FLXAnFRMRC.FFB) to the register FLXAnFROBCR. The Message Handler then transfers the message buffer addressed by the GET Index Register (GIDX) to the Output Buffer. After this transfer the GET Index Register (GIDX) is incremented.

(2) When the Data Transfer Function is Used:

The message received in FIFO can be transferred to the local RAM/global RAM by using the output data transfer function. For the output data transfer function, see **Section 25.3.16.2, Output Data Transfer**.

25.3.12 Message Handling

The Message Handler controls data transfers between the Input/Output Buffer and the Message RAM and between the Message RAM and the two Temporary buffers.

Access to the message buffers stored in the Message RAM is done under control of the Message Handler state machine. This avoids conflicts between accesses of the two FlexRay channel protocol controllers and the Host to the Message RAM.

Frame IDs of message buffers assigned to the static segment have to be in the range from 1 to FLXAnFRGTUC7.NSS. Frame IDs of message buffers assigned to the dynamic segment have to be in the range from FLXAnFRGTUC7.NSS + 1 to 2047.

Received messages with no matching dedicated receive buffer (static or dynamic segment) are stored in the receive FIFO (if configured) if they pass the FIFO rejection filter.

Access of the Host to the message buffer contents using the input or output buffer function is described in this subsection. Access to the message buffer contents using the data transfer function is mentioned in **Section 25.3.16, Usage of Data Transfer**.

25.3.12.1 Reconfiguration of Message Buffers

In case that an application needs to operate with more than 128 different messages, static and dynamic message buffers may be reconfigured during FlexRay operation. This is done by updating the header section of the respective message buffer via Input Buffer registers FLXAnFRWRHS1 to FLXAnFRWRHS3.

Reconfiguration has to be enabled via control bits FLXAnFRMRC.SEC in the Message RAM Configuration register.

If a message buffer has not been transmitted/updated from a received frame before reconfiguration starts, the respective message is lost.

The point in time when a reconfigured message buffer is ready for transmission/reception according to the reconfigured frame ID depends on the actual state of the slot counter when the update of the header section has completed. Therefore it may happen that a reconfigured message buffer is not transmitted/updated from a received frame in the cycle where it was reconfigured.

The Message RAM is scanned according to **Table 25.114, Scan of Message RAM** below.

Table 25.114 Scan of Message RAM

Start of Scan in Slot	Scan for Slots
1	2 … 15, 1 (next cycle)
8	16 … 23, 1 (next cycle)
16	24 … 31, 1 (next cycle)
24	32 … 39, 1 (next cycle)
…	…

A Message RAM scan is terminated with the start of NIT regardless whether it has completed or not. The scan of the Message RAM for slots 2 to 15 starts at the beginning of slot 1 of the actual cycle. The scan of the Message RAM for slot 1 is done in the cycle before by checking in parallel to each scan of the Message RAM whether there is a message buffer configured for slot 1 of the next cycle.

The number of the first dynamic message buffer is configured by FLXAnFRMRC.FDB. In case a Message RAM scan starts while the CC is in dynamic segment, the scan starts with the message buffer number configured by FLXAnFRMRC.FDB.

In case a message buffer should be reconfigured to be used in slot 1 of the next cycle, the following has to be considered:

- If the message buffer to be reconfigured for slot 1 is part of the “Static Buffers”, it will only be found if it is reconfigured before the last Message RAM scan in the static segment of the actual cycle evaluates this message buffer.
- If the message buffer to be reconfigured for slot 1 is part of the “Static + Dynamic Buffers”, it will be found if it is reconfigured before the last Message RAM scan in the actual cycle evaluates this message buffer.
- The start of NIT terminates the Message RAM scan. In case the Message RAM scan has not evaluated the reconfigured message buffer until this point in time, the message buffer will not be considered for the next cycle.

CAUTION

Reconfiguration of message buffers may lead to the loss of messages and therefore has to be used very carefully. In worst case (reconfiguration in consecutive cycles) it may happen that a message buffer is never transmitted/updated from a received frame.

25.3.12.2 Host Access to Message RAM

The message transfer between Input Buffer and Message RAM as well as between Message RAM and Output Buffer is triggered by the Host by writing the number of the target/source message buffer to be accessed to FLXAnFRIBCR or FLXAnFROBCR register.

The FLXAnFRIBCM and FLXAnFROBCM registers can be used to write/read header and data section of the selected message buffer separately.

If bit FLXAnFRIBCM.STXR is set to 1, the transmission request flag TXR of the selected message buffer is automatically set to 1 after the message buffer has been updated. If bit FLXAnFRIBCM.STXR is reset to 0, the transmission request flag TXR of the selected message buffer is reset. This can be used to stop transmission from message buffers operated in continuous mode.

Input Buffer (IBF) and Output Buffer (OBF) are configured as a double buffer structure. One half of this double buffer structure is accessible by the Host (IBF Host/OBF Host), while the other half (IBF Shadow/OBF Shadow) is accessed by the Message Handler for data transfers between IBF/OBF and Message RAM.

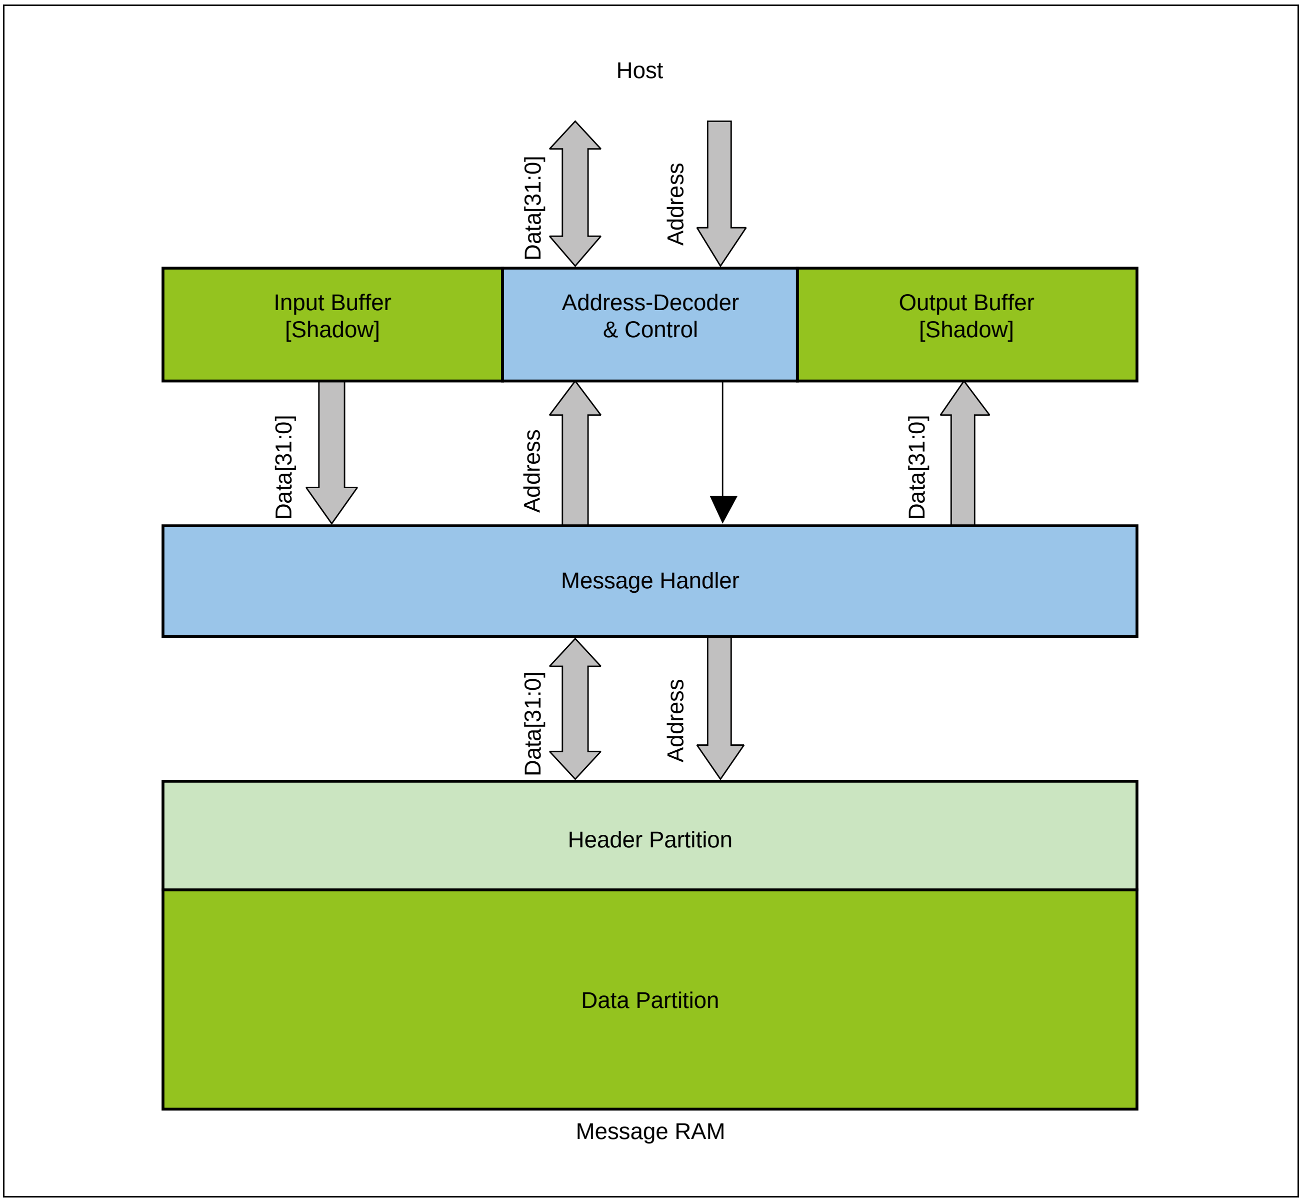

Figure 25.12 Host Access to Message RAM

(1) Data Transfer from Input Buffer to Message RAM

To configure/update a message buffer in the Message RAM, the Host has to write the data to FLXAnFRWRDSx and the header to FLXAnFRWRHS1 to FLXAnFRWRHS3. The specific action is selected by configuring the FlexRay Input Buffer Command Mask FLXAnFRIBCM.

When the Host writes the number of the target message buffer in the Message RAM to FLXAnFRIBCR.IBRH, IBF Host and IBF Shadow are swapped (see **Figure 25.13, Double Buffer Structure Input Buffer**).

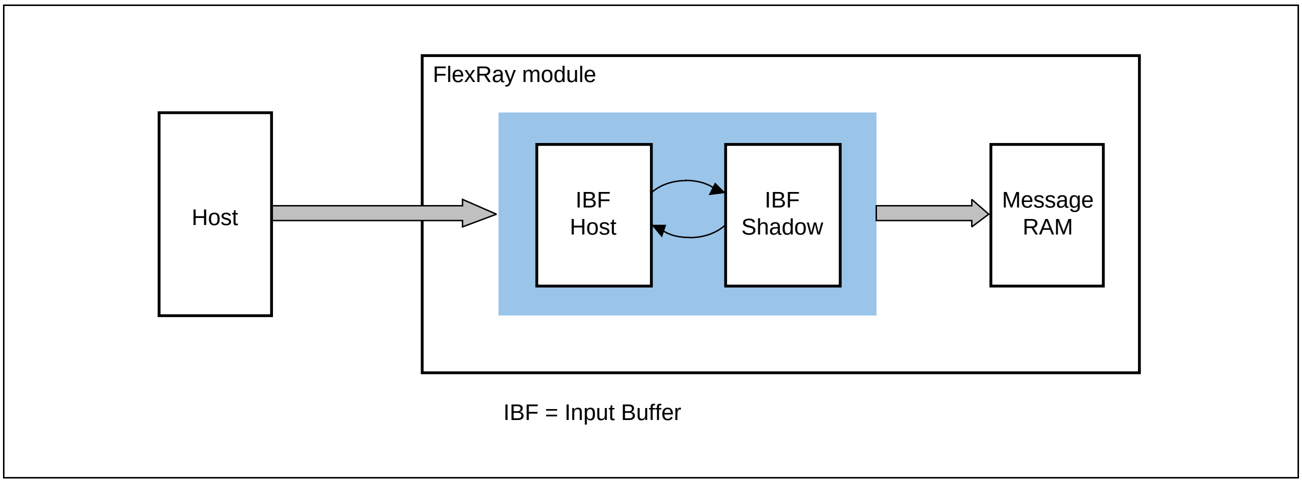

Figure 25.13 Double Buffer Structure Input Buffer

In addition the bits in the FLXAnFRIBCM and FLXAnFRIBCR registers are also swapped to keep them attached to the respective IBF section (see **Figure 25.14, Swapping of FLXAnFRIBCM and FLXAnFRIBCR Bits**).

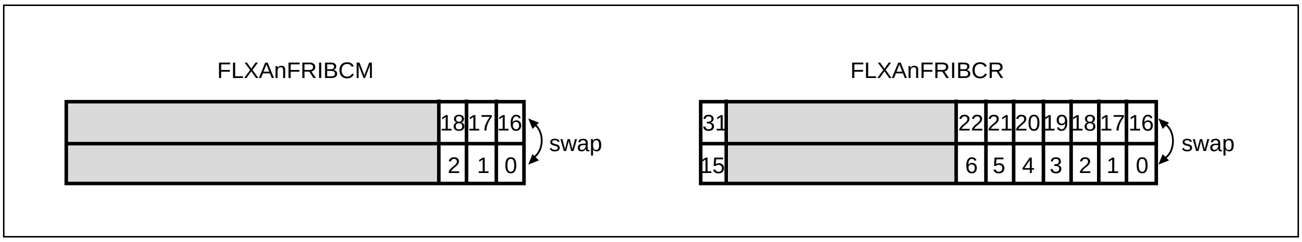

Figure 25.14 Swapping of FLXAnFRIBCM and FLXAnFRIBCR Bits

With this write operation bit FLXAnFRIBCR.IBSYS is set to 1. The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by FLXAnFRIBCR.IBRS.

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message to IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, bit FLXAnFRIBCR.IBSYS is set back to 0 and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to FLXAnFRIBCR.IBRH.

If a write access to FLXAnFRIBCR.IBRH occurs while FLXAnFRIBCR.IBSYS is 1, FLXAnFRIBCR.IBSYH is set to 1. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, FLXAnFRIBCR.IBSYH is reset to 0, FLXAnFRIBCR.IBSYS remains set to 1, and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS and the command mask flags are also swapped.

Example of 8/16/32-bit Host Access Sequence:

Configure/update n-th message buffer via IBF

- Wait until FLXAnFRIBCR.IBSYH is reset
- Write data section to FLXAnFRWRDSx
- Write header section to FLXAnFRWRHS1 to FLXAnFRWRHS3
- Write Command Mask: write FLXAnFRIBCM.STXRH, FLXAnFRIBCM.LDSH, FLXAnFRIBCM.LHSH
- Demand data transfer to target message buffer: write FLXAnFRIBCR.IBRH

Configure/update (n + 1)th message buffer via IBF

- Wait until FLXAnFRIBCR.IBSYH is reset
- Write data section to FLXAnFRWRDSx
- Write header section to FLXAnFRWRHS1 to FLXAnFRWRHS3
- Write Command Mask: write FLXAnFRIBCM.STXRH, FLXAnFRIBCM.LDSH, FLXAnFRIBCM.LHSH
- Demand data transfer to target message buffer: write FLXAnFRIBCR.IBRH

CAUTION

Any write access to IBF while FLXAnFRIBCR.IBSYH is 1 will set error flag FLXAnFREIR.IIBA to 1. In this case the write access has no effect.

Table 25.115 Assignment of FLXAnFRIBCM Bits

Pos.	Access	Bit	Function
18	r	STXRS	Set Transmission Request Shadow ongoing or finished
17	r	LDSS	Load Data Section Shadow ongoing or finished
16	r	LHSS	Load Header Section Shadow ongoing or finished
2	r/w	STXRH	Set Transmission Request Host
1	r/w	LDSH	Load Data Section Host
0	r/w	LHSH	Load Header Section Host

Table 25.116 Assignment of FLXAnFRIBCR Bits

Pos.	Access	Bit	Function
31	r	IBSYS	IBF Busy Shadow, signals ongoing transfer from IBF Shadow to Message RAM
22 to 16	r	IBRS	IBF Request Shadow, number of message buffer from which a message is currently being transferred or was last transferred
15	r	IBSYH	IBF Busy Host, transfer request pending for message buffer referenced by IBRH
6 to 0	r/w	IBRH	IBF Request Host, number of message buffer from which a message is to be transferred next

(2) Data Transfer from Message RAM to Output Buffer

To read a message buffer from the Message RAM, the Host has to write to register FLXAnFROBCR to trigger the data transfer as configured in FLXAnFROBCM. After the transfer has completed, the Host can read the transferred data from FLXAnFRRDDSx, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS.

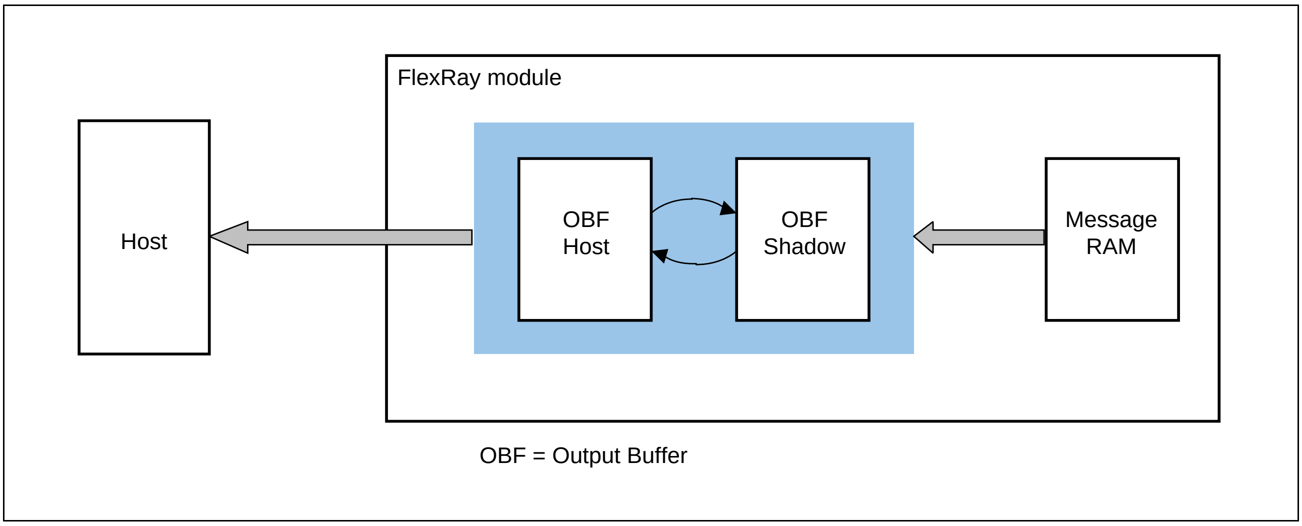

Figure 25.15 Double Buffer Structure Output Buffer

OBF Host and OBF Shadow as well as bits FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS, FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH and bits FLXAnFROBCR.OBRS, FLXAnFROBCR.OBRH are swapped under control of bits FLXAnFROBCR.VIEW and FLXAnFROBCR.REQ.

Writing bit FLXAnFROBCR.REQ to 1 copies bits FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS and bits FLXAnFROBCR.OBRS to an internal storage (see **Figure 25.16, Swapping of FLXAnFROBCM and FLXAnFROBCR Bits**).

After setting FLXAnFROBCR.REQ to 1, FLXAnFROBCR.OBSYS is set to 1, and the transfer of the message buffer selected by FLXAnFROBCR.OBRS from the Message RAM to OBF Shadow is started. After the transfer between the Message RAM and OBF Shadow has completed, the FLXAnFROBCR.OBSYS bit is set back to 0. Bits FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW can only be set to 1 while FLXAnFROBCR.OBSYS is 0.

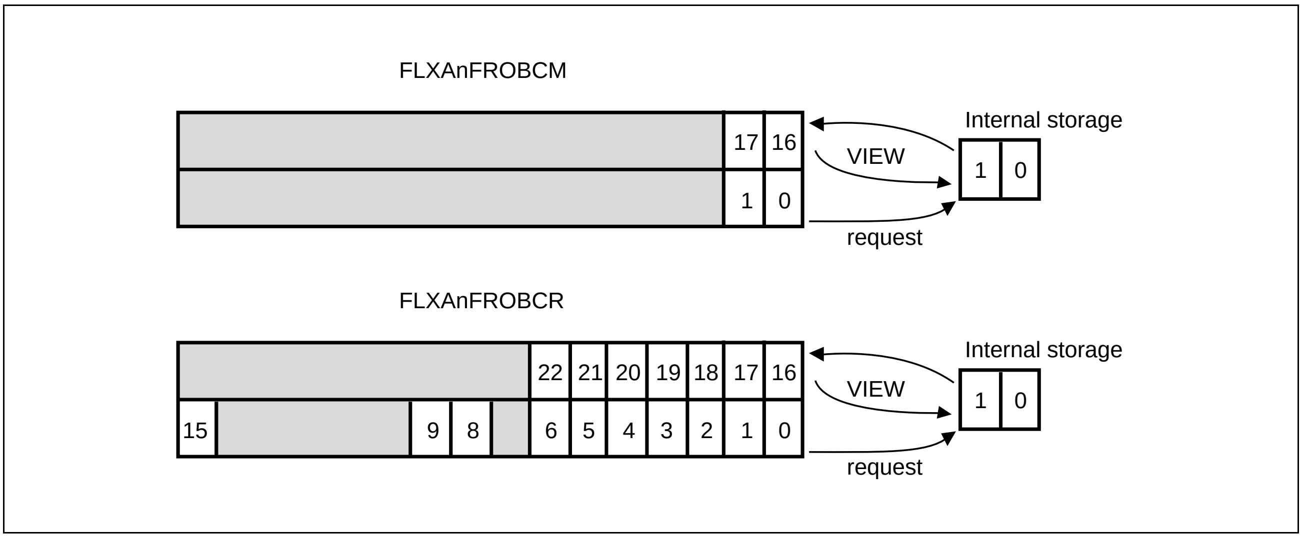

Figure 25.16 Swapping of FLXAnFROBCM and FLXAnFROBCR Bits

OBF Host and OBF Shadow are swapped by setting bit FLXAnFROBCR.VIEW to 1 while bit FLXAnFROBCR.OBSYS is 0 (see **Figure 25.15, Double Buffer Structure Output Buffer**).

In addition bits FLXAnFROBCR.OBRH and bits FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH are swapped with the registers internal storage thus assuring that the message buffer number stored in FLXAnFROBCR.OBRH and the mask configuration stored in FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH matches the transferred data stored in OBF Host (see **Figure 25.16, Swapping of FLXAnFROBCM and FLXAnFROBCR Bits**).

Now the Host can read the transferred message buffer from OBF Host while the Message Handler may transfer the next message from the Message RAM to OBF Shadow.

If bits REQ and VIEW are set to 1 with the same write access while FLXAnFROBSYS is 0, FLXAnFROBSYS is automatically set to 1 and OBF Shadow and OBF Host are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the registers internal storage to keep them attached to the respective Output Buffer transfer. Afterwards FLXAnFROBCR.OBRS is copied to the register internal storage, mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to register FLXAnFROBCM internal storage, and the transfer of the selected message buffer from the Message RAM to OBF Shadow is started. While the transfer is ongoing the Host can read the message buffer transferred by the previous transfer from OBF Host.

When the current transfer between Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCR.OBSYS back to 0.

Example of an 8/16/32-bit Host Access to a Single Message Buffer:

If a single message buffer has to be read out, two separate write accesses to FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW are necessary:

- Wait until FLXAnFROBCR.OBSYS is reset
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS
- Request transfer of message buffer to OBF Shadow by writing FLXAnFROBCR.OBRS and FLXAnFROBCR.REQ (in case of and 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ).
- Wait until FLXAnFROBCR.OBSYS is reset
- Toggle OBF Shadow and OBF Host by writing FLXAnFROBCR.VIEW = 1
- Read out transferred message buffer by reading FLXAnFRRDDSx, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS

Example of an 8/16/32-bit Host Access Sequence:

Request transfer of 1st message buffer to OBF Shadow

- Wait until FLXAnFROBCR.OBSYS is reset
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS for 1st message buffer
- Request transfer of 1st message buffer to OBF Shadow by writing FLXAnFROBCR.OBRS and FLXAnFROBCR.REQ (in case of an 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ).

Toggle OBF Shadow and OBF Host to read out 1st transferred message buffer and request transfer of 2nd message buffer:

- Wait until FLXAnFROBCR.OBSYS is reset to 0
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS for 2nd message buffer

- Toggle OBF Shadow and OBF Host and start transfer of 2nd message buffer to OBF Shadow simultaneously by writing FLXAnFROBCR.OBRS of 2nd message buffer, FLXAnFROBCR.REQ, and FLXAnFROBCR.VIEW (in case of and 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW).
- Read out 1st transferred message buffer by reading FLXAnFRRDDSx, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS

Demand access to last requested message buffer without request of another message buffer:

- Wait until FLXAnFROBCR.OBSYS is reset to 0
- Demand access to last transferred message buffer by writing FLXAnFROBCR.VIEW
- Read out last transferred message buffer by reading FLXAnFRRDDSx, FLXAnFRRDHS1 to FLXAnFRRDHS3, and FLXAnFRMBS

Table 25.117 Assignment of FLXAnFROBCM Bits

Pos.	Access	Bit	Function
17	r	RDSH	Data Section available for Host access
16	r	RHSH	Header Section available for Host access
1	r/w	RDSS	Read Data Section Shadow
0	r/w	RHSS	Read Header Section Shadow

Table 25.118 Assignment of FLXAnFROBCR Bits

Pos.	Access	Bit	Function
22 to 16	r	OBRH	OBF Request Host, number of message buffer available for Host access
15	r	OBSYS	OBF Busy Shadow, signals ongoing transfer from Message RAM to OBF Shadow
9	r/w	REQ	Request Transfer from Message RAM to OBF Shadow
8	r/w	VIEW	View OBF Shadow, swap OBF Shadow and OBF Host
6 to 0	r/w	OBRS	OBF Request Shadow, number of message buffer from which a message is to be transferred next

25.3.12.3 FlexRay Protocol Controller Access to Message RAM

The two Temporary buffers (TBF A, B) are used to buffer the data for transfer between the two FlexRay Protocol Controllers and the Message RAM.

Each Temporary buffer is build up as a double buffer, able to store two complete FlexRay messages. There is always one buffer assigned to the corresponding Protocol Controller while the other one is accessible by the Message Handler.

If, for example, the Message Handler writes the next message to be sent to Temporary buffer Tx, the FlexRay Channel Protocol Controller can access Temporary buffer Rx to store the message it is actually receiving. During transmission of the message stored in Temporary buffer Tx, the Message Handler transfers the last received message stored in Temporary buffer Rx to the Message RAM (if it passes acceptance filtering) and updates the respective message buffer.

Data transfers between the Temporary buffers and the shift registers of the FlexRay Channel Protocol Controllers are done in words of 32 bit. This enables the use of a 32 bit shift register independent of the length of the FlexRay messages.

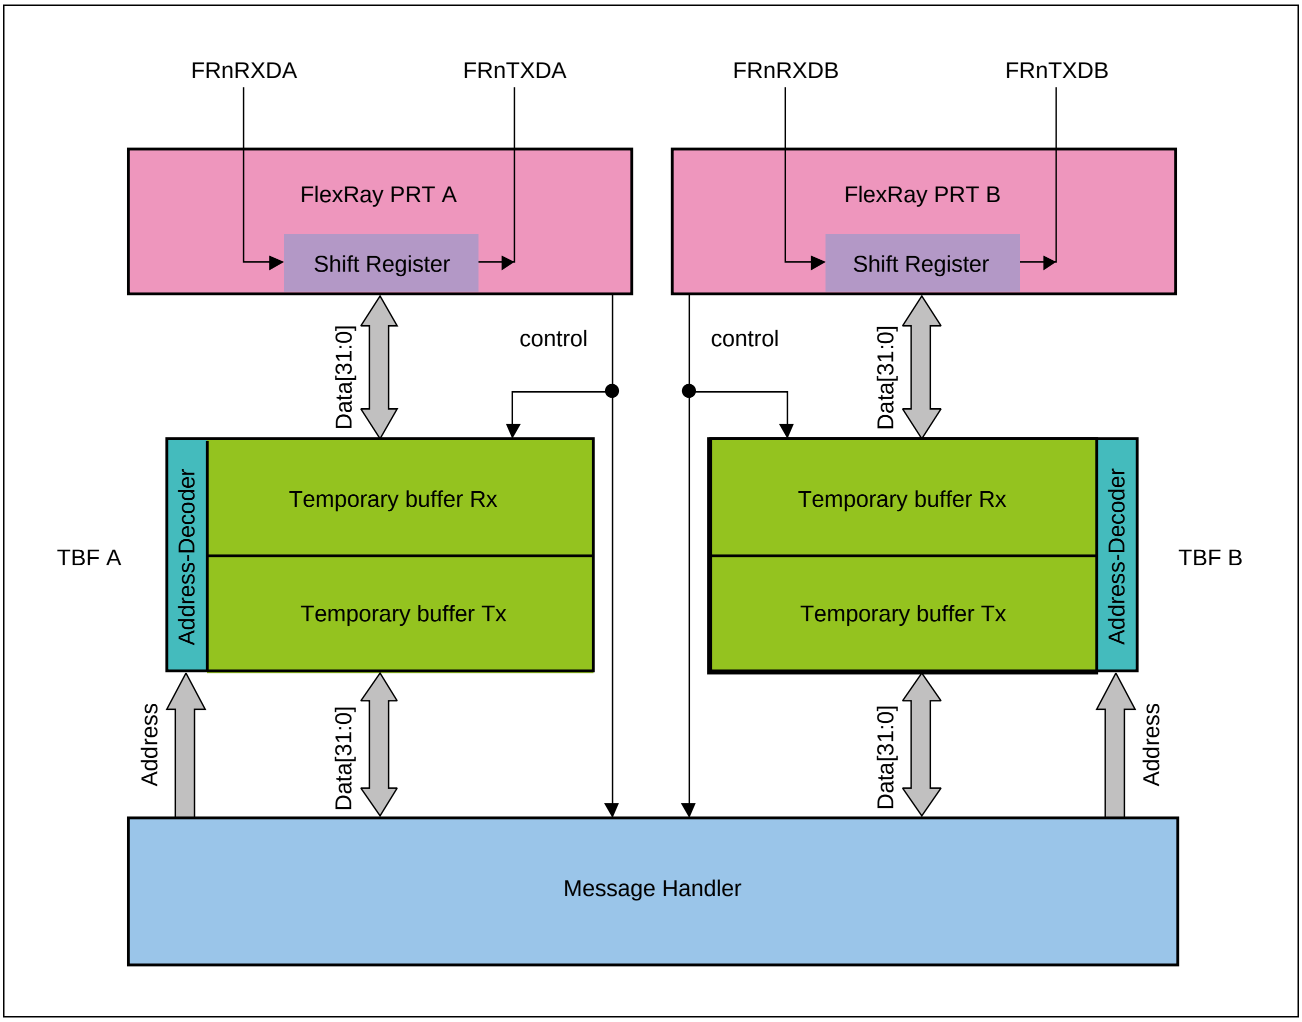

Figure 25.17 Access to Temporary Buffers

25.3.13 Message RAM

To avoid conflicts between Host access to the Message RAM and FlexRay message reception/transmission, the Host cannot directly access the message buffers in the Message RAM. These accesses are handled via the Input and Output Buffers. The Message RAM is able to store up to 128 message buffers depending on the configured payload length.

The Message RAM is able to store up to 2048 32-bit words. To achieve the required flexibility with respect to different numbers of data bytes per FlexRay frame (0 to 254), the Message RAM has a structure as shown in **Figure 25.18, Configuration Example of Message Buffers in the Message RAM**.

When specifying in the data section of the message buffer allocated immediately after the header partition that the message buffer is a receive buffer (FLXAnFRWRHS1.CFG bit = 0) or a receive FIFO buffer, configure an unused area of at least 32 bits at the start of the data partition. This means that the data partition can start from the message RAM word No. calculated by ((Value set by FLXAnFRMRC.LCB[7:0] bits + 1) × 4) + 1.

When specifying in the data section of the message buffer allocated immediately after the header partition that the message buffer is a transmit buffer (FLXAnFRWRHS1.CFG bit = 1), the data partition can start from the message RAM word No. calculated by ((Value set by FLXAnFRMRC.LCB[7:0] bits + 1) × 4).

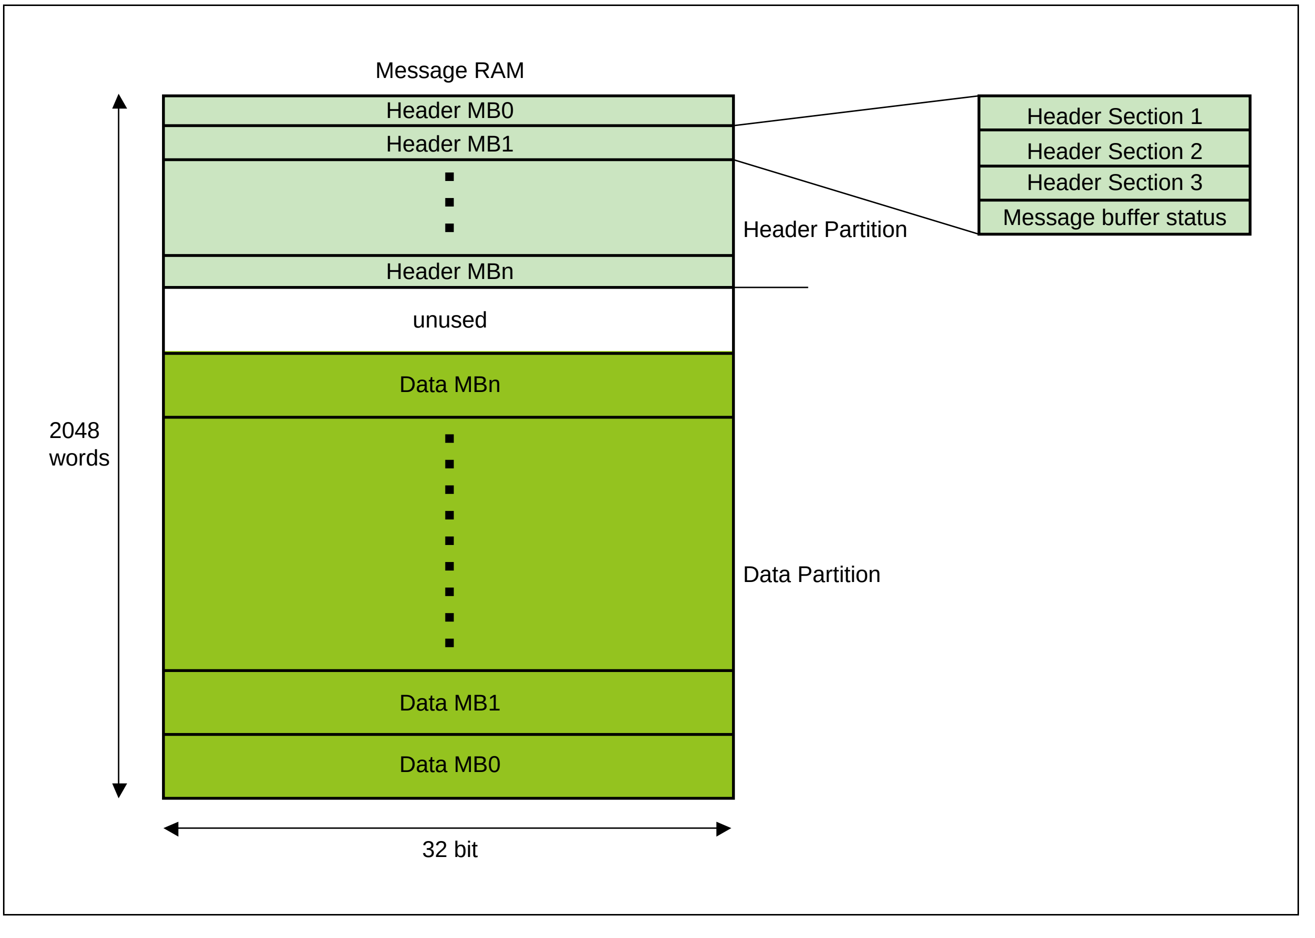

Figure 25.18 Configuration Example of Message Buffers in the Message RAM

Header Partition

Stores header sections of the configured message buffers:

- Supports a maximum of 128 message buffers
- Each message buffer has a header section of four 32 bit words
- Header 3 of each message buffer holds the 11-bit data pointer to the respective data section in the data partition

Data Partition

Flexible storage of data sections with different length. Some maximum values are:

- 30 message buffers with 254 byte data section each
- Or 56 message buffers with 128 byte data section each
- Or 128 message buffers with 48 byte data section each

CAUTION

Header partition + data partition may not occupy more than 2048 32-bit words.

25.3.13.1 Header Partition

The elements used for configuration of a message buffer as well as the actual message buffer status are stored in the header partition of the Message RAM as listed in **Table 25.119, Header Section of a Message Buffer in the Message RAM** below. Configuration of the header sections of the message buffers is done via IBF (FLXAnFRWRHS1 to FLXAnFRWRHS3). Read access to the header sections is done via OBF (FLXAnFRRDHS1 to FLXAnFRRDHS3 + FLXAnFRMBS). The data pointer has to be calculated by the user to define the starting point of the data section for the respective message buffer in the data partition of the Message RAM. The data pointer should not be modified during runtime. For message buffers belonging to the receive FIFO (re)configuration is possible in DEFAULT_CONFIG or CONFIG state only.

The header section of each message buffer occupies four 32-bit words in the header partition of the Message RAM. The header of message buffer 0 starts with the first word in the Message RAM.

For transmit buffers the Header CRC has to be calculated by the Host.

Payload Length Received PLR, Receive Cycle Count RCC, Received on Channel Indicator RCI, Startup Frame Indicator SFI, Sync Frame Indicator SYN, Null Frame Indicator NFI, Payload Preamble Indicator PPI, and Reserved Bit RES are updated from received valid data frames only.

Table 25.119 Header Section of a Message Buffer in the Message RAM

25.3.13.2 Data Partition

The data partition of the Message RAM stores the data sections of the message buffers configured for reception/transmission as defined in the header partition. The number of data bytes for each message buffer can vary from 0 to 254. To optimize the data transfer between the shift registers of the two FlexRay Protocol Controllers and the Message RAM as well as between the Host interface and the Message RAM, the physical width of the Message RAM is set to 4 bytes.

The data partition starts after the last word of the header partition. When configuring the message buffers in the Message RAM the user has to confirm that the data pointers point to addresses within the data partition. **Table 25.120, Example for Structure of the Data Partition in the Message RAM** below shows an example how the data sections of the configured message buffers can be stored in the data partition of the Message RAM.

The beginning and the end of a message buffer's data section is determined by the data pointer and the payload length configured in the message buffer's header section, respectively. This enables a flexible usage of the available RAM space for storage of message buffers with different data length.

If the size of the data section is an odd number of 2-byte words, the remaining 16 bits in the last 32-bit word are unused (see **Table 25.120, Example for Structure of the Data Partition in the Message RAM** below).

Table 25.120 Example for Structure of the Data Partition in the Message RAM

Bit Word	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

25.3.13.3 Message Data Integrity Check

There is a data integrity checking mechanism implemented in the FlexRay core to ensure the integrity of the data stored in the related RAM. Each RAM has a checksum generator/checker attached as shown in **Figure 25.19, Checksum Generation and Check**.

When data is written to a RAM, the local checksum generator generates the checksum. The checksum is stored together with the respective data word. The checksum is checked each time a data word is read from a RAM.

If a checksum error is detected, the respective access error flag is set. The access error flags FLXAnFRMHDS.AMR, FLXAnFRMHDS.ATBF1, FLXAnFRMHDS.ATBF2 and the faulty message buffer indicators FLXAnFRMHDS.FMBD, FLXAnFRMHDS.MFMB, FLXAnFRMHDS.FMB are located in the FlexRay Message Handler Status register. These single access error flags control the error interrupt flag FLXAnFREIR.AERR.

Figure 25.19, Checksum Generation and Check shows the data paths between the Input Buffer, Temporary Buffer and Message RAM.

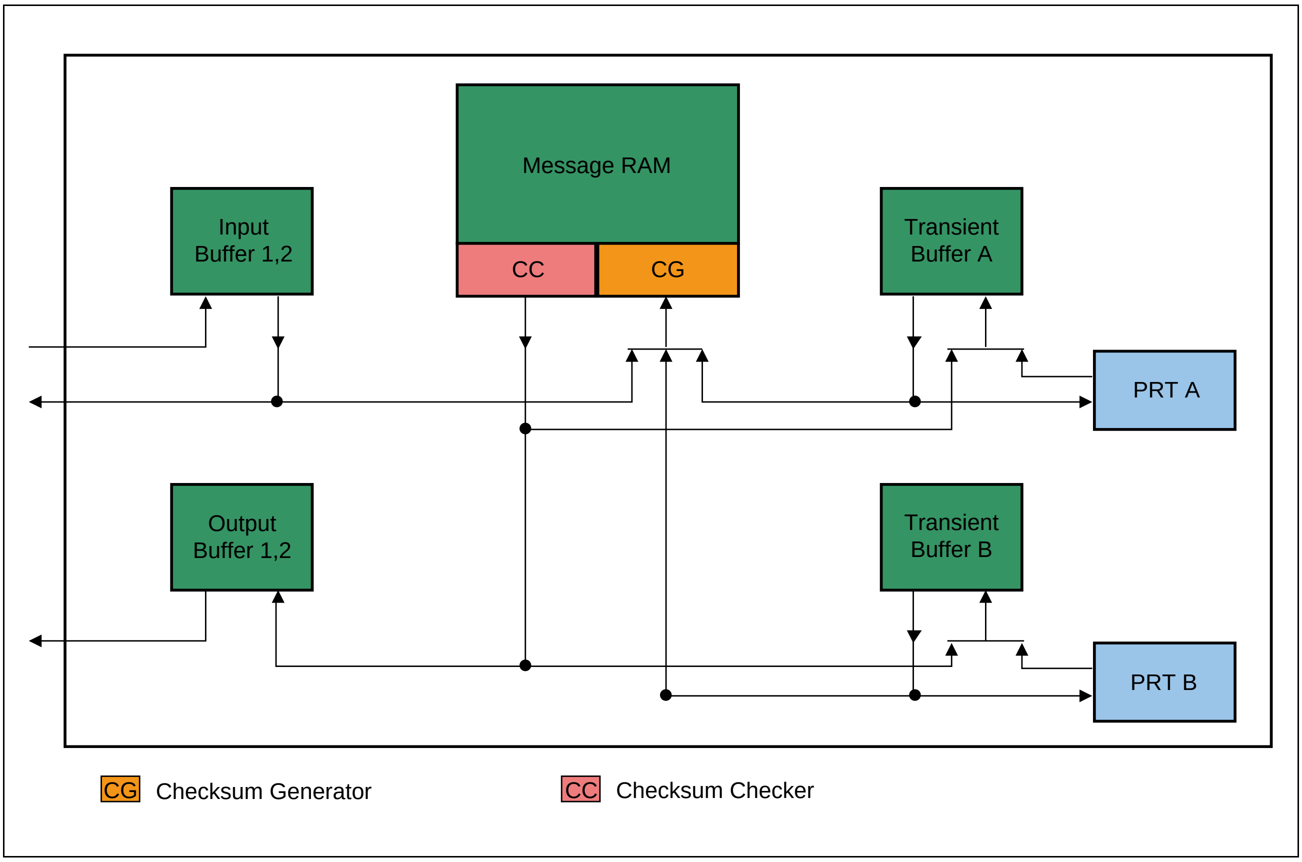

Figure 25.19 Checksum Generation and Check

When an access error has been detected the following actions will be performed:

In all cases:

- The respective access error flag in FLXAnFRMHDS register is set
- The access error flag FLXAnFREIR.AERR is set and, if enabled, a module interrupt to the Host will be generated.

Additionally in specific cases:

(1) Access Error during Data Transfer from Input Buffer 1, 2 to Message RAM When Reading Header Section of Respective Message Buffer from Message RAM:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- The data section of the respective message buffer is not updated.
- Transmit buffer: Transmission request for the respective message buffer is not set.

(2) Access Error during Scan of Header Sections in Message RAM:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- Ignore message buffer (message buffer is skipped).

(3) Access Error during Data Transfer from Message RAM to Temporary Buffer 1, 2:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- Frame not transmitted, frames already in transmission are invalidated by setting the frame CRC to zero.

(4) Access Error during Data Transfer from Temporary Buffer 1, 2 to Message RAM When Reading Header Section of Respective Message Buffer from Message RAM:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- The data section of the respective message buffer is not updated.

(5) Access Error during Data Transfer from Message RAM to Output Buffer:

- The access error flag FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.

(6) Access Error during a Data Transfer from Temporary Buffer 1, 2 to Protocol Controller 1, 2:

- FLXAnFRMHDS.ATBF1, 2 bit is set.
- Frames already in transmission are invalidated by setting the frame CRC to zero.

(7) Access Error during Data Transfer from Temporary Buffer 1, 2 to Message RAM When Reading Temporary Buffer RAM 1, 2:

- FLXAnFRMHDS.ATBF1, 2 bit is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.

(8) Access Error during Data Read of Temporary Buffer RAM 1, 2:

- When an access error occurs while the Message Handler read a frame with network management information (PPI = 1) from the Temporary Buffer RAM 1, 2, the corresponding network management vector registers FLXAnFRNMV1 to 3 are not updated from this frame.

25.3.13.4 Host Handling of Access Errors

Access error caused by temporary bit flips can be fixed by:

(1) Self-Healing

Access errors located in the Data Section of Message RAM, Temporary Buffer RAM A or Temporary Buffer RAM B are overwritten with the next write access to the disturbed bit(s) caused by Host access or by FlexRay communication.

(2) CLEAR_RAMS Command

The POC command CLEAR_RAMS initializes the message RAM to zero, when called in the DEFAULT_CONFIG or CONFIG state.

(3) Temporary Unlocking of Header Section

An access error in the header section of a locked message buffer can be fixed by a transfer from the Input Buffer to the locked buffer Header Section. For this transfer, the write access to the FLXAnFRIBCR (specifying the message buffer number) must be immediately preceded by the unlock sequence normally used to leave CONFIG state (see **Section 25.2.3.3, FLXAnFRLCK — FlexRay Lock Register**).

For that single transfer the respective message buffer header is unlocked, regardless whether it belongs to the FIFO or whether its locking is controlled by FLXAnFRMRC.SEC, and will be updated with new data.

25.3.14 Module Interrupt

In general, interrupts provide a close link to the protocol timing as they are triggered almost immediately when an error or status change is detected by the CC, a frame is received or transmitted, a configured timer interrupt is activated, or a stop watch event occurred. This enables the Host to react very quickly on specific error conditions, status changes, or timer events. On the other hand too many interrupts can cause the Host to miss deadlines required for the application. Therefore the CC supports enable/disable controls for each individual interrupt source separately.

An interrupt request may be triggered when

- An error was detected
- A status flag is set to 1
- A timer reaches a preconfigured value
- A message transfer from Input Buffer to Message RAM or from Message RAM to Output Buffer has completed
- A message transfer from the local RAM/global RAM to Message RAM or from Message RAM to local RAM/global RAM has completed
- A stop watch event occurred

Tracking status and generating interrupts when a status change or an error occurs are two independent tasks. Regardless of whether an interrupt is enabled or not, the corresponding status is tracked and indicated by the CC. The Host has access to the actual status and error information by reading registers FLXAnFREIR, FLXAnFRSIR, FLXAnFROS, FLXAnFROTS and FLXAnFRITS.

The general purpose interrupt lines to the Host, FlexRay Interrupt 0, FlexRay Interrupt 1, are controlled by the enabled interrupts in FLXAnFREIES and FLXAnFRSIES. In addition each of the two interrupt lines can be enabled/disabled separately by programming bit FLXAnFRILE.EINT0 and FLXAnFRILE.EINT1.

The input data transfer interrupt lines to the Host, FlexRay input queue empty interrupt, FlexRay input queue full interrupt, are controlled by the enabled interrupts in FLXAnFRITS. In addition each of the input data transfer interrupts can be enabled/disabled separately by programming the related bits in FLXAnFRITC.

The output data transfer interrupt lines to the Host, FlexRay FIFO transfer warning interrupt, FlexRay output transfer warning interrupt, FlexRay FIFO transfer interrupt, FlexRay output transfer interrupt, are controlled by the enabled interrupts in FLXAnFROTS. In addition each of the output data transfer interrupts can be enabled/disabled separately by programming the related bits in FLXAnFROTC.

The three timer interrupts lines to the Host are controlled by the enabled interrupts in FLXAnFROS. In addition each of the interrupt lines can be enabled/disabled separately by programming bit FLXAnFROC.T0IE, FLXAnFROC.T1IE and FLXAnFROC.T2IE.

When a transfer between IBF/OBF and the Message RAM has completed bit FLXAnFRSIR.TIBC or FLXAnFRSIR.TOBC is set to 1.

A stop watch event may be triggered via input pin FLXAnSTPWT.

25.3.16 Usage of Data Transfer

A mechanism is implemented to allow storage of FlexRay messages directly into the local RAM/global RAM (user RAM) and have transfers between the FlexRay internal message RAM and the local RAM/global RAM and vice versa with minimum CPU support. The data in the local RAM/global RAM should be indexed by data structure pointers located in data pointer tables stored in the local RAM/global RAM.

Data transfer from the local RAM/global RAM to the FlexRay internal message RAM (input transfer) needs to be initiated by the application. These transfers can be used to configure message buffers or to update transmit data.

A data transfer from the FlexRay internal message RAM to the local RAM/global RAM (output transfer) is initiated automatically by a reception into a receive message buffer or FlexRay internal FIFO or by a change in the slot status. It can be initiated also by a specific user transfer request.

The input and output data transfer can be activated independently. When the input data transfer is activated the application should not directly access message buffers using the FlexRay input buffer. When the output data transfer is activated the application should not directly access message buffers using the FlexRay output buffer.

25.3.16.1 Input Data Transfer

When the automatic input data transfer function is enabled, committed input data structures are transferred from the local RAM/global RAM to the FlexRay internal message RAM with minimum CPU support.

(1) Activation and Deactivation

The input data transfer function should be activated before usage. The activation of the input transfer handler initializes the input queue put index (FLXAnFRITS.IPIDX) and get index (FLXAnFRITS.IGIDX) to 0. Also the interrupt status flags in the FLXAnFRITS register (IQEIS and IQFIS) are set to 0.

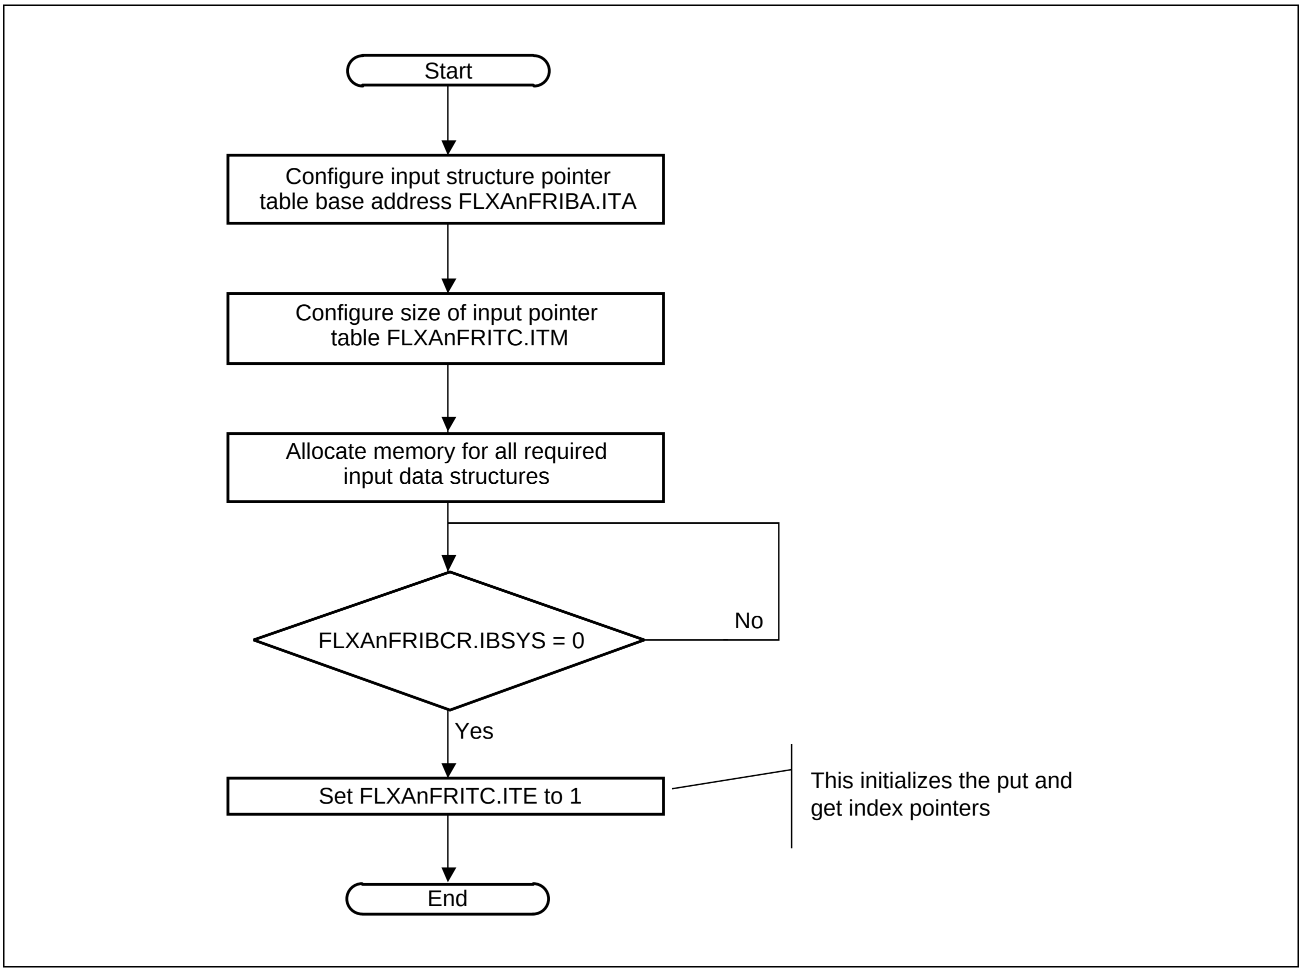

Figure 25.20 Input Transfer Enable Flow

A deactivation request of the input transfer function can be made at any time. The input queue put index and the input queue status are maintained independently from the input transfer function state.

Before the transfer function gets disabled (status indicated by FLXAnFRITS.ITS), user requested input transfers and all committed input transfers will be completed.

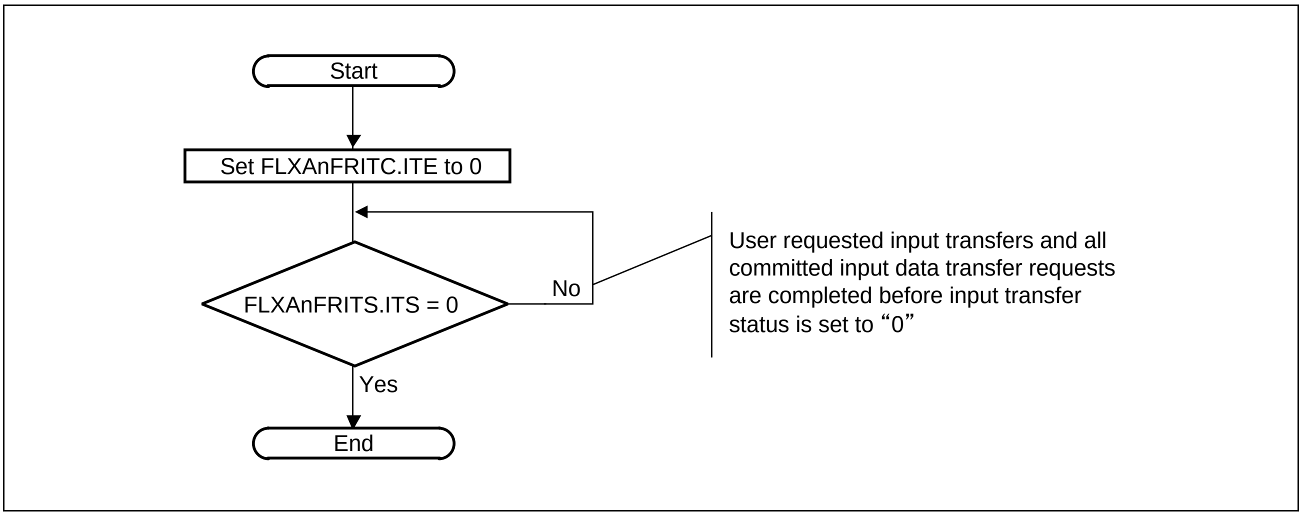

Figure 25.21 Input Transfer Disable Flow

(2) Input Data Structure

The application has to reserve a location in the local RAM/global RAM to provide the content for message buffer configuration (input data structure).

The location of this input data structure needs to be defined by an input data structure pointer also located in the local RAM/global RAM.

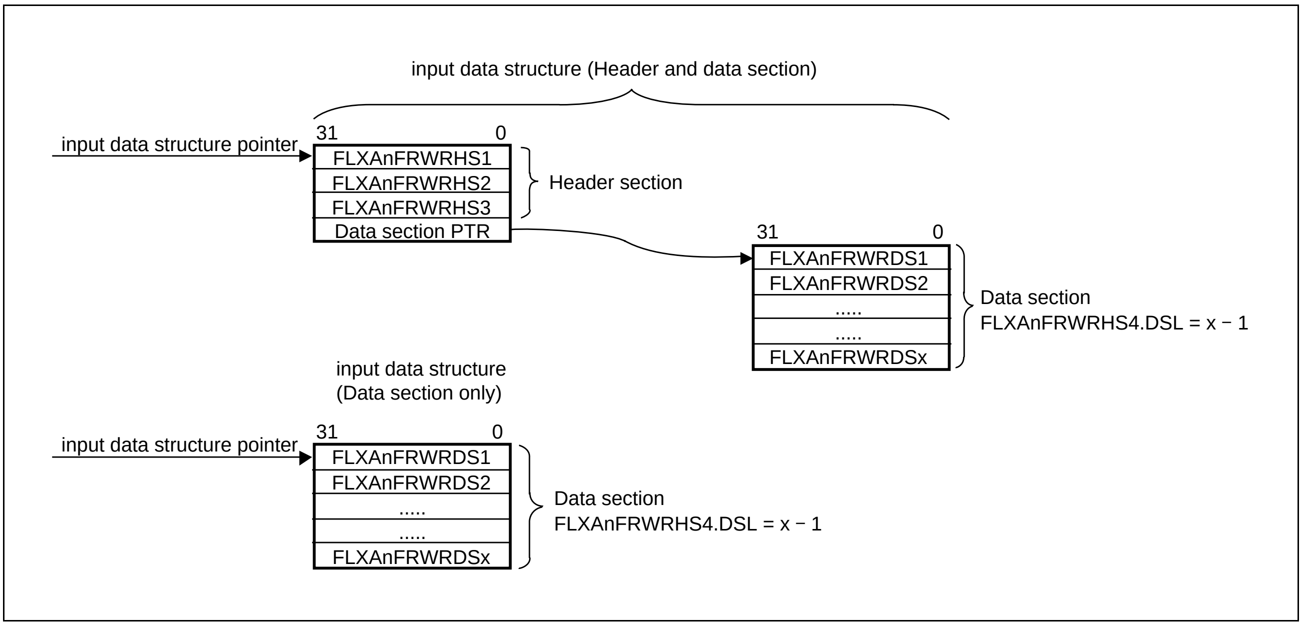

Figure 25.22 Input Data Structure

In general the input data structure consists of two sections, the header and the data section.

The header section consists of FLXAnFRWRHS1, FLXAnFRWRHS2, FLXAnFRWRHS3 and the data section pointer.

For bit alignment and bit function in the header section, see **Section 25.3.13.1, Header Partition**.

Depending on the settings in the control field (FLXAnFRWRHS4) located in the input pointer table, the data structure pointer is a reference to the address of FLXAnFRWRHS1 or FLXAnFRWRDS1. The data structure pointer has to be aligned to a 32 bit address.

If the bit LHS in the address related to FLXAnFRWRHS4 is set to 1 it is required to provide a valid header section. In this case FLXAnFRWRDS1 is the first element of the data structure.

If the bit LHS in the address related to FLXAnFRWRHS4 is set to 0 a header section is not required. In this case FLXAnFRWRDS1 is the first element of the data structure.

If the bit LDS in the address related to FLXAnFRWRHS4 is set to 1 it is required to provide a valid data section. The pointer to the data section is a reference to the address of the first payload long word (FLXAnFRWRDS1) and has to be aligned to a 32 bit address.

If the bit LDS in the address related to FLXAnFRWRHS4 is set to 0 a data section is not required. The data section pointer is not evaluated by the input handler.

The byte order for the FlexRay payload data in the input data structure is determined by FLXAnFROC.BEC. For information about the payload data alignment within the data section refer to **Section 25.3.13.2, Data Partition** and **Section 25.3.17, Byte Alignment**.

The length of the data section and the size to be allocated in the local RAM/global RAM depends on the configuration of the bits DSL in the address related to FLXAnFRWRHS4.

For the transfer into the FlexRay core internal message RAM the number of 16 bit words configured by FLXAnFRWRHS2.PLC is used. The application has to ensure, that a proper number of data words is provided in the local RAM/global RAM. In case the buffer is configured by FLXAnFRWRHS2.PLC to hold an odd payload length, the application has to write zero to the last 16 bit of the payload section to ensure that the padding data is all zero.

(3) Input Pointer Table

To transfer data from the input data structures located in the local RAM/global RAM to the FlexRay internal message RAM the related input data structure pointer and control field needs to be added to the input pointer table which is located in the local RAM/global RAM.

The location of the first element of this table is identified by the input pointer table base address (FLXAnFRIBA.ITA). This base address has to be aligned to a 32 bit address.

The maximum number of input requests that can be queued is defined by the Input queue Table Max register (FLXAnFRITC.ITM).

Each Input pointer table entry requires two long words. The required address range of the input pointer table for the queued transfer requests can be calculated by

Input pointer table size (byte) = (((FLXAnFRITC.ITM + 1) × 2) × 4)

Equation 1

The input pointer entry for the user requested input transfer should be added after the end of the input pointer table.

The pointer table index related to this entry and hence the number to be written to FLXAnFRUIR.UIDX, is FLXAnFRITC.ITM+1. The address in the input pointer table related to the user requested input transfer (user input address) can be calculated by

User input address = FLXAnFRIBA.ITA + Input pointer table size

Equation 2

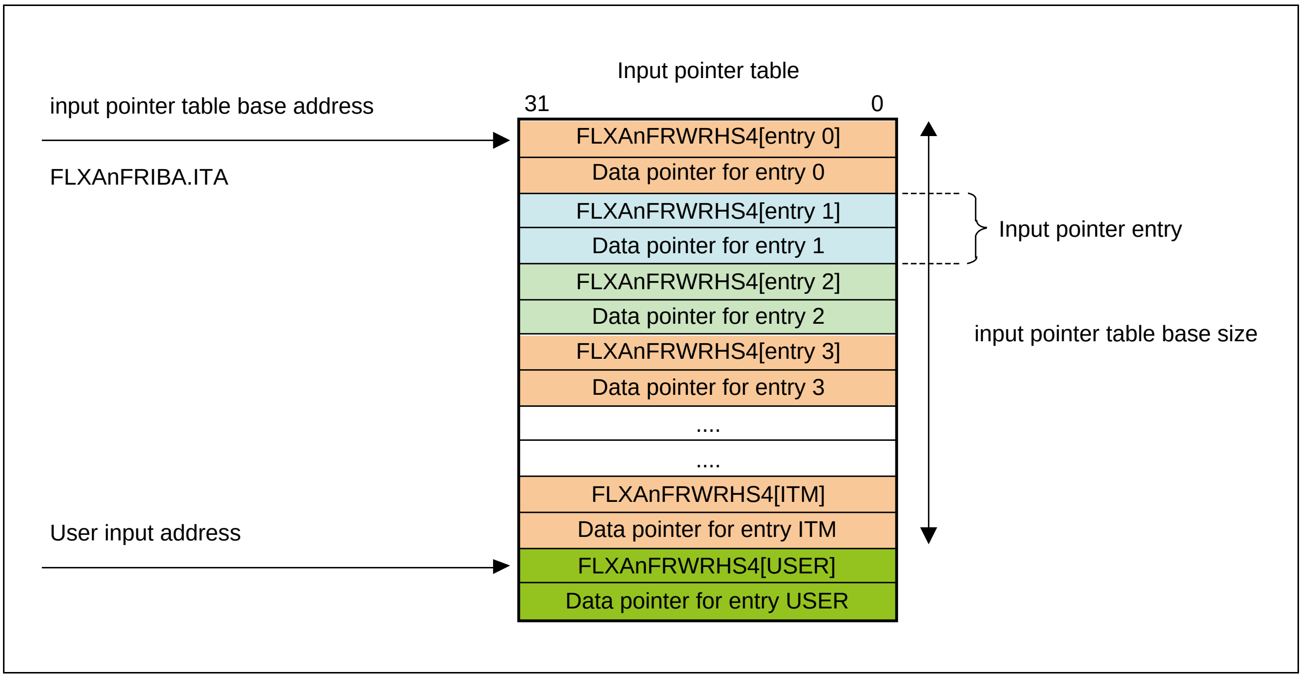

Figure 25.23 Input Pointer Table

The input pointer table holds the control field FLXAnFRWRHS4 and the pointers to the local RAM/global RAM location where the message buffer content (header section and/or data section) is stored.

The application has to write FLXAnFRWRHS4 and the input data structure pointer at the addresses in the input pointer table related to the put index position before a transfer request is initiated.

FLXAnFRWRHS4:

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	DSL[5:0]					

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	INV	STR	LDS	LHS	—	IMBNR[6:0]						

Table 25.122 FLXAnFRWRHS4 Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, an undefined value is read. When writing, always write 0.
21 to 16	DSL[5:0]	Data Section Length Bit Specifies the length of the data section in terms of 32 bit values.
15 to 12	Reserved	When read, an undefined value is read. When writing, always write 0.
11	INV	Invalidate entry Bit 0: The data structure is valid and will be transferred to the FlexRay internal message RAM. 1: The data structure is invalid. FlexRay internal message RAM is not updated using this input pointer entry.
10	STR	Set transmission request Bit 0: The bit FLXAnFRTXRQx.TXR for the message buffer selected by the bits IMBNR is set to 0. No data from this message buffer is transmitted. 1: The bit FLXAnFRTXRQx.TXR for the message buffer selected by the bits IMBNR is set to 1 to release the message buffer for transmission The application should not set the bit STR to 1 for receive buffers.
9	LDS	Load data section Bit 0: No update of data section. 1: Data section for the message buffer selected by the bits IMBNR is updated.
8	LHS	Load header section Bit 0: No update of header section. 1: Header section for the message buffer selected by the bits IMBNR is updated.
7	Reserved	When read, an undefined value is read. When writing, always write 0.
6 to 0	IMBNR[6:0]	Message buffer number to be updated Bit Selects the target message buffer number in the FlexRay internal message RAM for transfer

Note that the LHS bit should not be set for protected message buffers.

The bit LDS defines if the data section of the message buffer selected by the bits IMBNR should be updated.

If LDS is set to 1 (DSL + 1) 32 bit words of payload data are transferred from the local RAM/global RAM to the message buffer selected by the bits IMBNR.

If LDS is set to 0 no payload data is transferred from the local RAM/global RAM.

Note that the payload transferred is independent from the configured payload length (bits PLC in the address related to FLXAnFRWRHS2).

The bit INV can be used to invalidate a committed data structure. This bit should be only used to cancel the transfer of committed data structures when the input queue is halted (see **Section 25.3.16.2(5), Transfer Function of Dedicated Message Buffers**).

When this bit is set to 1 the message buffer number IMBNR is not updated. When the bit is set to 0 the message buffer number IMBNR is updated.

(4) Transfer Function of Input Data Structure

To use the input data structure transfer function the input transfer has to be activated (see **Section 25.3.16.1(1), Activation and Deactivation**). The activation process requires the setup of the input pointer table (see **Section 25.3.16.1(3), Input Pointer Table**) in order to specify the source location (input data structures) for the data structures to be transferred. When the input transfer gets enabled the get index pointer is initialized to zero.

All FlexRay internal message buffers can be updated using the input transfer queue which is built in the input pointer table. The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. For that purpose the application has to maintain a put index for the input pointer table that indicates where the pointer has to be written to.

To commit this table entry to the input handler, the application has to write the target message buffer number to the input queue control register (FLXAnFRIQC.IMBNR). Afterwards the application has to increment the application internal put index.

By writing to the input queue control register the data available flag (FLXAnFRDAi.DA[IMBNR]) is automatically set to 1. The input transfer handler also maintains the put index pointer in the status register (FLXAnFRITS.IPIDX).

In case the input queue gets full (number of queued input transfer requests is equal to the input queue table size) FLXAnFRITS.IQFP and FLXAnFRITS.IQFIS are set to 1. The input queue full condition pending flag (FLXAnFRITS.IQFP) changes from 1 to 0 when there are entries in the input queue available, whereby the input queue full interrupt status flag (FLXAnFRITS.IQFIS) needs to be cleared by the application.

The application cannot make any further write access to the bit IMBNR in the FLXAnFRIQC register as long as the bit IQFP in the FLXAnFRITS register is 1.

In case the input queue gets empty (number of queued input transfer requests changes to zero) FLXAnFRITS.IQEIS is set to 1. The input queue empty interrupt status flag (FLXAnFRITS.IQEIS) needs to be cleared by the application.

The transfer of the input data structures to the FlexRay message RAM is controlled by a get index pointer which is handled inside the FlexRay module and flagged in FLXAnFRITS.IGIDX. Note that the index is referring to the input entry and not the address offset in the input pointer table.

If the input queue is not empty, the transfer handler reads out the input pointer table entry of the transfer queue and starts the transfer of the input data structure from the address the input pointer is referring to. When all required data words are transferred to the FlexRay module, the data available flag for the transferred message buffer number is set to 0 and the get index in the transfer handler is incremented by one.

In case of an invalidated data structure (see **Section 25.3.16.1(5), Halting the Input Queue**) no FlexRay internal message buffer is updated and the related data available flag is automatically set to 0. The change of the data available flag can be used to confirm the cancellation a transmit request.

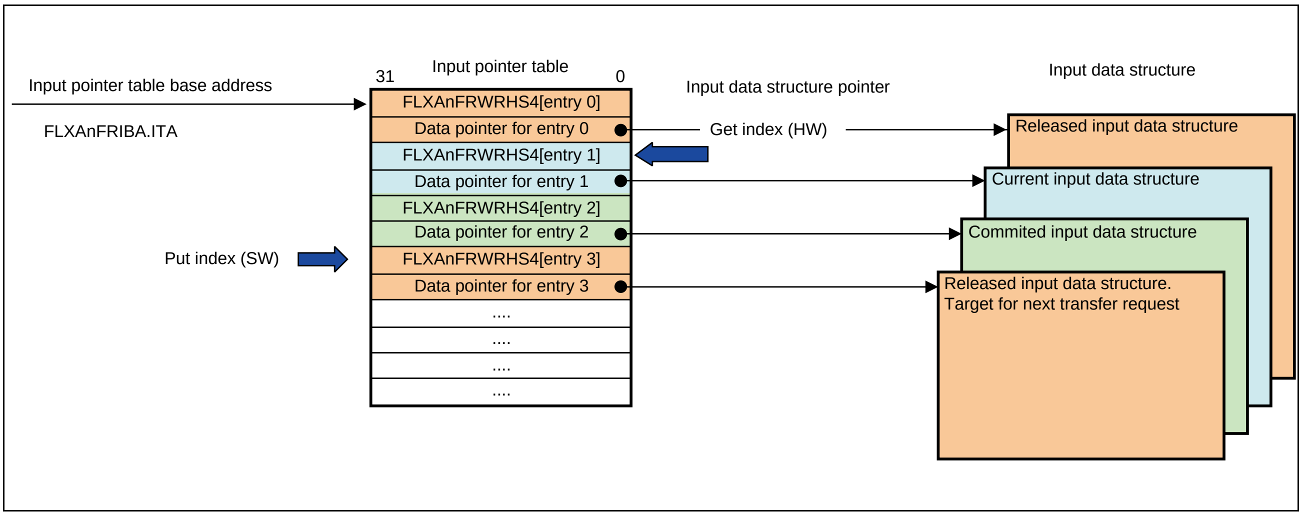

Figure 25.24 Input Pointer Table

Receive message buffers can be also configured using the input data transfer by setting up the required header sections and mark only the header section (FLXAnFRWRHS4.LDS = 0, FLXAnFRWRHS4.LHS = 1) to be updated in the FlexRay module.

(5) Halting the Input Queue

Committed data structures cannot be removed, but can be invalidated or updated when the input queue is halted.

To cancel data structures already committed to the input queue, the queue can be halted by writing a 1 to FLXAnFRITC.IQHR.

After the ongoing input transfer has been completed the queue is halted and FLXAnFRITS.IQH changes from 0 to 1.

To invalidate an entry of the input queue FLXAnFRWRHS4.INV has to be set to 1. All other bits in FWRHS4 should be unchanged.

Following flow shall be used to analyze whether a committed message has been already transferred to the FlexRay internal message RAM or not.

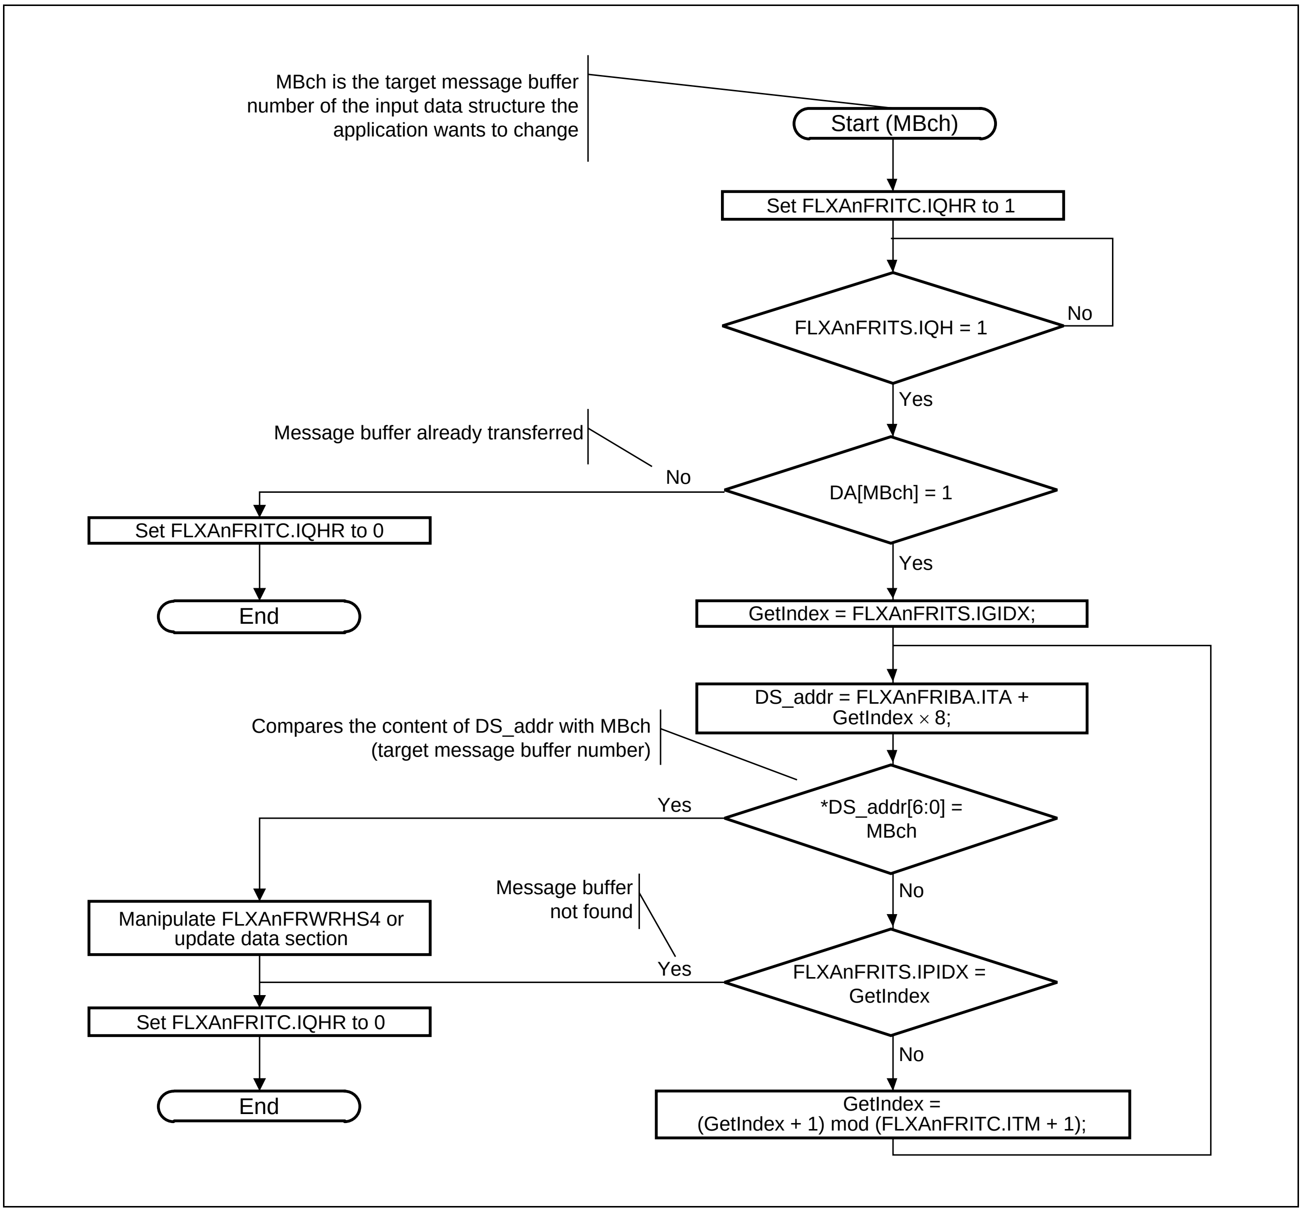

Figure 25.25 Input Table Analysis

In case the message buffer was already transferred to the FlexRay internal message RAM, the user input transfer request can be used to bypass the actual queue and update the required message buffer (see **Section 25.3.16.1(6), Transfer Function of User Requested Input Transfers**).

(6) Transfer Function of User Requested Input Transfers

To use this function the input transfer has to be activated (see **Section 25.3.16.1(1), Activation and Deactivation**).

The application is capable, by using FLXAnFRUIR.UIDX, to request a transfer of an input data structure. The user input transfer request is serviced first.

The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. The table entry for the user input transfer request should be added after the end of the input pointer table (see **Section 25.3.16.1(3), Input Pointer Table**).

To commit this table entry to the input handler, the application has to write the index (FLXAnFRITC.ITM + 1) to the user input transfer request register (FLXAnFRUIR.UIDX).

By writing to the user input transfer request register, the user input transfer request pending flag (FLXAnFRITS.UIRP) is automatically set to 1.

As long this flag is 1 the application should not make any further user input transfer requests.

The user input transfer request pending flag (FLXAnFRITS.UIRP) changes from 1 to 0 when the requested input transfer is completed. As next the pending transfers are processed.

25.3.16.2 Output Data Transfer

When the output data transfer function is enabled, received messages (either in dedicated message buffers or in the FlexRay receive FIFO) are transferred to the local RAM/global RAM by the output data handler. The output data handler can also transfer the message buffer content to the local RAM/global RAM on application request. When enabled the output handler is also capable to initiate a transfer when the message buffer status has changed.

(1) Activation and Deactivation

The output data transfer function should be activated before usage. The activation of the output transfer hander will initialize the FIFO put and get index pointer and FIFO fill level (FLXAnFROTS.FGIDX and FLXAnFROTS.FFL) to zero, set the bits FLXAnFROTS.FDA, FLXAnFROTS.OWP, FLXAnFROTS.FWP and FLXAnFROTS.UORP to 0. Also the interrupt status flags (FLXAnFROTS.OTIS, FLXAnFROTS.FIS, FLXAnFROTS.OWIS and FLXAnFROTS.FWIS) are set to 0.

The activation has no influence to the data available flags (FLXAnFRDAi.DA) which are related to the dedicated buffers; these flags have to be cleared by the application.

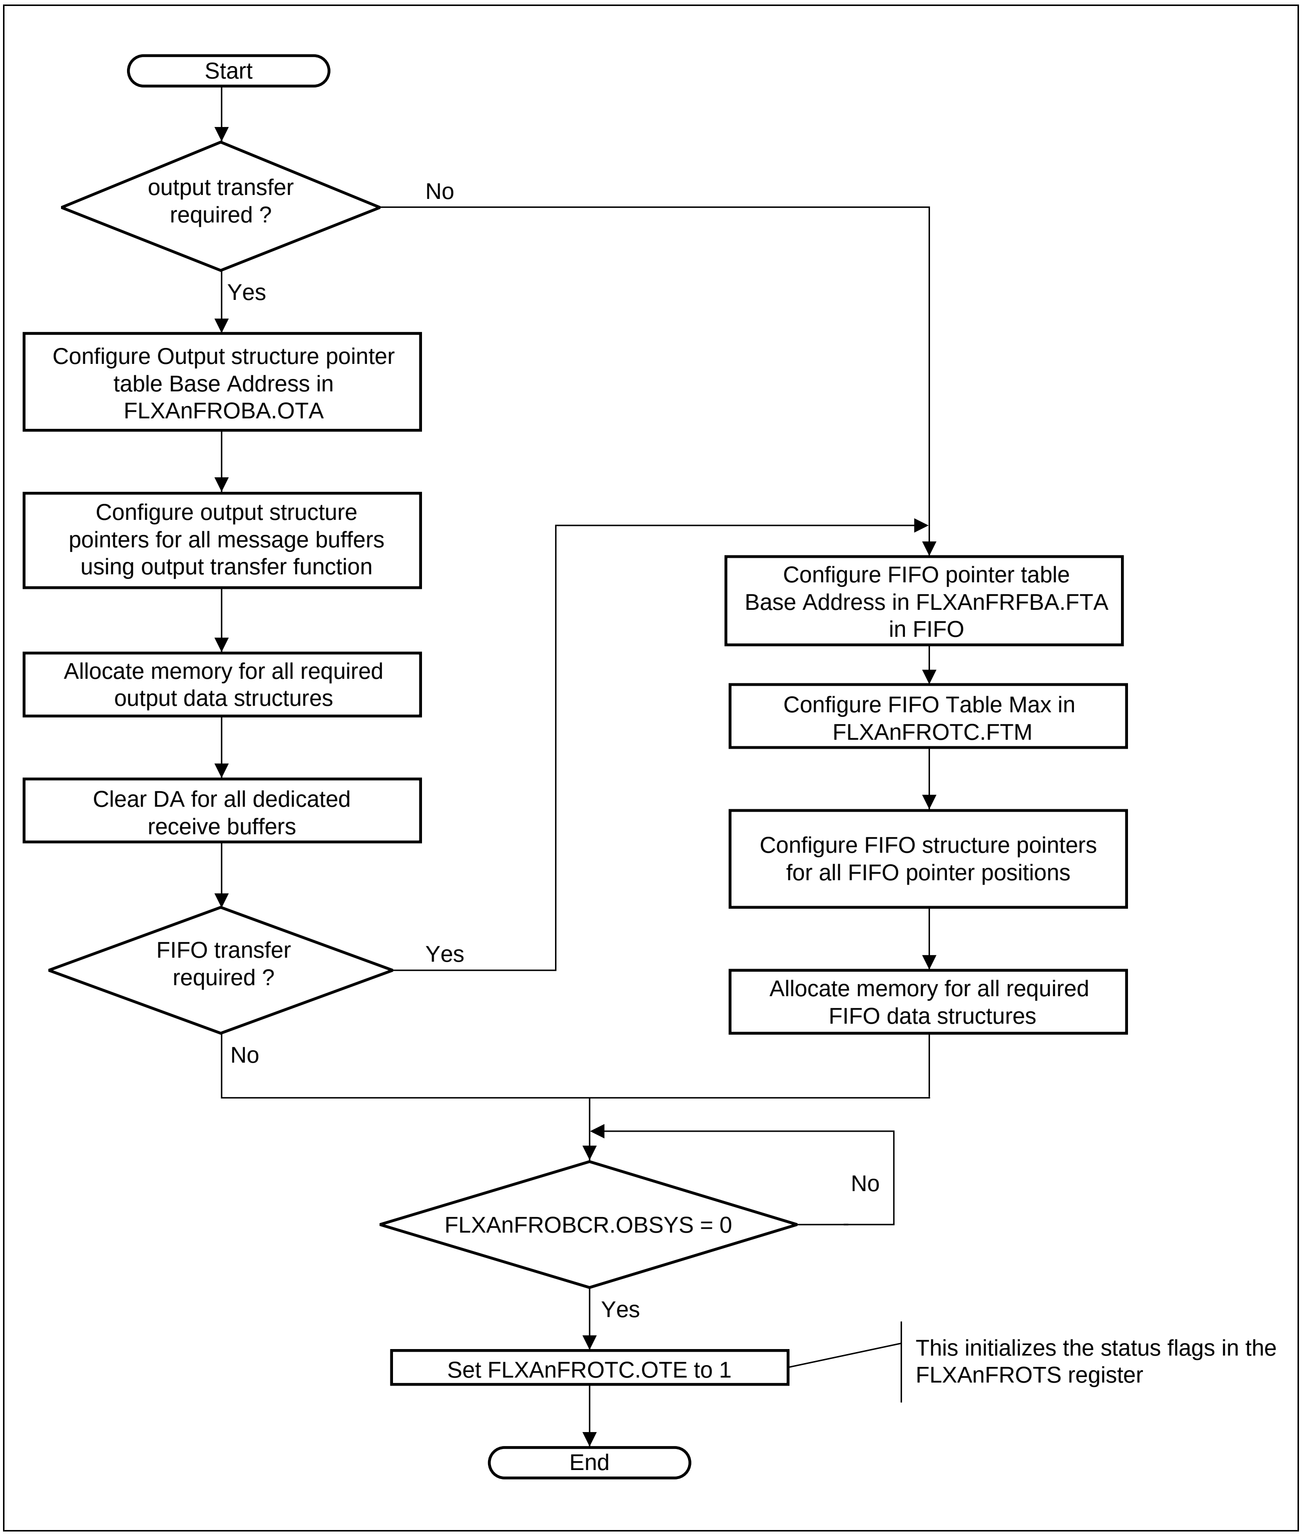

Figure 25.26 Output Transfer Enable Flow

A deactivation request of the output data transfer function can be made at any time. An ongoing transfer will be completed and the completion of this transfer will be flagged. During this time FLXAnFROTS.OTS remains 1.

When FLXAnFROTS.OTS changes from 1 to 0, the output transfer function is deactivated. The data available status flags and the FIFO get index are still maintained when the output transfer function is disabled.

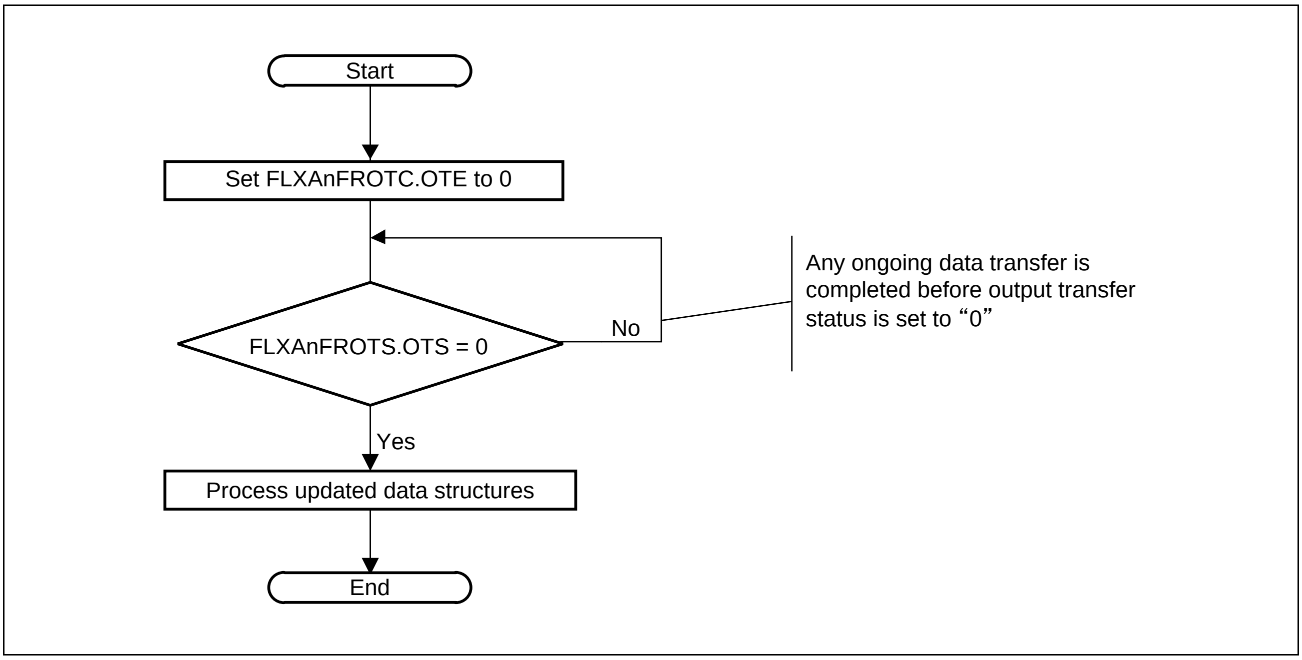

Figure 25.27 Output Transfer Disable Flow

(2) Output Transfer Data Structure

The data in the local RAM/global RAM is stored in an output data structure. The location of the output data structures are determined by output data structure pointers also located in the local RAM/global RAM. The output data structure and indexing is visualized in **Figure 25.28, Output Data Structure**.

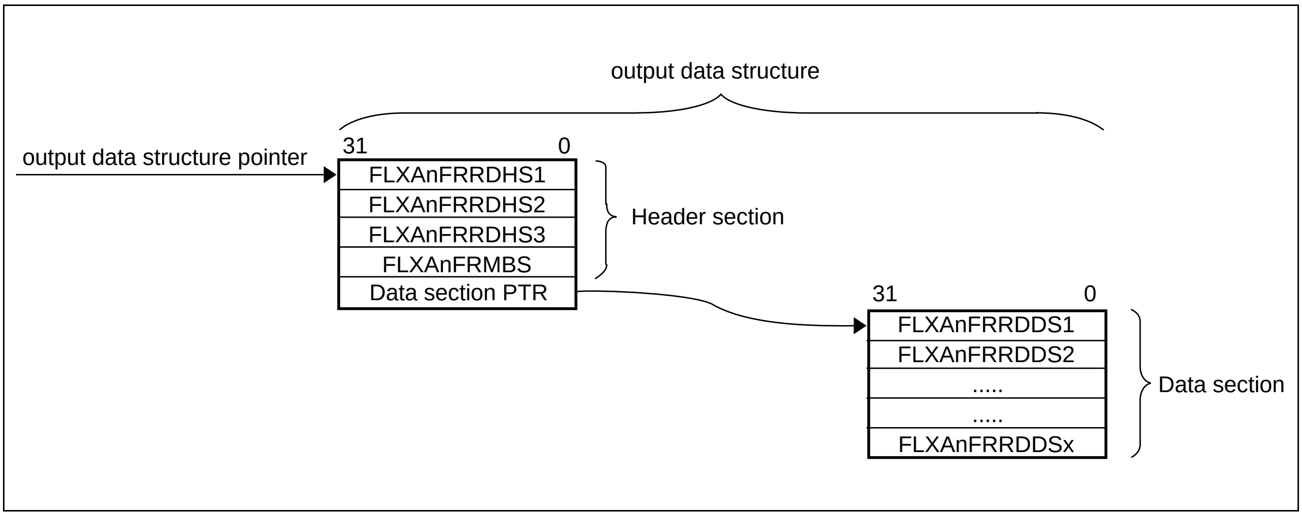

Figure 25.28 Output Data Structure

The output data structure consists of two sections, the header and data section. The header section consists of FLXAnFRRDHS1, FLXAnFRRDHS2, FLXAnFRRDHS3, FLXAnFRMBS and the data section pointer. FLXAnFRRDHS1 is the first element of the structure and has to be aligned to a 32 bit address. The data structure pointer is a reference to the address of FLXAnFRRDHS1. For information about the bit alignment and bit function within the header section refer to **Section 25.3.13.1, Header Partition**.

FLXAnFRRDDS1 is the first element of the data section. The data section pointer is a reference to the address of FLXAnFRRDDS1 and has to be aligned to a 32 bit address. The byte order for the FlexRay payload data in the output data structure is determined by the bit BEC in the FLXAnFROC register. For information about the payload data alignment within the data section refer to **Section 25.3.13.2, Data Partition**.

The length of the data section as well as the total structure size to be allocated in the local RAM/global RAM depends on the configured payload length (FLXAnFRRDHS2.PLC) of the related message buffer. In case the configured payload length is an odd number of words or the received payload length (FLXAnFRRDHS2.PLR) is smaller than the configured payload length, the remaining data words in the local RAM/global RAM are unused and cannot be used by the application.

The output data structure is identical for all three kinds of output transfers. In case only the header section is transferred the data section pointer is not evaluated by the output handler and the data section remains unchanged.

(3) Output Pointer Table

For the output data transfer function the application needs to set up an output pointer table in the local RAM/global RAM. The location of the first element of this table should be programmed into the output pointer table base address (FLXAnFROBA.OTA). This base address has to be aligned to a 32 bit address.

The size of the output pointer table is defined by the maximum of: the last configured dedicated message buffer and the highest message buffer number which will be used for the user output transfer request.

The output pointer table holds pointers (output data structure pointers) to the local RAM/global RAM location where a memory space is reserved for the target message buffer content (header section and data section).

There is a fixed linear relationship between the address of the entries in the output pointer table and the number of the related message buffers (see **Figure 25.29, Output Data Structure and Indexing**): the output pointer table starts with the entry for message buffer number 0 at the address configured in FLXAnFROBA.OTA and continues in ascending order for each following message buffer number, by 32 bit aligned address (e.g. message buffer 1 at address OTA + 4, message buffer 2 at address OTA + 8, etc.) for all possible message buffers.

When a set ND bit is the only transfer condition (FLXAnFROTC.OTCS is set to 0) only message buffers configured as a dedicated receive buffer or that will be used for user output transfer requests need have valid pointer entries.

When a set ND bit or a set MBC bit is the transfer condition (FLXAnFROTC.OTCS is set to 1) all dedicated receive buffer and dedicated transmit buffers need to have valid pointer entries.

(4) FIFO Output Pointer Table

The FlexRay module internal FIFO can be extended by a queued buffer structure in the local RAM/global RAM.

If the FlexRay module internal FIFO is used the application needs to setup the FIFO output pointer table. The location of the first element of this table is identified by the FIFO pointer table base address (FLXAnFRFBA.FTA). This base address has to be aligned to a 32 bit address.

The size of the FIFO pointer table and hence the maximum number of messages that can be added to the queue, is defined by FIFO Table Max (FLXAnFROTC.FTM).

The FIFO pointer table holds pointers (output data structure pointers) to the local RAM/global RAM location where a memory space is reserved the target message buffer content (header section and data section). For each table entry a data pointer shall be configured in this table.

(5) Transfer Function of Dedicated Message Buffers

To use this transfer function the output transfer has to be activated (see **Section 25.3.16.2(1), Activation and Deactivation**). The activation process requires to setup the output pointer table (see **Section 25.3.16.2(3), Output Pointer Table**) in order to specify the destination location (output data structures) for the data to transfer.
Figure 25.29, Output Data Structure and Indexing shows how the output pointer table references the output data structures.

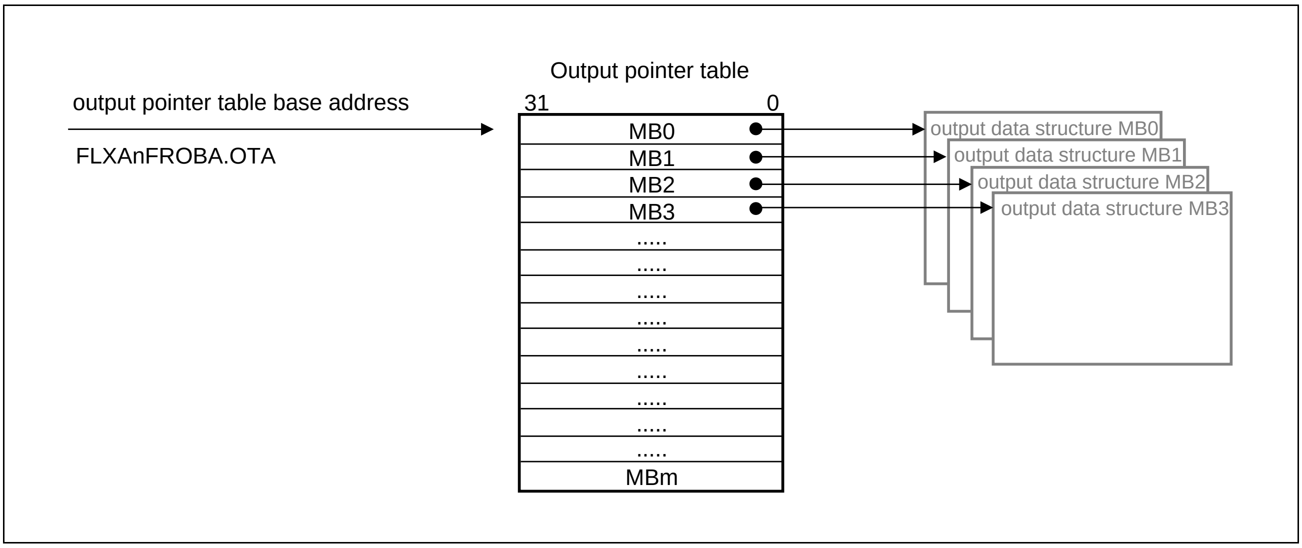

Figure 25.29 Output Data Structure and Indexing

With FLXAnFROTC.OTCS the output transfer condition can be selected between the “New data only mode” and the “New data and status changed mode”.

In the “New data only mode” an output data transfer is initiated when a valid FlexRay data frame has been stored into a dedicated receive buffer which causes the related ND flag in the FLXAnFRNDATi register to set. The ND flag in the FLXAnFRNDATi register is automatically set to 0 during the transfer procedure. The header section is also transferred and hence the MBC flag in the FLXAnFRMBSCi register is set to 0.

In the “New data and status changed mode” an output data transfer is initiated as described in the “New data only mode”. In addition an output data transfer is initiated when only the message buffer status has been changed which causes the related MBC flag in the FLXAnFRMBSCi register to be set. In this case only the header section is transferred. The MBC flag in the FLXAnFRMBSCi register is automatically set to 0 during the transfer procedure.

After transferring the message buffer data from the FlexRay internal message RAM to the output data structure the corresponding data available flag in the FLXAnFRDAi (i = 0 to 3) registers is set to 1. The update of the output data structure is also flagged by the setting of the output transfer interrupt status flag (FLXAnFROTS.OTIS).

As long as the data available flag remains 1 the corresponding output data structure will not be updated. In the case

- the data available flag is 1 and a valid received message was stored or
- when FLXAnFROTC.OTCS is 1 and the message buffer status was updated,

the output transfer warning interrupt flag (FLXAnFROTS.OWIS) is set to 1 notifying the application that new data is available but the output data structure transfer cannot be processed. In addition FLXAnFROTS.OWP is set to 1 that continuously flags that status of the output transfer warning condition.

If a valid receive message in the FlexRay internal message RAM is overwritten by an additional receive message, the message lost flag (FLXAnFRMBS.MLST) is set to 1. This flag can be evaluated after the message buffer has been transferred into an output data structure.

Following sections are giving a guidance how output data structures can be handled.

(a) Data Section Copy Method

One option is to copy the information from the output data structure to a different location of the local RAM/global RAM and then release the output data structure by clearing the related data available flag. The application should use the copied information for further processing.

(b) Data Structure Pointer Method

A different option is to modify the output data structure pointer in the output pointer table and to release the output data structure by clearing the related data available flag. The changed output data pointer should refer to a free data structure. The application should use the old data structure for further processing.

(c) Data Section Pointer Method

A third option is to modify the data section pointer in the output data structure and to release the output data structure by clearing the related data available flag. The changed data section pointer should refer to a free memory area. The application should use the old data section for further processing by forwarding the data section pointer.

(6) Transfer Function of FIFO Message Buffers

To use this buffer transfer function the output transfer has to be activated (see **Section 25.3.16.2(1), Activation and Deactivation**). The activation process requires the set up of the FIFO pointer table (see **Section 25.3.16.2(4), FIFO Output Pointer Table**) in order to specify a location in the local RAM/global RAM reserved for the storage of the required output data structures.

A FIFO data transfer is initiated when a valid FlexRay data frame has been stored in the FlexRay internal FIFO.

After transfers from the internal FIFO to the output data structure, the FIFO interrupt status flag (FLXAnFROTS.FIS) and FLXAnFROTS.FDA are set to 1. The bit FLXAnFROTS.FIS can be used as an interrupt source. The bit FLXAnFROTS.FDA indicates that the FIFO is not empty.

Up to FLXAnFROTS.FTM output structures configured in the FLXAnFROTC register can be queued.

The transfer to the extended FIFO buffer structure is controlled by index pointers. This put index is controlled by the FIFO transfer handler and is incremented after transferring a message to the output data structure.

The FIFO reception handler also maintains a get index which is flagged in FLXAnFROTS.FGIDX. The value of this get index is known by the application by either reading the status or maintaining a software variable. The get index (the value after a reset is zero) is incremented by one when the application releases the oldest entry of the FIFO queue by writing 1 to FLXAnFROTS.FDA. By comparing the put index and the get index the FIFO handler knows about the current fill level of the queued buffer structure.

The current FIFO fill level is flagged in FLXAnFROTS.FFL. When FLXAnFROTS.FDA is 1, there is at least one entry in the FIFO queue.

In case the queued buffer structure in the local RAM/global RAM is full (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1), no further transfers are initialized, new messages remain in the FlexRay internal FIFO and the FIFO transfer warning interrupt status flag (FLXAnFROTS.FWIS) is set to 1.

In case the FlexRay internal FIFO structure becomes full, messages in the FlexRay internal FIFO structure may get overwritten. The related status flags and configuration registers of the FlexRay core module can be used to generate desired warning notifications.

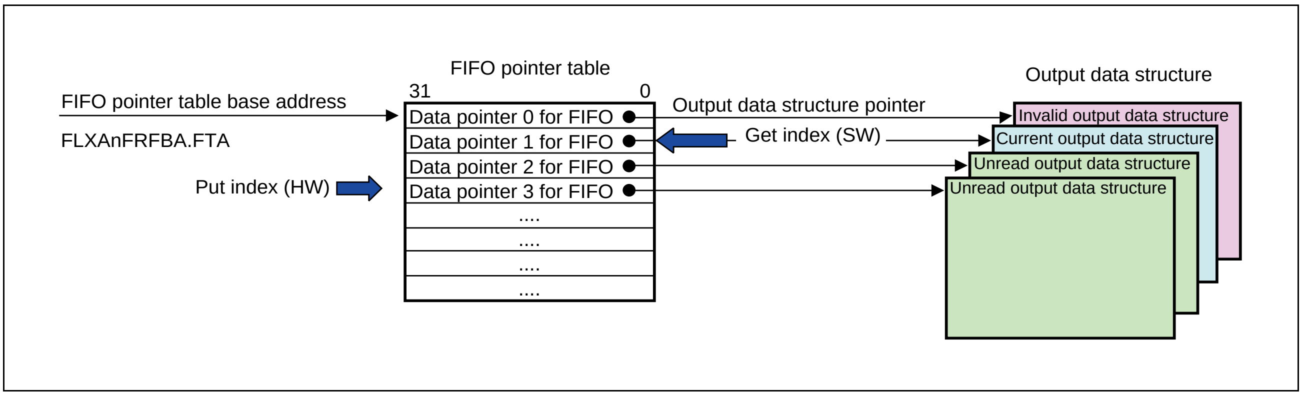

Figure 25.30 FIFO Pointer Table

(7) Transfer Function of User Output Transfer Requests

To use this transfer function the output transfer has to be activated (see **Section 25.3.16.2(1), Activation and Deactivation**). The activation process requires to setup the output pointer table (see **Section 25.3.16.2(3), Output Pointer Table**) in order to specify the location in the local RAM/global RAM reserved for the transfer of the data (output data structures).

The application is capable, by using FLXAnFRUOR.UMBNR, to request a transfer of dedicated message buffer to an output data structure. Except in CONFIG state, message buffers which are part of the FlexRay internal FIFO should not be requested.

The header section is always transferred to the output data structure. The transfer of the data section can be enabled by setting FLXAnFRUOR.URDS to 1. The selected message buffer content is stored in the output data structure location determined by the pointers in the output pointer table.

The data available status and transfer blocking by the DA bits in the FLXAnFRDAi register is also used for the user requested transfers. Therefore the DA bit in the FLXAnFRDAi register related to the requested buffer number (FLXAnFRUOR.UMBNR) should be released before making the transfer request.

After writing to FLXAnFRUOR.UMBNR, the bit FLXAnFROTS.UORP is set to 1 to indicate that there is a pending user transfer request. When the transfer has been processed the bit FLXAnFROTS.UORP is set to 0, the bit FLXAnFROTS.OTIS is set to 1 and the DA bit in the FLXAnFRDAi register related to the requested buffer number (FLXAnFRUOR.UMBNR) is set to 1.

User output transfer requests cannot be queued. The application should check the bit FLXAnFROTS.UORP before writing to FLXAnFRUOR.UMBNR.

User output transfer requests should not be made for message buffers which are pending in the input transfer queue.

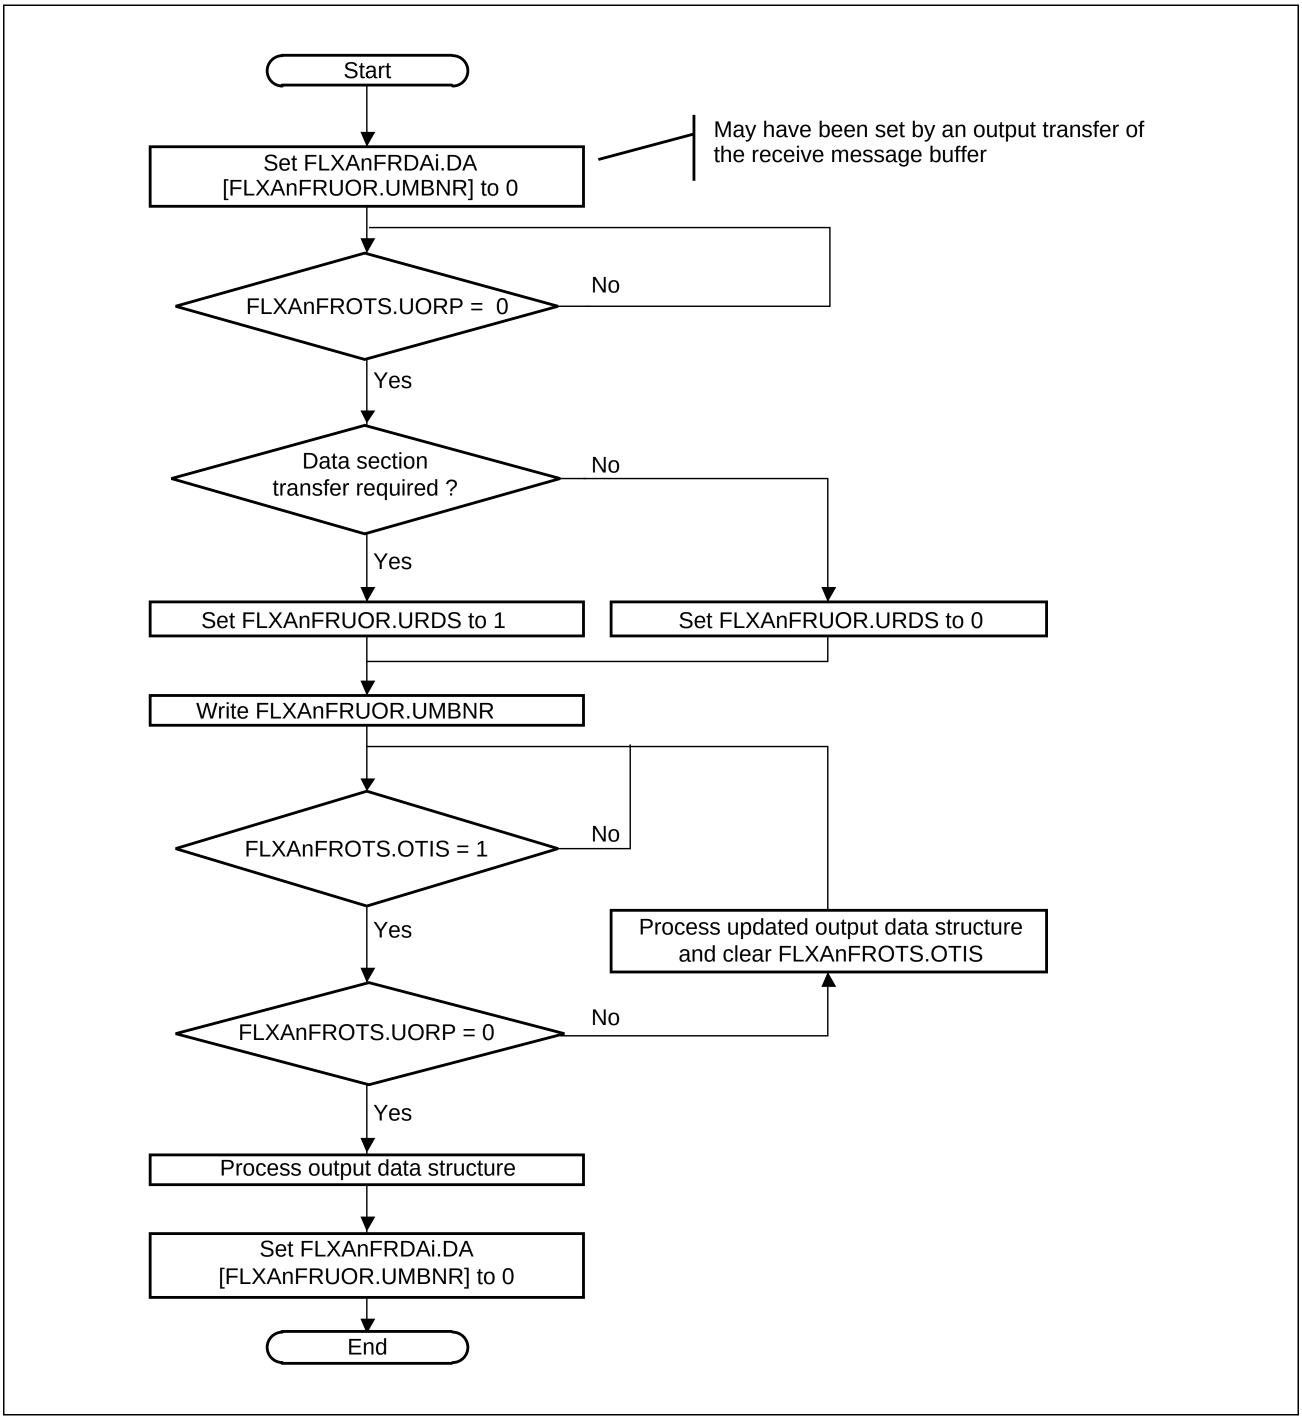

Figure 25.31 User Output Transfer Request Flow

Note that it may be possible that the data structure addressed by a user request is being updated due to a receive message buffer update (which causes the bit DA in the FLXAnFRDAi register being set).

This set DA flags inhibits the user output transfer request. Therefore polling FLXAnFROTS.UORP is not a secure method to identify when the transfer of a requested message buffer has been completed. The bits FLXAnFROTS.OTIS or the DA bit in the FLXAnFRDAi register can be used instead. The exact flow depends on the software architecture.

25.3.16.3 Data Structure Transfer Scheduling

Cyclically the different types of transfer requests are checked. In order to guarantee a certain transfer time the different types of transfers have different priorities.

Use requested input transfers have highest priority followed by the transfer of data structures committed into the active input transfer queue. No new output transfer will be started as long as there is a pending input transfer request.

The three output transfer request types are checked in a specific order:

(1) All Dedicated Message Buffers in Ascending Order

When FLXAnFROTC.OTCS is set to 0, set flags in the FLXAnFRNDATi register are causing a transfer of the message buffer to the output data structure if the destination area is free (DA bit in the FLXAnFRDAi register is 0).

When FLXAnFROTC.OTCS is set to 1, set flags in the FLXAnFRNDATi register or set flags in the FLXAnFRMBSCi register are causing a transfer of the message buffer to the output data structure if the destination area is free (DA bit in the FLXAnFRDAi register is 0).

(2) FlexRay Internal FIFO

When the FlexRay internal FIFO is not empty and there is a free destination area, one FIFO message is transferred into the output data structure addressed by the FIFO pointer table.

(3) User Output Request

If there is a pending user output transfer request, one message buffer is transferred into the corresponding output data structure.

The check sequence is suspended when an input transfer occurs.

25.3.16.4 Behavior in Case of Data Transfer Access Error

The memory areas accessed by the data transfer function may be protected by a memory protection unit (MPU). When the MPU flags an access to a protected address caused by an input or output transfer, an access error event is generated and the related bit in the FLXAnFRAES register is set.

The ongoing transfer is immediately terminated but succeeding transfers are processed and may generate further access errors. Any following access errors are only flagged in FLXAnFRAES.MAE. The other status flags are not updated.

(1) Access Error during Input Transfer

When an access error occurs during an input transfer:

- The ongoing transfer is immediately terminated. The FlexRay internal message RAM will not be updated
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.IAE is set to 1
- The input pointer table index is flagged in FLXAnFRAES.EIDX
- In case of an normal input transfer, the related DA flag in the FLXAnFRDAi register is set to 0
- In case of an user input transfer, request FLXAnFRITS.UIRP is set to 0

With the given status information the application is able to identify and correct the faulty data structure. In addition the application needs to clear the input access error flag (FLXAnFRAES.IAE).

(2) Access Error during Output Transfer

When an access error occurs during an output transfer:

- The ongoing transfer is immediately terminated but the update of the data structure may have started.
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.OAE is set to 1
- The output pointer table index is flagged in FLXAnFRAES.EIDX
- In case of an normal output transfer, the related DA flag in the FLXAnFRDAi register remains 0 and no output transfer, interrupt is generated
- In case of an user output transfer request FLXAnFROTS.UORP is set to 0

With the given status information the application is able to identify and correct the faulty data structure. The data structure in the local RAM/global RAM cannot be treated as valid.

In addition the application needs to clear the output access error flag (FLXAnFRAES.OAE).

The FlexRay module internal transfer of the message buffer is completed before the local RAM/global RAM access error is detected. The output transfer will not be re-initiated. To avoid loss of data, the application can perform a user output transfer request of this message buffer to a correct local RAM/global RAM location.

(3) Access Error during FIFO Transfer

When an access error occurs during an FIFO transfer:

- The ongoing transfer is immediately terminated
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.FAE is set to 1
- The FIFO pointer table index is flagged in FLXAnFRAES.EIDX
- The FIFO index pointer are not changed and hence the FIFO status flags are unchanged

With the given status information the application is able to identify and correct the faulty data structure. In addition the application needs to clear the FIFO access error flag (FLXAnFRAES.FAE).

The data in the local RAM/global RAM cannot be treated as valid and is not released to the application. The message cannot be recovered.

25.3.16.5 Behaviors in Case of RAM Read Errors

The FlexRay internal message RAM has an ECC checking mechanism. In case an uncorrectable RAM read error occurs, the application has to analyze the status in the FLXAnFRMHDS register and react as described in **Section 25.3.16.3, Data Structure Transfer Scheduling**. The input and output transfer handler reacts also on these errors detected in the message RAM when the error is related to an active transfer.

In addition, the Temporary Buffer RAM A and Temporary Buffer RAM B have an ECC checking mechanism as well. An uncorrectable RAM read errors does not impact the data transfer functionality but have to be handled as described in **Section 25.3.13.1(4), Message Buffer Status FLXAnFRMBS (Word 3)**.

In all cases, data causing a read error is never transferred to the local RAM/global RAM. If there is no recovery available in the application, the message is lost.

(1) Read Error during Transfer from TBF to MBF

This internal transfer is done for each valid FlexRay message received.

A read error can only occur when reading the header section in the FlexRay Message RAM (see read error flags in FLXAnFRMHDS). In this case, the message buffer needs to be re-configured.

For dedicated receive message buffers, the related ND flag in the FLXAnFRNDATi register will not get set. Consequently the affected message buffer will not be transferred to the output data structure.

For the FlexRay internal FIFO buffers, the ND flag in the FLXAnFRNDATi register is not set but the FlexRay internal FIFO put index is incremented. Due to this, a transfer procedure from the FlexRay internal FIFO buffer to the output buffer is started. However, if the read error is still present in the header section, updating of the output data structure will not start (see **Section 25.3.16.5(2), Read Error during Transfer from MBF to OBF**); thus the data in the local RAM/global RAM remains correct.

Note that the correction or any other reconfiguration of FIFO related to message buffers while there are pending FIFO transfers may result in incorrect data in the local RAM/global RAM. It is strongly recommended to deactivate the output data transfer before starting the reconfiguration and flush the FlexRay internal FIFO before reactivation of the output data transfer.

(2) Read Error during Transfer from MBF to OBF

This internal transfer is done for every output data transfer (dedicated reception, FIFO, user requested).

A read error can occur in the header and data section (see read error flags in FLXAnFRMHDS). In both cases the message gets lost. If the error is located in the header section, the message buffer needs to be re-configured. If the error is located in the data section, the error is corrected with the next data section update.

When a read error occurs during the transfer from the message RAM to the output buffer, the output data structure will not be updated and the data available will not be set to 1. The FIFO put index and the FIFO fill level are not changed also.

In case of user output transfer request, FLXAnFROTS.UORP is set to 0 even if there was no update of the output data structure.

(3) Read Error during Transfer from IBF to MBF

This internal transfer is done for every input data transfer.

A read error can occur only when there is no update of the header section requested (the bit LHS in FLXAnFRWRHS4 is set to 0) due to the reading of the header section from the message RAM (see read error flags in FLXAnFRMHDS). In this case, the message buffer needs to be re-configured.

When a read error occurs during the input data transfer, the actually transferred message in the input queue gets lost.

(4) Message RAM Read Errors

Read errors when reading the header section are flagged in the FLXAnFRMHDS register.

Depending on the buffer type and set buffer protection, a reconfiguration of the message buffer may not be possible.

The input transfer function cannot be used to reconfigure a locked message buffer using the method described in **Section 25.3.13.4(3), Temporary Unlocking of Header Section**.

Before reconfiguring a locked buffer, the user should disable the input transfer function and the output transfer function.

25.3.16.6 Data Transfer Timings

The transfer timing between the local RAM/global RAM and the FlexRay internal message buffers is composed of two elements. The first element is the FlexRay core internal transfer time between the interface buffer and the message RAM. The second element is the transfer time required between the local RAM/global RAM and the interface buffer.

The concept of the input- and output handler allows only one active transfer between the local RAM/global RAM and input buffer as well as only one active transfer between the input buffer and the message RAM. In case two requests are made at the same time, the input transfer task is handled at first.

Due to this concept constrains the calculation of transfer times does not consider a parallel transfer but the worst case scenario whereby an output transfer is started only after all input transfers are completed.

(1) FlexRay Core Internal Transfer Time

The number of clock cycles required for a transfer is given in FlexRay core module clock cycles (bus clock). The transfer time differs between the input and output transfer.

The time required for a transfer between the interface buffer and the FlexRay internal message RAM is given by [ERAY_ADD]

$$cycles_{req\_MHD[PL]} = (numberOfConcurrentTasks) \times \left(setupTime + \left(DataWords_{req[PL]}\right) + 75\right)$$

Equation 3

The number of data words (32 bit) can be calculated by

$$DataWords_{req[PL]} = 4 + floor\left(\frac{PLC + 1}{2}\right)$$

Equation 4

Whereby 4 is the number of header section words (32 bit) which needs to be always accessed even if the header section is not updated.

As there can be in total three parallel tasks in the FlexRay internal message handler but the number of concurrent tasks is unknown, not only for a worst case consideration the number of concurrent tasks must be set to 3. Beside the setup time and the number of words to be transferred a message handler internal delay time of 75 bus clock cycles must be added. The maximum number of payload to be transferred is in worst case 64.

The worst case for an input transfer is different from the worst case for an output transfer. For an input transfer the setup time required is 6 bus clock cycles and therefore

$$cycles_{req\_MHD\ input[64]} = 3 \times (6 + 68 + 75) = 447$$

Equation 5 Message Hander Internal Input Transfer Time (Worst Case)

For an output transfer the setup time required is 2 bus clock cycles and therefore

$$cycles_{req\_MHD\ output[64]} = 3 \times (2 + 68 + 75) = 435$$

Equation 6 Message Handler Internal Output Transfer Time (Worst Case)

(2) System Bus Transfer Time

The number of bus clock cycles required for a transfer is given in bus clock cycles and is identical for all kind of transfers between the local RAM/global RAM and the FlexRay module.

The time required by the transfer handler for a transfer between the local RAM/global RAM and the FlexRay interface buffer is given by

$$cycles_{req\_SB[PL]} = throughput \times \left(systemTime + \left(DataWords_{req[PL]}\right) + setupTime\right)$$

Equation 7 General System Bus Transfer Time Formula

The number of payload words (32 bit) can be calculated by using Equation 4.

The throughput depends on the utilization of the system bus and depends on the application. However, the data transfer handler has the highest priority for accessing the local RAM/global RAM and the data throughput factor can be assumed as XXXX even in worst case scenarios. The system time (read of the data pointer from local RAM/global RAM) can be set to 1 in all cases. The transfer setup time can be set to 3 in all cases.

Therefore the system bus transfer time (given in bus clock cycles) is given by

$$cycles_{req\_SB[64]} = throughput \times (2 + 68) + 3 = XXXX \times (2 + 68) + 3$$

Equation 8 System Bus Transfer Time (Worst Case)

In addition to the system bus transfer time a FlexRay module internal processing time needs to be taken into account. The number of clock cycles required for the internal processing time required is given in FlexRay core module clock cycles (bus clock) and is different between input transfers and output transfers but can be treated as constants.

$$cycles_{req\_THD\ input} = 2 + 4 = 6$$

Equation 9

Whereby 2 cycles are required to initiate the FlexRay module internal transfer from the input buffer to the message RAM. In addition 4 internal processing cycles are required.

$$cycles_{req\_THD\ output} = 3 + 4 = 7$$

Equation 10

Whereby 3 cycles are required to initiate the FlexRay module internal transfer from the input buffer to the message RAM. In addition 4 internal processing cycles are required.

(3) Summary Required Input Transfer Time

The worst case time (as a function of the transferred payload) required to transfer data between the local RAM/global RAM to the FlexRay internal message buffer can be calculated by

$$t\_input_{[PL]} = t\_chi \times \left(cycles_{req\_THD\_input} + cycles_{req\_MHD\_input[PL]}\right) + t\_sys \times \left(cycles_{req\_SB[\mathrm{PL}]}\right)$$

$$t\_input_{[PL]} = t\_chi \times \left(6 + 3 \times \left[81 + DataWords_{[PL]}\right]\right) + t\_sys \times \left(throughput \times \left[2 + DataWords_{[PL]}\right] + 3\right)$$

Equation 11 Input transfer time

With

$$t\_sys = \left(f(sysclk)\right)^{-1}$$

and.

$$t\_chi = \left(f(clkp2\_flx)\right)^{-1}$$

(4) Summary Required Output Transfer Time

The worst case time (as a function of the transferred payload) required to transfer data from the FlexRay internal message buffer to the local RAM/global RAM can be calculated by

$$t\_output_{[PL]} = t\_chi \times \left(cycles_{req\_THD\_output} + cycles_{req\_MHD\_output[PL]}\right) + t\_sys \times \left(cycles_{req\_SB[\mathrm{PL}]}\right)$$

$$t\_output_{[PL]} = t\_chi \times \left(7 + 3 \times \left[77 + DataWords_{[PL]}\right]\right) + t\_sys \times \left(throughput \times \left[2 + DataWords_{[PL]}\right] + 3\right)$$

Equation 12 Output Transfer Time

With

$$t\_sys = \left(f(sysclk)\right)^{-1}$$

and.

$$t\_chi = \left(f(clkp2\_flx)\right)^{-1}$$

25.3.17 Byte Alignment

The alignment of the bytes received by the FlexRay protocol and the alignment of the bytes required by the application may be different. The FlexRay module provides with FLXAnFROC.BEC a byte alignment function to support different byte ordering styles.

Figure 25.32, Byte Alignment on the FlexRay Bus shows the payload byte alignment in a FlexRay frame.

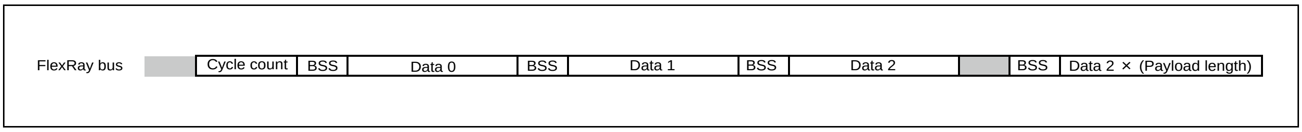

Figure 25.32 Byte Alignment on the FlexRay Bus

25.3.17.1 Little Endian Alignment

When FLXAnFROC.BEC is 0, the byte alignment is set to Little Endian.

(1) FLXAnFRNMVm (m = 1 to 3)

The byte alignment of the NMV bytes is as below.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FLXAnFRNMV1	Data 3								Data 2								Data 1								Data 0							
FLXAnFRNMV2	Data 7								Data 6								Data 5								Data 4							
FLXAnFRNMV3	Data 11								Data 10								Data 9								Data 8							

(2) FLXAnFRWRDSx (x = 1 to 64)

The byte alignment for the message payload in the FlexRay input buffer and the input data structure is as below.

FLXAnFRWRDSx.MD[7:0] = Data_{4x-4}
FLXAnFRWRDSx.MD[15:8] = Data_{4x-3}
FLXAnFRWRDSx.MD[23:16] =Data_{4x-2}
FLXAnFRWRDSx.MD[31:24] = Data_{4x-1}

Transmission order on the FlexRay bus is FLXAnFRWRDSx.MD[7:0], FLXAnFRWRDSx.MD [15:8], FLXAnFRWRDSx.MD [23:16], FLXAnFRWRDSx.MD [31:24] with the most significant bit (MSB) transmitted first.

(3) FLXAnFRRDDSx (x = 1 to 64)

The byte alignment for the message payload in the FlexRay output buffer and the output data structure is as below.

FLXAnFRRDDSx.MD[7:0] = Data_{4x-4}
FLXAnFRRDDSx.MD[15:8] = Data_{4x-3}
FLXAnFRRDDSx.MD[23:16] =Data_{4x-2}
FLXAnFRRDDSx.MD[31:24] = Data_{4x-1}

Reception order on the FlexRay bus is FLXAnFRRDDSx.MD[7:0], FLXAnFRRDDSx.MD [15:8], FLXAnFRRDDSx.MD [23:16], FLXAnFRRDDSx.MD [31:24] with the most significant bit (MSB) received first.

25.3.17.2 Big Endian Alignment

When FLXAnFROC.BEC is 1, the byte alignment is set to Big Endian.

(1) FLXAnFRNMVm (m = 1 to 3)

The byte alignment of the NMV bytes is as below.

Bit	31 to 24	23 to 16	15 to 8	7 to 0
FLXAnFRNMV1	Data 0	Data 1	Data 2	Data 3
FLXAnFRNMV2	Data 4	Data 5	Data 6	Data 7
FLXAnFRNMV3	Data 8	Data 9	Data 10	Data 11

(2) FLXAnFRWRDSx (x = 1 to 64)

The byte alignment for the message payload in the FlexRay input buffer and the input data structure is as below.

FLXAnFRWRDSx.MD[7:0] = Data_{4x-1}
FLXAnFRWRDSx.MD[15:8] = Data_{4x-2}
FLXAnFRWRDSx.MD[23:16] =Data_{4x-3}
FLXAnFRWRDSx.MD[31:24] = Data_{4x-4}

Transmission order on the FlexRay bus is FLXAnFRWRDSx.MD[31:24], FLXAnFRWRDSx.MD[23:16], FLXAnFRWRDSx.MD[15:8], FLXAnFRWRDSx.MD[7:0] with the most significant bit (MSB) transmitted first.

(3) FLXAnFRRDDSx (x = 1 to 64)

The byte alignment for the message payload in the FlexRay output buffer and the output data structure is as below.

FLXAnFRRDDSx.MD[7:0] = Data_{4x-1}
FLXAnFRRDDSx.MD[15:8] = Data_{4x-2}
FLXAnFRRDDSx.MD[23:16] =Data_{4x-3}
FLXAnFRRDDSx.MD[31:24] = Data_{4x-4}

Reception order on the FlexRay bus is FLXAnFRRDDSx.MD[31:24], FLXAnFRRDDSx.MD[23:16], FLXAnFRRDDSx.MD[15:8], FLXAnFRRDDSx.MD[7:0] with the most significant bit (MSB) received first.

25.4 Detection and Correction of Errors in FlexRay RAM

For details of ECC, see **Section 40A.2.6, ECC for Peripheral RAM**, **Section 40B.2.6, ECC for Peripheral RAM**, **Section 40C.2.5, ECC for Peripheral RAM**.

Section 26 Ethernet AVB (ETNB)

This section contains a generic description of the Ethernet AVB (ETNB).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of ETNB.

CAUTION

Read URAM in this manual as local RAM/global RAM/retention RAM.
Read AXI BUS in this manual as H-Bus.

26.1 Features of RH850/F1KH, RH850/F1KM ETNB

26.1.1 Number of Units

This microcontroller has the following number of ETNB units.

Each ETNB unit has single channel interface.

Table 26.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	2
Name	ETNBn (n = 0)	ETNBn (n = 0)	ETNBn (n = 0,1)

Table 26.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	—	—	1	1	1
Name	—	—	ETNBn (n = 0)	ETNBn (n = 0)	ETNBn (n = 0)

Table 26.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	—	—
Name	—	—	—	—

Table 26.4 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual ETNB units are identified by the index “n”; for example, ETNBnCCC (n = 0, 1) is the AVB-DMAC mode register.

Table 26.5 Index (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual ETNB units are identified by the index “n”; for example, ETNBnCCC (n = 0) is the AVB-DMAC mode register.

26.1.2 Register Base Addresses

ETNB base addresses are listed in the following table.

ETNB register addresses are given as an offset from the base addresses.

Table 26.6 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<ETNB0_base>	FFD6 E000$_H$
<ETNB1_base>	FFD6 E800$_H$

Table 26.7 Register Base Address (RH850/F1KM-S4)

Base Address Name	Base Address
<ETNB0_base>	FFD6 E000$_H$

26.1.3 Clock Supply

The ETNB clock supply is shown in the following table.

Table 26.8 Clock Supply (RH850/F1KH-D8)

Unit Name	Unit Clock Name	Supply Clock Name
ETNBn	clk_chi*1,*2	CPUCLK_L
	Register access clock*1,*2	CPUCLK_L

Note 1. ETNB clocks can be stoped by OPBT0.ETNBnEN, refer to **Section 44.9.2, OPBT0 — Option Byte 0**.

Note 2. ETNB clocks is more than 15 MHz.

Table 26.9 Clock Supply (RH850/F1KM-S4)

Unit Name	Unit Clock Name	Supply Clock Name
ETNBn	clk_chi*1,*2	CPUCLK_L
	Register access clock*1,*2	CPUCLK_L

Note 1. ETNB clocks can be stoped by OPBT0.ETNBnEN, refer to **Section 44.9.2, OPBT0 — Option Byte 0**.

Note 2. ETNB clocks is more than 15 MHz.

26.1.4 Interrupt Requests

ETNB interrupt requests are listed in the following table.

Table 26.10 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
ETNB0			
INTETNB0DATA	Data related interrupt	315	—
INTETNB0ERR	Error related interrupt	316	—
INTETNB0MNG	Management related interrupt	317	—
INTETNB0MAC	MAC interrupt	318	—
ETNB1			
INTETNB1DATA	Data related interrupt	377	—
INTETNB1ERR	Error related interrupt	378	—
INTETNB1MNG	Management related interrupt	379	—
INTETNB1MAC	MAC interrupt	380	—

Table 26.11 Interrupt Requests (RH850/F1KM-S4)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
ETNB0			
INTETNB0DATA	Data related interrupt	315	—
INTETNB0ERR	Error related interrupt	316	—

26.1.5 Reset Sources

ETNB reset sources are listed in the following table. ETNB is initialized by these reset sources.

Table 26.12 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
ETNBn	All reset sources (ISORES)

Table 26.13 Reset Sources (RH850/F1KM-S4)

Unit Name	Reset Source
ETNBn	All reset sources (ISORES)

26.1.6 External Input/Output Signals

External input/output signals of ETNB are listed below.

Table 26.14 ETNBn Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
ETNB0		
AVB_TX_CLK	MII transmit clock signal	ETNB0TXCLK
AVB_RX_CLK	MII receive clock signal	ETNB0RXCLK
AVB_TX_EN	MII transmit data enable signal	ETNB0TXEN
AVB_TXD[3:0]	MII transmit data signal	ETNB0TXD[3:0]
AVB_RX_DV	MII receive data valid signal	ETNB0RXDV
AVB_RXD[3:0]	MII receive data signal	ETNB0RXD[3:0]
AVB_RX_ER	MII receive error signal	ETNB0RXERR
AVB_MDC	PHY management clock signal	ETNB0MDC
AVB_MDIO	PHY management transfer data signal	ETNB0MDIO
AVB_LINK	PHY link status signal	ETNB0LINK
ETNB1		
AVB_TX_CLK	MII transmit clock signal	ETNB1TXCLK
AVB_RX_CLK	MII receive clock signal	ETNB1RXCLK
AVB_TX_EN	MII transmit data enable signal	ETNB1TXEN
AVB_TXD[3:0]	MII transmit data signal	ETNB1TXD[3:0]
AVB_RX_DV	MII receive data valid signal	ETNB1RXDV
AVB_RXD[3:0]	MII receive data signal	ETNB1RXD[3:0]
AVB_RX_ER	MII receive error signal	ETNB1RXERR
AVB_MDC	PHY management clock signal	ETNB1MDC
AVB_MDIO	PHY management transfer data signal	ETNB1MDIO
AVB_LINK	PHY link status signal	ETNB1LINK

Note: In RH850/F1KH, there is no TXERR pin. It is recommended to connect to EVSS or BVSS via a resistor for TXERR of PHY.

Table 26.15 ETNBn Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
ETNB0		
AVB_TX_CLK	MII transmit clock signal	ETNB0TXCLK
AVB_RX_CLK	MII receive clock signal	ETNB0RXCLK
AVB_TX_EN	MII transmit data enable signal	ETNB0TXEN
AVB_TXD[3:0]	MII transmit data signal	ETNB0TXD[3:0]
AVB_RX_DV	MII receive data valid signal	ETNB0RXDV
AVB_RXD[3:0]	MII receive data signal	ETNB0RXD[3:0]
AVB_RX_ER	MII receive error signal	ETNB0RXERR
AVB_MDC	PHY management clock signal	ETNB0MDC
AVB_MDIO	PHY management transfer data signal	ETNB0MDIO
AVB_LINK	PHY link status signal	ETNB0LINK

Note: In RH850/F1KM, there is no TXERR pin. It is recommended to connect to EVSS or BVSS via a resistor for TXERR of PHY.

26.2 Overview

26.2.1 Functional Overview

Table 26.16, Specifications of ETNB lists the specifications of the ETNB.

Table 26.16 Specifications of ETNB

Item	Description
Protocol	Flow control conforming with the IEEE 802.3x standard
Communication interface	MII
Transfer speed	● 100 Mbps ● 10 Mbps*1
Transfer mode	● Full-duplex mode
AVB function	● Conforming with the following standards stipulated for IEEE 802.1BA. – IEEE 802.1AS (time synchronization protocol) – IEEE 802.1Qav (real-time transfer) * IEEE 802.1Qat should be supported by software. ● Descriptor management system ● IEEE 1722 (AVTP presentation timestamp)

Note 1. Not available for the AVB function.

26.2.2 Block Diagram

Figure 26.1, Block Diagram of ETNB is a block diagram of the ETNB.

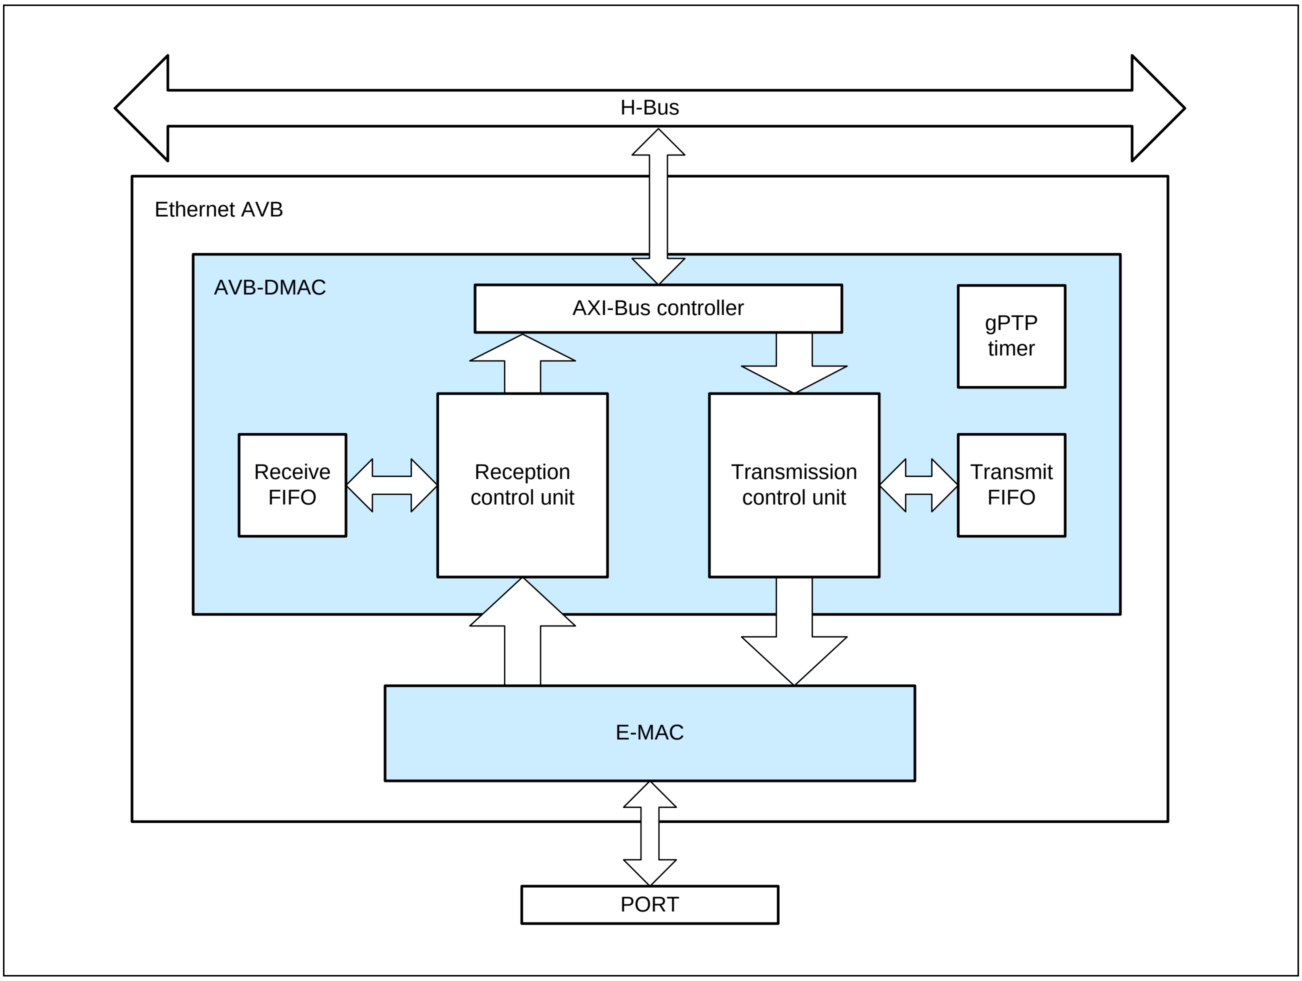

Figure 26.1 Block Diagram of ETNB

26.3 Registers

26.3.1 List of Registers

The following table lists the ETNB registers.

For details about <ETNBn_base>, see **Section 26.1.2, Register Base Address**.

Table 26.17 List of Registers

Module Name	Register Name	Abbreviation	Address
ETNBn	AVB-DMAC mode register	ETNBnCCC	<ETNBn_base> + 0000_H
	Descriptor base address table register	ETNBnDBAT	<ETNBn_base> + 0004_H
	Descriptor base address load request register	ETNBnDLR	<ETNBn_base> + 0008_H
	AVB-DMAC status register	ETNBnCSR	<ETNBn_base> + $000C_H$
	Current descriptor address register q (q = 0 to 21)	ETNBnCDARq	<ETNBn_base> + 0010_H + q × 4_H
	Error status register	ETNBnESR	<ETNBn_base> + 0088_H
	Receive configuration register	ETNBnRCR	<ETNBn_base> + 0090_H
	Receive queue configuration register i (i = 0 to 4)	ETNBnRQCi	<ETNBn_base> + 0094_H + i × 4_H
	Receive padding configuration register	ETNBnRPC	<ETNBn_base> + $00B0_H$
	Unread frame counter stop level configuration register	ETNBnUFCS	<ETNBn_base> + $00C0_H$
	Unread frame counter register i (i = 0 to 4)	ETNBnUFCVi	<ETNBn_base> + $00C4_H$ + i × 4_H
	Unread frame counter decrement register i (i = 0 to 4)	ETNBnUFCDi	<ETNBn_base> + $00E0_H$ + i × 4_H
	Separation filter offset register	ETNBnSFO	<ETNBn_base> + $00FC_H$
	Separation filter pattern register i (i = 0 to 31)	ETNBnSFPi	<ETNBn_base> + 0100_H + i × 4_H
	Separation filter mask register i (i = 0, 1)	ETNBnSFMi	<ETNBn_base> + $01C0_H$ + i × 4_H
	Transmit configuration register	ETNBnTGC	<ETNBn_base> + 0300_H
	Transmit configuration control register	ETNBnTCCR	<ETNBn_base> + 0304_H
	Transmit status register	ETNBnTSR	<ETNBn_base> + 0308_H
	Timestamp FIFO access register 0	ETNBnTFA0	<ETNBn_base> + 0310_H
	Timestamp FIFO access register 1	ETNBnTFA1	<ETNBn_base> + 0314_H
	Timestamp FIFO access register 2	ETNBnTFA2	<ETNBn_base> + 0318_H
	CBS increment value register c (c = 0, 1)	ETNBnCIVRc	<ETNBn_base> + 0320_H + c × 4_H
	CBS decrement value register c (c = 0, 1)	ETNBnCDVRc	<ETNBn_base> + 0328_H + c × 4_H
	CBS upper limit register c (c = 0, 1)	ETNBnCULc	<ETNBn_base> + 0330_H + c × 4_H
	CBS lower limit register c (c = 0, 1)	ETNBnCLLc	<ETNBn_base> + 0338_H + c × 4_H
	Descriptor interrupt control register	ETNBnDIC	<ETNBn_base> + 0350_H
	Descriptor interrupt status register	ETNBnDIS	<ETNBn_base> + 0354_H
	Error interrupt control register	ETNBnEIC	<ETNBn_base> + 0358_H
	Error interrupt status register	ETNBnEIS	<ETNBn_base> + $035C_H$
	Receive interrupt control register 0	ETNBnRIC0	<ETNBn_base> + 0360_H
	Receive interrupt status register 0	ETNBnRIS0	<ETNBn_base> + 0364_H
	Receive interrupt control register 1	ETNBnRIC1	<ETNBn_base> + 0368_H
	Receive interrupt status register 1	ETNBnRIS1	<ETNBn_base> + $036C_H$
	Receive interrupt control register 2	ETNBnRIC2	<ETNBn_base> + 0370_H
	Receive interrupt status register 2	ETNBnRIS2	<ETNBn_base> + 0374_H
	Transmit interrupt control register	ETNBnTIC	<ETNBn_base> + 0378_H
	Transmit interrupt status register	ETNBnTIS	<ETNBn_base> + $037C_H$
	Interrupt summary status register	ETNBnISS	<ETNBn_base> + 0380_H
	gPTP configuration control register	ETNBnGCCR	<ETNBn_base> + 0390_H

Table 26.17 List of Registers

Module Name	Register Name	Abbreviation	Address
ETNBn	gPTP maximum transit time register	ETNBnGMTT	<ETNBn_base> + 0394_H
	gPTP presentation time comparison register	ETNBnGPTC	<ETNBn_base> + 0398_H
	gPTP timer increment register	ETNBnGTI	<ETNBn_base> + $039C_H$
	gPTP timer offset register i (i = 0 to 2)	ETNBnGTOi	<ETNBn_base> + $03A0_H$ + i × 4_H
	gPTP interrupt control register	ETNBnGIC	<ETNBn_base> + $03AC_H$
	gPTP interrupt status register	ETNBnGIS	<ETNBn_base> + $03B0_H$
	gPTP timer capture register i (i = 0 to 2)	ETNBnGCTi	<ETNBn_base> + $03B8_H$ + i × 4_H
	E-MAC mode register	ETNBnECMR	<ETNBn_base> + 0500_H
	Receive frame length register	ETNBnRFLR	<ETNBn_base> + 0508_H
	E-MAC status register	ETNBnECSR	<ETNBn_base> + 0510_H
	E-MAC interrupt permission register	ETNBnECSIPR	<ETNBn_base> + 0518_H
	PHY interface register	ETNBnPIR	<ETNBn_base> + 0520_H
	PHY LINK status register	ETNBnPLSR	<ETNBn_base> + 0528_H
	Auto PAUSE frame time parameter register	ETNBnAPFTP	<ETNBn_base> + 0554_H
	Manual PAUSE frame register	ETNBnMPR	<ETNBn_base> + 0558_H
	PAUSE frame transmit counter	ETNBnPFTCR	<ETNBn_base> + $055C_H$
	PAUSE frame receive counter	ETNBnPFRCR	<ETNBn_base> + 0560_H
	MAC address high register	ETNBnMAHR	<ETNBn_base> + $05C0_H$
	MAC address low register	ETNBnMALR	<ETNBn_base> + $05C8_H$
	Transmit retry over counter register	ETNBnTROCR	<ETNBn_base> + 0700_H
	Late collision detect counter register	ETNBnCDCR	<ETNBn_base> + 0708_H
	Lost carrier counter register	ETNBnLCCR	<ETNBn_base> + 0710_H
	CRC error frame receive counter register	ETNBnCEFCR	<ETNBn_base> + 0740_H
	Frame receive error counter register	ETNBnFRECR	<ETNBn_base> + 0748_H
	Too-short frame receive counter register	ETNBnTSFRCR	<ETNBn_base> + 0750_H
	Too-long frame receive counter register	ETNBnTLFRCR	<ETNBn_base> + 0758_H
	Residual-bit frame receive counter register	ETNBnRFCR	<ETNBn_base> + 0760_H
	Multicast address frame receive counter register	ETNBnMAFCR	<ETNBn_base> + 0778_H
	Communication interface control register	ETNBnIFCTL	<ETNBn_base> + 1000_H

26.3.2 ETNBnCCC — AVB-DMAC Mode Register

The ETNBnCCC register specifies the operating mode of the AVB-DMAC.

Access: ETNBnCCC can be read or written in 32-bit units.
ETNBnCCCL and ETNBnCCCH can be read or written in 16-bit units.
ETNBnCCCLL, ETNBnCCCLH, ETNBnCCCHL, ETNBnCCCHH can be read or written in 8-bit units.

Address: ETNBnCCC: <ETNBn_base> + 0000$_H$
ETNBnCCCL: <ETNBn_base> + 0000$_H$
ETNBnCCCH: <ETNBn_base> + 0002$_H$
ETNBnCCCLL: <ETNBn_base> + 0000$_H$
ETNBnCCCLH: <ETNBn_base> + 0001$_H$
ETNBnCCCHL: <ETNBn_base> + 0002$_H$
ETNBnCCCHH: <ETNBn_base> + 0003$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.18 ETNBnCCC Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	FCE	Flow Control Enable 0: Flow control disabled 1: Flow control enabled
24	LBME	Loopback Mode Enable 0: Normal operation 1: Loopback mode is enabled.
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20	BOC	Byte Order Configuration 0: Big endian The first byte is the 8 lower-order bits (URAM[7:0]) 1: Little endian The first byte is the 8 higher-order bits (URAM[31:24])
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	CSEL[1:0]	gPTP Clock Select 00$_B$: gPTP is not in use. 01$_B$: Peripheral bus clock (clk_chi) 10$_B$: Ethernet transmission clock (ETNBnTXCLK) 11$_B$: Setting prohibited
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 26.18 ETNBnCCC Register Contents

Bit Position	Bit Name	Function
8	DTSR	Data Transmission Suspend Request 0: Normal operation 1: Requests suspension
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	OPC[1:0]	Operating Mode Configuration 00_B: Reset mode 01_B: Configuration mode 10_B: Operation mode 11_B: Standby mode

FCE (Flow Control Enable) Bit

This bit enables the flow control support of MAC.

When flow control is enabled, the MAC gets informed about the Rx-FIFO level (Rx-FIFO fill level reached ETNBnRCR.RFCL).

LBME (Loopback Mode Enable) Bit

This bit enables loopback mode.

In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the MII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode.

CAUTION

Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data. For details about the pin control, see **Section 2A, Pin Function of RH850/F1KH-D8**, **Section 2B, Pin Function of RH850/F1KM-S4**.

BOC (Byte Order Configuration) Bit

This bit specifies the assignment of the first byte of received Ethernet frames when it is allocated to the URAM.

This setting of this register does not affect the descriptor format and filter parameters of the URAM. Writing to this bit is only possible when the current operating mode is configuration mode.

Figure 26.2, Data of Ethernet Frame Received to **Figure 26.4, When ETNBnCCC.BOC = 1** show how data from frames received via the Ethernet connection are stored in the URAM.

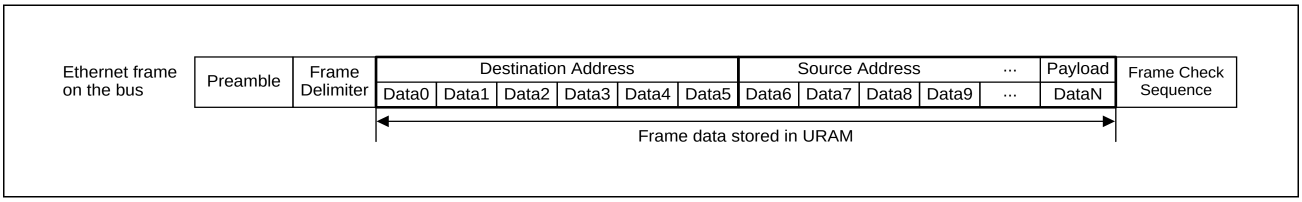

Figure 26.2 Data of Ethernet Frame Received

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

DPTR+4	Data4								Data5								Data6								Data7							
DPTR+8	Data8								Data9								Data10								Data11							

Figure 26.4 When ETNBnCCC.BOC = 1

CSEL[1:0] (gPTP Clock Select) Bits

These bits select the clock source for the gPTP timer.

Writing to these bits is only possible when the current operating mode is configuration mode.

DTSR (Data Transmission Suspend Request) Bit

This bit can suspend access to the URAM.

The access is suspended on completion of the transfer of the frame currently being transferred.

This function disables access to the URAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the URAM is necessary, for example, in checking its integrity.

CAUTION

The transmission and reception queues are not processed while access is suspended. Change neither the AVB-DMAC settings nor the mode until the suspend request is given by ETNBnCCC.DTSR and later the value of ETNBnCSR.DTS is updated.

OPC[1:0] (Operating Mode Configuration) Bits

These bits specify the operating mode.

For the operating modes, see **Section 26.4.1.1, Operating Modes**.

Writing to this bit is possible in any of the operating modes, but should not be done after the application system has issued a Power Off request.

26.3.3 ETNBnDBAT — Descriptor Base Address Table Register

The ETNBnDBAT register is used to set the base address of the descriptor table.

Access:	This register can be read or written in 32-bit units.
Address:	<ETNBn_base> + 0004_H
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TA[31:16]

Table 26.19 ETNBnDBAT Register Contents

Bit Position	Bit Name	Function
31 to 0	TA[31:0]	Descriptor Base Table Address Base address of the descriptor table in the URAM

CAUTION

The setting of this bit must be a multiple of four (Bit 0 and bit 1 must be set to “0”).

TA[31:0] (Descriptor Base Table Address) Bits

These bits specify the base address of the descriptor table in the URAM.

For the structure of the descriptor base address table, see **Section 26.4.3, Descriptors**.

Writing to this bit is only possible when the current operating mode is configuration mode.

26.3.4 ETNBnDLR — Descriptor Base Address Load Request Register

The ETNBnDLR register is used to issue a request to load the values from the descriptor base address table register (ETNBnDBAT) for each queue to the current descriptor address register q (ETNBnCDARq).

Access:	This register can be read or written in 32-bit units.
Address:	<ETNBn_base> + 0008_H
Value after reset:	$003F\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
14	LBA14	Base Address Load Request (Rx10: Stream 8) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
13	LBA13	Base Address Load Request (Rx9: Stream 7) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
12	LBA12	Base Address Load Request (Rx8: Stream 6) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
11	LBA11	Base Address Load Request (Rx7: Stream 5) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
10	LBA10	Base Address Load Request (Rx6: Stream 4) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
9	LBA9	Base Address Load Request (Rx5: Stream 3) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
8	LBA8	Base Address Load Request (Rx4: Stream 2) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
7	LBA7	Base Address Load Request (Rx3: Stream 1) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
6	LBA6	Base Address Load Request (Rx2: Stream 0) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
5	LBA5	Base Address Load Request (Rx1: Network Control) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
4	LBA4	Base Address Load Request (Rx0: Best Effort) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
3	LBA3	Base Address Load Request (Tx3: Stream Class A) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
2	LBA2	Base Address Load Request (Tx2: Stream Class B) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

Table 26.20 ETNBnDLR Register Contents

Bit Position	Bit Name	Function
1	LBA1	Base Address Load Request (Tx1: Network Control) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
0	LBA0	Base Address Load Request (Tx0: Best Effort) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

LBAq (q = 0 to 21) (Base Address Load Request) Bits

Each bit is used to issue requests to load base addresses and to indicate that a base address is currently being loaded. Setting this bit to 1 issues a request for loading the descriptor base address for the queue q.
If transfer is currently in progress, loading is executed on completion of transfer for the current frame. Completion of loading leads to automatic setting of the corresponding bit to 0.

For transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQt) is 1). Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is operation mode. Only 1 can be written to this bit.

26.3.5 ETNBnCSR — AVB-DMAC Status Register

The ETNBnCSR register is used to indicate the operating mode in which the AVB-DMAC is running and communications states.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	<ETNBn_base> + 000C$_{\text{H}}$
Value after reset:	0000 0001$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	RPO	TPO3	TPO2	TPO1	TPO0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DTS	—	—	—	—	OPS[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.21 ETNBnCSR Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned.
20	RPO	Receive Process Status 0: Normal operation 1: Reception is in progress.
19	TPO3	Transmit Process Status 3 (Stream Class A) 0: Normal operation 1: Transmission is in progress.
18	TPO2	Transmit Process Status 2 (Stream Class B) 0: Normal operation 1: Transmission is in progress.
17	TPO1	Transmit Process Status 1 (Network Control) 0: Normal operation 1: Transmission is in progress.
16	TPO0	Transmit Process Status 0 (Best Effort) 0: Normal operation 1: Transmission is in progress.
15 to 9	Reserved	When read, the value after reset is returned.
8	DTS	Data Transmission Suspended Status 0: Normal operation 1: Transmission is suspended.
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	OPS[3:0]	Operating Mode Status 0001$_{\text{B}}$: Reset 0010$_{\text{B}}$: Configuration mode 0100$_{\text{B}}$: Operation mode 1000$_{\text{B}}$: Standby mode Other settings are prohibited.

RPO (Receive Process Status) Bit

This bit indicates whether a reception queue contains an unread received frame.

This bit being set to 1 indicates that a received frame is yet to be stored in the URAM.

[Clearing conditions]

- The current operating mode changes from operation mode.
- Received frames in the reception FIFO all being stored in the URAM.

[Setting condition]

- A received frame being stored in the reception FIFO (but not yet in the URAM)

TPO3 (Transmit Process Status 3) Bit

This bit indicates whether a class A stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data.

[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ3) is set to 0)

[Setting condition]

- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ3))

TPO2 (Transmit Process Status 2) Bit

This bit indicates whether a class B stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data.

[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ2) is set to 0)

[Setting condition]

- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ2))

TPO1 (Transmit Process Status 1) Bit

This bit indicates whether a network control is being transmitted.

When this bit is set to 1, the AVB-DMAC is fetching data in the URAM or E-MAC is transmitting data.

[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ1) is set to 0)

[Setting condition]

- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ1))

TPO0 (Transmit Process Status 0) Bit

This bit indicates whether a best effort is being transmitted.

When this bit is set to 1, the AVB-DMAC is fetching data in the URAM or E-MAC is transmitting data.

[Clearing conditions]

- The current operating mode changes from operation mode.
- Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ0) is set to 0)

[Setting condition]

- Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (ETNBnTCCR.TSRQ0))

DTS (Data Transmission Suspend Status) Bit

This bit indicates whether access to the URAM is enabled.

[Clearing conditions]

- The current operating mode is not operating mode.
- The data transmission suspend request bit in the AVB-DMAC mode register (ETNBnCCC.DTSR) being 0.

[Setting condition]

- Access to the URAM not proceeding while the data transmission suspend request bit (ETNBnCCC.DTSR) in the AVB-DMAC mode register is 1 (if the URAM is being accessed, this bit is set to 1 on completion of access).

OPS[3:0] (Operating Mode Status) Bits

These bits indicate the current operating mode.

For the operating modes, see **Section 26.4.1.1, Operating Modes**.

26.3.6 ETNBnCDARq — Current Descriptor Address Register q (q = 0 to 21)

The ETNBnCDARq register indicates the current descriptor address.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ETNBn_base> + 0010_H + q × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CDA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CDA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.22 ETNBnCDARq Register Contents

Bit Position	Bit Name	Function
31 to 0	CDA[31:0]	Current Descriptor Address The address of the current descriptors for the transmission queues

CDA[31:0] (Current Descriptor Address) Bits

ETNBnCDAR0 to ETNBnCDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while ETNBnCDAR4 to ETNBnCDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, contents of this bits are changed to (ETNBnDBAT + q × 8).

Also, when the descriptor base address load request register (ETNBnDLR) issues a load request, the contents of the corresponding register are changed to the descriptor base address table register (ETNBnDBAT).

[Conditions for Updating]

- These bits are set to 0 when the operating mode is not operation mode.
- This register is updated when a descriptor to a queue is processed.

26.3.7 ETNBnESR — Error Status Register

The ETNBnESR register indicates the state of error by the AVB-DMAC.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ETNBn_base> + 0088_{H}

Value after reset: $0000\ 0000_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	EIL	ET[3:0]				—	—	—	EQN[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.23 ETNBnESR Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned.
12	EIL	Error Information Lost 0: No loss of error information 1: Lost of error information detected
11 to 8	ET[3:0]	Error Type 0000_{B}: Read descriptor from URAM 0001_{B}: Write descriptor to URAM 0010_{B}: Interpret read descriptor 0011_{B}: Tx-Buffer is corrupted 0100_{B}: Read data from URAM 0101_{B}: Write data or timestamp to URAM 0110_{B}: Reading from received FIFO 0111_{B}: Received FIFO is corrupted 1000_{B}: Frame size error during reception detected 1001_{B}: Frame size error during transmission detected 1010_{B}: Tx-Buffer overflow
7 to 5	Reserved	When read, the value after reset is returned.
4 to 0	EQN[4:0]	Error Queue Number

EIL Error Information Lost Bit

This bit indicates that error information detected by Ethernet AVB is lost because the previous reported error has not been processed by CPU.

[Changing condition]

- This bit is set to 0 when leaving OPERATION mode.
- This bit is set to 0 when CPU writes 0 to the queue error flag (ETNBnEIS.QEF) of the error interrupt status register.
- This bit is set to 1 when the set condition of the queue error flag (ETNBnEIS.QEF) is fulfilled while the queue error flag (ETNBnEIS.QEF) is 1.

ET[3:0] Error Type Bits

These bits indicate details about the transfer stage which was handled when Ethernet AVB has detected an error.

When a fault relates to the read descriptor (ETNBnESR.ET = 0000_B or 0010_B), the CPU needs to correct the faulty descriptor so that the related queues can continue processing. If a queue halts at a faulty descriptor, ETNBnCDARq.CDA (q = ETNBnESR.EQN) directly checks the faulty descriptor.

When the fault is related to descriptor writing (ETNBnESR.ET = 0001_B), CPU needs recognize the not-updated or incorrectly updated descriptor in queue ETNBnESR.EQN. The write problem is not influencing how Ethernet AVB processes the descriptor chain.

When the fault is related to the Tx-Buffer (ETNBnESR.ET = 0011_B) CPU needs to clean-up the Tx-Buffer to correct the buffer control configuration.

All other errors are transient in nature and may be corrected by continuation of HW or SW operation; so there is no strong demand on CPU interaction. For the details of the error processing, **Section 26.4.2.3, Checking Integrity**.

The CPU can only evaluate these bits when the queue error flag (ETNBnEIS.QEF) is 1.

[Changing condition]

These bits are updated when the queue error flag (ETNBnEIS.QEF) setting conditions are satisfied and ETNBnEIS.QEF is 0.

EQN[4:0] Error Queue Number Bits

These bits indicate the queue number which was handled when Ethernet AVB has detected an error. A fault reported for ETNBnESR.EQN = 0 to 3 is related to transmit queue t = 0 to 3.

From ETNBnESR.EQN = 4 the fault is related to receive queue r = ETNBnESR.EQN – 4. The CPU can only evaluate these bits when the queue error flag (ETNBnEIS.QEF) is 1.

The CPU can not evaluate these bits when the error type bit (ETNBnESR.ET) of the error status register is 0011_B or 0111_B.

[Changing condition]

These bits are updated when the set condition of the queue error flag (ETNBnEIS.QEF) is fulfilled and the queue error flag (ETNBnEIS.QEF) is 0

26.3.8 ETNBnRCR — Receive Configuration Register

The ETNBnRCR register is used to configure receive-relating settings of the AVB-DMAC.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0090_H

Value after reset: $1800\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	RFCL[12:0]												
Value after reset	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	ETS2	ETS0	ESF[1:0]		ENCF	EFFS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.24 ETNBnRCR Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28 to 16	RFCL[12:0]	Receive FIFO Warning Level Recommended value: 1800_H
15 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	ETS2	Timestamp Enable (Stream) 0: Timestamp is disabled. 1: Timestamp is enabled. Recommended value: 0
4	ETS0	Timestamp Enable (Best Effort) 0: Timestamp is disabled. 1: Timestamp is enabled. Recommended value: 0
3, 2	ESF[1:0]	Stream Filtering Select Settings for reception queues 2 to 17 00_B: Filtering is disabled. Frames are processed in queue 0 (best effort). 01_B: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching stream frames are processed in queue 0 (best effort). 10_B: The separation filter is enabled for AVB stream frames. Non-matching stream frames are discarded. 11_B: The separation filter is enabled for AVB stream frames. Non-matching stream frames are handled with queue 0 (best effort). Recommended value: 10_B or 11_B
1	ENCF	Network Control Filtering Enable Setting for reception queue 1 (network control) 0: Network control is disabled. 1: Network control is enabled.
0	EFFS	Error Frame Enable 0: Error frames are disabled. 1: Error frames are enabled. Recommended value: 0

RFCL[12:0] (Receive FIFO Warning Level) Bits

These bits set the caution level for the reception FIFO and are used to maintain the priority order of the storage of received data and the fetching of data for transmission.

If the reception FIFO contains less data than this level, processing of both transmission and reception queues becomes pending.

If the reception FIFO contains more data than this level, only data in the reception queue are transferred, and processing of the transmission queue becomes pending.

Writing to this bit is only possible when the current operating mode is configuration mode.

CAUTION

In the case of this LSI chip, set these bits to 1800_H.

ETS2 (Timestamp Enable (Stream)) Bit

This bit enables timestamp information included in reception queues 2 to 17.

Writing to this bit is only possible when the current operating mode is configuration mode. Set this bit to 1 when use the extended descriptor.

ETS0 (Timestamp Enable (Best Effort)) Bit

This bit enables timestamp information included in reception queue 0.

Writing to this bit is only possible when the current operating mode is configuration mode. Set this bit to 1 when use the extended descriptor.

ESF[1:0] (Stream Filtering Select) Bits

These bits select separation filtering to reception queues 2 to 17.

The queue-dependent separation filter can be used in combination with the identification of AVB stream frames.

When the value is 00_B, filtering is disabled and frames from streams are processed in reception queue 0 (best effort).

When the value is 01_B, the separation filter is enabled for both AVB stream frames and non-AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

When the value is 10_B, the separation filter is enabled for AVB stream frames; frames from non- matching streams are discarded.

When the value is 11_B, the separation filter is enabled for AVB stream frames; frames from non- matching streams are processed in reception queue 0 (best effort).

For separation filtering, see **Section 26.4.4.1(1), Separation Filtering**.

Writing to this bit is only possible when the current operating mode is configuration mode.

ENCF (Enable Network Control Filtering) Bit

Enables the AVB network control frame for reception queue 1.

When reception queue 1 is disabled, a received frame is stored in reception queue 0 (best effort). Writing to this bit is only possible when the current operating mode is configuration mode.

EFFS (Enable Error Frame) Bit

Enables or disables the reception of frames that have been classified as error frames by the E-MAC. Received error frames are stored in reception queue 0 (best effort).

An indicator of error detection by the E-MAC during reception is stored in the descriptor (DESCR.MSC).

Writing to this bit is only possible when the current operating mode is configuration mode.

26.3.9 ETNBnRQCi — Receive Queue Configuration Register i (i = 0 to 4)

The ETNBnRQCi register configures the settings of receive queue (r = 0 + i × 4 to 3 + i × 4).*1

Access:	ETNBnRQCi can be read or written in 32-bit units. ETNBnRQCiL and ETNBnRQCiH can be read or written in 16-bit units.*2 ETNBnRQCiLL, ETNBnRQCiLH, ETNBnRQCiHL, ETNBnRQCiHH can be read or written in 8-bit units.*2
Address:	ETNBnRQCi: <ETNBn_base> + 0094_H + i × 4_H ETNBnRQCiL: <ETNBn_base> + 0094_H + i × 4_H ETNBnRQCiH: <ETNBn_base> + 0094_H + i × 4_H + 2_H ETNBnRQCiLL: <ETNBn_base> + 0094_H + i × 4_H ETNBnRQCiLH: <ETNBn_base> + 0094_H + i × 4_H + 1_H ETNBnRQCiHL: <ETNBn_base> + 0094_H + i × 4_H + 2_H ETNBnRQCiHH: <ETNBn_base> + 0094H + i × 4_H + 3_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	UFCCr[1:0] (r = 3 + i × 4)*3		—	—	RSMr[1:0] (r = 3 + i × 4)*3		—	—	UFCCr[1:0] (r = 2 + i × 4)*3		—	—	RSMr[1:0] (r = 2 + i × 4)*3	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	UFCCr[1:0] (r = 1 + i × 4)*3		—	—	RSMr[1:0] (r = 1 + i × 4)*3		—	—	UFCCr[1:0] (r = 0 + i × 4)*3		—	—	RSMr[1:0] (r = 0 + i × 4)*3	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Note 1. The ETNBnRQC4 register corresponds to reception queues from 16 and 17.

Note 2. The ETNBnRQC4 register corresponds to ETNBnRQC4, ETNBnRQC4L, ETNBnRQC4LL, and ETNBnRQC4LH only.

Note 3. The ETNBnRQC4 register corresponds to RSM16[1:0], UFCC16[1:0], RSM17[1:0], and UFCC17[1:0] only and bits from 16 to 31 are reserved bits.

Table 26.25 ETNBnRQCi Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29, 28	UFCCr[1:0]	Unread Frame Counter Configuration (Receive Queue 3 + i × 4) These bits set the unread frame counter used in reception queue 3 + i × 4.
27, 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25, 24	RSMr[1:0]	Receive Synchronous Mode (Receive Queue 3 + i × 4) 00_B: Mode with write-back Other than 00_B: Setting prohibited
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21, 20	UFCCr[1:0]	Unread Frame Counter Configuration (Receive Queue 2 + i × 4) These bits set the unread frame counter used in reception queue 2 + i × 4.
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	RSMr[1:0]	Receive Synchronous Mode (Receive Queue 2 + i × 4) 00_B: Mode with write-back Other than 00_B: Setting prohibited
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13, 12	UFCCr[1:0]	Unread Frame Counter Configuration (Receive Queue 1 + i × 4) These bits set the unread frame counter used in reception queue 1 + i × 4.

Table 26.25 ETNBnRQCi Register Contents

Bit Position	Bit Name	Function
11, 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	RSMr[1:0]	Receive Synchronous Mode (Receive Queue 1 + i × 4) 00_B: Mode with write-back Other than 00_B: Setting prohibited
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	UFCCr[1:0]	Unread Frame Counter Configuration (Receive Queue 0 + i × 4) These bits set the unread frame counter used in reception queue 0 + i × 4.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	RSMr[1:0]	Receive Synchronous Mode (Receive Queue 0 + i × 4) 00_B: Mode with write-back Other than 00_B: Setting prohibited

UFCCr[1:0] (r = 0 to 17) Unread Frame Counter Configuration Bits

These bits set the unread frame counter for reception queue r.

With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter stop level configuration register (ETNBnUFCS) to set the warning level and stop level of the unread frame counter.

Set the pattern number (0 to 3) set in the unread frame counter stop level configuration register (ETNBnUFCS) in these bits.

When the value is 00_B, the stop function is disabled.

Writing to the bits is only possible when the current operating mode is configuration mode.

RSMr[1:0] (r = 0 to 17) Receive Synchronous Mode Bits

These bits set receive synchronous mode. Set 00_B in these bits.

For receive synchronous mode, see **Section 26.4.4.3(3), Mode with Write-Back**.

Writing to the bits is only possible when the current operating mode is configuration mode.

26.3.10 ETNBnRPC — Receive Padding Configuration Register

The ETNBnRPC register is used to set padding for received frames.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + $00B0_H$

Value after reset: $0000\ 0100_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 26.26 ETNBnRPC Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	DCNT[7:0]	Stored Data Counter These bits specify the amount of data to be stored with the descriptor. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	PCNT[2:0]	Stored Padding Counter These bits indicate the amount of padding to be stored in data areas for descriptors. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.

DCNT[7:0] Stored Data Counter Bits

These bits specify the amount of the frame data (1 to 255) to be stored following the padding. Counting by one indicates one word (4 bytes). For example, when these bits are set to 47, the amount of data is 47 words (= 188 bytes).

When these bits are 0, all received data is stored following the initial padding.

Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see **Section 26.4.4.3(2)(c), Padding**.

PCNT[2:0] Stored Padding Counter Bits

These bits specify the amount of padding (1 to 7) to be appended to the URAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1, the amount of padding is one word (= 4 bytes).

Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see **Section 26.4.4.3(2)(c), Padding**.

26.3.11 ETNBnUFCS — Unread Frame Counter Stop Level Configuration Register

The ETNBnUFCS register sets the stop levels for unread frames.

Access:	This register can be read or written in 32-bit units.
Address:	<ETNBn_base> + 00C0$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SL3[5:0]						—	—	SL2[5:0]

Table 26.27 ETNBnUFCS Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 24	SL3[5:0]	Stop Level 3 Unread frame count stop level 3
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 16	SL2[5:0]	Stop Level 2 Unread frame count stop level 2
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	SL1[5:0]	Stop Level 1 Unread frame count stop level 1
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	SL0[5:0]	Stop Level 0 Unread frame count stop level 0 The write value should be 0.

SL0 to SL3[5:0] Stop Level 0 to 3 Bits

These bits set the stop levels for unread frames.

One of the four stop levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (ETNBnRQCi) (i = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

26.3.12 ETNBnUFCVi — Unread Frame Counter Register i (i = 0 to 4)

The ETNBnUFCVi register indicates the number of unread frames in reception queues r (r = 0 + i × 4 to 3 + i × 4).*1

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ETNBn_base> + $00C4_H$ + i × 4_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CVr[5:0](r = 3 + i × 4)*2						—	—	CVr[5:0](r = 2 + i × 4)*2					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CVr[5:0](r = 1 + i × 4)*2						—	—	CVr[5:0](r = 0 + i × 4)*2					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The ETNBnUFCV4 register corresponds to reception queues from 16 to 17.

Note 2. The ETNBnUFCV4 register corresponds to CV16[5:0] and CV17[5:0] only and bits from 16 to 31 are reserved bits.

Table 26.28 ETNBnUFCVi Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned.
29 to 24	CVr[5:0]	Unread Frame Count 3 + 4 × i Number of unread frames in reception queue 3 + 4 × i
23, 22	Reserved	When read, the value after reset is returned.
21 to 16	CVr[5:0]	Unread Frame Count 2 + 4 × i Number of unread frames in reception queue 2 + 4 × i
15, 14	Reserved	When read, the value after reset is returned.
13 to 8	CVr[5:0]	Unread Frame Count 1 + 4 × i Number of unread frames in reception queue 1 + 4 × i
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	CVr[5:0]	Unread Frame Count 0 + 4 × i Number of unread frames in reception queue 0 + 4 × i

CVr[5:0] (r = 0 to 17) Unread Frame Count r Bits

These bits indicate the number of unread frames in reception queue r.

The number of unread frames is decremented by the value that is written to the unread frame counter decrement register i (ETNBnUFCDi).

For a description of how to use unread frames, refer to **Section 26.4.4.4, Unread Frame Counters**.

[Conditions for Updating]

- The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (ETNBnDLR) issues a base address load request.
- The number is incremented when data received in reception queue r are stored normally. The maximum increment is $3F_H$. If the value exceeds $3F_H$, incrementation will not proceed.)
- The number is decremented by the value written to the unread frame counter decrement register i (ETNBnUFCDi).

26.3.13 ETNBnUFCDi — Unread Frame Counter Decrement Register i (i = 0 to 4)

The ETNBnUFCDi register is used to decrement unread counters of reception queues r (r = 0 + i × 4 to 3 + i × 4).*1

Access: ETNBnUFCDi can be read or written in 32-bit units.

ETNBnUFCDiL and ETNBnUFCDiH can be read or written in 16-bit units.*2

ETNBnUFCDiLL, ETNBnUFCDiLH, ETNBnUFCDiHL, ETNBnUFCDiHH can be read or written in 8-bit units.*2

Address: ETNBnUFCDi: <ETNBn_base> + $00E0_H$ + i × 4_H

ETNBnUFCDiL: <ETNBn_base> + $00E0_H$ + i × 4_H

ETNBnUFCDiH: <ETNBn_base> + $00E0_H$ + i × 4_H + 2_H

ETNBnUFCDiLL: <ETNBn_base> + $00E0_H$ + i × 4_H

ETNBnUFCDiLH: <ETNBn_base> + $00E0_H$ + i × 4_H + 1_H

ETNBnUFCDiHL: <ETNBn_base> + $00E0_H$ + i × 4_H + 2_H

ETNBnUFCDiHH: <ETNBn_base> + $00E0_H$ + i × 4_H + 3_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	DVr[5:0] (r = 3 + i × 4) *3						—	—	DVr[5:0] (r = 2 + i × 4)*3

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	DVr[5:0] (r = 1 + i × 4)*3						—	—	DVr[5:0] (r = 0 + i × 4)*3					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The ETNBnUFCD4 register corresponds to reception queues from 16 to 17.

Note 2. The ETNBnUFCD4 register corresponds to ETNBnUFCD4, ETNBnUFCD4L, ETNBnUFCD4LL, and ETNBnUFCD4LH only.

Note 3. The ETNBnUFCD4 register corresponds to DV16[5:0] and DV17[5:0] only and bits from 16 to 31 are reserved bits.

Table 26.29 ETNBnUFCDi Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 24	DVr[5:0]	Unread Frame Decrement Value 3 + 4 × i Unread frame decrement value for reception queue 3 + 4 × i
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 16	DVr[5:0]	Unread Frame Decrement Value 2 + 4 × i Unread frame decrement value for reception queue 2 + 4 × i
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	DVr[5:0]	Unread Frame Decrement Value 1 + 4 × i Unread frame decrement value for reception queue 1 + 4 × i
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	DVr[5:0]	Unread Frame Decrement Value 0 + 4 × i Unread frame decrement value for reception queue 0 + 4 × i

DVr[5:0] (r = 0 to 17) Unread Frame Decrement Value r Bits

These bits set the decrement value for unread frames in reception queue r. The value of an unread frame counter register i (ETNBnUFCVi) (i = 0 to 4) is decremented by the value set in the corresponding bits of this register.

Write $3F_H$ to these bits to reset the unread counters in reception queue r. These bits are always read as 0.

26.3.14 ETNBnSFO — Separation Filter Offset Register

The ETNBnSFO register sets an offset into frames for use by the separation filter.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 00FC$_{H}$

Value after reset: 0000 0000$_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	FBP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.30 ETNBnSFO Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	FBP[5:0]	First Byte Position Position of the first byte of Ethernet frames in the separation filter

FBP[5:0] First Byte Position Bits

These bits set the position of the first byte of Ethernet frames in the separation filter.

When these bits are 0, the separation filter starts from the top of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see **Figure 26.2, Data of Ethernet Frame Received**, in **Section 26.3.2, ETNBnCCC — AVB-DMAC Mode Register**.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see **Section 26.4.4.1(1), Separation Filtering**.

CAUTION

Received frames having fewer bytes than the setting of these bits + 8 bytes do not match the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (ETNBnRCR.ESF).

26.3.15 ETNBnSFPi — Separation Filter Pattern Register i (i = 0 to 31)

The ETNBnSFPi register configures the pattern of the separation filter used for reception queues 2 to 17.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0100_H + i × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FPs[31:16]*2 (s = reception queue r – 2)															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FPs[15:0]*1 (s = reception queue r – 2)															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. In this case, i is an even number. When i is an odd number, FPs[47:32]

Note 2. In this case, i is an even number. When i is an odd number, FPs[63:48]

Table 26.31 ETNBnSFPi Register Contents

Bit Position	Bit Name	Function
31 to 0	FPs[63:0]	Separation Filter Pattern These bits set the pattern of the separation filter. The 64-bit filter pattern is set for each queue.

FPs[63:0] (s = 0 to 15) Separation Filter Pattern Bits

These bits set the pattern for a separation filter to be used with reception queues 2 to 17 (for streams 0 to 15).

Each queue has space of 64-bit. Reception queue 2 (Stream 0) uses ETNBnSFP0 and ETNBnSFP1. Reception queue 17 (Stream 15) uses ETNBnSFP30 and ETNBnSFP31.

The separation filter passes a frame when, after masking by the mask value set in the separation filter mask register (ETNBnSFMi), data from received frames match the value defined in these bits.

ETNBnSFPi.FPs[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while ETNBnSFPi.FPs[63:56] (where i is the odd number) are used for the byte at the address specified by the separation filter offset register (ETNBnSFO) + 7.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see **Section 26.4.4.1(1), Separation Filtering**.

26.3.16 ETNBnSFMi — Separation Filter Mask Register i (i = 0 or 1)

The ETNBnSFMi register sets the mask value of the separation filter used for reception queue 2 to 17.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + $01C0_H$ + i × 4_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CFM[31 + 32 × i: 16 + 32 × i]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	CFM[15 + 32 × i: 0 + 32 × i]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.32 ETNBnSFMi Register Contents

Bit Position	Bit Name	Function
31 to 0	CFM[63:0]	Separation Filter Mask These bits set the mask value for the separation filter.

CFM[63:0] Separation Filter Mask Bits

These bits set the mask value for the separation filter for use with the corresponding reception queue 2 to 17 (stream 0 to 15).

ETNBnSFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while ETNBnSFM1.CFM[63:56] are used for the separation filter offset register (ETNBnSFO) + 7.

Frame data at the positions of mask bits that are set to 0 are masked; that is, they do not affect pattern- matching by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode. For separation filtering, see **Section 26.4.4.1(1), Separation Filtering**.

26.3.17 ETNBnTGC — Transmit Configuration Register

The ETNBnTGC register configures the transmission-relating settings of the AVB-DMAC.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0300_H

Value after reset: $0022\ 2200_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.33 ETNBnTGC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21, 20	TBD3[1:0]	Transmit FIFO Size (Stream Class A) Number of frames to be fetched from transmission queue 3 (for stream class A) **CAUTION:** Write 2 to these bits.
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	TBD2[1:0]	Transmit FIFO Size (Stream Class B) Number of frames to be fetched from transmission queue 2 (for stream class B) **CAUTION:** Write 2 to these bits.
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13, 12	TBD1[1:0]	Transmit FIFO Size (Network Control) Number of frames to be fetched from transmission queue 1 (for network control) **CAUTION:** Write 2 to these bits.
11, 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	TBD0[1:0]	Transmit FIFO Size (Best Effort) Number of frames to be fetched from transmission queue 0 (for best effort) **CAUTION:** Write 2 to these bits.
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	TQP[1:0]	Transmit Queue Priority 00: Non-AVB mode 01: AVB mode 1 10: Setting prohibited 11: AVB mode 2
3	TSM3	Transmit Synchronous Mode (Stream Class A) 0: With write-back 1: Setting prohibited
2	TSM2	Transmit Synchronous Mode (Stream Class B) 0: With write-back 1: Setting prohibited

Table 26.33 ETNBnTGC Register Contents

Bit Position	Bit Name	Function
1	TSM1	Transmit Synchronous Mode (Network Control) 0: With write-back 1: Setting prohibited
0	TSM0	Transmit Synchronous Mode (Best Effort) 0: With write-back 1: Setting prohibited

TBDt[1:0] (t = 0 to 3) Transmit FIFO Size (Stream Class A/ Stream Class B/Network Control/Best Effort) Bits

These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queues. Writing to these bits is only possible when the current operating mode is configuration mode.

Set these bits to 2 (“10_B”).

TQP[1:0] Transmit Queue Priority Bits

These bits set the priority of the transmission queues.

00_B: Non-AVB mode: Q3 → Q2 → Q1 → Q0

01_B: AVB mode 1: Q3 (CBS) → Q2 (CBS) → Q1 → Q0

10_B: Setting prohibited

11_B: AVB mode 2: Q1 → Q3 (CBS) → Q2 (CBS) → Q0

For the credit-based shaping (CBS) algorithm, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

The CBS algorithm is invalidated in non-AVB mode (i.e. when the value is “00_B”).

Writing to the bits is only possible when the current operating mode is configuration mode.

TSM0 to TSM3 Transmit Synchronous Mode Bits

These bits set Transmit synchronous mode.

Writing to these bits is only possible when the current operating mode is configuration mode. Set these bits to 0.

26.3.18 ETNBnTCCR — Transmit Configuration Control Register

The ETNBnTCCR register controls transmission by the AVB-DMAC and is used to make related settings.

Access:	ETNBnTCCR can be read or written in 32-bit units. ETNBnTCCRL can be read or written in 16-bit units. ETNBnTCCRLL, ETNBnTCCRLH can be read or written in 8-bit units.
Address:	ETNBnTCCR: <ETNBn_base> + 0304_H ETNBnTCCRL: <ETNBn_base> + 0304_H ETNBnTCCRLL: <ETNBn_base> + 0304_H ETNBnTCCRLH: <ETNBn_base> + 0304_H + 1_H
Value after reset:	0000 0000_H

Table 26.34 ETNBnTCCR Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	TFR	Timestamp FIFO Release 0: (Not operating) 1: Releases the oldest entry in the timestamp FIFO.
8	TFEN	Timestamp FIFO Enable 0: Recording of transmission timestamps in the timestamp FIFO is disabled. 1: Recording of transmission timestamps in the timestamp FIFO is enabled.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	TSRQ3	Transmit Start Request (Queue 3 (Stream Class A)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Wait for transmission process to fetch is performed.
2	TSRQ2	Transmit Start Request (Queue 2 (Stream Class B)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Wait for transmission process to fetch is performed.
1	TSRQ1	Transmit Start Request (Queue 1 (Network Control)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Wait for transmission process to fetch is performed.
0	TSRQ0	Transmit Start Request (Queue 0 (Best Effort)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Wait for transmission process to fetch is performed.

TFR Timestamp FIFO Release Bit

This bit makes the timestamp FIFO release the oldest entry.

For a description of how to use the timestamp FIFO, see **Section 26.4.5.4, Timestamping in Transmission**.

TFEN Timestamp FIFO Enable Bit

This bit enables storage in the timestamp FIFO.

When it is set, timestamp information is stored for descriptors with DESCR.TSR set to 1 (for DESCR.TSR, see **Section 26.4.5.2(2), Configuration of Transmission Frame Data Descriptors**).

When 0 is set in this bit, all timestamp FIFO entries are invalidated.

For a description of how to use the timestamp FIFO, see **Section 26.4.5.4, Timestamping in Transmission**.

TSRQt (t = 0 to 3) Transmit Start Request (Queue t) Bit

This bit issues a request to start transmission for transmission queue t.

When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO.

Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission.

For the scheduling of transmission queues, see **Section 26.4.5.1, Transmission Modes**.

Writing to this bit is only possible when the current operating mode is configuration mode.

Only 1 can be written to the bit. Writing 0 to the bit has no effect.

[Conditions for Updating]

> The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type EEMPTY, FEMPTY or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, or when a descriptor with defective data is processed.

26.3.19 ETNBnTSR — Transmit Status Register

The ETNBnTSR register indicates the state of transmission by the AVB-DMAC.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ETNBn_base> + 0308_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TFFL[2:0]			—	—	—	—	CCS1[1:0]		CCS0[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.35 ETNBnTSR Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned.
10 to 8	TFFL[2:0]	Timestamp FIFO Count Number of timestamp FIFOs
7 to 4	Reserved	When read, the value after reset is returned.
3, 2	CCS1[1:0]	CBS Counter Status 1 (Class A) 00_B: The current credit value is within the range. 01_B: The current credit value is less than or equal to the lower limit. 10_B: The current credit value is greater than or equal to the upper limit. 11_B: (Reserved)
1, 0	CCS0[1:0]	CBS Counter Status 0 (Class B) 00_B: The current credit value is within the range. 01_B: The current credit value is less than or equal to the lower limit. 10_B: The current credit value is greater than or equal to the upper limit. 11_B: (Reserved)

TFFL[2:0] Timestamp FIFO Count Bits

These bits indicate the number of timestamps in the timestamp FIFO.

The value 0 indicates it is empty and the value 2 indicates it is full (values 3 to 7 are reserved).

[Conditions for Updating]

- The bits are set to 0 when the operating mode is not operation mode or when the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) = 0.
- When the timestamp FIFO enable bit (ETNBnTCCR.TFEN) is 1 and these bits are not 2, the value of these bits is incremented after a frame with DESCR.TSR set has been transmitted by the E- MAC (for DESCR.TSR, see **Section 26.4.5.2(2), Configuration of Transmission Frame Data Descriptors**).

The value of these bits is decremented if it is not 0 when 1 is written to the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR).

CCS0 and CCS1[1:0] CBS Counter Status 0 and 1 Bits

These bits indicate the CBS (credit-based shaping) state of stream data transmission queues 0 and 1. If the calculated credit value is outside the range specified by CBS upper limit register c (ETNBnCULc) and CBS lower limit register c (ETNBnCLLc), it falls outside the range for CBS.

[Conditions for Updating]

- The bits are set to 00_B when the operating mode is not operation mode.
- When the determined credit value is within the range, 00_B is set.
- If the determined credit value is lower than the CBS lower limit register c (ETNBnCLLc), 01_B is set.
- If the determined credit value is higher than the upper limit register c (ETNBnCULc), 10_B is set.

26.3.20 ETNBnTFA0 — Timestamp FIFO Access Register 0

ETNBnTFA0 indicates the nano seconds portion of the timestamp value.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ETNBn_base> + 0310_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSV[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.36 ETNBnTFA0 Register Contents

Bit Position	Bit Name	Function
31 to 0	TSV[31:0]	Timestamp Value

TSV[79:0] Timestamp Value Bits

These 80 bits consist of ETNBnTFA0.TSV[31:0], ETNBnTFA1.TSV[63:32], and ETNBnTFA2.TSV[79:64], which together indicate the oldest timestamp value stored in the timestamp FIFO.

Once the timestamp FIFO is full, no further timestamp values are stored.

[Conditions for Updating]

- The bits are set to $0000\ 0000_H$ when the operating mode is not operation mode.
- The register is updated whenever a value is stored in the timestamp FIFO (when the timestamp FIFO count bit in the transmit status register (ETNBnTSR.TFFL) changes from 0 to 1).
- The register is updated when the oldest entry is released (when the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR) is set to 1).

26.3.21 ETNBnTFA1 — Timestamp FIFO Access Register 1

The ETNBnTFA1 register indicates the lower seconds portion of the timestamp value.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	<ETNBn_base> + 0314$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSV[63:48]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSV[47:32]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.37 ETNBnTFA1 Register Contents

Bit Position	Bit Name	Function
31 to 0	TSV[63:32]	Timestamp Value

TSV[63:32] Timestamp Value Bits

For details, see **Section 26.3.20, ETNBnTFA0 — Timestamp FIFO Access Register 0**.

26.3.22 ETNBnTFA2 — Timestamp FIFO Access Register 2

The ETNBnTFA2 register indicates the timestamp tag and the higher seconds portion of the timestamp value.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ETNBn_base> + 0318_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	TST[9:0]									
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSV[79:64]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.38 ETNBnTFA2 Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned.
25 to 16	TST[9:0]	Timestamp Tag
15 to 0	TSV[79:64]	Timestamp Value

TST[9:0] Timestamp Tag Bits

These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the timestamp values (timestamp FIFO access register 0 to 2 (ETNBnTFA0 to 2)) which can be placed in the FIFO.

For transmit frame tagging, **Section 26.4.5.4, Timestamping in Transmission**.

[Conditions for Updating]

- The bits are set to 000_H when the operating mode is not operation mode.
- The bits are updated when a value is stored in the timestamp FIFO (when the value of the timestamp FIFO count bit in the transmit status register (ETNBnTSR.TFFL) changes from 0 to 1).
- The bits are updated when the oldest entry has been released (1 is set in the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR)).

TSV[79:64] Timestamp Value Bits

For details, see **Section 26.3.20, ETNBnTFA0 — Timestamp FIFO Access Register 0**.

26.3.23 ETNBnCIVRc — CBS Increment Value Register c (c = 0 or 1)

The ETNBnCIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B) and the ETNBnCIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0320_H + c × 4_H

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CIV[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	CIV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.39 ETNBnCIVRc Register Contents

Bit Position	Bit Name	Function
31 to 0	CIV[31:0]	CBS Increment Value Setting value: 1 to 65535 ($0000\ 0001_H$ to $0000\ FFFF_H$)

CIV[31:0] CBS Increment Value Bits

These bits set the increment for the CBS algorithm.
Set a value in the range from 1 to 65535 ($0000\ 0001_H$ to $0000\ FFFF_H$).
The value to be written to these bits depends on the Ethernet bit rate and clk_chi (peripheral bus clock).

For details, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

26.3.24 ETNBnCDVRc — CBS Decrement Value Register c (c = 0 or 1)

The ETNBnCDVR0 register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).

The ETNBnCDVR1 register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

Access:	This register can be read or written in 32-bit units.
Address:	<ETNBn_base> + 0328$_H$ + c × 4$_H$
Value after reset:	FFFF FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CDV[31:16]

Table 26.40 ETNBnCDVRc Register Contents

Bit Position	Bit Name	Function
31 to 0	CDV[31:0]	CBS Decrement Value Setting value: –1 to –65536 (FFFF FFFF$_H$ to FFFF 0000$_H$)

CDV[31:0] CBS Decrement Value Bits

These bits set the decrement for the CBS algorithm.
Set a negative value from –1 to –65536 (FFFF FFFF$_H$ to FFFF 0000$_H$).
The value to be written to these bits depends on the Ethernet bit rate and clk_chi (peripheral bus clock).

For details, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

26.3.25 ETNBnCULc — CBS Upper Limit Register c (c = 0 or 1)

The ETNBnCUL0 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The ETNBnCUL1 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0330_H + c × 4_H

Value after reset: $7FFF\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ULV[31:16]

Table 26.41 ETNBnCULc Register Contents

Bit Position	Bit Name	Function
31 to 0	ULV[31:0]	CBS Upper Limit Upper limit on CBS values

ULV[31:0] CBS Upper Limit Bits

These bits set the upper limit for credit values calculated by using the CBS algorithm.
The setting is a limiting value for error detection and does not normally affect operation of the algorithm.
Write a positive value to these bits.

For details, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

26.3.26 ETNBnCLLc — CBS Lower Limit Register c (c = 0 or 1)

The ETNBnCLL0 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The ETNBnCLL1 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0338_H + c × 4_H

Value after reset: 8000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LLV[31:16]

Table 26.42 ETNBnCLLc Register Contents

Bit Position	Bit Name	Function
31 to 0	LLV[31:0]	CBS Lower Limit Lower limit on CBS values

LLV[31:0] CBS Lower Limit Bits

These bits set the lower limit for credit values calculated by using the CBS algorithm.
The setting is a limiting value for error detection and does not normally affect operation of the algorithm.
Write a negative value to these bits.

For details, see **Section 26.4.6, CBS (Credit-Based Shaping)**.

26.3.27 ETNBnDIC — Descriptor Interrupt Control Register

The ETNBnDIC register is used to control descriptor interrupts 1 to 15.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0350$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

DPEi (i = 1 to 15) Descriptor Interrupt Enable Bits

When interrupts are allowed, and if an interrupt source occurs (descriptor interrupt status bit of the descriptor interrupt status register (ETNBnDIS 1 to 15) = 1), an interrupt is generated.

26.3.28 ETNBnDIS — Descriptor Interrupt Status Register

The ETNBnDIS register indicates the state of descriptor interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0354_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.44 ETNBnDIS Register Contents

Bit Position	Bit Name	Function
5	DPF5	Descriptor Interrupt Status 5 0: The interrupt is not pending. 1: The interrupt is pending.
4	DPF4	Descriptor Interrupt Status 4 0: The interrupt is not pending. 1: The interrupt is pending.
3	DPF3	Descriptor Interrupt Status 3 0: The interrupt is not pending. 1: The interrupt is pending.
2	DPF2	Descriptor Interrupt Status 2 0: The interrupt is not pending. 1: The interrupt is pending.
1	DPF1	Descriptor Interrupt Status 1 0: The interrupt is not pending. 1: The interrupt is pending.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

DPFi (i = 1 to 15) Descriptor Interrupt Status Bits

When DESCR.DIE is 1 to 15 (0001_B to 1111_B), the corresponding bit indicates completion of the processing of a descriptor within the reception or transmission queue.

When DESCR.DIE is 0, the descriptor interrupt is not generated. Only 0 can be written to these bits.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 after a descriptor with DESCR.DIE set to the corresponding number from 1 to 15 (0001_B to 1111_B) is processed.

26.3.29 ETNBnEIC — Error Interrupt Control Register

The ETNBnEIC register controls the AVB-DMAC-related error interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0358$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.45 ETNBnEIC Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	TFFE	Timestamp FIFO Full-Error Interrupt Enable 0: Disabled 1: Enabled
7	CULE1	CBS Upper Limit Error Interrupt Enable (Class A) 0: Disabled 1: Enabled
6	CULE0	CBS Upper Limit Error Interrupt Enable (Class B) 0: Disabled 1: Enabled
5	CLLE1	CBS Lower Limit Error Interrupt Enable (Class A) 0: Disabled 1: Enabled
4	CLLE0	CBS Lower Limit Error Interrupt Enable (Class B) 0: Disabled 1: Enabled
3	SEE	Separation Error interrupt Enable 0: Disabled 1: Enabled
2	QEE	Queue Error interrupt Enable 0: Disabled 1: Enabled
1	MTEE	MAC Transmission Error interrupt Enable 0: Disabled 1: Enabled
0	MREE	MAC Reception Error interrupt Enable 0: Disabled 1: Enabled

TFFE Timestamp FIFO Full-Error Interrupt Enable Bits

When the timestamp FIFO is full (the timestamp FIFO full error interrupt status bits of the error interrupt status register (ETNBnEIS.TFFF) = 1) and the interrupt is enabled, the interrupt is issued.

CULE1 CBS Upper Limit Error Interrupt Enable Bit (Class A)

When the CBS of Class A reached the upper limit value (CBS upper limit error interrupt status bit (Class A) (ETNBnEIS.CULF1) = 1) and the interrupt is enabled, an interrupt occurs.

CULE0 CBS Upper Limit Error Interrupt Enable Bit (Class B)

When the CBS of Class B reached the upper limit value (CBS upper limit error interrupt status bit (Class B) (ETNBnEIS.CULF0) = 1) and the interrupt is enabled, an interrupt occurs.

CLLE1 CBS Lower Limit Error Interrupt Enable Bit (Class A)

When the CBS of Class A reached the lower limit value (CBS lower limit error interrupt status bit (Class A) (ETNBnEIS.CLLF1) = 1) and the interrupt is enabled, an interrupt occurs.

CLLE0 CBS Lower Limit Error Interrupt Enable Bit (Class B)

When the CBS of Class B reached the lower limit value (CBS lower limit error interrupt status bit (Class B) (ETNBnEIS.CLLF0)=1) and the interrupt is enabled, an interrupt occurs.

SEE Separation Error interrupt Enable Bit

When the separation error flag (ETNBnEIS.SEF) is set to 1 and the interrupt is enabled, an interrupt occurs.

QEE Queue Error interrupt Enable Bit

When the queue error flag (ETNBnEIS.QEF) is set to 1 and the interrupt is enabled, an interrupt occurs.

MTEE MAC Transmission Error interrupt Enable Bit

When the MAC transmission error flag (ETNBnEIS.MTEF) is set to 1 and the interrupt is enabled, an interrupt occurs.

MREE MAC Reception Error interrupt Enable Bit

When the MAC reception error flag (ETNBnEIS.MREF) is set to 1 and the interrupt is enabled, an interrupt occurs.

26.3.30 ETNBnEIS — Error Interrupt Status Register

The ETNBnEIS register indicates the states of AVB-DMAC-related error interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + $035C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	TFFF	CULF1	CULF0	CLLF1	CLLF0	SEF	QEF	MTEF	MREF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.46 ETNBnEIS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	QFS	Queue Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	TFFF	Timestamp FIFO Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
7	CULF1	CBS Upper Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
6	CULF0	CBS Upper Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
5	CLLF1	CBS Lower Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
4	CLLF0	CBS Lower Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
3	SEF	Separation Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.
2	QEF	Queue Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.
1	MTEF	MAC Transmission Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.

Table 26.46 ETNBnEIS Register Contents

Bit Position	Bit Name	Function
0	MREF	MAC Reception Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.

QFS Queue Full Error Status Bit

With the interrupts enabled, this bit indicates that a queue is full (the receive queue r full interrupt status bit (QFFr) or the receive FIFO full interrupt status bit (RFFF) in receive interrupt status register 2 (ETNBnRIS2) = 1).

[Conditions for Changing]

- If the receive queue r full interrupt status bit (ETNBnRIS2.QFFr) and the receive queue r full interrupt enable bit in the receive interrupt control register 2 (ETNBnRIC2.QFEr) are updated, this bit is also updated.
- If the receive FIFO full interrupt status bit (ETNBnRIS2.RFFF) and the receive FIFO full interrupt enable bit (ETNBnRIC2.RFFE) are updated, this bit is also updated.

TFFF Timestamp FIFO Full-Error Interrupt Status Bit

This bit indicates that a new transmission timestamp has been discarded due to the timestamp FIFO being full (i.e. has reached the overrun state).
Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when a frame with DESCR.TSR set is transmitted while the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) is set to 1 and the timestamp FIFO count bit in the transmit status register (ETNBnTSR.TFFL) is set to 2.

CULF1 CBS Upper Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has exceeded the set upper limit (ETNBnCUL1.ULV in the CBS upper limit register c (ETNBnCULc)).
Only 0 can be written to the bit.

[Conditions for Changing]

- This bit is set to 0 when the operating mode is not operation mode.
- This bit is set to 1 when the value of the CBS counter status 1 (Class A) bits in the transmit status register (ETNBnTSR.CCS1) change from 00_B (within the range) to 10_B (indicating a value equal to or higher than the upper limit).

CULF0 CBS Upper Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has exceeded the set upper limit (ETNBnCUL0.ULV in the CBS upper limit register c (ETNBnCULc)).
Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the value of the CBS counter status 0 (Class B) (ETNBnTSR.CCS0) bit in the transmit status register changes from 00_B (within the range) to 10_B (indicating a value over the upper limit).

CLLF1 CBS Lower Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has fallen below the set lower limit (ETNBnCLL1.LLV in CBS lower limit register c (ETNBnCLLc)).
Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the value of the CBS counter status 1 (Class A) bit in the transmit status register (ETNBnTSR.CCS1) changes from 00_B (within the range) to 01_B (indicating a value less than the lower limit).

CLLF0 CBS Lower Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has fallen below the set lower limit (ETNBnCLL0.LLV in the CBS lower limit register c (ETNBnCLLc)).
Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register (ETNBnTSR.CCS0) changes from 00_B (within the range) to 01_B (indicating a value less than the lower limit).

SEF Separation Error Flag

This bit indicates that a received frame was discarded because it has not matched any configured separation filter for AVB stream data frames.
The CPU can only write 0 to this bit.

[Changing condition]

- This bit is set to 0 when leaving OPERATION mode.
- This bit is set to 1 when a valid AVB stream data frame was received by MAC but discarded because the separation filter select bits in the receive configuration register (ETNBnRCR.ESF) are 10_B and no separation filter has matched.

QEF Queue Error Flag

This bit indicates that an error has been detected while processing reception or transmit queue. Detail about the detected error is indicated by the error status register (ETNBnESR).

For the details of the error processing, **Section 26.4.2.3, Checking Integrity**.
The CPU can only write 0 to this bit.

[Changing condition]

- This bit is set to 0 when the operating mode changes from operation mode.
- This bit is set to 1 when a state of error is detected.

MTEF MAC Transmission Error Flag

This bit indicates that the MAC has detected a fault during transmission. For detail the MAC registers have to be checked.
The CPU can only write 0 to this bit.

[Changing condition]

- This bit is set to 0 when the operating mode changes from operation mode.
- This bit is set to 1 when MAC detects an error during frame transmission.

MREF MAC Reception Error Flag

This bit indicates that the MAC has detected a fault during reception.

For detail the MAC registers have to be checked.

NOTE

When the storage of faulty received frames (ETNBnRCR.EFFS) is enabled, the MAC error code (DESCR.MSC) is stored in the descriptor. By evaluating this information CPU can identify corrupted frames in URAM.

The CPU can only write 0 to this bit.

[Changing condition]

- This bit is set to 0 when leaving OPERATION mode.
- This bit is set to 1 when E-MAC detects an error during frame reception.

26.3.31 ETNBnRIC0 — Receive Interrupt Control Register 0

The ETNBnRIC0 register controls the AVB-DMAC receive interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0360$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	FRE0	Receive Frame Interrupt Enable 0 (Best Effort) 0: Disabled 1: Enabled

FREr (r = 0 to 17) Receive Frame Interrupt Enable Bits

When interrupts are allowed, and if an interrupt source occurs (receive interrupt status bit in the receive interrupt status register (ETNBnRIS0.FRF0 to 17) = 1), an interrupt is generated.

26.3.32 ETNBnRIS0 — Receive Interrupt Status Register 0

The ETNBnRIS0 register indicates the states of the AVB-DMAC receive interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0364$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

2	FRF2	Receive Frame Interrupt Status 2 (Stream 0) 0: The interrupt is not pending. 1: The interrupt is pending.
1	FRF1	Receive Frame Interrupt Status 1 (Network Control) 0: The interrupt is not pending. 1: The interrupt is pending.
0	FRF0	Receive Frame Interrupt Status 0 (Best Effort) 0: The interrupt is not pending. 1: The interrupt is pending.

FRFr (r = 0 to 17) Receive Frame Interrupt Status Bits

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data is queued for CPU processing.
Only 0 can be written to the bit.

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 0 when a value is written to the unread frame counter decrement register i (ETNBnUFCDi) (i = 0 to 4), and this decrements the value of unread frame counter register i (ETNBnUFCVi) (i = 0 to 4) to 0.
- When a frame is stored normally in a reception queue, the corresponding bit is set to 1.

26.3.33 ETNBnRIC1 — Receive Interrupt Control Register 1

The ETNBnRIC1 register controls AVB-DMAC receive interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0368_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.49 ETNBnRIC1 Register Contents

Bit Position	Bit Name	Function
31	RFWE	Receive FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
30 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

RFWE Receive FIFO Warning Interrupt Enable Bit

If the reception FIFO reaches the warning level (the value set in the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL)) with the corresponding interrupt enabled, an interrupt is issued.

26.3.34 ETNBnRIS1 — Receive Interrupt Status Register 1

The ETNBnRIS1 register indicates the states of AVB-DMAC receive interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + $036C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31	RFWF	Receive FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
30 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

RFWF Receive FIFO Warning Interrupt Status Bit

This bit indicates that the reception FIFO has reached the set caution level (the value set in the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL)).
Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the reception FIFO reaches the set caution level (the value set in the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL)).

26.3.35 ETNBnRIC2 — Receive Interrupt Control Register 2

The ETNBnRIC2 register controls AVB-DMAC receive interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0370_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	QFE0	Receive Queue 0 (Best Effort) Full Interrupt Enable 0: Disabled 1: Enabled

RFFE Receive FIFO Full Interrupt Enable Bit

When interrupts are allowed, and if the reception FIFO becomes full (the reception FIFO full interrupt status bit (ETNBnRIS2.RFFF) = 1 in receive interrupt status register 2), an interrupt is generated.

QFEr (r = 0 to 17) Receive Queue r Full Interrupt Enable Bits

When interrupts are allowed, and if a receive queue (0 to 17) becomes full (the receive queue r full interrupt status bit (ETNBnRIS2.QFF0 to 17) = 1 in receive interrupt status register 2), an interrupt is generated.

26.3.36 ETNBnRIS2 — Receive Interrupt Status Register 2

The ETNBnRIS2 register indicates the states of the AVB-DMAC receive interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0374_H

Value after reset: $0000\ 0000_H$

3	QFF3	Receive Queue 3 (Stream 1) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
2	QFF2	Receive Queue 2 (Stream 0) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
1	QFF1	Receive Queue 1 (Network Control) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
0	QFF0	Receive Queue 0 (Best Effort) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

RFFF Receive FIFO Full Interrupt Status Bit

This bit indicates that a frame was received but storing it was not possible due to the reception FIFO being full.

When receiving a frame is not possible, the frame will be discarded.

Other information regarding discarded frames is not retained. Even if the frame is not discarded, this bit may also be set to 1 if the E-MAC determines that the frame is an error frame
Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the reception FIFO cannot hold received frame data.

QFFr (r = 0 to 17) Receive r Full Interrupt Status Bits

When a received frame is dropped due to non-availability of empty descriptor, ETNBnRIS2.QFFr is correctly set to 1.

Additionally, when ETNBnUFCVi.CVr reached the configured stop level (ETNBnUFCS.SLj), the queue full flag (ETNBnRIS2.QFFr) is set to 1 even before any further received frame is dropped.

CAUTION

If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see **Section 26.4.4.3(1)(b), Storing Frame Data as Divided Frames**) an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 1 when reception queue r has no space available for storage.
- A bit is set to 1 when the unread frame counter (unread frame counter register i (ETNBnUFCVi) (i = 0 to 4)) reaches the set level for stopping.

26.3.37 ETNBnTIC — Transmit Interrupt Control Register

The ETNBnTIC register controls the AVB-DMAC transmit interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0378$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 26.53 ETNBnTIC Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	TFWE	Timestamp FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
8	TFUE	Timestamp FIFO Update Interrupt Enable 0: Disabled 1: Enabled
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

TFWE Timestamp FIFO Warning Interrupt Enable Bit

When the timestamp FIFO reaches the warning level while the interrupt is enabled, the interrupt is issued.

TFUE Timestamp FIFO Update Interrupt Enable Bit

When the timestamp FIFO is updated while the interrupt is enabled, the interrupt is issued.

26.3.38 ETNBnTIS — Transmit Interrupt Status Register

The ETNBnTIS register indicates the states of the AVB-DMAC transmit interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 037C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 26.54 ETNBnTIS Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11, 10	Reserved	When read, an undefined value is returned. When writing, write the value after reset.
9	TFWF	Timestamp FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The timestamp FIFO has reached the warning level.
8	TFUF	Timestamp FIFO Update Interrupt Status 0: The interrupt is not pending. 1: The timestamp FIFO has been updated.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	Reserved	When read, an undefined value is returned. When writing, write the value after reset.

TFWF Timestamp FIFO Warning Interrupt Status Bit

This bit indicates that the transmission timestamp FIFO has reached the warning level.
Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode, when the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) is 0, or when 1 is written to the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR).
- The bits are set to “1” after a frame including DESCR.TSR set has been transmitted and one entry has already been stored (the transmit status register timestamp FIFO count bit (ETNBnTSR.TFFL) is set to “1”) in the timestamp FIFO.

TFUF Timestamp FIFO Update Interrupt Status Bit

This bit indicates that the transmission timestamp FIFO has been updated.
Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode, when the timestamp FIFO enable bit in the transmit configuration control register (ETNBnTCCR.TFEN) is 0, or when 1 is written to the timestamp FIFO release bit in the transmit configuration control register (ETNBnTCCR.TFR).
- The bit is set to 1 when the timestamp FIFO enable bit (ETNBnTCCR.TFEN) is 1 after a frame including DESCR.TSR set has been transmitted.

26.3.39 ETNBnISS — Interrupt Summary Status Register

The ETNBnISS register gives a summary of the states of AVB-DMAC-related interrupts.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	<ETNBn_base> + 0380$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

17	DPS1	Descriptor Interrupt 1 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
16 to 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13	CGIS	gPTP Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
12	RFWS	Receive FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
11, 10	Reserved	When read, an undefined value is returned. When writing, write the value after reset.
9	TFWS	Timestamp FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
8	TFUS	Timestamp FIFO Update Interrupt 0: The interrupt is not pending. 1: The interrupt is pending.
7	MS	E-MAC Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
6	ES	Error Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
5 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	Reserved	When read, an undefined value is returned. When writing, write the value after reset.

DPSi (i = 1 to 15) Descriptor Interrupt 1 to 15 Summary Bits

These bits are set to 1 when the given descriptor interrupt enable bit (ETNBnDIC.DPE1 to ETNBnDIC.DPE15) and descriptor interrupt status flag (ETNBnDIS.DPF1 to ETNBnDIS.DPF15) are both 1.

CGIS gPTP Interrupt Summary Bit

This bit is set to 1 when either interrupt-related bit in the two gPTP-related interrupt registers (ETNBnGIC and ETNBnGIS) is 1.

RFWS Receive FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the receive FIFO warning interrupt enable bit (ETNBnRIC1.RFWE) and receive FIFO warning interrupt status flag (ETNBnRIS1.RFWF) are both 1.

TFWS Timestamp FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the timestamp FIFO warning interrupt enable bit (ETNBnTIC.TFWE) and timestamp FIFO warning interrupt status flag (ETNBnTIS.TFWF) are both 1.

TFUS Timestamp FIFO Update Interrupt Summary Bit

This bit is set to 1 when the timestamp FIFO update interrupt enable bit (ETNBnTIC.TFUE) and timestamp FIFO update interrupt status flag (ETNBnTIS.TFUF) are both 1.

MS E-MAC Interrupt Summary Bit

This bit is set to 1 when an E-MAC interrupt is issued.

ES Error Interrupt Summary Bit

This bit is set to 1 when any of the valid bits in the error interrupt status register (ETNBnEIS) is 1 or the queue full error interrupt status bit (ETNBnEIS.QFS) in the error interrupt status register (ETNBnEIS) is 1.

26.3.40 ETNBnGCCR — gPTP Configuration Control Register

The ETNBnGCCR register is used to set and control the gPTP (generalized precision time protocol).

Access:	ETNBnGCCR can be read or written in 32-bit units. ETNBnGCCRL can be read or written in16-bit units. ETNBnGCCRLL, ETNBnGCCRLH can be read or written in 8-bit units.
Address:	ETNBnGCCR: <ETNBn_base> + 0390_H ETNBnGCCRL: <ETNBn_base> + 0390_H ETNBnGCCRLL: <ETNBn_base> + 0390_H ETNBnGCCRLH: <ETNBn_base> + 0390_H + 1_H
Value after reset:	0000 $003C_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.56 ETNBnGCCR Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	TCSS[1:0]	Timer Capture Source Select 00_B: gPTP timer value 01_B: Adjusted gPTP timer value 10_B: AVTP presentation time 11_B: Setting prohibited
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LMTT	Maximum Transit Time Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
4	LPTC	Presentation Time Compare Value Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
3	LTI	Timer Increment Value Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
2	LTO	Timer Offset Value Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.

Table 26.56 ETNBnGCCR Register Contents

Bit Position	Bit Name	Function
1, 0	TCR[1:0]	Timer Control Request 00_B: Timer control is not requested. 01_B: gPTP/AVTP presentation time reset 10_B: Setting prohibited 11_B: Captures the value set in the TCSS bit.

TCSS[1:0] Timer Capture Source Select Bits

These bits select the source used for updating the captured timer register (gPTP timer capture register (ETNBnGCTi.CTV)).

These bits should still be controlled when timer control is not being requested (ETNBnGCCR.TCR = 00_B).

LMTT Maximum Transit Time Configuration Request Bit

This bit issues requests for configuring the gPTP maximum transit time configuration register (ETNBnGMTT).
Only 1 can be written to the bit.

[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of the gPTP maximum transit time configuration register (ETNBnGMTT) is loaded.

LPTC Presentation Time Compare Value Configuration Request Bit

This bit issues requests for configuring the gPTP presentation time comparison register (ETNBnGPTC).
Only 1 can be written to the bit.

[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of the gPTP presentation time comparison register (ETNBnGPTC) is loaded.

LTI Timer Increment Value Configuration Request Bit

This bit issues requests for configuring the gPTP timer increment configuration register (ETNBnGTI).
Only 1 can be written to the bit.

[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of the gPTP timer increment configuration register (ETNBnGTI) is loaded.

LTO Timer Offset Value Configuration Request Bit

This bit issues requests for configuring gPTP timer offset configuration register i (ETNBnGTOi).
Only 1 can be written to the bit.

[Conditions for Changing]

- The bit is set to 1 when the operating mode is not operation mode.
- The bit is set to 0 when the value of gPTP timer offset configuration register i (ETNBnGTOi) is loaded.

TCR[1:0] Timer Control Request Bits

These bits issue requests for controlling the gPTP timer.

Writing to the bits is only possible when the current operating mode is operation mode.

Do not write to the bits when the gPTP timer clock select bit in the AVB-DMAC mode register is 00_B.

[Conditions for Changing]

The bits are set to 00_B when the operating mode is not operation mode and on completion of the requested processing.

26.3.41 ETNBnGMTT — gPTP Maximum Transit Time Configuration Register

The ETNBnGMTT register sets the maximum time for transitions of the gPTP timer.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0394_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MTTV[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 26.57 ETNBnGMTT Register Contents

Bit Position	Bit Name	Function
31 to 0	MTTV[31:0]	Maximum Transit Time The maximum transition time for addition to the presentation time

MTTV[31:0] Maximum Transit Time Bits

These bits set the maximum transition time for use in calculating AVTP presentation times.

Write the desired setting to the bits, then issue the configuration request by setting the maximum transit time configuration request bit in the gPTP configuration control register (ETNBnGCCR.LMTT) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the maximum transit time configuration request bit (ETNBnGCCR.LMTT) is 1.

26.3.42 ETNBnGPTC — gPTP Presentation Time Comparison Register

The ETNBnGPTC register sets a value for comparison with presentation times in the gPTP timer.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0398_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.58 ETNBnGPTC Register Contents

Bit Position	Bit Name	Function
31 to 0	PTCV[31:0]	Presentation Time Comparison Value Value for comparison with the gPTP presentation times

PTCV[31:0] Presentation Time Comparison Value Bits

These bits set a value for comparison with AVTP timer values to which a maximum transit time is not appended.

Write the desired setting to the bits, then issue the configuration request by setting the presentation time comparison value configuration request bit in the gPTP configuration control register (ETNBnGCCR.LPTC) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the presentation time comparison value configuration request bit (ETNBnGCCR.LPTC) is 1.
Do not write the range of “x – 1 to x + 1” to the bits. (x is a value of ETNBnGTI.TIV[27:0])

26.3.43 ETNBnGTI — gPTP Timer Increment Configuration Register

The ETNBnGTI register sets the increment for the gPTP timer.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + $039C_H$

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	TIV[27:16]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.59 ETNBnGTI Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27 to 0	TIV[27:0]	gPTP Timer Increment Value Increment for the gPTP timer

TIV[27:0] Bits (gPTP Timer Increment Value)

When the gPTP clock select bits in the AVB-DMAV mode register (ETNBnCCC.CSEL) are selecting a clock signal, these bits set the value by which the timer is incremented each time a cycle of that clock signal elapses.

Write the desired setting to the bits, then issue the configuration request by setting the timer increment value configuration request bit in the gPTP configuration control register (ETNBnGCCR.LTI) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer increment value configuration request bit (ETNBnGCCR.LTI) is 1.
Do not write 0 to all bits.

26.3.44 ETNBnGTOi — gPTP Timer Offset Configuration Register i (i = 0 to 2)

The ETNBnGTOi register sets an offset value for the gPTP timer.

The offset value is added to the combination of bits 0 to 31 in ETNBnGTO0, 32 to 63 in ETNBnGTO1, and 64 to 79 in ETNBnGTO2, which together make up the gPTP timer.

Access:	This register can be read or written in 32-bit units.
Address:	ETNBnGTO0: <ETNBn_base> + 03A0$_\text{H}$ ETNBnGTO1: <ETNBn_base> + 03A4$_\text{H}$ ETNBnGTO2: <ETNBn_base> + 03A8$_\text{H}$
Value after reset:	0000 0000$_\text{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TOV[31 + 32 × i:16 + 32 × i][*1]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TOV[15 + 32 × i:0 + 32 × i][*1]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. ETNBnGTO2 register corresponds to TOV[79:64] only and bits from 16 to 31 are reserved bits.

Table 26.60 ETNBnGTOi Register Contents

Bit Position	Bit Name	Function
31 to 0	TOV[95:0]	Timer Offset Value Offset value for the gPTP timer

TOV[79:0] Timer Offset Value Bits

This is an 80-bit value consisting of the settings in ETNBnGTO0.TOV[31:0], ETNBnGTO1.TOV[63:32], and ETNBnGTO2.TOV[79:64], and is used to set an offset for adding to the value of the gPTP timer.

Write the desired setting to the bits, then issue the configuration request by setting the timer offset value configuration request bit in the gPTP configuration control register (GCCR.LTO) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer offset value configuration request bit (ETNBnGCCR.LTO) is 1.
Write 0000$_\text{H}$ to ETNBnGTO2.TOV[95:80].
Set a value in the range from 0 to 10^9-1 (0000 0000$_\text{H}$ to 3B9A C9FF$_\text{H}$) in ETNBnGTO0.TOV[31:0].

26.3.45 ETNBnGIC — gPTP Interrupt Control Register

The ETNBnGIC register is used to control gPTP-related interrupts.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 03AC$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R

Table 26.61 ETNBnGIC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PTME	Presentation Time Match Interrupt Enable 0: Disabled 1: Enabled
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

PTME Presentation Time Match Interrupt Enable Bit

When this bit is 1, setting of the presentation time match interrupt flag in the gPTP interrupt status register (ETNBnGIS.PTMF) to 1 leads to generation of that interrupt.

26.3.46 ETNBnGIS — gPTP Interrupt Status Register

The ETNBnGIS register indicates the state of the gPTP-related interrupt.

Access:	This register can be read or written in 32-bit units.
Address:	<ETNBn_base> + $03B0_H$
Value after reset:	$0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.62 ETNBnGIS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PTMF	Presentation Time Match Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

PTMF Presentation Time Match Interrupt Flag Bit

This bit indicates that the value of the AVTP timer exceeds the value of the gPTP presentation time comparison register (ETNBnGPTC).
Only 0 can be written to the bit.

[Conditions for Changing]

- The bit is set to 0 when the operating mode is not operation mode.
- The bit is set to 1 when the AVTP timer value is greater than or equal to the value of the gPTP presentation time comparison register (ETNBnGPTC).

26.3.47 ETNBnGCTi — gPTP Timer Capture Register i (i = 0 to 2)

The ETNBnGCTi registers form an 80-bit register that captures the gPTP timer value.

Access: This register can be read or written in 32-bit units.

Address: ETNBnGCT0: <ETNBn_base> + 03B8$_H$
ETNBnGCT1: <ETNBn_base> + 03BC$_H$
ETNBnGCT2: <ETNBn_base> + 03C0$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CTV[31 + 32 × i:16 + 32 × i][*1]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTV[15 + 32 × i:0 + 32 × i][*1]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. ETNBnGCT2 register corresponds to CTV[79:64] only and bits from 16 to 31 are reserved bits.

Table 26.63 ETNBnGCTi Register Contents

Bit Position	Bit Name	Function
31 to 0	CTV[95:0]	gPTP Timer Capture Value Captured timer value

CTV[79:0] gPTP Timer Capture Value Bits

These 80 bits consist of ETNBnGCT0.CTV[31:0], ETNBnGCT1.CTV[63:32] and ETNBnGCT2.CTV[79:64], which together indicate captured timer values.

When 00$_B$ (value of the gPTP timer) or 01$_B$ (adjusted gPTP timer value) is selected by the timer capture source select bits in the gPTP configuration control register (ETNBnGCCR.TCSS), the corresponding 80-bit values are stored in these bits.

When 10$_B$ (AVTP presentation time) is selected by the timer capture source select bits (ETNBnGCCR.TCSS), the corresponding 32-bit values are stored in these bits (ETNBnGCT0.CTV[31:0]).

Actual writing of the timer value specified by the timer capture source select bits (ETNBnGCCR.TCSS) proceeds when 11$_B$ (timer capture request) is written to the timer control request bits in the gPTP configuration control register (ETNBnGCCR.TCR).

Do not read the value while the value of the timer control request bits (ETNBnGCCR.TCR) is 11$_B$ because this indicates that storage is still in progress.

CAUTION

Write 0000$_H$ to ETNBnGCT2.CTV[95:80].

26.3.48 ETNBnECMR — E-MAC Mode Register

ETNBnECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while the transmission and reception functions are enabled (i.e. while the RE or TE bit in this register is 1).

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0500_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.64 ETNBnECMR Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	TRCCM	Counter Clear Mode 0: Writing to the counter register leads to the register being cleared to 0. 1: Reading from the counter register leads to the register being cleared to 0.
25, 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23	RCSC	Checksum Calculation 0: Checksums are not automatically calculated. 1: Checksums are automatically calculated.
22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	DPAD	Data Padding 0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted. 1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed.
20	RZPF	PAUSE Frame Reception with Time = 0 0: Reception of PAUSE frames with the TIME parameter value 0 is disabled. 1: Reception of PAUSE frames with the TIME parameter value 0 is enabled.
19	ZPF	PAUSE Frame Usage with TIME = 0 Enable ● PAUSE frame usage with TIME = 0 enable (in full-duplex mode) 0: Control in response to and for the sending of PAUSE frames with the TIME parameter value 0 is disabled. 1: Control in response to and for the sending of PAUSE frames with the TIME parameter value is 0 is enabled.

Table 26.64 ETNBnECMR Register Contents

Bit Position	Bit Name	Function
18	PFR	PAUSE Frame Receive Mode 0: PAUSE frames are not transferred to the AVB-DMAC. 1: PAUSE frames are transferred to the AVB-DMAC.
17	RXF	Reception Flow Control Operation Mode 0: Flow control for the receiving port (reception of PAUSE frame) is disabled. 1: Flow control for the receiving port (reception of PAUSE frame) is enabled.
16	TXF	Transmission Flow Control Operation Mode 0: Flow control for the transmitting port is disabled (PAUSE frames are not automatically transmitted). 1: Flow control for the transmitting port is enabled (PAUSE frames are automatically transmitted as required).
15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	RE	Reception Enable 0: Reception is disabled. 1: Reception is enabled.
5	TE	Transmission Enable 0: Transmission is disabled. 1: Transmission is enabled.
4 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DM	When Ethernet AVB is used, this bit must be set to 1 (the value after reset is 0).
0	PRM	Promiscuous Mode 0: Normal operation 1: Promiscuous mode operation

TRCCM Counter Clear Mode Bit

This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers.

RCSC Checksum Calculation Bit

Setting this bit to 1 enables automatic calculation of checksums for the data field in received frames.

Only the data field of an Ethernet frame is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion.

DPAD Data Padding Control Bit

This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted.

When this bit is set to 1, data are transmitted without padding; when it is set to 0, data are padded to make up 60-byte units for transmission.

RZPF (PAUSE Frame Reception with Time = 0) Bit

This bit is set to 0, received PAUSE frames with the Timer value 0 are discarded.

This bit is set to 1, release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0.

ZPF (PAUSE Frame Usage with TIME = 0 Enable) Bit

- PAUSE frame usage with TIME = 0 enable (In full-duplex mode)

  When this bit is set to 0, the next frame to be transmitted is not transmitted until the time specified by the Timer value has elapsed.
  When this bit is set to "1", if the amount of data in the reception FIFO becomes less than the setting of the receive FIFO warning level bits in the receive configuration register (ETNBnRCR.RFCL) before the time specified by the Timer value elapses, a PAUSE frame with a Timer value of 0 is automatically transmitted. If the interface is in the transmission wait state, it is released from that state on receiving a PAUSE frame with a Timer value of 0.

PFR PAUSE Frame Receive Mode Bit

This bit specifies whether PAUSE frames are transferred to the AVB-DMAC.

RXF (Operating Mode for Flow Control in Reception) Bit

This bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see **Section 26.3.57, ETNBnPFRCR — PAUSE Frame Receive Counter**.

Setting this bit to 0 disables PAUSE frame detection.

TXF (Operating Mode for Flow Control in Transmission) Bit

This bit enables or disables flow control in transmission. Setting this bit to 0 disables PAUSE frame detection.

RE Reception Enable Bit

When this bit is switched from the receive function enabled (RE = 1) to the receive function disabled (RE = 0), and if there is a frame is being received, the receive function remains enabled until the reception of the frame finishes.

TE Transmission Enable Bit

When this bit is switched from the transmit function enabled (TE = 1) to the transmit function disabled (TE = 0), and if there is a frame being transmitted, the transmit function remains enabled until the transmission of the frame finishes.

DM Duplex Mode Bit

This bit selects full-duplex operation.

PRM Promiscuous Mode Bit

This bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.).

26.3.49 ETNBnRFLR — Receive Frame Length Register

The ETNBnRFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI.

This register must not be changed while reception is enabled (while the reception enable bit (ETNBnECMR.RE) in the E-MAC mode register is set to “1”).

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0508_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFL[17:16]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 26.65 ETNBnRFLR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17 to 0	RFL[17:0]	Receive Frame Length Setting value Check value 00000_H: 1,518 bytes : : $005EE_H$: 1,518 bytes $005EF_H$: 1,519 bytes $005F0_H$: 1,520 bytes : : $1FFFF_H$: 131,071 bytes 20000_H: 131,072 bytes : : $3FFFF_H$: 131,072 bytes

RFL[17:0] Receive Frame Length Bits

Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value is discarded.

CAUTION

The prepared descriptor data size is just the specified value (ETNBnRFLR.RFL[17:0]).
Therefore descriptor data size must be more than ETNBnRFLR.RFL[17:0] + 8 if you will receive such the long frame.

26.3.50 ETNBnECSR — E-MAC Status Register

The ETNBnECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits that generate an interrupt, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ETNBnECSIPR) described in **Section 26.3.51, ETNBnECSIPR — E-MAC Interrupt Permission Register**.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0510$_H$

Value after reset: 0000 000X$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	LCHNG	—	ICD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	—	0	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 26.66 ETNBnECSR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LCHNG	Link signal change bit 0: Change of Link status signal (AVB_LINK) is not detected. 1: Change of Link status signal (AVB_LINK) is detected.
1	Reserved	When read, an undefined value is read. When writing, write the value after reset.
0	ICD	Illegal Carrier Detection 0: PHY-LSI has not detected an illegal carrier on the line. 1: PHY-LSI has detected an illegal carrier on the line.

LCHNG: Link Signal Change Bit

This bit indicates a transition of the link status signal (AVB_LINK) input from the PHY-LSI from high to low or low to high.

However, signal changes may also be detected at times when the link status signal (AVB_LINK) function is selected.

To check the current link state, refer to the link status pin state bit in the PHY status register (ETNBnPLSR.LINK).

Writing 1 to this bit clears it to 0.

ICD Illegal Carrier Detection Bit

This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used.

Writing 1 to this bit clears it to 0.

26.3.51 ETNBnECSIPR — E-MAC Interrupt Permission Register

The ETNBnECSIPR register instructs permission of interrupt sources reported by the ETNBnECSR register. The bits can permit interrupts corresponding to the ETNBnECSR bits.

Access:	This register can be read or written in 32-bit units.
Address:	<ETNBn_base> + 0518_H
Value after reset:	0000 0000_H

Table 26.67 ETNBnECSIPR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LINKIM	LINK Interrupt Mask 0: Interrupts by the LINKI setting prohibited. 1: Interrupts by the LINKI setting permitted.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ICDIP	False Carrier Detect Interrupt Enable 0: Interrupts by the ICD bit setting prohibited. 1: Interrupt by the ICD bit setting permitted.

LINKIM: Link Signal Change Interrupt Enable Bit

When this bit is set to “1” and the link signal change bit (ETNBnECSR.LCHNG) in the E-MAC status register is set to “1”, an interrupt occurs.

ICDIP Illegal Carrier Detect Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ETNBnECSR.ICD) in the E-MAC status register to 1.

26.3.52 ETNBnPIR — PHY Interface Register

The ETNBnPIR register provides a means of access to the PHY-LSI internal registers via the MII.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0520$_H$

Value after reset: 0000 000X$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 26.68 ETNBnPIR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	MDI	MII Management Data-In Indicates the level of the ETNBnMDIO pin.
2	MDO	MII Management Data-Out Stores data to output from the ETNBnMDIO pin.
1	MMD	MII Management Mode 0: Read direction is specified. 1: Write direction is specified.
0	MDC	MII Management Data Clock The value set in this bit is output from the ETNBnMDC pin, which supplies the management data clock for the MII.

MDI MII Management Data-In Bit

This bit indicates the level of the ETNBnMDIO pin.

MDO MII Management Data-Out Bit

This bit stores data to output from the ETNBnMDIO pin.

The ETNBnMDIO pin outputs data when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction).

MMD MII Management Mode Bit

This bit specifies the direction for data through MDIO (reading or writing).

MDC MII Management Data Clock Bit

Values set in this bit are output on the ETNBnMDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see **Section 26.4.12, Connection to PHY-LSI**.

26.3.53 ETNBnPLSR — PHY LINK Status Register

The ETNBnPLSR register is used to check the status of PHY LINK pins.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ETNBn_base> + 0528$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LINK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.69 ETNBnPLSR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	LINK	When read, this bit returns the state of the ETNBnLINK pin.

26.3.54 ETNBnAPFTP — Auto PAUSE Frame Time Parameter Register

The ETNBnAPFTP register is used to set the value for the TIME parameter of automatically generated PAUSE frame.

When a PAUSE frame is automatically transmitted, the value set in this register is used as its TIME parameter.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0554_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	APFTP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.70 ETNBnAPFTP Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	APFTP[15:0]	Automatic PAUSE Frame Time Parameter Set a time parameter value of the Automatic PAUSE Frame.*1,*2 0000_H: Setting prohibited 0001_H: 1 × 512 bit-period 0002_H: 2 × 512 bit-period : : $FFFF_H$: 65535 × 512 bit-period

Note 1. The bit-period changes relative to the transfer speed.
100 Mbps: 1 bit-period = 10 ns
10 Mbps: 1 bit-period = 100 ns

Note 2. When setting the Transmission flow control operation mode bit (ETNBnECMR.TXF) in the E-MAC mode register to “1”, set this register value other than $0000\ 0000_H$.

APFTP[15:0] Auto Pause Frame Time Parameter

These bit configure the time parameter value for the transmit of Auto Pause Frame. The unit of the setting value is 512 bit-period.

26.3.55 ETNBnMPR — Manual PAUSE Frame Register

The ETNBnMPR register is used to set the value for the TIME parameter of manually generated PAUSE frames. When a PAUSE frame is manually transmitted, the value set in this register is used as its TIME parameter.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0558_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.71 ETNBnMPR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	MP[15:0]	Manual PAUSE These bits set the TIME parameter value of a manual PAUSE frame.*1 0000_H: Setting prohibited 0001_H: 1 × 512 bit-period 0002_H: 2 × 512 bit-period : : $FFFF_H$: 65535 × 512 bit-period

Note 1. The bit-period changes relative to the transfer speed.
100 Mbps: 1 bit-period = 10 ns
10 Mbps: 1 bit-period = 100 ns

MP[15:0] Manual PAUSE Bits

These bits set the value of the TIME parameter in manually generated PAUSE frames. The unit for the setting is 512 bit periods.

26.3.56 ETNBnPFTCR — PAUSE Frame Transmit Counter

The ETNBnPFTCR register is a counter that indicates the number of times PAUSE frames have been transmitted.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ETNBn_base> + 055C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFTXC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.72 ETNBnPFTCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	PFTXC[15:0]	PAUSE Frame Transmit Counter These bits indicates the number of transmitted PAUSE frames.

PFTXC[15:0] PAUSE Frame Transmit Counter Bits

These bits indicate the total number of PAUSE frames that have been transmitted (both manually and automatically).

The bits are cleared to 0 when they are read.

If counting up and clearing of the counter coincide, clearing the counter takes priority.

26.3.57 ETNBnPFRCR — PAUSE Frame Receive Counter

The ETNBnPFRCR register is a counter that indicates the number of times PAUSE frames have been received.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ETNBn_base> + 0560_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFRXC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.73 ETNBnPFRCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	PFRXC[15:0]	PAUSE Frame Receive Counter Counter for counting the number of received PAUSE frames

PFRXC[15:0] PAUSE Frame Receive Counter Bits

These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ETNBnECMR = 1).

The bits are cleared to 0 when they are read.

If counting up and clearing the counter coincide, clearing the counter takes priority.

26.3.58 ETNBnMAHR — MAC Address High Register

The ETNBnMAHR register specifies the 32 higher-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

This register must not be changed while transmission or reception is enabled (E-MAC mode register reception enable bit (ETNBnECMR.RE) is set to “1” or transmission enable bit (ETNBnECMR.TE) is set to “1”).

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 05C0$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MA[47:32]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.74 ETNBnMAHR Register Contents

Bit Position	Bit Name	Function
31 to 0	MA[47:16]	MAC Address Bits 47 to 16 These bits are used to set the 32 higher-order bits of the MAC address.

MA[47:16] MAC Address Bits 47 to 16

These bits are used to set the 32 higher-order bits of the MAC address.

For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set 0123 4567$_H$ in the this register.

26.3.59 ETNBnMALR — MAC Address Low Register

The ETNBnMALR register specifies the 16 lower-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

This register must not be changed while transmission or reception is enabled (E-MAC mode register reception enable bit (ETNBnECMR.RE) is set to “1” or transmission enable bit (ETNBnECMR.TE) is set to “1”).

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 05C8$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	MA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.75 ETNBnMALR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	MA[15:0]	MAC Address Bits 15 to 0 These bits are used to set the 16 lower-order bits of the MAC address.

MA[15:0] MAC Address Bits 15 to 0

These bits are used to set the 16 lower-order bits of the MAC address.

For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set 89AB$_H$ in the ETNBnMALR register.

26.3.60 ETNBnTROCR — Transmit Retry Over Counter Register

In this product, this register is not used because a half-duplex mode is not supported.

It shall be retained the value after reset.

The ETNBnTROCR register is a counter that indicates the number of frames the module was unable to transmit in 16 attempts at transmission including the first attempt and retries. When 16 attempts to transmit a frame fail, this register is incremented by 1. Counting up stops when the value in this register reaches 0000 FFFF_H.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0700_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.76 ETNBnTROCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	TROC[15:0]	Transmit Retry Over Counter These bits indicate the number of frames the module was unable to transmit in 16 attempts at transmission, including the first attempt and retries.

TROC[15:0] Transmit Retry Over Counter Bits

These bits indicate the number of frames the module was unable to transmit in 16 attempts at transmission, including the first attempt and retries.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

26.3.61 ETNBnCDCR — Late Collision Detect Counter Register

In this product, this register is not used because a half-duplex mode is not supported.

It shall be retained the value after reset.

The ETNBnCDCR register is a counter that indicates the number of all late collisions that occurred on the line after the start of data transmission. Counting up stops when the value in this register reaches 0000 FFFF_{H}.

Access:	This register can be read or written in 32-bit units.
Address:	<ETNBn_base> + 0708_{H}
Value after reset:	0000 0000_{H}

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.77 ETNBnCDCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	COSDC[15:0]	Late Collision Detect Counter These bits indicate the number of all late collisions after the start of data transmission.

COSDC[15:0] Collision Detect Counter Bits

These bits indicate the number of all late collisions after the start of data transmission.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

26.3.62 ETNBnLCCR — Lost Carrier Counter Register

In this product, this register is not used because a half-duplex mode is not supported.

It shall be retained the value after reset.

The ETNBnLCCR register is a counter that indicates the number of times the carrier was lost during data transmission. Counting up stops when the value in this register reaches 0000 $FFFF_H$.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0710_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	LCC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.78 ETNBnLCCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	LCC[15:0]	Lost Carrier Counter These bits indicate the number of times the carrier was lost during data transmission.

LCC[15:0] Lost Carrier Counter Bits

These bits indicate the number of times the carrier was lost during data transmission.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

26.3.63 ETNBnCEFCR — CRC Error Frame Receive Counter Register

The ETNBnCEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches 0000 $FFFF_H$.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0740_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 26.79 ETNBnCEFCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	CEFC[15:0]	CRC Error Frame Counter These bits indicate the number of CRC error frames received.

CEFC[15:0] CRC Error Frame Counter Bits

These bits indicate the number of received frames having CRC errors.

The bits are cleared to “0” when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to “1”.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

26.3.64 ETNBnFRECR — Frame Receive Error Counter Register

The ETNBnFRECR register is a counter that indicates the number of frame receive errors were generated by input on the ETNBnRXERR pin from the PHY-LSI. Counting up stops when the value in this register reaches 0000 FFFF$_H$.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0748$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 26.80 ETNBnFRECR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	FREC[15:0]	Frame Receive Error Counter These bits indicate the number of errors during frame reception.

FREC[15:0] Frame Receive Error Counter Bits

These bits indicate the number of errors during frame reception.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

26.3.65 ETNBnTSFRCR — Too-Short Frame Receive Counter Register

The ETNBnTSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches 0000 FFFF_H.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0750_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 26.81 ETNBnTSFRCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	TSFRC[15:0]	Too-Short Frame Receive Counter These bits indicate the number of frames received with a length of less than 64 bytes.

TSFRCR[15:0] Too-Short Frame Receive Counter Bits

These bits indicate the number of received frames that were fewer than 64 bytes in length.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

26.3.66 ETNBnTLFRCR — Too-Long Frame Receive Counter Register

The ETNBnTLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (ETNBnRFLR). Counting up stops when the value in this register reaches 0000 FFFF$_{\text{H}}$.

Access:	This register can be read or written in 32-bit units.
Address:	<ETNBn_base> + 0758$_{\text{H}}$
Value after reset:	0000 0000$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TLFC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.82 ETNBnTLFRCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	TLFC[15:0]	Too-Long Frame Receive Counter These bits indicate the number of frames received with a length exceeding the value in ETNBnRFLR.

TLFRCR[15:0] Too-Long Frame Receive Counter Bits

These bits indicate the number of received frames that were longer than the value in ETNBnRFLR.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

26.3.67 ETNBnRFCR — Residual-Bit Frame Receive Counter Register

The ETNBnRFCR register is a counter that indicates the number of received frames containing “residual bits” (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches 0000 $FFFF_H$.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0760_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.83 ETNBnRFCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	RFC[15:0]	Residual-Bit Frame Receive Counter These bits indicate the number of received frames containing residual bits.

RFC[15:0] Residual-Bit Frame Receive Counter Bits

These bits indicate the number of received frames containing residual bits.

The bits are cleared to 0 when they are read while the counter clear mode bit (ETNBnECMR.TRCCM) in the E-MAC mode register is set to 1.

When ETNBnECMR.TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

26.3.68 ETNBnMAFCR — Multicast Address Frame Receive Counter Register

The ETNBnMAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches 0000 FFFF_H.

Access: This register can be read or written in 32-bit units.

Address: <ETNBn_base> + 0778_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
