Rev.1.10 Dec, 2018

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

   “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

(Rev.4.0-1 November 2017)

Notes for CMOS devices

(1) Voltage application waveform at input pin: Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIL (MAX) and VIH (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (MAX) and VIH (MIN).

(2) Handling of unused input pins: Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

(3) Precaution against ESD: A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

(4) Status before initialization: Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

(5) Power ON/OFF sequence: In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

(6) Input of signal during power off state: Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

How to Use This Manual

Readers This manual is intended for users who wish to understand the functions of the RH850/F1KH, RH850/F1KM and design application systems using the following RH850/F1KH, RH850/F1KM microcontrollers:

Purpose This manual is intended to give users an understanding of the hardware functions of the RH850/F1KH, RH850/F1KM shown in the *Organization* below.

Organization This manual is divided into two parts: Hardware (this manual) and Architecture (RH850G3KH User’s Manual: Software).

Hardware	Software
Pin functions	Overview
CPU function	Processor Model
On-chip peripheral functions	Register Reference
Flash memory programming	Exceptions and Interrupts
	Memory Management
	Instruction Reference
	Reset
	Appendix

How to read this manual It is assumed that the readers of this manual have general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.

To understand the overall functions of the RH850/F1KH, RH850/F1KM.

→ Read this manual according to the Contents.

To understand the details of an instruction function

→ See RH850G3KH User’s Manual: Software (R01US0165E) available separately.

This RH850/F1KH, RH850/F1KM Hardware User’s Manual corresponds to Rev.1.10.

The RH850/F1KH-D8 description relates to a revision level of Rev.1.00.

The xxA section describes the functionality of RH850/F1KH-D8.

The xxB section describes the functionality of RH850/F1KM-S4.

The xxC section describes the functionality of RH850/F1KM-S1.

The xxAB section describes the functionality of RH850/F1KH-D8 and RH850/F1KM-S4.

The xxBC section describes the functionality of RH850/F1KM-S4 and RH850/F1KM-S1.

The xxx section describes the functionality of all related products.

Conventions

Data significance: Higher digits on the left and lower digits on the right

Active low representation: xxx (overscore over pin or signal name)

Memory map address: Higher addresses on the top and lower addresses on the bottom

Note: Footnote for item marked with Note in the text

Caution: Information requiring particular attention

Remark: Supplementary information

Numeric representation: Binary ... xxxx or xxxx_B
Decimal ... xxxx
Hexadecimal ... xxxx_H

Prefix indicating power of 2 (address space, memory capacity):

K (kilo): 2^{10} = 1,024

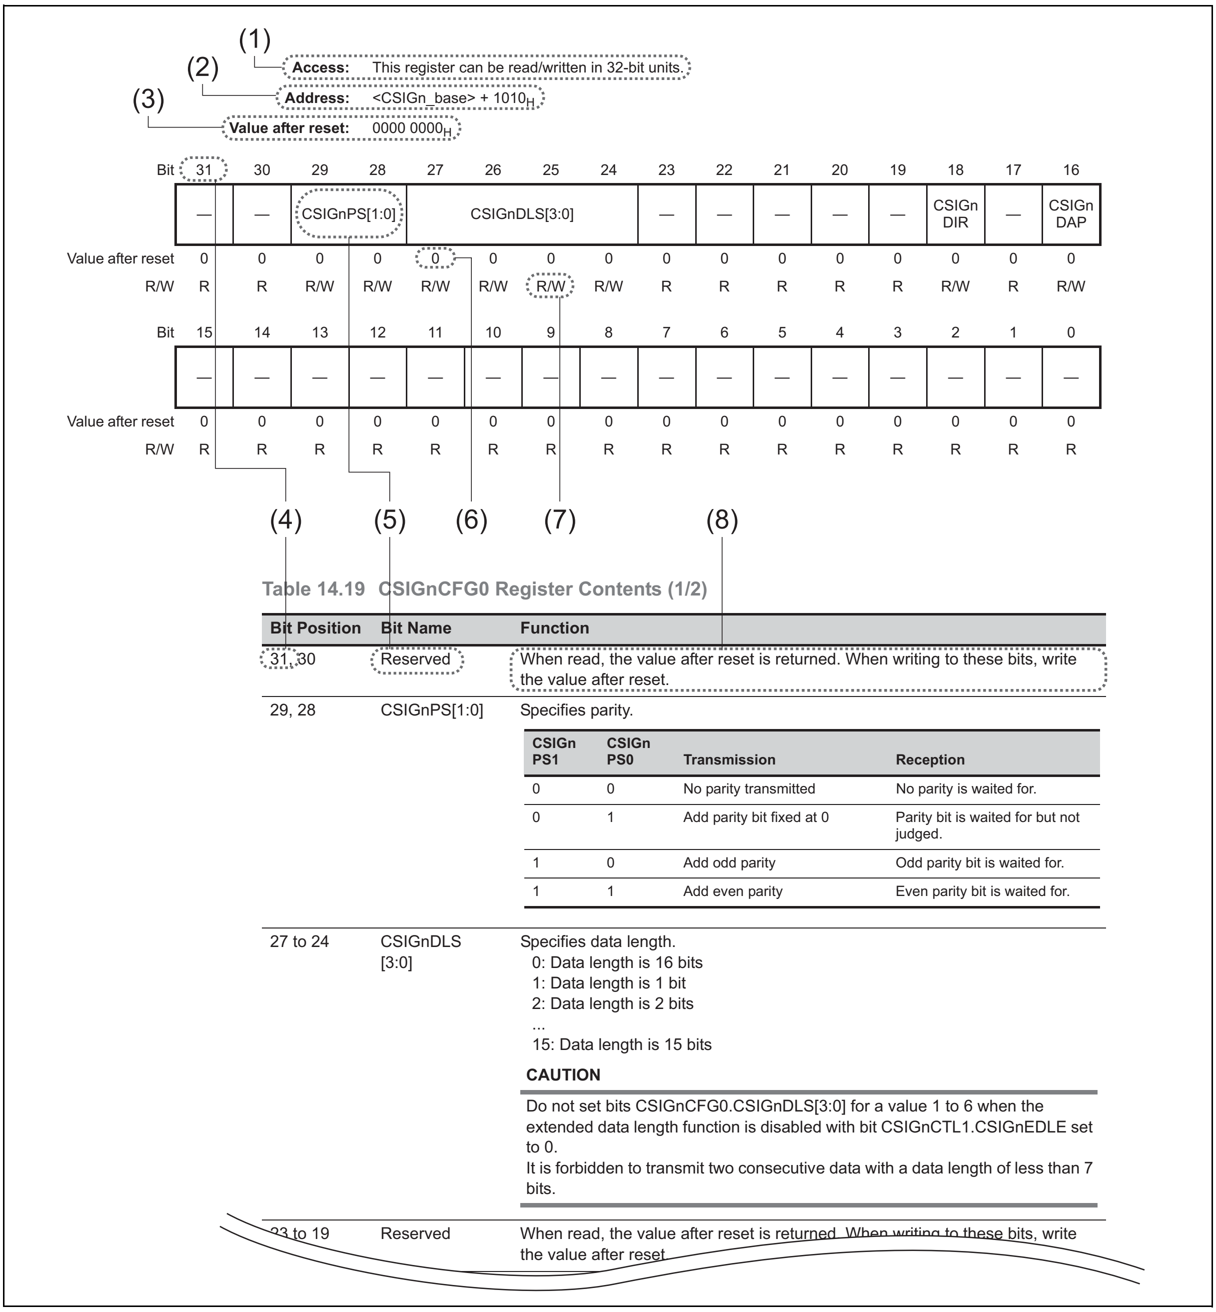
M (mega): $2^{20} = 1{,}024^2$

G (giga): $2^{30} = 1{,}024^3$

Description of Registers

Each register description includes register access, register address, and register value after a reset, a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meaning of the bit settings.

The standard format for bit charts and tables are described below.



Access: This register can be read/written in 32-bit units.

Address: <CSIGn_base> + 1010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CSIGnPS[1:0]		CSIGnDLS[3:0]				—	—	—	—	—	CSIGn DIR	—	CSIGn DAP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.19 CSIGnCFG0 Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
29, 28	CSIGnPS[1:0]	Specifies parity.
27 to 24	CSIGnDLS [3:0]	Specifies data length. 0: Data length is 16 bits 1: Data length is 1 bit 2: Data length is 2 bits ... 15: Data length is 15 bits **CAUTION** Do not set bits CSIGnCFG0.CSIGnDLS[3:0] for a value 1 to 6 when the extended data length function is disabled with bit CSIGnCTL1.CSIGnEDLE set to 0. It is forbidden to transmit two consecutive data with a data length of less than 7 bits.
23 to 19	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

CSIGn PS1	CSIGn PS0	Transmission	Reception
0	0	No parity transmitted	No parity is waited for.
0	1	Add parity bit fixed at 0	Parity bit is waited for but not judged.
1	0	Add odd parity	Odd parity bit is waited for.
1	1	Add even parity	Even parity bit is waited for.

(1) Access

The register can be accessed in the bit unit indicated here.

(2) Address

This is the register address.
For base address, see description of base address in each section.

(3) Value after a reset (in hexadecimal notation)

This is the value of all bits of the register after a reset. Values for bytes are given as numbers in the range from 0 to 9 and letters from A to F or as X where they are undefined.

(4) Bit position

This is the bit number.
The bits are numbered from 31 to 0 for 32-bit registers, 15 to 0 for 16-bit registers, and 7 to 0 for 8-bit registers.

(5) Bit name

Bit name or field name is indicated.
When clearly identifying the digits of a bit field is required, do so by using a form such as CSIGnDLS[3:0] above.
Indicate reserved bits by using a dash (—).

(6) Value after a reset (in binary notation)

This is the bit values after a reset.

0 : The value after a reset is 0.
1 : The value after a reset is 1.
— : The value after a reset is undefined.

(7) R/W

This is the bit attribute of all bits of the register.

R/W : The bit or field is readable and writable.
R : The bit or field is readable.
Note that all reserved bits are indicated as R. When written, the value specified in the bit chart or the value after a reset should be written.
In case of writing to writable registers that also include non-reserved bits with the R-attribute, writing to the R-attribute bits will be ignored unless otherwise specified.
W : This bit or field is writable. When read, the value is undefined. If a value is indicated in the bit chart, the value is returned.

(8) Function

This is function of the bit.

Section 47A Electrical Characteristics of RH850/F1KH-D8..4240

Section 1A Overview of RH850/F1KH-D8

1A.1 RH850/F1KH Product Features

The features of the RH850/F1KH are described below.

The RH850/F1KH is a 32-bit single-chip microcontroller with two G3KH CPU core. The key features of the F1KH are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode in which the power supply to the most circuits of the microcontroller can be turned off.

Applications

The RH850/F1KH is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

Section 1B Overview of RH850/F1KM-S4

1B.1 RH850/F1KM Product Features

The features of the RH850/F1KM are described below.

The RH850/F1KM is a 32-bit single-chip microcontroller with a G3KH CPU core. The key features of the F1KM are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode in which the power supply to the most circuits of the microcontroller can be turned off.

Applications

The RH850/F1KM is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

Section 1C Overview of RH850/F1KM-S1

1C.1 RH850/F1KM Product Features

The features of the RH850/F1KM are described below.

The RH850/F1KM is a 32-bit single-chip microcontroller with a G3KH CPU core. The key features of the F1KM are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode, in which the power supply to the most circuits of the microcontroller can be turned off.

Applications

The RH850/F1KM is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

1C.2 RH850/F1KM Functions

Table 1C.1 Overview of Product

Product Name			RH850/F1KM-S1			
			48 Pins	64 Pins	80 Pins	100 Pins
Memory			See **Table 1C.2, Product Lineup**.			
External Memory Access Controller (MEMC)			Not provided			
CPU	CPU System		G3KH			
	CPU frequency		120 MHz max			
	FPU		Single-Precision			
	Protection Function	Memory Protection Unit (MPU)	Provided			
		Internal Peripheral Guard (IPG)	Provided			
		Processor Element Guard (PEG)	Provided			
DMA			16 channels			
Operating clock	Main Oscillator (MainOSC)		8/16/20/24 MHz			
	Low Speed Internal Oscillator (LS IntOSC)		240 kHz(typ.)			
	High Speed Internal Oscillator (HS IntOSC)		8 MHz(typ.)			
	PLL	PLL0 (for CPU, with SSCG)	Not provided			
		PLL1 (for CPU/Peripheral)	Provided			
	Sub Oscillator (SubOSC)		Not provided			
I/O port			33	49	65	81
A/D converter	ADCA0	Physical input channels	Total 12 ch	Total 21 ch	Total 25 ch	Total 36 ch
			(12 bit resolution: 8 ch + 10 bit resolution: 4 ch)	(12 bit resolution: 10 ch + 10 bit resolution: 11 ch)	(12 bit resolution: 11 ch + 10 bit resolution: 14 ch)	(12 bit resolution: 16 ch + 10 bit resolution: 20 ch)
		External multiplexer support for channel number extension	Provided			
		Channels with T&H	3			6
	ADCA1	Physical input channels	Not provided			
		External multiplexer support for channel number extension	Not provided			
		Channels with T&H	Not provided			
Timer	Timer Array Unit D (TAUD)		1 unit (16 bit resolution timers × 16 channels /unit)			
	Timer Array Unit B (TAUB)		Not provided		1 unit (16 bit resolution timers × 16 channels /unit)	
	Timer Array Unit J (TAUJ)		4 units (32 bit resolution timers × 4 channels /unit)			
	Operating System Timer (OSTM)		1 unit			
	Real-Time Clock (RTCA)		1 unit			
	Encoder Timer (ENCA)		1 unit			
	Window Watchdog Timer A (WDTA)		2 units			

Table 1C.1 Overview of Product

Product Name		RH850/F1KM-S1			
		48 Pins	64 Pins	80 Pins	100 Pins
Serial interfaces	Clocked Serial Interface G (CSIG)	1 channel			
	Clocked Serial Interface H (CSIH)	1 channel		3 channels	4 channels
	CAN Interface (RS-CANFD)	1 channel	3 channels		6 channels
	LIN/UART Interface (RLIN3)	1 channel	2 channels	3 channels	4 channels
	LIN Master Interface (RLIN2)	2 channels			3 channels
	I^{2}C Bus Interface (RIIC)	2 channels			
	Clock Extension Peripheral Interface (CXP1)	Not provided			
	Single Edge Nibble Transmission (RSENT)	2 channels			
External Interrupts	Maskable	8		12	13
	Non-maskable (NMI)	1			
Other functions	Clock Monitors (CLMA)	For PLL1, HS IntOSC, MainOSC			
	Data CRC (DCRA)	1 channel		4 channels	
	Low-Voltage Indicator (LVI)	Provided			
	Power-On Clear (POC)	Provided			
	Core Voltage Monitors (CVM)	Provided			
	Error Correction Coding (ECC)	For Code Flash, Data Flash, Local RAM, Retention RAM, CSIH, RS-CANFD			
	Low Power Sampler (LPS)	Provided			
	PWM Output/Diagnostic (PWM-Diag)	13 channels	24 channels		48 channels
	Motor Control	1 unit			
	Key Return (KR)	6 channels	8 channels		
	CLOCK OUTPUT (FOUT)	Provided			
	RESET OUTPUT ($\overline{\text{RESETOUT}}$)	Not Provided	Provided		
	Intelligent Cryptographic Unit E (ICUSE)	Provided			
	Secure WDT (SWDT)	Provided			
	On-Chip debug (OCD)	Provided			
	Boundary Scan	Provided			
Voltage supply	Internal supply	VPOC to 5.5 V			
	Input/output buffer supplies	VPOC to 5.5 V			
	A/D Converter supplies	3.0 V to 5.5 V			
Package		48-pin LQFP	64-pin LQFP	80-pin LQFP	100-pin LQFP

	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3	—	n = 0 to 3 m = 0 to 3			
X1, X2	✓	✓	—	✓	—	Main OSC connections	MOSC
XT1, XT2	✓	✓	—	✓	—	Sub OSC connections	SOSC

CAUTION

When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.

- **(e.g.)** When RS-CANFD channel 0 is used:

CAN0TX	P0_0	P10_1
CAN0RX	P0_1	P10_0

Use one of the following pin combinations:

- P0_0 and P0_1, or
- P10_0 and P10_1.

The combinations of P0_0 and P10_0, and P0_1 and P10_1 are not allowed.

- **(e.g.)** When CSIH4 is used:

CSIH4SC	P1_5	P23_3
CSIH4SO	P2_4	P23_1
CSIH4SI	P1_4	P23_2

Use one of the following pin combinations:

- P1_5, P2_4 and P1_4, or
- P23_3, 23_1 and P23_2.

The pin combinations of the following are not allowed:

- P1_5, P2_4 and P23_2
- P1_5, P23_1 and P1_4
- P23_3, P2_4 and P23_2
- P1_5, P23_1 and P23_2
- P23_3, P2_4 and P1_4
- P23_3, P23_1 and P1_4.

2A.3 Pin Functions During and After Reset

Table 2A.6 Pin Functions During and After Reset

Pins	During Reset	After Reset
JP0_0	High impedance	JP0_0: Input Serial programming mode: FPDR, FPDT (1 wire UART) FPDR (2 wire UART) Nexus I/F: DCUTDI input LPD (4 pins): LPDI input LPD (1 pin): LPDIO input/output
JP0_1	High impedance	JP0_1: Input Serial programming mode: FPDT Nexus I/F: DCUTDO output LPD (4 pins): LPDO output LPD (1 pin): High impedance
JP0_2	High impedance	JP0_2: Input Serial programming mode: FPCK Nexus I/F: DCUTCK input LPD (4 pins): LPDCLK input LPD (1 pin): High impedance
JP0_3	High impedance	JP0_3: Input Serial programming mode: High impedance Nexus I/F: DCUTMS input LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_4	Input[*3,*5]	JP0_4: Input Serial programming mode: High impedance Nexus I/F: $\overline{\text{DCUTRST}}$ input[*1] LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_5	High impedance	JP0_5: Input Serial programming mode: High impedance Nexus I/F: $\overline{\text{DCURDY}}$ output LPD (4 pins): LPDCLKOUT output LPD (1 pin): High impedance
JP0_6	High impedance	JP0_6: Input Serial programming mode: High impedance Nexus I/F: $\overline{\text{EVTO}}$ output LPD (4 pins): High impedance LPD (1 pin): High impedance
P8_6	Output[*2,*4]	Output (OPBT0.RESETOUTEN = 1)[*2] High impedance (OPBT0.RESETOUTEN = 0)[*2,*4]
P0 to P3, P8 to P13, P18 to P24 (except P8_6, P10_1, P10_2, P10_6 and P10_8)	High impedance	High impedance
P10_1	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE0 input (FLMD0 = 1, FLMD1 = 1)
P10_2	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE1 input (FLMD0 = 1, FLMD1 = 1)

Table 2A.6 Pin Functions During and After Reset

Pins	During Reset	After Reset
P10_6	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 1) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 0) MODE2 input (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 1)
P10_8	High impedance	High impedance (FLMD0 = 0) FLMD1 input (FLMD0 = 1)
FLMD0	Input	Input
$\overline{\text{RESET}}$	Input	Input
AP0, AP1	High impedance	High impedance

Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low level.

Note 2. $\overline{\text{RESETOUT}}$ is output. For details, see **Section 2A.11, Port (Special I/O) Function Overview**.

Note 3. When the power is turned on or when $\overline{\text{RESET}}$ is low level, JP0_4 pin should be driven low level.

Note 4. If OPBT0.RESETOUTEN = 0, P8_6 pin status has a possibility to become unstable (less than 15 μs) at the transition moment to reset status by internal reset factors.

Note 5. When $\overline{\text{RESET}}$ is low level, on-chip pull-down resistor is connected to JP0_4.

2A.4 Port State in Standby Mode

For the port state in standby mode, see **Section 14.1.4, I/O Buffer Control**.

2A.5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.

Table 2A.7 Recommended Connection of Unused Pins

Pin	Recommended Connection of Unused Pins
A0VREF, A1VREF	Connected to EVCC or BVCC
A0VSS, A1VSS	Connected to EVSS or BVSS
$\overline{\text{RESET}}$	Connected to EVCC or BVCC via a resistor
XT1	Connected to REGnVCC or AWOVSS via a resistor*2 (bit 0 of IPIBC0 = 1) Connected to AWOVSS (bit 0 of IPIBC0 = 0)
X1	Connected to AWOVSS via a resistor
X2	Open
IP0_0	Connected to REGnVCC or AWOVSS via a resistor*2 (bit 0 of IPIBC0 = 1) Open (bit 0 of IPIBC0 = 0)
JP0 (excluding JP0_4) P0 P1 P2 P3 P8 (excluding P8_6) P9 P20 P23	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
P8_6	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
JP0_4	Connected to EVSS via a resistor
P10_1, P10_2, P10_6, P10_8	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open

Table 2A.7 Recommended Connection of Unused Pins

Pin	Recommended Connection of Unused Pins
P10 (excluding P10_1, P10_2, P10_6, P10_8) P11 P12 P13 P18 P19 P21 P22 P24	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to BVCC or BVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
AP0	Input: Open (when the PIBCn_m bit is 0) Connected to A0VREF or A0VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
AP1	Input: Open (when the PIBCn_m bit is 0) Connected to A1VREF or A1VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
Nexus/LPD I/F (JP0)	DCUTDI/LPDI/LPDIO (JP0_0): Connected to EVCC via a resistor DCUTDO/LPDO (JP0_1): Open DCUTCK/LPDCLK (JP0_2): Open DCUTMS (JP0_3): Connected to EVCC via a resistor $\overline{\text{DCUTRST}}$ (JP0_4): Connected to EVSS via a resistor*[1] $\overline{\text{DCURDY}}$ /LPDCLKOUT (JP0_5): Open $\overline{\text{EVTO}}$ (JP0_6): Open

Note 1. For in case when a debugging interface is used, this pin should be connected to EVCC through resistor depending on the development tool made by a third party.

Note 2. XT1 = IP0_0 (XT2) = REGnVCC or AWOVSS should be set.
XT1 is connected to IP0_0 (XT2) through an internal resistor. Therefore, it is necessary to maintain equal voltage level in order not to make a current path.

2A.6 Features of RH850/F1KH Port

2A.6.1 Port Group

The RH850/F1KH provides the following port groups, indicated by the numbers in the table below.

Table 2A.8 Port Groups in RH850/F1KH-D8

No. of Pins	Port Group	RH850/F1KH-D8
176 pins	Number	14
	Name	P0 to P2, P8 to P12, P18, P20, JP0, AP0,AP1, IP0
233 pins	Number	17
	Name	P0 to P3, P8 to P13, P18 to P20, JP0, AP0, AP1, IP0
324 pins	Number	21
	Name	P0 to P3, P8 to P13, P18 to P24, JP0, AP0, AP1, IP0

2A.6.2 Port Group Index n

Throughout this section, the port groups are identified by using the index “n”. For example, the port mode control register of the Pn pin is PMCn (n = 0 to 3, 8 to 13, 18 to 24).

2A.6.3 Register Base Addresses

Port and JTAG port base addresses are listed in the following table.

Port and JTAG port register addresses are given as offsets from the base addresses.

Table 2A.9 Register Base Addresses

Base Address Name	Base Address
<PORTn_base>	FFC1 0000_H
<JPORT0_base>	FFC2 0000_H

2A.6.4 Clock Supply

The clock supply to ports is shown in the following table.

Table 2A.10 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Port	Register access clock	CPUCLK_UL

2A.7 Port Functions

The microcontroller has various pins for input/output functions, known as ports. The ports are organized in port groups.

The RH850/F1KH also has several control registers to enable pins to be used as other than general-purpose input/output pins.

For a description of the terms pin, port, and port group, see **Section 2A.7.2, Terms**.

2A.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16.
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.
  Table 2A.39, JTAG Port 0 (JP0), **Table 2A.41, Port 0 (P0)**, **Table 2A.43, Port 1 (P1)**, **Table 2A.45, Port 2 (P2)**, **Table 2A.47, Port 3 (P3)**, **Table 2A.49, Port 8 (P8)**, **Table 2A.51, Port 9 (P9)**, **Table 2A.53, Port 10 (P10)**, **Table 2A.55, Port 11 (P11)**, **Table 2A.57, Port 12 (P12)**, **Table 2A.59, Port 13 (P13)**, **Table 2A.61, Port 18 (P18)**, **Table 2A.63, Port 19 (P19)**, **Table 2A.65, Port 20 (P20)**, **Table 2A.67, Port 21 (P21)**, **Table 2A.69, Port 22 (P22)**, **Table 2A.71, Port 23 (P23)**, **Table 2A.73, Port 24 (P24)**, **Table 2A.75, Analog Port 0 (AP0)**, **Table 2A.77, Analog Port 1 (AP1)**, **Table 2A.79, Input Port 0 (IP0)**, and **Section 2A.9.2, Pin Function Configuration**.

CAUTION

Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.

[Example]

INTP0 is assigned to the following pins on this device. However, the INTP0 function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

- JP0_0 (1st input alternative function)
- P0_1 (2nd, 3rd input alternative function)
- P10_0 (2nd input alternative function)

In the above case, when the 1st input alternative function (INTP0) of JP0_0 is selected, using the 2nd input alternative function (CAN0RX/INTP0) of P0_1 only for the CAN signal is also prohibited.

2A.7.2 Terms

The following terms are used in this section:

Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.

A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

Port mode and ports

A pin in port mode works as a general-purpose input/output pin. It is then called “port”.

The corresponding name is Pn_m. For example, P0_7 denotes port 7 of port group 0. It is referenced as “port P0_7”.

Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0_0 and INTP0. The different names indicate the function of the pin at that time.

2A.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging.

JTAG port group registers and bit names are prefixed by a “J”. For example, JP0 denotes JTAG port group 0, and JPM0.JPM0_m denotes the JPM0_m port mode bit of the JPM0 port mode register.

NOTE

In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

2A.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode (PMCn.PMCn_m bit = 0)
  A pin in port mode operates as a general-purpose input/output pin. The I/O mode is selected by setting the PMn.PMn_m bit.
- Software I/O control alternative mode (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 0)
  In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn_m bit.
- Direct I/O control alternative mode (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 1)
  In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.

An overview of the register settings is given in the tables below.

Table 2A.11 Pin Function Configuration (Overview)

	Bit			
Mode	PMCn_m	PMn_m	PIPCn_m	I/O
Port mode	0	0	X	O
		1*1		I
Software I/O control alternative mode	1	0	0	O
		1	0	I
Direct I/O control alternative mode		X	1	Controlled by the alternative function

Note 1. The input buffer must be enabled (PIBCn_m bit = 1).

- Software I/O control alternative mode (PIPCn.PIPCn_m bit = 0)
  - Output (PMn_m bit = 0): Alternative output mode 1 to Alternative output mode 7
  - Input (PMn_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPCn.PIPCn_m bit = 1)
  - The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

Table 2A.12 Alternative Mode Selection Overview (PMCn.PMCn_m Bit = 1)

Mode	Register					I/O
	PIPC*1	PM*1	PFCAE	PFCE	PFC	
Alternative output mode 1 (ALT-OUT1)	0	0	0	0	0	O
Alternative input mode 1 (ALT-IN1)		1				I
Alternative output mode 2 (ALT-OUT2)		0			1	O
Alternative input mode 2 (ALT-IN2)		1				I
Alternative output mode 3 (ALT-OUT3)		0		1	0	O
Alternative input mode 3 (ALT-IN3)		1				I
Alternative output mode 4 (ALT-OUT4)		0			1	O
Alternative input mode 4 (ALT-IN4)		1				I
Alternative output mode 5 (ALT-OUT5)		0	1	0	0	O
Alternative input mode 5 (ALT-IN5)		1				I
Alternative output mode 6 (ALT-OUT6)		0			1	O
Alternative input mode 6 (ALT-IN6)		1				I
Alternative output mode 7 (ALT-OUT7)		0		1	0	O
Alternative input mode 7 (ALT-IN7)		1				I
Other than the above	Setting prohibited					

Note 1. If PIPCn.PIPCn_m = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

If a pin is in alternative mode (PMCn.PMCn_m bit = 1), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

2A.7.4 Pin Data Input/Output

The registers used for data input/output are described below.

The location that is read via the PPRn register differs depending on the pin mode.

2A.7.4.1 Output Data

In the port mode (PMCn.PMCn_m = 0), the value of the Pn.Pn_m is output from the Pn_m pin.

2A.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn_m pin, the value of the Pn.Pn_m, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits.

The different PPRn read modes are shown in the table below.

Table 2A.13 PPRn_m Read Values

PMC n_m	PM n_m	PIBC n_m	PIPC n_m	PODC n_m	Mode	PPRn_m Read Value
0	1	0	X	X	Port input, input buffer disabled	Pn.Pn_m bit
		1		X	Port input, input buffer enabled	Pn_m pin
	0	X		0	Port push-pull output	Pn.Pn_m bit^{*1}
				1	Port open-drain output	
1	1	X	0	X	Software I/O control alternative input	Pn_m pin
	0			0	Software I/O control alternative push-pull output	Output signal from the alternative function^{*1}
				1	Software I/O control alternative open-drain output	
	X		1	0	Direct I/O control alternative input or push-pull output	I/O port in alternative mode: ● Input: Pn_m pin ● Output: Output signal from the alternative function^{*1}
				1	Direct I/O control alternative input or open-drain output	

Note 1. When PBDCn_m = 1, the level of the Pn_m pin is returned by the PPRn_m bit.

The control registers in the above table have the following effects:

- PMCn.PMCn_m bit
  This bit selects port mode (PMCn_m = 0) or alternative mode (PMCn_m = 1).
- PMn.PMn_m bit
  This bit selects input (PMn_m = 1) or output (PMn_m = 0) when the port mode (PMCn_m = 0) and software I/O control alternative mode (PMCn_m = 1, PIPCn_m = 0) have been selected.
- PIBCn.PIBCn_m bit
  This bit disables (PIBCn_m = 0) or enables (PIBCn_m = 1) the input buffer in input port mode (PMCn_m = 0 and PMn_m = 1). If the input buffer is disabled, PPRn_m reads the Pn.Pn_m bit; otherwise the Pn_m pin level is returned.
- PIPCn.PIPCn_m bit
  This bit selects software I/O control alternative mode or direct I/O control alternative mode.
- PODCn.PODCn_m bit
  This bit selects push-pull output (PODCn_m = 0) or open-drain output (PODCn_m = 1).

- PBDCn.PBDCn_m bit
  In output mode, when this bit is set to 1, the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

CAUTION

When using Pn_m as an alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m = 0), the level of the Pn_m pin can be read at the PPRn.PPRn_m bit by enabling bidirectional mode (PBDCn.PBDCn_m = 1).
Note, however, that the level of the Pn_m pin will be input to the alternative function that the Pn_m pin is being used as.

2A.7.4.3 Writing to the Pn Register

The data to be output via port Pn_m in port mode (PMCn.PMCn_m bit = 0) is held in port register Pn.

Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.
  In this case, new data can be written directly to the Pn register.
- By performing an indirect bitwise operation (a “set”, “reset”, or “not” operation) on the Pn register.
  An indirect bitwise operation (“set”, “reset”, or “not”) can be performed on the Pn register by using the following two registers:
  - Port Set/Reset register PSRn
    If the PSRn.PSRn (m + 16) bit = 1, the value of the Pn.Pn_m bit is determined by the value of the PSRn.PSRn_m bit.
    In other words, the Pn_m bit can be set or reset without writing directly to the Pn register.
  - Port NOT register PNOTn
    By setting PNOTn.PNOTn_m to 1, the Pn.Pn_m bit can be inverted without writing directly to the Pn register.

An indirect bitwise operation on the Pn register (“set”, “reset”, or “not”) has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

2A.8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.

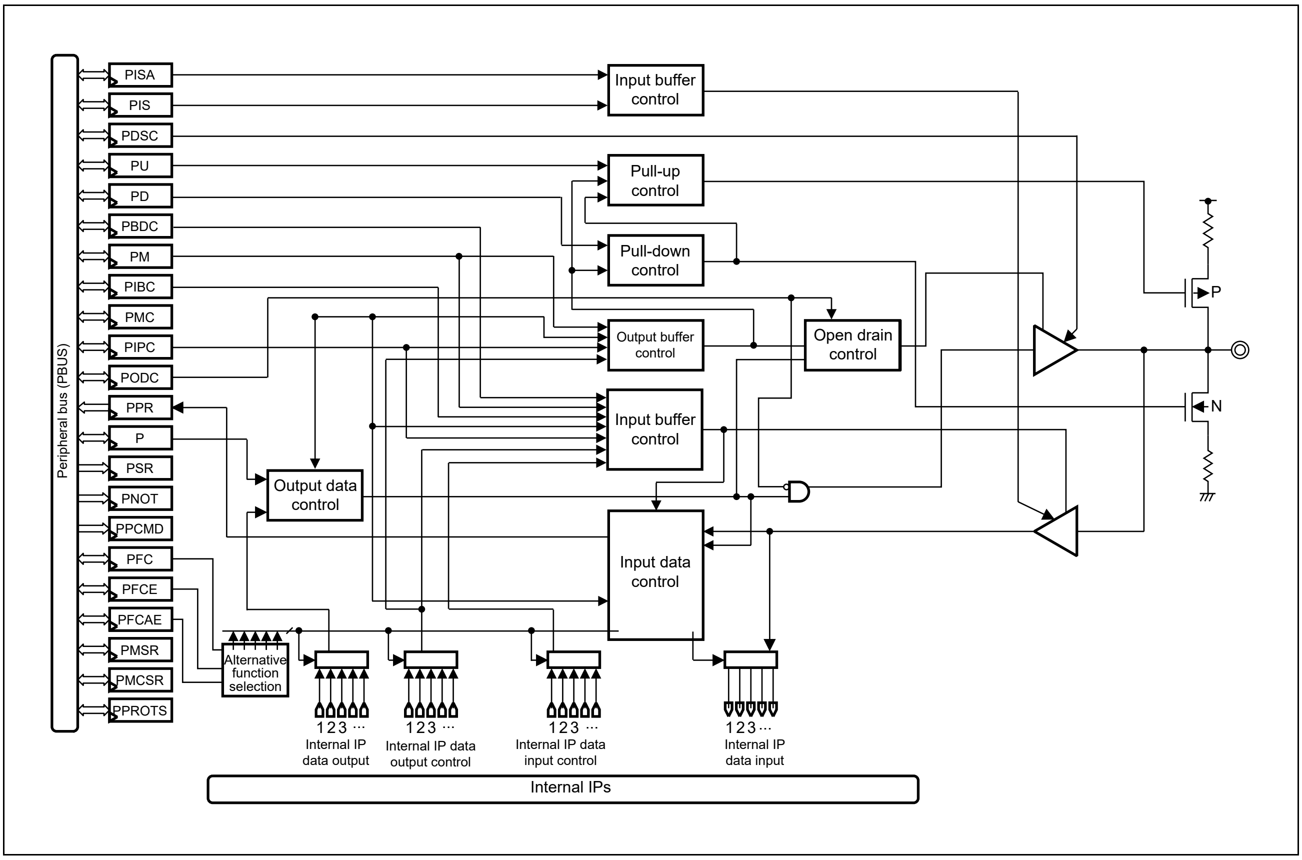

Figure 2A.5 Schematic View of Port Control

CAUTION

Use documented alternative functions only. The behavior and performance are not guaranteed when undocumented alternative functions are selected.

2A.9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

- **Section 2A.9.2, Pin Function Configuration**
- **Section 2A.9.3, Pin Data Input/Output**
- **Section 2A.9.4, Configuration of Electrical Characteristics**

2A.9.1 Overview

The following registers are used for setting the individual pins of the port groups.

For details on <PORTn_base> and <JPORT0_base>, see **Section 2A.6.3, Register Base Addresses**.

Table 2A.14 Port Group Configuration Registers

Module Name	Register Name	Symbol	Address
Pin function configuration			
PORT	Port mode control register	PMCn	<PORTn_base> + 0400_{H} + n × 4
JTAG		JPMC0	<JPORT0_base> + 0040_{H}
PORT	Port mode control set/reset register	PMCSRn	<PORTn_base> + 0900_{H} + n × 4
JTAG		JPMCSR0	<JPORT0_base> + 0090_{H}
PORT	Port IP control register	PIPCn	<PORTn_base> + 4200_{H} + n × 4
PORT	Port mode register	PMn	<PORTn_base> + 0300_{H} + n × 4
		APMn	<PORTn_base> + $03C8_{H}$ + n × 4

JTAG		JPPROTS0	<JPORT0_base> + 04B0$_H$

Index n

In **Table 2A.14, Port Group Configuration Registers**, the index “n” in register symbols denotes the actual indices of the individual port groups. For example, PMCn generically indicates a port mode control register for port group n (Pn). The values for n differ according to the number of pins on the device in the way shown in **Table 2A.15, Number of Pins on the Device, Name of Port Groups, and Values for “n” in Register Symbols**.

Table 2A.15 Number of Pins on the Device, Name of Port Groups, and Values for “n” in Register Symbols

Number of Pins on the Device	Port Groups	Values for “n”
176 pins	P0, P1, P2, P8, P9, P10, P11, P12, P18, P20	0,1,2,8,9,10,11,12,18,20
	AP0, AP1	0, 1
233 pins	P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20	0,1,2,3,8,9,10,11,12,13,18,19,20
	AP0, AP1	0, 1
324 pins	P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, P23, P24	0,1,2,3,8,9,10,11,12,13,18,19,20,21, 22,23,24
	AP0, AP1	0, 1

JTAG port registers

JTAG port registers are not explicitly described in the following register descriptions.

All descriptions (except for those of the PFCAEn register and PIPCn register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

Value after reset

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

2A.9.2 Pin Function Configuration

2A.9.2.1 PMCn / JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Access: PMCn: This register can be read or written in 16-bit units.
JPMC0: This register can be read or written in 8-bit units.

Address: PMCn: <PORTn_base> + 0400_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 20, 21, 22, 23, 24)
JPMC0: <JPORT0_base> + 0040_H[*1]

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMC n_15	PMC n_14	PMC n_13	PMC n_12	PMC n_11	PMC n_10	PMC n_9	PMC n_8	PMC n_7	PMC n_6	PMC n_5	PMC n_4	PMC n_3	PMC n_2	PMC n_1	PMC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, and **Table 2A.74, Control Registers (P24)**.

Table 2A.16 PMCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMCn_[15:0]	Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode

CAUTIONS

1. I/O is not controlled by only setting alternative mode (PMCn.PMCn_m bit = 1). If the alternative function requires direct I/O control, also set the PIPCn.PIPCn_m bit to 1.
2. If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLA0CTLm_<*name*>, DNFA<*name*>CTL and the DNFA<*name*>EN register. For details, see **Section 2A.12, Noise Filter & Edge/Level Detector**, and **Section 2A.13, Description of Port Noise Filter & Edge/Level Detection**.

NOTE

The control bits of the JTAG port mode control register (JPMC0) are JPMC0_[7:0].

2A.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.

The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

Access: PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of register PMCn.

JPMCSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000_H. Reading bits 7 to 0 returns the value of register JPMC0.

Address: PMCSRn: <PORTn_base> + 0900_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 20, 21, 22, 23, 24)

JPMCSR0: <JPORT0_base> + 0090_H*1

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMCSRn_31	PMCSRn_30	PMCSRn_29	PMCSRn_28	PMCSRn_27	PMCSRn_26	PMCSRn_25	PMCSRn_24	PMCSRn_23	PMCSRn_22	PMCSRn_21	PMCSRn_20	PMCSRn_19	PMCSRn_18	PMCSRn_17	PMCSRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCSRn_15	PMCSRn_14	PMCSRn_13	PMCSRn_12	PMCSRn_11	PMCSRn_10	PMCSRn_9	PMCSRn_8	PMCSRn_7	PMCSRn_6	PMCSRn_5	PMCSRn_4	PMCSRn_3	PMCSRn_2	PMCSRn_1	PMCSRn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, and **Table 2A.74, Control Registers (P24)**.

Table 2A.17 PMCSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMCSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMCSRn_m (PMCSRn_[15:0]) is written to PMCn_m. 0: PMCn_m is not affected by PMCSRn_m. 1: PMCn_m is PMCSRn_m. Example: If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15.
15 to 0	PMCSRn_[15:0]	Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1. 0: PMCn_m is 0. 1: PMCn_m is 1.

NOTE

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0_[31:0].

2A.9.2.3 PIPCn — Port IP Control Register

This register specifies whether the I/O direction of the Pn_m pin is controlled by the port mode register PMn.PMn_m or by an alternative function.

If the Pn_m pin is operated in alternative mode (PMCn.PMCn_m = 1) and the alternative function requires direct control of the I/O direction, then PIPCn.PIPCn_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn_m setting.

Regarding the alternative functions for which the PIPC register must be set, see **Section 2A.11, Port (Special I/O) Function Overview**.

Access: This register can be read or written in 16-bit units.

Address: PIPCn: <PORTn_base> + 4200_H + n × 4 (n = 0, 1, 2, 10, 11, 12, 20, 21, 22, 23)*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPC n_15	PIPC n_14	PIPC n_13	PIPC n_12	PIPC n_11	PIPC n_10	PIPC n_9	PIPC n_8	PIPC n_7	PIPC n_6	PIPC n_5	PIPC n_4	PIPC n_3	PIPC n_2	PIPC n_1	PIPC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, and **Table 2A.72, Control Registers (P23)**.

Table 2A.18 PIPCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIPCn_[15:0]	Specifies the I/O mode. 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control).

2A.9.2.4 PMn / APMn / JPM0 — Port Mode Register

This register specifies whether the individual pins of the port group n are in input mode or in output mode.

Access: PMn, APMn: These registers can be read or written in 16-bit units.

JPM0: This register can be read or written in 8-bit units.

Address: PMn: <PORTn_base> + 0300$_H$ + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APMn: <PORTn_base> + 03C8$_H$ + n × 4 (n = 0, 1)

JPM0: <JPORT0_base> + 0030$_H$*1

Value after reset: FFFF$_H$*2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn_15	PMn_14	PMn_13	PMn_12	PMn_11	PMn_10	PMn_9	PMn_8	PMn_7	PMn_6	PMn_5	PMn_4	PMn_3	PMn_2	PMn_1	PMn_0
Value after reset	1	1	1	1	1	1	1	1	1	1*3	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, **Table 2A.74, Control Registers (P24)**, **Table 2A.76, Control Registers (AP0)**, and **Table 2A.78, Control Registers (AP1)**.

Note 2. The PM8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8 register is FFBF$_H$.
When the OPBT0.RESETOUTEN = 0, the PM8 register is FFFF$_H$.

Note 3. The PM8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8_6 bit is 0.
When the OPBT0.RESETOUTEN = 0, the PM8_6 bit is 1.

Table 2A.19 PMn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMn_[15:0]	Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled)

NOTES

1. To use a port in input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), the input buffer must be enabled (PIBCn.PIBCn_m = 1).
2. By default, PMn.PMn_m specifies the I/O direction in port mode (PMCn.PMCn_m = 0) and alternative mode (PMCn.PMCn_m=1), since PIPCn.PIPCn_m = 0 after reset.
3. The control bits of the analog port register (APMn) are APMn_[15:0].
4. The control bits of the JTAG port mode register (JPM0) are JPM0_[7:0].

2A.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.

The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn_m is set by the corresponding bit in the lower 16 bits of PMSRn.

Access:	PMSRn, APMSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of registers PMn and APMn. JPMSR0: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000_H. Bits 15 to 8 are read as FF_H. Reading bits 7 to 0 returns the value of register JPM0.
Address:	PMSRn: <PORTn_base> + 0800_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24) APMSRn: <PORTn_base> + $08C8_H$ + n × 4 (n = 0, 1) JPMSR0: <JPORT0_base> + 0080_H[*1]
Value after reset:	0000 $FFFF_H$[*2]

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	1	1	1	1	1	1	1	1	1	1[*3]	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, **Table 2A.74, Control Registers (P24)**, **Table 2A.76, Control Registers (AP0)**, and **Table 2A.78, Control Registers (AP1)**.

Note 2. The PMSR8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8 register is 0000 $FFBF_H$.
When the OPBT0.RESETOUTEN = 0, the PMSR8 register is 0000 $FFFF_H$.

Note 3. The PMSR8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8_6 bit is 0.
When the OPBT0.RESETOUTEN = 0, the PMSR8_6 bit is 1.

Table 2A.20 PMSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to PMn_m. 0: PMn_m is not affected by PMSRn_m. 1: PMn_m is PMSRn_m. **Example:** If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15.
15 to 0	PMSRn_[15:0]	Data bits that specify the value of PMn_m if PMSRn_m of the corresponding upper bit (PMSRn_[31:16]) is 1. 0: PMn_m is 0. 1: PMn_m is 1.

NOTES

1. The control bits of the JTAG port mode set/reset register (JPMSR0) are JPMSR0_[31:0].
2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn_[31:0].

2A.9.2.6 PIBCn / APIBCn / JPIBC0 / IPIBC0 — Port Input Buffer Control Register

In input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), this register enables the port pin's input buffer.

Access: PIBCn, APIBCn, IPIBC0: These registers can be read or written in 16-bit units.

JPIBC0: This register can be read or written in 8-bit units.

Address: PIBCn: <PORTn_base> + 4000_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APIBCn: <PORTn_base> + $40C8_H$+ n × 4 (n = 0, 1)

JPIBC0: <JPORT0_base> + 0400_H

IPIBC0: <PORTn_base> + $40F0_H{}^{*1}$

Value after reset: 0000_H

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, **Table 2A.74, Control Registers (P24)**, **Table 2A.76, Control Registers (AP0)**, **Table 2A.78, Control Registers (AP1)**, and **Table 2A.80, Control Registers (IP0)**.

Table 2A.21 PIBCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enables/disables the input buffer. 0: Input buffer disabled 1: Input buffer enabled

NOTES

1. When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.
2. The control bits of the JTAG port input buffer control register (JPIBC0) are JPIBC0_[7:0].

CAUTION

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn_m = 1).

2A.9.2.7 PFCn / JPFC0 — Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCn: This register can be read or written in 16-bit units.
JPFC0: This register can be read or written in 8-bit units.

Address: PFCn: <PORTn_base> + 0500_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 20, 24)
JPFC0: <JPORT0_base> + 0050_H*[1]

Value after reset: 0000_H

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.66, Control Registers (P20)**, and **Table 2A.74, Control Registers (P24).**

Table 2A.22 PFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2A.25, Setting Alternative Functions**.

NOTE

The control bits of the JTAG port function control register (JPFC0) are JPFC0_[7:0].

2A.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access:	PFCEn: This register can be read or written in 16-bit units. JPFCE0: This register can be read or written in 8-bit units.
Address:	PFCEn: <PORTn_base> + 0600_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20) JPFCE0: <JPORT0_base> + 0060_H*1
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCEn_15	PFCEn_14	PFCEn_13	PFCEn_12	PFCEn_11	PFCEn_10	PFCEn_9	PFCEn_8	PFCEn_7	PFCEn_6	PFCEn_5	PFCEn_4	PFCEn_3	PFCEn_2	PFCEn_1	PFCEn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.62, Control Registers (P18)**, and **Table 2A.66, Control Registers (P20)**.

Table 2A.23 PFCEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCEn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2A.25, Setting Alternative Functions**.

2A.9.2.9 PFCAEn — Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCAEn: This register can be read or written in 16-bit units.

Address: PFCAEn: <PORTn_base> + $0A00_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 20)*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCAE n_15	PFCAE n_14	PFCAE n_13	PFCAE n_12	PFCAE n_11	PFCAE n_10	PFCAE n_9	PFCAE n_8	PFCAE n_7	PFCAE n_6	PFCAE n_5	PFCAE n_4	PFCAE n_3	PFCAE n_2	PFCAE n_1	PFCAE n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, and **Table 2A.66, Control Registers (P20)**.

Table 2A.24 PFCAEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCAEn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2A.25, Setting Alternative Functions**.

Table 2A.25 Setting Alternative Functions

PFCAEn_m	PFCEn_m	PFCn_m	PMn_m	Function
0	0	0	1	Alternative input mode 1
			0	Alternative output mode 1
		1	1	Alternative input mode 2
			0	Alternative output mode 2
	1	0	1	Alternative input mode 3
			0	Alternative output mode 3
		1	1	Alternative input mode 4
			0	Alternative output mode 4
1	0	0	1	Alternative input mode 5
			0	Alternative output mode 5
		1	1	Alternative input mode 6
			0	Alternative output mode 6
	1	0	1	Alternative input mode 7
			0	Alternative output mode 7
		1	X	Setting prohibited

CAUTION

- After selecting the alternative function by the PFCn_m, PFCEn_m, or PFCAEn_m bit, set the PMCn_m bit to “1”.
- With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited. For example, if the a/b/c pin is used as b, the b/d/e pin cannot be used as b. In this case, the b/d/e pin must be configured as a pin function other than b.

NOTE

For more details on the assignment of each function, see **Section 2A.10.1.2, Control Registers** to **Section 2A.10.15.2, Control Registers**.

2A.9.3 Pin Data Input/Output

2A.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

Access:	PBDCn, APBDCn: These registers can be read or written in 16-bit units. JPBDC0: This register can be read or written in 8-bit units.
Address:	PBDCn: <PORTn_base> + 4100_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24) APBDCn: <PORTn_base> + $41C8_H$ + n × 4 (n = 0, 1) JPBDC0: <JPORT0_base> + 0410_H^{*1}
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDCn_15	PBDCn_14	PBDCn_13	PBDCn_12	PBDCn_11	PBDCn_10	PBDCn_9	PBDCn_8	PBDCn_7	PBDCn_6	PBDCn_5	PBDCn_4	PBDCn_3	PBDCn_2	PBDCn_1	PBDCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, **Table 2A.74, Control Registers (P24)**, **Table 2A.76, Control Registers (AP0)**, and **Table 2A.78, Control Registers (AP1)**.

Table 2A.26 PBDCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin. 0: Bidirectional mode disabled 1: Bidirectional mode enabled

CAUTION

- When the Pn_m port is used for the alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m = 0), the level of the Pn_m pin can be read from PPRn.PPRn_m by enabling the bidirectional mode (PBDCn.PBDCn_m = 1).
- However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn_m, PFCEn.PFCEn_m, and PFCAEn.PFCAEn_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

NOTE

The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0_[7:0].

2A.9.3.2 PPRn / APPRn / JPPR0 / IPPR0 — Port Pin Read Register

This register reflects the actual level of the Pn_m pin, whether it is the value of the Pn.Pn_m bit or the level of an alternative output function.

Access: PPRn, APPRn, IPPR0: These registers are read-only registers that can be read in 16-bit units.

JPPR0: This register is a read-only register that can be read in 8-bit units.

Address: PPRn: <PORTn_base> + 0200$_H$ + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APPRn: <PORTn_base> + 02C8$_H$ + n × 4 (n = 0, 1)

JPPR0: <JPORT0_base> + 0020$_H$

IPPR0: <PORTn_base> + 02F0$_H$*1

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, **Table 2A.74, Control Registers (P24)**, **Table 2A.76, Control Registers (AP0)**, **Table 2A.78, Control Registers (AP1)**, and **Table 2A.80, Control Registers (IP0)**.

Table 2A.27 PPRn Register Contents

Bit Position	Bit Name	Function
15 to 0	PPRn_[15:0]	The Pn_m Pin, Pn.Pn_m value or alternative function output.

NOTES

1. For the read values of the PPRn register, see **Section 2A.7.4, Pin Data Input/Output**.
2. The control bits of the JTAG port pin read register (JPPR0) are JPPR0_[7:0].

2A.9.3.3 Pn / APn / JP0 — Port Register

This register holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 0).

Access: Pn, APn: These registers can be read or written in 16-bit units.

JP0: This register can be read or written in 8-bit units.

Address: Pn: <PORTn_base> + 0000_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APn: <PORTn_base> + $00C8_H$ + n × 4 (n = 0, 1)

JP0: <JPORT0_base> + 0000_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn_15	Pn_14	Pn_13	Pn_12	Pn_11	Pn_10	Pn_9	Pn_8	Pn_7	Pn_6	Pn_5	Pn_4	Pn_3	Pn_2	Pn_1	Pn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, **Table 2A.74, Control Registers (P24)**, **Table 2A.76, Control Registers (AP0)**, and **Table 2A.78, Control Registers (AP1)**.

Table 2A.28 Pn Register Contents

Bit Position	Bit Name	Function
15 to 0	Pn_[15:0]	Sets the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

NOTE

The control bits of the JTAG port register (JP0) are JP0_[7:0].

2A.9.3.4 PNOTn / APNOTn / JPNOT0 — Port NOT Register

This register allows the Pn_m bit of the port register Pn to be inverted without directly writing to Pn.

Access: PNOTn, APNOTn: These registers are write-only registers that can be written in 16-bit units. When read, 0000_H is returned.

JPNOT0: This register is a write-only register that can be written in 8-bit units. When read, 00_H is returned.

Address: PNOTn: <PORTn_base> + 0700_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APNOTn: <PORTn_base> + $07C8_H$ + n × 4 (n = 0, 1)

JPNOT0: <JPORT0_base> + 0070_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOTn_15	PNOTn_14	PNOTn_13	PNOTn_12	PNOTn_11	PNOTn_10	PNOTn_9	PNOTn_8	PNOTn_7	PNOTn_6	PNOTn_5	PNOTn_4	PNOTn_3	PNOTn_2	PNOTn_1	PNOTn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, **Table 2A.74, Control Registers (P24)**, **Table 2A.76, Control Registers (AP0)**, and **Table 2A.78, Control Registers (AP1).**

Table 2A.29 PNOTn Register Contents

Bit Position	Bit Name	Function
15 to 0	PNOTn_[15:0]	Specifies if Pn.Pn_m is inverted. 0: Pn.Pn_m is not inverted (Pn_m → Pn_m) 1: Pn.Pn_m is inverted ($\overline{\text{Pn\_m}}$ → Pn_m)

NOTE

The control bits of the JTAG port NOT register are JPNOT0_[7:0].

2A.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.

The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn_m is set by the corresponding bit in the lower 16 bits of PSRn.

Access: PSRn, APSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of registers Pn and APn.

JPSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000_H. Reading bits 7 to 0 returns the value of register JP0.

Address: PSRn: <PORTn_base> + 0100_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

APSRn: <PORTn_base> + $01C8_H$ + n × 4 (n = 0, 1)

JPSR0: <JPORT0_base> + 0010_H*1

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, **Table 2A.74, Control Registers (P24)**, **Table 2A.76, Control Registers (AP0)**, and **Table 2A.78, Control Registers (AP1)**.

Table 2A.30 PSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PSRn_[31:16]	Specifies whether the value of the corresponding lower bit PSRn_m (PSRn_[15:0]) is written to Pn_m. 0: Pn_m is not affected by PSRn_m 1: Pn_m is PSRn_m Example: If PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15.
15 to 0	PSRn_[15:0]	Specifies the Pn_m value if the corresponding upper bit (PSRn_[31:16]) PSRn_m is 1. 0: Pn_m = 0 1: Pn_m = 1

NOTE

The control bits of the JTAG port set/reset register (JPSR0) are JPSR0_[31:0].

2A.9.4 Configuration of Electrical Characteristics

2A.9.4.1 PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

Access: PUn: This register can be read or written in 16-bit units.

JPU0: This register can be read or written in 8-bit units.

Address: PUn: <PORTn_base> + 4300_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11,12, 13, 18, 19, 20, 21, 22, 23, 24)

JPU0: <JPORT0_base> + 0430_H[*1]

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PUn_15	PUn_14	PUn_13	PUn_12	PUn_11	PUn_10	PUn_9	PUn_8	PUn_7	PUn_6	PUn_5	PUn_4	PUn_3	PUn_2	PUn_1	PUn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, and **Table 2A.74, Control Registers (P24)**.

Table 2A.31 PUn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUn_[15:0]	Specifies whether an internal pull-up resistor is connected to the corresponding pin. 0: No internal pull-up resistor connected 1: An internal pull-up resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-up option register (JPU0) are JPU0_[7:0].

2A.9.4.2 PDn / JPD0 — Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

Access:	PDn: This register can be read or written in 16-bit units.
	JPD0: This register can be read or written in 8-bit units.
Address:	PDn: <PORTn_base> + 4400$_H$ + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)
	JPD0: <JPORT0_base> + 0440$_H$^{*1}
Value after reset:	0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDn_15	PDn_14	PDn_13	PDn_12	PDn_11	PDn_10	PDn_9	PDn_8	PDn_7	PDn_6	PDn_5	PDn_4	PDn_3	PDn_2	PDn_1	PDn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, and **Table 2A.74, Control Registers (P24)**.

Table 2A.32 PDn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDn_[15:0]	Specifies whether to connect an internal pull-down resistor to the corresponding pin. 0: No internal pull-down resistor connected 1: An internal pull-down resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPD0) are JPD0_[7:0].

2A.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**. Regarding the alternative functions for which the PDSC register needs to be set, see **Section 2A.11.3.3, Output Buffer Control (PDSC)**.

Access: PDSCn, JPDSC0: These registers can be read or written in 32-bit units.

Address: PDSCn: <PORTn_base> + 4600_H + n × 4 (n = 0, 1, 2, 3, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)
JPDSC0: <JPORT0_base> + 0460_H[*1]

Value after reset: 0000 0000_H

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, and **Table 2A.74, Control Registers (P24)**.

Table 2A.33 PDSCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PDSCn_[15:0]	Specifies the port drive strength of the output buffer of the port pin. 0: Lower drive strength (when the frequency output from the pin is 10 MHz or below) 1: High drive strength (when the frequency output from the pin is 40 MHz or less).

2A.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Access:	PODCn, JPODC0: These registers can be read or written in 32-bit units.
Address:	PODCn: <PORTn_base> + 4500_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24) JPODC0: <JPORT0_base> + 0450_H*1
Value after reset:	0000 0000_H*2

Value after reset	0	0	0	0	0	0	0	0	0	0*3	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, and **Table 2A.74, Control Registers (P24)**.

Note 2. The PODC8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PODC8 register is 0000 0040_H.
When the OPBT0.RESETOUTEN = 0, the PODC8 register is 0000 0000_H.

Note 3. The PODC8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PODC8_6 bit is 1.
When the OPBT0.RESETOUTEN = 0, the PODC8_6 bit is 0.

Table 2A.34 PODCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PODCn_[15:0]	Specifies the output buffer function. 0: Push-pull 1: Open-drain

NOTE

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0_[31:0].

2A.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

Access: PISn: This register can be read or written in 16-bit units.

JPIS0: This register can be read or written in 8-bit units.

Address: PISn: <PORTn_base> + 4700_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22, 23, 24)

JPIS0: <JPORT0_base> + 0470_H^{*1}

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIS n_15	PIS n_14	PIS n_13	PIS n_12	PIS n_11	PIS n_10	PIS n_9	PIS n_8	PIS n_7	PIS n_6	PIS n_5	PIS n_4	PIS n_3	PIS n_2	PIS n_1	PIS n_0
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.44, Control Registers (P1)**, **Table 2A.46, Control Registers (P2)**, **Table 2A.48, Control Registers (P3)**, **Table 2A.50, Control Registers (P8)**, **Table 2A.52, Control Registers (P9)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.64, Control Registers (P19)**, **Table 2A.66, Control Registers (P20)**, **Table 2A.68, Control Registers (P21)**, **Table 2A.70, Control Registers (P22)**, **Table 2A.72, Control Registers (P23)**, and **Table 2A.74, Control Registers (P24)**.

Table 2A.35 PISn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISn_[15:0]	Specifies the input buffer Characteristics: 0: Type 1 (SHMT1) 1: Type 2 (SHMT4)

NOTES

1. Details of the definition of type 1 and type 2 are given in **Section 2A.11.3.2, Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)**. For details, also see **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for input buffer characteristics.
2. The control bits of the JTAG port input buffer selection register (JPIS0) are JPIS0_[7:0].

2A.9.4.6 PISAn / JPISA0 — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

Access: PISAn: This register can be read or written in 16-bit units.
JPISA0: This register can be read or written in 8-bit units.

Address: PISAn: <PORTn_base> + $4A00_H$ + n × 4 (n = 10, 11, 12, 13, 18, 21, 22)
JPISA0: <JPORT0_base> + $04A0_H$[*1]

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PISAn_15	PISAn_14	PISAn_13	PISAn_12	PISAn_11	PISAn_10	PISAn_9	PISAn_8	PISAn_7	PISAn_6	PISAn_5	PISAn_4	PISAn_3	PISAn_2	PISAn_1	PISAn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The effective bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2A.10, Port (General I/O) Function Overview**: **Table 2A.40, Control Registers (JP0)**, **Table 2A.42, Control Registers (P0)**, **Table 2A.54, Control Registers (P10)**, **Table 2A.56, Control Registers (P11)**, **Table 2A.58, Control Registers (P12)**, **Table 2A.60, Control Registers (P13)**, **Table 2A.62, Control Registers (P18)**, **Table 2A.68, Control Registers (P21)**, and **Table 2A.70, Control Registers (P22)**.

Table 2A.36 PISAn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISA_[15:0]	Specifies the input buffer characteristics: 0: Type 2 (SHMT4) 1: Type 5 (TTL)

Table 2A.37 Port Input Selection Advanced Register Contents

PISAn	PISn	Function
0	0	Type 1 input buffer is selected (SHMT1)
	1	Type 2 input buffer is selected (SHMT4)
1	X	Type 5 input buffer is selected (TTL)

NOTE

Details of the definition of type 2 and type 5 are given in **Section 2A.11.3.2, Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)**. For details, also see **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for input buffer characteristics.

2A.9.5 Port Register Protection

RH850/F1KH has Port Protection Command Register (PPCMDn) and Port Protection Status Register (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see **Section 5, Write-Protected Registers**.

2A.9.6 Flowchart Examples for Port Settings

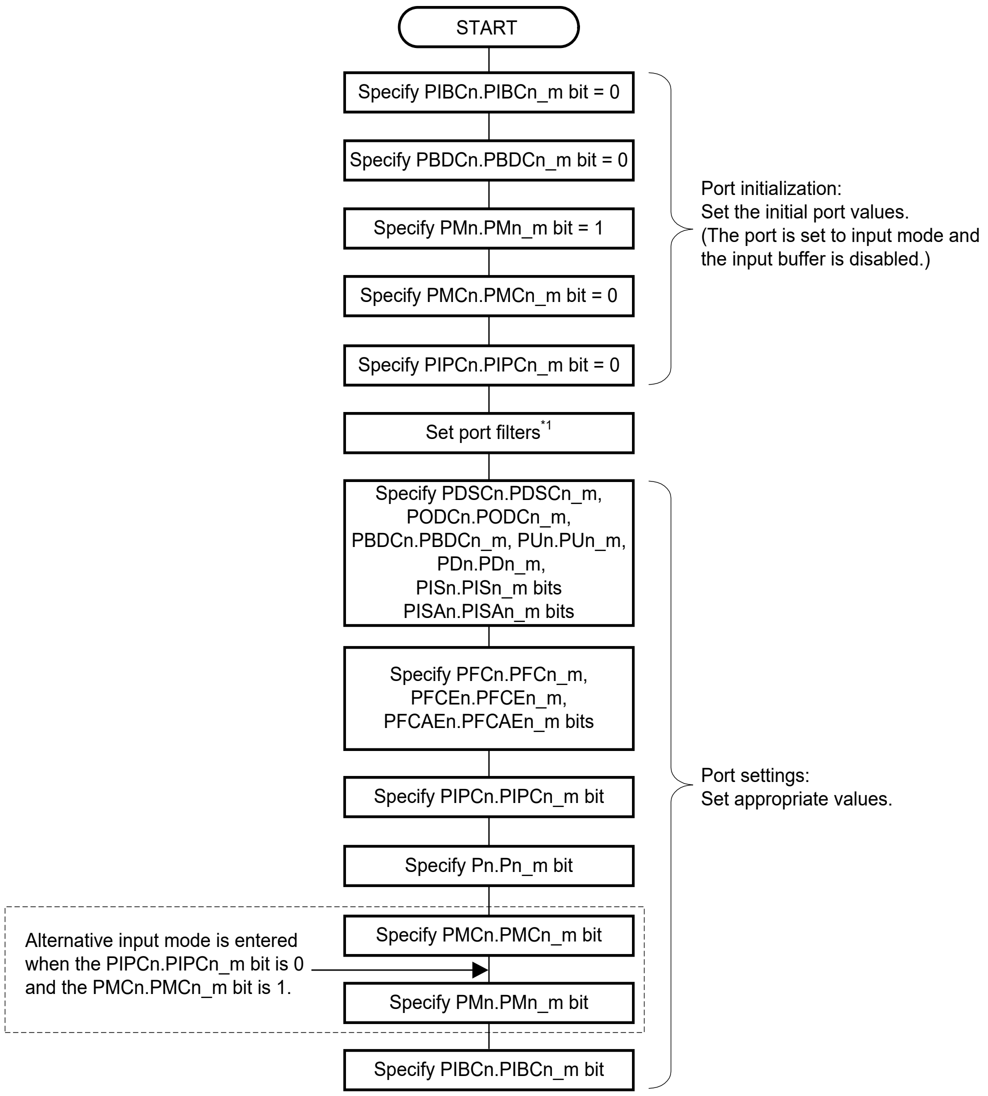
Examples of the port settings are shown in the flowchart below.

CAUTION

If the port is set to the PIPCn.PIPCn_m = 0 and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCn.PMCn_m bit is set to 1 and when the PMn.PMn_m bit is set to 0. If an interrupt-related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.

2A.9.6.1 Batch Setting

An example of specifying batch port settings is shown in the flowchart below.



Note 1. While PMC = 0, an interrupt may be triggered during the configuration of the port registers under the following conditions:

For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.

For INTP0-6 and INTP9-23 interrupt requests:

- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.

In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2A.6 Example of Port Settings (When Specified in Batch)

2A.9.6.2 Individual Settings

An example of specifying individual port settings is shown in the flowchart below.

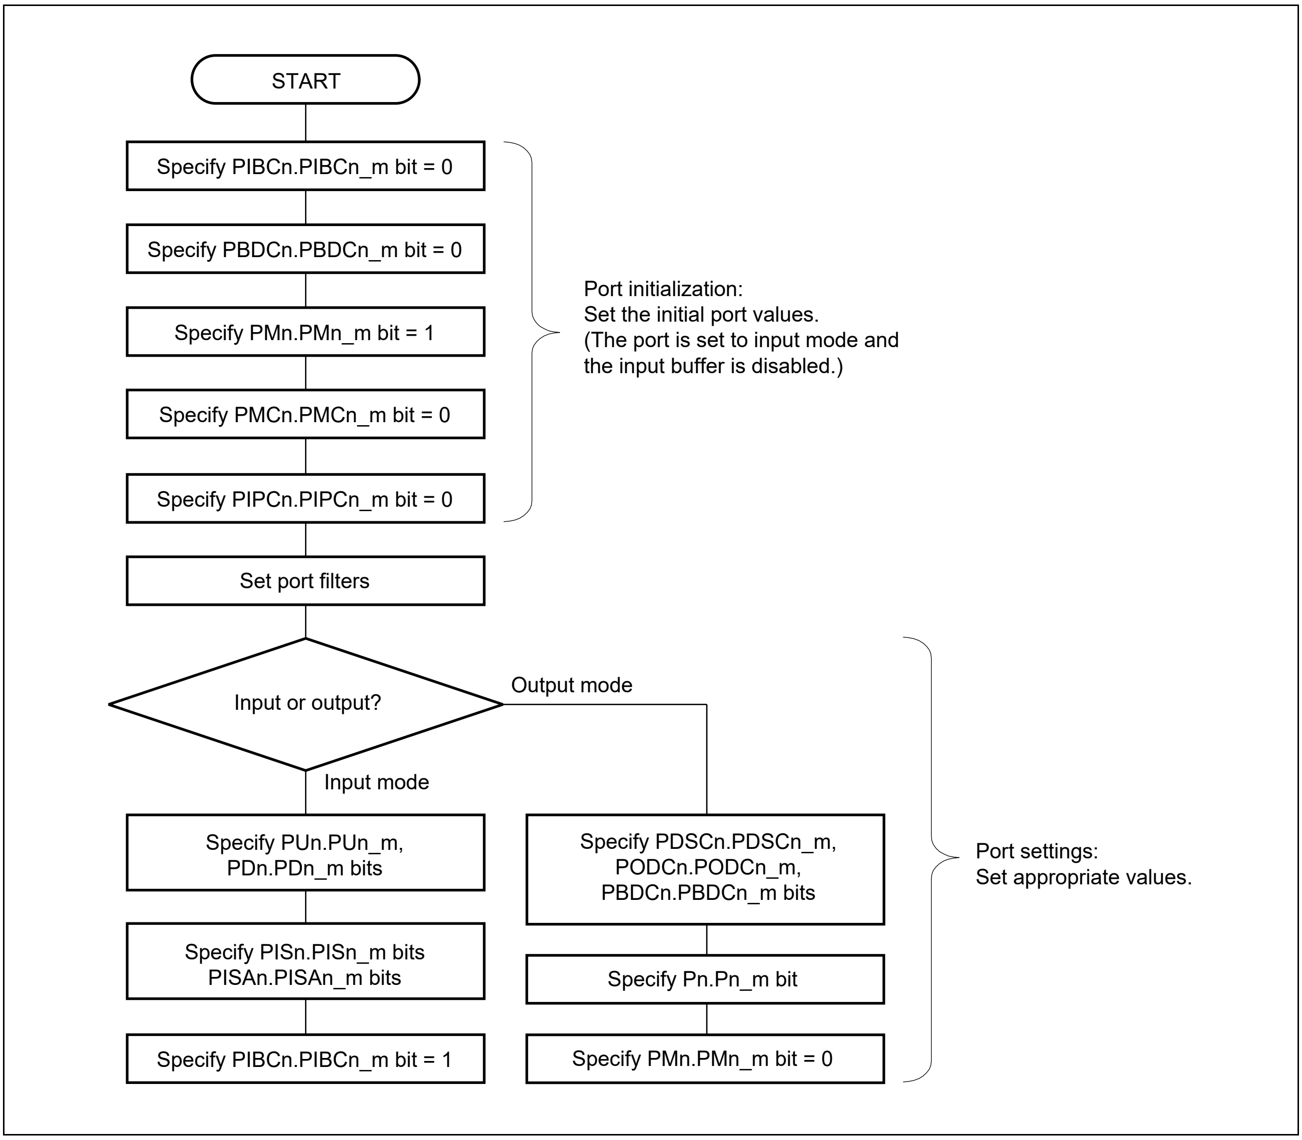


Figure 2A.7 Example of Port Settings (in Port Mode)

(1) With IP Control

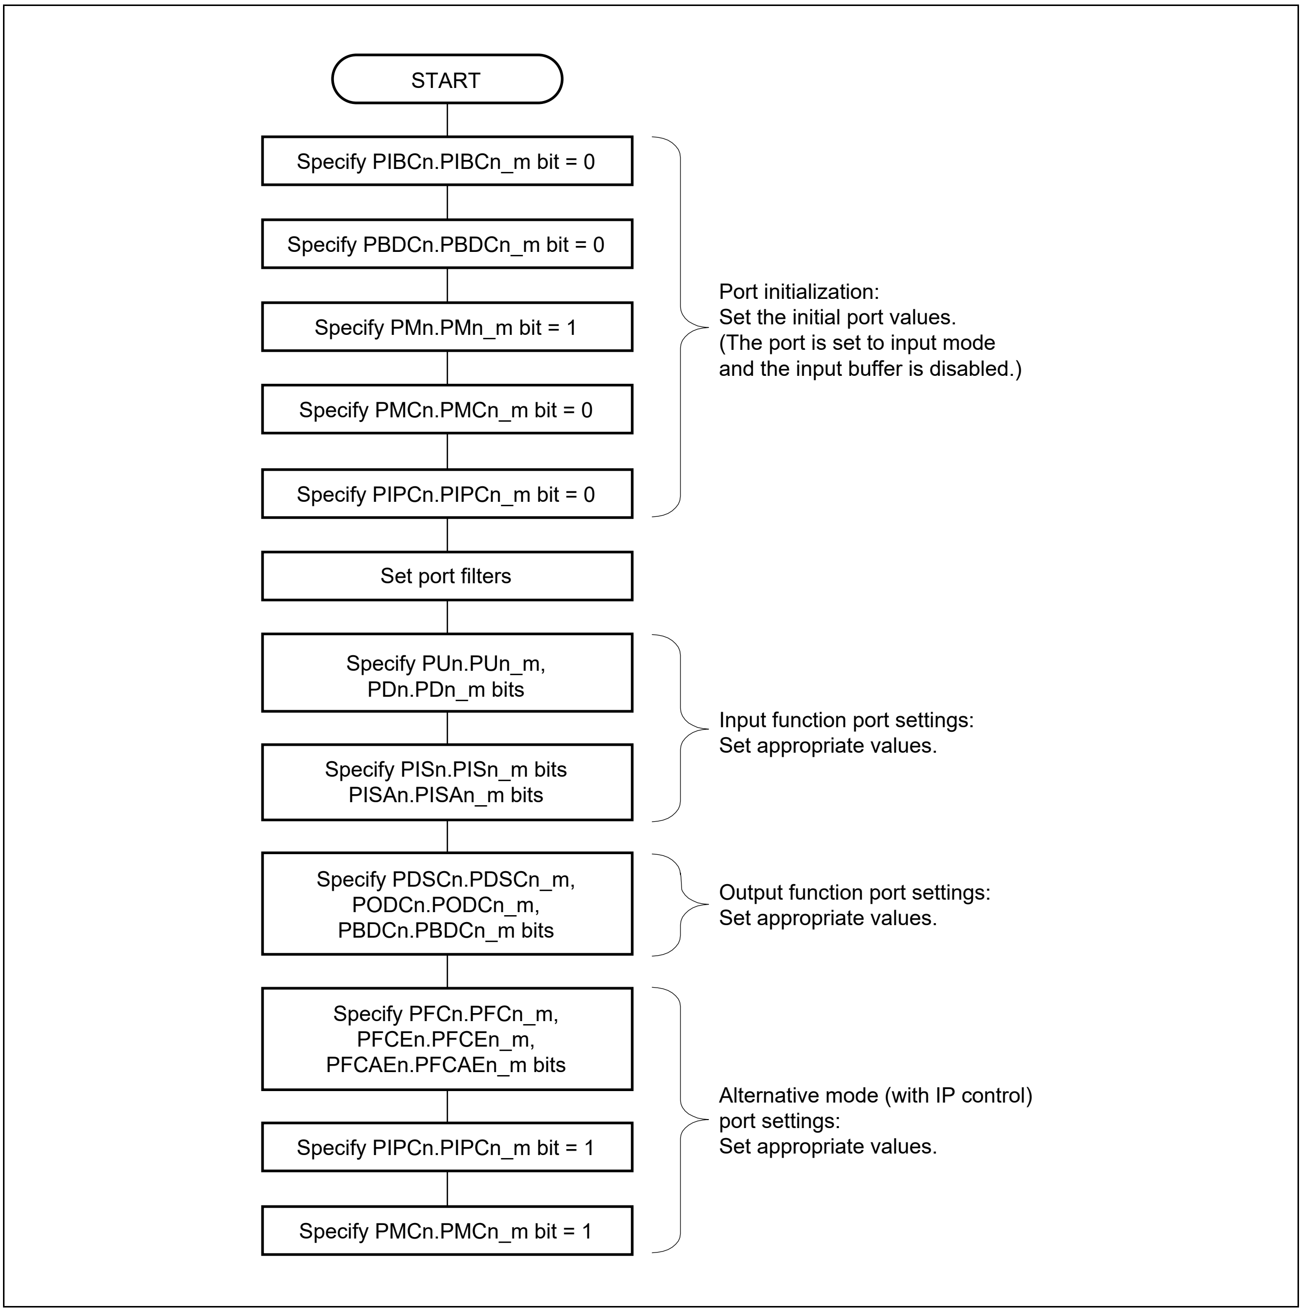

Figure 2A.8 Example of Port Settings (in Alternative Mode)

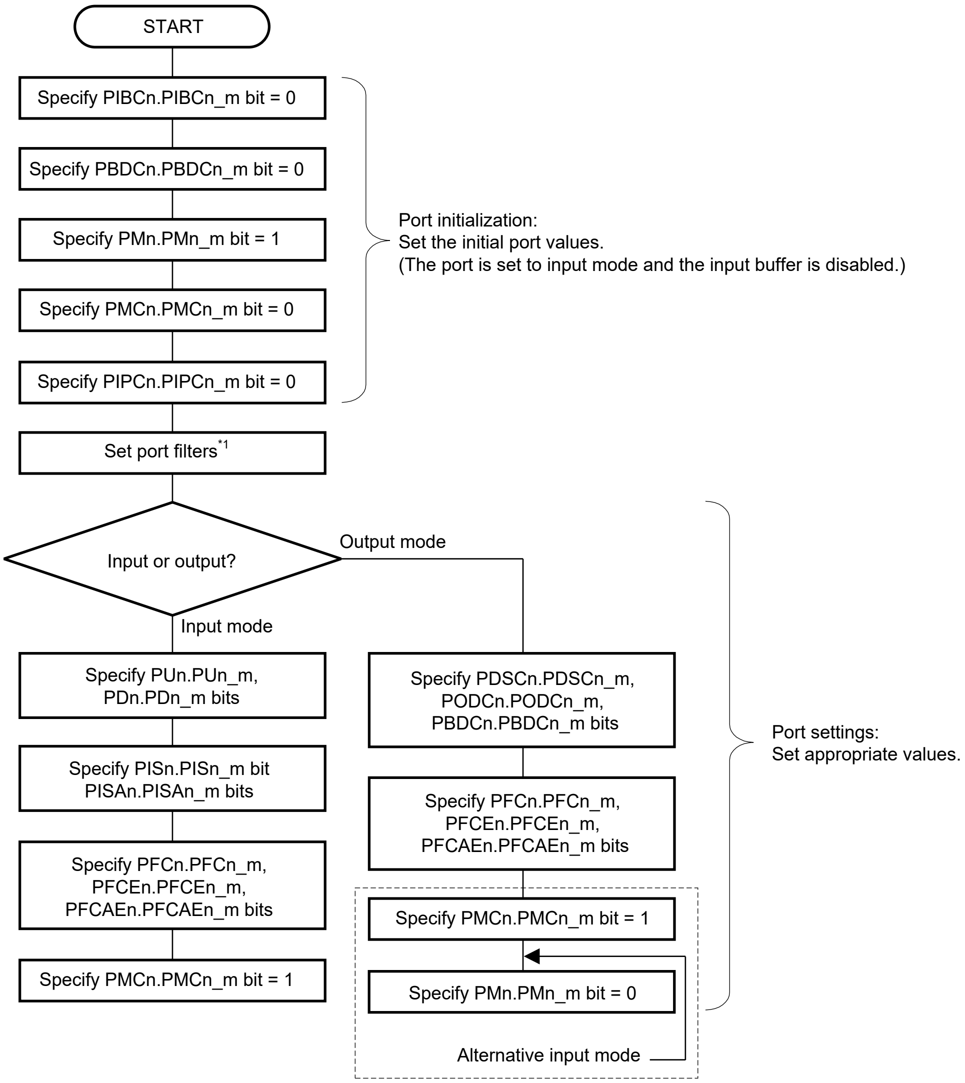
(2) Without IP Control



Note 1. While PMC = 0, an interrupt may be triggered during the configuration of the port registers under the following conditions:

For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.

For INTP0-6 and INTP9-23 interrupt requests:

- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.

In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2A.9 Example of Port Settings (in Alternative Mode)

2A.10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCn register setting. When PMCn.PMCn_m = 1, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

Table 2A.38 Port Function

Port	Pin Name	Size	Direction	Power Domain	Special Alternative Function	Device			
						176 Pins	233 Pins	272 Pins	324 Pins
JTAG Port 0	JP0_0 - 6	7 bits	In/Out	AWO	JTAG, LPD	✓	✓	—	✓
Port 0	P0_0 - 14	15 bits	In/Out	AWO		✓	✓	—	✓
Port 1	P1_0 - 5, 8-15	14 bits	In/Out	AWO		✓	✓	—	✓

	P21_0 – 14	15 bits				—	—	—	✓
Port 22	P22_0 - 15	16 bits	In/Out	ISO		—	—	—	✓
Port 23	P23_0 - 10	11 bits	In/Out	ISO		—	—	—	✓
Port 24	P24_0 - 7	8 bits	In/Out	ISO		—	—	—	✓
Analog Port 0	AP0_0 - 15	16 bits	In/Out	AWO	ADCA0 (12/10-bit resolution)	✓	✓	—	✓
Analog Port 1	AP1_0 - 15	16 bits	In/Out	ISO	ADCA1 (12/10-bit resolution)	✓	✓	—	✓
Input Port 0	IP0_0	1 bit	In	AWO	SOSC (XT2 pin)	✓	✓	—	✓

2A.10.1 JTAG Port 0 (JP0)

2A.10.1.1 Alternative Function

The following alternative functions are available when JTAG port 0 is configured as a general-purpose I/O port by setting OPJTAG[1:0] on the corresponding option byte to 00_B.

Table 2A.39 JTAG Port 0 (JP0)

Port Mode (JPMC0_m = 0)	Alternative Mode (JPMC0_m = 1)										ADC	Special Function	PKG No.			
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative				176 Pins	233 Pins	272 Pins	324 Pins
	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output						
JP0_0[*1]	INTP0		TAUJ2I0	TAUJ2O0	FPDR	FPDT						DCUTDI/LPDI/LPDIO	47	U4	—	AB4
JP0_1	INTP1		TAUJ0I0	TAUJ0O0		FPDT						DCUTDO/LPDO	46	P5	—	W6
JP0_2	INTP2		TAUJ0I1	TAUJ0O1	FPCK							DCUTCK/LPDCLK	45	T4	—	W5
JP0_3	INTP3	CSCXFOUT	TAUJ0I2	TAUJ0O2								DCUTMS	44	R4	—	Y5
JP0_4												$\overline{\text{DCUTRST}}$	43	R3	—	AB3
JP0_5	NMI	RTCA0OUT	TAUJ0I3	TAUJ0O3								$\overline{\text{DCURDY}}$/LPDCLKOUT	42	U3	—	AA4
JP0_6												$\overline{\text{EVTO}}$	66	U11	—	Y10

Note 1. In LPD (1 pin) mode, the JP0_0 output buffer state is Open-drain.

CAUTION

The behavior and performance are not guaranteed when alternative functions are not assigned to the register.

2A.10.1.2 Control Registers

Table 2A.40 Control Registers (JP0)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device			
			Position	R/W*1			176 Pins	233 Pins	272 Pins	324 Pins

CAUTIONS

1. The behavior and performance are not guaranteed when undocumented alternative functions are selected.
2. Use ADC functions with their initial settings. For details, see **Table 2A.50, Control Registers (P8)**.
3. When the $\overline{\text{RESETOUT}}$ function is selected for the P8_6 pin, the output on the pin is at the low level during a reset and after release from the reset state. For details, see **Section 2A.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

CAUTION

P8_6 drives a low level after any kind of reset release, until it is later configured differently by register settings. For details, see **Section 2A.11.1.1, P8_6: $\overline{\textbf{RESETOUT}}$** .

CAUTIONS

1. The behavior and performance are not guaranteed when undocumented alternative functions are selected.
2. Use ADC functions with their initial settings. For details, see **Table 2A.52, Control Registers (P9)**.

APBDC1	Analog port bidirection control register 1	16	15-0	R/W	$41CC_H$	0000_H	✓	✓	—	✓

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

2A.10.21 Input Port 0 (IP0)

2A.10.21.1 Alternative Function

Table 2A.79 Input Port 0 (IP0)

	Alternative Mode																PKG No.			
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative		6th Alternative		7th Alternative				176 Pins	233 Pins	272 Pins	324 Pins
Port Mode	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	ADC	Special Function				
IP0_0																XT2	57	T7	—	AA8

2A.10.21.2 Control Registers

Table 2A.80 Control Registers (IP0)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device			
			Position	R/W*[1]			176 Pins	233 Pins	272 Pins	324 Pins
IPPR0	Input port pin read register 0	16	0	R	$02F0_H$	0000_H	✓	✓	—	✓
IPIBC0	Port input buffer control register 0	16	0	R/W	$40F0_H$	0000_H	✓	✓	—	✓

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

CAUTION

When the IP0_0/XT2 pin is used as an input port, set the IPIBC0.0 bit to 1 and stop the SOSC operation. For details on the settings for SOSC operations, see **Section 12AB.4.2.7, SOSCE — SubOSC Enable Register**. When the IP0_0/XT2 pin is used for the SubOSC (SOSC) not as an input port, set the IPIBC0.0 bit to 0.

2A.11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

2A.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

2A.11.1.1 P8_6: $\overline{\mathrm{RESETOUT}}$

The P8_6 pin ($\overline{\mathrm{RESETOUT}}$ signal) changes PM8.PM8_6 and PODC8.PODC8_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.

(Case 1): OPBT0.RESETOUTEN = 1

- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 0: Output mode
- PODC8.PODC8_6 = 1: Open-drain

(Case 2): OPBT0.RESETOUTEN = 0

- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 1: Input mode
- PODC8.PODC8_6 = 0: Push-pull

For detail of OPBT0.RESETOUTEN register, see **Section 44.9.2, OPBT0 — Option Byte 0**, also see **Section 9A.1.3, Reset Output ($\overline{\mathrm{RESETOUT}}$)**.

When the P8_6 pin setting is updated with another value, the pin operates by new setting.

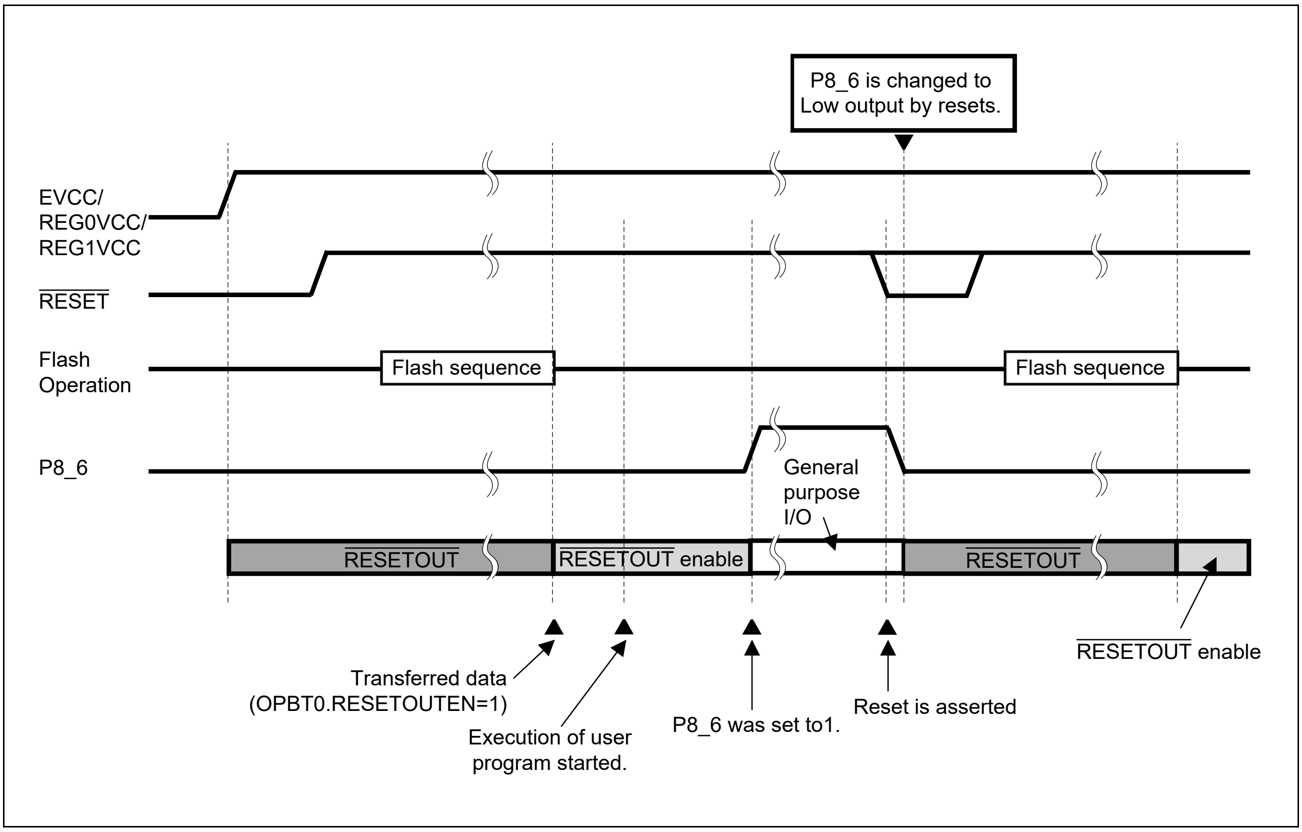

Figure 2A.10 P8_6 Pin (RESETOUT Signal) Operation While a Reset is asserted and released: (Case 1) OPBT0.RESETOUTEN setting is 1

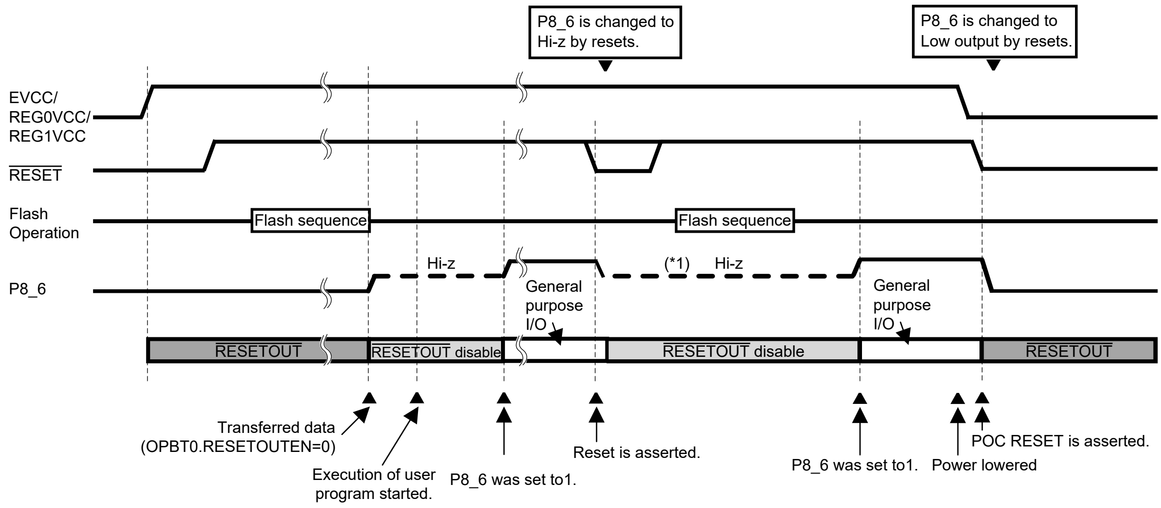

Note 1. When a reset except POC reset occurs with $\overline{\text{RESETOUT}}$ disable (OPBT0.RESETOUTEN = 0), P8_6 pin ($\overline{\text{RESETOUT}}$ signal) will be changed to Hi-z.

Figure 2A.11 P8_6 Pin ($\overline{\text{RESETOUT}}$ Signal) Operation While a Reset is asserted and released: (Case 2) OPBT0.RESETOUTEN setting is 0

2A.11.1.2 JP0_0 to JP0_6: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

Table 2A.81 Debug Interface

OPJTAG1	OPJTAG0	Mode	JP0_0	JP0_1	JP0_2	JP0_3	JP0_4	JP0_5	JP0_6
1	1	Nexus I/F	DCUTDI input	DCUTDO output	DCUTCK input	DCUTMS input	$\overline{\text{DCUTRST}}$ input	$\overline{\text{DCURDY}}$ output	$\overline{\text{EVTO}}$ output
0	1	LPD (4 pins)	LPDI input	LPDO output	LPDCLK input	Port/ alternative function	Port/ alternative function	LPDCLK OUT output	Port/ alternative function
1	0	LPD (1 pin)	LPDIO input/output	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function

NOTE

For the OPJTAG [1:0] settings, see **Section 44.9.2, OPBT0 — Option Byte 0**.

2A.11.1.3 FPDR(JP0_0), FPDT(JP0_1), FPCK(JP0_2): Flash Programmer

These pins are used for connecting a flash programmer. See *Flash Programmer's Manual* for details.

2A.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10_8: FLMD1 pin can select serial programming mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_2: MODE1 and the P10_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_6: MODE2, the P10_2: MODE1 and the P10_1: MODE0 pins can select user boot mode.

For details on the mode selection, see **Section 6, Operating Mode**.

2A.11.1.5 IP0_0: XT2

This pin is the SubOSC (SOSC) input pin. When the IPIBC0_0 bit = 1, the IP0_0/XT2 pin is used as an input port. If you make this setting, stop SOSC operation at the same time.

2A.11.2 A/D Input Alternative I/O

The following ports are permanently connected to A/D input functions. (However, an analog input to the A/D is controlled by the A/D module.)

Table 2A.82 A/D Input Alternative Pins

Port	A/D Input	Device			
		176 Pins	233 Pins	272 Pins	324 Pins

2A.11.3 Special I/O Control

2A.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.

The following table lists all alternative functions where PIPCn.PIPCn_m must be set to 1.

For details, see **Section 2A.9.2.3, PIPCn — Port IP Control Register**.

Table 2A.83 Alternative Modes that Require Setting PIPCn.PIPCn_m = 1

2A.11.3.2 Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/PISAn/JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type 1/2 or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in **Table 2A.85, JTAG Port Input Buffer Characteristics Selection**.

Table 2A.84 Port Input Buffer Characteristics Selection

JP0_5	SHMT1	SHMT4	—	✓	✓	—	✓
JP0_6	SHMT1	SHMT4	—	✓	✓	—	✓

Note 1. TTL is selected for Boundary scan mode without JPISA0 register setting.

Note 2. TTL is selected for Nexus in normal operating mode without JPISA0 register setting.

Note 3. TTL is selected for LPD (4 pins) in normal operating mode without JPISA0 register setting.

Note 4. TTL is selected for LPD (1 pin) in normal operating mode without JPISA0 register setting.

NOTES

1. For the SHMT1, SHMT4 and TTL pin characteristics, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**.
2. For the input buffer after reset, Type 2 (SHMT4) is selected.

2A.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

Table 2A.86 Output Buffer Characteristics Selection

Port Name	Output Drive Strength Selection		Device			
	Slow Mode (PDSCn_m = 0)	Fast Mode (PDSCn_m = 1)	176 Pins	233 Pins	272 Pins	324 Pins

Note 1. Supports Cload: 100 pF (The load capacitance of CSIH0 is 100 pF.)

Note 2. Supports Cload: 50 pF (The load capacitance of CSIH1 to CSIH4 are 50 pF.)

Note 3. In some of the functions, Fast mode or Slow mode is specified. For details, see **Section 47A.5, AC Characteristics**.

2A.12 Noise Filter & Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1KH supports both analog and digital filters.

It also supports the function for edge and level detection after the signals have passed through a filter.

The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter & edge/level detection control registers and control bits, and register addresses.

For details on the digital/analog filter function and noise filter & edge/level detection control registers, see **Section 2A.13, Description of Port Noise Filter & Edge/Level Detection**.

NOTE

In this section, <*name*> in the noise filter control register represents the peripheral function connected to a filter.

2A.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

2A.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

- Filter control register FCLA0CTLm_<*name*> (m = 0 to 7)
  A dedicated FCLA0CTLm_<*name*> register is provided for each pin in a port that incorporates an analog filter.

Table 2A.87 Input Pins that Incorporate Analog Filter Type A

Module Name	Input Pin	FCLA0CTL Register Configuration		Device

2A.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm_<*name*> (m = 0 to 2)
  Each port with a digital filter has a special FCLA0CTLm_<*name*> register.
- Digital noise elimination control register DNFA<*name*>CTL
  Each DNFA<*name*>CTL control register controls digital filter processing for three input signals per group.
- Digital noise elimination enable register DNFA<*name*>EN
  The setting of the DNFA<*name*>ENL[2:0] bits in DNFA<*name*>EN enables or disables digital noise elimination for three input signals per group.

Table 2A.90 Input Pins that Incorporate Digital Filter Type D

	Device				Digital Noise Elimination Control Register		Digital Noise Elimination Enable Register			Filter Control Register

2A.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA<*name*>CTL
  Each DNFA<*name*>CTL control register controls digital filter processing for up to 16 input signals per group.
- Digital noise elimination enable register DNFA<*name*>EN
  The setting of the DNFA<*name*>ENL[7:0] and DNFA<*name*>ENH[7:0] bits in DNFA<*name*>EN enables or disables digital noise elimination for up to 16 input signals per group.

SENTn	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—

Note 1. Power Domain

NOTE

For the Setting Register, see **Section 12AB.4.3, Clock Selector Control Register.**

2A.13 Description of Port Noise Filter & Edge/Level Detection

External signals pass through different types of filters according to the use of each external input signal.

NOTE

In this section, <*name*> in the noise filter control register represents the peripheral function connected to a filter.

2A.13.1 Overview

2A.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.
  Used for external interrupt signals.
- Type B: An analog filter
  Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.
- Type C: An analog filter only
  Used for the external RESET input and mode signals.

2A.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection.
  Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function.
  Used for the timer input signals and encoder input signals.

2A.13.2 Analog Filters

2A.13.2.1 Analog Filter Characteristic

See **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for the input conditions for signals input to pins that incorporate an analog filter.

2A.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm_<*name*> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in **Table 2A.87, Input Pins that Incorporate Analog Filter Type A**.

2A.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.

The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

(1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

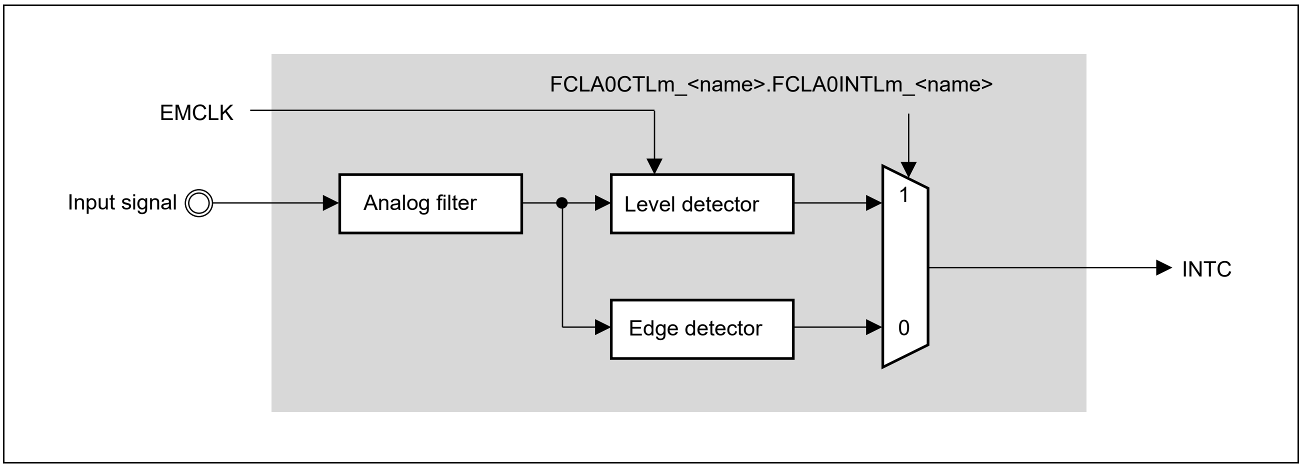

Figure 2A.12 Block Diagram of Analog Filter Type A

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit FCLA0CTLm_<*name*>.FCLA0INTLm_<*name*>.

- FCLA0INTLm_<*name*> bit = 0: Edge detection

  Whether a rising or falling edge is detected can be specified by setting the FCLA0CTLm_<*name*>.FCLA0INTRm_<*name*> and FCLA0CTLm_<*name*>.FCLA0INTFm_<*name*> bits.

- FCLA0INTLm_<*name*> bit = 1: Level detection

  The detection of a high level or low level can be specified by setting FCLA0CTLm_<*name*>.FCLA0INTRm_<*name*> bit.

The table below summarizes the detection conditions of the analog filter.

Table 2A.93 Analog Filter Event Detection Conditions

FCLA0INTLm_<name>	FCLA0INTFm_<*name*>	FCLA0INTRm_<*name*>	Edge Detection	Level Detection
0	0	0	No edge detected	Disabled
	0	1	Rising edge	
	1	0	Falling edge	
	1	1	Rising and falling edges	
1	X	0	Disabled	Low level
	X	1		High level

Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

(2) Analog filter type B

A block diagram of analog filter type B is shown below.

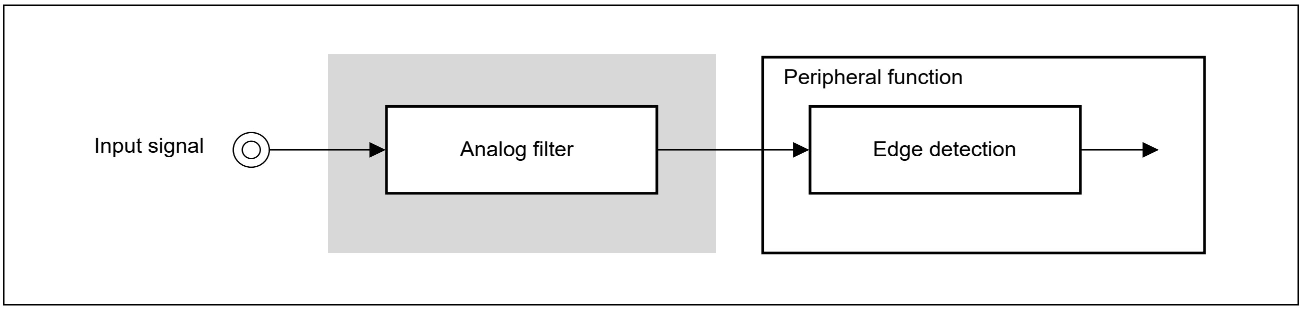

Figure 2A.13 Block Diagram of Analog Filter Type B

Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

(3) Analog filter type C

A block diagram of analog filter type C is shown below.

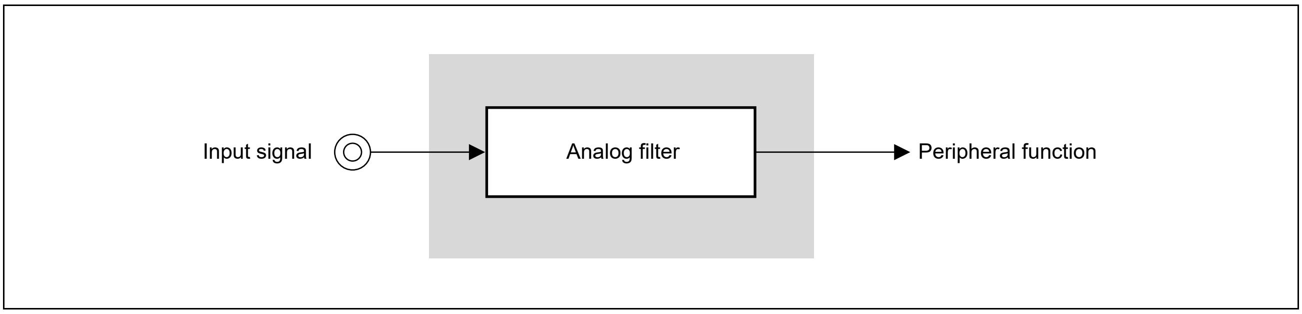

Figure 2A.14 Block Diagram of Analog Filter Type C

The generated signals are always input signals that have passed through an analog filter.

Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

2A.13.3 Digital Filters

2A.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.

The input signal is sampled with the sampling frequency fs.

If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFA<*name*>CTL.DNFA<*name*>PRS[2:0] select the sampling frequency based on
  $f_s = f_{DNFATCKI} / 2^{DNFA<name>PRS[2:0]}$
  where fDNFATCKI is the frequency of the DNFATCKI clock.
- DNFA<*name*>CTL.DNFA<*name*>NFSTS[1:0] determines the number of same level samples, “s”, (2 to 5):

  s = DNFA<*name*>NFSTS[1:0] + 2

External signal pulses shorter than the following are suppressed at all times.

$s \times 1/f_s$

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

$(s + 1) \times 1/f_s$

External signal pulses in the following range may be suppressed or judged as valid.

$s \times 1/f_s$ to $(s + 1) \times 1/f_s$

The filter operation is illustrated in the figure below with DNFA<*name*>NFSTS[1:0] = 01_B, i.e. s = 3 same level samples.

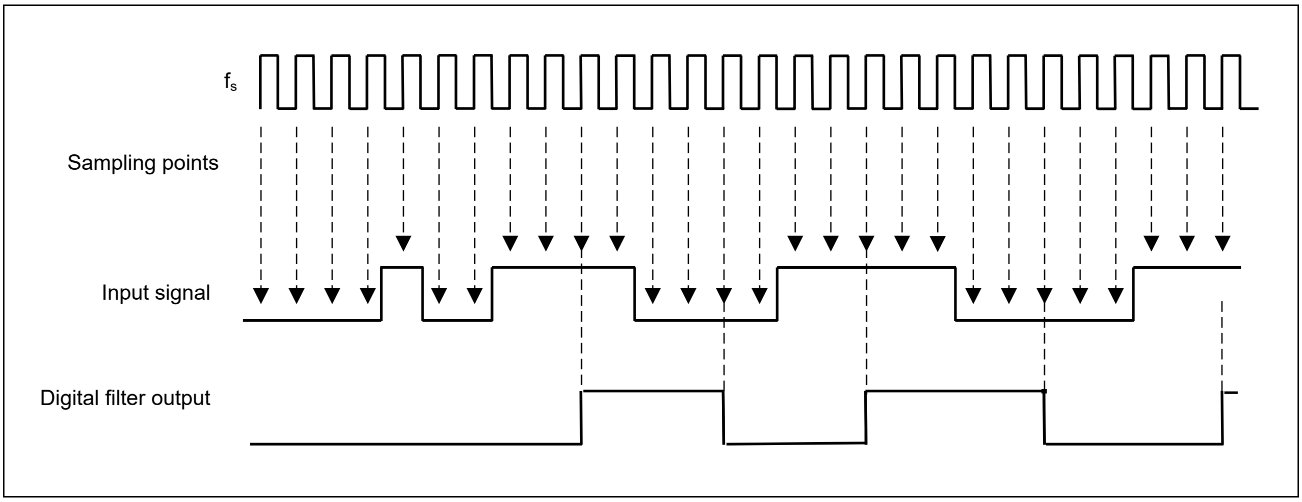

Figure 2A.15 Digital Filter Function

2A.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.

The digital filter characteristics, specified by DNFA<*name*>CTL.DNFA<*name*>PRS[2:0] and DNFA<*name*>NFSTS[1:0] apply to the signals.

However, the digital filter for each signal can be enabled or disabled separately by DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7).

CAUTIONS

1. When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) = 1 and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7) = 1) for the port pin to switch to the alternative function.
   s = DNFA<*name*>NFSTS[1:0] + 2
   $s \times 1/f_s + 2 \times 1/f_{DNFATCKI}$
2. When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) = 1 and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7) = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.
   $s \times 1/f_s + 3 \times 1/f_{DNFATCKI}$

2A.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.
Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

2A.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA<*name*>CTL and digital noise elimination enable register DNFA<*name*>EN are used to set all the filters in the same group (<*name*> = peripheral function group).

The DNFA<*name*>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <*name*>.

The DNFA<*name*>EN register enables/disables each filter by setting the corresponding bit in DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTLm_ADCn registers are ordered in groups of 3 registers with the same index n. The register index n is in 0 or 1.

The assignment of the input signals to the control registers and their addresses are given in **Table 2A.90, Input Pins that Incorporate Digital Filter Type D** and **Table 2A.91, Input Pins that Incorporate Digital Filter Type E** in **Section 2A.12.1, Port Filter Assignment**.

CAUTION

Do not change any control register settings while the corresponding digital filter is enabled by DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) = 1 and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7) = 1. Otherwise an unintended filter output may be generated.

(1) Digital filter type D

A block diagram of digital filter type D is shown below.

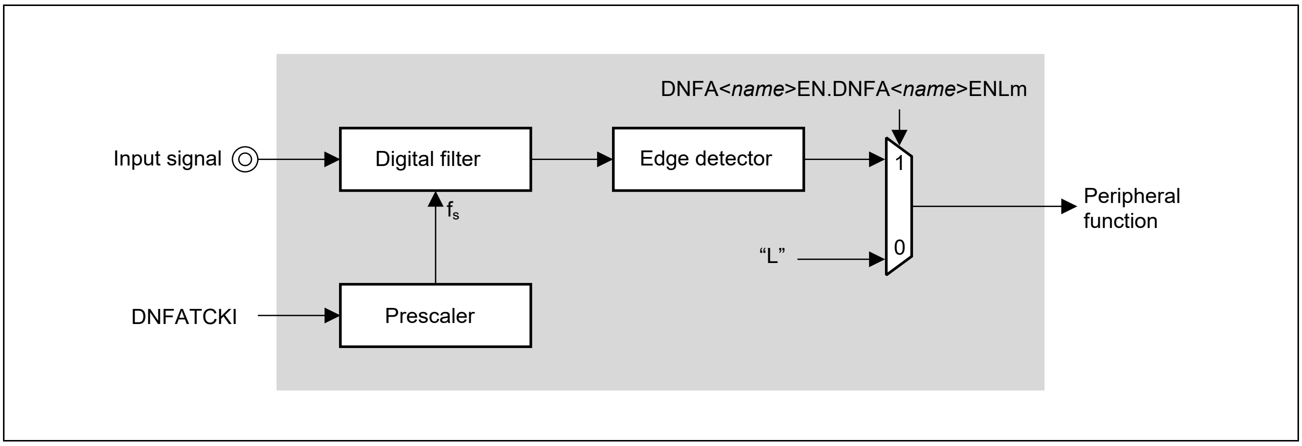

Figure 2A.16 Block Diagram of Digital Filter Type D

The generated signal depends on the register setting, as shown in the following table.

Table 2A.94 Output Options for Digital Filter Type D

DNFA<*name*>EN.DNFA<*name*>ENLm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

(2) Digital filter type E

A block diagram of digital filter type E is shown below.

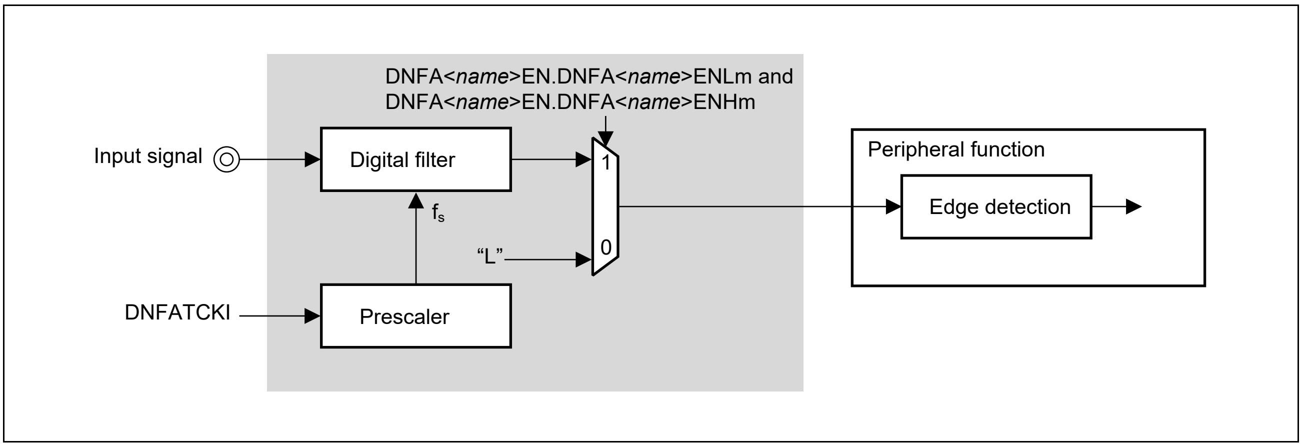

Figure 2A.17 Block Diagram of Digital Filter Type E

The generated signal depends on the register setting, as shown in the following table.

Table 2A.95 Output Options for Digital Filter Type E

DNFA<*name*>EN.DNFA<*name*>ENLm and DNFA<*name*>EN.DNFA<*name*>ENHm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

2A.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:

Table 2A.96 List of Filter Registers

Module Name	Register Name	Symbol	Address
FCLA0	Filter control register m	FCLA0CTLm_<name>	The addresses are shown in the tables in **Section 2A.12.1, Port Filter Assignment**.
DNF	Digital noise elimination control register	DNFA<name>CTL	
	Digital noise elimination enable register	DNFA<name>EN	
	Digital noise elimination enable H register	DNFA<name>ENH	
	Digital noise elimination enable L register	DNFA<name>ENL	

2A.13.4.1 FCLA0CTLm_<name> — Filter Control Register

This register controls the analog and digital filter operation.

Access: This register can be read or written in 8-bit units.

Address: The allocation of input signals to FCLA0CTLm_<name> registers and the address of each register are shown in the tables in **Section 2A.12.1, Port Filter Assignment**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

2	FCLA0INTLm _<name>	Detection Mode Selection 0: Edge detection 1: Level detection **NOTE:** This bit is only valid for analog filter type A.
1	FCLA0INTFm _<name>	● In level detection mode (FCLA0INTLm_<name> = 1): This bit has no effect. ● In edge detection mode (FCLA0INTLm_<name> = 0): Falling edge detection control 0: Falling edge detection disabled 1: Falling edge detection enabled **NOTE:** This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.
0	FCLA0INTRm _<name>	● In level detection mode (FCLA0INTLm_<name> = 1): Detected level selection 0: Low level detection 1: High level detection ● In edge detection mode (FCLA0INTLm_<name> = 0): Rising edge detection control 0: Rising edge detection disabled 1: Rising edge detection enabled **NOTE:** This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.

CAUTION

Digital filter type D: Always set bit 2 to "0".

2A.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 8-bit units.

Address: For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see **Table 2A.90, Input Pins that Incorporate Digital Filter Type D** and **Table 2A.91, Input Pins that Incorporate Digital Filter Type E** in **Section 2A.12.1, Port Filter Assignment.**

2A.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 16-bit units.

The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

Address: For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see **Table 2A.90, Input Pins that Incorporate Digital Filter Type D** and **Table 2A.91, Input Pins that Incorporate Digital Filter Type E** in **Section 2A.12.1, Port Filter Assignment.**

2A.13.4.4 DNFA<name>ENH – Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>EN register.

NOTE

This register is only valid for digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see **Table 2A.91, Input Pins that Incorporate Digital Filter Type E** in **Section 2A.12.1, Port Filter Assignment.**

Value after reset: 00_H

For details of the respective bit functions, see **Section 2A.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register**.

2A.13.4.5 DNFA<name>ENL – Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name>EN register.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see **Table 2A.90, Input Pins that Incorporate Digital Filter Type D** and **Table 2A.91, Input Pins that Incorporate Digital Filter Type E** in **Section 2A.12.1, Port Filter Assignment**.

X1, X2	✓	✓	✓	✓	✓	—	Main OSC connections	MOSC
XT1, XT2	—	✓	✓	✓	✓	—	Sub OSC connections	SOSC

CAUTION

When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.

- **(e.g.)** When RS-CANFD channel 0 is used:

CAN0TX	P0_0	P10_1
CAN0RX	P0_1	P10_0

Use one of the following pin combinations:

- P0_0 and P0_1, or
- P10_0 and P10_1.

The combinations of P0_0 and P10_0, and P0_1 and P10_1 are not allowed.

2B.3 Pin Functions During and After Reset

Table 2B.7 Pin Functions During and After Reset

Pins	During Reset	After Reset
JP0_0	High impedance	JP0_0: Input Serial programming mode: FPDR, FPDT (1 wire UART) FPDR (2 wire UART) Nexus I/F: DCUTDI input LPD (4 pins): LPDI input LPD (1 pin): LPDIO input/output
JP0_1	High impedance	JP0_1: Input Serial programming mode: FPDT Nexus I/F: DCUTDO output LPD (4 pins): LPDO output LPD (1 pin): High impedance
JP0_2	High impedance	JP0_2: Input Serial programming mode: FPCK Nexus I/F: DCUTCK input LPD (4 pins): LPDCLK input LPD (1 pin): High impedance
JP0_3	High impedance	JP0_3: Input Serial programming mode: High impedance Nexus I/F: DCUTMS input LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_4	Input[*3,*5]	JP0_4: Input Serial programming mode: High impedance Nexus I/F: $\overline{\text{DCUTRST}}$ input[*1] LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_5	High impedance	JP0_5: Input Serial programming mode: High impedance Nexus I/F: $\overline{\text{DCURDY}}$ output LPD (4 pins): LPDCLKOUT output LPD (1 pin): High impedance
JP0_6	High impedance	JP0_6: Input Serial programming mode: High impedance Nexus I/F: $\overline{\text{EVTO}}$ output LPD (4 pins): High impedance LPD (1 pin): High impedance
P8_6	Output[*2,*4]	Output (OPBT0.RESETOUTEN = 1)[*2] High impedance (OPBT0.RESETOUTEN = 0)[*2,*4]
P0 to P3, P8 to P13, P18 to P22 (except P8_6, P10_1, P10_2, P10_6 and P10_8)	High impedance	High impedance
P10_1	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE0 input (FLMD0 = 1, FLMD1 = 1)
P10_2	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE1 input (FLMD0 = 1, FLMD1 = 1)

Table 2B.7 Pin Functions During and After Reset

Pins	During Reset	After Reset
P10_6	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 1) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 0) MODE2 input (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 1)
P10_8	High impedance	High impedance (FLMD0 = 0) FLMD1 input (FLMD0 = 1)
FLMD0	Input	Input
$\overline{\text{RESET}}$	Input	Input
AP0, AP1	High impedance	High impedance

Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low level.

Note 2. $\overline{\text{RESETOUT}}$ is output. For details, see **Section 2B.11, Port (Special I/O) Function Overview**.

Note 3. When the power is turned on or when $\overline{\text{RESET}}$ is low level, JP0_4 pin should be driven low level.

Note 4. If OPBT0.RESETOUTEN = 0, P8_6 pin status has a possibility to become unstable (less than 15 μs) at the transition moment to reset status by internal reset factors.

Note 5. When $\overline{\text{RESET}}$ is low level, on-chip pull-down resistor is connected to JP0_4.

2B.4 Port State in Standby Mode

For the port state in standby mode, see **Section 14.1.4, I/O Buffer Control**.

2B.5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.

Table 2B.8 Recommended Connection of Unused Pins

Pin	Recommended Connection of Unused Pins
A0VREF, A1VREF[*1]	**[Excluding 100-Pin LQFP]** Connected to EVCC or BVCC **[100-Pin LQFP]** Connected to EVCC
A0VSS, A1VSS[*1]	**[Excluding 100-Pin LQFP]** Connected to EVSS or BVSS **[100-Pin LQFP]** Connected to EVSS
$\overline{\text{RESET}}$	**[Excluding 100-Pin LQFP]** Connected to EVCC or BVCC via a resistor **[100-Pin LQFP]** Connected to EVCC via a resistor
XT1	Connected to REGVCC or AWOVSS via a resistor[*3] (bit 0 of IPIBC0 = 1) Connected to AWOVSS (bit 0 of IPIBC0 = 0)
X1	Connected to AWOVSS via a resistor
X2	Open
IP0_0	Connected to REGVCC or AWOVSS via a resistor[*3] (bit 0 of IPIBC0 = 1) Open (bit 0 of IPIBC0 = 0)
JP0 (excluding JP0_4) P0 P1 P2 P3 P8 (excluding P8_6) P9 P20	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
P8_6	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
JP0_4	Connected to EVSS via a resistor
P10_1, P10_2, P10_6, P10_8	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open

Table 2B.8 Recommended Connection of Unused Pins

Pin	Recommended Connection of Unused Pins
P10 (excluding P10_1, P10_2, P10_6, P10_8) P11 P12 P13 P18 P19 P21 P22	**[Excluding 100-Pin LQFP]** Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to BVCC or BVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open **[100-Pin LQFP]** Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
AP0	Input: Open (when the PIBCn_m bit is 0) Connected to A0VREF or A0VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
AP1	Input: Open (when the PIBCn_m bit is 0) Connected to A1VREF or A1VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
Nexus/LPD I/F (JP0)	DCUTDI/LPDI/LPDIO (JP0_0): Connected to EVCC via a resistor DCUTDO/LPDO (JP0_1): Open DCUTCK/LPDCLK (JP0_2): Open DCUTMS (JP0_3): Connected to EVCC via a resistor $\overline{\text{DCUTRST}}$ (JP0_4): Connected to EVSS via a resistor[*2] $\overline{\text{DCURDY}}$ /LPDCLKOUT (JP0_5):Open $\overline{\text{EVTO}}$ (JP0_6): Open[*1]

Note 1. Only available for 272-pin, 233-pin, 176-pin and 144-pin devices

Note 2. For in case when a debugging interface is used, this pin should be connected to EVCC through resistor depending on the development tool made by a third party.

Note 3. XT1 = IP0_0 (XT2) = REGVCC or AWOVSS should be set.
XT1 is connected to IP0_0 (XT2) through an internal resistor. Therefore, it is necessary to maintain equal voltage level in order not to make a current path.

2B.6 Features of RH850/F1KM Port

2B.6.1 Port Group

The RH850/F1KM provides the following port groups, indicated by the numbers in the table below.

Table 2B.9 Port Groups in RH850/F1KM-S4

No. of Pins	Port Group	RH850/F1KM-S4
100 pins	Number	7
	Name	P0, P8 to P11, JP0, AP0
144 pins	Number	13
	Name	P0, P1, P8 to P12, P18, P20, JP0, AP0, AP1, IP0
176 pins	Number	14
	Name	P0 to P2, P8 to P12, P18, P20, JP0, AP0, AP1, IP0
233 pins	Number	17
	Name	P0 to P3, P8 to P13, P18 to P20, JP0, AP0, AP1, IP0
272 pins	Number	19
	Name	P0 to P3, P8 to P13, P18 to P22, JP0, AP0, AP1, IP0

2B.6.2 Port Group Index n

Throughout this section, the port groups are identified by using the index “n”. For example, the port mode control register of the Pn pin is PMCn (n = 0 to 3, 8 to 13, 18 to 22).

2B.6.3 Register Base Addresses

Port and JTAG port base addresses are listed in the following table.

Port and JTAG port register addresses are given as offsets from the base addresses.

Table 2B.10 Register Base Addresses

Base Address Name	Base Address
<PORTn_base>	FFC1 0000_H
<JPORT0_base>	FFC2 0000_H

2B.6.4 Clock Supply

The clock supply to ports is shown in the following table.

Table 2B.11 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Port	Register access clock	CPUCLK_UL

2B.7 Port Functions

This product has various pins for input/output ports. The ports are organized in port groups.

The RH850/F1KM also has several control registers to enable pins to be used as other than general-purpose input/output pins.

For a description of the terms pin, port, and port group, see **Section 2B.7.2, Terms**

2B.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16.
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.
  Table 2B.40, JTAG Port 0 (JP0), **Table 2B.42, Port 0 (P0)**, **Table 2B.44, Port 1 (P1)**, **Table 2B.46, Port 2 (P2)**, **Table 2B.48, Port 3 (P3)**, **Table 2B.50, Port 8 (P8)**, **Table 2B.52, Port 9 (P9)**, **Table 2B.54, Port 10 (P10)**, **Table 2B.56, Port 11 (P11)**, **Table 2B.58, Port 12 (P12)**, **Table 2B.60, Port 13 (P13)**, **Table 2B.62, Port 18 (P18)**, **Table 2B.64, Port 19 (P19)**, **Table 2B.66, Port 20 (P20)**, **Table 2B.68, Port 21 (P21)**, **Table 2B.70, Port 22 (P22)**, **Table 2B.72, Analog Port 0 (AP0)**, **Table 2B.74, Analog Port 1 (AP1)**, **Table 2B.76, Input Port 0 (IP0)**, and **Section 2B.9.2, Pin Function Configuration**.

CAUTION

Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.

[Example]

INTP0 is assigned to the following pins on this device. However, the INTP0 function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

- JP0_0 (1st input alternative function)
- P0_1 (2nd, 3rd input alternative function)
- P10_0 (2nd input alternative function)

In the above case, when the 1st input alternative function (INTP0) of JP0_0 is selected, using the 2nd input alternative function (CAN0RX/INTP0) of P0_1 only for the CAN signal is also prohibited.

2B.7.2 Terms

The following terms are used in this section:

Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.

A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

Port mode and ports

A pin in port mode works as a general-purpose input/output pin. It is then called “port”.

The corresponding name is Pn_m. For example, P0_7 denotes port 7 of port group 0. It is referenced as “port P0_7”.

Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0_0 and INTP0. The different names indicate the function of the pin at that time.

2B.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging.

JTAG port group registers and bit names are prefixed by a “J”. For example, JP0 denotes JTAG port group 0, and JPM0.JPM0_m denotes the JPM0_m port mode bit of the JPM0 port mode register.

NOTE

In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

2B.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode (PMCn.PMCn_m bit = 0)
  A pin in port mode operates as a general-purpose input/output pin. The I/O mode is selected by setting the PMn.PMn_m bit.
- Software I/O control alternative mode (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 0)
  In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn_m bit.
- Direct I/O control alternative mode (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 1)
  In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.

An overview of the register settings is given in the tables below.

Table 2B.12 Pin Function Configuration (Overview)

Mode	Bit			I/O
	PMCn_m	PMn_m	PIPCn_m	
Port mode	0	0	X	O
		1[*1]		I
Software I/O control alternative mode	1	0	0	O
		1	0	I
Direct I/O control alternative mode		X	1	Controlled by the alternative function

Note 1. The input buffer must be enabled (PIBCn_m bit = 1).

- Software I/O control alternative mode (PIPCn.PIPCn_m bit = 0)
  - Output (PMn_m bit = 0): Alternative output mode 1 to Alternative output mode 7
  - Input (PMn_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPCn.PIPCn_m bit = 1)
  - The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

Table 2B.13 Alternative Mode Selection Overview (PMCn.PMCn_m Bit = 1)

	Register					
Mode	PIPC*1	PM*1	PFCAE	PFCE	PFC	I/O
Alternative output mode 1 (ALT-OUT1)	0	0	0	0	0	O
Alternative input mode 1 (ALT-IN1)		1				I
Alternative output mode 2 (ALT-OUT2)		0			1	O
Alternative input mode 2 (ALT-IN2)		1				I
Alternative output mode 3 (ALT-OUT3)		0		1	0	O
Alternative input mode 3 (ALT-IN3)		1				I
Alternative output mode 4 (ALT-OUT4)		0			1	O
Alternative input mode 4 (ALT-IN4)		1				I
Alternative output mode 5 (ALT-OUT5)		0	1	0	0	O
Alternative input mode 5 (ALT-IN5)		1				I
Alternative output mode 6 (ALT-OUT6)		0			1	O
Alternative input mode 6 (ALT-IN6)		1				I
Alternative output mode 7 (ALT-OUT7)		0		1	0	O
Alternative input mode 7 (ALT-IN7)		1				I
Other than the above	Setting prohibited					

Note 1. If PIPCn.PIPCn_m = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

If a pin is in alternative mode (PMCn.PMCn_m bit = 1), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

2B.7.4 Pin Data Input/Output

The registers used for data input/output are described below.

The location that is read via the PPRn register differs depending on the pin mode.

2B.7.4.1 Output Data

In the port mode (PMCn.PMCn_m bit = 0), the value of the Pn.Pn_m bit is output from the Pn_m pin.

2B.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn_m pin, the value of the Pn.Pn_m bit, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits.

The different PPRn read modes are shown in the table below.

Table 2B.14 PPRn_m Read Values

PMC n_m	PM n_m	PIBC n_m	PIPC n_m	PODC n_m	Mode	PPRn_m Read Value
0	1	0	X	X	Port input, input buffer disabled	Pn.Pn_m bit
		1		X	Port input, input buffer enabled	Pn_m pin
	0	X		0	Port push-pull output	Pn.Pn_m bit*1
				1	Port open-drain output	
1	1	X	0	X	Software I/O control alternative input	Pn_m pin
	0			0	Software I/O control alternative push-pull output	Output signal from the alternative function*1
				1	Software I/O control alternative open-drain output	
	X		1	0	Direct I/O control alternative input or push-pull output	I/O port in alternative mode: ● Input: Pn_m pin ● Output: Output signal from the alternative function*1
				1	Direct I/O control alternative input or open-drain output	

Note 1. When PBDCn_m = 1, the level of the Pn_m pin is returned by the PPRn_m bit.

The control registers in the above table have the following effects:

- PMCn.PMCn_m bit
  This bit selects port mode (PMCn_m = 0) or alternative mode (PMCn_m = 1).
- PMn.PMn_m bit
  This bit selects input (PMn_m = 1) or output (PMn_m = 0) when the port mode (PMCn_m = 0) and software I/O control alternative mode (PMCn_m = 1, PIPCn_m = 0) have been selected.
- PIBCn.PIBCn_m bit
  This bit disables (PIBCn_m = 0) or enables (PIBCn_m = 1) the input buffer in input port mode (PMCn_m = 0 and PMn_m = 1). If the input buffer is disabled, PPRn_m reads the Pn.Pn_m bit; otherwise the Pn_m pin level is returned.
- PIPCn.PIPCn_m bit
  This bit selects software I/O control alternative mode or direct I/O control alternative mode.
- PODCn.PODCn_m bit
  This bit selects push-pull output (PODCn_m = 0) or open-drain output (PODCn_m = 1).

- PBDCn.PBDCn_m bit
  In output mode, when this bit is set to 1, the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

CAUTION

When using Pn_m as an alternative output function (PMCn.PMCn_m bit = 1, PMn.PMn_m bit = 0), the level of the Pn_m pin can be read at the PPRn.PPRn_m bit by enabling bidirectional mode (PBDCn.PBDCn_m bit = 1).
Note, however, that the level of the Pn_m pin will be input to the alternative function that the Pn_m pin is being used as.

2B.7.4.3 Writing to the Pn Register

The data to be output via port Pn_m in port mode (PMCn.PMCn_m bit = 0) is held in port register Pn.

Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.
  In this case, new data can be written directly to the Pn register.
- By performing an indirect bitwise operation (a "set", "reset", or "not" operation) on the Pn register.
  An indirect bitwise operation ("set", "reset", or "not") can be performed on the Pn register by using the following two registers:
  - Port Set/Reset register PSRn
    If the PSRn.PSRn (m + 16) bit = 1, the value of the Pn.Pn_m bit is determined by the value of the PSRn.PSRn_m bit.
    In other words, the Pn_m bit can be set or reset without writing directly to the Pn register.
  - Port NOT register PNOTn
    By setting PNOTn.PNOTn_m bit to 1, the Pn.Pn_m bit can be inverted without writing directly to the Pn register.

An indirect bitwise operation on the Pn register ("set", "reset", or "not") has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

2B.8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.

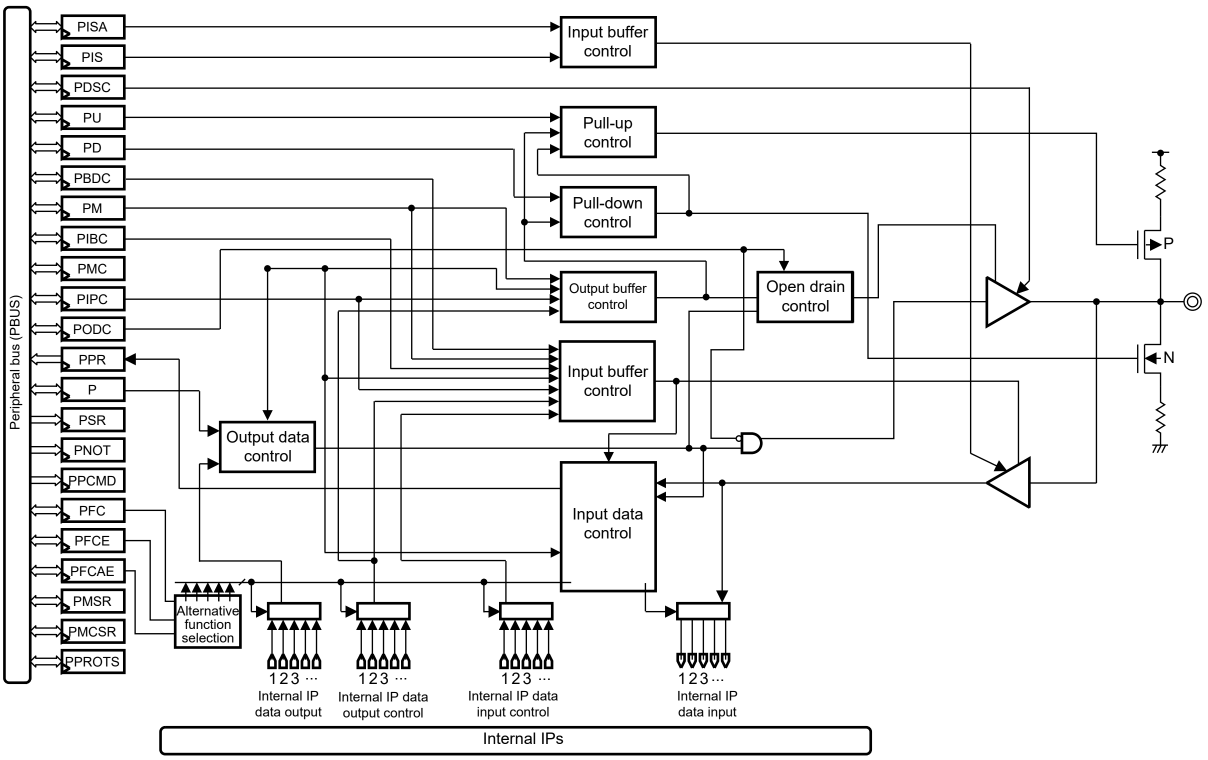

Figure 2B.6 Schematic View of Port Control

CAUTION

Use documented alternative functions only. The behavior and performance are not guaranteed when undocumented alternative functions are selected.

2B.9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

- **Section 2B.9.2, Pin Function Configuration**
- **Section 2B.9.3, Pin Data Input/Output**
- **Section 2B.9.4, Configuration of Electrical Characteristics**

2B.9.1 Overview

The following registers are used for setting the individual pins of the port groups.

For details on <PORTn_base> and <JPORT0_base>, see **Section 2B.6.3, Register Base Addresses**.

Table 2B.15 Port Group Configuration Registers

Module Name	Register Name	Symbol	Address
Pin function configuration			
PORT	Port mode control register	PMCn	<PORTn_base> + 0400_H + n × 4
JTAG		JPMC0	<JPORT0_base> + 0040_H
PORT	Port mode control set/reset register	PMCSRn	<PORTn_base> + 0900_H + n × 4
JTAG		JPMCSR0	<JPORT0_base> + 0090_H
PORT	Port IP control register	PIPCn	<PORTn_base> + 4200_H + n × 4

PORT	Port protection command register	PPCMDn	<PORTn_base> + 4C00$_H$ + n × 4
JTAG		JPPCMD0	<JPORT0_base> + 04C0$_H$
PORT	Port protection status register	PPROTSn	<PORTn_base> + 4B00$_H$ + n × 4
JTAG		JPPROTS0	<JPORT0_base> + 04B0$_H$

Index n

In **Table 2B.15, Port Group Configuration Registers**, the index "n" in register symbols denotes the actual indices of the individual port groups. For example, PMCn generically indicates a port mode control register for port group n (Pn). The values for n differ according to the number of pins on the device in the way shown in **Table 2B.16, Number of Pins on the Device, Name of Port Groups, and Values for "n" in Register Symbols**.

Table 2B.16 Number of Pins on the Device, Name of Port Groups, and Values for "n" in Register Symbols

Number of Pins on the Device	Port Groups	Values for "n"
100 pins	P0, P8, P9, P10, P11	0, 8, 9, 10, 11
	AP0	0
144 pins	P0, P1, P8, P9, P10, P11, P12, P18, P20	0, 1, 8, 9, 10, 11, 12, 18, 20
	AP0, AP1	0, 1
176 pins	P0, P1, P2, P8, P9, P10, P11, P12, P18, P20	0, 1, 2, 8, 9, 10, 11, 12, 18, 20
	AP0, AP1	0, 1
233 pins	P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20	0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20
	AP0, AP1	0, 1
272 pins	P0, P1, P2, P3, P8, P9, P10, P11, P12, P13, P18, P19, P20, P21, P22	0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22
	AP0, AP1	0, 1

JTAG port registers

JTAG port registers are not explicitly described in the following register descriptions.

All descriptions (except for those of the PFCAEn register and PIPCn register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

Value after reset

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

2B.9.2 Pin Function Configuration

2B.9.2.1 PMCn / JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Access:	PMCn: This register can be read or written in 16-bit units. JPMC0: This register can be read or written in 8-bit units.
Address:	PMCn: <PORTn_base> + 0400_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 20) JPMC0: <JPORT0_base> + 0040_H*1
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMC n_15	PMC n_14	PMC n_13	PMC n_12	PMC n_11	PMC n_10	PMC n_9	PMC n_8	PMC n_7	PMC n_6	PMC n_5	PMC n_4	PMC n_3	PMC n_2	PMC n_1	PMC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, and **Table 2B.67, Control Registers (P20)**.

Table 2B.17 PMCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMCn_[15:0]	Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode

CAUTIONS

1. I/O is not controlled by only setting alternative mode (PMCn.PMCn_m bit = 1). If the alternative function requires direct I/O control, also set the PIPCn.PIPCn_m bit to 1.
2. If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLA0CTLm_<*name*>, DNFA<*name*>CTL and the DNFA<*name*>EN register. For details, see **Section 2B.12, Noise Filter & Edge/Level Detector**, and **Section 2B.13, Description of Port Noise Filter & Edge/Level Detection**.

NOTE

The control bits of the JTAG port mode control register (JPMC0) are JPMC0_[7:0].

2B.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.

The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

Access: PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of register PMCn.

JPMCSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000_H. Reading bits 7 to 0 returns the value of register JPMC0.

Address: PMCSRn: <PORTn_base> + 0900_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 20)

JPMCSR0: <JPORT0_base> + 0090_H^{*1}

Value after reset: $0000\ 0000_H$

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, and **Table 2B.67, Control Registers (P20)**.

Table 2B.18 PMCSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMCSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMCSRn_m (PMCSRn_[15:0]) is written to PMCn_m. 0: PMCn_m is not affected by PMCSRn_m. 1: PMCn_m is PMCSRn_m. **Example:** If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15.
15 to 0	PMCSRn_[15:0]	Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1. 0: PMCn_m is 0. 1: PMCn_m is 1.

NOTE

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0_[31:0].

2B.9.2.3 PIPCn — Port IP Control Register

This register specifies whether the I/O direction of the Pn_m pin is controlled by the port mode register PMn.PMn_m or by an alternative function.

If the Pn_m pin is operated in alternative mode (PMCn.PMCn_m = 1) and the alternative function requires direct control of the I/O direction, then PIPCn.PIPCn_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn_m setting.

Regarding the alternative functions for which the PIPC register must be set, see **Section 2B.11, Port (Special I/O) Function Overview**.

Access: This register can be read or written in 16-bit units.

Address: PIPCn: <PORTn_base> + 4200_H + n × 4 (n = 0, 10, 11, 12, 20)*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPCn_15	PIPCn_14	PIPCn_13	PIPCn_12	PIPCn_11	PIPCn_10	PIPCn_9	PIPCn_8	PIPCn_7	PIPCn_6	PIPCn_5	PIPCn_4	PIPCn_3	PIPCn_2	PIPCn_1	PIPCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.43, Control Registers (P0)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11),** and **Table 2B.59, Control Registers (P12)**.

Table 2B.19 PIPCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIPCn_[15:0]	Specifies the I/O mode. 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control).

2B.9.2.4 PMn / APMn / JPM0 — Port Mode Register

This register specifies whether the individual pins of the port group n are in input mode or in output mode.

Access: PMn, APMn: These registers can be read or written in 16-bit units.
JPM0: This register can be read or written in 8-bit units.

Address: PMn: <PORTn_base> + 0300_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22)
APMn: <PORTn_base> + $03C8_H$ + n × 4 (n = 0, 1)
JPM0: <JPORT0_base> + $0030_H{}^{*1}$

Value after reset: $FFFF_H{}^{*2}$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn_15	PMn_14	PMn_13	PMn_12	PMn_11	PMn_10	PMn_9	PMn_8	PMn_7	PMn_6	PMn_5	PMn_4	PMn_3	PMn_2	PMn_1	PMn_0
Value after reset	1	1	1	1	1	1	1	1	1	1^{*3}	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20)**, **Table 2B.69, Control Registers (P21)**, **Table 2B.71, Control Registers (P22)**, **Table 2B.73, Control Registers (AP0)**, and **Table 2B.75, Control Registers (AP1)**.

Note 2. The PM8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8 register is $FFBF_H$.
When the OPBT0.RESETOUTEN = 0, the PM8 register is $FFFF_H$.

Note 3. The PM8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8_6 bit is 0.
When the OPBT0.RESETOUTEN = 0, the PM8_6 bit is 1.

Table 2B.20 PMn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMn_[15:0]	Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled)

NOTES

1. To use a port in input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), the input buffer must be enabled (PIBCn.PIBCn_m = 1).
2. By default, PMn.PMn_m specifies the I/O direction in port mode (PMCn.PMCn_m = 0) and alternative mode (PMCn.PMCn_m = 1), since PIPCn.PIPCn_m = 0 after reset.
3. The control bits of the analog port register (APMn) are APMn_[15:0].
4. The control bits of the JTAG port mode register (JPM0) are JPM0_[7:0].

2B.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.

The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn_m is set by the corresponding bit in the lower 16 bits of PMSRn.

Access: PMSRn, APMSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000$_H$.

Reading bits 15 to 0 returns the value of registers PMn and APMn.

JPMSR0: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000$_H$. Bits 15 to 8 are read as FF$_H$. Reading bits 7 to 0 returns the value of register JPM0.

Address: PMSRn: <PORTn_base> + 0800$_H$ + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22)

APMSRn: <PORTn_base> + 08C8$_H$ + n × 4 (n = 0, 1)

JPMSR0: <JPORT0_base> + 0080$_H$*1

Value after reset: 0000 FFFF$_H$*2

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMSRn_31	PMSRn_30	PMSRn_29	PMSRn_28	PMSRn_27	PMSRn_26	PMSRn_25	PMSRn_24	PMSRn_23	PMSRn_22	PMSRn_21	PMSRn_20	PMSRn_19	PMSRn_18	PMSRn_17	PMSRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMSRn_15	PMSRn_14	PMSRn_13	PMSRn_12	PMSRn_11	PMSRn_10	PMSRn_9	PMSRn_8	PMSRn_7	PMSRn_6	PMSRn_5	PMSRn_4	PMSRn_3	PMSRn_2	PMSRn_1	PMSRn_0
Value after reset	1	1	1	1	1	1	1	1	1	1*3	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20)**, **Table 2B.69, Control Registers (P21)**, **Table 2B.71, Control Registers (P22)**, **Table 2B.73, Control Registers (AP0)**, and **Table 2B.75, Control Registers (AP1)**.

Note 2. The PMSR8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8 register is 0000 FFBF$_H$.
When the OPBT0.RESETOUTEN = 0, the PMSR8 register is 0000 FFFF$_H$.

Note 3. The PMSR8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8_6 bit is 0.
When the OPBT0.RESETOUTEN = 0, the PMSR8_6 bit is 1.

Table 2B.21 PMSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to PMn_m. 0: PMn_m is not affected by PMSRn_m. 1: PMn_m is PMSRn_m. **Example:** If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15.
15 to 0	PMSRn_[15:0]	Data bits that specify the value of PMn_m if PMSRn_m of the corresponding upper bit (PMSRn_[31:16]) is 1. 0: PMn_m is 0. 1: PMn_m is 1.

NOTES

1. The control bits of the JTAG port mode set/reset register (JPMSR0) are JPMSR0_[31:0].
2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn_[31:0].

2B.9.2.6 PIBCn / APIBCn / JPIBC0 / IPIBC0 — Port Input Buffer Control Register

In input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), this register enables the port pin’s input buffer.

Access: PIBCn, APIBCn, IPIBC0: These registers can be read or written in 16-bit units.

JPIBC0: This register can be read or written in 8-bit units.

Address: PIBCn: <PORTn_base> + 4000$_H$ + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22)

APIBCn: <PORTn_base> + 40C8$_H$+ n × 4 (n = 0, 1)

JPIBC0: <JPORT0_base> + 0400$_H$

IPIBC0: <PORTn_base> + 40F0$_H$*1

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBC n_15	PIBC n_14	PIBC n_13	PIBC n_12	PIBC n_11	PIBC n_10	PIBC n_9	PIBC n_8	PIBC n_7	PIBC n_6	PIBC n_5	PIBC n_4	PIBC n_3	PIBC n_2	PIBC n_1	PIBC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20)**, **Table 2B.69, Control Registers (P21)**, **Table 2B.71, Control Registers (P22)**, **Table 2B.73, Control Registers (AP0)**, **Table 2B.75, Control Registers (AP1)** and **Table 2B.77, Control Registers (IP0)**.

Table 2B.22 PIBCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enables/disables the input buffer. 0: Input buffer disabled 1: Input buffer enabled

NOTES

1. When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.
2. The control bits of the JTAG port input buffer control register (JPIBC0) are JPIBC0_[7:0].

CAUTION

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn_m = 1).

2B.9.2.7 PFCn / JPFC0 — Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCn: This register can be read or written in 16-bit units.
JPFC0: This register can be read or written in 8-bit units.

Address: PFCn: <PORTn_base> + 0500_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 13, 18, 20)
JPFC0: <JPORT0_base> + 0050_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFC n_15	PFC n_14	PFC n_13	PFC n_12	PFC n_11	PFC n_10	PFC n_9	PFC n_8	PFC n_7	PFC n_6	PFC n_5	PFC n_4	PFC n_3	PFC n_2	PFC n_1	PFC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, and **Table 2B.67, Control Registers (P20)**.

Table 2B.23 PFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2B.26, Setting Alternative Functions**.

NOTE

The control bits of the JTAG port function control register (JPFC0) are JPFC0_[7:0].

2B.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCEn: This register can be read or written in 16-bit units.
JPFCE0: This register can be read or written in 8-bit units.

Address: PFCEn: <PORTn_base> + 0600_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPFCE0: <JPORT0_base> + 0060_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCEn_15	PFCEn_14	PFCEn_13	PFCEn_12	PFCEn_11	PFCEn_10	PFCEn_9	PFCEn_8	PFCEn_7	PFCEn_6	PFCEn_5	PFCEn_4	PFCEn_3	PFCEn_2	PFCEn_1	PFCEn_0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.63, Control Registers (P18)**, and **Table 2B.67, Control Registers (P20)**.

Table 2B.24 PFCEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCEn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2B.26, Setting Alternative Functions**.

2B.9.2.9 PFCAEn — Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCAEn: This register can be read or written in 16-bit units.

Address: PFCAEn: <PORTn_base> + $0A00_H$ + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 20)*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCAEn_15	PFCAEn_14	PFCAEn_13	PFCAEn_12	PFCAEn_11	PFCAEn_10	PFCAEn_9	PFCAEn_8	PFCAEn_7	PFCAEn_6	PFCAEn_5	PFCAEn_4	PFCAEn_3	PFCAEn_2	PFCAEn_1	PFCAEn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, and **Table 2B.67, Control Registers (P20)**.

Table 2B.25 PFCAEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCAEn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2B.26, Setting Alternative Functions**.

Table 2B.26 Setting Alternative Functions

PFCAEn_m	PFCEn_m	PFCn_m	PMn_m	Function
0	0	0	1	Alternative input mode 1
			0	Alternative output mode 1
		1	1	Alternative input mode 2
			0	Alternative output mode 2
	1	0	1	Alternative input mode 3
			0	Alternative output mode 3
		1	1	Alternative input mode 4
			0	Alternative output mode 4
1	0	0	1	Alternative input mode 5
			0	Alternative output mode 5
		1	1	Alternative input mode 6
			0	Alternative output mode 6
	1	0	1	Alternative input mode 7
			0	Alternative output mode 7
		1	X	Setting prohibited

CAUTION

- After selecting the alternative function by the PFCn_m, PFCEn_m, or PFCAEn_m bit, set the PMCn_m bit to “1”.
- With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited. For example, if the a/b/c pin is used as b, the b/d/e pin cannot be used as b. In this case, the b/d/e pin must be configured as a pin function other than b.

NOTE

For more details on the assignment of each function, see **Section 2B.10.1.2, Control Registers** to **Section 2B.10.15.2, Control Registers**.

2B.9.3 Pin Data Input/Output

2B.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

Access: PBDCn, APBDCn: These registers can be read or written in 16-bit units.
JPBDC0: This register can be read or written in 8-bit units.

Address: PBDCn: <PORTn_base> + 4100_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22)
APBDCn: <PORTn_base> + $41C8_H$ + n × 4 (n = 0, 1)
JPBDC0: <JPORT0_base> + 0410_H[*1]

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDC n_15	PBDC n_14	PBDC n_13	PBDC n_12	PBDC n_11	PBDC n_10	PBDC n_9	PBDC n_8	PBDC n_7	PBDC n_6	PBDC n_5	PBDC n_4	PBDC n_3	PBDC n_2	PBDC n_1	PBDC n_0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20)**, **Table 2B.69, Control Registers (P21)**, **Table 2B.71, Control Registers (P22)**, **Table 2B.73, Control Registers (AP0)**, and **Table 2B.75, Control Registers (AP1)**.

Table 2B.27 PBDCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin. 0: Bidirectional mode disabled 1: Bidirectional mode enabled

CAUTION

- When the Pn_m port is used for the alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m = 0), the level of the Pn_m pin can be read from PPRn.PPRn_m by enabling the bidirectional mode (PBDCn.PBDCn_m = 1).
- However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn_m, PFCEn.PFCEn_m, and PFCAEn.PFCAEn_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

NOTE

The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0_[7:0].

2B.9.3.2 PPRn / APPRn / JPPR0 / IPPR0 — Port Pin Read Register

This register reflects the actual level of the Pn_m pin, whether it is the value of the Pn.Pn_m bit or the level of an alternative output function.

Access:	PPRn, APPRn, IPPR0: These registers are read-only registers that can be read in 16-bit units. JPPR0: This register is a read-only register that can be read in 8-bit units.
Address:	PPRn: <PORTn_base> + 0200_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22) APPRn: <PORTn_base> + $02C8_H$ + n × 4 (n = 0, 1) JPPR0: <JPORT0_base> + 0020_H IPPR0: <PORTn_base> + $02F0_H$*1
Value after reset:	0000_H

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20)**, **Table 2B.69, Control Registers (P21)**, **Table 2B.71, Control Registers (P22)**, **Table 2B.73, Control Registers (AP0)**, **Table 2B.75, Control Registers (AP1)** and **Table 2B.77, Control Registers (IP0)**.

Table 2B.28 PPRn Register Contents

Bit Position	Bit Name	Function
15 to 0	PPRn_[15:0]	The Pn_m Pin, Pn.Pn_m value or alternative function output.

NOTES

1. For the read values of the PPRn register, see **Section 2B.7.4, Pin Data Input/Output**.
2. The control bits of the JTAG port pin read register (JPPR0) are JPPR0_[7:0].

2B.9.3.3 Pn / APn / JP0 — Port Register

This register holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 0).

Access: Pn, APn: These registers can be read or written in 16-bit units.
JP0: This register can be read or written in 8-bit units.

Address: Pn: <PORTn_base> + 0000_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22)
APn: <PORTn_base> + $00C8_H$ + n × 4 (n = 0, 1)
JP0: <JPORT0_base> + 0000_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20)**, **Table 2B.69, Control Registers (P21)**, **Table 2B.71, Control Registers (P22)**, **Table 2B.73, Control Registers (AP0)**, and **Table 2B.75, Control Registers (AP1)**.

Table 2B.29 Pn Register Contents

Bit Position	Bit Name	Function
15 to 0	Pn_[15:0]	Sets the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

NOTE

The control bits of the JTAG port register (JP0) are JP0_[7:0].

2B.9.3.4 PNOTn / APNOTn / JPNOT0 — Port NOT Register

This register allows the Pn_m bit of the port register Pn to be inverted without directly writing to Pn.

Access: PNOTn, APNOTn: These registers are write-only registers that can be written in 16-bit units. When read, 0000_H is returned.

JPNOT0: This register is a write-only register that can be written in 8-bit units. When read, 00_H is returned.

Address: PNOTn: <PORTn_base> + 0700_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22)

APNOTn: <PORTn_base> + $07C8_H$ + n × 4 (n = 0, 1)

JPNOT0: <JPORT0_base> + 0070_H[*1]

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOT n_15	PNOT n_14	PNOT n_13	PNOT n_12	PNOT n_11	PNOT n_10	PNOT n_9	PNOT n_8	PNOT n_7	PNOT n_6	PNOT n_5	PNOT n_4	PNOT n_3	PNOT n_2	PNOT n_1	PNOT n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20)**, **Table 2B.69, Control Registers (P21)**, **Table 2B.71, Control Registers (P22)**, **Table 2B.73, Control Registers (AP0)**, and **Table 2B.75, Control Registers (AP1)**.

Table 2B.30 PNOTn Register Contents

Bit Position	Bit Name	Function
15 to 0	PNOTn_[15:0]	Specifies if Pn.Pn_m is inverted. 0: Pn.Pn_m is not inverted (Pn_m → Pn_m) 1: Pn.Pn_m is inverted ($\overline{\text{Pn\_m}}$ → Pn_m)

NOTE

The control bits of the JTAG port NOT register are JPNOT0_[7:0].

2B.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.

The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn_m is set by the corresponding bit in the lower 16 bits of PSRn.

Access: PSRn, APSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000$_H$. Reading bits 15 to 0 returns the value of registers Pn and APn.

JPSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000$_H$. Reading bits 7 to 0 returns the value of register JP0.

Address: PSRn: <PORTn_base> + 0100$_H$ + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22)

APSRn: <PORTn_base> + 01C8$_H$ + n × 4 (n = 0, 1)

JPSR0: <JPORT0_base> + 0010$_H^{*1}$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20)**, **Table 2B.69, Control Registers (P21)**, **Table 2B.71, Control Registers (P22)**, **Table 2B.73, Control Registers (AP0)**, and **Table 2B.75, Control Registers (AP1)**.

Table 2B.31 PSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PSRn_[31:16]	Specifies whether the value of the corresponding lower bit PSRn_m (PSRn_[15:0]) is written to Pn_m. 0: Pn_m is not affected by PSRn_m 1: Pn_m is PSRn_m **Example:** If PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15.
15 to 0	PSRn_[15:0]	Specifies the Pn_m value if the corresponding upper bit (PSRn_[31:16]) PSRn_m is 1. 0: Pn_m = 0 1: Pn_m = 1

NOTE

The control bits of the JTAG port set/reset register (JPSR0) are JPSR0_[31:0].

2B.9.4 Configuration of Electrical Characteristics

2B.9.4.1 PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

Access: PUn: This register can be read or written in 16-bit units.

JPU0: This register can be read or written in 8-bit units.

Address: PUn: <PORTn_base> + 4300_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11,12, 13, 18, 19, 20, 21, 22)

JPU0: <JPORT0_base> + 0430_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20)**, **Table 2B.69, Control Registers (P21)**, and **Table 2B.71, Control Registers (P22)**.

Table 2B.32 PUn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUn_[15:0]	Specifies whether an internal pull-up resistor is connected to the corresponding pin. 0: No internal pull-up resistor connected 1: An internal pull-up resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-up option register (JPU0) are JPU0_[7:0].

2B.9.4.2 PDn / JPD0 — Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

Access: PDn: This register can be read or written in 16-bit units.
JPD0: This register can be read or written in 8-bit units.

Address: PDn: <PORTn_base> + 4400_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22)
JPD0: <JPORT0_base> + 0440_H^{*1}

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21)**, and **Table 2B.71, Control Registers (P22).**

Table 2B.33 PDn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDn_[15:0]	Specifies whether to connect an internal pull-down resistor to the corresponding pin. 0: No internal pull-down resistor connected 1: An internal pull-down resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPD0) are JPD0_[7:0].

2B.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**. Regarding the alternative functions for which the PDSC register needs to be set, see **Section 2B.11.3.3, Output Buffer Control (PDSC)**.

Access:	PDSCn, JPDSC0: These registers can be read or written in 32-bit units.
Address:	PDSCn: <PORTn_base> + 4600_H + n × 4 (n = 0, 1, 2, 3, 10, 11, 12, 13, 18, 19, 20) JPDSC0: <JPORT0_base> + 0460_H[*1]
Value after reset:	0000 0000_H

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, and **Table 2B.67, Control Registers (P20)**.

Table 2B.34 PDSCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PDSCn_[15:0]	Specifies the port drive strength of the output buffer of the port pin. 0: Lower drive strength (when the frequency output from the pin is 10 MHz or below) 1: High drive strength (when the frequency output from the pin is 40 MHz or less).

2B.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Access: PODCn, JPODC0: These registers can be read or written in 32-bit units.

Address: PODCn: <PORTn_base> + 4500_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22)

JPODC0: <JPORT0_base> + 0450_H*1

Value after reset: 0000 0000_H*2

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PODCn_15	PODCn_14	PODCn_13	PODCn_12	PODCn_11	PODCn_10	PODCn_9	PODCn_8	PODCn_7	PODCn_6	PODCn_5	PODCn_4	PODCn_3	PODCn_2	PODCn_1	PODCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0*3	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21)**, and **Table 2B.71, Control Registers (P22)**.

Note 2. The PODC8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PODC8 register is 0000 0040_H.
When the OPBT0.RESETOUTEN = 0, the PODC8 register is 0000 0000_H.

Note 3. The PODC8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PODC8_6 bit is 1.
When the OPBT0.RESETOUTEN = 0, the PODC8_6 bit is 0.

Table 2B.35 PODCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PODCn_[15:0]	Specifies the output buffer function. 0: Push-pull 1: Open-drain

NOTE

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0_[31:0].

2B.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

Access: PISn: This register can be read or written in 16-bit units.

JPIS0: This register can be read or written in 8-bit units.

Address: PISn: <PORTn_base> + 4700_H + n × 4 (n = 0, 1, 2, 3, 8, 9, 10, 11, 12, 13, 18, 19, 20, 21, 22)

JPIS0: <JPORT0_base> + $0470_H{}^{*1}$

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIS n_15	PIS n_14	PIS n_13	PIS n_12	PIS n_11	PIS n_10	PIS n_9	PIS n_8	PIS n_7	PIS n_6	PIS n_5	PIS n_4	PIS n_3	PIS n_2	PIS n_1	PIS n_0
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.43, Control Registers (P0)**, **Table 2B.45, Control Registers (P1)**, **Table 2B.47, Control Registers (P2)**, **Table 2B.49, Control Registers (P3)**, **Table 2B.51, Control Registers (P8)**, **Table 2B.53, Control Registers (P9)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, **Table 2B.63, Control Registers (P18)**, **Table 2B.65, Control Registers (P19)**, **Table 2B.67, Control Registers (P20), Table 2B.69, Control Registers (P21)**, and **Table 2B.71, Control Registers (P22)**.

Table 2B.36 PISn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISn_[15:0]	Specifies the input buffer Characteristics: 0: Type 1 (SHMT1) 1: Type 2 (SHMT4)

NOTES

1. Details of the definition of type 1 and type 2 are given in **Section 2B.11.3.2, Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)**. For details, also see **Section 47B, Electrical Characteristics of RH850/F1KM-S4** for input buffer characteristics.
2. The control bits of the JTAG port input buffer selection register (JPIS0) are JPIS0_[7:0].

2B.9.4.6 PISAn / JPISA0 — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

Access: PISAn: This register can be read or written in 16-bit units.

JPISA0: This register can be read or written in 8-bit units.

Address: PISAn: <PORTn_base> + $4A00_H$ + n × 4 (n = 10, 11, 12, 13, 18)

JPISA0: <JPORT0_base> + $04A0_H$^{*1}

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PISAn_15	PISAn_14	PISAn_13	PISAn_12	PISAn_11	PISAn_10	PISAn_9	PISAn_8	PISAn_7	PISAn_6	PISAn_5	PISAn_4	PISAn_3	PISAn_2	PISAn_1	PISAn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2B.10, Port (General I/O) Function Overview**: **Table 2B.41, Control Registers (JP0)**, **Table 2B.55, Control Registers (P10)**, **Table 2B.57, Control Registers (P11)**, **Table 2B.59, Control Registers (P12)**, **Table 2B.61, Control Registers (P13)**, and **Table 2B.63, Control Registers (P18)**.

Table 2B.37 PISAn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISA_[15:0]	Specifies the input buffer characteristics: 0: Type 2 (SHMT4) 1: Type 5 (TTL)

Table 2B.38 Port Input Selection Advanced Register Contents

PISAn	PISn	Function
0	0	Type 1 input buffer is selected (SHMT1)
	1	Type 2 input buffer is selected (SHMT4)
1	X	Type 5 input buffer is selected (TTL)

NOTE

Details of the definition of type 2 and type 5 are given in **Section 2B.11.3.2, Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)**. For details, also see **Section 47B, Electrical Characteristics of RH850/F1KM-S4** for input buffer characteristics.

2B.9.5 Port Register Protection

RH850/F1KM has Port Protection Command Registers (PPCMDn) and Port Protection Status Registers (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see **Section 5, Write-Protected Registers**.

2B.9.6 Flowchart Examples for Port Settings

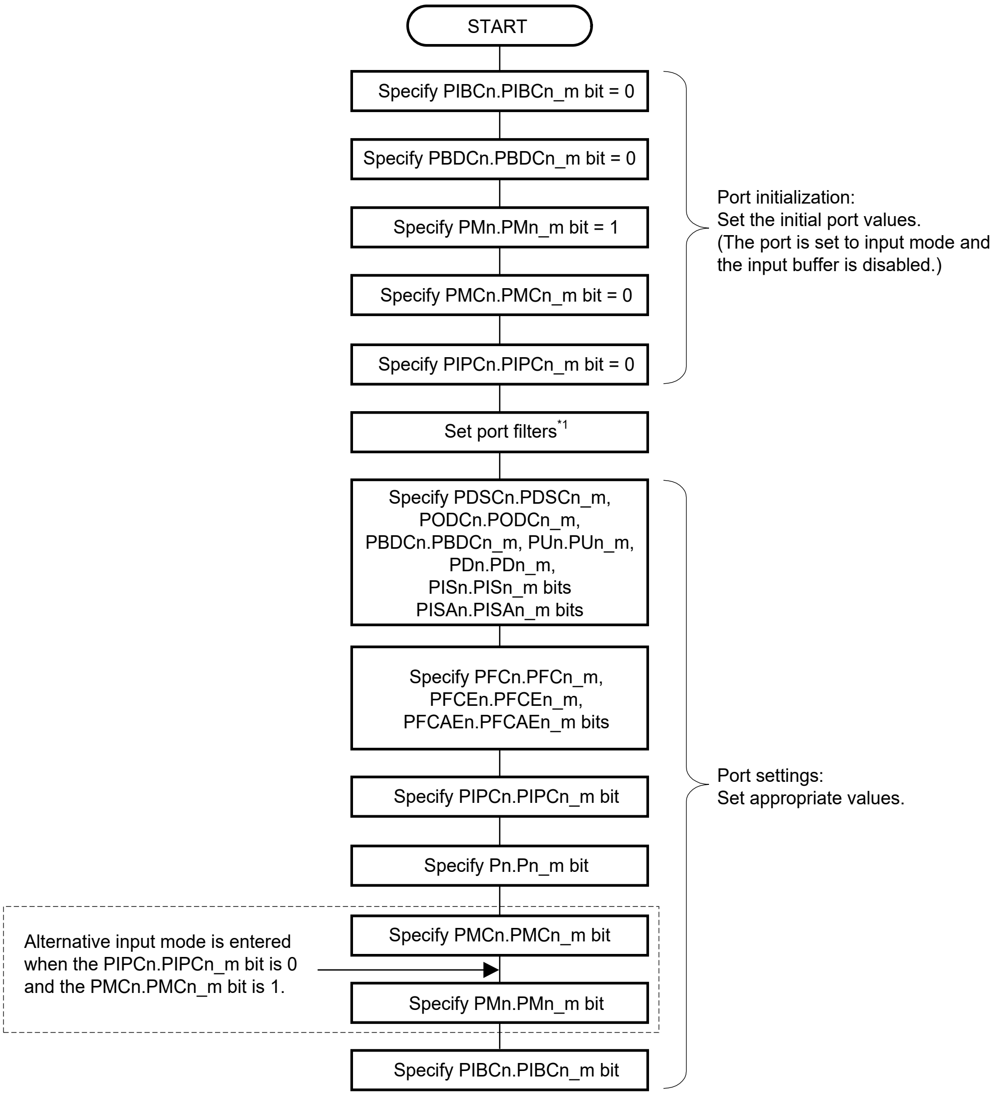
Examples of the port settings are shown in the flowchart below.

CAUTION

If the port is set to the PIPCn.PIPCn_m = 0 and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCn.PMCn_m bit is set to 1 and when the PMn.PMn_m bit is set to 0. If an interrupt-related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.

2B.9.6.1 Batch Setting

An example of specifying batch port settings is shown in the flowchart below.



Note 1. While PMC = 0, an interrupt may be triggered during the configuration of the port registers under the following conditions:

For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.

For INTP0-6 and INTP9-23 interrupt requests:

- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.

In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2B.7 Example of Port Settings (When Specified in Batch)

2B.9.6.2 Individual Settings

An example of specifying individual port settings is shown in the flowchart below.

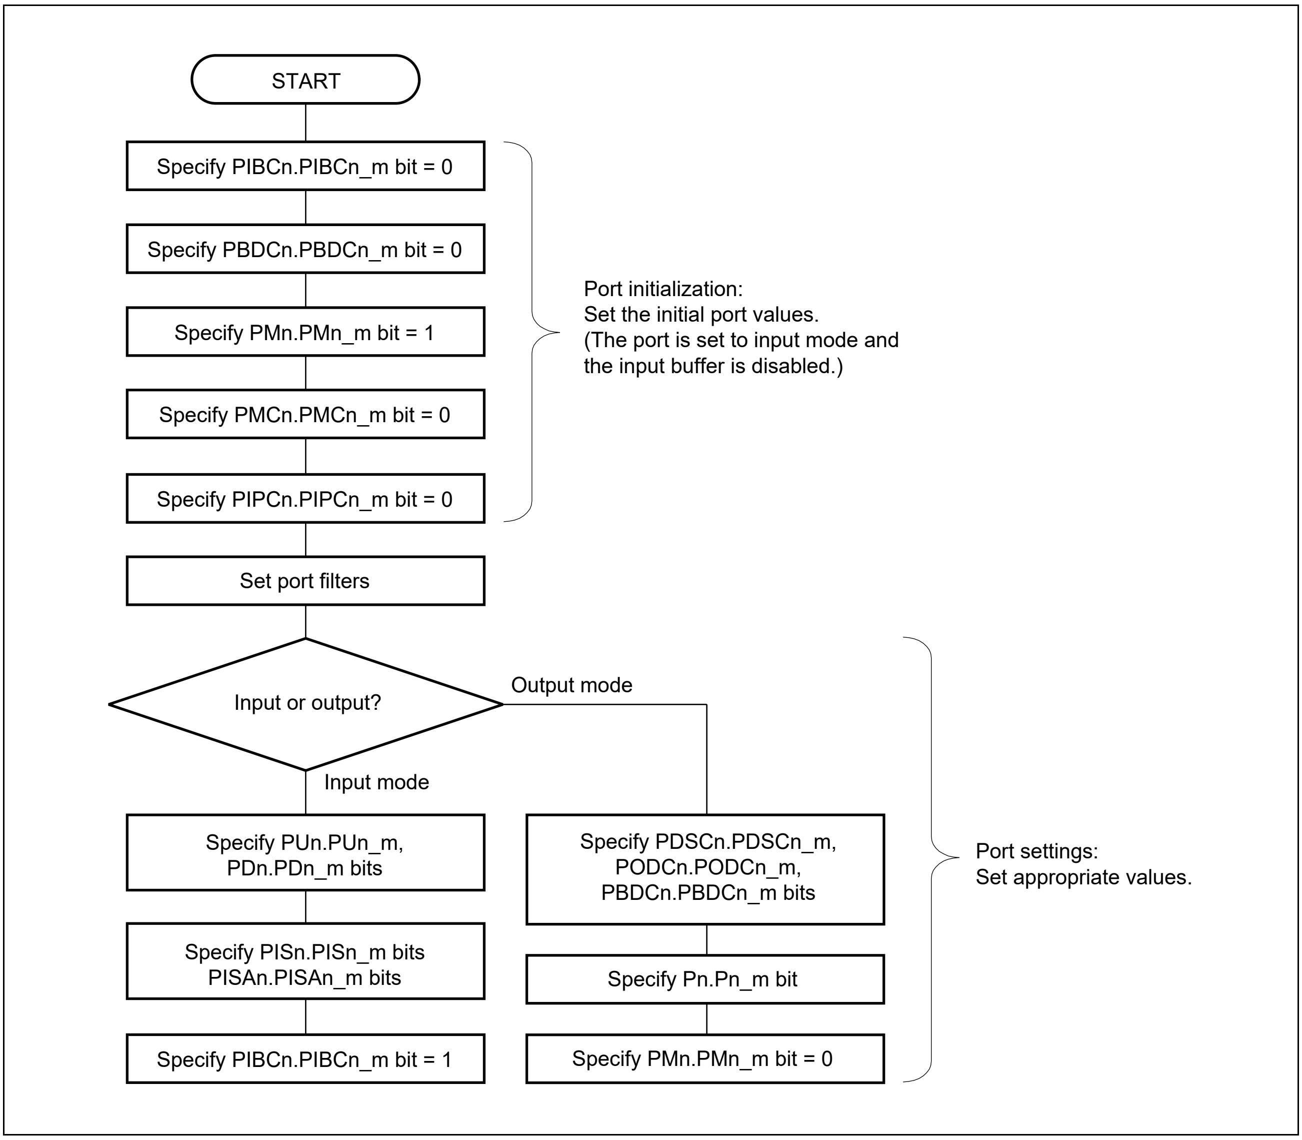


Figure 2B.8 Example of Port Settings (in Port Mode)

(1) With IP Control

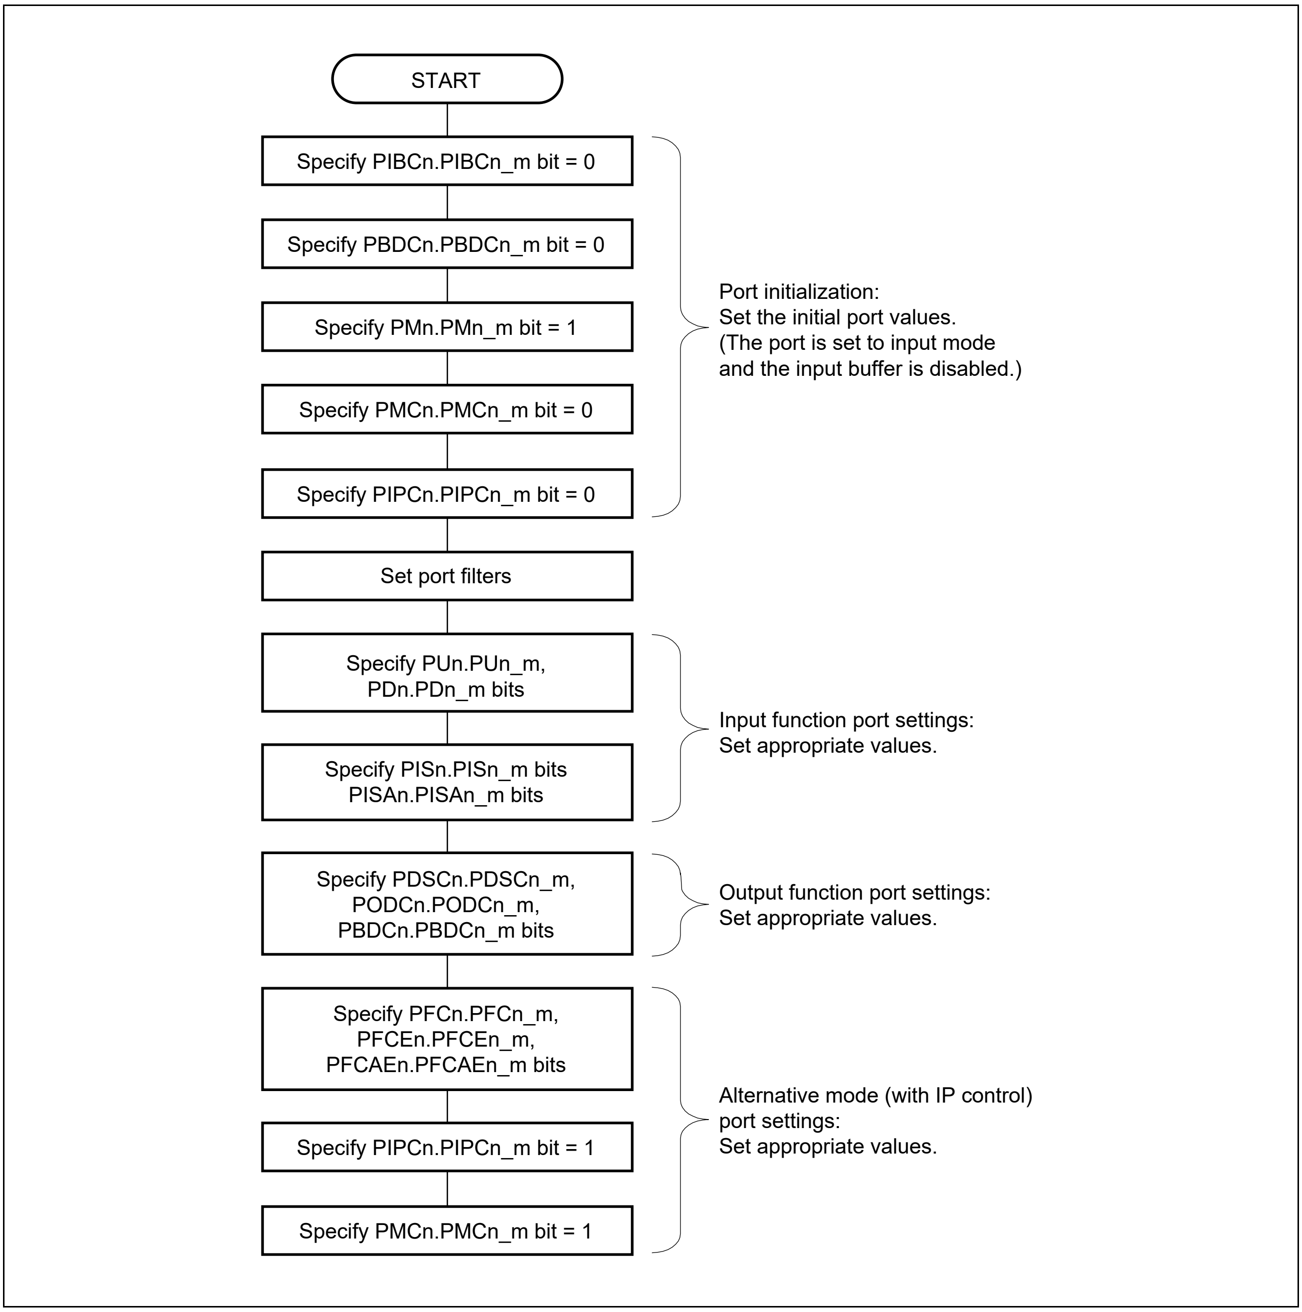

Figure 2B.9 Example of Port Settings (in Alternative Mode)

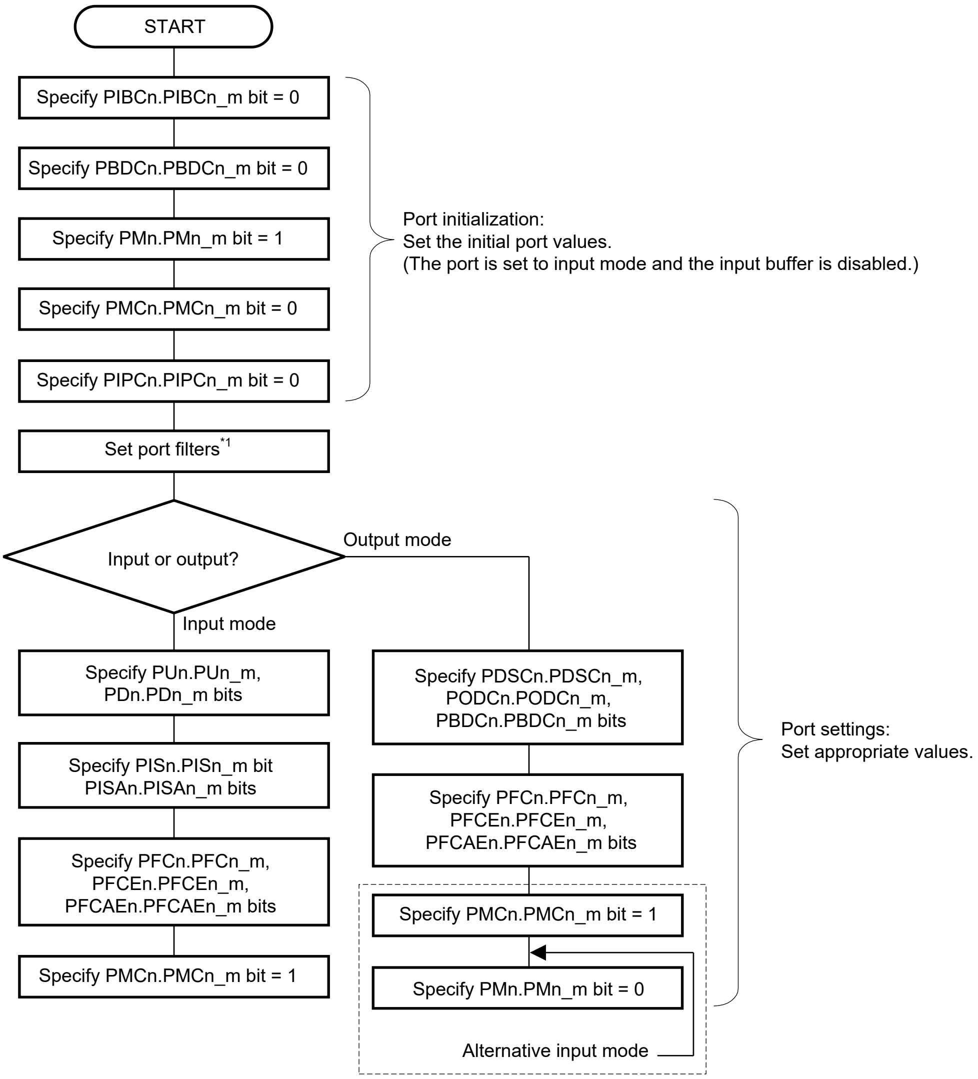
(2) Without IP Control



Note 1. While PMC = 0, an interrupt may be triggered during the configuration of the port registers under the following conditions:

For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.

For INTP0-6 and INTP9-23 interrupt requests:

- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.

In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2B.10 Example of Port Settings (in Alternative Mode)

2B.10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCn register setting. When PMCn.PMCn_m = 1, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

Table 2B.39 Port Function

Port	Pin Name	Size	Direction	Power Domain	Special Alternative Function	Device				
						100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
JTAG Port 0	JP0_0 - 5	6 bits	In/Out	AWO	JTAG, LPD	✓	—	—	—	—

2B.10.1 JTAG Port 0 (JP0)

2B.10.1.1 Alternative Function

The following alternative functions are available when JTAG port 0 is configured as a general-purpose I/O port by setting OPJTAG[1:0] on the corresponding option byte to 00_B.

Table 2B.40 JTAG Port 0 (JP0)

Port Mode (JPMC0_m = 0)	Alternative Mode (JPMC0_m = 1)										ADC	Special Function	PKG No.				
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative				100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output							
JP0_0*[1]	INTP0		TAUJ2I0	TAUJ2O0	FPDR	FPDT						DCUTDI/LPDI/LPDIO	28	39	47	U4	V5
JP0_1	INTP1		TAUJ0I0	TAUJ0O0		FPDT						DCUTDO/LPDO	27	38	46	P5	W4
JP0_2	INTP2		TAUJ0I1	TAUJ0O1	FPCK							DCUTCK/LPDCLK	26	37	45	T4	U5
JP0_3	INTP3	CSCXFOUT	TAUJ0I2	TAUJ0O2								DCUTMS	25	36	44	R4	V4
JP0_4												$\overline{\text{DCUTRST}}$	24	35	43	R3	Y3
JP0_5	NMI	RTCA0OUT	TAUJ0I3	TAUJ0O3								$\overline{\text{DCURDY}}$ /LPDCLKOUT	23	34	42	U3	W3
JP0_6												$\overline{\text{EVTO}}$	—	54	66	U11	W11

Note 1. In LPD (1 pin) mode, the JP0_0 output buffer state is Open-drain.

CAUTION

The behavior and performance are not guaranteed when alternative functions are not assigned to the register.

2B.10.1.2 Control Registers

Table 2B.41 Control Registers (JP0)

CAUTIONS

1. The behavior and performance are not guaranteed when undocumented alternative functions are selected.
2. Use ADC functions with their initial settings. For details, see **Table 2B.51, Control Registers (P8)**.
3. When the $\overline{\text{RESETOUT}}$ function is selected for the P8_6 pin, the output on the pin is at the low level during a reset and after release from the reset state. For details, see **Section 2B.11.1.1, P8_6: $\overline{\text{RESETOUT}}$** .

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

CAUTION

P8_6 drives a low level after any kind of reset release, until it is later configured differently by register settings. For details, see **Section 2B.11.1.1, P8_6: $\overline{\text{RESETOUT}}$** .

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device				
			Position	R/W*1			100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
IPPR0	Input port pin read register 0	16	0	R	$02F0_H$	0000_H	—	✓	✓	✓	✓
IPIBC0	Port input buffer control register 0	16	0	R/W	$40F0_H$	0000_H	—	✓	✓	✓	✓

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset

CAUTION

When the IP0_0/XT2 pin is used as an input port, set the IPIBC0.0 bit to 1 and stop the SOSC operation. For details on the settings for SOSC operations, see **Section 12AB.4.2.7, SOSCE — SubOSC Enable Register**. When the IP0_0/XT2 pin is used for the SubOSC (SOSC) not as an input port, set the IPIBC0.0 bit to 0.

2B.11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

2B.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

2B.11.1.1 P8_6: $\overline{\text{RESETOUT}}$

The P8_6 pin ($\overline{\text{RESETOUT}}$ signal) changes PM8.PM8_6 and PODC8.PODC8_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.

(Case 1): OPBT0.RESETOUTEN = 1

- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 0: Output mode
- PODC8.PODC8_6 = 1: Open-drain

(Case 2): OPBT0.RESETOUTEN = 0

- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 1: Input mode
- PODC8.PODC8_6 = 0: Push-pull

For detail of OPBT0.RESETOUTEN register, see **Section 44.9.2, OPBT0 — Option Byte 0**, also see **Section 9BC.1.3, Reset Output ($\overline{\text{RESETOUT}}$)**.

When the P8_6 pin setting is updated with another value, the pin operates by new setting.

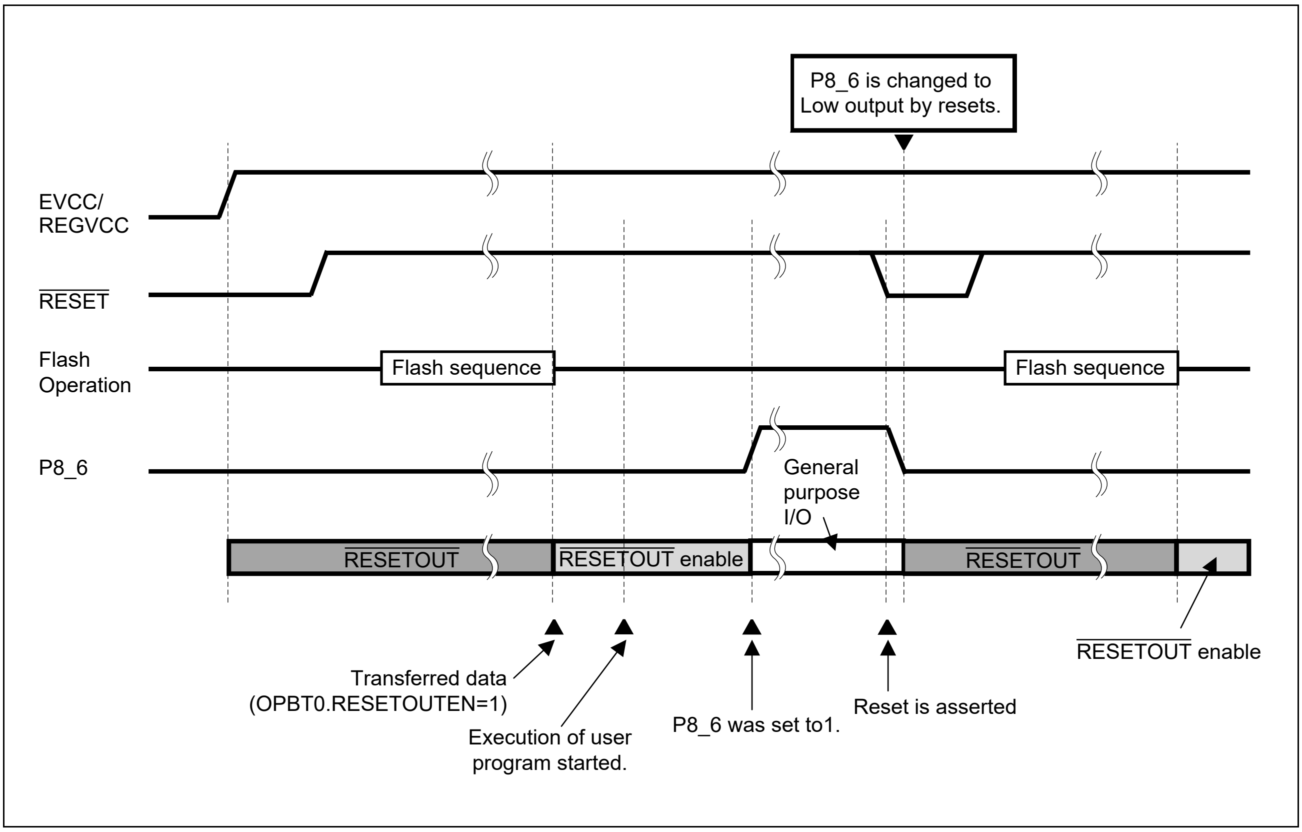

Figure 2B.11 P8_6 Pin ($\overline{\text{RESETOUT}}$ Signal) Operation While a Reset is asserted and released: (Case 1) OPBT0.RESETOUTEN setting is 1

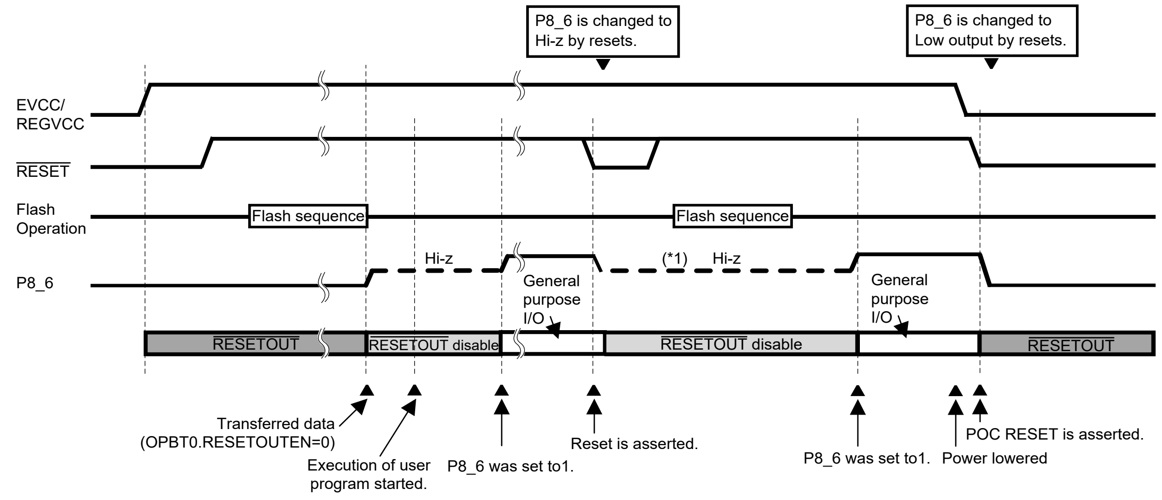

Note 1. When a reset except POC reset occurs with $\overline{\text{RESETOUT}}$ disable (OPBT0.RESETOUTEN = 0), P8_6 pin ($\overline{\text{RESETOUT}}$ signal) will be changed to Hi-z.

Figure 2B.12 P8_6 Pin ($\overline{\text{RESETOUT}}$ Signal) Operation While a Reset is asserted and released: (Case 2) OPBT0.RESETOUTEN setting is 0

2B.11.1.2 JP0_0 to JP0_6: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

Table 2B.78 Debug Interface

OPJTAG1	OPJTAG0	Mode	JP0_0	JP0_1	JP0_2	JP0_3	JP0_4	JP0_5	JP0_6
1	1	Nexus I/F	DCUTDI input	DCUTDO output	DCUTCK input	DCUTMS input	$\overline{\text{DCUTRST}}$ input	$\overline{\text{DCURDY}}$ output	$\overline{\text{EVTO}}$ output
0	1	LPD (4 pins)	LPDI input	LPDO output	LPDCLK input	Port/ alternative function	Port/ alternative function	LPDCLK OUT output	Port/ alternative function
1	0	LPD (1 pin)	LPDIO input/output	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function

NOTE

For the OPJTAG[1:0] settings, see **Section 44.9.2, OPBT0 — Option Byte 0**.

2B.11.1.3 FPDR(JP0_0), FPDT(JP0_1), FPCK(JP0_2): Flash Programmer

These pins are used for connecting a flash programmer. See *Flash Programmer's Manual* for details.

2B.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10_8: FLMD1 pin can select serial programming mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_2: MODE1 and the P10_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_6: MODE2, the P10_2: MODE1 and the P10_1: MODE0 pins can select user boot mode.

For details on the mode selection, see **Section 6, Operating Mode**.

2B.11.1.5 IP0_0: XT2

This pin is the SubOSC (SOSC) input pin. When the IPIBC0_0 bit = 1, the IP0_0/XT2 pin is used as an input port. If you make this setting, stop SOSC operation at the same time.

2B.11.2 A/D Input Alternative I/O

The following ports are permanently connected to A/D input functions. (However, an analog input to the A/D is controlled by the A/D module.)

Table 2B.79 A/D Input Alternative Pins

Port	A/D Input	Device				
		100 Pins	144 Pins	176 Pins	233 Pins	272 Pins

2B.11.3 Special I/O Control

2B.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.

The following table lists all alternative functions where PIPCn.PIPCn_m must be set to 1.

For details, see **Section 2B.9.2.3, PIPCn — Port IP Control Register**.

Table 2B.80 Alternative Modes that Require Setting PIPCn.PIPCn_m = 1

Function	Alternative functions Name	Port Name	Power Supply Area	Control	Reference Section

2B.11.3.2 Input Buffer Control (PISn/JPIS0, PISAn/JPISA0)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/PISAn/JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type 1/2 or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in **Table 2B.82, JTAG Port Input Buffer Characteristics Selection**.

Table 2B.81 Port Input Buffer Characteristics Selection

Note 1. TTL is selected for Boundary scan mode without JPISA0 register setting.

Note 2. TTL is selected for Nexus in normal operating mode without JPISA0 register setting.

Note 3. TTL is selected for LPD (4 pins) in normal operating mode without JPISA0 register setting.

Note 4. TTL is selected for LPD (1 pin) in normal operating mode without JPISA0 register setting.

NOTES

1. For the SHMT1, SHMT4 and TTL pin characteristics, see **Section 47B, Electrical Characteristics of RH850/F1KM-S4**.
2. For the input buffer after reset, Type 2 (SHMT4) is selected.

2B.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

Table 2B.83 Output Buffer Characteristics Selection

Port Name	Output Drive Strength Selection		Device

Note 1. Supports Cload: 100 pF (The load capacitance of CSIH0 is 100 pF.)

Note 2. Supports Cload: 50 pF (The load capacitance of CSIH1 to CSIH3 are 50 pF.)

Note 3. In some of the functions, Fast mode or Slow mode is specified. For details, see **Section 47B.5, AC Characteristics**.

2B.12 Noise Filter & Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1KM supports both analog and digital filters.

It also supports the function for edge and level detection after the signals have passed through a filter.

The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter & edge/level detection control registers and control bits, and register addresses.

For details on the digital/analog filter function and noise filter & edge/level detection control registers, see **Section 2B.13, Description of Port Noise Filter & Edge/Level Detection**.

NOTE

In this section, <*name*> in the noise filter control register represents the peripheral function connected to a filter.

2B.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

2B.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

- Filter control register FCLA0CTLm_<*name*> (m = 0 to 7)
  A dedicated FCLA0CTLm_<*name*> register is provided for each pin in a port that incorporates an analog filter.

Table 2B.84 Input Pins that Incorporate Analog Filter Type A

		FCLA0CTL Register Configuration		Device				
Module Name	Input Pin	Register	Address	100 Pins	144 Pins	176 Pins	233 Pins	272 Pins

$\overline{\text{DCUTRST}}$

2B.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm_<*name*> (m = 0 to 2)
  Each port with a digital filter has a special FCLA0CTLm_<*name*> register.
- Digital noise elimination control register DNFA<*name*>CTL
  Each DNFA<*name*>CTL control register controls digital filter processing for three input signals per group.
- Digital noise elimination enable register DNFA<*name*>EN
  The setting of the DNFA<*name*>ENL[2:0] bits in DNFA<*name*>EN enables or disables digital noise elimination for three input signals per group.

Table 2B.87 Input Pins that Incorporate Digital Filter Type D

	Device					Digital Noise Elimination Control Register		Digital Noise Elimination Enable Register			Filter Control Register	
Input Pin	100 Pins	144 Pins	176 Pins	233 Pins	272 Pins	Control Register	Address	Control Register	Control Bit	Address	Control Register	Address

2B.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA<*name*>CTL
  Each DNFA<*name*>CTL control register controls digital filter processing for up to 16 input signals per group.
- Digital noise elimination enable register DNFA<*name*>EN
  The setting of the DNFA<*name*>ENL[7:0] and DNFA<*name*>ENH[7:0] bits in DNFA<*name*>EN enables or disables digital noise elimination for up to 16 input signals per group.

RSENTn	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—

Note 1. Power Domain

NOTE

For the Setting Register, see **Section 12AB.4.3, Clock Selector Control Register.**

2B.13 Description of Port Noise Filter & Edge/Level Detection

External signals pass through different types of filters according to the use of each external input signal.

NOTE

In this section, <*name*> in the noise filter control register represents the peripheral function connected to a filter.

2B.13.1 Overview

2B.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.
  Used for external interrupt signals.
- Type B: An analog filter
  Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.
- Type C: An analog filter only
  Used for the external RESET input and mode signals.

2B.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection.
  Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function.
  Used for the timer input signals and encoder input signals.

2B.13.2 Analog Filters

2B.13.2.1 Analog Filter Characteristic

See **Section 47B, Electrical Characteristics of RH850/F1KM-S4** for the input conditions for signals input to pins that incorporate an analog filter.

2B.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm_<*name*> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in **Table 2B.84, Input Pins that Incorporate Analog Filter Type A**.

2B.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.

The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

(1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

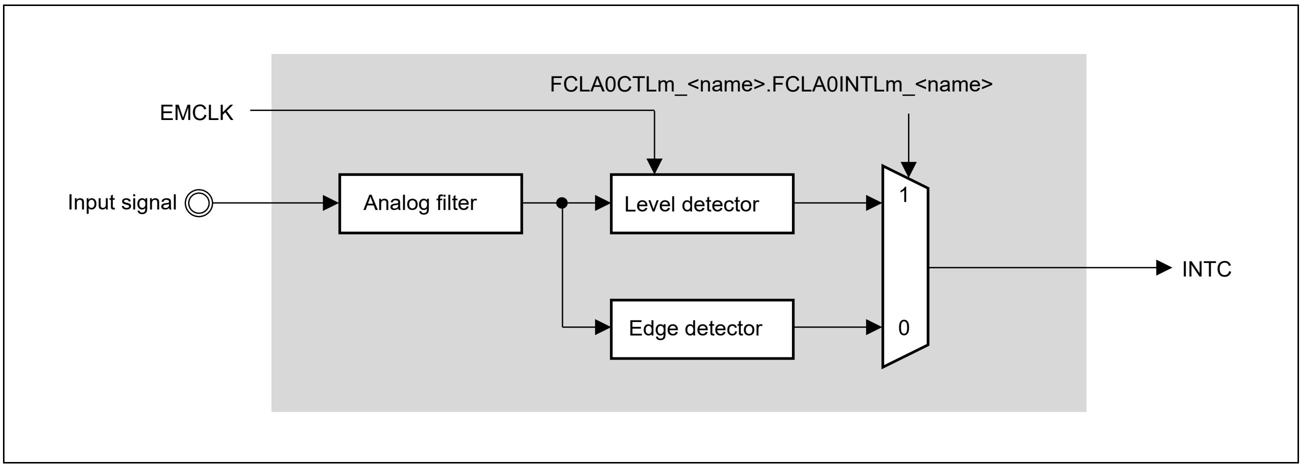

Figure 2B.13 Block Diagram of Analog Filter Type A

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit FCLA0CTLm_<*name*>.FCLA0INTLm_<*name*>.

- FCLA0INTLm_<*name*> bit = 0: Edge detection

  Whether a rising or falling edge is detected can be specified by setting the FCLA0CTLm_<*name*>.FCLA0INTRm_<*name*> and FCLA0CTLm_<*name*>.FCLA0INTFm_<*name*> bits.

- FCLA0INTLm_<*name*> bit = 1: Level detection

  The detection of a high level or low level can be specified by setting FCLA0CTLm_<*name*>.FCLA0INTRm_<*name*> bit.

The table below summarizes the detection conditions of the analog filter.

Table 2B.90 Analog Filter Event Detection Conditions

FCLA0INTLm_<name>	FCLA0INTFm_<*name*>	FCLA0INTRm_<*name*>	Edge Detection	Level Detection
0	0	0	No edge detected	Disabled
	0	1	Rising edge	
	1	0	Falling edge	
	1	1	Rising and falling edges	
1	X	0	Disabled	Low level
	X	1		High level

Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

(2) Analog filter type B

A block diagram of analog filter type B is shown below.

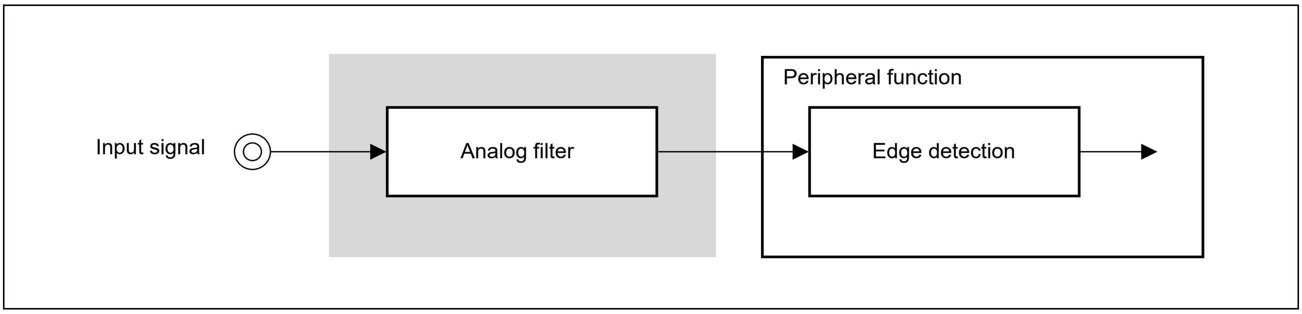

Figure 2B.14 Block Diagram of Analog Filter Type B

Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

(3) Analog filter type C

A block diagram of analog filter type C is shown below.

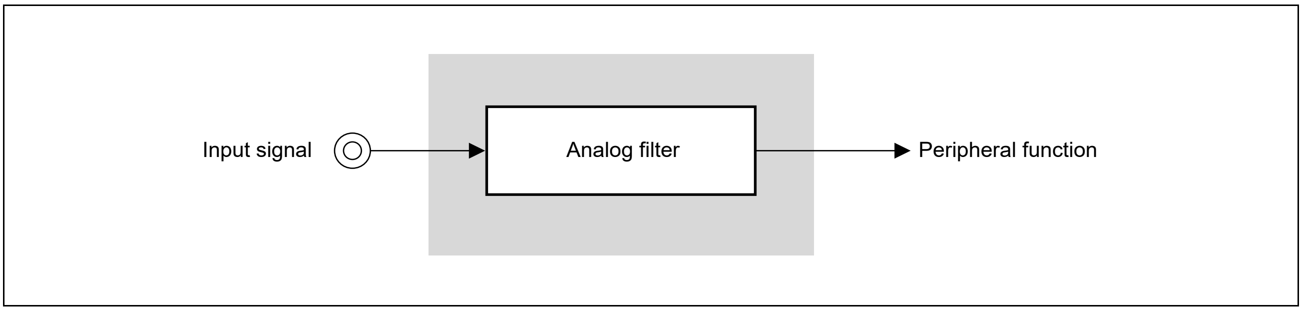

Figure 2B.15 Block Diagram of Analog Filter Type C

The generated signals are always input signals that have passed through an analog filter.

Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

2B.13.3 Digital Filters

2B.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.

The input signal is sampled with the sampling frequency fs.

If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFA<*name*>CTL.DNFA<*name*>PRS[2:0] select the sampling frequency based on

  $f_s = f_{DNFATCKI} / 2^{DNFA<name>PRS[2:0]}$
  where fDNFATCKI is the frequency of the DNFATCKI clock.

- DNFA<*name*>CTL.DNFA<*name*>NFSTS[1:0] determines the number of same level samples, “s”, (2 to 5):

  s = DNFA<*name*>NFSTS[1:0] + 2

External signal pulses shorter than the following are suppressed at all times.

$s \times 1/f_s$

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

$(s + 1) \times 1/f_s$

External signal pulses in the following range may be suppressed or judged as valid.

$s \times 1/f_s$ to $(s + 1) \times 1/f_s$

The filter operation is illustrated in the figure below with DNFA<*name*>NFSTS[1:0] = 01_B, i.e. s = 3 same level samples.

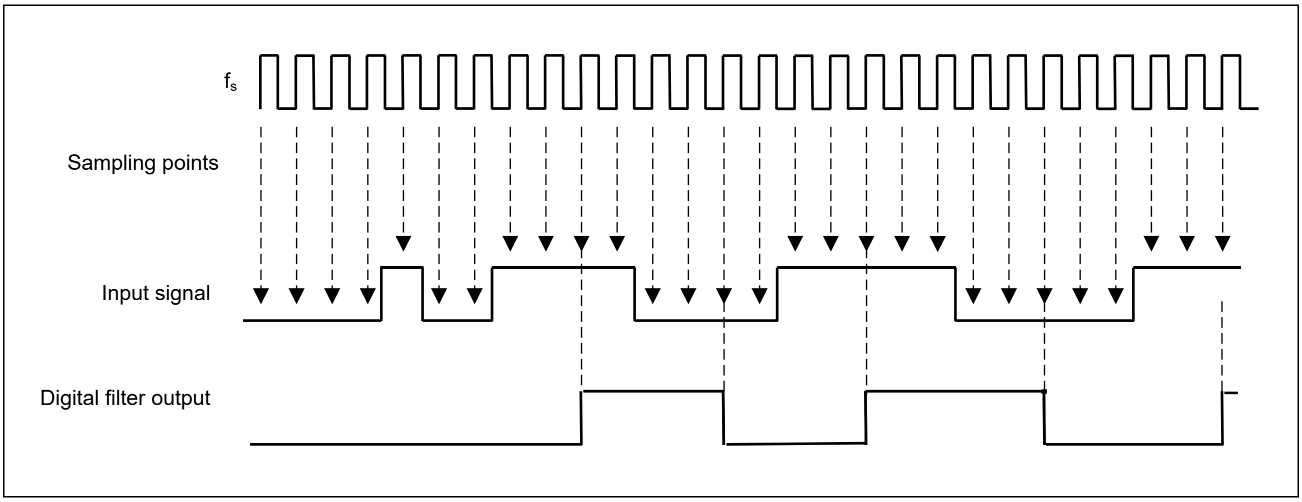

Figure 2B.16 Digital Filter Function

2B.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.

The digital filter characteristics, specified by DNFA<*name*>CTL.DNFA<*name*>PRS[2:0] and DNFA<*name*>NFSTS[1:0] apply to the signals.

However, the digital filter for each signal can be enabled or disabled separately by DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7).

CAUTIONS

1. When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) = 1 and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7) = 1) for the port pin to switch to the alternative function.
   s = DNFA<*name*>NFSTS[1:0] + 2
   $s \times 1/f_s + 2 \times 1/f_{DNFATCKI}$
2. When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) = 1 and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7) = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.
   $s \times 1/f_s + 3 \times 1/f_{DNFATCKI}$

2B.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.
Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

2B.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA<*name*>CTL and digital noise elimination enable register DNFA<*name*>EN are used to set all the filters in the same group (<*name*> = peripheral function group).

The DNFA<*name*>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <*name*>.

The DNFA<*name*>EN register enables/disables each filter by setting the corresponding bit in DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTLm_ADCn registers are ordered in groups of 3 registers with the same index n. The register index n is in 0 or 1.

The assignment of the input signals to the control registers and their addresses are given in **Table 2B.87, Input Pins that Incorporate Digital Filter Type D** and **Table 2B.88, Input Pins that Incorporate Digital Filter Type E** in **Section 2B.12.1, Port Filter Assignment**.

CAUTION

Do not change any control register settings while the corresponding digital filter is enabled by DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) = 1 and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7) = 1. Otherwise an unintended filter output may be generated.

(1) Digital filter type D

A block diagram of digital filter type D is shown below.

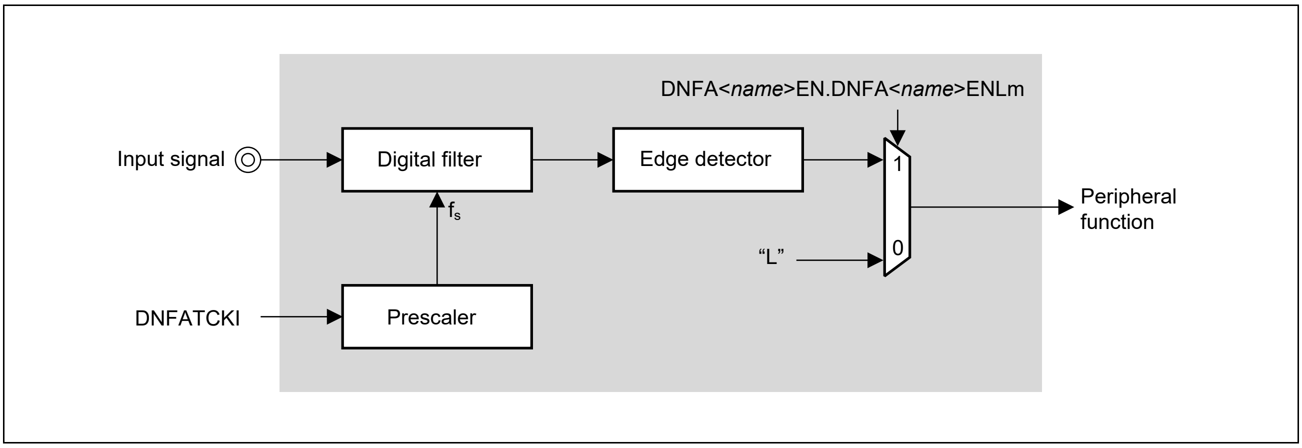

Figure 2B.17 Block Diagram of Digital Filter Type D

The generated signal depends on the register setting, as shown in the following table.

Table 2B.91 Output Options for Digital Filter Type D

DNFA<*name*>EN.DNFA<*name*>ENLm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

(2) Digital filter type E

A block diagram of digital filter type E is shown below.

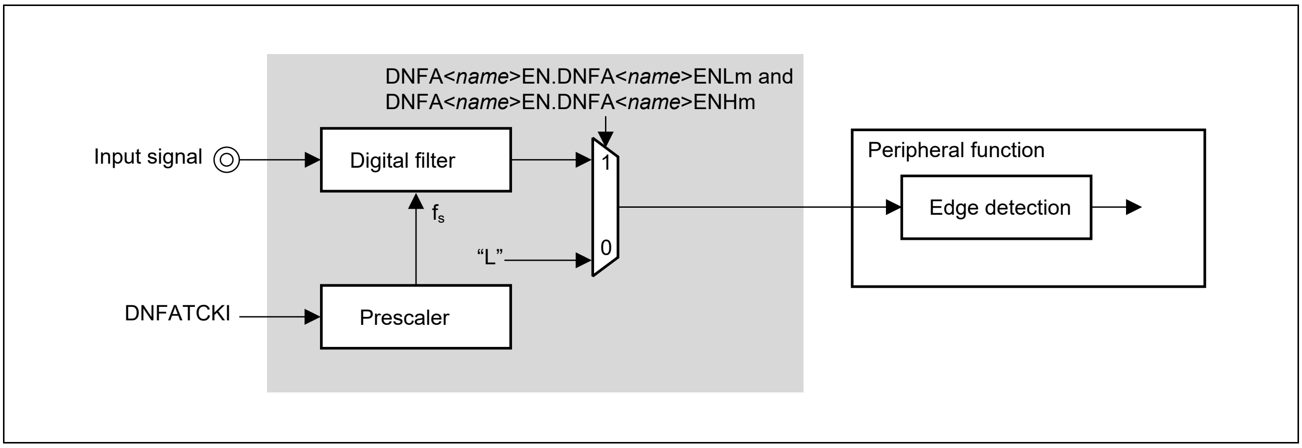

Figure 2B.18 Block Diagram of Digital Filter Type E

The generated signal depends on the register setting, as shown in the following table.

Table 2B.92 Output Options for Digital Filter Type E

DNFA<*name*>EN.DNFA<*name*>ENLm and DNFA<*name*>EN.DNFA<*name*>ENHm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

2B.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:

Table 2B.93 List of Filter Registers

Module Name	Register Name	Symbol	Address
FCLA0	Filter control register m	FCLA0CTLm_<name>	The addresses are shown in the tables in **Section 2B.12.1, Port Filter Assignment**.
DNF	Digital noise elimination control register	DNFA<name>CTL	
	Digital noise elimination enable register	DNFA<name>EN	
	Digital noise elimination enable H register	DNFA<name>ENH	
	Digital noise elimination enable L register	DNFA<name>ENL	

2B.13.4.1 FCLA0CTLm_<name> — Filter Control Register

This register controls the analog and digital filter operation.

Access: This register can be read or written in 8-bit units.

Address: The allocation of input signals to FCLA0CTLm_<name> registers and the address of each register are shown in the tables in **Section 2B.12.1, Port Filter Assignment**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

Table 2B.94 FCLA0CTLm_<name> Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	FCLA0INTLm _<name>	Detection Mode Selection 0: Edge detection 1: Level detection **NOTE:** This bit is only valid for analog filter type A.
1	FCLA0INTFm _<name>	● In level detection mode (FCLA0INTLm_<name> = 1): This bit has no effect. ● In edge detection mode (FCLA0INTLm_<name> = 0): Falling edge detection control 0: Falling edge detection disabled 1: Falling edge detection enabled **NOTE:** This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.
0	FCLA0INTRm _<name>	● In level detection mode (FCLA0INTLm_<name> = 1): Detected level selection 0: Low level detection 1: High level detection ● In edge detection mode (FCLA0INTLm_<name> = 0): Rising edge detection control 0: Rising edge detection disabled 1: Rising edge detection enabled **NOTE:** This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.

CAUTION

Digital filter type D: Always set bit 2 to “0”.

2B.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 8-bit units.

Address: For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see **Table 2B.87, Input Pins that Incorporate Digital Filter Type D** and **Table 2B.88, Input Pins that Incorporate Digital Filter Type E** in **Section 2B.12.1, Port Filter Assignment.**

2B.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 16-bit units.

The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

Address: For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see **Table 2B.87, Input Pins that Incorporate Digital Filter Type D** and **Table 2B.88, Input Pins that Incorporate Digital Filter Type E** in **Section 2B.12.1, Port Filter Assignment.**

2B.13.4.4 DNFA<name>ENH – Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>EN register.

NOTE

This register is only valid for digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see **Table 2B.88, Input Pins that Incorporate Digital Filter Type E** in **Section 2B.12.1, Port Filter Assignment.**

Value after reset: 00_H

For details of the respective bit functions, see **Section 2B.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register**.

2B.13.4.5 DNFA<name>ENL – Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name>EN register.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see **Table 2B.87, Input Pins that Incorporate Digital Filter Type D** and **Table 2B.88, Input Pins that Incorporate Digital Filter Type E** in **Section 2B.12.1, Port Filter Assignment**.

2C.2 Pin Description

Table 2C.5 Pin Functions

	No. of Pins						
Pin Name	48 Pins	64 Pins	80 Pins	100 Pins	IO	Pin Function	Unit
A0VREF	✓	✓	✓	✓	—	ADCAn voltage supply and reference voltage	ADCAn
A0VSS	✓	✓	✓	✓	—	ADCAn ground	
ADCA0Im	✓	✓	✓	✓	I	ADCA0 input channel m with 12-bit resolution	
	m = 0 to 7	m = 0 to 9	m = 0 to 10	m = 0 to 15			
ADCA0ImS	✓	✓	✓	✓	I	ADCA0 input channel m with 10-bit resolution	
	m = 0 to 3	m = 0 to 10	m = 0 to 13	m = 0 to 19			
ADCA0SELy	✓	✓	✓	✓	O	External MPX selection pin y for ADCA0 input	
	y = 0 to 2	y = 0 to 2	y = 0 to 2	y = 0 to 2			
ADCA0TRGy	✓	✓	✓	✓	I	ADCA0 external trigger pin y	
	y = 0 to 2	y = 0 to 2	y = 0 to 2	y = 0 to 2			
AP0_m	✓	✓	✓	✓	IO	Analog port 0_m	Port
	m = 0 to 7	m = 0 to 9	m = 0 to 10	m = 0 to 15			
APO	✓	✓	✓	✓	O	Port output signal for analog input	LPS0
AWOVCL	✓	✓	✓	✓	—	Voltage regulator for Always-On area (AWO area) capacitor connection	Power
AWOVSS	✓	✓	✓	✓	—	Internal logic for Always-On area (AWO area) ground	
CANzRX	✓	✓	✓	✓	I	CANz receive data input	RCFDCn
	z = 0	z = 0 to 2	z = 0 to 2	z = 0 to 5			
CANzTX	✓	✓	✓	✓	O	CANz transmit data output	
	z = 0	z = 0 to 2	z = 0 to 2	z = 0 to 5			
CSCXFOUT	✓	✓	✓	✓	O	Clock output	Clock
CSIG0RYI	✓	✓	✓	✓	I	CSIGn ready (1) / busy (0) input signal	CSIGn
CSIG0RYO	✓	✓	✓	✓	O	CSIGn ready (1) / busy (0) output signal	
CSIG0SC	✓	✓	✓	✓	IO	CSIGn serial clock signal	
CSIG0SI	✓	✓	✓	✓	I	CSIGn serial data input	
CSIG0SO	✓	✓	✓	✓	O	CSIGn serial data output	
$\overline{\text{CSIG0SSI}}$	✓	✓	✓	✓	I	CSIGn SS function control input signal	
CSIHnCSS0	✓	✓	✓	✓	O	CSIHn serial peripheral chip select signal 0	CSIHn
	n = 0	n = 0	n = 0 to 2	n = 0 to 3			
CSIHnCSS1	✓	✓	✓	✓	O	CSIHn serial peripheral chip select signal 1	
	n = 0	n = 0	n = 0 to 2	n = 0 to 3			
CSIHnCSS2	—	✓	✓	✓	O	CSIHn serial peripheral chip select signal 2	
		n = 0	n = 0 to 2	n = 0 to 3

$\overline{\text{DCURDY}}$	✓	✓	✓	✓	O	Debug ready	OCD
DCUTCK	✓	✓	✓	✓	I	Debug clock	
DCUTDI	✓	✓	✓	✓	I	Debug data input	
DCUTDO	✓	✓	✓	✓	O	Debug data output	
DCUTMS	✓	✓	✓	✓	I	Debug mode select	
$\overline{\text{DCUTRST}}$	✓	✓	✓	✓	I	Debug reset	
DPINm	✓	✓	✓	✓	I	Digital port input m	LPS0
	m = 0 to 2	m = 0 to 4, 8 to 10	m = 0 to 11	m = 0 to 16			
DPO	✓	✓	✓	✓	O	Port output signal for digital input	
ENCA0TINm	✓	✓	✓	✓	I	ENCA0 capture trigger input m	ENCAn
	m = 0, 1	m = 0, 1	m = 0, 1	m = 0, 1			
ENCA0EC	✓	✓	✓	✓	I	ENCA0 encoder clear input	
ENCA0E0	✓	✓	✓	✓	I	ENCA0 encoder input 0	
ENCA0E1	✓	✓	✓	✓	I	ENCA0 encoder input 1	
EVCC	✓	✓	✓	✓	—	Port buffer voltage supply	Power
EVSS	✓	✓	✓	✓	—	Port buffer ground	
FLMD0	✓	✓	✓	✓	I	Operating mode select pin 0	Mode
FLMD1	✓	✓	✓	✓	I	Operating mode select pin 1	
FPDR	✓	✓	✓	✓	I	Serial Communication Interface RXD	FLASH
FPDT	✓	✓	✓	✓	O	Serial Communication Interface TXD	
FPCK	✓	✓	✓	✓	I	Serial Communication Interface clock	
INTPm	✓	✓	✓	✓	I	External interrupt input m	INTC
	m = 0 to 5, 10, 11	m = 0 to 5, 10, 11	m = 0 to 8, 10 to 12	m = 0 to 8, 10 to 13			
ISOVCL	✓	✓	✓	✓	—	Voltage regulator for Isolated area (ISO area) capacitor connection	Power
ISOVSS	✓	✓	✓	✓	—	Internal logic for Isolated area (ISO area) ground	
JP0_m	✓	✓	✓	✓	IO	JTAG port 0_m	JTAG
	m = 0 to 5	m = 0 to 5	m = 0 to 5	m = 0 to 5			
KR0Im	✓	✓	✓	✓	I	KR0 key input signal	KRn
	m = 0 to 5	m = 0 to 7	m = 0 to 7	m = 0 to 7			
LPDCLK	✓	✓	✓	✓	I	LPD clock input (4-pin mode)	LPD
LPDCLKOUT	✓	✓	✓	✓	O	LPD clock output (4-pin mode)	
LPDI	✓	✓	✓	✓	I	LPD data input (4-pin mode)	
LPDIO	✓	✓	✓	✓	IO	LPD data input / output (1-pin mode)	
LPDO	✓	✓	✓	✓	O	LPD data output (4-pin mode)	
MODEm	✓	✓	✓	✓	I	Sub operating mode select (Boundary scan)	Mode
	m = 0 to 2	m = 0 to 2	m = 0 to 2	m = 0 to 2			
NMI	✓	✓	✓	✓	I	External non-maskable interrupt input	INTC
P0_m	✓	✓	✓	✓	IO	Port 0_m	Port
	m = 0 to 3	m = 0 to 6	m = 0 to 12	m = 0 to 14			
P8_m	✓	✓	✓	✓	IO	Port 8_m	
	m = 0 to 1	m = 0 to 6	m = 0 to 6	m = 0 to 12			
P9_m	✓	✓	✓	✓	IO	Port 9_m	
	m = 0 to 1	m = 0 to 3	m = 0 to 6	m = 0 to 6			

Table 2C.5 Pin Functions

	No. of Pins						
Pin Name	48 Pins	64 Pins	80 Pins	100 Pins	IO	Pin Function	Unit
P10_m	✓	✓	✓	✓	IO	Port 10_m	Port
	m = 0 to 10	m = 0 to 14	m = 0 to 15	m = 0 to 15			
P11_m	—	—	✓	✓	IO	Port 11_m	
			m = 0 to 4	m = 0 to 7			
PWGAnO	✓	✓	✓	✓	O	PWGAn output signal	PWGAn
	n = 0 to 12	n = 0 to 23	m =0 to 23	n = 0 to 47			
REGVCC	✓	✓	✓	✓	—	Voltage regulators voltage supply	Power
$\overline{\text{RESET}}$	✓	✓	✓	✓	I	External reset input	Reset
$\overline{\text{RESETOUT}}$	—	✓	✓	✓	O	Reset output	
RIICnSCL	✓	✓	✓	✓	IO	RIICn serial clock	RIICn
	n = 0 to 1	n = 0 to 1	n = 0 to 1	n = 0 to 1			
RIICnSDA	✓	✓	✓	✓	IO	RIICn serial data	
	n = 0 to 1	n = 0 to 1	n = 0 to 1	n = 0 to 1			
RLIN2mRX	✓	✓	✓	✓	I	RLIN2m receive data input	RLIN24n
	m = 0 to 1	m = 0 to 1	m = 0 to 1	m = 0 to 2			
RLIN2mTX	✓	✓	✓	✓	O	RLIN2m transmit data output	
	m = 0 to 1	m = 0 to 1	m = 0 to 1	m = 0 to 2			
RLIN3nRX	✓	✓	✓	✓	I	RLIN3n receive data input	RLIN3n
	n = 0	n = 0 to 1	n = 0 to 2	n = 0 to 3			
RLIN3nTX	✓	✓	✓	✓	O	RLIN3n transmit data output	
	n = 0	n = 0 to 1	n = 0 to 2	n = 0 to 3			
SENTnRX	✓	✓	✓	✓	I	SENT data input	RSENTn
	n = 0 to 1	n = 0 to 1	n = 0 to 1	n = 0 to 1			
SENTnSPCO	✓	✓	✓	✓	O	SENT SPC extension output	
	n = 0 to 1	n = 0 to 1	n = 0 to 1	n = 0 to 1			
RTCA0OUT	✓	✓	✓	✓	O	RTCA0 1Hz output	RTCAn
SELDPk	—	✓	✓	✓	O	External multiplexer selection output signal k for digital port	LPS0
		k = 0 to 2	k = 0 to 2	k = 0 to 2			
TAPA0ESO	✓	✓	✓	✓	I	Hi-Z control	TAPAn
TAPA0UN	✓	✓	✓	✓	O	Motor control output U phase (negative)	
TAPA0UP	✓	✓	✓	✓	O	Motor control output U phase (positive)	
TAPA0VN	✓	✓	✓	✓	O	Motor control output V phase (negative)	
TAPA0VP	✓	✓	✓	✓	O	Motor control output V phase (positive)	
TAPA0WN	✓	✓	✓	✓	O	Motor control output W phase (negative)	
TAPA0WP	✓	✓	✓	✓	O	Motor control output W phase (positive)	
TAUD0Im	✓	✓	✓	✓	I	TAUD0 channel input m	TAUDn
	m = 0 to 15	m = 0 to 15	m = 0 to 15	m = 0 to 15			
TAUD0Om	✓	✓	✓	✓	O	TAUD0 channel output m	
	m = 0 to 15	m = 0 to 15	m = 0 to 15	m = 0 to 15			
TAUB0Im	—	—	✓	✓	I	TAUBn channel input m	TAUBn
			m = 0 to 15	m = 0 to 15			
TAUB0Om	—	—	✓	✓	O	TAUBn channel output m	
			m = 0 to 15	m = 0 to 15			

Table 2C.5 Pin Functions

	No. of Pins						
Pin Name	48 Pins	64 Pins	80 Pins	100 Pins	IO	Pin Function	Unit
TAUJnIm	✓	✓	✓	✓	I	TAUJn channel input m	TAUJn
	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3			
TAUJnOm	✓	✓	✓	✓	O	TAUJn channel output m	
	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3	n = 0 to 3 m = 0 to 3			
X1, X2	✓	✓	✓	✓	—	MainOSC connections	MOSC

CAUTION

When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.

- **(e.g.)** When RS-CANFD channel 0 is used:

  CAN0TX P0_0 P10_1
  CAN0RX P0_1 P10_0

  Use one of the following pin combinations:

  - P0_0 and P0_1, or
  - P10_0 and P10_1.

  The combinations of P0_0 and P10_0, and P0_1 and P10_1 are not allowed.

2C.3 Pin Functions During and After Reset

Table 2C.6 Pin Functions During and After Reset

Pins	During Reset	After Reset
JP0_0	High impedance	JP0_0: Input Serial programming mode: FPDR, FPDT (1 wire UART) FPDR (2 wire UART) Nexus I/F: DCUTDI input LPD (4 pins): LPDI input LPD (1 pin): LPDIO input/output
JP0_1	High impedance	JP0_1: Input Serial programming mode: FPDT Nexus I/F: DCUTDO output LPD (4 pins): LPDO output LPD (1 pin): High impedance
JP0_2	High impedance	JP0_2: Input Serial programming mode: FPCK Nexus I/F: DCUTCK input LPD (4 pins): LPDCLK input LPD (1 pin): High impedance
JP0_3	High impedance	JP0_3: Input Serial programming mode: High impedance Nexus I/F: DCUTMS input LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_4	Input[*3,*5]	JP0_4: Input Serial programming mode: High impedance Nexus I/F: $\overline{\text{DCUTRST}}$ input[*1] LPD (4 pins): High impedance LPD (1 pin): High impedance
JP0_5	High impedance	JP0_5: Input Serial programming mode: High impedance Nexus I/F: $\overline{\text{DCURDY}}$ output LPD (4 pins): LPDCLKOUT output LPD (1 pin): High impedance
P8_6	Output[*2 *4]	Output (OPBT0.RESETOUTEN = 1)[*2] High impedance (OPBT0.RESETOUTEN = 0)[*2, *4]
P0, P8 to 11 (except P8_6, P10_1, P10_2, P10_6 and P10_8)	High impedance	High impedance
P10_1	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE0 input (FLMD0 = 1, FLMD1 = 1)
P10_2	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE1 input (FLMD0 = 1, FLMD1 = 1)
P10_6	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 1) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 0) MODE2 input (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 1)
P10_8	High impedance	High impedance (FLMD0 = 0) FLMD1 input (FLMD0 = 1)
FLMD0	Input	Input
$\overline{\text{RESET}}$	Input	Input
AP0	High impedance	High impedance

Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low level.

Note 2. $\overline{\text{RESETOUT}}$ is output. For details, see **Section 2C.11, Port (Special I/O) Function Overview**.

Note 3. When the power is turned on or when $\overline{\text{RESET}}$ is low level, JP0_4 pin should be driven low level.

Note 4. If OPBT0.RESETOUTEN = 0, P8_6 pin status has a possibility to become unstable (less than 15 μs) at the transition moment to reset status by internal reset factors.

Note 5. When $\overline{\text{RESET}}$ is low level, on-chip pull-down resistor is connected to JP0_4.

2C.4 Port State in Standby Mode

For the port state in standby mode, see **Section 14.1.4, I/O Buffer Control**.

2C.5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.

Table 2C.7 Recommended Connection of Unused Pins

Pin	Recommended Connection of Unused Pins
A0VREF	Connected to EVCC
A0VSS	Connected to EVSS
$\overline{\text{RESET}}$	Connected to EVCC via a resistor
X1	Connected to AWOVSS via a resistor
X2	Open
JP0 (excluding JP0_4) P0 P8 (excluding P8_6) P9	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
P8_6	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
JP0_4	Connected to EVSS via a resistor
P10 (excluding P10_1, P10_2, P10_6, P10_8) P11	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
P10_1, P10_2, P10_6, P10_8	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
AP0	Input: Open (when the PIBCn_m bit is 0) Connected to A0VREF or A0VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
Nexus/LPD I/F (JP0)	DCUTDI/LPDI/LPDIO (JP0_0): Connected to EVCC via a resistor DCUTDO/LPDO (JP0_1): Open DCUTCK/LPDCLK (JP0_2): Open DCUTMS (JP0_3): Connected to EVCC via a resistor $\overline{\text{DCUTRST}}$ (JP0_4): Connected to EVSS via a resistor*1 $\overline{\text{DCURDY}}$ /LPDCLKOUT (JP0_5): Open

Note 1. For in case when a debugging interface is used, this pin should be connected to EVCC through resistor depending on the development tool made by a third party.

2C.6 Features of RH850/F1KM Port

2C.6.1 Port Group

The RH850/F1KM provides the following port groups, indicated by the numbers in the table below.

Table 2C.8 Port Groups in RH850/F1KM-S1

No. of Pins	Port Group	RH850/F1KM-S1
48 pins	Number	6
	Name	P0, P8 to P10, JP0, AP0
64 pins	Number	6
	Name	P0, P8 to P10, JP0, AP0
80 pins	Number	7
	Name	P0, P8 to P11, JP0, AP0
100 pins	Number	7
	Name	P0, P8 to P11, JP0, AP0

2C.6.2 Port Group Index n

Throughout this section, the port groups are identified by using the index “n”. For example, the port mode control register of the Pn pin is PMCn (n = 0, and 8 to 11).

2C.6.3 Register Base Addresses

Port and JTAG port base addresses are listed in the following table.

Port and JTAG port register addresses are given as offsets from the base addresses.

Table 2C.9 Register Base Addresses

Base Address Name	Base Address
<PORTn_base>	FFC1 0000_H
<JPORT0_base>	FFC2 0000_H

2C.6.4 Clock Supply

The clock supply to ports is shown in the following table.

Table 2C.10 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Port	Register access clock	CPUCLK_UL

2C.7 Port Functions

This product has various pins for input/output ports. The ports are organized in port groups.

The RH850/F1KM also has several control registers to enable pins to be used as other than general-purpose input/output pins.

For a description of the terms pin, port, and port group, see **Section 2C.7.2, Terms**.

2C.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16.
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.

  Table 2C.39, JTAG Port 0 (JP0), **Table 2C.41, Port 0 (P0)**, **Table 2C.43, Port 8 (P8)**, **Table 2C.45, Port 9 (P9)**, **Table 2C.47, Port 10 (P10)**, **Table 2C.49, Port 11 (P11)**, **Table 2C.51, Analog Port 0 (AP0)** and **Section 2C.9.2, Pin Function Configuration**.

CAUTION

Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.

[Example]

INTP0 is assigned to the following pins on this device. However, the INTP0 function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

- JP0_0 (1st input alternative function)
- P0_1 (2nd, 3rd input alternative function)
- P10_0 (2nd input alternative function)

In the above case, when the 1st input alternative function (INTP0) of JP0_0 is selected, using the 2nd input alternative function (CAN0RX/INTP0) of P0_1 only for the CAN signal is also prohibited.

2C.7.2 Terms

The following terms are used in this section:

Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.

A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

Port mode and ports

A pin in port mode works as a general-purpose input/output pin. It is then called “port”.

The corresponding name is Pn_m. For example, P0_7 denotes port 7 of port group 0. It is referenced as “port P0_7”.

Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0_0 and INTP0. The different names indicate the function of the pin at that time.

2C.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging.

JTAG port group registers and bit names are prefixed by a “J”. For example, JP0 denotes JTAG port group 0, and JPM0.JPM0_m denotes the JPM0_m port mode bit of the JPM0 port mode register.

NOTE

In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

2C.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode (PMCn.PMCn_m bit = 0)

  A pin in port mode operates as a general-purpose input/output pin. The I/O mode is selected by setting the PMn.PMn_m bit.

- Software I/O control alternative mode (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 0)

  In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn_m bit.

- Direct I/O control alternative mode (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 1)

  In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.

An overview of the register settings is given in the tables below.

Table 2C.11 Pin Function Configuration (Overview)

	Bit			
Mode	PMCn_m	PMn_m	PIPCn_m	I/O
Port mode	0	0	X	O
		1[*1]		I
Software I/O control alternative mode	1	0	0	O
		1	0	I
Direct I/O control alternative mode		X	1	Controlled by the alternative function

Note 1. The input buffer must be enabled (PIBCn_m bit = 1).

- Software I/O control alternative mode (PIPCn.PIPCn_m bit = 0)
  - Output (PMn_m bit = 0): Alternative output mode 1 to Alternative output mode 7
  - Input (PMn_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPCn.PIPCn_m bit = 1)
  - The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

Table 2C.12 Alternative Mode Selection Overview (PMCn.PMCn_m Bit = 1)

	Register					
Mode	PIPC*[1]	PM*[1]	PFCAE	PFCE	PFC	I/O
Alternative output mode 1 (ALT-OUT1)	0	0	0	0	0	O
Alternative input mode 1 (ALT-IN1)		1				I
Alternative output mode 2 (ALT-OUT2)		0			1	O
Alternative input mode 2 (ALT-IN2)		1				I
Alternative output mode 3 (ALT-OUT3)		0		1	0	O
Alternative input mode 3 (ALT-IN3)		1				I
Alternative output mode 4 (ALT-OUT4)		0			1	O
Alternative input mode 4 (ALT-IN4)		1				I
Alternative output mode 5 (ALT-OUT5)		0	1	0	0	O
Alternative input mode 5 (ALT-IN5)		1				I
Alternative output mode 6 (ALT-OUT6)		0			1	O
Alternative input mode 6 (ALT-IN6)		1				I
Alternative output mode 7 (ALT-OUT7)		0		1	0	O
Alternative input mode 7 (ALT-IN7)		1				I
Other than the above	Setting prohibited					

Note 1. If PIPCn.PIPCn_m bit = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

If a pin is in alternative mode (PMCn.PMCn_m bit = 1), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

2C.7.4 Pin Data Input/Output

The registers used for data input/output are described below.

The location that is read via the PPRn register differs depending on the pin mode.

2C.7.4.1 Output Data

In the port mode (PMCn.PMCn_m bit = 0), the value of the Pn.Pn_m bit is output from the Pn_m pin.

2C.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn_m pin, the value of the Pn.Pn_m bit, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits. The different PPRn read modes are shown in the table below.

Table 2C.13 PPRn_m Read Values

PMC n_m	PM n_m	PIBC n_m	PIPC n_m	PODC n_m	Mode	PPRn_m Read Value
0	1	0	X	X	Port input, input buffer disabled	Pn.Pn_m bit
		1		X	Port input, input buffer enabled	Pn_m pin
	0	X		0	Port push-pull output	Pn.Pn_m bit*1
				1	Port open-drain output	
1	1	X	0	X	Software I/O control alternative input	Pn_m pin
	0			0	Software I/O control alternative push-pull output	Output signal from the alternative function*1
				1	Software I/O control alternative open-drain output	
	X		1	0	Direct I/O control alternative input or push-pull output	I/O port in alternative mode: • Input: Pn_m pin • Output: Output signal from the alternative function*1
				1	Direct I/O control alternative input or open-drain output	

Note 1. When PBDCn_m = 1, the level of the Pn_m pin is returned by the PPRn_m bit.

The control registers in the above table have the following effects:

- PMCn.PMCn_m bit

  This bit selects port mode (PMCn_m = 0) or alternative mode (PMCn_m = 1).

- PMn.PMn_m bit

  This bit selects input (PMn_m = 1) or output (PMn_m = 0) when the port mode (PMCn_m = 0) and software I/O control alternative mode (PMCn_m = 1, PIPCn_m = 0) have been selected.

- PIBCn.PIBCn_m bit

  This bit disables (PIBCn_m = 0) or enables (PIBCn_m = 1) the input buffer in input port mode (PMCn_m = 0 and PMn_m = 1). If the input buffer is disabled, PPRn_m reads the Pn.Pn_m bit; otherwise the Pn_m pin level is returned.

- PIPCn.PIPCn_m bit

  This bit selects software I/O control alternative mode or direct I/O control alternative mode.

- PODCn.PODCn_m bit

  This bit selects push-pull output (PODCn_m = 0) or open-drain output (PODCn_m = 1).

- PBDCn.PBDCn_m bit

  In output mode, when this bit is set to 1, the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

CAUTION

When using Pn_m as an alternative output function (PMCn.PMCn_m bit = 1, PMn.PMn_m bit = 0), the level of the Pn_m pin can be read at the PPRn.PPRn_m bit by enabling bidirectional mode (PBDCn.PBDCn_m bit = 1).
Note, however, that the level of the Pn_m pin will be input to the alternative input function that the Pn_m pin is being used as.

2C.7.4.3 Writing to the Pn Register

The data to be output via port Pn_m in port mode (PMCn.PMCn_m bit = 0) is held in port register Pn. Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.

  In this case, new data can be written directly to the Pn register.

- By performing an indirect bitwise operation (a “set”, “reset”, or “not” operation) on the Pn register.

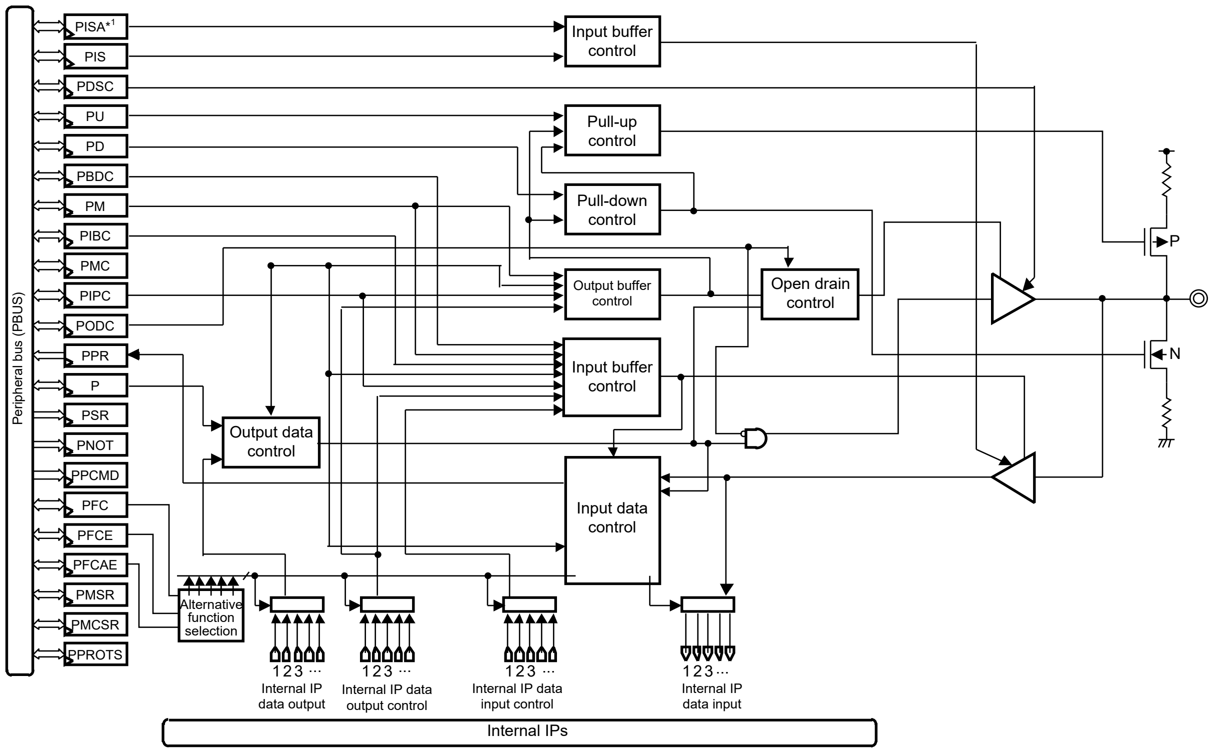
  An indirect bitwise operation (“set”, “reset”, or “not”) can be performed on the Pn register by using the following two registers:

  - Port Set/Reset register PSRn
    If the PSRn.PSRn (m + 16) bit = 1, the value of the Pn.Pn_m bit is determined by the value of the PSRn.PSRn_m bit.
    In other words, the Pn_m bit can be set or reset without writing directly to the Pn register.
  - Port NOT register PNOTn
    By setting PNOTn.PNOTn_m bit to 1, the Pn.Pn_m bit can be inverted without writing directly to the Pn register.

An indirect bitwise operation on the Pn register (“set”, “reset”, or “not”) has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

2C.8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.



Note 1. There is no PISAn register in RH850/F1KM-S1.

Figure 2C.5 Schematic View of Port Control

CAUTION

Use documented alternative functions only. The behavior and performance are not guaranteed when undocumented alternative functions are selected.

2C.9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

- **Section 2C.9.2, Pin Function Configuration**
- **Section 2C.9.3, Pin Data Input/Output**
- **Section 2C.9.4, Configuration of Electrical Characteristics**

2C.9.1 Overview

The following registers are used for setting the individual pins of the port groups.

For details on <PORTn_base> and <JPORT0_base>, see **Section 2C.6.3, Register Base Addresses**.

Table 2C.14 Port Group Configuration Registers

Module Name	Register Name	Symbol	Address
Pin function configuration			
PORT	Port mode control register	PMCn	<PORTn_base> + 0400$_H$ + n × 4
JTAG		JPMC0	<JPORT0_base> + 0040$_H$
PORT	Port mode control set/reset register	PMCSRn	<PORTn_base> + 0900$_H$ + n × 4
JTAG		JPMCSR0	<JPORT0_base> + 0090$_H$
PORT	Port IP control register	PIPCn	<PORTn_base> + 4200$_H$ + n × 4
PORT	Port mode register	PMn	<PORTn_base> + 0300$_H$ + n × 4
		APMn	<PORTn_base> + 03C8$_H$ + n × 4
JTAG		JPM0	<JPORT0_base> + 0030$_H$
PORT	Port mode set/reset register	PMSRn	<PORTn_base> + 0800$_H$ + n × 4

JTAG	Port input buffer selection advanced register	JPISA0	<JPORT0_base> + $04A0_H$
Port register protection			
PORT	Port protection command register	PPCMDn	<PORTn_base> + $4C00_H$ + n × 4
JTAG		JPPCMD0	<JPORT0_base> + $04C0_H$
PORT	Port protection status register	PPROTSn	<PORTn_base> + $4B00_H$ + n × 4
JTAG		JPPROTS0	<JPORT0_base> + $04B0_H$

Index n

In **Table 2C.14, Port Group Configuration Registers**, the index “n” in register symbols denotes the actual indices of the individual port groups. For example, PMCn generically indicates a port mode control register for port group n (Pn). The values for n differ according to the number of pins on the device in the way shown in **Table 2C.15, Number of Pins on the Device, Name of Port Groups, and Values for “n” in Register Symbols**.

Table 2C.15 Number of Pins on the Device, Name of Port Groups, and Values for “n” in Register Symbols

Number of Pins on the Device	Port Groups	Values for “n”
48 pins	P0, P8, P9, P10	0, 8, 9, 10
	AP0	0
64 pins	P0, P8, P9, P10	0, 8, 9, 10
	AP0	0
80 pins	P0, P8, P9, P10, P11	0, 8, 9, 10, 11
	AP0	0
100 pins	P0, P8, P9, P10, P11	0, 8, 9, 10, 11
	AP0	0

JTAG port registers

JTAG port registers are not explicitly described in the following register descriptions.

All descriptions (except for those of the PFCAEn register and PIPCn register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

Value after reset

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

2C.9.2 Pin Function Configuration

2C.9.2.1 PMCn / JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Access: PMCn: This register can be read or written in 16-bit units.

JPMC0: This register can be read or written in 8-bit units.

Address: PMCn: <PORTn_base> + 0400_H + n × 4 (n = 0, 8, 9, 10, 11)

JPMC0: <JPORT0_base> + 0040_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMC n_15	PMC n_14	PMC n_13	PMC n_12	PMC n_11	PMC n_10	PMC n_9	PMC n_8	PMC n_7	PMC n_6	PMC n_5	PMC n_4	PMC n_3	PMC n_2	PMC n_1	PMC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.16 PMCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMCn_[15:0]	Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode

CAUTIONS

1. I/O is not controlled by only setting alternative mode (PMCn.PMCn_m bit = 1). If the alternative function requires direct I/O control, also set the PIPCn.PIPCn_m bit to 1.
2. If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLA0CTLm_<*name*>, DNFA<*name*>CTL and the DNFA<*name*>EN register. For details, see **Section 2C.12, Noise Filter & Edge/Level Detector**, and **Section 2C.13, Description of Port Noise Filter & Edge/Level Detection**.

NOTE

The control bits of the JTAG port mode control register (JPMC0) are JPMC0_[7:0].

2C.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.

The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

Access:	PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000$_H$. Reading bits 15 to 0 returns the value of register PMCn. JPMCSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000$_H$. Reading bits 7 to 0 returns the value of register JPMC0.
Address:	PMCSRn: <PORTn_base> + 0900$_H$ + n × 4 (n = 0, 8, 9, 10, 11) JPMCSR0: <JPORT0_base> + 0090$_H$^{*1}
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMC SRn_31	PMC SRn_30	PMC SRn_29	PMC SRn_28	PMC SRn_27	PMC SRn_26	PMC SRn_25	PMC SRn_24	PMC SRn_23	PMC SRn_22	PMC SRn_21	PMC SRn_20	PMC SRn_19	PMC SRn_18	PMC SRn_17	PMC SRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMC SRn_15	PMC SRn_14	PMC SRn_13	PMC SRn_12	PMC SRn_11	PMC SRn_10	PMC SRn_9	PMC SRn_8	PMC SRn_7	PMC SRn_6	PMC SRn_5	PMC SRn_4	PMC SRn_3	PMC SRn_2	PMC SRn_1	PMC SRn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.17 PMCSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMCSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMCSRn_m (PMCSRn_[15:0]) is written to PMCn_m. 0: PMCn_m is not affected by PMCSRn_m. 1: PMCn_m is PMCSRn_m. Example: If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15.
15 to 0	PMCSRn_[15:0]	Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1. 0: PMCn_m is 0. 1: PMCn_m is 1.

NOTE

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0_[31:0].

2C.9.2.3 PIPCn — Port IP Control Register

This register specifies whether the I/O direction of the Pn_m pin is controlled by the port mode register PMn.PMn_m or by an alternative function.

If the Pn_m pin is operated in alternative mode (PMCn.PMCn_m = 1) and the alternative function requires direct control of the I/O direction, then PIPCn.PIPCn_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn_m setting.

Regarding the alternative functions for which the PIPC register must be set, see **Section 2C.11, Port (Special I/O) Function Overview**.

Access: This register can be read or written in 16-bit units.

Address: PIPCn: <PORTn_base> + 4200_H + n × 4 (n = 0, 10, 11) *1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPCn_15	PIPCn_14	PIPCn_13	PIPCn_12	PIPCn_11	PIPCn_10	PIPCn_9	PIPCn_8	PIPCn_7	PIPCn_6	PIPCn_5	PIPCn_4	PIPCn_3	PIPCn_2	PIPCn_1	PIPCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.42, Control Registers (P0)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.18 PIPCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIPCn_[15:0]	Specifies the I/O mode. 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control).

2C.9.2.4 PMn / APMn / JPM0 — Port Mode Register

This register specifies whether the individual pins of the port group n are in input mode or in output mode.

Access:	PMn, APMn: These registers can be read or written in 16-bit units. JPM0: This register can be read or written in 8-bit units.
Address:	PMn: <PORTn_base> + 0300_H + n × 4 (n = 0, 8, 9, 10, 11) APMn: <PORTn_base> + $03C8_H$ (n = 0) JPM0: <JPORT0_base> + 0030_H*1
Value after reset:	$FFFF_H$*2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn_15	PMn_14	PMn_13	PMn_12	PMn_11	PMn_10	PMn_9	PMn_8	PMn_7	PMn_6	PMn_5	PMn_4	PMn_3	PMn_2	PMn_1	PMn_0
Value after reset	1	1	1	1	1	1	1	1	1	1*3	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, **Table 2C.50, Control Registers (P11)** and **Table 2C.52, Control Registers (AP0)**.

Note 2. The PM8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8 register is $FFBF_H$.
When the OPBT0.RESETOUTEN = 0, the PM8 register is $FFFF_H$.

Note 3. The PM8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8_6 bit is 0.
When the OPBT0.RESETOUTEN = 0, the PM8_6 bit is 1.

Table 2C.19 PMn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMn_[15:0]	Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled)

NOTES

1. To use a port in input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), the input buffer must be enabled (PIBCn.PIBCn_m = 1).
2. By default, PMn.PMn_m specifies the I/O direction in port mode (PMCn.PMCn_m = 0) and alternative mode (PMCn.PMCn_m=1), since PIPCn.PIPCn_m = 0 (I/O mode is controlled by PMn.PMn_m) after reset.
3. The control bits of the analog port register (APMn) are APMn_[15:0].
4. The control bits of the JTAG port mode register (JPM0) are JPM0_[7:0].

2C.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.

The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn_m is set by the corresponding bit in the lower 16 bits of PMSRn.

Access: PMSRn, APMSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000$_{\text{H}}$.

Reading bits 15 to 0 returns the value of registers PMn and APMn.

JPMSR0: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000$_{\text{H}}$. Bits 15 to 8 are read as FF$_{\text{H}}$. Reading bits 7 to 0 returns the value of register JPM0.

Address: PMSRn: <PORTn_base> + 0800$_{\text{H}}$ + n × 4 (n = 0, 8, 9, 10, 11)

APMSRn: <PORTn_base> + 08C8$_{\text{H}}$ (n = 0)

JPMSR0: <JPORT0_base> + 0080$_{\text{H}}$^{*1}

Value after reset: 0000 FFFF$_{\text{H}}$^{*2}

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMSRn_31	PMSRn_30	PMSRn_29	PMSRn_28	PMSRn_27	PMSRn_26	PMSRn_25	PMSRn_24	PMSRn_23	PMSRn_22	PMSRn_21	PMSRn_20	PMSRn_19	PMSRn_18	PMSRn_17	PMSRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMSRn_15	PMSRn_14	PMSRn_13	PMSRn_12	PMSRn_11	PMSRn_10	PMSRn_9	PMSRn_8	PMSRn_7	PMSRn_6	PMSRn_5	PMSRn_4	PMSRn_3	PMSRn_2	PMSRn_1	PMSRn_0
Value after reset	1	1	1	1	1	1	1	1	1	1^{*3}	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, **Table 2C.50, Control Registers (P11)** and **Table 2C.52, Control Registers (AP0)**.

Note 2. The PMSR8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8 register is 0000 FFBF$_{\text{H}}$.
When the OPBT0.RESETOUTEN = 0, the PMSR8 register is 0000 FFFF$_{\text{H}}$.

Note 3. The PMSR8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8_6 bit is 0.
When the OPBT0.RESETOUTEN = 0, the PMSR8_6 bit is 1.

Table 2C.20 PMSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to PMn_m. 0: PMn_m is not affected by PMSRn_m. 1: PMn_m is PMSRn_m. Example: If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15.
15 to 0	PMSRn_[15:0]	Data bits that specify the value of PMn_m if PMSRn_m of the corresponding upper bit (PMSRn_[31:16]) is 1. 0: PMn_m is 0. 1: PMn_m is 1.

NOTES

1. The control bits of the JTAG port mode set/reset register (JPMSR0) are JPMSR0_[31:0].
2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn_[31:0].

2C.9.2.6 PIBCn / APIBCn / JPIBC0 — Port Input Buffer Control Register

In input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), this register enables the port pin's input buffer.

Access:	PIBCn, APIBCn: These registers can be read or written in 16-bit units.
	JPIBC0: This register can be read or written in 8-bit units.
Address:	PIBCn: <PORTn_base> + 4000_H + n × 4 (n = 0, 8, 9, 10, 11)
	APIBCn: <PORTn_base> + $40C8_H$ (n = 0)
	JPIBC0: <JPORT0_base> + 0400_H*1
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBCn_15	PIBCn_14	PIBCn_13	PIBCn_12	PIBCn_11	PIBCn_10	PIBCn_9	PIBCn_8	PIBCn_7	PIBCn_6	PIBCn_5	PIBCn_4	PIBCn_3	PIBCn_2	PIBCn_1	PIBCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, **Table 2C.50, Control Registers (P11)** and **Table 2C.52, Control Registers (AP0)**.

Table 2C.21 PIBCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enables/disables the input buffer. 0: Input buffer disabled 1: Input buffer enabled

NOTES

1. When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.
2. The control bits of the JTAG port input buffer control register (JPIBC0) are JPIBC0_[7:0].

CAUTION

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn_m = 1).

2C.9.2.7 PFCn / JPFC0 — Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access:	PFCn: This register can be read or written in 16-bit units. JPFC0: This register can be read or written in 8-bit units.
Address:	PFCn: <PORTn_base> + 0500_H + n × 4 (n = 0, 8, 9, 10, 11) JPFC0: <JPORT0_base> + 0050_H[*1]
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFC n_15	PFC n_14	PFC n_13	PFC n_12	PFC n_11	PFC n_10	PFC n_9	PFC n_8	PFC n_7	PFC n_6	PFC n_5	PFC n_4	PFC n_3	PFC n_2	PFC n_1	PFC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.22 PFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2C.25, Setting Alternative Functions**.

NOTE

The control bits of the JTAG port function control register (JPFC0) are JPFC0_[7:0].

2C.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCEn: This register can be read or written in 16-bit units.

JPFCE0: This register can be read or written in 8-bit units.

Address: PFCEn: <PORTn_base> + 0600_H + n × 4 (n = 0, 8, 9, 10, 11)

JPFCE0: <JPORT0_base> + 0060_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCE n_15	PFCE n_14	PFCE n_13	PFCE n_12	PFCE n_11	PFCE n_10	PFCE n_9	PFCE n_8	PFCE n_7	PFCE n_6	PFCE n_5	PFCE n_4	PFCE n_3	PFCE n_2	PFCE n_1	PFCE n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.23 PFCEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCEn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2C.25, Setting Alternative Functions**.

NOTE

The control bits of the JTAG port function control register (JPFCE0) are JPFCE0_[7:0].

2C.9.2.9 PFCAEn — Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCAEn: This register can be read or written in 16-bit units.

Address: PFCAEn: <PORTn_base> + $0A00_H$ + n × 4 (n = 0, 8, 9, 10, 11)*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCAE n_15	PFCAE n_14	PFCAE n_13	PFCAE n_12	PFCAE n_11	PFCAE n_10	PFCAE n_9	PFCAE n_8	PFCAE n_7	PFCAE n_6	PFCAE n_5	PFCAE n_4	PFCAE n_3	PFCAE n_2	PFCAE n_1	PFCAE n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.24 PFCAEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCAEn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2C.25, Setting Alternative Functions**.

Table 2C.25 Setting Alternative Functions

PFCAEn_m	PFCEn_m	PFCn_m	PMn_m	Function
0	0	0	1	Alternative input mode 1
			0	Alternative output mode 1
		1	1	Alternative input mode 2
			0	Alternative output mode 2
	1	0	1	Alternative input mode 3
			0	Alternative output mode 3
		1	1	Alternative input mode 4
			0	Alternative output mode 4
1	0	0	1	Alternative input mode 5
			0	Alternative output mode 5
		1	1	Alternative input mode 6
			0	Alternative output mode 6
	1	0	1	Alternative input mode 7
			0	Alternative output mode 7
		1	X	Setting prohibited

CAUTION

- After selecting the alternative function by the PFCn_m, PFCEn_m, or PFCAEn_m bit, set the PMCn_m bit to “1”.
- With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited.
  For example, if the a/b/c pin is used as b, the b/d/e pin cannot be used as b. In this case, the b/d/e pin must be configured as a pin function other than b.

NOTE

For more details on the assignment of each function, see **Sections 2C.10.1, JTAG Port 0 (JP0)** to **2C.10.7, Analog Port 0 (AP0)**.

2C.9.3 Pin Data Input/Output

2C.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

Access:	PBDCn, APBDCn: These registers can be read or written in 16-bit units. JPBDC0: This register can be read or written in 8-bit units.
Address:	PBDCn: <PORTn_base> + 4100_H + n × 4 (n = 0, 8, 9, 10, 11) APBDCn: <PORTn_base> + $41C8_H$ (n = 0) JPBDC0: <JPORT0_base> + 0410_H[*1]
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDCn_15	PBDCn_14	PBDCn_13	PBDCn_12	PBDCn_11	PBDCn_10	PBDCn_9	PBDCn_8	PBDCn_7	PBDCn_6	PBDCn_5	PBDCn_4	PBDCn_3	PBDCn_2	PBDCn_1	PBDCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, **Table 2C.50, Control Registers (P11)** and **Table 2C.52, Control Registers (AP0)**.

Table 2C.26 PBDCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin. 0: Bidirectional mode disabled 1: Bidirectional mode enabled

CAUTION

When the Pn_m port is used for the alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m = 0), the level of the Pn_m pin can be read from PPRn.PPRn_m by enabling the bidirectional mode (PBDCn.PBDCn_m = 1).

However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn_m, PFCEn.PFCEn_m, and PFCAEn.PFCAEn_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

NOTE

The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0_[7:0].

2C.9.3.2 PPRn / APPRn / JPPR0 — Port Pin Read Register

This register reflects the actual level of the Pn_m pin, whether it is the value of the Pn.Pn_m bit or the level of an alternative output function.

Access: PPRn, APPRn: These registers are read-only registers that can be read in 16-bit units.

JPPR0: This register is a read-only register that can be read in 8-bit units.

Address: PPRn: <PORTn_base> + 0200_H + n × 4 (n = 0, 8, 9, 10, 11)

APPRn: <PORTn_base> + $02C8_H$ (n = 0)

JPPR0: <JPORT0_base> + 0020_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PPRn_15	PPRn_14	PPRn_13	PPRn_12	PPRn_11	PPRn_10	PPRn_9	PPRn_8	PPRn_7	PPRn_6	PPRn_5	PPRn_4	PPRn_3	PPRn_2	PPRn_1	PPRn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, **Table 2C.50, Control Registers (P11)** and **Table 2C.52, Control Registers (AP0)**.

Table 2C.27 PPRn Register Contents

Bit Position	Bit Name	Function
15 to 0	PPRn_[15:0]	The Pn_m Pin, Pn.Pn_m value or alternative function output.

NOTES

1. For the read values of the PPRn register, see **Section 2C.7.4, Pin Data Input/Output**.
2. The control bits of the JTAG port pin read register (JPPR0) are JPPR0_[7:0].

2C.9.3.3 Pn / APn / JP0 — Port Register

This register holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 0).

Access:	Pn, APn: These registers can be read or written in 16-bit units. JP0: This register can be read or written in 8-bit units.
Address:	Pn: <PORTn_base> + 0000_H + n × 4 (n = 0, 8, 9, 10, 11) APn: <PORTn_base> + $00C8_H$ (n = 0) JP0: <JPORT0_base> + 0000_H^{*1}
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn_15	Pn_14	Pn_13	Pn_12	Pn_11	Pn_10	Pn_9	Pn_8	Pn_7	Pn_6	Pn_5	Pn_4	Pn_3	Pn_2	Pn_1	Pn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, **Table 2C.50, Control Registers (P11)** and **Table 2C.52, Control Registers (AP0)**.

Table 2C.28 Pn Register Contents

Bit Position	Bit Name	Function
15 to 0	Pn_[15:0]	Sets the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

NOTE

The control bits of the JTAG port register (JP0) are JP0_[7:0].

2C.9.3.4 PNOTn / APNOTn / JPNOT0 — Port NOT Register

This register allows the Pn_m bit of the port register Pn to be inverted without directly writing to Pn.

Access: PNOTn, APNOTn: These registers are write-only registers that can be written in 16-bit units. When read, 0000_H is returned.

JPNOT0: This register is a write-only register that can be written in 8-bit units. When read, 00_H is returned.

Address: PNOTn: <PORTn_base> + 0700_H + n × 4 (n = 0,8, 9, 10, 11)

APNOTn: <PORTn_base> + $07C8_H$ (n = 0)

JPNOT0: <JPORT0_base> + 0070_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOT n_15	PNOT n_14	PNOT n_13	PNOT n_12	PNOT n_11	PNOT n_10	PNOT n_9	PNOT n_8	PNOT n_7	PNOT n_6	PNOT n_5	PNOT n_4	PNOT n_3	PNOT n_2	PNOT n_1	PNOT n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, **Table 2C.50, Control Registers (P11)** and **Table 2C.52, Control Registers (AP0)**.

Table 2C.29 PNOTn Register Contents

Bit Position	Bit Name	Function
15 to 0	PNOTn_[15:0]	Specifies if Pn.Pn_m is inverted. 0: Pn.Pn_m is not inverted (Pn_m → Pn_m) 1: Pn.Pn_m is inverted ($\overline{\text{Pn\_m}}$ → Pn_m)

NOTE

The control bits of the JTAG port NOT register are JPNOT0_[7:0].

2C.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.

The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn_m is set by the corresponding bit in the lower 16 bits of PSRn.

Access: PSRn, APSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of registers Pn and APn.

JPSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000_H. Reading bits 7 to 0 returns the value of register JP0.

Address: PSRn: <PORTn_base> + 0100_H + n × 4 (n = 0, 8, 9, 10, 11)

APSRn: <PORTn_base> + $01C8_H$ (n = 0)

JPSR0: <JPORT0_base> + 0010_H*1

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSRn_31	PSRn_30	PSRn_29	PSRn_28	PSRn_27	PSRn_26	PSRn_25	PSRn_24	PSRn_23	PSRn_22	PSRn_21	PSRn_20	PSRn_19	PSRn_18	PSRn_17	PSRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PSRn_15	PSRn_14	PSRn_13	PSRn_12	PSRn_11	PSRn_10	PSRn_9	PSRn_8	PSRn_7	PSRn_6	PSRn_5	PSRn_4	PSRn_3	PSRn_2	PSRn_1	PSRn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, **Table 2C.50, Control Registers (P11)** and **Table 2C.52, Control Registers (AP0)**.

Table 2C.30 PSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PSRn_[31:16]	Specifies whether the value of the corresponding lower bit PSRn_m (PSRn_[15:0]) is written to Pn_m. 0: Pn_m is not affected by PSRn_m 1: Pn_m is PSRn_m Example: If PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15.
15 to 0	PSRn_[15:0]	Specifies the Pn_m value if the corresponding upper bit (PSRn_[31:16]) PSRn_m is 1. 0: Pn_m = 0 1: Pn_m = 1

NOTE

The control bits of the JTAG port set/reset register (JPSR0) are JPSR0_[31:0].

2C.9.4 Configuration of Electrical Characteristics

2C.9.4.1 PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

Access:	PUn: This register can be read or written in 16-bit units. JPU0: This register can be read or written in 8-bit units.
Address:	PUn: <PORTn_base> + 4300_H + n × 4 (n = 0, 8, 9, 10, 11) JPU0: <JPORT0_base> + $0430_H{}^{*1}$
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PUn_15	PUn_14	PUn_13	PUn_12	PUn_11	PUn_10	PUn_9	PUn_8	PUn_7	PUn_6	PUn_5	PUn_4	PUn_3	PUn_2	PUn_1	PUn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.31 PUn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUn_[15:0]	Specifies whether an internal pull-up resistor is connected to the corresponding pin. 0: No internal pull-up resistor connected 1: An internal pull-up resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-up option register (JPU0) are JPU0_[7:0].

2C.9.4.2 PDn / JPD0 — Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

Access: PDn: This register can be read or written in 16-bit units.

JPD0: This register can be read or written in 8-bit units.

Address: PDn: <PORTn_base> + 4400_H + n × 4 (n = 0, 8, 9, 10, 11)

JPD0: <JPORT0_base> + $0440_H{}^{*1}$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDn_15	PDn_14	PDn_13	PDn_12	PDn_11	PDn_10	PDn_9	PDn_8	PDn_7	PDn_6	PDn_5	PDn_4	PDn_3	PDn_2	PDn_1	PDn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.32 PDn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDn_[15:0]	Specifies whether to connect an internal pull-down resistor to the corresponding pin. 0: No internal pull-down resistor connected 1: An internal pull-down resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPD0) are JPD0_[7:0].

2C.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.
Regarding the alternative functions for which the PDSC register needs to be set, see **Section 2C.11.3.3, Output Buffer Control (PDSC)**.

Access: PDSCn, JPDSC0: These registers can be read or written in 32-bit units.

Address: PDSCn: <PORTn_base> + 4600_H + n × 4 (n = 0, 10, 11)

JPDSC0: <JPORT0_base> + 0460_H ^{*1}

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDSC n_15	PDSC n_14	PDSC n_13	PDSC n_12	PDSC n_11	PDSC n_10	PDSC n_9	PDSC n_8	PDSC n_7	PDSC n_6	PDSC n_5	PDSC n_4	PDSC n_3	PDSC n_2	PDSC n_1	PDSC n_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.33 PDSCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PDSCn_[15:0]	Specifies the port drive strength of the output buffer of the port pin. 0: Lower drive strength (when the frequency output from the pin is 10 MHz or below) 1: High drive strength (when the frequency output from the pin is 40 MHz or less).

NOTE

The control bits of the JTAG port drive strength control register (JPDSC0) are JPDSC0_[31:0].

2C.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Access: PODCn, JPODC0: These registers can be read or written in 32-bit units.

Address: PODCn: <PORTn_base> + 4500_H + n × 4 (n = 0, 8, 9, 10, 11)

JPODC0: <JPORT0_base> + 0450_H[*1]

Value after reset: 0000 0000_H[*2]

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PODCn_15	PODCn_14	PODCn_13	PODCn_12	PODCn_11	PODCn_10	PODCn_9	PODCn_8	PODCn_7	PODCn_6	PODCn_5	PODCn_4	PODCn_3	PODCn_2	PODCn_1	PODCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0[*3]	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Note 2. The PODC8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PODC8 register is 0000 0040_H.
When the OPBT0.RESETOUTEN = 0, the PODC8 register is 0000 0000_H.

Note 3. The PODC8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PODC8_6 bit is 1.
When the OPBT0.RESETOUTEN = 0, the PODC8_6 bit is 0.

Table 2C.34 PODCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PODCn_[15:0]	Specifies the output buffer function. 0: Push-pull 1: Open-drain

NOTE

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0_[31:0].

2C.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

Access: PISn: This register can be read or written in 16-bit units.
JPIS0: This register can be read or written in 8-bit units.

Address: PISn: <PORTn_base> + 4700_H + n × 4 (n = 0, 8, 9, 10, 11)
JPIS0: <JPORT0_base> + 0470_H*1

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PISn_15	PISn_14	PISn_13	PISn_12	PISn_11	PISn_10	PISn_9	PISn_8	PISn_7	PISn_6	PISn_5	PISn_4	PISn_3	PISn_2	PISn_1	PISn_0
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**, **Table 2C.42, Control Registers (P0)**, **Table 2C.44, Control Registers (P8)**, **Table 2C.46, Control Registers (P9)**, **Table 2C.48, Control Registers (P10)**, and **Table 2C.50, Control Registers (P11)**.

Table 2C.35 PISn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISn_[15:0]	Specifies the input buffer Characteristics: 0: Type 1 (SHMT1) 1: Type 2 (SHMT4)

NOTES

1. Details of the definition of type 1 and type 2 are given in **Section 2C.11.3.2, Input Buffer Control (PISn/JPIS0, JPISA0)**. For details, also see **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for input buffer characteristics.
2. The control bits of the JTAG port input buffer selection register (JPIS0) are JPIS0_[7:0]

2C.9.4.6 JPISA0 — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

Access: JPISA0: This register can be read or written in 8-bit units.

Address: JPISA0: <JPORT0_base> + $04A0_H$*1

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	JPISA0_3	JPISA0_2	—	JPISA0_0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2C.10, Port (General I/O) Function Overview**: **Table 2C.40, Control Registers (JP0)**.

Table 2C.36 JPISA0 Register Contents

Bit Position	Bit Name	Function
7 to 4, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2, 0	JPISA0_[3, 2, 0]	Specifies the input buffer characteristics: 0: Type 2 (SHMT4) 1: Type 5 (TTL)

Table 2C.37 JTAG Port Input Selection Advanced Register Contents

JPISA0	JPIS0	Function
0	0	Type 1 input buffer is selected (SHMT1)
	1	Type 2 input buffer is selected (SHMT4)
1	X	Type 5 input buffer is selected (TTL)

NOTE

Details of the definition of type 2 and type 5 are given in **Section 2C.11.3.2, Input Buffer Control (PISn/JPIS0, JPISA0)**. For details, also see **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for input buffer characteristics.

2C.9.5 Port Register Protection

RH850/F1KM has Port Protection Command Registers (PPCMDn) and Port Protection Status Registers (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see **Section 5, Write-Protected Registers**.

2C.9.6 Flowchart Examples for Port Settings

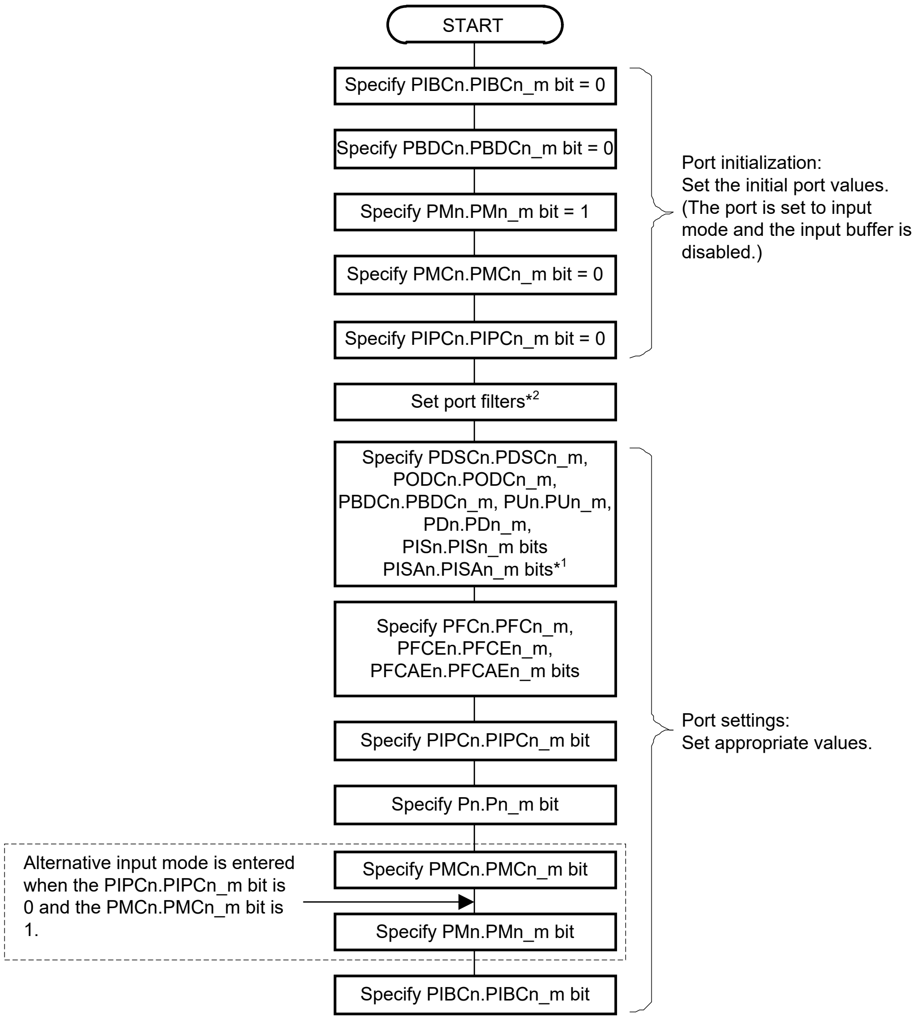
Examples of the port settings are shown in the flowchart below.

CAUTION

If the port is set to the PIPCn.PIPCn_m bit = 0 and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCn.PMCn_m bit is set to 1 and when the PMn.PMn_m bit is set to 0. If an interrupt- related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.

2C.9.6.1 Batch Setting

An example of specifying batch port group settings is shown in the flowchart below.



Note 1. There is no PISAn.PISAn_m bit in RH850/F1KM-S1.

Note 2. While PMC = 0, an interrupt may be triggered during the configuration of the port registers under the following conditions:

For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.

For INTP0-5 and INTP10-12 interrupt requests:

- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.

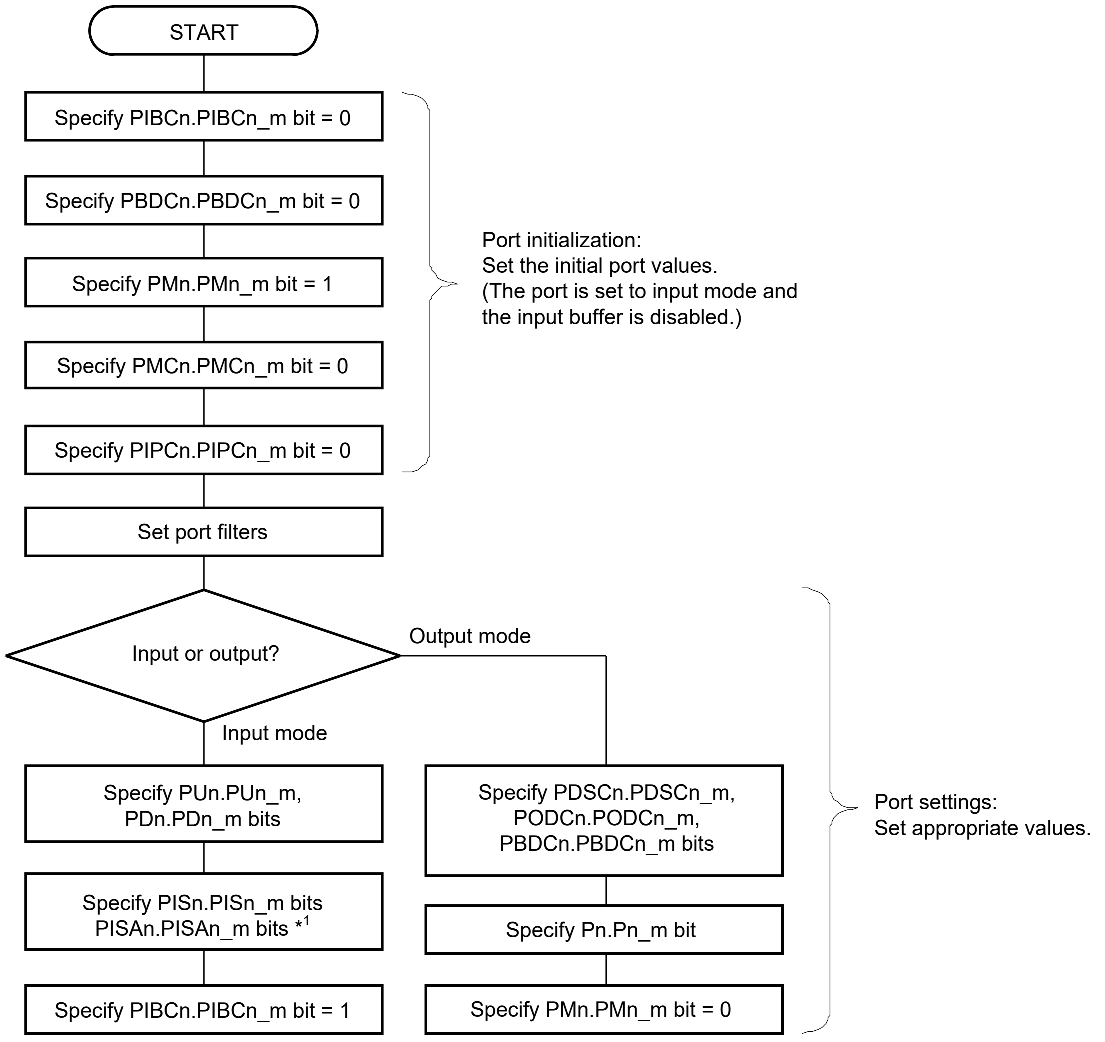
In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2C.6 Example of Port Settings (When Specified in Batch)

2C.9.6.2 Individual Settings

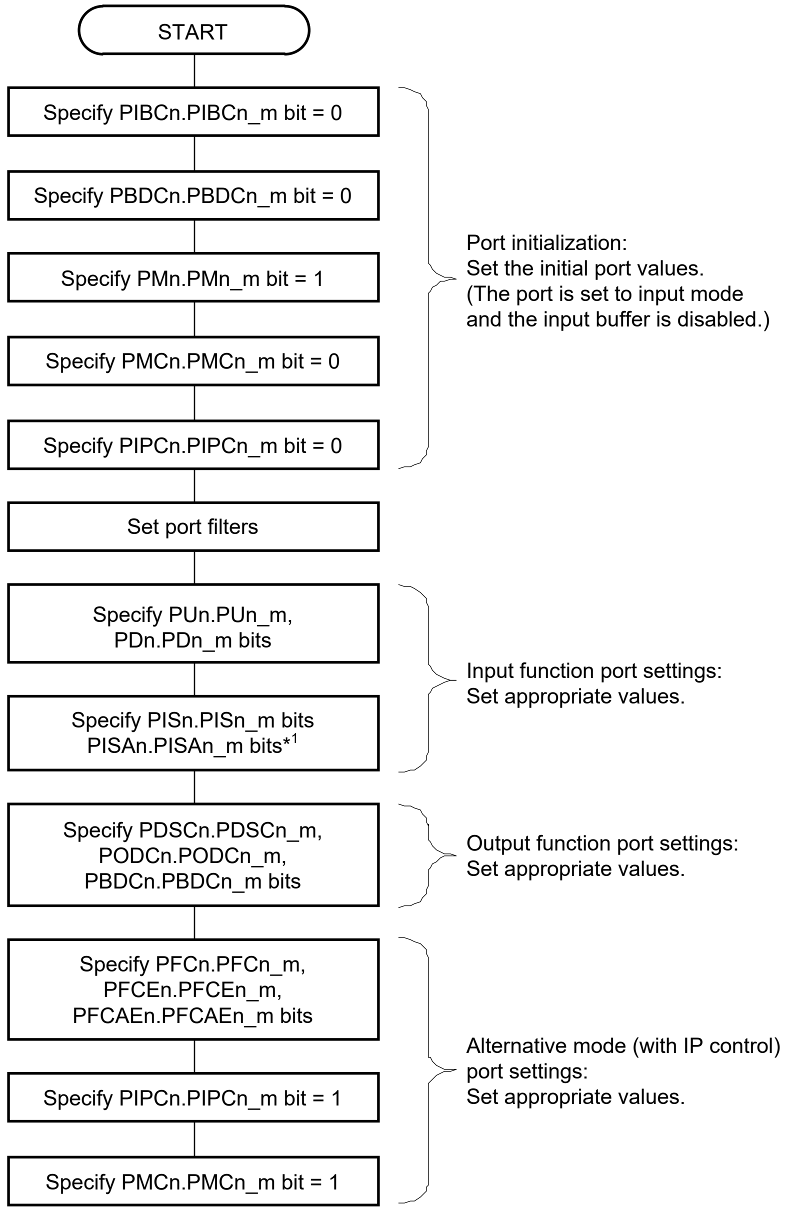
An example of specifying individual port settings is shown in the flowchart below.



Note 1. There is no PISAn.PISAn_m bit in RH850/F1KM-S1.

Figure 2C.7 Example of Port Settings (in Port Mode)

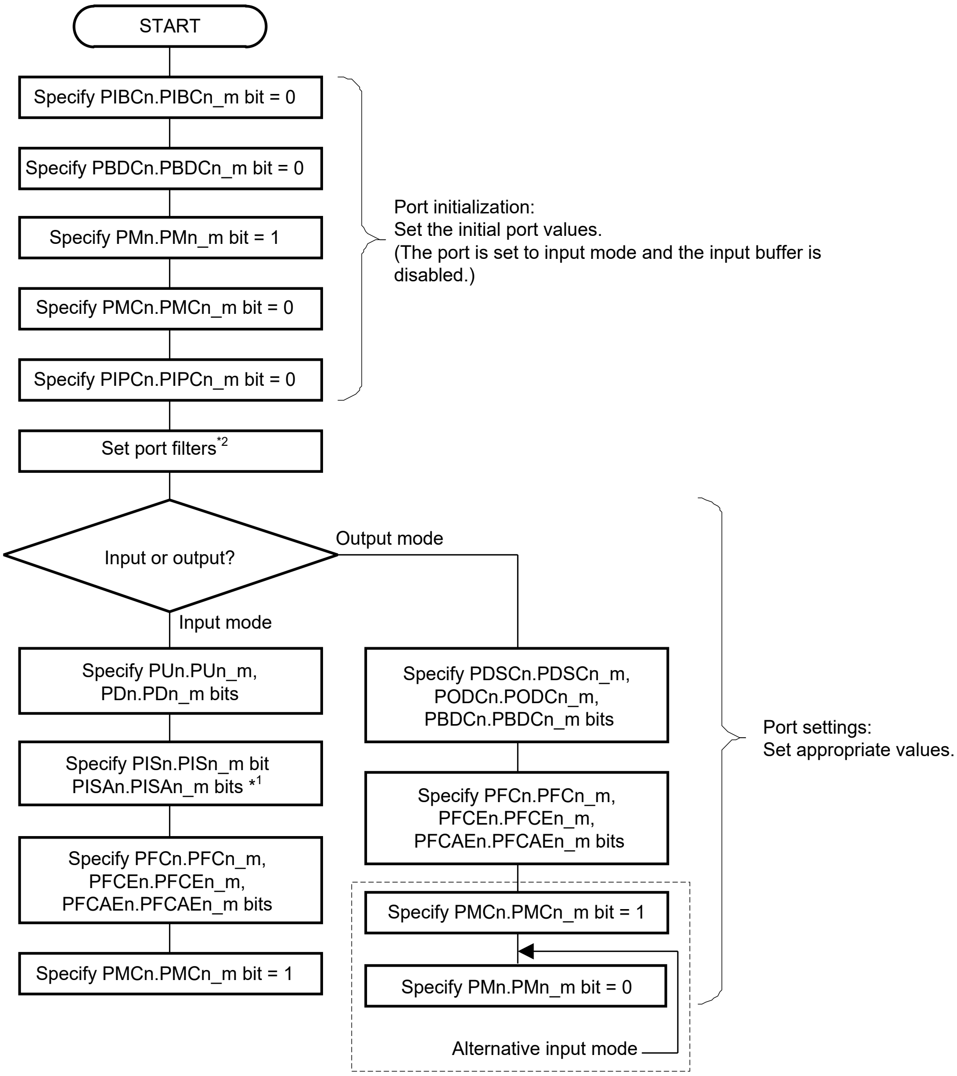
(1) With IP Control



Note 1. There is no PISAn.PISAn_m bit in RH850/F1KM-S1.

Figure 2C.8 Example of Port Settings (in Alternative Mode)

(2) Without IP Control



Note 1. There is no PISAn.PISAn_m bit in RH850/F1KM-S1.

Note 2. While PMC = 0, an interrupt may be triggered during the configuration of the port registers under the following conditions:

For NMI, INTP7 and INTP8 interrupt requests:

- The port filter is set to low level detection.
- The port filter is set to rising edge or both edge detection and the PMC register is set to 1 while the input terminal is at high level.

For INTP0-5 and INTP10-12 interrupt requests:

- The port filter is set to high level detection.
- The port filter is set to falling edge or both edges detection and the PMC register is set to 1 while the input terminal is at low level.

In order to avoid the unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMC register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2C.9 Example of Port Settings (in Alternative Mode)

2C.10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCn register setting. When PMCn.PMCn_m = 1, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

Table 2C.38 Port Function

						Device			
Port	Pin Name	Size	Direction	Power Domain	Special Alternative Function	48 Pins	64 Pins	80 Pins	100 Pins
JTAG Port 0	JP0_0 - 5	6 bits	In/Out	AWO	JTAG, LPD	✓	✓	✓	✓
Port 0	P0_0 - 3	4 bits	In/Out	AWO		✓	—	—	—
	P0_0 - 6	7 bits				—	✓	—	—
	P0_0 - 12	13 bits				—	—	✓	—
	P0_0 - 14	15 bits				—	—	—	✓
Port 8	P8_0 - 1	2 bits	In/Out	AWO	ADCA0 (10-bit resolution)	✓	—	—	—
	P8_0 - 6	7 bits				—	✓	✓	—
	P8_0 - 12	13 bits				—	—	—	✓
	P8_6	1 bit	In/Out	AWO	$\overline{\text{RESETOUT}}$	—	✓	✓	✓
Port 9	P9_0 - 1	2 bits	In/Out	ISO	ADCA0 (10-bit resolution)	✓	—	—	—
	P9_0 - 3	4 bits				—	✓	—	—
	P9_0 - 6	7 bit				—	—	✓	✓
Port 10	P10_0 - 10	11 bits	In/Out	ISO		✓	—	—	—
	P10_0 - 14	15 bits				—	✓	—	—
	P10_0 - 15	16 bits				—	—	✓	✓
Port 11	P11_0 - 4	5 bits	In/Out	ISO		—	—	✓	—
	P11_0 - 7	8 bits				—	—	—	✓
Analog Port 0	AP0_0 - 7	8 bits	In/Out	AWO	ADCA0 (12/10-bit resolution)	✓	—	—	—
	AP0_0 – 9	10 bits				—	✓	—	—
	AP0_0 – 10	11 bits				—	—	✓	—
	AP0_0 - 15	16 bits				—	—	—	✓

2C.10.1 JTAG Port 0 (JP0)

2C.10.1.1 Alternative Function

The following alternative functions are available when JTAG port 0 is configured as a general-purpose I/O port by setting OPJTAG[1:0] on the corresponding option byte to 00_B.

Table 2C.39 JTAG Port 0 (JP0)

Port Mode (JPMC 0_m = 0)	Alternative Mode (JPMC0_m = 1)														ADC	Special function	PKG No.			
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative		6th Alternative		7th Alternative				48 Pins	64 Pins	80 Pins	100 Pins
	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output						
JP0_0[*1]	INTP0		TAUJ2I0	TAUJ2O0	FPDR	FPDT										DCUTDI/ LPDI/ LPDIO	15	19	23	28
JP0_1	INTP1		TAUJ0I0	TAUJ0O0		FPDT										DCUTDO/ LPDO	14	18	22	27
JP0_2	INTP2		TAUJ0I1	TAUJ0O1	FPCK											DCUTCK/ LPDCLK	13	17	21	26
JP0_3	INTP3	CSCXFOUT	TAUJ0I2	TAUJ0O2												DCUTMS	12	16	20	25
JP0_4																$\overline{\text{DCUTRST}}$	11	15	19	24
JP0_5	NMI	RTCA0OUT	TAUJ0I3	TAUJ0O3												$\overline{\text{DCURDY}}$ / LPDCLKOUT	10	14	18	23

Note 1. In LPD (1 pin) mode, the JP0_0 output buffer state is Open-drain.

CAUTION

The behavior and performance are not guaranteed when alternative functions are not assigned to the register.

2C.10.1.2 Control Registers

Table 2C.40 Control Registers (JP0)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device			
			Position	R/W*1			48 Pins	64 Pins	80 Pins	100 Pins

CAUTIONS

1. The behavior and performance are not guaranteed when alternative functions are not assigned to the register.
2. Use ADC functions with their initial settings. For details, see **Table 2C.44, Control Registers (P8)**.
3. When the $\overline{\text{RESETOUT}}$ function is selected for the P8_6 pin, the P8_6 pin outputs a low-level as the $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is released. For details, see **Section 2C.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

CAUTION

P8_6 drives a low level after any kind of reset release, until it is later configured differently by register settings. For details, see **Section 2C.11.1.1, P8_6: $\overline{\textbf{RESETOUT}}$** .

CAUTIONS

1. The behavior and performance are not guaranteed when alternative functions are not assigned to the register.
2. Use ADC functions with their initial settings. For details, see **Table 2C.46, Control Registers (P9)**.

			10-0				—	—	✓	—
			15-0				—	—	—	✓

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

2C.11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

2C.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

2C.11.1.1 P8_6: $\overline{\text{RESETOUT}}$

The P8_6 pin ($\overline{\text{RESETOUT}}$ signal) changes PM8.PM8_6 and PODC8.PODC8_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.

(Case 1): OPBT0.RESETOUTEN = 1

- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 0: Output mode
- PODC8.PODC8_6 = 1: Open-drain

(Case 2): OPBT0.RESETOUTEN = 0

- P8.P8_6 = 0: Outputs low level
- PM8.PM8_6 = 1: Input mode
- PODC8.PODC8_6 = 0: Push-pull

For detail of OPBT0.RESETOUTEN register, see **Section 44.9.2, OPBT0 — Option Byte 0**, also see **Section 9BC.1.3, Reset Output ($\overline{\text{RESETOUT}}$)**.

When the P8_6 pin setting is updated with another value, the pin operates by new setting.

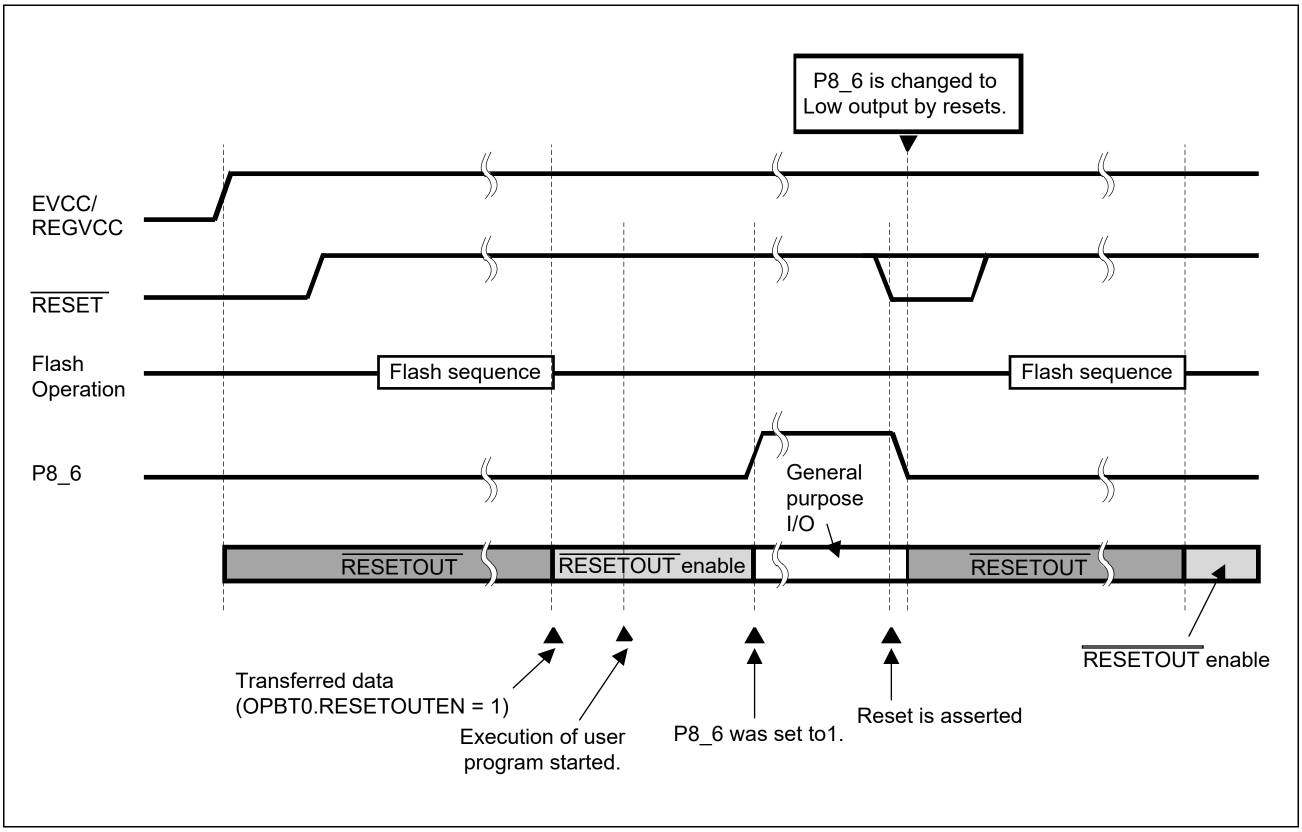

Figure 2C.10 P8_6 Pin ($\overline{\text{RESETOUT}}$ Signal) Operation While a Reset is asserted and released: (Case 1) OPBT0.RESETOUTEN setting is 1

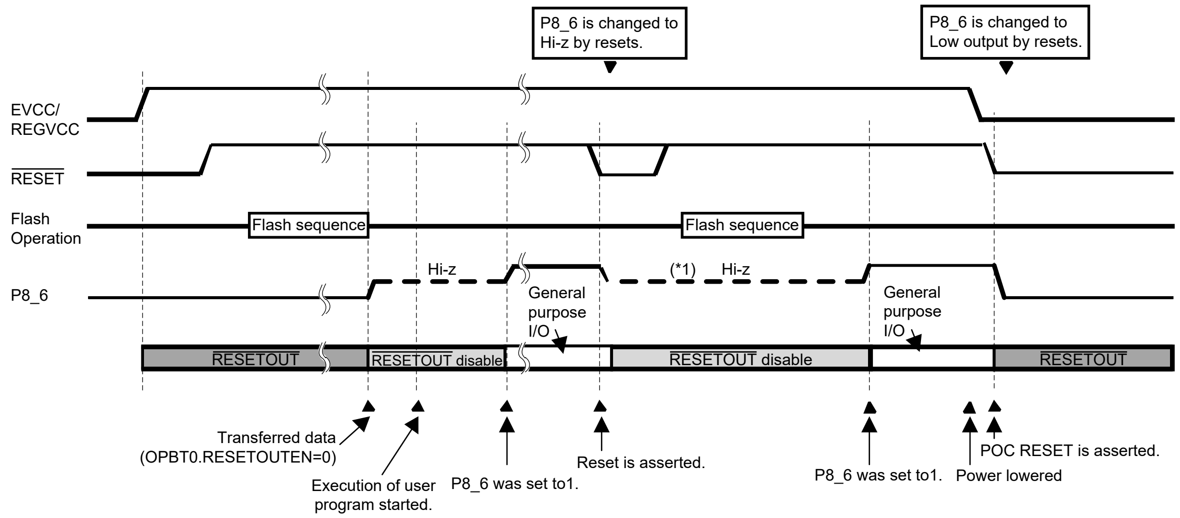

Note 1. When a reset except POC reset occurs with RESETOUT disable (OPBT0.RESETOUTEN = 0), P8_6 pin (RESETOUT signal) will be changed to Hi-z.

Figure 2C.11 P8_6 Pin (RESETOUT Signal) Operation While a Reset is asserted and released: (Case 2) OPBT0.RESETOUTEN setting is 0

2C.11.1.2 JP0_0 to JP0_5: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

Table 2C.53 Debug Interface

OPJTAG1	OPJTAG0	Mode	JP0_0	JP0_1	JP0_2	JP0_3	JP0_4	JP0_5
1	1	Nexus I/F	DCUTDI input	DCUTDO output	DCUTCK input	DCUTMS input	$\overline{\text{DCUTRST}}$ input	$\overline{\text{DCURDY}}$ output
0	1	LPD (4 pins)	LPDI input	LPDO output	LPDCLK input	Port/ alternative function	Port/ alternative function	LPDCLK OUT output
1	0	LPD (1 pin)	LPDIO input/output	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function

NOTE

For the OPJTAG[1:0] settings, see **Section 44.9.2, OPBT0 — Option Byte 0**.

2C.11.1.3 FPDR(JP0_0), FPDT(JP0_1), FPCK(JP0_2): Flash Programmer

These pins are used for connecting a flash programmer. See *Flash Programmer's Manual* for details.

2C.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10_8: FLMD1 pin can select serial programming mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_2: MODE1 and the P10_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_6: MODE2, the P10_2: MODE1 and the P10_1: MODE0 pins can select user boot mode.

For details on the mode selection, see **Section 6, Operating Mode**.

2C.11.2 A/D Input Alternative I/O

The following ports are permanently connected to A/D input functions. (However, an analog input to the A/D is controlled by the A/D module.)

Table 2C.54 A/D Input Alternative Pins

		Device			
Port	A/D Input	48 Pins	64 Pins	80 Pins	100 Pins
P8_0	ADCA0I0S	✓	✓	✓	✓
P8_1	ADCA0I1S	✓	✓	✓	✓

2C.11.3 Special I/O Control

2C.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.

The following table lists all alternative functions where PIPCn.PIPCn_m must be set to 1. For details, see **Section 2C.9.2.3, PIPCn — Port IP Control Register**.

Table 2C.55 Alternative Modes that Require Setting PIPCn.PIPCn_m = 1

Function	Alternative Functions Name	Port Name	Power Supply Area	Control	Reference Section
TAPA	TAPA0UP	P10_0	ISO	U phase Hi-Z control	**Section 36**
	TAPA0UN	P10_1	ISO		
	TAPA0VP	P10_2	ISO	V phase Hi-Z control	
	TAPA0VN	P10_3	ISO		
	TAPA0WP	P10_4	ISO	W phase Hi-Z control	
	TAPA0WN	P10_5	ISO

	CSIH3SC	P11_7	ISO	Master (1) / slave (0) mode signal	

2C.11.3.2 Input Buffer Control (PISn/JPIS0, JPISA0)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/ JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type 1/2 or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in **Table 2C.57, JTAG Port Input Buffer Characteristics Selection**.

Table 2C.56 Port Input Buffer Characteristics Selection

	Input Buffer Selection		Device

JP0_4	—	SHMT4	—*1,*2	✓	✓	✓	✓
JP0_5	SHMT1	SHMT4	—	✓	✓	✓	✓

Note 1. TTL is selected for Boundary scan mode without JPISA0 register setting.

Note 2. TTL is selected for Nexus in normal operating mode without JPISA0 register setting.

Note 3. TTL is selected for LPD (4 pins) in normal operating mode without JPISA0 register setting.

Note 4. TTL is selected for LPD (1 pin) in normal operating mode without JPISA0 register setting.

NOTES

1. For the SHMT1, SHMT4, and TTL pin characteristics, see **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.
2. For the input buffer after reset, Type 2 (SHMT4) is selected.

2C.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

Table 2C.58 Output Buffer Characteristics Selection

	Output Drive Strength Selection		Device			
Port Name	Slow Mode (PDSCn_m = 0)	Fast Mode (PDSCn_m = 1)	48 Pins	64 Pins	80 Pins	100 Pins
JP0_1	10 MHz	40 MHz	✓	✓	✓	✓

Note 2. Supports Cload: 50 pF (The load capacitance of CSIH1 to CSIH3 are 50 pF.)

Note 3. In some of the functions, Fast mode or Slow mode is specified. For details, see **Section 47C.5, AC Characteristics**.

2C.12 Noise Filter & Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1KM supports both analog and digital filters.

It also supports the function for edge and level detection after the signals have passed through a filter.

The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter & edge/level detection control registers and control bits, and register addresses.

For details on the digital/analog filter function and noise filter & edge/level detection control registers, see **Section 2C.13, Description of Port Noise Filter & Edge/Level Detection**.

NOTE

In this section, <*name*> in the noise filter control register represents the peripheral function connected to a filter.

2C.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

2C.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

Filter control register FCLA0CTLm_<*name*> (m = 0 to 7)

A dedicated FCLA0CTLm_<*name*> register is provided for each pin in a port that incorporates an analog filter.

Table 2C.59 Input Pins that Incorporate Analog Filter Type A

		FCLA0CTL Register Configuration		Device

2C.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm_<*name*> (m = 0 to 2)

  Each port with a digital filter has a special FCLA0CTLm_<name> register.

- Digital noise elimination control register DNFA<*name*>CTL

  Each DNFA<*name*>CTL control register controls digital filter processing for three input signals per group.

- Digital noise elimination enable register DNFA<*name*>EN

  The setting of the DNFA<*name*>ENL[2:0] bits in DNFA<*name*>EN enables or disables digital noise elimination for three input signals per group.

Table 2C.62 Input Pins that Incorporate Digital Filter Type D

	Device				Digital Noise Elimination Control Register		Digital Noise Elimination Enable Register			Filter Control Register

2C.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA<*name*>CTL

  Each DNFA<*name*>CTL control register controls digital filter processing for up to 16 input signals per group.

- Digital noise elimination enable register DNFA<*name*>EN

  The setting of the DNFA<*name*>ENL[7:0] and DNFA<*name*>ENH[7:0] bits in DNFA<*name*>EN enables or disables digital noise elimination for up to 16 input signals per group.

Table 2C.63 Input Pins that Incorporate Digital Filter Type E

Note 4. RSENT does not have the edge detection.

2C.12.2 Clock Supply for Port Filters

The following table shows the clock supply for each filter type in each port domain.

Table 2C.64 Clock Supply for Port Filters

Peripheral Function	Port Domain*[1]	Filter Type	Filter Clock	Setting Register	
				Source Clock Selection	Clock Selection
ADCA0	Always-On area (AWO area)	Digital filter type D	DNFATCKI	CKSC_AADCAS_CTL	CKSC_AADCAD_CTL
TAUD0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI1S_CTL	—
TAUB0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—
ENCA0	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI1S_CTL	—
RSENTn	Isolated area (ISO area)	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—

Note 1. Power Domain

NOTE

For the Setting Register, see **Section 12C.4.3, Clock Selector Control Register**.

2C.13 Description of Port Noise Filter & Edge/Level Detection

External signals pass through different types of filters according to the use of each external input signal.

NOTE

In this section, <*name*> in the noise filter control register represents the peripheral function connected to a filter.

2C.13.1 Overview

2C.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.

  Used for external interrupt signals.

- Type B: An analog filter

  Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.

- Type C: An analog filter only

  Used for the external $\overline{\text{RESET}}$ input and mode signals.

2C.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection. Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function. Used for the timer input signals and encoder input signals.

2C.13.2 Analog Filters

2C.13.2.1 Analog Filter Characteristic

See **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for the input conditions for signals input to pins that incorporate an analog filter.

2C.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm_<*name*> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in **Table 2C.59, Input Pins that Incorporate Analog Filter Type A**.

2C.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.

The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

(1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

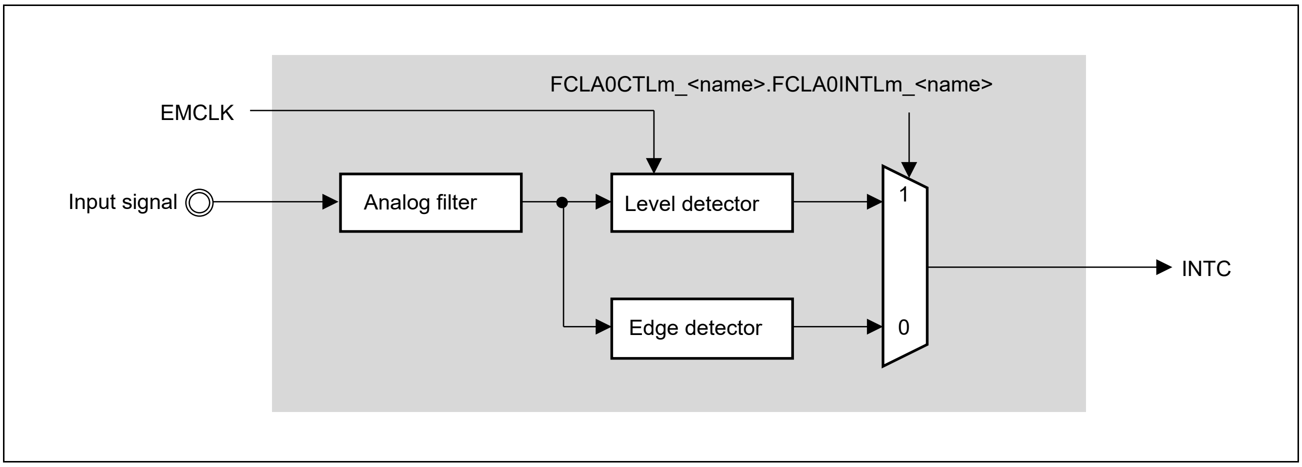

Figure 2C.12 Block Diagram of Analog Filter Type A

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit FCLA0CTLm_<*name*>.FCLA0INTLm_<*name*>.

- FCLA0INTLm_<*name*> bit = 0: Edge detection

  Whether a rising or falling edge is detected can be specified by setting the FCLA0CTLm_<*name*>.FCLA0INTRm_<*name*> and FCLA0CTLm_<*name*>.FCLA0INTFm_<*name*> bits.

- FCLA0INTLm_<*name*> bit = 1: Level detection

  The detection of a high level or low level can be specified by setting FCLA0CTLm_<*name*>.FCLA0INTRm_<*name*> bit.

The table below summarizes the detection conditions of the analog filter.

Table 2C.65 Analog Filter Event Detection Conditions

FCLA0INTLm_<*name*>	FCLA0INTFm_<*name*>	FCLA0INTRm_<*name*>	Edge Detection	Level Detection
0	0	0	No edge detected	Disabled
	0	1	Rising edge	
	1	0	Falling edge	
	1	1	Rising and falling edges	
1	X	0	Disabled	Low level
	X	1		High level

Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

(2) Analog filter type B

A block diagram of analog filter type B is shown below.

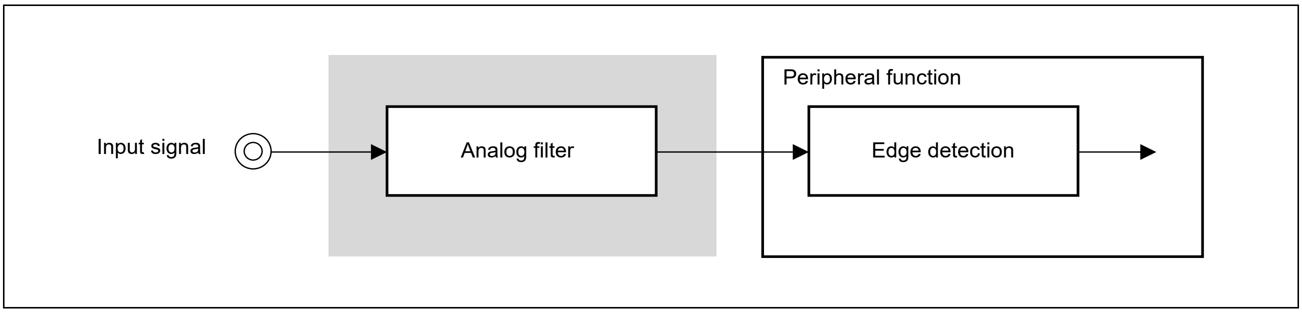

Figure 2C.13 Block Diagram of Analog Filter Type B

Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

(3) Analog filter type C

A block diagram of analog filter type C is shown below.

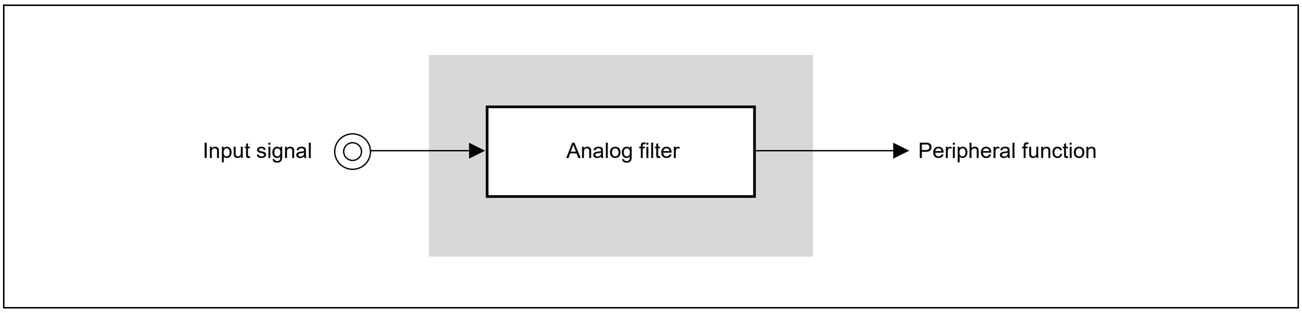

Figure 2C.14 Block Diagram of Analog Filter Type C

The generated signals are always input signals that have passed through an analog filter.

Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

2C.13.3 Digital Filters

2C.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.

The input signal is sampled with the sampling frequency fs.

If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFA<*name*>CTL.DNFA<*name*>PRS[2:0] select the sampling frequency based on

  $f_s = f_{DNFATCKI} / 2^{DNFA<name>PRS[2:0]}$

  where $f_{DNFATCKI}$ is the frequency of the DNFATCKI clock.

- DNFA<*name*>CTL.DNFA<*name*>NFSTS[1:0] determines the number of same level samples, “s”, (2 to 5):

  s = DNFA<*name*>NFSTS[1:0] + 2

External signal pulses shorter than the following are suppressed at all times.

$s \times 1/f_s$

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

$(s + 1) \times 1/f_s$

External signal pulses in the following range may be suppressed or judged as valid.

$s \times 1/f_s$ to $(s + 1) \times 1/f_s$

The filter operation is illustrated in the figure below with DNFA<*name*>NFSTS[1:0] = 01_B, i.e. s = 3 same level samples.

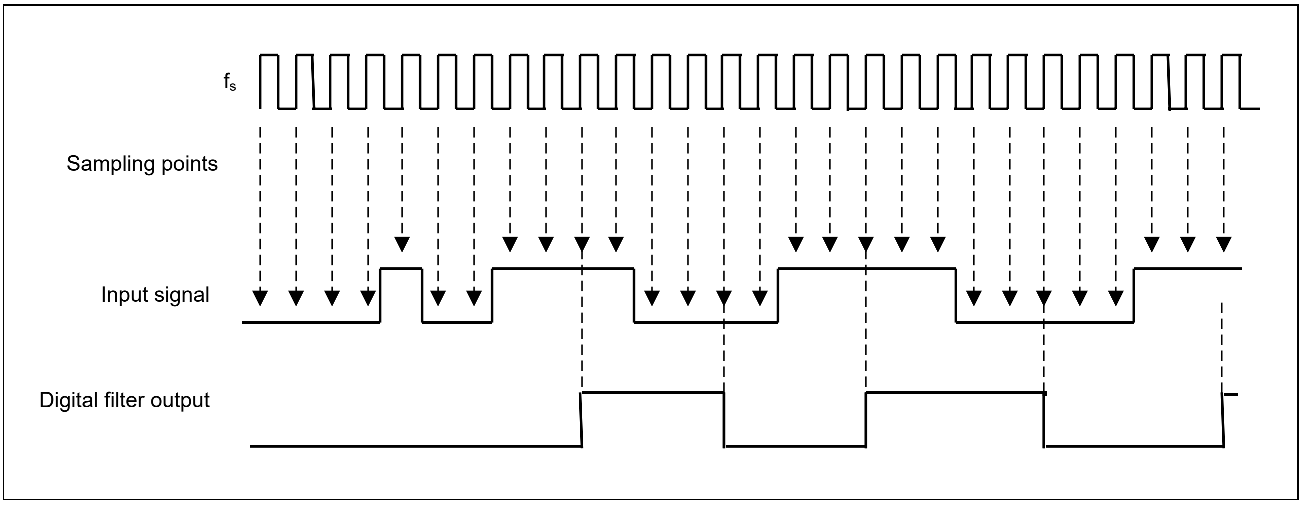

Figure 2C.15 Digital Filter Function

2C.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.

The digital filter characteristics, specified by DNFA<*name*>CTL.DNFA<*name*>PRS[2:0] and DNFA<*name*>NFSTS[1:0] apply to the signals.

However, the digital filter for each signal can be enabled or disabled separately by DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7).

CAUTIONS

1. When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) = 1 and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7) = 1) for the port pin to switch to the alternative function.
   s = DNFA<*name*>NFSTS[1:0] + 2
   $s \times 1/f_s + 2 \times 1/f_{DNFATCKI}$
2. When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) = 1 and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7) = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.
   $s \times 1/f_s + 3 \times 1/f_{DNFATCKI}$

2C.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.

Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

2C.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA<*name*>CTL and digital noise elimination enable register DNFA<*name*>EN are used to set all the filters in the same group (<*name*> = peripheral function group).

The DNFA<*name*>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <*name*>.

The DNFA<*name*>EN register enables/disables each filter by setting the corresponding bit in DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTLm_ADCn registers are ordered in groups of 3 registers with the same index n. The register index n is in 0 or 1.

The assignment of the input signals to the control registers and their addresses are given in **Table 2C.62, Input Pins that Incorporate Digital Filter Type D** and **Table 2C.63, Input Pins that Incorporate Digital Filter Type E** in **Section 2C.12.1, Port Filter Assignment**.

CAUTION

Do not change any control register settings while the corresponding digital filter is enabled by DNFA<*name*>EN.DNFA<*name*>ENLm (m = 0 to 7) = 1 and DNFA<*name*>EN.DNFA<*name*>ENHm (m = 0 to 7) = 1. Otherwise an unintended filter output may be generated.

(1) Digital filter type D

A block diagram of digital filter type D is shown below.

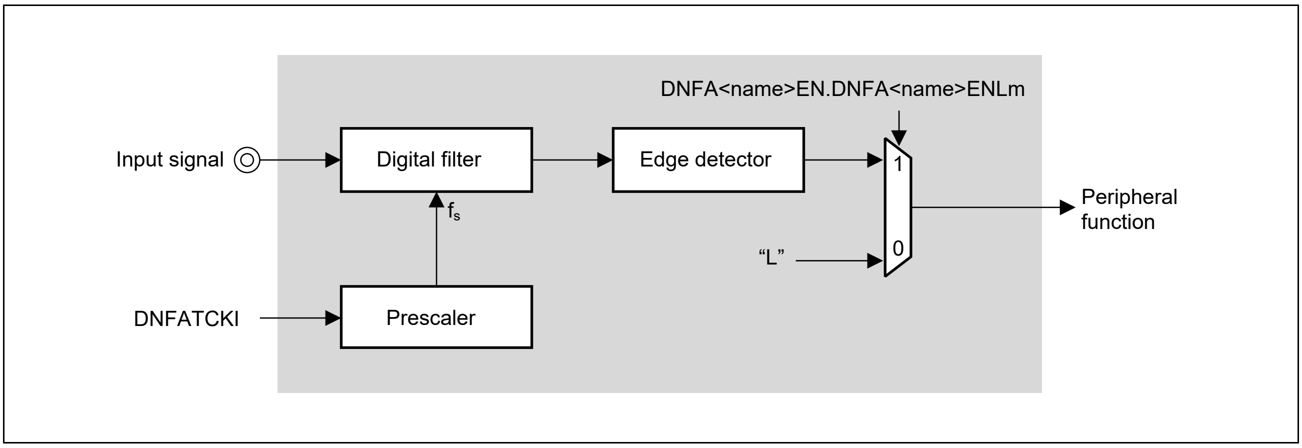

Figure 2C.16 Block Diagram of Digital Filter Type D

The generated signal depends on the register setting, as shown in the following table.

Table 2C.66 Output Options for Digital Filter Type D

DNFA<*name*>EN.DNFA<*name*>ENLm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

(2) Digital filter type E

A block diagram of digital filter type E is shown below.

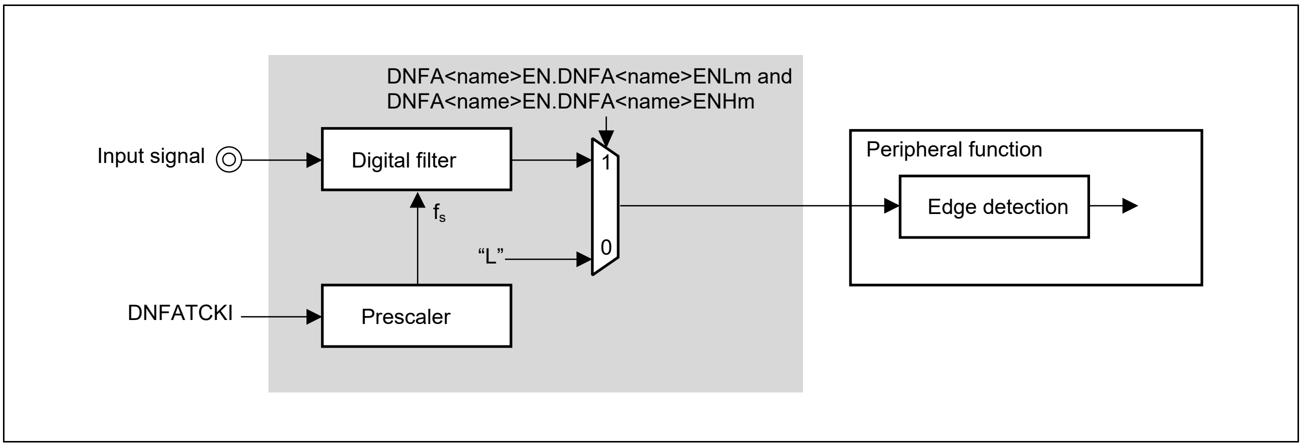

Figure 2C.17 Block Diagram of Digital Filter Type E

The generated signal depends on the register setting, as shown in the following table.

Table 2C.67 Output Options for Digital Filter Type E

DNFA<*name*>EN.DNFA<*name*>ENLm and DNFA<*name*>EN.DNFA<*name*>ENHm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

2C.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:

Table 2C.68 List of Filter Registers

Module Name	Register Name	Symbol	Address
FCLA0	Filter control register m	FCLA0CTLm_<name>	The addresses are shown in the tables in **Section 2C.12.1, Port Filter Assignment**.
DNF	Digital noise elimination control register	DNFA<name>CTL	
	Digital noise elimination enable register	DNFA<name>EN	
	Digital noise elimination enable H register	DNFA<name>ENH	
	Digital noise elimination enable L register	DNFA<name>ENL	

2C.13.4.1 FCLA0CTLm_<name> — Filter Control Register

This register controls the analog and digital filter operation.

Access: This register can be read or written in 8-bit units.

Address: The allocation of input signals to FCLA0CTLm_<*name*> registers and the address of each register are shown in the tables in **Section 2C.12.1, Port Filter Assignment**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	FCLA0INTLm_<name>	FCLA0INTFm_<name>	FCLA0INTRm_<name>
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 2C.69 FCLA0CTLm_<name> Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	FCLA0INTLm_<name>	Detection Mode Selection 0: Edge detection 1: Level detection **NOTE:** This bit is only valid for analog filter type A.
1	FCLA0INTFm_<name>	• In level detection mode (FCLA0INTLm_<name> = 1): This bit has no effect. • In edge detection mode (FCLA0INTLm_<name> = 0): Falling edge detection control 0: Falling edge detection disabled 1: Falling edge detection enabled **NOTE:** This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.
0	FCLA0INTRm_<name>	• In level detection mode (FCLA0INTLm_<name> = 1): Detected level selection 0: Low level detection 1: High level detection • In edge detection mode (FCLA0INTLm_<name> = 0): Rising edge detection control 0: Rising edge detection disabled 1: Rising edge detection enabled **NOTE:** This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.

CAUTION

Digital filter type D: Always set bit 2 to “0”.

2C.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 8-bit units.

Address: For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see **Table 2C.62, Input Pins that Incorporate Digital Filter Type D** and **Table 2C.63, Input Pins that Incorporate Digital Filter Type E** in **Section 2C.12.1, Port Filter Assignment**.

Value after reset: 00_{H}

110_{B}	DNFATCKI/64
111_{B}	DNFATCKI/128

2C.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 16-bit units.

The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

Address: For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see **Table 2C.62, Input Pins that Incorporate Digital Filter Type D** and **Table 2C.63, Input Pins that Incorporate Digital Filter Type E** in **Section 2C.12.1, Port Filter Assignment**.

Value after reset: 0000_H

2C.13.4.4 DNFA<name>ENH — Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>EN register.

NOTE

This register is only valid for digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see **Table 2C.63, Input Pins that Incorporate Digital Filter Type E** in **Section 2C.12.1, Port Filter Assignment**.

For details of the respective bit functions, see **Section 2C.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register**.

2C.13.4.5 DNFA<name>ENL — Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name>EN register.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see **Table 2C.62, Input Pins that Incorporate Digital Filter Type D** and **Table 2C.63, Input Pins that Incorporate Digital Filter Type E** in **Section 2C.12.1, Port Filter Assignment**.

Value after reset: 00_H

For details of the respective bit functions, see **Section 2C.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register**.

Section 3A CPU System of RH850/F1KH-D8

3A.1 Overview

3A.1.1 Block Configuration

Figure 3A.1, Block Configuration Diagram of the RH850/F1KH shows the block configuration diagram of RH850/F1KH.

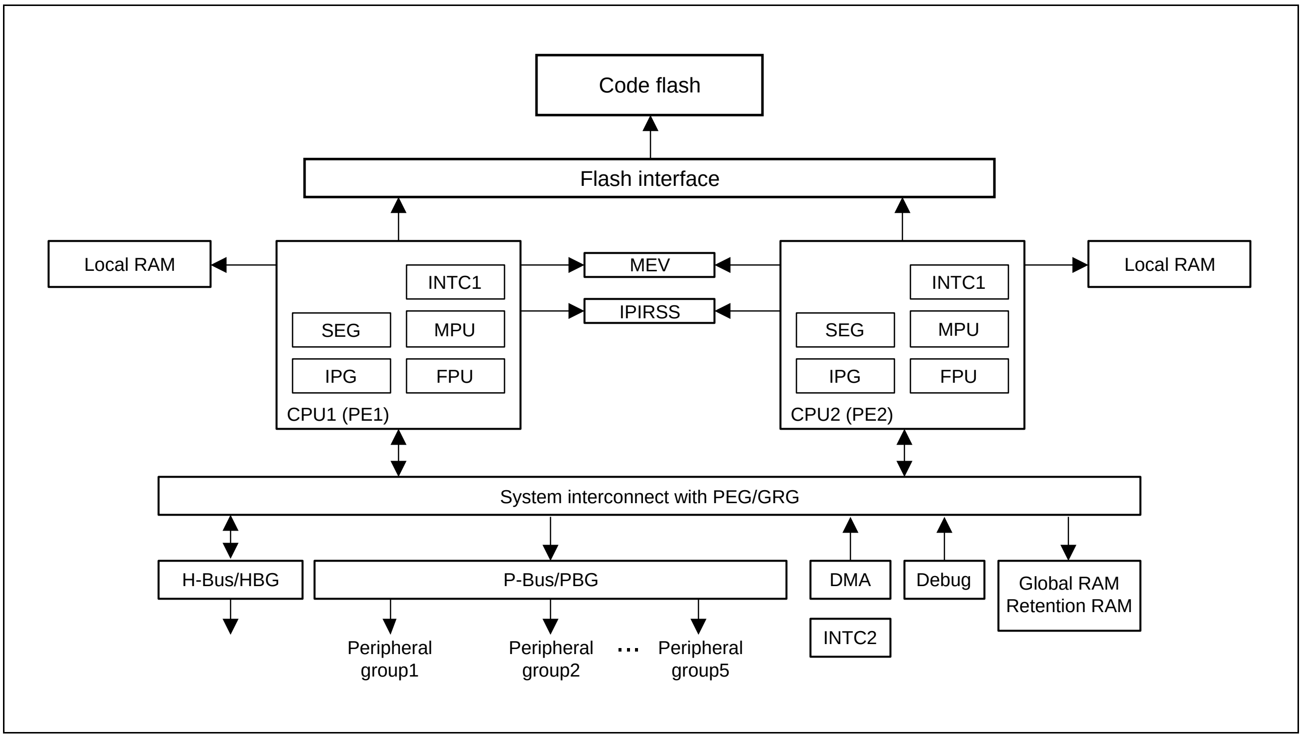

Figure 3A.1 Block Configuration Diagram of the RH850/F1KH

CPU1 (PE1)

The RH850G3KH2.0 Core is used as the main CPU.

CPU2 (PE2)

The RH850G3KH2.0 Core is used as an enhanced performance CPU.

Local RAM

Each CPU has a high-speed accessible RAM

Global RAM

The global RAM is a large-capacity RAM for data sharing among CPUs and with DMA.

Retention RAM

The retention RAM is used to retain values in DeepSTOP mode. Since the continuous global RAM area is assigned for the retention RAM, the retention RAM can also serve as a global RAM for sharing data with the DMA.

Code flash

The code flash memory is included for program storage. It is connected with CPU1 and CPU2 via the flash interface.

Data flash

The data flash memory can be rewritten by the CPUs. It has a greater write endurance than the code flash memory.

P-Bus and H-Bus

The P-Bus connects the peripheral IPs. The P-Bus is divided into five peripheral groups, 1 to 5.

INTC1, INTC2

There are two interrupt controllers, INTC1 and INTC2. INTC1 is an interrupt controller exclusive to each CPU. INTC2 is a common interrupt controller that CPU1 and CPU2 share. The PE to which an interrupt request is bound can be specified by a register setting.

DMA

The DMA transfer module (PDMA) is included.

Slave guard

The slave guard is a function to prevent unauthorized access from the specific bus master, and consists of the following guard structures:

(1) PE guard (PEG)
The PE guard is a function to prevent unauthorized access to the resources (local RAM) in the PE from an external master. After reset is released, access from other than the own PE is prohibited.

(2) Internal Peripheral Guard (IPG)
The PE with system interconnects supports “Internal Peripheral Guard” (IPG) that protects the registers of peripherals against invalid accesses.

(3) Global RAM guard (GRG)
The global RAM guard is a function to prevent unauthorized access to the global RAM and retention RAM from

an external master. The global RAM is in the unprotected state (accessible from all bus master) after reset is released. For details, see **Section 40A, Functional Safety of RH850/F1KH-D8**.

(4) Peripheral guard (PBG / HBG)
The peripheral guard is a function to prevent unauthorized access to peripherals. The control registers in the peripheral circuits are protected against illegal accesses.
For details, see **Section 40A, Functional Safety of RH850/F1KH-D8**.

3A.2 CPU

3A.2.1 Core Functions

3A.2.1.1 Features

Table 3A.1, Features of the RH850G3KH2.0 Core lists features of the RH850G3KH2.0 core.

Table 3A.1 Features of the RH850G3KH2.0 Core

Item	Feature
CPU	● Advanced 32-bit architecture for embedded control ● 32-bit internal data bus ● Thirty-two 32-bit general-purpose registers – RISC-type instruction set – Long-/short-format load/store instructions – Three-operand instructions – Instruction set based on C language ● CPU operating modes – User mode and supervisor mode ● Address space: 4-Gbyte linear address space for both data and instructions
Coprocessor	● Floating-point operation coprocessor (FPU) – Supports single precision (32 bits) – Supports data types and exceptions conforming to IEEE754. – Rounding mode: Neighborhood, 0 direction, +∞ direction, and −∞ direction – Handling of denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754
Exception/Interrupt	● 16 interrupt priority levels settable for each channel ● Vector selection method selectable according to performance request or memory usage – Direct branching exception vectors – Indirect branching exception vectors referring to the address table ● Supports the high-speed save/return processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt
Memory management	● Memory protection function (MPU): 16 areas settable
Cache	● No cache memory is equipped.

3A.2.1.2 Register Set

This subsection explains the program registers and system registers incorporated in this CPU.

(1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).

Table 3A.2 Program Registers

Program Register	Name	Function	Description
General-purpose registers	r0	Zero register	Always retains “0”
	r1	Assembler reserved register	Used as working register for generating addresses
	r2	Register for address and data variables (used when the real-time OS used does not use this register)	
	r3	Stack pointer (SP)	Used for generating a stack frame when a function is called
	r4	Global pointer (GP)	Used for accessing a global variable in the data area
	r5	Text pointer (TP)	Used as a register that indicates the start of the text area (area where program code is placed)
	r6 to r29	Register for address and data variables	
	r30	Element pointer (EP)	Used as a base pointer for generating addresses when accessing memory
	r31	Link pointer (LP)	Used when the compiler calls a function
Program counter	PC	Retains instruction addresses during execution of programs	

NOTE

For further descriptions of r1, r3 to r5, and r31 used by the assembler and/or C compiler, see the specification of each software development environment.

(a) General-Purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables. Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

1. r0, r3, r30

These registers are implicitly used by instructions.
r0 is a register that always retains “0”. It is used for operations that use 0 and addressing with base address being 0.
r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.
r30 is used as a base pointer when the SLD or SST instruction accesses memory.

2. r1, r4, r5, r31

These registers are implicitly used by the assembler and C compiler.
When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

3. r2

This register might be used by a real-time OS in some cases. If the real-time OS that is being used does not use r2, r2 can be used as a register for address variables or data variables.

(b) PC — Program Counter

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0, and branching to an odd number address is disabled.

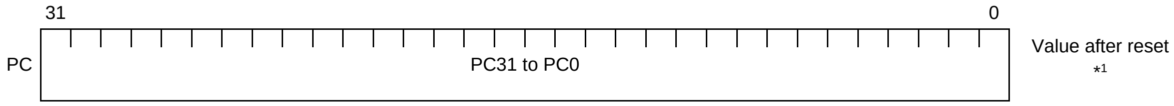

Table 3A.3 PC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	PC31 to PC1	These bits indicate the address of the instruction being executed.	R/W	*1
0	PC0	This bit is fixed to 0. Branching to an odd number address is disabled.	R/W	0

Note 1. The value after reset differs depending on the setting value of the reset vector. For details, see **(q) RBASE — Reset Vector Base Address Register**.

(2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.

System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and a selection ID.

Table 3A.4 Basic System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR0, 0	EIPC	Status save registers when acknowledging EI level exception	SV
SR1, 0	EIPSW	Status save registers when acknowledging EI level exception	SV
SR2, 0	FEPC	Status save registers when acknowledging FE level exception	SV
SR3, 0	FEPSW	Status save registers when acknowledging FE level exception	SV
SR5, 0	PSW	Program status word	*1
SR6, 0	FPSR	(Refer to FPU function registers.)	CU and SV
SR7, 0	FPEPC	(Refer to FPU function registers.)	CU and SV
SR8, 0	FPST	(Refer to FPU function registers.)	CU
SR9, 0	FPCC	(Refer to FPU function registers.)	CU
SR10, 0	FPCFG	(Refer to FPU function registers.)	CU
SR11, 0	FPEC	(Refer to FPU function registers.)	CU and SV
SR13, 0	EIIC	EI level exception source register	SV
SR14, 0	FEIC	FE level exception source register	SV
SR16, 0	CTPC	CALLT execution status save register	UM
SR17, 0	CTPSW	CALLT execution status save register	UM
SR20, 0	CTBP	CALLT base pointer register	UM
SR28, 0	EIWR	EI level exception working register	SV
SR29, 0	FEWR	FE level exception working register	SV
SR0, 1	MCFG0	Machine configuration register	SV
SR2, 1	RBASE	Reset vector base address register	SV
SR3, 1	EBASE	Exception handler vector address register	SV
SR4, 1	INTBP	Base address register of the interrupt handler address table	SV
SR5, 1	MCTL	CPU control	SV
SR6, 1	PID	Processor ID register	SV
SR11, 1	SCCFG	SYSCALL operation setting register	SV
SR12, 1	SCBP	SYSCALL base pointer register	SV
SR0, 2	HTCFG0	Thread configuration register	SV
SR6, 2	MEA	Memory error address register	SV
SR7, 2	ASID	Address space ID register	SV
SR8, 2	MEI	Memory error information register	SV

Note 1. The access permission differs depending on the bit.

(a) EIPC — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see "*Types of Exceptions*" in *Software Manual*).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address cannot be specified.

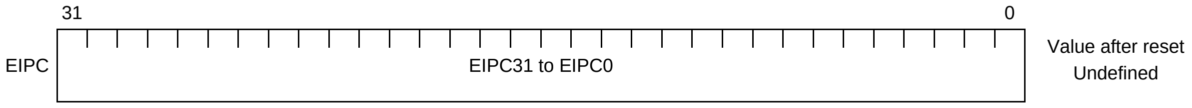

Table 3A.5 EIPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	EIPC31 to EIPC1	These bits indicate the PC saved when an EI level exception is acknowledged.	R/W	Undefined
0	EIPC0	This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0.	R/W	Undefined

(b) EIPSW — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

	31	30	29											17	16	15	14						8	7	6	5	4	3	2	1	0
EIPSW	0	UM	0	0	0	0	0	0	0	0	0	0	0	0	CU	EBV	0	0	0	0	0	0	0	NP	EP	ID	SAT	CY	OV	S	Z

Value after reset
$0000\ 0020_H$

Table 3A.6 EIPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an EI level exception is acknowledged.	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit stores the PSW.CU field setting when an EI level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an EI level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an EI level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an EI level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an EI level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an EI level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an EI level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an EI level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an EI level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an EI level exception is acknowledged.	R/W	0

(c) FEPC — Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see “*Types of Exceptions*” in *Software Manual*).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address cannot be specified.

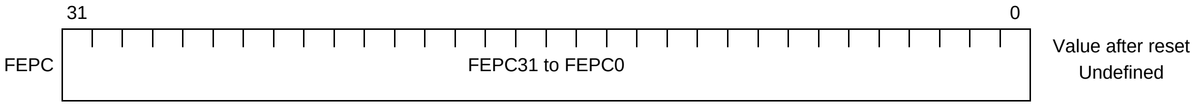

Table 3A.7 FEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FEPC31 to FEPC1	These bits indicate the PC saved when an FE level exception is acknowledged.	R/W	Undefined
0	FEPC0	This bit indicates the PC saved when an FE level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0.	R/W	Undefined

(d) FEPSW — Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

	31	30	29												17	16	15	14						8	7	6	5	4	3	2	1	0
FEPSW	0	UM	0	0	0	0	0	0	0	0	0	0	0	0	0	CU	EBV	0	0	0	0	0	0	0	NP	EP	ID	SAT	CY	OV	S	Z

Value after reset
$0000\ 0020_H$

Table 3A.8 FEPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an FE level exception is acknowledged.	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit stores the PSW.CU field setting when an FE level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an FE level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an FE level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an FE level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an FE level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an FE level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an FE level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an FE level exception is acknowledged.	R/W	0

(e) PSW — Program Status Word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by conditional instructions (Bcond, CMOV, etc.)).

CAUTIONS

1. When the LDSR instruction is used to change the contents of bit7 to 0 in this register, the changed contents become valid immediately after completion of the LDSR instruction execution. See “*APPENDIX A. Hazard Resolution Procedure for System Registers*” in *Software Manual* when the content of the other bits in this register is changed.
2. The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See **Table 3A.9, Access Permission for PSW Register** for the access permission for each bit.

Table 3A.9 Access Permission for PSW Register

Bit		Access Permission when Reading	Access Permission when Writing
30	UM	UM	SV*1
16	CU	UM	SV*1
15	EBV	UM	SV*1
7	NP	UM	SV*1
6	EP	UM	SV*1
5	ID	UM	SV*1
4	SAT	UM	UM
3	CY	UM	UM
2	OV	UM	UM
1	S	UM	UM
0	Z	UM	UM

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1. In this case, writing is ignored.

	31	30	29												17	16	15	14						8	7	6	5	4	3	2	1	0	
PSW	0	UM	0	0	0	0	0	0	0	0	0	0	0	0	0	CU	EBV	0	0	0	0	0	0	0	NP	EP	ID	SAT	CY	OV	S	Z	Value after reset 0000 0020H

Table 3A.10 PSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit indicates that the CPU is in user mode (in UM mode) 0: Supervisor mode 1: User mode	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit indicates the coprocessor use permissions. When the bit corresponding to the coprocessor is 0, a coprocessor unusable exception occurs if an instruction for the coprocessor is executed or a coprocessor resource (system register) is accessed. CU bit 16: FPU	R/W	0

Table 3A.10 PSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
15	EBV	This bit indicates the reset vector and exception vector operation. See the description on RBASE (**(q) RBASE — Reset Vector Base Address Register**) and EBASE (**(r) EBASE — Exception Handler Vector Address Register**) in this section.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see **Table 7A.1, List of Exception Sources**. 0: The acknowledgement of FE level exception is enabled. 1: The acknowledgement of FE level exception is disabled.	R/W	0
6	EP	This bit indicates that an exception other than an interrupt controlled by the interrupt controller is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. 0: An exception other than an interrupt is not being serviced. 1: An exception other than an interrupt is being serviced.	R/W	0
5	ID	This bit disables the acknowledgement of EI level exception. When an EI level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level exception. As for the exceptions which the ID bit disables the acknowledgment, see **Table 7A.1, List of Exception Sources**. This bit is also used to disable EI level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. 0: EI level exception is not being processed or the section is not a critical section (after execution of EI instruction). 1: EI level exception is being processed or the section is a critical section (after execution of DI instruction).	R/W	1
4	SAT*[1]	This bit indicates that the operation result is saturated because the operation result of a saturated operation instruction has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1, but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed. 0: Not saturated 1: Saturated	R/W	0
3	CY	This bit indicates whether a carry or borrow has occurred in the operation result. 0: Carry and borrow have not occurred. 1: Carry or borrow has occurred.	R/W	0
2	OV*[1]	This bit indicates whether or not an overflow has occurred during an operation. 0: Overflow has not occurred. 1: Overflow has occurred.	R/W	0
1	S*[1]	This bit indicates whether or not the result of an operation is negative. 0: Result of operation is positive or 0. 1: Result of operation is negative.	R/W	0
0	Z	This bit indicates whether or not the result of an operation is 0. 0: Result of operation is not 0. 1: Result of operation is 0.	R/W	0

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. The SAT flag is set to 1 only when the OV flag is set to 1 in a saturated operation.

Operation Result Status	Flag Status			Operation Result after Saturation Processing
	SAT	OV	S	
Exceeded positive maximum value	1	1	0	7FFF FFFF$_H$
Exceeded negative maximum value	1	1	1	8000 0000$_H$
Positive (maximum value not exceeded)	Value prior to operation is retained.	0	0	Operation result itself
Negative (maximum value not exceeded)			1	

(f) EIIC — EI Level Exception Source Register

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

Table 3A.11 EIIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIIC31 to EIIC0	These bits store the exception source code when an EI level exception is acknowledged. The EIIC15 to EIIC0 field stores the lower 16 bits of the exception source code. The EIIC31 to EIIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0.	R/W	0

(g) FEIC — FE Level Exception Source Register

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

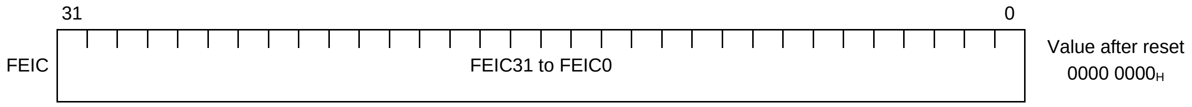

Table 3A.12 FEIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEIC31 to FEIC0	These bits store the exception source code when an FE level exception is acknowledged. The FEIC15 to FEIC0 field stores the lower 16 bits of the exception source code. The FEIC31 to FEIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0.	R/W	0

(h) CTPC — Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address cannot be specified.

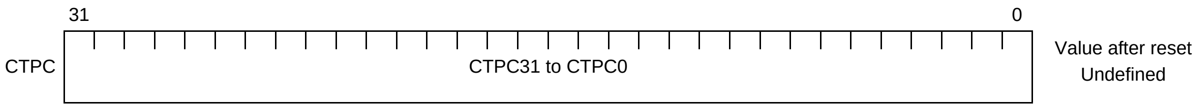

Table 3A.13 CTPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTPC31 to CTPC1	These bits indicate the PC of the instruction after the CALLT instruction.	R/W	Undefined
0	CTPC0	This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0.	R/W	Undefined

(i) CTPSW — Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

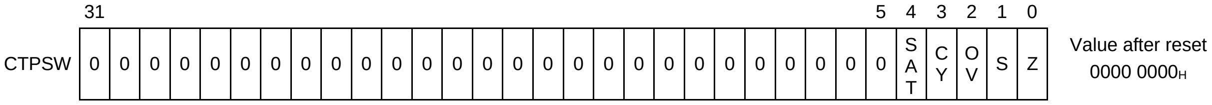

Table 3A.14 CTPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4	SAT	This bit stores the PSW.SAT bit setting when the CALLT instruction is executed.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when the CALLT instruction is executed.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when the CALLT instruction is executed.	R/W	0
1	S	This bit stores the PSW.S bit setting when the CALLT instruction is executed.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when the CALLT instruction is executed.	R/W	0

(j) CTBP — CALLT Base Pointer Register

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.

Be sure to set the CTBP register to a halfword address.

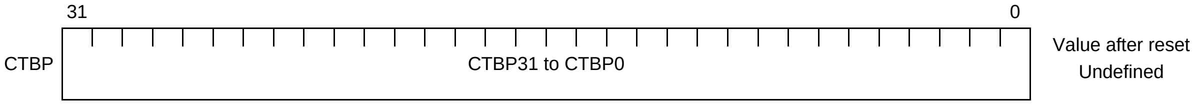

Table 3A.15 CTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTBP31 to CTBP1	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the start address of the table used by the CALLT instruction.	R/W	Undefined
0	CTBP0	This bit indicates the base pointer address of the CALLT instruction. This bit indicates the start address of the table used by the CALLT instruction. Always set this bit to 0.	R	0

(k) ASID — Address Space ID Register

This register indicates the address space ID. This is used to identify the address space provided by the memory management function.

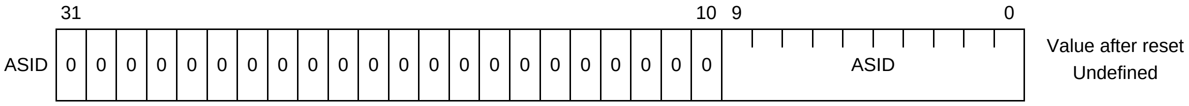

Table 3A.16 ASID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 10	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
9 to 0	ASID	These bits indicate the address space ID.	R/W	Undefined

(l) EIWR — EI Level Exception Working Register

The EIWR register is used as a working register when an EI level exception has occurred.

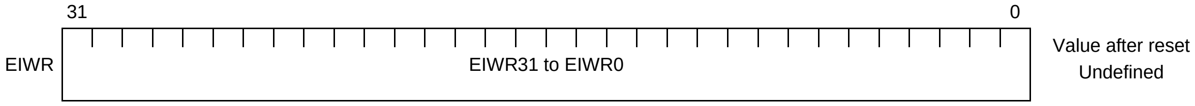

Table 3A.17 EIWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIWR31 to EIWR0	These bits constitute a working register that can be used for any purpose during the servicing of an EI level exception. This register can be used to temporarily save the values of general-purpose registers, etc.	R/W	Undefined

(m) FEWR — FE Level Exception Working Register

The FEWR register is used as a working register when an FE level exception has occurred.

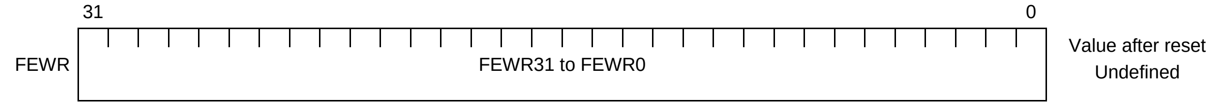

Table 3A.18 FEWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEWR31 to FEWR0	These bits constitute a working register that can be used for any purpose during the servicing of an FE level exception. This register can be used to temporarily save the values of general-purpose registers, etc.	R/W	Undefined

(n) HTCFG0 — Thread Configuration Register

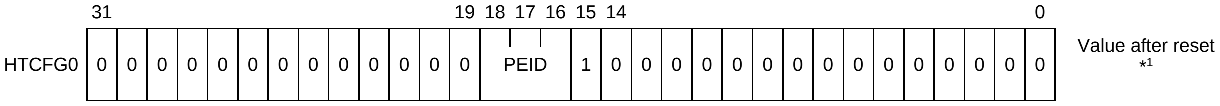

Table 3A.19 HTCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 19	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
18 to 16	PEID	These bits indicate the processor element number.	R	*2
15	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
14 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

Note 1. The value after reset is 0001 8000$_H$ for CPU1 (PE1) and 0002 8000$_H$ for CPU2 (PE2).

Note 2. The value after reset is 001$_B$ for CPU1 (PE1) and 010$_B$ for CPU2 (PE2).

(o) MEA — Memory Error Address Register

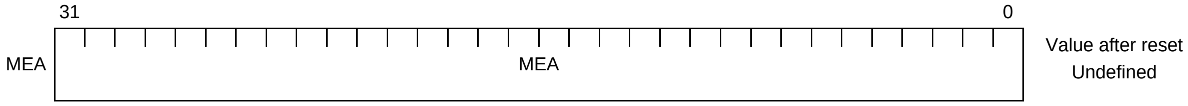

Table 3A.20 MEA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MEA	These bits store the violation address when an MAE (misaligned) or MPU occurs.	R/W	Undefined

(p) MEI — Memory Error Information Register

This register is used to store information about the instruction that caused a misaligned (MAE) or memory protection (MDP) exception when such an exception occurred. This information is used during emulation.

	31										21	20 16	15				11	10 9	8	7	6	5 1	0	
MEI	0	0	0	0	0	0	0	0	0	0	0	REG	0	0	0	0	0	DS		0	0	ITYPE	RW	Value after reset Undefined

Table 3A.21 MEI Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 21	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
20 to 16	REG	These bits indicate the number of the source or destination register accessed by the instruction that caused the exception. For details, see **Table 3A.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
15 to 11	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
10, 9	DS	These bits indicate the data type of the instruction that caused the exception.*1 0: Byte (8 bits) 1: Halfword (16 bits) 2: Word (32 bits) 3: Double-word (64 bits) For details, see **Table 3A.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
8	U	This bit indicates the sign extension method of the instruction that caused the exception. 0: Signed 1: Unsigned For details, see **Table 3A.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5 to 1	ITYPE	These bits indicate the instruction that caused the exception. For details, see **Table 3A.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
0	RW	This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory). 0: Read (Load-memory) 1: Write (Store-memory) For details, see **Table 3A.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3A.22 Instructions Causing Exceptions and Values of MEI Register

Instruction	REG	DS	U	RW	ITYPE
SLD.B	dst	0 (byte)	0 (signed)	0 (read)	00000_B
SLD.BU	dst	0 (byte)	1 (unsigned)	0 (read)	00000_B

CACHE	—	—	—	—	—
Interrupt (table reference)*1	—	2 (word)	0 (signed)	0 (read)	10101_B

Note 1. When reading the interrupt vector by using the table reference method.

NOTE

dst: destination register number, src: source register number

(q) RBASE — Reset Vector Base Address Register

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this vector address is also used as the exception vector address.

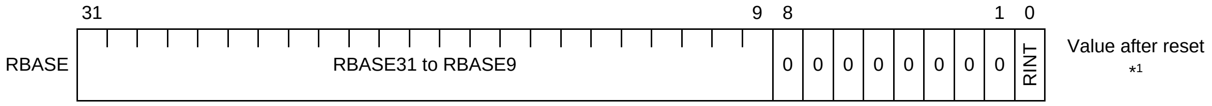

Table 3A.23 RBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	RBASE31 to RBASE9	These bits indicate the reset vector when there is a reset. When PSW.EBV = 0, this address is also used as the exception vector. For RBASE8 to RBASE0, 0 is used implicitly.	R	CPU1: 0000 0000 0000 0000 0000 000$_B$ CPU2: 0000 0000 1000 0000 0000 000$_B$*1
8 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See **Section 7A.10.1, Direct Vector Method**. This bit is valid when PSW.EBV = 0.	R	0

Note 1. The value depends on the reset vector. The values set at shipment are shown in the table. When the reset vector is modified, the address will be changed.

(r) EBASE — Exception Handler Vector Address Register

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

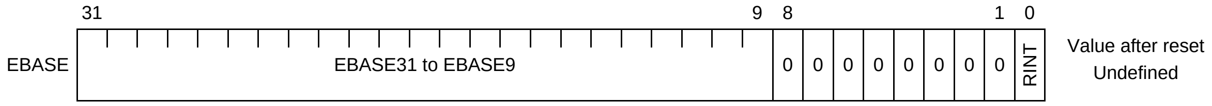

Table 3A.24 EBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	EBASE31 to EBASE9	The exception handler routine address is changed to the address resulting from adding the offset address of each exception to the base address specified for this register. For EBASE8 to EBASE0, 0 is used implicitly.	R/W	Undefined
8 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See **Section 7A.10.1, Direct Vector Method**.	R/W	Undefined

(s) INTBP — Base Address Register of the Interrupt Handler Address Table

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

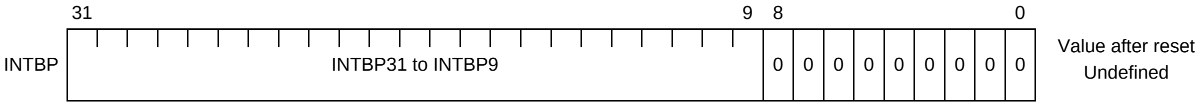

Table 3A.25 INTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	INTBP31 to INTBP9	These bits indicate the base pointer address for an interrupt when the table reference method is used. The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified by the table reference method (EIINT0 to EIINT511) is acknowledged. For INTBP8 to INTBP0, 0 is used implicitly.	R/W	Undefined
8 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(t) PID — Processor ID Register

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

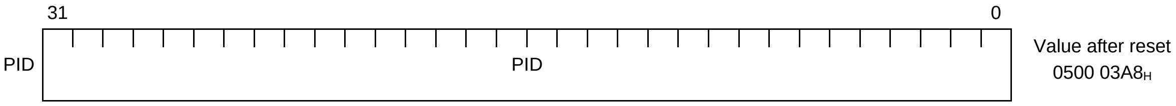

Table 3A.26 PID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 24	PID	Architecture Identifier This identifier indicates the architecture of the processor.	R	05_H
23 to 8		Function Identifier This identifier indicates the functions of the processor. These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). Bits 23 to 11: Reserved Bit 10: Double-precision floating-point operation function Bit 9: Single-precision floating-point operation function Bit 8: Memory protection function (MPU)	R	0003_H
7 to 0		Version Identifier This identifier indicates the version of the processor.	R	$A8_H$

(u) SCCFG — SYSCALL Operation Setting Register

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

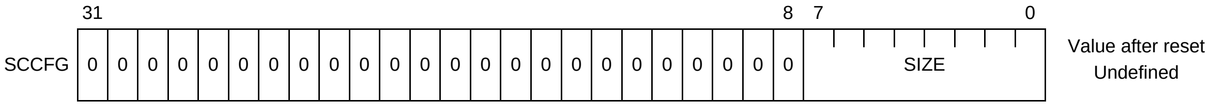

Table 3A.27 SCCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	SIZE	These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255. By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used. If vectors exceeding the maximum number of entries are specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry.	R/W	Undefined

(v) SCBP — SYSCALL Base Pointer Register

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

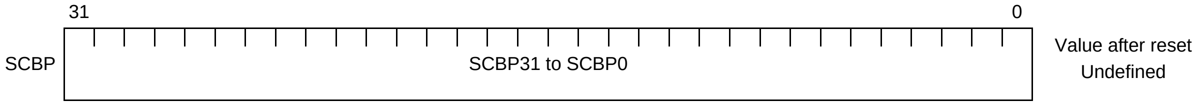

Table 3A.28 SCBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	SCBP31 to SCBP2	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction.	R/W	Undefined
1, 0	SCBP1, SCBP0	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction. Always set these bits to 0.	R	0

(w) MCFG0 — Machine Configuration Register

This register indicates the CPU configuration.

	31													18	17	16	15												3	2	1	0	
MCFG0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	SPID		0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	Value after reset *1

Table 3A.29 MCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 18	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
17, 16	SPID	These bits indicate the system protection number.	R/W	*2
15 to 3	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
2	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

Note 1. The value after reset is $0001\ 0004_H$ for CPU1 (PE1) and $0002\ 0004_H$ for CPU2 (PE2).

Note 2. The value after reset is 01_B for CPU1 (PE1) and 10_B for CPU2 (PE2).

(x) MCTL — Machine Control Register

This register is used to control the CPU.

	31																													2	1	0	
MCTL	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	MA	UIC	Value after reset $8000\ 0002_H$

Table 3A.30 MCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
30 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	MA	This bit is used to control the misaligned access. 0: In the event of a misaligned access, an exception is always generated.*1 1: The correct operation is controlled by hardware.*2	R/W	1
0	UIC	This bit is used to control the interrupt enable/disable operation in user mode. When this bit is set to 1, executing the EI/DI instruction in user mode becomes possible.	R/W	0

Note 1. Excluding LD.DW, and ST.DW for word boundary allocation.

Note 2. Exception still occurs in case of LD.DW or ST.DW for misaligned access except word boundary allocation.

(3) Interrupt Function Registers

Table 3A.31 Interrupt Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR7, 1	FPIPR	FPI exception interrupt priority setting register	SV
SR10, 2	ISPR	Priority of interrupt being serviced register	SV
SR11, 2	PMR	Interrupt priority masking register	SV
SR12, 2	ICSR	Interrupt control status register	SV
SR13, 2	INTCFG	Interrupt function setting register	SV

(a) FPIPR — FPI Exception Interrupt Priority Setting Register

This register is used to set the interrupt priority of FPI exception.

	31																										5	4 0	
FPIPR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	FPIPR	Value after reset $0000\ 0000_H$

Table 3A.32 FPIPR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	FPIPR	These bits are used to specify the interrupt priority of floating-point operation exceptions (imprecise) (FPI). Specify values from 0 to 16. Specifying 17 or greater is prohibited. FPI exceptions are handled using the specified interrupt priority. If an FPI exception occurs at the same time as an interrupt that has the same priority, the FPI exception is prioritized. **NOTE:** A set value of more than 16 is treated as 16.	R/W	0

(b) ISPR — Priority of Interrupt being Serviced Register

This register retains the priority of the *EIINTn* interrupt being serviced by the CPU. This priority value is then used to perform priority ceiling processing when multiple interrupts occur.

	31															16	15 0
ISPR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	ISP15 to ISP0

Value after reset
0000 0000$_H$

Table 3A.33 ISPR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	ISP15 to ISP0	These bits indicate the acknowledgment status of an *EIINTn* interrupt with a priority that corresponds to the relevant bit position. 0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged. 1: An interrupt request for an interrupt whose priority corresponds to the relevant bit position is being serviced by the CPU core. The bit positions correspond to the following priority levels. (see table below) When an interrupt request (*EIINTn*) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to ISP0 bits that are set to 1 (0 is the highest priority) is cleared to 0.*[1] While a bit in this register is set to 1, same or lower priority interrupts (*EIINTn*) and FPI exceptions*[2] are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged. When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit.	R*[3]	0

Bit	Priority
0	Priority 0 (highest)
1	Priority 1
:	
14	Priority 14
15	Priority 15 (lowest)

Note 1. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) to the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.

Note 2. Since FPI exceptions have the same level of priority as EIINTn interrupts, they are affected by interrupts in the same way as the ISPR. The priority of FPI exceptions is set by the FPIPR register.

Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

(c) PMR — Interrupt Priority Masking Register

This register is used to mask the specified interrupt priority.

	31															16	15 0	
PMR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	PM15 to PM0	Value after reset 0000 0000$_H$

Table 3A.34 PMR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	PM15 to PM0	These bits mask an interrupt request with a priority level that corresponds to the relevant bit position. 0: Servicing of an interrupt with a priority that corresponds to the relevant bit position is enabled. 1: Servicing of an interrupt with a priority that corresponds to the relevant bit position is disabled. The bit positions correspond to the following priority levels: Bit 0: Priority 0 (highest) Bit 1: Priority 1 : Bit 14: Priority 14 Bit 15: Priority 15 and priority 16 (lowest) While a bit in this register is set to 1, interrupts (*EIINTn*) and FPI exceptions*[1] with the priority corresponding to that bit are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged*[2].	R/W	0

Note 1. Since FPI exceptions are specified as the same level of priority as that of interrupts (*EIINTn*), it is affected by the PMR like interrupts. The priority of FPI exceptions is set by the FPIPR register.

Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, FF00$_H$ can be set, but F0F0$_H$ or 00FF$_H$ cannot.

(d) ICSR — Interrupt Control Status Register

This register indicates the interrupt control status in the CPU.

	31																													2	1	0	
ICSR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	PMFP	PMEI	Value after reset 0000 0000$_H$

Table 3A.35 ICSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	PMFP	This bit indicates that an FPI exception with the priority level masked by the PMR register exists.	R	0
0	PMEI	This bit indicates that an interrupt (*EIINTn*) with the priority level masked by the PMR register exists.	R	0

(e) INTCFG — Interrupt Function Setting Register

This register is used to specify settings related to the CPU’s internal interrupt function.

	31																														1	0
INTCFG	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	ISPC

Value after reset
0000 0000$_H$

Table 3A.36 INTCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	ISPC	This bit specifies how the ISPR register is updated. 0: The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored. 1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed. If this bit is cleared to 0, the bits of the ISPR register are automatically set to 1 when an interrupt (*EIINTn*) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, updating by the program (via execution of an LDSR instruction) is ignored. If this bit is set to 1, the bits of the ISPR register are not updated by the acknowledgement of an interrupt (*EIINTn*) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program. In normal cases, the ISPC bit should be cleared to 0. When performing software-based control of interrupt priorities, however, set this bit (1) and perform priority control by using the PMR register.	R/W	0

(4) FPU Function Registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations. The RH850/F1KH supports single-precision floating-point instruction and thirty-two 32-bit registers can be specified.

These registers correspond to general-purpose registers r0 to r31. The FPU can use the following system registers to control floating-point operation

Table 3A.37 FPU System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR6, 0	FPSR	Floating-point operation setting/status register	CU and SV
SR7, 0	FPEPC	Floating-point exception program counter register	CU and SV
SR8, 0	FPST	Floating-point operation status register	CU
SR9, 0	FPCC	Floating-point operation comparison result register	CU
SR10, 0	FPCFG	Floating-point operation configuration register	CU
SR11, 0	FPEC	Floating-point exception control register	CU and SV

(a) FPSR — Floating-point Operation Setting/Status Register

This register indicates the execution status of floating-point operations and any exceptions that occur.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FPSR	CC7	CC6	CC5	CC4	CC3	CC2	CC1	CC0	FN	IF	PEM	0	RM		FS	0	E	V	Z	O	U	I	V	Z	O	U	I	V	Z	O	U	I
																			*1						*2					*3		

Value after reset
See below

Note 1. Cause bits (XC)

Note 2. Enable bits(XE)

Note 3. Preservation bits (XP)

Table 3A.38 FPSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 24	CC[7:0]	These are the CC (condition) bits. They store the results of floating-point comparison instructions. The CC7 to CC0 bits are not affected by any instructions except the comparison instruction and LDSR instruction. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined
23	FN	This bit enables flush-to-nearest mode. When the FN bit is set to 1, if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number.	R/W	0
22	IF	This bit accumulates and indicates information about the flushing of input operands.	R/W	0
21	PEM	This bit specifies whether to handle an exception as a precise exception. If the PEM bit is 1, exceptions that are caused by the execution of a floating-point operation instruction are handled as precise exceptions.	R/W	0
20	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
19, 18	RM	These are the rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions.	R/W	00

RM Bits		Mnemonic	Description
19	18		
0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.
0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.
1	0	RP	Rounds the result toward +∞. The result is nearest to a value greater than the accurate result with infinite accuracy.
1	1	RM	Rounds the result toward −∞. The result is nearest to a value less than the accurate result with infinite accuracy.

Bit Position	Bit Name	Function	R/W	Value after Reset
17	FS	This bit enables values that cannot be normalized (subnormal numbers) to be flushed. If the FS bit is set, input operands and operation results that are subnormal numbers are flushed without causing an unimplemented operation exception (E). An input operand that is a subnormal number is flushed to 0 with the same sign. Operation results that are subnormal numbers either become 0 or the minimum normalized number, depending on the rounding mode.	R/W	1

Operation Result that is a Subnormal Number	Rounding Mode and Value after Flushing			
	RN*1	RZ	RP	RM
Positive	+0	+0	$+2^{Emin}$	+0
Negative	−0	−0	−0	-2^{Emin}

Note 1. If the rounding mode is RN and the FPSR.FN bit is set to 1, flushing will occur in the direction of higher accuracy.

Bit Position	Bit Name	Function	R/W	Value after Reset
16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 10	XC (E, V, Z, O, U, I)	These are the cause bits.	R/W	Undefined

Table 3A.38 FPSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
9 to 5	XE (V, Z, O, U, I)	These are the enable bits.	R/W	0
4 to 0	XP (V, Z, O, U, I)	These are the preservation bits.	R/W	Undefined

(b) FPEPC — Floating-point Exception Program Counter Register

When an exception that is enabled by an enable bit occurs, the program counter (PC) of the instruction that caused the exception is stored.

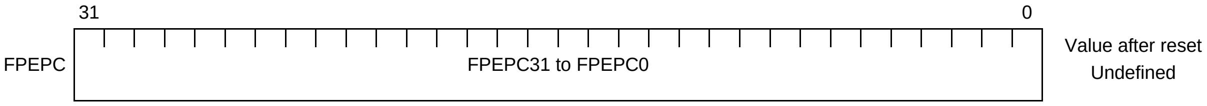

Table 3A.39 FPEPC Register Contents

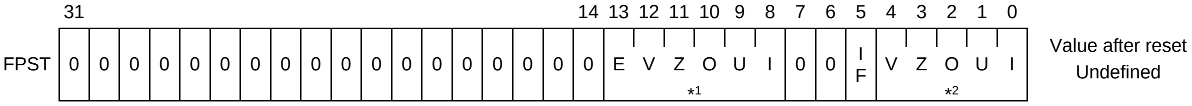
Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FPEPC31 to FPEPC1	These bits store the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs.	R/W	Undefined
0	FPEPC0	This bit stores the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs. Always set this bit to 0.	R	0

(c) FPST — Floating-point Operation Status Register

This register reflects the contents of the FPSR register bits related to the operation status.



Note 1. Cause bits (XC)

Note 2. Preservation bits (XP)

Table 3A.40 FPST Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 14	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
13 to 8	XC (E, V, Z, O, U, I)	These are cause bits. Values written to these bits are reflected in FPSR.XC bits.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	IF	This bit accumulates and indicates information about the flushing of input operands.	R/W	0
4 to 0	XP (V, Z, O, U, I)	These are preservation bits. Values written to these bits are reflected in FPSR.XP bits.	R/W	Undefined

(d) FPCC — Floating-point Operation Comparison Result Register

This register reflects the contents of the FPSR.CC[7:0] bits.

	31																							8	7	6	5	4	3	2	1	0	
FPCC	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	CC7	CC6	CC5	CC4	CC3	CC2	CC1	CC0	Value after reset Undefined

Table 3A.41 FPCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	CC[7:0]	These are CC (condition) bits. They store the result of a floating-point comparison instruction. The CC[7:0] bits are not affected by any instructions except the comparison instruction and LDSR instruction. Values written to these bits are reflected in the CC[7:0] bits of FPSR. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined

(e) FPCFG — Floating-point Operation Configuration Register

This register reflects the contents of the FPSR register bits related to the operation settings.

	31																					10	9	8	7		5	4	3	2	1	0	
FPCFG	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	RM		0	0	0	V	Z	O *1	U	I	Value after reset 0000 0000$_H$

Note 1. Enable bits (XE)

(f) FPEC — Floating-point Exception Control Register

This register controls the floating-point operation exception.

	31																														1	0	
FPEC	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	FPIVD	Value after reset $0000\ 0000_H$

Table 3A.43 FPEC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	FPIVD*[1]	This bit indicates the status of reporting the FPI exception. If this bit is set to 1, the FPI exception is reported to the CPU but is not acknowledged. It is automatically cleared to 0 when the CPU acknowledges the FPI exception. While this bit is set to 1, all the floating-point instructions are invalidated. Report of the FPI exception can be canceled by clearing (0) this bit by the LDSR instruction while it is set to 1. When report of the FPI exception is canceled, the CPU does not acknowledge the FPI exception. 0: FPI exception is not reported. 1: FPI exception is reported.	R/W	0

Note 1. The FPIVD bit can only be cleared to 0 by the write operation of the LDSR instruction. It cannot be set to 1.

(5) MPU Function Registers

Table 3A.44 MPU Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission

(a) MPM — Memory Protection Operation Mode Register

The memory protection mode register is used to define the basic operating state of the memory protection function.

	31																													2	1	0
MPM	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	SVP	MPE

Value after reset
0000 0000$_H$

Table 3A.45 MPM Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	SVP	In SV mode (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.*1 0: As usual, implicitly enable all access in SV mode. 1: Restrict access according to the SX, SW, and SR bits even in SV mode.*2	R/W	0
0	MPE	This bit is used to specify whether to enable or disable the MPU function. 0: Disable 1: Enable	R/W	0

Note 1. If the SVP bit is set to 1, access will be restricted in accordance with the setting for each protection area, even in SV mode. Therefore, specify the protection area beforehand so that the access from the program which set the SVP bit is not restricted.

Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

(b) MPRC — MPU Region Control Register

	31															16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MPRC	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	E15	E14	E13	E12	E11	E10	E9	E8	E7	E6	E5	E4	E3	E2	E1	E0

Value after reset
0000 0000$_H$

Table 3A.46 MPRC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	E15 to E0	These are the enable bits for each protection area. Bit En is a copy of bit MPATn.E (where n = 15 to 0).	R/W	0

(c) MPBRGN — MPU Base Region Register

This register indicates the minimum usable MPU area number.

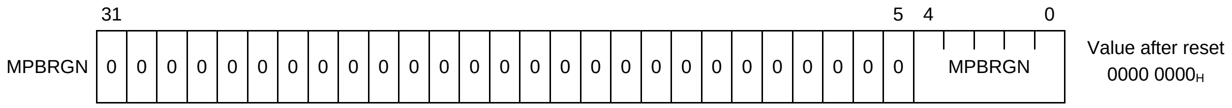

Table 3A.47 MPBRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	MPBRGN	These bits indicate the smallest number of an MPU area. These bits always indicate 0.	R	0

(d) MPTRGN — MPU End Region Register

This register indicates the maximum usable MPU area number + 1.

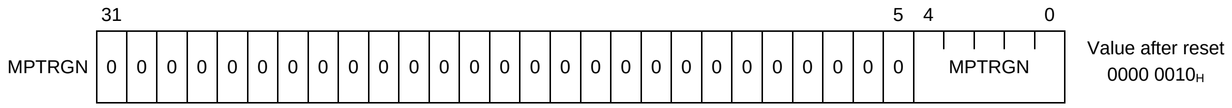

Table 3A.48 MPTRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	MPTRGN	These bits indicate the largest number of an MPU area + 1. These bits indicate the maximum number of MPU areas incorporated into the hardware.	R	10000_B

(e) MCA — Memory Protection Setting Check Address Register

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

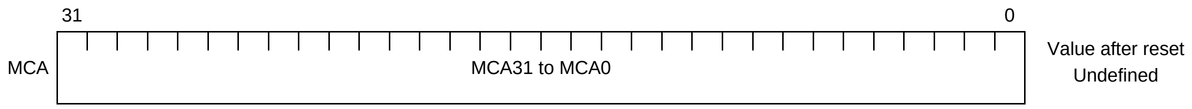

Table 3A.49 MCA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCA31 to MCA0	These bits are used to specify the start address of the memory area that is subject to a memory protection setting check in bytes.	R/W	Undefined

(f) MCS — Memory Protection Setting Check Size Register

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

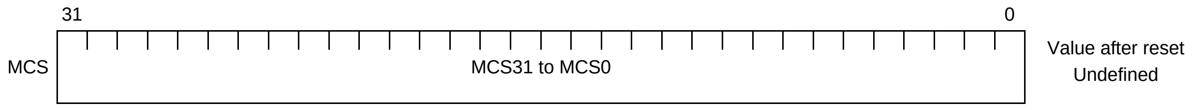

Table 3A.50 MCS Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCS31 to MCS0	These bits are used to specify the size of the memory area that is subject to a memory protection setting check and the size of the target area in bytes. Because the specified size is assumed to represent an unsigned integer, it is not possible to check an area in the direction in which the address value decreases relative to the MCA register value. Do not specify 0000 0000_H for the MCS register.	R/W	Undefined

(g) MCC — Memory Protection Setting Check Command Register

This register is used to specify the base address of the area where memory protection settings are checked.

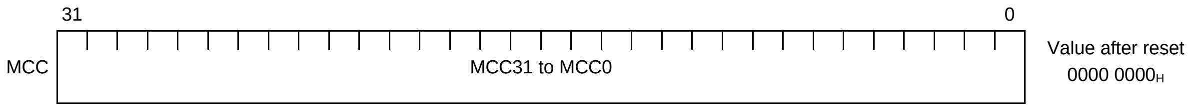

Table 3A.51 MCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCC31 to MCC0	When any value is written to the MCC register, a memory protection setting check starts. By setting up the MCA/MCS register and then writing to the MCC register, results are stored in MCR. Because the check is started by any written value, a check can be started by using r0 as the source register without using any unnecessary registers. Note that, for the check, the results are applied according to each area setting regardless of the state of the PSW.UM bit. When the MCC register is read, value 0000 0000_H is always returned.	R/W	0

(h) MCR — Memory Protection Setting Check Result Register

This register is used to store the results of a memory protection setting check.

Be sure to clear bits 31 to 9, 7 and 6.

	31																						9	8	7	6	5	4	3	2	1	0	
MCR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	OV	0	0	SXE	SWE	SRE	UXE	UWE	URE	Value after reset Undefined

Table 3A.52 MCR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
8	OV	If the specified area includes 0000 0000$_H$ or 7FFF FFFF$_H$, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	SXE	If the specified area is contained within one of the protection areas and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
4	SWE	If the specified area is contained within one of the protection areas and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
3	SRE	If the specified area is contained within one of the protection areas and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
2	UXE	If the specified area is contained within one of the protection areas and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
1	UWE	If the specified area is contained within one of the protection areas and writing to that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
0	URE	If the specified area is contained within one of the protection areas and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined

(i) MPLAn — Protection Area Lower Limit Address Register

These registers indicate the lower limit address of area n (where n = 0 to 15).

	31	2	1	0	
MPLAn	MPLAn		0	0	Value after reset Undefined

Table 3A.53 MPLAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPLA31 to MPLA2	These bits indicate the lower limit address of area n. For MPLA1 and MPLA0, 0 is used implicitly.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(j) MPUAn — Protection Area Upper Limit Address Register

These registers indicate the upper limit address of area n (where n = 0 to 15).

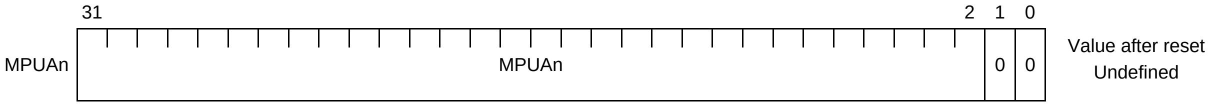

Table 3A.54 MPUAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPUA31 to MPUA2	These bits indicate the upper limit address of area n. For MPUAn.MPUA1 and MPUA0, 1 is used implicitly.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(k) MPATn — Protection Area Attribute Register

These registers indicate the attributes of area n (where n = 0 to 15).

	31					26	25 16	15							8	7	6	5	4	3	2	1	0	
MPATn	0	0	0	0	0	0	ASID	0	0	0	0	0	0	0	0	E	G	SX	SW	SR	UX	UW	UR	Value after reset Undefined

Table 3A.55 MPATn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 26	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
25 to 16	ASID	These bits indicate the ASID value to be used as the area match condition.	R/W	Undefined
15 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	E	This bit indicates whether area n is enabled or disabled. 0: Area n is disabled. 1: Area n is enabled.	R/W	0
6	G	0: Areas match only if ASIDs are equal. 1: Areas match even if ASIDs are not equal. If this bit is 0, MPATn.ASID = ASID.ASID is used as the area match condition. If this bit is 1, areas may match even if the values of MPATn.ASID and ASID.ASID are not equal.	R/W	Undefined
5	SX	This bit indicates the execution privilege for the supervisor mode.*1 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
4	SW	This bit indicates whether writing is enabled in the supervisor mode.*1 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
3	SR	This bit indicates whether writing is enabled in the supervisor mode.*1 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined
2	UX	This bit indicates the execution privilege for the user mode. 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
1	UW	This bit indicates whether writing is enabled in the user mode. 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
0	UR	This bit indicates whether writing is enabled in the user mode. 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

(6) Cache Operation Function Registers

The RH850/F1KH does not include a cache operation function, so all the following registers return a value of 0 when read, and writing to these registers is ignored.

Table 3A.56 Cache Operation Function Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR12, 4	BWERRL	Not implemented. A value of 0 is returned when read and writing is ignored.	SV
SR13, 4	BWERRH		SV
SR14, 4	BRERRL		SV
SR15, 4	BRERRH		SV
SR16, 4	ICTAGL		SV
SR17, 4	ICTAGH		SV
SR18, 4	ICDATL		SV
SR19, 4	ICDATH		SV
SR20, 4	DCTAGL		SV
SR21, 4	DCTAGH		SV
SR22, 4	DCDATL		SV
SR23, 4	DCDATH		SV
SR24, 4	ICCTRL		SV
SR25, 4	DCCTRL		SV
SR26, 4	ICCFG		SV
SR27, 4	DCCFG		SV
SR28, 4	ICERR		SV
SR29, 4	DCERR		SV

3A.2.1.3 Instruction

See “*Instruction*” in *Software Manual*.

A snooze instruction halts operation of the CPU1/2 core for 32 clocks.

3A.2.2 Buffers for Code Flash

3A.2.2.1 Features

CPUn (n = 1, 2) accesses Code flash by two paths; instruction fetch access is direct to Flash interface, and data access is via System interconnect to Code Flash. Both paths equip buffers, which can be cleared by software. See also **Figure 40A.1, Block Diagram of Code Flash ECC** for ECC decoders in these paths.

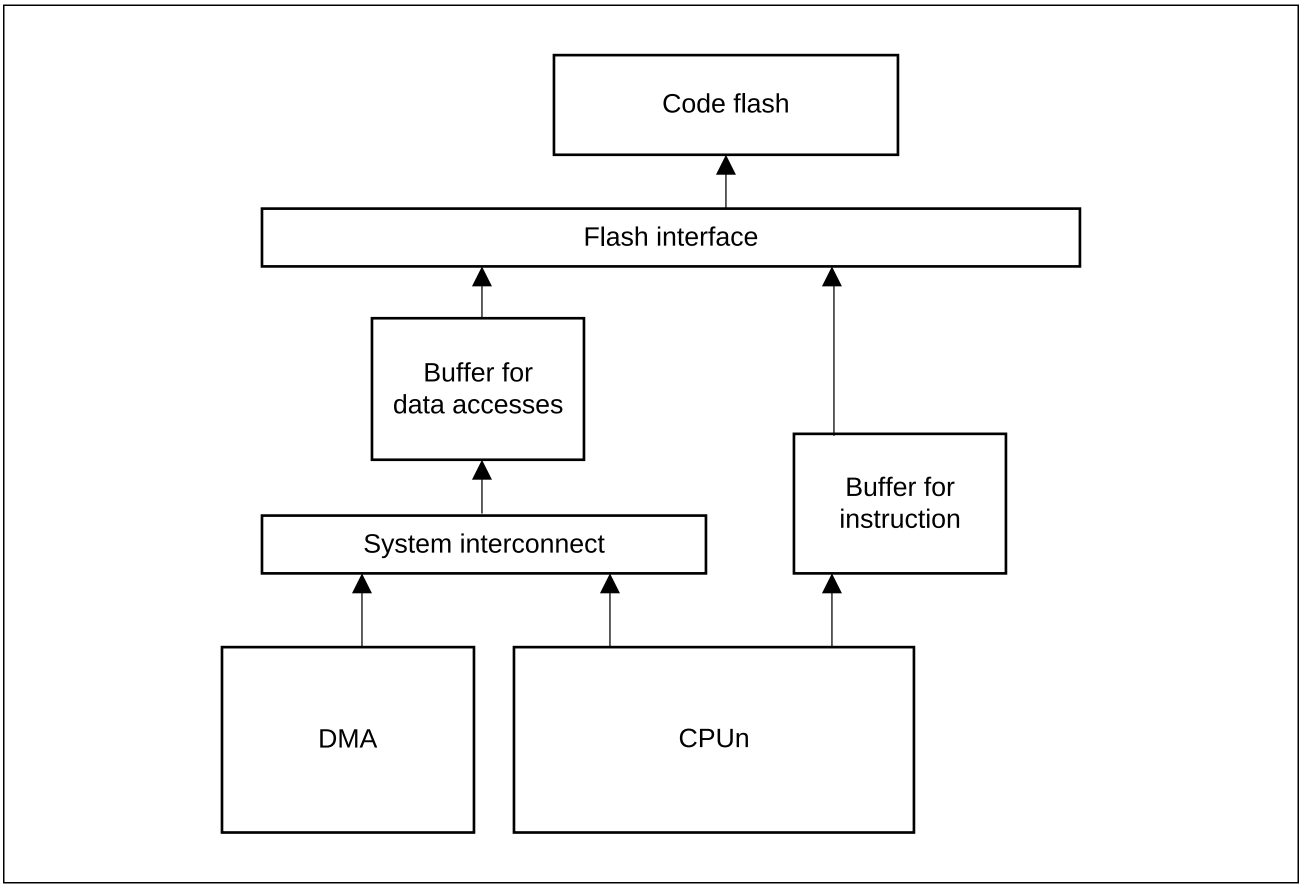

Figure 3A.2 Buffers for Code Flash

3A.2.2.2 Function of Buffers

One-line buffer with 128 bits is mounted for instruction fetches to code flash. The data is read out from the buffer after the next access to the same address, so the code flash is not accessed again within 128 bits location.

Two-line buffer with 128 bits is mounted as a data buffer. This buffer is not only used by the CPU but also used by DMA via system interconnect. The data is read out from the buffer if the next access is within the same 128 bits boundary.

16 entry branch history buffer is mounted to decrease branch penalty.
One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these three buffers.

3A.2.2.3 Registers for Buffer Control

(1) List of Buffer Control Registers

Table 3A.57 Buffer Control Register (Base Address: FFC5 B000$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32	
FBUF_CTRL	+000$_H$	4	Flash buffer clear control register	FBUFCCTL	—	R/W	—	✓	✓	✓	0000 0000$_H$

(2) Register Sets

Access: FBUFCCTL register can be read or written in 32-bit units.
FBUFCCTLL register can be read or written in 16-bit units.
FBUFCCTLLL register can be read or written in 8-bit units.

Address: FBUFCCTL: FFC5 B000$_H$
FBUFCCTLL: FFC5 B000$_H$
FBUFCCTLLL: FFC5 B000$_H$

	31																														1	0	
FBUFCCTL	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	FBUFCLR	Value after reset 0000 0000$_H$

Table 3A.58 FBUFCCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.	R	0
0	FBUFCLR	Buffer clear bits. To clear buffers, write 1 to this bit and then write 0. 0: Buffers are valid 1: Buffers are invalid (cleared)	R/W	0

Please do following procedures when you want to clear the buffers.

Step 1: Write 0 to FBUFCCTL.FBUFCLR

Step 2: Write 1 to FBUFCCTL.FBUFCLR

Step 3: Write 0 to FBUFCCTL.FBUFCLR

Step 4: Read the FBUFCCTL register (dummy read)

Step 5: Execute the SYNCP instruction

Step 6: Execute the SYNCI instruction

If you do not do Step 3 after Step 2, the buffers are kept invalid during FBUFCCTL.FBUFCLR = 1.

3A.2.3 Inter-Processor Interrupts

Four registers (IPIR_CHn) are provided for communicating four channels of interrupts between the CPUs (PEs).

IPIR_CH0 to IPIR_CH3 are assigned to CH0 to CH3 of user interrupts (EIINT). An interrupt for specific PEs (including own PE) can be requested by manipulating the bits corresponding to each PE.

3A.2.3.1 Inter-Processor Interrupt Control Registers

These registers are located in the CPU Peripheral.

Table 3A.59 List of Registers

Module Name	Address	Register Name	Symbol	R/W	Access Size				Value after Reset
					1	8	16	32	
IPIRSS	FFFE EC80$_H$	Inter-PE interrupt register 0	IPIR_CH0	R/W	—	✓	✓	✓	0000 0000$_H$
	FFFE EC84$_H$	Inter-PE interrupt register 1	IPIR_CH1	R/W	—	✓	✓	✓	0000 0000$_H$
	FFFE EC88$_H$	Inter-PE interrupt register 2	IPIR_CH2	R/W	—	✓	✓	✓	0000 0000$_H$
	FFFE EC8C$_H$	Inter-PE interrupt register 3	IPIR_CH3	R/W	—	✓	✓	✓	0000 0000$_H$

(1) IPIR_CHn — Inter-PE Interrupt Register n (n = 0 to 3)

Access: IPIR_CHn can be read or written in 32-bit units.
IPIR_CHnL can be read or written in 16-bit units.
IPIR_CHnLL can be read or written in 8-bit units.

Address: IPIR_CHn: FFFE EC80$_H$ + n × 4$_H$
IPIR_CHnL: FFFE EC80$_H$ + n × 4$_H$
IPIR_CHnLL: FFFE EC80$_H$ + n × 4$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PE2	PE1
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 3A.60 IPIR_CHn Registers Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PE2	Inter-PE Interrupt Request to PE2 Writing 1 to this bit enables an interrupt request to PE2. This bit is automatically cleared to 0 when the interrupt request has been notified. 0: Inter-PE interrupt request output is not specified or an interrupt request is not being output. 1: Interrupt request output is specified or an interrupt request is being output.
0	PE1	Inter-PE Interrupt Request to PE1 Writing 1 to this bit enables an interrupt request to PE1. This bit is automatically cleared to 0 when the interrupt request has been notified. 0: Inter-PE interrupt request output is not specified or an interrupt request is not being output. 1: Interrupt request output is specified or an interrupt request is being output.

3A.2.4 Reliability Functions

3A.2.4.1 PE Guard Function (PEG)

(1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the CPU (PE) from an external master. This function protects access to the local RAM in the PE. In the initial state after a reset, access by masters other than own PE is disabled. Setting the registers listed in (3) List of PEG Protection Setting Registers enables access by masters other than own PE.

(1) Detecting PE guard violation
If an external master makes an unauthorized access to the resource area in a PE for which PE guard is set, the access is detected as a PE guard violation.

(2) Blocking unauthorized access
When a PE guard violation is detected, unauthorized access to the internal resources of the PE are blocked to prevent unauthorized modification of the contents of PE resources.

(3) Notifying occurrence of violation
An error response to an unauthorized access is sent to the request source of external master. When DMA Controller makes an unauthorized access, meanwhile, a DMA transfer error is detected.
A PE guard violation is notified as INTGUARD interrupt request which is a source of FEINT.

(2) Protection Made by SPID

- Setting PEG Protection
  - Up to four areas can be set depending on the local RAM address of the own PE.
  - The area range is specified by the base address and the mask bit (4 kbytes to 4 Gbytes).
  - “Read enable” and “write enable” can be set for each area.
  - “Enable” or “disable” can be selected based on the system protection identifier (SPID) for each area.
- Procedure for permitting access by using the system protection identifier (SPID)

1. Is the area subject to access is the local RAM area? If so, go to step 2.
2. Is the area subject to access is within the range of valid areas 0, 1, 2, or 3? If so, go to step 3.
   Otherwise, return an error response.
3. Are all the conditions below for the relevant area satisfied? If so, permit access.
   - The system protection identifier (SPID) is enabled.
   - Required operations (read/write) are enabled.

   Otherwise, return an error response.

(3) List of PEG Protection Setting Registers

Specify the necessary settings in the registers below to protect PE resources from unauthorized access by an external master.

- Whether to permit access to the local RAM in the PE can be specified.

Table 3A.61 PEG Registers (Base Address: FFFE E600$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32	
PEG	+00C$_H$	4	PEG SPID control register	PEGSP	—	R/W	—	✓	✓	✓	0000 0000$_H$
	+080$_H$	4	PEG area 0 mask setting register	PEGG0MK	—	R/W	—	✓	✓	✓	0000 0000$_H$
	+084$_H$	4	PEG area 0 base setting register	PEGG0BA	—	R/W	—	✓	✓	✓	0000 0000$_H$

	+094$_H$	4	PEG area 1 base setting register	PEGG1BA	—	R/W	—	✓	✓	✓	0000 0000$_H$
	+0A0$_H$	4	PEG area 2 mask setting register	PEGG2MK	—	R/W	—	✓	✓	✓	0000 0000$_H$
	+0A4$_H$	4	PEG area 2 base setting register	PEGG2BA	—	R/W	—	✓	✓	✓	0000 0000$_H$
	+0B0$_H$	4	PEG area 3 mask setting register	PEGG3MK	—	R/W	—	✓	✓	✓	0000 0000$_H$
	+0B4$_H$	4	PEG area 3 base setting register	PEGG3BA	—	R/W	—	✓	✓	✓	0000 0000$_H$

(4) Register Set

(a) PEGSP — PEG SPID Control Register

Access: PEGSP register can be read or written in 32-bit units.
PEGSPL register can be read or written in 16-bit units.
PEGSPLL register can be read or written in 8-bit units.

Address: PEGSP: FFFE E60C$_H$
PEGSPL: FFFE E60C$_H$
PEGSPLL: FFFE E60C$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SPEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 3A.62 PEGSP Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SPEN	Access permission to external master with specified SPID. 0: Not permit. 1: Permit.

(b) PEGGnMK — PEG Area n Mask Setting Register (n = 0 to 3)

The PEGGnMK register defines which bits of PEGGnBA.GnBASE are compared with the access address. If bit PEGGnMK.GnMASK[m] is cleared, bit PEGGnBA.GnBASE[m] is compared with bit m of the access address.

Access: PEGGnMK register can be read or written in 32-bit units.
PEGGnMKL, PEGGnMKH registers can be read or written in 16-bit units.
PEGGnMKLH, PEGGnMKHL, PEGGnMKHH registers can be read or written in 8-bit units.

Address: PEGGnMK: FFFE $E680_H$ + (10_H × n)
PEGGnMKL: FFFE $E680_H$ + (10_H × n),
PEGGnMKH: FFFE $E682_H$ + (10_H × n)
PEGGnMKLH: FFFE $E681_H$ + (10_H × n),
PEGGnMKHL: FFFE $E682_H$ + (10_H × n),
PEGGnMKHH: FFFE $E683_H$ + (10_H × n)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GnMASK															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GnMASK				—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Table 3A.63 PEGGnMK Register Contents

Bit Position	Bit Name	Function
31 to 12	GnMASK	0: Target bits are compared when determining the PE guard area. 1: Target bits are not compared when determining the PE guard area.
11 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

NOTE

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

(c) PEGGnBA — PEG Area n Base Setting Register (n = 0 to 3)

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n. Setting the GnEN bit to 1 validates the access enable conditions specified by this register and the PEGGnMK register.

Access: PEGGnBA register can be read or written in 32-bit units.

PEGGnBAL, PEGGnBAH registers can be read or written in 16-bit units.

PEGGnBALL, PEGGnBALH, PEGGnBAHL, PEGGnBAHH registers can be read or written in 8-bit units.

Address: PEGGnBA: FFFE E684$_H$ + (10$_H$ × n)

PEGGnBAL: FFFE E684$_H$ + (10$_H$ × n),

PEGGnBAH: FFFE E686$_H$ + (10$_H$ × n)

PEGGnBALL FFFE E684$_H$ + (10$_H$ × n),

PEGGnBALH FFFE E685$_H$ + (10$_H$ × n),

PEGGnBAHL: FFFE E686$_H$ + (10$_H$ × n),

PEGGnBAHH: FFFE E687$_H$ + (10$_H$ × n)

Table 3A.64 PEGGnBA Register Contents

Bit Position	Bit Name	Function
31 to 12	GnBASE	Base address that specifies the range of PE guard protection area n.
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	GnSP3	Access permission setting from SPID = 3 external master to PE guard protection area n. 0: Not permit. 1: Permit.
6	GnSP2	Access permission setting from SPID = 2 (CPU2*1) external master to PE guard protection area n. 0: Not permit. 1: Permit.
5	GnSP1	Access permission setting from SPID = 1 (CPU1*1) external master to PE guard protection area n. 0: Not permit. 1: Permit.
4	GnSP0	Access permission setting from SPID = 0 (peripheral device connected to H-BUS) external master to PE guard protection area n. 0: Not permit. 1: Permit.
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	GnWR	Write access permission to PE guard protection area n. 0: Write access is disabled. 1: Write access is enabled.

Table 3A.64 PEGGnBA Register Contents

Bit Position	Bit Name	Function
1	GnRD	Read access permission to PE guard protection area n. 0: Read access is disabled. 1: Read access is enabled.
0	GnEN	Enables or Disables the setting for the access enable conditions to PE guard protection area n. 0: Settings for access enable conditions are disabled. 1: Settings for access enable conditions are enabled.

Note 1. Setting value of MCFG0.SPID

NOTE

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

3A.2.4.2 PE’s Internal Peripheral Device Protection Function (IPG)

(1) Overview of the IPG Function

The IPG is a function to prevent unauthorized accesses to peripheral devices from the CPU core equipped with the IPG. The IPG achieves the following functions. The IPG covers accesses to the SEG, the PEG, the IPIR, the MEV, the INTC1 and P-Bus.

(a) Detecting Violation of Peripheral Device Protection

If the CPU makes an unauthorized access to an area (peripheral device) for which peripheral device protection is set, the access is detected as “violation of peripheral device protection”.

(b) Storing Unauthorized Access Information

When a violation of peripheral device protection is detected, the unauthorized-access information is stored in the IPG’s internal register.

(c) Blocking Unauthorized Accesses

When a violation of peripheral device protection is detected, unauthorized accesses to peripheral devices are blocked to prevent contents of peripheral devices from being modified illegally.

(d) Notifying Violation

When a violation of peripheral device protection is detected, a request for generating an exception is made to ask the CPU to stop the processing.

NOTE

Even if a request for generating an exception is immediately sent to the CPU in step **(d) Notifying Violation** above, a subsequent access issued (before receiving a request from the IPG) by the CPU that does not know an occurrence of violation may illegally modify contents of peripheral devices. (Accesses after a violation has occurred result in unauthorized accesses.)

(2) IPG Function

- This function invalidates accesses according to their attributes (including address, transfer type, and access right).
- After an access right violation is detected until the error flag (described later) is cleared by writing by the software, subsequent accesses are invalidated. However, invalidation is applied only to accesses from the CPU and is not applied to accesses from outside the CPU core. Invalidation is performed independently of addresses.
- When a request for accessing different peripheral devices simultaneously is made due to misalignment or double-word access, the access is executed when all such accesses are enabled.

(3) IPG Protection Setting Registers for Illegal Users

To protect peripheral devices from unauthorized accesses by programs in user mode, necessary settings are required for the registers listed below.

- Accesses in user mode are to be detected.

Table 3A.65 IPG Registers (Base Address: FFFE $E000_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right*1	R/W	Operable Bit				Value after Reset
							1	8	16	32	
IPG	$+002_H$	2	Peripheral device protection violation access information register	IPGECRUM	SV	R/W	—	✓	✓	—	Undefined (retained)
	$+008_H$	4	Peripheral device protection violation access address register	IPGADRUM	SV	R/W	—	✓	✓	✓	Undefined (retained)
	$+00D_H$	1	Peripheral device protection enable register	IPGENUM	SV	R/W	—	✓	—	—	00_H
	$+020_H$	1	Peripheral device protection setting register 0	IPGPMTUM0	SV	R/W	—	✓	—	—	00_H
	$+022_H$	1	Peripheral device protection setting register 2	IPGPMTUM2	SV	R/W	—	✓	—	—	00_H
	$+023_H$	1	Peripheral device protection setting register 3	IPGPMTUM3	SV	R/W	—	✓	—	—	00_H
	$+024_H$	1	Peripheral device protection setting register 4	IPGPMTUM4	SV	R/W	—	✓	—	—	00_H

Note 1. Registers for which “SV” is described are accessible by accesses with SV right (UM = 0).

(4) Register Set

(a) IPGECRUM — Peripheral Device Protection Violation Access Information Register

Access: IPGECRUM register can be read or written in 16-bit units.
IPGECRUML register can be read or written in 8-bit units.

Address: IPGECRUM: FFFE E002$_{\text{H}}$
IPGECRUML: FFFE E002$_{\text{H}}$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	WD	HW	BY	EX	WR	RD	VD
Value after reset	0	0	0	0	0	0	0	0	0	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3A.66 IPGECRUM Register Contents

Bit Position	Bit Name	Function
15 to 7	Reserved	These bits are always read as 0. The write value should always be 0.
6	WD	This bit is set to 1 when a violation occurred in read word, instruction fetch read access, write word, CAXI, LDL or STC. In other cases, this bit is cleared to 0.
5	HW	This bit is set to 1 when a violation occurred in read halfword or write haflword. In other cases, this bit is cleared to 0.
4	BY	This bit is set to 1 when a violation occurred in read byte, write byte or bit operation. In other cases, this bit is cleared to 0.
3	EX	This bit is set to 1 when a violation occurred in an instruction fetch read access. In other cases, this bit is cleared to 0.
2	WR	This bit is set to 1 when a violation occurred in a write access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0.
1	RD	This bit is set to 1 when a violation occurred in a read access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0.
0	VD	This bit is set to 1 when a violation of peripheral device protection is detected by a program with the relevant right. Even if another violation of peripheral device protection is detected while this bit is 1, data of this IPGECRUM register and the IPGADRUM register is not updated and is retained.

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(b) IPGADRUM — Peripheral Device Protection Violation Access Address Register

Access: IPGADRUM register can be read or written in 32-bit units.

IPGADRUML, IPGADRUMH registers can be read or written in 16-bit units.

IPGADRUMLL, IPGADRUMLH, IPGADRUMHL, IPGADRUMHH registers can be read or written in 8-bit units.

Address: IPGADRUM: FFFE E008$_H$

IPGADRUML: FFFE E008$_H$, IPGADRUMH: FFFE E00A$_H$

IPGADRUMLL: FFFE E008$_H$, IPGADRUMLH: FFFE E009$_H$,

IPGADRUMHL: FFFE E00A$_H$, IPGADRUMHH: FFFE E00B$_H$

Table 3A.67 IPGADRUM Register Contents

Bit Position	Bit Name	Function
31 to 0	EADR	These bits store the address of the access in which a violation occurred.

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(c) IPGENUM — Peripheral Device Protection Enable Register

Access: IPGENUM register can be read or written in 8-bit units.

Address: IPGENUM: FFFE E00D$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IRE	E
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 3A.68 IPGENUM Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are always read as 0. The write value should always be 0.
1	IRE	This bit sets whether to store the access information in the peripheral device protection violation access address register and the peripheral device protection violation access information register when a violation of peripheral device protection occurred in an instruction fetch access. 0: Instruction fetch access information is not stored. (value after reset) 1: Instruction fetch access information is stored. **CAUTION:** If you do not want to detect speculative instruction fetches (no instruction is executed in some cases), clear this bit to 0.
0	E	This bit enables or disables the peripheral devices protection function against accesses by the relevant access right. 0: The peripheral device protection function is disabled. (Value after reset) 1: The peripheral device protection function is enabled.

(d) IPGPMTUM0 — Peripheral Device Protection Setting Register 0

Access: IPGPMTUM0 register can be read or written in 8-bit units.

Address: IPGPMTUM0: FFFE E020$_H$

Bit	7	6	5	4	3	2	1	0
	—	X1	W1	R1	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R

Table 3A.69 IPGPMTUM0 Register Contents

Bit Position	Bit Name	Function
7	Reserved	These bits are always read as 0. The write value should always be 0.
6	X1	This bit sets whether to enable instruction fetch read access to P-Bus. 0: Instruction fetch read access to P-Bus is treated as violation. (Value after reset) 1: Instruction fetch read access to P-Bus is not restricted.
5	W1	This bit sets whether to enable write access to P-Bus. 0: Write access to P-Bus is treated as violation. (Value after reset) 1: Write access to P-Bus is not restricted.
4	R1	This bit sets whether to enable read access to P-Bus. 0: Read access to P-Bus is treated as violation. (Value after reset) 1: Read access to P-Bus is not restricted.
3 to 0	Reserved	These bits are always read as 0. The write value should always be 0.

(e) IPGPMTUM2 — Peripheral Device Protection Setting Register 2

Access: IPGPMTUM2 register can be read or written in 8-bit units.

Address: IPGPMTUM2: FFFE E022$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	W1	R1	—	—	W0	R0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 3A.70 IPGPMTUM2 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	These bits are always read as 0. The write value should always be 0.
5	W1	This bit sets whether to enable write access to G0MEVm/IPIR_CHn. 0: Write access to G0MEVm/IPIR_CHn is treated as violation. (Value after reset) 1: Write access to G0MEVm/IPIR_CHn is not restricted.
4	R1	This bit sets whether to enable read access to G0MEVm/IPIR_CHn. 0: Read access to G0MEVm/IPIR_CHn is treated as violation. (Value after reset) 1: Read access to G0MEVm/IPIR_CHn is not restricted.
3, 2	Reserved	These bits are always read as 0. The write value should always be 0.
1	W0	This bit sets whether to enable write access to INTC1. 0: Write access to INTC1 is treated as violation. (Value after reset) 1: Write access to INTC1 is not restricted
0	R0	This bit sets whether to enable read access to INTC1. 0: Read access to INTC1 is treated as violation. (Value after reset) 1: Read access to INTC1 is not restricted.

(f) IPGPMTUM3 — Peripheral Device Protection Setting Register 3

Access: IPGPMTUM3 register can be read or written in 8-bit units.

Address: IPGPMTUM3: FFFE E023$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	W1	R1	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 3A.71 IPGPMTUM3 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	These bits are always read as 0. The write value should always be 0.
5	W1	This bit sets whether to enable write access to SysErrGen. 0: Write access to SysErrGen is treated as violation. (Value after reset) 1: Write access to SysErrGen is not restricted.
4	R1	This bit sets whether to enable read access to SysErrGen. 0: Read access to SysErrGen is treated as violation. (Value after reset) 1: Read access to SysErrGen is not restricted
3 to 0	Reserved	These bits are always read as 0. The write value should always be 0.

(g) IPGPMTUM4 — Peripheral Device Protection Setting Register 4

Access: IPGPMTUM4 register can be read or written in 8-bit units.

Address: IPGPMTUM4: FFFE E024$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	W0	R0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 3A.72 IPGPMTUM4 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are always read as 0. The write value should always be 0.
1	W0	This bit sets whether to enable write access to its own PEG. 0: Write access to its own PEG is treated as violation. (Value after reset) 1: Write access to its own PEG is not restricted.
0	R0	This bit sets whether to enable read access to its own PEG. 0: Read access to its own PEG is treated as violation. (Value after reset) 1: Read access to its own PEG is not restricted

3A.2.4.3 System Error Generator Function (SEG)

SEG (SysErrGen) controls interrupt notification and recording after a system error occurred by a data access.

Multiple error occurrence inputs are categorized according to error factor, and are processed sequentially from the highest-priority error factor, generating an FE-level exception (SYSERR).

The bit position of the SEGFLAG register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits.

Error address information is recorded only once regardless of error frequency.

The error with the highest priority among the error factors is valid when errors occur simultaneously. Recorded error address information is not overwritten by subsequent errors.

(1) List of SEG Function Control Registers

Table 3A.73 SEG Register (Base Address: FFFE E980$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right*1	R/W	Operable Bit				Value after Reset
							1	8	16	32	
SEG	+00$_H$	2	SEG error control register	SEGCONT	SV	R/W	—	—	✓	—	0000$_H$
	+02$_H$	2	SEG error flag register	SEGFLAG	SV	R/W	—	—	✓	—	0000$_H$
	+08$_H$	4	SEG error address information register	SEGADDR	SV	R/W	—	—	—	✓	Undefined (retained)

Note 1. Registers for which “SV” is described are writable with the SV right (UM = 0). Attempting to write, if these conditions do not hold, leads to a SYSERR exception with setting VCIF flag. No restriction is provided for read accesses.

(2) Register Set

(a) SEGCONT — SEG Error Control Register

This register is used to enable (= 1) or disable (= 0) notification of SysErr request in response to error flags that store the error occurrence status for each factor.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCSE	APIE	IPGE	—	TCME	—	VCIE	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R	R/W	R	R	R	R

Table 3A.74 SEGCONT Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	VCSE	This bit enables notification of an error response detected inside system interconnect: ● Error response from external bus masters in write access ● Illegal response to local RAM or peripherals or Flash from optional master in access (except instruction fetch from CPU). And illegal response to optional slave from external AHB master in access.
9	APIE	This bit enables notification of an error response from peripherals. The error notification includes the following cases: ● Error response from peripherals in write access ● PBG error in write access
8	IPGE	This bit enables notification of IPG illegal access detection.
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCME	This bit enables notification of an error during data access to its own local RAM from PE master. The error notification includes the following cases: ● ECC uncorrectable error (DED or SED & SECDIS=1) ● Detection of an access to RAM unimplemented area
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	VCIE	This bit enables notification of an error response during access to CPU peripherals, P-Bus (read access), global RAM, retention RAM, other PE local RAM, H-Bus and CodeFlash by PE. The error notification includes the following cases: ● IPG error from CPU peripherals and P-Bus ● Error response from H-Bus peripherals ● PBG error / HBG error from P-Bus and H-Bus ● GRG error from global RAM and retention RAM ● PEG error from other PE local RAM ● ECC uncorrectable error from CodeFlash, global RAM, retention RAM and other PE local RAM (DED or SED & SECDIS = 1) This bit enables notification of an error response when accessing to a part of access prohibited areas in address map.
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

(b) SEGFLAG — SEG Error Flag Register

This register indicates error flags that store error occurrence status of each factors. The flags are set to 1 by an error occurrence input. The flags are not automatically cleared to 0. Both setting and clearing of each flag are supported in writing to the register.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCSF	APIF	IPGF	—	TCMF	—	VCIF	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R	R/W	R	R	R	R

Table 3A.75 SEGFLAG Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	VCSF	Flag corresponding to bit 10 of the SEGCONT register
9	APIF	Flag corresponding to bit 9 of the SEGCONT register
8	IPGF	Flag corresponding to bit 8 of the SEGCONT register
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCMF	Flag corresponding to bit 6 of the SEGCONT register
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	VCIF	Flag corresponding to bit 4 of the SEGCONT register
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

NOTE

An error may lead to setting of multiple error flags in SEG. For example, if an IPG error occurs at peripheral registers read, both IPGF bit and VCIF bit in SEGFLAG are set.

(c) SEGADDR — Error Address Information Register

Address information (one record) which is notified with error occurrence is stored in the register. The register is not updated while one or more bits in SEGFLAG register are set.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Address[31:16]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Address[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3A.76 SEGADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	Address	These bits store the error address information.

CAUTIONS

1. SEGADDR stores error address information in case of an error occurrence related to VCIF bit or TCMF bit in SEGFLAG register. SEGADDR register stores all 0 data in case of an error occurrence related to VCSF bit, APIF bit or IPGF bit in SEGFLAG register.
2. In case of an error occurrence related to TCMF bit in SEGFLAG register, bit[18:0] of the error address are stored in SEGADDR[18:0] and SEGADDR[31:19] are filled with 0.

(3) SEG Function

(a) SEG Function: SYSERR Request Notification by Error Flag

- Setting an error flag takes precedence over clearing the same flag.
  - A simultaneous clearing operation is ignored.
- Priority of error factors
  - The bit position of each flags in SEGFLAG register which error notification is enabled by SEGCONT register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
  - The bit position of error factors is reported as a “SysErr factor code.”
- Conditions for starting SysErr request notification
  - Even if a flag which error notification is disabled by SEGCONT register is set to 1, notification is not made.
  - Notification is made immediately after a flag which error notification is enabled by SEGCONT register is set to 1.
  - After clearing of a flag, notification is made if an other flag which error notification is enabled by SEGCONT register remains set.
- Finishing notification at a SysErr acknowledgement
  - Even after notification is finished, the flag is not cleared automatically.
  - Notification is not made until setting or clearing the flag again.
  - If an error flag that is prioritized higher than the error factor is set prior to an acknowledgement, the notification information may be replaced with a higher prioritized SysErr factor code.

(b) SEG Function: Recording Error Address Information

- When an error which error notification is enabled by SEGCONT register occurs, the error address is retained in the SEGADDR register.
  - No information is retained by setting or clearing an error flag in SEGFLAG register.
  - When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While a flag which error notification is enabled by SEGCONT register is set to 1, overwrite to the SEGADDR register is inhibited.
  - If error occurrence input continues, information of subsequent error factors is not retained.
  - To reset the inhibition of overwrite to the register, clear either SEGCONT or SEGFLAG register (or both of them).

(c) Supplementary Notes on SYSERR Exception

- Even when a SYSERR exception occurs, the value of the PSW.EBV bit is held, and the base address of the exception handler does not switch.

3A.3 Inter-CPU Functions

3A.3.1 Processor Element Identifier

The PEID, processor element ID number, can be read from the PEID field in the HTCFG0 register. Which CPU core is executing a specific program can be checked by referring to the PEID. The following shows the PEID of this product.

CPU Core	PEID
CPU1 (PE1)	001_B
CPU2 (PE2)	010_B

3A.3.2 Inter-Processor Interrupt Function

Each CPU has the IPIR register as a peripheral function. Setting of the IPIR register enables an EI-level interrupt request from a PE to another PE. For details, see **Section 3A.2.3, Inter-Processor Interrupts**.

3A.3.3 Exclusive Control

The local RAM, global RAM, retention RAM, and exclusive control registers (G0MEVm; m = 0 to 31) are available as a resource for exclusive control. Atomic operation instructions LDL/STC, CAXI, SET1, CLR1, and NOT1 can be executed on the local RAM, global RAM, and retention RAM. CAXI, SET1, CLR1, and NOT1 can be executed on the exclusive control registers (G0MEVm). Note that the LD and ST instructions can also access these resources, but the access is not atomic.

3A.3.3.1 Exclusive Control Register (G0MEVm; m = 0 to 31)

This register supports exclusive control for variable shared between PEs (common resources). (MEV: Mutual Exclusion Variable Register)

- Thirty-two 32-bit G0MEVm registers are included.
- G0MEVm can be accessed in 8-, 16-, or 32-bit units.
- Access from CPU1 (PE1) and CPU2 (PE2) can be made.
- Atomic operation instructions CAXI, SET1, CLR1, and NOT1 can be executed.

CPU1 (PE1) and CPU2 (PE2) each have an independent access path for G0MEVm registers. Therefore, when CPU1 (PE1) and CPU2 (PE2) each access different G0MEVm registers, they do not need to wait for access. When they access the same G0MEVm register, however, waiting for access is required.

Table 3A.77 List of Registers

Module Name	Address*1	Register Name	Symbol	R/W	Access Size				Value after Reset
					1	8	16	32	
MEV	$+00_H$	Exclusive control register 0	G0MEV0	R/W	—	✓	✓	✓	$0000\ 0000_H$
	$+04_H$	Exclusive control register 1	G0MEV1	R/W	—	✓	✓	✓	$0000\ 0000_H$
	$+08_H$	Exclusive control register 2	G0MEV2	R/W	—	✓	✓	✓	$0000\ 0000_H$
	:	:	:	:	:	:	:	:	:
	$+7C_H$	Exclusive control register 31	G0MEV31	R/W	—	✓	✓	✓	$0000\ 0000_H$

Note 1. Base address: FFFE EC00_H

(1) G0MEVm — Exclusive Control Register m (m = 0 to 31)

Access: G0MEVm can be read or written in 32-bit units.

G0MEVmL and G0MEVmH can be read or written in 16-bit units.

G0MEVmLL, G0MEVmLH, G0MEVmHL, G0MEVmHH can be read or written in 8-bit units.

Address: G0MEVm: FFFE EC00$_H$ + m × 4$_H$,

G0MEVmL: FFFE EC00$_H$ + m × 4$_H$,

G0MEVmH: FFFE EC00$_H$ + m × 4$_H$ + 2$_H$,

G0MEVmLL: FFFE EC00$_H$ + m × 4$_H$,

G0MEVmLH: FFFE EC00$_H$ + m × 4$_H$ + 1$_H$,

G0MEVmHL: FFFE EC00$_H$ + m × 4$_H$ + 2$_H$,

G0MEVmHH: FFFE EC00$_H$ + m × 4$_H$ + 3$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 3A.78 G0MEVm Registers Contents

Bit Position	Bit Name	Function
31 to 0	G0MEVm[31:0]	These bits set the value for exclusive control.

3A.3.3.2 Operation of the LDL.W and STC.W Instructions

The LDL.W and STC.W instructions can be used to perform atomic read-modify-write operations for accurate processing in the updating of memory in multicore systems. The LDL.W and STC.W instructions operate as follows.

- Link generation: The CPU is capable of generating links to both the local RAM and global RAM (including the retention RAM). Executing the LDL.W instruction on the target RAM for the operation leads to the link flag being set and a link being generated in response to reading by the instruction. Two link flag systems are provided, one each for the following two areas of RAM.
  (1) The local RAM for the given processor
  (2) The global RAM (including the retention RAM)
- Success in storing: After a link has been generated, storing will only proceed in response to executing an STC.W instruction corresponding to the generated link.
- Failure in storing: If a link is lost, storing does not proceed even when an STC.W instruction for the corresponding address is processed. Storing also does not proceed when an STC.W instruction that does not correspond to the link is processed.
- Condition for successful storing: If the following condition is met, the STC.W instruction is judged to be for the address corresponding to the link.
  - The address for the LDL.W instruction which generated the link matches that for the STC.W instruction.
- Loss of the link: If any of the following occurs, the link flag is cleared and the link is lost.
  - Any of the following processing by the CPU for which the link was generated:
    - Execution of a STC.W instruction. The corresponding link (for (1) or (2) above) will be lost irrespective of the success or failure of storing.
    - Occurrence of an exception or the CPU executing an instruction to return from an exception processing routine (FERET or EIRET). The link flags for both areas of RAM are cleared.
    - Successive execution of LDL.W instructions for a location with the same link flags. The link generated in
    - response to the preceding LDL.W instruction will be lost. Do not execute such processing
    - Execution of a storing operation other than an STC.W instruction for the address generating the link. Do not execute such processing.
  - Access as described below by another bus master:
    Any storing operation, including execution of an STC.W instruction for the address generating the link.
    The corresponding link will be lost.

Success of the STC.W instruction means that the LDL.W and STC.W instructions have realized an atomic read-modify-write operation.

3A.4 CPU2 Boot Up Operation

After reset is released, CPU1 starts to fetch instruction. Initial condition of CPU2 is decided by option byte setting and its boot up condition can be set and confirmed by BOOTCTRL register.

(1) List of Register

Table 3A.79 BOOTCTRL Register (Base Address: FFC5 8000$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32	
—	+00$_H$	4	BOOTCTRL register	BOOTCTRL	—	R/W	—	—	—	✓	0000 0006$_H$ or 0000 0002$_H$

(2) BOOTCTRL — Boot Control Register

This register is used to control the start-up of CPU2. By setting bit to “1”, CPU2 starts its pipeline operation. When the value of CPU2EN is “1”, it cannot be overwritten to “0” excluding reset.

Access: BOOTCTRL register can be read or written in 32-bit units.

Address: FFC5 8000$_H$

Value after reset: The value after reset depends on the option byte setting.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CPU2 EN	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0/1[*1]	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R

Note 1. The setting of the option byte OPBT0.PE2BOOTEN is reflected. For details on the option byte, see **Section 44.9, Option Bytes**.

Table 3A.80 BOOTCTRL Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	CPU2EN	CPU2 operation setting 0: Invalid boot up of CPU2. 1: Valid boot up of CPU2. When the value of PE2EN (option byte) is “0”, it cannot be overwritten to “1”.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

3A.5 Notes

3A.5.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution

When a control register is updated by a store instruction, there is a time lag after the CPU executes the store instruction and before the control register is actually updated. Therefore, if the updated content of the control register is to be used by the instruction following the store instruction, the appropriate synchronization is required. How to perform synchronization processing is shown below.

For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see *APPENDIX A, Hazard Resolution Procedure for System Registers* in *the RH850G3KH User's Manual: Software*.

When the updated results in the control registers are to be used by the subsequent instruction:

Example 1: An interrupt is enabled by execution of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits.

Proceed as follows in this case.

(1) Execute the store instruction to update a control register (ST.W, etc.).

(2) Perform a dummy read of the above control register (LD.W, etc.).

(3) Execute SYNCP.

(4) Execute the subsequent instruction (EI).

In case of RH850/F1KH, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

Example 2: When you must wait until a control register (control register A) has been completely updated before accessing another control register (control register B), execute similar processing. For example, different peripheral functions are linked, or the interrupt mask for INTC is cleared after the peripheral function is set. Note that this processing is not required if the control registers A and B belong to the same peripheral group.

(1) Execute the store instruction to update the control register A (ST.W, etc.).

(2) Perform a dummy read of the above control register (LD.W, etc.).

(3) Execute SYNCP.

(4) Execute the store instruction to access the control register B (ST.W, LD.W, etc.).

In case of RH850/F1KH, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

The similar processing is also required when starting to access a memory or control register to be protected is started after a safety function (such as some kind of memory protection and ECC) has been completely set up.

When the updated results of the control register or memory to be used in the instruction fetch of the subsequent instruction:

(a) In case of writing the instructions to the RAM before jumping to the RAM to execute instructions from the RAM, take the following procedure.

(1) Execute the store instruction to update a memory (ST.W, etc.).

(2) Perform a dummy read of the above memory (LD.W, etc.).

(3) Execute SYNCP.

(4) Execute SYNCI.

(5) Execute the subsequent instruction (branch instruction, etc.).

(b) In case of updating control registers for memory protection and ECC functions before jumping to the memory to be controlled by the registers, take the following procedure.

(1) Execute the store instruction to update a control register (ST.W, etc.).

(2) Perform a dummy read of the control register (LD.W, etc.).

(3) Execute SYNCP.

(4) Execute SYNCI.

(5) Execute the subsequent instruction (branch instruction, etc.).

When switching the code flash memory area:

In this case, see *Section 10, Usage Notes, (7) Updating the BFASELR register* in *the RH850/F1KH, F1KM, F1K Flash Memory User’s Manual: Hardware Interface*.

3A.5.2 Ensure Coherency after Rewriting the Code Flash

The CPU1 is equipped with the buffer for the code flash area as described in **Section 3A.2.2, Buffers for Code Flash**.

Therefore, clear the buffer to ensure coherency after rewriting the code flash by self-programming.

3A.5.3 Access to Registers by Using Bit-Manipulation Instructions

Writing bit-manipulation instructions consists of read-modify-write processing in 8-bit units. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

3A.5.4 Caution of Prefetching

There is a possibility that the reading of the memory occurs by pre-fetch from the area where instruction codes do not exist. Secure more than 40-byte initialized area after the area where instruction codes are stored.

3A.5.5 Overwriting Context upon Acceptance of Multiple Exceptions

Acceptance of an exception depends on the type of exception source, regardless of the states of the ID and NP bits in the PSW register. When multiple exceptions are generated, the contents of the system register which hold the context information are overwritten. For the conditions for acceptance and whether correct return or recovery is possible for each exception source, see *the List of Exception Sources* in *the RH850G3KH User’s Manual: Software*.

Section 3BC CPU System of RH850/F1KM

3BC.1 Overview

3BC.1.1 Block Configuration

Figure 3BC.1, Block Configuration Diagram of the RH850/F1KM-S4 shows the block configuration diagram of RH850/F1KM-S4.

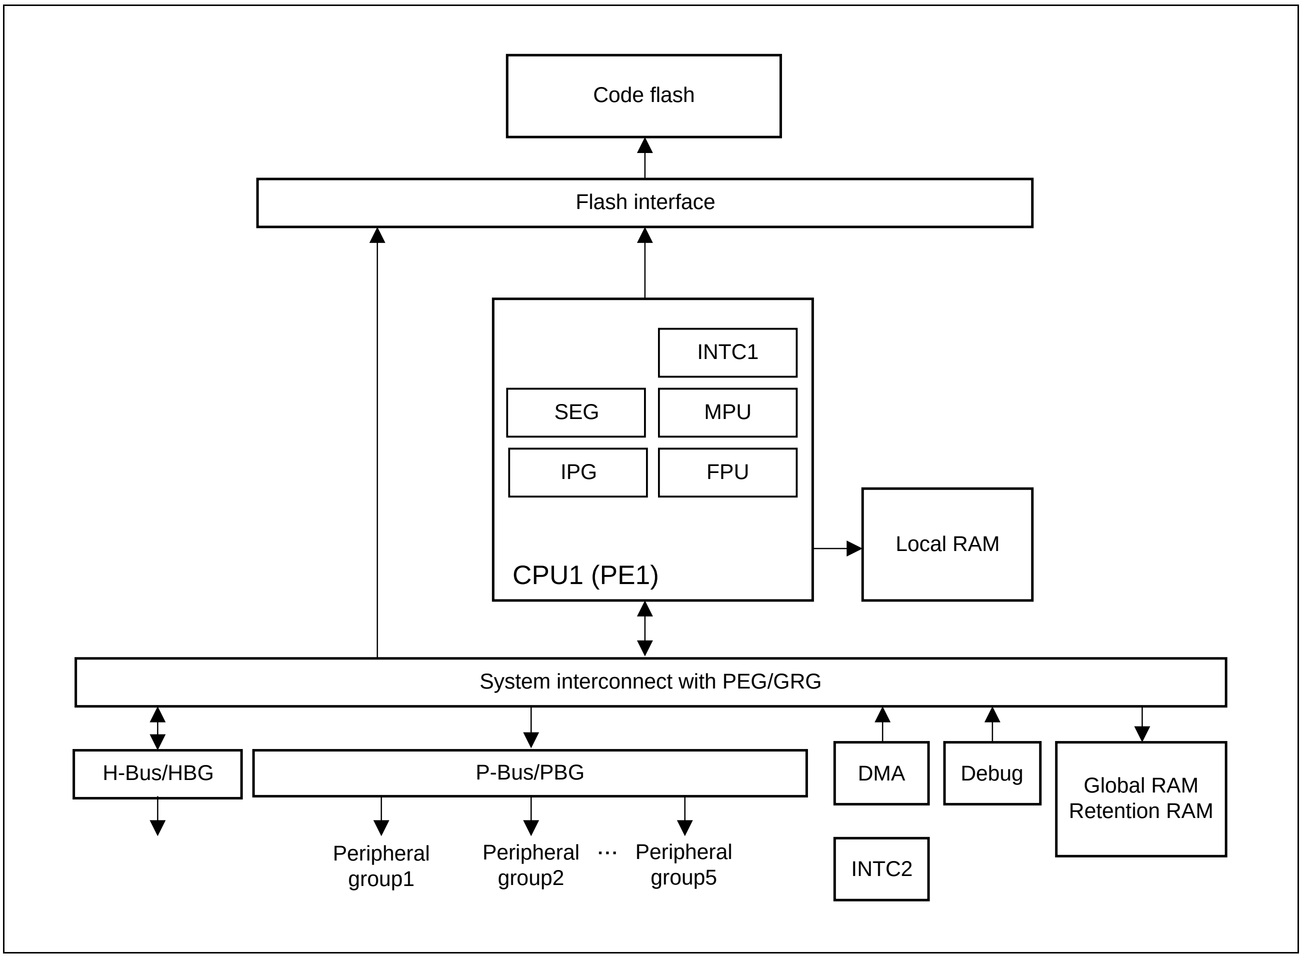

Figure 3BC.1 Block Configuration Diagram of the RH850/F1KM-S4

Figure 3BC.2, Block Configuration Diagram of the RH850/F1KM-S1 shows the block configuration diagram of RH850/F1KM-S1.

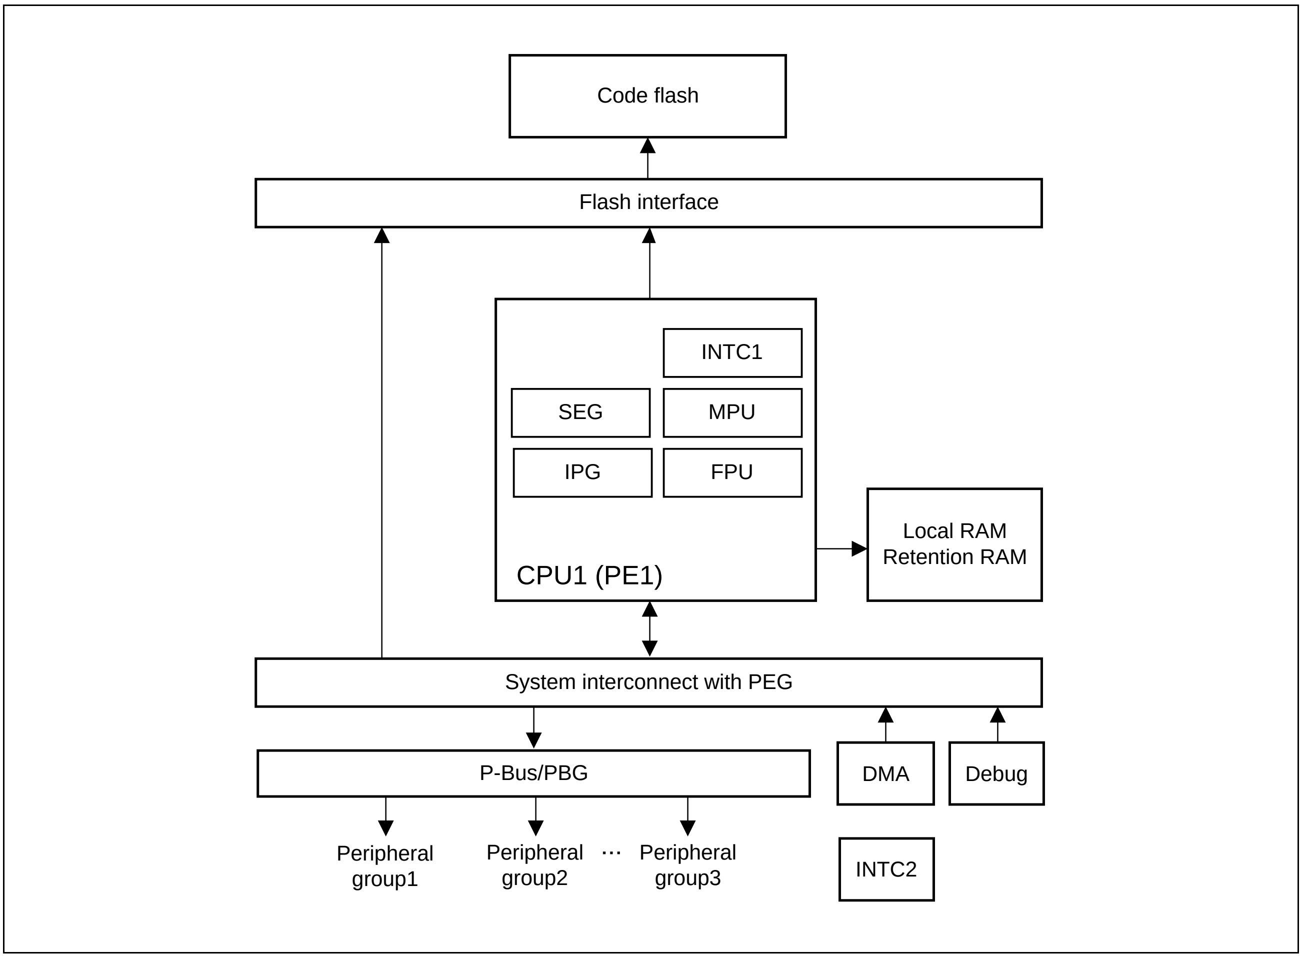

Figure 3BC.2 Block Configuration Diagram of the RH850/F1KM-S1

CPU1 (PE1)

The RH850G3KH2.0 Core is used as the main CPU.

Local RAM

This is a high-speed accessible RAM

Global RAM

The global RAM is a large-capacity RAM for data sharing among CPU and with DMA.

This is not supported with RH850/F1KM-S1.

Retention RAM

RH850/F1KM-S4:
The retention RAM is used to retain values in DeepSTOP mode. Since the continuous global RAM area is assigned for the retention RAM, the retention RAM can also serve as a global RAM for sharing data with the DMA.

RH850/F1KM-S1:
The retention RAM is used to retain values in DeepSTOP mode. Since the continuous local RAM area is assigned for the retention RAM, the retention RAM can also serve as a local RAM for sharing data with the DMA.

Code flash

The code flash memory is included for program storage. It is connected with CPU1 via the flash interface.

Data flash

The data flash memory can be rewritten by the CPU1. It has a greater write endurance than the code flash memory.

P-Bus and H-Bus (RH850/F1KM-S4)

The P-Bus connects the peripheral IPs. The P-Bus is divided into five peripheral groups, 1 to 5.

P-Bus (RH850/F1KM-S1)

The P-Bus connects the peripheral IPs. The P-Bus is divided into three peripheral groups, 1 to 3.

INTC1, INTC2

There are two interrupt controllers, INTC1 and INTC2.

DMA

The DMA transfer module (PDMA) is included.

Slave guard

The slave guard is a function to prevent unauthorized access from the specific bus master, and consists of the following guard structures:

(1) PE guard (PEG)
The PE guard is a function to prevent unauthorized access to the resources (local RAM) in the PE from an external master. After reset is released, access from other than the own PE is prohibited.

(2) Internal Peripheral Guard (IPG)
The PE with system interconnects supports “Internal Peripheral Guard” (IPG) that protects the registers of peripherals against invalid accesses.

(3) Global RAM guard (GRG) (RH850/F1KM-S4)
The global RAM guard is a function to prevent unauthorized access to the global RAM and retention RAM from an external master. The global RAM is in the unprotected state (accessible from all bus master) after reset is released. For details, see **Section 40B, Functional Safety of RH850/F1KM-S4**.

(4) Peripheral guard (PBG / HBG (RH850/F1KM-S4))
The peripheral guard is a function to prevent unauthorized access to peripherals. The control registers in the peripheral circuits are protected against illegal accesses.
For details, see **Section 40B, Functional Safety of RH850/F1KM-S4** and **Section 40C, Functional Safety of RH850/F1KM-S1**.

3BC.2 CPU

3BC.2.1 Core Functions

3BC.2.1.1 Features

Table 3BC.1, Features of the RH850G3KH2.0 Core lists features of the RH850G3KH2.0 core.

Table 3BC.1 Features of the RH850G3KH2.0 Core

Item	Feature
CPU	● Advanced 32-bit architecture for embedded control ● 32-bit internal data bus ● Thirty-two 32-bit general-purpose registers – RISC-type instruction set – Long-/short-format load/store instructions – Three-operand instructions – Instruction set based on C language ● CPU operating modes – User mode and supervisor mode ● Address space: 4-Gbyte linear address space for both data and instructions
Coprocessor	● Floating-point operation coprocessor (FPU) – Supports single precision (32 bits) – Supports data types and exceptions conforming to IEEE754. – Rounding mode: Neighborhood, 0 direction, +∞ direction, and −∞ direction – Handling of denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754
Exception/Interrupt	● 16 interrupt priority levels settable for each channel ● Vector selection method selectable according to performance request or memory usage – Direct branching exception vectors – Indirect branching exception vectors referring to the address table ● Supports the high-speed save/return processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt
Memory management	● Memory protection function (MPU): 16 areas settable
Cache	● No cache memory is equipped.

3BC.2.1.2 Register Set

This subsection explains the program registers and system registers incorporated in this CPU.

(1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).

Table 3BC.2 Program Registers

Program Register	Name	Function	Description
General-purpose registers	r0	Zero register	Always retains “0”
	r1	Assembler reserved register	Used as working register for generating addresses
	r2	Register for address and data variables (used when the real-time OS used does not use this register)	
	r3	Stack pointer (SP)	Used for generating a stack frame when a function is called
	r4	Global pointer (GP)	Used for accessing a global variable in the data area
	r5	Text pointer (TP)	Used as a register that indicates the start of the text area (area where program code is placed)
	r6 to r29	Register for address and data variables	
	r30	Element pointer (EP)	Used as a base pointer for generating addresses when accessing memory
	r31	Link pointer (LP)	Used when the compiler calls a function
Program counter	PC	Retains instruction addresses during execution of programs	

NOTE

For further descriptions of r1, r3 to r5, and r31 used by the assembler and/or C compiler, see the specification of each software development environment.

(a) General-Purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables. Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

1. r0, r3, r30

These registers are implicitly used by instructions.
r0 is a register that always retains “0”. It is used for operations that use 0 and addressing with base address being 0.
r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.
r30 is used as a base pointer when the SLD or SST instruction accesses memory.

2. r1, r4, r5, r31

These registers are implicitly used by the assembler and C compiler.
When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

3. r2

This register might be used by a real-time OS in some cases. If the real-time OS that is being used does not use r2, r2 can be used as a register for address variables or data variables.

(b) PC — Program Counter

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0, and branching to an odd number address is disabled.

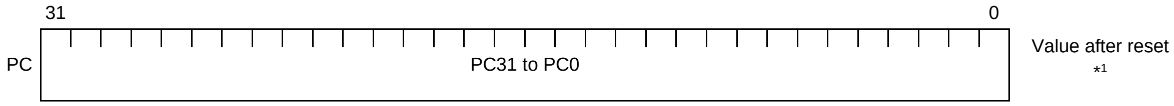

Table 3BC.3 PC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	PC31 to PC1	These bits indicate the address of the instruction being executed.	R/W	*1
0	PC0	This bit is fixed to 0. Branching to an odd number address is disabled.	R/W	0

Note 1. The value after reset differs depending on the setting value of the reset vector. For details, see **(q) RBASE — Reset Vector Base Address Register**.

(2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.

System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and a selection ID.

Table 3BC.4 Basic System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR0, 0	EIPC	Status save registers when acknowledging EI level exception	SV
SR1, 0	EIPSW	Status save registers when acknowledging EI level exception	SV
SR2, 0	FEPC	Status save registers when acknowledging FE level exception	SV
SR3, 0	FEPSW	Status save registers when acknowledging FE level exception	SV
SR5, 0	PSW	Program status word	*1
SR6, 0	FPSR	(Refer to FPU function registers.)	CU and SV
SR7, 0	FPEPC	(Refer to FPU function registers.)	CU and SV
SR8, 0	FPST	(Refer to FPU function registers.)	CU
SR9, 0	FPCC	(Refer to FPU function registers.)	CU
SR10, 0	FPCFG	(Refer to FPU function registers.)	CU
SR11, 0	FPEC	(Refer to FPU function registers.)	CU and SV
SR13, 0	EIIC	EI level exception source register	SV
SR14, 0	FEIC	FE level exception source register	SV
SR16, 0	CTPC	CALLT execution status save register	UM
SR17, 0	CTPSW	CALLT execution status save register	UM
SR20, 0	CTBP	CALLT base pointer register	UM
SR28, 0	EIWR	EI level exception working register	SV
SR29, 0	FEWR	FE level exception working register	SV
SR0, 1	MCFG0	Machine configuration register	SV
SR2, 1	RBASE	Reset vector base address register	SV
SR3, 1	EBASE	Exception handler vector address register	SV
SR4, 1	INTBP	Base address register of the interrupt handler address table	SV
SR5, 1	MCTL	CPU control	SV
SR6, 1	PID	Processor ID register	SV
SR11, 1	SCCFG	SYSCALL operation setting register	SV
SR12, 1	SCBP	SYSCALL base pointer register	SV
SR0, 2	HTCFG0	Thread configuration register	SV
SR6, 2	MEA	Memory error address register	SV
SR7, 2	ASID	Address space ID register	SV
SR8, 2	MEI	Memory error information register	SV

Note 1. The access permission differs depending on the bit.

(a) EIPC — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see “*Types of Exceptions*” in *Software Manual*).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address cannot be specified.

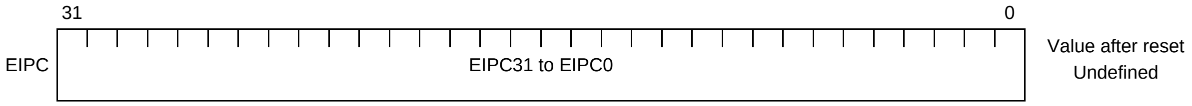

Table 3BC.5 EIPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	EIPC31 to EIPC1	These bits indicate the PC saved when an EI level exception is acknowledged.	R/W	Undefined
0	EIPC0	This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0.	R/W	Undefined

(b) EIPSW — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

	31	30	29												17	16	15	14						8	7	6	5	4	3	2	1	0	
EIPSW	0	UM	0	0	0	0	0	0	0	0	0	0	0	0	0	CU	EBV	0	0	0	0	0	0	0	NP	EP	ID	SAT	CY	OV	S	Z	Value after reset 0000 0020$_H$

Table 3BC.6 EIPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an EI level exception is acknowledged.	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit stores the PSW.CU field setting when an EI level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an EI level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an EI level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an EI level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an EI level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an EI level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an EI level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an EI level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an EI level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an EI level exception is acknowledged.	R/W	0

(c) FEPC — Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see “*Types of Exceptions*” in *Software Manual*).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address cannot be specified.

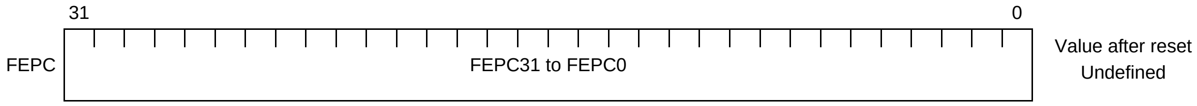

Table 3BC.7 FEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FEPC31 to FEPC1	These bits indicate the PC saved when an FE level exception is acknowledged.	R/W	Undefined
0	FEPC0	This bit indicates the PC saved when an FE level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0.	R/W	Undefined

(d) FEPSW — Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

	31	30	29												17	16	15	14						8	7	6	5	4	3	2	1	0
FEPSW	0	UM	0	0	0	0	0	0	0	0	0	0	0	0	0	CU	EBV	0	0	0	0	0	0	0	NP	EP	ID	SAT	CY	OV	S	Z

Value after reset
$0000\ 0020_H$

Table 3BC.8 FEPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an FE level exception is acknowledged.	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit stores the PSW.CU field setting when an FE level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an FE level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an FE level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an FE level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an FE level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an FE level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an FE level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an FE level exception is acknowledged.	R/W	0

(e) PSW — Program Status Word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by conditional instructions (Bcond, CMOV, etc.)).

CAUTIONS

1. When the LDSR instruction is used to change the contents of bit7 to 0 in this register, the changed contents become valid immediately after completion of the LDSR instruction execution. See “*APPENDIX A. Hazard Resolution Procedure for System Registers*” in *Software Manual* when the content of the other bits in this register is changed.
2. The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See **Table 3BC.9, Access Permission for PSW Register** for the access permission for each bit.

Table 3BC.9 Access Permission for PSW Register

Bit		Access Permission when Reading	Access Permission when Writing
30	UM	UM	SV*1
16	CU	UM	SV*1
15	EBV	UM	SV*1
7	NP	UM	SV*1
6	EP	UM	SV*1
5	ID	UM	SV*1
4	SAT	UM	UM
3	CY	UM	UM
2	OV	UM	UM
1	S	UM	UM
0	Z	UM	UM

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1. In this case, writing is ignored.

	31	30	29												17	16	15	14						8	7	6	5	4	3	2	1	0
PSW	0	UM	0	0	0	0	0	0	0	0	0	0	0	0	0	CU	EBV	0	0	0	0	0	0	0	NP	EP	ID	SAT	CY	OV	S	Z

Value after reset
0000 0020H

Table 3BC.10 PSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit indicates that the CPU is in user mode (in UM mode) 0: Supervisor mode 1: User mode	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit indicates the coprocessor use permissions. When the bit corresponding to the coprocessor is 0, a coprocessor unusable exception occurs if an instruction for the coprocessor is executed or a coprocessor resource (system register) is accessed. CU bit 16: FPU	R/W	0

Table 3BC.10 PSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
15	EBV	This bit indicates the reset vector and exception vector operation. See the description on RBASE (**(q) RBASE — Reset Vector Base Address Register**) and EBASE (**(r) EBASE — Exception Handler Vector Address Register**) in this section.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see **Table 7BC.1, List of Exception Sources**. 0: The acknowledgement of FE level exception is enabled. 1: The acknowledgement of FE level exception is disabled.	R/W	0
6	EP	This bit indicates that an exception other than an interrupt controlled by the interrupt controller is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. 0: An exception other than an interrupt is not being serviced. 1: An exception other than an interrupt is being serviced.	R/W	0
5	ID	This bit disables the acknowledgement of EI level exception. When an EI level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level exception. As for the exceptions which the ID bit disables the acknowledgment, see **Table 7BC.1, List of Exception Sources**. This bit is also used to disable EI level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. 0: EI level exception is not being processed or the section is not a critical section (after execution of EI instruction). 1: EI level exception is being processed or the section is a critical section (after execution of DI instruction).	R/W	1
4	SAT*1	This bit indicates that the operation result is saturated because the operation result of a saturated operation instruction has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1, but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed. 0: Not saturated 1: Saturated	R/W	0
3	CY	This bit indicates whether a carry or borrow has occurred in the operation result. 0: Carry and borrow have not occurred. 1: Carry or borrow has occurred.	R/W	0
2	OV*1	This bit indicates whether or not an overflow has occurred during an operation. 0: Overflow has not occurred. 1: Overflow has occurred.	R/W	0
1	S*1	This bit indicates whether or not the result of an operation is negative. 0: Result of operation is positive or 0. 1: Result of operation is negative.	R/W	0
0	Z	This bit indicates whether or not the result of an operation is 0. 0: Result of operation is not 0. 1: Result of operation is 0.	R/W	0

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. The SAT flag is set to 1 only when the OV flag is set to 1 in a saturated operation.

Operation Result Status	Flag Status			Operation Result after Saturation Processing
	SAT	OV	S	
Exceeded positive maximum value	1	1	0	7FFF FFFF_H
Exceeded negative maximum value	1	1	1	8000 0000_H
Positive (maximum value not exceeded)	Value prior to operation is retained.	0	0	Operation result itself
Negative (maximum value not exceeded)			1	

(f) EIIC — EI Level Exception Source Register

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

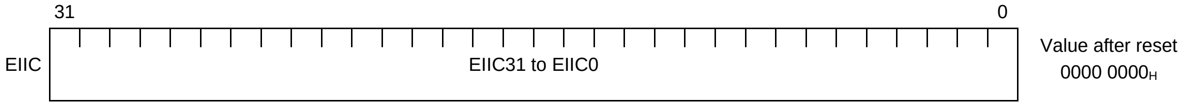

Table 3BC.11 EIIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIIC31 to EIIC0	These bits store the exception source code when an EI level exception is acknowledged. The EIIC15 to EIIC0 field stores the lower 16 bits of the exception source code. The EIIC31 to EIIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0.	R/W	0

(g) FEIC — FE Level Exception Source Register

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

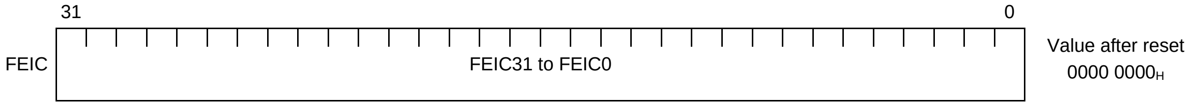

Table 3BC.12 FEIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEIC31 to FEIC0	These bits store the exception source code when an FE level exception is acknowledged. The FEIC15 to FEIC0 field stores the lower 16 bits of the exception source code. The FEIC31 to FEIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0.	R/W	0

(h) CTPC — Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address cannot be specified.

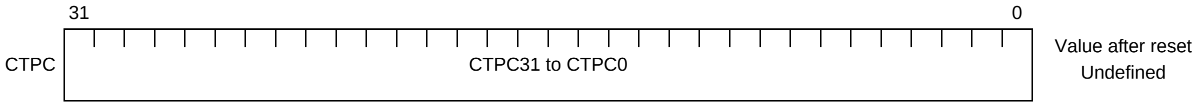

Table 3BC.13 CTPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTPC31 to CTPC1	These bits indicate the PC of the instruction after the CALLT instruction.	R/W	Undefined
0	CTPC0	This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0.	R/W	Undefined

(i) CTPSW — Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

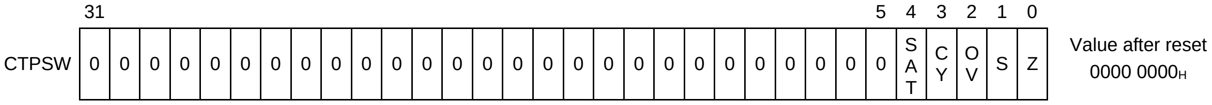

Table 3BC.14 CTPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4	SAT	This bit stores the PSW.SAT bit setting when the CALLT instruction is executed.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when the CALLT instruction is executed.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when the CALLT instruction is executed.	R/W	0
1	S	This bit stores the PSW.S bit setting when the CALLT instruction is executed.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when the CALLT instruction is executed.	R/W	0

(j) CTBP — CALLT Base Pointer Register

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.

Be sure to set the CTBP register to a halfword address.

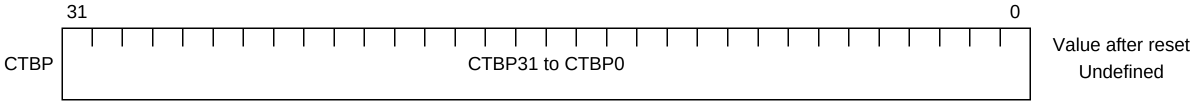

Table 3BC.15 CTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTBP31 to CTBP1	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the start address of the table used by the CALLT instruction.	R/W	Undefined
0	CTBP0	This bit indicates the base pointer address of the CALLT instruction. This bit indicates the start address of the table used by the CALLT instruction. Always set this bit to 0.	R	0

(k) ASID — Address Space ID Register

This register indicates the address space ID. This is used to identify the address space provided by the memory management function.

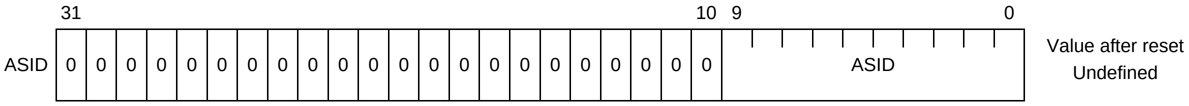

Table 3BC.16 ASID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 10	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
9 to 0	ASID	These bits indicate the address space ID.	R/W	Undefined

(l) EIWR — EI Level Exception Working Register

The EIWR register is used as a working register when an EI level exception has occurred.

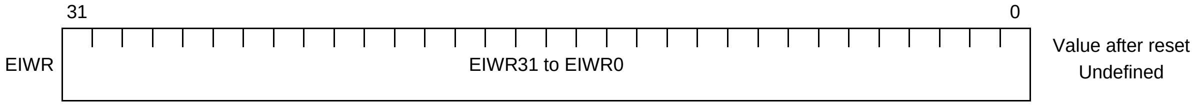

Table 3BC.17 EIWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIWR31 to EIWR0	These bits constitute a working register that can be used for any purpose during the servicing of an EI level exception. This register can be used to temporarily save the values of general-purpose registers, etc.	R/W	Undefined

(m) FEWR — FE Level Exception Working Register

The FEWR register is used as a working register when an FE level exception has occurred.

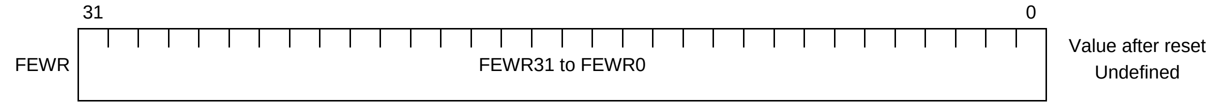

Table 3BC.18 FEWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEWR31 to FEWR0	These bits constitute a working register that can be used for any purpose during the servicing of an FE level exception. This register can be used to temporarily save the values of general-purpose registers, etc.	R/W	Undefined

(n) HTCFG0 — Thread Configuration Register

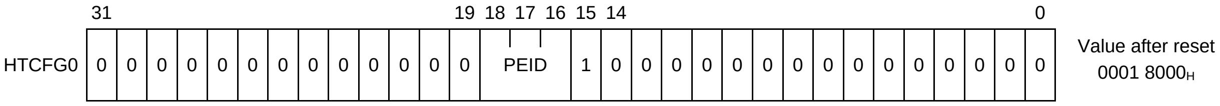

Table 3BC.19 HTCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 19	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
18 to 16	PEID	These bits indicate the processor element number.	R	001_B
15	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
14 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(o) MEA — Memory Error Address Register

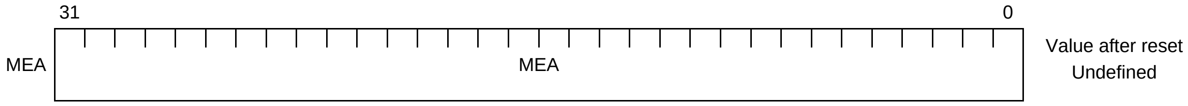

Table 3BC.20 MEA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MEA	These bits store the violation address when an MAE (misaligned) or MPU occurs.	R/W	Undefined

(p) MEI — Memory Error Information Register

This register is used to store information about the instruction that caused a misaligned (MAE) or memory protection (MDP) exception when such an exception occurred. This information is used during emulation.

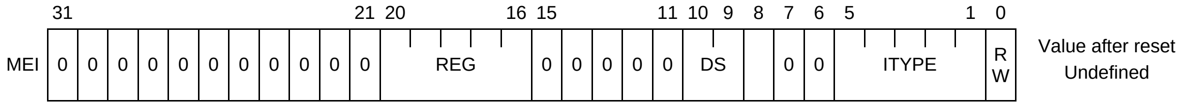

Table 3BC.21 MEI Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 21	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
20 to 16	REG	These bits indicate the number of the source or destination register accessed by the instruction that caused the exception. For details, see **Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
15 to 11	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
10, 9	DS	These bits indicate the data type of the instruction that caused the exception.*1 0: Byte (8 bits) 1: Halfword (16 bits) 2: Word (32 bits) 3: Double-word (64 bits) For details, see **Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
8	U	This bit indicates the sign extension method of the instruction that caused the exception. 0: Signed 1: Unsigned For details, see **Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5 to 1	ITYPE	These bits indicate the instruction that caused the exception. For details, see **Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
0	RW	This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory). 0: Read (Load-memory) 1: Write (Store-memory) For details, see **Table 3BC.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3BC.22 Instructions Causing Exceptions and Values of MEI Register

Instruction	REG	DS	U	RW	ITYPE
SLD.B	dst	0 (byte)	0 (signed)	0 (read)	00000_B
SLD.BU	dst	0 (byte)	1 (unsigned)	0 (read)	00000_B
SLD.H	dst	1 (halfword)	0 (signed)	0 (read)	00000_B

CACHE	—	—	—	—	—
Interrupt (table reference)*1	—	2 (word)	0 (signed)	0 (read)	10101_B

Note 1. When reading the interrupt vector by using the table reference method.

NOTE

dst: destination register number, src: source register number

(q) RBASE — Reset Vector Base Address Register

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this vector address is also used as the exception vector address.

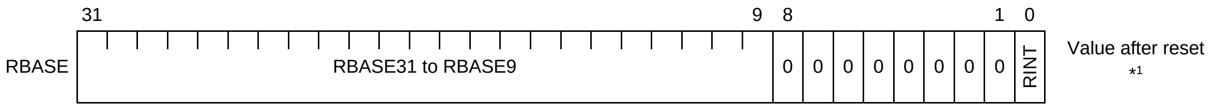

Table 3BC.23 RBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	RBASE31 to RBASE9	These bits indicate the reset vector when there is a reset. When PSW.EBV = 0, this address is also used as the exception vector. For RBASE8 to RBASE0, 0 is used implicitly.	R	0000 0000 0000 0000 0000 000$_B$*1
8 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See **Section 7BC.10.1, Direct Vector Method**. This bit is valid when PSW.EBV = 0.	R	0

Note 1. The value depends on the reset vector. The values set at shipment are shown in the table. When the reset vector is modified, the address will be changed.

(r) EBASE — Exception Handler Vector Address Register

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

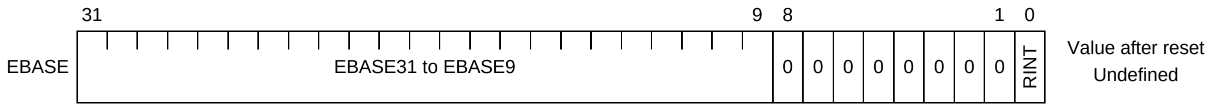

Table 3BC.24 EBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	EBASE31 to EBASE9	The exception handler routine address is changed to the address resulting from adding the offset address of each exception to the base address specified for this register. For EBASE8 to EBASE0, 0 is used implicitly.	R/W	Undefined
8 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See **Section 7BC.10.1, Direct Vector Method**.	R/W	Undefined

(s) INTBP — Base Address Register of the Interrupt Handler Address Table

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

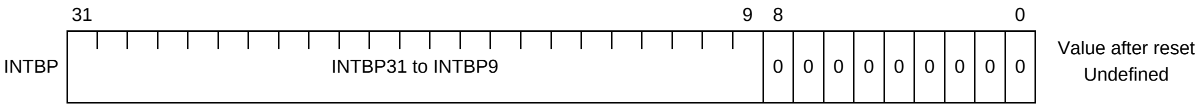

Table 3BC.25 INTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	INTBP31 to INTBP9	These bits indicate the base pointer address for an interrupt when the table reference method is used. The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified by the table reference method (EIINT0 to EIINT511) is acknowledged. For INTBP8 to INTBP0, 0 is used implicitly.	R/W	Undefined
8 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(t) PID — Processor ID Register

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

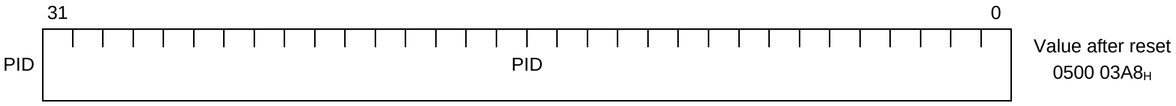

Table 3BC.26 PID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 24	PID	Architecture Identifier This identifier indicates the architecture of the processor.	R	05_H
23 to 8		Function Identifier This identifier indicates the functions of the processor. These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). Bits 23 to 11: Reserved Bit 10: Double-precision floating-point operation function Bit 9: Single-precision floating-point operation function Bit 8: Memory protection function (MPU)	R	0003_H
7 to 0		Version Identifier This identifier indicates the version of the processor.	R	$A8_H$

(u) SCCFG — SYSCALL Operation Setting Register

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

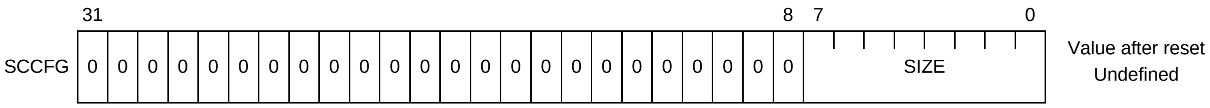

Table 3BC.27 SCCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	SIZE	These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255. By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used. If vectors exceeding the maximum number of entries are specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry.	R/W	Undefined

(v) SCBP — SYSCALL Base Pointer Register

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

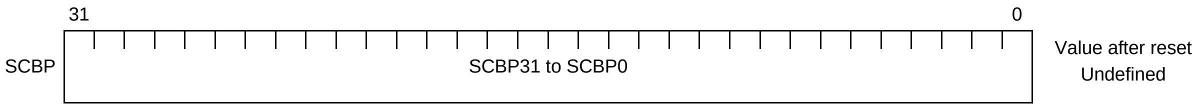

Table 3BC.28 SCBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	SCBP31 to SCBP2	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction.	R/W	Undefined
1, 0	SCBP1, SCBP0	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction. Always set these bits to 0.	R	0

(w) MCFG0 — Machine Configuration Register

This register indicates the CPU configuration.

	31													18	17	16	15												3	2	1	0	
MCFG0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	SPID		0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	Value after reset 0001 0004_H

Table 3BC.29 MCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 18	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
17, 16	SPID	These bits indicate the system protection number.	R/W	01_B
15 to 3	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
2	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(x) MCTL — Machine Control Register

This register is used to control the CPU.

	31																													2	1	0	
MCTL	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	MA	UIC	Value after reset 8000 0002_H

Table 3BC.30 MCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
30 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	MA	This bit is used to control the misaligned access. 0: In the event of a misaligned access, an exception is always generated.*[1] 1: The correct operation is controlled by hardware.*[2]	R/W	1
0	UIC	This bit is used to control the interrupt enable/disable operation in user mode. When this bit is set to 1, executing the EI/DI instruction in user mode becomes possible.	R/W	0

Note 1. Excluding LD.DW, and ST.DW for word boundary allocation.

Note 2. Exception still occurs in case of LD.DW or ST.DW for misaligned access except word boundary allocation.

(3) Interrupt Function Registers

Table 3BC.31 Interrupt Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR7, 1	FPIPR	FPI exception interrupt priority setting register	SV
SR10, 2	ISPR	Priority of interrupt being serviced register	SV
SR11, 2	PMR	Interrupt priority masking register	SV
SR12, 2	ICSR	Interrupt control status register	SV
SR13, 2	INTCFG	Interrupt function setting register	SV

(a) FPIPR — FPI Exception Interrupt Priority Setting Register

This register is used to set the interrupt priority of FPI exception.

	31																										5	4 0
FPIPR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	FPIPR

Value after reset
0000 0000$_H$

Table 3BC.32 FPIPR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	FPIPR	These bits are used to specify the interrupt priority of floating-point operation exceptions (imprecise) (FPI). Specify values from 0 to 16. Specifying 17 or greater is prohibited. FPI exceptions are handled using the specified interrupt priority. If an FPI exception occurs at the same time as an interrupt that has the same priority, the FPI exception is prioritized. **NOTE:** A set value of more than 16 is treated as 16.	R/W	0

(b) ISPR — Priority of Interrupt being Serviced Register

This register retains the priority of the *EIINTn* interrupt being serviced by the CPU. This priority value is then used to perform priority ceiling processing when multiple interrupts occur.

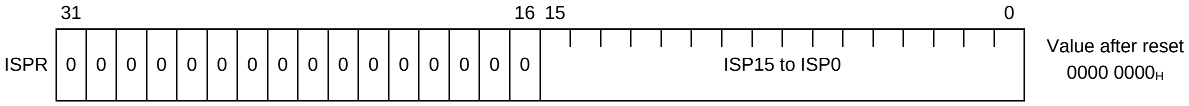

Table 3BC.33 ISPR Register Contents

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th><th>R/W</th><th>Value after Reset</th></tr>
<tr><td>31 to 16</td><td>—</td><td>(Reserved for future expansion. Be sure to set to 0.)</td><td>R</td><td>0</td></tr>
<tr><td>15 to 0</td><td>ISP15 to ISP0</td><td>These bits indicate the acknowledgment status of an <i>EIINTn</i> interrupt with a priority that corresponds to the relevant bit position.
0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged.
1: An interrupt request for an interrupt whose priority corresponds to the relevant bit position is being serviced by the CPU core.

The bit positions correspond to the following priority levels.
<table>
<tr><th>Bit</th><th>Priority</th></tr>
<tr><td>0</td><td>Priority 0 (highest)</td></tr>
<tr><td>1</td><td>Priority 1</td></tr>
<tr><td colspan="2">:</td></tr>
<tr><td>14</td><td>Priority 14</td></tr>
<tr><td>15</td><td>Priority 15 (lowest)</td></tr>
</table>
When an interrupt request (<i>EIINTn</i>) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to ISP0 bits that are set to 1 (0 is the highest priority) is cleared to 0.*1
While a bit in this register is set to 1, same or lower priority interrupts (<i>EIINTn</i>) and FPI exceptions*2 are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged.
When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit.</td><td>R*3</td><td>0</td></tr>
</table>

Note 1. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) to the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.

Note 2. Since FPI exceptions have the same level of priority as EIINTn interrupts, they are affected by interrupts in the same way as the ISPR. The priority of FPI exceptions is set by the FPIPR register.

Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

(c) PMR — Interrupt Priority Masking Register

This register is used to mask the specified interrupt priority.

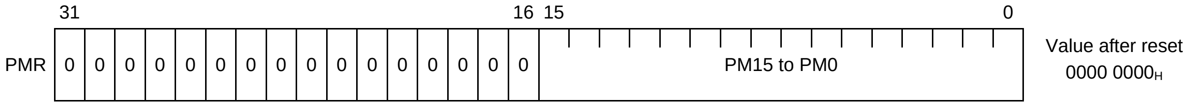

Table 3BC.34 PMR Register Contents

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th><th>R/W</th><th>Value after Reset</th></tr>
<tr><td>31 to 16</td><td>—</td><td>(Reserved for future expansion. Be sure to set to 0.)</td><td>R</td><td>0</td></tr>
<tr><td>15 to 0</td><td>PM15 to PM0</td><td>These bits mask an interrupt request with a priority level that corresponds to the relevant bit position.
0: Servicing of an interrupt with a priority that corresponds to the relevant bit position is enabled.
1: Servicing of an interrupt with a priority that corresponds to the relevant bit position is disabled.

The bit positions correspond to the following priority levels:
<table>
<tr><th>Bit</th><th>Priority</th></tr>
<tr><td>0</td><td>Priority 0 (highest)</td></tr>
<tr><td>1</td><td>Priority 1</td></tr>
<tr><td colspan="2">:</td></tr>
<tr><td>14</td><td>Priority 14</td></tr>
<tr><td>15</td><td>Priority 15 and priority 16 (lowest)</td></tr>
</table>
While a bit in this register is set to 1, interrupts (*EIINTn*) and FPI exceptions*[1] with the priority corresponding to that bit are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged*[2].</td><td>R/W</td><td>0</td></tr>
</table>

Note 1. Since FPI exceptions are specified as the same level of priority as that of interrupts (*EIINTn*), it is affected by the PMR like interrupts. The priority of FPI exceptions is set by the FPIPR register.

Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, $FF00_H$ can be set, but $F0F0_H$ or $00FF_H$ cannot.

(d) ICSR — Interrupt Control Status Register

This register indicates the interrupt control status in the CPU.

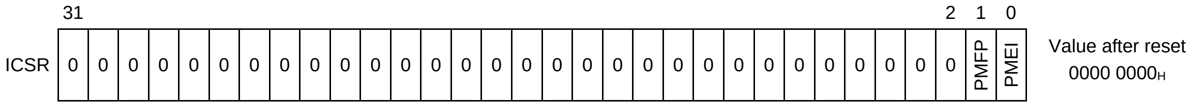

Table 3BC.35 ICSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	PMFP	This bit indicates that an FPI exception with the priority level masked by the PMR register exists.	R	0
0	PMEI	This bit indicates that an interrupt (*EIINTn*) with the priority level masked by the PMR register exists.	R	0

(e) INTCFG — Interrupt Function Setting Register

This register is used to specify settings related to the CPU’s internal interrupt function.

	31																														1	0
INTCFG	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	ISPC

Value after reset
0000 0000$_H$

Table 3BC.36 INTCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	ISPC	This bit specifies how the ISPR register is updated. 0: The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored. 1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed. If this bit is cleared to 0, the bits of the ISPR register are automatically set to 1 when an interrupt (*EIINTn*) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, updating by the program (via execution of an LDSR instruction) is ignored. If this bit is set to 1, the bits of the ISPR register are not updated by the acknowledgement of an interrupt (*EIINTn*) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program. In normal cases, the ISPC bit should be cleared to 0. When performing software-based control of interrupt priorities, however, set this bit (1) and perform priority control by using the PMR register.	R/W	0

(4) FPU Function Registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations. The RH850/F1KM supports single-precision floating-point instruction and thirty-two 32-bit registers can be specified.

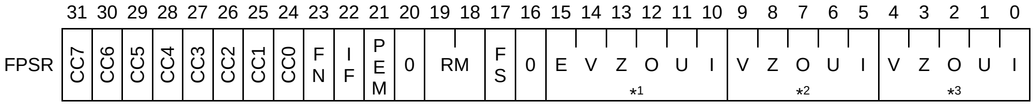
These registers correspond to general-purpose registers r0 to r31. The FPU can use the following system registers to control floating-point operation

Table 3BC.37 FPU System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR6, 0	FPSR	Floating-point operation setting/status register	CU and SV
SR7, 0	FPEPC	Floating-point exception program counter register	CU and SV
SR8, 0	FPST	Floating-point operation status register	CU
SR9, 0	FPCC	Floating-point operation comparison result register	CU
SR10, 0	FPCFG	Floating-point operation configuration register	CU
SR11, 0	FPEC	Floating-point exception control register	CU and SV

(a) FPSR — Floating-point Operation Setting/Status Register

This register indicates the execution status of floating-point operations and any exceptions that occur.



Value after reset
See below

Note 1. Cause bits (XC)

Note 2. Enable bits(XE)

Note 3. Preservation bits (XP)

Table 3BC.38 FPSR Register Contents

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th><th>R/W</th><th>Value after Reset</th></tr>
<tr><td>31 to 24</td><td>CC[7:0]</td><td>These are the CC (condition) bits. They store the results of floating-point comparison instructions. The CC7 to CC0 bits are not affected by any instructions except the comparison instruction and LDSR instruction.
0: Comparison result is false
1: Comparison result is true</td><td>R/W</td><td>Undefined</td></tr>
<tr><td>23</td><td>FN</td><td>This bit enables flush-to-nearest mode. When the FN bit is set to 1, if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number.</td><td>R/W</td><td>0</td></tr>
<tr><td>22</td><td>IF</td><td>This bit accumulates and indicates information about the flushing of input operands.</td><td>R/W</td><td>0</td></tr>
<tr><td>21</td><td>PEM</td><td>This bit specifies whether to handle an exception as a precise exception. If the PEM bit is 1, exceptions that are caused by the execution of a floating-point operation instruction are handled as precise exceptions.</td><td>R/W</td><td>0</td></tr>
<tr><td>20</td><td>—</td><td>(Reserved for future expansion. Be sure to set to 0.)</td><td>R</td><td>0</td></tr>

9 to 5	XE (V, Z, O, U, I)	These are the enable bits.	R/W	0
4 to 0	XP (V, Z, O, U, I)	These are the preservation bits.	R/W	Undefined

(b) FPEPC — Floating-point Exception Program Counter Register

When an exception that is enabled by an enable bit occurs, the program counter (PC) of the instruction that caused the exception is stored.

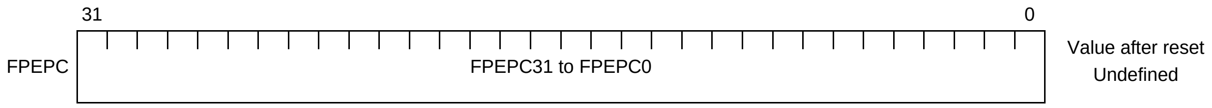

Table 3BC.39 FPEPC Register Contents

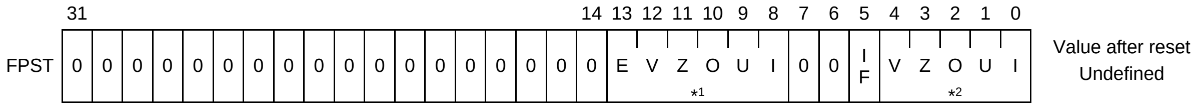
Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FPEPC31 to FPEPC1	These bits store the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs.	R/W	Undefined
0	FPEPC0	This bit stores the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs. Always set this bit to 0.	R	0

(c) FPST — Floating-point Operation Status Register

This register reflects the contents of the FPSR register bits related to the operation status.



Note 1. Cause bits (XC)

Note 2. Preservation bits (XP)

Table 3BC.40 FPST Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 14	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
13 to 8	XC (E, V, Z, O, U, I)	These are cause bits. Values written to these bits are reflected in FPSR.XC bits.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	IF	This bit accumulates and indicates information about the flushing of input operands.	R/W	0
4 to 0	XP (V, Z, O, U, I)	These are preservation bits. Values written to these bits are reflected in FPSR.XP bits.	R/W	Undefined

(d) FPCC — Floating-point Operation Comparison Result Register

This register reflects the contents of the FPSR.CC[7:0] bits.

	31																							8	7	6	5	4	3	2	1	0	
FPCC	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	CC7	CC6	CC5	CC4	CC3	CC2	CC1	CC0	Value after reset Undefined

Table 3BC.41 FPCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	CC[7:0]	These are CC (condition) bits. They store the result of a floating-point comparison instruction. The CC[7:0] bits are not affected by any instructions except the comparison instruction and LDSR instruction. Values written to these bits are reflected in the CC[7:0] bits of FPSR. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined

(e) FPCFG — Floating-point Operation Configuration Register

This register reflects the contents of the FPSR register bits related to the operation settings.

	31																					10	9	8	7		5	4	3	2	1	0	
FPCFG	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	RM		0	0	0	V	Z	O	U	I	Value after reset 0000 0000$_H$

(f) FPEC — Floating-point Exception Control Register

This register controls the floating-point operation exception.

	31																														1	0
FPEC	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	FPIVD

Value after reset
$0000\ 0000_H$

Table 3BC.43 FPEC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	FPIVD*[1]	This bit indicates the status of reporting the FPI exception. If this bit is set to 1, the FPI exception is reported to the CPU but is not acknowledged. It is automatically cleared to 0 when the CPU acknowledges the FPI exception. While this bit is set to 1, all the floating-point instructions are invalidated. Report of the FPI exception can be canceled by clearing (0) this bit by the LDSR instruction while it is set to 1. When report of the FPI exception is canceled, the CPU does not acknowledge the FPI exception. 0: FPI exception is not reported. 1: FPI exception is reported.	R/W	0

Note 1. The FPIVD bit can only be cleared to 0 by the write operation of the LDSR instruction. It cannot be set to 1.

(5) MPU Function Registers

Table 3BC.44 MPU Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission

(a) MPM — Memory Protection Operation Mode Register

The memory protection mode register is used to define the basic operating state of the memory protection function.

	31																												2	1	0	
MPM	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	SVP	MPE	Value after reset 0000 0000$_H$

Table 3BC.45 MPM Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	SVP	In SV mode (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.*[1] 0: As usual, implicitly enable all access in SV mode. 1: Restrict access according to the SX, SW, and SR bits even in SV mode.*[2]	R/W	0
0	MPE	This bit is used to specify whether to enable or disable the MPU function. 0: Disable 1: Enable	R/W	0

Note 1. If the SVP bit is set to 1, access will be restricted in accordance with the setting for each protection area, even in SV mode. Therefore, specify the protection area beforehand so that the access from the program which set the SVP bit is not restricted.

Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

(b) MPRC — MPU Region Control Register

	31															16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
MPRC	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	E15	E14	E13	E12	E11	E10	E9	E8	E7	E6	E5	E4	E3	E2	E1	E0	Value after reset 0000 0000$_H$

Table 3BC.46 MPRC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	E15 to E0	These are the enable bits for each protection area. Bit En is a copy of bit MPATn.E (where n = 15 to 0).	R/W	0

(c) MPBRGN — MPU Base Region Register

This register indicates the minimum usable MPU area number.

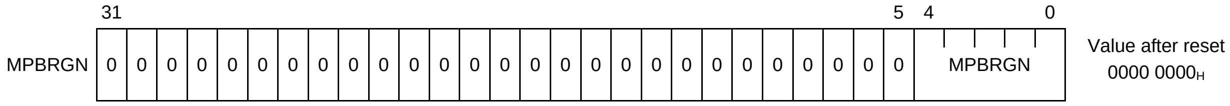

Table 3BC.47 MPBRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	MPBRGN	These bits indicate the smallest number of an MPU area. These bits always indicate 0.	R	0

(d) MPTRGN — MPU End Region Register

This register indicates the maximum usable MPU area number + 1.

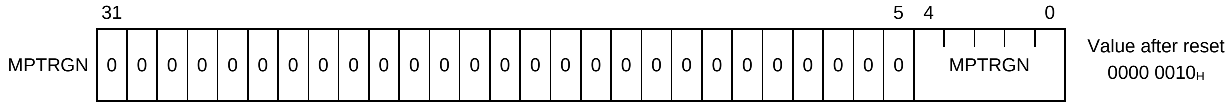

Table 3BC.48 MPTRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	MPTRGN	These bits indicate the largest number of an MPU area + 1. These bits indicate the maximum number of MPU areas incorporated into the hardware.	R	10000_B

(e) MCA — Memory Protection Setting Check Address Register

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

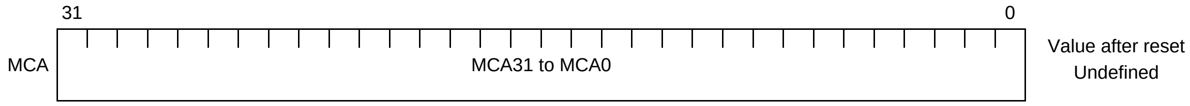

Table 3BC.49 MCA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCA31 to MCA0	These bits are used to specify the start address of the memory area that is subject to a memory protection setting check in bytes.	R/W	Undefined

(f) MCS — Memory Protection Setting Check Size Register

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

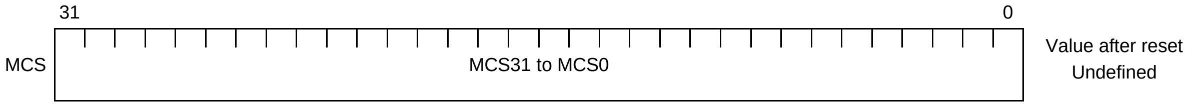

Table 3BC.50 MCS Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCS31 to MCS0	These bits are used to specify the size of the memory area that is subject to a memory protection setting check and the size of the target area in bytes. Because the specified size is assumed to represent an unsigned integer, it is not possible to check an area in the direction in which the address value decreases relative to the MCA register value. Do not specify 0000 0000_H for the MCS register.	R/W	Undefined

(g) MCC — Memory Protection Setting Check Command Register

This register is used to specify the base address of the area where memory protection settings are checked.

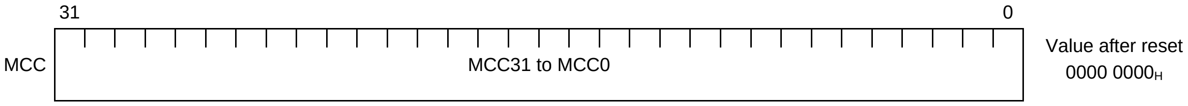

Table 3BC.51 MCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCC31 to MCC0	When any value is written to the MCC register, a memory protection setting check starts. By setting up the MCA/MCS register and then writing to the MCC register, results are stored in MCR. Because the check is started by any written value, a check can be started by using r0 as the source register without using any unnecessary registers. Note that, for the check, the results are applied according to each area setting regardless of the state of the PSW.UM bit. When the MCC register is read, value 0000 0000_H is always returned.	R/W	0

(h) MCR — Memory Protection Setting Check Result Register

This register is used to store the results of a memory protection setting check.

Be sure to clear bits 31 to 9, 7 and 6.

	31																						9	8	7	6	5	4	3	2	1	0	
MCR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	OV	0	0	SXE	SWE	SRE	UXE	UWE	URE	Value after reset Undefined

Table 3BC.52 MCR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
8	OV	If the specified area includes 0000 0000_H or 7FFF FFFF_H, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	SXE	If the specified area is contained within one of the protection areas and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
4	SWE	If the specified area is contained within one of the protection areas and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
3	SRE	If the specified area is contained within one of the protection areas and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
2	UXE	If the specified area is contained within one of the protection areas and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
1	UWE	If the specified area is contained within one of the protection areas and writing to that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
0	URE	If the specified area is contained within one of the protection areas and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined

(i) MPLAn — Protection Area Lower Limit Address Register

These registers indicate the lower limit address of area n (where n = 0 to 15).

	31	2	1	0	
MPLAn	MPLAn		0	0	Value after reset Undefined

Table 3BC.53 MPLAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPLA31 to MPLA2	These bits indicate the lower limit address of area n. For MPLA1 and MPLA0, 0 is used implicitly.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(j) MPUAn — Protection Area Upper Limit Address Register

These registers indicate the upper limit address of area n (where n = 0 to 15).

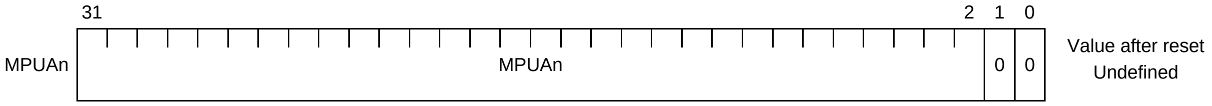

Table 3BC.54 MPUAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPUA31 to MPUA2	These bits indicate the upper limit address of area n. For MPUAn.MPUA1 and MPUA0, 1 is used implicitly.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(k) MPATn — Protection Area Attribute Register

These registers indicate the attributes of area n (where n = 0 to 15).

	31					26	25 16	15							8	7	6	5	4	3	2	1	0	Value after reset
MPATn	0	0	0	0	0	0	ASID	0	0	0	0	0	0	0	0	E	G	SX	SW	SR	UX	UW	UR	Undefined

Table 3BC.55 MPATn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 26	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
25 to 16	ASID	These bits indicate the ASID value to be used as the area match condition.	R/W	Undefined
15 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	E	This bit indicates whether area n is enabled or disabled. 0: Area n is disabled. 1: Area n is enabled.	R/W	0
6	G	0: Areas match only if ASIDs are equal. 1: Areas match even if ASIDs are not equal. If this bit is 0, MPATn.ASID = ASID.ASID is used as the area match condition. If this bit is 1, areas may match even if the values of MPATn.ASID and ASID.ASID are not equal.	R/W	Undefined
5	SX	This bit indicates the execution privilege for the supervisor mode.*1 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
4	SW	This bit indicates whether writing is enabled in the supervisor mode.*1 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
3	SR	This bit indicates whether writing is enabled in the supervisor mode.*1 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined
2	UX	This bit indicates the execution privilege for the user mode. 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
1	UW	This bit indicates whether writing is enabled in the user mode. 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
0	UR	This bit indicates whether writing is enabled in the user mode. 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

(6) Cache Operation Function Registers

The RH850/F1KM does not include a cache operation function, so all the following registers return a value of 0 when read, and writing to these registers is ignored.

Table 3BC.56 Cache Operation Function Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR12, 4	BWERRL	Not implemented. A value of 0 is returned when read and writing is ignored.	SV

3BC.2.1.3 Instruction

See “*Instruction*” in *Software Manual*.

A snooze instruction halts operation of the CPU core for 32 clocks.

3BC.2.2 Buffers for Code Flash

3BC.2.2.1 Features

CPU accesses Code flash by two paths; instruction fetch access is direct to Flash interface, and data access is via System interconnect to Code Flash. Both paths equip buffers, which can be cleared by software. See also **Figure 40B.1, Block Diagram of Code Flash ECC**, **Figure 40C.1, Block Diagram of Code Flash ECC** for ECC decoders in these paths.

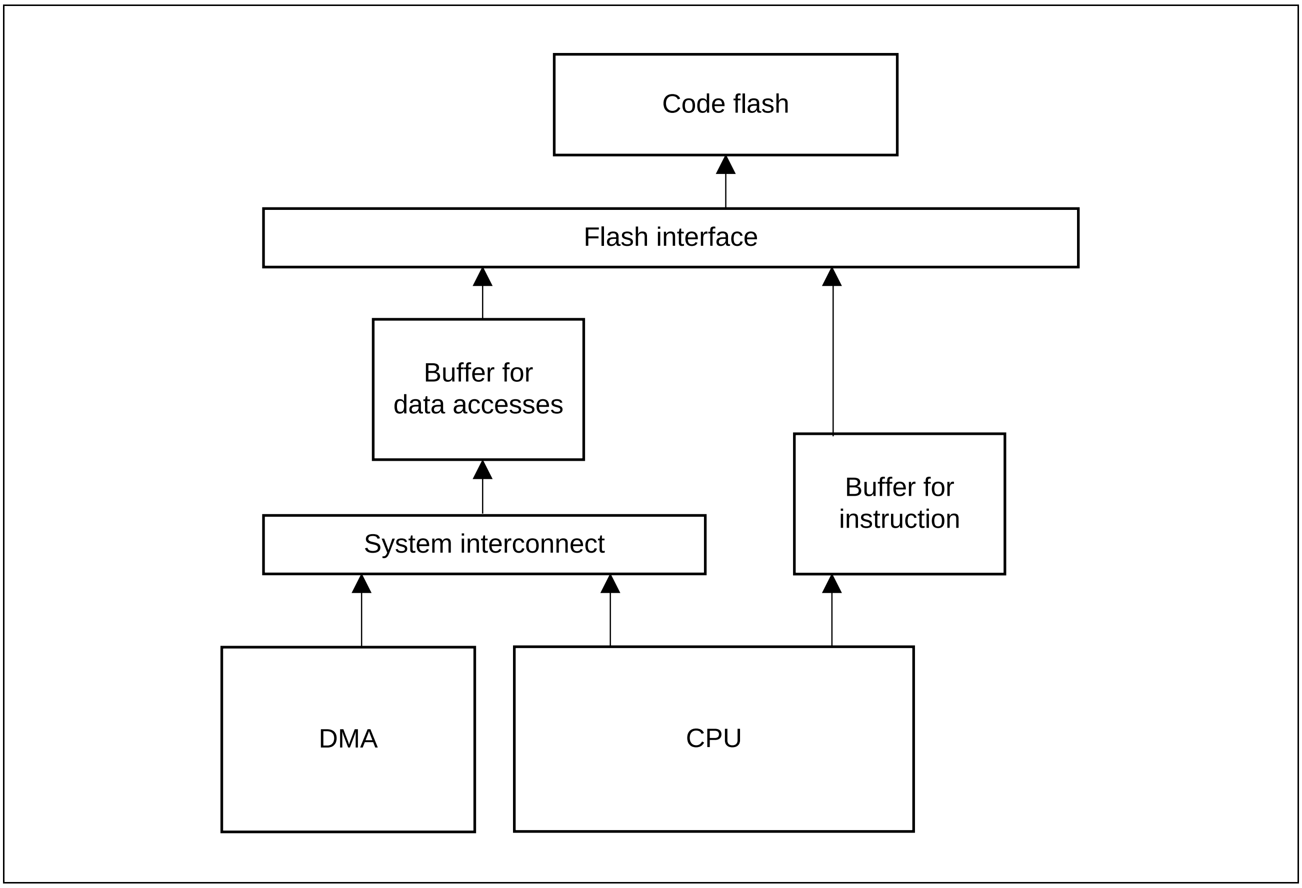

Figure 3BC.3 Buffers for Code Flash

3BC.2.2.2 Function of Buffers

One-line buffer with 128 bits is mounted for instruction fetches to code flash. The data is read out from the buffer after the next access to the same address, so the code flash is not accessed again within 128 bits location.

One-line buffer with 128 bits is mounted as a data buffer. This buffer is not only used by the CPU but also used by DMA via system interconnect. The data is read out from the buffer if the next access is within the same 128 bits boundary.

RH850/F1KM-S4:
16 entry branch history buffer is mounted to decrease branch penalty.
One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these three buffers.

RH850/F1KM-S1:
One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these two buffers.

3BC.2.2.3 Registers for Buffer Control

(1) List of Buffer Control Registers

Table 3BC.57 Buffer Control Register (Base Address: FFC5 B000$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32	
FBUF_CTRL	+000$_H$	4	Flash buffer clear control register	FBUFCCTL	—	R/W	—	✓	✓	✓	0000 0000$_H$

(2) Register Sets

Access: FBUFCCTL register can be read or written in 32-bit units.
FBUFCCTLL register can be read or written in 16-bit units.
FBUFCCTLLL register can be read or written in 8-bit units.

Address: FBUFCCTL: FFC5 B000$_H$
FBUFCCTLL: FFC5 B000$_H$
FBUFCCTLLL: FFC5 B000$_H$

	31																														1	0
FBUFCCTL	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	FBUFCLR

Value after reset
0000 0000$_H$

Table 3BC.58 FBUFCCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.	R	0
0	FBUFCLR	Buffer clear bits. To clear buffers, write 1 to this bit and then write 0. 0: Buffers are valid 1: Buffers are invalid (cleared)	R/W	0

Please do following procedures when you want to clear the buffers.

Step 1: Write 0 to FBUFCCTL.FBUFCLR

Step 2: Write 1 to FBUFCCTL.FBUFCLR

Step 3: Write 0 to FBUFCCTL.FBUFCLR

Step 4: Read the FBUFCCTL register (dummy read)

Step 5: Execute the SYNCP instruction

Step 6: Execute the SYNCI instruction

If you do not do Step 3 after Step 2, the buffers are kept invalid during FBUFCCTL.FBUFCLR = 1.

3BC.2.3 Reliability Functions

3BC.2.3.1 PE Guard Function (PEG)

(1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the CPU (PE) from an external master. This function protects access to the local RAM*[1] in the PE. In the initial state after a reset, access by masters other than own PE is disabled. Setting the registers listed in (3) List of PEG Protection Setting Registers enables access by masters other than own PE.

Note 1. It is the local RAM and the retention RAM in RH850/F1KM-S1.

(1) Detecting PE guard violation
If an external master makes an unauthorized access to the resource area in a PE for which PE guard is set, the access is detected as a PE guard violation.

(2) Blocking unauthorized access
When a PE guard violation is detected, unauthorized access to the internal resources of the PE are blocked to prevent unauthorized modification of the contents of PE resources.

(3) Notifying occurrence of violation
An error response to an unauthorized access is sent to the request source of external master. When DMA Controller makes an unauthorized access, meanwhile, a DMA transfer error is detected.
A PE guard violation is notified as INTGUARD interrupt request which is a source of FEINT.

(2) Protection Made by SPID

- Setting PEG Protection
  - Up to four areas can be set depending on the local RAM address*[1] of the own PE.
  - The area range is specified by the base address and the mask bit (4 kbytes to 4 Gbytes).
  - “Read enable” and “write enable” can be set for each area.
  - “Enable” or “disable” can be selected based on the system protection identifier (SPID) for each area.

Note 1. It is the local RAM address and the retention RAM address in RH850/F1KM-S1.

- Procedure for permitting access by using the system protection identifier (SPID)

1. Is the area subject to access is the local RAM area*[1]? If so, go to step 2.
2. Is the area subject to access is within the range of valid areas 0, 1, 2, or 3? If so, go to step 3.
   Otherwise, return an error response.
3. Are all the conditions below for the relevant area satisfied? If so, permit access.
   - The system protection identifier (SPID) is enabled.
   - Required operations (read/write) are enabled.

   Otherwise, return an error response.

Note 1. It is the local RAM area and the retention RAM area in RH850/F1KM-S1.

(3) List of PEG Protection Setting Registers

Specify the necessary settings in the registers below to protect PE resources from unauthorized access by an external master.

- Whether to permit access to the local RAM*[1] in the PE can be specified.

Note 1. It is local RAM and retention RAM in RH850/F1KM-S1.

Table 3BC.59 PEG Registers (Base Address: FFFE E600$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32	
PEG	+00C$_H$	4	PEG SPID control register	PEGSP	—	R/W	—	✓	✓	✓	0000 0000$_H$

(4) Register Set

(a) PEGSP — PEG SPID Control Register

Access:	PEGSP register can be read or written in 32-bit units. PEGSPL register can be read or written in 16-bit units. PEGSPLL register can be read or written in 8-bit units.
Address:	PEGSP: FFFE E60C$_H$ PEGSPL: FFFE E60C$_H$ PEGSPLL: FFFE E60C$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SPEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 3BC.60 PEGSP Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SPEN	Access permission to external master with specified SPID. 0: Not permit. 1: Permit.

(b) PEGGnMK — PEG Area n Mask Setting Register (n = 0 to 3)

The PEGGnMK register defines which bits of PEGGnBA.GnBASE are compared with the access address. If bit PEGGnMK.GnMASK[m] is cleared, bit PEGGnBA.GnBASE[m] is compared with bit m of the access address.

Access: PEGGnMK register can be read or written in 32-bit units.
PEGGnMKL, PEGGnMKH registers can be read or written in 16-bit units.
PEGGnMKLH, PEGGnMKHL, PEGGnMKHH registers can be read or written in 8-bit units.

Address: PEGGnMK: FFFE $E680_H$ + (10_H × n)
PEGGnMKL: FFFE $E680_H$ + (10_H × n),
PEGGnMKH: FFFE $E682_H$ + (10_H × n)
PEGGnMKLH: FFFE $E681_H$ + (10_H × n),
PEGGnMKHL: FFFE $E682_H$ + (10_H × n),
PEGGnMKHH: FFFE $E683_H$ + (10_H × n)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GnMASK															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3BC.61 PEGGnMK Register Contents

Bit Position	Bit Name	Function
31 to 12	GnMASK	0: Target bits are compared when determining the PE guard area. 1: Target bits are not compared when determining the PE guard area.
11 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

NOTE

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

(c) PEGGnBA — PEG Area n Base Setting Register (n = 0 to 3)

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n. Setting the GnEN bit to 1 validates the access enable conditions specified by this register and the PEGGnMK register.

Access: PEGGnBA register can be read or written in 32-bit units.
PEGGnBAL, PEGGnBAH registers can be read or written in 16-bit units.
PEGGnBALL, PEGGnBALH, PEGGnBAHL, PEGGnBAHH registers can be read or written in 8-bit units.

Address: PEGGnBA: FFFE E684$_H$ + (10$_H$ × n)
PEGGnBAL: FFFE E684$_H$ + (10$_H$ × n),
PEGGnBAH: FFFE E686$_H$ + (10$_H$ × n)
PEGGnBALL FFFE E684$_H$ + (10$_H$ × n),
PEGGnBALH FFFE E685$_H$ + (10$_H$ × n),
PEGGnBAHL: FFFE E686$_H$ + (10$_H$ × n),
PEGGnBAHH: FFFE E687$_H$ + (10$_H$ × n)

Table 3BC.62 PEGGnBA Register Contents

Bit Position	Bit Name	Function
31 to 12	GnBASE	Base address that specifies the range of PE guard protection area n.
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	GnSP3	Access permission setting from SPID = 3 external master to PE guard protection area n. 0: Not permit. 1: Permit.
6	GnSP2	Access permission setting from SPID = 2 external master to PE guard protection area n. 0: Not permit. 1: Permit.
5	GnSP1	Access permission setting from SPID = 1 (CPU1*[1]) external master to PE guard protection area n. 0: Not permit. 1: Permit.
4	GnSP0	Access permission setting from SPID = 0 (peripheral device connected to H-BUS*[2]) external master to PE guard protection area n. 0: Not permit. 1: Permit.
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	GnWR	Write access permission to PE guard protection area n. 0: Write access is disabled. 1: Write access is enabled.

Table 3BC.62 PEGGnBA Register Contents

Bit Position	Bit Name	Function
1	GnRD	Read access permission to PE guard protection area n. 0: Read access is disabled. 1: Read access is enabled.
0	GnEN	Enables or Disables the setting for the access enable conditions to PE guard protection area n. 0: Settings for access enable conditions are disabled. 1: Settings for access enable conditions are enabled.

Note 1. Setting value of MCFG0.SPID

Note 2. H-BUS is only supported by RH850/F1KM-S4.

NOTE

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

3BC.2.3.2 PE’s Internal Peripheral Device Protection Function (IPG)

(1) Overview of the IPG Function

The IPG is a function to prevent unauthorized accesses to peripheral devices from the CPU core equipped with the IPG. The IPG achieves the following functions. The IPG covers accesses to the SEG, the PEG, the INTC1 and P-Bus.

(a) Detecting Violation of Peripheral Device Protection

If the CPU makes an unauthorized access to an area (peripheral device) for which peripheral device protection is set, the access is detected as “violation of peripheral device protection”.

(b) Storing Unauthorized Access Information

When a violation of peripheral device protection is detected, the unauthorized-access information is stored in the IPG’s internal register.

(c) Blocking Unauthorized Accesses

When a violation of peripheral device protection is detected, unauthorized accesses to peripheral devices are blocked to prevent contents of peripheral devices from being modified illegally.

(d) Notifying Violation

When a violation of peripheral device protection is detected, a request for generating an exception is made to ask the CPU to stop the processing.

NOTE

Even if a request for generating an exception is immediately sent to the CPU in step **(d) Notifying Violation** above, a subsequent access issued (before receiving a request from the IPG) by the CPU that does not know an occurrence of violation may illegally modify contents of peripheral devices. (Accesses after a violation has occurred result in unauthorized accesses.)

(2) IPG Function

- This function invalidates accesses according to their attributes (including address, transfer type, and access right).
- After an access right violation is detected until the error flag (described later) is cleared by writing by the software, subsequent accesses are invalidated. However, invalidation is applied only to accesses from the CPU and is not applied to accesses from outside the CPU core. Invalidation is performed independently of addresses.
- When a request for accessing different peripheral devices simultaneously is made due to misalignment or double-word access, the access is executed when all such accesses are enabled.

(3) IPG Protection Setting Registers for Illegal Users

To protect peripheral devices from unauthorized accesses by programs in user mode, necessary settings are required for the registers listed below.

- Accesses in user mode are to be detected.

Table 3BC.63 IPG Registers (Base Address: FFFE E000$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right*1	R/W	Operable Bit				Value after Reset
							1	8	16	32	
IPG	+002$_H$	2	Peripheral device protection violation access information register	IPGECRUM	SV	R/W	—	✓	✓	—	Undefined (retained)
	+008$_H$	4	Peripheral device protection violation access address register	IPGADRUM	SV	R/W	—	✓	✓	✓	Undefined (retained)
	+00D$_H$	1	Peripheral device protection enable register	IPGENUM	SV	R/W	—	✓	—	—	00$_H$
	+020$_H$	1	Peripheral device protection setting register 0	IPGPMTUM0	SV	R/W	—	✓	—	—	00$_H$
	+022$_H$	1	Peripheral device protection setting register 2	IPGPMTUM2	SV	R/W	—	✓	—	—	00$_H$
	+023$_H$	1	Peripheral device protection setting register 3	IPGPMTUM3	SV	R/W	—	✓	—	—	00$_H$
	+024$_H$	1	Peripheral device protection setting register 4	IPGPMTUM4	SV	R/W	—	✓	—	—	00$_H$

Note 1. Registers for which “SV” is described are accessible by accesses with SV right (UM = 0).

(4) Register Set

(a) IPGECRUM — Peripheral Device Protection Violation Access Information Register

Access:	IPGECRUM register can be read or written in 16-bit units. IPGECRUML register can be read or written in 8-bit units.
Address:	IPGECRUM: FFFE E002$_H$ IPGECRUML: FFFE E002$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	WD	HW	BY	EX	WR	RD	VD
Value after reset	0	0	0	0	0	0	0	0	0	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3BC.64 IPGECRUM Register Contents

Bit Position	Bit Name	Function
15 to 7	Reserved	These bits are always read as 0. The write value should always be 0.
6	WD	This bit is set to 1 when a violation occurred in read word, instruction fetch read access, write word, CAXI, LDL or STC. In other cases, this bit is cleared to 0.
5	HW	This bit is set to 1 when a violation occurred in read halfword or write haflword. In other cases, this bit is cleared to 0.
4	BY	This bit is set to 1 when a violation occurred in read byte, write byte or bit operation. In other cases, this bit is cleared to 0.
3	EX	This bit is set to 1 when a violation occurred in an instruction fetch read access. In other cases, this bit is cleared to 0.
2	WR	This bit is set to 1 when a violation occurred in a write access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0.
1	RD	This bit is set to 1 when a violation occurred in a read access, bit operation, or execution of the CAXI instruction. In other cases, this bit is cleared to 0.
0	VD	This bit is set to 1 when a violation of peripheral device protection is detected by a program with the relevant right. Even if another violation of peripheral device protection is detected while this bit is 1, data of this IPGECRUM register and the IPGADRUM register is not updated and is retained.

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(b) IPGADRUM — Peripheral Device Protection Violation Access Address Register

Access: IPGADRUM register can be read or written in 32-bit units.

IPGADRUML, IPGADRUMH registers can be read or written in 16-bit units.

IPGADRUMLL, IPGADRUMLH, IPGADRUMHL, IPGADRUMHH registers can be read or written in 8-bit units.

Address: IPGADRUM: FFFE E008$_H$

IPGADRUML: FFFE E008$_H$, IPGADRUMH: FFFE E00A$_H$

IPGADRUMLL: FFFE E008$_H$, IPGADRUMLH: FFFE E009$_H$,

IPGADRUMHL: FFFE E00A$_H$, IPGADRUMHH: FFFE E00B$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EADR[31:16]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3BC.65 IPGADRUM Register Contents

Bit Position	Bit Name	Function
31 to 0	EADR	These bits store the address of the access in which a violation occurred.

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripheral device protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(c) IPGENUM — Peripheral Device Protection Enable Register

Access: IPGENUM register can be read or written in 8-bit units.

Address: IPGENUM: FFFE E00D$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IRE	E
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 3BC.66 IPGENUM Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are always read as 0. The write value should always be 0.
1	IRE	This bit sets whether to store the access information in the peripheral device protection violation access address register and the peripheral device protection violation access information register when a violation of peripheral device protection occurred in an instruction fetch access. 0: Instruction fetch access information is not stored. (value after reset) 1: Instruction fetch access information is stored. **CAUTION:** If you do not want to detect speculative instruction fetches (no instruction is executed in some cases), clear this bit to 0.
0	E	This bit enables or disables the peripheral devices protection function against accesses by the relevant access right. 0: The peripheral device protection function is disabled. (Value after reset) 1: The peripheral device protection function is enabled.

(d) IPGPMTUM0 — Peripheral Device Protection Setting Register 0

Access: IPGPMTUM0 register can be read or written in 8-bit units.

Address: IPGPMTUM0: FFFE E020$_H$

Bit	7	6	5	4	3	2	1	0
	—	X1	W1	R1	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R

Table 3BC.67 IPGPMTUM0 Register Contents

Bit Position	Bit Name	Function
7	Reserved	These bits are always read as 0. The write value should always be 0.
6	X1	This bit sets whether to enable instruction fetch read access to P-Bus. 0: Instruction fetch read access to P-Bus is treated as violation. (Value after reset) 1: Instruction fetch read access to P-Bus is not restricted.
5	W1	This bit sets whether to enable write access to P-Bus. 0: Write access to P-Bus is treated as violation. (Value after reset) 1: Write access to P-Bus is not restricted.
4	R1	This bit sets whether to enable read access to P-Bus. 0: Read access to P-Bus is treated as violation. (Value after reset) 1: Read access to P-Bus is not restricted.
3 to 0	Reserved	These bits are always read as 0. The write value should always be 0.

(e) IPGPMTUM2 — Peripheral Device Protection Setting Register 2

Access: IPGPMTUM2 register can be read or written in 8-bit units.

Address: IPGPMTUM2: FFFE E022$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	W0	R0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 3BC.68 IPGPMTUM2 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are always read as 0. The write value should always be 0.
1	W0	This bit sets whether to enable write access to INTC1. 0: Write access to INTC1 is treated as violation. (Value after reset) 1: Write access to INTC1 is not restricted
0	R0	This bit sets whether to enable read access to INTC1. 0: Read access to INTC1 is treated as violation. (Value after reset) 1: Read access to INTC1 is not restricted.

(f) IPGPMTUM3 — Peripheral Device Protection Setting Register 3

Access: IPGPMTUM3 register can be read or written in 8-bit units.

Address: IPGPMTUM3: FFFE E023$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	W1	R1	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 3BC.69 IPGPMTUM3 Register Contents

Bit Position	Bit Name	Function
7 to 6	Reserved	These bits are always read as 0. The write value should always be 0.
5	W1	This bit sets whether to enable write access to SysErrGen. 0: Write access to SysErrGen is treated as violation. (Value after reset) 1: Write access to SysErrGen is not restricted.
4	R1	This bit sets whether to enable read access to SysErrGen. 0: Read access to SysErrGen is treated as violation. (Value after reset) 1: Read access to SysErrGen is not restricted
3 to 0	Reserved	These bits are always read as 0. The write value should always be 0.

(g) IPGPMTUM4 — Peripheral Device Protection Setting Register 4

Access: IPGPMTUM4 register can be read or written in 8-bit units.

Address: IPGPMTUM4: FFFE $E024_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	W0	R0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 3BC.70 IPGPMTUM4 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are always read as 0. The write value should always be 0.
1	W0	This bit sets whether to enable write access to its own PEG. 0: Write access to its own PEG is treated as violation. (Value after reset) 1: Write access to its own PEG is not restricted.
0	R0	This bit sets whether to enable read access to its own PEG. 0: Read access to its own PEG is treated as violation. (Value after reset) 1: Read access to its own PEG is not restricted

3BC.2.3.3 System Error Generator Function (SEG)

SEG (SysErrGen) controls interrupt notification and recording after a system error occurred by a data access.

Multiple error occurrence inputs are categorized according to error factor, and are processed sequentially from the highest-priority error factor, generating an FE-level exception (SYSERR).

The bit position of the SEGFLAG register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits.

Error address information is recorded only once regardless of error frequency.

The error with the highest priority among the error factors is valid when errors occur simultaneously. Recorded error address information is not overwritten by subsequent errors.

(1) List of SEG Function Control Registers

Table 3BC.71 SEG Register (Base Address: FFFE E980$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right*1	R/W	Operable Bit				Value after Reset
							1	8	16	32	
SEG	+00$_H$	2	SEG error control register	SEGCONT	SV	R/W	—	—	✓	—	0000$_H$
	+02$_H$	2	SEG error flag register	SEGFLAG	SV	R/W	—	—	✓	—	0000$_H$
	+08$_H$	4	SEG error address information register	SEGADDR	SV	R/W	—	—	—	✓	Undefined (retained)

Note 1. Registers for which “SV” is described are writable with the SV right (UM = 0). Attempting to write, if these conditions do not hold, leads to a SYSERR exception with setting VCIF flag. No restriction is provided for read accesses.

(2) Register Set

(a) SEGCONT — SEG Error Control Register

This register is used to enable (= 1) or disable (= 0) notification of SysErr request in response to error flags that store the error occurrence status for each factor.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCSE	APIE	IPGE	—	TCME	—	VCIE	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R	R/W	R	R	R	R

Table 3BC.72 SEGCONT Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	VCSE	This bit enables notification of an error response detected inside system interconnect: ● Error response from external bus masters in write access ● Illegal response to local RAM or peripherals or Flash from optional master in access (except instruction fetch from CPU). And illegal response to optional slave from external AHB master in access.
9	APIE	This bit enables notification of an error response from peripherals. The error notification includes the following cases: ● Error response from peripherals in write access ● PBG error in write access
8	IPGE	This bit enables notification of IPG illegal access detection.
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCME	This bit enables notification of an error during data access to its own local RAM*[1] from PE master. The error notification includes the following cases: ● ECC uncorrectable error (DED or SED & SECDIS=1) ● Detection of an access to RAM unimplemented area
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 3BC.72 SEGCONT Register Contents

Bit Position	Bit Name	Function
4	VCIE	RH850/F1KM-S4: This bit enables notification of an error response during access to CPU peripherals, P-Bus (read access), global RAM, retention RAM, H-Bus and CodeFlash by PE. The error notification includes the following cases: ● IPG error from CPU peripherals and P-Bus ● Error response from H-Bus peripherals ● PBG error / HBG error from P-Bus and H-Bus ● GRG error from global RAM and retention RAM ● ECC uncorrectable error from CodeFlash, global RAM and retention RAM (DED or SED & SECDIS = 1) This bit enables notification of an error response when accessing to a part of access prohibited areas in address map. RH850/F1KM-S1: This bit enables notification of an error response during access to CPU peripherals, P-Bus (read access), global RAM and CodeFlash by PE. The error notification includes the following cases: ● IPG error from CPU peripherals and P-Bus ● PBG error from P-Bus ● ECC uncorrectable error from CodeFlash (DED or SED & SECDIS = 1) This bit enables notification of an error response when accessing to a part of access prohibited areas in address map.
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. It is local RAM and retention RAM in RH850/F1KM-S1.

(b) SEGFLAG — SEG Error Flag Register

This register indicates error flags that store error occurrence status of each factors. The flags are set to 1 by an error occurrence input. The flags are not automatically cleared to 0. Both setting and clearing of each flag are supported in writing to the register.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCSF	APIF	IPGF	—	TCMF	—	VCIF	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R	R/W	R	R	R	R

Table 3BC.73 SEGFLAG Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	VCSF	Flag corresponding to bit 10 of the SEGCONT register
9	APIF	Flag corresponding to bit 9 of the SEGCONT register
8	IPGF	Flag corresponding to bit 8 of the SEGCONT register
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCMF	Flag corresponding to bit 6 of the SEGCONT register
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	VCIF	Flag corresponding to bit 4 of the SEGCONT register
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

NOTE

An error may lead to setting of multiple error flags in SEG. For example, if an IPG error occurs at peripheral registers read, both IPGF bit and VCIF bit in SEGFLAG are set.

(c) SEGADDR — Error Address Information Register

Address information (one record) which is notified with error occurrence is stored in the register. The register is not updated while one or more bits in SEGFLAG register are set.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Address[31:16]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Address[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3BC.74 SEGADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	Address	These bits store the error address information.

CAUTIONS

1. SEGADDR stores error address information in case of an error occurrence related to VCIF bit or TCMF bit in SEGFLAG register. SEGADDR register stores all 0 data in case of an error occurrence related to VCSF bit, APIF bit or IPGF bit in SEGFLAG register.
2. In case of an error occurrence related to TCMF bit in SEGFLAG register, bit[18:0] of the error address are stored in SEGADDR[18:0] and SEGADDR[31:19] are filled with 0.

(3) SEG Function

(a) SEG Function: SYSERR Request Notification by Error Flag

- Setting an error flag takes precedence over clearing the same flag.
  - A simultaneous clearing operation is ignored.
- Priority of error factors
  - The bit position of each flags in SEGFLAG register which error notification is enabled by SEGCONT register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
  - The bit position of error factors is reported as a “SysErr factor code.”
- Conditions for starting SysErr request notification
  - Even if a flag which error notification is disabled by SEGCONT register is set to 1, notification is not made.
  - Notification is made immediately after a flag which error notification is enabled by SEGCONT register is set to 1.
  - After clearing of a flag, notification is made if an other flag which error notification is enabled by SEGCONT register remains set.
- Finishing notification at a SysErr acknowledgement
  - Even after notification is finished, the flag is not cleared automatically.
  - Notification is not made until setting or clearing the flag again.
  - If an error flag that is prioritized higher than the error factor is set prior to an acknowledgement, the notification information may be replaced with a higher prioritized SysErr factor code.

(b) SEG Function: Recording Error Address Information

- When an error which error notification is enabled by SEGCONT register occurs, the error address is retained in the SEGADDR register.
  - No information is retained by setting or clearing an error flag in SEGFLAG register.
  - When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While a flag which error notification is enabled by SEGCONT register is set to 1, overwrite to the SEGADDR register is inhibited.
  - If error occurrence input continues, information of subsequent error factors is not retained.
  - To reset the inhibition of overwrite to the register, clear either SEGCONT or SEGFLAG register (or both of them).

(c) Supplementary Notes on SYSERR Exception

- Even when a SYSERR exception occurs, the value of the PSW.EBV bit is held, and the base address of the exception handler does not switch.

3BC.3 Notes

3BC.3.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution

When a control register is updated by a store instruction, there is a time lag after the CPU executes the store instruction and before the control register is actually updated. Therefore, if the updated content of the control register is to be used by the instruction following the store instruction, the appropriate synchronization is required. How to perform synchronization processing is shown below.

For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see *APPENDIX A, Hazard Resolution Procedure for System Registers* in *the RH850G3KH User's Manual: Software*.

When the updated results in the control registers are to be used by the subsequent instruction:

Example 1: An interrupt is enabled by execution of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits.

Proceed as follows in this case.

(1) Execute the store instruction to update a control register (ST.W, etc.).

(2) Perform a dummy read of the above control register (LD.W, etc.).

(3) Execute SYNCP.

(4) Execute the subsequent instruction (EI).

In case of RH850/F1KM, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

Example 2: When you must wait until a control register (control register A) has been completely updated before accessing another control register (control register B), execute similar processing. For example, different peripheral functions are linked, or the interrupt mask for INTC is cleared after the peripheral function is set. Note that this processing is not required if the control registers A and B belong to the same peripheral group.

(1) Execute the store instruction to update the control register A (ST.W, etc.).

(2) Perform a dummy read of the above control register (LD.W, etc.).

(3) Execute SYNCP.

(4) Execute the store instruction to access the control register B (ST.W, LD.W, etc.).

In case of RH850/F1KM, SYNCM instruction has the same effects as above-mentioned (2) and (3). (Excludes RCFDCn, RCFDCn ECC register access.)

The similar processing is also required when starting to access a memory or control register to be protected is started after a safety function (such as some kind of memory protection and ECC) has been completely set up.

When the updated results of the control register or memory to be used in the instruction fetch of the subsequent instruction:

(a) In case of writing the instructions to the RAM before jumping to the RAM to execute instructions from the RAM, take the following procedure.

(1) Execute the store instruction to update a memory (ST.W, etc.).

(2) Perform a dummy read of the above memory (LD.W, etc.).

(3) Execute SYNCP.

(4) Execute SYNCI.

(5) Execute the subsequent instruction (branch instruction, etc.).

(b) In case of updating control registers for memory protection and ECC functions before jumping to the memory to be controlled by the registers, take the following procedure.

(1) Execute the store instruction to update a control register (ST.W, etc.).

(2) Perform a dummy read of the control register (LD.W, etc.).

(3) Execute SYNCP.

(4) Execute SYNCI.

(5) Execute the subsequent instruction (branch instruction, etc.).

When switching the code flash memory area:

In this case, see *Section 10, Usage Notes, (7) Updating the BFASELR register* in *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

3BC.3.2 Ensure Coherency after Rewriting the Code Flash

The CPU1 is equipped with the buffer for the code flash area as described in **Section 3BC.2.2, Buffers for Code Flash**.

Therefore, clear the buffer to ensure coherency after rewriting the code flash by self-programming.

3BC.3.3 Access to Registers by Using Bit-Manipulation Instructions

Writing bit-manipulation instructions consists of read-modify-write processing in 8-bit units. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

3BC.3.4 Caution of Prefetching

There is a possibility that the reading of the memory occurs by pre-fetch from the area where instruction codes do not exist. Secure more than 40-byte initialized area after the area where instruction codes are stored.

3BC.3.5 Overwriting Context upon Acceptance of Multiple Exceptions

Acceptance of an exception depends on the type of exception source, regardless of the states of the ID and NP bits in the PSW register. When multiple exceptions are generated, the contents of the system register which hold the context information are overwritten. For the conditions for acceptance and whether correct return or recovery is possible for each exception source, see *the List of Exception Sources* in *the RH850G3KH User's Manual: Software*.

Section 4A Address Space of RH850/F1KH-D8

4A.1 Address Space

Table 4A.1, Address Space (8-MB 176/233/324-Pin Product) to **Table 4A.2, Address Space (6-MB 176/233/324-Pin Product)** show the address space of the RH850/F1KH.

CAUTION

Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in **Table 4A.1, Address Space (8-MB 176/233/324-Pin Product)** to **Table 4A.2, Address Space (6-MB 176/233/324-Pin Product)**. If such an address is accessed, operation is not guaranteed.

NOTE

The Local RAM is accessible through the following three address areas in the address space.
CPU1 area: Address area accessible from CPU1, CPU2, DMA, FlexRay and ETNB.
CPU2 area: Address area accessible from CPU1, CPU2, DMA, FlexRay and ETNB.
Self area: Mirrored address area, accessible only from CPU (CPU1, CPU2) to refer the CPU’s self resource.

Table 4A.1 Address Space (8-MB 176/233/324-Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 003F FFFF$_H$	Code Flash (bank A)	4 MB
0040 0000$_H$ to 007F FFFF$_H$	Access prohibited area	
0080 0000$_H$ to 00BF FFFF$_H$	Code Flash (bank B)	4 MB
00C0 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	32 KB
0100 8000$_H$ to 1001 FFFF$_H$	Access prohibited area	
1002 0000$_H$ to 1002 1FFF$_H$	FlexRay Interface (FLXA)	8 KB
1002 2000$_H$ to 1002 FFFF$_H$	Access prohibited area	
1003 0000$_H$ to 1003 03FF$_H$	External Memory Access Controller (MEMC)	1 KB
1003 0400$_H$ to 1003 FFFF$_H$	Access prohibited area	
1004 0000$_H$ to 1004 0FFF$_H$	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000$_H$ to 1FFF FFFF$_H$	Access prohibited area	
2000 0000$_H$ to 20FF FFFF$_H$	External Memory Area(CS0)	16 MB^{*4}
2100 0000$_H$ to 21FF FFFF$_H$	Access prohibited area	
2200 0000$_H$ to 22FF FFFF$_H$	External Memory Area(CS1)	16 MB^{*4}
2300 0000$_H$ to 23FF FFFF$_H$	Access prohibited area	
2400 0000$_H$ to 24FF FFFF$_H$	External Memory Area(CS2)	16 MB^{*4}
2500 0000$_H$ to 27FF FFFF$_H$	Access prohibited area	
2800 0000$_H$ to 28FF FFFF$_H$	External Memory Area(CS3)	16 MB^{*4}
2900 0000$_H$ to 2FFF FFFF$_H$	Access prohibited area	
3000 0000$_H$ to 33FF FFFF$_H$	External Serial Flash Memory Area	64 MB
3400 0000$_H$ to FE9C FFFF$_H$	Access prohibited area	
FE9D 0000$_H$ to FE9F FFFF$_H$	Local RAM (CPU2 area)	192 KB^{*1}
FEA0 0000$_H$ to FEBC FFFF$_H$	Access prohibited area	
FEBD 0000$_H$ to FEBF FFFF$_H$	Local RAM (CPU1 area)	192 KB^{*1}

Table 4A.1 Address Space (8-MB 176/233/324-Pin Product)

Address	Address Space Type	Size
FEC0 0000_H to FEDC $FFFF_H$	Access prohibited area	
FEDD 0000_H to FEDF $FFFF_H$	Local RAM (self area)	192 KB*[1]
FEE0 0000_H to FEEB $7FFF_H$	Access prohibited area	
FEEB 8000_H to FEEF $FFFF_H$	Global RAM A	288 KB*[2]
FEF0 0000_H to FEF0 $FFFF_H$	Retention RAM	64 KB
FEF1 0000_H to FEFB $7FFF_H$	Access prohibited area	
FEFB 8000_H to FEFF $FFFF_H$	Global RAM B	288 KB*[2]
FF00 0000_H to FF1F $FFFF_H$	Access prohibited area	
FF20 0000_H to FF23 $FFFF_H$	Data flash	256 KB*[3]
FF24 0000_H to FF9F $FFFF_H$	Access prohibited area	
FFA0 0000_H to FFFD $FFFF_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000_H to FFFE $DFFF_H$	Access prohibited area	
FFFE $E000_H$ to FFFE $FFFF_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000_H to FFFF $4FFF_H$	Access prohibited area	
FFFF 5000_H to FFFF $FFFF_H$	On-chip peripheral I/O area	44 KB

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 256 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Note 4. 8 MB in 176/233-pin products: For details, see **Section 16, External Memory Access Controller (MEMC)**.

Table 4A.2 Address Space (6-MB 176/233/324-Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 002F FFFF$_H$	Code Flash (bank A)	3 MB
0030 0000$_H$ to 007F FFFF$_H$	Access prohibited area	
0080 0000$_H$ to 00AF FFFF$_H$	Code Flash (bank B)	3 MB
00B0 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	32 KB
0100 8000$_H$ to 1001 FFFF$_H$	Access prohibited area	
1002 0000$_H$ to 1002 1FFF$_H$	FlexRay Interface (FLXA)	8 KB
1002 2000$_H$ to 1002 FFFF$_H$	Access prohibited area	
1003 0000$_H$ to 1003 03FF$_H$	External Memory Access Controller (MEMC)	1 KB
1003 0400$_H$ to 1003 FFFF$_H$	Access prohibited area	
1004 0000$_H$ to 1004 0FFF$_H$	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000$_H$ to 1FFF FFFF$_H$	Access prohibited area	
2000 0000$_H$ to 20FF FFFF$_H$	External Memory Area (CS0)	16 MB*4
2100 0000$_H$ to 21FF FFFF$_H$	Access prohibited area	
2200 0000$_H$ to 22FF FFFF$_H$	External Memory Area (CS1)	16 MB*4
2300 0000$_H$ to 23FF FFFF$_H$	Access prohibited area	
2400 0000$_H$ to 24FF FFFF$_H$	External Memory Area (CS2)	16 MB*4
2500 0000$_H$ to 27FF FFFF$_H$	Access prohibited area	
2800 0000$_H$ to 28FF FFFF$_H$	External Memory Area (CS3)	16 MB*4
2900 0000$_H$ to 2FFF FFFF$_H$	Access prohibited area	
3000 0000$_H$ to 33FF FFFF$_H$	External Serial Flash Memory Area	64 MB

4A.2 Address Space Viewed from Each Bus Master

Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product) shows address spaces viewed from each bus master.

4A.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, local RAM, global RAM, and retention RAM.

4A.2.2 Data Space Accessible by CPU1

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from the CPU1.

4A.2.3 Data Space Accessible by CPU2

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from the CPU2.

4A.2.4 Data Space Accessible by DMA

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from the DMA.

4A.2.5 Data Space Accessible by Flexray

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from the Flexray.

4A.2.6 Data Space Accessible by ETNB

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from the ETNB.

4A.2.7 Data Space Accessible by Each Bus Master

See **Table 4A.3, Address Space Viewed from Each Bus Master (8-MB Product)** for the spaces accessible from Each Bus Master.

Table 4A.3 Address Space Viewed from Each Bus Master (8-MB Product)

Address	Resource	From CPU1	From CPU2	From DMA	From FlexRay	From ETNB
0000 0000$_H$ to 003F FFFF$_H$	Code Flash (bank A)	✓	✓	✓		
0040 0000$_H$ to 007F FFFF$_H$	Access prohibited area					
0080 0000$_H$ to 00BF FFFF$_H$	Code Flash (bank B)	✓	✓	✓		
00C0 0000$_H$ to 00FF FFFF$_H$	Access prohibited area					
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	✓	✓	✓		
0100 8000$_H$ to 1001 FFFF$_H$	Access prohibited area					
1002 0000$_H$ to 1002 1FFF$_H$	FlexRay Interface (FLXA)	✓	✓	✓		
1002 2000$_H$ to 1002 FFFF$_H$	Access prohibited area					
1003 0000$_H$ to 1003 03FF$_H$	External Memory Access Controller (MEMC)	✓	✓	✓		
1003 0400$_H$ to 1003 FFFF$_H$	Access prohibited area					
1004 0000$_H$ to 1004 0FFF$_H$	Serial Flash Memory Interface (SFMA)	✓	✓	✓		
1004 1000$_H$ to 1FFF FFFF$_H$	Access prohibited area					
2000 0000$_H$ to 20FF FFFF$_H$	External Memory Area (CS0)	✓	✓	✓		
2100 0000$_H$ to 21FF FFFF$_H$	Access prohibited area					
2200 0000$_H$ to 22FF FFFF$_H$	External Memory Area (CS1)	✓	✓	✓		
2300 0000$_H$ to 23FF FFFF$_H$	Access prohibited area					
2400 0000$_H$ to 24FF FFFF$_H$	External Memory Area (CS2)	✓	✓	✓		
2500 0000$_H$ to 27FF FFFF$_H$	Access prohibited area					
2800 0000$_H$ to 28FF FFFF$_H$	External Memory Area (CS3)	✓	✓	✓		
2900 0000$_H$ to 2FFF FFFF$_H$	Access prohibited area					
3000 0000$_H$ to 33FF FFFF$_H$	External Serial Flash Memory Area	✓	✓	✓		
3400 0000$_H$ to FE9C FFFF$_H$	Access prohibited area					
FE9D 0000$_H$ to FE9F FFFF$_H$	Local RAM (CPU2 area)	✓	✓	✓	✓	✓
FEA0 0000$_H$ to FEBC FFFF$_H$	Access prohibited area					
FEBD 0000$_H$ to FEBF FFFF$_H$	Local RAM (CPU1 area)	✓	✓	✓	✓	✓
FEC0 0000$_H$ to FEDC FFFF$_H$	Access prohibited area					
FEDD 0000$_H$ to FEDF FFFF$_H$	Local RAM (self area)	✓	✓			
FEE0 0000$_H$ to FEEB 7FFF$_H$	Access prohibited area					
FEEB 8000$_H$ to FEEF FFFF$_H$	Global RAM A	✓	✓	✓	✓	✓
FEF0 0000$_H$ to FEF0 FFFF$_H$	Retention RAM	✓	✓	✓	✓	✓
FEF1 0000$_H$ to FEFB 7FFF$_H$	Access prohibited area					
FEFB 8000$_H$ to FEFF FFFF$_H$	Global RAM B	✓	✓	✓	✓	✓
FF00 0000$_H$ to FF1F FFFF$_H$	Access prohibited area					
FF20 0000$_H$ to FF23 FFFF$_H$	Data flash	✓	✓	✓		
FF24 0000$_H$ to FF9F FFFF$_H$	Access prohibited area					
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	✓	✓	✓		
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area					
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	✓	✓			
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area					
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	✓	✓	✓		

Note: The following color coding is used in the map above.

🟧 Fetch and data access available
🟩 Data access available
⬜ Access prohibited

4A.3 Peripheral I/O Address Map

Table 4A.4, Peripheral I/O Address Map shows peripheral I/O address map.

Table 4A.4 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FF00 0000_H to FF1F $FFFF_H$	—	Access prohibited area
FF20 0000_H to FF23 $FFFF_H$	4	Data Flash
FF24 0000_H to FF9F $FFFF_H$	—	Access prohibited area
FFA0 0000_H to FFA0 $001F_H$	1	FLMD
FFA0 0020_H to FFA0 $0FFF_H$	—	Access prohibited area
FFA0 1000_H to FFA0 $103F_H$	—	Access prohibited area
FFA0 1040_H to FFA0 $1FFF_H$	—	Access prohibited area
FFA0 2000_H to FFA0 $201F_H$	—	Access prohibited area
FFA0 2020_H to FFA0 $7FFF_H$	—	Access prohibited area
FFA0 8000_H to FFA0 $801F_H$	—	Access prohibited area
FFA0 8020_H to FFA0 $FFFF_H$	—	Access prohibited area
FFA1 0000_H to FFA1 $1FFF_H$	1	FPSYS (Register)
FFA1 2000_H to FFA1 $FFFF_H$	—	Access prohibited area
FFA2 0000_H to FFA2 $FFFF_H$	1	FACI command-issuing area
FFA3 0000_H to FFBF $FFFF_H$	—	Access prohibited area
FFC0 0000_H to FFC0 $000F_H$	1	FENMI (ECON_NMI)
FFC0 0010_H to FFC0 $00FF_H$	—	Access prohibited area
FFC0 0100_H to FFC0 $010F_H$	1	FEINT (ECON_FEINT)
FFC0 0110_H to FFC0 $0FFF_H$	—	Access prohibited area
FFC0 1000_H to FFC0 1003_H	1	SELB_INTC (SL_INTC)
FFC0 1004_H to FFC0 $1FFF_H$	—	Access prohibited area
FFC0 2000_H to FFC0 $200F_H$	1	SELB_DMAC (SL_DMAC)
FFC0 2010_H to FFC0 $2FFF_H$	—	Access prohibited area
FFC0 3000_H to FFC0 $300F_H$	1	GRZF
FFC0 3010_H to FFC0 $FFFF_H$	—	Access prohibited area
FFC1 0000_H to FFC1 $FFFF_H$	1	PORTn
FFC2 0000_H to FFC2 $FFFF_H$	1	PORT (JTAG)
FFC3 0000_H to FFC3 $000F_H$	1	DNFA_TAUD0 (DNF)
FFC3 0010_H to FFC3 $001F_H$	—	Access prohibited area
FFC3 0020_H to FFC3 $002F_H$	1	DNFA_TAUB0 (DNF)
FFC3 0030_H to FFC3 $003F_H$	—	Access prohibited area
FFC3 0040_H to FFC3 $004F_H$	1	DNFA_TAUB1 (DNF)
FFC3 0050_H to FFC3 $005F_H$	—	Access prohibited area
FFC3 0060_H to FFC3 $006F_H$	1	DNFA_ENCA0 (DNF)
FFC3 0070_H to FFC3 $009F_H$	—	Access prohibited area
FFC3 $00A0_H$ to FFC3 $00AF_H$	1	DNFA_ADCA0 (DNF)
FFC3 $00B0_H$ to FFC3 $00BF_H$	—	Access prohibited area
FFC3 $00C0_H$ to FFC3 $00CF_H$	1	DNFA_ADCA1 (DNF)
FFC3 $00D0_H$ to FFC3 $00DF_H$	—	Access prohibited area
FFC3 $00E0_H$ to FFC3 $00EF_H$	1	DNFA_SENT (DNF)
FFC3 $00F0_H$ to FFC3 $00FF_H$	—	Access prohibited area

Table 4A.4 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFC3 0100$_H$ to FFC3 010F$_H$	—	Access prohibited area
FFC3 0110$_H$ to FFC3 3FFF$_H$	—	Access prohibited area
FFC3 4000$_H$ to FFC3 401F$_H$	1	FCLA_NMI (FCLA0)
FFC3 4020$_H$ to FFC3 403F$_H$	1	FCLA_INTPL (FCLA0)
FFC3 4040$_H$ to FFC3 405F$_H$	1	FCLA_INTPH (FCLA0)
FFC3 4060$_H$ to FFC3 407F$_H$	1	FCLA_ADCA0 (FCLA0)
FFC3 4080$_H$ to FFC3 409F$_H$	1	FCLA_ADCA1 (FCLA0)
FFC3 40A0$_H$ to FFC3 40BF$_H$	1	FCLA_INTPU (FCLA0)
FFC3 40C0$_H$ to FFC3 FFFF$_H$	—	Access prohibited area
FFC4 0000$_H$ to FFC4 004F$_H$	1	P-Bus guard (PBG10)
FFC4 0050$_H$ to FFC4 00FF$_H$	—	Access prohibited area
FFC4 0100$_H$ to FFC4 014F$_H$	1	P-Bus guard (PBG11)
FFC4 0150$_H$ to FFC4 03FF$_H$	—	Access prohibited area
FFC4 0400$_H$ to FFC4 044F$_H$	1	P-Bus guard (PBG12)
FFC4 0450$_H$ to FFC4 04FF$_H$	—	Access prohibited area
FFC4 0500$_H$ to FFC4 054F$_H$	1	P-Bus guard (PBG13)
FFC4 0550$_H$ to FFC4 05FF$_H$	—	Access prohibited area
FFC4 0600$_H$ to FFC4 064F$_H$	1	P-Bus guard (PBG14)
FFC4 0650$_H$ to FFC4 8FFF$_H$	—	Access prohibited area
FFC4 9000$_H$ to FFC4 907F$_H$	2	Global RAM Guard Bank A (MGDGR)
FFC4 9080$_H$ to FFC4 91FF$_H$	—	Access prohibited area
FFC4 9200$_H$ to FFC4 927F$_H$	2	Global RAM Guard Bank B (MGDGR)
FFC4 9280$_H$ to FFC4 BFFF$_H$	—	Access prohibited area
FFC4 C000$_H$ to FFC4 C00F$_H$	2	P-Bus guard (PBGC0)
FFC4 C010$_H$ to FFC4 C10F$_H$	—	Access prohibited area
FFC4 C110$_H$ to FFC4 C13F$_H$	2	P-Bus guard (PBGC1)
FFC4 C140$_H$ to FFC4 C7FF$_H$	—	Access prohibited area
FFC4 C800$_H$ to FFC4 C80F$_H$	2	ERRSLV (PBGC0)
FFC4 C810$_H$ to FFC4 C8FF$_H$	—	Access prohibited area
FFC4 C900$_H$ to FFC4 C90F$_H$	2	ERRSLV (PBGC1)
FFC4 C910$_H$ to FFC5 7FFF$_H$	—	Access prohibited area
FFC5 8000$_H$ to FFC5 803F$_H$	2	BOOTCTRL
FFC5 8040$_H$ to FFC5 97FF$_H$	—	Access prohibited area
FFC5 9800$_H$ to FFC5 981F$_H$	4	EEPRDCYCL (DCIB)
FFC5 9820$_H$ to FFC5 9BFF$_H$	—	Access prohibited area
FFC5 9C00$_H$ to FFC5 9C4F$_H$	4	P-Bus guard (PBG40)
FFC5 9C50$_H$ to FFC5 AFFF$_H$	—	Access prohibited area
FFC5 B000$_H$ to FFC5 B003$_H$	2	FBUFCCTL (FBUF_CTRL)
FFC5 B004$_H$ to FFC6 21FF$_H$	—	Access prohibited area
FFC6 2200$_H$ to FFC6 23FF$_H$	2	Code Flash ECC (CFECC_VCI)
FFC6 2400$_H$ to FFC6 25FF$_H$	2	Code Flash ECC (CFECC_CPU1)
FFC6 2600$_H$ to FFC6 29FF$_H$	—	Access prohibited area
FFC6 2A00$_H$ to FFC6 2A3F$_H$	4	Data Flash ECC (DFECC)
FFC6 2A40$_H$ to FFC6 3FFF$_H$	—	Access prohibited area

Table 4A.4 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFC6 4000$_H$ to FFC6 403F$_H$	2	Global RAM ECC Bank A (GRECC)
FFC6 4040$_H$ to FFC6 41FF$_H$	—	Access prohibited area
FFC6 4200$_H$ to FFC6 423F$_H$	2	Global RAM ECC Bank B (GRECC)
FFC6 4240$_H$ to FFC6 4FFF$_H$	—	Access prohibited area
FFC6 5000$_H$ to FFC6 501F$_H$	2	Local RAM ECC TEST PE1 (LRTST)
FFC6 5020$_H$ to FFC6 53FF$_H$	—	Access prohibited area
FFC6 5400$_H$ to FFC6 547F$_H$	2	Local RAM ECC PE1 (LRECC)
FFC6 5480$_H$ to FFC6 55FF$_H$	—	Access prohibited area

FFED 1010$_H$ to FFED 1FFF$_H$	—	Access prohibited area
FFED 2000$_H$ to FFED 200F$_H$	2	WDTA2
FFED 2010$_H$ to FFED 8FFF$_H$	—	Access prohibited area
FFED 9000$_H$ to FFED 907F$_H$	2	MMCA0
FFED 9080$_H$ to FFED 9FFF$_H$	—	Access prohibited area
FFED A000$_H$ to FFED A01F$_H$	2	ECCMMCA0A
FFED A020$_H$ to FFED A0FF$_H$	—	Access prohibited area
FFED A100$_H$ to FFED A11F$_H$	2	ECCMMCA0B
FFED A120$_H$ to FFF1 FFFF$_H$	—	Access prohibited area
FFF2 0000$_H$ to FFF2 07FF$_H$	1	ADCA0
FFF2 0800$_H$ to FFF6 FFFF$_H$	—	Access prohibited area
FFF7 0000$_H$ to FFF7 003F$_H$	1	DCRA0
FFF7 0040$_H$ to FFF7 0FFF$_H$	—	Access prohibited area
FFF7 1000$_H$ to FFF7 103F$_H$	1	DCRA1
FFF7 1040$_H$ to FFF7 1FFF$_H$	—	Access prohibited area
FFF7 2000$_H$ to FFF7 203F$_H$	1	DCRA2
FFF7 2040$_H$ to FFF7 2FFF$_H$	—	Access prohibited area
FFF7 3000$_H$ to FFF7 303F$_H$	1	DCRA3
FFF7 3040$_H$ to FFF7 7FFF$_H$	—	Access prohibited area
FFF7 8000$_H$ to FFF7 8003$_H$	1	KR0
FFF7 8004$_H$ to FFF7 FFFF$_H$	—	Access prohibited area
FFF8 0000$_H$ to FFF8 000F$_H$	1	Write protected register (WPROTR)
FFF8 0010$_H$ to FFF8 00FF$_H$	—	Access prohibited area
FFF8 0100$_H$ to FFF8 011F$_H$	1	STBC0
FFF8 0120$_H$ to FFF8 03FF$_H$	—	Access prohibited area
FFF8 0400$_H$ to FFF8 040F$_H$	1	STBC_WUF0
FFF8 0410$_H$ to FFF8 041F$_H$	1	STBC_WUF1
FFF8 0420$_H$ to FFF8 051F$_H$	—	Access prohibited area
FFF8 0520$_H$ to FFF8 052F$_H$	1	STBC_WUF20
FFF8 0530$_H$ to FFF8 075F$_H$	—	Access prohibited area
FFF8 0760$_H$ to FFF8 0AFF$_H$	1	Reset controller / Supply voltage monitor (LVI,VLVI)
FFF8 0B00$_H$ to FFF8 0FFF$_H$	1	STBC_IOHOLD
FFF8 1000$_H$ to FFF8 2FFF$_H$	1	Clock controller (CLKCTL)
FFF8 3000$_H$ to FFF8 307F$_H$	1	LPS0
FFF8 3080$_H$ to FFF8 30FF$_H$	—	Access prohibited area
FFF8 3100$_H$ to FFF8 3207$_H$	1	CVM (SVM)

Table 4A.4 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFF8 3208$_H$ to FFF8 3603$_H$	—	Access prohibited area
FFF8 3604$_H$ to FFF8 7FFF$_H$	—	Access prohibited area
FFF8 8000$_H$ to FFF8 800F$_H$	1	Write protected register (WPROTR)
FFF8 8010$_H$ to FFF8 810F$_H$	—	Access prohibited area
FFF8 8110$_H$ to FFF8 811F$_H$	1	STBC_WUFISO
FFF8 8120$_H$ to FFF8 BFFF$_H$	1	Clock controller (CLKCTL)
FFF8 C000$_H$ to FFF8 CFFF$_H$	1	CLMA0, CLMA
FFF8 D000$_H$ to FFF8 DFFF$_H$	1	CLMA1
FFF8 E000$_H$ to FFF8 EFFF$_H$	1	CLMA2
FFF8 F000$_H$ to FFF8 FFFF$_H$	1	CLMA3
FFF9 0000$_H$ to FFF9 004F$_H$	1	P-Bus guard (PBG50)
FFF9 0050$_H$ to FFF9 3FFF$_H$	—	Access prohibited area
FFF9 4000$_H$ to FFF9 404F$_H$	3	P-Bus guard (PBG30)
FFF9 4050$_H$ to FFF9 40FF$_H$	—	Access prohibited area
FFF9 4100$_H$ to FFF9 414F$_H$	3	P-Bus guard (PBG31)
FFF9 4150$_H$ to FFF9 41FF$_H$	—	Access prohibited area
FFF9 4200$_H$ to FFF9 424F$_H$	3	P-Bus guard (PBG32)
FFF9 4250$_H$ to FFF9 42FF$_H$	—	Access prohibited area
FFF9 4300$_H$ to FFF9 434F$_H$	3	P-Bus guard (PBG33)
FFF9 4350$_H$ to FFF9 BFFF$_H$	—	Access prohibited area
FFF9 C000$_H$ to FFF9 C04F$_H$	3	H-Bus guard (HBG00)
FFF9 C050$_H$ to FFF9 C0FF$_H$	—	Access prohibited area
FFF9 C100$_H$ to FFF9 C14F$_H$	3	H-Bus guard (HBG01)
FFF9 C150$_H$ to FFF9 C1FF$_H$	—	Access prohibited area
FFF9 C200$_H$ to FFF9 C24F$_H$	3	H-Bus guard (HBG02)
FFF9 C250$_H$ to FFFE DFFF$_H$	—	Access prohibited area
FFFE E000$_H$ to FFFE E03F$_H$	CPU local peripheral	IPG
FFFE E040$_H$ to FFFE E5FF$_H$		Access prohibited area
FFFE E600$_H$ to FFFE E6FF$_H$		PEG
FFFE E700$_H$ to FFFE E97F$_H$		Access prohibited area
FFFE E980$_H$ to FFFE E98F$_H$		SEG
FFFE E990$_H$ to FFFE E9FF$_H$		Access prohibited area
FFFE EA00$_H$ to FFFE EBFF$_H$		INTC1
FFFE EC00$_H$ to FFFE EC7F$_H$		MEV
FFFE EC80$_H$ to FFFE EC8F$_H$		IPIRSS
FFFE EC90$_H$ to FFFF 7FFF$_H$	—	Access prohibited area
FFFF 8000$_H$ to FFFF 8FFF$_H$	2	PDMA0
FFFF 9000$_H$ to FFFF 9FFF$_H$	2	PDMA1
FFFF A000$_H$ to FFFF AFFF$_H$	—	Access prohibited area
FFFF B000$_H$ to FFFF BFFF$_H$	2	INTC2
FFFF C000$_H$ to FFFF FFFF$_H$	—	Access prohibited area

Section 4B Address Space of RH850/F1KM-S4

4B.1 Address Space

Table 4B.1, Address Space (4-MB 176/233/272-Pin Product) to **Table 4B.6, Address Space (3-MB 100-Pin Product)** show the address space of the RH850/F1KM.

CAUTION

Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in **Table 4B.1, Address Space (4-MB 176/233/272-Pin Product)** to **Table 4B.6, Address Space (3-MB 100-Pin Product)**. If such an address is accessed, operation is not guaranteed.

NOTE

The Local RAM is accessible through the following two address areas in the address space.
CPU1 area: Address area accessible from CPU, DMA, FlexRay and ETNB.
Self area: Mirrored address area, accessible only from CPU to refer the CPU’s self resource.

Table 4B.1 Address Space (4-MB 176/233/272-Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 003F FFFF$_H$	Code Flash	4 MB
0040 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	32 KB
0100 8000$_H$ to 1001 FFFF$_H$	Access prohibited area	
1002 0000$_H$ to 1002 1FFF$_H$	FlexRay Interface (FLXA)	8 KB
1002 2000$_H$ to 1002 FFFF$_H$	Access prohibited area	
1003 0000$_H$ to 1003 03FF$_H$	External Memory Access Controller (MEMC)	1 KB
1003 0400$_H$ to 1003 FFFF$_H$	Access prohibited area	
1004 0000$_H$ to 1004 0FFF$_H$	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000$_H$ to 1FFF FFFF$_H$	Access prohibited area	
2000 0000$_H$ to 20FF FFFF$_H$	External Memory Area (CS0)	16 MB*4
2100 0000$_H$ to 21FF FFFF$_H$	Access prohibited area	
2200 0000$_H$ to 22FF FFFF$_H$	External Memory Area (CS1)	16 MB*4
2300 0000$_H$ to 23FF FFFF$_H$	Access prohibited area	
2400 0000$_H$ to 24FF FFFF$_H$	External Memory Area (CS2)	16 MB*4
2500 0000$_H$ to 27FF FFFF$_H$	Access prohibited area	
2800 0000$_H$ to 28FF FFFF$_H$	External Memory Area (CS3)	16 MB*4
2900 0000$_H$ to 2FFF FFFF$_H$	Access prohibited area	
3000 0000$_H$ to 33FF FFFF$_H$	External Serial Flash Memory Area	64 MB
3400 0000$_H$ to FEBB FFFF$_H$	Access prohibited area	
FEBC 0000$_H$ to FEBF FFFF$_H$	Local RAM (CPU1 area)	256 KB*1
FEC0 0000$_H$ to FEDB FFFF$_H$	Access prohibited area	
FEDC 0000$_H$ to FEDF FFFF$_H$	Local RAM (self area)	256 KB*1
FEE0 0000$_H$ to FEEE 7FFF$_H$	Access prohibited area	
FEEE 8000$_H$ to FEEF FFFF$_H$	Global RAM A	96 KB*2
FEF0 0000$_H$ to FEF0 FFFF$_H$	Retention RAM	64 KB
FEF1 0000$_H$ to FEFE 7FFF$_H$	Access prohibited area	

Table 4B.1 Address Space (4-MB 176/233/272-Pin Product)

Address	Address Space Type	Size
FEFE 8000_H to FEFF $FFFF_H$	Global RAM B	96 KB*2
FF00 0000_H to FF1F $FFFF_H$	Access prohibited area	
FF20 0000_H to FF21 $FFFF_H$	Data flash	128 KB*3
FF22 0000_H to FF9F $FFFF_H$	Access prohibited area	
FFA0 0000_H to FFFD $FFFF_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000_H to FFFE $DFFF_H$	Access prohibited area	
FFFE $E000_H$ to FFFE $FFFF_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000_H to FFFF $4FFF_H$	Access prohibited area	
FFFF 5000_H to FFFF $FFFF_H$	On-chip peripheral I/O area	44 KB

Note 1. 192 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 64 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Note 4. 8 MB in 176/233-pin products: For details, see **Section 16, External Memory Access Controller (MEMC)**.

Table 4B.2 Address Space (4-MB 144-Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 003F FFFF$_H$	Code Flash	4 MB
0040 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	32 KB
0100 8000$_H$ to 1001 FFFF$_H$	Access prohibited area	
1002 0000$_H$ to 1002 1FFF$_H$	FlexRay Interface (FLXA)	8 KB
1002 2000$_H$ to 1003 FFFF$_H$	Access prohibited area	
1004 0000$_H$ to 1004 0FFF$_H$	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000$_H$ to 2FFF FFFF$_H$	Access prohibited area	
3000 0000$_H$ to 33FF FFFF$_H$	External Serial Flash Memory Area	64 MB
3400 0000$_H$ to FEBB FFFF$_H$	Access prohibited area	
FEBC 0000$_H$ to FEBF FFFF$_H$	Local RAM (CPU1 area)	256 KB*[1]
FEC0 0000$_H$ to FEDB FFFF$_H$	Access prohibited area	
FEDC 0000$_H$ to FEDF FFFF$_H$	Local RAM (self area)	256 KB*[1]
FEE0 0000$_H$ to FEEE 7FFF$_H$	Access prohibited area	
FEEE 8000$_H$ to FEEF FFFF$_H$	Global RAM A	96 KB*[2]
FEF0 0000$_H$ to FEF0 FFFF$_H$	Retention RAM	64 KB
FEF1 0000$_H$ to FEFE 7FFF$_H$	Access prohibited area	
FEFE 8000$_H$ to FEFF FFFF$_H$	Global RAM B	96 KB*[2]
FF00 0000$_H$ to FF1F FFFF$_H$	Access prohibited area	
FF20 0000$_H$ to FF21 FFFF$_H$	Data flash	128 KB*[3]
FF22 0000$_H$ to FF9F FFFF$_H$	Access prohibited area	
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area	
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area	
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	44 KB

Note 1. 192 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 64 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Table 4B.3 Address Space (4-MB 100-Pin Product)

Address	Address Space Type	Size
0000 0000_H to 003F $FFFF_H$	Code Flash	4 MB
0040 0000_H to 00FF $FFFF_H$	Access prohibited area	
0100 0000_H to 0100 $7FFF_H$	Code Flash (Extended user area)	32 KB
0100 8000_H to 1001 $FFFF_H$	Access prohibited area	
1002 0000_H to 1002 $1FFF_H$	FlexRay Interface (FLXA)	8 KB
1002 2000_H to FEBB $FFFF_H$	Access prohibited area	
FEBC 0000_H to FEBF $FFFF_H$	Local RAM (CPU1 area)	256 KB*[1]
FEC0 0000_H to FEDB $FFFF_H$	Access prohibited area	
FEDC 0000_H to FEDF $FFFF_H$	Local RAM (self area)	256 KB*[1]
FEE0 0000_H to FEEE $7FFF_H$	Access prohibited area	
FEEE 8000_H to FEEF $FFFF_H$	Global RAM A	96 KB*[2]
FEF0 0000_H to FEF0 $FFFF_H$	Retention RAM	64 KB
FEF1 0000_H to FEFE $7FFF_H$	Access prohibited area	
FEFE 8000_H to FEFF $FFFF_H$	Global RAM B	96 KB*[2]
FF00 0000_H to FF1F $FFFF_H$	Access prohibited area	
FF20 0000_H to FF21 $FFFF_H$	Data flash	128 KB*[3]
FF22 0000_H to FF9F $FFFF_H$	Access prohibited area	
FFA0 0000_H to FFFD $FFFF_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000_H to FFFE $DFFF_H$	Access prohibited area	
FFFE $E000_H$ to FFFE $FFFF_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000_H to FFFF $4FFF_H$	Access prohibited area	
FFFF 5000_H to FFFF $FFFF_H$	On-chip peripheral I/O area	44 KB

Note 1. 192 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 64 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Table 4B.4 Address Space (3-MB 176/233/272-Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 002F FFFF$_H$	Code Flash	3 MB
0030 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	32 KB
0100 8000$_H$ to 1001 FFFF$_H$	Access prohibited area	
1002 0000$_H$ to 1002 1FFF$_H$	FlexRay Interface (FLXA)	8 KB
1002 2000$_H$ to 1002 FFFF$_H$	Access prohibited area	
1003 0000$_H$ to 1003 03FF$_H$	External Memory Access Controller (MEMC)	1 KB
1003 0400$_H$ to 1003 FFFF$_H$	Access prohibited area	
1004 0000$_H$ to 1004 0FFF$_H$	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000$_H$ to 1FFF FFFF$_H$	Access prohibited area	
2000 0000$_H$ to 20FF FFFF$_H$	External Memory Area (CS0)	16 MB[*4]
2100 0000$_H$ to 21FF FFFF$_H$	Access prohibited area	
2200 0000$_H$ to 22FF FFFF$_H$	External Memory Area (CS1)	16 MB[*4]
2300 0000$_H$ to 23FF FFFF$_H$	Access prohibited area	
2400 0000$_H$ to 24FF FFFF$_H$	External Memory Area (CS2)	16 MB[*4]
2500 0000$_H$ to 27FF FFFF$_H$	Access prohibited area	
2800 0000$_H$ to 28FF FFFF$_H$	External Memory Area (CS3)	16 MB[*4]
2900 0000$_H$ to 2FFF FFFF$_H$	Access prohibited area	
3000 0000$_H$ to 33FF FFFF$_H$	External Serial Flash Memory Area	64 MB
3400 0000$_H$ to FEBC FFFF$_H$	Access prohibited area	
FEBD 0000$_H$ to FEBF FFFF$_H$	Local RAM (CPU1 area)	192 KB[*1]
FEC0 0000$_H$ to FEDC FFFF$_H$	Access prohibited area	
FEDD 0000$_H$ to FEDF FFFF$_H$	Local RAM (self area)	192 KB[*1]
FEE0 0000$_H$ to FEEE FFFF$_H$	Access prohibited area	
FEEF 0000$_H$ to FEEF FFFF$_H$	Global RAM A	64 KB[*2]
FEF0 0000$_H$ to FEF0 FFFF$_H$	Retention RAM	64 KB
FEF1 0000$_H$ to FEFE FFFF$_H$	Access prohibited area	
FEFF 0000$_H$ to FEFF FFFF$_H$	Global RAM B	64 KB[*2]
FF00 0000$_H$ to FF1F FFFF$_H$	Access prohibited area	
FF20 0000$_H$ to FF21 FFFF$_H$	Data flash	128 KB[*3]
FF22 0000$_H$ to FF9F FFFF$_H$	Access prohibited area	
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area	
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area	
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	44 KB

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 48 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Note 4. 8 MB in 176/233-pin products: For details, see **Section 16, External Memory Access Controller (MEMC)**.

Table 4B.5 Address Space (3-MB 144-Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 002F FFFF$_H$	Code Flash	3 MB
0030 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	32 KB
0100 8000$_H$ to 1001 FFFF$_H$	Access prohibited area	
1002 0000$_H$ to 1002 1FFF$_H$	FlexRay Interface (FLXA)	8 KB
1002 2000$_H$ to 1003 FFFF$_H$	Access prohibited area	
1004 0000$_H$ to 1004 0FFF$_H$	Serial Flash Memory Interface (SFMA)	4 KB
1004 1000$_H$ to 2FFF FFFF$_H$	Access prohibited area	
3000 0000$_H$ to 33FF FFFF$_H$	External Serial Flash Memory Area	64 MB
3400 0000$_H$ to FEBC FFFF$_H$	Access prohibited area	
FEBD 0000$_H$ to FEBF FFFF$_H$	Local RAM (CPU1 area)	192 KB*1
FEC0 0000$_H$ to FEDC FFFF$_H$	Access prohibited area	
FEDD 0000$_H$ to FEDF FFFF$_H$	Local RAM (self area)	192 KB*1
FEE0 0000$_H$ to FEEE FFFF$_H$	Access prohibited area	
FEEF 0000$_H$ to FEEF FFFF$_H$	Global RAM A	64 KB*2
FEF0 0000$_H$ to FEF0 FFFF$_H$	Retention RAM	64 KB
FEF1 0000$_H$ to FEFE FFFF$_H$	Access prohibited area	
FEFF 0000$_H$ to FEFF FFFF$_H$	Global RAM B	64 KB*2
FF00 0000$_H$ to FF1F FFFF$_H$	Access prohibited area	
FF20 0000$_H$ to FF21 FFFF$_H$	Data flash	128 KB*3
FF22 0000$_H$ to FF9F FFFF$_H$	Access prohibited area	
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area	
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area	
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	44 KB

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 48 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

Table 4B.6 Address Space (3-MB 100-Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 002F FFFF$_H$	Code Flash	3 MB
0030 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	32 KB
0100 8000$_H$ to 1001 FFFF$_H$	Access prohibited area	
1002 0000$_H$ to 1002 1FFF$_H$	FlexRay Interface (FLXA)	8 KB
1002 2000$_H$ to FEBC FFFF$_H$	Access prohibited area	
FEBD 0000$_H$ to FEBF FFFF$_H$	Local RAM (CPU1 area)	192 KB*[1]
FEC0 0000$_H$ to FEDC FFFF$_H$	Access prohibited area	
FEDD 0000$_H$ to FEDF FFFF$_H$	Local RAM (self area)	192 KB*[1]
FEE0 0000$_H$ to FEEE FFFF$_H$	Access prohibited area	
FEEF 0000$_H$ to FEEF FFFF$_H$	Global RAM A	64 KB*[2]
FEF0 0000$_H$ to FEF0 FFFF$_H$	Retention RAM	64 KB
FEF1 0000$_H$ to FEFE FFFF$_H$	Access prohibited area	
FEFF 0000$_H$ to FEFF FFFF$_H$	Global RAM B	64 KB*[2]
FF00 0000$_H$ to FF1F FFFF$_H$	Access prohibited area	
FF20 0000$_H$ to FF21 FFFF$_H$	Data flash	128 KB*[3]
FF22 0000$_H$ to FF9F FFFF$_H$	Access prohibited area	
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area	
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area	
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	44 KB

Note 1. 160 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 2. 48 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 45, RAM**.

Note 3. 96 KB in products of CPU frequency 160 MHz max.: For detail, see **Section 44, Flash Memory**.

4B.2 Address Space Viewed from Each Bus Master

Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product) shows address spaces viewed from each bus master.

4B.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, local RAM, global RAM, and retention RAM.

4B.2.2 Data Space Accessible by CPU

See **Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product)** for the spaces accessible from the CPU.

4B.2.3 Data Space Accessible by DMA

See **Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product)** for the spaces accessible from the DMA.

4B.2.4 Data Space Accessible by Flexray

See **Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product)** for the spaces accessible from the Flexray.

4B.2.5 Data Space Accessible by ETNB

See **Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product)** for the spaces accessible from the ETNB.

4B.2.6 Data Space Accessible by Each Bus Master

See **Table 4B.7, Address Space Viewed from Each Bus Master (4-MB Product)** for the spaces accessible from Each Bus Master.

Table 4B.7 Address Space Viewed from Each Bus Master (4-MB Product)

Address	Resource	From CPU	From DMA	From FlexRay	From ETNB
0000 0000$_H$ to 003F FFFF$_H$	Code Flash	✓	✓		
0040 0000$_H$ to 00FF FFFF$_H$	Access prohibited area				
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	✓	✓		
0100 8000$_H$ to 1001 FFFF$_H$	Access prohibited area				
1002 0000$_H$ to 1002 1FFF$_H$	FlexRay Interface (FLXA)	✓	✓		
1002 2000$_H$ to 1002 FFFF$_H$	Access prohibited area				
1003 0000$_H$ to 1003 03FF$_H$	External Memory Access Controller (MEMC)	✓	✓		
1003 0400$_H$ to 1003 FFFF$_H$	Access prohibited area				
1004 0000$_H$ to 1004 0FFF$_H$	Serial Flash Memory Interface (SFMA)	✓	✓		
1004 1000$_H$ to 1FFF FFFF$_H$	Access prohibited area				
2000 0000$_H$ to 20FF FFFF$_H$	External Memory Area (CS0)	✓	✓		
2100 0000$_H$ to 21FF FFFF$_H$	Access prohibited area				
2200 0000$_H$ to 22FF FFFF$_H$	External Memory Area (CS1)	✓	✓		
2300 0000$_H$ to 23FF FFFF$_H$	Access prohibited area				
2400 0000$_H$ to 24FF FFFF$_H$	External Memory Area (CS2)	✓	✓		
2500 0000$_H$ to 27FF FFFF$_H$	Access prohibited area				
2800 0000$_H$ to 28FF FFFF$_H$	External Memory Area (CS3)	✓	✓		
2900 0000$_H$ to 2FFF FFFF$_H$	Access prohibited area				
3000 0000$_H$ to 33FF FFFF$_H$	External Serial Flash Memory Area	✓	✓		
3400 0000$_H$ to FEBB FFFF$_H$	Access prohibited area				
FEBC 0000$_H$ to FEBF FFFF$_H$	Local RAM (CPU1 area)	✓	✓	✓	✓
FEC0 0000$_H$ to FEDB FFFF$_H$	Access prohibited area				
FEDC 0000$_H$ to FEDF FFFF$_H$	Local RAM (self area)	✓			
FEE0 0000$_H$ to FEEE 7FFF$_H$	Access prohibited area				
FEEE 8000$_H$ to FEEF FFFF$_H$	Global RAM A	✓	✓	✓	✓
FEF0 0000$_H$ to FEF0 FFFF$_H$	Retention RAM	✓	✓	✓	✓
FEF1 0000$_H$ to FEFE 7FFF$_H$	Access prohibited area				
FEFE 8000$_H$ to FEFF FFFF$_H$	Global RAM B	✓	✓	✓	✓
FF00 0000$_H$ to FF1F FFFF$_H$	Access prohibited area				
FF20 0000$_H$ to FF21 FFFF$_H$	Data flash	✓	✓		
FF22 0000$_H$ to FF9F FFFF$_H$	Access prohibited area				
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	✓	✓		
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area				
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	✓			
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area				
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	✓	✓		

Note: The following color coding is used in the map above.

Fetch and data access available
Data access available
Access prohibited

4B.3 Peripheral I/O Address Map

Table 4B.8, Peripheral I/O Address Map shows peripheral I/O address map.

Table 4B.8 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FF00 0000$_H$ to FF1F FFFF$_H$	—	Access prohibited area
FF20 0000$_H$ to FF21 FFFF$_H$	4	Data Flash
FF22 0000$_H$ to FF9F FFFF$_H$	—	Access prohibited area
FFA0 0000$_H$ to FFA0 001F$_H$	1	FLMD
FFA0 0020$_H$ to FFA0 0FFF$_H$	—	Access prohibited area
FFA0 1000$_H$ to FFA0 103F$_H$	—	Access prohibited area
FFA0 1040$_H$ to FFA0 1FFF$_H$	—	Access prohibited area
FFA0 2000$_H$ to FFA0 201F$_H$	—	Access prohibited area
FFA0 2020$_H$ to FFA0 FFFF$_H$	—	Access prohibited area
FFA1 0000$_H$ to FFA1 1FFF$_H$	1	Flash controller
FFA1 2000$_H$ to FFA1 FFFF$_H$	—	Access prohibited area
FFA2 0000$_H$ to FFA2 FFFF$_H$	1	FACI command-issuing area
FFA3 0000$_H$ to FFBF FFFF$_H$	—	Access prohibited area
FFC0 0000$_H$ to FFC0 000F$_H$	1	FENMI (ECON_NMI)
FFC0 0010$_H$ to FFC0 00FF$_H$	—	Access prohibited area
FFC0 0100$_H$ to FFC0 010F$_H$	1	FEINT (ECON_FEINT)
FFC0 0110$_H$ to FFC0 0FFF$_H$	—	Access prohibited area
FFC0 1000$_H$ to FFC0 1003$_H$	1	SELB_INTC (SL_INTC)
FFC0 1004$_H$ to FFC0 1FFF$_H$	—	Access prohibited area
FFC0 2000$_H$ to FFC0 200F$_H$	1	SELB_DMAC (SL_DMAC)
FFC0 2010$_H$ to FFC0 2FFF$_H$	—	Access prohibited area
FFC0 3000$_H$ to FFC0 300F$_H$	1	GRZF
FFC0 3010$_H$ to FFC0 FFFF$_H$	—	Access prohibited area
FFC1 0000$_H$ to FFC1 4CCF$_H$	1	PORT
FFC1 4CD0$_H$ to FFC1 FFFF$_H$	—	Access prohibited area
FFC2 0000$_H$ to FFC2 04CF$_H$	1	PORT(JTAG)
FFC2 04D0$_H$ to FFC2 FFFF$_H$	—	Access prohibited area
FFC3 0000$_H$ to FFC3 000F$_H$	1	DNFA_TAUD0 (DNF)
FFC3 0010$_H$ to FFC3 001F$_H$	—	Access prohibited area
FFC3 0020$_H$ to FFC3 002F$_H$	1	DNFA_TAUB0 (DNF)
FFC3 0030$_H$ to FFC3 003F$_H$	—	Access prohibited area
FFC3 0040$_H$ to FFC3 004F$_H$	1	DNFA_TAUB1 (DNF)
FFC3 0050$_H$ to FFC3 005F$_H$	—	Access prohibited area
FFC3 0060$_H$ to FFC3 006F$_H$	1	DNFA_ENCA0 (DNF)
FFC3 0070$_H$ to FFC3 009F$_H$	—	Access prohibited area
FFC3 00A0$_H$ to FFC3 00AF$_H$	1	DNFA_ADCA0 (DNF)
FFC3 00B0$_H$ to FFC3 00BF$_H$	—	Access prohibited area
FFC3 00C0$_H$ to FFC3 00CF$_H$	1	DNFA_ADCA1 (DNF)
FFC3 00D0$_H$ to FFC3 00DF$_H$	—	Access prohibited area

Table 4B.8 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFC3 00E0$_H$ to FFC3 00EF$_H$	1	DNFA_SENT (DNF)
FFC3 00F0$_H$ to FFC3 00FF$_H$	—	Access prohibited area
FFC3 0100$_H$ to FFC3 010F$_H$	—	Access prohibited area
FFC3 0110$_H$ to FFC3 3FFF$_H$	—	Access prohibited area
FFC3 4000$_H$ to FFC3 401F$_H$	1	FCLA_NMI (FCLA0)
FFC3 4020$_H$ to FFC3 403F$_H$	1	FCLA_INTPL (FCLA0)
FFC3 4040$_H$ to FFC3 405F$_H$	1	FCLA_INTPH (FCLA0)
FFC3 4060$_H$ to FFC3 407F$_H$	1	FCLA_ADCA0 (FCLA0)
FFC3 4080$_H$ to FFC3 409F$_H$	1	FCLA_ADCA1 (FCLA0)
FFC3 40A0$_H$ to FFC3 40BF$_H$	1	FCLA_INTPU (FCLA0)
FFC3 40C0$_H$ to FFC3 FFFF$_H$	—	Access prohibited area
FFC4 0000$_H$ to FFC4 004F$_H$	1	P-Bus guard (PBG10)
FFC4 0050$_H$ to FFC4 00FF$_H$	—	Access prohibited area
FFC4 0100$_H$ to FFC4 014F$_H$	1	P-Bus guard (PBG11)
FFC4 0150$_H$ to FFC4 03FF$_H$	—	Access prohibited area
FFC4 0400$_H$ to FFC4 044F$_H$	1	P-Bus guard (PBG12)
FFC4 0450$_H$ to FFC4 04FF$_H$	—	Access prohibited area
FFC4 0500$_H$ to FFC4 054F$_H$	1	P-Bus guard (PBG13)
FFC4 0550$_H$ to FFC4 8FFF$_H$	—	Access prohibited area
FFC4 9000$_H$ to FFC4 907F$_H$	2	Global RAM Guard Bank A (MGDGR)
FFC4 9080$_H$ to FFC4 91FF$_H$	—	Access prohibited area
FFC4 9200$_H$ to FFC4 927F$_H$	2	Global RAM Guard Bank B (MGDGR)
FFC4 9280$_H$ to FFC4 BFFF$_H$	—	Access prohibited area
FFC4 C000$_H$ to FFC4 C00F$_H$	2	P-Bus guard (PBGC0)
FFC4 C010$_H$ to FFC4 C10F$_H$	—	Access prohibited area
FFC4 C110$_H$ to FFC4 C13F$_H$	2	P-Bus guard (PBGC1)
FFC4 C140$_H$ to FFC4 C7FF$_H$	—	Access prohibited area
FFC4 C800$_H$ to FFC4 C80F$_H$	2	ERRSLV (PBGC0)
FFC4 C810$_H$ to FFC4 C8FF$_H$	—	Access prohibited area
FFC4 C900$_H$ to FFC4 C90F$_H$	2	ERRSLV (PBGC1)
FFC4 C910$_H$ to FFC5 97FF$_H$	—	Access prohibited area
FFC5 9800$_H$ to FFC5 981F$_H$	4	EEPRDCYCL (DCIB)
FFC5 9820$_H$ to FFC5 9BFF$_H$	—	Access prohibited area
FFC5 9C00$_H$ to FFC5 9C4F$_H$	4	P-Bus guard (PBG40)
FFC5 9C50$_H$ to FFC5 AFFF$_H$	—	Access prohibited area
FFC5 B000$_H$ to FFC5 B003$_H$	2	FBUFCCTL (FBUF_CTRL)
FFC5 B004$_H$ to FFC6 21FF$_H$	—	Access prohibited area
FFC6 2200$_H$ to FFC6 23FF$_H$	2	Code Flash ECC (CFECC_VCI)
FFC6 2400$_H$ to FFC6 25FF$_H$	2	Code Flash ECC (CFECC_CPU1)
FFC6 2600$_H$ to FFC6 29FF$_H$	—	Access prohibited area
FFC6 2A00$_H$ to FFC6 2A3F$_H$	4	Data Flash ECC (DFECC)

Table 4B.8 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FFC6 2A40$_H$ to FFC6 3FFF$_H$	—	Access prohibited area
FFC6 4000$_H$ to FFC6 403F$_H$	2	Global RAM ECC Bank A (GRECC)
FFC6 4040$_H$ to FFC6 41FF$_H$	—	Access prohibited area
FFC6 4200$_H$ to FFC6 423F$_H$	2	Global RAM ECC Bank B (GRECC)
FFC6 4240$_H$ to FFC6 4FFF$_H$	—	Access prohibited area
FFC6 5000$_H$ to FFC6 501F$_H$	2	Local RAM ECC TEST PE1 (LRTST)
FFC6 5020$_H$ to FFC6 53FF$_H$	—	Access prohibited area
FFC6 5400$_H$ to FFC6 547F$_H$	2	Local RAM ECC PE1 (LRECC)
FFC6 5480$_H$ to FFC7 00FF$_H$	—	Access prohibited area
FFC7 0100$_H$ to FFC7 011F$_H$	3	ECCCSIH0
FFC7 0120$_H$ to FFC7 01FF$_H$	—	Access prohibited area
FFC7 0200$_H$ to FFC7 021F$_H$	3	ECCCSIH1
FFC7 0220$_H$ to FFC7 02FF$_H$	—	Access prohibited area
FFC7 0300$_H$ to FFC7 031F$_H$	3	ECCCSIH2
FFC7 0320$_H$ to FFC7 03FF$_H$	—	Access prohibited area
FFC7 0400$_H$ to FFC7 041F$_H$	3	ECCCSIH3
FFC7 0420$_H$ to FFC7 12FF$_H$	—	Access prohibited area
FFC7 1300$_H$ to FFC7 131F$_H$	5	ECCCFD0MB
FFC7 1320$_H$ to FFC7 13FF$_H$	—	Access prohibited area

FFFF 9000$_H$ to FFFF AFFF$_H$	—	Access prohibited area
FFFF B000$_H$ to FFFF BFFF$_H$	2	INTC2
FFFF C000$_H$ to FFFF FFFF$_H$	—	Access prohibited area

Section 4C Address Space of RH850/F1KM-S1

4C.1 Address Space

Table 4C.1, Address Space (1-MB 48/64/80/100-Pin Product), **Table 4C.2, Address Space (768-KB 48/64/80/100-Pin Product)**, and **Table 4C.3, Address Space (512-KB 48/64/80/100-Pin Product)** show the address space of the RH850/F1KM.

CAUTION

Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in **Table 4C.1, Address Space (1-MB 48/64/80/100-Pin Product)**, **Table 4C.2, Address Space (768-KB 48/64/80/100-Pin Product)**, and **Table 4C.3, Address Space (512-KB 48/64/80/100-Pin Product)**. If such an address is accessed, operation is not guaranteed.

NOTE

The Local RAM is accessible through the following two address areas in the address space.
CPU1 area: Address area accessible from CPU and DMA.
Self area: Mirrored address area, accessible only from CPU to refer the CPU's self resource.

Table 4C.1 Address Space (1-MB 48/64/80/100-Pin Product)

Address	Address Space Type	Size
0000 0000_H to 000F $FFFF_H$	Code Flash	1 MB
0010 0000_H to 00FF $FFFF_H$	Access prohibited area	
0100 0000_H to 0100 $7FFF_H$	Code Flash (Extended user area)	32 KB
0100 8000_H to FEBD $FFFF_H$	Access prohibited area	
FEBE 0000_H to FEBF $7FFF_H$	Local RAM (CPU1 area)	96 KB
FEBF 8000_H to FEBF $FFFF_H$	Retention RAM (CPU1 area)	32 KB
FEC0 0000_H to FEDD $FFFF_H$	Access prohibited area	
FEDE 0000_H to FEDF $7FFF_H$	Local RAM (self area)	96 KB
FEDF 8000_H to FEDF $FFFF_H$	Retention RAM (self area)	32 KB
FEE0 0000_H to FF1F $FFFF_H$	Access prohibited area	
FF20 0000_H to FF20 $FFFF_H$	Data Flash	64 KB
FF21 0000_H to FF9F $FFFF_H$	Access prohibited area	
FFA0 0000_H to FFFD $FFFF_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000_H to FFFE $DFFF_H$	Access prohibited area	
FFFE $E000_H$ to FFFE $FFFF_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000_H to FFFF $4FFF_H$	Access prohibited area	
FFFF 5000_H to FFFF $FFFF_H$	On-chip peripheral I/O area	44 KB

Table 4C.2 Address Space (768-KB 48/64/80/100-Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 000B FFFF$_H$	Code Flash	768 KB
000C 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	32 KB
0100 8000$_H$ to FEBE 7FFF$_H$	Access prohibited area	
FEBE 8000$_H$ to FEBF 7FFF$_H$	Local RAM (CPU1 area)	64 KB
FEBF 8000$_H$ to FEBF FFFF$_H$	Retention RAM (CPU1 area)	32 KB
FEC0 0000$_H$ to FEDE 7FFF$_H$	Access prohibited area	
FEDE 8000$_H$ to FEDF 7FFF$_H$	Local RAM (self area)	64 KB
FEDF 8000$_H$ to FEDF FFFF$_H$	Retention RAM (self area)	32 KB
FEE0 0000$_H$ to FF1F FFFF$_H$	Access prohibited area	
FF20 0000$_H$ to FF20 FFFF$_H$	Data Flash	64 KB
FF21 0000$_H$ to FF9F FFFF$_H$	Access prohibited area	
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area	
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area	
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	44 KB

Table 4C.3 Address Space (512-KB 48/64/80/100-Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 0007 FFFF$_H$	Code Flash	512 KB
0008 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	32 KB
0100 8000$_H$ to FEBE FFFF$_H$	Access prohibited area	
FEBF 0000$_H$ to FEBF 7FFF$_H$	Local RAM (CPU1 area)	32 KB
FEBF 8000$_H$ to FEBF FFFF$_H$	Retention RAM (CPU1 area)	32 KB
FEC0 0000$_H$ to FEDE FFFF$_H$	Access prohibited area	
FEDF 0000$_H$ to FEDF 7FFF$_H$	Local RAM (self area)	32 KB
FEDF 8000$_H$ to FEDF FFFF$_H$	Retention RAM (self area)	32 KB
FEE0 0000$_H$ to FF1F FFFF$_H$	Access prohibited area	
FF20 0000$_H$ to FF20 FFFF$_H$	Data Flash	64 KB
FF21 0000$_H$ to FF9F FFFF$_H$	Access prohibited area	
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area	
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area	
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	44 KB

4C.2 Address Space Viewed from Each Bus Master

Table 4C.4, Address Space Viewed from Each Bus Master (1-MB Product) shows address spaces viewed from each bus master.

4C.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, local RAM, and retention RAM.

4C.2.2 Data Space Accessible by CPU

See **Table 4C.4, Address Space Viewed from Each Bus Master (1-MB Product)** for the spaces accessible from the CPU.

4C.2.3 Data Space Accessible by Each Bus Master

See **Table 4C.4, Address Space Viewed from Each Bus Master (1-MB Product)** for the spaces accessible from Each Bus Master.

Table 4C.4 Address Space Viewed from Each Bus Master (1-MB Product)

Address	Resource	From CPU	From DMA
0000 0000$_H$ to 000F FFFF$_H$	Code Flash	✓	✓
0010 0000$_H$ to 00FF FFFF$_H$	Access prohibited area		
0100 0000$_H$ to 0100 7FFF$_H$	Code Flash (Extended user area)	✓	✓
0100 8000$_H$ to FEBD FFFF$_H$	Access prohibited area		
FEBE 0000$_H$ to FEBF 7FFF$_H$	Local RAM (CPU1 area)	✓	✓
FEBF 8000$_H$ to FEBF FFFF$_H$	Retention RAM (CPU1 area)	✓	✓
FEC0 0000$_H$ to FEDD FFFF$_H$	Access prohibited area		
FEDE 0000$_H$ to FEDF 7FFF$_H$	Local RAM (self area)	✓	
FEDF 8000$_H$ to FEDF FFFF$_H$	Retention RAM (self area)	✓	
FEE0 0000$_H$ to FF1F FFFF$_H$	Access prohibited area		
FF20 0000$_H$ to FF20 FFFF$_H$	Data Flash	✓	✓
FF21 0000$_H$ to FF9F FFFF$_H$	Access prohibited area		
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	✓	✓
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area		
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	✓	
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area		
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	✓	✓

Note: The following color coding is used in the map above.

Fetch and data access available

Data access available

Access prohibited

4C.3 Peripheral I/O Address Map

Table 4C.5, Peripheral I/O Address Map shows peripheral I/O address map.

Table 4C.5 Peripheral I/O Address Map

Address	Peripheral Group	Peripheral I/O
FF00 0000$_H$ to FF1F FFFF$_H$	—	Access prohibited area
FF20 0000$_H$ to FF20 FFFF$_H$	2	Data Flash
FF21 0000$_H$ to FF9F FFFF$_H$	—	Access prohibited area
FFA0 0000$_H$ to FFA0 001F$_H$	1	FLMD
FFA0 0020$_H$ to FFA0 0FFF$_H$	—	Access prohibited area
FFA0 1000$_H$ to FFA0 103F$_H$	—	Access prohibited area
FFA0 1040$_H$ to FFA0 1FFF$_H$	—	Access prohibited area
FFA0 2000$_H$ to FFA0 201F$_H$	—	Access prohibited area
FFA0 2020$_H$ to FFA0 FFFF$_H$	—	Access prohibited area
FFA1 0000$_H$ to FFA1 1FFF$_H$	1	Flash controller
FFA1 2000$_H$ to FFA1 FFFF$_H$	—	Access prohibited area
FFA2 0000$_H$ to FFA2 FFFF$_H$	1	FACI command-issuing area
FFA3 0000$_H$ to FFBF FFFF$_H$	—	Access prohibited area
FFC0 0000$_H$ to FFC0 000F$_H$	1	FENMI (ECON_NMI)
FFC0 0010$_H$ to FFC0 00FF$_H$	—	Access prohibited area
FFC0 0100$_H$ to FFC0 010F$_H$	1	FEINT (ECON_FEINT)
FFC0 0110$_H$ to FFC0 0FFF$_H$	—	Access prohibited area
FFC0 1000$_H$ to FFC0 1003$_H$	1	SELB_INTC (SL_INTC)
FFC0 1004$_H$ to FFC0 1FFF$_H$	—	Access prohibited area
FFC0 2000$_H$ to FFC0 2007$_H$	1	SELB_DMAC (SL_DMAC)
FFC0 2008$_H$ to FFC0 FFFF$_H$	—	Access prohibited area
FFC1 0000$_H$ to FFC1 4CCF$_H$	1	PORT
FFC1 4CD0$_H$ to FFC1 FFFF$_H$	—	Access prohibited area
FFC2 0000$_H$ to FFC2 04CF$_H$	1	PORT (JTAG)
FFC2 04D0$_H$ to FFC2 FFFF$_H$	—	Access prohibited area
FFC3 0000$_H$ to FFC3 000F$_H$	1	DNFA_TAUD0 (DNF)
FFC3 0010$_H$ to FFC3 001F$_H$	—	Access prohibited area
FFC3 0020$_H$ to FFC3 002F$_H$	1	DNFA_TAUB0 (DNF)
FFC3 0030$_H$ to FFC3 003F$_H$	—	Access prohibited area
FFC3 0040$_H$ to FFC3 004F$_H$	—	Access prohibited area
FFC3 0050$_H$ to FFC3 005F$_H$	—	Access prohibited area
FFC3 0060$_H$ to FFC3 006F$_H$	1	DNFA_ENCA0 (DNF)
FFC3 0070$_H$ to FFC3 009F$_H$	—	Access prohibited area
FFC3 00A0$_H$ to FFC3 00AF$_H$	1	DNFA_ADCA0 (DNF)
FFC3 00B0$_H$ to FFC3 00BF$_H$	—	Access prohibited area
FFC3 00C0$_H$ to FFC3 00CF$_H$	—	Access prohibited area
FFC3 00D0$_H$ to FFC3 00DF$_H$	—	Access prohibited area
FFC3 00E0$_H$ to FFC3 00EF$_H$	1	DNFA_SENT (DNF)
FFC3 00F0$_H$ to FFC3 00FF$_H$	—	Access prohibited area
FFC3 0100$_H$ to FFC3 010F$_H$	—	Access prohibited area
FFC3 0110$_H$ to FFC3 3FFF$_H$	—	Access prohibited area
FFC3 4000$_H$ to FFC3 401F$_H$	1	FCLA_NMI (FCLA0)

Section 5 Write-Protected Registers

This section contains a generic description of the write-protected registers.

The first part in this section describes the features specific to the write-protected registers, and the ensuing sections describe the various registers.

5.1 Overview

5.1.1 Functional Overview

The RH850/F1KH, RH850/F1KM products require a special procedure using write-protected registers to set important registers that affect the system, such as clock, reset, and port-related registers. The settings of protected registers are protected against illegal writing by programs by requiring a special procedure. For details about the protected registers, see **Section 5.1.5, Write-Protection Target Registers**. Write-protected registers are managed in units of protected registers called register protection clusters.

5.1.2 Writing Procedure to Write-Protected Registers

Write access to a write-protected register is enabled by using the following protection unlock sequence:

1. Write the fixed value 0000 $00A5_H$ to the protection command register.
2. Write the desired value to the protected register.
3. Write the bit-wise inversion of the desired value to the protected register.
4. Write the desired value to the protected register.
5. Verify that the desired value has been written to the protected register.

Verify successful write of the desired value to the protected register by verifying that the error monitor bit in the protection status register is “0”.

In case the write was not successful, indicated by the error monitor bit set to “1”, the entire sequence has to be restarted at step 1.

If another register (second register) is accessed between step 1 and step 4 of the above sequence for writing to a write-protected register (first register), the protection mechanism operates as follows:

- If the second register belongs to the same cluster, the write to the protected register fails (the error monitor bit is set to 1). The entire sequence has to be restarted at step 1.
- If the second register does not belong to the same cluster, the protection unlock sequence is not disrupted and the write to the first register completes successfully.

5.1.3 Interrupt during Write Protection Unlock

If an interrupt occurs during the protection unlock sequence, the protection mechanism operates as follows:

(1) If an interrupt request is accepted during the protection unlock sequence and write access to a register of the same cluster is performed.

The protection unlock sequence is disrupted, so the write operation to the protected register cannot be completed upon returning from the interrupt service routine. **Figure 5.1, Example of Interruption of Register Protection Unlock Sequence** shows an execution example.

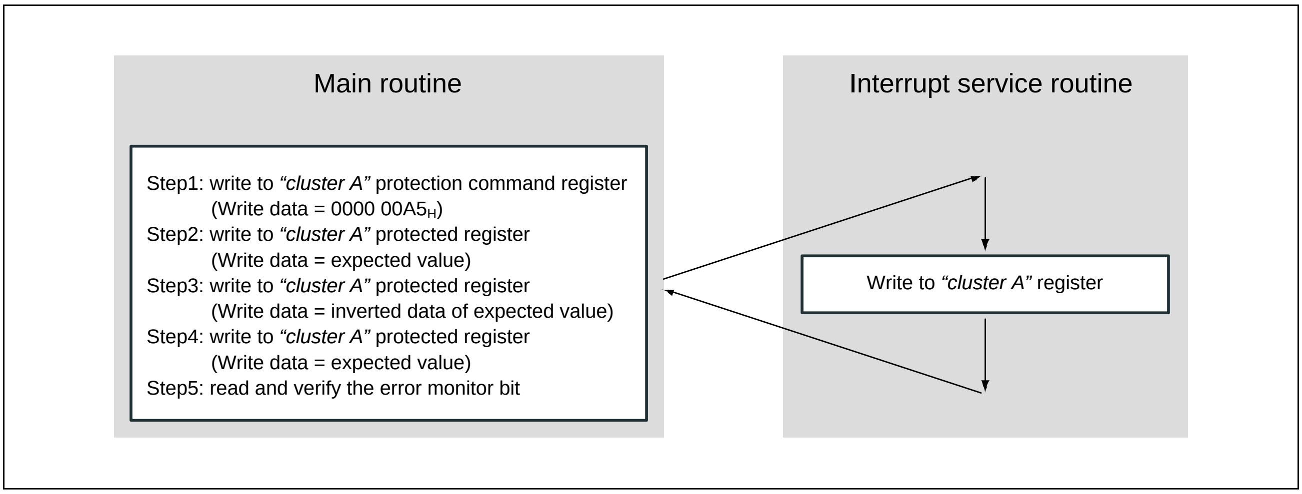

Figure 5.1 Example of Interruption of Register Protection Unlock Sequence

(2) If an interrupt request is accepted during the protection unlock sequence and write access to a register of a different cluster is performed.

The protection unlock sequence is not disrupted, so the write operation to the protected register is completed upon returning from the interrupt service routine. **Figure 5.2, Example of Successful Protection Unlock Sequence** shows an execution example.

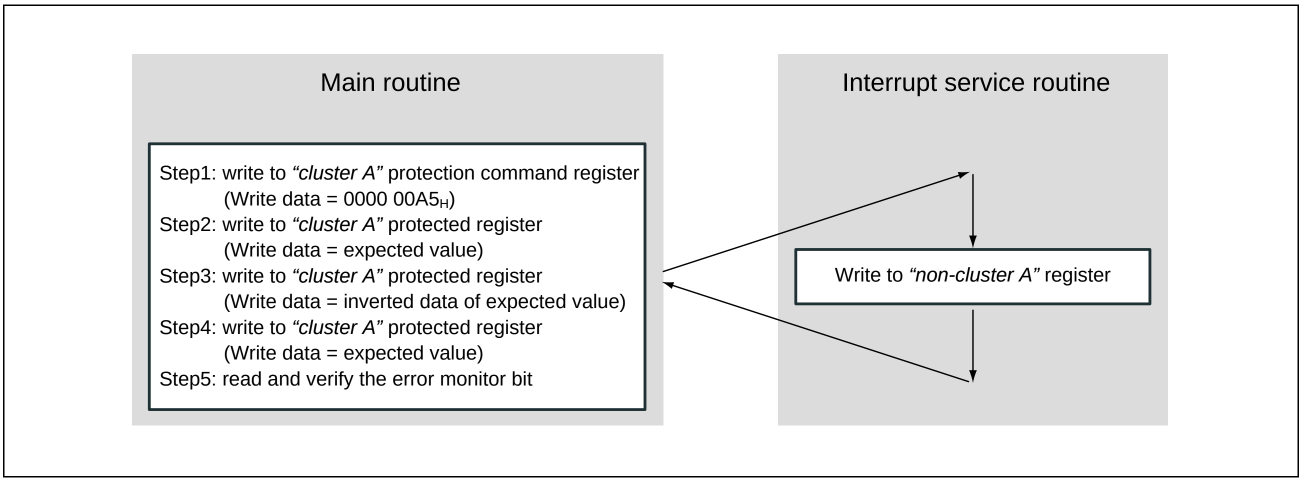

Figure 5.2 Example of Successful Protection Unlock Sequence

For more information on registers of RH850/F1KH, RH850/F1KM register protection clusters, see **Section 5.1.5, Write-Protection Target Registers**.

5.1.4 Emulation Break during Write Protection Unlock Sequence

If an emulation break occurs during the protection unlock sequence, e.g. because of a breakpoint hit, the register protection is suspended until normal operation is resumed.

Even if any register of the same cluster is accessed during the break, the protection unlock sequence is not disrupted and the error monitor bit is not set to 1.

5.1.5 Write-Protection Target Registers

The registers that are protected through the write-protection control registers are listed below.

Table 5.1 Write-Protection Target Registers (RH850/F1KH-D8)

		Protection Control Register		
Protection Target	Protection Target Register	Command Register	Status Register	Protection Cluster
Clock controller	MOSCE	PROTCMD0	PROTS0	Control protection cluster 0
	ROSCE			
	SOSCE			
	CKSC_AWDTAD_CTL

Note 1. Each port group has its own protection command register and status register. For details, see **Section 5.1.5(1), Port Protection Clusters**.

(1) Port Protection Clusters

The following port control registers have a write protection function:

- Port open drain control registers (PODCn, JPODC0)
- Port drive strength control registers (PDSCn, JPDSC0)

The write protected port registers are divided into two port protection clusters as shown in the following table:

Table 5.4 Port Protection Clusters (RH850/F1KH-D8)

Port Protection Cluster	Port Group
0	JP0, P0, P1, P2, P3, P8
1	P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, P23, P24

Table 5.5 Port Protection Clusters (RH850/F1KM-S4)

Port Protection Cluster	Port Group
0	JP0, P0, P1, P2, P3, P8
1	P9, P10, P11, P12, P13, P18, P19, P20, P21, P22

Table 5.6 Port Protection Clusters (RH850/F1KM-S1)

Port Protection Cluster	Port Group
0	JP0, P0, P8
1	P9, P10, P11

NOTE

Each port group n has its own port protection command register PPCMDn and port protection status register PPROTSn.

However, any port protection command registers of the same port protection cluster can be used in the protection unlock sequence. For instance, PPCMD0 can be used to unlock PODC8.

5.2 Registers

5.2.1 List of Registers

The following table lists the write-protection control registers.

Table 5.7 List of Registers (RH850/F1KH-D8)

Module Name	Register Name	Symbol	Address
Control protection cluster			
WPROTR	Protection command register 0	PROTCMD0	FFF8 0000_H

5.2.2 Details of Control Protection Cluster Registers

5.2.2.1 PROTCMDn — Protection Command Register

This register is used to initiate the write protection unlock sequence for write-protected registers.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)** and **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1)**.

Access: This register is a write-only register that can be written in 32-bit units.

Address: See **Table 5.7, List of Registers (RH850/F1KH-D8)**, **Table 5.8, List of Registers (RH850/F1KM-S4)** and **Table 5.9, List of Registers (RH850/F1KM-S1)**.

Value after reset: XXXX XX00$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	PCMDn[7:0]							
Value after reset	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 5.10 PROTCMDn Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write 0.
7 to 0	PCMDn[7:0]	Protection command register bits to enable writing to protected registers of control protection cluster

5.2.2.2 PROTSn — Protection Status Register

This register indicates the status of the protection unlock sequence performed by PROTCMDn.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)** and **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1)**.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 5.7, List of Registers (RH850/F1KH-D8)**, **Table 5.8, List of Registers (RH850/F1KM-S4)** and **Table 5.9, List of Registers (RH850/F1KM-S1)**.

Value after reset: 0000 0000_H

5.2.3 Details of Clock Monitor Control and Test Protection Cluster Registers

5.2.3.1 CLMAnPCMD — CLMAn Protection Command Register

This register is a protection command register for the CLMAnCTL0 register.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)** and **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1)**.

Access: This register is a write-only register that can be written in 8-bit units.

Address: See **Table 5.7, List of Registers (RH850/F1KH-D8)**, **Table 5.8, List of Registers (RH850/F1KM-S4)** and **Table 5.9, List of Registers (RH850/F1KM-S1)**.

5.2.3.2 CLMAnPS — CLMAn Protection Status Register

This register is used to verify whether the write-protected register (CLMAnCTL0) has been successfully written or not.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)** and **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1)**.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 5.7, List of Registers (RH850/F1KH-D8)**, **Table 5.8, List of Registers (RH850/F1KM-S4)** and **Table 5.9, List of Registers (RH850/F1KM-S1)**.

5.2.3.3 PROTCMDCLMA — Clock Monitor Test Protection Command Register

This register is a protection command register for the CLMATEST register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: See **Table 5.7, List of Registers (RH850/F1KH-D8)**, **Table 5.8, List of Registers (RH850/F1KM-S4)** and **Table 5.9, List of Registers (RH850/F1KM-S1)**.

5.2.4 Details of Core Voltage Monitor Protection Cluster Registers

5.2.4.1 PROTCMDCVM — Core Voltage Monitor Protection Command Register

This register is a protection command register for the CVMF and CVMDIAG registers.

Access: This register is a write-only register that can be written in 32-bit units.

Address: See **Table 5.7, List of Registers (RH850/F1KH-D8)**, **Table 5.8, List of Registers (RH850/F1KM-S4)** and **Table 5.9, List of Registers (RH850/F1KM-S1)**.

5.2.5 Details of Port Protection Cluster Registers

5.2.5.1 PPCMDn — Port Protection Command Register

PPCMDn is a protection command register for port group n.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)** and **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1)**.

Access: This register is a write-only register that can be written in 32-bit units.

Address: See **Table 5.7, List of Registers (RH850/F1KH-D8)**, **Table 5.8, List of Registers (RH850/F1KM-S4)** and **Table 5.9, List of Registers (RH850/F1KM-S1)**.

Value after reset: XXXX XX00$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7 to 0	PPCMDn[7:0]	Protection command register bits that enable writing to port protection cluster registers

NOTE

The protection command register for port group JP0 is JPPCMD0. Its bits are JPPCMD0[7:0].

5.2.5.2 PPROTSn — Port Protection Status Register

PPROTSn is a protection status register for write-protected registers of port group n. It indicates the status of the protection sequence operated by PPCMDn.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers (RH850/F1KH-D8)**, **Table 5.2, Write-Protection Target Registers (RH850/F1KM-S4)** and **Table 5.3, Write-Protection Target Registers (RH850/F1KM-S1)**.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 5.7, List of Registers (RH850/F1KH-D8)**, **Table 5.8, List of Registers (RH850/F1KM-S4)** and **Table 5.9, List of Registers (RH850/F1KM-S1)**.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	PPROTSnPRERR	Write protection sequence error monitor 0: No protection error occurred 1: Protection error occurred

NOTE

The protection status register for port group JP0 is JPPROTS0. Its bit is JPPROTS0PRERR.

5.2.6 Details of Self-Programming Protection Cluster Registers

5.2.6.1 FLMDPCMD — FLMD Protection Command Register

FLMDPCMD is a protection command register for the FLMDCNT register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: See **Table 5.7, List of Registers (RH850/F1KH-D8)**, **Table 5.8, List of Registers (RH850/F1KM-S4)** and **Table 5.9, List of Registers (RH850/F1KM-S1)**.

Value after reset: XXXX XX00$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

5.2.6.2 FLMDPS — FLMD Protection Error Status Register

This register is used to verify whether the write-protected register (FLMDCNT) has been successfully written or not.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	See **Table 5.7, List of Registers (RH850/F1KH-D8)**, **Table 5.8, List of Registers (RH850/F1KM-S4)** and **Table 5.9, List of Registers (RH850/F1KM-S1)**.
Value after reset:	0000 0000$_H$

Section 6 Operating Mode

This section describes the operating mode and mode selection of the RH850/F1KH, RH850/F1KM.

The RH850/F1KH, RH850/F1KM has the operating mode shown below.

- Normal operating mode

  This mode is for execution of the user program. The on-chip debug functions also use this mode. If FLMD0 is pulled up high during operation in this mode, writing to the code flash memory through self-programming is enabled.

  RH850/F1KH-D8:
  CPU2 (PE2) start-up control at reset release depends on the option byte setting. For details of the option byte, see **Section 44.9.2, OPBT0 — Option Byte 0**.

- Serial programming mode

  The dedicated flash memory programmer enables erasing/writing to flash memory.

- Boundary scan mode

  This mode allows boundary scan tests compliant with IEEE Standard 1149.1.

- User boot mode

  This mode is the same as normal operating mode except that the reset vector address is fixed to “0100 0000_H”, and transition to standby modes is not supported.

  RH850/F1KH-D8:
  CPU2 (PE2) is disabled regardless of the option byte setting in this mode.

When the external reset or power-on clear reset is generated, the state of the FLMD0, FLMD1, MODE0, MODE1, and MODE2 pins are used to determine the operating mode after reset is released. The operating mode is fixed by the release of these reset factors. **Table 6.1, Selection of Operating Mode** lists the relationship between the pin settings and the operating mode.

Table 6.1 Selection of Operating Mode

Pins					
FLMD0	FLMD1 (P10_8)	MODE0 (P10_1)	MODE1 (P10_2)	MODE2 (P10_6)	Operating Mode
0	x	x	x	x	Normal operating mode
1	0	x	x	x	Serial programming mode
1	1	0	1	x	Boundary scan mode
1	1	1	1	1	User boot mode
Other than the above					Setting prohibited

CAUTION

To change operating mode, restart from power-on clear reset. (Remove the power supply once and apply it again.) In the case of only by the external reset, some functions are not initialized after the mode transitions. For details of functions not initialized by the external reset, see **Section 9A.1.1, Reset Sources** and **9BC.1.1, Reset Sources**.

Section 7A Exception/Interrupts of RH850/F1KH-D8

7A.1 Features of RH850/F1KH Exception/Interrupts

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions.

The details on exceptions are described in *the RH850G3KH User's Manual: Software*.

Table 7A.1 List of Exception Sources

Name	Symbol	Source	Priority	Saved to
Reset	RESET	Reset input	High	—
FE level non-maskable interrupt*[1]	FENMI	FENMI input		FE
System error exception	SYSERR	SYSERR input		FE
FE level maskable interrupt*[1]	FEINT	FEINT input		FE
Floating-point arithmetic exception (imprecise)	FPI	Execution of FPU instruction		EI
EI level maskable interrupt*[1]	EIINT	Interrupt controller		EI
Memory protection exception (execution right)	MIP	Memory protection violation		FE
System error exception	SYSERR	Error input at instruction fetch		FE
Reserved instruction exception	RIE	Execution of reserved instruction		FE
Coprocessor unusable exception	UCPOP	Execution of coprocessor instruction/access right violation		FE
Privileged instruction exception	PIE	Execution of privileged instruction		FE
Misaligned exception	MAE	Generation of misaligned access		FE
Memory protection exception (access right)	MDP	Memory protection violation		FE
Floating-point arithmetic exception (precise)	FPP	Execution of FPU instruction		EI
System call	SYSCALL	Execution of SYSCALL instruction		EI
FE level trap	FETRAP	Execution of FETRAP instruction		FE
EI level trap 0	TRAP0	Execution of TRAP instruction		EI
EI level trap 1	TRAP1	Execution of TRAP instruction	Low	EI

Note 1. These interrupt exceptions are described in this section.

(1) Interrupts

The following three exceptions in **Table 7A.1, List of Exception Sources** are called interrupts, and are described in this section.

- FE level non-maskable interrupt (FENMI)
  An FENMI interrupt is acknowledged even if another FE level interrupt - FEINT - has been generated.
  - An FENMI interrupt is acknowledged even if the CPU system register PSW.NP = 1.
  - Return from an FENMI interrupt is not possible and neither is recovery.
- FE level maskable interrupt (FEINT)
  - FEINT can be acknowledged if the CPU system register PSW.NP = 0. It is masked if PSW.NP = 1.
  - Return from an FEINT interrupt is possible and so is recovery.
- EI level maskable interrupt (EIINT)
  An EIINT interrupt can be acknowledged if an FE level interrupt - FENMI or FEINT - has not been generated.
  - EIINT can be acknowledged if the CPU system register PSW.NP = 0.
    It is masked if PSW.NP = 1, EIINT with a higher priority is being processed, or PSW.ID = 1.
  - Return from an EIINT interrupt is possible and so is recovery.
  - Interrupt masking can be specified for each interrupt channel.
  - 16 interrupt priority levels can be specified for each interrupt channel
  - In this section, the EIINT that corresponds to interrupt channel n is indicated by “INTn”, whereas the EIINT that corresponds to interrupt source xxx is indicated by “INTxxx”.

For the PSW register, see **Table 3A.10, PSW Register Contents** and *the RH850G3KH User’s Manual: Software*.

NOTE

Return:	Indicates whether or not the program can resume from where it was interrupted.
Recovery:	Indicates whether or not the processor status (status of processor resources including general-purpose registers and system registers) can be restored to the status they were in when the program was interrupted.

These interrupt sources are described in **Section 7A.2, Interrupt Sources**.

(2) Overview of interrupts

- Simultaneous distribution of interrupt sources to multiple cores
  - A single interrupt source can be distributed to multiple CPU cores.
    (Distribution target cores: CPU1/CPU2)
  - Target interrupt sources: Non-maskable interrupt 1 source,
    FE level interrupt 1 source,
    EI level interrupts 29 sources
- Priority levels for interrupt
  16 priority levels of maskable interrupts by request can be set by interrupt control register.
- Detecting methods of external interrupts (TNMI/INTPm)
  A method of detecting external interrupts (TNMI and INTPm) can be selected from five types:
  rising edge, falling edge, both edges, low level, and high level.
- 2 types of interrupt handler address setting Direct branching method or table referencing method is selectable by register setting.
- Inter-processor interrupts
  High-speed inter-processor interrupts are enabled.

7A.2 Interrupt Sources

7A.2.1 Interrupt Sources

7A.2.1.1 FE Level Non-Maskable Interrupts

(1) Priority

See **Table 7A.1, List of Exception Sources**.

(2) Return PC

Return or recovery from an FE non-maskable interrupt is not possible.

(3) Status Register

See **Section 7A.4.5, FNC — FE Level NMI Status Register**.

(4) Return Instruction

None

Table 7A.2 FE Level Non-Maskable Interrupt Requests

Interrupt			Interrupt Request					
	Control Register							
Symbol	Name	Address	Name	Source	Unit	Priority	Exception Source Code	Handler Address 00000...
FENMI	FNC	FFFE EA78_H	TNMI	NMI pin	Port	*1	$0E0_H$	$0E0_H$

			WDTA1NMI	WDTA1 FENMI interrupt	WDTA1			
			WDTA2NMI	WDTA2 FENMI interrupt	WDTA2			

Note 1. See **Table 7A.1, List of Exception Sources**.

The source of the FENMI interrupt can be evaluated by a dedicated flag register. See **Section 7A.2.2, FE Level Non-Maskable Interrupt Sources** for details.

7A.2.1.2 FE Level Maskable Interrupts

(1) Priority

See **Table 7A.1, List of Exception Sources**.

(2) Return PC

The return PC returned from an interrupt handling routine by the FERET instruction is the PC from when the program was suspended (current PC).

(3) Status Register

See **Section 7A.4.6, FIC — FE Level Maskable Interrupt Status Register**.

(4) Return Instruction

FERET

Table 7A.3 FE Level Maskable Interrupt Requests (RH850/F1KH-D8)

Interrupt			Interrupt Request		Unit	176 Pins	233 Pins	272 Pins	324 Pins	Priority	Exception Source Code	Handler Address 00000...
	Control Register											
Symbol	Name	Address	Name	Source								
FEINT	FIC	FFFE EA7A$_H$	INTLVIL	LVI voltage detection (falling)	LVI	✓	✓	—	✓	*[1]	0F0$_H$	0F0$_H$
			INTECCEEP0	Data flash ECC 1-bit error or 2-bit error interrupt	Data flash	✓	✓	—	✓			
			INTECCFLRAM	FLXA0 ECC 1-bit error or 2-bit error interrupt	FLXA0	✓	✓	—	✓			
			INTECCCNFDRAM0	RCFDC0 ECC 1-bit error or 2-bit error interrupt	RCFDC0	✓	✓	—	✓			
			INTECCCSIH0	CSIH0 ECC 1-bit error or 2-bit error interrupt	CSIH0	✓	✓	—	✓			
			INTECCCSIH1	CSIH1 ECC 1-bit error or 2-bit error interrupt	CSIH1	✓	✓	—	✓			
			INTECCCSIH2	CSIH2 ECC 1-bit error or 2-bit error interrupt	CSIH2	✓	✓	—	✓			
			INTECCCSIH3	CSIH3 ECC 1-bit error or 2-bit error interrupt	CSIH3	✓	✓	—	✓			
			INTECCCSIH4	CSIH4 ECC 1-bit error or 2-bit error interrupt	CSIH4	✓	✓	—	✓			
			INTECCFLI0	Code Flash ECC 1-bit error or 2-bit error interrupt	Code flash	✓	✓	—	✓			
			INTECCRAM	RAM ECC 1-bit error or 2-bit error interrupt	RAM	✓	✓	—	✓			
			INTOSTM0_FE*[2]	OSTM0 interrupt	OSTM0	✓	✓	—	✓			
			INTLVIH	LVI voltage detection (rising)	LVI	✓	✓	—	✓			
			INTGUARD	PE Guard (PEG) error or Global RAM Guard (GRG) error or Peripheral Guard (PBG/HBG/PBGC)	PEG, GRG, PBG/HBG/PBGC	✓	✓	—	✓			
			INTOSTM1_FE	OSTM1 interrupt	OSTM1	✓	✓	—	✓			
			INTOSTM2_FE	OSTM2 interrupt	OSTM2	✓	✓	—	✓			
			INTOSTM3_FE	OSTM3 interrupt	OSTM3	✓	✓	—	✓			
			INTOSTM4_FE	OSTM4 interrupt	OSTM4	✓	✓	—	✓			
			INTECCCNFDRAM1	RCFDC1 ECC 1-bit error or 2-bit error interrupt	RCFDC1	—	—	—	✓			
			INTECCETH0	ETNB0 ECC 1-bit error or 2-bit error interrupt	ETNB0	✓	✓	—	✓			
			INTOSTM5_FE*[3]	OSTM5 interrupt	OSTM5	✓	✓	—	✓			
			INTOSTM6_FE	OSTM6 interrupt	OSTM6	✓	✓	—	✓			
			INTOSTM7_FE	OSTM7 interrupt	OSTM7	✓	✓	—	✓			
			INTOSTM8_FE	OSTM8 interrupt	OSTM8	✓	✓	—	✓			
			INTOSTM9_FE	OSTM9 interrupt	OSTM9	✓	✓	—	✓			
			INTECCETH1	ETNB1 ECC 1-bit error or 2-bit error interrupt	ETNB1	—	—	—	✓			
			INTECCMMCA0RAM	MMCA0 ECC 1-bit error or 2-bit error interrupt	MMCA0	—	—	—	✓			
			INTDMAERR	DMA transfer error interrupt	PDMAn	✓	✓	—	✓			

Note 1. See **Table 7A.1, List of Exception Sources**.

Note 2. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTM0 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM0.

Note 3. INTOSTM5 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTM5 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM5

* Timing monitor (TSU)
This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

7A.2.1.3 EI Level Maskable Interrupts

(1) Interrupt Naming Rules

The composition of the interrupt request signal names, their assigned interrupt control registers and the bits in these registers follow special rules.

In the following the name of the specific interrupt request is represented by <*name*>.

For details of the names used in **IC**<*name*>, see **Table 7A.4, EI Level Maskable Interrupt Sources**.

- Interrupt request name: **INT**<*name*>
  The prefix "**INT**" is appended to <*name*>.
- Interrupt request control register: **IC**<*name*>
  The prefix "**IC**" is appended to <*name*>.
  The 16-bit register **IC**<*name*> can also be accessed in byte units:
  - Low byte (bits [7:0]) of the **IC** <*name*> register: **IC** <*name*>L
    The suffix "L" is appended to the register name **IC**<*name*>.
  - High byte (bits [15:8]) of the **IC** <*name*> register: **IC** <*name*>H
    The suffix "H" is appended to the register name **IC**<*name*>.
- Interrupt control register bit names: **CT**<*name*>, **RF**<*name*>, **MK**<*name*>, **TB**<*name*>, **P3**<*name*>, **P2**<*name*>, **P1**<*name*>, **P0**<*name*>
  The bit prefix "**CT**", "**RF**", "**MK**", "**TB**", "**P3**", "**P2**", "**P1**", or "**P0**" is appended to the interrupt <*name*>.

Example

The interrupt request from channel 2 of TAUD0 channel (<*name*> = *TAUD0I2*) is named

INTTAUD0I2

The related interrupt control registers are

ICTAUD0I2, **IC**TAUD0I2L, **IC**TAUD0I2H

The bits in this register are

CTTAUD0I2,RFTAUD0I2, MKTAUD0I2, TBTAUD0I2, P3TAUD0I2, P2TAUD0I2,
P1TAUD0I2, P0TAUD0I2

(2) Priority

See **Table 7A.1, List of Exception Sources**.

(3) Return PC

The return PC returned from an interrupt handling routine by the EIRET instruction is the PC from when the program was suspended (current PC).

(4) Control Register

EI level maskable interrupt control register

See **Section 7A.4.2, ICxxx — EI Level Interrupt Control Registers**.

(5) Return Instruction

EIRET instruction

(6) Configuration

EI-level maskable interrupts are controlled by the two controllers, INTC1 and INTC2. The interrupts are supported on a total of 382 channels with a cascade connection of INTC1 and INTC2.

- INTC1
  CPU1 and CPU2 have their own interrupt controllers.
  Each CPU accesses the INTC1 register that corresponds to respective CPUs.
  INTC1 controls high-speed interrupt and has the following functions:
  - Priority setting
  - Interrupt mask setting
- INTC2
  INTC2 is a common interrupt controller that CPU1 and CPU2 share.
  INTC2 controls low-speed interrupts and has the following functions.
  - Priority setting
  - Interrupt mask setting
  - Binding setting

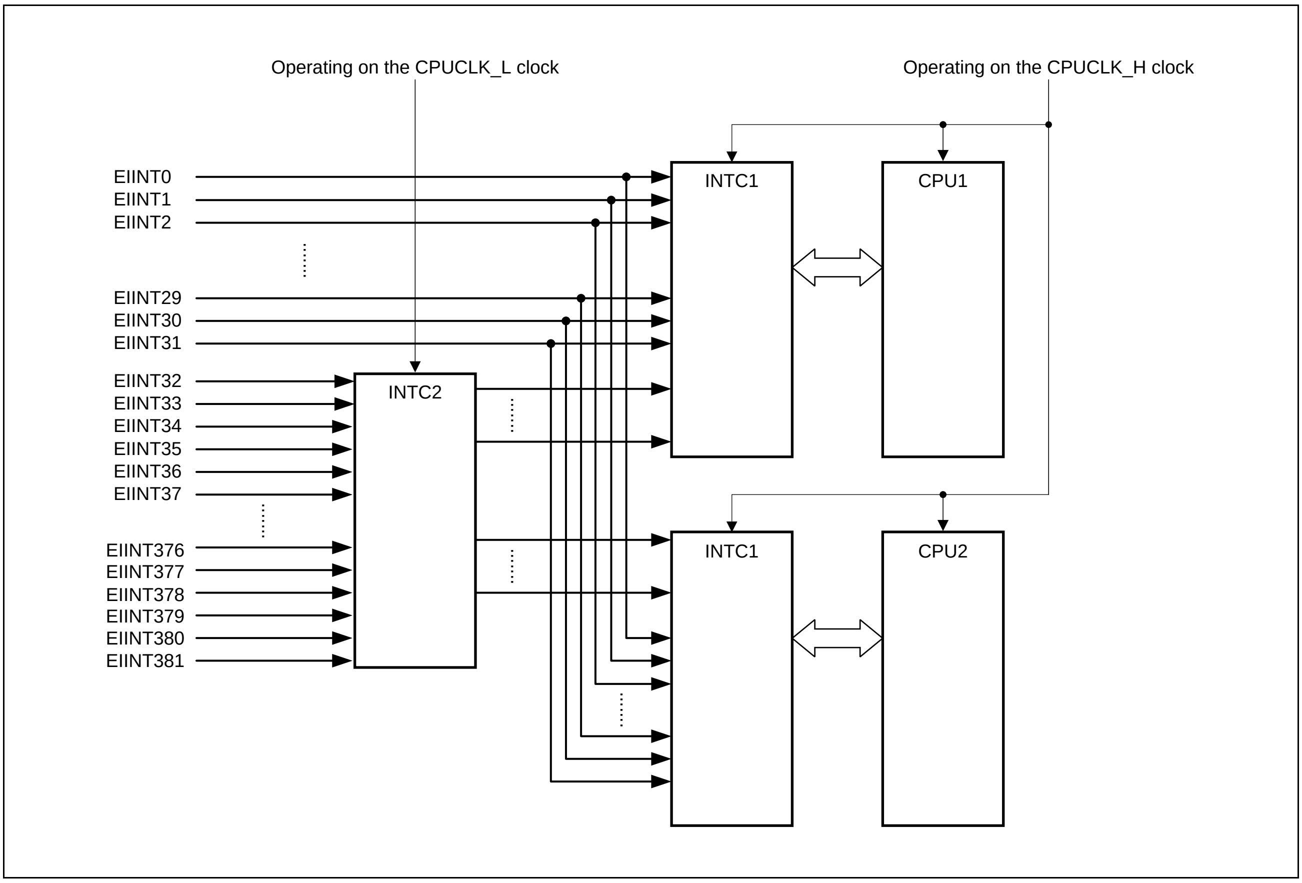

Figure 7A.1 Configuration Diagram of EI Level Maskable Interrupt

CAUTION

As CPUCLK_L is the operating clock for INTC2, the EIINT32 to EIINT381 interrupts, which are connected to INTC2, are delayed more than the interrupts directly connected to INTC1.

See **Table 7A.4, EI Level Maskable Interrupt Sources** lists EI level maskable interrupts.

Table 7A.4 EI Level Maskable Interrupt Sources

Interrupt			Interrupt Request				Exception Source Code	176 Pins	233 Pins	272 Pins	324 Pins	Handler Address (Offset)[*8]

381	ICDMA63	FFFF B2FA$_H$	INTDMA63	DMA37 transfer completion	PDMA1	Edge	117D$_H$	✓	✓	—	✓			+5F4$_H$

Note 1. Each interrupt is connected to INTC1 channel 0 to 31 and INTC2 channel 32 to 381.

Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an EI level interrupt control register. For details, see **Section 7A.4.2, ICxxx — EI Level Interrupt Control Registers**. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. The procedure shown in **Section 3A.5.1, Synchronization of Store Instruction Completion and Subsequent Instruction Execution** are required to reflect the result of the register update to the subsequent instruction.

Note 3. Irrespective of interrupt channels, an offset address is determined in the range from +100$_H$ to 1F0$_H$ according to the priority (0 to 15).

Note 4. Irrespective of the priority, offset addresses are uniformly +100$_H$.

Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.
Exception handler address read position = INTBP register + channel number × 4 bytes

Note 6. The same interrupt source is assigned to different interrupt channels. For details, see **Section 7A.5.2, SELB_INTC1 — INTC1 Interrupt Select Register**.

Note 7. 32 interrupt sources are assigned to the same interrupt channel. For details, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.

Note 8. For details, see **Section 7A.10, Exception Handler Address**.

Note 9. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible.
It is used as FEINT when OSTM0 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM0 functions as anything other than the TSU function.

Note 10. INTOSTM5 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible.
It is used as FEINT when OSTM5 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM5 functions as anything other than the TSU function.

Note 11. For details on the interrupt source, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

7A.2.2 FE Level Non-Maskable Interrupt Sources

7A.2.2.1 List of Registers

The following table lists the FE Level Non-Maskable Interrupt Sources registers.

Table 7A.5 List of Registers

Module Name	Register Name	Symbol	Address
ECON_NMI	FENMI factor register	WDTNMIF	FFC0 0000$_H$
	WDTNMI factor clear register	WDTNMIFC	FFC0 0008$_H$

7A.2.2.2 WDTNMIF — FENMI Factor Register

This register contains information about which source has generated the FE level non-maskable interrupt (FENMI). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC0 0000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7A.6 WDTNMIF Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	WDTA2NMIF	WDTA2NMI flag 0: No WDTA2NMI occurred 1: WDTA2NMI has occurred
2	WDTA1NMIF	WDTA1NMI flag 0: No WDTA1NMI occurred 1: WDTA1NMI has occurred
1	WDTA0NMIF	WDTA0NMI flag 0: No WDTA0NMI occurred 1: WDTA0NMI has occurred
0	TNMIF	Input signal flag from the NMI pin 0: No TNMI occurred 1: TNMI has occurred

7A.2.2.3 WDTNMIFC — WDTNMI Factor Clear Register

This register clears the FE level non-maskable interrupt flags of the WDTNMIF register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FFC0 0008$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	WDTA2 NMIFC	WDTA1 NMIFC	WDTA0 NMIFC	TNMIF C
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W	W

Table 7A.7 WDTNMIFC Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When writing, write the value after reset.
3	WDTA2NMIFC	WDTA2NMIF flag clear 0: — 1: Clear
2	WDTA1NMIFC	WDTA1NMIF flag clear 0: — 1: Clear
1	WDTA0NMIFC	WDTA0NMIF flag clear 0: — 1: Clear
0	TNMIFC	TNMIF flag clear 0: — 1: Clear

7A.2.3 FE Level Maskable Interrupt Sources

7A.2.3.1 List of Registers

The following table lists the FE Level Maskable Interrupt Sources registers.

Table 7A.8 List of Registers

Module Name	Register Name	Symbol	Address
ECON_FEINT	FEINT factor register	FEINTF	FFC0 0100$_H$
	FEINT factor mask register	FEINTFMSK	FFC0 0104$_H$
	FEINT factor clear register	FEINTFC	FFC0 0108$_H$

7A.2.3.2 FEINTF — FEINT Factor Register

This register contains information about which source has generated the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC0 0100$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

4	ECCEEP0 FEIF	INTECCEEP0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
3 to 1	Reserved	When read, the value after reset is returned.
0	LVILFEIF	INTLVIL interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred

Note 1. For the supported products, see **Table 7A.3, FE Level Maskable Interrupt Requests (RH850/F1KH-D8)**.

7A.2.3.3 FEINTFMSK — FEINT Factor Mask Register

This register masks the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFC0 0104_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. For the supported products, see **Table 7A.3, FE Level Maskable Interrupt Requests (RH850/F1KH-D8)**.

7A.2.3.4 FEINTFC — FEINT Factor Clear Register

This register clears the bits of the FEINT factor register (FEINTF).

CAUTION

After confirming that handling by both handlers is complete after the completion of processing by a handler for an FEINT interrupt of CPU1 or CPU2, use the FEINT factor clear register (FEINTFC) to clear the flag for the given FEINT interrupt. For example, if processing by CPU1 takes less time than that by CPU2, checking only for the advance completion of processing by CPU1 creates a concern of repeated processing of the interrupt.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FFC0 0108$_H$

Value after reset: 0000 0000$_H$

Note 1. For the supported products, see **Table 7A.3, FE Level Maskable Interrupt Requests (RH850/F1KH-D8)**.

7A.3 Edge/Level Detection

External interrupts (TNMI and INTPm) can be specified to be generated when a rising edge, falling edge, rising or falling edge, low level, or high level is detected at an external interrupt pin.

The following registers are used to specify the edge and level of each interrupt:

Table 7A.12 External Interrupt Edge/Level Detection Registers (RH850/F1KH-D8)

Interrupt	Register
TNMI	FCLA0CTL0_NMI
INTP0	FCLA0CTL0_INTPL
INTP1	FCLA0CTL1_INTPL
INTP2	FCLA0CTL2_INTPL
INTP3	FCLA0CTL3_INTPL
INTP4	FCLA0CTL4_INTPL
INTP5	FCLA0CTL5_INTPL
INTP6	FCLA0CTL6_INTPL
INTP7	FCLA0CTL7_INTPL
INTP8	FCLA0CTL0_INTPH
INTP9	FCLA0CTL1_INTPH
INTP10	FCLA0CTL2_INTPH
INTP11	FCLA0CTL3_INTPH

INTP13	FCLA0CTL5_INTPH
INTP14*[1]	FCLA0CTL6_INTPH
INTP15*[1]	FCLA0CTL7_INTPH
INTP16*[1]	FCLA0CTL0_INTPU
INTP17*[1]	FCLA0CTL1_INTPU
INTP18*[1]	FCLA0CTL2_INTPU
INTP19*[1]	FCLA0CTL3_INTPU
INTP20*[1]	FCLA0CTL4_INTPU
INTP21*[1]	FCLA0CTL5_INTPU
INTP22*[1]	FCLA0CTL6_INTPU
INTP23*[1]	FCLA0CTL7_INTPU

Note 1. For the supported products, see **Table 7A.4, EI Level Maskable Interrupt Sources.**

See **Section 2A, Pin Function of RH850/F1KH-D8** for details of these registers.

7A.4 Interrupt Controller Control Registers

Writing to the ICxxx, IMRm (m = 0 to 11), IBDxxx, FNC, and FIC registers is enabled only in supervisor mode (PSW.UM = 0).

7A.4.1 List of Registers

The following table lists the Interrupt Controller Control registers.

Table 7A.13 List of Registers

Module Name	Register Name	Symbol	Address
INTC1	EI level interrupt control registers	ICxxx*[1]	See **Table 7A.4, EI Level Maskable Interrupt Sources**
	EI level interrupt mask registers	IMR0	FFFE EAF0$_H$
	EI level interrupt binding registers	IBDxxx*[1]	See **Table 7A.17, List of IBDxxx Registers**
INTC2	EI level interrupt control registers	ICxxx*[2]	See **Table 7A.4, EI Level Maskable Interrupt Sources**
	EI level interrupt mask registers	IMRm	FFFF B400$_H$ + (04$_H$ × m)
	EI level interrupt binding registers	IBDxxx*[2]	See **Table 7A.17, List of IBDxxx Registers**
INTC1	FE level NMI status register	FNC	FFFE EA78$_H$
	FE level maskable interrupt status register	FIC	FFFE EA7A$_H$

Note 1. Channel No.0 to 31.

Note 2. Channel No.32 or more.

Among the registers shown in **Table 7A.16, IBDxxx Register Contents**, ICxxx, IMR0, and IBDxxx, which correspond to interrupt channel numbers 0 to 31, are located in INTC1 of the CPU peripheral field included in each CPU. Each register of these can only be accessed from CPU1 or CPU2 which includes it.

Writing is only possible in supervisor mode (PSW.UM = 0).

Among the registers shown in **Table 7A.16, IBDxxx Register Contents**, ICxxx, IMR1 to IMR11, and IBDxxx, which correspond to interrupt channel numbers 32 to 381, are located in INTC2 of peripheral group 0. Writing to these registers is only possible in supervisor mode (UM = 0) by a PE bound to IBDxxx or in supervisor mode (UM = 0) by CPU1.

When writing to IMR1 to IMR11, only the bits corresponding to the conditions described above are overwritten; other bits are not updated.

Among the registers shown in **Table 7A.16, IBDxxx Register Contents**, the values of those listed as reserved for the given channel numbers in **Table 7A.4, EI Level Maskable Interrupt Sources**, must retain their values after a reset.

7A.4.2 ICxxx — EI Level Interrupt Control Registers

One of these registers is assigned to each EI level maskable interrupt (EIINT) channel and is used to set the conditions for controlling that channel. This register is initialized by any reset. For each source, see **Table 7A.4, EI Level Maskable Interrupt Sources**.

CAUTION

If 0 is written to the RFxxx bit immediately after a peripheral module generates the corresponding interrupt request in edge detection mode (before an interrupt is accepted by the CPU), the request may be lost.

Writing 1 to the RFxxx bit immediately after an interrupt is accepted by the CPU may lead to re-issuing of the request.

Writing method to these registers contains the use of bit manipulation instructions (set1, clr1, and not1).

For bit-manipulation instructions, see also **Section 3A.5.3, Access to Registers by Using Bit-Manipulation Instructions**.

Executing a bit-manipulation instruction to the lower bytes including the MKxxx bit has no effect on the RFxxx bit.

Access: ICxxx can be read or written in 16-bit units.

ICxxxH and ICxxxL can be read or written in 8- or 1-bit units.

Access to bits 14, 13, 11 to 8, 5, and 4 by using a SET1, CLR1, or NOT1 instruction is prohibited.

Address: See **Table 7A.4, EI Level Maskable Interrupt Sources**.

Value after reset: $008F_H$ (edge detection), $808F_H$ (level detection)*[1]

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTxxx	—	—	RFxxx	—	—	—	—	MKxxx	TBxxx	—	—	P3xxx	P2xxx	P1xxx	P0xxx
Value after reset	0/1*[1]	0	0	0	0	0	0	0	1	0	0	0	1	1	1	1
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Note 1. The value after reset differs depending on the detection type of a given interrupt (edge detection: 0, level detection: 1). For details, see **Table 7A.4, EI Level Maskable Interrupt Sources**.

Table 7A.14 ICxxx Register Contents

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>15</td><td>CTxxx</td><td>This bit indicates the type of interrupt detection. This bit is read only.
0: Edge detection
1: Level detection
When writing in 8-bit or 16-bit units, write the value after reset.</td></tr>
<tr><td>14, 13</td><td>Reserved</td><td>When read, the value after reset is returned. When writing, write the value after reset.</td></tr>
<tr><td>12</td><td>RFxxx</td><td>This is an interrupt request flag.
The RFxxx bit can be written from a program. Setting the RFxxx bit to 1 generates an EI level maskable interrupt n (EIINTn), just as when an interrupt request is acknowledged.
0: No interrupt request is made.
1: Interrupt request is made.
<table>
<tr><th>Input Interface</th><th>Operation</th></tr>
<tr><td>Edge detection (CTxxx = 0)</td><td>This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software.</td></tr>
<tr><td>Level detection (CTxxx = 1)</td><td>This bit cannot be set or cleared by software. It can only be read.
It is not cleared when an interrupt request is acknowledged by the CPU core.</td></tr>
</table>
</td></tr>
</table>

Table 7A.14 ICxxx Register Contents

Bit Position	Bit Name	Function
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	MKxxx	This is the interrupt request mask bit. When the MKxxx bit is set, interrupt requests from the channel are masked and are not issued to the CPU core. The interrupt pending status is not reflected in the ICSR.PMEI bit for any channels that are masked. When the interrupt request from the channel is masked with MKxxx = 1, the RFxxx still reflects the interrupt request for the channel and can be polled in software. When the MKxxx bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the MKxxx bit is also reflected in the corresponding IMRm register. 0: Enables interrupt processing 1: Disables interrupt processing
6	TBxxx	This bit is used to select the way to determine the interrupt vector. 0: Direct jumping to an address determined from the level of priority 1: Table reference For details on the way to determine the interrupt vector, see *the RH850G3KH User's Manual: Software*.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	P3xxx to P0xxx	These bits specify the interrupt priority as one of 16 levels, with 0 as the highest and 15 as the lowest. When multiple EI level-interrupt requests are made simultaneously, the interrupt from the source with the highest priority setting in these bits is selected and conveyed to the CPU core for servicing first. When P3xxx to P0xxx bits specify the same priority level for simultaneously occurring interrupt requests, the source with the lower channel number takes priority.

CAUTIONS

1. Do not access ICxxx registers of interrupt channels listed as “Reserved” in **Table 7A.4, EI Level Maskable Interrupt Sources**, and of the channels which are not incorporated in the product.
2. When a channel n is defined as broadcast interrupt (IBDxxx.CST = 1), MKxxx and RFxxx bits of the ICxxx register of the channel must be set to 0 after an initial configuration of the channel. In the period when the EIINTn interrupt is enabled, it is prohibited to mask (MKxxx = 1) an interrupt processing of the channel. When it is necessary to mask a broadcast interrupt, MKBN0 of ICBN0 registers in INTC1 of each PE can be used to mask the corresponding broadcast interrupt.

7A.4.3 IMRm — EI Level Interrupt Mask Registers (m = 0 to 11)

These registers are a collection of the MKxxx bits of the ICxxx registers. Each bit of IMRm reflects the setting of the corresponding MKxxx bit. The setting for IMRm is also reflected in the corresponding MKxxx bit. This register is initialized by any reset.

Access: IMRm can be read or written in 32-bit units.
IMRmH and IMRmL can be read or written in 16-bit units.
IMRmHH, IMRmHL, IMRmLH, and IMRmLL can be read or written in 8- or 1-bit units.

Address: IMR0: FFFE EAF0$_{H}$
IMR0L: FFFE EAF0$_{H,}$
IMR0H: FFFE EAF2$_{H}$
IMR0LH: FFFE EAF1$_{H,}$
IMR0HL: FFFE EAF2$_{H,}$
IMR0HH: FFFE EAF3$_{H}$
IMRm (m = 1 to 11): FFFF B400$_{H}$ + (04$_{H}$ × m)
IMRmL (m = 1 to 11): FFFF B400$_{H}$ + (04$_{H}$ × m)
IMRmH (m = 1 to 11): FFFF B400$_{H}$ + (04$_{H}$ × m) + 2$_{H,}$
IMRmLL (m = 1 to 11): FFFF B400$_{H}$ + (04$_{H}$ × m)
IMRmLH (m = 1 to 11): FFFF B400$_{H}$ + (04$_{H}$ × m) + 1$_{H,}$
IMRmHL (m = 1 to 11): FFFF B400$_{H}$ + (04$_{H}$ × m) + 2$_{H,}$

Table 7A.15 IMRm Register Contents

Bit Position	Bit Name	Function
31 to 0	IMRmEIMK (m × 32 + 31) to IMRmEIMK (m × 32 + 0)	These are interrupt mask bits for EI level maskable interrupt (EIINT) channels 0 to 381. 0: Enables interrupt servicing 1: Disables interrupt servicing

CAUTIONS

1. MKxxx bits which correspond to channels listed as “Reserved” in **Table 7A.4, EI Level Maskable Interrupt Sources** and to channels which are not incorporated in the product must be set to “1”.
2. When a channel is used as broadcast interrupt (IBDxxx.CST = 1), IMRmEIMKn bit corresponding to the channel must be set to 0.

7A.4.4 IBDxxx — EI Level Interrupt Binding Registers

These registers, each of which is for an EI level maskable interrupt (EIINT), are used to set the conditions for control of the interrupts. The registers are initialized by any type of reset.

Access: This register can be read or written in 32-bit units.

Address: See **Table 7A.17 List of IBDxxx Registers.**

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. IBDxxx registers of CPU1 (PE1) (interrupt number 0 to 31): PEID[2:0] = 001B
IBDxxx registers of CPU2 (PE2) (interrupt number 0 to 31): PEID[2:0] = 010B
IBDxxx registers (from interrupt number 32): PEID[2:0]= 001B

Table 7A.16 IBDxxx Register Contents

Bit Position	Bit Name	Function
31	CST	This bit specifies whether interrupt input to the corresponding interrupt channel is or is not conveyed to multiple destinations (broadcast). It can only be set in INTC2. The bit in IBDxxx for interrupt number 0 to 31 (INTC1) has the fixed value 0. 0: The interrupt is handled as a normal interrupt (default value). 1: The interrupt is conveyed to multiple destinations.
30 to 25	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
24	BCP0	These bits specify the number of the broadcast port for output when the CST bit is 1. If the CST bit is 0, the setting of these bits are ignored. The bits in IBDxxx for interrupt number 0 to 31 (INTC1) has the fixed value 0. 0: Output to broadcast port 0 1: Output to broadcast port 1
23 to 18	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
17, 16	GPID[1:0]	These bits are implemented only in the IBDxxx registers (the interrupt number 32 or later). Select one of the followings for setting according to PEID settings. 00: When CPU1 is selected for a binding destination by using PEID 01: When CPU2 is selected for a binding destination by using PEID Other than the above: Setting prohibited These bits are reserved in the IBDxxx registers corresponding to interrupt number 0 to 31. When writing, write 0. These bits are always read as 0.
15 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Table 7A.16 IBDxxx Register Contents

Bit Position	Bit Name	Function
2 to 0	PEID[2:0]	Specify destination for binding (requesting) an interrupt. However, the PEID bit in the IBDxxx registers (interrupt number 0 to 31) multiplexed by each CPU (PE) is fixed to each CPU (PE) number and cannot be changed. 001: An interrupt is bound to CPU1. 010: An interrupt is bound to CPU2. When an interrupt corresponding to a source is performed, select one of the above settings.

CAUTIONS

1. Do not change the value of the corresponding IBDxxx register while the request for EIINT is being processed.
2. Only INTBN0 and INTBN1 support broadcast interrupts in this product. So, total 2 IBDxxx register of CST = 1 can be set.
3. The channel of INTC2 that can be bind to broadcast communication input is only edge detection type.

7A.4.5 FNC — FE Level NMI Status Register

This register indicates the status of an FE level non-maskable interrupt (FENMI).

This register is initialized by any reset.

Access:	FNC is a read-only register that can be read in 16-bit units. FNCH is a read-only register that can be read in 8- or 1-bit units.
Address:	FNC: FFFE EA78$_H$ FNCH: FFFE EA79$_H$
Value after reset:	0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FNRF	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7A.18 FNC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FNRF	Interrupt request flag 0: No interrupt request 1: Interrupt request occurred This bit is automatically cleared when an FE level NMI interrupt request is acknowledged by the CPU core.
11 to 0	Reserved	When read, the value after reset is returned.

7A.4.6 FIC — FE Level Maskable Interrupt Status Register

This register indicates the status of an FE level maskable interrupt (FEINT).

This register is initialized by any reset.

Access: FIC is a read-only register that can be read in 16-bit units.

FICH is a read-only register that can be read in 8- or 1-bit units.

Address: FIC: FFFE EA7A$_H$

FICH: FFFE EA7B$_H$

Value after reset: 8000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIRF	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7A.19 FIC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FIRF	Interrupt request flag 0: No interrupt request 1: Interrupt request occurred This bit cannot be set or cleared by software. It can only be read.
11 to 0	Reserved	When read, the value after reset is returned.

7A.5 EI Level Maskable Interrupt Select Register

The following registers are used to select an EI level maskable interrupt.

7A.5.1 List of Registers

The following table lists the EI Level Maskable Interrupt Select register.

Table 7A.20 List of Register

Module Name	Register Name	Symbol	Address
SL_INTC	INTC1 interrupt select register	SELB_INTC1	FFC0 1000_H

7A.5.2 SELB_INTC1 — INTC1 Interrupt Select Register

When two interrupt sources are assigned to one interrupt channel, this register selects which interrupt sources is enabled. This register is initialized by any reset.

NOTE

The channel described in each bit setting indicates the channel of an interrupt and the priority. For details on channels, see **Table 7A.4, EI Level Maskable Interrupt Sources**.

Access: This register can be read or written in 16-bit units.

Address: FFC0 1000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SELB_INTC1_12	SELB_INTC1_11	SELB_INTC1_10	SELB_INTC1_9	SELB_INTC1_8	SELB_INTC1_7	SELB_INTC1_6	SELB_INTC1_5	SELB_INTC1_4	SELB_INTC1_3	SELB_INTC1_2	SELB_INTC1_1	SELB_INTC1_0

1	SELB_INTC1_1	Interrupt channel selection 0: INTTAPA0IVLY0 (Channel 17) INTCSIH1IR (Channel 117) 1: INTCSIH1IR_1 (Channel 17) INTTAPA0IVLY0_2 (Channel 117)
0	SELB_INTC1_0	Interrupt channel selection 0: INTTAPA0IPEK0 (Channel 16) INTCSIH1IC (Channel 116) 1: INTCSIH1IC_1 (Channel 16) INTTAPA0IPEK0_2 (Channel 116)

NOTE

For the supported products, see **Table 7A.4, EI Level Maskable Interrupt Sources**.

CAUTION

The operation of peripheral functions should be enabled after setting the corresponding interrupt source by SELB_INTC1.

7A.6 Interrupt Function System Registers

See **Table 3A.31, Interrupt Function System Registers**.

7A.6.1 FPIPR — FPI Exception Interrupt Priority

See **Table 3A.32, FPIPR Register Contents**.

7A.6.2 ISPR — Priority of Interrupt being Serviced

See **Table 3A.33, ISPR Register Contents**.

7A.6.3 PMR — Interrupt Priority Masking

See **Table 3A.34, PMR Register Contents**.

7A.6.4 ICSR — Interrupt Control Status

See **Table 3A.35, ICSR Register Contents**.

7A.6.5 INTCFG — Interrupt Function Setting

See **Table 3A.36, INTCFG Register Contents**.

7A.7 Operation when Acknowledging an Interrupt

Check whether each interrupt that is reported during instruction execution is acknowledged according to the priority. The procedure for acknowledging each interrupt is shown below.

(1) Check whether the acknowledgment conditions are satisfied and whether interrupts are acknowledged according to their priority.

(2) Calculate the exception handler address according to the current PSW value.*[1]

(3) For FE-level non-maskable/maskable interrupts, the following processing is performed:

- Save the PC to the FEPC.
- Save the PSW to the FEPSW.
- Store the exception source code in the FEIC.
- Update the PSW.*[2]
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

(4) For EI level exceptions, the following processing is performed:

- Save the PC to the EIPC.
- Save the PSW to the EIPSW.
- Store the exception source code in the EIIC.
- Update the PSW.*[2]
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

Note 1. For details, see **Section 7A.10, Exception Handler Address**.

Note 2. For the values to be updated, see *Table 4.1 Exception Cause List* in *the RH850G3KH User's Manual: Software*.

The following figure shows steps (1) to (4).

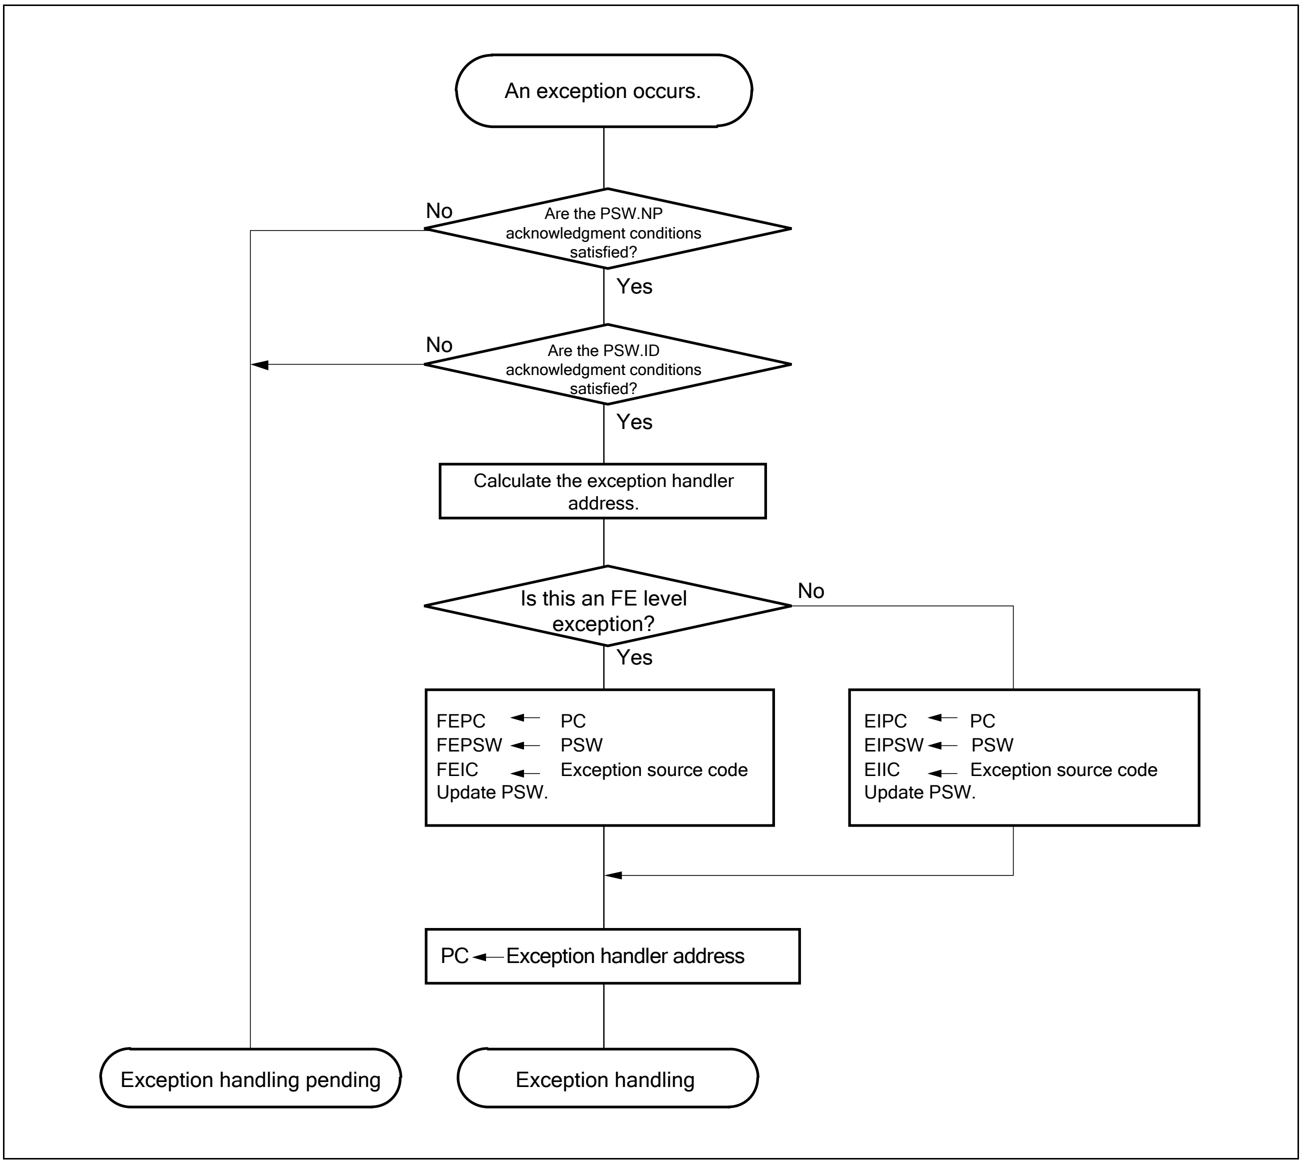

Figure 7A.2 Operation when Acknowledging an Interrupt

7A.7.1 Exception Source Codes for Different Types of SYSERR Exceptions

The following table lists exception source codes for the different types of SYSERR exceptions.

Table 7A.22 Exception Source Codes for Different Types of SYSERR Exceptions

Exception Source Code	Source of SYSERR Generation
11_H	● Detection of an error during the fetching of an instruction from the code flash memory area
13_H	● Detection of an error during the fetching of an instruction from the local, global or retention RAM areas
14_H	● Detection of an error during access to data in the code flash area ● Detection of an error during read access to a module via the system interconnect or PBUS The exception source code reports an occurrence of a system error factor corresponding to VCIF bit of SEGFLAG register*[1]
16_H	● Detection of an error during access to data in the own local RAM areas The exception source code reports an occurrence of a system error factor corresponding to TCMF bit of SEGFLAG register*[1]
18_H	● Detection of an IPG error The exception source code reports an occurrence of a system error factor corresponding to VCIF, IPGF bit of SEGFLAG register*[1]
19_H	● Detection of an error during write access to a module via the PBUS The exception source code reports an occurrence of a system error factor corresponding to APIF bit of SEGFLAG register*[1]
$1A_H$	● Detection of an error inside system interconnect The exception source code reports an occurrence of a system error factor corresponding to VCSF bit of SEGFLAG register*[1]

Note 1. See **Section 3A.2.4.3, System Error Generator Function (SEG)** for details.

7A.8 Return from Interrupts

To return from interrupt handling, execute the return instruction (EIRET or FERET) corresponding to each relevant interrupt level.

When a context has been saved in a stack and the like, the context must be restored before executing the return instruction.

The EIRET instruction is used to return from the EI level maskable interrupt handling and the FERET instruction is used to return from FE-level maskable interrupt handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes its control to the return PC address:

(1) When returning from the service routine for an EI-level exception, the PC and PSW values on return are loaded from the EIPC and EIPSW registers.
When returning from the service routine for an FE-level exception, the PC and PSW values on return are loaded from the FEPC and FEPSW registers.

(2) Control is passed to the addresses indicated by the return PC and PSW that were loaded.

(3) When EP = 0 and INTCFG.ISPC = 0, the CPU updates the ISPR register.

The flows for returning from exception handling using the EIRET and FERET instructions are shown below.

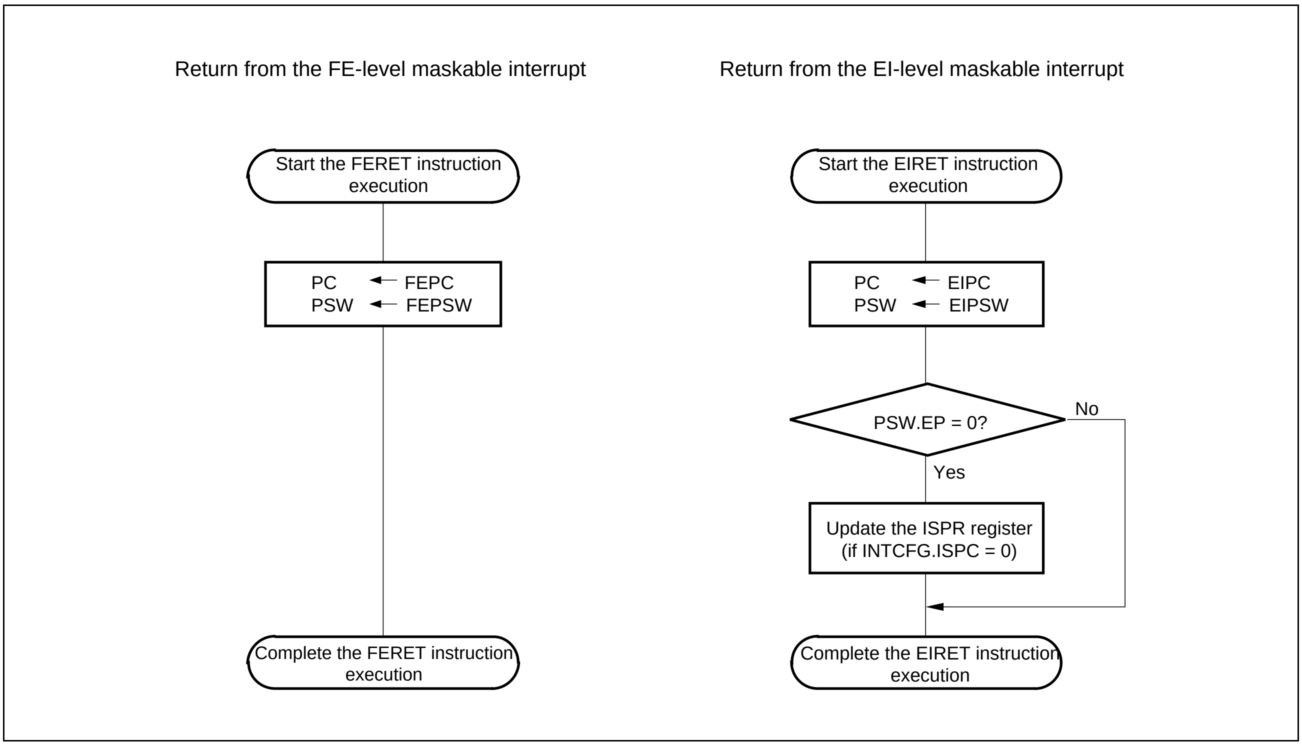

Figure 7A.3 Flow of Return from Interrupts

7A.9 Interrupt Operation

7A.9.1 Interrupt Mask Function of EI Level Maskable Interrupt (EIINT)

Interrupt masking can be specified for each respective interrupt channel of EIINT. Interrupt masking is performed by the following register settings.

Table 7A.23 Operation of the MKxxx Bit

ICxxx.MKxxx	Operation
1	Masks interrupt
0	Enables interrupt

The ICxxx.MKxxx bits can also be read and written via the corresponding IMRmEIMKn bits of the IMRm registers. The interrupt mask state is reflected in both the ICxxx registers and the IMRm registers.

[Operation example]

(1) When a 1 is written to an IMRm.IMRmEIMKn bit, interrupts are prohibited for the corresponding channel.

(2) When the corresponding ICxxx.MKxxx bit is read, 1 is returned.

CAUTION

If the MKxxx bit is set to 0 while an interrupt request is pending (RFxxx = 1), the interrupt service routine will be executed at that time (subject to the rules of interrupt prioritization). Even if an interrupt request is issued in software by setting the RFxxx bit to 1, the interrupt will not occur as long as the interrupt is masked with MKxxx = 1.
To cancel an interrupt request that is pending, clear the corresponding RFxxx bit in software.

7A.9.2 Interrupt Priority Level Judgment

When FE level non-maskable interrupts (FENMI), FE level maskable interrupts (FEINT), and EI level maskable interrupts (EIINT) are input, priorities including other exceptions are determined, and the exception with the highest priority (including interrupts) is processed. Exceptions occurred at the same time (including interrupts) are processed in a pre-allocated priority order (the default priority order). The priority orders of FENMI, FEINT, and EIINT interrupts are as follows.

FENMI > FEINT > EIINT

See *the RH850G3KH User's Manual: Software* for other exceptions.

For EIINT(INTn) interrupts, the interrupt priority can be set independently for each interrupt source. Specify the interrupt priority with the bits P3xxx to P0xxx. The interrupt priority levels can be set from 0 to 15: 0 is the highest and 15 is the lowest. Among multiple EIINT(INTn) interrupts with the same priority level, the interrupt with the lowest interrupt channel number has priority.

Table 7A.24 Example of EIINT (INTn) Interrupt Priority Level Settings and Priority Levels during Operation

EIINT (INTn)	ICxxx.P[3:0]xxx Setting	Priority Level During Operation
INT0	3	10
INT1	4	11
INT2	0	1
INT3	0	2
INT4	1	3
INT5	2	6
INT6	2	7
INT7	1	4
INT8	1	5
INT9	2	8
INT10	2	9

The interrupt controller executes multiple interrupt handling when another interrupt request is acknowledged while an interrupt processing is being executed. When multiple EIINT (INTn) interrupts occur at the same time, the interrupt to be acknowledged is determined by the following procedure.

7A.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled

Interrupts with the same or lower priority level as the interrupt currently being handled are held pending.

The priority level of the interrupt currently being handled is stored in the ISPR register.

Interrupts with a higher priority level than the interrupt currently being handled proceed to the next priority judgment stage.

7A.9.2.2 Masking through Priority Mask Register (PMR)

Only interrupts enabled by the PMR register proceed to the next priority judgment stage.

For the PMR register, see **Table 3A.34, PMR Register Contents**, or *the RH850G3KH User's Manual: Software*.

7A.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected

When interrupts are requested simultaneously from multiple sources, the interrupt set the highest priority by ICxxx.P[3:0]xxx bits takes priority.

When there are multiple highest priority interrupts, the lowest interrupt channel number is selected.

7A.9.2.4 Interrupt Suspended by CPU

Interrupt acknowledgment is held according to the state of the NP and ID bits of the PSW register. At this time, priority judgment among EIINT interrupts, and priority judgment among EIINT, FEINT and FENMI interrupts are performed even while interrupt acknowledgment is pending, and the interrupt with the highest priority is selected when the acknowledgment condition is satisfied.

Example

An EIINT interrupt with the priority level 5 has already been requested and interrupt generation is pending because the value of the PSW.ID bit is 1. If a subsequent EIINT interrupt with the priority level 3 is requested and the PSW.ID bit is cleared to 0, the latter EIINT interrupt (with the priority level 3) will be generated.

Figure 7A.4, Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1) shows an example of multiple interrupt handling when another interrupt request is acknowledged while interrupt processing is being executed.

When an interrupt request signal is acknowledged, the PSW.ID flag is automatically set to 1. Therefore, the ID flag should be cleared to 0 to execute multiple interrupt handling. Specifically, execute the EI instruction and the like in an interrupt handling program to enable the interrupt.

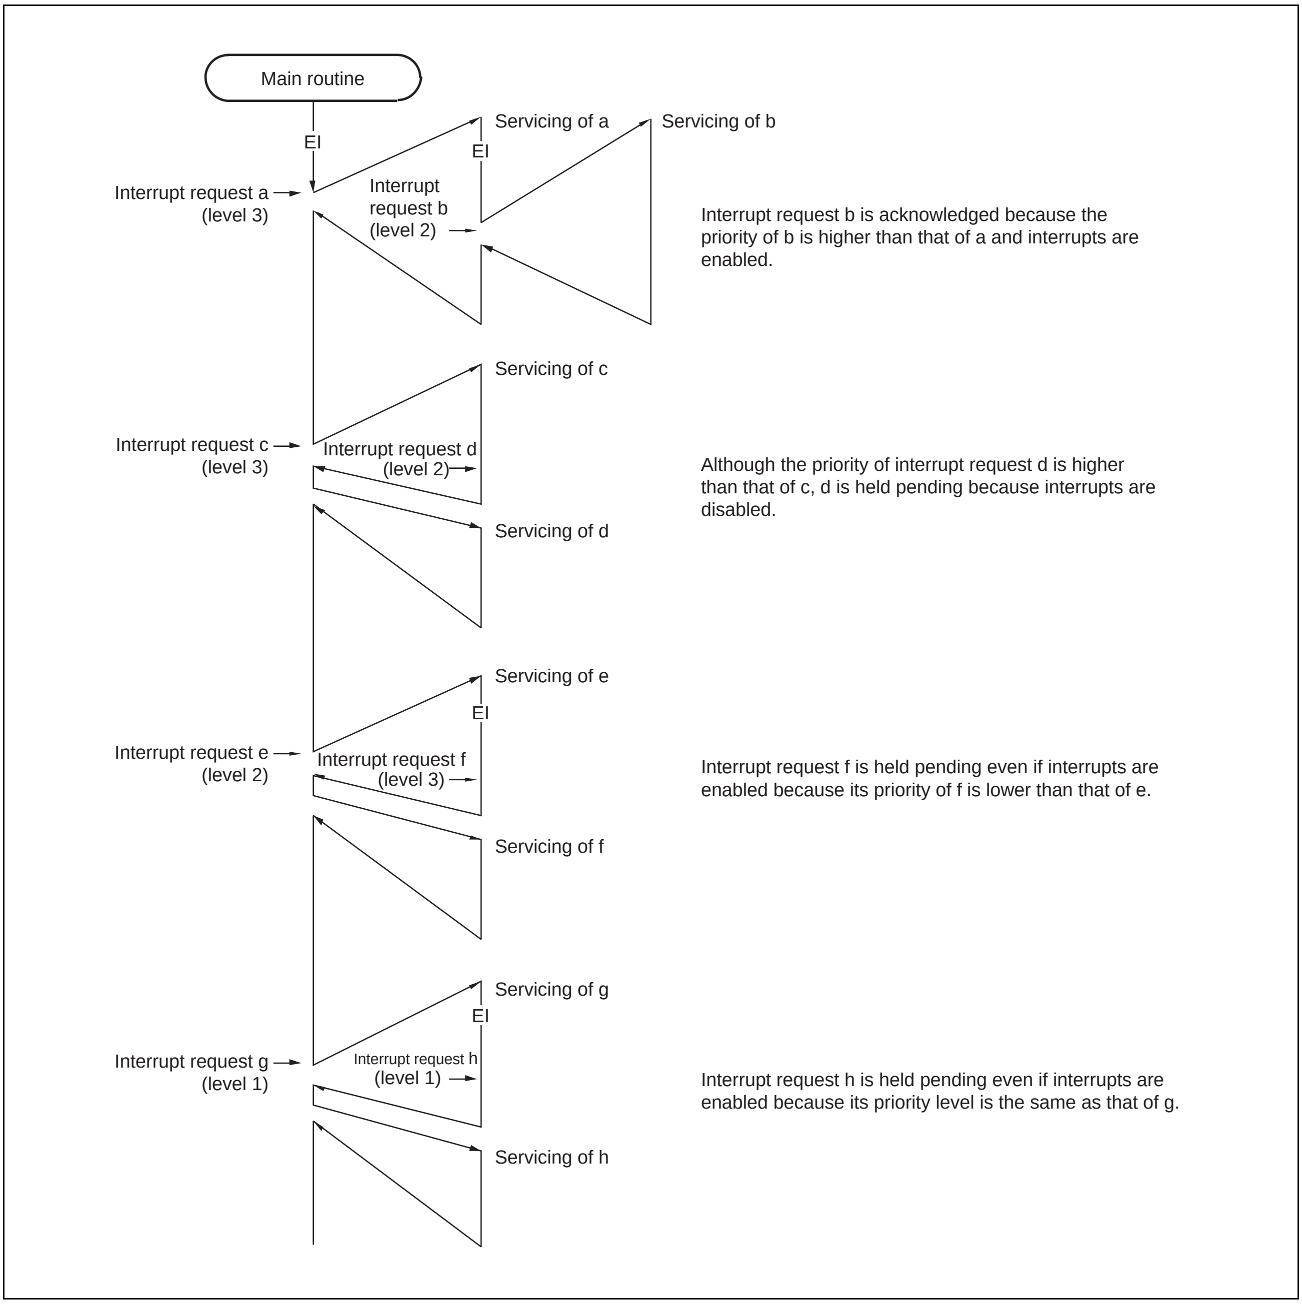

Figure 7A.4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1)

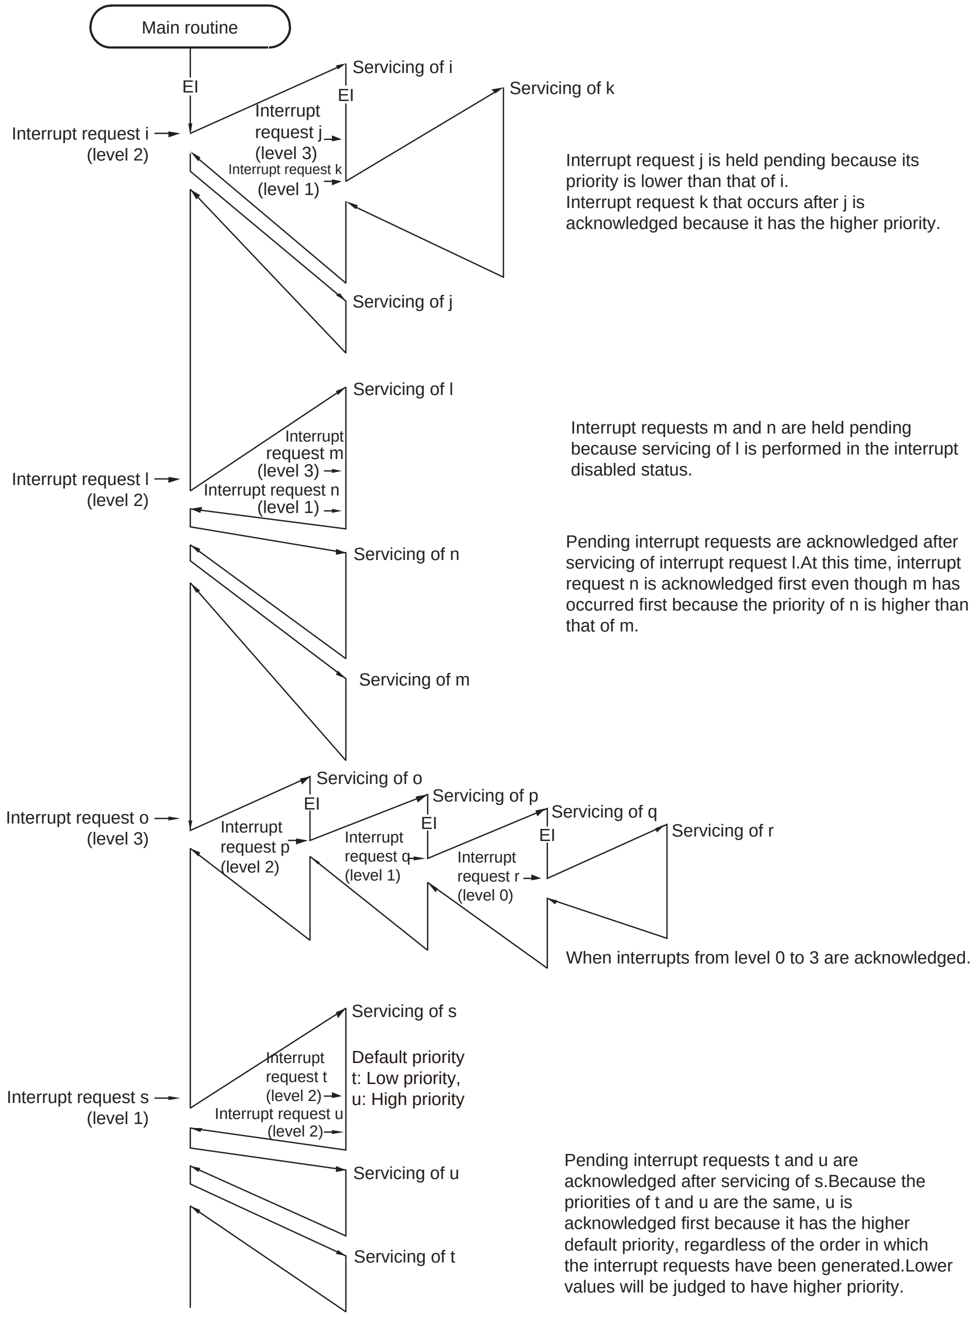


Interrupt request j is held pending because its priority is lower than that of i. Interrupt request k that occurs after j is acknowledged because it has the higher priority.

Interrupt requests m and n are held pending because servicing of l is performed in the interrupt disabled status.

Pending interrupt requests are acknowledged after servicing of interrupt request l.At this time, interrupt request n is acknowledged first even though m has occurred first because the priority of n is higher than that of m.

When interrupts from level 0 to 3 are acknowledged.

Pending interrupt requests t and u are acknowledged after servicing of s.Because the priorities of t and u are the same, u is acknowledged first because it has the higher default priority, regardless of the order in which the interrupt requests have been generated.Lower values will be judged to have higher priority.

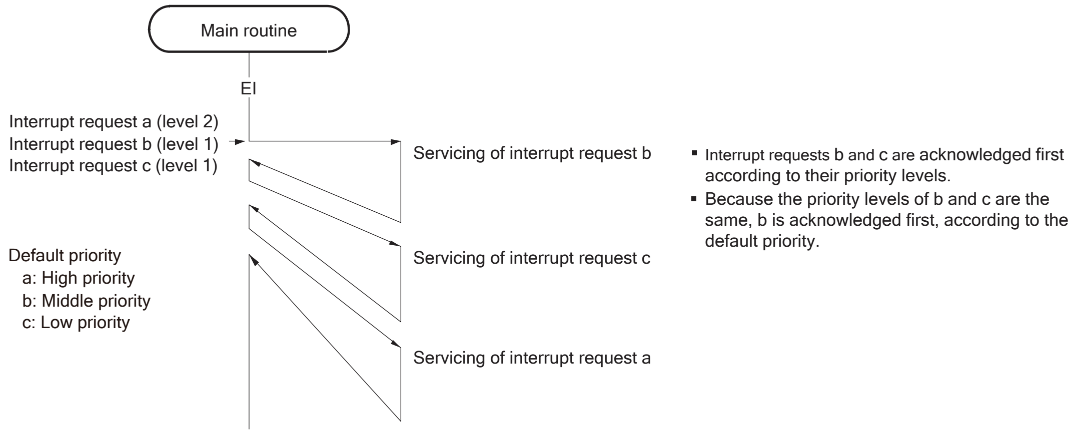
Note 1. “a” to “u” in the figure are the temporary names of interrupt request signals shown for the sake of explanation.

Note 2. The default priority (high/low) in the figure indicates the relative priority between two interrupt request signals.

Figure 7A.5 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (2)

CAUTION

To perform multiple interrupt servicing, the values of the EIPC and EIPSW registers must be saved before executing the EI instruction. When returning from multiple interrupt servicing, restore the values of EIPC and EIPSW after executing the DI instruction.



Note 1. “a” to “c” in the figure are the temporary names of interrupt request signals shown for the sake of explanation.

Note 2. The default priority (high/low) in the figure indicates the relative priority between two interrupt request signals.

Figure 7A.6 Example of Servicing Simultaneously Generated Interrupt Requests

7A.9.3 Interrupt Request Acknowledgement Conditions and the Priority

See *the RH850G3KH User's Manual: Software*.

7A.9.4 Exception Priority of Interrupts and the Priority Mask

See *the RH850G3KH User's Manual: Software*.

7A.9.5 Interrupt Priority Mask

See *the RH850G3KH User's Manual: Software*.

7A.9.6 Priority Mask Function

The priority mask function prohibits all EIINT interrupts of the specified interrupt priority level.

The interrupt priority levels to be masked are specified in the PMR register. Masking and acknowledgment can be set for each priority level.

The following operations are possible using this function:

- Temporary prohibition of interrupts that have a priority level that is lower than a given priority level
- Temporary prohibition of interrupts that have a given priority level

Table 7A.25 Operation of the PMR.PMm Bit

PMR.PMm	Operation
0	Acknowledges requests from priority level m interrupt source.
1	Masks requests from priority level m interrupt source.

Note: m = 0 to 15

The presence of EIINT interrupts held pending with this function can be checked with **Section 7A.9.7, Exception Management**.

For details on the PMR register, see **Table 3A.34, PMR Register Contents**, or *the RH850G3KH User's Manual: Software*.

7A.9.7 Exception Management

Pending interrupts can be checked in the RH850/F1KH. For details, see *the RH850G3KH User's Manual: Software*.

7A.9.8 Inter-Processor Interrupts

Four registers (IPIR_CHn) for conveying interrupts between PEs are provided.

IPIR_CH0 to IPIR_CH3 are assigned to CH0 to CH3 of user interrupt (EIINT). An interrupt for specific PEs (including own PE) can be requested by manipulating bits corresponding to respective PEs.

Interrupt priority levels can be set for each source in interrupt control registers, 16 levels for CPU1 and CPU2.

7A.9.9 Broadcast Function (Broadcast Communication Function)

All interrupts have an interrupt register and an interrupt-binding register.

Any single interrupt can be allocated to each PE by setting IBDxxx.CST to 0 (value after a reset) and IBDxxx.PEID[2:0] to a desired value.

Each interrupt which is type of edge detection can be conveyed to both PEs by using the broadcast function (setting IBDxxx.CST to 1). For detection type of each interrupt, refer to **Table 7A.4, EI Level Maskable Interrupt Sources**.

This product only supports the use of two broadcast interrupt. Accordingly, only two IBDxxx.CST bit can be set to 1 and broadcase destination (INTBN0 or INTBN1) can be selected by BCP0 bit setting.

All interrupts for INTC1 that have interrupt number 4 or 5 are allocated to the broadcast interrupt, INTBN0 or INTBN1.

- Allocating multiple interrupt channels to the broadcast interrupt is prohibited.
- The setting of the ICxxx.P[3:0] bits for the interrupt priority level of an INTxxx allocated as a broadcast interrupt is ignored.
- The ICBN0.MKBN0, ICBN1.MKBN1 interrupt mask bit of INTC1 can be used to mask broadcast interrupts for PEs.
- The interrupt vector for the broadcast interrupt of INTC1 (INTBN0, INTBN1) is the same for both PEs.

7A.9.9.1 Example of Operation

- The example is described about INTOSTM0 interrupt, which is allocated to interrupt number 84 of INTC2.
- Multiple-conveyance (broadcast) port 0 is in use (INTBN0 is in use).
- The broadcast interrupt (INTBN0) is connected to INTC1 as interrupt number 4.
- Set the IBDOSTM0.CST bit to 1_B (enabling broadcasting).
- Set the IBDOSTM0.BCP0 bit to 0_B (selecting broadcast port 0).
- Doing so leads to the allocation of the INTOSTM0 interrupt to interrupt number 4 of PE1 and PE2.
- The ICBN0.P[3:0]BN0 bits define the order of priority for this interrupt.
- The allocated mask bit is ICBN0.MKBN0 and ICBN0.RFBN0 is the interrupt request flag (accordingly, INTBN0 can be separately enabled or disabled for each PE in each INTC1).

  When INTOSTM0 is generated, this interrupt request is conveyed from INTC2 to INTC1 through the broadcast interrupt.

  Accordingly, the ICBN0.RFBN0 bit for INTC1 is set to 1_B in both PE1 and PE2.

  Both PEs execute the corresponding interrupt routine and each ICBN0.RFBN0 is automatically cleared.

  All register settings are listed in the table overleaf.

Table 7A.26 Register Settings (INTC2)

Register Name	Bit Name	Setting Value	Description
ICOSTM0	CTOSTM0	0	The user can only read the value.
	RFOSTM0	—	No function if the setting is for broadcast interrupts
	MKOSTM0	1/0	The user can set the value.
	TBOSTM0	—	No function if the setting is for broadcast interrupts
	P[3:0]OSTM0	—	No function if the setting is for broadcast interrupts
IBDOSTM0	CST	1	Interrupt input is conveyed to multiple destinations (broadcast).
	BCP0	0	Output to broadcast port 0
	PEID[2:0]	—	No function if the setting is for broadcast interrupts

Table 7A.27 Register Settings (INTC1)

Register Name	Bit Name	Setting Value	Description
ICBN0	CTBN0	0	The user can only read the value.
	RFBN0	1/0	Interrupt flag for broadcast interrupts
	MKBN0	1/0	Mask flag for broadcast interrupts
	TBBN0	1/0	The user can set the value.
	P[3:0]BN0	0 to 15	The user can set the value.
IBDBN0	CST	0	Fixed to 0
	BCP0	0	Fixed to 0
	PEID[2:0]	001 (PE1) 010 (PE2)	Fixed

7A.9.9.2 Inter-Processor Interrupt Flow

Figure 7A.7, Example of Inter-Processor Interrupt Processing Flow shows a flow example of inter-processor interrupt processing.

- Inter-processor interrupt generates an interrupt request by writing 1 to applicable bits of PE to which an interrupt of the inter-processor interrupt register (IPIR_CHn (n = 0 to 3)) are requested.
- The settings of interrupt request of the inter-PE interrupt registers (IPIR_CHn (n = 0 to 3)) are automatically cleared to 0 after notification of an interrupt request is complete.

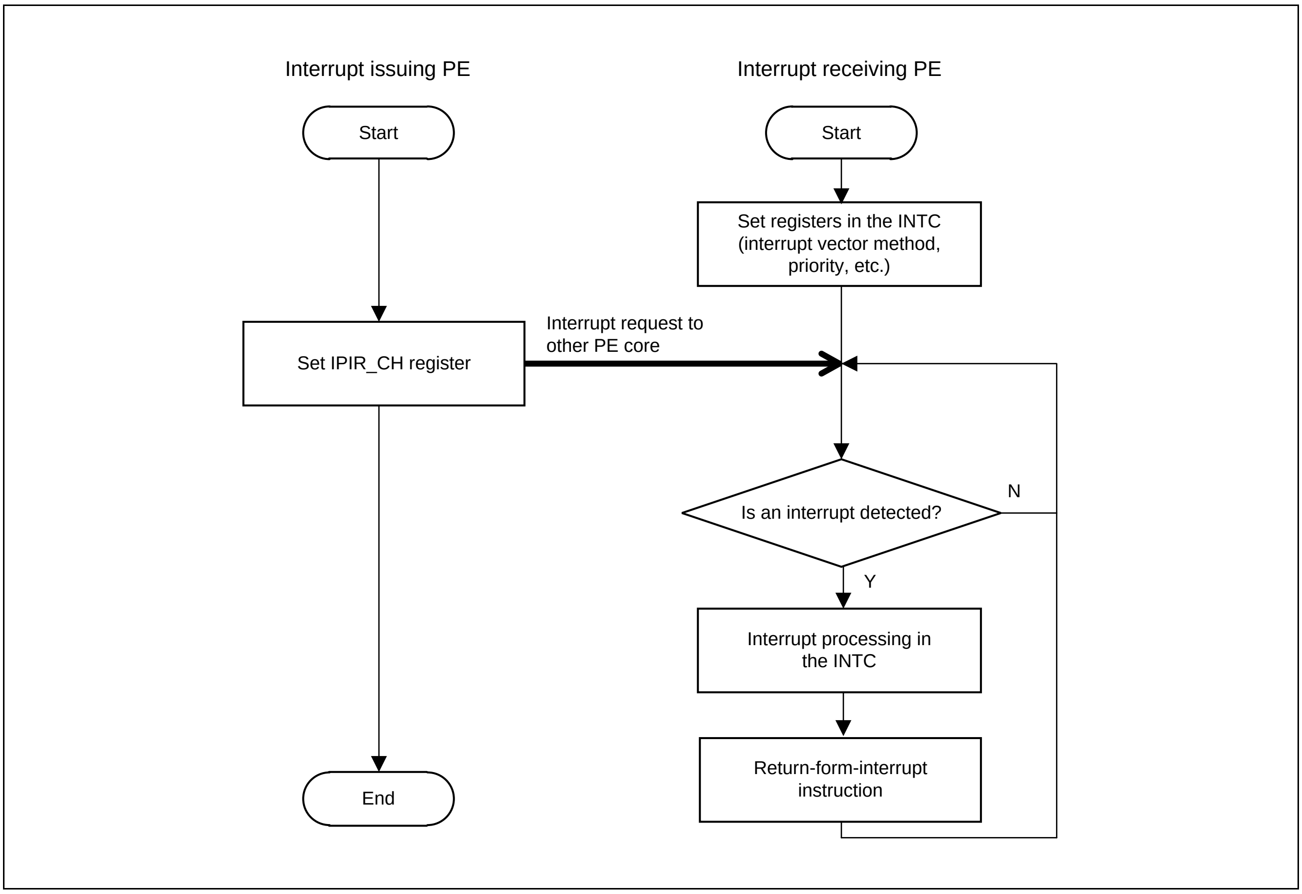


Figure 7A.7 Example of Inter-Processor Interrupt Processing Flow

7A.10 Exception Handler Address

In the RH850/F1KH, the exception handler address from which the handler is executed after a reset is input or when an exception or interrupt is acknowledged can be changed according to a setting.

The exception handler address for resets and exceptions (including interrupts) is determined with the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, the RBASE register, and the EBASE register. For interrupts, the direct vector method and table reference method can be selected for each channel. If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory.

CAUTION

The exception handler address of EIINT (INTn) selected using the direct vector method differs from that of the V850E2 core products. In the V850E2 core products, a different exception handler address is individually assigned to each interrupt channel (EIINT (INTn)). In the RH850/F1KH, one exception handler address is assigned to each interrupt priority. Consequently, interrupts that have the same priority level branch to the same exception handler.

7A.10.1 Direct Vector Method

The CPU uses the result of adding the offset shown in **Table 7A.28, Selection of Base Register/Offset Address** to the base address indicated by the RBASE or EBASE register as the exception handler address.

Select whether the RBASE or EBASE register is used as the base address by using the PSW.EBV bit*[1]. When the PSW.EBV bit is set to 1, the value of the EBASE register is used as the base address. When the PSW.EBV bit is cleared to 0, the value of the RBASE register is used as the base address.

For reset input the RBASE register is always used for reference.

In addition, user interrupts see the RINT bit of the corresponding base register, and reduce the offset address according to the bit status. If the RBASE.RINT bit or EBASE.RINT bit is set to 1, all user interrupts are handled using an offset of 100_H. If the bit is cleared to 0, the offset address is determined according to **Table 7A.28, Selection of Base Register/Offset Address**.

Note 1. Exception acknowledgment itself may sometimes update the status of the PSW.EBV bit. In this case, the base register is selected based on the updated value.

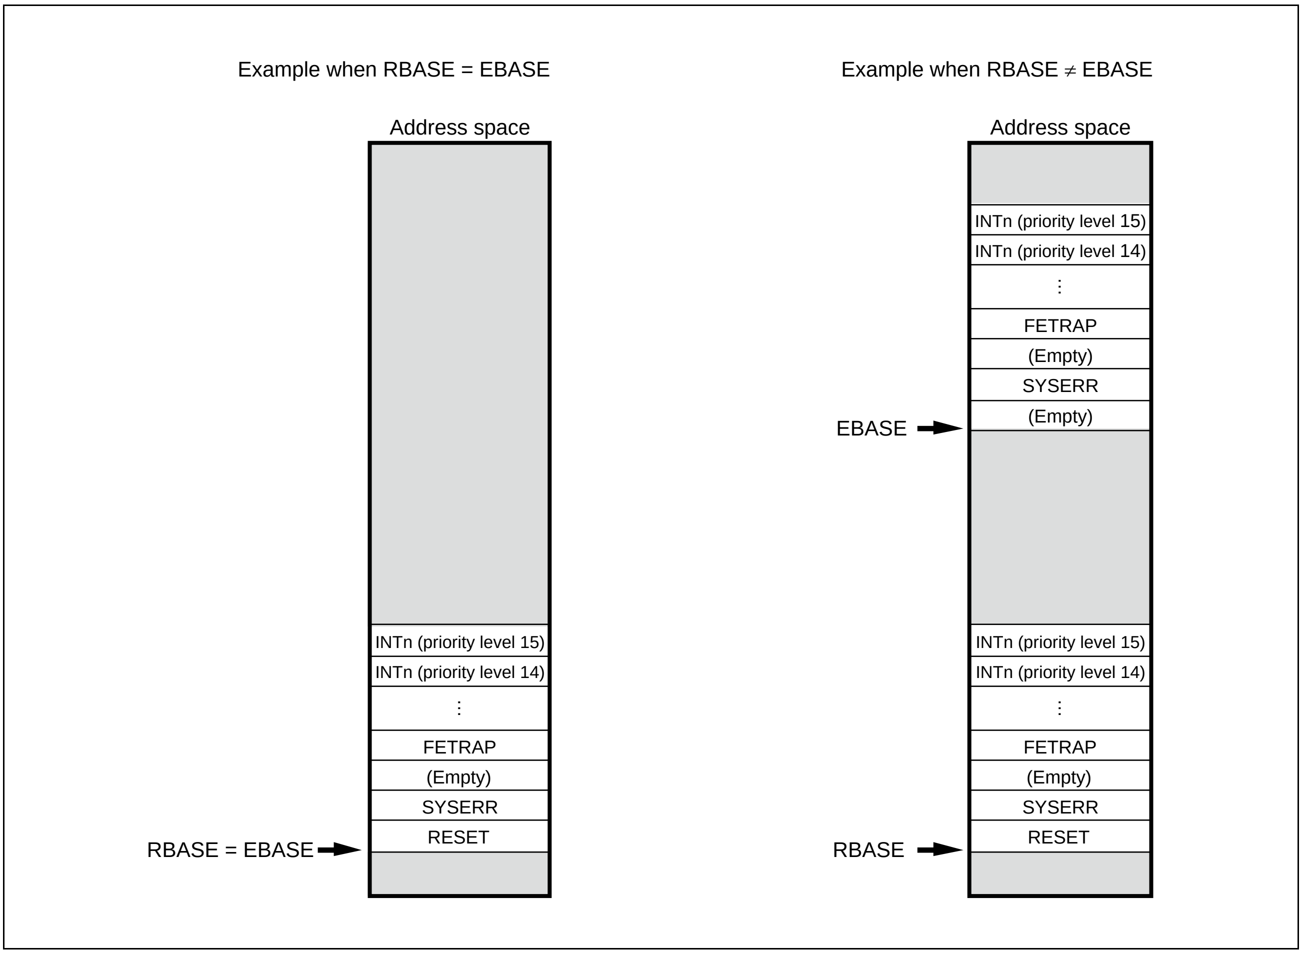

Figure 7A.8 Direct Vector Method

The table below shows how base register selection and offset address reduction function for each exception to determine the exception handler address. The value of the PSW bit determines the exception handler address on the basis of the value updated by the acknowledgment of an exception.

Table 7A.28 Selection of Base Register/Offset Address

	PSW.EBV = 0	PSW.EBV = 1	RINT = 0	RINT = 1
Exception/Interrupt	Base Register		Offset Address	
RESET	RBASE	N.A.	000_H	000_H
SYSERR		EBASE	010_H	010_H
Reserved			020_H	020_H
FETRAP			030_H	030_H
TRAP0			040_H	040_H
TRAP1			050_H	050_H
RIE			060_H	060_H
FPP/FPI			070_H	070_H
UCPOP			080_H	080_H
MIP/MDP			090_H	090_H
PIE			$0A0_H$	$0A0_H$
MAE			$0C0_H$	$0C0_H$
Reserved			$0D0_H$	$0D0_H$
FENMI			$0E0_H$	$0E0_H$
FEINT			$0F0_H$	$0F0_H$
INTn (Priority level 0)			100_H	100_H
INTn (Priority level 1)			110_H	
INTn (Priority level 2)			120_H	
INTn (Priority level 3)			130_H	
INTn (Priority level 4)			140_H	
INTn (Priority level 5)			150_H	
INTn (Priority level 6)			160_H	
INTn (Priority level 7)			170_H	
INTn (Priority level 8)			180_H	
INTn (Priority level 9)			190_H	
INTn (Priority level 10)			$1A0_H$	
INTn (Priority level 11)			$1B0_H$	
INTn (Priority level 12)			$1C0_H$	
INTn (Priority level 13)			$1D0_H$	
INTn (Priority level 14)			$1E0_H$	
INTn (Priority level 15)			$1F0_H$	

Base register selection is used to execute exception handling for resets and some hardware errors by using the programs in a relatively reliable area such as ROM instead of the areas that are easily affected by software errors such as RAM and cache area. The user interrupt offset address reduction function is used to reduce the memory occupation size required by the exception handler for specific system-internal operating modes. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

7A.10.2 Table Reference Method

With the direct vector method, there is one user-interrupt exception handler for each interrupt priority level, and interrupt channels that indicate multiple interrupts with the same priority branch to the same interrupt handler, but some users might want to use different code areas for each interrupt handler from the beginning.

The RH850/F1KH uses the table reference method for interrupts that assume the above usage.

If the table reference method is specified as the interrupt channel vector selection method in the interrupt controller and the like, the method for determining the exception handler address when an interrupt request corresponding to that interrupt channel is acknowledged differs as follows:

<1> In any of the following cases, the exception handler address is determined by using the direct vector method:

- When PSW.EBV = 0 and RBASE.RINT = 1
- When PSW.EBV = 1 and EBASE.RINT = 1
- When the interrupt channel setting is not the table reference method

<2> In cases other than <1>, calculate the table reference position.
Exception handler address read position = INTBP register + channel number × 4 bytes

<3> Read word data starting at the interrupt handler address read position calculated in <2>.

<4> Use the word data read in <3> as the exception handler address.

Table 7A.29, Exception Handler Address Expansion shows the exception handler address read positions corresponding to each interrupt channel and
Figure 7A.9, Table Reference Method shows an overview of the allocation in memory.

Table 7A.29 Exception Handler Address Expansion

Type of Interrupt	Exception Handler Address Read Position
EI level maskable interrupt channel 0	INTBP register value + 0 × 4
EI level maskable interrupt channel 1	INTBP register value + 1 × 4
EI level maskable interrupt channel 2	INTBP register value + 2 × 4
:	:
EI level maskable interrupt channel 380	INTBP register value + 380 × 4
EI level maskable interrupt channel 381	INTBP register value + 381 × 4

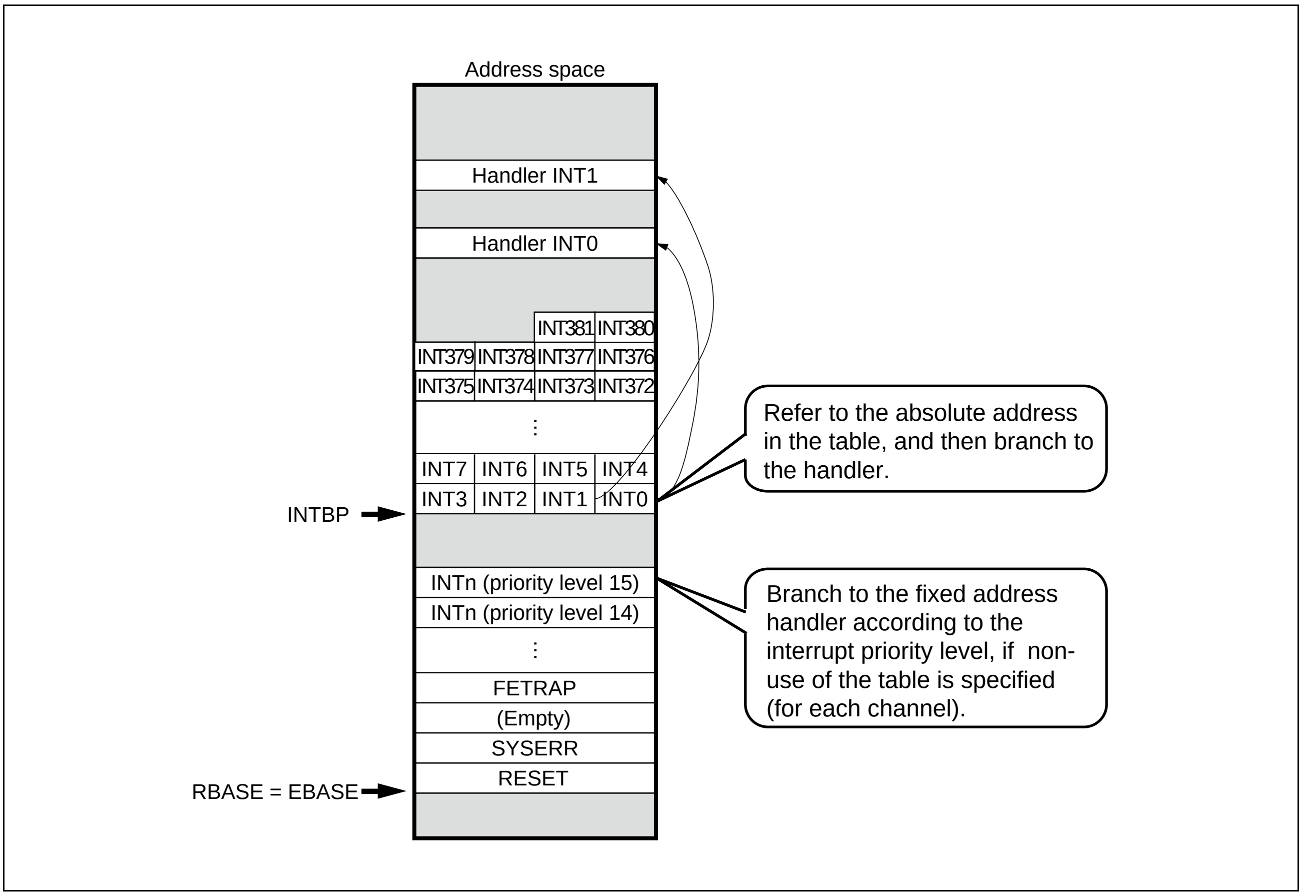

Figure 7A.9 Table Reference Method

Section 7BC Exception/Interrupts of RH850/F1KM

7BC.1 Features of RH850/F1KM Exception/Interrupts

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions.

The details on exceptions are described in *the RH850G3KH User's Manual: Software*.

Table 7BC.1 List of Exception Sources

Name	Symbol	Source	Priority	Saved to
Reset	RESET	Reset input	High	—
FE level non-maskable interrupt*[1]	FENMI	FENMI input		FE
System error exception	SYSERR	SYSERR input		FE
FE level maskable interrupt*[1]	FEINT	FEINT input		FE
Floating-point arithmetic exception (imprecise)	FPI	Execution of FPU instruction		EI
EI level maskable interrupt*[1]	EIINT	Interrupt controller		EI
Memory protection exception (execution right)	MIP	Memory protection violation		FE
System error exception	SYSERR	Error input at instruction fetch		FE
Reserved instruction exception	RIE	Execution of reserved instruction		FE
Coprocessor unusable exception	UCPOP	Execution of coprocessor instruction/access right violation		FE
Privileged instruction exception	PIE	Execution of privileged instruction		FE
Misaligned exception	MAE	Generation of misaligned access		FE
Memory protection exception (access right)	MDP	Memory protection violation		FE
Floating-point arithmetic exception (precise)	FPP	Execution of FPU instruction		EI
System call	SYSCALL	Execution of SYSCALL instruction		EI
FE level trap	FETRAP	Execution of FETRAP instruction		FE
EI level trap 0	TRAP0	Execution of TRAP instruction		EI
EI level trap 1	TRAP1	Execution of TRAP instruction	Low	EI

Note 1. These interrupt exceptions are described in this section.

(1) Interrupts

The following three exceptions in **Table 7BC.1, List of Exception Sources** are called interrupts, and are described in this section.

- FE level non-maskable interrupt (FENMI)
  An FENMI interrupt is acknowledged even if another FE level interrupt - FEINT - has been generated.
  - An FENMI interrupt is acknowledged even if the CPU system register PSW.NP = 1.
  - Return from an FENMI interrupt is not possible and neither is recovery.
- FE level maskable interrupt (FEINT)
  - FEINT can be acknowledged if the CPU system register PSW.NP = 0. It is masked if PSW.NP = 1.
  - Return from an FEINT interrupt is possible and so is recovery.
- EI level maskable interrupt (EIINT)
  An EIINT interrupt can be acknowledged if an FE level interrupt - FENMI or FEINT - has not been generated.
  - EIINT can be acknowledged if the CPU system register PSW.NP = 0.
    It is masked if PSW.NP = 1, EIINT with a higher priority is being processed, or PSW.ID = 1.
  - Return from an EIINT interrupt is possible and so is recovery.
  - Interrupt masking can be specified for each interrupt channel.
  - 16 interrupt priority levels can be specified for each interrupt channel
  - In this section, the EIINT that corresponds to interrupt channel n is indicated by “INTn”, whereas the EIINT that corresponds to interrupt source xxx is indicated by “INTxxx”.

For the PSW register, see **Table 3BC.10, PSW Register Contents** and *the RH850G3KH User’s Manual: Software*.

NOTE

Return:	Indicates whether or not the program can resume from where it was interrupted.
Recovery:	Indicates whether or not the processor status (status of processor resources including general-purpose registers and system registers) can be restored to the status they were in when the program was interrupted.

These interrupt sources are described in **Section 7BC.2, Interrupt Sources**.

(2) Overview of interrupts

- Priority levels for interrupt
  16 priority levels of maskable interrupts by request can be set by interrupt control register.
- Detecting methods of external interrupts (TNMI/INTPm)
  A method of detecting external interrupts (TNMI and INTPm) can be selected from five types:
  rising edge, falling edge, both edges, low level, and high level.
- 2 types of interrupt handler address setting Direct branching method or table referencing method is selectable by register setting.

7BC.2 Interrupt Sources

7BC.2.1 Interrupt Sources

7BC.2.1.1 FE Level Non-Maskable Interrupts

(1) Priority

See **Table 7BC.1, List of Exception Sources**.

(2) Return PC

Return or recovery from an FE non-maskable interrupt is not possible.

(3) Status Register

See **Section 7BC.4.4, FNC — FE Level NMI Status Register**.

(4) Return Instruction

None

Table 7BC.2 FE Level Non-Maskable Interrupt Requests

Interrupt			Interrupt Request					
	Control Register							
Symbol	Name	Address	Name	Source	Unit	Priority	Exception Source Code	Handler Address 00000...
FENMI	FNC	FFFE $EA78_H$	TNMI	NMI pin	Port	*1	$0E0_H$	$0E0_H$
			WDTA0NMI	WDTA0 FENMI interrupt	WDTA0			
			WDTA1NMI	WDTA1 FENMI interrupt	WDTA1			

Note 1. See **Table 7BC.1, List of Exception Sources**.

The source of the FENMI interrupt can be evaluated by a dedicated flag register. See **Section 7BC.2.2, FE Level Non-Maskable Interrupt Sources** for details.

7BC.2.1.2 FE Level Maskable Interrupts

(1) Priority

See **Table 7BC.1, List of Exception Sources**.

(2) Return PC

The return PC returned from an interrupt handling routine by the FERET instruction is the PC from when the program was suspended (current PC).

(3) Status Register

See **Section 7BC.4.5, FIC — FE Level Maskable Interrupt Status Register**.

(4) Return Instruction

FERET

Table 7BC.3 FE Level Maskable Interrupt Requests (RH850/F1KM-S4)

Interrupt			Interrupt Request										
	Control Register												
Symbol	Name	Address	Name	Source	Unit	100 Pins	144 Pins	176 Pins	233 Pins	272 Pins	Priority	Exception Source Code	Handler Address 00000...
FEINT	FIC	FFFE EA7A$_H$	INTLVIL	LVI voltage detection (falling)	LVI	✓	✓	✓	✓	✓	*1	0F0$_H$	0F0$_H$
			INTECCEEP0	Data flash ECC 1-bit error or 2-bit error interrupt	Data flash	✓	✓	✓	✓	✓			
			INTECCFLRAM	FLXA0 ECC 1-bit error or 2-bit error interrupt	FLXA0	✓	✓	✓	✓	✓			
			INTECCCNFDRAM	RCFDC0 ECC 1-bit error or 2-bit error interrupt	RCFDC0	✓	✓	✓	✓	✓			
			INTECCCSIH0	CSIH0 ECC 1-bit error or 2-bit error interrupt	CSIH0	✓	✓	✓	✓	✓			
			INTECCCSIH1	CSIH1 ECC 1-bit error or 2-bit error interrupt	CSIH1	✓	✓	✓	✓	✓			
			INTECCCSIH2	CSIH2 ECC 1-bit error or 2-bit error interrupt	CSIH2	✓	✓	✓	✓	✓			
			INTECCCSIH3	CSIH3 ECC 1-bit error or 2-bit error interrupt	CSIH3	✓	✓	✓	✓	✓			
			INTECCFLI0	Code Flash ECC 1-bit error or 2-bit error interrupt	Code flash	✓	✓	✓	✓	✓			
			INTECCRAM	RAM ECC 1-bit error or 2-bit error interrupt	RAM	✓	✓	✓	✓	✓			
			INTOSTM0_FE*2	OSTM0 interrupt	OSTM0	✓	✓	✓	✓	✓			
			INTLVIH	LVI voltage detection (rising)	LVI	✓	✓	✓	✓	✓			
			INTGUARD	PE Guard (PEG) error or Global RAM Guard (GRG) error or Peripheral Guard (PBG/HBG/PBGC)	PEG, GRG, PBG/HBG/PBGC	✓	✓	✓	✓	✓			
			INTOSTM1_FE	OSTM1 interrupt	OSTM1	✓	✓	✓	✓	✓			
			INTOSTM2_FE	OSTM2 interrupt	OSTM2	✓	✓	✓	✓	✓			
			INTOSTM3_FE	OSTM3 interrupt	OSTM3	✓	✓	✓	✓	✓			
			INTOSTM4_FE	OSTM4 interrupt	OSTM4	✓	✓	✓	✓	✓			
			INTECCETH	ETNB0 ECC 1-bit error or 2-bit error interrupt	ETNB0	—	—	✓	✓	✓			
			INTDMAERR	DMA transfer error interrupt	PDMA0	✓	✓	✓	✓	✓			

Note 1. See **Table 7BC.1, List of Exception Sources**.

Note 2. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTM0 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM0.

* Timing monitor (TSU)
This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

Table 7BC.4 FE Level Maskable Interrupt Requests (RH850/F1KM-S1)

Interrupt			Interrupt Request									
	Control Register											
Symbol	Name	Address	Name	Source	Unit	48 Pins	64 Pins	80 Pins	100 Pins	Priority	Exception Source Code	Handler Address 00000...
FEINT	FIC	FFFE EA7A_H	INTLVIL	LVI voltage detection (falling)	LVI	✓	✓	✓	✓	*1	0F0_H	0F0_H
			INTECCEEP0	Data flash ECC 1-bit error or 2-bit error interrupt	Data flash	✓	✓	✓	✓			
			INTECCCNFDRAM	RCFDC0 ECC 1-bit error or 2-bit error interrupt	RCFDC0	✓	✓	✓	✓			
			INTECCCSIH0	CSIH0 ECC 1-bit error or 2-bit error interrupt	CSIH0	✓	✓	✓	✓			
			INTECCCSIH1	CSIH1 ECC 1-bit error or 2-bit error interrupt	CSIH1	—	—	✓	✓			
			INTECCCSIH2	CSIH2 ECC 1-bit error or 2-bit error interrupt	CSIH2	—	—	✓	✓			
			INTECCCSIH3	CSIH3 ECC 1-bit error or 2-bit error interrupt	CSIH3	—	—	—	✓			
			INTECCFLI0	Code Flash ECC 1-bit error or 2-bit error interrupt	Code flash	✓	✓	✓	✓			
			INTECCRAM	RAM ECC 1-bit error or 2-bit error interrupt	RAM	✓	✓	✓	✓			
			INTOSTM0_FE*2	OSTM0 interrupt	OSTM0	✓	✓	✓	✓			
			INTLVIH	LVI voltage detection (rising)	LVI	✓	✓	✓	✓			
			INTGUARD	PE Guard (PEG) error or Peripheral Guard (PBG/PBGC)	PEG, PBG/PBGC	✓	✓	✓	✓			
			INTDMAERR	DMA transfer error interrupt	PDMA0	✓	✓	✓	✓			

Note 1. See **Table 7BC.1, List of Exception Sources**.

Note 2. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited. When INTOSTM0 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM0.

* Timing monitor (TSU)
This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

7BC.2.1.3 EI Level Maskable Interrupts

(1) Interrupt Naming Rules

The composition of the interrupt request signal names, their assigned interrupt control registers and the bits in these registers follow special rules.

In the following the name of the specific interrupt request is represented by <*name*>.

For details of the names used in **IC**<*name*>, see **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

- Interrupt request name: **INT**<*name*>
  The prefix "**INT**" is appended to <*name*>.
- Interrupt request control register: **IC**<*name*>
  The prefix "**IC**" is appended to <*name*>.
  The 16-bit register **IC**<*name*> can also be accessed in byte units:
  - Low byte (bits [7:0]) of the **IC** <*name*> register: **IC** <*name*>L
    The suffix "L" is appended to the register name **IC**<*name*>.
  - High byte (bits [15:8]) of the **IC** <*name*> register: **IC** <*name*>H
    The suffix "H" is appended to the register name **IC**<*name*>.
- Interrupt control register bit names: **CT**<*name*>, **RF**<*name*>, **MK**<*name*>, **TB**<*name*>, **P3**<*name*>, **P2**<*name*>, **P1**<*name*>, **P0**<*name*>
  The bit prefix "**CT**", "**RF**", "**MK**", "**TB**", "**P3**", "**P2**", "**P1**", or "**P0**" is appended to the interrupt <*name*>.

Example

The interrupt request from channel 2 of TAUD0 channel (<*name*> = *TAUD0I2*) is named

INTTAUD0I2

The related interrupt control registers are

ICTAUD0I2, **IC**TAUD0I2L, **IC**TAUD0I2H

The bits in this register are

CTTAUD0I2,RFTAUD0I2, MKTAUD0I2, TBTAUD0I2, P3TAUD0I2, P2TAUD0I2,
P1TAUD0I2, P0TAUD0I2

(2) Priority

See **Table 7BC.1, List of Exception Sources**.

(3) Return PC

The return PC returned from an interrupt handling routine by the EIRET instruction is the PC from when the program was suspended (current PC).

(4) Control Register

EI level maskable interrupt control register

See **Section 7BC.4.2, ICxxx — EI Level Interrupt Control Registers**.

(5) Return Instruction

EIRET instruction

(6) Configuration

EI-level maskable interrupts are controlled by the two controllers, INTC1 and INTC2. The interrupts are supported on a total of 377 channels with a cascade connection of INTC1 and INTC2.

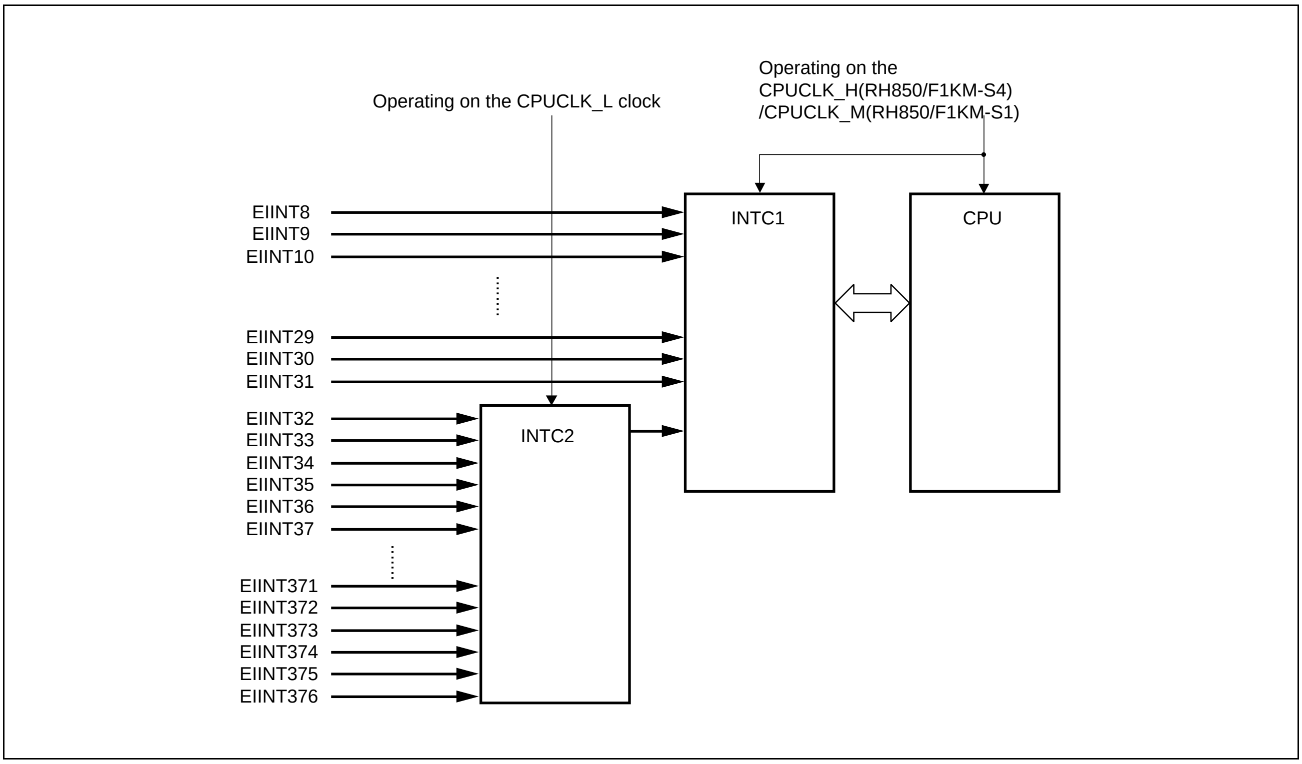

Figure 7BC.1 Configuration Diagram of EI Level Maskable Interrupt

CAUTION

As CPUCLK_L is the operating clock for INTC2, the EIINT32 to EIINT376 interrupts, which are connected to INTC2, are delayed more than the interrupts directly connected to INTC1.

Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4), **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)** lists EI level maskable interrupts.

Table 7BC.5 EI Level Maskable Interrupt Sources (RH850/F1KM-S4)

Interrupt			Interrupt Request				Exception Source Code	100 Pins	144 Pins	176 Pins	233 Pins	272 Pins	Handler Address (Offset)*8		
Channel No.*1	Control Register					Detection Type*2							Direct Jumping to an Address		Reference to a Table*5
	Name	Address	Name	Source	Unit								RINT = 0	RINT = 1	
0	Reserved	FFFE EA00$_H$					1000$_H$	—	—	—	—	—	*3	*4	+000$_H$
1	Reserved	FFFE EA02$_H$					1001$_H$	—	—	—	—	—			+004$_H$
2	Reserved	FFFE EA04$_H$					1002$_H$	—	—	—	—	—			+008$_H$
3	Reserved	FFFE EA06$_H$					1003$_H$	—	—	—	—	—			+00C$_H$
4	Reserved	FFFE EA08$_H$					1004$_H$	—	—	—	—	—			+010$_H$
5	Reserved	FFFE EA0AH					1005$_H$	—	—	—	—	—			+014$_H$
6	Reserved	FFFE EA0C$_H$					1006$_H$	—	—	—	—	—			+018$_H$
7	Reserved	FFFE EA0E$_H$					1007$_H$	—	—	—	—	—			+01C$_H$
8	ICTAUD0I0	FFFE EA10$_H$	INTTAUD0I0*6	Interrupt for CH0 of TAUD0	TAUD0	Edge	1008$_H$	✓	✓	✓	✓	✓			+020$_H$

Note 1. Each interrupt is connected to INTC1 channel 8 to 31 and INTC2 channel 32 to 376.

Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an EI level interrupt control register. For details, see **Section 7BC.4.2, ICxxx — EI Level Interrupt Control Registers**. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. The procedure shown in **Section 3BC.3.1, Synchronization of Store Instruction Completion and Subsequent Instruction Execution** are required to reflect the result of the register update to the subsequent instruction.

Note 3. Irrespective of interrupt channels, an offset address is determined in the range from +100$_H$ to 1F0$_H$ according to the priority (0 to 15).

Note 4. Irrespective of the priority, offset addresses are uniformly +100$_H$.

Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.
Exception handler address read position = INTBP register + channel number × 4 bytes

Note 6. The same interrupt source is assigned to different interrupt channels. For details, see **Section 7BC.5.2, SELB_INTC1 — INTC1 Interrupt Select Register**.

Note 7. 32 interrupt sources are assigned to the same interrupt channel. For details, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.

Note 8. For details, see **Section 7BC.10, Exception Handler Address**.

Note 9. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible.
It is used as FEINT when OSTM0 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM0 functions as anything other than the TSU function.

Note 10. For details on the interrupt source, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

Table 7BC.6 EI Level Maskable Interrupt Sources (RH850/F1KM-S1)

354	Reserved	FFFF B2C4$_H$					1162$_H$	—	—	—	—			+588$_H$
355	Reserved	FFFF B2C6$_H$					1163$_H$	—	—	—	—			+58C$_H$
356	ICDPE	FFFF B2C8$_H$	INTDPE	LPS0 digital port error interrupt	LPS0	Level	1164$_H$	✓	✓	✓	✓			+590$_H$
357	ICAPE	FFFF B2CA$_H$	INTAPE	LPS0 analog port error interrupt	LPS0	Level	1165$_H$	✓	✓	✓	✓			+594$_H$

Note 1. Each interrupt is connected to INTC1 channel 8 to 31 and INTC2 channel 32 to 357.

Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an EI level interrupt control register. For details, see **Section 7BC.4.2, ICxxx — EI Level Interrupt Control Registers**. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. The procedure shown in **Section 3BC.3.1, Synchronization of Store Instruction Completion and Subsequent Instruction Execution** are required to reflect the result of the register update to the subsequent instruction.

Note 3. Irrespective of interrupt channels, an offset address is determined in the range from +100$_H$ to 1F0$_H$ according to the priority (0 to 15).

Note 4. Irrespective of the priority, offset addresses are uniformly +100$_H$.

Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.
Exception handler address read position = INTBP register + channel number × 4 bytes

Note 6. The same interrupt source is assigned to different interrupt channels. For details, see **Section 7BC.5.2, SELB_INTC1 — INTC1 Interrupt Select Register**.

Note 7. 32 interrupt sources are assigned to the same interrupt channel. For details, see **Section 37, PWM Output/Diagnostic (PWM-Diag)**.

Note 8. For details, see **Section 7BC.10, Exception Handler Address**.

Note 9. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible.
It is used as FEINT when OSTM0 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM0 functions as anything other than the TSU function.

Note 10. For details on the interrupt source, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

7BC.2.2 FE Level Non-Maskable Interrupt Sources

7BC.2.2.1 List of Registers

The following table lists the FE Level Non-Maskable Interrupt Sources registers.

Table 7BC.7 List of Registers

Module Name	Register Name	Symbol	Address
ECON_NMI	FENMI factor register	WDTNMIF	FFC0 0000_H
	WDTNMI factor clear register	WDTNMIFC	FFC0 0008_H

7BC.2.2.2 WDTNMIF — FENMI Factor Register

This register contains information about which source has generated the FE level non-maskable interrupt (FENMI). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC0 0000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTA1 NMIF	WDTA0 NMIF	TNMIF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7BC.8 WDTNMIF Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	WDTA1NMIF	WDTA1NMI flag 0: No WDTA1NMI occurred 1: WDTA1NMI has occurred
1	WDTA0NMIF	WDTA0NMI flag 0: No WDTA0NMI occurred 1: WDTA0NMI has occurred
0	TNMIF	Input signal flag from the NMI pin 0: No TNMI occurred 1: TNMI has occurred

7BC.2.2.3 WDTNMIFC — WDTNMI Factor Clear Register

This register clears the FE level non-maskable interrupt flags of the WDTNMIF register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FFC0 0008$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

7BC.2.3 FE Level Maskable Interrupt Sources

7BC.2.3.1 List of Registers

The following table lists the FE Level Maskable Interrupt Sources registers.

Table 7BC.10 List of Registers

Module Name	Register Name	Symbol	Address
ECON_FEINT	FEINT factor register	FEINTF	FFC0 0100_H
	FEINT factor mask register	FEINTFMSK	FFC0 0104_H
	FEINT factor clear register	FEINTFC	FFC0 0108_H

7BC.2.3.2 FEINTF — FEINT Factor Register

This register contains information about which source has generated the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC0 0100_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7BC.11 FEINTF Register Contents

Bit Position	Bit Name	Function
31	DMAFEIF	INTDMAERR interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
30 to 24	Reserved	When read, the value after reset is returned.
23	ECCETHFEIF*1	RH850/F1KM-S4: INTECCETH interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S1: When read, the value after reset is returned.
22	Reserved	When read, the value after reset is returned.
21	OSTM4FEIF	RH850/F1KM-S4: INTOSTM4_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S1: When read, the value after reset is returned.
20	OSTM3FEIF	RH850/F1KM-S4: INTOSTM3_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S1: When read, the value after reset is returned.

Table 7BC.11 FEINTF Register Contents

Bit Position	Bit Name	Function
19	OSTM2FEIF	RH850/F1KM-S4: INTOSTM2_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S1: When read, the value after reset is returned.
18	OSTM1FEIF	RH850/F1KM-S4: INTOSTM1_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S1: When read, the value after reset is returned.
17	GUARDFEIF	INTGUARD interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
16	Reserved	When read, the value after reset is returned.
15	LVIHFEIF	INTLVIH interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
14	OSTM0 FEIF	INTOSTM0_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
13	ECCRAM FEIF	INTECCRAM interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
12	ECCFLI0 FEIF	INTECCFLI0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
11	Reserved	When read, the value after reset is returned.
10	ECCCSIH3 FEIF[*2]	INTECCCSIH3 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
9	ECCCSIH2 FEIF[*2]	INTECCCSIH2 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
8	ECCCSIH1 FEIF[*2]	INTECCCSIH1 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
7	ECCCSIH0 FEIF	INTECCCSIH0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
6	ECCCNFDRAMFEIF	INTECCCNFDRAM interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred

Table 7BC.11 FEINTF Register Contents

Bit Position	Bit Name	Function
5	ECCFLRAM FEIF	RH850/F1KM-S4: INTECCFLRAM interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred RH850/F1KM-S1: When read, the value after reset is returned.
4	ECCEEP0 FEIF	INTECCEEP0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
3 to 1	Reserved	When read, the value after reset is returned.
0	LVILFEIF	INTLVIL interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred

Note 1. For the supported products, see **Table 7BC.3, FE Level Maskable Interrupt Requests (RH850/F1KM-S4)**.

Note 2. For the supported products, see **Table 7BC.4, FE Level Maskable Interrupt Requests (RH850/F1KM-S1)**.

7BC.2.3.3 FEINTFMSK — FEINT Factor Mask Register

This register masks the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFC0 0104_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

6	ECCCNFDRAM FEIFC	ECCCNFDRAMFEIF flag clear 0: — 1: Clear
5	ECCFLRAM FEIFC	RH850/F1KM-S4: ECCFLRAMFEIF flag clear 0: — 1: Clear RH850/F1KM-S1: When writing, write the value after reset.
4	ECCEEP0 FEIFC	ECCEEP0FEIF flag clear 0: — 1: Clear

Table 7BC.13 FEINTFC Register Contents

Bit Position	Bit Name	Function
3 to 1	Reserved	When writing, write the value after reset.
0	LVILFEIFC	LVILFEIF flag clear 0: — 1: Clear

Note 1. For the supported products, see **Table 7BC.3, FE Level Maskable Interrupt Requests (RH850/F1KM-S4)**.

Note 2. For the supported products, see **Table 7BC.4, FE Level Maskable Interrupt Requests (RH850/F1KM-S1)**.

7BC.3 Edge/Level Detection

External interrupts (TNMI and INTPm) can be specified to be generated when a rising edge, falling edge, rising or falling edge, low level, or high level is detected at an external interrupt pin.

The following registers are used to specify the edge and level of each interrupt:

Table 7BC.14 External Interrupt Edge/Level Detection Registers (RH850/F1KM-S4)

Interrupt	Register
TNMI	FCLA0CTL0_NMI
INTP0	FCLA0CTL0_INTPL
INTP1	FCLA0CTL1_INTPL
INTP2	FCLA0CTL2_INTPL
INTP3	FCLA0CTL3_INTPL
INTP4	FCLA0CTL4_INTPL
INTP5	FCLA0CTL5_INTPL
INTP6	FCLA0CTL6_INTPL
INTP7	FCLA0CTL7_INTPL
INTP8	FCLA0CTL0_INTPH
INTP9	FCLA0CTL1_INTPH
INTP10	FCLA0CTL2_INTPH
INTP11	FCLA0CTL3_INTPH
INTP12	FCLA0CTL4_INTPH
INTP13	FCLA0CTL5_INTPH
INTP14*1	FCLA0CTL6_INTPH
INTP15*1	FCLA0CTL7_INTPH
INTP16*1	FCLA0CTL0_INTPU
INTP17*1	FCLA0CTL1_INTPU
INTP18*1	FCLA0CTL2_INTPU
INTP19*1	FCLA0CTL3_INTPU
INTP20*1	FCLA0CTL4_INTPU
INTP21*1	FCLA0CTL5_INTPU
INTP22*1	FCLA0CTL6_INTPU
INTP23*1	FCLA0CTL7_INTPU

Note 1. For the supported products, see **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**.

See **Section 2B, Pin Function of RH850/F1KM-S4** for details of these registers.

Table 7BC.15 External Interrupt Edge/Level Detection Registers (RH850/F1KM-S1)

Interrupt	Register
TNMI	FCLA0CTL0_NMI
INTP0	FCLA0CTL0_INTPL
INTP1	FCLA0CTL1_INTPL
INTP2	FCLA0CTL2_INTPL
INTP3	FCLA0CTL3_INTPL
INTP4	FCLA0CTL4_INTPL
INTP5	FCLA0CTL5_INTPL
INTP6*[1]	FCLA0CTL6_INTPL
INTP7*[1]	FCLA0CTL7_INTPL
INTP8*[1]	FCLA0CTL0_INTPH
INTP10	FCLA0CTL2_INTPH
INTP11	FCLA0CTL3_INTPH
INTP12*[1]	FCLA0CTL4_INTPH
INTP13*[1]	FCLA0CTL5_INTPH

Note 1. For the supported products, see **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

See **Section 2C, Pin Function of RH850/F1KM-S1** for details of these registers.

7BC.4 Interrupt Controller Control Registers

Writing to the ICxxx, IMRm (m = 0 to 11), FNC, and FIC registers is enabled only in supervisor mode (PSW.UM = 0).

7BC.4.1 List of Registers

The following table lists the Interrupt Controller Control registers.

Table 7BC.16 List of Registers

Module Name	Register Name	Symbol	Address
INTC1	EI level interrupt control registers	ICxxx*[1]	See **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**
	EI level interrupt mask registers	IMR0	FFFE EAF0$_H$
INTC2	EI level interrupt control registers	ICxxx*[2]	See **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**
	EI level interrupt mask registers	IMRm	FFFF B400$_H$ + (04$_H$ × m)
INTC1	FE level NMI status register	FNC	FFFE EA78$_H$
	FE level maskable interrupt status register	FIC	FFFE EA7A$_H$

Note 1. Channel No.0 to 31.

Note 2. Channel No.32 or more.

7BC.4.2 ICxxx — EI Level Interrupt Control Registers

One of these registers is assigned to each EI level maskable interrupt (EIINT) channel and is used to set the conditions for controlling that channel. This register is initialized by any reset. For each source, see **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

CAUTION

If 0 is written to the RFxxx bit immediately after a peripheral module generates the corresponding interrupt request in edge detection mode (before an interrupt is accepted by the CPU), the request may be lost.

Writing 1 to the RFxxx bit immediately after an interrupt is accepted by the CPU may lead to re-issuing of the request.

Writing method to these registers contains the use of bit manipulation instructions (set1, clr1, and not1).

For bit-manipulation instructions, see also **Section 3BC.3.3, Access to Registers by Using Bit-Manipulation Instructions**.

Executing a bit-manipulation instruction to the lower bytes including the MKxxx bit has no effect on the RFxxx bit.

Access:	ICxxx can be read or written in 16-bit units. ICxxxH and ICxxxL can be read or written in 8- or 1-bit units. Access to bits 14, 13, 11 to 8, 5, and 4 by using a SET1, CLR1, or NOT1 instruction is prohibited.
Address:	See **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.
Value after reset:	$008F_H$ (edge detection), $808F_H$ (level detection)*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTxxx	—	—	RFxxx	—	—	—	—	MKxxx	TBxxx	—	—	P3xxx	P2xxx	P1xxx	P0xxx
Value after reset	0/1*1	0	0	0	0	0	0	0	1	0	0	0	1	1	1	1
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Note 1. The value after reset differs depending on the detection type of a given interrupt (edge detection: 0, level detection: 1). For details, see **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

Table 7BC.17 ICxxx Register Contents

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>15</td><td>CTxxx</td><td>This bit indicates the type of interrupt detection. This bit is read only.
0: Edge detection
1: Level detection
When writing in 8-bit or 16-bit units, write the value after reset.</td></tr>
<tr><td>14, 13</td><td>Reserved</td><td>When read, the value after reset is returned. When writing, write the value after reset.</td></tr>
<tr><td>12</td><td>RFxxx</td><td>This is an interrupt request flag.
The RFxxx bit can be written from a program. Setting the RFxxx bit to 1 generates an EI level maskable interrupt n (EIINTn), just as when an interrupt request is acknowledged.
0: No interrupt request is made.
1: Interrupt request is made.
<table>
<tr><th>Input Interface</th><th>Operation</th></tr>
<tr><td>Edge detection
(CTxxx = 0)</td><td>This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software.</td></tr>
<tr><td>Level detection
(CTxxx = 1)</td><td>This bit cannot be set or cleared by software. It can only be read.
It is not cleared when an interrupt request is acknowledged by the CPU core.</td></tr>
</table>
</td></tr>
</table>

Table 7BC.17 ICxxx Register Contents

Bit Position	Bit Name	Function
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	MKxxx	This is the interrupt request mask bit. When the MKxxx bit is set, interrupt requests from the channel are masked and are not issued to the CPU core. The interrupt pending status is not reflected in the ICSR.PMEI bit for any channels that are masked. When the interrupt request from the channel is masked with MKxxx = 1, the RFxxx still reflects the interrupt request for the channel and can be polled in software. When the MKxxx bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the MKxxx bit is also reflected in the corresponding IMRm register. 0: Enables interrupt processing 1: Disables interrupt processing
6	TBxxx	This bit is used to select the way to determine the interrupt vector. 0: Direct jumping to an address determined from the level of priority 1: Table reference For details on the way to determine the interrupt vector, see *the RH850G3KH User's Manual: Software*.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	P3xxx to P0xxx	These bits specify the interrupt priority as one of 16 levels, with 0 as the highest and 15 as the lowest. When multiple EI level-interrupt requests are made simultaneously, the interrupt from the source with the highest priority setting in these bits is selected and conveyed to the CPU core for servicing first. When P3xxx to P0xxx bits specify the same priority level for simultaneously occurring interrupt requests, the source with the lower channel number takes priority.

CAUTION

Do not access ICxxx registers of interrupt channels listed as “Reserved” in **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)** and of the channels which are not incorporated in the product.

7BC.4.3 IMRm — EI Level Interrupt Mask Registers (m = 0 to 11)

These registers are a collection of the MKxxx bits of the ICxxx registers. Each bit of IMRm reflects the setting of the corresponding MKxxx bit. The setting for IMRm is also reflected in the corresponding MKxxx bit. This register is initialized by any reset.

Access: IMRm can be read or written in 32-bit units.
IMRmH and IMRmL can be read or written in 16-bit units.
IMRmHH, IMRmHL, IMRmLH, and IMRmLL can be read or written in 8- or 1-bit units.

Address: IMR0: FFFE EAF0$_H$
IMR0L: FFFE EAF0$_{H,}$
IMR0H: FFFE EAF2$_H$
IMR0LH: FFFE EAF1$_{H,}$
IMR0HL: FFFE EAF2$_{H,}$
IMR0HH: FFFE EAF3$_H$
IMRm (m = 1 to 11): FFFF B400$_H$ + (04$_H$ × m)
IMRmL (m = 1 to 11): FFFF B400$_H$ + (04$_H$ × m)

Table 7BC.18 IMRm Register Contents

Bit Position	Bit Name	Function
31 to 0	IMRmEIMK (m × 32 + 31) to IMRmEIMK (m × 32 + 0)	These are interrupt mask bits for EI level maskable interrupt (EIINT) channels 0 to 376. 0: Enables interrupt servicing 1: Disables interrupt servicing

CAUTION

MKxxx bits which correspond to channels listed as “Reserved” in **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)** and to channels which are not incorporated in the product must be set to “1”.

7BC.4.4 FNC — FE Level NMI Status Register

This register indicates the status of an FE level non-maskable interrupt (FENMI).

This register is initialized by any reset.

Access: FNC is a read-only register that can be read in 16-bit units.
FNCH is a read-only register that can be read in 8- or 1-bit units.

Address: FNC: FFFE EA78$_H$
FNCH: FFFE EA79$_H$

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FNRF	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7BC.19 FNC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FNRF	Interrupt request flag 0: No interrupt request 1: Interrupt request occurred This bit is automatically cleared when an FE level NMI interrupt request is acknowledged by the CPU core.
11 to 0	Reserved	When read, the value after reset is returned.

7BC.4.5 FIC — FE Level Maskable Interrupt Status Register

This register indicates the status of an FE level maskable interrupt (FEINT).

This register is initialized by any reset.

Access:	FIC is a read-only register that can be read in 16-bit units. FICH is a read-only register that can be read in 8- or 1-bit units.
Address:	FIC: FFFE EA7A$_{H}$ FICH: FFFE EA7B$_{H}$
Value after reset:	8000$_{H}$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIRF	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7BC.20 FIC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FIRF	Interrupt request flag 0: No interrupt request 1: Interrupt request occurred This bit cannot be set or cleared by software. It can only be read.
11 to 0	Reserved	When read, the value after reset is returned.

7BC.5 EI Level Maskable Interrupt Select Register

The following registers are used to select an EI level maskable interrupt.

7BC.5.1 List of Registers

The following table lists the EI Level Maskable Interrupt Select register.

Table 7BC.21 List of Register

Module Name	Register Name	Symbol	Address
SL_INTC	INTC1 interrupt select register	SELB_INTC1	FFC0 1000_H

7BC.5.2 SELB_INTC1 — INTC1 Interrupt Select Register

When two interrupt sources are assigned to one interrupt channel, this register selects which interrupt sources is enabled. This register is initialized by any reset.

NOTE

The channel described in each bit setting indicates the channel of an interrupt and the priority. For details on channels, see **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

Access:	This register can be read or written in 16-bit units.
Address:	FFC0 1000_H
Value after reset:	0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SELB_INTC1_12	SELB_INTC1_11	SELB_INTC1_10	SELB_INTC1_9	SELB_INTC1_8	SELB_INTC1_7	SELB_INTC1_6	SELB_INTC1_5	SELB_INTC1_4	SELB_INTC1_3	SELB_INTC1_2	SELB_INTC1_1	SELB_INTC1_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7BC.22 SELB_INTC1 Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	SELB_INTC1_12	Interrupt channel selection 0: INTADCA0I2 (Channel 20) INTCSIH0IJC (Channel 32) 1: INTCSIH0IJC_1 (Channel 20) INTADCA0I2_2 (Channel 32)

10	SELB_INTC1_10	Interrupt channel selection 0: INTTAUD0I12 (Channel 14) INTCSIH3IRE (Channel 160) 1: INTCSIH3IRE_1 (Channel 14) INTTAUD0I12_2 (Channel 160)
9	SELB_INTC1_9	Interrupt channel selection 0: INTTAUD0I10 (Channel 13) INTCSIH3IR (Channel 159) 1: INTCSIH3IR_1 (Channel 13) INTTAUD0I10_2 (Channel 159)
8	SELB_INTC1_8	Interrupt channel selection 0: INTTAUD0I2 (Channel 9) INTCSIH3IC (Channel 158) 1: INTCSIH3IC_1 (Channel 9) INTTAUD0I2_2 (Channel 158)

Table 7BC.22 SELB_INTC1 Register Contents

Bit Position	Bit Name	Function
7	SELB_INTC1_7	Interrupt channel selection 0: INTTAUD0I8 (Channel 12) INTCSIH2IJC (Channel 135) 1: INTCSIH2IJC_1 (Channel 12) INTTAUD0I8_2 (Channel 135)
6	SELB_INTC1_6	Interrupt channel selection 0: INTTAUD0I6 (Channel 11) INTCSIH2IRE (Channel 134) 1: INTCSIH2IRE_1 (Channel 11) INTTAUD0I6_2 (Channel 134)
5	SELB_INTC1_5	Interrupt channel selection 0: INTTAUD0I4 (Channel 10) INTCSIH2IR (Channel 133) 1: INTCSIH2IR_1 (Channel 10) INTTAUD0I4_2 (Channel 133)
4	SELB_INTC1_4	Interrupt channel selection 0: INTTAUD0I0 (Channel 8) INTCSIH2IC (Channel 132) 1: INTCSIH2IC_1 (Channel 8) INTTAUD0I0_2 (Channel 132)
3	SELB_INTC1_3	Interrupt channel selection 0: INTCSIG0IR (Channel 28) INTCSIH1IJC (Channel 119) 1: INTCSIH1IJC_1 (Channel 28) INTCSIG0IR_2 (Channel 119)
2	SELB_INTC1_2	Interrupt channel selection 0: INTCSIG0IC (Channel 27) INTCSIH1IRE (Channel 118) 1: INTCSIH1IRE_1 (Channel 27) INTCSIG0IC_2 (Channel 118)
1	SELB_INTC1_1	Interrupt channel selection 0: INTTAPA0IVLY0 (Channel 17) INTCSIH1IR (Channel 117) 1: INTCSIH1IR_1 (Channel 17) INTTAPA0IVLY0_2 (Channel 117)
0	SELB_INTC1_0	Interrupt channel selection 0: INTTAPA0IPEK0 (Channel 16) INTCSIH1IC (Channel 116) 1: INTCSIH1IC_1 (Channel 16) INTTAPA0IPEK0_2 (Channel 116)

NOTE

For the supported products, see **Table 7BC.5, EI Level Maskable Interrupt Sources (RH850/F1KM-S4)**, **Table 7BC.6, EI Level Maskable Interrupt Sources (RH850/F1KM-S1)**.

CAUTION

The operation of peripheral functions should be enabled after setting the corresponding interrupt source by SELB_INTC1.

7BC.6 Interrupt Function System Registers

See **Table 3BC.31, Interrupt Function System Registers**.

7BC.6.1 FPIPR — FPI Exception Interrupt Priority

See **Table 3BC.32, FPIPR Register Contents**.

7BC.6.2 ISPR — Priority of Interrupt being Serviced

See **Table 3BC.33, ISPR Register Contents**.

7BC.6.3 PMR — Interrupt Priority Masking

See **Table 3BC.34, PMR Register Contents**.

7BC.6.4 ICSR — Interrupt Control Status

See **Table 3BC.35, ICSR Register Contents**.

7BC.6.5 INTCFG — Interrupt Function Setting

See **Table 3BC.36, INTCFG Register Contents**.

7BC.7 Operation when Acknowledging an Interrupt

Check whether each interrupt that is reported during instruction execution is acknowledged according to the priority. The procedure for acknowledging each interrupt is shown below.

(1) Check whether the acknowledgment conditions are satisfied and whether interrupts are acknowledged according to their priority.

(2) Calculate the exception handler address according to the current PSW value.*[1]

(3) For FE-level non-maskable/maskable interrupts, the following processing is performed:

- Save the PC to the FEPC.
- Save the PSW to the FEPSW.
- Store the exception source code in the FEIC.
- Update the PSW.*[2]
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

(4) For EI level exceptions, the following processing is performed:

- Save the PC to the EIPC.
- Save the PSW to the EIPSW.
- Store the exception source code in the EIIC.
- Update the PSW.*[2]
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

Note 1. For details, see **Section 7BC.10, Exception Handler Address**.

Note 2. For the values to be updated, see *Table 4.1 Exception Cause List* in *the RH850G3KH User's Manual: Software*.

The following figure shows steps (1) to (4).

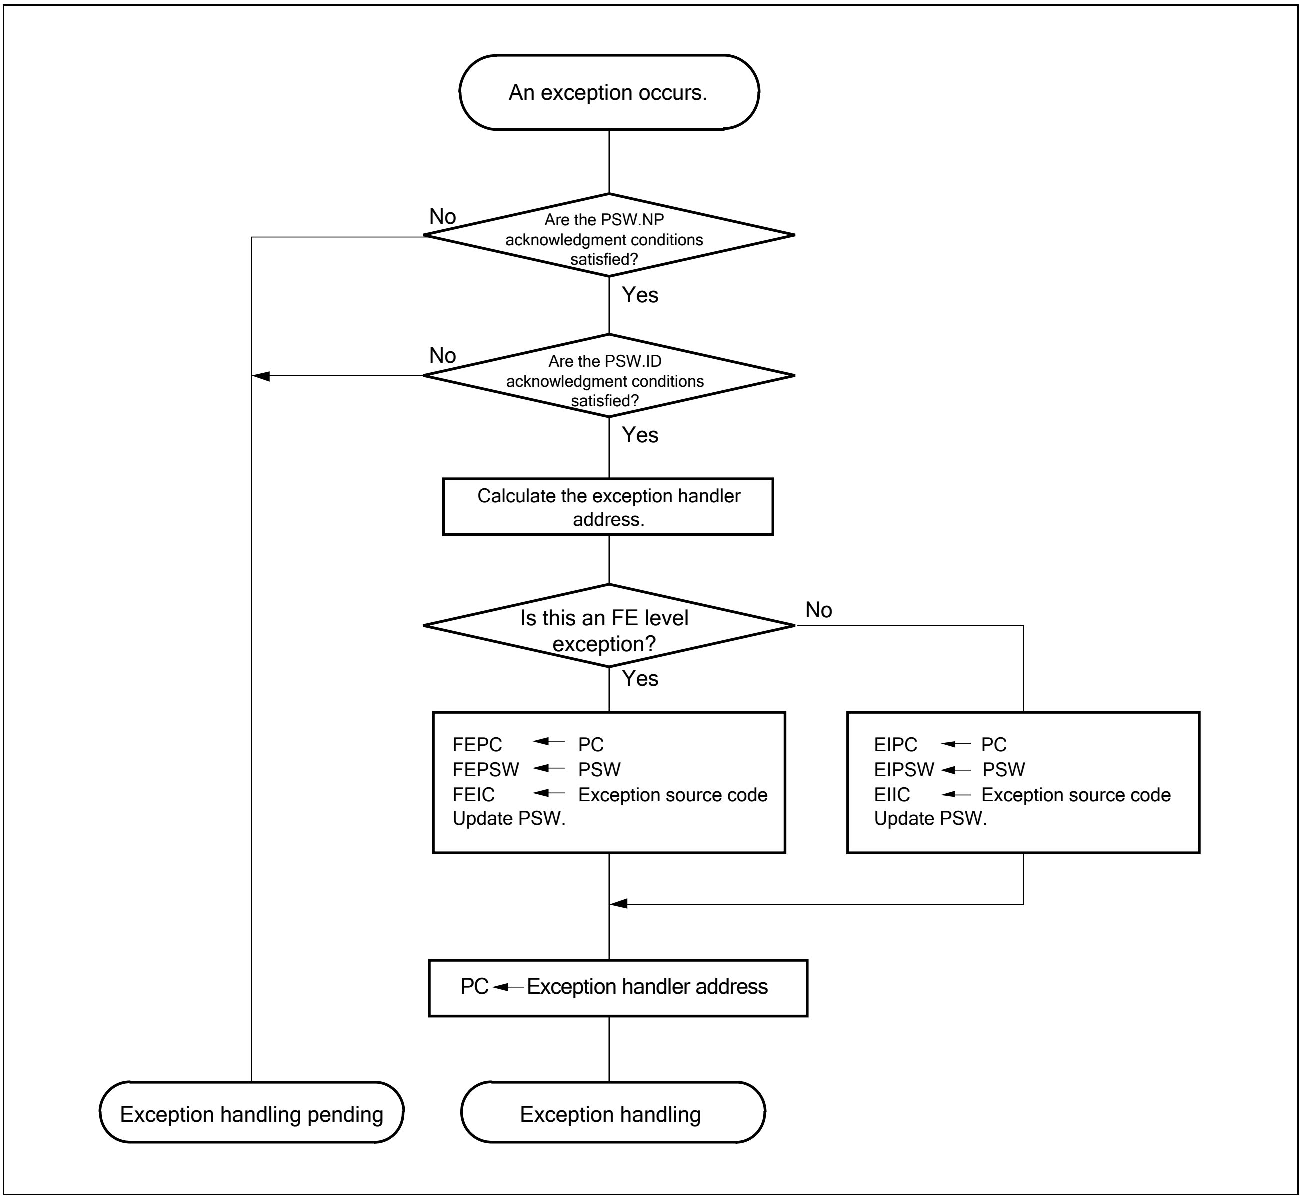

Figure 7BC.2 Operation when Acknowledging an Interrupt

7BC.7.1 Exception Source Codes for Different Types of SYSERR Exceptions

The following table lists exception source codes for the different types of SYSERR exceptions.

Table 7BC.23 Exception Source Codes for Different Types of SYSERR Exceptions

Exception Source Code	Source of SYSERR Generation
11_H	• Detection of an error during the fetching of an instruction from the code flash memory area
13_H	• Detection of an error during the fetching of an instruction from the local, global or retention RAM areas
14_H	• Detection of an error during access to data in the code flash area • Detection of an error during read access to a module via the system interconnect or PBUS The exception source code reports an occurrence of a system error factor corresponding to VCIF bit of SEGFLAG register*1
16_H	• Detection of an error during access to data in the own local RAM areas The exception source code reports an occurrence of a system error factor corresponding to TCMF bit of SEGFLAG register*1
18_H	• Detection of an IPG error The exception source code reports an occurrence of a system error factor corresponding to VCIF, IPGF bit of SEGFLAG register*1
19_H	• Detection of an error during write access to a module via the PBUS The exception source code reports an occurrence of a system error factor corresponding to APIF bit of SEGFLAG register*1
$1A_H$	• Detection of an error inside system interconnect The exception source code reports an occurrence of a system error factor corresponding to VCSF bit of SEGFLAG register*1

Note 1. See **Section 3BC.2.3.3, System Error Generator Function (SEG)** for details.

7BC.8 Return from Interrupts

To return from interrupt handling, execute the return instruction (EIRET or FERET) corresponding to each relevant interrupt level.

When a context has been saved in a stack and the like, the context must be restored before executing the return instruction.

The EIRET instruction is used to return from the EI level maskable interrupt handling and the FERET instruction is used to return from FE-level maskable interrupt handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes its control to the return PC address:

(1) When returning from the service routine for an EI-level exception, the PC and PSW values on return are loaded from the EIPC and EIPSW registers.
When returning from the service routine for an FE-level exception, the PC and PSW values on return are loaded from the FEPC and FEPSW registers.

(2) Control is passed to the addresses indicated by the return PC and PSW that were loaded.

(3) When EP = 0 and INTCFG.ISPC = 0, the CPU updates the ISPR register.

The flows for returning from exception handling using the EIRET and FERET instructions are shown below.

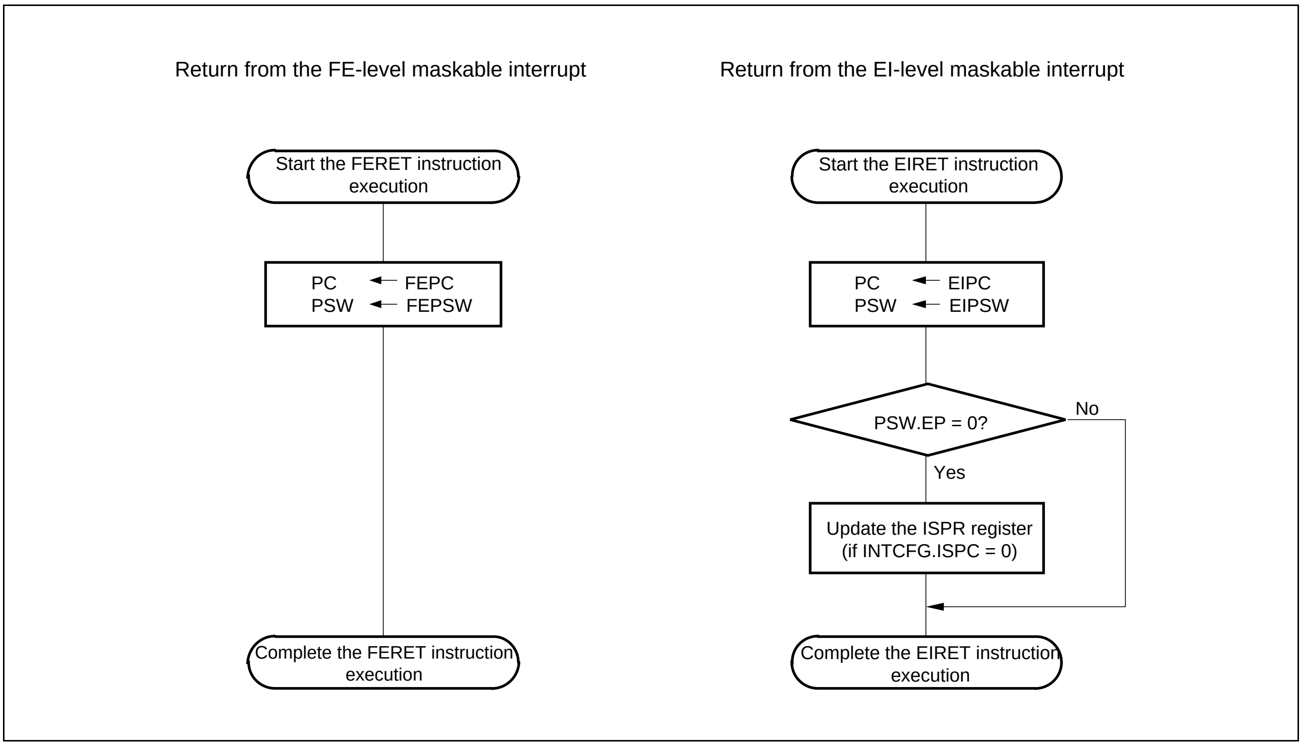

Figure 7BC.3 Flow of Return from Interrupts

7BC.9 Interrupt Operation

7BC.9.1 Interrupt Mask Function of EI Level Maskable Interrupt (EIINT)

Interrupt masking can be specified for each respective interrupt channel of EIINT. Interrupt masking is performed by the following register settings.

Table 7BC.24 Operation of the MKxxx Bit

ICxxx.MKxxx	Operation
1	Masks interrupt
0	Enables interrupt

The ICxxx.MKxxx bits can also be read and written via the corresponding IMRmEIMKn bits of the IMRm registers. The interrupt mask state is reflected in both the ICxxx registers and the IMRm registers.

[Operation example]

(1) When a 1 is written to an IMRm.IMRmEIMKn bit, interrupts are prohibited for the corresponding channel.

(2) When the corresponding ICxxx.MKxxx bit is read, 1 is returned.

CAUTION

If the MKxxx bit is set to 0 while an interrupt request is pending (RFxxx = 1), the interrupt service routine will be executed at that time (subject to the rules of interrupt prioritization). Even if an interrupt request is issued in software by setting the RFxxx bit to 1, the interrupt will not occur as long as the interrupt is masked with MKxxx = 1.
To cancel an interrupt request that is pending, clear the corresponding RFxxx bit in software.

7BC.9.2 Interrupt Priority Level Judgment

When FE level non-maskable interrupts (FENMI), FE level maskable interrupts (FEINT), and EI level maskable interrupts (EIINT) are input, priorities including other exceptions are determined, and the exception with the highest priority (including interrupts) is processed. Exceptions occurred at the same time (including interrupts) are processed in a pre-allocated priority order (the default priority order). The priority orders of FENMI, FEINT, and EIINT interrupts are as follows.

FENMI > FEINT > EIINT

See *the RH850G3KH User's Manual: Software* for other exceptions.

For EIINT (INTn) interrupts, the interrupt priority can be set independently for each interrupt source. Specify the interrupt priority with the bits P3xxx to P0xxx. The interrupt priority levels can be set from 0 to 15: 0 is the highest and 15 is the lowest. Among multiple EIINT (INTn) interrupts with the same priority level, the interrupt with the lowest interrupt channel number has priority.

Table 7BC.25 Example of EIINT (INTn) Interrupt Priority Level Settings and Priority Levels during Operation

EIINT (INTn)	ICxxx.P[3:0]xxx Setting	Priority Level During Operation
INT0	3	10
INT1	4	11
INT2	0	1
INT3	0	2
INT4	1	3
INT5	2	6
INT6	2	7
INT7	1	4
INT8	1	5
INT9	2	8
INT10	2	9

The interrupt controller executes multiple interrupt handling when another interrupt request is acknowledged while an interrupt processing is being executed. When multiple EIINT (INTn) interrupts occur at the same time, the interrupt to be acknowledged is determined by the following procedure.

7BC.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled

Interrupts with the same or lower priority level as the interrupt currently being handled are held pending.

The priority level of the interrupt currently being handled is stored in the ISPR register.

Interrupts with a higher priority level than the interrupt currently being handled proceed to the next priority judgment stage.

7BC.9.2.2 Masking through Priority Mask Register (PMR)

Only interrupts enabled by the PMR register proceed to the next priority judgment stage.

For the PMR register, see **Table 3BC.34, PMR Register Contents**, or *the RH850G3KH User's Manual: Software*.

7BC.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected

When interrupts are requested simultaneously from multiple sources, the interrupt set the highest priority by ICxxx.P[3:0]xxx bits takes priority.

When there are multiple highest priority interrupts, the lowest interrupt channel number is selected.

7BC.9.2.4 Interrupt Suspended by CPU

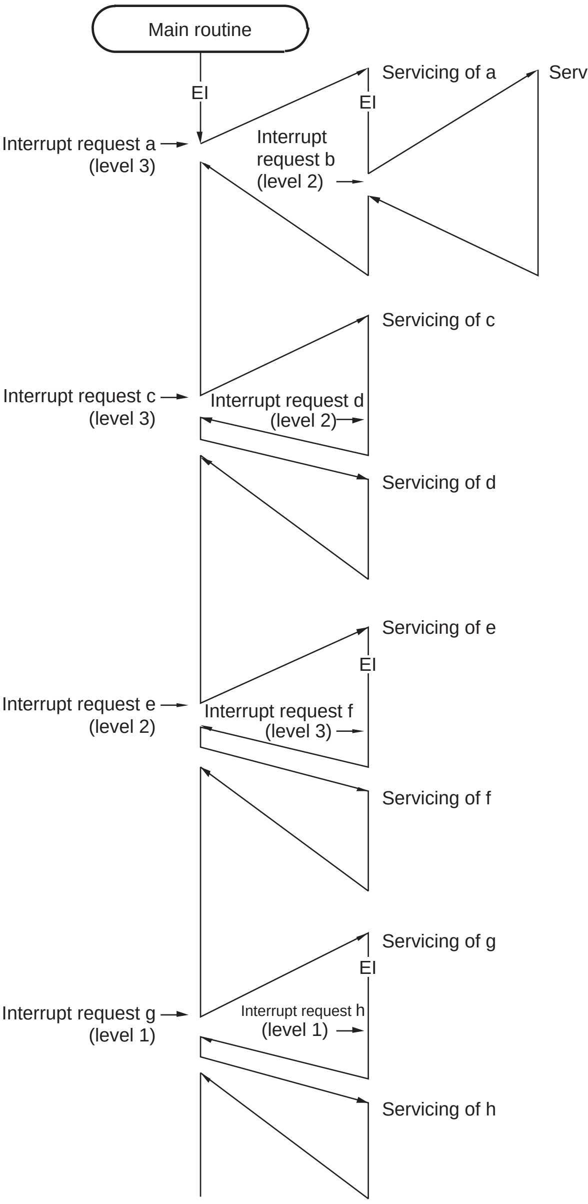
Interrupt acknowledgment is held according to the state of the NP and ID bits of the PSW register. At this time, priority judgment among EIINT interrupts, and priority judgment among EIINT, FEINT and FENMI interrupts are performed even while interrupt acknowledgment is pending, and the interrupt with the highest priority is selected when the acknowledgment condition is satisfied.

Example

An EIINT interrupt with the priority level 5 has already been requested and interrupt generation is pending because the value of the PSW.ID bit is 1. If a subsequent EIINT interrupt with the priority level 3 is requested and the PSW.ID bit is cleared to 0, the latter EIINT interrupt (with the priority level 3) will be generated.

Figure 7BC.4, Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1) shows an example of multiple interrupt handling when another interrupt request is acknowledged while interrupt processing is being executed.

When an interrupt request signal is acknowledged, the PSW.ID flag is automatically set to 1. Therefore, the ID flag should be cleared to 0 to execute multiple interrupt handling. Specifically, execute the EI instruction and the like in an interrupt handling program to enable the interrupt.



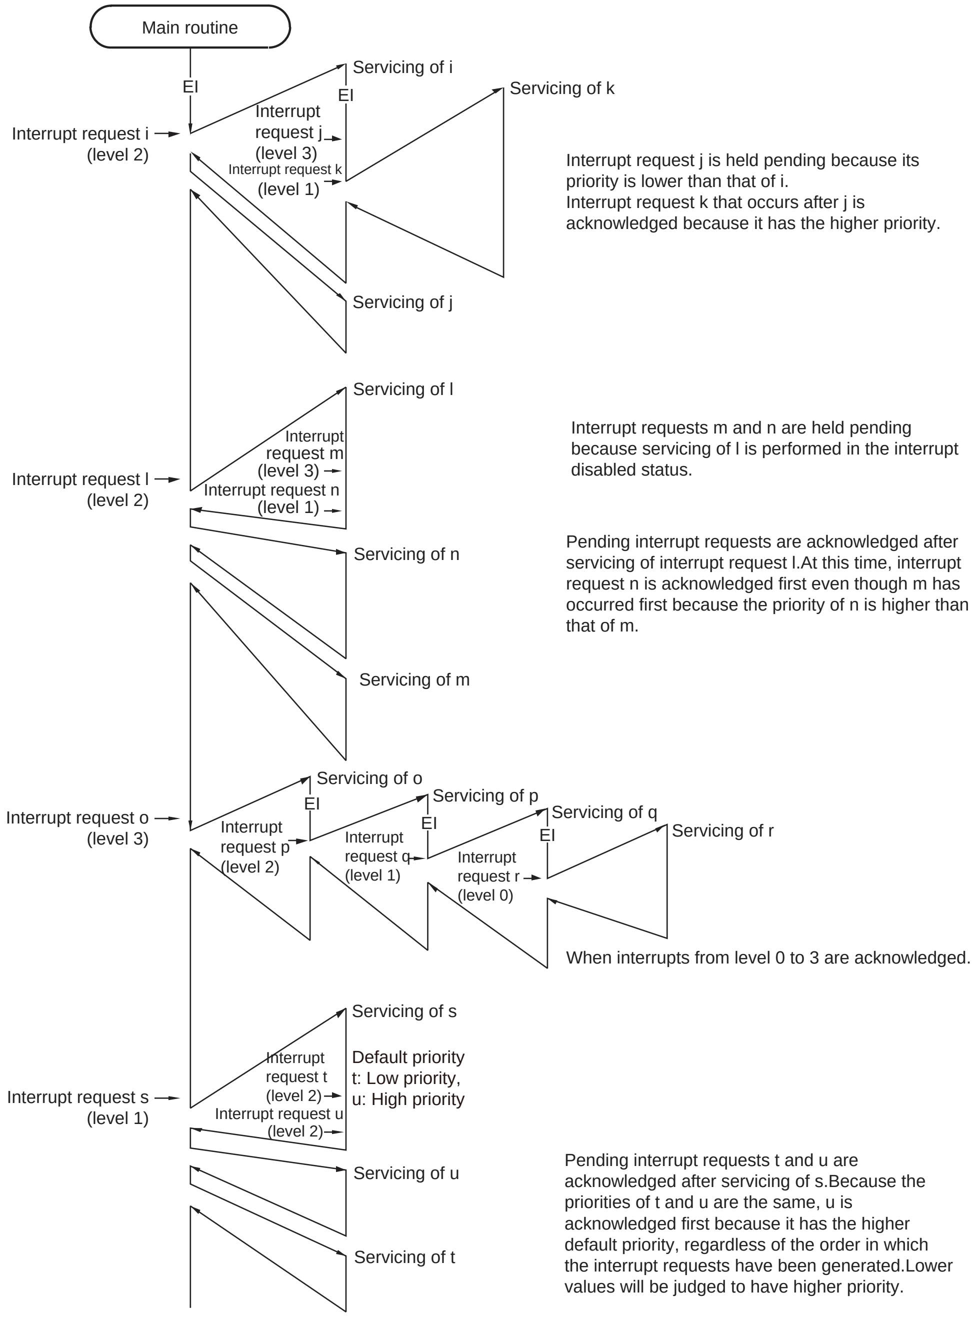
Interrupt request b is acknowledged because the priority of b is higher than that of a and interrupts are enabled.

Although the priority of interrupt request d is higher than that of c, d is held pending because interrupts are disabled.

Interrupt request f is held pending even if interrupts are enabled because its priority of f is lower than that of e.

Interrupt request h is held pending even if interrupts are enabled because its priority level is the same as that of g.

Figure 7BC.4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1)



Interrupt request j is held pending because its priority is lower than that of i. Interrupt request k that occurs after j is acknowledged because it has the higher priority.

Interrupt requests m and n are held pending because servicing of l is performed in the interrupt disabled status.

Pending interrupt requests are acknowledged after servicing of interrupt request l.At this time, interrupt request n is acknowledged first even though m has occurred first because the priority of n is higher than that of m.

When interrupts from level 0 to 3 are acknowledged.

Pending interrupt requests t and u are acknowledged after servicing of s.Because the priorities of t and u are the same, u is acknowledged first because it has the higher default priority, regardless of the order in which the interrupt requests have been generated.Lower values will be judged to have higher priority.

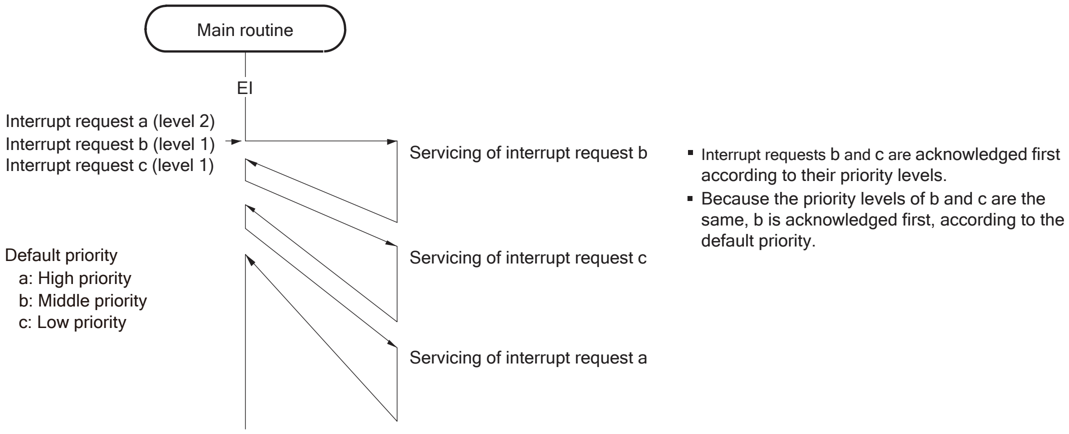
Note 1. “a” to “u” in the figure are the temporary names of interrupt request signals shown for the sake of explanation.

Note 2. The default priority (high/low) in the figure indicates the relative priority between two interrupt request signals.

Figure 7BC.4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (2)

CAUTION

To perform multiple interrupt servicing, the values of the EIPC and EIPSW registers must be saved before executing the EI instruction. When returning from multiple interrupt servicing, restore the values of EIPC and EIPSW after executing the DI instruction.



Note 1. "a" to "c" in the figure are the temporary names of interrupt request signals shown for the sake of explanation.

Note 2. The default priority (high/low) in the figure indicates the relative priority between two interrupt request signals.

Figure 7BC.5 Example of Servicing Simultaneously Generated Interrupt Requests

7BC.9.3 Interrupt Request Acknowledgement Conditions and the Priority

See *the RH850G3KH User's Manual: Software*.

7BC.9.4 Exception Priority of Interrupts and the Priority Mask

See *the RH850G3KH User's Manual: Software*.

7BC.9.5 Interrupt Priority Mask

See *the RH850G3KH User's Manual: Software*.

7BC.9.6 Priority Mask Function

The priority mask function prohibits all EIINT interrupts of the specified interrupt priority level.

The interrupt priority levels to be masked are specified in the PMR register. Masking and acknowledgment can be set for each priority level.

The following operations are possible using this function:

- Temporary prohibition of interrupts that have a priority level that is lower than a given priority level
- Temporary prohibition of interrupts that have a given priority level

Table 7BC.26 Operation of the PMR.PMm Bit

PMR.PMm	Operation
0	Acknowledges requests from priority level m interrupt source.
1	Masks requests from priority level m interrupt source.

Note: m = 0 to 15

The presence of EIINT interrupts held pending with this function can be checked with **Section 7BC.9.7, Exception Management**.

For details on the PMR register, see **Table 3BC.34, PMR Register Contents**, or *the RH850G3KH User's Manual: Software*.

7BC.9.7 Exception Management

Pending interrupts can be checked in the RH850/F1KM. For details, see *the RH850G3KH User's Manual: Software*.

7BC.10 Exception Handler Address

In the RH850/F1KM, the exception handler address from which the handler is executed after a reset is input or when an exception or interrupt is acknowledged can be changed according to a setting.

The exception handler address for resets and exceptions (including interrupts) is determined with the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, the RBASE register, and the EBASE register. For interrupts, the direct vector method and table reference method can be selected for each channel. If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory.

CAUTION

The exception handler address of EIINT (INTn) selected using the direct vector method differs from that of the V850E2 core products. In the V850E2 core products, a different exception handler address is individually assigned to each interrupt channel (EIINT (INTn)). In the RH850/F1KM, one exception handler address is assigned to each interrupt priority. Consequently, interrupts that have the same priority level branch to the same exception handler.

7BC.10.1 Direct Vector Method

The CPU uses the result of adding the offset shown in **Table 7BC.27, Selection of Base Register/Offset Address** to the base address indicated by the RBASE or EBASE register as the exception handler address.

Select whether the RBASE or EBASE register is used as the base address by using the PSW.EBV bit*[1]. When the PSW.EBV bit is set to 1, the value of the EBASE register is used as the base address. When the PSW.EBV bit is cleared to 0, the value of the RBASE register is used as the base address.

For reset input the RBASE register is always used for reference.

In addition, user interrupts see the RINT bit of the corresponding base register, and reduce the offset address according to the bit status. If the RBASE.RINT bit or EBASE.RINT bit is set to 1, all user interrupts are handled using an offset of 100_H. If the bit is cleared to 0, the offset address is determined according to **Table 7BC.27, Selection of Base Register/Offset Address**.

Note 1. Exception acknowledgment itself may sometimes update the status of the PSW.EBV bit. In this case, the base register is selected based on the updated value.

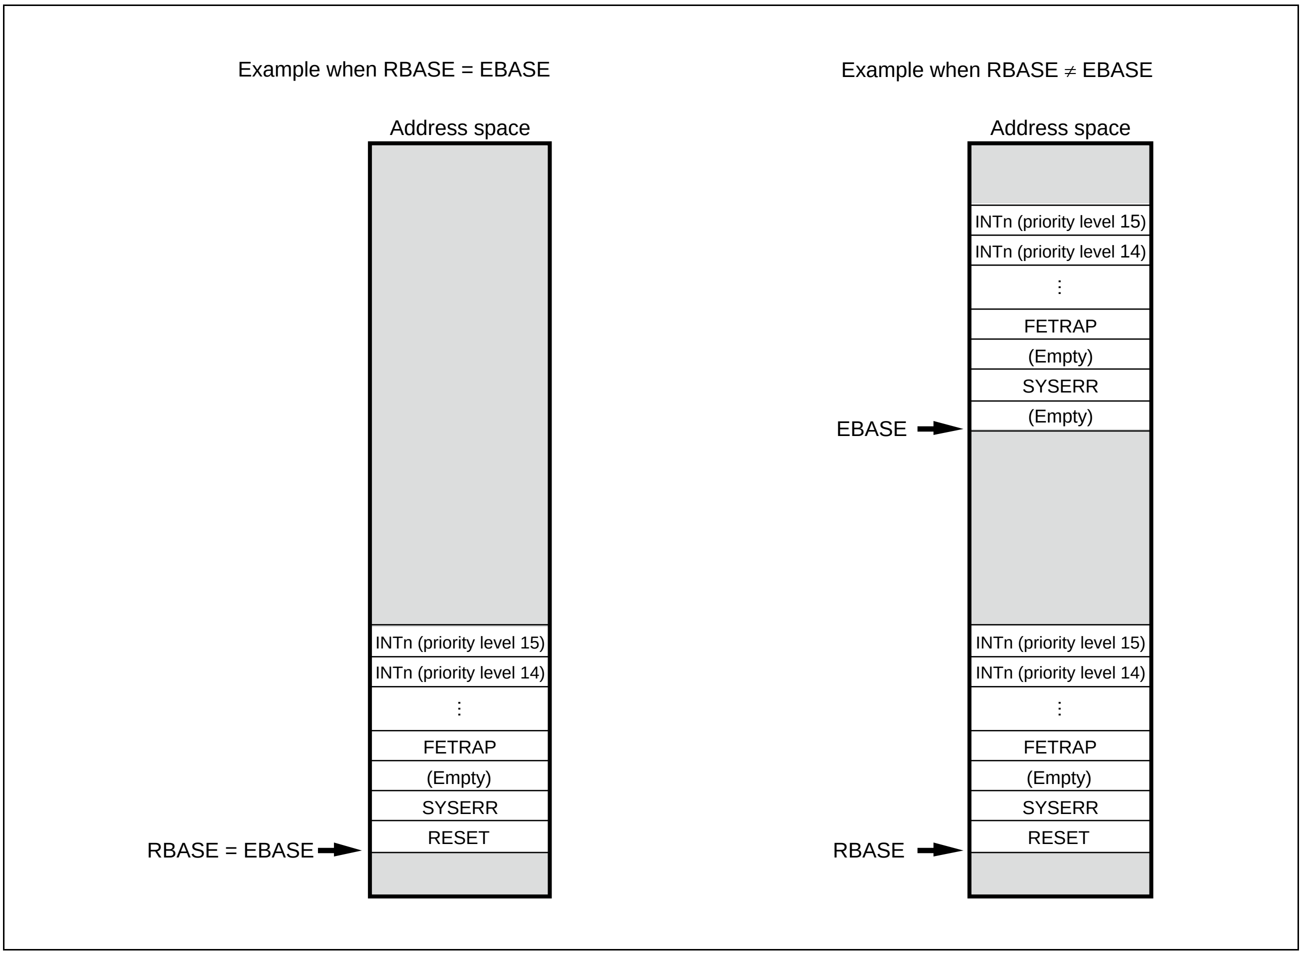


Figure 7BC.6 Direct Vector Method

The table below shows how base register selection and offset address reduction function for each exception to determine the exception handler address. The value of the PSW bit determines the exception handler address on the basis of the value updated by the acknowledgment of an exception.

Table 7BC.27 Selection of Base Register/Offset Address

Exception/Interrupt	PSW.EBV = 0	PSW.EBV = 1	RINT = 0	RINT = 1
	Base Register		Offset Address	
RESET	RBASE	N.A.	000_H	000_H

Base register selection is used to execute exception handling for resets and some hardware errors by using the programs in a relatively reliable area such as ROM instead of the areas that are easily affected by software errors such as RAM and cache area. The user interrupt offset address reduction function is used to reduce the memory occupation size required by the exception handler for specific system-internal operating modes. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

7BC.10.2 Table Reference Method

With the direct vector method, there is one user-interrupt exception handler for each interrupt priority level, and interrupt channels that indicate multiple interrupts with the same priority branch to the same interrupt handler, but some users might want to use different code areas for each interrupt handler from the beginning.

The RH850/F1KM uses the table reference method for interrupts that assume the above usage.

If the table reference method is specified as the interrupt channel vector selection method in the interrupt controller and the like, the method for determining the exception handler address when an interrupt request corresponding to that interrupt channel is acknowledged differs as follows:

<1> In any of the following cases, the exception handler address is determined by using the direct vector method:

  - When PSW.EBV = 0 and RBASE.RINT = 1
  - When PSW.EBV = 1 and EBASE.RINT = 1
  - When the interrupt channel setting is not the table reference method

<2> In cases other than <1>, calculate the table reference position.
Exception handler address read position = INTBP register + channel number × 4 bytes

<3> Read word data starting at the interrupt handler address read position calculated in <2>.

<4> Use the word data read in <3> as the exception handler address.

Table 7BC.28, Exception Handler Address Expansion shows the exception handler address read positions corresponding to each interrupt channel and
Figure 7BC.7, Table Reference Method shows an overview of the allocation in memory.

Table 7BC.28 Exception Handler Address Expansion

Type of Interrupt	Exception Handler Address Read Position
EI level maskable interrupt channel 0	INTBP register value + 0 × 4
EI level maskable interrupt channel 1	INTBP register value + 1 × 4
EI level maskable interrupt channel 2	INTBP register value + 2 × 4
:	:
EI level maskable interrupt channel 375	INTBP register value + 375 × 4
EI level maskable interrupt channel 376	INTBP register value + 376 × 4

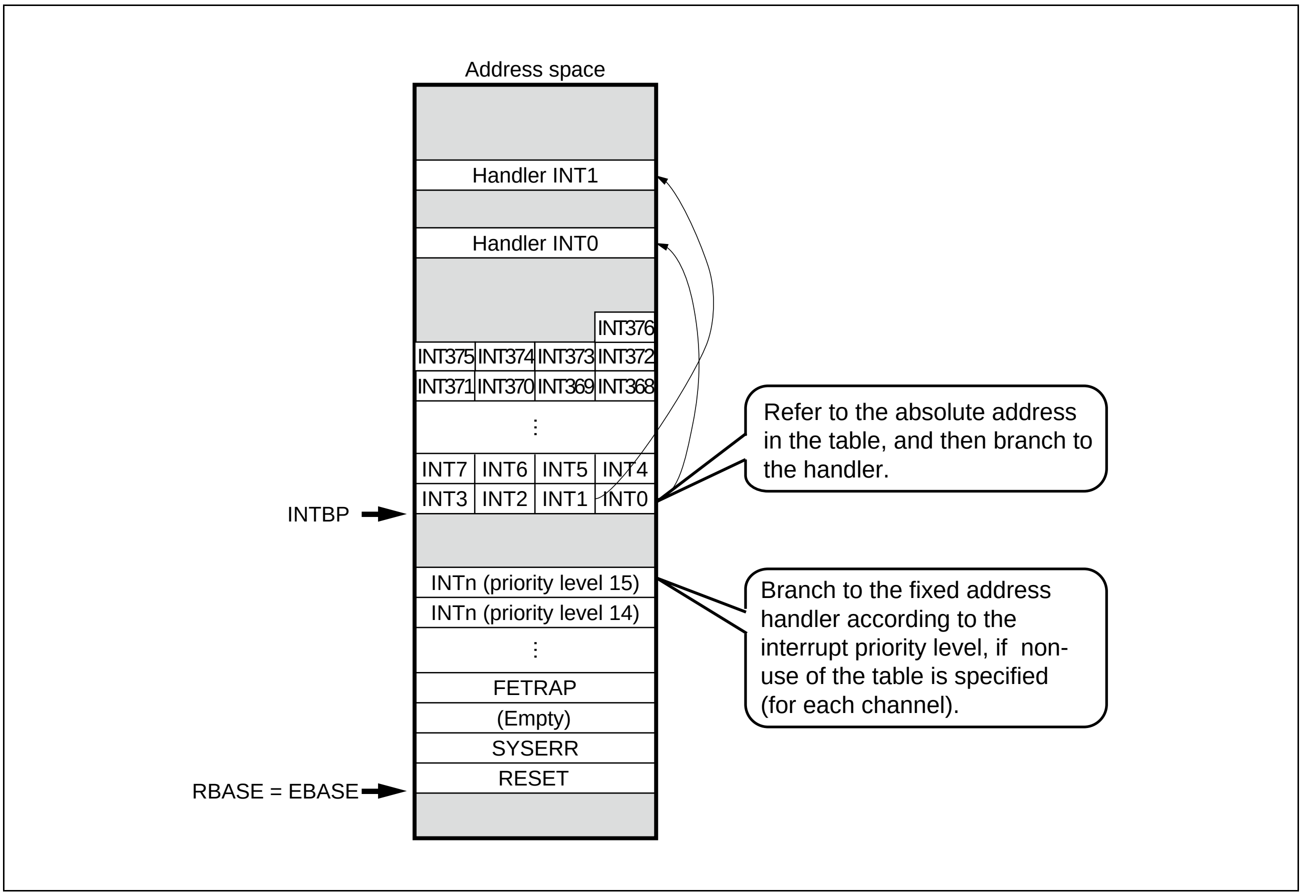

Figure 7BC.7 Table Reference Method

Section 8 DMA Controller

This section contains a generic description of the DMA controller (DMA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of channels, register base addresses, etc.

The remainder of the section describes the functions and registers of DMA.

8.1 Features of RH850/F1KH, RH850/F1KM DMA Controller

8.1.1 Number of Channels

This microcontroller has the following number of DMA channels.

Table 8.1 Number of Channels (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Channels	64 ch (8 ch × 4 × 2)	64 ch (8 ch × 4 × 2)	64 ch (8 ch × 4 × 2)

Table 8.2 Number of Channels (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of channels	32 ch (8 ch × 4)	32 ch (8 ch × 4)	32 ch (8 ch × 4)	32 ch (8 ch × 4)	32 ch (8 ch × 4)

Table 8.3 Number of Channels (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of channels	16 ch (8 ch × 2)	16 ch (8 ch × 2)	16 ch (8 ch × 2)	16 ch (8 ch × 2)

Table 8.4 Indices (RH850/F1KH-D8)

Index	Description
n	In this section, the DMA units are identified with an index “n” for example, as PDMAn (n = 0, 1).
y	In this section, the DMA groups are identified with an index “y” for example, as DMACy (y = 0 to 3).
m	In this section, the DMA channels are identified with an index “m”. For example, PDMAnDSAm (m = 0 to 31) is the DMA source address register.
i	In this section, the DMAC channels are identified with an index “i”. For example, PDMAnDMyiCM (i = 0 to 7) is the DMAC channel master.

Table 8.5 Indices (RH850/F1KM-S4)

Index	Description
n	In this section, the DMA units are identified with an index “n” for example, as PDMAn (n = 0).
y	In this section, the DMA groups are identified with an index “y” for example, as DMACy (y = 0 to 3).
m	In this section, the DMA channels are identified with an index “m”. For example, PDMAnDSAm (m = 0 to 31) is the DMA source address register.
i	In this section, the DMAC channels are identified with an index “i”. For example, PDMAnDMyiCM (i = 0 to 7) is the DMAC channel master.

Table 8.6 Indices (RH850/F1KM-S1)

Index	Description
n	In this section, the DMA units are identified with an index “n” for example, as PDMAn (n = 0).
y	In this section, the DMA groups are identified with an index “y” for example, as DMACy (y = 0, 1).
m	In this section, the DMA channels are identified with an index “m”. For example, PDMAnDSAm (m = 0 to 15) is the DMA source address register.
i	In this section, the DMAC channels are identified with an index “i”. For example, PDMAnDMyiCM (i = 0 to 7) is the DMAC channel master.

8.1.2 Register Base Addresses

The DMA base addresses are listed in the following table.

The DMA register addresses are given as offsets from the base addresses.

Table 8.7 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<DMA0_base>	FFFF 8000_H
<DMA1_base>	FFFF 9000_H

Table 8.8 Register Base Address (RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<DMA0_base>	FFFF 8000_H

8.1.3 Interrupt Requests

The DMA interrupt requests are listed in the following table.

Table 8.9 Interrupt Requests (RH850/F1KH-D8)

Unit Interrupt Signal	Description	Interrupt Number
PDMA0		
INTDMA0	PDMA0 DMA00 transfer completion	60
INTDMA1	PDMA0 DMA01 transfer completion	61
INTDMA2	PDMA0 DMA02 transfer completion	62
INTDMA3	PDMA0 DMA03 transfer completion	63

Note 1. For details, see **Section 8.10.2, DTFSEL_TAUD0/DTFSEL_TAUB0/DTFSEL_TAUB1 — DMA Trigger Factor Select Register**.

Note 2. For details INTDMAFL of the function, see *the RH850/F1KH, F1KM, F1K Flash Memory User's Manual: Hardware Interface*.

8.2 Overview

8.2.1 Overview

Direct memory access (DMA) is used to access data without intervention of the CPU.

DMA includes a DMA transfer module called DMAC. A DMAC includes registers for storing transfer information.

- RH850/F1KH-D8

  DMA has two 8-channel × 4-group DMAC modules. 2 DMA modules operate respectively as different master. This chapter describes the function of one DMAC unit.

- RH850/F1KM-S4

  DMA has one 8-channel × 4-group DMAC modules.

- RH850/F1KM-S1

  DMA has one 8-channel × 2-group DMAC modules.

In this manual, DTFR denotes the function to select among hardware DMA transfer sources for a DMAC and retain the DMA transfer request. The DTFR can handle 128 types of hardware DMA transfer sources.

The address space that can be used for DMA transfer is a 4 GB address space represented by a 32-bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DMA, see **Section 4A, Address Space of RH850/F1KH-D8**, **Section 4B, Address Space of RH850/F1KM-S4** and **Section 4C, Address Space of RH850/F1KM-S1**.

CAUTION

DMA can be used after PEG access permission setting.

- RH850/F1KH-D8:
  When accessing from the DMA to the local RAM in the PE, the PEGSP register, PEGGnMK register (n = 0 to 3), PEGGnBA register (n = 0 to 3) and PDMAnDMyiCM register (yi = 00 to 07, 10 to 17, 20 to 27, and 30 to 37) must be set.
- RH850/F1KM-S4:
  When accessing from the DMA to the local RAM in the PE, the PEGSP register, PEGGnMK register (n = 0 to 3), PEGGnBA register (n = 0 to 3) and PDMAnDMyiCM register (yi = 00 to 07, 10 to 17, 20 to 27, and 30 to 37) must be set.
- RH850/F1KM-S1:
  When accessing from the DMA to the local RAM and the retention RAM in the PE, the PEGSP register, PEGGnMK register (n = 0 to 3), PEGGnBA register (n = 0 to 3) and PDMAnDMyiCM register (yi = 00 to 07, 10 to 17) must be set.

8.2.2 Term Definition

Table 8.16, List of Term Definitions shows the terms used in this section.

Table 8.16 List of Term Definitions

Term	Description
DMA transfer	A general term for data transfer carried out by DMA.
DMA cycle	A series of actions that consist of reading an amount of data specified by the transfer size (8/16/32/64/128 bits) from the address specified by the source address and writing it to the address specified by the destination address. The first half of the DMA cycle (reading part) is called a read cycle, and the second half (writing part) is called a write cycle.
Hardware DMA transfer source	A trigger for a DMA transfer request sent by an internal peripheral device.
Hardware DMA transfer request	A DMA transfer request generated by a hardware DMA transfer source.
Software DMA transfer request	A DMA transfer request generated by software writing to a register.
DMA transfer request	A trigger to start DMA transfer with the DMAC.
Transfer information	The information required for DMA transfer, including the source address, destination address, transfer data size, and transfer count.
Single transfer	DMA transfer consisting of one DMA cycle started by one DMA transfer request.
Block transfer 1	DMA transfer consisting of the number of DMA cycles specified by the transfer count in the transfer information, started by one DMA transfer request.
Block transfer 2	DMA transfer consisting of the number of DMA cycles specified by the address reload count in the transfer information, started by one DMA transfer request.
Block transfer	A general term for both block transfer 1 and block transfer 2.
Last transfer	The DMA cycle carried out when the transfer count in the transfer information is 1.
Address reload transfer	The DMA cycle carried out when the address reload count in the transfer information is 1 if the reload function 2 is used.
Suspension	An action of pausing DMA transfer during block transfer. You can resume DMA transfer after suspension.
Resume	An action of resuming suspended DMA transfer.
Transfer abort	An action of aborting DMA transfer in the middle. You cannot resume DMA transfer after that.

8.3 DMA Function

8.3.1 Basic Operation of DMA Transfer

8.3.1.1 Transfer Mode

DMA has three transfer modes.

Single Transfer

One DMA cycle is executed when a DMA transfer request is acknowledged.

Block Transfer 1

The number of DMA cycles specified in the transfer count register are executed when a DMA transfer request is acknowledged.

Block Transfer 2

The number of DMA cycles specified by the address reload count are executed when a DMA transfer request is acknowledged. If the value specified in the address reload count is larger than the value in the transfer count register, the number of DMA cycles specified in the transfer count register are executed.

8.3.1.2 Executing a DMA Cycle

DMA always executes a write cycle after a read cycle is complete.

For example, if the transfer data size is 128 bits, a write cycle is executed after a read cycle for the 128-bit data is finished. A write cycle never starts in the middle of a read cycle.

8.3.1.3 Updating Transfer Information

When a DMA cycle is executed, DMA updates transfer information as follows:

Source Address and Destination Address

Transfer information will be updated as described in **Table 8.17, Updating the Source Addresses and the Destination Addresses** according to the settings in the transfer control register such as the count directions of source address and destination address and transfer data size.

Table 8.17 Updating the Source Addresses and the Destination Addresses

Count Direction	Transfer Data Size	Address after Update
Increment	8 bits	(address before update) + 0000 0001_H
	16 bits	(address before update) + 0000 0002_H
	32 bits	(address before update) + 0000 0004_H
	64 bits	(address before update) + 0000 0008_H
	128 bits	(address before update) + 0000 0010_H
Decrement	8 bits	(address before update) – 0000 0001_H
	16 bits	(address before update) – 0000 0002_H
	32 bits	(address before update) – 0000 0004_H
	64 bits	(address before update) – 0000 0008_H
	128 bits	(address before update) – 0000 0010_H
Fixed	—	Same as the address before update.

When you use the reload function, a special update rule is applied other than the one described in **Table 8.17, Updating the Source Addresses and the Destination Addresses** for the last transfer and the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

Transfer Count/Address Reload Count

The transfer count is decremented by one for every DMA cycle.

The address reload count is decremented by one for every DMA cycle when the reload function 2 or block transfer 2 is used. When the reload function 2 or block transfer 2 is not used, it is not updated.

When you use the reload function, a special update rule is applied for the last transfer and the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

Other transfer information

Other transfer information is not updated during execution of a DMA cycle.

8.3.1.4 Last Transfer and Address Reload Transfer

The last transfer means a DMA cycle executed when the value in the transfer count register, which shows the remaining number of transfers, is one. The last transfer differs in operation compared to other DMA cycles as follows.

- The transfer completion flag (PDMAnDCSTm.TC) is set when the last transfer is complete.
  The channel operation enable (PDMAnDCENm.DTE) bit is cleared when the last transfer is complete (when continuous transfer is disabled).
- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When the reload function 1 is enabled, the reload function 1 is executed at the timing of the last transfer. For details, see **Section 8.3.3, Reload Function**.

The address reload transfer means a DMA cycle executed when the reload function 2 is enabled and the address reload count is one. The reload function 2 is executed during the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

8.3.1.5 Transfer Completion Interrupt Output

DMA can output a transfer completion interrupt to external devices.

Transfer Completion Interrupt Output

When the transfer completion interrupt output enable (PDMAnDTCTm.TCE) is set in the transfer control register, a DMAC requests a transfer completion interrupt when the last transfer is complete.

Figure 8.1, Transfer Completion Interrupt shows the operation of the transfer completion interrupt.

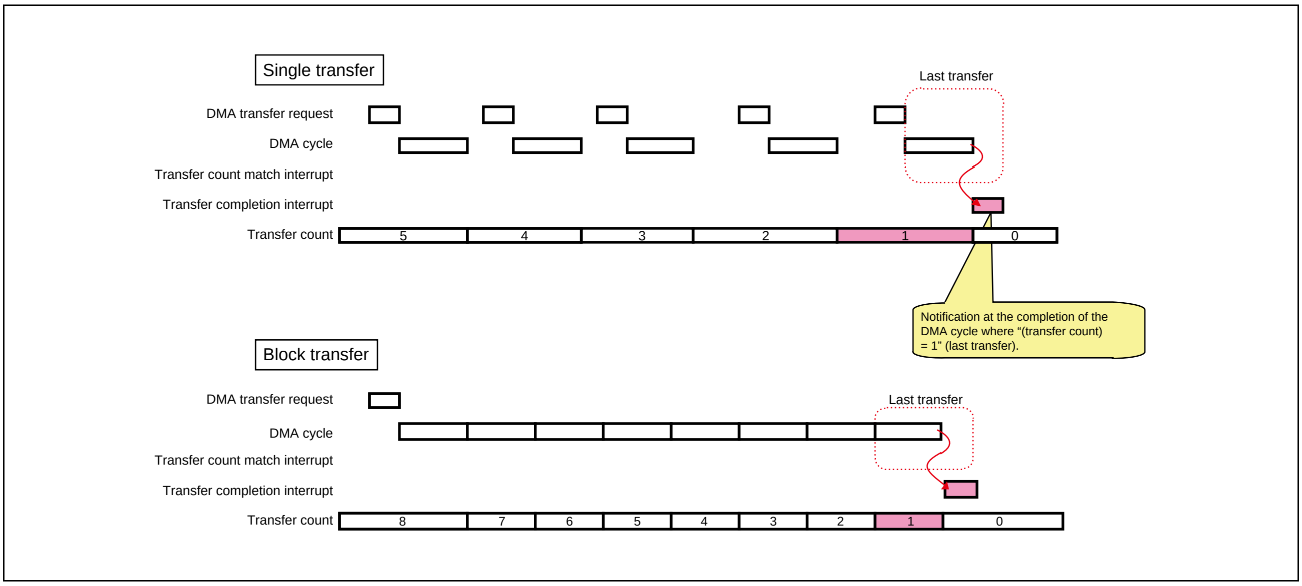

Figure 8.1 Transfer Completion Interrupt

8.3.1.6 Continuous Transfer

If the continuous transfer is not used, a DMAC sets the transfer completion flag (PDMAnDCSTm.TC) and clears the channel operation enable (PDMAnDCENm.DTE) bit when the last transfer is complete. In this case, a DMA transfer request is not accepted when the request is generated after the completion of the last transfer.

If the continuous transfer is used, the channel operation enable (PDMAnDCENm.DTE) bit is not cleared when the last transfer is complete, and a DMA transfer request can be accepted even when the transfer completion flag is set. If DMA is used for a case where a specified number of DMA transfers are executed repetitively, software overhead associated with clearing the transfer completion flag and setting the channel operation enable bit after the completion of the last transfer can be reduced by using the continuous transfer.

The continuous transfer is enabled by setting the continuous transfer enable (PDMAnDTCTm.MLE) in the DMAC transfer control register.

The continuous transfer is designed to work with the reload function 1. The continuous transfer function itself does not update the source address register, destination address register, and transfer count register. If, after the last transfer is complete, you want to restore the source address register, destination address register, and transfer count register to the state before the DMA transfer starts, use the reload function 1 and set the values of the source address register, destination address register, and the transfer count register before the DMA transfer starts to the reload source address register, reload destination address register, and reload transfer count register respectively.

Figure 8.2, Operation of Continuous Transfer by a DMAC shows an operation of continuous transfer by a DMAC.

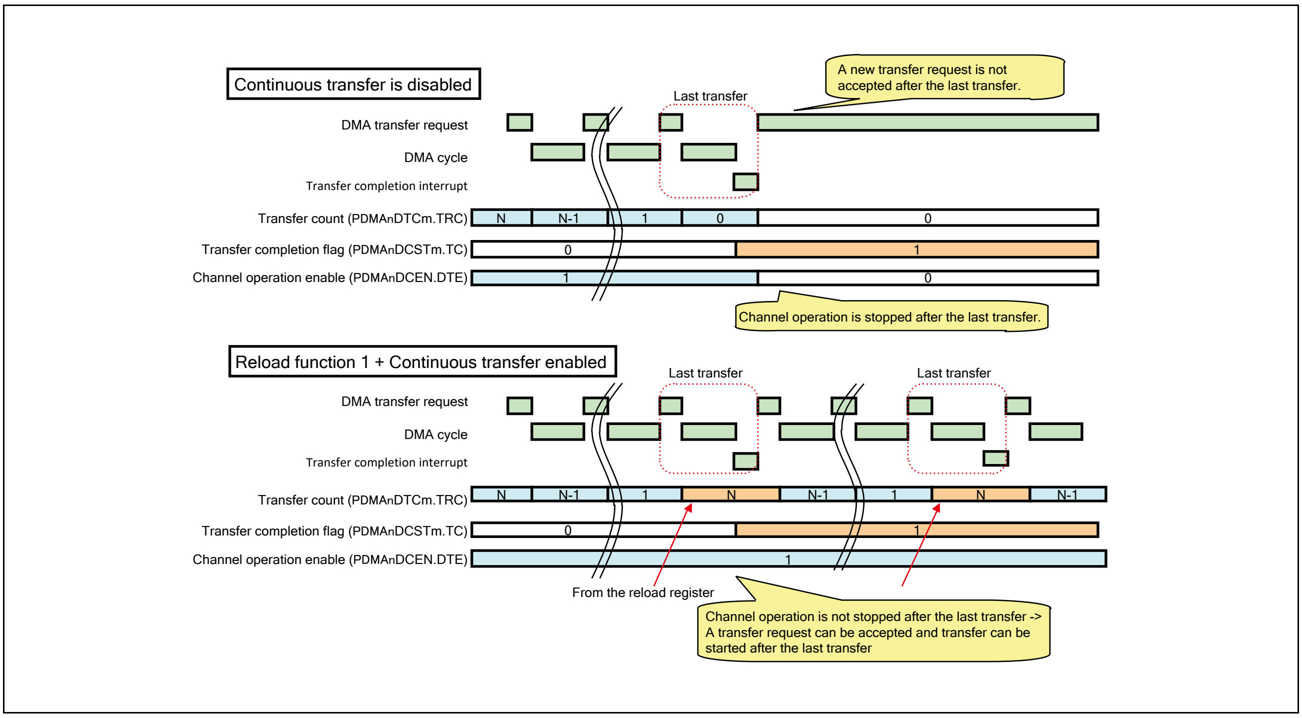

Figure 8.2 Operation of Continuous Transfer by a DMAC

8.3.2 Channel Priority Order

This subsection explains arbitration between multiple DMA channels.

8.3.2.1 DMAC Channel Arbitration

A DMAC select one channel out of eight channels with arbitration. Arbitration is done according to the fixed priority order. The priority order is “channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7” for DMAC0, and “channel 8 > channel 9 > channel 10 > channel 11 > channel 12 > channel 13 > channel 14 > channel 15” for DMAC1, “channel 16 > channel 17 > channel 18 > channel 19 > channel 20 > channel 21 > channel 22 > channel 23” for DMAC2, and “channel 24> channel 25 > channel 26 > channel 27 > channel 28 > channel 29 > channel 30 > channel 31” for DMAC3.

Arbitration is done for every DMA cycle. No arbitration occurs between the read and write of a DMA cycle.

If, at the timing when one DMA cycle completes in the middle of a block transfer of a channel, there is a DMA transfer request from a channel with a higher priority, a DMA cycle of the channel with the higher priority will be executed as the result of arbitration.

If a DMAC executes the block transfer 1 or block transfer 2, DMAC channel arbitration is done for every DMA cycle, and possibly a DMA cycle of another DMAC channel with a higher priority may interrupt.

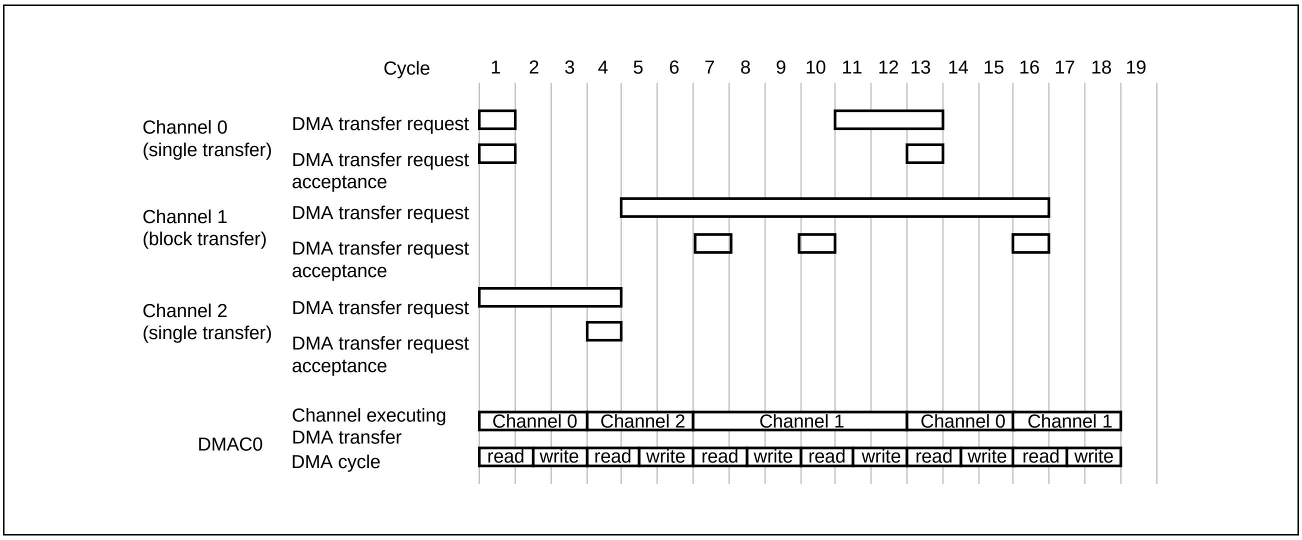

Figure 8.3 DMAC Channel Arbitration

Cycle numbers shown in **Figure 8.3, DMAC Channel Arbitration** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 8.3, DMAC Channel Arbitration**, DMA transfer requests for channels 0 and 2 are generated at Cycle 1. As a result of arbitration, a DMA cycle for channel 0 starts because its priority is higher. At Cycle 4, a DMA cycle for channel 2 starts. At Cycle 5, a DMA transfer request for channel 1 is generated. However, since the DMA cycle for channel 2 is still ongoing, no arbitration is done at this point. At Cycle 7, a DMA cycle for channel 1 starts. Because channel 1 uses block transfer, this DMA cycle continues at Cycle 10 where there are no other DMA transfer requests from other channel. At Cycle 11, a DMA transfer request for channel 0 is generated. However, since the DMA cycle for channel 1 is still ongoing, no arbitration is done at this point. At Cycle 12, the DMA cycle for channel 1 is complete. At Cycle 13, a DMA cycle for channel 0 starts as a result of arbitration between DMA channels 0 and 1.

It should be noted that, even though a block transfer of channel 1 has been already started, a DMA cycle of not channel 1 but channel 0 is executed at Cycle 13 because the priority of the latter is higher. At Cycle 15, the DMA cycle for channel 0 is complete. At Cycle 16, a DMA cycle for channel 1 starts again. At Cycle 18, the last DMA cycle of the block transfer of channel 1 is complete.

8.3.2.2 Interface Arbitration

DMAC0, DMAC1, DMAC2, and DMAC3 work independently and execute DMA transfer.

8.3.3 Reload Function

8.3.3.1 Overview of the Reload Function

The reload function updates a portion of transfer information, more specifically, the source address, destination address, transfer count, and address reload count, to the predefined values during DMA transfer.

The reload function has two types of functions: reload function 1 and reload function 2.

8.3.3.2 Operation of Reload Function 1

When the reload function 1 is enabled, actions described in **Table 8.18, Operation of Reload Function 1** are executed at the timing of the last transfer according to the reload function 1 setting.

Table 8.18 Operation of Reload Function 1

Reload Function 1 Setting	Register	Action at the Last Transfer
00 (Reload function 1 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Transfer count	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 1 enabled. Reloading source address and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	If the reload function 2 is disable: Not reloaded. If the reload function 2 is enabled: The reload address reload count is copied to this.
10 (Reload function 1 enabled. Reloading destination address and transfer count.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	If the reload function 2 is disable: Not reloaded. If the reload function 2 is enabled: The reload address reload count is copied to this.
11 (Reload function 1 enabled. Reloading source address, destination address, and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	If the reload function 2 is disable: Not reloaded. If the reload function 2 is enabled: The reload address reload count is copied to this.

Figure 8.4, Operation of Reload Function 1 shows an operation of the reload function 1.

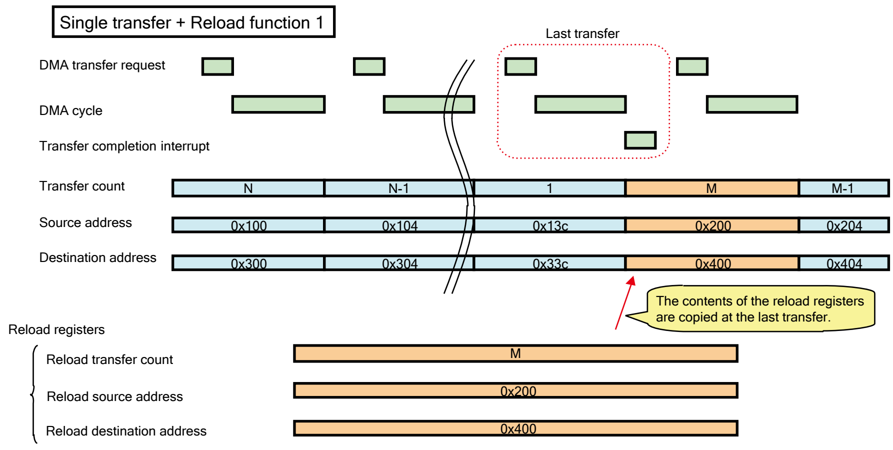

Figure 8.4 Operation of Reload Function 1

8.3.3.3 Reload Function 2

When the reload function 2 is enabled, actions described in **Table 8.19, Operation of Reload Function 2** are executed at the timing of the address reload transfer according to the reload function 2 setting.

Table 8.19 Operation of Reload Function 2

Reload Function 2 Setting	Register	Action at the Address Reload Transfer
00 (Reload function 2 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 2 enabled. Reloading source address and address reload count.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Address reload count	The reload address reload count is copied to this.
10 (Reload function 2 enabled. Reloading destination address and address reload count.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.
11 (Reload function 2 enabled. Reloading source address and destination address and address reload count.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.

Figure 8.5, Operation of Reload Function 2 shows an operation of the reload function 2.

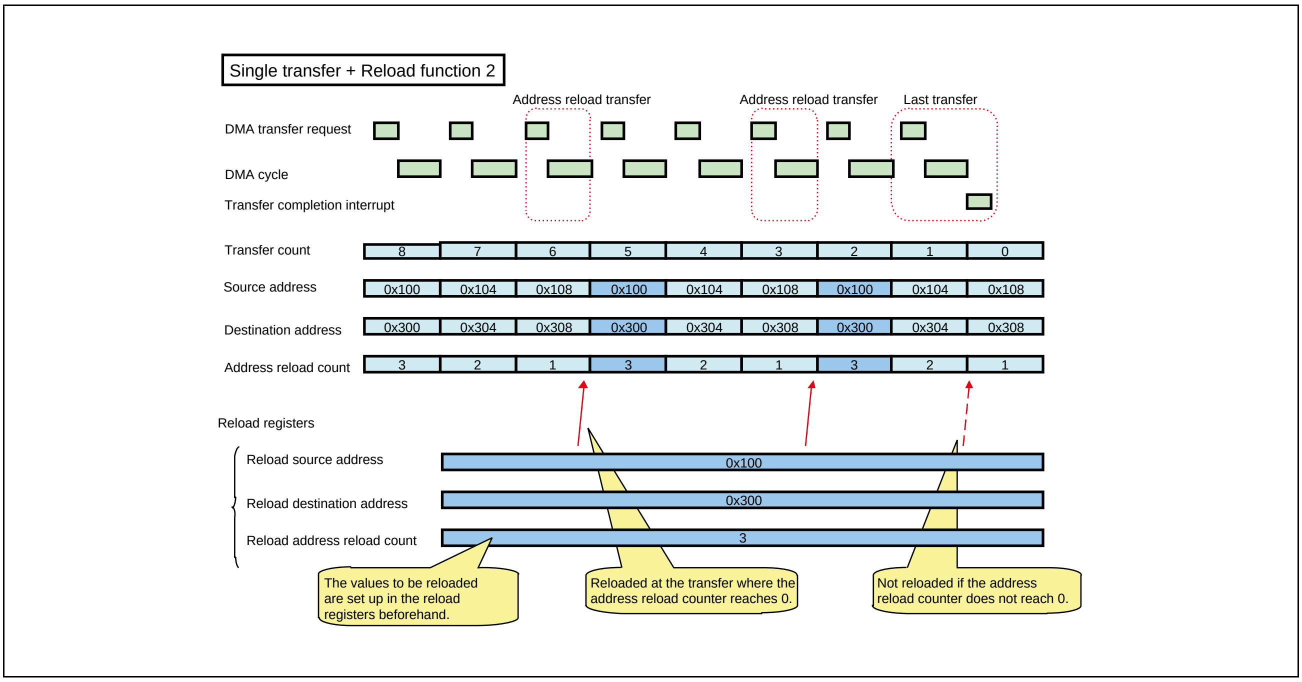

Figure 8.5 Operation of Reload Function 2

Figure 8.6, Operation when Combining the Reload Function 1 and the Reload Function 2 shows an operation when both the reload function 1 and the reload function 2 are used simultaneously.

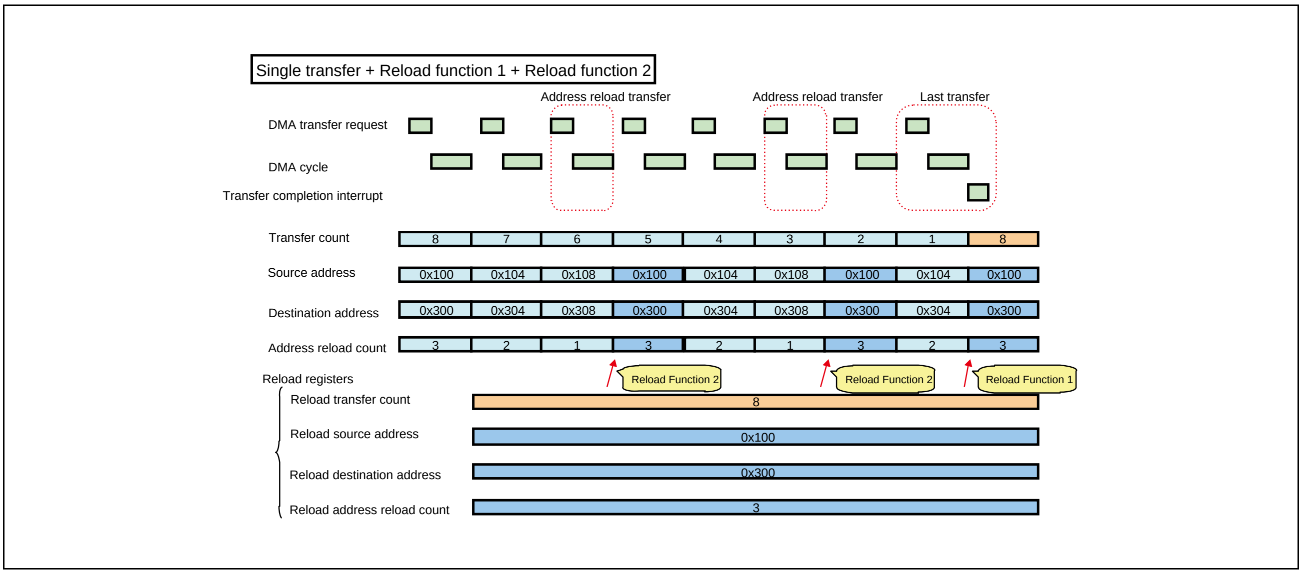

Figure 8.6 Operation when Combining the Reload Function 1 and the Reload Function 2

8.3.3.4 Timing of Setting DMAC Reload Registers

You can set up the reload source address register, reload destination address register, and reload transfer count register any time (even during DMA transfer). However, if you update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, there may be a conflict between reloading at the last transfer or address reload transfer and update of the reload register by users. In order to avoid this conflict, setting up reload registers must be completed before the last transfer or address reload transfer starts.

8.3.4 Chain Function

8.3.4.1 Overview

DMA offers a function called a chain function. With this function, the completion of the DMA cycle or last transfer for one channel can trigger a DMA transfer request for another channel. A DMA transfer request for another channel initiated by the chain function is called a chain request.

You can select the condition for generating a chain request from the following two options:

- Always chain: A chain request is generated at the completion of every DMA cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

Figure 8.7, Operation of “Always Chain” shows the operation of “always chain.”

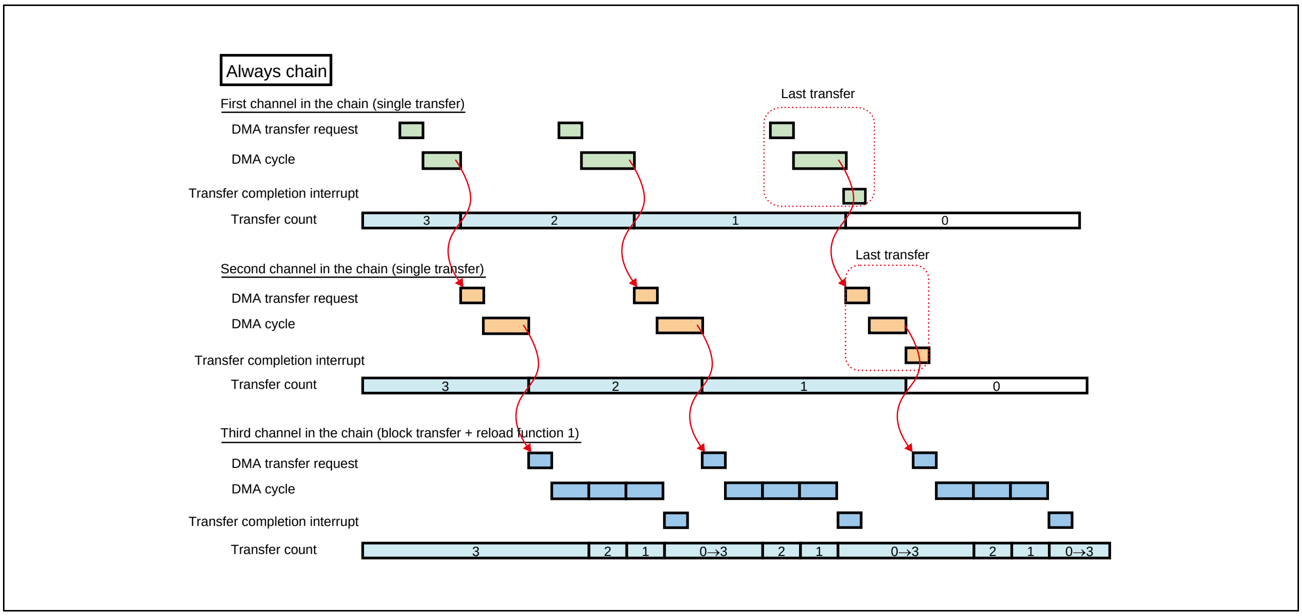

Figure 8.7 Operation of “Always Chain”

Figure 8.8, Operation of "Chain at the Last Transfer" shows the operation of "chain at the last transfer."

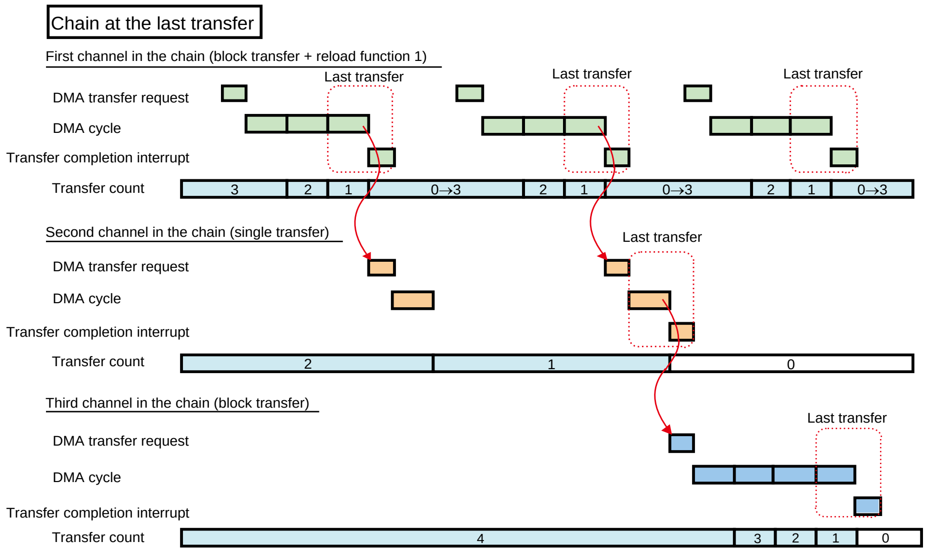

Figure 8.8 Operation of "Chain at the Last Transfer"

8.3.4.2 Setting Up the Chain Function

For a DMAC, you need to write to the chain enable (PDMAnDTCTm.CHNE) and the next channel in the chain selection (PDMAnDTCTm.CHNSEL) in the DMAC transfer control register in order to set up the type of chain function and the next channel number in the chain.

8.3.4.3 Caution for Using the Chain Function

The chain function is enabled by setting the software DMA transfer request flag of the next channel in the chain as a part of its function. Therefore, you need to set up the channel settings of the next channel in the chain in the same way as when the software DMA transfer request is used. If you specify a channel using the hardware DMA transfer request for the next channel in the chain, the chain function does not work.

A channel and its next channel in the chain must belong to the same group (DMAC0, DMAC1, DMAC2, and DMAC3). You cannot specify a channel in another group for its next channel in the chain.

8.3.5 DMAC Operation

8.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request selection assignment (PDMAnDTCTm.DRS) bit in the DMAC transfer control register (PDMAnDTCTm) determines whether a hardware DMA transfer request or a software DMA transfer request is used.

In the case of a hardware DMA transfer request for a DMAC, DTFR selects one out of 128 hardware DMA transfer factor and assigned to each channel of the DMAC. This assignment is configured in the DTFR setting registers.

8.3.5.2 Generating and Accepting a Software DMA Transfer Request

By setting the software DMA transfer request flag (PDMAnDCSTm.SR) in the DMAC transfer status register (PDMAnDCSTm) using the DMAC transfer status set register (PDMAnDCSTSm), a software DMA transfer request can be generated.

The software DMA transfer request flag is automatically cleared when the DMAC processes the DMA transfer request. The timing when the software DMA transfer request flag is automatically cleared differs depending on the transfer mode of the DMA transfer to be executed.

- In the single transfer mode, the software DMA transfer request flag is cleared whenever the software DMA transfer request is accepted.
- In the block transfer 1 mode, the software DMA transfer request flag is cleared when the last transfer starts.
- In the block transfer 2 mode, the software DMA transfer request flag is cleared when the last transfer or address reload transfer starts.

The software DMA transfer request flag can also be cleared by software using the DMAC transfer status clear register (PDMAnDCSTCm). When you abort a DMA transfer of a DMAC channel, you must clear the software DMA transfer request flag.

8.3.5.3 Executing DMA Transfer

When the DMAC accepts a DMA transfer request for a channel, the DMAC executes DMA transfer of the channel. If there are DMA transfer requests from multiple channels, DMAC does DMAC channel arbitration and decides a channel to be acknowledged.

8.4 Suspension, Resume, Transfer Abort, and Clearing of a DMA Transfer Request

8.4.1 DMA Suspension and Resume by Software Control

The DMA control register (PDMAnDMACTL) is used to suspend DMA transfer for all channels.

When the DMA suspension bit (PDMAnDMACTL.DMASPD) in the DMA control register is set, DMA puts all channels into the suspended state. If all channels are in the suspended state and the DMA suspension bit in the DMA control register is cleared, DMA restores all channels from the suspended state to the normal state and resumes the DMA transfer of the suspended channel.

When all channels are in the suspended state, DMA transfer is suspended for all channels without changing the value of the PDMAnDCENm.DTE bit of each DMAC channel.

8.4.2 Suspension, Resume, and Transfer Abort of a DMAC Channel

You can suspend the DMA transfer of a DMAC channel by clearing the channel operation enable bit (PDMAnDCENm.DTE) in the DMAC channel operation enable setting register for the channel. If a DMA cycle is ongoing, the DMA transfer of the channel is suspended after the currently ongoing DMA cycle is finished. If you set the PDMAnDCENm.DTE bit again while the DMA transfer of the channel is suspended, the DMA transfer of the channel is resumed.

If you want to abort the currently ongoing DMA transfer of a DMAC channel, similarly clear the channel operation enable bit (PDMAnDCENm.DTE) in the DMAC channel operation enable setting register, and then clear the hardware DMA transfer request in the DTFR in the case of a hardware DMA transfer request, or clear the software DMA transfer request flag (PDMAnDCSTm.SR) using the DMAC transfer request flag clear bit (PDMAnDCSTCm.SRC) in the DMAC transfer status clear register in the case of a software DMA transfer request.

In case that the continuous transfer enable bit (PDMAnDTCTm.MLE) is set, the channel operation enable bit (PDMAnDCENm.DTE) is kept to be set. Even though the channel operation enable bit (PDMAnDCENm.DTE) is cleared by software during a DMA cycle in a last transfer, the function of the continuous transfer enable bit (PDMAnDTCTm.MLE) is given high priority and the channel operation enable bit (PDMAnDCENm.DTE) is set after completion of the last transfer.

If you want to abort an ongoing DMA transfer of a DMAC channel when continuous transfer function is enabled, please clear the continuous transfer enable bit (PDMAnDTCTm.MLE) first and then clear the channel operation enable bit (PDMAnDCENm.DTE) to abort DMA transfer of the DMAC channel. Only for the operation, DMAC Transfer Control Register (PDMAnDTCTm) can be written under the channel operation is enabled (PDMAnDCENm.DTE = 1).

Figure 8.9, Example of Suspension, Resume, and Transfer Abort of a DMAC Channel shows an example of suspension, resume, and transfer abort of a DMAC channel.

In **Figure 8.9, Example of Suspension, Resume, and Transfer Abort of a DMAC Channel**, both channels 0 and 1 execute block transfer. At time tick 1, DMA transfer of channel 1 starts. At time tick 2, a DMA transfer request for channel 0 is accepted. As a result of DMAC channel arbitration, DMA transfer of channel 0 starts because channel 0 has a higher priority than channel 1. At time tick 3, the last transfer of channel 0 is complete, and the remaining DMA transfer in the block transfer of channel 1 starts. At time tick 4, the last transfer of channel 1 is complete. After time tick 5, DMA transfer of channel 0 and DMA transfer of channel 1 are executed similarly. At time tick 7, the DMA transfer of channel 0 is suspended and, as a result of DMAC channel arbitration, the DMA transfer of channel 1 starts. At time tick 8, the last transfer of channel 1 is complete, and then, at time tick 9, the DMA transfer of channel 0 resumes. At time tick 10, the DMA transfer of channel 0 is suspended again, and then, at time tick 11, the DMA transfer of channel 0 is aborted. At time tick 12, the suspended state for channel 0 is cleared, but the DMA transfer of channel 0 is not executed because the DMA transfer is aborted at time tick 11.

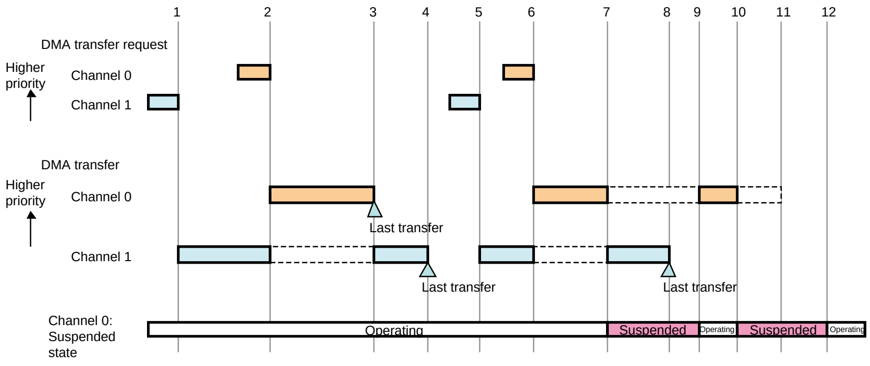

Figure 8.9 Example of Suspension, Resume, and Transfer Abort of a DMAC Channel

8.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR

If a DMAC uses a hardware DMA transfer request, you can temporarily disable (mask) the hardware DMA transfer request output from the DTFR to the DMAC by clearing the hardware DMA transfer source selection enable bit (PDMAnDTFRm.REQEN) in the DTFR setting register.

Also, if a hardware DMA transfer source is used, you can clear a hardware DMA transfer request retained in the DTFR by using the hardware DMA transfer request clear (PDMAnDTFRRQCm.DRQC) bit in the DTFR transfer request clear register.

Even if you suspend or abort DMA transfer of a DMAC channel, the hardware DMA transfer request selection/hold circuit of the DTFR is still running, and consequently, the DTFR may retain a hardware DMA transfer request that was input to the DTFR during the suspension or transfer abort period of the DMAC channel. When you resume or start DMA transfer of a DMAC channel, clear the hardware DMA transfer request retained in the DTFR as required.

In case that DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode, if DTFR hardware DMA transfer source selection enable bit is set to disable (PDMAnDTFRm.REQEN = 0) by software while DMAC is executing block transfer, the ongoing block transfer is suspended.

8.4.4 List of Suspend, Resume, and Transfer Abort Functions

Table 8.20 List of Suspend, Resume, and Transfer Abort Functions

Function	How to Execute the Function	Operation	Possibility of DMA Transfer Abort	Master that can Execute the Function (See **Section 8.6, Reliability Functions**.)
DMA suspension and resume by software control	Setting and clearing the PDMAnDMACTL.DMASPD	All channels are in the suspended state.	Not possible*[1]	Special master
Suspension and resume of a DMAC channel	Clearing and setting the PDMAnDCENm.DTE in each channel register*[2]	DMA transfer of a channel is suspended.	Possible (by clearing the DMA transfer request flag in suspension state)	Special master, and general master assigned to the channel.

Note 1. In order to abort DMA transfer, you need to abort transfer for the DMAC channel.

Note 2. In case that the continuous transfer enable bit (PDMAnDTCTm.MLE) is set, please clear the continuous transfer enable bit (PDMAnDTCTm.MLE) first before clearing the PDMAnDCENm.DTE bit to suspend the channel and set the continuous transfer enable bit (PDMAnDTCTm.MLE) before setting the PDMAnDCENm.DTE bit to resume the channel.

8.5 Error Control

8.5.1 Type of Error

DMA can generate the following type of error.

- DMA Transfer Error
  This error is generated when error is detected in the read cycle or write cycle in a DMA cycle. This error can be generated in all DMAC channels during execution of DMA transfer.
  A DMA transfer error leads to INTDMAERR interrupt request which is a source of FEINT.

8.5.2 DMA Transfer Error

8.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs

When DMA transfer error occurs in a DMAC, the transfer error flag (PDMAnDCSTm.ER) in the DMAC transfer status register of the channel where the DMA transfer error occurred is set. The DMAC error register (PDMAnDMACER) shows the transfer error flags of all 32 DMAC channels.

On a channel where the transfer error flag is set, a new DMA cycle is not executed if the transfer disable on transfer error setting (PDMAnDTCTm.ESE) bit is set. On the other hand, a DMA cycle is executed regardless of the value of the transfer error flag if the transfer error case DMA transfer disable setting (PDMAnDTCTm.ESE) bit is cleared.

If you want to abort the DMA transfer of a channel where the DMA transfer error occurred is set, follow the procedure to abort DMA transfer of the DMAC channel.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the result of write operation is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address register, destination address register, transfer count register, and address reload count register are updated.

8.6 Reliability Functions

8.6.1 Overview

In this product, DMA provides the following reliability functions:

- Register access protection function
- Master information inherit function

8.6.2 Register Access Protection Function

- RH850/F1KH-D8
  This product is designed to assign each DMA channel to CPU1 or CPU2.
- RH850/F1KM-S4, RH850/F1KM-S1
  This product is designed to assign DMA channel to a CPU1.

The register access protection function allows write access to the transfer information of each DMA channel only from the master assigned to the channel and prohibits write access from other masters.

The register access protection function enables you, for example, to prevent the settings of the channel from being updated by masters other than the one assigned to the channel.

8.6.2.1 Identifying the Accessing Master

DMA identifies a master based on the processor element ID number (PEID) of the accessing master, the system protection ID configured by the accessing CPU (SPID), and whether the CPU is in the supervisor mode (PSW.UM = 0) or the user mode (PSW.UM = 1).

8.6.2.2 Master Access

DMA handles accesses from CPU in the supervisor mode (PSW.UM = 0) as accesses from special masters. Special masters are allowed to read from or write to all DMA registers.

DMA handles the other masters except special masters as general masters. General masters are allowed to read from all DMA registers, but allowed to write to the following specific registers.

- Channel registers of the channels assigned by the channel assignment. (For details, see **Section 8.6.2.3, Channel Assignment**.)

From general masters, write access to registers other than the above is not allowed.

8.6.2.3 Channel Assignment

To each channel, DMA can assign a master so that the master is allowed to use the channel. Channel assignment is configured in the channel master setting register (PDMAnDMyiCM) by the CPU in the supervisor mode (PSW.UM = 0).

In general master access, the master assigned to a channel by the channel assignment is allowed to write the channel registers of the channel. If the channel registers of a channel is written by a master other than the master assigned to the channel, the access is called illegal access. For information about illegal access, see **Section 8.6.2.4, Illegal Access**.

8.6.2.4 Illegal Access

DMA handles the following access as illegal access.

(1) Write access to global registers from general masters

(2) Write access to channel registers from general masters who are not assigned to the channel

DMA never treat read access from any master as illegal access.

DMA’s actions against illegal access are as follows:

For both cases (1) and (2),

- Write access is ignored.

Only for the case (2),

- The information about the illegal access is stored in a register access protection violation register.
- The DMAC0, DMAC1, DMAC2, and DMAC3 have their own register access protection violation registers (PDMAnDM0CMV, PDMAnDM1CMV, PDMAnDM2CMV, and PDMAnDM3CMV respectively).

Only the special master can access the register access protection violation registers. The special master can check whether illegal access has occurred by checking the register access protection violation registers periodically.

In addition, it is recommended that, when a master uses DMA and configures transfer information in the channel registers, the master should check whether the configuration has been successfully completed without illegal access by, for example, reading back the settings.

8.6.3 Master Information Inherit Function

In this product, DMA inherits master information that is equivalent to the master information of the master to which the DMA channel is assigned.

The master information that is output from DMA is shown in **Table 8.21, Master Information that is Output from DMA**.

Table 8.21 Master Information that is Output from DMA

Meaning	Value that is Output from DMA
UM	UM bit value in the channel master setting register
SPID	SPID bit value in the channel master setting register
PEID	PEID bit value in the channel master setting register
DMA	1

8.6.4 Other Reliability Functions

8.6.4.1 Restriction on the Next Channel in the Chain

The reliability function limits the channels you can select as the next channel in the chain.

When you use the chain function, the channel master settings of a channel and its next channel in the chain must be the same.

The chain function is designed so that a channel and its next channel in the chain are managed by the same master.

When DMA detects that different masters are assigned to a channel and its next channel in the chain, it is deemed illegal and the chain function is suppressed. More specifically, when DMA tries to execute the chain function, DMA compares the chain master settings of the channel and its next channel in the chain, and if the settings are the same for both PEID and UM, the chain function is allowed and a chain request is sent to the next channel. If the channel master settings are not the same for either PEID or UM, a chain request is not sent.

8.7 Setting Up DMA Transfer

8.7.1 Overview of Setting Up DMA

Table 8.22 Overview of Setting Up DMA

No.	Master that Configures the Setting	Description	Register		Necessity of the Setting
1	Special master (CPU1/2 in the supervisor mode (UM = 0))	Overall DMA operation setting	PDMAnDM00CM to PDMAnDM37CM	DMAC channel master setting	Mandatory
2		Status clear	PDMAnCMVC	Channel protection violation clear register	Recommended
3	Master assigned to the DMAC channel	Channel setting	PDMAnDSAm	DMAC source address	Mandatory
4			PDMAnDDAm	DMAC destination address	Mandatory
5			PDMAnDTCm	DMAC transfer count	Mandatory
6			PDMAnDTCTm	DMAC transfer control	Mandatory
7			PDMAnDRSAm	DMAC reload source address	Mandatory if the reload function is used
8			PDMAnDRDAm	DMAC reload destination address	Mandatory if the reload function is used
9			PDMAnDRTCm	DMAC reload transfer count	Mandatory if the reload function is used
10			PDMAnDTFRm	DTFR setting register	Mandatory
11		Status clear	PDMAnDCSTCm	DMAC transfer status clear	Mandatory
12			PDMAnDTFRRQCm	DTFR transfer request clear	Recommended
13		Channel operation enable	PDMAnDCENm	DMAC channel operation enable setting	Mandatory

8.7.2 Setting Up the Overall DMA Operation

You need to set up the overall DMA operation before you start using DMA.

To configure the overall DMA operation, the special master (CPU1/2 in the supervisor mode (UM = 0)) needs to set up global registers. Global registers can be set up only by special master access. For details, see **Section 8.6, Reliability Functions**.

The following register must be set up to configure the overall DMA operation.

- DMAC channel master setting registers (PDMAnDMyiCM)

These registers configure channel assignment. (For details, see **Section 8.6, Reliability Functions**.)

If the DMAC channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

Also, if errors are detected in the following registers while the overall DMA operation is set up, clearing the errors is recommended.

- DMAC0 register access protection violation register (PDMAnDM0CMV)
- DMAC1 register access protection violation register (PDMAnDM1CMV)
- DMAC2 register access protection violation register (PDMAnDM2CMV)
- DMAC3 register access protection violation register (PDMAnDM3CMV)

8.7.3 Setting Up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC.

To configure the DMA channel setting, each channel’s master assigned by the channel assignment sets channel registers.

8.7.3.1 Setting Up the DMAC Channel Setting

Follow the procedure below to set up the DMAC channel setting in case of using DMAC.

(1) Disabling the DMAC Channel Operation

If the channel operation enable (PDMAnDCENm.DTE) in the DMAC channel operation enable setting register (PDMAnDCENm) is set, clear the PDMAnDCENm.DTE bit to disable the channel operation.

(2) Setting Up the Transfer Information

When you set up the transfer information of the DMAC, the following registers need to be set up.

- DMAC source address register (PDMAnDSAm)
- DMAC destination address register (PDMAnDDAm)
- DMAC transfer count register (PDMAnDTCm)
- DMAC transfer control register (PDMAnDTCTm)
- DMAC reload source address register (PDMAnDRSAm)
- DMAC reload destination address register (PDMAnDRDAm)
- DMAC reload transfer count register (PDMAnDRTCm)

(3) Setting Up the DMA Transfer Request

While setting the transfer information, you need to set up the DMA transfer request selection assignment (PDMAnDTCTm.DRS) bit in the DMAC transfer control register (PDMAnDTCTm) to define whether the hardware or software DMA transfer request is used.

You cannot use both the hardware and software DMA transfer requests for the same channel at the same time.

If you use the hardware DMA transfer request, you need to select the source used as the hardware DMA transfer request out of 128 hardware DMA transfer sources using the hardware DMA transfer source selection (PDMAnDTFRm.REQSEL) in the DTFR setting register. Also, you need to enable the hardware DMA transfer source selection (PDMAnDTFRm.REQEN) in the same register.

The DTFR may retain a hardware DMA transfer request before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (PDMAnDTFRRQm.DRQ) retained in the DTFR using the DTFR transfer request clear register (PDMAnDTFRRQCm) if necessary.

If you use the software DMA transfer request, disable the hardware DMA transfer source selection (PDMAnDTFRm.REQEN) in the DTFR setting register.

(4) Clearing the Transfer Status

The DMAC transfer status register (PDMAnDCSTm) may retain the result of the previous DMA transfer, so clear the flags in the DMAC transfer status register using the DMAC transfer status clear register (PDMAnDCSTCm).

(5) Enabling the DMAC Channel Operation

Set the channel operation enable (PDMAnDCENm.DTE) bit in the DMAC channel operation enable setting register to enable the channel operation.

After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and become ready for DMA transfer.

8.8 Global Registers

8.8.1 List of Global Register Address

The global register addresses are listed in the table below.

For <DMAn_base>, see **Section 8.1.2, Register Base Addresses**.

Table 8.23 List of Global Register Address (RH850/F1KH-D8)

				Access Permission	
Unit Name	Register Name	Symbol	Address	Special Master	General Master
PDMAn	DMA control register	PDMAnDMACTL	<DMAn_base> + 0000_H	✓	—[*1]
	DMAC error register	PDMAnDMACER	<DMAn_base> + 0020_H	✓	✓
	DMAC0 register access protection violation register	PDMAnDM0CMV	<DMAn_base> + 0030_H	✓	✓
	DMAC1 register access protection violation register	PDMAnDM1CMV	<DMAn_base> + 0034_H	✓	✓
	Register access protection violation clear register	PDMAnCMVC	<DMAn_base> + $003C_H$	✓	—[*1]
	DMAC2 register access protection violation register	PDMAnDM2CMV	<DMAn_base> + 0040_H	✓	✓
	DMAC3 register access protection violation register	PDMAnDM3CMV	<DMAn_base> + 0044_H	✓	✓
	DMAC0 channel 0 channel master setting	PDMAnDM00CM	<DMAn_base> + 0100_H	✓	—[*1]
	DMAC0 channel 1 channel master setting	PDMAnDM01CM	<DMAn_base> + 0104_H	✓	—[*1]
	DMAC0 channel 2 channel master setting	PDMAnDM02CM	<DMAn_base> + 0108_H	✓	—[*1]
	DMAC0 channel 3 channel master setting	PDMAnDM03CM	<DMAn_base> + $010C_H$	✓	—[*1]
	DMAC0 channel 4 channel master setting	PDMAnDM04CM	<DMAn_base> + 0110_H	✓	—[*1]
	DMAC0 channel 5 channel master setting	PDMAnDM05CM	<DMAn_base> + 0114_H	✓	—[*1]
	DMAC0 channel 6 channel master setting	PDMAnDM06CM	<DMAn_base> + 0118_H	✓	—[*1]
	DMAC0 channel 7 channel master setting	PDMAnDM07CM	<DMAn_base> + $011C_H$	✓	—[*1]
	DMAC1 channel 0 channel master setting	PDMAnDM10CM	<DMAn_base> + 0120_H	✓	—[*1]
	DMAC1 channel 1 channel master setting	PDMAnDM11CM	<DMAn_base> + 0124_H	✓	—[*1]
	DMAC1 channel 2 channel master setting	PDMAnDM12CM	<DMAn_base> + 0128_H	✓	—[*1]
	DMAC1 channel 3 channel master setting	PDMAnDM13CM	<DMAn_base> + $012C_H$	✓	—[*1]
	DMAC1 channel 4 channel master setting	PDMAnDM14CM	<DMAn_base> + 0130_H	✓	—[*1]
	DMAC1 channel 5 channel master setting	PDMAnDM15CM	<DMAn_base> + 0134_H	✓	—[*1]
	DMAC1 channel 6 channel master setting	PDMAnDM16CM	<DMAn_base> + 0138_H	✓	—[*1]
	DMAC1 channel 7 channel master setting	PDMAnDM17CM	<DMAn_base> + $013C_H$	✓	—[*1]
	DMAC2 channel 0 channel master setting	PDMAnDM20CM	<DMAn_base> + 0140_H	✓	—[*1]
	DMAC2 channel 1 channel master setting	PDMAnDM21CM	<DMAn_base> + 0144_H	✓	—[*1]
	DMAC2 channel 2 channel master setting	PDMAnDM22CM	<DMAn_base> + 0148_H	✓	—[*1]
	DMAC2 channel 3 channel master setting	PDMAnDM23CM	<DMAn_base> + $014C_H$	✓	—[*1]
	DMAC2 channel 4 channel master setting	PDMAnDM24CM	<DMAn_base> + 0150_H	✓	—[*1]
	DMAC2 channel 5 channel master setting	PDMAnDM25CM	<DMAn_base> + 0154_H	✓	—[*1]
	DMAC2 channel 6 channel master setting	PDMAnDM26CM	<DMAn_base> + 0158_H	✓	—[*1]
	DMAC2 channel 7 channel master setting	PDMAnDM27CM	<DMAn_base> + $015C_H$	✓	—[*1]
	DMAC3 channel 0 channel master setting	PDMAnDM30CM	<DMAn_base> + 0160_H	✓	—[*1]
	DMAC3 channel 1 channel master setting	PDMAnDM31CM	<DMAn_base> + 0164_H	✓	—[*1]
	DMAC3 channel 2 channel master setting	PDMAnDM32CM	<DMAn_base> + 0168_H	✓	—[*1]
	DMAC3 channel 3 channel master setting	PDMAnDM33CM	<DMAn_base> + $016C_H$	✓	—[*1]
	DMAC3 channel 4 channel master setting	PDMAnDM34CM	<DMAn_base> + 0170_H	✓	—[*1]
	DMAC3 channel 5 channel master setting	PDMAnDM35CM	<DMAn_base> + 0174_H	✓	—[*1]

8.8.2 Details of Global Registers

8.8.2.1 PDMAnDMACTL — DMA Control Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + 0000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA SPD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.26 PDMAnDMACTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DMASPD	DMA suspension This bit indicates that DMA transfer for all channels is suspended. If a user writes 1 to this bit, DMA transfer for all channels can be suspended. If a user writes 0 to this bit, suspension of DMA transfer for all channels can be released. The suspension controlled by this bit is independent from the suspension controlled by the transfer enable bit (PDMAnDCENm.DTE) of each DMAC channel. That means, if this bit is set to 1, all DMA transfers are suspended regardless of the values of the PDMAnDCENm.DTE bit of each DMAC channel. Writing to this bit does not affect the PDMAnDCENm.DTE bit of each DMAC channel. 0: DMA suspension cleared 1: DMA suspension request/DMA suspension ongoing

8.8.2.2 PDMAnDMACER — DMAC Error Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <DMAn_base> + 0020$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.27 PDMAnDMACER Register Contents

Bit Position	Bit Name	Function
31 to 24	DM3ER[7:0]	RH850F1KH-D8, RH850/F1KM-S4 DMAC3 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC3. Each bit is mapped from the PDMAnDCSTm.ER bit of each channel of the DMAC3 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated RH850/F1KM-S1: When read, the value after reset is returned.
23 to 16	DM2ER[7:0]	RH850F1KH-D8, RH850/F1KM-S4 DMAC2 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC2. Each bit is mapped from the PDMAnDCSTm.ER bit of each channel of the DMAC2 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated RH850/F1KM-S1: When read, the value after reset is returned.
15 to 8	DM1ER[7:0]	DMAC1 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC1. Each bit is mapped from the PDMAnDCSTm.ER bit of each channel of the DMAC1 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated
7 to 0	DM0ER[7:0]	DMAC0 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC0. Each bit is mapped from the PDMAnDCSTm.ER bit of each channel of the DMAC0 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated

8.8.2.3 PDMAnDM0CMV — DMAC0 Register Access Protection Violation Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <DMAn_base> + 0030_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	PEID2	PEID1	PEID0	SPID1	SPID0	UM	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	VCH2	VCH1	VCH0	—	—	—	VF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.28 PDMAnDM0CMV Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned.
22 to 17	PEID[2:0] SPID[1:0] UM	Illegal access master information These bits retain the accessing master information of the first illegal access after the PDMAnDM0CMV.VF bit is cleared to 0. If illegal access occurs while the PDMAnDM0CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
16 to 7	Reserved	When read, the value after reset is returned.
6 to 4	VCH[2:0]	Channel where an illegal access occurred. These bits retain the channel number (0 to 7) of the first illegal access after the PDMAnDM0CMV.VF bit is cleared to 0. If illegal access occurs while the PDMAnDM0CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is returned.
0	VF	Illegal access flag This bit shows whether illegal access occurred in the DMAC0. 0: No illegal access has occurred in the DMAC0 1: Illegal access has occurred in the DMAC0 If illegal access occurs in the DMAC0 while this bit is 0, this bit is set, and PDMAnDM0CMV.PEID[2:0], PDMAnDM0CMV.SPID[1:0], PDMAnDM0CMV.UM and PDMAnDM0CMV.VCH[2:0] store their respective information. If illegal access occurs in the DMAC0 while this bit is 1, this bit remains 1, and the contents of PDMAnDM0CMV.PEID[2:0], PDMAnDM0CMV.SPID[1:0], PDMAnDM0CMV.UM and PDMAnDM0CMV.VCH[2:0] do not change. This bit can be cleared by using the PDMAnCMVC register.

8.8.2.4 PDMAnDM1CMV — DMAC1 Register Access Protection Violation Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <DMAn_base> + 0034_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 8.29 PDMAnDM1CMV Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned.
22 to 17	PEID[2:0] SPID[1:0] UM	Illegal access master information These bits retain the accessing master information of the first illegal access after the PDMAnDM1CMV.VF bit is cleared to 0. If illegal access occurs while the PDMAnDM1CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
16 to 7	Reserved	When read, the value after reset is returned.
6 to 4	VCH[2:0]	Channel where an illegal access occurred. These bits retain the channel number (0 to 7) of the first illegal access after the PDMAnDM1CMV.VF bit is cleared to 0. If illegal access occurs while the PDMAnDM1CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is returned.
0	VF	Illegal access flag This bit shows whether illegal access occurred in the DMAC1. 0: No illegal access has occurred in the DMAC1 1: Illegal access has occurred in the DMAC1 If illegal access occurs in the DMAC1 while this bit is 0, this bit is set, and PDMAnDM1CMV.PEID[2:0], PDMAnDM1CMV.SPID[1:0], PDMAnDM1CMV.UM and PDMAnDM1CMV.VCH[2:0] store their respective information. If illegal access occurs in the DMAC1 while this bit is 1, this bit remains 1, and the contents of PDMAnDM1CMV.PEID[2:0], PDMAnDM1CMV.SPID[1:0], PDMAnDM1CMV.UM and PDMAnDM1CMV.VCH[2:0] do not change. This bit can be cleared by using the PDMAnCMVC register.

8.8.2.5 PDMAnDM2CMV — DMAC2 Register Access Protection Violation Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <DMAn_base> + 0040_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 8.32 PDMAnCMVC Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	DM3VC	RH850/F1KH-D8, RH850/F1KM-S4: DMAC3 illegal access flag clear The DMAC3 illegal access flag (PDMAnDM3CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0. RH850/F1KM-S1: When read, the value after reset is returned. When writing, write the value after reset.
4	DM2VC	RH850/F1KH-D8, RH850/F1KM-S4: DMAC2 illegal access flag clear The DMAC2 illegal access flag (PDMAnDM2CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0. RH850/F1KM-S1: When read, the value after reset is returned. When writing, write the value after reset.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DM1VC	DMAC1 illegal access flag clear The DMAC1 illegal access flag (PDMAnDM1CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.
0	DM0VC	DMAC0 illegal access flag clear The DMAC0 illegal access flag (PDMAnDM0CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.

8.8.2.8 PDMAnDMyiCM — DMAC Channel Master Setting (yi = 00 to 07, 10 to 17, 20 to 27, and 30 to 37 in RH850/F1KH-D8, yi = 00 to 07, 10 to 17, 20 to 27, and 30 to 37 in RH850/F1KM-S4, yi = 00 to 07 and 10 to 17 in RH850/F1KM-S1)

Access:	This register can be read or written in 32-bit units.
Address:	PDMAnDM0iCM: <DMAn_base> + 0100_H + 4_H × Ch. No. i (i = 0 to 7) PDMAnDM1iCM: <DMAn_base> + 0120_H + 4_H × Ch. No. i (i = 0 to 7) PDMAnDM2iCM: <DMAn_base> + 0140_H + 4_H × Ch. No. i (i = 0 to 7) PDMAnDM3iCM: <DMAn_base> + 0160_H + 4_H × Ch. No. i (i = 0 to 7)
Value after reset:	0000 0010_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	PEID2	PEID1	PEID0	SPID1	SPID0	UM	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 8.33 PDMAnDMyiCM Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 4	PEID[2:0]	Channel master PEID setting Specifies the PEID information of the master assigned to the channel. Set PEID value of PE that configures this register.
3, 2	SPID[1:0]	Channel master SPID setting Specifies the SPID information used by the master assigned to the channel.
1	UM	Channel master UM setting 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

PDMAnDM00CM to PDMAnDM07CM configure the channel master information of the DMAC0 channel 0 to 7 respectively.
PDMAnDM10CM to PDMAnDM17CM configure the channel master information of the DMAC1 channel 0 to 7 respectively.
PDMAnDM20CM to PDMAnDM27CM configure the channel master information of the DMAC2 channel 0 to 7 respectively.
PDMAnDM30CM to PDMAnDM37CM configure the channel master information of the DMAC3 channel 0 to 7 respectively.

For information about the functions this register offers, see **Section 8.6, Reliability Functions**.

8.9 DMAC Channel Registers

8.9.1 DMAC Channel Register Addresses

The DMAC channel registers are listed in the table below.

For <DMAn_base>, see **Section 8.1.2, Register Base Addresses**.

Table 8.34 DMAC Channel Register Addresses

Module Name	Register Name	Symbol	Address	Access Permission	
				Special Master	General Master
PDMAn	DMAC source address	PDMAnDSAm	<DMAn_base> + 0400_H + 40_H × [channel number]	✓	✓
	DMAC destination address	PDMAnDDAm	<DMAn_base> + 0404_H + 40_H × [channel number]	✓	✓
	DMAC transfer count	PDMAnDTCm	<DMAn_base> + 0408_H + 40_H × [channel number]	✓	✓
	DMAC transfer control	PDMAnDTCTm	<DMAn_base> + $040C_H$ + 40_H × [channel number]	✓	✓
	DMAC reload source address	PDMAnDRSAm	<DMAn_base> + 0410_H + 40_H × [channel number]	✓	✓
	DMAC reload destination address	PDMAnDRDAm	<DMAn_base> + 0414_H + 40_H × [channel number]	✓	✓
	DMAC reload transfer count	PDMAnDRTCm	<DMAn_base> + 0418_H + 40_H × [channel number]	✓	✓
	DMAC channel operation enable setting	PDMAnDCENm	<DMAn_base> + 0420_H + 40_H × [channel number]	✓	✓
	DMAC transfer status	PDMAnDCSTm	<DMAn_base> + 0424_H + 40_H × [channel number]	✓	✓
	DMAC transfer status set	PDMAnDCSTSm	<DMAn_base> + 0428_H + 40_H × [channel number]	✓	✓
	DMAC transfer status clear	PDMAnDCSTCm	<DMAn_base> + $042C_H$ + 40_H × [channel number]	✓	✓
	DTFR setting	PDMAnDTFRm	<DMAn_base> + 0430_H + 40_H × [channel number]	✓	✓
	DTFR transfer request status	PDMAnDTFRRQm	<DMAn_base> + 0434_H + 40_H × [channel number]	✓	✓
	DTFR transfer request clear	PDMAnDTFRRQCm	<DMAn_base> + 0438_H + 40_H × [channel number]	✓	✓

Note: The channel number in the offset addresses and “m” in the register symbols are numbers in the range from 0 to 31 in RH850/F1KH-D8, RH850/F1KM-S4, from 0 to 15 in RH850/F1KM-S1. The correspondence is as follows.

Channel Number m	Channel
0	DMAC0 channel 0
1	DMAC0 channel 1
2	DMAC0 channel 2
3	DMAC0 channel 3
4	DMAC0 channel 4
5	DMAC0 channel 5
6	DMAC0 channel 6
7	DMAC0 channel 7
8	DMAC1 channel 0
9	DMAC1 channel 1
10	DMAC1 channel 2
11	DMAC1 channel 3
12	DMAC1 channel 4
13	DMAC1 channel 5
14	DMAC1 channel 6
15	DMAC1 channel 7
16	DMAC2 channel 0
17	DMAC2 channel 1
18	DMAC2 channel 2
19	DMAC2 channel 3
20	DMAC2 channel 4
21	DMAC2 channel 5
22	DMAC2 channel 6
23	DMAC2 channel 7
24	DMAC3 channel 0
25	DMAC3 channel 1
26	DMAC3 channel 2
27	DMAC3 channel 3
28	DMAC3 channel 4
29	DMAC3 channel 5
30	DMAC3 channel 6
31	DMAC3 channel 7

8.9.2 Details of DMAC Channel Registers

8.9.2.1 PDMAnDSAm — DMAC Source Address Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + 0400_H + 40_H × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA31	SA30	SA29	SA28	SA27	SA26	SA25	SA24	SA23	SA22	SA21	SA20	SA19	SA18	SA17	SA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA15	SA14	SA13	SA12	SA11	SA10	SA9	SA8	SA7	SA6	SA5	SA4	SA3	SA2	SA1	SA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 8.35 PDMAnDSAm Register Contents

Bit Position	Bit Name	Function
31 to 0	SA[31:0]	Source address Specifies the DMA transfer source address. These bits are updated whenever a DMA cycle is executed. If you read from these bits, the transfer source address for the next DMA cycle is read.

CAUTIONS

1. It is forbidden to write to these bits when the channel operation is enabled (PDMAnDCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the source address is updated.
3. DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.)
   The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	SA3	SA2	SA1	SA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

8.9.2.2 PDMAnDDAm — DMAC Destination Address Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + 0404_H + 40_H × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA31	DA30	DA29	DA28	DA27	DA26	DA25	DA24	DA23	DA22	DA21	DA20	DA19	DA18	DA17	DA16

Table 8.36 PDMAnDDAm Register Contents

Bit Position	Bit Name	Function
31 to 0	DA[31:0]	Destination address Specifies the DMA transfer destination address. These bits are updated whenever a DMA cycle is executed. If you read from these bits, the transfer destination address for the next DMA cycle is read.

CAUTIONS

1. It is forbidden to write to these bits when the channel operation is enabled (PDMAnDCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
3. DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.)
   The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	DA3	DA2	DA1	DA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

8.9.2.3 PDMAnDTCm — DMAC Transfer Count Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + 0408_H + 40_H × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARC15	ARC14	ARC13	ARC12	ARC11	ARC10	ARC9	ARC8	ARC7	ARC6	ARC5	ARC4	ARC3	ARC2	ARC1	ARC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 8.37 PDMAnDTCm Register Contents

Bit Position	Bit Name	Function
31 to 16	ARC[15:0]	Address reload count Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. If you read from those bits during DMA transfer, the address reload count for the next DMA cycle is read. When the reload function 2 or block transfer 2 is used, PDMAnDTCm.ARC[15:0] is decremented by one for every DMA cycle. When the reload function 2 or block transfer 2 is not used, PDMAnDTCm.ARC[15:0] is not updated. If the value is 0000_H, it means that the number of transfers until the address reload when the reload function 2 is used and the number of transfers when the block transfer 2 is used are 65536.
15 to 0	TRC[15:0]	Transfer count Configures the number of transfers. PDMAnDTCm.TRC[15:0] is decremented by one whenever a DMA cycle is executed. If you read from those bits, the remaining number of transfers for the next DMA cycle is read. If the reload function is not used, after the last transfer is complete, the value at the completion (0000_H) is retained.

TRC15-0	Operation
0000_H	The number of transfers is 65536, or the transfer is complete.
0001_H	The number of transfers is 1, or remaining transfer count is 1.
:	:
$FFFF_H$	The number of transfers is 65535, or remaining transfer count is 65535.

CAUTIONS

1. It is forbidden to write to those bits when the channel operation is enabled (PDMAnDCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.

8.9.2.4 PDMAnDTCTm — DMAC Transfer Control Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + $040C_{H}$ + 40_{H} × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: $0000\ 0000_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 8.38 PDMAnDTCTm Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27	ESE	DMA transfer disable on transfer error setting Specifies whether to execute a DMA cycle when the PDMAnDCSTm.ER bit is set due to DMA transfer error. If this bit is cleared to 0, even when the PDMAnDCSTm.ER bit is set due to DMA transfer error, the following DMA cycles can be executed. If this bit is set to 1, the following DMA cycles are not executed when the PDMAnDCSTm.ER bit is set due to DMA transfer error. 0: DMA cycles are executed while the PDMAnDCSTm.ER bit is set. 1: DMA cycles are not executed while the PDMAnDCSTm.ER bit is set.
26	DRS	DMA transfer request selection assignment Selects the type of DMA transfer requests to be accepted. 0: Software DMA transfer request 1: Hardware DMA transfer request
25 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 18	CHNSEL[2:0]	Selection of next channel in the chain Specifies the next channel in the chain. The next channel must be another channel in the same DMAC. You cannot specify a channel in the different DMAC. It is prohibited to specify the channel as the next channel in the chain. (If you do, the correct operation is not guaranteed.)
17, 16	CHNE[1:0]	Chain enable Selects the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle when the remaining transfer count is one. 10: Setting prohibited. (The operation is not guaranteed.) 11: Always chain A chain request is generated at the completion of every DMA cycle.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	TCE	Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer.

Table 8.38 PDMAnDTCTm Register Contents

Bit Position	Bit Name	Function
13	MLE	Continuous transfer enable If this bit is set, the PDMAnDCENm.DTE bit is not cleared at the completion of DMA transfer. Even if the PDMAnDCSTm.TC bit is not cleared, DMA transfer starts when there is a DMA transfer request. 0: The PDMAnDCENm.DTE bit is cleared at the completion of DMA transfer. The next DMA transfer starts only after the PDMAnDCSTm.TC bit is cleared. 1: The PDMAnDCENm.DTE bit is not cleared at the completion of DMA transfer. Even if the PDMAnDCSTm.TC bit is not cleared, DMA transfer starts when there is a DMA transfer request.
12, 11	RLD2M[1:0]	Reload function 2 setting Specifies the reload function 2. 00: Reload function 2 is disabled. 01: Reload function 2 is enabled. The source address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 10: Reload function 2 is enabled. The destination address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 11: Reload function 2 is enabled. The source address, destination address, and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1.
10, 9	RLD1M[1:0]	Reload function 1 setting Specifies the reload function 1. 00: Reload function 1 is disabled. 01: Reload function 1 is enabled. The source address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 10: Reload function 1 is enabled. The destination address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 11: Reload function 1 is enabled. The source address, destination address, and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.)
8, 7	DACM[1:0]	Destination address count direction Specifies the count direction of the destination address. DACM1 / DACM0 / Direction of Count 0 / 0 / Increment 0 / 1 / Decrement 1 / 0 / Fixed 1 / 1 / Setting prohibited (The operation is not guaranteed.)
6, 5	SACM[1:0]	Source address count direction Specifies the count direction of the source address. SACM1 / SACM0 / Direction of Count 0 / 0 / Increment 0 / 1 / Decrement 1 / 0 / Fixed 1 / 1 / Setting prohibited (The operation is not guaranteed.)

Table 8.38 PDMAnDTCTm Register Contents

Bit Position	Bit Name	Function
4 to 2	DS[2:0]	Transfer data size Specifies the transfer data size.
1, 0	TRM[1:0]	Transfer mode Specifies the DMA transfer mode. 00: Single transfer 01: Block transfer 1 (The number of transfers is specified by the transfer count.) 10: Block transfer 2 (The number of transfers is specified by the address reload count.) 11: Setting prohibited (The operation is not guaranteed.)

DS2	DS1	DS0	Transfer Data Size
0	0	0	8 bits
0	0	1	16 bits
0	1	0	32 bits
0	1	1	64 bits
1	0	0	128 bits
Other than the above			Setting prohibited (The operation is not guaranteed.)

CAUTIONS

1. Except for the case to clear PDMAnDTCTm.MLE bit, it is forbidden to write to those bits when the channel operation is enabled (PDMAnDCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If forbidden settings are used for each bits, the correct operation is not guaranteed.

8.9.2.5 PDMAnDRSAm — DMAC Reload Source Address Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + 0410_H + 40_H × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSA31	RSA30	RSA29	RSA28	RSA27	RSA26	RSA25	RSA24	RSA23	RSA22	RSA21	RSA20	RSA19	RSA18	RSA17	RSA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.39 PDMAnDRSAm Register Contents

Bit Position	Bit Name	Function
31 to 0	RSA[31:0]	Reload source address Specifies the source address to be reloaded to the DMA source address register when the reload function 1 or reload function 2 is used.

CAUTION

DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.) The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	RSA3	RSA2	RSA1	RSA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

8.9.2.6 PDMAnDRDAm — DMAC Reload Destination Address Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + 0414$_H$ + 40$_H$ × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 8.40 PDMAnDRDAm Register Contents

Bit Position	Bit Name	Function
31 to 0	RDA[31:0]	Reload destination address Specifies the destination address to be reloaded to the DMA destination address register when the reload function 1 or reload function 2 is used.

CAUTION

DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.) The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	RDA3	RDA2	RDA1	RDA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

8.9.2.7 PDMAnDRTCm — DMAC Reload Transfer Count Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + 0418_H + 40_H × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 8.41 PDMAnDRTCm Register Contents

Bit Position	Bit Name	Function
31 to 16	RARC[15:0]	Reload address reload count Specifies the value to be reloaded to the address reload count in the transfer count register at the timing of reload when the reload function 2 is used.
15 to 0	RTRC[15:0]	Reload transfer count Specifies the value to be reloaded to the transfer count in the transfer count register at the timing of reload when the reload function 1 is used.

8.9.2.8 PDMAnDCENm — DMAC Channel Operation Enable Setting Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + 0420_H + 40_H × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.42 PDMAnDCENm Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DTE	Channel operation enable Specifies whether to enable or disable the transfer operation of the channel. If the PDMAnDCENm.DTE bit is 1, DMA transfer starts when there is a DMA transfer request. If the PDMAnDTCTm.MLE bit is 0, this bit is automatically cleared when DMA transfer is completed. In addition, if 0 is written to the PDMAnDCENm.DTE bit during DMA transfer, the DMA transfer is suspended. If 1 is written to the PDMAnDCENm.DTE bit during suspension, the suspension is cleared and the DMA transfer resumes. 0: Channel operation is disabled/Channel suspended 1: Channel operation is enabled/Channel suspension cleared

8.9.2.9 PDMAnDCSTm — DMAC Transfer Status Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <DMAn_base> + 0424_H + 40_H × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	ERWR	—	—	CY	ER	—	—	TC	—	—	DR	SR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.43 PDMAnDCSTm Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned.
11	ERWR	DMA Transfer Error occurring cycle This bit is updated at the same time as setting of the DMA transfer error flag (PDMAnDCSTm.ER), indicating in which cycle of read or write the DMA transfer error occurred. This bit is not updated when a new DMA transfer error occurs after the PDMAnDCSTm.ER bit has been set. If the PDMAnDCSTm.ER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in the read cycle. 1: DMA transfer error occurs in the write cycle.
10, 9	Reserved	When read, the value after reset is returned.
8	CY	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing.
7	ER	Transfer error flag This bit is set when DMA transfer error is generated. If this bit is 1 and the PDMAnDTCTm.ESE bit is set, a DMA cycle is not executed even when a DMA transfer request is generated. 0: No DMA transfer error is generated 1: DMA transfer error is generated
6, 5	Reserved	When read, the value after reset is returned.
4	TC	Transfer completion flag This bit is set at the completion of the last transfer and indicates that the DMA transfer is complete. If the PDMAnDTCTm.MLE bit is 0 and this bit is 1, a DMA cycle is not executed when a DMA transfer request is generated. 0: DMA transfer is incomplete 1: DMA transfer is complete
3, 2	Reserved	When read, the value after reset is returned.

Table 8.43 PDMAnDCSTm Register Contents

Bit Position	Bit Name	Function
1	DR	Hardware DMA transfer request status This bit shows whether there is a hardware DMA transfer request (PDMAnDMARQ) from the DTFR. This bit changes regardless of the value of the PDMAnDCENm.DTE bit when a hardware DMA transfer request from the DTFR is generated. If the software DMA transfer request has been selected in the transfer request selection bit (PDMAnDTCTm.DRS) in the DMAC transfer control register, this bit is not set even when a hardware DMA transfer request is input from the DTFR. 0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request
0	SR	Software DMA transfer request flag This bit shows whether there is a software DMA transfer request. This bit is automatically cleared when executing the DMA transfer. A user can set this bit by writing 1 to the PDMAnDCSTSm.SRS bit in the DMAC transfer status set register (PDMAnDCSTSm). In addition, a user can clear this bit by writing 1 to the PDMAnDCSTCm.SRC bit in the DMAC transfer status clear register (PDMAnDCSTCm), but if this is done, the ongoing DMA transfer is aborted and cannot be resumed. 0: There is no software DMA transfer request 1: There is a software DMA transfer request

8.9.2.10 PDMAnDCSTSm — DMAC Transfer Status Set Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + 0428_H + 40_H × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.44 PDMAnDCSTSm Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SRS	Software DMA transfer request flag A user can set the software DMA transfer request flag (PDMAnDCSTm.SR) by writing 1 to this bit. When read, this bit is always read as 0.

8.9.2.11 PDMAnDCSTCm — DMAC Transfer Status Clear Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + $042C_H$ + 40_H × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 8.45 PDMAnDCSTCm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ERC	Transfer error flag clear The DMA transfer error flag (PDMAnDCSTm.ER) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	TCC	Transfer completion flag clear The transfer completion flag (PDMAnDCSTm.TC) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.
3 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SRC	Software DMA transfer request flag clear The software DMA transfer request flag (PDMAnDCSTm.SR) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.

8.9.2.12 PDMAnDTFRm — DTFR Setting Register

Access: This register can be read or written in 32-bit units.

Address: <DMAn_base> + 0430_H + 40_H × Ch. No. m

(m = 0 to 31 in RH850/F1KH-D8, m = 0 to 31 in RH850/F1KM-S4, m = 0 to 15 in RH850/F1KM-S1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

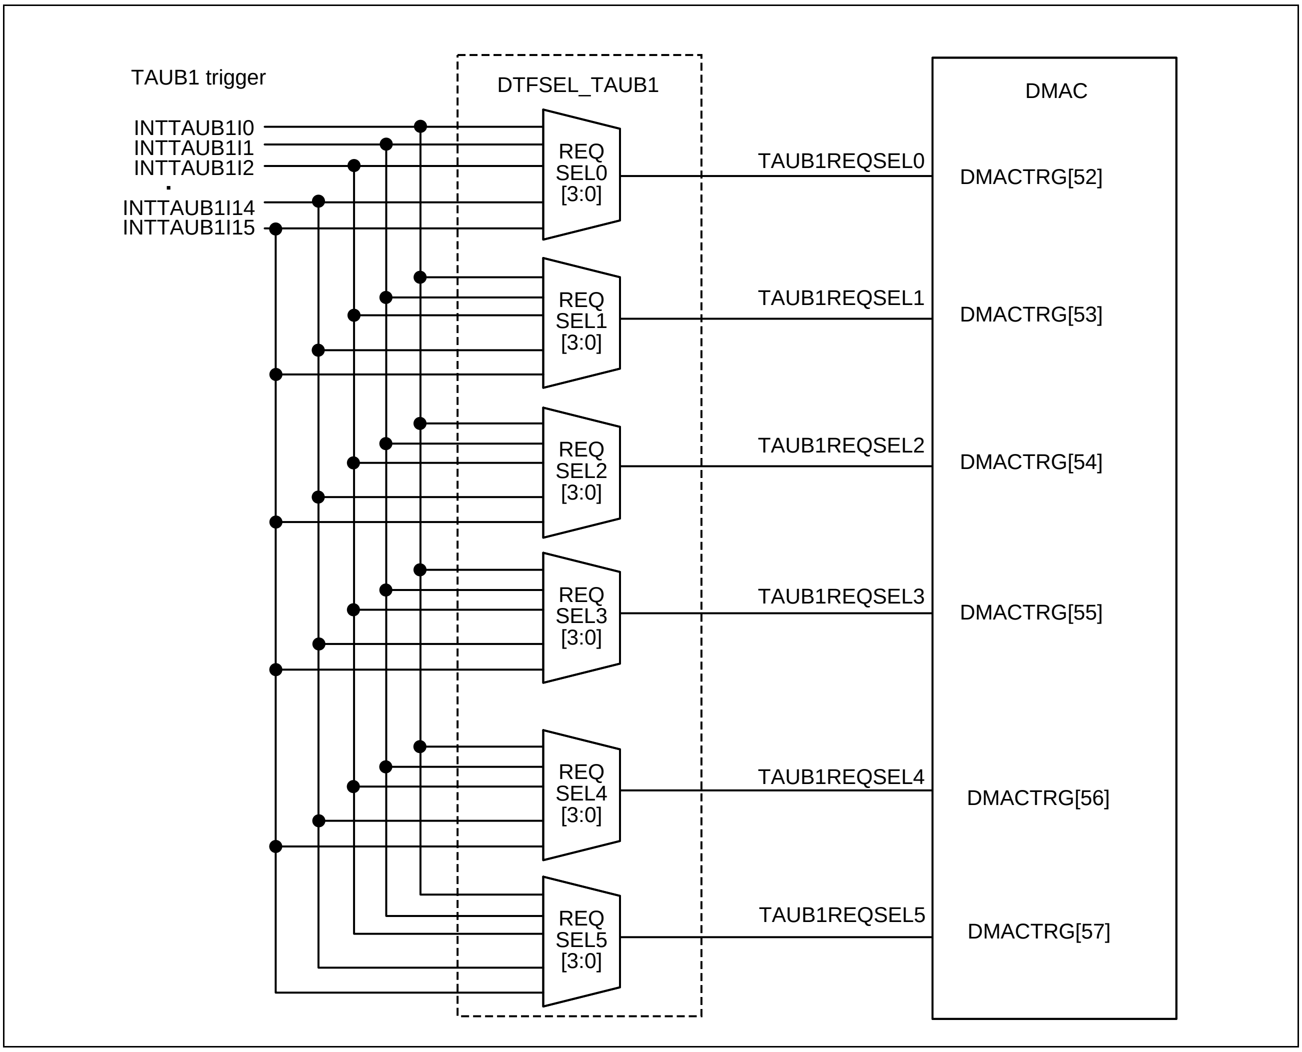

Figure 8.12 Configuration Diagram of DTFSEL_TAUB1 (RH850/F1KM-S4)

Section 9A Reset Controller of RH850/F1KH-D8

9A.1 Overview

Several system reset functions are provided in order to initialize CPU core and peripheral functions as well as their associated registers.

A reset can be caused by the following events:

Table 9A.1 Reset Sources and Reset Targets

Reset Source	Symbol	RH850/F1KH-D8
External reset	$\overline{\text{RESET}}$	✓
Power-On Clear	POCRES	✓
Watchdog timer reset	WDTA0RES	✓
	WDTA1RES	✓
	WDTA2RES	✓
Clock monitor reset	$\overline{\text{CLMA0RES}}$	✓
	$\overline{\text{CLMA1RES}}$	✓
	$\overline{\text{CLMA2RES}}$	✓
	$\overline{\text{CLMA3RES}}$	✓
Low-voltage indicator reset	$\overline{\text{LVIRES}}$	✓
Software reset	SWRES	✓
Debugger reset	$\overline{\text{DBRES}}$	✓
Core voltage monitor reset	$\overline{\text{CVMRES}}$	✓
Transition to DeepSTOP mode		✓

9A.1.1 Reset Sources

Reset levels and reset sources are shown below.

Various reset sources are assigned to the different levels of the reset.

Table 9A.2 Reset Sources and Reset Targets

Reset Level	Reset Source	Clock Generation (except PLL)/Real-Time Clock/CVM/LVI	Always-On area (AWO area) Modules*[1]	Isolated area (ISO area) Modules*[2]
1	Power-On Clear (POCRES) Debugger reset ($\overline{\text{DBRES}}$)	Reset	Reset	Reset
2	External reset ($\overline{\text{RESET}}$) Watchdog timer reset (WDTA0RES, WDTA1RES, WDTA2RES) Clock monitor reset ($\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$, $\overline{\text{CLMA3RES}}$) Core voltage monitor reset ($\overline{\text{CVMRES}}$) Low voltage indicator reset ($\overline{\text{LVIRES}}$) Software reset (SWRES)	Not reset target*[3]	Reset	Reset
3	Reset by DeepSTOP mode	Not reset target	Not reset target	Reset

Note 1. Clock generator, real-time clock, CVM, and LVI are excluded.

Note 2. PLL is included.

Note 3. In clock monitor reset, oscillator-related registers for clock monitoring are initialized.

Reset level 1: Initializes the entire microcontroller.

Reset level 2: For a quick return to normal operating mode by eliminating the oscillator stabilization time, initializes the entire microcontroller except for the clock generator and the real-time clock.

Reset level 3: At the transition to DeepSTOP mode, initializes all the Isolated area (ISO area).

If each reset is generated, local RAM data and global RAM data are not guaranteed to retaine.

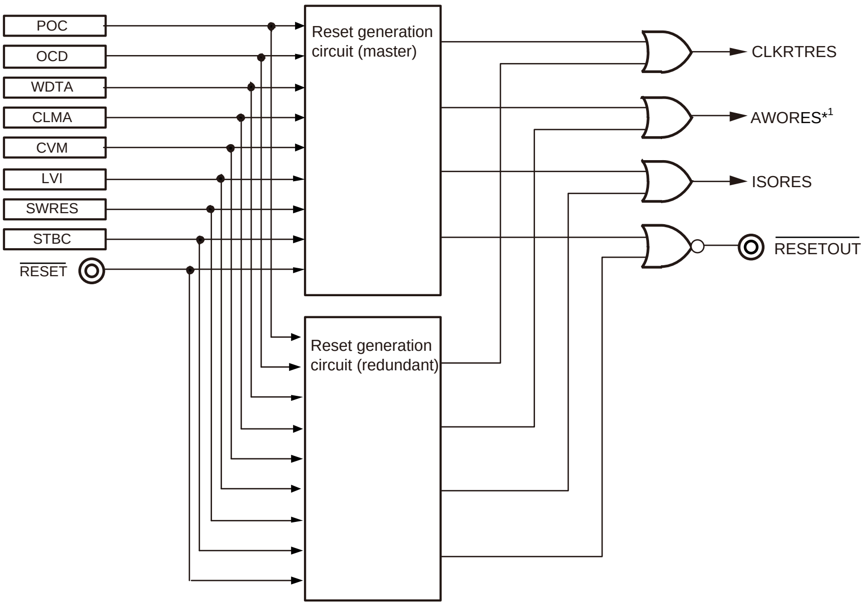
If each reset is generated, retention RAM data can be retained as long as the power-supply voltage (REG0VCC) does not fall below the RAM retention voltage (VVLVI).

In this case, data value writing to retention RAM address will be before or after writing.

9A.1.2 Reset Controller Redundancy

The reset controller of the microcontroller has a redundant configuration, and includes duplicated reset generation circuits. Such configuration enables initialization of the reset targeted area without failure even if one of the two reset generation circuits fails.

The configuration of the reset generation circuits is shown in the figure below.



Note 1. Real-time clock is excluded.

Figure 9A.1 Reset Controller Redundancy

At the generation of a reset, the same reset source signal is input to two reset generation circuits.

According to the reset source, the two reset generation circuits output the Always-On area (AWO area) reset signal (AWORES), Isolated area (ISO area) reset signal (ISORES), clock generator/real-time clock reset signal (CLKRTRES), and $\overline{\text{RESETOUT}}$ signal.

The AWORES, ISORES, CLKRTRES, and $\overline{\text{RESETOUT}}$ signals are generated by executing the logical OR of the signals output from two reset generation circuits. Thus, a reset signal is generated normally even if one of the two reset generation circuits fails.

Whether a reset generation circuit operates normally can be checked by reading and comparing the reset factor registers of the respective reset generation circuits.

9A.1.3 Reset Output ($\overline{\text{RESETOUT}}$)

When a reset source of reset level 1 or 2 is generated, a reset output signal ($\overline{\text{RESETOUT}}$) is output to the outside. Reset output is used to reset external devices at the same time as a reset is generated inside the microcontroller.

For details, see **Section 2A.11.1.1, P8_6: $\overline{\text{RESETOUT}}$** .

9A.1.4 Reset Flag

To identify a reset source, two registers with a flag for each reset source are provided. The main elements of the reset controller are shown in **Figure 9A.2, Block Diagram of the Reset Controller**.

9A.1.5 Clock Supply

The clock supply to the reset controller is shown in the following table.

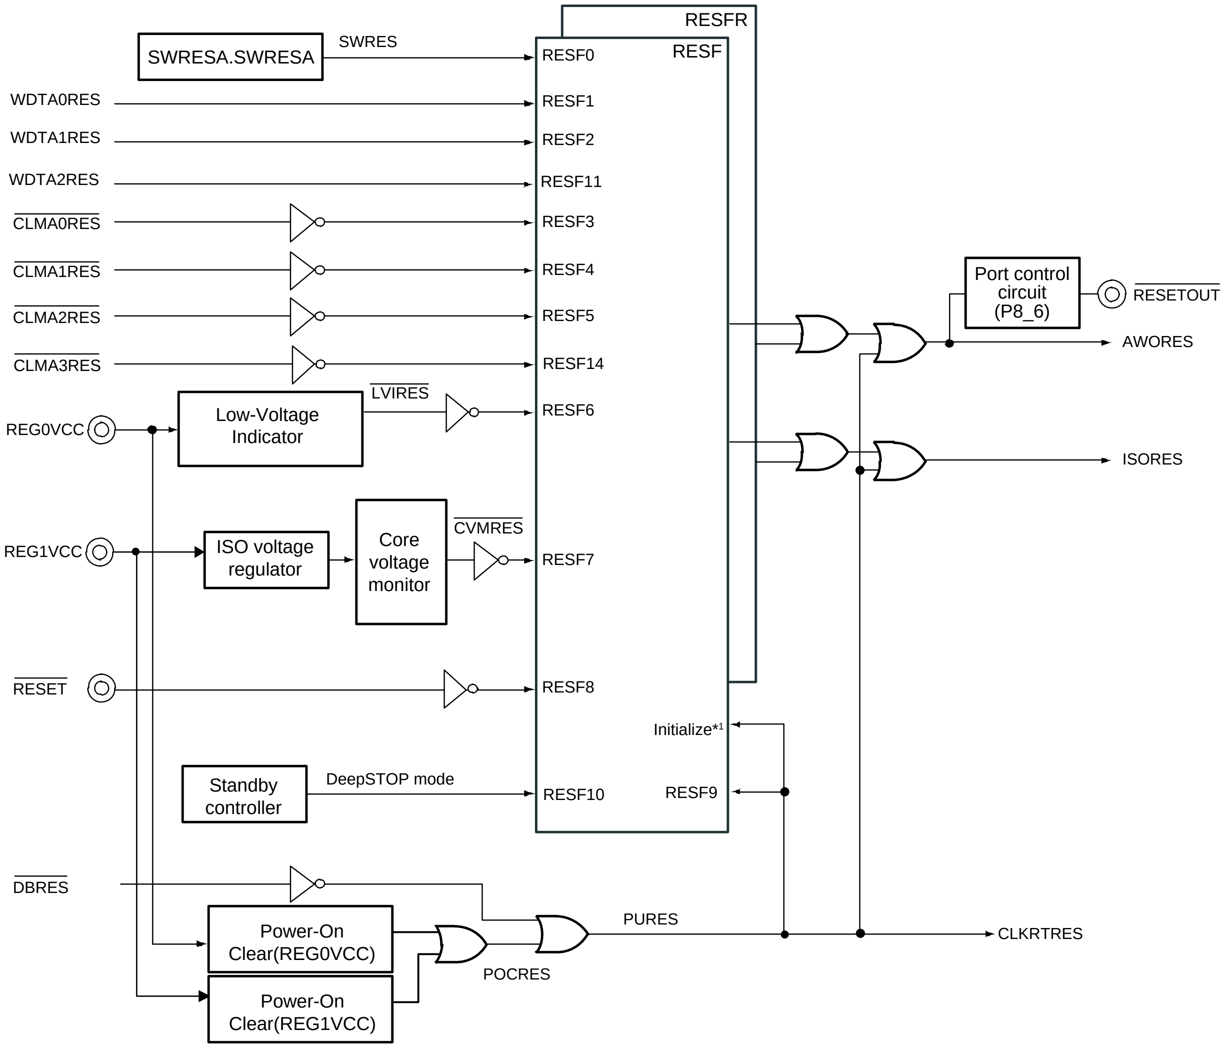
Table 9A.3 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Reset	Register access clock	CPUCLK_UL

9A.2 Configuration

9A.2.1 Block Diagram

Block diagram of reset circuits are shown below.



Note 1. Registers RESF and RESFR are initialized by PURES.
After an initialization, bits RESF9 and RESFR9 are set to 1.

Figure 9A.2 Block Diagram of the Reset Controller

(1) Reset Signals

The reset controller manages the generation of three reset signals upon occurrence of reset signals from various reset sources:

- Always-On area (AWO area) reset (AWORES)
  AWORES is generated by all reset sources except the transition to DeepSTOP mode.
  AWORES resets all modules in the Always-On area (AWO area) except clock generation circuit, real-time clock, core voltage monitor, and low-voltage detection circuit.
- Isolated area (ISO area) reset (ISORES)
  ISORES is generated by all reset sources.
  ISORES resets all modules (including PLL) in the Isolated area (ISO area).
- CLKRTRES
  CLKRTRES is generated by the power-on clear or debugger reset sources.
  CLKRTRES resets the clock generation circuit (excluding PLL) and real-time clock.

The power-up reset (PURES) is caused by the power-on clear and debugger reset sources.

Following the generation of an AWORES reset, with the exception of the PLL, all clock-generation circuits that were operating at the time (LS IntOSC, HS IntOSC, MainOSC, SubOSC) continue to operate. On the generation of a $\overline{\text{CLMA0RES}}$ reset, the HS IntOSC that was the target for CLMA0 monitoring is reset. On the generation of a $\overline{\text{CLMA1RES}}$ reset, the MainOSC that was the target for CLMA1 monitoring is reset.

The PURES initializes all of the clock generation circuits. It is necessary to restart the clock generation circuit after recovery from the PURES.

The CPU reset is the Isolated area (ISO area) reset (ISORES) to the CPU sub system.

(2) Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) hold a flag for each reset source, and this flag is set when the corresponding reset is asserted.

All reset flags except RESF9 and RESFR9 are initialized by a power-up reset (PURES). (Bits RESF9 and RESFR9 are set to 1 after initialization.) In addition, all the bits can be cleared by software.

For details, see **Section 9A.1.4, Reset Flag**.

(3) On-Chip Module Resets

(a) Watchdog Timer Resets

The watchdog timers can generate three types of resets: WDTA0RES, WDTA1RES and WDTA2RES.

For details, see **Section 9A.4.6, Watchdog Timer (WDTA) Reset**

(b) Clock Monitor Resets

The clock monitors can generate four resets: $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$, and $\overline{\text{CLMA3RES}}$.

For details, see **Section 9A.4.8, Clock Monitor (CLMA) Reset**.

(c) Debugger Reset

A reset is generated by a command from a debugger. This leads to a generation of power-up reset

PURES. For details, see **Section 9A.4.9, Debugger Reset**.

(4) Software Controlled Reset (SWRES)

A software reset SWRES can be generated by use of the software reset register SWRESA.

For details, see **Section 9A.4.7, Software Reset**.

(5) Reset Output Signal

During reset and after release from the reset, port P8_6 outputs low level as $\overline{\text{RESETOUT}}$ function.

For details, see **Section 2A.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

(6) Power Supply Monitoring

The following power supply detection circuits observe the level of the external power supply REG0VCC and REG1VCC.

(a) Low-Voltage Indicator

The low-voltage indicator (LVI) generates the $\overline{\text{LVIRES}}$ reset, if the voltage level of REG0VCC drops below a certain level. The level can be adjusted and the $\overline{\text{LVIRES}}$ can be masked.

For details, see **Section 9A.4.3, Low-Voltage Indicator (LVI) Reset**.

(b) Power-On Clear

The power-on clear circuit (POC) continuously compares the power supply voltage REG0VCC and REG1VCC with an internal reference voltage. Thus, a reset is generated when the power supply voltage goes below a certain level.

For details, see **Section 9A.4.2, Power-On Clear (POC) Reset**.

(c) Core Voltage Monitor

A reset can be generated when the core voltage monitor (CVM) detects over- or undervoltage in core voltage. (Output/not output can be set by option byte.)

For details, see **Section 9A.4.4, Core Voltage Monitor (CVM) Reset**.

(7) Masking of Reset Sources in Debugging Mode

The following reset sources can be masked during debugging:

Table 9A.4 Reset Sources to be Masked during Debugging

Reset Source	Maskable/Non-maskable
Power-on clear (POCRES)	—
Debugger reset ($\overline{\text{DBRES}}$)	—
External reset ($\overline{\text{RESET}}$)	✓
Low-voltage indicator reset ($\overline{\text{LVIRES}}$)	✓
Clock monitor reset ($\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$, $\overline{\text{CLMA3RES}}$)	✓
Watchdog timer reset (WDTA0RES, WDTA1RES, WDTA2RES)	✓
Core voltage monitor reset ($\overline{\text{CVMRES}}$)	✓
Software reset (SWRES)	✓
Reset by DeepSTOP mode	—

9A.3 Registers

This section contains a description of all registers of the reset controller.

9A.3.1 Reset Controller Registers Overview

The reset controller is controlled and operated by the following registers:

Table 9A.5 Reset Controller Registers Overview

Module Name	Register Name	Symbol	Address
RESCTL	Reset flag registers		
	Reset factor register	RESF	FFF8 0760$_H$
	Reset factor clear register	RESFC	FFF8 0768$_H$
	Redundant reset factor register	RESFR	FFF8 0860$_H$
	Redundant reset factor clear register	RESFCR	FFF8 0868$_H$
	Software reset control register		
	Software reset register	SWRESA	FFF8 0A04$_H$

NOTES

1. For the LVI related, RAM store related, and CVM related registers, see **Section 11A, Supply Voltage Monitor of RH850/F1KH-D8**.
2. As for the protection registers, see **Section 5, Write-Protected Registers**.

9A.3.2 Details of Reset Flag Registers

9A.3.2.1 RESF — Reset Factor Register

This register contains information about which type of resets occurred after the last power-on clear reset. This register is initialized by a power-up reset PURES.

Each reset condition sets the corresponding flag in the register.

For example, if a clock monitor reset $\overline{\text{CLMA0RES}}$ occurs after a watchdog timer reset WDTA0RES, RESF reads 0000 000A$_H$.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 0760$_H$

Value after reset: 0000 0200$_H$ / 0000 0300$_H$

9A.3.2.3 RESFR — Redundant Reset Factor Register

This register is a duplication of the reset factor register. This register is initialized by a power-up reset PURES.

In accordance with the setting conditions for each bit in the reset factor register, the same bits are set in this register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 0860$_H$

Value after reset: 0000 0200$_H$ / 0000 0300$_H$

9A.3.3 Details of Software Reset Control Register

9A.3.3.1 SWRESA — Software Reset Register

This register is used to generate a software reset SWRES. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FFF8 0A04$_H$

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	SWRESA	Software reset trigger 0: No Software reset trigger is generated. 1: Software reset trigger is generated.

9A.4 Functional Description

9A.4.1 Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) provide reset flags for each reset source.

If a reset has occurred, the corresponding flag is set. According to this, the source of the reset is evaluated.

RESF and RESFR are initialized by a power-up reset PURES (POCRES or $\overline{\text{DBRES}}$) (though bits RESF9 and RESFR9 are set to 1 after initialization). In addition, flags in RESF and RESFR can be cleared by the reset factor clear register (RESFC) and the redundant reset factor clear register (RESFCR).

Each reset source can set the corresponding flag independently from other reset sources.

9A.4.2 Power-On Clear (POC) Reset

The power-on clear circuit (POC) constantly compares the power supply voltage REG0VCC and REG1VCC with the internal reference voltage VPOC. It ensures that the microcontroller only operates as long as the power supply exceeds a certain level.

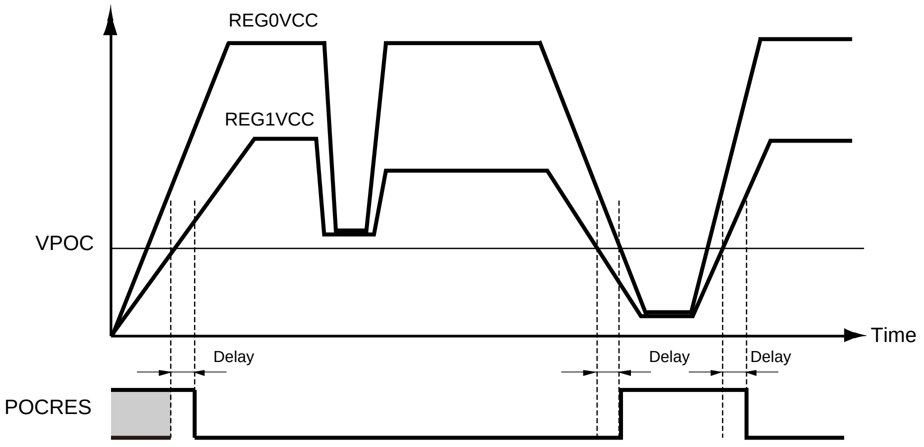
If REG0VCC or REG1VCC falls below the internal reference voltage (REG0VCC < VPOC or REG1VCC < VPOC), the internal reset signal POCRES and a power-up reset PURES are generated.

For details on the specification of the internal voltage reference level VPOC, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**.

The reset factor register (RESF) and the redundant reset factor register (RESFR) are cleared by the power-on clear reset. RESF9 and RESFR9 are set to 1 after initialization.

The power-on clear function holds the microcontroller in reset state as long as the power supply voltage does not exceed the threshold level VPOC.

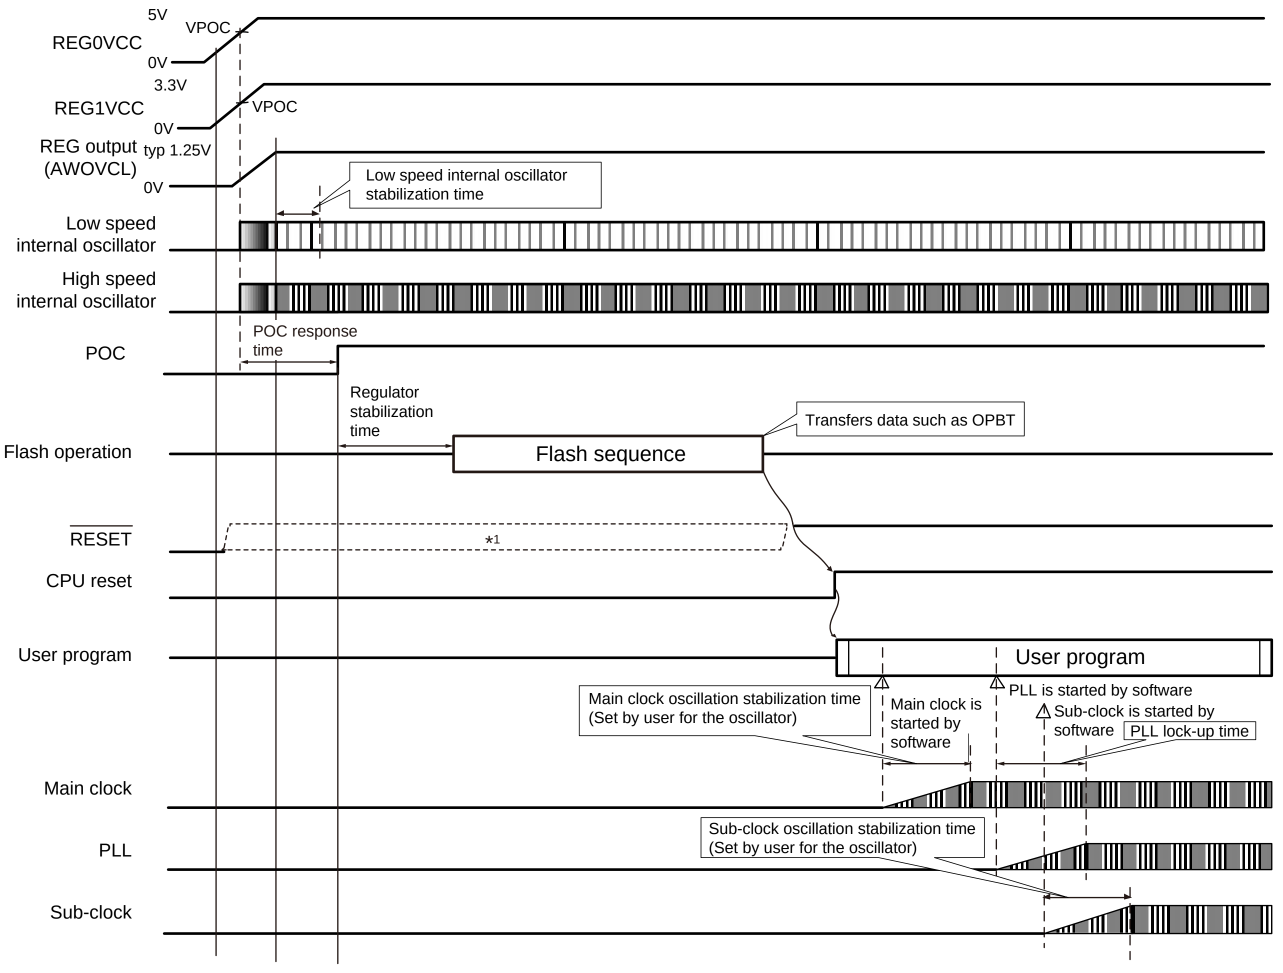
The following figure illustrates the timing of a POCRES.



Note: Delay:
When the REG0VCC and REG1VCC exceeds the VPOC, the POCRES is released after certain delay. When the REG0VCC and REG1VCC falls below the VPOC, the POCRES is asserted after certain delay.
See **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for the delay time.

Figure 9A.3 POC Reset Timing

(1) Overview of CPU System Startup after Power-On Clear



Note 1. The timing of releasing the $\overline{\text{RESET}}$ pin depends on the external circuit of the microcontroller.

If the $\overline{\text{RESET}}$ pin is low level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 1. If the $\overline{\text{RESET}}$ pin is high level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 0.

Figure 9A.4 When $\overline{\text{RESET}}$ is Released before the Flash Sequence is Completed

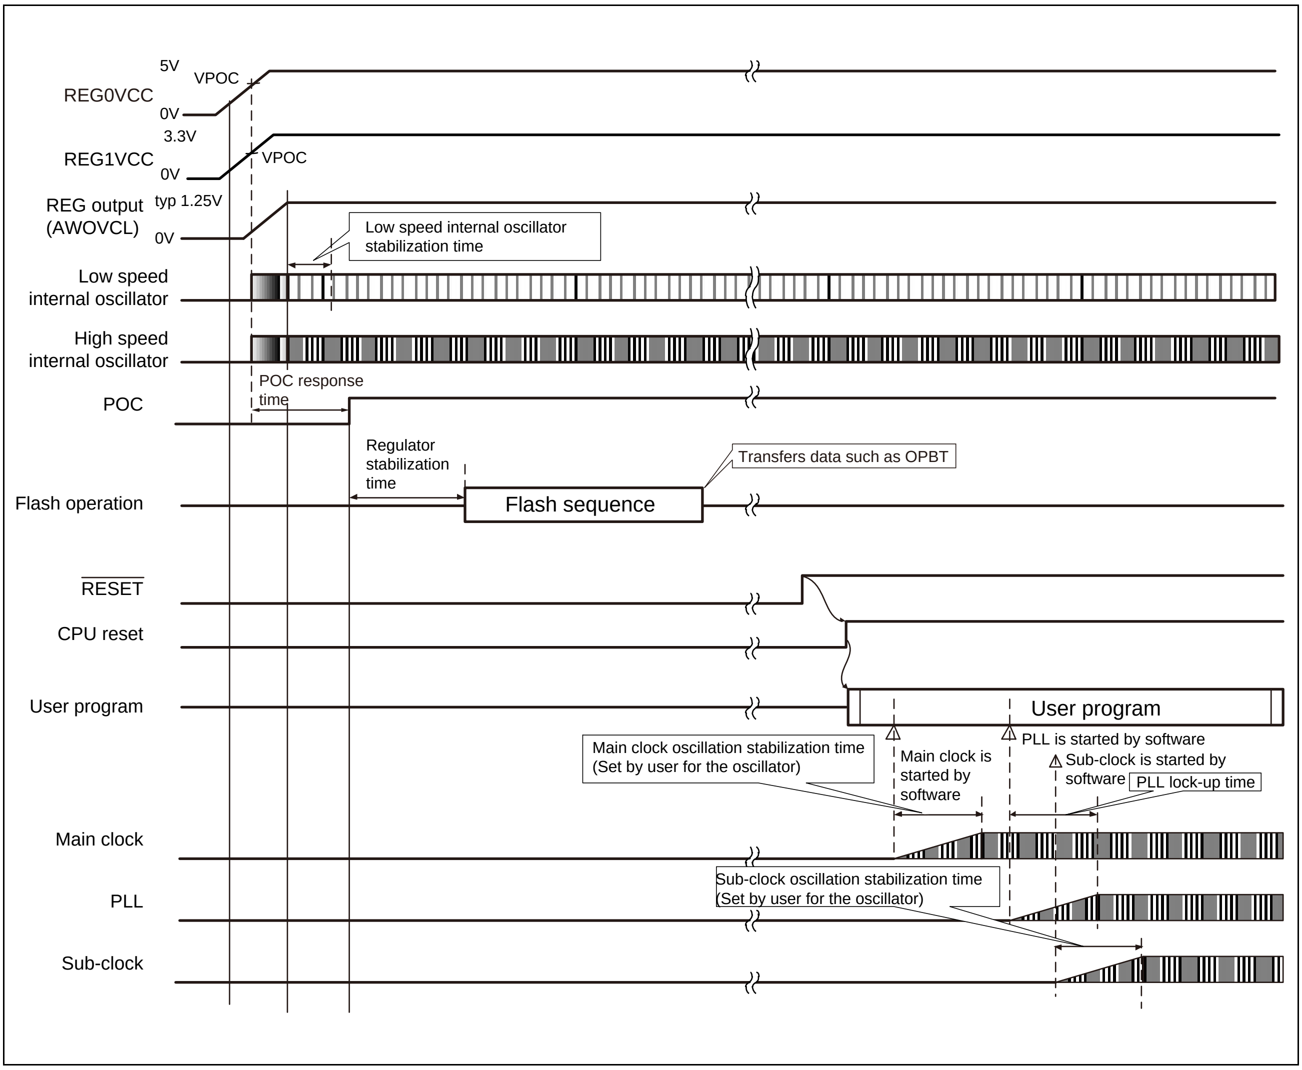


Figure 9A.5 When $\overline{\text{RESET}}$ is Released after the Flash Sequence is Completed

9A.4.3 Low-Voltage Indicator (LVI) Reset

The low-voltage indicator (LVI) constantly compares the power supply voltage REG0VCC with the LVI internal reference voltage VLVIn.

When setting the LVI detection voltage and releasing the LVIRESMK, if REG0VCC falls below the internal reference voltage (REG0VCC < VLVIn), the internal reset signal $\overline{\text{LVIRES}}$ is generated.

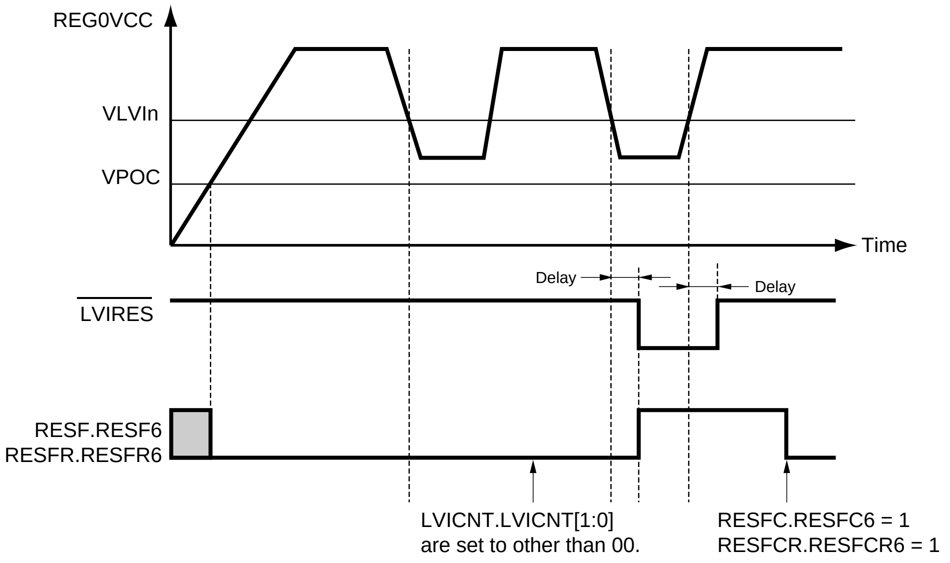
Additionally, the $\overline{\text{LVIRES}}$ flags (bits RESF.RESF6 and RESFR.RESFR6) are set.

After that, even if REG0VCC exceeds VLVIn, bits RESF.RESF6 and RESFR.RESFR6 are not cleared automatically. They are cleared as described below.

- Setting the RESFC.RESFC6 bit to 1 clears the RESF.RESF6 bit.
  Setting the RESFCR.RESFCR6 bit to 1 clears the RESFR.RESFR6 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

For details on the LVI functions, see **Section 11A, Supply Voltage Monitor of RH850/F1KH-D8**.

The following figure illustrates the timing of a $\overline{\text{LVIRES}}$ and bits RESF.RESF6 and RESFR.RESFR6.



Note: Delay:
When REG0VCC falls below VLVIn, $\overline{\text{LVIRES}}$ is asserted and the VLVIn reset flags (RESF.RESF6 and RESFR.RESFR6) are set after a certain delay. After that, when REG0VCC exceeds VLVIn, $\overline{\text{LVIRES}}$ is released after a certain delay.
See **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for the delay time.

Figure 9A.6 LVI Reset Timing

9A.4.4 Core Voltage Monitor (CVM) Reset

Core voltage monitor is used to monitor the core voltage inside the microcontroller.

The reset $\overline{\text{CVMRES}}$ is generated if the core voltage is not in the specified voltage range while CVM is enabled. Moreover, the $\overline{\text{CVMRES}}$ flags (RESF.RESF7 and RESFR.RESFR7) are set.

After that, the RESF.RESF7 and RESFR.RESFR7 bits are not automatically cleared even if the core voltage returns to the specified voltage range. The RESF.RESF7 and RESFR.RESFR7 bits are cleared as described below.

- Setting the RESFC.RESFC7 bit to 1 clears the RESF.RESF7 bit.
  Setting the RESFCR.RESFCR7 bit to 1 clears the RESFR.RESFR7 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off. Once $\overline{\text{CVMRES}}$ is generated upon high voltage detection, the microcontroller stays in the reset state. To cancel this state, it is mandatory to use the external reset ($\overline{\text{RESET}}$) input. Release the external reset ($\overline{\text{RESET}}$) after the voltage level becomes lower than the high detection voltage.

For details on the CVM function, see **Section 11A, Supply Voltage Monitor of RH850/F1KH-D8**.

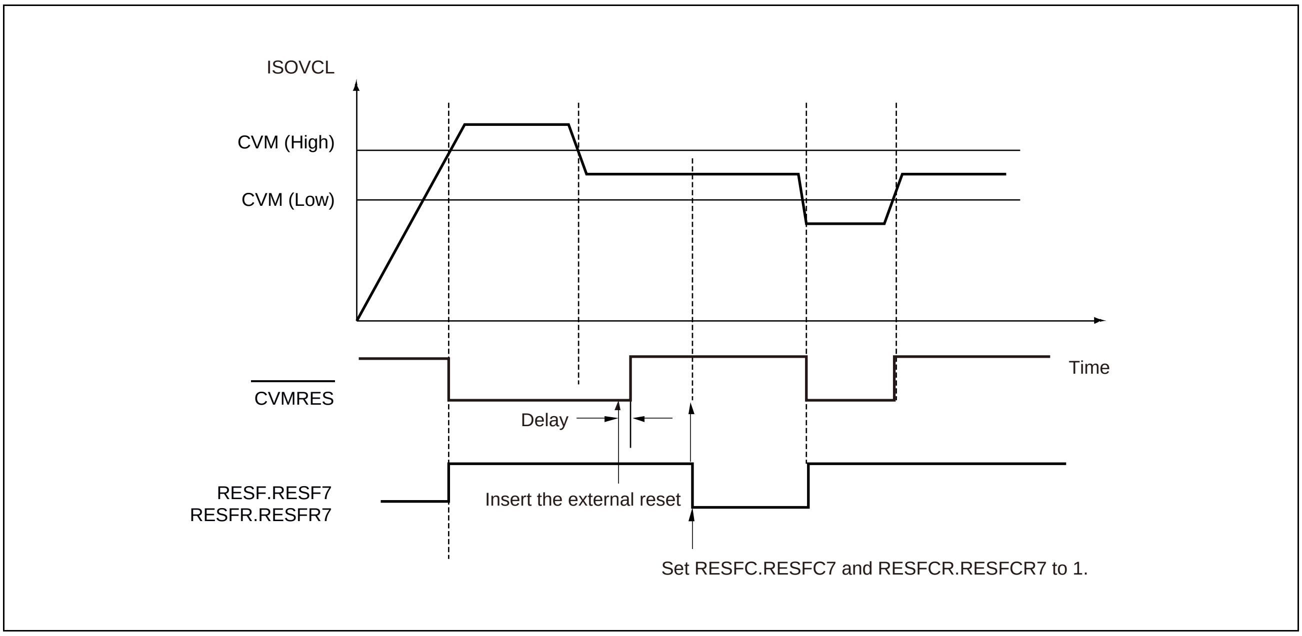


Figure 9A.7 CVM Reset Timing

9A.4.5 External Reset ($\overline{\text{RESET}}$)

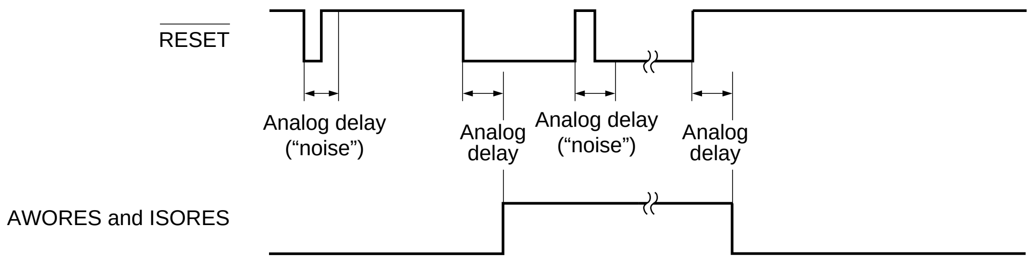
When a low level input is applied to the $\overline{\text{RESET}}$ pin, a reset is asserted and the RESF.RESF8 and RESFR.RESFR8 bits are set.

After that, bits RESF.RESF8 and RESFR.RESFR8 are not cleared automatically, even if the low-level input to the $\overline{\text{RESET}}$ pin is released. Bits RESF.RESF8 and RESFR.REFR8 are cleared as described below.

- Setting the RESFC.RESFC8 bit to 1 clears the RESF.RESF8 bit.
  Setting the RESFCR.RESFCR8 bit to 1 clears the RESFR.RESFR8 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

The $\overline{\text{RESET}}$ pin includes an analog noise filter to prevent erroneous resets due to noise.

The following figure shows the timing when AWORES and ISORES are generated by the external reset. This figure also shows the effect of the noise filter.



Note: The analog delay is caused by the analog filter. The filter regards pulses up to a certain width as noise and suppresses them. For the minimum $\overline{\text{RESET}}$ pulse width, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**.

Figure 9A.8 External Reset ($\overline{\text{RESET}}$)

9A.4.6 Watchdog Timer (WDTA) Reset

The watchdog timers can be configured to generate a reset if the overflow time is exceeded. After a watchdog timer reset is asserted, the corresponding watchdog timer reset flags (the RESF.RESF1 and RESFR.RESFR1 bits for WDTA0RES, and the RESF.RESF2 and RESFR.RESFR2 bits for WDTA1RES, and the RESF.RESF11 and RESFR.RESFR11 bits for WDTA2RES) are set.

After that, bits RESF.RESF1 and RESFR.RESFR1 (or bits RESF.RESF2 and RESFR.RESFR2 or bits RESF.RESF11 and RESFR.RESFR11) are not cleared automatically, even if WDTA0RES (or WDTA1RES or WDTA2RES) is released.

Bits RESF.RESF1 and RESFR.RESFR1, and bits RESF.RESF2 and RESFR.RESFR2 and bits RESF.RESF11 and RESFR.RESFR11 are cleared as described below.

- WDTA0RES:
  Setting the RESFC.RESFC1 bit to 1 clears the RESF.RESF1 bit.
  Setting the RESFCR.RESFCR1 bit to 1 clears the RESFR.RESFR1 bit.
- WDTA1RES:
  Setting the RESFC.RESFC2 bit to 1 clears the RESF.RESF2 bit.
  Setting the RESFCR.RESFCR2 bit to 1 clears the RESFR.RESFR2 bit.
- WDTA2RES:
  Setting the RESFC.RESFC11 bit to 1 clears the RESF.RESF11 bit.
  Setting the RESFCR.RESFCR11 bit to 1 clears the RESFR.RESFR11 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

9A.4.7 Software Reset

The software reset SWRES can be asserted by setting SWRESA.SWRESA to 1.

SWRES sets the reset flag RESF.RESF0 and the RESFR.RESFR0 bit.

RESF.RESF0 and RESFR.RESFR0 are not cleared automatically. RESF.RESF0 and RESFR.RESFR0 are cleared as described below.

- Setting the RESFC.RESFC0 bit to 1 clears the RESF.RESF0 bit.
  Setting the RESFCR.RESFCR0 bit to 1 clears the RESFR.RESFR0 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

9A.4.8 Clock Monitor (CLMA) Reset

The clock monitors can generate the following resets:

- $\overline{\text{CLMA0RES}}$, if a frequency abnormality in HS IntOSC is detected
- $\overline{\text{CLMA1RES}}$, if a frequency abnormality in MainOSC is detected
- $\overline{\text{CLMA2RES}}$, if a frequency abnormality in PLL0 is detected
- $\overline{\text{CLMA3RES}}$, if a frequency abnormality in PLL1 is detected

When the Clock Monitor detects frequency abnormality of the respective clocks, resets $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$, and $\overline{\text{CLMA3RES}}$ are generated.

In addition, flags $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$, and $\overline{\text{CLMA3RES}}$ (RESF.RESF3, RESFR.RESFR3, RESF.RESF4, RESFR.RESFR4, RESF.RESF5, RESFR.RESFR5, RESF.RESF14, and RESFR.RESFR14) are set.

These flags are not cleared automatically. They are cleared as described below.

- $\overline{\text{CLMA0RES}}$:
  Setting the RESFC.RESFC3 bit to 1 clears the RESF.RESF3 bit.
  Setting the RESFCR.RESFCR3 bit to 1 clears the RESFR.RESFR3 bit.
- $\overline{\text{CLMA1RES}}$:
  Setting the RESFC.RESFC4 bit to 1 clears the RESF.RESF4 bit.
  Setting the RESFCR.RESFCR4 bit to 1 clears the RESFR.RESFR4 bit.
- $\overline{\text{CLMA2RES}}$:
  Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.
  Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.
- $\overline{\text{CLMA3RES}}$:
  Setting the RESFC.RESFC14 bit to 1 clears the RESF.RESF14 bit.
  Setting the RESFCR.RESFCR14 bit to 1 clears the RESFR.RESFR14 bit
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

9A.4.9 Debugger Reset

Debugger reset ($\overline{\text{DBRES}}$) is generated via a debugger command. $\overline{\text{DBRES}}$ activates PURES, and therefore operates in the same way as the power-on clear reset POCRES:

- The clock generators are reset and stop operating. The clock generators should be restarted after release from the reset state.
- The reset factor register RESF and the redundant reset factor register RESFR are cleared (Bits RESF9 and RESFR9 are set to 1 after initialization).

Section 9BC Reset Controller of RH850/F1KM

9BC.1 Overview

Several system reset functions are provided in order to initialize CPU core and peripheral functions as well as their associated registers.

A reset can be caused by the following events:

Table 9BC.1 Reset Sources and Reset Targets (RH850/F1KM-S4)

9BC.1.1 Reset Sources

Reset levels and reset sources are shown below.

Various reset sources are assigned to the different levels of the reset.

Table 9BC.3 Reset Sources and Reset Targets

Reset Level	Reset Source	Clock Generation (except PLL)/Real-Time Clock/CVM/LVI	Always-On area (AWO area) Modules*[1]	Isolated area (ISO area) Modules*[2]
1	Power-On Clear (POCRES) Debugger reset ($\overline{\text{DBRES}}$)	Reset	Reset	Reset
2	External reset ($\overline{\text{RESET}}$) Watchdog timer reset (WDTA0RES, WDTA1RES) Clock monitor reset ($\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$, $\overline{\text{CLMA3RES}}$) Core voltage monitor reset ($\overline{\text{CVMRES}}$) Low voltage indicator reset ($\overline{\text{LVIRES}}$) Software reset (SWRES)	Not reset target*[3]	Reset	Reset
3	Reset by DeepSTOP mode	Not reset target	Not reset target	Reset

Note 1. Clock generator, real-time clock, CVM, and LVI are excluded.

Note 2. PLL is included.

Note 3. In clock monitor reset, oscillator-related registers for clock monitoring are initialized.

Reset level 1: Initializes the entire microcontroller.

Reset level 2: For a quick return to normal operating mode by eliminating the oscillator stabilization time, initializes the entire microcontroller except for the clock generator and the real-time clock.

Reset level 3: At the transition to DeepSTOP mode, initializes all the Isolated area (ISO area).

If each reset is generated, local RAM data and global RAM data*[1] are not guaranteed to retaine.

If each reset is generated, retention RAM data can be retained as long as the power-supply voltage (REGVCC) does not fall below the RAM retention voltage (VVLVI).

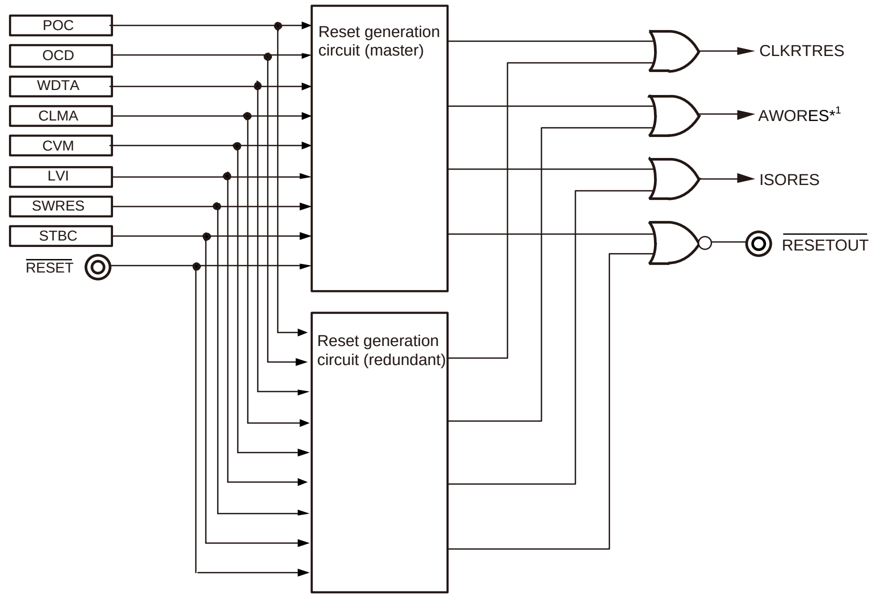
In this case, data value writing to retention RAM address will be before or after writing.

Note 1. The global RAM is not supported in RH850/F1KM-S1.

9BC.1.2 Reset Controller Redundancy

The reset controller of the microcontroller has a redundant configuration, and includes duplicated reset generation circuits. Such configuration enables initialization of the reset targeted area without failure even if one of the two reset generation circuits fails.

The configuration of the reset generation circuits is shown in the figure below.



Note 1. Real-time clock is excluded.

Figure 9BC.1 Reset Controller Redundancy

At the generation of a reset, the same reset source signal is input to two reset generation circuits.

According to the reset source, the two reset generation circuits output the Always-On area (AWO area) reset signal (AWORES), Isolated area (ISO area) reset signal (ISORES), clock generator/real-time clock reset signal (CLKRTRES), and $\overline{\text{RESETOUT}}$ signal.

The AWORES, ISORES, CLKRTRES, and $\overline{\text{RESETOUT}}$ signals are generated by executing the logical OR of the signals output from two reset generation circuits. Thus, a reset signal is generated normally even if one of the two reset generation circuits fails.

Whether a reset generation circuit operates normally can be checked by reading and comparing the reset factor registers of the respective reset generation circuits.

9BC.1.3 Reset Output ($\overline{\text{RESETOUT}}$)

When a reset source of reset level 1 or 2 is generated, a reset output signal ($\overline{\text{RESETOUT}}$) is output to the outside. Reset output is used to reset external devices at the same time as a reset is generated inside the microcontroller.

For details, see **Section 2B.11.1.1, P8_6: $\overline{\text{RESETOUT}}$** and **Section 2C.11.1.1, P8_6: $\overline{\text{RESETOUT}}$** .

9BC.1.4 Reset Flag

To identify a reset source, two registers with a flag for each reset source are provided. The main elements of the reset controller are shown in **Figure 9BC.2, Block Diagram of the Reset Controller**.

9BC.1.5 Clock Supply

The clock supply to the reset controller is shown in the following table.

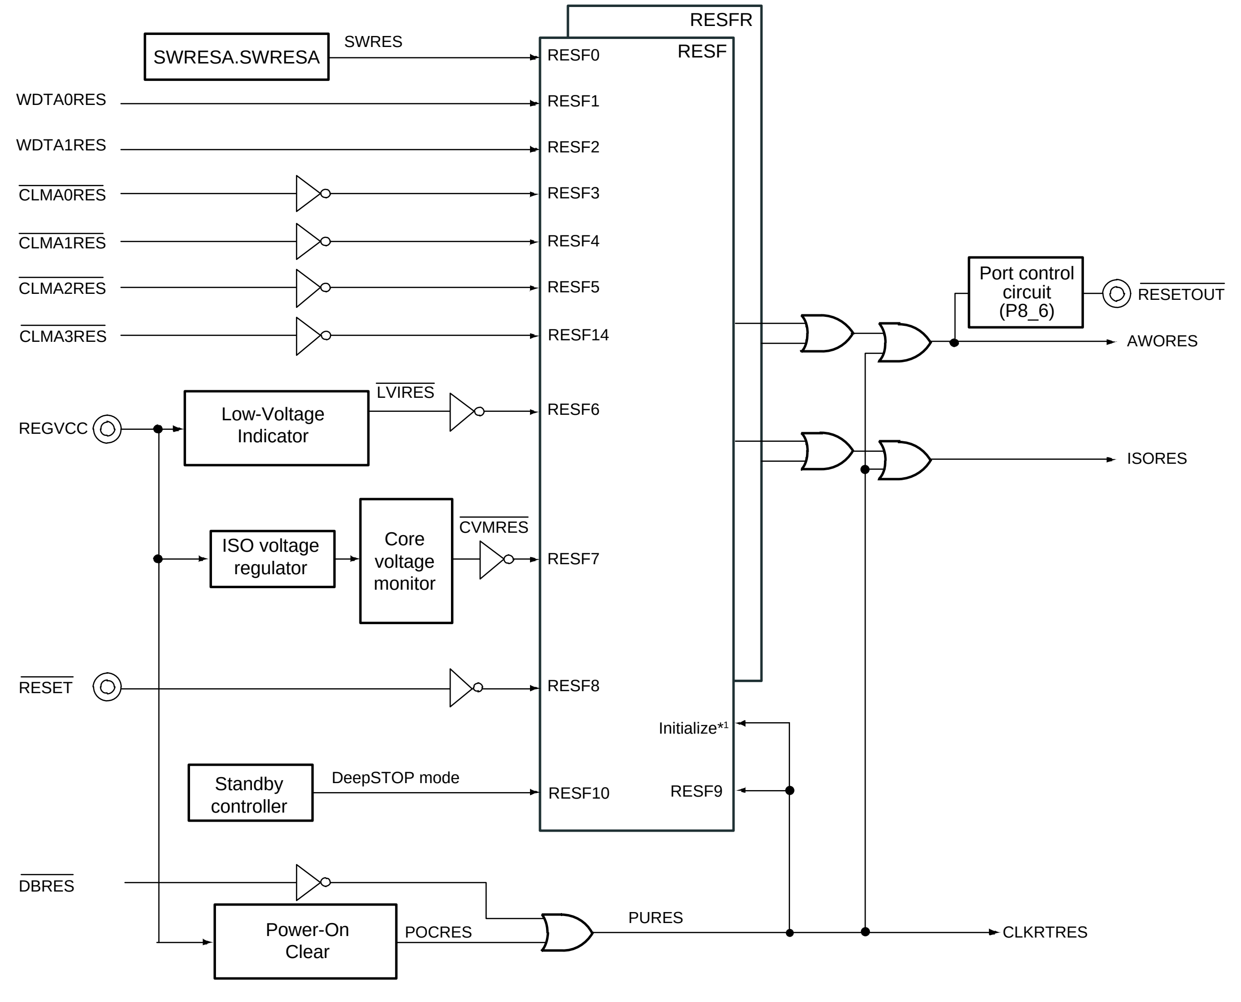
Table 9BC.4 Clock Supply (RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
Reset	Register access clock	CPUCLK_UL

9BC.2 Configuration

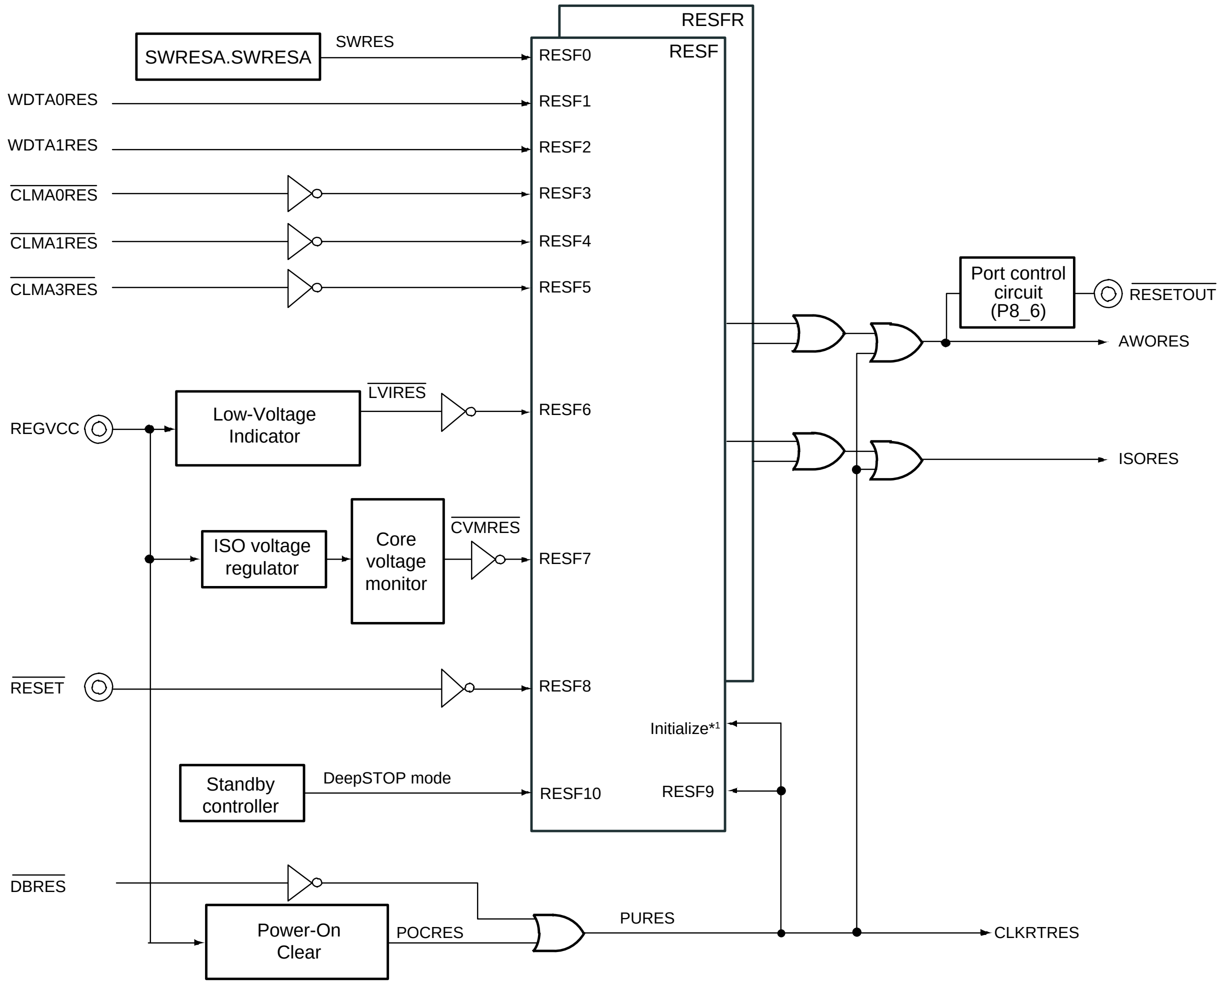
9BC.2.1 Block Diagram

Block diagram of reset circuits are shown below.



Note 1. Registers RESF and RESFR are initialized by PURES.
After an initialization, bits RESF9 and RESFR9 are set to 1.

Figure 9BC.2 Block Diagram of the Reset Controller (RH850/F1KM-S4)



Note 1. Registers RESF and RESFR are initialized by PURES.
After an initialization, bits RESF9 and RESFR9 are set to 1.

Figure 9BC.3 Block Diagram of the Reset Controller (RH850/F1KM-S1)

(1) Reset Signals

The reset controller manages the generation of three reset signals upon occurrence of reset signals from various reset sources:

- Always-On area (AWO area) reset (AWORES)
  AWORES is generated by all reset sources except the transition to DeepSTOP mode.
  AWORES resets all modules in the Always-On area (AWO area) except clock generation circuit, real-time clock, core voltage monitor, and low-voltage detection circuit.
- Isolated area (ISO area) reset (ISORES)
  ISORES is generated by all reset sources.
  ISORES resets all modules (including PLL) in the Isolated area (ISO area).
- CLKRTRES
  CLKRTRES is generated by the power-on clear or debugger reset sources.
  CLKRTRES resets the clock generation circuit (excluding PLL) and real-time clock.

The power-up reset (PURES) is caused by the power-on clear and debugger reset sources.

Following the generation of an AWORES reset, with the exception of the PLL, all clock-generation circuits that were operating at the time (LS IntOSC, HS IntOSC, MainOSC, SubOSC) continue to operate. On the generation of a $\overline{\text{CLMA0RES}}$ reset, the HS IntOSC that was the target for CLMA0 monitoring is reset. On the generation of a $\overline{\text{CLMA1RES}}$ reset, the MainOSC that was the target for CLMA1 monitoring is reset.

The PURES initializes all of the clock generation circuits. It is necessary to restart the clock generation circuit after recovery from the PURES.

The CPU reset is the Isolated area (ISO area) reset (ISORES) to the CPU sub system.

(2) Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) hold a flag for each reset source, and this flag is set when the corresponding reset is asserted.

All reset flags except RESF9 and RESFR9 are initialized by a power-up reset (PURES). (Bits RESF9 and RESFR9 are set to 1 after initialization.) In addition, all the bits can be cleared by software.

For details, see **Section 9BC.1.4, Reset Flag**.

(3) On-Chip Module Resets

(a) Watchdog Timer Resets

The watchdog timers can generate two types of resets: WDTA0RES and WDTA1RES.

For details, see **Section 9BC.4.6, Watchdog Timer (WDTA) Reset**.

(b) Clock Monitor Resets

The clock monitors can generate four resets: $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$, and $\overline{\text{CLMA3RES}}$.

For details, see **Section 9BC.4.8, Clock Monitor (CLMA) Reset**.

(c) Debugger Reset

A reset is generated by a command from a debugger. This leads to a generation of power-up reset PURES.

For details, see **Section 9BC.4.9, Debugger Reset**.

(4) Software Controlled Reset (SWRES)

A software reset SWRES can be generated by use of the software reset register SWRESA.

For details, see **Section 9BC.4.7, Software Reset**.

(5) Reset Output Signal

During reset and after release from the reset, port P8_6 outputs low level as $\overline{\text{RESETOUT}}$ function.

For details, see **Section 2B.11.1.1, P8_6: $\overline{\text{RESETOUT}}$** and **Section 2C.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

(6) Power Supply Monitoring

The following power supply detection circuits observe the level of the external power supply REGVCC.

(a) Low-Voltage Indicator

The low-voltage indicator (LVI) generates the $\overline{\text{LVIRES}}$ reset, if the voltage level of REGVCC drops below a certain level. The level can be adjusted and the $\overline{\text{LVIRES}}$ can be masked.

For details, see **Section 9BC.4.3, Low-Voltage Indicator (LVI) Reset**.

(b) Power-On Clear

The power-on clear circuit (POC) continuously compares the power supply voltage REGVCC with an internal reference voltage. Thus, a reset is generated when the power supply voltage goes below a certain level.

For details, see **Section 9BC.4.2, Power-On Clear (POC) Reset.**

(c) Core Voltage Monitor

A reset can be generated when the core voltage monitor (CVM) detects over- or undervoltage in core voltage. (Output/not output can be set by option byte.)

For details, see **Section 9BC.4.4, Core Voltage Monitor (CVM) Reset**.

(7) Masking of Reset Sources in Debugging Mode

The following reset sources can be masked during debugging:

Table 9BC.5 Reset Sources to be Masked during Debugging

Reset Source	Maskable/Non-maskable
Power-on clear (POCRES)	—
Debugger reset ($\overline{\text{DBRES}}$)	—
External reset ($\overline{\text{RESET}}$)	✓
Low-voltage indicator reset ($\overline{\text{LVIRES}}$)	✓
Clock monitor reset ($\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$, $\overline{\text{CLMA3RES}}$)	✓
Watchdog timer reset (WDTA0RES, WDTA1RES)	✓
Core voltage monitor reset ($\overline{\text{CVMRES}}$)	✓
Software reset (SWRES)	✓
Reset by DeepSTOP mode	—

9BC.3 Registers

This section contains a description of all registers of the reset controller.

9BC.3.1 Reset Controller Registers Overview

The reset controller is controlled and operated by the following registers:

Table 9BC.6 Reset Controller Registers Overview (RH850/F1KM-S4)

Module Name	Register Name	Symbol	Address
RESCTL	Reset flag registers		
	Reset factor register	RESF	FFF8 0760$_H$
	Reset factor clear register	RESFC	FFF8 0768$_H$
	Redundant reset factor register	RESFR	FFF8 0860$_H$
	Redundant reset factor clear register	RESFCR	FFF8 0868$_H$
	Software reset control register		
	Software reset register	SWRESA	FFF8 0A04$_H$

Table 9BC.7 Reset Controller Registers Overview (RH850/F1KM-S1)

Module Name	Register Name	Symbol	Address
RESCTL	Reset flag registers		
	Reset factor register	RESF	FFF8 0760$_H$
	Reset factor clear register	RESFC	FFF8 0768$_H$
	Redundant reset factor register	RESFR	FFF8 0860$_H$
	Redundant reset factor clear register	RESFCR	FFF8 0868$_H$
	Software reset control register		
	Software reset register	SWRESA	FFF8 0A04$_H$
	Cyclic RUN mode reset vector address register		
	Cyclic RUN mode RBASE register	CYCRBASE	FFF8 3600$_H$

NOTES

1. For the LVI related, RAM store related, and CVM related registers, see **Section 11BC, Supply Voltage Monitor of RH850/F1KM**.
2. As for the protection registers, see **Section 5, Write-Protected Registers**.

9BC.3.2 Details of Reset Flag Registers

9BC.3.2.1 RESF — Reset Factor Register

This register contains information about which type of resets occurred after the last power-on clear reset. This register is initialized by a power-up reset PURES.

Each reset condition sets the corresponding flag in the register.

For example, if a clock monitor reset $\overline{\text{CLMA0RES}}$ occurs after a watchdog timer reset WDTA0RES, RESF reads 0000 000A$_{\text{H}}$.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 0760$_{\text{H}}$

Value after reset: 0000 0200$_{\text{H}}$ / 0000 0300$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9BC.3.2.3 RESFR — Redundant Reset Factor Register

This register is a duplication of the reset factor register. This register is initialized by a power-up reset PURES.

In accordance with the setting conditions for each bit in the reset factor register, the same bits are set in this register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 0860_H

Value after reset: 0000 0200_H / 0000 0300_H

9BC.3.3 Details of Software Reset Control Register

9BC.3.3.1 SWRESA — Software Reset Register

This register is used to generate a software reset SWRES. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Access:	This register is a write-only register that can be written in 32-bit units.
Address:	FFF8 0A04$_H$
Value after reset:	Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9BC.3.4 Details of Cyclic RUN Mode Reset Vector Address Register

CYCRBASE Register is supported in RH850/F1KM-S1.

9BC.3.4.1 CYCRBASE — Cyclic RUN Mode RBASE Register

This register is used to specify reset vector address (RBASE) of the CPU, when the CPU returns to Cyclic RUN mode from DeepSTOP mode. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Update of this register is only permitted when the chip is in RUN mode. Do not change the value in Cyclic RUN mode.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can only be read or written in 32-bit units.

Address: FFF8 3600_H

Value after reset: FEBF 8000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 9BC.13 CYCRBASE Register Contents

Bit Position	Bit Name	Function
31 to 9	CYCRBASE	Reset vector base address (RBASE) in Cyclic RUN mode. Specifies the RBASE value in Cyclic RUN mode. The default value is set to the start address of the retention RAM.
8 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

9BC.4 Functional Description

9BC.4.1 Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) provide reset flags for each reset source.

If a reset has occurred, the corresponding flag is set. According to this, the source of the reset is evaluated.

RESF and RESFR are initialized by a power-up reset PURES (POCRES or $\overline{\text{DBRES}}$) (though bits RESF9 and RESFR9 are set to 1 after initialization). In addition, flags in RESF and RESFR can be cleared by the reset factor clear register (RESFC) and the redundant reset factor clear register (RESFCR).

Each reset source can set the corresponding flag independently from other reset sources.

9BC.4.2 Power-On Clear (POC) Reset

The power-on clear circuit (POC) constantly compares the power supply voltage REGVCC with the internal reference voltage VPOC. It ensures that the microcontroller only operates as long as the power supply exceeds a certain level.

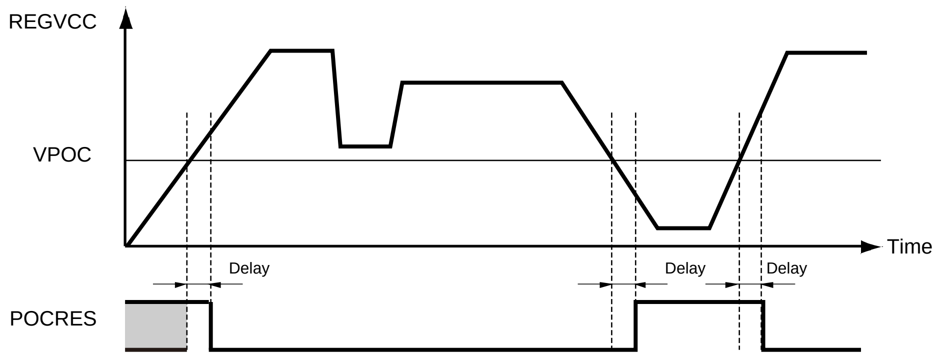
If REGVCC falls below the internal reference voltage (REGVCC < VPOC), the internal reset signal POCRES and a power-up reset PURES are generated.

For details on the specification of the internal voltage reference level VPOC, see **Section 47B, Electrical Characteristics of RH850/F1KM-S4** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.

The reset factor register (RESF) and the redundant reset factor register (RESFR) are cleared by the power-on clear reset. RESF9 and RESFR9 are set to 1 after initialization.

The power-on clear function holds the microcontroller in reset state as long as the power supply voltage does not exceed the threshold level VPOC.

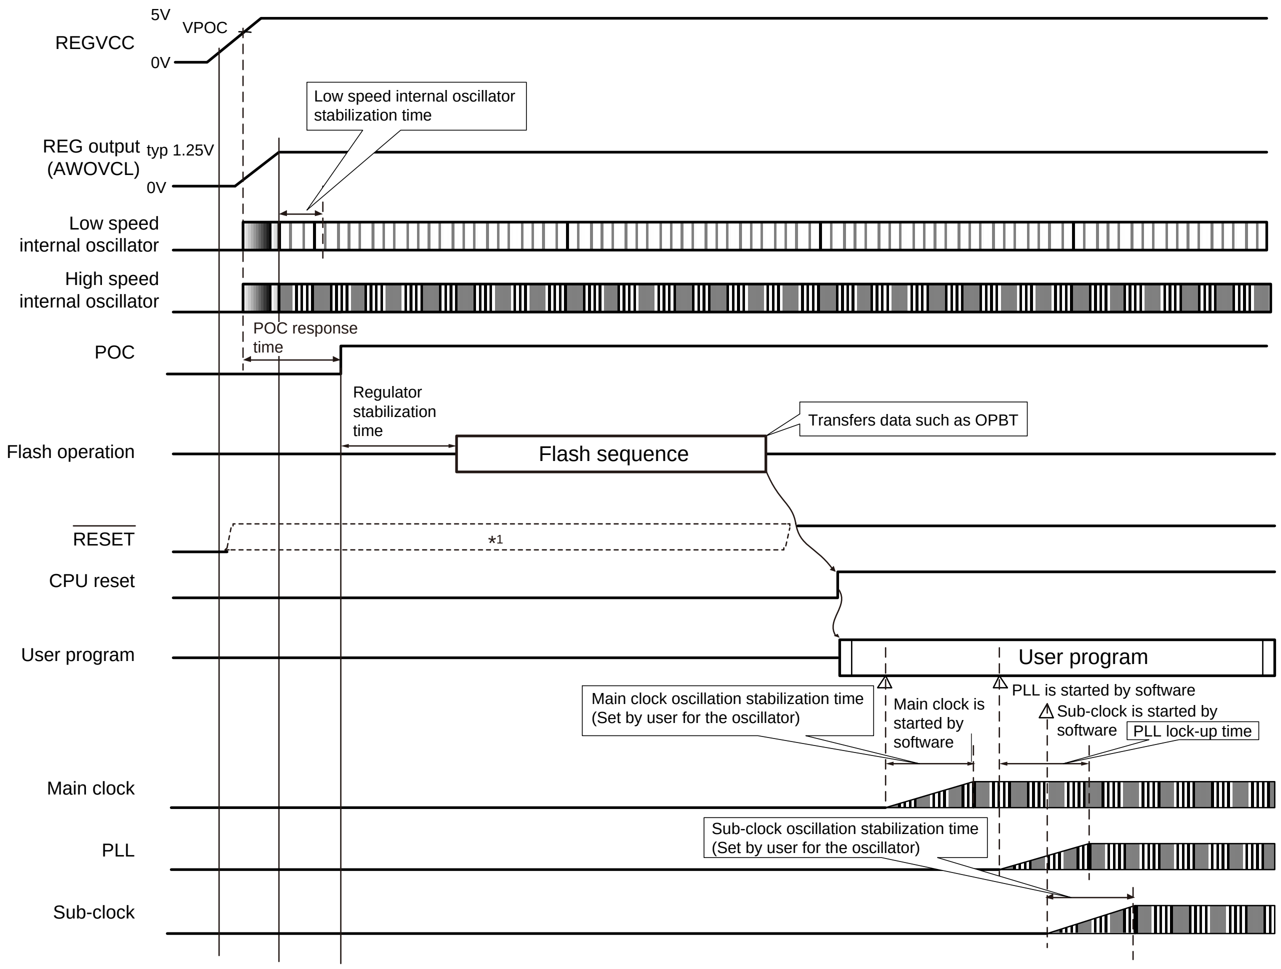
The following figure illustrates the timing of a POCRES.



Note: Delay:
When the REGVCC exceeds the VPOC, the POCRES is released after certain delay. When the REGVCC falls below the VPOC, the POCRES is asserted after certain delay.
See **Section 47B, Electrical Characteristics of RH850/F1KM-S4** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for the delay time.

Figure 9BC.4 POC Reset Timing

(1) Overview of CPU System Startup after Power-On Clear



Note 1. The timing of releasing the $\overline{\text{RESET}}$ pin depends on the external circuit of the microcontroller.

If the $\overline{\text{RESET}}$ pin is low level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 1. If the $\overline{\text{RESET}}$ pin is high level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 0.

Figure 9BC.5 When $\overline{\text{RESET}}$ is Released before the Flash Sequence is Completed

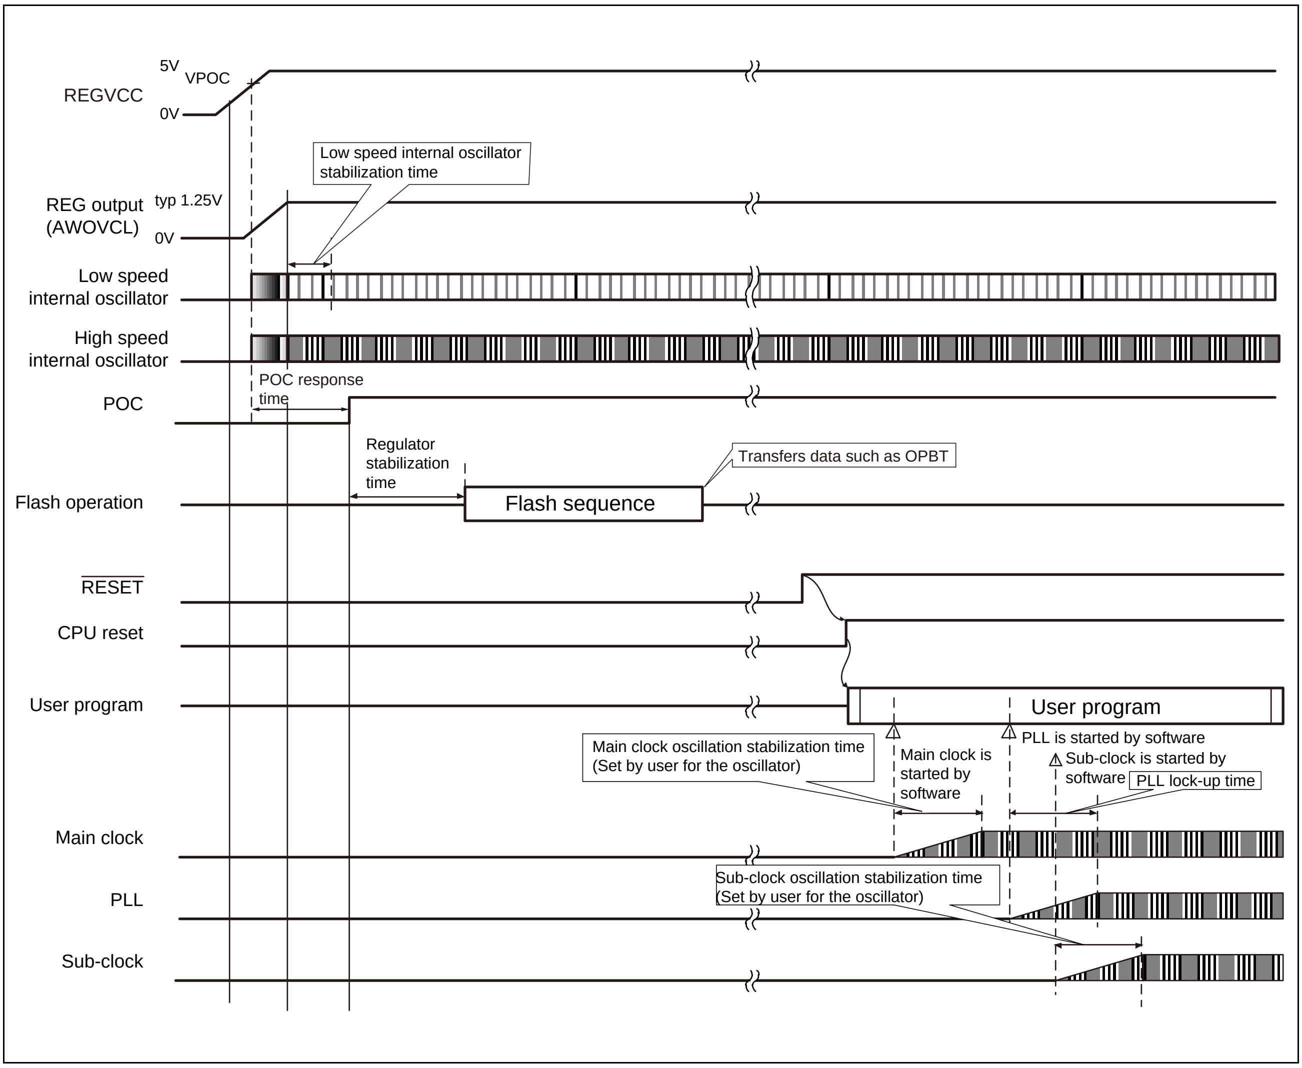


Figure 9BC.6 When $\overline{\text{RESET}}$ is Released after the Flash Sequence is Completed

9BC.4.3 Low-Voltage Indicator (LVI) Reset

The low-voltage indicator (LVI) constantly compares the power supply voltage REGVCC with the LVI internal reference voltage VLVIn.

When setting the LVI detection voltage and releasing the LVIRESMK, if REGVCC falls below the internal reference voltage (REGVCC < VLVIn), the internal reset signal $\overline{\text{LVIRES}}$ is generated.

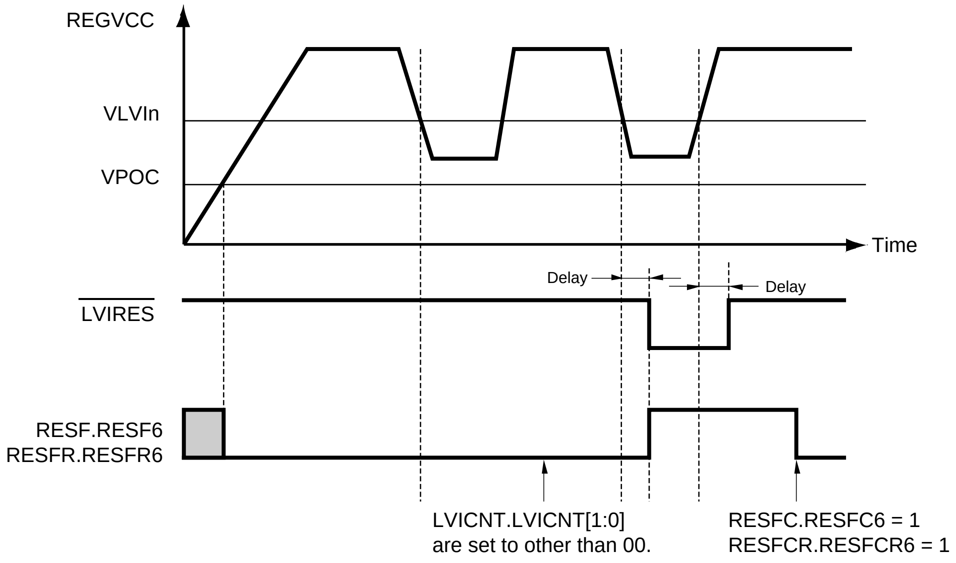
Additionally, the $\overline{\text{LVIRES}}$ flags (bits RESF.RESF6 and RESFR.RESFR6) are set.

After that, even if REGVCC exceeds VLVIn, bits RESF.RESF6 and RESFR.RESFR6 are not cleared automatically. They are cleared as described below.

- Setting the RESFC.RESFC6 bit to 1 clears the RESF.RESF6 bit.
  Setting the RESFCR.RESFCR6 bit to 1 clears the RESFR.RESFR6 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

For details on the LVI functions, see **Section 11BC, Supply Voltage Monitor of RH850/F1KM**.

The following figure illustrates the timing of a $\overline{\text{LVIRES}}$ and bits RESF.RESF6 and RESFR.RESFR6.



Note: Delay:
When REGVCC falls below VLVIn, $\overline{\text{LVIRES}}$ is asserted and the VLVIn reset flags (RESF.RESF6 and RESFR.RESFR6) are set after a certain delay. After that, when REGVCC exceeds VLVIn, $\overline{\text{LVIRES}}$ is released after a certain delay.
See **Section 47B, Electrical Characteristics of RH850/F1KM-S4** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for the delay time.

Figure 9BC.7 LVI Reset Timing

9BC.4.4 Core Voltage Monitor (CVM) Reset

Core voltage monitor is used to monitor the core voltage inside the microcontroller.

The reset $\overline{\text{CVMRES}}$ is generated if the core voltage is not in the specified voltage range while CVM is enabled. Moreover, the $\overline{\text{CVMRES}}$ flags (RESF.RESF7 and RESFR.RESFR7) are set.

After that, the RESF.RESF7 and RESFR.RESFR7 bits are not automatically cleared even if the core voltage returns to the specified voltage range. The RESF.RESF7 and RESFR.RESFR7 bits are cleared as described below.

- Setting the RESFC.RESFC7 bit to 1 clears the RESF.RESF7 bit.
  Setting the RESFCR.RESFCR7 bit to 1 clears the RESFR.RESFR7 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off. Once $\overline{\text{CVMRES}}$ is generated upon high voltage detection, the microcontroller stays in the reset state. To cancel this state, it is mandatory to use the external reset ($\overline{\text{RESET}}$) input. Release the external reset ($\overline{\text{RESET}}$) after the voltage level becomes lower than the high detection voltage.

For details on the CVM function, see **Section 11BC, Supply Voltage Monitor of RH850/F1KM**.

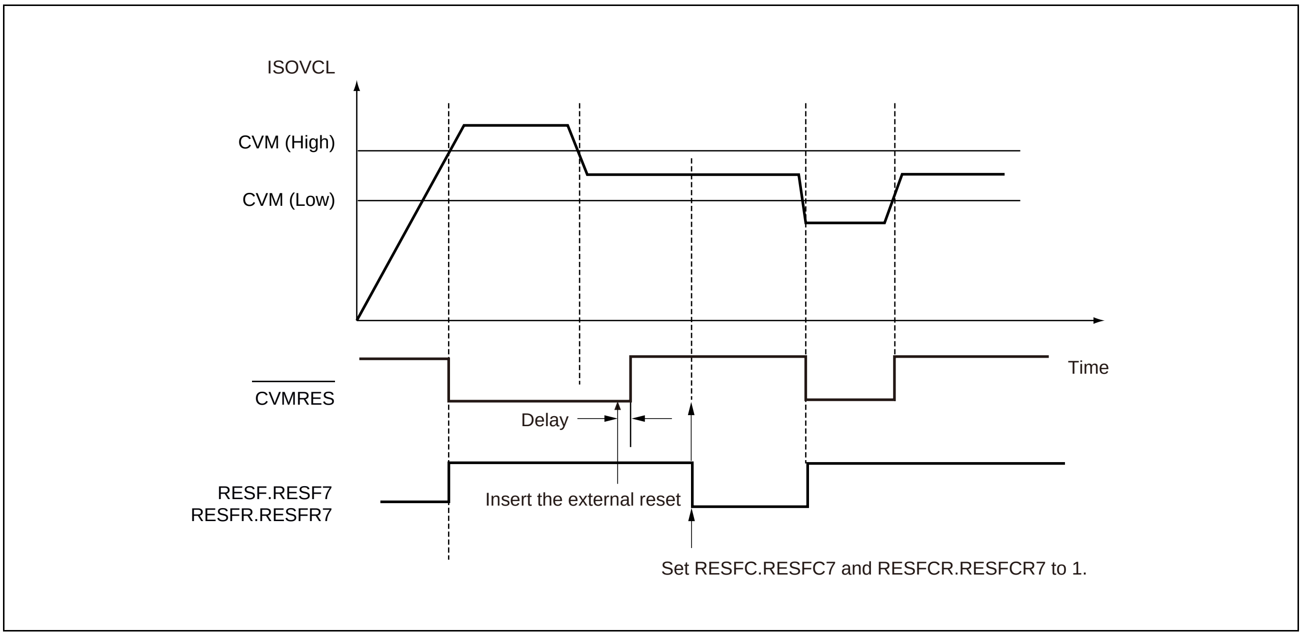


Figure 9BC.8 CVM Reset Timing

9BC.4.5 External Reset ($\overline{\text{RESET}}$)

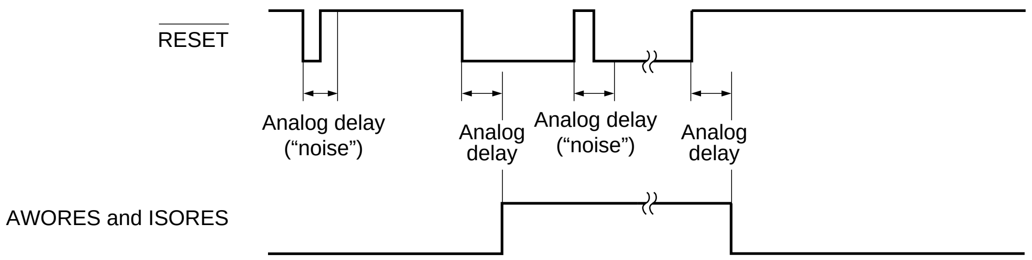
When a low level input is applied to the $\overline{\text{RESET}}$ pin, a reset is asserted and the RESF.RESF8 and RESFR.RESFR8 bits are set.

After that, bits RESF.RESF8 and RESFR.RESFR8 are not cleared automatically, even if the low-level input to the $\overline{\text{RESET}}$ pin is released. Bits RESF.RESF8 and RESFR.REFR8 are cleared as described below.

- Setting the RESFC.RESFC8 bit to 1 clears the RESF.RESF8 bit.
  Setting the RESFCR.RESFCR8 bit to 1 clears the RESFR.RESFR8 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

The $\overline{\text{RESET}}$ pin includes an analog noise filter to prevent erroneous resets due to noise.

The following figure shows the timing when AWORES and ISORES are generated by the external reset. This figure also shows the effect of the noise filter.



Note: The analog delay is caused by the analog filter. The filter regards pulses up to a certain width as noise and suppresses them. For the minimum $\overline{\text{RESET}}$ pulse width, see **Section 47B, Electrical Characteristics of RH850/F1KM-S4** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.

Figure 9BC.9 External Reset ($\overline{\text{RESET}}$)

9BC.4.6 Watchdog Timer (WDTA) Reset

The watchdog timers can be configured to generate a reset if the overflow time is exceeded. After a watchdog timer reset is asserted, the corresponding watchdog timer reset flags (the RESF.RESF1 and RESFR.RESFR1 bits for WDTA0RES, and the RESF.RESF2 and RESFR.RESFR2 bits for WDTA1RES) are set.

After that, bits RESF.RESF1 and RESFR.RESFR1 (or bits RESF.RESF2 and RESFR.RESFR2) are not cleared automatically, even if WDTA0RES (or WDTA1RES) is released.

Bits RESF.RESF1 and RESFR.RESFR1, and bits RESF.RESF2 and RESFR.RESFR2 are cleared as described below.

- WDTA0RES:
  Setting the RESFC.RESFC1 bit to 1 clears the RESF.RESF1 bit.
  Setting the RESFCR.RESFCR1 bit to 1 clears the RESFR.RESFR1 bit.
- WDTA1RES:
  Setting the RESFC.RESFC2 bit to 1 clears the RESF.RESF2 bit.
  Setting the RESFCR.RESFCR2 bit to 1 clears the RESFR.RESFR2 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

9BC.4.7 Software Reset

The software reset SWRES can be asserted by setting SWRESA.SWRESA to 1.

SWRES sets the reset flag RESF.RESF0 and the RESFR.RESFR0 bit.

RESF.RESF0 and RESFR.RESFR0 are not cleared automatically. RESF.RESF0 and RESFR.RESFR0 are cleared as described below.

- Setting the RESFC.RESFC0 bit to 1 clears the RESF.RESF0 bit.
  Setting the RESFCR.RESFCR0 bit to 1 clears the RESFR.RESFR0 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

9BC.4.8 Clock Monitor (CLMA) Reset

The clock monitors can generate the following resets:

- $\overline{\text{CLMA0RES}}$, if a frequency abnormality in HS IntOSC is detected
- $\overline{\text{CLMA1RES}}$, if a frequency abnormality in MainOSC is detected
- $\overline{\text{CLMA2RES}}$, if a frequency abnormality in PLL0 is detected
- $\overline{\text{CLMA3RES}}$, if a frequency abnormality in PLL1 is detected

When the Clock Monitor detects frequency abnormality of the respective clocks, resets $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$, and $\overline{\text{CLMA3RES}}$ are generated.

In addition, flags $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$, and $\overline{\text{CLMA3RES}}$ (RESF.RESF3, RESFR.RESFR3, RESF.RESF4, RESFR.RESFR4, RESF.RESF5, RESFR.RESFR5, RESF.RESF14, and RESFR.RESFR14) are set.

These flags are not cleared automatically. They are cleared as described below.

- $\overline{\text{CLMA0RES}}$:

  Setting the RESFC.RESFC3 bit to 1 clears the RESF.RESF3 bit.
  Setting the RESFCR.RESFCR3 bit to 1 clears the RESFR.RESFR3 bit.

- $\overline{\text{CLMA1RES}}$:

  Setting the RESFC.RESFC4 bit to 1 clears the RESF.RESF4 bit.
  Setting the RESFCR.RESFCR4 bit to 1 clears the RESFR.RESFR4 bit.

- $\overline{\text{CLMA2RES}}$:

  [RH850/F1KM-S4]
  Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.
  Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.

  [RH850/F1KM-S1]
  This is not supported.

- $\overline{\text{CLMA3RES}}$:

  [RH850/F1KM-S4]
  Setting the RESFC.RESFC14 bit to 1 clears the RESF.RESF14 bit.
  Setting the RESFCR.RESFCR14 bit to 1 clears the RESFR.RESFR14 bit.

  [RH850/F1KM-S1]
  Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.
  Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.

- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

9BC.4.9 Debugger Reset

Debugger reset ($\overline{\text{DBRES}}$) is generated via a debugger command. $\overline{\text{DBRES}}$ activates PURES, and therefore operates in the same way as the power-on clear reset POCRES:

- The clock generators are reset and stop operating. The clock generators should be restarted after release from the reset state.
- The reset factor register RESF and the redundant reset factor register RESFR are cleared (Bits RESF9 and RESFR9 are set to 1 after initialization).

9BC.4.10 Reset Vector Address of CPU

This function is supported in RH850/F1KM-S1.

The default value of reset vector base address (RBASE) of CPU is set to 0000 0000_H at shipment. In Cyclic RUN mode, the reset vector base address is automatically switched to the address specified by the CYCRBASE register. After returning to the RUN mode, the reset vector base address automatically switches back to the default address.

For details about the RBASE register, see **Section 3BC, CPU System of RH850/F1KM**.

Section 10A Power Supply Circuit of RH850/F1KH-D8

This section describes the power supply and power domains of the RH850/F1KH.

10A.1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area (AWO area) is always on in all operating modes and stand-by modes.

The power supply of the Isolated area (ISO area) can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.

For operation of the device, the following voltages are required:

- Power supply voltages REG0VCC and REG1VCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltages EVCC and BVCC for the I/O ports.
- Power supply voltages A0VREF and A1VREF for the A/D converters and the separated I/O ports.

10A.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.

Table 10A.1 Power Supply Pins

Power Supply	Power Supply Pins	Power Supply for
Power supply for internal circuits	REG0VCC	● On-chip voltage regulators for the Always-On area (AWO area) ● Port group IP0 ● MainOSC ● SubOSC ● POC (REG0VCC voltage detection) ● POC (REG1VCC voltage detection) ● LVI
	AWOVCL*1	
	AWOVSS	
	REG1VCC	● On-chip voltage regulators for the Isolated area (ISO area)
	ISOVCL*1	
	ISOVSS	
Power supply for I/O port	EVCC	● $\overline{\text{RESET}}$ ● FLMD0 (324-pin devices) ● Port groups JP0, P0, P1, P2, P3, P8, P9, P20, P23 (233-pin devices) ● Port groups JP0, P0, P1, P2, P3, P8, P9, P20 (176-pin devices) ● Port groups JP0, P0, P1, P2, P8, P9, P20
	EVSS	
	BVCC	(324-pin devices) ● Port groups P10, P11, P12, P13, P18, P19, P21, P22, P24 (233-pin devices) ● Port groups P10, P11, P12, P13, P18, P19 (176-pin devices) ● Port groups P10, P11, P12, P18
	BVSS	
Power supply for A/D converters	A0VREF	● Analog circuits of ADCA0, port group AP0
	A0VSS	
	A1VREF	● Analog circuits of ADCA1, port group AP1
	A1VSS	

Note: See **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for the voltage range of each power supply.

Note 1. Pin to connect a stabilization capacitor for on-chip voltage regulator.

10A.1.2 Block Diagram of Power Domains

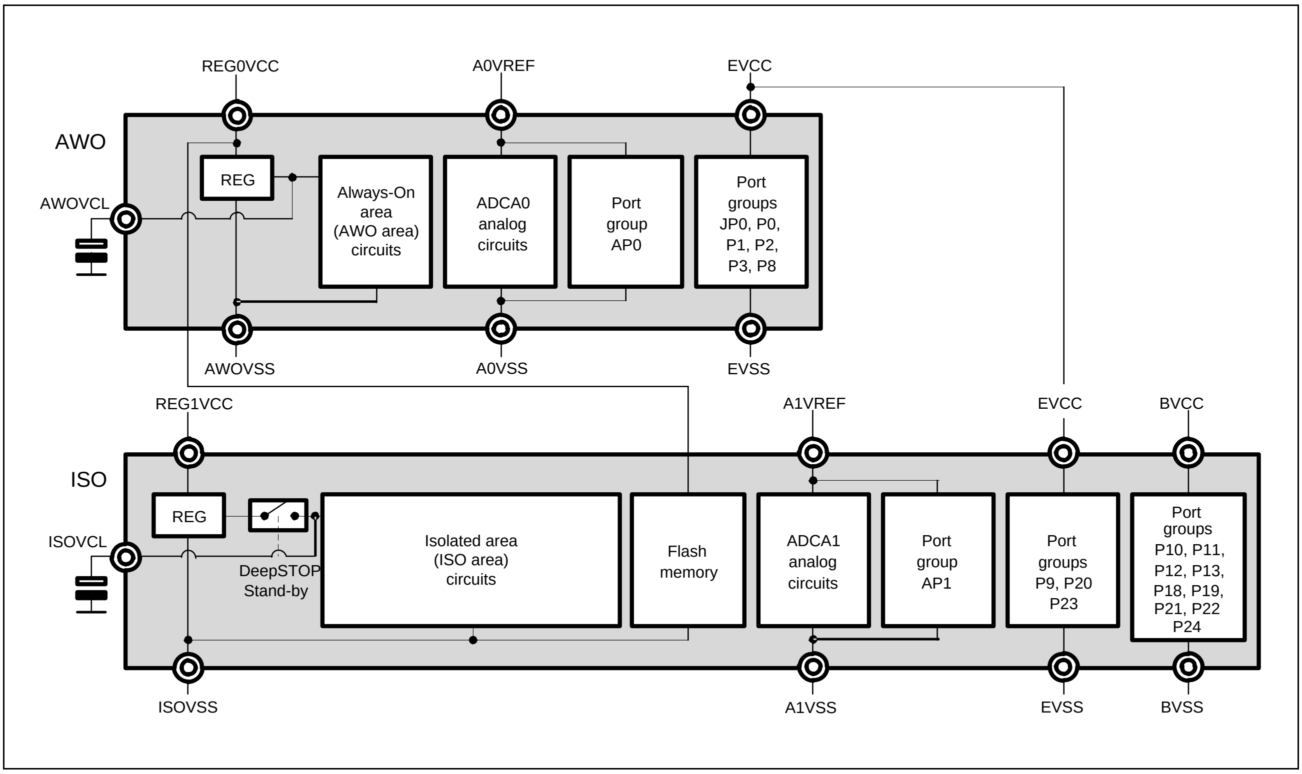

Figure 10A.4 Overview of Power Supply Circuit (324 Pins)

10A.1.3 Power Domains Arrangement

The table below lists the microcontroller functional modules for each power domain.

Table 10A.2 Functional Modules and Power Domain

Power Domain	Functions
Always-On area (AWO area)	• STBC, Reset controller • Retention RAM • MainOSC, SubOSC, LS IntOSC, HS IntOSC, CLMA0, CLMA1 • WDTA0, RTCAn, TAUJ0, TAUJ2, ADCA0, LPS0 • Port groups JP0, P0, P1, P2, P3, P8, AP0, IP0
Isolated area (ISO area)	• CPU subsystem • Code flash, Data flash, Local RAM, Global RAM • PLL0, PLL1, CLMA2, CLMA3 • WDTA1, WDTA2, DCRAn, TAUDn, TAUBn, TAUJ1, TAUJ3, OSTMn, PWM-Diag, CSIGn, CSIHn, RCFDCn, RLIN24n, RLIN3n, RIICn, ADCA1, Motor Control, ENCAn, KRn, MEMCn, SFMAn, FLXAn, ETNBn, RSENTn, MMCAn • Port groups P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, P23, P24, AP1

Section 10B Power Supply Circuit of RH850/F1KM-S4

This section describes the power supply and power domains of the RH850/F1KM.

10B.1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area (AWO area) is always on in all operating modes and stand-by modes.

The power supply of the Isolated area (ISO area) can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.

For operation of the device, the following voltages are required:

- Power supply voltage REGVCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltages EVCC and BVCC*[1] for the I/O ports.
- Power supply voltages A0VREF and A1VREF*[1] for the A/D converters and the separated I/O ports.

Note 1. Not supported for the 100-pin devices.

10B.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.

Table 10B.1 Power Supply Pins

Power Supply	Power Supply Pins	Power Supply for
Power supply for internal circuits	REGVCC	• On-chip voltage regulators for the Always-On area (AWO area) and Isolated area (ISO area) • Port group IP0*2 • MainOSC • SubOSC*2 • POC / LVI
	AWOVCL*1	
	AWOVSS	
	ISOVCL*1	
	ISOVSS	
Power supply for I/O port	EVCC	• $\overline{\text{RESET}}$ • FLMD0 (272-pin devices) • Port groups JP0, P0, P1, P2, P3, P8, P9, P20 (233-pin devices) • Port groups JP0, P0, P1, P2, P3, P8, P9, P20 (176-pin devices) • Port groups JP0, P0, P1, P2, P8, P9, P20 (144-pin devices) • Port groups JP0, P0, P1, P8, P9, P20 (100-pin devices) • Port groups JP0, P0, P8, P9, P10, P11
	EVSS	
	BVCC	(272-pin devices) • Port groups P10, P11, P12, P13, P18, P19, P21, P22 (233-pin devices) • Port groups P10, P11, P12, P13, P18, P19 (176-pin devices) • Port groups P10, P11, P12, P18 (144-pin devices) • Port groups P10, P11, P12, P18
	BVSS	
Power supply for A/D converters	A0VREF	• Analog circuits of ADCA0, port group AP0
	A0VSS	
	A1VREF	• Analog circuits of ADCA1, port group AP1*2
	A1VSS	

Note: See **Section 47B, Electrical Characteristics of RH850/F1KM-S4** for the voltage range of each power supply.

Note 1. Pin to connect a stabilization capacitor for on-chip voltage regulator.

Note 2. Not supported for the 100-pin devices.

10B.1.2 Block Diagram of Power Domains

Table 10B.2 Functional Modules and Power Domain

Power Domain	Functions
Always-On area (AWO area)	• STBC, Reset controller • Retention RAM • MainOSC, SubOSC, LS IntOSC, HS IntOSC, CLMA0, CLMA1 • WDTA0, RTCAn, TAUJ0, TAUJ2, ADCA0, LPS0 • Port groups JP0, P0, P1, P2, P3, P8, AP0, IP0
Isolated area (ISO area)	• CPU subsystem • Code flash, Data flash, Local RAM, Global RAM • PLL0, PLL1, CLMA2, CLMA3 • WDTA1, DCRAn, TAUDn, TAUBn, TAUJ1, TAUJ3, OSTMn, PWM-Diag, CSIGn, CSIHn, RCFDCn, RLIN24n, RLIN3n, RIICn, ADCA1, Motor Control, ENCAn, KRn, MEMCn, SFMAn, FLXAn, ETNBn, RSENTn • Port groups P9, P10, P11, P12, P13, P18, P19, P20, P21, P22, AP1

Section 10C Power Supply Circuit of RH850/F1KM-S1

This section describes the power supply and power domains of the RH850/F1KM.

10C.1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area (AWO area) is always on in all operating modes and stand-by modes.

The power supply of the Isolated area (ISO area) can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.

For operation of the device, the following voltages are required:

- Power supply voltage REGVCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltage EVCC for the I/O ports.
- Power supply voltage A0VREF for the A/D converters and the separated I/O ports.

10C.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.

Table 10C.1 Power Supply Pins

Power Supply	Power Supply Pins	Power Supply for
Power supply for internal circuits	REGVCC	• On-chip voltage regulators for the Always-On area (AWO area) and Isolated area (ISO area) • MainOSC • POC / LVI
	AWOVCL*[1]	
	AWOVSS	
	ISOVCL*[1]	
	ISOVSS	
Power supply for I/O port	EVCC	• $\overline{\text{RESET}}$ • FLMD0
	EVSS	(100/80-pin devices) • Port groups JP0, P0, P8, P9, P10, P11 (64/48-pin devices) • Port groups JP0, P0, P8, P9, P10
Power supply for A/D converters	A0VREF	• Analog circuits of ADCA0, port group AP0
	A0VSS	

Note: See **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for the voltage range of each power supply.

Note 1. Pin to connect a stabilization capacitor for on-chip voltage regulator.

10C.1.2 Block Diagram of Power Domains

10C.1.3 Power Domains Arrangement

The table below lists the microcontroller functional modules for each power domain.

Table 10C.2 Functional Modules and Power Domain

Power Domain	Functions
Always-On area (AWO area)	• STBC, Reset controller • Retention RAM • MainOSC, LS IntOSC, HS IntOSC, CLMA0, CLMA1 • WDTA0, RTCAn, TAUJ0, TAUJ2, ADCA0, LPS0 • Port groups JP0, P0, P8, AP0
Isolated area (ISO area)	• CPU subsystem • Code flash, Data flash, Local RAM • PLL1, CLMA3 • WDTA1, DCRAn, TAUDn, TAUBn, TAUJ1, TAUJ3, OSTMn, PWM-Diag, CSIGn, CSIHn, RCFDCn, RLIN24n, RLIN3n, RIICn, Motor Control, ENCAn, KRn, RSENTn • Port groups P9, P10, P11

Section 11A Supply Voltage Monitor of RH850/F1KH-D8

This section explains in general about the supply voltage monitor.

The first part in this section describes the supply voltage monitor function, and the ensuing sections describe the registers.

This supply voltage monitor is for detecting and control of a power supply failure. However, the supply voltage monitor does not detect all of the possible failures.

Therefore, a power supply monitoring with an external device is required for the following terminals, in case that the customer's system requires an appropriate failure detection and control for Functional Safety.

- REG0VCC
- REG1VCC
- EVCC
- BVCC
- A0VREF
- A1VREF
- AWOVCL
- ISOVCL

The required power supply specification for power supply monitoring with external device is shown at **Section 47A.4.5, Power Management Characteristics**.

11A.1 Overview

11A.1.1 Functional Overview

The supply voltage monitor continuously monitors multiple external and internal supply voltages in order to ensure that the device operates with a supply voltage within the specified range. If the voltage drops below the reference voltage or comparison voltage, an interrupt request signal or internal reset signal is generated. The following table lists the supply voltage monitor functions.

Table 11A.1 Supply Voltage Monitor Functions

Function Name	Monitor Voltage	Signal Generated when Voltage Drops below Certain Level
Power-On Clear (POC)	REG0VCC REG1VCC	Internal reset signal
Low-Voltage Indicator Circuit (LVI)	REG0VCC	Internal reset signal, interrupt request signal
Core Voltage Monitor (CVM)	Isolated area (ISO area) voltage	Internal reset signal
RAM Retention Voltage Indicator (VLVI)	REG0VCC	—

NOTES

1. The RAM Retention Voltage Indicator sets the very-low voltage detection flag (VLVF) when the voltage drops below the RAM retention voltage.
2. When the internal core voltage monitor (CVM) is used for customer's system as the functional safety measure, the voltage of the Always-On area (AWO area) shall be monitored by the external voltage monitor.

11A.1.2 Power-On Clear (POC)

The POC continuously monitors the external power supply voltage REG0VCC and REG1VCC. This ensures that the microcontroller only operates at or above power-on clear detection voltage (VPOC).

If REG0VCC or REG1VCC falls below the POC detection voltage (REG0VCC < VPOC, REG1VCC < VPOC), the internal reset signal (POCRES) is generated.

For details, see **Section 9A.4.2, Power-On Clear (POC) Reset**.

11A.1.3 Low Voltage Indicator Circuit (LVI)

The LVI continuously compares the external power supply voltage REG0VCC with the LVI reference voltage VLVIn.

If REG0VCC falls below the reference voltage (REG0VCC < VLVIn), an internal reset signal or interrupt request signal is generated.

11A.1.3.1 LVI Reference Voltage

The LVI reference voltage VLVIn can be selected from three different levels by LVICNT.LVICNT[1:0].

If LVICNT.LVICNT[1:0] is set to 00_B, the LVI is disabled.

For the specification of the reference voltage level VLVIn, see **Section 11A.2.2.1, LVICNT — LVI Control Register**.

11A.1.3.2 LVI Reset ($\overline{\text{LVIRES}}$)

When the LVI detection voltage is set and LVIRESMK is cleared, if REG0VCC falls below the reference voltage (REG0VCC < VLVIn), the internal reset signal $\overline{\text{LVIRES}}$ is generated.

For the specification of $\overline{\text{LVIRES}}$ generation, see **Section 9A.4.3, Low-Voltage Indicator (LVI) Reset**.

11A.1.3.3 LVI Interrupt (INTLVIL/INTLVIH)

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REG0VCC falls below the reference voltage (REG0VCC (MIN) < VLVIn), the LVI interrupt INTLVIL is generated.

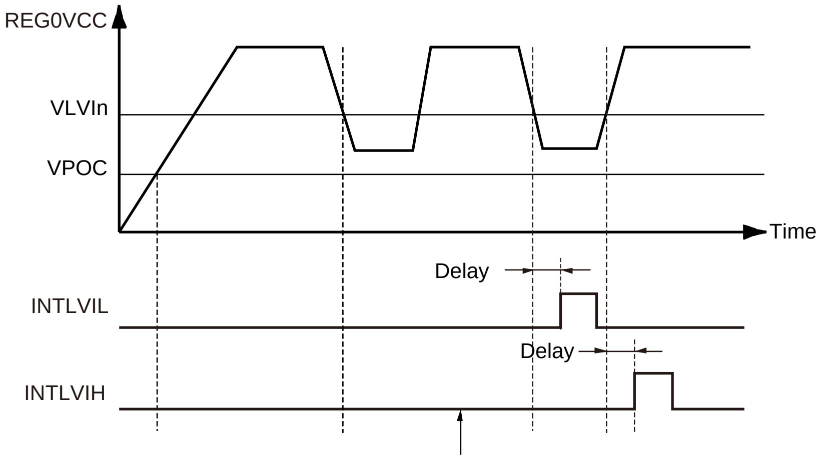
To use the LVI as an interrupt source, the INTLVIL interrupt must be unmasked.

INTLVIL interrupt can be used as wake-up source from all of standby modes. For details, see **Section 14, Stand-By Controller (STBC)**.

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REG0VCC exceeds the reference voltage (REG0VCC (MIN) > VLVIn), LVI interrupt INTLVIH is generated.

When LVI is used as an interrupt source, INTLVIH interrupt must be unmasked.

The following figure illustrates the timing of INTLVIL/INTLVIH.



Set LVICNT.LVICNT[1:0] to a value other than 00_B.
Set FEINTFMSK.LVILFEIFMSK = 0, FEINTFMSK.LVIHFEIFMSK = 0
(For detailed procedure, see **Section 11A.1.3.4, LVI Setting Procedure**.)

Note: Delay:
When REG0VCC falls below VLVIn, INTLVIL is generated after a certain delay.
After that, when REG0VCC exceeds VLVIn, INTLVIH is generated after a certain delay.
See **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for delay time.

Figure 11A.1 INTLVIL/INTLVIH Generation Timing

11A.1.3.4 LVI Setting Procedure

The setting procedures for LVI are shown below.

(1) Using LVI as the Reset Source

a. Mask LVI reset. (LVICNT.LVIRESMK = 1)*[1]

b. Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)

c. Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])*[1]

d. Insert ample wait time by software (see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**).

e. Unmask LVI reset. (LVICNT.LVIRESMK = 0)*[1]

(2) Using LVI as the Interrupt Source (FEINT)

a. Mask LVI reset. (LVICNT.LVIRESMK = 1)*[1]

b. Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)

c. Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])*[1]

d. Insert ample wait time by software (see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**).

e. Unmask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 0, FEINTFMSK.LVIHFEIFMSK = 0)

Note 1. Follow the register protection sequence to set LVICNT register because it is a write-protected register. For details on the write-protected registers, see **Section 5, Write-Protected Registers**.

CAUTION

If REG0VCC is not stable around the LVI detection level (VLVIn), correct judgment of whether INTLVIH or INTLVIL interrupt processing should proceed may not be possible.

For example, if multiple interrupts consisting of both INTLVIH and INTLVIL occur during INTLVIL interrupt processing due to REG0VCC being unstable, the software cannot detect which type of interrupt was generated last.

Consequently, if the last interrupt generated was an INTLVIL interrupt, regardless of REG0VCC (min.) being greater than VLVIn, the software erroneously judges that REG0VCC (min.) < VLVIn.

Accordingly, take measures such as programming the software so that LVI detection interrupt processing is completed before a next LVI interrupt. Also, consider control of REG0VCC.

11A.1.3.5 Clock Supply to the LVI

The clock supply to the LVI is shown in the following table.

Table 11A.2 Clock Supply to the LVI

Unit Name	Unit Clock Name	Supply Clock Name
LVI	Register access clock	CPUCLK_UL

11A.1.4 Core Voltage Monitor (CVM)

The core voltage monitor (CVM) monitors the Isolated area (ISO area) voltage (referred to as “core voltage” below) in the microcontroller.

If the regulator output voltage is outside of the specified range, the internal reset signal ($\overline{\text{CVMRES}}$) is generated.

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off in addition to a reset being generated.

When operation shifts to diagnostic mode (DIAG mode), the CVM enters the abnormal core voltage detection state. An abnormal core voltage detected state can be intentionally created by using the DIAG mode so that the CVM abnormal voltage detected flag can be checked for failures.

CAUTION

The CVM cannot detect drifts in the voltage of the Isolated area (ISO area) caused by the characteristics of the regulator, use conditions or the increase or decrease of voltage.

11A.1.4.1 CVM Reset ($\overline{\text{CVMRES}}$)

If the core voltage exceeds the specified level while high-voltage monitor is enabled (CVMDE.H_D_E = 1), then $\overline{\text{CVMRES}}$ is generated and the power supply to the Isolated area (ISO area) is stopped.

If the core voltage falls below the specified level while low voltage monitor is enabled (CVMDE.L_D_E = 1), $\overline{\text{CVMRES}}$ is generated.

For the specification of $\overline{\text{CVMRES}}$ generation, see **Section 9A.4.4, Core Voltage Monitor (CVM) Reset**.

11A.1.4.2 CVM Setting

Use the option byte to enable the high-voltage monitor and the low-voltage monitor.
For details, see **Section 44.9, Option Bytes**.

11A.1.4.3 Diagnostic (DIAG) Mode

This product supports diagnostic mode.

In diagnostic (DIAG) mode, whether the CVM abnormal voltage detection flag is set to 1 can be checked.

In diagnostic mode, $\overline{\text{CVMRES}}$ is not output.

The setting procedure for diagnostic mode is described below.

Set the registers according to this procedure. Otherwise the operation is not guaranteed.

1. Set CVMDIAG.CVM_DIAG_MASK.*1
2. Set CVMDIAG.CVM_DIAG.*1
3. Wait for 12 µs.*2
4. Read the CVMF register to confirm that the H_V_F and L_V_F bits are set to 1 (if these bits are 0, the CVM does not operate normally, requiring error handling).
5. Clear CVMDIAG.CVM_DIAG.*1
6. Clear the CVMF register.*1
7. Read the CVMF register to confirm that the H_V_F and L_V_F bits are set to 0 (if these bits are 1, go back to step 5 again).
8. Clear CVMDIAG.CVM_DIAG_MASK.*1

Note 1. Follow the register protection sequence to set CVMF and CVMDIAG registers because these are write-protected registers. For details, see **Section 5, Write-Protected Registers**.

Note 2. At least 50 µs must elapse after the following conditions are fulfilled before step (4) is started.

- Release from HALT state
- Release from STOP mode
- Release from the reset state, when a reset other than a reset due to the CVM is generated in RUN mode (include HALT state)
- The CPU clock is switched
- Operation of the MainOSC is started or stopped
- Operation of the PLL is started or stopped

11A.1.4.4 Clock Supply to the CVM

The clock supply to the CVM is shown in the following table.

Table 11A.3 Clock Supply to the CVM

Unit Name	Unit Clock Name	Supply Clock Name
CVM	Register access clock	CPUCLK_UL

11A.1.5 RAM Retention Voltage Indicator (Very-Low-Voltage Detection Circuit, VLVI)

The very-low-voltage detection circuit (VLVI) is used to detect the RAM retention voltage, and continuously compares the power supply voltage REG0VCC with the RAM retention voltage VVLVI.

See **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for the specification of the RAM retention voltage level VVLVI.

11A.1.5.1 Clock Supply to the VLVI

The clock supply to the VLVI is shown in the following table.

Table 11A.4 Clock Supply to the VLVI

Unit Name	Unit Clock Name	Supply Clock Name
VLVI	Register access clock	CPUCLK_UL

11A.1.5.2 Retention RAM Content Retention

If the power supply voltage REG0VCC does not fall below VVLVI, the content of the retention RAM (RRAM) is retained. See **Section 9A.1.1, Reset Sources** for retention during reset.

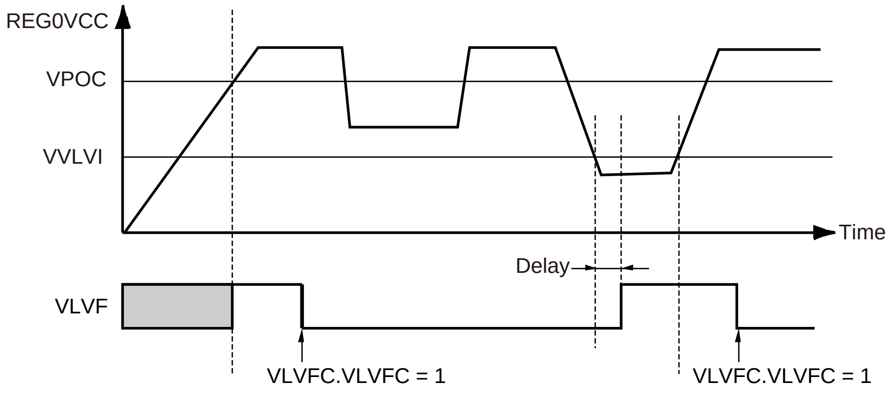
If REG0VCC falls below VVLVI, the RRAM content cannot be guaranteed. Thus the entire RRAM must be restored before continuing operation.

If REG0VCC falls below the RAM retention voltage (REG0VCC < VVLVI), the VLVF.VLVF bit is set.

After that, even if REG0VCC exceeds VVLVI, the VLVF.VLVF bit is not cleared automatically. It is cleared by

- setting VLVFC.VLVFC bit to 1.

The following figure illustrates the timing of VLVF.



Note: Delay:
When REG0VCC falls below VVLVI, the VLVF bit is set to 1 after a certain delay.
See **Section 47A, Electrical Characteristics of RH850/F1KH-D8** for delay time.

Figure 11A.2 VLVF Operation Timing

11A.1.6 Block Diagram

The block diagram of the supply voltage monitor is shown below.

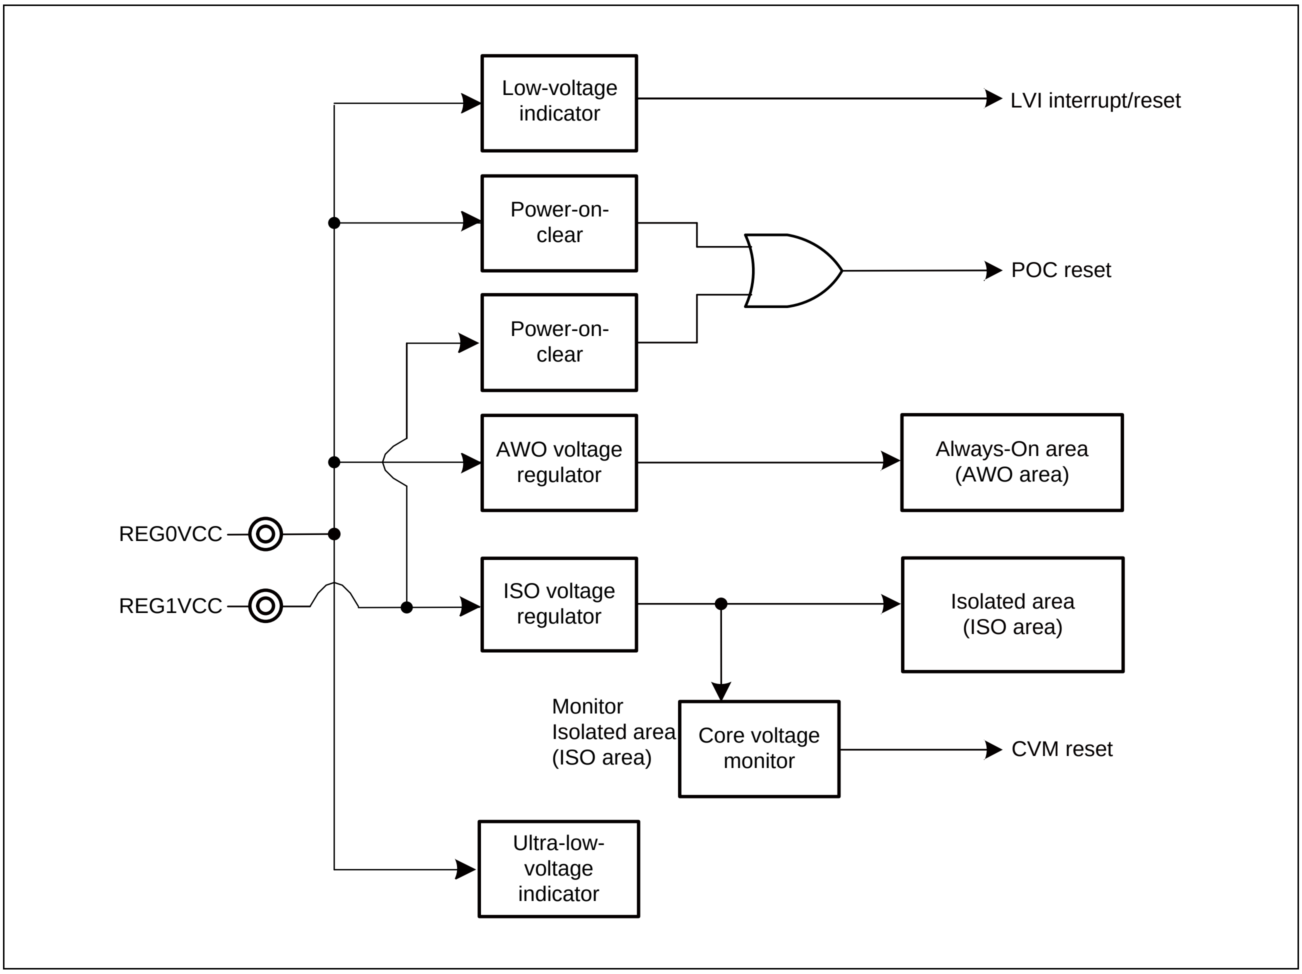


Figure 11A.3 Supply Voltage Monitor

11A.2 Registers

11A.2.1 List of Registers

The following table lists the supply voltage monitor registers.

Table 11A.5 List of Registers

Module Name	Register Name	Symbol	Address
SVM	Low-voltage indicator reset control register		
	LVI control register	LVICNT	FFF8 0A00$_H$
	Core voltage monitor control registers		
	CVM factor register	CVMF	FFF8 3100$_H$
	CVM detection enable register	CVMDE	FFF8 3104$_H$
	CVM diagnostic mode setting register	CVMDIAG	FFF8 3114$_H$
	Very-low-voltage detection control registers		
	Very-low-voltage detection register	VLVF	FFF8 0980$_H$
	Very-low-voltage detection clear register	VLVFC	FFF8 0988$_H$

11A.2.2 Low-Voltage Indicator Reset Control Register

11A.2.2.1 LVICNT — LVI Control Register

This register is used to control the Low-Voltage Indicator and to select the LVI detection level.

This register is initialized by power-up reset PURES.

The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 0A00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 11A.6 LVICNT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LVIRESMK	Mask LVI Reset 0: LVI reset is not masked 1: LVI reset is masked
1, 0	LVICNT[1:0]	Detection Level 0 0: LVI is ignored 0 1: VLVI0 = 4.0 ± 0.1 V (fall), 4.0 ± 0.13 V (rise) 1 0: VLVI1 = 3.7 ± 0.1 V (fall), 3.7 ± 0.13 V (rise) 1 1: VLVI2 = 3.5 ± 0.1 V (fall), 3.5 ± 0.13 V (rise)

NOTE

To use an LVI interrupt, LVI reset must be masked (LVIRESMK = 1) by LVIRESMK.

11A.2.3 Core Voltage Monitor Control Registers

11A.2.3.1 CVMF — CVM Factor Register

This register records the core voltage failure state generated after the last power-on clear reset POCRES.

The L_V_F bit and the H_V_F bit are set to 1 by hardware when the CVM detects core voltage failure.

If the L_V_F or H_V_F bit of this register is set to 1, that bit is not updated until it is initialized by a power-on clear reset POCRES or by writing 0 to the CVMF.L_V_F or CVMF.H_V_F bit. However, it continuously monitors an error signal from the core voltage monitoring circuit in diagnostic mode.

The correct write sequence using the PROTCMDCVM register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 3100_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 11A.7 CVMF Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	H_V_F	High-Voltage Failure Detection of the Core Voltage by the CVM Read access 0: No high-voltage failure state is detected 1: High-voltage failure state is detected Write access 0: Clear the H_V_F bit 1: Invalid
0	L_V_F	Low-Voltage Failure Detection of the Core Voltage by the CVM Read access 0: No low-voltage failure state is detected 1: Low-voltage failure state is detected Write access 0: Clear the L_V_F bit 1: Invalid

11A.2.3.2 CVMDE — CVM Detection Enable Register

This register is used to indicate the voltage detection enabled or disabled state.

This register is initialized only by power-up reset PURES.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 3104_H

Value after reset: The value after reset depends on the option byte setting.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The setting of the option byte OPBT0.CVM_HD_EN is reflected.

Note 2. The setting of the option byte OPBT0.CVM_LD_EN is reflected.
For details on the option byte, see **Section 44.9, Option Bytes**.

Table 11A.8 CVMDE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	H_D_E	High-Voltage Monitor Enable 0: High-voltage detection is disabled. 1: High-voltage detection is enabled.
0	L_D_E	Low-Voltage Monitor Enable 0: Low-voltage detection is disabled. 1: Low-voltage detection is enabled.

11A.2.3.3 CVMDIAG — CVM Diagnostic Mode Setting Register

This register sets the CVM diagnostic mode.

This register is initialized only by power-up reset PURES.

For details on the register settings in diagnostic mode, see **Section 11A.1.4.3, Diagnostic (DIAG) Mode**.

The correct write sequence using the PROTCMDCVM register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 3114_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	CVM_DIAG	CVM Diagnostic Mode Setting 0: Normal mode 1: Diagnostic mode

11A.2.4 Very-Low-Voltage Detection Control Registers

11A.2.4.1 VLVF — Very-Low-Voltage Detection Register

The very-low-voltage detection register (VLVF) shows the state of the RAM retention voltage detection.

This register is set upon detection of a voltage below the RAM retention voltage (VVLVI).

If VLVF is set, the retention RAM content cannot be guaranteed.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 0980_H

Value after power on: 0000 0001_H
This register is not initialized by any reset source.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Section 11BC Supply Voltage Monitor of RH850/F1KM

This section explains in general about the supply voltage monitor.

The first part in this section describes the supply voltage monitor function, and the ensuing sections describe the registers.

This supply voltage monitor is for detecting and control of a power supply failure. However, the supply voltage monitor does not detect all of the possible failures.

Therefore, a power supply monitoring with an external device is required for the following terminals, in case that the customer's system requires an appropriate failure detection and control for Functional Safety.

- REGVCC
- EVCC
- BVCC*1
- A0VREF
- A1VREF*1
- AWOVCL
- ISOVCL

Note 1. This is not supported for the 100-pin devices with RH850/F1KM-S4 and RH850/F1KM-S1.

The required power supply specification for power supply monitoring with external device is shown at **Section 47B.4.5, Power Management Characteristics**, **Section 47C.4.5, Power Management Characteristics**.

11BC.1 Overview

11BC.1.1 Functional Overview

The supply voltage monitor continuously monitors multiple external and internal supply voltages in order to ensure that the device operates with a supply voltage within the specified range. If the voltage drops below the reference voltage or comparison voltage, an interrupt request signal or internal reset signal is generated. The following table lists the supply voltage monitor functions.

Table 11BC.1 Supply Voltage Monitor Functions

Function Name	Monitor Voltage	Signal Generated when Voltage Drops below Certain Level
Power-On Clear (POC)	REGVCC	Internal reset signal
Low-Voltage Indicator Circuit (LVI)	REGVCC	Internal reset signal, interrupt request signal
Core Voltage Monitor (CVM)	Isolated area (ISO area) voltage	Internal reset signal
RAM Retention Voltage Indicator (VLVI)	REGVCC	—

NOTES

1. The RAM Retention Voltage Indicator sets the very-low voltage detection flag (VLVF) when the voltage drops below the RAM retention voltage.
2. When the internal core voltage monitor (CVM) is used for customer's system as the functional safety measure, the voltage of the Always-On area (AWO area) shall be monitored by the external voltage monitor.

11BC.1.2 Power-On Clear (POC)

The POC continuously monitors the external power supply voltage REGVCC. This ensures that the microcontroller only operates at or above power-on clear detection voltage (VPOC).

If REGVCC falls below the POC detection voltage (REGVCC < VPOC), the internal reset signal (POCRES) is generated.

For details, see **Section 9BC.4.2, Power-On Clear (POC) Reset**.

11BC.1.3 Low Voltage Indicator Circuit (LVI)

The LVI continuously compares the external power supply voltage REGVCC with the LVI reference voltage VLVIn.

If REGVCC falls below the reference voltage (REGVCC < VLVIn), an internal reset signal or interrupt request signal is generated.

11BC.1.3.1 LVI Reference Voltage

The LVI reference voltage VLVIn can be selected from three different levels by LVICNT.LVICNT[1:0].

If LVICNT.LVICNT[1:0] is set to 00_B, the LVI is disabled.

For the specification of the reference voltage level VLVIn, see **Section 11BC.2.2.1, LVICNT — LVI Control Register**.

11BC.1.3.2 LVI Reset ($\overline{\text{LVIRES}}$)

When the LVI detection voltage is set and LVIRESMK is cleared, if REGVCC falls below the reference voltage (REGVCC < VLVIn), the internal reset signal $\overline{\text{LVIRES}}$ is generated.

For the specification of $\overline{\text{LVIRES}}$ generation, see **Section 9BC.4.3, Low-Voltage Indicator (LVI) Reset**.

11BC.1.3.3 LVI Interrupt (INTLVIL/INTLVIH)

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REGVCC falls below the reference voltage (REGVCC (MIN) < VLVIn), the LVI interrupt INTLVIL is generated.

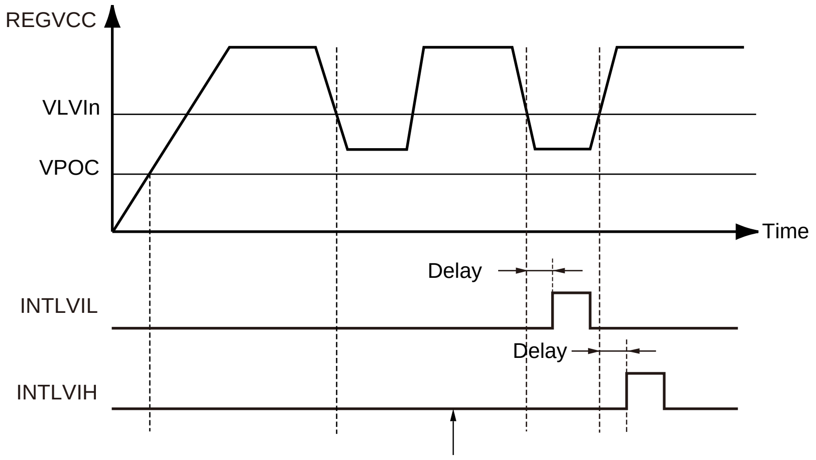
To use the LVI as an interrupt source, the INTLVIL interrupt must be unmasked.

INTLVIL interrupt can be used as wake-up source from all of standby modes. For details, see **Section 14, Stand-By Controller (STBC)**.

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REGVCC exceeds the reference voltage (REGVCC (MIN) > VLVIn), LVI interrupt INTLVIH is generated.

When LVI is used as an interrupt source, INTLVIH interrupt must be unmasked.

The following figure illustrates the timing of INTLVIL/INTLVIH.



Set LVICNT.LVICNT[1:0] to a value other than 00_B.
Set FEINTFMSK.LVILFEIFMSK = 0, FEINTFMSK.LVIHFEIFMSK = 0
(For detailed procedure, see **Section 11BC.1.3.4, LVI Setting Procedure**.)

Note: Delay:
When REGVCC falls below VLVIn, INTLVIL is generated after a certain delay.
After that, when REGVCC exceeds VLVIn, INTLVIH is generated after a certain delay.
See **Section 47B, Electrical Characteristics of RH850/F1KM-S4, Section 47C, Electrical Characteristics of RH850/F1KM-S1** for delay time.

Figure 11BC.1 INTLVIL/INTLVIH Generation Timing

11BC.1.3.4 LVI Setting Procedure

The setting procedures for LVI are shown below.

(1) Using LVI as the Reset Source

a. Mask LVI reset. (LVICNT.LVIRESMK = 1)*1

b. Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)

c. Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])*1

d. Insert ample wait time by software (see **Section 47B, Electrical Characteristics of RH850/F1KM-S4, Section 47C, Electrical Characteristics of RH850/F1KM-S1**).

e. Unmask LVI reset. (LVICNT.LVIRESMK = 0)*1

(2) Using LVI as the Interrupt Source (FEINT)

a. Mask LVI reset. (LVICNT.LVIRESMK = 1)*1

b. Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)

c. Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])*1

d. Insert ample wait time by software (see **Section 47B, Electrical Characteristics of RH850/F1KM-S4, Section 47C, Electrical Characteristics of RH850/F1KM-S1**).

e. Unmask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 0, FEINTFMSK.LVIHFEIFMSK = 0)

Note 1. Follow the register protection sequence to set LVICNT register because it is a write-protected register. For details on the write-protected registers, see **Section 5, Write-Protected Registers.**

CAUTION

If REGVCC is not stable around the LVI detection level (VLVIn), correct judgment of whether INTLVIH or INTLVIL interrupt processing should proceed may not be possible.

For example, if multiple interrupts consisting of both INTLVIH and INTLVIL occur during INTLVIL interrupt processing due to REGVCC being unstable, the software cannot detect which type of interrupt was generated last.

Consequently, if the last interrupt generated was an INTLVIL interrupt, regardless of REGVCC (min.) being greater than VLVIn, the software erroneously judges that REGVCC (min.) < VLVIn.

Accordingly, take measures such as programming the software so that LVI detection interrupt processing is completed before a next LVI interrupt. Also, consider control of REGVCC.

11BC.1.3.5 Clock Supply to the LVI

The clock supply to the LVI is shown in the following table.

Table 11BC.2 Clock Supply to the LVI (RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
LVI	Register access clock	CPUCLK_UL

11BC.1.4 Core Voltage Monitor (CVM)

The core voltage monitor (CVM) monitors the Isolated area (ISO area) voltage (referred to as “core voltage” below) in the microcontroller.

If the regulator output voltage is outside of the specified range, the internal reset signal ($\overline{\text{CVMRES}}$) is generated.

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off in addition to a reset being generated.

When operation shifts to diagnostic mode (DIAG mode), the CVM enters the abnormal core voltage detection state. An abnormal core voltage detected state can be intentionally created by using the DIAG mode so that the CVM abnormal voltage detected flag can be checked for failures.

CAUTION

The CVM cannot detect drifts in the voltage of the Isolated area (ISO area) caused by the characteristics of the regulator, use conditions or the increase or decrease of voltage.

11BC.1.4.1 CVM Reset ($\overline{\text{CVMRES}}$)

If the core voltage exceeds the specified level while high-voltage monitor is enabled (CVMDE.H_D_E = 1), then $\overline{\text{CVMRES}}$ is generated and the power supply to the Isolated area (ISO area) is stopped.

If the core voltage falls below the specified level while low voltage monitor is enabled (CVMDE.L_D_E = 1), $\overline{\text{CVMRES}}$ is generated.

For the specification of $\overline{\text{CVMRES}}$ generation, see **Section 9BC.4.4, Core Voltage Monitor (CVM) Reset**.

11BC.1.4.2 CVM Setting

Use the option byte to enable the high-voltage monitor and the low-voltage monitor.
For details, see **Section 44.9, Option Bytes**.

11BC.1.4.3 Diagnostic (DIAG) Mode

This product supports diagnostic mode.

In diagnostic (DIAG) mode, whether the CVM abnormal voltage detection flag is set to 1 can be checked.

In diagnostic mode, $\overline{\text{CVMRES}}$ is not output.

The setting procedure for diagnostic mode is described below.

Set the registers according to this procedure. Otherwise the operation is not guaranteed.

1. Set CVMDIAG.CVM_DIAG_MASK.*[1]
2. Set CVMDIAG.CVM_DIAG.*[1]
3. Wait for 12 µs.*[2]
4. Read the CVMF register to confirm that the H_V_F and L_V_F bits are set to 1 (if these bits are 0, the CVM does not operate normally, requiring error handling).
5. Clear CVMDIAG.CVM_DIAG.*[1]
6. Clear the CVMF register.*[1]
7. Read the CVMF register to confirm that the H_V_F and L_V_F bits are set to 0 (if these bits are 1, go back to step 5 again).
8. Clear CVMDIAG.CVM_DIAG_MASK.*[1]

Note 1. Follow the register protection sequence to set CVMF and CVMDIAG registers because these are write-protected registers. For details, see **Section 5, Write-Protected Registers**.

Note 2. At least 50 µs must elapse after the following conditions are fulfilled before step (4) is started.

- Release from HALT state
- Release from STOP mode
- Release from the reset state, when a reset other than a reset due to the CVM is generated in RUN mode (include HALT state)
- The CPU clock is switched
- Operation of the MainOSC is started or stopped
- Operation of the PLL is started or stopped

11BC.1.4.4 Clock Supply to the CVM

The clock supply to the CVM is shown in the following table.

Table 11BC.3 Clock Supply to the CVM (RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
CVM	Register access clock	CPUCLK_UL

11BC.1.5 RAM Retention Voltage Indicator (Very-Low-Voltage Detection Circuit, VLVI)

The very-low-voltage detection circuit (VLVI) is used to detect the RAM retention voltage, and continuously compares the power supply voltage REGVCC with the RAM retention voltage VVLVI.

See **Section 47B, Electrical Characteristics of RH850/F1KM-S4** and **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for the specification of the RAM retention voltage level VVLVI.

11BC.1.5.1 Clock Supply to the VLVI

The clock supply to the VLVI is shown in the following table.

Table 11BC.4 Clock Supply to the VLVI (RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
VLVI	Register access clock	CPUCLK_UL

11BC.1.5.2 Retention RAM Content Retention

If the power supply voltage REGVCC does not fall below VVLVI, the content of the retention RAM (RRAM) is retained. See **Section 9BC.1.1, Reset Sources** for retention during reset.

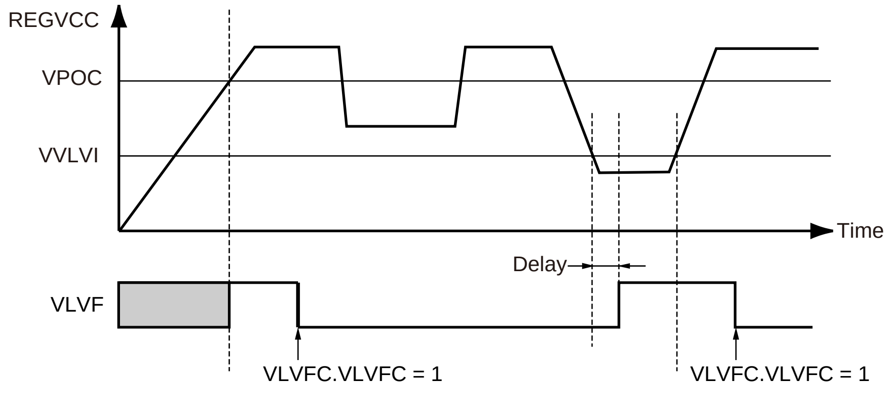
If REGVCC falls below VVLVI, the RRAM content cannot be guaranteed. Thus the entire RRAM must be restored before continuing operation.

If REGVCC falls below the RAM retention voltage (REGVCC < VVLVI), the VLVF.VLVF bit is set.

After that, even if REGVCC exceeds VVLVI, the VLVF.VLVF bit is not cleared automatically. It is cleared by

- setting VLVFC.VLVFC bit to 1.

The following figure illustrates the timing of VLVF.



Note: Delay:
When REGVCC falls below VVLVI, the VLVF bit is set to 1 after a certain delay.
See **Section 47B, Electrical Characteristics of RH850/F1KM-S4, Section 47C, Electrical Characteristics of RH850/F1KM-S1** for delay time.

Figure 11BC.2 VLVF Operation Timing

11BC.1.6 Block Diagram

The block diagram of the supply voltage monitor is shown below.

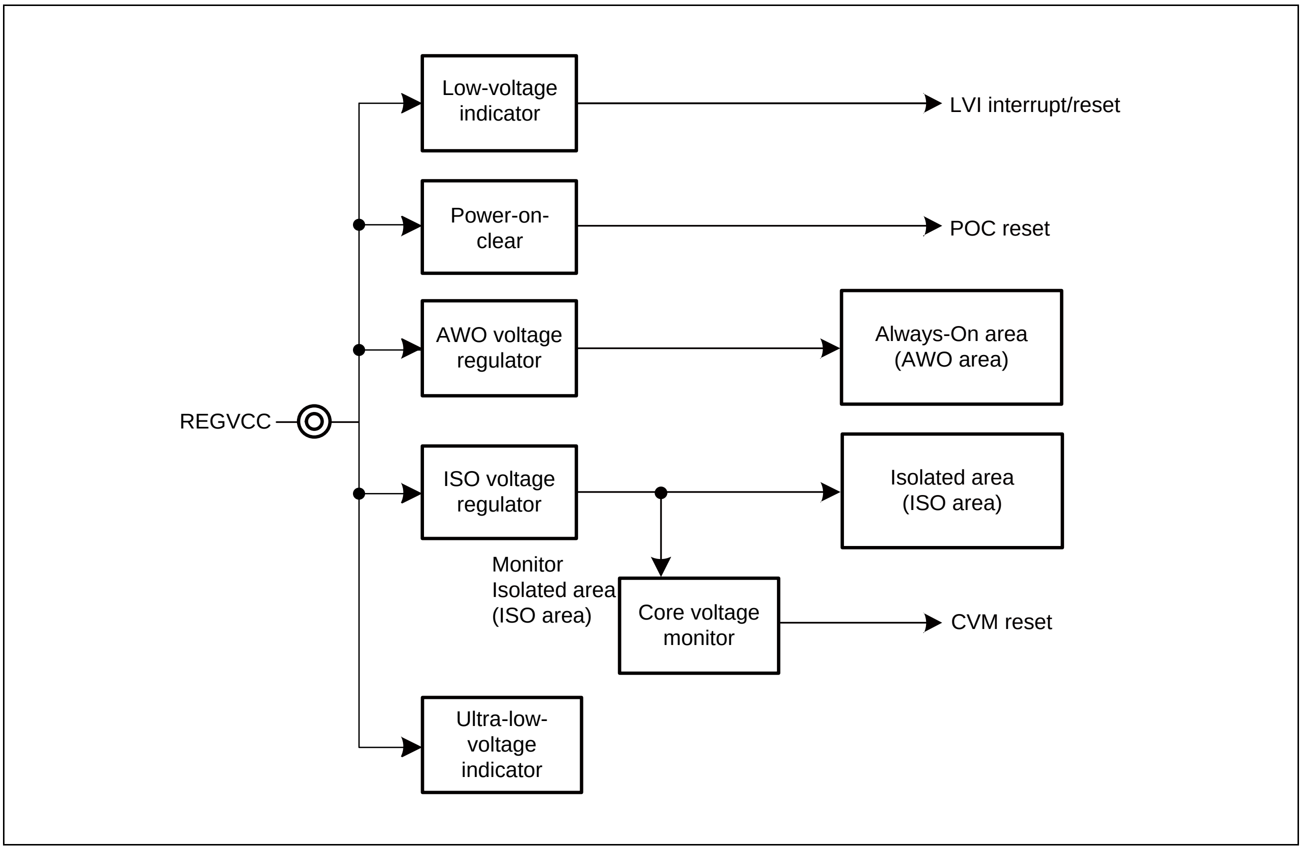


Figure 11BC.3 Supply Voltage Monitor (RH850/F1KM-S4, RH850/F1KM-S1)

11BC.2 Registers

11BC.2.1 List of Registers

The following table lists the supply voltage monitor registers.

Table 11BC.5 List of Registers

Module Name	Register Name	Symbol	Address
SVM	Low-voltage indicator reset control register		
	LVI control register	LVICNT	FFF8 0A00$_H$
	Core voltage monitor control registers		
	CVM factor register	CVMF	FFF8 3100$_H$
	CVM detection enable register	CVMDE	FFF8 3104$_H$
	CVM diagnostic mode setting register	CVMDIAG	FFF8 3114$_H$
	Very-low-voltage detection control registers		
	Very-low-voltage detection register	VLVF	FFF8 0980$_H$
	Very-low-voltage detection clear register	VLVFC	FFF8 0988$_H$

11BC.2.2 Low-Voltage Indicator Reset Control Register

11BC.2.2.1 LVICNT — LVI Control Register

This register is used to control the Low-Voltage Indicator and to select the LVI detection level.

This register is initialized by power-up reset PURES.

The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 0A00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 11BC.6 LVICNT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LVIRESMK	Mask LVI Reset 0: LVI reset is not masked 1: LVI reset is masked
1, 0	LVICNT[1:0]	Detection Level 0 0: LVI is ignored 0 1: VLVI0 = 4.0 ± 0.1 V (fall), 4.0 ± 0.13 V (rise) 1 0: VLVI1 = 3.7 ± 0.1 V (fall), 3.7 ± 0.13 V (rise) 1 1: VLVI2 = 3.5 ± 0.1 V (fall), 3.5 ± 0.13 V (rise)

NOTE

To use an LVI interrupt, LVI reset must be masked (LVIRESMK = 1) by LVIRESMK.

11BC.2.3 Core Voltage Monitor Control Registers

11BC.2.3.1 CVMF — CVM Factor Register

This register records the core voltage failure state generated after the last power-on clear reset POCRES.

The L_V_F bit and the H_V_F bit are set to 1 by hardware when the CVM detects core voltage failure.

If the L_V_F or H_V_F bit of this register is set to 1, that bit is not updated until it is initialized by a power-on clear reset POCRES or by writing 0 to the CVMF.L_V_F or CVMF.H_V_F bit. However, it continuously monitors an error signal from the core voltage monitoring circuit in diagnostic mode.

The correct write sequence using the PROTCMDCVM register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 3100_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

11BC.2.3.2 CVMDE — CVM Detection Enable Register

This register is used to indicate the voltage detection enabled or disabled state.

This register is initialized only by power-up reset PURES.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 3104_H
Value after reset:	The value after reset depends on the option byte setting.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

11BC.2.3.3 CVMDIAG — CVM Diagnostic Mode Setting Register

This register sets the CVM diagnostic mode.

This register is initialized only by power-up reset PURES.

For details on the register settings in diagnostic mode, see **Section 11BC.1.4.3, Diagnostic (DIAG) Mode**.

The correct write sequence using the PROTCMDCVM register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 3114$_{\text{H}}$

Value after reset: 0000 0000$_{\text{H}}$

11BC.2.4 Very-Low-Voltage Detection Control Registers

11BC.2.4.1 VLVF — Very-Low-Voltage Detection Register

The very-low-voltage detection register (VLVF) shows the state of the RAM retention voltage detection.

This register is set upon detection of a voltage below the RAM retention voltage (VVLVI).

If VLVF is set, the retention RAM content cannot be guaranteed.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 0980$_H$

Value after power on: 0000 0001$_H$
This register is not initialized by any reset source.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Section 12AB Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4

This section explains in general about the clock controller.

The first part in this section describes the specific features of the clock controller of the RH850/F1KH, RH850/F1KM microcontrollers. The ensuing sections describe the clock oscillation circuit, clock selectors, and clock output function that make up the clock controller.

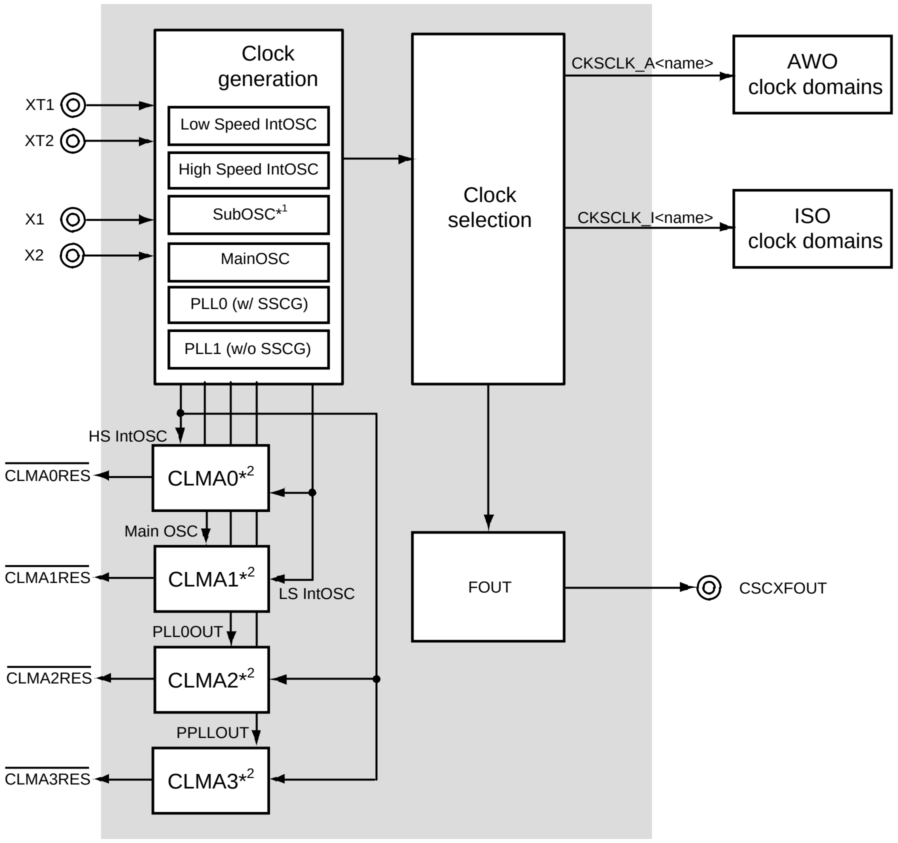
12AB.1 Features of RH850/F1KH, RH850/F1KM Clock Controller

The clock controller of the RH850/F1KH, RH850/F1KM microcontrollers has the following features.

- Six on-chip clock oscillators
  - Main Oscillator (MainOSC) with an oscillation frequency of 8, 16, 20, and 24 MHz
  - Sub Oscillator (SubOSC) with an oscillation frequency of 32.768 kHz*[1]
  - High Speed Internal Oscillator (HS IntOSC) with a nominal frequency of 8 MHz (Typ.)
  - Low Speed Internal Oscillator (LS IntOSC) with a nominal frequency of 240 kHz (Typ.)
  - PLL with SSCG (PLL0)
  - PLL without SSCG (PLL1)
- Fine management of clock supply to peripheral modules through clock domains
- On-chip clock monitor that detects clock anomalies when the Main Oscillator, High Speed Internal Oscillator, or PLL are in use. See **Section 13, Clock Monitor (CLMA)**.
- Clock output (FOUT)

Note 1. It isn’t supported with 100-pin product.

Figure 12AB.1, Clock Controller Overview shows the schematic diagram of the clock controller.



Note 1. It isn't supported with 100-pin product.

Note 2. See **Section 13, Clock Monitor (CLMA)** for details of clock monitors.

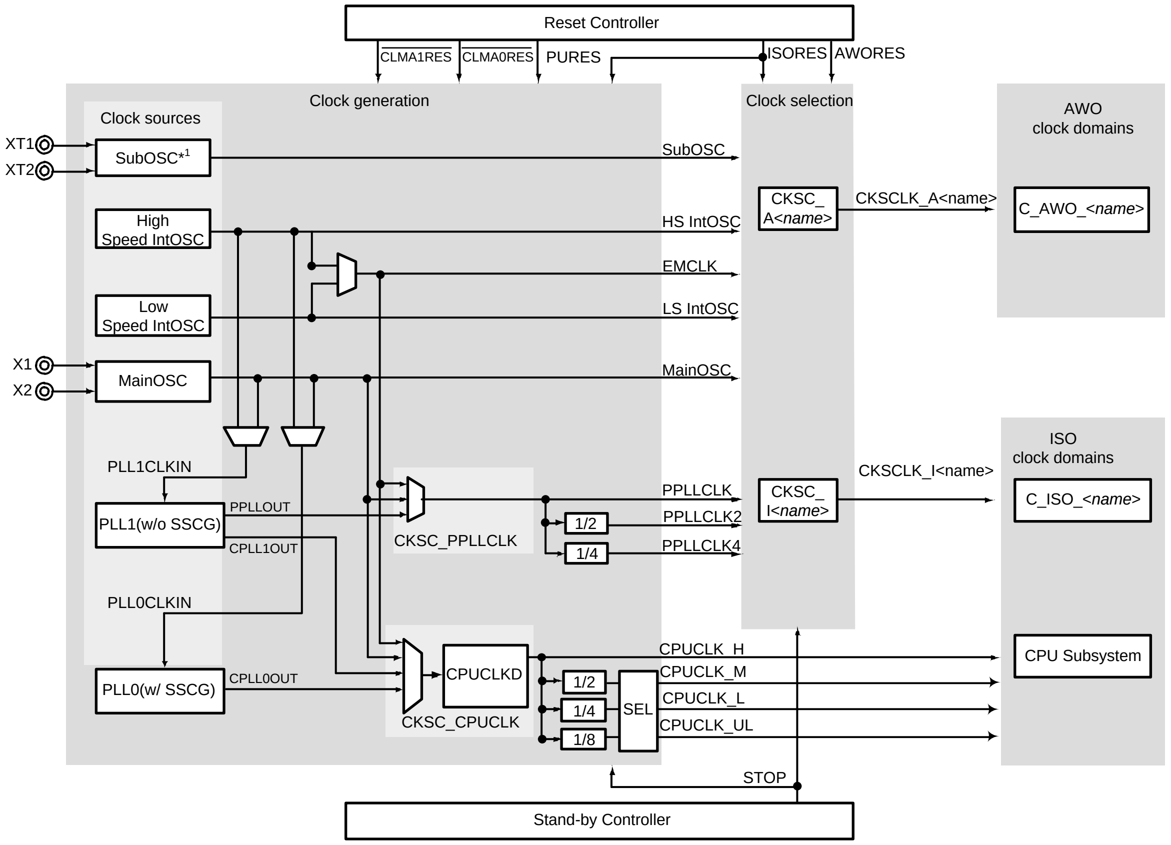
Figure 12AB.1 Clock Controller Overview

12AB.2 Configuration of Clock Controller

This section describes the configuration of the clock controller.

The clock controller is composed of clock oscillators and clock generation circuits that generate the clocks for the CPU and the peripheral modules, a clock selector for selecting the optimum clock, and clock domains for the CPU and the peripheral modules.

Figure 12AB.2, Clock Controller Configuration shows the configuration of the clock controller.



Note 1. It isn't supported with 100-pin product.

Figure 12AB.2 Clock Controller Configuration

NOTE

Clock domain and clock control register naming conventions

The clock signals and their control registers, etc., described in this section are named according to the following naming conventions to reflect the power domain or clock domain to which they belong. The placeholder “<*name*>” is used to identify the target module in the clock domain:

- Clock domain names:
  - C_AWO_<*name*>: Always-On area (AWO area)*[1] clock domain
  - C_ISO_<*name*>: Isolated area (ISO area)*[1] clock domain
- Domain clock names:
  - CKSCLK_A<*name*>: Always-On area (AWO area) domain clock
  - CKSCLK_I<*name*>: Isolated area (ISO area) domain clock
- Clock selector names:
  - CKSC_A<*name*>: Always-On area (AWO area) clock selector
  - CKSC_I<*name*>: Isolated area (ISO area) clock selector
- Clock selector registers:
  - CKSC_A<*name*>S_CTL: Always-On area (AWO area) source clock selector register
  - CKSC_A<*name*>D_CTL: Always-On area (AWO area) source clock divider register
  - CKSC_I<*name*>S_CTL: Isolated area (ISO area) source clock selector register
  - CKSC_I<*name*>D_CTL: Isolated area (ISO area) source clock divider register

Example

The clock signal CKSCLK_AADCA (placeholder <*name*> = ADCA) is the clock supplied to the clock domain C_AWO_ADCA in the Always-On area (AWO area). This clock is selected by the clock selector register CKSC_AADCAS_CTL.

Note 1. Always-On area (AWO area) and Isolated area (ISO area) refer to the power supply domains. Always-On area (AWO area) is an always-on power supply, and Isolated area (ISO area) is an isolated power supply that is switched on or off by the operation mode.
For details, see **Section 10A, Power Supply Circuit of RH850/F1KH-D8**, **Section 10B, Power Supply Circuit of RH850/F1KM-S4**.

12AB.2.1 Clock Generation Circuits

Six clock oscillators are provided:

Four clock oscillators are located on the Always-On area (AWO area) and two PLL (PLL0 and PLL1) are located on the Isolated area (ISO area).

Main Oscillator (MainOSC)

The MainOSC generates the main clock X.
Generation of the clock X requires the connection of an external resonator to X1 and X2.
The clock X is used as the reference clock for the PLL.

Sub Oscillator (SubOSC)

The SubOSC generates the sub-clock XT, which runs at a frequency of 32.768 kHz (Typ.). Generation of the sub clock XT requires the connection of an external resonator to XT1 and XT2.
This clock is mainly used for real-time clock applications.

High Speed Internal Oscillator (HS IntOSC)

The HS IntOSC generates the clock RH, which runs at a frequency of 8 MHz (Typ.).

Low Speed Internal Oscillator (LS IntOSC)

The LS IntOSC generates the clock RL, which runs at a frequency of 240 kHz (Typ.). It starts operation at power up and cannot be stopped, hence it is always operating.

PLL

The PLL circuits generate high speed operation clocks CPLL0OUT, CPLL1OUT and PPLLOUT for normal operation of the microcontroller.

The clocks supplied by the clock oscillators (X, XT, RH, RL, CPLL0OUT, CPLL1OUT, PPLLOUT) and their divided clocks (CPUCLK_H, CPUCLK_M, CPUCLK_L, CPUCLK_UL, PPLLCLK, PPLLCLK2, and PPLLCLK4) are all generated in the clock generation circuit.

12AB.2.2 Clock Selection

The clocks generated by the clock oscillators are input to the clock selectors CKSC_A<*name*>/CKSC_I<*name*>.

Domain clocks CKSCLK_A<*name*>/CKSCLK_I<*name*> are selected by dedicated clock selectors from clocks directly input from the oscillators, or in some cases from clocks that have been divided by clock dividers.

- CKSC_I<*name*>S_CTL/CKSC_I<*name*>D_CTL registers: determine the clock for the Isolated area (ISO area) clock domains.
- CKSC_A<*name*>S_CTL/CKSC_A<*name*>D_CTL registers: determine the clock for the Always-On area (AWO area) clock domains.

Note that not all available clocks generated by the clock oscillators are input to each clock selector.

The following clocks are supplied to the CPU and related modules from the clock generation circuit.

Emergency Clock (EMCLK)

The emergency clock EMCLK is supplied by the

- HS IntOSC, if it is active
- LS IntOSC, if HS IntOSC is inactive

The selection is done automatically after CLMA0 reset is occurred, so if the HS IntOSC becomes lower than the limit for any reason, vital modules of the microcontroller are still in operation, since the LS IntOSC does not stop.

CPU Subsystem Clock (CPUCLK)

The CPU Subsystem clock CPUCLK is derived from PLL0 clock CPLL0OUT, PLL1 clock CPLL1OUT, MainOSC, and EMCLK. The CPU clock selector CKSC_CPUCLK incorporates the selector CPUCLKS, followed by the clock divider CPUCLKD.

The CPUCLK clock divider provides the frequency-divided CPUCLK_H, CPUCLK_M, CPUCLK_L clock signal and CPUCLK_UL clock signal derived from CPUCLK. CPUCLK settings, see **Table 12AB.1, CPUCLK Divide Table**.

Table 12AB.1 CPUCLK Divide Table

	Products of CPU Frequency		
	240 MHz Max.		160 MHz Max.
CKDIVMD*[1]	1	0*[2]	1*[3]
CPUCLK_H	CPUCLK	CPUCLK	CPUCLK
CPUCLK_M	CPUCLK × 1/2	CPUCLK	CPUCLK × 1/2
CPUCLK_L	CPUCLK × 1/4	CPUCLK × 1/2	CPUCLK × 1/4
CPUCLK_UL	CPUCLK × 1/8	CPUCLK × 1/4	CPUCLK × 1/8

Note 1. For details, see **Section 44, Flash Memory**, **44.9.2, OPBT0 — Option Byte 0**

Note 2. When setting “0”, please set CPUCLK to 120 MHz or less.

Note 3. When writing, write “1” for products of CPU frequency 160 MHz max.

12AB.2.3 Clock Domains

The clock controller allows selection of the respective clocks for the CPU and peripheral modules. The clock control scope is called the clock domain. For the correspondence between the CPU and peripheral modules and clock domains, see **Section 12AB.5.3, Clock Domain Settings**.

12AB.2.4 Resetting Clock Oscillators

The clock oscillators on the Always-On area (AWO area) are reset by the PURES signal.

The HS IntOSC is reset when $\overline{\text{CLMA0RES}}$ is generated and the MainOSC is reset when $\overline{\text{CLMA1RES}}$ is generated.

The clock oscillator on the Isolated area (ISO area) is reset by the ISORES signal.

For further details on the clock oscillators, see **Section 12AB.3, Clock Oscillators**.

CAUTION

For the specifications of the frequencies, acceptable variation, and other parameters of the clock generators, see **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4**.

12AB.3 Clock Oscillators

12AB.3.1 Main Oscillator (MainOSC)

The Main Oscillator generates the clock X. X is also used as the PLL0 and PLL1 input clock PLL0CLKIN and PLL1CLKIN.

Figure 12AB.3, Main Oscillator (MainOSC) shows the basic configuration and signals of the MainOSC.

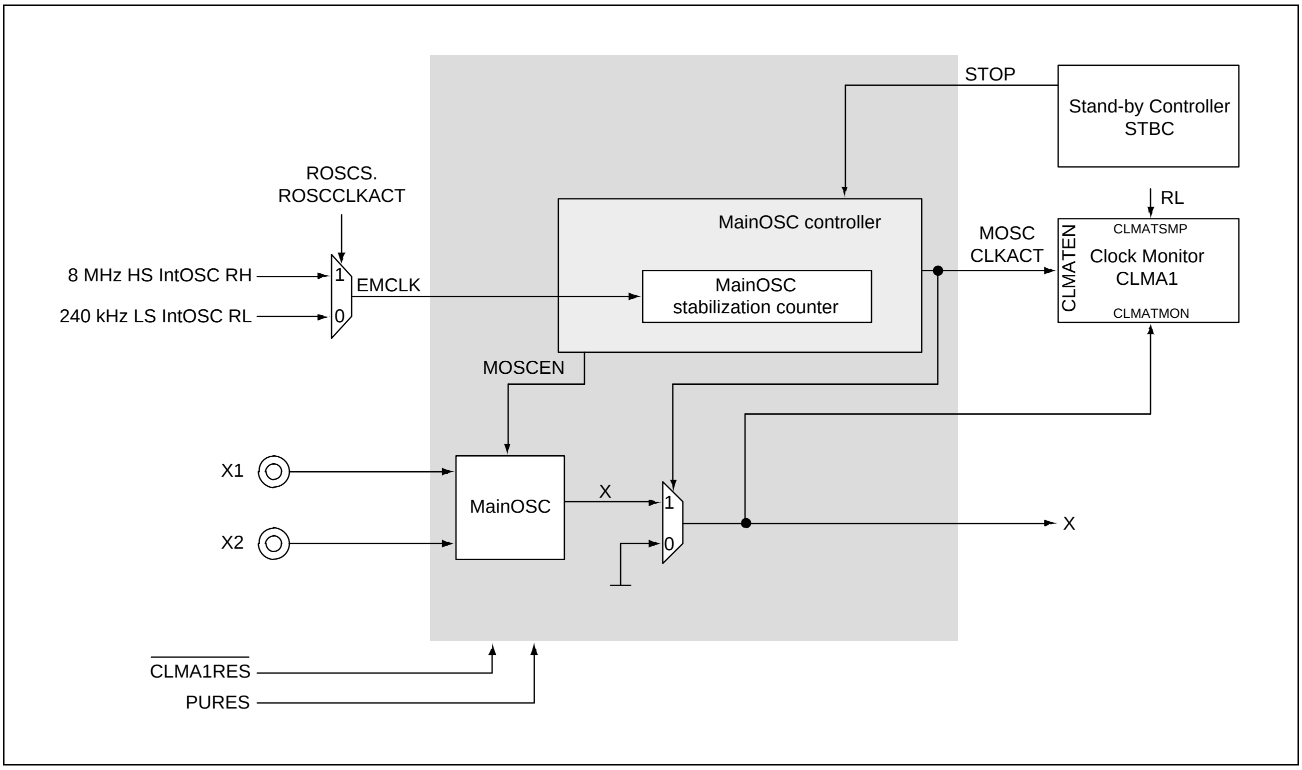


Figure 12AB.3 Main Oscillator (MainOSC)

MainOSC

The MainOSC stops operating after reset is released. To use the MainOSC, set the MainOSC enable trigger bit (MOSCE.MOSCENTRG) to 1 to start the MainOSC.

MainOSC Stabilization

The MOSCST.MOSCCLKST[16:0] bits set the MainOSC oscillation stabilization time.
The MainOSC stabilization counter counts the oscillation stabilization time with EMCLK as the clock source for counting. The oscillation stabilization time can be set to up to $2^{17} – 1$ EMCLK cycles.
As long as the MainOSC is not stable, the MOSCCLKACT signal disables the X output.
When the MainOSC stabilization counter reaches the value specified in MOSCST.MOSCCLKST[16:0], X is assumed to be stable and MOSCCLKACT switches from 0 to 1 to enable output of X when a waveform is output from MainOSC.

Stable and active X clock is indicated by MOSCS.MOSCCLKACT = 1.

MainOSC Amplification Gain

By using MOSCC.MOSCAMPSEL[1:0], the MainOSC’s input frequency, determined by the external resonator, can be selected from 8 MHz, 16 MHz, 20 MHz, and 24 MHz.

MainOSC STOP Requests in Stand-by Mode

The STOP signal from the Stand-by Controller requests the MainOSC Controller to switch off the X clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).

The stop request mask bit MOSCSTPM.MOSCSTPMSK controls whether the MainOSC is stopped during stand-by or continues operation:

- MOSCSTPM.MOSCSTPMSK = 0:
  The STOP request signal is not masked, so the MainOSC is stopped in stand-by.
  If the MainOSC is in operation before stand-by, it is automatically re-started after wake-up from stand-by, and the MainOSC stabilization counter counts the oscillation stabilization time.
  However, the STOP request is masked under the following conditions, even if MOSCSTPM.MOSCSTPMSK = 0. Therefore, the MainOSC will continue to operate even in stand-by mode.
  - If the stop mask is set (CKSC_xxxx_STPM = 0000 0003_H) for a clock domain for which the MainOSC is selected.
- MOSCSTPM.MOSCSTPMSK = 1:
  The STOP request signal is masked, so the MainOSC continues to operate in stand-by.

Clock Monitor Control

The MainOSC activity signal MOSCCLKACT enables or disables supervision by the Clock Monitor CLMA1. In case the MainOSC is inactive (MOSCCLKACT = 0), supervision of its output clock X by CLMA1 is also disabled.

MainOSC Enable/Disable Trigger

The MainOSC can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger MOSCE.MOSCENTRG = 1 starts the MainOSC.
  Note that setting the enable trigger is only effective if the MainOSC is inactive, i.e. if MOSCS.MOSCCLKACT = 0.
- Disable trigger MOSCE.MOSCDISTRG = 1 stops the MainOSC.
  Note that setting the disable trigger is only effective if the MainOSC is active (MOSCCLKACT = 1) and the MainOSC stop requests are not masked (MOSCSTPM.MOSCSTPMSK = 0).

Direct Clock Input to X1 (EXCLK Mode)

A clock waveform from an external clock source can be supplied to X1 pin. In this case, set the MOSCM bit of MOSCM register to 1 before clock input to X1 pin is supplied.

12AB.3.2 Sub Oscillator (SubOSC)

The Sub Oscillator generates the sub clock XT. XT has usually a frequency of 32.768 kHz and is used for the Real-time Clock.

Figure 12AB.4, Sub Oscillator (SubOSC) shows the basic structure and signals of the SubOSC.

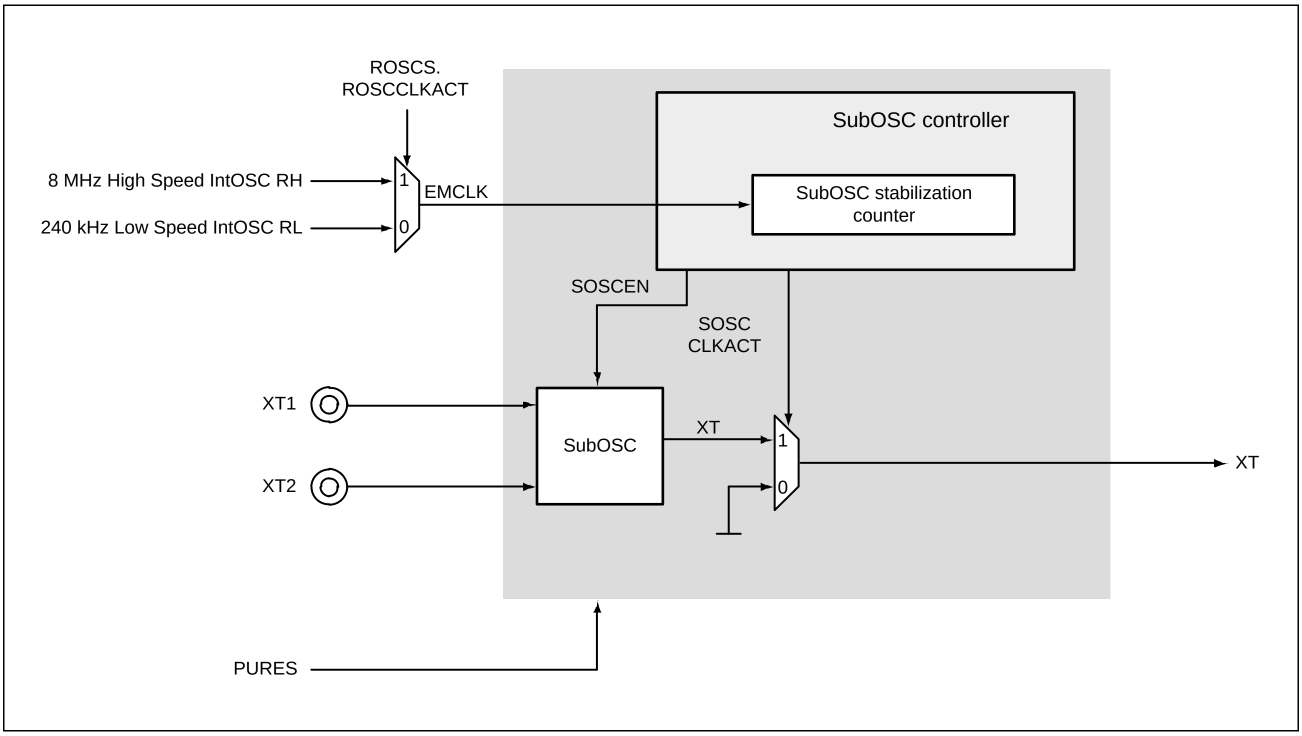

Figure 12AB.4 Sub Oscillator (SubOSC)

SubOSC Enable

The SubOSC stops operating after reset is released. To use the SubOSC, set SubOSC enable trigger bit (SOSCE.SOSCENTRG) to 1 to start the SubOSC.

SubOSC Stabilization

The SOSCST.SOSCCLKST[29:0] bits set the SubOSC oscillation stabilization time.
The SubOSC stabilization counter counts the oscillation stabilization time with EMCLK as the clock source for counting.
As long as the SubOSC is not stable, the SOSCCLKACT signal disables the XT output.
When the SubOSC stabilization counter reaches the value specified in SOSCST.SOSCCLKST[29:0], XT is assumed to be stable and SOSCCLKACT switches from 0 to 1 to enable output of XT.
Secure the stabilization time longer than 2 seconds.
Stable and active XT clock is indicated by SOSCS.SOSCCLKACT = 1.

SubOSC Input Frequencies

The SubOSC input frequency is 32.768 kHz (Typ.).

SubOSC Enable/Disable Trigger

SubOSC can be enabled or disabled by using enable/disable trigger control bit.

- Enable trigger SOSCE.SOSCENTRG = 1 starts the SubOSC.
  Note that setting the enable trigger is only effective if the SubOSC is inactive, i.e. if SOSCS.SOSCCLKACT = 0.
- Disable trigger SOSCE.SOSCDISTRG = 1 stops the SubOSC. Note that setting the disable trigger is only effective if the SubOSC is active; that is, if SOSCS.SOSCCLKACT = 1.

12AB.3.3 High Speed Internal Oscillator (HS IntOSC)

The High Speed Internal Oscillator generates the clock RH. RH has a nominal frequency of 8 MHz.

Figure 12AB.5, High Speed Internal Oscillator (HS IntOSC) shows the basic configuration and signals of the HS IntOSC.

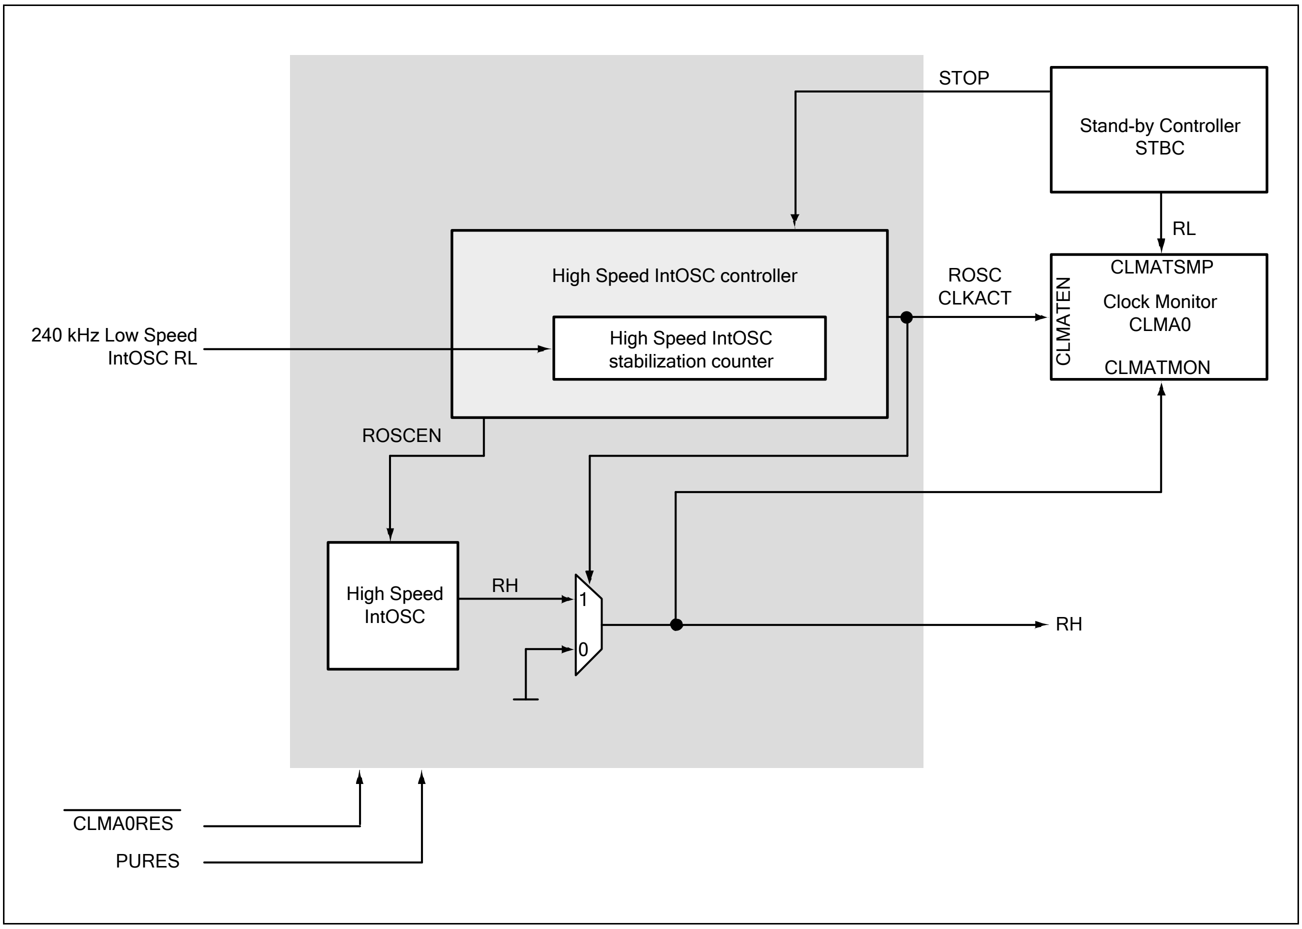

Figure 12AB.5 High Speed Internal Oscillator (HS IntOSC)

After reset release the HS IntOSC starts operation.

NOTE

The HS IntOSC can neither be stopped nor started by software. It can only be stopped in stand-by mode. On the other hand, when CLMA0 is reset, the HS IntOSC can be enabled to stop by software.

HS IntOSC Stabilization

HS IntOSC outputs RH when it is stabilized.
Stable and active RH clock is indicated by ROSCS.ROSCCLKACT = 1.

HS IntOSC STOP Requests in Stand-by Mode

The STOP signal from the Stand-By Controller requests the HS IntOSC Controller to switch off the RH clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).
The stop request mask bit ROSCSTPM.ROSCSTPMSK controls whether the HS IntOSC is stopped during stand-by or continues operation:

- ROSCSTPM.ROSCSTPMSK = 0:
  The STOP request signal is not masked, so the HS IntOSC is stopped during stand-by and automatically restarted after wake-up from stand-by.
  However, the STOP request is masked under the following conditions, even if ROSCSTPM.ROSCSTPMSK = 0. Therefore, the HS IntOSC will continue to operate even in stand-by mode.
  - If the stop mask is set (CKSC_xxxx_STPM = 0000 0003_H) for a clock domain for which the HS IntOSC is selected.
  - If the low power sampler (LPS) is operating
- ROSCSTPM.ROSCSTPMSK = 1:
  The STOP request signal is masked, so the HS IntOSC continues to operate during stand-by.

Clock Monitor Control

The HS IntOSC activity signal ROSCCLKACT enables or disables supervision by the Clock Monitor CLMA0. In case the HS IntOSC is inactive (ROSCCLKACT = 0), supervision of its output clock by CLMA0 is also deactivated.

The HS IntOSC clock RH is used as the sampling clock for Clock Monitor CLMA2 and CLMA3.

HS IntOSC Disable Trigger

The disable trigger, ROSCE.ROSCDISTRG = 1 stops the HS IntOSC.

The setting of the disable trigger is enabled when HS IntOSC is active (ROSCS.ROSCCLKACT = 1) and HS IntOSC stop requests are not masked (ROSCSTPM.ROSCSTPMSK = 0).

HS IntOSC User Calibration Function

The HS IntOSC user trimming register (ROSCUT) enables adjustment of the HS IntOSC frequency. The initial value of ROSCUT is the preset value of the HS IntOSC trimming data. Overwrite the value with “read value + 1” or “read value – 1” until the HS IntOSC frequency reaches the target frequency range.

12AB.3.4 Low Speed Internal Oscillator (LS IntOSC)

The Low Speed Internal Oscillator generates the clock RL. RL has a nominal frequency of 240 kHz.

Figure 12AB.6, Low Speed Internal Oscillator (LS IntOSC) shows the basic configuration and signals of the LS IntOSC.

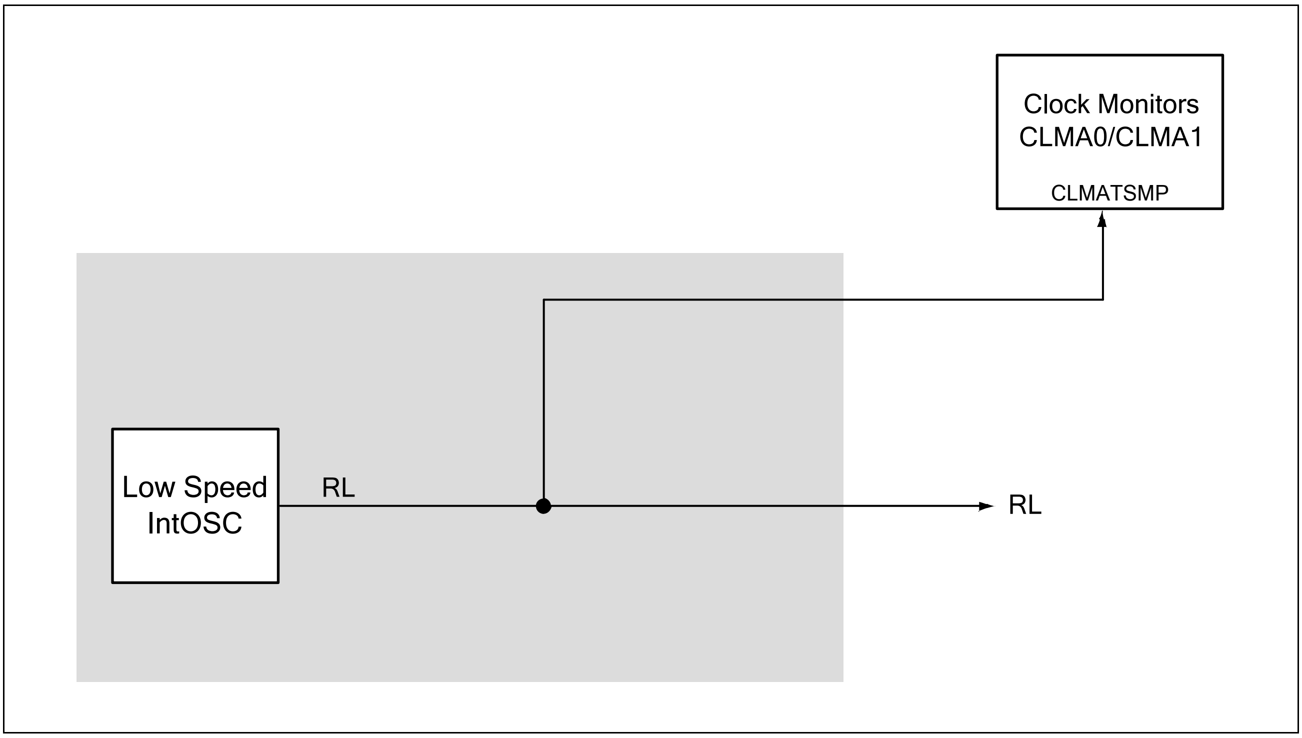

Figure 12AB.6 Low Speed Internal Oscillator (LS IntOSC)

After reset release the LS IntOSC starts operation. It cannot be stopped.

The LS IntOSC clock RL is used as the sampling clock for the Clock Monitors CLMA0 and CLMA1.

12AB.3.5 PLL

MainOSC or HS IntOSC is input to a phase-locked loop (PLL0 and PLL1) clock oscillator as PLL0CLKIN and PLL1CLKIN.
The PLL0 output clock CPLL0OUT, PLL1 output clocks CPLL1OUT and PPLLOUT serve as the main operation clocks for the microcontroller.

Figure 12AB.7, PLL shows the basic configuration and signals of the PLL.

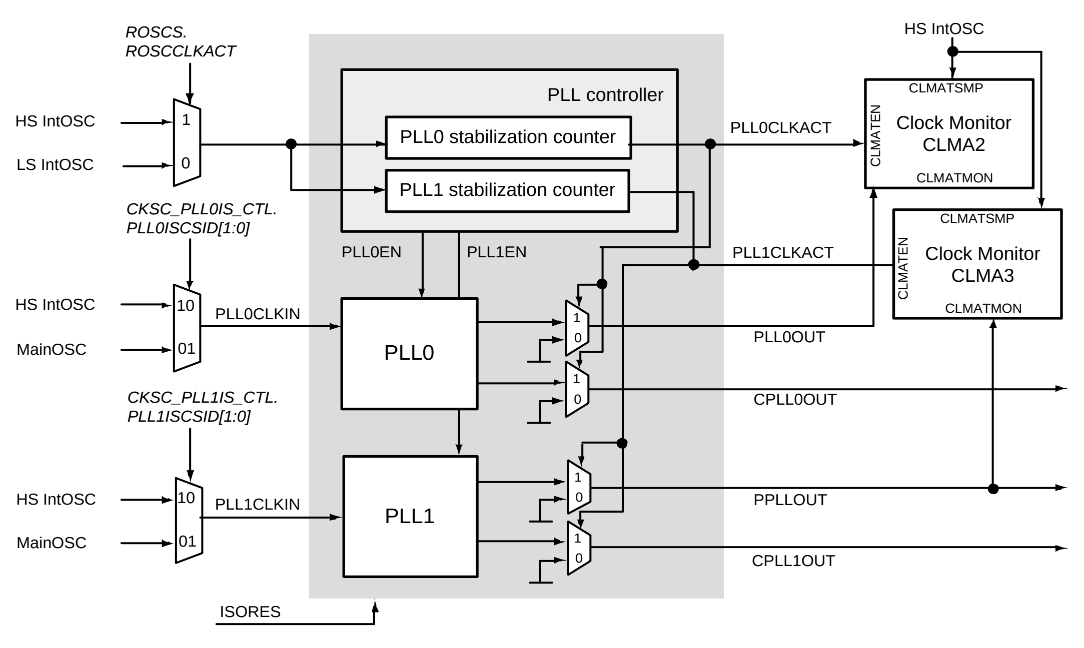

Figure 12AB.7 PLL

PLL Enable

The PLL0 stops operating after reset is released. To use the PLL0, set the PLL0 enable trigger bit (PLL0E.PLL0ENTRG) to 1 to start the PLL0.
The PLL1 stops operating after reset is released. To use the PLL1, set the PLL1 enable trigger bit (PLL1E.PLL1ENTRG) to 1 to start the PLL1.

PLL Stabilization

The PLL0 stabilization counter starts counting the stabilization time, after PLL0 enabled. As long as the PLL0 is not stable, the PLL0CLKACT signal disables the PLL0OUT and CPLL0OUT outputs.
When the PLL0 stabilization counter reaches the value set in PLL0ST.PLL0CLKST[12:0], PLL0OUT and CPLL0OUT are assumed to be stable and PLL0CLKACT switches from 0 to 1 to enable output of PLL0OUT and CPLL0OUT.
The stable and active state of the PLL0OUT and CPLL0OUT clocks is indicated by PLLS.PLL0CLKACT = 1.

The PLL1 stabilization counter starts counting the stabilization time, after PLL1 enabled. As long as the PLL1 is not stable, the PLL1CLKACT signal disables the PPLLOUT and CPLL1OUT outputs. When the PLL1 stabilization counter reaches the predefined value, PPLLOUT and CPLL1OUT are assumed to be stable and PLL1CLKACT switches from 0 to 1 to enable output of PPLLOUT and CPLL1OUT.

The stable and active state of the PPLLOUT and CPLL1OUT clocks is indicated by PLL1S.PLL1CLKACT = 1.

PLL in Stand-by Modes

In STOP mode, the PLL0 and PLL1 are automatically disabled and resumes operation after wake-up from STOP mode, if it was operating before entering STOP mode.

The PLL0 and PLL1 are also automatically disabled when transitioning to DeepSTOP mode. However, after restoring from DeepSTOP mode, the PLL0 and PLL1 need to be reconfigured.

In Cyclic RUN and Cyclic STOP mode, the PLL0 and PLL1 are not available. Do not enable the PLL0 and PLL1 in Cyclic RUN mode.

Clock Monitor Control

The PLL0 activity signal PLL0CLKACT enables or disables supervision by the Clock Monitor CLMA2. In case the PLL0 is inactive (PLL0CLKACT = 0), supervision of the output clock PLL0OUT by CLMA2 is also deactivated.

The PLL1 activity signal PLL1CLKACT enables or disables supervision by the Clock Monitor CLMA3. In case the PLL1 is inactive (PLL1CLKACT = 0), supervision of the output clock PPLLOUT by CLMA3 is also deactivated.

PLL Enable/Disable Trigger

The PLL0 and PLL1 can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger PLL0E.PLL0ENTRG = 1 starts the PLL0
  Note that setting the enable trigger is only effective if the PLL0 is inactive, i.e. if PLL0S.PLL0CLKACT = 0.
- Disable trigger PLL0E.PLL0DISTRG = 1 stops the PLL0
  Note that setting the disable trigger is only effective if the PLL0 is active, i.e. if PLL0S.PLL0CLKACT = 1.
- Enable trigger PLL1E.PLL1ENTRG = 1 starts the PLL1
  Note that setting the enable trigger is only effective if the PLL1 is inactive, i.e. if PLL1S.PLL1CLKACT = 0.
- Disable trigger PLL1E.PLL1DISTRG = 1 stops the PLL1
  Note that setting the disable trigger is only effective if the PLL1 is active, i.e. if PLL1S.PLL1CLKACT = 1.

PLL Input Clock Selection

The PLL0 input clock (PLL0CLKIN) can be selectable from MainOSC and HS IntOSC by using the CKSC_PLL0IS_CTL register.

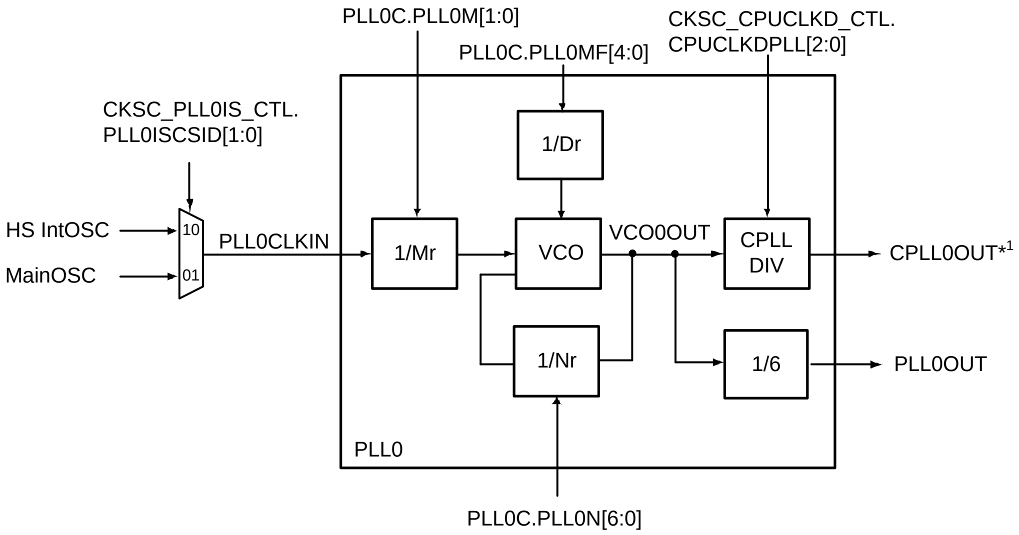
The maximum frequency of CPLL0OUT and PLL0OUT is limited in the case the HS IntOSC is selected as PLL0 input clock.

The PLL1 input clock (PLL1CLKIN) can be selectable from MainOSC and HS IntOSC by using the CKSC_PLL1IS_CTL register.

The maximum frequency of CPLL1OUT and PPLLOUT is limited in the case the HS IntOSC is selected as PLL1 input clock.

12AB.3.5.1 PLL0 Parameters

The PLL0 is configured by a set of parameters, loaded from the control register PLL0C and CKSC_CPUCLKD_CTL.



Note 1. When CPLL0OUT is selected as a source clock of C_ISO_CPUCLK with CKSC_CPUCLKS_CTL, this is valid. When it is not selected, this is invalid.

Figure 12AB.8 PLL0 Circuit

CPLL0OUT and PLL0OUT

The PLL0 has two clock outputs “CPLL0OUT” and “PLL0OUT”. The CPLL0OUT is one of the clock sources of the CPU subsystem, and the PLL0OUT is supervised by the Clock Monitor CLMA2. The CPLL0OUT and PLL0OUT shares the same clock source “VCO0OUT”, which is the output of Voltage Controlled Oscillator (VCO). The clock frequency of the VCO0OUT is calculated by the following formula:

$f_{\mathrm{VCO0OUT}} = f_{\mathrm{PLL0CLKIN}} \times (\mathrm{Nr} / \mathrm{Mr})$

The clock frequency of CPLL0OUT “f_{CPLL0OUT}” and that of PLL0OUT “f_{PLL0OUT}” are integer fractions of the VCO output frequency f_{VCO0OUT}. f_{CPLL0OUT} and f_{PLL0OUT} are calculated by the following formulas:

$f_{\mathrm{CPLL0OUT}} = f_{\mathrm{VCO0OUT}} \times 1/\mathrm{Pr} = f_{\mathrm{PLL0CLKIN}} \times (\mathrm{Nr} / \mathrm{Mr}) \times 1/\mathrm{Pr}$

$f_{\mathrm{PLL0OUT}} = f_{\mathrm{VCO0OUT}} \times 1/6 = f_{\mathrm{PLL0CLKIN}} \times (\mathrm{Nr} / \mathrm{Mr}) \times 1/6$

The values Nr and Mr are derived from PLL0C register bits:

Nr = PLL0C.PLL0N[6:0] + 1

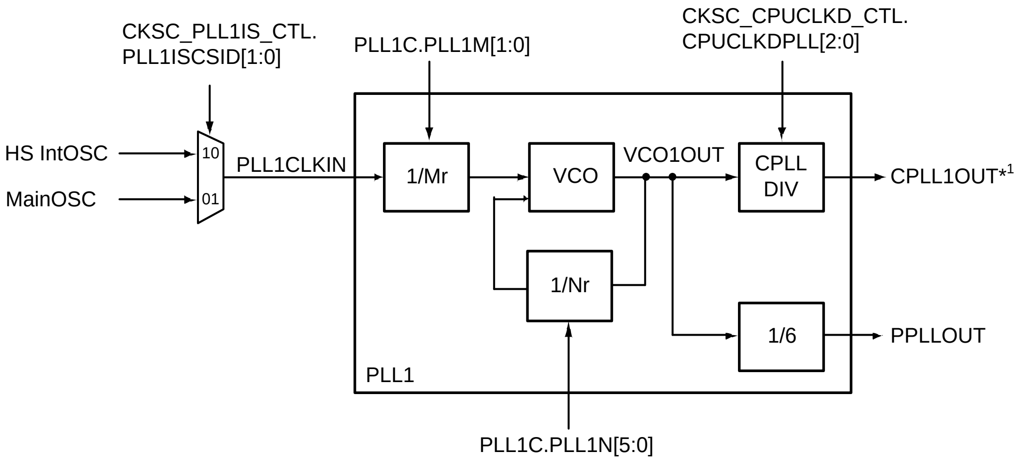
Mr = PLL0C.PLL0M[1:0] + 1

The setting range of Mr: $1 \leq \mathrm{Mr} \leq 3$

The value Pr is derived from CKSC_CPUCLKD_CTL. CPUCLKDPLL[2:0], and the value is 2, 3, 4, or 6.

12AB.3.5.2 PLL1 Parameters

The PLL1 is configured by a set of parameters, loaded from the control register PLL1C and CKSC_CPUCLKD_CTL.



Note 1. When this is selected as a source clock of C_ISO_CPUCLK with CKSC_CPUCLKS_CTL, this is valid.
When this is not selected, this is invalid.

Figure 12AB.9 PLL1 Circuit

CPLL1OUT and PPLLOUT

The PLL1 has two clock outputs “CPLL1OUT” and “PPLLOUT”. The CPLL1OUT is one of the clock sources of the CPU subsystem, and the PPLLOUT is one of the clock sources of the peripheral modules. CPLL1OUT and PPLLOUT shares the same clock source “VCO1OUT”, which is the output of the voltage controlled oscillator (VCO). The clock frequency of VCO1OUT is calculated by the following formula:

$f_{VCO1OUT} = f_{PLL1CLKIN} \times (Nr / Mr)$

The clock frequency of CPLL1OUT “$f_{CPLL1OUT}$” and that of PPLLOUT “$f_{PPLLOUT}$” are integer fractions of the VCO output frequency $f_{VCO1OUT}$. $f_{CPLL1OUT}$ and $f_{PPLLOUT}$ are calculated by the following formulas:

$f_{CPLL1OUT} = f_{VCO1OUT} \times 1/Pr = f_{PLL1CLKIN} \times (Nr / Mr) \times 1/Pr$

$f_{PPLLOUT} = f_{VCO1OUT} \times 1/6 = f_{PLL1CLKIN} \times (Nr / Mr) \times 1/6$

The values Nr and Mr are derived from PLL1C register bits:

Nr = PLL1C.PLL1N[5:0] + 1

Mr = PLL1C.PLL1M[1:0] + 1

The setting range of Mr: $1 \leq Mr \leq 3$

The value Pr is derived from CKSC_CPUCLKD_CTL. CPUCLKDPLL[2:0], and the value is 4 or 6.

12AB.4 Registers

12AB.4.1 List of Registers

The registers of the clock controller are listed below.

Table 12AB.2 List of Registers

Module Name	Register Name	Symbol	Address
CLKCTL	Clock oscillator registers:		
	MainOSC enable register	MOSCE	FFF8 1100_H
	MainOSC status register	MOSCS	FFF8 1104_H
	MainOSC control register	MOSCC	FFF8 1108_H
	MainOSC stabilization time register	MOSCST	FFF8 $110C_H$
	MainOSC stop mask register	MOSCSTPM	FFF8 1118_H
	MainOSC mode control register	MOSCM	FFF8 $111C_H$
	SubOSC enable register	SOSCE*1	FFF8 1200_H
	SubOSC status register	SOSCS*1	FFF8 1204_H
	SubOSC stabilization time register	SOSCST*1	FFF8 $120C_H$
	HS IntOSC enable register	ROSCE	FFF8 1000_H
	HS IntOSC status register	ROSCS	FFF8 1004_H
	HS IntOSC stop mask register	ROSCSTPM	FFF8 1018_H
	HS IntOSC user trimming register	ROSCUT	FFF8 $101C_H$
	PLL0 enable register	PLL0E	FFF8 9000_H
	PLL0 status register	PLL0S	FFF8 9004_H
	PLL0 control register	PLL0C	FFF8 9008_H
	PLL0 stabilization time register	PLL0ST	FFF8 $900C_H$
	PLL1 enable register	PLL1E	FFF8 9100_H
	PLL1 status register	PLL1S	FFF8 9104_H
	PLL1 control register	PLL1C	FFF8 9108_H
	PLL0 input clock selection register	CKSC_PLL0IS_CTL	FFF8 $A700_H$
	PLL0 input clock active register	CKSC_PLL0IS_ACT	FFF8 $A708_H$
	PLL1 input clock selection register	CKSC_PLL1IS_CTL	FFF8 $A710_H$
	PLL1 input clock active register	CKSC_PLL1IS_ACT	FFF8 $A718_H$
	PPLLCLK source clock selection register	CKSC_PPLLCLKS_CTL	FFF8 $A010_H$
	PPLLCLK source clock active register	CKSC_PPLLCLKS_ACT	FFF8 $A018_H$
	Clock selector control register:		
	C_AWO_WDTA clock divider selection register	CKSC_AWDTAD_CTL	FFF8 2000_H
	C_AWO_WDTA clock divider active register	CKSC_AWDTAD_ACT	FFF8 2008_H
	C_AWO_WDTA stop mask register	CKSC_AWDTAD_STPM	FFF8 2018_H
	C_AWO_TAUJ source clock selection register	CKSC_ATAUJS_CTL	FFF8 2100_H
	C_AWO_TAUJ source clock active register	CKSC_ATAUJS_ACT	FFF8 2108_H

	C_ISO_IIC source clock active register	CKSC_IIICS_ACT	FFF8 $AC08_H$

Note 1. It isn't supported with 100-pin product.

12AB.4.2 Clock Oscillator Registers

12AB.4.2.1 MOSCE — MainOSC Enable Register

This register is used to start and stop the MainOSC.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1100$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCDISTRG	MOSCENTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.3 MOSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MOSCDISTRG	MainOSC Disable Trigger*1,*3 MOSCSTPM.MOSCSTPMSK = 0 0: No function 1: Stops MainOSC MOSCSTPM.MOSCSTPMSK = 1 When writing this bit while MOSCSTPM.MOSCSTPMSK = 1, the write value should be 0. 0: No function 1: Setting Prohibited This bit is automatically cleared to 0 by hardware after MainOSC is disabled.
0	MOSCENTRG	MainOSC Enable Trigger*2,*3 0: No function 1: Starts MainOSC This bit is automatically cleared to 0 by hardware after MainOSC is enabled.

Note 1. Follow the procedure given below for stopping the MainOSC by using MOSCDISTRG.

1. Confirm that the MainOSC is neither waiting for being enabled nor stopped (both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).
2. Confirm that the MainOSC is active (MOSCS.MOSCCLKACT = 1).
3. Check that there is no clock domain for which the MainOSC is selected. If the MainOSC is selected for a clock domain, disable the setting or select a clock source other than MainOSC.
4. Confirm that the MainOSC stop mask register (MOSCSTPM) is NOT set to “MainOSC continues operation in standby mode” (MOSCSTPM.MOSCSTPMSK = 1). Otherwise, set the register to “MainOSC stops operation in stand-by mode” (MOSCSTPM.MOSCSTPMSK = 0).
5. Stop the MainOSC (MOSCE.MOSCDISTRG = 1).
6. Confirm that the MainOSC has been stopped (MOSCS.MOSCCLKACT = 0).

Note 2. Follow the procedure given below for starting the MainOSC by using MOSCENTRG

1. Confirm that the MainOSC is neither waiting for being enabled nor stopped (both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).
2. Confirm that the MainOSC is inactive (MOSCS.MOSCCLKACT = 0).
3. Start the MainOSC (MOSCE.MOSCENTRG = 1).
4. Confirm that the MainOSC has been started (MOSCS.MOSCCLKACT = 1).

Note 3. Starting and stopping the MainOSC at the same time by using the start and stop bits, i.e., by setting MOSCE.MOSCENTRG = 1 and MOSCE.MOSCDISTRG = 1 at the same time is not allowed.

12AB.4.2.2 MOSCS — MainOSC Status Register

This register provides active status information about the MainOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 1104$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1^{*1}	0^{*1}
	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCCLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12AB.4 MOSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	MOSCCLKACT	MainOSC Active Status 0: MainOSC is inactive 1: MainOSC is active
1, 0	Reserved	When read, an undefined value is returned.

12AB.4.2.3 MOSCC — MainOSC Control Register

This register is used to specify amplification gain of the MainOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1108_H

Value after reset: 0000 0004_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCAMPSEL [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.5 MOSCC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	MOSCAMPSEL[1:0]	MainOSC Amplification Gain Selection 00: Amplification gain for fx = 24 MHz 01: Amplification gain for fx = 20 MHz 10: Amplification gain for fx = 16 MHz 11: Amplification gain for fx = 8 MHz

CAUTION

Set this register when MainOSC is stopped.

12AB.4.2.4 MOSCST — MainOSC Stabilization Time Register

This register determines the MainOSC stabilization time.

This register is initialized by the power-up reset signal PURES and $\overline{\mathrm{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 110C$_\text{H}$

Value after reset: 0000 44C0$_\text{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCCLKST16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MOSCCLKST[15:0]															
Value after reset	0	1	0	0	0	1	0	0	1	1	0	0	0	0	0	0

Table 12AB.6 MOSCST Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16 to 0	MOSCCLKST[16:0]	The MOSCCLKST[16:0] bits specify the count value for the MainOSC stabilization counter. ● If HS IntOSC active (ROSCS.ROSCCLKACT = 1): Stabilization time = MOSCCLKST[16:0] / f_{RH} ● If HS IntOSC inactive (ROSCS.ROSCCLKACT = 0): Stabilization time = MOSCCLKST[16:0] / f_{RL}

NOTE

See **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4** for information about the MainOSC stabilization time.

CAUTION

Set this register when MainOSC is stopped.

12AB.4.2.5 MOSCSTPM — MainOSC Stop Mask Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1118$_H$

Value after reset: 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12AB.7 MOSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCSTPMSK	MainOSC Stop Request Mask 0: MainOSC stops operation in stand-by mode. MainOSC stops operation in the case the MainOSC disable trigger MOSCE.MOSCDISTRG is set to 1. 1: MainOSC continues operation in stand-by mode.

12AB.4.2.6 MOSCM — MainOSC Mode Control Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 111C$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCM

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12AB.8 MOSCM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCM	MainOSC Mode control 0: OSC mode. (default) 1: EXCLK mode. MainOSC amplifier is disabled.

CAUTION

Set this register when MainOSC is stopped.

NOTE

EXCLK mode is a mode to directly input clock to X1. For details, see **Section 12AB.3.1, Main Oscillator (MainOSC)**.

12AB.4.2.7 SOSCE — SubOSC Enable Register

This register is used to start and stop the SubOSC.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1200_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOSCDISTRG	SOSCENTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.9 SOSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SOSCDISTRG	SubOSC Disable Trigger*[1,*3] 0: No function 1: Stops SubOSC This bit is automatically cleared to 0 by hardware after SubOSC is disabled.
0	SOSCENTRG	SubOSC Enable Trigger*[2,*3] 0: No function 1: Starts SubOSC This bit is automatically cleared to 0 by hardware after SubOSC is enabled.

Note 1. Follow the procedure given below for stopping the SubOSC by using SOSCDISTRG.

1. Confirm that the SubOSC is neither waiting for being enabled nor stopped (SOSCE.SOSCDISTRG = 0 and SOSCE.SOSCENTRG = 0).
2. Confirm that the SubOSC is active (SOSCS.SOSCCLKACT = 1).
3. Check that there is no clock domain for which the SubOSC is selected. If the SubOSC is selected for a clock domain, disable the setting or select a clock source other than the SubOSC.
4. Stop the SubOSC (SOSCE.SOSCDISTRG = 1).
5. Confirm that the SubOSC has been stopped (SOSCS.SOSCCLKACT = 0).

Note 2. Follow the procedure given below for starting the SubOSC by using SOSCENTRG.

1. Confirm that the SubOSC is neither waiting for being enabled nor stopped (SOSCE.SOSCDISTRG = 0 and SOSCE.SOSCENTRG = 0).
2. Confirm that the SubOSC is inactive (SOSCS.SOSCCLKACT = 0).
3. Start the SubOSC (SOSCE.SOSCENTRG = 1).
4. Confirm that the SubOSC has been started (SOSCS.SOSCCLKACT = 1).

Note 3. Starting and stopping the SubOSC at the same time by using the start and stop bits, i.e., by setting SOSCE.SOSCENTRG = 1 and SOSCE.SOSCDISTRG = 1 at the same time is not allowed.

12AB.4.2.8 SOSCS — SubOSC Status Register

This register provides active status information about the SubOSC.

This register is initialized by the power-up reset signal PURES.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 1204_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1^{*1}	0^{*1}
	—	—	—	—	—	—	—	—	—	—	—	—	—	SOSCCLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12AB.10 SOSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	SOSCCLKACT	SubOSC Activation Status 0: SubOSC is inactive 1: SubOSC is active
1, 0	Reserved	When read, an undefined value is returned.

12AB.4.2.9 SOSCST — SubOSC Stabilization Time Register

This register determines the SubOSC stabilization time.

This register is initialized by the power-up reset signal PURES.

Access: This register can be read or written in 32-bit units.

Address: FFF8 $120C_H$

Value after reset: $010C\ 8E00_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SOSCCLKST[29:16]													
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	1	1	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SOSCCLKST[15:0]															
Value after reset	1	0	0	0	1	1	1	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 12AB.11 SOSCST Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 0	SOSCCLKST[29:0]	The SOSCCLKST[29:0] bits specify the count value for the SubOSC stabilization time counter. ● If the HS IntOSC is active (ROSCS.ROSCCLKACT = 1): Stabilization time = SOSCCLKST[29:0] / f_{RH} ● If the HS IntOSC is inactive (ROSCS.ROSCCLKACT = 0): Stabilization time = SOSCCLKST[29:0] / f_{RL}

NOTE

See **Section 47A, Electrical Characteristics of RH850/F1KH-D8**, **Section 47B, Electrical Characteristics of RH850/F1KM-S4** for information about the SubOSC stabilization time.

CAUTION

Set this register when SubOSC is stopped.

12AB.4.2.10 ROSCE — HS IntOSC Enable Register

This register is used to stop the HS IntOSC operation.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

CAUTION

Set the ROSCE.ROSCDISTRG bit only when the $\overline{\text{CLMA0RES}}$ has occurred. In other cases, setting this bit is prohibited.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12AB.14 ROSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ROSCSTPMSK	HS IntOSC Stop Request Mask 0: HS IntOSC stops operation in stand-by mode 1: HS IntOSC continues operation in stand-by mode Do not set the HS IntOSC disable trigger ROSCE.ROSCDISTRG to 1 while ROSCSTPMSK bit is set to 1.

12AB.4.2.13 PLL0E — PLL0 Enable Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 9000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL0DISTRG	PLL0ENTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.15 PLL0E Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PLL0DISTRG	PLL0 Disable Trigger[*1,*4] 0: No function 1: Stops PLL0 This bit is automatically cleared to 0 by hardware after PLL0 is disabled.
0	PLL0ENTRG	PLL0 Enable Trigger[*2,*3,*4] 0: No function 1: Starts PLL0 This bit is automatically cleared to 0 by hardware after PLL0 is activated.

Note 1. Follow the procedure given below for stopping the PLL0 by using PLL0DISTRG.

1. Confirm that the PLL0 is neither waiting for being enabled nor stopped (both PLL0E.PLL0DISTRG = 0 and PLL0E.PLL0ENTRG = 0).
2. Confirm that the PLL0 is active (PLL0S.PLL0CLKACT = 1).
3. Check that there is no clock domain for which the PLL0 is selected. If the PLL0 is selected for a clock domain, disable the setting or select a clock source other than the PLL0.
4. Stop the PLL0 (PLL0E.PLL0DISTRG = 1).
5. Confirm that the PLL0 has been stopped (PLL0S.PLL0CLKACT = 0).

Note 2. Before starting PLL0 using PLL0ENTRG, confirm that the PLL0 input clock (MainOSC or HS IntOSC, selected by the CKSC_PLL0IS_CTL) is operating.

Note 3. Follow the procedure given below for starting the PLL0 by using PLL0ENTRG.

1. Confirm that the PLL0 is neither waiting for being enabled nor stopped (both PLL0E.PLL0DISTRG = 0 and PLL0E.PLL0ENTRG = 0).
2. Confirm that the PLL0 is inactive (PLL0S.PLL0CLKACT = 0).
3. Start the PLL0 (PLL0E.PLL0ENTRG = 1).
4. Confirm that the PLL0 has been started (PLL0S.PLL0CLKACT = 1).

Note 4. Starting and stopping the PLL0 at the same time by using the start and stop bits, i.e., by setting PLL0E.PLL0ENTRG = 1 and PLL0E.PLL0DISTRG = 1 at the same time is not allowed.

12AB.4.2.14 PLL0S — PLL0 Status Register

This register provides active status information about the PLL0.

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 9004_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

1, 0	Reserved	When read, an undefined value is returned.

12AB.4.2.15 PLL0C — PLL0 Control Register

This register is used to set the PLL0 VCO output clock frequency $f_{VCO0OUT}$, shown in **Section 12AB.3.5.1, PLL0 Parameters**.

This register can only be written, if the PLL0 is disabled.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 9008_H

Value after reset: 6000 $503B_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

</table>

Note 1. The CPLL0OUT frequency is defined by CKSC_CPUCLKD_CTL.CPUCLKDPLL[2:0]. Refer to the CKSC_CPUCLKD_CTL register description.

Note 2. The limit of CPLL0OUT frequency is 80 MHz (typ.) when HS IntOSC is selected as clock source of PLL0.

Note 3. Settings other than those shown in this table are prohibited.

12AB.4.2.16 PLL0ST — PLL0 Stabilization Time Register

This register specifies stabilization time of the PLL0.

This register is initialized by all reset sources (ISORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 900C$_{\text{H}}$
Value after reset:	0000 1B80$_{\text{H}}$

12AB.4.2.17 **PLL1E — PLL1 Enable Register**

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 9100$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.20 PLL1E Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PLL1DISTRG	PLL1 Disable Trigger[*1,*4] 0: No function 1: Stops PLL1 This bit is automatically cleared to 0 by hardware after PLL1 is disabled.
0	PLL1ENTRG	PLL1 Enable Trigger[*2,*3,*4] 0: No function 1: Starts PLL1 This bit is automatically cleared to 0 by hardware after PLL1 is activated.

Note 1. Follow the procedure given below for stopping the PLL1 by using PLL1DISTRG.

1. Confirm that the PLL1 is neither waiting for being enabled nor stopped (both PLL1E.PLL1DISTRG = 0 and PLL1E.PLL1ENTRG = 0).
2. Confirm that the PLL1 is active (PLL1S.PLL1CLKACT = 1).
3. Check that there is no clock domain for which the PLL1 is selected. If the PLL1 is selected for a clock domain, disable the setting or select a clock source other than the PLL1.
4. Stop the PLL1 (PLL1E.PLL1DISTRG = 1).
5. Confirm that the PLL1 has been stopped (PLL1S.PLL1CLKACT = 0).

Note 2. Before starting PLL1 using PLL1ENTRG, confirm that the PLL1 input clock (MainOSC or HS IntOSC, selected by the CKSC_PLL1IS_CTL) is operating.

Note 3. Follow the procedure given below for starting the PLL1 by using PLL1ENTRG.

1. Confirm that the PLL1 is neither waiting for being enabled nor stopped (both PLL1E.PLL1DISTRG = 0 and PLL1E.PLL1ENTRG = 0).
2. Confirm that the PLL1 is inactive (PLL1S.PLL1CLKACT = 0).
3. Start the PLL1 (PLL1E.PLL1ENTRG = 1).
4. Confirm that the PLL1 has been started (PLL1S.PLL1CLKACT = 1).

Note 4. Starting and stopping the PLL1 at the same time by using the start and stop bits, i.e., by setting PLL1E.PLL1ENTRG = 1 and PLL1E.PLL1DISTRG = 1 at the same time is not allowed.

12AB.4.2.18 PLL1S — PLL1 Status Register

This register provides active status information about the PLL1.

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 9104$_{\text{H}}$

Value after reset: 0000 0000$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1CLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12AB.21 PLL1S Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	PLL1CLKACT	PLL1 Active Status 0: PLL1 is inactive 1: PLL1 is active
1, 0	Reserved	When read, an undefined value is returned.

12AB.4.2.19 PLL1C — PLL1 Control Register

This register is used to set the PLL1 VCO output clock frequency $f_{VCO1OUT}$, shown in **Section 12AB.3.5.2, PLL1 Parameters**.

This register can only be written, if the PLL1 is disabled.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 9108_H

Value after reset: 0001 $133B_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

24 (MainOSC)	10_B (Mr = 3)	$3B_H$ (Nr = 60)	480.0	120.0	80.0	80.0
8 (HS IntOSC)	00_B (Mr = 1)	$3B_H$ (Nr = 60)	480.0	N/A	80.0*2	80.0

Note 1. The CPLL1OUT frequency is defined by CKSC_CPUCLKD_CTL.CPUCLKDPLL[2:0]. Refer to the CKSC_CPUCLKD_CTL register description.

Note 2. The limit of CPLL1OUT frequency is 80 MHz (typ.) when HS IntOSC is selected as clock source of PLL1.

Note 3. Settings other than those shown in this table are prohibited.

12AB.4.2.20 PLL0 Input Clock Selection

(1) CKSC_PLL0IS_CTL — PLL0 Input Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A700$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

12AB.4.2.21 PLL1 Input Clock Selection

(1) CKSC_PLL1IS_CTL — PLL1 Input Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 $A710_H$
Value after reset:	0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1ISCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.26 CKSC_PLL1IS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PLL1ISCSID[1:0]	Source Clock Setting for PLL1 input clock 01_B: MainOSC (Default) 10_B: HS IntOSC*[1] Other than above: Setting prohibited

Note 1. The maximum frequency of CPLL1OUT and PPLLOUT is limited when the HS IntOSC is selected as the PLL1 input clock.

CAUTION

Set this register when PLL1 is stopped.

(2) CKSC_PLL1IS_ACT — PLL1 Input Clock Active Register

This register is initialized by all reset sources (ISORES).

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 A718$_{\text{H}}$
Value after reset:	0000 0001$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1ISACT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.27 CKSC_PLL1IS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PLL1ISACT[1:0]	Source clock for currently active PLL1 input clock

12AB.4.2.22 PPLLCLK Source Clock Selection

(1) CKSC_PPLLCLKS_CTL — PPLLCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 $A010_H$

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPLLCLKSCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.28 CKSC_PPLLCLKS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PPLLCLKSCSID[1:0]	Source Clock Setting for PPLLCLK 00_B: Setting prohibited 01_B: EMCLK (default) 10_B: MainOSC 11_B: PPLLOUT

(2) CKSC_PPLLCLKS_ACT — PPLLCLK Source Clock Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: $\text{FFF8 A018}_{\text{H}}$

Value after reset: $\text{0000 0001}_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPLLCLKSACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.29 CKSC_PPLLCLKS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PPLLCLKSACT[1:0]	Source clock for currently active PPLLCLK^{*1}

Note 1. The data read from this register is 00_B when the following conditions is satisfied.

- The selected source clock for all of the following clock domains is other than PPLLCLK (or PPLLCLK2): C_ISO_PERI1, C_ISO_PERI2, C_ISO_LIN, C_ISO_ADCA, C_ISO_CAN, C_ISO_CSI, C_ISO_IIC, C_ISO_ADCA
- The OPBT0.FLXA0EN bit is set to 0 (FlexRay is disabled).

12AB.4.2.23 ROSCUT — HS IntOSC User Trimming Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 $101C_H$
Value after reset:	0000 $0XXX_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	FADJUST[8:0]								
Value after reset	0	0	0	0	0	0	0	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 12AB.30 ROSCUT Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	FADJUST[8:0]	Frequency Adjustment parameters of HS IntOSC. The value after reset of this register is pre-set value of HS IntOSC trimming data. Overwrite this register with “read value + 1” or “read value – 1” until the HS IntOSC frequency becomes target frequency range.

12AB.4.3 Clock Selector Control Register

12AB.4.3.1 WDTA0 Clock Domain C_AWO_WDTA

(1) CKSC_AWDTAD_CTL — C_AWO_WDTA Clock Divider Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 2000_H
Value after reset:	0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.31 CKSC_AWDTAD_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	AWDTADCSID[1:0]	Clock Divider Setting for C_AWO_WDTA 00_B: Setting prohibited 01_B: LS IntOSC / 128 (default) 10_B: LS IntOSC / 1 11_B: Setting prohibited

(2) CKSC_AWDTAD_ACT — C_AWO_WDTA Clock Divider Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2008$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.32 CKSC_AWDTAD_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	AWDTADACT[1:0]	Clock divider for currently active C_AWO_WDTA

(3) CKSC_AWDTAD_STPM — C_AWO_WDTA Stop Mask Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2018_H

Value after reset: 0000 0002_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12AB.33 CKSC_AWDTAD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AWDTADSTPMSK*[1]	0: Clock domain C_AWO_WDTA is stopped in stand-by mode. 1: Clock domain C_AWO_WDTA is not stopped in stand-by mode.

Note 1. The return time from stand-by mode can be shortened by setting this bit to 1.

12AB.4.3.2 TAUJ Clock Domain C_AWO_TAUJ

(1) CKSC_ATAUJS_CTL — C_AWO_TAUJ Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2100$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ATAUJSCSID[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 12AB.34 CKSC_ATAUJS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	ATAUJSCSID[2:0]	Source Clock Setting for C_AWO_TAUJ*[1] 000$_B$: Disabled 001$_B$: HS IntOSC (default) 010$_B$: MainOSC 011$_B$: LS IntOSC 100$_B$: PPLLCLK2 Other than above: Setting prohibited

Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK2.

(2) CKSC_ATAUJS_ACT — C_AWO_TAUJ Source Clock Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2108_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ATAUJSACT[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.35 CKSC_ATAUJS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2 to 0	ATAUJSACT[2:0]	Source clock for currently active C_AWO_TAUJ

(3) CKSC_ATAUJD_CTL — C_AWO_TAUJ Clock Divider Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2200$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	—	—	—	ATAUJDACT[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.37 CKSC_ATAUJD_ACT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2 to 0	ATAUJDACT[2:0]	Clock divider for currently active C_AWO_TAUJ

(5) CKSC_ATAUJD_STPM — C_AWO_TAUJ Stop Mask Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2218_H

Value after reset: 0000 0002_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ATAUJ DSTP MSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12AB.38 CKSC_ATAUJD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ATAUJDSTPMSK	0: Clock domain C_AWO_TAUJ is stopped in stand-by mode. 1: Clock domain C_AWO_TAUJ is not stopped in stand-by mode.

12AB.4.3.3 RTCA Clock Domain C_AWO_RTCA

(1) CKSC_ARTCAS_CTL — C_AWO_RTCA Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by a power-up reset PURES.

Access: This register can be read or written in 32-bit units.

Address: FFF8 2300_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARTCASCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.39 CKSC_ARTCAS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	ARTCASCSID[1:0]	Source Clock Setting for C_AWO_RTCA 00_B: Disabled (default) 01_B: SubOSC*[1] 10_B: MainOSC*[2] 11_B: LS IntOSC

Note 1. It isn't supported with 100-pin product.

Note 2. To avoid supplying a clock signal equal to or higher than 4 MHz to the C_AWO_RTCA clock domain, check that CKSC_ARTCAD_ACT = 0000 0000_H (disabled) before setting CKSC_ARTCAS_CTL to 10_B (MainOSC).

(2) CKSC_ARTCAS_ACT — C_AWO_RTCA Source Clock Active Register

This register is initialized by a power-up reset PURES.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2308$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARTCASACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.40 CKSC_ARTCAS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	ARTCASACT[1:0]	Source clock for currently active C_AWO_RTCA

(3) CKSC_ARTCAD_CTL — C_AWO_RTCA Clock Divider Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by a power-up reset PURES.

Access: This register can be read or written in 32-bit units.

Address: FFF8 2400_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 12AB.41 CKSC_ARTCAD_CTL Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	ARTCADCSID[2:0]	Clock Divider Setting for C_AWO_RTCA 000_B: Disabled (default) 001_B: CKSC_ARTCAS_CTL selection /1 010_B: CKSC_ARTCAS_CTL selection /2 011_B: CKSC_ARTCAS_CTL selection /4 100_B: CKSC_ARTCAS_CTL selection /8 Other than above: Setting prohibited

(4) CKSC_ARTCAD_ACT — C_AWO_RTCA Clock Divider Active Register

This register is initialized by a power-up reset PURES.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2408_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ARTCADACT[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.42 CKSC_ARTCAD_ACT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2 to 0	ARTCADACT[2:0]	Clock divider for currently active C_AWO_RTCA

(5) CKSC_ARTCAD_STPM — C_AWO_RTCA Stop Mask Register

This register is initialized by a power-up reset PURES.

Access: This register can be read or written in 32-bit units.

Address: FFF8 2418_H

Value after reset: 0000 0002_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARTCADSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12AB.43 CKSC_ARTCAD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ARTCADSTPMSK	0: Clock domain C_AWO_RTCA is stopped in stand-by mode. 1: Clock domain C_AWO_RTCA is not stopped in stand-by mode.

12AB.4.3.4 ADCA0 Clock Domain C_AWO_ADCA

(1) CKSC_AADCAS_CTL — C_AWO_ADCA Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2500$_{H}$

Value after reset: 0000 0001$_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AADCASCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.44 CKSC_AADCAS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	AADCASCSID[1:0]	Source Clock Setting for C_AWO_ADCA*1 00$_{B}$: Disabled 01$_{B}$: HS IntOSC (default) 10$_{B}$: MainOSC 11$_{B}$: PPLLCLK2

Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK2.

(2) CKSC_AADCAS_ACT — C_AWO_ADCA Source Clock Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2508$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AADCASACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.45 CKSC_AADCAS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	AADCASACT[1:0]	Source clock for currently active C_AWO_ADCA

(3) CKSC_AADCAD_CTL — C_AWO_ADCA Clock Divider Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2600$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AADCADCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.46 CKSC_AADCAD_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	AADCADCSID[1:0]	Clock Divider Setting for C_AWO_ADCA 00$_B$: Setting prohibited 01$_B$: CKSC_AADCAS_CTL selection /1 (default) 10$_B$: CKSC_AADCAS_CTL selection /2*[1] 11$_B$: Setting prohibited

Note 1. Make sure that the frequency of CKSC_AADCA is no less than 8 MHz after division by 2.

(4) CKSC_AADCAD_ACT — C_AWO_ADCA Clock Divider Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2608$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AADCADACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.47 CKSC_AADCAD_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	AADCADACT[1:0]	Clock divider for currently active for C_AWO_ADCA

(5) CKSC_AADCAD_STPM — C_AWO_ADCA Stop Mask Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2618$_H$

Value after reset: 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AADCA DSTP MSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12AB.48 CKSC_AADCAD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AADCADSTPMSK	0: Clock domain C_AWO_ADCA is stopped in stand-by mode. 1: Clock domain C_AWO_ADCA is not stopped in stand-by mode.

12AB.4.3.5 FOUT Clock Domain C_AWO_FOUT

(1) CKSC_AFOUTS_CTL — C_AWO_FOUT Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2700_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	AFOUTSCSID[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 12AB.49 CKSC_AFOUTS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	AFOUTSCSID[2:0]	Source Clock Setting for C_AWO_FOUT*[1] 000_B: Disabled (default) 001_B: MainOSC 010_B: HS IntOSC 011_B: LS IntOSC 100_B: SubOSC*[2] 101_B: PPLLCLK4 110_B: PPLLCLK4 111_B: Setting prohibited

Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK4.

Note 2. It isn't supported with 100-pin product.

(2) CKSC_AFOUTS_ACT — C_AWO_FOUT Source Clock Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2708_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12AB.51 CKSC_AFOUTS_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AFOUTSSTPMSK	0: Clock domain C_AWO_FOUT is stopped in stand-by mode. 1: Clock domain C_AWO_FOUT is not stopped in stand-by mode.

12AB.4.3.6 CPU Clock Domain C_ISO_CPUCLK

(1) CKSC_CPUCLKS_CTL — C_ISO_CPUCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 $A000_H$

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUCLKSCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.52 CKSC_CPUCLKS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	CPUCLKSCSID[1:0]	Source Clock Setting for C_ISO_CPUCLK 00_B: CPLL0OUT 01_B: EMCLK (default) 10_B: MainOSC 11_B: CPLL1OUT

CAUTION

The clock source selected for the C_ISO_CPUCLK clock domain should not be stopped by software.

For the setting procedure of this register, refer to **Section 12AB.5.4, CPUCLK Source and Divided Clock Selection Method**.

(2) CKSC_CPUCLKS_ACT — C_ISO_CPUCLK Source Clock Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A008$_{\text{H}}$

Value after reset: 0000 0001$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUCLKSACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.53 CKSC_CPUCLKS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	CPUCLKSACT[1:0]	Source clock for currently active C_ISO_CPUCLK

(3) CKSC_CPUCLKD_CTL — C_ISO_CPUCLK Clock Divider Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 $A100_H$
Value after reset:	0000 0029_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.54 CKSC_CPUCLKD_CTL Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 3	CPUCLKDPLL[2:0] *1, *2	Clock Divider CPLLDIV Setting Specifies the CPLLDIV divisor, which determines maximum clock frequency of C_ISO_CPUCLK. 000_B: CPLL0/1OUT = VCO0/1OUT × 1/6 (80 MHz) (PLL0/1) 010_B: CPLL0/1OUT = VCO0/1OUT × 1/4 (120 MHz) (PLL0/1) 110_B: CPLL0OUT = VCO0OUT × 1/3 (160 MHz) (PLL0) 101_B: CPLL0OUT = VCO0OUT × 1/2 (240 MHz) (PLL0) Other than above: Setting prohibited
2 to 0	CPUCLKDCSID[2:0]	Clock Divider Setting for C_ISO_CPUCLK 000_B: Setting prohibited 001_B: CKSC_CPUCLKS_CTL selection /1 (Default) 010_B: CKSC_CPUCLKS_CTL selection /2 011_B: CKSC_CPUCLKS_CTL selection /4 100_B: CKSC_CPUCLKS_CTL selection /8 Other than above: Setting prohibited

Note 1. Setting of CKSC_CPUCLKD_CTL.CPUCLKDPLL[2:0] is effective only to the PLL selected by CKSC_CPUCLKS_CTL.

Note 2. For the supported settings, refer to the **Table 12AB.18, PLL0 Output Table and Table 12AB.23, PLL1 Output Table**.

CAUTION

The clock source selected for the C_ISO_CPUCLK clock domain should not be stopped by software.

For the setting procedure of this register, refer to **Section 12AB.5.4, CPUCLK Source and Divided Clock Selection Method**.

(4) CKSC_CPUCLKD_ACT — C_ISO_CPUCLK Clock Divider Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A108$_H$

Value after reset: 0000 0029$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 12AB.55 CKSC_CPUCLKD_ACT Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned.
5 to 3	CPUCLKDPLLACT [2:0]	Clock divider for currently active CPLLDIV.
2 to 0	CPUCLKDACT [2:0]	Clock divider for currently active C_ISO_CPUCLK

12AB.4.3.7 Peripheral Clock Domains C_ISO_PERI1 and C_ISO_PERI2

(1) CKSC_IPERI1S_CTL — C_ISO_PERI1 Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A200$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.56 CKSC_IPERI1S_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	IPERI1SCSID[1:0]	Source Clock Setting for C_ISO_PERI1 00_B: Disabled 01_B: PPLLCLK (default) 10_B: PPLLCLK 11_B: Setting prohibited

NOTE

When CKSCLK_IPERI1 is disabled, SFMA0 and SFMA0_MEM shall be set to access disabled, by the corresponding HFSGD01PROT0 and HFSGD01PROT1 registers.

(2) CKSC_IPERI1S_ACT — C_ISO_PERI1 Source Clock Active Register

This register is initialized by all reset sources (ISORES).

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 A208$_H$
Value after reset:	0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.59 CKSC_IPERI2S_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	IPERI2SACT[1:0]	Source clock for currently active C_ISO_PERI2

12AB.4.3.8 RLIN Clock Domains C_ISO_LIN

(1) CKSC_ILINS_CTL — C_ISO_LIN Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A400$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	ILINSCSID[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 12AB.60 CKSC_ILINS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	ILINSCSID[2:0]	Source Clock Setting for C_ISO_LIN*[1] 000$_B$: Disabled 001$_B$: PPLLCLK2 (default) 010$_B$: MainOSC 011$_B$: PPLLCLK2 100$_B$: HS IntOSC Other than above: Setting prohibited

Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK2.

(2) CKSC_ILINS_ACT — C_ISO_LIN Source Clock Active Register

This register is initialized by all reset sources (ISORES).

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 A408$_H$
Value after reset:	0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.61 CKSC_ILINS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2 to 0	ILINSACT[2:0]	Source clock for currently active C_ISO_LIN

(3) CKSC_ILIND_CTL — C_ISO_LIN Clock Divider Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 A800$_{H}$
Value after reset:	0000 0001$_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILINDCSID[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.62 CKSC_ILIND_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	ILINDCSID[1:0]	Clock Divider Setting for C_ISO_LIN 00$_{B}$: Setting prohibited 01$_{B}$: CKSC_ILINS_CTL selection /1 (default) 10$_{B}$: CKSC_ILINS_CTL selection /4 11$_{B}$: CKSC_ILINS_CTL selection /8

NOTE

The setting of this register is only applicable to RLIN30. The settings 10$_{B}$ (CKSC_ILINS_CTL selection /4) and 11$_{B}$ (CKSC_ILINS_CTL selection /8) are only available in UART mode.

(4) CKSC_ILIND_ACT — C_ISO_LIN Clock Divider Active Register

This register is initialized by all reset sources (ISORES).

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 A808$_H$
Value after reset:	0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILINDACT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.63 CKSC_ILIND_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	ILINDACT[1:0]	Clock divider for currently active C_ISO_LIN

(5) CKSC_ILIND_STPM — C_ISO_LIN Stop Mask Register

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A818$_H$

Value after reset: 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILIND STP MSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12AB.64 CKSC_ILIND_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ILINDSTPMSK	0: Clock domain C_ISO_LIN is stopped in stand-by mode. 1: Clock domain C_ISO_LIN is not stopped in stand-by mode.

12AB.4.3.9 ADCA1 Clock Domain C_ISO_ADCA

(1) CKSC_IADCAS_CTL — C_ISO_ADCA Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 A500$_H$
Value after reset:	0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IADCASCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12AB.65 CKSC_IADCAS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	IADCASCSID[1:0]	Source Clock Setting for C_ISO_ADCA 00$_B$: Disabled 01$_B$: HS IntOSC (default) 10$_B$: MainOSC 11$_B$: PPLLCLK2

CAUTION

The CKSC_IADCAS_CTL register and the CKSC_IADCAD_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of “(1) / (2) = 4 to 9.6” at CKDIVMD = 1[*1].

The CKSC_IADCAS_CTL register and the CKSC_IADCAD_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of “(1) / (2) = 2 to 4.8” at CKDIVMD = 0[*1].

(1) Frequency [MHz] specified by the C_ISO_CPUCLK source clock selection register (CKSC_CPUCLKS_CTL) and C_ISO_CPUCLK clock divider selection register (CKSC_CPUCLKD_CTL)

(2) Frequency [MHz] specified by the C_ISO_ADCA source clock selection register (CKSC_IADCAS_CTL) and the C_ISO_ADCA clock divider selection register (CKSC_IADCAD_CTL)

Note 1. For details, see **Section 44, Flash Memory, 44.9.2, OPBT0 — Option Byte 0**.

(2) CKSC_IADCAS_ACT — C_ISO_ADCA Source Clock Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 $A508_H$

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 12AB.67 CKSC_IADCAD_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	IADCADCSID[1:0]	Clock Divider Setting for C_ISO_ADCA 00$_B$: Setting prohibited 01$_B$: CKSC_IADCAS_CTL selection /1 (default) 10$_B$: CKSC_IADCAS_CTL selection /2*[1] 11$_B$: Setting prohibited

Note 1. Make sure that the frequency of CKSC_IADCA is no less than 8 MHz after division by 2.

CAUTION

The CKSC_IADCAS_CTL register and the CKSC_IADCAD_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of “(1) / (2) = 4 to 9.6” at CKDIVMD = 1*[1].

The CKSC_IADCAS_CTL register and the CKSC_IADCAD_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of “(1) / (2) = 2 to 4.8” at CKDIVMD = 0*[1].

(1) Frequency [MHz] specified by the C_ISO_CPUCLK source clock selection register (CKSC_CPUCLKS_CTL) and C_ISO_CPUCLK clock divider selection register (CKSC_CPUCLKD_CTL)

(2) Frequency [MHz] specified by the C_ISO_ADCA source clock selection register (CKSC_IADCAS_CTL) and the C_ISO_ADCA clock divider selection register (CKSC_IADCAD_CTL)

Note 1. For details, see **Section 44, Flash Memory**, **44.9.2, OPBT0 — Option Byte 0**.

(4) CKSC_IADCAD_ACT — C_ISO_ADCA Clock Divider Active Register

This register is initialized by all reset sources (ISORES).

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 A608$_H$
Value after reset:	0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

12AB.5 Clock Domain Setting Method

12AB.5.1 Clock Domain Setting

12AB.5.1.1 Overview of Clock Selector Register

The clock selector for a clock domain C_AWO_<*name*>/C_ISO_<*name*> can be controlled by the following registers:

- Source clock selection registers
  These registers select the clock to be used as the domain clock from the available source clocks.
  - AWO source clock selection: CKSC_A<*name*>S_CTL
  - ISO source clock selection: CKSC_I<*name*>S_CTL
- Clock divider selection registers
  These registers specify the clock division ratio for the selected source clock.
  - AWO clock divider: CKSC_A<*name*>D_CTL
  - ISO clock divider: CKSC_I<*name*>D_CTL
- Source clock active registers and clock divider active registers
  These registers return the currently active source clock selection and division ratio, respectively.
  - AWO source clock active register/clock divider active register: CKSC_A<*name*>S_ACT/CKSC_A<*name*>D_ACT
  - ISO source clock active register/clock divider active register: CKSC_I<*name*>S_ACT/CKSC_I<*name*>D_ACT

NOTE

- Not all clock selectors provide all the control functions described above.
- The symbol “I”, which indicates the power domain, is not added to the names of registers within clock domain C_ISO_CPUCLK.

12AB.5.1.2 Setting Procedure for Clock Domain

Procedure of setting up clock domain is described as below:

1. Set up a source clock
   - Select a source clock. (CKSC_A<*name*>S_CTL, CKSC_I<*name*>S_CTL)
   - Confirm completion of selection. (CKSC_A<*name*>S_ACT, CKSC_I<*name*>S_ACT)*[1]
2. Setting a clock divider
   - Select a clock divider. (CKSC_A<*name*>D_CTL, CKSC_I<*name*>D_CTL)
   - Confirm completion of selection. (CKSC_A<*name*>D_ACT, CKSC_I<*name*>D_ACT)*[2]

Note 1. Continue processing after CKSC_A<*name*>S_ACT and CKSC_I<*name*>S_ACT are updated with the new values written to CKSC_A<*name*>S_CTL and CKSC_I<*name*>S_CTL.

Note 2. Continue processing after CKSC_A<*name*>D_ACT and CKSC_I<*name*>D_ACT are updated with the new values written to CKSC_A<*name*>D_CTL and CKSC_I<*name*>D_CTL.

CAUTION

The source clock to be selected must be operating before performing these settings.
The behavior and performance are not guaranteed if setup is performed while the source clock is stopped.
Access to a peripheral module is prohibited while the clock is not supplied to the module.

12AB.5.2 Stopping the Clock in Stand-by Mode

In stand-by mode (STOP mode, DeepSTOP mode, and Cyclic STOP mode), clock domain C_AWO_<*name*>/C_ISO_<*name*> can be configured to stop or continue its clock CKSCLK_A<*name*>/CKSCLK_I<*name*> in response to clock stop requests from the stand-by controller.

The clock stop mask registers are used to determine the operation status of the clock in stand-by mode:

- CKSC_A<*name*>_STPM.A<*name*>STPMSK/CKSC_I<*name*>_STPM.I<*name*>STPMSK = 0:
  The STOP request signal is not masked, so the domain clock CKSCLK_A<*name*>/CKSCLK_I<*name*> is stopped during stand-by mode.
  If the domain clock was in operation before transition to stand-by mode, it is automatically re-started after wake-up from stand-by mode.
  If there is another clock domain which the same source clock is selected and its stop mask setting is set to 1 (CKSC_A<*name*>_STPM.A<*name*>STPMSK/CKSC_I<*name*>_STPM.I<*name*>STPMSK=1), the source clock will continue operation in stand-by mode.
  The CPU clock domain C_ISO_CPUCLK is always stopped in stand-by mode.
- CKSC_A<*name*>_STPM.A<*name*>STPMSK/CKSC_I<*name*>_STPM.I<*name*>STPMSK = 1:
  The STOP request signal is masked, so CKSCLK_A<*name*>/CKSCLK_I<*name*> continues to operate during stand-by.
  The source clock selected for the target clock domain will also continue to operate in stand-by mode.
  Supply of a clock signal to the clock domains in the Isolated area (ISO area) will be stopped in DeepSTOP mode.

12AB.5.3 Clock Domain Settings

The following table shows a selectable source clock, a frequency division ratio, and a register to be used for each clock domain.

Table 12AB.79 List of Selectable Clocks (RH850/F1KH-D8)

Clock Domain	Clock Name	Selectable Register		Frequency Divided Register		Maximum Frequency	Applicable Unit
C_AWO_WDTA	CKSCLK_AWDTA	—	**LS IntOSC**	CKSC_AWDTAD_CTL	1/1	240 kHz	WDTA0
					1/128		
C_AWO_TAUJ	CKSCLK_ATAUJ	CKSC_ATAUJS_CTL	MainOSC	CKSC_ATAUJD_CTL	**1/1**	40 MHz	TAUJ0
			HS IntOSC		1/2		TAUJ2
			LS IntOSC		1/4		
			PPLLCLK2		1/8		
			Disable		—		
C_AWO_RTCA	CKSCLK_ARTCA	CKSC_ARTCAS_CTL	MainOSC	CKSC_ARTCAD_CTL	1/1	4 MHz	RTCA0
			LS IntOSC		1/2		
			SubOSC		1/4		
			Disable		1/8		
			—		**Disable**

			Disable				

Note: The items written in bold are the initial setting clocks for each register.

Note 1. It isn’t supported with 100-pin product.

Note 2. For the supported settings, refer to the **Table 12AB.18, PLL0 Output Table** and **Table 12AB.23, PLL1 Output Table**.

Note 3. The setting of this register only applies to RLIN30. The settings 1/4 and 1/8 are only available in UART mode.

Note 4. CKSC_CPUCLKS_CTL selects selection of Main OSC, CPLL0OUT, CPLL1OUT and EMCLK. CKSC_CPUCLKD_CTL.CPUCLKDPLL[2:0] selects clock frequency of CPLL0OUT or CPLL1OUT which is selected as a source clock of C_ISO_CPUCLK with CKSC_CPUCLKS_CTL.

CAUTION

To stop the clock source selected for the clock domain before transitioning to STOP/DeepSTOP mode, select “Disable” for that clock domain in advance. Do not stop the source clock of a clock domain for which “Disable” cannot be selected while functions are operating on that clock domain. To stop the clock source selected for the domain by transitioning to STOP/DeepSTOP mode, “Disable” does not need to be selected.
Instead of setting “Disable”, select “Stop” for the clock domain in stand-by mode by using the stop mask register.

12AB.5.4 CPUCLK Source and Divided Clock Selection Method

In case of changing CPUCLK frequency, follow the procedure below.

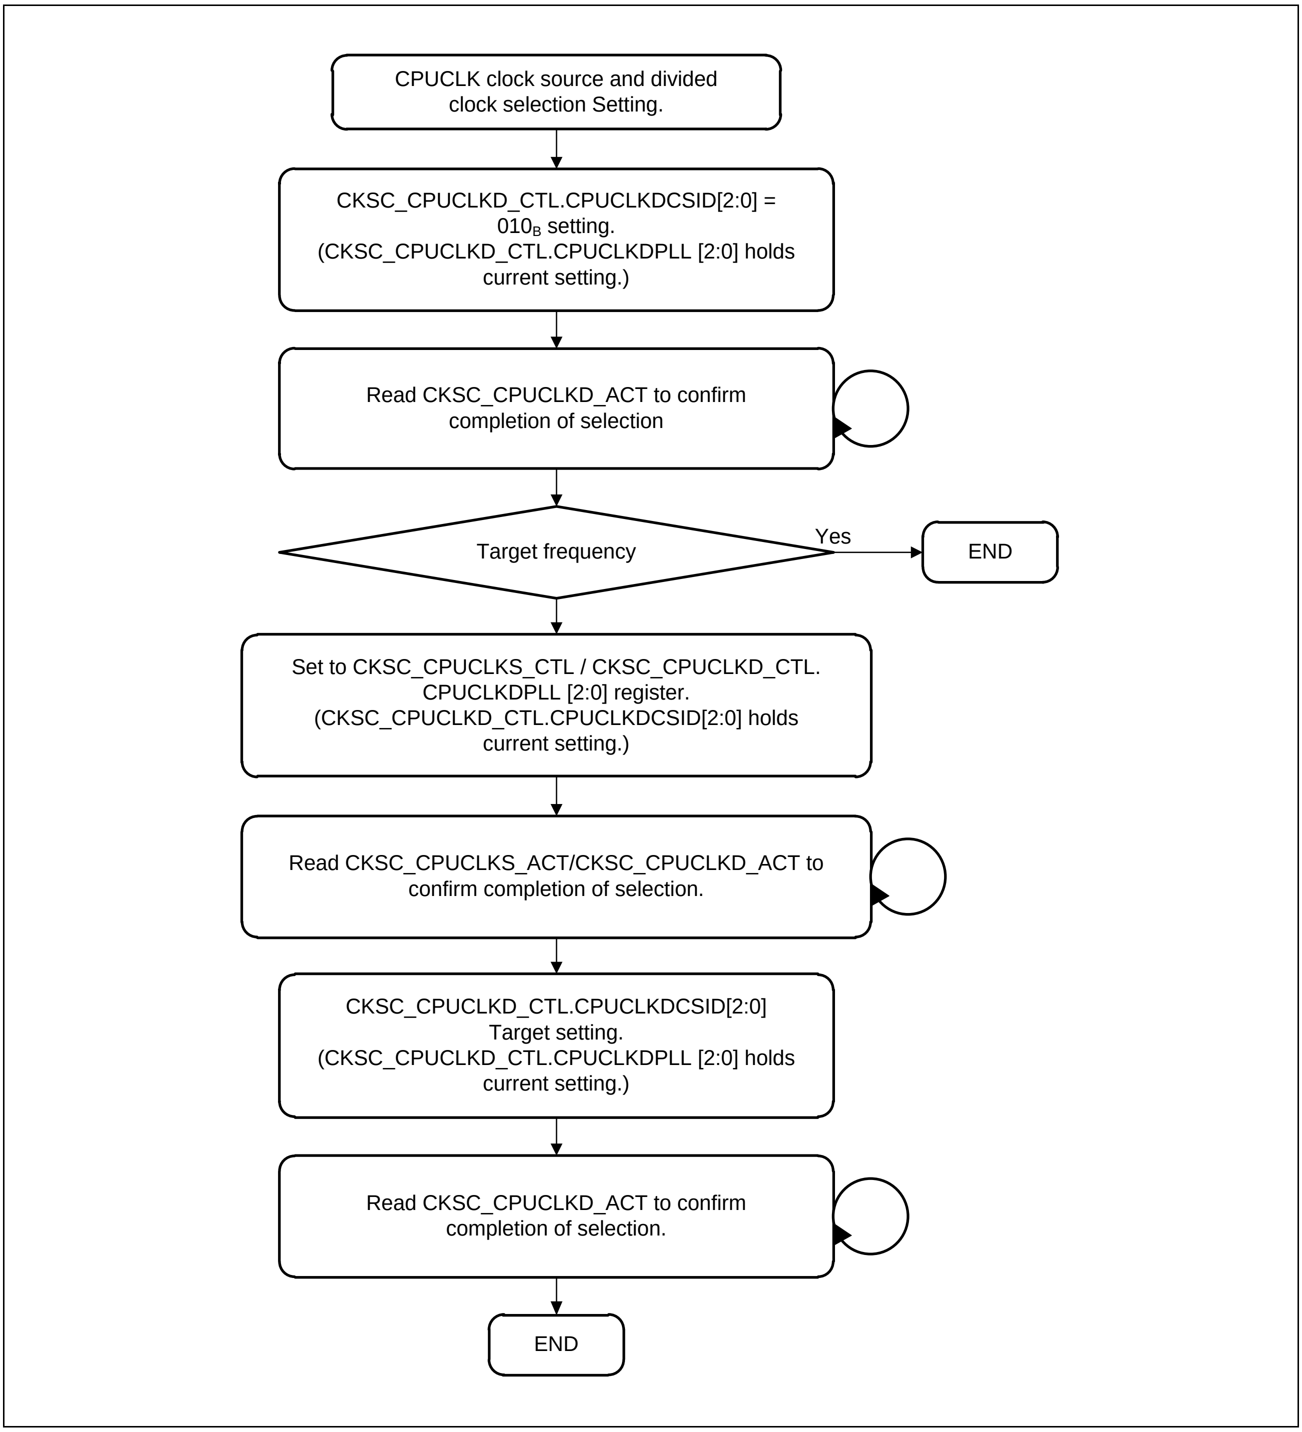

Figure 12AB.10 CPUCLK Source and Divided Clock Selection Method

CAUTION

In RH850/F1KH-D8, operation cannot be guaranteed unless the above procedure is conformed.

In RH850/F1KM-S4, the above procedure is optional.

12AB.5.5 CPUCLK Setting in STOP Mode Method

Transition before STOP mode, follow the procedure below.

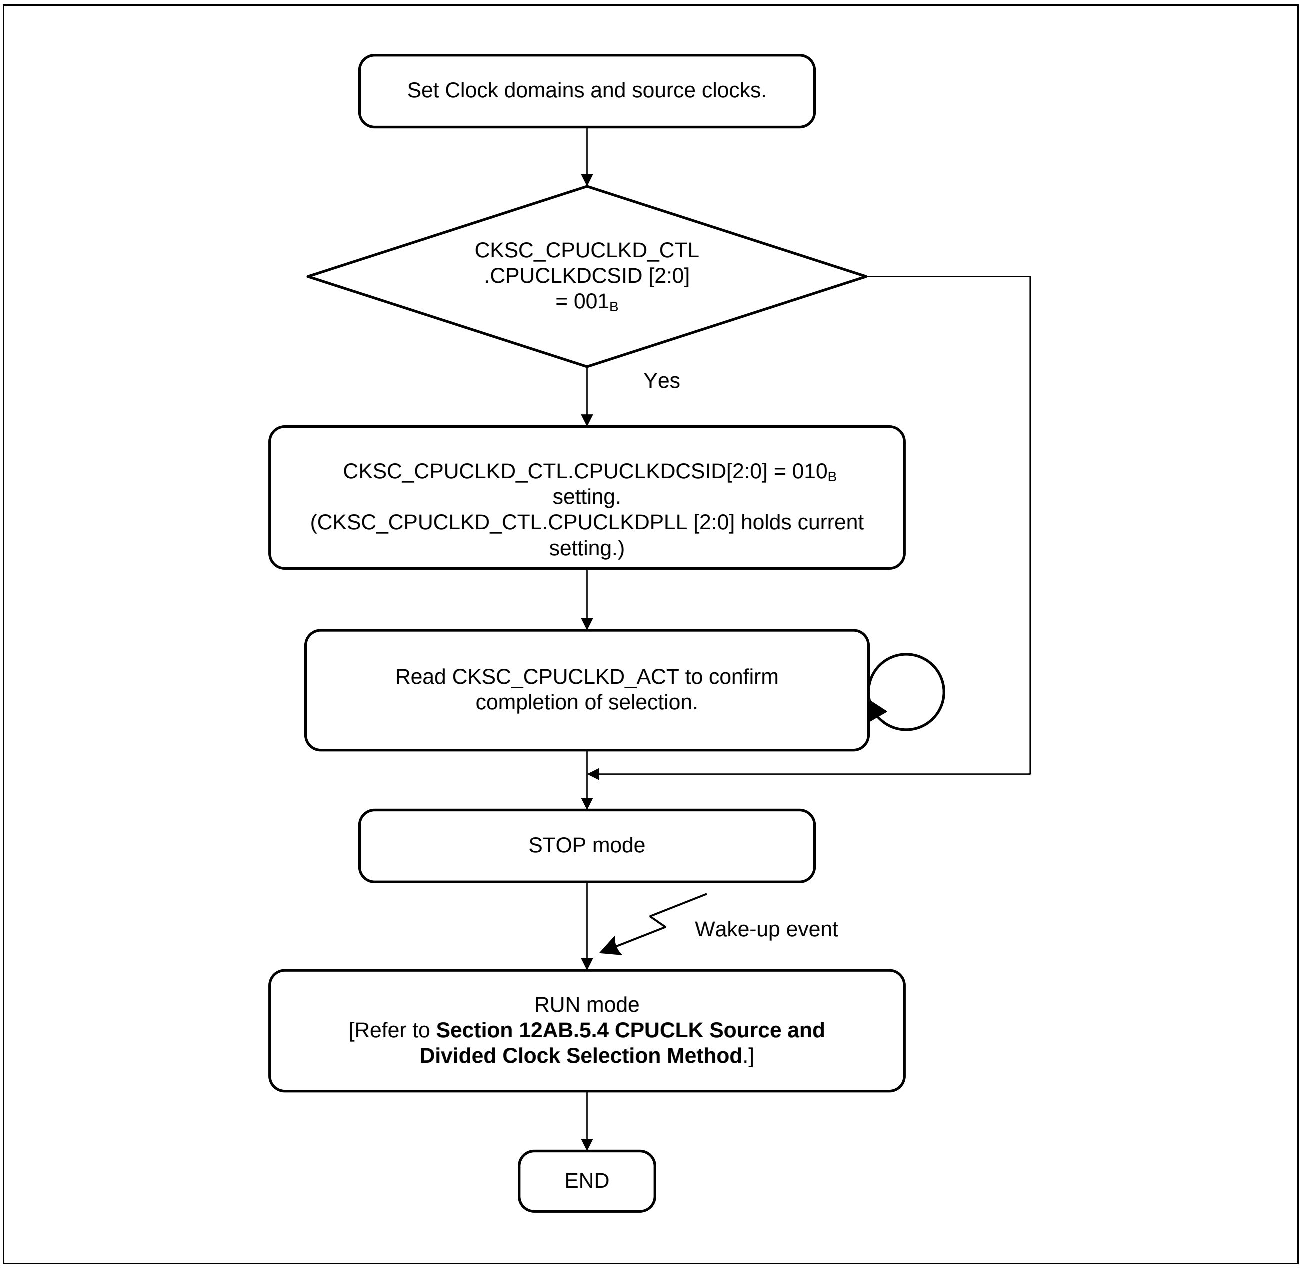

Figure 12AB.11 CPUCLK Setting in STOP Mode Method

CAUTION

In RH850/F1KH-D8, operation cannot be guaranteed unless the above procedure is conformed.

In RH850/F1KM-S4, the above procedure is optional.

12AB.6 Frequency Output Function (FOUT)

The frequency output function (FOUT) allows the clock to be output the clock as the external signal. Furthermore, the frequency can be divided by the clock divider before it is output.

12AB.6.1 Functional Overview

Figure 12AB.12, Frequency Output Function shows the configuration of the frequency output function.

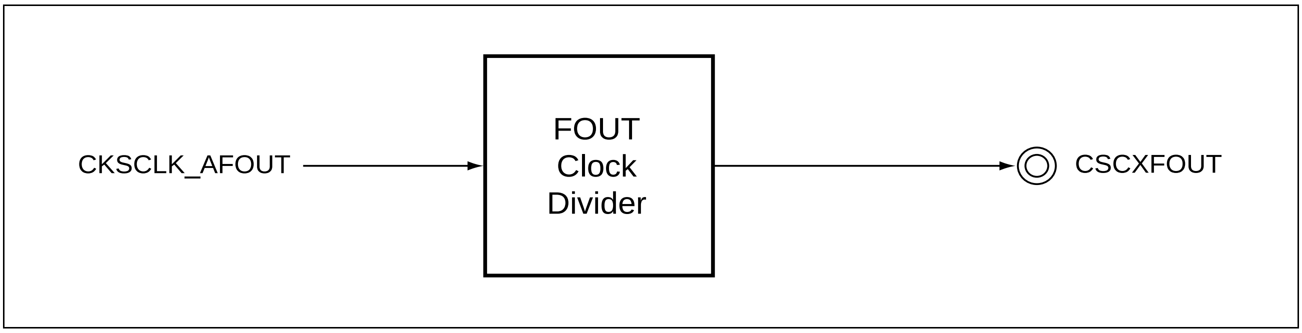

Figure 12AB.12 Frequency Output Function

The clock output function outputs the CKSCLK_AFOUT clock divided by 1 to 63 through the clock divider from CSCXFOUT. Division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register. Clock output frequency f_{CSCXFOUT} is expressed by the following equation.

$$f_{\mathrm{CSCXFOUT}} = (\text{CKSCLK\_AFOUT clock frequency}) / N$$

Clock output starts when, after CKSCLK_AFOUT is set and the clock output for the pin function is selected, division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register.

When a new division ratio is written to the FOUTDIV.FOUTDIV[5:0] bits, it becomes effective in synchronization with the CSCXFOUT output clock. Accordingly, the division ratio can be changed even while the CSCXFOUT clock is operating. The clock output is stopped by writing 000_H to the FOUTDIV[5:0] bits.

12AB.6.2 Clock Supply

The clock supply to the CSCXFOUT is shown in the following table.

Table 12AB.81 Clock Supply

Module	Unit Clock Name	Supply Clock Name	Description
CSCXFOUT	PCLK	CPUCLK_UL	Bus clock (Register access)
	CKSCLK_AFOUT	CKSCLK_AFOUT	Clock source of FOUT clock divider

12AB.6.3 Registers

12AB.6.3.1 List of Registers

The FOUT registers are listed in the following table.

Table 12AB.82 List of Registers

Module Name	Register Name	Symbol	Address
CLKCTL	Clock division ratio register	FOUTDIV	FFF8 2800_H
	Clock divider status register	FOUTSTAT	FFF8 2804_H

12AB.6.3.2 FOUTDIV — Clock Division Ratio Register

This register defines the clock divisor.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 2800$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 12AB.83 FOUTDIV Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	FOUTDIV[5:0]	Clock Divider N 00$_H$: Clock output is stopped 01$_H$: N = 1 02$_H$: N = 2 : 3E$_H$: N = 62 3F$_H$: N = 63

12AB.6.3.3 FOUTSTAT — Clock Divider Status Register

This register indicates the clock output status.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2804_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FOUTCLKACT	FOUTSYNC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12AB.84 FOUTSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	FOUTCLKACT	Clock Divider Active 0: Frequency output is stopped. 1: Frequency output is ongoing.
0	FOUTSYNC	Clock Divider Synchronized 0: The clock divider is in the process of synchronization. 1: The clock divider is stable (or stopped).

Section 12C Clock Controller of RH850/F1KM-S1

This section explains in general about the clock controller.

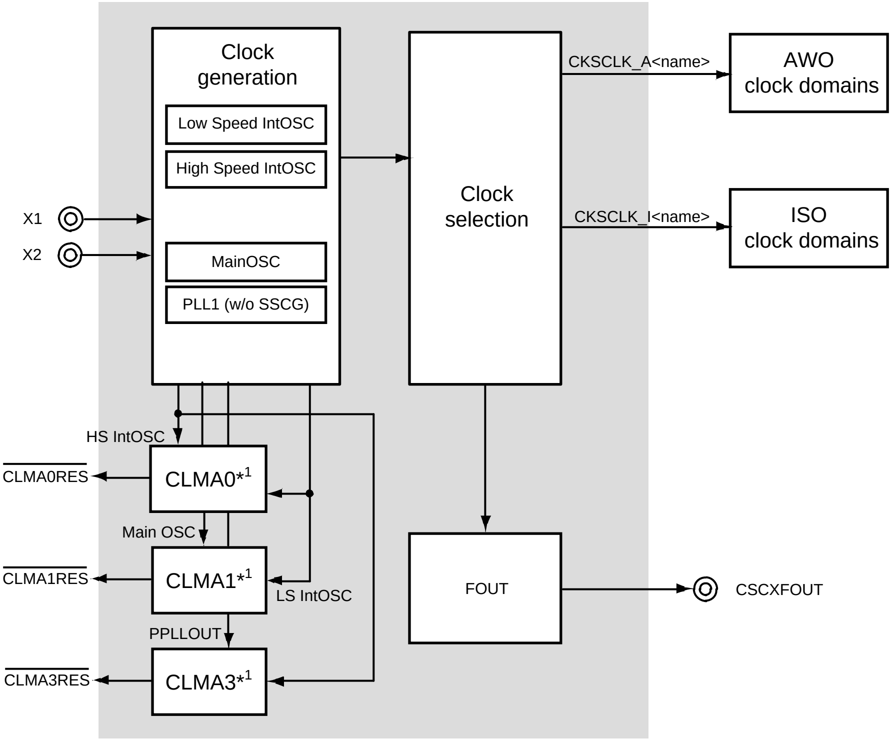
The first part in this section describes the specific features of the clock controller of the RH850/F1KM microcontrollers. The ensuing sections describe the clock oscillation circuit, clock selectors, and clock output function that make up the clock controller.

12C.1 Features of RH850/F1KM Clock Controller

The clock controller of the RH850/F1KM microcontrollers has the following features.

- Four on-chip clock oscillators
  - Main Oscillator (MainOSC) with an oscillation frequency of 8, 16, 20, and 24 MHz
  - High Speed Internal Oscillator (HS IntOSC) with a nominal frequency of 8 MHz (Typ.)
  - Low Speed Internal Oscillator (LS IntOSC) with a nominal frequency of 240 kHz (Typ.)
  - PLL without SSCG (PLL1)
- Fine management of clock supply to peripheral modules through clock domains
- On-chip clock monitor that detects clock anomalies when the Main Oscillator, High Speed Internal Oscillator, or PLL are in use. See **Section 13, Clock Monitor (CLMA)**.
- Clock output (FOUT)

Figure 12C.1, Clock Controller Overview shows the schematic diagram of the clock controller.



Note 1. See **Section 13, Clock Monitor (CLMA)** for details of clock monitors.

Figure 12C.1 Clock Controller Overview

12C.2 Configuration of Clock Controller

This section describes the configuration of the clock controller.

The clock controller is composed of clock oscillators and clock generation circuits that generate the clocks for the CPU and the peripheral modules, a clock selector for selecting the optimum clock, and clock domains for the CPU and the peripheral modules.

Figure 12C.2, Clock Controller Configuration shows the configuration of the clock controller.

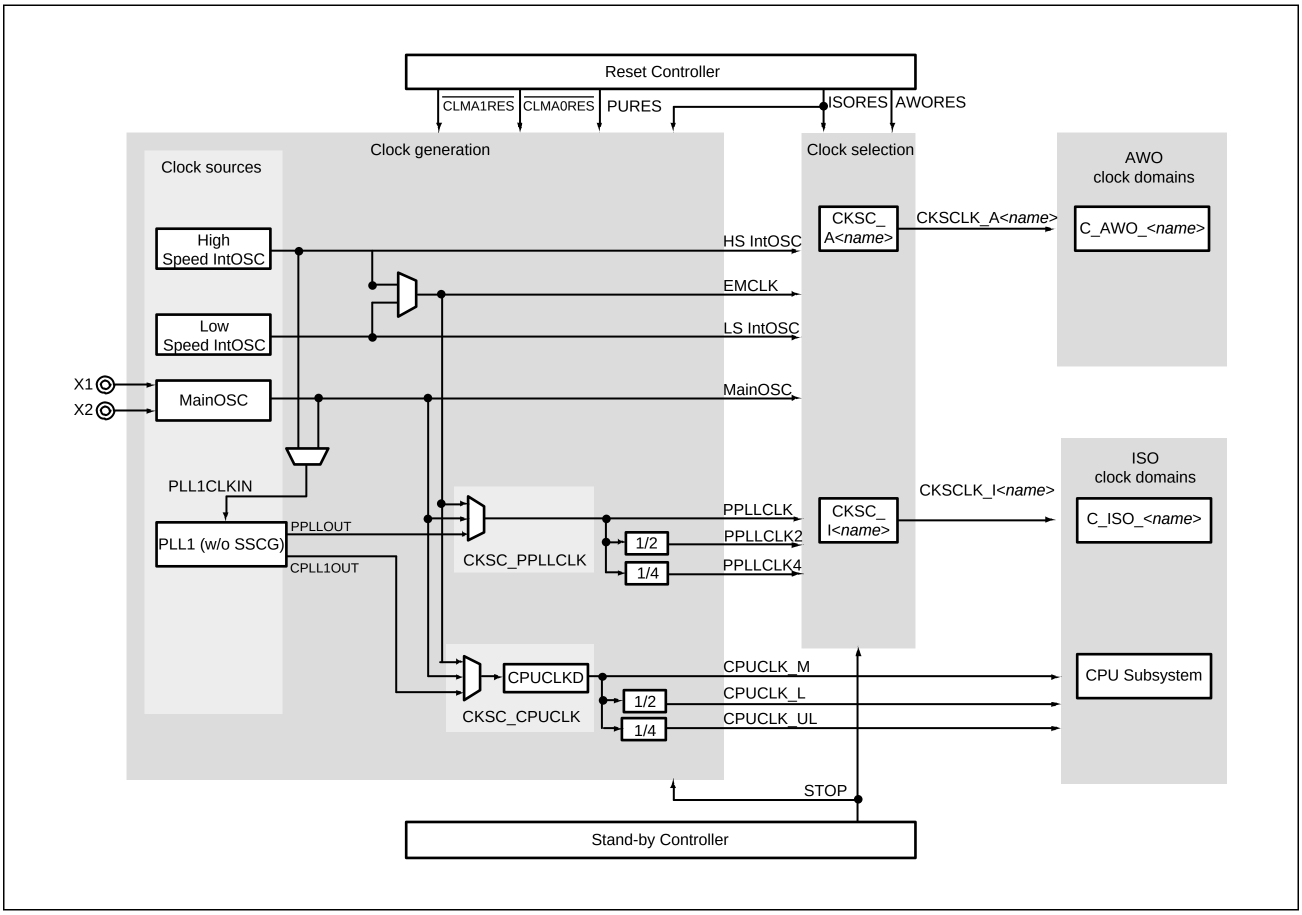


Figure 12C.2 Clock Controller Configuration

NOTE

Clock domain and clock control register naming conventions

The clock signals and their control registers, etc., described in this section are named according to the following naming conventions to reflect the power domain or clock domain to which they belong. The placeholder “<*name*>” is used to identify the target module in the clock domain:

- Clock domain names:
  - C_AWO_<*name*>: Always-On area (AWO area)*[1] clock domain
  - C_ISO_<*name*>: Isolated area (ISO area)*[1] clock domain
- Domain clock names:
  - CKSCLK_A<*name*>: Always-On area (AWO area) domain clock
  - CKSCLK_I<*name*>: Isolated area (ISO area) domain clock
- Clock selector names:
  - CKSC_A<*name*>: Always-On area (AWO area) clock selector
  - CKSC_I<*name*>: Isolated area (ISO area) clock selector
- Clock selector registers:
  - CKSC_A<*name*>S_CTL: Always-On area (AWO area) source clock selector register
  - CKSC_A<*name*>D_CTL: Always-On area (AWO area) source clock divider register
  - CKSC_I<*name*>S_CTL: Isolated area (ISO area) source clock selector register
  - CKSC_I<*name*>D_CTL: Isolated area (ISO area) source clock divider register

Example

The clock signal CKSCLK_AADCA (placeholder <*name*> = ADCA) is the clock supplied to the clock domain C_AWO_ADCA in the Always-On area (AWO area). This clock is selected by the clock selector register CKSC_AADCAS_CTL.

Note 1. Always-On area (AWO area) and Isolated area (ISO area) refer to the power supply domains. Always-On area (AWO area) is an always-on power supply, and Isolated area (ISO area) is an isolated power supply that is switched on or off by the operation mode.
For details, see **Section 10C, Power Supply Circuit of RH850/F1KM-S1**.

12C.2.1 Clock Generation Circuits

Four clock oscillators are provided:

Three clock oscillators are located on the Always-On area (AWO area) and PLL (PLL1) is located on the Isolated area (ISO area).

Main Oscillator (MainOSC)

The MainOSC generates the main clock X.
Generation of the clock X requires the connection of an external resonator to X1 and X2.
The clock X is used as the reference clock for the PLL.

High Speed Internal Oscillator (HS IntOSC)

The HS IntOSC generates the clock RH, which runs at a frequency of 8 MHz (Typ.).

Low Speed Internal Oscillator (LS IntOSC)

The LS IntOSC generates the clock RL, which runs at a frequency of 240 kHz (Typ.). It starts operation at power up and cannot be stopped, hence it is always operating.

PLL

The PLL circuits generate high speed operation clocks CPLL1OUT and PPLLOUT for normal operation of the microcontroller.

The clocks supplied by the clock oscillators (X, XT, RH, RL, CPLL1OUT, PPLLOUT) and their divided clocks (CPUCLK_M, CPUCLK_L, CPUCLK_UL, PPLLCLK, PPLLCLK2, and PPLLCLK4) are all generated in the clock generation circuit.

12C.2.2 Clock Selection

The clocks generated by the clock oscillators are input to the clock selectors CKSC_A<*name*>/CKSC_I<*name*>.

Domain clocks CKSCLK_A<*name*>/CKSCLK_I<*name*> are selected by dedicated clock selectors from clocks directly input from the oscillators, or in some cases from clocks that have been divided by clock dividers.

- CKSC_I<*name*>S_CTL/CKSC_I<*name*>D_CTL registers: determine the clock for the Isolated area (ISO area) clock domains.
- CKSC_A<*name*>S_CTL/CKSC_A<*name*>D_CTL registers: determine the clock for the Always-On area (AWO area) clock domains.

Note that not all available clocks generated by the clock oscillators are input to each clock selector.

The following clocks are supplied to the CPU and related modules from the clock generation circuit.

Emergency Clock (EMCLK)

The emergency clock EMCLK is supplied by the

- HS IntOSC, if it is active
- LS IntOSC, if the HS IntOSC is inactive

The selection is done automatically after CLMA0 reset is occurred, so if the HS IntOSC becomes lower than the limit for any reason, vital modules of the microcontroller are still in operation, since the LS IntOSC does not stop.

CPU Subsystem Clock (CPUCLK)

The CPU Subsystem clock CPUCLK is derived from PLL1 clock CPLL1OUT, MainOSC, and EMCLK. The CPU clock selector CKSC_CPUCLK incorporates the selector CPUCLKS, followed by the clock divider CPUCLKD.

The CPUCLK clock divider provides the frequency-divided CPUCLK_L clock signal and CPUCLK_UL clock signal derived from CPUCLK.

12C.2.3 Clock Domains

The clock controller allows selection of the respective clocks for the CPU and peripheral modules. The clock control scope is called the clock domain. For the correspondence between the CPU and peripheral modules and clock domains, see **Section 12C.5.3, Clock Domain Settings**.

12C.2.4 Resetting Clock Oscillators

The clock oscillators on the Always-On area (AWO area) are reset by the PURES signal.

The HS IntOSC is reset when $\overline{\text{CLMA0RES}}$ is generated and the MainOSC is reset when $\overline{\text{CLMA1RES}}$ is generated.

The clock oscillator on the Isolated area (ISO area) is reset by the ISORES signal.

For further details on the clock oscillators, see **Section 12C.3, Clock Oscillators**.

CAUTION

For the specifications of the frequencies, acceptable variation, and other parameters of the clock generators, see **Section 47C, Electrical Characteristics of RH850/F1KM-S1**.

12C.3 Clock Oscillators

12C.3.1 Main Oscillator (MainOSC)

The Main Oscillator generates the clock X. X is also used as the PLL1 input clock PLL1CLKIN.

Figure 12C.3, Main Oscillator (MainOSC) shows the basic configuration and signals of the MainOSC.

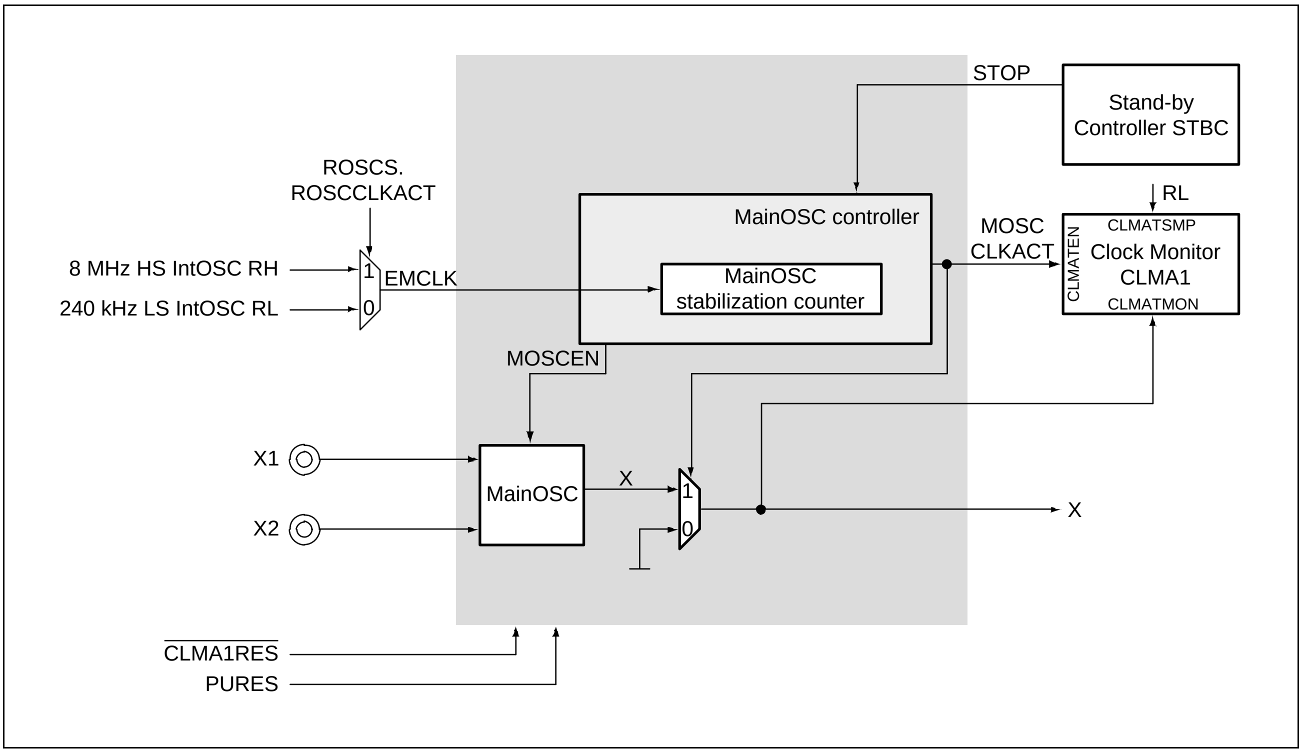

Figure 12C.3 Main Oscillator (MainOSC)

MainOSC

The MainOSC stops operating after reset is released. To use the MainOSC, set the MainOSC enable trigger bit (MOSCE.MOSCENTRG) to 1 to start the MainOSC.

MainOSC Stabilization

The MOSCST.MOSCCLKST[16:0] bits set the MainOSC oscillation stabilization time.
The MainOSC stabilization counter counts the oscillation stabilization time with EMCLK as the clock source for counting. The oscillation stabilization time can be set to up to $2^{17} – 1$ EMCLK cycles.
As long as the MainOSC is not stable, the MOSCCLKACT signal disables the X output.
When the MainOSC stabilization counter reaches the value specified in MOSCST.MOSCCLKST[16:0], X is assumed to be stable and MOSCCLKACT switches from 0 to 1 to enable output of X when a waveform is output from MainOSC.

Stable and active X clock is indicated by MOSCS.MOSCCLKACT = 1.

MainOSC Amplification Gain

By using MOSCC.MOSCAMPSEL[1:0], the MainOSC’s input frequency, determined by the external resonator, can be selected from 8 MHz, 16 MHz, 20 MHz, and 24 MHz.

MainOSC STOP Requests in Stand-by Mode

The STOP signal from the Stand-by Controller requests the MainOSC Controller to switch off the X clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).

The stop request mask bit MOSCSTPM.MOSCSTPMSK controls whether the MainOSC is stopped during stand-by or continues operation:

- MOSCSTPM.MOSCSTPMSK = 0:
  The STOP request signal is not masked, so the MainOSC is stopped in stand-by.
  If the MainOSC is in operation before stand-by, it is automatically re-started after wake-up from stand-by, and the MainOSC stabilization counter counts the oscillation stabilization time.
  However, the STOP request is masked under the following conditions, even if MOSCSTPM.MOSCSTPMSK = 0. Therefore, the MainOSC will continue to operate even in stand-by mode.
  - If the stop mask is set (CKSC_xxxx_STPM = 0000 0003_H) for a clock domain for which the MainOSC is selected.
- MOSCSTPM.MOSCSTPMSK = 1:
  The STOP request signal is masked, so the MainOSC continues to operate in stand-by.

Clock Monitor Control

The MainOSC activity signal MOSCCLKACT enables or disables supervision by the Clock Monitor CLMA1. In case the MainOSC is inactive (MOSCCLKACT = 0), supervision of its output clock X by CLMA1 is also disabled.

MainOSC Enable/Disable Trigger

The MainOSC can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger MOSCE.MOSCENTRG = 1 starts the MainOSC.
  Note that setting the enable trigger is only effective if the MainOSC is inactive, i.e. if MOSCS.MOSCCLKACT = 0.
- Disable trigger MOSCE.MOSCDISTRG = 1 stops the MainOSC.
  Note that setting the disable trigger is only effective if the MainOSC is active (MOSCCLKACT = 1) and the MainOSC stop requests are not masked (MOSCSTPM.MOSCSTPMSK = 0).

Direct Clock Input to X1 (EXCLK mode)

A clock waveform from an external clock source can be supplied to X1 pin. In this case, set the MOSCM bit of MOSCM register to 1 before clock input to X1 pin is supplied.

12C.3.2 High Speed Internal Oscillator (HS IntOSC)

The High Speed Internal Oscillator generates the clock RH. RH has a nominal frequency of 8 MHz.

Figure 12C.4, High Speed Internal Oscillator (HS IntOSC) shows the basic configuration and signals of the HS IntOSC.

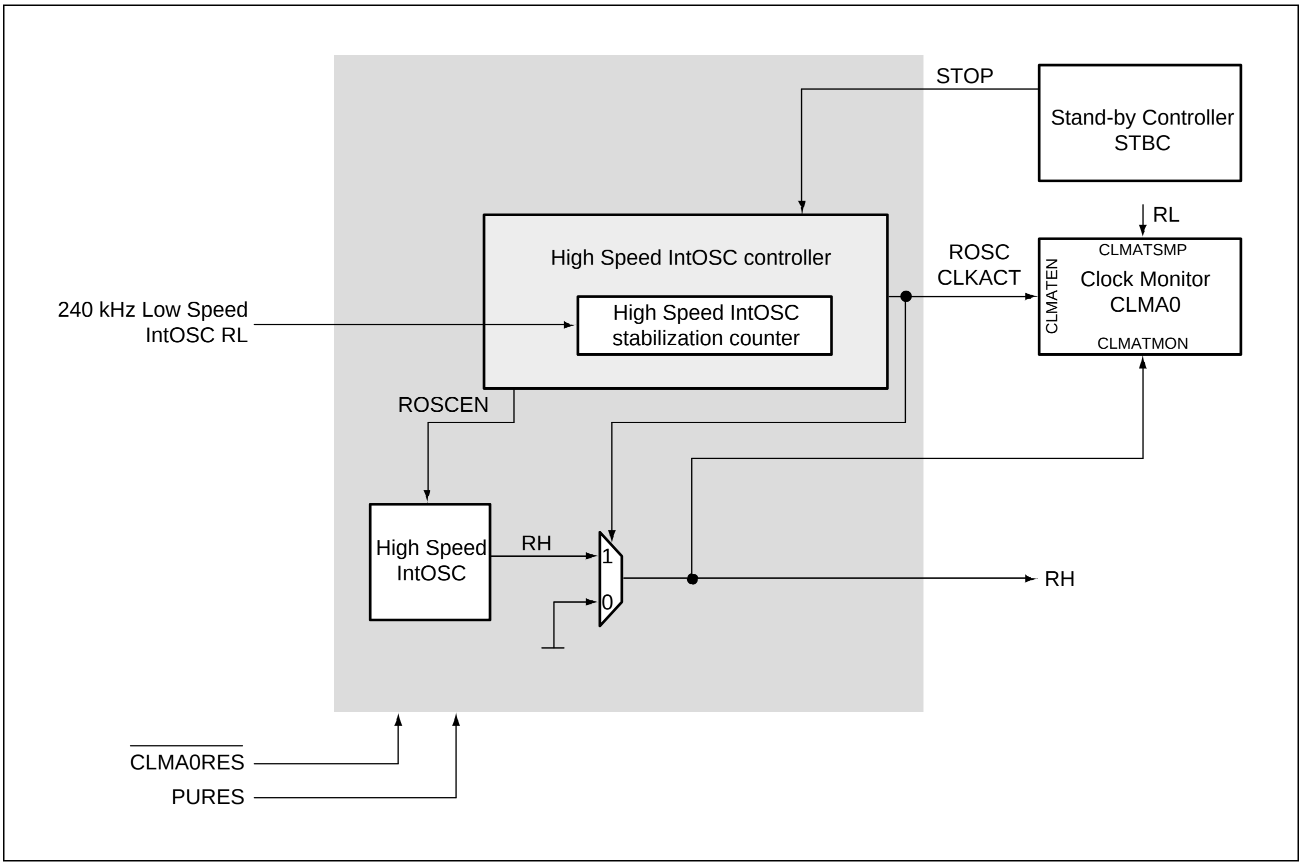

Figure 12C.4 High Speed Internal Oscillator (HS IntOSC)

After reset release the HS IntOSC starts operation.

NOTE

The HS IntOSC can neither be stopped nor started by software. It can only be stopped in stand-by mode. On the other hand, when CLMA0 is reset, the HS IntOSC can be enabled to stop by software.

HS IntOSC Stabilization

HS IntOSC outputs RH when it is stabilized.
Stable and active RH clock is indicated by ROSCS.ROSCCLKACT = 1.

HS IntOSC STOP Requests in Stand-by Mode

The STOP signal from the Stand-By Controller requests the HS IntOSC Controller to switch off the RH clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).
The stop request mask bit ROSCSTPM.ROSCSTPMSK controls whether the HS IntOSC is stopped during stand-by or continues operation:

- ROSCSTPM.ROSCSTPMSK = 0:
  The STOP request signal is not masked, so the HS IntOSC is stopped during stand-by and automatically restarted after wake-up from stand-by.
  However, the STOP request is masked under the following conditions, even if ROSCSTPM.ROSCSTPMSK = 0. Therefore, the HS IntOSC will continue to operate even in stand-by mode.
  - If the stop mask is set (CKSC_xxxx_STPM = 0000 0003_H) for a clock domain for which the HS IntOSC is selected.
  - If the low power sampler (LPS) is operating
- ROSCSTPM.ROSCSTPMSK = 1:
  The STOP request signal is masked, so the HS IntOSC continues to operate during stand-by.

Clock Monitor Control

The HS IntOSC activity signal ROSCCLKACT enables or disables supervision by the Clock Monitor CLMA0. In case the HS IntOSC is inactive (ROSCCLKACT = 0), supervision of its output clock by CLMA0 is also deactivated.

The HS IntOSC clock RH is used as the sampling clock for Clock Monitor CLMA3.

HS IntOSC Disable Trigger

The disable trigger, ROSCE.ROSCDISTRG = 1 stops the HS IntOSC.

The setting of the disable trigger is enabled when HS IntOSC is active (ROSCS.ROSCCLKACT = 1) and HS IntOSC stop requests are not masked (ROSCSTPM.ROSCSTPMSK = 0).

HS IntOSC User Calibration Function

The HS IntOSC User trimming register (ROSCUT) enables adjustment of HS IntOSC frequency. The initial value of ROSCUT is preset value of the HS IntOSC trimming data. Overwrite the value with “read value + 1” or “read value – 1” until the HS IntOSC frequency reaches the target frequency range.

12C.3.3 Low Speed Internal Oscillator (LS IntOSC)

The Low Speed Internal Oscillator generates the clock RL. RL has a nominal frequency of 240 kHz.

Figure 12C.5, Low Speed Internal Oscillator (LS IntOSC) shows the basic configuration and signals of the LS IntOSC.

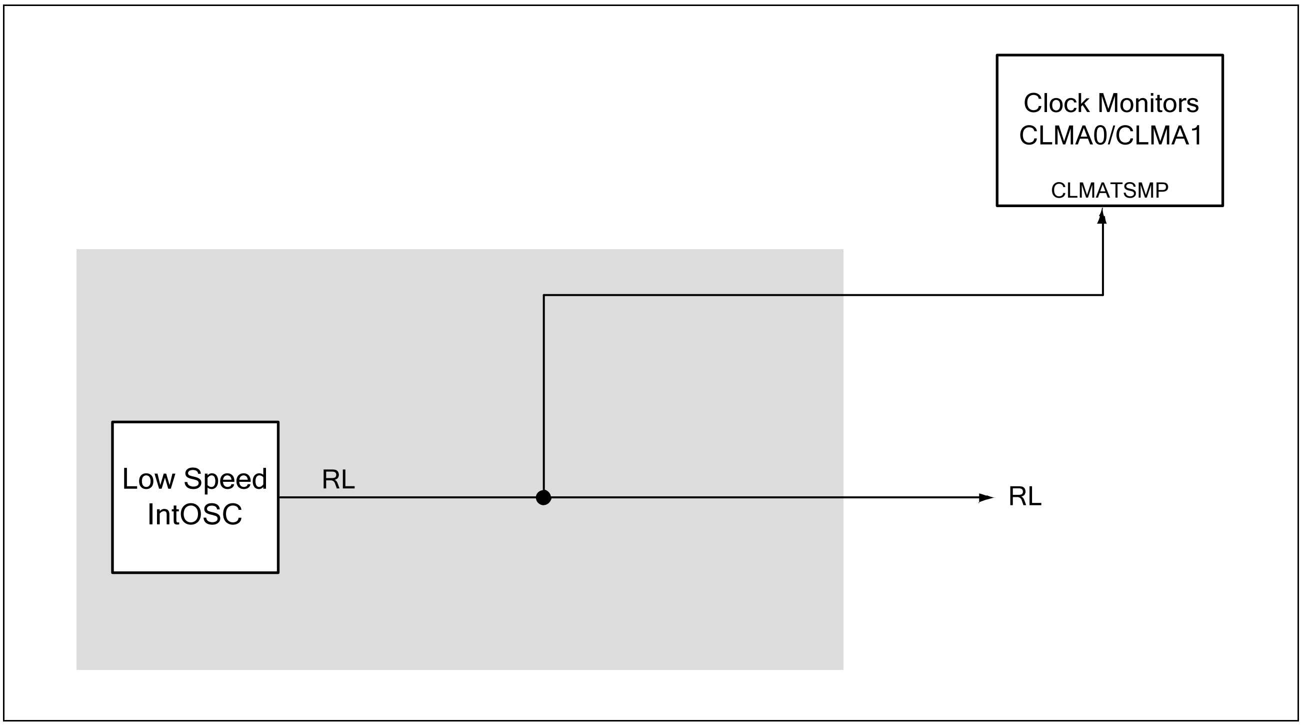

Figure 12C.5 Low Speed Internal Oscillator (LS IntOSC)

After reset release the LS IntOSC starts operation. It cannot be stopped.

The LS IntOSC clock RL is used as the sampling clock for the Clock Monitors CLMA0 and CLMA1.

12C.3.4 PLL

MainOSC or HS IntOSC is input to the phase-locked loops (PLL1) clock oscillator as PLL1CLKIN. The PLL1 output clocks CPLL1OUT and PPLLOUT serve as the main operation clocks for the microcontroller.

Figure 12C.6, PLL shows the basic configuration and signals of the PLL.

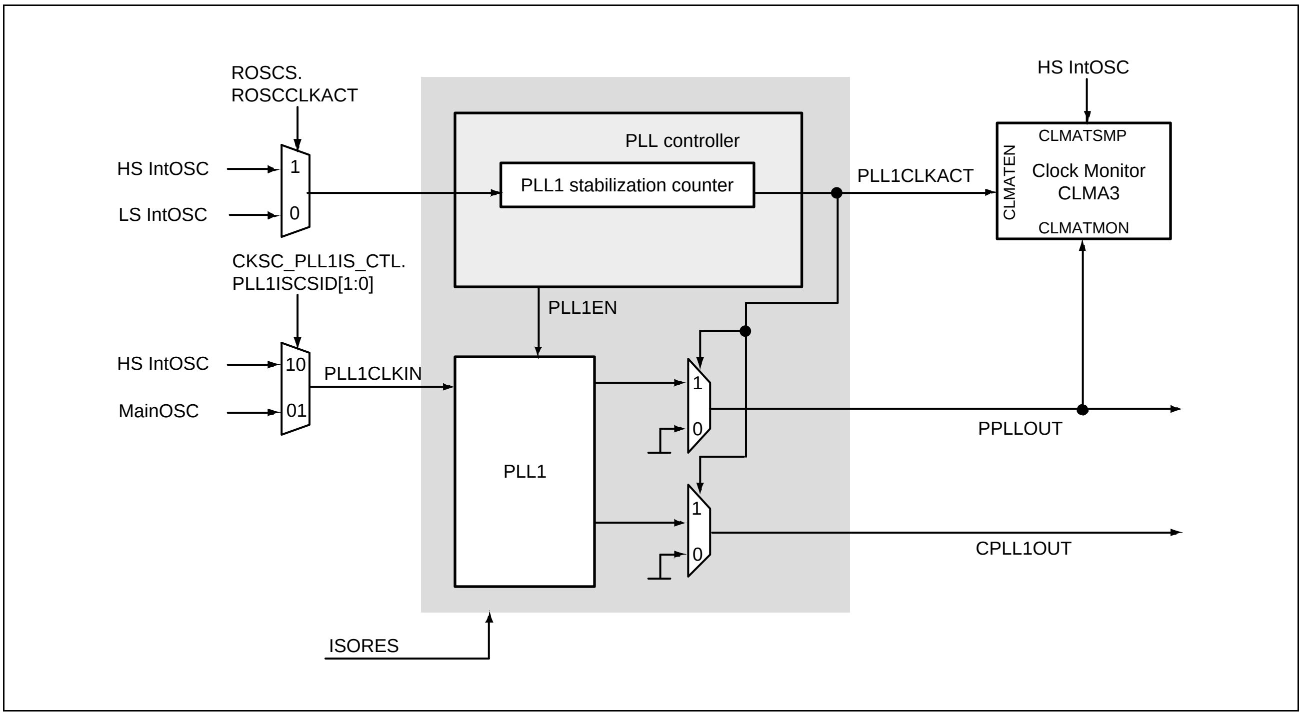

Figure 12C.6 PLL

PLL Enable

The PLL1 stops operating after reset is released. To use the PLL1, set the PLL1 enable trigger bit (PLL1E.PLL1ENTRG) to 1 to start the PLL1.

PLL Stabilization

The PLL1 stabilization counter starts counting the stabilization time, after PLL1 enabled.
As long as the PLL1 is not stable, the PLL1CLKACT signal disables the PPLLOUT and CPLL1OUT outputs.
When the PLL1 stabilization counter reaches the predefined value, PPLLOUT and CPLL1OUT are assumed to be stable and PLL1CLKACT switches from 0 to 1 to enable output of PPLLOUT and CPLL1OUT.

The stable and active state of the PPLLOUT and CPLL1OUT clocks is indicated by PLL1S.PLL1CLKACT = 1.

PLL in Stand-by Modes

In STOP mode, the PLL1 is automatically disabled and resumes operation after wake-up from STOP mode, if it was operating before entering STOP mode.

The PLL1 is also automatically disabled when transitioning to DeepSTOP mode. However, after restoring from DeepSTOP mode, the PLL1 needs to be reconfigured.

In Cyclic RUN and Cyclic STOP mode, the PLL1 is not available. Do not enable the PLL1 in Cyclic RUN mode.

Clock Monitor Control

The PLL1 activity signal PLL1CLKACT enables or disables supervision by the Clock Monitor CLMA3. In case the PLL1 is inactive (PLL1CLKACT = 0), supervision of the output clock PPLLOUT by CLMA3 is also deactivated.

PLL Enable/Disable Trigger

The PLL1 can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger PLL1E.PLL1ENTRG = 1 starts the PLL1
  Note that setting the enable trigger is only effective if the PLL1 is inactive, i.e. if PLL1S.PLL1CLKACT = 0.
- Disable trigger PLL1E.PLL1DISTRG = 1 stops the PLL1
  Note that setting the disable trigger is only effective if the PLL1 is active, i.e. if PLL1S.PLL1CLKACT = 1.

PLL Input Clock Selection

The PLL1 input clock (PLL1CLKIN) can be selected from MainOSC and HS IntOSC by using the CKSC_PLL1IS_CTL register.

The maximum frequency of CPLL1OUT and PPLLOUT is limited when the HS IntOSC is selected as PLL1 input clock.

12C.3.4.1 PLL1 Parameters

The PLL1 is configured by a set of parameters, loaded from the control register PLL1C and CKSC_CPUCLKD_CTL.

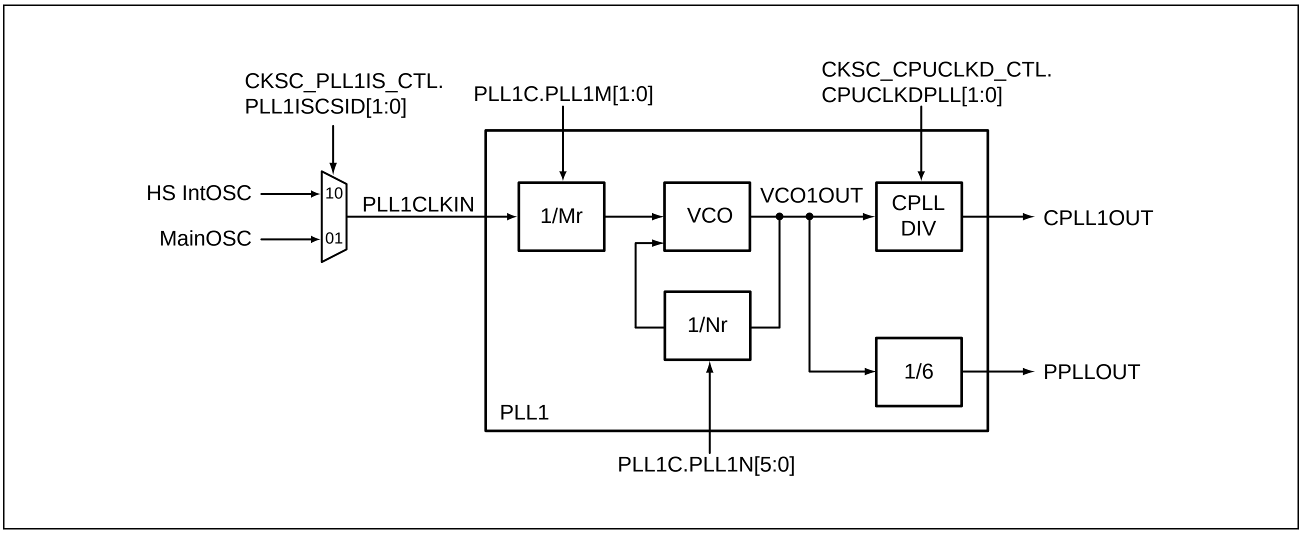

Figure 12C.7 PLL1 Circuit

CPLL1OUT and PPLLOUT

The PLL1 has two clock outputs “CPLL1OUT” and “PPLLOUT”. The CPLL1OUT is one of the clock sources of the CPU subsystem, and the PPLLOUT is one of the clock sources of the peripheral modules. CPLL1OUT and PPLLOUT shares the same clock source “VCO1OUT”, which is the output of the voltage controlled oscillator (VCO). The clock frequency of VCO1OUT is calculated by the following formula:

$f_{VCO1OUT} = f_{PLL1CLKIN} \times (Nr / Mr)$

The clock frequency of CPLL1OUT “$f_{CPLL1OUT}$” and that of PPLLOUT “$f_{PPLLOUT}$” are integer fractions of the VCO output frequency $f_{VCO1OUT}$. $f_{CPLL1OUT}$ and $f_{PPLLOUT}$ are calculated by the following formulas:

$f_{CPLL1OUT} = f_{VCO1OUT} \times 1/Pr = f_{PLL1CLKIN} \times (Nr / Mr) \times 1/Pr$

$f_{PPLLOUT} = f_{VCO1OUT} \times 1/6 = f_{PLL1CLKIN} \times (Nr / Mr) \times 1/6$

The values Nr and Mr are derived from PLL1C register bits:

Nr = PLL1C.PLL1N[5:0] + 1

Mr = PLL1C.PLL1M[1:0] + 1

The setting range of Mr: $1 \leq Mr \leq 3$

The value Pr is derived from CKSC_CPUCLKD_CTL. CPUCLKDPLL[1:0], and the value is 4, 5, or 6.

12C.4 Registers

12C.4.1 List of Registers

The registers of the clock controller are listed below.

Table 12C.1 List of Registers

Module Name	Register Name	Symbol	Address
CLKCTL	Clock oscillator registers:		
	MainOSC enable register	MOSCE	FFF8 1100_H
	MainOSC status register	MOSCS	FFF8 1104_H
	MainOSC control register	MOSCC	FFF8 1108_H
	MainOSC stabilization time register	MOSCST	FFF8 $110C_H$
	MainOSC stop mask register	MOSCSTPM	FFF8 1118_H
	MainOSC mode control register	MOSCM	FFF8 $111C_H$
	HS IntOSC enable register	ROSCE	FFF8 1000_H
	HS IntOSC status register	ROSCS	FFF8 1004_H
	HS IntOSC stop mask register	ROSCSTPM	FFF8 1018_H
	HS IntOSC user trimming register	ROSCUT	FFF8 $101C_H$
	PLL1 enable register	PLL1E	FFF8 9000_H
	PLL1 status register	PLL1S	FFF8 9004_H
	PLL1 control register	PLL1C	FFF8 9008_H
	PLL1 input clock selection register	CKSC_PLL1IS_CTL	FFF8 $A700_H$
	PLL1 input clock active register	CKSC_PLL1IS_ACT	FFF8 $A708_H$
	PPLLCLK source clock selection register	CKSC_PPLLCLKS_CTL	FFF8 $A010_H$
	PPLLCLK source clock active register	CKSC_PPLLCLKS_ACT	FFF8 $A018_H$
	Clock selector control register:		
	C_AWO_WDTA clock divider selection register	CKSC_AWDTAD_CTL	FFF8 2000_H
	C_AWO_WDTA clock divider active register	CKSC_AWDTAD_ACT	FFF8 2008_H
	C_AWO_WDTA stop mask register	CKSC_AWDTAD_STPM	FFF8 2018_H
	C_AWO_TAUJ source clock selection register	CKSC_ATAUJS_CTL	FFF8 2100_H
	C_AWO_TAUJ source clock active register	CKSC_ATAUJS_ACT	FFF8 2108_H
	C_AWO_TAUJ clock divider selection register	CKSC_ATAUJD_CTL	FFF8 2200_H
	C_AWO_TAUJ clock divider active register	CKSC_ATAUJD_ACT	FFF8 2208_H
	C_AWO_TAUJ stop mask register	CKSC_ATAUJD_STPM	FFF8 2218_H

	C_ISO_IIC source clock active register	CKSC_IIICS_ACT	FFF8 AC08$_H$

12C.4.2 Clock Oscillator Registers

12C.4.2.1 MOSCE — MainOSC Enable Register

This register is used to start and stop the MainOSC.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1100$_{H}$

Value after reset: 0000 0000$_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCDISTRG	MOSCENTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.2 MOSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MOSCDISTRG	MainOSC Disable Trigger*1,*3 MOSCSTPM.MOSCSTPMSK = 0 0: No function 1: Stops MainOSC MOSCSTPM.MOSCSTPMSK = 1 When writing this bit while MOSCSTPM.MOSCSTPMSK = 1, the write value should be 0. 0: No function 1: Setting Prohibited This bit is automatically cleared to 0 by hardware after MainOSC is disabled.
0	MOSCENTRG	MainOSC Enable Trigger*2,*3 0: No function 1: Starts MainOSC This bit is automatically cleared to 0 by hardware after MainOSC is enabled.

Note 1. Follow the procedure given below for stopping the MainOSC by using MOSCDISTRG.

1. Confirm that the MainOSC is neither waiting for being enabled nor stopped (both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).
2. Confirm that the MainOSC is active (MOSCS.MOSCCLKACT = 1).
3. Check that there is no clock domain for which the MainOSC is selected. If the MainOSC is selected for a clock domain, disable the setting or select a clock source other than MainOSC.
4. Confirm that the MainOSC stop mask register (MOSCSTPM) is NOT set to “MainOSC continues operation in standby mode” (MOSCSTPM.MOSCSTPMSK = 1). Otherwise, set the register to “MainOSC stops operation in stand-by mode” (MOSCSTPM.MOSCSTPMSK = 0).
5. Stop the MainOSC (MOSCE.MOSCDISTRG = 1).
6. Confirm that the MainOSC has been stopped (MOSCS.MOSCCLKACT = 0).

Note 2. Follow the procedure given below for starting the MainOSC by using MOSCENTRG.

1. Confirm that the MainOSC is neither waiting for being enabled nor stopped (both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).
2. Confirm that the MainOSC is inactive (MOSCS.MOSCCLKACT = 0).
3. Start the MainOSC (MOSCE.MOSCENTRG = 1).
4. Confirm that the MainOSC has been started (MOSCS.MOSCCLKACT = 1).

Note 3. Starting and stopping the MainOSC at the same time by using the start and stop bits, i.e., by setting MOSCE.MOSCENTRG = 1 and MOSCE.MOSCDISTRG = 1 at the same time is not allowed.

12C.4.2.2 MOSCS — MainOSC Status Register

This register provides active status information about the MainOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 1104$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1^{*1}	0^{*1}
	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCCLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12C.3 MOSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	MOSCCLKACT	MainOSC Active Status 0: MainOSC is inactive 1: MainOSC is active
1, 0	Reserved	When read, an undefined value is returned.

12C.4.2.3 MOSCC — MainOSC Control Register

This register is used to specify amplification gain of the MainOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1108_H

Value after reset: 0000 0004_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.4 MOSCC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	MOSCAMPSEL[1:0]	MainOSC Amplification Gain Selection 00: Amplification gain for fx = 24 MHz 01: Amplification gain for fx = 20 MHz 10: Amplification gain for fx = 16 MHz 11: Amplification gain for fx = 8 MHz

CAUTION

Set this register when MainOSC is stopped.

12C.4.2.4 MOSCST — MainOSC Stabilization Time Register

This register determines the MainOSC stabilization time.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 110C$_H$

Value after reset: 0000 44C0$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCCLKST16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12C.5 MOSCST Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16 to 0	MOSCCLKST[16:0]	The MOSCCLKST[16:0] bits specify the count value for the MainOSC stabilization counter. ● If HS IntOSC active (ROSCS.ROSCCLKACT = 1): Stabilization time = MOSCCLKST[16:0] / f_{RH} ● If HS IntOSC inactive (ROSCS.ROSCCLKACT = 0): Stabilization time = MOSCCLKST[16:0] / f_{RL}

NOTE

See **Section 47C, Electrical Characteristics of RH850/F1KM-S1** for information about the MainOSC stabilization time.

CAUTION

Set this register when MainOSC is stopped.

12C.4.2.5 MOSCSTPM — MainOSC Stop Mask Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1118_H

Value after reset: 0000 0002_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12C.6 MOSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCSTPMSK	MainOSC Stop Request Mask 0: MainOSC stops operation in stand-by mode. MainOSC stops operation in the case the MainOSC disable trigger MOSCE.MOSCDISTRG is set to 1. 1: MainOSC continues operation in stand-by mode.

12C.4.2.6 MOSCM — MainOSC Mode Control Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 111C$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 12C.7 MOSCM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCM	MainOSC Mode control 0: OSC mode. (default) 1: EXCLK mode. MainOSC amplifier is disabled.

CAUTION

Set this register when MainOSC is stopped.

NOTE

EXCLK mode is a mode to directly input clock to X1. For details, see **Section 12C.3.1, Main Oscillator (MainOSC)**.

12C.4.2.7 ROSCE — HS IntOSC Enable Register

This register is used to stop the HS IntOSC operation.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

CAUTION

Set the ROSCE.ROSCDISTRG bit only when the $\overline{\text{CLMA0RES}}$ has occurred. In other cases, setting this bit is prohibited.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ROSCDISTRG	HS IntOSC Disable Trigger ROSCSTPM.ROSCSTPMSK = 0 0: No function 1: Stops HS IntOSC ROSCSTPM.ROSCSTPMSK = 1 Setting prohibited
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

12C.4.2.8 ROSCS — HS IntOSC Status Register

This register provides active status information about the HS IntOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 1004$_H$
Value after reset:	0000 0007$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1[*1]	0[*1]
	—	—	—	—	—	—	—	—	—	—	—	—	—	ROSCCLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12C.9 ROSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	ROSCCLKACT	HS IntOSC Active Status 0: HS IntOSC is inactive 1: HS IntOSC is active
1, 0	Reserved	When read, an undefined value is returned.

12C.4.2.9 ROSCSTPM — HS IntOSC Stop Mask Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1018$_H$

Value after reset: 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ROSCSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12C.10 ROSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ROSCSTPMSK	HS IntOSC Stop Request Mask 0: HS IntOSC stops operation in stand-by mode 1: HS IntOSC continues operation in stand-by mode Do not set the HS IntOSC disable trigger ROSCE.ROSCDISTRG to 1 while ROSCSTPMSK bit is set to 1.

12C.4.2.10 **PLL1E — PLL1 Enable Register**

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 9000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1DISTRG	PLL1ENTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.11 PLL1E Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PLL1DISTRG	PLL1 Disable Trigger[*1,*4] 0: No function 1: Stops PLL1 This bit is automatically cleared to 0 by hardware after PLL1 is disabled.
0	PLL1ENTRG	PLL1 Enable Trigger[*2,*3,*4] 0: No function 1: Starts PLL1 This bit is automatically cleared to 0 by hardware after PLL1 is activated.

Note 1. Follow the procedure given below for stopping the PLL1 by using PLL1DISTRG.

1. Confirm that the PLL1 is neither waiting for being enabled nor stopped (both PLL1E.PLL1DISTRG = 0 and PLL1E.PLL1ENTRG = 0).
2. Confirm that the PLL1 is active (PLL1S.PLL1CLKACT = 1).
3. Check that there is no clock domain for which the PLL1 is selected. If the PLL1 is selected for a clock domain, disable the setting or select a clock source other than the PLL1.
4. Stop the PLL1 (PLL1E.PLL1DISTRG = 1).
5. Confirm that the PLL1 has been stopped (PLL1S.PLL1CLKACT = 0).

Note 2. Before starting PLL1 using PLL1ENTRG, confirm that the PLL1 input clock (MainOSC or HS IntOSC, selected by the CKSC_PLL1IS_CTL) is operating.

Note 3. Follow the procedure given below for starting the PLL1 by using PLL1ENTRG.

1. Confirm that the PLL1 is neither waiting for being enabled nor stopped (both PLL1E.PLL1DISTRG = 0 and PLL1E.PLL1ENTRG = 0).
2. Confirm that the PLL1 is inactive (PLL1S.PLL1CLKACT = 0).
3. Start the PLL1 (PLL1E.PLL1ENTRG = 1).
4. Confirm that the PLL1 has been started (PLL1S.PLL1CLKACT = 1).

Note 4. Starting and stopping the PLL1 at the same time by using the start and stop bits, i.e., by setting PLL1E.PLL1ENTRG = 1 and PLL1E.PLL1DISTRG = 1 at the same time is not allowed.

12C.4.2.11 PLL1S — PLL1 Status Register

This register provides active status information about the PLL1.

This register is initialized by all reset sources (ISORES).

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 9004$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1[*1]	0[*1]
	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1CLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12C.12 PLL1S Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	PLL1CLKACT	PLL1 Active Status 0: PLL1 is inactive 1: PLL1 is active
1, 0	Reserved	When read, an undefined value is returned.

12C.4.2.12 PLL1C — PLL1 Control Register

This register is used to set the PLL1 VCO output clock frequency $f_{VCO1OUT}$, shown in **Section 12C.3.4.1, PLL1 Parameters**.

This register can only be written, if the PLL1 is disabled.

This register is initialized by all reset sources (ISORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 9008$_{H}$
Value after reset:	0001 133B$_{H}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PLL1M[1:0]		—	—	—	—	—	PLL1N[5:0]					
Value after reset	0	0	0	1	0	0	1	1	0	0	1	1	1	0	1	1
R/W	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 12C.13 PLL1C Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12, 11	PLL1M[1:0]	Division ratio Mr is set. For PLL1M[1:0] settings, see **Table 12C.14, PLL1 Output Table**.
10 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	PLL1N[5:0]	Division ratio Nr is set. For PLL1N[5:0] settings, see **Table 12C.14, PLL1 Output Table**.

CAUTION

Set this register when PLL1 is stopped.

Table 12C.14 PLL1 Output Table

PLL1CLKIN frequency $f_{PLL1CLKIN}$ (MHz)	PLL1C. PLL1M[1:0] (Mr)*5	PLL1C. PLL1N[5:0] (Nr)*5	VCO1OUT frequency $f_{VCO1OUT}$ (MHz)	CPLL1OUT frequency $f_{CPLL1OUT}$ (MHz)*1			PPLLOUT frequency $f_{PPLLOUT}$ (MHz)
				VCO1OUT × 1/4	VCO1OUT × 1/5	VCO1OUT × 1/6	
8 (MainOSC)	00_B (Mr = 1)	$3B_H$ (Nr = 60)	480.0	120.0	96.0	80.0	80.0
16 (MainOSC)	01_B (Mr = 2)	$3B_H$ (Nr = 60)	480.0	120.0	96.0	80.0	80.0
20 (MainOSC)	01_B (Mr = 2)	$2F_H$ (Nr = 48)	480.0	120.0	96.0	80.0	80.0
24 (MainOSC)	01_B (Mr = 2)	27_H (Nr = 40)	480.0	120.0	96.0	80.0	80.0
	10_B (Mr = 3)	$3B_H$ (Nr = 60)	480.0	120.0	96.0	80.0	80.0
8 (HS IntOSC)*2, *4	00_B (Mr = 1)	$3B_H$ (Nr = 60)	480.0	N/A	N/A	80.0*2, *3	80.0*2

Note 1. The CPLL1OUT frequency is defined by CKSC_CPUCLKD_CTL.CPUCLKDPLL[1:0]. Refer to the CKSC_CPUCLKD_CTL register description.

Note 2. Typical frequencies. User calibration of HS IntOSC is required before setting HS IntOSC as PLL1CLKIN.

Note 3. The limit of CPLL1OUT frequency is 80 MHz (typ.) when HS IntOSC is selected as clock source of PLL1.

Note 4. See **Section 44.10, Usage Notes**.

Note 5. Settings other than those shown in this table are prohibited.

12C.4.2.13 PLL1 Input Clock Selection

(1) CKSC_PLL1IS_CTL — PLL1 Input Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A700$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1ISCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.15 CKSC_PLL1IS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PLL1ISCSID[1:0]	Source Clock Setting for PLL1 input clock 01$_B$: MainOSC (Default) 10$_B$: HS IntOSC^{*1} Other than above: Setting prohibited

Note 1. The maximum frequency of CPLL1OUT and PPLLOUT is limited when the HS IntOSC is selected as the PLL1 input clock.

CAUTION

Set this register when PLL1 is stopped.

(2) CKSC_PLL1IS_ACT — PLL1 Input Clock Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A708$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1ISACT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12C.16 CKSC_PLL1IS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PLL1ISACT[1:0]	Source clock for currently active PLL1 input clock

12C.4.2.14 PPLLCLK Source Clock Selection

(1) CKSC_PPLLCLKS_CTL — PPLLCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A010_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPLLCLKSCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.17 CKSC_PPLLCLKS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PPLLCLKSCSID[1:0]	Source Clock Setting for PPLLCLK 00_B: Setting prohibited 01_B: EMCLK (default) 10_B: MainOSC 11_B: PPLLOUT

(2) CKSC_PPLLCLKS_ACT — PPLLCLK Source Clock Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A018$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPLLCLKSACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12C.18 CKSC_PPLLCLKS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PPLLCLKSACT[1:0]	Source clock for currently active PPLLCLK*[1]

Note 1. The data read from this register is 00$_B$ if the selected source clock for all of the following clock domains is other than PPLLCLK (or PPLLCLK2):
C_ISO_PERI1, C_ISO_PERI2, C_ISO_LIN, C_ISO_CAN, C_ISO_CSI, C_ISO_IIC

12C.4.2.15 ROSCUT — HS IntOSC User Trimming Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 $101C_H$
Value after reset:	0000 $0XXX_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	FADJUST[8:0]								
Value after reset	0	0	0	0	0	0	0	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 12C.19 ROSCUT Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	FADJUST[8:0]	Frequency Adjustment parameters of HS IntOSC. The value after reset of this register is pre-set value of HS IntOSC trimming data. Overwrite this register with “read value + 1” or “read value – 1” until the HS IntOSC frequency becomes target frequency range.

12C.4.3 Clock Selector Control Register

12C.4.3.1 WDTA0 Clock Domain C_AWO_WDTA

(1) CKSC_AWDTAD_CTL — C_AWO_WDTA Clock Divider Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 2000_H
Value after reset:	0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.20 CKSC_AWDTAD_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	AWDTADCSID[1:0]	Clock Divider Setting for C_AWO_WDTA 00_B: Setting prohibited 01_B: LS IntOSC / 128 (default) 10_B: LS IntOSC / 1 11_B: Setting prohibited

(2) CKSC_AWDTAD_ACT — C_AWO_WDTA Clock Divider Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2008_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12C.21 CKSC_AWDTAD_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	AWDTADACT[1:0]	Clock divider for currently active C_AWO_WDTA

(3) CKSC_AWDTAD_STPM — C_AWO_WDTA Stop Mask Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 2018_H
Value after reset:	0000 0002_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12C.22 CKSC_AWDTAD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AWDTADSTPMSK*1	0: Clock domain C_AWO_WDTA is stopped in stand-by mode. 1: Clock domain C_AWO_WDTA is not stopped in stand-by mode.

Note 1. The return time from stand-by mode can be shortened by setting this bit to 1.

12C.4.3.2 TAUJ Clock Domain C_AWO_TAUJ

(1) CKSC_ATAUJS_CTL — C_AWO_TAUJ Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 2100_H
Value after reset:	0000 0001_H

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12C.27 CKSC_ATAUJD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ATAUJDSTPMSK	0: Clock domain C_AWO_TAUJ is stopped in stand-by mode. 1: Clock domain C_AWO_TAUJ is not stopped in stand-by mode.

12C.4.3.3 RTCA Clock Domain C_AWO_RTCA

(1) CKSC_ARTCAS_CTL — C_AWO_RTCA Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by a power-up reset PURES.

Access: This register can be read or written in 32-bit units.

Address: FFF8 2300$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARTCASCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.28 CKSC_ARTCAS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	ARTCASCSID[1:0]	Source Clock Setting for C_AWO_RTCA 00$_B$: Disabled (default) 01$_B$: Setting Prohibited 10$_B$: MainOSC*1 11$_B$: LS IntOSC

Note 1. To avoid supplying a clock signal equal to or higher than 4 MHz to the C_AWO_RTCA clock domain, check that CKSC_ARTCAD_ACT = 0000 0000$_H$ (disabled) before setting the CKSC_ARTCAS_CTL to 10$_B$ (MainOSC).

(2) CKSC_ARTCAS_ACT — C_AWO_RTCA Source Clock Active Register

This register is initialized by a power-up reset PURES.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 2308_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12C.37 CKSC_AADCAD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AADCADSTPMSK	0: Clock domain C_AWO_ADCA is stopped in stand-by mode. 1: Clock domain C_AWO_ADCA is not stopped in stand-by mode.

12C.4.3.5 FOUT Clock Domain C_AWO_FOUT

(1) CKSC_AFOUTS_CTL — C_AWO_FOUT Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2700$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12C.40 CKSC_AFOUTS_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AFOUTSSTPMSK	0: Clock domain C_AWO_FOUT is stopped in stand-by mode. 1: Clock domain C_AWO_FOUT is not stopped in stand-by mode.

12C.4.3.6 CPU Clock Domain C_ISO_CPUCLK

(1) CKSC_CPUCLKS_CTL — C_ISO_CPUCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 A000$_H$
Value after reset:	0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12C.41 CKSC_CPUCLKS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	CPUCLKSCSID[1:0]	Source Clock Setting for C_ISO_CPUCLK 00$_B$: Setting prohibited 01$_B$: EMCLK (default) 10$_B$: MainOSC 11$_B$: CPLL1OUT

CAUTION

The clock source selected for the C_ISO_CPUCLK clock domain should not be stopped by software.

(2) CKSC_CPUCLKS_ACT — C_ISO_CPUCLK Source Clock Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A008$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUCLKSACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12C.42 CKSC_CPUCLKS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	CPUCLKSACT[1:0]	Source clock for currently active C_ISO_CPUCLK

(3) CKSC_CPUCLKD_CTL — C_ISO_CPUCLK Clock Divider Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A100$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

1, 0	ILINDCSID[1:0]	Clock Divider Setting for C_ISO_LIN 00$_B$: Setting prohibited 01$_B$: CKSC_ILINS_CTL selection /1 (default) 10$_B$: CKSC_ILINS_CTL selection /4 11$_B$: CKSC_ILINS_CTL selection /8

NOTE

The setting of this register is only applicable to RLIN30. The settings 10$_B$ (CKSC_ILINS_CTL selection /4) and 11$_B$ (CKSC_ILINS_CTL selection /8) are only available in UART mode.

(4) CKSC_ILIND_ACT — C_ISO_LIN Clock Divider Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A808$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILINDACT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12C.52 CKSC_ILIND_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	ILINDACT[1:0]	Clock divider for currently active C_ISO_LIN

(5) CKSC_ILIND_STPM — C_ISO_LIN Stop Mask Register

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A818$_H$

Value after reset: 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILIND STP MSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12C.53 CKSC_ILIND_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ILINDSTPMSK	0: Clock domain C_ISO_LIN is stopped in stand-by mode. 1: Clock domain C_ISO_LIN is not stopped in stand-by mode.

12C.4.3.9 RS-CANFD Clock Domains C_ISO_CAN and C_ISO_CANOSC

(1) CKSC_ICANS_CTL — C_ISO_CAN Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A900$_{\text{H}}$

Value after reset: 0000 0003$_{\text{H}}$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1, 0	ICANOSCDACT[1:0]	Clock divider for currently active C_ISO_CANOSC

(6) CKSC_ICANOSCD_STPM — C_ISO_CANOSC Stop Mask Register

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 AA18$_H$

Value after reset: 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ICANOSCDSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12C.59 CKSC_ICANOSCD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ICANOSCDSTPMSK	0: Clock domain C_ISO_CANOSC is stopped in stand-by mode. 1: Clock domain C_ISO_CANOSC is not stopped in stand-by mode.

12C.4.3.10 CSI Clock Domain C_ISO_CSI

(1) CKSC_ICSIS_CTL — C_ISO_CSI Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 AB00$_H$
Value after reset:	0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 12C.63 CKSC_IIICS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	IIICSACT[1:0]	Source clock for currently active C_ISO_IIC

12C.5 Clock Domain Setting Method

12C.5.1 Clock Domain Setting

12C.5.1.1 Overview of Clock Selector Register

The clock selector for a clock domain C_AWO_<*name*>/C_ISO_<*name*> can be controlled by the following registers:

- Source clock selection registers
  These registers select the clock to be used as the domain clock from the available source clocks.
  - AWO source clock selection: CKSC_A<*name*>S_CTL
  - ISO source clock selection: CKSC_I<*name*>S_CTL
- Clock divider selection registers
  These registers specify the clock division ratio for the selected source clock.
  - AWO clock divider: CKSC_A<*name*>D_CTL
  - ISO clock divider: CKSC_I<*name*>D_CTL
- Source clock active registers and clock divider active registers
  These registers return the currently active source clock selection and division ratio, respectively.
  - AWO source clock active register/clock divider active register: CKSC_A<*name*>S_ACT/CKSC_A<*name*>D_ACT
  - ISO source clock active register/clock divider active register: CKSC_I<*name*>S_ACT/CKSC_I<*name*>D_ACT

NOTE

- Not all clock selectors provide all of the control functions described above.
- The symbol “I”, which indicates the power domain, is not added to the names of registers within clock domain C_ISO_CPUCLK.

12C.5.1.2 Setting Procedure for Clock Domain

Procedure of setting up clock domain is described as below:

1. Set up a source clock
   - Select a source clock. (CKSC_A<*name*>S_CTL, CKSC_I<*name*>S_CTL)
   - Confirm completion of selection. (CKSC_A<*name*>S_ACT, CKSC_I<*name*>S_ACT)*[1]
2. Setting a clock divider
   - Select a clock divider. (CKSC_A<*name*>D_CTL, CKSC_I<*name*>D_CTL)
   - Confirm completion of selection. (CKSC_A<*name*>D_ACT, CKSC_I<*name*>D_ACT)*[2]

Note 1. Continue processing after CKSC_A<*name*>S_ACT and CKSC_I<*name*>S_ACT are updated with the new values written to CKSC_A<*name*>S_CTL and CKSC_I<*name*>S_CTL.

Note 2. Continue processing after CKSC_A<*name*>D_ACT and CKSC_I<*name*>D_ACT are updated with the new values written to CKSC_A<*name*>D_CTL and CKSC_I<*name*>D_CTL.

CAUTION

The source clock to be selected must be operating before performing these settings.
The behavior and performance are not guaranteed if setup is performed while the source clock is stopped.
Access to a peripheral module is prohibited while the clock is not supplied to the module.

12C.5.2 Stopping the Clock in Stand-by Mode

In stand-by mode (STOP mode, DeepSTOP mode, and Cyclic STOP mode), clock domain C_AWO_<*name*>/C_ISO_<*name*> can be configured to stop or continue its clock CKSCLK_A<*name*>/CKSCLK_I<*name*> in response to clock stop requests from the stand-by controller.

The clock stop mask registers are used to determine the operation status of the clock in stand-by mode:

- CKSC_A<*name*>_STPM.A<*name*>STPMSK/CKSC_I<*name*>_STPM.I<*name*>STPMSK = 0:
  The STOP request signal is not masked, so the domain clock CKSCLK_A<*name*>/CKSCLK_I<*name*> is stopped during stand-by mode.
  If the domain clock was in operation before transition to stand-by mode, it is automatically re-started after wake-up from stand-by mode.
  If there is another clock domain which the same source clock is selected and its stop mask setting is set to 1 (CKSC_A<*name*>_STPM.A<*name*>STPMSK/CKSC_I<*name*>_STPM.I<*name*>STPMSK = 1), the source clock will continue operation in stand-by mode.
  The CPU clock domain C_ISO_CPUCLK is always stopped in stand-by mode.
- CKSC_A<*name*>_STPM.A<*name*>STPMSK/CKSC_I<*name*>_STPM.I<*name*>STPMSK = 1:
  The STOP request signal is masked, so CKSCLK_A<*name*>/CKSCLK_I<*name*> continues to operate during stand-by.
  The source clock selected for the target clock domain will also continue to operate in stand-by mode.
  Supply of a clock signal to the clock domains in the Isolated area (ISO area) will be stopped in DeepSTOP mode.

12C.5.3 Clock Domain Settings

The following table shows a selectable source clock, a frequency division ratio, and a register to be used for each clock domain.

Table 12C.64 List of Selectable Clocks

Clock Domain	Clock Name	Selectable Register		Frequency Divided Register		Maximum Frequency	Applicable Unit
C_AWO_WDTA	CKSCLK_AWDTA	—	**LS IntOSC**	CKSC_AWDTAD_CTL	1/1	240 kHz	WDTA0
					1/128		
C_AWO_TAUJ	CKSCLK_ATAUJ	CKSC_ATAUJS_CTL	MainOSC	CKSC_ATAUJD_CTL	**1/1**	40 MHz	TAUJ0 TAUJ2
			HS IntOSC		1/2		
			LS IntOSC		1/4		
			PPLLCLK2		1/8		
			Disable		—		
C_AWO_RTCA	CKSCLK_ARTCA	CKSC_ARTCAS_CTL	MainOSC	CKSC_ARTCAD_CTL	1/1	4 MHz	RTCA0
			LS IntOSC		1/2		
			Disable		1/4		
			—		1/8		
					Disable		
C_AWO_ADCA	CKSCLK_AADCA	CKSC_AADCAS_CTL	MainOSC	CKSC_AADCAD_CTL	**1/1**	40 MHz	ADCA0
			HS IntOSC		1/2

			Disable				

Note: The items written in bold are the initial setting clocks for each register.

Note 1. The setting of this register only applies to RLIN30. The settings 1/4 and 1/8 are only available in UART mode.

Note 2. CKSC_CPUCLKS_CTL selects selection of Main OSC, CPLL1OUT and EMCLK. CKSC_CPUCLKD_CTL.CPUCLKDPLL[1:0] selects CPLL1OUT clock frequency.

Note 3. For the supported settings, refer to the **Table 12C.14, PLL1 Output Table**.

CAUTION

To stop the clock source selected for the clock domain before transitioning to STOP/DeepSTOP mode, select “Disable” for that clock domain in advance. Do not stop the source clock of a clock domain for which “Disable” cannot be selected while functions are operating on that clock domain. To stop the clock source selected for the domain by transitioning to STOP/DeepSTOP mode, “Disable” does not need to be selected.
Instead of the setting “Disable”, select “Stop” for the clock domain in stand-by mode by using the stop mask register.

12C.6 Frequency Output Function (FOUT)

The frequency output function (FOUT) allows the clock to be output the clock as the external signal. Furthermore, the frequency can be divided by the clock divider before it is output.

12C.6.1 Functional Overview

Figure 12C.8, Frequency Output Function shows the configuration of the frequency output function.

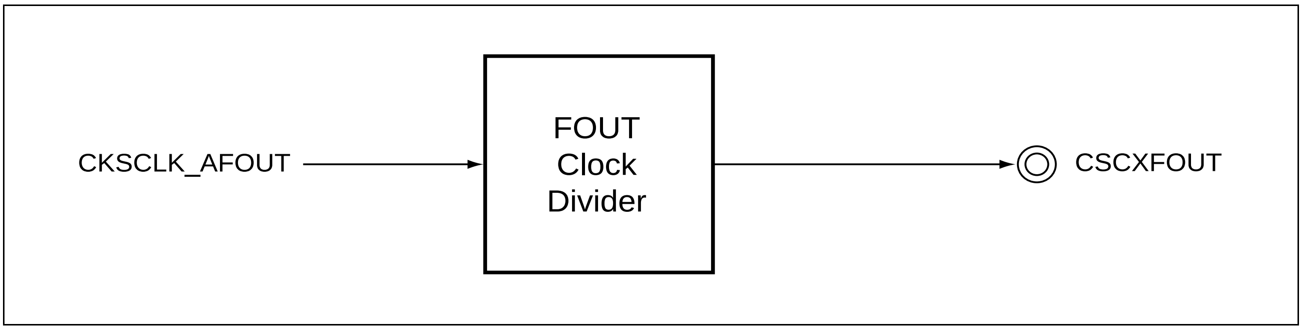

Figure 12C.8 Frequency Output Function

The clock output function outputs the CKSCLK_AFOUT clock divided by 1 to 63 through the clock divider from CSCXFOUT. Division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register. Clock output frequency f_{CSCXFOUT} is expressed by the following equation.

$$f_{\text{CSCXFOUT}} = (\text{CKSCLK\_AFOUT clock frequency}) / N$$

Clock output starts when, after CKSCLK_AFOUT is set and the clock output for the pin function is selected, division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register.

When a new division ratio is written to the FOUTDIV.FOUTDIV[5:0] bits, it becomes effective in synchronization with the CSCXFOUT output clock. Accordingly, the division ratio can be changed even while the CSCXFOUT clock is operating. The clock output is stopped by writing 000_H to the FOUTDIV[5:0] bits.

12C.6.2 Clock Supply

The clock supply to the CSCXFOUT is shown in the following table.

Table 12C.65 Clock Supply

Module	Unit Clock Name	Supply Clock Name	Description
CSCXFOUT	PCLK	CPUCLK_UL	Bus clock (Register access)
	CKSCLK_AFOUT	CKSCLK_AFOUT	Clock source of FOUT clock divider

12C.6.3 Registers

12C.6.3.1 List of Registers

The FOUT registers are listed in the following table.

Table 12C.66 List of Registers

Module Name	Register Name	Symbol	Address
CLKCTL	Clock division ratio register	FOUTDIV	FFF8 2800_H
	Clock divider status register	FOUTSTAT	FFF8 2804_H

12C.6.3.2 FOUTDIV — Clock Division Ratio Register

This register defines the clock divisor.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2800_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 12C.67 FOUTDIV Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	FOUTDIV[5:0]	Clock Divider N 00_H: Clock output is stopped 01_H: N = 1 02_H: N = 2 : $3E_H$: N = 62 $3F_H$: N = 63

12C.6.3.3 FOUTSTAT — Clock Divider Status Register

This register indicates the clock output status.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2804$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12C.68 FOUTSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	FOUTCLKACT	Clock Divider Active 0: Frequency output is stopped. 1: Frequency output is ongoing.
0	FOUTSYNC	Clock Divider Synchronized 0: The clock divider is in the process of synchronization. 1: The clock divider is stable (or stopped).

Section 13 Clock Monitor (CLMA)

This section contains a generic description of the clock monitor (CLMA).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of CLMA.

13.1 Features of RH850/F1KH, RH850/F1KM CLMA

13.1.1 Number of Units

This microcontroller has the following number of CLMA units.

Each CLMA unit has single channel interface. “channel” is used with the same meaning as “unit” in this section.

Table 13.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	4	4	4
Name	CLMAn (n = 0 to 3)	CLMAn (n = 0 to 3)	CLMAn (n = 0 to 3)

Table 13.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	4	4	4	4	4
Name	CLMAn (n = 0 to 3)	CLMAn (n = 0 to 3)	CLMAn (n = 0 to 3)	CLMAn (n = 0 to 3)	CLMAn (n = 0 to 3)

Table 13.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	3	3	3	3
Name	CLMAn (n = 0, 1, 3)	CLMAn (n = 0, 1, 3)	CLMAn (n = 0, 1, 3)	CLMAn (n = 0, 1, 3)

Table 13.4 Index (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual CLMA Channels are identified by the index “n”: for example, CLMAnCTL0 (n = 0 to 3) is the CLMAn control register 0.

Table 13.5 Index (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual CLMA Channels are identified by the index “n”: for example, CLMAnCTL0 (n = 0 to 3) is the CLMAn control register 0.

Table 13.6 Index (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual CLMA Channels are identified by the index “n”: for example, CLMAnCTL0 (n = 0, 1, 3) is the CLMAn control register 0.

13.1.2 Register Base Addresses

The CLMA base addresses are listed in the following table.

The CLMA register addresses are given as offsets from the base addresses.

Table 13.7 Register Base Addresses (RH850/F1KH-D8)

Base Address Name	Base Address
<CLMA0_base>	FFF8 C000$_H$
<CLMA1_base>	FFF8 D000$_H$
<CLMA2_base>	FFF8 E000$_H$
<CLMA3_base>	FFF8 F000$_H$

Table 13.8 Register Base Addresses (RH850/F1KM-S4)

Base Address Name	Base Address
<CLMA0_base>	FFF8 C000$_H$
<CLMA1_base>	FFF8 D000$_H$
<CLMA2_base>	FFF8 E000$_H$
<CLMA3_base>	FFF8 F000$_H$

Table 13.9 Register Base Addresses (RH850/F1KM-S1)

Base Address Name	Base Address
<CLMA0_base>	FFF8 C000$_H$
<CLMA1_base>	FFF8 D000$_H$
<CLMA3_base>	FFF8 E000$_H$

13.1.3 Clock Supply

The clocks monitored by CLMA and the CLMA sampling clocks are indicated below.

Table 13.10 Clock Supply (RH850/F1KH-D8)

Channel Name	Unit Clock Name	Supply Clock Name
CLMA0	CLMATMON (monitored clock)	HS IntOSC
	CLMATSMP (sampling clock)	LS IntOSC
	Register access clock	CPUCLK_UL
CLMA1	CLMATMON (monitored clock)	MainOSC
	CLMATSMP (sampling clock)	LS IntOSC
	Register access clock	CPUCLK_UL
CLMA2	CLMATMON (monitored clock)	PLL0OUT*1
	CLMATSMP (sampling clock)	HS IntOSC
	Register access clock	CPUCLK_UL
CLMA3	CLMATMON (monitored clock)	PPLLOUT
	CLMATSMP (sampling clock)	HS IntOSC
	Register access clock	CPUCLK_UL

Note 1. For details, see **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4, Section 12AB.3.5.1, PLL0 Parameters, Figure 12AB.8, PLL0 Circuit**.

Table 13.11 Clock Supply (RH850/F1KM-S4)

Channel Name	Unit Clock Name	Supply Clock Name
CLMA0	CLMATMON (monitored clock)	HS IntOSC
	CLMATSMP (sampling clock)	LS IntOSC
	Register access clock	CPUCLK_UL
CLMA1	CLMATMON (monitored clock)	MainOSC
	CLMATSMP (sampling clock)	LS IntOSC
	Register access clock	CPUCLK_UL
CLMA2	CLMATMON (monitored clock)	PLL0OUT*1
	CLMATSMP (sampling clock)	HS IntOSC
	Register access clock	CPUCLK_UL
CLMA3	CLMATMON (monitored clock)	PPLLOUT
	CLMATSMP (sampling clock)	HS IntOSC
	Register access clock	CPUCLK_UL

Note 1. For details, see **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4, Section 12AB.3.5.1, PLL0 Parameters, Figure 12AB.8, PLL0 Circuit**.

Table 13.12 Clock Supply (RH850/F1KM-S1)

Channel Name	Unit Clock Name	Supply Clock Name
CLMA0	CLMATMON (monitored clock)	HS IntOSC
	CLMATSMP (sampling clock)	LS IntOSC
	Register access clock	CPUCLK_UL
CLMA1	CLMATMON (monitored clock)	MainOSC
	CLMATSMP (sampling clock)	LS IntOSC
	Register access clock	CPUCLK_UL
CLMA3	CLMATMON (monitored clock)	PPLLOUT
	CLMATSMP (sampling clock)	HS IntOSC
	Register access clock	CPUCLK_UL

13.1.4 Reset Sources

The reset sources of the CLMA are listed in the following table. The CLMA are initialized by these reset sources.

Table 13.13 Reset Sources (RH850/F1KH-D8)

Channel Name	Reset Source
CLMA0	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA1	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA2	All reset sources (ISORES)
CLMA3	All reset sources (ISORES)
Common Registers (CLMATEST, CLMATESTS)	Power-up reset PURES (power-on-clear or debugger reset)

Table 13.14 Reset Sources (RH850/F1KM-S4)

Channel Name	Reset Source
CLMA0	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA1	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA2	All reset sources (ISORES)
CLMA3	All reset sources (ISORES)
Common Registers (CLMATEST, CLMATESTS)	Power-up reset PURES (power-on-clear or debugger reset)

Table 13.15 Reset Sources (RH850/F1KM-S1)

Channel Name	Reset Source
CLMA0	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA1	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA3	All reset sources (ISORES)
Common Registers (CLMATEST, CLMATESTS)	Power-up reset PURES (power-on-clear or debugger reset)

13.1.5 Internal Input/Output Signals

The internal input/output signals of CLMA are listed in the following table.

Table 13.16 Internal Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Connection
$\overline{\text{CLMATRES}}$	CLMA0 error reset output	Reset controller ($\overline{\text{CLMA0RES}}$)
$\overline{\text{CLMATRES}}$	CLMA1 error reset output	Reset controller ($\overline{\text{CLMA1RES}}$)
$\overline{\text{CLMATRES}}$	CLMA2 error reset output	Reset controller ($\overline{\text{CLMA2RES}}$)
$\overline{\text{CLMATRES}}$	CLMA3 error reset output	Reset controller ($\overline{\text{CLMA3RES}}$)

Table 13.17 Internal Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Connection
$\overline{\text{CLMATRES}}$	CLMA0 error reset output	Reset controller ($\overline{\text{CLMA0RES}}$)
$\overline{\text{CLMATRES}}$	CLMA1 error reset output	Reset controller ($\overline{\text{CLMA1RES}}$)
$\overline{\text{CLMATRES}}$	CLMA2 error reset output	Reset controller ($\overline{\text{CLMA2RES}}$)
$\overline{\text{CLMATRES}}$	CLMA3 error reset output	Reset controller ($\overline{\text{CLMA3RES}}$)

Table 13.18 Internal Input/Output Signals (RH850/F1KM-S1)

Unit Signal Name	Description	Connection
$\overline{\text{CLMATRES}}$	CLMA0 error reset output	Reset controller ($\overline{\text{CLMA0RES}}$)
$\overline{\text{CLMATRES}}$	CLMA1 error reset output	Reset controller ($\overline{\text{CLMA1RES}}$)
$\overline{\text{CLMATRES}}$	CLMA3 error reset output	Reset controller ($\overline{\text{CLMA3RES}}$)

13.2 Overview

13.2.1 Functional Overview

Clock monitor CLMA detects frequency abnormalities in the monitored clock. It uses sampling clock CLMATSMP to monitor whether the frequency of input clock CLMATMON is within a specific range.

Upon detection of an abnormal clock, it outputs a reset request signal.

The main components of the clock monitor are shown in **Figure 13.1, Block Diagram of the Clock Monitor**.

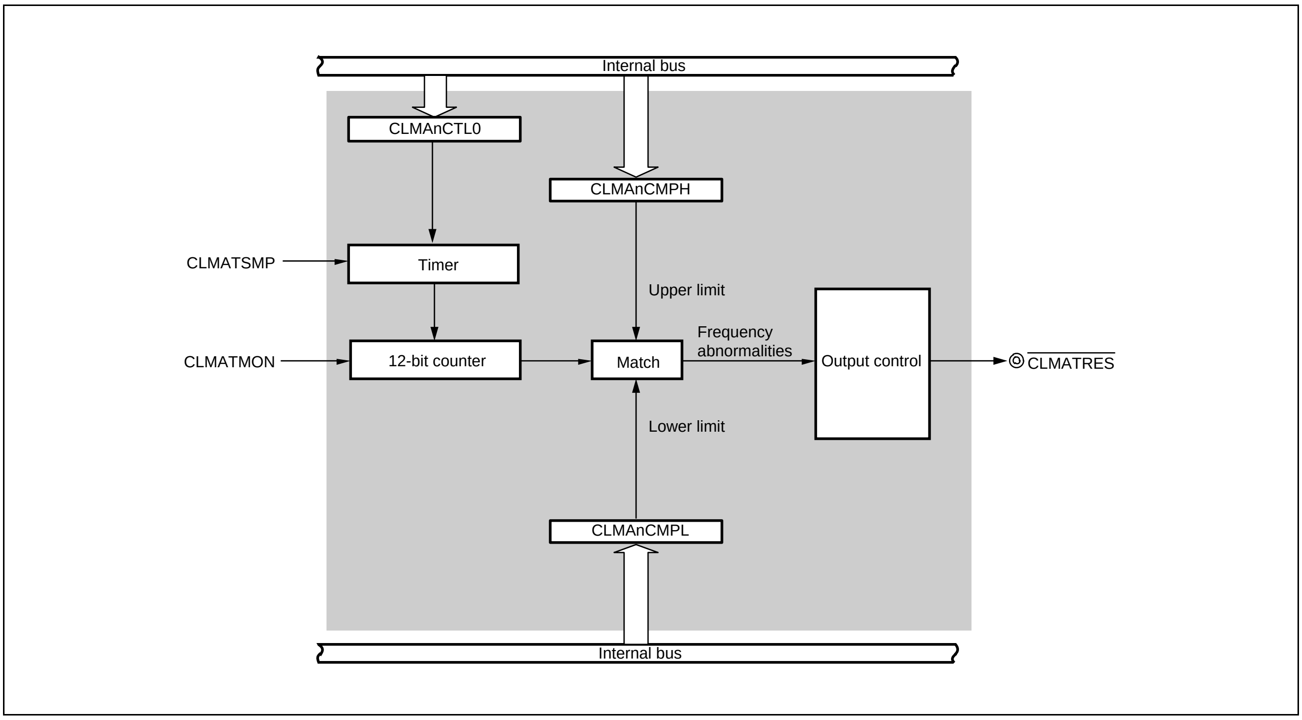

Figure 13.1 Block Diagram of the Clock Monitor

NOTE

Once enabled, only a reset can disable the CLMAn.

13.3 Enabling CLMA

Clock monitoring is started by the clock monitor when CLMAnCTL0.CLMAnCLME = 1.

When the monitored clock is stopped by a register operation or transition to stand-by mode, the corresponding clock monitor is automatically disabled. After the monitored clock starts oscillation again and becomes stable, the clock monitor also starts operation.

Since CLMA2 and CLMA3 is initialized on return from DeepSTOP, the CLMA2 and CLMA3 register must be set again before further operation is started.

13.4 Functions

13.4.1 Detection of Abnormal Clock Frequencies

Detection Method

1. CLMAn counts the rising edges of the monitored clock CLMATMON within 16 cycles of the sampling clock CLMATSMP and then compares the counter value with the specified thresholds:
    - CLMAnCMPL.CLMAnCMPL[11:0] defines the lower threshold.
    - CLMAnCMPH.CLMAnCMPH[11:0] defines the upper threshold.
2. When CLMATMON frequency*[1] is lower than the limit, the counter falls below CLMAnCMPL.CLMAnCMPL[11:0].
3. When the frequency of CLMATMON is higher than the limit, the counter exceeds CLMAnCMPH.CLMAnCMPH[11:0].

Note 1. There is a case that the abnormal state is not detected when the monitor clock completely stops.

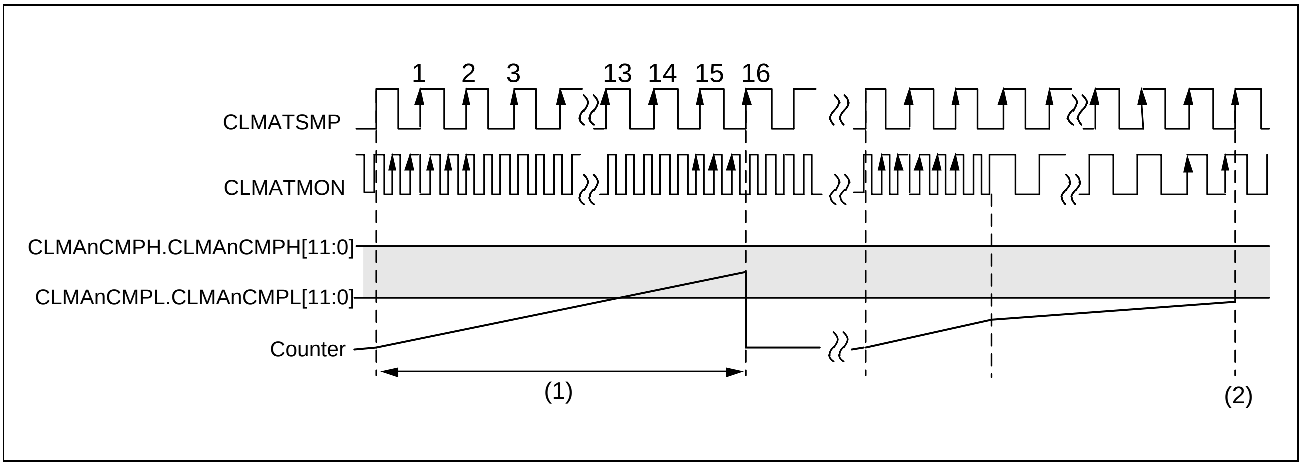

Figure 13.2 Example: $f_{CLMATMON}$ is Lower than the Specified Limit

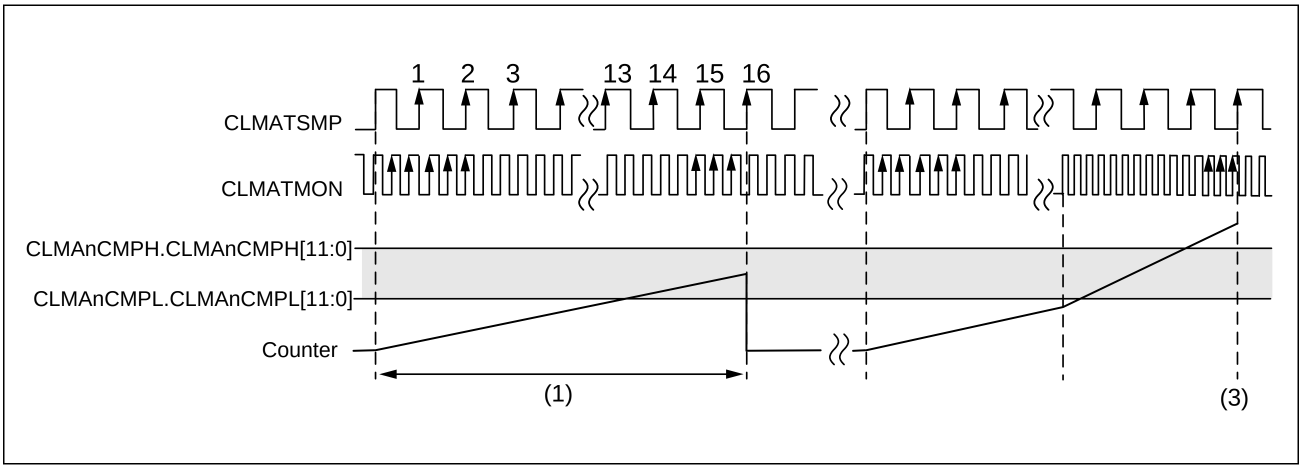

Figure 13.3 Example: $f_{CLMATMON}$ is Higher than the Specified Limit

NOTE

Even if $f_{CLMATMON}$ exceeds or falls below the specified limits during a sampling interval, the counter might be within the valid range.

Abnormal $f_{CLMATMON}$ is detected after one sampling interval.

(1) Calculation Method of the Thresholds CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]

The compare registers CLMAnCMPL and CLMAnCMPH are configured with the minimum and maximum number of clock cycles of CLMATMON that are assumed to be valid within 16 cycles of the sampling clock CLMATSMP.

The expected number of clock cycles is denoted by N.

$$\frac{16}{f_{CLMATSMP}} = \frac{N}{f_{CLMATMON}}$$

$$N = \frac{f_{CLMATMON}}{f_{CLMATSMP}} \times 16$$

Considering the allowed frequency deviations of CLMATMON and CLMATSMP, the threshold values can be calculated by the following formulas:

$$\text{Lower threshold} = N_{min} = \frac{f_{CLMATMON(dmin)}}{f_{CLMATSMP(max)}} \times 16 - 1$$

$$\text{Upper threshold} = N_{max} = \frac{f_{CLMATMON(max)}}{f_{CLMATSMP(min)}} \times 16 + 1$$

NOTE

The jitter of the PLL is covered by “+1” and “–1” in the formulas.

Example:

When $f_{CLMATSMP}$ = 240 kHz (±8%) and $f_{CLMATMON}$ = 16 MHz (±5%), the recommended threshold values are as follows:

N_{min} = 15,200 / 259.2 × 16 – 1
= 937.27
CLMAnCMPL = 937 = $03A9_H$

N_{max} = 16,800 / 220.8 × 16 + 1
= 1218.39
CLMAnCMPH = 1219 = $04C3_H$

Minimum Thresholds

The following restrictions must be taken into account:

- CLMAnCMPL ≥ 0001_H
- CLMAnCMPH ≥ CLMAnCMPL + 0003_H

(2) Definition of the Initial Value Input to the Threshold Registers

The reset values of the threshold registers are set as follows:

- CLMAnCMPL[11:0] = 001_H
- CLMAnCMPH[11:0] = $3FF_H$

13.4.2 Notification of Abnormal Clock Frequency

If $f_{CLMATMON}$ exceeds the upper threshold or falls below the lower threshold, this is indicated as follows:

1. The reset request signal $\overline{\text{CLMATRES}}$ is set to low level.
2. The system reset (AWORES or ISORES) is generated and CLMAn is reset.

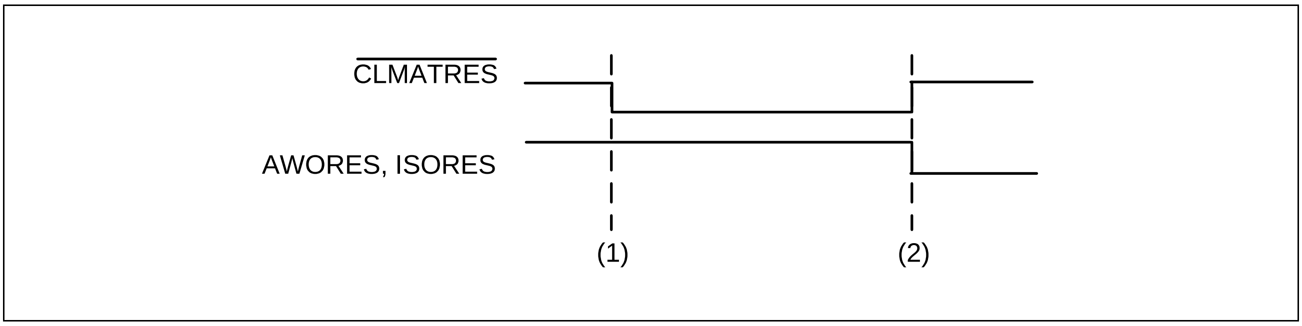

Figure 13.4 Error Request Signal Output if $f_{CLMATMON}$ Exceeds Upper Threshold

CAUTION

For usage notes for CLMAn abnormality detection, see **Section 13.6, Usage Notes for CLMAn**.

13.5 Registers

13.5.1 List of Registers

The following table lists the CLMA registers.

<CLMAn_base> is defined in **Section 13.1.2, Register Base Addresses**.

Table 13.19 List of Registers

Module Name	Register Name	Symbol	Address
CLMAn	CLMAn control register 0	CLMAnCTL0	<CLMAn_base> + 00_H
	CLMAn compare register L	CLMAnCMPL	<CLMAn_base> + 08_H
	CLMAn compare register H	CLMAnCMPH	<CLMAn_base> + $0C_H$
	CLMAn emulation register 0	CLMAnEMU0	<CLMAn_base> + 18_H
CLMA	CLMA test register	CLMATEST	FFF8 $C100_H$
	CLMA test status register	CLMATESTS	FFF8 $C104_H$

13.5.2 CLMAnCTL0 — CLMAn Control Register 0

This register enables the clock monitor CLMAn.

The correct write sequence using the CLMAnPCMD register is required in order to update this register.
For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 8-bit units.

Address: <CLMAn_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAnCLME
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 13.20 CLMAnCTL0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CLMAnCLME	Enables or disables the clock monitor. 0: CLMAn is disabled. 1: CLMAn is enabled.

CAUTION

The CLMAnPRERR bit in CLMAnPS register is set to 1 when 0 is written to the CLMAnCTL0.CLMAnCLME bit. The only condition for clearing the bit is a reset (AWORES, ISORES). In addition, the bit is cleared when the CLMATEST.RESCLM bit is set to 1 during self-test of CLMAn.

13.5.3 CLMAnCMPH — CLMAn Compare Register H

This register specifies the upper limit of frequency.

It can only be written when CLMAn is disabled (CLMAnCTL0.CLMAnCLME = 0).

For details, see **Section 13.4.1(1), Calculation Method of the Thresholds CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]**.

Access: This register can be read or written in 16-bit units.

Address: <CLMAn_base> + $0C_H$

Value after reset: $03FF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPH[11:0]											
Value after reset	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.21 CLMAnCMPH Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CLMAnCMPH[11:0]	Specifies the upper threshold. ● The recommended value is $f_{CLMATMON\ (max)} / f_{CLMATSMP\ (min)} \times 16 + 1$. ● The minimum value is CLMAnCMPL + 0003_H.

13.5.4 CLMAnCMPL — CLMAn Compare Register L

This register specifies the lower limit of frequency.

It can only be written when CLMAn is disabled (CLMAnCTL0.CLMAnCLME = 0).

For details, see **Section 13.4.1(1), Calculation Method of the Thresholds CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]**.

Access: This register can be read or written in 16-bit units.

Address: <CLMAn_base> + 08_H

Value after reset: 0001_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 13.22 CLMAnCMPL Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CLMAnCMPL[11:0]	Specifies the lower threshold. ● The recommended value is $f_{CLMATMON\ (min)} / f_{CLMATSMP\ (max)} \times 16 - 1$. ● The minimum value is 0001_H.

13.5.5 CLMATEST — CLMA Test Register

This register is used to control self-test of CLMA0, CLMA1, CLMA2, and CLMA3.

The correct write sequence using the PROTCMDCLMA register is required in order to update this register.
For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 C100$_H$

Value after reset: 0000 0000$_H$ This register is initialized by a power-up reset PURES (power-on clear or debugger reset).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 13.23 CLMATEST Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	CLMA3TESEN	RH850/F1KH-D8, RH850/F1KM-S4: CLMA3 Self-Test Enable/Disable 0: Test disabled 1: Test enabled RH850/F1KM-S1: When read, the value after reset is returned. When writing, write the value after reset.
5	CLMA2TESEN	RH850/F1KH-D8, RH850/F1KM-S4: CLMA2 Self-Test Enable/Disable 0: Test disabled 1: Test enabled RH850/F1KM-S1: CLMA3 Self-Test Enable/Disable 0: Test disabled 1: Test enabled
4	CLMA1TESEN	CLMA1 Self-Test Enable/Disable 0: Test disabled 1: Test enabled
3	CLMA0TESEN	CLMA0 Self-Test Enable/Disable 0: Test disabled 1: Test enabled
2	ERRMSK	CLMA Test Error Mask Setting Masks a reset request to the reset controller when CLMAn detects an error. When the ERRMSK is set for CLMAn, that CLMAn does not issue a reset request to the reset controller even if it detects an error. The ERRMSK setting is valid only for the CLMAn for which CLMAnTESEN bit is set to 1. 0: Reset request signal generation enabled 1: Reset request signal generation disabled (masked)

Table 13.23 CLMATEST Register Contents

Bit Position	Bit Name	Function
1	MONCLKMSK	Monitor Clock Mask Setting Fixes the clock input to the CLMAn to low level. The MONCLKMSK setting is valid only for the CLMAn for which CLMAnTESEN bit is set to 1. 0: Monitor clock enabled 1: Monitor clock disabled (masked)
0	RESCLM	CLMAn Test Reset Signal Control Initializes CLMAn forcibly. The RESCLM setting is valid only for the CLMAn for which CLMAnTESEN bit is set to 1. 0: Reset released 1: Reset executed

13.5.6 CLMATESTS — CLMA Test Status Register

This register is used to confirm the self-test result of CLMA0, CLMA1, CLMA2, and CLMA3.

Access:	This register is a read-only register that can be read in 32-bit units.
Address:	FFF8 C104$_H$
Value after reset:	0000 0000$_H$ This register is initialized by a power-up reset PURES (power-on clear or debugger reset).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 13.24 CLMATESTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	CLMA3ERRS	RH850/F1KH-D8, RH850/F1KM-S4: CLMA3 Error Status 0: Errors are not detected 1: Errors are detected RH850/F1KM-S1: When read, the value after reset is returned.
2	CLMA2ERRS	RH850/F1KH-D8, RH850/F1KM-S4: CLMA2 Error Status 0: Errors are not detected 1: Errors are detected RH850/F1KM-S1: CLMA3 Error Status 0: Errors are not detected 1: Errors are detected
1	CLMA1ERRS	CLMA1 Error Status 0: Errors are not detected 1: Errors are detected
0	CLMA0ERRS	CLMA0 Error Status 0: Errors are not detected 1: Errors are detected

13.5.7 CLMAnEMU0 — CLMAn Emulation Register 0

This register intentionally generates CLMAn error at emulation.

This register can be accessed only during break by debugger and is reset by break release.

Access: This register can be read or written in 8-bit units.

Address: <CLMAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLMAnSLFST	CLMAnSLSLW
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 13.25 CLMAnEMU0 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CLMAnSLFST	Specifies whether $f_{CLMATMON}$ is assumed to be high. 0: CLMATMON is assumed to be within the normal frequency range. 1: CLMATMON is assumed to exceed the upper threshold.
0	CLMAnSLSLW	Specifies whether $f_{CLMATMON}$ is assumed to be low. 0: CLMATMON is assumed to be within the normal frequency range. 1: CLMATMON is assumed to fall below the lower threshold.

CAUTION

It is prohibited to emulate a low and high CLMATMON at the same time. Thus CLMAnEMU0 must not be set to 03_H.

13.6 Usage Notes for CLMAn

Do not use a clock for which the CLMAn bit indicates an abnormality. The behavior and performance are not guaranteed if such a clock is used. When CLMA0 detects clock abnormality, modifying the clock domain settings is prohibited.

Table 13.26, Usage Notes for CLMAn provides usage notes for each CLMAn.

Table 13.26 Usage Notes for CLMAn

Monitor Clock	CPU Clock after CLMA Reset Release	Note
HS IntOSC (CLMA0)	EMCLK*1	Set ROSCE.ROSCDISTRG to 1.*1 Do not set the control registers of the MainOSC, the PLL0 and the PLL1. After $\overline{\text{CLMA0RES}}$ occurs, modifying any of the clock domain settings is prohibited.
MainOSC (CLMA1)	EMCLK (= HS IntOSC)	Do not set control registers of the MainOSC, the PLL0 (when it was a MainOSC source clock) and the PLL1 (when it was a MainOSC source clock). After occurrence of the $\overline{\text{CLMA1RES}}$, do not select a clock whose source clock is the MainOSC, the PLL0 or the PLL1.
PLL0OUT (CLMA2)	EMCLK (= HS IntOSC)	Do not set control registers of the PLL0. After occurrence of the $\overline{\text{CLMA2RES}}$, do not select a clock whose source clock is the PLL0.
PPLLOUT (CLMA3)	EMCLK (= HS IntOSC)	Do not set control registers of the PLL1. After occurrence of the $\overline{\text{CLMA3RES}}$, do not select a clock whose source clock is the PLL1.

Note 1. The state of EMCLK after reset by $\overline{\text{CLMA0RES}}$ depends on the state of HS IntOSC oscillation. If HS IntOSC is completely stopped, LS IntOSC is supplied as EMCLK. If HS IntOSC continues oscillating, the HS IntOSC will be supplied as the clock source of EMCLK regardless of the frequency of the HS IntOSC. Therefore, it is necessary to change the source clock of EMCLK to LS IntOSC. After setting the ROSCE.ROSCDISTRG bit to 1, EMCLK is switched from HS IntOSC to LS IntOSC.

Section 14 Stand-By Controller (STBC)

This section describes the functions, registers, and various stand-by modes of the stand-by controller (STBC).

14.1 Functions

14.1.1 Types of Stand-By Mode

The RH850/F1KH, RH850/F1KM supports STOP mode and DeepSTOP mode for system-level low power status. In addition, the RH850/F1KH, RH850/F1KM supports cyclic operation (Cyclic RUN mode and Cyclic STOP mode) which supports low-power operation of limited functions. Transition between each mode is described in the **Section 14.1.5, Transition to Stand-By Mode**.

- RUN mode
  RUN mode is a normal operation mode where the CPU is operating and all of other modules can operate. The CPU can enter “HALT” state by executing the “HALT” instruction to stop its operation in this mode.
- STOP mode
  STOP mode is a chip-level stand-by mode in which the clock supply to a certain clock domain can be stopped.
  STOP mode is entered when the STBC0STPT.STBC0STPTRG bit is set to 1.
  The clock supply to clock domains can continue even in STOP mode by setting CKSC_xxx_STPM.xxxSTPMSK = 1. For details on the CKSC_xxx_STPM register, see **Section 12AB, Clock Controller of RH850/F1KH-D8, RH850/F1KM-S4**, **Section 12C, Clock Controller of RH850/F1KM-S1**.
- DeepSTOP mode
  DeepSTOP mode is a chip-level stand-by mode to reduce power consumption further than STOP mode. In addition to the clock supply stop, the power supply to the Isolated area (ISO area) is switched off.
  DeepSTOP mode is entered when the STBC0PSC.STBC0DISTRG is set to 1.
- Cyclic RUN mode
  Cyclic RUN mode is a low-power operation mode in which limited modules can operate at low speed. In this mode, only the CPU1, the peripheral functions in the Always-On area (AWO area), RLIN3 and CSIG0 can operate.
  Data/Code flash memory and PLL are not available. The CPU2 is also not available.
  The CPU1 executes the instructions in the retention RAM.
  In this mode, the CPU1 can issue the “HALT” instruction to enter HALT state.
  The mode transition to Cyclic RUN mode from DeepSTOP mode is triggered by wake-up factor 2, and the mode transition to Cyclic RUN mode from Cyclic STOP mode is triggered by either wake-up factor 1 or wake-up factor 2.
  CSIG0 cannot be wake-up factor.
- Cyclic STOP mode
  Cyclic STOP mode is a STOP mode in cyclic operation, and the CPU1 halts its operation.
  This mode is entered by setting the STBC0STPT.STBC0STPTRG bit to 1 in Cyclic RUN mode.

14.1.2 Wake-Up Control

14.1.2.1 Wake-Up Factors for Stand-By Modes

The stand-by controller can initiate return from stand-by mode by the following wake-up factors.

Table 14.1 Wake-Up Factor 1 (RH850/F1KH-D8)

INTRCAN6REC*2	RCFDC0	✓	—	—	—
INTRCAN7REC*2	RCFDC0	✓	—	—	—
INTRCANGRECC1*2	RCFDC1	✓	—	—	—
INTRCAN8REC*2	RCFDC1	✓	—	—	—
INTRCAN9REC*2	RCFDC1	✓	—	—	—
INTRCAN10REC*2	RCFDC1	✓	—	—	—
INTRCAN11REC*2	RCFDC1	✓	—	—	—

Note 1. The mode returns to RUN mode via DeepSTOP mode. When the transition from Cyclic STOP to Cyclic RUN is made by wake-up factor 1, if the transition to DeepSTOP by STBC0PSC.STBC0DISTRG is made without clearing wake-up factor 1, the transition to RUN mode is made.

Note 2. By using the INTP external interrupt assigned to the alternate-function pin shared with the CAN reception pin, wake-up from stand-by modes such as DeepSTOP is possible. As the trigger for waking up from DeepSTOP, use a pin of port P0, P1, P2, P3, or P8, which is assigned to the Always-On area (AWO area).
To clear the wake-up factor flag, the interrupt request must be cleared in each CAN module.

Note 3. Cannot be cleared while REG0VCC is below the reference voltage (REG0VCC (min.) < VLVIn).
To clear the wake-up factor flag (WUF0[2]), WUFC0[2] must be set while WUFMSK0[2] = 1 and REG0VCC is above the reference voltage (REG0VCC (min.) > VLVIn). The INTLVIH interrupt can be used to check that REG0VCC is above the reference voltage.

Note 1. These wake-up factors are only available in LPS analog input mode.

CAUTION

For the pins of the function used for the wake-up factors from DeepSTOP, use the multiplexed functions of the ports assigned to the Always-On area (AWO area).

14.1.2.2 Setting of Wake-Up Factors

Wake-up factors for returning from stand-by modes are controlled by the following stand-by controller registers:

- Wake-up factor registers: WUF0, WUF1, WUF20, WUF_ISO0

  Upon occurrence of an effective wake-up factor, the associated wake-up factor flag is set to 1. By checking these registers and their flags, it is possible to identify the wake-up factor.

- Wake-up factor mask registers: WUFMSK0, WUFMSK1, WUFMSK20, WUFMSK_ISO0

  Each bit of these registers is assigned to a certain wake-up factor. Wake-up by this factor is enabled if its mask bit is set to 0. Wake-up factors assigned to both wake-up factor 1 and 2 should not be enabled at the same time.

- Wake-up factor clear registers: WUFC0, WUFC1, WUFC20, WUFC_ISO0

  By setting the applicable bits in these registers to 1, the wake-up factor bit (WUFy) in the wake-up factor registers (WUF0, WUF1, WUF20, WUF_ISO0) can be cleared.

NOTE

The wake-up factor flags in the wake-up factor registers (WUF0, WUF1, WUF20, and WUF_ISO0) only indicate the occurrence of wake-up factor. These flags do not indicate a transition from stand-by mode to normal mode.

The assignment of the wake-up factors to the control register bits and status register bits are shown in the following tables.

For details about the wake-up control and status registers, see **Section 14.2.2.3, WUF0/WUF1/WUF20/WUF_ISO0 — Wake-Up Factor Registers**, **Section 14.2.2.4, WUFMSK0/WUFMSK1/WUFMSK20/WUFMSK_ISO0 — Wake-Up Factor Mask Registers**, and **Section 14.2.2.5, WUFC0/WUFC1/WUFC20/WUFC_ISO0 — Wake-Up Factor Clear Registers**.

14.1.3 On-Chip Debug Wake-Up

The On-Chip Debug unit (OCD) generates a wake-up event while the microcontroller runs the application program in the following cases:

- The debugger issues a stop request
- A breakpoint is hit

In either case all stand-by modes are terminated, provided the OCD debug event is enabled as a wake-up factor via the WUFMSK0 register.

CAUTION

If the OCD wake-up event is disabled, it is not possible to wake up from stand-by modes via an On-chip debugger request.
The OCD wake-up event can be enabled as a wake-up factor for all stand-by modes by setting WUFMSK0[31] = 0.
When the hot plug-in function is used, make sure to enable the OCD wake-up event and return from stand-by mode by INTDCUTDI interrupt.

14.1.4 I/O Buffer Control

This section describes the behavior of the I/O buffers during various stand-by modes.

The port groups in the Isolated area (ISO area) support the I/O buffer hold state. The port groups in the Always-On area (AWO area) remain their state before entering stand-by mode.
For details on the port group assignment to the Isolated area (ISO area) and to the Always-On area (AWO area), see **Section 10A, Power Supply Circuit of RH850/F1KH-D8**, **Section 10B, Power Supply Circuit of RH850/F1KM-S4**, **Section 10C, Power Supply Circuit of RH850/F1KM-S1**.

14.1.4.1 I/O Buffer Hold State

During the I/O buffer hold state, the I/O buffers maintains the state it was in before entering this state. Therefore, no external or internal signal can change the state of the I/O buffer until the I/O buffer hold state is terminated.

14.1.4.2 I/O Buffers during STOP Mode

In STOP mode, the I/O buffers remain their state before entering STOP mode (I/O buffer hold state is not entered).

14.1.4.3 I/O Buffers during DeepSTOP Mode

In DeepSTOP mode, the I/O buffers of port groups in the Isolated area (ISO area) transition to I/O buffer hold state.

After wake-up from DeepSTOP, the I/O buffers remain in I/O buffer hold state until the state is canceled by software. To cancel I/O buffer hold state, follow the steps shown below.

1. Re-configure the peripheral or port function.
2. Set IOHOLD.IOHOLD = 0.

The following table is a summary of the I/O buffer in the Isolated area (ISO area) during stand-by mode and after wake-up.

Table 14.13 Buffer Operation during Stand-by Mode and after Wake-Up (I/O buffers in the Isolated area (ISO area))

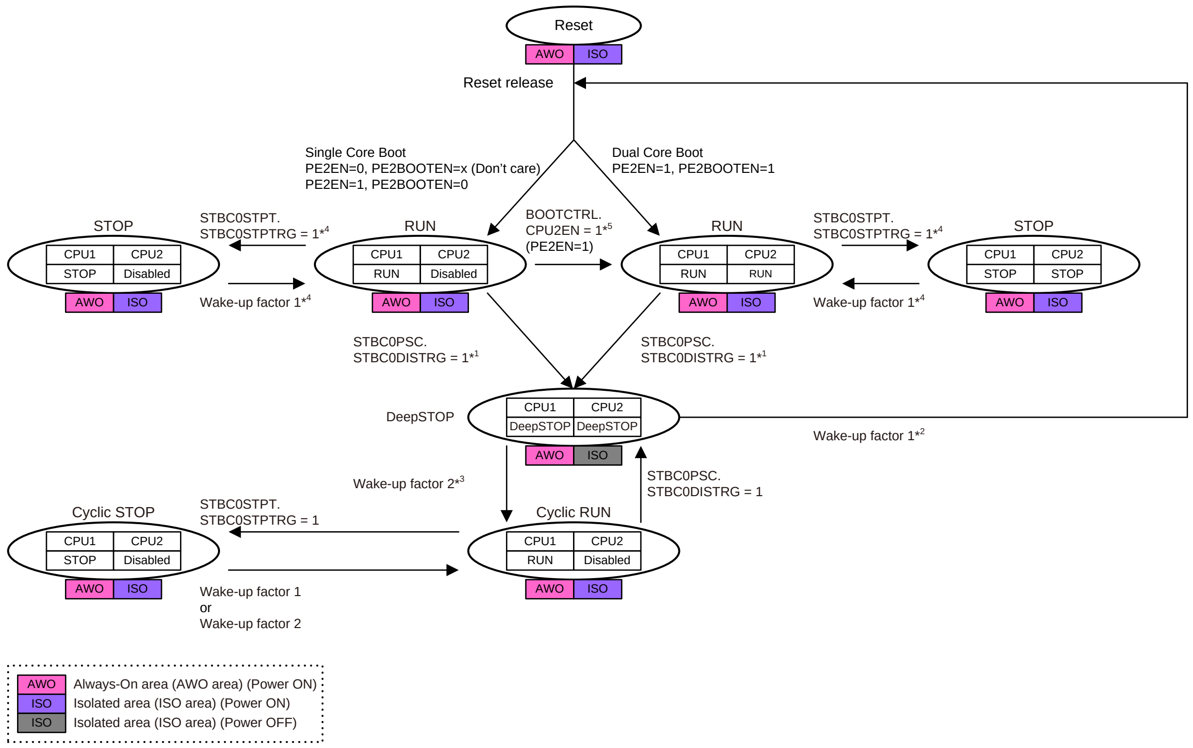
	Before Stand-By	During Stand-By	After Wake-Up
STOP mode	Normal operation		
DeepSTOP mode	Normal operation	I/O buffer hold state	I/O buffer hold state*[1]

Note 1. Set the IOHOLD.IOHOLD bit to “0” to release the I/O buffer hold state.

The port groups in the Always-On area (AWO area) don’t support I/O buffer hold state. They continue operation and remain its state before entering DeepSTOP. In the case an alternative function of modules in Isolated area (ISO area) is assigned to the pin in the Always-On area (AWO area), the state of the I/O buffer may change in the transition to the DeepSTOP due to initialization of the modules in the Isolated area (ISO area) by ISORES. To avoid this behavior, it is recommended to change to function of modules in Always-On area (AWO area) (e. g. Port mode) before entering DeepSTOP.

14.1.5 Transition to Stand-By Mode

The figure below shows transition between RUN mode and stand-by mode.



Note: The return time from stand-by mode can be shortened by setting the AWDTADSTPMSK bit of the CKSC_AWDTAD_STPM register to 1.

Note 1. Set a clock other than the PLL clock as the CPU clock source.

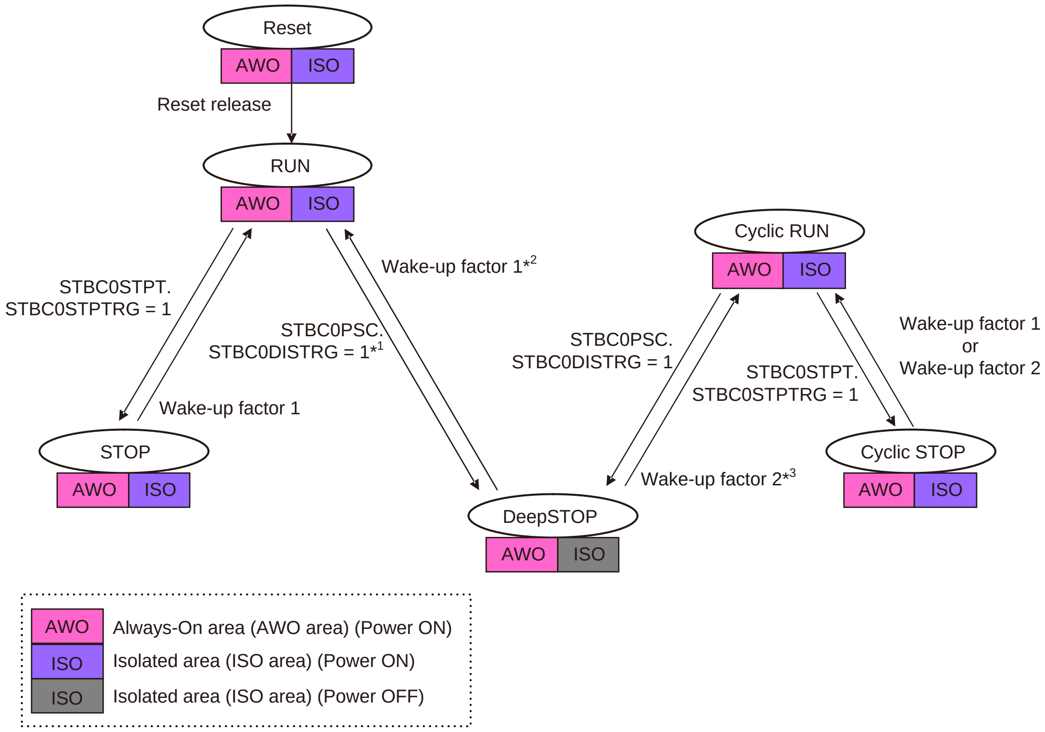
Note 2. To return from DeepSTOP to RUN, ISO peripheral function registers must be set again.
The CPU1/CPU2 starts the operation from the reset address on the code flash.

Note 3. The CPU1 starts the operation from the reset address on the retention RAM.

Note 4. Set a clock according to the method described in **Section 12AB.5.5, CPUCLK Setting in STOP Mode Method**.

Note 5. For details on the BOOTCTRL register, see **Section 3A.4, CPU2 Boot Up Operation**.

Figure 14.1 Transition to Stand-By Mode (RH850/F1KH-D8)



Note: The return time from stand-by mode can be shortened by setting the AWDTADSTPMSK bit of the CKSC_AWDTAD_STPM register to 1.

Note 1. Set a clock other than the PLL clock as the CPU clock source.

Note 2. To return from DeepSTOP to RUN, ISO peripheral function registers must be set again.
The CPU starts the operation from the reset address on the code flash.

Note 3. The CPU starts the operation from the reset address on the retention RAM.

Figure 14.2 Transition to Stand-By Mode (RH850/F1KM-S4, RH850/F1KM-S1)

14.1.6 Clock Supply

The clock supply to the stand-by controller is shown in the following table.

Table 14.14 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
Stand-by controller	Register access clock	CPUCLK_L, EMCLK

14.2 Registers

14.2.1 List of Registers

The following table lists the stand-by controller registers.

Table 14.15 List of Registers

Module Name	Register Name	Symbol	Address
STBC0	Power save control register	STBC0PSC	FFF8 0100_H
	Power stop trigger register	STBC0STPT	FFF8 0110_H
STBC_WUF0	Wake-up factor registers	WUF0	FFF8 0400_H
STBC_WUF1		WUF1	FFF8 0410_H
STBC_WUF20		WUF20	FFF8 0520_H

STBC_IOHOLD	I/O buffer hold control register	IOHOLD	FFF8 $0B00_H$

14.2.2 Details of Stand-By Controller Control Registers

14.2.2.1 STBC0PSC — Power Save Control Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 0100_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 14.16 STBC0PSC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	STBC0DISTRG	0: No effect 1: Transition to DeepSTOP mode This bit is cleared automatically after transition to the DeepSTOP mode.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

14.2.2.2 STBC0STPT — Power Stop Trigger Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 0110_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 14.17 STBC0STPT Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	STBC0STPTRG	0: No effect. 1: Transition to STOP mode – In RUN mode: Transition to STOP mode – In Cyclic RUN mode: Transition to Cyclic STOP mode This bit is cleared automatically after transition to the STOP / Cyclic STOP mode.

14.2.2.3 WUF0/WUF1/WUF20/WUF_ISO0 — Wake-Up Factor Registers

These registers indicate the generation of wake-up factors.

WUF0, WUF1 and WUF20 are initialized by all reset sources except the transition to DeepSTOP mode (AWORES). WUF_ISO0 is initialized by all reset sources (ISORES).

Access: These registers are read-only registers that can be read in 32-bit units.

Address: WUF0: FFF8 0400$_H$
WUF1: FFF8 0410$_H$
WUF20: FFF8 0520$_H$
WUF_ISO0: FFF8 8110$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.18 WUF0/WUF1/WUF20/WUF_ISO0 Register Contents

Bit Position	Bit Name	Function
31 to 0	WUFy	Indicates the generation of a wake-up factor. 0: Wake-up factor is not generated 1: Wake-up factor is generated

NOTE

While the WUFMSKy bit in the wake-up factor mask register is 1, WUFy is not set to 1 at the generation of a wake-up factor.

Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.7, Wake-Up Factor 1 Register Assignment (RH850/F1KH-D8)**, **Table 14.8, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S4)**, **Table 14.9, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S1)**, **Table 14.10, Wake-Up Factor 2 Register Assignment (RH850/F1KH-D8)**, **Table 14.11, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S4)**, and **Table 14.12, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S1)**.

The bit to which a wake-up factor is not assigned is read as the value “0”.

14.2.2.4 WUFMSK0/WUFMSK1/WUFMSK20/WUFMSK_ISO0 — Wake-Up Factor Mask Registers

These registers enable wake-up factors.

WUFMSK0, WUFMSK1 and WUFMSK20 are initialized by all reset sources except the transition to DeepSTOP mode (AWORES). WUFMSK_ISO0 is initialized by all reset sources (ISORES).

Access: These registers can be read or written in 32-bit units.

Address:
WUFMSK0: FFF8 0404$_H$
WUFMSK1: FFF8 0414$_H$
WUFMSK20: FFF8 0524$_H$
WUFMSK_ISO0: FFF8 8114$_H$

Value after reset:
WUFMSK0: FFFF FFFF$_H$
WUFMSK1: FFFF FFFF$_H$
WUFMSK20: FFFF FFFF$_H$
WUFMSK_ISO0: FFFF FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WUFMSK31	WUFMSK30	WUFMSK29	WUFMSK28	WUFMSK27	WUFMSK26	WUFMSK25	WUFMSK24	WUFMSK23	WUFMSK22	WUFMSK21	WUFMSK20	WUFMSK19	WUFMSK18	WUFMSK17	WUFMSK16
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WUFMSK15	WUFMSK14	WUFMSK13	WUFMSK12	WUFMSK11	WUFMSK10	WUFMSK09	WUFMSK08	WUFMSK07	WUFMSK06	WUFMSK05	WUFMSK04	WUFMSK03	WUFMSK02	WUFMSK01	WUFMSK00
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 14.19 WUFMSK0/WUFMSK1/WUFMSK20/WUFMSK_ISO0 Register Contents

Bit Position	Bit Name	Function
31 to 0	WUFMSKy	Enables/disables a wake-up factor. 0: Wake-up factor is enabled 1: Wake-up factor is disabled

NOTE

While the WUFMSKy bit is 1, WUFy of the wake-up factor register is not set to 1 at the generation of a wake-up factor.

Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.7, Wake-Up Factor 1 Register Assignment (RH850/F1KH-D8)**, **Table 14.8, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S4)**, **Table 14.9, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S1)**, **Table 14.10, Wake-Up Factor 2 Register Assignment (RH850/F1KH-D8)**, **Table 14.11, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S4)**, and **Table 14.12, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S1)**.

When writing to these registers, write the value “1” to the bits to which wake-up factors are not assigned.

14.2.2.5 WUFC0/WUFC1/WUFC20/WUFC_ISO0 — Wake-Up Factor Clear Registers

These registers clear the WUFy bits in the wake-up factor registers.

Access: These registers are write-only registers that can be written in 32-bit units.

Address: WUFC0: FFF8 0408$_H$

WUFC1: FFF8 0418$_H$

WUFC20: FFF8 0528$_H$

WUFC_ISO0: FFF8 8118$_H$

Value after reset: Undefined

Table 14.20 WUFC0/WUFC1/WUFC20/WUFC_ISO0 Register Contents

Bit Position	Bit Name	Function
31 to 0	WUFCy	Clears the wake-up factor bit WUFy in the wake-up factor registers. 0: WUFy is not modified 1: WUFy is cleared

Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.7, Wake-Up Factor 1 Register Assignment (RH850/F1KH-D8)**, **Table 14.8, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S4)**, **Table 14.9, Wake-Up Factor 1 Register Assignment (RH850/F1KM-S1)**, **Table 14.10, Wake-Up Factor 2 Register Assignment (RH850/F1KH-D8)**, **Table 14.11, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S4)**, and **Table 14.12, Wake-Up Factor 2 Register Assignment (RH850/F1KM-S1)**.

When writing to these registers, write the value “0” to the bits to which wake-up factors are not assigned.

14.2.2.6 IOHOLD — I/O Buffer Hold Control Register

This register specifies the hold state of the I/O buffer in DeepSTOP mode. The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access:	This register can be read or written in 32-bit units.
Address:	FFF8 0B00$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IOHOLD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 14.21 IOHOLD Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	IOHOLD	0: I/O hold state is released 1: I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is prohibited. To release the I/O hold state after the wake-up, set this bit to 0 by software.

14.3 Mode Transition

This section explains the mode transition procedures.

CAUTION

Transition to stand-by mode should be performed by CPU1. When CPU1 shifts to stand-by mode, CPU2 will also shift to stand-by mode.

14.3.1 STOP Mode

In STOP mode, most of the clock supplies to the Always-On area (AWO area) and the Isolated area (ISO area) are stopped. The clock stop mask registers control clock supply to related clock domains in stand-by mode. Stop all of the peripheral functions before transition to STOP mode if the clock supply to the function will be stopped in STOP mode.

The transition procedure (example) to STOP mode is shown below.

Preparation for stand-by

- Stop all of the peripheral functions to which the clock supply is to be stopped.
- Disable the interrupt handling by issuing the CPU instruction “DI”.
- Set the interrupt control registers.
  - Clear the interrupt flag (ICxxx.RFxxx = 0).
  - Mask the interrupts for non-wake-up factors (ICxxx.MKxxx = 1).
  - Release the masks of the interrupts for wake-up factors (ICxxx.MKxxx = 0).
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC1/WUFC_ISO0 registers).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK1/WUFMSK_ISO0 registers).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK1/WUFMSK_ISO0 registers).
- Set the clock stop mask register to select the clock domains to be stopped and the ones to continue operating (using the CKSC_xxx_STPM.xxxxSTPMSK bit).
- Specify whether to oscillate or stop each clock source. In addition, set the clock stop mask register to select the clock sources to be stopped and the ones to continue operating (using the MOSCSTPMSK bit in the MOSCSTPM register and the ROSCSTPMSK bit in the ROSCSTPM register).
- RH850/F1KH-D8
  Set a clock according to the method described in **Section 12AB.5.5, CPUCLK Setting in STOP Mode Method**.

Start of stand-by

Set the STBC0STPTRG bit in the STBC0STPT register to 1 to transition to STOP mode.

End of stand-by

When a wake-up factor is generated, the microcontroller returns from STOP mode.

Wake-up handling

The generation of the wake-up factors can be determined by the wake-up factor flags (WUF0, WUF1, WUF_ISO0).

When an interrupt is enabled by the CPU instruction “EI”, the generated wake-up interrupt will be executed.

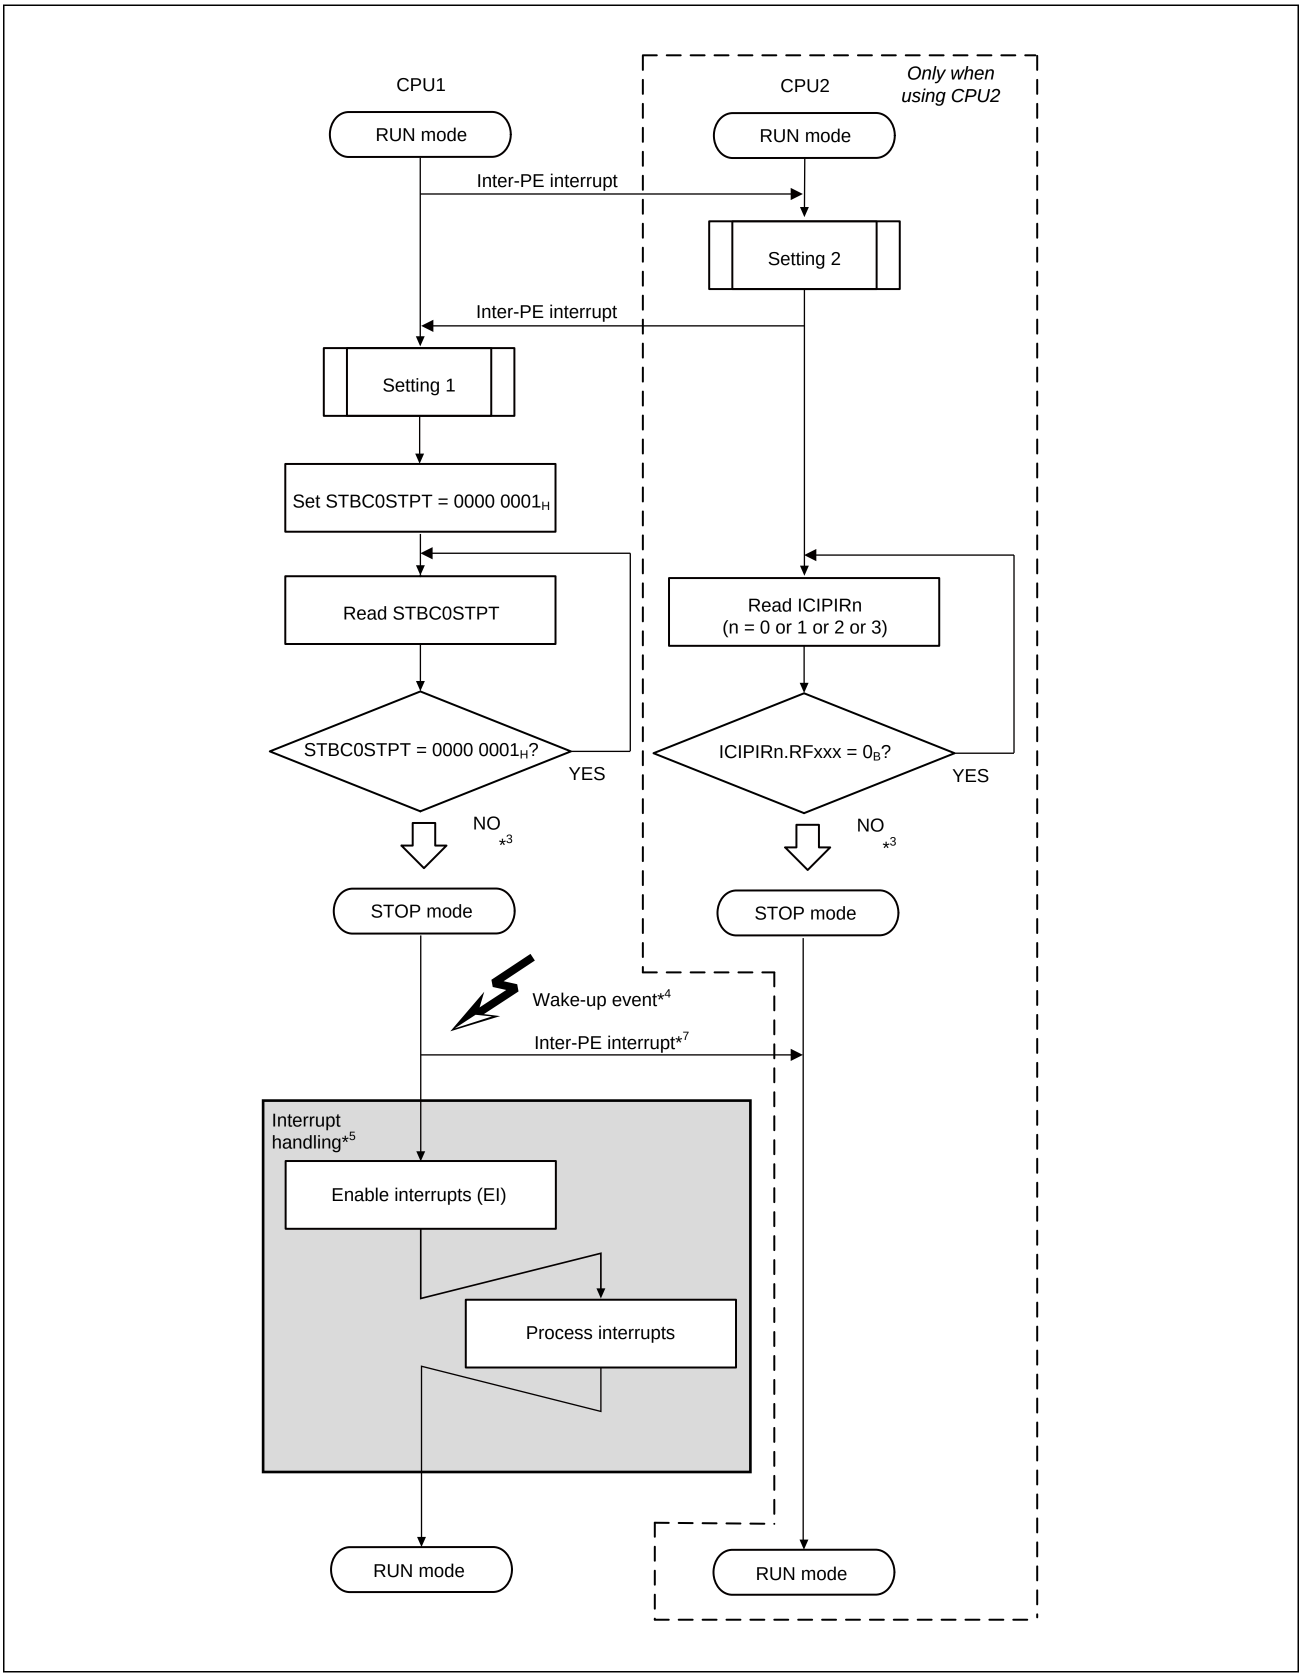

Figure 14.3 Example of STOP Mode Transition (RH850/F1KH-D8) (1/2)

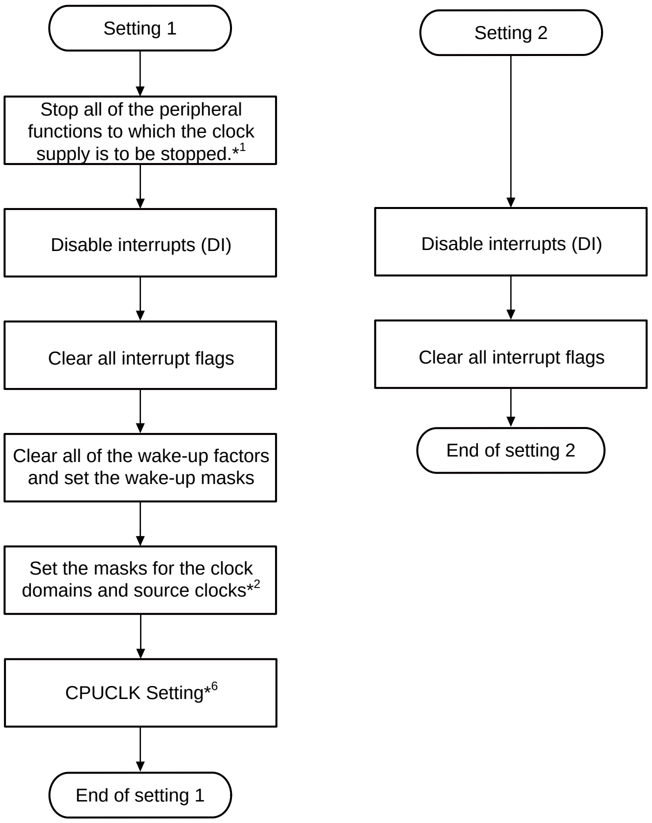


Note 1. When the operation of the peripheral function is stopped during operating due to the transition to the STOP mode, the operation of the peripheral function may be incorrect. Before the transition to the STOP mode, stop all of the peripheral functions to which the clock supply is to be stopped.

Note 2. Though the clock mask can be set before this flow is started, it must be set before 0000 0001_H is written to STBC0STPT.

Note 3. The clock supply to the CPU is stopped and the operation transitions to the STOP mode while checking that STBC0STPT = 0000 0001_H and ICIPIRn.RFxxx = 0_B.

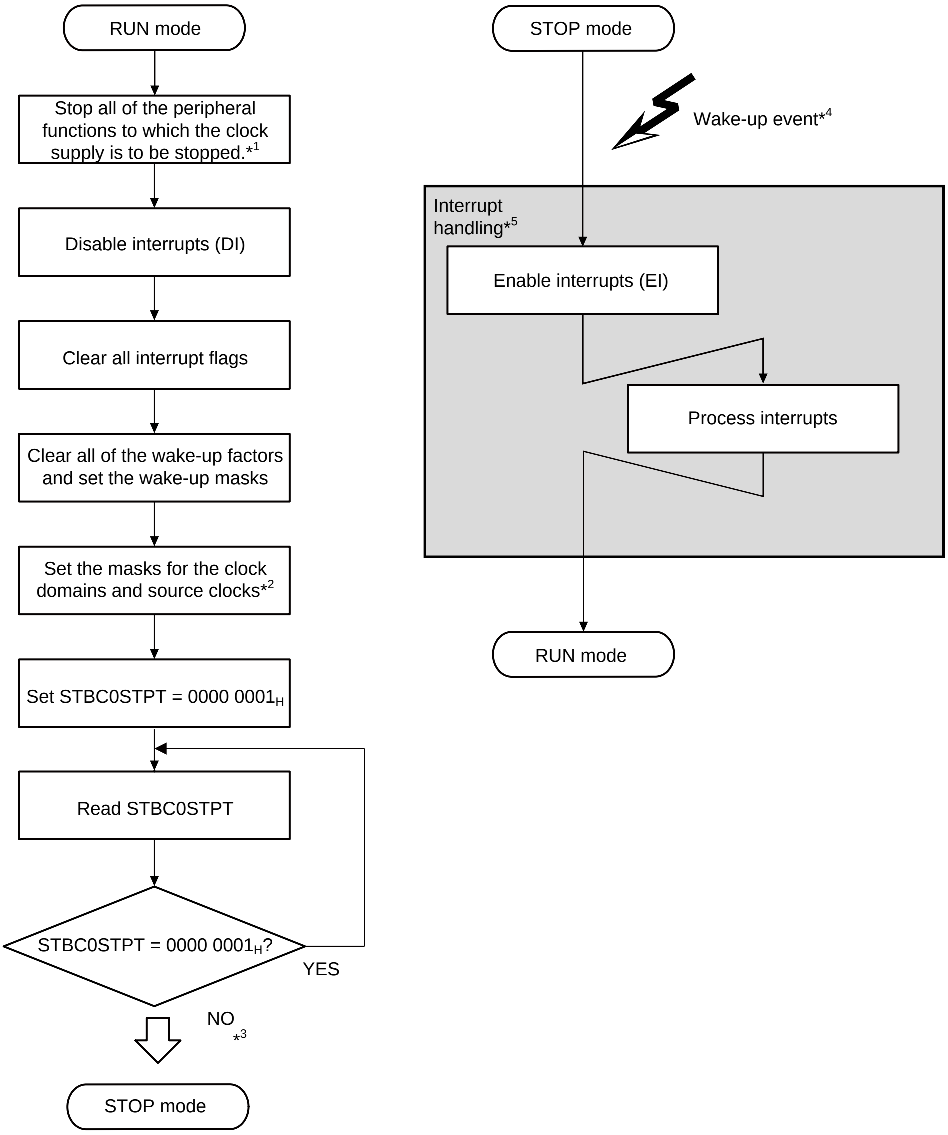
Note 4. STBC0STPT is set to 0000 0000_H at the generation of a wake-up factor. The generated wake-up factor can be checked by the WUF0, WUF1 and WUF_ISO0 registers.

Note 5. This processing is optional. It is required when executing the interrupt handling after the wake-up.

Note 6. For details on the CPUCLK Setting, see **Section, 12AB.5.4 CPUCLK Source and Divided Clock Selection Method**, **Section, 12AB.5.5 CPUCLK Setting in STOP Mode Method**.

Note 7. ICIPIRn.RFxxx can be set to 1_B by the Inter-PE interrupt. ICIPIRn.RFxxx should be cleared by software.

Figure 14.3 Example of STOP Mode Transition (RH850/F1KH-D8) (2/2)



Note 1. When the operation of the peripheral function is stopped during operating due to the transition to the STOP mode, the operation of the peripheral function may be incorrect. Before the transition to the STOP mode, stop all of the peripheral functions to which the clock supply is to be stopped.

Note 2. Though the clock mask can be set before this flow is started, it must be set before 0000 0001_H is written to STBC0STPT.

Note 3. The clock supply to the CPU is stopped and the operation transitions to the STOP mode while checking that STBC0STPT = 0000 0001_H.

Note 4. STBC0STPT is set to 0000 0000_H at the generation of a wake-up factor. The generated wake-up factor can be checked by the WUF0, WUF1 and WUF_ISO0 registers.

Note 5. This processing is optional. It is required when executing the interrupt handling after the wake-up.

Figure 14.4 Example of STOP Mode Transition (RH850/F1KM-S4, RH850/F1KM-S1)

14.3.2 DeepSTOP Mode

In DeepSTOP mode, the clock supply to all areas and the power supply to the Isolated area (ISO area) are stopped. However, clock supply to peripheral functions in the Always-On area (AWO area) can be continued by setting the clock stop mask register.

Select the clock other than the PLL as the CPU operating clock, before the transition to DeepSTOP mode.

The transition procedure (example) to DeepSTOP mode is shown below.

Preparation for stand-by

- Stop all of the peripheral functions to which the clock supply is to be stopped.
- Disable the interrupt handling by issuing the CPU instruction “DI”.
- Set the interrupt control registers.
  - Clear the interrupt flag (ICxxx.RFxxx = 0).
  - Mask the interrupts for non-wake-up factors (ICxxx.MKxxx = 1).
  - Release the masks of the interrupts for wake-up factors (ICxxx.MKxxx = 0).
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC1/WUFC20 registers).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK1/WUFMSK20 registers).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK1/WUFMSK20 registers).

CAUTION

When a wake-up factor is assigned to both wake-up factor 1 registers and wake-up factor 2 registers, it can be used only in one of them.

- Set the clock stop mask register to select the clock domains to be stopped and the ones to continue operating (using the CKSC_xxx_STPM.xxxxSTPMSK bit).
- Specify whether to oscillate or stop each clock source. In addition, set the clock stop mask register to select the clock sources to be stopped and the ones to continue operating (using the MOSCSTPMSK bit in the MOSCSTPM register and the ROSCSTPMSK bit in the ROSCSTPM register).

Start of stand-by

Set the STBC0DISTRG bit in the STBC0PSC register to 1 to transition to DeepSTOP mode.

End of stand-by

When a wake-up factor is generated, the microcontroller returns from DeepSTOP mode.

Wake-up handling

- When returned from DeepSTOP mode due to wake-up factor 1, the microcontroller starts the operation from the reset vector address.

  If one of the following interrupts has been generated before recovery from DeepSTOP mode to RUN mode, the microcontroller restarts operation from the exception handler address:

  - FENMI: FENMI handler address ($E0_H$)
  - FEINT: FEINT handler address ($F0_H$)

  RH850/F1KH-D8, RH850/F1KM-S4:

  Note that the general-purpose registers, local RAM and global RAM are undefined value after return from DeepSTOP mode.

  RH850/F1KM-S1:

  Note that the general-purpose registers and local RAM are undefined value after return from DeepSTOP mode.

- The generation of the wake-up factors can be determined by the wake-up factor flags (WUF0, WUF1).

- The ports in the Isolated area (ISO area) maintain the I/O buffer hold state.
  Release the I/O buffer hold state by executing the following steps:
  1. Re-configure the peripheral functions and port functions.
  2. Set IOHOLD.IOHOLD = 0.

- To execute an interrupt of the wake-up factor after the wake-up, evaluate the information of wake-up factor flag by software and set the interrupt request flag in the interrupt control register. In addition, release the masking of the interrupt used as wake-up factors. Then, when an interrupt is enabled by the CPU instruction “EI”, the generated wake-up interrupt will be executed.

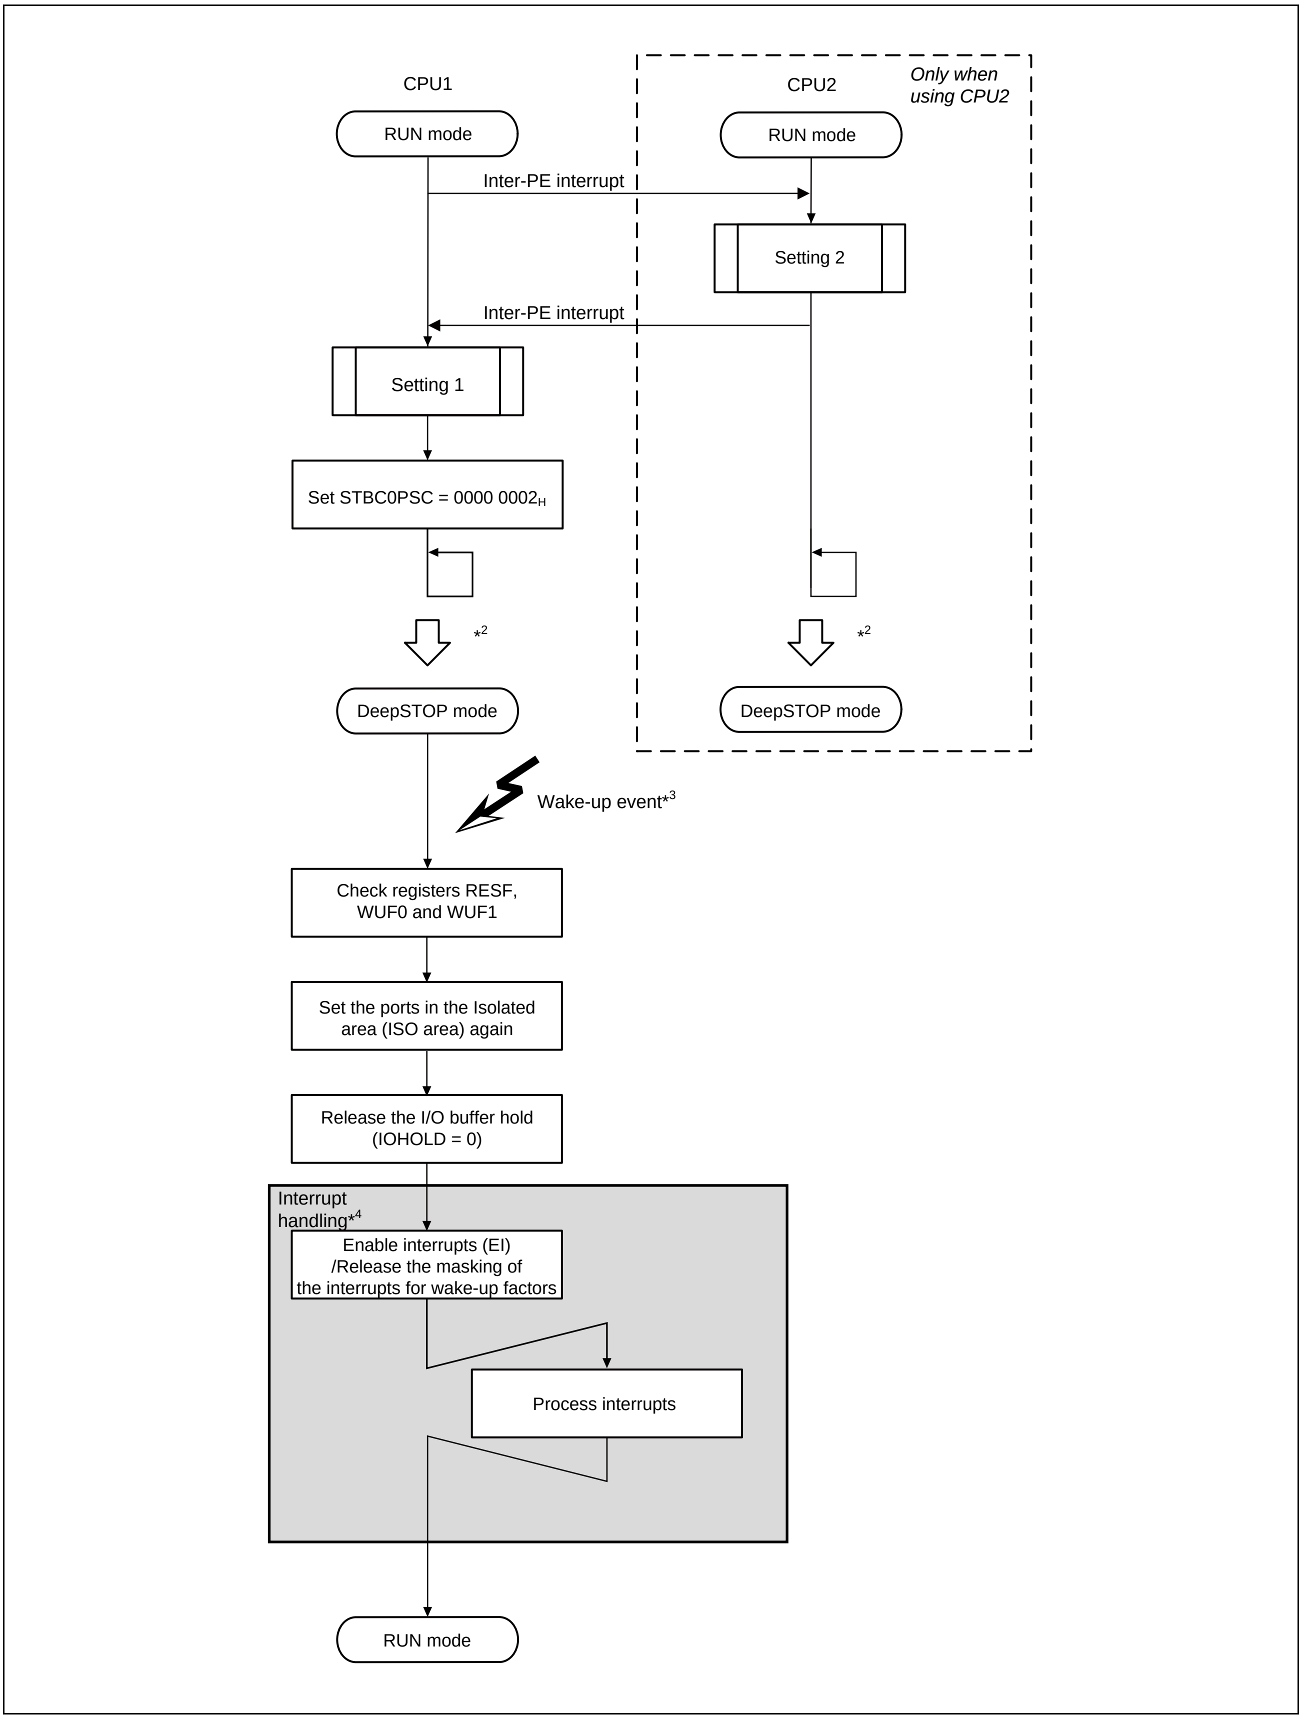


Figure 14.5 Example of DeepSTOP Mode Transition (RH850/F1KH-D8) (1/2)

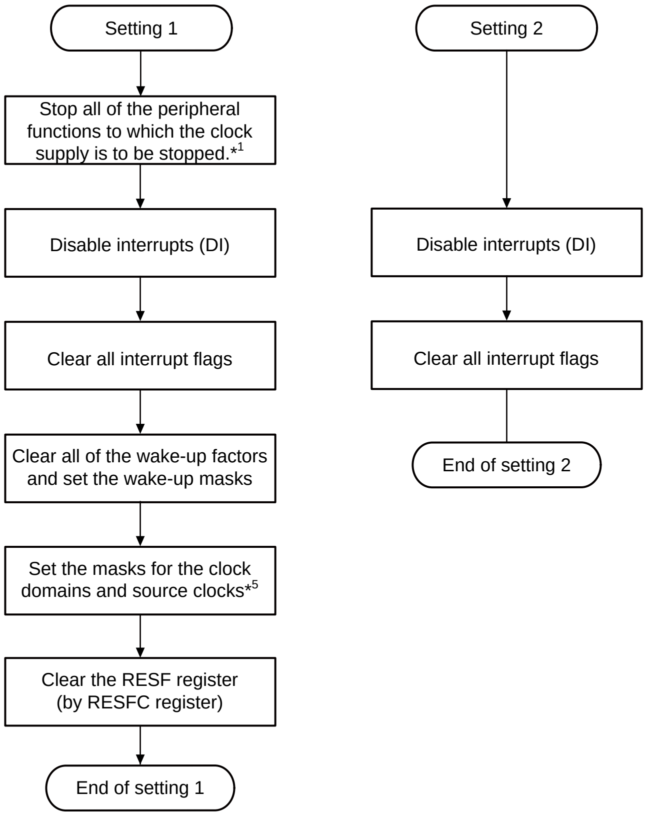


Note 1. When the operation of the peripheral function is stopped during operating due to the transition to the DeepSTOP mode, the operation of the peripheral function may be incorrect. Before the transition to the DeepSTOP mode, stop all of the peripheral functions to which the clock supply is to be stopped.

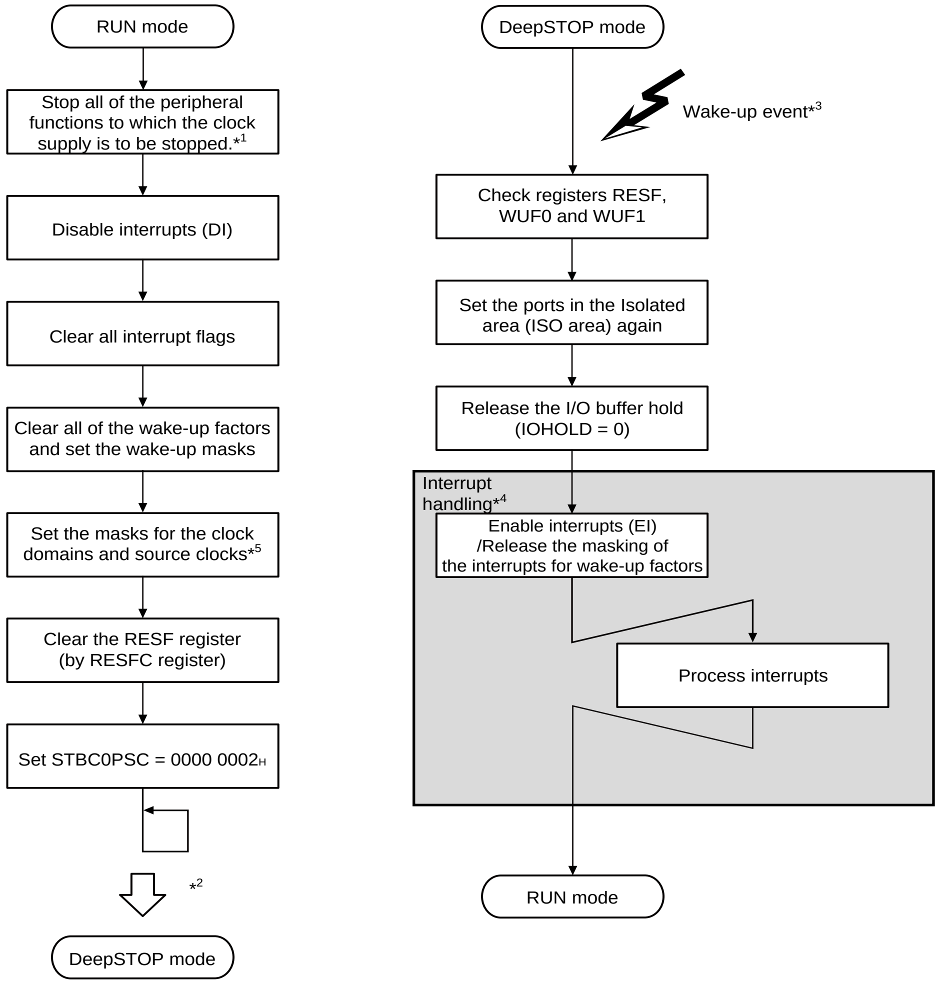
Note 2. After setting STBC0PSC = 0000 0002_H, wait for the transition to the DeepSTOP mode by the unconditional loop.

Note 3. The CPU starts the program from the reset vector after the generation of a wake-up factor. The return from the DeepSTOP mode by a reset can be checked by the RESF register. In addition, the generated wake-up factor can be checked by the WUF0 and WUF1 registers.

Note 4. This processing is optional. It is required when executing the interrupt handling after the wake-up. To execute an interrupt of the wake-up factor after the wake-up, evaluate the information of wake-up factor flag by software and set the interrupt request flag in the interrupt control register. After that, the interrupt should be enabled.

Note 5. Though the clock mask can be set before this flow is started, it must be set before 0000 0002_H is written to STBC0PSC.

Figure 14.5 Example of DeepSTOP Mode Transition (RH850/F1KH-D8) (2/2)



Note 1. When the operation of the peripheral function is stopped during operating due to the transition to the DeepSTOP mode, the operation of the peripheral function may be incorrect. Before the transition to the DeepSTOP mode, stop all of the peripheral functions to which the clock supply is to be stopped.

Note 2. After setting STBC0PSC = 0000 0002_H, wait for the transition to the DeepSTOP mode by the unconditional loop.

Note 3. The CPU starts the program from the reset vector after the generation of a wake-up factor. The return from the DeepSTOP mode by a reset can be checked by the RESF register. In addition, the generated wake-up factor can be checked by the WUF0 and WUF1 registers.

Note 4. This processing is optional. It is required when executing the interrupt handling after the wake-up. To execute an interrupt of the wake-up factor after the wake-up, evaluate the information of wake-up factor flag by software and set the interrupt request flag in the interrupt control register. After that, the interrupt should be enabled.

Note 5. Though the clock mask can be set before this flow is started, it must be set before 0000 0002_H is written to STBC0PSC.

Figure 14.6 Example of DeepSTOP Mode Transition (RH850/F1KM-S4, RH850/F1KM-S1)

14.3.3 Cyclic RUN Mode

In Cyclic RUN mode, the functions except the CPU1, peripheral functions in Always-On area (AWO area), RLIN3, and CSIG0 are stopped. In this mode, PLL and Flash Memory are not available. The CPU2 is also not available. The transition procedure (example) to Cyclic RUN mode is shown below.

Preparation of Cyclic RUN

- RH850/F1KH-D8, RH850/F1KM-S4
  Allocate the program for Cyclic RUN to the retention RAM. The reset vector base address (RBASE) in Cyclic RUN operation is set to the first address of the retention RAM (FEF0 0000_H). Note that neither the code flash memory nor the data flash memory is available in Cyclic RUN mode.
- RH850/F1KM-S1
  Allocate the program for Cyclic RUN to the retention RAM. The reset vector base address (RBASE) in Cyclic RUN operation should be specified in the CYCRBASE register described in **Section 9BC, Reset Controller of RH850/F1KM**. Note that neither the code flash memory nor the data flash memory is available in Cyclic RUN mode.

  The instruction to transition to DeepSTOP mode should be arranged in the interrupt exception handler or a polling routine of interrupt request which is used as the source of returning to the RUN mode.

  For details on the exception vector, see *the RH850G3KH User's Manual: Software*.

CAUTION

Do not change the PSW.EBV bit from its value after reset in Cyclic RUN mode (Do not set the PSW.EBV bit to 1 in Cyclic RUN mode).

- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC20 register).
  - Mask the non-wake-up factor (the WUFMSK20 register).
  - Release the masks of the wake-up factors (the WUFMSK20 register).
- Transition to DeepSTOP mode. For details on the transition to DeepSTOP mode, see **Section 14.3.2, DeepSTOP Mode**.

Start of Cyclic RUN

The operation transitions to Cyclic RUN mode from DeepSTOP mode at the generation of wake-up factor 2.

The operation transitions to Cyclic RUN mode from Cyclic STOP mode at the generation of wake-up factors 1 and 2.

- RH850/F1KH-D8, RH850/F1KM-S4
  The microcontroller starts operation from the reset vector address of Cyclic RUN mode (the first address of the retention RAM (FEF0 0000_H)). If one of the following interrupts has been generated during recovery from DeepSTOP mode to Cyclic RUN mode, the microcontroller restart operation from the exception handler address:
  - FENMI: FENMI handler address in Cyclic RUN mode (FEF0 0000_H + $E0_H$)
  - FEINT: FEINT handler address in Cyclic RUN mode (FEF0 0000_H + $F0_H$)

  Note that the general-purpose registers, local RAM and global RAM are undefined value after the transition to Cyclic RUN mode from DeepSTOP mode.

- RH850/F1KM-S1
  The microcontroller starts operation from the reset vector address of Cyclic RUN mode specified by the CYCRBASE register. If one of the following interrupts has been generated during recovery from DeepSTOP mode to Cyclic RUN mode, the microcontroller restart operation from the exception handler address:
  - FENMI: FENMI handler address in Cyclic RUN mode (CYCRBASE + $E0_H$)
  - FEINT: FEINT handler address in Cyclic RUN mode (CYCRBASE + $F0_H$)

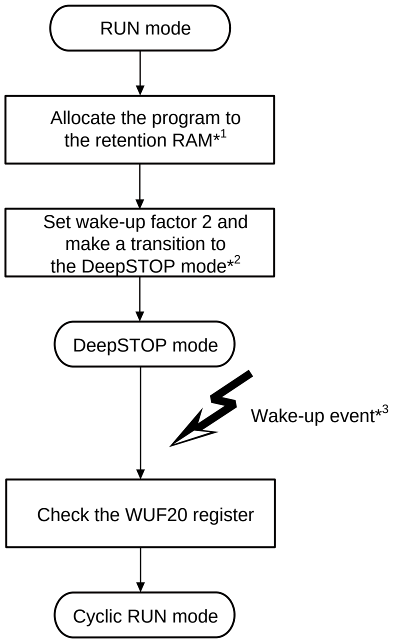
  Note that the general-purpose registers and local RAM are undefined value after the transition to Cyclic RUN mode from DeepSTOP mode.

End of Cyclic RUN

The Cyclic RUN mode ends at the transition to the Cyclic STOP mode by setting the STBC0STPT.STBC0STPTRG bit to 1, or at the transition to the DeepSTOP mode by setting the STBC0PSC.STBC0DISTRG bit to 1.

Wake-up handling

The generation of the wake-up factors can be determined by the wake-up factor flags (WUF20).



Note 1. When the mode transitions from the Cyclic RUN mode to the RUN mode by a wake-up factor, the transition to the DeepSTOP mode should be made in the processing of the interrupt vector for the wake-up factor. In that case, allocate the interrupt processing program to the retention RAM as well.

Note 2. Before the transition to the DeepSTOP mode, clear the flag for wake-up factor 2 in the WUFC20 register and set wake-up factor 2 that is to be used in the WUFMSK20 register. Other parts of the procedure for transition to DeepSTOP mode are the same as the normal procedure.

Note 3.

- RH850/F1KH-D8, RH850/F1KM-S4
  The CPU starts the program from the top address (FEF0 0000_H) of the retention RAM after the generation of a wake-up factor. The generated wake-up factor can be checked by the WUF20 register.
- RH850/F1KM-S1
  The CPU starts the program from the address specified by CYCRBASE register after the generation of a wake-up factor. The generated wake-up factor can be checked by the WUF20 register.

Figure 14.7 Example of Cyclic RUN Mode Transition

14.3.4 Cyclic STOP Mode

In Cyclic STOP mode, the functions except the peripheral functions in the Always-On area (AWO area) and RLIN3 are stopped.

The transition procedure (example) to Cyclic STOP mode is shown below.

Preparation for Cyclic STOP

- Transition to Cyclic RUN mode.
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC1/WUFC20 register).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK1/WUFMSK20 register).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK1/WUFMSK20 register).

Start of Cyclic STOP

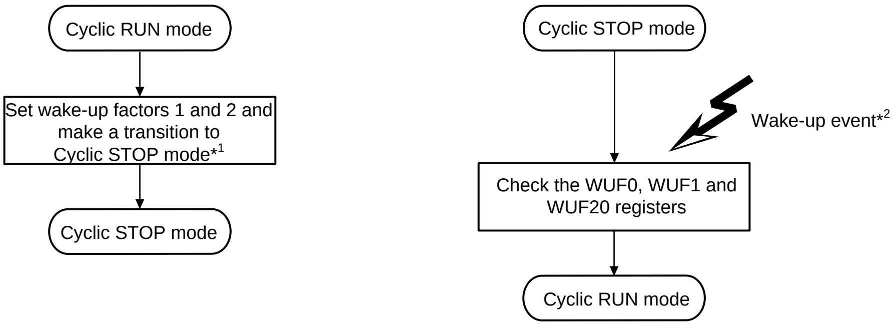
Set the STBC0STPT.STBC0STPTRG bit to 1 to transition to Cyclic STOP mode.

End of Cyclic STOP

The operation transitions to Cyclic RUN mode at the generation of wake-up factor 1 or 2.

Wake-up handling

The generation of the wake-up factors can be determined by the wake-up factor flags (WUF0, WUF1, WUF20).



Note 1. Set wake-up factors 1 and 2 to be used for transitioning to RUN mode and Cyclic RUN mode, respectively. When the mode transitions to RUN mode by wake-up factor 1, the transition processing to DeepSTOP mode should be added in Cyclic RUN mode.

Note 2. When a wake-up factor is generated in Cyclic STOP mode, the mode transitions to Cyclic RUN mode and the operation starts immediately after the processing shifted to Cyclic STOP mode. The generated wake-up factors can be checked by the WUF0, WUF1 and WUF20 registers.

Figure 14.8 Example of Cyclic STOP Mode Transition

14.4 Writing to the Stand-By Controller Related Registers

The following stand-by controller registers are write-protected registers.

- STBC0PSC register
- STBC0STPT register
- IOHOLD register

The write-protected registers are protected against the illegal writing due to an incorrect program operation.

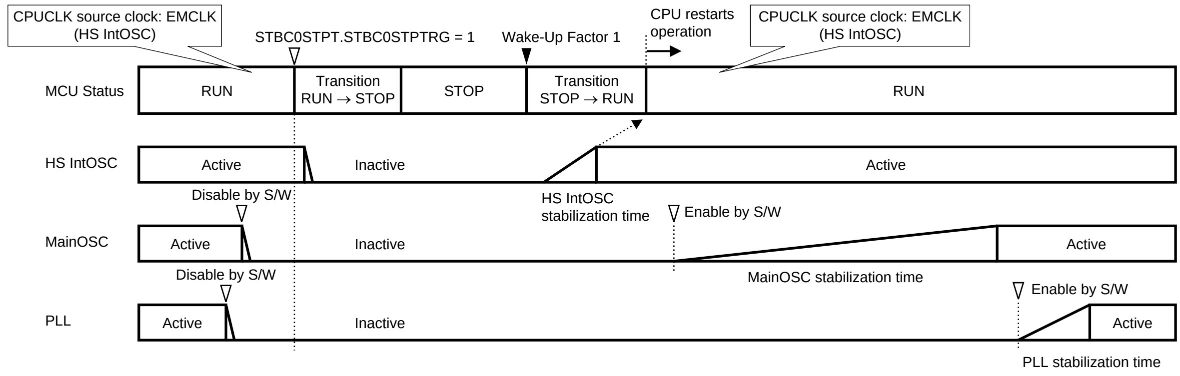
For details on the write-protected sequence, see **Section 5, Write-Protected Registers**.

14.5 Clock Oscillator Behavior During Stand-By Mode Transition

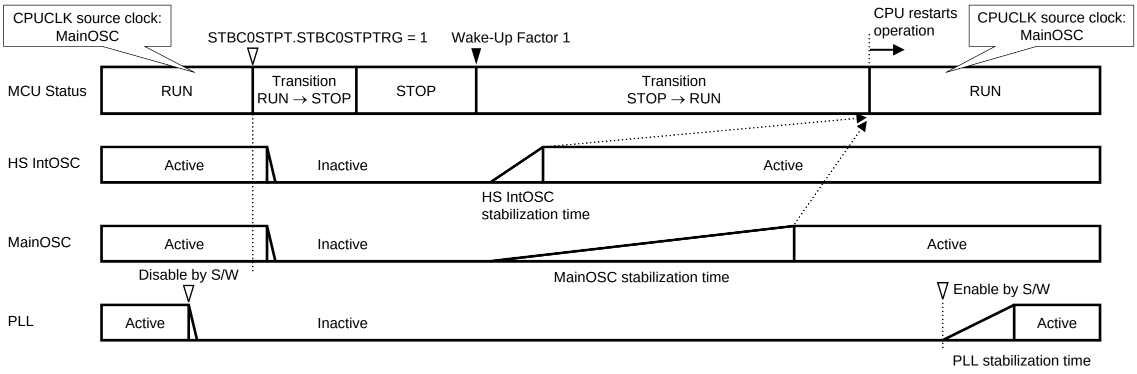
The following figures explain clock oscillator behavior during stand-by mode transition. The clock oscillators restart operation automatically if they are used before entering stand-by.

- If MainOSC and PLL are enabled before entering STOP mode, they restart oscillation automatically during wake-up from STOP mode, and CPU restarts operation after oscillations of these clock sources become stable.
- If MainOSC is enabled before entering DeepSTOP mode, it restarts oscillation automatically during wake-up from DeepSTOP mode, and CPU restarts operation after oscillation of MainOSC becomes stable. PLL is not restarted automatically even if it is enabled before entering DeepSTOP mode.
- If MainOSC is enabled before entering Cyclic STOP mode, it restarts oscillation automatically during wake-up from Cyclic STOP mode. CPU restarts operation after oscillation of MainOSC becomes stable.

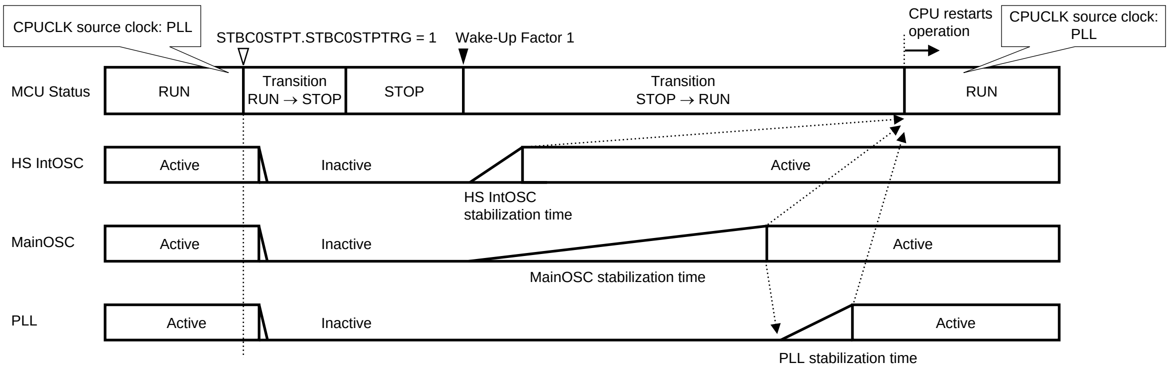
Note that behavior of HS IntOSC and MainOSC in the following figures is in the case they stop oscillation during stand-by mode. HS IntOSC and MainOSC continue oscillation during stand-by mode if their stop mask register is set to 1 (ROSCSTPMSK bit of ROSCSTPM register and MOSCSTPMSK bit of MOSCSTPM register respectively) or there is a clock domain which uses the source clock during stand-by by setting its stop mask bit (CKSC_xxxx_STPM = 0000 0003_H).



(a) PLL and MainOSC are disabled before entering STOP mode.
Restart MainOSC and PLL by software after wake-up.
CPUCLK source clock after wake-up from STOP mode is the same source clock before entering STOP mode.

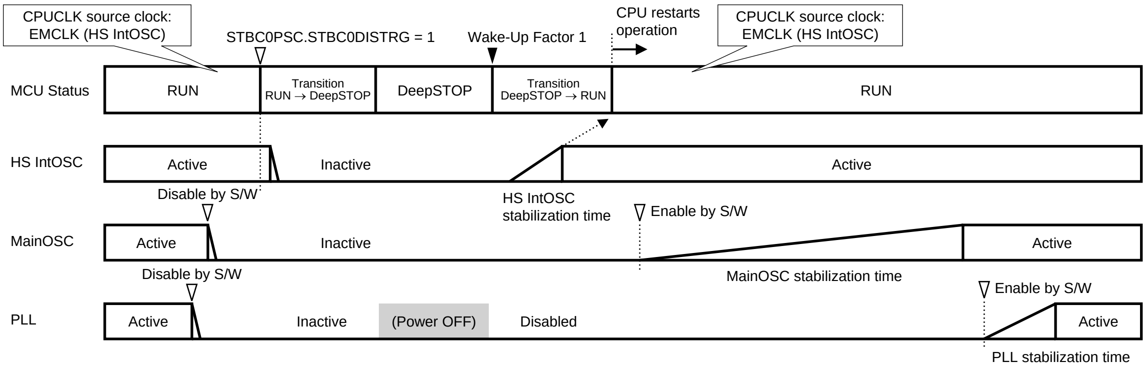


(b) PLL is disabled, and MainOSC is enabled before entering STOP mode.
MainOSC is restarted automatically during transition to RUN mode, and becomes stable before CPU restarts operation.
Restart PLL by software after wake-up.
CPUCLK source clock after wake-up from STOP mode is the same source clock before entering STOP mode.

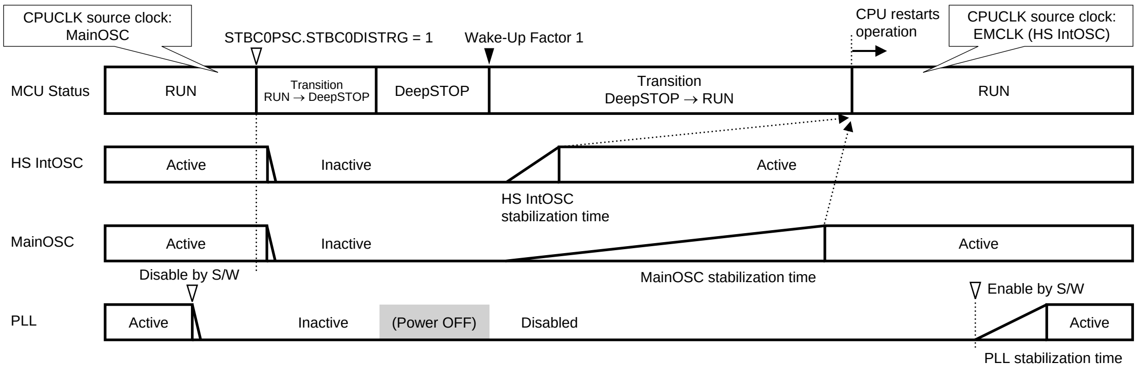


(c) PLL and MainOSC are enabled before entering STOP mode.
PLL and MainOSC are restarted automatically during transition to RUN mode, and become stable CPU restarts operation.
CPUCLK source clock after wake-up from STOP mode is the same source clock before entering STOP mode.

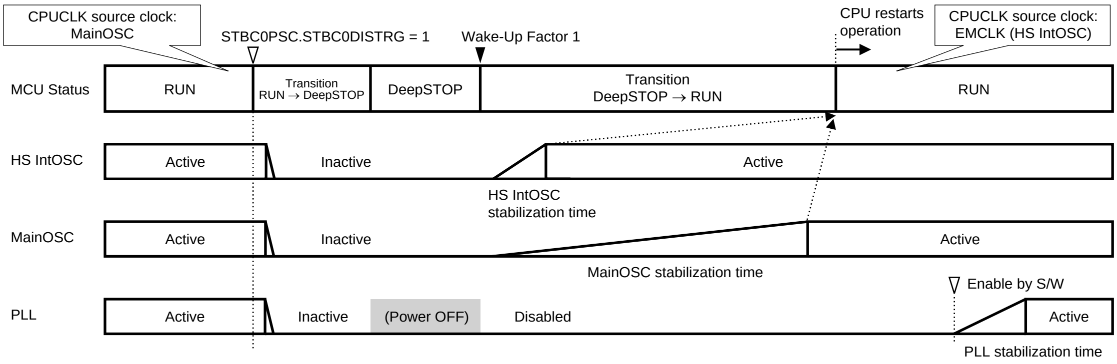
Figure 14.9 Clock Oscillators Behavior in Stand-By Mode Transition
(RUN → STOP → RUN)



(a) PLL and MainOSC are disabled before entering DeepSTOP mode.
Restart MainOSC and PLL by software after wake-up.
CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

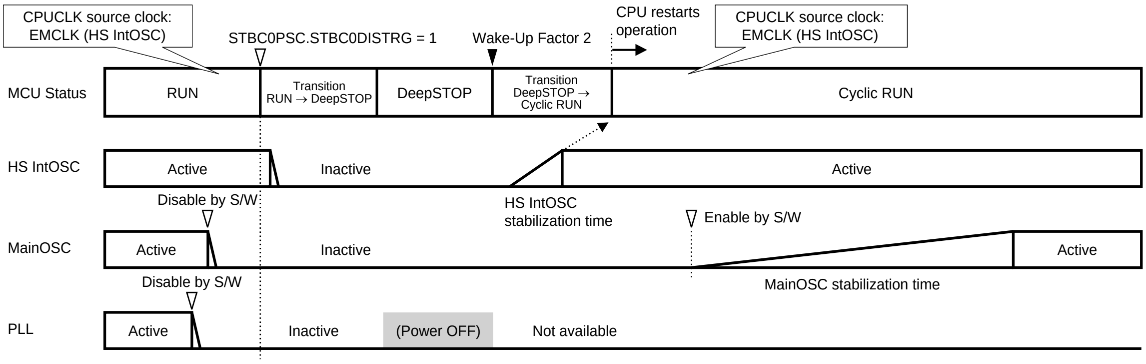


(b) PLL is disabled, and MainOSC is enabled before entering DeepSTOP mode.
MainOSC is restarted automatically during transition to RUN mode, and becomes stable before CPU restarts operation.
Restart PLL by software after wake-up.
CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

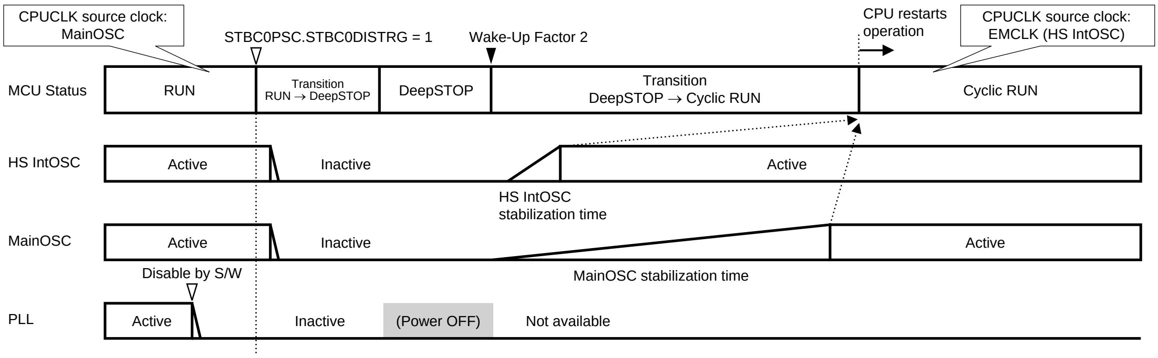


(c) PLL and MainOSC are enabled before entering DeepSTOP mode.
MainOSC is restarted automatically during transition to RUN mode, and becomes stable before CPU restarts operation.
Restart PLL by software after wake-up.
CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

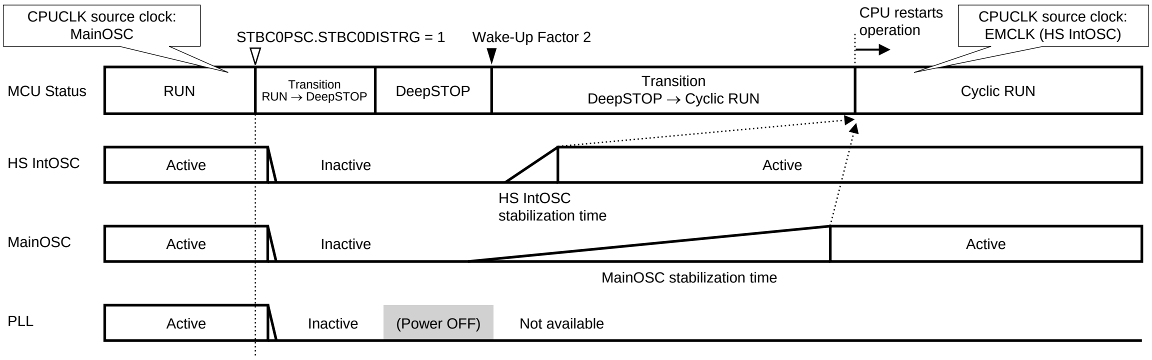
Figure 14.10 Clock Oscillators Behavior in Stand-By Mode Transition (RUN → DeepSTOP → RUN)



(a) PLL and MainOSC are disabled before entering DeepSTOP mode.
Restart MainOSC by software after wake-up. PLL is not available in Cyclic RUN mode.
CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).



(b) PLL is disabled, and MainOSC is enabled before entering DeepSTOP mode.
MainOSC is restarted automatically during transition to Cyclic RUN mode, and becomes stable before CPU starts operation. PLL is not available in Cyclic RUN mode.
CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).



(c) PLL and MainOSC are enabled before entering DeepSTOP mode.
MainOSC is restarted automatically during transition to Cyclic RUN mode, and becomes stable before CPU starts operation. PLL is not available in Cyclic RUN mode.
CPUCLK source clock after wake-up from DeepSTOP mode is EMCLK (HS IntOSC).

Figure 14.11 Clock Oscillators Behavior in Stand-By Mode Transition (RUN → DeepSTOP → Cyclic RUN)

(Cyclic RUN → Cyclic STOP → Cyclic RUN)

14.6 Cautions when Using Stand-By Modes

14.6.1 Cautions Concerning Transitioning to DeepSTOP Mode When Using a Debugger

When using a debugger, executing a program that causes the mode to transition to DeepSTOP mode immediately after the program is started may cause improper communication between the OCD emulator and microcontroller because the microcontroller will enter DeepSTOP mode before the preparations for communication between the OCD emulator and microcontroller are completed.

The communication preparation period depends on the OCD emulator's host PC environment and the operating frequency of the microcontroller, so when performing debugging that causes the program to enter DeepSTOP mode immediately after the program starts, insert a wait between reset release and the DeepSTOP execution instruction so that the debugger starts normally.

In DeepSTOP mode, the debugging controller stops. For return from DeepSTOP mode by the debugger, see **Section 14.1.3, On-Chip Debug Wake-Up**.

Section 15 Low-Power Sampler (LPS)

This section contains a generic description of the low-power sampler (LPS).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of LPS.

15.1 Features of RH850/F1KH, RH850/F1KM LPS

15.1.1 Number of Units

This microcontroller has the following number of LPS units.

Table 15.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)

Table 15.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	1	1	1	1	1
Name	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)

Table 15.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	1	1	1	1
Name	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)

Table 15.7 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual LPS units are identified by the index “n” (n = 0).
m	Throughout this section, the number of digital port input channels for LPS port polling is indicated by the index “m” (m = 0 to 23) and the number of analog input channels for A/D converter is indicated by the index “m” (m = 0 to 15)
k	The external multiplexer select output signal is indicated by the index “k”.
x	LPS sequence start trigger input signal is indicated by the index “x”.
y	Throughout this section, the individual TAUJ units are identified by the index “y”.

Table 15.8 Indices (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual LPS units are identified by the index “n” (n = 0).
m	Throughout this section, the number of digital port input channels for LPS port polling is indicated by the index “m” (m = 0 to 23) and the number of analog input channels for A/D converter is indicated by the index “m” (m = 0 to 15)
k	The external multiplexer select output signal is indicated by the index “k”.
x	LPS sequence start trigger input signal is indicated by the index “x”.
y	Throughout this section, the individual TAUJ units are identified by the index “y”.

Table 15.9 Indices (RH850/F1KM-S1)

Index	Description
n	Throughout this section, the individual LPS units are identified by the index “n” (n = 0).
m	Throughout this section, the number of digital port input channels for LPS port polling is indicated by the index “m” (m = 0 to 16) and the number of analog input channels for A/D converter is indicated by the index “m” (m = 0 to 15)
k	The external multiplexer select output signal for digital port is indicated by the index “k”.
x	LPS sequence start trigger input signal is indicated by the index “x”.
y	Throughout this section, the individual TAUJ units are identified by the index “y”.

NOTE

Descriptions of functions and registers in this section are based on the maximum configurations. Adjust the indices in the text to the proper value for each product. When writing a value to a register that will result in writing to bits outside the range of the index for the product you are using, write the value after reset to these bits.

The following table shows values indicated by the indices of each product.

Table 15.10 Indices of Products (RH850/F1KH-D8)

Indices of Each Product		
176 Pins	233 Pins	324 Pins
m = 0 to 23*[1] m = 0 to 15*[2]	m = 0 to 23*[1] m = 0 to 15*[2]	m = 0 to 23*[1] m = 0 to 15*[2]
k = 0 to 2	k = 0 to 2	k = 0 to 2
x = 0 to 3	x = 0 to 3	x = 0 to 3
y = 0, 2	y = 0, 2	y = 0, 2

Note 1. Digital port input m for port polling

Note 2. Analog input m for A/D converter

Table 15.11 Indices of Products (RH850/F1KM-S4)

Indices of Each Product				
100 Pins	144 Pins	176 Pins	233 Pins	272 Pins
m = 1 to 16*[1] m = 0 to 15*[2]	m = 0 to 23*[1] m = 0 to 15*[2]	m = 0 to 23*[1] m = 0 to 15*[2]	m = 0 to 23*[1] m = 0 to 15*[2]	m = 0 to 23*[1] m = 0 to 15*[2]
k = 0 to 2	k = 0 to 2	k = 0 to 2	k = 0 to 2	k = 0 to 2
x = 0 to 3	x = 0 to 3	x = 0 to 3	x = 0 to 3	x = 0 to 3
y = 0, 2	y = 0, 2	y = 0, 2	y = 0, 2	y = 0, 2

Note 1. Digital port input m for port polling

Note 2. Analog input m for A/D converter

Table 15.12 Indices of Products (RH850/F1KM-S1)

Indices of Each Product			
48 Pins	64 Pins	80 Pins	100 Pins
m = 0 to 2*[1] m = 0 to 7*[2]	m = 0 to 4, 8 to 10*[1] m = 0 to 9*[2]	m = 0 to 11*[1] m = 0 to 10*[2]	m = 0 to 16*[1] m = 0 to 15*[2]
—*[3]	k = 0 to 2	k = 0 to 2	k = 0 to 2
x = 0 to 3	x = 0 to 3	x = 0 to 3	x = 0 to 3
y = 0, 2	y = 0, 2	y = 0, 2	y = 0, 2

Note 1. Digital port input m for port polling

Note 2. Analog input m for A/D converter

Note 3. ADCA0SELk is k = 0 to 2.
For details, see **Section 38.1.6, External Input/Output Signals**.

15.1.2 Register Base Address

The LPS base address is listed in the following table.

LPS register addresses are given as an offset from the base address.

Table 15.13 Register Base Address (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Base Address Name	Base Address
<LPS0_base>	FFF8 3000_H

15.1.3 Clock Supply

The LPS clock supply is shown in the following table.

If the operation request signal for the low-power sampler (LPS) is at the active level, the clock for C_AWO_ADCA for which the HS IntOSC is selected also operates.

Table 15.14 Clock Supply (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Unit Clock Name	Supply Clock Name
LPSn	Register access clock	CPUCLK_L, EMCLK
	Operating clock	EMCLK

15.1.4 Interrupt Requests

The LPS interrupt requests are listed in the following table.

Table 15.15 Interrupt Requests (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
LPS0			
INTCWEND	Port polling end interrupt (LPS)	112	—
INTDPE	Digital port error interrupt (LPS)	356	—
INTAPE	Analog port error interrupt (LPS)	357	—
INTADCA0I0*[1]	ADCA0 SG1 end interrupt	18	4
INTADCA0I1*[1]	ADCA0 SG2 end interrupt	19	5
INTADCA0I2*[1]	ADCA0 SG3 end interrupt	20, 32	6

Note 1. These signals are output from ADCA0.

15.1.5 Reset Sources

The LPS reset sources are shown in the following table. The LPS is initialized by these reset sources.

Table 15.16 Reset Sources (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Name	Reset Source
LPSn	All reset sources except transition to DeepSTOP mode (AWORES)

15.1.6 External Input/Output Signals

External input/output signals of LPS are listed below.

Table 15.17 External Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Alternative Port Pin Signal
LPS0		
DPO	Port output signal for digital input	DPO
DPSELk	External multiplexer select output signal for digital port	SELDPk
DPINm	Digital port input signal	DPINm
APO	Port output signal for analog input	APO
ADCA0SELk*[1]	External analog multiplexer (MPX) output pin	ADCA0SELk
ADCA0Im*[1]	ADCA input channel signal	ADCA0Im

Note 1. These signals are input/output of ADCA0. For details, see **Section 38.1.6, External Input/Output Signals**.

15.1.7 Internal Input/Output Signals

Internal input/output signals for connecting the LPS and the STBC or the LPS and the TAUJ are listed below.

Table 15.18 Internal Input/Output Signals (RH850/F1KH-D8, RH850/F1KM-S4, RH850/F1KM-S1)

Unit Signal Name	Description	Connected to
WUTRG0	LPS wake-up source trigger 0 output signal	STBC
WUTRG1	LPS wake-up source trigger 1 output signal	STBC
INTTAUJyIx	LPS sequence start trigger x input signal	TAUJy

15.2 Overview

15.2.1 Functional Overview

To monitor the external input without consuming CPU resources, the low-power sampler (LPS) can check the digital input ports and analog input ports without using the CPU. The figure below shows a connection example between the main components of the LPS and the external circuit.

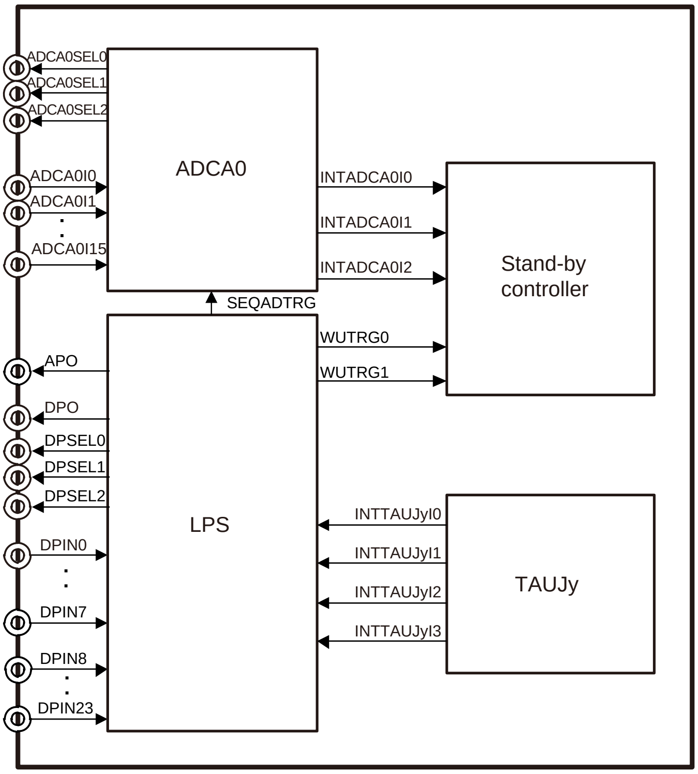

Figure 15.1 Block Diagram of the LPS

CAUTION

DPSEL2 to DPSEL0 are assigned to the same pins as DPIN10 to DPIN8 as alternative function.
They cannot be used simultaneously.

15.3 Registers

15.3.1 List of Registers

LPS registers are listed in the following table.

For details about <LPS0_base>, see **Section 15.1.2, Register Base Address**.

Table 15.19 List of Registers

Module Name	Register Name	Symbol	Address
LPS0	LPS control register	SCTLR	<LPS0_base > + 00_H
	Event flag register	EVFR	<LPS0_base > + 04_H
	DPIN select register 0	DPSELR0	<LPS0_base > + 08_H
	DPIN select register M	DPSELRM	<LPS0_base > + $0C_H$
	DPIN select register H	DPSELRH	<LPS0_base > + 10_H
	DPIN data set register 0	DPDSR0	<LPS0_base > + 14_H
	DPIN data set register M	DPDSRM	<LPS0_base > + 18_H
	DPIN data set register H	DPDSRH	<LPS0_base > + $1C_H$
	DPIN data input monitor register 0	DPDIMR0	<LPS0_base > + 20_H
	DPIN data input monitor register 1	DPDIMR1	<LPS0_base > + 24_H
	DPIN data input monitor register 2	DPDIMR2	<LPS0_base > + 28_H
	DPIN data input monitor register 3	DPDIMR3	<LPS0_base > + $2C_H$
	DPIN data input monitor register 4	DPDIMR4	<LPS0_base > + 30_H
	DPIN data input monitor register 5	DPDIMR5	<LPS0_base > + 34_H
	DPIN data input monitor register 6	DPDIMR6	<LPS0_base > + 38_H
	DPIN data input monitor register 7	DPDIMR7	<LPS0_base > + $3C_H$
	Count value register	CNTVAL	<LPS0_base > + 40_H
	LPS operation status register	SOSTR	<LPS0_base > + 44_H

15.3.2 SCTLR — LPS Control Register

This register is used to configure the LPS.

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TJIS2	NUMDP2	NUMDP1	NUMDP0	TJIS1	TJIS0	ADEN	DPEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.20 SCTLR Register Contents

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>31 to 8</td><td>Reserved</td><td>When read, the value after reset is returned. When writing, write the value after reset.</td></tr>
<tr><td>6 to 4</td><td>NUMDP[2:0]</td><td>These bits specify the number of times the port is read in digital input mode. If two or more times are specified, the external multiplexer is controlled by the DPSEL[2:0] pins.
The bits for which comparison is enabled in the DPSELR0, DPSELRM, and DPSELRH registers are compared regardless of the repeat number setting, and WUTRG will be generated according to the results.
<table>
<tr><th>NUMDP[2:0]</th><th>Number of Times the Port Is Read</th></tr>
<tr><td>000_B</td><td>One time</td></tr>
<tr><td>001_B</td><td>Two times</td></tr>
<tr><td>010_B</td><td>Three times</td></tr>
<tr><td>011_B</td><td>Four times</td></tr>
<tr><td>100_B</td><td>Five times</td></tr>
<tr><td>101_B</td><td>Six times</td></tr>
<tr><td>110_B</td><td>Seven times</td></tr>
<tr><td>111_B</td><td>Eight times</td></tr>
</table>
These bits should be set before the TAUJy and sequence operations are started (when the SCTLR.DPEN bit = 0, the SCTLR.ADEN bit = 0, and the SOSTR.SOF bit = 0).
(When changing the SCTLR.DPEN bit and the SCTLR.ADEN bit, write the same value to these bits.)</td></tr>
<tr><td>7, 3, 2</td><td>TJIS[2:0]</td><td>Sequence Start Trigger Select
000: INTTAUJ0I0 100: INTTAUJ2I0
001: INTTAUJ0I1 101: INTTAUJ2I1
010: INTTAUJ0I2 110: INTTAUJ2I2
011: INTTAUJ0I3 111: INTTAUJ2I3
These bits should be set before the sequence operation is started (when the SCTLR.DPEN bit = 0, the SCTLR.ADEN bit = 0, and the SOSTR.SOF bit = 0).
(When changing the SCTLR.DPEN bit and the SCTLR.ADEN bit, write the same value to these bits.)</td></tr>
<tr><td>1</td><td>ADEN</td><td>0: Analog input mode is disabled
1: Analog input mode is enabled</td></tr>
<tr><td>0</td><td>DPEN</td><td>0: Digital input mode is disabled
1: Digital input mode is enabled</td></tr>
</table>

15.3.3 EVFR — Event Flag Register

This register indicates the result of comparing the data sequentially captured at the digital input pins and stored in the DPDIMR7 to DPDIMR0 registers with the comparison target data in the DPDSRH/DPDSRM/DPDSR0 registers.

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 04$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DINEVF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 15.21 EVFR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DINEVF	This bit indicates the result of comparing the data captured at the digital input pins and stored in the DPDIMR7 to DPDIMR0 registers with the comparison target data in the DPDSRH/DPDSRM/DPDSR0 registers. Read: 0: The result of comparison is a match. 1: The result of comparison is a mismatch. Write: 0: Clear the bit. 1: Prohibited. This bit is set to 1 when a mismatch is detected even in one bit. Only 0 can be written to clear this bit.

15.3.4 DPSELR0 — DPIN Select Register 0

This register specifies the compare target bits in the DPDSR0 and DPDIMR0 registers.

Write to the DPSELR0 register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	D0EN_23	D0EN_22	D0EN_21	D0EN_20	D0EN_19	D0EN_18	D0EN_17	D0EN_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	D0EN_15	D0EN_14	D0EN_13	D0EN_12	D0EN_11	D0EN_10	D0EN_9	D0EN_8	D0EN_7	D0EN_6	D0EN_5	D0EN_4	D0EN_3	D0EN_2	D0EN_1	D0EN_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.22 DPSELR0 Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 0	D0EN_n (n = 23 to 0)	These bits enable or disable comparing each bit of the first data captured at the digital input pins and stored in the DPDIMR0 register with the comparison target data in the DPDSR0 register. 0: Disables comparison. 1: Enables comparison.

15.3.5 DPSELRM — DPIN Select Register M

This register specifies the compare target bits in the DPDSRM and DPDIMRm (m = 4 to 1) registers.

Write to the DPSELRM register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access:	DPSELRM can be read or written in 32-bit units. DPSELRML and DPSELRMH can be read or written in 16-bit units. DPSELR1, DPSELR2, DPSELR3, and DPSELR4 can be read or written in 8-bit units.
Address:	DPSELRM: <LPS0_base> + 0C$_H$ DPSELRML: <LPS0_base> + 0C$_H$, DPSELRMH: <LPS0_base> + 0E$_H$ DPSELR1: <LPS0_base> + 0C$_H$, DPSELR2: <LPS0_base> + 0D$_H$, DPSELR3: <LPS0_base> + 0E$_H$, DPSELR4: <LPS0_base> + 0F$_H$
Value after reset:	0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	D4EN_7	D4EN_6	D4EN_5	D4EN_4	D4EN_3	D4EN_2	D4EN_1	D4EN_0	D3EN_7	D3EN_6	D3EN_5	D3EN_4	D3EN_3	D3EN_2	D3EN_1	D3EN_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	D2EN_7	D2EN_6	D2EN_5	D2EN_4	D2EN_3	D2EN_2	D2EN_1	D2EN_0	D1EN_7	D1EN_6	D1EN_5	D1EN_4	D1EN_3	D1EN_2	D1EN_1	D1EN_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.23 DPSELRM Register Contents

Bit Position	Bit Name	Function
31 to 24	D4EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the fifth data captured at the digital input pins and stored in the DPDIMR4 register with the comparison target data in the DPDSR4 register. 0: Disables comparison. 1: Enables comparison.
23 to 16	D3EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the fourth data captured at the digital input pins and stored in the DPDIMR3 register with the comparison target data in the DPDSR3 register. 0: Disables comparison. 1: Enables comparison.
15 to 8	D2EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the third data captured at the digital input pins and stored in the DPDIMR2 register with the comparison target data in the DPDSR2 register. 0: Disables comparison. 1: Enables comparison.
7 to 0	D1EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the second data captured at the digital input pins and stored in the DPDIMR1 register with the comparison target data in the DPDSR1 register. 0: Disables comparison. 1: Enables comparison.

15.3.6 DPSELRH — DPIN Select Register H

This register specifies the compare target bits in the DPDSRH and DPDIMRm (m = 7 to 5) registers.

Write to the DPSELRH register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access:	DPSELRH can be read or written in 32-bit units. DPSELRHL and DPSELRHH can be read or written in 16-bit units. DPSELR5, DPSELR6, and DPSELR7 can be read or written in 8-bit units.
Address:	DPSELRH: <LPS0_base> + 10_H DPSELRHL: <LPS0_base> + 10_H, DPSELRHH: <LPS0_base> + 12_H DPSELR5: <LPS0_base> + 10_H, DPSELR6: <LPS0_base> + 11_H, DPSELR7: <LPS0_base> + 12_H
Value after reset:	0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 15.24 DPSELRH Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	D7EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the eighth data captured at the digital input pins and stored in the DPDIMR7 register with the compare target data in the DPDSR7 register. 0: Disables comparison. 1: Enables comparison.
15 to 8	D6EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the seventh data captured at the digital input pins and stored in the DPDIMR6 register with the compare target data in the DPDSR6 register. 0: Disables comparison. 1: Enables comparison.
7 to 0	D5EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the sixth data captured at the digital input pins and stored in the DPDIMR5 register with the compare target data in the DPDSR5 register. 0: Disables comparison. 1: Enables comparison.

15.3.7 DPDSR0 — DPIN Data Set Register 0

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR0 register.

Write to the DPDSR0 register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 14_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 0	D0_n (n = 23 to 0)	Data to be compared with the first digital port input (DPINm)

15.3.8 DPDSRM — DPIN Data Set Register M

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR4 to DPDIMR1 registers.

Write to the DPDSRM register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access:	DPDSRM can be read or written in 32-bit units. DPDSRML and DPDSRMH can be read or written in 16-bit units. DPDSR1, DPDSR2, DPDSR3, and DPDSR4 can be read or written in 8-bit units.
Address:	DPDSRM: <LPS0_base> + 18_H DPDSRML: <LPS0_base> + 18_H, DPDSRMH: <LPS0_base> + $1A_H$ DPDSR1: <LPS0_base> + 18_H, DPDSR2: <LPS0_base> + 19_H, DPDSR3: <LPS0_base> + $1A_H$, DPDSR4: <LPS0_base> + $1B_H$

15 to 8	D2_n (n = 7 to 0)	Data to be compared with the third digital port input (DPINm)
7 to 0	D1_n (n = 7 to 0)	Data to be compared with the second digital port input (DPINm)

15.3.9 DPDSRH — DPIN Data Set Register H

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR7 to DPDIMR5 registers.

Write to the DPDSRH register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: DPDSRH can be read or written in 32-bit units.
DPDSRHL and DPDSRHH can be read or written in 16-bit units.
DPDSR5, DPDSR6, and DPDSR7 can be read or written in 8-bit units.

Address: DPDSRH: <LPS0_base> + $1C_H$
DPDSRHL: <LPS0_base> + $1C_H$,
DPDSRHH: <LPS0_base> + $1E_H$
DPDSR5: <LPS0_base> + $1C_H$,

7 to 0	D5_n (n = 7 to 0)	Data to be compared with the sixth digital port input (DPINm)

15.3.10 DPDIMR0 — DPIN Data Input Monitor Register 0

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 23)) in digital input mode. DPDIMR0 stores the data acquired for the first time.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <LPS0_base> + 20_H

Value after reset: $0000\ 0000_H$

7 to 0	D7M_n (n = 7 to 0)	The eighth digital port input (DPINm) data

15.3.18 CNTVAL — Count Value Register

This register specifies the stabilization time of the external circuits (digital signal source and analog signal source).

- In digital mode
  The time from when the DPO output is set to 1 to the time when the port input is acquired for the first time
- In analog mode
  The time from when the APO output is set to 1 to the time when the LPS outputs the A/D conversion trigger to the ADCA0

Write to the CNTVAL register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: This register can be read or written in 16-bit units.

Address: <LPS0_base> + 40_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNT17	CNT16	CNT15	CNT14	CNT13	CNT12	CNT11	CNT10	CNT07	CNT06	CNT05	CNT04	CNT03	CNT02	CNT01	CNT00

Table 15.36 CNTVAL Register Contents

Bit Position	Bit Name	Function
15 to 8	CNT1n (n = 7 to 0)	These bits set the stabilization time of the external circuit (analog signal source). Stabilization time = $(1/f_{RH}) \times 16 \times$ CNT1n (set value)
7 to 0	CNT0n (n = 7 to 0)	These bits set the stabilization time of the external circuit (digital signal source). Stabilization time = $(1/f_{RH}) \times 16 \times$ CNT0n (set value)

15.3.19 SOSTR — LPS Operation Status Register

This register indicates the operating state of the LPS.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <LPS0_base> + 44_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SOF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 15.37 SOSTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	SOF	LPS Operation Status Flag 0: Initial state before the occurrence of the start trigger 1: LPS operation is in progress (after the start trigger occurs) If the start trigger occurs while the SOF bit is set to 1 (during the LPS operation), the start trigger is canceled.

NOTE

When DPEN or ADEN is set to 0 for stop of the LPS, SOF bit is set to 0 after the bit becomes 1 once by hardware.

15.4 Digital Input Mode

With the digital input port DPINm and the externally connected multiplexer, up to 64 input ports can be monitored as shown in **Table 15.38, Combination of Monitored Ports**.

Port DPSELk is used to switch the external multiplexer. The DPSELk output is switched for the number of times specified in the SCTLR register.

TAUJy is used to set the timing to check the value input to the port.

Table 15.38 Combination of Monitored Ports

Combination (Number of Ports × Number of Checks)	Ports Used	Total Number
Direct mode When input ports are checked simultaneously without using the external multiplexer Up to 24 ports × 1	DPIN23 to DPIN0	Up to 24
Multiplexer mode When input ports are checked by using a small number of pins and the external multiplexer Up to 8 ports × 8	DPIN7 to DPIN0 DPSEL2 to DPSEL0	Up to 64
MIX mode When input ports are checked using a combination of the above two modes Up to 14 ports × 1 + Up to 7 ports × 7	DPIN7 to DPIN0 DPIN16 to DPIN11 DPSEL2 to DPSEL0*[1]	Up to 63

Note 1. DPIN16 to DPIN11 and DPIN7 are checked only for the first time. DPIN10 to DPIN8 cannot be used because they are shared with DPSEL2 to DPSEL0.

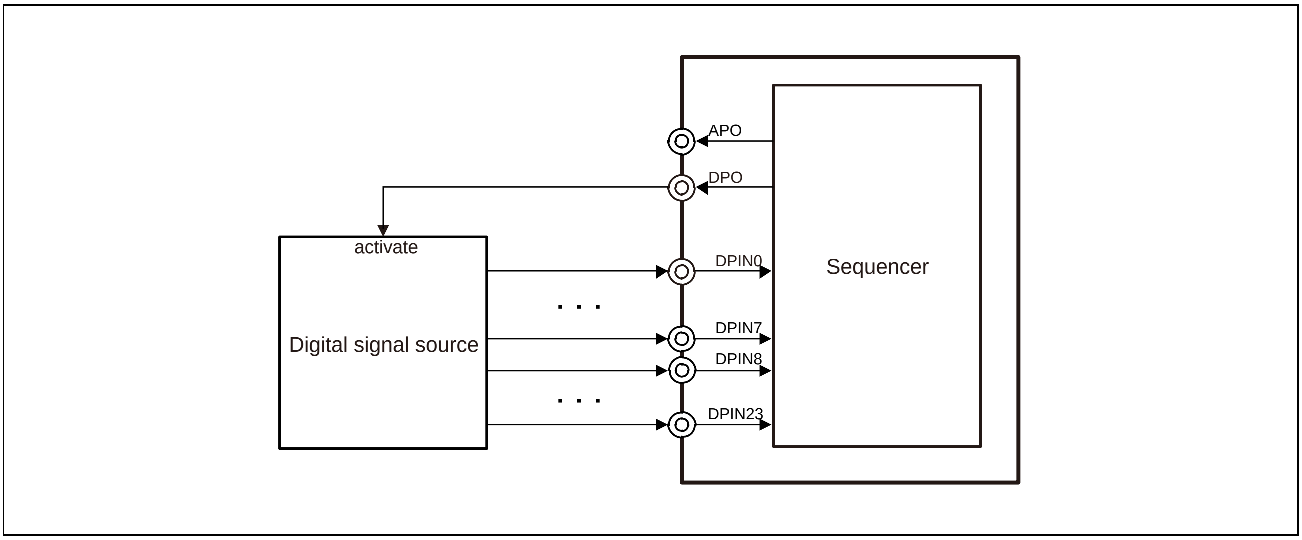

Figure 15.2 Direct Mode Connection Example

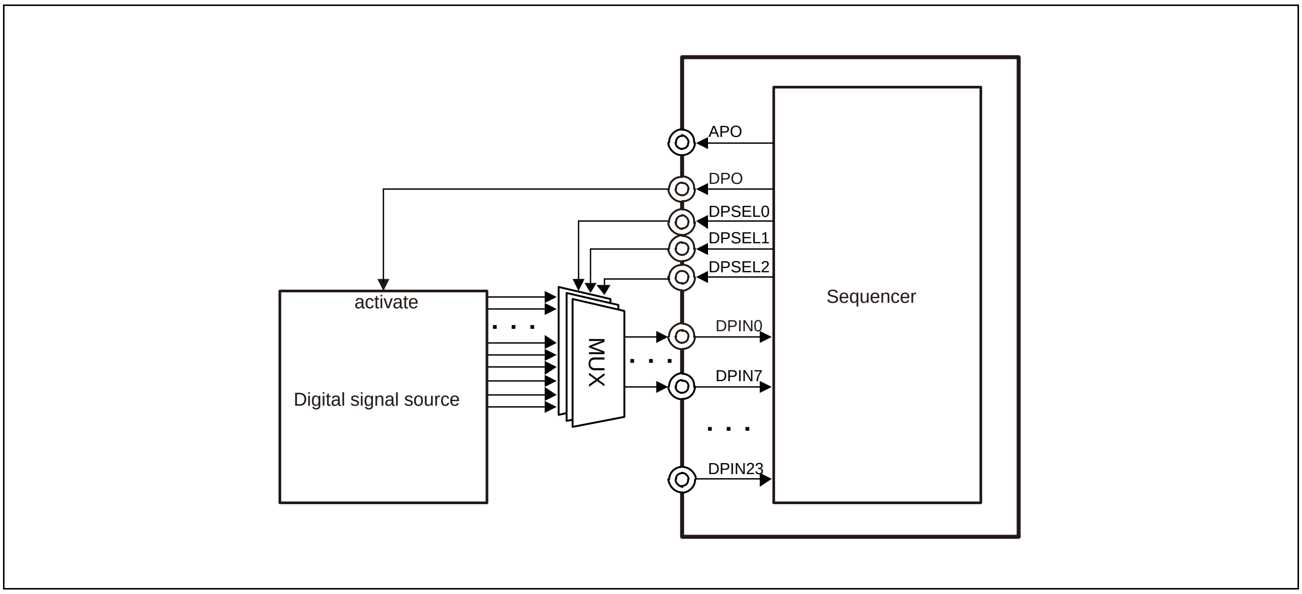

Figure 15.3 Multiplexer Mode Connection Example

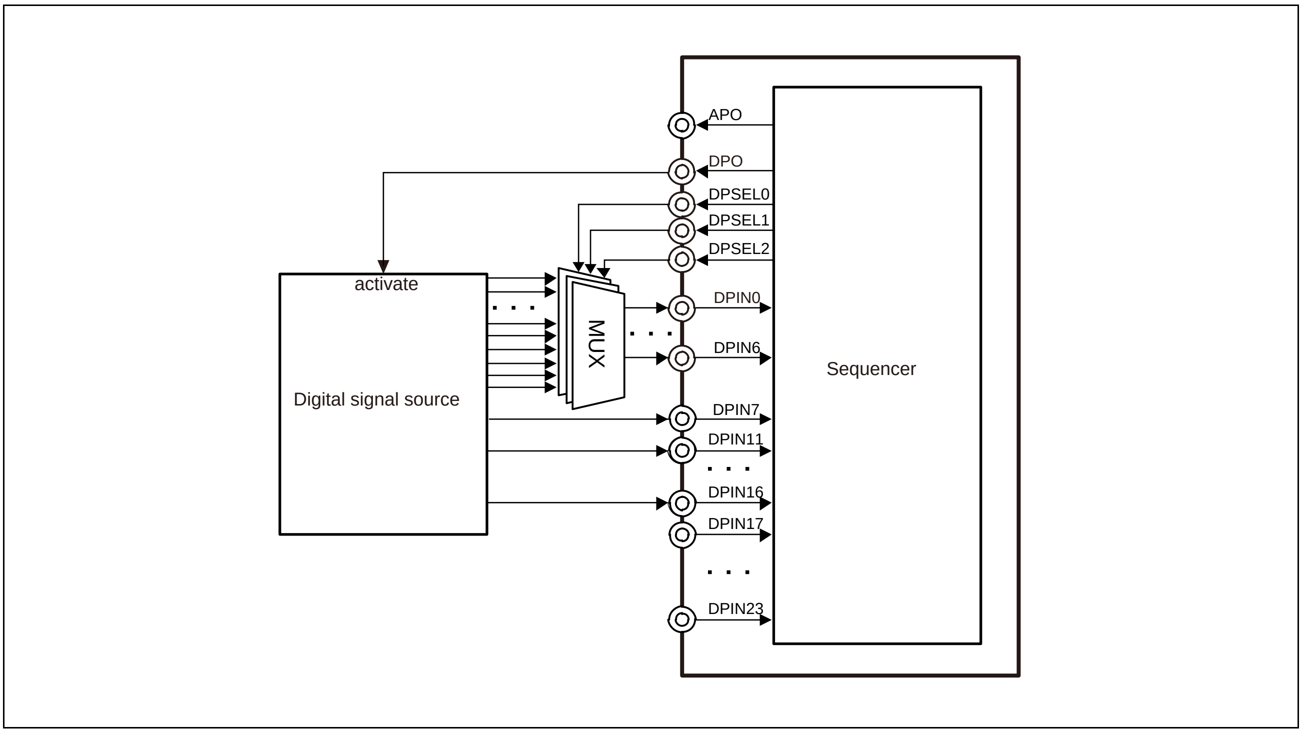

Figure 15.4 MIX Mode Connection Example

CAUTION

DPSEL2 to DPSEL0 are assigned to the same pins as DPIN10 to DPIN8 as alternative function.

They cannot be used simultaneously.

Preparation

- Set NUMDP[2:0] and TJIS[2:0] bits in the SCTLR register to specify the number of times the port is to be read, and the TAUJy interrupt to be used as sequence start trigger.
- Set TAUJy to interval timer mode.
- Set the wait time of the digital signal source by using the lower 8 bits in the CNTVAL register.
- Set expected values in the DPDSR0, DPDSRM and DPDSRH registers.
- Set the ports to be checked in the DPSELR0, DPSELRM, and DPSELRH registers.

Start

- Start the TAUJy.
- Set the SCTLR.DPEN bit to 1.

After the operation starts, ports are checked at the interval set in TAUJy. The operation continues regardless of whether the mode is RUN mode or power save mode. If the HS IntOSC is stopped in stand-by mode, it can only resume operation while the sequencer is running.

Upon completion of checking all ports that have been set, the INTCWEND interrupt occurs. In addition, if the input value of the port is different from the expected value set by the DPDSR0, DPDSRM, or DPDSRH register, the wake-up factor WUTRG0 occurs. The following figures show an example of the operation in digital input mode.

Stop

To stop the LPS operation in Digital Input Mode (by changing the SCTLR.DPEN bit setting from 1 to 0), follow the procedure shown below. In this example, the P0_0 pin is used as DPO.

1. Set the port register to specify low level output on the pin (P0.P0_0 = 0).
2. Change the setting for the P0_0 pin from the alternative port mode to the port mode (PMC0.PMC0_0 = 0).
3. Set SCTLR.DPEN = 0.

NOTE

The above procedure applies when the P0_0 pin is used as DPO. If the P0_2 pin is used as DPO, specify the P0_2 pin settings in the same way.

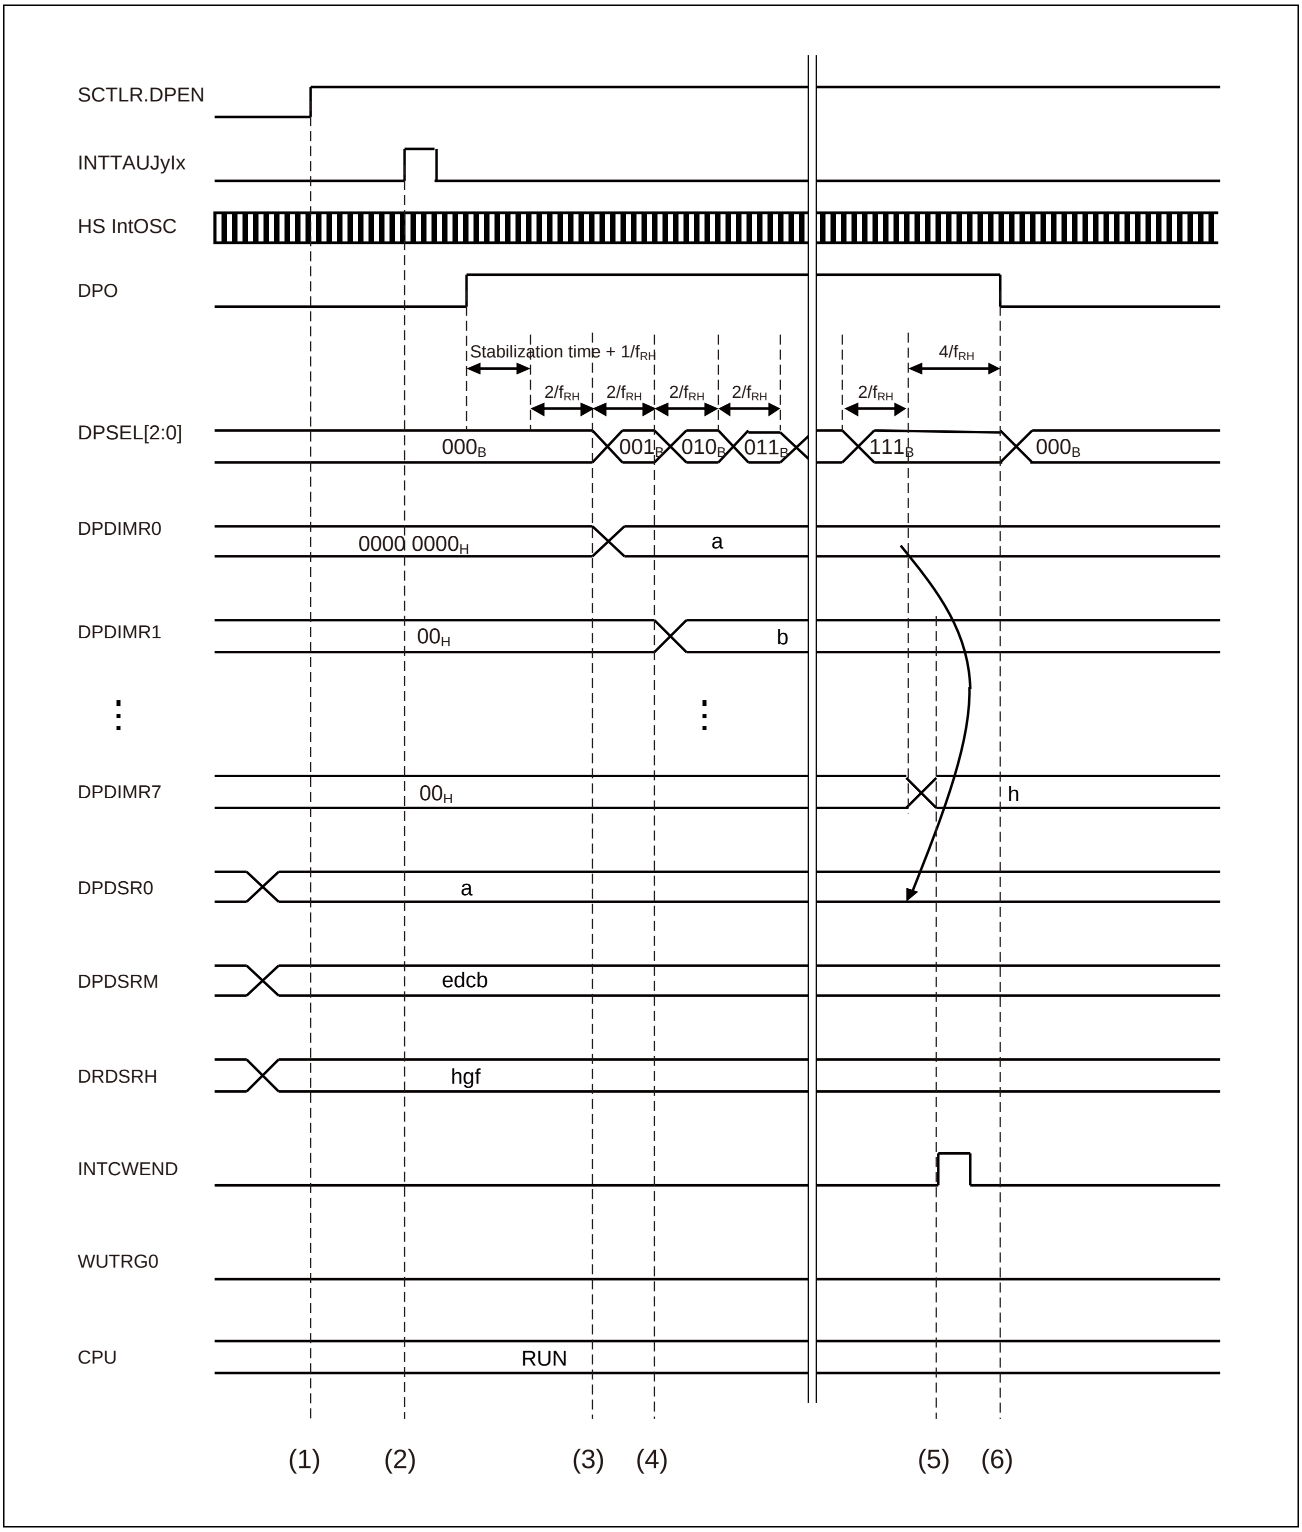

Figure 15.5 Operation of Digital Input Mode (8 Ports × 8) when the Input Value is not Changed (RUN Mode)

(1) Set the SCTLR.DPEN bit to 1 by software to enable the digital input mode of the LPS.

(2) When the INTTAUJyIx interrupt specified by the SCTLR.TJIS bit is generated, the sequencer outputs the high level from the DPO pin and waits for the time specified by CNTVAL.CNT0n to secure the stabilization of the external digital signal source.

(3) After the completion of the signal source stabilization, the LPS stores the DPIN[7:0] input value to the DPDIMR0 register and increments the DPSEL[2:0] pins to switch the external multiplexer.

(4) After the switching of the DPSEL[2:0] pins, the LPS stores the values in the DPDIMRn registers in order from DPDIMR1 and continues to increment the DPSEL[2:0] pins.

(5) After the value is stored up to the DPDIMR7 register, the INTCWEND interrupt is generated and the value is compared with the expected value set in the DPDSR0, DPDSRM, and DPDSRH registers.

(6) When the value is not different from the expected value, the wake-up factor WUTRG0 is not generated. The LPS stops the DPO output and returns to the waiting state for the trigger.

High level width of the DPO pin is calculated by the following formula. For the Stabilization time, see **Section 15.3.18, CNTVAL — Count Value Register.**

High level width of the DPO pin

$$= \text{Stabilization time} + (1/f_{RH}) \times 1 + (1/f_{RH}) \times 2 \times (\text{SCTLR.NUMDP (set value)} + 1) + (1/f_{RH}) \times 4$$

$$= \text{Stabilization time} + (1/f_{RH}) \times (2 \times \text{SCTLR.NUMDP (set value)} + 7)$$

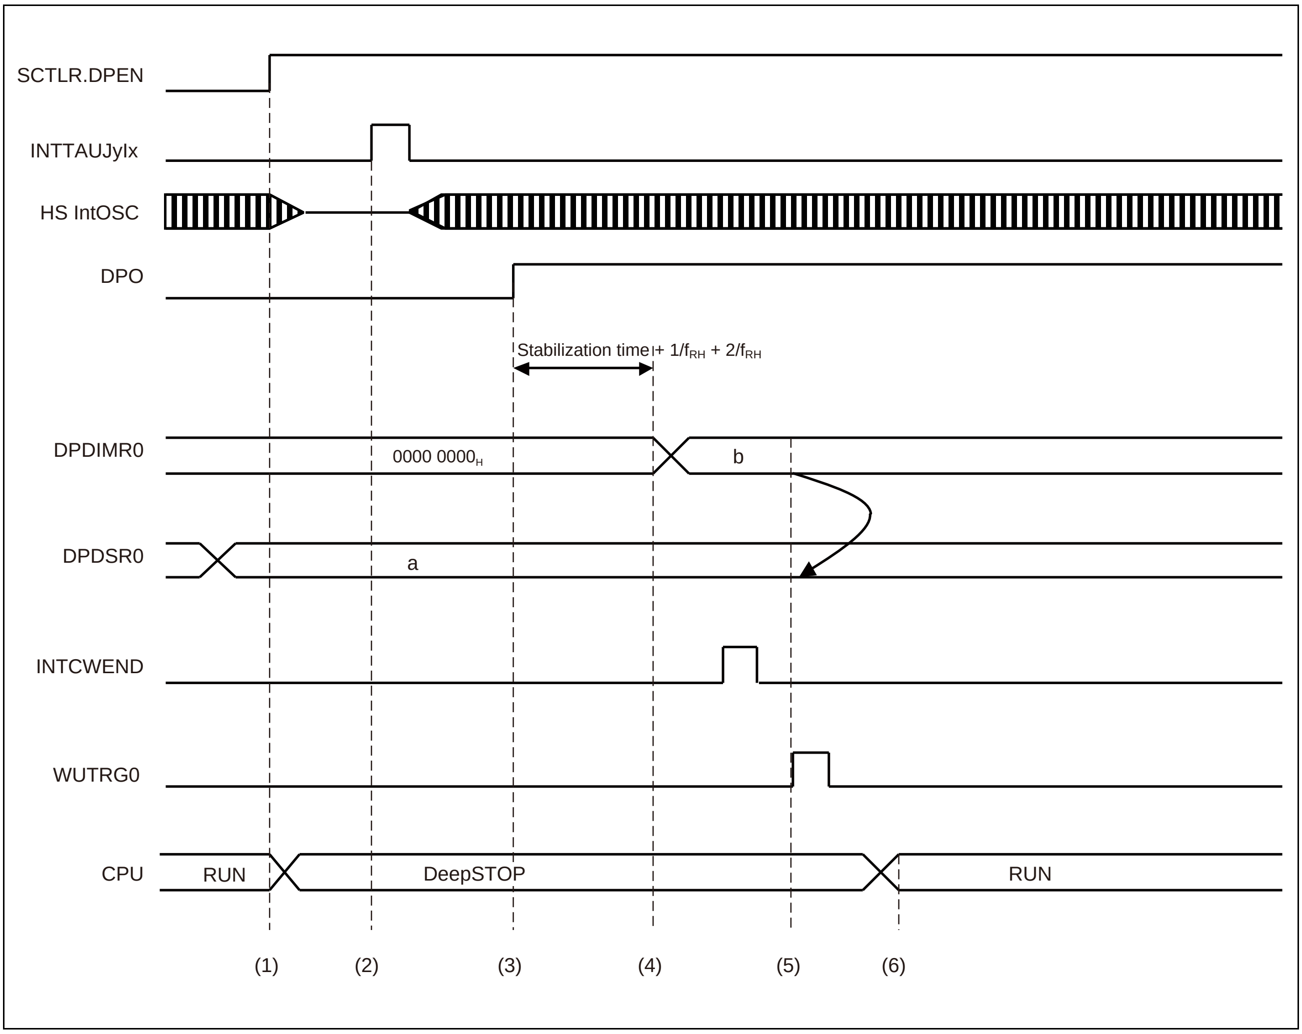

Figure 15.6 Operation of Digital Input Mode (24 Ports × 1) when the Input Value is Changed (DeepSTOP Mode)

(1) Set the STBC0PSC.STBC0DISTRG bit to 1 to transition to the DeepSTOP mode, while the SCTLR.DPEN bit is set to 1 by software to enable the digital input mode of the LPS.

(2) When the INTTAUJyIx interrupt specified by the SCTLR.TJIS bit is generated, the LPS enables the HS IntOSC to start the oscillation.

(3) After the completion of the HS IntOSC stabilization time, the LPS outputs the high level from the DPO pin and waits for the time specified by CNTVAL.CNT0n to secure the stabilization of the external digital signal source.

(4) After the completion of the signal source stabilization, the LPS stores the DPIN[23:0] input value to the DPDIMR0 register and the INTCWEND interrupt is generated.

(5) The value stored in the DPDIMR0 register is compared with the expected value set in the DPDSR0 register. When the value is different from the expected value, the wake-up factor WUTRG0 is generated.

(6) The CPU returns to RUN mode at the generation of WUTRG0. The DPO pin is driven high until the EVFR.DINEVF bit is cleared to 0 by software.

15.4.1 Digital Port Error Interrupt

A level sensitive interrupt indicating a data comparison mismatch is generated. This interrupt is generated not only in stand-by mode but also in RUN mode. The set and clear conditions are shown below.

Table 15.39 Digital Port Error Interrupt

Unit Interrupt Signal	Set Condition	Clear Condition
INTDPE	When EVFR.DINEVF is set to 1 by hardware	When EVFR.DINEVF is cleared to 0 by software

15.5 Analog Input Mode

The analog input port ADCA0Im (m = 0 to 15) can be monitored.

TAUJy is used to set the timing to check the value input to the port.

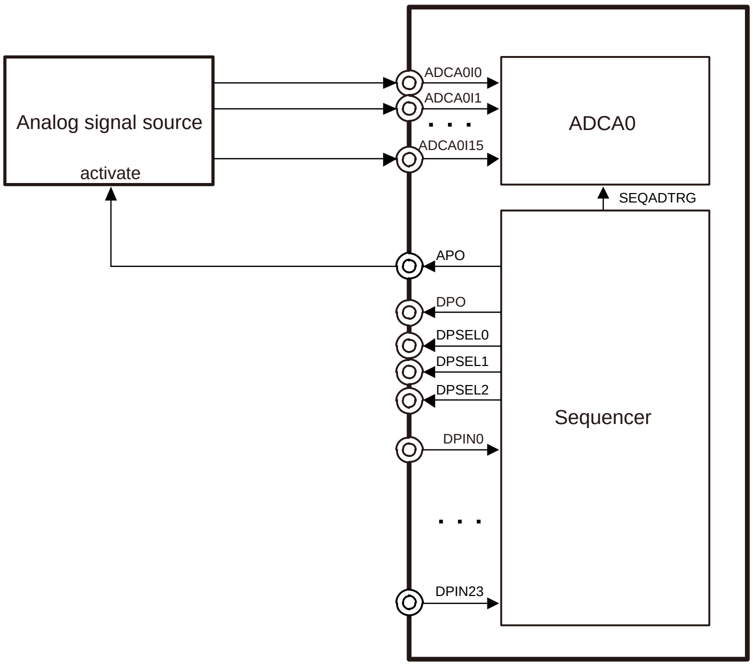

Figure 15.7 Analog Input Mode Connection Example 1

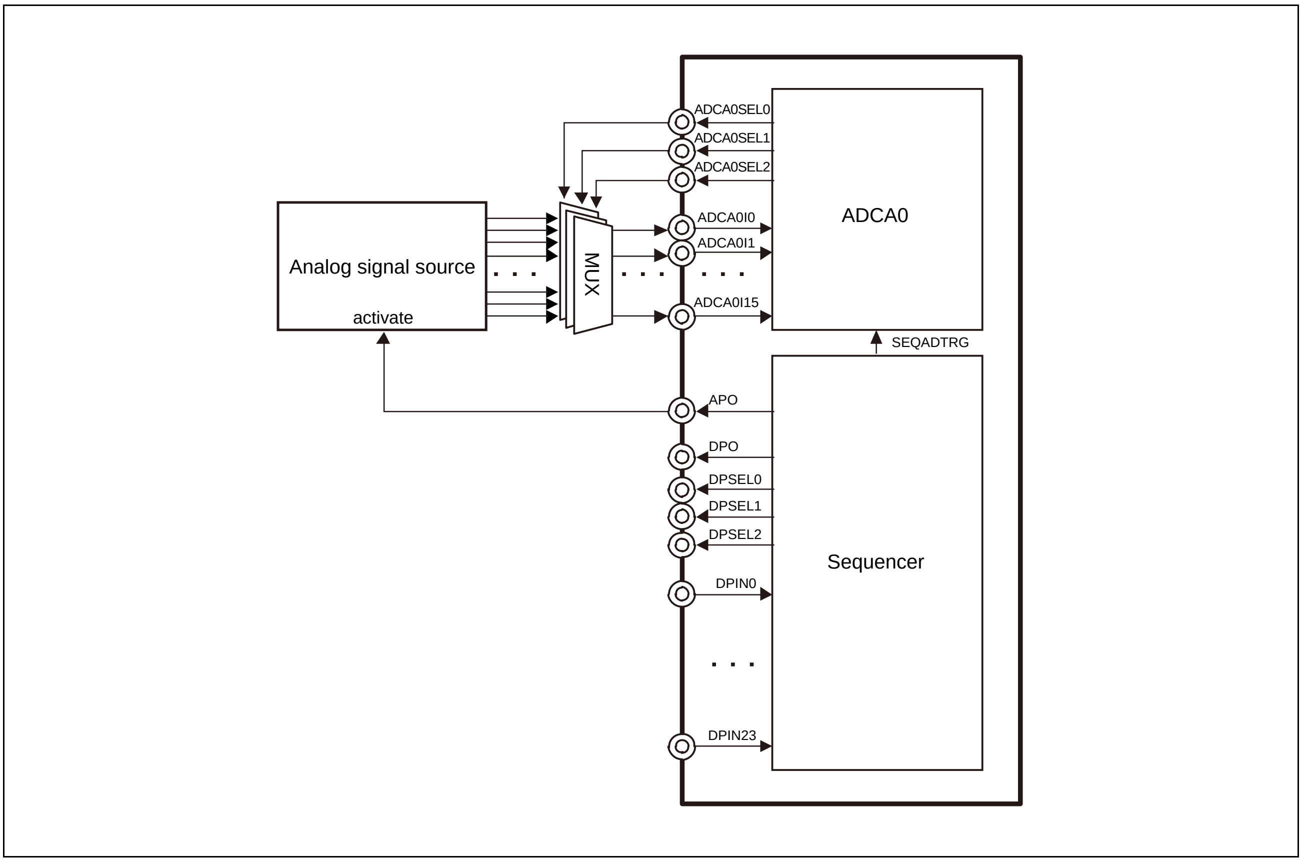

Figure 15.8 Analog Input Mode Connection Example 2

Preparation

- Set TJIS[2:0] bits in the SCTLR register to specify the TAUJy interrupt to be used as sequence start trigger.
- Set TAUJy to interval timer mode.
- Set the wait time of the analog signal source by using the upper 8 bits in the CNTVAL register.
- Set the ADCA0.

CAUTIONS

1. When the LPS is in use, the A/D conversion completion interrupt (INTADCA0Ix_{-1}) should be output after the conversion of all channels of the LPS has been completed. The setting is as follows.
    - Set the ADIE bit in virtual channel register j (ADCA0VCRj) to 0 (a scan group x end interrupt (INTADCA0Ix_{-1}) is not generated when A/D conversion for virtual channel j ends in SGx.).
    - Set the ADIE bit in the scan group x control register (ADCA0SGCRx) to 1 (INTADCA0Ix_{-1} is output when the scan for SGx ends).
2. Over the period from the generation of the LPS sequence start trigger set by the SCLTR.TJIS[2:0] bits to the completion of A/D conversion for all channels of the LPS, only proceed with A/D conversion for PWM-Diag. LPS acknowledges the A/D conversion completion interrupts of the scan group SG1, SG2 or SG3, but does not recognize the kind of SG (three interrupts are ORed to one interrupt). During LPS operation using one SG, an A/D conversion completion interrupt and A/D error interrupt cannot be set for another SG.
3. Over the period from the generation of the LPS sequence start trigger set by the SCLTR.TJIS[2:0] bits to the completion of A/D conversion for all channels of LPS, do not forcibly end A/D conversion by using the ADCA0ADHALTR.HALT bit.

4. When the LPS is in use, do not use the following modes.
   - Continuous scan mode
     (the setting ADCA0SGCRx.SCANMD = 1 is prohibited)
   - Multicycle scan mode with 2 or more cycles
     (the settings ADCA0SGMCYCRx.MCYC = 01_B and 11_B are prohibited)
   - Channel repeat mode with 2 or more cycles
     (the settings ADCA0SGCRx.SCT = 01_B and 10_B are prohibited)

Start

- Start the TAUJy.
- Set the SCTLR.ADEN bit to 1.

After the operation starts, ports are checked at the interval set in TAUJy. The operation continues regardless of whether the mode is RUN mode or power save mode. If the HS IntOSC is stopped in stand-by mode, it can only resume operation while the sequencer is running.

To detect whether the analog input value differs from the expected value, use the A/D error interrupt request (INTADCA0ERR) of the A/D converter.

In addition, if the analog input value is different from the expected value, the wake-up factor WUTRG1 occurs.

For details on the A/D error interrupt request (INTADCA0ERR), see **Section 38.4.13, A/D Error Interrupt Request***[1]. The following figures show an example of the operation in analog input mode.

Note 1. In **Section 38, A/D Converter (ADCA)**, the name of the A/D error interrupt request is described as "INT_ADE".

Stop

To stop the LPS operation in Analog Input Mode (by changing the SCTLR.ADEN bit setting from 1 to 0), follow the procedure shown below. Note that the P0_1 pin is used as APO.

1. Set the port register to specify low level output on the pin (P0.P0_1 = 0).
2. Change the setting for the P0_1 pin from the alternative port mode to the port mode (PMC0.PMC0_1 = 0).
3. Set SCTLR.ADEN = 0.

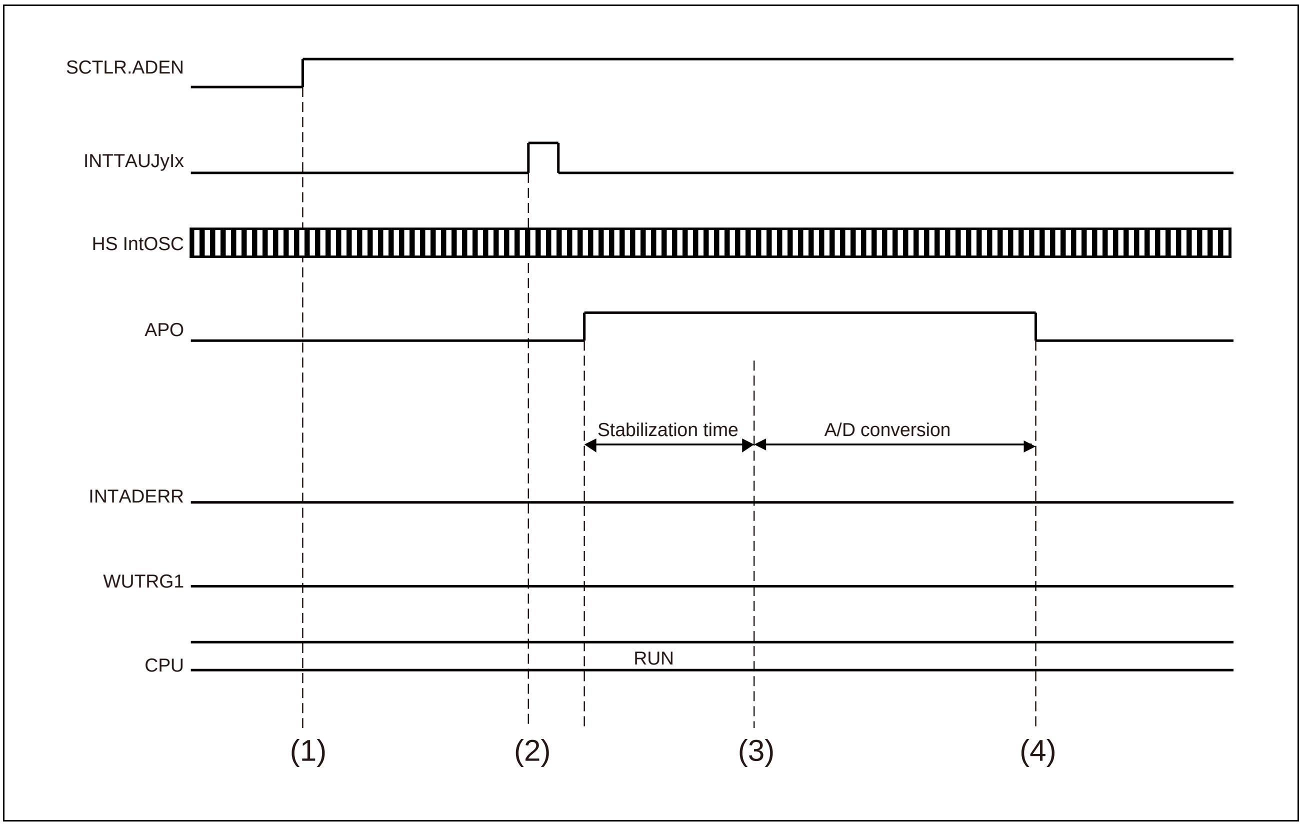

Figure 15.9 Operation of Analog Input Mode when the Conversion Result is within the Expected Range (RUN Mode)

(1) Set the conversion trigger, scan group, and expected range of the A/D converter by software. Then, set the SCTLR.ADEN bit to 1 to enable the analog input mode of the LPS.

(2) When the INTTAUJyIx interrupt specified by the SCTLR.TJIS bit is generated, the LPS outputs the high level from the APO pin at the same time it enables the A/D converter, and waits for the time specified by CNTVAL.CNT1n to secure the stabilization of the external analog signal source.

(3) After the completion of the signal source stabilization, the LPS triggers the start of conversion to the A/D converter and then the A/D conversion of ADCA0Im (m = 0 to 15), set in the A/D converter scan group, is started.

(4) When the INTADCA0ERR interrupt is not generated as a result of A/D conversion, the LPS halts the A/D converter and resets the APO pin.

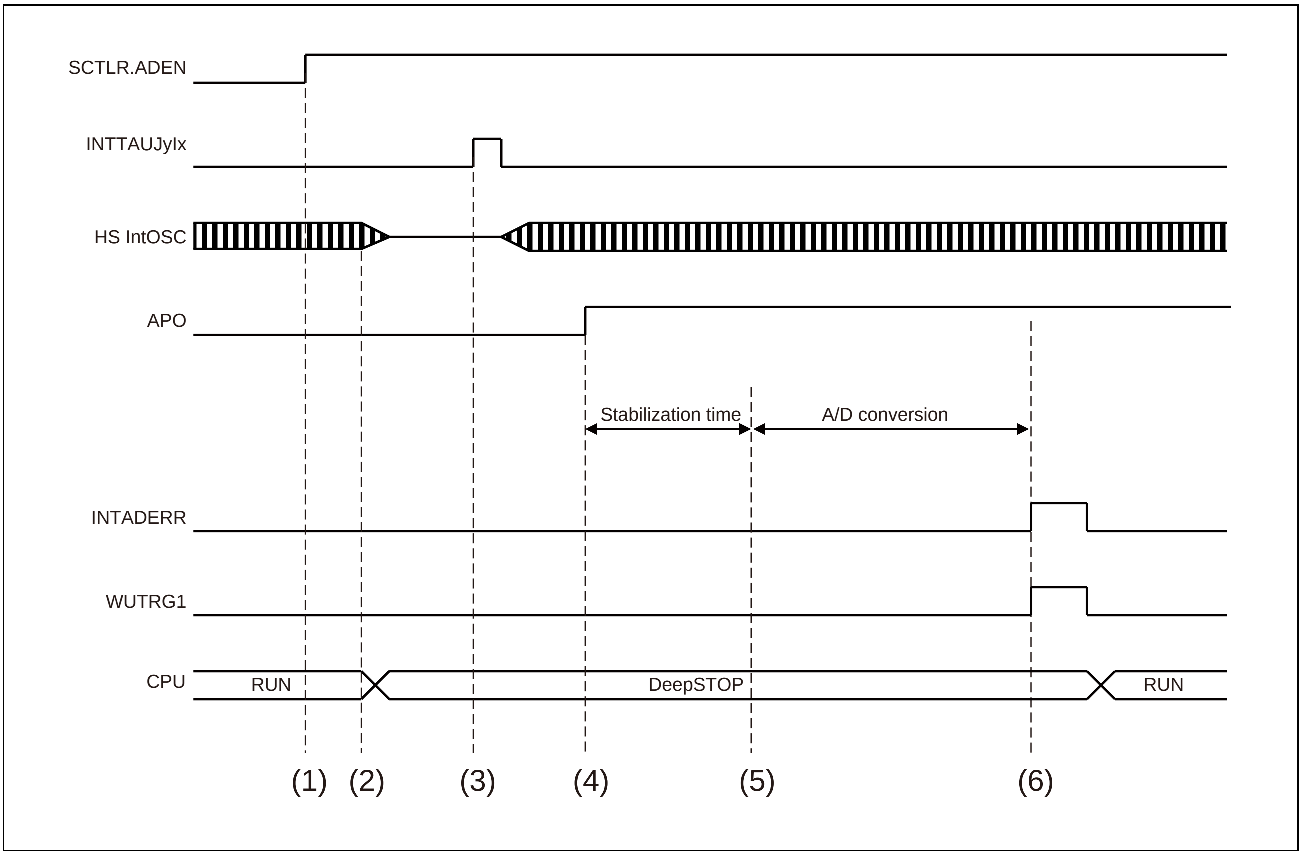

Figure 15.10 Operation of Analog Input Mode when the Conversion Result is not within the Expected Range (DeepSTOP Mode)

(1) Set the conversion trigger, scan group, and expected range of the A/D converter by software. Then, set the SCTLR.ADEN bit to 1 to enable the analog input mode of the LPS.

(2) Set the STBC0PSC.STBC0DISTRG bit to 1 by software to transition to the DeepSTOP mode.

(3) When the INTTAUJyIx interrupt specified by the SCTLR.TJIS bit is generated, the LPS enables the HS IntOSC to start the oscillation.

(4) After the completion of the HS IntOSC stabilization, the LPS outputs the high level from the APO pin at the same time it enables the A/D converter, and waits for the time specified by CNTVAL.CNT1n to secure the stabilization of the external analog signal source.

(5) After the completion of the signal source stabilization, the LPS triggers the start of conversion to the A/D converter and then the A/D conversion of ADCA0Im (m = 0 to 15), set in the A/D converter scan group, is started.

(6) When the INTADCA0ERR interrupt is generated as a result of A/D conversion, the wake-up factor WUTRG1 is generated and the CPU returns to RUN mode. The APO pin is driven high until the upper limit/lower limit error flag of the A/D converter is cleared to 0 by software.

NOTE

WUTRG1 is generated when the first ADCA0 SG interrupt occurred after ADCAnULER.UE or ADCAnULER.LE is set.

15.5.1 Analog Port Error Interrupt

A level sensitive interrupt indicating a data comparison mismatch is generated. This interrupt is generated not only in the stand-by mode but also in RUN mode. The set and clear conditions are shown below.

Table 15.40 Analog Port Error Interrupt

Unit Interrupt Signal	Set Condition	Clear Condition
INTAPE	When WUTRG1 is set to 1 by hardware	When both ADCAnULER.UE and ADCAnULER.LE are cleared to 0 by software

Section 16 External Memory Access Controller (MEMC)

This section contains a generic description of the external memory access controller (MEMC).

The first part of this section describes the features specific to RH850/F1KH, RH850/F1KM, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of MEMC.

16.1 Features of RH850/F1KH, RH850/F1KM MEMC

16.1.1 Number of Units

This microcontroller has the following number of MEMC units.

Table 16.1 Number of Units (RH850/F1KH-D8)

Product Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Number of Units	1	1	1
Name	MEMCn (n = 0)	MEMCn (n = 0)	MEMCn (n = 0)

Table 16.2 Number of Units (RH850/F1KM-S4)

Product Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Number of Units	—	—	1	1	1
Name	—	—	MEMCn (n = 0)	MEMCn (n = 0)	MEMCn (n = 0)

Table 16.3 Number of Units (RH850/F1KM-S1)

Product Name	RH850/F1KM-S1 48 Pins	RH850/F1KM-S1 64 Pins	RH850/F1KM-S1 80 Pins	RH850/F1KM-S1 100 Pins
Number of Units	—	—	—	—
Name	—	—	—	—

Table 16.4 Indices (RH850/F1KH-D8)

Index	Description
n	Throughout this section, the individual MEMC units are identified by the index “n” (n = 0).
x	Throughout this section, chip select areas are identified by “x”. For example, the external memory area of CSx is described as the CSx (x = 0 to 3) area.

Table 16.5 Indices (RH850/F1KM-S4)

Index	Description
n	Throughout this section, the individual MEMC units are identified by the index “n” (n = 0).
x	Throughout this section, chip select areas are identified by “x”. For example, the external memory area of CSx is described as the CSx (x = 0 to 3) area.

Table 16.6 External Memory Access Functions (RH850/F1KH-D8)

Control Signal Name	RH850/F1KH-D8 176 Pins	RH850/F1KH-D8 233 Pins	RH850/F1KH-D8 324 Pins
Address output	23 bits	23 bits	24 bits
Chip select output	4	4	4
Data bus	16 bits	16 bits	16 bits

Table 16.7 External Memory Access Functions (RH850/F1KM-S4)

Control Signal Name	RH850/F1KM-S4 100 Pins	RH850/F1KM-S4 144 Pins	RH850/F1KM-S4 176 Pins	RH850/F1KM-S4 233 Pins	RH850/F1KM-S4 272 Pins
Address output	—	—	23 bits	23 bits	24 bits
Chip select output	—	—	4	4	4
Data bus	—	—	16 bits	16 bits	16 bits

16.1.2 Register Base Address

The MEMC base address is listed in the following table.

The MEMC register addresses are given as an offset from the base address.

Table 16.8 Register Base Address (RH850/F1KH-D8)

Base Address Name	Base Address
<MEMC0_base>	1003 0000_H

Table 16.9 Register Base Address (RH850/F1KM-S4)

Base Address Name	Base Address
<MEMC0_base>	1003 0000_H

16.1.3 Clock Supply

The MEMC clock supply is shown in the following table.

Table 16.10 Clock Supply (RH850/F1KH-D8)

Unit Name	Unit Clock Name	Supply Clock Name	Description
MEMCn	MEMC0CLK	CPUCLK_L*1	Communication clock
	Register access clock	CPUCLK_L*1	Bus clock

Note 1. This supply clock runs at half the frequency of the CPUCLK_L signal.

Table 16.11 Clock Supply (RH850/F1KM-S4)

Unit Name	Unit Clock Name	Supply Clock Name	Description
MEMCn	MEMC0CLK	CPUCLK_L*1	Communication clock
	Register access clock	CPUCLK_L*1	Bus clock

Note 1. This supply clock runs at half the frequency of the CPUCLK_L signal.

16.1.4 Reset Sources

The MEMC reset sources are shown below. MEMC is initialized by the following reset sources.

Table 16.12 Reset Sources (RH850/F1KH-D8)

Unit Name	Reset Source
MEMCn	All reset sources (ISORES)

Table 16.13 Reset Sources (RH850/F1KM-S4)

Unit Name	Reset Source
MEMCn	All reset sources (ISORES)

16.1.5 External Input/Output Signals

External input/output signals of MEMC are listed below.

Table 16.14 External Input/Output Signals (RH850/F1KH-D8)

Unit Signal Name	Description	Alternative Port Pin Signal
MEMC0		
MEMC0A[23:16]	Address Bus Output Signal	MEMC0A[23:16]
MEMC0AD[15:0]	Address/Data Bus I/O Signal	MEMC0AD[15:0]
MEMC0ASTB	Address Strobe Output Signal	$\overline{\text{MEMC0ASTB}}$
MEMC0BEN[1:0]	Byte Enable Output Signal	$\overline{\text{MEMC0BEN[1:0]}}$
MEMC0CLK	Bus Clock Output Signal	MEMC0CLK
MEMC0CS[3:0]	Chip Select Output Signal	$\overline{\text{MEMC0CS[3:0]}}$
MEMC0RD	Read Strobe Output Signal	$\overline{\text{MEMC0RD}}$
MEMC0WAIT	External Wait Request Input Signal	$\overline{\text{MEMC0WAIT}}$
MEMC0WR	Write Strobe Output Signal	$\overline{\text{MEMC0WR}}$

Note: For the port to be used as MEMC, set the output driver strength to high (PDSCn_m = 1).

Table 16.15 External Input/Output Signals (RH850/F1KM-S4)

Unit Signal Name	Description	Alternative Port Pin Signal
MEMC0		
MEMC0A[23:16]	Address Bus Output Signal	MEMC0A[23:16]
MEMC0AD[15:0]	Address/Data Bus I/O Signal	MEMC0AD[15:0]
MEMC0ASTB	Address Strobe Output Signal	$\overline{\text{MEMC0ASTB}}$
MEMC0BEN[1:0]	Byte Enable Output Signal	$\overline{\text{MEMC0BEN[1:0]}}$
MEMC0CLK	Bus Clock Output Signal	MEMC0CLK
MEMC0CS[3:0]	Chip Select Output Signal	$\overline{\text{MEMC0CS[3:0]}}$
MEMC0RD	Read Strobe Output Signal	$\overline{\text{MEMC0RD}}$
MEMC0WAIT	External Wait Request Input Signal	$\overline{\text{MEMC0WAIT}}$
MEMC0WR	Write Strobe Output Signal	$\overline{\text{MEMC0WR}}$

Note: For the port to be used as MEMC, set the output driver strength to high (PDSCn_m = 1).

16.2 Overview

The external memory access controller provides four chip select areas, and wait time is selectable in each chip select area.

The bus clock runs at half the frequency of the MEMC supply clock.

16.2.1 Functional Overview

The main features of the external memory access controller:

- Multiplexed bus mode
- Four chip select areas and 16-bit bus width
- The data endian format can be selected for each chip select area individually.
- Various wait functions can be set individually for each chip select area.
- External wait on SRAM access cycles
- External wait error detection

16.2.1.1 Multiplexed Bus

This is an operation mode that connects address output and data input/output to external memory using the same signal line, making it possible to reduce the number of pins required for external memory connection.

16.2.1.2 Chip Select Output Function

The external bus area of the memory space is divided into four chip select areas, and a chip select signal can be output for each chip select area. The allocation of these chip select areas is fixed by the system and cannot be changed through programming.

In addition, the bus width is 16-bit fixed.

16.2.1.3 Data Endian Setting Function

The data endian (little endian/big endian) can be specified for each chip select area.

16.2.1.4 Programmable Wait Setting Functions

This microcontroller has the following wait functions, which can be set for each chip select area.

- Programmable data wait
- Data hold wait
- Data setup wait
- Address setup wait
- Address hold wait
- Idle cycle

16.2.1.5 External Wait Function

Waits of any width can be inserted externally from the $\overline{\text{MEMC0WAIT}}$ pin. The $\overline{\text{MEMC0WAIT}}$ pin is sampled just before the data output cycle, and the data latch timing can be delayed by any amount.

16.2.1.6 External Wait Error Detection Function

This microcontroller has a function to forcibly cancel a wait state if an external wait is continuously input for 128 clock cycles, to prevent the system hanging up if an external wait is continuously input due to a defect of the $\overline{\text{MEMC0WAIT}}$ pin.

16.3 Registers

16.3.1 List of Registers

The MEMC registers are listed in the following table.

For details on <MEMCn_base>, see **Section 16.1.2, Register Base Address**.

Table 16.16 List of Registers

Module Name	Register Name	Symbol	Address
MEMCn	Data endian configuration register	DEC	<MEMCn_base> + 02_H
	Data wait configuration register	DWC	<MEMCn_base> + 08_H
	Data hold wait configuration register	DHC	<MEMCn_base> + $0C_H$
	Data setup wait configuration register	DSC	<MEMCn_base> + $0E_H$
	Address wait configuration register	AWC	<MEMCn_base> + 10_H
	Idle cycle configuration register	ICC	<MEMCn_base> + 14_H
	External wait error configuration register	EWC	<MEMCn_base> + $1A_H$

16.3.2 DEC — Data Endian Configuration Register

The DEC register is used to set the endianness for the external bus.

Access: This register can be read or written in 16-bit units.

Address: <MEMCn_base> + 02$_{\text{H}}$

Value after reset: 0000$_{\text{H}}$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	DE3	—	DE2	—	DE1	—	DE0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R	R/W

Table 16.17 DEC Register Contents

Bit Position	Bit Name	Function
15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DE3	Data Endian Setting These bits set the endian of each chip select area. 0: Little endian 1: Big endian
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	DE2	Data Endian Setting These bits set the endian of each chip select area. 0: Little endian 1: Big endian
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	DE1	Data Endian Setting These bits set the endian of each chip select area. 0: Little endian 1: Big endian
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DE0	Data Endian Setting These bits set the endian of each chip select area. 0: Little endian 1: Big endian

The relationship between each chip select area and the control bits is shown below.

Table 16.18 Relationship between DEx Bit and Chip Select Area

Chip Select Area	DEx Bit
CS3 area	DE3
CS2 area	DE2
CS1 area	DE1
CS0 area	DE0

16.3.3 DWC — Data Wait Configuration Register

The DWC register is used to set the number of data wait states for the external bus.
