

## Uncased USB memory stick 16Gb – 19-9996

This uncased **16Gb** USB memory stick is ideal for allowing students to design and make their own case. The finished product is a practical item that students can keep for transporting homework and other data.

The rear section of the PCB from the front of the rectangular hole does not have any components on it so can be used for fixing part of the case. The PCB can be safely removed after the point marked **X** without damaging the memory stick. This can be useful when making more compact cases.

Any case designs should not protrude any further than the front of the PCB so that the USB connector is not obscured.

The maximum thickness of the PCB and components is 5mm.
