|  |                                  |      | These are values used in separate switchgear. The actual values will depend on   |
|  |                                  |      | the temperature around the circuit-breaker, which is influenced by the ambient<br>temperature, the degree of protection (IP), the mounting height, the partitions, and<br>any external ventilation. Depending on the specific switchgear design, this may<br>result in derating, which can then be compensated for by increasing the cross-<br>sectional area. Temperature rise tests in the specific switchgear can provide<br>specific and detailed information. |
|  |                                  |      |  |

Permissible continuous current for circuit-breakers operating in switchboards at various internal ambient temperatures. The switchboard's internal ambient temperature should be estimated using the calculation methods of IEC regulation.

External IZMX-DTP-PTM-1 voltage measuring module required (1 module is suitable for 16 circuit-breakers)

Notes

# Design verification as per IEC/EN 61439
