

ISO1176 Isolated RS-485 Profibus Transceiver

1 Features

- Meets or Exceeds the Requirements of EN 50170 and TIA/EIA-485-A
- Signaling Rates up to 40 Mbps
- Differential Output Exceeds 2.1 V (54-Ω Load)
- Low Bus Capacitance – 10 pF (Maximum)
- Up to 160 Transceivers on a Bus
- 50 kV/μs Typical Transient Immunity
- Fail-Safe Receiver for Bus Open, Short, Idle
- 3.3-V Inputs are 5-V Tolerant
- Bus-Pin ESD Protection
 - 16-kV HBM Between Bus Pins and GND2
 - 6-kV HBM Between Bus Pins and GND1
- Safety and Regulatory Approvals
 - 4000- V_{PK} Isolation, 560- V_{PK} V_{IORM} per DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12 and DIN EN 61010-1
 - 2500 V_{RMS} Isolation Rating per UL 1577
 - 4000 V_{PK} Isolation Rating per CSA CA5A and IEC 60950-1

2 Applications

- Profibus
- Factory Automation
- Networked Sensors
- Motor and Motion Control
- HVA and Building Automation Networks
- Networked Security Stations

3 Description

The ISO1176 device is an isolated differential line transceiver designed for use in PROFIBUS applications. The device is ideal for long transmission lines because the ground loop is broken to provide for operation with a much larger common-mode voltage range. The symmetrical isolation barrier of each device is tested to provide 2500 V_{RMS} of isolation per UL between the line transceiver and the logic level interface.

The galvanically isolated differential bus transceiver is an integrated circuit designed for bidirectional data communication on multipoint bus-transmission lines. The transceiver combines a galvanically isolated differential line driver and differential input line receiver. The driver has an active-high enable with isolated enable-state output on the ISODE pin (pin 10) to facilitate direction control. The driver differential outputs and the receiver differential inputs connect internally to form a differential input/output (I/O) bus port that is designed to offer minimum loading to the bus allowing up to 160 nodes.

The PV pin (pin 7) is provided as a full-chip enable option. All device outputs become high impedance when a logic low is applied to the PV pin. For more information, see the function tables in [Device Functional Modes](#).

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ISO1176	SOIC (16)	10.30 mm × 7.50 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision D (March 2010) to Revision E	Page
• Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1
• VDE standard changed to DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12	1
• Changed the IEC 60664-1 Ratings Table. Basic isolation group SPECIFICATION entry From: IIIa To: II	19

Changes from Revision C (October 2008) to Revision D	Page
• Added 560-V _{peak} V _{IORM} to the first Features List	1
• Added UL 1577, IEC 60747-5-2 (VDE 0884, Rev. 2), to the Features List	1
• Added Input pulse width MIN = 10 ns to the RECOMMENDED OPERATING CONDITIONS table	5
• Added the CSA column to the Regulatory Information table	20
• Changed the ISO1176 "Sticky Bit" Issue section	26

Changes from Revision B (June 2008) to Revision C	Page
• Changed the text in the second paragraph of the DESCRIPTION From: "whenever the driver is disabled or V _{CC2} = 0" To: "allowing up to 160 nodes."	1

Changes from Revision A (May 2008) to Revision B	Page
• Changed L(IO1), Minimum air gap (Clearance) in the PACKAGE CHARACTERISTICS table From: MIN = 7.7mm To: 8.34mm	19

Changes from Original (March 2008) to Revision A**Page**

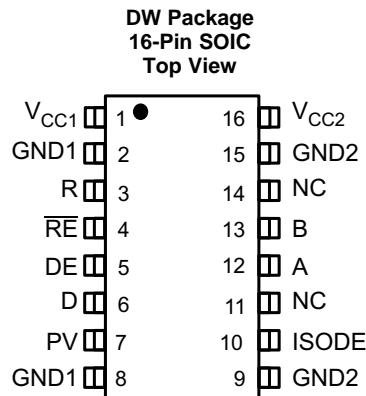

• Added 3.3-V Inputs are 5-V Tolerant to the Features List.....	1
• Added the Bus-Pin ESD Protection bullet and sub bullets to the Features List.....	1
• Added Bus pins to GND1 and Bus pins to GND2 to the ESD information in the Handling Rating table	5
• Added the APPLICATION INFORMATION section.....	24

5 Description (continued)

Any cabled I/O can be subjected to electrical noise transients from various sources. These noise transients can cause damage to the transceiver and/or nearby sensitive circuitry if they are of sufficient magnitude and duration. The ISO1176 can significantly reduce the risk of data corruption and damage to expensive control circuits.

The device is characterized for operation over the ambient temperature range of -40°C to $+85^{\circ}\text{C}$.

6 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
A	12	I/O	Noninverting bus output
B	13	I/O	Inverting bus output
D	6	I	Driver input
DE	5	I	Driver logic-high enable
GND1	2, 8	—	Logic-side ground; internally connected
GND2	9, 15	—	Bus-side ground; internally connected
ISODE	10	—	Bus-side driver enable output
NC	11, 14	—	Not connected internally; may be left floating
PV	7	I	ISO1176 chip enable, logic high applied immediately after power up for device operation. A logic low 3-states all outputs.
R	3	O	Receiver output
$\overline{\text{RE}}$	4	I	Receiver logic-low enable
V_{CC1}	1	—	Logic side power supply
V_{CC2}	16	—	Bus side power supply

7 Specifications

7.1 Absolute Maximum Ratings

over operating junction temperature range unless otherwise noted⁽¹⁾

			MIN	MAX	UNIT
V _{CC}	Supply voltage ⁽²⁾	V _{CC1} , V _{CC2}	-0.5	7	V
V _O	Voltage at any bus I/O pins		-9	14	V
V _I	Voltage input	D, DE or \overline{RE}	-0.5	7	V
I _O	Receiver output current		-10	10	mA
T _J	Maximum junction temperature			170	°C
T _{stg}	Storage temperature		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to the network ground terminal unless otherwise noted.
- (2) All voltage values except differential I/O bus voltages are with respect to the referenced network ground terminal and are peak voltage values.

7.2 ESD Ratings

			VALUE	UNIT	
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	Bus pins to 2, 8	±6000	V
			Bus pins to 9, 15	±16000	
			All pins	±4000	
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000		
		Machine model (MM), per ANSI/ESDS5.2-1996, all pins	±200		

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
V _{CC}	Logic-side supply voltage, V _{CC1} (with respect to GND1)		3.15		5.5	V
	Bus-side supply voltage, V _{CC2} (with respect to GND2)		4.75		5.25	
V _{CM}	Voltage at either bus I/O terminal	A, B	-7		12	V
V _{IH}	High-level input voltage	PV, \overline{RE}	2		5.5	V
		D, DE	0.7 V _{CC1}			
V _{IL}	Low-level input voltage	PV, \overline{RE}	0		0.8	V
		D, DE			0.3 V _{CC1}	
V _{ID}	Differential input voltage	A with respect to B	-12		12	V
I _O	Output current	Driver	-70		70	mA
		Receiver	-8		8	
	Input pulse width		10			ns
T _A	Ambient temperature		-40	25	85	°C
T _J	Junction temperature				150	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ISO1176		UNIT
		DW [SOIC]		
		16 PINS		
R _{θJA}	Junction-to-ambient thermal resistance	High-K board	81.4	°C/W
		Low-K board	168	
R _{θJC(top)}	Junction-to-case (top) thermal resistance		41.4	°C/W
R _{θJB}	Junction-to-board thermal resistance		46.4	°C/W
ψ _{JT}	Junction-to-top characterization parameter		13.1	°C/W
ψ _{JB}	Junction-to-board characterization parameter		45.8	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance		N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

7.5 Electrical Characteristics: ISODE-Pin

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{OH}	High-level output voltage	I _{OH} = –8 mA	V _{CC2} – 0.8	4.6		V
		I _{OH} = –20 μA	V _{CC2} – 0.1	5		
V _{OL}	Low-level output voltage	I _{OL} = 8 mA		0.2	0.4	V
		I _{OL} = 20 μA		0	0.1	

7.6 Supply Current

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
I _{CC1}	Logic-side RMS supply current	3 V	DE at 0 V		4	6	mA
			DE at V _{CC1} , 2 Mbps		5		
			DE at V _{CC1} , 25 Mbps		6		
		5.5 V	DE at 0 V		7	10	
			DE at V _{CC1} , 2 Mbps		8		
			DE at V _{CC1} , 25 Mbps		11		
I _{CC2}	Bus-side RMS supply current	5.25 V	DE at 0 V		15	18	mA
			DE at V _{CC1} , 2 Mbps, 54-Ω load		70		
			DE at V _{CC1} , 25 Mbps, 54-Ω load		75		

7.7 Electrical Characteristics: Driver

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{OD}	Open-circuit differential output voltage	$ V_A - V_B $, Figure 8	1.5		V_{CC2}	V
$ V_{OD(SS)} $	Steady-state differential output voltage magnitude	See Figure 9 and Figure 13	2.1			V
		Common-mode loading with V_{test} from -7 V to 12 V, See Figure 10	2.1			
$ \Delta V_{OD(SS)} $	Change in steady-state differential output voltage between logic states	$R_L = 54 \Omega$, See Figure 11 and Figure 12	-0.2		0.2	V
$V_{OC(SS)}$	Steady-state common-mode output voltage	$R_L = 54 \Omega$, See Figure 11 and Figure 12	2		3	V
$\Delta V_{OC(SS)}$	Change in steady-state common-mode output voltage		-0.2		0.2	
$V_{OC(PP)}$	Peak-to-peak common-mode output voltage		0.5			
$V_{OD(RING)}$	Differential output voltage over- and undershoot	See Figure 13 and Figure 17			10%	$V_{OD(PP)}$
$V_{I(HYS)}$	Input voltage hysteresis	See Figure 14		150		mV
I_I	Input current	D, DE at 0 V or V_{CC1}	-10		10	μA
		PV ⁽¹⁾ at 0 V or V_{CC1}			120	
$I_{O(OFF)}$	Output current with power off	$V_{CC} \leq 2.5$ V	See receiver input current in Electrical Characteristics: Receiver			
I_{OZ}	High-impedance state output current	DE at 0 V				
$I_{OS(P)}$	Peak short-circuit output current		$V_{OS} = -7$ V to 12 V	-250	250	mA
$I_{OS(SS)}$	Steady-state short-circuit output current	DE at V_{CC} . See Figure 15 and Figure 16	$V_{OS} = 12$ V, D at GND1		135	
			$V_{OS} = -7$ V, D at V_{CC1}	-135		
C_{OD}	Differential output capacitance		See receiver C_{IN} in Electrical Characteristics: Receiver			
CMTI	Common-mode transient immunity	See Figure 27	25			kV/ μs

(1) The PV pin has a 50-k Ω pullup resistor and leakage current depends on supply voltage.

7.8 Electrical Characteristics: Receiver

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
$V_{IT(+)}$	Positive-going differential input voltage threshold	See Figure 22	$I_O = -8 \text{ mA}$		-80	-10	mV
$V_{IT(-)}$	Negative-going differential input voltage threshold		$I_O = 8 \text{ mA}$		-200	-120	mV
V_{hys}	Hysteresis voltage ($V_{IT+} - V_{IT-}$)				40		mV
V_{OH}	High-level output voltage	V_{CC1} at 3.3 V and V_{CC2} at 5 V	$V_{ID} = 200 \text{ mV}$, See Figure 22	$I_{OH} = -8 \text{ mA}$	$V_{CC1} - 0.4$	3	V
V_{OL}	Low-level output voltage		$V_{ID} = -200 \text{ mV}$, See Figure 22	$I_{OH} = -20 \text{ }\mu\text{A}$	$V_{CC1} - 0.1$	3.3	
V_{OH}	High-level output voltage	V_{CC1} at 5 V and V_{CC2} at 5 V	$V_{ID} = 200 \text{ mV}$, See Figure 22	$I_{OL} = 8 \text{ mA}$		0.2	0.4
V_{OL}	Low-level output voltage		$V_{ID} = -200 \text{ mV}$, See Figure 22	$I_{OL} = 20 \text{ }\mu\text{A}$		0	0.1
I_A, I_B	Bus pin input current	$V_I = -7 \text{ V}$ or 12 V , Other input = 0 V	$V_{CC} = 4.75 \text{ V}$ or 5.25 V		-160	200	μA
$I_{A(OFF)}$ $I_{B(OFF)}$							
I_I	Receiver enable input current	$\overline{RE} = 0 \text{ V}$			-50	50	μA
I_{OZ}	High-impedance state output current	$\overline{RE} = V_{CC1}$			-1	1	μA
R_{ID}	Differential input resistance	A, B			48		k Ω
C_{ID}	Differential input capacitance	Test input signal is a 1.5-MHz sine wave with 1 V_{pp} amplitude, C_D is measured across A and B			7	10	pF
CMR	Common-mode rejection	See Figure 26			4		V

7.9 Power Dissipation Characteristics

PARAMETER		VALUE	UNIT
P_D	Power Dissipation	$V_{CC1} = V_{CC2} = 5.25 \text{ V}$, $T_J = 150^\circ\text{C}$, $CL = 15 \text{ pF}$, Input a 20 MHz 50% duty-cycle square wave	220 mW

7.10 Switching Characteristics: Driver

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
t_{pLH}, t_{pHL}	Propagation delay time	See Figure 17			35	ns	
$t_{sk(p)}$	Pulse skew ($ t_{pHL} - t_{pLH} $)		V_{CC1} at 5 V V_{CC2} at 5 V		2	5	ns
t_{pLH}, t_{pHL}	Propagation delay time		V_{CC1} at 3.3 V V_{CC2} at 5 V			40	ns
$t_{sk(p)}$	Pulse skew ($ t_{pHL} - t_{pLH} $)				2	5	ns
t_r	Differential output signal rise time			2	3	7.5	ns
t_f	Differential output signal fall time			2	3	7.5	ns
t_{pDE}	DE to ISODE prop delay	See Figure 21			30	ns	
$t_{t(MLH)}, t_{t(MHL)}$	Output transition skew	See Figure 18			1	ns	
$t_{p(AZH)}, t_{p(BZH)}$ $t_{p(AZL)}, t_{p(BZL)}$	Propagation delay time, high-impedance-to-active output	$C_L = 50 \text{ pF}$, \overline{RE} at 0 V , See Figure 19 and Figure 20			80	ns	
$t_{p(AHZ)}, t_{p(BHZ)}$ $t_{p(A LZ)}, t_{p(B LZ)}$	Propagation delay time, active-to-high-impedance output				80	ns	
$ t_{p(AZL)} - t_{p(BZH)} $ $ t_{p(AZH)} - t_{p(BZL)} $	Enable skew time			0.55	1.5	ns	
$t_{(CFB)}$	Time from application of short-circuit to current foldback		See Figure 16		0.5	μs	
$t_{(TSD)}$	Time from application of short-circuit to thermal shutdown	$T_A = 25^\circ\text{C}$, See Figure 16		100	μs		

7.11 Switching Characteristics: Receiver

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{pLH} , t_{pHL}	Propagation delay time	See Figure 23			50	ns
$t_{sk(p)}$	Pulse skew ($ t_{pHL} - t_{pLH} $)			2	5	ns
t_{pLH} , t_{pHL}	Propagation delay time				55	ns
$t_{sk(p)}$	Pulse skew ($ t_{pHL} - t_{pLH} $)			2	5	ns
t_r	Output signal rise time			2	4	ns
t_f	Output signal fall time			2	4	ns
t_{pZH}	Propagation delay time, high-impedance-to-high-level output	DE at V_{CC1} , See Figure 24		13	25	ns
t_{pHZ}	Propagation delay time, high-level-to-high-impedance output			13	25	ns
t_{pZL}	Propagation delay time, high-impedance-to-low-level output	DE at V_{CC} , See Figure 25		13	25	ns
t_{pLZ}	Propagation delay time, low-level-to-high-impedance output			13	25	ns

9 Detailed Description

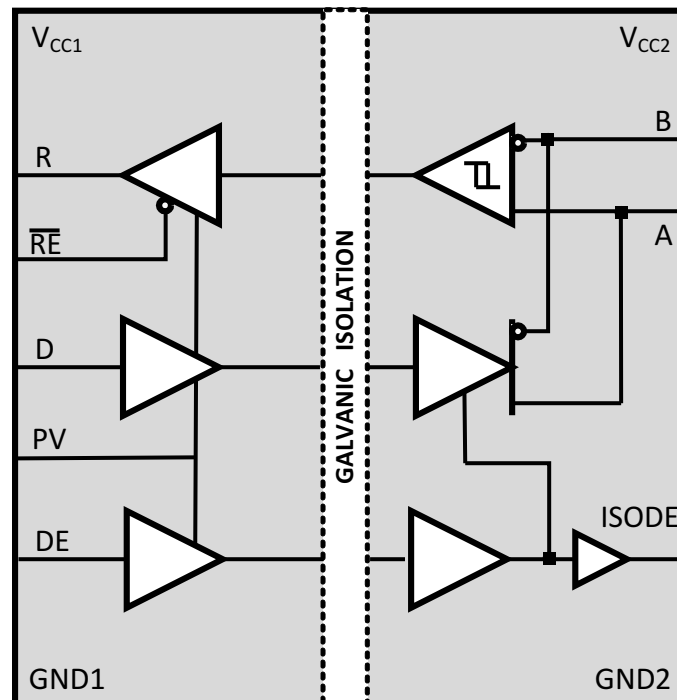

9.1 Overview

The ISO1176 is an isolated half-duplex differential line transceiver that meets the requirements of EN 50170 and TIA/EIA 485/422 applications. The device is rated to provide galvanic isolation of up to 2500 V_{RMS} for 60 s per UL 1577. The device has active-high driver enable and active-low receiver enable functions to control the data flow. The device has maximum data transmission speed of 40 Mbps.

When the driver enable pin, DE, is logic high, the differential outputs A and B follow the logic states at data input D. A logic high at D causes A to turn high and B to turn low. In this case, the differential output voltage defined as $V_{OD} = V_{(A)} - V_{(B)}$ is positive. When D is low, the output states reverse, B turns high, A becomes low, and V_{OD} is negative. When DE is low, both outputs turn high-impedance. In this condition, the logic state at D is irrelevant. The DE pin has an internal pulldown resistor to ground, thus when left open the driver is disabled (high-impedance) by default. The D pin has an internal pullup resistor to V_{CC}, thus, when left open while the driver is enabled, output A turns high and B turns low.

When the receiver enable pin, \overline{RE} , is logic low, the receiver is enabled. When the differential input voltage defined as $V_{ID} = V_{(A)} - V_{(B)}$ is positive and higher than the positive input threshold, V_{IT+} , the receiver output, R, turns high. When V_{ID} is negative and less than the negative and lower than the negative input threshold, V_{IT-} , the receiver output, R, turns low. If V_{ID} is between V_{IT+} and V_{IT-} the output is indeterminate. When \overline{RE} is logic high or left open, the receiver output is high-impedance and the magnitude and polarity of V_{ID} are irrelevant. Internal biasing of the receiver inputs causes the output to go failsafe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted (short-circuit), or the bus is not actively driven (idle bus).

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Insulation and Safety-Related Package Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
L(I01)	Minimum air gap (Clearance)	Shortest terminal-to-terminal distance through air	8.34			mm
L(I02)	Minimum external tracking (Creepage) ⁽¹⁾	Shortest terminal-to-terminal distance across the package surface	8.1			mm
CTI	Tracking resistance (Comparative Tracking Index)	DIN IEC 60112 / VDE 0303 Part 1	≥400			V
	Minimum internal gap (Internal Clearance)	Distance through the insulation	0.008			mm
R _{IO}	Isolation resistance	Input to output, V _{IO} = 500 V, T _A = 25°C, all pins on each side of the barrier tied together creating a 2-terminal device		>10 ¹²		Ω
C _{IO}	Barrier capacitance Input to output	V _I = 0.4 sin (4E6πt)		2		pF
C _I	Input capacitance to ground	V _I = 0.4 sin (4E6πt)		2		pF

(1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit-board (PCB) do not reduce this distance.

Creepage and clearance on a PCB become equal according to the measurement techniques shown in the Isolation Glossary. Techniques such as inserting grooves and/or ribs on a PCB are used to help increase these specifications.

9.3.2 DIN V VDE V 0884-10 Insulation Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	SPECIFICATION	UNIT
V _{IOTM}	Transient overvoltage	t = 60 s	4000	V _{PK}
V _{IORM}	Maximum working insulation voltage		560	V _{PK}
V _{PR}	Input to output test voltage	Method b1, V _{PR} = V _{IORM} × 1.875, 100% Production test with t = 1 s, Partial discharge <5 pC	1050	V _{PK}
R _S	Insulation resistance	V _{IO} = 500 V at T _S	>10 ⁹	Ω
	Pollution degree		2	

9.3.3 IEC 60664-1 Ratings Table

PARAMETER	TEST CONDITIONS	SPECIFICATION
Basic isolation group	Material group	II
Installation classification	Rated mains voltage < 150 V _{RMS}	I-IV
	Rated mains voltage < 300 V _{RMS}	I-III

9.3.4 Safety Limiting Values

Safety limiting intends to prevent potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current-limiting, dissipate sufficient power to overheat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _S	Safety input, output, or supply current	DW-16 R _{θJA} = 168°C/W, V _I = 5.5 V, T _J = 170°C, T _A = 25°C			157	mA
T _S	Maximum case temperature	DW-16			150	°C

The safety-limiting constraint is the absolute maximum junction temperature specified in [Absolute Maximum Ratings](#). The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in [Thermal Information](#) is that of a device installed in the JESD51-3, Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages and is conservative.

The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance..

Figure 28. DW-16 $R_{\theta JC}$ Thermal Derating Curve per VDE

9.3.5 Regulatory Information

VDE	CSA	UL
Certified according to DIN V VDE V 0884-10 (VDE V 0884-10):2006-12	Approved under CSA Component Acceptance Notice 5A and IEC 60950-1	Recognized under UL 1577 Component Recognition Program ⁽¹⁾

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The ISO1176 device consists of a RS-485 transceiver, commonly used for asynchronous data transmissions. For half-duplex transmission, only one pair is shared for both transmission and reception of data. To eliminate line reflections, each cable end is terminated with a termination resistor, $R(T)$, whose value matches the characteristic impedance, Z_0 , of the cable. This method, known as parallel termination, allows for higher data rates over longer cable length.

10.2 Typical Application

Figure 31. Half-Duplex Transceiver Configurations

10.2.1 Design Requirements

RS-485 is a robust electrical standard suitable for long-distance networking that may be used in a wide range of applications with varying requirements, such as distance, data rate, and number of nodes.

Table 3. Design Parameters

PARAMETER	VALUE
Pullup and Pulldown Resistors	1 k Ω to 10 k Ω
Decoupling Capacitors	100 nF

10.2.2 Detailed Design Procedure

Isolating of a circuit insulates it from other circuits and earth, so that noise voltage develops across the insulation rather than circuit components. The most common noise threat to data-line circuits is voltage surges or electrical fast transients that occur after installation. The transient ratings of the ISO1176 standard are sufficient for all but the most severe installations. However, some equipment manufacturers use ESD generators to test equipment transient susceptibility. This practice can exceed insulation ratings. ESD generators simulate static discharges that may occur during device or equipment handling with low-energy but high-voltage transients.

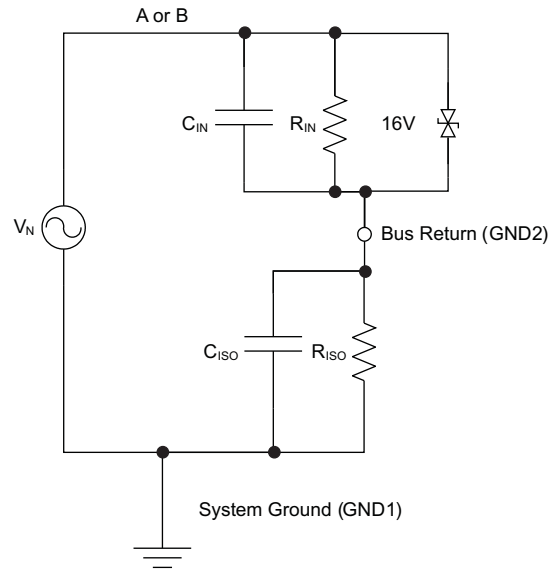

Figure 32. Device Model for Static Discharge Testing

Figure 32 models the ISO1176 bus IO connected to a noise generator. C_{IN} and R_{IN} is the device, and any other stray or added capacitance or resistance across the A or B pin to GND2. C_{ISO} and R_{ISO} is the capacitance and resistance between GND1 and GND2 of the ISO1176, plus those of any other insulation (transformer, and so forth). Stray inductance is assumed to be negligible.

10.2.2.1 Transient Voltages

From this model, the voltage at the isolated bus return is

$$V_{GND2} = V_N \frac{Z_{ISO}}{Z_{ISO} + Z_{IN}} \quad (1)$$

and is always less than 16 V from V_N . If the ISO1176 is tested as a stand-alone device,

- $R_{IN} = 6 \times 10^4 \Omega$,
- $C_{IN} = 16 \times 10^{-12} \text{ F}$,
- $R_{ISO} = 10^9 \Omega$ and
- $C_{ISO} = 10^{-12} \text{ F}$.

Notice from Figure 32 that the resistor ratio determines the voltage ratio at low frequencies, and that the inverse capacitance ratio determines the voltage ratio at high frequencies. In the stand-alone case and for low frequencies,

$$\frac{V_{GND2}}{V_N} = \frac{R_{ISO}}{R_{ISO} + R_{IN}} = \frac{10^9}{10^9 + 6 \times 10^4} \quad (2)$$

or essentially all of the noise appears across the barrier.

At high frequencies,

$$\frac{V_{GND2}}{V_N} = \frac{1/C_{ISO}}{1/C_{ISO} + 1/C_{IN}} = \frac{1}{1 + C_{ISO}/C_{IN}} = \frac{1}{1 + 1/16} = 0.94 \quad (3)$$

and 94% of V_N appears across the barrier. As long as R_{ISO} is greater than R_{IN} and C_{ISO} is less than C_{IN} , most of the transient noise appears across the isolation barrier, as it should.

Using ESD generators to test equipment transient susceptibility, or considering product claims of ESD ratings greater than the barrier transient ratings of an isolated interface is not recommended. ESD is best managed through recessing or covering connector pins in a conductive connector shell, and by proper installer training.

10.2.2.2 ISO1176 “Sticky Bit” Issue (Under Certain Conditions)

Summary: In applications with sufficient differential noise on the bus, the output of the ISO1176 receiver may “stick” at an incorrect state for up to 30 μ s.

Description: The ISO1176 isolated Profibus (RS-485) transceiver is rated for signaling up to 40 Mbps on twisted-pair bus lines. The receiver thresholds comply with RS-485 and Profibus specifications; an input differential voltage $V_{ID} = V_A - V_B > 200$ mV causes a logic High on the R output, and $V_{ID} < -200$ mV causes a logic Low on the R output. To assure a known receiver output when the bus is shorted or idle, the upper threshold is set below zero, such that $V_{ID} = 0$ mV causes a logic High on the R output. The data sheet specifies a typical upper threshold (V_{IT+}) of -80 mV and a typical lower threshold (V_{IT-}) of -120 mV.

At a signaling rate of 40 Mbps, each valid data bit has a duration of 25 ns. At typical Profibus signaling rates of 12 Mbps or lower, each valid data bit has a duration of 83 ns or more. The ISO1176 correctly sets the R output for each of these valid data bits.

In applications with a high degree of differential noise on the bus lines, it is possible to get short periods when an invalid bus voltage triggers a change in state of the internal receiver circuits. An issue with the digital isolation channel in the ISO1176 may cause the invalid receiver state to “stick” rather than immediately transition back to the correct state. The receiver output will always transition to the correct state, but may stick in the incorrect state for up to 30 μ s. This can cause a temporary loss of data.

Figure 33 shows two cases which could result in temporary loss of data.

Case 1

Case 2

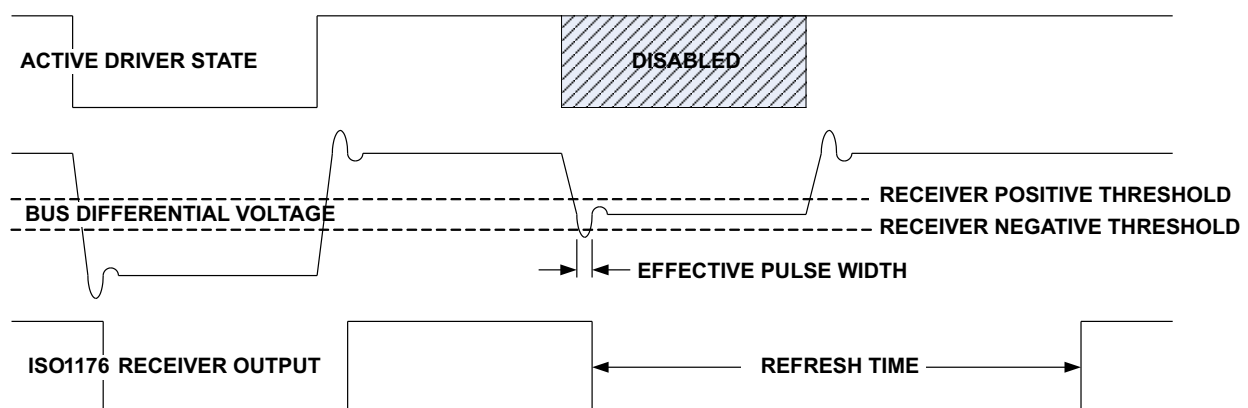

Figure 33. “Sticky Bit” Issue Waveforms

10.2.3 Application Curve

At maximum working voltage, ISO1176 isolation barrier has more than 28 years of life.

Figure 34. Time-Dependent Dielectric Breakdown Test Results

11 Power Supply Recommendations

To ensure reliable operation at all data rates and supply voltages, TI recommends a 0.1- μF bypass capacitor at input and output supply pins ($V_{\text{CC}1}$ and $V_{\text{CC}2}$). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as TI's [SN6501](#). For such applications, detailed power supply design and transformer selection recommendations are available in SN6501 data sheet ([SLLSEA0](#)).

12 Layout

12.1 Layout Guidelines

ON-chip IEC-ESD protection is good for laboratory and portable equipment but never sufficient for EFT and surge transients occurring in industrial environments. Therefore, robust and reliable bus node design requires the use of external transient protection devices. Because ESD and EFT transients have a wide frequency bandwidth from approximately 3-MHz to 3-GHz, high-frequency layout techniques must be applied during PCB design. A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 35](#)).

- Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane, and low-frequency signal layer.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in².
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.
- Place the protection circuitry close to the bus connector to prevent noise transients from penetrating your board.
- Use V_{CC} and ground planes to provide low-inductance. High-frequency currents might follow the path of least inductance and not necessarily the path of least resistance.
- Design the protection components into the direction of the signal path. Do not force the transient currents to divert from the signal path to reach the protection device.
- Apply 0.1- μF bypass capacitors as close as possible to the V_{CC} -pins of transceiver, UART, and controller ICs on the board.
- Use at least two vias for V_{CC} and ground connections of bypass capacitors and protection devices to minimize effective via-inductance.
- Use 1-k Ω to 10-k Ω pullup and pulldown resistors for enable lines to limit noise currents in these lines during transient events.
- Insert pulse-proof resistors into the A and B bus lines if the TVS clamping voltage is higher than the specified maximum voltage of the transceiver bus pins. These resistors limit the residual clamping current into the transceiver and prevent it from latching up.
- While pure TVS protection is sufficient for surge transients up to 1 kV, higher transients require metal-oxide varistors (MOVs) which reduce the transients to a few hundred volts of clamping voltage, and transient blocking units (TBUs) that limit transient current to less than 1 mA.
- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.

If an additional supply voltage plane or signal layer is needed, add a second power and ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

NOTE

For detailed layout recommendations, see Application Note *Digital Isolator Design Guide*, [SLLA284](#).

ISO1176DWR	ACTIVE	SOIC	DW	16	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	ISO1176	Samples
ISO1176DWRG4	ACTIVE	SOIC	DW	16	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	ISO1176	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
