PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

32-bit MCUs (up to 2 MB Live-Update Flash and 512 KB SRAM) with FPU, Audio and Graphics Interfaces, HS USB, Ethernet, and Advanced Analog

Operating Conditions

- 2.1V to 3.6V, -40ºC to +85ºC, DC to 252 MHz
- 2.1V to 3.6V, -40ºC to +125ºC, DC to 180 MHz

Core: 252 MHz (up to 415 DMIPS) M-Class

- 16 KB I-Cache, 4 KB D-Cache
- FPU for 32-bit and 64-bit floating point math
- MMU for optimum embedded OS execution
- microMIPS™ mode for up to 35% smaller code size
- DSP-enhanced core:
  - Four 64-bit accumulators
  - Single-cycle MAC, saturating, and fractional math
  - IEEE 754-compliant
- Code-efficient (C and Assembly) architecture

Clock Management

- Programmable PLLs and oscillator clock sources
- Fail-Safe Clock Monitor (FSCM)
- Independent Watchdog Timers (WDT) and Deadman Timer (DMT)
- Fast wake-up and start-up

Power Management

- Low-power modes (Sleep and Idle)
- Integrated Power-on Reset (POR) and Brown-out Reset (BOR)

Memory Interfaces

- 50 MHz External Bus Interface (EBI)
- 50 MHz Serial Quad Interface (SQI)

Audio and Graphics Interfaces

- Graphics interfaces: EBI or PMP
- Audio data communication: I^2S, LJ, and RJ
- Audio control interfaces: SPI and I^2C
- Audio master clock: Fractional clock frequencies with USB synchronization

High-Speed (HS) Communication Interfaces (with Dedicated DMA)

- USB 2.0-compliant Hi-Speed On-The-Go (OTG) controller
- 10/100 Mbps Ethernet MAC with MII and RMII interface

Security Features

- Crypto Engine with RNG for data encryption/decryption and authentication (AES, 3DES, SHA, MD5, and HMAC)
- Advanced memory protection:
  - Peripheral and memory region access control

Direct Memory Access (DMA)

- Eight channels with automatic data size detection
- Programmable Cyclic Redundancy Check (CRC)

Advanced Analog Features

- 12-bit ADC module:
  - 18 Msps with up to six Sample and Hold (S&H) circuits (five dedicated and one shared)
  - Up to 48 analog inputs
  - Can operate during Sleep and Idle modes
  - Multiple trigger sources
  - Six Digital Comparators and six Digital Filters
- Two comparators with 32 programmable voltage references
- Temperature sensor with ±2ºC accuracy

Communication Interfaces

- Two CAN modules (with dedicated DMA channels):
  - 2.0B Active with DeviceNet™ addressing support
- Six UART modules (25 Mbps):
  - Supports up to LIN 2.1 and IrDA® protocols
- Six 4-wire SPI modules (up to 50 MHz)
- SQI configurable as an additional SPI module (50 MHz)
- Five I^2C modules (up to 1 Mbaud) with SMBus support
- Parallel Master Port (PMP)
- Peripheral Pin Select (PPS) to enable function remap

Timers/Output Compare/Input Capture

- Nine 16-bit or up to four 32-bit timers/counters
- Nine Output Compare (OC) modules
- Nine Input Capture (IC) modules
- Real-Time Clock and Calendar (RTCC) module

Input/Output

- 5V-tolerant pins with up to 32 mA source/sink
- Selectable open drain, pull-ups, pull-downs, and slew rate controls
- External interrupts on all I/O pins
- PPS to enable function remap

Qualification and Class B Support

- AEC-Q100 REVH (Grade 1 -40ºC to +125ºC)
- Class B Safety Library, IEC 60730 (planned)
- Back-up internal oscillator

Debugger Development Support

- In-circuit and in-application programming
- 4-wire MIPS® Enhanced JTAG interface
- Unlimited software and 12 complex breakpoints
- IEEE 1149.2-compatible (JTAG) boundary scan
- Non-intrusive hardware-based instruction trace

Software and Tools Support

- C/C++ compiler with native DSP/fractional and FPU support
- MPLAB® Harmony Integrated Software Framework
- TCP/IP, USB, Graphics, and mTouch™ middleware
- MFi, Android™, and Bluetooth® audio frameworks
- RTOS Kernels: Express Logic ThreadX, FreeRTOS™, OPENRTOS®, Micriμm® μC/OS™, and SEGGER embOS®

Packages

Note 1: The RPn pins can be used by remappable peripherals. See Table 1 for the available peripherals and **Section 12.4 "Peripheral Pin Select (PPS)"** for restrictions.
2: Every I/O port pin (RAx-RJx) can be used as a change notification pin (CNAx-CNJx). See **Section 12.0 "I/O Ports"** for more information.
3: Shaded pins are 5V tolerant.
4: The metal plane at the bottom of the device is not connected to any pins and is recommended to be connected to VSS externally.

Table of Contents

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com**. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; **http://www.microchip.com**
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at **www.microchip.com** to receive the most current information on all of our products.

Referenced Sources

This device data sheet is based on the following individual sections of the *"PIC32 Family Reference Manual"*. These documents should be considered as the general reference for the operation of a particular module or device feature.

Note: To access the following documents, browse the documentation section of the Microchip web site (www.microchip.com).

- **Section 1. "Introduction"** (DS60001127)
- **Section 7. "Resets"** (DS60001118)

NOTES:

1.0 DEVICE OVERVIEW

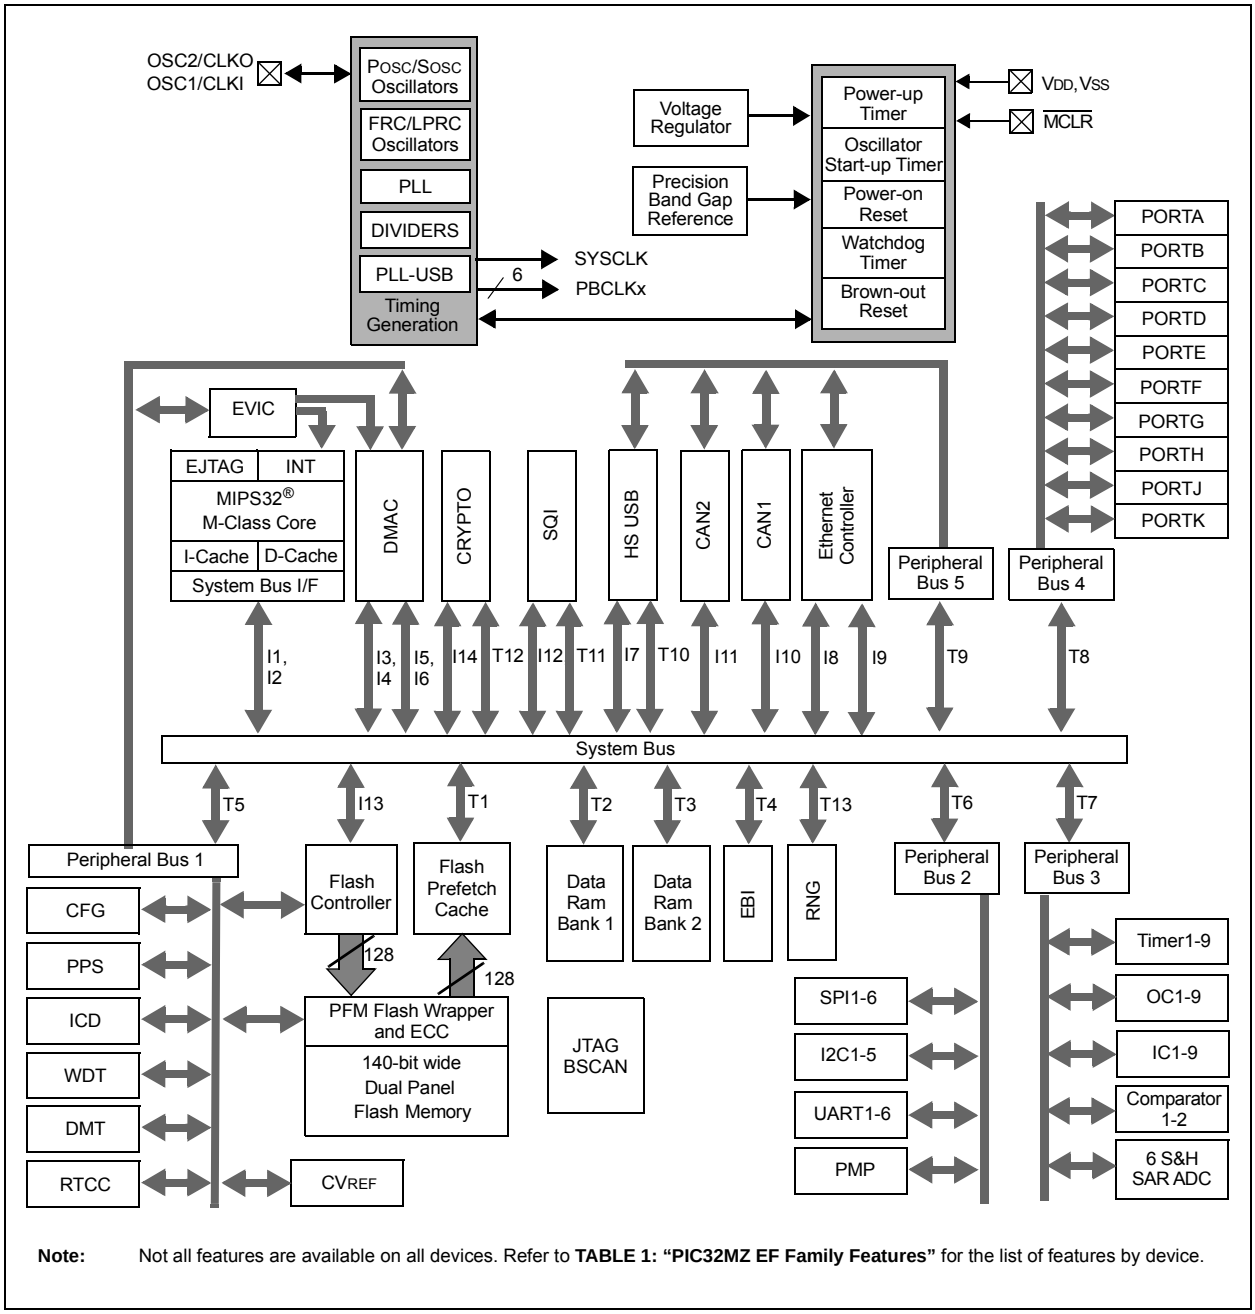
Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

This data sheet contains device-specific information for PIC32MZ EF devices.

Figure 1-1 illustrates a general block diagram of the core and peripheral modules in the PIC32MZ EF family of devices.

Table 1-21 through Table 1-22 list the pinout I/O descriptions for the pins shown in the device pin tables (see Table 2 through Table 5).

FIGURE 1-1: PIC32MZ EF FAMILY BLOCK DIAGRAM



Note: Not all features are available on all devices. Refer to **TABLE 1: "PIC32MZ EF Family Features"** for the list of features by device.

TABLE 1-1: ADC PINOUT I/O DESCRIPTIONS

Pin Name	Pin Number					Pin Type	Buffer Type	Description
	64-pin QFN/ TQFP	100-pin TQFP	124-pin VTLA	144-pin TQFP/ LQFP	144-pin TFBGA			
AN0	16	25	A18	36	A1	I	Analog	Analog Input Channels
AN1	15	24	A17	35	A2	I	Analog

TABLE 1-2: OSCILLATOR PINOUT I/O DESCRIPTIONS

Pin Name	Pin Number					Pin Type	Buffer Type	Description
	64-pin QFN/ TQFP	100-pin TQFP	124-pin VTLA	144-pin TQFP/ LQFP	144-pin TFBGA			
CLKI	31	49	B28	71	M1	I	ST/CMOS	External clock source input. Always associated with OSC1 pin function.
CLKO	32	50	A33	72	N1	O	—	Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. Always associated with OSC2 pin function.
OSC1	31	49	B28	71	M1	I	ST/CMOS	Oscillator crystal input. ST buffer when configured in RC mode; CMOS otherwise.
OSC2	32	50	A33	72	N1	O	—	Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes.
SOSCI	47	72	B41	105	N12	I	ST/CMOS	32.768 kHz low-power oscillator crystal input; CMOS otherwise.
SOSCO	48	73	A49	106	M12	O	—	32.768 low-power oscillator crystal output.
REFCLKI1	PPS	PPS	PPS	PPS	PPS	I	—	Reference Clock Generator Inputs 1-4
REFCLKI3	PPS	PPS	PPS	PPS	PPS	I	—	
REFCLKI4	PPS	PPS	PPS	PPS	PPS	I	—	
REFCLKO1	PPS	PPS	PPS	PPS	PPS	O	—	Reference Clock Generator Outputs 1-4
REFCLKO3	PPS	PPS	PPS	PPS	PPS	O	—	
REFCLKO4	PPS	PPS	PPS	PPS	PPS	O	—

NOTES:

2.0 GUIDELINES FOR GETTING STARTED WITH 32-BIT MICROCONTROLLERS

Note 1: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

2.1 Basic Connection Requirements

Getting started with the PIC32MZ EF family of 32-bit Microcontrollers (MCUs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and VSS pins (see **2.2 "Decoupling Capacitors"**)
- All AVDD and AVSS pins, even if the ADC module is not used (see **2.2 "Decoupling Capacitors"**)
- $\overline{\text{MCLR}}$ pin (see **2.3 "Master Clear (MCLR) Pin"**)
- PGECx/PGEDx pins, used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see **2.4 "ICSP Pins"**)
- OSC1 and OSC2 pins, when external oscillator source is used (see **2.7 "External Oscillator Pins"**)

The following pin(s) may be required as well:

VREF+/VREF- pins, used when external voltage reference for the ADC module is implemented.

Note: The AVDD and AVSS pins must be connected, regardless of ADC use and the ADC voltage reference source.

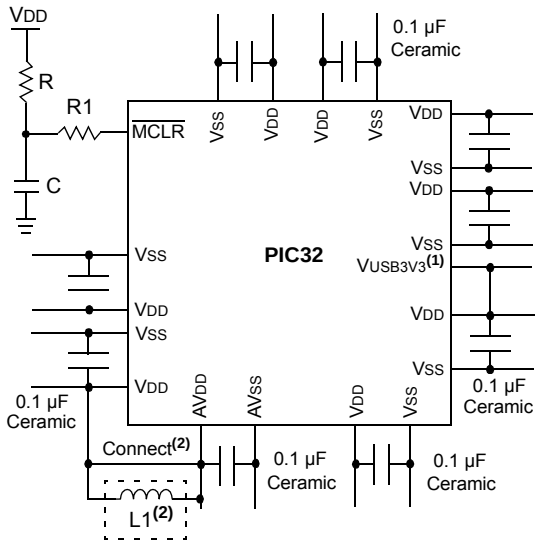
2.2 Decoupling Capacitors

The use of decoupling capacitors on power supply pins, such as VDD, VSS, AVDD and AVSS is required. See Figure 2-1.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A value of 0.1 µF (100 nF), 10-20V is recommended. The capacitor should be a low Equivalent Series Resistance (low-ESR) capacitor and have resonance frequency in the range of 20 MHz and higher. It is further recommended that ceramic capacitors be used.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended that the capacitors be placed on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high frequency noise:** If the board is experiencing high frequency noise, upward of tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 µF to 0.001 µF. Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 µF in parallel with 0.001 µF.
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum thereby reducing PCB track inductance.

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION



Note 1: If the USB module is not used, this pin must be connected to VSS. When connected to VSS, the shared pin functions on USBID will not be available.

2: As an option, instead of a hard-wired connection, an inductor (L1) can be substituted between VDD and AVDD to improve ADC noise rejection. The inductor impedance should be less than 1Ω and the inductor capacity greater than 10 mA.

Where:

$$f \quad \frac{FCNV}{2} \quad \text{(i.e., ADC conversion rate/2)}$$

$$f \quad \frac{1}{(2\pi\sqrt{LC})}$$

$$L \quad \left(\frac{1}{(2\pi f\sqrt{C})}\right)^2$$

2.2.1 BULK CAPACITORS

The use of a bulk capacitor is recommended to improve power supply stability. Typical values range from 4.7 µF to 47 µF. This capacitor should be located as close to the device as possible.

2.3 Master Clear ($\overline{\text{MCLR}}$) Pin

The $\overline{\text{MCLR}}$ pin provides for two specific device functions:

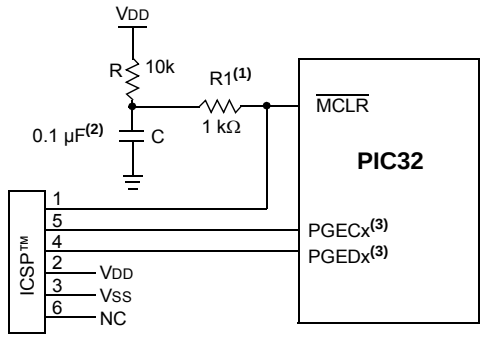
- Device Reset
- Device programming and debugging

Pulling The $\overline{\text{MCLR}}$ pin low generates either a device Reset or a POR, depending on the setting of the SMCLR bit (DEVCFG0<15>). Figure 2-2 illustrates a typical $\overline{\text{MCLR}}$ circuit. During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the $\overline{\text{MCLR}}$ pin. Consequently, specific voltage levels (VIH and VIL) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as illustrated in Figure 2-2, it is recommended that the capacitor C be isolated from the $\overline{\text{MCLR}}$ pin during programming and debugging operations.

Place the components illustrated in Figure 2-2 within one-quarter inch (6 mm) from the $\overline{\text{MCLR}}$ pin.

FIGURE 2-2: EXAMPLE OF $\overline{\text{MCLR}}$ PIN CONNECTIONS



Note 1: 470Ω ≤ R1 ≤ 1kΩ will limit any current flowing into $\overline{\text{MCLR}}$ from the external capacitor C, in the event of $\overline{\text{MCLR}}$ pin breakdown, due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS). Ensure that the $\overline{\text{MCLR}}$ pin VIH and VIL specifications are met without interfering with the Debug/Programmer tools.

2: The capacitor can be sized to prevent unintentional Resets from brief glitches or to extend the device Reset period during POR.

3: No pull-ups or bypass capacitors are allowed on active debug/program PGECx/PGEDx pins.

2.4 ICSP Pins

The PGECx and PGEDx pins are used for ICSP and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (V_{IH}) and input low (V_{IL}) requirements.

Ensure that the "Communication Channel Select" (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® ICD 3 or MPLAB REAL ICE™.

For more information on ICD 3 and REAL ICE connection requirements, refer to the following documents that are available from the Microchip web site.

- *"Using MPLAB® ICD 3"* (poster) (DS50001765)
- *"MPLAB® ICD 3 Design Advisory"* (DS50001764)
- *"MPLAB® REAL ICE™ In-Circuit Debugger User's Guide" (*DS50001616)
- *"Using MPLAB® REAL ICE™ Emulator"* (poster) (DS50001749)

2.5 JTAG

The TMS, TDO, TDI and TCK pins are used for testing and debugging according to the Joint Test Action Group (JTAG) standard. It is recommended to keep the trace length between the JTAG connector and the JTAG pins on the device as short as possible. If the JTAG connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the TMS, TDO, TDI and TCK pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (V_{IH}) and input voltage low (V_{IL}) requirements.

2.6 Trace

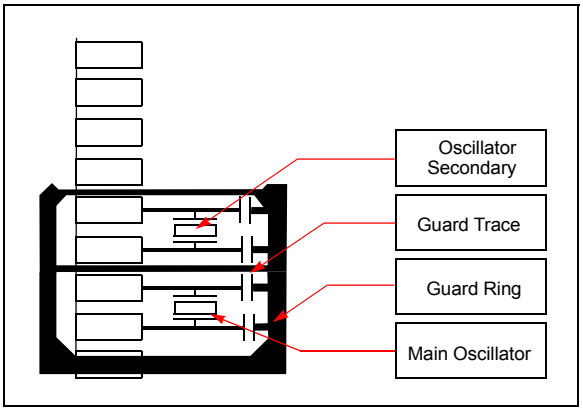
The trace pins can be connected to a hardware trace-enabled programmer to provide a compressed real-time instruction trace. When used for trace, the TRD3, TRD2, TRD1, TRD0 and TRCLK pins should be dedicated for this use. The trace hardware requires a 22 Ohm series resistor between the trace pins and the trace connector.

2.7 External Oscillator Pins

Many MCUs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to **Section 8.0 "Oscillator Configuration"** for details).

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is illustrated in Figure 2-3.

FIGURE 2-3: SUGGESTED OSCILLATOR CIRCUIT PLACEMENT



2.8 Unused I/Os

Unused I/O pins should not be allowed to float as inputs. They can be configured as outputs and driven to a logic-low state.

Alternatively, inputs can be reserved by connecting the pin to V_{SS} through a 1k to 10k resistor and configuring the pin as an input.

2.9 Designing for High-Speed Peripherals

The PIC32MZ EF family devices have peripherals that operate at frequencies much higher than typical for an embedded environment. Table 2-1 lists the peripherals that produce high-speed signals on their external pins:

TABLE 2-1: PERIPHERALS THAT PRODUCE HS SIGNALS ON EXTERNAL PINS

Peripheral	High-Speed Signal Pins	Maximum Speed on Signal Pin
EBI	EBIAx, EBIDx	50 MHz
SQI1	SQICLK, $\overline{\text{SQICSx}}$, SQIDx	50 MHz
HS USB	D+, D-	480 MHz

Due to these high-speed signals, it is important to consider several factors when designing a product that uses these peripherals, as well as the PCB on which these components will be placed. Adhering to these recommendations will help achieve the following goals:

- Minimize the effects of electromagnetic interference to the proper operation of the product
- Ensure signals arrive at their intended destination at the same time
- Minimize crosstalk
- Maintain signal integrity
- Reduce system noise
- Minimize ground bounce and power sag

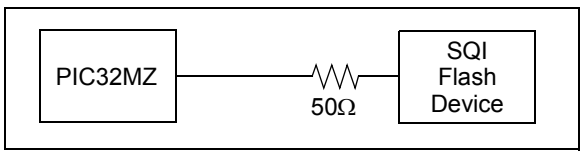
2.9.1 SYSTEM DESIGN

2.9.1.1 Impedance Matching

When selecting parts to place on high-speed buses, particularly the SQI bus, if the impedance of the peripheral device does not match the impedance of the pins on the PIC32MZ EF device to which it is connected, signal reflections could result, thereby degrading the quality of the signal.

If it is not possible to select a product that matches impedance, place a series resistor at the load to create the matching impedance. See Figure 2-4 for an example.

FIGURE 2-4: SERIES RESISTOR



2.9.1.2 PCB Layout Recommendations

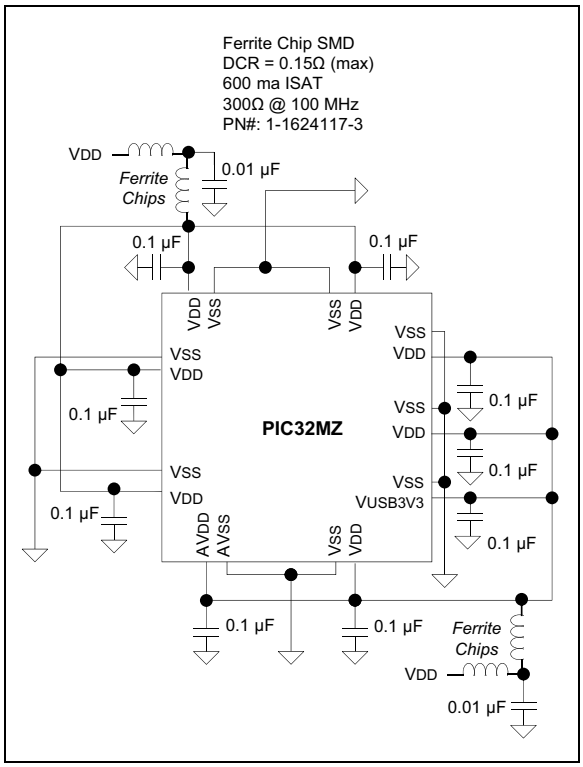
The following list contains recommendations that will help ensure the PCB layout will promote the goals previously listed.

- **Component Placement**
  - Place bypass capacitors as close to their component power and ground pins as possible, and place them on the same side of the PCB
  - Devices on the same bus that have larger setup times should be placed closer to the PIC32MZ EF device
- **Power and Ground**
  - Multi-layer PCBs will allow separate power and ground planes
  - Each ground pin should be connected to the ground plane individually
  - Place bypass capacitor vias as close to the pad as possible (preferably inside the pad)
  - If power and ground planes are not used, maximize width for power and ground traces
  - Use low-ESR, surface-mount bypass capacitors
- **Clocks and Oscillators**
  - Place crystals as close as possible to the PIC32MZ EF device OSC/SOSC pins
  - Do not route high-speed signals near the clock or oscillator
  - Avoid via usage and branches in clock lines (SQICLK)
  - Place termination resistors at the end of clock lines
- **Traces**
  - Higher-priority signals should have the shortest traces
  - Match trace lengths for parallel buses (EBIAx, EBIDx, SQIDx)
  - Avoid long run lengths on parallel traces to reduce coupling
  - Make the clock traces as straight as possible
  - Use rounded turns rather than right-angle turns
  - Have traces on different layers intersect on right angles to minimize crosstalk
  - Maximize the distance between traces, preferably no less than three times the trace width
  - Power traces should be as short and as wide as possible
  - High-speed traces should be placed close to the ground plane

2.9.1.3 EMI/EMC/EFT (IEC 61000-4-4 and IEC 61000-4-2) Suppression Considerations

The use of LDO regulators is preferred to reduce overall system noise and provide a cleaner power source. However, when utilizing switching Buck/Boost regulators as the local power source for PIC32MZ EF devices, as well as in electrically noisy environments or test conditions required for IEC 61000-4-4 and IEC 61000-4-2, users should evaluate the use of T-Filters (i.e., L-C-L) on the power pins, as shown in Figure 2-5. In addition to a more stable power source, use of this type of T-Filter can greatly reduce susceptibility to EMI sources and events.

FIGURE 2-5: EMI/EMC/EFT SUPPRESSION CIRCUIT



2.10 Typical Application Connection Examples

Examples of typical application connections are shown in Figure 2-8 and Figure 2-9.

FIGURE 2-6: AUDIO PLAYBACK APPLICATION

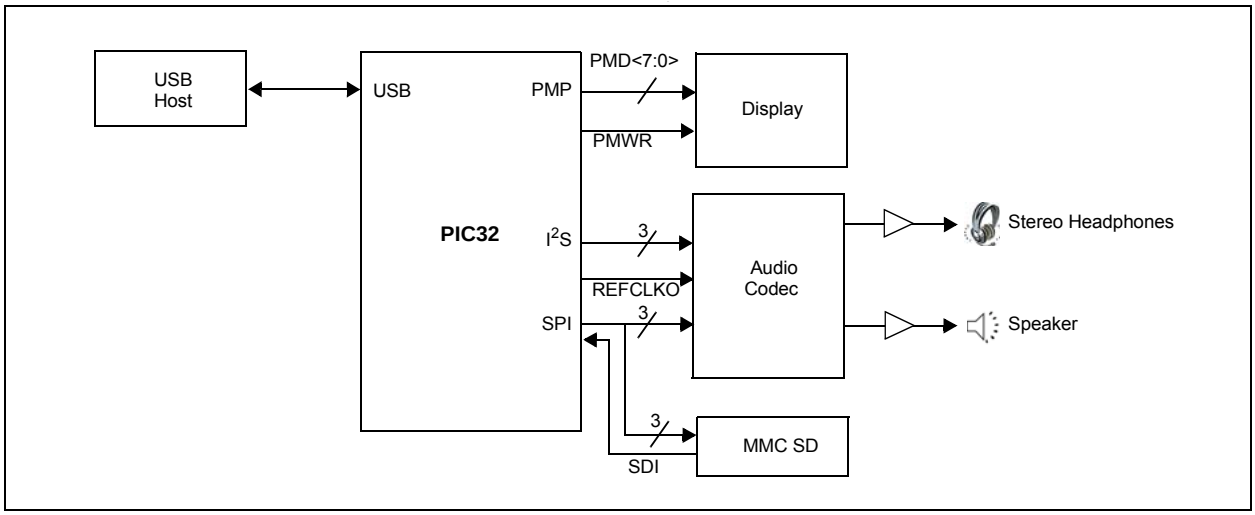


FIGURE 2-7: LOW-COST CONTROLLERLESS (LCC) GRAPHICS APPLICATION WITH PROJECTED CAPACITIVE TOUCH

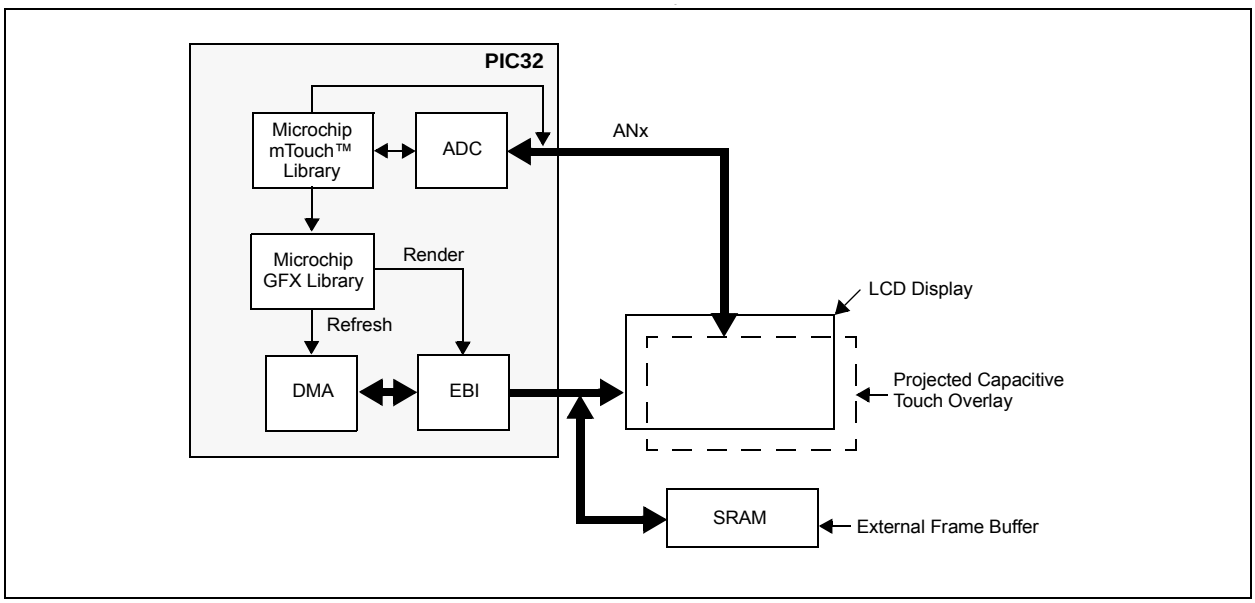


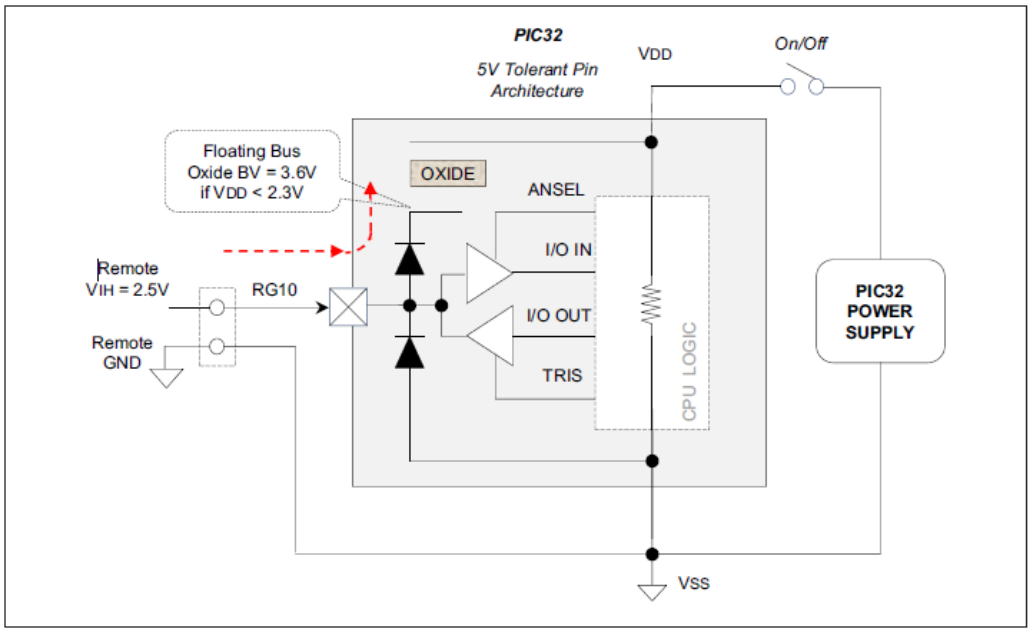
2.11 Considerations when Interfacing to Remotely Powered Circuits

2.11.1 NON-5V TOLERANT INPUT PINS

A quick review of the section “Absolute Maximum Rating” in Electrical Characteristics chapter indicates that the voltage on any non-5V tolerant pin may not exceed V_{DD} + 0.3V. The exception is, if the input current is limited to meet the respective injection current specifications defined by the parameters, such as DI60a, DI60b, and DI60c as shown in Table 37-10.

Figure 2-8 shows an example of a remote circuit using an independent power source which is powered while connected to a PIC32 non-5V tolerant circuit that is not powered.

FIGURE 2-8: PIC32 NON-5V TOLERANT CIRCUIT EXAMPLE



Without proper signal isolation, on non-5V tolerant pins, the remote signal can power the PIC32 device through the high side ESD protection diodes. Besides violating the absolute maximum rating specification, when VDD of the PIC32 device is restored and ramping up or ramping down, it can also negatively affect the internal Power-on Reset (POR) and Brown-out Reset (BOR) circuits, which can lead to improper initialization of internal PIC32 logic circuits. In these cases, it is recommended to implement digital or analog signal isolation as shown in Figure 2-9. This is indicative of all industry microcontrollers and not only Microchip products.

FIGURE 2-9: EXAMPLE DIGITAL/ANALOG SIGNAL ISOLATION CIRCUITS

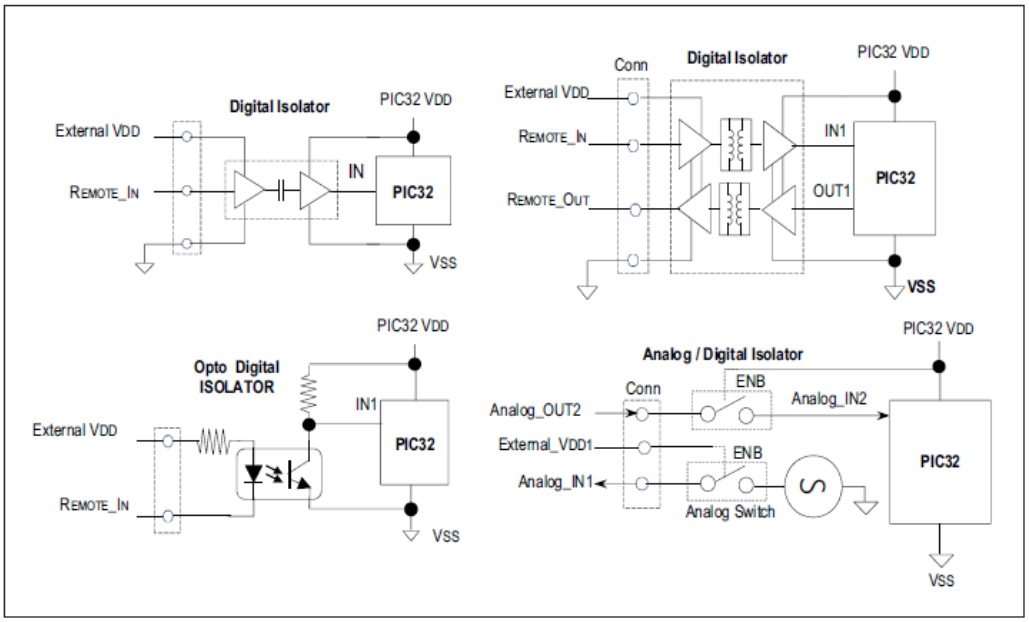


TABLE 2-2: EXAMPLES OF DIGITAL ISOLATORS WITH OPTIONAL LEVEL TRANSLATION

Example Digital/Analog Signal Isolation Circuits	Inductive Coupling	Capacitive Coupling	Opto Coupling	Analog/Digital Coupling
ADuM7241/40 ARZ (1Mbps)	X	—	—	—
ADuM7241/40 ARZ (25 Mbps)	X	—	—	—
ISO721	—	X	—	—
LTV-829S (2 Chan)	—	—	X	—
LTV-849S (4 Chan)	—	—	—	—
FSA266/NC7WB66	—	—	—	X

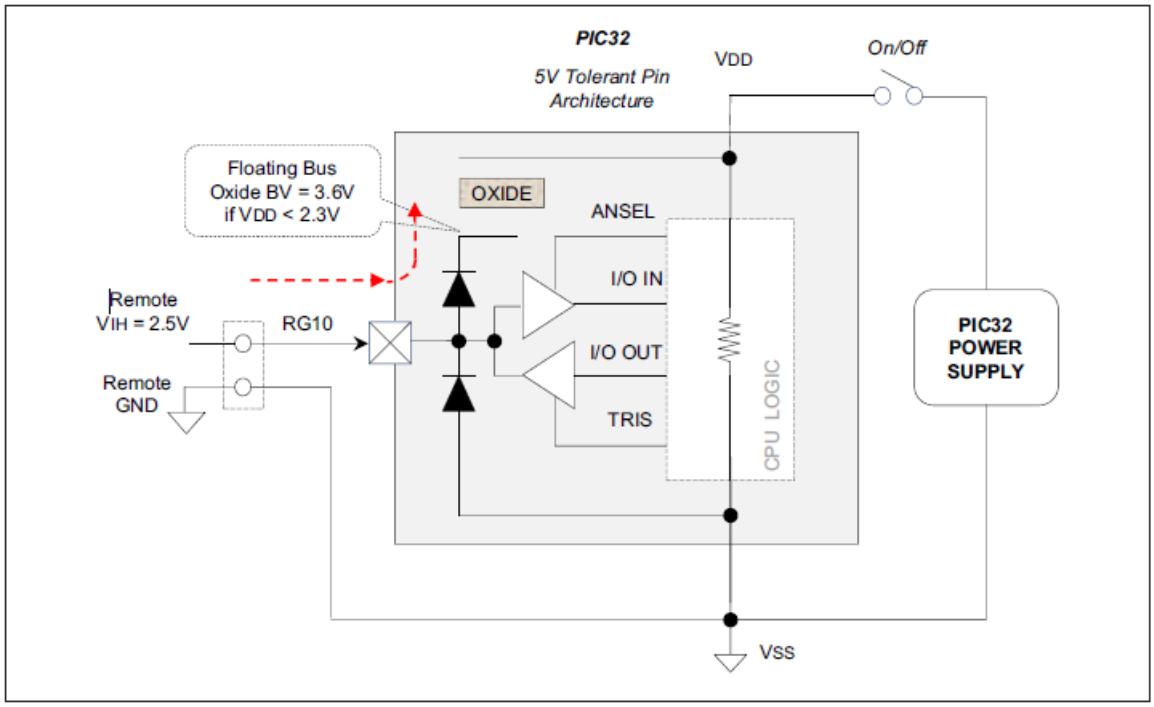
2.11.2 5V TOLERANT INPUT PINS

The internal high-side diode on 5v tolerant pins are bussed to an internal floating node, rather than being connected to VDD, as shown in Figure 2-10. Voltages on these pins, if VDD < 2.3V, should not exceed roughly 3.2V relative to VSS of the PIC32 device.

Voltage of 3.6V or higher will violate the absolute maximum specification, and will stress the oxide layer separating the high side floating node, which impacts device reliability.

If a remotely powered “digital-only” signal can be guaranteed to always be ≤ 3.2V relative to Vss on the PIC32 device side, a 5V tolerant pin could be used without the need for a digital isolator. This is assuming there is not a ground loop issue, logic ground of the two circuits not at the same absolute level, and a remote logic low input is not less than VSS - 0.3V.

FIGURE 2-10: PIC32 5V TOLERANT PIN ARCHITECTURE EXAMPLE



NOTES:

3.0 CPU

Note 1: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

2: The Series 5 Warrior M-class CPU core resources are available at: www.imgtec.com.

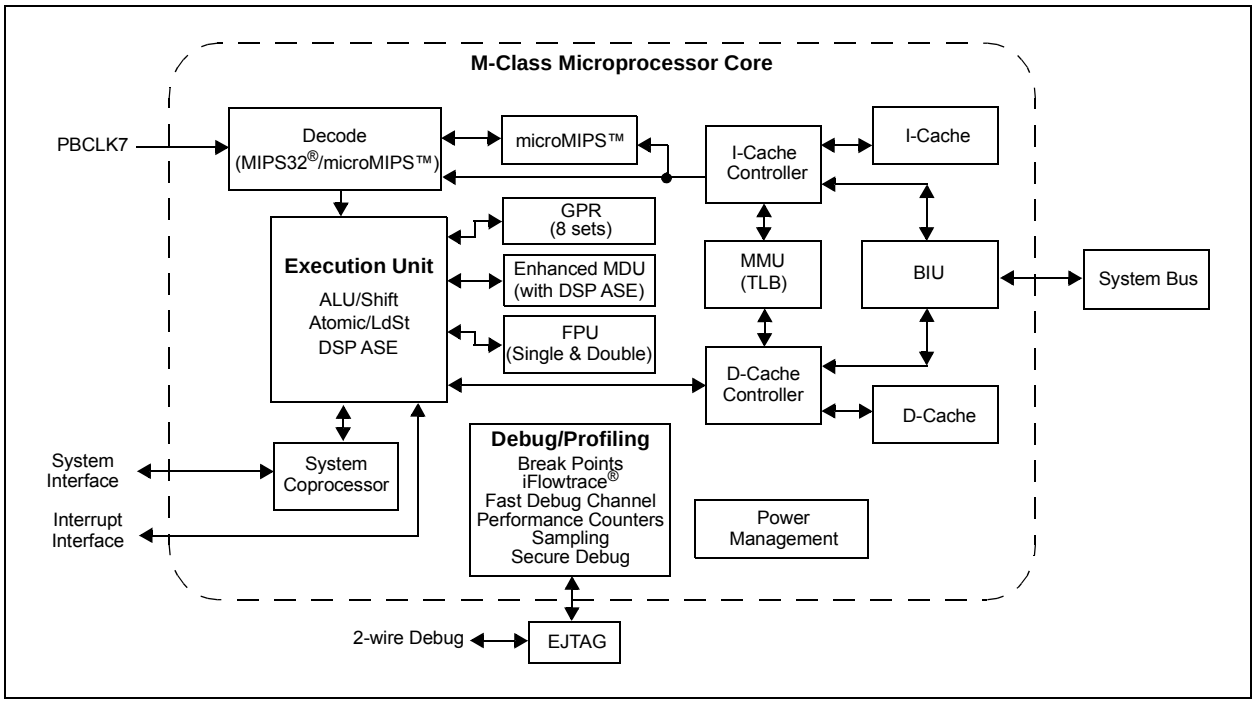
The MIPS32® M-Class Core is the heart of the PIC32MZ EF family device processor. The CPU fetches instructions, decodes each instruction, fetches source operands, executes each instruction and writes the results of instruction execution to the proper destinations.

Key features include:

- 5-stage pipeline
- 32-bit address and data paths
- MIPS32 Enhanced Architecture (Release 5):
  - Multiply-accumulate and multiply-subtract instructions
  - Targeted multiply instruction
  - Zero/One detect instructions
  - `WAIT` instruction
  - Conditional move instructions (`MOVN`, `MOVZ`)
  - Vectored interrupts
  - Programmable exception vector base
  - Atomic interrupt enable/disable
  - GPR shadow registers to minimize latency for interrupt handlers
  - Bit field manipulation instructions
  - Virtual memory support
- microMIPS™ compatible instruction set:
  - Improves code size density over MIPS32, while maintaining MIPS32 performance.
  - Supports all MIPS32 instructions (except branch-likely instructions)
  - Fifteen additional 32-bit instructions and 39 16-bit instructions corresponding to commonly-used MIPS32 instructions
  - Stack pointer implicit in instruction
  - MIPS32 assembly and ABI compatible
- MMU with Translation Lookaside Buffer (TLB) mechanism:
  - 16 dual-entry fully associative Joint TLB
  - 4-entry fully associative Instruction and Data TLB
  - 4 KB pages
- Separate L1 data and instruction caches:
  - 16 KB 4-way Instruction Cache (I-Cache)
  - 4 KB 4-way Data Cache (D-Cache)
- Autonomous Multiply/Divide Unit (MDU):
  - Maximum issue rate of one 32x32 multiply per clock
  - Early-in iterative divide. Minimum 12 and maximum 38 clock latency (dividend (*rs*) sign extension-dependent)
- Power Control:
  - Minimum frequency: 0 MHz
  - Low-Power mode (triggered by `WAIT` instruction)
  - Extensive use of local gated clocks
- EJTAG Debug and Instruction Trace:
  - Support for single stepping
  - Virtual instruction and data address/value breakpoints
  - Hardware breakpoint supports both address match and address range triggering.
  - Eight instruction and four data complex breakpoints
- iFlowtrace® version 2.0 support:
  - Real-time instruction program counter
  - Special events trace capability
  - Two performance counters with 34 user-selectable countable events
  - Disabled if the processor enters Debug mode
  - Program Counter sampling
- Four Watch registers:
  - Instruction, Data Read, Data Write options
  - Address match masking options
- DSP ASE Extension:
  - Native fractional format data type operations
  - Register Single Instruction Multiple Data (SIMD) operations (add, subtract, multiply, shift)
  - GPR-based shift
  - Bit manipulation
  - Compare-Pick
  - DSP Control Access
  - Indexed-Load
  - Branch
  - Multiplication of complex operands
  - Variable bit insertion and extraction
  - Virtual circular buffers
  - Arithmetic saturation and overflow handling
  - Zero-cycle overhead saturation and rounding operations
- Floating Point Unit (FPU):
  - 1985 IEEE-754 compliant Floating Point Unit
  - Supports single and double precision datatypes
  - 2008 IEEE-754 compatibility control of NaN handling and Abs/Neg instructions
  - Runs at 1:1 core/FPU clock ratio

A block diagram of the PIC32MZ EF family processor core is shown in Figure 3-1.

FIGURE 3-1: PIC32MZ EF FAMILY MICROPROCESSOR CORE BLOCK DIAGRAM



3.1 Architecture Overview

The MIPS32 M-Class Microprocessor core in PIC32MZ EF family devices contains several logic blocks working together in parallel, providing an efficient high-performance computing engine. The following blocks are included with the core:

- Execution unit
- General Purpose Register (GPR)
- Multiply/Divide Unit (MDU)
- System control coprocessor (CP0)
- Floating Point Unit (FPU)
- Memory Management Unit (MMU)
- Instruction/Data cache controllers
- Power Management
- Instructions and data caches
- microMIPS support
- Enhanced JTAG (EJTAG) controller

3.1.1 EXECUTION UNIT

The processor core execution unit implements a load/store architecture with single-cycle ALU operations (logical, shift, add, subtract) and an autonomous multiply/divide unit. The core contains thirty-two 32-bit General Purpose Registers (GPRs) used for integer operations and address calculation. Seven additional register file shadow sets (containing thirty-two registers) are added to minimize context switching overhead during interrupt/exception processing. The register file consists of two read ports and one write port and is fully bypassed to minimize operation latency in the pipeline.

The execution unit includes:

- 32-bit adder used for calculating the data address
- Address unit for calculating the next instruction address
- Logic for branch determination and branch target address calculation
- Load aligner
- Trap condition comparator
- Bypass multiplexers used to avoid stalls when executing instruction streams where data producing instructions are followed closely by consumers of their results
- Leading Zero/One detect unit for implementing the `CLZ` and `CLO` instructions
- Arithmetic Logic Unit (ALU) for performing arithmetic and bitwise logical operations
- Shifter and store aligner
- DSP ALU and logic block for performing DSP instructions, such as arithmetic/shift/compare operations

3.1.2 MULTIPLY/DIVIDE UNIT (MDU)

The processor core includes a Multiply/Divide Unit (MDU) that contains a separate pipeline for multiply and divide operations, and DSP ASE multiply instructions. This pipeline operates in parallel with the Integer Unit (IU) pipeline and does not stall when the IU pipeline stalls. This allows MDU operations to be partially masked by system stalls and/or other integer unit instructions.

The high-performance MDU consists of a 32x32 booth recoded multiplier, four pairs of result/accumulation registers (HI and LO), a divide state machine, and the necessary multiplexers and control logic. The first number shown ('32' of 32x32) represents the *rs* operand. The second number ('32' of 32x32) represents the *rt* operand.

The MDU supports execution of one multiply or multiply-accumulate operation every clock cycle.

Divide operations are implemented with a simple 1-bit-per-clock iterative algorithm. An early-in detection checks the sign extension of the dividend (*rs*) operand. If *rs* is 8 bits wide, 23 iterations are skipped. For a 16-bit wide *rs*, 15 iterations are skipped and for a 24-bit wide *rs*, 7 iterations are skipped. Any attempt to issue a subsequent `MDU` instruction while a divide is still active causes an IU pipeline stall until the divide operation has completed.

Table 3-1 lists the repeat rate (peak issue rate of cycles until the operation can be reissued) and latency (number of cycles until a result is available) for the processor core multiply and divide instructions. The approximate latency and repeat rates are listed in terms of pipeline clocks.

TABLE 3-1: MIPS32® M-CLASS MICROPROCESSOR CORE HIGH-PERFORMANCE INTEGER MULTIPLY/DIVIDE UNIT LATENCIES AND REPEAT RATES

Opcode	Operand Size (mul *rt*) (div *rs*)	Latency	Repeat Rate
`MULT/MULTU, MADD/MADDU, MSUB/MSUBU` (HI/LO destination)	16 bits	5	1
	32 bits	5	1
`MUL` (GPR destination)	16 bits	5	1
	32 bits	5	1
`DIV/DIVU`	8 bits	12/14	12/14
	16 bits	20/22	20/22
	24 bits	28/30	28/30
	32 bits	36/38	36/38

The MIPS architecture defines that the result of a multiply or divide operation be placed in one of four pairs of HI and LO registers. Using the Move-From-HI (MFHI) and Move-From-LO (MFLO) instructions, these values can be transferred to the General Purpose Register file.

In addition to the HI/LO targeted operations, the MIPS32 architecture also defines a multiply instruction, MUL, which places the least significant results in the primary register file instead of the HI/LO register pair. By avoiding the explicit MFLO instruction required when using the LO register, and by supporting multiple destination registers, the throughput of multiply-intensive operations is increased.

Two other instructions, Multiply-Add (MADD) and Multiply-Subtract (MSUB), are used to perform the multiply-accumulate and multiply-subtract operations. The MADD instruction multiplies two numbers and then adds the product to the current contents of the HI and LO registers. Similarly, the MSUB instruction multiplies two operands and then subtracts the product from the HI and LO registers. The MADD and MSUB operations are commonly used in DSP algorithms.

The MDU also implements various shift instructions operating on the HI/LO register and multiply instructions as defined in the DSP ASE. The MDU supports all of the data types required for this purpose and includes three extra HI/LO registers as defined by the ASE.

Table 3-2 lists the latencies and repeat rates for the DSP multiply and dot-product operations. The approximate latencies and repeat rates are listed in terms of pipeline clocks.

TABLE 3-2: DSP-RELATED LATENCIES AND REPEAT RATES

Op code	Latency	Repeat Rate
Multiply and dot-product without saturation after accumulation	5	1
Multiply and dot-product with saturation after accumulation	5	1
Multiply without accumulation	5	1

3.1.3 SYSTEM CONTROL COPROCESSOR (CP0)

In the MIPS architecture, CP0 is responsible for the virtual-to-physical address translation and cache protocols, the exception control system, the processor's diagnostics capability, the operating modes (Kernel, User and Debug) and whether interrupts are enabled or disabled. Configuration information, such as cache size and set associativity, and the presence of options like microMIPS is also available by accessing the CP0 registers, as listed in Table 3-3. Refer to the "Series 5 Warrior M-class CPU core" resources which are available at: www.imgtec.com for more information.

TABLE 3-3: COPROCESSOR 0 REGISTERS

Register Number	Register Name	Function
0	Index	Index into the TLB array (MPU only).
1	Random	Randomly generated index into the TLB array (MPU only).
2	EntryLo0	Low-order portion of the TLB entry for even-numbered virtual pages (MPU only).
3	EntryLo1	Low-order portion of the TLB entry for odd-numbered virtual pages (MPU only).
4	Context/ UserLocal	Pointer to the page table entry in memory (MPU only). User information that can be written by privileged software and read via the RDHWR instruction.
5	PageMask/ PageGrain	PageMask controls the variable page sizes in TLB entries. PageGrain enables support of 1 KB pages in the TLB (MPU only).
6	Wired	Controls the number of fixed (i.e., wired) TLB entries (MPU only).
7	HWREna	Enables access via the RDHWR instruction to selected hardware registers in Non-privileged mode.
8	BadVAddr	Reports the address for the most recent address-related exception.
	BadInstr	Reports the instruction that caused the most recent exception.
	BadInstrP	Reports the branch instruction if a delay slot caused the most recent exception.
9	Count	Processor cycle count.
10	EntryHi	High-order portion of the TLB entry (MPU only).
11	Compare	Core timer interrupt control.

TABLE 3-3: COPROCESSOR 0 REGISTERS (CONTINUED)

Register Number	Register Name	Function
12	Status	Processor status and control.
	IntCtl	Interrupt control of vector spacing.
	SRSCtl	Shadow register set control.
	SRSMap	Shadow register mapping control.
	View_IPL	Allows the Priority Level to be read/written without extracting or inserting that bit from/to the Status register.
	SRSMAP2	Contains two 4-bit fields that provide the mapping from a vector number to the shadow set number to use when servicing such an interrupt.
	GuestCtl0	Control of Virtualized Guest OS
	GTOffset	Guest Timer Offset
13	Cause	Describes the cause of the last exception.
	NestedExc	Contains the error and exception level status bit values that existed prior to the current exception.
	View_RIPL	Enables read access to the RIPL bit that is available in the Cause register.
14	EPC	Program counter at last exception.
	NestedEPC	Contains the exception program counter that existed prior to the current exception.
15	PRID	Processor identification and revision
	Ebase	Exception base address of exception vectors.
	CDMMBase	Common device memory map base.
16	Config	Configuration register.
	Config1	Configuration register 1.
	Config2	Configuration register 2.
	Config3	Configuration register 3.
	Config4	Configuration register 4.
	Config5	Configuration register 5.
	Config7	Configuration register 7.
17	LLAddr	Load link address (MPU only).
18	WatchLo	Low-order watchpoint address (MPU only).
19	WatchHi	High-order watchpoint address (MPU only).
20-22	Reserved	Reserved in the PIC32 core.
23	Debug	EJTAG debug register.
	TraceControl	EJTAG trace control.
	TraceControl2	EJTAG trace control 2.
	UserTraceData1	EJTAG user trace data 1 register.
	TraceBPC	EJTAG trace breakpoint register.
	Debug2	Debug control/exception status 1.
24	DEPC	Program counter at last debug exception.
	UserTraceData2	EJTAG user trace data 2 register.
25	PerfCtl0	Performance counter 0 control.
	PerfCnt0	Performance counter 0.
	PerfCtl1	Performance counter 1 control.
	PerfCnt1	Performance counter 1.
26	ErrCtl	Software test enable of way-select and data RAM arrays for I-Cache and D-Cache (MPU only).
27	Reserved	Reserved in the PIC32 core.
28	TagLo/DataLo	Low-order portion of cache tag interface (MPU only).
29	Reserved	Reserved in the PIC32 core.
30	ErrorEPC	Program counter at last error exception.

TABLE 3-3: COPROCESSOR 0 REGISTERS (CONTINUED)

Register Number	Register Name	Function
31	DeSave	Debug exception save.
	KScratchn	Scratch Registers for Kernel Mode

3.1.4 FLOATING POINT UNIT (FPU)

The Floating Point Unit (FPU), Coprocessor (CP1), implements the MIPS Instruction Set Architecture for floating point computation. The implementation supports the ANSI/IEEE Standard 754 (IEEE for Binary Floating Point Arithmetic) for 32-bit and 64-bit floating point data formats. The FPU can be programmed to have thirty-two 32-bit or 64-bit floating point registers used for floating point operations.

The performance is optimized for 32-bit formats. Most instructions have one FPU cycle throughput and four FPU cycle latency. The FPU implements the multiply-add (MADD) and multiply-sub (MSUB) instructions with intermediate rounding after the multiply function. The result is guaranteed to be the same as executing a MUL and an ADD instruction separately, but the instruction latency, instruction fetch, dispatch bandwidth, and the total number of register accesses are improved.

IEEE denormalized input operands and results are supported by hardware for some instructions. IEEE denormalized results are not supported by hardware in general, but a fast flush-to-zero mode is provided to optimize performance. The fast flush-to-zero mode is enabled through the FCCR register, and use of this mode is recommended for best performance when denormalized results are generated.

The FPU has a separate pipeline for floating point instruction execution. This pipeline operates in parallel with the integer core pipeline and does not stall when the integer pipeline stalls. This allows long-running FPU operations, such as divide or square root, to be partially masked by system stalls and/or other integer unit instructions. Arithmetic instructions are always dispatched and completed in order, but loads and stores can complete out of order. The exception model is “precise” at all times.

Table 3-4 contains the floating point instruction latencies and repeat rates for the processor core. In this table, 'Latency' refers to the number of FPU cycles necessary for the first instruction to produce the result needed by the second instruction. The “Repeat Rate” refers to the maximum rate at which an instruction can be executed per FPU cycle.

TABLE 3-4: FPU INSTRUCTION LATENCIES AND REPEAT RATES

Op code	Latency (FPU Cycles)	Repeat Rate (FPU Cycles)
ABS.[S,D], NEG.[S,D], ADD.[S,D], SUB.[S,D], C.cond.[S,D], MUL.S	4	1
MADD.S, MSUB.S, NMADD.S, NMSUB.S, CABS.cond.[S,D]	4	1

MOV.[S,D], MOVF.[S,D], MOVN.[S,D], MOVT.[S,D], MOVZ.[S,D]	4	1
MUL.D	5	2
MADD.D, MSUB.D, NMADD.D, NMSUB.D	5	2
RECIP.S	13	10
RECIP.D	26	21
RSQRT.S	17	14
RSQRT.D	36	31
DIV.S, SQRT.S	17	14
DIV.D, SQRT.D	32	29
MTC1, DMTC1, LWC1, LDC1, LDXC1, LUXC1, LWXC1	4	1
MFC1, DMFC1, SWC1, SDC1, SDXC1, SUXC1, SWXC1	1	1

Legend: S = Single (32-bit) D = Double (64-bit)
W = Word (32-bit) L = Long word (64-bit)

The FPU implements a high-performance 7-stage pipeline:

- Decode, register read and unpack (FR stage)
- Multiply tree, double pumped for double (M1 stage)
- Multiply complete (M2 stage)
- Addition first step (A1 stage)
- Addition second and final step (A2 stage)
- Packing to IEEE format (FP stage)
- Register writeback (FW stage)

The FPU implements a bypass mechanism that allows the result of an operation to be forwarded directly to the instruction that needs it without having to write the result to the FPU register and then read it back.

Table 3-5 lists the Coprocessor 1 Registers for the FPU.

TABLE 3-5: FPU (CP1) REGISTERS

Register Number	Register Name	Function
0	FIR	Floating Point implementation register. Contains information that identifies the FPU.
25	FCCR	Floating Point condition codes register.
26	FEXR	Floating Point exceptions register.
28	FENR	Floating Point enables register.
31	FCSR	Floating Point Control and Status register.

3.2 Power Management

The processor core offers a number of power management features, including low-power design, active power management and power-down modes of operation. The core is a static design that supports slowing or halting the clocks, which reduces system power consumption during Idle periods.

3.2.1 INSTRUCTION-CONTROLLED POWER MANAGEMENT

The mechanism for invoking Power-Down mode is through execution of the `WAIT` instruction. For more information on power management, see **Section 33.0 "Power-Saving Features"**.

3.2.2 LOCAL CLOCK GATING

The majority of the power consumed by the processor core is in the clock tree and clocking registers. The PIC32MZ family makes extensive use of local gated-clocks to reduce this dynamic power consumption.

3.3 L1 Instruction and Data Caches

3.3.1 INSTRUCTION CACHE (I-CACHE)

The I-Cache is an on-core memory block of 16 Kbytes. Because the I-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access rather than having to wait for the physical address translation. The tag holds 22 bits of physical address, a valid bit, and a lock bit. The LRU replacement bits are stored in a separate array.

The I-Cache block also contains and manages the instruction line fill buffer. Besides accumulating data to be written to the cache, instruction fetches that reference data in the line fill buffer are serviced either by a bypass of that data, or data coming from the external interface. The I-Cache control logic controls the bypass function.

The processor core supports I-Cache locking. Cache locking allows critical code or data segments to be locked into the cache on a per-line basis, enabling the system programmer to maximize the efficiency of the system cache.

The cache locking function is always available on all I-Cache entries. Entries can then be marked as locked or unlocked on a per entry basis using the `CACHE` instruction.

3.3.2 DATA CACHE (D-CACHE)

The D-Cache is an on-core memory block of 4 Kbytes. This virtually indexed, physically tagged cache is protected. Because the D-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access. The tag holds 22 bits of physical address, a valid bit, and a lock bit. There is an additional array holding dirty bits and LRU replacement algorithm bits for each set of the cache.

In addition to I-Cache locking, the processor core also supports a D-Cache locking mechanism identical to the I-Cache. Critical data segments are locked into the cache on a per-line basis. The locked contents can be updated on a store hit, but cannot be selected for replacement on a cache miss.

The D-Cache locking function is always available on all D-Cache entries. Entries can then be marked as locked or unlocked on a per-entry basis using the `CACHE` instruction.

3.3.3 ATTRIBUTES

The processor core I-Cache and D-Cache attributes are listed in the Configuration registers (see Register 3-1 through Register 3-4).

3.4 EJTAG Debug Support

The processor core provides for an Enhanced JTAG (EJTAG) interface for use in the software debug of application and kernel code. In addition to standard User mode and Kernel modes of operation, the processor core provides a Debug mode that is entered after a debug exception (derived from a hardware breakpoint, single-step exception, etc.) is taken and continues until a Debug Exception Return (DERET) instruction is executed. During this time, the processor executes the debug exception handler routine.

The EJTAG interface operates through the Test Access Port (TAP), a serial communication port used for transferring test data in and out of the core. In addition to the standard JTAG instructions, special instructions defined in the EJTAG specification specify which registers are selected and how they are used.

3.5 MIPS DSP ASE Extension

The MIPS DSP Application-Specific Extension Revision 2 is an extension to the MIPS32 architecture. This extension comprises new integer instructions and states that include new HI/LO accumulator register pairs and a DSP control register. This extension is crucial in a wide range of DSP, multimedia, and DSP-like algorithms covering Audio and Video processing applications. The extension supports native fractional format data type operations, register Single Instruction Multiple Data (SIMD) operations, such as add, subtract, multiply, and shift. In addition, the extension includes the following features that are essential in making DSP algorithms computationally efficient:

- Support for multiplication of complex operands
- Variable bit insertion and extraction
- Implementation and use of virtual circular buffers
- Arithmetic saturation and overflow handling support
- Zero cycle overhead saturation and rounding operations

3.6 microMIPS ISA

The processor core supports the microMIPS ISA, which contains all MIPS32 ISA instructions (except for branch-likely instructions) in a new 32-bit encoding scheme, with some of the commonly used instructions also available in 16-bit encoded format. This ISA improves code density through the additional 16-bit instructions while maintaining a performance similar to MIPS32 mode. In microMIPS mode, 16-bit or 32-bit instructions will be fetched and recoded to legacy MIPS32 instruction opcodes in the pipeline's I stage, so that the processor core can have the same microAptiv UP microarchitecture. Because the microMIPS instruction stream can be intermixed with 16-bit halfword or 32-bit word size instructions on halfword or word boundaries, additional logic is in place to address the word misalignment issues, thus minimizing performance loss.

3.7 M-Class Core Configuration

Register 3-1 through Register 3-4 show the default configuration of the M-Class core, which is included on the PIC32MZ EF family of devices.

1 = User mode FR switching instructions are supported
0 = User mode FR switching instructions are not supported

bit 27-25 **Unimplemented:** Read as '0'

bit 24 **FC:** Full Convert Ranges bit
1 = Full convert ranges are implemented (all numbers can be converted to another type by the FPU)
0 = Full convert ranges are not implemented

bit 23 **HAS008:** IEEE-754-2008 bit
1 = MAC2008, ABS2008, NAN2008 bits exist within the FCSR register
0 = MAC2009, ABS2008, and NAN2008 bits do not exist within the FCSR register

bit 22 **F64:** 64-bit FPU bit
1 = This is a 64-bit FPU
0 = This is not a 64-bit FPU

bit 21 **L: L**ong Fixed Point Data Type bit
1 = Long fixed point data types are implemented
0 = Long fixed point data types are not implemented

bit 20 **W:** Word Fixed Point data type bit
1 = Word fixed point data types are implemented
0 = Word fixed point data types are not implemented

bit 19 **MIPS3D:** MIPS-3D ASE bit
1 = MIPS-3D is implemented
0 = MIPS-3D is not implemented

bit 18 **PS:** Paired Single Floating Point data bit
1 = PS floating point is implemented
0 = PS floating point is not implemented

bit 17 **D:** Double-precision (64-bit) Floating Point Data bit
1 = Double-precision floating point data types are implemented
0 = Double-precision floating point data types are not implemented

bit 16 **S:** Single-precision (32-bit) Floating Point Data bit
1 = Single-precision floating point data types are implemented
0 = Single-precision floating point data types are not implemented

bit 15-8 **PRID<7:0>:** Processor Identification bits
These bits allow software to distinguish between the various types of MIPS processors. For PIC32 devices with the M-Class core, this value is 0xA7.

bit 7-0 **REVISION<7:0>:** Processor Revision Identification bits
These bits allow software to distinguish between one revision and another of the same processor type. This number is increased on major revisions of the processor core

bit 31-25 **FCC<7:1>:** Floating Point Condition Code bits
These bits record the results of floating point compares and are tested for floating point conditional branches and conditional moves.

bit 24 **FS:** Flush to Zero control bit
1 = Denormal input operands are flushed to zero. Tiny results are flushed to either zero or the applied format's smallest normalized number (MinNorm) depending on the rounding mode settings.
0 = Denormal input operands result in an Unimplemented Operation exception.

bit 23 **FCC<0>:** Floating Point Condition Code bits
These bits record the results of floating point compares and are tested for floating point conditional branches and conditional moves.

bit 22 **FO:** Flush Override Control bit
1 = The intermediate result is kept in an internal format, which can be perceived as having the usual mantissa precision but with unlimited exponent precision and without forcing to a specific value or taking an exception.
0 = Handling of Tiny Result values depends on setting of the FS bit.

bit 21 **FN:** Flush to Nearest Control bit
1 = Final result is rounded to either zero or 2E_min (MinNorm), whichever is closest when in Round to Nearest (RN) rounding mode. For other rounding modes, a final result is given as if FS was set to 1.
0 = Handling of Tiny Result values depends on setting of the FS bit.

bit 20 **MAC2008:** Fused Multiply Add mode control bit
0 = Unfused multiply-add. Intermediary multiplication results are rounded to the destination format.

bit 19 **ABS2008:** Absolute value format control bit
1 = ABS.fmt and NEG.fmt instructions compliant with IEEE Standard 754-2008. The ABS and NEG functions accept QNAN inputs without trapping.

bit 18 **NAN2008:** NaN Encoding control bit
1 = Quiet and signaling NaN encodings recommended by the IEEE Standard 754-2008. A quiet NaN is encoded with the first bit of the fraction being 1 and a signaling NaN is encoded with the first bit of the fraction being 0.

bit 17-12 **CAUSE<5:0>:** FPU Exception Cause bits
These bits indicated the exception conditions that arise during execution of an FPU arithmetic instruction.

bit 17 **E:** Unimplemented Operation bit

00 = Round to Nearest

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source.For detailed information, refer to **Section 48. "Memory Organization and Permissions"** in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF microcontrollers provide 4 GB of unified virtual memory address space. All memory regions, including program, data memory, SFRs and Configuration registers, reside in this address space at their respective unique addresses. The program and data memories can be optionally partitioned into user and kernel memories. In addition, PIC32MZ EF devices allow execution from data memory.

Key features include:

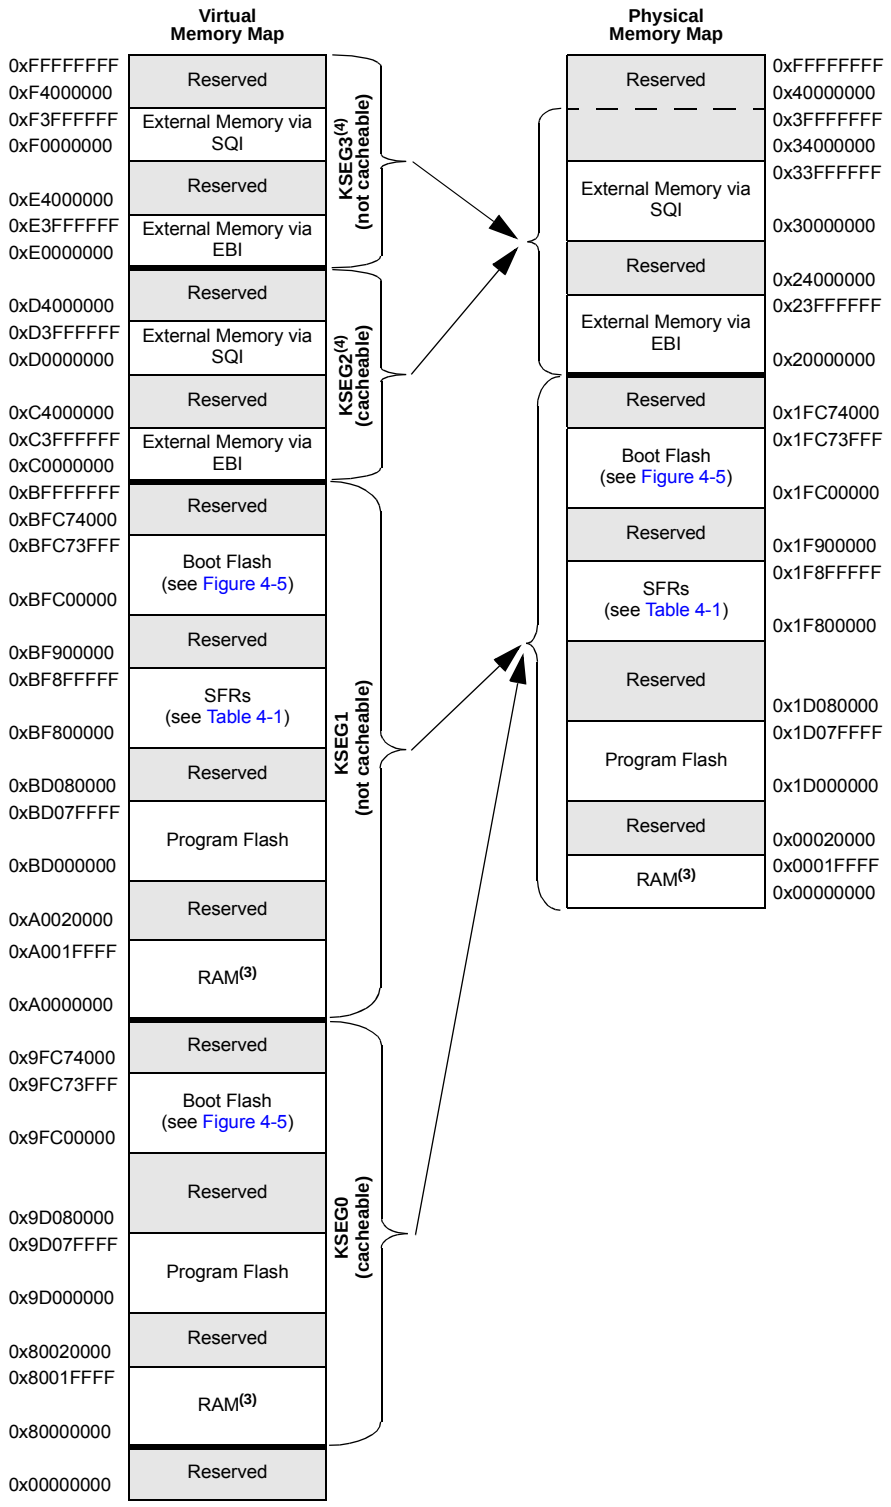
- 32-bit native data width
- Separate User (KUSEG) and Kernel (KSEG0/KSEG1/KSEG2/KSEG3) mode address space
- Separate boot Flash memory for protected code
- Robust bus exception handling to intercept runaway code
- Cacheable (KSEG0/KSEG2) and non-cacheable (KSEG1/KSEG3) address regions
- Read/write permission access to predefined memory regions

4.1 Memory Layout

PIC32MZ EF microcontrollers implement two address schemes: virtual and physical. All hardware resources, such as program memory, data memory and peripherals, are located at their respective physical addresses. Virtual addresses are exclusively used by the CPU to fetch and execute instructions as well as access peripherals. Physical addresses are used by bus master peripherals, such as DMA and the Flash controller, that access memory independently of the CPU.

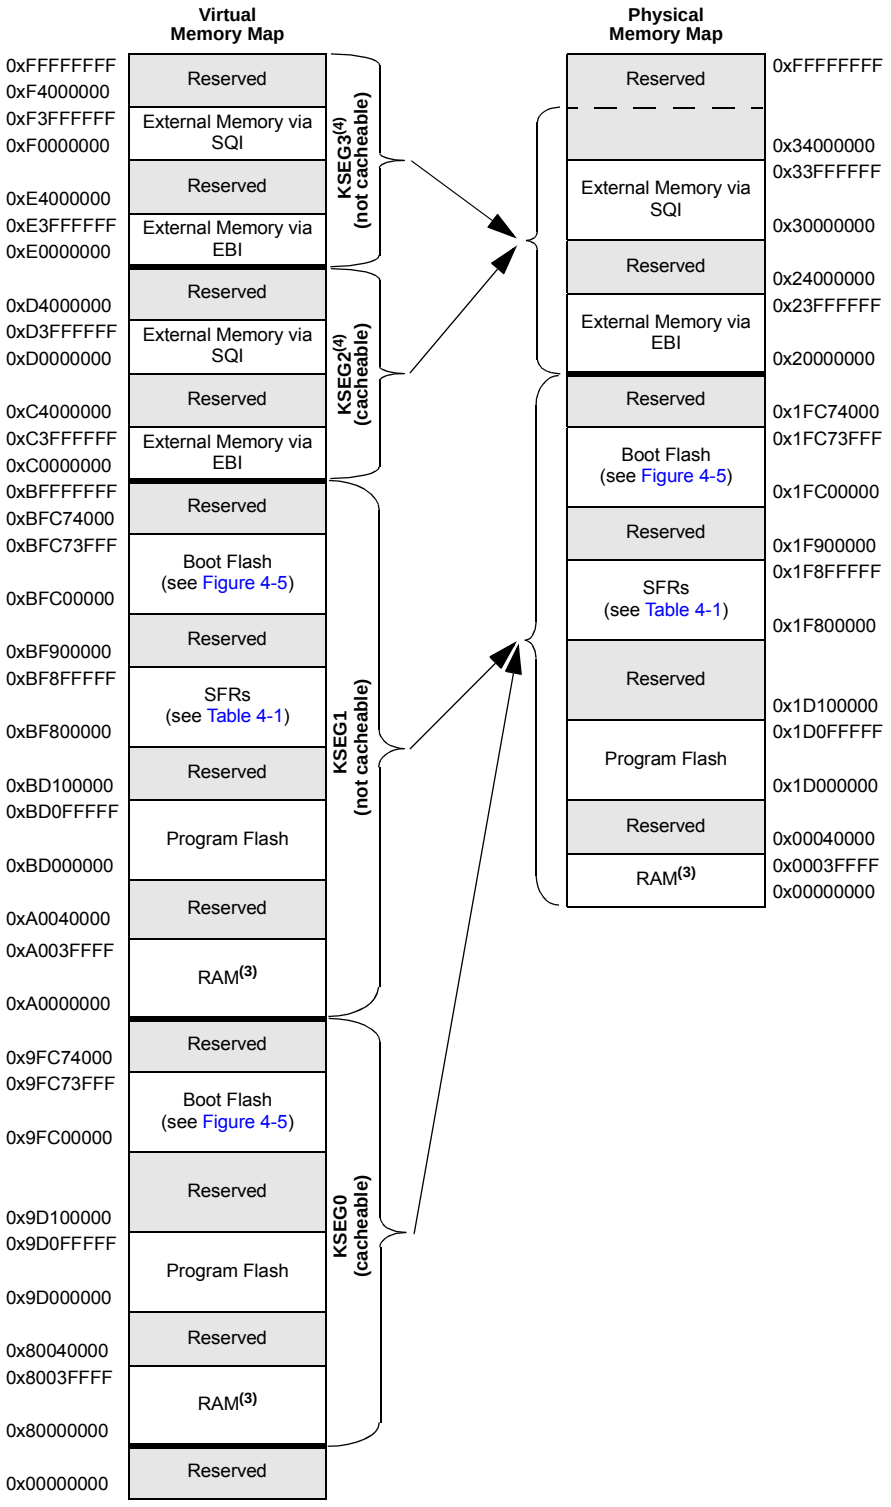
The main memory maps for the PIC32MZ EF devices are illustrated in Figure 4-1 through Figure 4-4. Figure 4-5 provides memory map information for boot Flash and boot alias. Table 4-1 provides memory map information for Special Function Registers (SFRs).

FIGURE 4-1: MEMORY MAP FOR DEVICES WITH 512 KB OF PROGRAM MEMORY(1,2)



Note 1: Memory areas are not shown to scale.
2: The Cache, MMU, and TLB are initialized by compiler start-up code.
3: RAM memory is divided into two equal banks: RAM Bank 1 and RAM Bank 2 on a half boundary.
4: The MMU must be enabled and the TLB must be set up to access this segment.

FIGURE 4-2: MEMORY MAP FOR DEVICES WITH 1024 KB OF PROGRAM MEMORY AND 256 KB OF RAM(1,2)



Note 1: Memory areas are not shown to scale.

Note 1: Refer to **4.2 "System Bus Arbitration"** for important legal information.

4.1.1 BOOT FLASH SEQUENCE AND CONFIGURATION SPACES

Sequence space is used to identify which boot Flash is aliased by aliased regions. If the value programmed into the TSEQ<15:0> bits of the BF1SEQ3 word is equal to or greater than the value programmed into the TSEQ<15:0> bits of the BF2SEQ3 word, boot Flash 1 is aliased by the lower boot alias region, and boot Flash 2 is aliased by the upper boot alias region. If the TSEQ<15:0> bits of the BF2SEQ3 word is greater than the TSEQ<15:0> bits of the BF1SEQ3 word, the opposite is true (see Table 4-2 and Table 4-3 for BFxSEQ3 word memory locations).

The CSEQ<15:0> bits must contain the one's complement value of the TSEQ<15:0> bits; otherwise, the value of the TSEQ<15:0> bits is considered invalid, and an alternate sequence is used. See **Section 4.1.2 "Alternate Sequence and Configuration Words"** for more information.

Once boot Flash memories are aliased, configuration space located in the lower boot alias region is used as the basis for the Configuration words, DEVSIGN0, DEVCP0, and DEVCFGx (and the associated alternate configuration registers). This means that the boot Flash region to be aliased by lower boot alias region memory must contain configuration values in the appropriate memory locations.

Note:	Do not use word program operation (NVMOP<3:0> = `0001`) when programming data into the sequence and configuration spaces.

4.1.2 ALTERNATE SEQUENCE AND CONFIGURATION WORDS

Every word in the configuration space and sequence space has an associated alternate word (designated by the letter A as the first letter in the name of the word). During device start-up, primary words are read and if uncorrectable ECC errors are found, the BCFGERR (RCON<27>) flag is set and alternate words are used. If uncorrectable ECC errors are found in primary and alternate words, the BCFGFAIL (RCON<26>) flag is set and the default configuration is used.

4.2 System Bus Arbitration

Note: The System Bus interconnect implements one or more instantiations of the SonicsSX® interconnect from Sonics, Inc. This document contains materials that are (c) 2003-2015 Sonics, Inc., and that constitute proprietary information of Sonics, Inc. SonicsSX is a registered trademark of Sonics, Inc. All such materials and trademarks are used under license from Sonics, Inc.

As shown in the PIC32MZ EF Family Block Diagram (see Figure 1-1), there are multiple initiator modules (I1 through I14) in the system that can access various target modules (T1 through T13). Table 4-4 illustrates which initiator can access which target. The System Bus supports simultaneous access to targets by initiators, so long as the initiators are accessing different targets. The System Bus will perform arbitration, if multiple initiators attempt to access the same target.

TABLE 4-4: INITIATORS TO TARGETS ACCESS ASSOCIATION

Target #	Initiator ID	1	2	3	4	5	6	7	8	9	10	11	12	13	14
	Name	CPU		DMA Read		DMA Write		USB	Ethernet Read	Ethernet Write	CAN1	CAN2	SQI1	Flash Controller	Crypto
1	**Flash Memory:** Program Flash, Boot Flash, Prefetch Module	X		X				X	X		X	X			X
2	RAM Bank 1 Memory	X		X		X		X	X	X	X	X	X	X	X
3	RAM Bank 2 Memory	X		X		X		X	X	X	X	X	X	X	X
4	External Memory via EBI and EBI Module	X		X		X		X	X	X	X	X	X		X
5	**Peripheral Set 1:** System Control, Flash Control, DMT, RTCC, CVR, PPS Input, PPS Output, Interrupts, DMA, WDT	X													
6	**Peripheral Set 2:** SPI1-SPI6, I2C1-I2C5, UART1-UART6, PMP	X		X		X									
7	**Peripheral Set 3:** Timer1-Timer9, IC1-IC9, OC1-OC9, ADC, Comparator 1, Comparator 2	X		X		X									
8	**Peripheral Set 4:** PORTA-PORTK	X		X		X									
9	**Peripheral Set 5:** CAN1, CAN2, Ethernet Controller	X													
10	**Peripheral Set 6**: USB	X													
11	External Memory via SQI1 and SQI1 Module	X													
12	**Peripheral Set 7:** Crypto Engine	X													
13	**Peripheral Set 8:** RNG Module	X													

The System Bus arbitration scheme implements a non-programmable, Least Recently Serviced (LRS) priority, which provides Quality Of Service (QOS) for most initiators. However, some initiators can use Fixed High Priority (HIGH) arbitration to guarantee their access to data.

The arbitration scheme for the available initiators is shown in Table 4-5.

TABLE 4-5: INITIATOR ID AND QOS

Name	ID	QOS
CPU	1	LRS(1)
CPU	2	HIGH(1,2)
DMA Read	3	LRS(1)
DMA Read	4	HIGH(1,2)
DMA Write	5	LRS(1)
DMA Write	6	HIGH(1,2)
USB	7	LRS
Ethernet Read	8	LRS
Ethernet Write	9	LRS
CAN1	10	LRS
CAN2	11	LRS
SQI1	12	LRS
Flash Controller	13	HIGH(2)
Crypto	14	LRS

Note 1: When accessing SRAM, the DMAPRI bit (CFGCON<25>) and the CPUPRI bit (CFGCON<24>) provide arbitration control for the DMA and CPU (when servicing an interrupt (i.e., EXL = 1)), respectively, by selecting the use of LRS or HIGH When using HIGH, the DMA and CPU get arbitration preference over all initiators using LRS.

2: Using HIGH arbitration can have serious negative effects on other initiators. Therefore, it is recommended to not enable this type of arbitration for an initiator that uses significant system bandwidth. HIGH arbitration is intended to be used for low bandwidth applications that require low latency, such as LCC graphics applications.

4.3 Permission Access and System Bus Registers

The System Bus on PIC32MZ EF family of microcontrollers provides access control capabilities for the transaction initiators on the System Bus.

The System Bus divides the entire memory space into fourteen target regions and permits access to each target by initiators via permission groups. Four Permission Groups (0 through 3) can be assigned to each initiator. Each permission group is independent of the others and can have exclusive or shared access to a region.

Using the CFGPG register (see Register 34-10 in **Section 34.0 "Special Features"**), Boot firmware can assign a permission group to each initiator, which can make requests on the System Bus.

The available targets and their regions, as well as the associated control registers to assign protection, are described and listed in Table 4-6.

Register 4-2 through Register 4-10 are used for setting and controlling access permission groups and regions.

To change these registers, they must be unlocked in hardware. The register lock is controlled by the PGLOCK Configuration bit (CFGCON<11>). Setting PGLOCK prevents writes to the control registers; clearing PGLOCK allows writes.

To set or clear the PGLOCK bit, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the *"PIC32 Family Reference Manual"* for details.

TABLE 4-6: SYSTEM BUS TARGETS AND ASSOCIATED PROTECTION REGISTERS

Target Number	Target Description[5]	SBTxREGy Register							SBTxRDy Register		SBTxWRy Register

		SBT5REG1	R/W	R/W	R/W	R/W	—	3	SBT5RD1	R/W[1]	SBT5WR1	R/W[1]
		SBT5REG2	R/W	R/W	R/W	R/W	0	1	SBT5RD2	R/W[1]	SBT5WR2	R/W[1]

Legend: R = Read; R/W = Read/Write; 'x' in a register name = 0-13; 'y' in a register name = 0-8.

Note 1: Reset values for these bits are '0', '1', '1', '1', respectively.

2: The BASE<21:0> bits must be set to the corresponding Physical Address and right shifted by 10 bits. For Read-only bits, this value is set by hardware on Reset.

3: The SIZE<4:0> bits must be set to the corresponding Region Size, based on the following formula: Region Size = $2^{(SIZE-1)}$ x 1024 bytes. For read-only bits, this value is set by hardware on Reset.

4: Refer to the Device Memory Maps (Figure 4-1 through Figure 4-4) for specific device memory sizes and start addresses.

5: See Table 4-1for information on specific target memory size and start addresses.

6: The SBTxREG1 SFRs are reserved, and therefore, are not listed in this table for this target.

bit 1 **Group1:** Group 1 Write Permissions bits
- 1 = Privilege Group 1 has write permission
- 0 = Privilege Group 1 does not have write permission

bit 0 **Group0:** Group 0 Write Permissions bits
- 1 = Privilege Group 0 has write permission
- 0 = Privilege Group 0 does not have write permission

Note 1: Refer to Table 4-6 for the list of available targets and their descriptions.
2: For some target regions, certain bits in this register are read-only with preset values. See Table 4-6 for more information.

5.0 FLASH PROGRAM MEMORY

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices contain an internal Flash program memory for executing user code, which includes the following features:

- Two Flash banks for live update support
- Dual boot support
- Write protection for program and boot Flash
- ECC support

The user can program this memory using the following methods:

- Run-Time Self-Programming (RTSP)
- EJTAG Programming
- In-Circuit Serial Programming™ (ICSP™)

RTSP is performed by software, executing from either Flash or RAM memory. Information about RTSP techniques is available in **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) in the *"PIC32 Family Reference Manual".*

EJTAG is performed using the EJTAG port of the device and an EJTAG capable programmer.

ICSP is performed using a serial data connection to the device and allows much faster programming times than RTSP.

The EJTAG and ICSP methods are described in the *"PIC32 Flash Programming Specification"* (DS60001145), which is available for download from the Microchip web site (www.microchip.com).

Note: In PIC32MZ EF devices, the Flash page size is 16 KB (4K IW) and the row size is 2 KB (512 IW).

	PFSWAP	BFSWAP	—	—	NVMOP<3:0>			

Legend:	HC = Hardware Set	HC = Hardware Cleared	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **WR:** Write Control bit(1)
This bit cannot be cleared and can be set only when WREN = 1 and the unlock sequence has been performed.
1 = Initiate a Flash operation
0 = Flash operation is complete or inactive

bit 14 **WREN:** Write Enable bit(1)
1 = Enable writes to the WR bit and disables writes to the NVMOP<3:0> bits
0 = Disable writes to WR bit and enables writes to the NVMOP<3:0> bits

bit 13 **WRERR:** Write Error bit(1)
This bit can be cleared only by setting the NVMOP<3:0> bits = 0000 and initiating a Flash operation.
1 = Program or erase sequence did not complete successfully
0 = Program or erase sequence completed normally

bit 12 **LVDERR:** Low-Voltage Detect Error bit(1)
This bit can be cleared only by setting the NVMOP<3:0> bits = 0000 and initiating a Flash operation.
1 = Low-voltage detected (possible data corruption, if WRERR is set)
0 = Voltage level is acceptable for programming

bit 11-8 **Unimplemented:** Read as '0'

bit 7 **PFSWAP:** Program Flash Bank Swap Control bit
This bit is only writable when WREN = 0 and the unlock sequence has been performed.
1 = Program Flash Bank 2 is mapped to the lower mapped region and program Flash Bank 1 is mapped to the upper mapped region
0 = Program Flash Bank 1 is mapped to the lower mapped region and program Flash Bank 2 is mapped to the upper mapped region

Note 1: These bits are only reset by a Power-on Reset (POR) and are not affected by other reset sources.

2: This operation results in a "no operation" (NOP) when the Dynamic Flash ECC Configuration bits = 00 (FECCCON<1:0> (DVCFG0<9:8>)), which enables ECC at all times. For all other FECCCON<1:0> bit settings, this command will execute, but will not write the ECC bits for the word and can cause DED errors if dynamic Flash ECC is enabled (FECCCON<1:0> = 01). Refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) for information regarding ECC and Flash programming.

REGISTER 5-1: NVMCON: FLASH PROGRAMMING CONTROL REGISTER (CONTINUED)

bit 6 **BFSWAP:** Boot Flash Bank Alias Swap Control bit

This bit is only writable when WREN = 0 and the unlock sequence has been performed.

1 = Boot Flash Bank 2 is mapped to the lower boot alias and boot Flash Bank 1 is mapped to the upper boot alias

0 = Boot Flash Bank 1 is mapped to the lower boot alias and boot Flash Bank 2 is mapped to the upper boot alias

bit 5-4 **Unimplemented:** Read as '0'

bit 3-0 **NVMOP<3:0>:** NVM Operation bits

These bits are only writable when WREN = 0.

1111 = Reserved

•

•

•

1000 = Reserved

0111 = Program erase operation: erase all of program Flash memory (all pages must be unprotected, PWP<23:0> = 0x000000)

0110 = Upper program Flash memory erase operation: erases only the upper mapped region of program Flash (all pages in that region must be unprotected)

0101 = Lower program Flash memory erase operation: erases only the lower mapped region of program Flash (all pages in that region must be unprotected)

0100 = Page erase operation: erases page selected by NVMADDR, if it is not write-protected

0011 = Row program operation: programs row selected by NVMADDR, if it is not write-protected

0010 = Quad Word (128-bit) program operation: programs the 128-bit Flash word selected by NVMADDR, if it is not write-protected

0001 = Word program operation: programs word selected by NVMADDR, if it is not write-protected(2)

0000 = No operation

Note 1: These bits are only reset by a Power-on Reset (POR) and are not affected by other reset sources.

2: This operation results in a "no operation" (NOP) when the Dynamic Flash ECC Configuration bits = 00 (FECCCON<1:0> (DVCFG0<9:8>)), which enables ECC at all times. For all other FECCCON<1:0> bit settings, this command will execute, but will not write the ECC bits for the word and can cause DED errors if dynamic Flash ECC is enabled (FECCCON<1:0> = 01). Refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) for information regarding ECC and Flash programming.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **PWPULOCK:** Program Flash Memory Page Write-protect Unlock bit
1 = Register is not locked and can be modified
0 = Register is locked and cannot be modified
This bit is only clearable and cannot be set except by any reset.

bit 30-24 **Unimplemented:** Read as '0'

bit 23-0 **PWP<23:0>:** Flash Program Write-protect (Page) Address bits
Physical memory below address 0x1Dxxxxxx is write protected, where 'xxxxxx' is specified by PWP<23:0>. When PWP<23:0> has a value of '0', write protection is disabled for the entire program Flash. If the specified address falls within the page, the entire page and all pages below the current page will be protected.

Note: The bits in this register are only writable when the NVMKEY unlock sequence is followed.

REGISTER 5-8: NVMBWP: FLASH BOOT (PAGE) WRITE-PROTECT REGISTER

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **LBWPULOCK:** Lower Boot Alias Write-protect Unlock bit
1 = LBWPx bits are not locked and can be modified
0 = LBWPx bits are locked and cannot be modified
This bit is only clearable and cannot be set except by any reset.

bit 14-13 **Unimplemented:** Read as '0'

bit 12 **LBWP4:** Lower Boot Alias Page 4 Write-protect bit(1)
1 = Write protection for physical address 0x01FC10000 through 0x1FC13FFF enabled
0 = Write protection for physical address 0x01FC10000 through 0x1FC13FFF disabled

bit 11 **LBWP3:** Lower Boot Alias Page 3 Write-protect bit(1)
1 = Write protection for physical address 0x01FC0C000 through 0x1FC0FFFF enabled
0 = Write protection for physical address 0x01FC0C000 through 0x1FC0FFFF disabled

bit 10 **LBWP2:** Lower Boot Alias Page 2 Write-protect bit(1)
1 = Write protection for physical address 0x01FC08000 through 0x1FC0BFFF enabled
0 = Write protection for physical address 0x01FC08000 through 0x1FC0BFFF disabled

bit 9 **LBWP1:** Lower Boot Alias Page 1 Write-protect bit(1)
1 = Write protection for physical address 0x01FC04000 through 0x1FC07FFF enabled
0 = Write protection for physical address 0x01FC04000 through 0x1FC07FFF disabled

bit 8 **LBWP0:** Lower Boot Alias Page 0 Write-protect bit(1)
1 = Write protection for physical address 0x01FC00000 through 0x1FC03FFF enabled
0 = Write protection for physical address 0x01FC00000 through 0x1FC03FFF disabled

bit 7 **UBWPULOCK:** Upper Boot Alias Write-protect Unlock bit
1 = UBWPx bits are not locked and can be modified
0 = UBWPx bits are locked and cannot be modified
This bit is only user-clearable and cannot be set except by any reset.

bit 6 **Reserved:** This bit is reserved for use by development tools

bit 5 **Unimplemented:** Read as '0'

Note 1: These bits are only available when the NVMKEY unlock sequence is performed and the associated Lock bit (LBWPULOCK or UBWPULOCK) is set.

Note: The bits in this register are only writable when the NVMKEY unlock sequence is followed.

REGISTER 5-8: NVMBWP: FLASH BOOT (PAGE) WRITE-PROTECT REGISTER

bit 4 **UBWP4:** Upper Boot Alias Page 4 Write-protect bit(1)
1 = Write protection for physical address 0x01FC30000 through 0x1FC33FFF enabled
0 = Write protection for physical address 0x01FC30000 through 0x1FC33FFF disabled

bit 3 **UBWP3:** Upper Boot Alias Page 3 Write-protect bit(1)
1 = Write protection for physical address 0x01FC2C000 through 0x1FC2FFFF enabled
0 = Write protection for physical address 0x01FC2C000 through 0x1FC2FFFF disabled

bit 2 **UBWP2:** Upper Boot Alias Page 2 Write-protect bit(1)
1 = Write protection for physical address 0x01FC28000 through 0x1FC2BFFF enabled
0 = Write protection for physical address 0x01FC28000 through 0x1FC2BFFF disabled

bit 1 **UBWP1:** Upper Boot Alias Page 1 Write-protect bit(1)
1 = Write protection for physical address 0x01FC24000 through 0x1FC27FFF enabled
0 = Write protection for physical address 0x01FC24000 through 0x1FC27FFF disabled

bit 0 **UBWP0:** Upper Boot Alias Page 0 Write-protect bit(1)
1 = Write protection for physical address 0x01FC20000 through 0x1FC23FFF enabled
0 = Write protection for physical address 0x01FC20000 through 0x1FC23FFF disabled

Note 1: These bits are only available when the NVMKEY unlock sequence is performed and the associated Lock bit (LBWPULOCK or UBWPULOCK) is set.

Note:	The bits in this register are only writable when the NVMKEY unlock sequence is followed.

6.0 RESETS

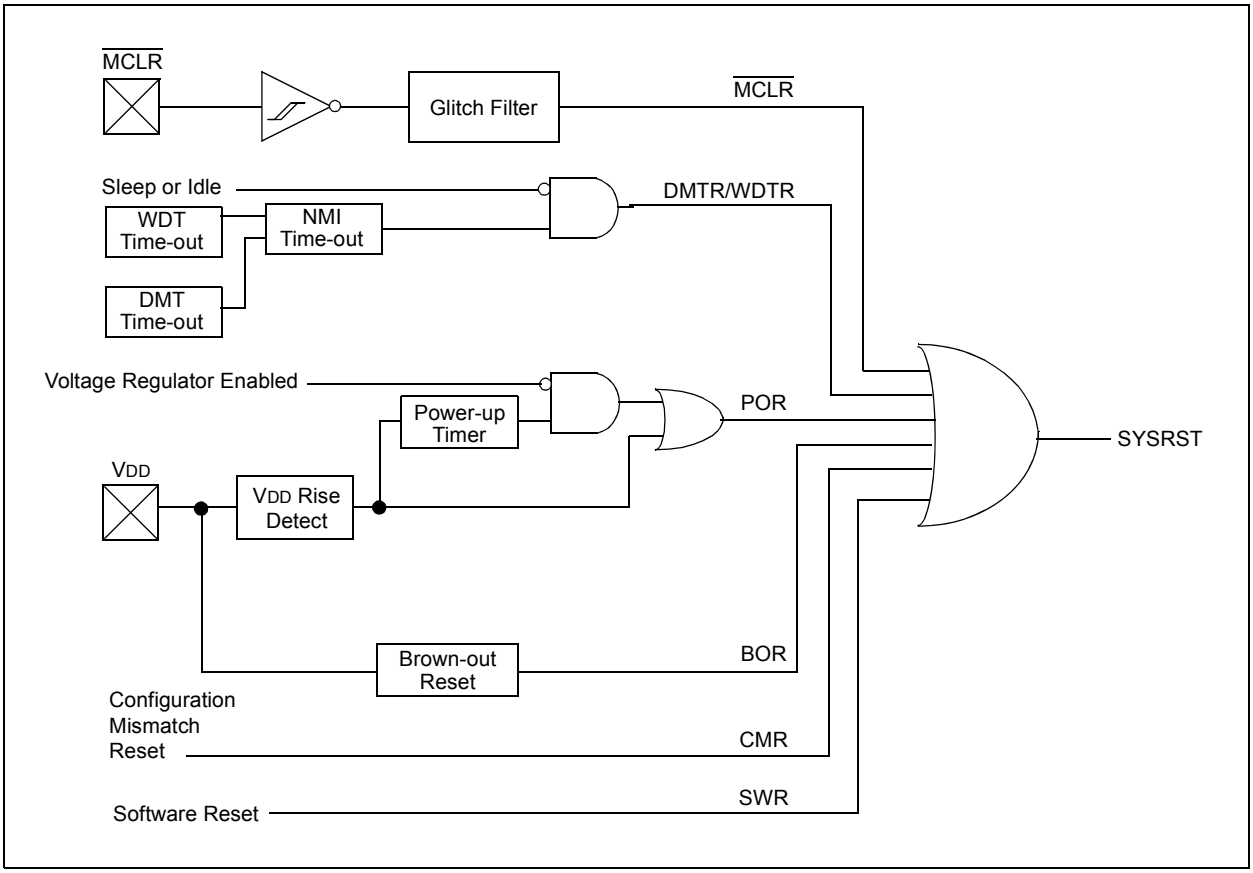
Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 7. "Resets"** (DS60001118) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Reset module combines all Reset sources and controls the device Master Reset signal, SYSRST. The device Reset sources are as follows:

- Power-on Reset (POR)
- Master Clear Reset pin ($\overline{MCLR}$)
- Software Reset (SWR)
- Watchdog Timer Reset (WDTR)
- Brown-out Reset (BOR)
- Configuration Mismatch Reset (CMR)
- Deadman Timer Reset (DMTR)

A simplified block diagram of the Reset module is illustrated in Figure 6-1.

FIGURE 6-1: SYSTEM RESET BLOCK DIAGRAM



6.1 Reset Control Registers

TABLE 6-1: RESETS REGISTER MAP

Virtual Address (BF80_#)	Register Name(1)	Bit Range	Bits																All Resets

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-28 **Unimplemented:** Read as '0'

bit 27 **BCFGERR:** Primary Configuration Registers Error Flag bit
1 = An error occurred during a read of the primary configuration registers
0 = No error occurred during a read of the primary configuration registers

bit 26 **BCFGFAIL:** Primary/Secondary Configuration Registers Error Flag bit
1 = An error occurred during a read of the primary and alternate configuration registers
0 = No error occurred during a read of the primary and alternate configuration registers

bit 25-10 **Unimplemented:** Read as '0'

bit 9 **CMR:** Configuration Mismatch Reset Flag bit
1 = A Configuration Mismatch Reset has occurred
0 = A Configuration Mismatch Reset has not occurred

bit 8 **Unimplemented:** Read as '0'

bit 7 **EXTR:** External Reset ($\overline{\text{MCLR}}$) Pin Flag bit
1 = Master Clear (pin) Reset has occurred
0 = Master Clear (pin) Reset has not occurred

bit 6 **SWR:** Software Reset Flag bit
1 = Software Reset was executed
0 = Software Reset was not executed

bit 5 **DMTO:** Deadman Timer Time-out Flag bit
1 = A DMT time-out has occurred
0 = A DMT time-out has not occurred

bit 4 **WDTO:** Watchdog Timer Time-out Flag bit
1 = WDT Time-out has occurred
0 = WDT Time-out has not occurred

bit 3 **SLEEP:** Wake From Sleep Flag bit
1 = Device was in Sleep mode
0 = Device was not in Sleep mode

bit 2 **IDLE:** Wake From Idle Flag bit
1 = Device was in Idle mode
0 = Device was not in Idle mode

bit 1 **BOR:** Brown-out Reset Flag bit(1)
1 = Brown-out Reset has occurred
0 = Brown-out Reset has not occurred

bit 0 **POR:** Power-on Reset Flag bit(1)
1 = Power-on Reset has occurred
0 = Power-on Reset has not occurred

Note 1: User software must clear this bit to view the next detection.

REGISTER 6-2: RSWRST: SOFTWARE RESET REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
23:16	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
15:8	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
7:0	U-0	U-0	U-0	U-0	U-0	U-0	U-0	W-0, HC
	—	—	—	—	—	—	—	SWRST(1,2)

Legend:	HC = Hardware Cleared		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-1 **Unimplemented:** Read as '0'

bit 0 **SWRST:** Software Reset Trigger bit(1,2)
- 1 = Enable software Reset event
- 0 = No effect

Note 1: The system unlock sequence must be performed before the SWRST bit can be written. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the *"PIC32 Family Reference Manual"* for details.

2: Once this bit is set, any read of the RSWRST register will cause a reset to occur.

REGISTER 6-3: RNMICON: NON-MASKABLE INTERRUPT (NMI) CONTROL REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	U-0	U-0	U-0	U-0	U-0	U-0	R/W-0	R/W-0
	—	—	—	—	—	—	DMTO	WDTO
23:16	R/W-0	U-0	U-0	U-0	R/W-0	U-0	R/W-0	R/W-0
	SWNMI	—	—	—	GNMI	—	CF	WDTS
15:8	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	NMICNT<15:8>							
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	NMICNT<7:0>							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-26 **Unimplemented:** Read as '0'

bit 25 **DMTO:** Deadman Timer Time-out Flag bit
1 = DMT time-out has occurred and caused a NMI
0 = DMT time-out has not occurred
Setting this bit will cause a DMT NMI event, and NMICNT will begin counting.

bit 24 **WDTO:** Watchdog Timer Time-Out Flag bit
1 = WDT time-out has occurred and caused a NMI
0 = WDT time-out has not occurred
Setting this bit will cause a WDT NMI event, and MNICNT will begin counting.

bit 23 **SWNMI:** Software NMI Trigger.
1 = An NMI will be generated
0 = An NMI will not be generated

bit 22-20 **Unimplemented:** Read as '0'

bit 19 **GNMI:** General NMI bit
1 = A general NMI event has been detected or a user-initiated NMI event has occurred
0 = A general NMI event has not been detected
Setting GNMI to a '1' causes a user-initiated NMI event. This bit is also set by writing 0x4E to the NMIKEY<7:0> (INTCON<31:24>) bits.

bit 18 **Unimplemented:** Read as '0'

bit 17 **CF:** Clock Fail Detect bit
1 = FSCM has detected clock failure and caused an NMI
0 = FSCM has not detected clock failure

Setting this bit will cause a a CF NMI event, but will not cause a clock switch to the BFRC.

bit 16 **WDTS:** Watchdog Timer Time-out in Sleep Mode Flag bit
1 = WDT time-out has occurred during Sleep mode and caused a wake-up from sleep
0 = WDT time-out has not occurred during Sleep mode

Setting this bit will cause a WDT NMI.

bit 15-0 **NMICNT<15:0>:** NMI Reset Counter Value bits
1111111111111111-0000000000000001 = Number of SYSCLK cycles before a device Reset occurs(1)
0000000000000000 = No delay between NMI assertion and device Reset event

Note 1: When a Watchdog Timer NMI event (when not in Sleep mode) or a Deadman Timer NMI event is triggered the NMICNT will start decrementing. When NMICNT reaches zero, the device is Reset. This NMI reset counter is only applicable to these two specific NMI events.

Note: The system unlock sequence must be performed before the SWRST bit can be written. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the *"PIC32 Family Reference Manual"* for details.

	—	—	—	—	—	—	—	VREGS

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-1 **Unimplemented:** Read as '0'

bit 0 **VREGS:** Voltage Regulator Stand-by Enable bit
1 = Voltage regulator will remain active during Sleep
0 = Voltage regulator will go to Stand-by mode during Sleep

7.0 CPU EXCEPTIONS AND INTERRUPT CONTROLLER

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 8. "Interrupt Controller"** (DS60001108) and **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices generate interrupt requests in response to interrupt events from peripheral modules. The Interrupt Controller module exists outside of the CPU and prioritizes the interrupt events before presenting them to the CPU.

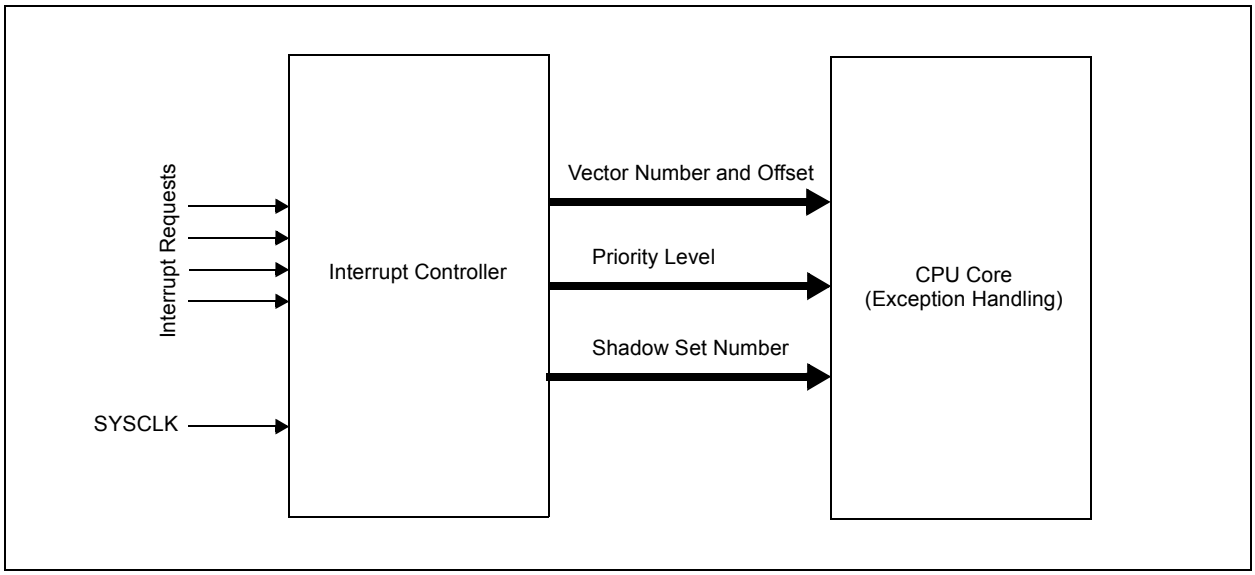
The CPU handles interrupt events as part of the exception handling mechanism, which is described in **Section 7.1 "CPU Exceptions"**.

The Interrupt Controller module includes the following features:

- Up to 213 interrupt sources and vectors with dedicated programmable offsets, eliminating the need for redirection
- Single and multi-vector mode operations
- Five external interrupts with edge polarity control
- Interrupt proximity timer
- Seven user-selectable priority levels for each vector
- Four user-selectable subpriority levels within each priority
- Seven shadow register sets that can be used for any priority level, eliminating software context switch and reducing interrupt latency
- Software can generate any interrupt

Figure 7-1 shows the block diagram for the Interrupt Controller and CPU exceptions.

FIGURE 7-1: CPU EXCEPTIONS AND INTERRUPT CONTROLLER MODULE BLOCK DIAGRAM



7.1 CPU Exceptions

CPU coprocessor 0 contains the logic for identifying and managing exceptions. Exceptions can be caused by a variety of sources, including boundary cases in data, external events or program errors. Table 7-1 lists the exception types in order of priority.

TABLE 7-1: MIPS32® M-CLASS MICROPROCESSOR CORE EXCEPTION TYPES

Exception Type (In Order of Priority)	Description	Branches to	Status Bits Set	Debug Bits Set	EXCCODE	XC32 Function Name
Highest Priority						
Reset	Assertion $\overline{\text{MCLR}}$ or a Power-on Reset (POR).	0xBFC0_0000	BEV, ERL	—	—	_on_reset
Soft Reset	Assertion of a software Reset.	0xBFC0_0000	BEV, SR, ERL	—	—	_on_reset
DSS	EJTAG debug single step.	0xBFC0_0480	—	DSS	—	—
DINT	EJTAG debug interrupt. Caused by the assertion of the external EJ_DINT input or by setting the EjtagBrk bit in the ECR register.	0xBFC0_0480	—	DINT	—	—
NMI	Assertion of NMI signal.	0xBFC0_0000	BEV, NMI, ERL	—	—	_nmi_handler
Machine Check	TLB write that conflicts with an existing entry.	EBASE+0x180	MCHECK, EXL	—	0x18	_general_exception_handler
Interrupt	Assertion of unmasked hardware or software interrupt signal.	See Table 7-2.	IPL<2:0>	—	0x00	See Table 7-2.
Deferred Watch	Deferred watch (unmasked by K|DM=>!(K|DM) transition).	EBASE+0x180	WP, EXL	—	0x17	_general_exception_handler
DIB	EJTAG debug hardware instruction break matched.	0xBFC0_0480	—	DIB	—	—
WATCH	A reference to an address that is in one of the Watch registers (fetch).	EBASE+0x180	EXL	—	0x17	_general_exception_handler
AdEL	Fetch address alignment error. Fetch reference to protected address.	EBASE+0x180	EXL	—	0x04	_general_exception_handler
TLBL	Fetch TLB miss or fetch TLB hit to page with V = 0.	EBASE if Status.EXL = 0	—	—	0x02	—
		EBASE+0x180 if Status.EXL == 1	—	—	0x02	_general_exception_handler
TLBL Execute Inhibit	An instruction fetch matched a valid TLB entry that had the XI bit set.	EBASE+0x180	EXL	—	0x14	_general_exception_handler
IBE	Instruction fetch bus error.	EBASE+0x180	EXL	—	0x06	_general_exception_handler

TABLE 7-1: MIPS32® M-CLASS MICROPROCESSOR CORE EXCEPTION TYPES (CONTINUED)

Exception Type (In Order of Priority)	Description	Branches to	Status Bits Set	Debug Bits Set	EXCCODE	XC32 Function Name
Instruction Validity Exceptions	An instruction could not be completed because it was not allowed to access the required resources (Coprocessor Unusable) or was illegal (Reserved Instruction). If both exceptions occur on the same instruction, the Coprocessor Unusable Exception takes priority over the Reserved Instruction Exception.	EBASE+0x180	EXL	—	0x0A or 0x0B	_general_exception_handler
Execute Exception	An instruction-based exception occurred: Integer overflow, trap, system call, breakpoint, floating point, or DSP ASE state disabled exception.	EBASE+0x180	EXL	—	0x08-0x0C	_general_exception_handler
Tr	Execution of a trap (when trap condition is true).	EBASE+0x180	EXL	—	0x0D	_general_exception_handler
DDBL/DDBS	EJTAG Data Address Break (address only) or EJTAG data value break on store (address + value).	0xBFC0_0480	—	DDBL or DDBS	—	—
WATCH	A reference to an address that is in one of the Watch registers (data).	EBASE+0x180	EXL	—	0x17	_general_exception_handler
AdEL	Load address alignment error. User mode load reference to kernel address.	EBASE+0x180	EXL	—	0x04	_general_exception_handler
AdES	Store address alignment error. User mode store to kernel address.	EBASE+0x180	EXL	—	0x05	_general_exception_handler
TLBL	Load TLB miss or load TLB hit to page with V = 0.	EBASE+0x180	EXL	—	0x02	_general_exception_handler
TLBS	Store TLB miss or store TLB hit to page with V = 0.	EBASE+0x180	EXL	—	0x03	_general_exception_handler
DBE	Load or store bus error.	EBASE+0x180	EXL	—	0x07	_general_exception_handler
DDBL	EJTAG data hardware breakpoint matched in load data compare.	0xBFC0_0480	—	DDBL	—	—
CBrk	EJTAG complex breakpoint.	0xBFC0_0480	—	DIBIMPR, DDBLIMPR, and/or DDBSIMPR	—	—
Lowest Priority						

7.2 Interrupts

The PIC32MZ EF family uses variable offsets for vector spacing. This allows the interrupt vector spacing to be configured according to application needs. A unique interrupt vector offset can be set for each vector using its associated OFFx register.

For details on the Variable Offset feature, refer to **8.5.2 "Variable Offset"** in **Section 8. "Interrupt Controller"** (DS60001108) of the *"PIC32 Family Reference Manual"*.

Table 7-2 provides the Interrupt IRQ, vector and bit location information.

TABLE 7-2: INTERRUPT IRQ, VECTOR, AND BIT LOCATION

Interrupt Source(1)	XC32 Vector Name	IRQ #	Vector #	Interrupt Bit Location				Persistent Interrupt
				Flag	Enable	Priority	Sub-priority

3: This bit or register is not available on devices without a CAN module.
4: This bit or register is not available on 100-pin devices.
5: Bits 31 and 30 are not available on 64-pin and 100-pin devices; bits 29 through 14 are not available on 64-pin devices.
6: Bits 31, 30, 29, and bits 5 through 0 are not available on 64-pin and 100-pin devices; bit 31 is not available on 124-pin devices; bit 22 is not available on 64-pin devices.
7: This bit or register is not available on devices without a Crypto module.
8: This bit or register is not available on 124-pin devices.

TABLE 7-3: INTERRUPT REGISTER MAP (CONTINUED)

Virtual Address (BF81_#)	Register Name(1)	Bit Range	Bits																All Resets
			31/15	30/14	29/13	28/12	27/11	26/10	25/9	24/8	23/7	22/6	21/5	20/4	19/3	18/2	17/1	16/0

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers in this table with the exception of the OFFx registers, have corresponding CLR, SET, and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See **Section 12.3 "CLR, SET, and INV Registers"** for more information.
2: This bit or register is not available on 64-pin devices.
3: This bit or register is not available on devices without a CAN module.
4: This bit or register is not available on 100-pin devices.
5: Bits 31 and 30 are not available on 64-pin and 100-pin devices; bits 29 through 14 are not available on 64-pin devices.
6: Bits 31, 30, 29, and bits 5 through 0 are not available on 64-pin and 100-pin devices; bit 31 is not available on 124-pin devices; bit 22 is not available on 64-pin devices.
7: This bit or register is not available on devices without a Crypto module.
8: This bit or register is not available on 124-pin devices.

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers in this table with the exception of the OFFx registers, have corresponding CLR, SET, and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See **Section 12.3 "CLR, SET, and INV Registers"** for more information.
2: This bit or register is not available on 64-pin devices.
3: This bit or register is not available on devices without a CAN module.
4: This bit or register is not available on 100-pin devices.
5: Bits 31 and 30 are not available on 64-pin and 100-pin devices; bits 29 through 14 are not available on 64-pin devices.
6: Bits 31, 30, 29, and bits 5 through 0 are not available on 64-pin and 100-pin devices; bit 31 is not available on 124-pin devices; bit 22 is not available on 64-pin devices.
7: This bit or register is not available on devices without a Crypto module.
8: This bit or register is not available on 124-pin devices.

	—	—	—	MVEC	—	TPC<2:0>		
7:0	U-0	U-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	—	—	—	INT4EP	INT3EP	INT2EP	INT1EP	INT0EP

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **NMIKEY<7:0>:** Non-Maskable Interrupt Key bits
When the correct key (0x4E) is written, a software NMI will be generated. The status is indicated by the GNMI bit (RNMICON<19>).

bit 23-13 **Unimplemented:** Read as '0'

bit 12 **MVEC:** Multi Vector Configuration bit
1 = Interrupt controller configured for multi vectored mode
0 = Interrupt controller configured for single vectored mode

8.0 OSCILLATOR CONFIGURATION

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

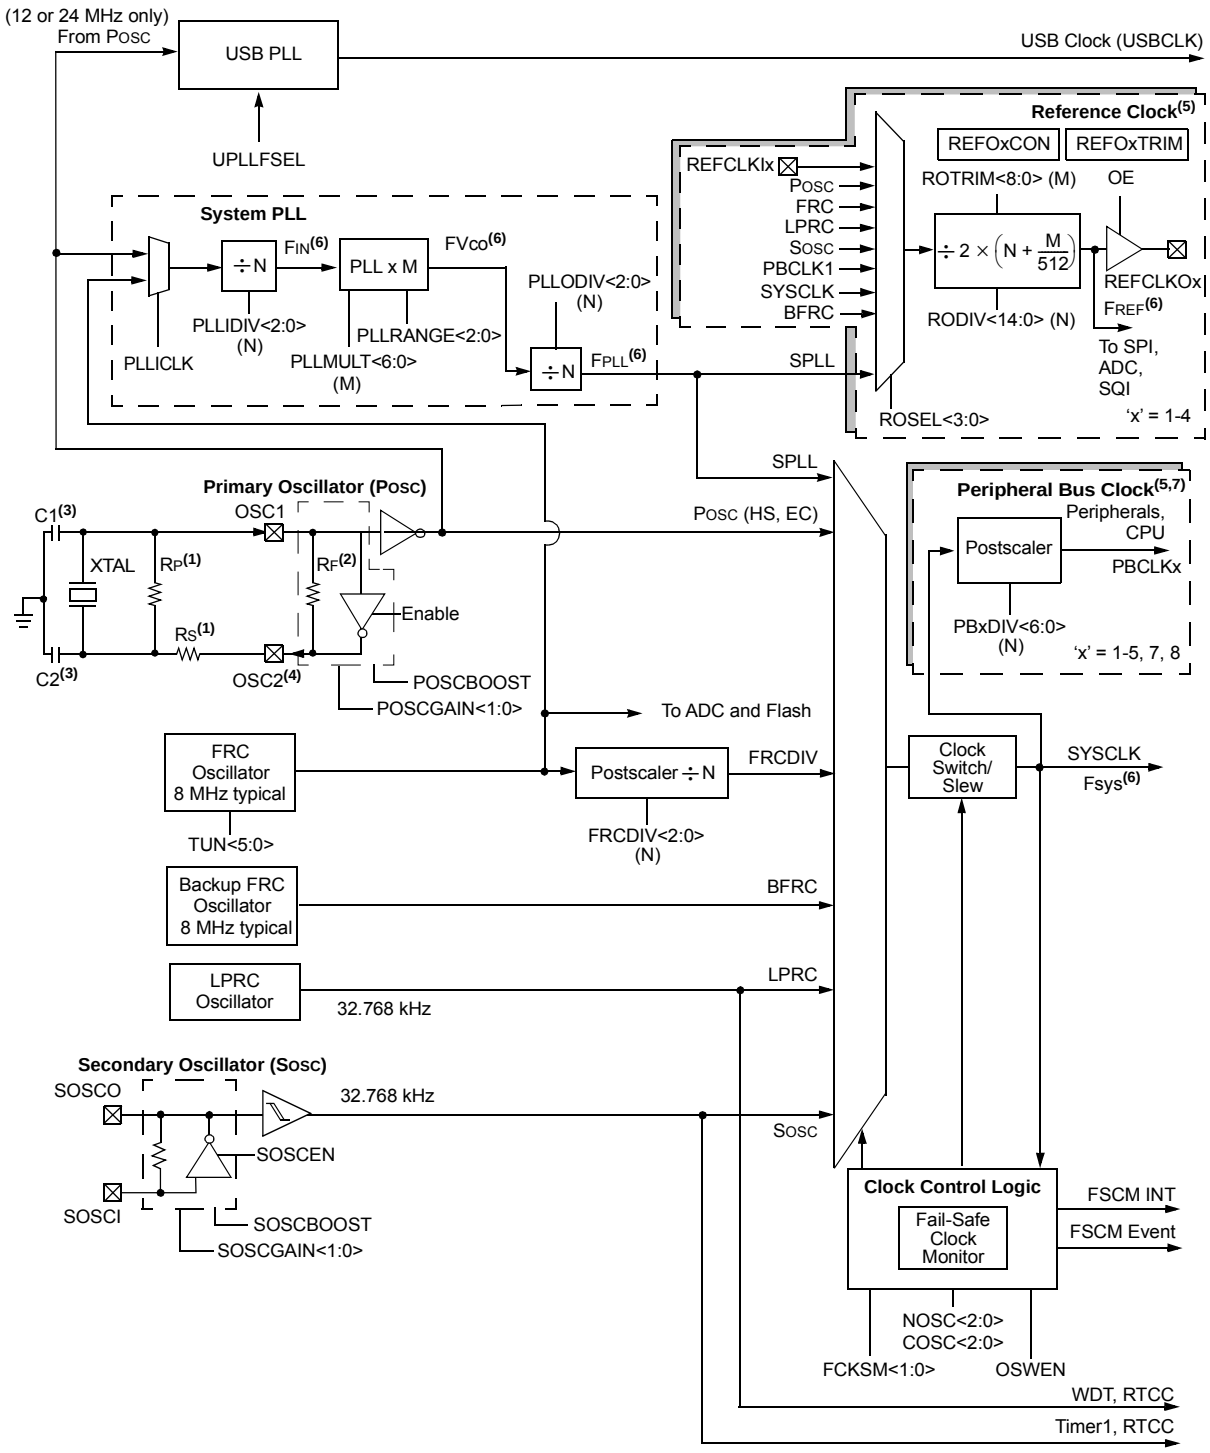
The PIC32MZ EF oscillator system has the following modules and features:

- A total of five external and internal oscillator options as clock sources
- On-Chip PLL with user-selectable input divider, multiplier and output divider to boost operating frequency on select internal and external oscillator sources
- On-Chip user-selectable divisor postscaler on select oscillator sources
- Software-controllable switching between various clock sources
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown with dedicated Back-up FRC (BFRC)
- Dedicated On-Chip PLL for USB peripheral
- Flexible reference clock output
- Multiple clock branches for peripherals for better performance flexibility
- Clock switch/slew control with output divider

A block diagram of the oscillator system is shown in Figure 8-1. The clock distribution is provided in Table 8-1.

Note: Devices that support 252 MHz operation should be configured for SYSCLK <= 200 MHz operation. Adjust the dividers of the PBCLKs, and then increase the SYSCLK to the desired speed.

FIGURE 8-1: PIC32MZ EF FAMILY OSCILLATOR DIAGRAM



Notes:

1. A series resistor, RS, may be required for AT strip cut crystals, or to eliminate clipping. Alternately, to increase oscillator circuit gain, add a parallel resistor, RP.
2. The internal feedback resistor, RF, is typically in the range of 2 to 10 MΩ.
3. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the "*PIC32 Family Reference Manual*" for help in determining the best oscillator components.
4. PBCLK1 divided by 2 is available on the OSC2 pin in certain clock modes.
5. Shaded regions indicate multiple instantiations of a peripheral or feature.
6. Refer to Table 37-19 in **Section 37.0 "Electrical Characteristics"** for frequency limitations.
7. If the DEVCFG registers are configured for a SYSCLK speed greater than 200 MHz, these PBCLKs will be running faster than the maximum rating when the device comes out of Reset. To ensure proper operation, firmware must start the device at a speed less than or equal to 200 MHz, adjust the speed of the PBCLKs, and then raise the SYSCLK speed to the desired speed.

TABLE 8-1: SYSTEM AND PERIPHERAL CLOCK DISTRIBUTION

Peripheral	Clock Source															
	FRC	LPRC	SOSC	SYSCLK	USBCLK	PBCLK1(1)	PBCLK2	PBCLK3	PBCLK4	PBCLK5	PBCLK7	PBCLK8	REFCLKO1	REFCLKO2	REFCLKO3
CPU											X

Timers			X(4)					X							
Output Compare								X							
Input Capture								X							
Ports									X						
DMA				X											
Interrupts				X											
Prefetch				X											
OSC2 Pin						X(5)									

Note 1: PBCLK1 is used by system modules and cannot be turned off.

2: SYSCLK/PBCLK1 is used to fetch data from/to the Flash Controller, while the FRC clock is used for programming.

3: Special Function Register (SFR) access only.

4: Timer1 only.

5: PBCLK1 divided by 2 is available on the OSC2 pin in certain clock modes.

8.1 Fail-Safe Clock Monitor (FSCM)

The PIC32MZ EF oscillator system includes a Fail-safe Clock Monitor (FSCM). The FSCM monitors the SYSCLK for continuous operation. If it detects that the SYSCLK has failed, it switches the SYSCLK over to the BFRC oscillator and triggers a NMI. The BFRC is an untuned 8 MHz oscillator that will drive the SYSCLK during FSCM event. When the NMI is executed, software can attempt to restart the main oscillator or shut down the system.

In Sleep mode both the SYSCLK and the FSCM halt, which prevents FSCM detection.

8.2 Oscillator Control Registers

	—	COSC<2:0>			—	NOSC<2:0>		
7:0	R/W-0	U-0	U-0	R/W-0	R/W-0, HS	U-0	R/W-y	R/W-y
	CLKLOCK	—	—	SLPEN	CF	—	SOSCEN	OSWEN(1)

Legend:	y = Value set from Configuration bits on POR		HS = Hardware Set
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-27 **Unimplemented:** Read as '0'

bit 26-24 **FRCDIV<2:0>:** Internal Fast RC (FRC) Oscillator Clock Divider bits
- 111 = FRC divided by 256
- 110 = FRC divided by 64
- 101 = FRC divided by 32
- 100 = FRC divided by 16
- 011 = FRC divided by 8
- 010 = FRC divided by 4
- 001 = FRC divided by 2
- 000 = FRC divided by 1 (default setting)

bit 23 **DRMEN:** Dream Mode Enable bit
- 1 = Dream mode is enabled
- 0 = Dream mode is disabled

bit 22 **Unimplemented:** Read as '0'

bit 21 **SLP2SPD:** Sleep 2-speed Startup Control bit(1)
- 1 = Use FRC as SYSCLK until selected clock is ready
- 0 = Use the selected clock directly

bit 20-15 **Unimplemented:** Read as '0'

bit 14-12 **COSC<2:0>:** Current Oscillator Selection bits
- 111 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)
- 110 = Back-up Fast RC (BFRC) Oscillator
- 101 = Internal Low-Power RC (LPRC) Oscillator
- 100 = Secondary Oscillator (SOSC)
- 011 = Reserved
- 010 = Primary Oscillator (POSC) (HS or EC)
- 001 = System PLL (SPLL)
- 000 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)

bit 11 **Unimplemented:** Read as '0'

Note 1: The reset value for this bit depends on the setting of the IESO bit (DEVCFG1<7>). When IESO = 1, the reset value is '1'. When IESO = 0, the reset value is '0'.

Note: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

REGISTER 8-1: OSCCON: OSCILLATOR CONTROL REGISTER

bit 10-8 **NOSC<2:0>:** New Oscillator Selection bits
- 111 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)
- 110 = Reserved
- 101 = Internal Low-Power RC (LPRC) Oscillator
- 100 = Secondary Oscillator (SOSC)
- 011 = Reserved
- 010 = Primary Oscillator (POSC) (HS or EC)
- 001 = System PLL (SPLL)
- 000 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)

On Reset, these bits are set to the value of the FNOSC<2:0> Configuration bits (DEVCFG1<2:0>).

bit 7 **CLKLOCK:** Clock Selection Lock Enable bit
- 1 = Clock and PLL selections are locked
- 0 = Clock and PLL selections are not locked and may be modified

bit 6-5 **Unimplemented:** Read as '0'

bit 4 **SLPEN:** Sleep Mode Enable bit
- 1 = Device will enter Sleep mode when a WAIT instruction is executed
- 0 = Device will enter Idle mode when a WAIT instruction is executed

bit 3 **CF:** Clock Fail Detect bit
- 1 = FSCM has detected a clock failure
- 0 = No clock failure has been detected

bit 2 **Unimplemented:** Read as '0'

bit 1 **SOSCEN:** Secondary Oscillator (SOSC) Enable bit
- 1 = Enable Secondary Oscillator
- 0 = Disable Secondary Oscillator

bit 0 **OSWEN:** Oscillator Switch Enable bit**(1)**
- 1 = Initiate an oscillator switch to selection specified by NOSC<2:0> bits
- 0 = Oscillator switch is complete

Note 1: The reset value for this bit depends on the setting of the IESO bit (DEVCFG1<7>). When IESO = 1, the reset value is '1'. When IESO = 0, the reset value is '0'.

Note:	Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

REGISTER 8-2: OSCTUN: FRC TUNING REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	—	—	—	—	—	—	—	—
7:0	U-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	—	—	TUN<5:0>(1)					

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-6 **Unimplemented:** Read as '0'

bit 5-0 **TUN<5:0>:** FRC Oscillator Tuning bits(1)

100000 = Center frequency -2%
100001 =
•
•
•
111111 =
000000 = Center frequency; Oscillator runs at nominal frequency (8 MHz)
000001 =
•
•
•
011110 =
011111 = Center frequency +2%

Note 1: OSCTUN functionality has been provided to help customers compensate for temperature effects on the FRC frequency over a wide range of temperatures. The tuning step size is an approximation, and is neither characterized nor tested.

Note: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

REGISTER 8-3: SPLLCON: SYSTEM PLL CONTROL REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	PLLICLK	—	—	—	—	PLLRANGE<2:0>		

Legend:	y = Value set from Configuration bits on POR		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-27 **Unimplemented:** Read as '0'

bit 26-24 **PLLODIV<2:0>:** System PLL Output Clock Divider bits

111 = Reserved
110 = Reserved
101 = PLL Divide by 32
100 = PLL Divide by 16
011 = PLL Divide by 8
010 = PLL Divide by 4
001 = PLL Divide by 2
000 = Reserved

The default setting is specified by the FPLLODIV<2:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

bit 23 **Unimplemented:** Read as '0'

bit 22-16 **PLLMULT<6:0>:** System PLL Multiplier bits

1111111 = Multiply by 128
1111110 = Multiply by 127
1111101 = Multiply by 126
1111100 = Multiply by 125
•
•
•
0000000 = Multiply by 1

The default setting is specified by the FPLLMULT<6:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

bit 15-11 **Unimplemented:** Read as '0'

Note 1: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

2: Writes to this register are not allowed if the SPLL is selected as a clock source (COSC<2:0> = 001).

REGISTER 8-3: SPLLCON: SYSTEM PLL CONTROL REGISTER

bit 10-8 **PLLIDIV<2:0>:** System PLL Input Clock Divider bits

111 = Divide by 8
110 = Divide by 7
101 = Divide by 6
100 = Divide by 5
011 = Divide by 4
010 = Divide by 3
001 = Divide by 2
000 = Divide by 1

The default setting is specified by the FPLLIDIV<2:0> Configuration bits in the DEVCFG2 register. If the PLLICLK is set for FRC, this setting is ignored by the PLL and the divider is set for Divide-by-1. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

bit 7 **PLLICLK:** System PLL Input Clock Source bit

1 = FRC is selected as the input to the System PLL
0 = POSC is selected as the input to the System PLL
The POR default is specified by the FPLLICLK Configuration bit in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

bit 6-3 **Unimplemented:** Read as '0'

bit 2-0 **PLLRANGE<2:0>:** System PLL Frequency Range Selection bits

111 = Reserved
110 = Reserved
101 = 34-64 MHz
100 = 21-42 MHz
011 = 13-26 MHz
010 = 8-16 MHz
001 = 5-10 MHz
000 = Bypass

The default setting is specified by the FPLLRNG<2:0> Configuration bits in the DEVCFG2 register. Refer to Register 34-5 in **Section 34.0 "Special Features"** for information.

Note 1: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

2: Writes to this register are not allowed if the SPLL is selected as a clock source (COSC<2:0> = 001).

REGISTER 8-4: REFOxCON: REFERENCE OSCILLATOR CONTROL REGISTER ('x' = 1-4)

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	—	—	—	—	ROSEL<3:0>(3)			

Legend:	HC = Hardware Cleared	HS = Hardware Set	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **Unimplemented:** Read as '0'

bit 30-16 **RODIV<14:0>** Reference Clock Divider bits

This value specifies 1/2 period of the reference clock in the source clocks.

111111111111111 = REFO clock is Base clock frequency divided by 65,534 (32,767*2)

111111111111110 = REFO clock is Base clock frequency divided by 65,532 (32,766*2)

•

•

•

000000000000011 = REFO clock is Base clock frequency divided by 6 (3*2)

000000000000010 = REFO clock is Base clock frequency divided by 4 (2*2)

000000000000001 = REFO clock is Base clock frequency divided by 2 (1*2)

000000000000000 = REFO is the same frequency as Base Clock (no divider)

bit 15 **ON:** Output Enable bit(1)

1 = Reference Oscillator module is enabled

0 = Reference Oscillator module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Peripheral Stop in Idle Mode bit

1 = Discontinue module operation when device enters Idle mode

0 = Continue module operation in Idle mode

bit 12 **OE:** Reference Clock Output Enable bit

1 = Reference clock is driven out on REFCLKOx pin

0 = Reference clock is not driven out on REFCLKOx pin

bit 11 **RSLP:** Reference Oscillator Module Run in Sleep bit(2)

1 = Reference Oscillator module output continues to run in Sleep

0 = Reference Oscillator module output is disabled in Sleep

bit 10 **Unimplemented:** Read as '0'

bit 9 **DIVSWEN:** Divider Switch Enable bit

1 = Divider switch is in progress

0 = Divider switch is complete

bit 8 **ACTIVE:** Reference Clock Request Status bit(1)

1 = Reference clock request is active

0 = Reference clock request is not active

bit 7-4 **Unimplemented:** Read as '0'

Note 1: Do not write to this register when the ON bit is not equal to the ACTIVE bit.

2: This bit is ignored when the ROSEL<3:0> bits = 0000 or 0001.

3: The ROSEL<3:0> bits should not be written while the ACTIVE bit is '1', as undefined behavior may result.

REGISTER 8-4: REFOxCON: REFERENCE OSCILLATOR CONTROL REGISTER ('x' = 1-4)

bit 3-0 **ROSEL<3:0>:** Reference Clock Source Select bits(3)
1111 = Reserved
•
•
•
1001 = BFRC
1000 = REFCLKIx
0111 = System PLL output
0110 = Reserved

	—	PBDIV<6:0>						

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Peripheral Bus 'x' Output Clock Enable bit(1)
- 1 = Output clock is enabled
- 0 = Output clock is disabled

bit 14-12 **Unimplemented:** Read as '0'

bit 11 **PBDIVRDY:** Peripheral Bus 'x' Clock Divisor Ready bit
- 1 = Clock divisor logic is not switching divisors and the PBxDIV<6:0> bits may be written
- 0 = Clock divisor logic is currently switching values and the PBxDIV<6:0> bits cannot be written

bit 10-7 **Unimplemented:** Read as '0'

bit 6-0 **PBDIV<6:0>:** Peripheral Bus 'x' Clock Divisor Control bits
- 1111111 = PBCLKx is SYSCLK divided by 128
- 1111110 = PBCLKx is SYSCLK divided by 127
- •
- •
- •
- 0000011 = PBCLKx is SYSCLK divided by 4
- 0000010 = PBCLKx is SYSCLK divided by 3
- 0000001 = PBCLKx is SYSCLK divided by 2 (default value for x ≠ 7)
- 0000000 = PBCLKx is SYSCLK divided by 1 (default value for x = 7)

Note 1: The clock for peripheral bus 1 cannot be turned off. Therefore, the ON bit in the PB1DIV register cannot be written as a '0'.

Note: Writes to this register require an unlock sequence. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

REGISTER 8-7: SLEWCON: OSCILLATOR SLEW CONTROL REGISTER

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-20 **Unimplemented:** Read as '0'

bit 19-16 **SYSDIV<3:0>:** System Clock Divide Control bits(1)

1111 = SYSCLK is divided by 16
1110 = SYSCLK is divided by 15
.
.
.
0010 = SYSCLK is divided by 3
0001 = SYSCLK is divided by 2
0000 = SYSCLK is not divided

bit 15-11 **Unimplemented:** Read as '0'

bit 10-8 **SLWDIV<2:0>:** Slew Divisor Steps Control bits

These bits control the maximum division steps used when slewing during a frequency change.
111 = Steps are divide by 128, 64, 32, 16, 8, 4, 2, and then no divisor
110 = Steps are divide by 64, 32, 16, 8, 4, 2, and then no divisor
101 = Steps are divide by 32, 16, 8, 4, 2, and then no divisor
100 = Steps are divide by 16, 8, 4, 2, and then no divisor
011 = Steps are divide by 8, 4, 2, and then no divisor
010 = Steps are divide by 4, 2, and then no divisor
001 = Steps are divide by 2, and then no divisor
000 = No divisor is used during slewing

Note: The steps apply in reverse order (i.e., 2, 4, 8, etc.) during a downward frequency change.

bit 7-3 **Unimplemented:** Read as '0'

bit 2 **UPEN:** Upward Slew Enable bit

1 = Slewing enabled for switching to a higher frequency
0 = Slewing disabled for switching to a higher frequency

bit 1 **DNEN:** Downward Slew Enable bit

1 = Slewing enabled for switching to a lower frequency
0 = Slewing disabled for switching to a lower frequency

bit 0 **BUSY:** Clock Switching Slewing Active Status bit

1 = Clock frequency is being actively slewed to the new frequency
0 = Clock switch has reached its final value

Note 1: The SYSDIV<3:0> bit settings are ignored if both UPEN and DNEN = 0, and SYSCLK will be divided by 1.

1 = FRC is stable and ready
0 = FRC is disabled for not operating

9.0 PREFETCH MODULE

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 41. "Prefetch Module for Devices with L1 CPU Cache"** (DS60001183) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Prefetch module is a performance enhancing module that is included in the PIC32MZ EF family of devices. When running at high-clock rates, Wait states must be inserted into Program Flash Memory (PFM) read transactions to meet the access time of the PFM. Wait states can be hidden to the core by prefetching and storing instructions in a temporary holding area that the CPU can access quickly. Although the data path to the CPU is 32 bits wide, the data path to the PFM is 128 bits wide. This wide data path provides the same bandwidth to the CPU as a 32-bit path running at four times the frequency.

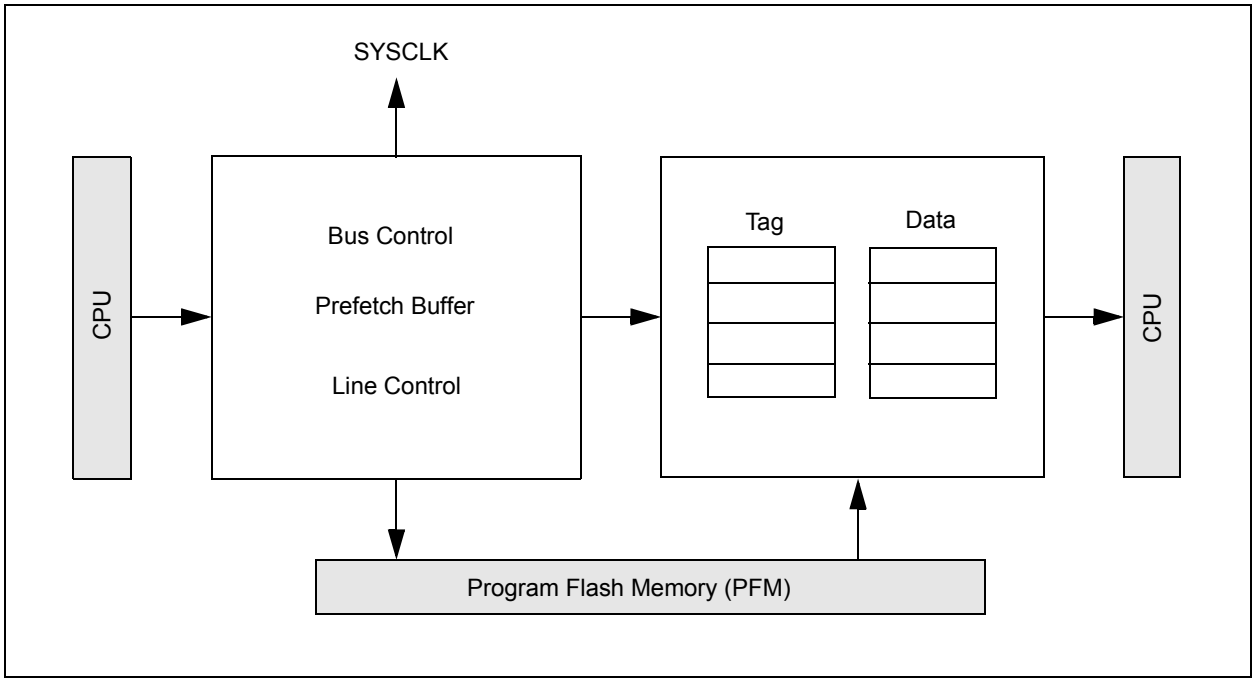
The Prefetch module holds a subset of PFM in temporary holding spaces known as lines. Each line contains a tag and data field. Normally, the lines hold a copy of what is currently in memory to make instructions or data available to the CPU without Flash Wait states.

The following are key features of the Prefetch module:

- 4x16 byte fully-associative lines
- One line for CPU instructions
- One line for CPU data
- Two lines for peripheral data
- 16-byte parallel memory fetch
- Configurable predictive prefetch
- Error detection and correction

A simplified block diagram of the Prefetch module is shown in Figure 9-1.

FIGURE 9-1: PREFETCH MODULE BLOCK DIAGRAM



9.1 Prefetch Control Registers

10.0 DIRECT MEMORY ACCESS (DMA) CONTROLLER

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 31. "Direct Memory Access (DMA) Controller"** (DS60001117) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Direct Memory Access (DMA) Controller is a bus master module useful for data transfers between different devices without CPU intervention. The source and destination of a DMA transfer can be any of the memory mapped modules existent in the device such as SPI, UART, PMP, etc., or memory itself.

The following are key features of the DMA Controller:

- Eight identical channels, each featuring:
  - Auto-increment source and destination address registers
  - Source and destination pointers
  - Memory to memory and memory to peripheral transfers
- Automatic word-size detection:
  - Transfer granularity, down to byte level
  - Bytes need not be word-aligned at source and destination
- Fixed priority channel arbitration
- Flexible DMA channel operating modes:
  - Manual (software) or automatic (interrupt) DMA requests
  - One-Shot or Auto-Repeat Block Transfer modes
  - Channel-to-channel chaining
- Flexible DMA requests:
  - A DMA request can be selected from any of the peripheral interrupt sources
  - Each channel can select any (appropriate) observable interrupt as its DMA request source
  - A DMA transfer abort can be selected from any of the peripheral interrupt sources
  - Up to 2-byte Pattern (data) match transfer termination
- Multiple DMA channel status interrupts:
  - DMA channel block transfer complete
  - Source empty or half empty
  - Destination full or half full
  - DMA transfer aborted due to an external event
  - Invalid DMA address generated
- DMA debug support features:
  - Most recent error address accessed by a DMA channel
  - Most recent DMA channel to transfer data
- CRC Generation module:
  - CRC module can be assigned to any of the available channels
  - CRC module is highly configurable

bit 31-30 **Unimplemented:** Read as '0'

bit 29-28 **BYTO<1:0>:** CRC Byte Order Selection bits
- 11 = Endian byte swap on half-word boundaries (i.e., source half-word order with reverse source byte order per half-word)
- 10 = Swap half-words on word boundaries (i.e., reverse source half-word order with source byte order per half-word)
- 01 = Endian byte swap on word boundaries (i.e., reverse source byte order)
- 00 = No swapping (i.e., source byte order)

bit 27 **WBO:** CRC Write Byte Order Selection bit(1)
- 1 = Source data is written to the destination re-ordered as defined by BYTO<1:0>
- 0 = Source data is written to the destination unaltered

bit 26-25 **Unimplemented:** Read as '0'

bit 24 **BITO:** CRC Bit Order Selection bit

When CRCTYP (DCRCCON<5>) = 1 (CRC module is in IP Header mode):
- 1 = The IP header checksum is calculated Least Significant bit (LSb) first (i.e., reflected)
- 0 = The IP header checksum is calculated Most Significant bit (MSb) first (i.e., not reflected)

When CRCTYP (DCRCCON<5>) = 0 (CRC module is in LFSR mode):
- 1 = The LFSR CRC is calculated Least Significant bit first (i.e., reflected)
- 0 = The LFSR CRC is calculated Most Significant bit first (i.e., not reflected)

bit 23-13 **Unimplemented:** Read as '0'

bit 12-8 **PLEN<4:0>:** Polynomial Length bits(1)

When CRCTYP (DCRCCON<5>) = 1 (CRC module is in IP Header mode):

These bits are unused.

When CRCTYP (DCRCCON<5>) = 0 (CRC module is in LFSR mode):

Denotes the length of the polynomial – 1.

bit 7 **CRCEN:** CRC Enable bit
- 1 = CRC module is enabled and channel transfers are routed through the CRC module
- 0 = CRC module is disabled and channel transfers proceed normally

Note 1: When WBO = 1, unaligned transfers are not supported and the CRCAPP bit cannot be set.

REGISTER 10-4: DCRCCON: DMA CRC CONTROL REGISTER (CONTINUED)

bit 6 **CRCAPP:** CRC Append Mode bit(1)
1 = The DMA transfers data from the source into the CRC but NOT to the destination. When a block transfer completes the DMA writes the calculated CRC value to the location given by CHxDSA
0 = The DMA transfers data from the source through the CRC obeying WBO as it writes the data to the destination

bit 5 **CRCTYP:** CRC Type Selection bit
1 = The CRC module will calculate an IP header checksum
0 = The CRC module will calculate a LFSR CRC

bit 4-3 **Unimplemented:** Read as '0'

bit 2-0 **CRCCH<2:0>:** CRC Channel Select bits
111 = CRC is assigned to Channel 7
110 = CRC is assigned to Channel 6
101 = CRC is assigned to Channel 5
100 = CRC is assigned to Channel 4
011 = CRC is assigned to Channel 3
010 = CRC is assigned to Channel 2
001 = CRC is assigned to Channel 1
000 = CRC is assigned to Channel 0

Note 1: When WBO = 1, unaligned transfers are not supported and the CRCAPP bit cannot be set.

bit 31-0 **DCRCDATA<31:0>:** CRC Data Register bits

Writing to this register will seed the CRC generator. Reading from this register will return the current value of the CRC. Bits greater than PLEN will return '0' on any read.

When CRCTYP (DCRCCON<5>) = 1 (CRC module is in IP Header mode):
Only the lower 16 bits contain IP header checksum information. The upper 16 bits are always '0'. Data written to this register is converted and read back in 1's complement form (i.e., current IP header checksum value).

When CRCTYP (DCRCCON<5>) = 0 (CRC module is in LFSR mode):
Bits greater than PLEN will return '0' on any read.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **CHPIGN<7:0>:** Channel Register Data bits
Pattern Terminate mode:
Any byte matching these bits during a pattern match may be ignored during the pattern match determination when the CHPIGNEN bit is set. If a byte is read that is identical to this data byte, the pattern match logic will treat it as a "don't care" when the pattern matching logic is enabled and the CHPIGEN bit is set.

bit 23-16 **Unimplemented:** Read as '0'

bit 15 **CHBUSY:** Channel Busy bit
1 = Channel is active or has been enabled
0 = Channel is inactive or has been disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **CHPIGNEN:** Enable Pattern Ignore Byte bit
1 = Treat any byte that matches the CHPIGN<7:0> bits as a "don't care" when pattern matching is enabled
0 = Disable this feature

bit 12 **Unimplemented:** Read as '0'

bit 11 **CHPATLEN:** Pattern Length bit
1 = 2 byte length
0 = 1 byte length

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **CHCHNS:** Chain Channel Selection bit(1)
1 = Chain to channel lower in natural priority (CH1 will be enabled by CH2 transfer complete)
0 = Chain to channel higher in natural priority (CH1 will be enabled by CH0 transfer complete)

bit 7 **CHEN:** Channel Enable bit(2)
1 = Channel is enabled
0 = Channel is disabled

bit 6 **CHAED:** Channel Allow Events If Disabled bit
1 = Channel start/abort events will be registered, even if the channel is disabled
0 = Channel start/abort events will be ignored if the channel is disabled

bit 5 **CHCHN:** Channel Chain Enable bit
1 = Allow channel to be chained
0 = Do not allow channel to be chained

Note 1: The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).

2: When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

REGISTER 10-7: DCHxCON: DMA CHANNEL x CONTROL REGISTER (CONTINUED)

bit 4 **CHAEN:** Channel Automatic Enable bit
1 = Channel is continuously enabled, and not automatically disabled after a block transfer is complete
0 = Channel is disabled on block transfer complete

bit 3 **Unimplemented:** Read as '0'

bit 2 **CHEDET:** Channel Event Detected bit
1 = An event has been detected
0 = No events have been detected

bit 1-0 **CHPRI<1:0>:** Channel Priority bits
11 = Channel has priority 3 (highest)
10 = Channel has priority 2
01 = Channel has priority 1
00 = Channel has priority 0

Note 1: The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).

2: When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

Unused.

NOTES:

11.0 HI-SPEED USB WITH ON-THE-GO (OTG)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 51. "Hi-Speed USB with On-The-Go (OTG)"** (DS60001326) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Universal Serial Bus (USB) module contains analog and digital components to provide a USB 2.0 embedded host, device, or OTG implementation with a minimum of external components.

The module supports Hi-Speed, Full-Speed, or Low-Speed in any of the operating modes. This module in Host mode is intended for use as an embedded host and therefore does not implement a UHCI or OHCI controller.

The USB module consists of the RAM controller, packet encode/decode, UTM synchronization, end-point control, a dedicated USB DMA controller, pull-up and pull-down resistors, and the register interface. A block diagram of the PIC32 USB OTG module is presented in Figure 11-1.

The USB module includes the following features:

- USB Hi-Speed, Full-Speed, and Low-Speed support for host and device
- USB OTG support with one or more Hi-Speed, Full-Speed, or Low-Speed device
- Integrated signaling resistors
- Integrated analog comparators for VBUS monitoring
- Integrated USB transceiver
- Transaction handshaking performed by hardware
- Integrated 8-channel DMA to access system RAM and Flash
- Seven transmit endpoints and seven receive endpoints, in addition to Endpoint 0
- Session Request Protocol (SRP) and Host Negotiation Protocol (HNP) support
- Suspend and resume signaling support
- Dynamic FIFO sizing
- Integrated RAM for the FIFOs, eliminating the need for system RAM for the FIFOs
- Link power management support

Note 1: The implementation and use of the USB specifications, as well as other third party specifications or technologies, may require licensing; including, but not limited to, USB Implementers Forum, Inc. (also referred to as USB-IF). The user is fully responsible for investigating and satisfying any applicable licensing obligations.

2: If the USB module is used, the Primary Oscillator (POSC) is limited to either 12 MHz or 24 MHz.

	—	FUNC<6:0>						
		—	—	—	—	—	—	—

Legend:	HS = Hardware Set	HC = Hardware Cleared	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23-17 **EP7TXIF:EP1TXIF:** Endpoint 'n' TX Interrupt Flag bit
1 = Endpoint has a transmit interrupt to be serviced
0 = No interrupt event

bit 16 **EP0IF:** Endpoint 0 Interrupt bit
1 = Endpoint 0 has an interrupt to be serviced
0 = No interrupt event

All EPxTX and EP0 bits are cleared when the byte is read. Therefore, these bits must be read independently from the remaining bits in this register to avoid accidental clearing.

bit 15 **ISOUPD:** ISO Update bit (*Device mode only; unimplemented in Host mode*)
1 = USB module will wait for a SOF token from the time TXPKTRDY is set before sending the packet
0 = No change in behavior

This bit only affects endpoints performing isochronous transfers when in *Device mode*. This bit is unimplemented in *Host mode*.

bit 14 **SOFTCONN:** Soft Connect/Disconnect Feature Selection bit
1 = The USB D+/D- lines are enabled and active
0 = The USB D+/D- lines are disabled and are tri-stated

This bit is only available in *Device mode*.

bit 13 **HSEN:** Hi-Speed Enable bit
1 = The USB module will negotiate for Hi-Speed mode when the device is reset by the hub
0 = Module only operates in Full-Speed mode

bit 12 **HSMODE:** Hi-Speed Mode Status bit
1 = Hi-Speed mode successfully negotiated during USB reset
0 = Module is not in Hi-Speed mode

In *Device mode*, this bit becomes valid when a USB reset completes. In *Host mode*, it becomes valid when the RESET bit is cleared.

bit 11 **RESET:** Module Reset Status bit
1 = Reset signaling is present on the bus
0 = Normal module operation

In *Device mode*, this bit is read-only. In *Host mode*, this bit is read/write.

REGISTER 11-1: USBCSR0: USB CONTROL STATUS REGISTER 0 (CONTINUED)

bit 10 **RESUME:** Resume from Suspend control bit
1 = Generate Resume signaling when the device is in Suspend mode
0 = Stop Resume signaling

In *Device mode*, the software should clear this bit after 10 ms (a maximum of 15 ms) to end Resume signaling. In *Host mode*, the software should clear this bit after 20 ms.

bit 9 **SUSPMODE:** Suspend Mode status bit
1 = The USB module is in Suspend mode
0 = The USB module is in Normal operations

This bit is read-only in Device mode. In Host mode, it can be set by software, and is cleared by hardware.

bit 8 **SUSPEN:** Suspend Mode Enable bit
1 = Suspend mode is enabled
0 = Suspend mode is not enabled

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **FUNC<6:0>:** Device Function Address bits

These bits are only available in *Device mode*. This field is written with the address received through a SET_ADDRESS command, which will then be used for decoding the function address in subsequent token packets.

bit 31 **FORCEHST:** Test Mode Force Host Select bit
1 = Forces USB module into *Host mode*, regardless of whether it is connected to any peripheral
0 = Normal operation

bit 30 **FIFOACC:** Test Mode Endpoint 0 FIFO Transfer Force bit
1 = Transfers the packet in the Endpoint 0 TX FIFO to the Endpoint 0 RX FIFO
0 = No transfer

bit 29 **FORCEFS:** Test mode Force Full-Speed Mode Select bit
This bit is only active if FORCEHST = 1.
1 = Forces USB module into Full-Speed mode. Undefined behavior if FORCEHS = 1.
0 = If FORCEHS = 0, places USB module into Low-Speed mode.

bit 28 **FORCEHS:** Test mode Force Hi-Speed Mode Select bit
This bit is only active if FORCEHST = 1.
1 = Forces USB module into Hi-Speed mode. Undefined behavior if FORCEFS = 1.
0 = If FORCEFS = 0, places USB module into Low-Speed mode.

bit 27 **PACKET:** Test_Packet Test Mode Select bit
This bit is only active if module is in Hi-Speed mode.
1 = The USB module repetitively transmits on the bus a 53-byte test packet. Test packet must be loaded into the Endpoint 0 FIFO before the test mode is entered.
0 = Normal operation

bit 26 **TESTK:** Test_K Test Mode Select bit
1 = Enters Test_K test mode. The USB module transmits a continuous K on the bus.
0 = Normal operation
This bit is only active if the USB module is in Hi-Speed mode.

bit 25 **TESTJ:** Test_J Test Mode Select bit
1 = Enters Test_J test mode. The USB module transmits a continuous J on the bus.
0 = Normal operation
This bit is only active if the USB module is in Hi-Speed mode.

bit 24 **NAK:** Test_SE0_NAK Test Mode Select bit
1 = Enter Test_SE0_NAK test mode. The USB module remains in Hi-Speed mode but responds to any valid IN token with a NAK
0 = Normal operation
This mode is only active if module is in Hi-Speed mode.

bit 23-20 **Unimplemented:** Read as '0'

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-28 **Unimplemented:** Read as '0'

bit 27 **DISPING:** Disable Ping tokens control bit (*Host mode*)
1 = USB Module will not issue PING tokens in data and status phases of a Hi-Speed Control transfer
0 = Ping tokens are issued

bit 26 **DTWREN:** Data Toggle Write Enable bit (*Host mode*)
1 = Enable the current state of the Endpoint 0 data toggle to be written. Automatically cleared.
0 = Disable data toggle write

bit 25 **DATATGGL:** Data Toggle bit (*Host mode*)
When read, this bit indicates the current state of the Endpoint 0 data toggle.
If DTWREN = 1, this bit is writable with the desired setting.
If DTWREN = 0, this bit is read-only.

bit 24 **FLSHFIFO:** Flush FIFO Control bit
1 = Flush the next packet to be transmitted/read from the Endpoint 0 FIFO. The FIFO pointer is reset and the TXPKTRDY/RXPKTRDY bit is cleared. Automatically cleared when the operation completes. Should only be used when TXPKTRDY/RXPKTRDY = 1.
0 = No Flush operation

bit 23 **SVCSETEND:** Clear SETUPEND Control bit (*Device mode*)
1 = Clear the SETUPEND bit in this register. This bit is automatically cleared.
0 = Do not clear

NAKTMOUT: NAK Time-out Control bit (*Host mode*)
1 = Endpoint 0 is halted following the receipt of NAK responses for longer than the time set by the NAKLIM<4:0> bits (USBICSR<28:24>)
0 = Allow the endpoint to continue

bit 22 **SVCRPR:** Serviced RXPKTRDY Clear Control bit (*Device mode*)
1 = Clear the RXPKTRDY bit in this register. This bit is automatically cleared.
0 = Do not clear

STATPKT: Status Stage Transaction Control bit (*Host mode*)
1 = When set at the same time as the TXPKTRDY or REQPKT bit is set, performs a status stage transaction
0 = Do not perform a status stage transaction

REGISTER 11-5: USBIE0CSR0: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 0 (ENDPOINT 0) (CONTINUED)

bit 21 **SENDSTALL:** Send Stall Control bit (*Device mode*)
1 = Terminate the current transaction and transmit a STALL handshake. This bit is automatically cleared.
0 = Do not send STALL handshake.

REQPKT: IN transaction Request Control bit (*Host mode*)
1 = Request an IN transaction. This bit is cleared when the RXPKTRDY bit is set.
0 = Do not request an IN transaction

bit 20 **SETUPEND:** Early Control Transaction End Status bit (*Device mode*)
1 = A control transaction ended before the DATAEND bit has been set. An interrupt will be generated and the FIFO flushed at this time.
0 = Normal operation

This bit is cleared by writing a '1' to the SVCSETEND bit in this register.

ERROR: No Response Error Status bit (*Host mode*)
1 = Three attempts have been made to perform a transaction with no response from the peripheral. An interrupt is generated.
0 = Clear this flag. Software must write a '0' to this bit to clear it.

bit 19 **DATAEND:** End of Data Control bit (*Device mode*)
The software sets this bit when:

- Setting TXPKTRDY for the last data packet
- Clearing RXPKTRDY after unloading the last data packet
- Setting TXPKTRDY for a zero length data packet

Hardware clears this bit.

SETUPPKT: Send a SETUP token Control bit (*Host mode*)
1 = When set at the same time as the TXPKTRDY bit is set, the module sends a SETUP token instead of an OUT token for the transaction
0 = Normal OUT token operation

Setting this bit also clears the Data Toggle.

bit 18 **SENTSTALL:** STALL sent status bit (*Device mode*)
1 = STALL handshake has been transmitted
0 = Software clear of bit

RXSTALL: STALL handshake received Status bit (*Host mode*)
1 = STALL handshake was received
0 = Software clear of bit

bit 17 **TXPKTRDY:** TX Packet Ready Control bit
1 = Data packet has been loaded into the FIFO. It is cleared automatically.
0 = No data packet is ready for transmit

bit 16 **RXPKTRDY:** RX Packet Ready Status bit
1 = Data packet has been received. Interrupt is generated (when enabled) when this bit is set.
0 = No data packet has been received

This bit is cleared by setting the SVCRPR bit.

bit 15-0 **Unimplemented:** Read as '0'

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **AUTOSET:** Auto Set Control bit

1 = TXPKTRDY will be automatically set when data of the maximum packet size (value in TXMAXP) is loaded into the TX FIFO. If a packet of less than the maximum packet size is loaded, then TXPKTRDY will have to be set manually.

0 = TXPKTRDY must be set manually for all packet sizes

bit 30 **ISO:** Isochronous TX Endpoint Enable bit (Device mode)

1 = Enables the endpoint for Isochronous transfers

0 = Disables the endpoint for Isochronous transfers and enables it for Bulk or Interrupt transfers.

This bit only has an effect in Device mode. In Host mode, it always returns zero.

bit 29 **MODE:** Endpoint Direction Control bit

1 = Endpoint is TX

0 = Endpoint is RX

This bit only has any effect where the same endpoint FIFO is used for both TX and RX transactions.

bit 28 **DMAREQEN:** Endpoint DMA Request Enable bit

1 = DMA requests are enabled for this endpoint

0 = DMA requests are disabled for this endpoint

bit 27 **FRCDATTG:** Force Endpoint Data Toggle Control bit

1 = Forces the endpoint data toggle to switch and the data packet to be cleared from the FIFO, regardless of whether an ACK was received.

0 = No forced behavior

bit 26 **DMAREQMD:** Endpoint DMA Request Mode Control bit

1 = DMA Request Mode 1

0 = DMA Request Mode 0

This bit must not be cleared either before or in the same cycle as the above DMAREQEN bit is cleared.

bit 25 **DATAWEN:** Data Toggle Write Enable bit (Host mode)

1 = Enable the current state of the TX Endpoint data toggle (DATATGGL) to be written

0 = Disables writing the DATATGGL bit

bit 24 **DATATGGL:** Data Toggle Control bit (Host mode)

When read, this bit indicates the current state of the TX Endpoint data toggle. If DATAWEN = 1, this bit may be written with the required setting of the data toggle. If DATAWEN = 0, any value written to this bit is ignored.

REGISTER 11-8: USBIENCSR0: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 0 (ENDPOINT 1-7) (CONTINUED)

bit 23 **INCOMPTX:** Incomplete TX Status bit (Device mode)

1 = For high-bandwidth Isochronous endpoint, a large packet has been split into 2 or 3 packets for transmission but insufficient IN tokens have been received to send all the parts

0 = Normal operation

In anything other than isochronous transfers, this bit will always return 0.

NAKTMOUT: NAK Time-out status bit (Host mode)

1 = TX endpoint is halted following the receipt of NAK responses for longer than the NAKLIM setting

0 = Written by software to clear this bit

bit 22 **CLRDT:** Clear Data Toggle Control bit

1 = Resets the endpoint data toggle to 0

0 = Do not clear the data toggle

bit 21 **SENTSTALL:** STALL handshake transmission status bit (Device mode)

1 = STALL handshake is transmitted. The FIFO is flushed and the TXPKTRDY bit is cleared.

0 = Written by software to clear this bit

RXSTALL: STALL receipt bit (Host mode)

1 = STALL handshake is received. Any DMA request in progress is stopped, the FIFO is completely flushed and the TXPKTRDY bit is cleared.

0 = Written by software to clear this bit

bit 20 **SENDSTALL:** STALL handshake transmission control bit (Device mode)

1 = Issue a STALL handshake to an IN token

0 = Terminate stall condition

This bit has no effect when the endpoint is being used for Isochronous transfers.

SETUPPKT: Definition bit (Host mode)

1 = When set at the same time as the TXPKTRDY bit is set, send a SETUP token instead of an OUT token for the transaction. This also clears the Data Toggle.

0 = Normal OUT token for the transaction

bit 19 **FLUSH:** FIFO Flush control bit

1 = Flush the latest packet from the endpoint TX FIFO. The FIFO pointer is reset, TXPKTRDY is cleared and an interrupt is generated.

0 = Do not flush the FIFO

bit 18 **UNDERRUN:** Underrun status bit (Device mode)

1 = An IN token has been received when TXPKTRDY is not set.

0 = Written by software to clear this bit.

ERROR: Handshake failure status bit (Host mode)

1 = Three attempts have been made to send a packet and no handshake packet has been received

0 = Written by software to clear this bit.

bit 17 **FIFONE:** FIFO Not Empty status bit

1 = There is at least 1 packet in the TX FIFO

0 = TX FIFO is empty

bit 16 **TXPKTRDY:** TX Packet Ready Control bit

The software sets this bit after loading a data packet into the FIFO. It is cleared automatically when a data packet has been transmitted. This bit is also automatically cleared prior to loading a second packet into a double-buffered FIFO.

REGISTER 11-8: USBIENCSR0: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 0 (ENDPOINT 1-7) (CONTINUED)

bit 15-11 **MULT<4:0>:** Multiplier Control bits

For Isochronous/Interrupt endpoints or of packet splitting on Bulk endpoints, multiplies TXMAXP by MULT+1 for the payload size.

For Bulk endpoints, MULT can be up to 32 and defines the number of “USB” packets of the specified payload into which a single data packet placed in the FIFO should be split, prior to transfer. The data packet is required to be an exact multiple of the payload specified by TXMAXP.

For Isochronous/Interrupts endpoints operating in Hi-Speed mode, MULT may be either 2 or 3 and specifies the maximum number of such transactions that can take place in a single microframe.

bit 10-0 **TXMAXP<10:0>:** Maximum TX Payload per transaction Control bits

This field sets the maximum payload (in bytes) transmitted in a single transaction. The value is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in Full-Speed and Hi-Speed operations.

TXMAXP must be set to an even number of bytes for proper interrupt generation in DMA Mode 1.

	RXMAXP<7:0>							

Legend:	HC = Hardware Cleared	HS = Hardware Set	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **AUTOCLR:** RXPKTRDY Automatic Clear Control bit

1 = RXPKTRDY will be automatically cleared when a packet of RXMAXP bytes has been unloaded from the RX FIFO. When packets of less than the maximum packet size are unloaded, RXPKTRDY will have to be cleared manually. When using a DMA to unload the RX FIFO, data is read from the RX FIFO in 4-byte chunks regardless of the RXMAXP.

0 = No automatic clearing of RXPKTRDY

This bit should not be set for high-bandwidth Isochronous endpoints.

bit 30 **ISO:** Isochronous Endpoint Control bit (*Device mode*)

1 = Enable the RX endpoint for Isochronous transfers

0 = Enable the RX endpoint for Bulk/Interrupt transfers

AUTORQ: Automatic Packet Request Control bit (*Host mode*)

1 = REQPKT will be automatically set when RXPKTRDY bit is cleared.

0 = No automatic packet request

This bit is automatically cleared when a short packet is received.

bit 29 **DMAREQEN:** DMA Request Enable Control bit

1 = Enable DMA requests for the RX endpoint.

0 = Disable DMA requests for the RX endpoint.

bit 28 **DISNYET:** Disable NYET Handshakes Control/PID Error Status bit (*Device mode*)

1 = In Bulk/Interrupt transactions, disables the sending of NYET handshakes. All successfully received RX packets are ACKed including at the point at which the FIFO becomes full.

0 = Normal operation.

In Bulk/Interrupt transactions, this bit only has any effect in Hi-Speed mode, in which mode it should be set for all Interrupt endpoints.

PIDERR: PID Error Status bit (*Host mode*)

1 = In ISO transactions, this indicates a PID error in the received packet.

0 = No error

bit 27 **DMAREQMD:** DMA Request Mode Selection bit

1 = DMA Request Mode 1

0 = DMA Request Mode 0

REGISTER 11-9: USBIENCSR1: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 1 (ENDPOINT 1-7) (CONTINUED)

bit 26 **DATATWEN:** Data Toggle Write Enable Control bit (*Host mode*)
1 = DATATGGL can be written
0 = DATATGGL is not writable

bit 25 **DATATGGL:** Data Toggle bit (*Host mode*)
When read, this bit indicates the current state of the endpoint data toggle.
If DATATWEN = 1, this bit may be written with the required setting of the data toggle.
If DATATWEN = 0, any value written to this bit is ignored.

bit 24 **INCOMPRX:** Incomplete Packet Status bit
1 = The packet in the RX FIFO during a high-bandwidth Isochronous/Interrupt transfer is incomplete because parts of the data were not received
0 = Written by then software to clear this bit
In anything other than Isochronous transfer, this bit will always return 0.

bit 23 **CLRDT:** Clear Data Toggle Control bit
1 = Reset the endpoint data toggle to 0
0 = Leave endpoint data toggle alone

bit 22 **SENTSTALL:** STALL Handshake Status bit (*Device mode*)
1 = STALL handshake is transmitted
0 = Written by the software to clear this bit

RXSTALL: STALL Handshake Receive Status bit (*Host mode*)
1 = A STALL handshake has been received. An interrupt is generated.
0 = Written by the software to clear this bit

bit 21 **SENDSTALL:** STALL Handshake Control bit (*Device mode*)
1 = Issue a STALL handshake
0 = Terminate stall condition

REQPKT: IN Transaction Request Control bit (*Host mode*)
1 = Request an IN transaction.
0 = No request
This bit is cleared when RXPKTRDY is set.

bit 20 **FLUSH:** Flush FIFO Control bit
1 = Flush the next packet to be read from the endpoint RX FIFO. The FIFO pointer is reset and the RXPKTRDY bit is cleared. This should only be used when RXPKTRDY is set. If the FIFO is double-buffered, FLUSH may need to be set twice to completely clear the FIFO.
0 = Normal FIFO operation
This bit is automatically cleared.

bit 19 **DATAERR:** Data Packet Error Status bit (*Device mode*)
1 = The data packet has a CRC or bit-stuff error.
0 = No data error
This bit is cleared when RXPKTRDY is cleared. This bit is only valid when the endpoint is operating in ISO mode. In Bulk mode, it always returns zero.

DERRNAKT: Data Error/NAK Time-out Status bit (*Host mode*)
1 = The data packet has a CRC or bit-stuff error. In Bulk mode, the RX endpoint is halted following the receipt of NAK responses for longer than the time set as the NAK limit.
0 = No data or NAK time-out error

REGISTER 11-9: USBIENCSR1: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 1 (ENDPOINT 1-7) (CONTINUED)

bit 18 **OVERRUN:** Data Overrun Status bit (*Device mode*)

1 = An OUT packet cannot be loaded into the RX FIFO.

0 = Written by software to clear this bit

This bit is only valid when the endpoint is operating in ISO mode. In Bulk mode, it always returns zero.

ERROR: No Data Packet Received Status bit (*Host mode*)

1 = Three attempts have been made to receive a packet and no data packet has been received. An interrupt is generated.

0 = Written by the software to clear this bit.

This bit is only valid when the RX endpoint is operating in Bulk or Interrupt mode. In ISO mode, it always returns zero.

bit 17 **FIFOFULL:** FIFO Full Status bit

1 = No more packets can be loaded into the RX FIFO

0 = The RX FIFO has at least one free space

bit 16 **RXPKTRDY:** Data Packet Reception Status bit

1 = A data packet has been received. An interrupt is generated.

0 = Written by software to clear this bit when the packet has been unloaded from the RX FIFO.

bit 15-11 **MULT<4:0>:** Multiplier Control bits

For Isochronous/Interrupt endpoints or of packet splitting on Bulk endpoints, multiplies TXMAXP by MULT+1 for the payload size.

For Bulk endpoints, MULT can be up to 32 and defines the number of “USB” packets of the specified payload into which a single data packet placed in the FIFO should be split, prior to transfer. The data packet is required to be an exact multiple of the payload specified by TXMAXP.

For Isochronous/Interrupts endpoints operating in Hi-Speed mode, MULT may be either 2 or 3 and specifies the maximum number of such transactions that can take place in a single microframe.

bit 10-0 **RXMAXP<10:0>:** Maximum RX Payload Per Transaction Control bits

This field sets the maximum payload (in bytes) transmitted in a single transaction. The value is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in Full-Speed and Hi-Speed operations.

RXMAXP must be set to an even number of bytes for proper interrupt generation in DMA Mode 1.

bit 31-24 **TXINTERV<7:0>:** Endpoint TX Polling Interval/NAK Limit bits (*Host mode*)

For Interrupt and Isochronous transfers, this field defines the polling interval for the endpoint. For Bulk endpoints, this field sets the number of frames/microframes after which the endpoint should time out on receiving a stream of NAK responses.

The following table describes the valid values and interpretation for these bits:

Transfer Type	Speed	Valid Values (m)	Interpretation
Interrupt	Low/Full	0x01 to 0xFF	Polling interval is 'm' frames.
	High	0x01 to 0x10	Polling interval is $2^{(m-1)}$ frames.
Isochronous	Full or High	0x01 to 0x10	Polling interval is $2^{(m-1)}$ frames/microframes.
Bulk	Full or High	0x02 to 0x10	NAK limit is $2^{(m-1)}$ frames/microframes. A value of '0' or '1' disables the NAK time-out function.

bit 23-22 **SPEED<1:0>:** TX Endpoint Operating Speed Control bits (*Host mode*)
11 = Low-Speed
10 = Full-Speed
01 = Hi-Speed
00 = Reserved

bit 21-20 **PROTOCOL<1:0>:** TX Endpoint Protocol Control bits
11 = Interrupt
10 = Bulk
01 = Isochronous
00 = Control

bit 19-16 **TEP<3:0>:** TX Target Endpoint Number bits

This value is the endpoint number contained in the TX endpoint descriptor returned to the USB module during device enumeration.

bit 15-14 **Unimplemented:** Read as '0'

bit 13-0 **RXCNT<13:0>:** Receive Count bits

The number of received data bytes in the endpoint RX FIFO. The value returned changes as the contents of the FIFO change and is only valid while RXPKTRDY is set.

bit 31-0 **DATA<31:0>:** USB Transmit/Receive FIFO Data bits

Writes to this register loads data into the TxFIFO for the corresponding endpoint. Reading from this register unloads data from the RxFIFO for the corresponding endpoint.

Transfers may be 8-bit, 16-bit or 32-bit as required, and any combination of access is allowed provided the data accessed is contiguous. However, all transfers associated with one packet must be of the same width so that data is consistently byte-, word- or double-word aligned. The last transfer may contain fewer bytes than the previous transfers in order to complete an odd-byte or odd-word transfer.

bit 31-24 **VPLEN<7:0>:** VBUS pulsing charge length bits
Sets the duration of the VBUS pulsing charge in units of 546.1 µs. (The default setting corresponds to 32.77 ms.)

bit 23-20 **WTCON<3:0>:** Connect/Disconnect filter control bits
Sets the wait to be applied to allow for the connect/disconnect filter in units of 533.3 ns. The default setting corresponds to 2.667 µs.

bit 19-6 **WTID<3:0>:** ID delay valid control bits
Sets the delay to be applied from IDPULLUP being asserted to IDDIG being considered valid in units of 4.369ms. The default setting corresponds to 52.43ms.

bit 15-12 **DMACHANS<3:0>:** DMA Channels bits
These read-only bits provide the number of DMA channels in the USB module. For the PIC32MZ EF family, this number is 8.

bit 11-8 **RAMBITS<3:0>:** RAM address bus width bits
These read-only bits provide the width of the RAM address bus. For the PIC32MZ EF family, this number is 12.

bit 7-4 **RXENDPTS<3:0>:** Included RX Endpoints bits
This read-only register gives the number of RX endpoints in the design. For the PIC32MZ EF family, this number is 7.

bit 3-0 **TXENDPTS<3:0>:** Included TX Endpoints bits
These read-only bits provide the number of TX endpoints in the design. For the PIC32MZ EF family, this number is 7.

bit 31-4 **Unimplemented:** Read as '0'

bit 3-0 **THBST<3:0>:** High Speed Time-out Adder bits
These bits represent the value to be added to the minimum high speed time-out period of 736 bit times. The time-out period can be increased in increments of 64 Hi-Speed bit times (133 ns).

Note:	Use of this register will allow the Hi-Speed time-out to be set to values that are greater than the maximum specified in the USB 2.0 specification, making the USB module non-compliant.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-30 **Unimplemented:** Read as '0'

bit 29 **LPMERRIE:** LPM Error Interrupt Enable bit
1 = LPMERR interrupt is enabled
0 = LPMERR interrupt is disabled

bit 28 **LPMRESIE:** LPM Resume Interrupt Enable bit
1 = LPMRES interrupt is enabled
0 = LPMRES interrupt is disabled

bit 27 **LPMACKIE:** LPM Acknowledge Interrupt Enable bit
1 = Enable the LPMACK Interrupt
0 = Disable the LPMACK Interrupt

bit 26 **LPMNYIE:** LPM NYET Interrupt Enable bit
1 = Enable the LPMNYET Interrupt
0 = Disable the LPMNYET Interrupt

bit 25 **LPMSTIE:** LPM STALL Interrupt Enable bit
1 = Enable the LPMST Interrupt
0 = Disable the LPMST Interrupt

bit 24 **LPMTOIE:** LPM Time-out Interrupt Enable bit
1 = Enable the LPMTO Interrupt
0 = Disable the LPMTO Interrupt

bit 23-21 **Unimplemented:** Read as '0'

bit 20 **LPMNAK:** LPM-only Transaction Setting bit
1 = All endpoints will respond to all transactions other than a LPM transaction with a NAK
0 = Normal transaction operation
Setting this bit to '1' will only take effect after the USB module as been LPM suspended.

bit 19-18 **LPMEN<1:0>:** LPM Enable bits (*Device mode*)
11 = LPM Extended transactions are supported
10 = LPM and Extended transactions are not supported
01 = LPM mode is not supported but Extended transactions are supported
00 = LPM Extended transactions are supported

bit 17 **LPMRES:** LPM Resume bit
1 = Initiate resume (remote wake-up). Resume signaling is asserted for 50 µs.
0 = No resume operation
This bit is self-clearing.

REGISTER 11-28: USBLPMR1: USB LINK POWER MANAGEMENT CONTROL REGISTER 1 (CONTINUED)

bit 16 **LPMXMT:** LPM Transition to the L1 State bit

When in *Device mode*:

1 = USB module will transition to the L1 state upon the receipt of the next LPM transaction. LPMEN must be set to '0b11. Both LPMXMT and LPMEN must be set in the same cycle.

0 = Maintain current state

When LPMXMT and LPMEN are set, the USB module can respond in the following ways:

- If no data is pending (all TX FIFOs are empty), the USB module will respond with an ACK. The bit will self clear and a software interrupt will be generated.
- If data is pending (data resides in at least one TX FIFO), the USB module will respond with a NYET. In this case, the bit will not self clear however a software interrupt will be generated.

When in *Host mode*:

1 = USB module will transmit an LPM transaction. This bit is self clearing, and will be immediately cleared upon receipt of any Token or three time-outs have occurred.

0 = Maintain current state

bit 15-12 **ENDPOINT<3:0>:** LPM Token Packet Endpoint bits

This is the endpoint in the token packet of the LPM transaction.

bit 11-9 **Unimplemented:** Read as '0'

bit 8 **RMTWAK:** Remote Wake-up Enable bit

This bit is applied on a temporary basis only and is only applied to the current suspend state.

1 = Remote wake-up is enabled

0 = Remote wake-up is disabled

bit 7-4 **HIRD<3:0>:** Host Initiated Resume Duration bits

The minimum time the host will drive resume on the bus. The value in this register corresponds to an actual resume time of:

Resume Time = 50 µs + HIRD * 75 µs. The resulting range is 50 µs to 1200 µs.

bit 3-0 **LNKSTATE<3:0>:** Link State bits

This value is provided by the host to the peripheral to indicate what state the peripheral must transition to after the receipt and acceptance of a LPM transaction. The only valid value for this register is '1' for Sleep State (L1). All other values are reserved.

bit 0 **USBWKUPEN:** USB Activity Detection Interrupt Enable bit
1 = Enable interrupt for detection of activity on USB bus in Sleep mode
0 = Disable interrupt for detection of activity on USB bus in Sleep mode

12.0 I/O PORTS

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 12. "I/O Ports"** (DS60001120) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

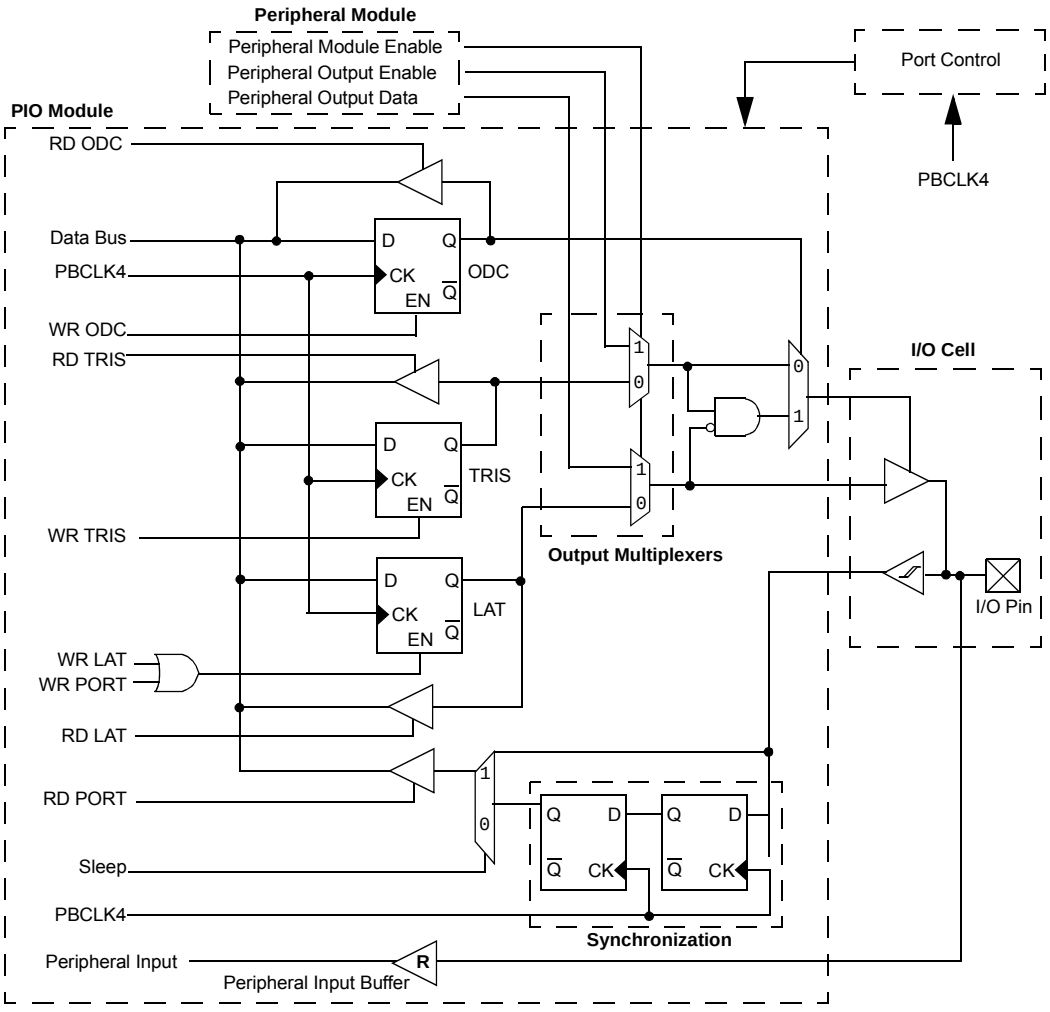
General purpose I/O pins are the simplest of peripherals. They allow the PIC32MZ EF family device to monitor and control other devices. To add flexibility and functionality, some pins are multiplexed with alternate function(s). These functions depend on which peripheral features are on the device. In general, when a peripheral is functioning, that pin may not be used as a general purpose I/O pin.

Some of the key features of the I/O ports are:

- Individual output pin open-drain enable/disable
- Individual input pin weak pull-up and pull-down
- Monitor selective inputs and generate interrupt when change in pin state is detected
- Operation during Sleep and Idle modes
- Fast bit manipulation using CLR, SET and INV registers

Figure 12-1 illustrates a block diagram of a typical multiplexed I/O port.

FIGURE 12-1: BLOCK DIAGRAM OF A TYPICAL MULTIPLEXED PORT STRUCTURE



Legend: R = Peripheral input buffer types may vary. Refer to Table 1-1 for peripheral details.

Note: This block diagram is a general representation of a shared port/peripheral structure for illustration purposes only. The actual structure for any specific port/peripheral combination may be different than it is shown here.

12.1 Parallel I/O (PIO) Ports

All port pins have up to 14 registers directly associated with their operation as digital I/O. The data direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx) read the latch. Writes to the latch write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

12.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORTx, LATx, and TRISx registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired 5V-tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

Refer to the pin name tables (Table 2 through Table 5) for the available pins and their functionality.

12.1.2 CONFIGURING ANALOG AND DIGITAL PORT PINS

The ANSELx register controls the operation of the analog port pins. The port pins that are to function as analog inputs must have their corresponding ANSEL and TRIS bits set. In order to use port pins for I/O functionality with digital modules, such as Timers, UARTs, etc., the corresponding ANSELx bit must be cleared.

The ANSELx register has a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

If the TRIS bit is cleared (output) while the ANSELx bit is set, the digital output level (VOH or VOL) is converted by an analog peripheral, such as the ADC module or Comparator module.

When the PORT register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

12.1.3 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be an NOP.

12.1.4 INPUT CHANGE NOTIFICATION

The input change notification function of the I/O ports allows the PIC32MZ EF devices to generate interrupt requests to the processor in response to a change-of-state on selected input pins. This feature can detect input change-of-states even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a change-of-state.

Seven control registers are associated with the CN functionality of each I/O port. The CNENx/CNNEx registers contain the CN interrupt enable control bits for each of the input pins. Setting any of these bits enables a CN interrupt for the corresponding pins. CNENx enables a mismatch CN interrupt condition when the EDGEDETECT bit (CNCONx<11>) is not set. When the EDGEDETECT bit is set, CNNEx controls the negative edge while CNENx controls the positive.

The CNSTATx/CNFx registers indicate the status of change notice based on the setting of the EDGEDETECT bit. If the EDGEDETECT bit is set to '0', the CNSTATx register indicates whether a change occurred on the corresponding pin since the last read of the PORTx bit. If the EDGEDETECT bit is set to '1', the CNFx register indicates whether a change has occurred and through the CNNEx/CNENx registers the edge type of the change that occurred is also indicated.

Each I/O pin also has a weak pull-up and a weak pull-down connected to it. The pull-ups act as a current source or sink source connected to the pin, and eliminate the need for external resistors when push-button or keypad devices are connected. The pull-ups and pull-downs are enabled separately using the CNPUx and the CNPDx registers, which contain the control bits for each of the pins. Setting any of the control bits enables the weak pull-ups and/or pull-downs for the corresponding pins.

Note:	Pull-ups and pull-downs on change notification pins should always be disabled when the port pin is configured as a digital output.

An additional control register (CNCONx) is shown in Register 12-3.

12.2 Registers for Slew Rate Control

Some I/O pins can be configured for various types of slew rate control on its associated port. This is controlled by the Slew Rate Control bits in the SRCON1x and SRCON0x registers that are associated with each I/O port. The slew rate control is configured using the corresponding bit in each register, as shown in Table 12-1.

As an example, writing 0x0001, 0x0000 to SRCON1A and SRCON0A, respectively, will enable slew rate control on the RA0 pin and sets the slew rate to the slow edge rate.

TABLE 12-1: SLEW RATE CONTROL BIT SETTINGS

SRCON1x	SRCON0x	Description
1	1	Slew rate control is enabled and is set to the slowest edge rate.
1	0	Slew rate control is enabled and is set to the slow edge rate.
0	1	Slew rate control is enabled and is set to the medium edge rate.
0	0	Slew rate control is disabled and is set to the fastest edge rate.

Note: By default, all of the Port pins are set to the fastest edge rate.

12.3 CLR, SET, and INV Registers

Every I/O module register has a corresponding CLR (clear), SET (set) and INV (invert) register designed to provide fast atomic bit manipulations. As the name of the register implies, a value written to a SET, CLR or INV register effectively performs the implied operation, but only on the corresponding base register and only bits specified as '1' are modified. Bits specified as '0' are not modified.

Reading SET, CLR and INV registers returns undefined values. To see the affects of a write operation to a SET, CLR or INV register, the base register must be read.

12.4 Peripheral Pin Select (PPS)

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin-count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient workarounds in application code or a complete redesign may be the only option.

PPS configuration provides an alternative to these choices by enabling peripheral set selection and their placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The PPS configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to these I/O pins. PPS is performed in software and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

12.4.1 AVAILABLE PINS

The number of available pins is dependent on the particular device and its pin count. Pins that support the PPS feature include the designation "RPn" in their full pin designation, where "RP" designates a remappable peripheral and "n" is the remappable port number.

12.4.2 AVAILABLE PERIPHERALS

The peripherals managed by the PPS are all digital-only peripherals. These include general serial communications (UART, SPI, and CAN), general purpose timer clock inputs, timer-related peripherals (input capture and output compare), interrupt-on-change inputs, and reference clocks (input and output).

In comparison, some digital-only peripheral modules are never included in the PPS feature. This is because the peripheral's function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. These modules include I^2C among others. A similar requirement excludes all modules with analog inputs, such as the Analog-to-Digital Converter (ADC).

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/O and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

12.4.3 CONTROLLING PPS

PPS features are controlled through two sets of SFRs: one to map peripheral inputs, and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

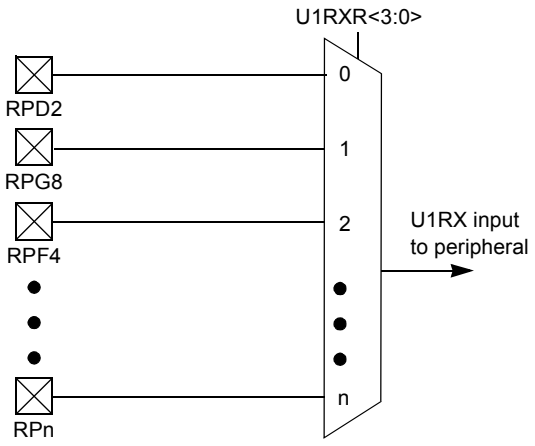
The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

12.4.4 INPUT MAPPING

The inputs of the PPS options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The [*pin name*]R registers, where [*pin name*] refers to the peripheral pins listed in Table 12-2, are used to configure peripheral input mapping (see Register 12-1). Each register contains sets of 4 bit fields. Programming these bit fields with an appropriate value maps the RPn pin with the corresponding value to that peripheral. For any given device, the valid range of values for any bit field is shown in Table 12-2.

For example, Figure 12-2 illustrates the remappable pin selection for the U1RX input.

FIGURE 12-2: REMAPPABLE INPUT EXAMPLE FOR U1RX



Note: For input only, PPS functionality does not have priority over TRISx settings. Therefore, when configuring RPn pin for input, the corresponding bit in the TRISx register must also be configured for input (set to '1').

Note 1: This selection is not available on 64-pin devices.

2: This selection is not available on 64-pin or 100-pin devices.

3: This selection is not available on devices without a CAN module.

4: This selection is not available when the USB module is not used and the pin is connected to VSS.

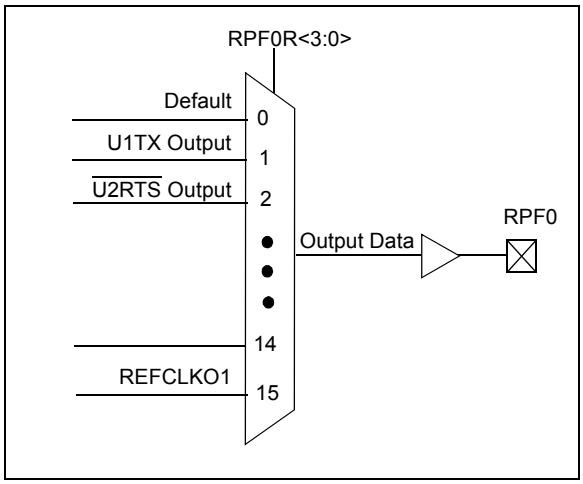
12.4.5 OUTPUT MAPPING

In contrast to inputs, the outputs of the PPS options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPnR registers (Register 12-2) are used to control output mapping. Like the [*pin name*]R registers, each register contains sets of 4 bit fields. The value of the bit field corresponds to one of the peripherals, and that peripheral's output is mapped to the pin (see Table 12-3 and Figure 12-3).

A null output is associated with the output register reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

FIGURE 12-3: EXAMPLE OF MULTIPLEXING OF REMAPPABLE OUTPUT FOR RPF0



12.4.6 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. PIC32MZ EF devices include two features to prevent alterations to the peripheral map:

- Control register lock sequence
- Configuration bit select lock

12.4.6.1 Control Register Lock

Under normal operation, writes to the RPnR and [*pin name*]R registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK Configuration bit (CFGCON<13>). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear the IOLOCK bit, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the *"PIC32 Family Reference Manual"* for details.

12.4.6.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPnR and [*pin name*]R registers. The IOL1WAY Configuration bit (DEVCFG3<29>) blocks the IOLOCK bit from being cleared after it has been set once. If IOLOCK remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session.

	ON	—	—	—	EDGEDETECT	—	—	—
7:0	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Change Notice (CN) Control ON bit
- 1 = CN is enabled
- 0 = CN is disabled

bit 14-12 **Unimplemented:** Read as '0'

bit 11 **EDGEDETECT:** Change Notification Style bit
- 1 = Edge Style. Detect edge transitions (CNFx used for CN Event).
- 0 = Mismatch Style. Detect change from last PORTx read (CNSTATx used for CN Event).

bit 10-0 **Unimplemented:** Read as '0'

13.0 TIMER1

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. "Timers"** (DS60001105) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices feature one synchronous/asynchronous 16-bit timer that can operate as a free-running interval timer for various timing applications and counting external events. This timer can also be used with the Low-Power Secondary Oscillator (SOSC) for real-time clock applications.

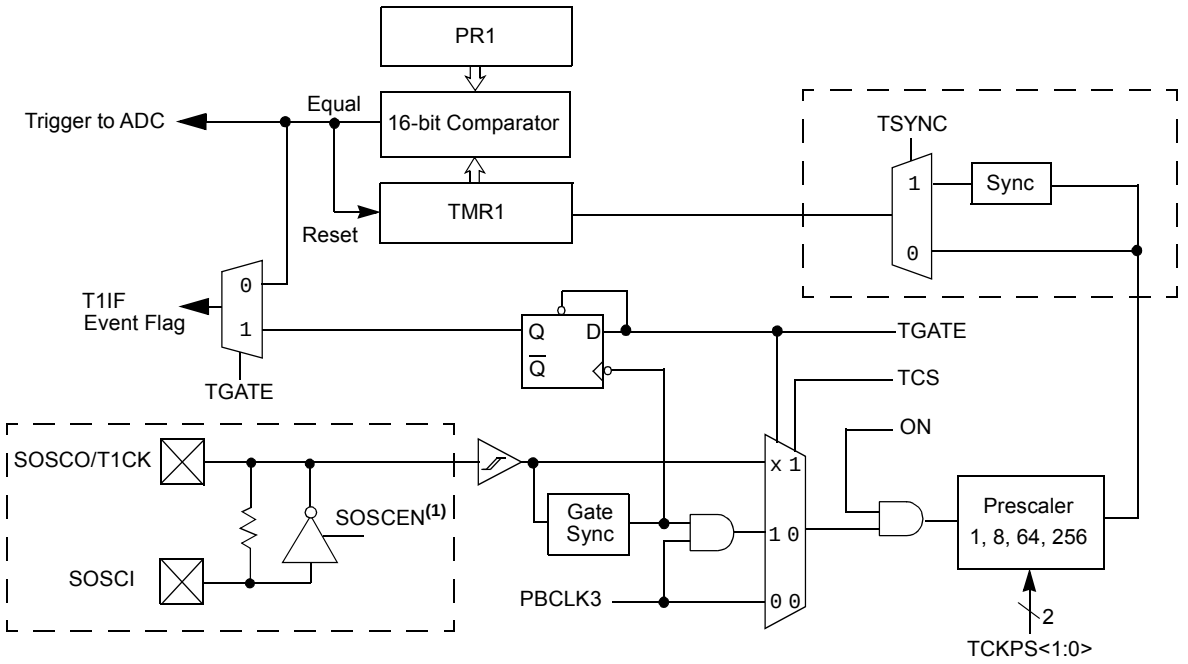
The following modes are supported by Timer1:

- Synchronous Internal Timer
- Synchronous Internal Gated Timer
- Synchronous External Timer
- Asynchronous External Timer

13.1 Additional Supported Features

- Selectable clock prescaler
- Timer operation during Sleep and Idle modes
- Fast bit manipulation using CLR, SET and INV registers
- Asynchronous mode can be used with the SOSC to function as a real-time clock
- ADC event trigger

FIGURE 13-1: TIMER1 BLOCK DIAGRAM



Note 1: The default state of the SOSCEN bit (OSCCON<1>) during a device Reset is controlled by the FSOSCEN bit in Configuration Word, DEVCFG1.

14.0 TIMER2/3, TIMER4/5, TIMER6/7, AND TIMER8/9

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. "Timers"** (DS60001105) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The PIC32MZ EF family of devices features eight synchronous 16-bit timers (default) that can operate as a free-running interval timer for various timing applications and counting external events.

The following modes are supported:

- Synchronous internal 16-bit timer
- Synchronous internal 16-bit gated timer
- Synchronous external 16-bit timer

Four 32-bit synchronous timers are available by combining Timer2 with Timer3, Timer4 with Timer5, Timer6 with Timer7, and Timer8 with Timer9.

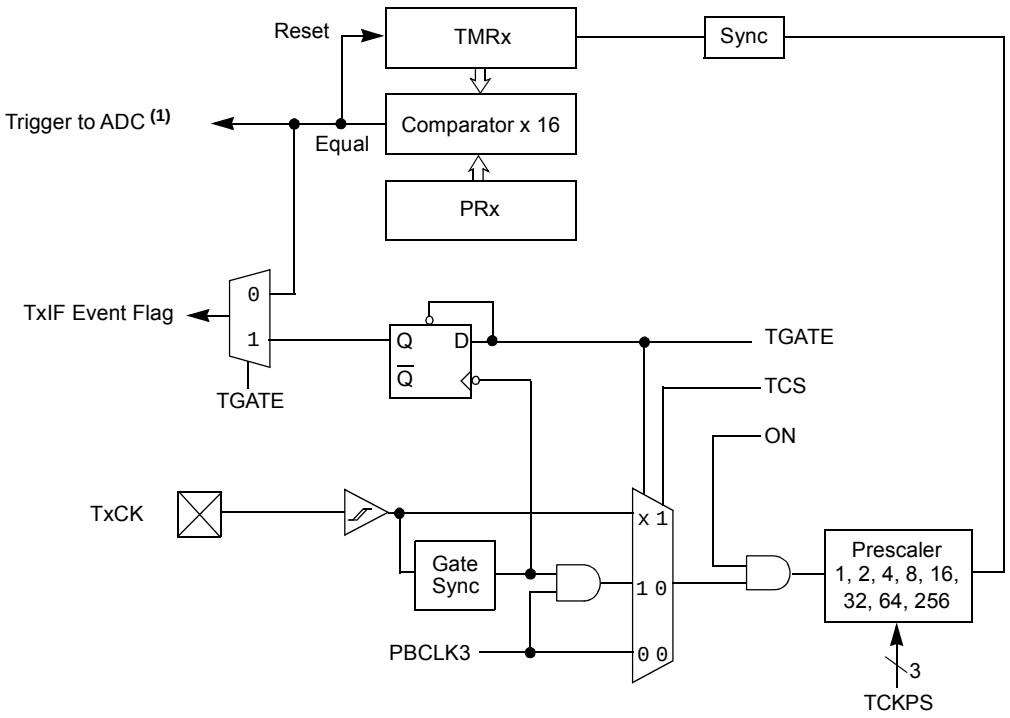
The 32-bit timers can operate in one of three modes:

- Synchronous internal 32-bit timer
- Synchronous internal 32-bit gated timer
- Synchronous external 32-bit timer

14.1 Additional Supported Features

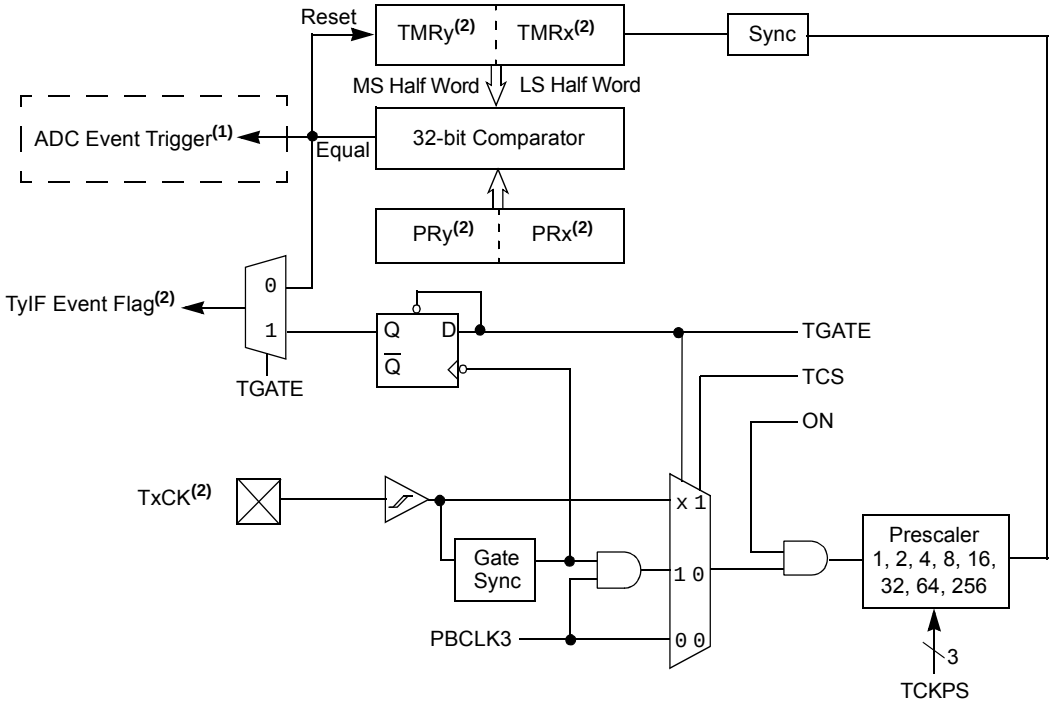
- Selectable clock prescaler
- Timers operational during CPU idle
- Time base for Input Capture and Output Compare modules (Timer2 through Timer7 only)
- ADC event trigger (Timer3 and Timer5 only)
- Fast bit manipulation using CLR, SET, and INV registers

FIGURE 14-1: TIMER2 THROUGH TIMER9 BLOCK DIAGRAM (16-BIT)



Note 1: The ADC event trigger is available on Timer3 and Timer5 only.

FIGURE 14-2: TIMER2/3, TIMER4/5, TIMER6/7, AND TIMER8/9 BLOCK DIAGRAM (32-BIT)



Note 1: ADC event trigger is available only on the Timer2/3 and TImer4/5 pairs.
2: In this diagram, 'x' represents Timer2, 4, 6, or 8, and 'y' represents Timer3, 5, 7, or 9.

Note 1: While operating in 32-bit mode, this bit has no effect for odd numbered timers (Timer1, Timer3, Timer5, Timer7, and Timer9). All timer functions are set through the even numbered timers.

2: While operating in 32-bit mode, this bit must be cleared on odd numbered timers to enable the 32-bit timer in Idle mode.

3: This bit is available only on even numbered timers (Timer2, Timer4, Timer6, and Timer8).

15.0 DEADMAN TIMER (DMT)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. "Watchdog, Deadman, and Power-up Timers"** (DS60001114) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

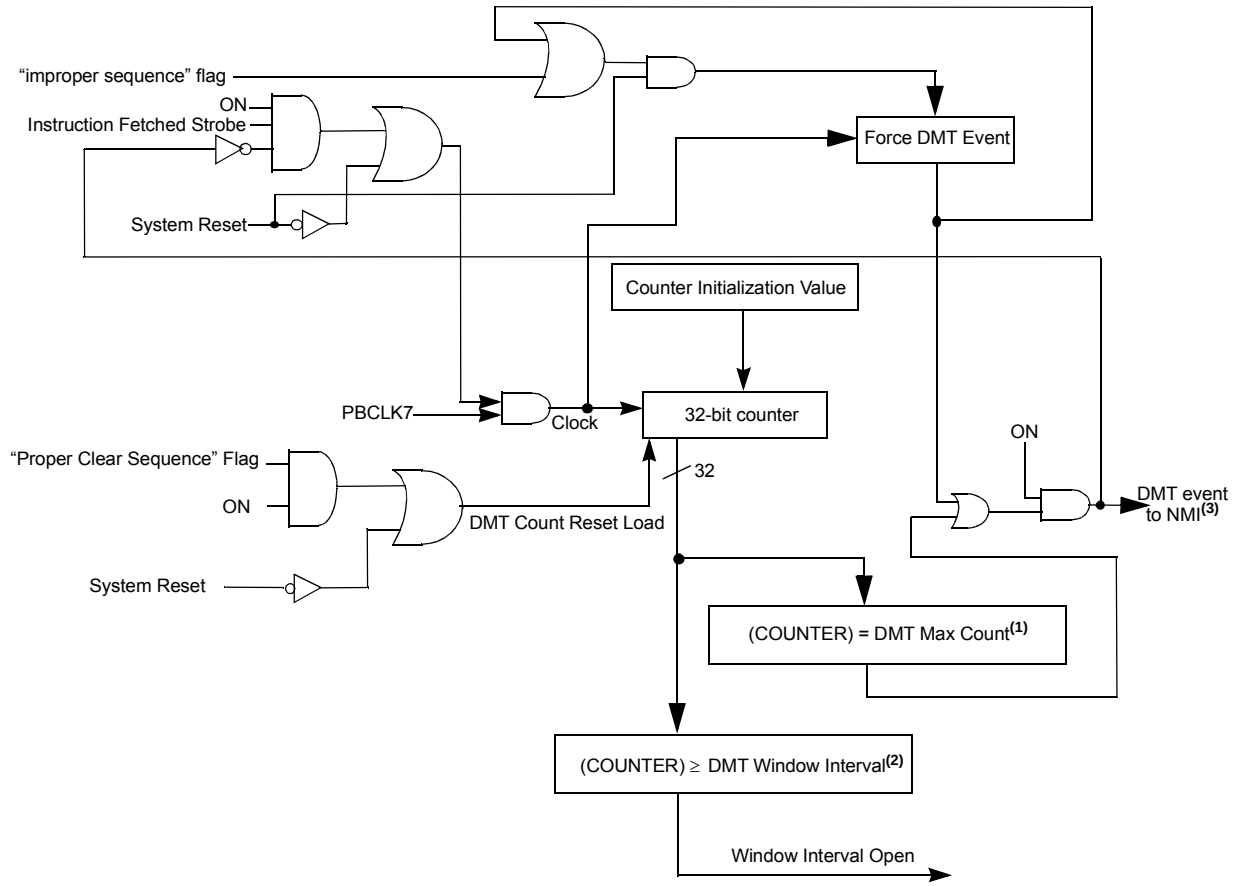
The primary function of the Deadman Timer (DMT) is to reset the processor in the event of a software malfunction. The DMT is a free-running instruction fetch timer, which is clocked whenever an instruction fetch occurs until a count match occurs. Instructions are not fetched when the processor is in Sleep mode.

The DMT consists of a 32-bit counter with a time-out count match value as specified by the DMTCNT<3:0> bits in the DEVCFG1 Configuration register.

A Deadman Timer is typically used in mission critical and safety critical applications, where any single failure of the software functionality and sequencing must be detected.

Figure 15-1 shows a block diagram of the Deadman Timer module.

FIGURE 15-1: DEADMAN TIMER BLOCK DIAGRAM



Note 1: DMT Max Count is controlled by the DMTCNT<3:0> bits in the DEVCFG1 Configuration register.
2: DMT Window Interval is controlled by the DMTINTV<2:0> bits in the DEVCFG1 Configuration register.
3: Refer to **Section 6.0 "Resets"** for more information.

bit 31-8 **Unimplemented:** Read as '0'

bit 7-0 **STEP2<7:0>:** Clear Timer bits

00001000 = Clears STEP1<7:0>, STEP2<7:0> and the Deadman Timer if, and only if, preceded by correct loading of STEP1<7:0> bits in the correct sequence. The write to these bits may be verified by reading DMTCNT and observing the counter being reset.

All other write patterns = Set BAD2 bit, the value of STEP1<7:0> will remain unchanged, and the new value being written STEP2<7:0> will be captured. These bits are also cleared when a DMT reset event occurs.

If the STEP2<7:0> bits are written without preceding with a correct loading of STEP1<7:0> bits, the BAD1 bit is set.

bit 31-8 **PSINTV<31:0>:** DMT Window Interval Configuration Status bits
This is always the value of the DMTINTV<2:0> bits in the DEVCFG1 Configuration register.

NOTES:

16.0 WATCHDOG TIMER (WDT)

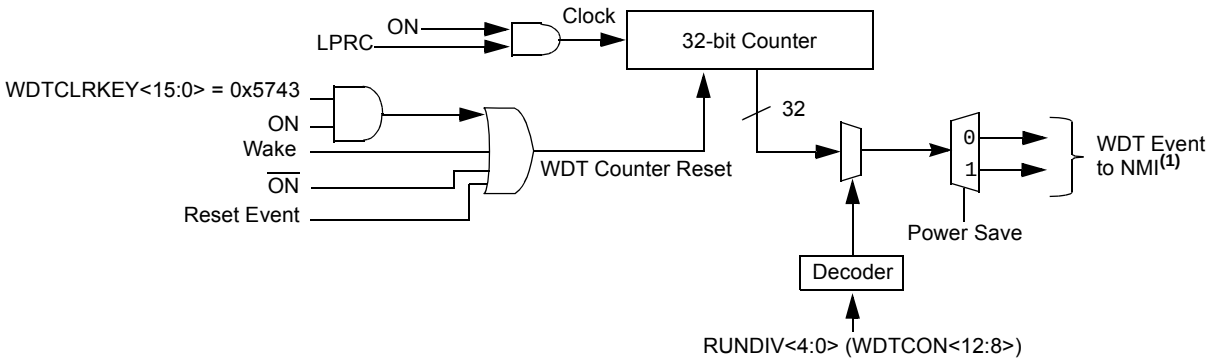
Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. "Watchdog, Deadman, and Power-up Timers"** (DS60001114) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

When enabled, the Watchdog Timer (WDT) operates from the internal Low-Power Oscillator (LPRC) clock source and can be used to detect system software malfunctions by resetting the device if the WDT is not cleared periodically in software. Various WDT time-out periods can be selected using the WDT postscaler. The WDT can also be used to wake the device from Sleep or Idle mode.

The following are key features of the WDT module:

- Configuration or software controlled
- User-configurable time-out period
- Can wake the device from Sleep or Idle

FIGURE 16-1: WATCHDOG TIMER BLOCK DIAGRAM



Note 1: Refer to **6.0 "Resets"** for more information.

16.1 Watchdog Timer Control Registers

bit 31-16 **WDTCLRKEY:** Watchdog Timer Clear Key bits
To clear the Watchdog Timer to prevent a time-out, software must write the value 0x5743 to this location using a single 16-bit write.

bit 15 **ON:** Watchdog Timer Enable bit(1)
1 = The WDT is enabled
0 = The WDT is disabled

bit 14-13 **Unimplemented:** Read as '0'

bit 12-8 **RUNDIV<4:0>:** Watchdog Timer Postscaler Value bits
On reset, these bits are set to the values of the WDTPS<4:0> Configuration bits in DEVCFG1.

bit 7-1 **Unimplemented:** Read as '0'

bit 0 **WDTWINEN:** Watchdog Timer Window Enable bit
1 = Enable windowed Watchdog Timer
0 = Disable windowed Watchdog Timer

Note 1: This bit only has control when the FWDTEN bit (DEVCFG1<23>) = 0.

NOTES:

17.0 INPUT CAPTURE

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 15. "Input Capture"** (DS60001122) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Input Capture module is useful in applications requiring frequency (period) and pulse measurement.

The Input Capture module captures the 16-bit or 32-bit value of the selected Time Base registers when an event occurs at the ICx pin.

Capture events are caused by the following:

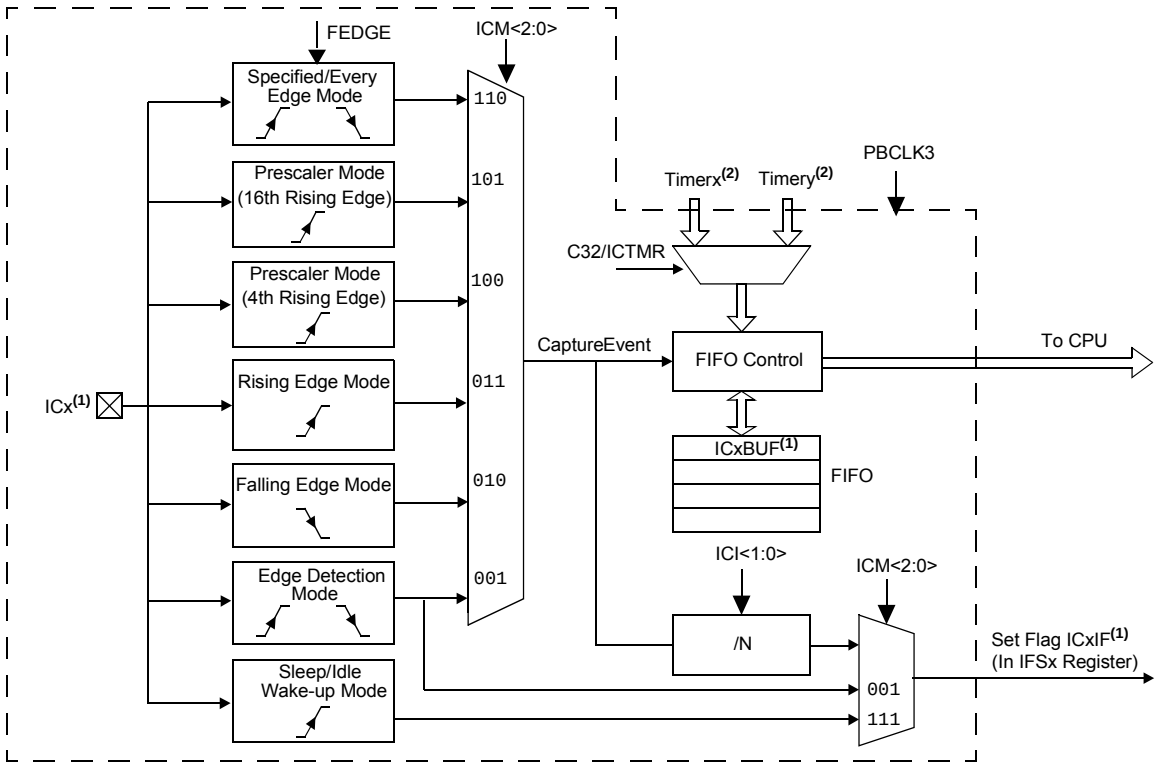
- Capture timer value on every edge (rising and falling), specified edge first
- Prescaler capture event modes:
  - Capture timer value on every 4th rising edge of input at ICx pin
  - Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select between one of six 16-bit timers for the time base, or two of six 16-bit timers together to form a 32-bit timer. The selected timer can use either an internal or external clock.

Other operational features include:

- Device wake-up from capture pin during Sleep and Idle modes
- Interrupt on input capture event
- 4-word FIFO buffer for capture values; Interrupt optionally generated after 1, 2, 3, or 4 buffer locations are filled
- Input capture can also be used to provide additional sources of external interrupts

FIGURE 17-1: INPUT CAPTURE BLOCK DIAGRAM



Note 1: An 'x' in a signal, register or bit name denotes the number of the capture channel.

2: See Table 17-1 for Timerx and Timery selections.

The timer source for each Input Capture module depends on the setting of the ICACLK bit in the CFGCON register. The available configurations are shown in Table 17-1.

TABLE 17-1: TIMER SOURCE CONFIGURATIONS

Input Capture Module	Timerx	Timery

- 1 = Input capture buffer is not empty; at least one more capture value can be read
- 0 = Input capture buffer is empty

bit 2-0 **ICM<2:0>:** Input Capture Mode Select bits
- 111 = Interrupt-Only mode (only supported while in Sleep mode or Idle mode)
- 110 = Simple Capture Event mode – every edge, specified edge first and every edge thereafter
- 101 = Prescaled Capture Event mode – every sixteenth rising edge
- 100 = Prescaled Capture Event mode – every fourth rising edge
- 011 = Simple Capture Event mode – every rising edge
- 010 = Simple Capture Event mode – every falling edge
- 001 = Edge Detect mode – every edge (rising and falling)
- 000 = Input Capture module is disabled

Note 1: Refer to Table 17-1 for Timerx and Timery selections.

18.0 OUTPUT COMPARE

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 16. "Output Compare"** (DS60001111) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

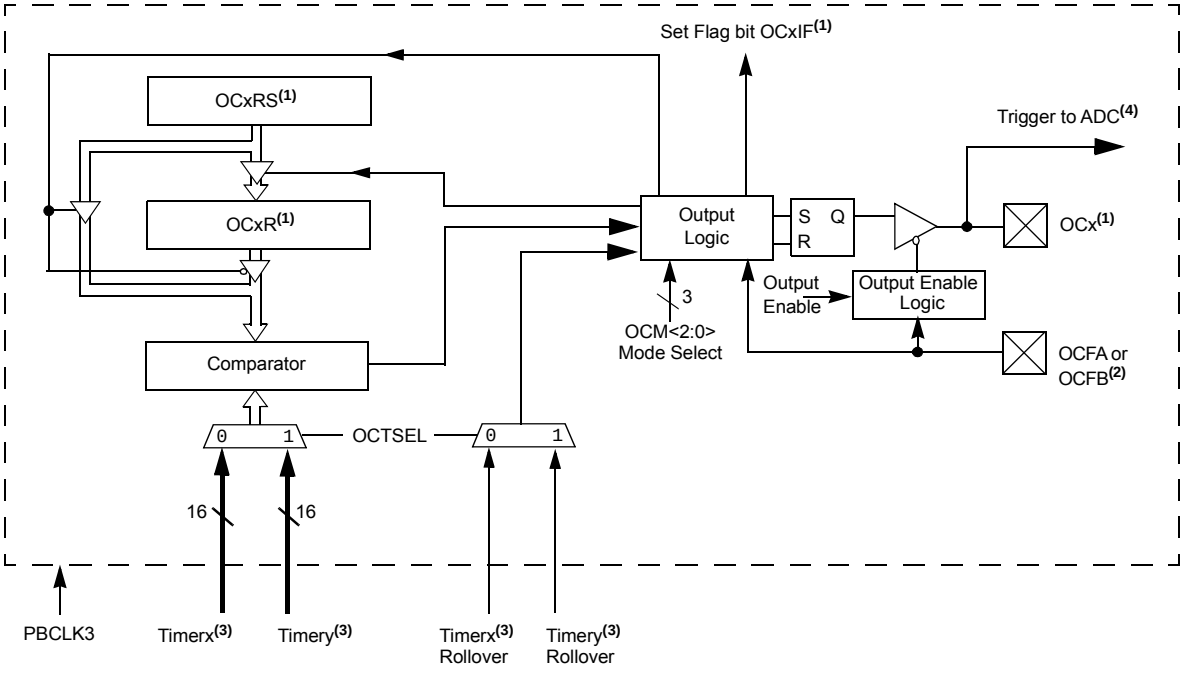
The Output Compare module is used to generate a single pulse or a train of pulses in response to selected time base events.

For all modes of operation, the Output Compare module compares the values stored in the OCxR and/or the OCxRS registers to the value in the selected timer. When a match occurs, the Output Compare module generates an event based on the selected mode of operation.

The following are key features of the Output Compare module:

- Multiple Output Compare modules in a device
- Programmable interrupt generation on compare event
- Single and Dual Compare modes
- Single and continuous output pulse generation
- Pulse-Width Modulation (PWM) mode
- Hardware-based PWM Fault detection and automatic output disable
- Programmable selection of 16-bit or 32-bit time bases
- Can operate from either of two available 16-bit time bases or a single 32-bit time base
- ADC event trigger

FIGURE 18-1: OUTPUT COMPARE MODULE BLOCK DIAGRAM



Note 1: Where 'x' is shown, reference is made to the registers associated with the respective output compare channels, 1 through 9.

2: The OCFA pin controls the OC1, OC3, and OC7-OC9 channels. The OCFB pin controls the OC4-OC6 channels.

3: Refer to Table 18-1 for Timerx and Timery selections.

4: The ADC event trigger is only available on OC1, OC3, and OC 5.

The timer source for each Output Compare module depends on the setting of the OCACLK bit in the CFGCON register. The available configurations are shown in Table 18-1.

TABLE 18-1: TIMER SOURCE CONFIGURATIONS

Output Compare Module	Timerx	Timery

	ON	—	SIDL	—	—	—	—	—
7:0	U-0	U-0	R/W-0	R-0	R/W-0	R/W-0	R/W-0	R/W-0
	—	—	OC32	OCFLT(1)	OCTSEL(2)	OCM<2:0>		

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Output Compare Peripheral On bit
- 1 = Output Compare peripheral is enabled
- 0 = Output Compare peripheral is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
- 1 = Discontinue operation when CPU enters Idle mode
- 0 = Continue operation in Idle mode

bit 12-6 **Unimplemented:** Read as '0'

bit 5 **OC32:** 32-bit Compare Mode bit
- 1 = OCxR<31:0> and/or OCxRS<31:0> are used for comparisons to the 32-bit timer source
- 0 = OCxR<15:0> and OCxRS<15:0> are used for comparisons to the 16-bit timer source

bit 4 **OCFLT:** PWM Fault Condition Status bit(1)
- 1 = PWM Fault condition has occurred (cleared in HW only)
- 0 = No PWM Fault condition has occurred

bit 3 **OCTSEL:** Output Compare Timer Select bit(2)
- 1 = Timery is the clock source for this Output Compare module
- 0 = Timerx is the clock source for this Output Compare module

bit 2-0 **OCM<2:0>:** Output Compare Mode Select bits
- 111 = PWM mode on OCx; Fault pin is enabled
- 110 = PWM mode on OCx; Fault pin is disabled
- 101 = Initialize OCx pin low; generate continuous output pulses on OCx pin
- 100 = Initialize OCx pin low; generate single output pulse on OCx pin
- 011 = Compare event toggles OCx pin
- 010 = Initialize OCx pin high; compare event forces OCx pin low
- 001 = Initialize OCx pin low; compare event forces OCx pin high
- 000 = Output compare peripheral is disabled but continues to draw current

Note 1: This bit is only used when OCM<2:0> = '111'. It is read as '0' in all other modes.

2: Refer to Table 18-1 for Timerx and Timery selections.

NOTES:

19.0 SERIAL PERIPHERAL INTERFACE (SPI) AND INTER-IC SOUND (I^2S)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 23. "Serial Peripheral Interface (SPI)"** (DS60001106) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

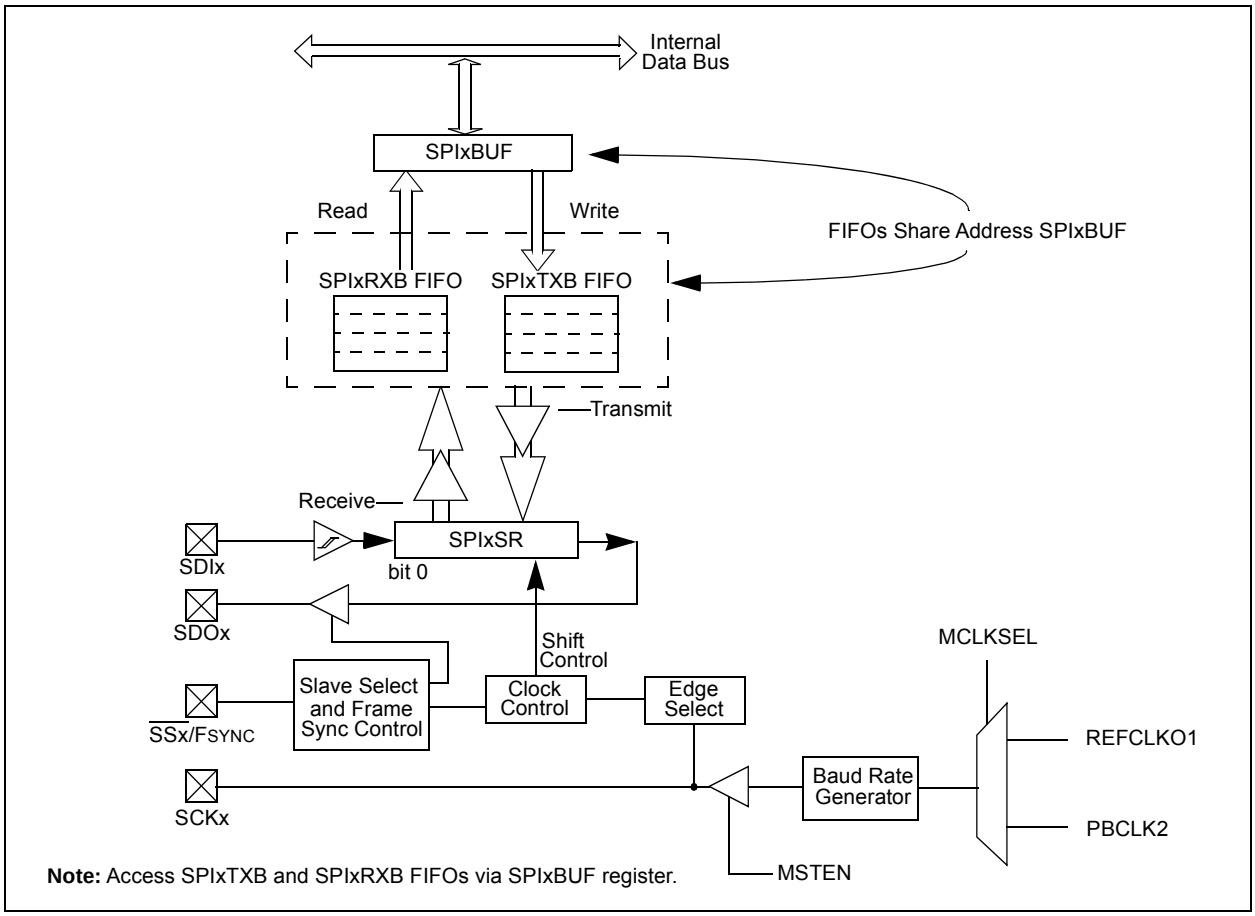
The SPI/I^2S module is a synchronous serial interface that is useful for communicating with external peripherals and other microcontroller devices, as well as digital audio devices. These peripheral devices may be Serial EEPROMs, Shift registers, display drivers, Analog-to-Digital Converters, and so on.

The SPI/I^2S module is compatible with Motorola® SPI and SIOP interfaces.

The following are key features of the SPI module:

- Master and Slave modes support
- Four different clock formats
- Enhanced Framed SPI protocol support
- User-configurable 8-bit, 16-bit and 32-bit data width
- Separate SPI FIFO buffers for receive and transmit
  - FIFO buffers act as 4/8/16-level deep FIFOs based on 32/16/8-bit data width
- Programmable interrupt event on every 8-bit, 16-bit and 32-bit data transfer
- Operation during Sleep and Idle modes
- Audio Codec Support:
  - I^2S protocol
  - Left-justified
  - Right-justified
  - PCM

FIGURE 19-1: SPI/I^2S MODULE BLOCK DIAGRAM



Note: Access SPIxTXB and SPIxRXB FIFOs via SPIxBUF register.

15:8	R/W-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	ON	—	SIDL	DISSDO(4)	MODE32	MODE16	SMP	CKE(2)
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	SSEN	CKP(3)	MSTEN	DISSDI(4)	STXISEL<1:0>		SRXISEL<1:0>	

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **FRMEN:** Framed SPI Support bit
1 = Framed SPI support is enabled ($\overline{SSx}$ pin used as FSYNC input/output)
0 = Framed SPI support is disabled

bit 30 **FRMSYNC:** Frame Sync Pulse Direction Control on $\overline{SSx}$ pin bit (Framed SPI mode only)
1 = Frame sync pulse input (Slave mode)
0 = Frame sync pulse output (Master mode)

bit 29 **FRMPOL:** Frame Sync / Slave Select Polarity bit (Framed SPI or Master Transmit modes only)
1 = Frame pulse or $\overline{SSx}$ pin is active-high
0 = Frame pulse or $\overline{SSx}$ is active-low

bit 28 **MSSEN:** Master Mode Slave Select Enable bit
1 = Slave select SPI support is enabled. The $\overline{SS}$ pin is automatically driven during transmission in Master mode. Polarity is determined by the FRMPOL bit.
0 = Slave select SPI support is disabled.

bit 27 **FRMSYPW:** Frame Sync Pulse Width bit
1 = Frame sync pulse is one character wide
0 = Frame sync pulse is one clock wide

bit 26-24 **FRMCNT<2:0>:** Frame Sync Pulse Counter bits. Controls the number of data characters transmitted per pulse. This bit is only valid in Framed mode.
111 = Reserved
110 = Reserved
101 = Generate a frame sync pulse on every 32 data characters
100 = Generate a frame sync pulse on every 16 data characters
011 = Generate a frame sync pulse on every 8 data characters
010 = Generate a frame sync pulse on every 4 data characters
001 = Generate a frame sync pulse on every 2 data characters
000 = Generate a frame sync pulse on every data character

bit 23 **MCLKSEL:** Master Clock Enable bit(1)
1 = REFCLKO1 is used by the Baud Rate Generator
0 = PBCLK2 is used by the Baud Rate Generator

bit 22-18 **Unimplemented:** Read as '0'

Note 1: This bit can only be written when the ON bit = 0. Refer to **Section 37.0 "Electrical Characteristics"** for maximum clock frequency requirements.

2: This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).

3: When AUDEN = 1, the SPI/I^2S module functions as if the CKP bit is equal to '1', regardless of the actual value of the CKP bit.

4: This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see **Section 12.4 "Peripheral Pin Select (PPS)"** for more information).

REGISTER 19-1: SPIxCON: SPI CONTROL REGISTER (CONTINUED)

bit 17 **SPIFE:** Frame Sync Pulse Edge Select bit (Framed SPI mode only)
1 = Frame synchronization pulse coincides with the first bit clock
0 = Frame synchronization pulse precedes the first bit clock

bit 16 **ENHBUF:** Enhanced Buffer Enable bit(1)
1 = Enhanced Buffer mode is enabled
0 = Enhanced Buffer mode is disabled

bit 15 **ON:** SPI/I2S Module On bit
1 = SPI/I2S module is enabled
0 = SPI/I2S module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Discontinue operation when CPU enters in Idle mode
0 = Continue operation in Idle mode

bit 12 **DISSDO:** Disable SDOx pin bit(4)
1 = SDOx pin is not used by the module. Pin is controlled by associated PORT register
0 = SDOx pin is controlled by the module

bit 11-10 **MODE<32,16>:** 32/16-Bit Communication Select bits

When AUDEN = 1:

MODE32	MODE16	Communication
1	1	24-bit Data, 32-bit FIFO, 32-bit Channel/64-bit Frame
1	0	32-bit Data, 32-bit FIFO, 32-bit Channel/64-bit Frame
0	1	16-bit Data, 16-bit FIFO, 32-bit Channel/64-bit Frame
0	0	16-bit Data, 16-bit FIFO, 16-bit Channel/32-bit Frame

When AUDEN = 0:

MODE32	MODE16	Communication
1	x	32-bit
0	1	16-bit
0	0	8-bit

bit 9 **SMP:** SPI Data Input Sample Phase bit
Master mode (MSTEN = 1):
1 = Input data sampled at end of data output time
0 = Input data sampled at middle of data output time
Slave mode (MSTEN = 0):
SMP value is ignored when SPI is used in Slave mode. The module always uses SMP = 0.

bit 8 **CKE:** SPI Clock Edge Select bit(2)
1 = Serial output data changes on transition from active clock state to Idle clock state (see CKP bit)
0 = Serial output data changes on transition from Idle clock state to active clock state (see CKP bit)

bit 7 **SSEN:** Slave Select Enable (Slave mode) bit
1 = $\overline{SSx}$ pin is used for Slave mode
0 = SSx pin is not used for Slave mode, pin is controlled by the port function.

bit 6 **CKP:** Clock Polarity Select bit(3)
1 = Idle state for clock is a high level; active state is a low level
0 = Idle state for clock is a low level; active state is a high level

Note 1: This bit can only be written when the ON bit = 0. Refer to **Section 37.0 "Electrical Characteristics"** for maximum clock frequency requirements.

2: This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).

3: When AUDEN = 1, the SPI/I2S module functions as if the CKP bit is equal to '1', regardless of the actual value of the CKP bit.

4: This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see **Section 12.4 "Peripheral Pin Select (PPS)"** for more information).

REGISTER 19-1: SPIxCON: SPI CONTROL REGISTER (CONTINUED)

bit 5 **MSTEN:** Master Mode Enable bit
1 = Master mode
0 = Slave mode

bit 4 **DISSDI:** Disable SDI bit(4)
1 = SDI pin is not used by the SPI module (pin is controlled by PORT function)
0 = SDI pin is controlled by the SPI module

bit 3-2 **STXISEL<1:0>:** SPI Transmit Buffer Empty Interrupt Mode bits
11 = Interrupt is generated when the buffer is not full (has one or more empty elements)
10 = Interrupt is generated when the buffer is empty by one-half or more
01 = Interrupt is generated when the buffer is completely empty
00 = Interrupt is generated when the last transfer is shifted out of SPISR and transmit operations are complete

bit 1-0 **SRXISEL<1:0>:** SPI Receive Buffer Full Interrupt Mode bits
11 = Interrupt is generated when the buffer is full
10 = Interrupt is generated when the buffer is full by one-half or more
01 = Interrupt is generated when the buffer is not empty
00 = Interrupt is generated when the last word in the receive buffer is read (i.e., buffer is empty)

Note 1: This bit can only be written when the ON bit = 0. Refer to **Section 37.0 "Electrical Characteristics"** for maximum clock frequency requirements.

2: This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).

3: When AUDEN = 1, the SPI/I^2S module functions as if the CKP bit is equal to '1', regardless of the actual value of the CKP bit.

4: This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see **Section 12.4 "Peripheral Pin Select (PPS)"** for more information).

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **SPISGNEXT:** Sign Extend Read Data from the RX FIFO bit
- 1 = Data from RX FIFO is sign extended
- 0 = Data from RX FIFO is not sign extended

bit 14-13 **Unimplemented:** Read as '0'

bit 12 **FRMERREN:** Enable Interrupt Events via FRMERR bit
- 1 = Frame Error overflow generates error events
- 0 = Frame Error does not generate error events

bit 11 **SPIROVEN:** Enable Interrupt Events via SPIROV bit
- 1 = Receive overflow generates error events
- 0 = Receive overflow does not generate error events

bit 10 **SPITUREN:** Enable Interrupt Events via SPITUR bit
- 1 = Transmit Underrun Generates Error Events
- 0 = Transmit Underrun Does Not Generates Error Events

bit 9 **IGNROV:** Ignore Receive Overflow bit (for Audio Data Transmissions)
- 1 = A ROV is not a critical error; during ROV data in the FIFO is not overwritten by receive data
- 0 = A ROV is a critical error which stop SPI operation

bit 8 **IGNTUR:** Ignore Transmit Underrun bit (for Audio Data Transmissions)
- 1 = A TUR is not a critical error and zeros are transmitted until the SPIxTXB is not empty
- 0 = A TUR is a critical error which stop SPI operation

bit 7 **AUDEN:** Enable Audio CODEC Support bit(1)
- 1 = Audio protocol is enabled
- 0 = Audio protocol is disabled

bit 6-5 **Unimplemented:** Read as '0'

bit 3 **AUDMONO:** Transmit Audio Data Format bit(1,2)
- 1 = Audio data is mono (Each data word is transmitted on both left and right channels)
- 0 = Audio data is stereo

bit 2 **Unimplemented:** Read as '0'

bit 1-0 **AUDMOD<1:0>:** Audio Protocol Mode bit(1,2)
- 11 = PCM/DSP mode
- 10 = Right Justified mode
- 01 = Left Justified mode
- 00 = I^2S mode

Note 1: This bit can only be written when the ON bit = 0.

2: This bit is only valid for AUDEN = 1.

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-29 **Unimplemented:** Read as '0'

bit 28-24 **RXBUFELM<4:0>:** Receive Buffer Element Count bits (valid only when ENHBUF = 1)

bit 23-21 **Unimplemented:** Read as '0'

bit 20-16 **TXBUFELM<4:0>:** Transmit Buffer Element Count bits (valid only when ENHBUF = 1)

bit 15-13 **Unimplemented:** Read as '0'

bit 12 **FRMERR:** SPI Frame Error status bit
1 = Frame error is detected
0 = No Frame error is detected
This bit is only valid when FRMEN = 1.

bit 11 **SPIBUSY:** SPI Activity Status bit
1 = SPI peripheral is currently busy with some transactions
0 = SPI peripheral is currently idle

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **SPITUR:** Transmit Under Run bit
1 = Transmit buffer has encountered an underrun condition
0 = Transmit buffer has no underrun condition
This bit is only valid in Framed Sync mode; the underrun condition must be cleared by disabling/re-enabling the module.

bit 7 **SRMT:** Shift Register Empty bit (valid only when ENHBUF = 1)
1 = When SPI module shift register is empty
0 = When SPI module shift register is not empty

bit 6 **SPIROV:** Receive Overflow Flag bit
1 = A new data is completely received and discarded. The user software has not read the previous data in the SPIxBUF register.
0 = No overflow has occurred
This bit is set in hardware; can only be cleared (= 0) in software.

bit 5 **SPIRBE:** RX FIFO Empty bit (valid only when ENHBUF = 1)
1 = RX FIFO is empty (CRPTR = SWPTR)
0 = RX FIFO is not empty (CRPTR ≠ SWPTR)

bit 4 **Unimplemented:** Read as '0'

REGISTER 19-3: SPIxSTAT: SPI STATUS REGISTER

bit 3 **SPITBE:** SPI Transmit Buffer Empty Status bit
1 = Transmit buffer, SPIxTXB is empty
0 = Transmit buffer, SPIxTXB is not empty
Automatically set in hardware when SPI transfers data from SPIxTXB to SPIxSR.
Automatically cleared in hardware when SPIxBUF is written to, loading SPIxTXB.

bit 2 **Unimplemented:** Read as '0'

bit 1 **SPITBF:** SPI Transmit Buffer Full Status bit
1 = Transmit is not yet started, SPITXB is full
0 = Transmit buffer is not full
Standard Buffer Mode:
Automatically set in hardware when the core writes to the SPIBUF location, loading SPITXB.
Automatically cleared in hardware when the SPI module transfers data from SPITXB to SPISR.
Enhanced Buffer Mode:
Set when CWPTR + 1 = SRPTR; cleared otherwise

bit 0 **SPIRBF:** SPI Receive Buffer Full Status bit
1 = Receive buffer, SPIxRXB is full
0 = Receive buffer, SPIxRXB is not full
Standard Buffer Mode:
Automatically set in hardware when the SPI module transfers data from SPIxSR to SPIxRXB.
Automatically cleared in hardware when SPIxBUF is read from, reading SPIxRXB.
Enhanced Buffer Mode:
Set when SWPTR + 1 = CRPTR; cleared otherwise

NOTES:

20.0 SERIAL QUAD INTERFACE (SQI)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 46. "Serial Quad Interface (SQI)"** (DS60001244) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

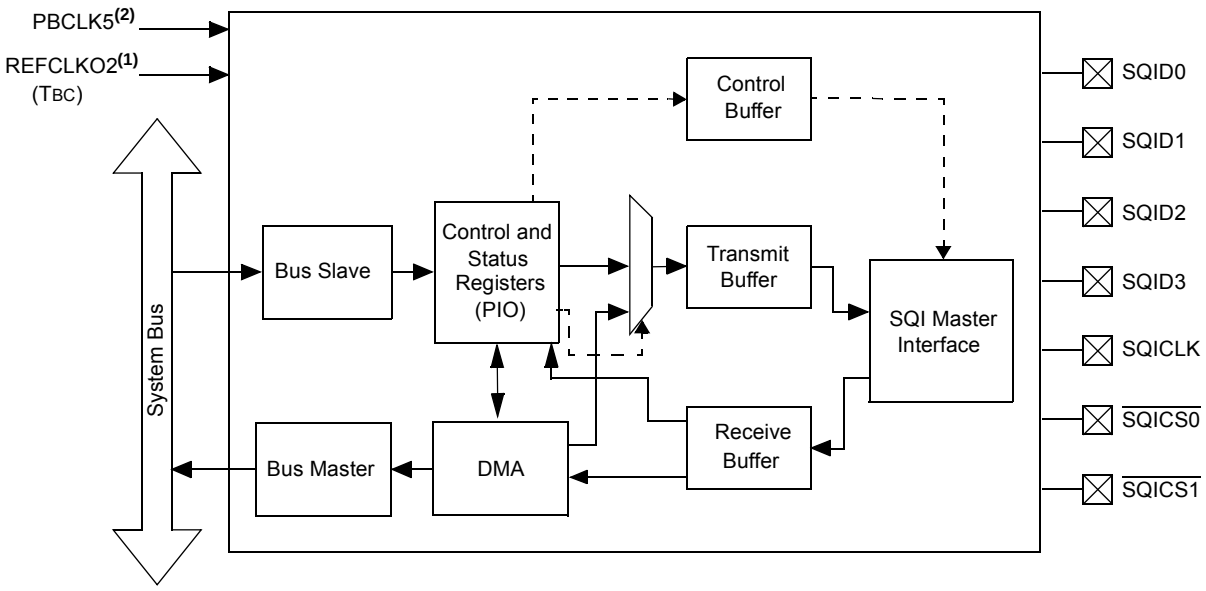
The SQI module is a synchronous serial interface that provides access to serial Flash memories and other serial devices. The SQI module supports Single Lane (identical to SPI), Dual Lane, and Quad Lane modes.

The following are key feature of the SQI module:

- Supports Single, Dual, and Quad Lane modes
- Supports Single Data Rate (SDR) mode
- Programmable command sequence
- eXecute-In-Place (XIP)
- Data transfer:
  - Programmed I/O mode (PIO)
  - Buffer descriptor DMA
- Supports SPI Mode 0 and Mode 3
- Programmable Clock Polarity (CPOL) and Clock Phase (CPHA) bits
- Supports up to two Chip Selects
- Supports up to four bytes of Flash address
- Programmable interrupt thresholds
- 32-byte transmit data buffer
- 32-byte receive data buffer
- 4-word controller buffer

Note: Once the SQI module is configured, external devices are memory mapped into KSEG2 and KSEG3 (see Figure 4-1 through Figure 4-4 in **Section 4.0 "Memory Organization"** for more information). The MMU must be enabled and the TLB must be set up to access this memory (refer to **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"* for more information).

FIGURE 20-1: SQI MODULE BLOCK DIAGRAM



Note 1: When configuring the REFCLKO2 clock source, a value of '0' for the ROTRIM<8:0> bits must be selected.

2: This clock source is only used for SQI Special Function Register (SFR) access.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-13 **Unimplemented:** Read as '0'

bit 12-8 **TXCMDTHR<4:0>:** Transmit Command Threshold bits

In transmit initiation mode, the SQI module performs a transmit operation when transmit command threshold bytes are present in the TX FIFO. These bits should usually be set to '1' for normal Flash commands, and set to a higher value for page programming. For 16-bit mode, the value should be a multiple of 2.

bit 7-5 **Unimplemented:** Read as '0'

bit 4-0 **RXCMDTHR<4:0>:** Receive Command Threshold bits(1)

In receive initiation mode, the SQI module attempts to perform receive operations to fetch the receive command threshold number of bytes in the receive buffer. If space for these bytes is not present in the FIFO, the SQI will not initiate a transfer. For 16-bit mode, the value should be a multiple of 2.

If software performs any reads, thereby reducing the FIFO count, hardware would initiate a receive transfer to make the FIFO count equal to the value in these bits. If software would not like any more words latched into the FIFO, command initiation mode needs to be changed to Idle before any FIFO reads by software.

In the case of Boot/XIP mode, the SQI module will use the System Bus burst size, instead of the receive command threshold value.

Note 1: These bits should only be programmed when a receive is not active (i.e., during Idle mode or a transmit).

bit 31-0 **TXDATA<31:0>:** Transmit Command Data bits

Data is loaded into this register before being transmitted. Prior to the data transfer, the data in TXDATA is loaded into the shift register (SFDR).

Multiple writes to TXDATA can occur while a transfer is in progress. There can be a maximum of eight commands that can be queued.

REGISTER 20-11: SQI1RXDATA: SQI RECEIVE DATA BUFFER REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	STATCMD<7:0>							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-21 **Unimplemented:** Read as '0'

bit 20 **STATPOS:** Status Bit Position in Flash bit
Indicates the BUSY bit position in the Flash Status register. This bit is added to support all Flash types (with BUSY bit at 0 and at 7).
1 = BUSY bit position is bit 7 in status register
0 = BUSY bit position is bit 0 in status register

bit 19-18 **STATTYPE<1:0>:** Status Command/Read Lane Mode bits
11 = Reserved
10 = Status command and read are executed in Quad Lane mode
01 = Status command and read are executed in Dual Lane mode
00 = Status command and read are executed in Single Lane mode

bit 17-16 **STATBYTES<1:0>:** Number of Status Bytes bits
11 = Reserved
10 = Status command/read is 2 bytes long
01 = Status command/read is 1 byte long
00 = Reserved

bit 15-8 **STATDATA<7:0>:** Status Data bits
These bits contain the status value of the Flash device

bit 7-0 **STATCMD<7:0>:** Status Command bits
The status check command is written into these bits

REGISTER 20-25: SQI1XCON3: SQI XIP CONTROL REGISTER 3

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-29 **Unimplemented:** Read as '0'

bit 28 **INIT1SCHECK:** Flash Initialization 1 Command Status Check bit
1 = Check the status after executing the INIT1 command
0 = Do not check the status

bit 27-26 **INIT1COUNT<1:0>:** Flash Initialization 1 Command Count bits
11 = INIT1CMD1, INIT1CMD2, and INIT1CMD3 are sent
10 = INIT1CMD1 and INIT1CMD2 are sent, but INIT1CMD3 is still pending
01 = INIT1CMD1 is sent, but INIT1CMD2 and INIT1CMD3 are still pending
00 = No commands are sent

bit 25-24 **INIT1TYPE<1:0>:** Flash Initialization 1 Command Type bits
11 = Reserved
10 = INIT1 commands are sent in Quad Lane mode
01 = INIT1 commands are sent in Dual Lane mode
00 = INIT1 commands are sent in Single Lane mode

bit 24-16 **INIT1CMD3<7:0>:** Flash Initialization Command 3 bits(1)
Third command of the Flash initialization.

bit 15-8 **INIT1CMD2<7:0>:** Flash Initialization Command 2 bits(1)
Second command of the Flash initialization.

bit 7-0 **INIT1CMD1<7:0>:** Flash Initialization Command 1 bits(1)
First command of the Flash initialization.

Note 1: INIT1CMD1 can be WEN and INIT1CMD2 can be SECTOR UNPROTECT.

Note:	Some Flash devices require Write Enable and Sector Unprotect commands before read/write operations and this register is useful in working with those Flash types (XIP mode only)

REGISTER 20-26: SQI1XCON4: SQI XIP CONTROL REGISTER 4

01 = INIT2 commands are sent in Dual Lane mode
00 = INIT2 commands are sent in Single Lane mode

bit 24-16 **INIT2CMD3<7:0>:** Flash Initialization Command 3 bits(1)
Third command of the Flash initialization.

bit 15-8 **INIT2CMD2<7:0>:** Flash Initialization Command 2 bits(1)
Second command of the Flash initialization.

bit 7-0 **INIT2CMD1<7:0>:** Flash Initialization Command 1 bits(1)
First command of the Flash initialization.

Note 1: INIT2CMD1 can be WEN and INIT2CMD2 can be SECTOR UNPROTECT.

Note: Some Flash devices require Write Enable and Sector Unprotect commands before read/write operations and this register is useful in working with those Flash types (XIP mode only)

NOTES:

21.0 INTER-INTEGRATED CIRCUIT (I^2C)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 24. "Inter-Integrated Circuit (I^2C)"** (DS60001116) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The I^2C module provides complete hardware support for both Slave and Multi-Master modes of the I^2C serial communication standard.

Each I^2C module has a 2-pin interface:

- SCLx pin is clock
- SDAx pin is data

Each I^2C module offers the following key features:

- I^2C interface supporting both master and slave operation
- I^2C Slave mode supports 7-bit and 10-bit addressing
- I^2C Master mode supports 7-bit and 10-bit addressing
- I^2C port allows bidirectional transfers between master and slaves
- Serial clock synchronization for the I^2C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- I^2C supports multi-master operation; detects bus collision and arbitrates accordingly
- Provides support for address bit masking
- SMBus support

Figure 21-1 illustrates the I^2C module block diagram.

	ON	—	SIDL	SCKREL	STRICT	A10M	DISSLW	SMEN
7:0	R/W-0	R/W-0	R/W-0	R/W-0, HC	R/W-0, HC	R/W-0, HC	R/W-0, HC	R/W-0, HC
	GCEN	STREN	ACKDT	ACKEN	RCEN	PEN	RSEN	SEN

Legend:	HC = Cleared in Hardware		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-23 **Unimplemented:** Read as '0'

bit 22 **PCIE:** Stop Condition Interrupt Enable bit (I²C Slave mode only)
- 1 = Enable interrupt on detection of Stop condition
- 0 = Stop detection interrupts are disabled

bit 21 **SCIE:** Start Condition Interrupt Enable bit (I²C Slave mode only)
- 1 = Enable interrupt on detection of Start or Restart conditions
- 0 = Start detection interrupts are disabled

bit 20 **BOEN:** Buffer Overwrite Enable bit (I²C Slave mode only)
- 1 = I2CxRCV is updated and $\overline{ACK}$ is generated for a received address/data byte, ignoring the state of the I2COV bit (I2CxSTAT<6>)only if the RBF bit (I2CxSTAT<2>) = 0
- 0 = I2CxRCV is only updated when the I2COV bit (I2CxSTAT<6>) is clear

bit 19 **SDAHT:** SDA Hold Time Selection bit
- 1 = Minimum of 300 ns hold time on SDA after the falling edge of SCL
- 0 = Minimum of 100 ns hold time on SDA after the falling edge of SCL

bit 18 **SBCDE:** Slave Mode Bus Collision Detect Enable bit (I²C Slave mode only)
- 1 = Enable slave bus collision interrupts
- 0 = Slave bus collision interrupts are disabled

bit 18 **AHEN:** Address Hold Enable bit (Slave mode only)
- 1 = Following the 8th falling edge of SCL for a matching received address byte; SCKREL bit will be cleared and the SCL will be held low.
- 0 = Address holding is disabled

bit 16 **DHEN:** Data Hold Enable bit (I²C Slave mode only)
- 1 = Following the 8th falling edge of SCL for a received data byte; slave hardware clears the SCKREL bit and SCL is held low
- 0 = Data holding is disabled

bit 15 **ON:** I²C Enable bit
- 1 = Enables the I²C module and configures the SDA and SCL pins as serial port pins
- 0 = Disables the I²C module; all I²C pins are controlled by PORT functions

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
- 1 = Discontinue module operation when device enters Idle mode
- 0 = Continue module operation in Idle mode

REGISTER 21-1: I2CxCON: I²C CONTROL REGISTER (CONTINUED)

bit 12 **SCLREL:** SCLx Release Control bit (when operating as I²C slave)
1 = Release SCLx clock
0 = Hold SCLx clock low (clock stretch)
If STREN = 1:
Bit is R/W (i.e., software can write '0' to initiate stretch and write '1' to release clock). Hardware clear at beginning of slave transmission. Hardware clear at end of slave reception.
If STREN = 0:
Bit is R/S (i.e., software can only write '1' to release clock). Hardware clear at beginning of slave transmission.

bit 11 **STRICT:** Strict I²C Reserved Address Rule Enable bit
1 = Strict reserved addressing is enforced. Device does not respond to reserved address space or generate addresses in reserved address space.
0 = Strict I²C Reserved Address Rule is not enabled

bit 10 **A10M:** 10-bit Slave Address bit
1 = I2CxADD is a 10-bit slave address
0 = I2CxADD is a 7-bit slave address

bit 9 **DISSLW:** Disable Slew Rate Control bit
1 = Slew rate control is disabled
0 = Slew rate control is enabled

bit 8 **SMEN:** SMBus Input Levels bit
1 = Enable I/O pin thresholds compliant with SMBus specification
0 = Disable SMBus input thresholds

bit 7 **GCEN:** General Call Enable bit (when operating as I²C slave)
1 = Enable interrupt when a general call address is received in the I2CxRSR (module is enabled for reception)
0 = General call address is disabled

bit 6 **STREN:** SCLx Clock Stretch Enable bit (when operating as I²C slave)
Used in conjunction with SCLREL bit.
1 = Enable software or receive clock stretching
0 = Disable software or receive clock stretching

bit 5 **ACKDT:** Acknowledge Data bit (when operating as I²C master, applicable during master receive)
Value that is transmitted when the software initiates an Acknowledge sequence.
1 = Send NACK during Acknowledge
0 = Send ACK during Acknowledge

bit 4 **ACKEN:** Acknowledge Sequence Enable bit
(when operating as I²C master, applicable during master receive)
1 = Initiate Acknowledge sequence on SDAx and SCLx pins and transmit ACKDT data bit. Hardware clear at end of master Acknowledge sequence.
0 = Acknowledge sequence not in progress

bit 3 **RCEN:** Receive Enable bit (when operating as I²C master)
1 = Enables Receive mode for I²C. Hardware clear at end of eighth bit of master receive data byte.
0 = Receive sequence not in progress

bit 2 **PEN:** Stop Condition Enable bit (when operating as I²C master)
1 = Initiate Stop condition on SDAx and SCLx pins. Hardware clear at end of master Stop sequence.
0 = Stop condition not in progress

bit 1 **RSEN:** Repeated Start Condition Enable bit (when operating as I²C master)
1 = Initiate Repeated Start condition on SDAx and SCLx pins. Hardware clear at end of master Repeated Start sequence.
0 = Repeated Start condition not in progress

bit 0 **SEN:** Start Condition Enable bit (when operating as I²C master)
1 = Initiate Start condition on SDAx and SCLx pins. Hardware clear at end of master Start sequence.
0 = Start condition not in progress

Legend:	HS = Hardware Set	HC = Hardware Cleared	SC = Software Cleared
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	C = Clearable bit

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ACKSTAT:** Acknowledge Status bit
(when operating as I^{2}C master, applicable to master transmit operation)
1 = NACK received from slave
0 = ACK received from slave
Hardware set or clear at end of slave Acknowledge.

bit 14 **TRSTAT:** Transmit Status bit (when operating as I^{2}C master, applicable to master transmit operation)
1 = Master transmit is in progress (8 bits + ACK)
0 = Master transmit is not in progress
Hardware set at beginning of master transmission. Hardware clear at end of slave Acknowledge.

bit 13 **ACKTIM:** Acknowledge Time Status bit (Valid in I^{2}C Slave mode only)
1 = I^{2}C bus is in an Acknowledge sequence, set on the eight falling edge of SCL clock
0 = Not an Acknowledge sequence, cleared on 9th rising edge of SCL clock

bit 12-11 **Unimplemented:** Read as '0'

bit 10 **BCL:** Master Bus Collision Detect bit
1 = A bus collision has been detected during a master operation
0 = No collision
Hardware set at detection of bus collision.

bit 9 **GCSTAT:** General Call Status bit
1 = General call address was received
0 = General call address was not received
Hardware set when address matches general call address. Hardware clear at Stop detection.

bit 8 **ADD10:** 10-bit Address Status bit
1 = 10-bit address was matched
0 = 10-bit address was not matched
Hardware set at match of 2nd byte of matched 10-bit address. Hardware clear at Stop detection.

bit 7 **IWCOL:** Write Collision Detect bit
1 = An attempt to write the I2CxTRN register failed because the I^{2}C module is busy
0 = No collision
Hardware set at occurrence of write to I2CxTRN while busy (cleared by software).

bit 6 **I2COV:** Receive Overflow Flag bit
1 = A byte was received while the I2CxRCV register is still holding the previous byte
0 = No overflow
Hardware set at attempt to transfer I2CxRSR to I2CxRCV (cleared by software).

REGISTER 21-2: I2CxSTAT: I^2C STATUS REGISTER (CONTINUED)

bit 5 **D_A:** Data/Address bit (when operating as I^2C slave)
1 = Indicates that the last byte received was data
0 = Indicates that the last byte received was device address
Hardware clear at device address match. Hardware set by reception of slave byte.

bit 4 **P:** Stop bit
1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last
Hardware set or clear when Start, Repeated Start or Stop detected.

bit 3 **S:** Start bit
1 = Indicates that a Start (or Repeated Start) bit has been detected last
0 = Start bit was not detected last
Hardware set or clear when Start, Repeated Start or Stop detected.

bit 2 **R_W:** Read/Write Information bit (when operating as I^2C slave)
1 = Read – indicates data transfer is output from slave
0 = Write – indicates data transfer is input to slave
Hardware set or clear after reception of I^2C device address byte.

bit 1 **RBF:** Receive Buffer Full Status bit
1 = Receive complete, I2CxRCV is full
0 = Receive not complete, I2CxRCV is empty
Hardware set when I2CxRCV is written with received byte. Hardware clear when software reads I2CxRCV.

bit 0 **TBF:** Transmit Buffer Full Status bit
1 = Transmit in progress, I2CxTRN is full
0 = Transmit complete, I2CxTRN is empty
Hardware set when software writes I2CxTRN. Hardware clear at completion of data transmission.

22.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 21. "Universal Asynchronous Receiver Transmitter (UART)"** (DS60001107) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The UART module is one of the serial I/O modules available in the PIC32MZ EF family of devices. The UART is a full-duplex, asynchronous communication channel that communicates with peripheral devices and personal computers through protocols, such as RS-232, RS-485, LIN, and IrDA®. The module also supports the hardware flow control option, with $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins, and also includes an IrDA encoder and decoder.

The primary features of the UART module are:

- Full-duplex, 8-bit or 9-bit data transmission
- Even, Odd or No Parity options (for 8-bit data)
- One or two Stop bits
- Hardware auto-baud feature
- Hardware flow control option
- Fully integrated Baud Rate Generator (BRG) with 16-bit prescaler
- Baud rates ranging from 76 bps to 25 Mbps at 100 MHz (PBCLK2)
- 8-level deep First-In-First-Out (FIFO) transmit data buffer
- 8-level deep FIFO receive data buffer
- Parity, framing and buffer overrun error detection
- Support for interrupt-only on address detect (9th bit = 1)
- Separate transmit and receive interrupts
- Loopback mode for diagnostic support
- LIN Protocol support
- IrDA encoder and decoder with 16x baud clock output for external IrDA encoder/decoder support

Figure 22-1 illustrates a simplified block diagram of the UART module.

	WAKE	LPBACK	ABAUD	RXINV	BRGH	PDSEL<1:0>		STSEL

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** UARTx Enable bit
- 1 = UARTx is enabled. UARTx pins are controlled by UARTx as defined by UEN<1:0> and UTXEN control bits
- 0 = UARTx is disabled. All UARTx pins are controlled by corresponding bits in the PORTx, TRISx and LATx registers; UARTx power consumption is minimal

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
- 1 = Discontinue operation when device enters Idle mode
- 0 = Continue operation in Idle mode

bit 12 **IREN:** IrDA Encoder and Decoder Enable bit
- 1 = IrDA is enabled
- 0 = IrDA is disabled

bit 11 **RTSMD:** Mode Selection for $\overline{\text{UxRTS}}$ Pin bit
- 1 = $\overline{\text{UxRTS}}$ pin is in Simplex mode
- 0 = $\overline{\text{UxRTS}}$ pin is in Flow Control mode

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **UEN<1:0>:** UARTx Enable bits(1)
- 11 = UxTX, UxRX and UxBCLK pins are enabled and used; $\overline{\text{UxCTS}}$ pin is controlled by corresponding bits in the PORTx register
- 10 = UxTX, UxRX, $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins are enabled and used
- 01 = UxTX, UxRX and $\overline{\text{UxRTS}}$ pins are enabled and used; $\overline{\text{UxCTS}}$ pin is controlled by corresponding bits in the PORTx register
- 00 = UxTX and UxRX pins are enabled and used; $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$/UxBCLK pins are controlled by corresponding bits in the PORTx register

bit 7 **WAKE:** Enable Wake-up on Start bit Detect During Sleep Mode bit
- 1 = Wake-up is enabled
- 0 = Wake-up is disabled

bit 6 **LPBACK:** UARTx Loopback Mode Select bit
- 1 = Loopback mode is enabled
- 0 = Loopback mode is disabled

Note 1: These bits are present for legacy compatibility, and are superseded by PPS functionality on these devices. For additional information, see **Section 12.4 "Peripheral Pin Select (PPS)"**.

REGISTER 22-1: UxMODE: UARTx MODE REGISTER (CONTINUED)

bit 5 **ABAUD:** Auto-Baud Enable bit
- 1 = Enable baud rate measurement on the next character – requires reception of Sync character (0x55); cleared by hardware upon completion
- 0 = Baud rate measurement is disabled or completed

bit 4 **RXINV:** Receive Polarity Inversion bit
- 1 = UxRX Idle state is '0'
- 0 = UxRX Idle state is '1'

bit 3 **BRGH:** High Baud Rate Enable bit
- 1 = High-Speed mode – 4x baud clock enabled
- 0 = Standard Speed mode – 16x baud clock enabled

bit 2-1 **PDSEL<1:0>:** Parity and Data Selection bits
- 11 = 9-bit data, no parity
- 10 = 8-bit data, odd parity
- 01 = 8-bit data, even parity
- 00 = 8-bit data, no parity

bit 0 **STSEL:** Stop Selection bit
- 1 = 2 Stop bits
- 0 = 1 Stop bit

Note 1: These bits are present for legacy compatibility, and are superseded by PPS functionality on these devices. For additional information, see **Section 12.4 "Peripheral Pin Select (PPS)"**.

bit 31-25 **Unimplemented:** Read as '0'

bit 24 **ADM_EN:** Automatic Address Detect Mode Enable bit
- 1 = Automatic Address Detect mode is enabled
- 0 = Automatic Address Detect mode is disabled

bit 23-16 **ADDR<7:0>:** Automatic Address Mask bits

When the ADM_EN bit is '1', this value defines the address character to use for automatic address detection.

bit 15-14 **UTXISEL<1:0>:** TX Interrupt Mode Selection bits
- 11 = Reserved, do not use
- 10 = Interrupt is generated and asserted while the transmit buffer is empty
- 01 = Interrupt is generated and asserted when all characters have been transmitted
- 00 = Interrupt is generated and asserted while the transmit buffer contains at least one empty space

bit 13 **UTXINV:** Transmit Polarity Inversion bit

If IrDA mode is disabled (i.e., IREN (UxMODE<12>) is '0'):
- 1 = UxTX Idle state is '0'
- 0 = UxTX Idle state is '1'

If IrDA mode is enabled (i.e., IREN (UxMODE<12>) is '1'):
- 1 = IrDA encoded UxTX Idle state is '1'
- 0 = IrDA encoded UxTX Idle state is '0'

bit 12 **URXEN:** Receiver Enable bit
- 1 = UARTx receiver is enabled. UxRX pin is controlled by UARTx (if ON = 1)
- 0 = UARTx receiver is disabled. UxRX pin is ignored by the UARTx module

bit 11 **UTXBRK:** Transmit Break bit
- 1 = Send Break on next transmission. Start bit followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion
- 0 = Break transmission is disabled or completed

bit 10 **UTXEN:** Transmit Enable bit
- 1 = UARTx transmitter is enabled. UxTX pin is controlled by UARTx (if ON = 1)
- 0 = UARTx transmitter is disabled. Any pending transmission is aborted and buffer is reset

bit 9 **UTXBF:** Transmit Buffer Full Status bit (read-only)
- 1 = Transmit buffer is full
- 0 = Transmit buffer is not full, at least one more character can be written

bit 8 **TRMT:** Transmit Shift Register is Empty bit (read-only)
- 1 = Transmit shift register is empty and transmit buffer is empty (the last transmission has completed)
- 0 = Transmit shift register is not empty, a transmission is in progress or queued in the transmit buffer

REGISTER 22-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

bit 7-6 **URXISEL<1:0>:** Receive Interrupt Mode Selection bit
11 = Reserved
10 = Interrupt flag bit is asserted while receive buffer is 3/4 or more full
01 = Interrupt flag bit is asserted while receive buffer is 1/2 or more full
00 = Interrupt flag bit is asserted while receive buffer is not empty (i.e., has at least 1 data character)

bit 5 **ADDEN:** Address Character Detect bit (bit 8 of received data = 1)
1 = Address Detect mode is enabled. If 9-bit mode is not selected, this control bit has no effect
0 = Address Detect mode is disabled

bit 4 **RIDLE:** Receiver Idle bit (read-only)
1 = Receiver is Idle
0 = Data is being received

bit 3 **PERR:** Parity Error Status bit (read-only)
1 = Parity error has been detected for the current character
0 = Parity error has not been detected

bit 2 **FERR:** Framing Error Status bit (read-only)
1 = Framing error has been detected for the current character
0 = Framing error has not been detected

bit 1 **OERR:** Receive Buffer Overrun Error Status bit.
This bit is set in hardware and can only be cleared (= 0) in software. Clearing a previously set OERR bit resets the receiver buffer and RSR to empty state.
1 = Receive buffer has overflowed
0 = Receive buffer has not overflowed

bit 0 **URXDA:** Receive Buffer Data Available bit (read-only)
1 = Receive buffer has data, at least one more character can be read
0 = Receive buffer is empty

Figure 22-2 and Figure 22-3 illustrate the typical receive and transmit timing for the UART module.

23.0 PARALLEL MASTER PORT (PMP)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 13. "Parallel Master Port (PMP)"** (DS60001128) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

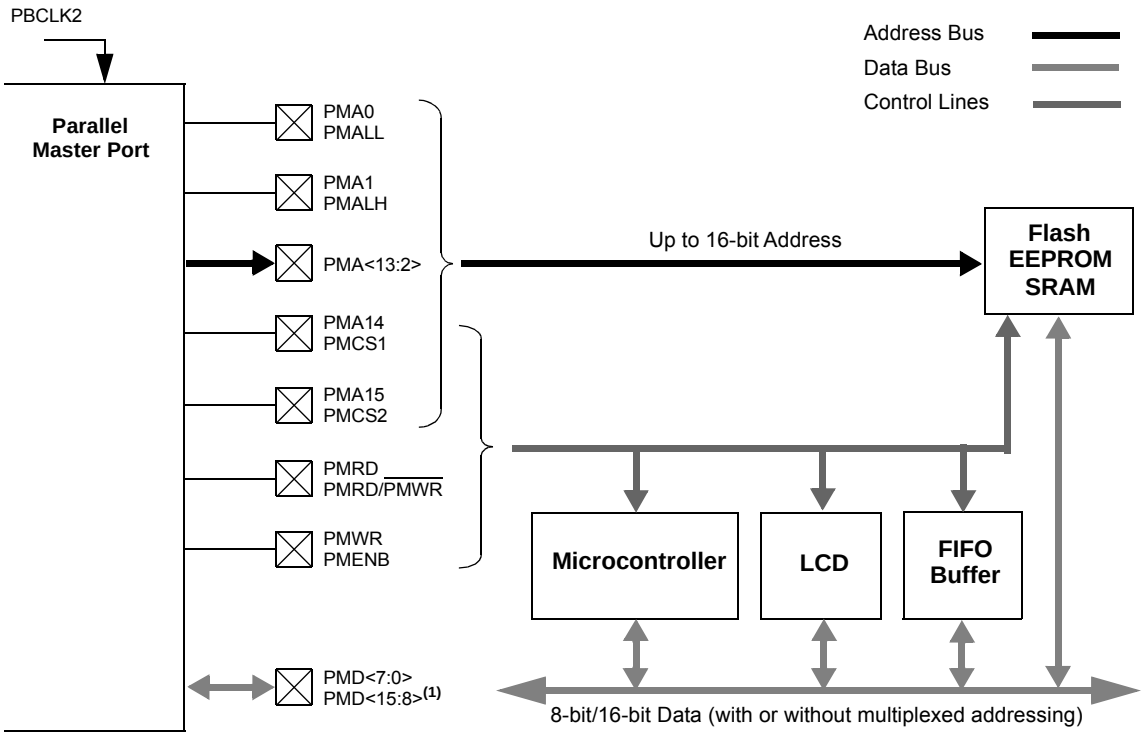
The PMP is a parallel 8-bit/16-bit input/output module specifically designed to communicate with a wide variety of parallel devices, such as communications peripherals, LCDs, external memory devices and microcontrollers. Because the interface to parallel peripherals varies significantly, the PMP module is highly configurable.

The following are key features of the PMP module:

- 8-bit,16-bit interface
- Up to 16 programmable address lines
- Up to two Chip Select lines
- Programmable strobe options:
  - Individual read and write strobes, or
  - Read/write strobe with enable strobe
- Address auto-increment/auto-decrement
- Programmable address/data multiplexing
- Programmable polarity on control signals
- Parallel Slave Port support:
  - Legacy addressable
  - Address support
  - 4-byte deep auto-incrementing buffer
- Programmable Wait states
- Operate during Sleep and Idle modes
- Separate configurable read/write registers or dual buffers for Master mode
- Fast bit manipulation using CLR, SET, and INV registers

Note: On 64-pin devices, data pins PMD<15:8> are not available in 16-bit Master modes.

FIGURE 23-1: PMP MODULE PINOUT AND CONNECTIONS TO EXTERNAL DEVICES



Note: On 64-pin devices, data pins PMD<15:8> are not available in 16-bit Master modes.

23.1 PMP Control Registers

	CSF<1:0>(1)		ALP(1)	CS2P(1)	CS1P(1)	—	WRSP	RDSP

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23 **RDSTART:** Start Read on PMP Bus bit
This bit is cleared by hardware at the end of the read cycle.
1 = Start a read cycle on the PMP bus
0 = No effect

bit 22-18 **Unimplemented:** Read as '0'

bit 17 **DUALBUF:** Dual Read/Write Buffers enable bit
This bit is valid in Master mode only.
1 = PMP uses separate registers for reads and writes (PMRADDR, PMDATAIN, PMWADDR, PMDATAOUT)
0 = PMP uses legacy registers (PMADDR, PMDATA)

bit 16 **Unimplemented:** Read as '0'

bit 15 **ON:** Parallel Master Port Enable bit
1 = PMP is enabled
0 = PMP is disabled, no off-chip access performed

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12-11 **ADRMUX<1:0>:** Address/Data Multiplexing Selection bits
11 = Lower 8 bits of address are multiplexed on PMD<15:0> pins; upper 8 bits are not used
10 = All 16 bits of address are multiplexed on PMD<15:0> pins
01 = Lower 8 bits of address are multiplexed on PMD<7:0> pins, upper bits are on PMA<15:8>
00 = Address and data appear on separate pins

bit 10 **PMPTTL:** PMP Module TTL Input Buffer Select bit
1 = PMP module uses TTL input buffers
0 = PMP module uses Schmitt Trigger input buffer

bit 9 **PTWREN:** Write Enable Strobe Port Enable bit
1 = PMWR/PMENB port is enabled
0 = PMWR/PMENB port is disabled

bit 8 **PTRDEN:** Read/Write Strobe Port Enable bit
1 = PMRD/PMWR port is enabled
0 = PMRD/PMWR port is disabled

Note 1: These bits have no effect when their corresponding pins are used as address lines.

REGISTER 23-1: PMCON: PARALLEL PORT CONTROL REGISTER (CONTINUED)

bit 7-6 **CSF<1:0>:** Chip Select Function bits(1)
11 = Reserved
10 = PMCS1 and PMCS2 function as Chip Select
01 = PMCS2 functions as Chip Select and PMCS1 functions as address bit 14
00 = PMCS1 and PMCS2 function as address bit 14 and address bit 15

bit 5 **ALP:** Address Latch Polarity bit(1)
1 = Active-high (PMALL and PMALH)
0 = Active-low ($\overline{\text{PMALL}}$ and $\overline{\text{PMALH}}$)

bit 4 **CS2P:** Chip Select 2 Polarity bit(1)
1 = Active-high (PMCS2)
0 = Active-low ($\overline{\text{PMCS2}}$)

bit 3 **CS1P:** Chip Select 1 Polarity bit(1)
1 = Active-high (PMCS1)
0 = Active-low ($\overline{\text{PMCS1}}$)

bit 2 **Unimplemented:** Read as '0'

bit 1 **WRSP:** Write Strobe Polarity bit
For Slave Modes and Master mode 2 (MODE<1:0> = 00,01,10):
1 = Write strobe active-high (PMWR)
0 = Write strobe active-low ($\overline{\text{PMWR}}$)
For Master mode 1 (MODE<1:0> = 11):
1 = Enable strobe active-high (PMENB)
0 = Enable strobe active-low ($\overline{\text{PMENB}}$)

bit 0 **RDSP:** Read Strobe Polarity bit
For Slave modes and Master mode 2 (MODE<1:0> = 00,01,10):
1 = Read Strobe active-high (PMRD)
0 = Read Strobe active-low ($\overline{\text{PMRD}}$)
For Master mode 1 (MODE<1:0> = 11):
1 = Read/write strobe active-high (PMRD/$\overline{\text{PMWR}}$)
0 = Read/write strobe active-low ($\overline{\text{PMRD}}$/PMWR)

Note 1: These bits have no effect when their corresponding pins are used as address lines.

REGISTER 23-2: PMMODE: PARALLEL PORT MODE REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	BUSY	IRQM<1:0>		INCM<1:0>		MODE16	MODE<1:0>	
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	WAITB<1:0>(1)		WAITM<3:0>(1)				WAITE<1:0>(1)	

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **BUSY:** Busy bit (Master mode only)
- 1 = Port is busy
- 0 = Port is not busy

bit 14-13 **IRQM<1:0>:** Interrupt Request Mode bits
- 11 = Reserved, do not use
- 10 = Interrupt is generated when Read Buffer 3 is read or Write Buffer 3 is written (Buffered PSP mode) or on a read or write operation when PMA<1:0> =11 (Addressable Slave mode only)
- 01 = Interrupt is generated at the end of the read/write cycle
- 00 = No Interrupt is generated

bit 12-11 **INCM<1:0>:** Increment Mode bits
- 11 = Slave mode read and write buffers auto-increment (MODE<1:0> = 00 only)
- 10 = Decrement ADDR<15:0> and ADDR<14> by 1 every read/write cycle(2)
- 01 = Increment ADDR<15:0> and ADDR<14> by 1 every read/write cycle(2)
- 00 = No increment or decrement of address

bit 10 **MODE16:** 8/16-bit Mode bit
- 1 = 16-bit mode: a read or write to the data register invokes a single 16-bit transfer
- 0 = 8-bit mode: a read or write to the data register invokes a single 8-bit transfer

bit 9-8 **MODE<1:0>:** Parallel Port Mode Select bits
- 11 = Master mode 1 (PMCSx, PMRD/PMWR, PMENB, PMA<x:0>, and PMD<15:0>)(3)
- 10 = Master mode 2 (PMCSx, PMRD, PMWR, PMA<x:0>, and PMD<15:0>)(3)
- 01 = Enhanced Slave mode, control signals (PMRD, PMWR, PMCSx, PMD<7:0>, and PMA<1:0>)
- 00 = Legacy Parallel Slave Port, control signals (PMRD, PMWR, PMCSx, and PMD<7:0>)

bit 7-6 **WAITB<1:0>:** Data Setup to Read/Write Strobe Wait States bits(1)
- 11 = Data wait of 4 TPBCLK2; multiplexed address phase of 4 TPBCLK2
- 10 = Data wait of 3 TPBCLK2; multiplexed address phase of 3 TPBCLK2
- 01 = Data wait of 2 TPBCLK2; multiplexed address phase of 2 TPBCLK2
- 00 = Data wait of 1 TPBCLK2; multiplexed address phase of 1 TPBCLK2 (default)

Note 1: Whenever WAITM<3:0> = 0000, WAITB and WAITE bits are ignored and forced to 1 TPBCLK2 cycle for a write operation; WAITB = 1 TPBCLK2 cycle, WAITE = 0 TPBCLK2 cycles for a read operation.

2: Address bits 14 and 15 are is not subject to auto-increment/decrement if configured as Chip Select.

3: The PMD<15:8> bits are not active is the MODE16 bit = 1.

REGISTER 23-2: PMMODE: PARALLEL PORT MODE REGISTER (CONTINUED)

bit 5-2 **WAITM<3:0>:** Data Read/Write Strobe Wait States bits(1)

1111 = Wait of 16 TPBCLK2

•

•

•

0001 = Wait of 2 TPBCLK2

0000 = Wait of 1 TPBCLK2 (default)

bit 1-0 **WAITE<1:0>:** Data Hold After Read/Write Strobe Wait States bits(1)

11 = Wait of 4 TPBCLK2

10 = Wait of 3 TPBCLK2

01 = Wait of 2 TPBCLK2

00 = Wait of 1 TPBCLK2 (default)

For Read operations:

11 = Wait of 3 TPBCLK2

10 = Wait of 2 TPBCLK2

01 = Wait of 1 TPBCLK2

00 = Wait of 0 TPBCLK2 (default)

Note 1: Whenever WAITM<3:0> = 0000, WAITB and WAITE bits are ignored and forced to 1 TPBCLK2 cycle for a write operation; WAITB = 1 TPBCLK2 cycle, WAITE = 0 TPBCLK2 cycles for a read operation.

2: Address bits 14 and 15 are is not subject to auto-increment/decrement if configured as Chip Select.

3: The PMD<15:8> bits are not active is the MODE16 bit = 1.

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **DATAOUT<15:0>:** Port Data Output bits

This register is used for Read operations in the Enhanced Parallel Slave mode and Write operations for Dual Buffer Master mode.

In Dual Buffer Master mode, the DUALBUF bit (PMPCON<17>) = 1, a write to the MSB triggers the transaction on the PMP port. When MODE16 = 1, MSB = DATAOUT<15:8>. When MODE16 = 0, MSB = DATAOUT<7:0>.

Note: In Master mode, a read will return the last value written to the register. In Slave mode, a read will return indeterminate results.

REGISTER 23-5: PMDIN: PARALLEL PORT INPUT DATA REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	DATAIN<15:8>							
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	DATAIN<7:0>							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **DATAIN<15:0>:** Port Data Input bits

This register is used for both Parallel Master Port mode and Enhanced Parallel Slave mode.

In Parallel Master mode, a write to the MSB triggers the write transaction on the PMP port. Similarly, a read to the MSB triggers the read transaction on the PMP port.

When MODE16 = 1, MSB = DATAIN<15:8>. When MODE16 = 0, MSB = DATAIN<7:0>.

Note: This register is not used in Dual Buffer Master mode (i.e., DUALBUF bit (PMPCON<17>) = 1).

REGISTER 23-6: PMAEN: PARALLEL PORT PIN ENABLE REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	PTEN<7:0>							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-15 **Unimplemented:** Read as '0'

bit 15-14 **PTEN<15:14>:** PMCS1 Strobe Enable bits
- 1 = PMA15 and PMA14 function as either PMA<15:14> or PMCS1 and PMCS2(1)
- 0 = PMA15 and PMA14 function as port I/O

bit 13-2 **PTEN<13:2>:** PMP Address Port Enable bits
- 1 = PMA<13:2> function as PMP address lines
- 0 = PMA<13:2> function as port I/O

bit 1-0 **PTEN<1:0>:** PMALH/PMALL Strobe Enable bits
- 1 = PMA1 and PMA0 function as either PMA<1:0> or PMALH and PMALL(2)
- 0 = PMA1 and PMA0 pads function as port I/O

Note 1: The use of these pins as PMA15 and PMA14 or CS1 and CS2 is selected by the CSF<1:0> bits in the PMCON register.

2: The use of these pins as PMA1/PMA0 or PMALH/PMALL depends on the Address/Data Multiplex mode selected by bits ADRMUX<1:0> in the PMCON register.

	RDATAIN<7:0>							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **RDATAIN<15:0>:** Port Read Input Data bits

Note: This register is only used when the DUALBUF bit (PMCON<17>) is set to '1' and exclusively for reads. If the DUALBUF bit is '0', the PMDIN register (Register 23-5) is used for reads instead of PMRDIN.

NOTES:

24.0 EXTERNAL BUS INTERFACE (EBI)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 47. "External Bus Interface (EBI)"** (DS60001245) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The External Bus Interface (EBI) module provides a high-speed, convenient way to interface external parallel memory devices to the PIC32MZ EF family device.

With the EBI module, it is possible to connect asynchronous SRAM and NOR Flash devices, as well as non-memory devices such as camera sensors and LCDs.

The features of the EBI module depend on the pin count of the PIC32MZ EF device, as shown in Table 24-1.

Note: The EBI module is not available on 64-pin devices.

TABLE 24-1: EBI MODULE FEATURES

Feature	Number of Device Pins		
	100	124	144
Async SRAM	Y	Y	Y
Async NOR Flash	Y	Y	Y
Available address lines	20	20	24
8-bit data bus support	Y	Y	Y
16-bit data bus support	Y	Y	Y
Available Chip Selects	1	1	4
Timing mode sets	3	3	3
8-bit R/W from 16-bit bus	N	N	Y
Non-memory device	Y	Y	Y
LCD	Y	Y	Y

Note: Once the EBI module is configured, external devices will be memory mapped and can be access from KSEG2 memory space (see Figure 4-1 through Figure 4-4 in **Section 4.0 "Memory Organization"** for more information). The MMU must be enabled and the TLB must be set up to access this memory (refer to **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"* for more information).

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-27 **Unimplemented:** Read as '0'

bit 26 **RDYMODE:** Data Ready Device Select bit
The device associated with register set 'x' is a data-ready device, and will use the EBIRDYx pin.
1 = EBIRDYx input is used
0 = EBIRDYx input is not used

bit 25-24 **PAGESIZE<1:0>:** Page Size for Page Mode Device bits
11 = 32-word page
10 = 16-word page
01 = 8-word page
00 = 4-word page

bit 23 **PAGEMODE:** Memory Device Page Mode Support bit
1 = Device supports Page mode
0 = Device does not support Page mode

bit 22-19 **TPRC<3:0>:** Page Mode Read Cycle Time bits(1)
Read cycle time is TPRC + 1 clock cycle.

bit 18-16 **TBTA<2:0>:** Data Bus Turnaround Time bits(1)
Clock cycles (0-7) for static memory between read-to-write, write-to-read, and read-to-read when Chip Select changes.

bit 15-10 **TWP<5:0>:** Write Pulse Width bits(1)
Write pulse width is TWP + 1 clock cycle.

bit 9-8 **TWR<1:0>:** Write Address/Data Hold Time bits(1)
Number of clock cycles to hold address or data on the bus.

bit 7-6 **TAS<1:0>:** Write Address Setup Time bits(1)
Clock cycles for address setup time. A value of '0' is only valid in the case of SSRAM.

bit 5-0 **TRC<5:0>:** Read Cycle Time bits(1)
Read cycle time is TRC + 1 clock cycle.

Note 1: Refer to the **Section 47. "External Bus Interface (EBI)"** in the *"PIC32 Family Reference Manual"* for the EBI timing diagrams and additional information.

bit 6-1 **Unimplemented:** Read as '0'

bit 0 **SMRP:** Flash Reset/Power-down mode Select bit

After a Reset, the controller internally performs a power-down for Flash, and then sets this bit to '1'.
- 1 = Flash is taken out of Power-down mode
- 0 = Flash is forced into Power-down mode

NOTES:

25.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 29. "Real-Time Clock and Calendar (RTCC)"** (DS60001125) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The RTCC module is intended for applications in which accurate time must be maintained for extended periods of time with minimal or no CPU intervention. Low-power optimization provides extended battery lifetime while keeping track of time.

The following are key features of the RTCC module:

- Time: hours, minutes, and seconds
- 24-hour format (military time)
- Visibility of one-half second period
- Provides calendar: Weekday, date, month and year
- Alarm intervals are configurable for half of a second, one second, 10 seconds, one minute, 10 minutes, one hour, one day, one week, one month, and one year
- Alarm repeat with decrementing counter
- Alarm with indefinite repeat: Chime
- Year range: 2000 to 2099
- Leap year correction
- BCD format for smaller firmware overhead
- Optimized for long-term battery operation
- Fractional second synchronization
- User calibration of the clock crystal frequency with auto-adjust
- Calibration range: ±0.66 seconds error per month
- Calibrates up to 260 ppm of crystal error
- Uses external 32.768 kHz crystal or 32 kHz internal oscillator
- Alarm pulse, seconds clock, or internal clock output on RTCC pin

	RTC OUTSEL<0>(2)	RTC CLKON(5)	—	—	RTC WREN(3)	RTC SYNC	HALFSEC(4)	RTCOE

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-26 **Unimplemented:** Read as '0'

bit 25-16 **CAL<9:0>:** Real-Time Clock Drift Calibration bits, which contain a signed 10-bit integer value

0111111111 = Maximum positive adjustment, adds 511 real-time clock pulses every one minute
•
•
•
0000000001 = Minimum positive adjustment, adds 1 real-time clock pulse every one minute
0000000000 = No adjustment
1111111111 = Minimum negative adjustment, subtracts 1 real-time clock pulse every one minute
•
•
•
1000000000 = Maximum negative adjustment, subtracts 512 real-time clock pulses every one minute

bit 15 **ON:** RTCC On bit(1)

1 = RTCC module is enabled
0 = RTCC module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit

1 = Disables RTCC operation when CPU enters Idle mode
0 = Continue normal operation when CPU enters Idle mode

bit 12-11 **Unimplemented:** Read as '0'

Note 1: The ON bit is only writable when RTCWREN = 1.
2: Requires RTCOE = 1 (RTCCON<0>) for the output to be active.
3: The RTCWREN bit can be set only when the write sequence is enabled.
4: This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).
5: This bit is undefined when RTCCLKSEL<1:0> = 00 (LPRC is the clock source).

Note: This register is reset only on a Power-on Reset (POR).

REGISTER 25-1: RTCCON: REAL-TIME CLOCK AND CALENDAR CONTROL REGISTER

bit 10-9 **RTCCLKSEL<1:0>:** RTCC Clock Select bits
When a new value is written to these bits, the Seconds Value register should also be written to properly reset the clock prescalers in the RTCC.
11 = Reserved
10 = Reserved
01 = RTCC uses the external 32.768 kHz Secondary Oscillator (SOSC)
00 = RTCC uses the internal 32 kHz oscillator (LPRC)

bit 8-7 **RTCOUTSEL<1:0>:** RTCC Output Data Select bits(2)
11 = Reserved
10 = RTCC Clock is presented on the RTCC pin
01 = Seconds Clock is presented on the RTCC pin
00 = Alarm Pulse is presented on the RTCC pin when the alarm interrupt is triggered

bit 6 **RTCCLKON:** RTCC Clock Enable Status bit(5)
1 = RTCC Clock is actively running
0 = RTCC Clock is not running

bit 5-4 **Unimplemented:** Read as '0'

bit 3 **RTCWREN:** Real-Time Clock Value Registers Write Enable bit(3)
1 = Real-Time Clock Value registers can be written to by the user
0 = Real-Time Clock Value registers are locked out from being written to by the user

bit 2 **RTCSYNC:** Real-Time Clock Value Registers Read Synchronization bit
1 = Real-time clock value registers can change while reading (due to a rollover ripple that results in an invalid data read). If the register is read twice and results in the same data, the data can be assumed to be valid.
0 = Real-time clock value registers can be read without concern about a rollover ripple

bit 1 **HALFSEC:** Half-Second Status bit(4)
1 = Second half period of a second
0 = First half period of a second

bit 0 **RTCOE:** RTCC Output Enable bit
1 = RTCC output is enabled
0 = RTCC output is not enabled

Note 1: The ON bit is only writable when RTCWREN = 1.
2: Requires RTCOE = 1 (RTCCON<0>) for the output to be active.
3: The RTCWREN bit can be set only when the write sequence is enabled.
4: This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).
5: This bit is undefined when RTCCLKSEL<1:0> = 00 (LPRC is the clock source).

Note:	This register is reset only on a Power-on Reset (POR).

REGISTER 25-2: RTCALRM: REAL-TIME CLOCK ALARM CONTROL REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
23:16	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
	—	—	—	—	—	—	—	—
15:8	R/W-0	R/W-0	R/W-0	R-0	R/W-0	R/W-0	R/W-0	R/W-0
	ALRMEN(1,2)	CHIME(2)	PIV(2)	ALRMSYNC	AMASK<3:0>(2)			
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	ARPT<7:0>(2)							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ALRMEN:** Alarm Enable bit(1,2)
- 1 = Alarm is enabled
- 0 = Alarm is disabled

bit 14 **CHIME:** Chime Enable bit(2)
- 1 = Chime is enabled – ARPT<7:0> is allowed to rollover from 0x00 to 0xFF
- 0 = Chime is disabled – ARPT<7:0> stops once it reaches 0x00

bit 13 **PIV:** Alarm Pulse Initial Value bit(2)

When ALRMEN = 0, PIV is writable and determines the initial value of the Alarm Pulse.
When ALRMEN = 1, PIV is read-only and returns the state of the Alarm Pulse.

bit 12 **ALRMSYNC:** Alarm Sync bit
- 1 = ARPT<7:0> and ALRMEN may change as a result of a half second rollover during a read. The ARPT must be read repeatedly until the same value is read twice. This must be done since multiple bits may be changing.
- 0 = ARPT<7:0> and ALRMEN can be read without concerns of rollover because the prescaler is more than 32 real-time clocks away from a half-second rollover

bit 11-8 **AMASK<3:0>:** Alarm Mask Configuration bits(2)
- 0000 = Every half-second
- 0001 = Every second
- 0010 = Every 10 seconds
- 0011 = Every minute
- 0100 = Every 10 minutes
- 0101 = Every hour
- 0110 = Once a day
- 0111 = Once a week
- 1000 = Once a month
- 1001 = Once a year (except when configured for February 29, once every four years)
- 1010 = Reserved
- 1011 = Reserved
- 11xx = Reserved

Note 1: Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.

2: This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.

Note: This register is reset only on a Power-on Reset (POR).

REGISTER 25-2: RTCALRM: REAL-TIME CLOCK ALARM CONTROL REGISTER (CONTINUED)

bit 7-0 **ARPT<7:0>:** Alarm Repeat Counter Value bits(2)

11111111 = Alarm will trigger 256 times
•
•
•
00000000 = Alarm will trigger one time
The counter decrements on any alarm event. The counter only rolls over from 0x00 to 0xFF if CHIME = 1.

Note 1: Hardware clears the ALRMEN bit anytime the alarm event occurs, when ARPT<7:0> = 00 and CHIME = 0.

2: This field should not be written when the RTCC ON bit = '1' (RTCCON<15>) and ALRMSYNC = 1.

Note:	This register is reset only on a Power-on Reset (POR).

bit 7-4 **Unimplemented:** Read as '0'

bit 3-0 **WDAY01<3:0>:** Binary Coded Decimal value of weekdays bits, 1 digit; contains a value from 0 to 6

26.0 CRYPTO ENGINE

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 49. "Crypto Engine (CE) and Random Number Generator (RNG)"** (DS60001246) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Crypto Engine is intended to accelerate applications that need cryptographic functions. By executing these functions in the hardware module, software overhead is reduced and actions, such as encryption, decryption, and authentication can execute much more quickly.

The Crypto Engine uses an internal descriptor-based DMA for efficient programming of the security association data and packet pointers (allowing scatter/gather data fetching). An intelligent state machine schedules the Crypto Engines based on the protocol selection and packet boundaries. The hardware engines can perform the encryption and authentication in sequence or in parallel.

The following are key features of the Crypto Engine:

- Bulk ciphers and hash engines
- Integrated DMA to off-load processing:
  - Buffer descriptor-based
  - Secure association per buffer descriptor
- Some functions can execute in parallel

Bulk ciphers that are handled by the Crypto Engine include:

- AES:
  - 128-bit, 192-bit, and 256-bit key sizes
  - CBC, ECB, CTR, CFB, and OFB modes
- DES/TDES:
  - CBC, ECB, CFB, and OFB modes

Authentication engines that are available through the Crypto Engine include:

- SHA-1
- SHA-256
- MD-5
- AES-GCM
- HMAC operation (for all authentication engines)

The rate of data that can be processed by the Crypto Engine depends on these factors:

- Which engine is in use
- Whether the engines are used in parallel or in series
- The demands on source and destination memories by other parts of the system (i.e., CPU, DMA, etc.)
- The speed of PBCLK5, which drives the Crypto Engine

Table 26-1 shows typical performance for various engines.

TABLE 26-1: CRYPTO ENGINE PERFORMANCE

Engine/ Algorithm	Performance Factor (Mbps/MHz)	Maximum Mbps (PBCLK5 = 100 MHz)
DES	14.4	1440
TDES	6.6	660
AES-128	9.0	900
AES-192	7.9	790
AES-256	7.2	720
MD5	15.6	1560
SHA-1	13.2	1320
SHA-256	9.3	930

26.2 Crypto Engine Buffer Descriptors

Host software creates a linked list of buffer descriptors and the hardware updates them. Table 26-3 provides a list of the Crypto Engine buffer descriptors, followed by format descriptions of each buffer descriptor (see Figure 26-2 through Figure 26-9).

TABLE 26-3: CRYPTO ENGINE BUFFER DESCRIPTORS

Name (see Note 1)		Bit 31/2315/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
BD_CTRL	31:24	DESC_EN	—	CRY_MODE<2:0>			—	—	—
	23:16	—	SA_FETCH_EN	—	—	LAST_BD	LIFM	PKT_INT_EN	CBD_INT_EN
	15:8	BD_BUFLEN<15:8>

	23:16	BD_UPDADDR<23:16>							
	15:8	BD_UPDADDR<15:8>							
	7:0	BD_UPDADDR<7:0>							
BD_MSG_LEN	31:24	MSG_LENGTH<31:24>							
	23:16	MSG_LENGTH<23:16>							
	15:8	MSG_LENGTH<15:8>							
	7:0	MSG_LENGTH<7:0>							
BD_ENC_OFF	31:24	ENCR_OFFSET<31:24>							
	23:16	ENCR_OFFSET<23:16>							
	15:8	ENCR_OFFSET<15:8>							
	7:0	ENCR_OFFSET<7:0>							

Note 1: The buffer descriptor must be allocated in memory on a 64-bit boundary.

FIGURE 26-2: FORMAT OF BD_CTRL

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	DESC_EN	—	CRY_MODE<2:0>			—	—	—
23-16	—	SA_ FETCH_EN	—	—	LAST_BD	LIFM	PKT_ INT_EN	CBD_ INT_EN
15-8	BD_BUFLEN<15:8>							
7-0	BD_BUFLEN<7:0>							

bit 31 **DESC_EN**: Descriptor Enable
1 = The descriptor is owned by hardware. After processing the BD, hardware resets this bit to '0'.
0 = The descriptor is owned by software

bit 30 **Unimplemented:** Must be written as '0'

bit 29-27 **CRY_MODE<2:0>:** Crypto Mode
111 = Reserved
110 = Reserved
101 = Reserved
100 = Reserved
011 = CEK operation
010 = KEK operation
001 = Preboot authentication
000 = Normal operation

bit 22 **SA_FETCH_EN:** Fetch Security Association From External Memory
1 = Fetch SA from the SA pointer. This bit needs to be set to '1' for every new packet.
0 = Use current fetched SA or the internal SA

bit 21-20 **Unimplemented:** Must be written as '0'

bit 19 **LAST_BD:** Last Buffer Descriptors
1 = Last Buffer Descriptor in the chain
0 = More Buffer Descriptors in the chain
After the last BD, the CEBDADDR goes to the base address in CEBDPADDR.

bit 18 **LIFM:** Last In Frame
In case of Receive Packets (from H/W-> Host), this field is filled by the Hardware to indicate whether the packet goes across multiple buffer descriptors. In case of transmit packets (from Host -> H/W), this field indicates whether this BD is the last in the frame.

bit 17 **PKT_INT_EN:** Packet Interrupt Enable
Generate an interrupt after processing the current buffer descriptor, if it is the end of the packet.

bit 16 **CBD_INT_EN:** CBD Interrupt Enable
Generate an interrupt after processing the current buffer descriptor.

bit 15-0 **BD_BUFLEN<15:0>:** Buffer Descriptor Length
This field contains the length of the buffer and is updated with the actual length filled by the receiver.

FIGURE 26-3: FORMAT OF BD_SADDR

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	BD_SAADDR<31:24>							
23-16	BD_SAADDR<23:16>							
15-8	BD_SAADDR<15:8>							
7-0	BD_SAADDR<7:0>							

bit 31-0 **BD_SAADDR<31:0>:** Security Association IP Session Address
The sessions' SA pointer has the keys and IV values.

FIGURE 26-4: FORMAT OF BD_SRCADDR

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	BD_SCRADDR<31:24>							
23-16	BD_SCRADDR<23:16>							
15-8	BD_SCRADDR<15:8>							
7-0	BD_SCRADDR<7:0>							

bit 31-0 **BD_SCRADDR:** Buffer Source Address
The source address of the buffer that needs to be passed through the PE-CRDMA for encryption or authentication. This address must be on a 32-bit boundary.

FIGURE 26-5: FORMAT OF BD_DSTADDR

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	BD_DSTADDR<31:24>							
23-16	BD_DSTADDR<23:16>							
15-8	BD_DSTADDR<15:8>							
7-0	BD_DSTADDR<7:0>							

bit 31-0 **BD_DSTADDR:** Buffer Destination Address
The destination address of the buffer that needs to be passed through the PE-CRDMA for encryption or authentication. This address must be on a 32-bit boundary.

FIGURE 26-6: FORMAT OF BD_NXTADDR

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	BD_NXTADDR<31:24>							
23-16	BD_NXTADDR<23:16>							
15-8	BD_NXTADDR<15:8>							
7-0	BD_NXTADDR<7:0>							

bit 31-0 **BD_NXTADDR:** Next BD Pointer Address Has Next Buffer Descriptor
The next buffer can be a next segment of the previous buffer or a new packet.

FIGURE 26-7: FORMAT OF BD_UPDPTR

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	BD_UPDADDR<31:24>							
23-16	BD_UPDADDR<23:16>							
15-8	BD_UPDADDR<15:8>							
7-0	BD_UPDADDR<7:0>							

bit 31-0 **BD_UPDADDR:** UPD Address Location

The update address has the location where the CRDMA results are posted. The updated results are the ICV values, key output values as needed.

FIGURE 26-8: FORMAT OF BD_MSG_LEN

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	MSG_LENGTH<31:24>							
23-16	MSG_LENGTH<23:16>							
15-8	MSG_LENGTH<15:8>							
7-0	MSG_LENGTH<7:0>							

bit 31-0 **MSG_LENGTH:** Total Message Length

Total message length for the hash and HMAC algorithms in bytes. Total number of crypto bytes in case of GCM algorithm (LEN-C).

FIGURE 26-9: FORMAT OF BD_ENC_OFF

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	ENCR_OFFSET<31:24>							
23-16	ENCR_OFFSET<23:16>							
15-8	ENCR_OFFSET<15:8>							
7-0	ENCR_OFFSET<7:0>							

bit 31-0 **ENCR_OFFSET:** Encryption Offset

Encryption offset for the multi-task test cases (both encryption and authentication). The number of AAD bytes in the case of GCM algorithm (LEN-A).

26.3 Security Association Structure

Table 26-4 shows the Security Association Structure. The Crypto Engine uses the Security Association to determine the settings for processing a Buffer Descriptor Processor. The Security Association contains:

- Which algorithm to use
- Whether to use engines in parallel (for both authentication and encryption/decryption)
- The size of the key
- Authentication key
- Encryption/decryption key
- Authentication Initialization Vector (IV)
- Encryption IV

TABLE 26-4: CRYPTO ENGINE SECURITY ASSOCIATION STRUCTURE

Figure 26-10 shows the Security Association control word structure.

The Crypto Engine fetches different structures for different flows and ensures that hardware fetches minimum words from SA required for processing. The structure is ready for hardware optimal data fetches.

FIGURE 26-10: FORMAT OF SA_CTRL

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31-24	—	—	VERIFY	—	NO_RX	OR_EN	ICVONLY	IRFLAG
23-16	LNC	LOADIV	FB	FLAGS	—	—	—	ALGO<6>
15-8	ALGO<5:0>						ENC	KEY SIZE<1>
7-0	KEY SIZE<0>	MULTITASK<2:0>			CRYPTOALGO<3:0>			

bit 31-30 **Reserved:** Do not use

bit 29 **VERIFY:** NIST Procedure Verification Setting
1 = NIST procedures are to be used
0 = Do not use NIST procedures

bit 28 **Reserved:** Do not use

bit 27 **NO_RX:** Receive DMA Control Setting
1 = Only calculate ICV for authentication calculations
0 = Normal processing

bit 26 **OR_EN:** OR Register Bits Enable Setting
1 = OR the register bits with the internal value of the CSR register
0 = Normal processing

bit 25 **ICVONLY:** Incomplete Check Value Only Flag
This affects the SHA-1 algorithm only. It has no effect on the AES algorithm.
1 = Only three words of the HMAC result are available
0 = All results from the HMAC result are available

bit 24 **IRFLAG:** Immediate Result of Hash Setting
This bit is set when the immediate result for hashing is requested.
1 = Save the immediate result for hashing
0 = Do not save the immediate result

bit 23 **LNC:** Load New Keys Setting
1 = Load a new set of keys for encryption and authentication
0 = Do not load new keys

bit 22 **LOADIV:** Load IV Setting
1 = Load the IV from this Security Association
0 = Use the next IV

bit 21 **FB:** First Block Setting
This bit indicates that this is the first block of data to feed the IV value.
1 = Indicates this is the first block of data
0 = Indicates this is not the first block of data

bit 20 **FLAGS:** Incoming/Outgoing Flow Setting
1 = Security Association is associated with an outgoing flow
0 = Security Association is associated with an incoming flow

bit 19-17 **Reserved:** Do not use

Figure 26-10: Format of SA_CTRL (Continued)

bit 16-10 **ALGO<6:0>:** Type of Algorithm to Use
1xxxxxx = HMAC 1
x1xxxxx = SHA-256
xx1xxxx = SHA1
xxx1xxx = MD5
xxxx1xx = AES
xxxxx1x = TDES
xxxxxx1 = DES

bit 9 **ENC:** Type of Encryption Setting
1 = Encryption
0 = Decryption

bit 8-7 **KEYSIZE<1:0>:** Size of Keys in SA_AUTHKEYx or SA_ENCKEYx
11 = Reserved; do not use
10 = 256 bits
01 = 192 bits
00 = 128 bits(1)

bit 6-4 **MULTITASK<2:0>:** How to Combine Parallel Operations in the Crypto Engine
111 = Parallel pass (decrypt and authenticate incoming data in parallel)
101 = Pipe pass (encrypt the incoming data, and then perform authentication on the encrypted data)
011 = Reserved
010 = Reserved
001 = Reserved
000 = Encryption or authentication or decryption (no pass)

bit 3-0 **CRYPTOALGO<3:0>:** Mode of operation for the Crypto Algorithm
1111 = Reserved
1110 = AES_GCM (for AES processing)
1101 = RCTR (for AES processing)
1100 = RCBC_MAC (for AES processing)
1011 = ROFB (for AES processing)
1010 = RCFB (for AES processing)
1001 = RCBC (for AES processing)
1000 = RECB (for AES processing)
0111 = TOFB (for Triple-DES processing)
0110 = TCFB (for Triple-DES processing)
0101 = TCBC (for Triple-DES processing)
0100 = TECB (for Triple-DES processing)
0011 = OFB (for DES processing)
0010 = CFB (for DES processing)
0001 = CBC (for DES processing)
0000 = ECB (for DES processing)

Note 1: This setting does not alter the size of SA_AUTHKEYx or SA_ENCKEYx in the Security Association, only the number of bits of SA_AUTHKEYx and SA_ENCKEYx that are used.

27.0 RANDOM NUMBER GENERATOR (RNG)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 49. "Crypto Engine (CE) and Random Number Generator (RNG)"** (DS60001246) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Random Number Generator (RNG) core implements a thermal noise-based, True Random Number Generator (TRNG) and a cryptographically secure Pseudo-Random Number Generator (PRNG).

The TRNG uses multiple ring oscillators and the inherent thermal noise of integrated circuits to generate true random numbers that can initialize the PRNG.

The PRNG is a flexible LSFR, which is capable of manifesting a maximal length LFSR of up to 64-bits.

The following are some of the key features of the Random Number Generator:

- TRNG:
  - Up to 25 Mbps of random bits
  - Multi-Ring Oscillator based design
  - Built-in Bias Corrector
- PRNG:
  - LSFR-based
  - Up to 64-bit polynomial length
  - Programmable polynomial
  - TRNG can be seed value

bit 31-13 **Unimplemented:** Read as '0'

bit 12 **LOAD:** Device Select bit

This bit is self-clearing and is used to load the seed from the TRNG (i.e., the random value) as a seed to the PRNG.

bit 11 **TRNGMODE:** TRNG Mode Selection bit

1 = Use ring oscillators with bias corrector
0 = Use ring oscillators with XOR tree

Note: Enabling this bit will generate numbers with a more even distribution of randomness.

bit 10 **CONT:** PRNG Number Shift Enable bit

1 = The PRNG random number is shifted every cycle
0 = The PRNG random number is shifted when the previous value is removed

bit 9 **PRNGEN:** PRNG Operation Enable bit

1 = PRNG operation is enabled
0 = PRNG operation is not enabled

bit 8 **TRNGEN:** TRNG Operation Enable bit

1 = TRNG operation is enabled
0 = TRNG operation is not enabled

bit 7-0 **PLEN<7:0>:** PRNG Polynomial Length bits

These bits contain the length of the polynomial used for the PRNG.

28.0 12-BIT HIGH-SPEED SUCCESSIVE APPROXIMATION REGISTER (SAR) ANALOG-TO-DIGITAL CONVERTER (ADC)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 22. "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"** (DS60001344) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The 12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC) includes the following key features:

- 12-bit resolution
- Six ADC modules with dedicated Sample and Hold (S&H) circuits
- Two dedicated ADC modules can be combined in Turbo mode to provide double conversion rate (clock sources for combined ADC modules must be synchronous)
- Single-ended and/or differential inputs
- Can operate during Sleep mode
- Supports touch sense applications
- Six digital comparators
- Six digital filters supporting two modes:
  - Oversampling mode
  - Averaging mode
- Early interrupt generation resulting in faster processing of converted data
- Designed for motor control, power conversion, and general purpose applications

A simplified block diagram of the ADC module is illustrated in Figure 28-1.

The 12-bit HS SAR ADC has up to five dedicated ADC modules (ADC0-ADC4) and one shared ADC module (ADC7). The dedicated ADC modules use a single input (or its alternate) and are intended for high-speed and precise sampling of time-sensitive or transient inputs. The the shared ADC module incorporates a multiplexer on the input to facilitate a larger group of inputs, with slower sampling, and provides flexible automated scanning option through the input scan logic.

For each ADC module, the analog inputs are connected to the S&H capacitor. The clock, sampling time, and output data resolution for each ADC module can be set independently. The ADC module performs the conversion of the input analog signal based on the configurations set in the registers. When conversion is complete, the final result is stored in the result buffer for the specific analog input and is passed to the digital filter and digital comparator if configured to use data from this particular sample. Input to ADCx mapping is illustrated in Figure 28-2.

28.1 Activation Sequence

Step 1: Initialize the ADC calibration values by copying it from the factory programmed DEVADCx Flash locations starting at 0xBFC45000 into the ADCxCFG registers starting at 0xBF887D00. Then, configure the AICPMPEN bit (ADCCON1<12> and the IOANCPEN bit (CFGCON<7>) = 1 if and only if VDD is less than 2.5V. The default is '0', which assumes VDD is greater than or equal to 2.5V.

Step 2: Write all the essential ADC configuration SFRs including the ADC control clock and all ADC core clocks setup as given below:

- ADCCON1, keeping the ON bit = 0
- ADCCON2, especially paying attention to ADCDIV<6:0> and SAMC<9:0>
- ADCANCON, keeping all analog enables ANENx bit = 0, WKUPCLKCNT bit = 0xA
- ADCCON3, keeping all DIGEN5x = 0, especially paying attention to ADCSEL<1:0>, CONCLKDIV <5:0>, and VREFSEL<2:0>
- ADCxTIME, ADCDIVx<6:0>, and SAMCx<9:0>
- ADCTRGMODE, ADCIMCONx, ADCTRGSNS, ADCCSSx, ADCGIRQENx, ADCTRGx, ADCBASE
- Comparators, filters, and so on

Step 3: Set the ON bit to '1', which enables the ADC control clock.

Step 4: Wait for the interrupt or polls the status bit BGVRRDY = 1, which signals that the device analog environment (band gap and VREF) is ready.

Step 5: Set the ANENx bit to '1' for each of the ADC SAR cores to be used.

Step 6: Wait for the interrupt or polls the warm-up ready bits WKRDYx = 1, which signals that the respective ADC SAR cores are ready to operate.

Step 7: Set the DIGENx bit to '1', which enables the digital circuitry to immediately begin processing incoming triggers to perform data conversions.

The throughput rate (see Table 37-39 in **37.0 "Electrical Characteristics"**) is calculated, as shown in Equation 28-1.

EQUATION 28-1: ADC THROUGHPUT RATE

$$FTP \quad \frac{T_{AD}}{(T_{SAMP} \quad T_{CONV})}$$

Where,

T_{AD} = the frequency of the individual ADC module

Note 1: Prior to enabling the ADC module, the user application must copy the ADC calibration data (DEVADC0-DEVADC4, DEVADC7; see Register 34-13) from the Configuration memory into the ADC Configuration registers (ADC0CFG-ADC4CFG, ADC7CFG).

2: Configure the AICPMPEN (ADCCON1<12>) and IOANCPEN (CFGCON<7>) bits to '0' if VDD >= 2.5V. Set the AICPMPEN and IOANCPEN bits to '1' if VDD < 2.5V.

TABLE 28-1: PIC32MZXXEFXX INTERLEAVED ADC THROUGHPUT RATES

#No. of Interleaved ADC Possible	ADC TAD (min) = 20 ns (50 Mhz max.)			
	12-bit (max.) msps	10-bit (max.) msps	8-bit (max.) msps	6-bit (max.) msps
1	3.125 msps	3.571 msps	4.167 msps	5.0 msps
2	6.250 msps	7.143 msps	8.333 msps	10.00 msps
3	8.330 msps	10.00 msps	12.50 msps	12.50 msps
4	12.50 msps	12.50 msps	16.667 msps	16.667 msps

Note: Interleaved ADCs in this context means connecting the same analog source signal to multiple dedicated Class_1 ADCs (i.e., ADC0-ADC5), and using independent staggered trigger sources accordingly for each interleaved ADC.

Note 1: This bit or register is not available on 64-pin devices.
2: This bit or register is not available on 64-pin and 100-pin devices.
3: Before enabling the ADC, the user application must initialize the ADC calibration values by copying them from the factory-programmed DEVADCx Flash registers into the corresponding ADCxCFG registers.

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **TRBEN:** Turbo Channel Enable bit
1 = Enable the Turbo channel
0 = Disable the Turbo channel

bit 30 **TRBERR:** Turbo Channel Error Status bit
1 = An error occurred while setting the Turbo channel and Turbo channel function to be disabled regardless of the TRBEN bit being set to '1'.
0 = Turbo channel error did not occur

Note: The status of this bit is valid only after the TRBEN bit is set.

bit 29-27 **TRBMST<2:0>:** Turbo Master ADCx bits
111 = Reserved
110 = ADC4 is selected as the Turbo Master
•
•
•
000 = ADC0 is selected as the Turbo Master

bit 26-24 **TRBSLV<2:0>:** Turbo Slave ADCx bits
111 = Reserved
110 = ADC4 is selected as the Turbo Slave
•
•
•
000 = ADC0 is selected as the Turbo Slave

bit 23 **FRACT:** Fractional Data Output Format bit
1 = Fractional
0 = Integer

bit 22-21 **SELRES<1:0>:** Shared ADC (ADC7) Resolution bits
11 = 12 bits (default)
10 = 10 bits
01 = 8 bits
00 = 6 bits

Note: Changing the resolution of the ADC does not shift the result in the corresponding ADCDATAx register. The result will still occupy 12 bits, with the corresponding lower unused bits set to '0'. For example, a resolution of 6 bits will result in ADCDATAx<5:0> being set to '0', and ADCDATAx<11:6> holding the result.

REGISTER 28-1: ADCCON1: ADC CONTROL REGISTER 1 (CONTINUED)

bit 20-16 **STRGSRC<4:0>:** Scan Trigger Source Select bits
11111 = Reserved
•
•
•
01101 = Reserved
01100 = Comparator 2 (COUT)
01011 = Comparator 1 (COUT)
01010 = OCMP5
01001 = OCMP3
01000 = OCMP1
00111 = TMR5 match

00010 = Global level software trigger (GLSWTRG)
00001 = Global software edge trigger (GSWTRG)
00000 = No Trigger

bit 15 **ON:** ADC Module Enable bit
1 = ADC module is enabled
0 = ADC module is disabled

Note: The ON bit should be set only after the ADC module has been configured.

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12 **AICPMPEN:** Analog Input Charge Pump Enable bit
1 = Analog input charge pump is enabled (default)
0 = Analog input charge pump is disabled

Note 1: For proper analog operation at VVDIO less than 2.5V, the AICPMPEN bit and the IOANCPEN (CFGCON<7>) bit must be set to '1.' , and these bits should not be set if VDDIO is greater than 2.5V.

2: ADC throughput rate performance is reduced as defined in the table below if the AICPMPEN (ADCCON1<12>) bit and the IOANCPEN(CFGCON<7>) bit are set to '1'.

ADC0	ADC1	ADC2	ADC3	ADC4	ADC7	Maximum combined
ON	OFF	OFF	OFF	OFF	OFF	2 MSPS
ON	ON	OFF	OFF	OFF	OFF	4 MSPS
ON	ON	ON	OFF	OFF	OFF	5 MSPS

ON	ON	ON	ON	ON	OFF	9 MSPS
ON	ON	ON	ON	ON	ON	10 MSPS

REGISTER 28-1: ADCCON1: ADC CONTROL REGISTER 1 (CONTINUED)

bit 11 **CVDEN:** Capacitive Voltage Division Enable bit
1 = CVD operation is enabled
0 = CVD operation is disabled

bit 10 **FSSCLKEN:** Fast Synchronous System Clock to ADC Control Clock bit
1 = Fast synchronous system clock to ADC control clock is enabled
0 = Fast synchronous system clock to ADC control clock is disabled

bit 9 **FSPBCLKEN:** Fast Synchronous Peripheral Clock to ADC Control Clock bit
1 = Fast synchronous peripheral clock to ADC control clock is enabled
0 = Fast synchronous peripheral clock to ADC control clock is disabled

bit 8-7 **Unimplemented:** Read as '0'

bit 6-4 **IRQVS<2:0>:** Interrupt Vector Shift bits
To determine interrupt vector address, this bit specifies the amount of left shift done to the ARDYx status bits in the ADCDSTAT1 and ADCDSTAT2 registers, prior to adding with the ADCBASE register.

Interrupt Vector Address = Read Value of ADCBASE and Read Value of ADCBASE = Value written to ADCBASE + x << IRQVS<2:0>, where 'x' is the smallest active input ID from the ADCDSTAT1 or ADCDSTAT2 registers (which has highest priority).

111 = Shift x left 7 bit position
110 = Shift x left 6 bit position
101 = Shift x left 5 bit position
100 = Shift x left 4 bit position
011 = Shift x left 3 bit position
010 = Shift x left 2 bit position
001 = Shift x left 1 bit position
000 = Shift x left 0 bit position

bit 3 **STRGLVL:** Scan Trigger High Level/Positive Edge Sensitivity bit
1 = Scan trigger is high level sensitive. Once STRIG mode is selected (TRGSRCx<4:0> in the ADCTRGx register), the scan trigger will continue for all selected analog inputs, until the STRIG option is removed.
0 = Scan trigger is positive edge sensitive. Once STRIG mode is selected (TRGSRCx<4:0> in the ADCTRGx register), only a single scan trigger will be generated, which will complete the scan of all selected analog inputs.

bit 2-0 **Unimplemented:** Read as '0'

REGISTER 28-2: ADCCON2: ADC CONTROL REGISTER 2

	—	ADCDIV<6:0>						

Legend:	HC = Hardware Set	HS = Hardware Cleared	r = Reserved
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **BGVRRDY:** Band Gap Voltage/ADC Reference Voltage Status bit

1 = Both band gap voltage and ADC reference voltages (VREF) are ready
0 = Either or both band gap voltage and ADC reference voltages (VREF) are not ready

Data processing is valid only after BGVRRDY is set by hardware, so the application code must check that the BGVRRDY bit is set to ensure data validity. This bit set to '0' when ON (ADCCON1<15>) = 0.

bit 30 **REFFLT:** Band Gap/VREF/AVDD BOR Fault Status bit

1 = Fault in band gap or the VREF voltage while the ON bit (ADCCON1<15>) was set. Most likely a band gap or VREF fault will be caused by a BOR of the analog VDD supply.
0 = Band gap and VREF voltage are working properly

This bit is cleared when the ON bit (ADCCON1<15>) = 0 and the BGVRRDY bit = 1.

bit 29 **EOSRDY:** End of Scan Interrupt Status bit

1 = All analog inputs are considered for scanning through the scan trigger (all analog inputs specified in the ADCCSS1 and ADCCSS2 registers) have completed scanning
0 = Scanning has not completed

This bit is cleared when ADCCON2<31:24> are read in software.

bit 28-26 **CVDCPL<2:0>:** Capacitor Voltage Divider (CVD) Setting bit

111 = 7 * 2.5 pF = 17.5 pF
110 = 6 * 2.5 pF = 15 pF
101 = 5 * 2.5 pF = 12.5 pF
100 = 4 * 2.5 pF = 10 pF
011 = 3 * 2.5 pF = 7.5 pF
010 = 2 * 2.5 pF = 5 pF
001 = 1 * 2.5 pF = 2.5 pF
000 = 0 * 2.5 pF = 0 pF

bit 25-16 **SAMC<9:0>:** Sample Time for the Shared ADC (ADC7) bits

1111111111 = 1025 TAD7
.
.
.
0000000001 = 3 TAD7
0000000000 = 2 TAD7

Where TAD7 = period of the ADC conversion clock for the Shared ADC (ADC7) controlled by the ADCDIV<6:0> bits.

bit 15 **BGVRIEN:** Band Gap/VREF Voltage Ready Interrupt Enable bit

1 = Interrupt will be generated when the BGVRDDY bit is set
0 = No interrupt is generated when the BGVRRDY bit is set

REGISTER 28-2: ADCCON2: ADC CONTROL REGISTER 2 (CONTINUED)

bit 14 **REFFLTIEN:** Band Gap/VREF Voltage Fault Interrupt Enable bit
1 = Interrupt will be generated when the REFFLT bit is set
0 = No interrupt is generated when the REFFLT bit is set

bit 13 **EOSIEN:** End of Scan Interrupt Enable bit
1 = Interrupt will be generated when EOSRDY bit is set
0 = No interrupt is generated when the EOSRDY bit is set

bit 12 **ADCEIOVR:** Early Interrupt Request Override bit
1 = Early interrupt generation is not overridden and interrupt generation is controlled by the ADCEIEN1 and ADCEIEN2 registers
0 = Early interrupt generation is overridden and interrupt generation is controlled by the ADCGIRQEN1 and ADCGIRQEN2 registers

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **ADCEIS<2:0>:** Shared ADC (ADC7) Early Interrupt Select bits
These bits select the number of clocks (TAD7) prior to the arrival of valid data that the associated interrupt is generated.
111 = The data ready interrupt is generated 8 ADC clocks prior to end of conversion
110 = The data ready interrupt is generated 7 ADC clocks prior to end of conversion
•
•
•
001 = The data ready interrupt is generated 2 ADC module clocks prior to end of conversion
000 = The data ready interrupt is generated 1 ADC module clock prior to end of conversion

Note: All options are available when the selected resolution, set by the SELRES<1:0> bits (ADCCON1<22:21>), is 12-bit or 10-bit. For a selected resolution of 8-bit, options from '000' to '101' are valid. For a selected resolution of 6-bit, options from '000' to '011' are valid.

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **ADCDIV<6:0>:** Shared ADC (ADC7) Clock Divider bits
1111111 = 254 * TQ = TAD7
•
•
•
0000011 = 6 * TQ = TAD7
0000010 = 4 * TQ = TAD7
0000001 = 2 * TQ = TAD7
0000000 = Reserved

The ADCDIV<6:0> bits divide the ADC control clock (TQ) to generate the clock for the Shared ADC, ADC7 (TAD7).

bit 23 **DIGEN7:** Shared ADC (ADC7) Digital Enable bit
1 = ADC7 is digital enabled
0 = ADC7 is digital disabled

bit 22-21 **Unimplemented:** Read as '0'

bit 20 **DIGEN4:** ADC4 Digital Enable bit
1 = ADC4 is digital enabled
0 = ADC4 is digital disabled

bit 19 **DIGEN3:** ADC3 Digital Enable bit
1 = ADC3 is digital enabled
0 = ADC3 is digital disabled

Note 1: The SAMP bit has the highest priority and setting this bit will keep the S&H circuit in Sample mode until the bit is cleared. Also, usage of the SAMP bit will cause settings of SAMC<9:0> bits (ADCCON2<25:16>) to be ignored.

2: The SAMP bit only connects Class 2 and Class 3 analog inputs to the shared ADC, ADC7. All Class 1 analog inputs are not affected by the SAMP bit.

3: The SAMP bit is not a self-clearing bit and it is the responsibility of application software to first clear this bit and only after setting the RQCNVRT bit to start the analog-to-digital conversion.

4: Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRCx<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

REGISTER 28-3: ADCCON3: ADC CONTROL REGISTER 3 (CONTINUED)

1 = ADC0 is digital enabled
0 = ADC0 is digital disabled

bit 15-13 **VREFSEL<2:0>:** Voltage Reference (VREF) Input Selection bits

VREFSEL<2:0>	ADREF+	ADREF-
1xx	Reserved; do not use	
011	External VREFH	External VREFL
010	AVDD	External VREFL
001	External VREFH	AVss
000	AVDD	AVss

bit 12 **TRGSUSP:** Trigger Suspend bit
1 = Triggers are blocked from starting a new analog-to-digital conversion, but the ADC module is not disabled
0 = Triggers are not blocked

bit 11 **UPDIEN:** Update Ready Interrupt Enable bit
1 = Interrupt will be generated when the UPDRDY bit is set by hardware
0 = No interrupt is generated

bit 10 **UPDRDY:** ADC Update Ready Status bit
1 = ADC SFRs can be updated
0 = ADC SFRs cannot be updated

Note: This bit is only active while the TRGSUSP bit is set and there are no more running conversions of any ADC modules.

bit 9 **SAMP:** Class 2 and Class 3 Analog Input Sampling Enable bit**(1,2,3,4)**
1 = The ADC S&H amplifier is sampling
0 = The ADC S&H amplifier is holding

bit 8 **RQCNVRT:** Individual ADC Input Conversion Request bit
This bit and its associated ADINSEL<5:0> bits enable the user to individually request an analog-to-digital conversion of an analog input through software.
1 = Trigger the conversion of the selected ADC input as specified by the ADINSEL<5:0> bits
0 = Do not trigger the conversion

Note: This bit is automatically cleared in the next ADC clock cycle.

bit 7 **GLSWTRG:** Global Level Software Trigger bit
1 = Trigger conversion for ADC inputs that have selected the GLSWTRG bit as the trigger signal, either through the associated TRGSRC<4:0> bits in the ADCTRGx registers or through the STRGSRC<4:0> bits in the ADCCON1 register
0 = Do not trigger an analog-to-digital conversion

Note 1: The SAMP bit has the highest priority and setting this bit will keep the S&H circuit in Sample mode until the bit is cleared. Also, usage of the SAMP bit will cause settings of SAMC<9:0> bits (ADCCON2<25:16>) to be ignored.

2: The SAMP bit only connects Class 2 and Class 3 analog inputs to the shared ADC, ADC7. All Class 1 analog inputs are not affected by the SAMP bit.

3: The SAMP bit is not a self-clearing bit and it is the responsibility of application software to first clear this bit and only after setting the RQCNVRT bit to start the analog-to-digital conversion.

4: Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRCx<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

REGISTER 28-3: ADCCON3: ADC CONTROL REGISTER 3 (CONTINUED)

bit 6 **GSWTRG:** Global Software Trigger bit

1 = Trigger conversion for ADC inputs that have selected the GSWTRG bit as the trigger signal, either through the associated TRGSRC<4:0> bits in the ADCTRGx registers or through the STRGSRC<4:0> bits in the ADCCON1 register

0 = Do not trigger an analog-to-digital conversion

Note: This bit is automatically cleared in the next ADC clock cycle.

bit 5-0 **ADINSEL<5:0>:** Analog Input Select bits

These bits select the analog input to be converted when the RQCNVRT bit is set. As a general rule:

111111 = Reserved
•
•
•
101101 = Reserved
101100 = MAX_AN_INPUT + 2 = IV_{TEMP}
101011 = MAX_AN_INPUT + 1 = IV_{REF}
101010 = MAX_AN_INPUT = AN[MAX_AN_INPUT]
•
•
•
000001 = AN1
000000 = AN0

Note 1: The SAMP bit has the highest priority and setting this bit will keep the S&H circuit in Sample mode until the bit is cleared. Also, usage of the SAMP bit will cause settings of SAMC<9:0> bits (ADCCON2<25:16>) to be ignored.

2: The SAMP bit only connects Class 2 and Class 3 analog inputs to the shared ADC, ADC7. All Class 1 analog inputs are not affected by the SAMP bit.

3: The SAMP bit is not a self-clearing bit and it is the responsibility of application software to first clear this bit and only after setting the RQCNVRT bit to start the analog-to-digital conversion.

4: Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRCx<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

bit 31-0 **CSS31:CSS0:** Analog Common Scan Select bits(2,3)
1 = Select AN*x* for input scan
0 = Skip AN*x* for input scan

Note 1: This bit is not available on 64-pin devices.

2: In addition to setting the appropriate bits in this register, Class 1 and Class 2 analog inputs must select the STRIG input as the trigger source if they are to be scanned through the CSS*x* bits. Refer to the bit descriptions in the ADCTRGx registers for selecting the STRIG option.

3: If a Class 1 or Class 2 input is included in the scan by setting the CSSx bit to '1' and by setting the TRGSRCx<4:0> bits to STRIG mode ('0b11), the user application must ensure that no other triggers are generated for that input using the RQCNVRT bit in the ADCCON3 register or the hardware input or any digital filter. Otherwise, the scan behavior is unpredictable.

bit 31 **AFEN:** Digital Filter 'x' Enable bit
1 = Digital filter is enabled
0 = Digital filter is disabled and the AFRDY status bit is cleared

bit 30 **DATA16EN:** Filter Significant Data Length bit
1 = All 16 bits of the filter output data are significant
0 = Only the first 12 bits are significant, followed by four zeros
Note: This bit is significant only if DFMODE = 1 (Averaging Mode) and FRACT (ADCCON1<23>) = 1 (Fractional Output Mode).

bit **DFMODE:** ADC Filter Mode bit
1 = Filter 'x' works in Averaging mode
0 = Filter 'x' works in Oversampling Filter mode (default)

bit 28-26 **OVRSAM<2:0>:** Oversampling Filter Ratio bits
If DFMODE is '0':
111 = 128 samples (shift sum 3 bits to right, output data is in 15.1 format)
110 = 32 samples (shift sum 2 bits to right, output data is in 14.1 format)
101 = 8 samples (shift sum 1 bit to right, output data is in 13.1 format)
100 = 2 samples (shift sum 0 bits to right, output data is in 12.1 format)
011 = 256 samples (shift sum 4 bits to right, output data is 16 bits)
010 = 64 samples (shift sum 3 bits to right, output data is 15 bits)
001 = 16 samples (shift sum 2 bits to right, output data is 14 bits)
000 = 4 samples (shift sum 1 bit to right, output data is 13 bits)

If DFMODE is '1':
111 = 256 samples (256 samples to be averaged)
110 = 128 samples (128 samples to be averaged)
101 = 64 samples (64 samples to be averaged)
100 = 32 samples (32 samples to be averaged)
011 = 16 samples (16 samples to be averaged)
010 = 8 samples (8 samples to be averaged)
001 = 4 samples (4 samples to be averaged)
000 = 2 samples (2 samples to be averaged)

bit 25 **AFGIEN:** Digital Filter 'x' Interrupt Enable bit
1 = Digital filter interrupt is enabled and is generated by the AFRDY status bit
0 = Digital filter is disabled

REGISTER 28-16: ADCFLTRx: ADC DIGITAL FILTER 'x' REGISTER ('x' = 1 THROUGH 6)

bit 24 **AFRDY:** Digital Filter 'x' Data Ready Status bit
1 = Data is ready in the FLTRDATA<15:0> bits
0 = Data is not ready

Note: This bit is cleared by reading the FLTRDATA<15:0> bits or by disabling the Digital Filter module (by setting AFEN to '0').

bit 23-21 **Unimplemented:** Read as '0'

bit 20-16 **CHNLID<4:0>:** Digital Filter Analog Input Selection bits
These bits specify the analog input to be used as the oversampling filter data source.
11111 = Reserved
.
.
.
01100 = Reserved
01011 = AN11
.
.
.
00010 = AN2
00001 = AN1
00000 = AN0

Note: Only the first 12 analog inputs, Class 1 (AN0-AN11) and Class 2 (AN5-AN11), can use a digital filter.

bit 15-0 **FLTRDATA<15:0>:** Digital Filter 'x' Data Output Value bits
The filter output data is as per the fractional format set in the FRACT bit (ADCCON1<23>). The FRACT bit should not be changed while the filter is enabled. Changing the state of the FRACT bit after the operation of the filter ended will not update the value of the FLTRDATA<15:0> bits to reflect the new format.

bit 31-16 **CVDDATA<15:0>:** CVD Data Status bits

In CVD mode, these bits obtain the CVD differential output data (subtraction of CVD positive and negative measurement), whenever a Digital Comparator interrupt is generated. The value in these bits is compliant with the FRACT bit (ADCCON1<23>) and is always signed.

bit 15-14 **Unimplemented:** Read as '0'

bit 13-8 **AINID<5:0>:** Digital Comparator 0 Analog Input Identification (ID) bits

When a digital comparator event occurs (DCMPED = 1), these bits identify the analog input being monitored by Digital Comparator 0.

Note: In normal ADC mode, only analog inputs <31:0> can be processed by the Digital Comparator 0. The Digital Comparator 0 also supports the CVD mode, in which all Class 2 and Class 3 analog inputs may be stored in the AINID<5:0> bits.

bit 12-0 **AN<44:32>:** ADC Analog Input bits

These bits reflect the system configuration and are updated during boot-up time. By reading these read-only bits, the user application can determine whether or not an analog input in the device is available.

AN<63:32>: Reflects the presence or absence of the respective analog input (AN63-AN32).

29.0 CONTROLLER AREA NETWORK (CAN)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 34. "Controller Area Network (CAN)"** (DS60001154) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Controller Area Network (CAN) module supports the following key features:

- Standards Compliance:
  - Full CAN 2.0B compliance
  - Programmable bit rate up to 1 Mbps
- Message Reception and Transmission:
  - 32 message FIFOs
  - Each FIFO can have up to 32 messages for a total of 1024 messages
  - FIFO can be a transmit message FIFO or a receive message FIFO
  - User-defined priority levels for message FIFOs used for transmission
  - 32 acceptance filters for message filtering
  - Four acceptance filter mask registers for message filtering
  - Automatic response to remote transmit request
  - DeviceNet™ addressing support
- Additional Features:
  - Loopback, Listen All Messages and Listen Only modes for self-test, system diagnostics and bus monitoring
  - Low-power operating modes
  - CAN module is a bus master on the PIC32 System Bus
  - Use of DMA is not required
  - Dedicated time-stamp timer
  - Dedicated DMA channels
  - Data-only Message Reception mode

Figure 29-1 illustrates the general structure of the CAN module.

	—	—	—	DNCNT<4:0>				

Legend:	HC = Hardware Clear	S = Settable bit	
R = Readable bit	W = Writable bit	P = Programmable bit	r = Reserved bit
U = Unimplemented bit	-n = Bit Value at POR: (‘0’, ‘1’, x = Unknown)		

bit 31-28 **Unimplemented:** Read as ‘0’

bit 27 **ABAT:** Abort All Pending Transmissions bit
1 = Signal all transmit buffers to abort transmission
0 = Module will clear this bit when all transmissions aborted

bit 26-24 **REQOP<2:0>:** Request Operation Mode bits
111 = Set Listen All Messages mode
110 = Reserved - Do not use
101 = Reserved - Do not use
100 = Set Configuration mode
011 = Set Listen Only mode
010 = Set Loopback mode
001 = Set Disable mode
000 = Set Normal Operation mode

bit 23-21 **OPMOD<2:0>:** Operation Mode Status bits
111 = Module is in Listen All Messages mode
110 = Reserved
101 = Reserved
100 = Module is in Configuration mode
011 = Module is in Listen Only mode
010 = Module is in Loopback mode
001 = Module is in Disable mode
000 = Module is in Normal Operation mode

bit 20 **CANCAP:** CAN Message Receive Time Stamp Timer Capture Enable bit
1 = CANTMR value is stored on valid message reception and is stored with the message
0 = Disable CAN message receive time stamp timer capture and stop CANTMR to conserve power

bit 19-16 **Unimplemented:** Read as ‘0’

bit 15 **ON:** CAN On bit(1)
1 = CAN module is enabled
0 = CAN module is disabled

bit 14 **Unimplemented:** Read as ‘0’

Note 1: If the user application clears this bit, it may take a number of cycles before the CAN module completes the current transaction and responds to this request. The user application should poll the CANBUSY bit to verify that the request has been honored.

REGISTER 29-1: CiCON: CAN MODULE CONTROL REGISTER (CONTINUED)

bit 13 **SIDLE:** CAN Stop in Idle bit
1 = CAN Stops operation when system enters Idle mode
0 = CAN continues operation when system enters Idle mode

bit 12 **Unimplemented:** Read as '0'

bit 11 **CANBUSY:** CAN Module is Busy bit
1 = The CAN module is active
0 = The CAN module is completely disabled

bit 10-5 **Unimplemented:** Read as '0'

bit 4-0 **DNCNT<4:0>:** Device Net Filter Bit Number bits
10011-11111 = Invalid Selection (compare up to 18-bits of data with EID)
10010 = Compare up to data byte 2 bit 6 with EID17 (CiRXFn<17>)
•
•
•
00001 = Compare up to data byte 0 bit 7 with EID0 (CiRXFn<0>)
00000 = Do not compare data bytes

Note 1: If the user application clears this bit, it may take a number of cycles before the CAN module completes the current transaction and responds to this request. The user application should poll the CANBUSY bit to verify that the request has been honored.

bit 31-0 **CiFIFOBA<31:0>:** CAN FIFO Base Address bits

These bits define the base address of all message buffers. Individual message buffers are located based on the size of the previous message buffers. This address is a physical address. Note that bits <1:0> are read-only and read '0', forcing the messages to be 32-bit word-aligned in device RAM.

Note 1: This bit is unimplemented and will always read '0', which forces word-alignment of messages.

Note: This register can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> (CiCON<23:21>) = 100).

REGISTER 29-20: CiFIFOCONn: CAN FIFO CONTROL REGISTER 'n' ('n' = 0-31)

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-21 **Unimplemented:** Read as '0'

bit 20-16 **FSIZE<4:0>:** FIFO Size bits(1)
11111 = FIFO is 32 messages deep
•
•
•
00010 = FIFO is 3 messages deep
00001 = FIFO is 2 messages deep
00000 = FIFO is 1 message deep

bit 15 **Unimplemented:** Read as '0'

bit 14 **FRESET:** FIFO Reset bits
1 = FIFO will be reset when bit is set, cleared by hardware when FIFO is reset. After setting, the user application should poll whether this bit is clear before taking any action
0 = No effect

bit 13 **UINC:** Increment Head/Tail bit
TXEN = 1: (FIFO configured as a Transmit FIFO)
When this bit is set, the FIFO head will increment by a single message
TXEN = 0: (FIFO configured as a Receive FIFO)
When this bit is set, the FIFO tail will increment by a single message

bit 12 **DONLY:** Store Message Data Only bit(1)
TXEN = 1: (FIFO configured as a Transmit FIFO)
This bit is not used and has no effect.
TXEN = 0: (FIFO configured as a Receive FIFO)
1 = Only data bytes will be stored in the FIFO
0 = Full message is stored, including identifier

bit 11-8 **Unimplemented:** Read as '0'

bit 7 **TXEN:** TX/RX Buffer Selection bit
1 = FIFO is a Transmit FIFO
0 = FIFO is a Receive FIFO

Note 1: These bits can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> bits (CiCON<23:21>) = 100).
2: This bit is updated when a message completes (or aborts) or when the FIFO is reset.
3: This bit is reset on any read of this register or when the FIFO is reset.

REGISTER 29-20: CiFIFOCONn: CAN FIFO CONTROL REGISTER 'n' ('n' = 0-31) (CONTINUED)

bit 6 **TXABAT:** Message Aborted bit(2)
1 = Message was aborted
0 = Message completed successfully

bit 5 **TXLARB:** Message Lost Arbitration bit(3)
1 = Message lost arbitration while being sent
0 = Message did not lose arbitration while being sent

bit 4 **TXERR:** Error Detected During Transmission bit(3)
1 = A bus error occurred while the message was being sent
0 = A bus error did not occur while the message was being sent

bit 3 **TXREQ:** Message Send Request
TXEN = 1: (FIFO configured as a Transmit FIFO)
Setting this bit to '1' requests sending a message.
The bit will automatically clear when all the messages queued in the FIFO are successfully sent.
Clearing the bit to '0' while set ('1') will request a message abort.
TXEN = 0: (FIFO configured as a Receive FIFO)
This bit has no effect.

bit 2 **RTREN:** Auto RTR Enable bit
1 = When a remote transmit is received, TXREQ will be set
0 = When a remote transmit is received, TXREQ will be unaffected

bit 1-0 **TXPR<1:0>:** Message Transmit Priority bits
11 = Highest Message Priority
10 = High Intermediate Message Priority
01 = Low Intermediate Message Priority
00 = Lowest Message Priority

Note 1: These bits can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> bits (CiCON<23:21>) = 100).
2: This bit is updated when a message completes (or aborts) or when the FIFO is reset.
3: This bit is reset on any read of this register or when the FIFO is reset.

bit 31-5 **Unimplemented:** Read as '0'

bit 4-0 **CiFIFOCIn<4:0>:** CAN Side FIFO Message Index bits

TXEN = 1: (FIFO configured as a Transmit Buffer)

A read of this register will return an index to the message that the FIFO will next attempt to transmit.

TXEN = 0: (FIFO configured as a Receive Buffer)

A read of this register will return an index to the message that the FIFO will use to save the next message.

30.0 ETHERNET CONTROLLER

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 35. "Ethernet Controller"** (DS60001155) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Ethernet controller is a bus master module that interfaces with an off-chip Physical Layer (PHY) to implement a complete Ethernet node in a system.

Key features of the Ethernet Controller include:

- Supports 10/100 Mbps data transfer rates
- Supports full-duplex and half-duplex operation
- Supports RMII and MII PHY interface
- Supports MIIM PHY management interface
- Supports both manual and automatic Flow Control
- RAM descriptor-based DMA operation for both receive and transmit path
- Fully configurable interrupts
- Configurable receive packet filtering
  - CRC check
  - 64-byte pattern match
  - Broadcast, multicast and unicast packets
  - Magic Packet™
  - 64-bit hash table
  - Runt packet
- Supports packet payload checksum calculation
- Supports various hardware statistics counters

Figure 30-1 illustrates a block diagram of the Ethernet controller.

FIGURE 30-1: ETHERNET CONTROLLER BLOCK DIAGRAM

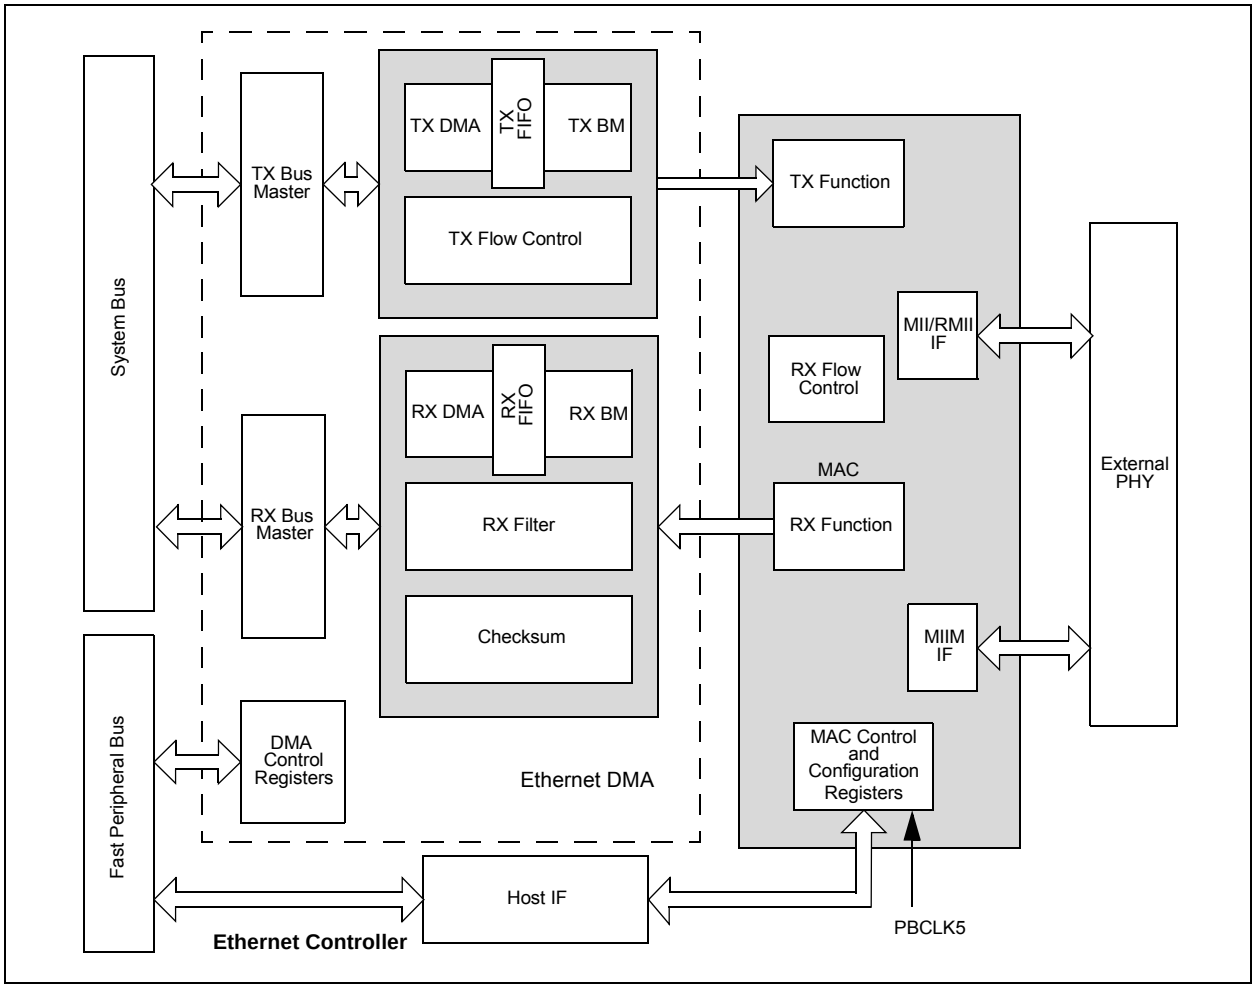

Table 30-1, Table 30-2, Table 30-3 and Table 30-4 show four interfaces and the associated pins that can be used with the Ethernet Controller.

REGISTER 30-1: ETHCON1: ETHERNET CONTROLLER CONTROL REGISTER 1

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	PTV<15:8>							
23:16	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	PTV<7:0>							
15:8	R/W-0	U-0	R/W-0	U-0	U-0	U-0	R/W-0	R/W-0
	ON	—	SIDL	—	—	—	TXRTS	RXEN(1)
7:0	R/W-0	U-0	U-0	R/W-0	U-0	U-0	U-0	R/W-0
	AUTOFC	—	—	MANFC	—	—	—	BUFCDEC

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **PTV<15:0>:** PAUSE Timer Value bits

PAUSE Timer Value used for Flow Control.
This register should only be written when RXEN (ETHCON1<8>) is not set.

These bits are only used for Flow Control operations.

bit 15 **ON:** Ethernet ON bit

1 = Ethernet module is enabled
0 = Ethernet module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Ethernet Stop in Idle Mode bit

1 = Ethernet module transfers are paused during Idle mode
0 = Ethernet module transfers continue during Idle mode

bit 12-10 **Unimplemented:** Read as '0'

bit 9 **TXRTS:** Transmit Request to Send bit

1 = Activate the TX logic and send the packet(s) defined in the TX EDT
0 = Stop transmit (when cleared by software) or transmit done (when cleared by hardware)

After the bit is written with a '1', it will clear to a '0' whenever the transmit logic has finished transmitting the requested packets in the Ethernet Descriptor Table (EDT). If a '0' is written by the CPU, the transmit logic finishes the current packet's transmission and then stops any further.

This bit only affects TX operations.

bit 8 **RXEN:** Receive Enable bit(1)

1 = Enable RX logic, packets are received and stored in the RX buffer as controlled by the filter configuration
0 = Disable RX logic, no packets are received in the RX buffer

This bit only affects RX operations.

Note 1: It is not recommended to clear the RXEN bit and then make changes to any RX related field/register. The Ethernet Controller must be reinitialized (ON cleared to '0'), and then the RX changes applied.

REGISTER 30-1: ETHCON1: ETHERNET CONTROLLER CONTROL REGISTER 1 (CONTINUED)

bit 7 **AUTOFC:** Automatic Flow Control bit

1 = Automatic Flow Control enabled
0 = Automatic Flow Control disabled

Setting this bit will enable automatic Flow Control. If set, the full and empty watermarks are used to automatically enable and disable the Flow Control, respectively. When the number of received buffers BUFCNT (ETHSTAT<16:23>) rises to the full watermark, Flow Control is automatically enabled. When the BUFCNT falls to the empty watermark, Flow Control is automatically disabled.

This bit is only used for Flow Control operations and affects both TX and RX operations.

bit 6-5 **Unimplemented:** Read as '0'

bit 4 **MANFC:** Manual Flow Control bit

1 = Manual Flow Control is enabled
0 = Manual Flow Control is disabled

Setting this bit will enable manual Flow Control. If set, the Flow Control logic will send a PAUSE frame using the PAUSE timer value in the PTV register. It will then resend a PAUSE frame every 128 * PTV<15:0>/2 TX clock cycles until the bit is cleared.

Note: For 10 Mbps operation, TX clock runs at 2.5 MHz. For 100 Mbps operation, TX clock runs at 25 MHz.

When this bit is cleared, the Flow Control logic will automatically send a PAUSE frame with a 0x0000 PAUSE timer value to disable Flow Control.

This bit is only used for Flow Control operations and affects both TX and RX operations.

bit 3-1 **Unimplemented:** Read as '0'

bit 0 **BUFCDEC:** Descriptor Buffer Count Decrement bit

The BUFCDEC bit is a write-1 bit that reads as '0'. When written with a '1', the Descriptor Buffer Counter, BUFCNT, will decrement by one. If BUFCNT is incremented by the RX logic at the same time that this bit is written, the BUFCNT value will remain unchanged. Writing a '0' will have no effect.

This bit is only used for RX operations.

Note 1: It is not recommended to clear the RXEN bit and then make changes to any RX related field/register. The Ethernet Controller must be reinitialized (ON cleared to '0'), and then the RX changes applied.

REGISTER 30-2: ETHCON2: ETHERNET CONTROLLER CONTROL REGISTER 2

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

0010 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches) AND (Destination Address = Station Address)**(1)**
0001 = Pattern match is successful if (NOTPM = 1 XOR Pattern Match Checksum matches)**(1)**
0000 = Pattern Match is disabled; pattern match is always unsuccessful

Note 1: XOR = True when either one or the other conditions are true, but not both.
2: This Hash Table Filter match is active regardless of the value of the HTEN bit.
3: This Magic Packet Filter match is active regardless of the value of the MPEN bit.

Note 1: This register is only used for RX operations.
2: The bits in this register may only be changed while the RXEN bit (ETHCON1<8>) = 0.

REGISTER 30-11: ETHRXFC: ETHERNET CONTROLLER RECEIVE FILTER CONFIGURATION REGISTER (CONTINUED)

bit 7 **CRCERREN:** CRC Error Collection Enable bit
1 = The received packet CRC must be invalid for the packet to be accepted
0 = Disable CRC Error Collection filtering
This bit allows the user to collect all packets that have an invalid CRC.

bit 6 **CRCOKEN:** CRC OK Enable bit
1 = The received packet CRC must be valid for the packet to be accepted
0 = Disable CRC filtering
This bit allows the user to reject all packets that have an invalid CRC.

bit 5 **RUNTERREN:** Runt Error Collection Enable bit
1 = The received packet must be a runt packet for the packet to be accepted
0 = Disable Runt Error Collection filtering

This bit allows the user to collect all packets that are runt packets. For this filter, a runt packet is defined as any packet with a size of less than 64 bytes (when CRCOKEN = 0) or any packet with a size of less than 64 bytes that has a valid CRC (when CRCOKEN = 1).

bit 4 **RUNTEN:** Runt Enable bit
1 = The received packet must not be a runt packet for the packet to be accepted
0 = Disable Runt filtering

This bit allows the user to reject all runt packets. For this filter, a runt packet is defined as any packet with a size of less than 64 bytes.

bit 3 **UCEN:** Unicast Enable bit
1 = Enable Unicast Filtering
0 = Disable Unicast Filtering

This bit allows the user to accept all unicast packets whose Destination Address matches the Station Address.

bit 2 **NOTMEEN:** Not Me Unicast Enable bit
1 = Enable Not Me Unicast Filtering
0 = Disable Not Me Unicast Filtering

This bit allows the user to accept all unicast packets whose Destination Address does not match the Station Address.

bit 1 **MCEN:** Multicast Enable bit
1 = Enable Multicast Filtering
0 = Disable Multicast Filtering

This bit allows the user to accept all Multicast Address packets.

bit 0 **BCEN:** Broadcast Enable bit
1 = Enable Broadcast Filtering
0 = Disable Broadcast Filtering

This bit allows the user to accept all Broadcast Address packets.

Note 1: XOR = True when either one or the other conditions are true, but not both.
2: This Hash Table Filter match is active regardless of the value of the HTEN bit.
3: This Magic Packet Filter match is active regardless of the value of the MPEN bit.

Note 1: This register is only used for RX operations.
2: The bits in this register may only be changed while the RXEN bit (ETHCON1<8>) = 0.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-15 **Unimplemented:** Read as '0'

bit 14 **TXBUSE:** Transmit BVCI Bus Error Interrupt bit(2)

1 = BVCI Bus Error has occurred
0 = BVCI Bus Error has not occurred

This bit is set when the TX DMA encounters a BVCI Bus error during a memory access. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 13 **RXBUSE:** Receive BVCI Bus Error Interrupt bit(2)

1 = BVCI Bus Error has occurred
0 = BVCI Bus Error has not occurred

This bit is set when the RX DMA encounters a BVCI Bus error during a memory access. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 12-10 **Unimplemented:** Read as '0'

bit 9 **EWMARK:** Empty Watermark Interrupt bit(2)

1 = Empty Watermark pointer reached
0 = No interrupt pending

This bit is set when the RX Descriptor Buffer Count is less than or equal to the value in the RXEWM bit (ETHRXWM<0:7>) value. It is cleared by BUFCNT bit (ETHSTAT<16:23>) being incremented by hardware. Writing a '0' or a '1' has no effect.

bit 8 **FWMARK:** Full Watermark Interrupt bit(2)

1 = Full Watermark pointer reached
0 = No interrupt pending

This bit is set when the RX Descriptor Buffer Count is greater than or equal to the value in the RXFWM bit (ETHRXWM<16:23>) field. It is cleared by writing the BUFCDEC (ETHCON1<0>) bit to decrement the BUFCNT counter. Writing a '0' or a '1' has no effect.

Note 1: This bit is only used for TX operations.
2: This bit is are only used for RX operations.

Note: It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

REGISTER 30-14: ETHIRQ: ETHERNET CONTROLLER INTERRUPT REQUEST REGISTER

bit 7 **RXDONE:** Receive Done Interrupt bit(2)

1 = RX packet was successfully received
0 = No interrupt pending

This bit is set whenever an RX packet is successfully received. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 6 **PKTPEND:** Packet Pending Interrupt bit(2)

1 = RX packet pending in memory
0 = RX packet is not pending in memory

This bit is set when the BUFCNT counter has a value other than '0'. It is cleared by either a Reset or by writing the BUFCDEC bit to decrement the BUFCNT counter. Writing a '0' or a '1' has no effect.

bit 5 **RXACT:** Receive Activity Interrupt bit(2)

1 = RX packet data was successfully received
0 = No interrupt pending

This bit is set whenever RX packet data is stored in the RXBM FIFO. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 4 **Unimplemented:** Read as '0'

bit 3 **TXDONE:** Transmit Done Interrupt bit(2)

1 = TX packet was successfully sent
0 = No interrupt pending

This bit is set when the currently transmitted TX packet completes transmission, and the Transmit Status Vector is loaded into the first descriptor used for the packet. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 2 **TXABORT:** Transmit Abort Condition Interrupt bit(2)

1 = TX abort condition occurred on the last TX packet
0 = No interrupt pending

This bit is set when the MAC aborts the transmission of a TX packet for one of the following reasons:

- Jumbo TX packet abort
- Underrun abort
- Excessive defer abort
- Late collision abort
- Excessive collisions abort

This bit is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 1 **RXBUFNA:** Receive Buffer Not Available Interrupt bit(2)

1 = RX Buffer Descriptor Not Available condition has occurred
0 = No interrupt pending

This bit is set by a RX Buffer Descriptor Overrun condition. It is cleared by either a Reset or a CPU write of a '1' to the CLR register.

bit 0 **RXOVFLW:** Receive FIFO Over Flow Error bit(2)

1 = RX FIFO Overflow Error condition has occurred
0 = No interrupt pending

RXOVFLW is set by the RXBM Logic for an RX FIFO Overflow condition. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

Note 1: This bit is only used for TX operations.
2: This bit is are only used for RX operations.

Note:	It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-24 **Unimplemented:** Read as '0'

bit 23-16 **BUFCNT<7:0>:** Packet Buffer Count bits(1)

Number of packet buffers received in memory. Once a packet has been successfully received, this register is incremented by hardware based on the number of descriptors used by the packet. Software decrements the counter (by writing to the BUFCDEC bit (ETHCON1<0>) for each descriptor used) after a packet has been read out of the buffer. The register does not roll over (0xFF to 0x00) when hardware tries to increment the register and the register is already at 0xFF. Conversely, the register does not roll under (0x00 to 0xFF) when software tries to decrement the register and the register is already at 0x0000. When software attempts to decrement the counter at the same time that the hardware attempts to increment the counter, the counter value will remain unchanged.

When this register value reaches 0xFF, the RX logic will halt (only if automatic Flow Control is enabled) awaiting software to write the BUFCDEC bit in order to decrement the register below 0xFF.

If automatic Flow Control is disabled, the RXDMA will continue processing and the BUFCNT will saturate at a value of 0xFF.

When this register is non-zero, the PKTPEND status bit will be set and an interrupt may be generated, depending on the value of the ETHIEN bit <PKTPENDIE> register.

When the ETHRXST register is written, the BUFCNT counter is automatically cleared to 0x00.

Note: BUFCNT will not be cleared when ON is set to '0'. This enables software to continue to utilize and decrement this count.

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **ETHBUSY:** Ethernet Module busy bit(5)

1 = Ethernet logic has been turned on (ON (ETHCON1<15>) = 1) or is completing a transaction
0 = Ethernet logic is idle

This bit indicates that the module has been turned on or is completing a transaction after being turned off.

Note 1: This bit is only used for RX operations.
2: This bit is only affected by TX operations.
3: This bit is only affected by RX operations.
4: This bit is affected by TX and RX operations.
5: This bit will be *set* when the ON bit (ETHCON1<15>) = 1.
6: This bit will be *cleared* when the ON bit (ETHCON1<15>) = 0.

REGISTER 30-15: ETHSTAT: ETHERNET CONTROLLER STATUS REGISTER (CONTINUED)

bit 6 **TXBUSY:** Transmit Busy bit(2,6)

1 = TX logic is receiving data
0 = TX logic is idle

This bit indicates that a packet is currently being transmitted. A change in this status bit is not necessarily reflected by the TXDONE interrupt, as TX packets may be aborted or rejected by the MAC.

bit 5 **RXBUSY:** Receive Busy bit(3,6)

1 = RX logic is receiving data
0 = RX logic is idle

This bit indicates that a packet is currently being received. A change in this status bit is not necessarily reflected by the RXDONE interrupt, as RX packets may be aborted or rejected by the RX filter.

bit 4-0 **Unimplemented:** Read as '0'

Note 1: This bit is only used for RX operations.
2: This bit is only affected by TX operations.
3: This bit is only affected by RX operations.
4: This bit is affected by TX and RX operations.
5: This bit will be *set* when the ON bit (ETHCON1<15>) = 1.
6: This bit will be *cleared* when the ON bit (ETHCON1<15>) = 0.

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **RXOVFLWCNT<15:0>:** Dropped Receive Frames Count bits

Increment counter for frames accepted by the RX filter and subsequently dropped due to internal receive error (RXFIFO overrun). This event also sets the RXOVFLW bit (ETHIRQ<0>) interrupt flag.

Note 1: This register is only used for RX operations.

2: This register is automatically cleared by hardware after a read operation, unless the byte enables for bytes 0/1 are '0'.

3: It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **SOFTRESET:** Soft Reset bit
Setting this bit will put the MACMII in reset. Its default value is '1'.

bit 14 **SIMRESET:** Simulation Reset bit
Setting this bit will cause a reset to the random number generator within the Transmit Function.

bit 13-12 **Unimplemented:** Read as '0'

bit 11 **RESETRMCS:** Reset MCS/RX bit
Setting this bit will put the MAC Control Sub-layer/Receive domain logic in reset.

bit 10 **RESETRFUN:** Reset RX Function bit
Setting this bit will put the MAC Receive function logic in reset.

bit 9 **RESETTMCS:** Reset MCS/TX bit
Setting this bit will put the MAC Control Sub-layer/TX domain logic in reset.

bit 8 **RESETTFUN:** Reset TX Function bit
Setting this bit will put the MAC Transmit function logic in reset.

bit 7-5 **Unimplemented:** Read as '0'

bit 4 **LOOPBACK:** MAC Loopback mode bit
1 = MAC Transmit interface is loop backed to the MAC Receive interface
0 = MAC normal operation

bit 3 **TXPAUSE:** MAC TX Flow Control bit
1 = PAUSE Flow Control frames are allowed to be transmitted
0 = PAUSE Flow Control frames are blocked

bit 2 **RXPAUSE:** MAC RX Flow Control bit
1 = The MAC acts upon received PAUSE Flow Control frames
0 = Received PAUSE Flow Control frames are ignored

bit 1 **PASSALL:** MAC Pass all Receive Frames bit
1 = The MAC will accept all frames regardless of type (Normal vs. Control)
0 = The received Control frames are ignored

bit 0 **RXENABLE:** MAC Receive Enable bit
1 = Enable the MAC receiving of frames
0 = Disable the MAC receiving of frames

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

REGISTER 30-24: EMAC1CFG2: ETHERNET CONTROLLER MAC CONFIGURATION 2 REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 25/16/8/0

	AUTO PAD(1,2)	VLAN PAD(1,2)	PAD ENABLE(1,3)	CRC ENABLE	DELAYCRC	HUGEFRM	LENGTHCK	FULLDPLX

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-15 **Unimplemented:** Read as '0'

bit 14 **EXCESSDER:** Excess Defer bit
1 = The MAC will defer to carrier indefinitely as per the Standard
0 = The MAC will abort when the excessive deferral limit is reached

bit 13 **BPNOBKOFF:** Backpressure/No Backoff bit
1 = The MAC after incidentally causing a collision during backpressure will immediately retransmit without backoff reducing the chance of further collisions and ensuring transmit packets get sent
0 = The MAC will not remove the backoff

bit 12 **NOBKOFF:** No Backoff bit
1 = Following a collision, the MAC will immediately retransmit rather than using the Binary Exponential Back-off algorithm as specified in the Standard
0 = Following a collision, the MAC will use the Binary Exponential Backoff algorithm

bit 11-10 **Unimplemented:** Read as '0'

bit 9 **LONGPRE:** Long Preamble Enforcement bit
1 = The MAC only allows receive packets which contain preamble fields less than 12 bytes in length
0 = The MAC allows any length preamble as per the Standard

bit 8 **PUREPRE:** Pure Preamble Enforcement bit
1 = The MAC will verify the content of the preamble to ensure it contains 0x55 and is error-free. A packet with errors in its preamble is discarded
0 = The MAC does not perform any preamble checking

bit 7 **AUTOPAD:** Automatic Detect Pad Enable bit(1,2)
1 = The MAC will automatically detect the type of frame, either tagged or untagged, by comparing the two octets following the source address with 0x8100 (VLAN Protocol ID) and pad accordingly
0 = The MAC does not perform automatic detection

Note 1: Table 30-6 provides a description of the pad function based on the configuration of this register.
2: This bit is ignored if the PADENABLE bit is cleared.
3: This bit is used in conjunction with the AUTOPAD and VLANPAD bits.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware

REGISTER 30-24: EMAC1CFG2: ETHERNET CONTROLLER MAC CONFIGURATION 2 REGISTER

bit 6 **VLANPAD:** VLAN Pad Enable bit(1,2)
1 = The MAC will pad all short frames to 64 bytes and append a valid CRC
0 = The MAC does not perform padding of short frames

bit 5 **PADENABLE:** Pad/CRC Enable bit(1,3)
1 = The MAC will pad all short frames
0 = The frames presented to the MAC have a valid length

bit 4 **CRCENABLE:** CRC Enable1 bit
1 = The MAC will append a CRC to every frame whether padding was required or not. Must be set if the PADENABLE bit is set.
0 = The frames presented to the MAC have a valid CRC

bit 3 **DELAYCRC:** Delayed CRC bit
This bit determines the number of bytes, if any, of proprietary header information that exist on the front of the IEEE 802.3 frames.
1 = Four bytes of header (ignored by the CRC function)
0 = No proprietary header

bit 2 **HUGEFRM:** Huge Frame enable bit
1 = Frames of any length are transmitted and received
0 = Huge frames are not allowed for receive or transmit

bit 1 **LENGTHCK:** Frame Length checking bit
1 = Both transmit and receive frame lengths are compared to the Length/Type field. If the Length/Type field represents a length then the check is performed. Mismatches are reported on the transmit/receive statistics vector.
0 = Length/Type field check is not performed

bit 0 **FULLDPLX:** Full-Duplex Operation bit
1 = The MAC operates in Full-Duplex mode
0 = The MAC operates in Half-Duplex mode

Note 1: Table 30-6 provides a description of the pad function based on the configuration of this register.
2: This bit is ignored if the PADENABLE bit is cleared.
3: This bit is used in conjunction with the AUTOPAD and VLANPAD bits.

Note:	Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware

TABLE 30-6: PAD OPERATION

Type	AUTOPAD	VLANPAD	PADENABLE	Action
Any	x	x	0	No pad, check CRC
Any	0	0	1	Pad to 60 Bytes, append CRC
Any	x	1	1	Pad to 64 Bytes, append CRC
Any	1	0	1	If untagged: Pad to 60 Bytes, append CRC If VLAN tagged: Pad to 64 Bytes, append CRC

bit 31-7 **Unimplemented:** Read as '0'

bit 6-0 **B2BIPKTGP<6:0>:** Back-to-Back Interpacket Gap bits

This is a programmable field representing the nibble time offset of the minimum possible period between the end of any transmitted packet, to the beginning of the next. In Full-Duplex mode, the register value should be the desired period in nibble times minus 3. In Half-Duplex mode, the register value should be the desired period in nibble times minus 6. In Full-Duplex the recommended setting is 0x15 (21d), which represents the minimum IPG of 0.96 µs (in 100 Mbps) or 9.6 µs (in 10 Mbps). In Half-Duplex mode, the recommended setting is 0x12 (18d), which also represents the minimum IPG of 0.96 µs (in 100 Mbps) or 9.6 µs (in 10 Mbps).

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 31-15 **Unimplemented:** Read as '0'

bit 14-8 **NB2BIPKTGP1<6:0>:** Non-Back-to-Back Interpacket Gap Part 1 bits

This is a programmable field representing the optional carrierSense window referenced in section 4.2.3.2.1 "Deference" of the IEEE 80.23 Specification. If carrier is detected during the timing of IPGR1, the MAC defers to carrier. If, however, carrier becomes after IPGR1, the MAC continues timing IPGR2 and transmits, knowingly causing a collision, thus ensuring fair access to medium. Its range of values is 0x0 to IPGR2. Its recommend value is 0xC (12d).

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **NB2BIPKTGP2<6:0>:** Non-Back-to-Back Interpacket Gap Part 2 bits

This is a programmable field representing the non-back-to-back Inter-Packet-Gap. Its recommended value is 0x12 (18d), which represents the minimum IPG of 0.96 µs (in 100 Mbps) or 9.6 µs (in 10 Mbps).

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

REGISTER 30-27: EMAC1CLRT: ETHERNET CONTROLLER MAC COLLISION WINDOW/RETRY LIMIT REGISTER

bit 31-14 **Unimplemented:** Read as '0'

bit 13-8 **CWINDOW<5:0>:** Collision Window bits

This is a programmable field representing the slot time or collision window during which collisions occur in properly configured networks. Since the collision window starts at the beginning of transmission, the preamble and SFD is included. Its default of 0x37 (55d) corresponds to the count of frame bytes at the end of the window.

bit 7-4 **Unimplemented:** Read as '0'

bit 3-0 **RETX<3:0>:** Retransmission Maximum bits

This is a programmable field specifying the number of retransmission attempts following a collision before aborting the packet due to excessive collisions. The Standard specifies the maximum number of attempts (attemptLimit) to be 0xF (15d). Its default is '0xF'.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

REGISTER 30-28: EMAC1MAXF: ETHERNET CONTROLLER MAC MAXIMUM FRAME LENGTH REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0
31:24	U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **MACMAXF<15:0>:** Maximum Frame Length bits(1)

These bits reset to 0x05EE, which represents a maximum receive frame of 1518 octets. An untagged maximum size Ethernet frame is 1518 octets. A tagged frame adds four octets for a total of 1522 octets. If a shorter/longer maximum length restriction is desired, program this 16-bit field.

Note 1: If a proprietary header is allowed, this bit should be adjusted accordingly. For example, if 4-byte headers are prepended to frames, MACMAXF could be set to 1527 octets. This would allow the maximum VLAN tagged frame plus the 4-byte header.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 15 **RESETMGMT:** Test Reset MII Management bit
1 = Reset the MII Management module
0 = Normal Operation

bit 14-6 **Unimplemented:** Read as '0'

bit 5-2 **CLKSEL<3:0>:** MII Management Clock Select 1 bits(1)
These bits are used by the clock divide logic in creating the MII Management Clock (MDC), which the IEEE 802.3 Specification defines to be no faster than 2.5 MHz. Some PHYs support clock rates up to 12.5 MHz.

bit 1 **NOPRE:** Suppress Preamble bit
1 = The MII Management will perform read/write cycles without the 32-bit preamble field. Some PHYs support suppressed preamble
0 = Normal read/write cycles are performed

bit 0 **SCANINC:** Scan Increment bit
1 = The MII Management module will perform read cycles across a range of PHYs. The read cycles will start from address 1 through the value set in EMAC1MADR<PHYADDR>
0 = Continuous reads of the same PHY

Note 1: Table 30-7 provides a description of the clock divider encoding.

Note: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 31-16 **Unimplemented:** Read as '0'

bit 15-8 **STNADDR4<7:0>:** Station Address Octet 4 bits
These bits hold the fourth transmitted octet of the station address.

bit 7-0 **STNADDR3<7:0>:** Station Address Octet 3 bits
These bits hold the third transmitted octet of the station address.

Note 1: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

2: This register is loaded at reset from the factory preprogrammed station address.

bit 31-16 **Reserved:** Maintain as '0'; ignore read

bit 15-8 **STNADDR2<7:0>:** Station Address Octet 2 bits
These bits hold the second transmitted octet of the station address.

bit 7-0 **STNADDR1<7:0>:** Station Address Octet 1 bits
These bits hold the most significant (first transmitted) octet of the station address.

Note 1: Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.
2: This register is loaded at reset from the factory preprogrammed station address.

31.0 COMPARATOR

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. "Comparator"** (DS60001110) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

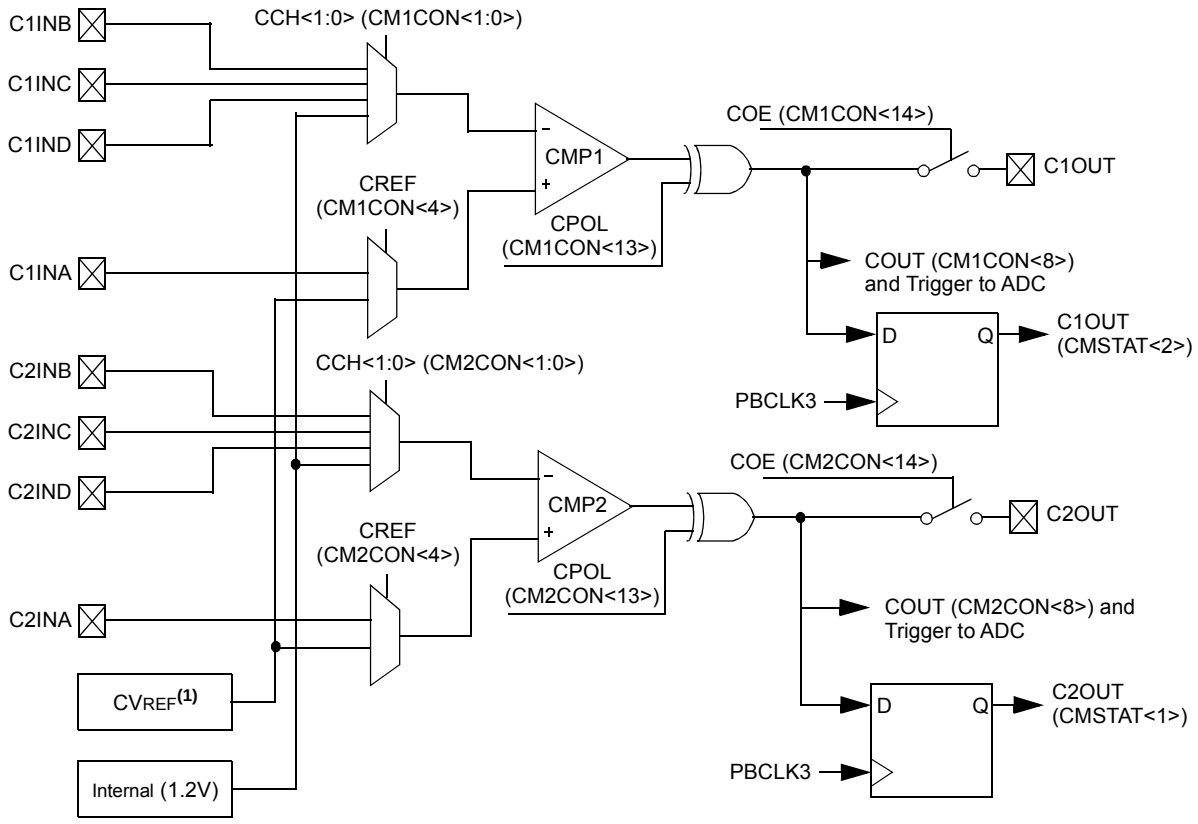
The Analog Comparator module consists of two comparators that can be configured in a variety of ways.

The following are key features of the Analog Comparator module:

- Differential inputs
- Rail-to-rail operation
- Selectable output polarity
- Selectable inputs:
  - Analog inputs multiplexed with I/O pins
  - On-chip internal absolute voltage reference
  - Comparator voltage reference (CVREF)
- Selectable interrupt generation

A block diagram of the comparator module is illustrated in Figure 31-1.

FIGURE 31-1: COMPARATOR BLOCK DIAGRAM



Note 1: Internally connected. See **Section 32.0 "Comparator Voltage Reference (CVREF)"** for more information.

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Comparator ON bit
- 1 = Module is enabled. Setting this bit does not affect the other bits in this register
- 0 = Module is disabled and does not consume current. Clearing this bit does not affect the other bits in this register

bit 14 **COE:** Comparator Output Enable bit
- 1 = Comparator output is driven on the output CxOUT pin
- 0 = Comparator output is not driven on the output CxOUT pin

bit 13 **CPOL:** Comparator Output Inversion bit(1)
- 1 = Output is inverted
- 0 = Output is not inverted

bit 12-9 **Unimplemented:** Read as '0'

bit 8 **COUT:** Comparator Output bit
- 1 = Output of the Comparator is a '1'
- 0 = Output of the Comparator is a '0'

bit 7-6 **EVPOL<1:0>:** Interrupt Event Polarity Select bits
- 11 = Comparator interrupt is generated on a low-to-high or high-to-low transition of the comparator output
- 10 = Comparator interrupt is generated on a high-to-low transition of the comparator output
- 01 = Comparator interrupt is generated on a low-to-high transition of the comparator output
- 00 = Comparator interrupt generation is disabled

bit 5 **Unimplemented:** Read as '0'

bit 4 **CREF:** Comparator Positive Input Configure bit
- 1 = Comparator non-inverting input is connected to the internal CVREF
- 0 = Comparator non-inverting input is connected to the CXINA pin

bit 3-2 **Unimplemented:** Read as '0'

bit 1-0 **CCH<1:0>:** Comparator Negative Input Select bits for Comparator
- 11 = Comparator inverting input is connected to the IVREF
- 10 = Comparator inverting input is connected to the CxIND pin
- 01 = Comparator inverting input is connected to the CxINC pin
- 00 = Comparator inverting input is connected to the CxINB pin

Note 1: Setting this bit will invert the signal to the comparator interrupt generator as well. This will result in an interrupt being generated on the opposite edge from the one selected by EVPOL<1:0>.

- 0 = Output of Comparator 1 is a '0'

32.0 COMPARATOR VOLTAGE REFERENCE (CVREF)

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 20. "Comparator Voltage Reference (CVREF)"** (DS60001109) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The CVREF module is a 16-tap, resistor ladder network that provides a selectable reference voltage. Although its primary purpose is to provide a reference for the analog comparators, it also may be used independently of them.

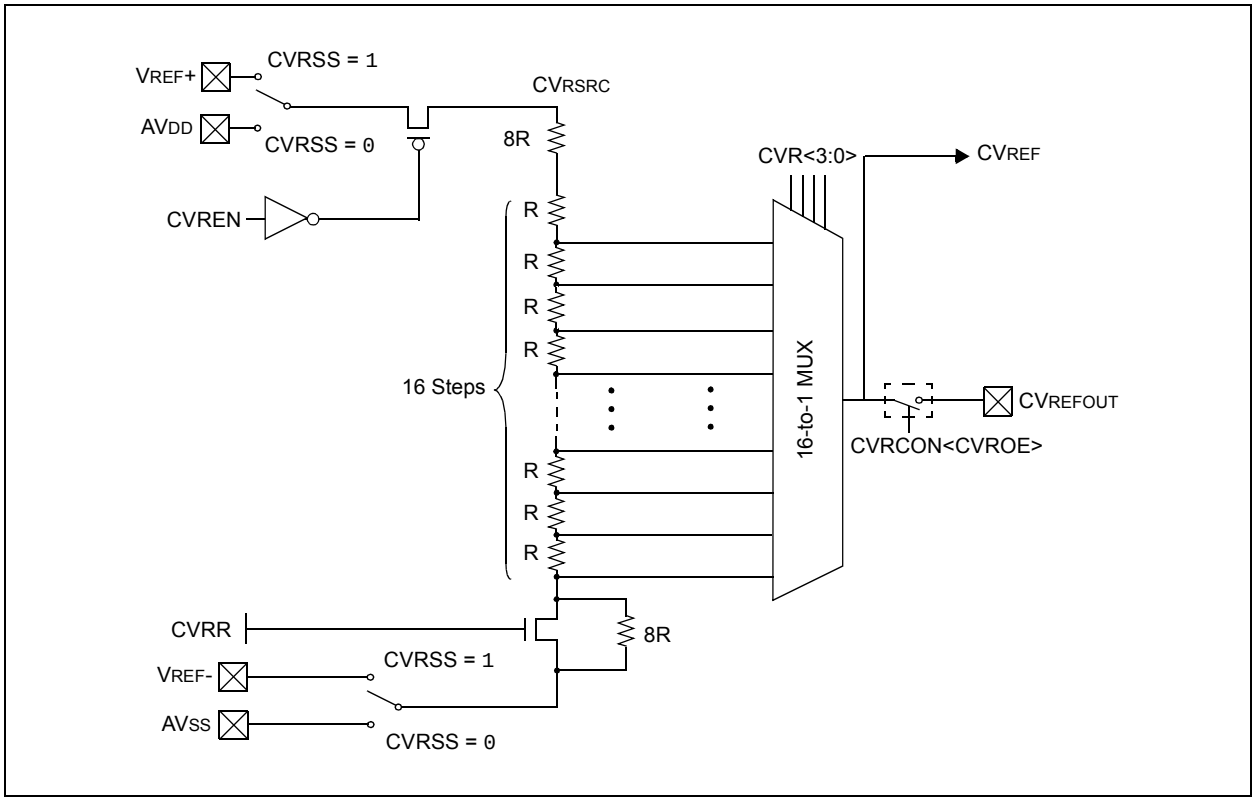
The resistor ladder is segmented to provide two ranges of voltage reference values and has a power-down function to conserve power when the reference is not being used. The module's supply reference can be provided from either device VDD/VSS or an external voltage reference. The CVREF output is available for the comparators and typically available for pin output.

The comparator voltage reference has the following features:

- High and low range selection
- Sixteen output levels available for each range
- Internally connected to comparators to conserve device pins
- Output can be connected to a pin

A block diagram of the CVREF module is illustrated in Figure 32-1.

FIGURE 32-1: COMPARATOR VOLTAGE REFERENCE BLOCK DIAGRAM



32.1 Comparator Voltage Reference Control Registers

TABLE 32-1: COMPARATOR VOLTAGE REFERENCE REGISTER MAP

	—	CVROE	CVRR	CVRSS	CVR<3:0>			

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ON:** Comparator Voltage Reference On bit
- 1 = Module is enabled
  Setting this bit does not affect other bits in the register.
- 0 = Module is disabled and does not consume current.
  Clearing this bit does not affect the other bits in the register.

bit 14-7 **Unimplemented:** Read as '0'

bit 6 **CVROE:** CV_{REFOUT} Enable bit
- 1 = Voltage level is output on CV_{REFOUT} pin
- 0 = Voltage level is disconnected from CV_{REFOUT} pin

bit 5 **CVRR:** CV_{REF} Range Selection bit
- 1 = 0 to 0.67 CV_{RSRC}, with $CV_{RSRC}/24$ step size
- 0 = 0.25 CV_{RSRC} to 0.75 CV_{RSRC}, with $CV_{RSRC}/32$ step size

bit 4 **CVRSS:** CV_{REF} Source Selection bit
- 1 = Comparator voltage reference source, $CV_{RSRC} = (V_{REF+}) – (V_{REF-})$
- 0 = Comparator voltage reference source, $CV_{RSRC} = AV_{DD} – AV_{SS}$

bit 3-0 **CVR<3:0>:** CV_{REF} Value Selection $0 \le CVR<3:0> \le 15$ bits

When CVRR = 1:
$CV_{REF} = (CVR<3:0>/24) \bullet (CV_{RSRC})$

When CVRR = 0:
$CV_{REF} = 1/4 \bullet (CV_{RSRC}) + (CVR<3:0>/32) \bullet (CV_{RSRC})$

NOTES:

33.0 POWER-SAVING FEATURES

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 10. "Power-Saving Features"** (DS60001130) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

This section describes power-saving features for the PIC32MZ EF devices. These devices offer various methods and modes that allow the user to balance power consumption with device performance. In all of the methods and modes described in this section, power-saving is controlled by software.

33.1 Power Saving with CPU Running

When the CPU is running, power consumption can be controlled by reducing the CPU clock frequency, lowering the speed of PBCLK7, or selecting a lower power clock source (i.e., LPRC or SOSC).

In addition, the Peripheral Bus Scaling mode is available for each peripheral bus where peripherals are clocked at reduced speed by selecting a higher divider for the associated PBCLKx, or by disabling the clock completely.

33.2 Power-Saving with CPU Halted

Peripherals and the CPU can be Halted or disabled to further reduce power consumption.

33.2.1 SLEEP MODE

Sleep mode has the lowest power consumption of the device power-saving operating modes. The CPU and most peripherals are Halted and the associated clocks are disabled. Select peripherals can continue to operate in Sleep mode and can be used to wake the device from Sleep. See the individual peripheral module sections for descriptions of behavior in Sleep.

Sleep mode includes the following characteristics:

- There can be a wake-up delay based on the oscillator selection
- The Fail-Safe Clock Monitor (FSCM) does not operate during Sleep mode
- The BOR circuit remains operative during Sleep mode
- The WDT, if enabled, is not automatically cleared prior to entering Sleep mode
- Some peripherals can continue to operate at limited functionality in Sleep mode. These peripherals include I/O pins that detect a change in the input signal, WDT, ADC, UART and peripherals that use an external clock input or the internal LPRC oscillator (e.g., RTCC, Timer1 and Input Capture).
- I/O pins continue to sink or source current in the same manner as they do when the device is not in Sleep

The processor will exit, or 'wake-up', from Sleep on one of the following events:

- On any interrupt from an enabled source that is operating in Sleep. The interrupt priority must be greater than the current CPU priority.
- On any form of device Reset
- On a WDT time-out

If the interrupt priority is lower than or equal to the current priority, the CPU will remain Halted, but the peripheral bus clocks will start running and the device will enter into Idle mode.

33.2.2 IDLE MODE

In Idle mode, the CPU is Halted; however, all clocks are still enabled. This allows peripherals to continue to operate. Peripherals can be individually configured to Halt when entering Idle by setting their respective SIDL bit. Latency, when exiting Idle mode, is very low due to the CPU oscillator source remaining active.

The device enters Idle mode when the SLPEN bit (OSCCON<4>) is clear and a `WAIT` instruction is executed.

The processor will wake or exit from Idle mode on the following events:

- On any interrupt event for which the interrupt source is enabled. The priority of the interrupt event must be greater than the current priority of the CPU. If the priority of the interrupt event is lower than or equal to current priority of the CPU, the CPU will remain Halted and the device will remain in Idle mode.
- On any form of device Reset
- On a WDT time-out interrupt

33.3 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have effect and read values are invalid.

To disable a peripheral, the associated PMDx bit must be set to '1'. To enable a peripheral, the associated PMDx bit must be cleared (default). See Table 33-1 for more information.

Note:	Disabling a peripheral module while it's ON bit is set, may result in undefined behavior. The ON bit for the associated peripheral module must be cleared prior to disable a module via the PMDx bits.

TABLE 33-1: PERIPHERAL MODULE DISABLE BITS AND LOCATIONS(1)

Peripheral	PMDx bit Name	Register Name and Bit Location
ADC	ADCMD	PMD1<0>
Comparator Voltage Reference	CVRMD	PMD1<12>

Note 1: Not all modules and associated PMDx bits are available on all devices. See **TABLE 1: "PIC32MZ EF Family Features"** for the lists of available peripherals.

2: Module must not be busy after clearing the associated ON bit and prior to setting the USBMD bit.

33.3.1 CONTROLLING CONFIGURATION CHANGES

Because peripherals can be disabled during run time, some restrictions on disabling peripherals are needed to prevent accidental configuration changes. PIC32MZ EF devices include two features to prevent alterations to enabled or disabled peripherals:

- Control register lock sequence
- Configuration bit select lock

33.3.1.1 Control Register Lock

Under normal operation, writes to the PMDx registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the PMDLOCK Configuration bit (CFGCON<12>). Setting PMDLOCK prevents writes to the control registers; clearing PMDLOCK allows writes.

To set or clear PMDLOCK, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

33.3.1.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the PMDx registers. The PMDL1WAY Configuration bit (DEVCFG3<28>) blocks the PMDLOCK bit from being cleared after it has been set once. If PMDLOCK remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable PMD functionality is to perform a device Reset.

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See **Section 12.3 "CLR, SET, and INV Registers"** for more information.

NOTES:

34.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of the PIC32MZ EF family of devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 32. "Configuration"** (DS60001124) and **Section 33. "Programming and Diagnostics"** (DS60001129) in the *"PIC32 Family Reference Manual"*, which are available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices include several features intended to maximize application flexibility and reliability and minimize cost through elimination of external components. These are:

- Flexible device configuration
- Joint Test Action Group (JTAG) interface
- In-Circuit Serial Programming™ (ICSP™)
- Internal temperature sensor

34.1 Configuration Bits

PIC32MZ EF devices contain two Boot Flash memories (Boot Flash 1 and Boot Flash 2), each with an associated configuration space. These configuration spaces can be programmed to contain various device configurations. Configuration space that is aliased by the Lower Boot Alias memory region is used to provide values for the following Configuration registers. See **4.1.1 "Boot Flash Sequence and Configuration Spaces"** for more information.

- DEVSIGN0/ADEVSIGN0: Device Signature Word 0 Register
- DEVCP0/ADEVCP0: Device Code-Protect 0 Register
- DEVCFG0/ADEVCFG0: Device Configuration Word 0
- DEVCFG1/ADEVCFG1: Device Configuration Word 1
- DEVCFG2/ADEVCFG2: Device Configuration Word 2
- DEVCFG3/ADEVCFG3: Device Configuration Word 3
- DEVADCx: Device ADC Calibration Word 'x' ('x' = 0-4, 7)

The following run-time programmable Configuration registers provide additional configuration control:

- CFGCON: Configuration Control Register
- CFGEBIA: External Bus Interface Address Pin Configuration Register
- CFGEBIC: External Bus Interface Control Pin Configuration Register
- CFGPG: Permission Group Configuration Register

In addition, the DEVID register provides device and revision information, and the DEVADC0-DEVADC4 and DEVADC7 registers provide ADC module calibration/configuration data. The DEVSN0, DEVSN1, DEVSN2, and DEVSN3 registers contain a unique serial number of the device.

Note: Do not use Word program operation (NVMOP<3:0> = 0001) when programming the device Words that are described in this section.

34.2 Registers

Legend:	r = Reserved bit	y = Value set from Configuration bits on POR
R = Readable bit	P = Programmable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared x = Bit is unknown

bit 31 **Reserved:** The reset value of this bit is the same as DEVSIGN0<31>.

bit 30 **EJTAGBEN:** EJTAG Boot Enable bit
- 1 = Normal EJTAG functionality
- 0 = Reduced EJTAG functionality

bit 29-22 **Reserved:** Write as '1'

bit 21 **POSCBOOST:** Primary Oscillator Boost Kick Start Enable bit
- 1 = Boost the kick start of the oscillator
- 0 = Normal start of the oscillator

bit 20-19 **POSCGAIN<1:0>:** Primary Oscillator Gain Control bits
- 11 = Gain Level 3 (highest)
- 10 = Gain Level 2
- 01 = Gain Level 1
- 00 = Gain Level 0 (lowest)

bit 18 **SOSCBOOST:** Secondary Oscillator Boost Kick Start Enable bit
- 1 = Boost the kick start of the oscillator
- 0 = Normal start of the oscillator

bit 17-16 **SOSCGAIN<1:0>:** Secondary Oscillator Gain Control bits
- 11 = Gain Level 3 (highest)
- 10 = Gain Level 2
- 01 = Gain Level 1
- 00 = Gain Level 0 (lowest)

bit 15 **SMCLR:** Soft Master Clear Enable bit
- 1 = $\overline{\text{MCLR}}$ pin generates a normal system Reset
- 0 = $\overline{\text{MCLR}}$ pin generates a POR Reset

bit 11 **Reserved:** This bit is controlled by debugger/emulator development tools and should not be modified by the user.

bit 10 **FSLEEP:** Flash Sleep Mode bit
- 1 = Flash is powered down when the device is in Sleep mode
- 0 = Flash remains powered when the device is in Sleep mode

bit 9-8 **FECCCON<1:0>:** Dynamic Flash ECC Configuration bits

Upon a device Reset, the value of these bits is copied to the ECCCON<1:0> bits (CFGCON<5:4>).
- 11 = ECC and dynamic ECC are disabled (ECCCON<1:0> bits are writable)
- 10 = ECC and dynamic ECC are disabled (ECCCON<1:0> bits are locked)
- 01 = Dynamic Flash ECC is enabled (ECCCON<1:0> bits are locked)
- 00 = Flash ECC is enabled (ECCCON<1:0> bits are locked; disables word Flash writes)

bit 7 **Reserved:** Write as '1'

Note 1: This bit sets the value of the JTAGEN bit in the CFGCON register.

REGISTER 34-3: DEVCFG0/ADEVCFG0: DEVICE CONFIGURATION WORD 0 (CONTINUED)

bit 6 **BOOTISA:** Boot ISA Selection bit
- 1 = Boot code and Exception code is MIPS32®
  (ISAONEXC bit is set to '0' and the ISA<1:0> bits are set to '10' in the CP0 Config3 register)
- 0 = Boot code and Exception code is microMIPS™
  (ISAONEXC bit is set to '1' and the ISA<1:0> bits are set to '11' in the CP0 Config3 register)

bit 5 **TRCEN:** Trace Enable bit
- 1 = Trace features in the CPU are enabled
- 0 = Trace features in the CPU are disabled

bit 4-3 **ICESEL<1:0>:** In-Circuit Emulator/Debugger Communication Channel Select bits
- 11 = PGEC1/PGED1 pair is used
- 10 = PGEC2/PGED2 pair is used
- 01 = Reserved
- 00 = Reserved

bit 2 **JTAGEN:** JTAG Enable bit(1)
- 1 = JTAG is enabled
- 0 = JTAG is disabled

bit 1-0 **DEBUG<1:0>:** Background Debugger Enable bits (forced to '11' if code-protect is enabled)
- 1x = Debugger is disabled
- 0x = Debugger is enabled

Note 1: This bit sets the value of the JTAGEN bit in the CFGCON register.

- 0 = Permission Group registers are not locked. Writes to PG registers are allowed

bit 10-9 **Unimplemented:** Read as '0'

bit 8 **USBSSEN:** USB Suspend Sleep Enable bit(1)

Enables features for USB PHY clock shutdown in Sleep mode.
- 1 = USB PHY clock is shut down when Sleep mode is active
- 0 = USB PHY clock continues to run when Sleep is active

Note 1: To change this bit, the unlock sequence must be performed. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

REGISTER 34-7: CFGCON: CONFIGURATION CONTROL REGISTER (CONTINUED)

bit 7 **IOANCPEN:** I/O Analog Charge Pump Enable bit

The analog IO charge pump improves analog performance when the device is operating at lower voltages. However, the charge pumps consume additional current.

1 = Charge pump is enabled

0 = Charge pump is disabled

Note: 1) For proper analog operation at VDD is less than 2.5V, the AICPMPEN bit (ADCCON1<12>) must be = 1 and the IOANCPEN bit must be set to '1;' however, the charge pumps will consume additional current. These bits should not be set if VDD is greater than 2.5V.

2) ADC throughput rate performance is reduced as defined in the table below if ADCCON1<AICPMPEN> = 1 and CFGCON<IOANCPEN> = 1.

ADC0	ADC1	ADC2	ADC3	ADC4	ADC7	Maximum combined
ON	OFF	OFF	OFF	OFF	OFF	2 MSPS
ON	ON	OFF	OFF	OFF	OFF	4 MSPS
ON	ON	ON	OFF	OFF	OFF	5 MSPS
OFF	OFF	OFF	ON	OFF	OFF	2 MSPS
OFF	OFF	OFF	ON	ON	OFF	4 MSPS
OFF	OFF	OFF	ON	ON	ON	5 MSPS
ON	ON	ON	ON	OFF	OFF	7 MSPS
ON	ON	ON	ON	ON	OFF	9 MSPS
ON	ON	ON	ON	ON	ON	10 MSPS

bit 6 **Unimplemented:** Read as '0'

bit 5-4 **ECCCON<1:0>:** Flash ECC Configuration bits

11 = ECC and dynamic ECC are disabled (ECCCON<1:0> bits are writable)

10 = ECC and dynamic ECC are disabled (ECCCON<1:0> bits are locked)

01 = Dynamic Flash ECC is enabled (ECCCON<1:0> bits are locked)

00 = Flash ECC is enabled (ECCCON<1:0> bits are locked; disables word Flash writes)

bit 3 **JTAGEN:** JTAG Port Enable bit

1 = Enable the JTAG port

0 = Disable the JTAG port

bit 2 **TROEN:** Trace Output Enable bit

1 = Enable trace outputs and start trace clock (trace probe must be present)

0 = Disable trace outputs and stop trace clock

bit 1 **Unimplemented:** Read as '0'

bit 0 **TDOEN:** TDO Enable for 2-Wire JTAG

1 = 2-wire JTAG protocol uses TDO

0 = 2-wire JTAG protocol does not use TDO

Note 1: To change this bit, the unlock sequence must be performed. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

This data must be copied to the corresponding ADCxCFG register. Refer to **28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"** for more information.

34.3 On-Chip Voltage Regulator

The core and digital logic for all PIC32MZ EF devices is designed to operate at a nominal 1.8V. To simplify system designs, devices in the PIC32MZ EF family incorporate an on-chip regulator providing the required core logic voltage from VDD.

34.3.1 ON-CHIP REGULATOR AND POR

It takes a fixed delay for the on-chip regulator to generate an output. During this time, designated as TPU, code execution is disabled. TPU is applied every time the device resumes operation after any power-down, including Sleep mode.

34.3.2 ON-CHIP REGULATOR AND BOR

PIC32MZ EF devices also have a simple brown-out capability. If the voltage supplied to the regulator is inadequate to maintain a regulated level, the regulator Reset circuitry will generate a Brown-out Reset. This event is captured by the BOR flag bit (RCON<1>). The brown-out voltage levels are specific in **Section 37.1 "DC Characteristics"**.

34.4 On-chip Temperature Sensor

PIC32MZ EF devices include a temperature sensor that provides accurate measurement of a device's junction temperature (see **Section 37.2 "AC Characteristics and Timing Parameters"** for more information).

The temperature sensor is connected to the ADC module and can be measured using the shared S&H circuit (see **Section 28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"** for more information).

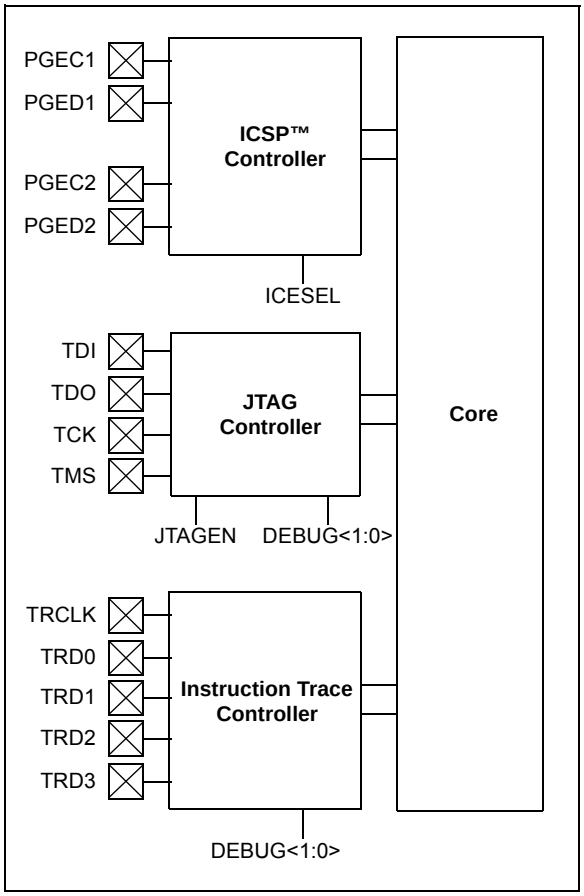
34.5 Programming and Diagnostics

PIC32MZ EF devices provide a complete range of programming and diagnostic features that can increase the flexibility of any application using them. These features allow system designers to include:

- Simplified field programmability using two-wire In-Circuit Serial Programming™ (ICSP™) interfaces
- Debugging using ICSP
- Programming and debugging capabilities using the EJTAG extension of JTAG
- JTAG boundary scan testing for device and board diagnostics

PIC32 devices incorporate two programming and diagnostic modules, and a trace controller, that provide a range of functions to the application developer.

FIGURE 34-1: BLOCK DIAGRAM OF PROGRAMMING, DEBUGGING AND TRACE PORTS



NOTES:

35.0 INSTRUCTION SET

The PIC32MZ EF family instruction set complies with the MIPS32® Release 5 instruction set architecture. The PIC32MZ EF device family *does not* support the following features:

- Core extend instructions
- Coprocessor 2 instructions

Note:	Refer to *"MIPS32® Architecture for Programmers Volume II: The MIPS32® Instruction Set"* at www.imgtec.com for more information.

NOTES:

36.0 DEVELOPMENT SUPPORT

The PIC® microcontrollers (MCU) and dsPIC® digital signal controllers (DSC) are supported with a full range of software and hardware development tools:

- Integrated Development Environment
  - MPLAB® X IDE Software
- Compilers/Assemblers/Linkers
  - MPLAB XC Compiler
  - MPASM™ Assembler
  - MPLINK™ Object Linker/ MPLIB™ Object Librarian
  - MPLAB Assembler/Linker/Librarian for Various Device Families
- Simulators
  - MPLAB X SIM Software Simulator
- Emulators
  - MPLAB REAL ICE™ In-Circuit Emulator
- In-Circuit Debuggers/Programmers
  - MPLAB ICD 3
  - PICkit™ 3
- Device Programmers
  - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards, Evaluation Kits and Starter Kits
- Third-party development tools

36.1 MPLAB X Integrated Development Environment Software

The MPLAB X IDE is a single, unified graphical user interface for Microchip and third-party software, and hardware development tool that runs on Windows®, Linux and Mac OS® X. Based on the NetBeans IDE, MPLAB X IDE is an entirely new IDE with a host of free software components and plug-ins for high-performance application development and debugging. Moving between tools and upgrading from software simulators to hardware debugging and programming tools is simple with the seamless user interface.

With complete project management, visual call graphs, a configurable watch window and a feature-rich editor that includes code completion and context menus, MPLAB X IDE is flexible and friendly enough for new users. With the ability to support multiple tools on multiple projects with simultaneous debugging, MPLAB X IDE is also suitable for the needs of experienced users.

Feature-Rich Editor:

- Color syntax highlighting
- Smart code completion makes suggestions and provides hints as you type
- Automatic code formatting based on user-defined rules
- Live parsing

User-Friendly, Customizable Interface:

- Fully customizable interface: toolbars, toolbar buttons, windows, window placement, etc.
- Call graph window

Project-Based Workspaces:

- Multiple projects
- Multiple tools
- Multiple configurations
- Simultaneous debugging sessions

File History and Bug Tracking:

- Local file history feature
- Built-in support for Bugzilla issue tracker

36.2 MPLAB XC Compilers

The MPLAB XC Compilers are complete ANSI C compilers for all of Microchip's 8, 16, and 32-bit MCU and DSC devices. These compilers provide powerful integration capabilities, superior code optimization and ease of use. MPLAB XC Compilers run on Windows, Linux or MAC OS X.

For easy source level debugging, the compilers provide debug information that is optimized to the MPLAB X IDE.

The free MPLAB XC Compiler editions support all devices and commands, with no time or memory restrictions, and offer sufficient code optimization for most applications.

MPLAB XC Compilers include an assembler, linker and utilities. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. MPLAB XC Compiler uses the assembler to produce its object file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

36.3 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code, and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB X IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multipurpose source files
- Directives that allow complete control over the assembly process

36.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

36.5 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC DSC devices. MPLAB XC Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

36.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

36.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

36.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

36.9 PICkit 3 In-Circuit Debugger/ Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a full-speed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™ (ICSP™).

36.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at V_{DDMIN} and V_{DDMAX} for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.

36.11 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

36.12 Third-Party Development Tools

Microchip also offers a great collection of tools from third-party vendors. These tools are carefully selected to offer good value and unique functionality.

- Device Programmers and Gang Programmers from companies, such as SoftLog and CCS
- Software Tools from companies, such as Gimpel and Trace Systems
- Protocol Analyzers from companies, such as Saleae and Total Phase
- Demonstration Boards from companies, such as MikroElektronika, Digilent® and Olimex
- Embedded Ethernet Solutions from companies, such as EZ Web Lynx, WIZnet and IPLogika®

37.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ EF electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC32MZ EF devices are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions, above the parameters indicated in the operation listings of this specification, is not implied.

Specifications for Extended Temperature devices (-40ºC to +125ºC) that are different from the specifications in this section are provided in **38.0 "Extended Temperature Electrical Characteristics"**.

Absolute Maximum Ratings

(See Note 1)

Ambient temperature under bias ..... -40°C to +85°C
Storage temperature ..... -65°C to +150°C
Voltage on V_{DD} with respect to V_{SS} ..... -0.3V to +4.0V
Voltage on any pin that is not 5V tolerant, with respect to V_{SS} **(Note 3)** ..... -0.3V to (V_{DD} + 0.3V)
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} \geq 2.1V$ **(Note 3)** ..... -0.3V to +5.5V
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} < 2.1V$ **(Note 3)** ..... -0.3V to +3.6V
Voltage on D+ or D- pin with respect to V_{USB3V3} ..... -0.3V to (V_{USB3V3} + 0.3V)
Voltage on V_{BUS} with respect to V_{SS} ..... -0.3V to +5.5V
Maximum current out of V_{SS} pin(s) ..... 200 mA
Maximum current into V_{DD} pin(s) **(Note 2)** ..... 200 mA
Maximum current sunk/sourced by any 4x I/O pin **(Note 4)** ..... 15 mA
Maximum current sunk/sourced by any 8x I/O pin **(Note 4)** ..... 25 mA
Maximum current sunk/sourced by any 12x I/O pin **(Note 4)** ..... 33 mA
Maximum current sunk by all ports ..... 150 mA
Maximum current sourced by all ports **(Note 2)** ..... 150 mA

Note 1: Stresses above those listed under **"Absolute Maximum Ratings"** may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

2: Maximum allowable current is a function of device maximum power dissipation (see Table 37-2).

3: See the pin name tables (Table 2 through Table 4) for the 5V tolerant pins.

4: Characterized, but not tested. Refer to parameters DO10, DO20, and DO20a for the 4x, 8x, and 12x I/O pin lists.

37.1 DC Characteristics

TABLE 37-1: OPERATING MIPS VS. VOLTAGE

Characteristic	VDD Range (in Volts) (Note 1)	Temp. Range (in °C)	Max. Frequency	Comment
			PIC32MZ EF Devices	
DC5	2.1V-3.6V	-40°C to +85°C	200 MHz	—

Note 1: Overall functional device operation at VBORMIN < VDD < VDDMIN is guaranteed, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below VDDMIN. Refer to parameter BO10 in Table 37-5 for BOR values.

TABLE 37-2: THERMAL OPERATING CONDITIONS

Rating	Symbol	Min.	Typical	Max.	Unit
Industrial Temperature Devices					
Operating Junction Temperature Range	TJ	-40	—	+125	°C
Operating Ambient Temperature Range	TA	-40	—	+85	°C
Extended Temperature Devices					
Operating Junction Temperature Range	TJ	-40	—	+140	°C
Operating Ambient Temperature Range	TA	-40	—	+125	°C
Power Dissipation: Internal Chip Power Dissipation: PINT = VDD x (IDD – S IOH) I/O Pin Power Dissipation: PI/O = S (({VDD – VOH} x IOH) + S (VOL x IOL))	PD	PINT + PI/O			W
Maximum Allowed Power Dissipation	PDMAX	(TJ – TA)/θJA			W

TABLE 37-3: THERMAL PACKAGING CHARACTERISTICS

Characteristics	Symbol	Typical	Max.	Unit	Notes
Package Thermal Resistance, 64-pin QFN (9x9x0.9 mm)	θJA	28	—	°C/W	**1**
Package Thermal Resistance, 64-pin TQFP (10x10x1 mm)	θJA	49	—	°C/W	**1**
Package Thermal Resistance, 100-pin TQFP (12x12x1 mm)	θJA	43	—	°C/W	**1**
Package Thermal Resistance, 100-pin TQFP (14x14x1 mm)	θJA	40	—	°C/W	**1**
Package Thermal Resistance, 124-pin VTLA (9x9x0.9 mm)	θJA	30	—	°C/W	**1**
Package Thermal Resistance, 144-pin TQFP (16x16x1 mm)	θJA	42	—	°C/W	**1**
Package Thermal Resistance, 144-pin LQFP (20x20x1.4 mm)	θJA	39	—	°C/W	**1**
Package Thermal Resistance, 144-pin TFBGA (7x7x1.02 mm)	θJA	33	—	°C/W	**1**

Note 1: Junction to ambient thermal resistance, Theta-JA (θJA) numbers are achieved by package simulations.

TABLE 37-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typical**	**Max.**	**Units**	**Conditions**
Operating Voltage							
DC10	VDD	**Supply Voltage (Note 1)**	2.1	—	3.6	V	—
DC12	VDR	**RAM Data Retention Voltage (Note 2)**	2.0	—	—	V	—
DC16	VPOR	**VDD Start Voltage** to Ensure Internal Power-on Reset Signal **(Note 3)**	1.75	—	—	V	—
DC17	SVDD	**VDD Rise Rate** to Ensure Internal Power-on Reset Signal	0.000011	—	1.1	V/µs	300 ms to 3 µs @ 3.3V

Note 1: Overall functional device operation at VBORMIN < VDD < VDDMIN is guaranteed, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below VDDMIN. Refer to parameter BO10 in Table 37-5 for BOR values.

2: This is the limit to which VDD can be lowered without losing RAM data.

3: This is the limit to which VDD must be lowered to ensure Power-on Reset.

TABLE 37-5: ELECTRICAL CHARACTERISTICS: BOR

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics**	**Min.(1)**	**Typical**	**Max.**	**Units**	**Conditions**
BO10	VBOR	BOR Event on VDD transition high-to-low **(Note 2)**	1.88	—	2.02	V	—

Note 1: Parameters are for design guidance only and are not tested in manufacturing.

2: Overall functional device operation at VBORMIN < VDD < VDDMIN is tested, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below VDDMIN.

TABLE 37-6: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial	
Parameter No.	**Typical(3)**	**Maximum(6)**	**Units**	**Conditions**
Operating Current (IDD)(1)				
DC20	8	25	mA	4 MHz **(Note 4,5)**
DC21	10	30	mA	10 MHz **(Note 5)**
DC22	32	65	mA	60 MHz **(Note 2,4)**
DC23	40	75	mA	80 MHz **(Note 2,4)**
DC25	61	95	mA	130 MHz **(Note 2,4)**
DC26	72	110	mA	160 MHz **(Note 2,4)**
DC28	81	120	mA	180 MHz **(Note 2,4)**
DC27a	92	130	mA	200 MHz **(Note 2)**
DC27b	78	100	mA	200 MHz **(Note 4,5)**

Note 1: A device's IDD supply current is mainly a function of the operating voltage and frequency. Other factors, such as PBCLK (Peripheral Bus Clock) frequency, number of peripheral modules enabled, internal code execution pattern, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.

2: The test conditions for IDD measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), VUSB3V3 is connected to VSS
- CPU, Program Flash, and SRAM data memory are operational, Program Flash memory Wait states are equal to two
- L1 Cache and Prefetch modules are enabled
- No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{MCLR}$ = VDD
- CPU executing `while(1)` statement from Flash
- RTCC and JTAG are disabled

3: Data in "Typical" column is at 3.3V, +25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.

4: This parameter is characterized, but not tested in manufacturing.

5: Note 2 applies with the following exceptions: L1 Cache and Prefetch modules are disabled, Program Flash memory Wait states are equal to seven.

6: Data in the "Maximum" column is at 3.3V, +85ºC at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 37-7: DC CHARACTERISTICS: IDLE CURRENT (IIDLE)

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial	
Parameter No.	**Typical(2)**	**Maximum(4)**	**Units**	**Conditions**
Idle Current (IIDLE): Core Off, Clock on Base Current (Note 1)				
DC30a	7	22	mA	4 MHz **(Note 3)**
DC31a	8	24	mA	10 MHz
DC32a	13	32	mA	60 MHz **(Note 3)**
DC33a	21	42	mA	130 MHz **(Note 3)**
DC34	26	48	mA	180 MHz **(Note 3)**
DC35	28	52	mA	200 MHz

Note 1: The test conditions for IIDLE current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBPMD = 1), VUSB3V3 is connected to VSS, PBCLKx divisor = 1:128 ('x' ≠ 7)
- CPU is in Idle mode (CPU core Halted)
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared (except USBPMD)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{MCLR}$ = VDD
- RTCC and JTAG are disabled

2: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: This parameter is characterized, but not tested in manufacturing.

4: Data in the "Maximum" column is at 3.3V, +85ºC at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 37-8: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial		
Param. No.	**Typical(2)**	**Maximum(5)**	**Units**	**Conditions**	
Power-Down Current (IPD) (Note 1)					
DC40k	0.7	7	mA	-40°C	Base Power-Down Current
DC40l	1.5	7	mA	+25°C	
DC40n	7	20	mA	+85°C	
Module Differential Current					
DC41e	15	50	µA	3.6V	Watchdog Timer Current: ΔIWDT **(Note 3)**
DC42e	25	50	µA	3.6V	RTCC + Timer1 w/32 kHz Crystal: ΔIRTCC **(Note 3)**
DC43d	3	3.8	mA	3.6V	ADC: ΔIADC **(Notes 3, 4)**
DC44	15	50	µA	3.6V	Deadman Timer Current: ΔIDMT **(Note 3)**

Note 1: The test conditions for IPD current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), VUSB3V3 is connected to VSS
- CPU is in Sleep mode
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{\text{MCLR}}$ = VDD
- RTCC and JTAG are disabled
- Voltage regulator is in Stand-by mode (VREGS = 0)

2: Data in the "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: The Δ current is the additional current consumed when the module is enabled. This current should be added to the base IPD current.

4: Voltage regulator is operational (VREGS = 1).

5: Data in the "Maximum" column is at 3.3V, +85ºC at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 37-9: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.(1)**	**Max.**	**Units**	**Conditions**
	VIL	**Input Low Voltage**					
DI10		I/O Pins with PMP	VSS	—	0.15 * VDD	V	
		I/O Pins	VSS	—	0.2 * VDD	V	
DI18		SDAx, SCLx	VSS	—	0.3 * VDD	V	SMBus disabled **(Note 4)**
DI19		SDAx, SCLx	VSS	—	0.8	V	SMBus enabled **(Note 4)**
	VIH	**Input High Voltage**					
DI20		I/O Pins not 5V-tolerant(5)	0.80 * VDD	—	VDD	V	**(Note 4,6)**
		I/O Pins 5V-tolerant with PMP(5)	0.80 * VDD	—	5.5	V	**(Note 4,6)**
		I/O Pins 5V-tolerant(5)	0.80 * VDD	—	5.5	V	
DI28a		SDAx, SCLx on non-5V tolerant pins(5)	0.80 * VDD	—	VDD	V	SMBus disabled **(Note 4,6)**
DI29a		SDAx, SCLx on non-5V tolerant pins(5)	2.1	—	VDD	V	SMBus enabled, 2.1V ≤ VPIN ≤ 5.5 **(Note 4,6)**
DI28b		SDAx, SCLx on 5V tolerant pins(5)	0.80 * VDD	—	5.5	V	SMBus disabled **(Note 4,6)**
DI29b		SDAx, SCLx on 5V tolerant pins(5)	2.1	—	5.5	V	SMBus enabled, 2.1V ≤ VPIN ≤ 5.5 **(Note 4,6)**
DI30	ICNPU	**Change Notification Pull-up Current**	—	—	-40	µA	VDD = 3.3V, VPIN = VSS **(Note 3,6)**
DI31	ICNPD	**Change Notification Pull-down Current(4)**	40	—	—	µA	VDD = 3.3V, VPIN = VDD
	IIL	**Input Leakage Current (Note 3)**					
DI50		I/O Ports	—	—	±1	µA	VSS ≤ VPIN ≤ VDD, Pin at high-impedance
DI51		Analog Input Pins	—	—	±1	µA	VSS ≤ VPIN ≤ VDD, Pin at high-impedance
DI55		$\overline{\text{MCLR}}$(2)	—	—	±1	µA	VSS ≤ VPIN ≤ VDD
DI56		OSC1	—	—	±1	µA	VSS ≤ VPIN ≤ VDD, HS mode

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

3: Negative current is defined as current sourced by the pin.

4: This parameter is characterized, but not tested in manufacturing.

5: See the pin name tables (Table 2 through Table 4) for the 5V-tolerant pins.

6: The VIH specifications are only in relation to externally applied inputs, and not with respect to the user-selectable internal pull-ups. External open drain input signals utilizing the internal pull-ups of the PIC32 device are guaranteed to be recognized only as a logic "high" internally to the PIC32 device, provided that the external load does not exceed the minimum value of ICNPU. For External "input" logic inputs that require a pull-up source, to guarantee the minimum VIH of those components, it is recommended to use an external pull-up resistor rather than the internal pull-ups of the PIC32 device.

TABLE 37-10: DC CHARACTERISTICS: I/O PIN INPUT INJECTION CURRENT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typical(1)**	**Max.**	**Units**	**Conditions**
DI60a	IICL	**Input Low Injection Current**	0	—	-5(2,5)	mA	This parameter applies to all pins, with the exception of RB10. Maximum IICH current for this exception is 0 mA.
DI60b	IICH	**Input High Injection Current**	0	—	+5(3,4,5)	mA	This parameter applies to all pins, with the exception of all 5V tolerant pins, OSCI, OSCO, SOSCI, SOSCO, D+, D- and RB10. Maximum IICH current for these exceptions is 0 mA.
DI60c	∑IICT	**Total Input Injection Current (sum of all I/O and control pins)**	-20(6)	—	+20(6)	mA	Absolute instantaneous sum of all ± input injection currents from all I/O pins (| IICL + | IICH |) ≤ ∑IICT

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: VIL source < (VSS - 0.3). Characterized but not tested.

3: VIH source > (VDD + 0.3) for non-5V tolerant pins only.

4: Digital 5V tolerant pins do not have an internal high side diode to VDD, and therefore, cannot tolerate any "positive" input injection current.

5: Injection currents > | 0 | can affect the ADC results by approximately 4 to 6 counts (i.e., VIH Source > (VDD + 0.3) or VIL source < (VSS - 0.3)).

6: Any number and/or combination of I/O pins not excluded under IICL or IICH conditions are permitted provided the "absolute instantaneous" sum of the input injection currents from all pins do not exceed the specified limit. If **Note 2**, IICL = (((Vss - 0.3) - VIL source) / Rs). If **Note 3**, IICH = ((IICH source - (VDD + 0.3)) / RS). RS = Resistance between input source voltage and device pin. If (VSS - 0.3) ≤ VSOURCE ≤ (VDD + 0.3), injection current = 0.

TABLE 37-11: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

			2.0	—	—	V	IOH ≥ -25 mA, VDD = 3.3V
			3.0	—	—	V	IOH ≥ -14 mA, VDD = 3.3V

Note 1: Parameters are characterized, but not tested.

TABLE 37-12: DC CHARACTERISTICS: PROGRAM MEMORY(3)

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Sym.**	**Characteristics**	**Min.**	**Typ.(1)**	**Max.**	**Units**	**Conditions**
D130a	EP	Cell Endurance	10,000	—	—	E/W	Without ECC
D130b			20,000	—	—	E/W	With ECC
D131	VPR	VDD for Read	VDDMIN	—	VDDMAX	V	—
D132	VPEW	VDD for Erase or Write	VDDMIN	—	VDDMAX	V	—
D134a	TRETD	Characteristic Retention	10	—	—	Year	Without ECC
D134b			20	—	—	Year	With ECC
D135	IDDP	Supply Current during Programming	—	—	30	mA	—
D136	TRW	Row Write Cycle Time **(Notes 2, 4)**	—	66813	—	FRC Cycles	—
D137	TQWW	Quad Word Write Cycle Time **(Note 4)**	—	773	—	FRC Cycles	—
D138	TWW	Word Write Cycle Time **(Note 4)**	—	383	—	FRC Cycles	—
D139	TCE	Chip Erase Cycle Time **(Note 4)**	—	515373	—	FRC Cycles	—
D140	TPFE	All Program Flash (Upper and Lower regions) Erase Cycle Time **(Note 4)**	—	256909	—	FRC Cycles	—
D141	TPBE	Program Flash (Upper or Lower regions) Erase Cycle Time **(Note 4)**	—	128453	—	FRC Cycles	—
D142	TPGE	Page Erase Cycle Time **(Note 4)**	—	128453	—	FRC Cycles	—

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated.

2: The minimum PBCLK5 for row programming is 4 MHz.

3: Refer to the *"PIC32 Flash Programming Specification"* (DS60001145) for operating conditions during programming and erase cycles.

4: This parameter depends on FRC accuracy (see Table 37-20) and FRC tuning values (see the OSCTUN register: Register 8-2).

TABLE 37-13: DC CHARACTERISTICS: PROGRAM FLASH MEMORY WAIT STATES

DC CHARACTERISTICS	Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended		
Required Flash Wait States(1)	**SYSCLK**	**Units**	**Conditions**
With ECC:			
0 Wait states	0 < SYSCLK ≤ 60	MHz	—
1 Wait state	60 < SYSCLK ≤ 120		
2 Wait states	120 < SYSCLK ≤ 200		
Without ECC:			
0 Wait states	0 < SYSCLK ≤ 74	MHz	—
1 Wait state	74 < SYSCLK ≤ 140		
2 Wait states	140 < SYSCLK ≤ 200		

Note 1: To use Wait states, the Prefetch module must be enabled (PREFEN<1:0> ≠ 00) and the PFMWS<2:0> bits must be written with the desired Wait state value.

TABLE 37-14: COMPARATOR SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions (see Note 3): 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typical**	**Max.**	**Units**	**Comments**
D300	VIOFF	Input Offset Voltage	—	±10	—	mV	AVDD = VDD, AVSS = VSS
D301	VICM	Input Common Mode Voltage	0	—	VDD	V	AVDD = VDD, AVSS = VSS **(Note 2)**
D302	CMRR	Common Mode Rejection Ratio	55	—	—	dB	Max VICM = (VDD – 1)V **(Note 2, 4)**
D303	TRESP	Response Time	—	150	—	ns	AVDD = VDD, AVSS = VSS **(Notes 1, 2)**
D304	ON2OV	Comparator Enabled to Output Valid	—	—	10	µs	Comparator module is configured before setting the comparator ON bit **(Note 2)**
D305	IVREF	Internal Voltage Reference	1.194	1.2	1.206	V	—

Note 1: Response time measured with one comparator input at (VDD – 1.5)/2, while the other input transitions from VSS to VDD.

2: These parameters are characterized but not tested.

3: The Comparator module is functional at VBORMIN < VDD < VDDMIN, but with degraded performance. Unless otherwise stated, module functionality is guaranteed, but not characterized.

4: CMRR measurement characterized with a 1 MΩ resistor in parallel with a 25 pF capacitor to VSS.

TABLE 37-15: COMPARATOR VOLTAGE REFERENCE SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions (see Note 3): 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Comments**
D312	TSET	Internal 4-bit DAC Comparator Reference Settling time	—	—	10	µs	See **Note 1**
D313	DACREFH	CVREF Input Voltage Reference Range	AVSS	—	AVDD	V	CVRSRC with CVRSS = 0
			VREF-	—	VREF+	V	CVRSRC with CVRSS = 1
D314	DVREF	CVREF Programmable Output Range	0	—	0.625 x DACREFH	V	0 to 0.625 DACREFH with DACREFH/24 step size
			0.25 x DACREFH	—	0.719 x DACREFH	V	0.25 x DACREFH to 0.719 DACREFH with DACREFH/32 step size
D315	DACRES	Resolution	—	—	DACREFH/24		CVRCON<CVRR> = 1
			—	—	DACREFH/32		CVRCON<CVRR> = 0
D316	DACACC	Absolute Accuracy(2)	—	—	1/4	LSB	DACREFH/24, CVRCON<CVRR> = 1
			—	—	1/2	LSB	DACREFH/32, CVRCON<CVRR> = 0

Note 1: Settling time was measured while CVRR = 1 and CVR<3:0> transitions from '0000' to '1111'. This parameter is characterized, but is not tested in manufacturing.

2: These parameters are characterized but not tested.

37.2 AC Characteristics and Timing Parameters

The information contained in this section defines PIC32MZ EF device AC characteristics and timing parameters.

FIGURE 37-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

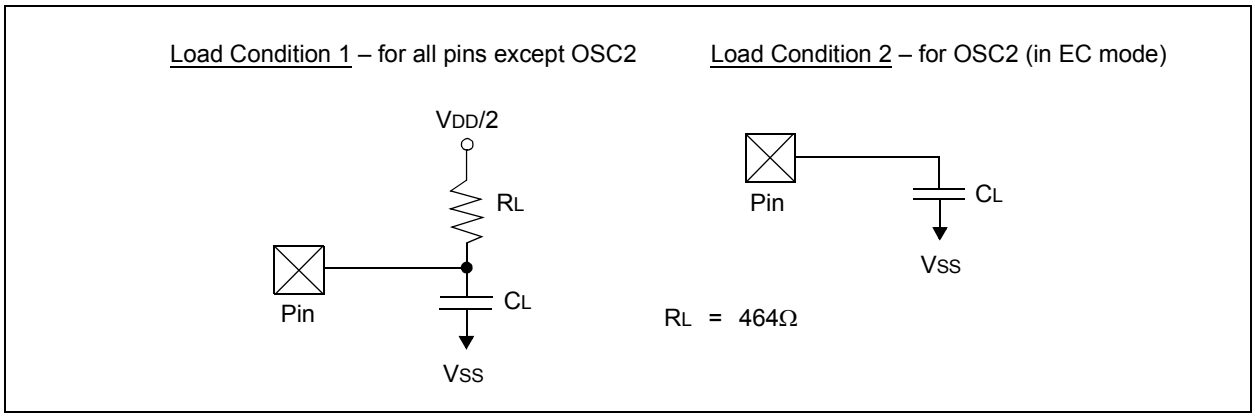

TABLE 37-16: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typical(1)**	**Max.**	**Units**	**Conditions**
DO56	CL	All I/O pins (except pins used as CxOUT)	—	—	50	pF	EC mode for OSC2
DO58	CB	SCLx, SDAx	—	—	400	pF	In I^2C mode
DO59	CSQI	All SQI pins	—	—	10	pF	—

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

FIGURE 37-2: EXTERNAL CLOCK TIMING

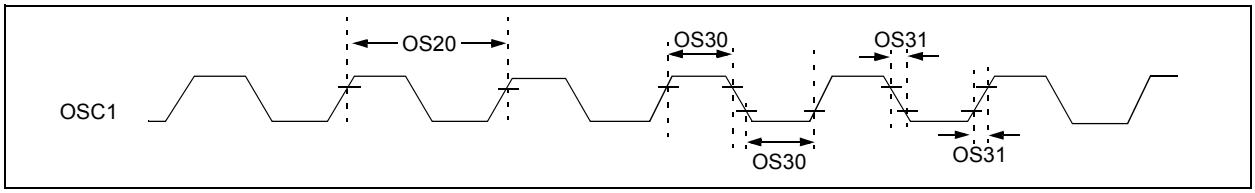

TABLE 37-17: EXTERNAL CLOCK TIMING REQUIREMENTS (PRIMARY OSCILLATOR ONLY)

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics**	**Minimum**	**Typical(1)**	**Maximum**	**Units**	**Conditions**
OS10	FOSC	External CLKI Frequency (External clocks allowed only in EC and ECPLL modes)	DC	—	64	MHz	EC **(Note 2,3)**
OS13		Oscillator Crystal Frequency	4	—	32	MHz	HS **(Note 2,3)**
OS15			32	32.768	100	kHz	SOSC **(Note 2)**
OS20	TOSC	TOSC = 1/FOSC	—	—	—	—	See parameter OS10 for FOSC value
OS30	TOSL, TOSH	External Clock In (OSC1) High or Low Time	0.375 x TOSC	—	—	ns	EC **(Note 2)**
OS31	TOSR, TOSF	External Clock In (OSC1) Rise or Fall Time	—	—	7.5	ns	EC **(Note 2)**
OS40	TOST	Oscillator Start-up Timer Period (Only applies to HS, HSPLL, and SOSC Clock Oscillator modes)	—	1024	—	TOSC	**(Note 2)**
OS41	TFSCM	Primary Clock Fail Safe Time-out Period	—	2	—	ms	**(Note 2)**
OS42	GM	External Oscillator Transconductance	—	400	—	µA/V	VDD = 3.3V, TA = +25°C, HS **(Note 2)**

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are characterized but are not tested.

2: This parameter is characterized, but not tested in manufacturing.

3: See parameter OS50 for PLL input frequency limitations.

TABLE 37-18: SYSTEM TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Minimum**	**Typical**	**Maximum**	**Units**	**Conditions**
OS51	FSYS	System Frequency	DC	—	200	MHz	USB module disabled
			60	—	200	MHz	USB module enabled
OS55a	FPB	Peripheral Bus Frequency	DC	—	100	MHz	For PBCLKx, 'x' ≠ 4, 7
OS55b			DC	—	200	MHz	For PBCLK4, PBCLK7
OS56	FREF	Reference Clock Frequency	—	—	50	MHz	For REFCLKI1, 3, 4 and REFCLKO1, 3, 4 pins

TABLE 37-19: PLL CLOCK TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics(1)**	**Min.**	**Typical**	**Max.**	**Units**	**Conditions**
OS50	FIN	PLL Input Frequency Range	5	—	64	MHz	ECPLL, HSPLL, FRCPLL modes
OS52	TLOCK	PLL Start-up Time (Lock Time)	—	—	100	µs	—
OS53	DCLK	CLKO Stability(2) (Period Jitter or Cumulative)	-0.25	—	+0.25	%	Measured over 100 ms period
OS54	FVCO	PLL VCO Frequency Range	350	—	700	MHz	—
OS54a	FPLL	PLL Output Frequency Range	10	—	200	MHz	—

Note 1: These parameters are characterized, but not tested in manufacturing.

2: This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{PBCLK2}{CommunicationClock}}}$$

For example, if PBCLK2 = 100 MHz and SPI bit rate = 50 MHz, the effective jitter is as follows:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{100}{50}}} \quad \frac{D_{CLK}}{1.41}$$

TABLE 37-20: INTERNAL FRC ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
Internal FRC Accuracy @ 8.00 MHz(1)						
F20	FRC	-5	—	+5	%	0°C ≤ TA ≤ +85°C
		-8	—	+8	%	-40°C ≤ TA ≤ +85°C
		-10	—	+10	%	-40°C ≤ TA ≤ +125°C

Note 1: Frequency calibrated at +25°C and 3.3V. The TUN bits (OSCTUN<5:0>) can be used to compensate for temperature drift.

TABLE 37-21: INTERNAL LPRC ACCURACY

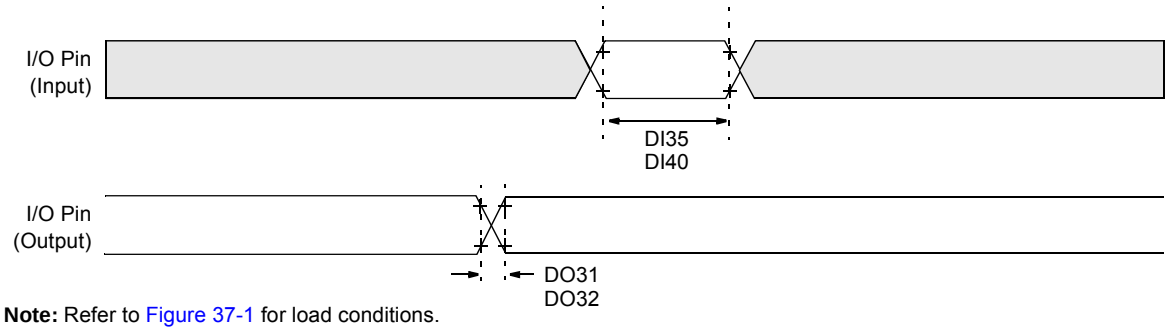
AC CHARACTERISTICS		Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
Internal LPRC @ 32.768 kHz(1)						
F21	LPRC	-8	—	+8	%	0°C ≤ TA ≤ +85°C
		-25	—	+25	%	-40°C ≤ TA ≤ +125°C

Note 1: Change of LPRC frequency as VDD changes.

TABLE 37-22: INTERNAL BACKUP FRC (BFRC) ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
Internal BFRC Accuracy @ 8 MHz						
F22	BFRC	—	±30	—	%	—

FIGURE 37-3: I/O TIMING CHARACTERISTICS



Note: Refer to Figure 37-1 for load conditions.

TABLE 37-23: I/O TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics(2)**	**Min.**	**Typ.(1)**	**Max.**	**Units**	**Conditions**
DO31	TIOR	**Port Output Rise Time** I/O Pins: 4x Source Driver Pins - RA3, RA9, RA10, RA14, RA15 RB0-RB2, RB4, RB6-RB7, RB11, RB13 RC12-RC15 RD0, RD6-RD7, RD11, RD14 RE8, RE9 RF2, RF3, RF8 RG15 RH0, RH1, RH4-RH6, RH8-RH13 RJ0-RJ2, RJ8, RJ9, RJ11	—	—	9.5	ns	CLOAD = 50 pF

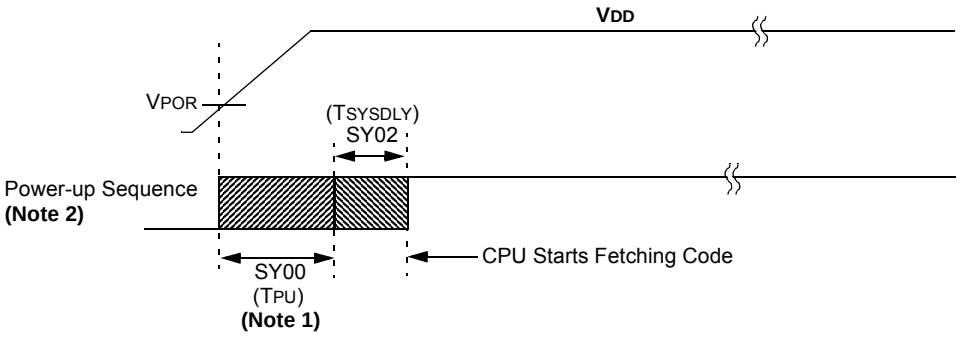
DI35	TINP	INTx Pin High or Low Time	5	—	—	ns	—
DI40	TRBP	CNx High or Low Time (input)	5	—	—	ns	—

Note 1: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated.

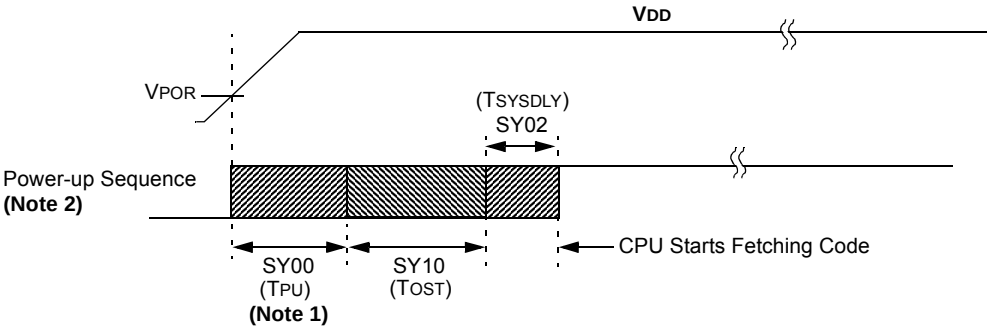
2: This parameter is characterized, but not tested in manufacturing.

FIGURE 37-4: POWER-ON RESET TIMING CHARACTERISTICS

Internal Voltage Regulator Enabled
Clock Sources = (FRC, FRCDIV, FRCPLL, EC, ECPLL and LPRC)



Internal Voltage Regulator Enabled
Clock Sources = (HS, HSPLL, and SOSC)



Note 1: The power-up period will be extended if the power-up sequence completes before the device exits from BOR ($V_{DD} < V_{DDMIN}$).

2: Includes interval voltage regulator stabilization delay.

FIGURE 37-5: EXTERNAL RESET TIMING CHARACTERISTICS

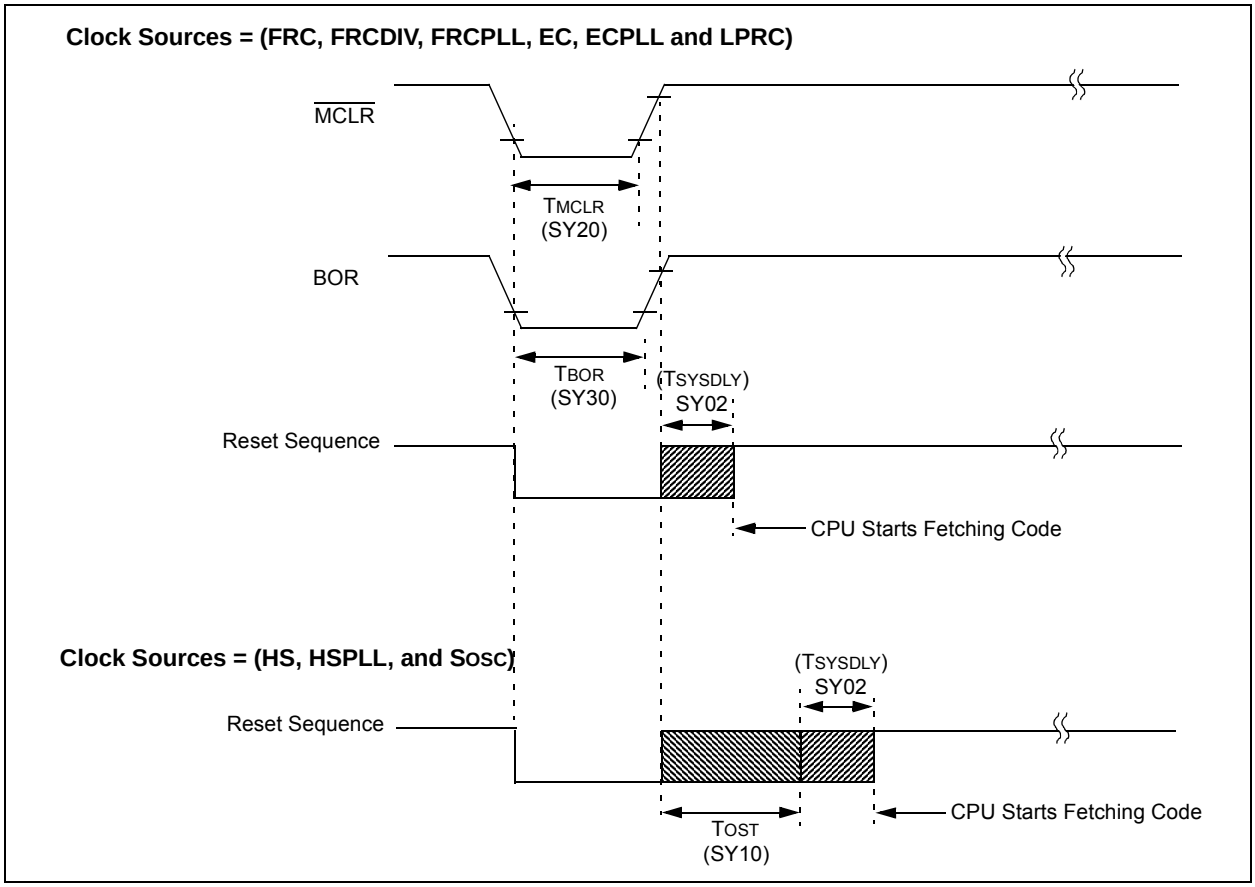


TABLE 37-24: RESETS TIMING

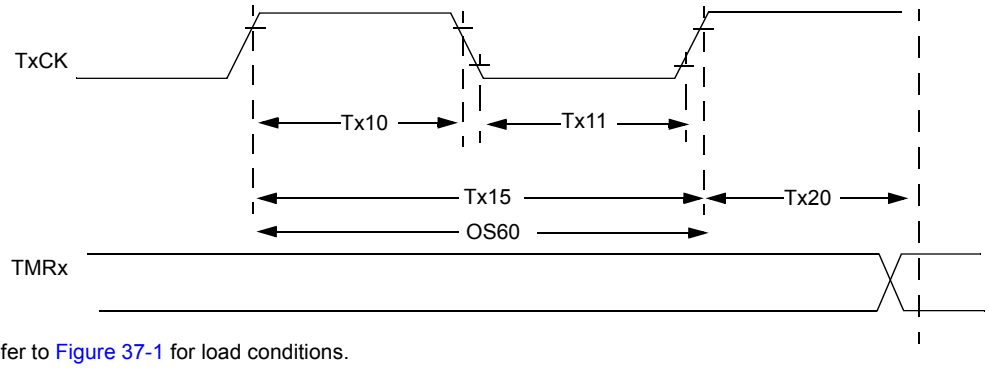
AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics(1)**	**Min.**	**Typical(2)**	**Max.**	**Units**	**Conditions**
SY00	TPU	Power-up Period Internal Voltage Regulator Enabled	—	400	600	µs	—
SY02	TSYSDLY	System Delay Period: Time Required to Reload Device Configuration Fuses plus SYSCLK Delay before First instruction is Fetched.	—	1 µs + 8 SYSCLK cycles	—	—	—
SY20	TMCLR	$\overline{\text{MCLR}}$ Pulse Width (low)	2	—	—	µs	—
SY30	TBOR	BOR Pulse Width (low)	—	1	—	µs	—

Note 1: These parameters are characterized, but not tested in manufacturing.

2: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Characterized by design but not tested.

FIGURE 37-6: TIMER1-TIMER9 EXTERNAL CLOCK TIMING CHARACTERISTICS



Note: Refer to Figure 37-1 for load conditions.

TABLE 37-25: TIMER1 EXTERNAL CLOCK TIMING REQUIREMENTS(1)

AC CHARACTERISTICS				Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics(2)**		**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
TA10	TTXH	TxCK High Time	Synchronous, with prescaler	[(12.5 ns or 1 TPBCLK3) /N] + 20 ns	—	—	ns	Must also meet parameter TA15 (**Note 3**)
			Asynchronous, with prescaler	10	—	—	ns	—
TA11	TTXL	TxCK Low Time	Synchronous, with prescaler	[(12.5 ns or 1 TPBCLK3) /N] + 20 ns	—	—	ns	Must also meet parameter TA15 (**Note 3**)
			Asynchronous, with prescaler	10	—	—	ns	—
TA15	TTXP	TxCK Input Period	Synchronous, with prescaler	[(Greater of 20 ns or 2 TPBCLK3)/N] + 30 ns	—	—	ns	VDD > 2.7V (**Note 3**)
				[(Greater of 20 ns or 2 TPBCLK3)/N] + 50 ns	—	—	ns	VDD < 2.7V (**Note 3**)
			Asynchronous, with prescaler	20	—	—	ns	VDD > 2.7V
				50	—	—	ns	VDD < 2.7V
OS60	FT1	SOSC1/T1CK Oscillator Input Frequency Range (oscillator enabled by setting TCS bit (T1CON<1>))		32	—	50	kHz	—
TA20	TCKEXTMRL	Delay from External TxCK Clock Edge to Timer Increment		—		1	TPBCLK3	—

Note 1: Timer1 is a Type A timer.

2: This parameter is characterized, but not tested in manufacturing.

3: N = Prescale Value (1, 8, 64, 256).

TABLE 37-26: TIMER2-TIMER9 EXTERNAL CLOCK TIMING REQUIREMENTS

AC CHARACTERISTICS				Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics(1)**		**Min.**	**Max.**	**Units**	**Conditions**	
TB10	TTXH	TxCK High Time	Synchronous, with prescaler	[(12.5 ns or 1 TPBCLK3) /N] + 25 ns	—	ns	Must also meet parameter TB15	N = prescale value (1, 2, 4, 8, 16, 32, 64, 256)
TB11	TTXL	TxCK Low Time	Synchronous, with prescaler	[(12.5 ns or 1 TPBCLK3) /N] + 25 ns	—	ns	Must also meet parameter TB15	
TB15	TTXP	TxCK Input Period	Synchronous, with prescaler	[(Greater of [(25 ns or 2 TPBCLK3)/N] + 30 ns	—	ns	VDD > 2.7V	
				[(Greater of [(25 ns or 2 TPBCLK3)/N] + 50 ns	—	ns	VDD < 2.7V	
TB20	TCKEXTMRL	Delay from External TxCK Clock Edge to Timer Increment		—	1	TPBCLK3	—	

Note 1: These parameters are characterized, but not tested in manufacturing.

SP60	TssL2doV	SDOx Data Output Valid after $\overline{SSx}$ Edge	—	—	12.5	ns	—

Note 1: These parameters are characterized, but not tested in manufacturing.

2: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: The minimum clock period for SCKx is 20 ns.

4: Assumes 30 pF load on all SPIx pins.

38.0 EXTENDED TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ EF electrical characteristics for devices running up to 125ºC. Additional information will be provided in future revisions of this document as it becomes available.

The specifications for Extended Temperature are identical to those shown in **37.0 "Electrical Characteristics"**, with the exception of the parameters listed in this chapter.

Parameters in this chapter begin with the letter "E", which denotes Extended Temperature operation. For example, parameter DC28 in **37.0 "Electrical Characteristics"**, is the Extended Temperature operation equivalent for EDC28.

Absolute maximum ratings for the PIC32MZ EF devices are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions, above the parameters indicated in the operation listings of this specification, is not implied.

Absolute Maximum Ratings

(See Note 1)

Ambient temperature under bias.....-40°C to +125°C

Note	**1:**	Stresses above those listed under **"Absolute Maximum Ratings"** may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

38.1 DC Characteristics

TABLE 38-1: OPERATING MIPS VS. VOLTAGE

Characteristic	VDD Range (in Volts) (Note 1)	Temp. Range (in °C)	Max. Frequency	Comment
			PIC32MZ EF Devices	
EDC5	2.1V-3.6V	-40°C to +125°C	180 MHz	—

Note 1: Overall functional device operation at VBORMIN < VDD < VDDMIN is guaranteed, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below VDDMIN. Refer to parameter BO10 in Table 37-5 for BOR values.

TABLE 38-2: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +125°C for Extended	
Parameter No.	Typical(3)	Maximum(6)	Units	Conditions
Operating Current (IDD)(1)				
EDC20	8	54	mA	4 MHz **(Note 4,5)**
EDC21	10	60	mA	10 MHz **(Note 5)**
EDC22	32	95	mA	60 MHz **(Note 2,4)**
EDC23	40	105	mA	80 MHz **(Note 2,4)**
EDC25	61	125	mA	130 MHz **(Note 2,4)**
EDC26	72	140	mA	160 MHz **(Note 2,4)**
EDC28	81	150	mA	180 MHz **(Note 2,4)**

Note 1: A device's IDD supply current is mainly a function of the operating voltage and frequency. Other factors, such as PBCLK (Peripheral Bus Clock) frequency, number of peripheral modules enabled, internal code execution pattern, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.

2: The test conditions for IDD measurements are as follows:

- Oscillator mode is EC+PLL with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), VUSB3V3 is connected to VSS
- CPU, Program Flash, and SRAM data memory are operational, Program Flash memory Wait states are equal to four
- L1 Cache and Prefetch modules are enabled
- No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{MCLR}$ = VDD
- CPU executing `while(1)` statement from Flash
- RTCC and JTAG are disabled

3: Data in "Typical" column is at 3.3V, +25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.

4: This parameter is characterized, but not tested in manufacturing.

5: Note 2 applies with the following exceptions: L1 Cache and Prefetch modules are disabled, Program Flash memory Wait states are equal to seven.

6: Data in the "Maximum" column is at 3.3V, +125ºC at specified operating frequency. Parameters are for design guidance only and are not tested.

TABLE 38-3: DC CHARACTERISTICS: IDLE CURRENT (IIDLE)

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +125°C for Extended	
Parameter No.	**Typical(2)**	**Maximum(4)**	**Units**	**Conditions**
Idle Current (IIDLE): Core Off, Clock on Base Current (Note 1)				
EDC30a	7	52	mA	4 MHz **(Note 3)**
EDC31a	8	56	mA	10 MHz
EDC32a	13	66	mA	60 MHz **(Note 3)**
EDC33a	21	86	mA	130 MHz **(Note 3)**
EDC34	26	96	mA	180 MHz **(Note 3)**

Note 1: The test conditions for IIDLE current measurements are as follows:

- Oscillator mode is EC+PLL with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBPMD = 1), VUSB3V3 is connected to VSS, PBCLKx divisor = 1:128 ('x' ≠ 7)
- CPU is in Idle mode (CPU core Halted)
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared (except USBPMD)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{\text{MCLR}}$ = VDD
- RTCC and JTAG are disabled

2: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: This parameter is characterized, but not tested in manufacturing.

4: Data in the "Maximum" column is at 3.3V, +125ºC at specified operating frequency. Parameters are for design guidance only and are not tested.

TABLE 38-4: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +125°C for Extended		
Param. No.	**Typical(2)**	**Maximum(5)**	**Units**	**Conditions**	
Power-Down Current (IPD) (Note 1)					
EDC40m	20	46	mA	+125ºC	Base Power-Down Current
Module Differential Current					
EDC41e	15	50	µA	3.6V	Watchdog Timer Current: ΔIWDT **(Note 3)**
EDC42e	25	50	µA	3.6V	RTCC + Timer1 w/32 kHz Crystal: ΔIRTCC **(Note 3)**
EDC43d	3	3.8	mA	3.6V	ADC: ΔIADC **(Notes 3, 4)**
EDC44	15	50	µA	3.6V	Deadman Timer Current: ΔIDMT **(Note 3)**

Note 1: The test conditions for IPD current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), VUSB3V3 is connected to VSS
- CPU is in Sleep mode
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{MCLR}$ = VDD
- RTCC and JTAG are disabled
- Voltage regulator is in Stand-by mode (VREGS = 0)

2: Data in the "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: The Δ current is the additional current consumed when the module is enabled. This current should be added to the base IPD current.

4: Voltage regulator is operational (VREGS = 1).

5: Data in the "Maximum" column is at 3.3V, +125ºC at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

38.2 AC Characteristics and Timing Parameters

The information contained in this section defines PIC32MZ EF device AC characteristics and timing parameters.

TABLE 38-5: SYSTEM TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics**	**Min.**	**Typ.**	**Max.**	**Units**	**Conditions**
EOS51	FSYS	System Frequency	DC	—	180	MHz	USB module disabled
			30	—	180	MHz	USB module enabled
EOS55a	FPB	Peripheral Bus Frequency	DC	—	90	MHz	For PBCLKx, 'x' ≠ 4, 7
EOS55b			DC	—	180	MHz	For PBCLK4, PBCLK7
EOS56	FREF	Reference Clock Frequency	—	—	45	MHz	For REFCLKI1, 3, 4 and REFCLKO1, 3, 4 pins

TABLE 38-6: PLL CLOCK TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +125°C for Extended				
Param. No.	**Symbol**	**Characteristics(1)**	**Min.**	**Typical**	**Max.**	**Units**	**Conditions**
EOS54a	FPLL	PLL Output Frequency Range	10	—	180	MHz	—

Note 1: These parameters are characterized, but not tested in manufacturing.

2: This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{PBCLK2}{CommunicationClock}}}$$

For example, if PBCLK2 = 100 MHz and SPI bit rate = 50 MHz, the effective jitter is as follows:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{100}{50}}} \quad \frac{D_{CLK}}{1.41}$$

NOTES:

39.0 252 MHz ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ EF electrical characteristics for devices running at 252 MHz. Additional information will be provided in future revisions of this document as it becomes available.

The specifications for 252 MHz are identical to those shown in **37.0 "Electrical Characteristics"** including absolute maximum ratings, with the exception of the parameters listed in this chapter.

Parameters in this chapter begin with the letter "M", which denotes 252 MHz operation. For example, parameter DC27a in **37.0 "Electrical Characteristics"**, is the up to 200 MHz operation equivalent for MDC27a.

39.1 DC Characteristics

TABLE 39-1: OPERATING MIPS VS. VOLTAGE

Characteristic	VDD Range (in Volts) (Note 1)	Temp. Range (in °C)	Max. Frequency	Comment
			PIC32MZ EF Devices	
MDC5	2.1V-3.6V	-40°C to +85°C	252 MHz	—

Note 1: Overall functional device operation at VBORMIN < VDD < VDDMIN is guaranteed, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below VDDMIN. Refer to parameter BO10 in Table 37-5 for BOR values.

TABLE 39-2: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial	
Parameter No.	Typical(3)	Maximum(6)	Units	Conditions
Operating Current (IDD)(1)				
MDC27a	156	170	mA	252 MHz **(Note 2)**
MDC27b	115	135	mA	252 MHz **(Note 4,5)**

Note 1: A device's IDD supply current is mainly a function of the operating voltage and frequency. Other factors, such as PBCLK (Peripheral Bus Clock) frequency, number of peripheral modules enabled, internal code execution pattern, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.

2: The test conditions for IDD measurements are as follows:

- Oscillator mode is EC+PLL with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), VUSB3V3 is connected to VSS
- CPU, Program Flash, and SRAM data memory are operational, Program Flash memory Wait states are equal to four
- L1 Cache and Prefetch modules are enabled
- No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{MCLR}$ = VDD
- CPU executing `while(1)` statement from Flash
- RTCC and JTAG are disabled

3: Data in "Typical" column is at 3.3V, +25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.

4: This parameter is characterized, but not tested in manufacturing.

5: Note 2 applies with the following exceptions: L1 Cache and Prefetch modules are disabled, Program Flash memory Wait states are equal to seven.

6: Data in the "Maximum" column is at 3.3V, +85ºC at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 39-3: DC CHARACTERISTICS: IDLE CURRENT (I_{IDLE})

DC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial	
Parameter No.	**Typical(2)**	**Maximum(4)**	**Units**	**Conditions**
Idle Current (I_{IDLE}): Core Off, Clock on Base Current (Note 1)				
MDC35	41	60	mA	252 MHz

Note 1: The test conditions for I_{IDLE} current measurements are as follows:

- Oscillator mode is EC+PLL with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBPMD = 1), V_{USB3V3} is connected to V_{SS}, PBCLKx divisor = 1:128 ('x' ≠ 7)
- CPU is in Idle mode (CPU core Halted)
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared (except USBPMD)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to V_{SS}
- $\overline{MCLR}$ = V_{DD}
- RTCC and JTAG are disabled

2: Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: This parameter is characterized, but not tested in manufacturing.

4: Data in the "Maximum" column is at 3.3V, +85ºC at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 39-4: DC CHARACTERISTICS: PROGRAM FLASH MEMORY WAIT STATES

DC CHARACTERISTICS	Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial		
Required Flash Wait States(1)	**SYSCLK**	**Units**	**Conditions**
With ECC:			
0 Wait states	0 < SYSCLK ≤ 60	MHz	—
1 Wait state	60 < SYSCLK ≤ 120		
2 Wait states	120 < SYSCLK ≤ 200		
4 Wait states	200 < SYSCLK ≤ 252		
Without ECC:			
0 Wait states	0 < SYSCLK ≤ 74	MHz	—
1 Wait state	74 < SYSCLK ≤ 140		
2 Wait states	140 < SYSCLK ≤ 200		
4 Wait states	200 < SYSCLK ≤ 252		

Note 1: To use Wait states, the Prefetch module must be enabled (PREFEN<1:0> ≠ 00) and the PFMWS<2:0> bits must be written with the desired Wait state value.

39.2 AC Characteristics and Timing Parameters

The information contained in this section defines PIC32MZ EF device AC characteristics and timing parameters.

TABLE 39-5: SYSTEM TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics**	**Minimum**	**Typical**	**Maximum**	**Units**	**Conditions**
MOS51	FSYS	System Frequency	DC	—	252	MHz	USB module disabled
			60	—	252	MHz	USB module enabled
MOS55a	FPB	Peripheral Bus Frequency	DC	—	100	MHz	For PBCLKx, 'x' ≠ 4, 7 (see **Note 1**)
MOS55b			DC	—	200	MHz	For PBCLK4
MOS55c			DC	—	252	MHz	For PBCLK7
MOS56	FREF	Reference Clock Frequency	—	—	50	MHz	For REFCLKI1, 3, 4 and REFCLKO1, 3, 4 pins

Note 1: If the DEVCFG registers are configured for a SYSCLK speed greater than 200 MHz, these PBCLKs will be running faster than the maximum rating when the device comes out of Reset. To ensure proper operation, firmware must start the device at a speed less than or equal to 200 MHz, adjust the speed of the PBCLKs, and then raise the SYSCLK speed to the desired speed.

TABLE 39-6: PLL CLOCK TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param. No.	**Symbol**	**Characteristics(1)**	**Min.**	**Typical**	**Max.**	**Units**	**Conditions**
MOS54a	FPLL	PLL Output Frequency Range	10	—	252	MHz	—

Note 1: These parameters are characterized, but not tested in manufacturing.

2: This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{PBCLK2}{CommunicationClock}}}$$

For example, if PBCLK2 = 100 MHz and SPI bit rate = 50 MHz, the effective jitter is as follows:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{100}{50}}} \quad \frac{D_{CLK}}{1.41}$$

NOTES:

40.0 AC AND DC CHARACTERISTICS GRAPHS

Note: The graphs provided are a statistical summary based on a limited number of samples and are provided for design guidance purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore, outside the warranted range.

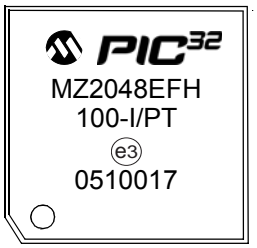
		Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

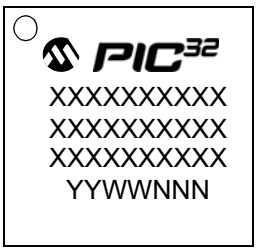
41.1 Package Marking Information (Continued)

100-Lead TQFP (12x12x1 mm)

Example



124-Lead VTLA (9x9x0.9 mm)



Example

144-Lead TQFP (16x16x1 mm)

Example

144-Lead LQFP (20x20x1.40 mm)

Example

Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code
		Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

144-Lead TFBGA (7x7x1.02 mm)

Example

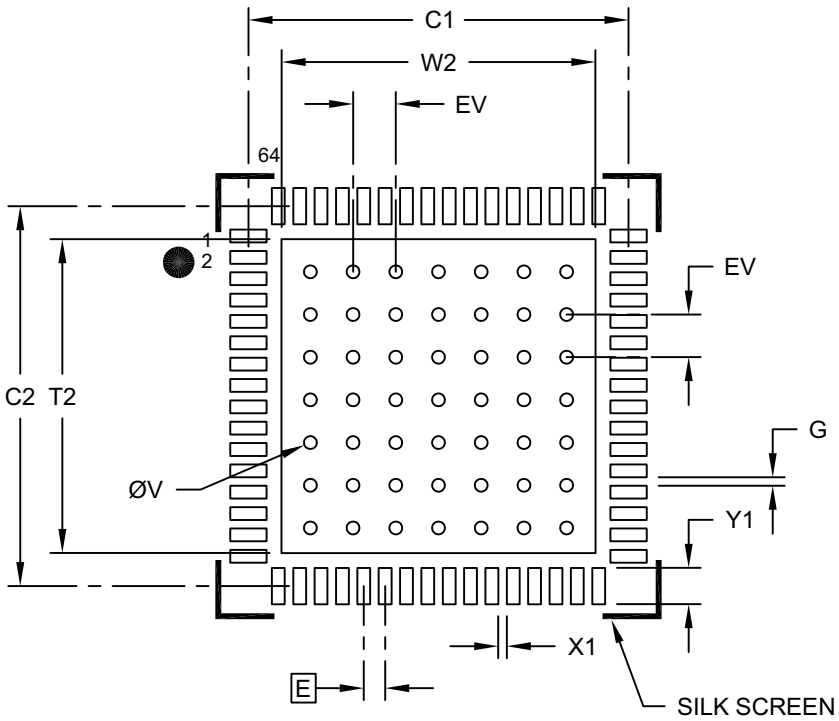
Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code
		Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

41.2 Package Details

64-Lead Plastic Quad Flat, No Lead Package (MR) – 9x9x0.9 mm Body [QFN]
With 0.40 mm Contact Length and 7.70x7.70mm Exposed Pad

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



RECOMMENDED LAND PATTERN

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E	0.50 BSC		
Optional Center Pad Width	W2			7.50
Optional Center Pad Length	T2			7.50
Contact Pad Spacing	C1		8.90	
Contact Pad Spacing	C2		8.90	
Contact Pad Width (X20)	X1			0.30
Contact Pad Length (X20)	Y1			0.90
Contact Pad to Center Pad (X20)	G	0.20		
Thermal Via Diameter	V		0.30	
Thermal Via Pitch	EV		1.00	

Notes:

1. Dimensioning and tolerancing per ASME Y14.5M
   BSC: Basic Dimension. Theoretically exact value shown without tolerances.
2. For best soldering results, thermal vias, if used, should be filled or tented to avoid solder loss during reflow process

Microchip Technology Drawing No. C04-2213B

64-Lead Plastic Quad Flat, No Lead Package (MR) – 9x9x0.9 mm Body [QFN]
With 7.70 x 7.70 Exposed Pad [QFN]

Note:	For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

APPENDIX A: MIGRATING FROM PIC32MX5XX/6XX/7XX TO PIC32MZ EF

This appendix provides an overview of considerations for migrating from PIC32MX5XX/6XX/7XX devices to the PIC32MZ EF family of devices. The code developed for PIC32MX5XX/6XX/7XX devices can be ported to PIC32MZ EF devices after making the appropriate changes outlined in the following sections.

The PIC32MZ EF devices are based on a new architecture, and feature many improvements and new capabilities over PIC32MX5XX/6XX/7XX devices.

A.1 Oscillator and PLL Configuration

Because the maximum speed of the PIC32MZ EF family is greater, the configuration of the oscillator is different from prior PIC32MX5XX/6XX/7XX devices.

Oscillator Configuration differences summarizes the differences (indicated by **Bold** type) between the family devices for the oscillator.

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Primary Oscillator Configuration	
On PIC32MX devices, XT mode had to be selected if the input frequency was in the 3 MHz to 10 MHz range (4-10 for PLL), and HS mode had to be selected if the input frequency was in the 10 MHz to 20 MHz range.	On PIC32MZ EF devices, HS mode has a wider input frequency range (4 MHz to 12 MHz). The bit setting of '01' is Reserved.
POSCMOD<1:0> (DEVCFG1<9:8>) 11 = Primary Oscillator disabled 10 = HS Oscillator mode selected **01 = XT Oscillator mode selected** 00 = External Clock mode selected	POSCMOD<1:0> (DEVCFG1<9:8>) 11 = Primary Oscillator disabled 10 = HS Oscillator mode selected **01 = Reserved** 00 = External Clock mode selected
On PIC32MX devices, crystal mode could be selected with the HS or XT POSC setting, but an external oscillator could be fed into the OSC1/CLKI pin and the part would operate normally.	On PIC32MZ devices, this option is not available. External oscillator signals should only be fed into the OSC1/CLKI pin with the POSC set to EC mode.
Oscillator Selection	
On PIC32MX devices, clock selection choices are as follows:	On PIC32MZ EF devices, clock selection choices are as follows:
FNOSC<2:0> (DEVCFG1<2:0>) NOSC<2:0> (OSCCON<10:8>) 111 = FRCDIV **110 = FRCDIV16** 101 = LPRC 100 = SOSC **011 = POSC with PLL module** 010 = POSC (XT, HS, EC) **001 = FRCDIV+PLL** **000 = FRC**	FNOSC<2:0> (DEVCFG1<2:0>) NOSC<2:0> (OSCCON<10:8>) 111 = FRCDIV **110 = Reserved** 101 = LPRC 100 = SOSC **011 = Reserved** 010 = POSC (HS or EC) **001 = System PLL (SPLL)** **000 = FRCDIV**
COSC<2:0> (OSCCON<14:12>) 111 = FRC divided by FRCDIV **110 = FRC divided by 16** 101 = LPRC 100 = SOSC **011 = POSC + PLL module** 010 = POSC **001 = FRCPLL** **000 = FRC**	COSC<2:0> (OSCCON<14:12>) 111 = FRC divided by FRCDIV **110 = BFRC** 101 = LPRC 100 = SOSC **011 = Reserved** 010 = POSC **001 = System PLL** **000 = FRC divided by FRCDIV**

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES (CONTINUED)

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Secondary Oscillator Enable	
FSOSCEN (DEVCFG1<**5**>)	The location of the SOSCEN bit in the Flash Configuration Words has moved. FSOSCEN (DEVCFG1<**6**>)
PLL Configuration	
The FNOSC<2:0> and NOSC<2:0> bits select between POSC and FRC. **FNOSC<2:0> (DEVCFG1<2:0>)** **NOSC<2:0> (OSCCON<10:8>)**	Selection of which input clock (POSC or FRC) is now done through the FPLLICLK/PLLICLK bits. **FPLLICLK (DEVCFG2<7>)** **PLLICLK (SPLLCON<7>)**
On PIC32MX devices, the input frequency to the PLL had to be between 4 MHz and 5 MHz. FPLLIDIV selected how to divide the input frequency to give it the appropriate range. FPLLIDIV<2:0> (DEVCFG2<2:0>) **111 = 12x divider** **110 = 10x divider** 101 = 6x divider 100 = 5x divider 011 = 4x divider 010 = 3x divider 001 = 2x divider 000 = 1x divider	On PIC32MZ EF devices, the input range for the PLL is wider (5 MHz to 64 MHz). The input divider values have changed, and new FPLLRNG/PLLRNG bits have been added to indicate under what range the input frequency falls. FPLLIDIV<2:0> (DEVCFG2<2:0>) **PLLIDIV<2:0> (SPLLCON<2:0>)** **111 = Divide by 8** **110 = Divide by 7** 101 = Divide by 6 100 = Divide by 5 011 = Divide by 4 010 = Divide by 3 001 = Divide by 2 000 = Divide by 1 **FPLLRNG<2:0> (DEVCFG2<6:4>)** **PLLRNG<2:0> (SPLLCON<2:0>)** **111 = Reserved** **110 = Reserved** **101 = 34-64 MHz** **100 = 21-42 MHz** **011 = 13-26 MHz** **010 = 8-16 MHz** **001 = 5-10 MHz** **000 = Bypass**
On PIC32MX devices, the output frequency of PLL is between 60 MHz and 120 MHz. The PLL multiplier and divider bits configure the PLL for this range. FPLLMUL<**2**:0> (DEVCFG2<**6:4**>) PLLMULT<**2**:0> (OSCCON<18:16>) **111 = 24x multiplier** **110 = 21x multiplier** **101 = 20x multiplier** **100 = 19x multiplier** **011 = 18x multiplier** **010 = 17x multiplier** **001 = 16x multiplier** **000 = 15x multiplier** FPLLODIV<2:0> (DEVCFG2<18:16>) PLLODIV<2:0> (OSCCON<29:27>) **111 = 24x multiplier** **110 = 21x multiplier** **101 = 20x multiplier** **100 = 19x multiplier** **011 = 18x multiplier** **010 = 17x multiplier** **001 = 16x multiplier** **000 = 15x multiplier**	The PLL multiplier and divider on PIC32MZ EF devices have a wider range to accommodate the wider PLL specification range. FPLLMUL**T**<**6**:0> (DEVCFG2<**14:8**>) PLLMULT<**6**:0> (**SPLLCON<22:16>**) **1111111 = Multiply by 128** **1111110 = Multiply by 127** **1111101 = Multiply by 126** **1111100 = Multiply by 125** • • • **0000000 = Multiply by 1** FPLLODIV<2:0> (DEVCFG2<18:16>) PLLODIV<2:0> (**SPLLCON<26:24>**) **111 = PLL Divide by 32** **110 = PLL Divide by 32** **101 = PLL Divide by 32** **100 = PLL Divide by 16** **011 = PLL Divide by 8** **010 = PLL Divide by 4** **001 = PLL Divide by 2** **000 = PLL Divide by 2**

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES (CONTINUED)

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Crystal/Oscillator Selection for USB	
Any frequency that can be divided down to 4 MHz using UPLLIDIV, including 4, 8, 12, 16, 20, 40, and 48 MHz.	If the USB module is used, the Primary Oscillator is limited to either 12 MHz or 24 MHz. Which frequency is used is selected using the UPLLFSEL (DEVCFG2<30>) bit.
USB PLL Configuration	
On PIC32MX devices, the PLL for the USB requires an input frequency of 4 MHz. **UPLLIDIV<2:0> (DEVCFG2<10:8>)** **111 = 12x divider** **110 = 10x divider** **101 = 6x divider** **100 = 5x divider** **011 = 4x divider** **010 = 3x divider** **010 = 3x divider** **001 = 2x divider** **000 = 1x divider**	On PIC32MZ EF devices, the HS USB PHY requires an input frequency of 12 MHz or 24 MHz. UPLLIDIV has been replaced with UPLLFSEL. **UPLLFSEL (DEVCFG2<30>)** **1 = UPLL input clock is 24 MHz** **0 = UPLL input clock is 12 MHz**
Peripheral Bus Clock Configuration	
On PIC32MX devices, there is one peripheral bus, and the clock for that bus is divided from the SYSCLK using FPBDIV/PBDIV. In addition, the maximum PBCLK frequency is the same as SYSCLK. **FPBDIV<1:0> (DEVCFG1<5:4>)** PBDIV<**1**:0> (**OSCCON<20:19>**) **11 = PBCLK is SYSCLK divided by 8** **10 = PBCLK is SYSCLK divided by 4** **01 = PBCLK is SYSCLK divided by 2** **00 = PBCLK is SYSCLK divided by 1**	On PIC32MZ EF devices, there are eight peripheral buses with their own clocks. FPBDIV is removed, and each PBDIV is in its own register for each PBCLK. The initial PBCLK speed is fixed at reset, and the maximum PBCLK speed is limited to100 MHz for all buses, with the exception of PBCLK7, which is 200 MHz. PBDIV<**6**:0> (**PBxDIV**<**6**:0>) **1111111 = PBCLKx is SYSCLK divided by 128** **1111110 = PBCLKx is SYSCLK divided by 127** • • • **0000011 = PBCLKx is SYSCLK divided by 4** **0000010 = PBCLKx is SYSCLK divided by 3** **0000001 = PBCLKx is SYSCLK divided by 2** **(default value for x < 7)** **0000000 = PBCLKx is SYSCLK divided by 1** **(default value for x ³ 7)**
CPU Clock Configuration	
On PIC32MX devices, the CPU clock is derived from SYSCLK.	On PIC32MZ EF devices, the CPU clock is derived from PBCLK7.
FRCDIV Default	
On PIC32MX devices, the default value for FRCDIV was to divide the FRC clock by two. FRCDIV<2:0> (OSCCON<26:24>) 111 = FRC divided by 256 110 = FRC divided by 64 101 = FRC divided by 32 100 = FRC divided by 16 011 = FRC divided by 8 010 = FRC divided by 4 001 = FRC divided by 2 **(default)** 000 = FRC divided by 1	On PIC32MZ EF devices, the default has been changed to divide by one. FRCDIV<2:0> (OSCCON<26:24>) 111 = FRC divided by 256 110 = FRC divided by 64 101 = FRC divided by 32 100 = FRC divided by 16 011 = FRC divided by 8 010 = FRC divided by 4 001 = FRC divided by 2 000 = FRC divided by 1 **(default)**

TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES (CONTINUED)

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Fail-Safe Clock Monitor (FSCM)	
On PIC32MX devices, the internal FRC became the clock source on a failure of the clock source.	On PIC32MZ EF devices, a separate internal Backup FRC (BFRC) becomes the clock source upon a failure at the clock source.
On PIC32MX devices, a clock failure resulted in the triggering of a specific interrupt when the switchover was complete. **FSCM generates an interrupt.**	On PIC32MZ EF devices, a NMI is triggered instead, and must be handled by the NMI routine. **FSCM generates a NMI.**
FCKSM<1:0> (DEVCFG1<15:14>) **1x = Clock switching is disabled, FSCM is disabled** 01 = Clock switching is enabled, FSCM is disabled **00 = Clock switching is enabled, FSCM is enabled**	The definitions of the FCKSM<1:0> bits has changed on PIC32MZ EF devices. FCKSM<1:0> (DEVCFG1<15:14>) **11 = Clock switching is enabled and clock monitoring is enabled** **10 = Clock switching is disabled and clock monitoring is enabled** 01 = Clock switching is enabled and clock monitoring is disabled **00 = Clock switching is disabled and clock monitoring is disabled**
On PIC32MX devices, the CF (OSCCON<3>) bit indicates a clock failure. Writing to this bit initiates a FSCM event.	On PIC32MZ EF devices, the CF (OSCCON<3>) bit has the same functionality as that of PIC32MX device; however, an additional CF(RNMICON<1>) bit is available to indicate a NMI event. Writing to this bit causes a NMI event, but not a FSCM event.
On PIC32MX devices, the CLKLOCK (OSCCON<7>) bit is controlled by the FSCM. CLKLOCK (OSCCON<7>) **If clock switching and monitoring is disabled (FCKSM<1:0> = 1x):** 1 = Clock and PLL selections are locked 0 = Clock and PLL selections are not locked and may be modified **If clock switching and monitoring is enabled (FCKSM<1:0> = 0x):** **Clock and PLL selections are never locked and may be modified.**	On PIC32MZ EF devices, the CLKLOCK (OSCCON<7>) bit is not impacted by the FSCM. CLKLOCK (OSCCON<7>) 1 = Clock and PLL selections are locked 0 = Clock and PLL selections are not locked and may be modified

A.2 Analog-to-Digital Converter (ADC)

The PIC32MZ EF family of devices has a new 12-bit High-Speed Successive Approximation Register (SAR) ADC module that replaces the 10-bit ADC module in PIC32MX5XX/6XX/7XX devices; therefore, the use of **Bold** type to show differences is *not* used in the following table. Note that not all register differences are described in this section; however, the key feature differences are listed in ADC Differences.

TABLE A-3: ADC DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Clock Selection and Operating Frequency (TAD)	
On PIC32MX devices, the ADC clock was derived from either the FRC or from the PBCLK. ADRC (AD1CON3<15>) 1 = FRC clock 0 = Clock derived from Peripheral Bus Clock (PBCLK)	On PIC32MZ EF devices, the three possible sources of the ADC clock are FRC, REFCLKO3, and SYSCLK. ADCSEL<1:0> (ADCCON3<31:30>) 11 = FRC 10 = REFCLKO3 01 = SYSCLK 00 = Reserved
On PIC32MX devices, if the ADC clock was derived from the PBCLK, that frequency was divided further down, with a maximum divisor of 512, and a minimum divisor of two. ADCS<7:0> (AD1CON3<7:0>) 11111111 = 512 * TPB = TAD • • • 00000001 = 4 * TPB = TAD 00000000 = 2 * TPB = TAD	On PIC32MZ EF devices, any ADC clock source can be divided down separately for each dedicated ADC and the shared ADC, with a maximum divisor of 254. The input clock can also be fed directly to the ADC. ADCDIV<6:0> (ADCTIMEx<22:16>) ADCDIV<6:0> (ADCCON2<6:0>) 1111111 = 254 * TQ = TAD • • • 0000011 = 6 * TQ = TAD 0000010 = 4 * TQ = TAD 0000001 = 2 * TQ = TAD 0000000 = TQ = TAD

TABLE A-3: ADC DIFFERENCES (CONTINUED)

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Scan Trigger Source	
On PIC32MX devices, there are four sources that can trigger a scan conversion in the ADC module: Auto, Timer3, INT0, and clearing the SAMP bit. SSRC<2:0> (AD1CON1<7:5>) 111 = Auto convert 110 = Reserved 101 = Reserved 100 = Reserved 011 = Reserved 010 = Timer3 period match 001 = Active transition on INT0 pin 000 = Clearing SAMP bit	On PIC32MZ EF devices, the list of sources for triggering a scan conversion has been expanded to include the comparators, Output Compare, and two additional Timers. In addition, trigger sources can be simulated by setting the RQCNVRT (ADCCON3<8>) bit. STRGSRC<4:0> (ADCCON1<20:16>) 11111 = Reserved • • • 01101 = Reserved 01100 = Comparator 2 COUT 01011 = Comparator 1 COUT 01010 = OCMP5 01001 = OCMP3 01000 = OCMP1 00111 = TMR5 match 00110 = TMR3 match 00101 = TMR1 match 00100 = INT0 00011 = Reserved 00010 = Global level software trigger (GLSWTRG) 00001 = Global software trigger (GSWTRG) 00000 = No trigger
Output Format	
On PIC32MX devices, the output format was decided for all ADC channels based on the setting of the FORM<2:0> bits. FORM<2:0> (AD1CON1<10:8>) 011 = Signed Fractional 16-bit 010 = Fractional 16-bit 001 = Signed Integer 16-bit 000 = Integer 16-bit 111 = Signed Fractional 32-bit 110 = Fractional 32-bit 101 = Signed Integer 32-bit 100 = Integer 32-bit	On PIC32MZ EF devices, the FRACT bit determines whether fractional or integer format is used. Then, each input can have its own setting for input (differential or single-ended) and sign (signed or unsigned) using the DIFFx and SIGNx bits in the ADCIMODx registers. FRACT (ADCCON1<23>) 1 = Fractional 0 = Integer DIFFx (ADCIMODy) 1 = Channel x is using Differential mode 0 = Channel x is using Single-ended mode SIGNx (ADCMODy) 1 = Channel x is using Signed Data mode 0 = Channel x is using Unsigned Data mode
Interrupts	
On PIC32MX devices, an interrupt is triggered from the ADC module when a certain number of conversions have taken place, irrespective of which channel was converted.	On PIC32MZ EF devices, the ADC module can trigger an interrupt for each channel when it is converted. Use the Interrupt Controller bits, IEC1<31:27>, IEC2<31:0>, and IEC3<7:0>, to enable/disable them. In addition, the ADC support one global interrupt to indicate conversion on any number of channels.

TABLE A-3: ADC DIFFERENCES (CONTINUED)

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
SMPI<3:0> (AD1CON2<5:2>) 1111 = Interrupt for each 16th sample/convert sequence 1110 = Interrupt for each 15th sample/convert sequence • • • 0001 = Interrupt for each 2nd sample/convert sequence 0000 = Interrupt for each sample/convert sequence	AGIENxx (ADCGIRQENx<y>) 1 = Data ready event will generate a Global ADC interrupt 0 = No global interrupt In addition, interrupts can be generated for filter and comparator events.
ADC Calibration	
On PIC32MX devices, the ADC module can be used immediately, once it is enabled.	PIC32MZ devices require a calibration step prior to operation. This is done by copying the calibration data from DEVADCx to the corresponding ADCxCFG register.
I/O Pin Analog Function Selection	
On PIC32MX devices, the analog function of an I/O pin was determined by the PCFGx bit in the AD1PCFG register.	On PIC32MZ EF devices, the analog selection function has been moved into a separate register on each I/O port. Note that the sense of the bit is different.
PCFGx (AD1PCFG<x>) 1 = Analog input pin in Digital mode 0 = Analog input pin in Analog mode	ANSxy (ANSELx<y>) 1 = Analog input pin in Analog mode 0 = Analog input pin in Digital mode
Electrical Specifications and Timing Requirements	
Refer to **"Section 31. Electrical Characteristics"** in the PIC32MX5XX/6XX/7XX Data Sheet for ADC module specifications and timing requirements.	On PIC32MZ EF devices, the ADC module sampling and conversion time and other specifications have changed. Refer to **37.0 "Electrical Characteristics"** for more information.

A.3 CPU

The CPU in the PIC32MZ EF family of devices has been changed to the MIPS32 M-Class MPU architecture. This CPU includes DSP ASE, internal data and instruction L1 caches, and a TLB-based MMU.

CPU Differences summarizes some of the key differences (indicated by **Bold** type) in the internal CPU registers.

TABLE A-4: CPU DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
L1 Data and Instruction Cache and Prefetch Wait States	
On PIC32MX devices, the cache was included in the prefetch module outside the CPU.	On PIC32MZ EF devices, the CPU has a separate L1 instruction and data cache in the core. The PREFEN<1:0> bits still enable the prefetch module; however, the K0<2:0> bits in the CP0 registers controls the internal L1 cache for the designated regions.
PREFEN<1:0> (**CHECON**<5:4>) **11 = Enable predictive prefetch for both cacheable and non-cacheable regions** **10 = Enable predictive prefetch for non-cacheable regions only** **01 = Enable predictive prefetch for cacheable regions only** 00 = Disable predictive prefetch DCSZ<1:0> (CHECON<9:8>) Changing these bits causes all lines to be reinitialized to the "invalid" state. 11 = Enable data caching with a size of 4 lines 10 = Enable data caching with a size of 2 lines 01 = Enable data caching with a size of 1 line 00 = Disable data caching CHECOH (CHECON<16>) 1 = Invalidate all data and instruction lines 0 = Invalidate all data and instruction lines that are not locked	PREFEN<1:0> (**PRECON**<5:4>) **11 = Enable predictive prefetch for any address** **10 = Enable predictive prefetch for CPU instructions and CPU data** **01 = Enable predictive prefetch for CPU instructions only** 00 = Disable predictive prefetch **K0<2:0> (CP0 Reg 16, Select 0)** **011 = Cacheable, non-coherent, write-back, write allocate** **010 = Uncached** **001 = Cacheable, non-coherent, write-through, write allocate** **000 = Cacheable, non-coherent, write-through, no write allocate**
PFMWS<2:0> (**CHECON**<2:0>) 111 = Seven Wait states 110 = Six Wait states 101 = Five Wait states 100 = Four Wait states 011 = Three Wait states 010 = Two Wait states **(61-80 MHz)** 001 = One Wait state **(31-60 MHz)** 000 = Zero Wait state **(0-30 MHz)**	The Program Flash Memory read wait state frequency points have changed in PIC32MZ EF devices. The register for accessing the PFMWS field has changed from CHECON to PRECON. PFMWS<2:0> (**PRECON**<2:0>) 111 = Seven Wait states • • • 100 = Four Wait states **(200-252 MHz)** 011 = Reserved 010 = Two Wait states **(133-200 MHz)** 001 = One Wait state **(66-133 MHz)** 000 = Zero Wait states **(0-66 MHz)** **Note:** Wait states listed are for ECC enabled.
Core Instruction Execution	
On PIC32MX devices, the CPU can execute MIPS16e instructions and uses a 16-bit instruction set, which reduces memory size. **MIPS16e®**	On PIC32MZ EF devices, the CPU can operate a mode called microMIPS. microMIPS mode is an enhanced MIPS32® instruction set that uses both 16-bit and 32-bit opcodes. This mode of operation reduces memory size with minimum performance impact. **microMIPS™** The BOOTISA (DEVCFG0<6>) Configuration bit controls the MIPS32 and microMIPS modes for boot and exception code. 1 = Boot code and Exception code is MIPS32® (ISAONEXC bit is set to '0' and the ISA<1:0> bits are set to '10' in the CP0 Config3 register) 0 = Boot code and Exception code is microMIPS™ (ISAONEXC bit is set to '1' and the ISA<1:0> bits are set to '11' in the CP0 Config3 register)

A.4 Resets

The PIC32MZ EF family of devices has updated the resets modules to incorporate the new handling of NMI resets from the WDT, DMT, and the FSCM. In addition, some bits have been moved, as summarized in Reset Differences.

TABLE A-5: RESET DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Power Reset	
	The VREGS bit, which controls whether the internal regulator is enabled in Sleep mode, has been moved from RCON in PIC32MX5XX/6XX/7XX devices to a new PWRCON register in PIC32MZ EF devices.
VREGS (**RCON<8>**) 1 = Regulator is enabled and is on during Sleep mode 0 = Regulator is disabled and is off during Sleep mode	VREGS (**PWRCON<0>**) 1 = Voltage regulator will remain active during Sleep 0 = Voltage regulator will go to Stand-by mode during Sleep
Watchdog Timer Reset	
On PIC32MX devices, a WDT expiration immediately triggers a device reset.	On PIC32MZ EF devices, the WDT expiration now causes a NMI. The WDTO bit in RNMICON indicates that the WDT caused the NMI. A new timer, NMICNT, runs when the WDT NMI is triggered, and if it expires, the device is reset.
WDT expiration immediately causes a device reset.	**WDT expiration causes a NMI, which can then trigger the device reset.** **WDTO (RNMICON<24>)** **1 = WDT time-out has occurred and caused a NMI** **0 = WDT time-out has not occurred** **NMICNT<7:0> (RNMICON<7:0>)**

A.5 USB

The PIC32MZ EF family of devices has a new Hi-Speed USB module, which requires the updated USB stack from Microchip. In addition, the USB PLL was also updated. See **A.1 "Oscillator and PLL Configuration"** for more information and USB Differences for a list of additional differences.

TABLE A-6: USB DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Debug Mode	
On PIC32MX devices, when stopping on a breakpoint during debugging, the USB module can be configured to stop or continue execution from the Freeze Peripherals dialog in MPLAB X IDE.	On PIC32MZ EF devices, the USB module continues operating when stopping on a breakpoint during debugging.
VBUSON Pin	
PIC32MX devices feature a VBUSON pin for controlling the external transceiver power supply.	On PIC32MZ EF devices, the VBUSON pin is not available. A port pin can be used to achieve the same functionality.

A.6 DMA

The DMA controller in PIC32MZ EF devices is similar to the DMA controller in PIC32MX5XX/6XX/7XX devices. New features include the extension of pattern matching to two by bytes and the addition of the optional Pattern Ignore mode. DMA Differences lists differences (indicated by **Bold** type) that will affect software migration.

TABLE A-7: DMA DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Read/Write Status on Error	
RDWR (DMASTAT<**3**>) 1 = Last DMA bus access when an error was detected was a read 0 = Last DMA bus access when an error was detected was a write	The RDWR bit has moved from DMASTAT<3> in PIC32MX5XX/6XX/7XX devices to DMASTAT<31> in PIC32MZ EF devices. RDWR (DMASTAT<**31**>) 1 = Last DMA bus access when an error was detected was a read 0 = Last DMA bus access when an error was detected was a write
Source-to-Destination Transfer	
On PIC32MX devices, a DMA channel performs a read of the source data and completes the transfer of this data into the destination address before it is ready to read the next data from the source.	On PIC32MZ EF devices, the DMA implements a 4-deep queue for data transfers. A DMA channel reads the source data and places it into the queue, regardless of whether previous data in the queue has been delivered to the destination address.

A.7 Interrupts and Exceptions

The key difference between Interrupt Controllers in PIC32MX5XX/6XX/7XX devices and PIC32MZ EF devices concerns vector spacing. Previous PIC32MX devices had fixed vector spacing, which is adjustable in set increments, and every interrupt had the same amount of space. PIC32MZ EF devices replace this with a variable offset spacing, where each interrupt has an offset register to determine where to begin execution.

In addition, the IFSx, IECx, and IPCx registers for old peripherals have shifted to different registers due to new peripherals. Please refer to **7.0 "CPU Exceptions and Interrupt Controller"** to determine where the interrupts are now located.

Interrupt Differences lists differences (indicated by **Bold** type) in the registers that will affect software migration.

TABLE A-8: INTERRUPT DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Vector Spacing	
On PIC32MX devices, the vector spacing was determined by the VS field in the CPU core. **VS<4:0> (IntCtl<9:5>: CP0 Register 12, Select 1)** **10000 = 512-byte vector spacing** **01000 = 256-byte vector spacing** **00100 = 128-byte vector spacing** **00010 = 64-byte vector spacing** **00001 = 32-byte vector spacing** **00000 = 0-byte vector spacing**	On PIC32MZ EF devices, the vector spacing is variable and determined by the Interrupt controller. The VOFFx<17:1> bits in the OFFx register are set to the offset from EBASE where the interrupt service routine is located. **VOFFx<17:1> (OFFx<17:1>)** **Interrupt Vector 'x' Address Offset bits**
Shadow Register Sets	
On PIC32MX devices, there was one shadow register set which could be used during interrupt processing. Which interrupt priority could use the shadow register set was determined by the FSRSSEL field in DEVCFG3 and SS0 on INTCON. **FSRSSEL<2:0> (DEVCFG3<18:16>)** **111 = Assign Interrupt Priority 7 to a shadow register set** **110 = Assign Interrupt Priority 6 to a shadow register set** • • • **001 = Assign Interrupt Priority 1 to a shadow register set** **000 = All interrupt priorities are assigned to a shadow register set** SS0 (**INTCON<16>**) 1 = Single vector is presented with a shadow register set 0 = Single vector is not presented with a shadow register set	On PIC32MZ EF devices, there are seven shadow register sets, and each priority level can be assigned a shadow register set to use via the PRIxSS<3:0> bits in the PRISS register. The SS0 bit is also moved to PRISS<0>. **PRIxSS<3:0> PRISS<y:z>** **1xxx = Reserved (by default, an interrupt with a priority level of x uses Shadow Set 0)** **0111 = Interrupt with a priority level of x uses Shadow Set 7** **0110 = Interrupt with a priority level of x uses Shadow Set 6** • • • **0001 = Interrupt with a priority level of x uses Shadow Set 1** **0000 = Interrupt with a priority level of x uses Shadow Set 0** SS0 (**PRISS<0>**) 1 = Single vector is presented with a shadow register set 0 = Single vector is not presented with a shadow register set
Status	
PIC32MX devices, the VEC<5:0> bits show which interrupt is being serviced. **VEC<5:0> (INTSTAT<5:0>)** 11111-00000 = The interrupt vector that is presented to the CPU	On PIC32MZ EF devices, the SIRQ<7:0> bits show the IRQ number of the interrupt last serviced. **SIRQ<7:0> (INTSTAT<7:0>)** 11111111-00000000 = The last interrupt request number serviced by the CPU

A.8 Flash Programming

The PIC32MZ EF family of devices incorporates a new Flash memory technology. Applications ported from PIC32MX5XX/6XX/7XX devices that take advantage of Run-time Self Programming will need to adjust the Flash programming steps to incorporate these changes.

Flash Programming Differences lists the differences (indicated by **Bold** type) that will affect software migration.

TABLE A-9: FLASH PROGRAMMING DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Program Flash Write Protection	
On PIC32MX devices, the Program Flash write-protect bits are part of the Flash Configuration words (DEVCFG0). PWP<**7**:0> (**DEVCFG0<19:12>**) 11111111 = Disabled 11111110 = 0xBD000FFF 11111101 = 0xBD001FFF 11111100 = 0xBD002FFF 11111011 = 0xBD003FFF 11111010 = 0xBD004FFF 11111001 = 0xBD005FFF 11111000 = 0xBD006FFF 11110111 = 0xBD007FFF 11110110 = 0xBD008FFF 11110101 = 0xBD009FFF 11110100 = 0xBD00AFFF 11110011 = 0xBD00BFFF 11110010 = 0xBD00CFFF 11110001 = 0xBD00DFFF 11110000 = 0xBD00EFFF 11101111 = 0xBD00FFFF • • • 01111111 = 0xBD07FFFF	On PIC32MZ EF devices, the write-protect register is contained separately as the NVMPWP register. It has been expanded to 24 bits, and now represents the address below, which all Flash memory is protected. Note that the lower 14 bits are forced to zero, so that all memory locations in the page are protected. PWP<**23**:0> (**NVMPWP<23:0>**) Physical memory below address 0x1Dxxxxxx is write protected, where 'xxxxxx' is specified by PWP<23:0>. When PWP<23:0> has a value of '0', write protection is disabled for the entire program Flash. If the specified address falls within the page, the entire page and all pages below the current page will be protected.
Code Protection	
On PIC32MX devices, code protection is enabled by the CP (**DEVCFG**<28>) bit.	On PIC32MZ EF devices, code protection is enabled by the CP (**DEVCP0**<28>) bit.
Boot Flash Write Protection	
On PIC32MX devices, Boot Flash write protection is enable by the **BWP (DEVCFG<24>)** bit and protects the entire Boot Flash memory.	On PIC32MZ EF devices, Boot Flash write protection is divided into pages and is enable by the **LBWPx** and **UBWPx** bits in the **NVMBWP** register.
Low-Voltage Detect Status	
LVDSTAT (NVMCON<11>) 1 = Low-voltage event is active 0 = Low-voltage event is not active	The LVDSTAT bit is not available in PIC32MZ EF devices.

TABLE A-9: FLASH PROGRAMMING DIFFERENCES (CONTINUED)

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Flash Programming	
	The op codes for programming the Flash memory have been changed to accommodate the new quad-word programming and dual-panel features. The row size has changed to 2 KB (512 IW) from 128 IW. The page size has changed to 16 KB (4K IW) from 4 KB (1K IW). Note that the NVMOP register is now protected, and requires the WREN bit be set to enable modification.
NVMOP<3:0> (NVMCON<3:0>) 1111 = Reserved • • • **0111 = Reserved** **0110 = No operation** **0101 = Program Flash (PFM) erase operation** 0100 = Page erase operation 0011 = Row program operation **0010 = No operation** 0001 = Word program operation 0000 = No operation	NVMOP<3:0> (NVMCON<3:0>) 1111 = Reserved • • • 1000 = Reserved **0111 = Program erase operation** **0110 = Upper program Flash memory erase operation** **0101 = Lower program Flash memory erase operation** 0100 = Page erase operation 0011 = Row program operation **0010 = Quad Word (128-bit) program operation** 0001 = Word program operation 0000 = No operation
PIC32MX devices feature a single NVMDATA register for word programming. NVMDATA	On PIC32MZ EF devices, to support quad word programming, the NVMDATA register has been expanded to four words. NVMDATA**x**, where 'x' = 0 through 3
Flash Endurance and Retention	
PIC32MX devices support Flash endurance and retention of up to 20K E/W cycles and 20 years.	On PIC32MZ EF devices, ECC must be enabled to support the same endurance and retention as PIC32MX devices.
Configuration Words	
On PIC32MX devices, Configuration Words can be programmed with **Word or Row program** operation.	On PIC32MZ EF devices, all Configuration Words must be programmed with **Quad Word or Row Program** operations.
Configuration Words Reserved Bit	
On PIC32MX devices, the **DEVCFG0<15>** bit is Reserved and must be programmed to '0'.	On PIC32MZ EF devices, this bit is **DEVSIGN0<31>**.

A.9 Other Peripherals and Features

Most of the remaining peripherals on PIC32MZ EF devices act identical to their counterparts on PIC32MX-5XX/6XX/7XX devices. The main differences have to do with handling the increased peripheral bus clock speed and additional clock sources.

Peripheral Differences lists the differences (indicated by **Bold** type) that will affect software and hardware migration.

TABLE A-10: PERIPHERAL DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
I^2C	
On PIC32MX devices, all pins are 5V-tolerant.	On PIC32MZ EF devices, the I2C4 port uses non-5V tolerant pins, and will have different VOL/VOH specifications.
I2CxBRG<**11**:0>	The Baud Rate Generator register has been expanded from 12 bits to 16 bits. I2CxBRG<**15**:0>
Watchdog Timer	
Clearing the Watchdog Timer on PIC32MX5XX/6XX/7XX devices required writing a '1' to the WDTCLR bit. **WDTCLR** (WDTCON<**0**>)	On PIC32MZ EF devices, the WDTCLR bit has been replaced with the 16-bit WDTCLRKEY, which must be written with a specific value (0x5743) to clear the Watchdog Timer. In addition, the WDTSPGM (DEVCFG1<21>) bit is used to control operation of the Watchdog Timer during Flash programming. **WDTCLRKEY<15:0>** (WDTCON<**31:16**>)
RTCC	
On PIC32MX devices, the output of the RTCC pin was selected between the Seconds Clock or the Alarm Pulse. RTCSECSEL (RTCCON<7>) 1 = RTCC Seconds Clock is selected for the RTCC pin 0 = RTCC Alarm Pulse is selected for the RTCC pin	On PIC32MZ EF devices, the RTCC Clock is added as an option. RTCSECSEL has been renamed RTCOUTSEL and expanded to two bits. **RTCOUTSEL<1:0>** (RTCCON<**8:**7>) **11 = Reserved** **10 = RTCC Clock is presented on the RTCC pin** 01 = Seconds Clock is presented on the RTCC pin 00 = Alarm Pulse is presented on the RTCC pin when the alarm interrupt is triggered
On PIC32MX devices, the Secondary Oscillator (SOSC) serves as the input clock for the RTCC module.	On PIC32MZ EF devices, an additional clock source, LPRC, is available as a choice for the input clock. **RTCCLKSEL<1:0> (RTCCON<10:9>)** **11 = Reserved** **10 = Reserved** **01 = RTCC uses the external 32.768 kHz SOSC** **00 = RTCC uses the internal 32 kHz oscillator (LPRC)**

TABLE A-10: PERIPHERAL DIFFERENCES (CONTINUED)

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
Ethernet	
	On PIC32MZ EF devices, the input clock divider for the Ethernet module has expanded options to accommodate the faster peripheral bus clock.
CLKSEL<3:0> (EMAC1MCFG<5:2>) 1000 = SYSCLK divided by 40 0111 = SYSCLK divided by 28 0110 = SYSCLK divided by 20 0101 = SYSCLK divided by 14 0100 = SYSCLK divided by 10 0011 = SYSCLK divided by 8 0010 = SYSCLK divided by 6 000x = SYSCLK divided by 4	CLKSEL<3:0> (EMAC1MCFG<5:2>) **1010 = PBCLK5 divided by 50** **1001 = PBCLK5 divided by 48** 1000 = PBCLK5 divided by 40 0111 = PBCLK5 divided by 28 0110 = PBCLK5 divided by 20 0101 = PBCLK5 divided by 14 0100 = PBCLK5 divided by 10 0011 = PBCLK5 divided by 8 0010 = PBCLK5 divided by 6 000x = PBCLK5 divided by 4
Comparator/Comparator Voltage Reference	
On PIC32MX devices, it was possible to select the VREF+ pin as the output to the CVREFOUT pin. VREFSEL (CVRCON<10>) 1 = CVREF = VREF+ 0 = CVREF is generated by the resistor network	On PIC32MZ EF devices, the CVREFOUT pin must come from the resistor network. This bit is not available.
On PIC32MX devices, the internal voltage reference (IVREF) could be chosen by the BGSEL<1:0> bits. BGSEL<1:0> (CVRCON<9:8>) 11 = IVREF = VREF+ 10 = Reserved 01 = IVREF = 0.6V (nominal, default) 00 = IVREF = 1.2V (nominal)	On PIC32MZ EF devices, IVREF is fixed and cannot be changed. These bits are not available.
Change Notification	
On PIC32MX devices, Change Notification is controlled by the **CNCON, CNEN, and CNPUE** registers.	On PIC32MZ EF devices, Change Notification functionality has been relocated into each I/O port and is controlled by the **CNPUx, CNPDx, CNCONx, CNENx, and CNSTATx** registers.
System Bus	
On PIC32MX devices, the System Bus registers can be used to configure RAM memory for data and program memory partitions, cacheability of Flash memory, and RAM Wait states. These registers are: **BMXCON, BMXDKPBA, BMXDUDBA, BMXDUPBA, BMXPUPBA, BMXDRMSZ, BMXPFMSZ, and BMXBOOTSZ.**	On PIC32MZ EF devices, a new System Bus is utilized that supports using RAM memory for program or data without the need for special configuration. Therefore, no special registers are associated with the System Bus to configure these features.
On PIC32MX devices, various arbitration modes are used as initiators on the System Bus. These modes can be selected by the **BMXARB<2:0> (BMXCON<2:0>)** bits.	On PIC32MZ EF devices, a new arbitration scheme has been implemented on the System Bus. All initiators use the Least Recently Serviced (LRS) scheme, with the exception of the DMA, CPU, and the Flash Controller. The Flash Controller always has High priority over LRS initiators. The DMA and CPU (when servicing an interrupt) can be selected to have LRS or High priority using the **DMAPRI (CFGCON<25>)** and **CPUPRI (CFGCON<24>)** bits.

A.10 Package Differences

In general, PIC32MZ EF devices are mostly pin compatible with PIC32MX5XX/6XX/7XX devices; however, some pins are not. In particular, the VDD and VSS pins have been added and moved to different pins. In addition, I/O functions that were on fixed pins now will largely be on remappable pins.

TABLE A-11: PACKAGE DIFFERENCES

PIC32MX5XX/6XX/7XX Feature	PIC32MZ EF Feature
VCAP Pin	
On PIC32MX devices, an external capacitor is required between a VCAP pin and GND, which provides a filtering capacitor for the internal voltage regulator.	On PIC32MZ EF devices, this requirement has been removed.
A low-ESR capacitor (typically 10 µF) is required on the VCAP pin.	No VCAP pin.
VDD and VSS Pins	
	There are more VDD pins on PIC32MZ EF devices, and many are located on different pins.
VDD on 64-pin packages: 10, 26, 38, 57 VDD on 100-pin packages: 2, 16, 37, 46, 62, 86	VDD on 64-pin packages: 8, 26, 39, 54, 60 VDD on 100-pin packages: 14, 37, 46, 62, 74, 83, 93
	There are more VSS pins on PIC32MZ EF devices, and many are located on different pins.
VSS on 64-pin packages: 9, 25, 41 VSS on 100-pin packages: 15, 36, 45, 65, 75	VSS on 64-pin packages: 7, 25, 35, 40, 55, 59 VSS on 100-pin packages: 13, 36, 45, 53, 63, 75, 84, 92
PPS I/O Pins	
	Peripheral functions on PIC32MZ EF devices are now routed through a PPS module, which routes the signals to the desired pins. When migrating software, it is necessary to initialize the PPS I/O functions in order to get the signal to and from the correct pin.
All peripheral functions are fixed as to what pin upon which they operate.	PPS functionality for the following peripherals: • CAN • UART • SPI (except SCK) • Input Capture • Output Compare • External Interrupt (except INT0) • Timer Clocks (except Timer1) • Reference Clocks (except REFCLK2)

APPENDIX B: MIGRATING FROM PIC32MZ EC TO PIC32MZ EF

This appendix provides an overview of considerations for migrating from PIC32MZ EC devices to the PIC32MZ EF family of devices. The code developed for PIC32MZ EC devices can be ported to PIC32MZ EF devices after making the appropriate changes outlined in the following sections.

The PIC32MZ EF devices are similar to PIC32MZ EC devices, with many feature improvements and new capabilities.

B.1 Oscillator and PLL Configuration

A number of new features have been added to the oscillator and PLL to enhance their ability to work with crystals and to change frequencies.

Oscillator Differences summarizes the differences (indicated by **Bold** type) between the family differences for the oscillator.

TABLE B-1: OSCILLATOR DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
Primary Oscillator Crystal Power	
On PIC32MZ EC devices, the crystal HS POSC mode is only functional with crystals that have certain characteristics, such as very low ESR.	On PIC32MZ EF devices, some DEVCFG0 bits have been added to allow control over the strength of the oscillator and to add a kick start boost. POSCBOOST (DEVCFG0<21>) 1 = Boost the kick start of the oscillator 0 = Normal start of the oscillator POSCGAIN<1:0> (DEVCFG0<20:19>) 11 = 2x gain setting 10 = 1.5x gain setting 01 = 0.5x gain setting 00 = 1x gain setting Note that the default for POSCGAIN (2x gain setting) may overdrive crystals and shorten their life. It is the responsibility of the designer to ensure crystals are operated properly.
Secondary Oscillator Crystal Power	
On PIC32MZ EC devices, the Secondary Oscillator (SOSC) is not functional.	On PIC32MZ EF devices, the Secondary Oscillator is now functional, and provides similar strength and kick start boost features as the POSC. SOSCBOOST (DEVCFG0<18>) 1 = Boost the kick start of the oscillator 0 = Normal start of the oscillator SOSCGAIN<1:0> (DEVCFG0<17:16>) 11 = 2x gain setting 10 = 1.5x gain setting 01 = 0.5x gain setting 00 = 1x gain setting Note that the default for SOSCGAIN (2x gain setting) may overdrive crystals and shorten their life. It is the responsibility of the designer to ensure crystals are operated properly.
Clock Status Bits	
On PIC32MZ EC devices, the SOSCRDY bit (OSCCON<22>) indicates when the Secondary Oscillator is ready. There are no indications of other oscillator status.	A new register, CLKSTAT, has been added, which includes the SOSCRDY bit (CLKSTAT<4>). In addition, new status bits are available: • LPRCRDY (CLKSTAT<5>) • POSCRDY (CLKSTAT<2>) • DIVSPLLRDY (CLKSTAT<1>) • FRCRDY (CLKSTAT<0>)
Clock Switching	
On PIC32MZ EC devices, clock switches occur as soon as the switch command is issued. Also, the only clock sources that can be divided are the output of the PLL, and the FRC.	To reduce power spikes during clock switches, PIC32MZ EF devices add a clock slewing feature, so that clock switches can be controlled in their rate and size. The SLEWCON register controls this feature. The SLEWCON register also features a SYSCLK divider, so that all of the possible clock sources may be divided further as needed.

B.2 Analog-to-Digital Converter (ADC)

The PIC32MZ EC family features a Pipelined ADC module, while the PIC32MZ EF family of devices has an entirely new 12-bit High-Speed SAR ADC module. Nearly all registers in this new ADC module differ from the registers in PIC32MZ EC devices. Due to this difference, code will not port from PIC32MZ EC devices to PIC32MZ EF devices. ADC Differences lists some of the differences in registers to note to adapt code as quickly as possible.

TABLE B-2: ADC DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
Clock Selection and Operating Frequency (TAD)	
On PIC32MZ EC devices, there are three possible sources of the ADC clock: FRC, REFCLKO3, and SYSCLK.	On PIC32MZ EF devices, there are four sources for the ADC clock. In addition to the ones for PIC32MZ EC, PBCLK4 is added as a source. Also, the clock source selection is in a different register.
ADCSEL<1:0> (AD1CON1<9:8>) 11 = FRC 10 = REFCLKO3 01 = SYSCLK 00 = Reserved	ADCSEL<1:0> (ADCCON3<31:30>) 11 = FRC 10 = REFCLKO3 01 = SYSCLK **00 = PBCLK4**
Scan Trigger Sources	
On PIC32MZ EC devices, there are 10 available trigger sources for starting ADC sampling and conversion.	On PIC32MZ EF devices, two new sources have been added. One is a shared trigger source (STRIG). The other is a Global Level Software Trigger (GLSWTRG). With the GLSWTRG, the conversions continue until the bit is cleared in software.
STRGSRC<4:0> (AD1CON1<26:22>) 11111 = Reserved • • • 01101 = Reserved 01100 = Comparator 2 COUT 01011 = Comparator 1 COUT 01010 = OCMP5 01001 = OCMP3 01000 = OCMP1 00111 = TMR5 match 00110 = TMR3 match 00101 = TMR1 match 00100 = INT0 **00011 = Reserved** **00010 = Reserved** 00001 = Global Software Trigger (GSWTRG) 00000 = No trigger	TRGSRC<4:0> (ADCTRGx<y:z>) 11111 = Reserved • • • 01101 = Reserved 01100 = Comparator 2 COUT 01011 = Comparator 1 COUT 01010 = OCMP5 01001 = OCMP3 01000 = OCMP1 00111 = TMR5 match 00110 = TMR3 match 00101 = TMR1 match 00100 = INT0 **00011 = STRIG** **00010 = Global Level Software Trigger (GLSWTRG)** 00001 = Global Software Trigger (GSWTRG) 00000 = No trigger
Debug Mode	
On PIC32MZ EC devices, the ADC module continues operating when stopping on a breakpoint during debugging.	On PIC32MZ EF devices, the ADC module will stop during debugging when stopping on a breakpoint.
Electrical Specifications and Timing Requirements	
Refer to the **"Electrical Characteristics"** chapter in the PIC32MZ EC data sheet for ADC module specifications and timing requirements.	On PIC32MZ EF devices, the ADC module sampling and conversion time and other specifications have changed. Refer to **37.0 "Electrical Characteristics"** for more information.
ADC Calibration	

TABLE B-2: ADC DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
PIC32MZ EC devices require calibration values be copied into the AD1CALx registers before turning on the ADC. These values come from the DEVADCx registers.	PIC32MZ EF devices also require ADC calibration values, but the destination registers are named ADCxCAL.

B.3 CPU

The CPU in PIC32MZ EC devices is the microAptiv™ MPU architecture. The CPU in the PIC32MZ EF devices is the Series 5 Warrior M-Class M5150 MPU architecture. Most PIC32MZ EF M-Class core features are identical to the microAptiv™ core in PIC32MZ EC devices. The main differences are that in PIC32MZ EF devices, a floating-point unit (FPU) is included for improved math performance, and PC Sampling for performance measurement.

B.4 System Bus

The system bus on PIC32MZ EF devices is similar to the system bus on PIC32MZ EC devices. There are two key differences listed in System Bus Differences.

TABLE B-3: SYSTEM BUS DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
Permission Groups during NMI	
On PIC32MZ EC devices, the permission group in which the CPU is part of is lost during NMI handling, and must be manually restored.	On PIC32MZ EF devices, the prior permission group is preserved, and is restored when the CPU returns from the NMI handler.
DMA Access	
The DMA can access the peripheral registers on Peripheral Bus 1.	On PIC32MZ EF devices, the DMA no longer has access to registers on Peripheral Bus 1. Refer to Initiators to Targets Access Association for details on which peripherals are now excluded.

B.5 Flash Controller

The Flash controller on PIC32MZ EF devices adds the ability both to control boot Flash aliasing, and for locking the current swap settings. Flash Controller Differences lists theses differences.

TABLE B-4: FLASH CONTROLLER DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
Boot Flash Aliasing	
On PIC32MZ EC devices, Boot Flash aliasing is done through the DEVSEQ0 register, but no further changes are possible without rebooting the processor.	On PIC32MZ EF devices, the initial Boot Flash aliasing is determined by the DEVSEQ3 register, but the BFSWAP bit (NVMCON<6>) reflects the state of the aliasing, and can be modified to change it during run-time. BFSWAP (NVMCON<6>) 1 = Boot Flash Bank 2 is mapped to the lower boot alias, and Boot Flash bank 1 is mapped to the upper boot alias 0 = Boot Flash Bank 1 is mapped to the lower boot alias, and Boot Flash Bank 2 is mapped to the upper boot alias
PFM and BFM Swap Locking	
On PIC32MZ EC devices, the swapping of PFM is always available.	On PIC32MZ EF devices, a new control, SWAPLOCK<1:0> (NVMCON2<7:6>) allows the locking of PFSWAP and BFSWAP bits, and can restrict any further changes. SWAPLOCK<1:0> (NVMCON2<7:6>) 11 = PFSWAP and BFSWAP are not writable and SWAPLOCK is not writable 10 = PFSWAP and BFSWAP are not writable and SWAPLOCK is writable 01 = PFSWAP and BFSWAP are not writable and SWAPLOCK is writable 00 = PFSWAP and BFSWAP are writable and SWAPLOCK is writable

B.6 Resets

On PIC32MZ EF devices, the Reset module adds eight bits to the NMICNT field to make the time-out period before device Reset longer, as described in Resets Differences.

TABLE B-5: RESETS DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
Countdown to Reset During NMIs	
On PIC32MZ EC devices, the NMICNT<7:0> field is eight bits long, giving a maximum of 256 instructions before the device Reset.	On PIC32MZ EF devices, the NMICNT<15:0> field is now 16 bits long, giving a longer period of time (up to 65,536 instructions) prior to a device Reset.

B.7 USB

On PIC32MZ EF devices, a new USBCRCON register has been added to assist in controlling the reset of the USB module, and triggering interrupts based on VBUS voltage levels. This register also overcomes an errata on PIC32MZ EC devices that requires a three second start-up on the USB module.

B.8 I/O Ports

On PIC32MZ EF devices, many of the I/O pins now feature slew rate control bits to control how fast the pin makes a low-to-high or high-to-low transition. The Change Notification feature has also been enhanced to allow detection of level events in addition to edge detection. However, the SIDL bit is not present in the CNCONx registers on PIC32MZ EF devices, as it is on PIC32MZ EC devices.

B.9 Watchdog Timer

PIC32MZ EF devices use a new Watchdog Timer, although the overall control through the DEVCFGx words remains identical to that of PIC32MZ EC devices. Watchdog Timer Differences lists two more changes, as well.

TABLE B-6: WATCHDOG TIMER DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
Watchdog Timer Postscaler	
On PIC32MZ EC devices, the SWDTPS<4:0> bits (WDTCON<6:2>) reflect the postscaler setting for the Watchdog Timer.	On PIC32MZ EF devices, the field has been changed to the RUNDIV<4:0> bits (WDTCON<12:8>).
Watchdog Windowed Mode	
On PIC32MZ EC devices, WDTWINEN is at bit position 1 (WDTCON<1>).	On PIC32MZ EF devices, WDTWINEN is now at bit position 0 (WDTCON<0>).

B.10 Serial Quad Interface (SQI)

On PIC32MZ EF devices, the SQI module has been updated with the following features:

- FIFOs can be reset through the CONFIFORST (SQI1CFG<19>), RXFIFORST (SQI1CFG<18>), and TXFIFORST (SQI1CFG<17>) bits in Register 20-3
- A new Flash Status check is available, which will allow the SQI to automatically query the status of the external device during write/erase operations without software intervention. See the SCHECK bit (SQI1CON<24>) and the SQI1MEMSTAT register (Register 20-4 and Register 20-24, respectively).
- The SQI clock divider bits have been expanded, and can use an undivided clock. See the CLKDIV<10:0> bits (SQI1CLKCON<18:8>) in Register 20-5.
- A new DMA Bus Error Interrupt is available through the DMAEIE (SQI1INTEN<11>), DMAEIF (SQI1INTSTAT<11>), and DMAEISE (SQI1INTSIGEN<11>) bits in Register 20-8, Register 20-9, and Register 20-22, respectively
- The SQI1STAT2 register (see Register 20-13) has two new fields:
  - CMDSTAT<1:0> (SQI1STAT2<17:16>) indicates the current command status
  - CONAVAIL<4:0> (SQI1STAT<11:8>) indicates how many spaces are available in the Control FIFO.
- The TAP Controller within the SQI can be configured for various timing requirements via the SQI1TAPCON register (Register 20-23)
- Two new XIP mode registers (SQI1XCON3 and SQI1XCON4) have been added for additional command sequencing (see Register 20-25 and Register 20-26, respectively)

Refer to **20.0 “Serial Quad Interface (SQI)”** and **Section 46. “Serial Quad Interface (SQI)”** (DS60001128) for more information.

B.11 PMP

On PIC32MZ EF devices, the PMP features the ability to buffer reads and writes in both directions, and can read and write from different addresses. Refer to **23.0 “Parallel Master Port (PMP)”** and **Section 43. “Parallel Master Port”** (DS60001346) for information.

B.12 Crypto Engine

Crypto Differences lists the changes available for the Crypto Engine.

TABLE B-7: CRYPTO DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
Output Data Format	
On PIC32MZ EC devices, the output of the Crypto Engine is always in big-endian format, usually requiring a software (or DMA) solution to put the data into little-endian format, which the core handles natively.	On PIC32MZ EF devices, the SWAPOEN bit (CECON<7>) has been added to control output byte swapping. This bit, when enabled, will byte-swap the output.

B.13 Device Configuration and Control

A number of enhancements have been added to the PIC32MZ EF devices that allow greater control and flexibility on the device. Some bit fields have also changed location. Device Configuration and Control Differences lists these changes.

TABLE B-8: DEVICE CONFIGURATION AND CONTROL DIFFERENCES

PIC32MZ EC Feature	PIC32MZ EF Feature
MCLR Pin Configuration	
On PIC32MZ EC devices, the MCLR pin always generate a system reset.	On PIC32MZ EF devices, the $\overline{\text{MCLR}}$ pin can now be configured to generate either a system Reset or an emulated POR Reset. SMCLR (DEVCFG0<15>) 1 = MCLR pin generates a normal system Reset 0 = MCLR pin generates an emulated POR Reset
I/O Analog Charge Pump	
Low VDD environments cause attenuation of analog inputs.	A new bit enables an I/O charge pump, which improves analog performance when operating at lower VDD. IOANCPEN (CFGCON<7>) 1 = Charge pump is enabled 0 = Charge pump is disabled
EBI Ready Pin Control	
EBIRDYINV<3:1> (CFGEBIC<30:28>) EBIRDYEN<3:1> (CFGEBIC<26:24>)	The EBIRDY control bits have been moved. EBIRDYINV<3:1> (CFGEBIC<31:29>) EBIRDYEN<3:1> (CFGEBIC<27:25>)
Boot Flash Sequence Control	
On PIC32MZ EC devices, the Boot Flash Sequence (specifying which boot memory was mapped to the lower boot alias) was determined with the BFxSEQ0 registers.	On PIC32MZ EF devices, the Boot Flash Sequence has been moved to the BFxSEQ3 register.

APPENDIX C: REVISION HISTORY

Revision A (January 2015)

This is the initial released version of the document.

Revision B (July 2015)

The document status was updated from Advance Information to Preliminary.

The revision includes the following major changes, which are referenced by their respective chapter in Major Section Updates.

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE C-1: MAJOR SECTION UPDATES

Section Name	Update Description
32-bit MCUs (up to 2 MB Live-Update Flash and 512 KB SRAM) with FPU, Audio and Graphics Interfaces, HS USB, Ethernet, and Advanced Analog	The Operating Conditions were updated to: 2.1V to 3.6V.
4.0 "Memory Organization"	Legal information on the System Bus was added (see **4.2 "System Bus Arbitration"**).
5.0 "Flash Program Memory"	The BOOTSWAP bit in the NVMCON register was changed to: BFSWAP (see Register 5-1).
6.0 "Resets"	The NVMLTA bit was removed from the RCON register (see Register 6-1). The GNMI bit was added to the RNMICON register (see Register 6-3).
7.0 "CPU Exceptions and Interrupt Controller"	The ADC FIFO Data Ready Interrupt, IRQ 45, was added (see Table 7-2). ADC FIFO bits were added, and Note 7 regarding devices without a Crypto module was added to the Interrupt Register Map (see Table 7-3). The NMIKEY<7:0> bits were added to the INTCON register (see Register 7-1).
8.0 "Oscillator Configuration"	The SPLLRDY bit was removed and the SPLLDIVRDY bit was added to the CLKSTAT register (see Register 8-8
11.0 "Hi-Speed USB with On-The-Go (OTG)"	The VBUSIE and VBUSIF bits were changed to: VBUSERRIE and VBUSERRIF, respectively in the USBCSR2 register (see Register 11-3).
15.0 "Deadman Timer (DMT)"	The POR values were updated for the PSCNT<4:0> bits in the Post Status Configure DMT Count Status register (see Register 15-6). The POR values were updated for the PSINTV<2:0> bits in the Post Status Configure DMT Interval Status register (see Register 15-7).
16.0 "Watchdog Timer (WDT)"	The WDTCON register was updated (see Register 16-1).
23.0 "Parallel Master Port (PMP)"	The PMDOUT, PMDIN, and PMRDIN registers were added (see Register 23-4, Register 23-4, and Register 23-10). The PMADDR, PMWADDR, and PMRADDR registers were updated (see Register 23-3, Register 23-8, and Register 23-9). The PMRDATA register was removed.
24.0 "External Bus Interface (EBI)"	Reset values for the EBIMSK2, EBIMSK3, EBISMT0-EBISMT2, and EBIFTRPD registers were updated in the EBI Register Map (see Table 24-2). POR value changes were implemented to the EBI Static Memory Timing Register (see Register 24-3).

TABLE C-1: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
27.0 "Random Number Generator (RNG)"	The TRNGMODE bit was added to the RNGCON register (see Register 27-2).
28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"	The S&H Block Diagram was updated (see Figure 28-2). The registers, ADCTRG4 through ADCTRG8, were removed. The bit value definitions for the ADCSEL<1:0> and CONCLKDIV<5:0> bits in the ADCCON3 register were updated (see Register 28-3). The bit names in the ADC Status registers (Register 28-12 and Register 28-13) were updated to match the names in the SFR summary table. The ADCTRGSNS register was updated (see Register 28-26). The POR values were changed in the ADC System Configuration registers (see Register 28-34 and Register 28-35).
34.0 "Special Features"	The FDBGWP bit was removed from the DEVCFG0/ADEVCFG0 registers (see Register 34-3).
37.0 "Electrical Characteristics"	V-Temp (-40°C £ TA £ +105°C) information was removed from all tables. The operating conditions voltage range was updated in the Absolute Maximum Ratings and in all tables to: 2.1V to 3.6V. Notes on Maximum value operating conditions were added to the Operating, Idle, and Power-Down Current tables (see Table 37-6, Table 37-7, and Table 37-8, respectively). The conditions for System Timing Requirement parameters OS55a and OS55b were updated (see Table 37-18). The Internal FRC Accuracy specifications were updated (see Table 37-20). The Internal LPRC Accuracy specifications were updated (see Table 37-21). The ADC Module Specifications were updated (see Table 37-38). The Analog-to-Digital Conversion Timing Requirements were updated (see Table 37-39).
Appendix B: "Migrating from PIC32MZ EC to PIC32MZ EF"	This appendix was added, which provides an overview of considerations for migrating from PIC32MZ EC devices to the PIC32MZ EF family of devices.
Product Identification System	V-Temp (-40°C £ TA £ +105°C) information was removed.

Revision C (March 2016)

In this revision, the Preliminary status was removed from the document footer.

The revision also includes the following major changes, which are referenced by their respective chapter in Major Section Updates. In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE C-2: MAJOR SECTION UPDATES

Section Name	Update Description
2.0 "Guidelines for Getting Started with 32-bit Microcontrollers"	**2.9.1.3 "EMI/EMC/EFT (IEC 61000-4-4 and IEC 61000-4-2) Suppression Considerations"** and Figure 2-5 were updated.
4.0 "Memory Organization"	The names of the Boot Flash Words were updated from BFxSEQ0 to BFxSEQ3 (see **4.1.1 "Boot Flash Sequence and Configuration Spaces"**). The ABFxSEQx registers were removed from the Boot Flash Sequence and Configuration tables (see Table 4-2 and Table 4-3).
7.0 "CPU Exceptions and Interrupt Controller"	The Cache Error exception type was removed from the MIPS32 M-Class Microprocessor Core Exception Types (see Table 7-1).
8.0 "Oscillator Configuration"	The PLLODIV<2:0> bit value settings were updated in the SPLLCON register (see Register 8-3).
12.0 "I/O Ports"	The SIDL bit was removed from the CNCONx registers (see Table 12-4 through Table 12-21 and Register 12-3).
20.0 "Serial Quad Interface (SQI)"	The following bits were removed from the SQI1XCON1 register (see Table 20-1 and Register 20-1): DDRDATA, DDRDUMMY, DDRMODE, DDRADDR, and DDRCMD. The DDRMODE bit was removed from the SQI1CON register (see Table 20-1 and Register 20-4).
28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"	A note was added to the SELRES<1:0> bits in the ADCCON1 and ADCxTIME registers (see Register 28-1 and Register 28-27). The ADCID<2:0 bit values were updated in the ADCFSTAT register (see Register 28-22).
34.0 "Special Features"	The bit value definitions for the POSCGAIN<1:0> and SOSCGAIN<1:0> bits were updated (see Register 34-3). The Device ADC Calibration Word (DEVADCx) register was added (see Table 34-5 and Register 34-13).

TABLE C-2: MAJOR SECTION UPDATES (CONTINUED)

Section Name	Update Description
37.0 "Electrical Characteristics"	The DC Characteristics: Operating Current (I_{DD}) and Note 6 were updated (see Table 37-6). The DC Characteristics: Idle Current (I_{IDLE}) and Note 4 were updated (see Table 37-7). Parameter DC40m and Note 5 in the DC Characteristics: Power-down Current (I_{PD}) were updated (see Table 37-8). Parameter DO50 (Cosco) was removed from the Capacitive Loading Requirements on Output Pins (see Table 37-16). The Internal FRC Accuracy and Internal LPRC conditions were updated for 125ºC (see Table 37-20 and Table 37-21). Parameter SP15 and Note 5 of the SPIx Module Master Mode Timing Requirements were updated (see Table 37-30 and Table 37-31). The Temperature Sensor Specifications were updated (see Table 37-41).
38.0 "Extended Temperature Electrical Characteristics"	New chapter for Extended Temperature devices was added.
39.0 "AC and DC Characteristics Graphs"	The Typical Temperature Sensor Voltage graph was updated (see Figure 39-7).
40.0 "Packaging Information"	The package drawings and land pattern for the 64-Lead Plastic Quad Flat, No Lead Package (MR) were updated.
Appendix A: "Migrating from PIC32MX5XX/6XX/7XX to PIC32MZ EF"	The Primary Oscillator Configuration section in the Oscillator Configuration Differences was updated (see Table A-1).
Appendix B: "Migrating from PIC32MZ EC to PIC32MZ EF"	Boot Flashing aliasing was updated for PIC32MZ EF devices (see Table B-4).

Revision D (July 2016)

This revision includes the following major changes, which are referenced by their respective chapter in Major Section Updates.

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE C-3: MAJOR SECTION UPDATES

Section Name	Update Description
32-bit MCUs (up to 2 MB Live-Update Flash and 512 KB SRAM) with FPU, Audio and Graphics Interfaces, HS USB, Ethernet, and Advanced Analog	Updated the Operating Conditions and Core MHz values. The XFBGA package was renamed to TFBGA.
20.0 "Serial Quad Interface (SQI)"	The CLKDIV<9:0> bits in the SQI1CLKCON register were updated (see Register 20-5). The THRES<4:0> bits in the SQI1THR register were updated (see Register 20-21).
37.0 "Electrical Characteristics"	The Program Flash Memory Wait States were updated (see DC Characteristics: Program Flash Memory Wait States). The minimum value for System Time Requirements parameter OS51 (when the USB module is enabled) was updated (see System Timing Requirements).
39.0 "252 MHz electrical characteristics"	This chapter was added.
Appendix A: "Migrating from PIC32MX5XX/6XX/7XX to PIC32MZ EF"	The new ADC module reference was updated (see **A.2 "Analog-to-Digital Converter (ADC)"**). ADC Calibration was added to **B.2 "Analog-to-Digital Converter (ADC)"**
Appendix B: "Migrating from PIC32MZ EC to PIC32MZ EF"	The Device Configuration and Control Differences (Device Configuration and Control Differences) were updated to include the Boot Flash Sequence. **B.10 "Serial Quad Interface (SQI)"** was updated.
Product Identification System	The Speed category was added.

Revision E (June 2018)

This revision includes the following major changes, which are referenced by their respective chapter in Table C-4.

In addition, minor updates to text and formatting were incorporated throughout the document.

TABLE C-4: MAJOR SECTION UPDATES

Section Name	Update Description
TABLE 1: "PIC32MZ EF Family Features"	144-Lead TFBGA package information was added
TABLE 6: "Pin Names for 144-pin Devices"	Table was added to describe the Pin Names and locations for the 144-Lead TFBGA package.
TABLE 1-1: "ADC Pinout I/O Descriptions" through **Table 1-22: "JTAG, Trace, and Programming/Debugging Pinout I/O Descriptions"**	144-Lead TFBGA Package Information was added.
2.11 "Considerations when Interfacing to Remotely Powered Circuits"	This section was added which provides some issues to consider when interfacing the PIC32MZ to circuits using an independent power source.
28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"	Information relating to initialization and interleaved operation and charge pump usage are added to aid in throughput calculation.
Register 34-10: "CFGPG: Permission Group Configuration Register"	A note was added to provide assistance in setting the CPU group permission value.
37.1 "DC Characteristics"	144-Lead TFBGA package thermal information was added.
41.0 "Packaging Information"	144-Lead TFBGA package information was added.
Product Identification System	144-Lead TFBGA package thermal information was added.

NOTES:

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

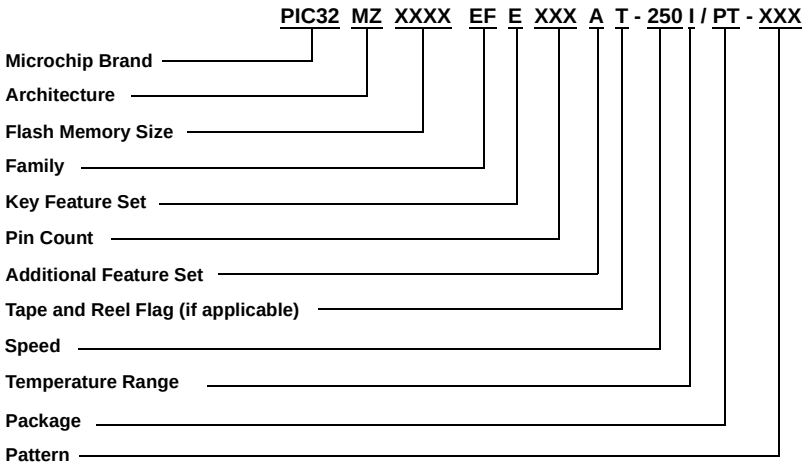
- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://microchip.com/support

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.



Example:

PIC32MZ2048EFH144-I/PT:
Embedded Connectivity PIC32,
MIPS32® M-Class MPU core,
2048 KB program memory,
144-pin, with Floating Point Unit,
Industrial temperature, TQFP package.

Flash Memory Family

Architecture	MZ	= MIPS32® M-Class MPU Core
Flash Memory Size	0512	= 512 KB
	1024	= 1024 KB
	2048	= 2048 KB
Family	EF	= Embedded Connectivity Microcontroller Family with Floating Point Unit
Key Feature	E	= PIC32 EF Family Features (no CAN, no Crypto)
	F	= PIC32 EF Family Features (CAN, no Crypto)
	G	= PIC32 EF Family Features (no CAN, no Crypto)
	H	= PIC32 EF Family Features (CAN, no Crypto)
	K	= PIC32 EF Family Features (Crypto and CAN)
	M	= PIC32 EF Family Features (Crypto and CAN)
Pin Count	064	= 64-pin
	100	= 100-pin
	124	= 124-pin
	144	= 144-pin
Speed	Blank	= Up to 200 MHz
	250	= Up to 252 MHz
Temperature Range	I	= -40°C to +85°C (Industrial)
	E	= -40°C to +125°C (Extended)
Package	MR	= 64-Lead (9x9x0.9 mm) QFN (Plastic Quad Flatpack)
	PT	= 64-Lead (10x10x1 mm) TQFP (Thin Quad Flatpack)
	PT	= 100-Lead (12x12x1 mm) TQFP (Thin Quad Flatpack)
	PF	= 100-Lead (14x14x1 mm) TQFP (Thin Quad Flatpack)
	TL	= 124-Lead (9x9x0.9 mm) VTLA (Very Thin Leadless Array)
	PH	= 144-Lead (16x16x1 mm) TQFP (Thin Quad Flatpack)
	PL	= 144-Lead (20x20x1.40 mm) LQFP (Low Profile Quad Flatpack)
	JWX	= 144-Lead (7x7x1 mm) Thin Fine Pitch Ball Grid Array
Pattern		Three-digit QTP, SQTP, Code or Special Requirements (blank otherwise)
	ES	= Engineering Sample

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
