Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Contents

1. Overview

1.1 Features of This LSI

This LSI is a single-chip microcontroller that includes an Arm Cortex®-A9 processor along with the integrated peripheral functions required to configure a system.

This LSI includes a 32-Kbyte L1 instruction cache, a 32-Kbyte L1 data cache, and a 128-Kbyte L2 cache. It also includes the following on-chip peripheral functions that are necessary for system configuration.

- 4-Mbyte large-capacity RAM (128 Kbytes are also used as data-retention RAM)
- HyperBus™*1 controller
- Octa memory*2 controller
- IEEE 1588 PTP compliant Ethernet MAC controller
- USB 2.0 host/function module
- Video display controller 6
- Image renderer engine
- 2D drawing engine
- MIPI CSI-2 interface
- SD/MMC host interface

The features of this LSI are listed in Table 1.1.

Note 1. HyperBus™, HyperFlash™ and HyperRAM™ are trademarks of Cypress Semiconductor Corporation.
Note 2. OctaFlash™ and OctaRAM™ are trademarks of Macronix International Co., Ltd.

Table 1.1 Features of RZ/A2M

Items	Specification
CPU	• Arm Cortex-A9 processor • Maximum operating frequency: 528 MHz • Instruction cache size: 32 Kbytes • Data cache size: 32 Kbytes (write-back algorithm) • TLB entries: 128 entries • Jazelle® architecture extension: Full implementation • Media processing engine with NEON™ technology
Boot modes	• Eight boot modes Boot mode 0: Booting from memory (bus width: 16 bits) connected to the CS0 space Note: This only applies to 324-pin products. Boot mode 1: Booting from a NAND flash memory with SD controller Boot mode 2: Booting from a NAND flash memory with MMC controller (data bus width: 8 bits) Boot mode 3: Booting from a serial flash memory (3.3 V) connected to the SPI multi I/O bus space Boot mode 4: Booting from an Octal-SPI flash memory connected to the SPI multi I/O bus space Boot mode 5: Booting from a HyperFlash connected to the SPI multi I/O bus space Boot mode 6: Booting from an OctaFlash connected to the OctaFlash space Boot mode 7: Booting from a HyperFlash connected to the HyperFlash space
Secondary cache	• Arm CoreLink™ Level 2 Cache Controller L2C-310 • Operating frequency: 132 MHz • Cache size: 128 Kbytes
Clock pulse generator	• Clock mode: Input clock can be selected from external input (EXTAL) or crystal resonator. • Input clock can be multiplied by 44 (max.) by the internal PLL circuit. • Peak values of EMI noise can be reduced by the on-chip SSCG circuit. • Five types of clocks generated: —CPU clock (Iφ): Maximum 528 MHz —Image processing clock (Gφ): Maximum 264 MHz —Internal bus clock (Bφ): Maximum 132 MHz —Peripheral clock 1 (P1φ): Maximum 66 MHz —Peripheral clock 0 (P0φ): Maximum 33 MHz
Interrupt controller	• Arm CoreLink™ Generic Interrupt Controller (GIC-400) • External interrupt pins (NMI, IRQ7 to IRQ0, and TINT31 to TINT0) • On-chip peripheral interrupts: Priority level set for each module • 32 priority levels available
Bus state controller [Only for 324-pin products]	• Address space divided into six areas (0 to 5), each a maximum of 64 Mbytes • The following features settable for each area independently —Bus size (8 or 16 bits): Available sizes depend on the area. —Number of access wait cycles (different wait cycles can be specified for read and write access cycles in some areas) —Idle wait cycle insertion (between the same area access cycles or different area access cycles) —Specifying the memory to be connected to each area enables direct connection to SRAM, SRAM with byte selection, SDRAM, and burst ROM (clocked synchronous or asynchronous). The address/data multiplexed I/O (MPX) interface is also available. • Outputs a chip select signal (CS0# to CS5#) according to the target area (CS assert or negate timing can be selected by software) • SDRAM refresh Auto refresh or self refresh mode selectable • SDRAM burst access
Direct memory access controller	• Two modules, sixteen channels; external requests are available for one channel. • Can be activated by on-chip peripheral modules. • A specific DMA transfer interval can be specified to adjust the bus occupancy. • Link mode (DMA transfer under descriptor control) supported • Transfer information can be automatically reloaded.

Table 1.1 Features of RZ/A2M

Items	Specification
Multi-function timer pulse unit 3	• 9 channels (16 bits × 8 channels, 32 bits × 1 channel) • Maximum 28 lines of pulse inputs/outputs and 3 lines of pulse inputs • 14 types of count clocks (P1φ/1, P1φ/2, P1φ/4, P1φ/8, P1φ/16, P1φ/32, P1φ/64, P1φ/256, P1φ/1024, MTCLKA, MTCLKB, MTCLKC, MTCLKD, MTIOC1A) selectable —14 types of count clocks selectable (channel 0) —12 types of count clocks selectable (channel 2) —11 types of count clocks selectable (channels 1, 3, 4, 6, 7, and 8) —10 types of count clocks selectable (channel 5) • Input capture function • 39 output compare and input capture registers • Counter clear operation (Simultaneous counter clearing by Compare match or Input capture is available.) • Simultaneous writing to multiple timer counters (TCNT) • Synchronous input/output of each register due to synchronous operation of the counter. • Buffered operation • Cascade-connected operation • 43 types of interrupt sources • Automatic transfer of register data • Pulse output modes Toggle, PWM, complementary PWM, and reset-synchronized PWM modes • Synchronization of multiple counters • Complementary PWM output mode —Non-overlapping waveforms output for 3-phase inverter control —Automatic dead time setting —0% to 100% PWM duty value specifiable —A/D converter start request delaying function —Interrupt skipping at crest or trough • Reset-synchronized PWM mode Three-phase PWM waveforms in positive and negative phases can be output with a required duty value. • Phase counting mode: 16-bit mode (channels 1 and 2) / 32-bit mode (channels 1 and 2) • Counter function of dead time compensation • Conversion start trigger of A/D converter can be generated. • Conversion start trigger of A/D converter can be skipped. • Digital filter functions for the input capture and external count clock pin.
Port output enable 3	• Control of the high-impedance state of the MTU3a waveform output pins • Activation with four input pins • Activation on detection of short-circuited outputs (detection of simultaneous PWM output to the active level) • Activation by register write • Additional programming of output control target pins is possible.
General PWM timer	• 32 bits × 8 channels • Counting up or down (sawtooth wave), counting up and down (triangular wave) selectable for all channels. • Independent selectable for each channel. • 2 input/output pins per channel • 2 output compare/input capture registers per channel • For the 2 output compare/input capture registers of each channel, 4 registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can be at peaks or troughs, enabling the generation of laterally asymmetrically PWM waveforms. • Registers for setting up frame intervals on each channel (with capability for generating interrupts on overflow or underflow) • Generation of dead times in PWM operation • Synchronous start / stop / clear of counters on arbitrary channels. • Starting, stopping, and clearing up/down counters in response to a maximum of eight events • Starting, stopping, and clearing up/down counters in response to input level comparison • Starting, stopping, and clearing up/down counters in response to a maximum of four external triggers • Output pin invalidation functions due to dead time error or detection of short circuit between output pins. • Generation of triggers for A/D converter conversion • Digital filter functions for the input capture and external trigger pins

Table 1.1 Features of RZ/A2M

Items	Specification
Port output enable for GPT	• Output prohibition control of the GPT waveform output pin • Activation with up to four input pins • Activation by dead time error detection or output short detection • Activation by register write
OS timer	• Three-channel 32-bit counters • Two operating modes: —Interval timer mode —Free-running comparison mode • DMA transfer request or interrupt request can be issued when a compare match occurs.
Watchdog timer	• On-chip one-channel watchdog timer • A counter overflow can reset the LSI. • CPU parity error can reset the LSI.
Realtime clock	• Internal clock, Two types of count mode, alarm function • Interrupts can be generated at intervals of 1/64 s by the 32.768-kHz on-chip crystal oscillator.
Serial communications interface with FIFO	• Five channels • Clock synchronous mode or asynchronous mode selectable • Simultaneous transmission and reception (full-duplex communication) supported • Dedicated baud rate generator • Separate 16-byte FIFO registers for transmission and reception • Modem control function (channels 0, 1, and 2 in asynchronous mode)
Serial communications interface	• Two channels • Clock synchronous mode, asynchronous mode, or smart card interface mode is selectable. • Simultaneous transmission and reception (full-duplex communication) supported • Dedicated baud rate generator • LSB first/MSB first selectable • Modem control function • Encoding and decoding of IrDA communications waveforms in accord with version 1.0 of the IrDA standard (on channel 0)
Renesas serial peripheral interface	• Three channels • SPI operation • Master mode and slave mode selectable • Programmable bit length, clock polarity, and clock phase can be selected. • Consecutive transfers • MSB first/LSB first selectable • Maximum transfer rate: 33.00 Mbps
SPI multi I/O bus controller	• One channel • Up to two serial flash memories with multiple I/O bus sizes (single/quad) can be connected. • Connectable with one Octal-SPI flash memory. • Connectable with one HyperFlash™ memory. • External address space read mode (built-in read cache) • SPI operating mode • Maximum frequency: 132 MHz (QSPI0_SPCLK)
HyperBus controller	• Two channels • Support HyperBus interface • One HyperFlash and HyperRAM can be connected per channel. • Maximum frequency: 132 MHz (HM_CK, HM_CK#)
Octa memory controller	• Two channels • Support Macronix Serial Multi I/O (MXSMIO®) Octa Peripheral Interface (OPI) interface. • One OctaFlash and OctaRAM can be connected per channel. • Support memory-map read/write feature with independent Flash/RAM address space. • OctaFlash supports STR (Single Transfer Rate) mode and DTR (Double Transfer Rate) mode. • SPI operation • Support Read-While-Write (RWW) function • Maximum frequency: 132 MHz (OM_SCLK)
I^2C bus interface	• Four channels • Master mode and slave mode supported • Support for 7-bit and 10-bit slave address formats • Support for multi-master operation • Timeout detection

Table 1.1 Features of RZ/A2M

Items	Specification
Serial sound interface	• Four-channel bidirectional serial transfer • Duplex communication (channels 0, 1, and 3) • Support of I²S, Monaural, and TDM audio formats • Support of master and slave functions • Generation of programmable word clock and bit clock • Multi-channel formats • Support of 8, 16, 18, 20, 22, 24, and 32-bit data formats • Support of 32-stage FIFO for transmission and reception • Support of LR-clock continue function in which the LR-clock signal is not stopped.
CANFD interface	• Two channels • ISO11898-1 (2003) compliant • CAN-FD ISO 11898-1 (2015) compliant • Message buffer: —Up to 64 × 2-channel receive message buffers: shared among all channels. —16 transmit message buffers per channel
Renesas SPDIF interface	• Support of IEC60958 standard (stereo and consumer use modes only) • Sampling frequencies of 32 kHz, 44.1 kHz, and 48 kHz • Audio word sizes of 16 to 24 bits per sample • Biphase mark encoding • Double buffered data • Parity encoded serial data
Ethernet MAC controller	• 176-pin products: 1 channel when the media independent interface (MII) is in use, 2 channels when the reduced media independent interface (RMII) is in use 256-, 272-, or 324-pin products: 2 channels whether the MII or RMII is in use • Conforms with the Ethernet / IEEE802.3 MAC (Media Access Control) layer standard • Supports transfer at 10 and 100 Mbps • Supports full-duplex and half-duplex mode • Supports Media Independent Interface (MII) compliant with the IEEE802.3u standard and Reduced Media Independent Interface (RMII) • Magic Packet™* detection and Wake-On-LAN (WOL) signal output • Built-in PTP controller (EPTPC) for Ethernet controller that uses Time Precision Time Protocol (PTP) defined by IEEE 1588-2008 (Version 2.0) to synchronize time between devices. • E-DMAC (Direct Memory Access Controller for Ethernet controller) function Note: * Magic Packet is a trademark of Advanced Micro Devices, Inc.
A/D converter	• 12-bit resolution • Eight input channels • Minimum conversion time: 1 µs per channel • A/D conversion request by the external trigger or timer trigger
NAND flash controller	• Direct-connected memory interface with NAND-type flash memory • ONFI 1.0 (mode 1 to 2) • ECC: 2, 4, 8, 16, 24, and 32 bits • Supports flash memory requiring Large block (2048+64) • Supports flash memory requiring 5-byte addresses (2 Gbits and more) • Interrupt request • Two types of DMA mode
USB 2.0 host/function module	• Two channels • USB 2.0-compliant host/function module • 480-Mbps, 12-Mbps, and 1.5-Mbps transfer rates provided (host mode) • 480-Mbps and 12-Mbps transfer rates provided (function mode) • On-chip 1-Kbyte RAM as communication buffers (host mode) • On-chip 8-Kbyte RAM as communication buffers (function mode)

Table 1.1 Features of RZ/A2M

Items	Specification
Video display controller 6	• Video input interface: BT601, BT656 format (NTSC/PAL) input: Input clock: 27 MHz/54 MHz Digital pin input (channel 0): YCbCr422, YCbCr444, RGB888, RGB666, RGB565 Digital pin input size: Maximum input video image size to be set*: 1920 pixels × 1080 lines (horizontal × vertical) Note: * Depends on the AC characteristics of the connected device. Examples of input video image size: XGA (1024 × 768) SVGA (800 × 600), WVGA (800 × 480), VGA (640 × 480), WQVGA (480 × 240), QVGA (320 × 240, 240 × 320) • Input video control Horizontal noise reduction (NR), brightness adjustment and contrast adjustment using matrix operation • Scaling control Vertical and horizontal scaling up or down of input video possible at a desired ratio (scaling up of graphics also possible) Scaling up ratio: 1 to 8; scaling down ratio: 1/8 to 1 Interpolation: Hold or linear selectable 2D IP conversion: 2D IP conversion through separately setting the initial phases for the top and bottom fields • Video recording Output pixel format: YCbCr444, YCbCr422, RGB888, RGB565 Output field rate: 1/1, 1/2, 1/4, 1/8 Rotation: Horizontal mirroring and 90/180/270 degree rotation for YCbCr422 and RGB565 Maximum video image size to be stored: ×1 size of input video image • Output video control Black stretch: Black area stretched according to Y signal state Enhancer capability: LTI (transient improvement) and sharpness (contour emphasis) for Y signal • Three graphics layers (one of them also for input video) Available input pixel formats 1 bit/pixel: CLUT1 4 bits/pixel: CLUT4 8 bits/pixel: CLUT8 16 bits/pixel: YCbCr422 (graphics layers 0), RGB565, ARGB1555, RGBA5551, ARGB4444 32 bits/pixel: ARGB8888, RGBA8888, RGB888, YCbCr444 (graphics layers 0) • Superimposition Alpha blending in a rectangular area: Input video, layer 1, and layer 2 blended according to the transparency percentage α (fade-in and fade-out function available) Chroma key function: Mixing based on transparency percentage α using the specified RGB and CLUT value Pixel-base alpha blending: Alpha blending for each pixel based on transparency percentage α • Panel output control Panel output correction: Brightness adjustment and contrast adjustment, gamma correction, panel dithering TCON: Various timing output for LCD panel driving provided by a total of seven vertical and horizontal panel driver signals Panel output pixel format: RGB888, RGB666, RGB565, serial RGB Output video image size: Maximum output video image size to be set*: 1999 pixels × 2035 lines (horizontal × vertical) Note: * Depends on the AC characteristics of the display panel. Examples of output video image size: XGA (1024 × 768) SVGA (800 × 600), WVGA (800 × 480), VGA (640 × 480), WQVGA (480 × 240), QVGA (320 × 240, 240 × 320)

Table 1.1 Features of RZ/A2M

Items	Specification
LVDS output interface	• Four pairs of differential output conforming to the TIA/EIA-644 standard (three pairs for data and one pair for the clock) • When the LVDS output interface is not used, the LVDS pins can be used as CMOS input/output. • The LVDS PLL generates clocks of various frequencies. • LVDS Power-down function
Image renderer (IMR-LS2)	• One channel • Refers to the video captured data as two-dimensional texture data and draws a shape by performing texture mapping for an arbitrary shape divided into triangular objects. • Display list system • Drawing functions Texture mapping, bilinear filtering, automatic coordinate generation (and relative coordinate input) • Instruction system Draw instruction: TRI for drawing a triangle Control instructions: TRAP, INT, NOP, SYNCM, SYNCW, WTL, and WTS • Drawing space Destination coordinates: 0 ≤ X ≤ 2,047, 0 ≤ Y ≤ 2,047 • Source coordinates: 0 ≤ u ≤ 1,439, 0 ≤ v ≤ 1,023
2D drawing engine (DRW)	• Support almost any object geometry, rather than being bound to only a few specific geometries such as lines, triangles, or circles. The edges of every object can be independently blurred or anti-aliased. • Color Formats Frame buffer formats 8-bit: a (8) 16-bit: RGB (565), aRGB (4444), aRGB (1555) 32-bit: aRGB (8888). Texture formats 1-bit: CLUT (1)/I (1) 2-bit: CLUT (2)/I (2) 4-bit: CLUT (4)/I (4) 8-bit: a (8), CLUT (8)/I (8), aCLUT (44) 16-bit: aRGB (4444), aRGB (1555), RGB (565) 24-bit: RGB (888) (run length encoded (RLE) unit) 32-bit: aRGB (8888). CLUT formats use a 256-entry color lookup table.
Sprite engine (SPEA)	• RLE Unit Supports Targa RLE data packet formats • Sprite Unit Two channels Up to 16 separate sprites processed by each channel
JPEG codec unit	• Compression and decompression method conforming to the JPEG baseline standard within the range described in this document. • Operational precision: Conforming to JPEG Part 2, ISO-IEC10918-2 • Pixel format: Compression: YCbCr422 Decompression: YCbCr444, YCbCr422, YCbCr411, YCbCr420 Output pixel format to the buffer: YCbCr422, ARGB8888, RGB565 • Four quantization tables provided • Four Huffman tables provided (two tables for AC coefficients and two tables for DC coefficients) • Markers supported: SOI, SOF0, SOS, DQT, DHT, DRI, RSTm, and EOI • Image data rate: Max. 132 Mbytes/s (at 66-MHz operation)

Table 1.1 Features of RZ/A2M

Items	Specification
Capture engine unit	• Examples of input video image size : 5 megapixels (2,560 × 1,920) 3 megapixels (2,048 × 1,536) 2 megapixels (1,632 × 1,224) UXGA (1,600 × 1,200) SXGA (1) (1,280 × 1,024) SXGA (2) (1,280 × 960) WXGA (1,280 × 768) XGA (1,024 × 768) SVGA (800 × 600) WVGA (800 × 480) VGA (640 × 480) WQVGA (480 × 240) QVGA (320 × 240, 240 × 320) Note: Depends on the AC characteristics of the connected device, frame rate of the connected device, and transfer speed to the destination RAM. • Input format: 8- or 16-bit binary data • Memory output format: YCbCr422, YCbCr420 Note: The captured data cannot be displayed via the video display controller 6 because the Y data and CbCr data are split when written to memory.
MIPI CSI-2 interface [Only for 256-, 272-, or 324-pin products]	• Up to 1.0-Gbps transfer rate of MIPI CSI-2 • ECC 1-bit error correction and 2-bit or more error detection of a packet header • CRC error detection of a payload data part • Generation of VD (vertical sync), HD (horizontal sync), and FLD (field) signals • Lane swapping
Video input module	• Input formats MIPI CSI2 interface: YCbCr422, RGB888, RAW8 Up to 2048 × 2048 pixels capture area • Memory output data formats YCbCr422, RGB565, ARGB1555, RGB888, ARGB8888
SD/MMC host interface	• 176-pin products: 1 channel 256-, 272-, or 324-pin products: 2 channels • SD memory I/O card interface (1-/4-bit SD bus) • SD, SDHC, and SDXC SD memory card access supported • Default, high-speed, UHS-I/SDR50, DDR50, and SDR104 transfer modes supported • Error check function: CRC7 (command), CRC16 (data) • Interrupt request: 2 • Card detection function, write protect supported • MMC interface (1-/4-/8-bit MMC bus) Note: Channel 1 only supports a 1- or 4-bit MMC bus. • e-MMC device access supported • High-speed, HS200 transfer modes supported
On-chip RAM	• 4-Mbyte large capacity memory for video display/recording and work (128 Kbytes are used for data retention) • 128-Kbyte memory for data retention (16 Kbytes × 2, 32 Kbytes × 1, 64 Kbytes × 1)
General I/O ports	• 176-pin products: 47 I/Os, 8 inputs with open-drain outputs, 14 inputs (input only), and 1 output (output only) • 256-pin products: 92 I/Os, 8 inputs with open-drain outputs, 14 inputs (input only), and 1 output (output only) • 272-pin products: 92 I/Os, 8 inputs with open-drain outputs, 14 inputs (input only), and 1 output (output only) • 324-pin products: 128 I/Os, 8 inputs with open-drain outputs, 14 inputs (input only), and 1 output (output only) • Input or output can be selected for each bit.
Power-down modes	• Four power-down modes provided to reduce the power consumption in this LSI —Sleep mode —Software standby mode —Deep standby mode —Module standby mode
Debugger interface	• Arm CoreSight™ architecture • JTAG-standard pin assignment

Table 1.1 Features of RZ/A2M

Items	Specification
Trusted Secure IP [option]	• Security algorithm Common key encryption: AES (compliant with NIST FIPS PUB 197), 3DES, ARC4 Non-common key encryption: RSA • Other features TRNG (true-random number generator) Hash value generation: SHA1, SHA224, SHA256, GHASH Support of unique ID
OTP	• A nonvolatile memory that can be written only once • Security setting, authentication setting and the OTP boot setting are possible.
Dynamic reconfigurable processor (DRP) [option]	• Dynamically reconfigurable intellectual property module • 6 tiles • 32 I/O ports
Power supply voltage	• Vcc: 1.14 to 1.26 V, PVcc: 3.0 to 3.6 V, PVcc_HO: 1.7 to 1.9 V • PVcc_SPI/PVcc_SD0/PVcc_SD1: 1.7 to 1.9 V/3.0 to 3.6 V
Temperature range	-40 to +85°C
Quality level	Industrial usage, etc.
Package	• PLBG0176GA-B 176-pin BGA, 13-mm square, 0.8-mm pitch JEITA Package Code: P-LFBGA176-13×13-0.80 RENESAS Code: PLBG0176GA-B • PLBG0256KA-A 256-pin BGA, 11-mm square, 0.5-mm pitch JEITA Package Code: P-LFBGA256-11×11-0.50 RENESAS Code: PLBG0256KA-A • PRBG0272GA-A 272-pin BGA, 17-mm square, 0.80-mm pitch JEITA Package Code: P-LFBGA272-17×17-0.80 RENESAS Code: PRBG0272GA-A • PRBG0324GA-A 324-pin BGA, 19-mm square, 0.8-mm pitch JEITA Package Code: P-FBGA324-19x19-0.80 RENESAS Code: PRBG0324GA-A

1.2 Product Lineup

Table 1.2 Product Lineup

Group	Part Number	DRP Function	Trusted Secure IP	Package
RZ/A2M	R7S921040VCBG	No DRP	No Trusted Secure IP	PLBG0176GA-B
	R7S921041VCBG			PLBG0256KA-A
	R7S921042VCBG			PRBG0272GA-A
	R7S921043VCBG			PRBG0324GA-A
	R7S921045VCBG		Available	PLBG0176GA-B
	R7S921046VCBG			PLBG0256KA-A
	R7S921047VCBG			PRBG0272GA-A

	R7S921051VCBG	Available	No Trusted Secure IP	PLBG0256KA-A
	R7S921052VCBG			PRBG0272GA-A
	R7S921053VCBG			PRBG0324GA-A
	R7S921056VCBG		Available	PLBG0256KA-A
	R7S921057VCBG			PRBG0272GA-A
	R7S921058VCBG			PRBG0324GA-A

Note: Usable pins of the modules listed below depend on the type of package in which the given product comes. For details, see section 1.6, List of Pins.
- Interrupt controller
- Direct memory access controller
- Multi-function timer pulse unit 3
- General PWM timer
- HyperBus controller
- Serial sound interface
- CANFD interface
- Renesas SPDIF interface
- NAND flash controller
- Video display controller 6

1.3 Block Diagram

1.5 Pin Functions

Table 1.3 Pin Function

Classification	Symbol	I/O	Name	Function
Power supply	Vcc	I	Power supply	Power supply pins. All the Vcc pins must be connected to the system power supply. This LSI does not operate correctly if there is a pin left open.
	Vss	I	Ground	Ground pins. All the Vss pins must be connected to the system power supply (0 V). This LSI does not operate correctly if there is a pin left open.
	PVcc	I	Power supply for I/O circuits	Power supply for I/O pins. All the PVcc pins must be connected to the system power supply. This LSI does not operate correctly if there is a pin left open.
	PVcc_SPI, PVcc_HO, PVcc_SD0, PVcc_SD1	I	Power supply for I/O circuits	Power supply for I/O pins. All the PVcc_SPI, PVcc_HO, PVcc_SD0, PVcc_SD1 pins must be connected to the system power supply. This LSI does not operate correctly if there is a pin left open.
	PLLVcc	I	Power supply for PLL	Power supply for the on-chip PLL oscillator.
Clock	EXTAL	I	External clock	Connected to a crystal resonator. An external clock signal may also be input to the EXTAL pin.
	XTAL	O	Crystal	Connected to a crystal resonator.
	CKIO	O	System clock output	Supplies the system clock to external devices.
	AUDIO_CLK	I	External clock for audio	Input pin of external clock for audio. A clock input to the divider is selected from an oscillation clock input on this pin or pins AUDIO_X1 and AUDIO_X2.
	AUDIO_X1	I	Crystal resonator/ external clock for audio	Pins connected to a crystal resonator for audio. An external clock can be input on pin AUDIO_X1. A clock input to the divider is selected from an oscillation clock input on these pins or the AUDIO_CLK pin.
	AUDIO_X2	O		
	AUDIO_XOUT	O	AUDIO_X1 clock output	Output for the on-chip crystal oscillator on AUDIO_X1 or the external clock signal.
Operating mode control	MD_BOOT2, MD_BOOT1, MD_BOOT0	I	Mode set	Sets the operating mode. Do not change the signal levels on these pins while the RES# pin is asserted or until the mode is fixed, after the negation.
	MD_CLK	I	Clock mode set	Sets the clock operating mode. Do not change the signal levels on this pin while the RES# pin is asserted or until the mode is fixed, after the negation.
	MD_CLKS	I	SSCG clock mode set	Switches the SSCG circuit on or off. Do not change the signal levels on this pin while the RES# pin is asserted or until the mode is fixed, after the negation.
	BSCANP	I	Boundary scan set	Boundary scan setting pin. This pin is set to the high level for a boundary scan and to the low level for normal operation.
System control	RES#	I	Power-on reset	This LSI enters the power-on reset state when this signal goes low.
	WDTOVF# / PERROUT#	O	Watchdog timer overflow / CPU Parity error	Outputs an overflow signal from the watchdog timer. Outputs the CPU parity error.

Table 1.3 Pin Function

Classification	Symbol	I/O	Name	Function
Interrupts	NMI	I	Non-maskable interrupt	Non-maskable interrupt request pin. It is handled as an FIQ exception. Fix it high when not in use.
	IRQ7 to IRQ0	I	Interrupt requests 7 to 0	Maskable interrupt request pins. Level-input or edge-input detection can be selected. When the edge-input detection is selected, the rising edge, falling edge, or both edges can also be selected.
Address bus	A25 to A0	O	Address bus	Outputs addresses
Data bus	D15 to D0	I/O	Data bus	Bidirectional data bus
Bus control	CS5# to CS0#	O	Chip select 5 to 0	Chip-select signals for external memory or devices.
	RD#	O	Read	Indicates that data is read from an external device.
	RD/WR#	O	Read/write	Read/write signal
	BS#	O	Bus start	Bus-cycle start signal
	AH#	O	Address hold	Address hold timing signal for the device that uses the address/data-multiplexed bus.
	WAIT#	I	Wait	Inserts a wait cycle into the bus cycles during access to the external space.
	WE0#	O	Byte select	Indicates a write access to bits 7 to 0 of data of external memory or device.
	WE1#	O	Byte select	Indicates a write access to bits 15 to 8 of data of external memory or device.
	DQML	O	Byte select	Selects bits D7 to D0 when SDRAM is connected.
	DQMU	O	Byte select	Selects bits D15 to D8 when SDRAM is connected.
	RAS#	O	RAS	Connected to the RAS# pin when SDRAM is connected.
	CAS#	O	CAS	Connected to the CAS# pin when SDRAM is connected.
	CKE	O	CK enable	Connected to the CKE pin when SDRAM is connected.
Direct memory access controller	DREQ0	I	DMA-transfer request	Input pin to receive external requests for DMA transfer.
	DACK0	O	DMA-transfer request accept	Output pin for signals indicating acceptance of external requests from external devices.
	TEND0	O	DMA-transfer end output	Output pin for DMA transfer end.

Table 1.3 Pin Function

Classification	Symbol	I/O	Name	Function
Multi-function timer pulse unit 3	MTCLKA, MTCLKB, MTCLKC, MTCLKD	I	Timer clock input	Input pins for external clock signals or for phase counting mode clock signals.
	MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D	I/O	Input capture/output compare (channel 0)	TGRA_0 to TGRD_0 input capture input/output compare output/PWM output pins.
	MTIOC1A, MTIOC1B	I/O	Input capture/output compare (channel 1)	TGRA_1 and TGRB_1 input capture input/output compare output/PWM output pins.
	MTIOC2A, MTIOC2B	I/O	Input capture/output compare (channel 2)	TGRA_2 and TGRB_2 input capture input/output compare output/PWM output pins.
	MTIOC3A, MTIOC3B, MTIOC3C, MTIOC3D	I/O	Input capture/output compare (channel 3)	TGRA_3 to TGRD_3 input capture input/output compare output/PWM output pins.
	MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D	I/O	Input capture/output compare (channel 4)	TGRA_4 to TGRD_4 input capture input/output compare output/PWM output pins.
	MTIC5U, MTIC5V, MTIC5W	I/O	Input capture/output compare (channel 5)	TGRU_5, TGRV_5, and TGRW_5 input capture input/dead time compensation input pins.
	MTIOC6A, MTIOC6B, MTIOC6C, MTIOC6D	I/O	Input capture/output compare (channel 6)	TGRA_6 and TGRB_6 input capture input/output compare output/PWM output pins.
	MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D	I/O	Input capture/output compare (channel 7)	TGRA_7 to TGRD_7 input capture input/output compare output/PWM output pins.
	MTIOC8A, MTIOC8B, MTIOC8C, MTIOC8D	I/O	Input capture/output compare (channel 8)	TGRA_8 to TGRD_8 input capture input/output compare output pins.
Port output enable 3	POE0#, POE4#, POE8#, POE10#	I	High impedance request	Input pins for request signals to place the MTU3a waveform output pins in the high impedance state.
General purpose PWM timer	GTETRGA to GTETRGD	I	External trigger	External trigger input pins.
	GTIOC0A to GTIOC7A, GTIOC0B to GTIOC7B	I/O	Timer I/O	Input capture, output compare, or PWM output pins.
Realtime clock	RTC_X1	I	Crystal resonator for realtime clock/external clock	Connected to 32.768-kHz crystal resonator The RTC_X1 pin can also be used to input an external clock.
	RTC_X2	O		
	EXTAL	I	Crystal resonator for internal clock/external clock	Connected to a crystal resonator.
	XTAL	O		
Serial communication interface with FIFO	TxD4 to TxD0	O	Transmit data	Data output pins.
	RxD4 to RxD0	I	Receive data	Data input pins.
	SCK4 to SCK0	I/O	Serial clock	Clock input/output pins.
	RTS2#, RTS1#, RTS0#	O	Transmit request	Modem control pins.
	CTS2#, CTS1#, CTS0#	I/O	Transmit enable	Modem control pins.
Serial communication interface	SCI_SCK1, SCI_SCK0	I/O	Serial clock	Clock input/output pins.
	SCI_TXD1, SCI_TXD0	O	Transmit data	Data output pins.
	SCI_RXD1, SCI_RXD0	I	Receive data	Data input pins.
	SCI_CTS1# / RTS1#, SCI_CTS0# / RTS0#	I/O	Transmit and receive start control	I/O pins for controlling the start of transmission and reception.
I^2C bus interface	RIIC3SCL to RIIC0SCL	I/O	Serial clock pin	Serial clock I/O pins.
	RIIC3SDA to RIIC0SDA	I/O	Serial data pin	Serial data I/O pins.
Serial sound interface	SSITxD3, SSITxD1, SSITxD0	O	Data output	Serial data output pin.
	SSIRxD3, SSIRxD1, SSIRxD0	I	Data input	Serial data input pin.
	SSIDATA2	I/O	Data I/O	Serial data I/O pins.
	SSIBCK3 to SSISBCK0	I/O	bit clock I/O	I/O pins for bit clocks.
	SSILRCK3 to SSILRCK0	I/O	LR clock I/O	I/O pins for LR clock / frame sync.

Table 1.3 Pin Function

Classification	Symbol	I/O	Name	Function
CANFD interface	CAN_CLK	I	Clock source for CAN communication	Clock source for CAN communication.
	CAN1TX, CAN0TX	O	CAN bus transmit data	Output pins for transmit data on the CAN bus.
	CAN1RX, CAN0RX	I	CAN bus receive data	Input pins for receive data on the CAN bus.
	CAN0RX_DATARATE_EN, CAN1RX_DATARATE_EN	O	CAN Bus receive data phase	This pin indicates the receive data phase of the CAN bus. This pin is set to "1" in the data (high-speed bit rate) area.
	CAN0TX_DATARATE_EN, CAN1TX_DATARATE_EN	O	CAN bus transmit data phase	This pin indicates the transmit data phase of the CAN bus. This pin is set to "1" in the data (high-speed bit rate) area.
Renesas SPDIF interface	SPDIF_OUT	O	Data output	Transmit data output pin.
	SPDIF_IN	I	Data input	Receive data input pin.
Renesas serial peripheral interface	MOSI2 to MOSI0	I/O	Data	Data I/O pins.
	MISO2 to MISO0	I/O	Data	Data I/O pins.
	RSPCK2 to RSPCK0	I/O	Clock	Clock I/O pins.
	SSL20, SSL10, SSL00	I/O	Slave select	Slave select I/O pins.
SPI multi I/O bus controller	QSPI0_SPCLK, QSPI1_SPCLK	O	Clock	Clock output pins.
	QSPI0_SSL	O	Slave select	Slave select output pins.
	QSPI1_SSL	I/O	Slave select or Data strobe	When serial flash memory is connected: This pin serves as a slave select output pin. When Octal-SPI flash or HyperFlash memory is connected: This pin serves as a data strobe input pin.
	QSPI0_IO3 to QSPI0_IO0, QSPI1_IO3 to QSPI1_IO0	I/O	Data	Data I/O pins.
	RPC_RESET#	O	Reset	Reset output pin.
	RPC_WP#	O	Write protect	Write protect output pin.
	RPC_INT#	I	Interrupt	Interrupt input pin.
HyperBus controller	HM_CK	O	Clock	Differential clock output pin.
	HM_CK#	O	Clock	Differential clock output pin.
	HM_CS0#	O	Chip select 0	Chip select signal for the external memory.
	HM_CS1#	O	Chip select 1	Chip select signal for the external memory.
	HM_RWDS	I/O	Read Write Data Strobe	Read: data strobe pin. Write: data Mask pin.
	HM_DQ7 to HM_DQ0	I/O	Data	Data I/O pin.
	HM_RESET#	O	Reset output	Reset signal for the external memory.
	HM_RSTO#	I	Reset input	Reset signal from the external memory.
	HM_INT#	I	Interrupt input	Interrupt signal from the external memory.

Table 1.3 Pin Function

Classification	Symbol	I/O	Name	Function
Octa memory controller	OM_SCLK	O	Clock	clock output pin.
	OM_CS0#	O	Chip select 0	Chip select signal for the external memory.
	OM_CS1#	O	Chip select 1	Chip select signal for the external memory.
	OM_DQS	I/O	Data strobe	Read: data strobe pin. Write: data Mask pin.
	OM_SIO7 to OM_SIO0	I/O	Data	Data I/O pins.
	OM_RESET#	O	Reset output	Reset signal for the external memory.
	OM_ECS#	I	ECC error detection	ECC error detection pin from the external memory.
Ethernet controller	ET1_TXCLK, ET0_TXCLK	I	Transmit clock	MII clock pin for transmission.
	ET1_TXEN, ET0_TXCLK	O	Transmit enable	MII transmit data enable pin
	ET0_TXD3 to ET0_TXD0, ET1_TXD3 to ET1_TXD0	O	Transmit data	MII transmit data pins.
	ET1_COL, ET0_COL	I	Collision detection	MII collision detection pin.
	ET1_TXER, ET0_TXER	O	Transmit error	MII transmit error output pin.
	ET1_RXCLK, ET0_RXCLK	I	Receive clock	MII receive clock pin
	ET1_RXDV, ET0_RXDV	I	Receive enable	MII receive data enable pin
	ET1_RXD3 to ET1_RXD0, ET0_RXD3 to ET0_RXD0	I	Receive data	MII receive data pins.
	ET1_RXER, ET0_RXER	I	Receive error	MII receive error input pin.
	ET1_CRS, ET0_CRS	I	Carrier detection	MII carrier detection pin.
	REF50CK0, REF50CK1	I	Reference clock	RMII reference clock pin.
	RMII0_CRS_DV, RMII1_CRS_DV	I	Carrier detection and Receive enable	RMII carrier detection and Receive enable pin.
	RMII0_TXD1, RMII0_TXD0, RMII1_TXD1, RMII1_TXD0	O	Transmit data	RMII transmit data pin.
	RMII0_TXD_EN, RMII1_TXD_EN	O	Transmit enable	RMII transmit enable pin.
	RMII0_RXER, RMII1_RXER	I	Receive error	RMII receive error input pin.
	RMII0_RXD1, RMII0_RXD0, RMII1_RXD1, RMII1_RXD0	I	Receive data	RMII receive data pin.
	ET1_MDC, ET0_MDC	O	Management data clock	Clock pin for information transfer via MDIO.
	ET1_MDIO, ET0_MDIO	I/O	Management data I/O	Bidirectional pin for exchange of management data.
	ET1_LINKSTA, ET0_LINKSTA	I	Status	Link status pin from the PHY-LSI.
	ET1_EXOUT, ET0_EXOUT	O	General purpose output	General purpose output pin.
	ET1_WOL, ET0_WOL	O	Wake-On-LAN	Indicate the LSI receive a Magic Packet.
	ET0_SCLKIN, ET1_SCLKIN	I	SCLKA clock	Clock signal supplied to the statistical time correction algorithm unit.

Table 1.3 Pin Function

Classification	Symbol	I/O	Name	Function
NAND flash controller	NFALE	O	Flash memory address latch enable	Asserted for address output and negated for data I/O.
	NFRE#	O	Flash memory read enable	Reads data at falling edge.
	NFCE#	O	Flash memory chip enable	Enables the flash memory connected to this LSI.
	NFCLE	O	Flash memory command latch enable	Asserted at command output.
	NFRB#	I	Flash memory ready/busy	High level indicates ready state and low level indicates busy state.
	NFWE#	O	Flash memory write enable	Flash memory latches commands, addresses, and data at falling edge.
	NFDATA[7:0]	I/O	Flash memory data	Data I/O pins.
USB 2.0 host/function module	DP1, DP0	I/O	USB 2.0 host/function module D+ data	D+ data pins for USB 2.0 host/function module bus.
	DM1, DM0	I/O	USB 2.0 host/function module D– data	D– data pins for USB 2.0 host/function module bus.
	VBUSIN1, VBUSIN0	I	VBUS input	A pin for monitoring connection of the USB cable. Step down the VBUS voltage to 3.3 V. Connect this pin to the Vbus pin of the USB bus so that it can detect connection and disconnection of the Vbus pin.
	VBUSEN1, VBUSEN0	O	VBUS output	VBUS power supply enable pin.
	OVRCUR1, OVRCUR0	I	Overcurrent input	Overcurrent input pin.
	OTG_EXICEN1, OTG_EXICEN0	O	OTG Power supply IC control	OTG Power supply IC control pin.
	OTG_ID1, OTG_ID0	I	OTG Power supply IC ID	OTG Power supply IC ID pin.
	CC1_Rd1, CC1_Ra1, CC2_Rd1, CC2_Ra1, CC1_Rd0, CC1_Ra0, CC2_Rd0, CC2_Ra0	I	CC input	These pins are used to monitor the state of the resistance on the CC pins of the USB Type-C connector. Check the state of the resistance of the USB Type-C connector and input the result of checking through the CC pins of the RZ/A2M.
	RREF1, RREF0	I	Reference input	Connected to USBVss via 2.2kΩ ± 1% resistance.
	USB_X1	I	Crystal resonator for USB 2.0 host/function module	Connected to a crystal resonator for USB 2.0 host/function module.
	USB_X2	O		
	USBAPVcc1, USBAPVcc0	I	Power supply for transceiver analog pins	Power supply for pins.
	USBDPVcc1, USBDPVcc0	I	Power supply for transceiver digital pins	Power supply for pins.
	USBVss	I	Ground for transceiver pins	Ground for pins.
Video display controller 6	LCD0_DATA23 to LCD0_DATA0	O	Output data	Data output pins for panel.
	LCD0_TCON6 to LCD0_TCON0	O	Panel timing adjustment output	Output pins for panel timing adjustment.
	LCD0_CLK	O	Panel clock	Panel clock output pins.
	LCD0_EXTCLK	I	Panel clock source	Panel clock source input pins.
	DV0_DATA23 to DV0_DATA0	I	Input data	Data input pins for graphics data.
	DV0_VSYNC	I	VSYNC input	VSYNC input pins.
	DV0_HSYNC	I	HSYNC input	HSYNC input pins.
	DV0_CLK	I	Input clock	Clock input signal pins for graphics data.

Table 1.3 Pin Function

Classification	Symbol	I/O	Name	Function
LVDS output interface	TXCLKOUTP, TXCLKOUTM	O	Output clock	LVDS differential clock output pins.
	TXOUT2P to TXOUT0P, TXOUT2M to TXOUT0M	O	Output data	LVDS differential data output pins.
	LVDSAPVcc	I	LVDS analog power supply	Power supply for LVDS output.
	LVDSPLLVcc	I	LVDS PLL power supply	Power supply for LVDS PLL.
Capture engine unit	VIO_D15 to VIO_D0	I	Input data	Graphics data input pins.
	VIO_CLK	I	Input clock	Graphics data clock input pin.
	VIO_VD	I	VSYNC input	VSYNC input pin.
	VIO_HD	I	HSYNC input	HSYNC input pin.
	VIO_FLD	I	FIELD input	Input pin for field information
MIPI CSI-2 interface	CSI_DATA0P	I	Input data	Positive data receive pin for CSI Lane 0 differential input.
	CSI_DATA0N	I	Input data	Negative data receive pin for CSI Lane 0 differential input.
	CSI_DATA1P	I	Input data	Positive data receive pin for CSI Lane 1 differential input.
	CSI_DATA1N	I	Input data	Negative data receive pin for CSI Lane 1 differential input.
	CSI_CLKP	I	Input clock	Positive receive pin for CSI clock Lane input.
	CSI_CLKN	I	Input clock	Negative receive pin for CSI clock Lane input.
	MIPIAVcc18	I	MIPI analog power supply	Power supply for the MIPI analog circuits.
SD/MMC host interface	SD0_CLK, SD1_CLK	O	SD/MMC clock	Output pins for SD/MMC clock.
	SD0_CMD, SD1_CMD	I/O	SD/MMC command	SD/MMC command output and response input signals.
	SD0_DAT7 to SD0_DAT0, SD1_DAT3 to SD1_DAT0	I/O	SD/MMC data	SD/MMC data bus signals.
	SD0_CD, SD1_CD	I	SD/MMC card detection	SD/MMC card detection.
	SD0_WP, SD1_WP	I	SD/MMC write protection	SD/MMC write protection signals.
	SD0_RST#	O	SD/MMC reset	SD/MMC reset signal.
A/D converter	AN007 to AN000	I	Analog input pins	Analog input pins.
	ADTRG#	I	A/D conversion trigger input	External trigger input pin for starting A/D conversion.
	AVcc	I	Analog power supply and reference voltage	Analog power supply and reference voltage pin for A/D converter.
	AVss	I	Analog ground	Ground pin for A/D converter.
General I/O ports	P0_0 to PK_5	I/O	General port	General purpose I/O port pins 176-pin products: 47 pins 256-pin products: 92 pins 272-pin products: 92 pins 324-pin products: 128 pins
	PD_0 to PD_7	I/O	General port	8 general input port pins with open-drain output.
	P5_0 to P5_7, PL_0 to PL_4, JP0_0	I	General port	14 general input port pins
	JP0_1	O	General port	1 general output port pin

Table 1.3 Pin Function

Classification	Symbol	I/O	Name	Function
Debugger interface	TCK/SWDCLK	I	Test clock	Test-clock input pin. Also used as the input clock pin for serial wire debugging
	TMS/SWDIO	I/O	Test mode select	Test-mode select signal input pin. Also used as the I/O data pin for serial wire debugging
	TDI	I	Test data input	Serial input pin for instructions and data.
	TDO/SWO	O	Test data output	Serial output pin for instructions and data.
	TRST#	I	Test reset	Initialization-signal input pin.
	TRACEDATA3 to TRACEDATA0	O	Data output	Trace data output pins.
	TRACECLK	O	Clock output	Trace clock output pin.
	TRACECTL	O	Enable output	Trace enable output pin.
Dynamic Reconfigurable Processor (DRP)*	DRP31 to DRP00	I/O	DRP I/O pins	32 DRP input/output pins

Note: * Only in products with a DRP

1.6 List of Pins

Table 1.4 List of Pins (324-Pin BGA)

Ball Number	Port Function/ Dedicated Function		Mode Function		Function 1		Function 2		Function 3		Function 4		Function 5		Function 6		Function 7		Simplified Circuit Diagram Figure 51.1 to Figure 51.15

2. CPU

This product incorporates the Arm single-core Cortex-A9 MPCore, where the IP version is r4p1.

2.1 Features*1

- Instruction cache size: 32 Kbytes
- Data cache size*2: 32 Kbytes
- TLB size: 128 entries
- BTAC size: 512 entries
- GHB size: 4096 descriptors
- Instruction micro TLB: 32 entries
- Jazelle architecture extension: Full
- Media processing engine with NEON technology: Included
- FPU: Included
- PTM interface: Included
- Wrappers to support for power off and dormant mode: Not included
- Preload engine: Not included
- Number of interrupts: 0
- Accelerator Coherence Port: Not included
- Support for cache parity error detection*4: Yes

Note 1. For details, refer to Cortex-A9 MPCore Technical Reference Manual issued by Arm Ltd.
Note 2. Contents of memory regions which are set as write-through are not cached even if data caching is enabled. For details, refer to Cortex-A9 Technical Reference Manual issued by Arm Ltd.
Note 3. Hardware resets in response to requests from the watchdog timer for the Snoop Control Unit (SCU) of the MPCore are not supported.
Note 4. For handling of the parity error signal, see section 15, Watchdog Timer.

2.2 Configuration Signals

Table 2.1 shows the Cortex-A9 configuration signals and the settings.

Table 2.1 Cortex-A9 Configuration Signal Settings

Configuration Signal	Setting Values
CFGEND	1'b0
CFGNMFI	1'b0
CLUSTERID	4'h0
FILTEREN*1	1'b1
FILTERSTART[31:20]*1	12'hE00
FILTEREND[31:20]*1	12'hFFF
PERIPHBASE[31:13]*2	19'b111_1000_0000_0000_0000
TEINIT	1'b0
VINITHI	1'b1

Note 1. Do not change the initial settings (setting values) of these signals by software.
Note 2. The base address for the private memory area in the Cortex-A9 processor is H'F0000000. For details and overview of the registers located in the addresses relative to this base address, refer to Cortex-A9 MPCore Technical Reference Manual issued by Arm Ltd.

3. Boot Mode

This LSI can be booted from the memory connected to the CS0 space, the serial flash memory, the OctaFlash™*1, Xccela™ flash memory*2, and the HyperFlash™*3.

Note 1. OctaFlash is a trademark of Macronix International Co., Ltd.
Note 2. Xccela™ flash memory is a trademark of Micron Technology, Inc.
Note 3. HyperFlash is a trademark of Cypress Semiconductor Corporation.
Note 4. Booting from the NAND flash memory with an SD controller and the NAND flash memory with an MMC controller are not currently supported.

3.1 Features

Eight boot modes
Boot mode 0: Boots the LSI from the memory (bus width: 16 bits) connected to the CS0 space
Boot mode 1: Boots the LSI from the NAND flash memory with the SD controller*1
Boot mode 2: Boots the LSI from the NAND flash memory with the MMC controller*2 (data bus width: 8 bits*3)
Boot mode 3: Boots the LSI from the serial flash memory (SPI mode, 3.3-V products) connected to the SPI multi I/O bus space
Boot mode 4: Boots the LSI from the Octal-SPI flash memory*4 (SPI mode, 1.8-V products) connected to the SPI multi I/O bus space
Boot mode 5: Boots the LSI from the HyperFlash (1.8-V products) connected to the SPI multi I/O bus space
Boot mode 6: Boots the LSI from the OctaFlash (SPI mode, 1.8-V products) connected to the OctaFlash space
Boot mode 7: Boots the LSI from the HyperFlash (1.8-V products) connected to the HyperFlash space

Note 1. It is possible to boot the LSI from the embedded SD (eSD) defined by the SD specification part 1 eSD addendum version 2.10 standard.
Note 2. It is possible to boot the LSI from the eMMC device corresponding to the alternative boot operation mode of the JEDEC standard JESD84 A44 (MMCA 4.4) Standard. (It is not possible to boot the LSI from the MMC card.)
Note 3. The boot program is assumed to run when the data bus width is 8 bits.
Booting up by the boot program cannot proceed normally when the data bus width is not 8 bits.
Note 4. In this manual, the 8-bit SPI flash memory (OctaFlash or Xccela flash memory) with 1 chip select, 1 clock source, and 1 data strobe configuration is called "Octal-SPI flash memory".

3.2 Boot Mode and Pin Function Setting

This LSI can determine the boot mode using external pins when RES# is low. The external pin settings for selecting the boot mode are shown in Table 3.1.

Table 3.1 External Pin (MD_BOOT2 to MD_BOOT0) Settings and Corresponding Boot Modes

MD_BOOT2	MD_BOOT1	MD_BOOT0	Boot Mode
0	0	0	Boot Mode 0 (CS0-space 16-bit booting) Boots the LSI from the memory (bus width: 16 bits) connected to the CS0 space.
0	0	1	Boot Mode 1 (eSD booting) Boots the LSI from the NAND flash memory with the SD controller. The only way to boot this LSI chip is from channel 0 of the SD/MMC host interface in this mode.
0	1	0	Boot Mode 2 (eMMC booting) Boots the LSI from the NAND flash memory with the MMC controller. The only way to boot this LSI chip is from channel 0 of the SD/MMC host interface in this mode.
0	1	1	Boot Mode 3 (serial flash booting, 3.3-V products) Boots the LSI from the serial flash memory (SPI mode) connected to the SPI multi I/O bus space.
1	0	0	Boot Mode 4 (Octal-SPI flash booting, 1.8-V products) Boots the LSI from the Octal-SPI flash memory (SPI mode) connected to the SPI multi I/O bus space.

Table 3.1 External Pin (MD_BOOT2 to MD_BOOT0) Settings and Corresponding Boot Modes

MD_BOOT2	MD_BOOT1	MD_BOOT0	Boot Mode
1	0	1	Boot Mode 5 (HyperFlash booting 1, 1.8-V products) Boots the LSI from the HyperFlash connected to the SPI multi I/O bus space.
1	1	0	Boot Mode 6 (OctaFlash booting, 1.8-V products) Boots the LSI from the OctaFlash (SPI mode) connected to the OctaFlash space.
1	1	1	Boot Mode 7 (HyperFlash booting 2, 1.8-V products) Boots the LSI from the HyperFlash connected to the HyperFlash space.

3.3 Hardware Used in Each Boot Mode

Table 3.2 gives information about the hardware used in each boot mode.

Table 3.2 Hardware Used in Each Boot Mode

Boot Mode	Peripheral Module	Pins Used	Remarks*2
Boot Mode 0 (CS0-space 16-bit booting)	Bus state controller	A[20:1] D[15:0] CS0# RD# CKIO *1	CKIO clock frequency: P1φ
Boot Mode 1 (eSD booting)	SD/MMC host interface (channel 0)	SD0_CLK SD0_CMD SD0_D[3:0]	SD0_CLK frequency: Bφ/8
Boot Mode 2 (eMMC booting)	SD/MMC host interface (channel 0)	SD0_CLK SD0_CMD SD0_D[7:0] SD0_RST#	SD0_CLK frequency: Bφ/8
Boot Mode 3 (Serial flash booting, 3.3-V products)	SPI multi I/O bus controller	QSPI0_SPCLK QSPI0_SSL QSPI0_IO[1:0]	QSPI0_SPCLK frequency: P0φ/2
Boot Mode 4 (Octal-SPI flash booting, 1.8-V products)	SPI multi I/O bus controller	QSPI0_SPCLK QSPI0_SSL QSPI0_IO[1:0]	QSPI0_SPCLK frequency: P0φ/2
Boot Mode 5 (HyperFlash booting 1, 1.8-V products)	SPI multi I/O bus controller	QSPI0_SSL QSPI0_SPCLK QSPI1_SPCLK QSPI0_IO[3:0] QSPI1_IO[3:0] QSPI1_SSL RPC_RESET#	QSPI0_SPCLK, QSPI1_SPCLK frequency: P1φ/2
Boot Mode 6 (OctaFlash booting, 1.8-V products)	Octa Memory controller	OM_SCLK OM_CS0# OM_SIO[1:0]	OM_SCLK frequency: P0φ/2
Boot Mode 7 (HyperFlash booting 2, 1.8-V products)	HyperBus controller	HM_CS0# HM_CK HM_CK# HM_DQ[7:0] HM_RWDS HM_RESET#	HM_CK, HM_CK# frequency: P1φ/2

Note 1. The pins used in boot mode 0 work as general I/O pins immediately after this LSI is released from the reset state. The pin function should be changed to the external bus function through execution of the boot program.

Note 2. This column shows the operating frequency of the peripheral module in each boot mode while the boot program is being executed.

3.4 Exception Vector Address at a Reset in Each Boot Mode

In this LSI, the boot program is executed at the exception vector address H'FFFF_0000 (high vector) in all boot modes when a reset is generated. The address of the exception vector after the boot program is executed depends on the boot mode. In the boot mode 0, the exception vector is located at H'0000_0000 (low vector). In the boot modes 1 to 7, the exception vector is located at H'FFFF_0000 (high vector).
In this LSI, an on-chip ROM is allocated in area H'FFFF_0000 to H'FFFF_FFFF. The on-chip ROM has a boot program which executes processing corresponding to the boot mode set by the MD_BOOT2 to MD_BOOT0 external pins.
Table 3.3 lists the exception vector address for each boot mode.

Table 3.3 Exception Vector Address in Each Boot Mode

Boot Mode	Exception Vector Address after boot program execution	Memory Allocated at the Exception Vector Address
Boot Mode 0 (CS0-space 16-bit booting)	H'0000 0000 (low vector)	Memory connected to the CS0 space
Boot Mode 1 (eSD booting)	H'FFFF 0000 (high vector)	On-chip ROM
Boot Mode 2 (eMMC booting)	H'FFFF 0000 (high vector)	On-chip ROM
Boot Mode 3 (Serial flash booting, 3.3-V products)	H'FFFF 0000 (high vector)	On-chip ROM
Boot Mode 4 (Octal-SPI flash booting, 1.8-V products)	H'FFFF 0000 (high vector)	On-chip ROM
Boot Mode 5 (HyperFlash booting 1, 1.8-V products)	H'FFFF 0000 (high vector)	On-chip ROM
Boot Mode 6 (OctaFlash booting, 1.8-V products)	H'FFFF 0000 (high vector)	On-chip ROM
Boot Mode 7 (HyperFlash booting 2, 1.8-V products)	H'FFFF 0000 (high vector)	On-chip ROM

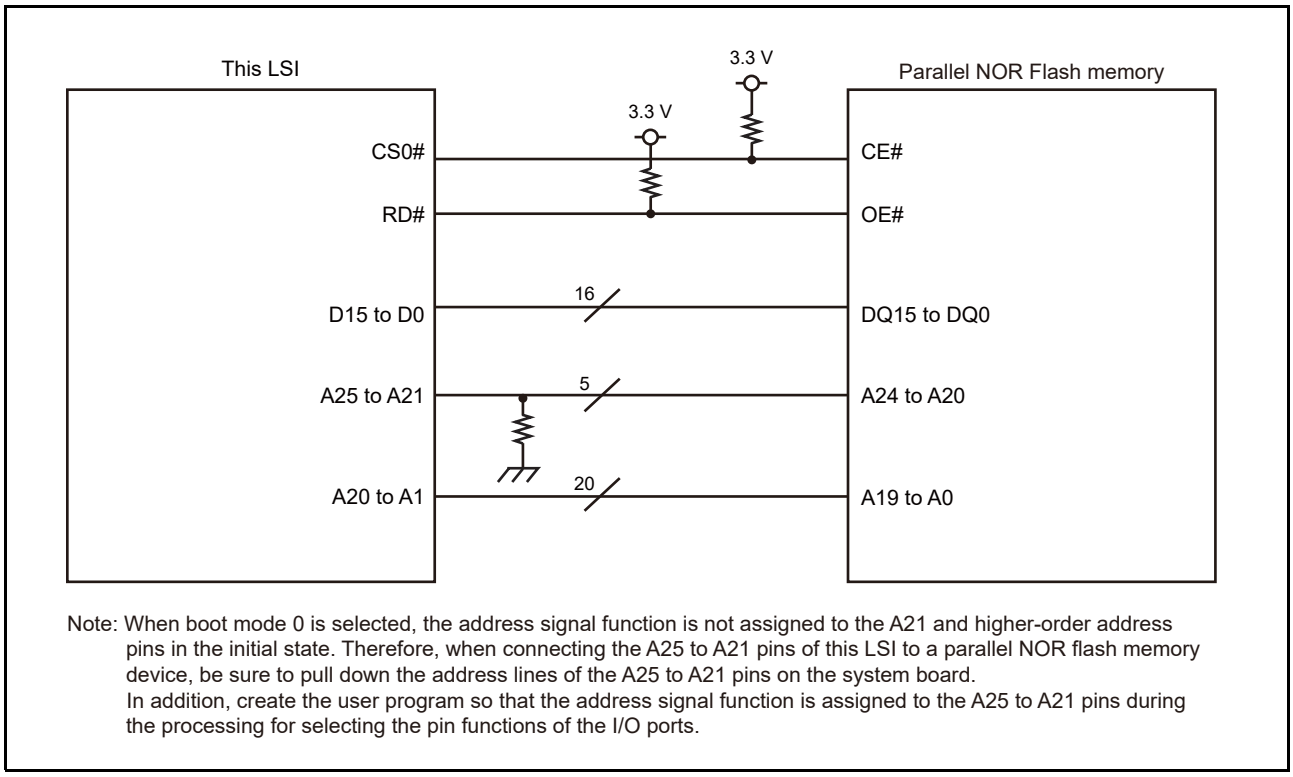
3.5 Operation

3.5.1 Boot Mode 0

In boot mode 0, this LSI is booted from the memory connected to the CS0 space. In this mode, this LSI operates as follows:

After the power-on reset is canceled, the boot program stored in the on-chip ROM (starting from H'FFFF_0000) is executed. In the boot program, set the pins to access the CS0 space. Set the V bit of the CP15 system control register (SCTLR) to 0 and switch to the low vector. After the power-on reset is canceled, program execution is started from H'0000_0000 in the memory connected to the CS0 space.

Figure 3.1 shows an example of connection with an external memory of CS0 space. Table 3.4 shows the register setting values of each peripheral module in boot mode 0.



Note: When boot mode 0 is selected, the address signal function is not assigned to the A21 and higher-order address pins in the initial state. Therefore, when connecting the A25 to A21 pins of this LSI to a parallel NOR flash memory device, be sure to pull down the address lines of the A25 to A21 pins on the system board.
In addition, create the user program so that the address signal function is assigned to the A25 to A21 pins during the processing for selecting the pin functions of the I/O ports.

Figure 3.1 Example of connection with an external memory of CS0 space (Parallel NOR Flash memory)

3.5.2 Boot Mode 1

In boot mode 1, this LSI is booted from the NAND flash memory with the SD controller that is connected to channel 0 of the SD/MMC host interface. In this mode, this LSI operates as follows.
After this LSI is released from the power-on reset state, it executes the boot program stored in the on-chip ROM (starting from the address H'FFFF_0000).
The boot program releases channel 0 of the SD/MMC host interface from the module standby state, sets up the registers in the channel, transfers the program stored in the NAND flash memory with the SD controller to the area starting from the address H'8002_4000 in the large-capacity on-chip RAM for the size of the program.
The program that the boot program transfers to the large-capacity on-chip RAM is called a loader program.
The size of the loader program should be between 512 bytes and 4,046,848 bytes. If the size of the user application exceeds 4,046,848 bytes, create a program for transferring the application to the external memory and implement it in the loader program.
The loader program needs to be stored in the NAND flash memory with the SD controller in accordance with the loader program storage specifications.
After the processing of the boot program is completed, execution branches to the address H'8002_4000 (the large-capacity on-chip RAM).
The boot program uses the address area from H'8002_0000 to H'8002_3FFF as work memory.
Figure 3.2 is a schematic diagram of the specifications of boot mode 1. Figure 3.3 shows the loader program storage specifications. Figure 3.4 shows the specifications of the loader program size block used in boot mode 1.
In boot mode 1, the SD0_WP and SD0_CD pins are not used. In the SD/MMC host interface, dedicated pins are assigned to the command, clock, and data signals, but the write protect and card detection pins are not dedicated pins but multiplexed pins. For boot operation, be sure to supply the 3.3-V power to the SDVcc pin.

Note: Developing a host device compliant with the SD specification requires execution of an SD Host/Ancillary Product License Agreement (SD HALA).

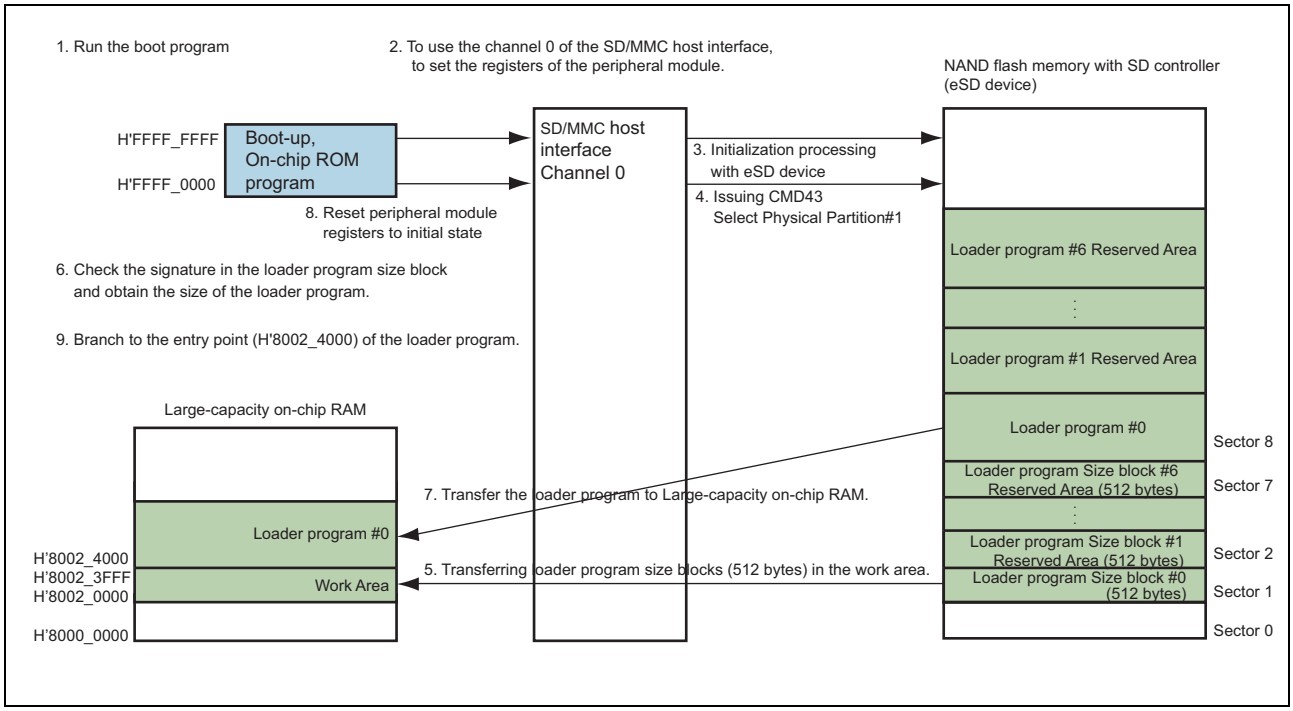

Figure 3.2 Schematic View of Specification for Boot Mode 1

1. The program stored in the on-chip ROM is executed after this LSI is released from the power-on reset state.
2. The program stored in the on-chip ROM sets up the peripheral module registers to access the eSD device connected to channel 0 of the SD/MMC host interface.
3. The processing for initializing the eSD device is executed.
4. The partition switch command (CMD43) is issued to the eSD device to select physical partition #1 (boot code area). When the connected eSD device supports this command, the processing after this step is applied to physical partition #1.
   When an SD card is connected, the processing after this step handles the SD card as a single-partition device, so booting from the SD card becomes possible.
   (When an SD card is connected, issuing the partition switch command will generate an error because the SD card does not support this command. However, the program stored in the on-chip ROM does not check this error.)
5. The read command is issued from channel 0 of the SD/MMC host interface to the eSD device to transfer loader program size block #0 to the work area in the large-capacity on-chip RAM.
6. The signature (H'AA55) in the loader program size block transferred to the large-capacity on-chip RAM is checked. When the signature matches the expected value, the size of the loader program is obtained from the loader program size block and the processing for transfer of the loader program (step 7) is executed. When the signature does not match the expected value, transfer of the loader program size block from the next multiplexed area begins. When reading of loader program size blocks #0 to #6 has failed, execution enters an infinite loop in the program stored in the on-chip ROM and the boot processing is terminated.
7. The read command is issued from channel 0 of the SD/MMC host interface to the eSD device to transfer loader program #0 to the area starting from the address H'8002_4000 in the large-capacity on-chip RAM for the size of the loader program.
   When the SD/MMC host interface detects a data transfer error during transfer, transfer of the loader program from the next multiplexed area begins. When reading of loader programs #0 to #6 has failed, execution enters an infinite loop in the program stored in the on-chip ROM and the boot processing is terminated.
8. The values of the registers changed to use channel 0 of the SD/MMC host interface are restored to the initial state.
9. Execution branches to the entry point (address H'8002_4000) of the loader program.

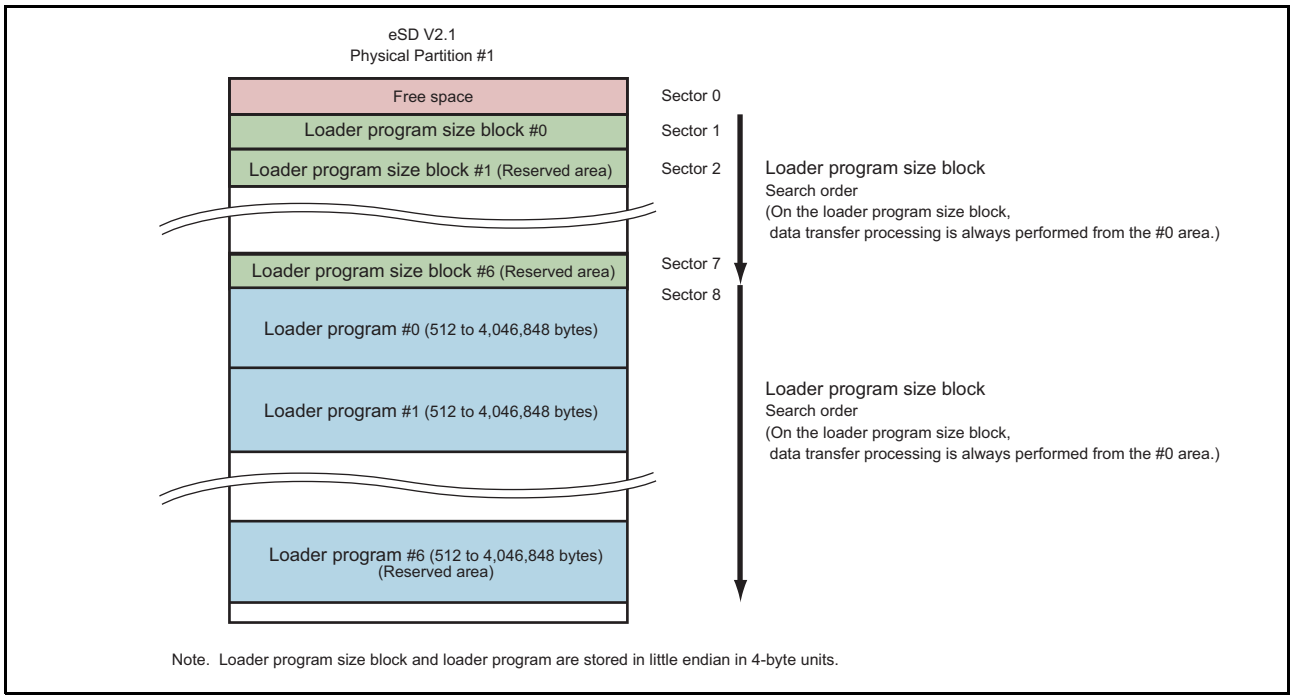

Figure 3.3 Loader program storage specification

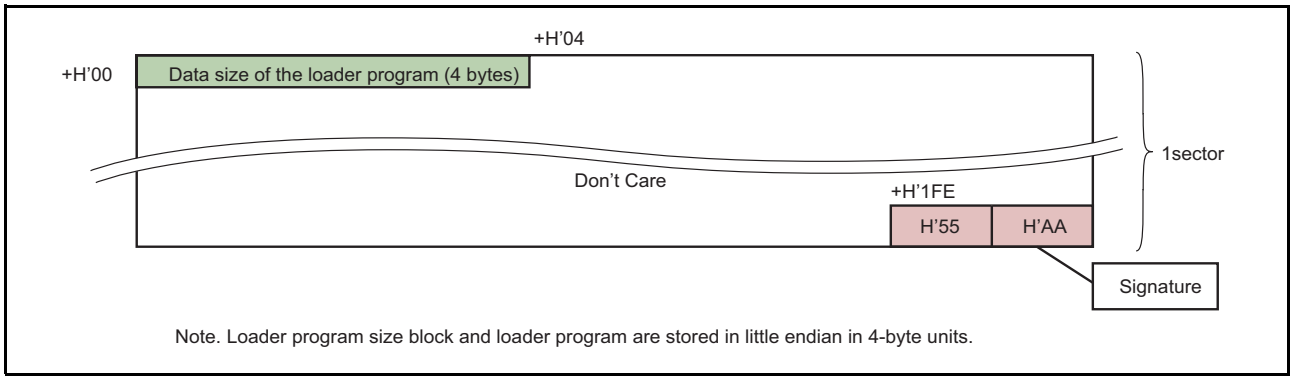

Figure 3.4 Loader program size Block configuration

3.5.3 Boot Mode 2

In boot mode 2, this LSI is booted from the NAND flash memory with the MMC controller that is connected to channel 0 of the SD/MMC host interface. In this mode, this LSI operates as follows.
After this LSI is released from the power-on reset state, it executes the boot program stored in the on-chip ROM (starting from the address H'FFFF_0000).
The boot program releases channel 0 of the SD/MMC host interface from the module standby state, sets up the registers in the channel, transfers the program stored in the NAND flash memory with the MMC controller to the area starting from the address H'8002_4000 in the large-capacity on-chip RAM for the size of the program. The program that the boot program transfers to the large-capacity on-chip RAM is called a loader program. The size of the loader program should be between 512 bytes to 4,046,848 bytes. If the size of the user application exceeds 4,046,848 bytes, create a program for transferring the application to the external memory and implement it in the loader program.
The loader program needs to be stored in the NAND flash memory with the MMC controller in accordance with the loader program storage specifications.
After the processing of the boot program is completed, execution branches to the address H'8002_4000 (the large-capacity on-chip RAM). The boot program uses the address area from H'8002_0000 to H'8002_3FFF as work memory. Note that the data bus width is eight bits in boot mode 2.
Figure 3.5 is a schematic diagram of the specifications of boot mode 2. Figure 3.6 shows the loader program storage specifications. Figure 3.7 shows the specifications of the loader program size block used in boot mode 2. Figure 3.8 shows an example of connections with the eMMC device.
In addition, the extended CSD register in the eMMC device needs to be set up appropriately. Table 3.5 shows the values that should be specified in extended CSD register.

Note: For details of the specifications of the eMMC device, refer to the JESD84 A44 (MMCA 4.4) standard.

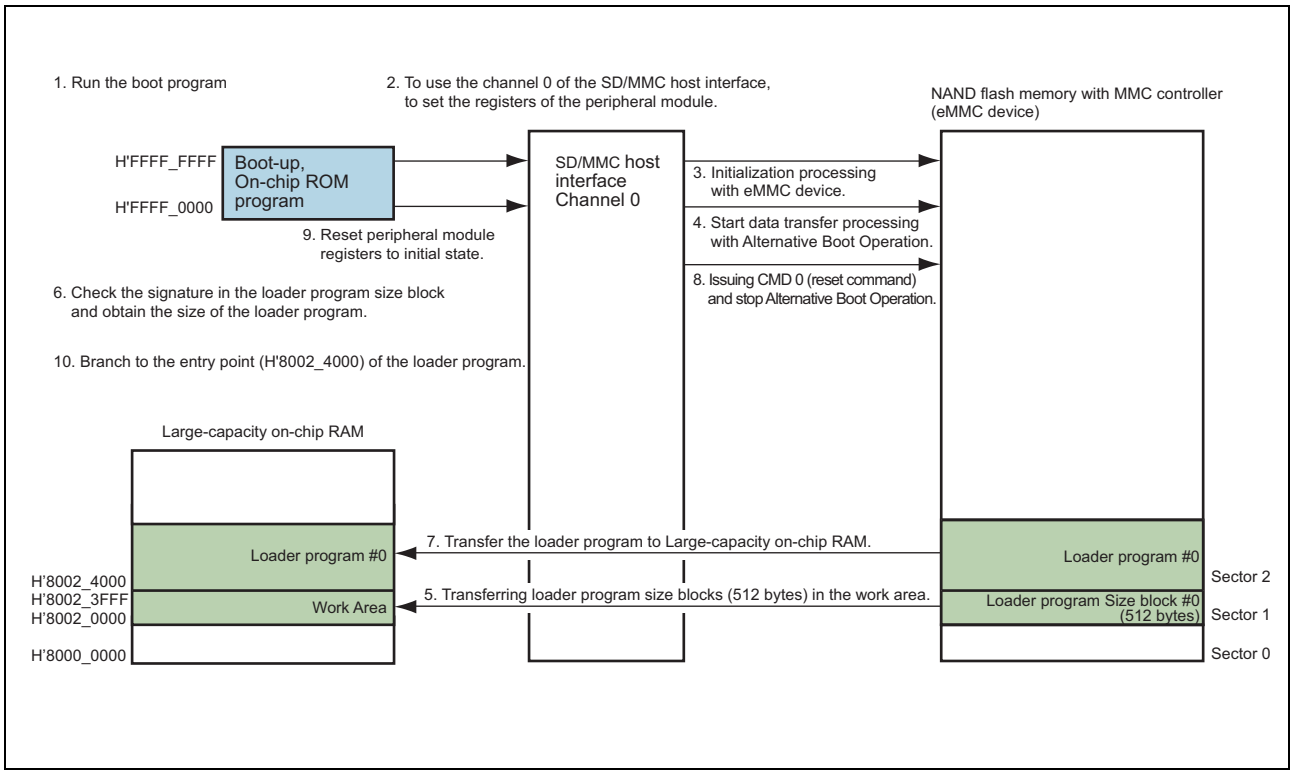

Figure 3.5 Schematic View of Specification for Boot Mode 2

1. The program stored in the on-chip ROM is executed after this LSI is released from the power-on reset state.
2. The program stored in the on-chip ROM sets up the peripheral module registers to access the eMMC device connected to channel 0 of the SD/MMC host interface.
3. The processing for initializing the eMMC device is executed.
4. The Alternative Boot Operation start command is issued to the eMMC device. In the Alternative Boot Operation mode, reading from sector 0 in the partition selected in the [179] field (PARTITION_CONFIG) of the extended CSD (EXT_CSD) register in the eMMC device begins.
5. After transfer from sector 0 to the work area in the large-capacity on-chip RAM is completed (Note), loader program block size #0 is transferred from sector 1.
   Note: In the Alternative Boot Operation mode, the read processing begins from sector 0 of the partition selected in the EXT_CSD[179] field. The boot program does not use the data in sector 0.
6. The signature (H'AA55) in the loader program size block transferred in step 5 is checked.
   When the signature matches the expected value, the size of the loader program is obtained from the loader program size block and the processing for transfer of the loader program (step 7) is executed.
   When the signature does not match the expected value, execution enters an infinite loop in the program stored in the on-chip ROM and the boot processing is terminated.
7. In the Alternative Boot Operation mode, loader program #0 is transferred to the area starting from the address H'8002_4000 in the large-capacity on-chip RAM for the size of the loader program.
   When the SD/MMC host interface detects a data transfer error during transfer, execution enters an infinite loop in the program stored in the on-chip ROM and the boot processing is terminated.
8. The reset command (CMD0/Reset) is issued from channel 0 of the SD/MMC host interface to the eMMC device to exit from the Alternative Boot Operation mode.
9. The values of the registers changed to use channel 0 of the SD/MMC host interface are restored to the initial state.
10. Execution branches to the entry point (address H'8002_4000) of the loader program.

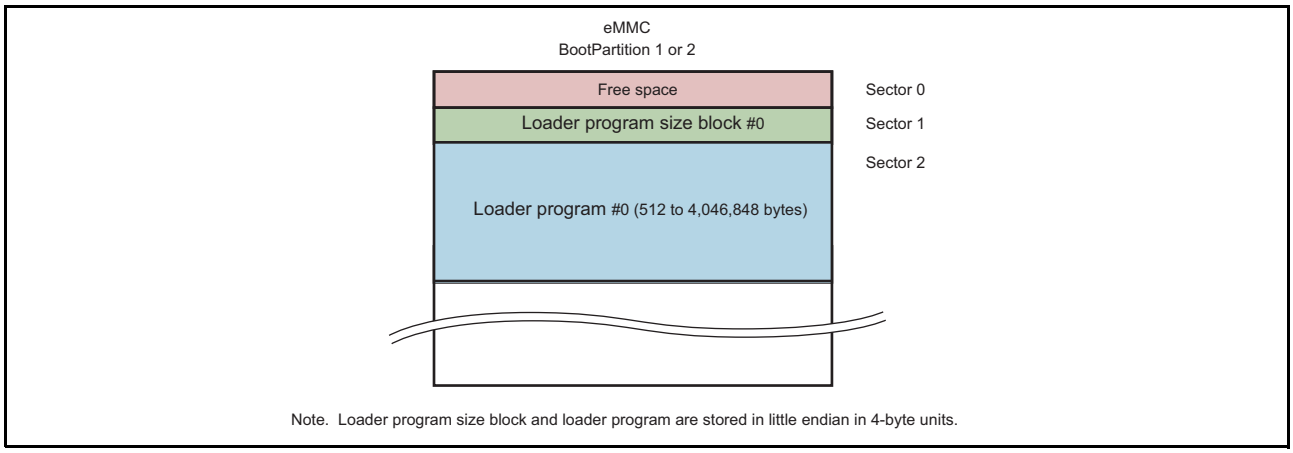

Figure 3.6 Loader program storage specification

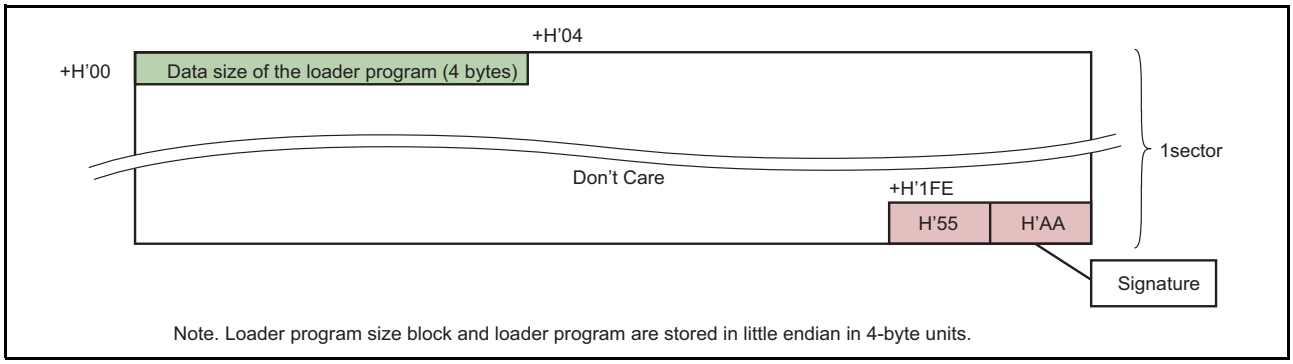

Figure 3.7 Loader program size Block configuration

Table 3.5 Extended CSD register setting value

eMMC device Fields in Extended CSD	Setting contents
BOOT_BUS_WIDTH[177]	Sets BOOT_MODE (Bit[4:3]) to B'00. (During Alternative Boot Operation, data is transferred in SDR mode.) Sets BOOT_BUS_WIDTH (Bit[1:0]) to B'10. (During Alternative Boot Operation, the data bus operates with 8 bits width.)
PARTITION_CONFIG[179]	Sets BOOT_ACK (Bit[6]) to B'0. (During Alternative Boot Operation, eMMC device does not output BOOT Acknowledge.) Set the boot partition to BOOT_PARTITION_ENABLE (Bit[5:3]). B'001: Boot from sector 0 of boot partition 1 in boot operation. B'010: Boot from sector 0 of boot partition 2 in boot operation.

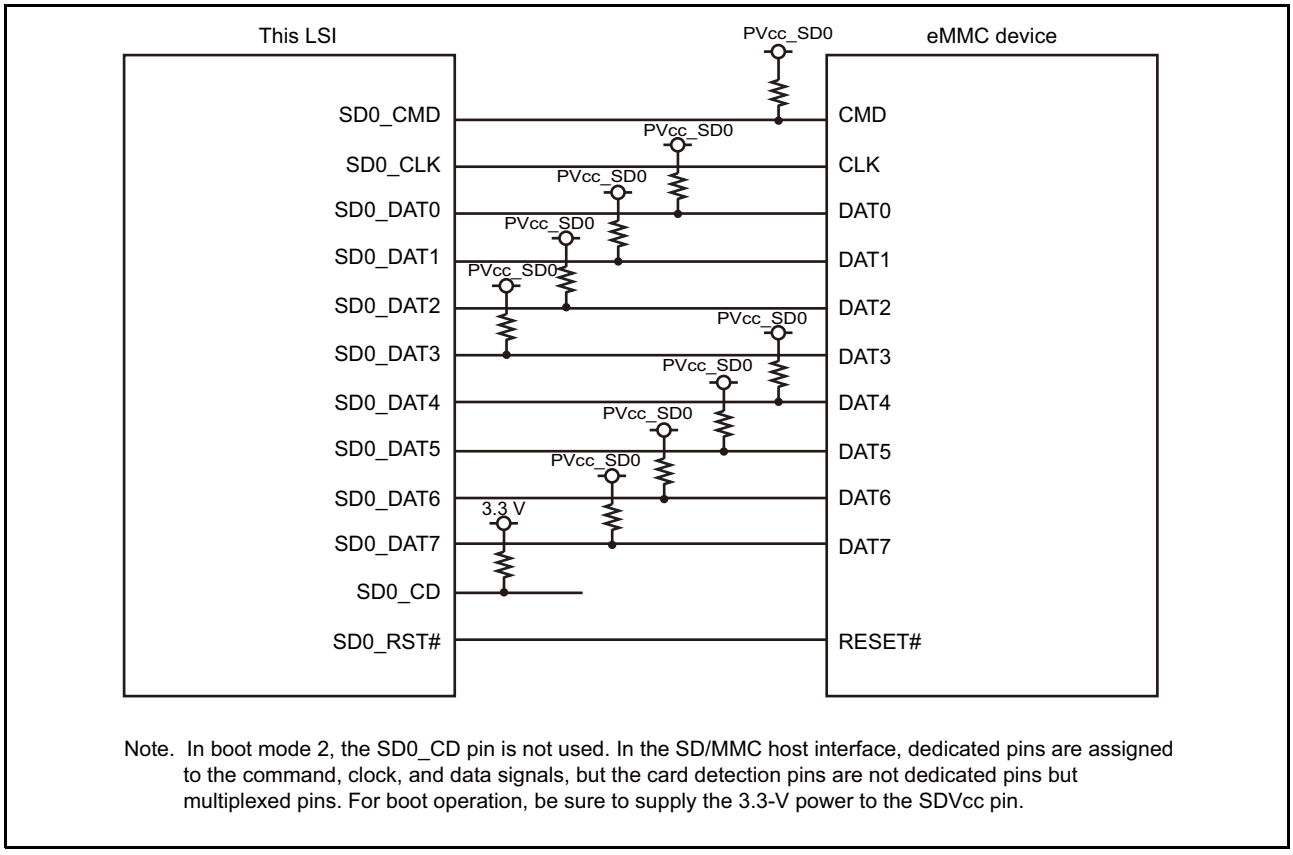

Figure 3.8 Example of connection with eMMC device

3.5.4 Boot Mode 3

In boot mode 3, booting up is from the serial flash memory (3.3-V products) connected to the SPI multi I/O bus space. In this mode, this LSI operates as follows:

After the power-on reset is canceled, the boot program stored in the on-chip ROM (starting from H'FFFF_0000) is executed. The boot program clears the module standby state of the SPI multi I/O bus controller and configures the SPI multi I/O bus controller in external address space read mode.

With this configuration, this LSI converts reads from the SPI multi I/O bus space to SPI communications and is ready to read directly from the connected serial flash memory.

The boot program configures a read command (opcode: 03H, address: 3 bytes, dummy cycle: none) as the command to the serial flash memory used for SPI communication conversion.

Figure 3.9 shows the control signals output to the serial flash memory through SPI communication conversion.

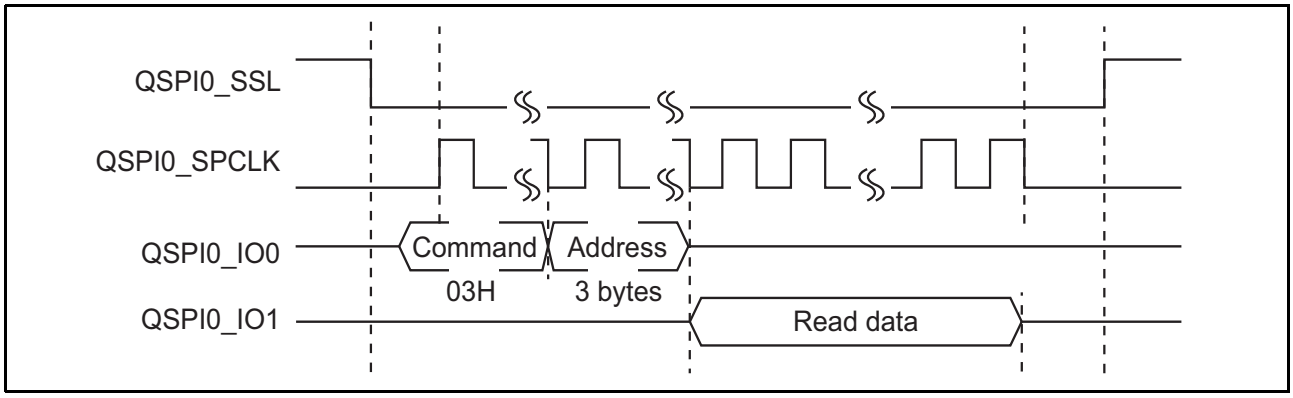

Figure 3.9 Control signals output to the serial flash memory through SPI communication conversion

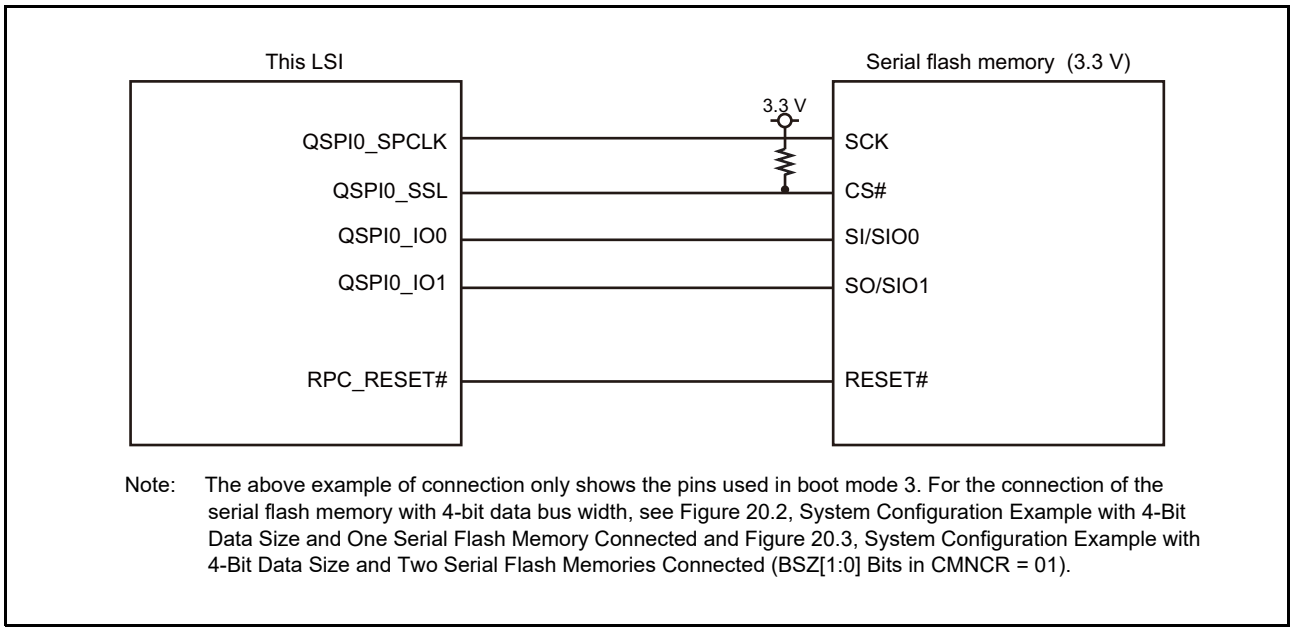
The boot program uses the area at H'8002_0000 to H'8002_3FFF as work memory. It branches to H'2000_0000 (SPI multi I/O bus space) at the end of the processing.

Table 3.6 shows the setting values of each peripheral module after executing the boot program, and Figure 3.10 shows an example of connection with the serial flash memory.

Table 3.6 Register setting value of each peripheral module in boot mode 3

Peripheral module	Register	Initial value after reset	Setting value after boot program execution
Power-Down Modes	STBCR8	H'FF	H'F7
Clock Pulse Generator	SCLKSEL	H'0000	H'0000
SPI multi I/O bus controller	CMNCR	H'0155_7301	H'01AA_A200
	SSLDR	H'0000_0000	H'0000_0000
	DRCR	H'001F_0100	H'0003_0100
	DRCMR	H'00A0_0000	H'0003_0000
	DRENR	H'A222_D400	H'0000_4700
	DRDMCR	H'0000_000B	H'0000_0000
	DRDRENR	H'0000_5101	H'0000_0000
	PHYCNT	H'0000_0263	H'0000_0260
	PHYOFFSET1	H'2151_1144	H'3151_1144
	PHYINT	H'0707_0002	H'0707_0002
GPIO	PPOC	H'0000_0000F	H'0000_0101
	PSPIBSC	H'0FFF_FFFF	H'0555_5555

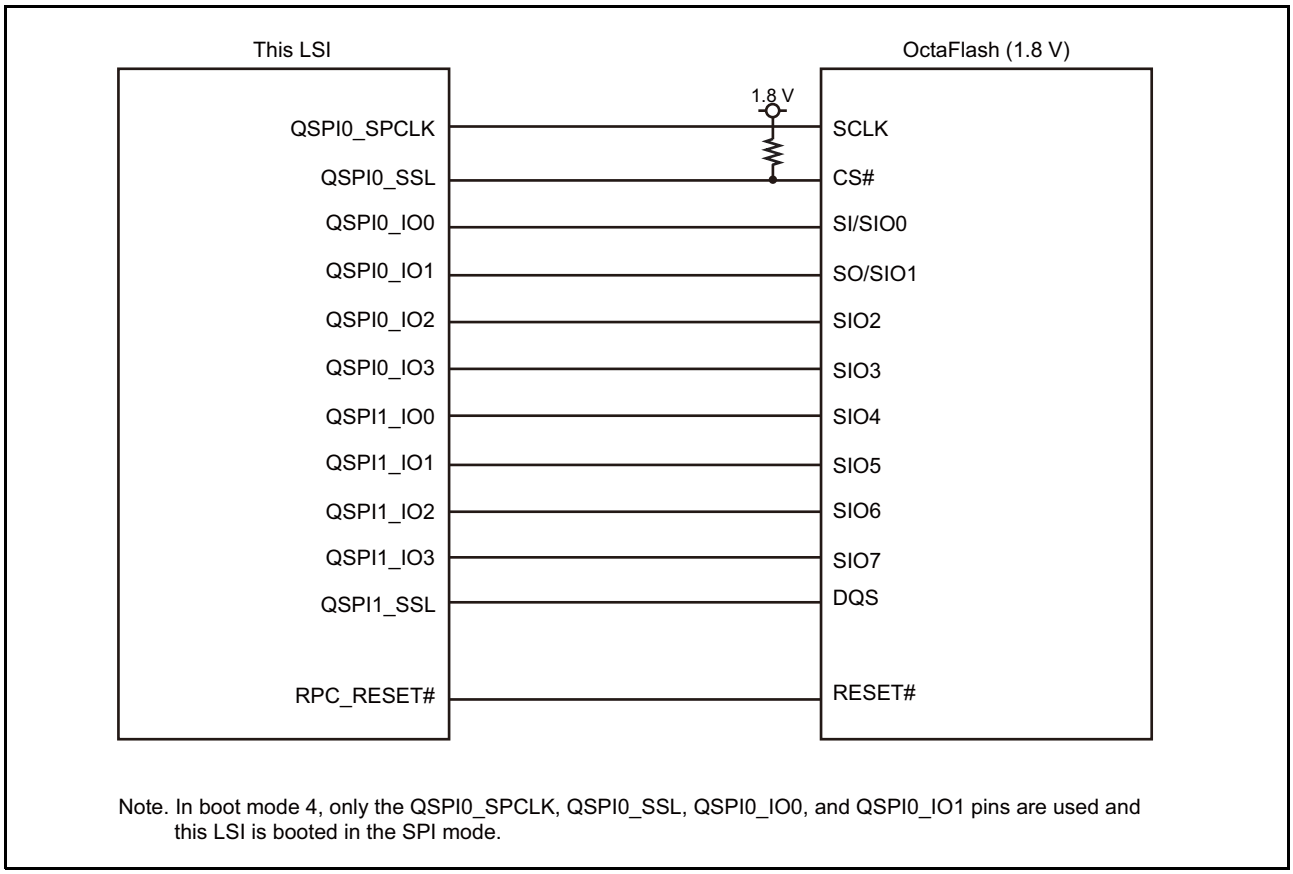


Note: The above example of connection only shows the pins used in boot mode 3. For the connection of the serial flash memory with 4-bit data bus width, see Figure 20.2, System Configuration Example with 4-Bit Data Size and One Serial Flash Memory Connected and Figure 20.3, System Configuration Example with 4-Bit Data Size and Two Serial Flash Memories Connected (BSZ[1:0] Bits in CMNCR = 01).

Figure 3.10 Connection example when using boot mode 3

3.5.5 Boot Mode 4

In boot mode 4, this LSI is booted from the Octal-SPI flash memory (1.8-V products) connected to the SPI multi I/O bus space. In this mode, booting from the serial flash memory is not supported.
The operation of this LSI in this mode is the same as that in boot mode 3. Refer to section 3.5.4, Boot Mode 3. Table 3.7 shows the setting values of each peripheral module after executing the boot program, and Figure 3.11 shows an example of connection with the OctaFlash.



Note. In boot mode 4, only the QSPI0_SPCLK, QSPI0_SSL, QSPI0_IO0, and QSPI0_IO1 pins are used and this LSI is booted in the SPI mode.

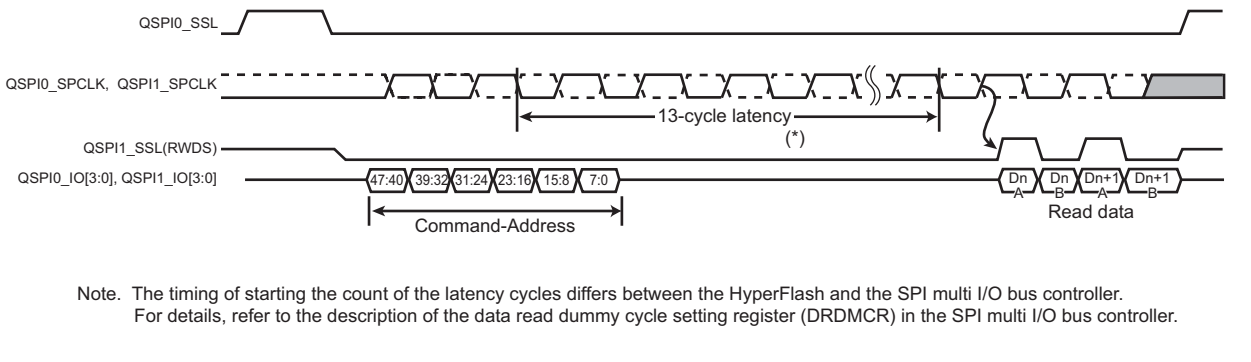
Figure 3.11 Connection example when using boot mode 4

Table 3.7 Register setting value of each peripheral module in boot mode 4

Peripheral module	Register	Initial value after reset	Setting value after boot program execution
general I/O port	PPOC	H'0000_000F	H'0000_0100
	PSPIBSC	H'0FFF_FFFF	H'0FFF_FFFF
The register settings of modules other than the general I/O port registers listed above are the same as those for boot mode 3.			

3.5.6 Boot Mode 5

In boot mode 5, this LSI is booted from the HyperFlash (1.8-V products) connected to the SPI multi I/O bus space.
In this mode, this LSI operates as follows.
After this LSI is released from the power-on reset state, it executes the boot program stored in the on-chip ROM (starting from the address H'FFFF_0000).
The boot program releases the SPI multi I/O bus controller from the module standby state and places the SPI multi I/O bus controller in the external address space read mode that supports the HyperFlash. In this mode, this LSI can convert read transactions to the SPI multi I/O bus space into the HyperBus protocol and read data directly from the connected HyperFlash.
Figure 3.12 shows the control signals output to the HyperFlash after conversion to the HyperBus protocol.
Note that the parameters for read access to the HyperFlash should be set to the fixed values for boot mode 5. Be sure to set up the HyperFlash configuration register (Non-Volatile) as shown in Table 3.8



Note. The timing of starting the count of the latency cycles differs between the HyperFlash and the SPI multi I/O bus controller. For details, refer to the description of the data read dummy cycle setting register (DRDMCR) in the SPI multi I/O bus controller.

Figure 3.12 Control signal output to HyperFlash by HyperBus protocol conversion

The boot program uses the area at H'8002_0000 to H'8002_3FFF as work memory. It branches to H'2000_0000 (SPI multi I/O bus space) at the end of the processing.
Table 3.9 shows the setting values of each peripheral module after executing the boot program, and Figure 3.13 shows an example of connection with HyperFlash.

Table 3.8 HyperFlash configuration register (Non-Volatile) setting value

Bit	Bit name	Description
[11]	NVCR Freeze	B'1: VCR, NVCR rewritable
[7:4]	Read Latency	B'1000: 13-Clock

Table 3.9 Register setting value of each peripheral module of the boot mode 5

Peripheral module	Register	Initial values after reset	Setting values after boot program execution
Power-Down Modes	STBCR8	H'FF	H'F7
Clock Pulse Generator	SCLKSEL	H'0000	H'0001
SPI multi I/O bus controller	CMNCR	H'0155_7301	H'0155_7301
	SSLDR	H'0000_0000	H'0000_0000
	DRCR	H'001F_0100	H'0003_0100

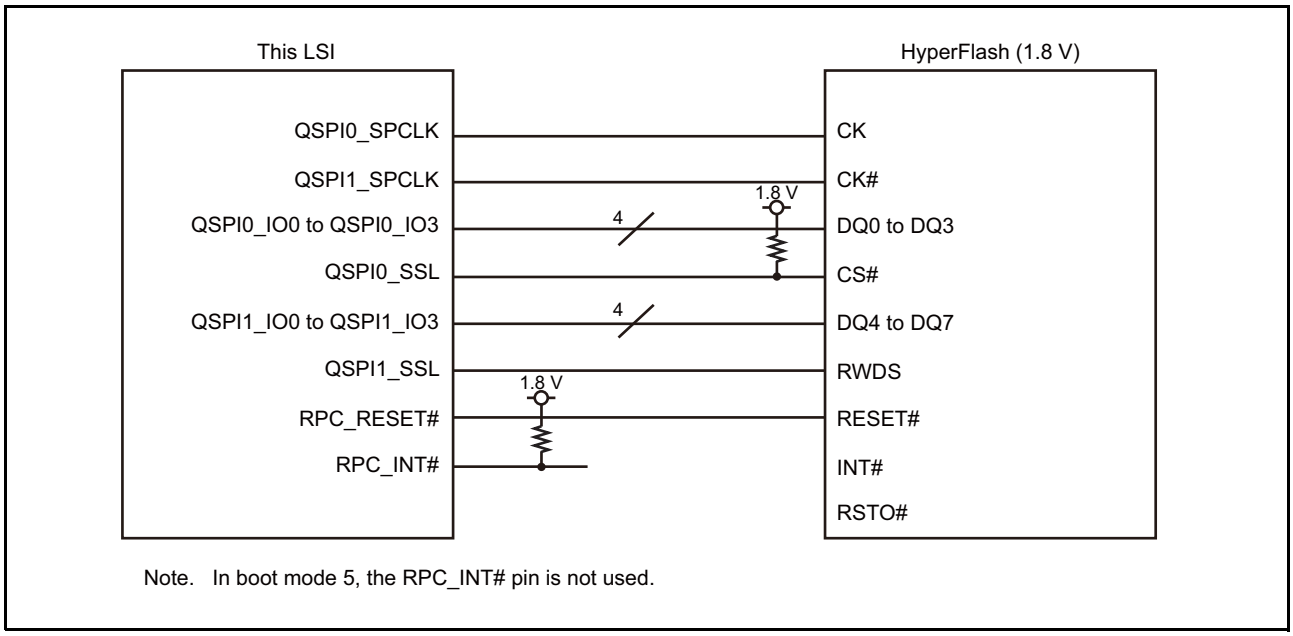
	DRDRENR	H'0000_5101	H'0000_5101
	PHYCNT	H'0000_0263	H'0000_0263
	PHYOFFSET1	H'2151_1144	H'2151_1144
	PHYINT	H'0707_0002	H'0707_0002
General I/O Port	PPOC	H'0000_000F	H'0000_000F
	PSPIBSC	H'0FFF_FFFF	H'0FFF_FFFF



Note. In boot mode 5, the RPC_INT# pin is not used.

Figure 3.13 Connection example when using boot mode 5

3.5.7 Boot Mode 6

In boot mode 6, booting up is from the OctaFlash (1.8-V products) connected to the OctaFlash space. In this boot mode, booting from the serial flash memory is not supported.
In this mode, this LSI operates as follows:
After the power-on reset is canceled, the boot program stored in the on-chip ROM (starting from H'FFFF_0000) is executed.
The boot program cancels the module standby state of the Octa memory controller and configures the Octa memory controller to read mode compatible with SPI communication.
With this configuration, this LSI converts the read transaction to OctaFlash space into SPI communication and ready to read directly from the OctaFlash connected to the OctaFlash space.
The boot program configures a read command (opcode: 03H, address: 3 bytes, dummy cycle: none) as the command to the OctaFlash used for SPI communication conversion.
Figure 3.14 shows the control signals output to the OctaFlash by SPI communication conversion.

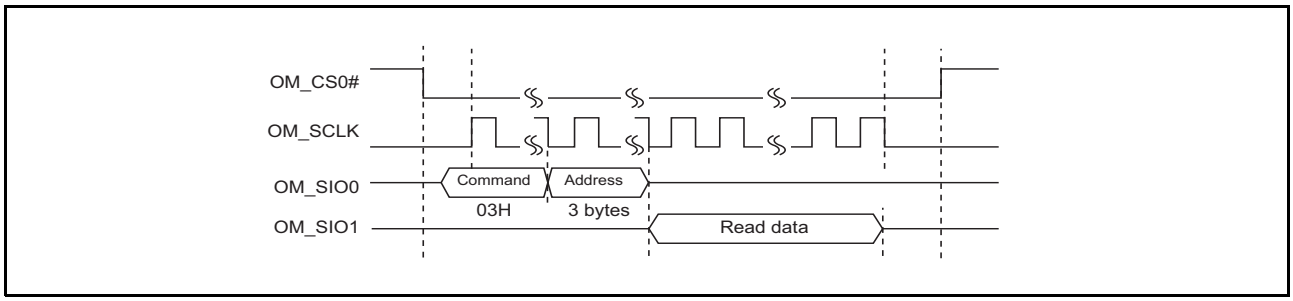


Figure 3.14 Control signals output to the OctaFlash

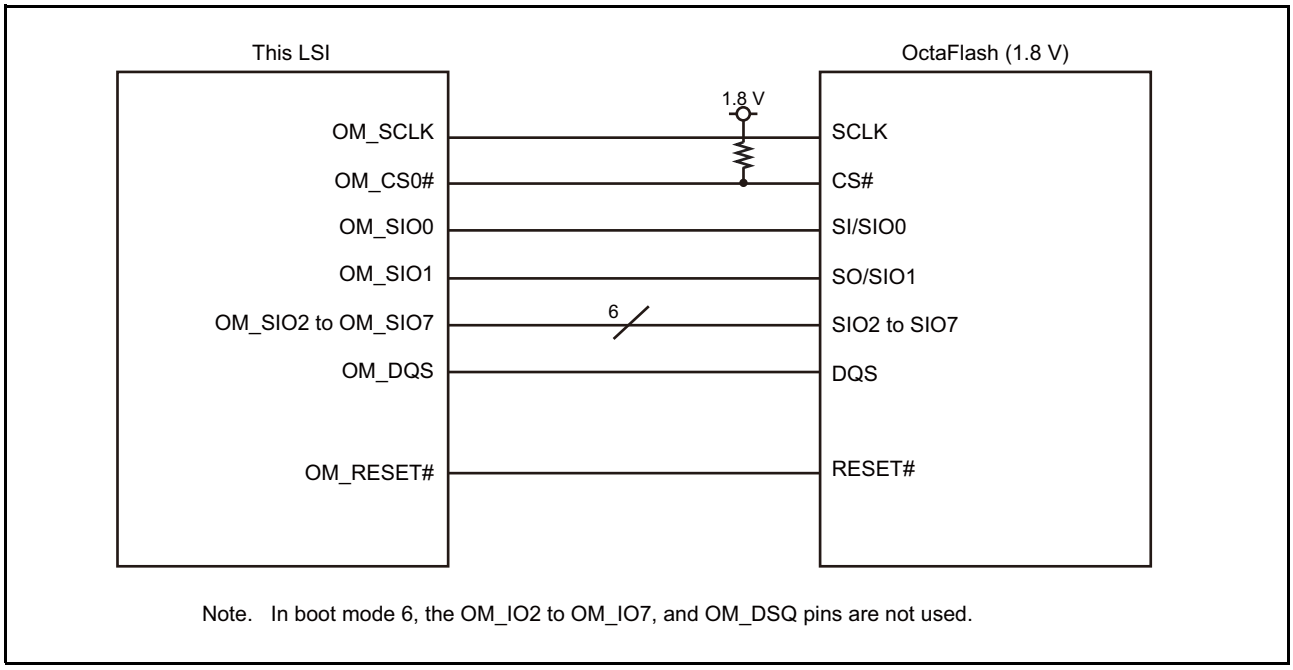
The boot program uses the area at H'8002_0000 to H'8002_3FFF as work memory. It branches to H'5000_0000 (OctaFlash space) at the end of the processing.
Table 3.10 shows the setting values of each peripheral module after executing the boot program, and Figure 3.15 shows an example of connection with OctaFlash.

Table 3.10 Register setting value of each peripheral module in boot mode 6

Peripheral module	Register	Initial values after reset	Setting values after boot program execution
Power-Down Modes	STBCR9	H'FF	H'FB
Clock Pulse Generator	SCLKSEL	H'0000	H'0000
Octa Memory controller	DSR0	H'0000_0000	H'0100_0000
	DRCSTR	H'0000_0000	H'0000_0000
	CDSR	H'0000_0000	H'8000_0000
	MDLR	H'0000_0000	H'0000_0000
	MRWCR0	H'0000_0000	H'0000_0003
	MRWCSR	H'0000_0000	H'0000_000B
General I/O Port	PHMOM0	3FFF_7FFE	3FFF_7FFF



Note. In boot mode 6, the OM_IO2 to OM_IO7, and OM_DSQ pins are not used.

Figure 3.15 Connection example when using boot mode 6

3.5.8 Boot Mode 7

In boot mode 7, this LSI is booted from the HyperFlash (1.8-V products) connected to the HyperFlash space.
In this mode, this LSI operates as follows.
After this LSI is released from the power-on reset state, it executes the boot program stored in the on-chip ROM (starting from the address H'FFFF_0000).
The boot program releases the HyperBus controller from the module standby state and sets up the registers in the HyperBus controller.
With these register settings, this LSI can convert read transactions to the HyperFlash space into the HyperBus protocol and read data directly from the connected HyperFlash. Figure 3.16 shows the control signals output to the HyperFlash after conversion to the HyperBus protocol.

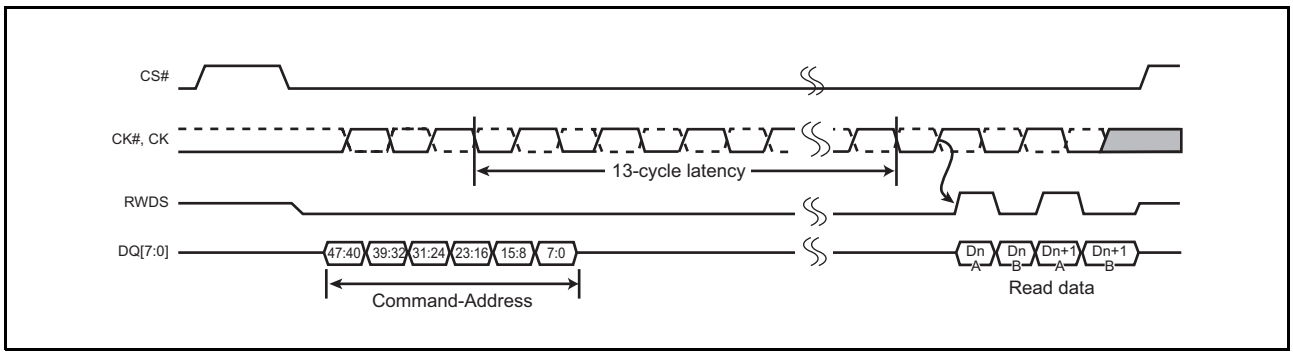


Figure 3.16 Control signal output to HyperFlash by HyperBus protocol conversion

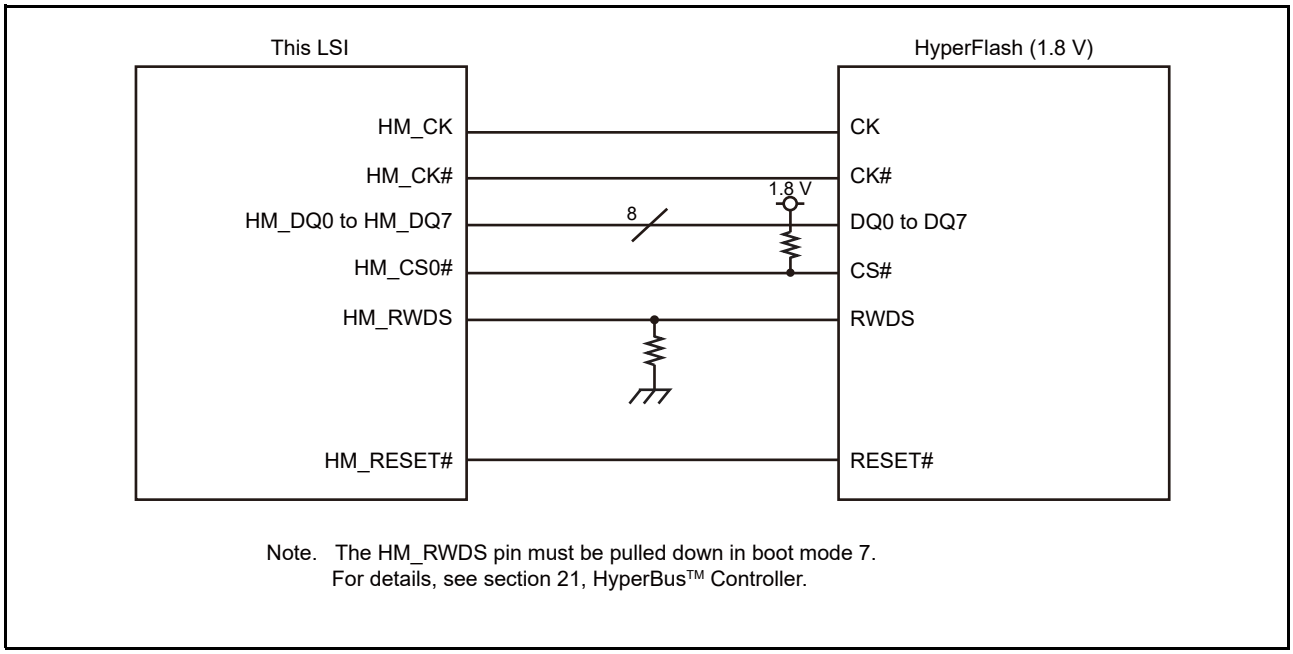
The boot program uses the area at H'8002_0000 to H'8002_3FFF as work memory. It branches to H'3000_0000 (HyperFlash space) at the end of the processing.
Table 3.11 shows the setting values of each peripheral module after executing the boot program, and Figure 3.17 shows an example of connection with HyperFlash.

Table 3.11 Register setting value of each peripheral module in boot mode 7

Peripheral module	Register	Initial values after reset	Setting values after boot program execution
Power-Down Modes	STBCR9	H'FF	H'F7
Clock Pulse Generator	SCLKSEL	H'0000	H'0010
HyperBus controller	IEN	H'0000_0000	H'0000_0000
	MCR0	H'0000_0003	H'0000_0003
	MTR0	H'0000_0001	H'0000_0001
General I/O Port	PHMOM0	3FFF_7FFE	3FFF_7FFE



Note. The HM_RWDS pin must be pulled down in boot mode 7.
For details, see section 21, HyperBus™ Controller.

Figure 3.17 Connection example when using boot mode 7

3.6 Current Program Status Register (CPSR) Setting Value

Table 3.12 shows the setting values of the current program status register (CPSR).

Table 3.12 Current program status register (CPSR) setting value

Bit	Bit name	Initial values after reset	Setting values after boot program execution
7	I	1 (IRQ exception prohibited)	1 (IRQ exception prohibited)
6	F	1 (FIQ exception prohibited)	1 (FIQ exception prohibited)
5	T	0 (Arm state)	0 (Arm state)
[4:0]	M	B’10011 (SVC: Supervisor)	B’10011 (SVC: Supervisor)

3.7 Notes

3.7.1 Boot Related Pins

The initial states and output states in deep standby mode of the pins related to CS0 space memory read, SPI multi I/O bus space memory read, channel 0 of the SD/MMC host interface, Octa memory controller, and the HyperBus controller are different in each boot mode.
For details, refer to section 8, Bus State Controller, section 51, GPIO, and section 52, Power-Down Modes.

3.7.2 Operation when an Exception Occurs with the Exception Vector Set to the High Vector Address

In this LSI, the program counter loops to its own address (exception vector address) in the on-chip ROM if an exception (except for a reset) occurs when the exception vector is set to the high vector address. In any mode from among boot modes 1 to 7, set the V bit in SCTLR to 0 to set the exception vector to the low vector address before an exception (except for a reset) occurs. For the details about the CP15 system control register (SCTLR), refer to the Arm Architecture Reference Manual.

Table 3.13 Self loop address

Occurrence exception	Self loop address
Undefined instruction exception	H'FFFF_0004
Software interrupt exception	H'FFFF_0008
Prefetch abort exception	H'FFFF_000C
Data abort exception	H'FFFF_0010
IRQ exception	H'FFFF_0018
FIQ exception	H'FFFF_001C

3.7.3 Notes on Serial Flash Booting (Boot Mode 3, 4, 6) after This LSI is Reset

In boot mode 3 (booting from a 3.3-V serial flash memory products) or boot mode 4 (Octal-SPI flash boot) or boot mode 6 (OctaFlash boot), read commands (opcode: 03H; address: 3 bytes; dummy cycles: none) are issued to the flash memory. Therefore, if this LSI enters the reset state while the flash memory cannot accept read commands, this LSI may not boot up correctly.
For example, if this LSI is reset while the flash memory is being erased (in the busy state), the flash memory cannot accept read commands.
In such system configuration that the LSI may be reset while the flash memory cannot accept read commands, take appropriate measures to ensure that the flash memory accepts read commands after this LSI is released from the reset state. For example, use the flash memory that has a reset pin or turn off the power to the flash memory when a reset occurs.

4. Secondary Cache

This product incorporates Arm's PL310 as a secondary cache. The IP version is r3p3.

4.1 Features

- Total cache size: 128 Kbytes
- Number of cache ways: 8
- Number of master ports: 2
- Number of slave ports: 2
- Lockdown by master: No
- Lockdown by line: Defined
- Speculative read: No
- Sideband signal from CA9: No
- Support for cache parity error detection: Yes

For details, see CoreLink™ Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.

4.2 Configuration Signals

The setting values of the configuration signals are shown in Table 4.1.

Table 4.1 Setting Values of Configuration Signals

Configuration Signals	Setting Values
ASSOCIATIVITY*1	1'b0 (8 ways)
CACHEID[5:0]	6'b000000

TAGSETUPLAT[2:0]*1	3'b000
TAGWRITELAT[2:0]*1	3'b000
WAYSIZE[2:0]*1	3'b001 (16 Kbytes)

Note 1. Do not change the initial settings (setting values) of these signals by software.
Note 2. The base address for the PL310 registers is H'1F003000. For the details and overview of the registers, see CoreLink™ Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.

5. LSI Internal Bus

5.1 LSI Internal Bus

5.1.1 Configuration

This LSI has two main buses: the north main bus where peripheral modules are connected and the south main bus where on-chip RAM and external ROM and RAM are connected. Figure 5.1 is a schematic diagram of the internal buses.

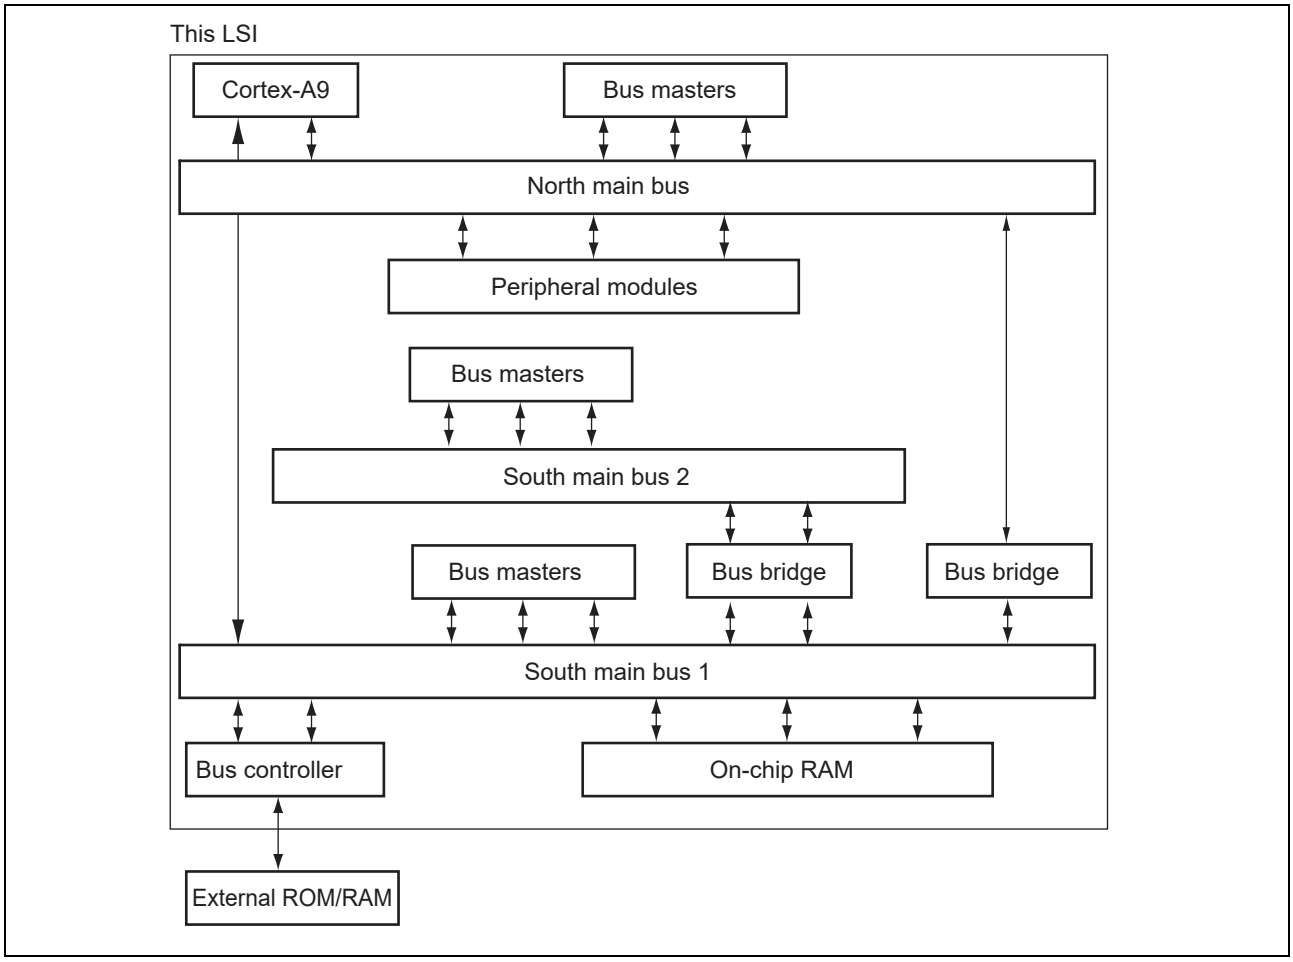

Figure 5.1 Schematic Diagram of LSI Internal Bus

5.1.2 Operation

Cortex-A9 has separate interfaces for the north main bus and south main bus 1. The addresses assigned to the north main bus are accessed through the north main bus interface, and those assigned to the south main bus 1 are accessed through the south main bus 1 interface.

When a bus master connected to the north main bus, except for Cortex-A9, accesses the on-chip RAM or external ROM or RAM, access is executed through the bus bridge for access from the north main bus to the south main bus. The bus masters connected to the south main buses 1 or 2 cannot access an address assigned to the north main bus.

5.2 North Main Bus

5.2.1 Configuration

Various peripheral modules are connected to the north main bus. Figure 5.2 shows the configuration of the north main bus.

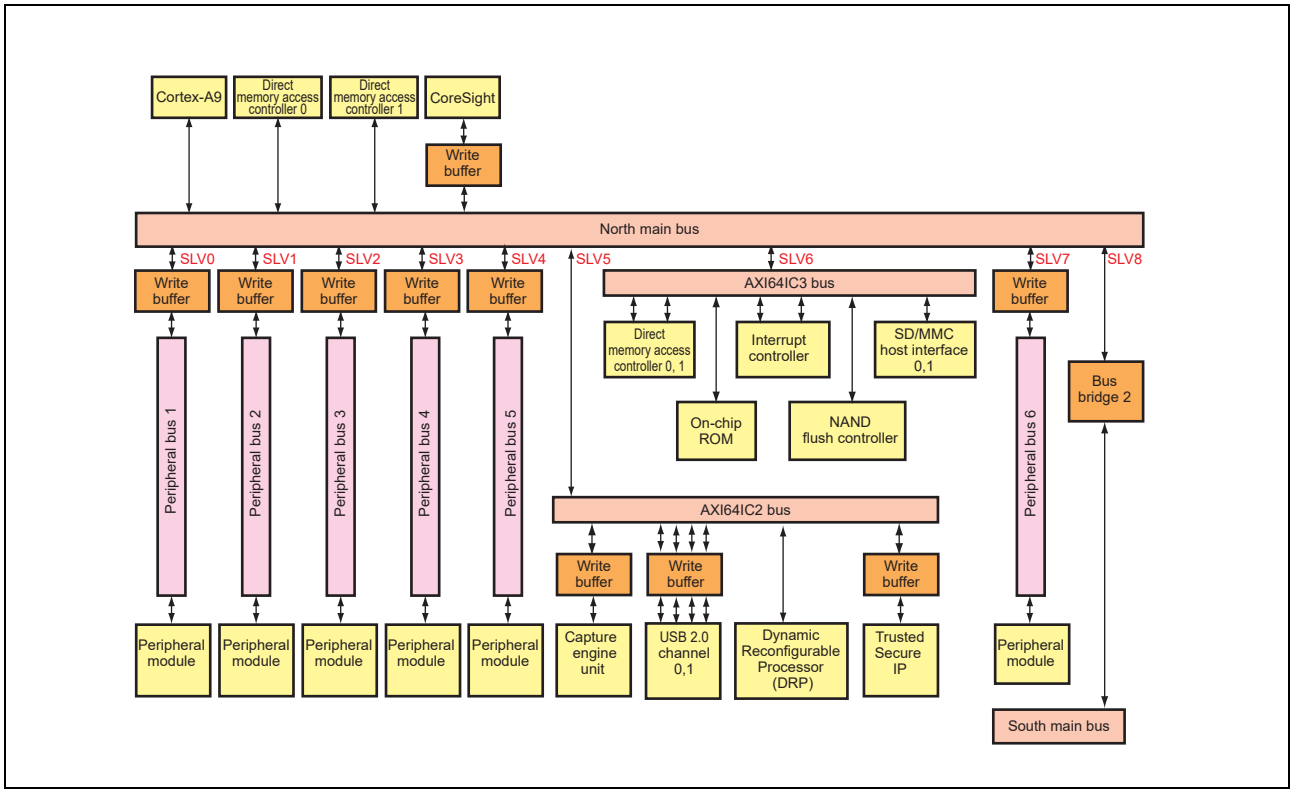

Figure 5.2 North Main Bus Configuration

5.2.2 Features

Table 5.1 shows the features of the north main bus.

Table 5.1 North Main Bus

Item	Description
Bus protocol	AMBA® AXI protocol
Bus system configuration	AXI interconnect with multi-layer configuration for all channels
Bus clock frequency	Bφ
Bus width	64 bits
Arbitration	Round robin

5.2.3 Peripheral Buses

Table 5.2 is a list of the peripheral buses connected to the north main bus.

Table 5.2 List of Peripheral Buses

Item	Description
Peripheral bus 1	
Bus clock frequency	P0φ
Bus width	32 bits
Connected peripheral modules	Realtime clock channels 0 and 1
	Video display controller 6
	Image renderer (IMR-LS2)
Peripheral bus 2	
Bus clock frequency	P0φ
Bus width	32 bits
Connected peripheral modules	Clock pulse generator
	Interrupt controller
	Direct memory access controller units 0 and 1
	General I/O ports
Peripheral bus 3	
Bus clock frequency	P1φ
Bus width	32 bits
Connected peripheral modules	CANFD interface
	Sprite engine
	OS timers 0 to 2
	I^2C bus interfaces 0 to 3
	Renesas SPDIF interface
	Serial sound interfaces 0 to 3
	Multi-function timer pulse unit 3
	General-purpose PWM timer
	Port output enable
	OTP
Peripheral bus 4	
Bus clock frequency	P1φ
Bus width	32 bits
Connected peripheral modules	Serial communication interface with FIFO channels 0 to 4
	Serial communication interface channels 0 and 1
	Renesas serial peripheral interface channels 0 to 2
	A/D converter
	JPEG codec unit
Peripheral bus 5	
Bus clock frequency	Bφ
Bus width	32 bits
Connected peripheral modules	Ethernet MAC controllers 0 and 1
	2D graphic engine
	MIPI CSI-2 interface
	Video input module
AXI64IC2 and AXI64IC3 buses	

Table 5.2 List of Peripheral Buses

Item	Description
Bus protocol	AMBA AXI protocol

Table 5.5 Address Map

Address	Area	Slave Area Viewed from North Main Bus Masters	Slave area viewed from the AXI64IC4 bus masters	Slave area viewed from the south main bus masters
H'1F00_4000 to H'1F3F_FFFF	Reserved	-		-
H'1F00_3000 to H'1F00_3FFF	IO area	SLV8	SLV0	SLV0
H'1F00_0000 to H'1F00_2FFF				
H'1C00_0000 to H'1EFF_FFFF	Reserved	-		-
H'1800_0000 to H'1BFF_FFFF	Reserved	-	-	-
H'1400_0000 to H'17FF_FFFF	CS5 area (64 Mbytes)	SLV8	SLV0	SLV0
H'1000_0000 to H'13FF_FFFF	CS4 area (64 Mbytes)			
H'0C00_0000 to H'0FFF_FFFF	CS3 area (64 Mbytes)			
H'0800_0000 to H'0BFF_FFFF	CS2 area (64 Mbytes)			
H'0400_0000 to H'07FF_FFFF	CS1 area (64 Mbytes)			
H'0000_0000 to H'03FF_FFFF	CS0 area (64 Mbytes)			

Note 1. Only Cortex-A9 and CoreSight can access this area. If any other north main bus master accesses this area, a decode error will occur.
Note 2. A slave error may occur depending on the CoreSight state.
Note 3. If any address from H'E822_3000 to H'E822_5FFF or from H'E822_C000 to H'E823_FFFF is accessed, a slave error will occur.
Note 4. If any addresses from H'E821_5000 to H'E821_7FFF or from H'E821_C000 to H'E821_FFFF is accessed, a slave error will occur.
Note 5. If the on-chip large-capacity RAM is accessed while access is disabled, a slave error will occur.
Note 6. If the area indicated as " - " is accessed, a decode error or a slave error will occur.
Note 7. I/O areas should be accessed in the size specified for each slave module.

5.5 Address Remapping

5.5.1 Overview

Execution in Cortex-A9 jumps to an exception vector placed in addresses H'0000_0000 to H'0000_001C when an exception such as a reset or an interrupt occurs. The interrupt response time depends on the time to access the memory connected to this area, and when low-speed memory is connected, the overhead is large. To avoid this, the exception vectors can be remapped to the on-chip high-speed RAM by using the MMU or vector base address register, or the address remapping function can be used to allocate the addresses where the exception vectors are placed to the on-chip high-speed RAM.

Figure 5.4 show the address maps before and after address remapping.

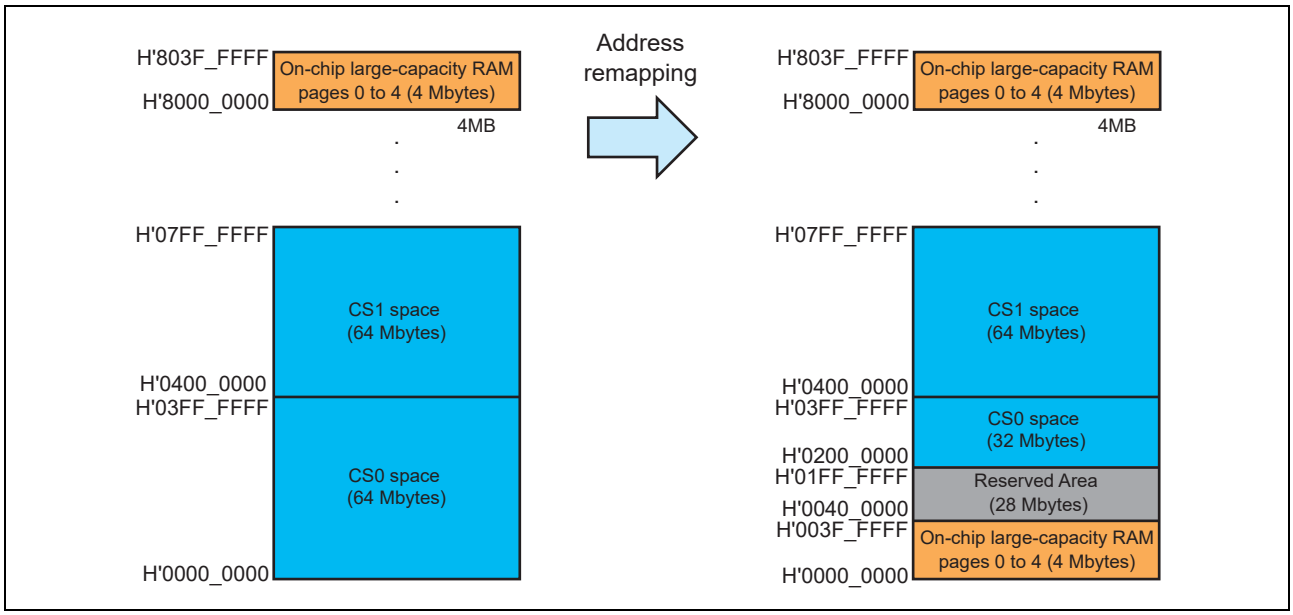

Figure 5.4 Address Remapping

5.5.2 Operation

Addresses are remapped by setting the AXI128 bit in the remap register to 0. After address remapping, pages 0 to 4 of the on-chip large-capacity RAM are allocated to addresses H'0000_0000 to H'003F_FFFF.
During address remapping, access to addresses H'0000_0000 to H'003F_FFFF is prohibited. Accordingly, to modify the remap register, use the following steps.

(1) Stop the bus masters except for Cortex-A9, or make settings so that addresses H'0000_0000 to H'003F_FFFF are never accessed.
(2) Execute a program outside addresses H'0000_0000 to H'003F_FFFF.
(3) After modifying the value of the remap register, execute a dummy read of the remap register.

5.6 AXI Interconnect

5.6.1 Configuration

The AXI interconnect in this LSI has a multi-layer configuration in all channels.
Figure 5.5 shows a conceptual diagram of the AXI interconnect configuration.

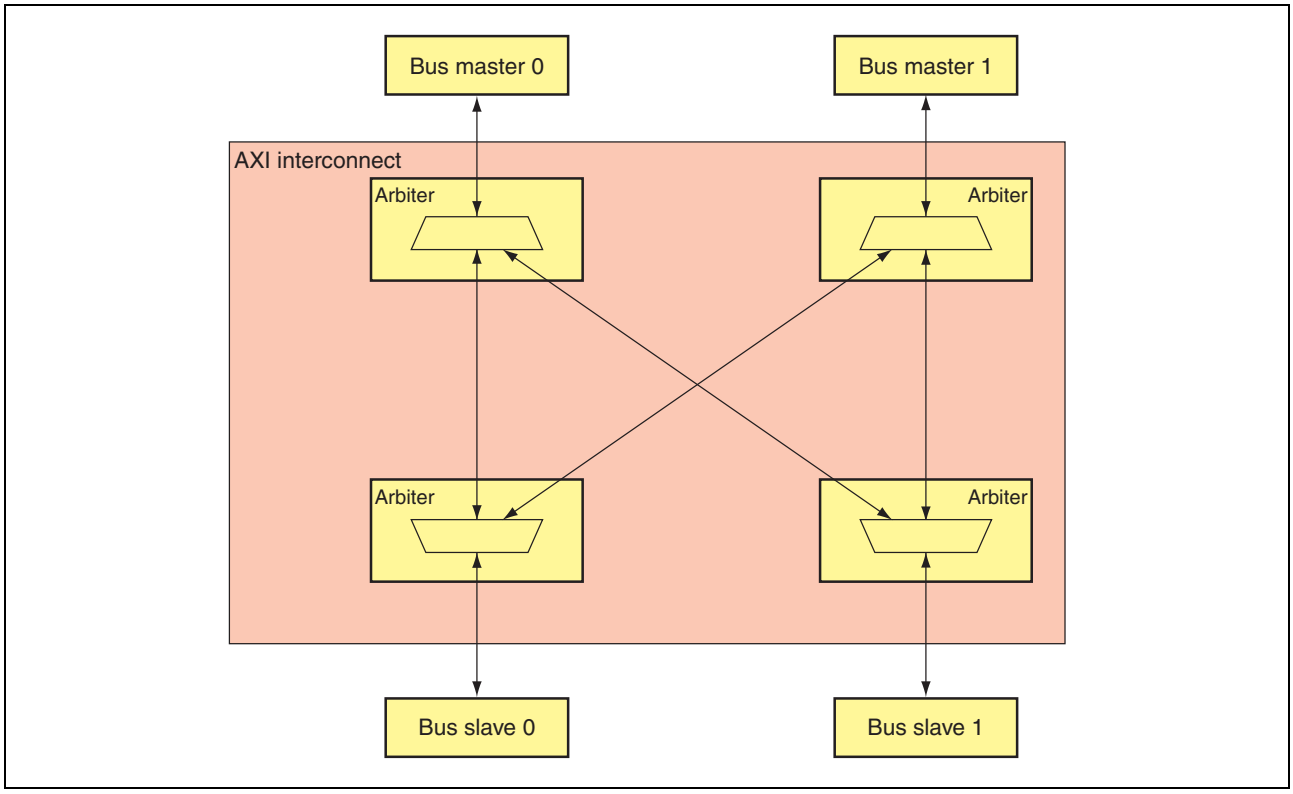

Figure 5.5 Conceptual Diagram of AXI Interconnect Configuration

5.6.2 Operation

In the AXI interconnect, the necessary wiring is prepared for connection between all bus masters and all bus slaves in all channels. When bus masters and slaves access bus slaves and masters, transfer will proceed after bus arbitration by the arbiter. The bus mastership priority changes in a round-robin manner. When multiple bus masters or slaves access different bus slaves or masters, multiple accesses can be executed in parallel. However, when multiple bus masters or slaves access a single bus slave or master at the same time, the bus arbiter executes bus arbitration. When a bus master or slave cannot obtain the bus mastership, it enters a wait state until the bus master or slave that has the bus mastership completes transfer unless the access destination bus master or slave cannot accept multiple transfers. When the destination bus master or slave can accept multiple transfers, bus arbitration is done again with the next transfer timing.

5.7 Bus Bridges

Access from the north main bus to the south main bus and access to the AXI64IC4 bus from the south main bus are executed through a bus bridge. There is only one bus bridge used for access to the south main bus from the north main bus. There are two bus bridges used for access to the south main bus from the AXI64IC4 bus and which bus bridge is used is determined depending on the slave area to be accessed. For assignment of the slave areas to be accessed, see Table 5.5.
Each bus bridge can accept up to eight transfers at the same time. Out-of-order transfer is also supported. Therefore, when access to low-speed external ROM and access to on-chip high-speed RAM from different bus masters occur sequentially in this order, the on-chip RAM access can be done without waiting for completion of the previous external ROM access completion.

5.8 AXI Protocol Control Signals

The AXI protocol control signals can be set as desired for each bus master. For details of the AXI protocol control signals, refer to the AMBA AXI Protocol Specification prepared by Arm Ltd.

5.8.1 Bus Masters other than Cortex-A9, CoreSight, and the Direct Memory Access Controller

(1) Cache control signals (ARCACHE[3:0], AWCACHE[3:0])

Use the AXI bus control register (AXIBUSCTL) to make settings of the ARCACHE[3:0] and AWCACHE[3:0] signals for each bus master. Be sure to make settings while the target bus master does not use the AXI bus.

(2) Response signals (RRESP[1:0], BRESP[1:0])

Use the AXI bus response error status register (AXIRERRST) to read the RRESP[1:0] and BRESP[1:0] signals received by each bus master. The register value is updated when a response error occurs. The status register value can be cleared to 00 through the AXI bus response error clear register (AXIRERRCLR).
In addition, enabling interrupts through the AXI bus response error interrupt control register (AXIRERRCTL) allows an interrupt to be generated when a response error occurs.
This interrupt should be used only for debugging purposes. Make sure that no response error occurs during system operation.

(3) Protection unit information (ARPROT[2:0], AWPROT[2:0])

Use the master access control register (MSTACCCTL) to make settings of the ARPROT[1] and AWPROT[1] signals for each bus master. Be sure to make settings while the target bus master does not use the AXI bus. Note that signals ARPROT[2], ARPROT[0], AWPROT[2], and AWPROT[0] are fixed as follows and cannot be modified.
ARPROT[2], AWPROT[2]: 0 (data access)
ARPROT[0], AWPROT[0]: 0 (normal access)

(4) Atomic access (ARLOCK[1:0], AWLOCK[1:0])

Signals ARLOCK[1:0] and AWLOCK[1:0] are fixed as follows and cannot be modified.
ARLOCK[1:0], AWLOCK[1:0]: 00 (normal access)

5.8.2 Cortex-A9

For details on the Cortex-A9, refer to the Arm Architecture Reference Manual.

5.8.3 CoreSight

For details on CoreSight, refer to the technical reference manual issued by Arm Ltd.
The bus master side (AHB access port) of CoreSight is connected to the main bus via the AHB-AXI bus conversion circuit.
The signals are converted as follows for connection to the AXI bus.

(1) Cache control (ARCACHE[3:0], AWCACHE[3:0])

ARCACHE[3], AWCACHE[3]: 0 when HPROT[3] is 0, 1 when HPROT[3] is 1.
ARCACHE[2], AWCACHE[2]: 0 when HPROT[3] is 0, 1 when HPROT[3] is 1.
ARCACHE[1], AWCACHE[1]: Value of HPROT[3] (cacheable)
ARCACHE[0], AWCACHE[0]: Value of HPROT[2] (bufferable)

(2) Response unit (RRESP[1:0], BRESP[1:0])

OKAY is returned when RRESP[1:0] and BRESP[1:0] are 00 or 01.
ERROR is returned when RRESP[1:0] and BRESP[1:0] are 10 or 11.

(3) Protection unit information (ARPROT[2:0], AWPROT[2:0])

ARPROT[2], AWPROT[2]: Inverse of HPROT[0] (data/opcode)
ARPROT[1], AWPROT[1]: Value of HPROT[6] (nonsecure/secure)
ARPROT[0], AWPROT[0]: Value of HPROT[1] (privileged)

(4) Atomic access (ARLOCK[1:0], AWLOCK[1:0])

ARLOCK[1:0], AWLOCK[1:0]: Fixed to 00 (normal access)

5.8.4 Direct Memory Access Controller

For details on the direct memory access controller, refer to section 9, Direct Memory Access Controller.

5.8.5 Slave Area

The control signals are handled as follows by the modules in the slave area.

(1) Cache control (ARCACHE[3:0], AWCACHE[3:0])

The secondary cache and write buffer refer to these signals. Other modules in the slave area do not refer to them.

(2) Response unit (RRESP[1:0], BRESP[1:0])

See Table 5.5.

(3) Protection unit information (ARPROT[2:0], AWPROT[2:0])

ARPROT[2], AWPROT[2] (instruction/data): The modules in the slave area do not refer to these signals.
ARPROT[1], AWPROT[1] (non-secure/secure): The interrupt controller and secondary cache refer to these signals. For details, refer to the technical reference manual issued by Arm Ltd.
The slave access control registers (SLVACCCTL0 to SLVACCCTL4) are available to specify whether secure access to some modules* in the slave area other than the interrupt controller and secondary cache is only allowed or not. When the respective bit in the slave access controlling register is set to 0 (enabling only secure access), secure access (access with ARPROT[1] or AWPROT[1] is set to 0) is only allowed and non-secure access (access with ARPROT[1] or AWPROT[1] is set to 1) is not allowed. If a non-secure access is attempted when the given bit is set to 0, ERROR (slave error or decode error) is returned.
ARPROT[0], AWPROT[0] (privileged/user): The modules in the slave area do not refer to these signals.

Note: • Secure access is only allowed for the following modules in the slave area; direct memory access controller unit 0, realtime clock channel 0, on-chip ROM, internal bus (address range from H'FCFE_9000 to H'FCFE_97FF), and OTP.
• Secure access or non-secure access is allowed for the following modules in the slave area; direct memory access controller unit 1, realtime clock channel 1, and internal bus (address range from H'FCFE_8000 to H'FCFE_87FF).

(4) Atomic access (ARLOCK[1:0], AWLOCK[1:0])

This LSI does not support atomic access. Signals ARLOCK[1:0] and AWLOCK[1:0] should be fixed to 00 for normal access by the bus master.*

Note: * This restriction means that instructions for exclusive access (LDREX, STREX, LDREXB, STREXB, LDREXD, STREXD, LDREXH, STREXH) and semaphore instructions (SWP, SWPB) cannot be used by the Cortex-A9 in the internal non-cacheable areas.

5.9 Write Buffers

A write buffer is provided at each connection between the north main bus and a peripheral bus and at each connection between the AXI64IC2 bus and some slave modules.
When the write buffer proceeds writing with the AWCACHE[1:0] cache control signals being set to cache-enabled or buffer-enabled (either of the AWCACHE[1:0] signals is set to 1), it sends a write completion response to the bus master before accessing the slave area under the write buffer.
At this time, even if a slave error response is returned from the slave area to be accessed, it is ignored. However, reception of a slave error response during writing can be notified to the interrupt controller by the interrupt signal.
Note that the write buffers connected between the AXI64IC2 bus and slave modules do not receive the slave error response, so the interrupt signal is not generated.
A write buffer is also provided at each connection between some bus master modules and the north main bus and south main buses 1 and 2. These write buffers always return the OKAY response to the bus master modules regardless of the settings of the cache control signals AWCACHE[1:0] in response to the decode error or slave error from the modules in the slave area during writing. However, reception of an error response during writing can also be notified to the interrupt controller by the interrupt signal. For details on the interrupt signals for the write buffers, see section 5.12, Interrupt Request.

5.10 Control Over the Order of Access to the Memory and I/O Areas

In access to the memory and I/O areas, the order with which write instructions appear in the software and the order in which the details of the actual instructions are reflected do not necessarily match. This depends on factors such as the settings for memory attributes, bus configuration, write-back, and so on.
In Figure 5.2, for example, in a case where writing to the register of a peripheral module connected to peripheral bus 2 after writing to the register of a peripheral modules connected to peripheral bus 1 is required, preserving the desired order in which instructions are written in the software may not be possible when the I/O area for peripheral modules connected to peripheral bus 1 has the bufferable attribute. This is because the buffer has to return a response signal before actual access to peripheral bus 1.
Furthermore, even in the case of settings where caching is disabled for the I/O area for peripheral modules connected to peripheral bus 1 and the area has the non-bufferable attribute, preserving the order may still not be possible in cases where actually reflecting the written value in the peripheral module takes a long enough time.
Accordingly, in cases requiring control over the order of processing, add processing to set suitable attributes for memory and, as required, to dummy-read the same register after writing to it.

5.11 Register Descriptions

Table 5.6 shows the registers related to the internal bus.

Table 5.6 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
BSID register	BSID	R	H'083B6447	H'FCFE_8004	32

Initial Value :	0	0	0	0	1	0	0	0	0	0	1	1	1	0	1	1
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DID[15:0]															
Initial Value :	0	1	1	0	0	1	0	0	0	1	0	0	0	1	1	1
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DID[31:0]	H’083B6447	R	Device ID These bits indicate the device ID of the RZ/A2 series products. Note that the higher-order four bits may be changed according to the chip version.

5.11.2 Remap Register (RMPR)

This register controls the address remapping function.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AXI 128
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	AXI128	1	R/W	AXI128 Address Remapping This bit enables or disables allocation of addresses H’0000_0000 to H'003F_FFFF to on-chip RAM pages 0 to 4. 0: Address remapping is enabled. 1: Address remapping is disabled. Note: The addresses H'0040_0000 to H'01FF_FFFF are reserved areas.

5.11.3 AXI Bus Control Register 0 (AXIBUSCTL0)

This register controls the cache operation for the JPEG codec unit and Ethernet MAC controller.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	JCUARCACHE[3:0]				—	—	—	—	JCUAWCACHE[3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ETHAXCACHE [1:0]	
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	JCU ARCACHE [3:0]	0000	R/W	ARCACHE[3:0] Signals for JPEG Codec Unit These bits specify the system cache operation when the JPEG codec unit performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the JPEG codec unit. Modify the values of these bits only while the JPEG codec unit does not use the internal bus.
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	JCU AWCACHE [3:0]	0000	R/W	AWCACHE[3:0] Signals for JPEG Codec Unit These bits specify the system cache operation when the JPEG codec unit performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the JPEG codec unit. Modify the values of these bits only while the JPEG codec unit does not use the internal bus.
15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ETH AXCACHE [1:0]	All 0	R/W	AWCACHE[3:0] and ARCACHE[3:0] Signals for Ethernet MAC Controller These bits specify the system cache operation when the Ethernet MAC controller performs read/write access. The values of these bits are used as the AWCACHE[3:0] and ARCACHE[3:0] signals for the Ethernet MAC controller. The value of the ETHAXCACHE[0] is used as the ARCACHE[0] and AWCACHE[0] signals. When ETHAXCACHE[1] is set to 0, ARCACHE[3:1] and AWCACHE[3:1] are all 0. When ETHAXCACHE[1] is set to 1, ARCACHE[3:1] and AWCACHE[3:1] are all 1. Modify the values of these bits only while the Ethernet MAC controller does not use the internal bus.

5.11.4 AXI Bus Control Register 1 (AXIBUSCTL1)

This register controls the cache operation for the distortion correction engine (IMR-LS2), and MIPI CSI-2 interface.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	IMR20ARCACHE[3:0]				—	—	—	—	IMR20AWCACHE[3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	VINAWCACHE[3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	IMR20 ARCACHE [3:0]	0000	R/W	ARCACHE[3:0] Signals for Image Renderer (IMR-LS2) These bits specify the system cache operation when image renderer (IMR-LS2) performs read access. The values of these bits are used as the ARCACHE[3:0] signals for image renderer (IMR-LS2). Modify the values of these bits only while image renderer (IMR-LS2) does not use the internal bus.
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	IMR20 AWCACHE [3:0]	0000	R/W	AWCACHE[3:0] Signals for Image Renderer (IMR-LS2) These bits specify the system cache operation when image renderer (IMR-LS2) performs write access. The values of these bits are used as the AWCACHE[3:0] signals for image renderer (IMR-LS2). Modify the values of these bits only while image renderer (IMR-LS2) does not use the internal bus.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	VIN AWCACHE [3:0]	0000	R/W	AWCACHE[3:0] Signals for Video Input Module These bits specify the system cache operation when the video input module performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the video input module. Modify the values of these bits only while the video input module does not use the internal bus.

5.11.5 AXI Bus Control Register 2 (AXIBUSCTL2)

This register controls the cache operation for the capture engine unit.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CEUAWCACHE[3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CEU AWCACHE [3:0]	0000	R/W	AWCACHE[3:0] Signals for Capture Engine Unit These bits specify the system cache operation when capture engine unit performs write access. The values of these bits are used as the AWCACHE[3:0] signals for capture engine unit. Modify the values of these bits only while capture engine unit does not use the internal bus.

5.11.6 AXI Bus Control Register 3 (AXIBUSCTL3)

This register controls the cache operation for the SD/MMC host interface.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	SDMMC0ARCACHE[3:0]				—	—	—	—	SDMMC0AWCACHE[3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SDMMC1ARCACHE[3:0]				—	—	—	—	SDMMC1AWCACHE[3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	SDMMC0 ARCACHE [3:0]	0000	R/W	ARCACHE[3:0] Signals for SD/MMC Host Interface 0 These bits specify the system cache operation when the SD/MMC host interface 0 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the SD/MMC host interface 0. Modify the values of these bits only while the SD/MMC host interface 0 does not use the internal bus.
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	SDMMC0 AWCACHE [3:0]	All 0	R/W	AWCACHE[3:0] Signals for SD/MMC Host Interface 0 These bits specify the system cache operation when the SD/MMC host interface 0 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the SD/MMC host interface 0. Modify the values of these bits only while the SD/MMC host interface 0 does not use the internal bus.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	SDMMC1 ARCACHE [3:0]	All 0	R/W	ARCACHE[3:0] Signals for SD/MMC Host Interface 1 These bits specify the system cache operation when the SD/MMC Host Interface 1 performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the SD/MMC host interface 1. Modify the values of these bits only while the SD/MMC host interface 1 does not use the internal bus.
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	SDMMC1 AWCACHE [3:0]	0000	R/W	AWCACHE[3:0] Signals for SD/MMC Host Interface 1 These bits specify the system cache operation when the SD/MMC host interface 1 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the SD/MMC host interface 1. Modify the values of these bits only while the SD/MMC host interface 1 does not use the internal bus.

5.11.7 AXI Bus Control Register 4 (AXIBUSCTL4)

This register controls the cache operation for the NAND flash controller and dynamic reconfigurable processor (DRP).

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	NANDARCACHE[3:0]				—	—	—	—	NANDAWCACHE[3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DRPARCACHE[3:0]				—	—	—	—	DRPAWCACHE[3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	NAND ARCACHE [3:0]	0000	R/W	ARCACHE[3:0] Signals for NAND flash controller These bits specify the system cache operation when the NAND flash controller performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the NAND flash controller. Modify the values of these bits only while the NAND flash controller does not use the internal bus.
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	NAND AWCACHE [3:0]	0000	R/W	AWCACHE[3:0] Signals for NAND flash controller These bits specify the system cache operation when the NAND flash controller performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the NAND flash controller. Modify the values of these bits only while the NAND flash controller does not use the internal bus.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	DRP ARCACHE [3:0]	0000	R/W	ARCACHE[3:0] Signals for DRP These bits specify the system cache operation when the DRP performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the DRP. Modify the values of these bits only while the DRP does not use the internal bus. The setting of these bits is only effective for products with a DRP. For products without a DRP, always write 0 to these bits.
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	DRP AWCACHE [3:0]	0000	R/W	AWCACHE[3:0] Signals for DRP These bits specify the system cache operation when the DRP performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the DRP. Modify the values of these bits only while the DRP does not use the internal bus. The setting of these bits is only effective for products with a DRP. For products without a DRP, always write 0 to these bits.

5.11.8 AXI Bus Control Register 5 (AXIBUSCTL5)

This register controls the cache operation for the 2D Drawing Engine.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	D2D0AXCACHE [1:0]	
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	D2D1AXCACHE [1:0]	
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	D2D0 AXCACHE [1:0]	All 0	R/W	AWCACHE[3:0] and ARCACHE[3:0] Signals for 2D Drawing Engine 0 These bits specify the system cache operation when the 2D drawing engine 0 performs read or write access. The values of these bits are used as the AWCACHE[3:0] and ARCACHE[3:0] signals for the media local bus. The D2D0AXCACHE[0] value is used as ARCACHE[0] and AWCACHE[0] without change. When D2D0AXCACHE[1] = 0, ARCACHE[3:1] and AWCACHE[3:1] signals are all set to 0. When D2D0AXCACHE[1] = 1, ARCACHE[3:1] and AWCACHE[3:1] signals are all set to 1. Modify the values of these bits only while the 2D drawing engine 0 does not use the internal bus.
15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	D2D1 AXCACHE [1:0]	All 0	R/W	AWCACHE[3:0] and ARCACHE[3:0] Signals for 2D Drawing Engine 1 These bits specify the system cache operation when the 2D drawing engine 1 performs read or write access. The values of these bits are used as the AWCACHE[3:0] and ARCACHE[3:0] signals for the media local bus. The D2D1AXCACHE[0] value is used as ARCACHE[0] and AWCACHE[0] without change. When D2D1AXCACHE[1] = 0, ARCACHE[3:1] and AWCACHE[3:1] signals are all set to 0. When D2D1AXCACHE[1] = 1, ARCACHE[3:1] and AWCACHE[3:1] signals are all set to 1. Modify the values of these bits only while the 2D drawing engine 1 does not use the internal bus.

5.11.9 AXI Bus Control Register 6 (AXIBUSCTL6)

This register controls the cache operation for video display controller 6.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	VDC601ARCACHE[3:0]				—	—	—	—	VDC601AWCACHE[3:0]			
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	VDC602ARCACHE[3:0]				—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	VDC601 ARCACHE [3:0]	0000	R/W	ARCACHE[3:0] Signals for Video Display Controller 6 IV3-BUS and Sprite Engine (RLED) These bits specify the system cache operation when the IV3-BUS in video display controller 6, or Sprite Engine (RLED) performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV3-BUS in video display controller 6, and Sprite Engine (RLED). Modify the values of these bits only while the video display controller 6 and Sprite Engine (RLED) do not use the internal bus.
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	VDC601 AWCACHE [3:0]	0000	R/W	AWCACHE[3:0] Signals for Video Display Controller 6 IV1-BUS These bits specify the system cache operation when the IV1-BUS in the video display controller 6 performs write access. The values of these bits are used as the AWCACHE[3:0] signals for the IV1-BUS in video display controller 6. Modify the values of these bits only while the video display controller 6 does not use the internal bus.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	VDC602 ARCACHE [3:0]	0000	R/W	ARCACHE[3:0] Signals for Video Display Controller 6 IV5-BUS and Sprite Engine (SU0) These bits specify the system cache operation when the IV5-BUS in the video display controller 6, or Sprite Engine (SU0) performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV5-BUS in video display controller 6, and Sprite Engine (SU0). Modify the values of these bits only while the video display controller 6 and Sprite Engine (SU0) do not use the internal bus.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.10 AXI Bus Control Register 7 (AXIBUSCTL7)

This register controls the cache operation for video display controller 6.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	VDC604ARCACHE[3:0]				—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	VDC604 ARCACHE [3:0]	0000	R/W	ARCACHE[3:0] Signals for Video Display Controller 6 IV6-BUS and Sprite Engine (SU1) These bits specify the system cache operation when the IV6-BUS in the video display controller 6, or Sprite Engine (SU1) performs read access. The values of these bits are used as the ARCACHE[3:0] signals for the IV6-BUS in video display controller 6, and Sprite Engine (SU1). Modify the values of these bits only while the video display controller 6 and Sprite Engine (SU1) do not use the internal bus.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.11 AXI Bus Response Error Interrupt Control Register 0 (AXIRERRCTL0)

This register controls AXI bus response error interrupts.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	JCUR ERREN	—	—	—	—	—	—	—	IMR20R ERREN	—	—	—	VINR ERREN
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CEUR ERREN	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	JCU RERREN	0	R/W	Response Error Interrupt Enable for JPEG Codec Unit Enables or disables interrupt requests when access from the JPEG codec unit generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
27 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	IMR20 RERREN	0	R/W	Response Error Interrupt Enable for Image Renderer (IMR-LS2) Enables or disables interrupt requests when access from image renderer (IMR-LS2) generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VIN RERREN	0	R/W	Response Error Interrupt Enable for Video Input Module Enables or disables interrupt requests when access from the video input module generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CEU RERREN	0	R/W	Response Error Interrupt Enable for Capture Engine Unit Enables or disables interrupt requests when access from capture engine unit generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.12 AXI Bus Response Error Interrupt Control Register 1 (AXIRERRCTL1)

This register controls AXI bus response error interrupts.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SDMMC0 RERREN	—	—	—	SDMMC1 RERREN	—	—	—	NAND RERREN	—	—	—	DRP RERREN
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SDMMC0 RERREN	0	R/W	Response Error Interrupt Enable for SD/MMC Host Interface 0 Enables or disables interrupt requests when access from the SD/MMC host interface 0 generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	SDMMC1 RERREN	0	R/W	Response Error Interrupt Enable for SD/MMC Host Interface 1 Enables or disables interrupt requests when access from the SD/MMC host interface 1 generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	NAND RERREN	0	R/W	Response Error Interrupt Enable for NAND flash controller Enables or disables interrupt requests when access from the NAND flash controller generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	DRP RERREN	0	R/W	Response Error Interrupt Enable for DRP Enables or disables interrupt requests when access from the DRP generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled. The setting of this bit is only effective for products with a DRP. For products without a DRP, always write 0 to this bit.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.13 AXI Bus Response Error Interrupt Control Register 2 (AXIRERRCTL2)

This register controls AXI bus response error interrupts.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	VDC601 RERREN	—	—	—	VDC602 RERREN	—	—	—	—	—	—	—	VDC604 RERREN
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	VDC601 RERREN	0	R/W	Response Error Interrupt Enable for Video Display Controller 6 IV1/3-BUS and Sprite Engine (RLED) Enables or disables interrupt requests when access from the IV1/3-BUS in video display controller 6, or the sprite engine (RLED) generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	VDC602 RERREN	0	R/W	Response Error Interrupt Enable for Video Display Controller 6 IV5-BUS and Sprite Engine (SU0) Enables or disables interrupt requests when access from the IV5-BUS in video display controller 6, or the sprite engine (SU0) generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VDC604 RERREN	0	R/W	Response Error Interrupt Enable for Video Display Controller 6 IV6-BUS and Sprite Engine (SU1) Enables or disables interrupt requests when access from the IV6-BUS in video display controller 6, or the sprite engine (SU1) generates a response error. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.14 AXI Bus Response Error Status Register 0 (AXIRERRST0)

This register indicates occurrence of AXI bus response errors.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	JCURRESP [1:0]		JCUBRESP [1:0]		—	—	—	—	IMR20RRESP [1:0]		IMR20BRESP [1:0]		—	—	VINBRESP [1:0]	
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CEUBRESP [1:0]		—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	JCU RRESP [1:0]	00	R	RRESP[1:0] Signals for JPEG Codec Unit These bits indicate the RRESP[1:0] signals received by the JPEG codec unit. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
29, 28	JCU BRESP [1:0]	00	R	BRESP[1:0] Signals for JPEG Codec Unit These bits indicate the BRESP[1:0] signals received by the JPEG codec unit. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
27 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23, 22	IMR20 RRESP [1:0]	00	R	RRESP[1:0] Signals for Image Renderer (IMR-LS2) These bits indicate the RRESP[1:0] signals received by image renderer (IMR-LS2). The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
21, 20	IMR20 BRESP [1:0]	00	R	BRESP[1:0] Signals for Image Renderer (IMR-LS2) These bits indicate the BRESP[1:0] signals received by image renderer (IMR-LS2). The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	VIN BRESP [1:0]	00	R	BRESP[1:0] Signals for Video Input Module These bits indicate the BRESP[1:0] signals received by the video input module. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	CEU BRESP [1:0]	00	R	BRESP[1:0] Signals for Capture Engine Unit These bits indicate the BRESP[1:0] signals received by capture engine unit. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.15 AXI Bus Response Error Status Register 1 (AXIRERRST1)

This register indicates occurrence of AXI bus response errors.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SDMMC0 RRESP[1:0]		SDMMC0 BRESP[1:0]		SDMMC1 RRESP[1:0]		SDMMC1 BRESP[1:0]		NAND RRESP[1:0]		NAND BRESP[1:0]		DRP RRESP[1:0]		DRP BRESP[1:0]	
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	SDMMC0 RRESP [1:0]	00	R	RRESP[1:0] Signals for SD/MMC Host Interface 0 These bits indicate the RRESP[1:0] signals received by the SD/MMC Host Interface 0. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
29, 28	SDMMC0 BRESP [1:0]	00	R	BRESP[1:0] Signals for SD/MMC Host Interface 0 These bits indicate the BRESP[1:0] signals received by the SD/MMC Host Interface 0. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
27, 26	SDMMC1 RRESP [1:0]	00	R	RRESP[1:0] Signals for SD/MMC Host Interface 1 These bits indicate the RRESP[1:0] signals received by the SD/MMC Host Interface 1. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
25, 24	SDMMC1 BRESP [1:0]	00	R	BRESP[1:0] Signals for SD/MMC Host Interface 1 These bits indicate the BRESP[1:0] signals received by the SD/MMC Host Interface 1. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
23, 22	NAND RRESP [1:0]	00	R	RRESP[1:0] Signals for NAND flash Controller These bits indicate the RRESP[1:0] signals received by the NAND flash controller. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
21, 20	NAND BRESP [1:0]	00	R	BRESP[1:0] Signals for NAND flash Controller These bits indicate the BRESP[1:0] signals received by the NAND flash controller. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
19, 18	DRP RRESP [1:0]	00	R	RRESP[1:0] Signals for DRP These bits indicate the RRESP[1:0] signals received by the DRP. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR Note that these bits are always read as 0 in products without a DRP.

Bit	Bit Name	Initial Value	R/W	Description
17, 16	DRP BRESP [1:0]	00	R	BRESP[1:0] Signals for DRP These bits indicate the BRESP[1:0] signals received by the DRP. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR Note that these bits are always read as 0 in products without a DRP.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.16 AXI Bus Response Error Status Register 2 (AXIRERRST2)

This register indicates occurrence of AXI bus response errors.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VDC601 RRESP[1:0]		VDC601 BRESP[1:0]		VDC602 RRESP[1:0]		—	—	—	—	—	—	VDC604 RRESP[1:0]		—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	VDC601 RRESP [1:0]	00	R	RRESP[1:0] Signals for Video Display Controller 6 Channel 0 IV3-BUS and Sprite Engine (RLED) These bits indicate the RRESP[1:0] signals received by the IV3-BUS in channel 0 of video display controller 6 and the sprite engine (RLED). The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
29, 28	VDC601 BRESP [1:0]	00	R	BRESP[1:0] Signals for Video Display Controller 6 Channel 0 IV1-BUS These bits indicate the BRESP[1:0] signals received by the IV1-BUS in channel 0 of video display controller 6. The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
27, 26	VDC602 RRESP [1:0]	00	R	RRESP[1:0] Signals for Video Display Controller 6 Channel 0 IV5-BUS and Sprite Engine (SU0) These bits indicate the RRESP[1:0] signals received by the IV3-BUS in channel 0 of video display controller 6 and the sprite engine (SU0). The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
25 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19, 18	VDC604 RRESP [1:0]	00	R	RRESP[1:0] Signals for Video Display Controller 6 Channel 0 IV6-BUS and Sprite Engine (SU1) These bits indicate the RRESP[1:0] signals received by the IV6-BUS in channel 0 of video display controller 6 and the sprite engine (SU1). The values of these bits are updated when a response error occurs. 00: OKAY 10: SLVERR 11: DECERR
17 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.17 AXI Bus Response Error Clear Register 0 (AXIRERRCLR0)

This register clears the AXI bus response error status.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	JCURRESPCLR	—	JCUBRESPCLR	—	—	—	—	—	IMR20RRESPCL	—	IMR20BRESPCL	—	—	—	VINBRESPCLR
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R/W	R	R/W	R	R	R	R	R	R/W	R	R/W	R	R	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SERRESPCLR	—	SERBRESPCLR	—	—	—	CEUBRESPCLR	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R/W	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	JCU RRESP CLR	0	R/W	JCURRESP[1:0] Clear Writing 1 to this bit clears the JCURRESP[1:0] bits to 00. This bit is always read as 0.
29	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
28	JCU BRESP CLR	0	R/W	JCUBRESP[1:0] Clear Writing 1 to this bit clears the JCUBRESP[1:0] bits to 00. This bit is always read as 0.
27 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22	IMR20 RRESP CLR	0	R/W	IMR20RRESP[1:0] Clear Writing 1 to this bit clears the IMR20RRESP[1:0] bits to 00. This bit is always read as 0.
21	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
20	IMR20 BRESP CLR	0	R/W	IMR20BRESP[1:0] Clear Writing 1 to this bit clears the IMR20BRESP[1:0] bits to 00. This bit is always read as 0.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VIN BRESP CLR	0	R/W	VINBRESP[1:0] Clear Writing 1 to this bit clears the VINBRESP[1:0] bits to 00. This bit is always read as 0.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	SER RRESP CLR	0	R/W	SERRRESP[1:0] Clear Writing 1 to this bit clears the SERRRESP[1:0] bits to 00. This bit is always read as 0.
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	SER BRESP CLR	0	R/W	SERBRESP[1:0] Clear Writing 1 to this bit clears the SERBRESP[1:0] bits to 00. This bit is always read as 0.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CEU BRESP CLR	0	R/W	CEUBRESP[1:0] Clear Writing 1 to this bit clears the CEUBRESP[1:0] bits to 00. This bit is always read as 0.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.18 AXI Bus Response Error Clear Register 1 (AXIRERRCLR1)

This register clears the AXI bus response error status.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SDMMC0 RRESP CLR	—	SDMMC0 BRESP CLR	—	SDMMC1 RRESP CLR	—	SDMMC1 BRESP CLR	—	NAND RRESP CLR	—	NAND BRESP CLR	—	DRP RRESP CLR	—	DRP BRESP CLR
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	SDMMC0 RRESP CLR	0	R/W	SDMMC0RRESP[1:0] Clear Writing 1 to this bit clears the SDMMC0RRESP[1:0] bits to 00. This bit is always read as 0.
29	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
28	SDMMC0 BRESP CLR	0	R/W	SDMMC0BRESP[1:0] Clear Writing 1 to this bit clears the SDMMC0BRESP[1:0] bits to 00. This bit is always read as 0.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26	SDMMC1 RRESP CLR	0	R/W	SDMMC1RRESP[1:0] Clear Writing 1 to this bit clears the SDMMC1RRESP[1:0] bits to 00. This bit is always read as 0.
25	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
24	SDMMC1 BRESP CLR	0	R/W	SDMMC1BRESP[1:0] Clear Writing 1 to this bit clears the SDMMC1BRESP[1:0] bits to 00. This bit is always read as 0.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	NAND RRESP CLR	0	R/W	NANDRRESP[1:0] Clear Writing 1 to this bit clears the NANDRRESP[1:0] bits to 00. This bit is always read as 0.
21	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
20	NAND BRESP CLR	0	R/W	NANDBRESP[1:0] Clear Writing 1 to this bit clears the NANDBRESP[1:0] bits to 00. This bit is always read as 0.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	DRP RRESP CLR	0	R/W	DRPRRESP[1:0] Clear Writing 1 to this bit clears the DRPRRESP[1:0] bits to 00. This bit is always read as 0. For products without a DRP, always write 0 to this bit.
17	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
16	DRP BRESP CLR	0	R/W	DRPBRESP[1:0] Clear Writing 1 to this bit clears the DRPBRESP[1:0] bits to 00. This bit is always read as 0. For products without a DRP, always write 0 to this bit.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.19 AXI Bus Response Error Clear Register 2 (AXIRERRCLR2)

This register clears the AXI bus response error status.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	VDC601 RRESP CLR	—	VDC601 BRESP CLR	—	VDC602 RRESP CLR	—	—	—	—	—	—	—	VDC604 RRESP CLR	—	—

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	VDC601 RRESP CLR	0	R/W	VDC601RRESP[1:0] Clear Writing 1 to this bit clears the VDC601RRESP[1:0] bits to 00. This bit is always read as 0.
29	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
28	VDC601 BRESP CLR	0	R/W	VDC601BRESP[1:0] Clear Writing 1 to this bit clears the VDC601BRESP[1:0] bits to 00. This bit is always read as 0.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26	VDC602 RRESP CLR	0	R/W	VDC602RRESP[1:0] Clear Writing 1 to this bit clears the VDC602RRESP[1:0] bits to 00. This bit is always read as 0.
25 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18	VDC604 RRESP CLR	0	R/W	VDC604RRESP[1:0] Clear Writing 1 to this bit clears the VDC604RRESP[1:0] bits to 00. This bit is always read as 0.
17 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.20 Master Access Control Register 0 (MSTACCCTL0)

This register controls the access attribute when the master module accesses the slave area.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	JCU ARNS	—	—	—	JCU AWNS	—	—	—	—	—	—	—	ETH AxNS	—
Initial value :	0	0	1	0	0	0	1	0	0	0	0	0	0	0	1	0
R/W :	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R/W	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	IMR20 ARNS	—	—	—	IMR20 AWNS	—	—	—	—	—	—	—	VIN AWNS	—
Initial value :	0	0	1	0	0	0	1	0	0	0	0	0	0	0	1	0
R/W :	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	JCU ARNS	1	R/W	JPEG Codec Unit Access Attribute when Reading This bit specifies access attribute when the JPEG codec unit performs read access. The value of this bit is used as the ARPROT[1] signal for the JPEG codec unit. 0: Secure access 1: Non-secure access Modify the value of this bit only while the JPEG codec unit does not use the internal bus.
28 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	JCU AWNS	1	R/W	JPEG Codec Unit Access Attribute when Writing This bit specifies access attribute when the JPEG codec unit performs write access. The value of this bit is used as the AWPROT[1] signal for the JPEG codec unit. 0: Secure access 1: Non-secure access Modify the value of this bit only while the JPEG codec unit does not use the internal bus.
24 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	ETH AxNS	1	R/W	Ethernet MAC controller Access Attribute when Reading/Writing This bit specifies access attribute when the Ethernet MAC controller performs read/write access. The value of this bit is used as the ARPROT[1]/AWPROT[1] signal for the Ethernet MAC controller. 0: Secure access 1: Non-secure access Modify the value of this bit only while the Ethernet MAC controller does not use the internal bus.
16 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	IMR20 ARNS	1	R/W	Image Renderer (IMR-LS2) Access Attribute when Reading This bit specifies access attribute when the Image Renderer (IMR-LS2) performs read access. The value of this bit is used as the ARPROT[1] signal for the Image Renderer (IMR-LS2) . 0: Secure access 1: Non-secure access Modify the value of this bit only while the Image Renderer (IMR-LS2) does not use the internal bus.
12 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9	IMR20 AWNS	1	R/W	Image Renderer (IMR-LS2) Access Attribute when Writing This bit specifies access attribute when the Image Renderer (IMR-LS2) performs write access. The value of this bit is used as the ARPROT[1] signal for the Image Renderer (IMR-LS2) . 0: Secure access 1: Non-secure access Modify the value of this bit only while the Image Renderer (IMR-LS2) does not use the internal bus.
8 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	VIN AWNS	1	R/W	Video Input Module Access Attribute when Writing This bit specifies access attribute when the Video Input Module performs write access. The value of this bit is used as the ARPROT[1] signal for the Video Input Module. 0: Secure access 1: Non-secure access Modify the value of this bit only while the Video Input Module does not use the internal bus.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

5.11.21 Master Access Control Register 1 (MSTACCCTL1)

This register controls the access attribute when the master module accesses the slave area.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CEU AWNS	—
Initial value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SDMMC 0ARNS	—	—	—	SDMMC 0AWNS	—	—	—	SDMMC 1ARNS	—	—	—	SDMMC 1AWNS	—
Initial value :	0	0	1	0	0	0	1	0	0	0	1	0	0	0	1	0
R/W :	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	CEU AWNS	1	R/W	Capture Engine Unit Access Attribute when Writing This bit specifies access attribute when the Capture Engine Unit performs write access. The value of this bit is used as the AWPROT[1] signal for the Capture Engine Unit. 0: Secure access 1: Non-secure access Modify the value of this bit only while the Capture Engine unit does not use the internal bus.
16 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	SDMMC0 ARNS	1	R/W	SD/MMC host interface channel 0 Access Attribute when Reading This bit specifies access attribute when the SD/MMC host interface channel 0 performs read access. The value of this bit is used as the ARPROT[1] signal for the SD/MMC host interface channel 0. 0: Secure access 1: Non-secure access Modify the value of this bit only while the SD/MMC host interface channel 0 does not use the internal bus.
12 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	SDMMC0 AWNS	1	R/W	SD/MMC host interface channel 0 Access Attribute when Writing This bit specifies access attribute when the SD/MMC host interface channel 1 performs write access. The value of this bit is used as the AWPROT[1] signal for the SD/MMC host interface channel 0. 0: Secure access 1: Non-secure access Modify the value of this bit only while the SD/MMC host interface channel 0 does not use the internal bus.
8 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	SDMMC1 ARNS	1	R/W	SD/MMC host interface channel 1 Access Attribute when Reading This bit specifies access attribute when the SD/MMC host interface channel 1 performs read access. The value of this bit is used as the ARPROT[1] signal for the SD/MMC host interface channel 1. 0: Secure access 1: Non-secure access Modify the value of this bit only while the SD/MMC host interface channel 1 does not use the internal bus.

Bit	Bit Name	Initial Value	R/W	Description
4 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SDMMC1 AWNS	1	R/W	SD/MMC host interface channel 1 Access Attribute when Writing This bit specifies access attribute when the SD/MMC host interface channel 1 performs write access. The value of this bit is used as the AWPROT[1] signal for the SD/MMC host interface channel 1. 0: Secure access 1: Non-secure access Modify the value of this bit only while the SD/MMC host interface channel 1 does not use the internal bus.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

5.11.22 Master Access Control Register 2 (MSTACCCTL2)

This register controls the access attribute when the master module accesses the slave area.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	NAND ARNS	—	—	—	NAND AWNS	—	—	—	DRP ARNS	—	—	—	DRP AWNS	—
Initial value :	0	0	1	0	0	0	1	0	0	0	1	0	0	0	1	0
R/W :	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	D2D0 AxNS	—	—	—	—	—	—	—	D2D1 AxNS	—
Initial value :	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0
R/W :	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	NAND ARNS	1	R/W	NAND flash controller Access Attribute when Reading This bit specifies access attribute when the NAND flash controller performs read access. The value of this bit is used as the ARPROT[1] signal for the NAND flash controller. 0: Secure access 1: Non-secure access Modify the value of this bit only while the NAND flash controller does not use the internal bus.
28 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	NAND AWNS	1	R/W	NAND flash controller Access Attribute when Writing This bit specifies access attribute when the NAND flash controller performs write access. The value of this bit is used as the AWPROT[1] signal for the NAND flash controller. 0: Secure access 1: Non-secure access Modify the value of this bit only while the NAND flash controller does not use the internal bus.
24 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	DRP ARNS	1	R/W	DRP Access Attribute when Reading This bit specifies access attribute when the DRP performs read access. The value of this bit is used as the ARPROT[1] signal for the DRP. 0: Secure access 1: Non-secure access Modify the value of this bit only while the DRP does not use the internal bus. The setting of this bit is only effective for products with a DRP. For products without a DRP, always write 1 to this bit.
20 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	DRP AWNS	1	R/W	DRP Access Attribute when Writing This bit specifies access attribute when the DRP performs write access. The value of this bit is used as the ARPROT[1] signal for the DRP. 0: Secure access 1: Non-secure access Modify the value of this bit only while the DRP does not use the internal bus. The setting of this bit is only effective for products with a DRP. For products without a DRP, always write 1 to this bit.
16 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9	D2D0 AxNS	1	R/W	2D Drawing Engine channel 0 Access Attribute when Reading/Writing This bit specifies access attribute when the 2D Drawing Engine channel 0 performs read/write access. The value of this bit is used as the ARPROT[1]/AWPROT[1] signal for the 2D Drawing Engine channel 0. 0: Secure access 1: Non-secure access Modify the value of this bit only while the 2D Drawing Engine channel 0 does not use the internal bus.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	D2D1 AxNS	1	R/W	2D Drawing Engine channel 1 Access Attribute when Reading/Writing This bit specifies access attribute when the 2D Drawing Engine channel 1 performs read/write access. The value of this bit is used as the ARPROT[1]/AWPROT[1] signal for the 2D Drawing Engine channel 1. 0: Secure access 1: Non-secure access Modify the value of this bit only while the 2D Drawing Engine channel 1 does not use the internal bus.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

5.11.23 Master Access Control Register 3 (MSTACCCTL3)

This register controls the access attribute when the master module accesses the slave area.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	VDC601 ARNS	—	—	—	VDC601 AWNS	—	—	—	VDC602 ARNS	—	—	—	—	—
Initial value :	0	0	1	0	0	0	1	0	0	0	1	0	0	0	0	0
R/W :	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	VDC604 ARNS	—	—	—	—	—
Initial value :	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	VDC601 ARNS	1	R/W	Video Display Controller 6 IV3-BUS and Sprite Engine (RLED) Access Attribute when Reading This bit specifies access attribute when the Video Display Controller 6 IV3-BUS and Sprite Engine (RLED) perform read access. The value of this bit is used as the ARPROT[1] signal for the Video Display Controller 6 IV3-BUS and Sprite Engine (RLED). 0: Secure access 1: Non-secure access Modify the value of this bit only while the Video Display Controller 6 IV3-BUS and Sprite Engine (RLED) do not use the internal bus.
28 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	VDC601 AWNS	1	R/W	Video Display Controller 6 IV1-BUS Access Attribute when Writing This bit specifies access attribute when the Video Display Controller 6 IV1-BUS performs write access. The value of this bit is used as the AWPROT[1] signal for the Video Display Controller 6 IV1-BUS. 0: Secure access 1: Non-secure access Modify the value of this bit only while the Video Display Controller 6 IV3-BUS does not use the internal bus.
24 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	VDC602 ARNS	1	R/W	Video Display Controller 6 IV5-BUS and Sprite Engine (SU0) Access Attribute when Reading This bit specifies access attribute when the Video Display Controller 6 IV5-BUS and Sprite Engine (SU0) perform read access. The value of this bit is used as the ARPROT[1] signal for the Video Display Controller 6 IV5-BUS and Sprite Engine (SU0). 0: Secure access 1: Non-secure access Modify the value of this bit only while the Video Display Controller 6 IV5-BUS and Sprite Engine (SU0) do not use the internal bus.
20 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5	VDC604 ARNS	1	R/W	Video Display Controller 6 IV6-BUS and Sprite Engine (SU1) Access Attribute when Reading This bit specifies access attribute when the Video Display Controller 6 IV6-BUS and Sprite Engine (SU1) perform read access. The value of this bit is used as the ARPROT[1] signal for the Video Display Controller 6 IV6-BUS and Sprite Engine (SU1). 0: Secure access 1: Non-secure access Modify the value of this bit only while the Video Display Controller 6 IV6-BUS and Sprite Engine (SU1) do not use the internal bus.
4 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.24 Master Access Control Register 4 (MSTACCCTL4)

This register controls the access attribute when the master module accesses the slave area.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	USB00 AxNS	—	—	—	—	—	—	—	USB01 AxNS	—
Initial value :	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0
R/W :	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	USB10 AxNS	—	—	—	—	—	—	—	USB11 AxNS	—
Initial value :	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0
R/W :	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	USB00 AxNS	1	R/W	USB 2.0 Host/Function Module channel 0 port 0 Access Attribute when Reading/Writing This bit specifies access attribute when the USB 2.0 Host/Function Module channel 0 port 0 performs read/write access. The value of this bit is used as the ARPROT[1]/AWPROT[1] signal for the USB 2.0 Host/Function Module channel 0 port 0. 0: Secure access 1: Non-secure access Modify the value of this bit only while the USB 2.0 Host/Function Module channel 0 port 0 does not use the internal bus.
24 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	USB01 AxNS	1	R/W	USB 2.0 Host/Function Module channel 0 port 1 Access Attribute when Reading/Writing This bit specifies access attribute when the USB 2.0 Host/Function Module channel 0 port 1 performs read/write access. The value of this bit is used as the ARPROT[1]/AWPROT[1] signal for the USB 2.0 Host/Function Module channel 0 port 1. 0: Secure access 1: Non-secure access Modify the value of this bit only while the USB 2.0 Host/Function Module channel 0 port 1 does not use the internal bus.
16 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	USB10 AxNS	1	R/W	USB 2.0 Host/Function Module channel 1 port 0 Access Attribute when Reading/Writing This bit specifies access attribute when the USB 2.0 Host/Function Module channel 1 port 0 performs read/write access. The value of this bit is used as the ARPROT[1]/AWPROT[1] signal for the USB 2.0 Host/Function Module channel 1 port 0. 0: Secure access 1: Non-secure access Modify the value of this bit only while the USB 2.0 Host/Function Module channel 1 port 0 does not use the internal bus.
8 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	USB11 AxNS	1	R/W	USB 2.0 Host/Function Module channel 1 port 1 Access Attribute when Reading/Writing This bit specifies access attribute when the USB 2.0 Host/Function Module channel 1 port 1 performs read/write access. The value of this bit is used as the ARPROT[1]/AWPROT[1] signal for the USB 2.0 Host/Function Module channel 1 port 1. 0: Secure access 1: Non-secure access Modify the value of this bit only while the USB 2.0 Host/Function Module channel 1 port 1 does not use the internal bus.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

5.11.25 Slave Access Control Register 0 (SLVACCCTL0)

This register specifies whether secure access to the modules in the slave area is only allowed or not.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SYS NS	—	—	—	—	—	VDC60 NS	—	IMR20 NS	—	MTU3 NS	—	GPT NS	—	POE3 NS
Initial value :	0	1	0	0	0	1	0	1	0	1	0	1	0	1	0	1
R/W :	R	R/W	R	R	R	R	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	POEG NS	—	—	—	—	—	—	—	INTC2 NS	—	WDT NS	—	—	—	—
Initial value :	0	1	0	0	0	0	0	1	0	1	0	1	0	0	0	0
R/W :	R	R/W	R	R	R	R	R	R	R	R/W	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	SYS NS	1	R/W	System Control Registers Access Attribute This bit specifies whether secure access to the registers for low-power mode and clock-pulse generator is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the registers for low-power mode and clock-pulse generator are not being accessed.
29 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
25	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
24	VDC60 NS	1	R/W	Video Display Controller 6 Access Attribute This bit specifies whether secure access to the video display controller 6 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the video display controller 6 is not being accessed.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	IMR20 NS	1	R/W	Distortion correction engine (IMR-LS2) Access Attribute This bit specifies whether secure access to the Distortion correction engine (IMR-LS2) is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Distortion correction engine (IMR-LS2) is not being accessed.
21	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
20	MTU3 NS	1	R/W	Multi-function timer pulse unit 3 Access Attribute This bit specifies whether secure access to the Multi-function timer pulse unit 3 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Multi-function timer pulse unit 3 is not being accessed.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
18	GPT NS	1	R/W	General-Purpose PWM Timer Access Attribute This bit specifies whether secure access to the General-Purpose PWM Timer is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the General-Purpose PWM Timer is not being accessed.
17	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
16	POE3 NS	1	R/W	Port Output Enable 3 Access Attribute This bit specifies whether secure access to the Port Output Enable 3 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Port Output Enable 3 is not being accessed.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	POEG NS	1	R/W	Port Output Enable Access Attribute for GPT This bit specifies whether secure access to the port output enable for GPT is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the port output enable for GPT is not being accessed.
13 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	INTC2 NS	1	R/W	Interrupt Controller (other than GIC-400 register) Access Attribute This bit specifies whether secure access to the Interrupt Controller (other than GIC-400 register) is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Interrupt Controller (other than GIC-400 register) is not being accessed.
5	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
4	WDT NS	1	R/W	Watchdog Timer Access Attribute This bit specifies whether secure access to the Watchdog Timer is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Watchdog Timer is not being accessed.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.26 Slave Access Control Register 1 (SLVACCCTL1)

This register specifies whether secure access to the modules in the slave area is only allowed or not.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GPIO NS	—	I2C NS	—	OSTM0 NS	—	OSTM1 NS	—	OSTM2 NS	—	SSIF NS	—	SPDIF NS	—	RCAN NS
Initial value :	0	1	0	1	0	0	0	1	0	1	0	1	0	1	0	1
R/W :	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SE NS	—	—	—	AD NS	—	IRDA NS	—	SCI NS	—	SCIF NS	—	JCU NS	—	RSPI NS
Initial value :	0	1	0	0	0	1	0	1	0	1	0	1	0	1	0	1
R/W :	R	R/W	R	R	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
30	GPIO NS	1	R/W	General I/O ports Access Attribute This bit specifies whether secure access to the General I/O ports is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the General I/O ports is not being accessed.
29	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
28	I^2C NS	1	R/W	I^2C Bus Interface channel 0 to 3 Access Attribute This bit specifies whether secure access to the I^2C Bus Interface channel 0 to 3 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the I^2C Bus Interface channel 0 to 3 is not being accessed.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26	OSTM0 NS	0	R/W	OS Timer channel 0 Access Attribute This bit specifies whether secure access to the OS Timer channel 0 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the OS Timer channel 0 is not being accessed.
25	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
24	OSTM1 NS	1	R/W	OS Timer channel 1 Access Attribute This bit specifies whether secure access to the OS Timer channel 1 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the OS Timer channel 1 is not being accessed.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	OSTM2 NS	1	R/W	OS Timer channel 2 Access Attribute This bit specifies whether secure access to the OS Timer channel 2 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the OS Timer channel 2 is not being accessed.
21	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
20	SSIFNS	1	R/W	Serial Sound Interface Access Attribute This bit specifies whether secure access to the Serial Sound Interface is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Serial Sound Interface is not being accessed.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	SPDIFNS	1	R/W	Renesas SPDIF Interface Access Attribute This bit specifies whether secure access to the Renesas SPDIF Interface is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Renesas SPDIF Interface is not being accessed.
17	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
16	RCANNS	1	R/W	CANFD Interface Access Attribute This bit specifies whether secure access to the CANFD interface is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the CANFD interface is not being accessed.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	SENS	1	R/W	Sprite Engine Access Attribute This bit specifies whether secure access to the Sprite Engine is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Sprite Engine is not being accessed.
13 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10	ADNS	1	R/W	A/D Converter Access Attribute This bit specifies whether secure access to the A/D Converter is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the A/D Converter is not being accessed.
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	IRDANS	1	R/W	IrDA Access Attribute This bit specifies whether secure access to the IrDA is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the IrDA is not being accessed.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	SCINS	1	R/W	Serial Communications Interface channel 0, 1 Access Attribute This bit specifies whether secure access to the Serial Communications Interface channel 0, 1 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Serial Communications Interface channel 0, 1 is not being accessed.
5	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
4	SCIFNS	1	R/W	Serial Communications Interface with FIFO channel 0 to 4 Access Attribute This bit specifies whether secure access to the Serial Communications Interface with FIFO channel 0 to 4 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Serial Communications Interface with FIFO channel 0 to 4 is not being accessed.

Bit	Bit Name	Initial Value	R/W	Description
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	JCU NS	1	R/W	JPEG Codec Unit Access Attribute This bit specifies whether secure access to the JPEG Codec Unit is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the JPEG Codec Unit is not being accessed.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	RSPI NS	1	R/W	Renesas Serial Peripheral Interface channel 0 to 2 Access Attribute This bit specifies whether secure access to the Renesas Serial Peripheral Interface channel 0 to 2 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Renesas Serial Peripheral Interface channel 0 to 2 is not being accessed.

5.11.27 Slave Access Control Register 2 (SLVACCCTL2)

This register specifies whether secure access to the modules in the slave area is only allowed or not.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	ETH NS	—	—	—	D2D NS	—	MIPI NS	—	VIN NS	—	—	—	—	—	—
Initial value :	0	1	0	0	0	1	0	1	0	1	0	1	0	1	0	1
R/W :	R	R/W	R	R	R	R/W	R	R/W	R	R/W	R	R	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	USB00 NS	—	USB01 NS	—	USB10 NS	—	USB11 NS	—	CEU NS	—	DRP NS	—	TSIP NS	—	—
Initial value :	0	1	0	1	0	1	0	1	0	1	0	1	0	0	0	0
R/W :	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	ETH NS	1	R/W	Ethernet MAC controller channel 0/1 Access Attribute This bit specifies whether secure access to the Ethernet MAC controller channel 0/1 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Ethernet MAC controller channel 0/1 is not being accessed.
29 to 27	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
26	D2D NS	1	R/W	2D Drawing Engine Access Attribute This bit specifies whether secure access to the 2D Drawing Engine is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the 2D Drawing Engine is not being accessed.
25	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
24	MIPI NS	1	R/W	MIPI CSI-2 Interface Access Attribute This bit specifies whether secure access to the MIPI CSI-2 Interface is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the MIPI CSI-2 Interface is not being accessed.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	VIN NS	1	R/W	Video Input Module Access Attribute This bit specifies whether secure access to the Video Input Module is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Video Input Module is not being accessed.
21	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
20	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Bit	Bit Name	Initial Value	R/W	Description
17	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
16	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	USB00NS	1	R/W	USB 2.0 Host/Function Module channel 0 port 0 Access Attribute This bit specifies whether secure access to the USB 2.0 Host/Function Module channel 0 port 0 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the USB 2.0 Host/Function Module channel 0 port 0 is not being accessed.
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	USB01NS	1	R/W	USB 2.0 Host/Function Module channel 0 port 1 Access Attribute This bit specifies whether secure access to the USB 2.0 Host/Function Module channel 0 port 1 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the USB 2.0 Host/Function Module channel 0 port 1 is not being accessed.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	USB10NS	1	R/W	USB 2.0 Host/Function Module channel 1 port 0 Access Attribute This bit specifies whether secure access to the USB 2.0 Host/Function Module channel 1 port 0 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the USB 2.0 Host/Function Module channel 1 port 0 is not being accessed.
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	USB11NS	1	R/W	USB 2.0 Host/Function Module channel 1 port 1 Access Attribute This bit specifies whether secure access to the USB 2.0 Host/Function Module channel 1 port 1 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the USB 2.0 Host/Function Module channel 1 port 1 is not being accessed.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	CEUNS	1	R/W	Capture Engine Unit Access Attribute This bit specifies whether secure access to the Capture Engine Unit is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Capture Engine Unit is not being accessed.
5	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
4	DRPNS	1	R/W	DRP Access Attribute This bit specifies whether secure access to the DRP is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the DRP is not being accessed. The setting of this bit is only effective for products with a DRP. For products without a DRP, always write 1 to this bit.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2	TSIPNS	0	R/W	Trusted Secure IP Access Attribute This bit specifies whether secure access to the Trusted Secure IP is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Trusted Secure IP is not being accessed. Note: Always write 0 to this bit in products without the Trusted Secure IP.
1, 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.28 Slave Access Control Register 3 (SLVACCCTL3)

This register specifies whether secure access to the modules in the slave area is only allowed or not.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SDMMC 0NS	—	SDMMC 1NS	—	NAND NS	—	—	—	CS NS	—	—	—	—
Initial value :	0	0	0	1	0	1	0	1	0	0	0	1	0	0	0	0
R/W :	R	R	R	R/W	R	R/W	R	R/W	R	R	R	R/W	R	R	R	R

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value :	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W :	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SDMMC0 NS	1	R/W	SD/MMC host interface channel 0 Access Attribute This bit specifies whether secure access to the SD/MMC host interface channel 0 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the SD/MMC host interface channel 0 is not being accessed.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26	SDMMC1 NS	1	R/W	SD/MMC host interface channel 1 Access Attribute This bit specifies whether secure access to the SD/MMC host interface channel 1 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the SD/MMC host interface channel 1 is not being accessed.
25	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
24	NAND NS	1	R/W	NAND flash controller Access Attribute This bit specifies whether secure access to the NAND flash controller is only allowed or not. 0: Secure access is only allowed./ 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the NAND flash controller is not being accessed.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	CS NS	1	R/W	CoreSight Access Attribute This bit specifies whether secure access to the CoreSight is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the CoreSight is not being accessed.
19 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.11.29 Slave Access Control Register 4 (SLVACCCTL4)

This register specifies whether secure access to the modules in the slave area is only allowed or not.

Bit :	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	BSC NS	—	SPI NS	—	OCTA NS	—	OCTAR NS	—	HYP NS	—	HYPR NS	—	RRAM NS	—	VRAM0 NS
Initial value :	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1
R/W :	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W	R	R/W

Bit :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	VRAM1 NS	—	VRAM2 NS	—	VRAM3 NS	—	VRAM4 NS	—	—	—	—	—	—	—	—
Initial value :	0	1	0	1	0	1	0	1	0	0	0	0	0	0	0	0
R/W :	R	R/W	R	R/W	R	R/W	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	BSC NS	1	R/W	Bus State Controller Access Attribute This bit specifies whether secure access to the Bus State Controller is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Bus State Controller is not being accessed.
29	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
28	SPI NS	1	R/W	SPI Multi I/O bus controller Access Attribute This bit specifies whether secure access to the SPI Multi I/O bus controller is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the SPI Multi I/O bus controller is not being accessed.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26	OCTA NS	1	R/W	Octa Memory Controller Access Attribute This bit specifies whether secure access to the Octa Memory Controller is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Octa Memory Controller is not being accessed.
25	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
24	OCTAR NS	1	R/W	Octa Memory Controller Register Area Access Attribute This bit specifies whether secure access to the Octa Memory Controller Register Area is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the Octa Memory Controller Register Area is not being accessed.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	HYP NS	1	R/W	HyperBus™ Controller Access Attribute This bit specifies whether secure access to the HyperBus™ Controller is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the HyperBus™ Controller is not being accessed.

Bit	Bit Name	Initial Value	R/W	Description
21	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
20	HYPRNS	1	R/W	HyperBus™ Controller Register Area Access Attribute This bit specifies whether secure access to the HyperBus™ Controller Register Area is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the HyperBus™ Controller Register Area is not being accessed.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	RRAMNS	1	R/W	On-Chip Data-Retention RAM Access Attribute This bit specifies whether secure access to the On-Chip Data-Retention RAM is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the On-Chip Data-Retention RAM is not being accessed.
17	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
16	VRAM0NS	1	R/W	On-chip large-capacity RAM page 0 Access Attribute This bit specifies whether secure access to the On-chip large-capacity RAM page 0 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the On-chip large-capacity RAM page 0 is not being accessed.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	VRAM1NS	1	R/W	On-chip large-capacity RAM page 1 Access Attribute This bit specifies whether secure access to the On-chip large-capacity RAM page 1 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the On-chip large-capacity RAM page 1 is not being accessed.
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	VRAM2NS	1	R/W	On-chip large-capacity RAM page 2 Access Attribute This bit specifies whether secure access to the On-chip large-capacity RAM page 2 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the On-chip large-capacity RAM page 2 is not being accessed.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	VRAM3NS	1	R/W	On-chip large-capacity RAM page 3 Access Attribute This bit specifies whether secure access to the On-chip large-capacity RAM page 3 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the On-chip large-capacity RAM page 3 is not being accessed.
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	VRAM4NS	1	R/W	On-chip large-capacity RAM page 4 Access Attribute This bit specifies whether secure access to the On-chip large-capacity RAM page 4 is only allowed or not. 0: Secure access is only allowed. 1: Non-secure access or secure access is allowed. Modify the value of this bit only while the On-chip large-capacity RAM page 4 is not being accessed.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

5.12 Interrupt Request

When a decode error or a slave error occurs as described in the AXI bus response error status register (AXIRERRST), an AXI bus response error interrupt request (PRRI) is issued.
An interrupt request is issued when a response is returned from the bus for which interrupt requests are enabled through the AXI bus response error interrupt control register (AXIRERRCTL). To check the response error type, read the AXI bus response error status register (AXIRERRST). To clear the interrupt request, clear the AXI bus response error status register through the AXI bus response error clear register (AXIRERRCLR).
The write buffer listed in Table 5.7 outputs an interrupt request, when an error response is received during the transfer described in the condition.
The interrupt signal is asserted high for eight cycles of the bus clock (Bφ). See Table 5.7 for the interrupt signals for the write buffers.
This interrupt should be used only for debugging purposes. Make sure that no response error occurs during system operation.

Table 5.7 Interrupt Signals for the Write Buffers

Interrupt signals	Write Buffer Connection Source/Destination	Condition
X2HPERI12_ERRINT	North main bus / Peripheral buses 1 and 2	During write transfer with bufferable attribute
X2HPERI34_ERRINT	North main bus / Peripheral bus 3	
X2HPERI5_ERRINT	North main bus / Peripheral bus 4	
X2HPERI67_ERRINT	North main bus / Peripheral bus 5	
X2HDBGR_ERRINT	North main bus / Peripheral bus 6	
H2XDBG_ERRINT	CoreSight / North main bus	During write or read transfer
H2XETH_ERRINT	Ethernet MAC controller / South main bus 2	
H2XDAV0_ERRINT	2D Drawing Engine 0 / South main bus 1	
H2XDAV1_ERRINT	2D Drawing Engine 1 / South main bus 1	
H2XUSB00_ERRINT	USB 2.0 channel 0 / South main bus 2	
H2XUSB01_ERRINT	USB 2.0 channel 0 / South main bus 2	
H2XUSB10_ERRINT	USB 2.0 channel 1 / South main bus 2	
H2XUSB11_ERRINT	USB 2.0 channel 1 / South main bus 2	

6. Clock Pulse Generator

This LSI has a clock pulse generator that generates a CPU clock (Iφ), image processing clock (Gφ), internal bus clock (Bφ), peripheral clock 1 (P1φ), and peripheral clock 0 (P0φ). The clock pulse generator consists of a crystal oscillator, PLL circuits, and divider circuits.

6.1 Features

- Clock types
  A CPU clock (Iφ); an image processing clock (Gφ); an internal bus clock (Bφ); peripheral clock 1 (P1φ) for the external bus interface; peripheral clock 0 (P0φ) for the on-chip peripheral modules. (CKIO: P1φ or Bφ)
- Frequency change function
  CPU and image processing clock frequencies can be changed independently using the PLL (phase locked loop) circuits and divider circuits within this module. Frequencies are changed by software using frequency control register (FRQCR) settings.
- Clock selection
  The clocks of CKIO, SPI multi I/O bus controller, HyperBus™ controller, and Octa memory controller can be changed by setting register (CKIOSEL, SCLKSEL).
- Power-down mode control
  The clock can be stopped in sleep mode, software standby mode, and deep standby mode, and specific modules can be stopped using the module standby function. For details on clock control in the power-down modes, see section 52, Power-Down Modes.
- SSCG function
  The PLL (phase locked loop) circuit in the clock pulse generator includes an SSCG (spread spectrum clock generator).
  The SSCG can be used to decrease the peak value of EMI (electromagnetic interference) noise by frequency modulation, that is, by slightly modulating the output frequency.
  The specification of the SSCG for this LSI is as follows.
- Specification of SSCG
  (1) Modulation waveform (modulation profile): Triangle wave
  (2) Type of spreading: Down-spreading
  (3) Modulation rate: -2.2%
  (4) Modulation frequency: 20.00 to 24.00 kHz
  (clock mode 0: frequency on the EXTAL pin ÷ 500
  clock mode 1: frequency on the EXTAL pin ÷ 1000)

Figure 6.1 shows a block diagram of the clock pulse generator.

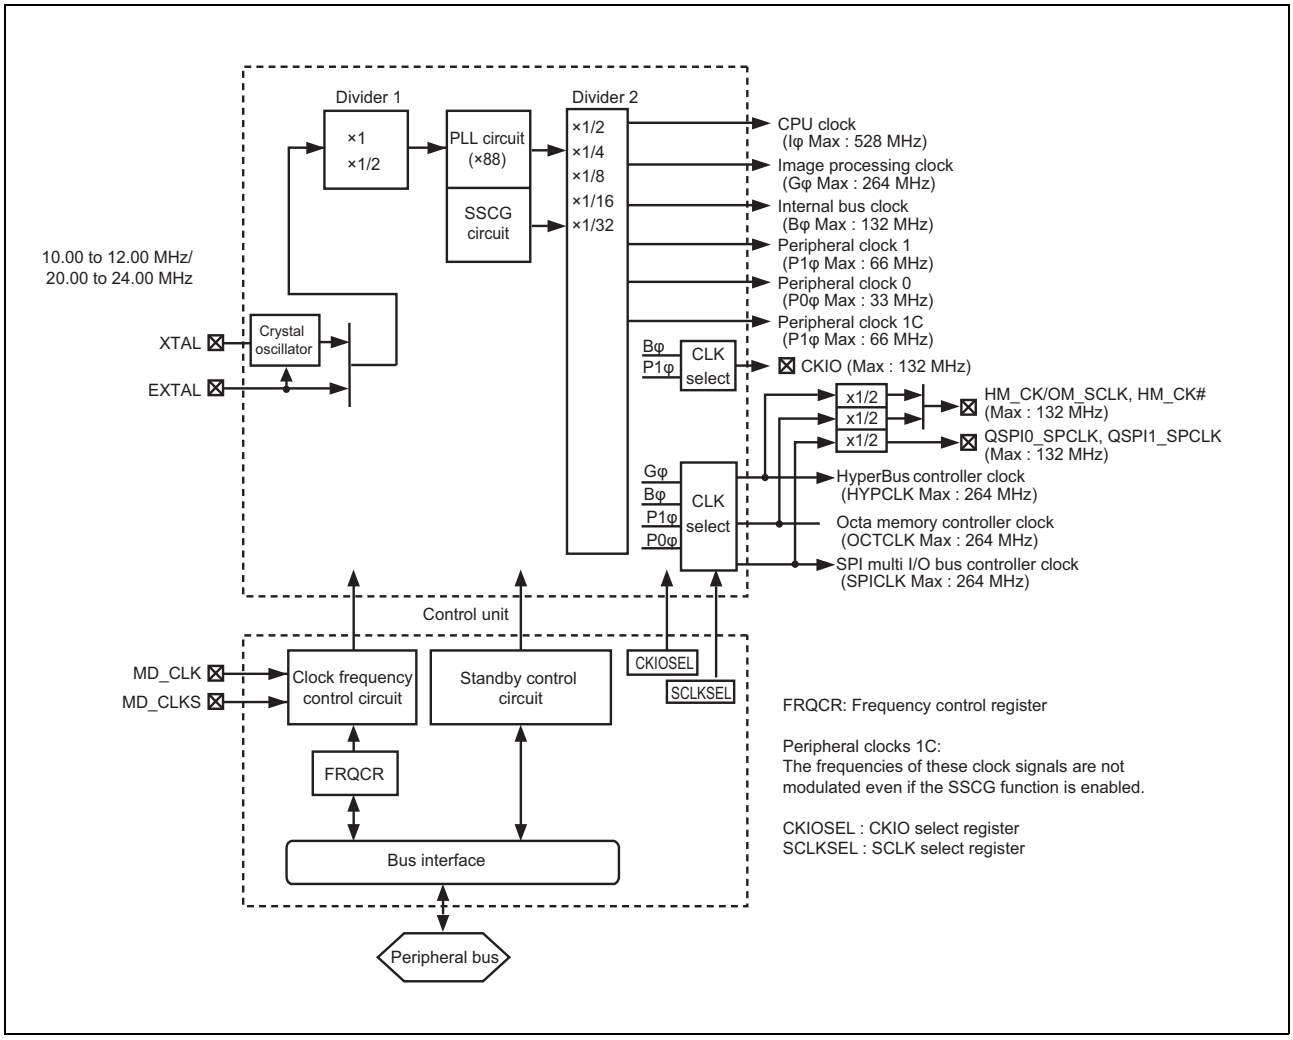

Figure 6.1 Block Diagram

The blocks of this module function as follows:

(1) Crystal Oscillator

A crystal oscillator is connected to the XTAL and EXTAL pins. The frequency range is selected by the clock mode settings.

(2) PLL Circuit

The PLL circuit is capable of multiplying the frequency of the input clock signal from the EXTAL pin by 88.

(3) Divider 1 and Divider 2

The frequency division ratio by divider 1 is one or one half, and is set by the clock mode.
Divider 2 generates a clock signal whose operating frequency can be used for the CPU clock, image processing clock, internal bus clock, peripheral clock 1, and peripheral clock 0. Except for peripheral clock 0, the division ratio is set by the frequency control register (FRQCR). The division ratios for peripheral clock 0 is fixed to 1/32.

(4) Clock Frequency Control Circuit

The clock frequency control circuit controls the clock frequency using the frequency control register (FRQCR).

(5) Standby Control Circuit

The standby control circuit controls the states of the on-chip oscillation circuit and other modules during clock switching, or, software standby or deep standby mode.
In addition, the standby control register is provided to control the power-down mode of other modules. For details on the standby control register, see section 52, Power-Down Modes.

(6) Frequency Control Register (FRQCR)

The frequency control register (FRQCR) has control bits assigned for the following functions: clock output/non-output from the CKIO pin during software standby mode or deep standby mode and the frequency division ratio of the CPU clock (Iφ), the internal bus clock (Bφ), and the peripheral clock 1 (P1φ). The frequency control register (FRQCR) has control bits assigned for the frequency division ratio of the image processing clock (Gφ).

(7) CKIO Select Register (CKIOSEL) / SCLK Select Register (SCLKSEL)

The clock select registers (CKIOSEL, SCLKSEL) have control bits assigned for clock selection of the CKIO, the SPI multi I/O bus controller, the HyperBus controller, and the Octa memory controller.

(8) SSCG Circuit

Operation of the SSCG circuit is switched on or off (enabled or disabled) by the MD_CLKS pin. When the SSCG function is disabled, all of the internal clock frequencies are fixed, i.e. not modulated. When the SSCG function is enabled, the frequencies of clock signals supplied to peripheral modules other than those listed below are modulated.

Peripheral modules to which non-modulated clock signals are supplied:
Multi-function timer pulse unit 3, serial communications interface with FIFO, CAN FD interface, OS timer, general PWM timer, serial communication interface, LVDS output interface (LVDS PLL circuit only), port output enable, and dynamic reconfigurable processor.

6.2 Input/Output Pins

Table 6.1 lists the clock pulse generator pins and their functions.

Table 6.1 Pin Configuration and Functions of the Clock Pulse Generator

Pin Name	Symbol	I/O	Function
Mode control pin	MD_CLK	Input	Switches the frequency range of EXTAL input.
	MD_CLKS	Input	Enables or disables the SSCG circuit.
Crystal input/output pins (clock input pins)	XTAL	Output	Connected to the crystal resonator. (Leave this pin open when the crystal resonator is not in use.)
	EXTAL	Input	Connected to the crystal resonator or used to input external clock.
Clock output pin	CKIO	Output	Clock output pin.

6.3 Clock Mode

Table 6.2 indicates the input/output clock frequency.

Table 6.2 Input/Output Clock Frequency

Mode	MD_CLK Pin Setting	Clock I/O		Divider 1	PLL Circuit	CKIO Frequency
		Source	Output			
0	0	EXTAL/crystal resonator (10MHz to 12MHz)	CKIO	1	ON (x 88)	(EXTAL/crystal) Bφ :x11/x5.5/x2.75 P1φ:x5.5/x2.75
1	1	EXTAL/crystal resonator (20MHz to 24MHz)	CKIO	1/2	ON (x 88)	(EXTAL/crystal) Bφ :x5.5/x2.75/x1.375 P1φ:x2.75/x1.375

This LSI switches the division ratio of the PLL input clock by the setting of the MD_CLKS pin while the RES# pin is being held low.
The SSCG function is switched on or off by the setting of the MD_CLKS pin while the RES# pin is being held low. The following table shows the correspondence between SSCG operation and pin settings. Note that the pin setting does not affect the PLL frequency multipliers and division ratios for individual clock signals.

Table 6.3 SSCG operation settings

MD_CLKS pin setting value	SSCG operation
0	OFF
1	ON

Table 6.4 lists the available frequency range and Table 6.5 lists the usable frequency range of output clock (CKIO).

Table 6.4 Available frequency range

Mode	FRQCR Register Setting Value*1	PLL frequency multiplier: PLL circuit	Internal Clock ratio (I : G : B : P1 : P0)*2	Settable frequency range (MHz) (*3): Input clock	CPU clock (Iφ)	Image processing clock (Gφ)	Internal bus clock (Bφ)	Peripheral clock 1 (P1φ)	Peripheral clock 0 (P0φ)
0	H'x012	ON (×88)	44 : 22 : 11 : 5.5 : 2.75	10.0 to 12.0	440 to 528	220 to 264	110 to 132	55 to 66	27.5 to 33
	H'x112		22 : 22 : 11 : 5.5 : 2.75		220 to 264				
	H'x212		11 : 22 : 11 : 5.5 : 2.75		110 to 132				
	H'x322		5.5 : 11 : 5.5 : 5.5 : 2.75		55 to 66	110 to 132	55 to 66		
	H'x333		5.5 : 5.5 : 2.75 : 2.75 : 2.75			55 to 66	27.5 to 33	27.5 to 33	
1	H'x012	ON (×88)	22 : 11 : 5.5 : 2.75 : 1.375	20.0 to 24.0	440 to 528	220 to 264	110 to 132	55 to 66	27.5 to 33

Table 6.5 Usable frequency range of output clock (CKIO)

CKIO select register (CKIOSEL[1:0]) setting value	External clock (CKIO pin)
00	Bφ (max.132MHz)
01	P1φ (max. 66MHz)

Note 1. x in the FRQCR register setting depends on the set value in bits 12, 13, and 14.
Note 2. The ratio of clock frequencies, where the input clock frequency is assumed to be 1.
Note 3. When using the MIPI CSI-2 interface, be sure to set Gφ = 264 MHz. Gφ is always twice Bφ.
Note 4. When using the Image Renderer, be sure to set FRQCR = H'x012 or H'x112.

Caution: Do not use this LSI with frequency settings other than those in Table 6.4.

6.4 Register Descriptions

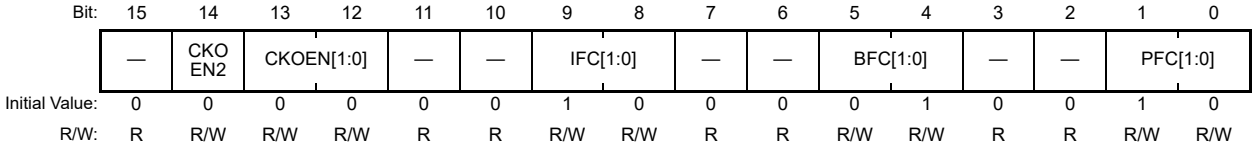
Table 6.6 shows the register configuration of the clock pulse generator.

Table 6.6 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Frequency Control Register	FRQCR	R/W	H'0212	H'FCFE0010	16
CKIO Select Register	CKIOSEL	R/W	H'0001	H'FCFE0100	16
SCLK Select Register	SCLKSEL	R/W	H'0000	H'FCFE0104	16

6.4.1 Frequency Control Register (FRQCR)

FRQCR is a 16-bit readable/writable register used to specify whether a clock is output from the CKIO pin during normal operation mode, change of gain of crystal oscillator for the XTAL pin, software standby mode, deep standby mode, and standby mode cancellation. The register specifies the frequency division ratio for the CPU clock (Iφ), the internal bus clock (Bφ), and the peripheral clock 1 (P1φ) used in the external bus interface. The image processing clock (Gφ) is always twice the internal bus clock (Bφ). FRQCR can be accessed in 16-bit units.



Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	CKOEN2	CKOEN[1:0]		—	—	IFC[1:0]		—	—	BFC[1:0]		—	—	PFC[1:0]	
Initial Value:	0	0	0	0	0	0	1	0	0	0	0	1	0	0	1	0
R/W:	R	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	CKOEN2	0	R/W	Clock Output Enable 2 Specifies whether the CKIO pin outputs clock signals or is fixed to the low level when the gain of the crystal oscillator for the XTAL pin is changed. If this bit is set to 1, the CKIO pin is fixed to the low level when the gain of the crystal oscillator for the XTAL pin is changed. Therefore, the malfunction of an external circuit caused by an unstable CKIO clock while changing the gain of the crystal oscillator for the XTAL pin can be prevented. 0: Unstable clock output 1: Low-level output
13, 12	CKOEN [1:0]	00	R/W	Clock Output Enable These bits specify whether the CKIO pin outputs clock signals, or is set to a fixed level or high impedance (Hi-Z) during normal operation mode, deep standby mode, software standby mode, or cancellation of standby mode. If these bits are set to 01, the CKIO pin is fixed at low during deep standby mode, software standby mode, or cancellation of software standby mode. Therefore, the malfunction of an external circuit caused by an unstable CKIO clock during cancellation of software standby mode can be prevented. Table 6.7 lists CKOEN[1:0] settings.
11, 10	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9, 8	IFC [1:0]	10	R/W	CPU Clock Frequency Division Ratio These bits specify the frequency division ratio of the CPU clock with respect to the output frequency of PLL circuit. Note: See section 6.5.1, Changing the Division Ratio. 00: 1/2 time 01: 1/4 time 10: 1/8 time 11: 1/16 time
7, 6	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	BFC [1:0]	01	R/W	Internal bus clock Frequency Division Ratio These bits specify the frequency division ratio of the internal bus clock with respect to the output frequency of PLL circuit. Note: See section 6.5.1, Changing the Division Ratio. 00: Reserved (setting prohibited) 01: 1/8 time 10: 1/16 time 11: 1/32 time
3, 2	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PFC [1:0]	10	R/W	Frequency division ratio of peripheral clock 1 used in the external bus interface These bits specify the frequency division ratio of the peripheral clock 1 with respect to the output frequency of PLL circuit. Note: See section 6.5.1, Changing the Division Ratio. 00: Reserved (setting prohibited) 01: Reserved (setting prohibited) 10: 1/16 time 11: 1/32 time

Table 6.7 CKOEN[1:0] Settings

Setting	Normal Operation	Software Standby Mode	Deep Standby Mode*
00	Output	Output off (Hi-Z)	Output off (Hi-Z)
01	Output	Low-level output	Low-level output
10	Output	Output (unstable clock output)	Low-level or high-level output
11	Output off (Hi-Z)	Output off (Hi-Z)	Output off (Hi-Z)

Note: Note that the first cycle of the output CKIO clock may be missing after release from deep standby.

6.4.2 CKIO Select Register (CKIOSEL)

CKIOSEL is a 16-bit readable/writable register used to select the CKIO output clock. CKIOSEL can be accessed in 16-bit units.

This register setting can not be processed while accessing the CS0 to CS5 external address spaces. This register setting must be processed by the program on the on-chip RAM.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CKIOSEL[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CKIOSEL[1:0]	01	R/W	CKIO Output Clock Select 00: Bφ Clock output 01: P1φ Clock output 10: Reserved (Setting prohibited) 11: Reserved (Setting prohibited)

6.4.3 SCLK Select Register (SCLKSEL)

SCLKSEL is a 16-bit readable/writable register used to change the frequency of SPI multi I/O bus controller, HyperBus controller, and Octa memory controller. SCLKSEL can be accessed in 16-bit units.
Register setting of SCLKSEL can not be processed while accessing the setting target memory. This register setting must be processed by the program on the on-chip RAM.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OCTCR [1:0]		—	—	HYMCR [1:0]		—	—	SPICR[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	OCTCR [1:0]	00	R/W	Octa memory controller Clock Select*1 00: P0φ Clock output 01: P1φ Clock output 10: Bφ Clock output 11: Gφ Clock output
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	HYMCR [1:0]	00	R/W	HyperBus controller Clock Select*1 00: P0φ Clock output*2 01: P1φ Clock output 10: Bφ Clock output 11: Gφ Clock output
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	SPICR [1:0]	00	R/W	SPI multi I/O bus controller Clock Select*1 00: P0φ Clock output 01: P1φ Clock output 10: Bφ Clock output 11: Gφ Clock output

Note 1. The setting value that satisfies both the electrical characteristics of this LSI and the external memory must be selected.
Note 2. If the HyperBus controller is to be used, set these bits to a value other than 00.
Note 3. The frequency of the external output clock is one half that of the frequency selected by this register.

6.5 Changing the Frequency

The frequency of the CPU clock (Iφ), internal bus clock (Bφ), peripheral clock 1 (P1φ) and image processing clock (Gφ) can be changed by changing the division rate of divider. The division rate can be changed by software through the frequency control register (FRQCR).

6.5.1 Changing the Division Ratio

The division rate of divider can be changed by the following operation.

Change IFC[1:0], BFC[1:0] or PFC[1:0] of the frequency control register (FRQCR).
After waiting for the completion of the issued request from the bus master, hardware will automatically stop the bus master and start the frequency change.
If the issued request is not completed, the frequency can not be changed. Do not access registers of the modules in the standby state.

In addition, in order to suppress an unintended requests from the bus master, each bus master must be stopped by software before changing the frequency.
The clock selection registers (CKIOSEL, SCLKSEL) switch the clock of the CKIO, SPI multi I/O bus controller, HyperBus controller, and Octa memory controller without waiting for completion of the issued request for the bus master.

1. Set the standby_mode_en bit of the power control register in the PL310. For details of registers, refer to CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by ARM Ltd.
2. In the initial state, IFC[1:0] = B'10, BFC[1:0] = B'01, and PFC[1:0] = B'10.
3. Set the desired value in the IFC[1:0], BFC[1:0], and PFC[1:0] bits. Note that if the wrong value is set, this LSI will malfunction.
4. After the register bits (IFC[1:0], BFC[1:0], and PFC[1:0]) have been set, the clock is supplied of the new division ratio.

Note: When executing the WFI instruction after changing the frequency, be sure to read the frequency control registers (FRQCR) to confirm that the new settings are in place and read the ISBUSY bit in the CPU status register (CPUSTS) to confirm that it is set to 0 beforehand.
For the CPUSTS register, see section 52, Power-Down Modes.

6.6 Usage of the Clock Pins

For the connection of a crystal resonator or the input of a clock signal, this LSI circuit has the pins listed in Table 6.8. With regard to these pins, take care on the following points. Furthermore, Xin pin and Xout pin are used in this section to refer to the pins listed in the table.

Table 6.8 Clock Pins

Xin Pins (Used for Connection of a Crystal Resonator and Input of External Clock Signals)	Xout Pins (Used for Connection of a Crystal Resonator)
EXTAL	XTAL
USB_X1	USB_X2
AUDIO_X1	AUDIO_X2
RTC_X1	RTC_X2

6.6.1 In the Case of Inputting an External Clock

An example of the connection of an external clock is shown in Figure 6.2. In cases where the Xout pin is left in the open-circuit state, make sure the parasitic capacitance is no greater than 10pF.

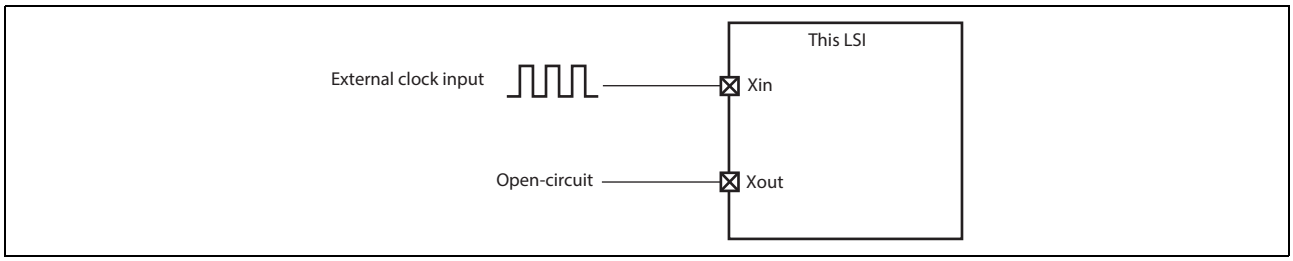


Figure 6.2 Example of the Connection of an External Clock

6.6.2 In the Case of Using a Crystal Resonator

An example of the connection of crystal resonator is shown in Figure 6.3.

Place the crystal resonator and capacitors (CL1 and CL2) as close to pins Xin and Xout as possible. Furthermore, to avoid inductance so that oscillation is correct, use the points where the capacitors are connected to the crystal resonator in common and do not place wiring patterns close to these components.

Since the design of the user board is closely connected with the effective characteristics of the crystal resonator, refer to the example of connection of the crystal resonator that is introduced in this section and perform thorough evaluation on the user side as well. The rated value of the crystal resonator will vary with the floating capacitances and so on of the crystal resonator and mounted circuit, so proceed with decisions on the basis of full discussions with the maker of the crystal resonator. Ensure that voltages applied to the clock pins do not exceed the maximum rated values.

Although the feedback resistor is included in this LSI, an external feedback resistor may be required in some cases. This depends on the characteristics of the crystal resonator.

Set the parameters (of resistors and capacitors) with thorough evaluation on the user side.

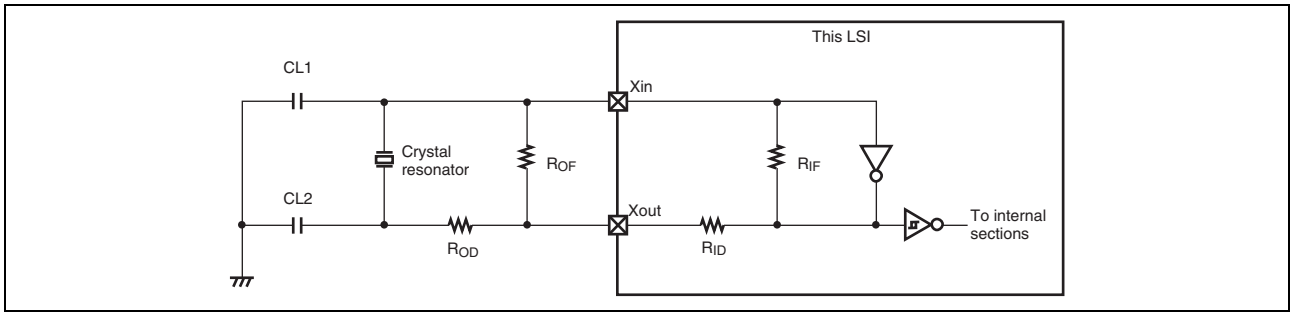

Figure 6.3 Example of the Connection of a Crystal Resonator

6.6.3 In the Case of Not Using the Clock Pin

In cases where the pins are not in use, fix the level on the Xin pin by connecting it to a pull-up resistor, pull-down resistor, the power supply, or to the ground, and leave the Xout pin open-circuit.

6.7 Oscillation Stabilizing Time

6.7.1 Oscillation Stabilizing Time of the On-chip Crystal Oscillator

In the case of using a crystal resonator, wait for the oscillation stabilizing time of the on-chip oscillation circuit at the following cases, to keep the oscillation stabilizing time of the on-chip crystal oscillator (in the case of inputting an external clock input, it is not necessary).

- Power on
- Releasing the software standby mode or deep standby mode by RES# pin
- Changing from halting oscillation to running oscillation by power-on reset or register setting (AUDIO_X1)
- Changing from halting oscillation to running oscillation by register setting (RTC_X1)
- Changing the gain of the on-chip crystal oscillator by RES# pin (EXTAL)

6.7.2 Oscillation Stabilizing Time of the PLL circuit

The clock from EXTAL is supplied to the PLL circuit. So, regardless of whether using a crystal resonator or inputting an external clock from EXTAL, wait for at least the oscillation stabilizing time at the following cases, to keep the oscillation stabilizing time of the PLL circuit.

- Power on (in the case of using the crystal resonator)/start inputting external clock (in the case of inputting the external clock)
- Releasing the software standby mode or deep standby mode by RES# pin

Note: The oscillation stabilizing time is kept by the counter running in the LSI at the following cases.

- Releasing the software standby mode or deep standby mode by the other than RES# pin
- Changing the gain of the on-chip crystal oscillator by the register setting (EXTAL)

6.8 Notes on Board Design

6.8.1 Note on Using a PLL Oscillation Circuit

In the PLLVcc connection pattern for the PLL, signal lines from the board power supply pins must be as short as possible and pattern width must be as wide as possible to reduce inductive interferences.

Since the analog power supply pins of the PLL are sensitive to the noise, the system may malfunction due to inductive interference at the other power supply pins. To prevent such malfunction, the analog power supply pins and the digital power supply pins Vcc and PVcc should not supply the same resources on the board if at all possible.

6.9 Definition of Modulation Rate and Frequency in the SSCG Specification

The SSCG circuit can be used to decrease the peak value of electromagnetic interference noise by frequency modulation, i.e. by slightly modulating the output frequency. In this case, the rate of change in the frequency and the size of the change to the input clock frequency are defined as the modulation rate and modulation frequency, respectively.
Figure 6.4 shows the modulation rate and modulation frequency.

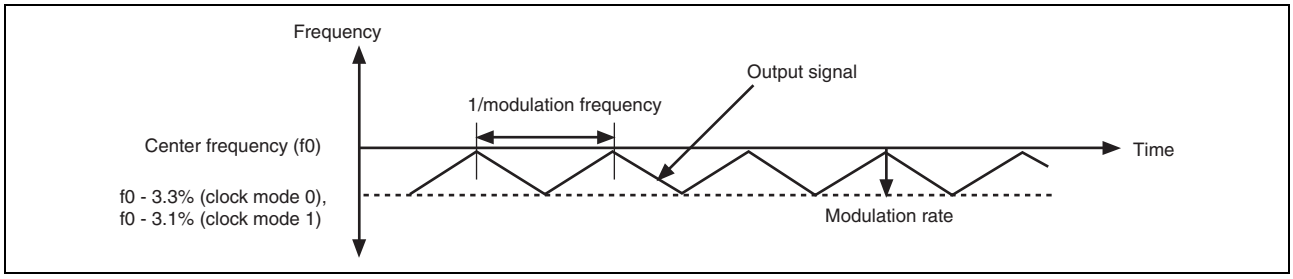

Figure 6.4 Definition of SSCG Modulation Rate and Frequency

7. Interrupt Controller

The interrupt controller ascertains the priority of interrupt sources and controls interrupt requests to the CPU. The interrupt controller registers set the order of priority of each interrupt, allowing the user to process interrupt requests according to the user-set priority.

7.1 Features

- 32 levels of interrupt priority can be set.
  By setting the interrupt priority registers, the priorities of IRQ interrupts, on-chip peripheral module interrupts, and pin interrupts can be selected from 32 levels for request sources.
- NMI noise canceler function
  An NMI input-level bit indicates the NMI pin state. By reading this bit in the interrupt exception service routine, the pin state can be checked, enabling it to be used as the noise canceler function.
- Arm PrimeCell® generic interrupt controller (GIC-400)*

Note: * The GIC-400 supports version 2 of the specification for the architecture of the Arm generic interrupt controller (GIC).

Figure 7.1 shows a block diagram.

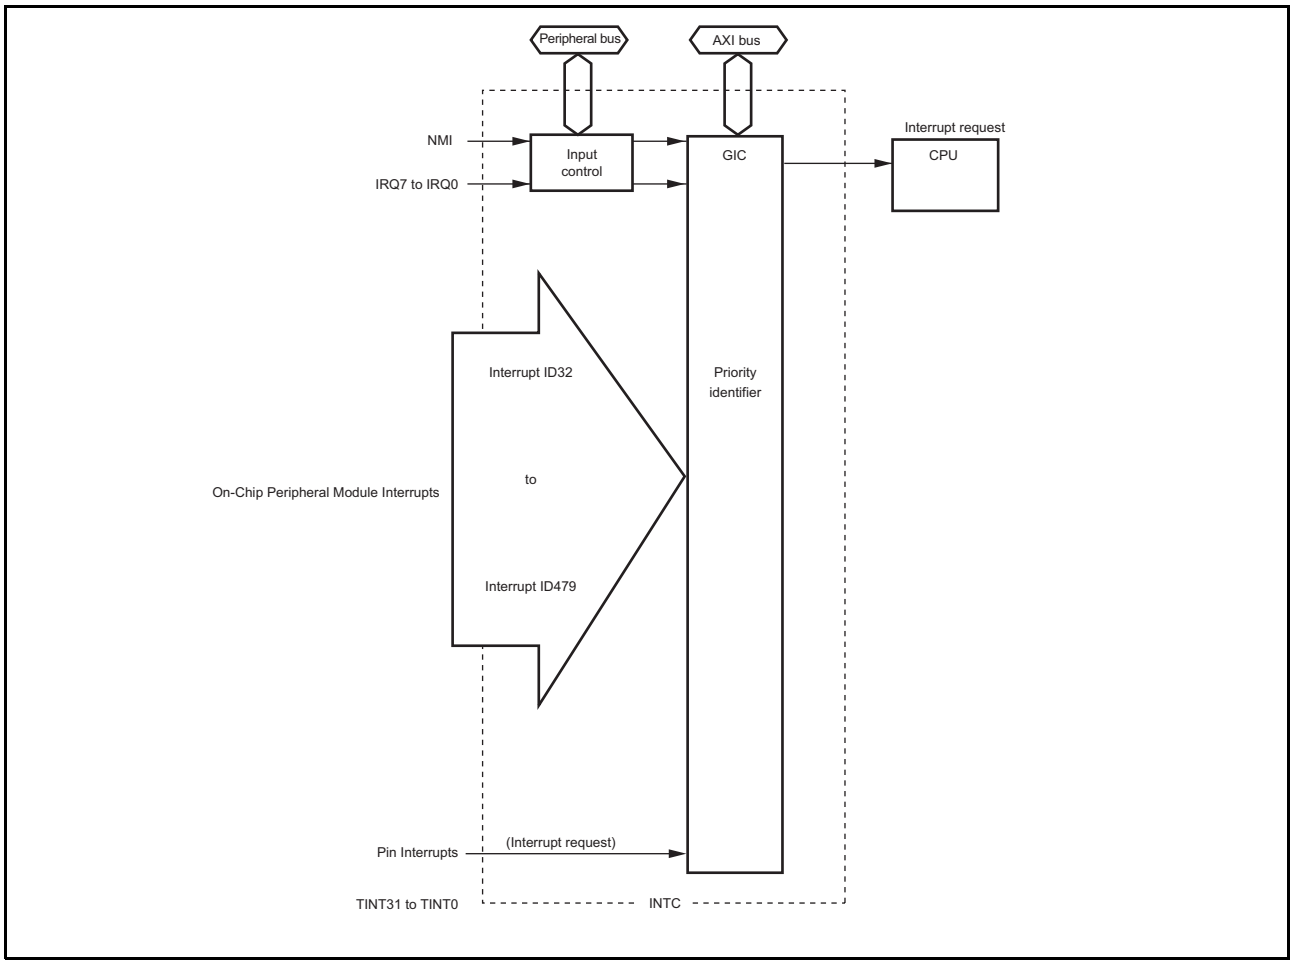

Figure 7.1 Block Diagram

7.2 Input/Output Pins

Table 7.1 shows the pin configuration.

Table 7.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Nonmaskable interrupt input pin	NMI	Input	Input of nonmaskable interrupt request signal
Interrupt request input pins	IRQ7 to IRQ0	Input	Input of maskable interrupt request signals
	TINT31 to TINT0	Input	Input of maskable interrupt request signals

7.3 Register Descriptions

Table 7.2 shows the register configuration. These registers are used to set the interrupt priorities and control detection of the external interrupt input signal.
For a description of the registers other than interrupt control register 0, interrupt control register 1, and IRQ interrupt request register, see the Arm Generic Interrupt Controller Architecture Specification and the PrimeCell® Generic Interrupt Controller (GIC-400) Technical Reference Manual from Arm.

Table 7.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Interrupt control register 0	ICR0	RW	*1	H'FCFE F800	16
Interrupt control register 1	ICR1	RW	H'0000	H'FCFE F802	16

Note 1. When the NMI pin is high, becomes H'8000; when low, becomes H'0000.
Note 2. Only 0 can be written after reading 1, to clear the flag.
Note 3. Use the following expression to calculate the number of interrupts from the number of IT lines.
(15+1)×32: 512
Note 4. This interrupt controller does not support Virtual interface control blocks and Virtual CPU interfaces.
Address setting H'E822 3000 or more is invalid.

7.3.1 Interrupt Control Register 0 (ICR0)

ICR0 is a 16-bit register that sets the input signal detection mode for the external interrupt input pin NMI, and indicates the input level at the NMI pin.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NMIL	—	—	—	—	—	—	NMIE	—	—	—	—	—	—	NMIF	—
Initial Value:	*1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R(W)*2	R

Note 1. 1 when the NMI pin is high, and 0 when the NMI pin is low.
Note 2. Only 0 can be written after reading 1, to clear the flag.

Bit	Bit Name	Initial Value	R/W	Description
15	NMIL	*1	R	NMI Input Level Sets the level of the signal input at the NMI pin. The NMI pin level can be obtained by reading this bit. This bit cannot be modified. 0: Low level is input to NMI pin 1: High level is input to NMI pin
14 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	NMIE	0	R/W	NMI Edge Select Selects whether the falling or rising edge of the interrupt request signal on the NMI pin is detected. 0: Interrupt request is detected on falling edge of NMI input 1: Interrupt request is detected on rising edge of NMI input
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	NMIF	0	R/(W)*2	NMI Interrupt Request This bit indicates the status of the NMI interrupt request. This bit cannot be modified. 0: NMI interrupt request has not occurred [Clearing conditions] • Cleared by changing NMIE of ICR0 • Cleared by reading NMIF while NMIF = 1, then writing 0 to NMIF 1: NMI interrupt request is detected [Setting condition] • Edge corresponding to NMIE of ICR0 has occurred at NMI pin
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

7.3.2 Interrupt Control Register 1 (ICR1)

ICR1 is a 16-bit register that specifies the detection mode for external interrupt input pins IRQ7 to IRQ0 individually: low level, falling edge, rising edge, or both edges.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IRQ 71S	IRQ 70S	IRQ 61S	IRQ 60S	IRQ 51S	IRQ 50S	IRQ 41S	IRQ 40S	IRQ 31S	IRQ 30S	IRQ 21S	IRQ 20S	IRQ 11S	IRQ 10S	IRQ 01S	IRQ 00S
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	IRQ71S	0	R/W	IRQ Sense Select These bits select whether interrupt signals corresponding to pins IRQ7 to IRQ0 are detected by a low level, falling edge, rising edge, or both edges. 00: Interrupt request is detected on low level of IRQn input 01: Interrupt request is detected on falling edge of IRQn input 10: Interrupt request is detected on rising edge of IRQn input 11: Interrupt request is detected on both edges of IRQn input
14	IRQ70S	0	R/W	
13	IRQ61S	0	R/W	
12	IRQ60S	0	R/W	
11	IRQ51S	0	R/W	
10	IRQ50S	0	R/W	
9	IRQ41S	0	R/W	
8	IRQ40S	0	R/W	
7	IRQ31S	0	R/W	
6	IRQ30S	0	R/W	
5	IRQ21S	0	R/W	
4	IRQ20S	0	R/W	
3	IRQ11S	0	R/W	
2	IRQ10S	0	R/W	
1	IRQ01S	0	R/W	
0	IRQ00S	0	R/W	

[Legend]
n = 7 to 0

7.3.3 IRQ Interrupt Request Register (IRQRR)

IRQRR is a 16-bit register that indicates interrupt requests from external input pins IRQ7 to IRQ0. If edge detection is set for the IRQ7 to IRQ0 interrupts, writing 0 to the IRQ7F to IRQ0F bits after reading IRQ7F to IRQ0F = 1 cancels the retained interrupts.

IRQMSK is a bit to set release, when the IRQ signal is used as a software standby cancel source signal. For details, refer to section 52.3.2, Software Standby Mode.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IRQ MSK	—	—	—	—	—	—	—	IRQ 7F	IRQ 6F	IRQ 5F	IRQ 4F	IRQ 3F	IRQ 2F	IRQ 1F	IRQ 0F
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R(W)*	R(W)*	R(W)*	R(W)*	R(W)*	R(W)*	R(W)*	R(W)*

Note: * Only 0 can be written to clear the flag after 1 is read.

Bit	Bit Name	Initial Value	R/W	Description
15	IRQMSK	0	R/W	IRQ Software standby cancel Source Mask bit *1 0: Masked 1: Unmasked
14 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	IRQ7F	0	R/(W)*	IRQ Interrupt Request These bits indicate the status of the IRQ7 to IRQ0 interrupt requests. Level detection: 0: IRQn interrupt request has not occurred [Clearing condition] • IRQn input is high 1: IRQn interrupt has occurred [Setting condition] • IRQn input is low Edge detection: 0: IRQn interrupt request is not detected [Clearing condition] • Cleared by reading IRQnF while IRQnF = 1, then writing 0 to IRQnF 1: IRQn interrupt request is detected [Setting condition] • Edge corresponding to IRQn1S or IRQn0S of ICR1 has occurred at IRQn pin
6	IRQ6F	0	R/(W)*	
5	IRQ5F	0	R/(W)*	
4	IRQ4F	0	R/(W)*	
3	IRQ3F	0	R/(W)*	
2	IRQ2F	0	R/(W)*	
1	IRQ1F	0	R/(W)*	
0	IRQ0F	0	R/(W)*	

[Legend]

n = 7 to 0

Note 1. When IRQMSK is 1 (Unmasked), the IRQ signal can be used as a software standby cancel source.

7.4 Interrupt Sources

There are four types of interrupt sources: NMI, IRQ, on-chip peripheral modules, and pin interrupts. Each interrupt has a priority level (0 to 31), with 0 the highest and 31 the lowest.

7.4.1 NMI Interrupt

The NMI interrupt with the highest priority is accepted by the CPU as an FIQ exception all times. NMI interrupt requests are edge-detected, and the NMI edge select bit (NMIE) in ICR0 selects whether the rising edge or falling edge is detected. The status of the interrupt request can be checked by reading the NMI interrupt request bit (NMIF) in the ICR0. When the NMIE bit is changed, the NMI interrupt request that is retained is cleared.
When deep standby mode is entered, deep standby mode is canceled by the NMI interrupt.

7.4.2 IRQ Interrupts

IRQ interrupts are input from pins IRQ7 to IRQ0. For the IRQ interrupts, low-level, falling-edge, rising-edge, or both-edge detection can be selected individually for each pin by the IRQ sense select bits (IRQ71S to IRQ01S and IRQ70S to IRQ00S) in interrupt control register 1 (ICR1).
When using low-level sensing for IRQ interrupts, an interrupt request signal is sent to the interrupt controller while the IRQ7 to IRQ0 pins are low. An interrupt request signal is stopped being sent to the interrupt controller when the IRQ7 to IRQ0 pins are driven high. The status of the interrupt requests can be checked by reading the IRQ interrupt request bits (IRQ7F to IRQ0F) in the IRQ interrupt request register (IRQRR).
When using edge-sensing for IRQ interrupts, an interrupt request is detected due to change of the IRQ7 to IRQ0 pin states, and an interrupt request signal is sent to the interrupt controller. The result of IRQ interrupt request detection is retained until that interrupt request is accepted. Whether IRQ interrupt requests have been detected or not can be checked by reading the IRQ7F to IRQ0F bits in the IRQ interrupt request register (IRQRR). Writing 0 to these bits after reading them as 1 clears the result of IRQ interrupt request detection.
When returning from IRQ interrupt exception service routine, execute the return instruction after confirming that the interrupt request has been cleared by the IRQ interrupt request register (IRQRR) so as not to accidentally receive the interrupt request again.

7.4.3 On-Chip Peripheral Module Interrupts

When returning from the interrupt exception service routine for an interrupt request at the peripheral-module level, execute the return instruction after clearing the source flag at the source of the request and reading the source flag so that the interrupt request is not accidentally received again.

7.4.4 Pin Interrupts

Pin interrupts are input from the general-purpose I/O port pins. Signals input on the general-purpose I/O port pins are conveyed as interrupt signals regardless of mode settings for the general-purpose I/O port pin.
Accordingly, if pin interrupts are to be used, set the pin as an input port. In cases where the general-purpose I/O port pins are used for the peripheral functions, pin interrupts can only be set when the pins are specified as input or input and output. For the pin interrupts, the general-purpose I/O port pins are divided into 32-group of TINT31 to TINT0. The pin interrupts select mask in each group can be set with the pin function control register. For the settings of general purpose I/O port pins and function control registers, see section 51, GPIO.
For the pin interrupts, high-level or rising-edge detection can be selected individually for each pin group by the interrupt configuration registers (GICD_ICFGRn).
For a description of the interrupt configuration registers (GICD_ICFGRn), see the GIC architecture specification.

7.5 Interrupt IDs

Table 7.3 lists the interrupt sources and their interrupt IDs, and the registers for setting the interrupt sources. Do not make settings other than those in Table 7.3, otherwise, the operation cannot be guaranteed.
Each interrupt source is allocated a different interrupt ID. To control notification of the interrupt source to the CPU and reference its status, it is necessary to set and reference the following registers which correspond to given interrupt IDs.

- Interrupt group registerGICD_IGROUPRn
- Interrupt set-enable registerGICD_ISENABLERn
- Interrupt clear-enable registerGICD_ICENABLERn
- Interrupt set-pending registerGICD_ISPENDRn
- Interrupt clear-pending register GICD_ICPENDRn
- Active bit set register GICD_ISACTIVERn
- Interrupt configuration register GICD_ICFGRn
- Interrupt priority register GICD_IPRIORITYRn
- Interrupt processor target register GICD_ITARGETSRn

For the procedure for the initial settings of the registers, see section 7.6.1, Interrupt Settings. For details on individual registers, see the Arm Generic Interrupt Controller Architecture Specification and the PrimeCell® Generic Interrupt Controller (GIC-400) Technical Reference Manual from Arm.

Table 7.3 List of Interrupt IDs

Interrupt Source					Register Allocation

7.6 Operation

7.6.1 Interrupt Settings

Figure 7.2 shows the procedure of the initial settings for the interrupt controller.
Figure 7.3 shows the procedure of the settings when a pin interrupt or IRQ interrupt is to be used, and the procedure for setting the senses of NMI and IRQ interrupts.

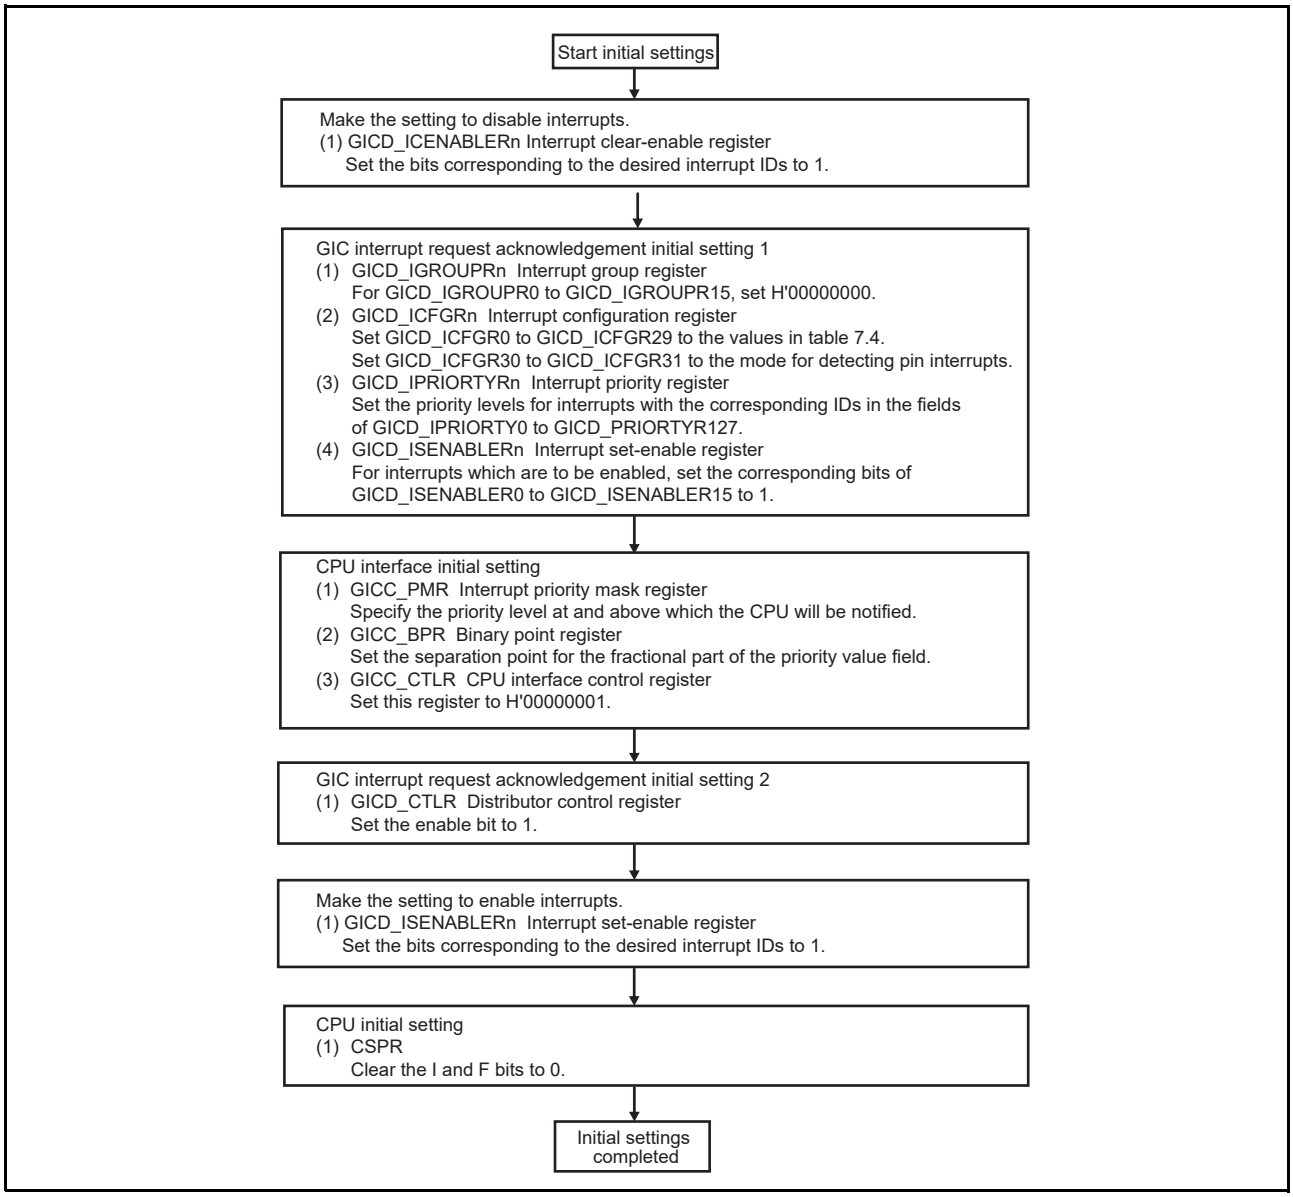

Figure 7.2 Flow of Initial Settings

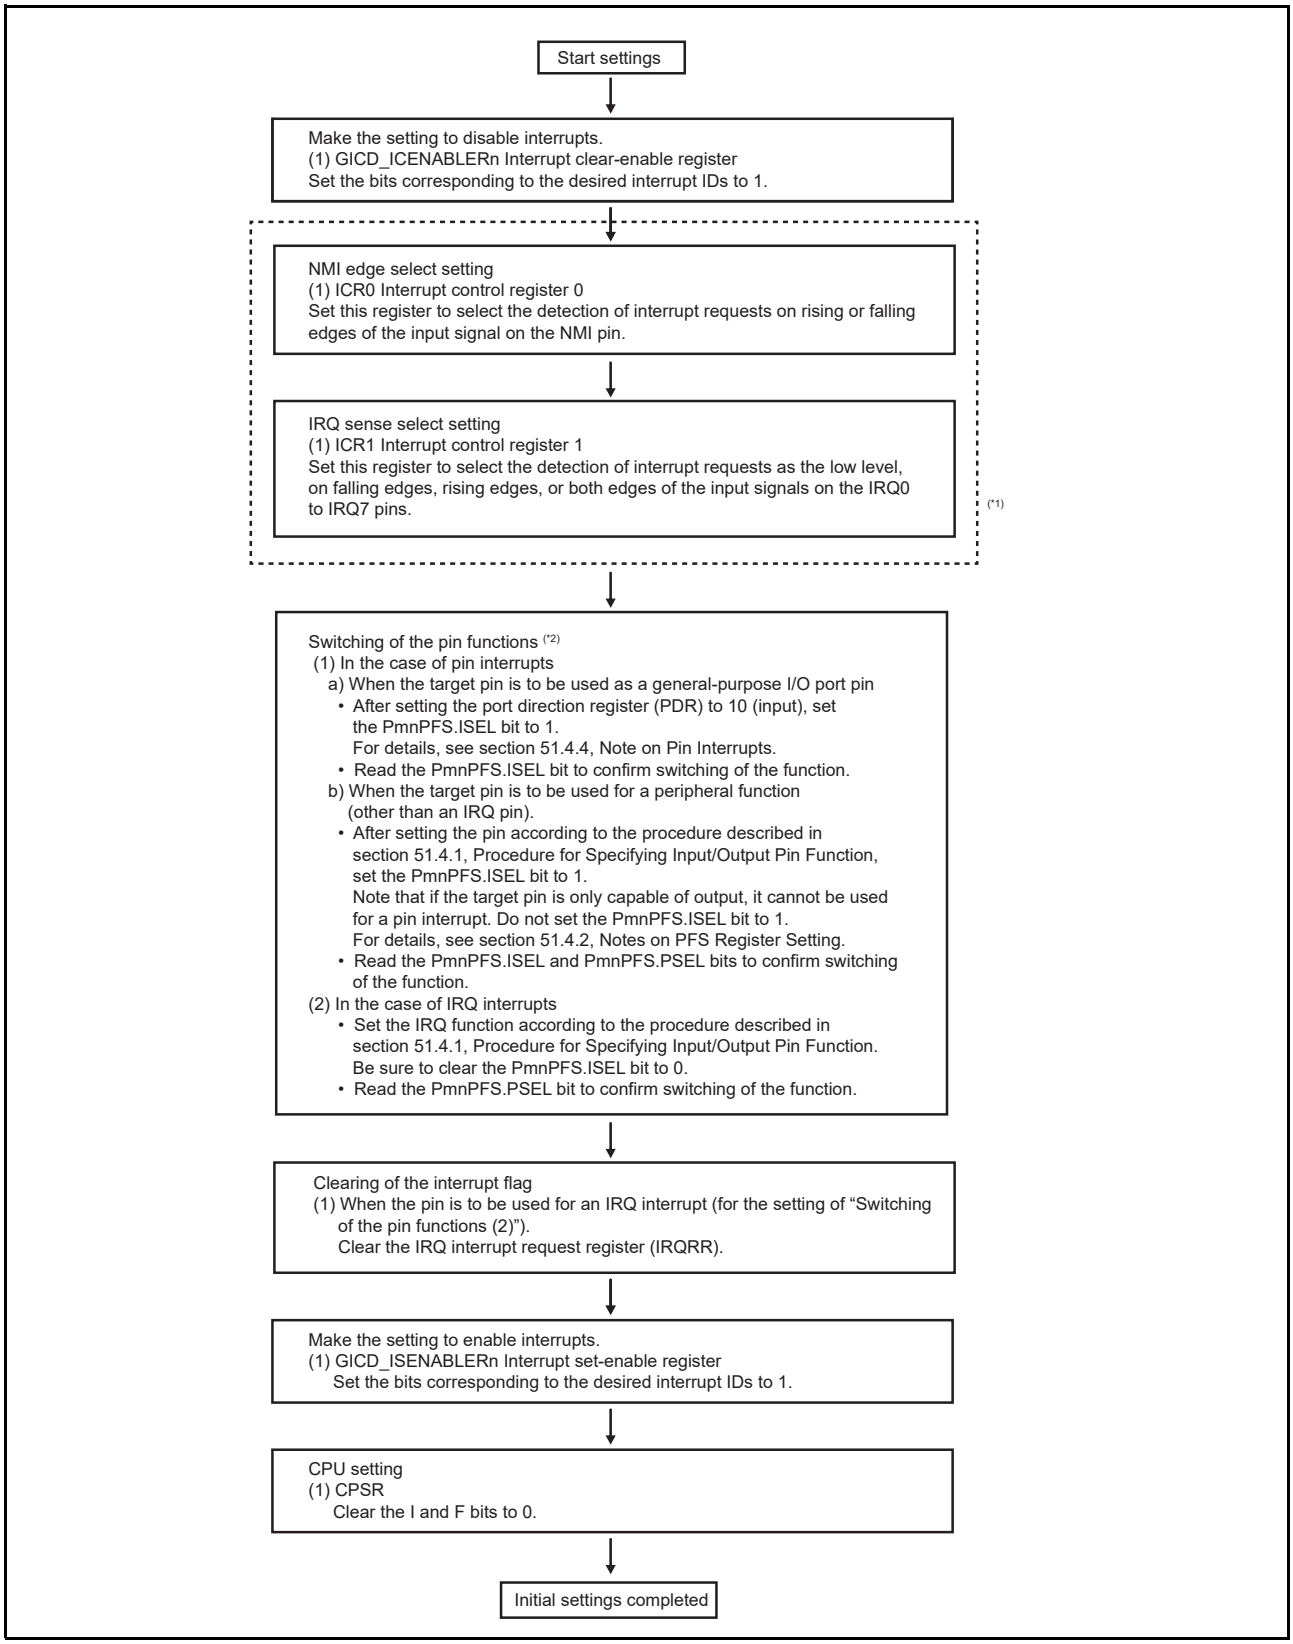

Figure 7.3 Flow of Switching Pin Functions *3

Note 1. If the settings in the broken lines have already been completed when the pin function is switched, that part of the procedure can be omitted.
Note 2. For the register of the general-purpose input/output port, see section 51.3, Register Description.
Note 3. From the start of the settings to the end of the settings, keep pins for use as pin interrupts at the low level, and pins for use as IRQ interrupts at the high level.

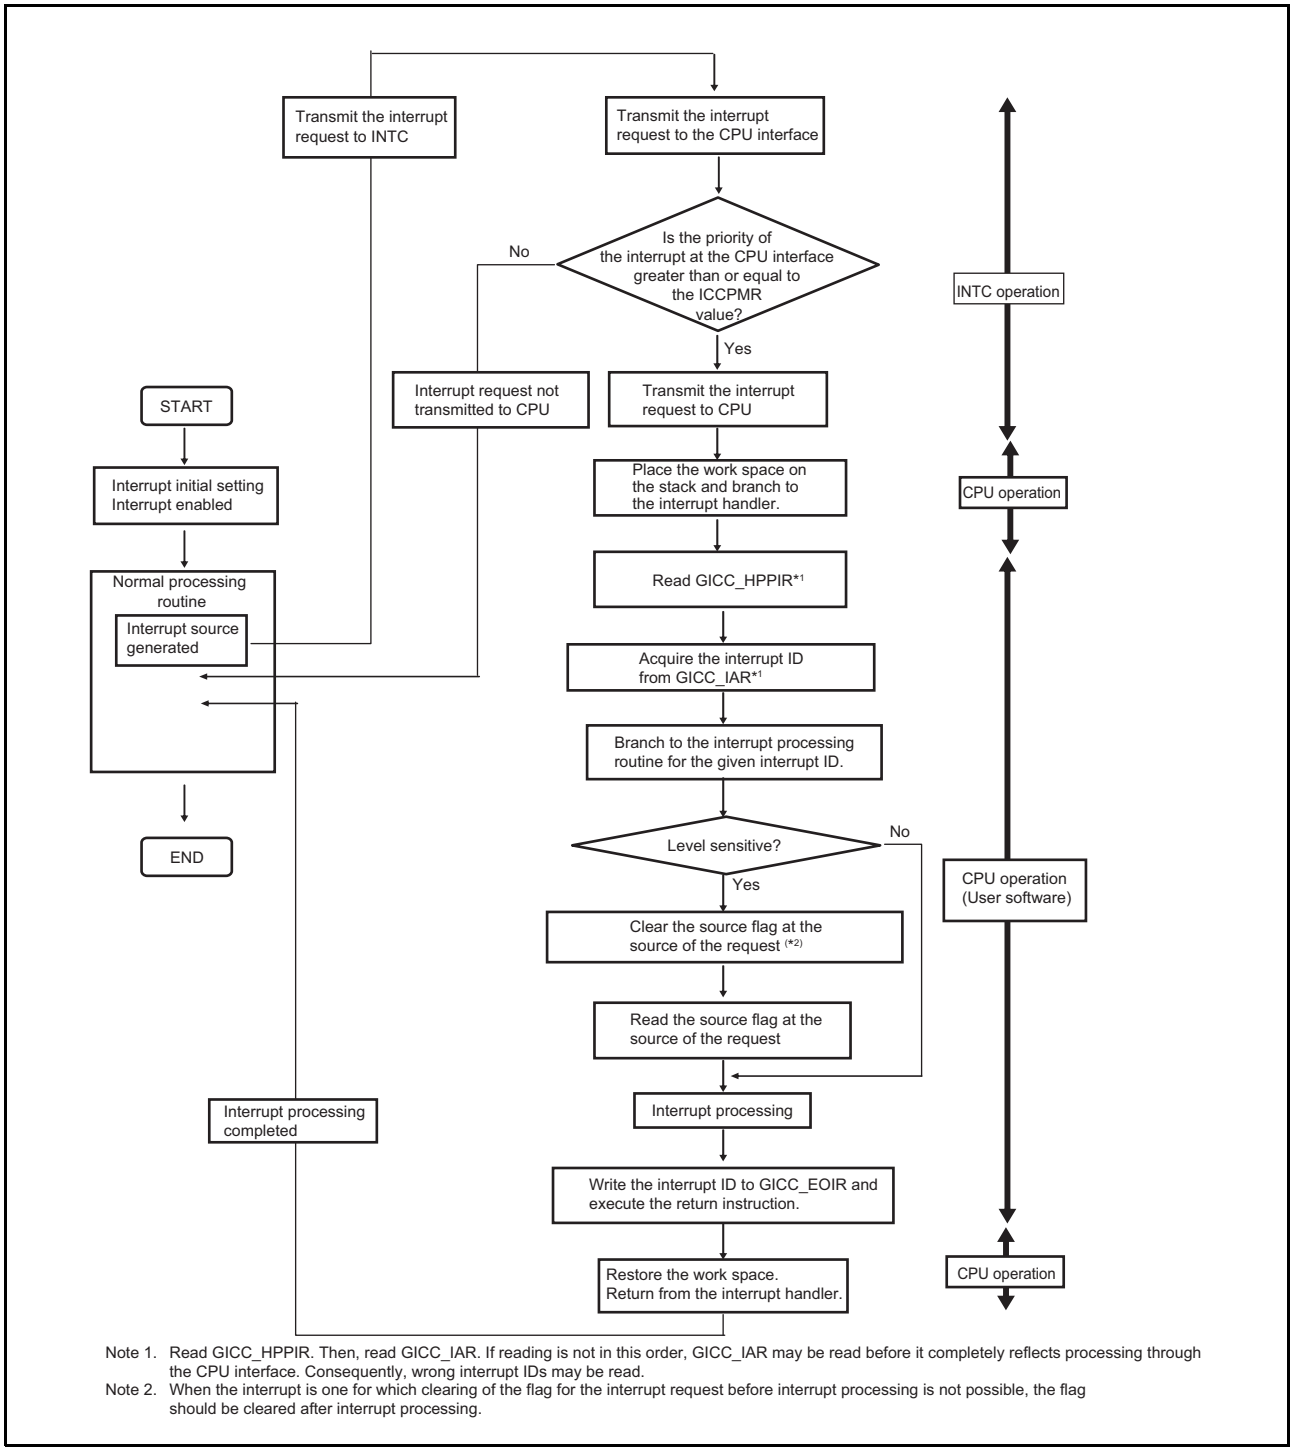
Table 7.4 GICD_ICFGRn Interrupt Configuration Register Settings

Register Name	Setting	Interrupt ID
GICD_ICFGR0	H'AAAA_AAAA	15 to 0
GICD_ICFGR1	H'5554_0000	31 to 16
GICD_ICFGR2	H'FD55_5555	47 to 32
GICD_ICFGR3	H'7FFF_FFFF	63 to 48
GICD_ICFGR4	H'5555_5555	79 to 64
GICD_ICFGR5	H'D57F_5555	95 to 80
GICD_ICFGR6	H'FFFF_FFFF	111 to 96
GICD_ICFGR7	H'FFFF_FFFF	127 to 112
GICD_ICFGR8	H'FFFF_FFFF	143 to 128
GICD_ICFGR9	H'FFFF_FFFF	159 to 144
GICD_ICFGR10	H'FFFF_FFFF	175 to 160
GICD_ICFGR11	H'FFFF_FFFF	191 to 176
GICD_ICFGR12	H'FFFF_FFFF	207 to 192
GICD_ICFGR13	H'FFFF_FFFF	223 to 208
GICD_ICFGR14	H'FFFF_FFFF	239 to 224
GICD_ICFGR15	H'7D5F_D57F	255 to 240
GICD_ICFGR16	H'557D_7DDF	271 to 256
GICD_ICFGR17	H'557D_557D	287 to 272
GICD_ICFGR18	H'5555_557D	303 to 288
GICD_ICFGR19	H'5555_5555	319 to 304
GICD_ICFGR20	H'F555_5555	335 to 320
GICD_ICFGR21	H'5555_FFFF	351 to 336
GICD_ICFGR22	H'F555_5555	367 to 352
GICD_ICFGR23	H'FFDD_55F5	383 to 368
GICD_ICFGR24	H'FFFF_FFFF	399 to 384
GICD_ICFGR25	H'FFFF_FFFF	415 to 400
GICD_ICFGR26	H'FFFF_FFFF	431 to 416
GICD_ICFGR27	H'5FFF_FFDF	447 to 432
GICD_ICFGR28	H'5555_5555	463 to 448
GICD_ICFGR29	H'5555_5555	479 to 464
GICD_ICFGR30*1	H'5555_5555	495 to 480
GICD_ICFGR31*1	H'5555_5555	511 to 496

Note 1. Edge or level detection can be selected for IDs corresponding to pin interrupts. The settings in the above table select level detection.

7.6.2 Flow of Interrupt Operations

For details on operation involved in interrupt generation, see the Arm Generic Interrupt Controller Architecture Specification and the PrimeCell® Generic Interrupt Controller (GIC-400) Technical Reference Manual from Arm. Figure 7.4 shows the flow of interrupt operations.



Note 1. Read GICC_HPPIR. Then, read GICC_IAR. If reading is not in this order, GICC_IAR may be read before it completely reflects processing through the CPU interface. Consequently, wrong interrupt IDs may be read.
Note 2. When the interrupt is one for which clearing of the flag for the interrupt request before interrupt processing is not possible, the flag should be cleared after interrupt processing.

Figure 7.4 Flow of Interrupt Operations

7.7 Data Transfer with Interrupt Request Signals

Interrupt request signals can be used to activate the direct memory access controller and transfer data.
Interrupt sources for which the direct memory access controller is designated as the destination by DMA extension resource selectors 0 to 7 are masked and requests from them are not input to the interrupt controller.
Figure 7.5 shows a block diagram of interrupt control. For details, see section 9, Direct Memory Access Controller.

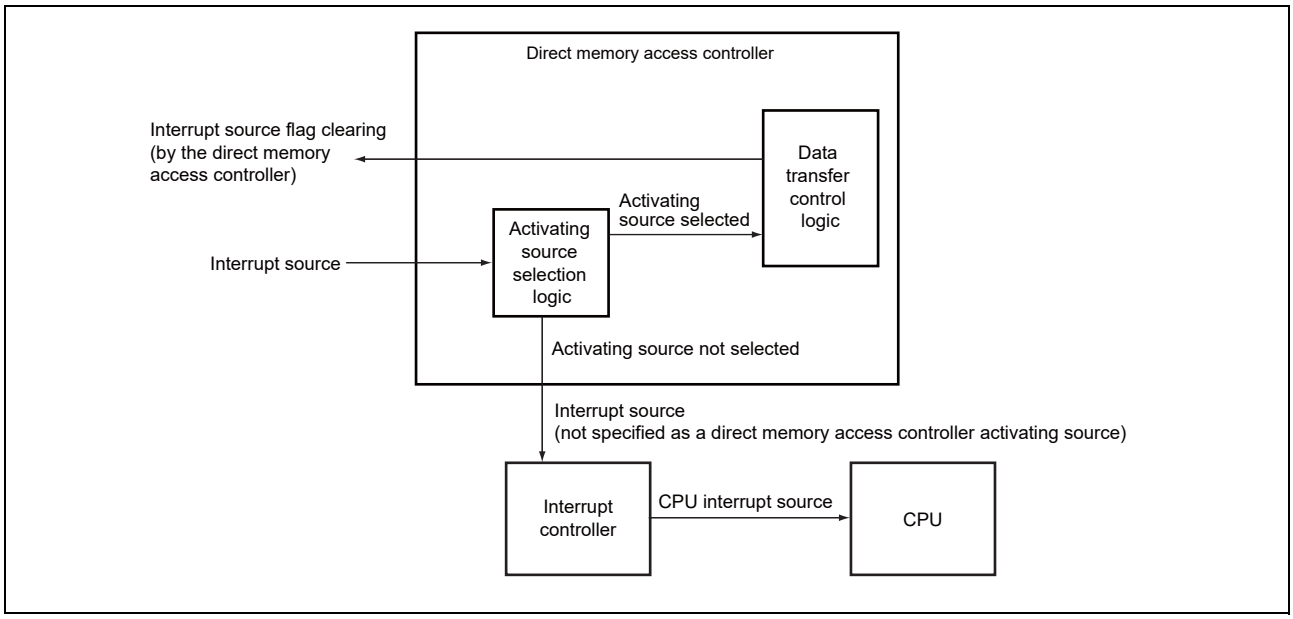


Figure 7.5 Interrupt Control Block Diagram

7.7.1 Handling Interrupt Request Signals as Sources for CPU Interrupt but Not Direct Memory Access Controller Activating

1. Do not select direct memory access controller activating sources.
2. When interrupts occur, interrupt requests are sent to the CPU.
3. The CPU clears the interrupt source and performs the necessary processing in the interrupt exception service routine.

7.7.2 Handling Interrupt Request Signals as Sources for Activating Direct Memory Access Controller but Not CPU Interrupt

1. Select direct memory access controller activating sources.
2. Activating sources are applied to the direct memory access controller when interrupts occur.
3. The direct memory access controller clears the interrupt sources when starting transfer.

7.8 Usage Note

7.8.1 Timing to Clear Interrupt Source

Clear the interrupt source flag to 0 in the interrupt exception handler. It takes some time to clear an interrupt in the CPU after clearing the interrupt source flag to 0. Read the interrupt source flag after clearing it to ensure that the interrupt request that should have been cleared is not received again erroneously. After that, execute the return instruction.

7.8.2 Notes on Selecting IRQ Interrupt Pin Functions

While the interrupt control register 1 (ICR1) is set so that an interrupt request is detected on the falling edge of an IRQn input and the current input on the pin is at the low level, the relevant edge will be detected when the pin function is switched to the IRQ interrupt function.

8. Bus State Controller

The bus state controller outputs control signals for various types of memory and external devices that are connected to the external address space. The functions of this module enable this LSI to connect directly with SRAM, SDRAM, and other memory storage devices, and external devices.

8.1 Features

1. External address space
   - A maximum of 64 Mbytes for each of areas CS0 to CS5.
   - Can specify the normal space interface, SRAM interface with byte selection, burst ROM (clocked synchronous or asynchronous), MPX-I/O, and SDRAM memory type for each address space.
   - Can select the data bus width (8 or 16 bits) for each of address spaces.
   - Controls insertion of wait cycles for each address space.
   - Controls insertion of wait cycles for each read access and write access.
   - Can set independent idle cycles during the continuous access for five cases: read-write (in same space/different spaces), read-read (in same space/different spaces), the first cycle is a write access.
2. Normal space interface
   - Supports the interface that can directly connect to the SRAM.
3. Burst ROM interface (clocked asynchronous)
   - High-speed access to the ROM that has the page mode function.
4. MPX-I/O interface
   - Can directly connect to a peripheral LSI that needs an address/data multiplexing.
5. SDRAM interface
   - Can set the SDRAM in up to two areas.
   - Multiplex output for row address/column address.
   - Efficient access by single read/single write.
   - High-speed access in bank-active mode.
   - Supports an auto-refresh and self-refresh.
   - Supports a power-down mode.
   - Issues MRS and EMRS commands.
6. SRAM interface with byte selection
   - Can connect directly to a SRAM with byte selection.
7. Burst ROM interface (clocked synchronous)
   - Can connect directly to a burst ROM of the clocked synchronous type.
8. Refresh function
   - Supports the auto-refresh and self-refresh functions.
   - Specifies the refresh interval using the refresh counter and clock selection.
   - Can execute concentrated refresh by specifying the refresh counts (1, 2, 4, 6, or 8).
9. Usage as interval timer for refresh counter
   - Generates an interrupt request at compare match.
10. Detection of long wait state for access by the signal on the external WAIT# pin.
    - A timeout detection condition is specifiable per CS space.
    - Once timeout is detected, the external WAIT function is disabled and a timeout detection interrupt request is issued.

Figure 8.1 shows a block diagram of this module.

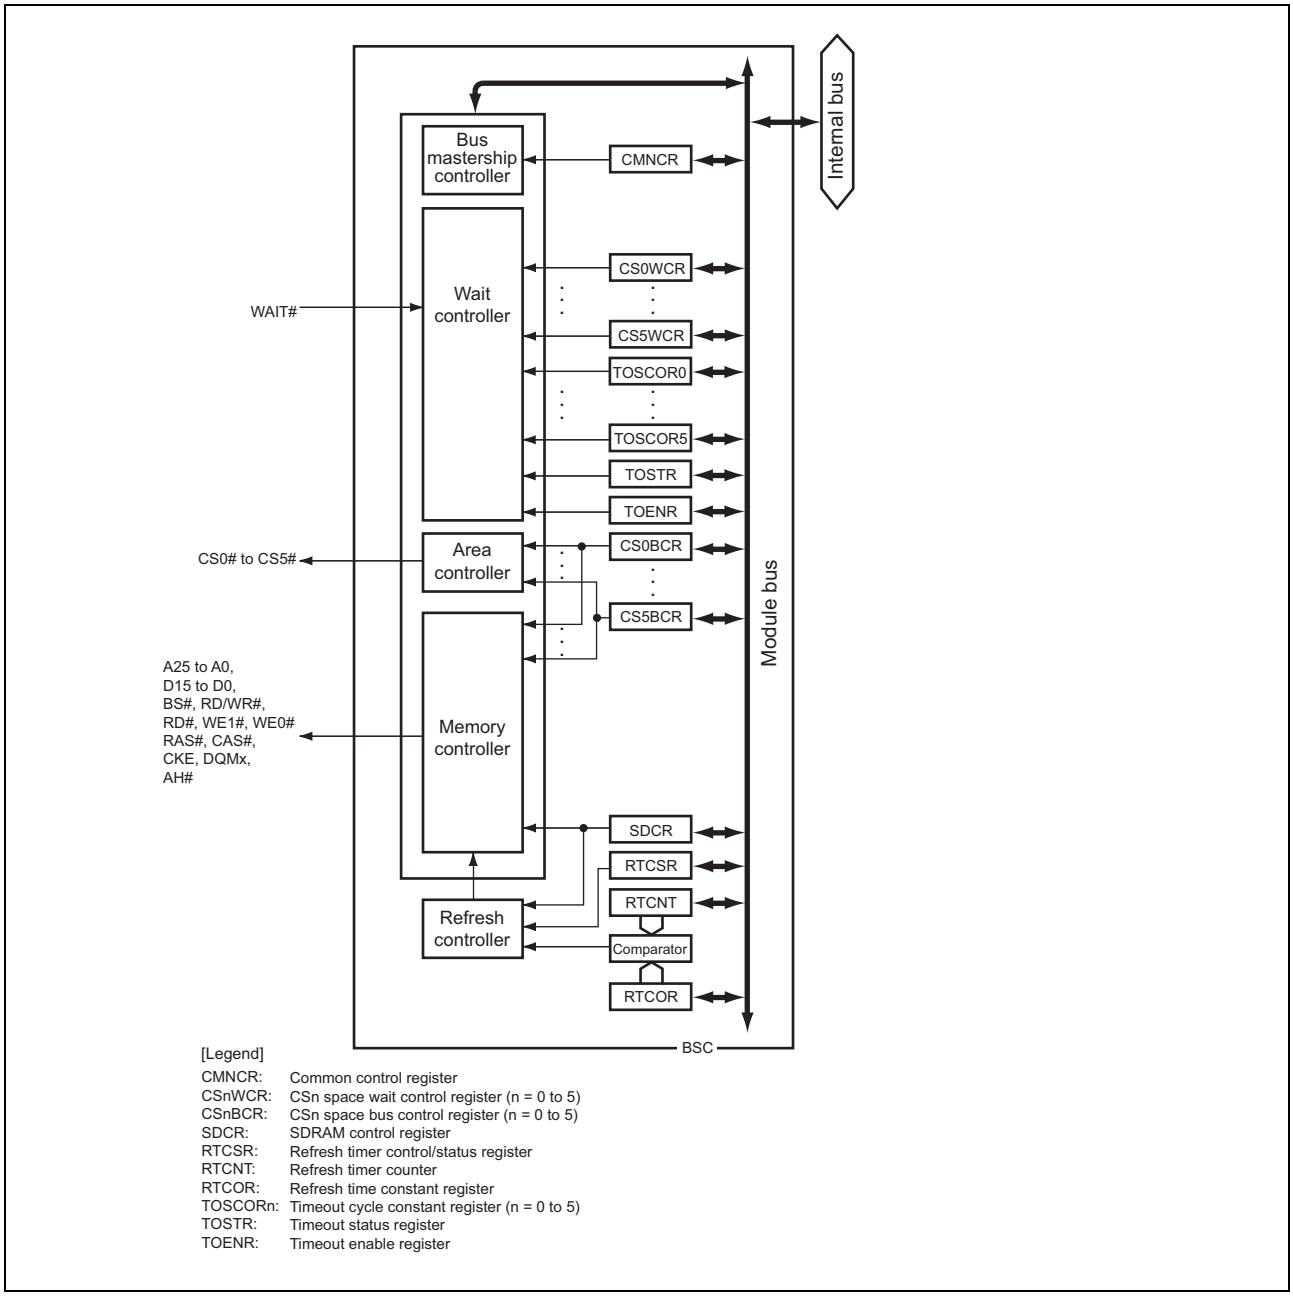

Figure 8.1 Block Diagram of Bus State Controller

8.2 Input/Output Pins

Table 8.1 shows the pin configuration.

Table 8.1 Pin Configuration

Name	I/O	Function
A25 to A0	Output	Address bus
D15 to D0	I/O	Data bus
BS#	Output	Bus cycle start
CS0# to CS5#	Output	Chip select
RD/WR#	Output	Read/write Connects to WE# pins when SDRAM or SRAM with byte selection is connected.
RD#	Output	Read pulse signal (read data output enable signal)
AH#	Output	Functions as the address hold signal when the MPX-I/O is used.
WE1#/DQMU	Output	Indicates that D15 to D8 are being written to. Connected to the byte select signal when a SRAM with byte selection is connected. Functions as the select signals for D15 to D8 when SDRAM is connected.
WE0#/DQML	Output	Indicates that D7 to D0 are being written to. Connected to the byte select signal when a SRAM with byte selection is connected. Functions as the select signals for D7 to D0 when SDRAM is connected.
RAS#	Output	Connects to RAS# pin when SDRAM is connected.
CAS#	Output	Connects to CAS# pin when SDRAM is connected.
CKE	Output	Connects to CKE pin when SDRAM is connected.
WAIT#	Input	External wait input

8.3 Area Overview

8.3.1 Address Map

In the architecture, this LSI has a 32-bit address space, which is divided into external memory spaces (SPI multi I/O bus space, on-chip large-capacity RAM, on-chip data retention RAM, on-chip peripheral modules, and reserved areas) according to the upper bits of the address.
See section 5, LSI Internal Bus for how to enable or disable caching for the CS0 to CS5 external address spaces.
The kind of memory to be connected and the data bus width are specified in each partial space. The address map for the external address space is listed below.

Table 8.2 Address Map

Internal Address	Space	Memory to be Connected
H'00000000 to H'03FFFFFF	CS0	Normal space, SRAM with byte selection, burst ROM (asynchronous or synchronous)
H'04000000 to H'07FFFFFF	CS1	Normal space, SRAM with byte selection
H'08000000 to H'0BFFFFFF	CS2	Normal space, SRAM with byte selection, SDRAM
H'0C000000 to H'0FFFFFFF	CS3	Normal space, SRAM with byte selection, SDRAM
H'10000000 to H'13FFFFFF	CS4	Normal space, SRAM with byte selection, burst ROM (asynchronous)
H'14000000 to H'17FFFFFF	CS5	Normal space, SRAM with byte selection, MPX-I/O
H'1F000000 to H'8FFFFFFF	Others	On-chip peripheral module, SPI multi I/O bus space, HyperFlash™ / HyperRAM™ space, OctaFlash™ / OctaRAM™ space, on-chip large-capacity RAM, on-chip data retention RAM, reserved area*1

Note 1. For the on-chip large-capacity RAM space and on-chip data retention RAM space, access the addresses shown in section 50, On-Chip RAM. For the on-chip peripheral module space, access the addresses shown in section 55, Register States. Do not access addresses which are not described in these sections. Otherwise, the correct operation cannot be guaranteed.

8.3.2 Data Bus Width and Related Pin Setting for Each Area Depending on Boot Mode

The initial state of data bus width and settings of the pins related to this module depends on boot mode. For boot mode, refer to section 3, Boot Mode.

In boot mode 0, the state of area 0 is fixed to the state with bus width of 16 bits, because this LSI is started up by the program stored in the ROM connected to area 0. The initial states of areas 1 to 5 are the same as that of area 0, but the bus width can be changed by the program. Immediately after a power-on reset in these modes, some of the address signals and the data-bus and the CS0# and RD# signals are automatically selected by default as the functions of the corresponding pins, since these signals are required to read ROM data from area 0. With the exception of these pins, the general purpose pin function is selected by default, and other required pin functions must be specified by the program.

Read access to area 0 is only permitted before the pin settings are completed.

In boot modes 1 to 7, the state of areas 0 to 5 can be changed from the initial state by the program, because the LSI is started by the program stored in the SPI serial memory, the NAND flash memory with the SD controller, or the NAND flash memory with the MMC controller. Since pin functions related to this module are not set automatically, they need to be set by the program. Do not access external address spaces before the pin settings are completed.

Table 8.3 shows the initial state by areas 0 to 5 in boot modes 0, and 1 to 7.

The sample access waveforms shown in this section include the pins such as BS#, RD/WR#, and WEn#. They are the waveforms when pin functions are assigned to the general I/O ports. For example, when 8-bit bus width is used in boot mode 0, setting for pin A0 is needed.

For details on pin function settings, see section 51, GPIO.

Table 8.3 Initial States by Areas in Boot Modes 0, and 1 to 7

Boot Mode	Item	Area 0	Areas 1 to 5
0	Data bus width	Fixed to 16 bits. Not changeable.	16 bits. Can be changed by program.
	Settings of pins related to this module	Pins A20 to A1, D15 to D0, CS0#, and RD# are set automatically. Other pins need to be set by program.	
1 to 7	Data bus width	16 bits. Can be changed by program.	
	Settings of pins related to this module	General I/O function. For external bus access, all the necessary pins need to be set by program.	

Note 1. In boot mode 0, if a boot ROM that uses A21 and higher-order address lines is connected, the circuit board must include pull-down resistors for those address lines.

Note 2. The data-bus width may be limited by the type of memory in use. For details, see section 8.4.2, CSn Space Bus Control Register (CSnBCR) (n = 0 to 5).

8.4 Register Descriptions

Table 8.4 shows the register configuration of this module.
Do not access the areas until settings of the connected memory interface are completed.

Table 8.4 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Common control register	CMNCR	R/W	H'00001018	H'1F000000	32
CS0 space bus control register	CS0BCR	R/W	H'36DB0C00	H'1F000004	32
CS1 space bus control register	CS1BCR	R/W	H'36DB0C00	H'1F000008	32
CS2 space bus control register	CS2BCR	R/W	H'36DB0C00	H'1F00000C	32
CS3 space bus control register	CS3BCR	R/W	H'36DB0C00	H'1F000010	32
CS4 space bus control register	CS4BCR	R/W	H'36DB0C00	H'1F000014	32

8.4.1 Common Control Register (CMNCR)

CMNCR is a 32-bit register that controls the common items for each area.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	TL0	—	—	—	AL0	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	DPRTY[1:0]		—	—	—	—	—	—	—	HIZ MEM	HIZ CNT*
Initial value:	0	0	0	1	0	0	0	0	0	0	0	1	1	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	TL0	0	R/W	Transfer End Level Specifies the TEND0 signal output is high active or low active. 0: Low-active output from TEND0 1: High-active output from TEND0
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	AL0	0	R/W	Specifies the DACK0 (acknowledge) signal output is high active or low active. 0: Low-active output from DACK0 1: High-active output from DACK0
23 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10, 9	DPRTY[1:0]	00	R/W	DMA Burst Transfer Priority Specify the priority for a refresh request during DMA burst transfer. 0*: Accepts a refresh request during DMA burst transfer. 10: Does not accept a refresh request during DMA burst transfer. 11: Reserved (setting prohibited)
8 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4, 3	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	HIZMEM	0	R/W	High-Z Memory Control Specifies the pin state in software standby mode or deep standby mode for A25 to A0, BS#, CSn#, RD/WR#, WEn# /DQMx/AH#, and RD#. 0: High impedance in software standby mode or deep standby mode. 1: Driven in software standby mode or deep standby mode
0	HIZCNT*	0	R/W	High-Z Control Specifies the state in software standby mode or deep standby mode for CKE, RAS#, and CAS#. 0: High impedance in software standby mode or deep standby mode for CKE, RAS#, and CAS#. 1: Driven in software standby mode or deep standby mode for CKE, RAS#, and CAS#.

Note: * For High-Z control of CKIO, see section 6, Clock Pulse Generator.

8.4.2 CSn Space Bus Control Register (CSnBCR) (n = 0 to 5)

CSnBCR is a 32-bit readable/writable register that specifies the memory connected to each space, the number of idle cycles between bus cycles, and the bus width.

Do not access external memory for the corresponding area until CSnBCR initial setting and pin setting are completed. Idle cycles may be inserted even when they are not specified. For details, see section 8.5.10, Wait between Access Cycles.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	1	1*	0*	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	IWW[2:0]	011	R/W	Idle Cycles between Write-Read Cycles and Write-Write Cycles These bits specify the number of idle cycles to be inserted after the access to a memory that is connected to the space. The target access cycles are the write-read cycle and write-write cycle. 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted
27 to 25	IWRWD[2:0]	011	R/W	Idle Cycles for Another Space Read-Write Specify the number of idle cycles to be inserted after the access to a memory that is connected to the space. The target access cycle is a read-write one in which continuous access cycles switch between different spaces. 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted
24 to 22	IWRWS[2:0]	011	R/W	Idle Cycles for Read-Write in the Same Space Specify the number of idle cycles to be inserted after the access to a memory that is connected to the space. The target cycle is a read-write cycle of which continuous access cycles are for the same space. 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted

Bit	Bit Name	Initial Value	R/W	Description
21 to 19	IWRRD[2:0]	011	R/W	Idle Cycles for Read-Read in Another Space Specify the number of idle cycles to be inserted after the access to a memory that is connected to the space. The target cycle is a read-read cycle of which continuous access cycles switch between different space. 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted
18 to 16	IWRRS[2:0]	011	R/W	Idle Cycles for Read-Read in the Same Space Specify the number of idle cycles to be inserted after the access to a memory that is connected to the space. The target cycle is a read-read cycle of which continuous access cycles are for the same space. 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	TYPE[2:0]	000	R/W	Specify the type of memory connected to a space. 000: Normal space 001: Burst ROM (clock asynchronous) 010: MPX-I/O 011: SRAM with byte selection 100: SDRAM 101: Reserved (setting prohibited) 110: Reserved (setting prohibited) 111: Burst ROM (clock synchronous) For details for memory type in each area, see Table 8.2. Note: When connecting the burst ROM to the CS0 space in boot mode 0, change the CS0WCR register to the settings by the burst ROM CS0WCR uses and then set TYPE[2:0] to the burst ROM setting. In boot modes 1 to 7, first set the CS0BCR register that includes the TYPE[2:0] bits and then set the CS0WCR register.
11	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
10, 9	BSZ[1:0]	10*	R/W	Data Bus Width Specification Specify the data bus widths of spaces. 00: Reserved (setting prohibited) 01: 8-bit size 10: 16-bit size 11: In MPX-I/O, the bus width can be specified by the address. Other than in MPX-I/O, setting is prohibited. Note 1. If area 5 is specified as MPX-I/O, the bus width can be specified as 8 bits or 16 bits by the address according to the SZSEL bit in CS5WCR by specifying the BSZ[1:0] bits to 11. The fixed bus width can be specified as 8 bits or 16 bits Note 2. In boot mode 0, the BSZ[1:0] bits settings in CS0BCR are ignored. Note 3. If area 2 or area 3 is specified as SDRAM space, the bus width can be specified as 16 bits only. Note 4. If area 0 is specified as clocked synchronous burst ROM space, the bus width can be specified as 16 bits only.
8 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

8.4.3 CSn Space Wait Control Register (CSnWCR) (n = 0 to 5)

CSnWCR specifies various wait cycles for memory access. The bit configuration of this register varies as shown below according to the memory type (TYPE2 to TYPE0) specified by the CSn space bus control register (CSnBCR). Specify CSnWCR before accessing the target area. Specify CSnBCR first, then specify CSnWCR.

(1) Normal Space, SRAM with Byte Selection, and MPX-I/O

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	—*	0	R/W	Reserved Set this bit to 0 when the interfaces for normal space or for SRAM with byte selection are used.
20	BAS	0	R/W	SRAM with Byte Selection Byte Access Select Specifies the WEn# and RD/WR# signal timing when the SRAM interface with byte selection is used. 0: Asserts the WEn# signal at the read/write timing and asserts the RD/WR# signal during the write access cycle. 1: Asserts the WEn# signal during the read/write access cycle and asserts the RD/WR# signal at the write timing.
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	—*	All 0	R/W	Reserved Set these bits to 0 when the interfaces for normal space or for SRAM with byte selection are used.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12, 11	SW[1:0]	00	R/W	Number of Delay Cycles from Address, CS0# Assertion to RD#, WEn# Assertion Specify the number of delay cycles from address and CS0# assertion to RD# and WEn# assertion. 00: 0.5 cycles 01: 1.5 cycles 10: 2.5 cycles 11: 3.5 cycles

Bit	Bit Name	Initial Value	R/W	Description
10 to 7	WR[3:0]	1010	R/W	Number of Access Wait Cycles Specify the number of cycles that are necessary for read/write access. 0000: No cycle 0001: 1 cycle 0010: 2 cycles 0011: 3 cycles 0100: 4 cycles 0101: 5 cycles 0110: 6 cycles 0111: 8 cycles 1000: 10 cycles 1001: 12 cycles 1010: 14 cycles 1011: 18 cycles 1100: 24 cycles 1101: Reserved (setting prohibited) 1110: Reserved (setting prohibited) 1111: Reserved (setting prohibited)
6	WM	0	R/W	External Wait Mask Specification Specifies whether or not the external wait input is valid. The specification by this bit is valid even when the number of access wait cycle is 0. 0: External wait input is valid 1: External wait input is ignored
5 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	HW[1:0]	00	R/W	Delay Cycles from RD# , WEn# Negation to Address, CS0# Negation Specify the number of delay cycles from RD# and WEn# negation to address and CS0# negation. 00: 0.5 cycles 01: 1.5 cycles 10: 2.5 cycles 11: 3.5 cycles

Note: * In boot mode 0, to connect the burst ROM to the CS0 space and switch to burst ROM interface after activation, set the TYPE[2:0] bits in CS0BCR after setting the burst number by the bits 20 and 21 and the burst wait cycle number by the bits 16 and 17. Do not write 1 to the reserved bits other than above bits.

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	SZSEL	0	R/W	MPX-I/O Interface Bus Width Specification Specifies an address to select the bus width when the BSZ[1:0] of CS5BCR are specified as 11. This bit is valid only when area 5 is specified as MPX-I/O. 0: Selects the bus width by address A14 1: Selects the bus width by address A21 The relationship between the SZSEL bit and bus width selected by A14 or A21 are summarized below.
20	MPXW	0	R/W	MPX-I/O Interface Address Wait This bit setting is valid only when area 5 is specified as MPX-I/O. Specifies the address cycle insertion wait for MPX-I/O interface. 0: Inserts no wait cycle 1: Inserts 1 wait cycle
	BAS	0	R/W	SRAM with Byte Selection Byte Access Select This bit setting is valid only when area 5 is specified as SRAM with byte selection. Specifies the WEn# and RD/WR# signal timing when the SRAM interface with byte selection is used. 0: Asserts the WEn# signal at the read timing and asserts the RD/WR# signal during the write access cycle. 1: Asserts the WEn# signal during the read access cycle and asserts the RD/WR# signal at the write timing.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	WW[2:0]	000	R/W	Number of Write Access Wait Cycles Specify the number of cycles that are necessary for write access. 000: The same cycles as WR[3:0] setting (number of read access wait cycles) 001: No cycle 010: 1 cycle 011: 2 cycles 100: 3 cycles 101: 4 cycles 110: 5 cycles 111: 6 cycles
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

SZSEL	A14	A21	Bus Width
0	0	Not affected	8 bits
0	1	Not affected	16 bits
1	Not affected	0	8 bits
1	Not affected	1	16 bits

Bit	Bit Name	Initial Value	R/W	Description
12, 11	SW[1:0]	00	R/W	Number of Delay Cycles from Address, CS5# Assertion to RD#, WE# Assertion Specify the number of delay cycles from address and CS5# assertion to RD# and WEn# assertion when area 5 is specified as normal space or SRAM with byte selection. Specify the number of delay cycles from the end of address cycle (Ta3) to RD# and WEn# assertion when area 5 is specified as MPx-I/O. 00: 0.5 cycles 01: 1.5 cycles 10: 2.5 cycles 11: 3.5 cycles
10 to 7	WR[3:0]	1010	R/W	Number of Read Access Wait Cycles Specify the number of cycles that are necessary for read access. 0000: No cycle 0001: 1 cycle 0010: 2 cycles 0011: 3 cycles 0100: 4 cycles 0101: 5 cycles 0110: 6 cycles 0111: 8 cycles 1000: 10 cycles 1001: 12 cycles 1010: 14 cycles 1011: 18 cycles 1100: 24 cycles 1101: Reserved (setting prohibited) 1110: Reserved (setting prohibited) 1111: Reserved (setting prohibited)
6	WM	0	R/W	External Wait Mask Specification Specifies whether or not the external wait input is valid. The specification by this bit is valid even when the number of access wait cycle is 0. 0: External wait input is valid 1: External wait input is ignored
5 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	HW[1:0]	00	R/W	Delay Cycles from RD#, WEn# Negation to Address, CS5# Negation Specify the number of delay cycles from RD# and WEn# negation to address and CS5# negation when area 5 is specified as normal space or SRAM with byte selection. Specify the number of delay cycles from RD# and WEn# negation to CS5# negation when area 5 is specified as MPx-I/O. 00: 0.5 cycles 01: 1.5 cycles 10: 2.5 cycles 11: 3.5 cycles

(2) Burst ROM (Clocked Asynchronous)

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	BST[1:0]	00	R/W	Burst Count Specification Specify the burst count for 16-byte or more access. These bits must not be set to B'11, because B'11 setting is reserved.

Bus Width	BST[1:0]	Burst count (16-byte access)
8 bits	00	16 burst × one time
	01	4 burst × four times
16 bits	00	8 burst × one time
	01	2 burst × four times
	10	4-4 or 2-4-2 burst

Note: For details, see Table 8.13, Relationship between Bus Width, Access Size, and Number of Bursts.

19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	BW[1:0]	00	R/W	Number of Burst Wait Cycles Specify the number of wait cycles to be inserted between the second or subsequent access cycles in burst access. 00: No cycle 01: 1 cycle 10: 2 cycles 11: 3 cycles
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 7	W[3:0]	1010	R/W	Number of Access Wait Cycles Specify the number of wait cycles to be inserted in the first access cycle. 0000: No cycle 0001: 1 cycle 0010: 2 cycles 0011: 3 cycles 0100: 4 cycles 0101: 5 cycles 0110: 6 cycles 0111: 8 cycles 1000: 10 cycles 1001: 12 cycles 1010: 14 cycles 1011: 18 cycles 1100: 24 cycles 1101: Reserved (setting prohibited) 1110: Reserved (setting prohibited) 1111: Reserved (setting prohibited)
6	WM	0	R/W	External Wait Mask Specification Specifies whether or not the external wait input is valid. The specification by this bit is valid even when the number of access wait cycle is 0. 0: External wait input is valid 1: External wait input is ignored
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

R/W:	R	R/W	R/W	R	R/W	R/W	R	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14, 13	WTRP[1:0]*	00	R/W	Number of Auto-Precharge Completion Wait Cycles Specify the number of minimum precharge completion wait cycles as shown below. • From the start of auto-precharge and issuing of ACTV command for the same bank • From issuing of the PRE/PALL command to issuing of the ACTV command for the same bank • Till entering the power-down mode or deep power-down mode • From the issuing of PALL command to issuing REF command in auto refresh mode • From the issuing of PALL command to issuing SELF command in self refresh mode The setting for areas 2 and 3 is common. 00: No cycle 01: 1 cycle 10: 2 cycles 11: 3 cycles
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
11, 10	WTRCD [1:0]*	01	R/W	Number of Wait Cycles between ACTV Command and READ(A)/WRIT(A) Command Specify the minimum number of wait cycles from issuing the ACTV command to issuing the READ(A)/WRIT(A) command. The setting for areas 2 and 3 is common. 00: No cycle 01: 1 cycle 10: 2 cycles 11: 3 cycles
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8, 7	A3CL[1:0]	10	R/W	CAS Latency for Area 3 Specify the CAS latency for area 3. 00: 1 cycle 01: 2 cycles 10: 3 cycles 11: 4 cycles
6, 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4, 3	TRWL[1:0]*	00	R/W	Number of Auto-Precharge Startup Wait Cycles Specify the number of minimum auto-precharge startup wait cycles as shown below. • Cycle number from the issuance of the WRITA command by this LSI until the completion of auto-precharge in the SDRAM. Equivalent to the cycle number from the issuance of the WRITA command until the issuance of the ACTV command. Confirm that how many cycles are required between the WRITA command receive in the SDRAM and the auto-precharge activation, referring to each SDRAM data sheet. And set the cycle number so as not to exceed the cycle number specified by these bits. • Cycle number from the issuance of the WRIT command until the issuance of the PRE command. This is the case when accessing another low address in the same bank in bank active mode. The setting for areas 2 and 3 is common. 00: No cycle 01: 1 cycle 10: 2 cycles 11: 3 cycles
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1, 0	WTRC[1:0]*	00	R/W	Number of Idle Cycles from REF Command/Self-Refresh Release to ACTV/REF/MRS Command Specify the number of minimum idle cycles in the periods shown below. • From the issuance of the REF command until the issuance of the ACTV/REF/MRS command • From releasing self-refresh until the issuance of the ACTV/REF/MRS command. The setting for areas 2 and 3 is common. 00: 2 cycles 01: 3 cycles 10: 5 cycles 11: 8 cycles

Note: * If both areas 2 and 3 are specified as SDRAM, WTRP[1:0], WTRCD[1:0], TRWL[1:0], and WTRC[1:0] bit settings are used in both areas in common.
If only one area is connected to the SDRAM, specify area 3. In this case, specify area 2 as normal space or SRAM with byte selection.

17, 16	BW[1:0]	00	R/W	Number of Burst Wait Cycles Specify the number of wait cycles to be inserted between the second or subsequent access cycles in burst access. 00: No cycle 01: 1 cycle 10: 2 cycles 11: 3 cycles
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 7	W[3:0]	1010	R/W	Number of Access Wait Cycles Specify the number of wait cycles to be inserted in the first access cycle. 0000: No cycle 0001: 1 cycle 0010: 2 cycles 0011: 3 cycles 0100: 4 cycles 0101: 5 cycles 0110: 6 cycles 0111: 8 cycles 1000: 10 cycles 1001: 12 cycles 1010: 14 cycles 1011: 18 cycles 1100: 24 cycles 1101: Reserved (setting prohibited) 1110: Reserved (setting prohibited) 1111: Reserved (setting prohibited)
6	WM	0	R/W	External Wait Mask Specification Specifies whether or not the external wait input is valid. The specification by this bit is valid even when the number of access wait cycle is 0. 0: External wait input is valid 1: External wait input is ignored
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

8.4.4 SDRAM Control Register (SDCR)

SDCR specifies the method to refresh and access SDRAM, and the types of SDRAMs to be connected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	A2ROW[1:0]		—	A2COL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	DEEP	—	RFSH	RMODE	PDOWN	BACTV	—	—	—	A3ROW[1:0]		—	A3COL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20, 19	A2ROW[1:0]	00	R/W	Number of Bits of Row Address for Area 2 Specify the number of bits of row address for area 2. 00: 11 bits 01: 12 bits 10: 13 bits 11: Reserved (setting prohibited)
18	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
17, 16	A2COL[1:0]	00	R/W	Number of Bits of Column Address for Area 2 Specify the number of bits of column address for area 2. 00: 8 bits 01: 9 bits 10: 10 bits 11: Reserved (setting prohibited)
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	DEEP	0	R/W	Deep Power-Down Mode This bit is valid for low-power SDRAM. If the RFSH or RMODE bit is set to 1 while this bit is set to 1, the deep power-down entry command is issued and the low-power SDRAM enters the deep power-down mode. 0: Self-refresh mode 1: Deep power-down mode
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
11	RFSH	0	R/W	Refresh Control Specifies whether or not the refresh operation of the SDRAM is performed. 0: No refresh 1: Refresh
10	RMODE	0	R/W	Refresh Mode Specifies whether to perform auto-refresh or self-refresh when the RFSH bit is 1. When the RFSH bit is 1 and this bit is 1, self-refresh starts immediately. When the RFSH bit is 1 and this bit is 0, auto-refresh starts according to the contents that are set in registers RTCSR, RTCNT, and RTCOR. 0: Auto-refresh is performed 1: Self-refresh is performed
9	PDOWN	0	R/W	Power-Down Mode Specifies whether the SDRAM will enter the power-down mode after the access to the SDRAM. With this bit being set to 1, after the SDRAM is accessed, the CKE signal is driven low and the SDRAM enters the power-down mode. 0: The SDRAM does not enter the power-down mode after being accessed. 1: The SDRAM enters the power-down mode after being accessed.

Bit	Bit Name	Initial Value	R/W	Description
8	BACTV	0	R/W	Bank Active Mode Specifies to access whether in auto-precharge mode (using READA and WRITA commands) or in bank active mode (using READ and WRIT commands). 0: Auto-precharge mode (using READA and WRITA commands) 1: Bank active mode (using READ and WRIT commands) Note: Bank active mode can be set only for area 3. When both areas 2 and 3 are set to SDRAM, specify the auto-precharge mode.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4, 3	A3ROW[1:0]	00	R/W	Number of Bits of Row Address for Area 3 Specify the number of bits of the row address for area 3. 00: 11 bits 01: 12 bits 10: 13 bits 11: Reserved (setting prohibited)
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1, 0	A3COL[1:0]	00	R/W	Number of Bits of Column Address for Area 3 Specify the number of bits of the column address for area 3. 00: 8 bits 01: 9 bits 10: 10 bits 11: Reserved (setting prohibited)

8.4.5 Refresh Timer Control/Status Register (RTCSR)

RTCSR specifies various items about refresh for SDRAM.
When RTCSR is written, the upper 16 bits of the write data must be H'A55A to cancel write protection.
The phase of the clock for incrementing the count in the refresh timer counter (RTCNT) is adjusted only by a power-on reset. Note that there is an error in the time until the compare match flag is set for the first time after the timer is started with the CKS[2:0] bits being set to a value other than B'000.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	CMF	CMIE	CKS[2:0]			RRC[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0.
7	CMF	0	R/W	Compare Match Flag Indicates that a compare match occurs between the refresh timer counter (RTCNT) and refresh time constant register (RTCOR). This bit is set or cleared in the following conditions. 0: Clearing condition: When 0 is written in CMF after reading out RTCSR during CMF = 1. 1: Setting condition: When the condition RTCNT = RTCOR is satisfied.
6	CMIE	0	R/W	Compare Match Interrupt Enable Enables or disables CMF interrupt requests when the CMF bit in RTCSR is set to 1. 0: Disables CMF interrupt requests. 1: Enables CMF interrupt requests.
5 to 3	CKS[2:0]	000	R/W	Clock Select Select the clock input to count-up the refresh timer counter (RTCNT). 000: Stop the counting-up 001: CKIOφ/4 010: CKIOφ/16 011: CKIOφ/64 100: CKIOφ/256 101: CKIOφ/1024 110: CKIOφ/2048 111: CKIOφ/4096
2 to 0	RRC[2:0]	000	R/W	Refresh Count Specify the number of continuous refresh cycles, when the refresh request occurs after the coincidence of the values of the refresh timer counter (RTCNT) and the refresh time constant register (RTCOR). These bits can make the period of occurrence of refresh long. 000: 1 time 001: 2 times 010: 4 times 011: 6 times 100: 8 times 101: Reserved (setting prohibited) 110: Reserved (setting prohibited) 111: Reserved (setting prohibited)

8.4.6 Refresh Timer Counter (RTCNT)

RTCNT is an 8-bit counter that increments using the clock selected by bits CKS[2:0] in RTCSR. When RTCNT matches RTCOR, RTCNT is cleared to 0. The value in RTCNT returns to 0 after counting up to 255. When the RTCNT is written, the upper 16 bits of the write data must be H'A55A to cancel write protection.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0.
7 to 0		All 0	R/W	8-Bit Counter

8.4.7 Refresh Time Constant Register (RTCOR)

RTCOR is an 8-bit register. When RTCOR matches RTCNT, the CMF bit in RTCSR is set to 1 and RTCNT is cleared to 0. When the RFSH bit in SDCR is 1, a memory refresh request is issued by this matching signal. This request is maintained until the refresh operation is performed. If the request is not processed when the next matching occurs, the previous request is ignored.

When the CMIE bit in RTCSR is set to 1, an interrupt request is issued by this matching signal. The request continues to be output until the CMF bit in RTCSR is cleared. Clearing the CMF bit only affects the interrupt request and does not clear the refresh request. Therefore, a combination of refresh request and interval timer interrupt can be specified so that the number of refresh requests are counted by using timer interrupts while refresh is performed periodically.

When RTCOR is written, the upper 16 bits of the write data must be H'A55A to cancel write protection.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0.
7 to 0		All 0	R/W	8-Bit Counter

8.4.8 Timeout Cycle Constant Register (TOSCORn) (n = 0 to 5)

TOSCORn is a 16-bit register the value of which is effective when the WM bit in the CSn space wait control register (CSnWCR) is 0 and the corresponding bit in the timeout enable register (TOENR) is 1. When the number of cycles of waiting due to the signal on the eternal wait input pin matches the setting of TOSCORn, external wait input is disabled to end the cycle of access, the timeout status flag for the corresponding space in the timeout status register (TOSTR) is set, and a timeout detection interrupt request is generated. The timeout detection interrupt request is retained until the corresponding bit in TOENR is set to 0 or 0 is written to the timeout status flag for the corresponding space. Note that timeout detection is enabled even while the timeout status flag for the corresponding space in TOSTR is 1, and external wait input is disabled in response to a further timeout.

8.4.9 Timeout Status Register (TOSTR)

TOSTOR is an 8-bit register that holds the timeout status flags for the CS spaces. When the WM bit in the CSn space wait control register (CSnWCR) is 0 and the corresponding bit in the timeout enable register (TOENR) is 1 and the number of cycles of waiting in response to the signal on the eternal wait input matches the setting of TOSCORn, the timeout status flag for the corresponding space is set and a timeout detection interrupt request is generated. The only writable value for the timeout status flags is 0, which clears the flag. Writing 1 to a flag is ignored.

5	CS5TOSTF	0	R/W	CS5 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS5 space has matched the setting of the CS5 space timeout cycle constant register (TOSCOR5). This bit is set or cleared in the following conditions. 0: Clearing condition When 0 is written in CS5TOSTF. 1: Setting condition When the WM bit in the CS5 space wait control register (CS5WCR) is 0 and the CS5TOEN bit in the timeout enable register (TOENR) is 1, the number of cycles of waiting due to the input on the external wait pin during access to the CS5 space has matched the setting of TOSCOR5.
4	CS4TOSTF	0	R/W	CS4 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS4 space has matched the setting of the CS4 space timeout cycle constant register (TOSCOR4). For the condition to set or clear this bit, refer to the description of CS5TOSTF.
3	CS3TOSTF	0	R/W	CS3 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS3 space has matched the setting of the CS3 space timeout cycle constant register (TOSCOR3). For the condition to set or clear this bit, refer to the description of CS5TOSTF.
2	CS2TOSTF	0	R/W	CS2 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS2 space has matched the setting of the CS2 space timeout cycle constant register (TOSCOR2). For the condition to set or clear this bit, refer to the description of CS5TOSTF.
1	CS1TOSTF	0	R/W	CS1 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS1 space has matched the setting of the CS1 space timeout cycle constant register (TOSCOR1). For the condition to set or clear this bit, refer to the description of CS5TOSTF.
0	CS0TOSTF	0	R/W	CS0 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS0 space has matched the setting of the CS0 space timeout cycle constant register (TOSCOR0). For the condition to set or clear this bit, refer to the description of CS5TOSTF.

8.4.10 Timeout Enable Register (TOENR)

TOENR is an 8-bit register that specifies enabling or disabling the detection of timeout for waiting in each of the CS spaces.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CS5 TOEN	CS4 TOEN	CS3 TOEN	CS2 TOEN	CS1 TOEN	CS0 TOEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0.
5	CS5TOEN	0	R/W	CS5 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS5 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.
4	CS4TOEN	0	R/W	CS4 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS4 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.
3	CS3TOEN	0	R/W	CS3 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS3 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.
2	CS2TOEN	0	R/W	CS2 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS2 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.
1	CS1TOEN	0	R/W	CS1 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS1 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.
0	CS0TOEN	0	R/W	CS0 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS0 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.

8.4.11 AC Characteristics Adjustment Register (ACADJ)

ACADJ is a register that adjusts the input/output timing of the bus state controller. It is used for AC characteristics adjustment for SDRAM interface.

Do not change for the initial values when SDRAM is not used.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	SDRODLY[3:0]

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	SDRODLY[3:0]	All 0	R/W	Output characteristics adjustment bit Adjust the output delay time. H'0: Initial setting. The SDRAM is not to be connected. H'2: The SDRAM is to be connected. Other than above: Setting prohibited
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	SDRIDLY[3:0]	All 0	R/W	Input characteristics adjustment bit Adjust the input data capture timing. H'0: Initial setting. The SDRAM is not to be connected. H'F: The SDRAM is to be connected. Other than above: Setting prohibited

8.5 Operation

8.5.1 Access Size and Data Alignment

This LSI supports little endian, in which the least significant byte (LSB) is that in the direction of the 0th address.
Data bus width can be selected from 8 bits and 16 bits for the normal memory and SRAM with byte selection. Data bus width can be selected from 16 bits for SDRAM. For MPX-I/O, the data bus width is fixed to either 8 or 16 bits, or made selectable as 8 bits or 16 bits by one of the address lines.
Data bus width varies depending on boot mode. For details, refer to section 8.3.2, Data Bus Width and Related Pin Setting for Each Area Depending on Boot Mode.
Data alignment is performed in accordance with the data bus width selected for the device. This also means that four read operations are required to read 32-bit data from a byte-width device. In this LSI, data alignment and conversion of data length is performed automatically between the respective interfaces.
Table 8.5 and Table 8.6 show the relationship between device data width and access unit.

Table 8.5 16-Bit External Device Access and Data Alignment in Little Endian

		Data Bus		Strobe Signals	
Operation		D15 to D8	D7 to D0	WE1#, DQMU	WE0#, DQML

8.5.2 Normal Space Interface

(1) Basic Timing

For access to a normal space, this LSI uses strobe signal output in consideration of the fact that mainly static RAM will be directly connected. When using SRAM with a byte-selection pin, see section 8.5.8, SRAM Interface with Byte Selection. Figure 8.2 shows the basic timings of normal space access. A no-wait normal access is completed in two cycles. The BS# signal is asserted for one cycle to indicate the start of a bus cycle.

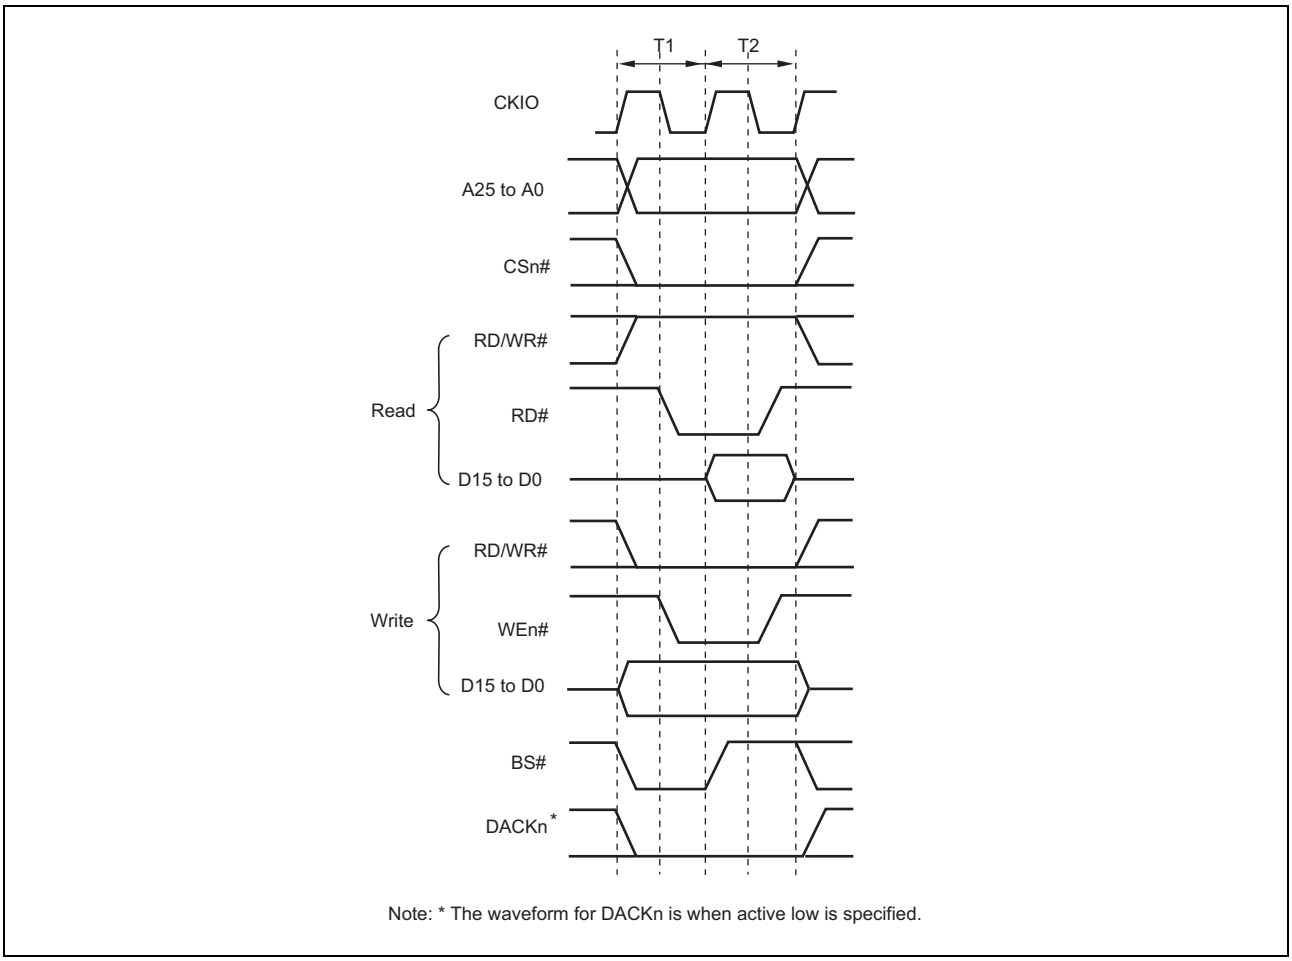

Figure 8.2 Normal Space Basic Access Timing (Access Wait 0)

There is no access size specification when reading. The correct access start address is output in the least significant bit of the address, but since there is no access size specification, 16 bits are always read in case of a 16-bit device. When writing, only the WEn# signal for the byte to be written is asserted.

It is necessary to output the data that has been read using RD# when a buffer is established in the data bus. The RD#/WR# signal is in a read state (high output) when no access has been carried out. Therefore, care must be taken when controlling the external data buffer with this signal, to avoid output collision.

Figure 8.3 and Figure 8.4 show the basic timings in continuous access to normal space. If the WM bit in CSnWCR is cleared to 0, a Tnop cycle is inserted after the CSn space access to evaluate the external wait (Figure 8.3). If the WM bit in CSnWCR is set to 1, external waits are ignored and no Tnop cycle is inserted (Figure 8.4).

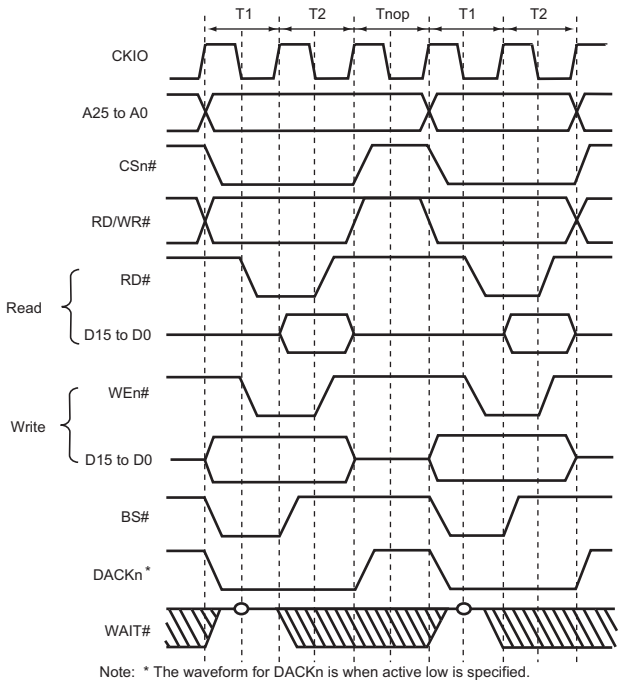

Figure 8.3 Continuous Access to Normal Space (1) Bus Width = 16 Bits, 32-Bit Access, CSnWCR.WM Bit = 0 (Access Wait = 0, Cycle Wait = 0)

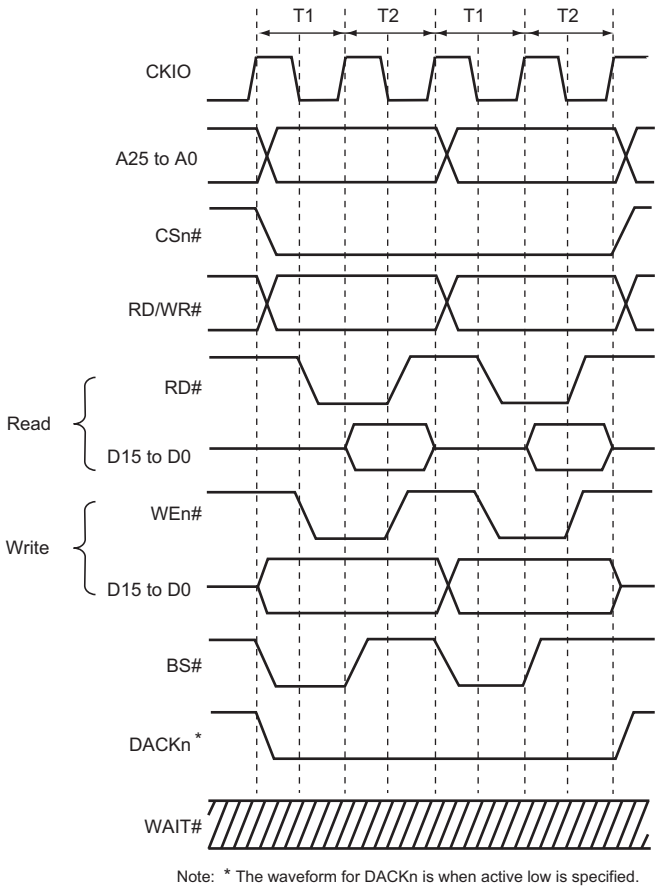

Figure 8.4 Continuous Access to Normal Space (2) Bus Width = 16 Bits, 32-Bit Access, CSnWCR.WM Bit = 1 (Access Wait = 0, Cycle Wait = 0)

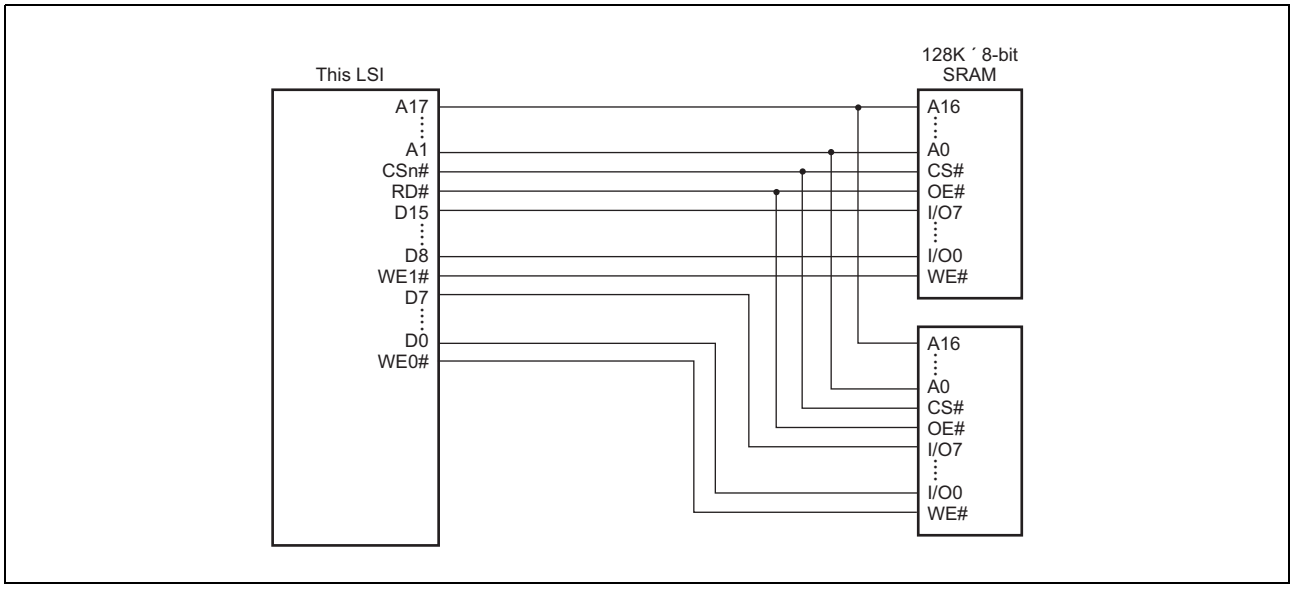

Figure 8.5 Example of 16-Bit Data-Width SRAM Connection

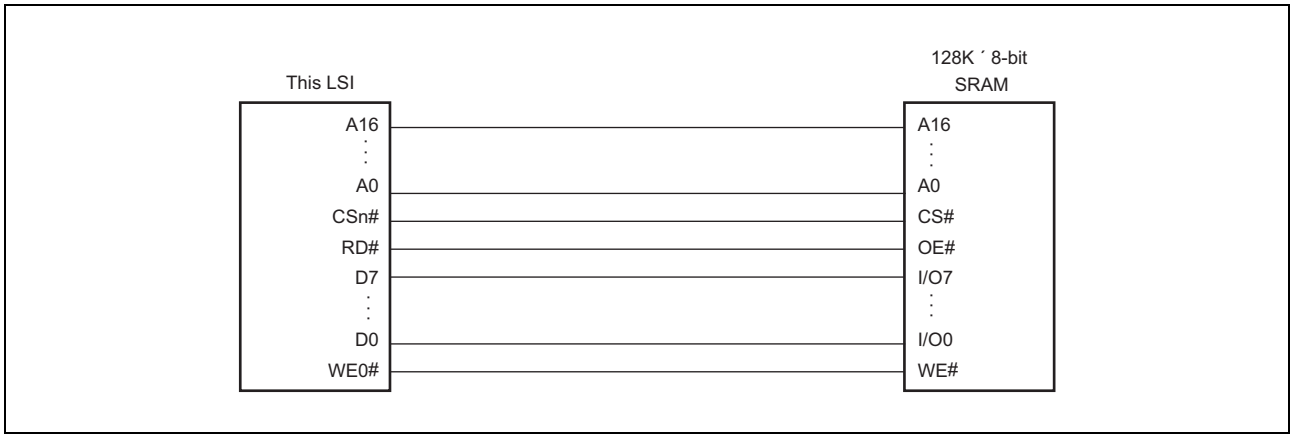

Figure 8.6 Example of 8-Bit Data-Width SRAM Connection

8.5.3 Access Wait Control

Wait cycle insertion on a normal space access can be controlled by the settings of bits WR3 to WR0 in CSnWCR. It is possible for areas 1, 4, and 5 to insert wait cycles independently in read access and in write access. Areas 0, 2, and 3 have common access wait for read cycle and write cycle. The specified number of Tw cycles are inserted as wait cycles in a normal space access shown in Figure 8.7.

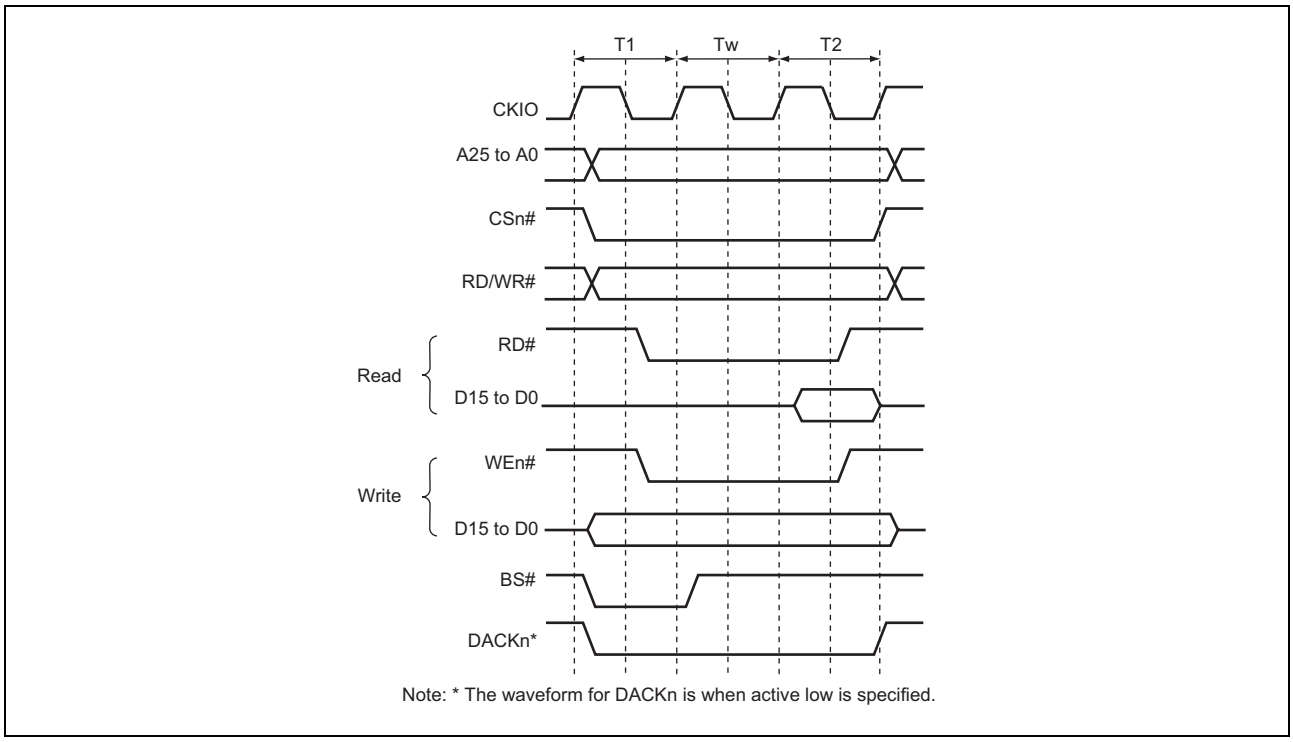

Figure 8.7 Wait Timing for Normal Space Access (Software Wait Only)

When the WM bit in CSnWCR is cleared to 0, the external wait input WAIT# signal is also sampled. WAIT# pin sampling is shown in Figure 8.8. A 2-cycle wait is specified as a software wait. The WAIT# signal is sampled on the falling edge of CKIO at the transition from the T1 or Tw cycle to the T2 cycle.

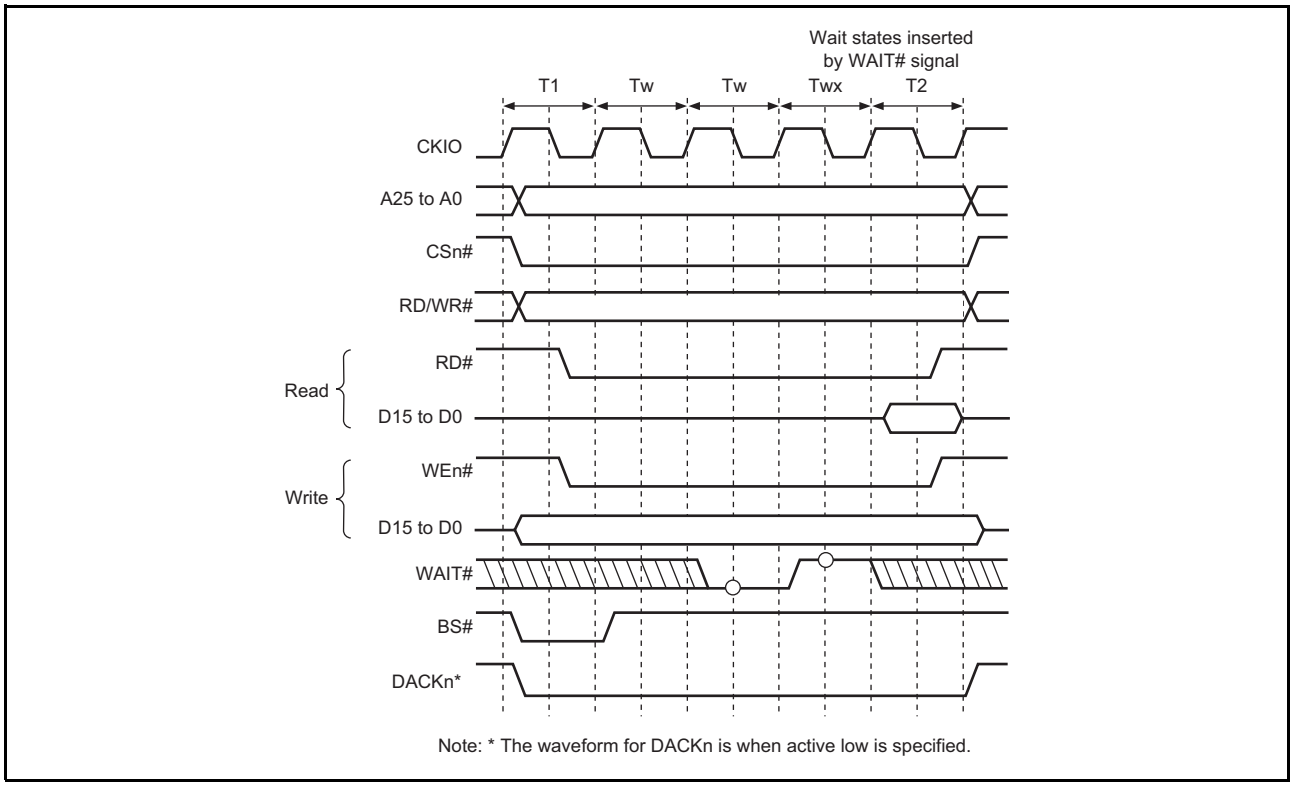

Figure 8.8 Wait Cycle Timing for Normal Space Access (Wait Cycle Insertion Using WAIT# Signal)

8.5.4 CSn# Assert Period Expansion

The number of cycles from CSn# assertion to RD#, WEn# assertion can be specified by setting bits SW1 and SW0 in CSnWCR. The number of cycles from RD#, WEn# negation to CSn# negation can be specified by setting bits HW1 and HW0. Therefore, a flexible interface to an external device can be obtained. Figure 8.9 shows an example. A Th cycle and a Tf cycle are added before and after an ordinary cycle, respectively. In these cycles, RD# and WEn# are not asserted, while other signals are asserted. The data output is prolonged to the Tf cycle, and this prolongation is useful for devices with slow writing operations.

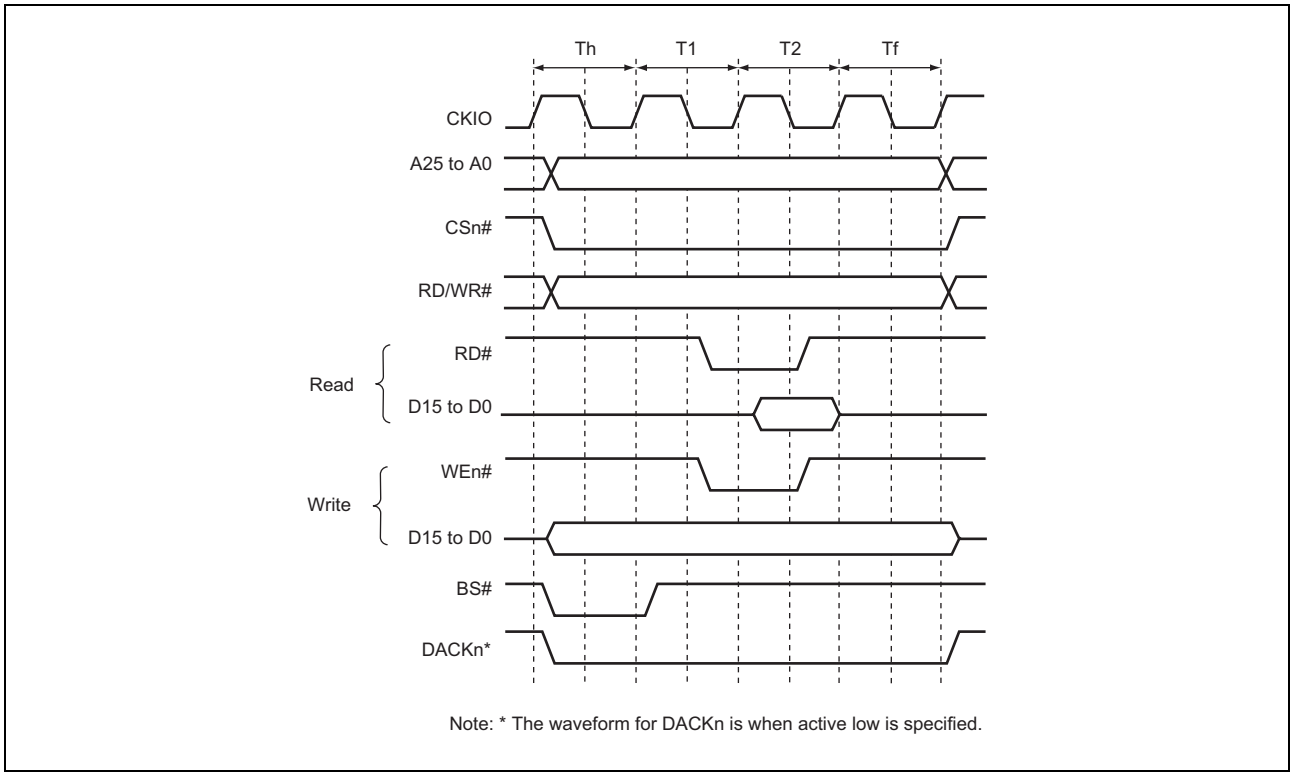

Figure 8.9 CSn# Assert Period Expansion

8.5.5 MPX-I/O Interface

Access timing for the MPX space is shown below. In the MPX space, CS5#, AH#, RD#, and WEn# signals control the accessing. The basic access for the MPX space consists of 2 cycles of address output followed by an access to a normal space. The bus width for the address output cycle or the data input/output cycle is fixed to 8 bits or 16 bits. Alternatively, it can be 8 bits or 16 bits depending on the address to be accessed.

Output of the addresses D15 to D0 or D7 to D0 is performed from cycle Ta2 to cycle Ta3. Because cycle Ta1 has a high-impedance state, collisions of addresses and data can be avoided without inserting idle cycles, even in continuous access cycles. Address output is increased to 3 cycles by setting the MPXW bit in CS5WCR to 1.

The RD/WR# signal is output at the same time as the CS5# signal; it is high in the read cycle and low in the write cycle. The data cycle is the same as that in a normal space access.

The delay cycles the number of which is specified by SW[1:0] are inserted between cycle Ta3 and cycle T1. The delay cycles the number of which is specified by HW[1:0] are added after cycle T2.

Timing charts are shown in Figure 8.10 to Figure 8.13.

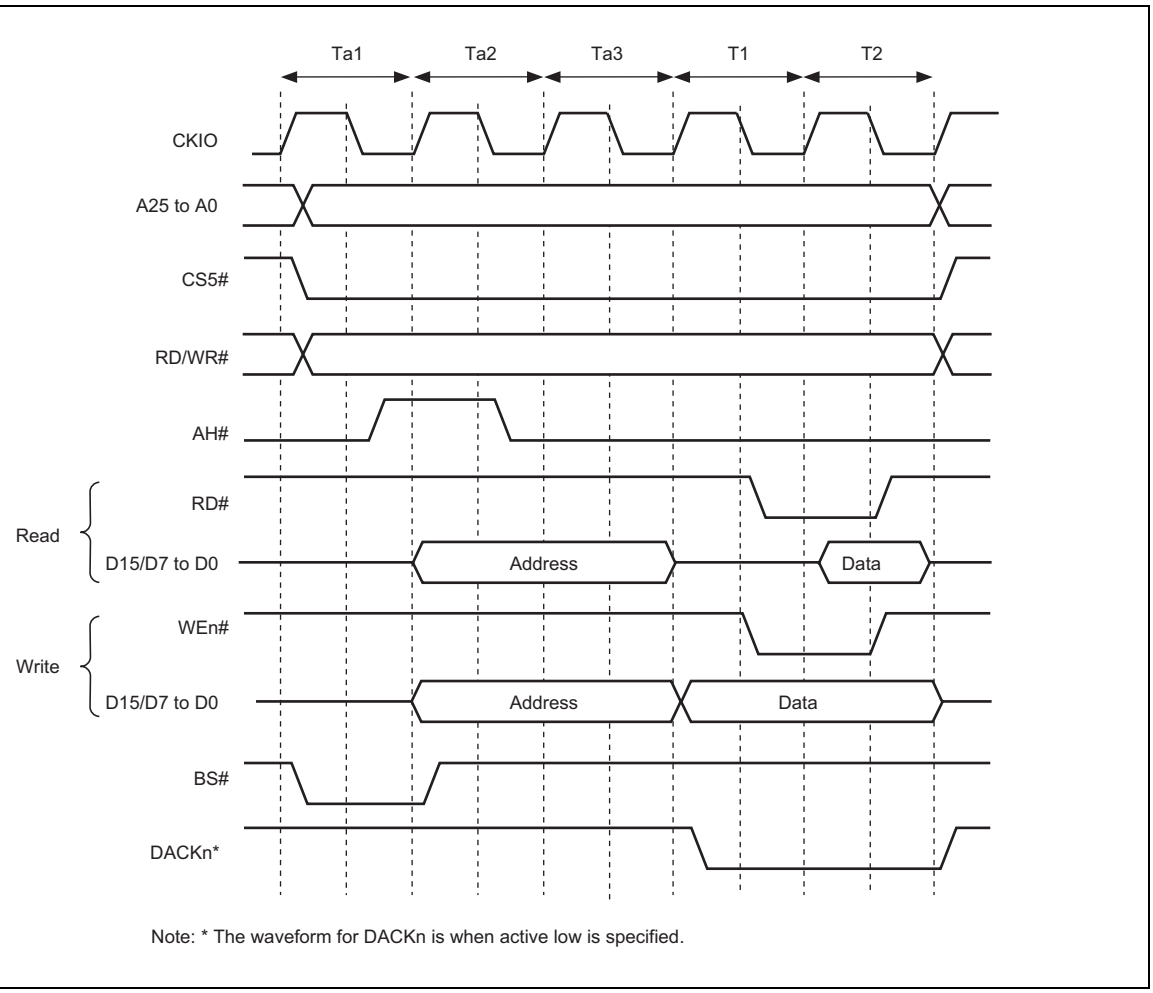

Figure 8.10 (1) Access Timing for MPX Space (Address Cycle No Wait, Data Cycle No Wait)

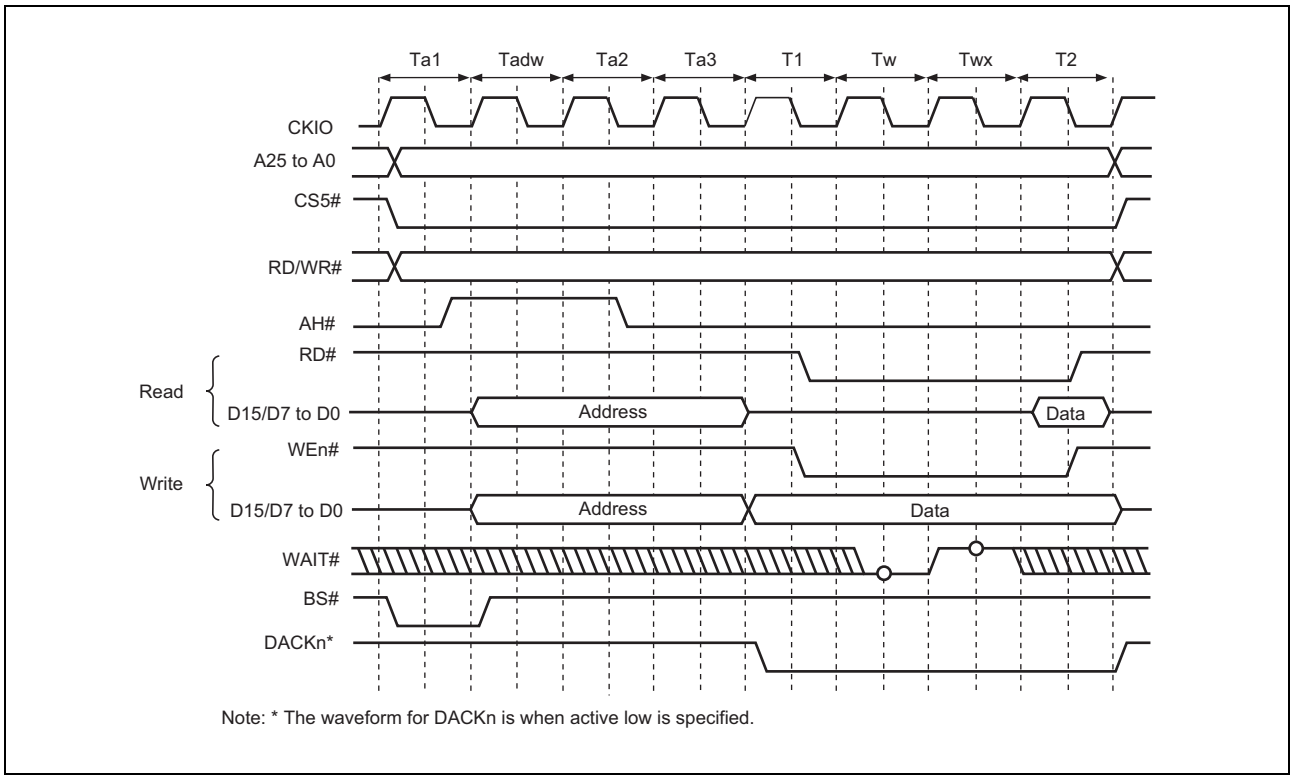

Figure 8.13 Access Timing for MPX Space (Address Cycle Access Wait 1, Data Cycle Wait 1, External Wait 1)

8.5.6 SDRAM Interface

(1) SDRAM Direct Connection

The SDRAM that can be connected to this LSI is a product that has 11/12/13 bits of row address, 8/9/10 bits of column address, 4 or less banks, and uses the A10 pin for setting precharge mode in read and write command cycles.

The control signals for direct connection of SDRAM are RAS#, CAS#, RD/WR#, DQMU, DQML, CKE, CS2#, and CS3#. All the signals other than CS2# and CS3# are common to all areas, and signals other than CKE are valid only when CS2# or CS3# is asserted. SDRAM can be connected to up to 2 spaces. The data bus width of the area that is connected to SDRAM is 16 bits only.
Burst read/single write (burst length 1) and burst read/burst write (burst length 1) are supported as the SDRAM operating mode.
Commands for SDRAM can be specified by RAS#, CAS#, RD/WR#, and specific address signals. These commands supports:

- NOP
- Auto-refresh (REF)
- Self-refresh (SELF)
- All banks pre-charge (PALL)
- Specified bank pre-charge (PRE)
- Bank active (ACTV)
- Read (READ)
- Read with pre-charge (READA)
- Write (WRIT)
- Write with pre-charge (WRITA)
- Write mode register (MRS, EMRS)

The byte to be accessed is specified by DQMU and DQML. Reading or writing is performed for a byte whose corresponding DQMx is low. For details on the relationship between DQMx and the byte to be accessed, see section 8.5.1, Access Size and Data Alignment.

Figure 8.14 shows examples of the connection of the SDRAM with the LSI.

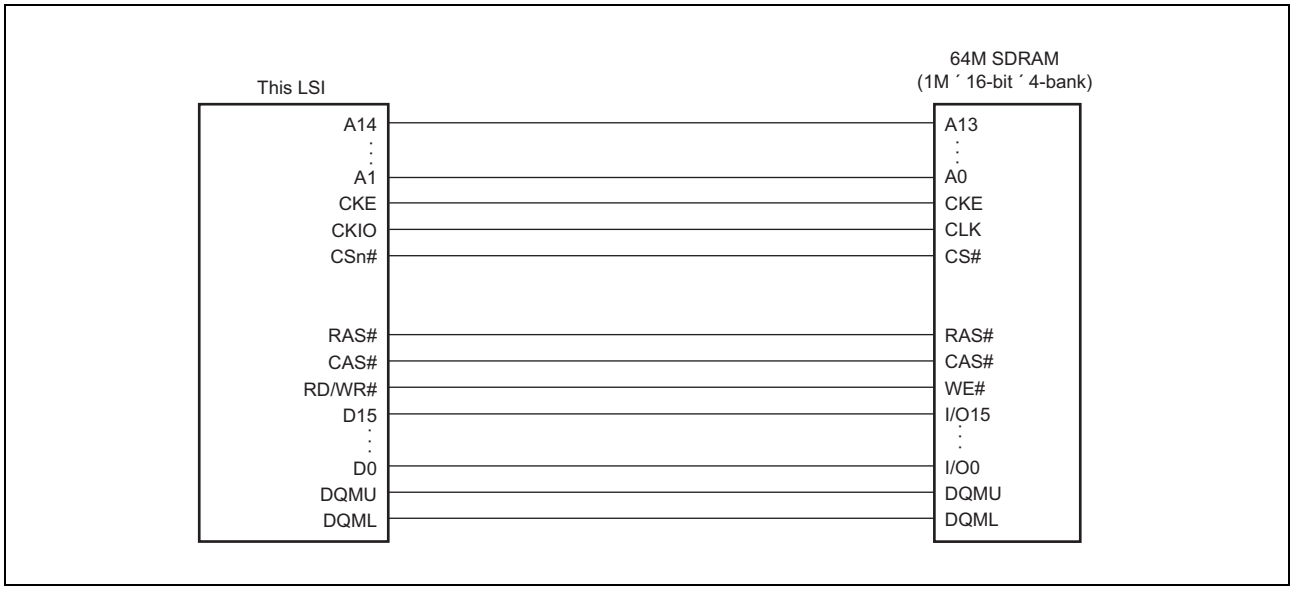

Figure 8.14 Example of 16-Bit Data Width SDRAM Connection

(2) Address Multiplexing

An address multiplexing is specified so that SDRAM can be connected without external multiplexing circuitry according to the setting of bits BSZ[1:0] in CSnBCR and bits A2ROW[1:0], A2COL[1:0], A3ROW[1:0], and A3COL[1:0] in SDCR. Table 8.7 to Table 8.9 show the relationship between the settings of bits BSZ[1:0], A2ROW[1:0], A2COL[1:0], A3ROW[1:0], and A3COL[1:0] and the bits output at the address pins. Do not specify those bits in the manner other than this table, otherwise the operation of this LSI is not guaranteed. A25 to A18 are not multiplexed and the original values of address are always output at these pins.
When the data bus width is 16 bits (BSZ1 and BSZ0 = B'10), A0 of SDRAM specifies a 16-bit address. Therefore, connect this A0 pin of SDRAM to the A1 pin of the LSI; the A1 pin of SDRAM to the A2 pin of the LSI, and so on.

Table 8.7 Relationship between BSZ[1:0], A2/3ROW[1:0], A2/3COL[1:0], and Address Multiplex Output (1)

(3) Burst Read

A burst read occurs in the following cases with this LSI.

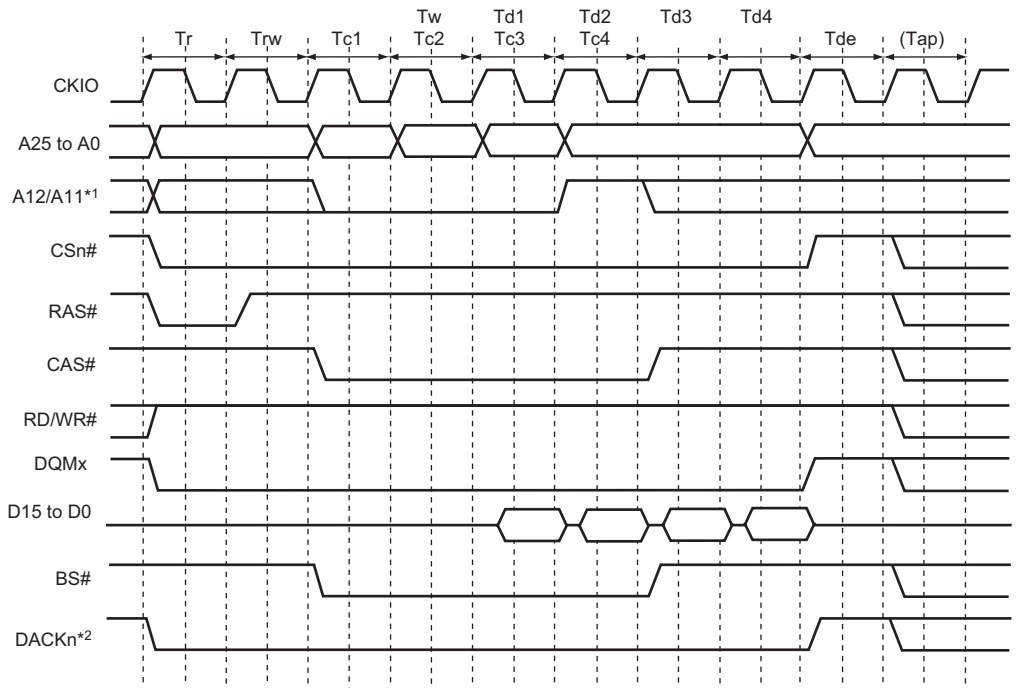
1. Access size in reading is larger than data bus width.
2. 16-, 32- or 64-byte transfer

This LSI always accesses the SDRAM with burst length 1. For example, read access of burst length 1 is performed consecutively 8 times to read 16-byte continuous data from the SDRAM that is connected to a 16-bit data bus. This access is called the burst read with the burst number 8. Table 8.10 shows the relationship between the access size and the number of bursts.

Table 8.10 Relationship between Access Size and Number of Bursts

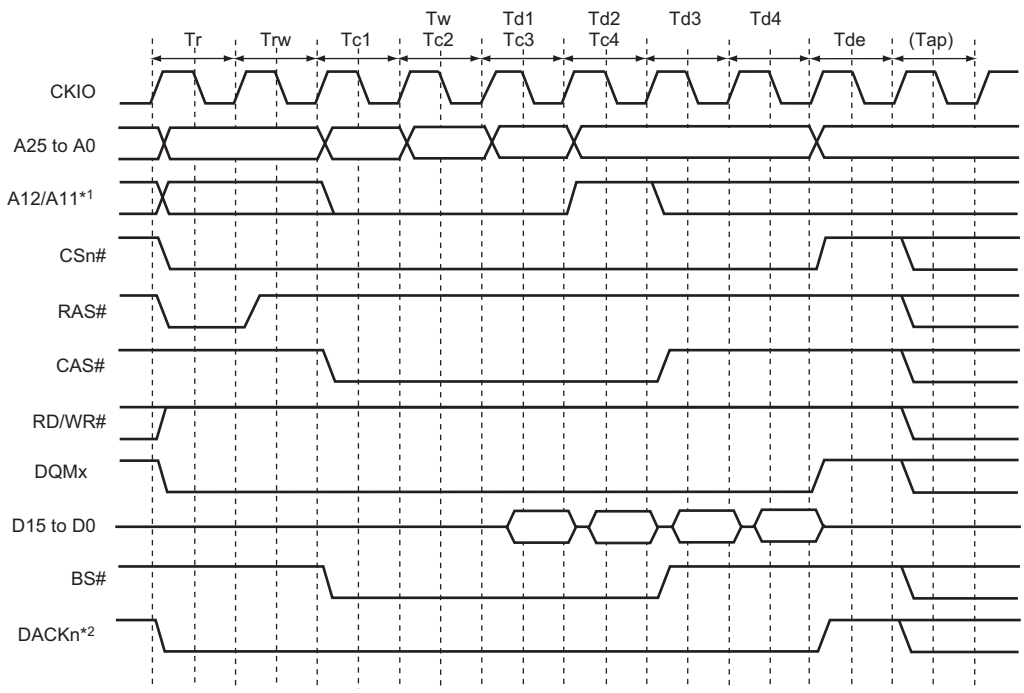
Bus Width	Access Size	Number of Bursts
16 bits	8 bits	1
	16 bits	1
	32 bits	2
	16 bytes	8
	32 bytes	16
	64 bytes	32

Figure 8.15 and Figure 8.16 show timing charts in burst read. In burst read, an ACTV command is output in the Tr cycle, the READ command is issued in the Tc1, Tc2, and Tc3 cycles, the READA command is issued in the Tc4 cycle, and the read data is received at the rising edge of the external clock (CKIO) in the Td1 to Td4 cycles. The Tap cycle is used to wait for the completion of an auto-precharge induced by the READA command in the SDRAM. In the Tap cycle, a new command will not be issued to the same bank. However, access to another CS space or another bank in the same SDRAM space is enabled. The number of Tap cycles is specified by the WTRP1 and WTRP0 bits in CS3WCR.
In this LSI, wait cycles can be inserted by specifying each bit in CS3WCR to connect the SDRAM in variable frequencies. Figure 8.15 shows an example in which wait cycles are inserted. The number of cycles from the Tr cycle where the ACTV command is output to the Tc1 cycle where the READ command is output can be specified using the WTRCD1 and WTRCD0 bits in CS3WCR. If the WTRCD1 and WTRCD0 bits specify one cycles or more, a Trw cycle where the NOP command is issued is inserted between the Tr cycle and Tc1 cycle. The number of cycles from the Tc1 cycle where the READ command is output to the Td1 cycle where the read data is latched can be specified for the CS2 and CS3 spaces independently, using the A2CL1 and A2CL0 bits in CS2WCR or the A3CL1 and A3CL0 bits in CS3WCR. The number of cycles from Tc1 to Td1 corresponds to the SDRAM CAS latency. The CAS latency for the SDRAM is normally defined as up to three cycles. However, the CAS latency in this LSI can be specified as 1 to 4 cycles. This CAS latency can be achieved by connecting a latch circuit between this LSI and the SDRAM.
A Tde cycle is an idle cycle required to transfer the read data into this LSI and occurs once for every burst read or every single read.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

Figure 8.15 Burst Read Basic Timing (CAS Latency 1, Auto Pre-Charge)



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

Figure 8.16 Burst Read Wait Specification Timing (CAS Latency 2, WTRCD[1:0] = 1 Cycle, Auto Pre-Charge)

(4) Single Read

A read access ends in one cycle when the data bus width is larger than or equal to the access size. As the SDRAM is set to the burst read with the burst length 1, only the required data is output. A read access that ends in one cycle is called single read.

Figure 8.17 shows the single read basic timing.

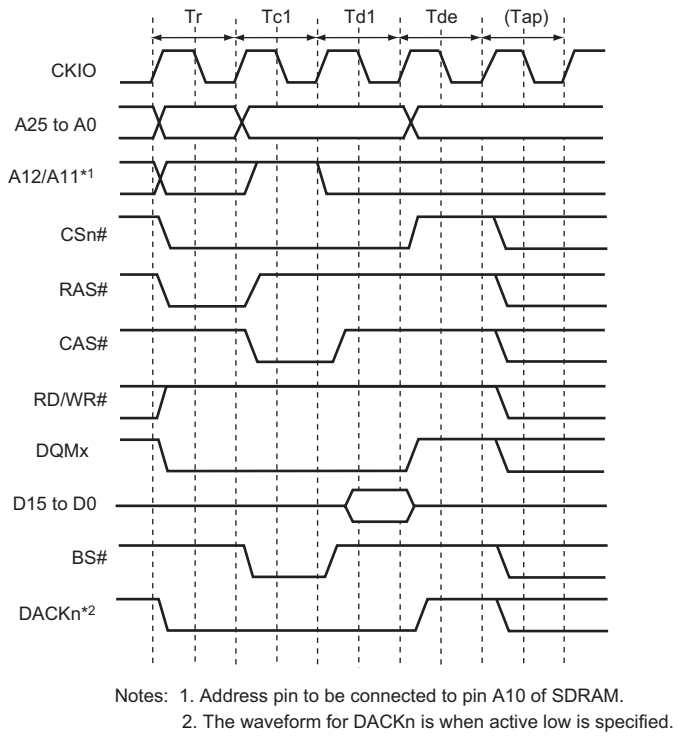


Figure 8.17 Basic Timing for Single Read (CAS Latency 1, Auto Pre-Charge)

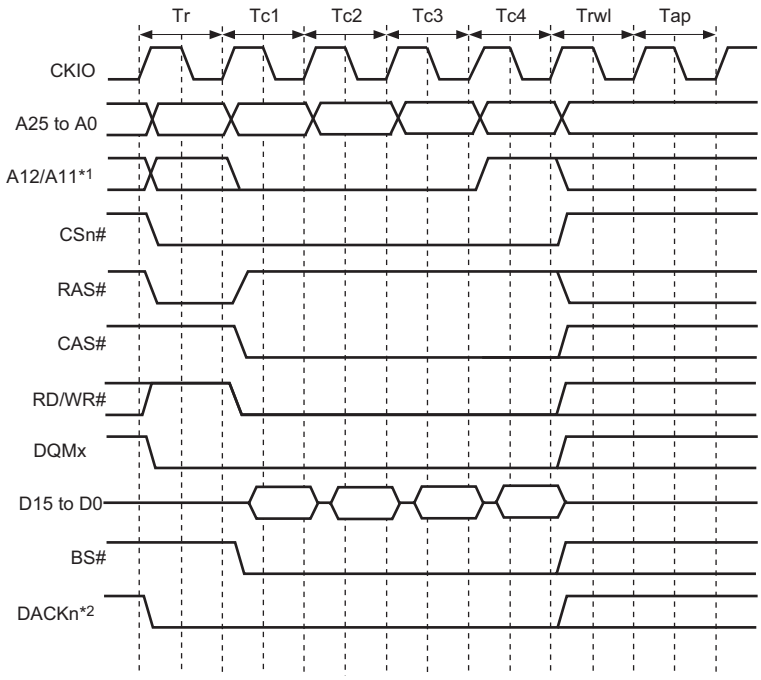
(5) Burst Write

A burst write occurs in the following cases in this LSI.

1. Access size in writing is larger than data bus width.
2. 16-, 32- or 64-byte transfer

This LSI always accesses SDRAM with burst length 1. For example, write access of burst length 1 is performed continuously 8 times to write 16-byte continuous data to the SDRAM that is connected to a 16-bit data bus. This access is called burst write with the burst number 8. The relationship between the access size and the number of bursts is shown in Table 8.10. Figure 8.18 shows a timing chart for burst writes. In burst write, an ACTV command is output in the Tr cycle, the WRIT command is issued in the Tc1, Tc2, and Tc3 cycles, and the WRITA command is issued to execute an auto-precharge in the Tc4 cycle. In the write cycle, the write data is output simultaneously with the write command. After the write command with the auto-precharge is output, the Trw1 cycle that waits for the auto-precharge initiation is followed by the Tap cycle that waits for completion of the auto-precharge induced by the WRITA command in the SDRAM. Between the Trwl and the Tap cycle, a new command will not be issued to the same bank. However, access to another CS space or another bank in the same SDRAM space is enabled. The number of Trw1 cycles is specified by the TRWL1 and TRWL0 bits in CS3WCR. The number of Tap cycles is specified by the WTRP1 and WTRP0 bits in CS3WCR.

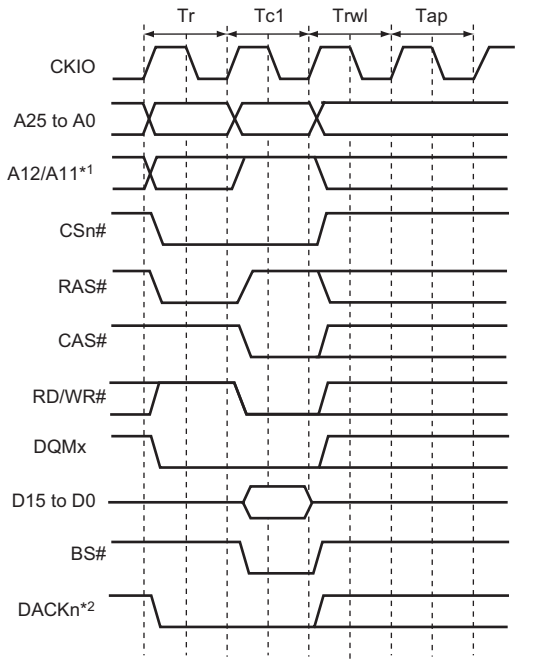


Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

Figure 8.18 Basic Timing for Burst Write (Auto Pre-Charge)

(6) Single Write

A write access ends in one cycle when the data bus width is larger than or equal to access size. As a single write or burst write with burst length 1 is set in SDRAM, only the required data is output. The write access that ends in one cycle is called single write. Figure 8.19 shows the single write basic timing.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

Figure 8.19 Single Write Basic Timing (Auto-Precharge)

(7) Bank Active

The SDRAM bank function can be used to support high-speed access to the same row address. When the BACTV bit in SDCR is 1, access is performed using commands without auto-precharge (READ or WRIT). This function is called bank-active function. This function is valid only for area 3. When area 3 is set to bank-active mode, area 2 should be set to normal space or SRAM with byte selection. When areas 2 and 3 are both set to SDRAM, auto precharge mode must be set.

When the bank-active function is used, precharging is not performed when the access ends. When accessing the same row address in the same bank, it is possible to issue the READ or WRIT command immediately, without issuing an ACTV command. As SDRAM is internally divided into several banks, it is possible to activate one row address in each bank. If the next access is to a different row address, a PRE command is first issued to precharge the relevant bank, then when precharging is completed, the access is performed by issuing an ACTV command followed by a READ or WRIT command. If this is followed by an access to a different row address, the access time will be longer because of the precharging performed after the access request is issued. The number of cycles between issuance of the PRE command and the ACTV command is determined by the WTRP1 and WTPR0 bits in CS3WCR.

In a write, when an auto-precharge is performed, a command cannot be issued to the same bank for a period of Trwl + Tap cycles after issuance of the WRITA command. When bank active mode is used, READ or WRIT commands can be issued successively if the row address is the same. The number of cycles can thus be reduced by Trwl + Tap cycles for each write.

There is a limit on tRAS, the time for placing each bank in the active state. If there is no guarantee that there will not be a cache hit and another row address will be accessed within the period in which this value is maintained by program execution, it is necessary to set auto-refresh and set the refresh cycle to no more than the maximum value of tRAS.

A burst read cycle without auto-precharge is shown in Figure 8.20, a burst read cycle for the same row address in Figure 8.21, and a burst read cycle for different row addresses in Figure 8.22. Similarly, a single write cycle without auto-precharge is shown in Figure 8.23, a single write cycle for the same row address in Figure 8.24, and a single write cycle for different row addresses in Figure 8.25.

In Figure 8.21, a Tnop cycle in which no operation is performed is inserted before the Tc cycle that issues the READ command. The Tnop cycle is inserted to acquire two cycles of CAS latency for the DQMx signal that specifies the read byte in the data read from the SDRAM. If the CAS latency is specified as two cycles or more, the Tnop cycle is not inserted because the two cycles of latency can be acquired even if the DQMx signal is asserted after the Tc cycle.

When bank active mode is set, if only access cycles to the respective banks in the area 3 space are considered, as long as access cycles to the same row address continue, the operation starts with the cycle in Figure 8.20 or Figure 8.23, followed by repetition of the cycle in Figure 8.21 or Figure 8.24. An access to a different area during this time has no effect. If there is an access to a different row address in the bank active state, the bus cycle in Figure 8.22 or Figure 8.25 is executed instead of that in Figure 8.21 or Figure 8.24. In bank active mode, too, all banks become inactive after a refresh cycle.

(8) Refreshing

This module has a function for controlling SDRAM refreshing. Auto-refreshing can be performed by clearing the RMODE bit to 0 and setting the RFSH bit to 1 in SDCR. A continuous refreshing can be performed by setting the RRC2 to RRC0 bits in RTCSR. If SDRAM is not accessed for a long period, self-refresh mode, in which the power consumption for data retention is low, can be activated by setting both the RMODE bit and the RFSH bit to 1.

(a) Auto-refreshing

Refreshing is performed at intervals determined by the input clock selected by bits CKS2 to CKS0 in RTCSR, and the value set by in RTCOR. The value of bits CKS2 to CKS0 in RTCOR should be set so as to satisfy the refresh interval stipulation for the SDRAM used. First make the settings for RTCOR, RTCNT, and the RMODE and RFSH bits in SDCR, and then make the CKS2 to CKS0 and RRC2 to RRC0 settings. When the clock is selected by bits CKS2 to CKS0, RTCNT starts counting up from the value at that time. The RTCNT value is constantly compared with the RTCOR value, and if the two values are the same, a refresh request is generated and an auto-refresh is performed for the number of times specified by the RRC2 to RRC0. At the same time, RTCNT is cleared to zero and the count-up is restarted.
Figure 8.26 shows the auto-refresh cycle timing. After starting the auto refreshing, PALL command is issued in the Tp cycle to make all the banks to pre-charged state from active state when some bank is being pre-charged. Then REF command is issued in the Trr cycle after inserting idle cycles of which number is specified by the WTRP1 and WTRP0 bits in CS3WCR. A new command is not issued for the duration of the number of cycles specified by the WTRC1 and WTRC0 bits in CS3WCR after the Trr cycle. The WTRC1 and WTRC0 bits must be set so as to satisfy the SDRAM refreshing cycle time stipulation (tRC). An idle cycle is inserted between the Tp cycle and Trr cycle when the setting value of the WTRP1 and WTRP0 bits in CS3WCR is longer than or equal to 1 cycle.

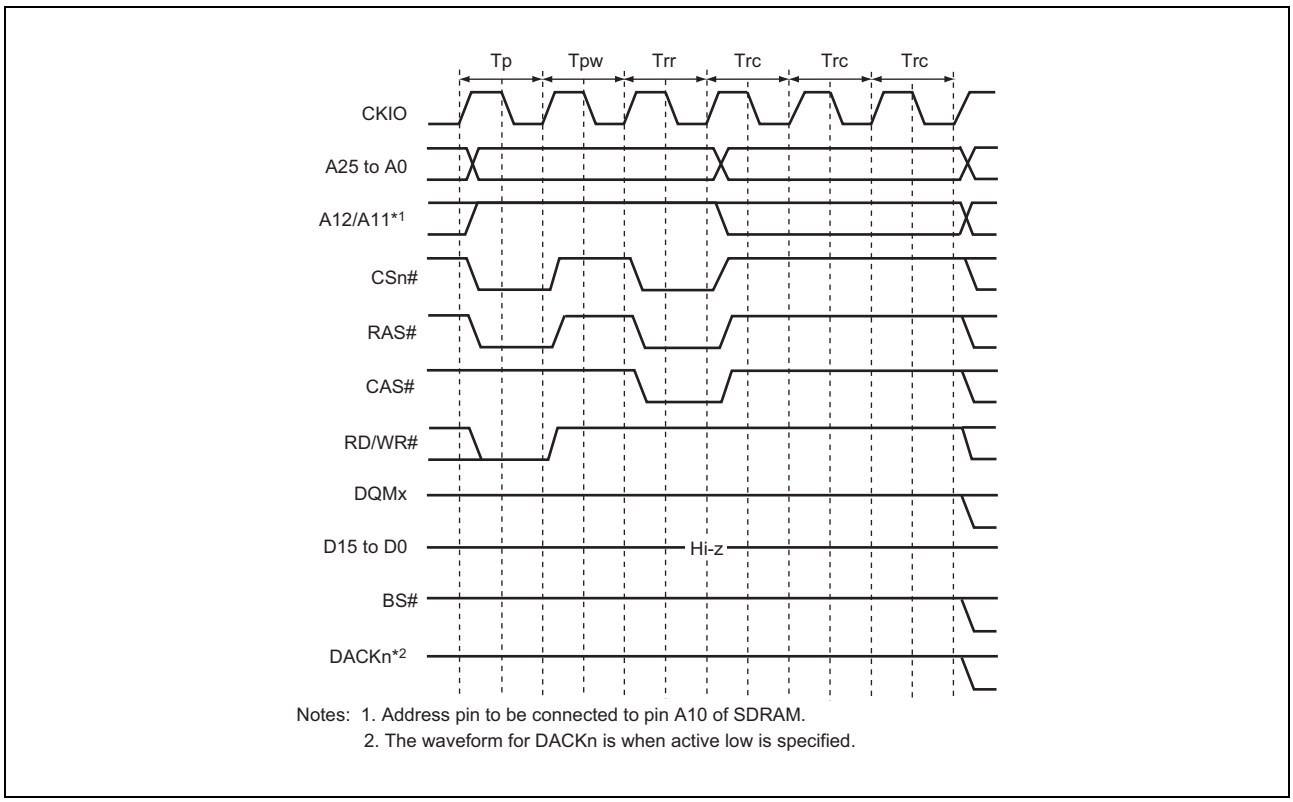

Figure 8.26 Auto-Refresh Timing

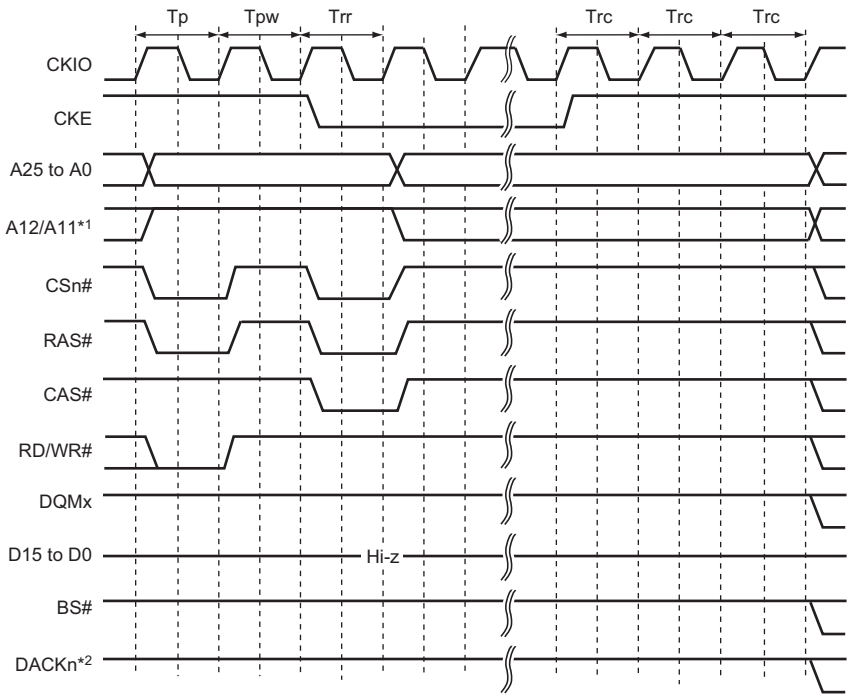
(b) Self-refreshing

Self-refresh mode is a kind of standby mode, in which the refresh timing and refresh addresses are generated within the SDRAM. Self-refreshing is activated by setting both the RMODE bit and the RFSH bit in SDCR to 1. After starting the self-refreshing, PALL command is issued in Tp cycle after the completion of the pre-charging bank. A SELF command is then issued after inserting idle cycles of which number is specified by the WTRP1 and WTRP0 bits in CS3WSR.
SDRAM cannot be accessed while in the self-refresh state. Self-refresh mode is cleared by clearing the RMODE bit to 0. After self-refresh mode has been cleared, command issuance is disabled for the number of cycles specified by the WTRC1 and WTRC0 bits in CS3WCR.
Self-refresh timing is shown in Figure 8.27. Settings must be made so that self-refresh clearing and data retention are performed correctly, and auto-refreshing is performed at the correct intervals. When self-refreshing is activated from the state in which auto-refreshing is set, auto-refreshing is restarted if the RFSH bit is set to 1 and the RMODE bit is cleared to 0 when self-refresh mode is cleared. If the transition from clearing of self-refresh mode to the start of auto-refreshing takes time, this time should be taken into consideration when setting the initial value of RTCNT. Making the RTCNT value 1 less than the RTCOR value will enable refreshing to be started immediately.
After self-refreshing has been set, the self-refresh state continues even if the chip standby state is entered using the LSI standby function, and is maintained even after recovery from standby mode due to an interrupt. Note that the necessary signals such as CKE must be driven even in standby state by setting the HIZCNT bit in CMNCR to 1.
In case of a power-on reset, the bus state controller's registers are initialized, and therefore the self-refresh state is cleared.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

Figure 8.27 Self-Refresh Timing

(9) Relationship between Refresh Requests and Bus Cycles

If a refresh request occurs during bus cycle execution, the refresh cycle must wait for the bus cycle to be completed. If a new refresh request occurs while waiting for the previous refresh request, the previous refresh request is deleted. To refresh correctly, a bus cycle longer than the refresh interval must be prevented from occurring.

(10) Power-Down Mode

If the PDOWN bit in SDCR is set to 1, the SDRAM is placed in power-down mode by bringing the CKE signal to the low level in the non-access cycle. This power-down mode can effectively lower the power consumption in the non-access cycle. However, please note that if an access occurs in power-down mode, a cycle of overhead occurs because a cycle is needed to assert the CKE in order to cancel the power-down mode.
Figure 8.28 shows the access timing in power-down mode.

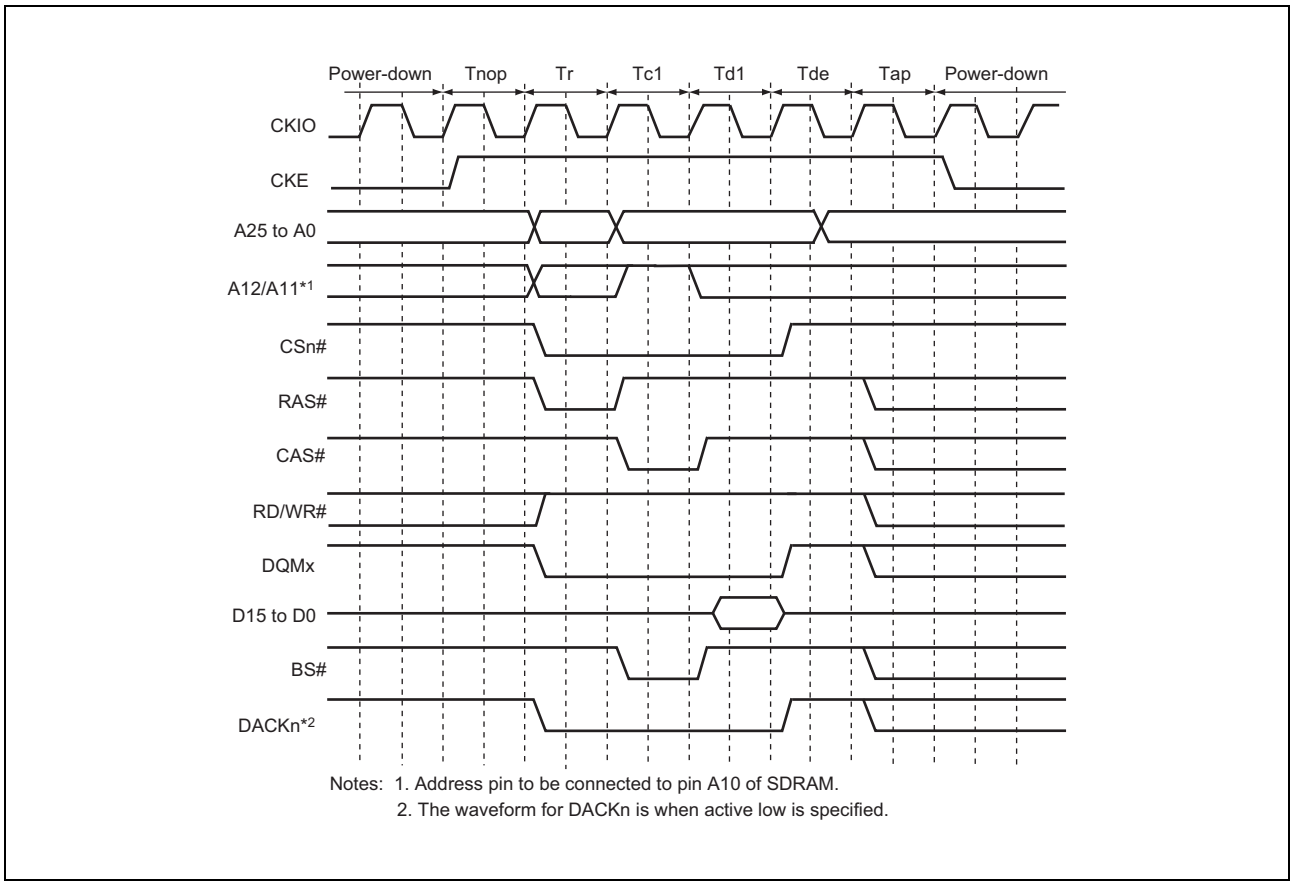


Figure 8.28 Power-Down Mode Access Timing

(11) Power-On Sequence

In order to use SDRAM, mode setting must first be made for SDRAM after the pose interval specified for the SDRAM to be used after powering on. The pose interval should be obtained by a power-on reset generating circuit or software.
To perform SDRAM initialization correctly, the registers of this module must first be set, followed by a write to the SDRAM mode register. In SDRAM mode register setting, the address signal value at that time is latched by a combination of the CSn#, RAS#, CAS#, and RD/WR# signals. If the value to be set is X, the bus state controller provides for value X to be written to the SDRAM mode register by performing a 16-bit write to address 1F001000 + X for area 2 SDRAM, and to address 1F002000 + X for area 3 SDRAM. In this operation the data is ignored, but the mode write is performed as a byte-size access. To set burst read/single write or burst read/burst write (CAS latency 2 to 3, wrap type = sequential, and burst length 1) supported by the LSI, arbitrary data is written in 16 bits to the access addresses shown in Table 8.11. In this time 0 is output at the external address pins of A12 or later.

Table 8.11 Access Address in SDRAM Mode Register Write

- Setting for Area 2

Burst read/single write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	H'1F001440	H'0000440
	3	H'1F001460	H'0000460

Burst read/burst write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	H'1F001040	H'0000040
	3	H'1F001060	H'0000060

- Setting for Area 3

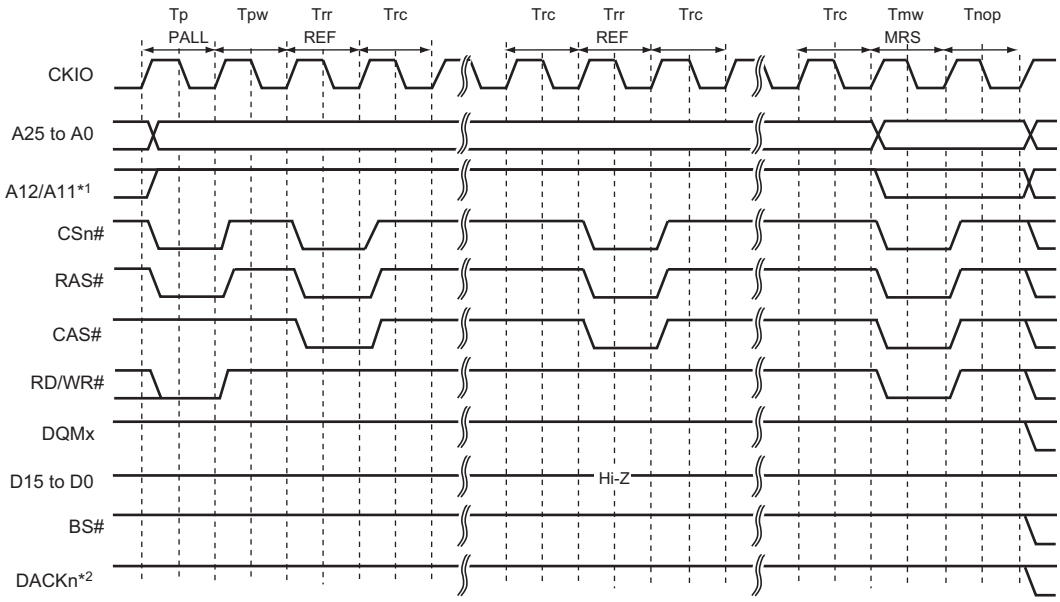
Burst read/single write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	H'1F002440	H'0000440
	3	H'1F002460	H'0000460

Burst read/burst write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	H'1F002040	H'0000040
	3	H'1F002060	H'0000060

Mode register setting timing is shown in Figure 8.29. A PALL command (all bank pre-charge command) is firstly issued. A REF command (auto refresh command) is then issued 8 times. An MRS command (mode register write command) is finally issued. Idle cycles, of which number is specified by the WTRP1 and WTRP0 bits in CS3WCR, are inserted between the PALL and the first REF. Idle cycles, of which number is specified by the WTRC1 and WTRC0 bits in CS3WCR, are inserted between REF and REF, and between the 8th REF and MRS. One or more idle cycles are inserted between the MRS and a command to be issued next.
It is necessary to keep idle time of certain cycles for SDRAM before issuing PALL command after power-on. Refer to the manual of the SDRAM for the idle time to be needed. When the pulse width of the reset signal is longer than the idle time, mode register setting can be started immediately after the reset, but care should be taken when the pulse width of the reset signal is shorter than the idle time.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

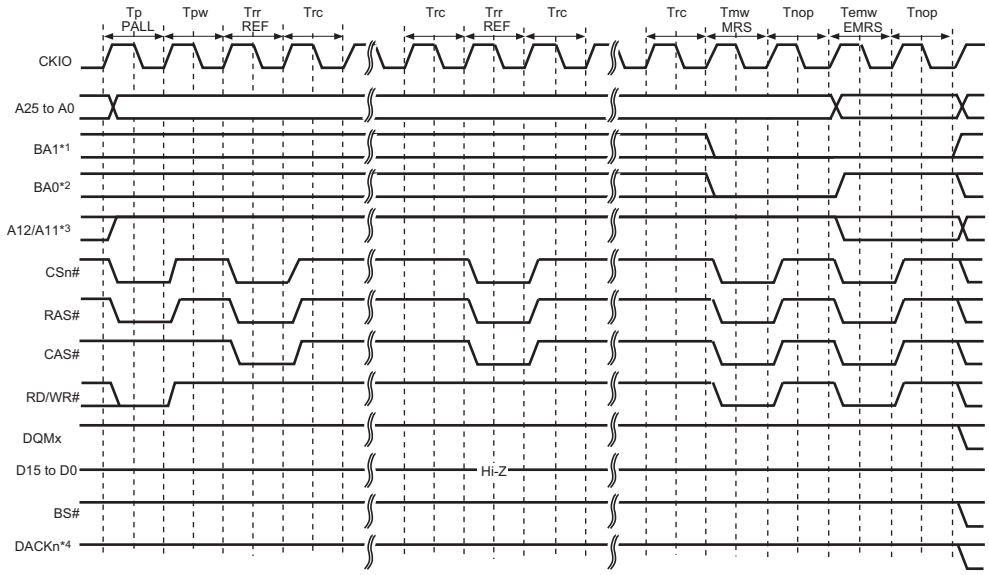
Figure 8.29 SDRAM Mode Write Timing (Based on JEDEC)

(12) Low-Power SDRAM

The low-power SDRAM can be accessed using the same protocol as the normal SDRAM.
The differences between the low-power SDRAM and normal SDRAM are that partial refresh takes place that puts only a part of the SDRAM in the self-refresh state during the self-refresh function, and that power consumption is low during refresh under user conditions such as the operating temperature. The partial refresh is effective in systems in which the data in a work area other than the specific area can be lost without severe repercussions. For details, please refer to the Data Sheet for the low-power SDRAM to be used.
The low-power SDRAM supports the extension mode register in addition to the mode registers as the normal SDRAM. This LSI supports issuing of the extension mode register write command (EMRS).
The EMRS command is issued according to the conditions specified in table below. For example, if data H'0YYYYYYY is written to address H'1F002XX0 in 32 bits, the commands are issued to the CS3 space in the following sequence: PALL -> REF × 8 -> MRS -> EMRS. In this case, the MRS and EMRS issue addresses are H'0000XX0 and H'YYYYYYY, respectively. If data H'1YYYYYYY is written to address H'1F002XX0 in 32 bits, the commands are issued to the CS3 space in the following sequence: PALL -> MRS -> EMRS.

Table 8.12 Output Addresses when EMRS Command Is Issued

Command to be Issued	Access Address	Access Data	Write Access Size	MRS Command Issue Address	EMRS Command Issue Address
CS2 MRS	H'1F001XX0	H'********	16 bits	H'0000XX0	—
CS3 MRS	H'1F002XX0	H'********	16 bits	H'0000XX0	—
CS2 MRS + EMRS (with refresh)	H'1F001XX0	H'0YYYYYYY	32 bits	H'0000XX0	H'YYYYYYY
CS3 MRS + EMRS (with refresh)	H'1F002XX0	H'0YYYYYYY	32 bits	H'0000XX0	H'YYYYYYY
CS2 MRS + EMRS (without refresh)	H'1F001XX0	H'1YYYYYYY	32 bits	H'0000XX0	H'YYYYYYY
CS3 MRS + EMRS (without refresh)	H'1F002XX0	H'1YYYYYYY	32 bits	H'0000XX0	H'YYYYYYY

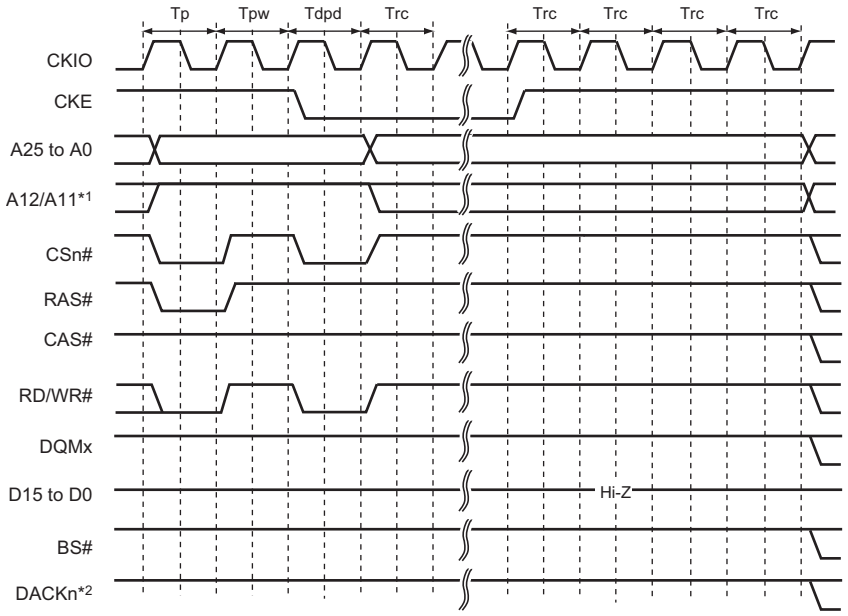


Notes: 1. Address pin to be connected to pin BA1 of SDRAM.
2. Address pin to be connected to pin BA0 of SDRAM.
3. Address pin to be connected to pin A10 of SDRAM.
4. The waveform for DACKn is when active low is specified.

Figure 8.30 EMRS Command Issue Timing

- Deep power-down mode
  The low-power SDRAM supports the deep power-down mode as a low-power consumption mode. In the partial self-refresh function, self-refresh is performed on a specific area. In the deep power-down mode, self-refresh will not be performed on any memory area. This mode is effective in systems where all of the system memory areas are used as work areas.

If the RMODE bit in the SDCR is set to 1 while the DEEP and RFSH bits in the SDCR are set to 1, the low-power SDRAM enters the deep power-down mode. If the RMODE bit is cleared to 0, the CKE signal is pulled high to cancel the deep power-down mode. Before executing an access after returning from the deep power-down mode, the power-up sequence must be re-executed.



Notes: 1. Address pin to be connected to pin A10 of SDRAM.
2. The waveform for DACKn is when active low is specified.

Figure 8.31 Deep Power-Down Mode Transition Timing

8.5.7 Burst ROM (Clocked Asynchronous) Interface

The burst ROM (clocked asynchronous) interface is used to access a memory with a high-speed read function using a method of address switching called the burst mode or page mode. In a burst ROM (clocked asynchronous) interface, basically the same access as the normal space is performed, but the 2nd and subsequent access cycles are performed only by changing the address, without negating the RD# signal at the end of the 1st cycle. In the 2nd and subsequent access cycles, addresses are changed at the falling edge of the CKIO.

For the 1st access cycle, the number of wait cycles specified by the W3 to W0 bits in CSnWCR is inserted. For the 2nd and subsequent access cycles, the number of wait cycles specified by the BW1 and BW0 bits in CSnWCR is inserted.

In the access to the burst ROM (clocked asynchronous), the BS# signal is asserted only to the first access cycle. An external wait input is valid only to the first access cycle.

In the single access or write access that does not perform the burst operation in the burst ROM (clocked asynchronous) interface, access timing is same as a normal space.

Table 8.13 lists a relationship between bus width, access size, and the number of bursts. Figure 8.32 shows a timing chart.

Table 8.13 Relationship between Bus Width, Access Size, and Number of Bursts

Bus Width	Access Size	CSnWCR. BST[1:0] Bits	Number of Bursts	Access Count
8 bits	8 bits	Not affected	1	1
	16 bits	Not affected	2	1
	32 bits	Not affected	4	1
	16 bytes	00	16	1
		01	4	4
	32 bytes	00	16	2
		01	4	8
	64 bytes	00	16	4
		01	4	16
16 bits	8 bits	Not affected	1	1
	16 bits	Not affected	1	1
	32 bits	Not affected	2	1
	16 bytes	00	8	1
		01	2	4
		10*1	4	2
			2, 4, 2	3
	32 bytes	00	8	2
		01	2	8
		10*1	4	4
			2, 4, 2	6
	64 bytes	00	8	4
		01	2	16
		10*1	4	8
			2, 4, 2	12

Note 1. When the bus width is 16 bits, the access size is 16 bytes or more, and the BST[1:0] bits in CSnWCR are 10, the number of bursts and access count depend on the access start address. At address H'xxx0 or H'xxx8, 4-4 burst access is performed. At address H'xxx4 or H'xxxC, 2-4-2 burst access is performed.

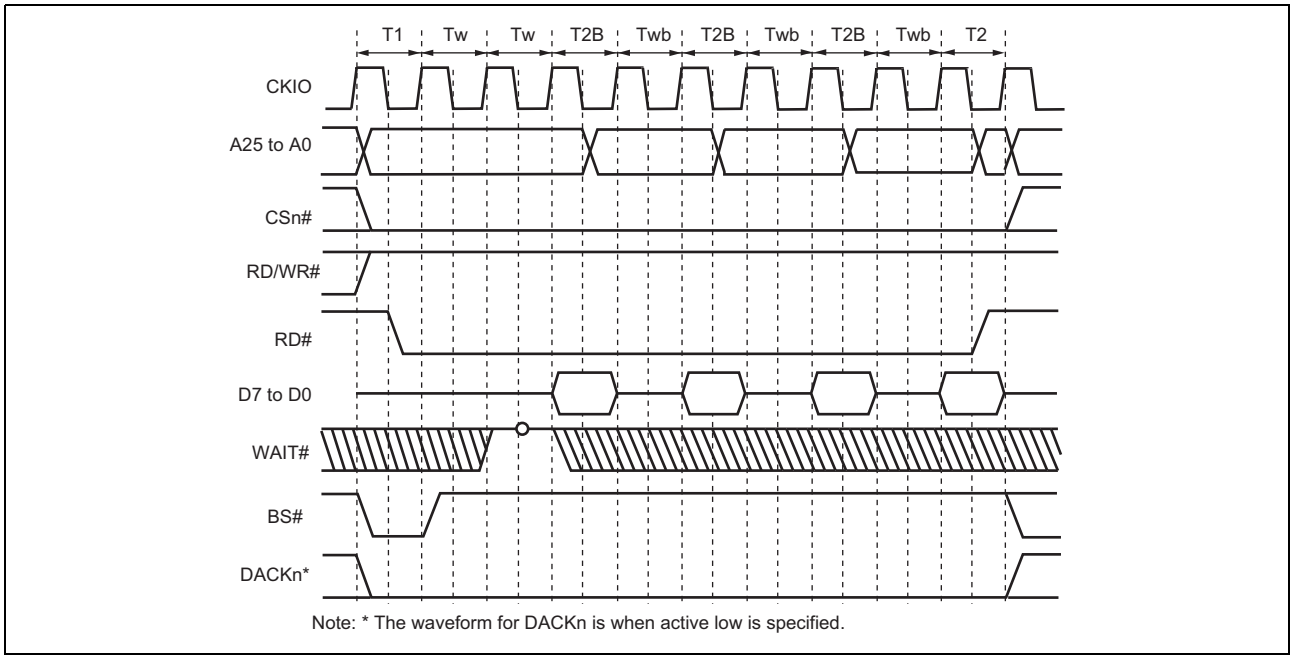


Figure 8.32 Burst ROM Access Timing (Clocked Asynchronous) (Bus Width =8 Bits, 32 Byte Transfer (Number of Burst 4), Wait Cycles Inserted in First Access = 2, Wait Cycles Inserted in Second and Subsequent Access Cycles = 1)

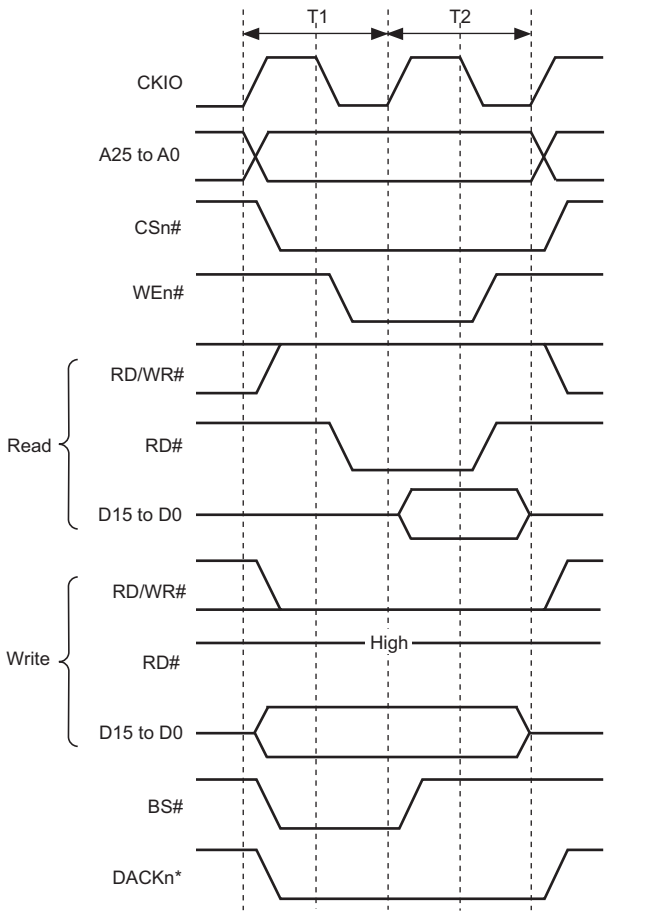
8.5.8 SRAM Interface with Byte Selection

The SRAM interface with byte selection is a memory interface that outputs the byte selection signal (WEn#) in both read and write bus cycles. This interface has 16-bit data pins and accesses SRAMs having upper and lower byte selection pins, such as UB# and LB#.

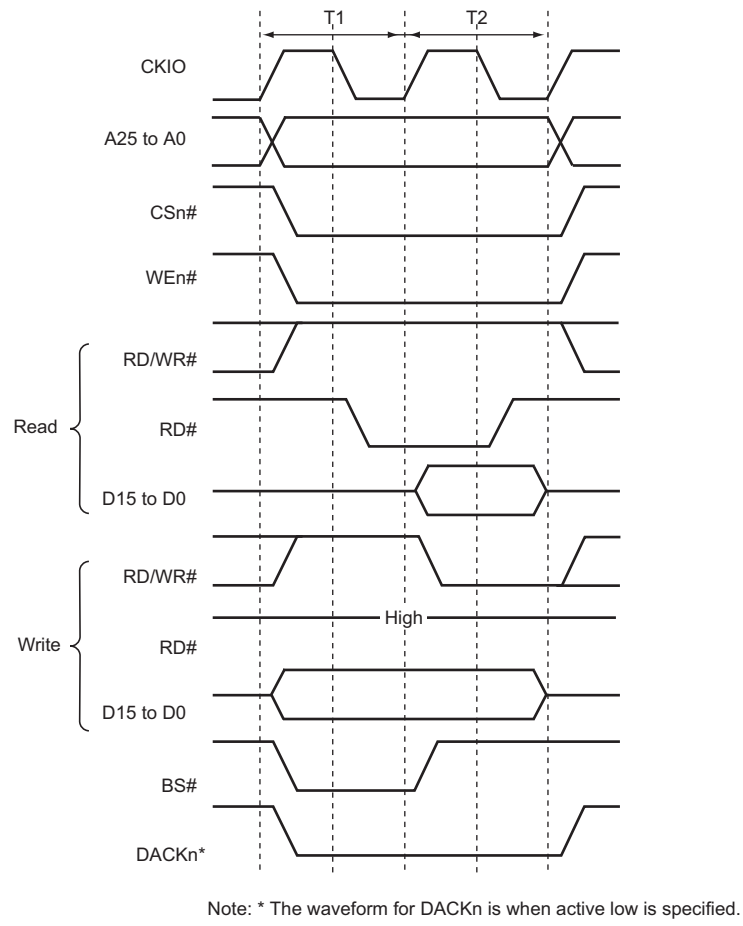
When the BAS bit in CSnWCR is cleared to 0 (initial value), the write access timing of the SRAM interface with byte selection is the same as that for the normal space interface. While in read access of a byte-selection SRAM interface, the byte-selection signal is output from the WEn# pin, which is different from that for the normal space interface. The basic access timing is shown in Figure 8.33. In write access, data is written to the memory according to the timing of the byte-selection pin (WEn#). For details, please refer to the Data Sheet for the corresponding memory.

If the BAS bit in CSnWCR is set to 1, the WEn# pin and RD/WR# pin timings change. Figure 8.34 shows the basic access timing. In write access, data is written to the memory according to the timing of the write enable pin (RD/WR#). The data hold timing from RD/WR# negation to data write must be acquired by setting the HW1 and HW0 bits in CSnWCR. Figure 8.35 shows the access timing when a software wait is specified.



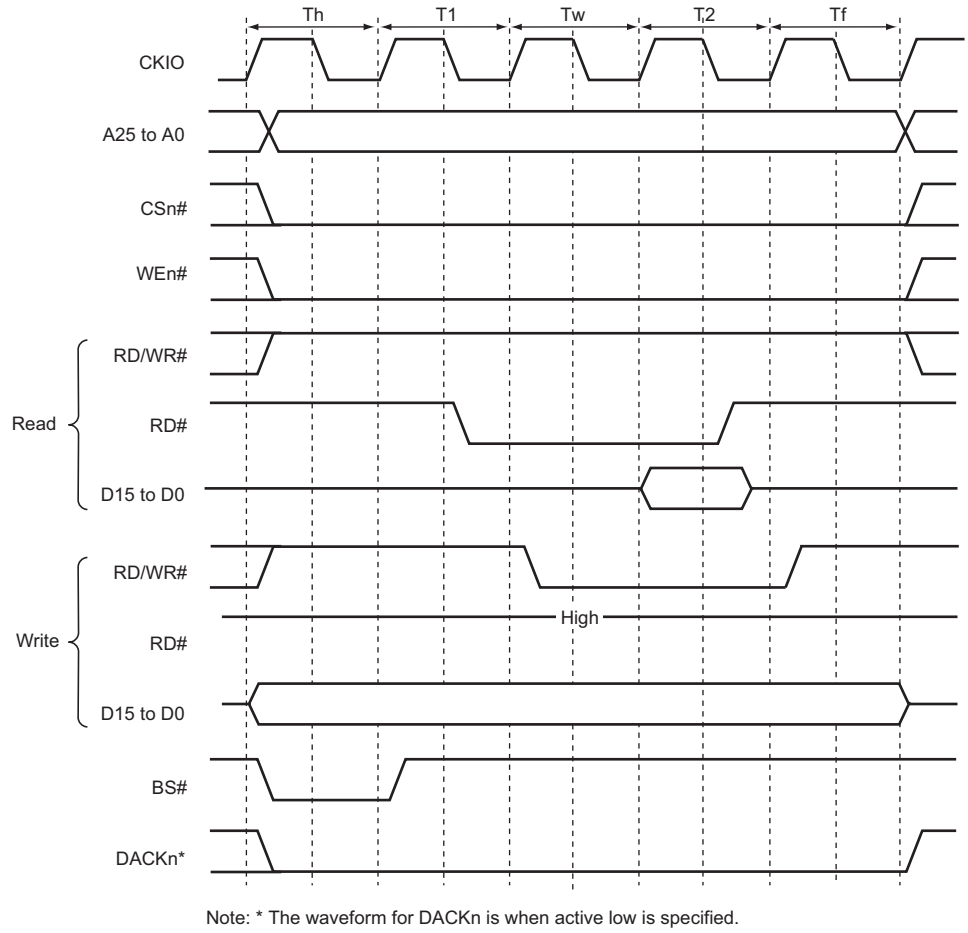
Note: * The waveform for DACKn is when active low is specified.

Figure 8.33 Basic Access Timing for SRAM with Byte Selection (BAS = 0)



Note: * The waveform for DACKn is when active low is specified.

Figure 8.34 Basic Access Timing for SRAM with Byte Selection (BAS = 1)



Note: * The waveform for DACKn is when active low is specified.

Figure 8.35 Wait Timing for SRAM with Byte Selection (BAS = 1) (SW[1:0] = 01, WR[3:0] = 0001, HW[1:0] = 01)

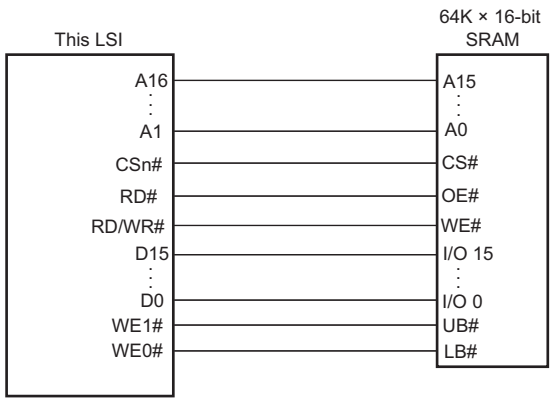


Figure 8.36 Example of Connection with 16-Bit Data-Width SRAM with Byte Selection

8.5.9 Burst ROM (Clocked Synchronous) Interface

The burst ROM (clocked synchronous) interface is supported to access a ROM with a synchronous burst function at high speed. The burst ROM interface accesses the burst ROM in the same way as a normal space. This interface is valid only for area 0.

In the first access cycle, wait cycles are inserted. In this case, the number of wait cycles to be inserted is specified by the W3 to W0 bits in CS0WCR. In the second and subsequent cycles, the number of wait cycles to be inserted is specified by the BW1 and BW0 bits in CS0WCR.

While the burst ROM (clocked synchronous) is accessed, the BS# signal is asserted only for the first access cycle and an external wait input is also valid for the first access cycle. When the bus width is 16 bits, the burst length must be specified as 8. The burst ROM interface does not support the 8-bit bus width for the burst ROM.

The burst ROM interface performs burst operations for all read access. For example, in a 32-bit access over a 16-bit bus, valid 16-bit data is read two times and invalid 16-bit data is read six times. These invalid data read cycles increase the memory access time and degrade the program execution speed and DMA transfer speed. To prevent this problem, it is recommended using a read in a 16-byte or more access size. The burst ROM interface performs write access in the same way as normal space access.

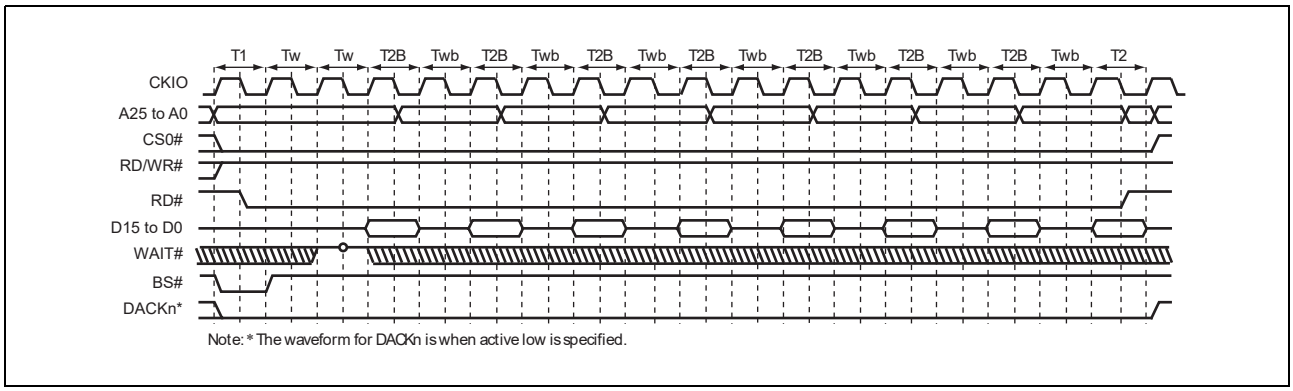

Figure 8.37 Burst ROM Access Timing (Clocked Synchronous) (Burst Length = 8, Wait Cycles Inserted in First Access = 2, Wait Cycles Inserted in Second and Subsequent Access Cycles = 1)

8.5.10 Wait between Access Cycles

As the operating frequency of LSIs becomes higher, the off-operation of the data buffer often collides with the next data access when the read operation from devices with slow access speed is completed. As a result of these collisions, the reliability of the device is low and malfunctions may occur. A function that avoids data collisions by inserting idle (wait) cycles between continuous access cycles has been newly added.
The number of wait cycles between access cycles can be set by the WM bit in CSnWCR, bits IWW2 to IWW0, IWRWD2 to IWRWD0, IWRWS2 to IWRWS0, IWRRD2 to IWRRD0, and IWRRS2 to IWRRS 0 in CSnBCR. The conditions for setting the idle cycles between access cycles are shown below.

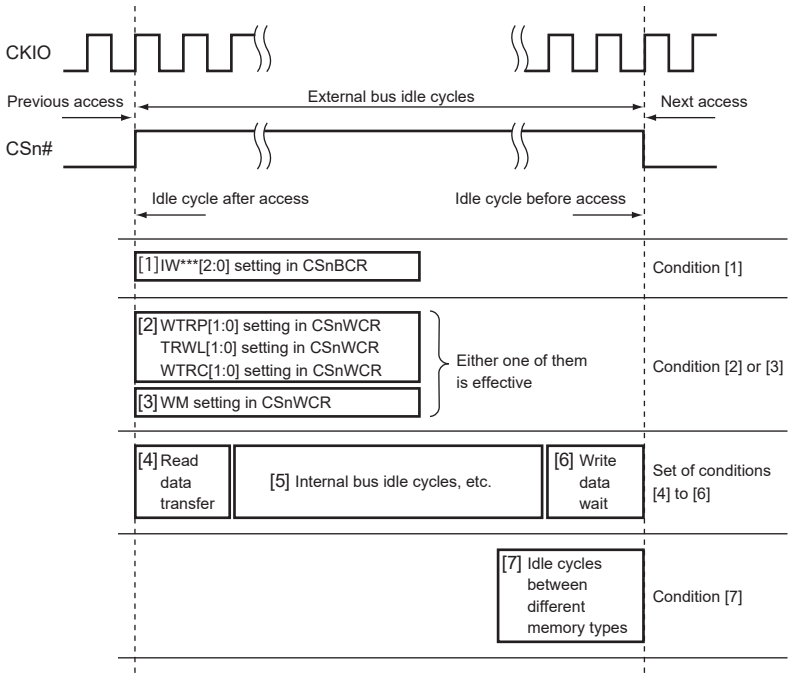
1. Continuous access cycles are write-read or write-write
2. Continuous access cycles are read-write for different spaces
3. Continuous access cycles are read-write for the same space
4. Continuous access cycles are read-read for different spaces
5. Continuous access cycles are read-read for the same space

For the specification of the number of idle cycles between access cycles described above, refer to the description of each register.
Besides the idle cycles between access cycles specified by the registers, idle cycles must be inserted to interface with the internal bus or to obtain the minimum pulse width for a multiplexed pin (WEn#). The following gives detailed information about the idle cycles and describes how to estimate the number of idle cycles.
The number of idle cycles on the external bus from CSn# negation to CSn# or CSm# assertion is described below.
There are seven conditions that determine the number of idle cycles on the external bus as shown in Table 8.14. The effects of these conditions are shown in Figure 8.38.

Table 8.14 Conditions for Determining Number of Idle Cycles

No.	Condition	Description	Range	Note
[1]	IW***[2:0] in CSnBCR	These bits specify the number of idle cycles for access. The number of idle cycles can be specified independently for each combination of the previous and next cycles. For example, in the case where reading CS1 space followed by reading other CS space, the bits IWRRD[2:0] in CS1BCR should be set to B'100 to specify six or more idle cycles. This condition is effective only for access cycles other than single address transfer and generates idle cycles after the access is completed.	0 to 12	Do not set 0 for the number of idle cycles between memory types which are not allowed to be accessed successively.
[2]	SDRAM-related bits in CSnWCR	These bits specify precharge completion and startup wait cycles and idle cycles between commands for SDRAM access. This condition is effective only for SDRAM access and generates idle cycles after the access is completed	0 to 3	Specify these bits in accordance with the specification of the target SDRAM.
[3]	WM in CSnWCR	This bit enables or disables external WAIT# pin input for the memory types other than SDRAM. When this bit is cleared to 0 (external WAIT# enabled), one idle cycle is inserted to check the external WAIT# pin input after the access is completed. When this bit is set to 1 (disabled), no idle cycle is generated.	0 or 1	
[4]	Read data transfer cycle	One idle cycle is inserted after a read access is completed. This idle cycle is not generated for the first or middle cycles in divided access cycles. This is neither generated when the HW[1:0] bits in CSnWCR are not B'00.	0 or 1	One idle cycle is always generated after a read cycle with SDRAM.
[5]	Internal bus idle cycles, etc.	External bus access requests from the CPU or the direct memory access controller and their results are passed through the internal bus. The external bus enters idle state during internal bus idle cycles or while a bus other than the external bus is being accessed. This condition is not effective for divided access cycles, which are generated by the bus state controller when the access size is larger than the external data bus width.	0 or larger	The number of internal bus idle cycles may not become 0 depending on the CPU: internal bus: CKIO
[6]	Write data wait cycles	During write access, a write cycle is executed on the external bus only after the write data becomes ready. This write data wait period generates idle cycles before the write cycle. Note that when the previous cycle is a write cycle and the internal bus idle cycles are shorter than the previous write cycle, write data can be prepared in parallel with the previous write cycle and therefore, no idle cycle is generated (write buffer effect).	0 or 1	For write → write or write → read access cycles, successive access cycles without idle cycles may be available due to the write buffer effect described in the left column. If successive access cycles without idle cycles are not allowed, specify the minimum number of idle cycles between access cycles through CSnBCR.
[7]	Idle cycles between different memory types	To ensure the minimum pulse width on the signal-multiplexed pins, idle cycles may be inserted before access after memory types are switched. For some memory types, idle cycles are inserted even when memory types are not switched.	0 to 2	The number of idle cycles depends on the target memory types. See Table 8.15.

In the above conditions, a total of four conditions, that is, condition [1], condition [2] or [3] (either one is effective), a set of conditions [4] to [6] (these are generated successively, and therefore the sum of them should be taken as one set of idle cycles), and condition [7] are generated at the same time. The maximum number of idle cycles among these four conditions become the number of idle cycles on the external bus. To ensure the minimum idle cycles, be sure to make register settings for condition [1].



Note: A total of four conditions (condition [1], condition [2] or [3], a set of conditions [4] to [6], and condition [7]) generate idle cycle at the same time. Accordingly, the maximum number of cycles among these four conditions become the number of idle cycles.

Figure 8.38 Idle Cycle Conditions

Table 8.15 Number of Idle Cycles Inserted between Access Cycles to Different Memory Types

	Next Cycle						
Previous Cycle	SRAM	Burst ROM (Asynchronous)	MPX-I/O	Byte SRAM (BAS = 0)	Byte SRAM (BAS = 1)	SDRAM	Burst ROM (Synchronous)
SRAM	0	0	1	0	0/1*1	0/1*1	0
Burst ROM (asynchronous)	0	0	1	0	0/1*1	0/1*1	0
MPX-I/O	1	1	0	1	1	1	1
Byte SRAM (BAS = 0)	0	0	1	0	0/1*1	0/1*1	0
Byte SRAM (BAS = 1)	0/1*1	0/1*1	1/2*1	0/1*1	0	0	0/1*1
SDRAM	1	1	2	1	0	0	1
Burst ROM (synchronous)	0	0	1	0	1	1	0

Note 1. The number of idle cycles is determined by the setting of bits HW[1:0] in the CSnWCR register for the previous cycle. The values on the left and right sides of the virgules show the numbers of idle cycles when HW[1:0] ≠ B'00 and HW[1:0] = B'00, respectively. If the memory connected to the CSn space in the previous cycle is of a type for which bits HW[1:0] in the CSnWCR register are ineffective, the number of idle cycles will be the value on the right side.

8.5.11 Others

(1) Reset

This module can be initialized completely only at power-on reset. At power-on reset, all signals are negated and data output buffers are turned off regardless of the bus cycle state after the internal reset is synchronized with the internal clock. All control registers are initialized. In software standby and sleep, control registers of the bus state controller are not initialized.

(2) Caution on Write Buffer

Since the bus state controller incorporates a one-stage write buffer, it can execute an access via the internal bus before the previous external bus cycle is completed in a write cycle. If the on-chip module is read or written after the external low-speed memory is written, the on-chip module can be accessed before the completion of the external low-speed memory write cycle.

In read cycles, the CPU is placed in the wait state until read operation has been completed. To continue the process after the data write to the device has been completed, perform a dummy read to the same address to check for completion of the write before the next process to be executed.

The write buffer of the bus state controller functions in the same way for an access by a bus master other than the CPU such as the direct memory access controller. Accordingly, to perform DMA transfers, the next read cycle is initiated before the previous write cycle is completed. Note, however, that if both the DMA source and destination addresses exist in external memory space, the next read cycle will not be initiated until the previous write cycle is completed.

Changing the registers in this module while the write buffer is operating may disrupt correct write access. Therefore, do not change the registers in this module immediately after a write access. If this change becomes necessary, do it after executing a dummy read of the write data.

(3) On-Chip Peripheral Module Access

To access an on-chip module register, two or more peripheral module clock (P0φ or P1φ) cycles are required. Care must be taken in system design.

When the CPU writes data to the internal peripheral registers, the CPU performs the succeeding instructions without waiting for the completion of writing to registers.

For example, a case is described here in which the system is transferring to the software standby mode for power savings. To make this transition, the WFI instruction must be performed after setting the STBY bit in the STBCR1 register to 1. However a dummy read of the STBCR1 register is required before executing the WFI instruction. If a dummy read is omitted, the CPU executes the WFI instruction before the STBY bit is set to 1, thus the system enters sleep mode not software standby mode. A dummy read of the STBCR1 register is indispensable to complete writing to the STBY bit.

To reflect the change by internal peripheral registers while performing the succeeding instructions, execute a dummy read of registers to which write instruction is given and then perform the succeeding instructions.

(4) Usage Note on Changing CKIO Clock Selections

The CKIO clock can be selected and switched between 27.5 MHz and 132 MHz, but it can not be switched while CS0 to CS5 external address space is being accessed. (Setting of CKIO select register (CKIOSEL) is prohibited while external address space is being accessed.)

For example, a procedure for switching the CKIO clock from 66 MHz to 132 MHz and using SDRAM in the CS2 or CS3 space, after starting up in the normal space interface of CS0 in boot mode 0 is as follows:

1. Transfer the program to a memory area other than CS0 to CS5 (internal RAM, etc.).
2. Jump to the area where the program was transferred.
3. Configure the bus state controller that the transferred program in the CS0 to CS5 areas can operate even if the CKIO clock is 132 MHz.
4. Set the CKIO clock to 132 MHz with the CKIO select register (CKIOSEL).
5. Continue instruction execution with internal RAM and so on, or return to the CS0 program area.

It is also prohibited to access the CS0 to CS5 external address space from a bus master other than the CPU such as the direct memory access controller while switching the CKIO clock.

9. Direct Memory Access Controller

The direct memory access controller can be used in place of the CPU to perform high-speed transfers between external devices that have DACK (transfer request acknowledge signal), external memory, on-chip memory, memory-mapped external devices, and on-chip peripheral modules.
This module has a controller that handles secure and non-secure access. For details on secure and non-secure access, see section 5.8.1 (3), 5.8.2, 5.8.3, and 5.8.4. Do not assign the same DMA transfer request to secure access and non-secure access, respectively.

9.1 Features

- Number of channels selectable: 16 channels (CH0 to CH15). Only the CH0 channel can receive external requests.
- 4-Gbyte address space (according to the architecture)
- Transfer data size: Byte, two bytes, four bytes, eight bytes, 16 bytes, 32 bytes, 64 bytes, and 128 bytes
- Maximum transfer count: 2^{32} - 1 bytes
- Address mode: Dual address mode
- Transfer requests: Can be selected from the three types of external request, on-chip peripheral module request, and auto request (software trigger)
- Transfer mode: Single transfer mode and block transfer mode are selectable.
- Priority: The channel priority levels within channels 0 to 7 and within channels 8 to 15 are selectable between fixed mode and round-robin mode (the channel priority level between the group of channels 0 to 7 and the group of channels 8 to 15 is round-robin mode).
- Interrupt request: An interrupt request can be sent to the CPU on completion of data transfer (DMA transfer end interrupt per channel) or on occurrence of a transfer error (DMA error interrupt).
- External request detection: Low level detection, high level detection, rising edge detection, and falling edge detection are selectable for DREQ input detection.
- The DMA registers have a continuous execution function that allows the next DMA transfer to be executed continuously by making settings for the next DMA transfer during execution of the current DMA transfer. This continuous execution function can be enabled or disabled independently in each channel.
- Link mode: In this mode, the setting data (descriptor data) located in the memory by the CPU is automatically retrieved by the DMAC, and DMA transfer is performed according to those values.
- Buffer sweep: If an ongoing DMA transfer is forced to end, the data already retrieved into the buffer can be output before DMA transfer ends.
- Interval: A specific DMA transfer interval can be specified to adjust the bus occupancy.

9.2 Input/Output Pins

Table 9.1 lists the pin configuration. This module has pins for a single channel (CH0) as the external bus use.

Table 9.1 Pin Configuration

Channel	Name	Pin Name	I/O	Function
0	DMA transfer request	DREQ0	Input	DMA transfer request input from an external device to channel 0
	DMA transfer request acknowledge	DACK0	Output	DMA transfer request acknowledge output from channel 0 of this module
	DMA transfer end	TEND0	Output	DMA transfer end output for channel 0 of this module

Note 1. For the active level of DACK0 and TEND0, refer to section 8, Bus State Controller.

9.3 Register Configuration

The register configuration is shown in the figure below.

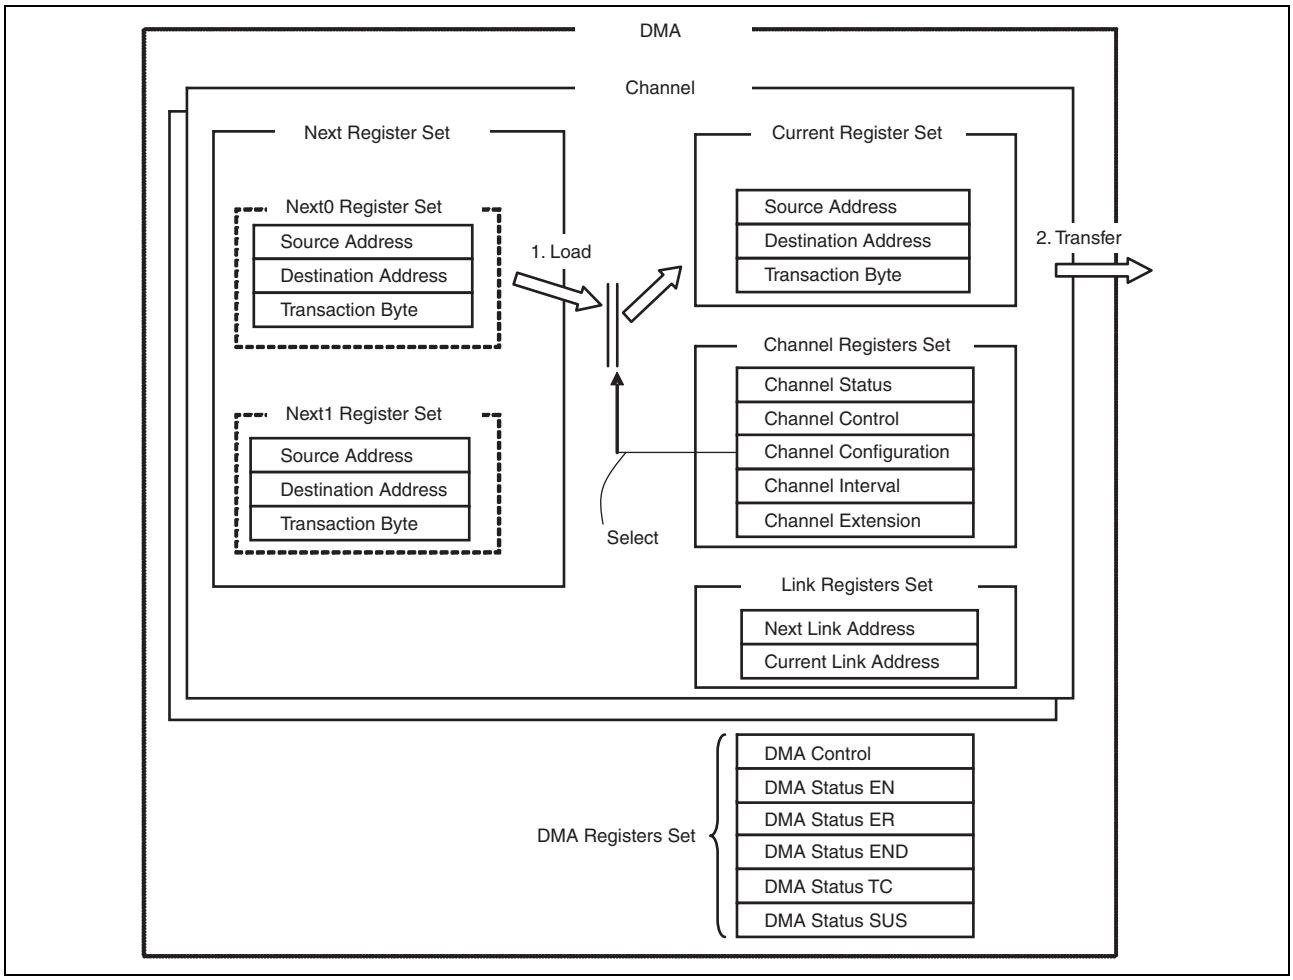


Figure 9.1 Register Configuration

(a) Next Register Set

This register set is used to set the source address, destination address, and transfer byte count of the DMA transaction to be executed next.

It consists of the Next0 register set and the Next1 register set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These register set values are loaded to the Current Register Set and used for DMA transfer.

(b) Current Register Set

This register set indicates the source address, destination address, and transfer byte count of the currently executed DMA transaction.

The values are loaded from the Next0/1 register set (register mode) or from the descriptor read data (link mode). The user cannot write directly to this register set.

The register set is automatically updated each time a DMA transaction is executed.

(c) Channel Register Set

This register set is used to make the DMA transfer settings.

The settings to be made with this register set include channel status indication, channel control, DMA transaction setting, and DMA transaction interval.

(d) Link Register Set

This register set consists of a register that sets the address of the descriptor to be loaded next in link mode (Next Link Address Register) and a register that indicates the address of the currently executed descriptor (Current Link Address Register).
The Current Link Address Register is automatically updated when a descriptor is read. The user cannot write directly to this register set.

(e) DMA Register Set

This register set consists of a register that controls DMA as a whole and registers that indicate the status of the corresponding channels. It enables channel priority control as well as the monitoring of the channel status (EN, ER, END, TC, and SUS).

(f) Extended Resource Selector Register Set

This register set is used to select the on-chip peripheral module to perform DMA transfer and the external request.

9.4 Register Descriptions

Table 9.2 lists the register configuration. There are eleven control registers and five status registers for each channel, and twelve common control registers are used by all channels. In addition, there is one extension resource selector per two channels.

The notation for the registers of each channel is as follows.

Next 0 Source Address Register of channel 0 for secure access: Next 0 Source Address Register 0S (abbreviation: N0SA_0S)

Next 0 Source Address Register of channel 0 for non-secure access: Next 0 Source Address Register 0 (abbreviation: N0SA_0)

Table 9.2 Register Configuration

		Abbreviation				Address		
Channel	Register Name	Non-secure	Secure	R/W	Initial Value	Non-secure	Secure	Access Size
0	Next0 Source Address Register 0/0S	N0SA_0	N0SA_0S	RW	H'00000000	H'E8226000	H'E8220000	32

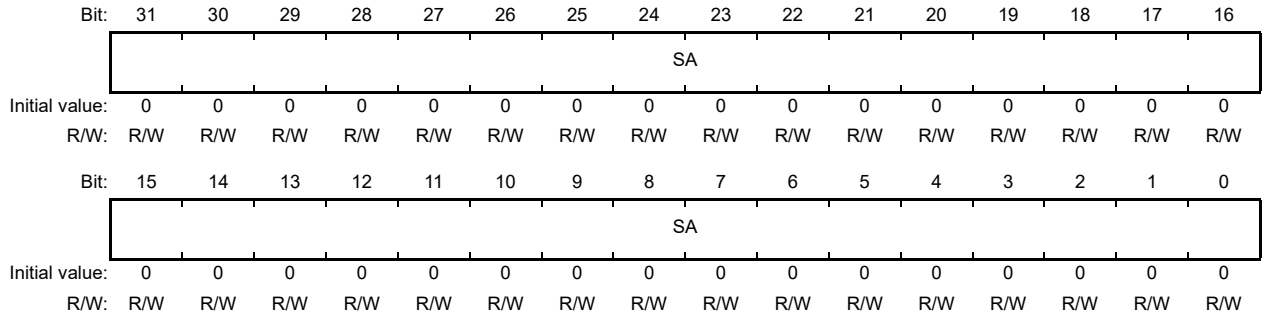
9.4.1 Next Source Address Register n/nS (N0SA_n/nS, N1SA_n/nS)

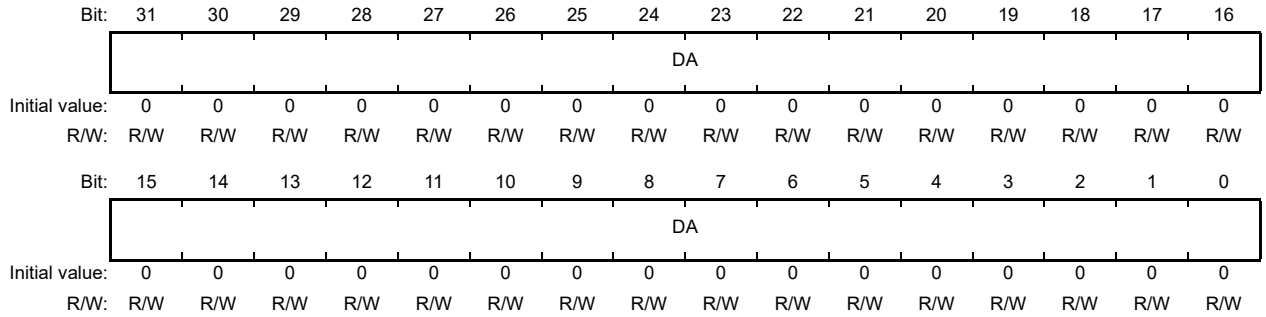
This register sets the DMA transfer source address (32 bits) of DMA channel n (n = 0 to 15) which is to be executed next.
N0SA_n/nS is for the Next0 Register Set, and N1SA_n/nS is for the Next1 Register Set.
In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.
These register set values are loaded to the Current Register Set and used for DMA transfer.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SA	All 0	R/W	Source Address Sets the start address of the DMA transfer source.

9.4.2 Next Destination Address Register n/nS (N0DA_n/nS, N1DA_n/nS)

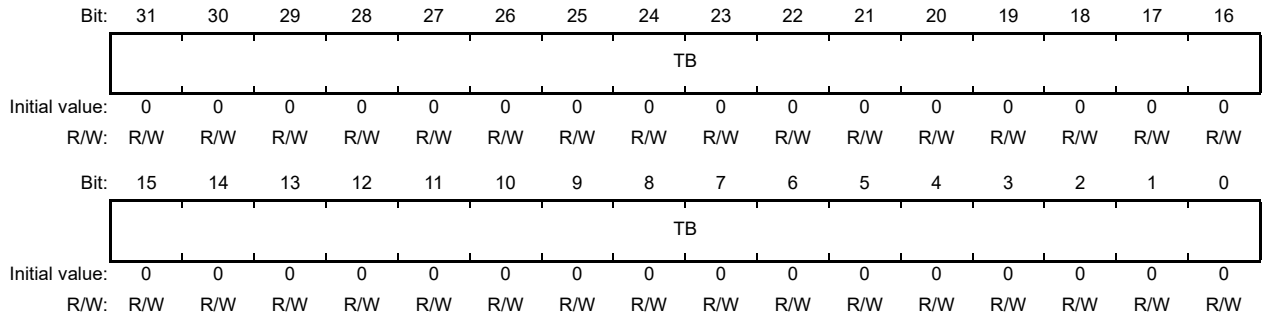
This register sets the DMA transfer destination address (32 bits) of DMA channel n (n = 0 to 15) which is to be executed next.
N0DA_n/nS is for the Next0 Register Set, and N1DA_n/nS is for the Next1 Register Set.
In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.
These register set values are loaded to the Current Register Set and used for DMA transfer.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DA	All 0	R/W	Destination Address Sets the start address of the DMA transfer destination.

9.4.3 Next Transaction Byte Register n/nS (N0TB_n/nS, N1TB_n/nS)

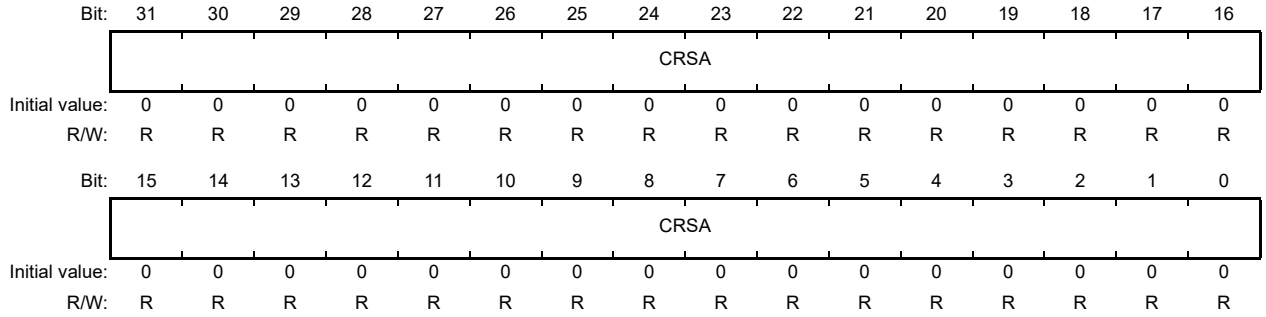
This register sets the total transfer byte count (DMA transaction) of DMA channel (n = 0 to 15) which is to be executed next.
N0TB_n/nS is for the Next0 Register Set, and N1TB_n/nS is for the Next1 Register Set.
In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.
These register set values are loaded to the Current Register Set and used for DMA transfer.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TB	All 0	R/W	Transaction Byte Sets the total transfer byte count. Caution: Do not start a DMA transaction with 0 set in this register.

9.4.4 Current Source Address Register n/nS (CRSA_n/nS)

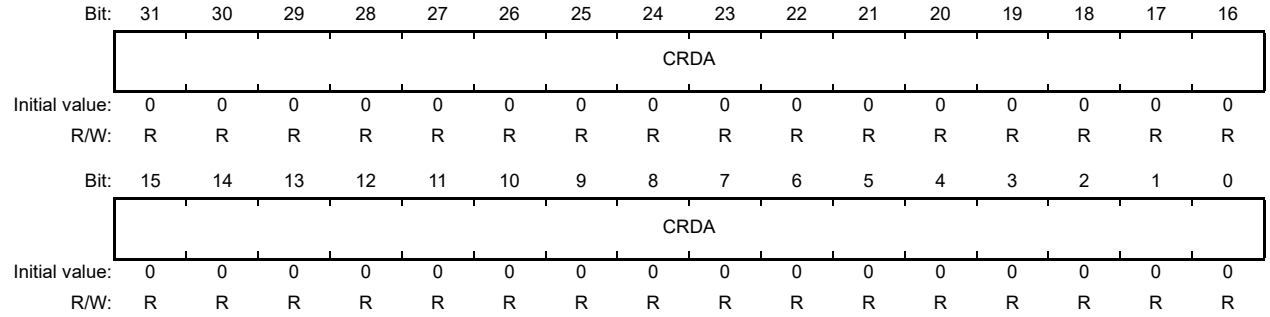
This register indicates the DMA transfer source address of DMA channel n (n = 0 to 15).
The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRSA	All 0	R	Current Source Address Register Indicates the read address of the next DMA transaction. The value automatically increments during the DMA transaction. (The value is fixed when 1 is set in SAD of the CHCFG_n/nS register.) The value increments when a read transfer starts. Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.)

9.4.5 Current Destination Address Register n/nS (CRDA_n/nS)

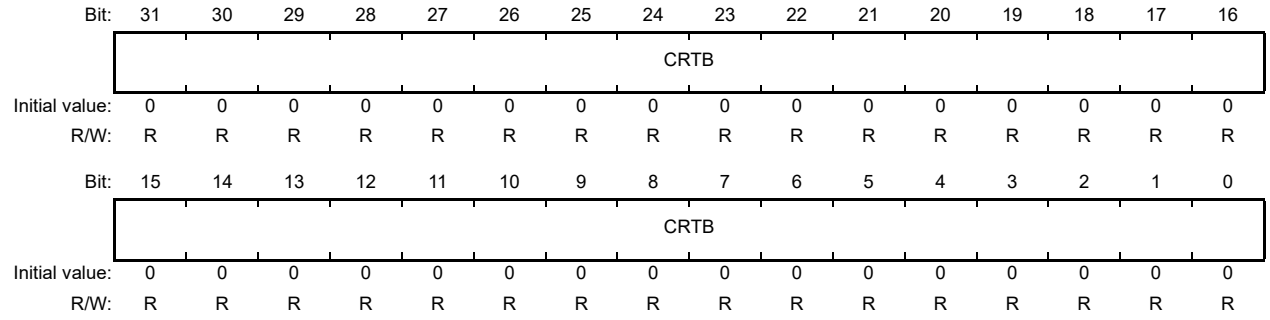
This register indicates the DMA transfer destination address of DMA channel n (n = 0 to 15).
The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRDA	All 0	R	Current Destination Address Register Indicates the write address of the next DMA transaction. The value automatically increments during the DMA transaction. (The value is fixed when 1 is set in DAD of the CHCFG_n/nS register.) The value increments when a write transfer starts. Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.)

9.4.6 Current Transaction Byte Register n/nS (CRTB_n/nS)

This register indicates the total transfer byte count of DMA channel n (n = 0 to 15). The value of this register becomes 0 when the transaction ends.
The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRTB	All 0	R	Current Transaction Byte Register Indicates the remaining transfer byte count of the currently executed DMA transaction. The value automatically decrements during the DMA transaction. The value decrements when a write transfer is completed. Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.)

9.4.7 Channel Status Register n/nS (CHSTAT_n/nS)

This register indicates the status of DMA channel n (n = 0 to 15).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INT MSK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MODE	DER	DW	DL	SR	TC	END	ER	SUS	TACT	RQST	EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
16	INTMSK	0	R	Indicates the temporary mask status of the DMA transfer end interrupt. 1: Masked temporarily 0: Unmasked temporarily Set condition(s): • When SETINTMSK (CHCTRL_n/nS) is set to 1 Reset condition(s): • When CLRINTMSK (CHCTRL_n/nS) is set to 1 • When SWRST (CHCTRL_n/nS) is set to 1
15 to 12	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
11	MODE	0	R	DMA Mode Indicates the DMA mode. It corresponds to the value set in the DMS bit of the CHCFG_n/nS register. 0: Register mode 1: Link mode
10	DER	0	R	Descriptor Error Indicates whether the link valid value of the read descriptor is invalid (LV = 0) (this is not dependent on the DIM level of the descriptor). If a descriptor error has occurred, the transfer is stopped but no DMA error interrupt occurs. 0: Descriptor Error not detected 1: Descriptor Error detected Set condition(s): • When the LV value loaded with the descriptor in link mode is 0 Reset condition(s): • When SWRST (CHCTRL_n/nS) is set to 1
9	DW	0	R	Descriptor WriteBack Indicates the descriptor writeback status. The bit maintains 1 if a bus error is received during descriptor writeback. 0: Operation other than writeback is being performed for the header in link mode. 1: (ER = 0) Writeback is being performed for the header in link mode. (ER = 1) A bus error occurs during writeback for the header in link mode. Set condition(s): • When header writeback in link mode starts Reset condition(s): • When header writeback in link mode ends with an OK response • When SWRST (CHCTRL_n/nS) is set to 1

Bit	Bit Name	Initial Value	R/W	Description
8	DL	0	R	Descriptor Load Indicates whether the descriptor is being loaded. The bit maintains 1 if a bus error is received during descriptor load. 0: Operation other than descriptor load 1: (ER = 0) Descriptor load is in progress in link mode. (ER = 1) A bus error occurs during descriptor load in link mode. Set condition(s): • When descriptor load in link mode starts Reset condition(s): • When descriptor load in link mode ends with an OK response • When SWRST (CHCTRL_n/nS) is set to 1
7	SR	0	R	Selected Register Set Indicates the register set currently selected in register mode. 0: Next0 Register Set 1: Next1 Register Set Set condition(s): • When RSEL (CHCFG_n/nS) is set to 1 Reset condition(s): • When RSEL (CHCFG_n/nS) is set to 0
6	TC	0	R	Terminal Count Indicates whether the DMA transaction is completed. 0: DMA transfer not completed 1: DMA transfer completed Set condition(s): • When data equivalent to the total transfer byte count set in the CRTB register has been transferred in register mode • When data equivalent to the total transfer byte count set in the CRTB register has been transferred in link mode, with 1 set in WBD of the descriptor header • When descriptor writeback is completed in link mode, with 0 set in WBD of the descriptor header Clear condition(s): • When the CLRTC (CHCTRL_n/nS) bit is set to 1 • When the SWRST (CHCTRL_n/nS) bit is set to 1
5	END	0	R	DMAEND Interrupted Indicates whether the DMA transaction is completed and whether the DMA transfer end interrupt has occurred. 0: DMA transfer not completed 1: DMA transfer completed Set condition(s): • When one of the set conditions for the TC bit is met and 0 is set in DEM of the CHCFG_n/nS register • When the descriptor is read in link mode and both LV of the header and DIM are set to 0 Clear condition(s): • When CLREND (CHCTRL_n/nS) is set to 1 • When SWRST (CHCTRL_n/nS) is set to 1
4	ER	0	R	Error bit Indicates that a DMA error interrupt has occurred because an error response has been received from the transfer source or destination and a bus error has occurred during the DMA transfer. 0: No bus error has occurred 1: A DMA error interrupt has occurred due to a bus error Set condition(s): • When a bus error has occurred during a bus cycle Clear condition(s): • When SWRST (CHCTRL_n/nS) is set to 1

Bit	Bit Name	Initial Value	R/W	Description
3	SUS	0	R	Suspend Indicates whether the channel is suspended. 0: Channel_n not suspended 1: Channel_n suspended Set condition(s): • When SETSUS (CHCTRL_n/nS) is set to 1 during a DMA transfer on Channel_n, creating a SUSPEND status internally Clear condition(s): • When CLRSUS (CHCTRL_n/nS) is set to 1 • When CLREN (CHCTRL_n/nS) is set to 1
2	TACT	0	R	Transaction Active Indicates whether the DMAC is active. This bit is intended to check that the channel is completely inactive. 0: DMA on Channel_n inactive 1: DMA on Channel_n active Set condition(s): • When a DMA transaction starts on Channel_n Clear condition(s): • When a DMA transaction is completed
1	RQST	0	R	Request Indicates whether a transfer request is being received. 0: DMA transfer request not being received 1: DMA transfer request being received Set condition(s): • When the STG bit (CHCTRL_n/nS) is set to 1 (auto request) • When a transfer request is received from the DMA request source set in the CHCFG_n/nS register Clear condition(s): • When SWRST (CHCTRL_n/nS) is set to 1 • When CLRRQ (CHCTRL_n/nS) is set to 1 • When a transfer is executed on the side specified by REQD (CHCFG_n/nS) in single transfer mode (TM = 0). • When all DMA transactions are completed in register mode (the transaction ends with REN set to 0) • When the DMA transfer of the last descriptor (LE = 1) is completed in link mode • When descriptor read stops (LV = 0) in link mode • When a bus error is received due to an error response
0	EN	0	R	Enable Indicates whether the operation of DMA channel n is enabled or disabled. 0: Operation disabled 1: Operation enabled Set condition(s): • When SETEN (CHCTRL_n/nS) is set to 1 Clear condition(s): • When SWRST (CHCTRL_n/nS) is set to 1 • When CLREN (CHCTRL_n/nS) is set to 1 • When a bus error is received due to an error response during the transfer • When all DMA transactions are completed in register mode (the transaction ends with REN set to 0) • When the DMA transfer of the last descriptor (LE = 1) is completed in link mode (writeback when WBD is set to 0) • When descriptor read stops (LV = 0) in link mode

<Caution> If the ER bit is set to 1 for any transfer, the whole transfer should be handled as invalid.
To suspend a DMA transaction, mask or clear the transfer request or clear the Enable bit (for the procedure, see section 9.7.11 (2), Transfer Stop).
If a transfer request from an on-chip peripheral module or the external DREQ input is made concurrently with an auto request (by setting 1 in the STG bit) for the same one channel, the trigger source that takes effect cannot be identified. Make sure that only one of these transfer requests is used in the system.
When transfer is requested by an auto request, wait for the last requested DMA transfer to complete (use the Current Register or other data to check the status) before setting the STG bit for the next transfer request.

9.4.8 Channel Control Register n/nS (CHCTRL_n/nS)

This register controls the DMA transfer operation on DMA channel n (n = 0 to 15).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRINTMSK	SETINTMSK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLRSUS	SETSUS	—	CLRTC	CLREND	CLRRQ	SWRST	STG	CLREN	SETEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
17	CLRINTMSK	0	R/W	When this bit is set to 1, the mask of the DMA transfer end interrupt is cleared. Also, the INTMSK bit of the CHSTAT_n/nS register is set to 0. If the mask is cleared when 1 is set in both LVINT of the DCTRL register and END of the CHSTAT_n/nS register, the DMA transfer end interrupt becomes active. (It does not become active when 0 is set in LVINT.) A read operation results in 0 being read. 1: Clears the mask set by SETINTMSK. 0: Does not affect the operation.
16	SETINTMSK	0	R/W	When this bit is set to 1, the DMA transfer end interrupt is temporarily masked. Also, the INTMSK bit of the CHSTAT_n/nS register is set to 1. A read operation results in 0 being read. 1: Masks the DMA transfer end interrupt. 0: Does not affect the operation.
15 to 10	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
9	CLRSUS	0	R/W	Clear Suspend Clears the suspend status. Setting this bit to 1 when 1 is set in SUS of the CHSTAT_n/nS register can clear the suspend status. An attempt to read this bit results in 0 being read. 1: Clears the suspend status of the current DMA transfer. 0: Does not affect the operation.
8	SETSUS	0	R/W	Set Suspend Suspends the current DMA transfer. Setting this bit to 1 when 1 is set in EN of the CHSTAT_n/nS register can suspend the current DMA transfer. An attempt to read this bit results in 0 being read. 1: Suspends the current DMA transfer. 0: Does not affect the operation.
7	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
6	CLRTC	0	R/W	Clear TC bit Setting this bit to 1 can clear the TC bit of the CHSTAT_n/nS register. An attempt to read this bit results in 0 being read. 1: Clears the TC bit. 0: Does not affect the operation.
5	CLREND	0	R/W	Clear End bit Setting this bit to 1 can clear the END bit of the CHSTAT_n/nS register. Also, the DMA transfer end interrupt is cleared. An attempt to read this bit results in 0 being read. 1: Clears the END bit. 0: Does not affect the operation.
4	CLRRQ	0	R/W	Clear Request bit Setting this bit to 1 can clear the RQST bit of the CHSTAT_n/nS register. An attempt to read this bit results in 0 being read. 1: Clears the RQST bit. 0: Does not affect the operation.

Bit	Bit Name	Initial Value	R/W	Description
3	SWRST	0	R/W	Software Reset Setting this bit to 1 can clear the channel status register (CHSTAT_n/nS). When setting this bit to 1, make sure that both the EN bit and TACT bit are set to 0. An attempt to read this bit results in 0 being read. 1: Resets the channel status register. 0: Does not affect the operation.
2	STG	0	R/W	Software Trigger Setting this bit to 1 sets an auto request. If this bit is set at the same time the SWRST bit is set, the clear operation by the SWRST bit takes precedence. An attempt to read this bit results in 0 being read. 1: Sets a transfer request triggered by an auto request (sets 1 in the RQST bit). 0: Does not affect the operation.
1	CLREN	0	R/W	Clear Enable Setting this bit to 1 can clear the EN bit (for details, see section 9.7.11 (2), Transfer Stop). An attempt to read this bit results in 0 being read. 1: Stops the DMA transfer (clears the EN bit). 0: Does not affect the operation.
0	SETEN	0	R/W	Set Enable Enables a DMA transfer on DMA channel n. If this bit is set at the same time the SWRST bit is set, the clear operation by the SWRST bit takes precedence and the transfer does not start. An attempt to read this bit results in 0 being read. 1: Enables a DMA transfer (sets 1 in the EN bit). 0: Does not affect the operation.

9.4.9 Channel Configuration Register n/nS (CHCFG_n/nS)

This register controls the DMA transfer operation on DMA channel n (n = 0 to 15).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMS	REN	RSW	RSEL	SBE	—	—	DEM	—	TM	DAD	SAD	DDS[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SDS[3:0]				—	AM[2:0]			—	LVL	HIEN	LOEN	REQD	SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	DMS	0	R/W	DMA Mode Select Sets the DMA mode. 0: Register mode (initial value) 1: Link mode
30	REN	0	R/W	Register Set Enable After a DMA transaction is completed, DMA transfers are continued using the Next register set selected by RSEL. This bit is valid only in register mode. 0: Does not continue DMA transfers. 1: Continues DMA transfers. Set condition(s): • When 1 is written to this bit Clear condition(s): • When 0 is written to this bit • When a DMA transaction is completed, with REN set to 1
29	RSW	0	R/W	Register Select Switch Inverts RSEL automatically after a DMA transaction is completed. This bit is valid only in register mode. 0: Does not invert RSEL automatically after a DMA transaction (initial value). 1: Inverts RSEL automatically after a DMA transaction.
28	RSEL	0	R/W	Register Set Select Selects the Next register set to be executed next. This bit is valid only in register mode. When RSW is set to 1, this bit is inverted automatically when a DMA transaction is completed. 0: Executes the Next0 Register Set (initial value). 1: Executes the Next1 Register Set. Transition condition(s): • When a DMA transaction is completed, with RSW set to 1
27	SBE	0	R/W	Sweep Buffer Enable Selects whether to sweep (write) the data already read into the buffer and stop the DMA transfer if the Enable bit is cleared to 0 during a DMA transaction. The sweep mode is available only when REQD is set to 0. 0: Stops the DMA transfer without sweeping the buffer (initial value). 1: Stops the DMA transfer after sweeping the buffer.
26, 25	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
24	DEM	0	R/W	DMA Transfer End Interrupt Mask Masks the DMA transfer end interrupt for register mode transfer. If 1 is set in this bit when a DMA transfer end interrupt is output, the DMA transfer end interrupt signal is not asserted. In this case, DEM is cleared to 0 automatically. 0: Does not mask the DMA transfer end interrupt (initial value). 1: Masks the DMA transfer end interrupt. Clear condition(s): • When a DMA transaction is completed with DEM set to 1

Bit	Bit Name	Initial Value	R/W	Description
23	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
22	TM	0	R/W	Transfer Mode Sets the DMA transfer mode. 0: Single transfer mode (initial value) 1: Block transfer mode
21	DAD	0	R/W	Sets the destination address counting direction of DMA channel n. 0: Increment (initial value) 1: Fixed
20	SAD	0	R/W	Sets the source address counting direction of DMA channel n. 0: Increment (initial value) 1: Fixed
19 to 16	DDS[3:0]	0000	R/W	Destination Data Size Sets the DMA transfer size of the transfer destination.

Value	Size	Remark
0000	8 bits	Initial value
0001	16 bits	
0010	32 bits	
0011	64 bits	
0100	128 bits	
0101	256 bits	
0110	512 bits	
0111	1024 bits	
Other than the above	—	Setting prohibited

15 to 12	SDS[3:0]	0000	R/W	Source Data Size Sets the DMA transfer size of the transfer source.

Value	Size	Remark
0000	8 bits	Initial value
0001	16 bits	
0010	32 bits	
0011	64 bits	
0100	128 bits	
0101	256 bits	
0110	512 bits	
0111	1024 bits	
Other than the above	—	Setting prohibited

11	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
10 to 8	AM[2:0]	000	R/W	ACK Mode Sets the DMAACK output mode. 000: (initial value) 001: Level mode (active until the transfer request from an on-chip peripheral module or the external DREQ input becomes inactive) 01x: Bus cycle mode (active while the DMA transfer is in a bus cycle) 1xx: DMAACK not to be output (this setting should be made when an auto request is made by STG (CHCTRL_n/nS) or when the SCIFA transfer is performed)
7	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
6	LVL	0	R/W	Level Selects whether to detect a DMA request based on the level or edge of the signal. 0: Detects based on the edge (initial value). 1: Detects based on the level.

Bit	Bit Name	Initial Value	R/W	Description
5	HIEN	0	R/W	High Enable Selects whether to detect a DMA request using the High level or rising edge of the signal. When LVL = 0: HIEN = 1: Detects a request in response to the rising edge of the signal. HIEN = 0: Does not detect a request in response to the rising edge of the signal (initial value). When LVL = 1: HIEN = 1: Detects a request when the signal is at the High level. HIEN = 0: Does not detect a request even when the signal is at the High level (initial value).
4	LOEN	0	R/W	Low Enable Selects whether to detect a DMA request using the Low level or falling edge of the signal. When LVL = 0: LOEN = 1: Detects a request in response to the falling edge of the signal. LOEN = 0: Does not detect a request in response to the falling edge of the signal (initial value). When LVL = 1: LOEN = 1: Detects a request when the signal is at the Low level. LOEN = 0: Does not detect a request even when the signal is at the Low level (initial value).
3	REQD	0	R/W	Request Direction Selects whether DMAREQ selected by the SEL bit is the source or destination. This bit is also used to define when DMAACK is to become active. 0: Source; DMAACK is to become active when read (initial value). 1: Destination; DMAACK is to become active when written.
2 to 0	SEL[2:0]	000	R/W	These bits are used to set a DMAC channel. Set one of the following values so that the channel set by the SEL bits matches the CHCFG_n/nS channel. 000: CH0/CH8 001: CH1/CH9 010: CH2/CH10 011: CH3/CH11 100: CH4/CH12 101: CH5/CH13 110: CH6/CH14 111: CH7/CH15

9.4.10 Channel Interval Register n/nS (CHITVL_n/nS)

This register sets the transfer interval for DMA channel n (n = 0 to 15).

For details, see section 9.7.9, Interval Count Function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ITVL															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
15 to 0	ITVL	All 0	R/W	Sets the channel transfer interval.

9.4.11 Channel Extension Register n/nS (CHEXT_n/nS)

This is an extension register for DMA channel n (n = 0 to 15).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCA[3:0]				—	DPR[2:0]			SCA[3:0]				—	SPR[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

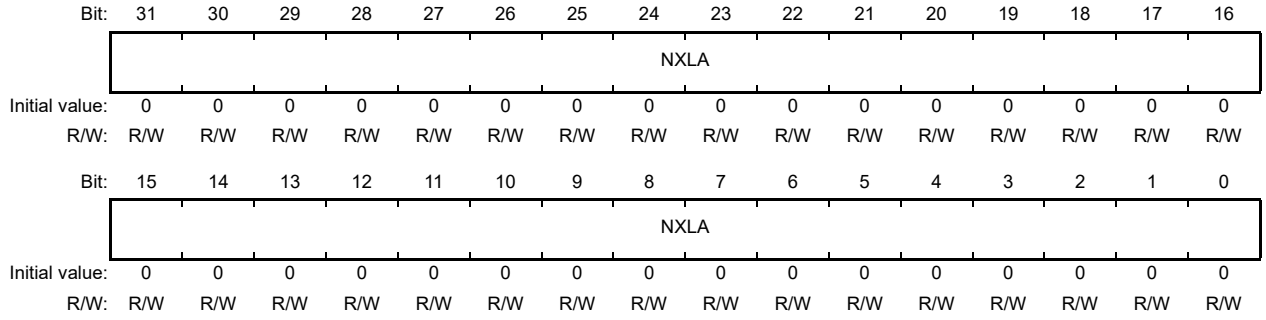
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Set 0. A read operation results in 0 being read.
15 to 12	DCA[3:0]	0000	R/W	Destination CACHE Sets the value to be output to AWCACHE[3:0] for DMA write transfer. See Note 1 below.
11	—	0	R	Set 0. A read operation results in 0 being read.
10 to 8	DPR[2:0]	000	R/W	Destination PROT Sets the value to be output to AWPROT[2:0] for DMA write transfer. In the case of non-secure access, the value output as AWPROT[1] is fixed to 1 regardless of the setting of the DPR[1] bit. See Note 2 below.
7 to 4	SCA[3:0]	0000	R/W	Source CACHE Sets the value to be output to ARCACHE[3:0] for DMA read transfer. See Note 1 below.
3	—	0	R	Set 0. A read operation results in 0 being read.
2 to 0	SPR[2:0]	000	R/W	Source PROT Sets the value to be output to ARPROT[2:0] for DMA read transfer. In the case of non-secure access, the value output as ARPROT[1] is fixed to 1 regardless of the setting of the SPR[1] bit. See Note 2 below.

Note 1. Cache support: Bits SCA and DCA are used to change the settings.
When the transfer destination or source is not in the external bus space, set these bits to 0000.
Even when the transfer destination or source is in the external bus space but the secondary cache is not in use, set these bits to 0000. In this case, the DACK0 output and TEND0 output are issued in response to the DREQ0 transfer request.
When the secondary cache is in use in the external bus space, set CACHE[3:0].

Note 2. Protection unit support: Bits SPR and DPR are used to change the settings.
For the setting value, see AMBA AXI Protocol Specification from Arm Limited.

9.4.12 Next Link Address Register n/nS (NXLA_n/nS)

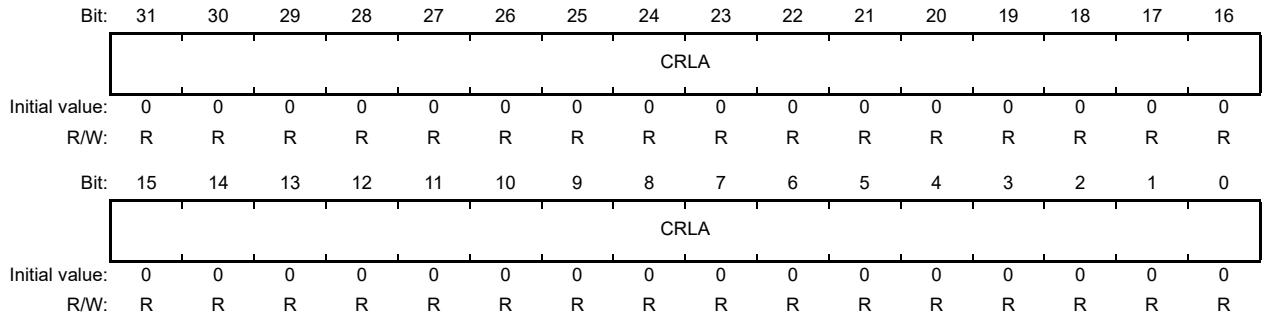
This is a 32-bit register that sets the link address of DMA channel n (n = 0 to 15).
For information about the link mode, see section 9.6.3, Link Mode.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NXLA	All 0	R/W	Sets a link address. The low-order 2 bits are masked with 0s. Only an address aligned with a 4-byte boundary can be set.

9.4.13 Current Link Address Register n/nS (CRLA_n/nS)

This is a 32-bit register that indicates the link address of DMA channel n (n = 0 to 15).
For information about the link mode, see section 9.6.3, Link Mode.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRLA	All 0	R	Indicates the address of the currently executed descriptor.

9.4.14 DMA Control Register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S)

This register sets the transfer type for descriptor access and the arbitration between channels.
(DCTRL_0_7/0_7S is common for channels 0 to 7 and DCTRL_8_15/8_15S is common for channels 8 to 15.)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LWCA				—	LWPR			LDCA				—	LDPR		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LVINT	PR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	LWCA	0000	R/W	Link WriteBack CACHE Sets the value to be output to AWCACHE[3:0] during descriptor writeback in link mode. For the setting value, see Note in section 9.4.11, Channel Extension Register n/nS (CHEXT_n/nS).
27	—	0	R	Reserved. Set 0. The initial value is 0.
26 to 24	LWPR	000	R/W	Link WriteBack PROT Sets the value to be output to AWPROT[2:0] during descriptor writeback in link mode. In the case of non-secure access, the value output as AWPROT[1] is fixed to 1 regardless of the setting of the LWPR[1] bit. For the setting value, see AMBA AXI Protocol Specification from Arm Limited.
23 to 20	LDCA	0000	R/W	Link Descriptor CACHE Sets the value to be output to ARCACHE[3:0] during descriptor load in link mode. For the setting value, see Note in section 9.4.11, Channel Extension Register n/nS (CHEXT_n/nS).
19	—	0	R	Reserved. Set 0. The initial value is 0.
18 to 16	LDPR	000	R/W	Link Descriptor PROT Sets the value to be output to ARPROT[2:0] during descriptor load in link mode. In the case of non-secure access, the value output as ARPROT[1] is fixed to 1 regardless of the setting of the LDPR[1] bit. For the setting value, see AMBA AXI Protocol Specification from Arm Limited.
15 to 2	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
1	LVINT	0	R/W	Sets whether to use pulse output or level output for the DMA transfer end interrupt and DMA error interrupt. Set pulse output for this product. 0: Pulse output (initial value) 1: Level output
0	PR	0	R/W	Sets the transfer priority control mode between channels (see section 9.7.2, Priority Control for DMA Channels). 0: Fixed priority mode (initial value) 1: Round robin mode

9.4.15 DMA Status EN Register (DSTAT_EN_0_7/0_7S)

This register indicates the EN bit status of the CHSTAT_n/nS register (n = 0 to 7).
Writing to this register does not affect the values of the bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	EN7	EN6	EN5	EN4	EN3	EN2	EN1	EN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	EN7	0	R	Indicates the EN bit status of DMA channel 7.
6	EN6	0	R	Indicates the EN bit status of DMA channel 6.
5	EN5	0	R	Indicates the EN bit status of DMA channel 5.
4	EN4	0	R	Indicates the EN bit status of DMA channel 4.
3	EN3	0	R	Indicates the EN bit status of DMA channel 3.
2	EN2	0	R	Indicates the EN bit status of DMA channel 2.
1	EN1	0	R	Indicates the EN bit status of DMA channel 1.
0	EN0	0	R	Indicates the EN bit status of DMA channel 0.

9.4.16 DMA Status EN Register (DSTAT_EN_8_15/8_15S)

This register indicates the EN bit status of the CHSTAT_n/nS register (n = 8 to 15).
Writing to this register does not affect the values of the bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	EN15	EN14	EN13	EN12	EN11	EN10	EN9	EN8
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	EN15	0	R	Indicates the EN bit status of DMA channel 15.
6	EN14	0	R	Indicates the EN bit status of DMA channel 14.
5	EN13	0	R	Indicates the EN bit status of DMA channel 13.
4	EN12	0	R	Indicates the EN bit status of DMA channel 12.
3	EN11	0	R	Indicates the EN bit status of DMA channel 11.
2	EN10	0	R	Indicates the EN bit status of DMA channel 10.
1	EN9	0	R	Indicates the EN bit status of DMA channel 9.
0	EN8	0	R	Indicates the EN bit status of DMA channel 8.

9.4.17 DMA Status ER Register (DSTAT_ER_0_7/0_7S)

This register indicates the ER bit status of the CHSTAT_n/nS register (n = 0 to 7).
Writing to this register does not affect the values of the bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ER7	ER6	ER5	ER4	ER3	ER2	ER1	ER0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	ER7	0	R	Indicates the ER bit status of DMA channel 7.
6	ER6	0	R	Indicates the ER bit status of DMA channel 6.
5	ER5	0	R	Indicates the ER bit status of DMA channel 5.
4	ER4	0	R	Indicates the ER bit status of DMA channel 4.
3	ER3	0	R	Indicates the ER bit status of DMA channel 3.
2	ER2	0	R	Indicates the ER bit status of DMA channel 2.
1	ER1	0	R	Indicates the ER bit status of DMA channel 1.
0	ER0	0	R	Indicates the ER bit status of DMA channel 0.

9.4.18 DMA Status ER Register (DSTAT_ER_8_15/8_15S)

This register indicates the ER bit status of the CHSTAT_n/nS register (n = 8 to 15).
Writing to this register does not affect the values of the bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ER15	ER14	ER13	ER12	ER11	ER10	ER9	ER8
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	ER15	0	R	Indicates the ER bit status of DMA channel 15.
6	ER14	0	R	Indicates the ER bit status of DMA channel 14.
5	ER13	0	R	Indicates the ER bit status of DMA channel 13.
4	ER12	0	R	Indicates the ER bit status of DMA channel 12.
3	ER11	0	R	Indicates the ER bit status of DMA channel 11.
2	ER10	0	R	Indicates the ER bit status of DMA channel 10.
1	ER9	0	R	Indicates the ER bit status of DMA channel 9.
0	ER8	0	R	Indicates the ER bit status of DMA channel 8.

9.4.19 DMA Status END Register (DSTAT_END_0_7/0_7S)

This register indicates the END bit status of the CHSTAT_n/nS register (n = 0 to 7).
Writing to this register does not affect the values of the bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	END7	END6	END5	END4	END3	END2	END1	END0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	END7	0	R	Indicates the END bit status of DMA channel 7.
6	END6	0	R	Indicates the END bit status of DMA channel 6.
5	END5	0	R	Indicates the END bit status of DMA channel 5.
4	END4	0	R	Indicates the END bit status of DMA channel 4.
3	END3	0	R	Indicates the END bit status of DMA channel 3.
2	END2	0	R	Indicates the END bit status of DMA channel 2.
1	END1	0	R	Indicates the END bit status of DMA channel 1.
0	END0	0	R	Indicates the END bit status of DMA channel 0.

9.4.20 DMA Status END Register (DSTAT_END_8_15/8_15S)

This register indicates the END bit status of the CHSTAT_n/nS register (n = 8 to 15).
Writing to this register does not affect the values of the bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	END15	END14	END13	END12	END11	END10	END9	END8
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	END15	0	R	Indicates the END bit status of DMA channel 15.
6	END14	0	R	Indicates the END bit status of DMA channel 14.
5	END13	0	R	Indicates the END bit status of DMA channel 13.
4	END12	0	R	Indicates the END bit status of DMA channel 12.
3	END11	0	R	Indicates the END bit status of DMA channel 11.
2	END10	0	R	Indicates the END bit status of DMA channel 10.
1	END9	0	R	Indicates the END bit status of DMA channel 9.
0	END8	0	R	Indicates the END bit status of DMA channel 8.

9.4.21 DMA Status TC Register (DSTAT_TC_0_7/0_7S)

This register indicates the TC bit status of the CHSTAT_n/nS register (n = 0 to 7).
Writing to this register does not affect the values of the bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TC7	TC6	TC5	TC4	TC3	TC2	TC1	TC0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	TC7	0	R	Indicates the TC bit status of DMA channel 7.
6	TC6	0	R	Indicates the TC bit status of DMA channel 6.
5	TC5	0	R	Indicates the TC bit status of DMA channel 5.
4	TC4	0	R	Indicates the TC bit status of DMA channel 4.
3	TC3	0	R	Indicates the TC bit status of DMA channel 3.
2	TC2	0	R	Indicates the TC bit status of DMA channel 2.
1	TC1	0	R	Indicates the TC bit status of DMA channel 1.
0	TC0	0	R	Indicates the TC bit status of DMA channel 0.

9.4.22 DMA Status TC Register (DSTAT_TC_8_15/8_15S)

This register indicates the TC bit status of the CHSTAT_n/nS register (n = 8 to 15).
Writing to this register does not affect the values of the bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	TC15	0	R	Indicates the TC bit status of DMA channel 15.
6	TC14	0	R	Indicates the TC bit status of DMA channel 14.
5	TC13	0	R	Indicates the TC bit status of DMA channel 13.
4	TC12	0	R	Indicates the TC bit status of DMA channel 12.
3	TC11	0	R	Indicates the TC bit status of DMA channel 11.
2	TC10	0	R	Indicates the TC bit status of DMA channel 10.
1	TC9	0	R	Indicates the TC bit status of DMA channel 9.
0	TC8	0	R	Indicates the TC bit status of DMA channel 8.

9.4.23 DMA Status SUS Register (DSTAT_SUS_0_7/0_7S)

This register indicates the SUS bit status of the CHSTAT_n/nS register (n = 0 to 7).
Writing to this register does not affect the values of the bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SUS7	SUS6	SUS5	SUS4	SUS3	SUS2	SUS1	SUS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	SUS7	0	R	Indicates the SUS bit status of DMA channel 7.
6	SUS6	0	R	Indicates the SUS bit status of DMA channel 6.
5	SUS5	0	R	Indicates the SUS bit status of DMA channel 5.
4	SUS4	0	R	Indicates the SUS bit status of DMA channel 4.
3	SUS3	0	R	Indicates the SUS bit status of DMA channel 3.
2	SUS2	0	R	Indicates the SUS bit status of DMA channel 2.
1	SUS1	0	R	Indicates the SUS bit status of DMA channel 1.
0	SUS0	0	R	Indicates the SUS bit status of DMA channel 0.

9.4.24 DMA Status SUS Register (DSTAT_SUS_8_15/8_15S)

This register indicates the SUS bit status of the CHSTAT_n/nS register (n = 8 to 15).
Writing to this register does not affect the values of the bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	SUS15	0	R	Indicates the SUS bit status of DMA channel 15.
6	SUS14	0	R	Indicates the SUS bit status of DMA channel 14.
5	SUS13	0	R	Indicates the SUS bit status of DMA channel 13.
4	SUS12	0	R	Indicates the SUS bit status of DMA channel 12.
3	SUS11	0	R	Indicates the SUS bit status of DMA channel 11.
2	SUS10	0	R	Indicates the SUS bit status of DMA channel 10.
1	SUS9	0	R	Indicates the SUS bit status of DMA channel 9.
0	SUS8	0	R	Indicates the SUS bit status of DMA channel 8.

9.4.25 DMA Extension Resource Selectors 0/0S to 7/7S (DMARS0/0S to DMARS7/7S)

DMARSn/nS (n = 0 to 7) are 32-bit readable/writable registers that specify the DMA transfer sources from peripheral modules in each channel. DMARS0/0S is for channels 0/0S and 1/1S, DMARS1/1S is for channels 2/2S and 3/3S, and so on.

Table 9.4 shows the specifiable combinations.

Some on-chip peripheral modules in this product use the same signal both for an interrupt request and for a DMA transfer request. If such a module is selected by a DMARSn/nS register, the signal works as a DMA transfer request signal and interrupt requests to the interrupt controller are masked. To enable the interrupt, clear the setting of DMARSn/nS (set all MID[7:0] and RID[1:0] to 0).

9.5 Operation

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority order; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in three modes: auto request, external request, and on-chip peripheral module request.

9.5.1 Transfer Flow

After the next source address register (N0SA_n/nS, N1SA_n/nS), next destination address register (N0DA_n/nS, N1DA_n/nS), next transaction byte register (N0TB_n/nS, N1TB_n/nS), channel control register (CHCTRL_n/nS), channel configuration register (CHCFG_n/nS), channel extension register (CHEXT_n/nS), DMA control register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S), and DMA extension resource selector (DMARSn/nS) are set for the target transfer conditions, the DMAC transfers data according to the following procedure:

1. Checks to see if transfer is enabled (EN = 0 and TACT = 0 in channel status register).
2. Clears the channel status register (set 1 in the SWRST bit of the channel control register).
3. Enables DMA transfer (set 1 in the SETEN bit of the channel control register).
4. When a transfer request comes and transfer is enabled, the DMAC transfers one transfer unit of data (depending on the DDS[3:0] and SDS[3:0] bit settings). For an auto request, the transfer begins automatically when 1 is set in the STG bit of the channel control register. The CRTB_n/nS value will be decremented by 1 for each transfer.
5. If 0 is set in the REN bit of the channel configuration register when transfer has been completed for the specified count (when CRTB_n/nS reaches 0), transfer ends normally. If the DEM bit of the channel configuration register is set to 0 at this time, a DMA transfer end interrupt is sent to the CPU. If the REN bit is 1 when CRTB_n/nS reaches 0, transfer operations are continued with the values of N0SA_n/nS, N1SA_n/nS, N0DA_n/nS, N1DA_n/nS, N0TB_n/nS, and N1TB_n/nS set by the RSEL bit of the channel configuration register until there are no more transfer requests.
6. When an address error in the DMAC is generated, the transfer is stopped. Transfers are also stopped when 1 is set in the CLREN bit of CHCTRL_n/nS.

9.5.2 DMA Transfer Requests

DMA transfer requests are basically generated in either the data transfer source or destination, but they can also be generated in external devices and on-chip peripheral modules that are neither the transfer source nor destination. Transfers can be requested in three modes: auto request, external request, and on-chip peripheral module request. External request or on-chip peripheral module request is selected by the DMARS0/0S to DMARS7/7S registers.

(1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the DMAC to automatically generate a transfer request signal internally. When the STG bit in channel control register n is set to 1, the transfer begins so long as the TACT bit in channel status register is 0.

(2) External Request Mode

In this mode a transfer is performed at the transfer request signal (DREQ0) of an external device of the LSI. When the DMA transfer is enabled, DMA transfer is performed upon a DREQ input.
Choose to detect DREQ0 by either the edge or level of the signal input with the LVL, HIEN, and LOEN bits in channel configuration register 0 as shown below. The source of the transfer request does not have to be the data transfer source or destination.
For the output level settings of the DACK0 and TEND0 pins, refer to section 8, Bus State Controller.

Table 9.3 Settings for External Request Detection

CHCFG_0/CHCFG_0S			
LVL	HIEN	LOEN	Detection of External Request
0	0	1	Falling edge detection
	1	0	Rising edge detection
1	0	1	Low level detection
	1	0	High level detection

When DREQ0 is accepted, the DREQ0 pin enters the request accept disabled state (non-sensitive period). After issuing an acknowledge DACK0 signal for the accepted DREQ0, the DREQ0 pin again enters the request accept enabled state.

(3) On-Chip Peripheral Module Request Mode

In this mode, the transfer is performed in response to the DMA transfer request signal from an on-chip peripheral module.
When a transfer request signal is sent in on-chip peripheral module request mode while DMA transfer is enabled, the DMA transfer is performed.
The DMA transfer request signals to be sent from on-chip peripheral modules or external pin input are listed in Table 9.4.
The transfer source or destination is fixed for some on-chip peripheral module requests. For details, see Table 9.4.

9.6 DMA Mode

9.6.1 Mode Setting

The DMS field of the CHCFG_n/nS register can be used to toggle between register mode and link mode.

Table 9.5 DMA Mode Setting

DMS (CHCFG_n/nS)	Mode	Description
0	Register mode	A DMA transfer is executed using the values set in the Next Register Set.
1	Link mode	A DMA transfer is executed using the descriptor set in the Current register. The DMAC repeatedly loads the descriptor and executes the DMA transfer unless otherwise set by the descriptor or stopped by the control register.

9.6.2 Register Mode

In register mode, a DMA transfer is executed using the values set in the internal registers.
Two sets of the source address, destination address, and transfer byte count (Next0 Register Set and Next1 Register Set) can be set. It is possible to select the Next register set to be used for the DMA transfer, as well as to execute two Next register sets continuously for the DMA transfer.

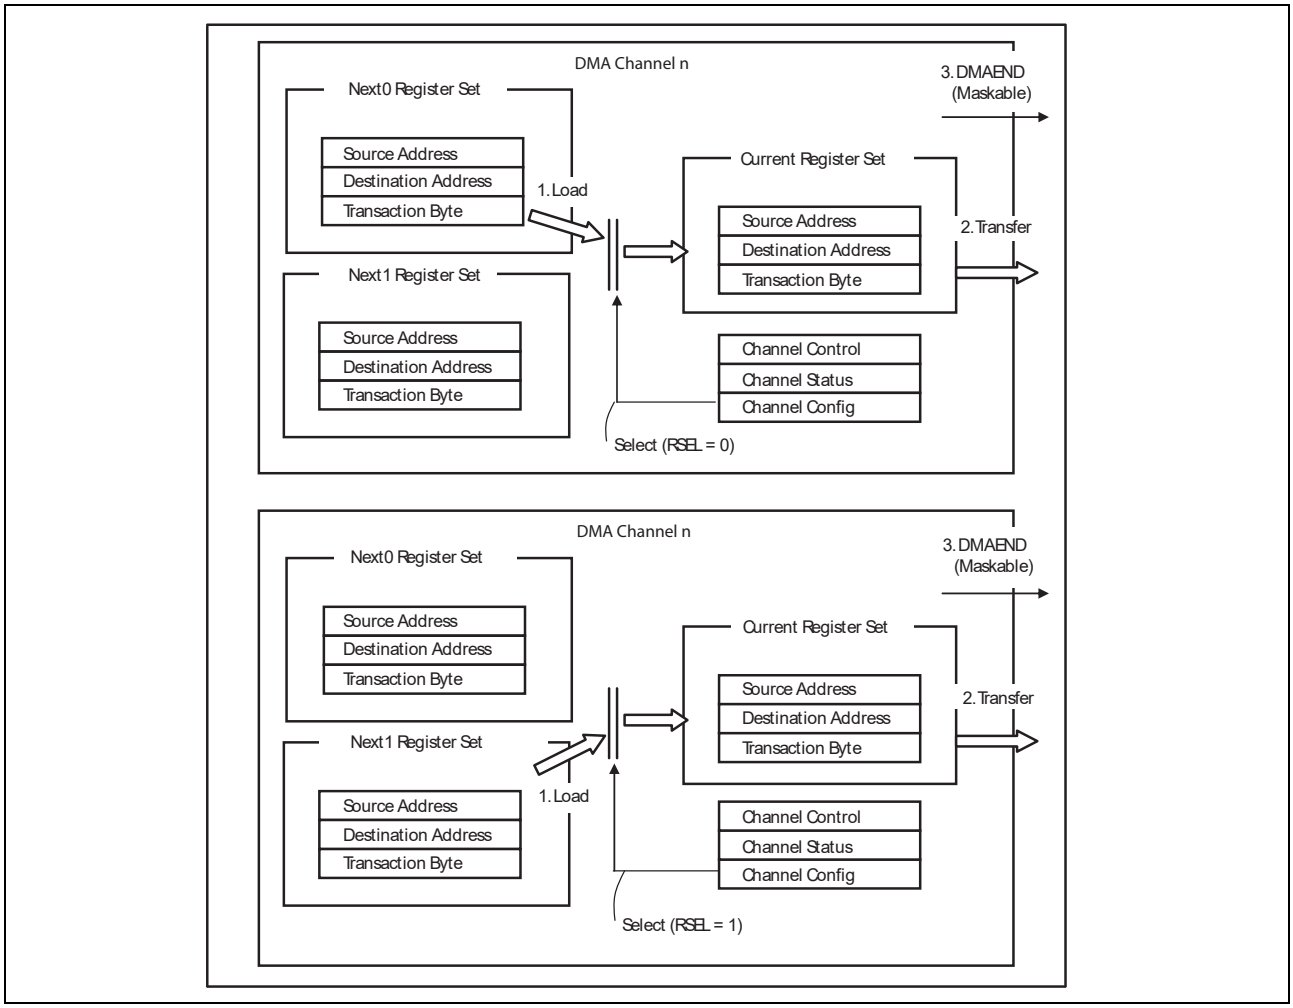

Figure 9.2 Outline of Normal Register Mode

The above figure shows how the transfer is executed when the Next0 Register Set is used (upper part of the figure) and when the Next1 Register Set is used (lower part of the figure).

(1) Operation Flow

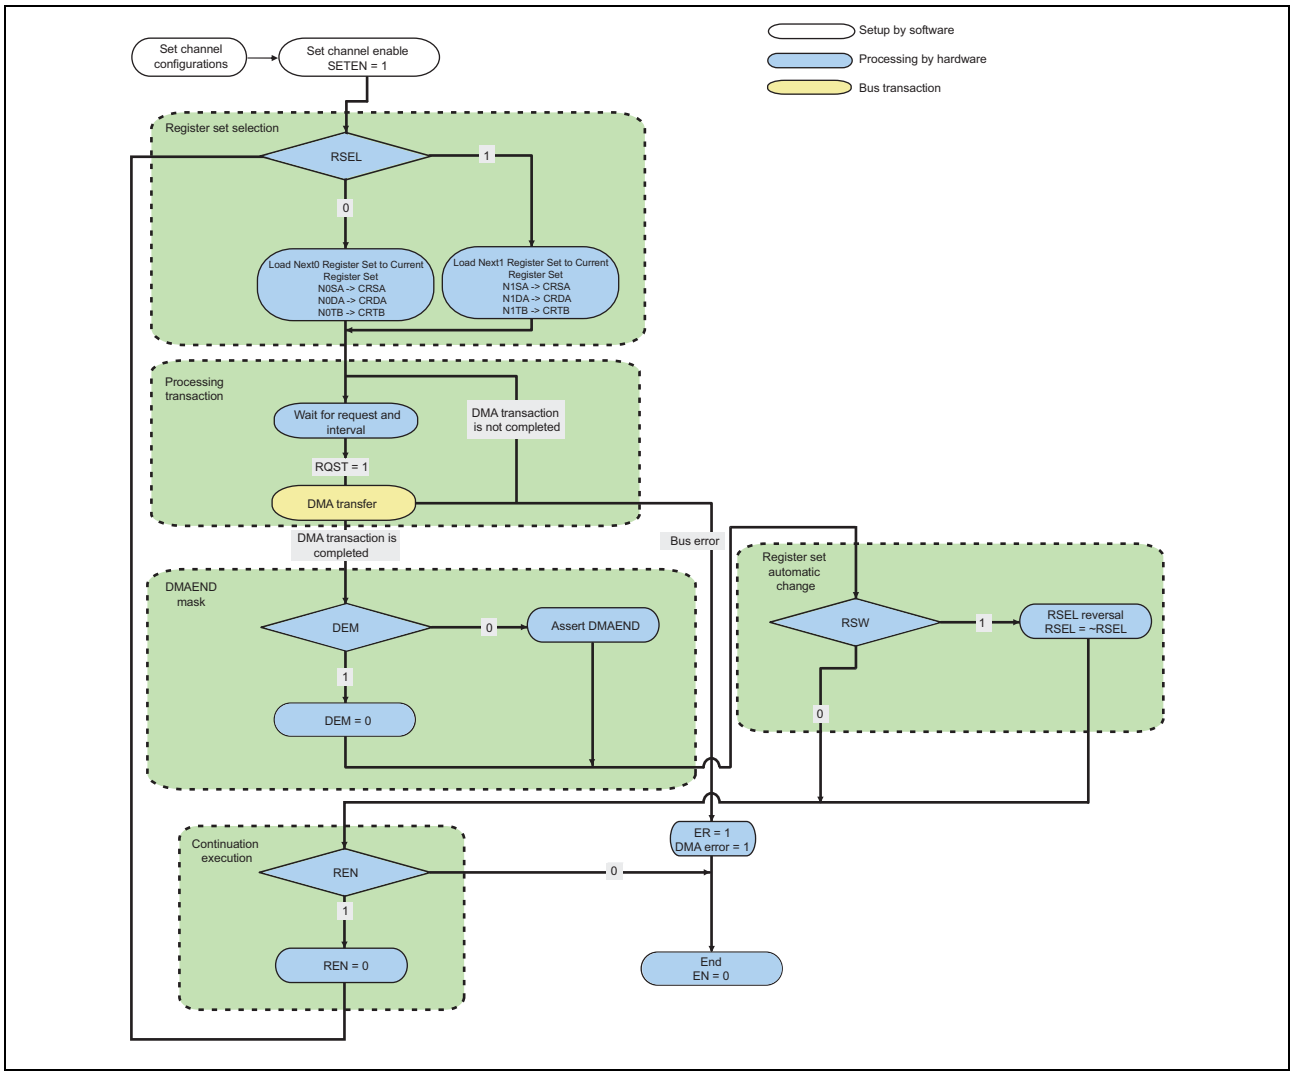

Figure 9.3 Register Mode Flow

<Explanation of the register mode flow>

1. Channel setting (set channel configuration)
   The Next0 or Next1 register set (destination address, source address, and total transfer byte count) is set.
   In the Channel register set, the DMA register set (REQ, DMAACK, transfer size, etc.) is set. (See section 9.7, DMA Transfer.)

2. Register set selection (register set selection)
   When 1 is set in EN, the values set in the Next register set selected by RSEL are loaded to the Current register set.

3. DMA transaction (processing transaction)
   A DMA transfer is executed according to the set values. For details of the transfer, see section 9.7, DMA Transfer.

4. DMA transfer end interrupt mask (DMAINT mask)
   The DMA transfer end interrupt is masked according to the value set in the DEM bit of CHCFG_n/nS.
   When 1 is set in DEM, the DMA transfer end interrupt is not output. Also, immediately after that, DEM is automatically cleared to 0.

5. Automatic register set change (register set automatic change)
   Whether to use the other Next register set is determined by the value set in the RSW bit of CHCFG_n/nS.

6. Continuation of execution (continuation execution)
   Whether to continue the execution of the DMA transfer is determined by the value set in the REN bit of CHCFG_n/nS. When 1 is set in REN, the execution of the DMA transfer is continued. Also, immediately after that, REN is automatically cleared to 0.

(2) Register Setting

(a) Register mode setting

Select the register set to be executed.

Table 9.6 Register Mode Setting

DMS (CHCFG_n/nS)	RSEL (CHCFG_n/nS)	Description
0	0	Executes the Next0 Register Set.
	1	Executes the Next1 Register Set.

(b) DMA transfer end interrupt mask setting

The DMA transfer end interrupt can be masked individually for each register set.

Table 9.7 DMAINT Mask Setting

DEM (CHCFG_n/nS)	Operation
0	When the DMA transaction is completed, a DMA transfer end interrupt is issued.
1	Even when the DMA transaction is completed, a DMA transfer end interrupt is not issued. After the DMA transaction is completed, DEM is cleared to 0 by hardware.

(c) Automatic register set execution setting

After DMA transfers, the DMA transaction of the selected register set is automatically executed.

Table 9.8 Automatic Register Set Execution Setting

REN (CHCFG_n/nS)	Operation	Remark
0	When the DMA transaction of the register set selected by RSEL is completed, the EN bit is cleared and the DMA operation ends.	Set this value to execute a DMA transaction once.
1	When a DMA transaction is completed, the DMAC continues to execute a DMA transfer by using the data set in the selected register set. When continuous transfers are successful, REN is cleared to 0.	Set this value to continuously execute DMA transfers by using the data set in separate register sets.

(d) Automatic register set change setting

When 1 is set in REN, the DMAC can automatically change to the register set to be executed next, after a DMA transaction is completed.

Table 9.9 Automatic Register Set Change Setting

RSW (CHCFG_n/nS)	Operation	Remark
0	If 1 is set in REN when a DMA transaction is completed, the register set is not changed.	Set this value to use only one register set.
1	If 1 is set in REN when a DMA transaction is completed, the value of RSEL is automatically inverted and the other register set is selected.	Set this value to change the register set.

(3) Setting Examples

(a) When only the Next0 register set is used

Table 9.10 Register Mode Setting Example 1

DMS (CHCFG_n/nS)	RSEL (CHCFG_n/nS)	DEM (CHCFG_n/nS)	RSW (CHCFG_n/nS)	REN (CHCFG_n/nS)
0 (Register mode)	0 (Next0)	0 (not masked)	0 (not switched)	0 (not continuously executed)

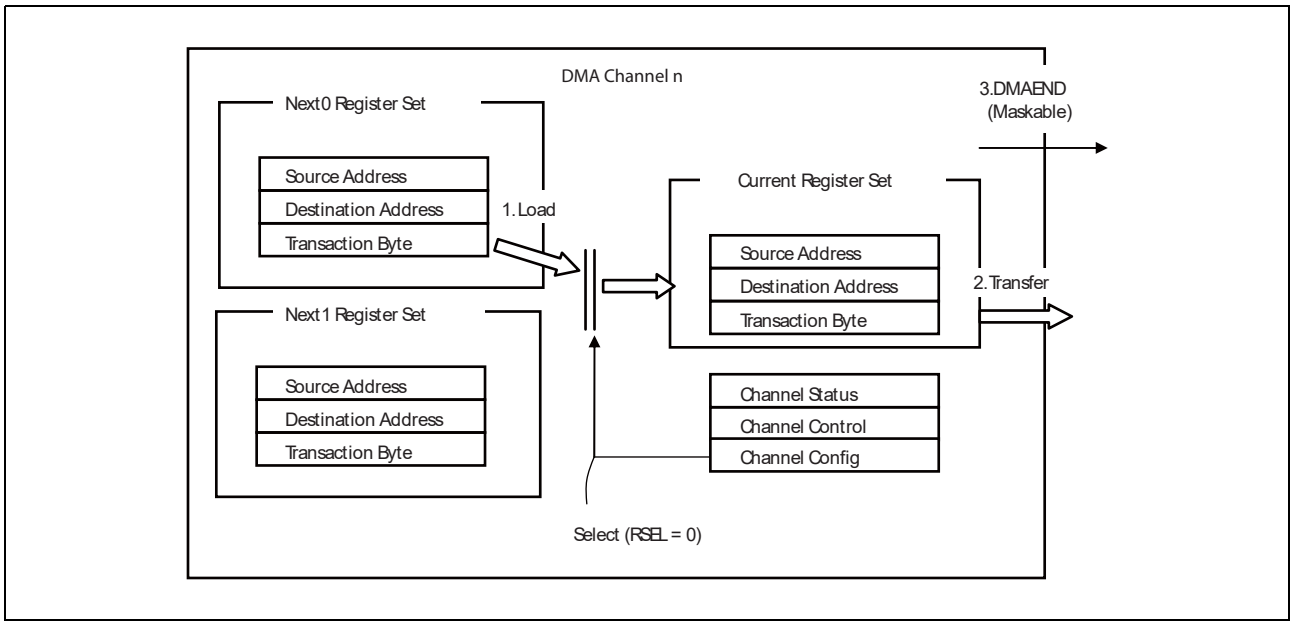

Figure 9.4 Register Mode Setting Example 1

1. 1 is set in EN (SETEN = 1), and the Next0 register set is loaded to the Current register set.
2. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
3. Because 0 is set in DEM, the DMA transfer end interrupt is issued after the DMA transaction is completed.
4. Because 0 is set in REN, EN is cleared to 0 and the DMA transaction ends.

(b) When two register sets are used continuously

Table 9.11 Automatic Register Set Execution Setting

DMS (CHCFG_n/nS)	RSEL (CHCFG_n/nS)	DEM (CHCFG_n/nS)	RSW (CHCFG_n/nS)	REN (CHCFG_n/nS)
0 (Register mode)	0 (Next0)	1 (masked)	1 (switched)	1 (continuously executed)

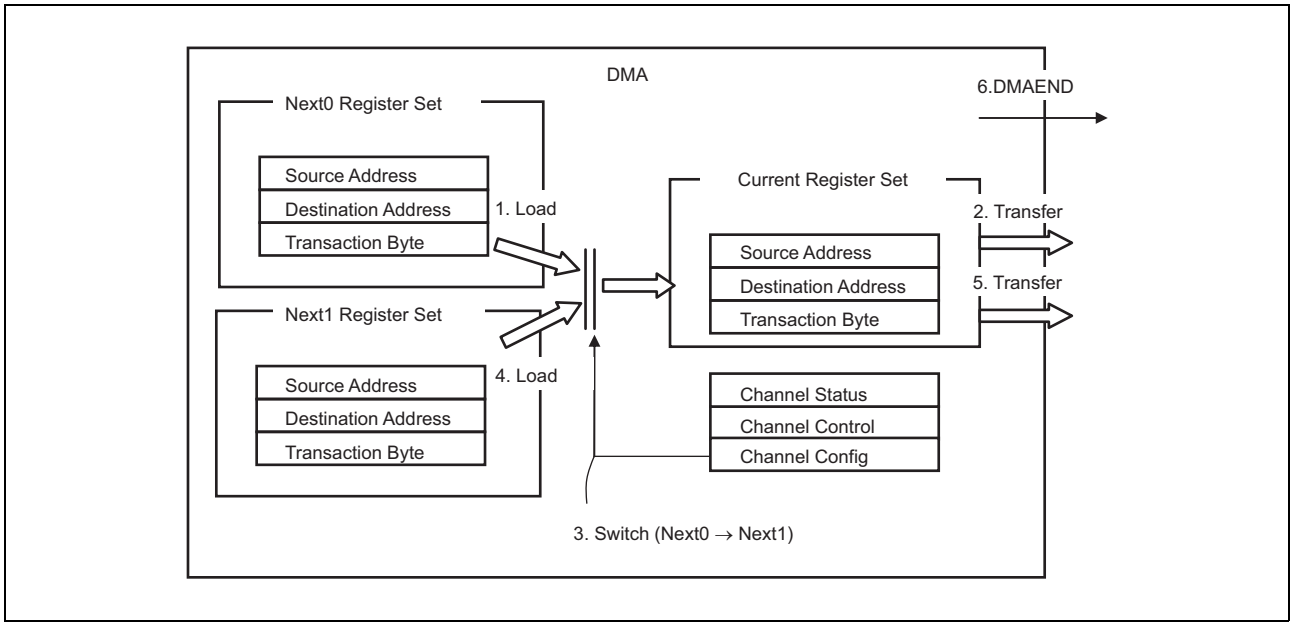

Figure 9.5 Register Mode Setting Example 2

1. 1 is set in EN (SETEN = 1), and the Next0 register set is loaded to the Current register set.
2. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
3. Because 1 is set in DEM, DMA transfer end interrupt is not output after the DMA transaction is completed. Also, DEM is automatically cleared to 0.
4. Because 1 is set in REN, the execution is continued. Also, REN is automatically cleared to 0.
5. Because 1 is set in RSW, the register set to be executed next is switched (RSEL = 0 → 1).
6. The Next1 register set is loaded to the Current register set.
7. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
8. Because 0 is set in DEM, the DMA transfer end interrupt is issued after the DMA transaction is completed.
9. Because 0 is set in REN, EN is cleared to 0 and the DMA transaction ends.

9.6.3 Link Mode

In link mode, a descriptor stored in external memory is loaded as set values and a DMA transaction is executed using the loaded values. The DMAC contains a Next Link address and a Current Link address for each channel, and these addresses are used to set the descriptor address to be executed next and to indicate the descriptor address of the currently executed DMA transaction, respectively.

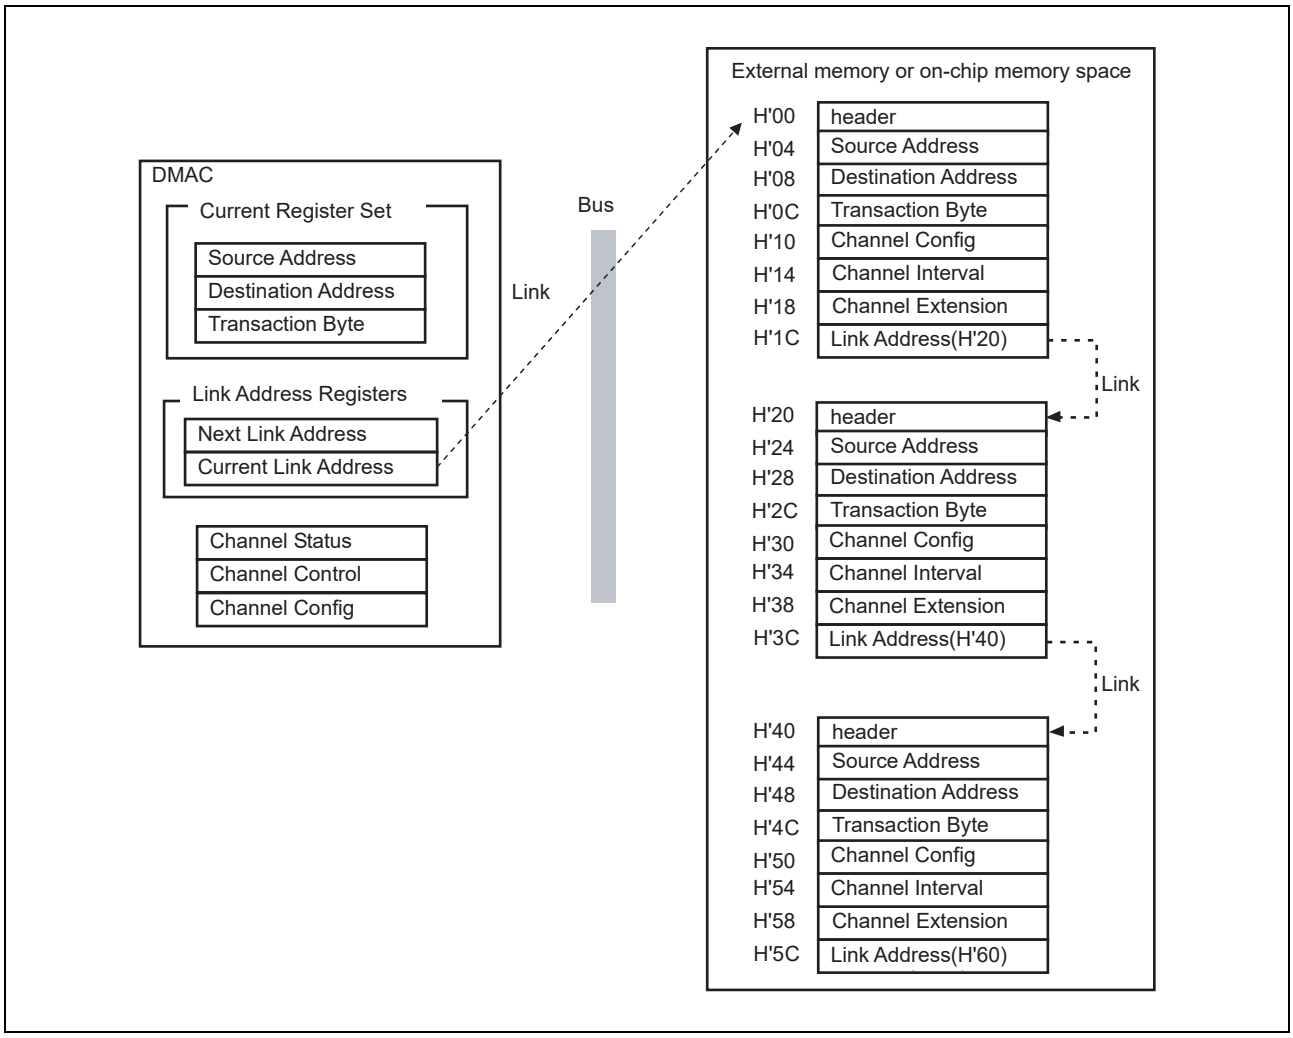

Figure 9.6 Link Mode Outline

(1) Operation Flow

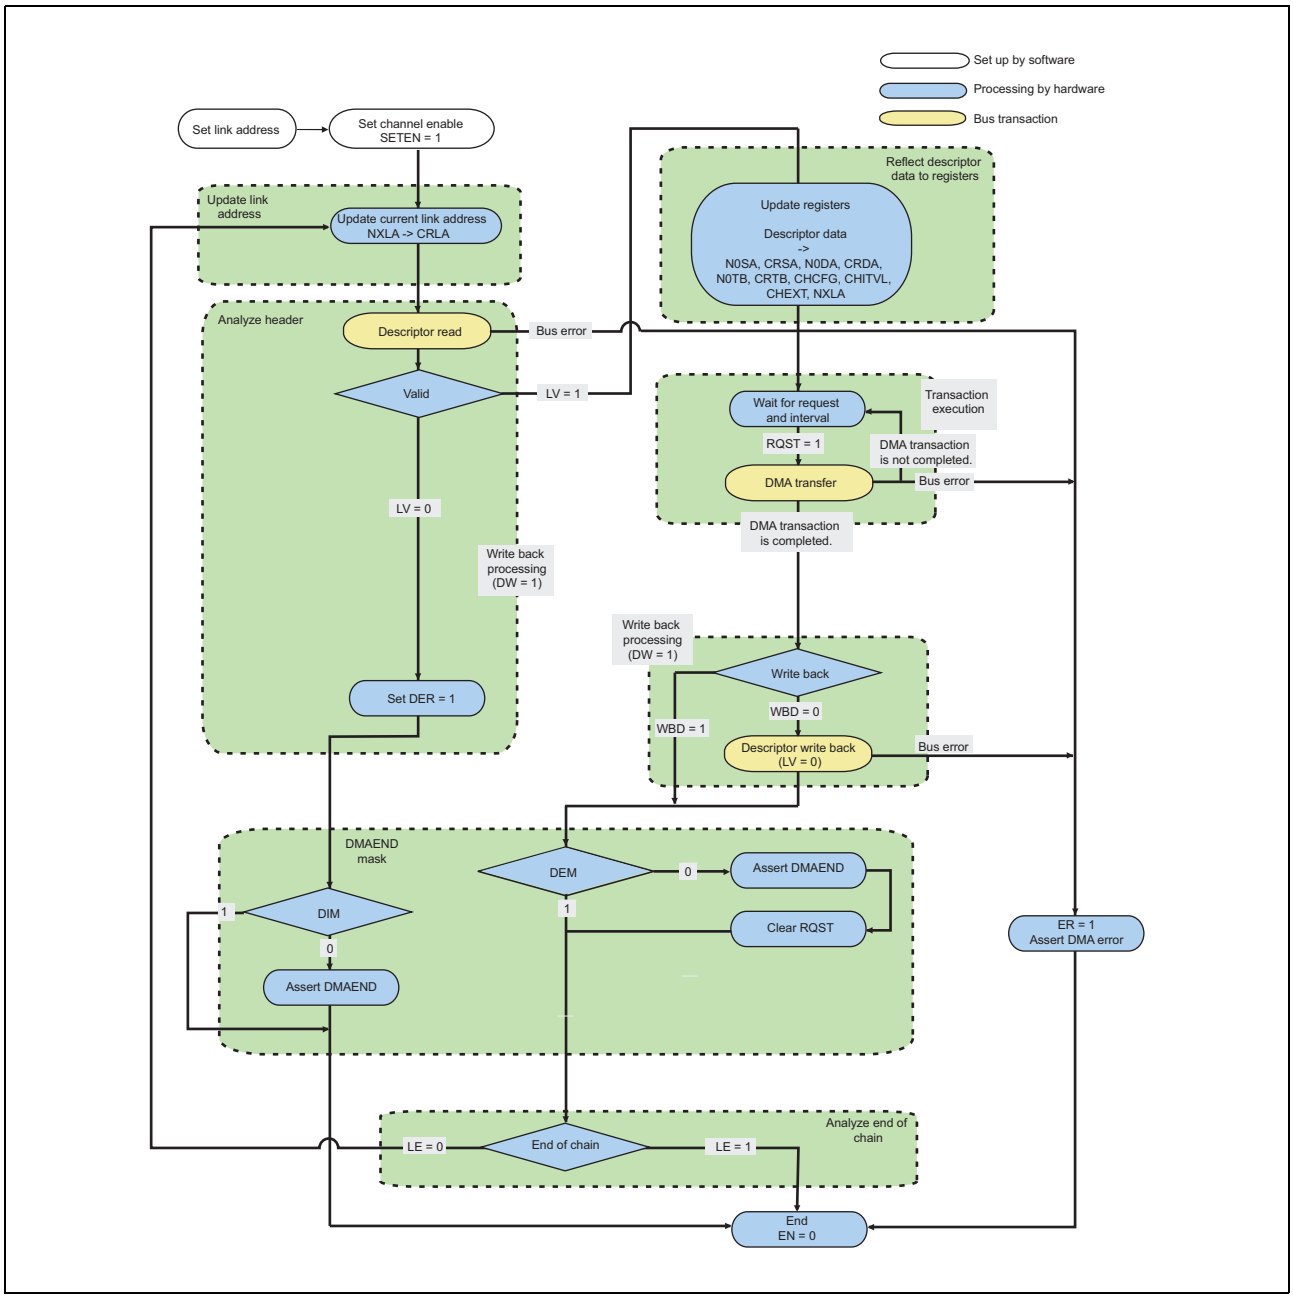

Figure 9.7 Link Mode Flow

<Explanation of the link mode flow>

1. Channel setting
   The start address of the link destination is set in NXLA_n/nS.

2. Link address update
   When 1 is set in EN (1 is set in SETEN), the Link address set in NXLA_n/nS is loaded to CRLA_n/nS.

3. Descriptor load and header analysis
   The DMAC begins to load the descriptor and then analyzes the content of the header. When LV is 0, the DMAC discards the loaded descriptor and sets 1 in DER to end the operation (EN = 0). In this case, if 0 is set in DIM of the header, DMAEND is issued.

4. Descriptor setting
   The loaded descriptor is set in the Current register set and Channel register set. Also, the next link address is set in NXLA_n/nS.

5. DMA transaction
   A DMA transaction is executed according to the set values.

6. Header writeback
   When 0 is set in WBD of the header, the DMAC writes back the header with 0 set in its LV bit.

7. DMAINT mask
   When 0 is set in the DEM bit of CHCFG_n/nS, the DMA transfer end interrupt is issued.

8. Link end analysis
   When 1 is set in LE of the header, the operation is ended by clearing EN to 0, after transfer using the settings of the descriptor is completed. If the setting of LE is 0, the Current registers are then updated and loading of the next descriptor begins. The TEND signal is issued after the transfer of each descriptor.

(2) Register Setting

(a) Link mode setting

To use the link mode, set 1 in the DMS bit of the CHCFG_n/nS register.

Table 9.12 Link Mode Setting

DMS (CHCFG_n/nS)	Description
1	Operates in link mode. This bit cannot be changed using a descriptor.

(b) Link address setting

There are two registers that indicate a link address: Next Link address register and Current Link address register.
To start the link mode, set a link address in the Next Link address register.
The Next Link address indicates the next link address after a descriptor is loaded. The Current Link address indicates the currently executed link address.

Table 9.13 Link Address Register Set

Register	Description
Next Link Address Register (NXLA_n/nS)	Sets and indicates the next link address. Before starting the link mode, set a link address in this register.
Current Link Address Register (CRLA_n/nS)	Indicates the currently executed link address. This register is read-only.

<Caution> In link mode, the settings can be changed by reading a descriptor. It is not possible, however, to synchronize the change of the settings with a peripheral module request or external request. Therefore, when using a peripheral module request or external request, set AM, LVL, HIEN, LOEN, and SEL of the CHCFG_n/nS register before setting Enable and do not change any of these bits in the descriptor.

(3) Descriptor Setting

In a link address, prepare a descriptor with data arranged in the order shown below.
The DMAC reads the descriptor in burst mode.

(a) Descriptor data arrangement

Table 9.14 Descriptor Data Arrangement

Address	Data	Remark
Link address + H'00	header	
Link address + H'04	Source Address	
Link address + H'08	Destination Address	
Link address + H'0C	Transaction Byte	
Link address + H'10	Config	The register mode cannot be set.
Link address + H'14	Interval	
Link address + H'18	Extension	
Link address + H'1C	Next Link Address	

Remark: As a link address, set an address aligned along the 32-bit boundary.

(b) header

The header indicates the status of the descriptor, as shown below.
The DMAC reads this area when a DMA transfer is started in link mode. Also, after a DMA transaction is completed, the DMAC writes back the transfer status to the area.

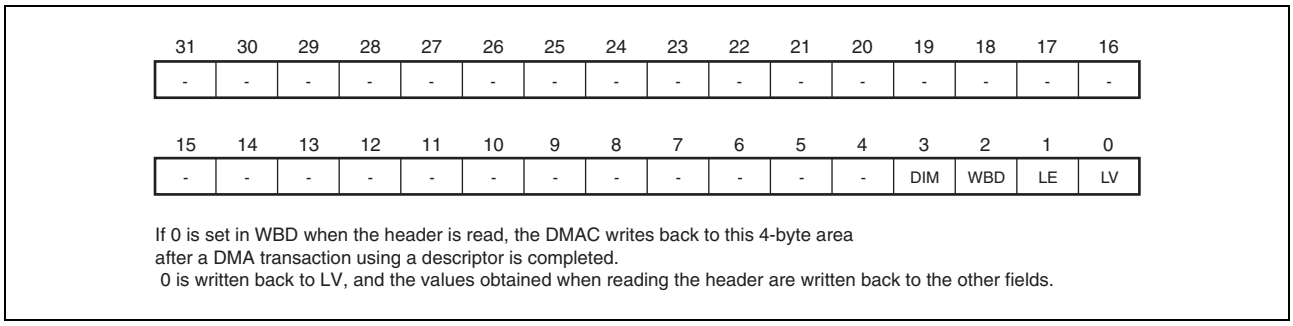

Figure 9.8 Header Area

Table 9.15 Header Area

Bit Position	Bit Name	Meaning
31 to 4	—	—
3	DIM	Descriptor Interrupt Mask Sets whether to mask the DMA transfer end interrupt if 0 is set in LV when the header is loaded. 0: Issues a DMA transfer end interrupt. 1: Does not issue a DMA transfer end interrupt.
2	WBD	Write Back Disable Sets whether to mask LV bit writeback. When 1 is set in this bit, the DMAC does not perform writeback. 0: Writes the LV bit back to 0. 1: Does not write back the LV bit.
1	LE	Link End Indicates whether the link ends with the DMA transaction of this descriptor. Set 1 in this bit to indicate the end of the link. 0: The link continues. 1: The link ends.
0	LV	Link Valid Indicates whether this descriptor is valid. If 0 is set in WBD, the DMAC writes 0 in this bit after the DMA transaction written in the descriptor is executed. When setting the header, set 1 in this bit. 0: Descriptor invalid 1: Descriptor valid

(c) Descriptor data other than the header

The data items of the descriptor other than the header are the same as defined in the internal register specifications (note that the DMS bit of the CHCFG_n/nS register cannot be changed using the descriptor). For information about the internal register specifications, see section 9.4, Register Descriptions.
For descriptor setting examples, see section 9.8, DMA Setting Examples.

(d) CACHE settings for descriptor access

The CACHE settings for descriptor access can be set in LWCA and LDCA of the DMA control register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S). Make these settings as appropriate for the access destination in which the descriptor is prepared.

(e) Descriptor area and DMA transfer area

The following figure outlines the descriptor area and DMA transfer area that are accessed by the DMAC.

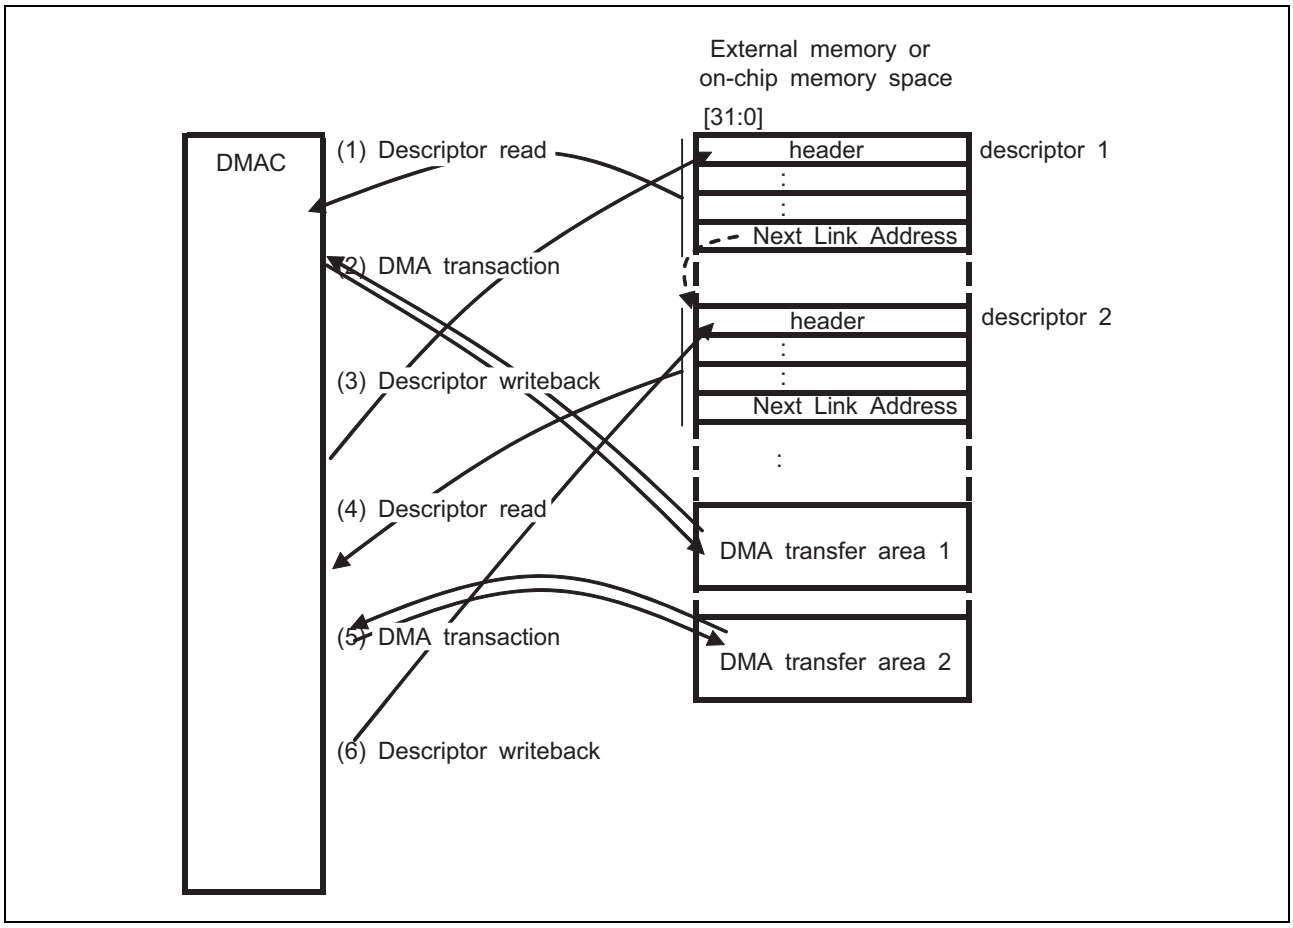

Figure 9.9 Outline of the Descriptor Area and DMA Transfer Area

1. Descriptor read
   The values set in the internal Next Link Address register are loaded to the Current Link Address register, and a descriptor is read from the external memory space (descriptor1) pointed to by the Current Link Address register.
2. DMA transfer
   When 1 is set in the LV bit of the header in the descriptor, a DMA transfer is executed according to the descriptor data.
3. Descriptor writeback
   When 0 is set in the WBD bit of the header after the DMA transfer of the set number of bytes is completed, the DMAC writes back data in word size to the header of descriptor1, with 0 set in LV and the other bits containing the values read in <1>.
4. Descriptor read
   When 0 is set in the LE bit of the header in the last read descriptor (<1>), the next descriptor is read from the address (descriptor2) indicated by Next Link Address in the descriptor.
5. DMA transfer
   When 1 is set in the LV bit of the header in the descriptor, a DMA transfer is executed according to the descriptor data.
6. Descriptor writeback
   When 0 is set in the WBD bit of the header after the DMA transfer of the set number of bytes is completed, the DMAC writes back data in word size to the header of descriptor2, with 0 set in LV and the other bits containing the values read in <4>.

4 through 6 are repeated.
When the header contains 1 in LE and 0 in WBD, the DMAC executes a DMA transfer using the settings of that descriptor, writes back data with 0 set in the LV bit of the header and ends the operation.
When the header contains 1 in both LE and WBD, the DMAC executes a DMA transfer using the settings of that descriptor and ends the operation (without writing back).
When the header contains 0 in LV, the DMAC ends the operation (without executing a DMA transfer).

(4) Descriptor Configuration Examples

In link mode, a descriptor can be configured as shown below.

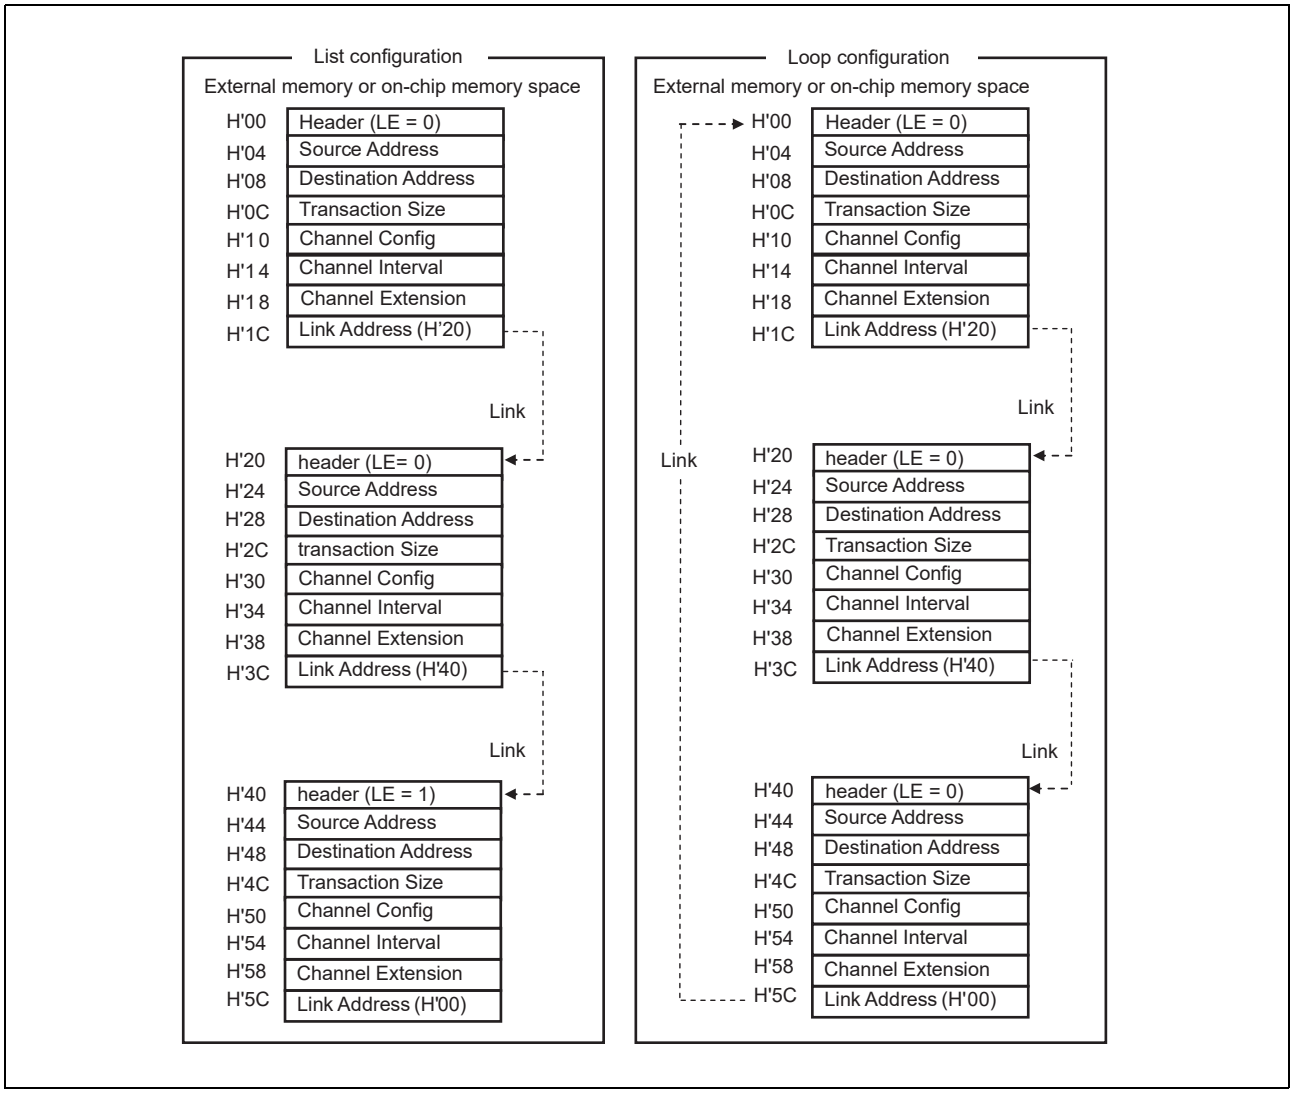

Figure 9.10 Descriptor Configuration Examples

- List configuration
  The link is ended by setting 1 in the LE bit of the header in the last descriptor.

- Loop configuration
  A descriptor can be created with a loop configuration, by setting the address of the top descriptor in the link address of the last descriptor. To end the loop, change the value of the LE bit of the header to 1 before the DMAC reads the descriptor, or follow the transfer suspension procedure.

9.7 DMA Transfer

The basic operation of DMA transfer is described here.

9.7.1 Transfer Mode

Two transfer modes are supported: single transfer mode and block transfer mode.
To select a transfer mode, set the TM bit of CHCFG_n/nS for each channel.

Table 9.16 Basic Transfer Setting

Transfer Mode	TM (CHCFG_n/nS)	Function
Single transfer	0	A single DMA transfer is executed in response to a DMAREQ.
Block transfer	1	In response to a DMAREQ, the DMAC continues to execute the transfer until the DMA transaction is completed.

(1) Single Transfer Mode

When a DMA transfer request is received, a DMA transfer is executed once in the direction indicated by REQD (source or destination). A DMA transfer is executed once each time a transfer request is received, and this operation continues until the number of bytes loaded to CRTB_n/nS is reached (arbitration between channels is accomplished for each DMA transfer).

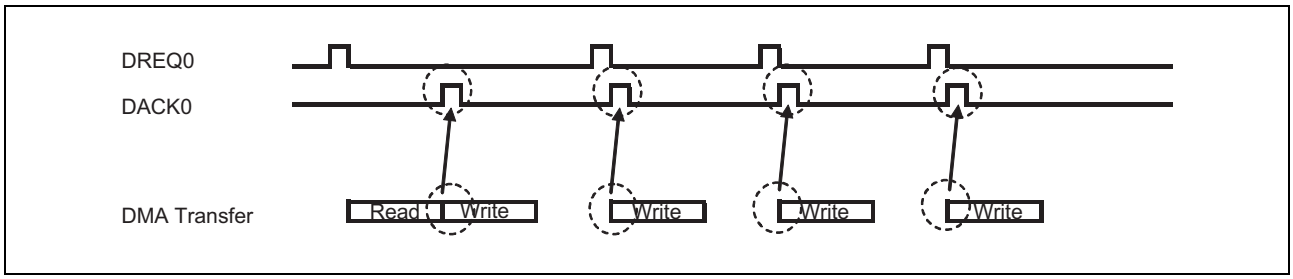

Figure 9.11 Single Transfer Mode (REQD = 1, SDS > DDS)

(2) Block Transfer Mode

Once a DMA transfer request is received, the DMAC continues to execute the transfer until data equivalent to the number of bytes loaded to the DMA transfer byte register (CRTB_n/nS register) is transferred (the DMA transaction is completed) (arbitration between channels is accomplished for each DMA transfer).

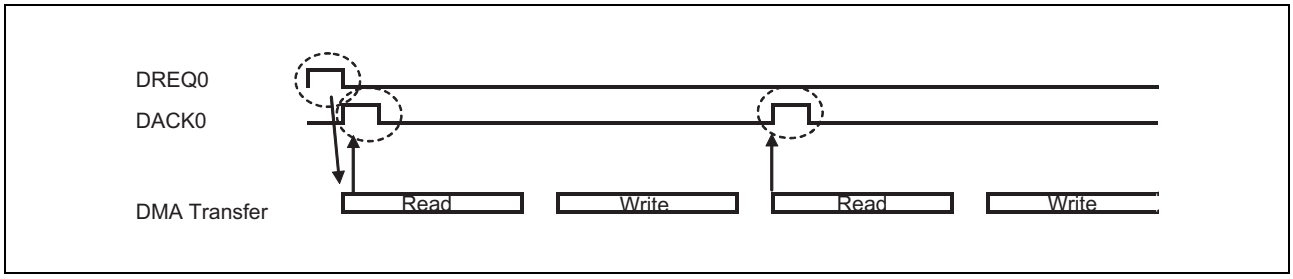

Figure 9.12 Block Transfer Mode (REQD = 0, SDS < DDS)

9.7.2 Priority Control for DMA Channels

Within channels 0 to 7 and 8 to 15, two priority control modes are supported: fixed priority mode and round robin mode. Only round robin mode is supported for priority control between the group of channels 0 to 7 and the group of channels 8 to 15. To select a priority control mode, use the PR bit of the DMA control register (DCTRL register). The fixed priority mode is selected when 0 is set in the PR bit, and the round robin mode is selected when 1 is set.
Read priority and write priority are controlled independently.
The DMAC issues transfer requests to different channels concurrently without waiting for the completion of any particular transfer and processes responses in the order it receives them. Therefore, the order in which the channels start transactions is not necessarily consistent with the order in which the transactions end.

Table 9.17 Priority Control Setting

Mode	PR (DCTRL)	Function	Purpose
Fixed priority	0	Requests are controlled based on the fixed order of priority for channels 0 to 7 and 8 to 15 (High: CH0 (CH8) > CH1 (CH9) > CH2 (CH10) > CH3 (CH11) > CH4 (CH12) > CH5 (CH13) > CH6 (CH14) > CH7 (CH15): Low).	Use this mode when the channels have a specific order of priority.
Round robin	1	Requests are controlled in a round robin fashion.	Use this mode to execute all requests evenly.

(1) Fixed Priority Mode

In fixed priority mode, the channels have a fixed order of priority in channels 0 to 7 and 8 to 15. Round robin mode is used to determine the priority between the group of channels 0 to 7 and the group of channels 8 to 15.

Immediately after a reset, the order of priority is as follows.
High CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15 Low

If there is a transfer request from DMA channel 0 in this state, a transfer is executed on DMA channel 0. After the transfer is completed, the order of priority is as follows.
High CH8 > CH0 > CH9 > CH1 > CH10 > CH2 > CH11 > CH3 > CH12 > CH4 > CH13 > CH5 > CH14 > CH6 > CH15 > CH7 Low

If a DMA transfer request occurs on multiple channels simultaneously, the DMA transfer request of the channel having the smallest channel number is given priority. The following figure shows an example where a DMA transfer request occurs on a channel having a higher priority while a DMA transfer is being executed in fixed priority mode.

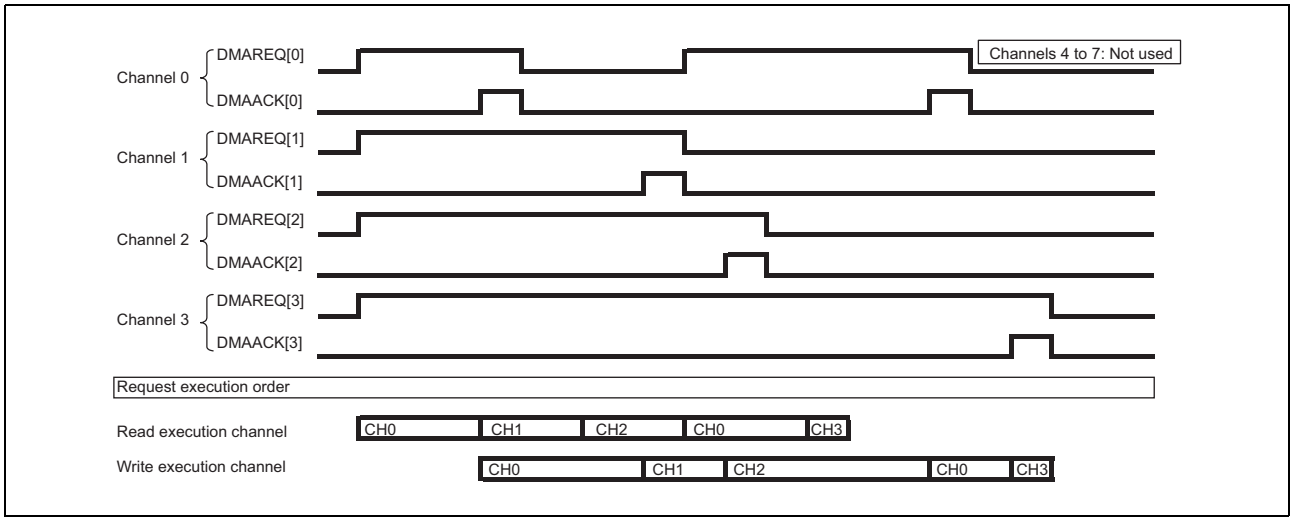

Figure 9.13 Fixed Priority Mode (Number of Channels = 4, REQD = 1)

(2) Round Robin Mode

In round robin mode, each time a transfer request is received from a channel in the group of channels 0 to 7 and the group of channels 8 to 15, the order of priority is changed in such a way that the channel that executed a transfer last has the lowest priority.
Round robin mode is used to determine the priority between the group of channels 0 to 7 and the group of channels 8 to 15.

Immediately after a reset, the order of priority is the same as that of the fixed priority mode, which is as follows.
High CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15 Low

If a transfer request is received from DMA channel 2 in this state, a transfer is executed on DMA channel 2. After the transfer is completed, the order of priority is as follows.
High CH8 > CH3 > CH9 > CH4 > CH10 > CH5 > CH11 > CH6 > CH12 > CH7 > CH13 > CH0 > CH14 > CH1 > CH15 > CH2 Low

The following figure shows an example where DMA transfers are executed in round robin mode.

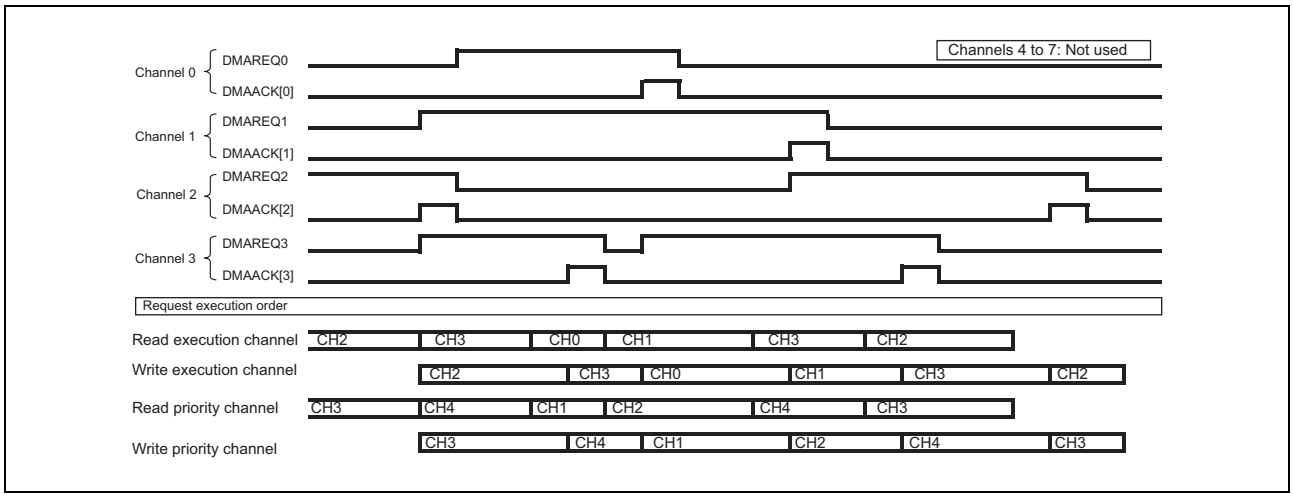

Figure 9.14 Round Robin Mode (Number of Channels = 4, REQD = 0)

The channel whose channel number is the number of the currently transferring channel + 1 gets to execute a DMA transfer next. If there is no transfer request from this channel, the channel whose channel number is the number of this channel + 1 gets to execute a DMA transfer.

9.7.3 Number of States of an External Bus Cycle

When this module is the bus master, the number of states of an external bus cycle is controlled by the bus state controller as when the CPU is the bus master. For details, refer to section 8, Bus State Controller.

9.7.4 DMA Transfer Request

Edge detection or level detection can be selected using the LVL bit of the CHCFG_n/nS register.
The HIEN and LOEN bits of the CHCFG_n/nS register are used to select either the rising edge or falling edge in the case of edge detection or either the high level or low level in the case of level detection.
When the transfer request is by an on-chip peripheral module, set the CHCFG_n/nS register according to Table 9.4.
When the transfer request is by the external pin (DREQ0), set the detection conditions (rising/falling edge and high/low level) according to Table 9.18.

Table 9.18 Setting for Detection of External Pin Request

Mode	LVL (CHCFG_0/0S)	HIEN (CHCFG_0/0S)	LOEN (CHCFG_0/0S)	Function
Edge detection	0	0	0	Specify this value when auto request triggers are in use.
			1	Detects external pin request (DREQ0) at its falling edge.
		1	0	Detects external pin request (DREQ0) at its rising edge.
			1	Setting prohibited
Level detection	1	0	0	Setting prohibited
			1	Detects external pin request (DREQ0) in Low level mode.
		1	0	Detects external pin request (DREQ0) in High level mode.
			1	Setting prohibited

(1) Edge Detection

Setting 0 in the LVL bit of the CHCFG_n/nS register enables edge detection.
When 1 is set in the HIEN bit of the CHCFG_n/nS register, rising edge detection is enabled. When 1 is set in the LOEN bit, falling edge detection is enabled.
Wait for DACK0 to be detected, before issuing the next DREQ0 request.

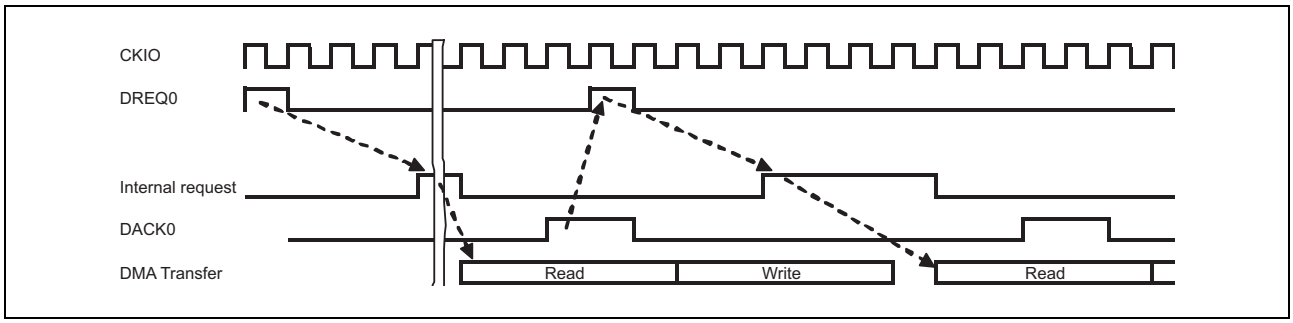

Figure 9.15 Edge Detection Timing (HIEN = 1, REQD = 0)

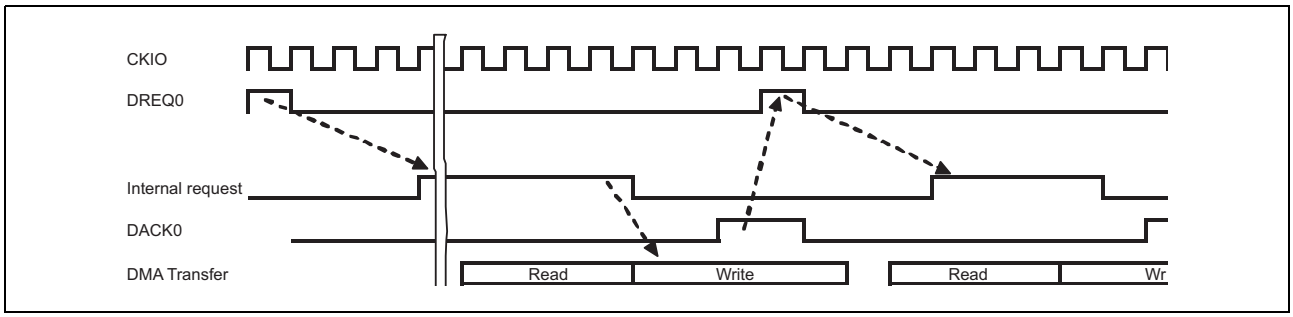

Figure 9.16 Edge Detection Timing (HIEN = 1, REQD = 1)

(2) Level Detection

Setting 1 in the LVL bit of the CHCFG_n/nS register enables level detection.
DREQ0 is regarded as valid when it remains active for two consecutive clock cycles or more (depending on the HIEN and LOEN settings).
When the level mode is selected for DACK0, it remains at the High level until DREQ0 is deasserted.
When the next DMA transfer request is to be issued, DACK0 needs to be deasserted before that DREQ0 can be asserted.

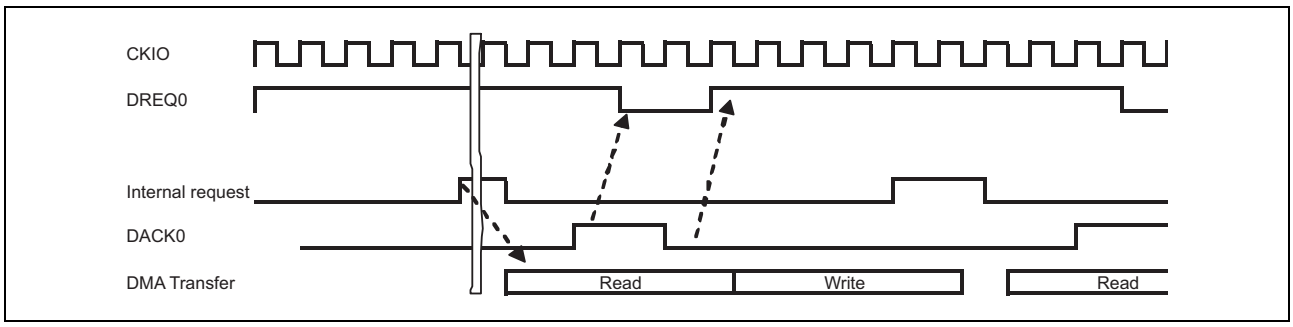

Figure 9.17 Level Detection Timing (HIEN = 1, REQD = 0, AM[2:0] = 001)

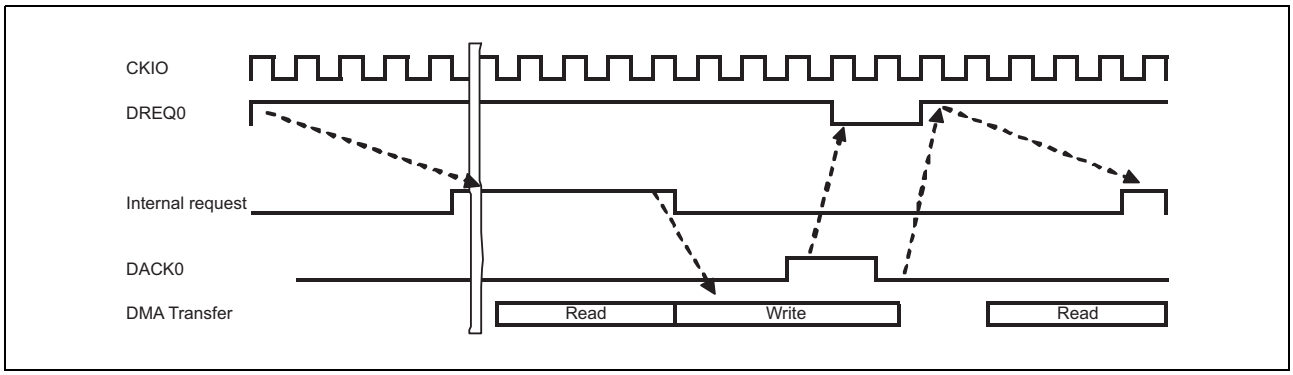

Figure 9.18 Level Detection Timing (HIEN = 1, REQD = 1, AM[2:0] = 001)

9.7.5 DMA Acknowledge Output Function

DACK0 is an acknowledge signal that is sent to DREQ0. Level output and bus cycle output settings are supported as the DACK0 output mode. DACK0 is asserted at the same time as CS# assertion except for the MPX-IO interface. For details, refer to section 8, Bus State Controller.

(1) DMA Acknowledge Signal Output Timing Setting

Upon receiving a DMA transfer request, the DACK0 pin becomes active (High level output). By using the REQD and AM[2:0] bits of the CHCFG_n/nS register, the DACK0 output timing can be set as shown below.

Table 9.19 DACK0 Output Timing Setting

Mode	AM[2] (CHCFG_0/0S)	AM[1:0] (CHCFG_0/0S)	REQD (CHCFG_0/0S)	Purpose
Pulse	0	00	0	Setting prohibited
			1	
Level	0	01	0 (Active during read)	DACK0 is output as a level. DACK0 remains asserted until DREQ0 is deasserted.
			1 (Active during write)	
Bus cycle	0	10 11	0 (Active during read)	DACK0 is output for the duration of a bus cycle. Use this mode to keep DACK0 asserted until the end of the bus cycle.
			1 (Active during write)	
Mask	1	—	—	Make this setting when using auto request trigger or when performing the SCIFA transfer.

(2) Level Output

Setting 001 in the AM bits of the CHCFG_n/nS register enables level output. DACK0 remains asserted until DREQ0 is deasserted.

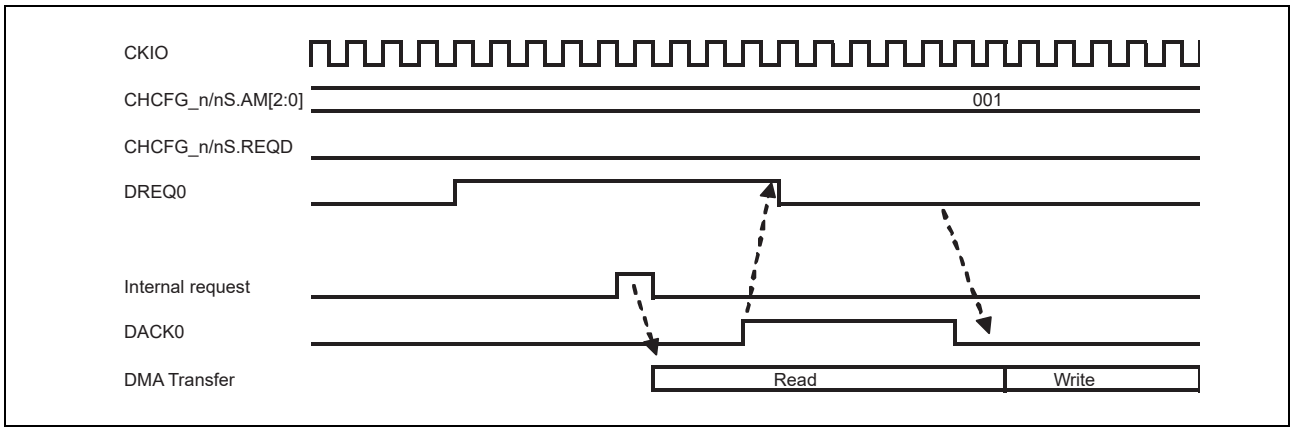

Figure 9.19 DACK0 Output Timing (AM[2:0] = 001, REQD = 0)

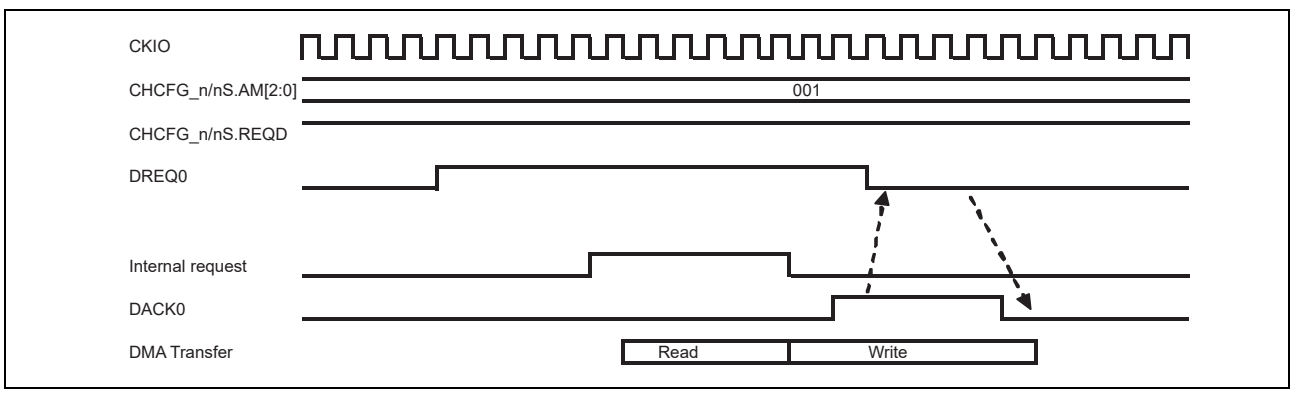

Figure 9.20 DACK0 Output Timing (AM[2:0] = 001, REQD = 1)

(3) Bus Cycle Output

Setting 010 in the AM bits of the CHCTRL_n/nS register enables bus cycle output. DACK0 remains active for the duration of a bus cycle.

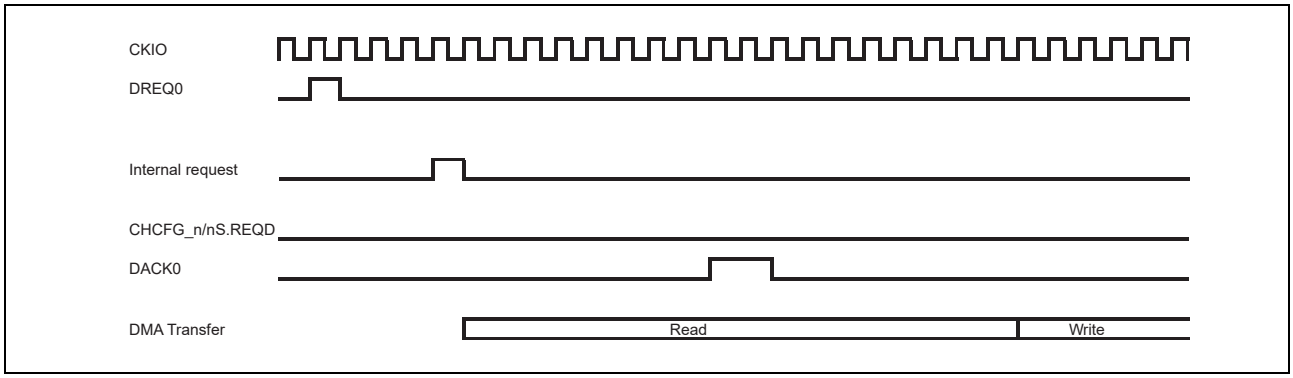

Figure 9.21 Bus Cycle Output Timing (REQD = 0)

- In the read active mode (REQD = 0), DACK0 remains active from the time when a read request is output on the bus until one cycle after the final read data.
- When level detection is selected for DREQ0, DREQ0 remains disabled until the cycle following the end of the bus cycle.

The following signals trigger the rise and fall of DACK0:
Rise: Transfer start (MARVALID = 1)
Fall: Transfer end (MRLAST & MRREADY = 1)

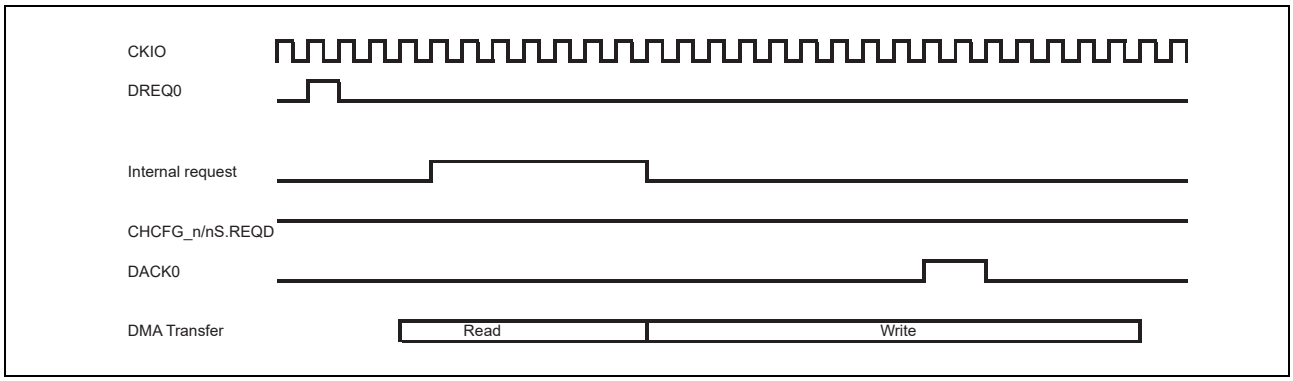

Figure 9.22 Bus Cycle Output Timing (REQD = 1)

- In the write active mode (REQD = 1), DACK0 remains active from the time when a write request is output until one cycle after the response to the final data is returned.
- When level detection is selected for DREQ0, DREQ0 remains disabled until the cycle following the end of the bus cycle.

The following signals trigger the rise and fall of DACK0:
Rise: Transfer start (MAWVALID = 1)
Fall: Transfer end (MBVALID & MBREADY = 1)

9.7.6 DMA Transfer End Output Function

TEND0 is a transaction completion signal that is sent to the source of a DMA transfer request. TEND0 is asserted as the same time as DACK0 for the last transfer transaction. Figure 9.23 shows the TEND0 output timing.

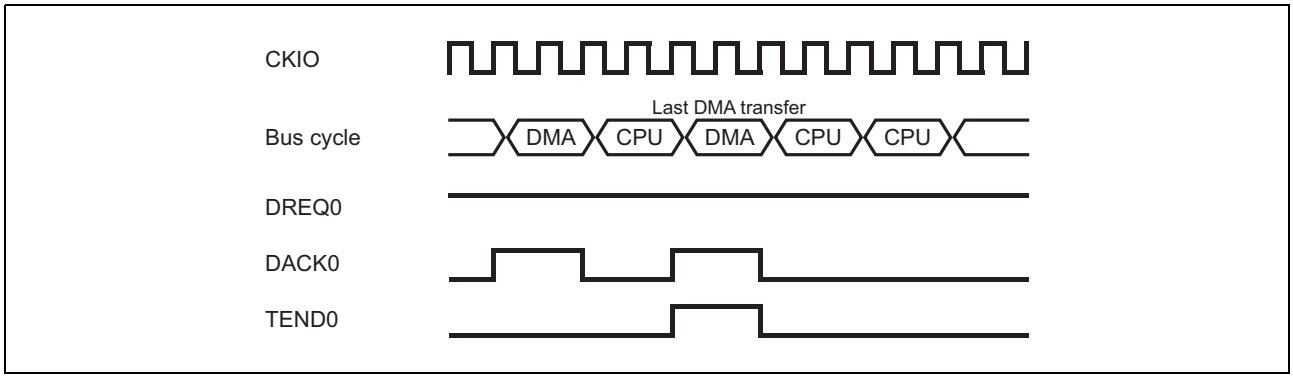

Figure 9.23 TEND0 Output Timing

9.7.7 DMA Transfer End Interrupt

The DMA transfer end interrupt is an interrupt request signal that indicates that a DMA transaction is completed.
There is an independent DMA transfer end interrupt for each channel.
When the transfer of data equivalent to the total transfer byte count loaded to the CRTB (Current Transaction Byte) is completed, 1 is set in END of the CHSTAT_n/nS register. In this case, when 0 is set in DEM of the CHCFG_n/nS register, the DMA transfer end interrupt is output (n = 0 to 15). (When writeback is performed in link mode, the signal is output after the writeback operation.)
When 0 is set in LV of the header in the read descriptor in link mode, 1 is set in DER of the CHSTAT_n/nS register. In this case, when 0 is set in DIM of the header, the DMA transfer end interrupt is output.

Table 9.20 Assertion Conditions of DMA Transfer End Interrupt

Source	Condition	DMA Transfer End Interrupt Mask Signal
DMA transaction end	When the transfer of data equivalent to the total transfer byte count loaded to the CRTB (Current Transaction Byte) is completed with an OKAY response (or after the writeback operation when writeback is performed in link mode)	DEM bit of the CHCFG_n/nS register
Descriptor invalid	When 0 is set in LV of the header in the read descriptor in link mode while 0 is set in DIM of the header	DIM bit of the header

9.7.8 DMA Error Interrupt

If an error response is received for a DMA transfer or descriptor access, the DMAC regards it as an error and stops the transfer. Upon receiving an error response, the EN bit of the CHSTAT_n/nS register of transferring channel n is cleared to 0 and 1 is set in the ER bit (n = 0 to 15). Also, the DMA error interrupt is output.
The DMA error interrupt cannot be masked.
Once an error occurs, the data of the whole transfer cannot be guaranteed. Be sure to start the transaction again from the beginning by following the procedure below.

1. Set 1 in the SWRST bit of the CHCTRL_n/nS register.
2. Set each register again.

9.7.9 Interval Count Function

The interval at which a DMA transfer is executed can be adjusted by setting the ITVL bit of the channel interval register (CHITVL_n/nS). This function is intended to prevent the DMA controller from occupying the bus all the time.
When a read or write operation is completed, a countdown starts from the value set in CHITVL_n/nS. The next internal request is not executed until the count value reaches 0.
The following figure shows an example of how this works.

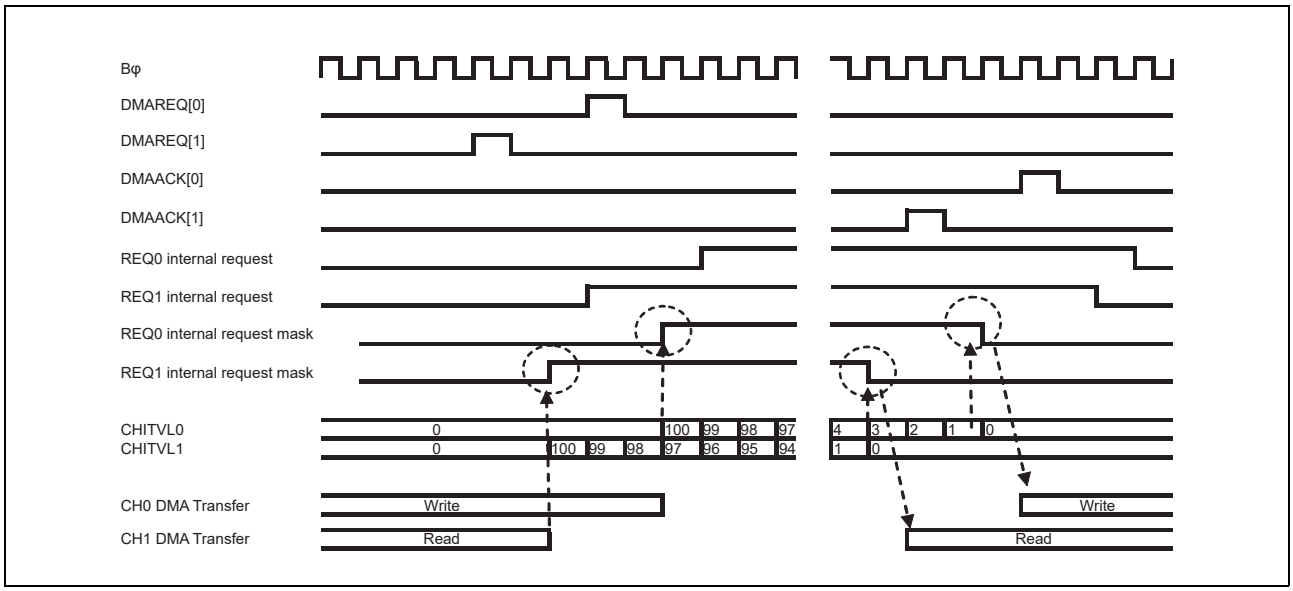

Figure 9.24 Interval Count

9.7.10 Difference in Operation Due to the Transfer Size

(1) When the Source Transfer Size Is Smaller

When the read of data equivalent to the destination data size is completed, the data is written to the destination.
The following figure shows a timing chart where the source transfer size is 8 bits and the destination transfer size is 32 bits (in the case of rising edge detection).

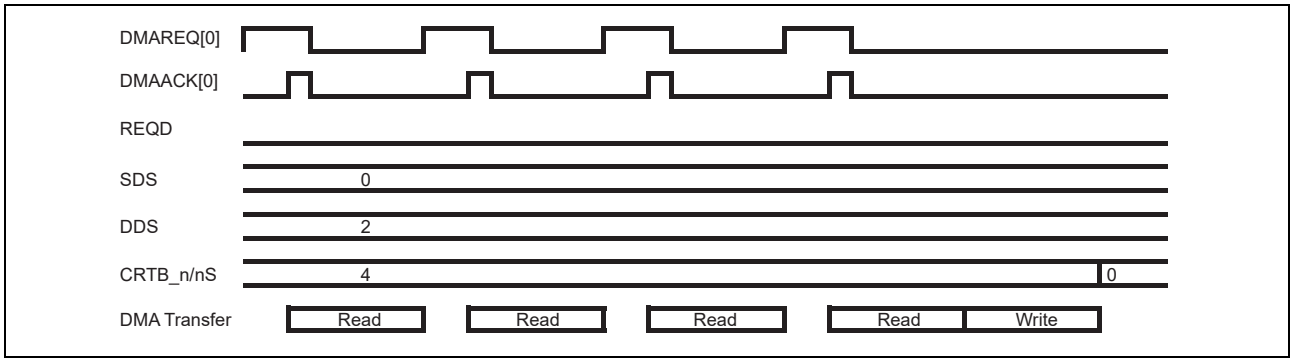

Figure 9.25 When the Source Transfer Size Is Smaller (LVL = 0, HIEN = 1, REQD = 0, SDS < DDS in CHCFG_n/nS)

(2) When the Destination Transfer Size Is Smaller

Since the source transfer size is larger, multiple destination writes occur after a single source read. The following figure shows a timing chart where the source transfer size is 64 bits and the destination transfer size is 16 bits (in the case of rising edge detection) (1 is set in REQD of the CHCFG_n/nS register).

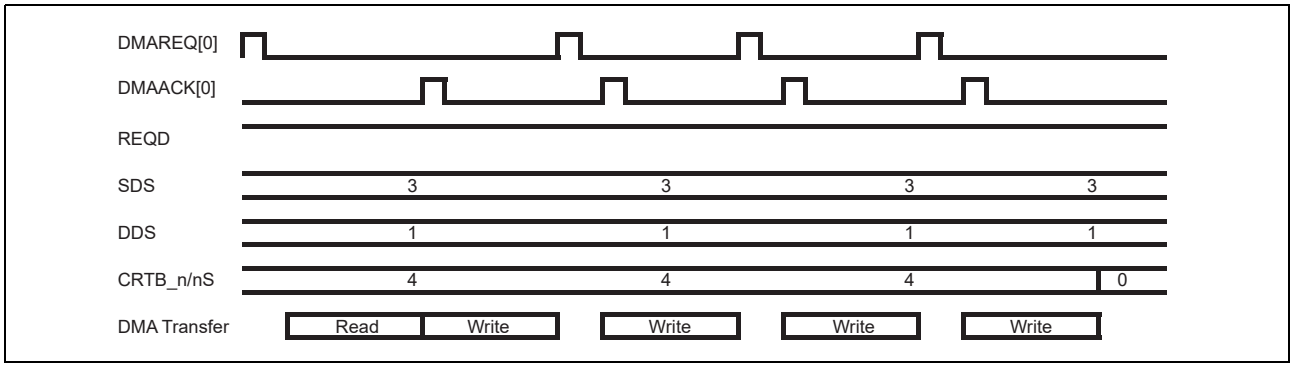

Figure 9.26 When the Destination Transfer Size Is Smaller (LVL = 0, HIEN = 1, REQD = 1, SDS > DDS in CHCFG_n/nS)

(3) When the Source Transfer Size Is the Same as the Destination Transfer Size

Every time a DMA transfer request is detected, a source read and a destination write occur.
The following figure shows a timing chart where the source transfer size and the destination transfer size are both 8 bits (in the case of rising edge detection, with 1 set in REQD of the CHCFG_n/nS register).

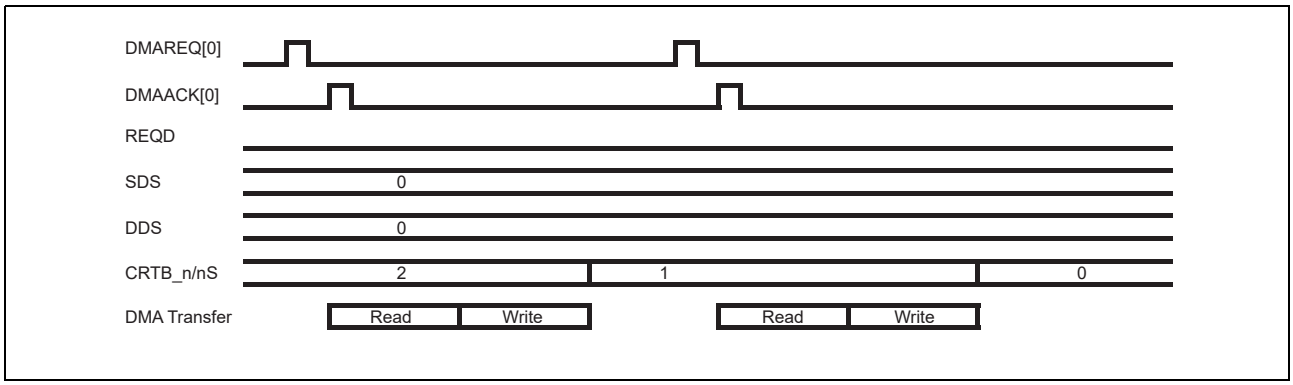

Figure 9.27 When the Source Transfer Size Is the Same as the Destination Transfer Size (LVL = 0, HIEN = 1, REQD = 0, SDS = DDS in CHCFG_n/nS)

9.7.11 Transfer Status

The channel status register indicates the status of DMA transfer execution on a channel.

(1) Suspend

A DMA transfer can be suspended by using the SETSUS bit of CHCTRL_n/nS. In this case, if an ongoing bus cycle exists, the DMAC waits for that cycle to end before suspending the transfer. Writing 1 in the CLRSUS bit restores the DMA transfer from the suspend status.

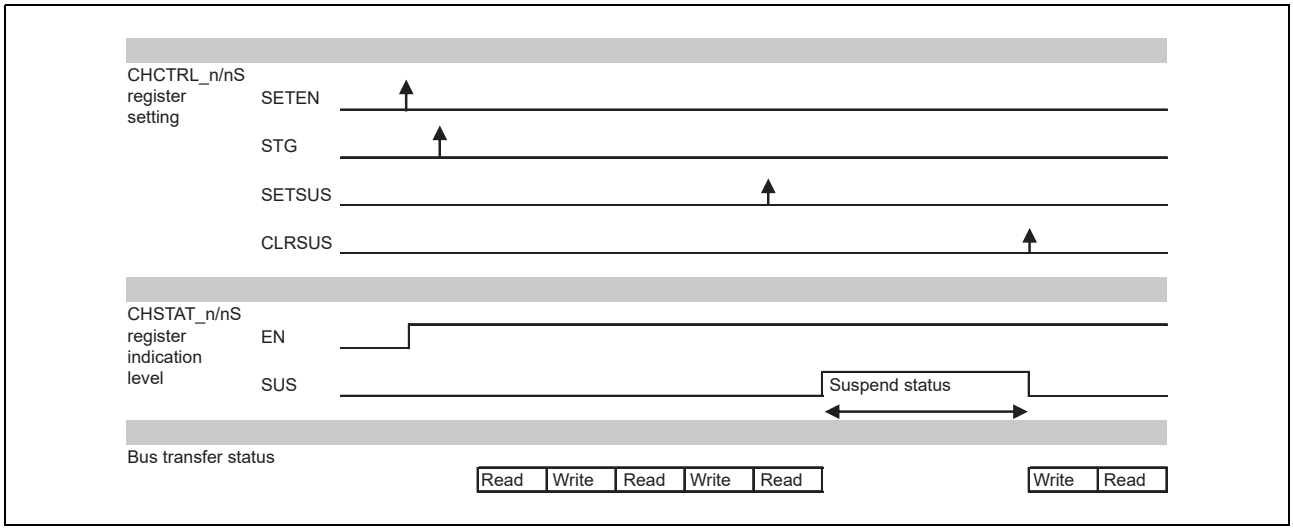

Figure 9.28 DMAC Suspend Status (Auto Request/Block Transfer)

In the above case, the DMA transfer is suspended after the read transfer is completed.
If there is any ongoing DMA transfer, the suspend status starts when that transfer is completed. To make sure that the transfer is suspended, read the CHSTAT or DSTAT_SUS register, after setting SETSUS, and check that 1 is set in the SUS bit for the relevant channel.

(2) Transfer Stop

If 1 is written to CLREN while a DMA transaction is in progress, the DMA transaction for the corresponding channel can be stopped. For the post-stop processing, two modes are supported: one sweeps out the data remaining in the buffer when the transaction is stopped (SBE = 1) and the other does not (SBE = 0). One of these modes can be selected using the SBE bit of the CHCFG_n/nS register. By default, SBE is set to 0.
When this sweep mode is enabled and CLREN is set to 1, and if a DMA transaction is stopped with data remaining in the DMAC buffer, the transaction is completed after the DMAC sweeps the data.

(a) Transfer Stop (Buffer Sweep Disabled - SBE = 0)

If 1 is set in CLREN during a DMA transfer, the DMA transfer is stopped. The stop timing depends on the value set in REQD. After stopping a DMA transfer, be sure to set 1 in SWRST to clear the DMA internal status before setting the next transfer.

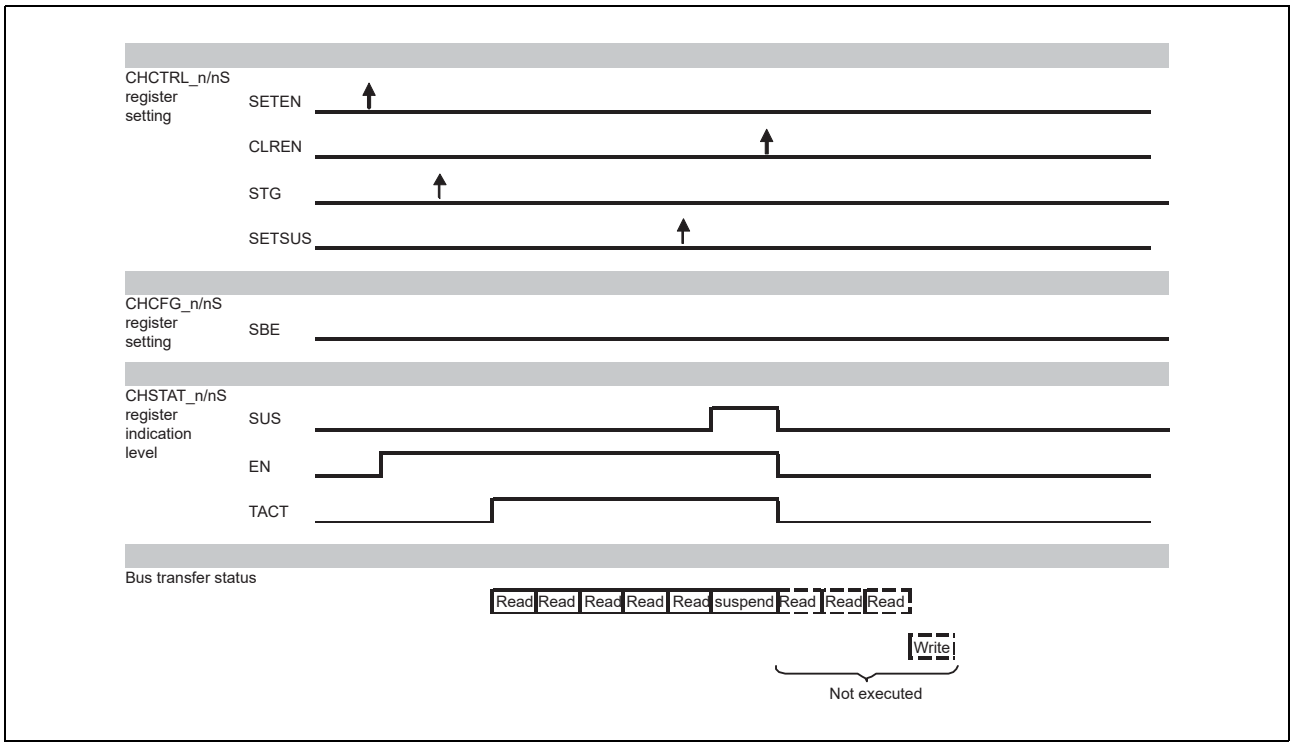

Figure 9.29 DMAC Transfer Stop

- The setting of the TACT bit being 0 indicates that the channel has been brought to a complete stop.
- If an ongoing DMA transfer is stopped before it is completed, the DMA transfer end interrupt is not asserted.
- If 0 is set in REQD, the DMA transfer is stopped when the next read is completed. (If the buffer contains any data that can be written, the DMA transfer is stopped after the data is written.)
- If 1 is set in REQD, the DMA transfer is stopped when the next write is completed.

(b) Transfer Stop (Buffer Sweep Enabled - SBE = 1)

If 1 is set in CLREN during a DMA transfer, the DMA transfer is stopped. When 0 is set in REQD, the DMA transfer is stopped after the DMAC sweeps (writes) the already read data. If 1 is set in REQD to use hardware requests, do not use the sweep mode. After stopping a DMA transfer, be sure to set 1 in SWRST to clear the DMAC internal status before setting the next transfer.

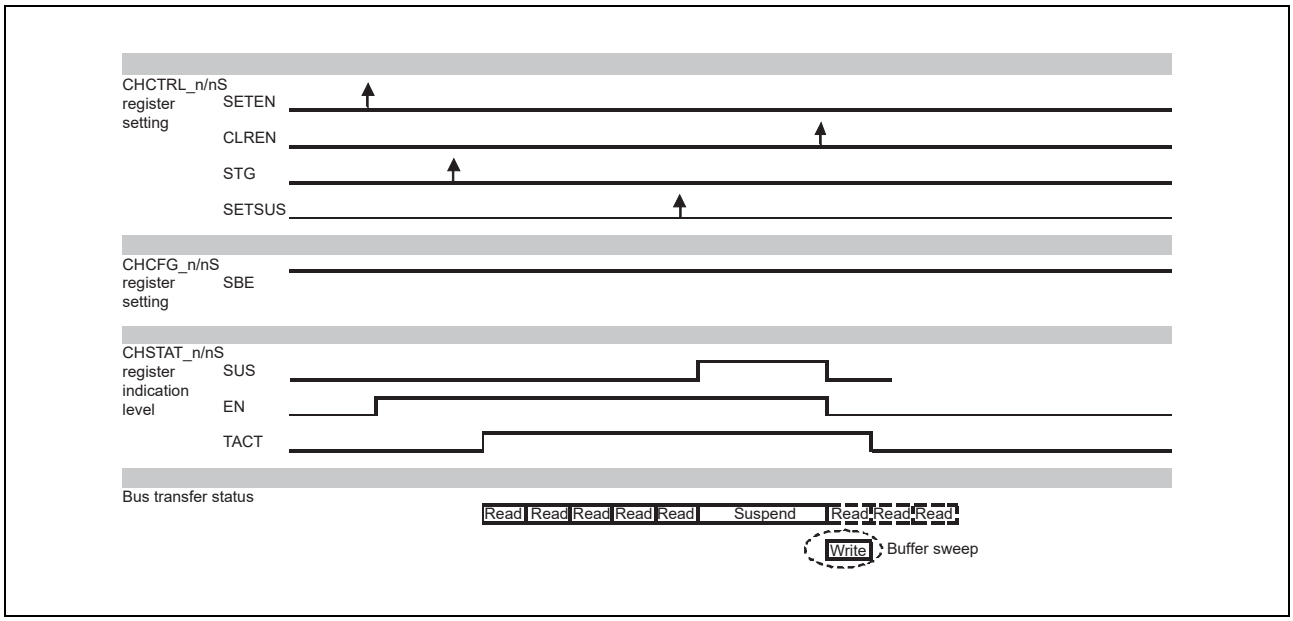

Figure 9.30 DMA Transfer Stop (Buffer Sweep Mode)

- The setting of the TACT bit being 0 indicates that the channel has been brought to a complete stop.
- If a transfer is stopped in sweep mode (SBE = 1) during the fifth read transfer by setting SETSUS and then CLREN, the read data is written before the DMA transfer is stopped.

(c) Channel Stop Check Method

Even when the EN bit is cleared to 0, the DMA transfer cannot be stopped immediately, if the bus is already executing the transfer. Therefore, in order to make sure that the DMAC has been brought to a complete stop, check that the EN bit and TACT bit are both set to 0.

(d) Transfer Stop Procedure

The transfer stop procedure is described below.

1. Set 1 in SETSUS of CHCTRL_n/nS.
2. Repeat polling until the SUS bit of CHSTAT_n/nS is set to 1. (If EN is already set to 0, the DMAC has already been stopped. Go to step 6.)
3. Set 1 in CLREN of CHCTRL_n/nS.
4. When 0 is set in SBE, the transfer is stopped according to the value of REQD. When 1 is set in SBE, the sweep mode is enabled. When 1 is set in SBE, set 0 in REQD.
5. Read CHSTAT_n/nS to check that 0 is set in the TACT bit. When TACT is set to 0, it means that the DMAC has been brought to a complete stop. When TACT is set to 1, repeat polling until this bit is set to 0.
6. To execute the next DMA transfer after stopping a transfer, be sure to set 1 in the SWRST (software reset) bit of CHCTRL_n/nS before the next DMA transfer starts.

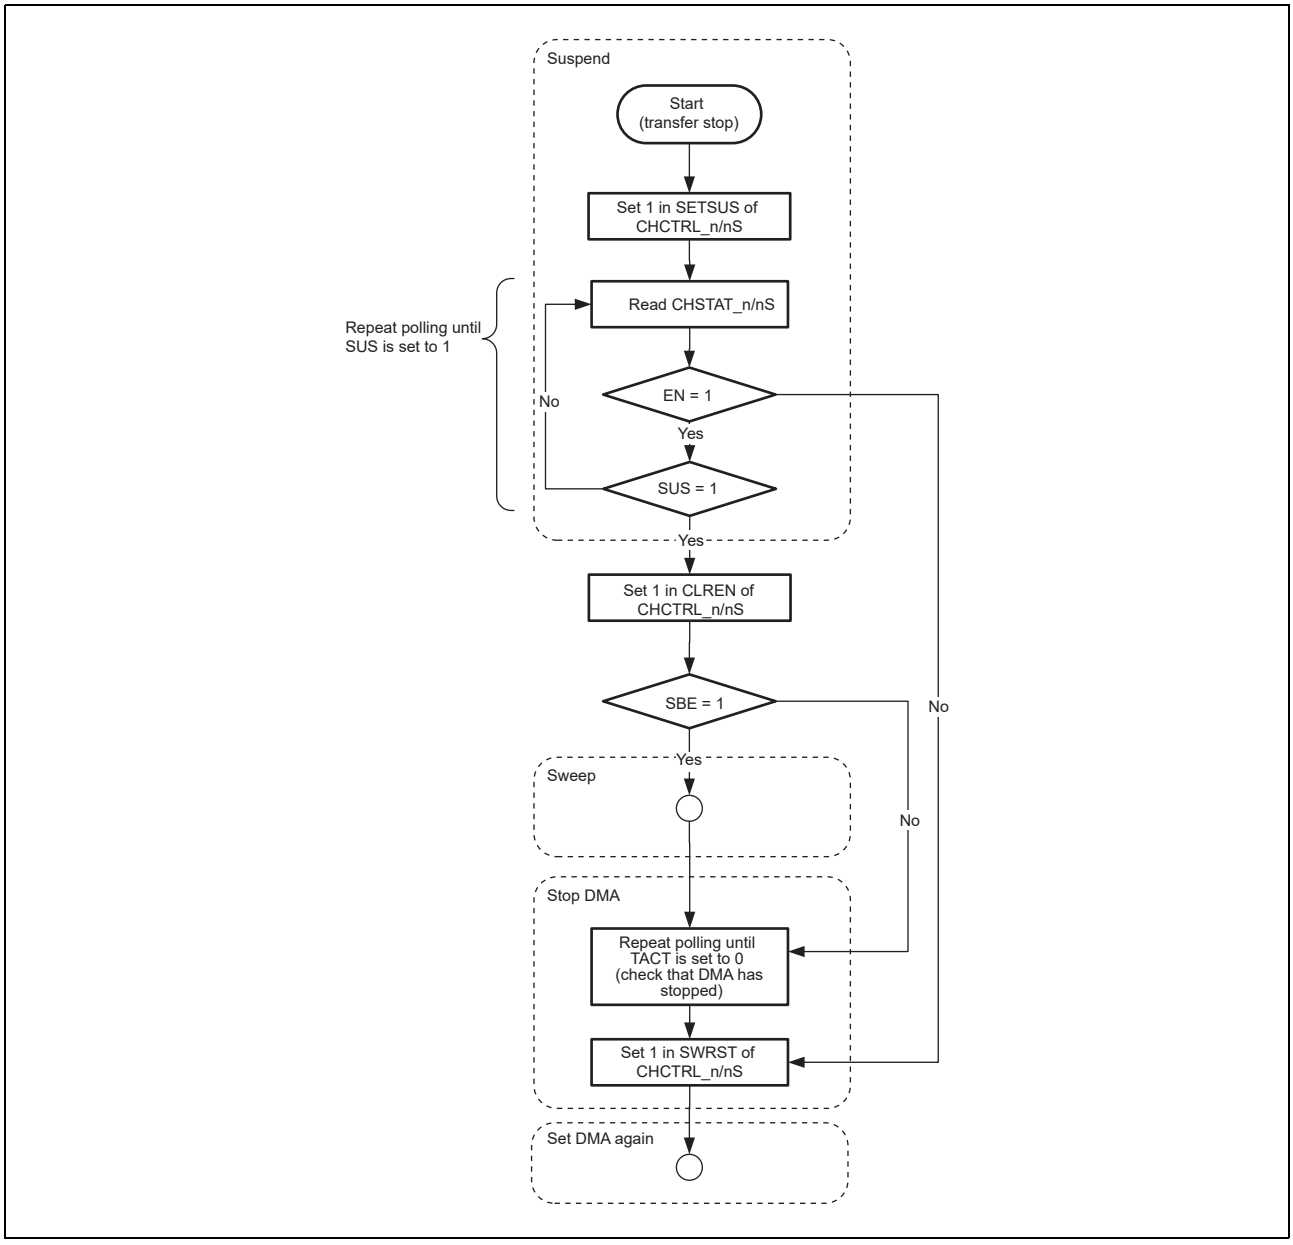

Figure 9.31 Transfer Stop Flow

9.8 DMA Setting Examples

Setting examples applicable when DMA transfer is executed using the direct memory access controller are shown in the following.
The transfer conditions for these setting examples are as follows.

Table 9.21 Transfer Condition List for DMA Transfer Setting Examples

	DMA Mode	Transfer Mode	Transfer Request
Setting example 1	Register	Single	Hardware
Setting example 2	Register	Block	Software
Setting example 3	Register (continuous execution)	Block	Software
Setting example 4	Link	Block	Software

For details of the settings, see the individual setting examples.

9.8.1 Setting Example 1 (Register Mode/Hardware Request)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 9.22 DMA Transfer Setting Example 1

Item		Description	
Channel used		3	
DMA mode		Register	
Transfer mode		Single transfer	
Register set used		Next0	
Source/destination		Source	Destination
	Start address	H'11110000	H'22220000
	Address direction	Increment	Increment
	Data size	32 bits	32 bits
DMA transfer byte count		64 bytes	
DMA transfer request		Rising edge detection by hardware	
DMAACK signal		Level output during read	
DMA transfer end interrupt mask		Not masked	
CACHE setting		Default value	

Setting example 1

N0SA = H'11110000 (source address)
N0DA = H'22220000 (destination address)
N0TB = H'00000040 (transfer byte count)

CHCFG = H'00022123 (configuration)
CHITVL = H'00000000 (interval)
CHEXT = H'00000000 (CACHE setting)

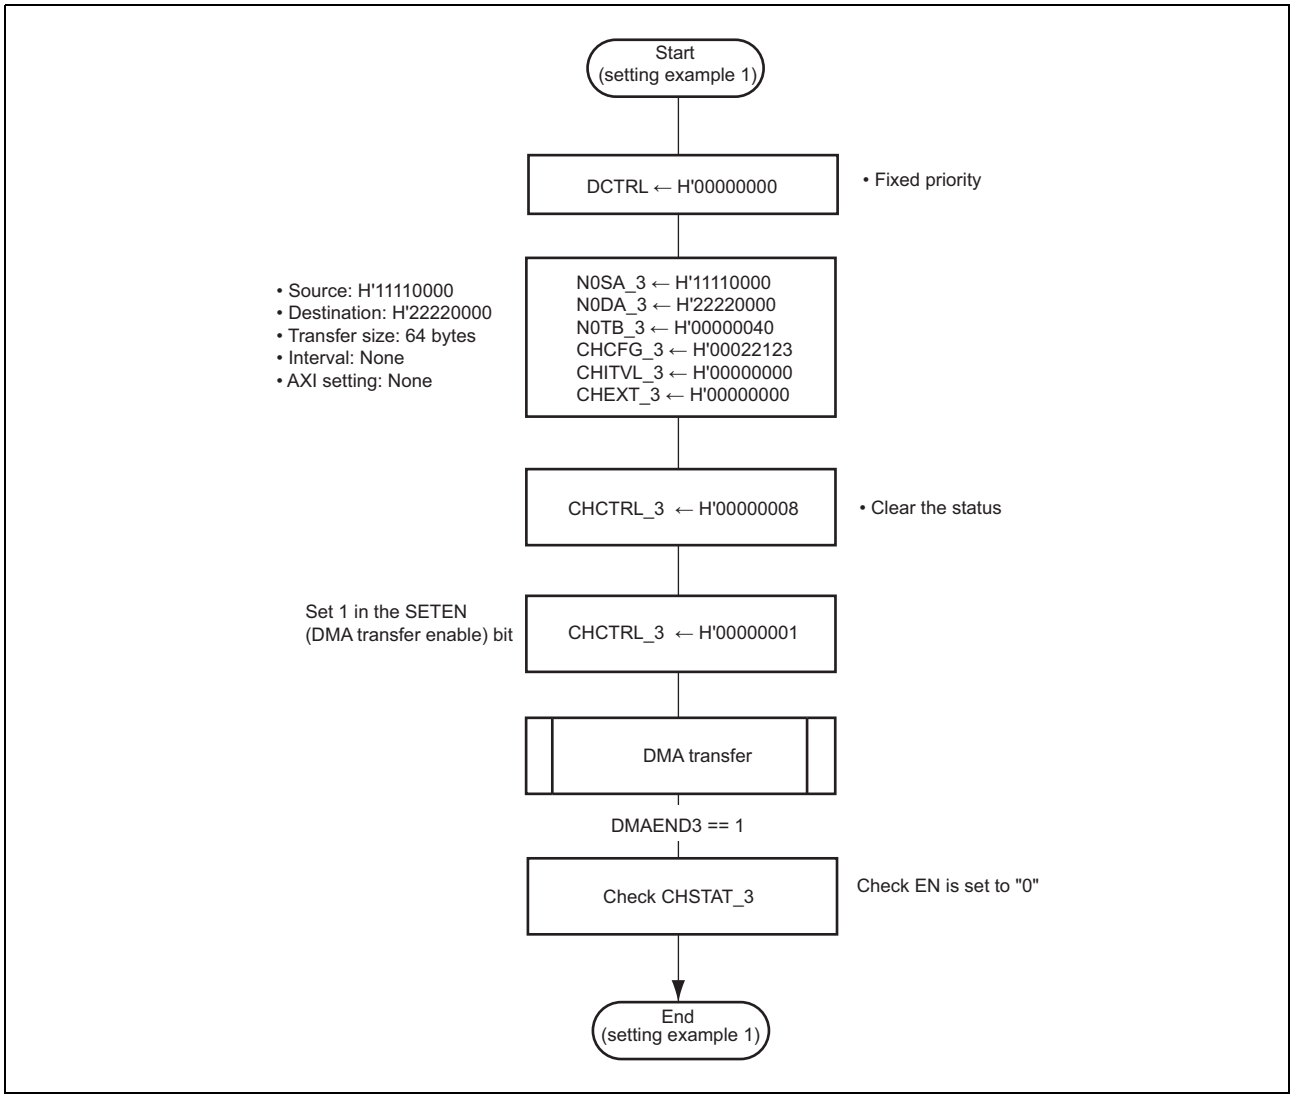

Figure 9.32 Setting Example 1

9.8.2 Setting Example 2 (Register Mode/Software Request)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 9.23 DMA Transfer Setting Example 2

Item		Description	
Channel used		2	
Priority control		Round robin	
DMA mode		Register	
Transfer mode		Block transfer	
Register set used		Next1	
Source/destination		Source	Destination
	Start address	H'0FFFE000	H'33330000
	Address direction	Increment	Increment
	Data size	8 bits	256 bits
DMA transfer byte count		128 bytes	
DMA transfer request		Auto request	
DMAACK signal		Masked	
DMA transfer end interrupt mask		Not masked	
CACHE setting		Default value	

Setting example 2

DCTRL = H'00000001 (DMA setting)

N1SA = H'0FFFE000 (source address)
N1DA = H'33330000 (destination address)
N1TB = H'00000080 (transfer byte count)

CHCFG = H'10450402 (configuration)
CHITVL = H'00000000 (interval)
CHEXT = H'00000000 (CACHE setting)

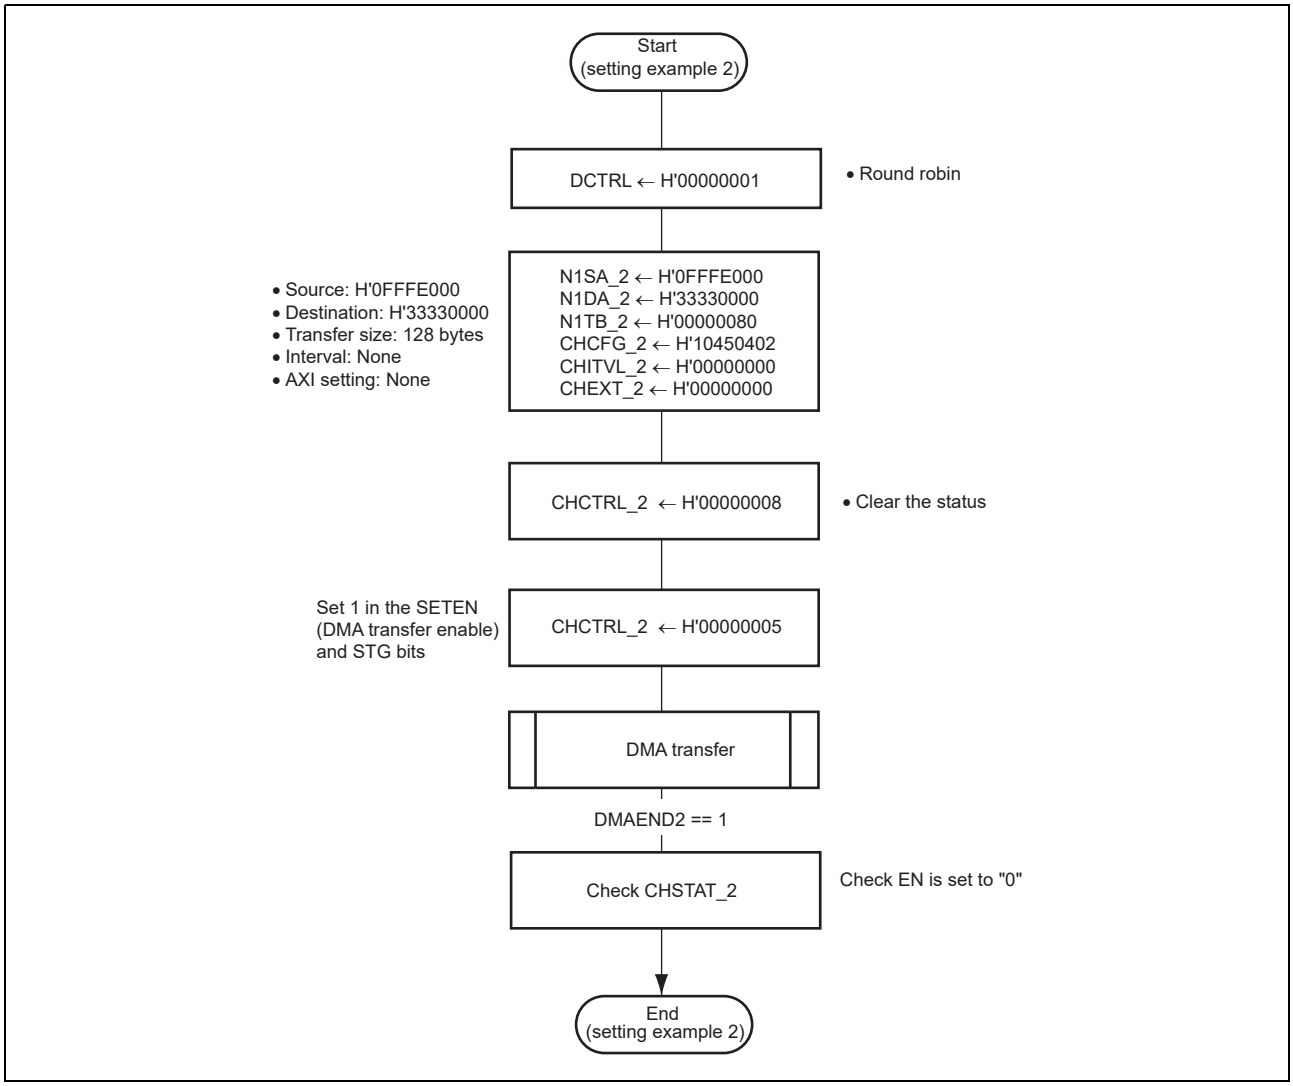

Figure 9.33 Setting Example 2

9.8.3 Setting Example 3 (Register Mode/Continuous Execution)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 9.24 DMA Transfer Setting Example 3

Item		Description	
Channel used		1	
Priority control		Round robin	
DMA mode		Register	
Transfer mode		Block transfer	
Register set used		Use Next0 and then Next1 continuously	
Next0		Source	Destination
	Start address	H'11110000	H'33330000
	Address direction	Fixed	Fixed
	Data size	32 bits	512 bits
	DMA transfer byte count	512 bytes	
Next1		Source	Destination
	Start address	H'22220000	H'44440000
	Address direction	Fixed	Fixed
	Data size	32 bits	512 bits
	DMA transfer byte count	2048 bytes	
DMA transfer request		Auto request	
DMAACK signal		Not output	
DMA transfer end interrupt mask		Mask the DMA transfer end interrupt upon completion of Next0	
CACHE setting		Default value	

Setting example 3

DCTRL = H'00000001 (DMA setting)

N0SA = H'11110000 (source address)
N0DA = H'33330000 (destination address)
N0TB = H'00000200 (transfer byte count)

N1SA = H'22220000 (source address)
N1DA = H'44440000 (destination address)
N1TB = H'00000800 (transfer byte count)

CHCFG = H'61762001 (configuration)
CHITVL = H'00000000 (interval)
CHEXT = H'00000000 (CACHE setting)

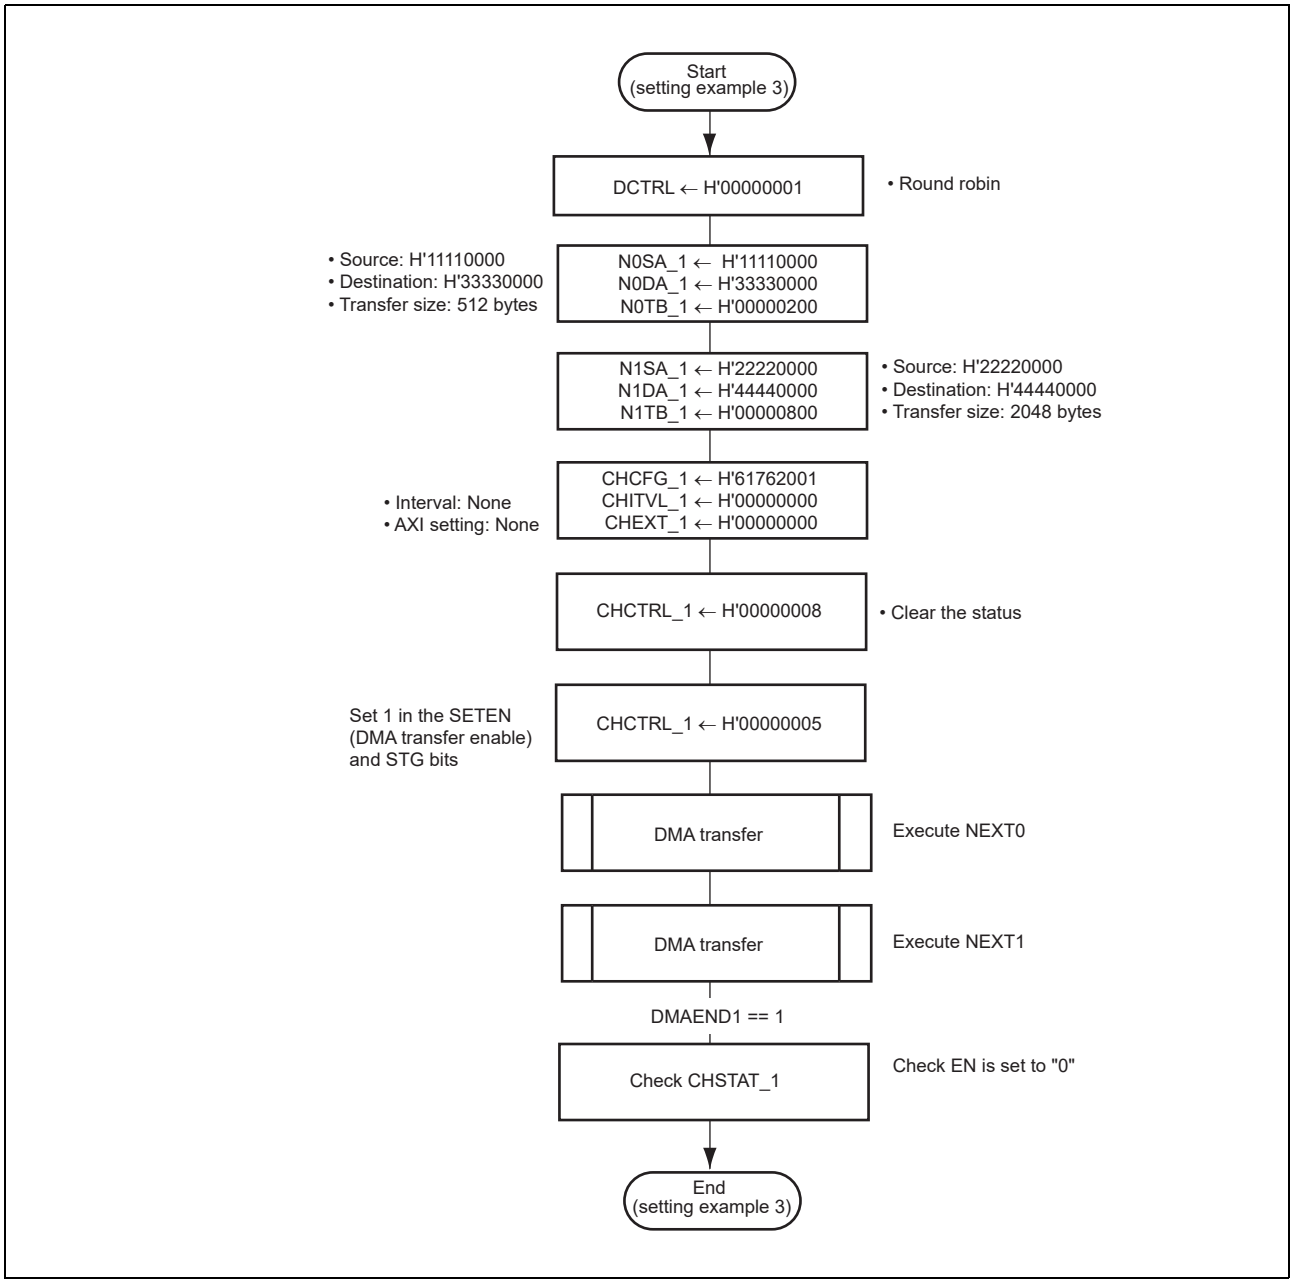

Figure 9.34 Setting Example 3

9.8.4 Setting Example 4 (Link Mode)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 9.25 DMA Transfer Setting Example 4

Item	Description
Channel used	0
Priority control	Round robin
DMA mode	Link
Transfer mode	Block transfer
Register set used	—
Descriptor start address	H'00001000

Table 9.26 DMA Transfer Setting Example 4 (Descriptor 1)

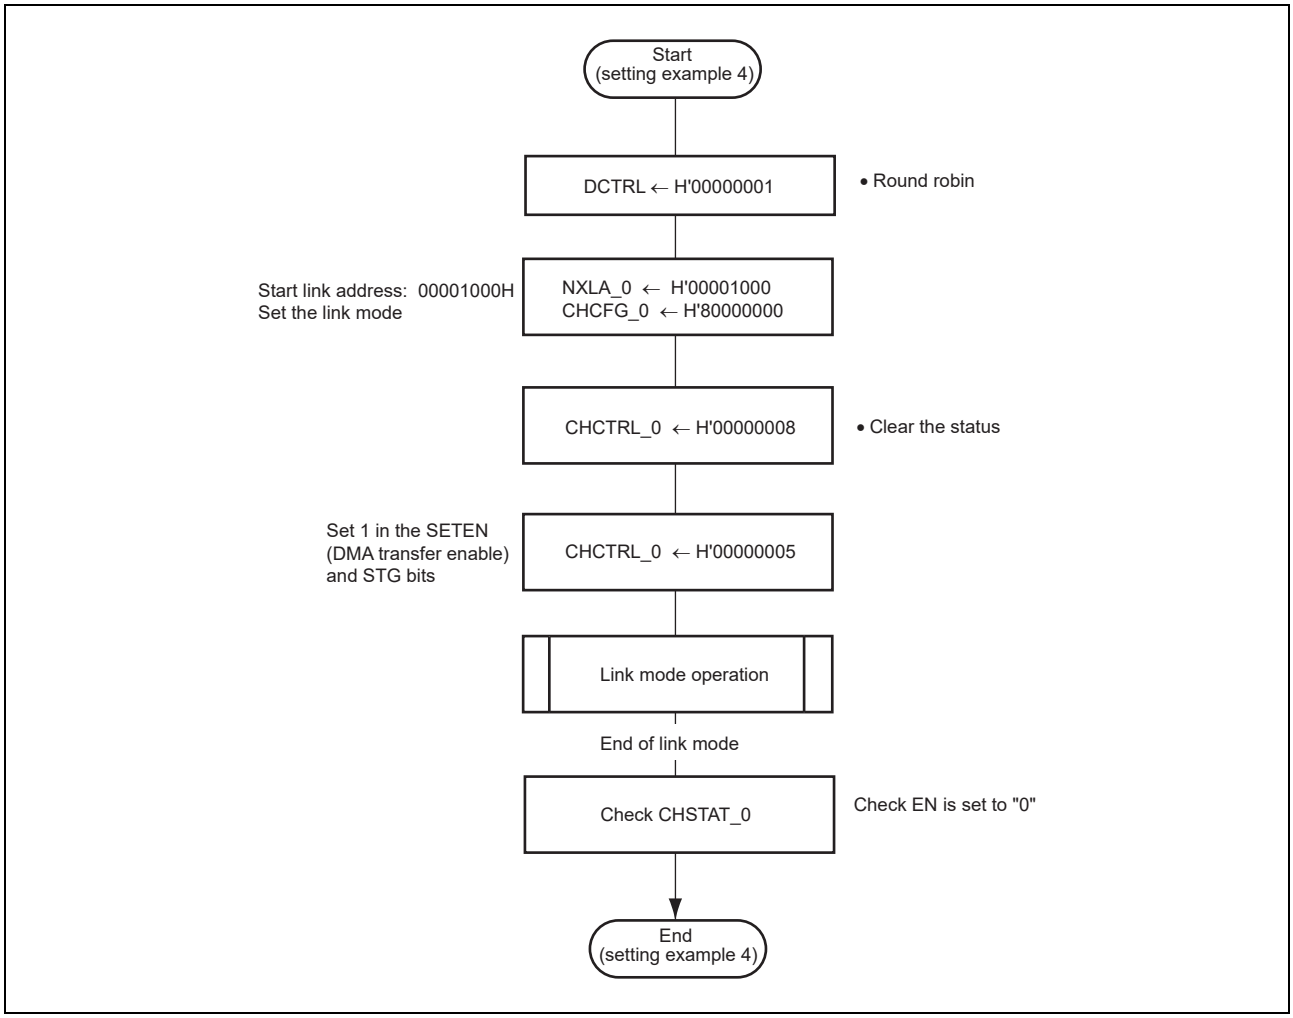

Figure 9.35 Setting Example 4

9.8.5 Next Register Set Continuous Execution Setting

The following figure shows the flowchart for executing DMA transfers continuously by using two Next register sets in register mode. While a DMA transaction is being executed using one Next register set, the other Next register set is set in order to continue to execute DMA transfers.

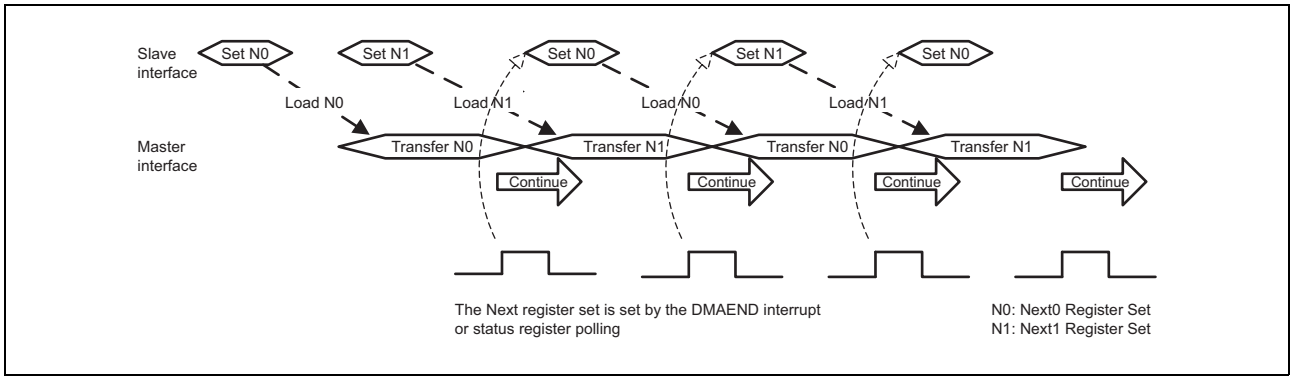

Figure 9.36 Image of Next Register Set Continuous Execution

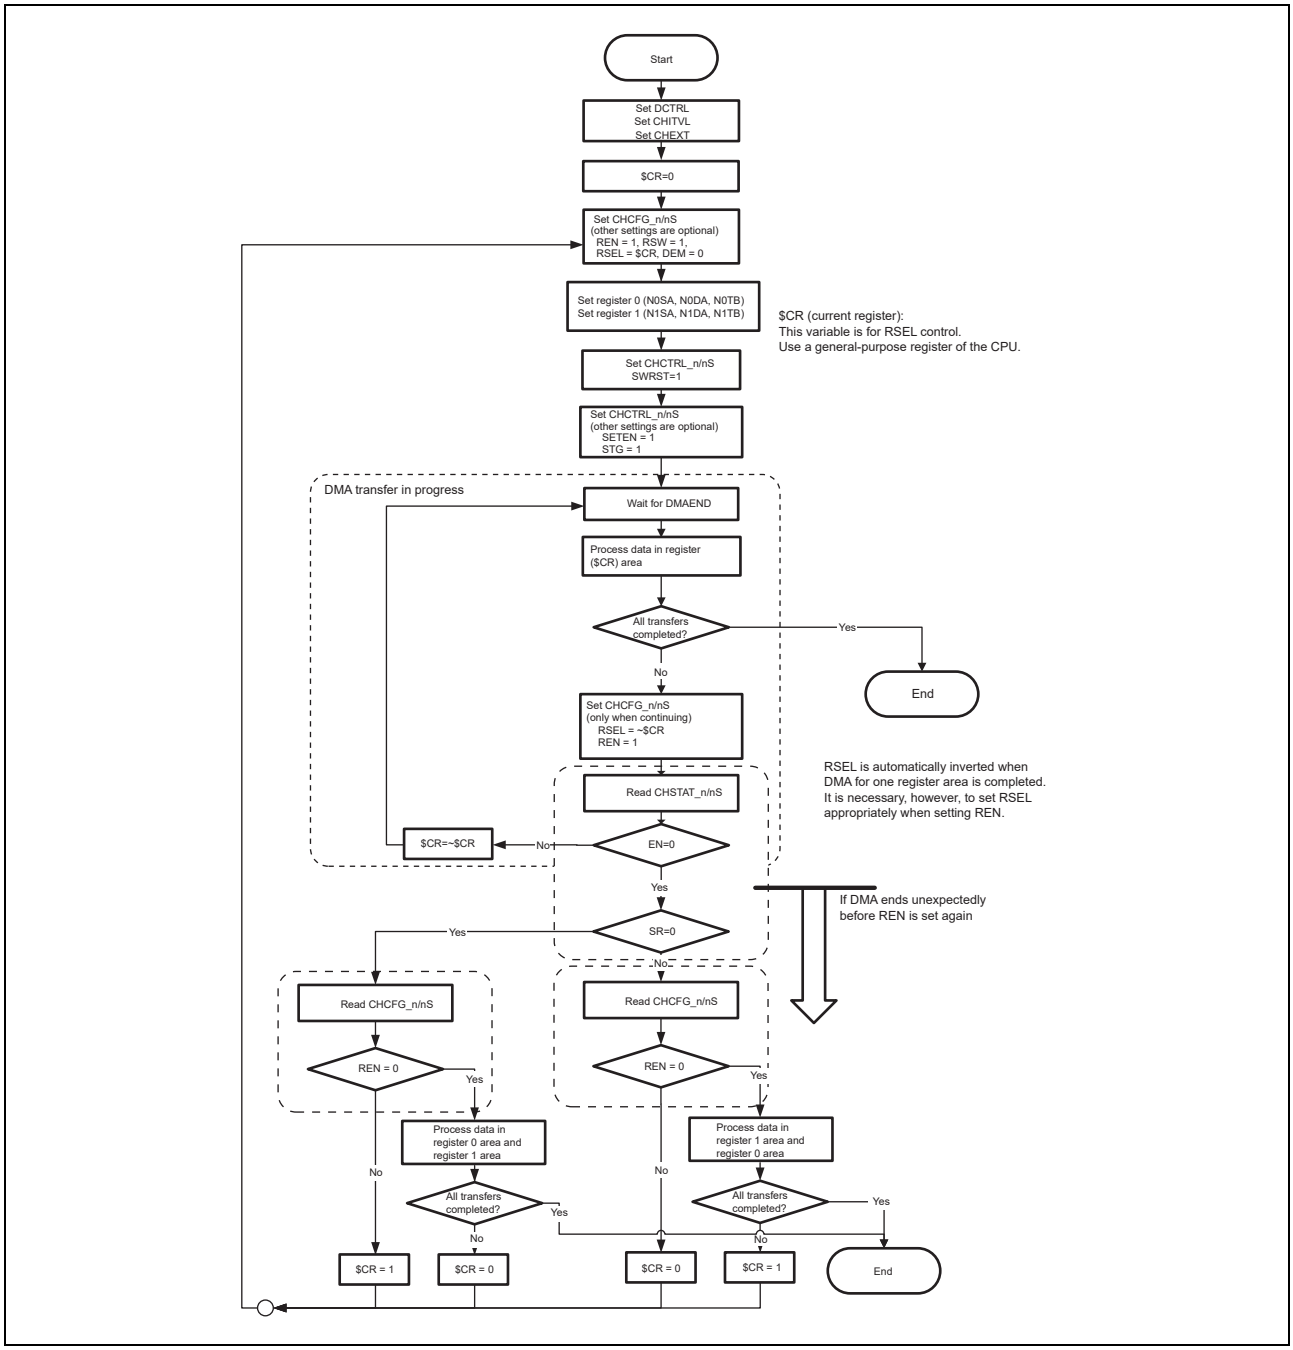

Figure 9.37 Example of Continuous DMA Execution by Using a Next Register Set

- Supplementary information
  First, save the data of the register sets to be used for DMA transfers (0 (N0SA, N0DA, and N0TB) and 1 (N1SA, N1DA, and N1TB)) to a general-purpose register of the CPU (the values of this register is referred to as $CR for the sake of convenience).
  Each time the DMA transfers for one register set are completed (the DMA transfer end interrupt is output), REN is automatically cleared to 0. In order to continue to execute DMA transfers, it is necessary to set REN of the CHCFG_n/nS register every time the DMA transfer end interrupt is asserted. This register also contains the RSEL bit, and the value of this bit needs to be set appropriately as well. Therefore, use $CR.
  In this mode, two Next register sets are executed continuously. However, if CLREN is not set before the DMA transaction is completed (the next DMA transfer end interrupt is output), continuous execution stops. In this case, how much of data has been transferred can be checked by reading the SR and EN bits of the CHSTAT_n/nS register and the REN bit of the CHCFG_n/nS register. To restart the DMA transaction, follow the flowchart shown above.

9.9 Note

9.9.1 Divided Output of DACK0 and TEND0

When transferring 4 bytes or more to an 8-bit or 16-bit external device or transferring 2 bytes or more to an 8-bit external device, each DMA transfer unit is divided into multiple bus cycles. Note that, if the setting is such that DMA transfer is divided into multiple bus cycles and CS# is negated between bus cycles, the DACK0 output and the TEND0 output is divided to align data as with CS#. Figure 9.38 shows an example.

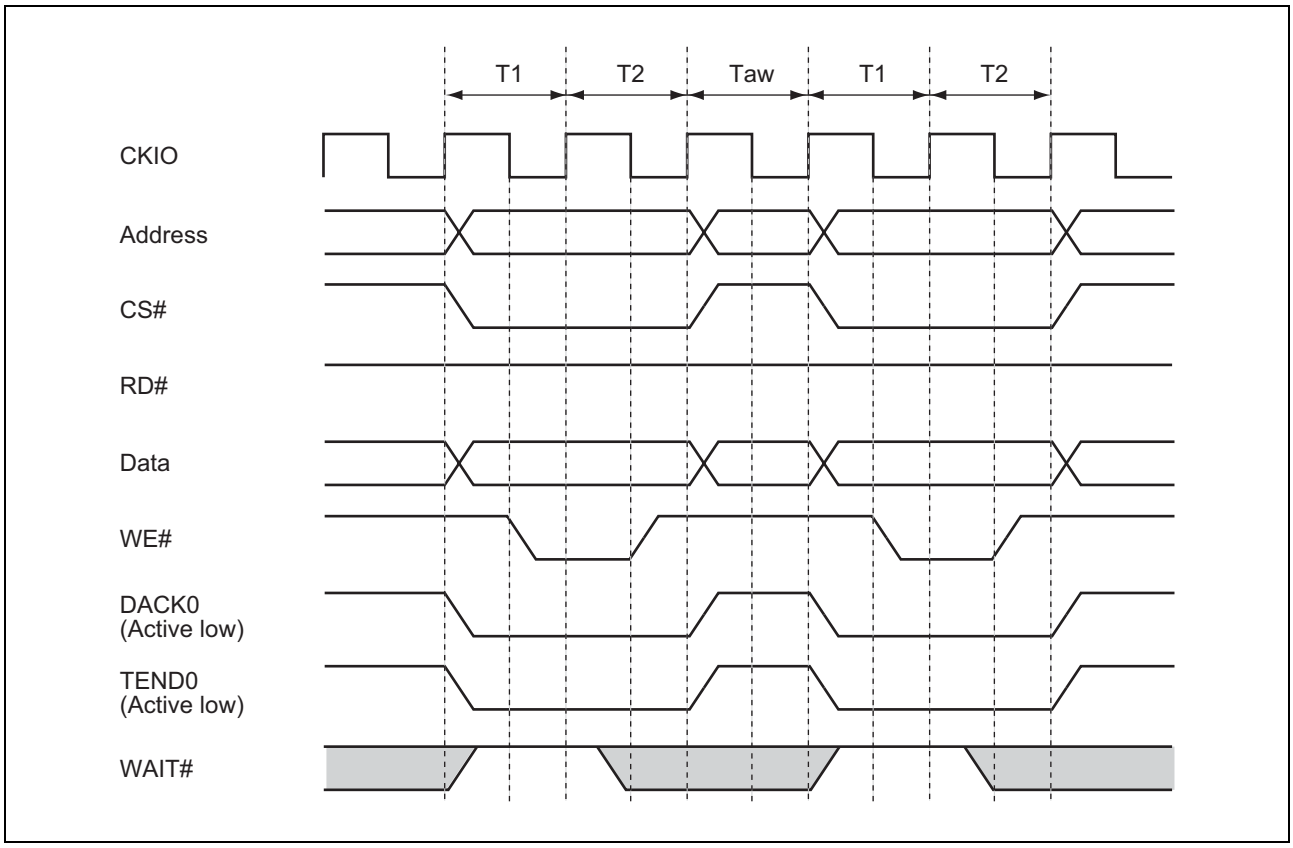

Figure 9.38 Example of TEND0 Divided Output Timing

9.9.2 TEND0 Not Output

Note that TEND0 may not be output depending on the combination of the bits DDS[3:0], SDS[3:0] and REQD in the CHCFG_0/0S register.

Table 9.30 shows when TEND0 is not output and Figure 9.39 shows an operation example.

Table 9.30 Bit Combination when TEND0 Is Not Output

CHCFG_0/0S Register			
REQD	DDS	SDS	TEND0 Output
1	—	—	Output
0	DDS > SDS		Output
	DDS = SDS		Output
	DDS < SDS		Not output

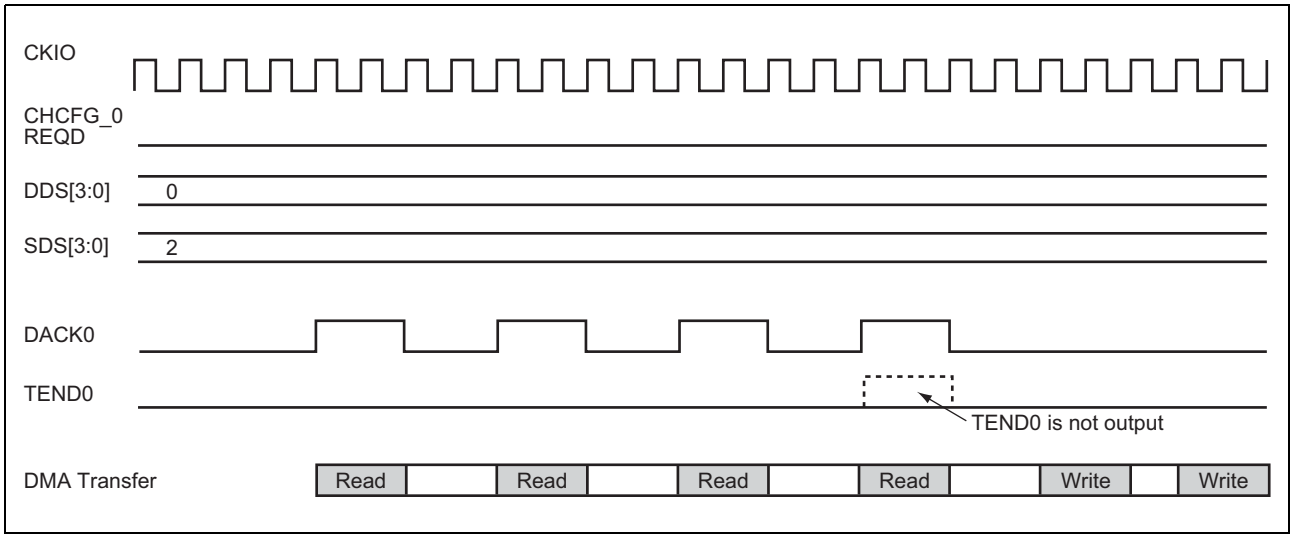

Figure 9.39 TEND0 Not Output

9.9.3 Atomic Access (ARLOCK[1:0] and AWLOCK[1:0])

This module does not support atomic (locked or exclusive) access, that is, it only supports normal access.
Signals ARLOCK[1:0] and AWLOCK[1:0] are fixed as follows and cannot be modified.
ARLOCK[1:0], AWLOCK[1:0]: 00 (normal access)

10. Multi-Function Timer Pulse Unit 3 (MTU3a)

10.1 Overview

This LSI has an on-chip multi-function timer pulse unit 3 (MTU3a), consisting of eight 16-bit timer channels and one 32-bit timer channel.

Table 10.1 shows the specifications of the MTU and Table 10.2 lists the functions of the MTU. Figure 10.1 and Figure 10.2 are block diagrams of the MTU.

Table 10.1 MTU Specifications

Item	Description
Pulse input/output	28 lines max.
Pulse input	3 lines
Count clock	11 clocks for each channel (14 clocks for MTU0, 12 clocks for MTU2, and 10 clocks for MTU5, four clocks for MTU1-MTU2 combination (when LWA = 1))
Operating frequency	Up to 66 MHz
Available operations	[MTU0 to MTU4, MTU6, MTU7, and MTU8] • Waveform output on compare match • Input capture function (noise filter setting available) • Counter-clearing operation • Simultaneous writing to multiple timer counters (TCNT) (excluding MTU8) • Simultaneous clearing on compare match or input capture (excluding MTU8) • Simultaneous input and output to registers in synchronization with counter operations (excluding MTU8) • Up to 12-phase PWM output in combination with synchronous operation (excluding MTU8)
	[MTU0 MTU3, MTU4, MTU6, MTU7, and MTU8] • Buffer operation specifiable
	[MTU1, MTU2] • Phase counting mode can be specified independently • 32-bit phase counting mode can be specified for interlocked operation of MTU1 and MTU2 (when TMDR3.LWA = 1) • Cascade connection operation available
	[MTU3, MTU4, MTU6, and MTU7] • Through interlocked operation of MTU3/4 and MTU6/7, the positive and negative signals in six phases (12 phases in total) can be output in complementary PWM and reset-synchronized PWM operation. • In complementary PWM mode, values can be transferred from buffer registers to temporary registers at crests and troughs of the timer-counter values or when the buffer registers (TGRD registers in MTU4 and MTU7) are written to. • Double-buffering selectable in complementary PWM mode
	[MTU3 and MTU4] • Through interlocking with MTU0, a mode for driving AC synchronous motors (brushless DC motors) by using complementary PWM output and reset-synchronized PWM output is settable and allows the selection of two types of waveform output (chopping or level)
	[MTU5] • Capable of operation as a dead-time compensation counter
	[MTU0/MTU5, MTU1, MTU2, and MTU8] 32-bit phase counting mode specifiable by combining MTU1 and MTU2 and through interlocked operation with MTU0/MTU5 and MTU8
Interrupt-skipping function	• In complementary PWM mode, interrupts on crests and troughs of counter values and triggers to start conversion by the A/D converter can be skipped
Interrupt sources	43 sources
Buffer operation	Automatic transfer of register data (transfer from the buffer register to the timer register)
Trigger generation	A/D converter start triggers can be generated
	A/D converter start request delaying function enables A/D converter to be started with any desired timing and to be synchronized with PWM output
Low power consumption function	The MTU3a can be placed in the module-stop state.

Table 10.2 MTU Functions (1/2)

Module stop function	STBCR3.MSTP33*4									

√: Possible —: Not possible

Note 1. When LWA is 1, the TGRALW capture source can be selected from either of the following: an input from MTIOC1A or MTU0.TGRA compare match/input capture event.
The TGRBLW capture source can be selected from any of the following: an input from MTIOC1B, MTU0.TGRC compare match/input capture event, or MTU8.TGRC compare match event.

Note 2. Capture in MTU8 is supported only in normal mode.

Note 3. The underflow interrupt source is valid only in complementary PWM mode.

Note 4. For details on the module stop function, refer to section 52, Power-Down Modes.

TITCNT2B: Timer interrupt skipping counter 2
NFCRn: Noise filter control register n

Figure 10.2 Block Diagram of MTU (MTU5 to MTU7)

Table 10.3 shows the configuration of pins for the MTU.

Table 10.3 Pin Configuration of the MTU

Channel	Pin Name	I/O	Function
MTU	MTCLKA	Input	External clock A input pin (MTU1/MTU2 phase counting mode A phase input)
	MTCLKB	Input	External clock B input pin (MTU1/MTU2 phase counting mode B phase input)
	MTCLKC	Input	External clock C input pin (MTU2 phase counting mode A phase input)
	MTCLKD	Input	External clock D input pin (MTU2 phase counting mode B phase input)
MTU0	MTIOC0A	I/O	MTU0 TGRA input capture input/output compare output/PWM output pin
	MTIOC0B	I/O	MTU0 TGRB input capture input/output compare output/PWM output pin
	MTIOC0C	I/O	MTU0 TGRC input capture input/output compare output/PWM output pin
	MTIOC0D	I/O	MTU0 TGRD input capture input/output compare output/PWM output pin
MTU1	MTIOC1A	I/O	MTU1 TGRA input capture input/output compare output/PWM output pin
	MTIOC1B	I/O	MTU1 TGRB input capture input/output compare output/PWM output pin
MTU2	MTIOC2A	I/O	MTU2 TGRA input capture input/output compare output/PWM output pin
	MTIOC2B	I/O	MTU2 TGRB input capture input/output compare output/PWM output pin
MTU3	MTIOC3A	I/O	MTU3 TGRA input capture input/output compare output/PWM output pin
	MTIOC3B	I/O	MTU3 TGRB input capture input/output compare output/PWM output pin
	MTIOC3C	I/O	MTU3 TGRC input capture input/output compare output/PWM output pin
	MTIOC3D	I/O	MTU3 TGRD input capture input/output compare output/PWM output pin
MTU4	MTIOC4A	I/O	MTU4 TGRA input capture input/output compare output/PWM output pin
	MTIOC4B	I/O	MTU4 TGRB input capture input/output compare output/PWM output pin
	MTIOC4C	I/O	MTU4 TGRC input capture input/output compare output/PWM output pin
	MTIOC4D	I/O	MTU4 TGRD input capture input/output compare output/PWM output pin
MTU5	MTIC5U	Input	MTU5 TGRU input capture input/external pulse input pin
	MTIC5V	Input	MTU5 TGRV input capture input/external pulse input pin
	MTIC5W	Input	MTU5 TGRW input capture input/external pulse input pin
MTU6	MTIOC6A	I/O	MTU6 TGRA input capture input/output compare output/PWM output pin
	MTIOC6B	I/O	MTU6 TGRB input capture input/output compare output/PWM output pin
	MTIOC6C	I/O	MTU6 TGRC input capture input/output compare output/PWM output pin
	MTIOC6D	I/O	MTU6 TGRD input capture input/output compare output/PWM output pin
MTU7	MTIOC7A	I/O	MTU7 TGRA input capture input/output compare output/PWM output pin
	MTIOC7B	I/O	MTU7 TGRB input capture input/output compare output/PWM output pin
	MTIOC7C	I/O	MTU7 TGRC input capture input/output compare output/PWM output pin
	MTIOC7D	I/O	MTU7 TGRD input capture input/output compare output/PWM output pin
MTU8	MTIOC8A	I/O	MTU8.TGRA input capture input/output compare output pin
	MTIOC8B	I/O	MTU8.TGRB input capture input/output compare output pin
	MTIOC8C	I/O	MTU8.TGRC input capture input/output compare output pin
	MTIOC8D	I/O	MTU8.TGRD input capture input/output compare output pin

10.2 Register Descriptions

Table 10.4 shows the register configuration.

Table 10.4 Register configuration

Channel	Register Name	Abbreviation	Address	Access size
MTU0	Timer control register	TCR	H'E8041300	8
	Timer mode register 1	TMDR1	H'E8041301	8
	Timer I/O control register H	TIORH	H'E8041302	8
	Timer I/O control register L	TIORL	H'E8041303	8
	Timer interrupt enable register	TIER	H'E8041304	8
	Timer counter	TCNT	H'E8041306	16
	Timer general register A	TGRA	H'E8041308	16
	Timer general register B	TGRB	H'E804130A	16
	Timer general register C	TGRC	H'E804130C	16
	Timer general register D	TGRD	H'E804130E	16
	Timer general register E	TGRE	H'E8041320	16
	Timer general register F	TGRF	H'E8041322	16
	Timer interrupt enable register 2	TIER2	H'E8041324	8
	Timer buffer operation transfer mode register	TBTM	H'E8041326	8
	Timer control register 2	TCR2	H'E8041328	8
	Noise filter control register 0	NFCR0	H'E8041290	8
	Noise filter control register C	NFCRC	H'E8041299	8
MTU1	Timer control register	TCR	H'E8041380	8
	Timer mode register 1	TMDR1	H'E8041381	8
	Timer I/O control register	TIOR	H'E8041382	8
	Timer interrupt enable register	TIER	H'E8041384	8
	Timer status register	TSR	H'E8041385	8
	Timer counter	TCNT	H'E8041386	16
	Timer general register A	TGRA	H'E8041388	16
	Timer general register B	TGRB	H'E804138A	16
	Timer input capture control register	TICCR	H'E8041390	8
	Timer mode register 3	TMDR3	H'E8041391	8
	Timer control register 2	TCR2	H'E8041394	8
	Timer longword counter	TCNTLW	H'E80413A0	32
	Timer longword general register A	TGRALW	H'E80413A4	32
	Timer longword general register B	TGRBLW	H'E80413A8	32
	Noise filter control register 1	NFCR1	H'E8041291	8
MTU2	Timer control register	TCR	H'E8041400	8
	Timer mode register 1	TMDR1	H'E8041401	8
	Timer I/O control register	TIOR	H'E8041402	8
	Timer interrupt enable register	TIER	H'E8041404	8
	Timer status register	TSR	H'E8041405	8
	Timer counter	TCNT	H'E8041406	16

10.2.1 Timer Control Register (TCR)

- MTU0.TCR, MTU1.TCR, MTU2.TCR, MTU3.TCR, MTU4.TCR, MTU6.TCR, MTU7.TCR, MTU8.TCR

Address(es): MTU0.TCR H'E8041300, MTU1.TCR H'E8041380, MTU2.TCR H'E8041400, MTU3.TCR H'E8041200, MTU4.TCR H'E8041201, MTU6.TCR H'E8041A00, MTU7.TCR H'E8041A01, MTU8.TCR H'E8041600

	b7	b6	b5	b4	b3	b2	b1	b0
	CCLR[2:0]			CKEG[1:0]		TPSC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TPSC[2:0]	Time Prescaler Select	See Table 10.7 to Table 10.10.	R/W
b4, b3	CKEG[1:0]	Clock Edge Select	b4 b3 0 0: Count at rising edge 0 1: Count at falling edge 1 x: Count at both edges	R/W
b7 to b5	CCLR[2:0]	Counter Clear Source Select	See Table 10.5 and Table 10.6.	R/W

x: Don't care

The TCR register controls the TCNT operation for each channel in combination with the TCR2 register. The MTU has a total of 11 TCR registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8 and three (TCRU, TCRV, and TCRW) for MTU5. TCR values should be specified only while TCNT operation is stopped.

TPSC[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. The clock source can be selected independently for each channel. See Table 10.7 to Table 10.10 for details.

CKEG[1:0] Bits (Clock Edge Select)

These bits select the count clock source edge, including the MTIOC1A pin. When the internal clock is counted at both edges, the count clock period is halved (e.g. P1φ/4 at both edges = P1φ/2 at rising edge). If phase counting mode is used on MTU1 and MTU2, the setting of these bits is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the count clock source is P1φ/2 or slower. When P1φ/1 or the overflow/underflow in another channel is selected for the count clock source, a value can be written to these bits but counter operation compiles with the initial value.

CCLR[2:0] Bits (Counter Clear Source Select)

These bits select the TCNT counter clearing source. See Table 10.5 and Table 10.6 for details.

Table 10.5 CCLR[2:0] (MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8)

Channel	Bit 7 CCLR2	Bit 6 CCLR1	Bit 5 CCLR0	Description
MTU0 MTU3 MTU4 MTU6 MTU7 MTU8	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*1
	1	0	0	TCNT clearing disabled
	1	0	1	TCNT cleared by TGRC compare match/input capture*2
	1	1	0	TCNT cleared by TGRD compare match/input capture*2
	1	1	1	TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*1

Note 1. Synchronous operation is selected by setting a SYNC bit in TSYRA or TSYRB to 1 except for MTU8.
Note 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority and compare match/input capture does not occur.

Table 10.6 CCLR[2:0] (MTU1 and MTU2)

Channel	Bit 7 Reserved*2	Bit 6 CCLR1	Bit 5 CCLR0	Description
MTU1 MTU2	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*1

Note 1. Synchronous operation is selected by setting a SYNC bit in TSYRA or TSYRB to 1.
Note 2. Bit 7 is reserved in MTU1 and MTU2. It is read as 0. The write value is ignored.

- MTU5.TCRU, MTU5.TCRV, MTU5.TCRW

Address(es): MTU5.TCRU H'E8041C84, MTU5.TCRV H'E8041C94, MTU5.TCRW H'E8041CA4

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TPSC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	TPSC[1:0]	Time Prescaler Select	See Table 10.11.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TPSC[1:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. See Table 10.11 for details.

10.2.2 Timer Control Register 2 (TCR2)

- MTU0.TCR2, MTU3.TCR2, MTU4.TCR2, MTU6.TCR2, MTU7.TCR2, MTU8.TCR2

Address(es): MTU0.TCR2 H'E8041328, MTU3.TCR2 H'E804124C, MTU4.TCR2 H'E804124D, MTU6.TCR2 H'E8041A4C, MTU7.TCR2 H'E8041A4D, MTU8.TCR2 H'E8041606

	—	—	—	PCB[1:0]		TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TPSC2[2:0]	Time Prescaler Select	See Table 10.7 to Table 10.10.	R/W
b4, b3	PCB[1:0]	Phase Counting Mode Function Expansion Control	Functional Expansion Control for Phase Counting Modes 2, 3, and 5	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. The MTU has a total of 11 TCR2 registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8 and three (TCR2U, TCR2V, and TCR2W) for MTU5. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] Bits (Time Prescaler Select)

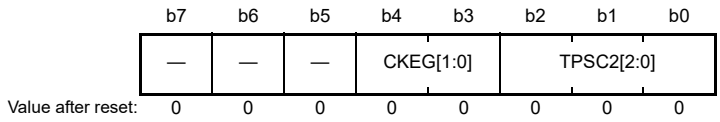
These bits select the TCNT count clock source. The clock source can be selected independently for each channel. See Table 10.7 to Table 10.10 for details.

PCB[1:0] Bits (Phase Counting Mode Function Expansion Control)

These bits control extended functions for phase counting mode 2, 3, and 5 in MTU1 and MTU2. See section 10.3.6, Phase Counting Mode.

- MTU5.TCR2U, MTU5.TCR2V, MTU5.TCR2W

Address(es): MTU5.TCR2U H'E8041C85, MTU5.TCR2V H'E8041C95, MTU5.TCR2W H'E8041CA5



Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TPSC2[2:0]	Time Prescaler Select	See Table 10.11.	R/W
b4, b3	CKEG[1:0]	Clock Edge Select	b4 b3 0 0: Counts at the rising edge. 0 1: Counts at the falling edge. 1 x: Counts at both edges.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

x: Don't care

TPSC2[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. See Table 10.11 for details.

CKEG[1:0] Bits (Clock Edge Select)

These bits select the edge of the count clock source signal output from the MTIOC1A pin.

10.2.3 Timer Mode Register 1 (TMDR1)

- MTU0.TMDR1

Address(es): MTU0.TMDR1 H'E8041301

	b7	b6	b5	b4	b3	b2	b1	b0
	—	BFE	BFB	BFA	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

- MTU1.TMDR1, MTU2.TMDR1

Address(es): MTU1.TMDR1 H'E8041381, MTU2.TMDR1 H'E8041401

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

- MTU3.TMDR1, MTU4.TMDR1, MTU6.TMDR1, MTU7.TMDR1, MTU8.TMDR1

Address(es): MTU3.TMDR1 H'E8041202, MTU4.TMDR1 H'E8041203, MTU6.TMDR1 H'E8041A02, MTU7.TMDR1 H'E8041A03, MTU8.TMDR1 H'E8041601

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	BFB	BFA	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MD[3:0]	Mode Select	These bits specify the timer operating mode. See Table 10.12 for details.	R/W
b4	BFA	Buffer Operation A	0: TGRA and TGRC operate normally 1: TGRA and TGRC used together for buffer operation	R/W
b5	BFB	Buffer Operation B	0: TGRB and TGRD operate normally 1: TGRB and TGRD used together for buffer operation	R/W
b6	BFE	Buffer Operation E	0: MTU0.TGRE and MTU0.TGRF operate normally 1: MTU0.TGRE and MTU0.TGRF used together for buffer operation	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

The TMDR1 register specifies the operating mode of each channel. The MTU has a total of eight TMDR1 registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8. TMDR1 register values should be specified only while TCNT operation is stopped.

Table 10.12 Operating Mode Setting by MD[3:0] Bits (MTU0 to MTU4, MTU6 to MTU8)

Bit 3 MD3	Bit 2 MD2	Bit 1 MD1	Bit 0 MD0	Description	MTU0	MTU1	MTU2	MTU1 & MTU2 (LWA = 1)	MTU3	MTU4	MTU6	MTU7	MTU8
0	0	0	0	Normal mode	√	√	√		√	√	√	√	√
0	0	0	1	Setting prohibited									
0	0	1	0	PWM mode 1	√	√	√		√	√	√	√	
0	0	1	1	PWM mode 2	√	√	√						
0	1	0	0	Phase counting mode 1		√	√	√					
0	1	0	1	Phase counting mode 2		√	√	√					
0	1	1	0	Phase counting mode 3		√	√	√					
0	1	1	1	Phase counting mode 4		√	√	√					
1	0	0	0	Reset-synchronized PWM mode*1					√		√		
1	0	0	1	Phase counting mode 5		√	√	√					
1	0	1	x	Setting prohibited									
1	1	0	0	Setting prohibited									
1	1	0	1	Complementary PWM mode 1 (transfer at crest)*1					√		√		
1	1	1	0	Complementary PWM mode 2 (transfer at trough)*1					√		√		
1	1	1	1	Complementary PWM mode 3 (transfer at crest and trough)*1					√		√		

x: Don't care

Note: Only set the corresponding operating mode listed above for each channel.

Note 1. Reset-synchronized PWM mode and complementary PWM mode can only be set for MTU3 and MTU6. When MTU3 or MTU6 is set to reset-synchronized PWM mode or complementary PWM mode, the MTU4 or MTU7 settings become ineffective and automatically conform to the MTU3 or MTU6 setting, respectively. MTU4 and MTU7 should be set to the initial values (normal mode).

BFA Bit (Buffer Operation A)

This bit specifies whether to operate TGRA in the normal way or to use TGRA and TGRC together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare does not take place in modes other than complementary PWM mode, but compare match with TGRC occurs in complementary PWM mode.

If a compare match occurs on MTU4 in the Tb interval in complementary PWM mode, the TGIEC bit in timer interrupt enable register (MTU4.TIER) should be set to 0.

In reset-synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFA bit of MTU3.TMDR1 (MTU6.TMDR1). The BFA bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRC, this bit is reserved. It is read as 0. The write value should be 0.

See Figure 10.50 for an illustration of the Tb interval in complementary PWM mode.

BFB Bit (Buffer Operation B)

This bit specifies whether to operate TGRB in the normal way or to use TGRB and TGRD together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare does not take place in modes other than complementary PWM mode, but compare match with TGRD occurs in complementary PWM mode.

If a compare match occurs on MTU4 in the Tb interval in complementary PWM mode, the TGIED bit in timer interrupt enable register (MTU4.TIER) should be set to 0.

In reset-synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFB bit of MTU3.TMDR1 (MTU6.TMDR1). The BFB bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRD, this bit is reserved. It is read as 0. The write value should be 0.

See Figure 10.50 for an illustration of the Tb interval in complementary PWM mode.

BFE Bit (Buffer Operation E)

This bit specifies whether to operate MTU0.TGRE and MTU0.TGRF in the normal way or to use them together for buffer operation. Compare match with TGRF occurs even when TGRF is used as a buffer register.
In MTU0 to MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

10.2.4 Timer Mode Registers 2 (TMDR2A and TMDR2B)

Address(es): MTU.TMDR2A H'E8041270, MTU.TMDR2B H'E8041A70

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DRS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DRS	Double Buffer Select	0: Double buffer function is disabled 1: Double buffer function is enabled	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TMDR2A and TMDR2B specify the double buffer function in complementary PWM mode 3 (transfer at the crest and trough of the counter value). The MTU has two TMDR2 registers, one each for MTU3 (TMDR2A) and MTU6 (TMDR2B). TMDR2A and TMDR2B values should be specified only while TCNT operation is stopped.

DRS Bit (Double Buffer Select)

This bit enables or disables the double buffer function in complementary PWM mode.

10.2.5 Timer Mode Register 3 (TMDR3)

Address(es): MTU1.TMDR3 H'E8041391

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PHCK SEL	LWA
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Bit Name	Description	R/W
b0	LWA	MTU1/MTU2 Combination Longword Access Control	0: 16-bit access is enabled. 1: 32-bit access is enabled.	R/W
b1	PHCKSEL	External Input Phase Clock Select	Selects the external clock pin for phase counting mode. 0: MTCLKA and MTCLKB are selected for the external phase clock. 1: MTCLKC and MTCLKD are selected for the external phase clock.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The TMDR3 register controls longword access to a 32-bit register or counter in a combination of MTU1 and MTU2. There is only one TMDR3 register in MTU1. The counter (TCNTLW), general register A (TGRALW), and general register B (TGRBLW) of MTU1 and MTU2 are accessed in the combinations listed in Table 10.13.

LWA Bit (MTU1/MTU2 Combination Longword Access Control)

This bit selects a 32-bit access in a combination of MTU1 and MTU2.

When the LWA bit is set to 0, MTU1 and MTU2 operate independently as 16-bit timers and the TCNTLW, TGRALW, and TGRBLW registers cannot be accessed.

When the LWA bit is set to 1, MTU1 and MTU2 are cascaded and operate as a 32-bit timer, which is controlled through the TCR, TCR2, TIOR, and TMDR1 registers in MTU1. The TCR, TCR2, TIOR, and TMDR1 register settings in MTU2 are ignored. The 16-bit registers (TCNT, TGRA, and TGRB) in MTU1 and MTU2 cannot be accessed. MTU2 input capture and compare match are disabled.

Note that MTU1 and MTU2 can be cascaded by setting the LWA bit to 1 only in phase-counting mode. Cascade connection cannot be used in normal, PWM1, or PWM2 mode. When setting the LWA bit to 1, be sure to select phase-counting mode.

In addition, initialize the TCNT, TGRA, and TGRB registers in MTU1 and MTU2 before setting the LWA bit to 1.

PHCKSEL Bit (External Input Phase Clock Select)

When the MTU1 and MTU2 registers are combined for 32-bit phase counting mode or MTU2 phase counting mode, this bit selects either the A- or B-phase signal from the external clock. See Table 10.66, Clock Input Pins in Phase Counting Mode for details.

Table 10.13 Setting and Combination of the TMDR3 Register

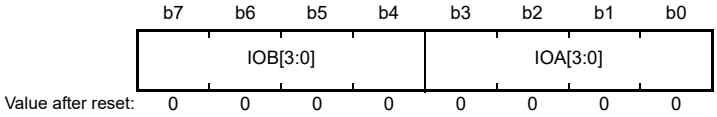
	TMDR3.LWA = 0		TMDR3.LWA = 1	
Register	Symbol	Access mode	Symbol	Access mode
Counter in MTU1*1	MTU1.TCNT	Word	MTU1.TCNT_1_LW	Longword
Counter in MTU2	MTU2.TCNT	Word		
General register A in MTU1	MTU1.TGRA	Word	MTU1.TGRA_1_LW	Longword
General register A in MTU2	MTU2.TGRA	Word		
General register B in MTU1	MTU1.TGRB	Word	MTU1.TGRB_1_LW	Longword
General register B in MTU2	MTU2.TGRB	Word		

Note 1. When the LWA bit is set to 1, setting the count clock for MTU1 as MTU2.TCNT overflow/underflow is not required.

10.2.6 Timer I/O Control Register (TIOR)

- MTU0.TIORH, MTU1.TIOR, MTU2.TIOR, MTU3.TIORH, MTU4.TIORH, MTU6.TIORH, MTU7.TIORH, MTU8.TIORH

Address(es): MTU0.TIORH H'E8041302, MTU1.TIOR H'E8041382, MTU2.TIOR H'E8041402, MTU3.TIORH H'E8041204, MTU4.TIORH H'E8041206, MTU6.TIORH H'E8041A04, MTU7.TIORH H'E8041A06, MTU8.TIORH H'E8041602



Bit	Symbol	Bit Name	Description	R/W
b3 to b0	IOA[3:0]	I/O Control A*1	See the following tables. MTU0.TIORH: Table 10.28 MTU1.TIOR: Table 10.30 MTU2.TIOR: Table 10.31 MTU3.TIORH: Table 10.32 MTU4.TIORH: Table 10.34 MTU6.TIORH: Table 10.36 MTU7.TIORH: Table 10.38 MTU8.TIORH: Table 10.40	R/W
b7 to b4	IOB[3:0]	I/O Control B*1	See the following tables. MTU0.TIORH: Table 10.14 MTU1.TIOR: Table 10.16 MTU2.TIOR: Table 10.17 MTU3.TIORH: Table 10.18 MTU4.TIORH: Table 10.20 MTU6.TIORH: Table 10.22 MTU7.TIORH: Table 10.24 MTU8.TIORH: Table 10.26	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

- MTU0.TIORL, MTU3.TIORL, MTU4.TIORL, MTU6.TIORL, MTU7.TIORL, MTU8.TIORL

Address(es): MTU0.TIORL H'E8041303, MTU3.TIORL H'E8041205, MTU4.TIORL H'E8041207, MTU6.TIORL H'E8041A05, MTU7.TIORL H'E8041A07, MTU8.TIORL H'E8041603

	b7	b6	b5	b4	b3	b2	b1	b0
	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	IOC[3:0]	I/O Control C*1	See the following tables. MTU0.TIORL: Table 10.29 MTU3.TIORL: Table 10.33 MTU4.TIORL: Table 10.35 MTU6.TIORL: Table 10.37 MTU7.TIORL: Table 10.39 MTU8.TIORL: Table 10.41	R/W
b7 to b4	IOD[3:0]	I/O Control D*1	See the following tables. MTU0.TIORL: Table 10.15 MTU3.TIORL: Table 10.19 MTU4.TIORL: Table 10.21 MTU6.TIORL: Table 10.23 MTU7.TIORL: Table 10.25 MTU8.TIORL: Table 10.27	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

- MTU5.TIORU, MTU5.TIORV, MTU5.TIORW

Address(es): MTU5.TIORU H'E8041C86, MTU5.TIORV H'E8041C96, MTU5.TIORW H'E8041CA6

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	IOC[4:0]				
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	IOC[4:0]	I/O Control C	See the following table. MTU5.TIORU, MTU5.TIORV, MTU5.TIORW: Table 10.42	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The TIOR register controls the TGR register. The MTU has a total of 17 TIOR registers, two each for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, one each for MTU1 and MTU2, and three (MTU5.TIORU/TIORV/TIORW) for MTU5. The TIOR register should be set when the TMDR register setting is normal mode, PWM mode, or phase counting mode.

Note that TIOR is affected by the TMDR1 setting.

The initial output specified by TIOR is valid when the counter is stopped (the CSTn bits in TSTRA and TSTRB are cleared to 0). Note also that, in PWM mode 2, the output at the point at which the counter is cleared to 0 is specified.

When TGRC or TGRD is designated for buffer operation, this setting is invalid and the register operates as a buffer register.

Table 10.14 TIORH (MTU0)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU0.TGRB Function	MTIOC0B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*1

x: Don't care

Note 1. Input capture will not be generated in MTU0 if P1φ/1 is selected as the count clock for MTU1. Select a clock other than P1φ/1.

Table 10.15 TIORL (MTU0)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	IOD2	IOD1	IOD0	MTU0.TGRD Function	MTIOC0D Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register*1	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*2

x: Don't care

Note 1. When the MTU0.TMDR1.BFB is set to 1 and MTU0.TGRD is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Note 2. Input capture will not be generated in MTU0 if P1φ/1 is selected as the count clock for MTU1. Select a clock other than P1φ/1.

Table 10.16 TIOR (MTU1)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU1.TGRB/TGRBLW Function	MTIOC1B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	0	0		Input capture at occurrence of compare match or input capture in the MTU0.TGRC register
1	1	1	x		Input capture at occurrence of compare match in the MTU8.TGRC register

x: Don't care

Table 10.17 TIOR (MTU2)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU2.TGRB Function	MTIOC2B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the BFA bit in MTU6.TMDR1 is set to 1 and MTU6.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 10.38 TIORH (MTU7)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU7.TGRA Function	MTIOC7A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Table 10.39 TIORL (MTU7)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU7.TGRC Function	MTIOC7C Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the BFA bit in MTU7.TMDR1 is set to 1 and MTU7.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 10.40 TIORH (MTU8)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU8.TGRA Function	MTIOC8A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Table 10.41 TIORL (MTU8)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU8.TGRC Function	MTIOC8C Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the MTU8.TMDR1.BFA bit is set to 1 and the MTU8.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 10.42 TIORU, TIORV, and TIORW (MTU5)

Description						
Bit 4 IOC4	Bit 3 IOC3	Bit 2 IOC2	Bit 1 IOC1	Bit 0 IOC0	MTU5.TGRU, MTU5.TGRV, MTU5.TGRW Function	MTIC5U, MTIC5V, MTIC5W Pin Function
0	0	0	0	0	Output compare register	No function
0	0	0	0	1		Setting prohibited
0	0	0	1	x		Setting prohibited
0	0	1	x	x		Setting prohibited
0	1	x	x	x		Setting prohibited
1	0	0	0	0	Input capture register*1	Setting prohibited
1	0	0	0	1		Input capture at rising edge.
1	0	0	1	0		Input capture at falling edge.
1	0	0	1	1		Input capture at both edges.
1	0	1	x	x		Input capture on generation of compare match with MTU8.TGRC
1	1	0	0	0		Setting prohibited
1	1	0	0	1		Measurement of low pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	0	1	0		Measurement of low pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	0	1	1		Measurement of low pulse width of external input signal. Capture at crest and trough of complementary PWM mode.
1	1	1	0	0		Setting prohibited
1	1	1	0	1		Measurement of high pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	1	1	0		Measurement of high pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	1	1	1		Measurement of high pulse width of external input signal. Capture at crest and trough of complementary PWM mode.

x: Don't care

Note 1. Setting the IOC[4:0] bits to "19h", "1Ah", "1Bh", "1Dh", "1Eh", or "1Fh" is only allowed when the external pulse width measurement function is used or the dead time compensation function, in coordination with MTU6 and MTU7, is used. For details, refer to section 10.3.11, External Pulse Width Measurement, and section 10.3.12, Dead Time Compensation.

10.2.7 Timer Compare Match Clear Register (TCNTCMPCLR)

Address(es): MTU5.TCNTCMPCLR H'E8041CB6

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	CMPCLR5U	CMPCLR5V	CMPCLR5W
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CMPCLR5W	TCNT Compare Clear 5W	0: Disables MTU5.TCNTW to be cleared to 0000h at MTU5.TCNTW and MTU5.TGRW compare match or input capture 1: Enables MTU5.TCNTW to be cleared to 0000h at MTU5.TCNTW and MTU5.TGRW compare match or input capture	R/W
b1	CMPCLR5V	TCNT Compare Clear 5V	0: Disables MTU5.TCNTV to be cleared to 0000h at MTU5.TCNTV and MTU5.TGRV compare match or input capture 1: Enables MTU5.TCNTV to be cleared to 0000h at MTU5.TCNTV and MTU5.TGRV compare match or input capture	R/W
b2	CMPCLR5U	TCNT Compare Clear 5U	0: Disables MTU5.TCNTU to be cleared to 0000h at MTU5.TCNTU and MTU5.TGRU compare match or input capture 1: Enables MTU5.TCNTU to be cleared to 0000h at MTU5.TCNTU and MTU5.TGRU compare match or input capture	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TCNTCMPCLR specifies requests to clear MTU5.TCNTU, MTU5.TCNTV, and MTU5.TCNTW. The MTU has one TCNTCMPCLR (on MTU5).

10.2.8 Timer Interrupt Enable Register (TIER)

- MTU1.TIER, MTU2.TIER

Address(es): MTU1.TIER H'E8041384, MTU2.TIER H'E8041404

	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	—	TCIEU	TCIEV	—	—	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

- MTU0.TIER, MTU3.TIER, MTU6.TIER

Address(es): MTU0.TIER H'E8041304, MTU3.TIER H'E8041208, MTU6.TIER H'E8041A08

	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

- MTU4.TIER, MTU7.TIER

Address(es): MTU4.TIER H'E8041209, MTU7.TIER H'E8041A09

	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	TTGE2	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

- MTU8.TIER

Address(es): MTU8.TIER H'E8041604

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TGIEA	TGR Interrupt Enable A	0: Interrupt requests (TGIA) disabled 1: Interrupt requests (TGIA) enabled	R/W
b1	TGIEB	TGR Interrupt Enable B	0: Interrupt requests (TGIB) disabled 1: Interrupt requests (TGIB) enabled	R/W
b2	TGIEC	TGR Interrupt Enable C	0: Interrupt requests (TGIC) disabled 1: Interrupt requests (TGIC) enabled	R/W
b3	TGIED	TGR Interrupt Enable D	0: Interrupt requests (TGID) disabled 1: Interrupt requests (TGID) enabled	R/W
b4	TCIEV	Overflow Interrupt Enable	0: Interrupt requests (TCIV) disabled 1: Interrupt requests (TCIV) enabled	R/W
b5	TCIEU	Underflow Interrupt Enable	0: Interrupt requests (TCIU) disabled 1: Interrupt requests (TCIU) enabled	R/W
b6	TTGE2	A/D Converter Start Request Enable 2	0: A/D converter start request generation by MTUn.TCNT underflow (trough) disabled 1: A/D converter start request generation by MTUn.TCNT underflow (trough) enabled	R/W
b7	TTGE	A/D Converter Start Request Enable	0: A/D converter start request generation disabled 1: A/D converter start request generation enabled	R/W

n = 4, 7

The TIER register enables or disables interrupt requests from each channel. The MTU has a total of ten TIER registers, two for MTU0 and one each for MTU1 to MTU8.

TGIEA and TGIEB Bits (TGR Interrupt Enable A and B)

Each bit enables or disables interrupt requests (TGIn) (n = A, B).

TGIEC and TGIED Bits (TGR Interrupt Enable C and D)

Each bit enables or disables an interrupt request (TGIn) (n = C, D).
In MTU1 and MTU2, these bits are reserved. They are read as 0. The write value should be 0.

TCIEV Bit (Overflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIV).

TCIEU Bit (Underflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIU).
In MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

TTGE2 Bit (A/D Converter Start Request Enable 2)

This bit enables or disables generation of A/D converter start requests by MTUn.TCNT underflow (trough) in complementary PWM mode (n = 4, 7).
In MTU0 to MTU3, MTU6, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

TTGE Bit (A/D Converter Start Request Enable)

This bit enables or disables generation of A/D converter start requests by TGRA input capture/compare match.
MTU8 is a reserved bit. It is read as 0. The write value should be 0.

- MTU0.TIER2

Address(es): MTU0.TIER2 H'E8041324

	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE2	—	—	—	—	—	TGIEF	TGIEE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TGIEE	TGR Interrupt Enable E	0: Interrupt requests (TGIE) disabled 1: Interrupt requests (TGIE) enabled	R/W
b1	TGIEF	TGR Interrupt Enable F	0: Interrupt requests (TGIF) disabled 1: Interrupt requests (TGIF) enabled	R/W
b6 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	TTGE2	A/D Converter Start Request Enable 2	0: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE disabled 1: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE enabled	R/W

TGIEE and TGIEF Bits (TGR Interrupt Enable E and F)

Each bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRn (n = E, F).

TTGE2 Bit (A/D Converter Start Request Enable 2)

This bit enables or disables AD converter start requests by compare match between TCNT and TGRE in MTU0.

- MTU5.TIER

Address(es): MTU5.TIER H'E8041CB2

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TGIE5U	TGIE5V	TGIE5W
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	TGIE5W	TGR Interrupt Enable 5W	0: Interrupt requests TGIW5 disabled 1: Interrupt requests TGIW5 enabled	R/W
b1	TGIE5V	TGR Interrupt Enable 5V	0: Interrupt requests TGIV5 disabled 1: Interrupt requests TGIV5 enabled	R/W
b2	TGIE5U	TGR Interrupt Enable 5U	0: Interrupt requests TGIU5 disabled 1: Interrupt requests TGIU5 enabled	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TGIE5n Bits (TGR Interrupt Enable 5n)

Each bit enables or disables interrupt requests (TGIn5) (n = U, V, W).

10.2.9 Timer Status Register (TSR)

- MTU1.TSR, MTU2.TSR

Address(es): MTU1.TSR H'E8041385, MTU2.TSR H'E8041405

	b7	b6	b5	b4	b3	b2	b1	b0
	TCFD	—	—	—	—	—	—	—
Value after reset:	1	1	0	0	0	0	0	0

- MTU3.TSR, MTU4.TSR, MTU6.TSR, MTU7.TSR

Address(es): MTU3.TSR H'E804122C, MTU4.TSR H'E804122D, MTU6.TSR H'E8041A2C, MTU7.TSR H'E8041A2D

	b7	b6	b5	b4	b3	b2	b1	b0
	TCFD	—	—	—	—	—	—	—
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	The read value is undefined.The write value should be 1.	R/W
b6	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b7	TCFD	Count Direction Flag	0: TCNT counts down 1: TCNT counts up	R

TSR indicates the states of each of the channels. The MTU has a total of six TSR registers, one each for MTU1 to MTU4, MTU6, and MTU7.

TCFD Flag (Count Direction Flag)

Status flag that indicates the direction in which TCNT is counting in MTU1 to MTU4, MTU6, and MTU7.

10.2.10 Timer Buffer Operation Transfer Mode Register (TBTM)

- MTU0.TBTM

Address(es): MTU0.TBTM H'E8041326

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TTSE	TTSB	TTSA
Value after reset:	0	0	0	0	0	0	0	0

- MTU3.TBTM, MTU4.TBTM, MTU6.TBTM, MTU7.TBTM

Address(es): MTU3.TBTM H'E8041238, MTU4.TBTM H'E8041239, MTU6.TBTM H'E8041A38, MTU7.TBTM H'E8041A39

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TTSB	TTSA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TTSA	Timing Select A	0: When compare match A occurs in each channel, data is transferred from TGRC to TGRA 1: When TCNT is cleared in each channel, data is transferred from TGRC to TGRA	R/W
b1	TTSB	Timing Select B	0: When compare match B occurs in each channel, data is transferred from TGRD to TGRB 1: When TCNT is cleared in each channel, data is transferred from TGRD to TGRB	R/W
b2	TTSE	Timing Select E	0: When compare match E occurs in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE 1: When MTU0.TCNT is cleared in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TBTM specifies the timing for transferring data from the buffer register to the timer general register in PWM mode. The MTU has a total of five TBTM registers, one each for MTU0, MTU3, MTU4, MTU6, and MTU7.

TTSA Bit (Timing Select A)

This bit specifies the timing for transferring data from TGRC to TGRA in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSA bit in the channel to 1.

TTSB Bit (Timing Select B)

This bit specifies the timing for transferring data from TGRD to TGRB in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSB bit in the channel to 1.

TTSE Bit (Timing Select E)

This bit specifies the timing for transferring data from MTU0.TGRF to MTU0.TGRE when they are used together for buffer operation.

In MTU3, MTU4, MTU6, and MTU7, this bit is reserved. It is read as 0 and the write value should be 0. When a channel is not set to PWM mode, do not set the TTSE bit in the channel to 1.

10.2.11 Timer Input Capture Control Register (TICCR)

Address(es): MTU1.TICCR H'E8041390

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	I2BE	I2AE	I1BE	I1AE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	I1AE	Input Capture Enable	0: Does not include the MTIOC1A pin in the MTU2.TGRA input capture conditions 1: Includes the MTIOC1A pin in the MTU2.TGRA input capture conditions	R/W
b1	I1BE	Input Capture Enable	0: Does not include the TMTIOC1B pin in the MTU2.TGRB input capture conditions 1: Includes the MTIOC1B pin in the MTU2.TGRB input capture conditions	R/W
b2	I2AE	Input Capture Enable	0: Does not include the MTIOC2A pin in the MTU1.TGRA input capture conditions 1: Includes the MTIOC2A pin in the MTU1.TGRA input capture conditions	R/W
b3	I2BE	Input Capture Enable	0: Does not include the MTIOC2B pin in the MTU1.TGRB input capture conditions 1: Includes the MTIOC2B pin in the MTU1.TGRB input capture conditions	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TICCR specifies input capture conditions when MTU1.TCNT and MTU2.TCNT are cascaded. The MTU has one TICCR for MTU1.

10.2.12 Timer Synchronous Clear Register (TSYCR)

Address(es): MTU6.TSYCR H'E8041A50

	b7	b6	b5	b4	b3	b2	b1	b0
	CE0A	CE0B	CE0C	CE0D	CE1A	CE1B	CE2A	CE2B
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CE2B	Clear Enable 2B	0: Disables counter clearing by the MTU2.TGIB2 interrupt generation timing. 1: Enables counter clearing by the MTU2.TGIB2 interrupt generation timing.	R/W
b1	CE2A	Clear Enable 2A	0: Disables counter clearing by the MTU2.TGIA2 interrupt generation timing*1. 1: Enables counter clearing by the MTU2.TGIA2 interrupt generation timing*1.	R/W
b2	CE1B	Clear Enable 1B	0: Disables counter clearing by the MTU1.TGIB1 interrupt generation timing*1. 1: Enables counter clearing by the MTU1.TGIB1 interrupt generation timing*1.	R/W
b3	CE1A	Clear Enable 1A	0: Disables counter clearing by the MTU1.TGIA1 interrupt generation timing*1. 1: Enables counter clearing by the MTU1.TGIA1 interrupt generation timing*1.	R/W
b4	CE0D	Clear Enable 0D	0: Disables counter clearing by the MTU0.TGID0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGID0 interrupt generation timing*1.	R/W
b5	CE0C	Clear Enable 0C	0: Disables counter clearing by the MTU0.TGIC0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGIC0 interrupt generation timing*1.	R/W
b6	CE0B	Clear Enable 0B	0: Disables counter clearing by the MTU0.TGIB0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGIB0 interrupt generation timing*1.	R/W
b7	CE0A	Clear Enable 0A	0: Disables counter clearing by the MTU0.TGIA0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGIA0 interrupt generation timing*1.	R/W

Note 1. This does not depend on the TIERn.TGIEm bit setting. (n = 0, 1, 2; m = A, B, C, D)

TSYCR specifies synchronous clear conditions for MTU6.TCNT and MTU7.TCNT. The MTU has one TSYCR for MTU1.

CEnm Bits (Clear Enable nm; n = 0, 1, 2; m = A, B, C, D)

These bits enable or disable counter clearing by the MTUn.TGImn interrupt generation timing.

10.2.13 Timer Counter (TCNT)

- MTU0.TCNT to MTU7.TCNT

Address(es): MTU0.TCNT H'E8041306, MTU1.TCNT H'E8041386, MTU2.TCNT H'E8041406, MTU3.TCNT H'E8041210, MTU4.TCNT H'E8041212, MTU5.TCNTU H'E8041C80, MTU5.TCNTV H'E8041C90, MTU5.TCNTW H'E8041CA0, MTU6.TCNT H'E8041A10, MTU7.TCNT H'E8041A12

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: TCNT must not be accessed in eight bits; it should be accessed in 16 bits.

- MTU8.TCNT

Address(es): MTU8.TCNT H'E8041608

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: TCNT must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

MTU0.TCNT to MTU7.TCNT are 16-bit readable/writable counters and MTU8.TCNT is a 32-bit readable/writable counter. The MTU has a total of 11 TCNT counters, one each for MTU0 to MTU4, MTU6, MTU7, and MTU8 and three (TCNTU, TCNTV, and TCNTW) for MTU5. The TCNT counters in MTU0 to MTU4, MTU6, and MTU7 are initialized to 0000h by a reset, and the TCNT counter in MTU8 is initialized to 00000000h by a reset. The TCNTU, TCNTV, and TCNTW counters in MTU5 are initialized to 0000h by a reset. In MTU0 to MTU4, MTU6, and MTU7, the TCNT counters must not be accessed in 8-bit units; they should be accessed in 16-bit units. The MTU8.TCNT counter must not be accessed in 8- or 16-bit units; it should be accessed in 32-bit units.
The MTU1.TCNT and MTU2.TCNT counters are read as 0000h when TMDR3.LWA is 1. See section 10.2.5, Timer Mode Register 3 (TMDR3) for details.

10.2.14 Timer Longword Counter (TCNTLW)

Address(es): MTU1.TCNTLW H'E80413A0

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: TCNTLW must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

The TCNTLW counter is a 32-bit readable/writable counter. Only one counter of this type is provided, and is formed by combining MTU1.TCNT and MTU2.TCNT. Such operation is only effective when TMDR3.LWA is 1. The TCNTLW counter is initialized to 0000 0000h by a reset. This counter is read as 0000 0000h when TMDR3.LWA is 0. See section 10.2.5, Timer Mode Register 3 (TMDR3) for details. This register can only be used in 32-bit phase counting mode.

10.2.15 Timer General Register (TGR)

- MTU0.TGR to MTU7.TGR

Address(es): MTU0.TGRA H'E8041308, MTU0.TGRB H'E804130A, MTU0.TGRC H'E804130C, MTU0.TGRD H'E804130E, MTU0.TGRE H'E8041320, MTU0.TGRF H'E8041322,
MTU1.TGRA H'E8041388, MTU1.TGRB H'E804138A,
MTU2.TGRA H'E8041408, MTU2.TGRB H'E804140A,
MTU3.TGRA H'E8041218, MTU3.TGRB H'E804121A, MTU3.TGRC H'E8041224, MTU3.TGRD H'E8041226, MTU3.TGRE H'E8041272
MTU4.TGRA H'E804121C, MTU4.TGRB H'E804121E, MTU4.TGRC H'E8041228, MTU4.TGRD H'E804122A, MTU4.TGRE H'E8041274, MTU4.TGRF H'E8041276,
MTU5.TGRU H'E8041C82, MTU5.TGRV H'E8041C92, MTU5.TGRW H'E8041CA2,
MTU6.TGRA H'E8041A18, MTU6.TGRB H'E8041A1A, MTU6.TGRC H'E8041A24, MTU6.TGRD H'E8041A26, MTU6.TGRE H'E8041A72,
MTU7.TGRA H'E8041A1C, MTU7.TGRB H'E8041A1E, MTU7.TGRC H'E8041A28, MTU7.TGRD H'E8041A2A, MTU7.TGRE H'E8041A74, MTU7.TGRF H'E8041A76

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TGR must not be accessed in eight bits; it should be accessed in 16 bits. The initial value of TGR is FFFFh.

- MTU8.TGR

Address(es): MTU8.TGRA H'E804160C, MTU8.TGRB H'E8041610, MTU8.TGRC H'E8041614, MTU8.TGRD H'E8041618

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TGR must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

The MTU0.TGR to MTU7.TGR registers are 16-bit readable/writable registers; the MTU8.TGR register is a 32-bit readable/writable register. The MTU has a total of 39 TGR registers, six for MTU0, two each for MTU1 and MTU2, five each for MTU3 and MTU6, six each for MTU4 and MTU7, three for MTU5 and four for MTU8.
The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.
MTU0.TGRE and MTU0.TGRF function as compare registers. When the MTU0.TCNT count matches the MTU0.TGRE value, an A/D converter start request can be issued. The TGRF register can also be designated for operation as a buffer register. TGR buffer register combination is TGRE and TGRF. MTU5.TGRU, MTU5.TGRV, and MTU5.TGRW function as compare match, input capture, or external pulse width measurement registers.
The MTU1.TGRA, MTU2.TGRA, MTU1.TGRB, and MTU2.TGRB registers are read as 0000h when TMDR3.LWA is 1. See section 10.2.5, Timer Mode Register 3 (TMDR3) for details.

10.2.16 Timer Longword General Registers (TGRALW and TGRBLW)

Address(es): MTU1.TGRALW H'E80413A4, MTU1.TGRBLW H'E80413A8

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TGRALW and TGRBLW must not be accessed in 8 or 16 bits; they should be accessed in 32 bits.

The TGRALW (TGRBLW) register is a 32-bit readable/writable register. Two general registers of this type are provided, and are formed by combining the TGRA (TGRB) registers in MTU1 and MTU2. Such operation is only effective when TMDR3.LWA is 1.

The TGRALW (TGRBLW) register is initialized to FFFF FFFFh by a reset, but it is read as 0000 0000h when TMDR3.LWA is 0. See section 10.2.5, Timer Mode Register 3 (TMDR3) for details.

The TGRALW (TGRBLW) register functions as an output compare or input capture register when TMDR3.LWA is 1. This register can only be used in 32-bit phase counting mode.

10.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR)

- MTU.TSTRA (MTU0, MTU1, MTU2, MTU3, MTU4, MTU8)

Address(es): MTU.TSTRA H'E8041280

	b7	b6	b5	b4	b3	b2	b1	b0
	CST4	CST3	—	—	CST8	CST2	CST1	CST0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CST0	Counter Start 0	0: MTU0.TCNT counting is stopped 1: MTU0.TCNT performs count operation	R/W
b1	CST1	Counter Start 1	0: MTU1.TCNT counting is stopped 1: MTU1.TCNT performs count operation	R/W
b2	CST2	Counter Start 2	0: MTU2.TCNT counting is stopped 1: MTU2.TCNT performs count operation	R/W
b3	CST8	Counter start 8	0: MTU8.TCNT counting is stopped 1: MTU8.TCNT performs count operation.	R/W
b5, b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	CST3	Counter Start 3	0: MTU3.TCNT counting is stopped 1: MTU3.TCNT performs count operation	R/W
b7	CST4	Counter Start 4	0: MTU4.TCNT counting is stopped 1: MTU4.TCNT performs count operation	R/W

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRA is also set to 1 automatically.

The TSTRA register starts or stops TCNT operation in MTU0 to MTU4 and MTU8.
TSTRA starts or stops TCNT operation in MTU0 to MTU4.
TSTRB starts or stops TCNT operation in MTU6 and MTU7.
TSTR starts or stops TCNT operation in MTU5.
Before setting the operating mode in TMDR1 or setting the TCNT count clock in TCR, be sure to stop the TCNT counting.

CSTn Bits (Counter Start n) (n = 0, 1, 2, 3, 4, 8)

Each bit starts or stops TCNT in the corresponding channel.
If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. In this case, the initial output value specified by the TOCR1A or TOCR2A register is output from the MTIOC pin in complementary PWM mode or reset-synchronized PWM mode.
In the other modes, the level of the output compare signal from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the level of output from the pin will be updated to the specified initial output value.

- MTU.TSTRB(MTU6, MTU7)

Address(es): MTU.TSTRB H'E8041A80

	b7	b6	b5	b4	b3	b2	b1	b0
	CST7	CST6	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	CST6	Counter Start 6	0: MTU6.TCNT counting is stopped 1: MTU6.TCNT performs count operation	R/W
b7	CST7	Counter Start 7	0: MTU7.TCNT counting is stopped 1: MTU7.TCNT performs count operation	R/W

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRB is also set to 1 automatically.

CSTn Bits (Counter Start n) (n = 6, 7)

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. In this case, the initial output value specified by the TOCR1B or TOCR2B register is output from the MTIOC pin in complementary PWM mode or reset-synchronized PWM mode.

In the other modes, the level of the output compare signal from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the level of output from the pin will be updated to the specified initial output value.

- MTU5.TSTR(MTU5)

Address(es): MTU5.TSTR H'E8041CB4

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	CSTU5	CSTV5	CSTW5
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CSTW5	Counter Start W5	0: MTU5.TCNTW counting is stopped 1: MTU5.TCNTW performs count operation	R/W
b1	CSTV5	Counter Start V5	0: MTU5.TCNTV counting is stopped 1: MTU5.TCNTV performs count operation	R/W
b2	CSTU5	Counter Start U5	0: MTU5.TCNTU counting is stopped 1: MTU5.TCNTU performs count operation	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

10.2.18 Timer Synchronous Registers (TSYRA and TSYRB)

- MTU.TSYRA(MTU0, MTU1, MTU2, MTU3, MTU4)

Address(es): MTU.TSYRA H'E8041281

	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC4	SYNC3	—	—	—	SYNC2	SYNC1	SYNC0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SYNC0	Timer Synchronous Operation 0	0: MTU0.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU0.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)	R/W
b1	SYNC1	Timer Synchronous Operation 1	0: MTU1.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU1.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)	R/W
b2	SYNC2	Timer Synchronous Operation 2	0: MTU2.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU2.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)	R/W
b5 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	SYNC3	Timer Synchronous Operation 3	0: MTU3.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU3.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)	R/W
b7	SYNC4	Timer Synchronous Operation 4	0: MTU4.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU4.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)	R/W

TSYRA selects independent operation or synchronous operation of TCNT in MTU0 to MTU4.
TSYRB selects independent operation or synchronous operation of TCNT in MTU6 and MTU7.
A channel performs synchronous operation when the corresponding bit in TSYR is set to 1.

SYNCn Bits (Timer Synchronous Operation n) (n = 0, 1, 2, 3, 4)

Each bit selects whether operation is independent of or synchronized with other channels.
When synchronous operation is selected, the TCNT synchronous setting of multiple channels and synchronous clearing by counter clearing on another channel are possible.
To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of the TCR.CCLR[2:0] bits.

- MTU.TSYRB(MTU6, MTU7)

Address(es): MTU.TSYRB H'E8041A81

	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC7	SYNC6	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	SYNC6	Timer Synchronous Operation 6	0: MTU6.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU6.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)	R/W
b7	SYNC7	Timer Synchronous Operation 7	0: MTU7.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU7.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)	R/W

SYNCn Bits (Timer Synchronous Operation n) (n = 6, 7)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous setting of multiple channels and synchronous clearing by counter clearing on another channel are possible.

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits TCR.CCLR[2:0].

10.2.19 Timer Counter Synchronous Start Register (TCSYSTR)

Address(es): MTU.TCSYSTR H'E8041282

	b7	b6	b5	b4	b3	b2	b1	b0
	SCH0	SCH1	SCH2	SCH3	SCH4	—	SCH6	SCH7
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SCH7	Synchronous Start 7	0: Does not specify synchronous start for MTU7.TCNT 1: Specifies synchronous start for MTU7.TCNT	R/(W)*1
b1	SCH6	Synchronous Start 6	0: Does not specify synchronous start for MTU6.TCNT 1: Specifies synchronous start for MTU6.TCNT	R/(W)*1
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R
b3	SCH4	Synchronous Start 4	0: Does not specify synchronous start for MTU4.TCNT 1: Specifies synchronous start for MTU4.TCNT	R/(W)*1
b4	SCH3	Synchronous Start 3	0: Does not specify synchronous start for MTU3.TCNT 1: Specifies synchronous start for MTU3.TCNT	R/(W)*1
b5	SCH2	Synchronous Start 2	0: Does not specify synchronous start for MTU2.TCNT 1: Specifies synchronous start for MTU2.TCNT	R/(W)*1
b6	SCH1	Synchronous Start 1	0: Does not specify synchronous start for MTU1.TCNT 1: Specifies synchronous start for MTU1.TCNT	R/(W)*1
b7	SCH0	Synchronous Start 0	0: Does not specify synchronous start for MTU0.TCNT 1: Specifies synchronous start for MTU0.TCNT	R/(W)*1

Note 1. Only 1 can be written to this bit. It is automatically cleared to 0 when counting begins.

TCSYSTR specifies synchronous start of the counters.

SCH7 Bit (Synchronous Start 7)

This bit controls synchronous start of TCNT in MTU7.

[Clearing condition]

- When the CST7 bit in TSTRB is set to 1 while SCH7 = 1

SCH6 Bit (Synchronous Start 6)

This bit controls synchronous start of TCNT in MTU6.

[Clearing condition]

- When the CST6 bit in TSTRB is set to 1 while SCH6 = 1

SCH4 Bit (Synchronous Start 4)

This bit controls synchronous start of TCNT in MTU4.

[Clearing condition]

- When the CST4 bit in TSTRA is set to 1 while SCH4 = 1

SCH3 Bit (Synchronous Start 3)

This bit controls synchronous start of TCNT in MTU3.

[Clearing condition]

- When the CST3 bit in TSTRA is set to 1 while SCH3 = 1

SCH2 Bit (Synchronous Start 2)

This bit controls synchronous start of TCNT in MTU2.
[Clearing condition]

- When the CST2 bit in TSTRA is set to 1 while SCH2 = 1

SCH1 Bit (Synchronous Start 1)

This bit controls synchronous start of TCNT in MTU1.
[Clearing condition]

- When the CST1 bit in TSTRA is set to 1 while SCH1 = 1

SCH0 Bit (Synchronous Start 0)

This bit controls synchronous start of TCNT in MTU0.
[Clearing condition]

- When the CST0 bit in TSTRA is set to 1 while SCH0 = 1

10.2.20 Timer Read/Write Enable Registers (TRWERA and TRWERB)

Address(es): MTU.TRWERA H'E8041284, MTU.TRWERB H'E8041A84

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RWE
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	RWE	Read/Write Enable	0: Read/write access to the registers is disabled 1: Read/write access to the registers is enabled	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TRWERA enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU3 and MTU4.
TRWERB enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU6 and MTU7.

RWE Bit (Read/Write Enable)

This bit enables or disables access to the registers that have write-protection capability against accidental modification.
[Clearing condition]
When 0 is written to the RWE bit after reading RWE = 1

- Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERA)
  24 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, TOERA, TOCR1A, TOCR2A, TGCRA, TCDRA, TDDRA, and MTUn.TCNT (n = 3, 4)
- Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERB)
  23 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, TOERB, TOCR1B, TOCR2B, TCDRB, TDDRB, and MTUn.TCNT (n = 6, 7)

10.2.21 Timer Output Master Enable Registers (TOERA and TOERB)

- MTU.TOERA

Address(es): MTU.TOERA H'E804120A

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OE4D	OE4C	OE3D	OE4B	OE4A	OE3B
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OE3B	Master Enable MTIOC3B	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b1	OE4A	Master Enable MTIOC4A	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b2	OE4B	Master Enable MTIOC4B	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b3	OE3D	Master Enable MTIOC3D	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b4	OE4C	Master Enable MTIOC4C	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b5	OE4D	Master Enable MTIOC4D	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b7, b6	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note 1. To output the inactive level from each pin when the MTU output is set to disabled, first set the data direction register (PDR) and port output data register (PODR) of I/O ports to output the inactive level from general I/O ports, and then set the port mode register (PMR) to use general I/O ports. For details, refer to section 51, GPIO.

TOERA enables or disables output settings for output pins MTIOC4D, MTIOC4C, MTIOC3D, MTIOC4B, MTIOC4A, and MTIOC3B.

These pins do not output values correctly if the bits of the TOERA register are not appropriately set. Write a desired value to the TOERA register before setting up the TIOR registers in MTU3 and MTU4.

Set the TOERA register after clearing the CST3 and CST4 bits in the TSTRA register to 0 (see Figure 10.44 and Figure 10.48).

- MTU.TOERB

Address(es): MTU.TOERB H'E8041A0A

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OE7D	OE7C	OE6D	OE7B	OE7A	OE6B
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OE6B	Master Enable MTIOC6B	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b1	OE7A	Master Enable MTIOC7A	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b2	OE7B	Master Enable MTIOC7B	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b3	OE6D	Master Enable MTIOC6D	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b4	OE7C	Master Enable MTIOC7C	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b5	OE7D	Master Enable MTIOC7D	0: MTU output is disabled*1 1: MTU output is enabled	R/W
b7, b6	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note 1. To output the inactive level from each pin when the MTU output is set to disabled, first set the data direction register (PDR) and port output data register (PODR) of I/O ports to output the inactive level from general I/O ports, and then set the port mode register (PMR) to use general I/O ports. For details, refer to section 51, GPIO.

TOERB enables or disables output settings for output pins MTIOC7D, MTIOC7C, MTIOC6D, MTIOC7B, MTIOC7A, and MTIOC6B.

These pins do not output values correctly if the bits of the TOERB register are not appropriately set. Write a desired value to the TOERB register before setting up the TIOR registers in MTU6 and MTU7.

Set the TOERB register after clearing the CST6 and CST7 bits in the TSTRB register to 0 (see Figure 10.44 and Figure 10.48).

10.2.22 Timer Output Control Registers 1 (TOCR1A and TOCR1B)

Address(es): MTU.TOCR1A H'E804120E, MTU.TOCR1B H'E8041A0E

	b7	b6	b5	b4	b3	b2	b1	b0
	—	PSYE	—	—	TOCL	TOCS	OLSN	OLSP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OLSP	Output Level Select P*1*3	See Table 10.43.	R/W
b1	OLSN	Output Level Select N*1*3	See Table 10.44.	R/W
b2	TOCS	TOC Select	0: TOCR1j setting is selected (j = A, B) 1: TOCR2j setting is selected	R/W
b3	TOCL	TOC Register Write Protection*2*4	0: Write access to the TOCS, OLSN, and OLSP bits is enabled 1: Write access to the TOCS, OLSN, and OLSP bits is disabled	R/W
b5, b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	PSYE	PWM Synchronous Output Enable	0: Toggle output is disabled 1: Toggle output is enabled	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. Clearing the TOCR1j.TOCS bit to 0 makes this bit setting valid.
Note 2. Setting the TOCR1j.TOCL bit to 1 prevents accidental modification when the CPU goes out of control.
Note 3. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSP bit is valid.
Note 4. This bit can be set to 1 only once after a reset. After 1 is written, 0 cannot be written to the bit.

TOCR1A and TOCR1B enable or disable PWM-synchronized toggle output in complementary PWM mode and reset-synchronized PWM mode, and control inversion of PWM output level.

OLSP Bit (Output Level Select P)

This bit selects the positive-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

OLSN Bit (Output Level Select N)

This bit selects the negative-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

TOCS Bit (TOC Select)

This bit selects either the TOCR1j or TOCR2j (j = A, B) setting to be used for the output level in complementary PWM mode and reset-synchronized PWM mode.

TOCL Bit (TOC Register Write Protection)

This bit enables or disables write access to the TOCS, OLSN, and OLSP bits in TOCR1j (j = A, B).

PSYE Bit (PWM Synchronous Output Enable)

This bit enables or disables toggle output synchronized with the PWM cycle.

Table 10.43 Output Level Select Function

Bit 0	Function			
			Compare Match Output	
OLSP	Initial Output	Active Level	Up-Counting	Down-Counting
0	High level	Low level	Low level	High level
1	Low level	High level	High level	Low level

Table 10.44 Output Level Select Function

Bit 1	Function			
			Compare Match Output	
OLSN	Initial Output	Active Level	Up-Counting	Down-Counting
0	High level	Low level	High level	Low level
1	Low level	High level	Low level	High level

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Figure 10.3 shows an example of output in complementary PWM mode (one phase) when OLSN = 1 and OLSP = 1.

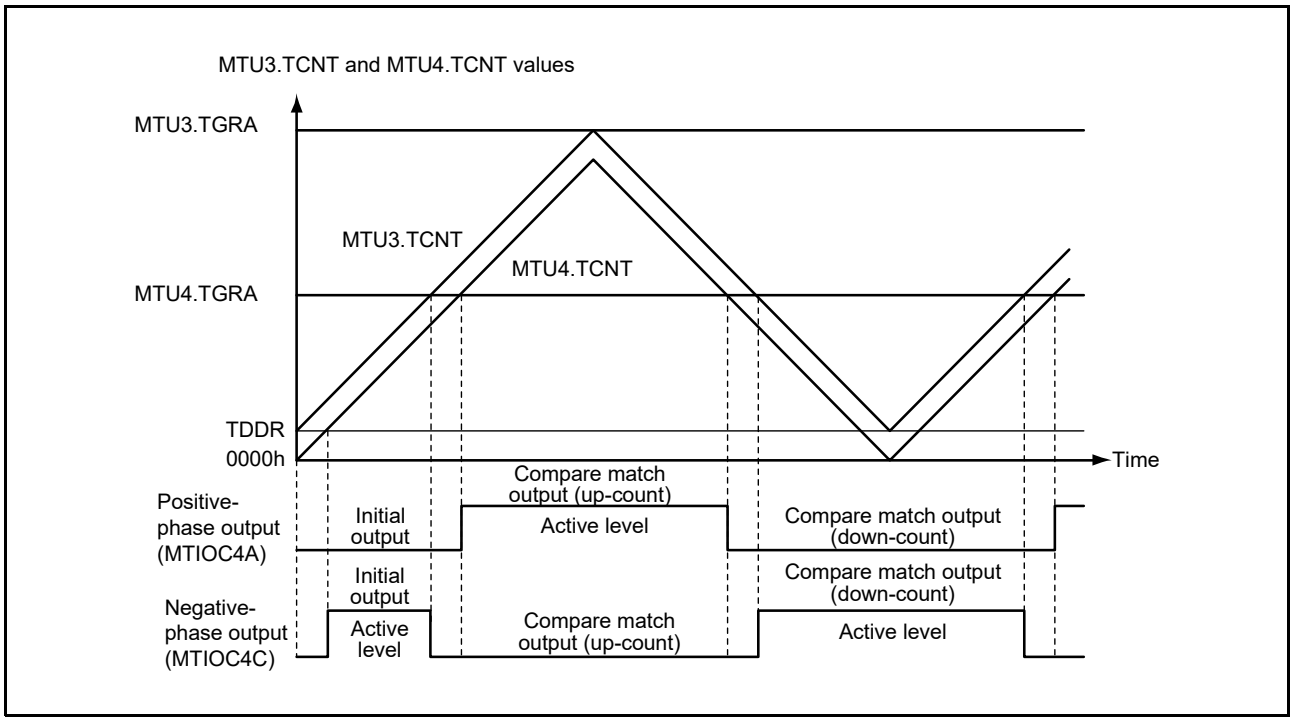

Figure 10.3 Example of Output in Complementary PWM Mode

10.2.23 Timer Output Control Registers 2 (TOCR2A and TOCR2B)

Address(es): MTU.TOCR2A H'E804120F, MTU.TOCR2B H'E8041A0F

	b7	b6	b5	b4	b3	b2	b1	b0
	BF[1:0]		OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OLS1P	Output Level Select 1P*1*2	This bit selects the output level on MTIOC3B or MTIOC6B in reset-synchronized PWM mode and complementary PWM mode. See Table 10.45.	R/W
b1	OLS1N	Output Level Select 1N*1*2	This bit selects the output level on MTIOC3D or MTIOC6D in reset-synchronized PWM mode and complementary PWM mode. See Table 10.46.	R/W
b2	OLS2P	Output Level Select 2P*1*2	This bit selects the output level on MTIOC4A or MTIOC7Ain reset-synchronized PWM mode and complementary PWM mode. See Table 10.47.	R/W
b3	OLS2N	Output Level Select 2N*1*2	This bit selects the output level on MTIOC4C or MTIOC7C in reset-synchronized PWM mode and complementary PWM mode. See Table 10.48.	R/W
b4	OLS3P	Output Level Select 3P*1*2	This bit selects the output level on MTIOC4B or MTIOC7B in reset-synchronized PWM mode and complementary PWM mode. See Table 10.49.	R/W
b5	OLS3N	Output Level Select 3N*1*2	This bit selects the output level on MTIOC4D or MTIOC7D in reset-synchronized PWM mode and complementary PWM mode. See Table 10.50.	R/W
b7, b6	BF[1:0]	TOLBR Buffer Transfer Timing Select	These bits select the timing for transferring data from TOLBRj to TOCR2j. See Table 10.51 for details.	R/W

j = A, B

Note 1. Setting the TOCR1j.TOCS bit to 1 makes this bit setting valid.

Note 2. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSiP bits are valid (i = 1 to 3).

TOCR2A and TOCR2B control inversion of PWM output level in complementary PWM mode and reset-synchronized PWM mode.

The initial output is selected while the counter is stopped.

Table 10.45 MTIOCmB Output Level Select Function

Bit 0	Function

m = 4, 7

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Table 10.51 Setting of TOCR2j.BF[1:0] Bits

Bit 7	Bit 6	Description	
BF1	BF0	Complementary PWM Mode	Reset-Synchronized PWM Mode
0	0	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.
	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest of the MTUn.TCNT count.	Transfers data from the buffer register (TOLBRj) to TOCR2j when MTUm.TCNT or MTUn.TCNT is cleared.
1	0	Transfers data from the buffer register (TOLBRj) to TOCR2j at the trough of the MTUn.TCNT count.	Setting prohibited
	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest and trough of the MTUn.TCNT count.	Setting prohibited

n = 4, 7; m = 3, 6; j = A, B

10.2.24 Timer Output Level Buffer Registers (TOLBRA and TOLBRB)

Address(es): MTU.TOLBRA H'E8041236, MTU.TOLBRB H'E8041A36

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OLS1P	Output Level Select 1P	Specify the buffer value to be transferred to the OLS1P bit in TOCR2j.	R/W
b1	OLS1N	Output Level Select 1N	Specify the buffer value to be transferred to the OLS1N bit in TOCR2j.	R/W
b2	OLS2P	Output Level Select 2P	Specify the buffer value to be transferred to the OLS2P bit in TOCR2j.	R/W
b3	OLS2N	Output Level Select 2N	Specify the buffer value to be transferred to the OLS2N bit in TOCR2j.	R/W
b4	OLS3P	Output Level Select 3P	Specify the buffer value to be transferred to the OLS3P bit in TOCR2j.	R/W
b5	OLS3N	Output Level Select 3N	Specify the buffer value to be transferred to the OLS3N bit in TOCR2j.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

j = A, B

TOLBRA and TOLBRB are buffer registers for TOCR2A and TOCR2B and specify the PWM output level in complementary PWM mode and reset-synchronized PWM mode.

Figure 10.4 shows an example of the PWM output level setting procedure in buffer operation.

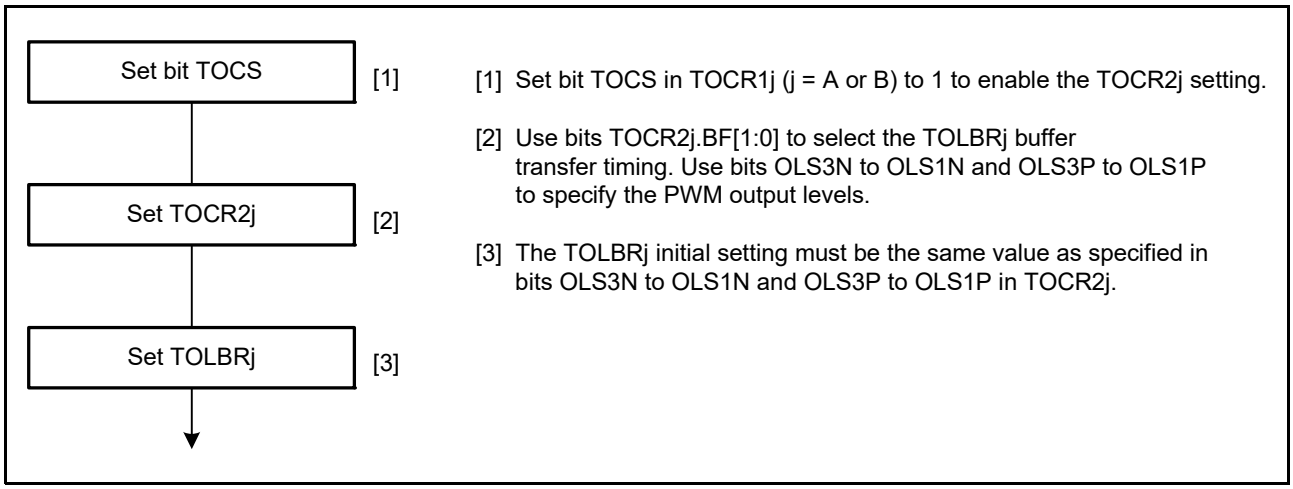

Figure 10.4 Example of PWM Output Level Setting Procedure in Buffer Operation

10.2.25 Timer Gate Control Register A (TGCRA)

Address(es): MTU.TGCRA H'E804120D

	b7	b6	b5	b4	b3	b2	b1	b0
	—	BDC	N	P	FB	WF	VF	UF
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	UF	Output Phase Switch	These bits turn on or off the positive-phase/negative-phase output. The setting of these bits is valid only when the FB bit is set to 1. In this case, the setting of b0 to b2 is used instead of the external input. See Table 10.52.	R/W
b1	VF			R/W
b2	WF			R/W
b3	FB	External Feedback Signal Enable	0: Output is switched by external input (input sources are TGRA, TGRB, and TGRC input capture signals in MTU0) 1: Output is switched by software (TGCRA's UF, VF, and WF settings)	R/W
b4	P	Positive-Phase Output (P) Control	0: Level output 1: Reset-synchronized PWM or complementary PWM output	R/W
b5	N	Negative-Phase Output (N) Control	0: Level output 1: Reset-synchronized PWM or complementary PWM output	R/W
b6	BDC	Brushless DC Motor	0: Ordinary output 1: Functions of this register are effective.	R/W
b7	—	Reserved	This bit is read as 1. The write value should be 1.	R/W

TGCRA controls the output waveform necessary for brushless DC motor control in reset-synchronized PWM mode and complementary PWM mode. TGCRA register settings are ineffective for anything other than complementary PWM mode and reset-synchronized PWM mode.

UF, VF, and WF Bits (Output Phase Switch)

The setting of these bits is valid only when the FB bit is set to 1. In this case, the setting of b0 to b2 is used instead of the external input. See Table 10.52 for details.

FB Bit (External Feedback Signal Enable)

This bit selects whether the positive-/negative-phase output is switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0 or by writing 0 or 1 to bits 2 to 0 in TGCRA.
When the FB bit in the TGCRA register is 0, the output signals from MTU3 and MTU4 are switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0.

P Bit (Positive-Phase Output (P) Control)

This bit selects either the level output or the reset-synchronized PWM/complementary PWM output for the positive-phase output pins (MTIOC3B, MTIOC4A, and MTIOC4B pins).

N Bit (Negative-Phase Output (N) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the negative-phase output pins (MTIOC3D, MTIOC4C, and MTIOC4D pins).

BDC Bit (Brushless DC Motor)

This bit selects whether to make the functions of TGCRA effective or ineffective.

Table 10.52 Output Level Select Function

Bit 2	Bit 1	Bit 0	Function					
			MTIOC3B	MTIOC4A	MTIOC4B	MTIOC3D	MTIOC4C	MTIOC4D
WF	VF	UF	U Phase	V Phase	W Phase	U Phase	V Phase	W Phase
0	0	0	OFF	OFF	OFF	OFF	OFF	OFF
		1	ON	OFF	OFF	OFF	OFF	ON
	1	0	OFF	ON	OFF	ON	OFF	OFF
		1	OFF	ON	OFF	OFF	OFF	ON
1	0	0	OFF	OFF	ON	OFF	ON	OFF
		1	ON	OFF	OFF	OFF	ON	OFF
	1	0	OFF	OFF	ON	ON	OFF	OFF
		1	OFF	OFF	OFF	OFF	OFF	OFF

10.2.26 Timer Subcounters (TCNTSA and TCNTSB)

Address(es): MTU.TCNTSA H'E8041220, MTU.TCNTSB H'E8041A20

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: TCNTSA and TCNTSB must not be accessed in eight bits; it should be accessed in 16 bits.

TCNTSA and TCNTSB are 16-bit read-only counters that are used only in complementary PWM mode.
The initial value of TCNTSA and TCNTSB after a reset is 0000h.

10.2.27 Timer Cycle Data Registers (TCDRA and TCDRB)

Address(es): MTU.TCDRA H'E8041214, MTU.TCDRB H'E8041A14

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TCDRA and TCDRB must not be accessed in eight bits; it should be accessed in 16 bits.

TCDRA and TCDRB are 16-bit readable/writable registers used only in complementary PWM mode. Set half the PWM carrier cycle as the TCDRA and TCDRB values. The TCDRA and TCDRB registers are constantly compared with the TCNTSA and TCNTSB counters in complementary PWM mode, respectively. When a match occurs, the TCNTSA and TCNTSB counters switch the count direction (down-count to up-count). The initial value of TCDRA and TCDRB after a reset is FFFFh.

10.2.28 Timer Cycle Buffer Registers (TCBRA and TCBRB)

Address(es): MTU.TCBRA H'E8041222, MTU.TCBRB H'E8041A22

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TCBRA and TCBRB must not be accessed in eight bits; it should be accessed in 16 bits.

TCBRA and TCBRB are 16-bit readable/writable registers, used only in complementary PWM mode, that function as buffer registers for TCDRA and TCDRB. The TCBRA and TCBRB values are transferred to TCDRA and TCDRB with the transfer timing set in TMDR1. The initial value of TCBRA and TCBRB after a reset is FFFFh.

10.2.29 Timer Dead Time Data Registers (TDDRA and TDDRB)

Address(es): MTU.TDDRA H'E8041216, MTU.TDDRB H'E8041A16

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TDDRA and TDDRB must not be accessed in eight bits; it should be accessed in 16 bits.

TDDRA and TDDRB are 16-bit readable/writable registers, used only in complementary PWM mode, that specify the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counter offset value. In complementary PWM mode, when the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counters are cleared and then restarted, the TDDRA (TDDRB) value is loaded into the MTU3.TCNT (MTU6.TCNT) counter and the count operation starts. The initial value of TDDRA and TDDRB after a reset is FFFFh.

10.2.30 Timer Dead Time Enable Registers (TDERA and TDERB)

Address(es): MTU.TDERA H'E8041234, MTU.TDERB H'E8041A34

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TDER
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	TDER	Dead Time Enable	0: No dead time is generated 1: Dead time is generated*1	R/(W)
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. TDDRA and TDDRB must be set to 1 or a larger value.

TDERA and TDERB control dead time generation in complementary PWM mode. The MTU has one TDER each for MTU3 and MTU6. TDERA and TDERB should be modified only while TCNT stops.

TDER Bit (Dead Time Enable)

This bit specifies whether to generate dead time.

[Clearing condition]

- When 0 is written to TDER after reading TDER = 1

10.2.31 Timer Buffer Transfer Set Registers (TBTERA and TBTERB)

Address(es): MTU.TBTERA H'E8041232, MTU.TBTERB H'E8041A32

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	BTE[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	BTE[1:0]	Buffer Transfer Disable and Interrupt Skipping Link Setting	These bits enable or disable transfer from the buffer registers*1 used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping function 1. For details, see Table 10.53.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Applicable buffer registers (TBTERA):
MTU3.TGRC, MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, and TCBRA
Applicable buffer registers (TBTERB):
MTU6.TGRC, MTU6.TGRD, MTU7.TGRC, MTU7.TGRD, and TCBRB

TBTERA and TBTERB enable or disable transfer from the buffer registers used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping 1 operation.

Table 10.53 Setting of BTE[1:0] Bits in TBTERA and TBTERB

Bit 1	Bit 0	
BTE1	BTE0	Description
0	0	Enables transfer from the buffer registers to the temporary registers*1 and does not link the transfer with interrupt skipping function 1.
	1	Disables transfer from the buffer registers to the temporary registers.
1	0	Links transfer from the buffer registers to the temporary registers with interrupt skipping function 1.*2
	1	Setting prohibited

Note 1. Data is transferred according to the MD3 to MD0 bit setting in TMDR1. For details, refer to section 10.3.8, Complementary PWM Mode.

Note 2. When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits are cleared to 0 in the timer interrupt skipping set register (TITCR1A (TITCR1B)) or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), be sure to disable link of buffer transfer with interrupt skipping (clear the BTE1 bit in the timer buffer transfer set register (TBTERA (TBTERB)) to 0). If link with interrupt skipping is enabled while interrupt skipping is disabled, buffer transfer will not be performed.

10.2.32 Timer Waveform Control Registers (TWCRA and TWCRB)

Address(es): MTU.TWCRA H'E8041260, MTU.TWCRB H'E8041A60

	b7	b6	b5	b4	b3	b2	b1	b0
	CCE	—	—	—	—	—	SCC	WRE
Value after reset:	0*2	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	WRE	Waveform Retain Enable	0: Initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output 1: Initial output is inhibited	R/(W) *3
b1	SCC*1*3	Synchronous Clearing Control	(Only valid in register TWCRB) 0: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is enabled. 1: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is disabled.	R/(W)
b6 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	CCE*2	Compare Match Clear Enable	0: Counters are not cleared at MTU3.TGRA (MTU6.TGRA) compare match 1: Counters are cleared at MTU3.TGRA (MTU6.TGRA) compare match	R/(W)

Note 1. This bit is only valid in register TWCRB and is a reserved bit in register TWCRA.
Note 2. Do not set to 1 when complementary PWM mode 1 is not selected.
Note 3. Do not set to 1 when complementary PWM mode is not selected.

TWCRA and TWCRB control the output waveform when synchronous counter clearing occurs in MTU3.TNCT and MTU4.TNCT (MTU6.TNCT and MTU7.TNCT) in complementary PWM mode and specifies whether to clear the counters at MTU3.TGRA (MTU6.TGRA) compare match.
The CCE bit and WRE bit in TWCRA and TWCRB should be modified only while TCNT stops.

WRE Bit (Waveform Retain Enable)

This bit selects the waveform output when synchronous counter clearing occurs in complementary PWM mode.
The initial output is inhibited with this function only when synchronous clearing occurs within the Tb interval at the trough in complementary PWM mode. When synchronous clearing occurs outside this interval, the initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output regardless of the WRE bit setting. The initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are also output when synchronous clearing occurs in the Tb interval at the trough immediately after MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) start operation.
For the Tb interval at the trough in complementary PWM mode, see Figure 10.50.
[Setting condition]

- When 1 is written to the WRE bit after reading WRE = 0

SCC Bit (Synchronous Clearing Control)

The setting of this bit selects whether MTU6.TCNT and MTU7.TCNT are or are not cleared when counter-synchronous clearing is generated for MTU0, MTU1, MTU2–MTU6, MTU7 in complementary PWM mode.
Make the complementary PWM mode settings for MTU6 and MTU7 when this function is in use. When writing a new value to the SCC bit while the counter is operating, do not change the values of the CCE and WRE bits.
Synchronous clearing from the MTU module only becomes disabled due to the setting of the SCC bit when synchronous clearing is generated outside the Tb interval in the trough. If synchronous clearing is generated within the Tb interval in the trough including immediately after the value at which MTU6.TCNT and MTU7.TCNT start, MTU6.TCNT and MTU7.TCNT are cleared.
Regarding the Tb interval in the trough in complementary PWM mode, see Figure 10.50.

[Setting condition]

- Writing of 1 to the SCC bit after reading it as 0

The corresponding bit in register TWCRA is reserved and is read as 0. When writing to TWCRA, write 0 to this bit.

CCE Bit (Compare Match Clear Enable)

This bit specifies whether to clear counters at MTU3.TGRA (MTU6.TGRA) compare match in complementary PWM mode.

[Setting condition]

- When 1 is written to CCE after reading CCE = 0

10.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C)

- MTU0.NFCR0, MTU1.NFCR1, MTU2.NFCR2, MTU3.NFCR3, MTU4.NFCR4, MTU6.NFCR6, MTU7.NFCR7, MTU8.NFCR8

Address(es): MTU0.NFCR0 H'E8041290, MTU1.NFCR1 H'E8041291, MTU2.NFCR2 H'E8041292, MTU3.NFCR3 H'E8041293, MTU4.NFCR4 H'E8041294, MTU6.NFCR6 H'E8041A93, MTU7.NFCR7 H'E8041A94, MTU8.NFCR8 H'E8041298

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	NFAEN	Noise Filter A Enable	0: The noise filter for the MTIOCnA pin is disabled. 1: The noise filter for the MTIOCnA pin is enabled.	R/W
b1	NFBEN	Noise Filter B Enable	0: The noise filter for the MTIOCnB pin is disabled. 1: The noise filter for the MTIOCnB pin is enabled.	R/W
b2	NFCEN	Noise Filter C Enable	0: The noise filter for the MTIOCnC pin is disabled. 1: The noise filter for the MTIOCnC pin is enabled.	R/W *1
b3	NFDEN	Noise Filter D Enable	0: The noise filter for the MTIOCnD pin is disabled. 1: The noise filter for the MTIOCnD pin is enabled.	R/W *1
b5, b4	NFCS[1:0]	Noise Filter Clock Select	b5 b4 0 0: P1φ/1 0 1: P1φ/8 1 0: P1φ/32 1 1: Clock source for counting	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. These bits are reserved in the NFCR1 and NFCR2 registers. These bits are read as 0 and writing to them has no effect.

The NFCRn register (n = 0 to 4, 6, 7, or 8) specifies the noise filter function of the input capture input pin of the corresponding channel.

NFAEN Bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTIOCnA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFBEN Bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTIOCnB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCEN Bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTIOCnC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFDEN Bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTIOCnD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function. When the NFCS[1:0] bits are set to 11b, i.e. selecting the external clock as the source to drive counting, wait for two cycles of the external clock before setting the input capture function.

- MTU0.NFCRC

Address(es): MTU0.NFCRC H'E8041299

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	NFAEN	Noise Filter A Enable	0: The noise filter for the MTCLKA pin is disabled. 1: The noise filter for the MTCLKA pin is enabled.	R/W
b1	NFBEN	Noise Filter B Enable	0: The noise filter for the MTCLKB pin is disabled. 1: The noise filter for the MTCLKB pin is enabled.	R/W
b2	NFCEN	Noise Filter C Enable	0: The noise filter for the MTCLKC pin is disabled. 1: The noise filter for the MTCLKC pin is enabled.	R/W
b3	NFDEN	Noise Filter D Enable	0: The noise filter for the MTCLKD pin is disabled. 1: The noise filter for the MTCLKD pin is enabled.	R/W
b5, b4	NFCS[1:0]	Noise Filter Clock Select	b5 b4 0 0: P1φ/1 0 1: P1φ/2 1 0: P1φ/8 1 1: P1φ/32	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The NFCRC register is used in common with all channels and specifies the noise filter function of the external clock pins.

NFAEN Bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTCLKA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFBEN Bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTCLKB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCEN Bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTCLKC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFDEN Bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTCLKD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. After setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval to set the input capture function.

10.2.34 Noise Filter Control Register 5 (NFCR5)

Address(es): MTU5.NFCR5 H'E8041A95

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		—	NFWEN	NFVEN	NFUEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	NFUEN	Noise Filter U Enable	0: The noise filter for the MTIC5U pin is disabled. 1: The noise filter for the MTIC5U pin is enabled.	R/W
b1	NFVEN	Noise Filter V Enable	0: The noise filter for the MTIC5V pin is disabled. 1: The noise filter for the MTIC5V pin is enabled.	R/W
b2	NFWEN	Noise Filter W Enable	0: The noise filter for the MTIC5W pin is disabled. 1: The noise filter for the MTIC5W pin is enabled.	R/W
b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5, b4	NFCS[1:0]	Noise Filter Clock Select	b5 b4 0 0: P1φ/1 0 1: P1φ/8 1 0: P1φ/32 1 1: Clock source for counting	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

NFUEN Bit (Noise Filter U Enable)

This bit disables or enables the noise filter for input from the MTIC5U pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFVEN Bit (Noise Filter V Enable)

This bit disables or enables the noise filter for input from the MTIC5V pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFWEN Bit (Noise Filter W Enable)

This bit disables or enables the noise filter for input from the MTIC5W pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

10.2.35 Timer A/D Converter Start Request Control Register (TADCR)

- MTU4.TADCR

Address(es): MTU4.TADCR H'E8041240

b3	ITA3AE	TGIA3 Interrupt Skipping Link Enable*1*2*3	0: A/D converter start request signal TRG4AN and TGIA3 interrupt skipping 1 are not linked 1: A/D converter start request signal TRG4AN and TGIA3 interrupt skipping 1 are linked	R/W
b4	DT4BE	Down-Count TRG4BN Enable*3	0: A/D converter start requests (TRG4BN) disabled during MTU4.TCNT down-count operation 1: A/D converter start requests (TRG4BN) enabled during MTU4.TCNT down-count operation	R/W
b5	UT4BE	Up-Count TRG4BN Enable	0: A/D converter start requests (TRG4BN) disabled during MTU4.TCNT up-count operation 1: A/D converter start requests (TRG4BN) enabled during MTU4.TCNT up-count operation	R/W
b6	DT4AE	Down-Count TRG4AN Enable*3	0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT down-count operation 1: A/D converter start requests (TRG4AN) enabled during MTU4.TCNT down-count operation	R/W
b7	UT4AE	Up-Count TRG4AN Enable	0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT up-count operation 1: A/D converter up requests (TRG4AN) enabled during MTU4.TCNT down-count operation	R/W
b13 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15, b14	BF[1:0]	MTU4.TADCOBRA/TADCOBRB Transfer Timing Select	See Table 10.54 for details. These bits specify the transfer timing from MTU4.TADCOBRA and MTU4.TADCOBRB to MTU4.TADCORA and MTU4.TADCORB.	R/W

Note: The TADCR register in MTU4 must not be accessed in eight bits; it should be accessed in 16 bits.
Note 1. Clear the bit to 0 when interrupt skipping is disabled (the T3AEN or T4VEN bit in TITCR1A is cleared to 0 or the T3ACOR or T4VCOR bits in TITCR1A are cleared to 0).
Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.
Note 3. Clear the bit to 0 when complementary PWM mode is not selected.

TADCR enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping function. The MTU has one TADCR each for MTU4 and MTU7.

Table 10.54 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU4)

Bit 15	Bit 14	Description			
BF[1]	BF[0]	Complementary PWM Mode	Reset-Synchronized PWM Mode	PWM Mode 1	Normal Mode
0	0	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).
0	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the crest of the TCNT count in MTU4.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU3.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU4.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU4.
1	0	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the trough of the TCNT count in MTU4.	Setting prohibited	Setting prohibited	Setting prohibited
1	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the crest and trough of the TCNT count in MTU4.	Setting prohibited	Setting prohibited	Setting prohibited

b13 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15, b14	BF[1:0]	MTU7.TADCOBRA/TADCOBRB Transfer Timing Select	See Table 10.55 for details. These bits specify the transfer timing from MTU7.TADCOBRA and MTU7.TADCOBRB to MTU7.TADCORA and MTU7.TADCORB.	R/W

Note: The TADCR register in MTU7 must not be accessed in eight bits; it should be accessed in 16 bits.
Note 1. Clear the bit to 0 when interrupt skipping is disabled (the T6AEN or T7VEN bit in TITCR1B is cleared to 0 or the T6ACOR or T7VCOR bits in TITCR1B are cleared to 0).
Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.
Note 3. Clear the bit to 0 when complementary PWM mode is not selected.

Table 10.55 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU7)

Bit 15	Bit 14	Description			
BF[1]	BF[0]	Complementary PWM Mode	Reset-Synchronized PWM Mode	PWM Mode 1	Normal Mode
0	0	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).
0	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the crest of the TCNT count in MTU7.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU6.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU7.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU7.
1	0	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the trough of the TCNT count in MTU7.	Setting prohibited	Setting prohibited	Setting prohibited
1	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the crest and trough of the TCNT count in MTU7.	Setting prohibited	Setting prohibited	Setting prohibited

10.2.36 Timer A/D Converter Start Request Cycle Set Registers (TADCORA and TADCORB)

Address(es): MTU4.TADCORA H'E8041244, MTU4.TADCORB H'E8041246, MTU7.TADCORA H'E8041A44, MTU7.TADCORB H'E8041A46

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TADCORA and TADCORB must not be accessed in eight bits; it should be accessed in 16 bits.

Note 1. When the A/D converter start request delaying function linked with skipping function 1 (for details, see section 10.3.9 (5) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1) is used, the value of this register should be 0002h to TCDRA setting - 2 in MTU4 and 0002h to TCDRB setting - 2 in MTU7.

Note 2. When interrupt skipping function 2 is used and the difference between the TADCORA value and the TADCORB value is small, the skipping count may not be counted correctly and the A/D converter start request may not be generated with the expected timing in some cases. The TADCORA and TADCORB values should satisfy the following conditions.

(1) When skipping function 2 is specified with the skipping count set to 0
- The difference between the TADCORA and TADCORB values should be equal to or greater than 4.
- The TADCORA compare interval should be equal to or greater than 4 P1φ cycles (the TADCORA update value should be the previous value + 4 or greater, or previous value - 4 or smaller).
- The TADCORB compare interval should be equal to or greater than 4 P1φ cycles (the TADCORB update value should be the previous value + 4 or greater, or previous value - 4 or smaller).

(2) When skipping function 2 is specified with the skipping count set to 1 or greater
- The difference between the TADCORA and TADCORB values should be equal to or greater than 2.
- The TADCORB compare interval should be equal to or greater than 2 P1φ cycles (the TADCORB update value should be the previous value + 2 or greater, or previous value - 2 or smaller).

TADCORA and TADCORB are 16-bit readable/writable registers that issue a corresponding A/D converter start request when the MTUn.TCNT (n = 4, 7) count reaches the value in TADCORA or TADCORB.
MTUn.TADCORA and TADCORB are initialized to FFFFh by a reset.

10.2.37 Timer A/D Converter Start Request Cycle Set Buffer Registers (TADCOBRA and TADCOBRB)

Address(es): MTU4.TADCORA H'E8041248, MTU4.TADCORB H'E804124A, MTU7.TADCORA H'E8041A48, MTU7.TADCORB H'E8041A4A

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TADCOBRA and TADCOBRB must not be accessed in eight bits; it should be accessed in 16 bits.

TADCOBRA and TADCOBRB are 16-bit readable/writable registers whose values are transferred to TADCORA and TADCORB, respectively, when the crest or trough of the MTUn.TCNT count is reached.
TADCOBRA and TADCOBRB are initialized to FFFFh by a reset.

10.2.38 Timer Interrupt Skipping Mode Registers (TITMRA and TITMRB)

Address(es): MTU.TITMRA H'E804123A, MTU.TITMRB H'E8041A3A

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TITM
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TITM	Interrupt Skipping Function Select	Selects one of the two types of interrupt skipping functions. 0: Selects interrupt skipping function 1*1 1: Selects interrupt skipping function 2*2	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. TITCR1A or TITCR1B is used to enable interrupt skipping function 1.
Note 2. TITCR2A or TITCR2B is used to enable interrupt skipping function 2.

TITMRA and TITMRB are used to select either of two skipping functions for the TITMRA and TITMRB registers.

10.2.39 Timer Interrupt Skipping Set Registers 1 (TITCR1A and TITCR1B)

- MTU.TITCR1A

Address(es): MTU.TITMRA H'E8041230

	b7	b6	b5	b4	b3	b2	b1	b0
	T3AEN	T3ACOR[2:0]			T4VEN	T4VCOR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	T4VCOR[2:0]	TCIV4 Interrupt Skipping Count Setting	These bits specify the TCIV4 interrupt skipping count within the range from 0 to 7.*1 For details, see Table 10.56.	R/W
b3	T4VEN	T4VEN	0: TCIV4 interrupt skipping disabled 1: TCIV4 interrupt skipping enabled	R/W
b6 to b4	T3ACOR[2:0]	TGIA3 Interrupt Skipping Count Setting	These bits specify the TGIA3 interrupt skipping count within the range from 0 to 7. For details, see Table 10.57.	R/W
b7	T3AEN	T3AEN	0: TGIA3 interrupt skipping disabled 1: TGIA3 interrupt skipping enabled	R/W

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to clear the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0 to clear the skipping counter (TITCNT1A).

- MTU.TITCR1B

Address(es): MTU.TITCR1B H'E8041A30

	b7	b6	b5	b4	b3	b2	b1	b0
	T6AEN	T6ACOR[2:0]			T7VEN	T7VCOR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	T7VCOR[2:0]	TCIV7 Interrupt Skipping Count Setting	These bits specify the TCIV7 interrupt skipping count within the range from 0 to 7.*1 For details, see Table 10.58.	R/W
b3	T7VEN	T7VEN	0: TCIV7 interrupt skipping disabled 1: TCIV7 interrupt skipping enabled	R/W
b6 to b4	T6ACOR[2:0]	TGIA6 Interrupt Skipping Count Setting	These bits specify the TGIA6 interrupt skipping count within the range from 0 to 7.*1 For details, see Table 10.59.	R/W
b7	T6AEN	T6AEN	0: TGIA6 interrupt skipping disabled 1: TGIA6 interrupt skipping enabled	R/W

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to clear the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0 to clear the skipping counter (TITCNT1B).

TITCR1A and TITCR1B enable or disable interrupt skipping and specify the interrupt skipping count.
The setting in the TITCR1A (TITCR1B) register is valid only while the TITM bit in TITMRA (TITMRB) is set to 0; when the TITM bit in TITMRA (TITMRB) is set to 1, the setting in TITCR1A (TITCR1B) is cleared.

Table 10.56 Setting of Interrupt Skipping Count by T4VCOR[2:0] Bits

Bit 2 T4VCOR2	Bit 1 T4VCOR1	Bit 0 T4VCOR0	Description
0	0	0	Does not skip TCIV4 interrupts.
		1	Sets the TCIV4 interrupt skipping count to 1.
	1	0	Sets the TCIV4 interrupt skipping count to 2.
		1	Sets the TCIV4 interrupt skipping count to 3.
1	0	0	Sets the TCIV4 interrupt skipping count to 4.
		1	Sets the TCIV4 interrupt skipping count to 5.
	1	0	Sets the TCIV4 interrupt skipping count to 6.
		1	Sets the TCIV4 interrupt skipping count to 7.

Table 10.57 Setting of Interrupt Skipping Count by T3ACOR[2:0] Bits

Bit 6 T3ACOR2	Bit 5 T3ACOR1	Bit 4 T3ACOR0	Description
0	0	0	Does not skip TGIA3 interrupts.
		1	Sets the TGIA3 interrupt skipping count to 1.
	1	0	Sets the TGIA3 interrupt skipping count to 2.
		1	Sets the TGIA3 interrupt skipping count to 3.
1	0	0	Sets the TGIA3 interrupt skipping count to 4.
		1	Sets the TGIA3 interrupt skipping count to 5.
	1	0	Sets the TGIA3 interrupt skipping count to 6.
		1	Sets the TGIA3 interrupt skipping count to 7.

Table 10.58 Setting of Interrupt Skipping Count by T7VCOR[2:0] Bits

Bit 2 T7VCOR2	Bit 1 T7VCOR1	Bit 0 T7VCOR0	Description
0	0	0	Does not skip TCIV7 interrupts.
		1	Sets the TCIV7 interrupt skipping count to 1.
	1	0	Sets the TCIV7 interrupt skipping count to 2.
		1	Sets the TCIV7 interrupt skipping count to 3.
1	0	0	Sets the TCIV7 interrupt skipping count to 4.
		1	Sets the TCIV7 interrupt skipping count to 5.
	1	0	Sets the TCIV7 interrupt skipping count to 6.
		1	Sets the TCIV7 interrupt skipping count to 7.

Table 10.59 Setting of Interrupt Skipping Count by T6ACOR[2:0] Bits

Bit 6 T6ACOR2	Bit 5 T6ACOR1	Bit 4 T6ACOR0	Description
0	0	0	Does not skip TGIA6 interrupts.
		1	Sets the TGIA6 interrupt skipping count to 1.
	1	0	Sets the TGIA6 interrupt skipping count to 2.
		1	Sets the TGIA6 interrupt skipping count to 3.
1	0	0	Sets the TGIA6 interrupt skipping count to 4.
		1	Sets the TGIA6 interrupt skipping count to 5.
	1	0	Sets the TGIA6 interrupt skipping count to 6.
		1	Sets the TGIA6 interrupt skipping count to 7.

10.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A and TITCNT1B)

- MTU.TITCNT1A

Address(es): MTU.TITCNT1A H'E8041231

	b7	b6	b5	b4	b3	b2	b1	b0
	—	T3ACNT[2:0]			—	T4VCNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	T4VCNT[2:0]	TCIV4 Interrupt Counter	While the T4VEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TCIV4 interrupt occurs.	R
b3	—	Reserved	This bit is read as 0.	R
b6 to b4	T3ACNT[2:0]	TGIA3 Interrupt Counter	While the T3AEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TGIA3 interrupt occurs.	R
b7	—	Reserved	This bit is read as 0.	R

Note 1. To clear the TITCNT1A, clear the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0.

TITCNT1A and TITCNT1B are 8-bit readable/writable counters. TITCNTA and TITCNTB retain their values even after stopping the count operation of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

T4VCNT[2:0] Bits (TCIV4 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T4VEN bit in TITCR1A is cleared to 0
- When the T4VCOR[2:0] bits in TITCR1A are cleared to 000b
- When the T4VCNT[2:0] bits in TITCNT1A match the T4VCOR[2:0] bits in TITCR1A

T3ACNT[2:0] Bits (TGIA3 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T3AEN bit in TITCR1A is cleared to 0
- When the T3ACOR[2:0] bits in TITCR1A are cleared to 000b
- When the T3ACNT[2:0] bits in TITCNT1A match the T3ACOR[2:0] bits in TITCR1A

- MTU.TITCNT1B

Address(es): MTU.TITCNT1B H'E8041A31

	b7	b6	b5	b4	b3	b2	b1	b0
	—	T6ACNT[2:0]			—	T7VCNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	T7VCNT[2:0]	TCIV7 Interrupt Counter	While the T7VEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TCIV7 interrupt occurs.	R
b3	—	Reserved	This bit is read as 0.	R
b6 to b4	T6ACNT[2:0]	TGIA6 Interrupt Counter	While the T6AEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TGIA6 interrupt occurs.	R
b7	—	Reserved	This bit is read as 0.	R

Note 1. To clear the TITCNT1B, clear the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0.

T7VCNT[2:0] Bits (TCIV7 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T7VEN bit in TITCR1B is cleared to 0
- When the T7VCOR[2:0] bits in TITCR1B are cleared to 000b
- When the T7VCNT[2:0] bits in TITCNT1B match the T7VCOR[2:0] bits in TITCR1B

T6ACNT[2:0] Bits (TGIA6 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T6AEN bit in TITCR1B is cleared to 0
- When the T6ACOR[2:0] bits in TITCR1B are cleared to 000b
- When the T6ACNT[2:0] bits in TITCNT1B match the T6ACOR[2:0] bits in TITCR1B

10.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A and TITCR2B)

- MTU.TITCR2A

Address(es): MTU.TITCR2A H'E804123B

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG4COR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TRG4COR[2:0]	TRG4AN/TRG4BN Interrupt Skipping Count Setting	These bits specify the TRG4AN/TRG4BN interrupt skipping count within the range from 0 to 7. For details, see Table 10.60.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TITCR2A and TITCR2B specify the interrupt skipping count for TRG4AN and TRG4BN (TRG7AN and TRG7BN). This setting is valid only while TITMRA or TITMRB is set to 1.

Table 10.60 Setting of Interrupt Skipping Count by TRG4COR[2:0] Bits

Bit 2	Bit 1	Bit 0	
TRG4COR2	TRG4COR1	TRG4COR0	Description
0	0	0	Does not skip TRG4AN and TRG4BN interrupts.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 1.
	1	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 2.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 3.
1	0	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 4.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 5.
	1	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 6.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 7.

- MTU.TITCR2B

Address(es): MTU.TITCR2B H'E8041A3B

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG7COR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TRG7COR[2:0]	TRG7AN/TRG7BN Interrupt Skipping Count Setting	These bits specify the TRG7AN/TRG7BN interrupt skipping count within the range from 0 to 7. For details, see Table 10.61.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Table 10.61 Setting of Interrupt Skipping Count by TRG7COR[2:0] Bits

Bit 2	Bit 1	Bit 0	
TRG7COR2	TRG7COR1	TRG7COR0	Description
0	0	0	Does not skip TRG7AN and TRG7BN interrupts.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 1.
	1	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 2.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 3.
1	0	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 4.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 5.
	1	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 6.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 7.

10.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A and TITCNT2B)

- MTU.TITCNT2A

Address(es): MTU.TITCNT2A H'E804123C

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG4CNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TRG4CNT[2:0]	TRG4AN/TRG4BN Interrupt Counter	These bits start counting from the value set in TRG4COR[2:0] and the count decrements every time TRG4AN or TRG4BN is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.	R
b7 to b3	—	Reserved	These bits are read as 0.	R

TITCNT2A and TITCNT2B start counting from the values set in the TRG4COR[2:0] and TRG7COR[2:0] bits and the count decrements every time TRG4AN or TRG4BN (TITCNT2A) is generated or TRG7AN or TRG7BN (TITCNT2B) is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts or the TRG7AN and TRG7BN interrupts become valid.

TRG4CNT[2:0] Bits (TRG4AN/TRG4BN Interrupt Counter)

These bits start counting from the value set in the TRG4COR[2:0] bits and the count decrements every time a TRG4AN or TRG4BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRA is 0
- When the TRG4COR[2:0] bits in TITCR2A are cleared to 000b
- When the count of TRG4AN and TRG4BN occurrence matches the TRG4COR[2:0] value in TITCR2A

- MTU.TITCNT2B

Address(es): MTU.TITCNT2B H'E8041A3C

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG7CNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TRG7CNT[2:0]	TRG7AN/TRG7BN Interrupt Counter	These bits start counting from the value set in TRG7COR[2:0] and the count decrements every time TRG7AN or TRG7BN is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.	R
b7 to b3	—	Reserved	These bits are read as 0.	R

TRG7CNT[2:0] Bits (TRG7AN/TRG7BN Interrupt Counter)

These bits start counting from the value set in the TRG7COR[2:0] bits and the count decrements every time a TRG7AN or TRG7BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRB is 0
- When the TRG7COR[2:0] bits in TITCR2B are cleared to 000b
- When the count of TRG7AN and TRG7BN occurrence matches the TRG7COR[2:0] value in TITCR2B

10.2.43 Bus Master Interface

The timer counter (MTU8.TCNT), general registers (MTU8.TGRn) for MTU8, and MTU1.TCNTLW, MTU1.TGRALW, and MTU1.TGRBLW registers when TMDR3.LWA = 1 are 32-bit registers. A 32-bit data bus to the bus master enables 32-bit read/write access. 8- and 16-bit read/write are not allowed. Access these registers in 32-bit units.

Excluding MTU8, the timer counters (MTU0.TCNT to MTU7.TCNT), general registers (MTU0.TGRn to MTU7.TGRn), timer subcounters (TCNTSA and TCNTSB), timer cycle buffer registers (TCBRA and TCBRB), timer dead time data registers (TDDRA and TDDRB), timer cycle data registers (TCDRA and TCDRB), timer A/D converter start request control registers (MTU4.TADCR and MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA, MTU4.TADCORB, MTU7.TADCORA, and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA, MTU4.TADCOBRB, MTU7.TADCOBRA, and MTU7.TADCOBRB) are 16-bit registers. A 16-bit data bus to the bus master enables 16-bit read/write access. 8-bit read/write is not allowed. Access the registers in 16-bit units.

All registers other than the above registers are 8-bit registers. Read from/write to these registers in 8-bit units.

10.3 Operation

10.3.1 Basic Functions

Each channel has TCNT and TGR. TCNT in each channel performs up-counting and is also capable of free-running count, periodic count, and external event count operations.
Each TGR can be used as an input capture register or an output compare register.

(1) Counter Operation

When one of bits CST0 to CST4 and CST8 in TSTRA, bits CST6 and CST7 in TSTRB, and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR is set to 1, TCNT for the corresponding channel begins counting. TCNT can perform various count operations such as free-running count or periodic count operations.

(a) Example of Count Operation Setting Procedure

Figure 10.5 shows an example of the count operation setting procedure.

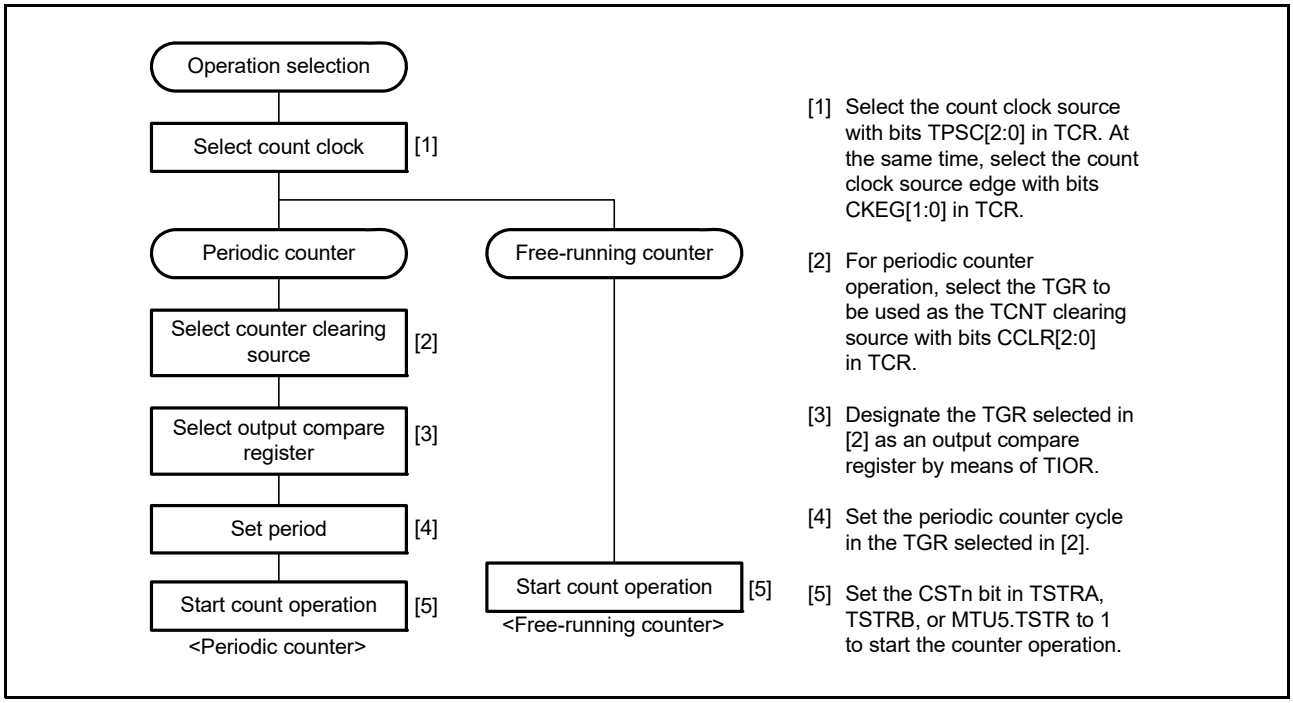

Figure 10.5 Example of Count Operation Setting Procedure

(b) Free-Running Count Operation and Periodic Count Operation

Immediately after a reset, all TCNT counters are designated as free-running counters. When the CSTn bit in TSTRA, TSTRB, or TSTR in MTU5 is set to 1, the corresponding TCNT counter starts up-counting as a free-running counter. When TCNT overflows (from FFFFh to 0000h), if the corresponding TIER.TCIEV bit is 1, an interrupt request is issued to the CPU. After an overflow, TCNT starts counting up again from 0000h.
Figure 10.6 illustrates free-running counter operation.

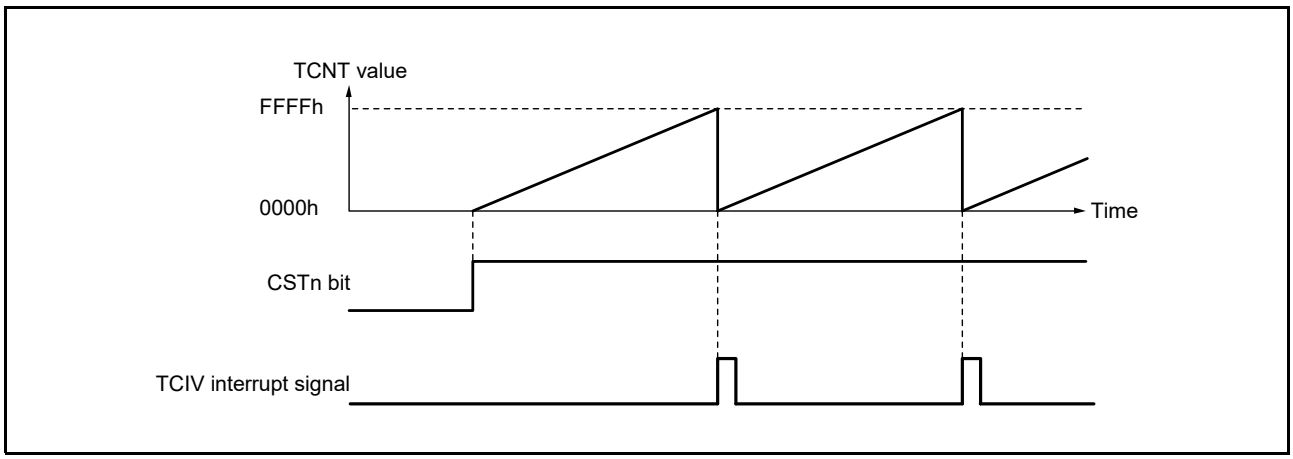

Figure 10.6 Free-Running Counter Operation

When compare match is selected as the TCNT clearing source, TCNT for the relevant channel performs periodic count operation. TGR for setting the cycle is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR[2:0] in TCR. After the settings have been made, TCNT starts up-counting as a periodic counter when the corresponding CSTn bit in TSTRA, TSTRB, or TSTR in MTU5 is set to 1. When the count matches the value in TGR, TCNT is cleared to 0000h.
If the value of the corresponding TIER.TGIE bit is 1 at this point, an interrupt request is issued to the CPU. After a compare match, TCNT starts counting up again from 0000h.
Figure 10.7 illustrates periodic counter operation.

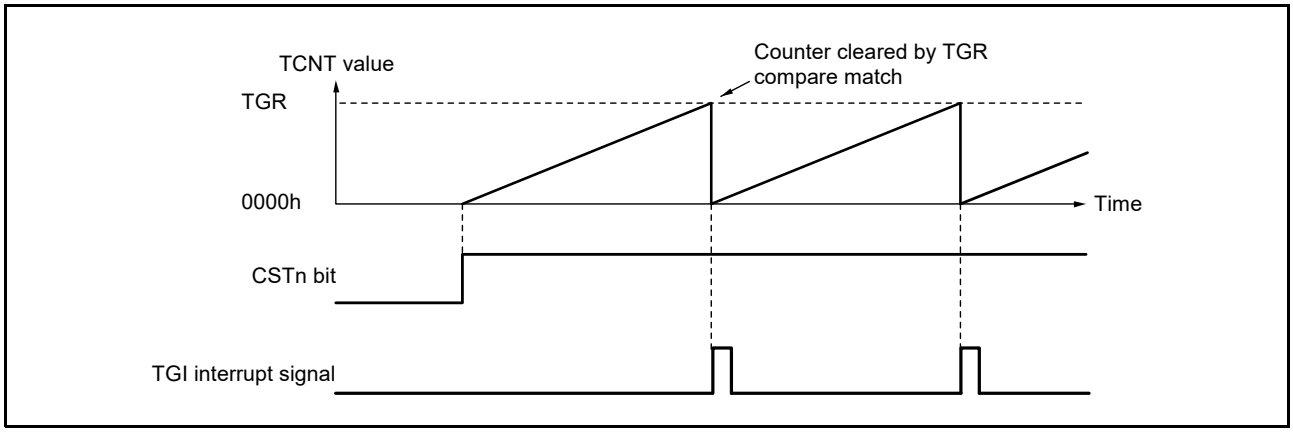

Figure 10.7 Periodic Counter Operation

(2) Waveform Output by Compare Match

Upon compare match, low, high, or toggle output from the corresponding pin can be performed.
The compare match output operation is not available in MTU5.

(a) Example of Procedure for Setting Waveform Output by Compare Match

Figure 10.8 shows an example of the procedure for setting waveform output by compare match

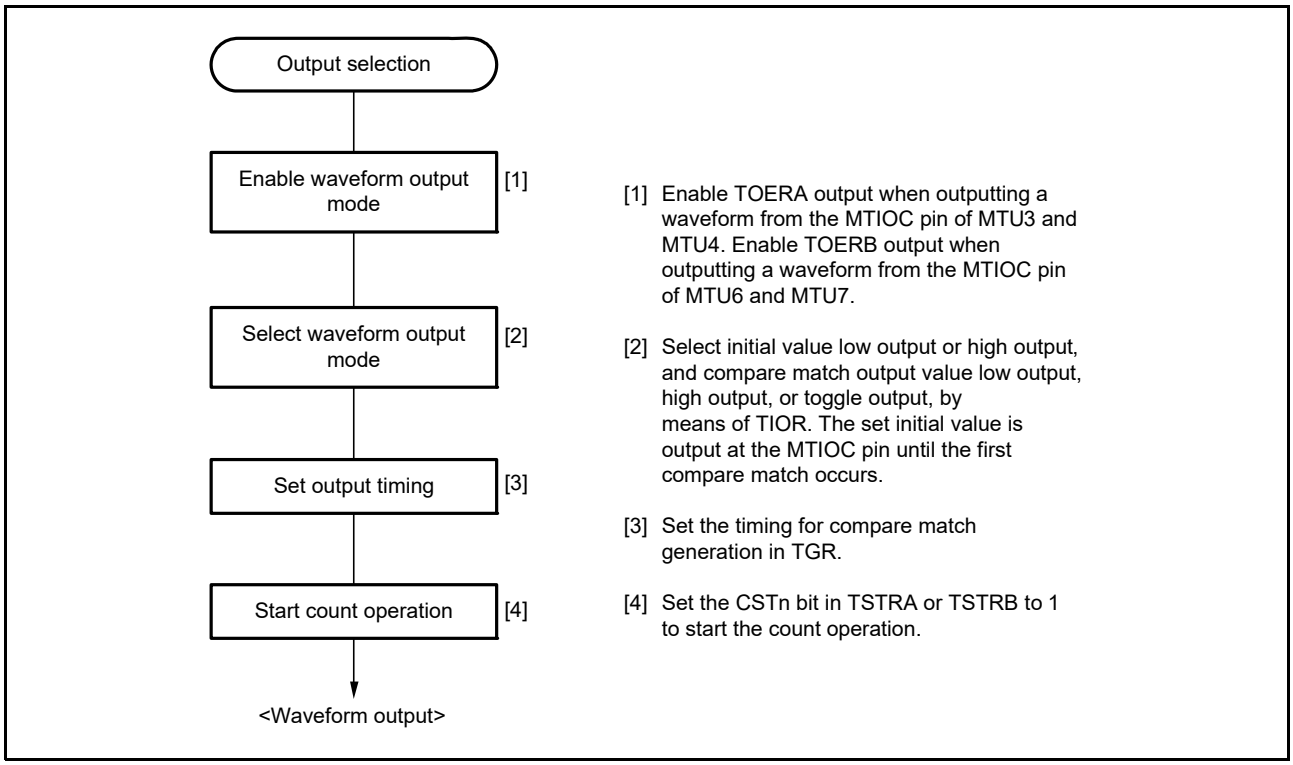

Figure 10.8 Example of Procedure for Setting Waveform Output by Compare Match

(b) Examples of Waveform Output Operation

Figure 10.9 shows an example of low output and high output.
In this example, TCNT has been designated as a free-running counter, and settings have been made so that high is output by compare match A and low is output by compare match B. When the pin level is the same as the specified level, the pin level does not change.

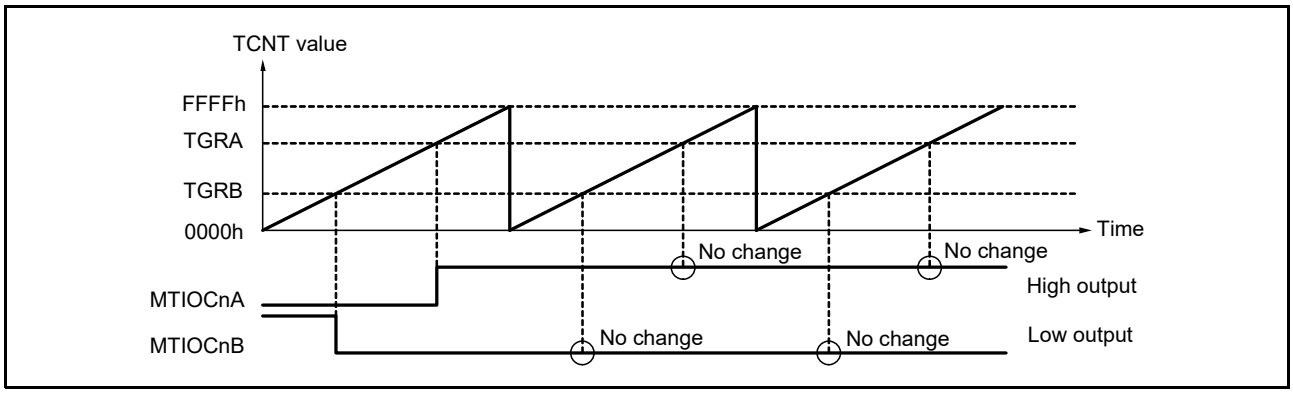

Figure 10.9 Example of low output and high output Operation (n = 0 to 4, 6, 7, 8)

Figure 10.10 shows an example of toggle output.
In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made so that the output is toggled by both compare match A and compare match B.

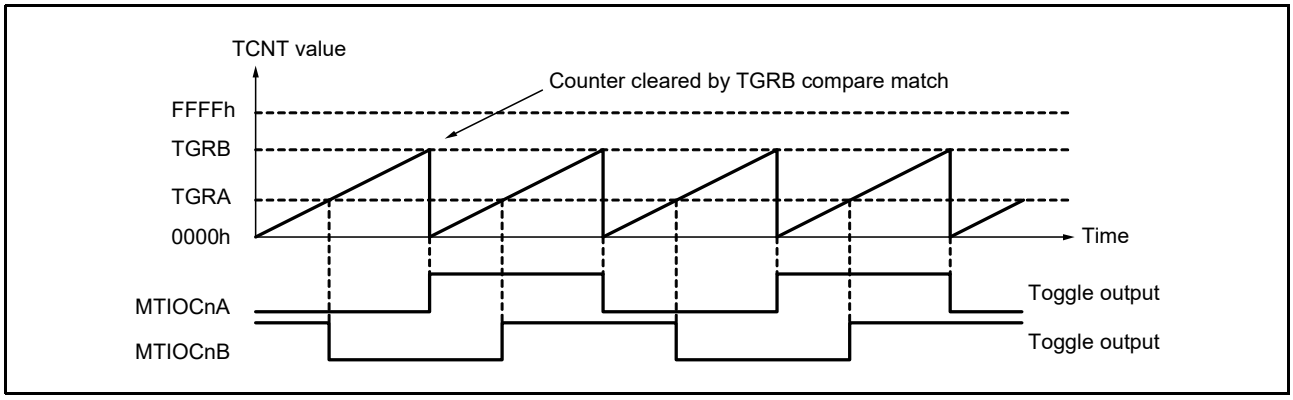

Figure 10.10 Example of Toggle Output Operation (n = 0 to 4, 6, 7, 8)

(3) Input Capture Function

The TCNT value can be transferred to TGR on detection of the MTIOCnm, MTIC5U, MTIC5V, or MTIC5W pin (n = 0 to 4, 6, 7, 8; m = A to D), input edge.
The rising edge, falling edge, or both edges can be selected as the detection edge. For MTU0 and MTU1, another channel's count clock or compare match signal can also be specified as the input capture source.

Note: When another channel's count clock is used as the input capture input for MTU0 and MTU1, P1φ/1 should not be selected as the count clock used for input capture input. Input capture will not be generated if P1φ/1 is selected.

(a) Example of Input Capture Operation Setting Procedure

Figure 10.11 shows an example of the input capture operation setting procedure.

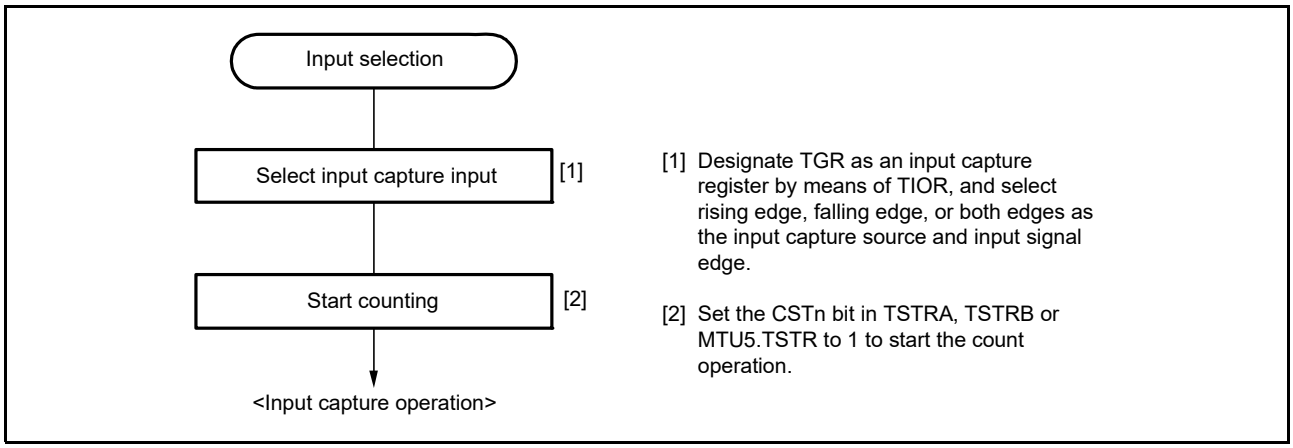

Figure 10.11 Example of Input Capture Operation Setting Procedure

(b) Example of Input Capture Operation

Figure 10.12 shows an example of input capture operation.
In this example, both rising and falling edges have been selected as the MTIOCnA pin input capture input edge, the falling edge has been selected as the MTIOCnB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT. (n = 0 to 4, 6, 7, 8)

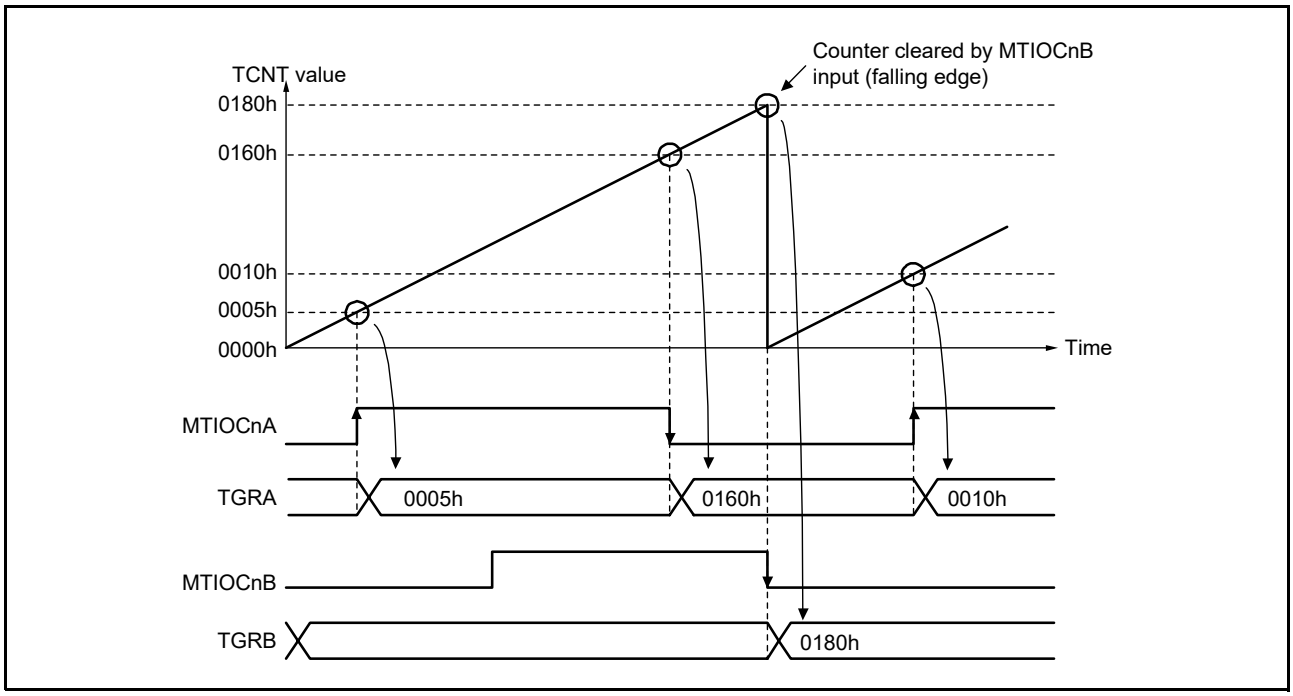

Figure 10.12 Example of Input Capture Operation (n = 0 to 4, 6, 7, 8)

10.3.2 Synchronous Operation

In synchronous operation, the values in multiple TCNT counters can be modified simultaneously (synchronous setting). In addition, multiple TCNT counters can be cleared simultaneously (synchronous clearing) by making the appropriate setting in TCR.
Synchronous operation can increase the number of TGR registers assigned to the same time base.
MTU0 to MTU4, MTU6, and MTU7 can all be designated for synchronous operation. MTU5 and MTU8 cannot be used for synchronous operation.

(1) Example of Synchronous Operation Setting Procedure

Figure 10.13 shows an example of the synchronous operation setting procedure.

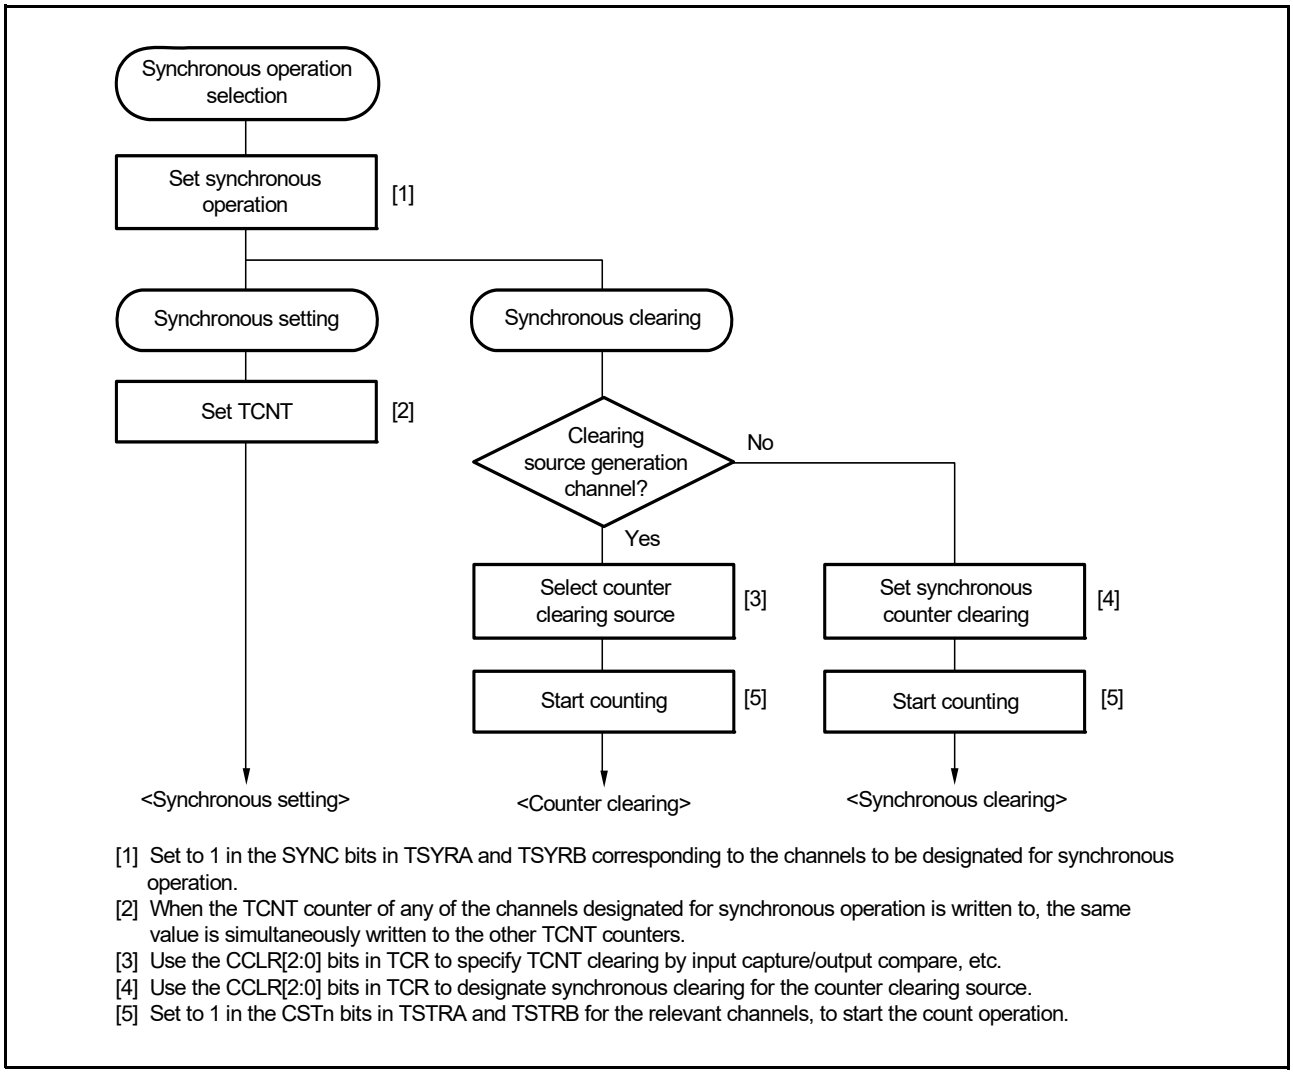

Figure 10.13 Example of Synchronous Operation Setting Procedure

(2) Example of Synchronous Operation

Figure 10.14 shows an example of synchronous operation.
In this example, synchronous operation and PWM mode 1 have been designated for MTU0 to MTU 2, MTU0.TGRB compare match has been set as the counter clearing source in MTU0, and synchronous clearing has been set for the counter clearing source in MTU1 and MTU2.
Three-phase PWM waveforms are output from pins MTIOC0A, MTIOC1A, and MTIOC2A. At this time, synchronous setting and synchronous clearing by MTU0.TGRB compare match are performed for the TCNT counters in MTU0 to MTU2, and the data set in MTU0.TGRB is used as the PWM cycle.
For details of PWM modes, see section 10.3.5, PWM Modes .

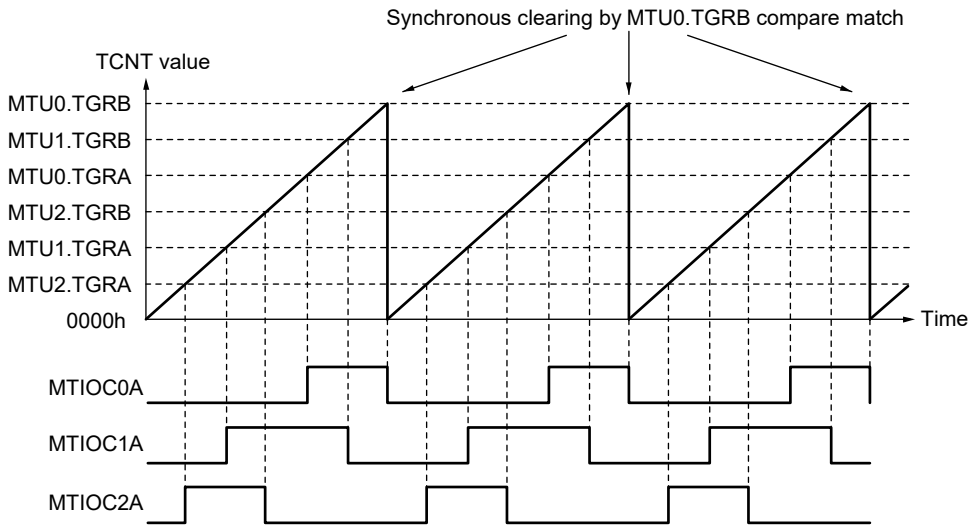

Figure 10.14 Example of Synchronous Operation

10.3.3 Buffer Operation

Buffer operation, provided for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, enables TGRC and TGRD to be used as buffer registers. In MTU0, TGRF can also be used as a buffer register.
Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

Note: MTU0.TGRE cannot be designated as an input capture register and can only operate as a compare match register.

Table 10.62 shows the register combinations used in buffer operation.

Table 10.62 Register Combinations in Buffer Operation

Channel	Timer General Register	Buffer Register
MTU0	TGRA	TGRC
	TGRB	TGRD
	TGRE	TGRF
MTU3	TGRA	TGRC
	TGRB	TGRD
MTU4	TGRA	TGRC
	TGRB	TGRD
MTU6	TGRA	TGRC
	TGRB	TGRD
MTU7	TGRA	TGRC
	TGRB	TGRD
MTU8	TGRA	TGRC
	TGRB	TGRD

- When TGR is an output compare register

  When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is illustrated in Figure 10.15.

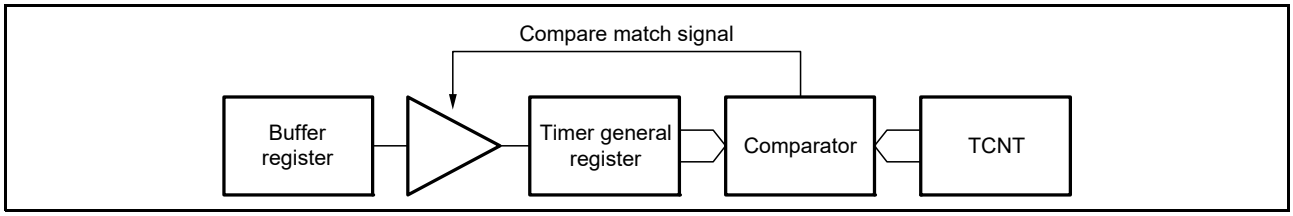

Figure 10.15 Compare Match Buffer Operation

- When TGR is an input capture register

  When an input capture occurs, the value in TCNT is transferred to TGR and the value previously held in TGR is transferred to the buffer register.

This operation is illustrated in Figure 10.16.

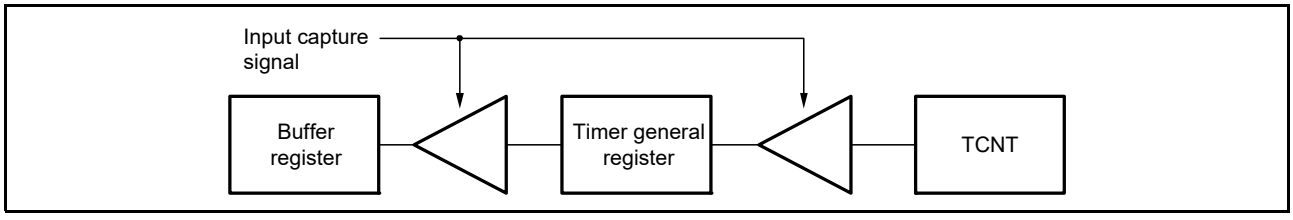

Figure 10.16 Input Capture Buffer Operation

(1) Example of Buffer Operation Setting Procedure

Figure 10.17 shows an example of the buffer operation setting procedure.

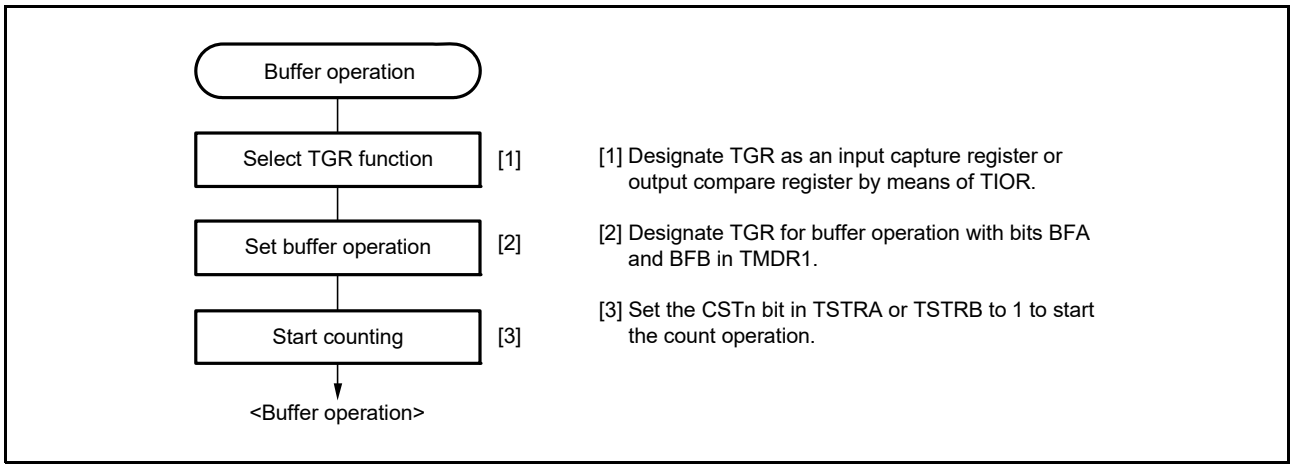

Figure 10.17 Example of Buffer Operation Setting Procedure

(2) Examples of Buffer Operation

(a) When TGR is an Output Compare Register

Figure 10.18 shows an operation example in which PWM mode 1 has been designated for MTU0, and buffer operation has been designated for TGRA and TGRC. The settings used in this example are TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. In this example, the TTSA bit in TBTM is cleared to 0.

As buffer operation has been set, when compare match A occurs, the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time compare match A occurs.

For details of PWM modes, see section 10.3.5, PWM Modes .

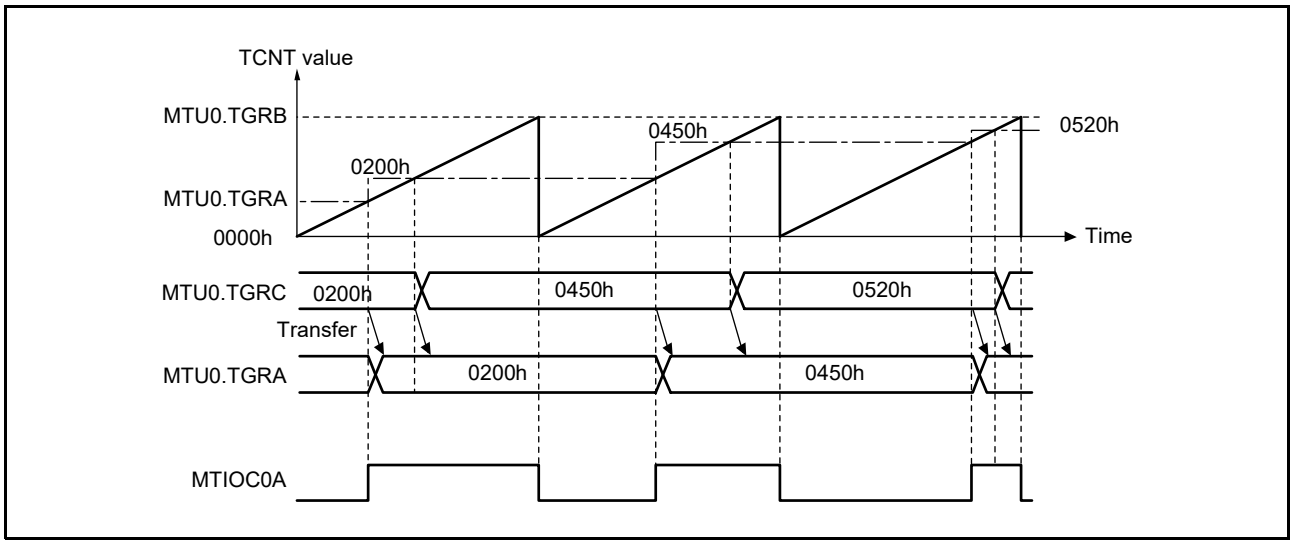

Figure 10.18 Example of Buffer Operation (1)

(b) When TGR is an Input Capture Register

Figure 10.19 shows an operation example in which TGRA has been designated as an input capture register, and buffer operation has been designated for TGRA and TGRC.
Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the MTIOCnA pin input capture input edge. (n = 0 to 4, 6, 7, 8)
As buffer operation has been set, when the TCNT value is transferred to TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

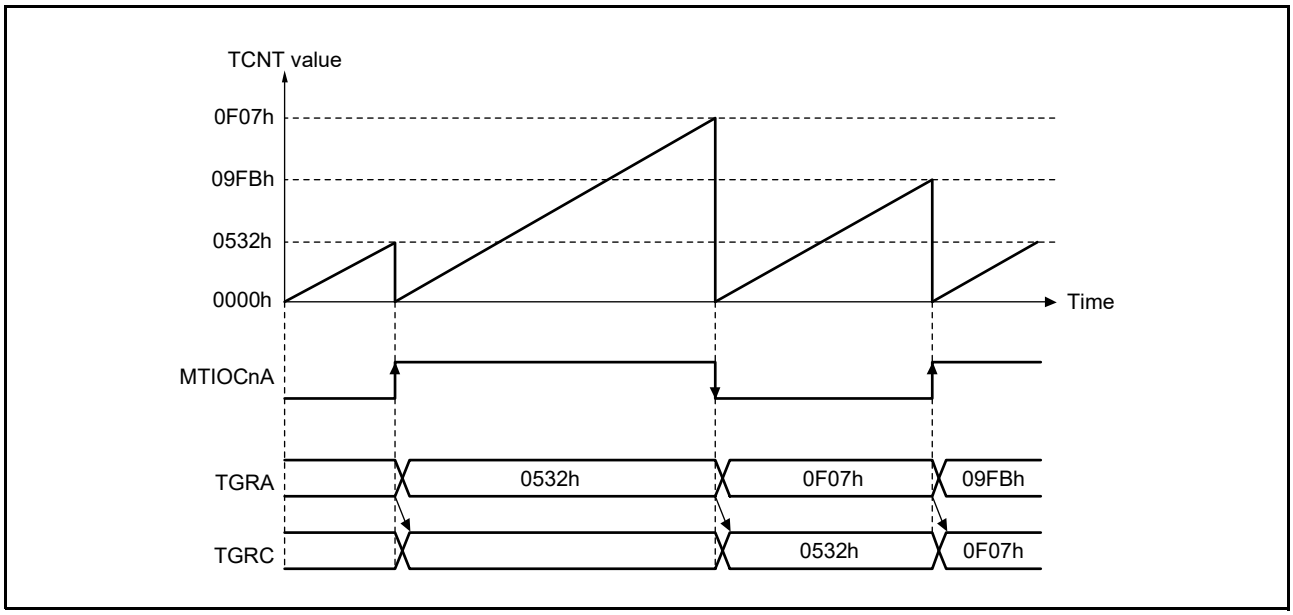

Figure 10.19 Example of Buffer Operation (2) (n = 0 to 4, 6, 7, 8)

(3) Selecting Timing for Transfer from Buffer Registers to Timer General Registers in Buffer Operation

The timing for transfer from buffer registers to timer general registers can be selected in PWM mode 1 or 2 for MTU0 or in PWM mode 1 for MTU3, MTU4, MTU6, and MTU7 by setting the buffer operation transfer mode registers (MTUn.TBTM (n = 0, 3, 4, 6, 7)). Either compare match (value after reset) or TCNT clearing can be selected for the transfer timing. TCNT clearing as transfer timing is one of the following cases.

- When TCNT overflows (FFFFh to 0000h)
- When 0000h is written to TCNT during counting
- When TCNT is cleared to 0000h under the condition specified in the CCLR[2:0] bits in TCR

Note: TBTM must be modified only while TCNT stops.

Figure 10.20 shows an operation example in which PWM mode 1 is designated for MTU0 and buffer operation is designated for MTU0.TGRA and MTU0.TGRC. The settings used in this example are MTU0.TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. The TTSA bit in MTU0.TBTM is set to 1.

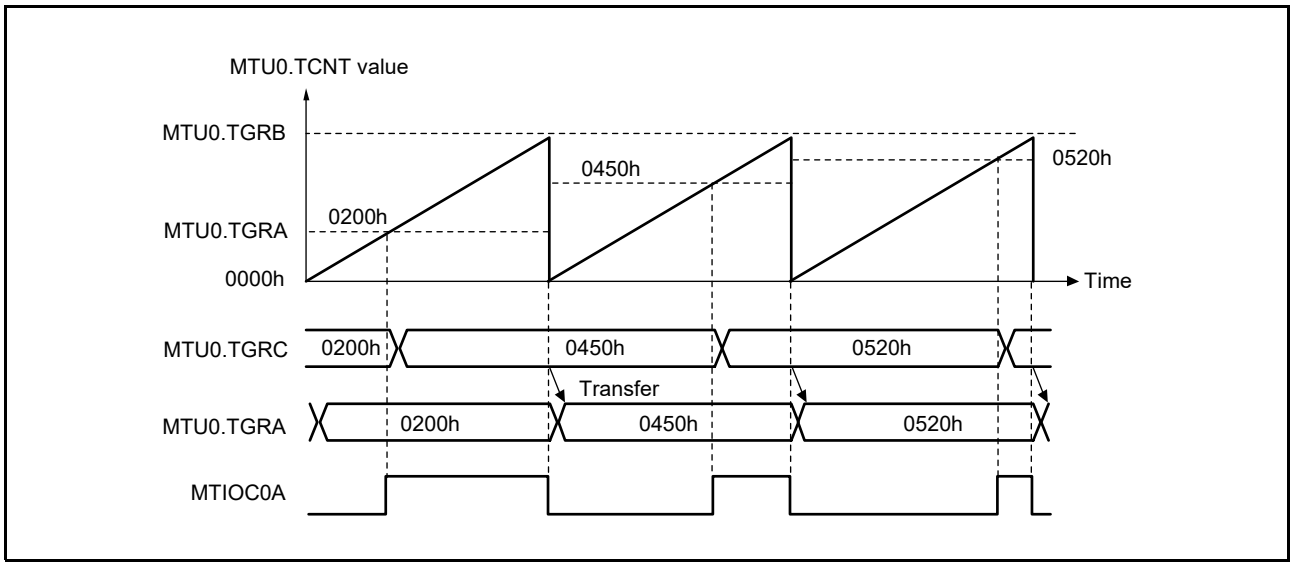

Figure 10.20 Example of Buffer Operation When MTU0.TCNT Clearing is Selected for MTU0.TGRC to MTU0.TGRA Transfer Timing

10.3.4 Cascaded Operation

In cascaded operation, two 16-bit counters in different channels are used together as a 32-bit counter.
There are two functions for connecting MTU1 and MTU2 to use as a 32-bit counter: cascade connection to be set when the MTU1.TMDR3.LWA bit is 0, and cascade connection 32-bit phase counting mode to be set when the MTU1.TMDR3.LWA bit is 1. For details on cascade connection 32-bit phase counting mode, refer to section 10.3.6.2, Cascade Connection 32-Bit Phase Counting Mode. This section describes the cascade connection function to be set when the MTU1.TMDR3.LWA bit is 0.
This function works when the LWA bit of TMDR3 in MTU1 is set to 0 and the TPSC[2:0] bits of TCR in MTU1 are set so that TCNT in MTU1 counts at an overflow/underflow of TCNT in MTU2.
Underflow occurs only when the MTU2 to which the lower 16 bits allocated is in phase counting mode.

Table 10.63 shows the register combinations used in cascaded operation.

Note: When phase counting mode is set for MTU1, the count clock setting is invalid and the counters operate independently in phase counting mode.

Table 10.63 Cascaded Combinations

Combination	Upper 16 Bits	Lower 16 Bits
MTU1 and MTU2	MTU1.TCNT	MTU2.TCNT

For simultaneous input capture of MTU1.TCNT and MTU2.TCNT during cascaded operation, additional input capture input pins can be specified by the input capture control register (TICCR). The input-capture condition is of edges in the signal produced by taking the logical OR of the input level on the main input pin and the input level on the added input pin. Accordingly, if either is at the high level, a change in the level of the other will not produce an edge for detection. For details, see (4) Cascaded Operation Example (c). For input capture in cascade connection, refer to section 10.6.21, Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection.

Table 10.64 shows the TICCR setting and input capture input pins.

Table 10.64 TICCR Setting and Input Capture Input Pins

Target Input Capture	TICCR Setting	Input Capture Input Pin
Input capture from MTU1.TCNT to MTU1.TGRA	I2AE bit = 0 (Initial value)	MTIOC1A
	I2AE bit = 1	MTIOC1A, MTIOC2A
Input capture from MTU1.TCNT to MTU1.TGRB	I2BE bit = 0 (Initial value)	MTIOC1B
	I2BE bit = 1	MTIOC1B, MTIOC2B
Input capture from MTU2.TCNT to MTU2.TGRA	I1AE bit = 0 (Initial value)	MTIOC2A
	I1AE bit = 1	MTIOC2A, MTIOC1A
Input capture from MTU2.TCNT to MTU2.TGRB	I1BE bit = 0 (Initial value)	MTIOC2B
	I1BE bit = 1	MTIOC2B, MTIOC1B

(1) Example of Cascaded Operation Setting Procedure

Figure 10.21 shows an example of the cascaded operation setting procedure.

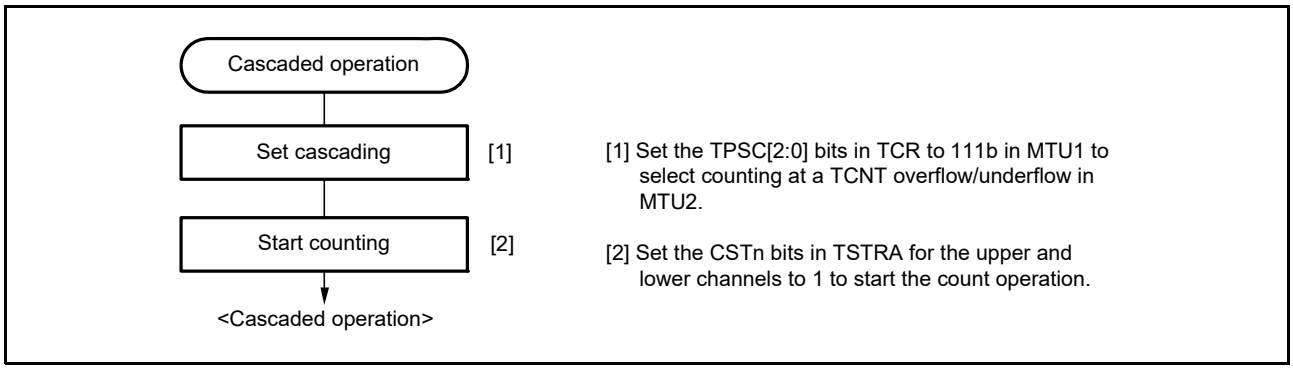

Figure 10.21 Cascaded Operation Setting Procedure

(2) Cascaded Operation Example (a)

Figure 10.22 shows the operation when MTU1.TCNT is set for counting at MTU2.TCNT overflow/underflow and MTU2 is set for phase counting mode 1 while MTU1.TCNT and MTU2.TCNT are cascaded.
MTU1.TCNT is incremented by MTU2.TCNT overflow and decremented by MTU2.TCNT underflow.

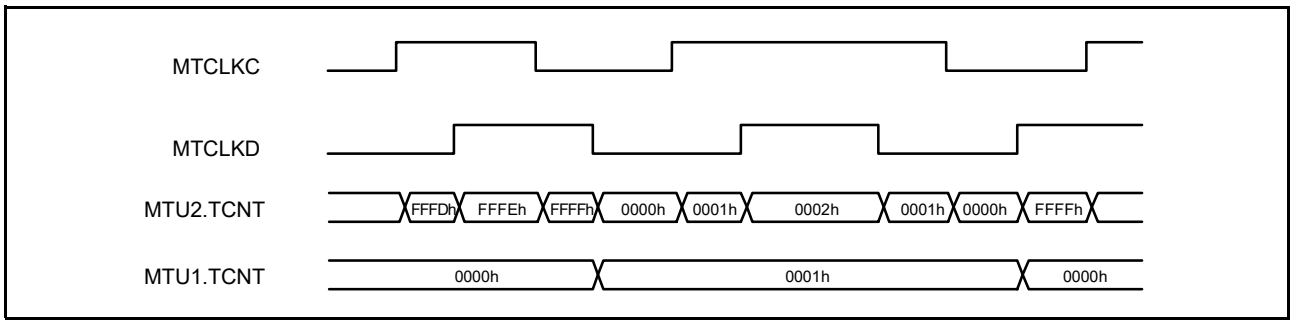

Figure 10.22 Cascaded Operation Example (a)

(3) Cascaded Operation Example (b)

Figure 10.23 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the I2AE bit in TICCR has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the MTU1.TIOR.IOA[3:0] bits have selected the MTIOC1A rising edge for the input capture timing while the MTU2.TIOR.IOA[3:0] bits have selected the MTIOC2A rising edge for the input capture timing.
Under these conditions, the rising edge of both MTIOC1A and MTIOC2A is used for the MTU1.TGRA input capture condition. For the MTU2.TGRA input capture condition, the MTIOC2A rising edge is used.

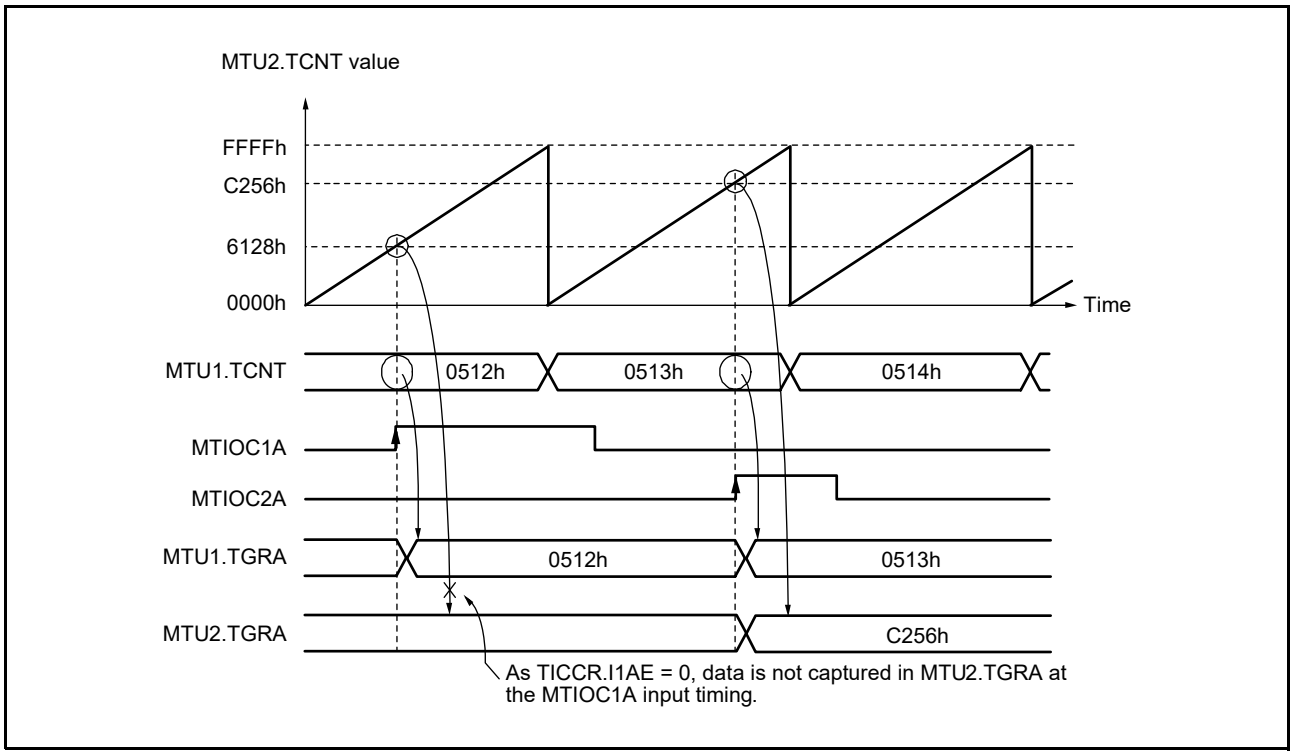

Figure 10.23 Cascaded Operation Example (b)

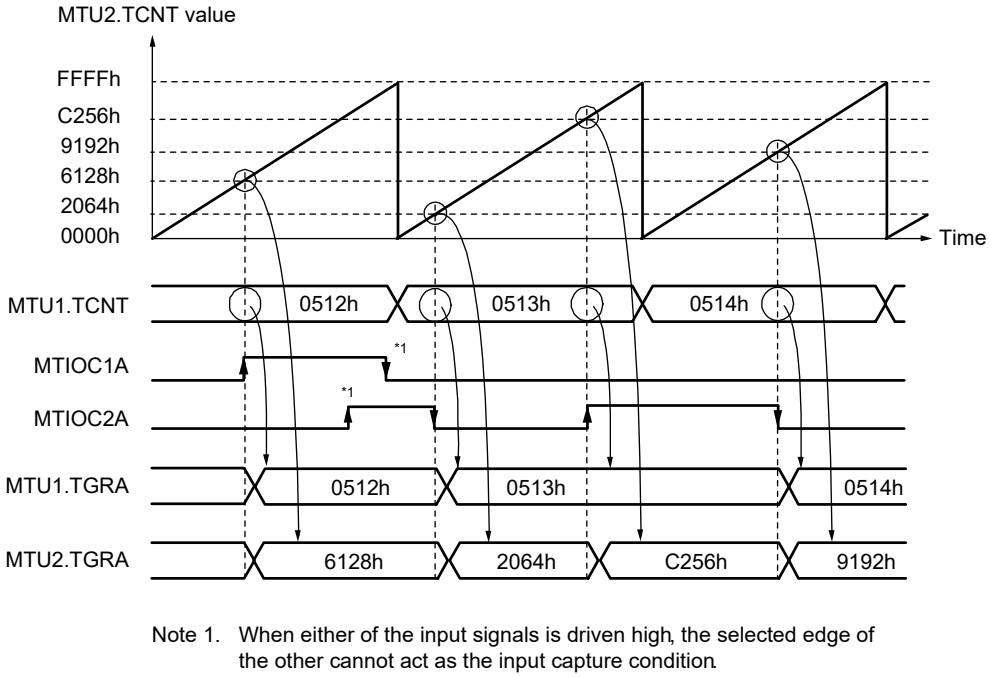
(4) Cascaded Operation Example (c)

Figure 10.24 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE and I1AE bits have been set to 1 to include the MTIOC2A and MTIOC1A pins in the MTU1.TGRA and MTU2.TGRA input capture conditions, respectively. In this example, the IOA[3:0] bits in both MTU1.TIOR and MTU2.TIOR have selected both the rising and falling edges for the input capture timing. Under these conditions, the ORed result of MTIOC1A and MTIOC2A input is used for the MTU1.TGRA and MTU2.TGRA input capture conditions.



Note 1. When either of the input signals is driven high, the selected edge of the other cannot act as the input capture condition.

Figure 10.24 Cascaded Operation Example (c)

(5) Cascaded Operation Example (d)

Figure 10.25 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE bit has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the IOA[3:0] bits in MTU1.TIOR have selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing while the IOA[3:0] bits in MTU2.TIOR have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, as MTU1.TIOR has selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing, the MTIOC2A edge is not used for MTU1.TGRA input capture condition although the I2AE bit in TICCR has been set to 1.

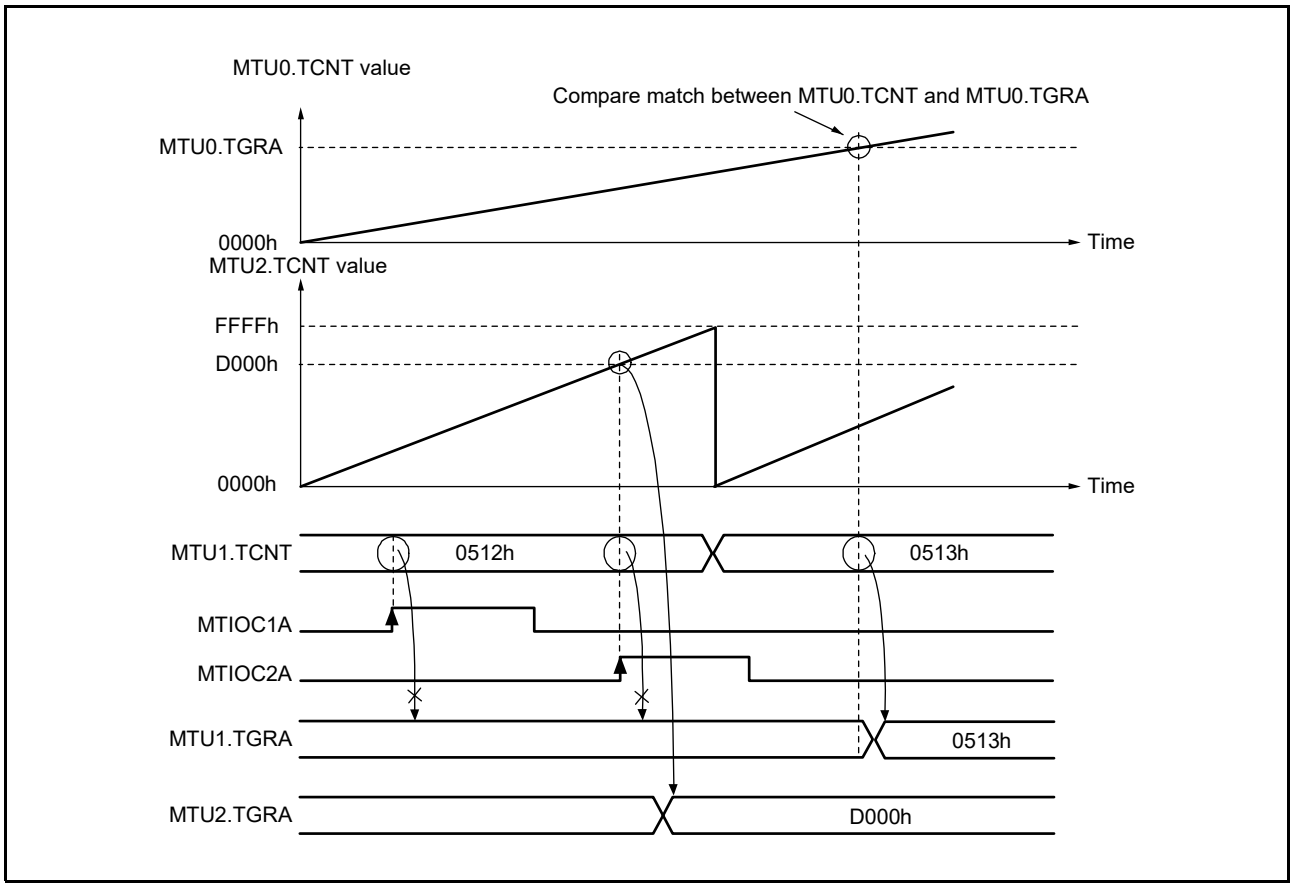


Figure 10.25 Cascaded Operation Example (d)

10.3.5 PWM Modes

PWM modes are provided to output PWM waveforms from the external pins. The output level can be selected as low, high, or toggle output in response to a compare match of each TGR.
PWM waveforms in the range of 0% to 100% duty cycle can be output according to the TGR settings.
By designating TGR compare match as the counter clearing source, the PWM cycle can be specified in that register.
Every channel except MTU5 and MTU8 can be set to PWM mode independently. Synchronous operation is also possible between the channels placed in PWM mode or between a channel in PWM mode and another channel in a different mode.
There are two PWM modes as described below.

(a) PWM Mode 1

PWM waveforms are output from the MTIOCnA and MTIOCnC pins by pairing TGRA with TGRB and TGRC with TGRD. The levels specified by the TIOR.IOA[3:0] and IOC[3:0] bits are output from the MTIOCnA and MTIOCnC pins at compare matches A and C, and the level specified by the TIOR.IOB[3:0] and IOD[3:0] bits are output at compare matches B and D (n = 0 to 4, 6, 7). The initial output value is set in TGRA or TGRC. If the values set in paired TGRs are identical, the output value does not change even when a compare match occurs.

In PWM mode 1, PWM waveforms in up to 12 phases can be output.

(b) PWM Mode 2

PWM waveform output is generated using one TGR as the cycle register and the others as duty registers. The level specified in TIOR is output at compare matches. Upon counter clearing by a cycle register compare match, the initial value set in TIOR is output from each pin. If the values set in the cycle and duty registers are identical, the output value does not change even when a compare match occurs.

In PWM mode 2, up to eight phases of PWM waveforms can be output when synchronous clearing is used as synchronous operation in the channels that cannot be placed in PWM mode 2.

The correspondence between PWM output pins and registers is shown in Table 10.65.

Table 10.65 PWM Output Registers and Output Pins

		Output Pins	
Channel	Register	PWM Mode 1	PWM Mode 2
MTU0	TGRA	MTIOC0A	MTIOC0A
	TGRB		MTIOC0B
	TGRC	MTIOC0C	MTIOC0C
	TGRD		MTIOC0D
MTU1	TGRA	MTIOC1A	MTIOC1A
	TGRB		MTIOC1B
MTU2	TGRA	MTIOC2A	MTIOC2A
	TGRB		MTIOC2B
MTU3	TGRA	MTIOC3A	Setting prohibited
	TGRB		
	TGRC	MTIOC3C	
	TGRD		
MTU4	TGRA	MTIOC4A	
	TGRB		
	TGRC	MTIOC4C	
	TGRD		
MTU6	TGRA	MTIOC6A	
	TGRB		
	TGRC	MTIOC6C	
	TGRD		
MTU7	TGRA	MTIOC7A	
	TGRB		
	TGRC	MTIOC7C	
	TGRD		

Note: In PWM mode 2, PWM waveform output is not possible for the TGR register in which the PWM cycle is set.

(1) Example of PWM Mode Setting Procedure

Figure 10.26 shows an example of the PWM mode setting procedure.

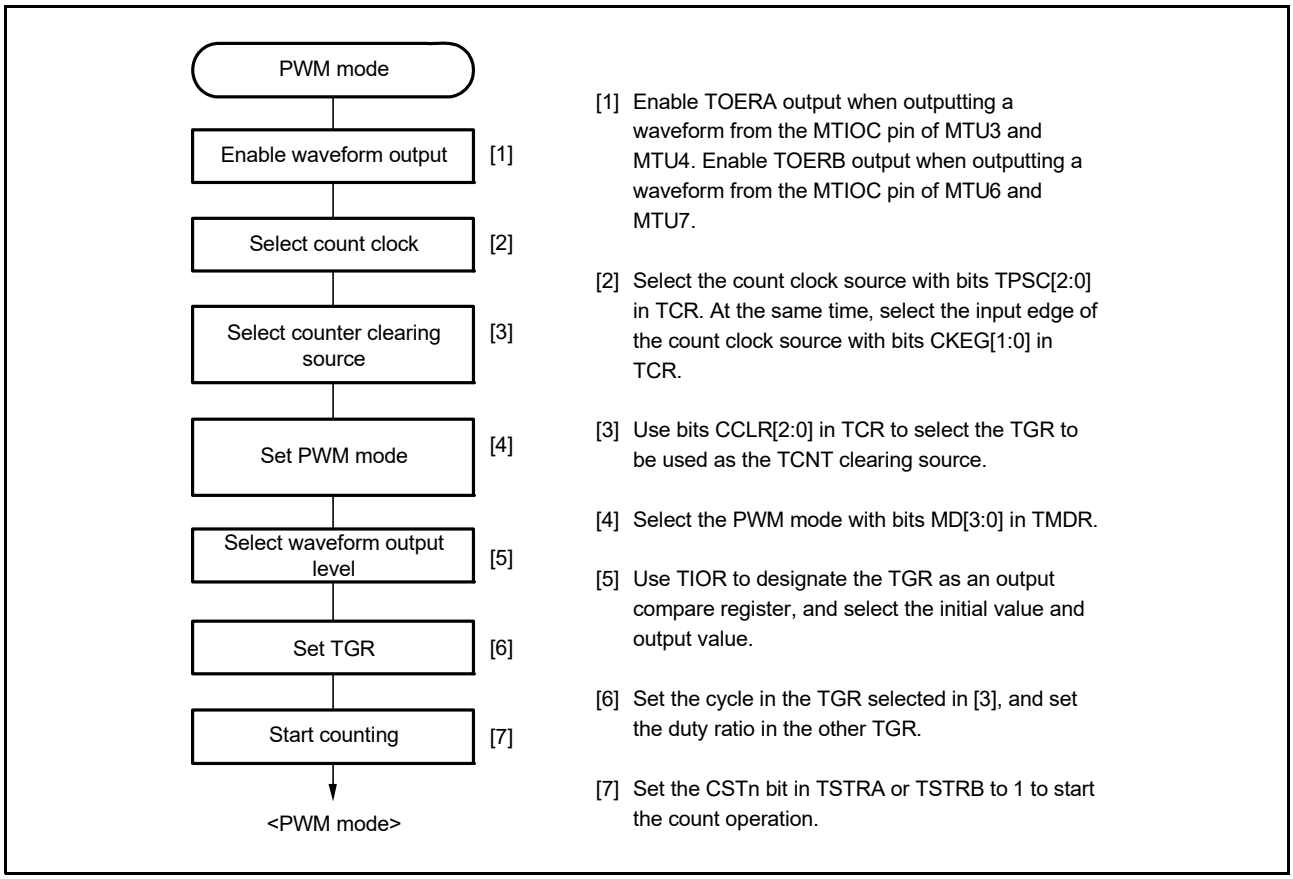

Figure 10.26 Example of PWM Mode Setting Procedure

(2) Examples of PWM Mode Operation

Figure 10.27 shows an example of operation in PWM mode 1.
In this example, TGRA compare match is set as the TCNT clearing source, 0 is set as the initial output value and output value for TGRA, and 1 is set as the output value for TGRB.
In this case, the value set in TGRA is used as the cycle, and the value set in TGRB is used as the duty ratio.

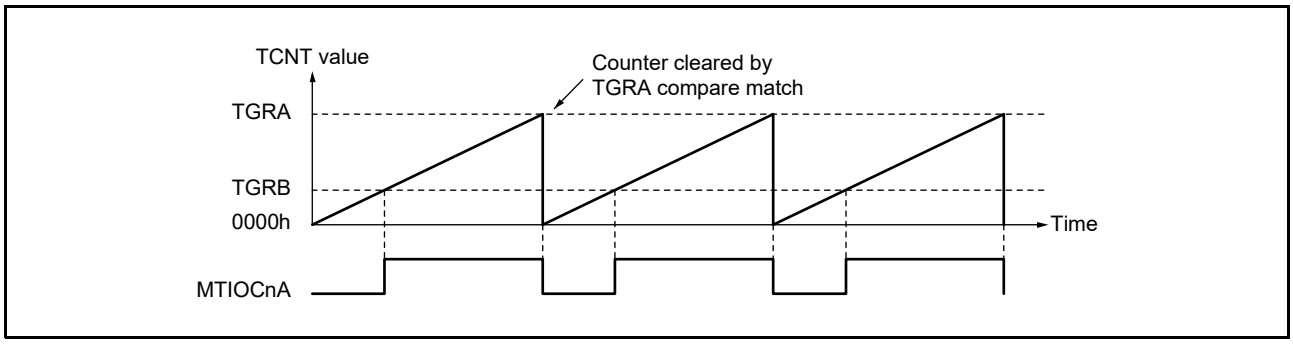

Figure 10.27 Example of PWM Mode 1 Operation (n = 0 to 4, 6, 7)

Figure 10.28 shows an example of operation in PWM mode 2.
In this example, synchronous operation is designated for MTU0 and MTU1, MTU1.TGRB compare match is set as the TCNT clearing source, and low is set as the initial output value and high as the output value for the other TGR registers (MTU0.TGRA to MTU0.TGRD and MTU1.TGRA), outputting 5-phase PWM waveforms.
In this case, the value set in MTU1.TGRB is used as the cycle, and the values set in the other TGRs are used as the duty ratio.

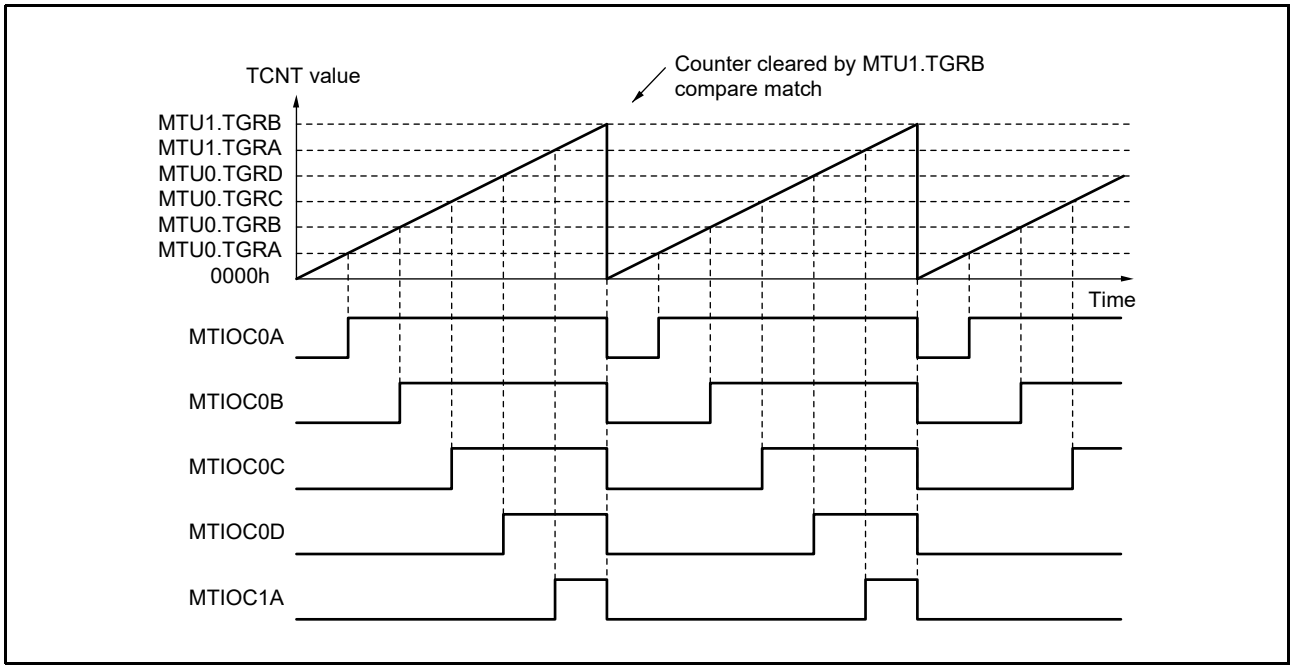

Figure 10.28 Example of PWM Mode 2 Operation

Figure 10.29 shows examples of PWM waveform output with 0% duty and 100% duty in PWM mode 1. In these examples, TGRA compare match is selected as the TCNT clearing source, the initial output value and the output value for TGRA are set to the low level, and the output value for TGRB is set to the high level.

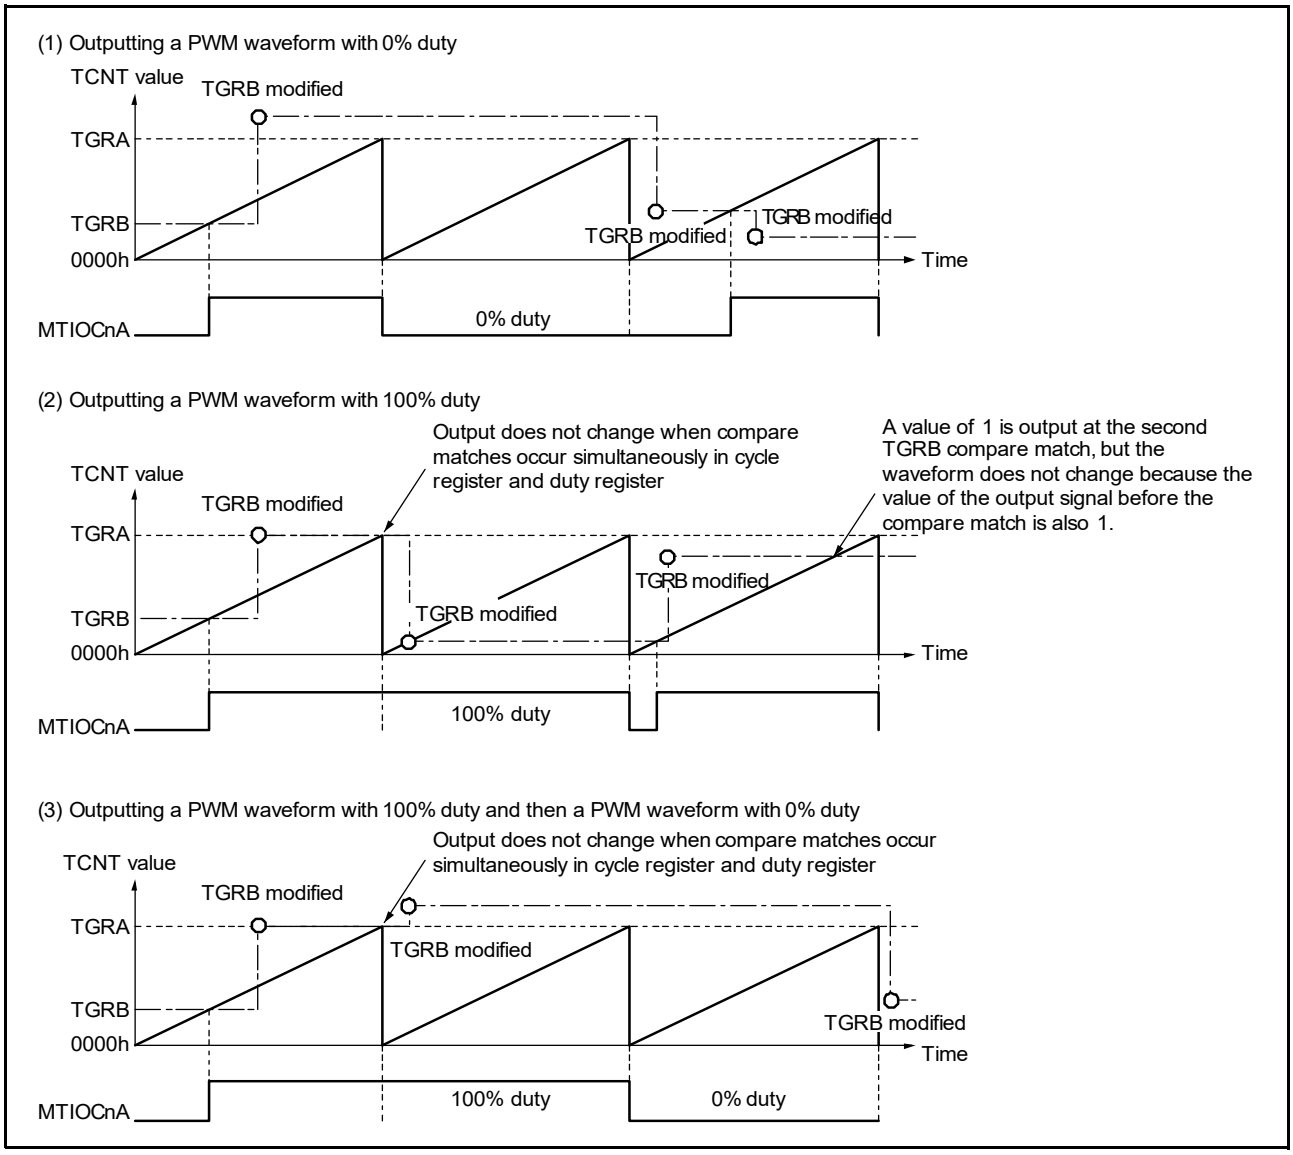

Figure 10.29 Examples of PWM Mode Operation (PWM Waveform Output with 0% Duty and 100% Duty)
(n = 0 to 4, 6, 7)

10.3.6 Phase Counting Mode

There are two phase counting modes: 16-bit phase counting mode in which MTU1 and MTU2 operate independently, and cascade connection 32-bit phase counting mode in which MTU1 and MTU2 are cascaded.

In phase counting mode, the phase difference between two external input clocks is detected and the corresponding TCNT is incremented or decremented.

Two external clock input pins for each phase counting mode are not affected by the settings of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. The two external clock input pins used in 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2 can be selected by MTU1.TMDR3.PHCKSEL. In a phase counting mode other than 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2, MTCLKA and MTCLKB are selected for A-phase and B-phase, respectively. In phase counting mode, the external clock pins MTCLKA, MTCLKB, MTCLKC, and MTCLKD are used for two-phase encoder pulse input.

Table 10.66 lists the external clock input pins to be connected in each phase counting mode.

Table 10.66 Clock Input Pins in Phase Counting Mode

		External Clock Input Pins	
Phase Counting Mode	TMDR3.PHCKSEL bit	A-Phase	B-Phase
MTU1 16-bit phase counting mode	x (Don't care)	MTCLKA	MTCLKB
MTU2 16-bit phase counting mode	0	MTCLKA	MTCLKB
	1 (initial value)	MTCLKC	MTCLKD
Cascade connection 32-bit phase counting mode	0	MTCLKA	MTCLKB
	1 (initial value)	MTCLKC	MTCLKD

10.3.6.1 16-Bit Phase Counting Mode

When the MTU1.TMDR3.LWA is 0, 16-bit phase counting mode can be set individually for MTU1 and MTU2.
In 16-bit phase counting mode, the phase difference between two external input clocks is detected and the 16-bit counter TCNT of the corresponding channel is incremented or decremented.
When 16-bit phase counting mode is specified, an external clock is selected as the count clock and TCNT operates as an up-counter/down-counter regardless of the setting of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. However, the functions of TCR.CCLR[1:0],TIOR, TIER, and TGR are enabled, and input capture/compare match and interrupt functions can be used.
These external input pins can be used for two-phase encoder pulse input.
If an overflow occurs during TCNT up-counting, a TCIV interrupt is generated when the corresponding TCIEV bit in the TIER register is set to 1.
If an underflow occurs during TCNT down-counting, a TCIU interrupt is generated when the corresponding TCIEU bit in the TIER register is set to 1.
The TCFD bit in TSR is the count direction flag. Read the TCFD flag to check whether TCNT is counting up or down.

(1) Example of 16-Bit Phase Counting Mode Setting Procedure

Figure 10.30 shows an example of the phase counting mode setting procedure.

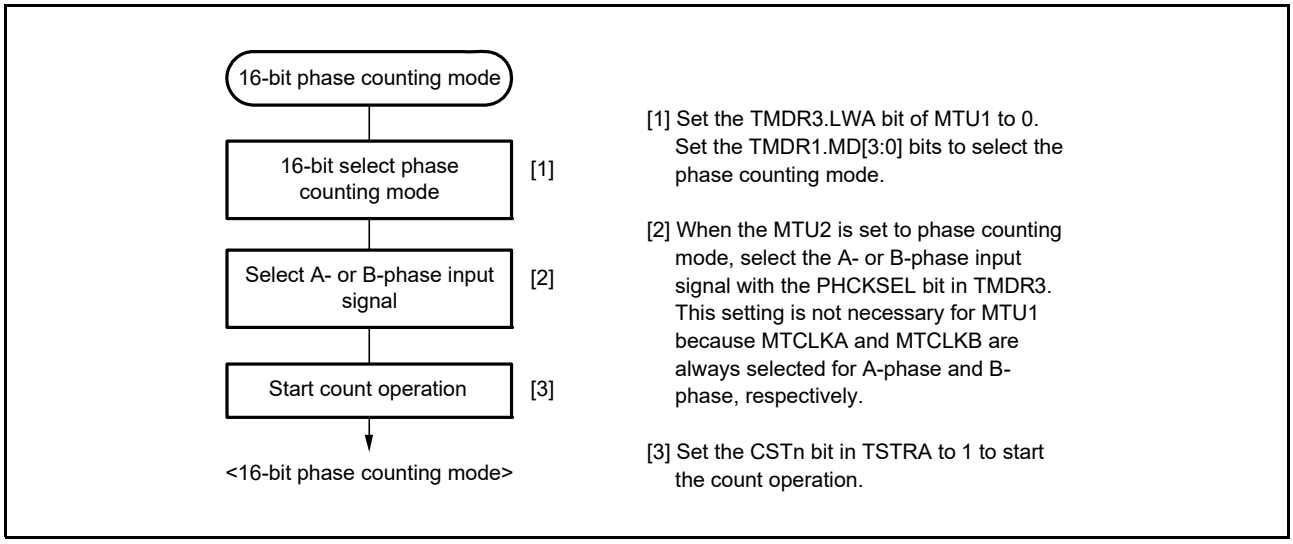

Figure 10.30 Example of 16-Bit Phase Counting Mode Setting Procedure

(2) Examples of 16-Bit Phase Counting Mode Operation

In phase counting mode, TCNT is incremented or decremented according to the phase difference between two external clocks. There are five modes according to the count conditions. Each mode operates under the condition PHCKSEL = 1, which means the phase clock for MTU1 is input from MTCLKA or MTCLKB and that for MTU2 is input from MTCLKC or MTCLKD.

(a) Phase Counting Mode 1

Figure 10.31 shows an example of operation in phase counting mode 1, and Table 10.67 summarizes the TCNT up-counting and down-counting conditions.

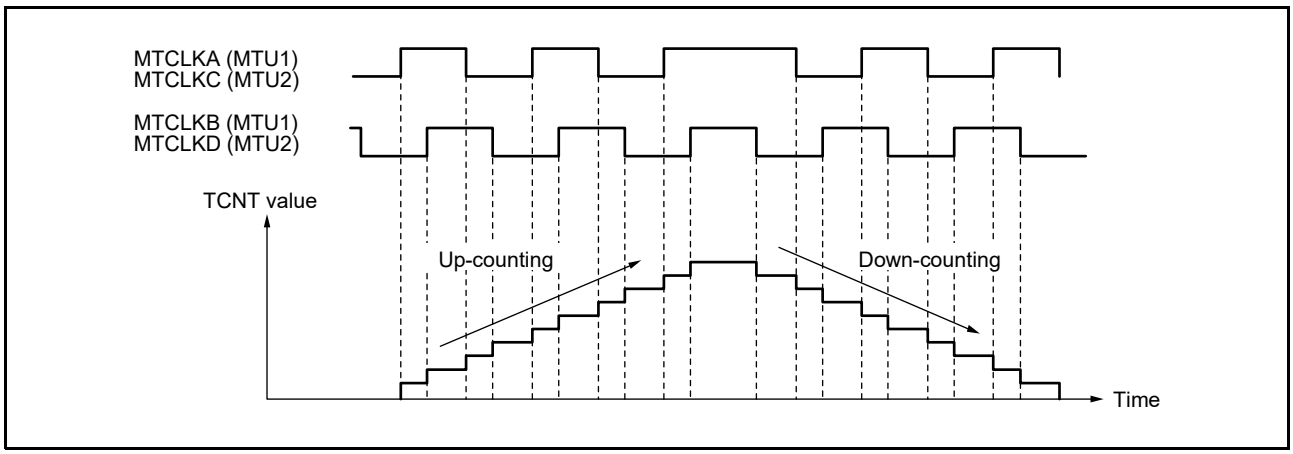

Figure 10.31 Example of Operation in Phase Counting Mode 1

(3) 16-Bit Phase Counting Mode Application Example

Figure 10.41 shows an example in which MTU1 is in phase counting mode, and MTU1 is coupled with MTU0 to input 2-phase encoder pulses of a servo motor in order to detect position or speed.
MTU1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to MTCLKA and MTCLKB.
In MTU0, MTU0.TGRC compare match is specified as the TCNT clearing source and MTU0.TGRA and MTU0.TGRC are used for the compare match function and are set with the speed control cycle and position control cycle.
MTU0.TGRB is used for input capture, with MTU0.TGRB and MTU0.TGRD operating in buffer mode. The MTU1 count clock is designated as the MTU0.TGRB input capture source, and the widths of 2-phase encoder 4-multiplication pulses are detected.
MTU1.TGRA and MTU1.TGRB for MTU1 are designated for the input capture function and MTU0.TGRA and MTU0.TGRC compare matches in MTU0 are selected as the input capture sources to store the up/down-counter values for the control cycles.
This procedure enables the accurate detection of position and speed.

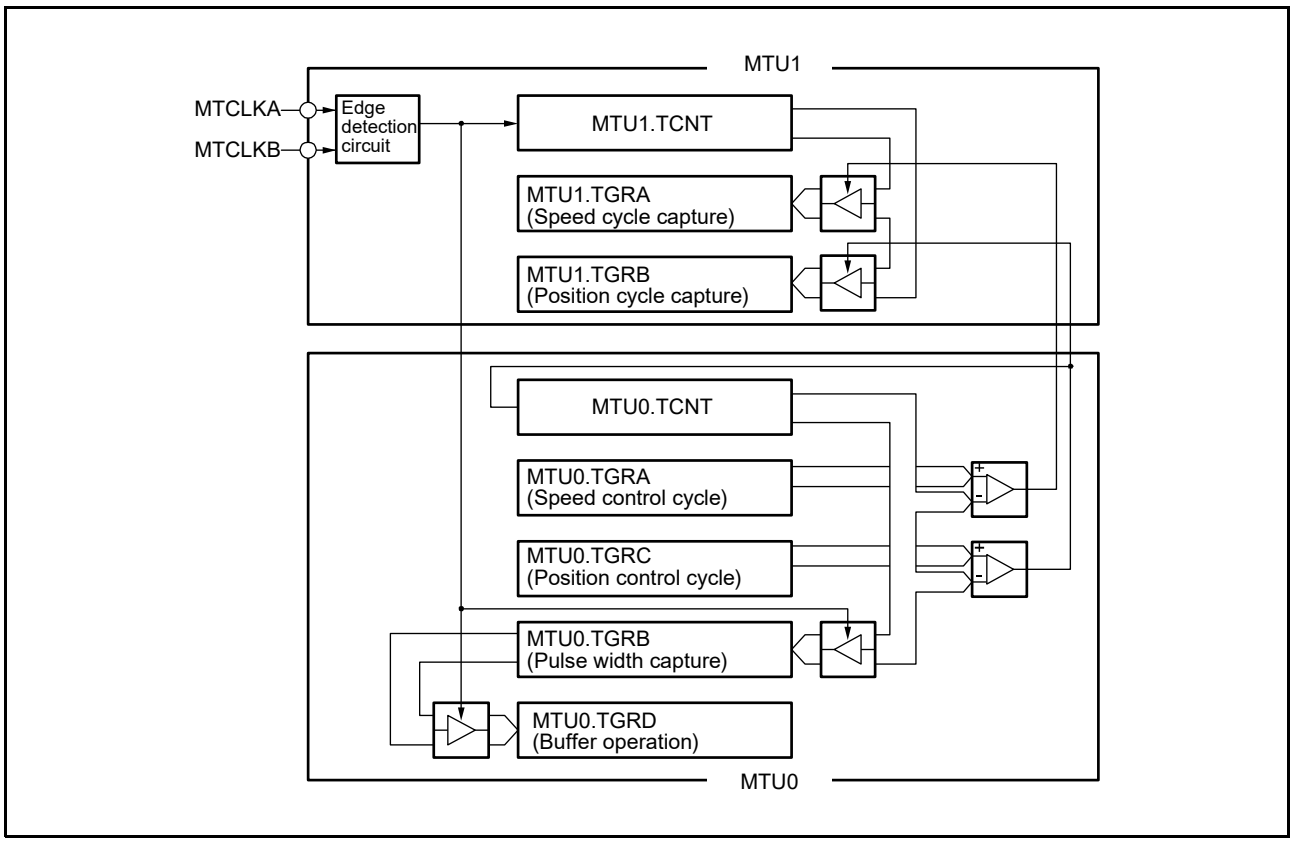

Figure 10.41 16-Bit Phase Counting Mode Application Example

10.3.6.2 Cascade Connection 32-Bit Phase Counting Mode

When MTU1 is set to phase counting mode by setting MTU1.TMDR3.LWA = 1, MTU1 and MTU2 are connected to operate in cascade connection 32-bit phase counting mode as shown in Figure 10.42. When this mode is used, the TCR, TCR2, TIOR, TIER, TGR, and TSR registers are controlled by MTU1 and the settings of MTU2 are disabled. See Figure 10.43 for the procedure for setting cascade connection 32-bit phase counting mode.

In this mode, three-phase (A, B, and Z) signals can be input. As an encoder pulse signal, the external input phase clocks MTCLKA and MTCLKB or MTCLKC and MTCLKD can be selected for A-phase and B-phase, and MTIOC1A can be selected for Z-phase, respectively. See Table 10.70 for selecting external clock input of A-phase and B-phase. A counter event is generated using an A-phase or B-phase pulse and counted by the 32-bit counter MTU1.TCNTLW.

An input capture can also be generated using a Z-phase signal; thus, an angular velocity can be measured using the value captured in the general register.

Furthermore, MTU8 can be used as a channel for measuring a 1-ms interval, and a compare match signal can be output at a 1-ms interval to the MTU1 and MTU2, which operate in cascade connection 32-bit phase counting mode. That is, a compare match signal of MTU8 is used as a capture signal of MTU1 and MTU2, and the number of A-phase and B-phase pulses for a 1-ms period can be measured.

When MTU0 or MTU5 is specified as the channel for measuring Z-phase signal pulses, this compare match signal of TGRC in MTU8 can be output as a capture signal or a clear signal to MTU0 or MTU5; thus, the Z-phase count can be measured at 1-ms intervals.

In addition, a counter event signal of combined MTU1 and MTU2 can be used as a capture signal of TGRD in MTU8, and measurement can be performed including the intervals of A, B, or both phase pulses. In this case, the TGRD register in MTU8 should be set to buffer operation.

Refer to section 10.3.4, Cascaded Operation, for details on the cascade connection function for connecting MTU1 and MTU2 in a mode other than cascade connection 32-bit phase counting mode.

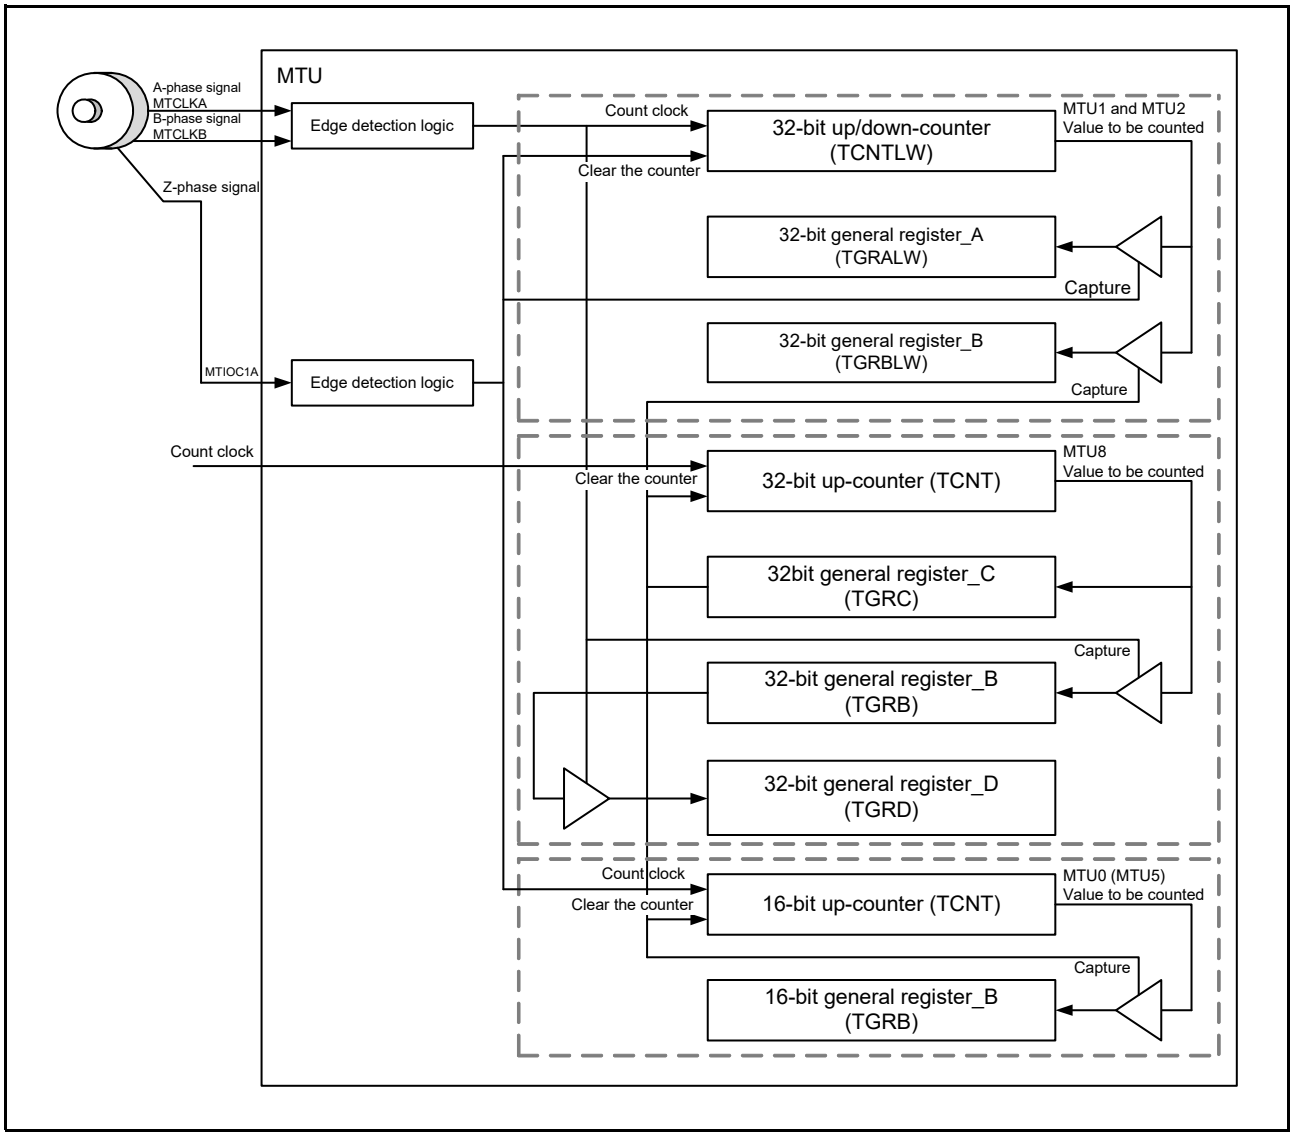

Figure 10.42 Block Diagram for Operation in Cascade Connection 32-Bit Phase Counting Mode

(1) Example of Setting Cascade Connection 32-Bit Phase Counting Mode

Figure 10.43 shows an example of the procedure for setting cascade connection 32-bit phase counting mode.

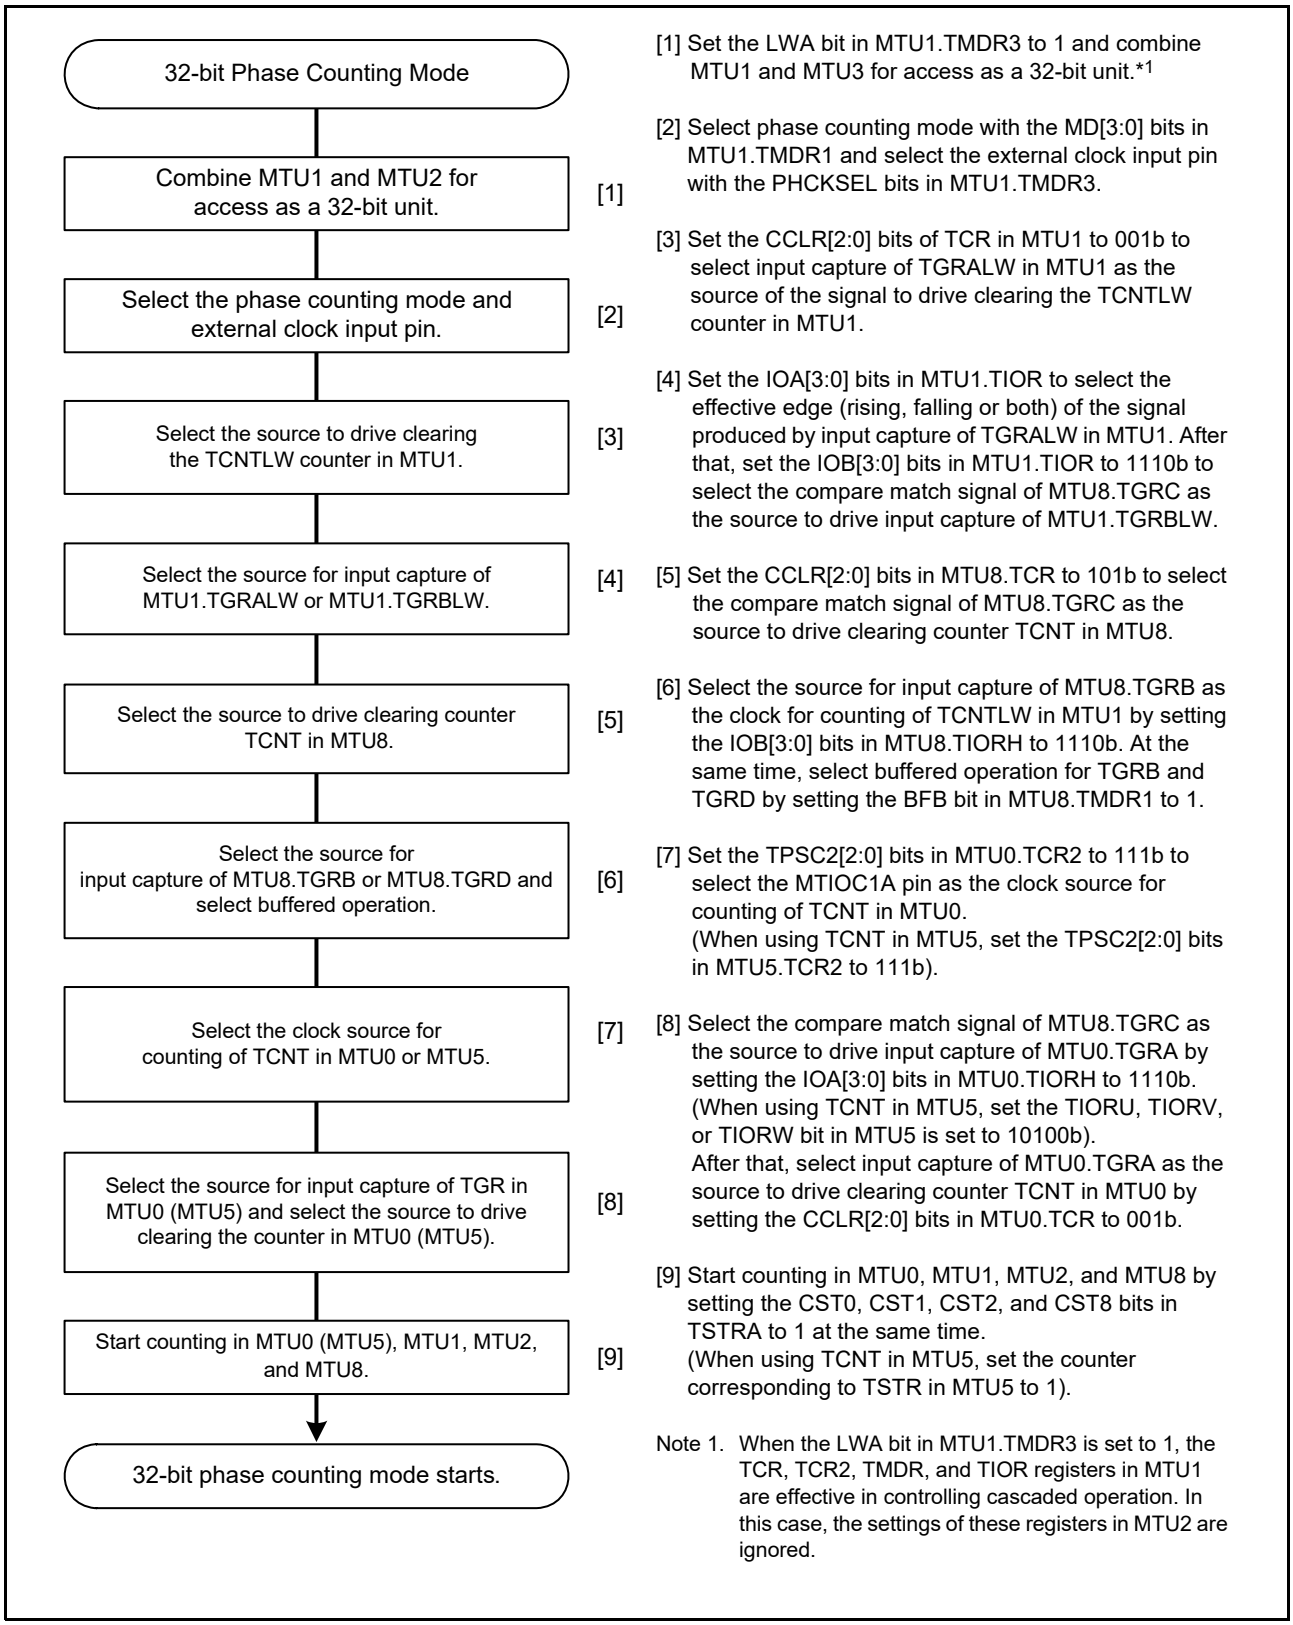

Figure 10.43 Procedure for Setting Cascade Connection 32-Bit Phase Counting Mode

10.3.7 Reset-Synchronized PWM Mode

In the reset-synchronized PWM mode, three phases of positive and negative PWM waveforms (six phases in total) that share a common wave transition point can be output by combining MTU3 and MTU4 and MTU6 and MTU7.
When set for reset-synchronized PWM mode, the MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D pins function as PWM output pins and timer counters 6 and 12 (MTU3.TCNT and MTU6.TCNT) functions as an up-counter.

Table 10.72 shows the PWM output pins used. Table 10.73 shows the settings of the registers.

Table 10.72 Output Pins for Reset-Synchronized PWM Mode

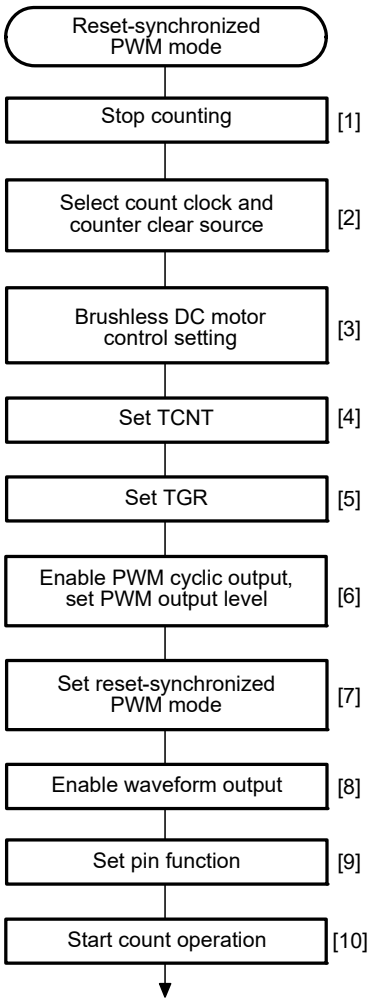
Channel	Output Pin	Description
MTU3	MTIOC3B	PWM output pin 1
	MTIOC3D	PWM output pin 1' (negative-phase waveform of PWM output 1)
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (negative-phase waveform of PWM output 2)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (negative-phase waveform of PWM output 3)
MTU6	MTIOC6B	PWM output pin 4
	MTIOC6D	PWM output pin 4' (negative-phase waveform of PWM output 4)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (negative-phase waveform of PWM output 5)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (negative-phase waveform of PWM output 6)

Table 10.73 Register Settings for Reset-Synchronized PWM Mode

Register	Setting
MTU3.TCNT	Initial setting (0000h)
MTU4.TCNT	Initial setting (0000h)
MTU3.TGRA	Set the count cycle for MTU3.TCNT
MTU3.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC3B and MTIOC3D pins
MTU4.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC4A and MTIOC4C pins
MTU4.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC4B and MTIOC4D pins
MTU6.TCNT	Initial setting (0000h)
MTU7.TCNT	Initial setting (0000h)
MTU6.TGRA	Set the count cycle for MTU6.TCNT
MTU6.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC6B and MTIOC6D pins
MTU7.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC7A and MTIOC7C pins
MTU7.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC7B and MTIOC7D pins

(1) Example of Procedure for Setting Reset-Synchronized PWM Mode

Figure 10.44 shows an example of the procedure for specifying the reset-synchronized PWM mode.



[1] Clear the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 0 to stop the TCNT count operation. Specify the reset-synchronized PWM mode while MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) are stopped.

[2] Set the TCR.TPSC[2:0] and TCR.CKEG[1:0] bits of MTU3 (MTU6) to select the count clock source and clock edge for MTU3 (MTU6). Set the TCR.CCLR[2:0] bits to select TGRA compare match as the counter clear source.

[3] To control a brushless DC motor, set the TGCRA.BDC bit and set the feedback signal input source and output chopping or gate signal direct output (only when MTU3 and MTU4 are used).

[4] Set MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) to 0000h.

[5] MTU3.TGRA (MTU6.TGRA) is the cycle register. Set the PWM cycle in MTU3.TGRA (MTU6.TGRA).
Set the PWM output transition timing in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB).
Note that the setting values should be within the range of compare match with MTU3.TCNT (MTU6.TCNT).

$X \leq$ MTU3.TGRA (X: Set value)

[6] Set the PSYE bit in the TOCR1A (TOCR1B) register to enable or disable toggle output synchronized with the PMW cycle, and set the OLSP and OLSN bits to select the PWM output level.
When specifying the PWM output level using the TOCR2A (TOCR2B) and TOLBRA (TOLBRB) in buffer operation, see Timer Output Level Buffer Registers (TOLBRA and TOLBRB).

[7] Set the MD[3:0] bits in MTU3.TMDR1 (MTU6.TMDR1) register to 1000b to select the reset-synchronized PWM mode. Specify the buffer operation (BFA = 1) of the MTU3.TGRA (MTU6.TGRA) register and the buffer operation (BFB = 1) of the MTU3.TGRB register when necessary. Set the MTU4.TMDR1 (MTU7.TMDR1) register to the initial value (normal operation; BFA = 0 and BFB = 0).

[8] Set the TOERA (TOERB) register to enable or disable output from the PWM output pin. Then, set the MTU3.TIORH (MTU6.TIORH), MTU3.TIORL (MTU6.TIORL), MTU4.TIORH (MTU7.TIORH), and MTU4.TIORL (MTU7.TIORL) registers to 00h.

[9] Set the port mode registers (PMR) and Pmn pin function control register (PmnPFS) of the GPIO ports.

[10] Set the TSTRA.CST3 (TSTRB.CST6) bit to 1 to start count operation.

Note: The output waveform starts to toggle at the point of MTU3.TCNT (MTU6.TCNT) = MTU3.TGRA (MTU6.TGRA) = X by setting X = MTU3.TGRA (MTU6.TGRA), i.e., cycle = duty ratio.

Figure 10.44 Procedure for Selecting Reset-Synchronized PWM Mode

(2) Example of Reset-Synchronized PWM Mode Operation

Figure 10.45 shows an example of operation in the reset-synchronized PWM mode.
MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) operate as up-counters. The counters are cleared when a compare match occurs between MTU3.TCNT (MTU6.TCNT) and MTU3.TGRA (MTU6.TGRA), and then begin incrementing from 0000h. The output from the PWM pins toggles every time a compare match occurs in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB) and the counters are cleared.

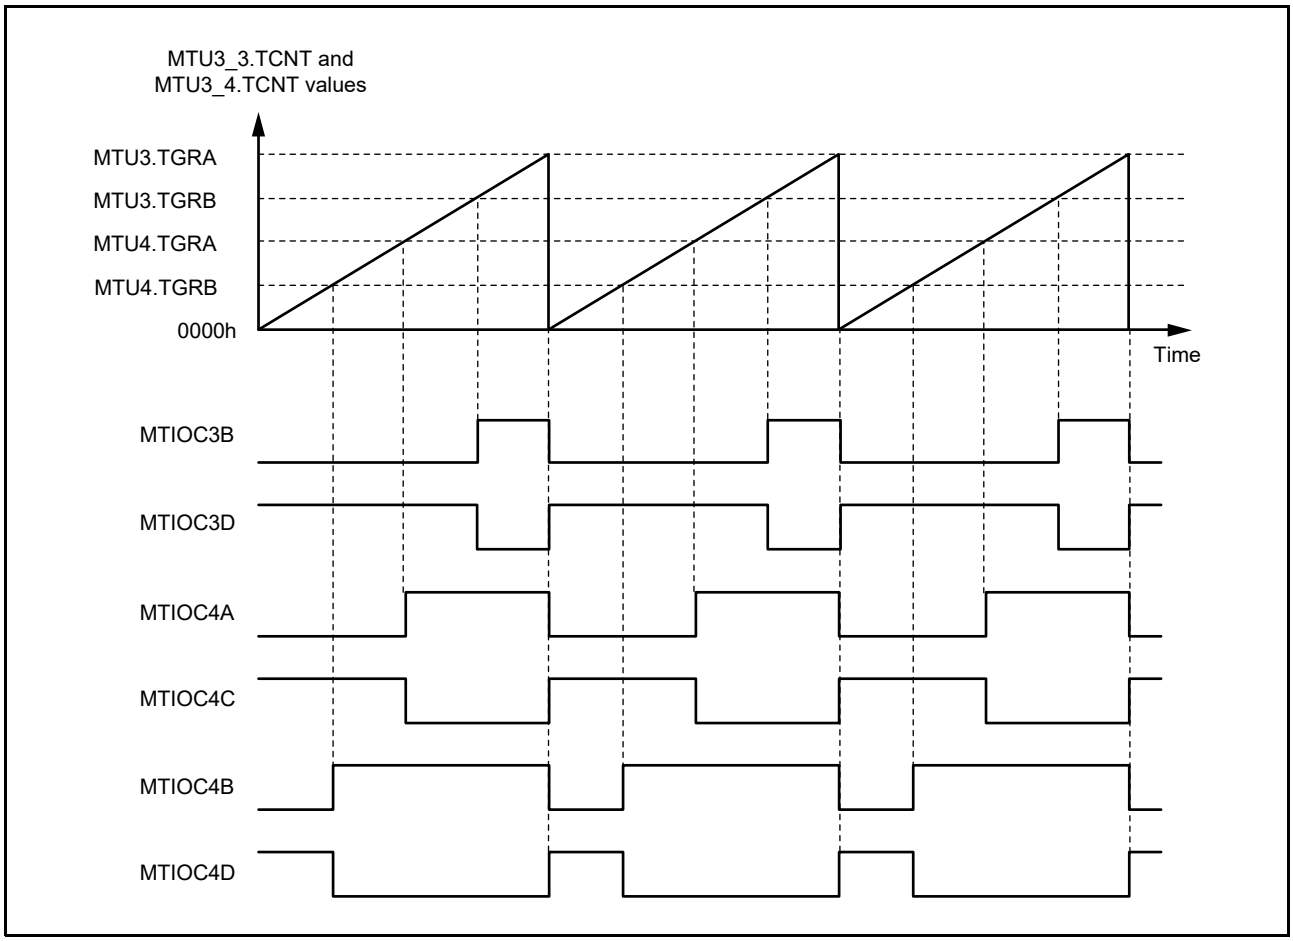


Figure 10.45 Example of Reset-Synchronized PWM Mode Operation
(When OLSN = 1 and OLSP = 1 in MTU3.TOCR1 and MTU4.TOCR1)

10.3.8 Complementary PWM Mode

In complementary PWM mode, dead time can be set for PWM waveforms to be output. The dead time is the period during which the upper and lower arm transistors are set to the inactive level in order to prevent short-circuiting of the arms.
Six positive-phase and six negative-phase PWM waveforms (12 phases in total) with dead time can be output by combining MTU3/ MTU4 and MTU6/MTU7. PWM waveforms without dead time can also be output.
In complementary PWM mode, MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D pins function as PWM output pins, and the MTIOC3A and MTIOC6A pins can be set for toggle output synchronized with the PWM cycle.
MTU3.TCNT, MTU4.TCNT, MTU6.TCNT, and MTU7.TCNT function as up/down-counters.

Table 10.74 shows the PWM output pins used. Table 10.75 shows the settings of the registers used.
A function to directly cut off the PWM output by using an external signal is supported as a port function.

Table 10.74 Output Pins for Complementary PWM Mode

Channel	Output Pin	Description
MTU3	MTIOC3A	Toggle output synchronized with PWM cycle (or I/O port)
	MTIOC3B	PWM output pin 1
	MTIOC3C	I/O port*1
	MTIOC3D	PWM output pin 1' (negative-phase waveform output of PWM output 1)
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (negative-phase waveform output of PWM output 1)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (negative-phase waveform output of PWM output 1)
MTU6	MTIOC6A	Toggle output synchronized with PWM cycle (or I/O port)
	MTIOC6B	PWM output pin 4
	MTIOC6C	I/O port*1
	MTIOC6D	PWM output pin 4' (negative-phase waveform output of PWM output 4)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (negative-phase waveform output of PWM output 5)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (negative-phase waveform output of PWM output 6)

Note 1. Avoid setting the MTIOC3C and MTIOC6C pins as timer I/O pins in complementary PWM mode.

Table 10.75 Register Settings for Complementary PWM Mode (1/2)

Channel	Counter / Register	Description	Read/Write from CPU
MTU3	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERA setting*1
	TGRA	Set MTU3.TCNT upper limit value (1/2 carrier cycle + dead time)	Maskable by TRWERA setting*1
	TGRB	PWM output 1 compare register	Maskable by TRWERA setting*1
	TGRC	MTU3.TGRA buffer register	Readable/writable
	TGRD	PWM output 1/MTU3.TGRB buffer register	Readable/writable
	TGRE	MTU3.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU4	TCNT	Starts up-counting after being initialized to 0000h	Maskable by TRWERA setting*1
	TGRA	PWM output 2 compare register	Maskable by TRWERA setting*1
	TGRB	PWM output 3 compare register	Maskable by TRWERA setting*1
	TGRC	PWM output 2/MTU4.TGRA buffer register	Readable/writable
	TGRD	PWM output 3/MTU4.TGRB buffer register	Readable/writable
	TGRE	MTU4.TGRA buffer register B (when double buffer function is used)	Readable/writable
	TGRF	MTU4.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU6	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERB setting*2
	TGRA	Set MTU6.TCNT upper limit value (1/2 carrier cycle + dead time)	Maskable by TRWERB setting*2
	TGRB	PWM output 4 compare register	Maskable by TRWERB setting*2
	TGRC	MTU6.TGRA buffer register	Readable/writable
	TGRD	PWM output 4/MTU6.TGRB buffer register	Readable/writable
	TGRE	MTU6.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU7	TCNT	Starts up-counting after being initialized to 0000h	Maskable by TRWERB setting*2
	TGRA	PWM output 5 compare register	Maskable by TRWERB setting*2
	TGRB	PWM output 6 compare register	Maskable by TRWERB setting*2
	TGRC	PWM output 5/MTU7.TGRA buffer register	Readable/writable
	TGRD	PWM output 6/MTU7.TGRB buffer register	Readable/writable
	TGRE	MTU7.TGRA buffer register B (when double buffer function is used)	Readable/writable
	TGRF	MTU7.TGRB buffer register B (when double buffer function is used)	Readable/writable

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).
Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

Table 10.76 Register Settings for Complementary PWM Mode (2/2)

Counter / Register	Description	Read/Write from CPU
Timer dead time data register A (TDDRA)	Set MTU4.TCNT and MTU3.TCNT offset value (dead time value)	Maskable by TRWERA setting*1
Timer dead time data register B (TDDRB)	Set MTU7.TCNT and MTU6.TCNT offset value (dead time value)	Maskable by TRWERB setting*2
Timer cycle data register A (TCDRA)	Set MTU4.TCNT upper limit value (1/2 carrier cycle)	Maskable by TRWERA setting*1
Timer cycle data register B (TCDRB)	Set MTU7.TCNT upper limit value (1/2 carrier cycle)	Maskable by TRWERB setting*2
Timer cycle buffer register A (TCBRA)	TCDRA buffer register	Readable/writable
Timer cycle buffer register B (TCBRB)	TCDRB buffer register	Readable/writable
Subcounter A (TCNTSA)	Subcounter A for dead time generation	Read-only
Subcounter B (TCNTSB)	Subcounter B for dead time generation	Read-only
Temporary register 1A (TEMP1A)	PWM output 1/MTU3.TGRB temporary register A	Not readable or writable
Temporary register 1B (TEMP1B)	PWM output 1/MTU3.TGRB temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 2A (TEMP2A)	PWM output 2/MTU4.TGRA temporary register A	Not readable or writable
Temporary register 2B (TEMP2B)	PWM output 2/MTU4.TGRA temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 3A (TEMP3A)	PWM output 3/MTU4.TGRB temporary register A	Not readable or writable
Temporary register 3B (TEMP3B)	PWM output 3/MTU4.TGRB temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 4A (TEMP4A)	PWM output 4/MTU6.TGRB temporary register A	Not readable or writable
Temporary register 4B (TEMP4B)	PWM output 4/MTU6.TGRB temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 5A (TEMP5A)	PWM output 5/MTU7.TGRA temporary register A	Not readable or writable
Temporary register 5B (TEMP5B)	PWM output 5/MTU7.TGRA temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 6A (TEMP6A)	PWM output 6/MTU7.TGRB temporary register A	Not readable or writable
Temporary register 6B (TEMP6B)	PWM output 6/MTU7.TGRB temporary register B (when double buffer function is used)	Not readable or writable

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).
Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

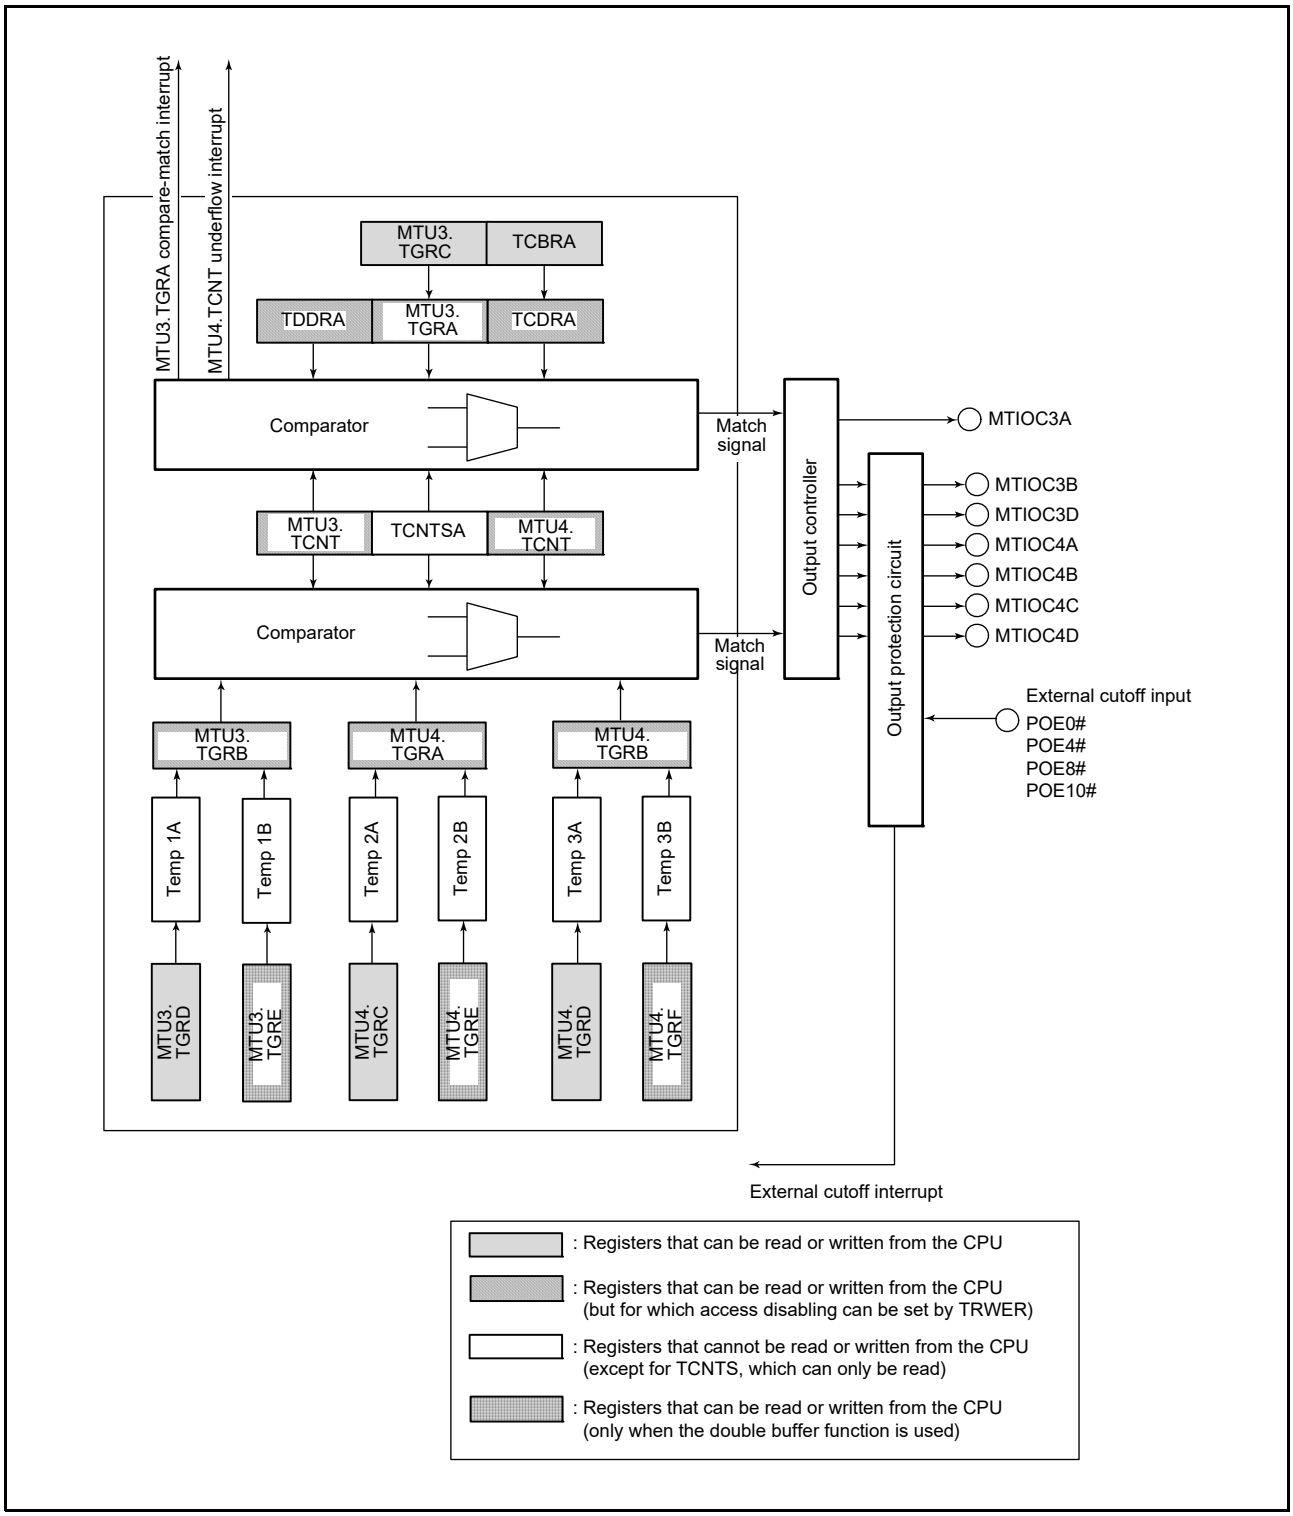

Figure 10.46 Block Diagram of MTU3 and MTU4 in Complementary PWM Mode

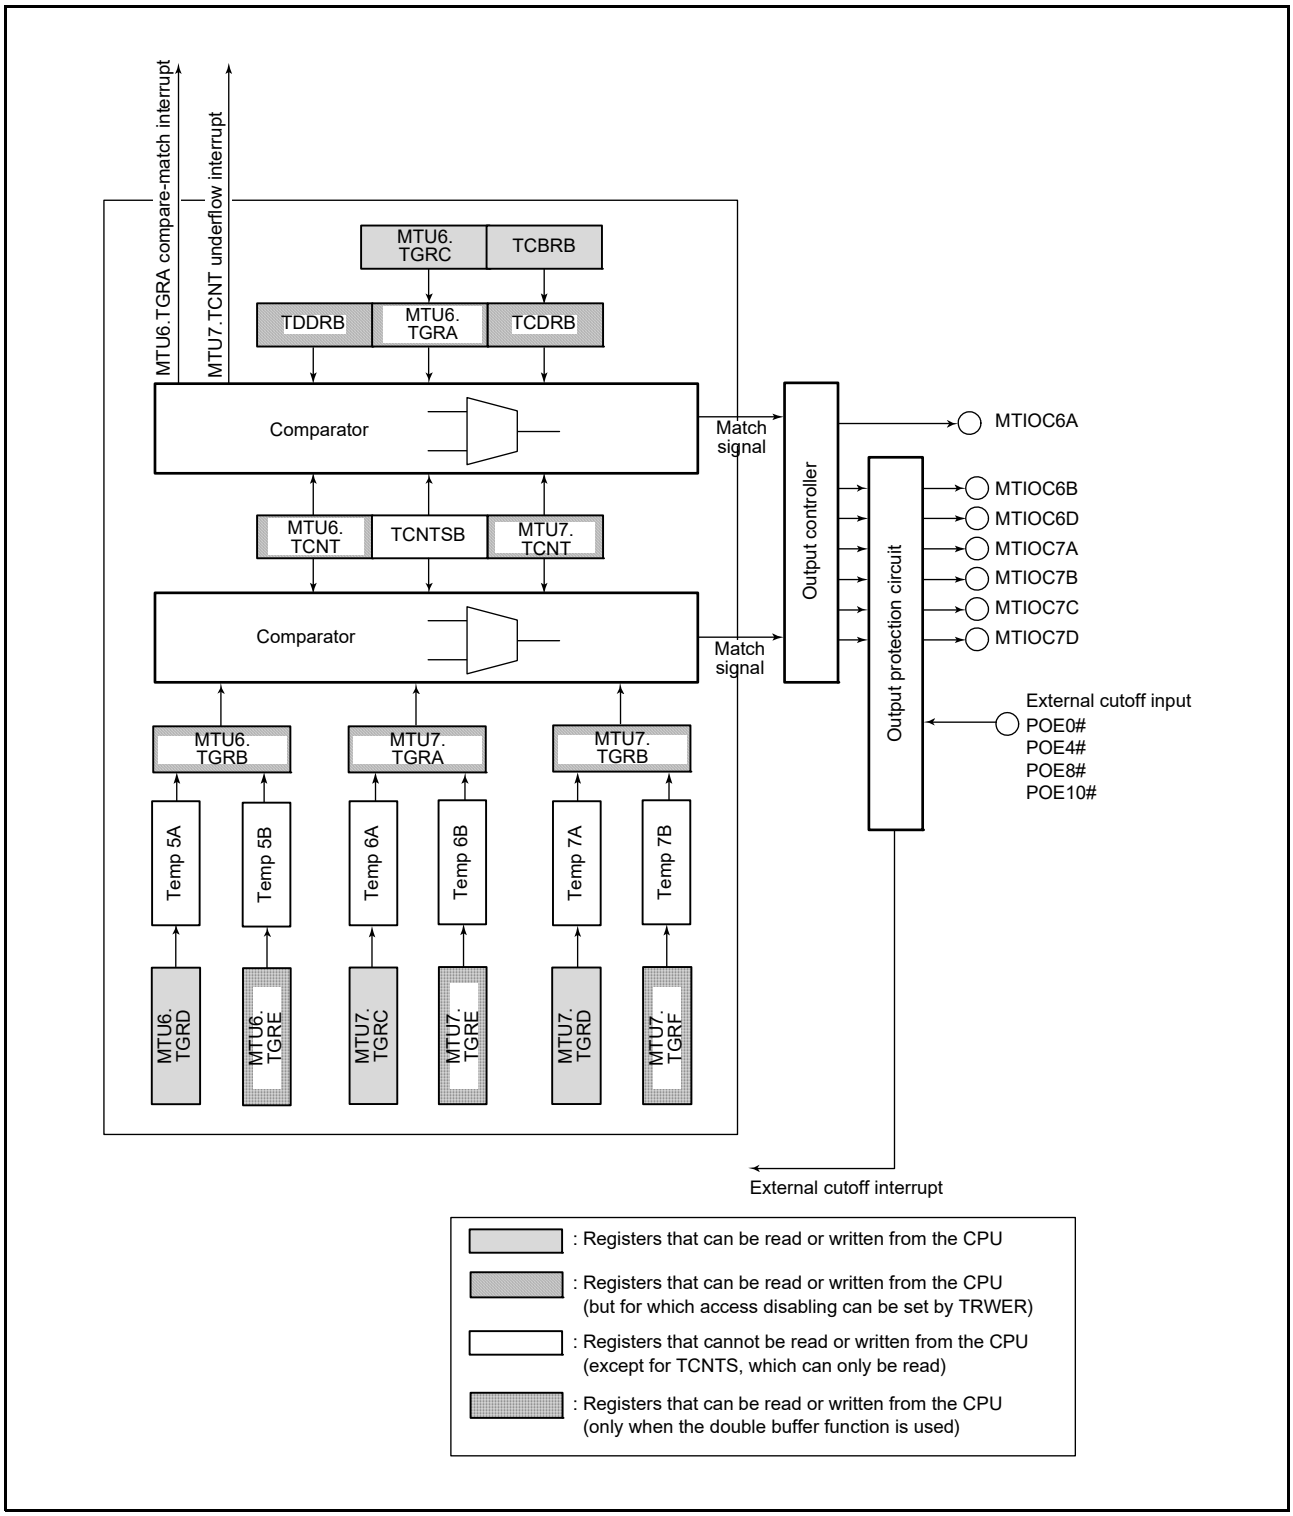

Figure 10.47 Block Diagram of MTU6 and MTU7 in Complementary PWM Mode

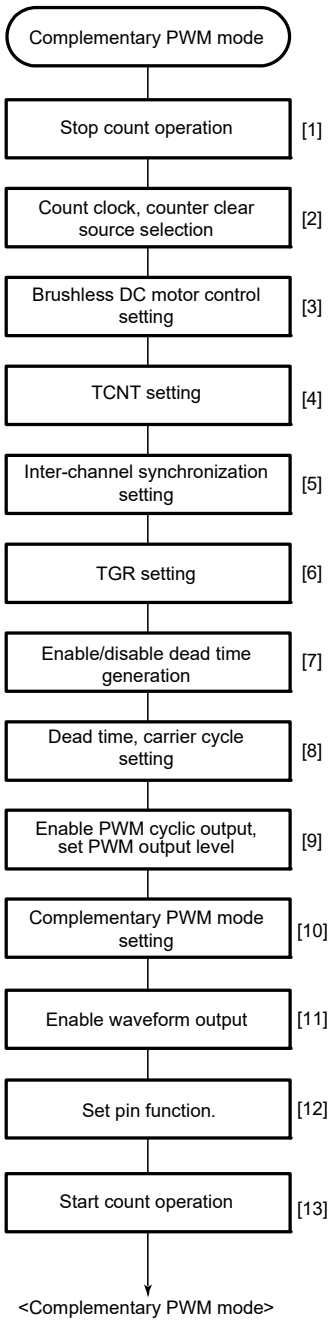
(1) Example of Complementary PWM Mode Setting Procedure

Figure 10.48 shows an example of the complementary PWM mode setting procedure.



[1] Clear the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 0 to stop the TCNT count operation.
Specify complementary PWM mode while MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) are stopped.

[2] Set the TCR.TPSC[2:0] and TCR.CKEG[1:0] bits of MTU3 and MTU4 (MTU6 and MTU7) to select the same count clock source and clock edge for MTU3 and MTU4 (MTU6 and MTU7).
Set the TCR.CCLR[2:0] bits only when restarting by synchronous clearing with another channel during complementary PWM operation.

[3] To control a brushless DC motor, set the TGCRA.BDC bit and set the feedback signal input source and output chopping or gate signal direct output (only when MTU3 and MTU4 are used).

[4] Set the dead time in MTU3.TCNT (MTU6.TCNT). Set MTU4.TCNT (MTU7.TCNT) to 0000h.

[5] Make this setting only when restarting by synchronous clearing with another channel during complementary PWM mode operation. In this case, set the TSYRA register (TSYRB) to synchronize the channel generating the synchronous clear with MTU3 and MTU4 (MTU6 and MTU7).

[6] When MTU3 and MTU6 are used, set the PWM output duty ratio in the duty registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB) and buffer registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD).
Be sure to set the same value in each pair of the duty registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD) and buffer registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB).
Only when the double buffer function is used, set the PWM output duty value - 1 in the buffer registers (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF).
When MTU6 and MTU7 are used, set the value to the following registers:
Duty registers (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)
Buffer registers (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)
Buffer registers when the double buffer function is used (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)

[7] This setting is necessary only when no dead time should be generated. Make appropriate settings in the TDERA (TDERB) register so that no dead time generated.

[8] Set the dead time in the TDDRA (TDDRB) register, 1/2 the PWM cycle in the TCDRA (TCDRB) register and TCBRA (TCBRB) register, and 1/2 the PWM cycle plus the dead time in MTU3.TGRA (MTU6.TGRA) and MTU3.TGRC (MTU6.TGRC).
When no dead time generation is selected, set 1 in the TDDRA (TDDRB) register and 1/2 the PWM cycle + 1 in MTU3.TGRA (MTU6.TGRA) and MTU3.TGRC (MTU6.TGRC).

[9] Set the PSYE bit in the TOCR1A register to enable or disable toggle output synchronized with the PWM cycle, and set the OLSP and OLSN bits to select the PWM output level.
When specifying the PWM output level using the TOCR2A (TOCR2B) and TOLBRA (TOLBRA) in buffer operation, see Timer Output Level Buffer Registers (TOLBRA and TOLBRB).

[10] Select complementary PWM mode in MTU3.TMDR1 (MTU6.TMDR1). Specify the buffer operation (BFA = 1) of MTU3.TGRA (MTU6.TGRA) and the buffer operation (BFB = 1) of MTU3.TGRB (MTU6.TGRB).
Only when the double buffer function is used, set the TMDR2A (TMDR2B) register to enable the double buffer function.

[11] Set the TOERA (TOERB) register to enable or disable output from the PWM output pin. Then, set the MTU3.TIORH (MTU6.TIORH), MTU3.TIORL (MTU6.TIORL), MTU4.TIORH (MTU7.TIORH), and MTU4.TIORL (MTU7.TIORL) to 00h.

[12] Set the port mode registers (PMR) and Pmn pin function control register (PmnPFS) of the GPIO ports.

[13] Set the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 1 simultaneously to start count operation.

Figure 10.48 Example of Complementary PWM Mode Setting Procedure

(2) Outline of Complementary PWM Mode Operation

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. Figure 10.49 illustrates counter operation in complementary PWM mode (MTU3 and MTU4), and Figure 10.50 shows an example of operation in complementary PWM mode.

(a) Counter Operation

In complementary PWM mode, three counters—MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) —in each unit perform up-/down-count operations.
MTU3.TCNT (MTU6.TCNT) is automatically initialized to the value set in TDDRA (TDDRB) when complementary PWM mode is selected and the CST3 bit in TSTRA (TSTRB) is 0. When the CST3 bit is set to 1, MTU3.TCNT (MTU6.TCNT) counts up to the value set in MTU3.TGRA (MTU6.TGRA), then switches to down-counting when it matches MTU3.TGRA (MTU6.TGRA). When the MTU4.TCNT (MTU7.TCNT) value matches 0000h, MTU3.TCNT (MTU6.TCNT) switches to up-counting, and the operation is repeated in this way.
TCNT in MTU4 (MTU7) should be initialized to 0000h after a reset. When the CST4 bit is set to 1, MTU4.TCNT (MTU7.TCNT) counts up in synchronization with MTU3.TCNT (MTU6.TCNT), and switches to down-counting when MTU3.TCNT (MTU6.TCNT) matches MTU3.TGRA (MTU6.TGRA). On reaching 0000h, MTU4.TCNT (MTU7.TCNT) switches to up-counting, and the operation is repeated in this way. TCNTSA (TCNTSB) is a read-only counter. It does not need to be initialized after a reset.
In counting up by MTU3.TCNT and MTU4.TCNT (or MTU6.TCNT and MTU7.TCNT), MTU3.TCNT (or MTU6.TCNT) starts counting up when it matches TCDRA (or TCDRB) and switches to counting down when it matches MTU3.TGRA (or MTU6.TGRA). Furthermore, when MTU4.TCNT (or MTU7.TCNT) matches TDDRA (or TDDRB), TCNTSA (or TCNTSB) is set to the value in MTU3.TGRA (or MTU6.TGRA) and counting is stopped.
When MTU4.TCNT (MTU7.TCNT) matches TDDRA (TDDRB) during down-counting of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT), TCNTSA (TCNTSB) starts up-counting, and when MTU4.TCNT (MTU7.TCNT) matches 0000h, the operation switches to down-counting. When MTU3.TCNT (MTU6.TCNT) matches TCDRA (TCDRB), TCNTSA (TCNTSB) is cleared to 0000h and stops counting.
TCNTSA (TCNTSB) is compared with the compare register and temporary register, in which the PWM duty is specified, only during the count operation.

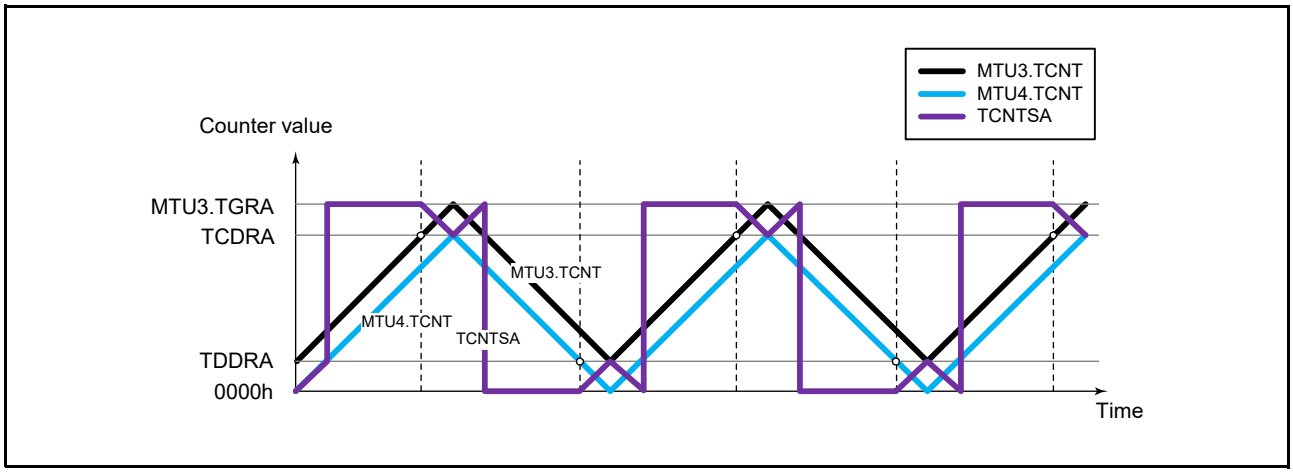


Figure 10.49 Count Operation in Complementary PWM Mode (MTU3 and MTU4)

(b) Register Operation

In complementary PWM mode, nine registers (compare registers, buffer registers, and temporary registers) are used to control the duty ratio for the PWM output. Figure 10.50 shows an example of operation in complementary PWM mode (MTU3 and MTU4).

MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB) are constantly compared with the counters to generate PWM waveforms. When these registers match the counter, the value set in the OLSN and OLSP bits in the timer output control registers (TOCR1A and TOCR1B) is output from the PWM output pin.

MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD) are buffer registers for these compare registers.

When the double buffer function is used, MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) are also used as buffer registers B. For details of double buffer operation, refer to section 10.3.8 (2) (s), Double Buffer Function in Complementary PWM Mode.

Data in a compare register can be changed by writing new data to the corresponding buffer register. The buffer registers can be read or written at any time.

When modifying data in a buffer register, write to MTU4.TGRD (MTU7.TGRD) last and enable data transfer from the buffer register to a temporary register. At this time, transfer from the TCBRA (TCBRB) register and MTU3.TGRC (MTU6.TGRC) register, which operate as buffer registers for the timer cycle registers, to temporary registers is also enabled. Data is transferred to all five temporary registers at the same time.

When transfer is enabled in the Ta interval, data written to a buffer register is transferred to the temporary register. The data is not transferred to the temporary register in the Tb1 and Tb2 intervals. Data enabled for transfer in this interval is transferred to the temporary register at the end of this interval.

The value transferred to a temporary register is transferred to the compare register at the end of the Tb1 interval (when matches MTU3.TGRA (MTU6.TGRA) while TCNTSA (TCNTSB) is counting up), or at the end of the Tb2 interval (when matches 0000h while TCNTSA (TCNTSB) is counting down). The timing for transfer from the temporary register to the compare register can be selected with bits MD[3:0] in the timer mode register 1 (TMDR1). Figure 10.50 shows an example in which the trough is selected for the transfer timing.

In the Tb interval in which data is not transferred to the temporary register (Tb1 in Figure 10.50), the temporary register has the same function as the compare register and is compared with the counter. In this interval, therefore, there are two compare match registers for one output phase; the compare register contains the pre-change data and the temporary register contains new data. In this interval, three counters MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) and two registers (compare register and temporary register) are compared, and PWM output is controlled accordingly.

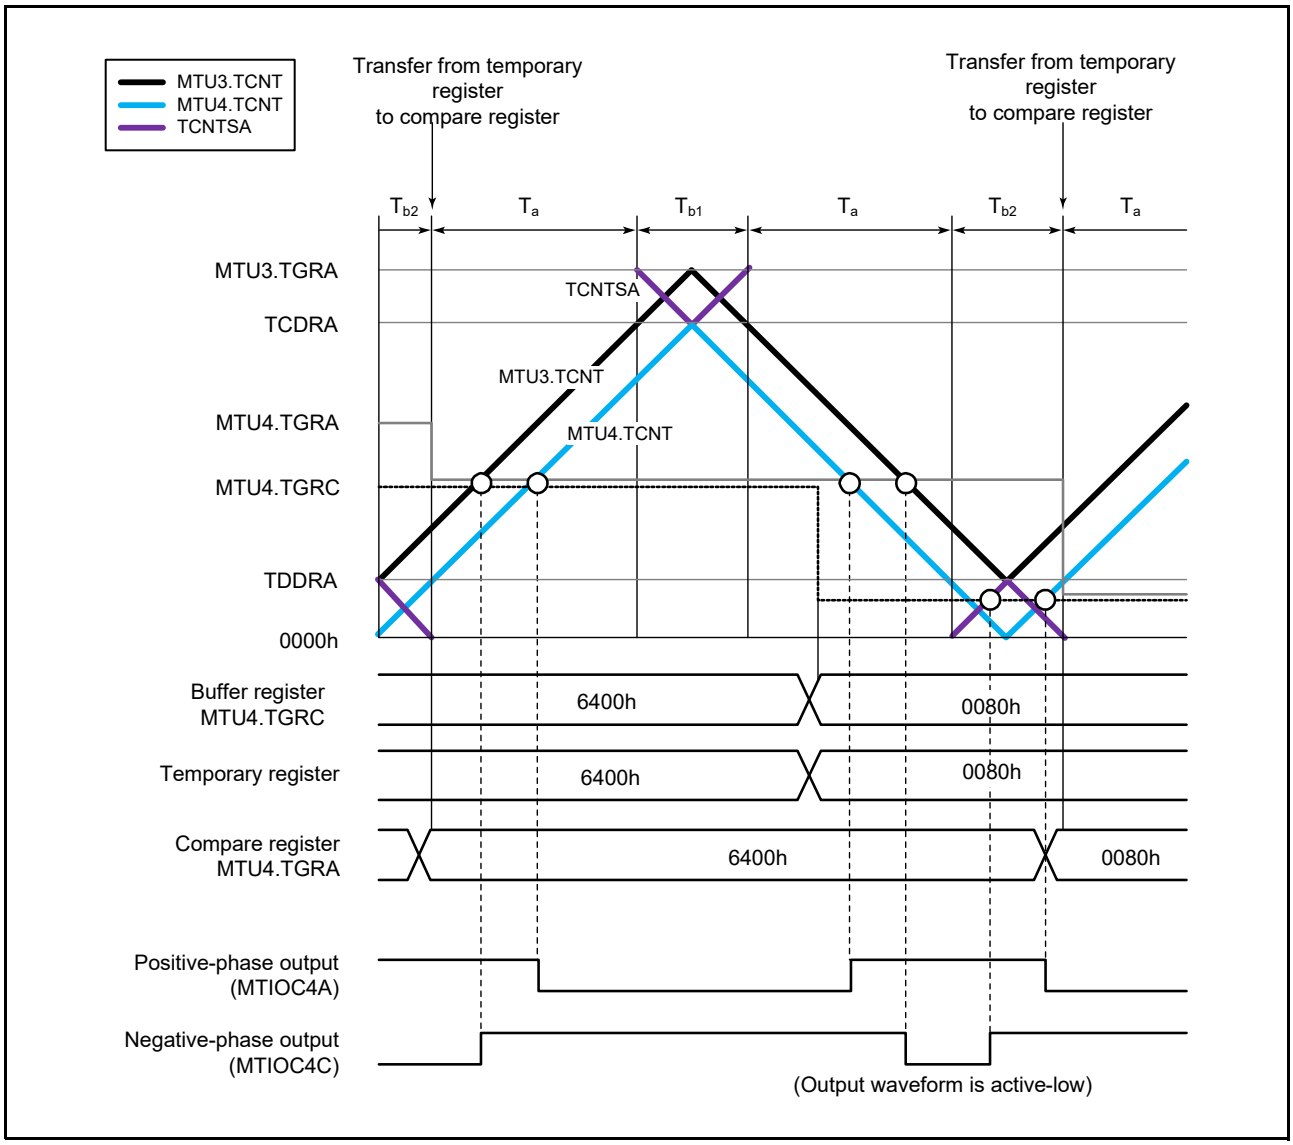

Figure 10.50 Example of Operation in Complementary PWM Mode (MTU3 and MTU4)

(c) Initial Setting

In complementary PWM mode, there are nine registers that require initial setting. In addition, there is a register that specifies whether to generate dead time (it should be used only when dead time generation should be disabled).
Before setting complementary PWM mode with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits, initial values should be set in the following registers.
The TOCR1A, TOCR2A, TOCR1B, and TOCR2B registers are used to set the PWM output level. MTU3.TGRC (MTU6.TGRC) operates as the buffer register for MTU3.TGRA (MTU6.TGRA), and should be set with 1/2 the PWM cycle + dead time Td. The timer cycle buffer register (TCBRA or TCBRB) operates as the buffer register for the timer cycle data register (TCDRA or TCDRB), and should be set with 1/2 the PWM cycle. Set dead time Td in the timer dead time data register (TDDRA or TDDRB).
When dead time is not needed, the TDER bit in the timer dead time enable register (TDERA or TDERB) should be cleared to 0, MTU3.TGRC and MTU3.TGRA (MTU6.TGRC and MTU6.TGRA) should be set to 1/2 the PWM carrier cycle + 1, and TDDRA (TDDRB) should be set to 1.
Set the respective initial PWM duty values in three buffer registers A (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)).
Set the respective (initial PWM duty – 1) values in three buffer registers B (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)) only when the double buffer function is used.
The values set in the five buffer registers excluding TDDRA (TDDRB) are transferred to the corresponding compare registers as soon as complementary PWM mode is set.
Set MTU4.TCNT (MTU7.TCNT) to 0000h before setting complementary PWM mode.

Table 10.77 Registers and Counters Requiring Initial Setting

Register and Counter	Setting
TOCR1A, TOCR2A, TOCR1B, TOCR2B	PWM output level
MTU3.TGRC MTU6.TGRC	1/2 PWM cycle + dead time Td (1/2 PWM cycle + 1 when dead time generation is disabled by the TDERA or TDERB setting)
TDDRA, TDDRB	Dead time Td (1 when dead time generation is disabled by the TDERA or TDERB setting)
TCBRA, TCBRB	1/2 PWM cycle
MTU3.TGRD, MTU4.TGRC, MTU4.TGRD MTU6.TGRD, MTU7.TGRC, MTU7.TGRD	Initial PWM duty ratio value for each phase
MTU3.TGRE, MTU4.TGRE, MTU4.TGRF MTU6.TGRE, MTU7.TGRE, MTU7.TGRF	Initial PWM duty ratio – 1 value for each phase (only when double buffer function is used)
MTU4.TCNT MTU7.TCNT	0000h

Note: The value set in MTU3.TGRC (MTU6.TGRC) should be the sum of 1/2 the PWM cycle set in TCBRA (TCBRB) and dead time Td set in TDDRA (TDDRB). When dead time generation is disabled by TDERA (TDERB), TGRC should be set to 1/2 the PWM cycle + 1.

(d) PWM Output Level Setting

In complementary PWM mode, the PWM output level is set with bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1P to OLS3P and OLS1N to OLS3N in timer output control register 2 (TOCR2A or TOCR2B).
The output level can be set for each of the three positive phases and three negative phases of 6-phase output.
Complementary PWM mode should be cleared before setting or changing output levels.

(e) Dead Time Setting

In complementary PWM mode, dead time can be set for PWM output.
The dead time is set in the timer dead time data register (TDDRA or TDDRB). The value set in TDDRA (TDDRB) is used as the MTU3.TCNT (MTU6.TCNT) counter start value and creates a non-overlapping interval between MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT). Complementary PWM mode should be cleared before changing the contents of TDDRA (TDDRB).

(f) Dead Time Suppressing

Dead time generation is suppressed by clearing the TDER bit in the timer dead time enable register (TDERA or TDERB) to 0. TDERA (TDERB) can be cleared to 0 only when 0 is written to it after reading TDER = 1.
MTU3.TGRA and MTU4.TGRC (MTU6.TGRA and MTU7.TGRC) should be set to 1/2 PWM cycle + 1 and the timer dead time data register (TDDRA or TDDRB) should be set to 1.
By the above settings, PWM waveforms without dead time can be obtained. Figure 10.51 shows an example of operation without dead time (MTU3 and MTU4).

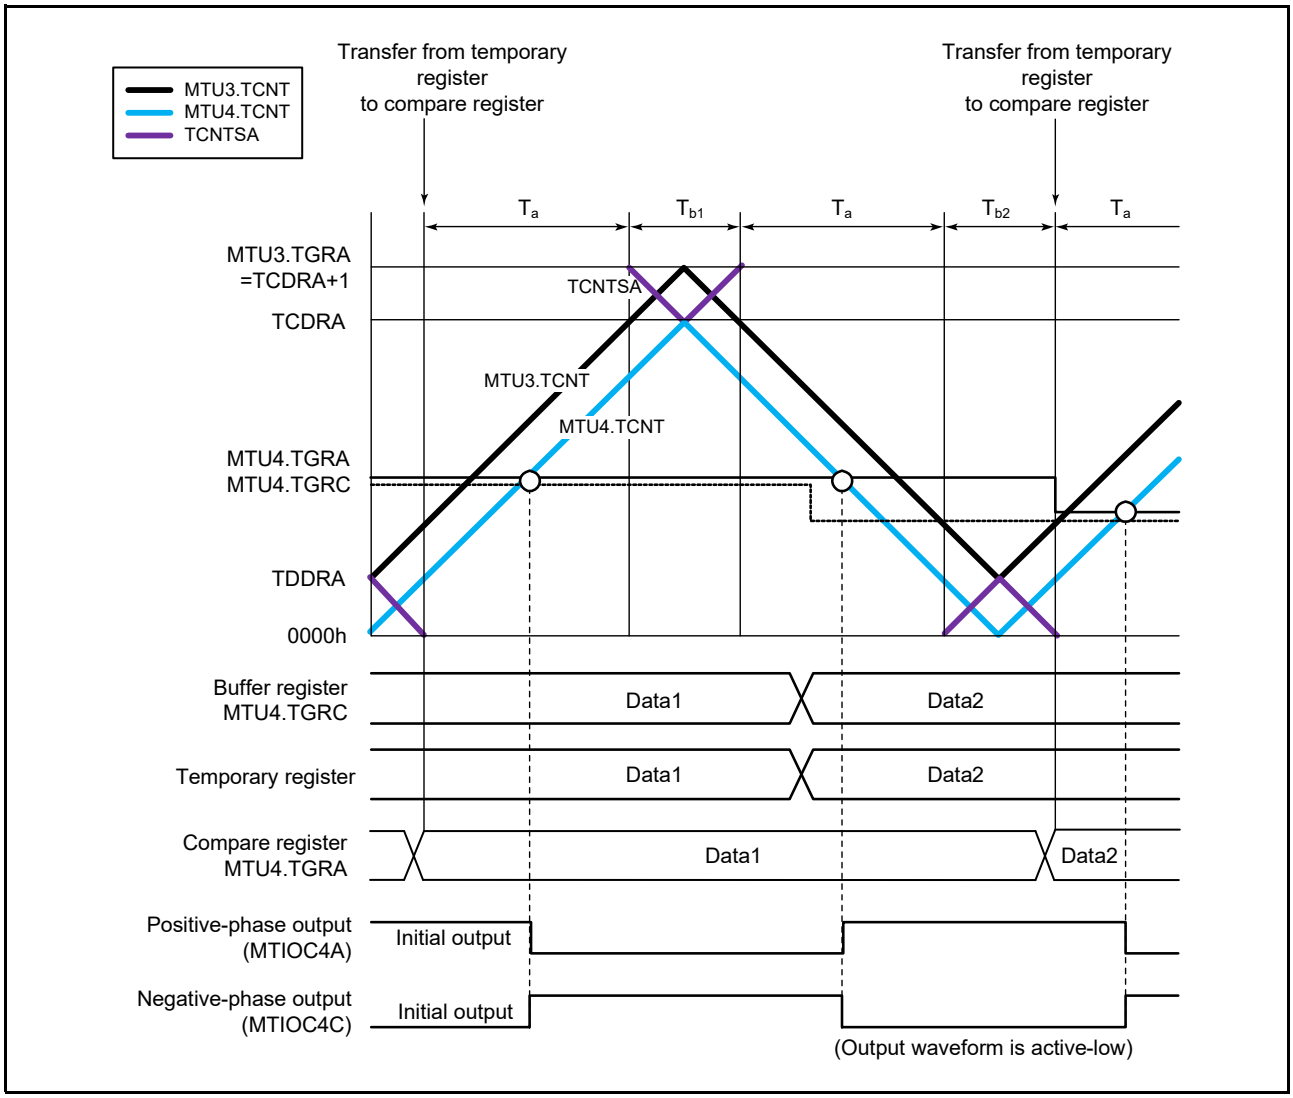

Figure 10.51 Example of Operation without Dead Time (MTU3 and MTU4)

(g) PWM Cycle Setting

In complementary PWM mode, the PWM cycle is set in two registers—MTU3.TGRA (MTU6.TGRA), in which the MTU3.TCNT (MTU6.TCNT) upper limit value is set, and TCDRA (TCDRB), in which the MTU4.TCNT (MTU7.TCNT) upper limit value is set. The settings should be made so as to achieve the following relationship between these two registers:

With dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + TDDRA (TDDRB) setting
Without dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + 1

In addition, the settings should be made so as to achieve the following relationship between the TCDRA (TCDRB) register and the TDDRA (TDDRB) register:

TCDRA (TCDRB) setting > TDDRA (TDDRB) setting × 2 + 2

The MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) settings are made by setting values in buffer registers MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB). When data is written to MTU4.TGRD (MTU7.TGRD) to enable transfers, the values set in MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB) are transferred simultaneously to the MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) with the transfer timing selected with the MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits.
The new PWM cycle is reflected from the next cycle when data is updated at the crest, or from the current cycle when updated in the trough. Figure 10.52 illustrates the operation when the PWM cycle is updated at the crest.
See the following section, (h), Register Data Updating, for the method of updating the data in each buffer register.

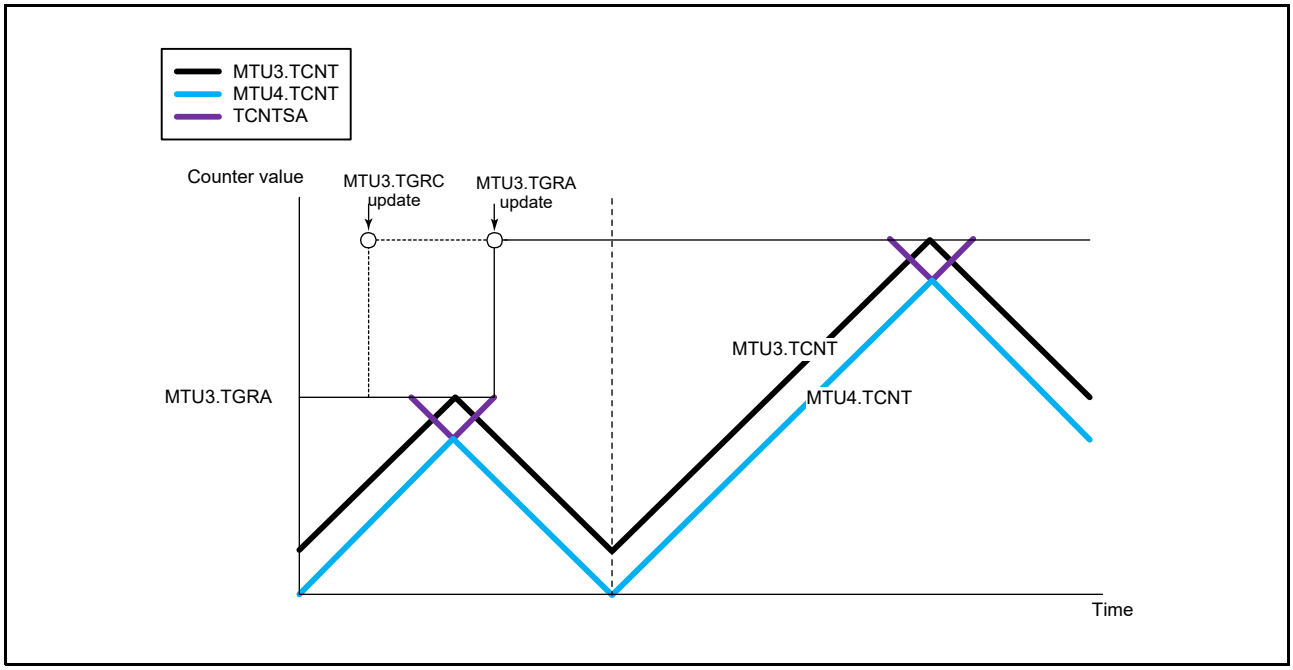

Figure 10.52 Example of PWM Cycle Updating (MTU3 and MTU4)

(h) Register Data Updating

In complementary PWM mode, buffer registers are used to update the data in five compare registers for PWM duty and PWM cycle. The update data can be written to the buffer registers at any time.

There is a temporary register between each of these registers and its buffer register. While subcounter TCNTSA (TCNTSB) is not counting, if buffer register data is updated, the temporary register value also changes. Data is not transferred from buffer registers to temporary registers while TCNTSA (TCNTSB) is counting; in this case, the value written to a buffer register is transferred after TCNTSA (TCNTSB) halts.

The temporary register value is transferred to the compare register at the data update timing set with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits. Figure 10.53 shows an example of data updating in complementary PWM mode (MTU3 and MTU4). This example shows the mode in which data is updated at both the counter crest and trough.

When updating buffer register data, be sure to write to MTU4.TGRD (MTU7.TGRD) at the end of the update. Data is transferred from buffer registers to the temporary registers simultaneously for all five registers after the write to MTU4.TGRD (MTU7.TGRD).

Even when not updating all five registers or when not updating the MTU4.TGRD (MTU7.TGRD) data, be sure to write to MTU4.TGRD (MTU7.TGRD) after writing data to the registers to be updated. In this case, the data written to MTU4.TGRD (MTU7.TGRD) should be the same as the data prior to the write operation.

See section 10.3.8 (2) (s) Double Buffer Function in Complementary PWM Mode, for data updating when the double buffer function is used.

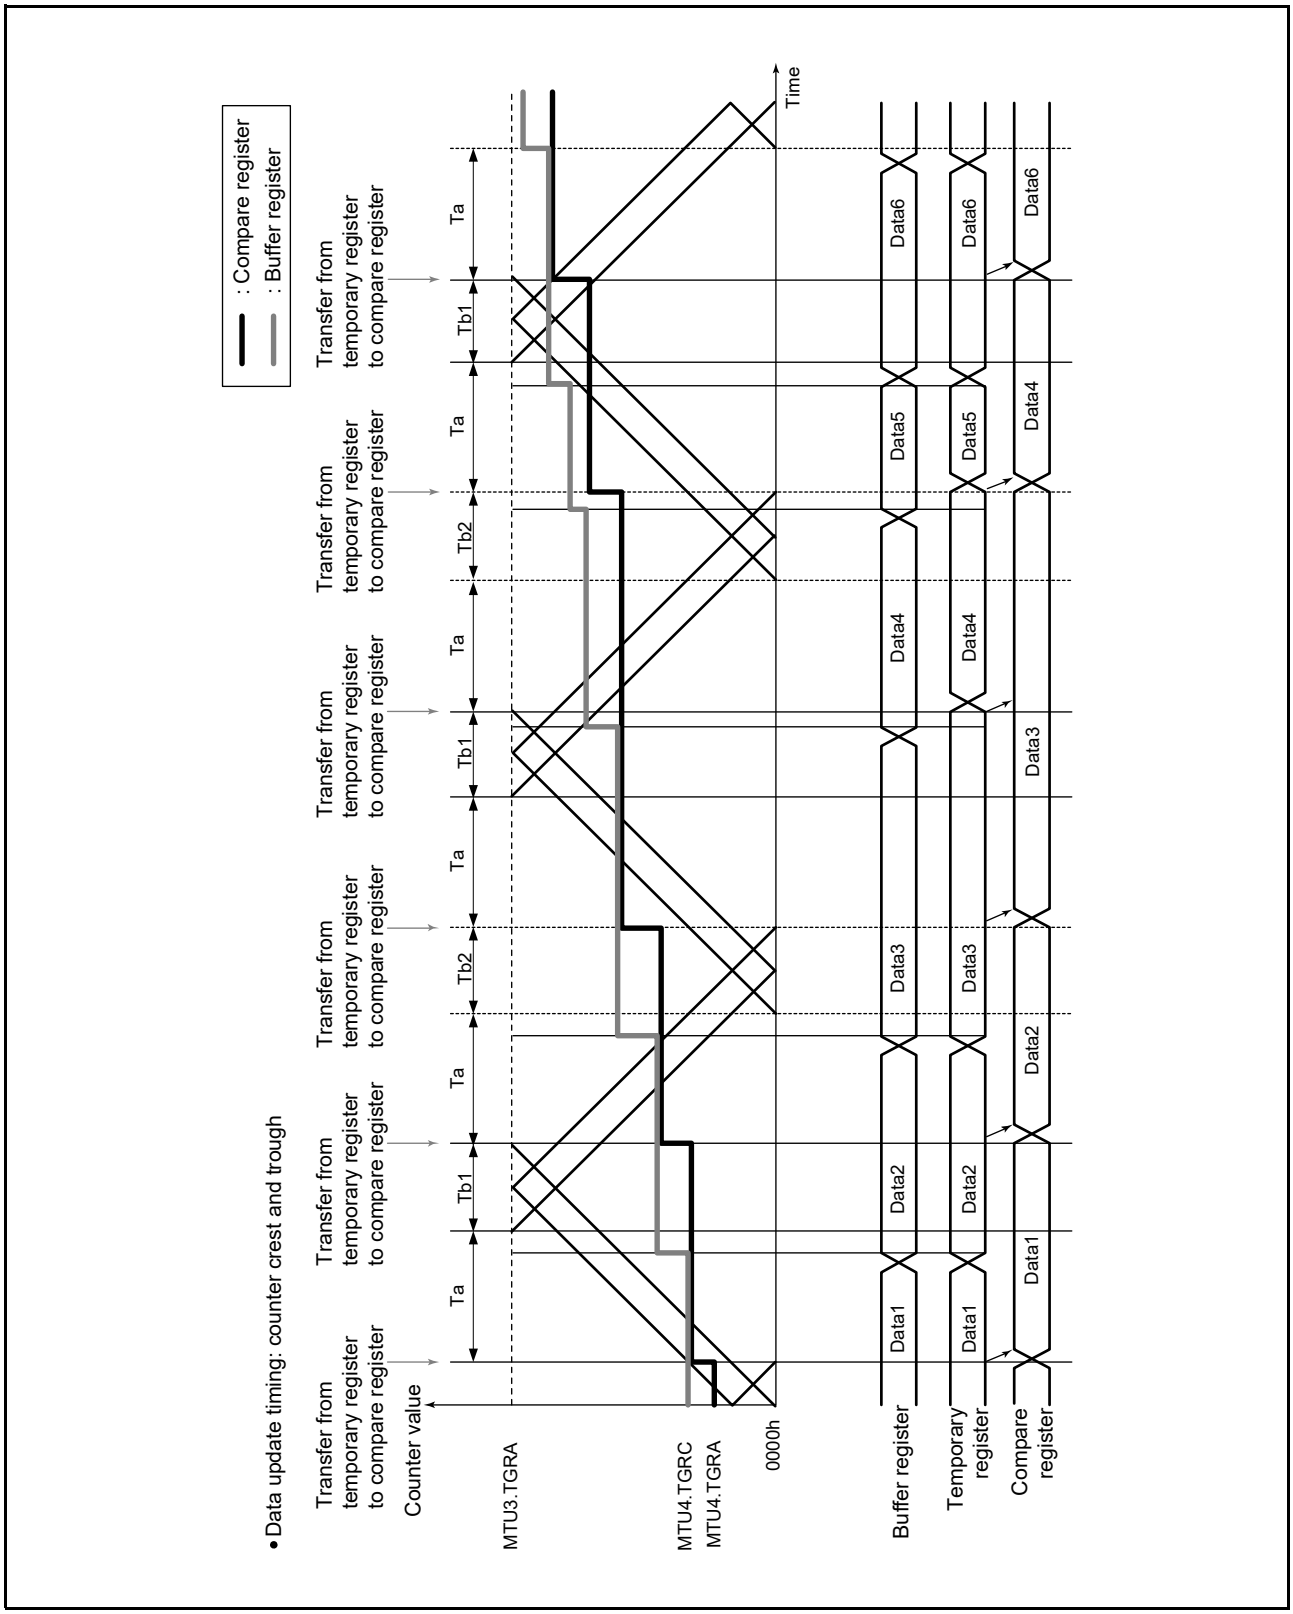

Figure 10.53 Example of Data Updating in Complementary PWM Mode (MTU3 and MTU4)

(i) Initial Output in Complementary PWM Mode

In complementary PWM mode, the initial output is determined by the setting of the OLSN and OLSP bits in the TOCR1A (TOCR1B) register or the OLS1N to OLS3N and OLS1P to OLS3P bits in the TOCR2A register (TOCR2B). This initial output is the non-active level of the PWM output and continues from when complementary PWM mode is set with the MTU3.TMDR1 (MTU6.TMDR1) until MTU4.TCNT (MTU7.TCNT) exceeds the value set in the TDDRA (TDDRB) register. Figure 10.54 shows an example of the initial output in complementary PWM mode.
An example of the waveform when the initial PWM duty ratio value is smaller than the TDDRA (TDDRB) value is shown in Figure 10.55.

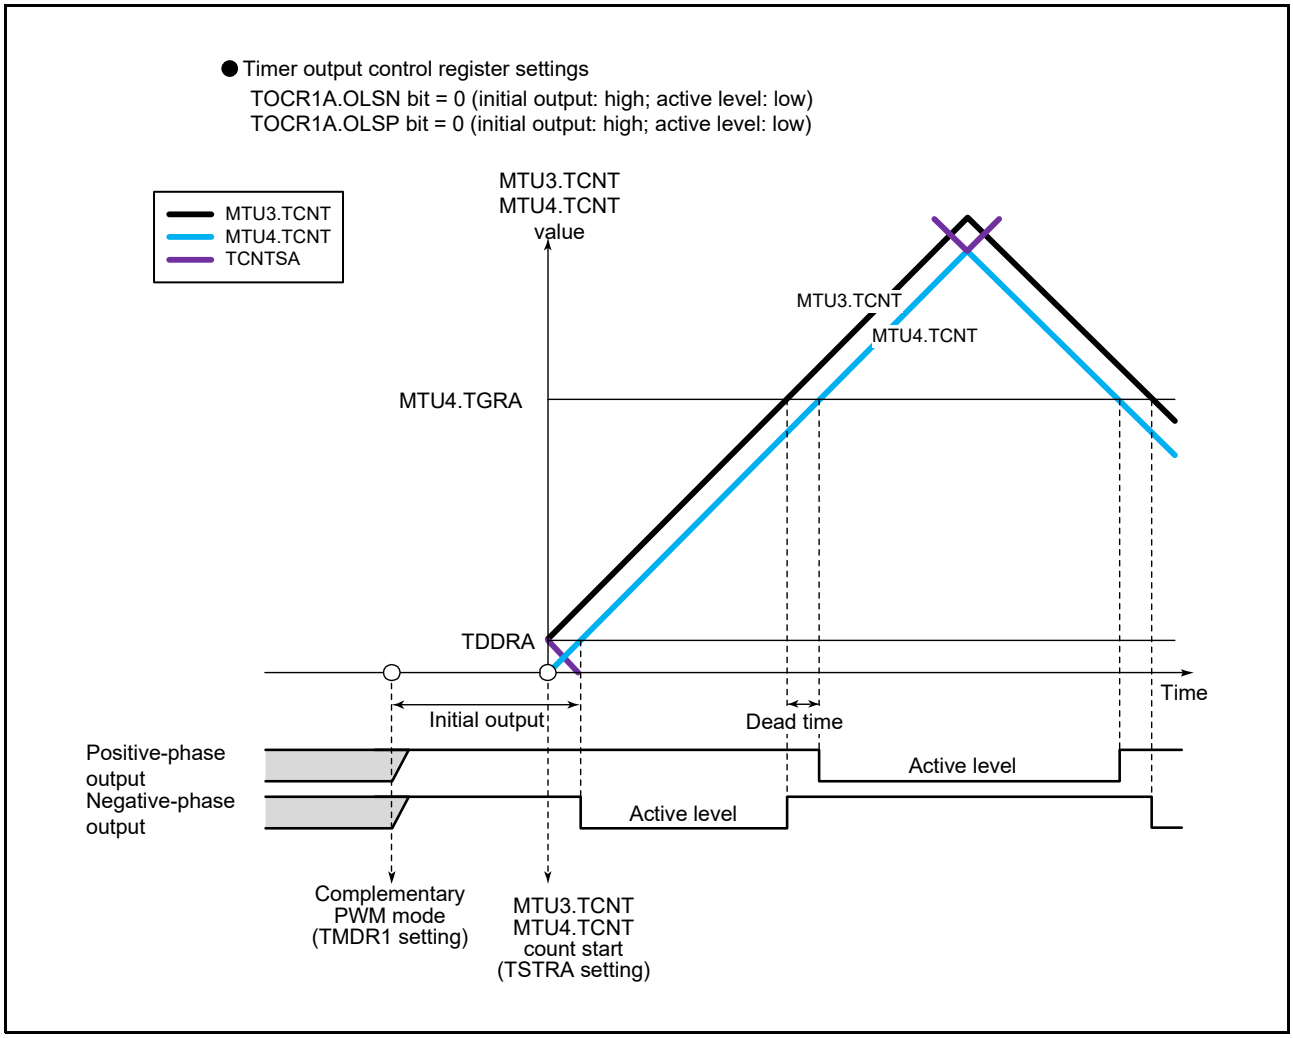

Figure 10.54 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (1)

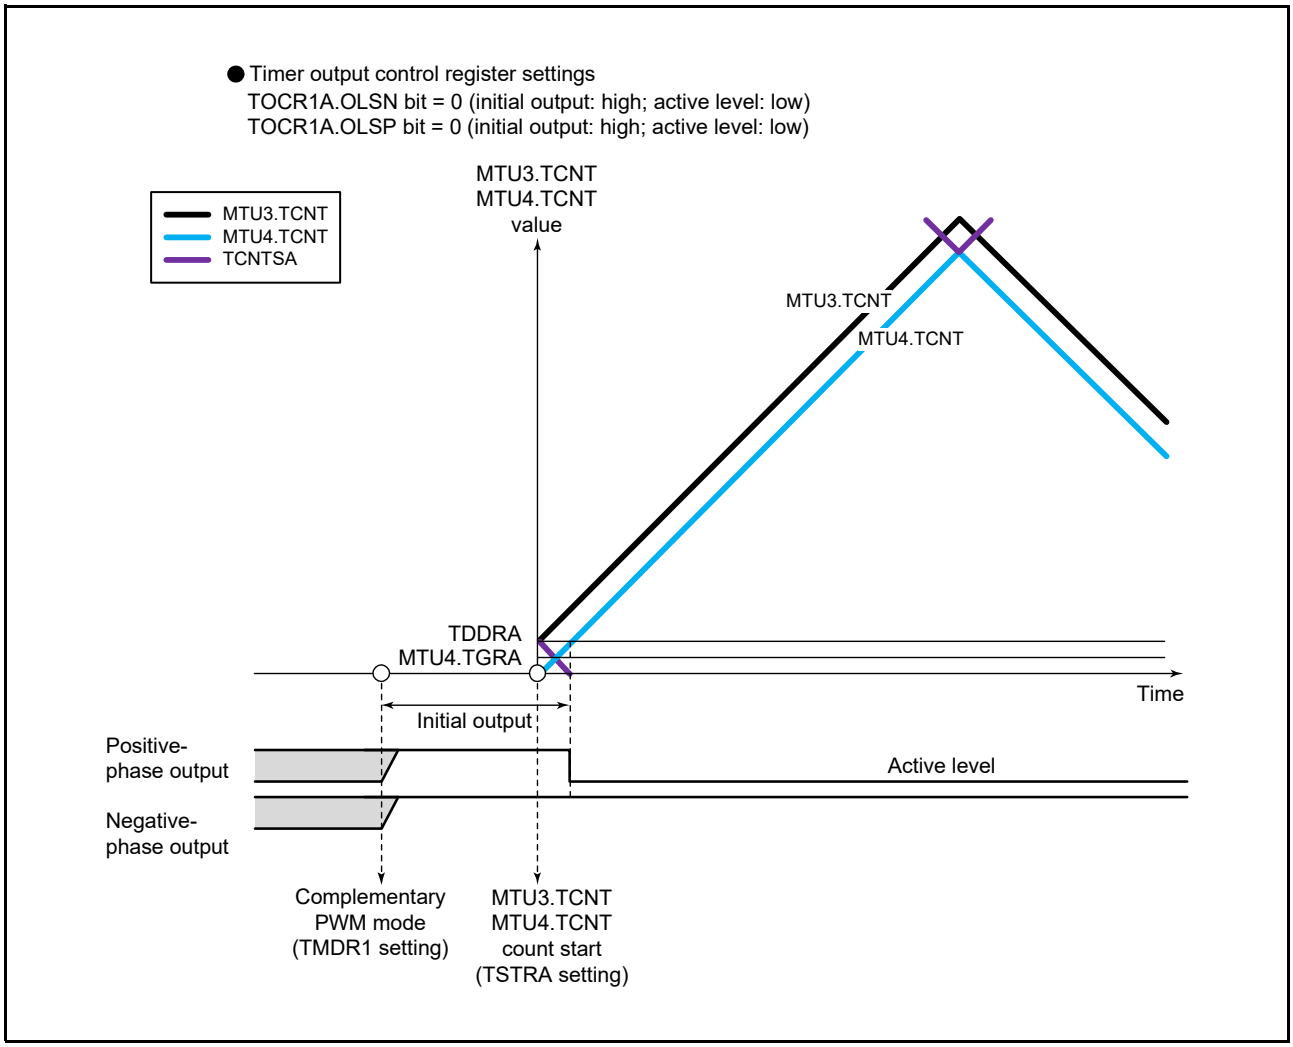

Figure 10.55 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (2)

(j) Method for Generating PWM Output in Complementary PWM Mode

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. Dead time can be set for PWM waveforms to be output.

A PWM waveform is generated by output of the level selected in the timer output control register in the event of a compare match between a counter and a compare register. While TCNTSA (TCNTSB) is counting, the compare register and temporary register values are simultaneously compared to create consecutive PWM output from 0 to 100% duty ratio. The relative timing of turn-on and turn-off compare match occurrence may vary, but the compare match that turns off each phase takes precedence to secure the dead time and ensure that the positive-phase and negative-phase turn-on times do not overlap. Figure 10.56 to Figure 10.58 show examples of waveform generation in complementary PWM mode.

The positive-phase and negative-phase turn-off timing is generated by a compare match with the counter indicated by a solid line, and the turn-on timing is generated by a compare match with the counter indicated by a dotted line, which operates with a delay equal to the dead time behind the counter indicated by a solid line. In the T1 period, compare match a that turns off the negative phase has the highest priority, and compare matches before a are ignored. In the T2 period, compare match c that turns off the positive phase has the highest priority, and compare matches before c are ignored.

In most cases, compare matches occur in the order a → b → c → d (or c → d → a' → b') as shown in Figure 10.56.

If compare matches deviate from the a → b → c → d order, since the time for which the negative phase is off is shorter than twice the dead time, the positive phase is not turned on. If compare matches deviate from the c → d → a' → b' order, since the time for which the positive phase is off is shorter than twice the dead time, the negative phase is not turned on.

As shown in Figure 10.57, if compare match c follows compare match a before compare match b, compare match b is ignored and the negative phase is turned on by compare match d. This is because turning off the positive phase has priority due to the occurrence of compare match c (positive-phase off timing) before compare match b (positive-phase on timing) (consequently, the waveform does not change because the positive phase goes from off to off).

Similarly, in the example in Figure 10.58, turning off the negative phase has priority due to the occurrence of compare match a' (negative-phase off timing) before compare match d (negative-phase on timing). As a result, the negative phase is not turned on.

Thus, in complementary PWM mode, compare matches at turn-off timings take precedence, and turn-on timing compare matches that occur before a turn-off timing compare match are ignored.

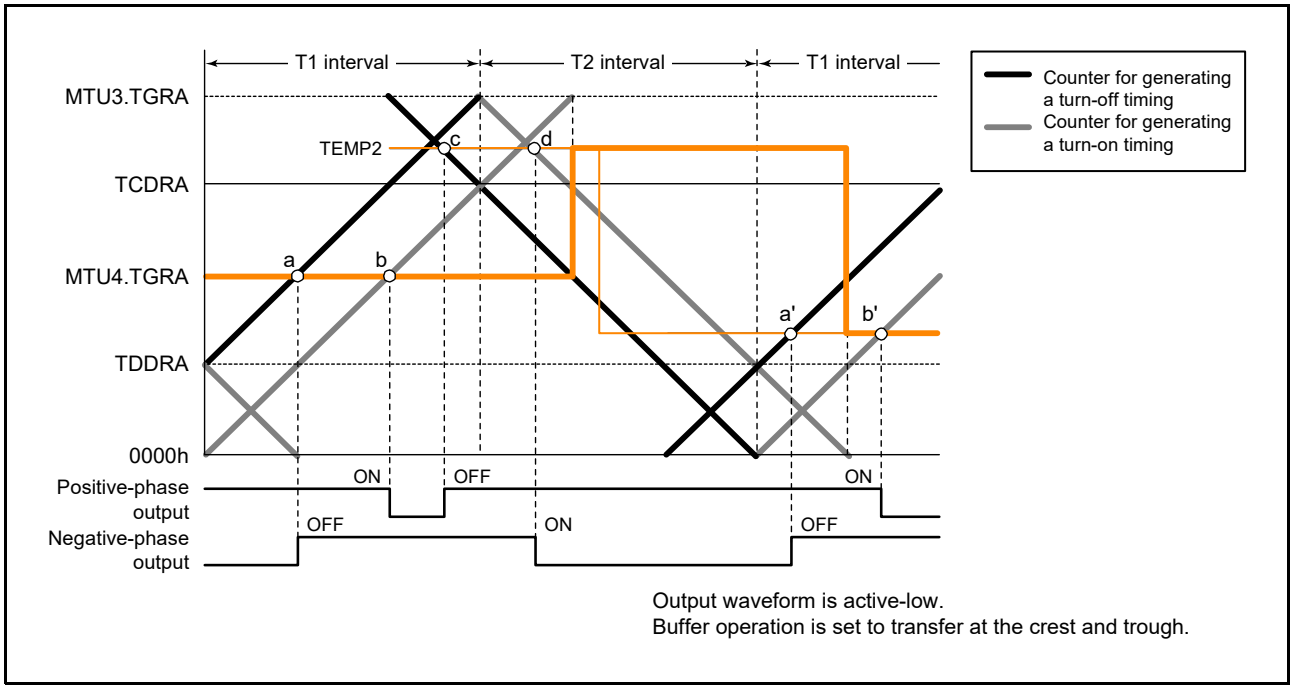

Figure 10.56 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

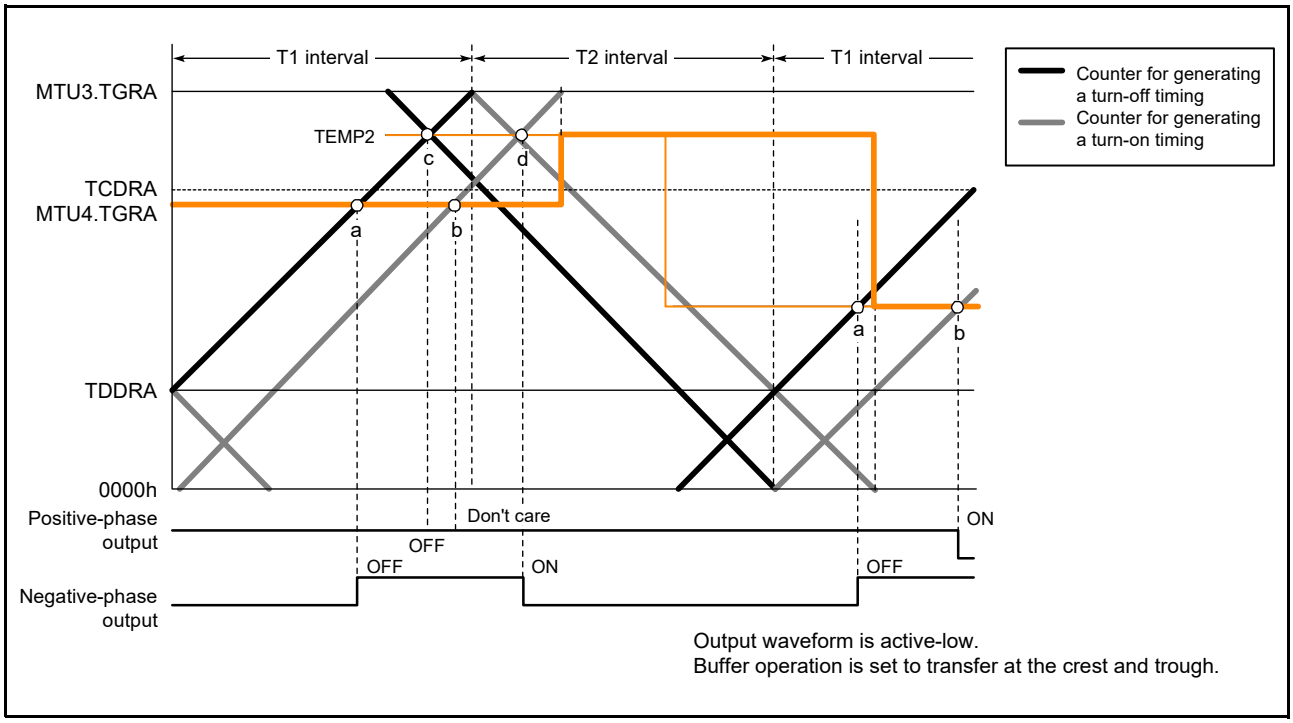

Figure 10.57 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (2)

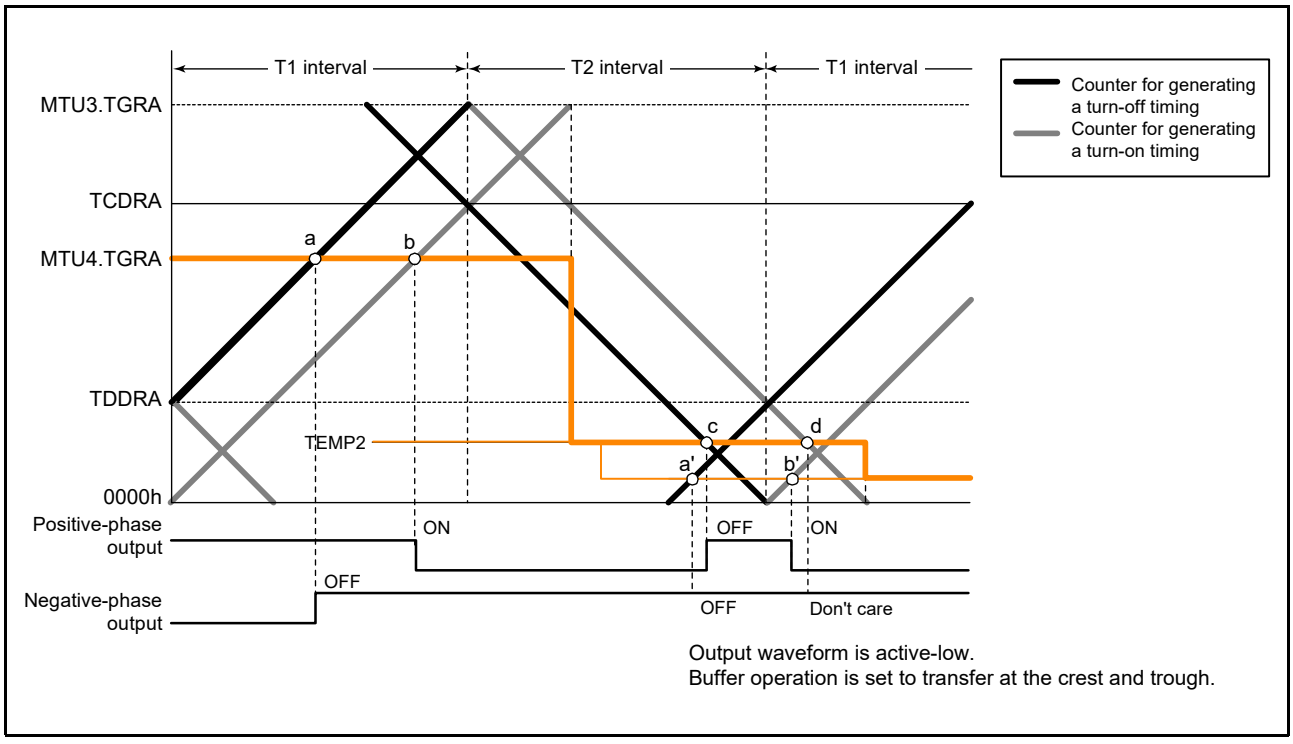

Figure 10.58 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (3)

(k) 0% and 100% Duty Ratio Output in Complementary PWM Mode

In complementary PWM mode, 0% and 100% duty PWM output can be output as required. Figure 10.59 to Figure 10.63 show output examples.

A 100% duty waveform is output when the compare register value is set to 0000h. The waveform in this case has a positive phase with a 100% on-state. A 0% duty waveform is output when the compare register value is set to the same value as MTU3.TGRA (MTU6.TGRA). The waveform in this case has a positive phase with a 100% off-state.

Turn-on and turn-off compare matches occur simultaneously, but if a turn-on compare match and turn-off compare match for the same phase occur simultaneously, both compare matches are ignored and the waveform does not change.

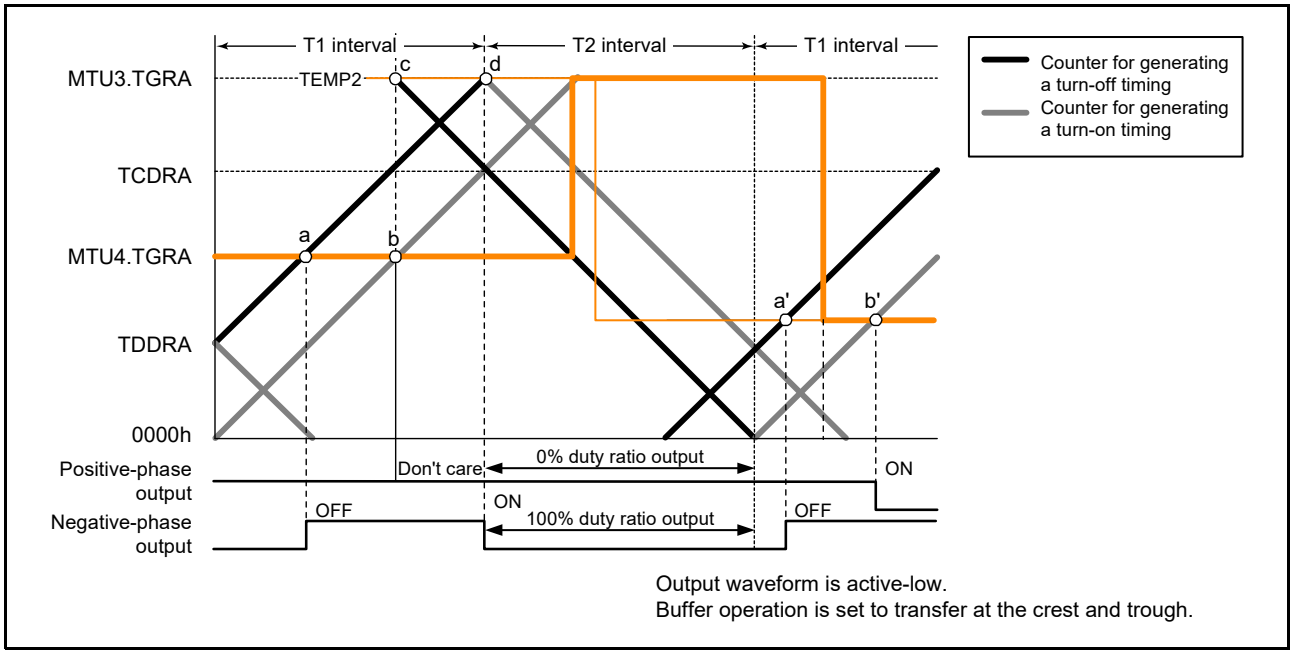

Figure 10.59 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

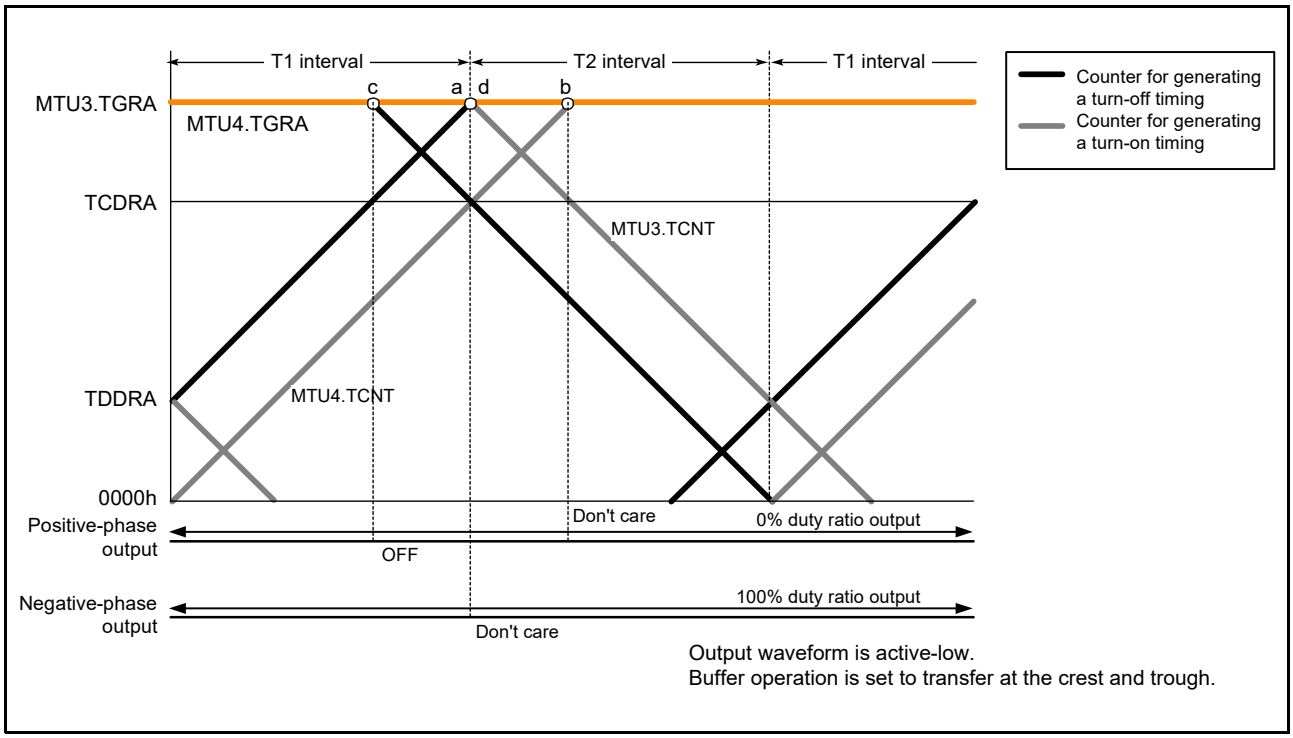

Figure 10.63 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (5)

(l) Toggle Output Synchronized with PWM Cycle

In complementary PWM mode, toggle output from the PWM output pin in synchronization with the PWM cycle can be enabled by setting the PSYE bit in the TOCR1A (TOCR1B) register to 1. An example of a toggle output waveform is shown in Figure 10.64.

This output is toggled by a compare match between MTU3.TCNT and MTU3.TGRA (MTU6.TCNT and MTU6.TGRA) and a compare match between MTU4.TCNT (MTU7.TCNT) and 0000h.

The MTIOC3A (MTIOC6A) pin is assigned for this toggle output. The initial output is high-level output.

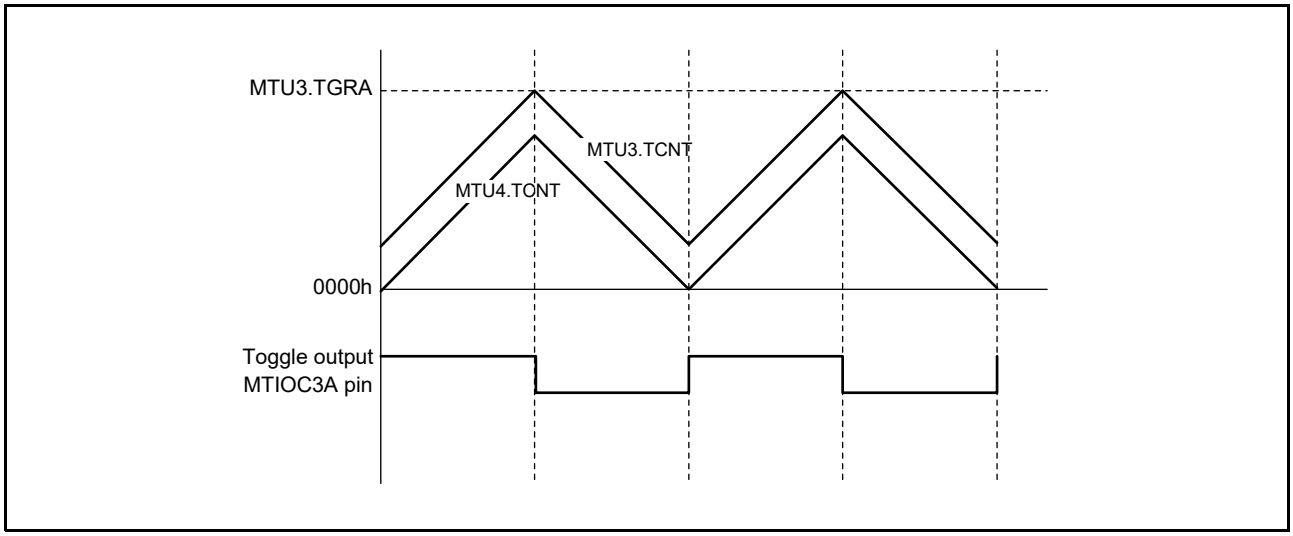

Figure 10.64 Example of Toggle Output Waveform Synchronized with PWM Output (MTU3 and MTU4)

(m) Counter Clearing by Another Channel

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by another channel source when a mode for synchronization with another channel is specified through the TSYRA (TSYRB) register and synchronous clearing is selected with MTU3.TCR.CCLR[2:0] (MTU6.TCR.CCLR[2:0]) bits.

Figure 10.65 illustrates an example of this operation.

Use of this function enables a counter to be cleared and restarted through an external signal.

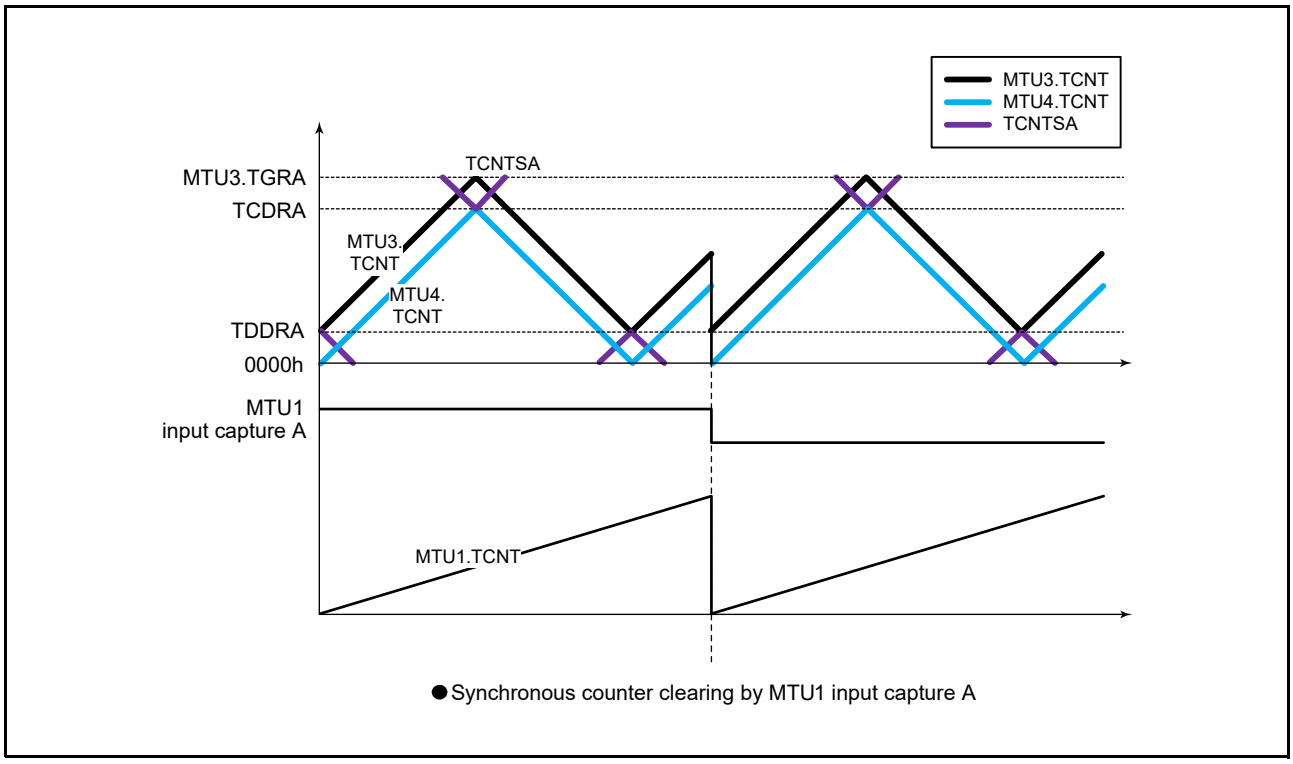

Figure 10.65 Counter Clearing Synchronized with Another Channel (MTU3 and MTU4)

(n) Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Setting the WRE bit in TWCRA (TWCRB) to 1 suppresses initial output when synchronous counter clearing occurs in the Tb interval (Tb2 interval) at the trough in complementary PWM mode and controls abrupt change in duty cycle at synchronous counter clearing.

Initial output suppression through the WRE bit = 1 is applicable only when synchronous clearing occurs in the Tb2 interval as indicated by (10) or (11) in Figure 10.66. When synchronous clearing occurs outside that interval, the initial value specified by the OLSN and OLSP bits in TOCR1A (TOCR1B) is output. Even in the Tb2 interval, if synchronous clearing occurs in the initial value output period (indicated by (1) in Figure 10.66) immediately after the counters start operation, initial value output is not suppressed.

This function can be used in both channel combinations of MTU 3 and MTU4 and MTU6 and MTU7. In MTU3 and MTU4, synchronous clearing in MTU0, MTU1, and MTU2 can cause counter clearing; in MTU6 and MTU7, compare match or input capture generated in MTU0, MTU1, and MTU2 can cause counter clearing.

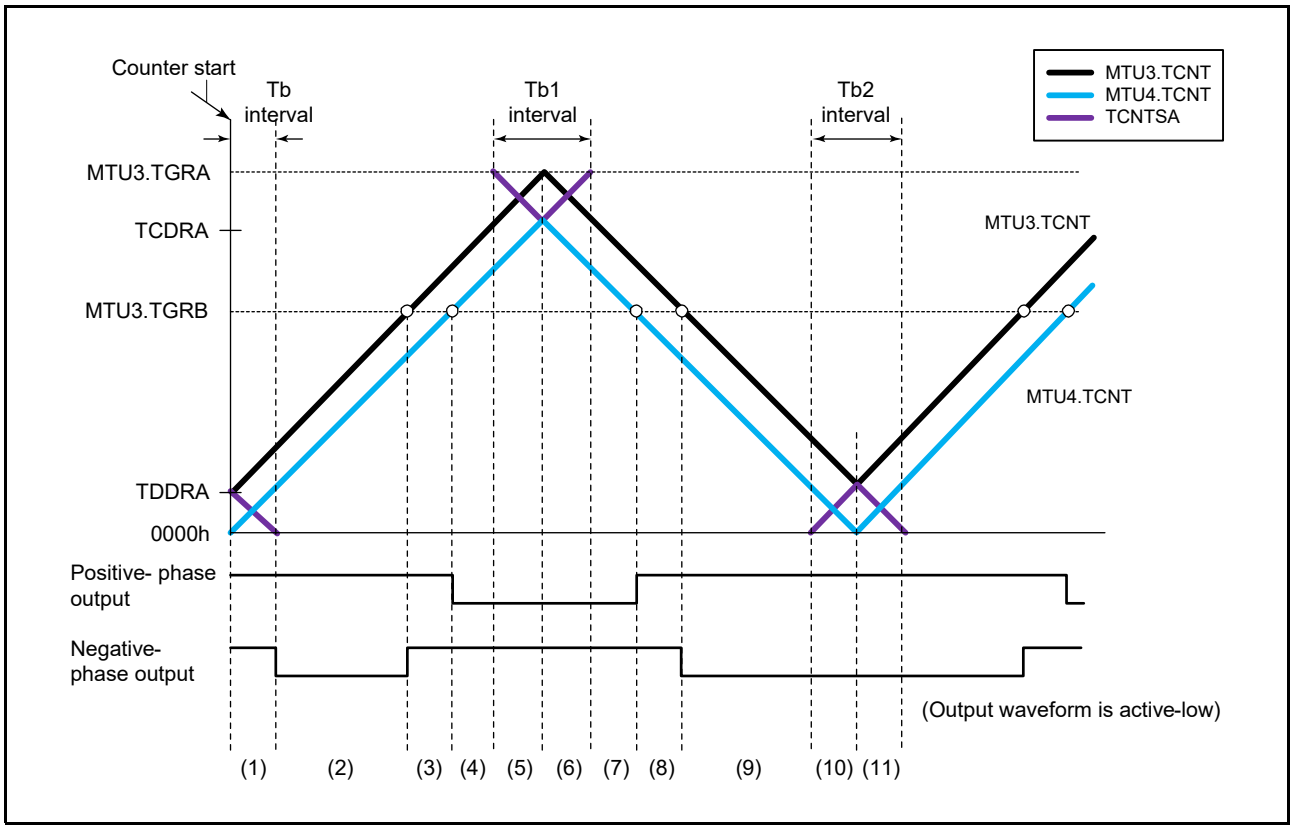

Figure 10.66 Timing for Synchronous Counter Clearing (MTU3 and MTU4)

- Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode.

An example of the procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode is shown in Figure 10.67.

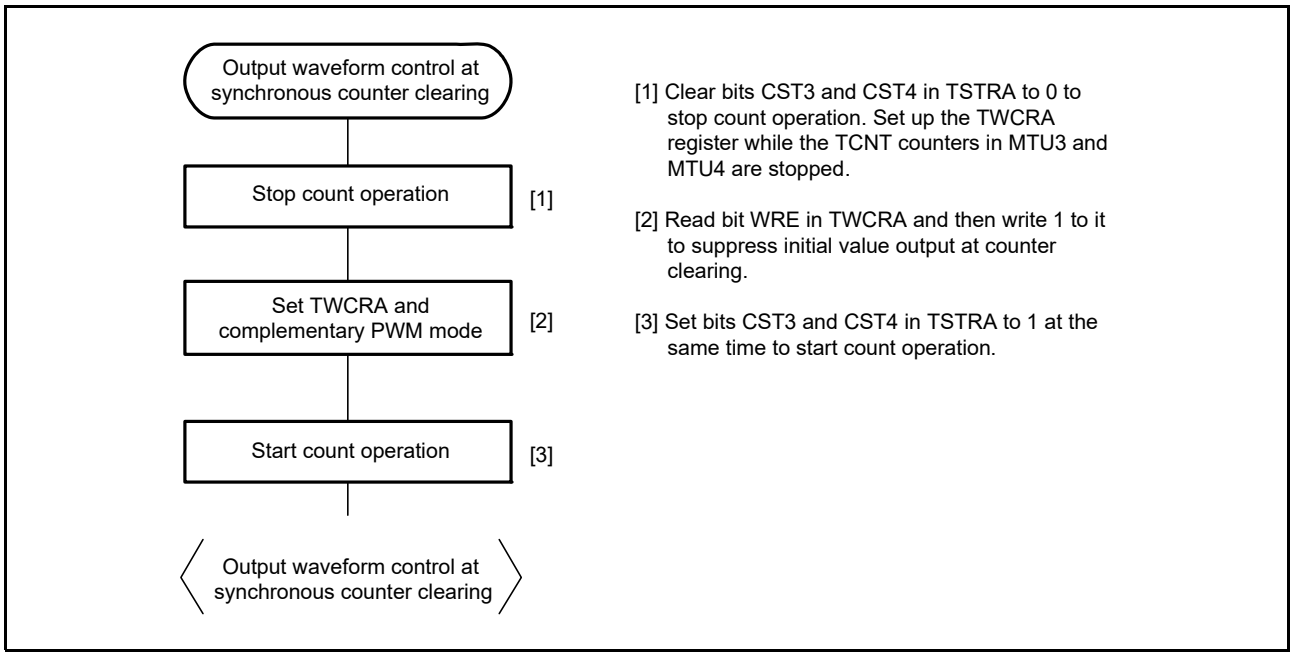

Figure 10.67 Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode (MTU3 and MTU4)

- Examples of Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Figure 10.68 to Figure 10.71 show examples of output waveform control in which MTU3 and MTU4 operate in complementary PWM mode and synchronous counter clearing is generated while the WRE bit in TWCRA is set to 1. In the examples shown in Figure 10.68 to Figure 10.71, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 10.66, respectively.
In MTU6 and MTU7, these examples are equivalent to the cases when MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing is generated while the SCC bit is cleared to 0 and the WRE bit is set to 1 in TWCRB.

(o) Suppressing Synchronous Counter Clearing for MTU0 to MTU2 and MTU6 and MTU7

In MTU6 and MTU7, setting the SCC bit in TWCRB to 1 suppresses synchronous counter clearing caused by MTU0 to MTU2.

Synchronous counter clearing is suppressed only within the interval shown in Figure 10.72. When using this function, MTU6 and MTU7 should be set to complementary PWM mode.

For details of synchronous clearing caused by MTU0 to MTU2, refer to section 10.3.10 (2), Synchronous Counter Clearing for MTU6 and MTU7.

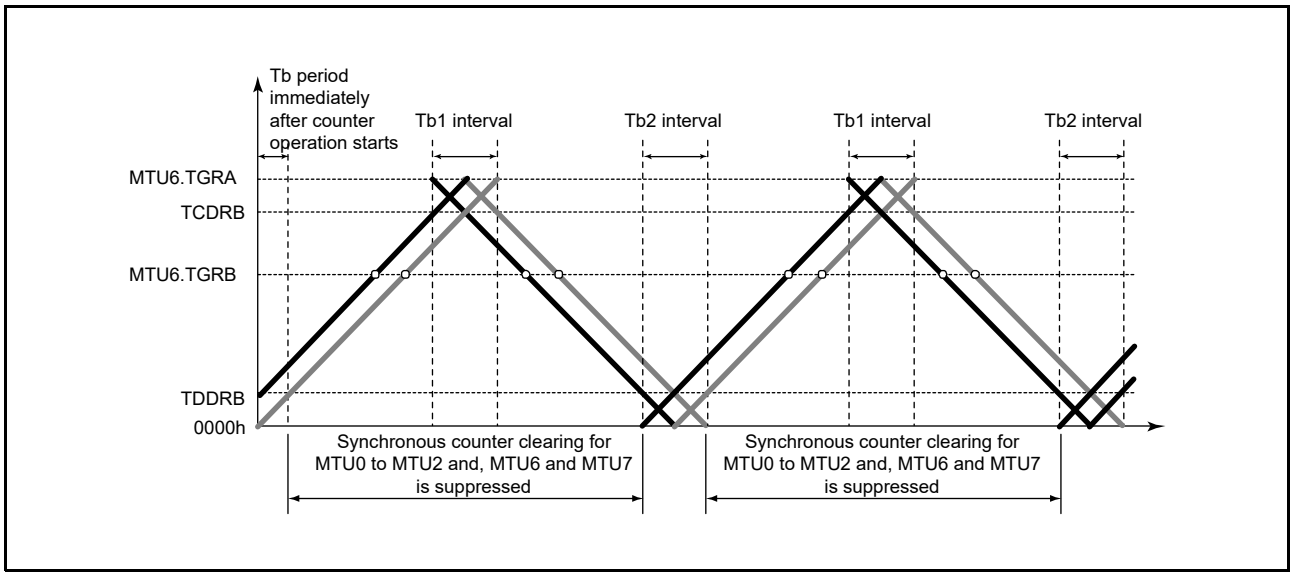

Figure 10.72 Synchronous Clearing-Suppressed Interval Specified by TWCRB.SCC Bit for MTU0, MTU1 and MTU2, and MTU6 and MTU7

- Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

An example of the procedure for suppressing synchronous counter clearing for MTU0 to MTU2, and MTU6 and MTU7 is shown in Figure 10.73.

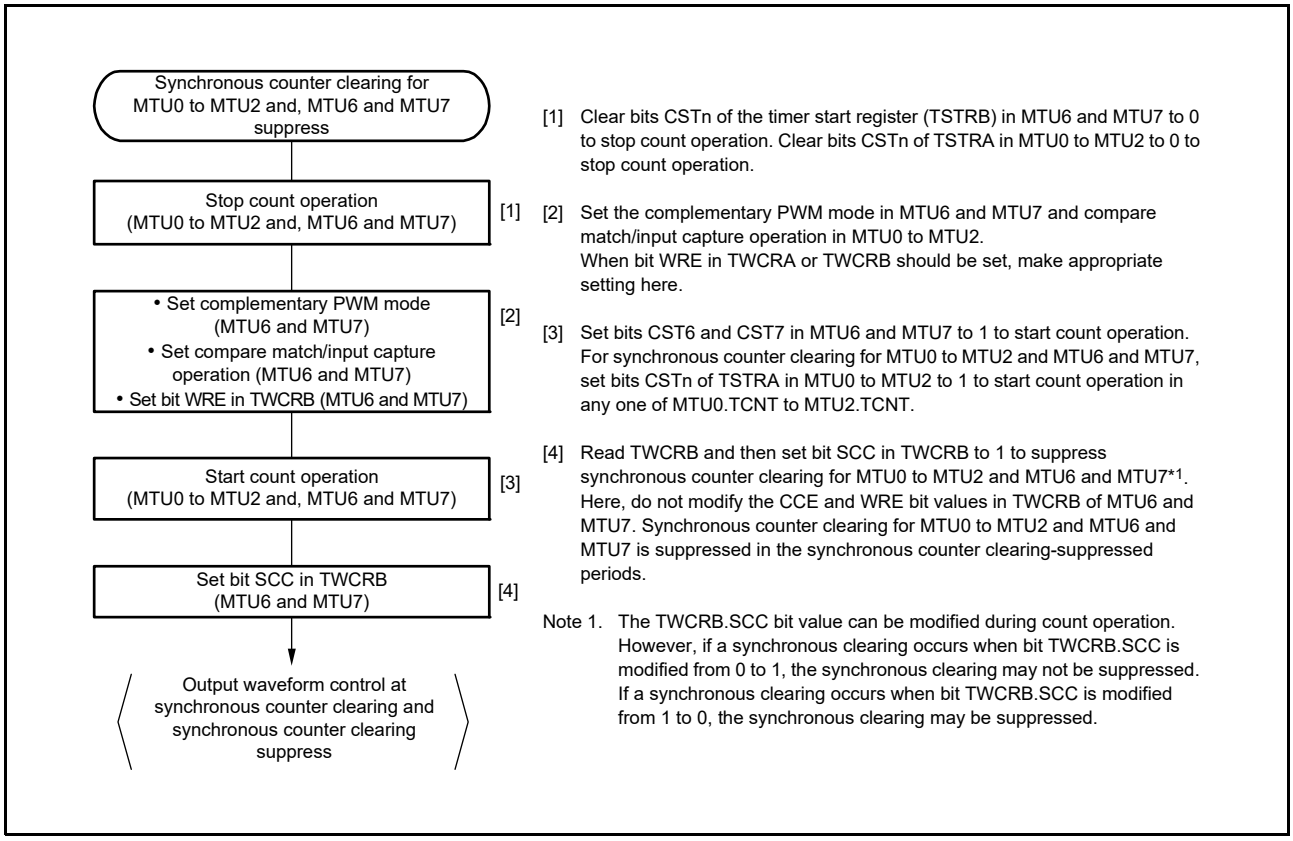

Figure 10.73 Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

- Examples of Suppression of Synchronous Counter Clearing for MTU 0 to MTU2, and MTU6 and MTU7

Figure 10.74 to Figure 10.77 show examples of operation in which MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing for MTU 0 to MTU2, and MTU6 and MTU7 is suppressed by setting the SCC bit in TWCRB in MTU6 and MTU7 to 1. In the examples shown in Figure 10.74 to Figure 10.77, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 10.66, respectively. In these examples, the WRE bit in TWCRB in MTU6 and MTU7 is set to 1.

(p) Counter Clearing by MTU3.TGRA (MTU6.TGRA) Compare Match

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by MTU3.TGRA (MTU6.TGRA) compare match when the TWCRA.CCE (TWCRB.CCE) bit.

Figure 10.78 illustrates an operation example.

Note 1. Use this function only in complementary PWM mode 1 (transfer at crest).
Note 2. Do not specify synchronous clearing by another channel (do not set 1 in the SYNC0 to SYNC4 or SYNC6 to SYNC7 bits in the timer synchronous register (TSYRA or TSYRB) and the CEOA to CEOD or CEIA to CEID bits in TSYCR).
Note 3. Do not set the PWM duty value to 0000h.
Note 4. Do not set the PSYE bit in timer output control register 1 (TOCR1A or TOCR1B) to 1.

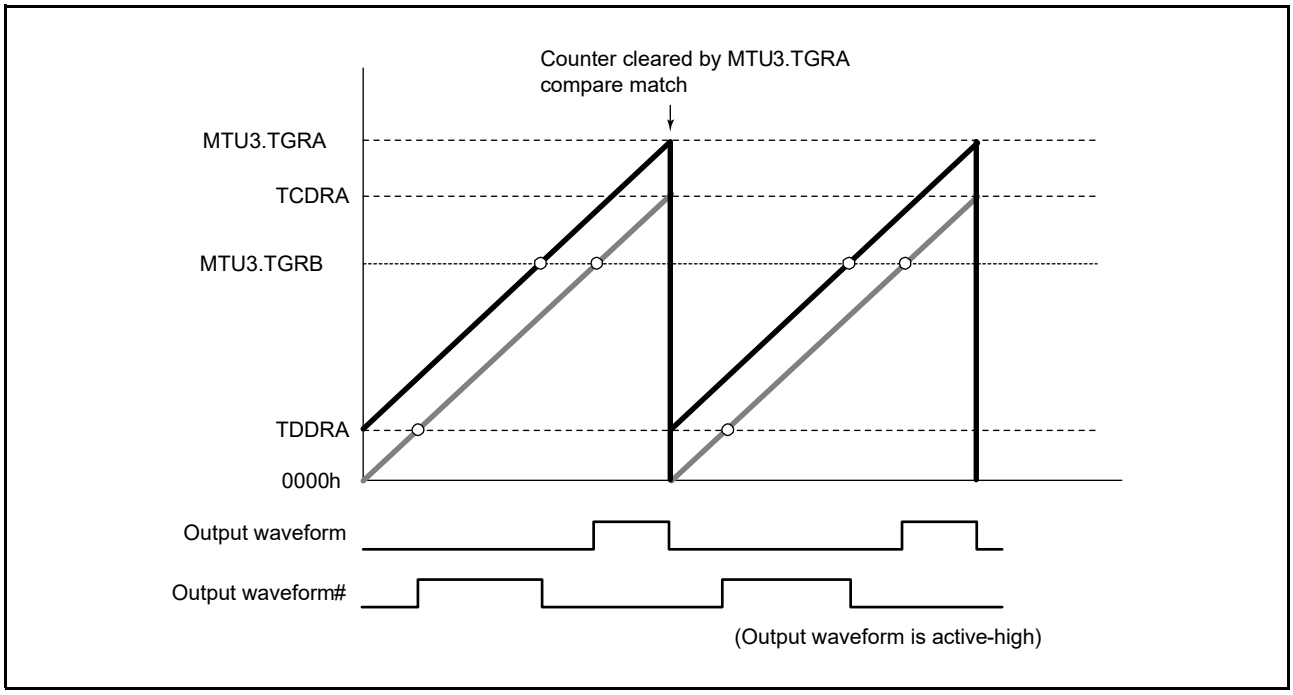

Figure 10.78 Example of Counter Clearing Operation by MTU3.TGRA Compare Match

(q) Example of Waveform Output for Driving AC Synchronous Motor (Brushless DC Motor)

In complementary PWM mode when MTU3 and MTU4 are used, a brushless DC motor can easily be controlled using TGCRA. Figure 10.79 to Figure 10.82 show examples of brushless DC motor driving waveforms created using TGCRA.

To switch the output phases for a 3-phase brushless DC motor by means of external signals detected with a Hall element, etc., clear the TGCRA.FB bit to 0. In this case, the external signals indicating the magnetic pole position should be input to pins MTIOC0A, MTIOC0B, and MTIOC0C in MTU0 (make appropriate settings with the port mode registers (PMR) and Pmn pin function control register (PmnPFS) of the GPIO ports). When an edge is detected at pin MTIOC0A, MTIOC0B, or MTIOC0C, the output on/off state is switched automatically.

When the TGCRA.FB bit is 1, the output on/off state is switched when the UF, VF, or WF bit in TGCRA is cleared to 0 or set to 1.

The driving waveforms are output from the 6-phase PWM output pins for complementary PWM mode.

With this 6-phase output, while the output is turned on, chopping output is available through complementary PWM mode output function by setting the N bit or P bit in TGCRA to 1. When the N bit or P bit is 0, the level output is selected.

The active level of the 6-phase output (on output level) can be set with the TOCR1A.OLSN and TOCR1A.OLSP bits regardless of the setting of the N and P bits.

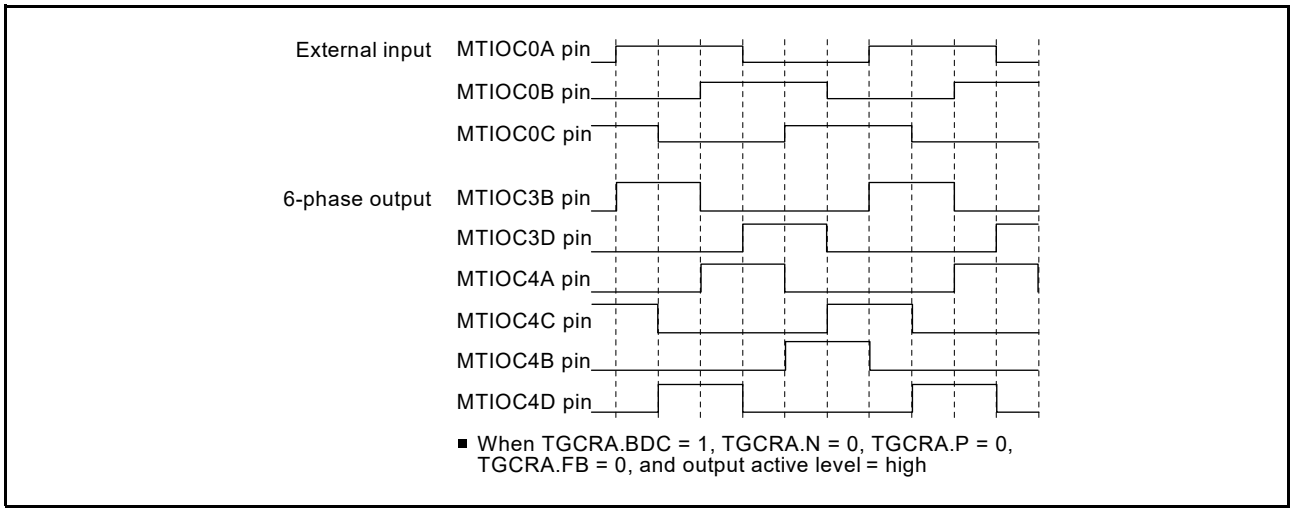

Figure 10.79 Example of Output Phase Switching by External Input (1)

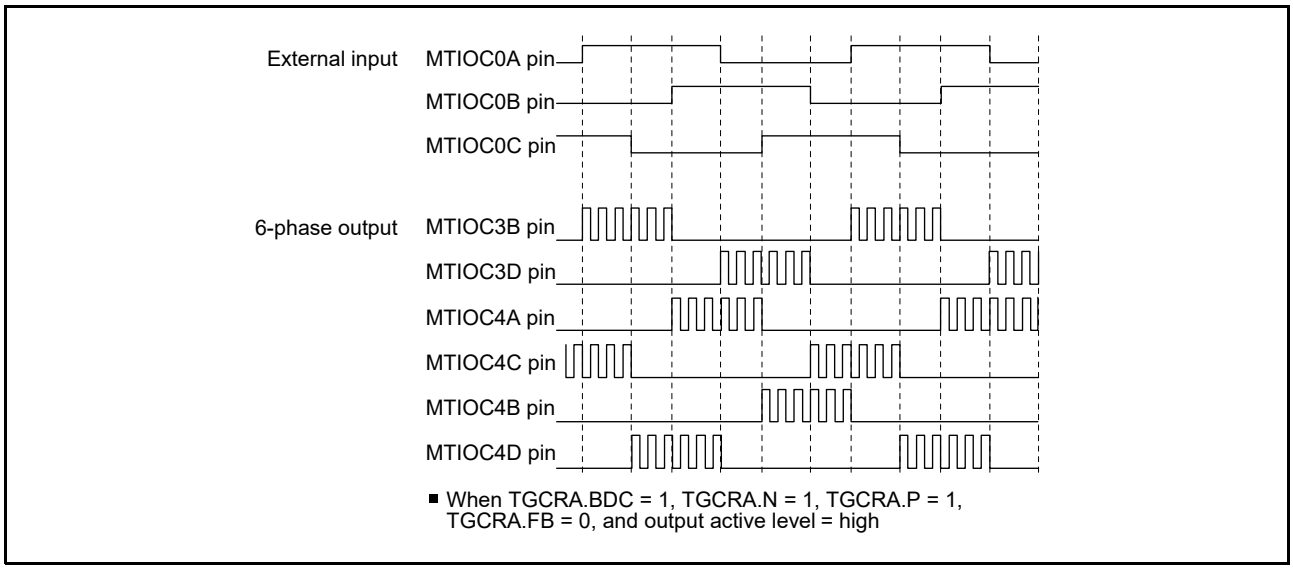

Figure 10.80 Example of Output Phase Switching by External Input (2)

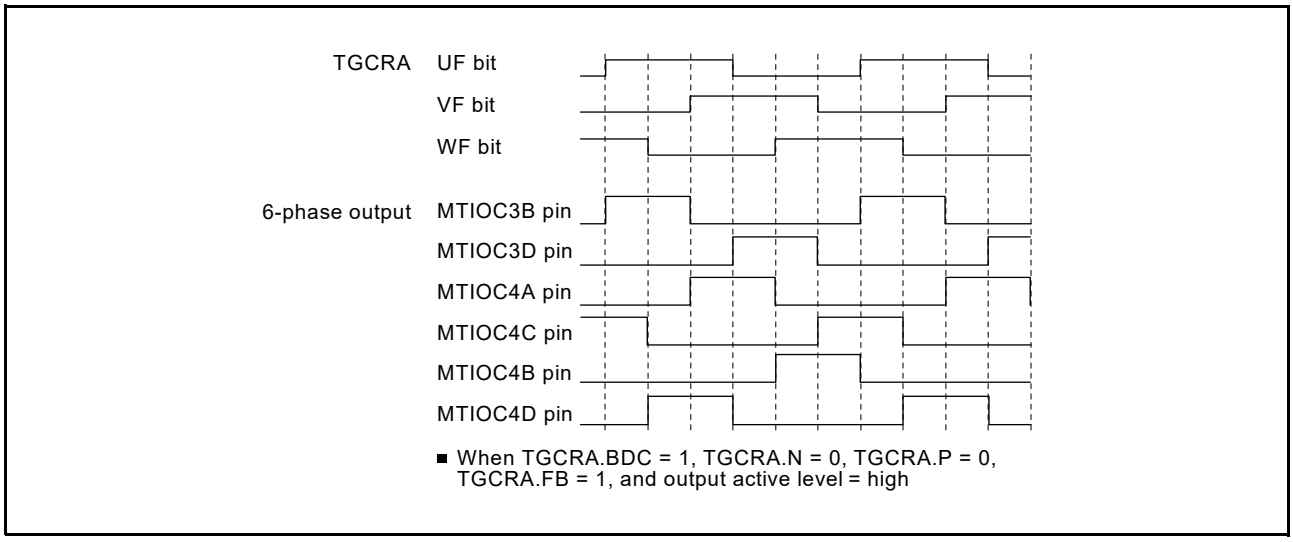

Figure 10.81 Example of Output Phase Switching through UF, VF, and WF Bit Settings (1)

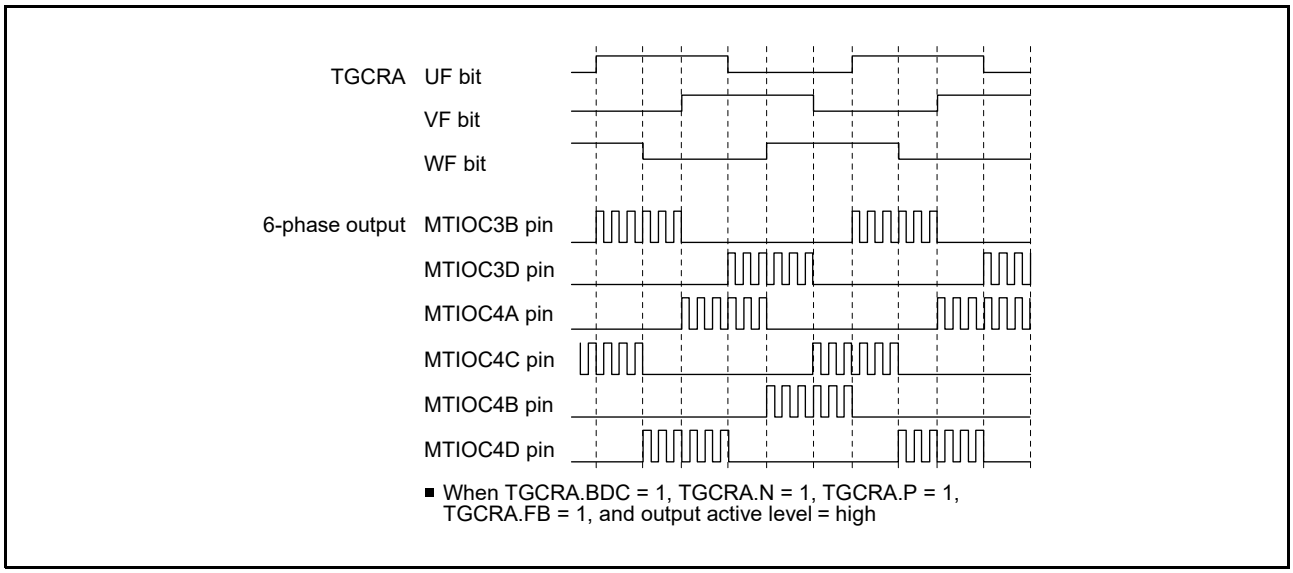

Figure 10.82 Example of Output Phase Switching through UF, VF, and WF Bit Settings (2)

(r) A/D Converter Start Request Setting

In complementary PWM mode, an A/D converter start request can be issued using MTU3.TGRA (MTU6.TGRA) compare match, MTU4.TCNT (MTU7.TCNT) underflow (trough), or compare match on a channel other than MTU3 and MTU4 (MTU6 and MTU7).
When start requests using MTU3.TGRA (MTU6.TGRA) compare match are specified, A/D conversion can be started at the crest of the MTU3.TCNT (MTU6.TCNT) count.
A/D converter start requests can be specified by setting the TIER.TTGE bit. To issue an A/D converter start request at an MTU4.TCNT (MTU7.TCNT) underflow (trough), set the MTU4.TIER.TTGE2 (MTU7.TIER.TTGE2) bit to 1.

(s) Double Buffer Function in Complementary PWM Mode

In complementary PWM mode 3 (transfer at the crest and trough), the PWM output setting resolution can be improved from ±2 to ±1 by setting the TMDR2A.DRS (TMDR2B.DRS) bit to 1.
When setting buffer registers A (TGRD in MTU3, TGRC and TGRD in MTU4, TGRD in MTU6, and TGRC and TGRD in MTU7), set also buffer registers B (TGRE in MTU3, TGRE and TGRF in MTU4, TGRE in MTU6, and TGRE and TGRF in MTU7) at the same time. Each buffer register B should be set to the buffer register A value or (buffer register A value – 1). For details of the setting procedure, refer to section 10.3.8 (1), Example of Complementary PWM Mode Setting Procedure.

Note: When a buffer register B is set to the buffer register A value, symmetric PWM waveforms are output. When a buffer register B is set to (buffer register A value – 1), asymmetric PWM waveforms are output.

Figure 10.83 shows an example of double buffer operation.
Each register data is transferred as follows.

- After TGRD (buffer A) in MTU4 or MTU7 is written to, data is transferred from TGRD (buffer A) in MTU4 or MTU7 to Temp3A or Temp6A (temporary A) and from TGRF (buffer B) in MTU4 or MTU7 to Temp3B or Temp6B (temporary B).
- With timing (1) in the figure, data is transferred from Temp3A or Temp6A (temporary A) to TGRB (compare) in MTU4 or MTU7.
- With timing (2) in the figure, data is transferred from Temp3B or Temp6B (temporary B) to TGRB (compare) in MTU4 or MTU7.

In the crest interval (Tb1 interval), the compare register and temporary register A are valid; in the trough interval (Tb2 interval), the compare register and temporary register B are valid.

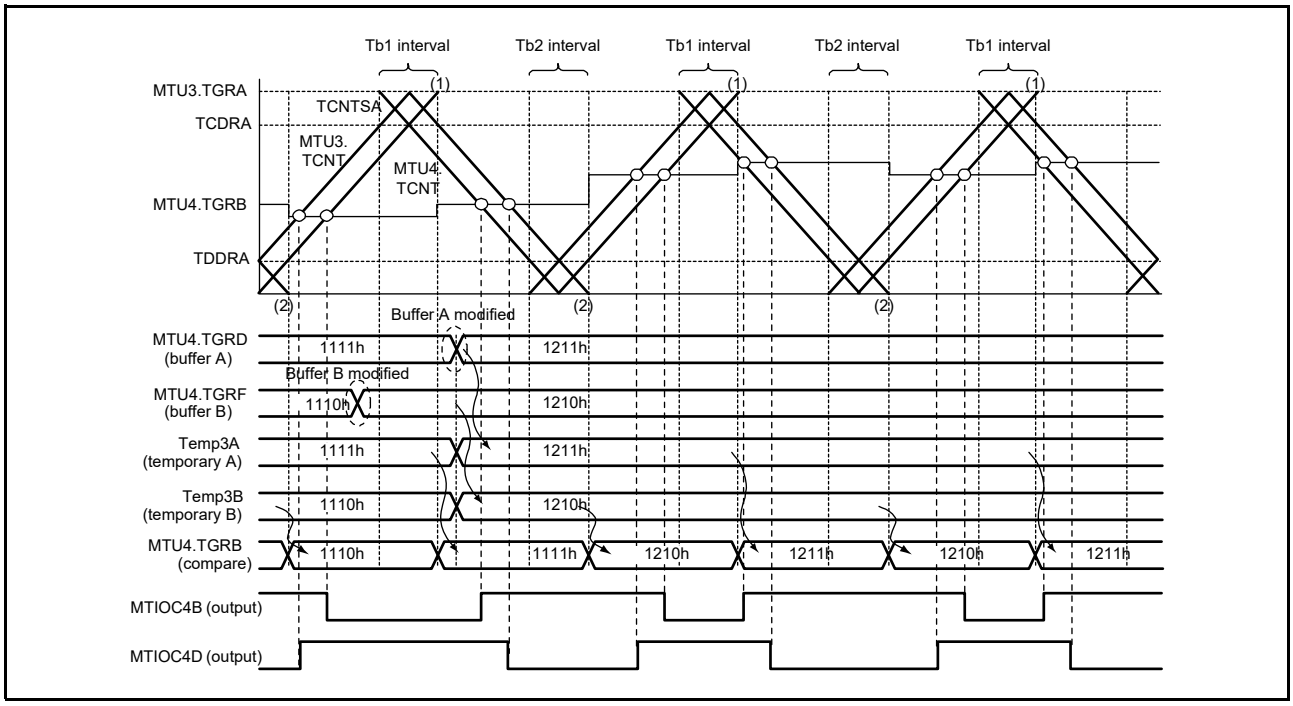

Figure 10.83 Example of Double Buffer Operation

Figure 10.84 shows an example when the buffer write value is smaller than the TDDRA (TDDRB) value, and Figure 10.85 shows an example when the write value is greater than TCDRA (TCDRB).
In the crest interval, the output is controlled according to the compare match with the compare register or temporary register A; in the trough interval, the output is controlled according to the compare match with the compare register or temporary register B.

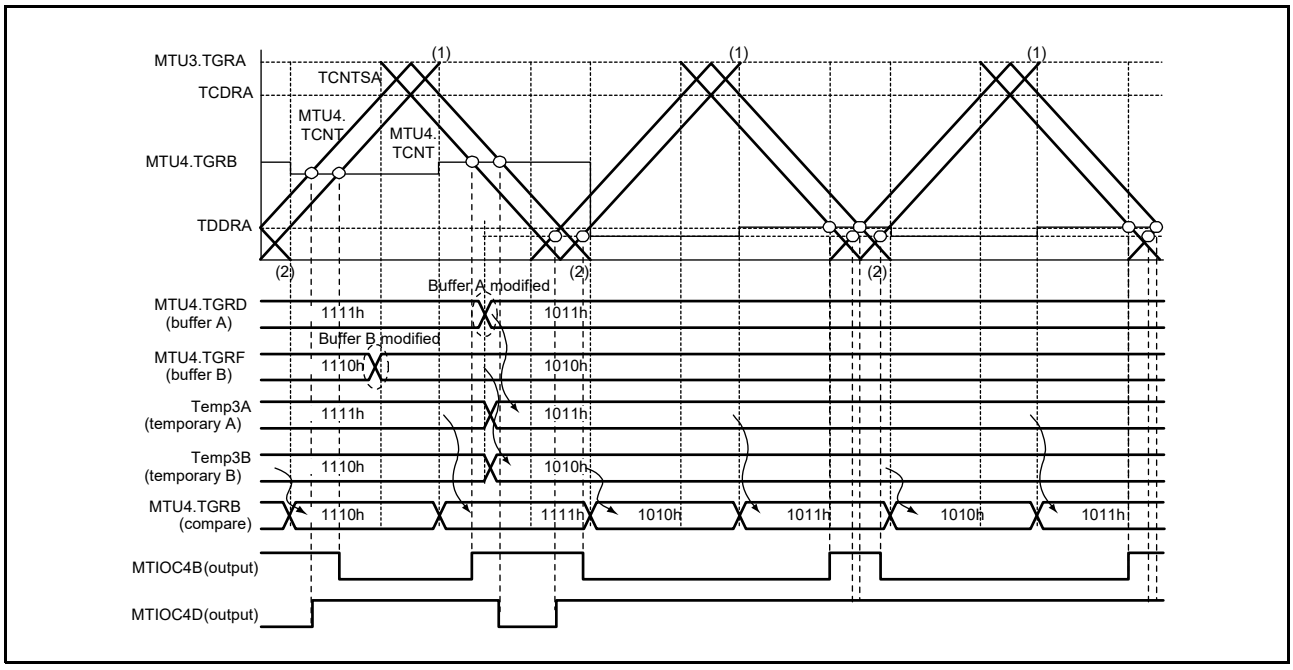

Figure 10.84 Example of Double Buffer Operation (Buffer Write Value is Smaller than TDDRA)

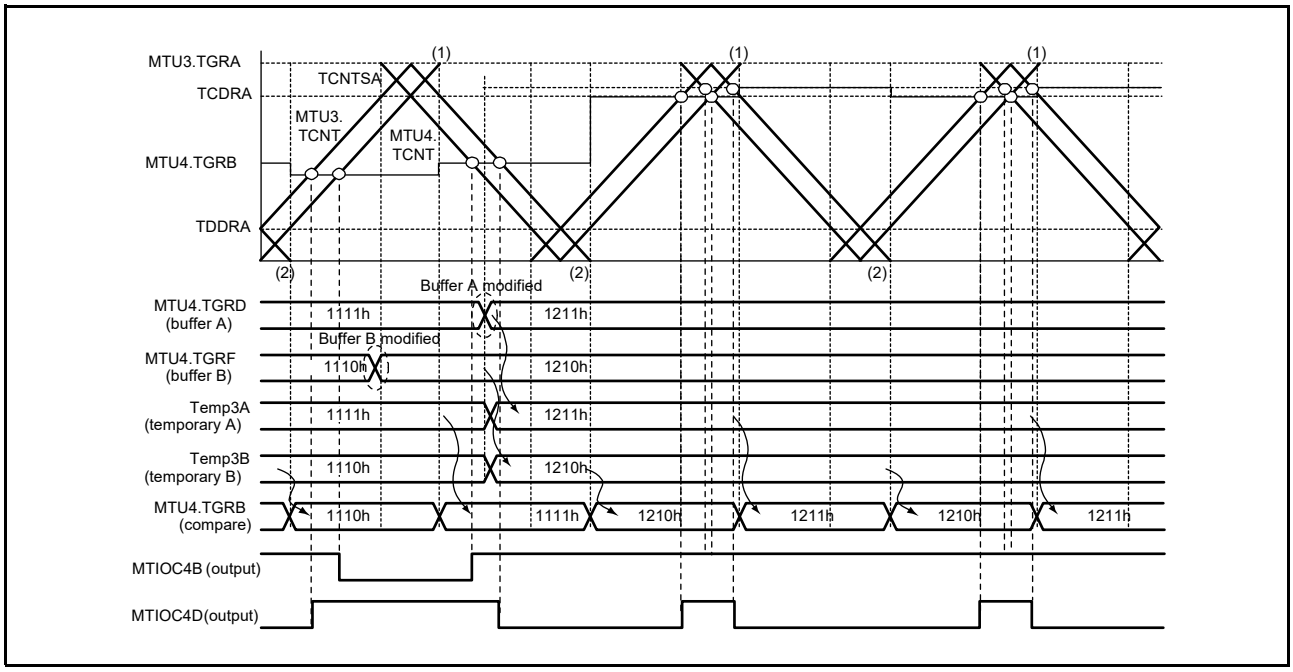

Figure 10.85 Example of Double Buffer Operation (Buffer Write Value is Greater than TCDRA)

(3) Interrupt Skipping Function 1 in Complementary PWM Mode

Interrupts TGIA3 (TGIA6) (at the crest) and TCIV4 (TCIV7) (at the trough) in MTU3 and MTU4 (MTU6 and MTU7) can be skipped up to seven times by making settings in the TITCR1A (TITCR1B) register.
Transfers from a buffer register to a temporary register or a compare register can be skipped in coordination with interrupt skipping by making settings in the TBTERA (TBTERB) register. For the linkage with buffer registers, refer to description (c), Buffer Transfer Control Linked with Interrupt Skipping, below.
A/D converter start requests generated by the A/D converter start request delaying function can also be skipped in coordination with interrupt skipping by making settings in the MTU4.TADCR (MTU7.TADCR) register. For the linkage with the A/D converter start request delaying function, refer to section 10.3.9, A/D Converter Start Request Delaying Function.
The TITCR1A (TITCR1B) register should be set while interrupt skipping function 1 is selected by setting the TITM bit in the timer interrupt skipping mode register (TITMRA or TITMRB) to 0, TGIA3 (TGIA6) interrupt requests are disabled by setting the MTU3.TIER (MTU6.TIER) register, TCIV4 (TCIV7) interrupt requests are disabled by setting the MTU4.TIER (MTU7.TIER) register, and a compare match is not generated. Before changing the skipping count, be sure to clear the T3AEN (T6AEN) and T4VEN (T7VEN) bits to 0 to clear the skipping counter.

(a) Example of Interrupt Skipping Function 1 Setting Procedure

Figure 10.86 shows an example of the interrupt skipping function 1 setting procedure. Figure 10.87 shows the periods during which interrupt skipping count can be changed.

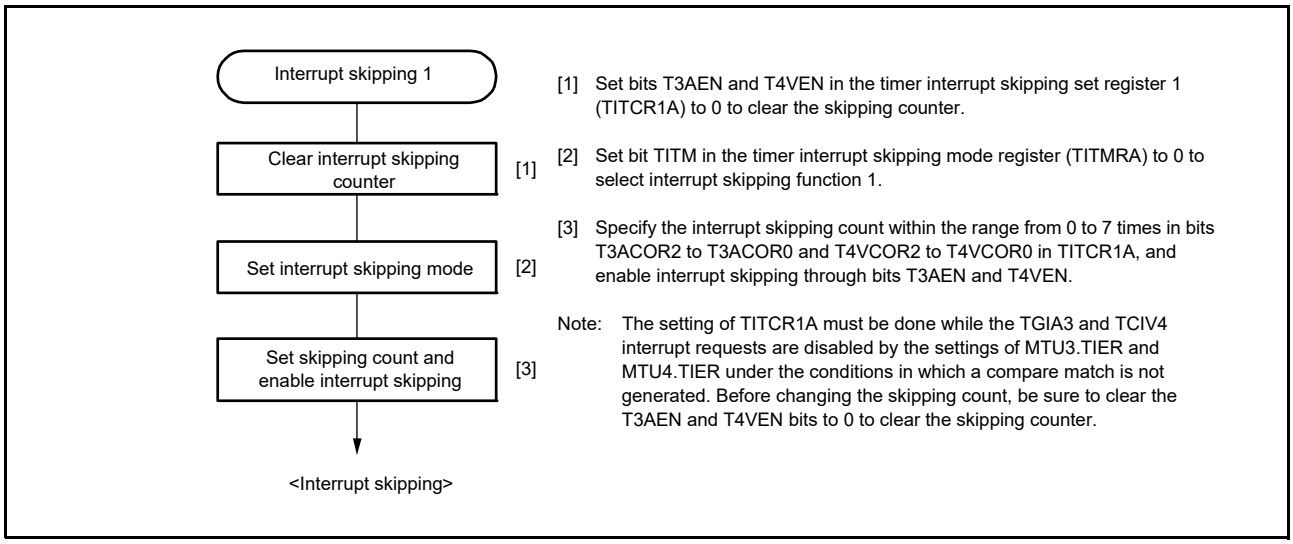

Figure 10.86 Example of Interrupt Skipping Function 1 Setting Procedure

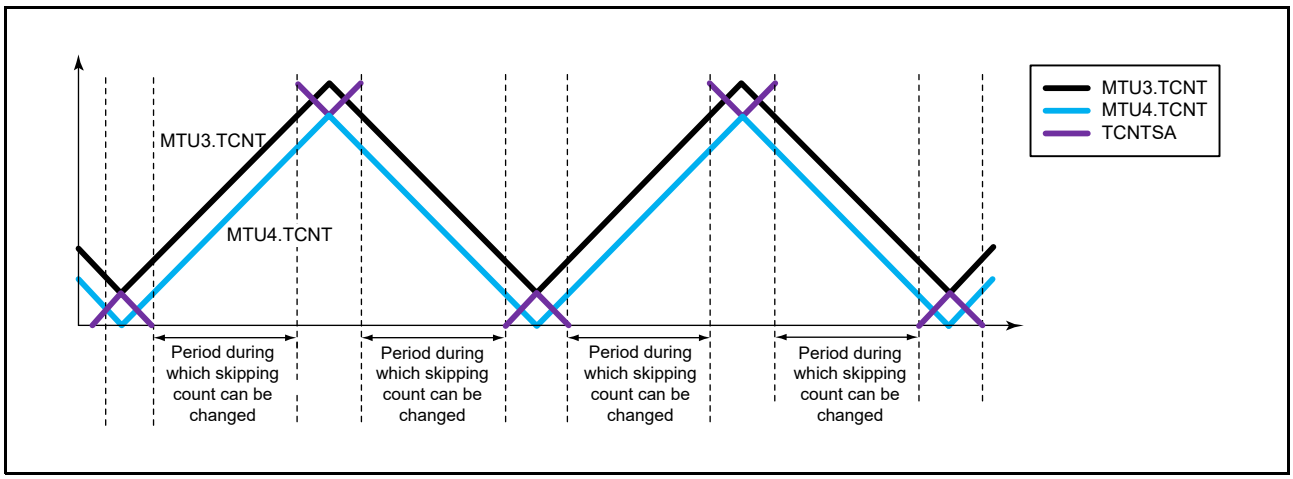

Figure 10.87 Periods during which Interrupt Skipping Count can be Changed

(b) Example of Interrupt Skipping Function 1

Figure 10.88 shows an example of TGIA3 (TGIA6) interrupt skipping in which the interrupt skipping count is set to three by the T3ACOR (T6ACOR) bits and the T3AEN (T6AEN) bit is set to 1 in the TITCR1A (TITCR1B) register.

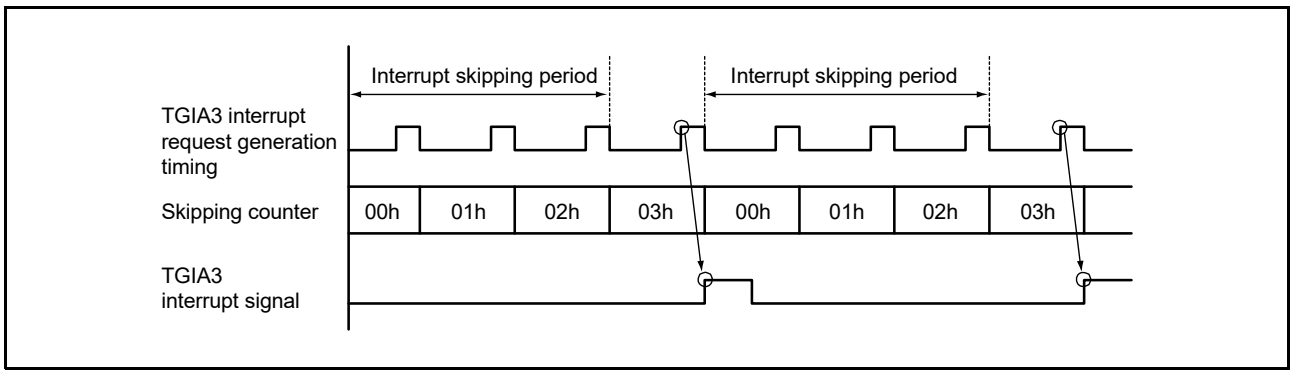

Figure 10.88 Example of Interrupt Skipping Function 1

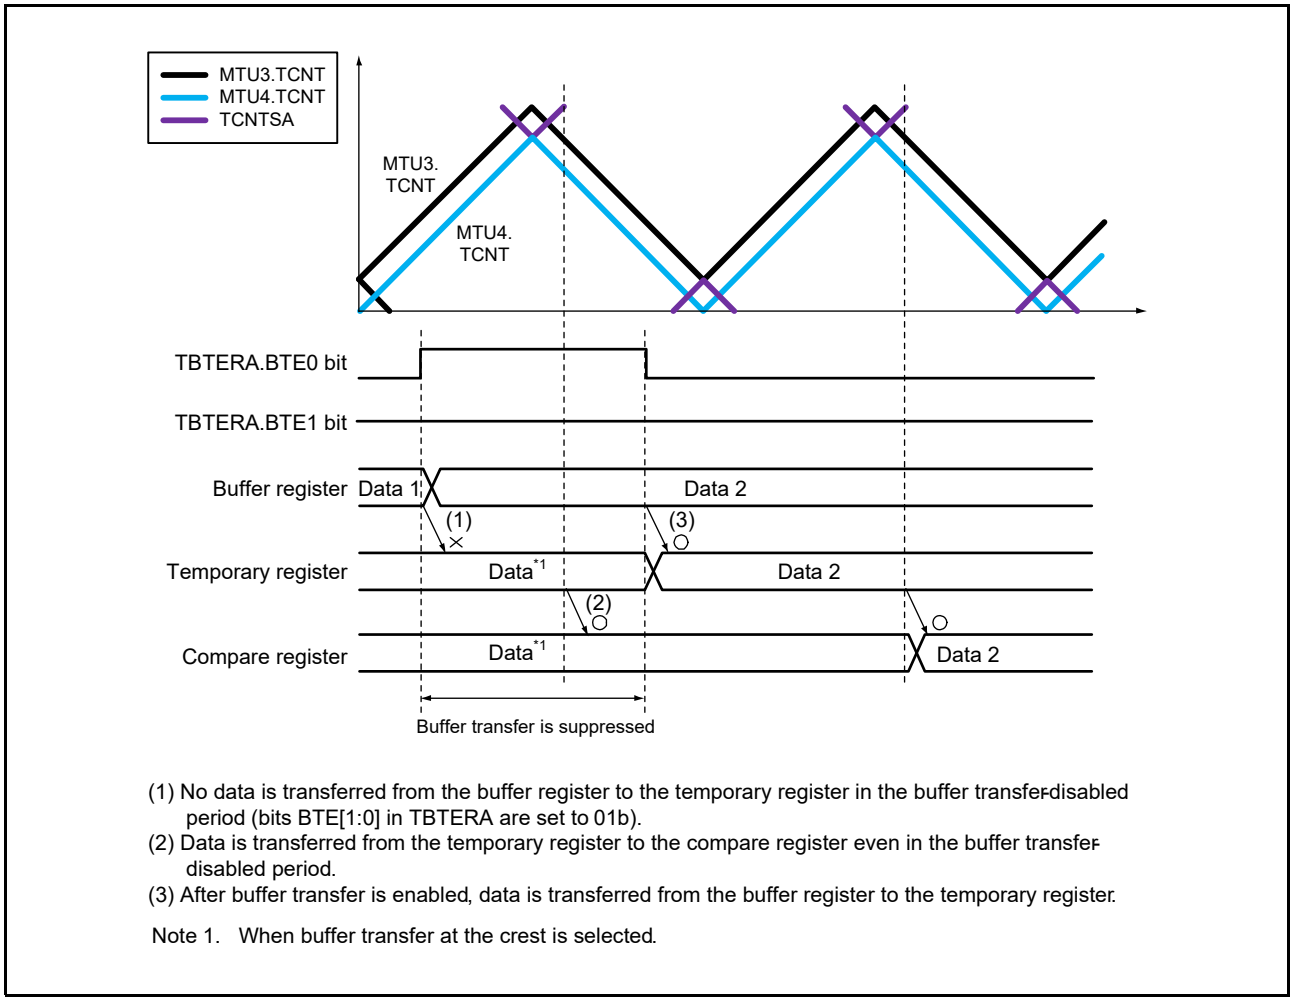
(c) Buffer Transfer Control Linked with Interrupt Skipping

In complementary PWM mode, whether to transfer data from a buffer register to a temporary register and whether to link the transfer with interrupt skipping can be specified with the BTE[1:0] bits in the TBTERA (TBTERB) register.
Figure 10.89 shows an example of operation when buffer transfer is disabled (BTE[1:0] = 01b). While this setting is valid, data is not transferred from the buffer register to the temporary register.
Figure 10.90 shows an example of operation when buffer transfer is linked with interrupt skipping (BTE[1:0] = 10b). While this setting is valid, data is not transferred from the buffer register outside the buffer transfer-enabled period. Note that the buffer transfer-enabled period differs depending on whether only the T3AEN (T6AEN) bit in the TITCR1A (TITCR1B) register is set to 1, only the T4VEN (T7VEN) bit in the TITCR1A (TITCR1B) register is set to 1, or both the T3AEN and T4VEN (T6AEN and T7VEN) bits are set to 1. Figure 10.91 shows the relationship between the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in TITCR1A (TITCR1B) and buffer transfer-enabled period.

Note: This function must be used in combination with interrupt skipping function 1.
When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B) are cleared to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), make sure that buffer transfer is not linked with interrupt skipping (clear the BTE1 bit in TBTERA or TBTERB to 0).
If buffer transfer is linked with interrupt skipping while interrupt skipping is disabled, buffer transfer is never performed.



(1) No data is transferred from the buffer register to the temporary register in the buffer transfer-disabled period (bits BTE[1:0] in TBTERA are set to 01b).
(2) Data is transferred from the temporary register to the compare register even in the buffer transfer-disabled period.
(3) After buffer transfer is enabled, data is transferred from the buffer register to the temporary register.

Note 1. When buffer transfer at the crest is selected.

Figure 10.89 Example of Operation When Buffer Transfer is Disabled (BTE[1:0] = 01b)

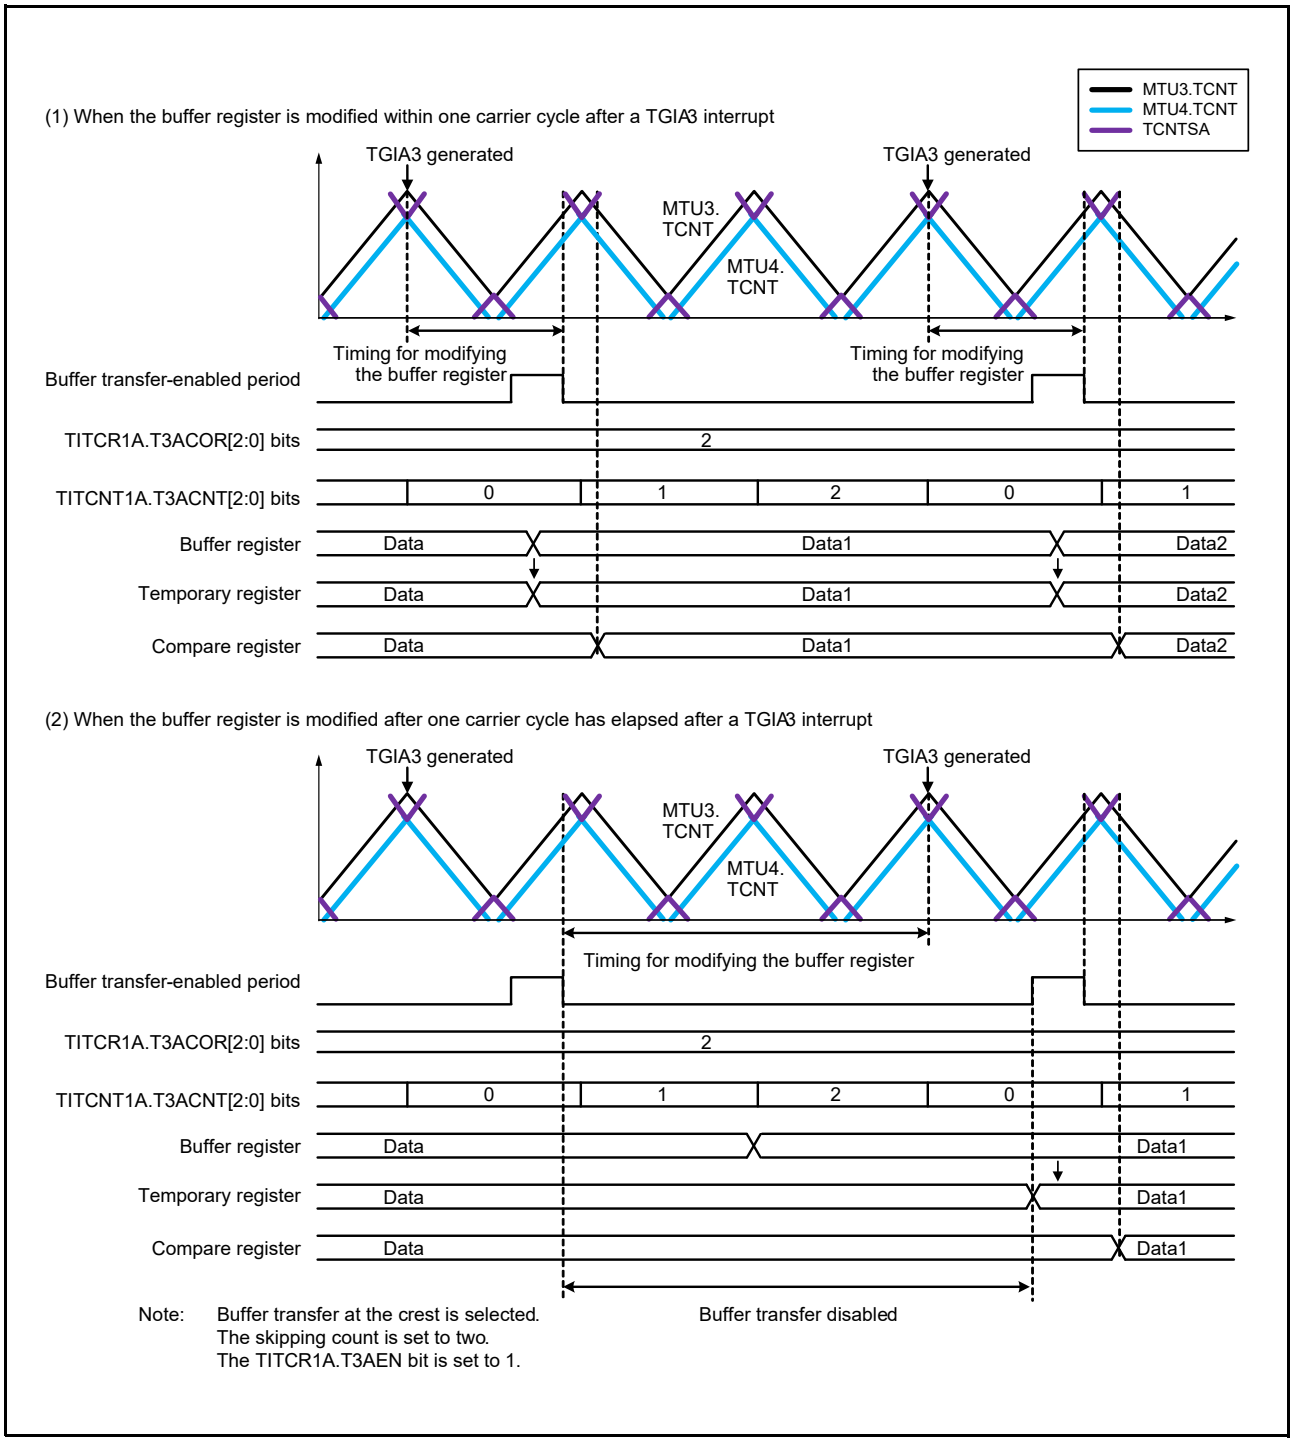


Figure 10.90 Example of Operation When Buffer Transfer is Linked with Interrupt Skipping (BTE[1:0] = 10b)

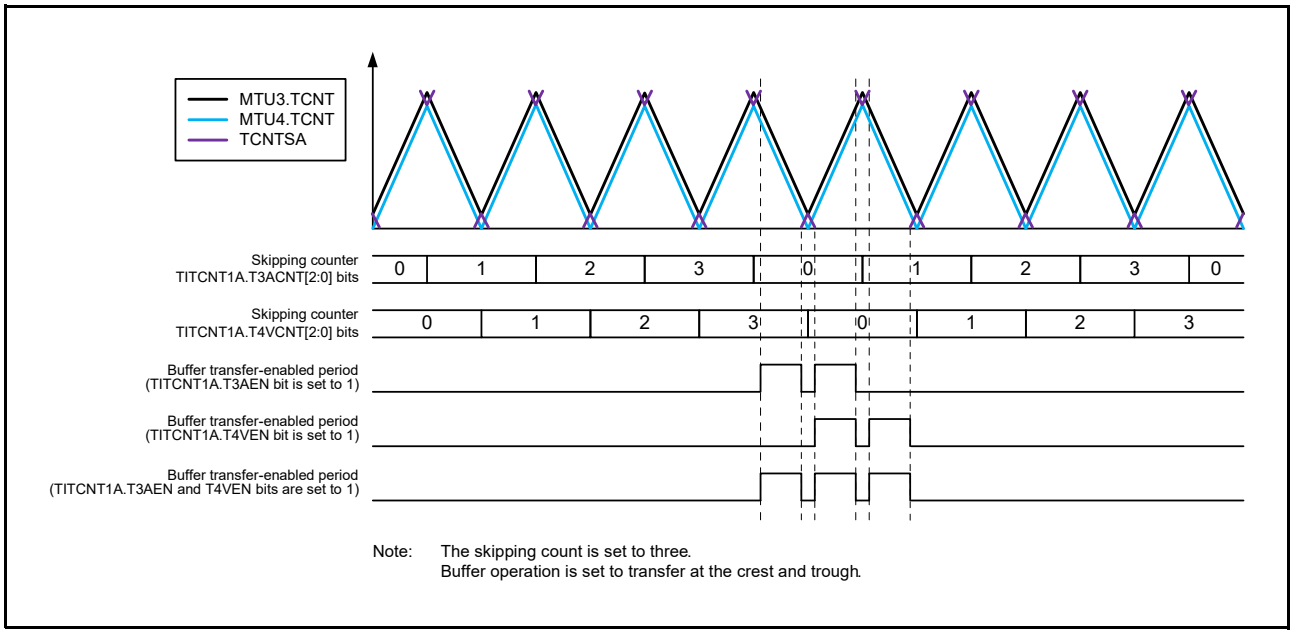

Figure 10.91 Relationship between Bits T3AEN and T4VEN in TITCR1A and Buffer Transfer-Enabled Period

(4) Complementary PWM Mode Output Protection Functions

The following output protection functions are provided for complementary PWM mode.

(a) Register and Counter Miswrite Prevention Function

Access from the CPU to the mode registers, control registers, compare registers, and counters can be enabled or disabled by setting the RWE bit in the TRWERA (TRWERB) register. The applicable registers are some of the registers in MTU3, MTU4, MTU6, and MTU7 shown below:
MTU3.TCR, MTU4.TCR, MTU3.TCR2, MTU4.TCR2, MTU3.TMDR1, MTU4.TMDR1, MTU3.TIORH, MTU4.TIORH, MTU3.TIORL, MTU4.TIORL, MTU3.TIER, MTU4.TIER,
MTU3.TCNT, MTU4.TCNT, MTU3.TGRA, MTU4.TGRA, MTU3.TGRB, MTU4.TGRB,
MTU.TOERA, MTU.TOCR1A, MTU.TOCR2A, MTU.TGCRA, MTU.TCDRA, MTU.TDDRA
MTU6.TCR, MTU7.TCR, MTU6.TCR2, MTU7.TCR2, MTU6.TMDR1, MTU7.TMDR1, MTU6.TIORH, MTU7.TIORH,
MTU6.TIORL, MTU7.TIORL, MTU6.TIER, MTU7.TIER, MTU6.TCNT, MTU7.TCNT,
MTU6.TGRA, MTU7.TGRA, MTU6.TGRB, MTU7.TGRB,
MTU.TOERB, MTU.TOCR1B, MTU.TOCR2B, MTU.TCDRB, and MTU.TDDRB
47 registers in total
This function can disable CPU access to the mode registers, control registers, and counters to prevent miswriting due to CPU runaway. In the access-disabled state, the applicable registers are read as undefined and writing to these registers is ignored.

(b) Halting of PWM Output by External Signal

The PWM output pins of MTU0, MTU3, MTU4, MTU6, and MTU7 can be set to the high-impedance state automatically.
See section 11, Port Output Enable 3 (POE3), for details.

10.3.9 A/D Converter Start Request Delaying Function

A/D converter start requests can be issued in MTU4 or MTU7 by making settings in the timer A/D converter start request control register (MTU4.TADCR or MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB).
The A/D converter start request delaying function compares MTU4.TCNT with MTU4.TADCORA or MTU4.TADCORB (MTU7.TCNT with MTU7.TADCORA or MTU7.TADCORB), and when their values match, the function issues a respective A/D converter start request (TRG4AN or TRG4BN (TRG7AN or TRG7BN)).
A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be skipped in coordination with interrupt skipping by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in the TADCR register in MTU4 (the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in the TADCR register in MTU7).

(1) Example of Procedure for Specifying A/D Converter Start Request Delaying Function

Figure 10.92 shows an example of procedure for specifying the A/D converter start request delaying function.

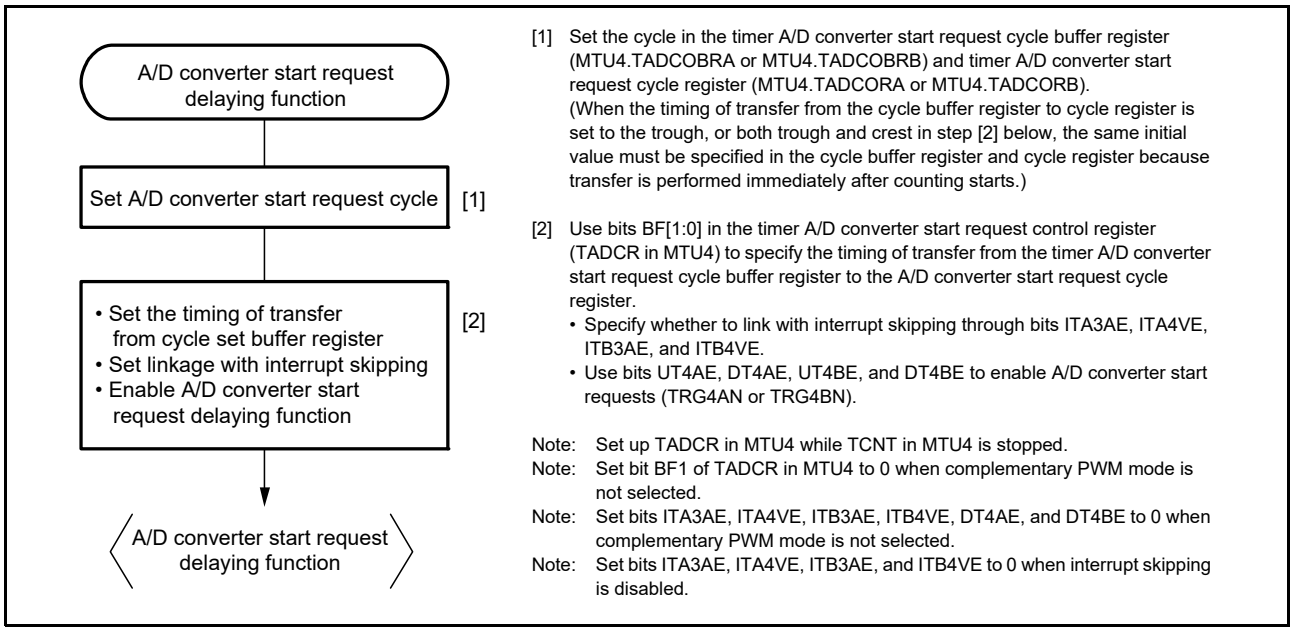

Figure 10.92 Example of Procedure for Specifying A/D Converter Start Request Delaying Function (MTU3 and MTU4)

(2) Basic Example of A/D Converter Start Request Delaying Function Operation

Figure 10.93 shows a basic example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when the trough of MTU4.TCNT (MTU7.TCNT) is specified for the buffer transfer timing and an A/D converter start request signal is output during MTU4.TCNT (MTU7.TCNT) down-counting.

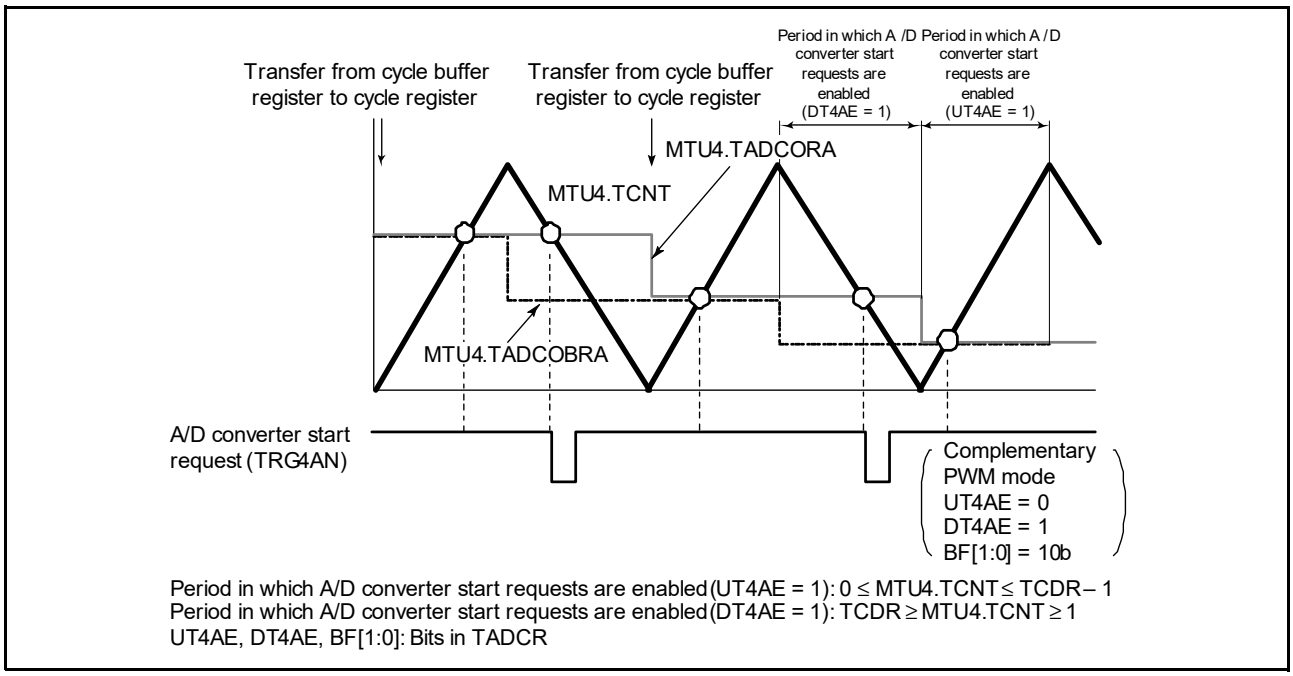

Figure 10.93 Basic Example of A/D Converter Start Request Signal (TRG4AN) Operation

(3) Period in which A/D Converter Start Requests are Enabled

An A/D converter start request (TRG4AN or TRG4BN) can be issued when the TCNT counter value in MTU4 (MTU7) matches the value of the corresponding cycle set register (TADCORA or TADCORB) in MTU4 (MTU7) within the period specified by the UT4AE or UT4BE (UT7AE or UT7BE) bit of TADCR in MTU4 (MTU7).

When the UT4AE or UT4BE (UT7AE or UT7BE) bit is set to 1 in complementary PWM mode, issuing of AD converter start requests is enabled for the period of TCNT up-counting (0 ≤ TCNT ≤ TCDR - 1) in MTU4 (MTU7). When the DT4AE or DT4BE (DT7AE or DT7BE) bit is set to 1, issuing of AD converter start requests is enabled for the period of TCNT down-counting (TCDR ≥ TCNT ≥ 1) in MTU4 (MTU7) (Figure 10.93).

(4) Buffer Transfer

The data in the timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB) is updated by writing data to the timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB). Data is transferred from the buffer registers to the respective cycle set registers at the timing selected with the BF[1:0] bits in the MTU4.TADCR (MTU7.TADCR) register.

In complementary PWM mode, data is also transferred from the timer A/D converter start request cycle set buffer registers to the timer A/D converter start request cycle set registers when MTU4.TGRD (MTU7.TGRD) register is updated.

When using buffer transfer in complementary PWM mode, pay attention to the buffer transfer timing. For details, refer to section 10.6.27, Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode.

When complementary PWM mode is not selected, be sure to clear the BF1 bit of the TADCR register in MTU4 or MTU7.

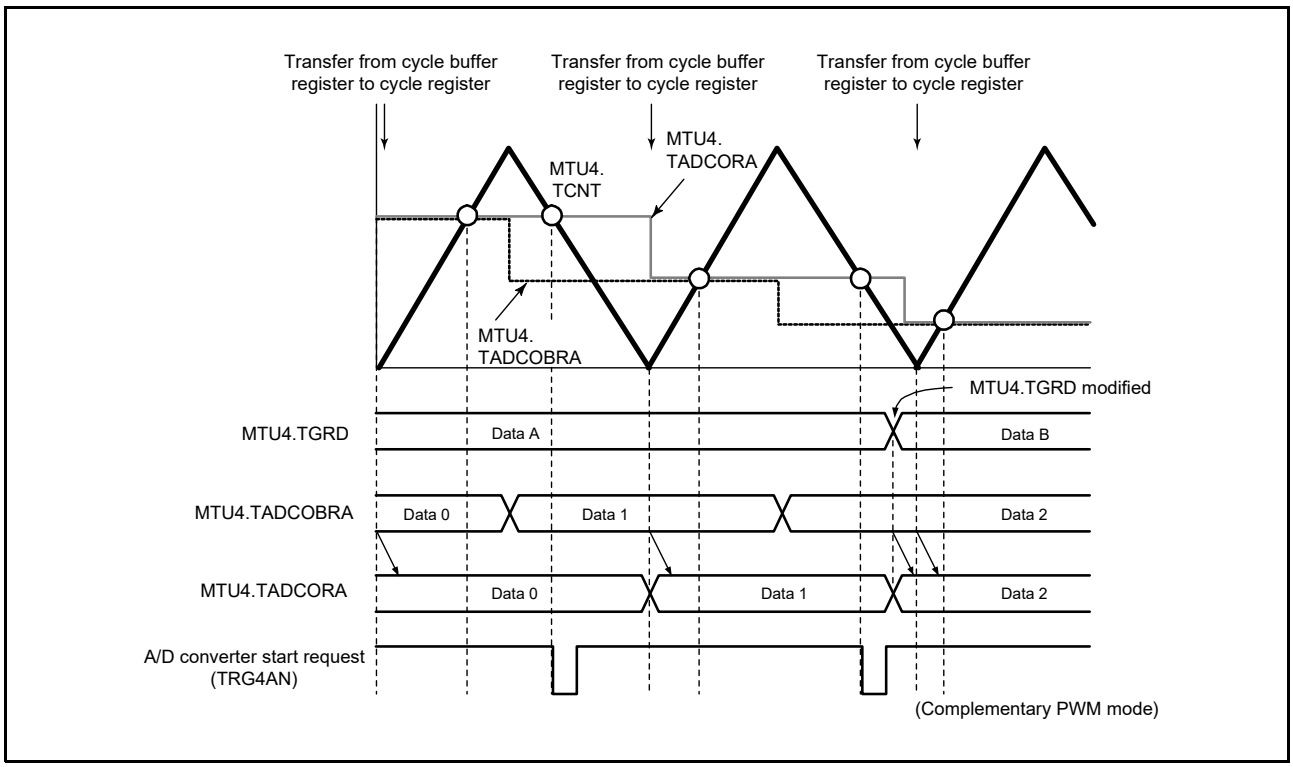

Figure 10.94 Example of A/D Converter Start Request Signal (TRG4AN) and Buffer Transfer Operation

(5) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1

In complementary PWM mode, A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be issued in coordination with interrupt skipping 1 by setting the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits of the TADCR register in MTU4 (MTU7).

Figure 10.95 shows an example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and down-counting and A/D converter start requests are linked with interrupt skipping 1.

Figure 10.96 shows another example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and A/D converter start requests are linked with interrupt skipping 1.

When complementary PWM mode is not selected, A/D converter start request delaying function cannot be used in coordination with interrupt skipping 1; clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits of the TADCR register to 0 in MTU4 (MTU7).

Note: This function should be used in combination with interrupt skipping 1.
When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register (TITCR1A (TITCR1B)) are cleared to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), make sure that A/D converter start requests are not linked with interrupt skipping 1 (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the timer A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) to 0).
When this function is used, MTU4.TADCORA and MTU4.TADCORB (MTU7.TADCORA and MTU7.TADCORB) should be set with the value ranging 0002h to the value set in TCDRA minus 2 (value set in TCDRB minus 2).

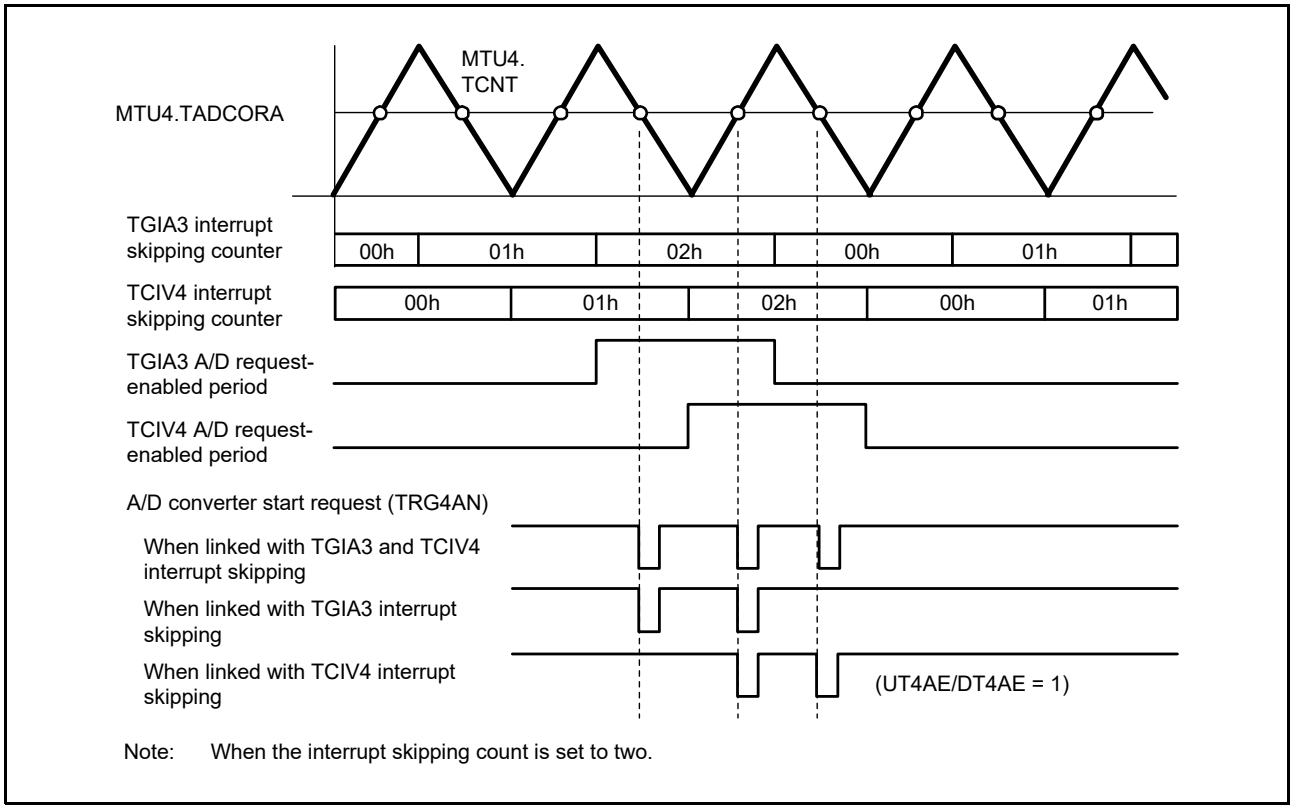

Figure 10.95 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE and DT4AE = 1)

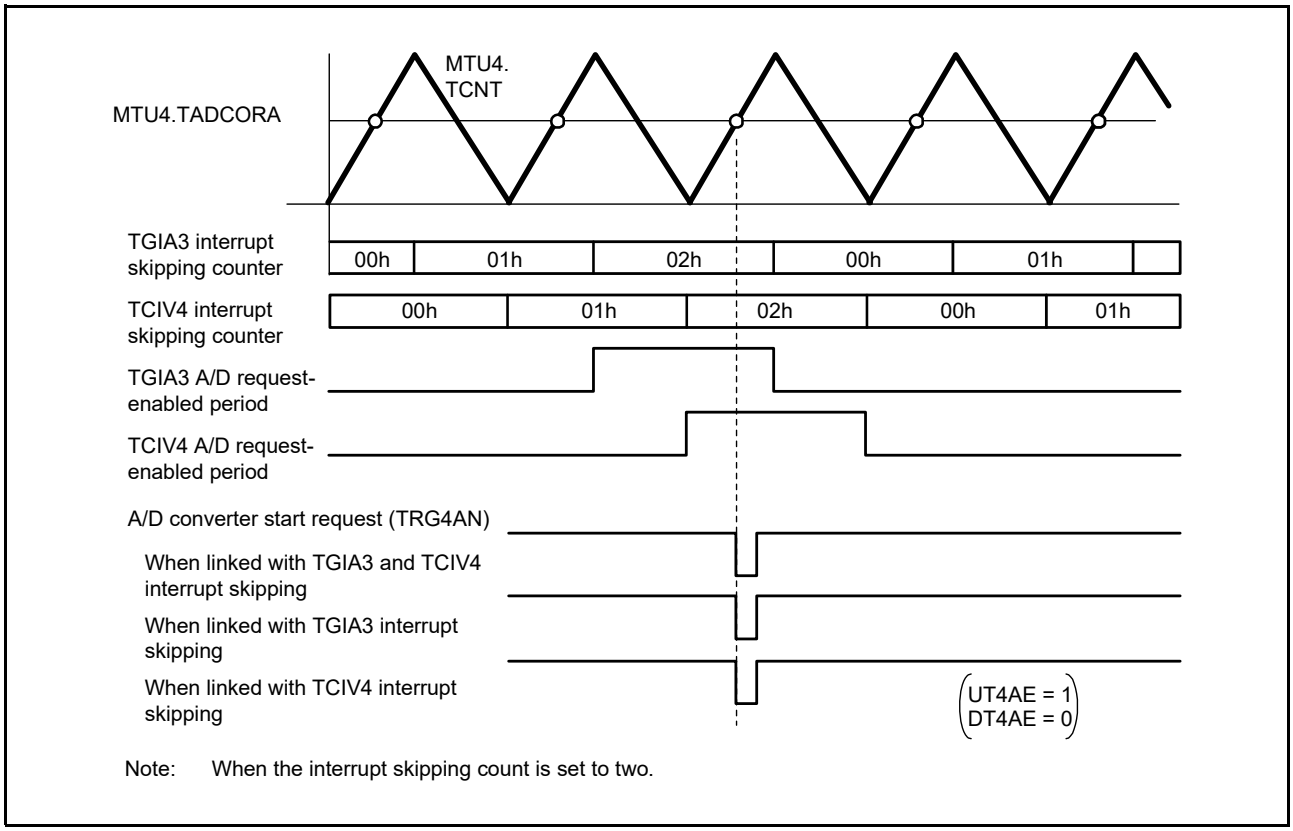

Figure 10.96 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE = 1, DT4AE = 0)

(6) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 2

By setting the TITM bit to 1 in the TITMRA (TITMRB) register, the counter starts down-counting from the value (0 to 7) set in the TRG4COR[2:0] (TRG7COR[2:0]) bits in TITCR2A (TITCR2B) register every time an A/D converter start trigger (TRG4AN or TRG4BN (TRG7AN or TRG7BN)) is generated. When the counter value reaches 0 and is reloaded, the TRG4AN and TRG4BN (TRG7AN and TRG7BN) interrupts become valid and an A/D converter start request signal (TRG4ABN (TRG7ABN)) is output.
This function is valid only when the A/D converter request delaying function is enabled.

10.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7

(1) Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

The counters in MTU0 to MTU4, MTU6, and MTU7 can be started synchronously by making the TCSYSTR settings.

(a) Example of Procedure for Setting Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

Figure 10.99 shows an example of the procedure for specifying synchronous counter start in MTU0 to MTU4, MTU6, and MTU7.

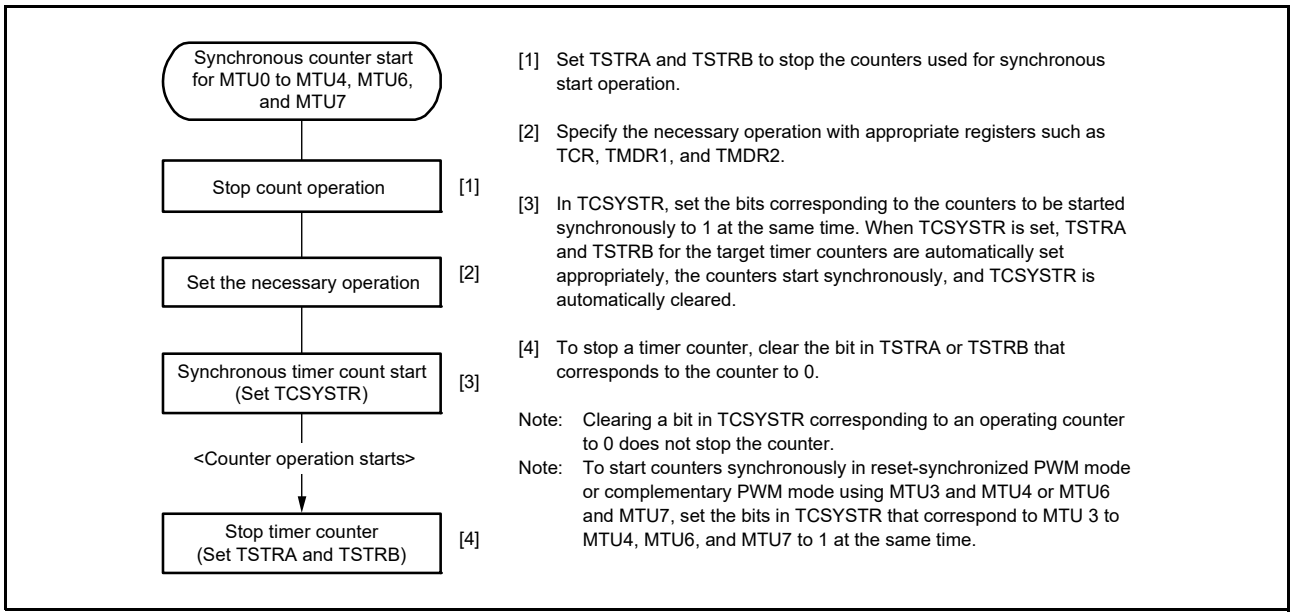

Figure 10.99 Example of Procedure for Specifying Synchronous Counter Start in MTU0 to MTU4, MTU6, and MTU7

(b) Examples of Synchronous Counter Start Operation

Figure 10.100 shows an example of the synchronous counter start operation in MTU0 to MTU4, MTU6, and MTU7.

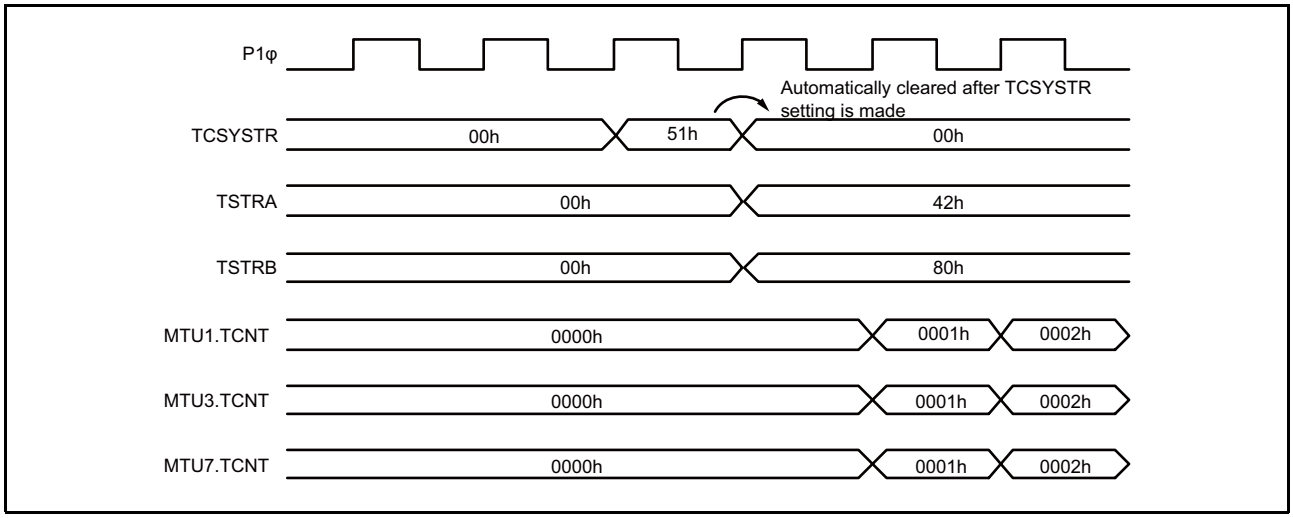

Figure 10.100 Example of Synchronous Counter Start Operation in MTU0 to MTU4, MTU6, and MTU7

(2) Synchronous Counter Clearing for MTU6 and MTU7

The counters in MTU6 and MTU7 can be cleared by the TGImn interrupt generation timing (m = A to D; n = 0 to 2) through the TSYCR setting.

(a) Example of Procedure for Specifying Synchronous Counter Clearing for MTU6 and MTU7

Figure 10.101 shows an example of the procedure for specifying synchronous counter clearing in MTU6 and MTU7 by using the interrupt generation timing.

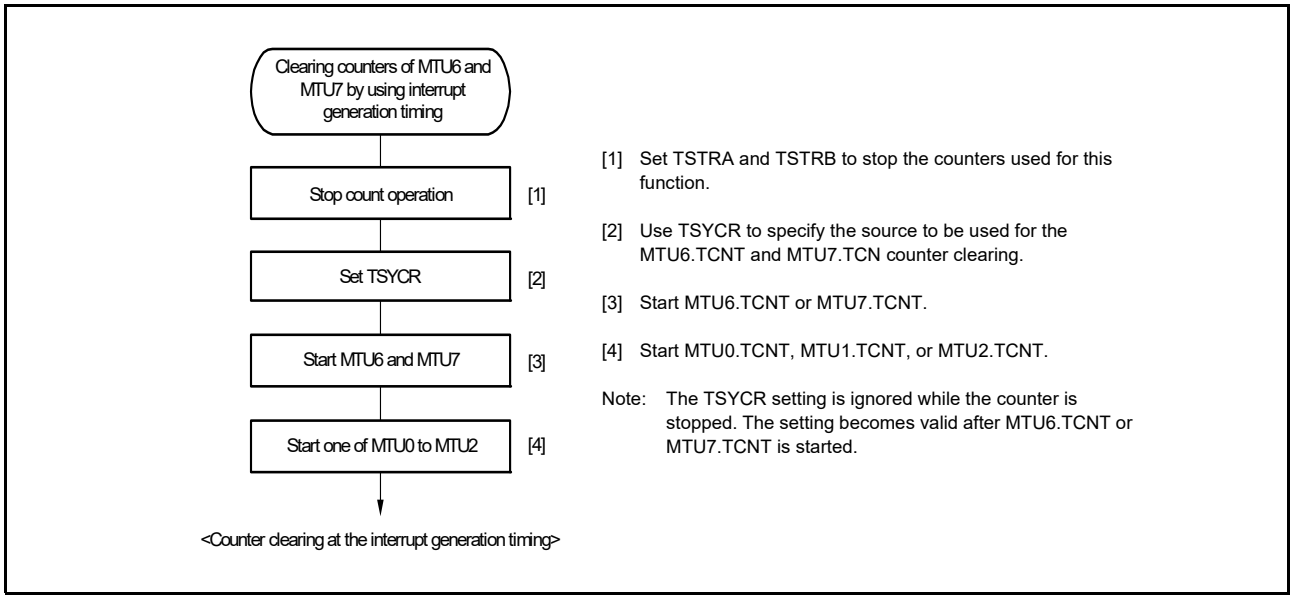

Figure 10.101 Example of Procedure for Specifying Synchronous Counter Clearing in MTU6 and MTU7

(b) Examples of Synchronous Counter Clearing in MTU6 and MTU7

Figure 10.102 and Figure 10.103 show examples of synchronous counter clearing in MTU6 and MTU7 by using the interrupt generation timing.

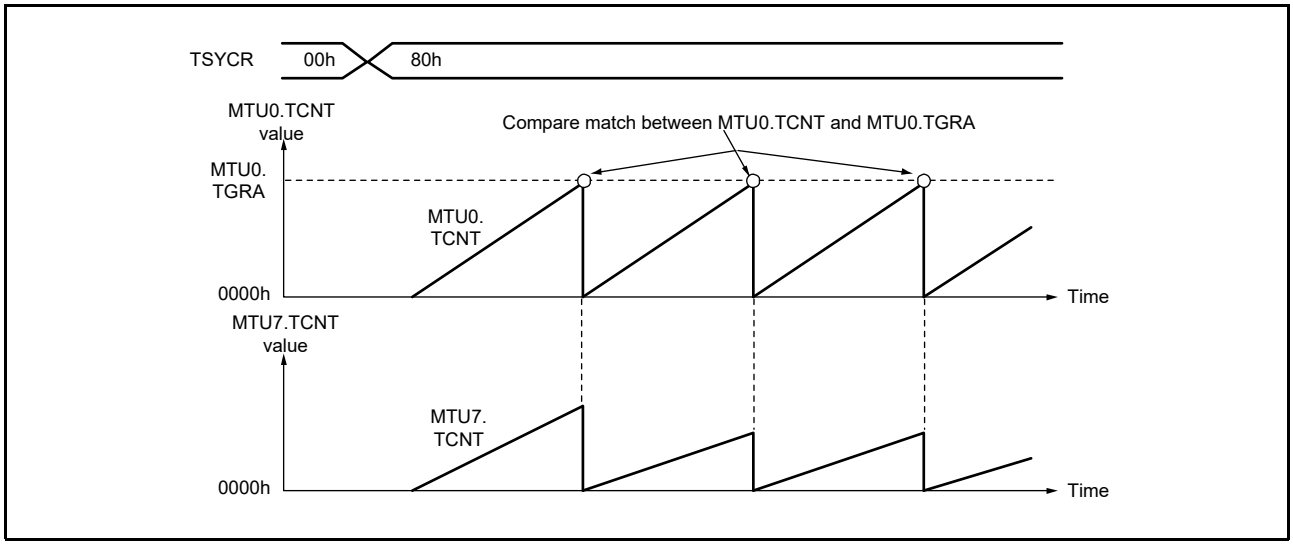

Figure 10.102 Example of Synchronous Counter Clearing in MTU6 and MTU7 (1)

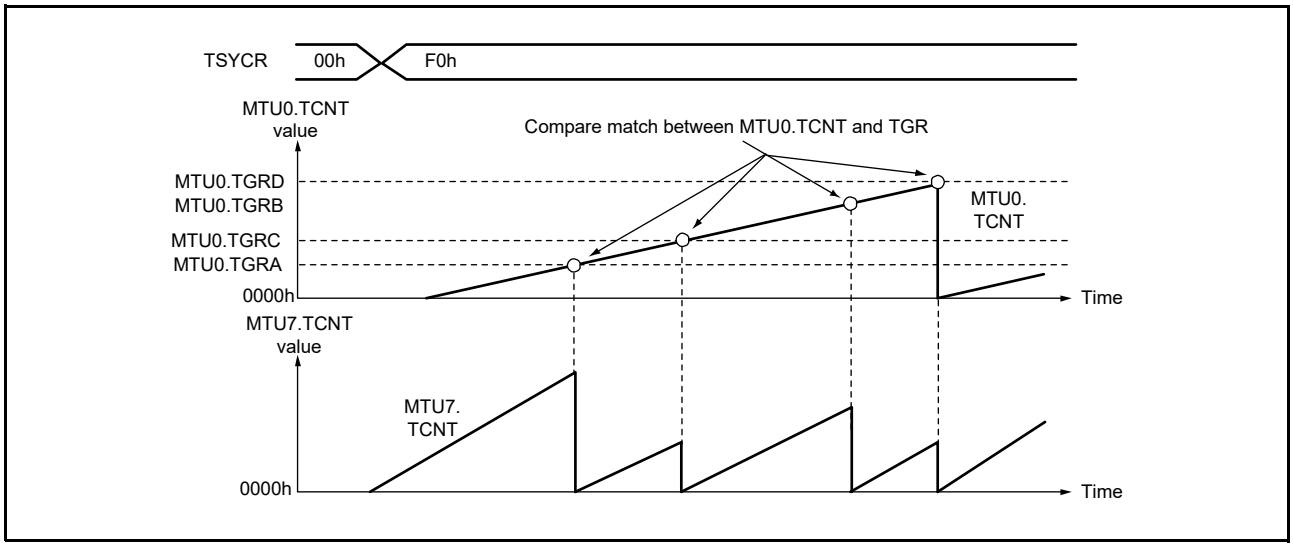

Figure 10.103 Example of Synchronous Counter Clearing in MTU6 and MTU7 (2)

10.3.11 External Pulse Width Measurement

The pulse widths of up to three external input lines can be measured in MTU5.
When the IOC[4:0] bits in MTU5.TIORU, MTU5.TIORV, MTU5.TIORW are set for pulse width measurement, the pulse width of the signal input to the MTIC5U, MTIC5V, and MTIC5W pins are measured. TCNTU, TCNTV, and TCNTW count up while the level specified by the IOC[4:0] bits is input.
Figure 10.104 shows an example of setting external pulse width measurement, and Figure 10.105 an example of external pulse width measurement.

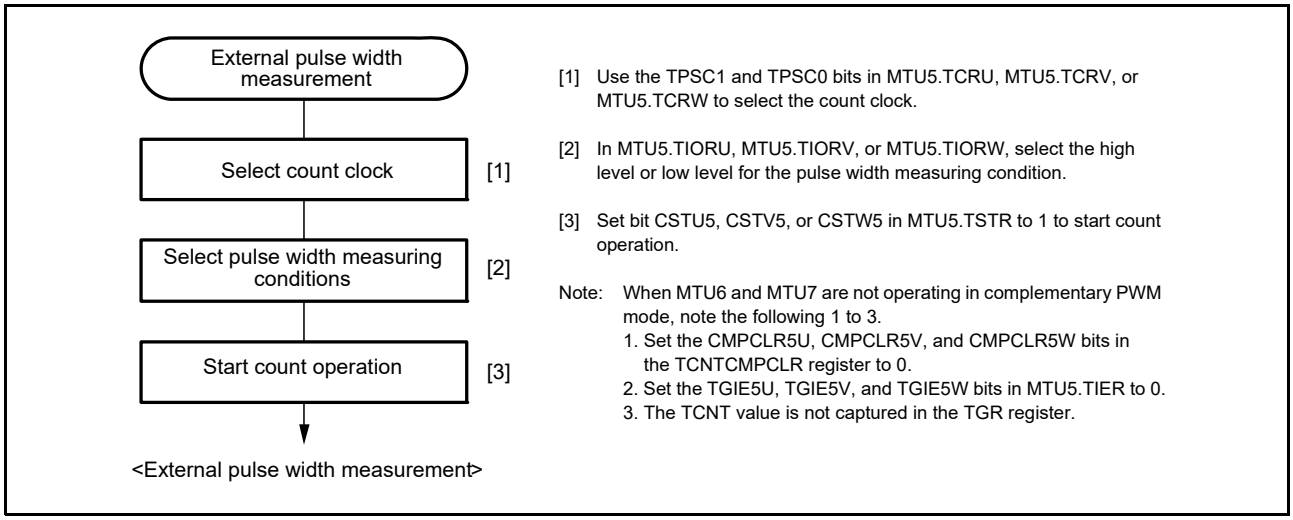

Figure 10.104 Example of External Pulse Width Measurement Setting Procedure

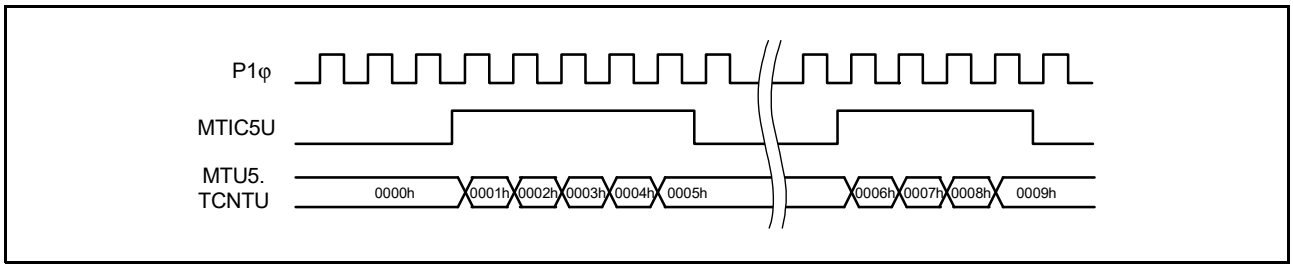

Figure 10.105 Example of External Pulse Width Measurement (Measuring High Pulse Width)

10.3.12 Dead Time Compensation

MTU5 to MTU7 can be used in combination to compensate for the delay in the dead time (the delay between complementary PWM output and inverter output).

Figure 10.106 shows an example of a motor control circuit in which the combination of MTU5 to MTU7 is used to compensate for the dead time delay.

The external pulse measurement function of MTU5 allows the specification of a correction to the duty cycle specified in the PWM output compare registers by measuring the delay between the complementary PWM output and inverter output. This can be used for dead time compensation for the PWM output waveform during complementary PWM operation of MTU6 and MTU7 (Figure 10.107).

Figure 10.108 shows the procedure for setting dead time compensation using MTU5 to MTU7. For details on MTU5 operation at this time, refer to section 10.3.13, TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode.

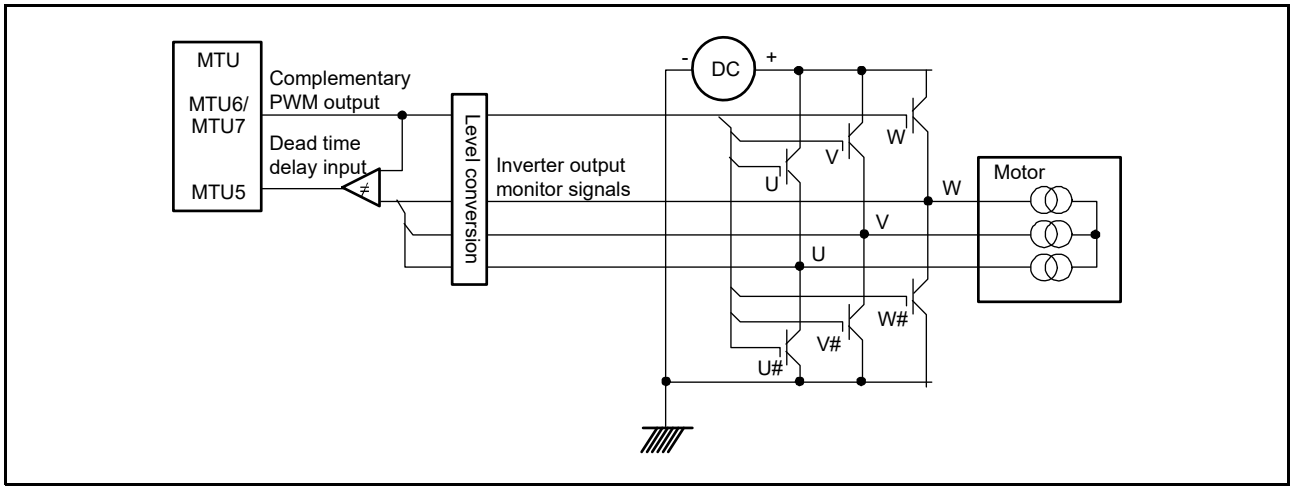

Figure 10.106 Motor Control Circuit Example

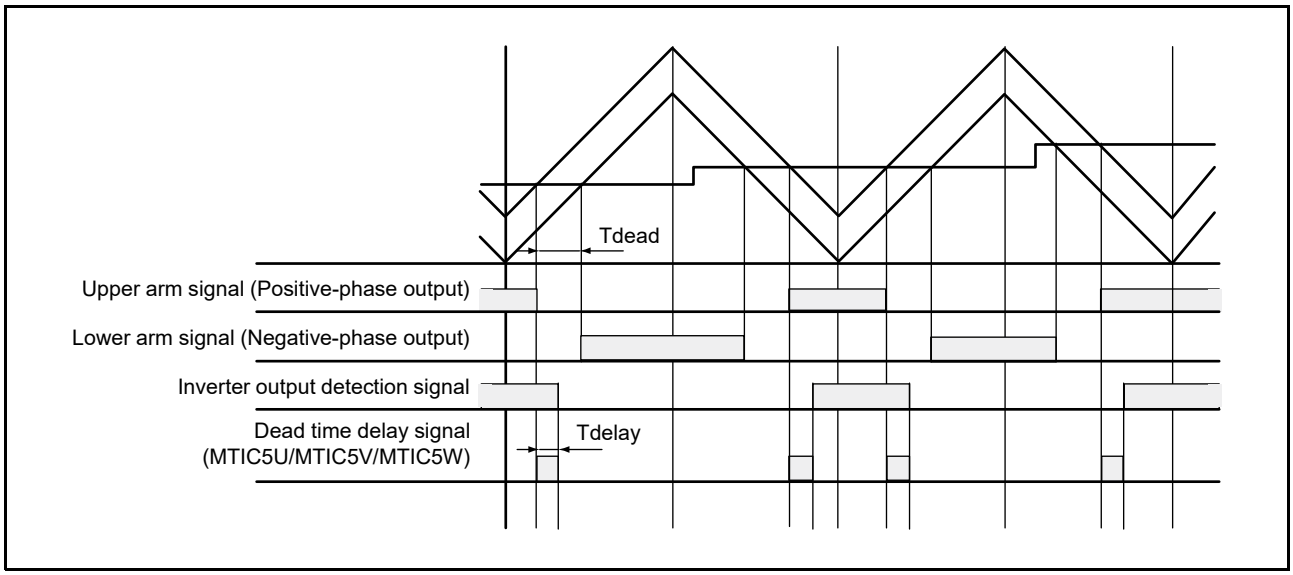

Figure 10.107 Delay in Dead Time in Complementary PWM Operation

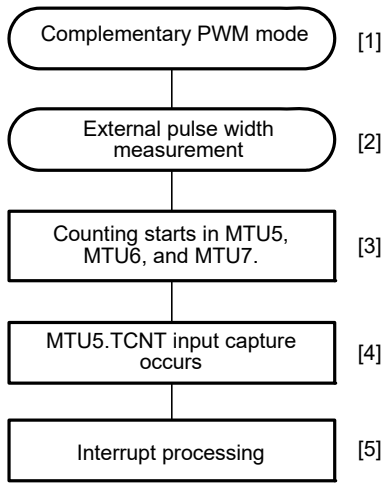
(1) Example of Dead Time Compensation Setting Procedure

Figure 10.108 shows an example of dead time compensation setting procedure by using three counters in MTU5.



[1] Set MTU6 and MTU7 to complementary PWM mode. For details, refer to section 10.3.8, Complementary PWM Mode.

[2] Specify the external pulse width measurement function for the target TIOR in MTU5. For details, refer to section 10.3.11, External Pulse Width Measurement.

[3] Set bits CST6 and CST7 in TSTRB and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR to 1 to start count operation.

[4] When the capture condition specified in TIOR is satisfied, the MTU5.TCNT value is captured in MTU5.TGR.
To prevent the generation of the MTU5.TGIm5 interrupt (m = U, V, W) request under the capture condition specified in TIOR, do not enable interrupt requests in MTU5.TIER.

[5] For U-phase dead time compensation, when an interrupt is generated at the crest (TGIA6) or trough (TCIV7) in complementary PWM mode, read the MTU5.TGRU value, calculate the difference in time between MTU6.TGRB and MTU5.TGRU, and write the corrected value to MTU6.TGRD in the interrupt processing.
For the V phase and W phase, read the MTU5.TGRV and MTU5.TGRW values and write the corrected values to MTU7.TGRC and TGRD, respectively, in the same way as for U-phase compensation.
The MTU5.TCNT value should be cleared through the TCNTCMPCLR setting or by software.

Note: The port mode registers (PMR) and Pmn pin function control register (PmnPFS) of the GPIO ports should be set up in advance.
As the interrupt flag is set under the capture condition specified in TIOR, do not enable interrupt requests in MTU5.TIER.

Figure 10.108 Example of Dead Time Compensation Setting Procedure

10.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode

The external pulse width measurement function of MTU5 can be used to transfer the values of TCNTU, TCNTV, and TCNTW to TGRU, TGRV, and TGRW at the crests, troughs, or both crests and troughs of the complementary PWM output when MTU6 and MTU7 are being used in complementary PWM mode. The type of transfer timing is specified in TIORU, TIORV, and TIORW. When the CMPCLR5U, CMPCLR5V, and CMPCLR5W bits in the TCNTCNPCLR register are set to 1, TCNTU, TCNTV, and TCNTW are cleared to 0000h at the timing for transfer to TGRU, TGRV, and TGRW.
Note that the TCNTU, TCNTV, and TCNTW capture operation at the crest and/or trough of complementary PWM output in MTU5 is not available when MTU3 and MTU4 are used in complementary PWM mode.

Figure 10.109 shows an operation example in which TCNTU is used as a free-running counter without being cleared and the value is captured in TGRU at the crest and trough in complementary PWM mode.

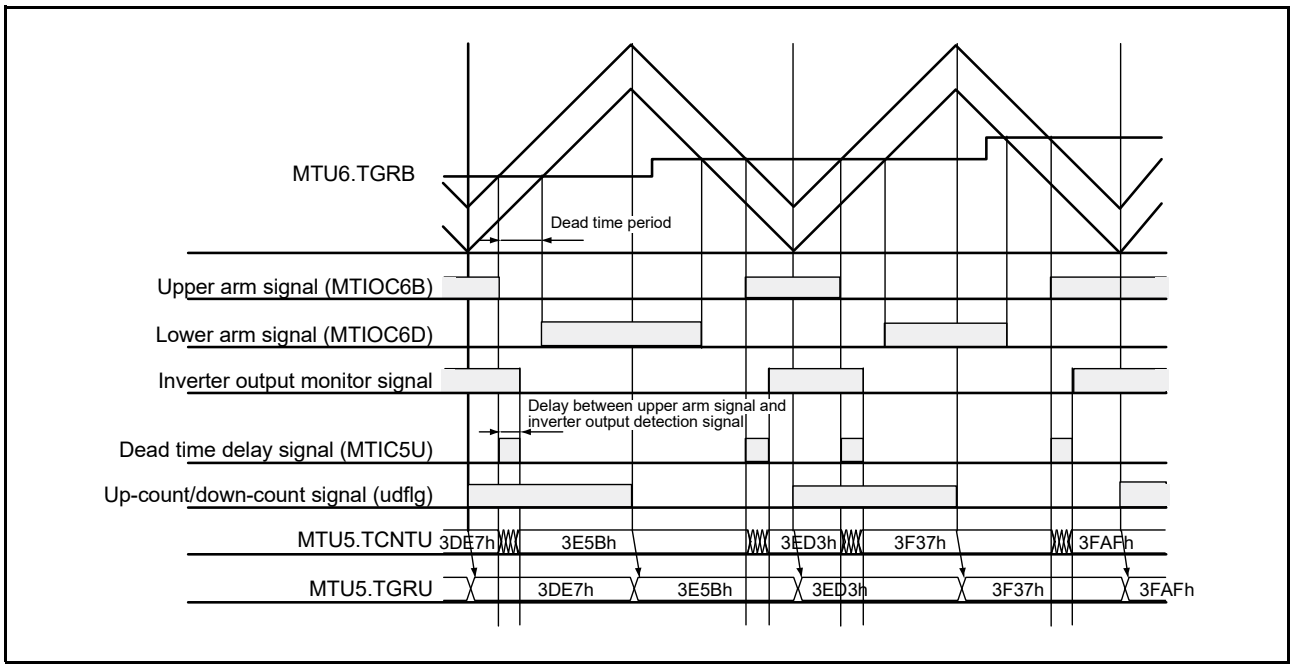


Figure 10.109 TCNTU Capture at Crest and Trough in Complementary PWM Operation

10.3.14 Noise Filter Function

The input capture input pins and external pulse input pins have a noise filter function.
Set the NFCRn register (n = 0 to 7, C) to enable or disable the noise filter function and set the sampling clock. The noise filter for each pin can be enabled or disabled individually, and the sampling clock can be set for each channel.
Figure 10.110 shows the timing of noise filtering.

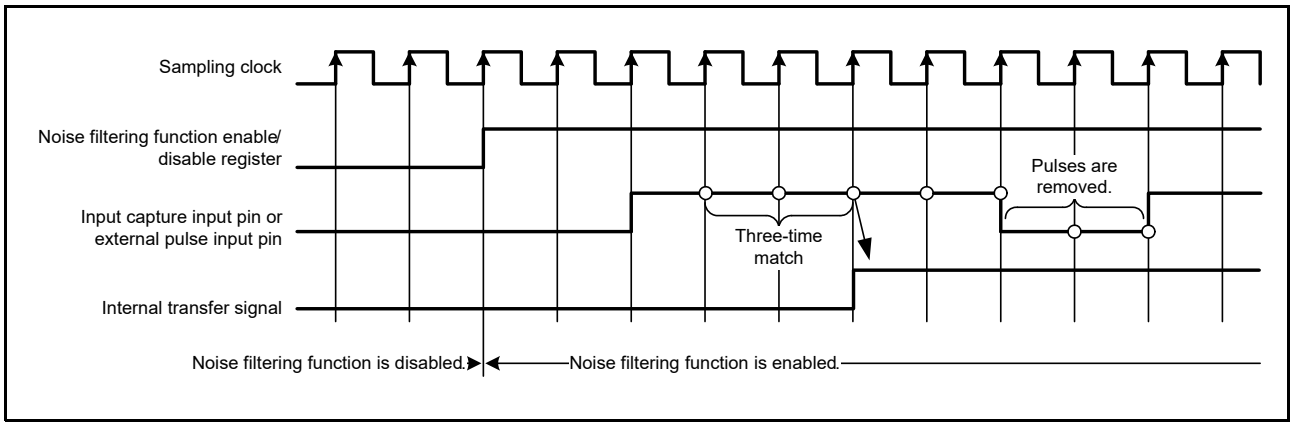

Figure 10.110 Timing of Noise Filtering

10.4 Interrupt Sources

10.4.1 Interrupt Sources and Priorities

There are three kinds of interrupt source; TGR input capture/compare match, TCNT overflow, and TCNT underflow. Each interrupt source has its own enable/disable bit, allowing the generation of interrupt request signals to be enabled or disabled individually.

When an interrupt source is generated, if the corresponding enable/disable bit in TIER is set to 1, an interrupt is requested.

Relative channel priorities can be changed by the interrupt controller; however the priority within a channel is fixed. For details, refer to section 7, Interrupt Controller. Table 10.78 lists the MTU interrupt sources.

Table 10.78 MTU Interrupt Sources

Channel	Name	Interrupt Source	DMAC Activation
MTU0	TGIA0	MTU0.TGRA input capture/compare match	Possible
	TGIB0	MTU0.TGRB input capture/compare match	Possible
	TGIC0	MTU0.TGRC input capture/compare match	Possible
	TGID0	MTU0.TGRD input capture/compare match	Possible
	TCIV0	MTU0.TCNT overflow	Not possible
	TGIE0	MTU0.TGRE compare match	Not possible
	TGIF0	MTU0.TGRF compare match	Not possible
MTU1	TGIA1	MTU1.TGRA input capture/compare match	Possible
	TGIB1	MTU1.TGRB input capture/compare match	Possible
	TCIV1	MTU1.TCNT overflow	Not possible
	TCIU1	MTU1.TCNT underflow	Not possible
MTU2	TGIA2	MTU2.TGRA input capture/compare match	Possible
	TGIB2	MTU2.TGRB input capture/compare match	Possible
	TCIV2	MTU2.TCNT overflow	Not possible
	TCIU2	MTU2.TCNT underflow	Not possible
MTU3	TGIA3	MTU3.TGRA input capture/compare match	Possible
	TGIB3	MTU3.TGRB input capture/compare match	Possible
	TGIC3	MTU3.TGRC input capture/compare match	Possible
	TGID3	MTU3.TGRD input capture/compare match	Possible
	TCIV3	MTU3.TCNT overflow	Not possible
MTU4	TGIA4	MTU4.TGRA input capture/compare match	Possible
	TGIB4	MTU4.TGRB input capture/compare match	Possible
	TGIC4	MTU4.TGRC input capture/compare match	Possible
	TGID4	MTU4.TGRD input capture/compare match	Possible
	TCIV4	MTU4.TCNT overflow/underflow*1	Possible
MTU5	TGIU5	MTU5.TGRU input capture/compare match	Possible
	TGIV5	MTU5.TGRV input capture/compare match	Possible
	TGIW5	MTU5.TGRW input capture/compare match	Possible
MTU6	TGIA6	MTU6.TGRA input capture/compare match	Possible
	TGIB6	MTU6.TGRB input capture/compare match	Possible
	TGIC6	MTU6.TGRC input capture/compare match	Possible
	TGID6	MTU6.TGRD input capture/compare match	Possible
	TCIV6	MTU6.TCNT overflow	Not possible

Table 10.78 MTU Interrupt Sources

Channel	Name	Interrupt Source	DMAC Activation
MTU7	TGIA7	MTU7.TGRA input capture/compare match	Possible
	TGIB7	MTU7.TGRB input capture/compare match	Possible
	TGIC7	MTU7.TGRC input capture/compare match	Possible
	TGID7	MTU7.TGRD input capture/compare match	Possible
	TCIV7	MTU7.TCNT overflow/underflow*1	Possible
MTU8	TGIA8	MTU8.TGRA input capture/compare match	Possible
	TGIB8	MTU8.TGRB input capture/compare match	Possible
	TGIC8	MTU8.TGRC input capture/compare match	Possible
	TGID8	MTU8.TGRD input capture/compare match	Possible
	TCIV8	MTU8.TCNT overflow	Possible

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

Note 1. The underflow interrupt source is valid only in complementary PWM mode.

(1) Input Capture/Compare Match Interrupt

If the TIER.TGIE bit is set to 1 when a TGR input capture/compare match occurs on a channel, an interrupt is requested. The MTU has 33 input capture/compare match interrupts (six for MTU0, four each for MTU3, MTU4, MTU6, MTU7, and MTU8, two each for MTU1 and MTU2, and three for MTU5).

(2) Overflow Interrupt

If the TIER.TCIEV bit is set to 1 when a TCNT overflow occurs on a channel, clearing an interrupt is requested. The MTU provides a total of eight overflow interrupts (one for each channel except MTU5).
In complementary PWM mode, an overflow interrupt is generated even when an underflow occurs in TCNT in MTU4 or MTU7.

(3) Underflow Interrupt

If the TIER.TCIEU bit is set to 1 when a TCNT underflow occurs on a channel, an interrupt is requested. The MTU has two underflow interrupts (one each for MTU1, and MTU2).

10.4.2 DMAC Activation

(1) DMAC Activation

The DMAC can be activated by the TGR input capture/compare match interrupt and the overflow interrupt in MTU4 and MTU7. For details, see section 9, Direct Memory Access Controller.
The MTU provides a total of 33 interrupts (input capture/compare match and overflow interrupts) that can be used as DMAC activation sources: four each for MTU0, MTU3, MTU6, and MTU8, two each for MTU1 and MTU2, five each for MTU4 and MTU7, and three for MTU5.

10.4.3 A/D Converter Activation

The A/D converter can be activated by one of the following three methods in the MTU. Table 10.79 shows the relationship between interrupt sources and A/D converter start request signals.

(1) A/D Converter Activation by TGRA Input Capture/Compare Match or at MTU4.TCNT (MTU7.TCNT) Trough in Complementary PWM Mode

The A/D converter can be activated by the occurrence of a TGRA input capture/compare match in each channel. In addition, if complementary PWM operation is performed while the TTGE2 bit in MTU4.TIER (MTU7.TIER) is set to 1, the A/D converter can be activated at the trough of MTU4.TCNT (MTU7.TCNT) count (MTU4.TCNT (MTU7.TCNT) = 0000h).
A/D converter start request signal TRGAnN is issued to the A/D converter under either of the following conditions (n = 0 to 4, 6, or 7).

- When a TGRA input capture/compare match occurs on a channel while the TIER.TTG bit is set to 1
- When the MTU4.TCNT (MTU7.TCNT) count reaches the trough (MTU4.TCNT (MTU7.TCNT) = 0000h) during complementary PWM operation while the TTGE2 bit in MTU4.TIER (MTU7.TIER) is set to 1

When either condition is satisfied, if A/D converter start signal TRGAnN from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(2) A/D Converter Activation by Compare Match between MTU0.TCNT and MTU0.TGRE

A/D converter start request signal TRG0N is issued to the A/D converter when a compare match occurs between MTU0.TCNT and MTU0.TGRE.
When a compare match occurs between MTU0.TCNT and MTU0.TGRE in MTU0 while the TTGE2 bit.TIER2 is set to 1, A/D converter start request TGR0N is issued to the A/D converter. If A/D converter start signal TRG0N from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(3) A/D Converter Activation by A/D Converter Start Request Delaying Function

The A/D converter can be activated by generating A/D converter start request signal TRG4AN or TRG4BN (TRG7AN or TRG7BN) when the MTU4.TCNT (MTU7.TCNT) count matches the MTU4.TADCORA or MTU4.TADCORB (MTU7.TADCORA or MTU7.TADCORB) value if the UT4AE, DT4AE, UT4BE, or DT4BE (UT7AE, DT7AE, UT7BE, or DT7BE) bit in the A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) is set to 1. For details, refer to section 10.3.9, A/D Converter Start Request Delaying Function.
A/D conversion will start when TRG4AN (TRG7AN) is generated if A/D converter start signal TRG4AN (TRG7AN) from the MTU is selected as the trigger in the A/D converter, when TRG4BN (TRG7BN) is generated if TRG4BN (TRG7BN) from the MTU is selected as the trigger in the A/D converter, or when TRG4ABN (TRG7ABN) is generated if TRG4ABN (TRG7ABN) from the MTU is selected as the trigger in the A/D converter.

Table 10.79 Interrupt Sources and A/D Converter Start Request Signals

Target Registers	Interrupt Source	A/D Converter Start Request Signal
MTU0.TGRA and MTU0.TCNT	Input capture/compare match	TRGA0N
MTU1.TGRA and MTU1.TCNT		TRGA1N
MTU2.TGRA and MTU2.TCNT		TRGA2N
MTU3.TGRA and MTU3.TCNT		TRGA3N
MTU4.TGRA and MTU4.TCNT*1		TRGA4N
MTU4.TCNT	MTU4.TCNT trough in complementary PWM mode	
MTU6.TGRA and MTU6.TCNT	Input capture/compare match	TRGA6N
MTU7.TGRA and MTU7.TCNT*1		TRGA7N
MTU7.TCNT	MTU7.TCNT trough in complementary PWM mode	
MTU0.TGRE and MTU0.TCNT	Compare match	TRG0N
MTU4.TADCORA and MTU4.TCNT		TRG4AN
MTU4.TADCORB and MTU4.TCNT		TRG4BN
MTU7.TADCORA and MTU7.TCNT		TRG7AN
MTU7.TADCORB and MTU7.TCNT		TRG7BN
MTU4.TADCORA and MTU4.TCNT, MTU4.TADCORB and MTU4.TCNT	Compare match (interrupt skipping function 2)	TRG4ABN
MTU7.TADCORA and MTU7.TCNT, MTU7.TADCORB and MTU7.TCNT		TRG7ABN

Note 1. Since PWM waveforms are generated in complementary PWM mode, MTU4.TGRA (MTU7.TGRA) compare match not only with MTU4.TCNT (MTU7.TCNT) but also with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) is detected. Accordingly, when compare match with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) occurs, TRGA4N (TRGA7N) is also generated. When MTU3 and MTU 4 (MTU 6 and MTU7) are made to operate in complementary PWM mode for generating an A/D converter start request, use the A/D converter start request by compare match between MTU4.TCNT (MTU7.TCNT) and MTU4.TADCORA or TADCORB (MTU7.TADCORA or TADCORB).

10.5 Operation Timing

10.5.1 Input/Output Timing

(1) TCNT Count Timing

Figure 10.111 and Figure 10.112 show the TCNT count timing in internal clock operation, Figure 10.113 shows the TCNT count timing in external clock operation (normal mode), and Figure 10.114 shows the TCNT count timing in external clock operation (phase counting mode).

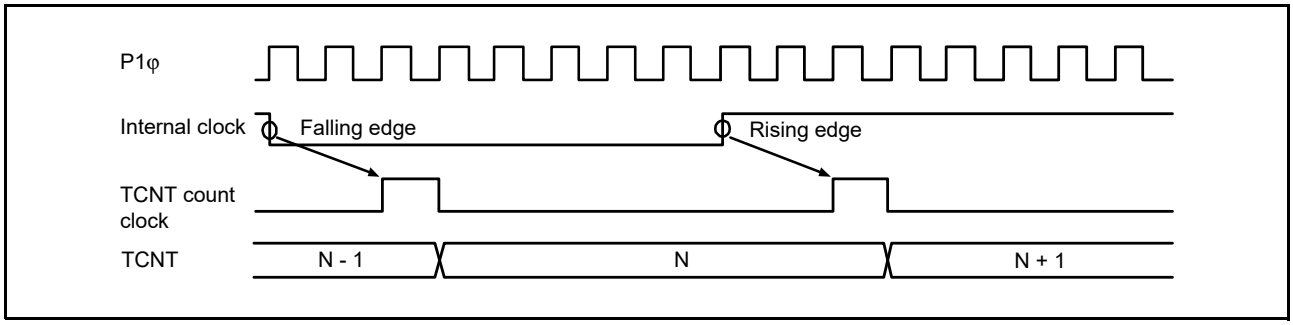

Figure 10.111 Count Timing in Internal Clock Operation (MTU0 to MTU4 and MTU6 to MTU8)

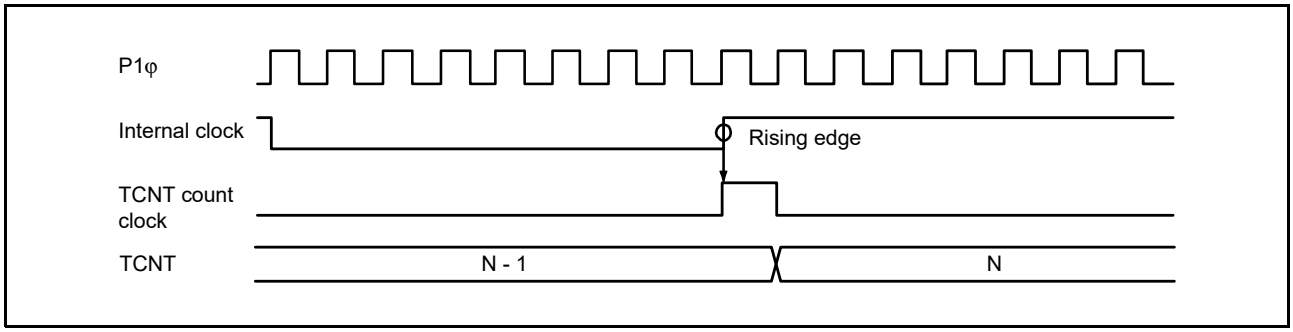

Figure 10.112 Count Timing in Internal Clock Operation (MTU5)

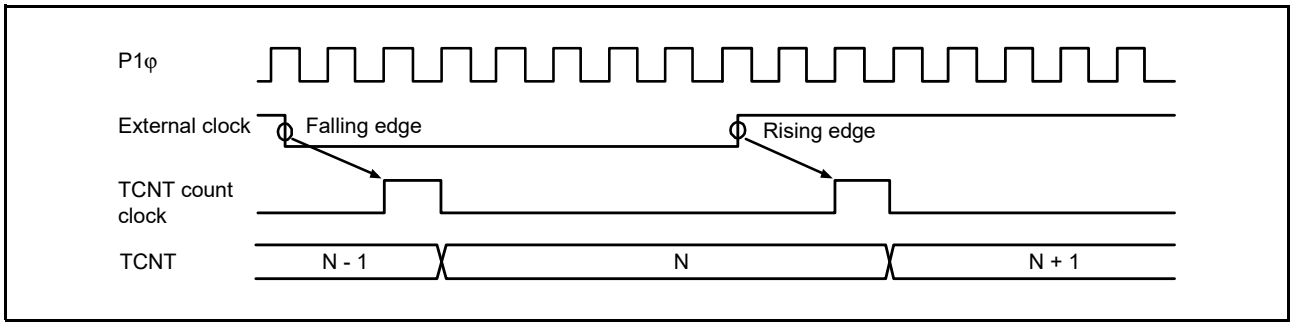

Figure 10.113 Count Timing in External Clock Operation (MTU0 to MTU4, MTU6 to MTU8)

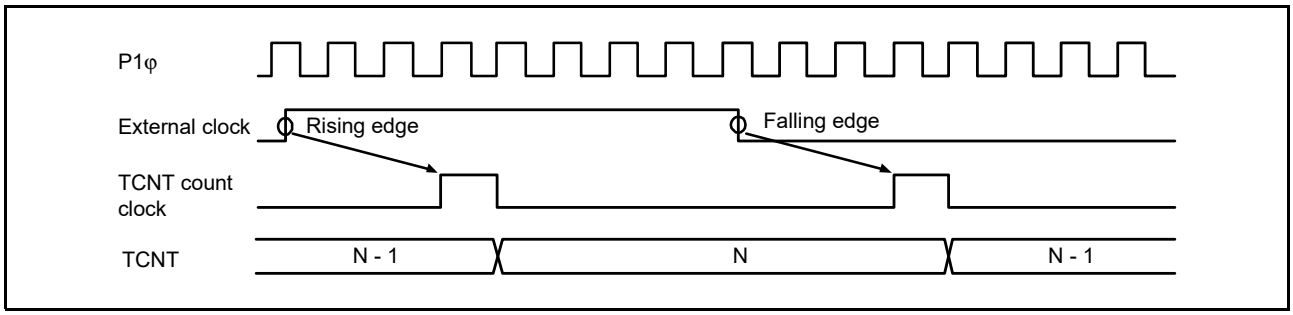

Figure 10.114 Count Timing in External Clock Operation (Phase Counting Mode)

(2) Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the value set in TIOR is output from MTIOCnm pin (n = 0 to 4, 6, 7, 8; m = A to D). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT count clock is generated.

Figure 10.115 shows the output compare output timing (normal mode or PWM mode) and Figure 10.116 shows the output compare output timing (complementary PWM mode or reset-synchronized PWM mode).

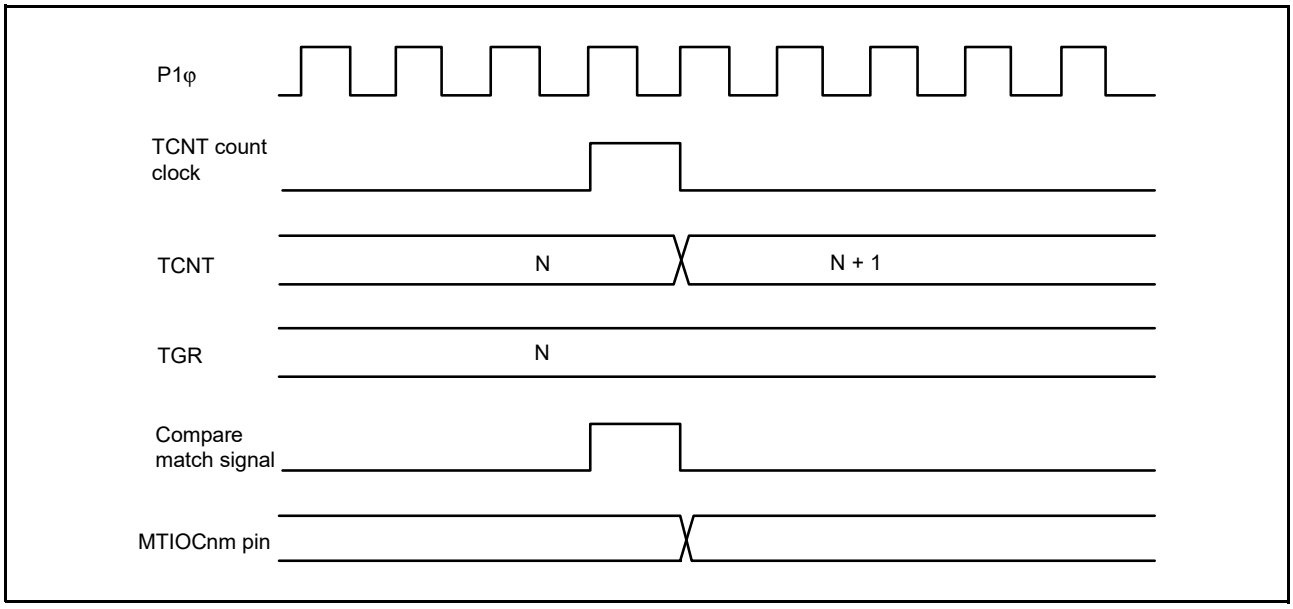

Figure 10.115 Output Compare Output Timing (Normal Mode or PWM Mode) (n = 0 to 4, 6, 7, 8; m = A to D)

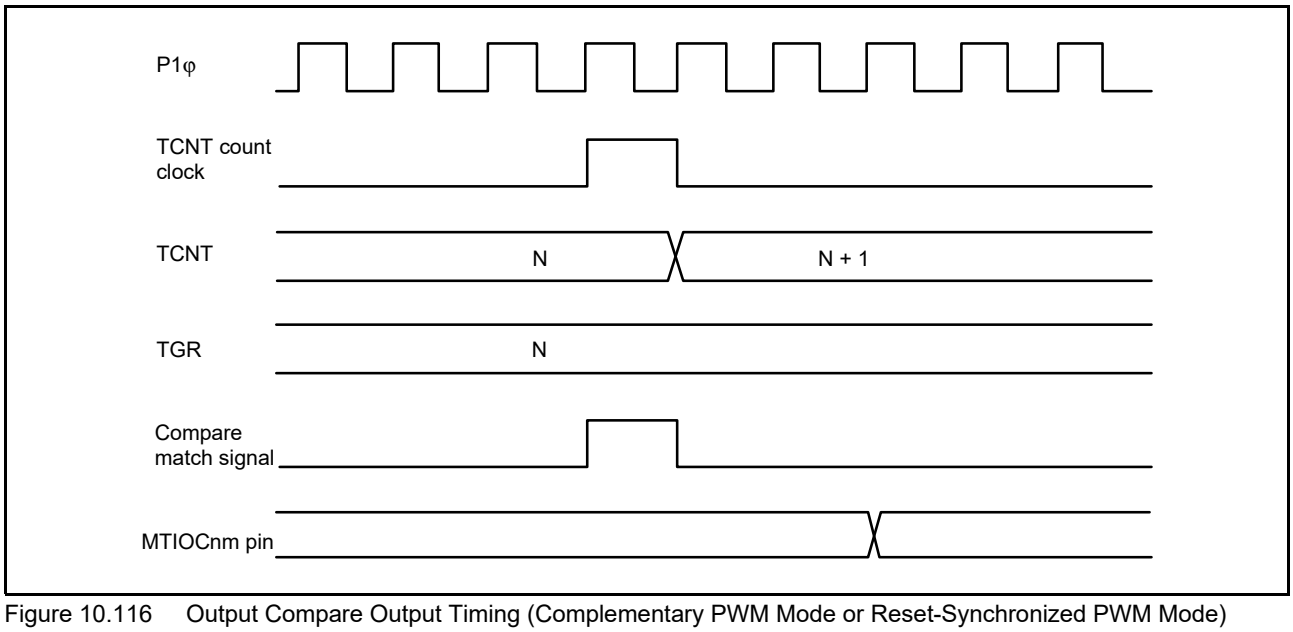

Figure 10.116 Output Compare Output Timing (Complementary PWM Mode or Reset-Synchronized PWM Mode) (n = 0 to 4, 6, 7, 8; m = A to D)

(3) Input Capture Signal Timing

Figure 10.117 shows the input capture signal timing.

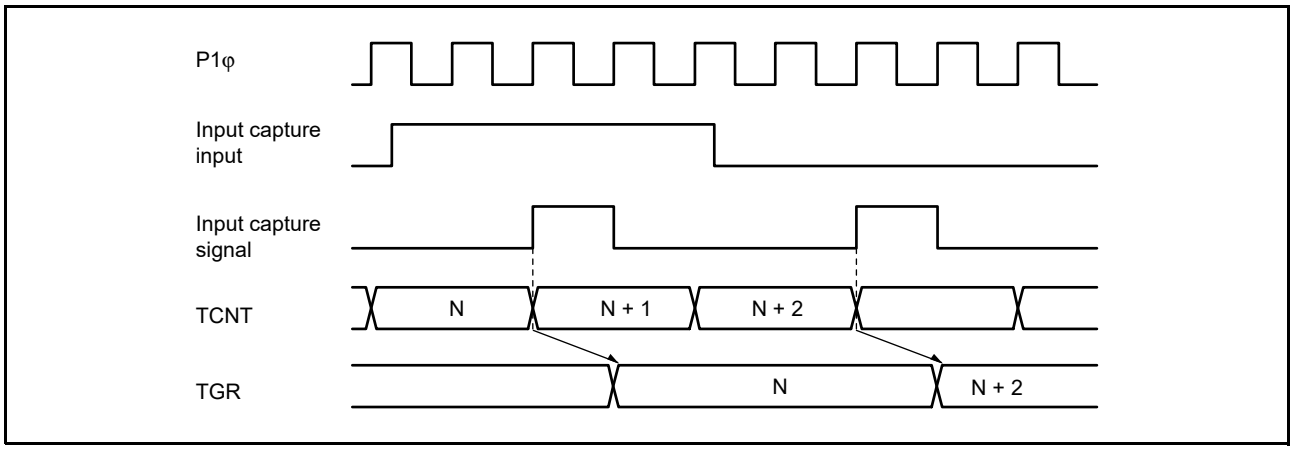

Figure 10.117 Input Capture Input Signal Timing

(4) Timing for Counter Clearing by Compare Match/Input Capture

Figure 10.118 and Figure 10.119 show the timing when counter clearing on compare match is specified, and Figure 10.120 shows the timing when counter clearing on input capture is specified.

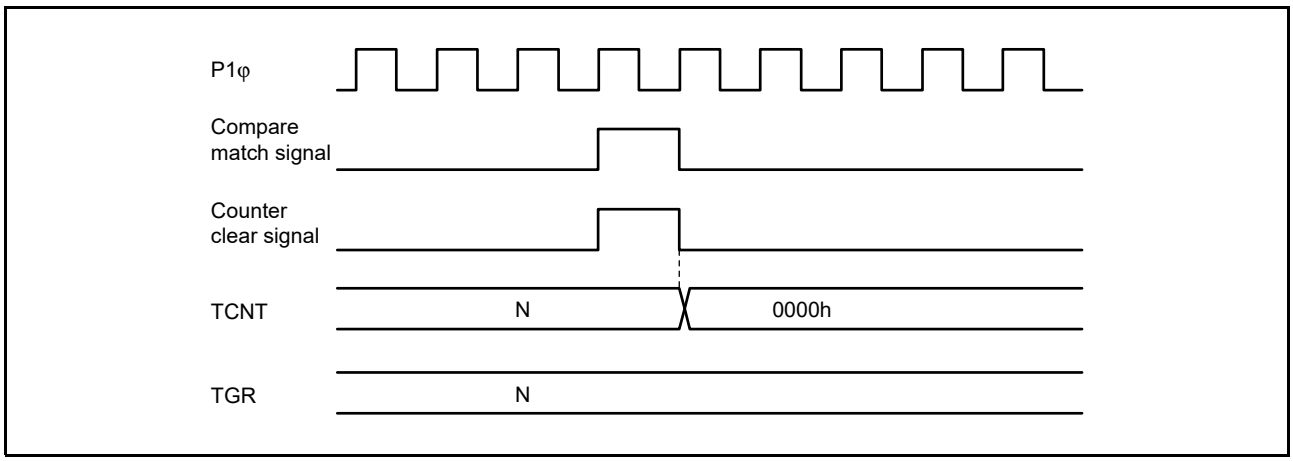

Figure 10.118 Counter Clear Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8)

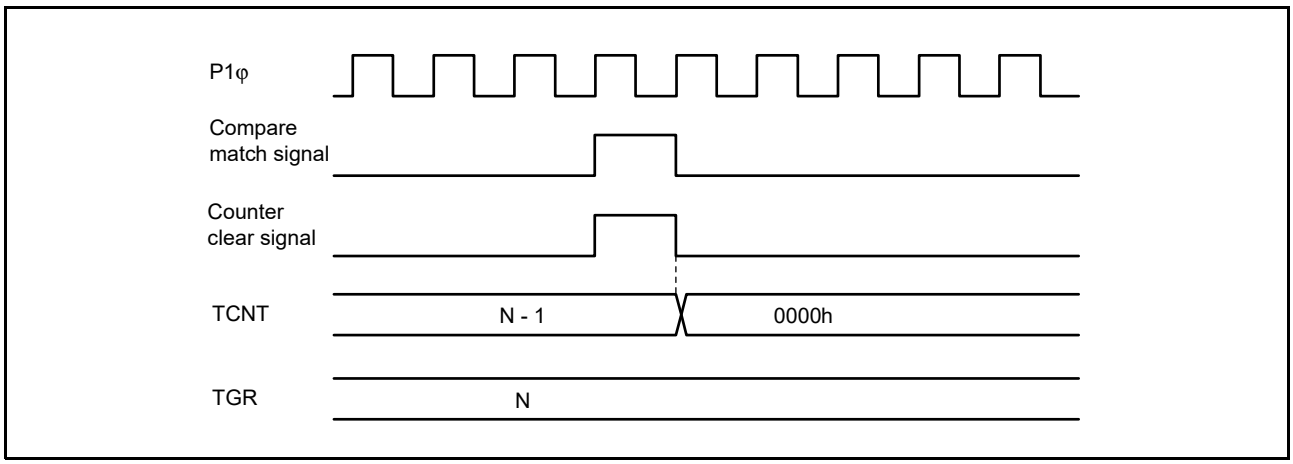

Figure 10.119 Counter Clear Timing (Compare Match) (MTU5)

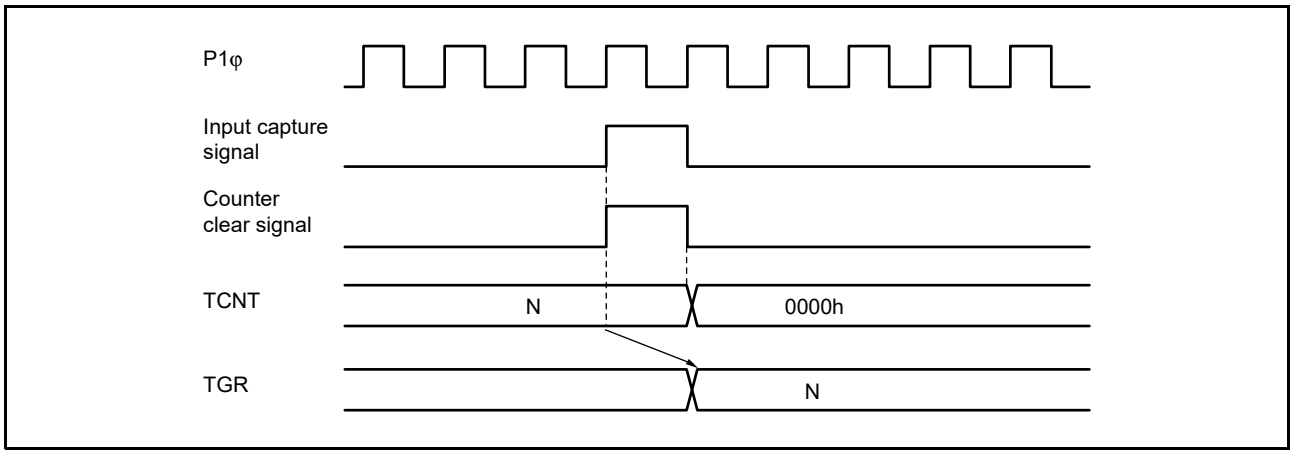

Figure 10.120 Counter Clear Timing (Input Capture) (MTU0 to MTU8)

(5) Buffer Operation Timing

Figure 10.121 to Figure 10.123 show the timing in buffer operation.

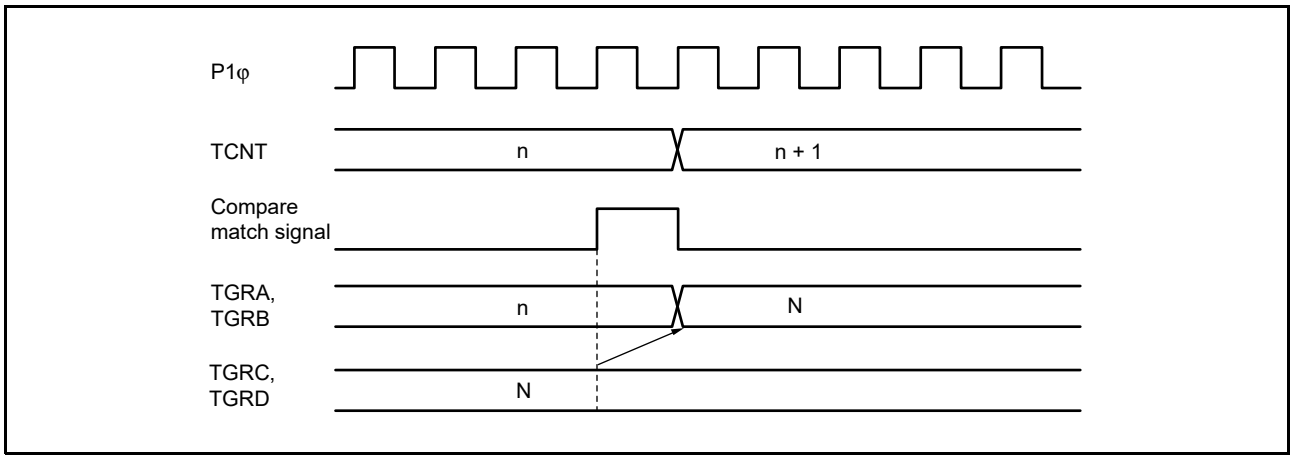

Figure 10.121 Buffer Operation Timing (Compare Match)

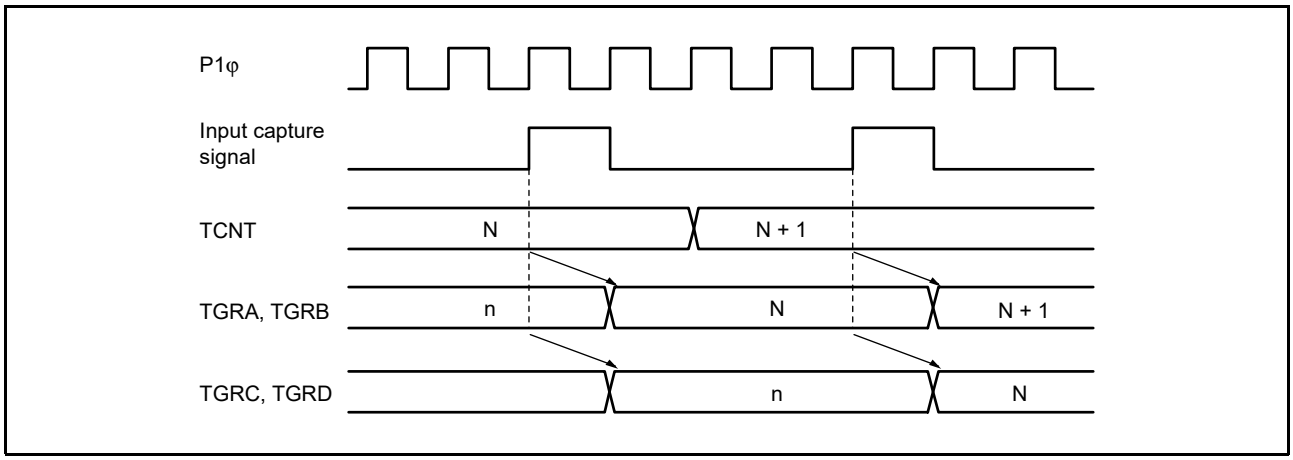

Figure 10.122 Buffer Operation Timing (Input Capture)

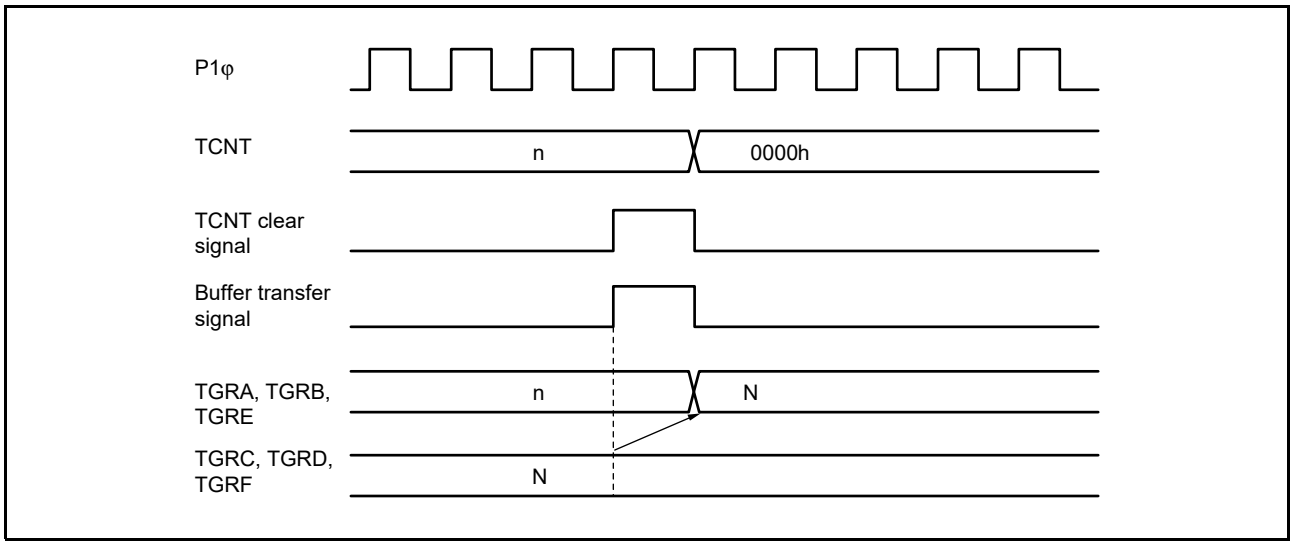

Figure 10.123 Buffer Operation Timing (When TCNT Cleared)

(6) Buffer Transfer Timing (Complementary PWM Mode)

Figure 10.124 to Figure 10.126 show the buffer transfer timing in complementary PWM mode.

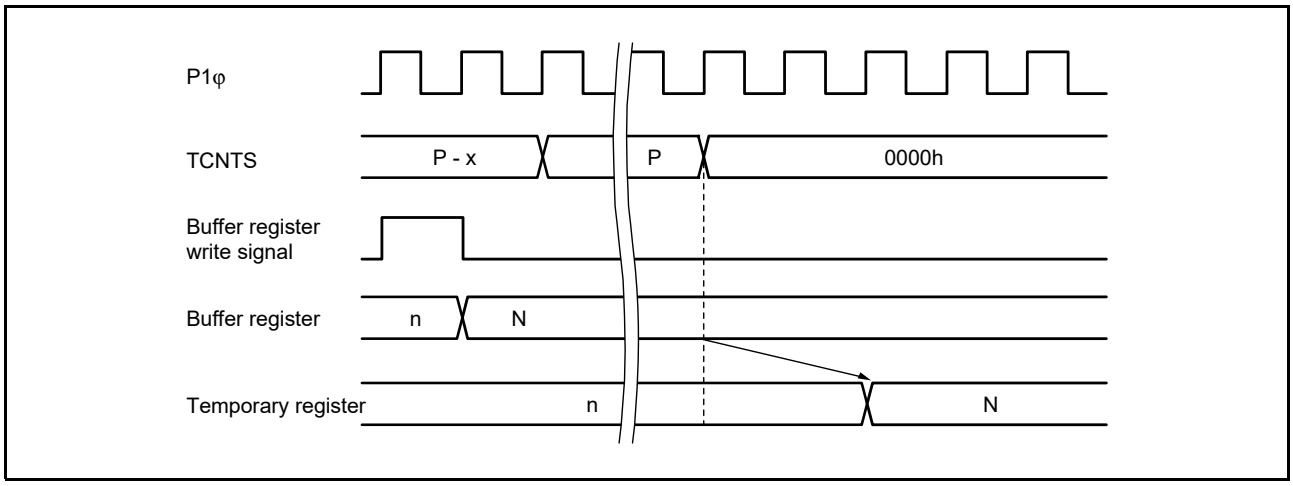

Figure 10.125 Transfer Timing from Buffer Register to Temporary Register (TCNTSA Operating)

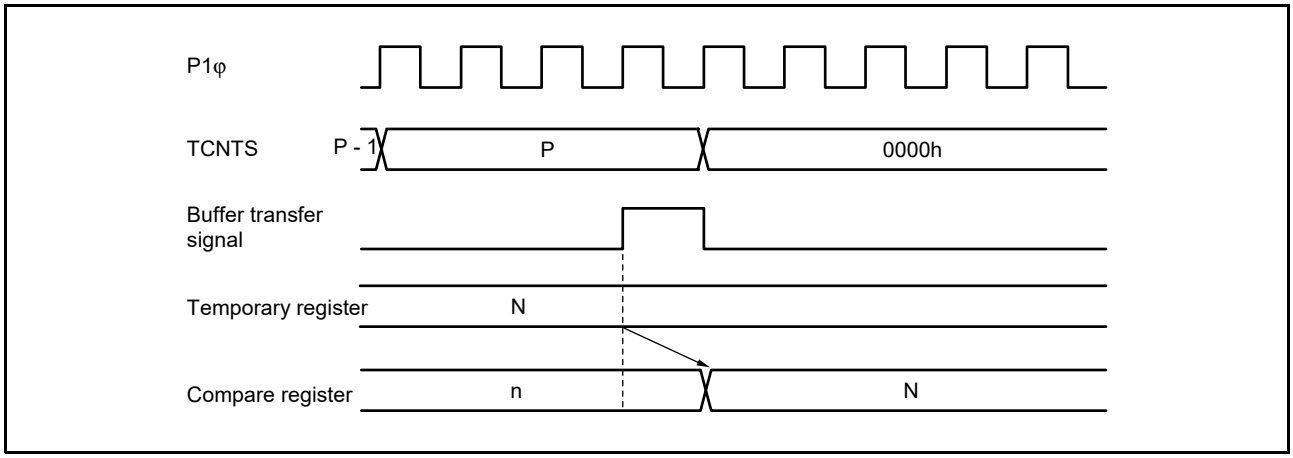

Figure 10.126 Transfer Timing from Temporary Register to Compare Register

10.5.2 Interrupt Signal Timing

(1) TGI Interrupt Timing by Compare Match

Figure 10.127 and Figure 10.128 show the TGI interrupt request signal timing when a compare match occurs.

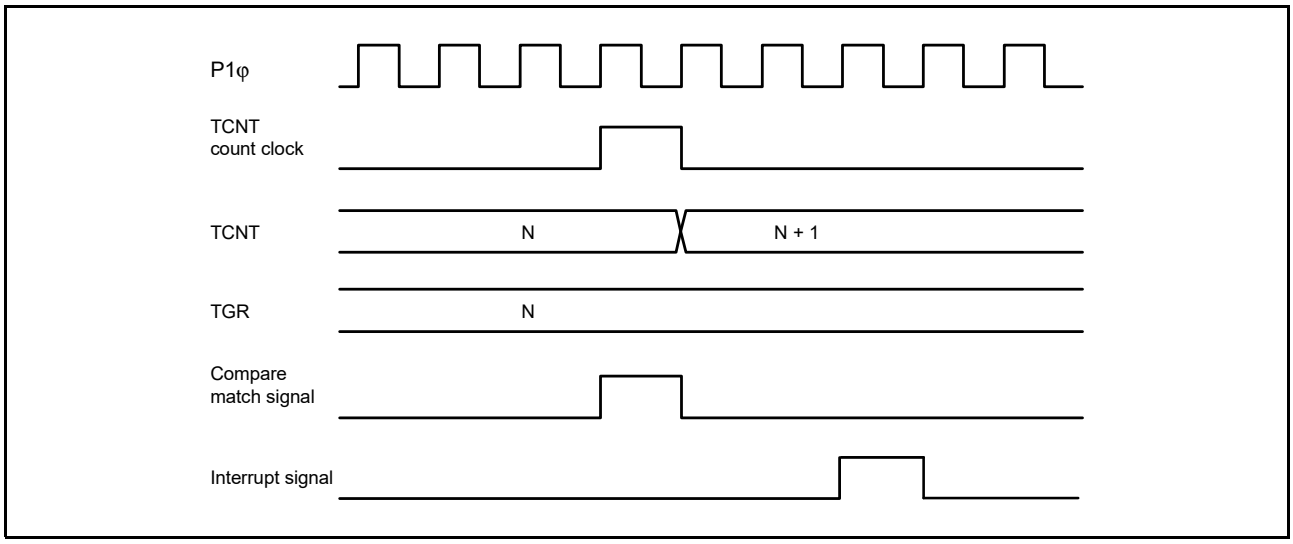

Figure 10.127 TGI Interrupt Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8)

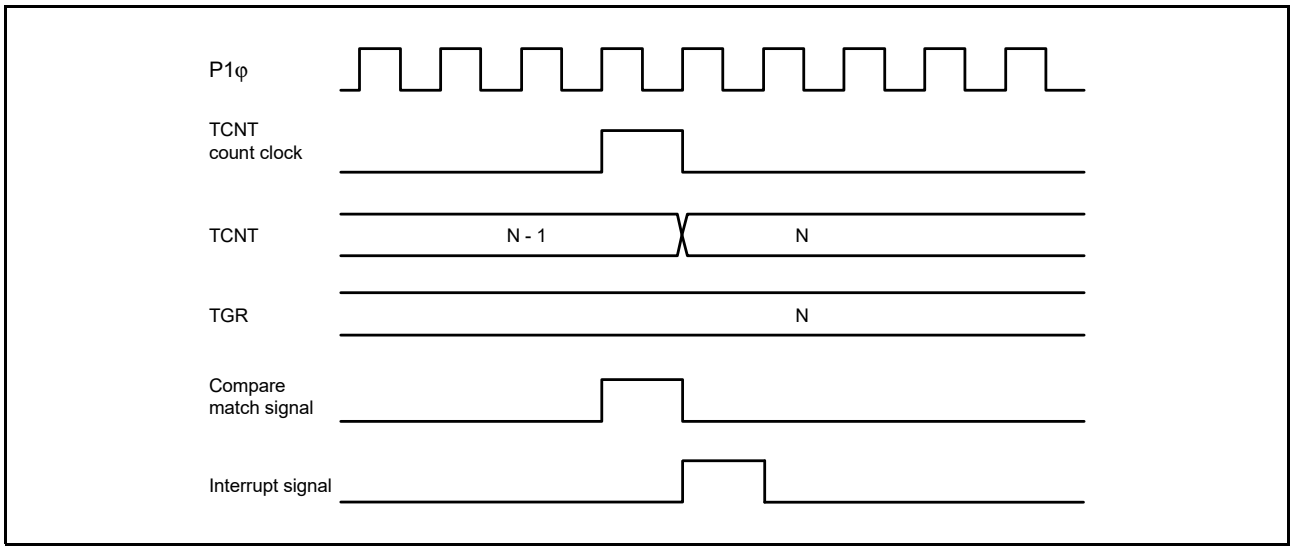

Figure 10.128 TGI Interrupt Timing (Compare Match) (MTU5)

(2) TGI Interrupt Timing by Input Capture

Figure 10.129 and Figure 10.130 show the TGI interrupt request signal timing when an input capture occurs.

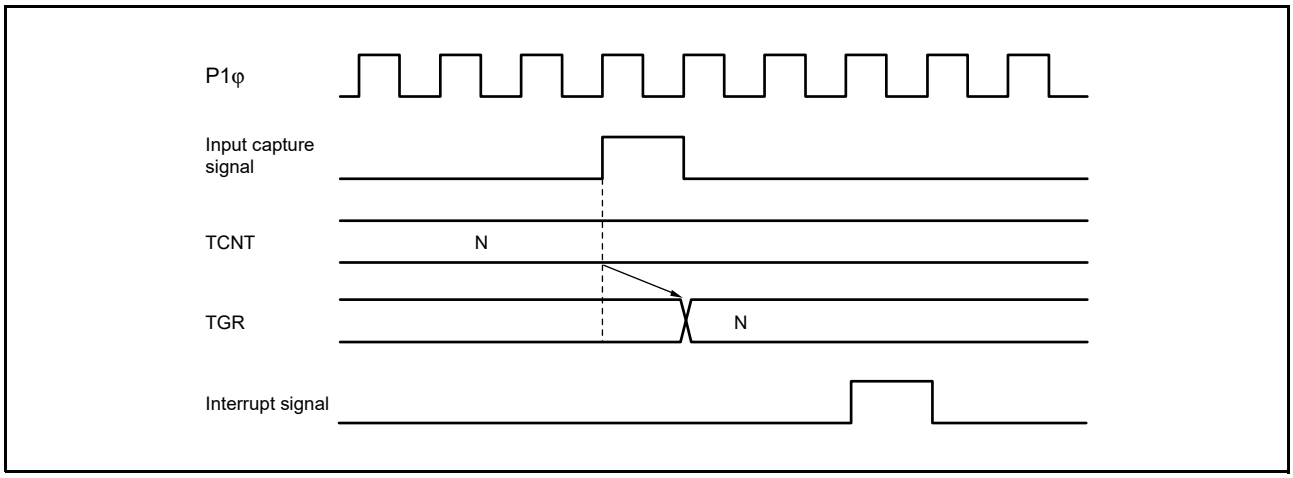

Figure 10.129 TGI Interrupt Timing (Input Capture) (MTU0 to MTU4 and MTU6 to MTU8)

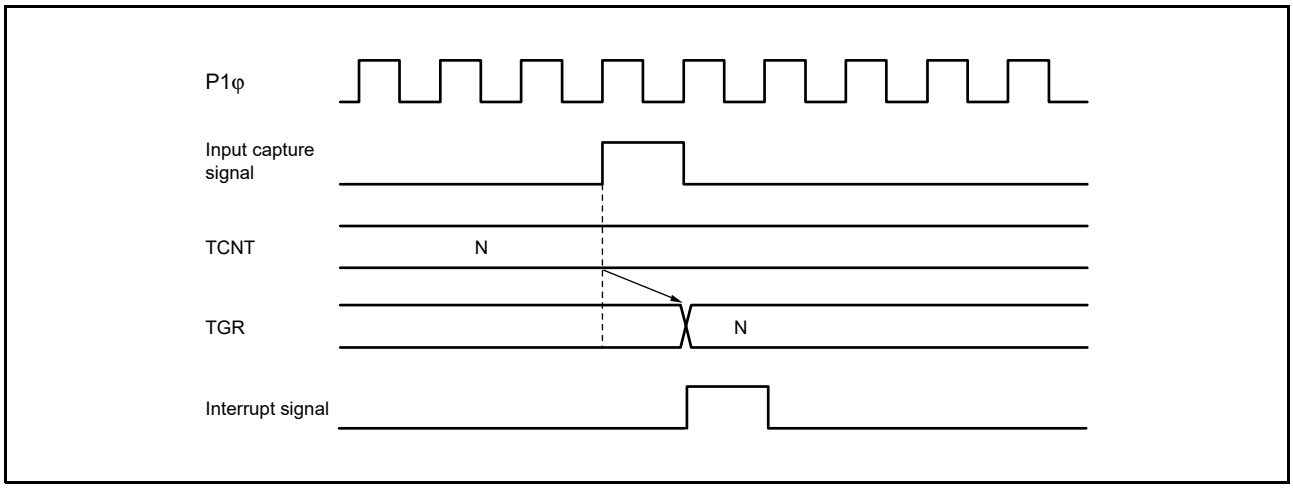

Figure 10.130 TGI Interrupt Timing (Input Capture) (MTU5)

(3) TCFV and TCFU Interrupt Timing

Figure 10.131 shows the TCIV interrupt request signal timing when an overflow is generated.
Figure 10.132 shows the TCIU interrupt request signal timing when an underflow is generated.

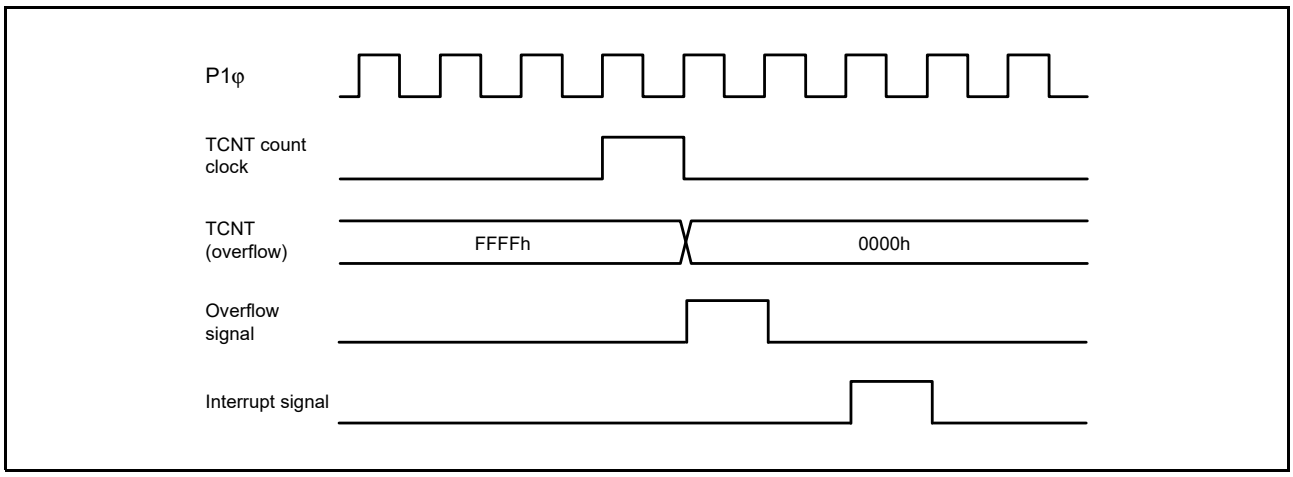

Figure 10.131 TCIV Interrupt Timing

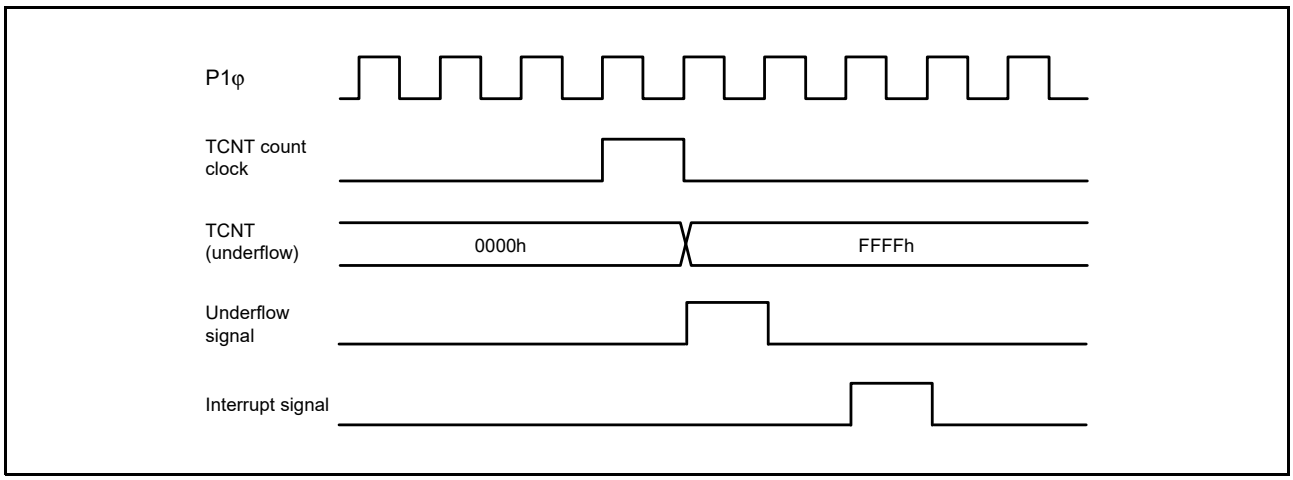

Figure 10.132 TCIU Interrupt Timing

10.6 Usage Notes

10.6.1 Module Stop Function Setting

MTU operation can be disabled or enabled using the module stop control register. MTU operation is stopped with the initial setting. Register access is enabled by releasing the module clock stop state. For details, refer to section 52, Power-Down Modes.

10.6.2 Count Clock Restrictions

The count clock source pulse width must be at least three P1φ clock cycles for single-edge detection, and at least five P1φ clock cycles for both-edge detection. The MTU will not operate properly at narrower pulse widths.
In phase counting mode, the phase difference and overlap between the two input clocks must be at least three P1φ clock cycles, and the pulse width must be at least five P1φ clock cycles. Figure 10.133 shows the input clock conditions in phase counting mode.

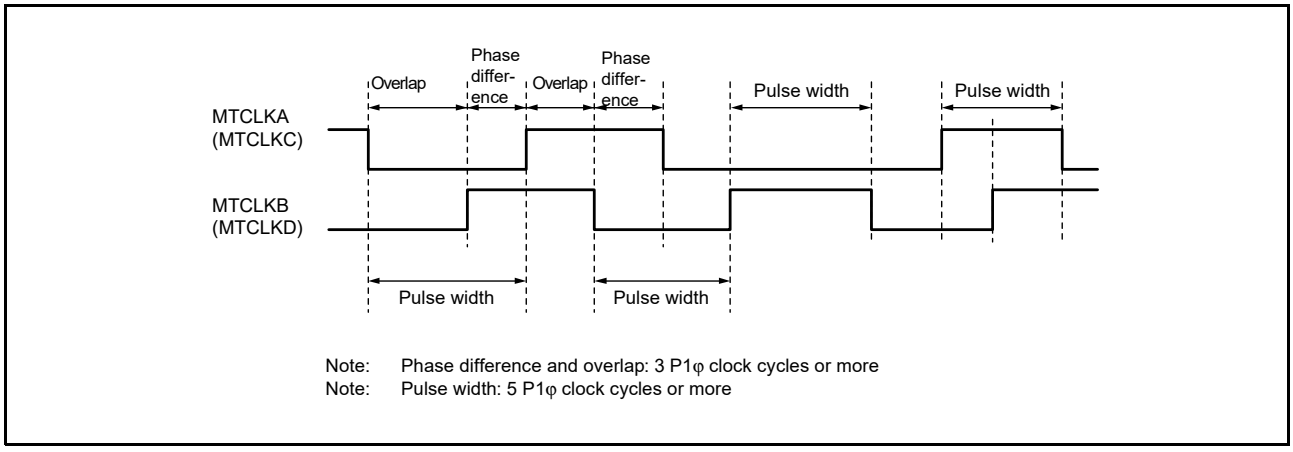

Figure 10.133 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

10.6.3 Note on Cycle Setting

When counter clearing on compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which TCNU updates the matched count value). Consequently, the actual counter frequency is given by the following formula:

- MTU0 to MTU4 and MTU6 to MTU8

$$f = \frac{CNTCLK}{N + 1}$$

- MTU5

$$f = \frac{CNTCLK}{N}$$

f: Counter frequency
CNTCLK: The count clock frequency set by TCR.TPSC[2:0] and TCR2.TPSC2[2:0]
N: TGR setting

10.6.4 Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the TCNT write cycle, TCNT clearing takes precedence and TCNT write operation is not performed.
Figure 10.134 shows the timing in this case.

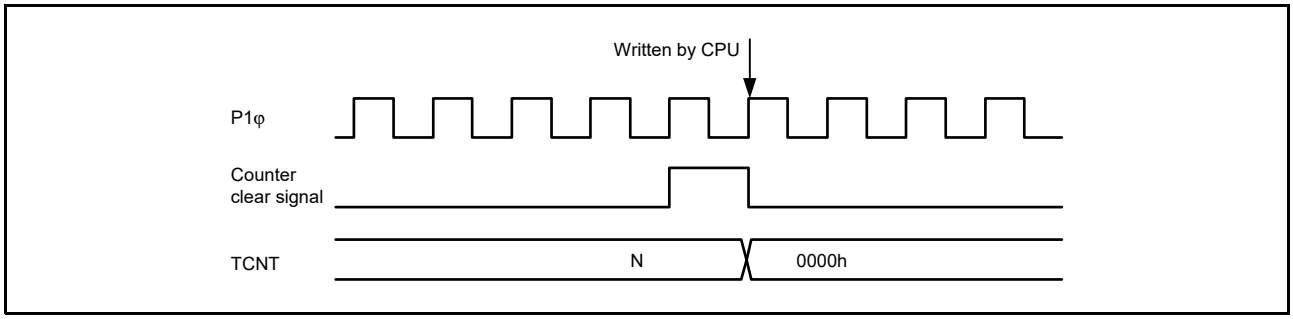

Figure 10.134 Contention between TCNT Write and Clear Operations

10.6.5 Contention between TCNT Write and Increment Operations

If incrementing occurs in a TCNT write cycle, TCNT write operation takes precedence and TCNT is not incremented.
Figure 10.135 shows the timing in this case.

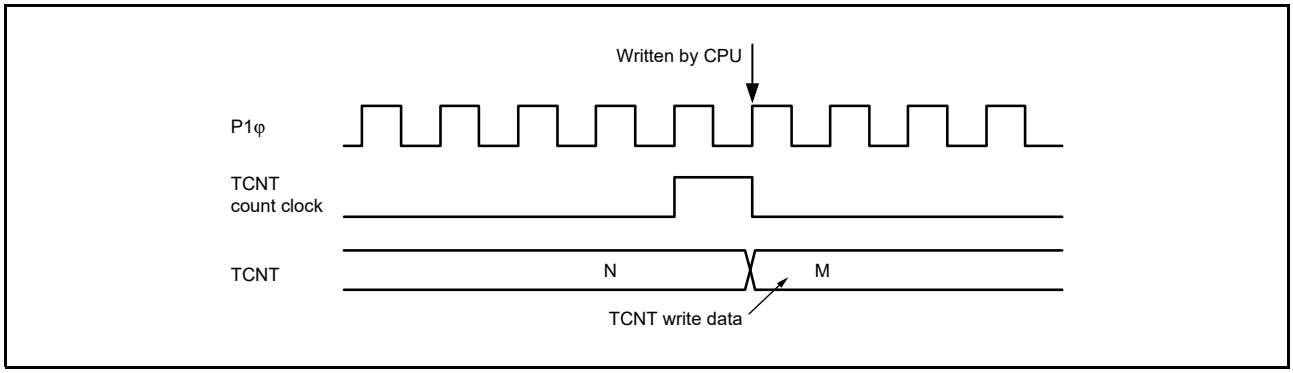

Figure 10.135 Contention between TCNT Write and Increment Operations

10.6.6 Contention between TGR Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, TGR write operation is executed and the compare match signal is also generated.

Figure 10.136 shows the timing in this case.

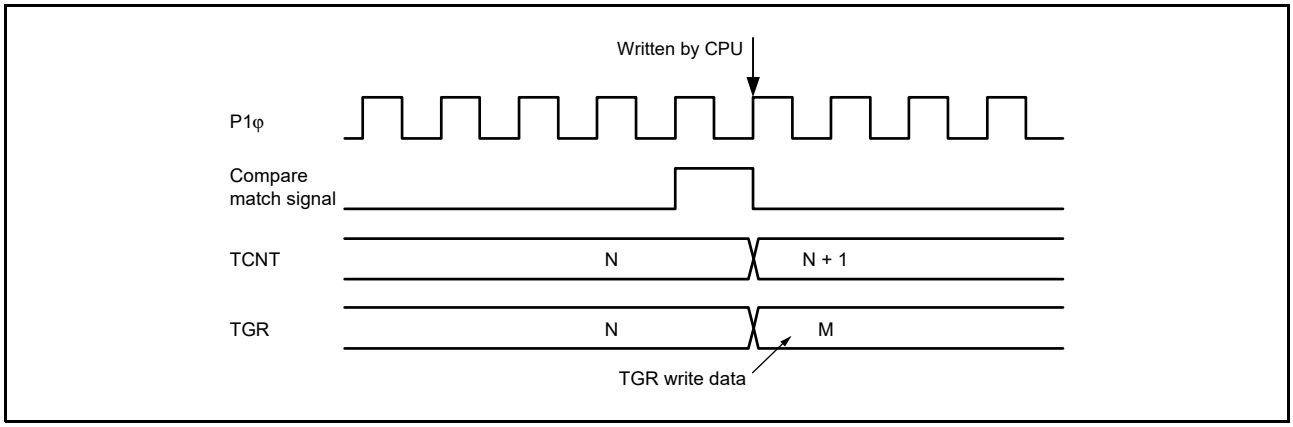

Figure 10.136 Contention between TGR Write Operation and Compare Match

10.6.7 Contention between Buffer Register Write Operation and Compare Match

If a compare match occurs in the T2 state in a TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 10.137 shows the timing in this case.

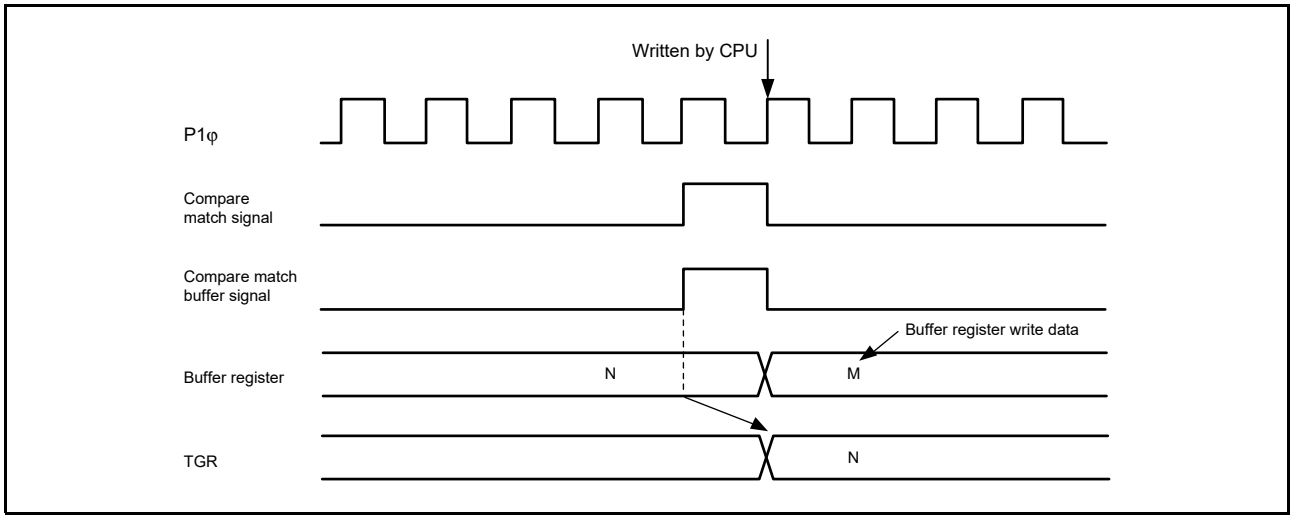

Figure 10.137 Contention between Buffer Register Write Operation and Compare Match

10.6.8 Contention between Buffer Register Write and TCNT Clear Operations

When the buffer transfer timing is set to the TCNT clear timing by the timer buffer transfer mode register (TBTM), if TCNT is cleared during the TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.
Figure 10.138 shows the timing in this case.

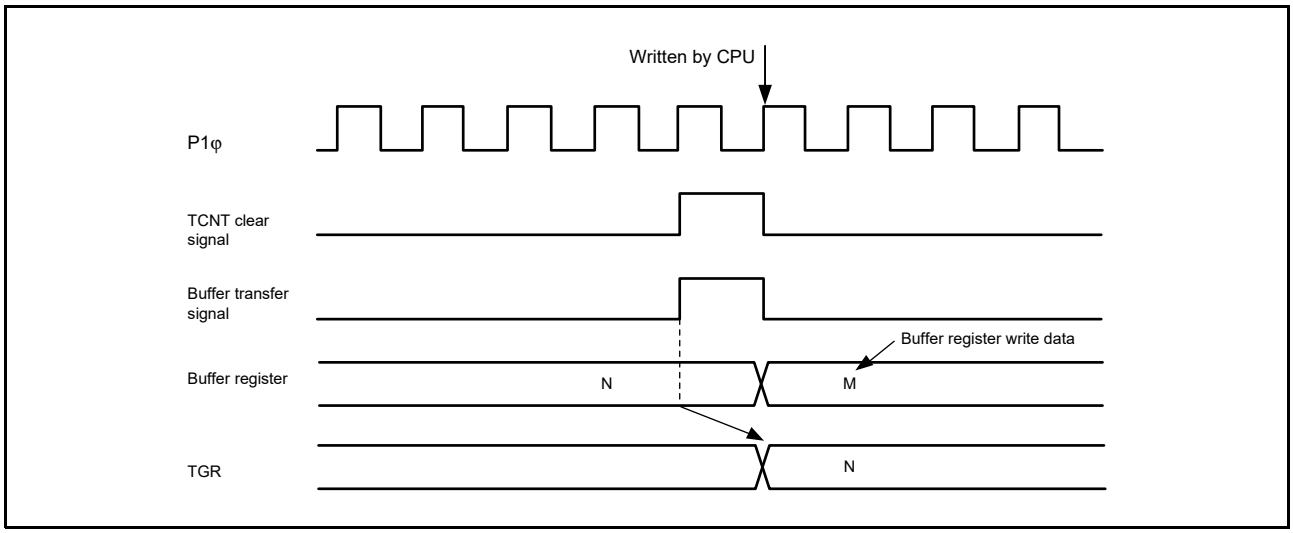

Figure 10.138 Contention between Buffer Register Write and TCNT Clear Operations

10.6.9 Contention between TGR Read Operation and Input Capture

If an input capture signal is generated in a TGR read cycle, the data before input capture transfer is read.
Figure 10.139 shows the timing in this case.

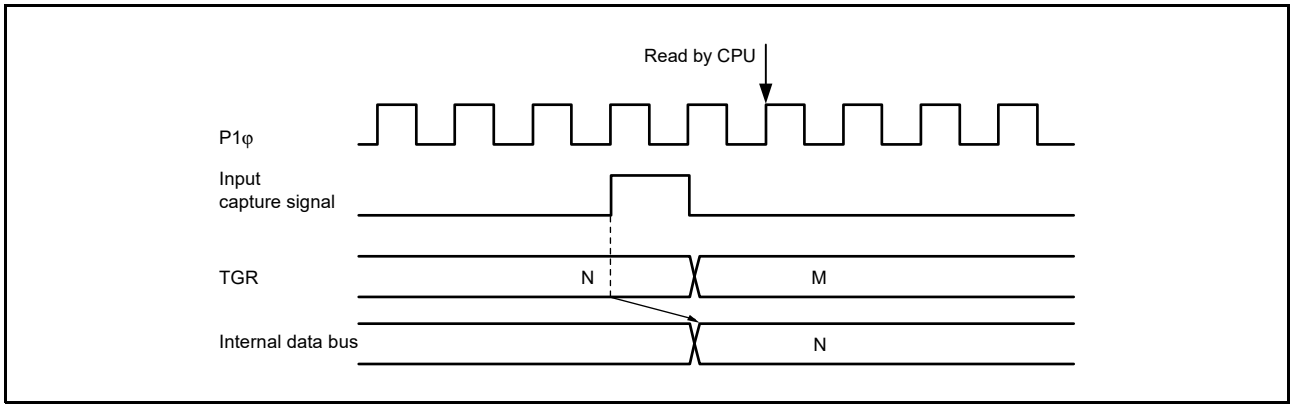

Figure 10.139 Contention between TGR Read Operation and Input Capture (MTU0 to MTU8)

10.6.10 Contention between TGR Write Operation and Input Capture

If an input capture signal is generated in the TGR write cycle, the input capture operation takes precedence and the TGR write operation is not performed in MTU0 to MTU4 and MTU6 to MTU8. In MTU5, the TGR write operation is performed and the input capture signal is generated.
Figure 10.140 and Figure 10.141 show the timing in this case.

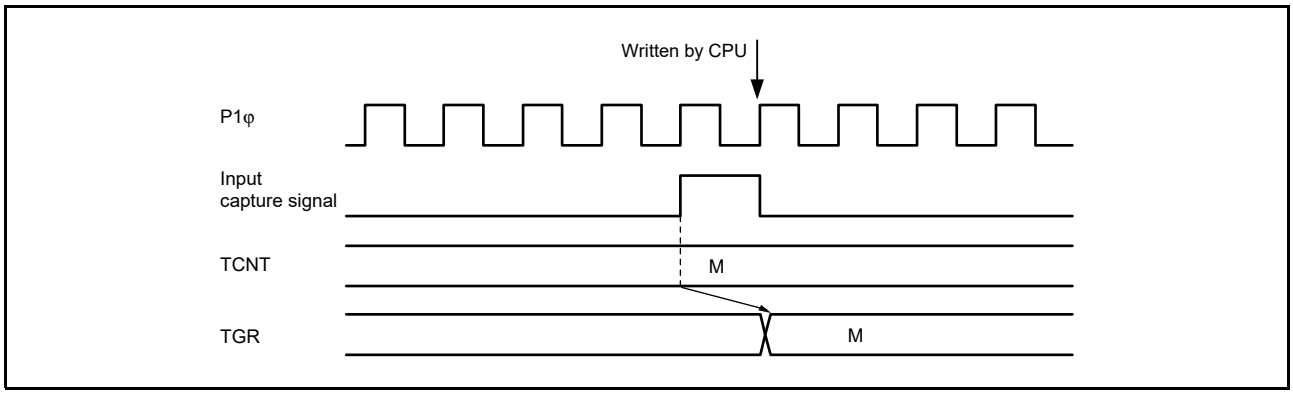

Figure 10.140 Contention between TGR Write Operation and Input Capture (MTU0 to MTU4 and MTU6 to MTU8)

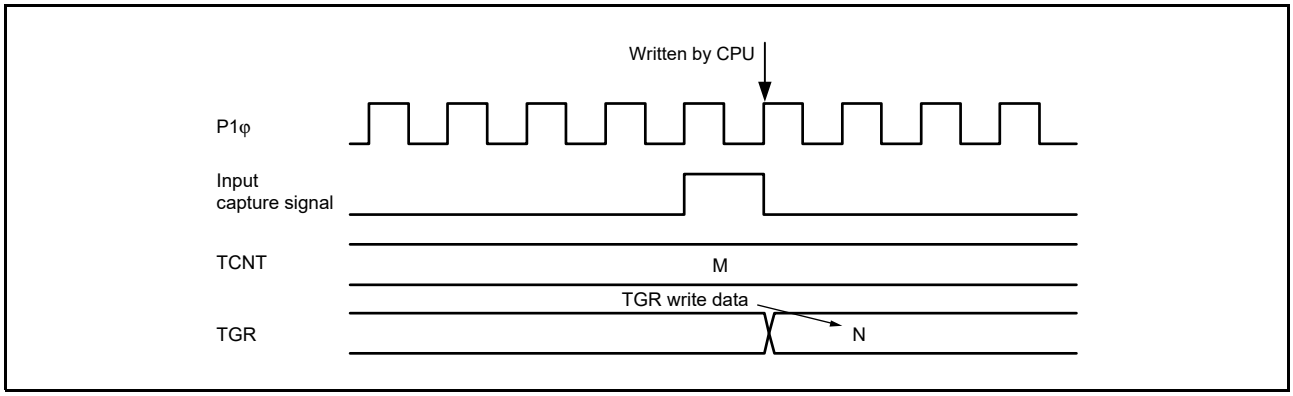

Figure 10.141 Contention between TGR Write Operation and Input Capture (MTU5)

10.6.11 Contention between Buffer Register Write Operation and Input Capture

If an input capture signal is generated in the buffer register write cycle, the buffer operation takes precedence and the buffer register write operation is not performed.
Figure 10.142 shows the timing in this case.

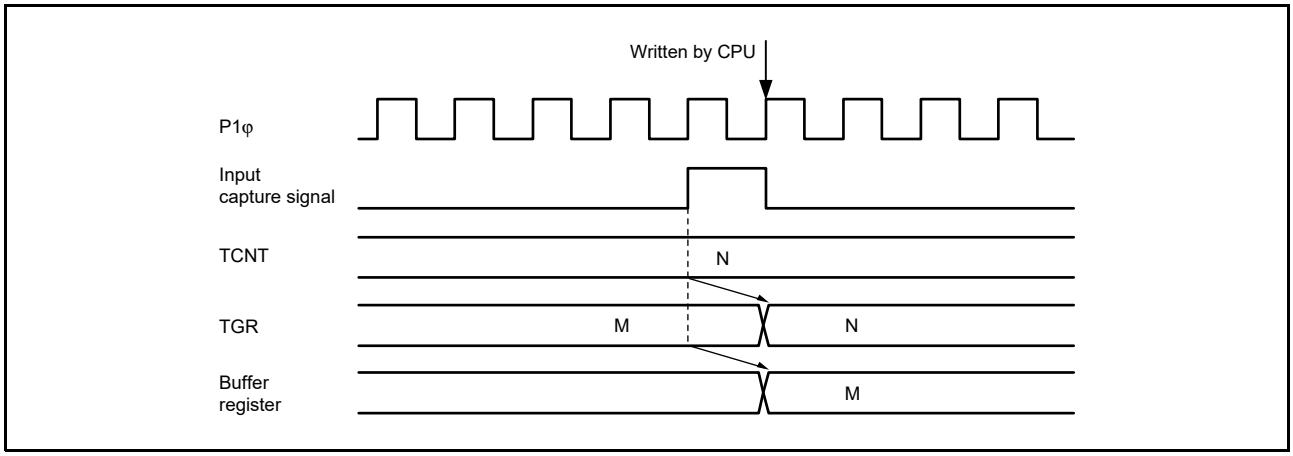

Figure 10.142 Contention between Buffer Register Write Operation and Input Capture

10.6.12 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

With timer counters TCNT in MTU1 and MTU2 cascaded, when a contention occurs between the counting by TCNT in MTU1 (a TCNT overflow/underflow in MTU2) and the writing to TCNT in MTU2, the TCNT write operation is performed in MTU2 and the TCNT count signal in MTU1 is disabled. In this case, if TGRA in MTU1 works as a compare match register and there is a match between the values of TGRA and TCNT in MTU1, a compare match signal is issued.

Furthermore, when the TCNT count clock in MTU1 is selected as the input capture source of MTU0, TGRA to TGRD in MTU0 work in input capture mode. In addition, when the TGRC compare match/input capture in MTU0 is selected as the input capture source of TGRB in MTU1, TGRB in MTU1 works in input capture mode.

Figure 10.143 shows the timing in this case.

When setting the TCNT clearing function in cascaded operation, be sure to synchronize MTU1 and MTU2.

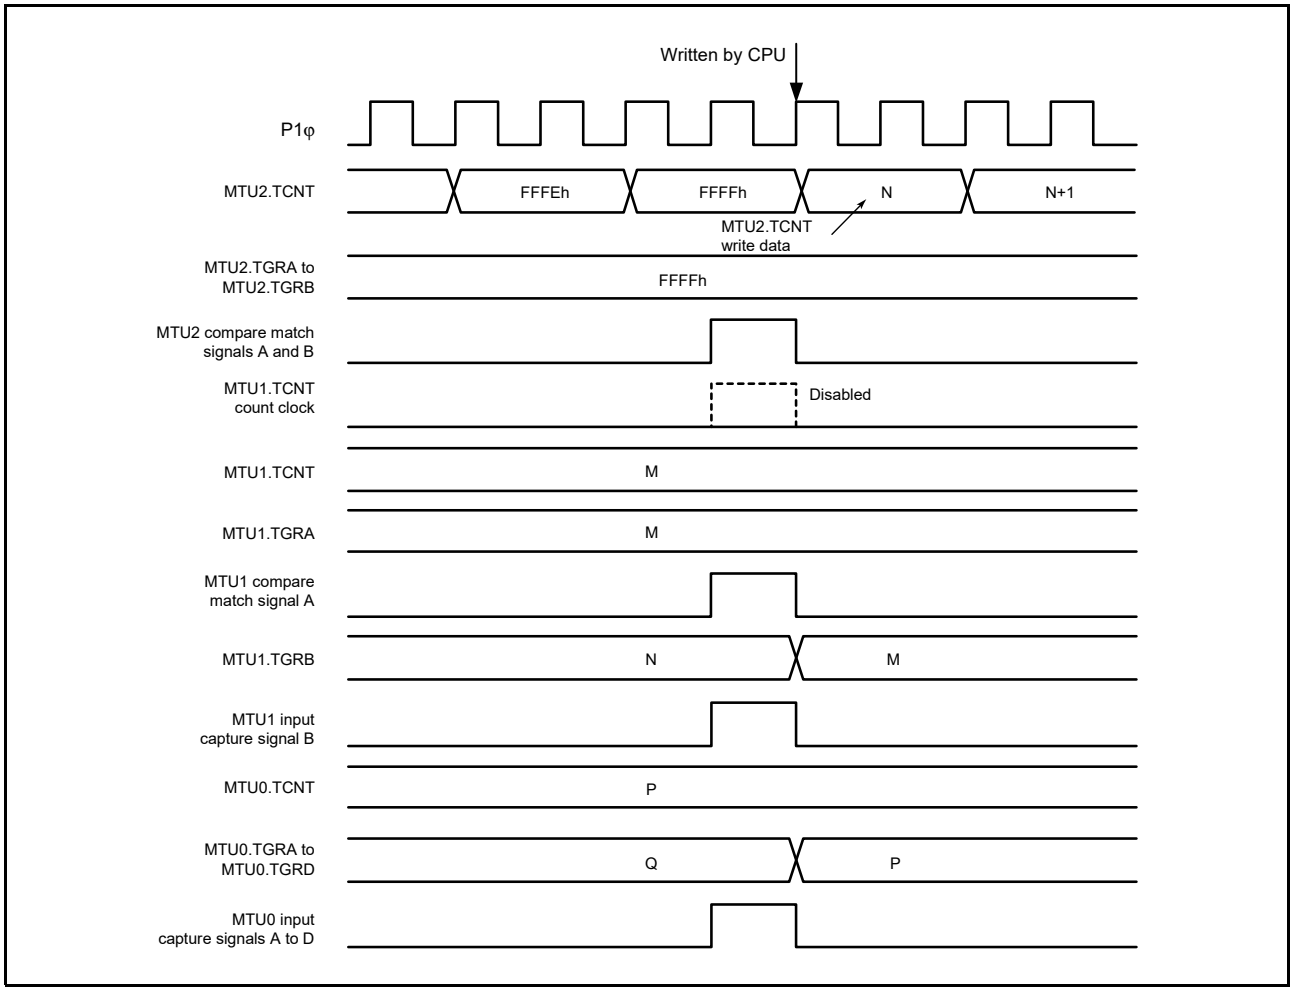

Figure 10.143 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

10.6.13 Counter Value When Count Operation is Stopped in Complementary PWM Mode

When counting operation in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) is stopped in complementary PWM mode, the MTU3.TCNT (MTU6.TCNT) value is set to the timer dead time register (TDDRA (TDDRB)) value and MTU4.TCNT (MTU7.TCNT) is set to 0000h.
When operation is restarted in complementary PWM mode, counting begins automatically from the initial setting state. Figure 10.144 shows this operation.
When counting begins in another operating mode, be sure to make initial settings in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

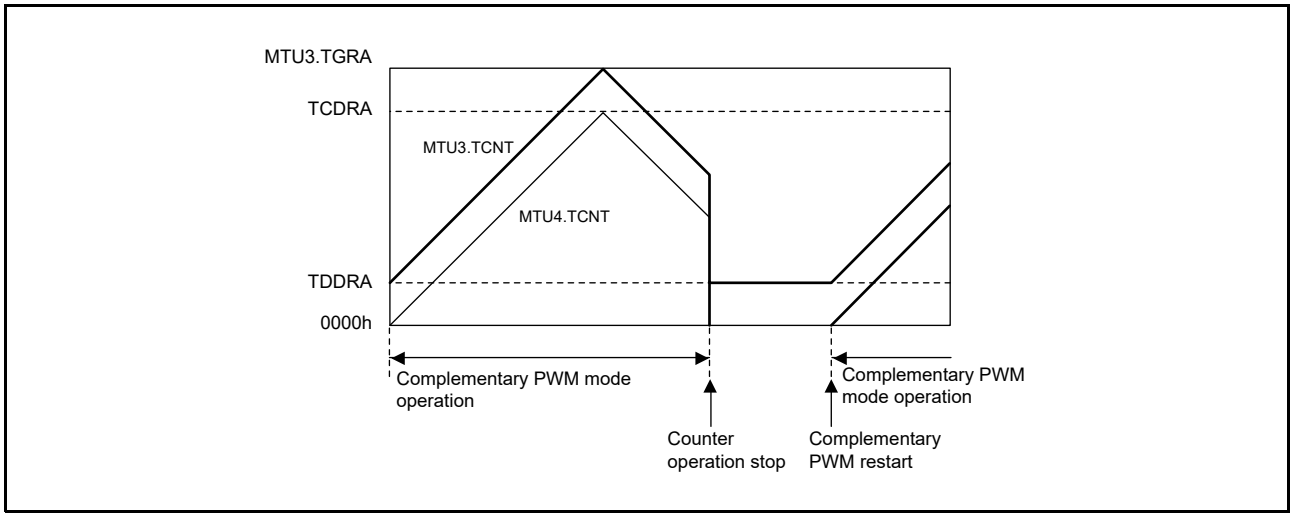

Figure 10.144 Counter Value When Stopped in Complementary PWM Mode

10.6.14 Buffer Operation Setting in Complementary PWM Mode

When modifying the PWM cycle set register (MTU3.TGRA or MTU6.TGRA), timer cycle data register (TCDRA or TCDRB), and duty set registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)) in complementary PWM mode, be sure to use buffer operation. In addition, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.
In complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in bits BFA and BFB of MTU3.TMDR1 (MTU6.TMDR1). When the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA), and TCBRA (TCBRB) functions as a buffer register for TCDRA (TCDRB).

10.6.15 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

When setting buffer operation in reset-synchronized PWM mode, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In reset-synchronized PWM mode, buffer operation in MTU3 and MTU4 (or MTU 6 and MTU7) depends on the settings in the BFA and BFB bits of MTU3.TMDR1 (MTU6.TMDR1). For example, if the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA).

While the MTU3.TGRC (MTU6.TGRC) and MTU3.TGRD (MTU6.TGRD) are operating as buffer registers, a TGImn interrupt (m = C or D; n = 3, 4, 6, or 7) is not generated.

Figure 10.145 shows an example of MTU3.TGR (MTU6.TGR), MTU4.TGR (MTU7.TGR), MTIOC3 (MTIOC6), and MTIOC4 (MTIOC7) operation with the BFA and BFB bits in MTU3.TMDR1 (MTU6.TMDR1) set to 1 and the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) set to 0.

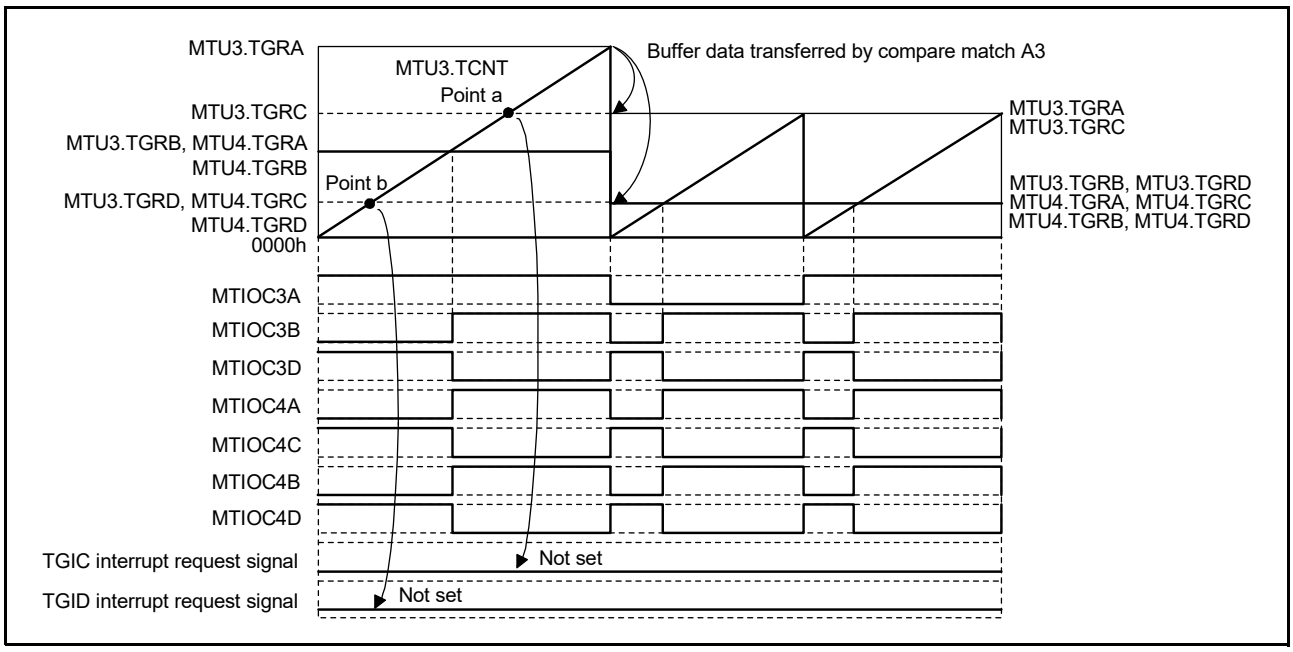

Figure 10.145 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

10.6.16 Overflow in Reset-Synchronized PWM Mode

After reset-synchronized PWM mode is selected, the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) start counting when the CST3 (CST6) bit of TSTRA (TSTRB) is set to 1. In this state, the TCNT count clock source and count edge in MTU4 (MTU7) are determined by the setting of TCR in MTU3 (MTU6).

In reset-synchronized PWM mode, with cycle register TGRA in MTU3 (MTU6) set to FFFFh and the TGRA compare match in MTU3 (MTU6) selected as the counter clearing source, the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) count up to FFFFh, then a compare match occurs with TGRA in MTU3 (MTU6), and the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) are both cleared. In this case, a TCIVn interrupt (n = 3, 4, 6, or 7) is not generated.

Figure 10.146 shows an example of the operation in reset-synchronized PWM mode with cycle register TGRA in MTU3 (MTU6) set to FFFFh and the TGRA compare match in MTU3 (MTU6) specified for the counter clearing source.

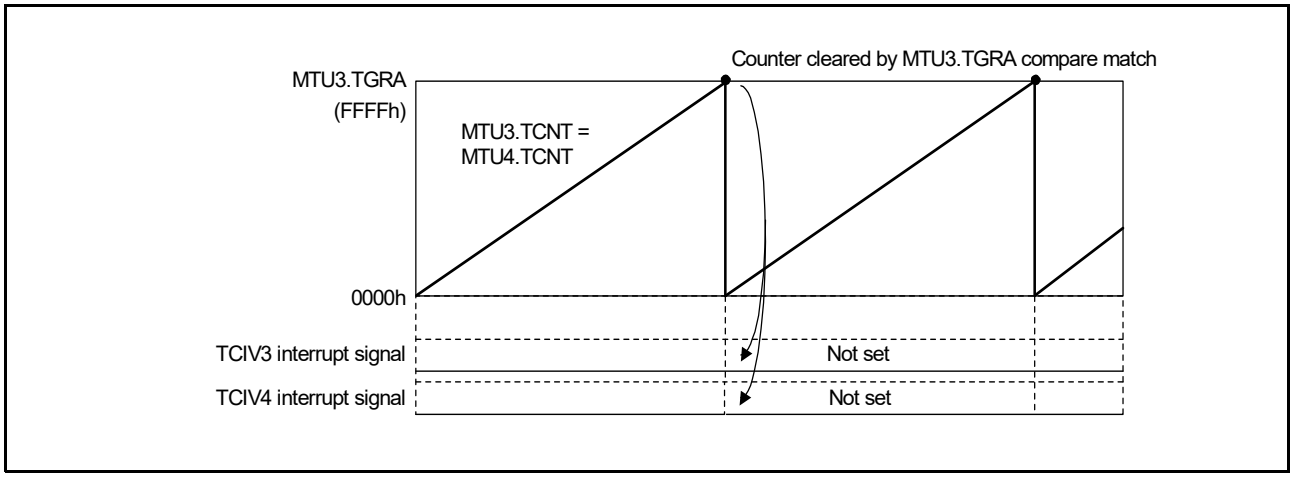

Figure 10.146 Overflow in Reset-Synchronized PWM Mode

10.6.17 Contention between Overflow/Underflow and Counter Clearing

If an overflow/underflow and counter clearing occur simultaneously, a TCIVn interrupt (n = 0 to 4 or 6 to 8) nor a TCIUn interrupt (n = 1 or 2) is not generated and TCNT clearing takes precedence.

Figure 10.147 shows the operation timing when a TGR compare match is specified as the clearing source and TGR is set to FFFFh.

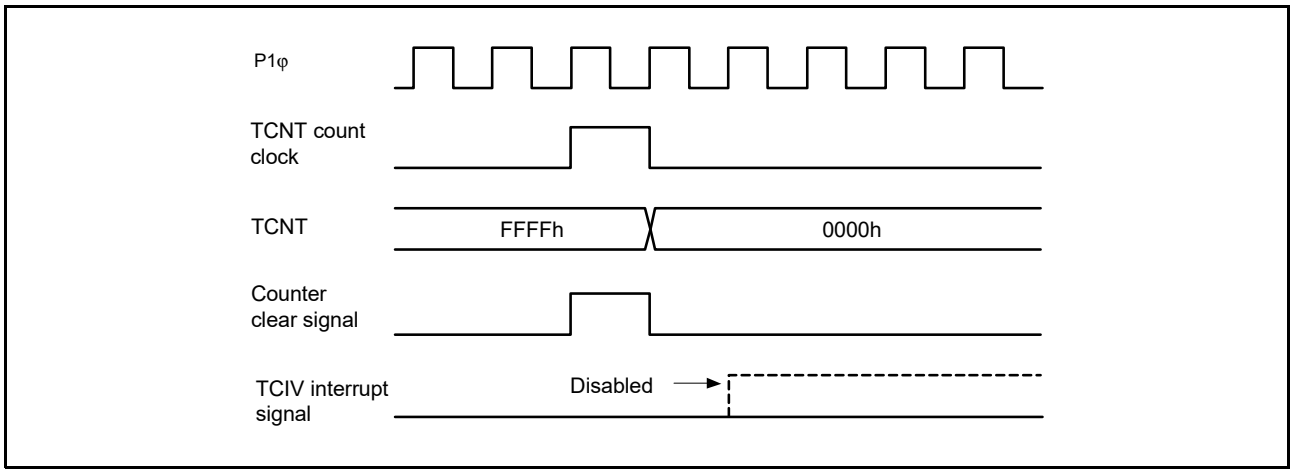

Figure 10.147 Contention between Overflow and Counter Clearing

10.6.18 Contention between TCNT Write Operation and Overflow/Underflow

If TCNT counts up or down in a TCNT write cycle and an overflow or an underflow occurs, the TCNT write operation takes precedence. A TCIVn interrupt (n = 0 to 4 or 6 to 8) nor a TCIUn interrupt (n = 1 or 2) is not generated.
Figure 10.148 shows the operation timing when there is contention between TCNT write operation and overflow.

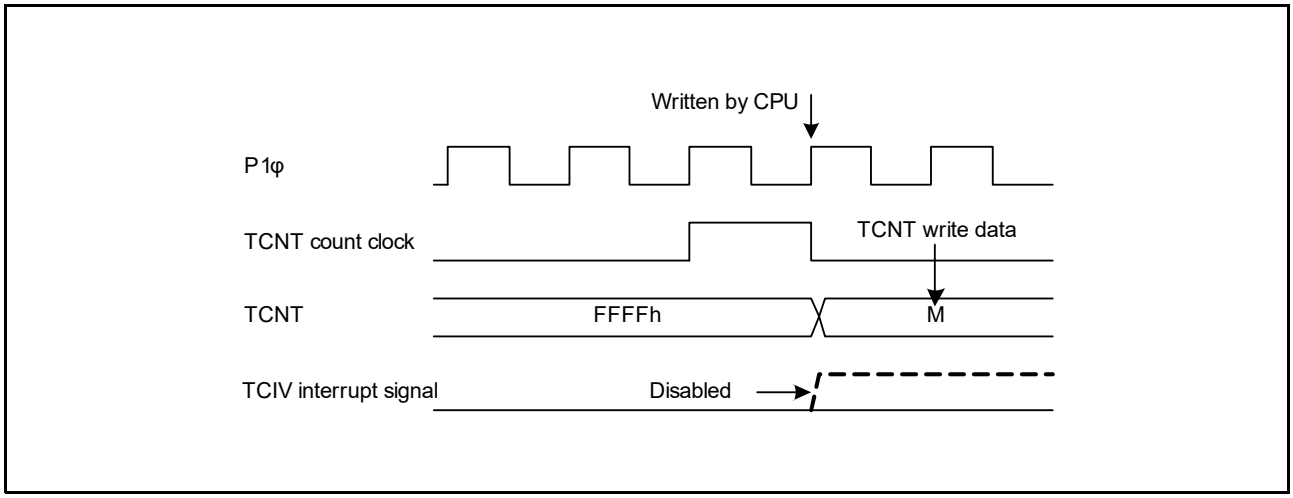

Figure 10.148 Contention between TCNT Write Operation and Overflow

10.6.19 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode

When making a transition from normal mode or PWM mode 1 to reset-synchronized PWM mode in MTU3 and MTU4 (or MTU6 and MTU7), if the counter is stopped while the output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D) are held at a high level and then operation is started after a transition to reset-synchronized PWM mode, the initial pin output will not be correct.
When making a transition from normal mode to reset-synchronized PWM mode, write 11h to MTU3.TIORH, MTU3.TIORL, MTU4.TIORH, and MTU4.TIORL (MTU6.TIORH, MTU6.TIORL, MTU7.TIORH, and MTU7.TIORL) to initialize the output pin state to a low level, then set the registers to the initial value (00h) before making the mode transition.
When making a transition from PWM mode 1 to reset-synchronized PWM mode, switch to normal mode, initialize the output pin state to a low level, and then set the registers to the initial value (00h) before making the transition to reset-synchronized PWM mode.

10.6.20 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode

When MTU3 and MTU4 (or MTU6 and MTU7) are in complementary PWM mode or reset-synchronized PWM mode, the PWM waveform output level is determined by the OLSP and OLSN bits in the timer output control register (TOCR1A or TOCR1B). In complementary PWM mode or reset-synchronized PWM mode, TIOR should be set to 00h. The output level in negative phase when the TDER bit in TDERA (TDERB) is set to 0 in complementary PWM mode (the dead time is not generated) does not depend on the setting of the OLSN bit in TOCR1A (TOCR1B). It is equivalent to the inverted level of positive phase output based on the setting of the OLSP bit in TOCR1A (TOCR1B).

10.6.21 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection

When timer counters 1 and 2 (MTU1.TCNT and MTU2.TCNT) operate as a 32-bit counter in cascade connection, the cascaded counter value cannot be captured successfully in some cases even if input-capture input is simultaneously done to MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B. This is because the input timing of MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B may not be the same when external input-capture signals input into MTU1.TCNT and MTU2.TCNT are taken in synchronization with the internal clock.
For example, MTU1.TCNT (the counter for upper 16 bits) does not capture the count-up value by an overflow from MTU2.TCNT (the counter for lower 16 bits) but captures the count value before the up-counting. In this case, the values of MTU1.TCNT = FFF1h and MTU2.TCNT = 0000h should be transferred to MTU1.TGRA and MTU2.TGRA or to MTU1.TGRB and MTU2.TGRB, but the values of MTU1.TCNT = FFF0h and MTU2.TCNT = 0000h are erroneously transferred.
The MTU has a function that allows simultaneous capture of MTU1.TCNT and MTU2.TCNT with a single input capture input. This function can be used to read the 32-bit counter such that MTU1.TCNT and MTU2.TCNT are captured at the same time. For details, see section 10.2.11, Timer Input Capture Control Register (TICCR).

10.6.22 Interrupt-Skipping Function 2

When interrupt-skipping function 2 is in use and the difference between the values in MTU4.TADCORA and MTU4.TADCORB is small, correct counting of the number skipped may not be possible, in which case requests for A/D conversion will not be generated with the expected timing. The conditions listed below thus apply to these settings.
For MTU6 and MTU7, the same conditions apply to the settings of MTU7.TADCORA and MTU7.TADCORB.

(1) When the number skipped is zero for skipping function 2

- The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least four.
- The interval of comparison for MTU4.TADCORA must be at least four cycles of P1φ clock (the updated value of MTU4.TADCORA is set to the previous value plus or minus at least four).
- The interval of comparison for MTU4.TADCORB must be at least four cycles of P1φ clock (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least four).

(2) When the number skipped is one or more for skipping function 2

- The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least two.
- The interval of comparison for MTU4.TADCORB must be at least two cycles of P1φ (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least two).

10.6.23 Notes When Complementary PWM Mode Output Protection Function is Not Used

The complementary PWM mode output protection function is initially enabled. For details, refer to section 11, Port Output Enable 3 (POE3).

10.6.24 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR)

Do not set TGRj (j = U, V, or W) in MTU5 to the value of the corresponding TCNTj in MTU5 plus one while counting by TCNTj in MTU5 is stopped. If such a setting is made, a compare match will be generated even though counting is stopped.

In this case, if the value of the compare match enable bit (TGIE5j bit of TIER in MTU5) is 1 (enabled), a compare match interrupt will also be generated. If the value of the timer compare match clear register is 1 (enabled), the TCNTj counter in MTU5 is automatically cleared to 0000h when the compare match is generated, regardless of whether compare match interrupts are enabled or disabled.

10.6.25 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode

If control of the output waveform is enabled (the WRE bit of TWCRA or TWCRB is 1) at the time of synchronous counter clearing in complementary PWM mode, satisfaction of either condition 1 or 2 below has the following effects.

- Dead time on the PWM output pins is shortened (or disappears).
- The active level is output on the negative phase PWM output pins beyond the period for active-level output.

Condition 1: In portion (10) of the initial output inhibition period in Figure 10.149, synchronous clearing occurs within the dead-time period for PWM output.

Condition 2: In portions (10) and (11) of the initial output inhibition period in Figure 10.150, synchronous clearing occurs when any condition from among TGRB in MTU3 (MTU6) ≤ TDDR (TDDRB), TGRA in MTU4 (MTU7) ≤ TDDR (TDDRB), and TGRB in MTU4 (MTU7) ≤ TDDR (TDDRB) is satisfied.

The following method avoids the above phenomena.
Ensure that synchronous clearing proceeds with the value of each comparison register (TGRB in MTU3 (MTU6), TGRA in MTU4 (MTU7), and TGRB in MTU4 (MTU7)) set to at least double the value of the TDDRA register (TDDRB register).

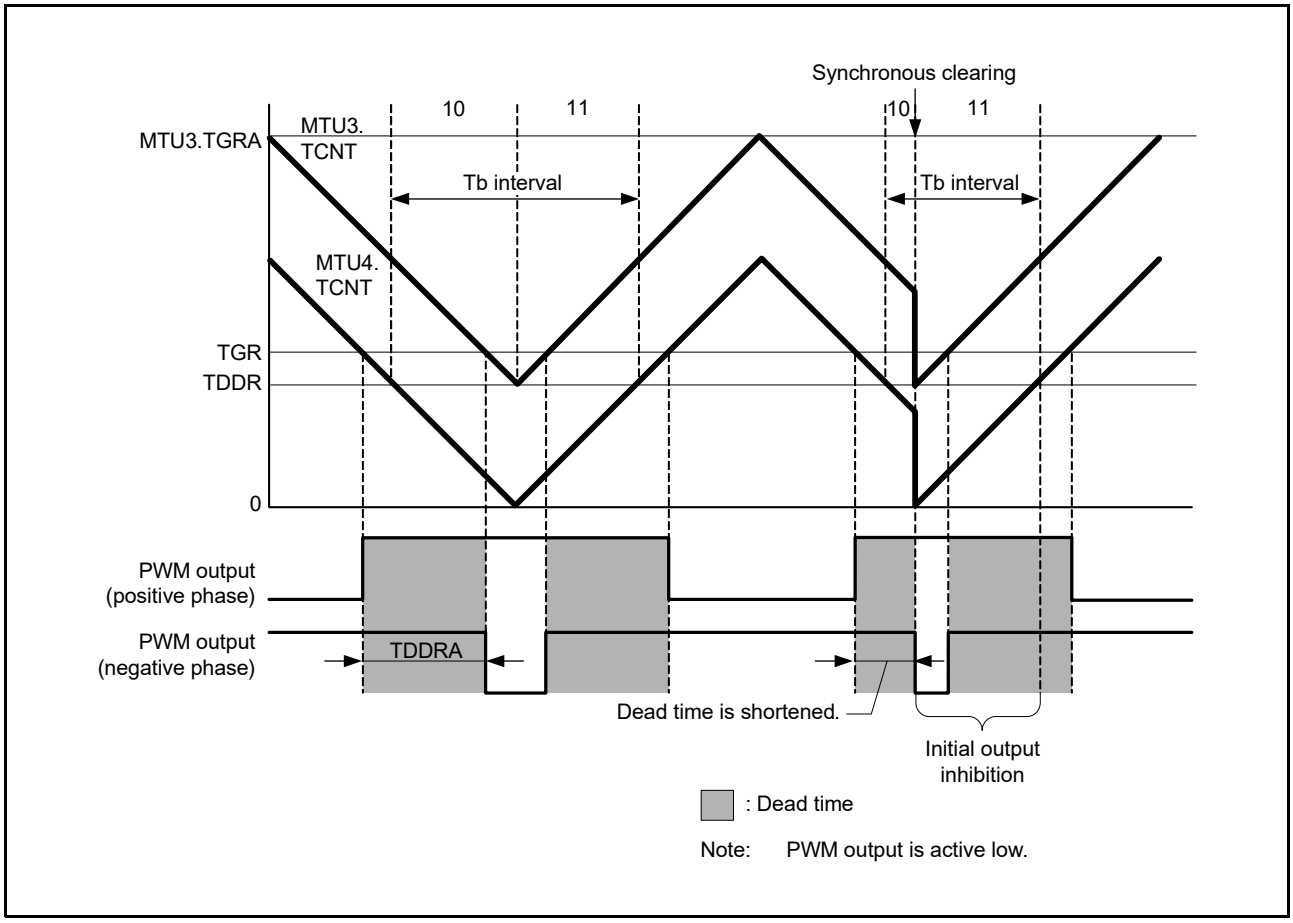

Figure 10.149 Example of Synchronous Clearing (When Condition 1 Applies)

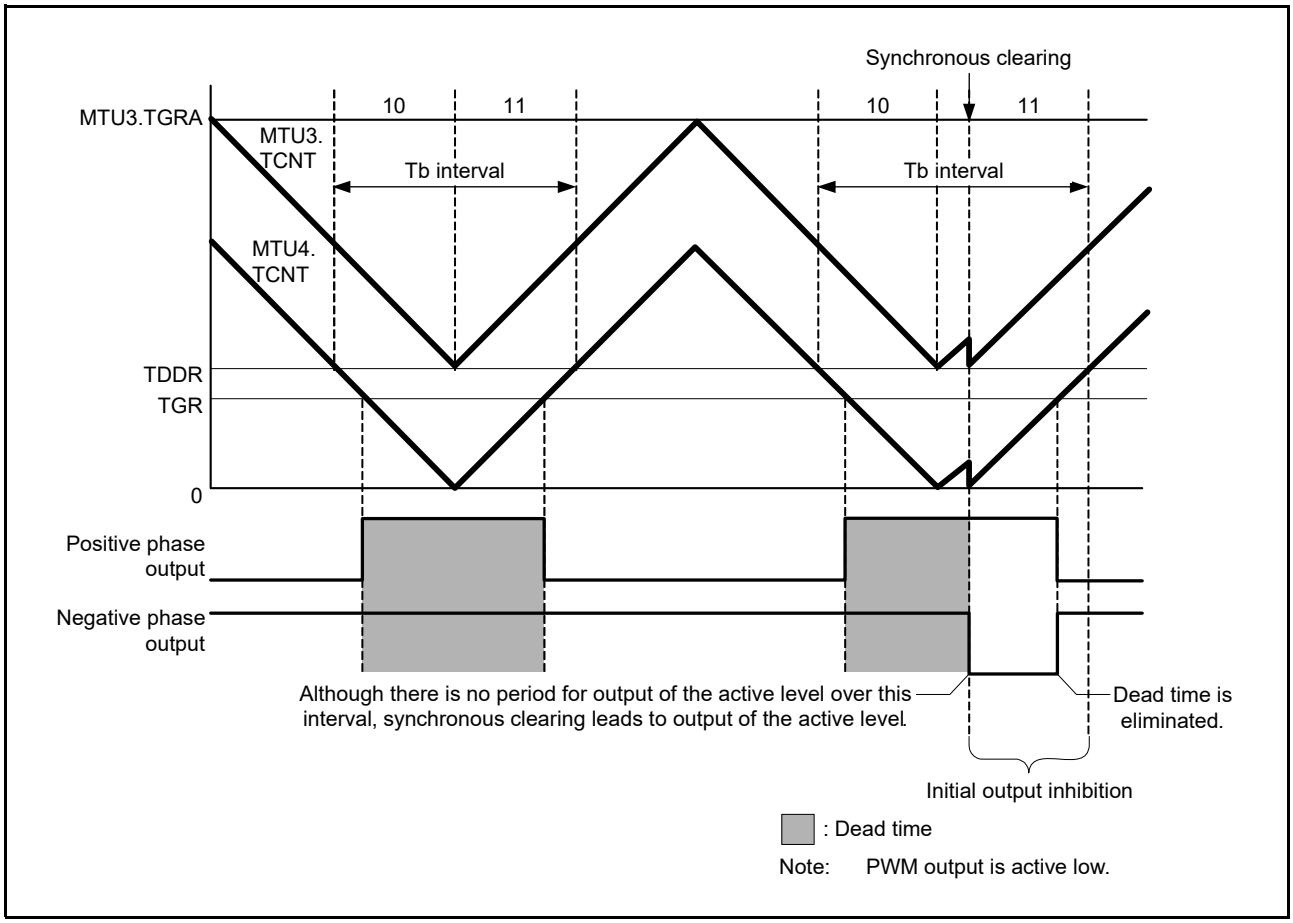

Figure 10.150 Example of Synchronous Clearing (When Condition 2 Applies)

10.6.26 Continuous Output of Interrupt Signal in Response to a Compare Match

When the TGR register is set to 0000h, the P1φ/1 clock is set as the count clock, and compare match is set as the trigger for clearing of the count clock, the value of the TCNT counter remains 0000h, and the interrupt signal will be output continuously (i.e. its level will be flat) rather than output over a single cycle. Consequently, interrupts will not be detected in response to second and subsequent compare matches.

Figure 10.151 shows the timing for continuous output of the interrupt signal in response to a compare match.

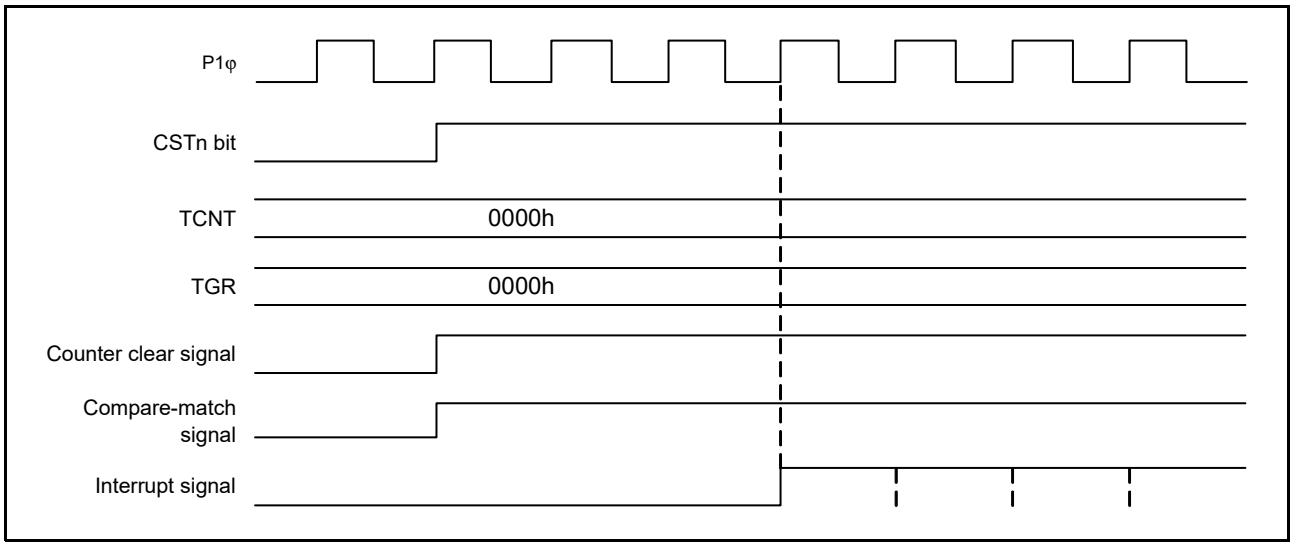

Figure 10.151 Continuous Output of Interrupt Signal in Response to a Compare Match

10.6.27 Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode

- When the TADCOBRA or TADCOBRB register in MTU4 (MTU7) is set to 0, the UT4AE or UT4BE (UT7AE or UT7BE) bit of TADCR in MTU4 (MTU7) is set to 1, and buffer transfer is performed at the trough of the value of the TCNT counter in MTU4 (MTU7), an A/D converter start request is not issued during up-counting immediately after the transfer (Figure 10.152).
- When the TADCOBRA or TADCOBRB register in MTU4 (MTU7) is set to the same value as that in the TCDR register, the DT4AE or DT4BE (DT7AE or DT7BE) bit of TADCR in MTU4 (MTU7) is set to 1, and buffer transfer is performed at the crest of the value of the TCNT counter in MTU4 (MTU7), an A/D converter start request is not issued during down-counting immediately after the transfer (Figure 10.153).
- When using A/D converter start requests in coordination with the interrupt skipping function, set up the TADCORA or TADCORB register in MTU4 (MTU7) so that the setting satisfies the condition "2 ≤ TADCORA or TADCORB in MTUn ≤ TCDR - 2" (n = 4 or 7).

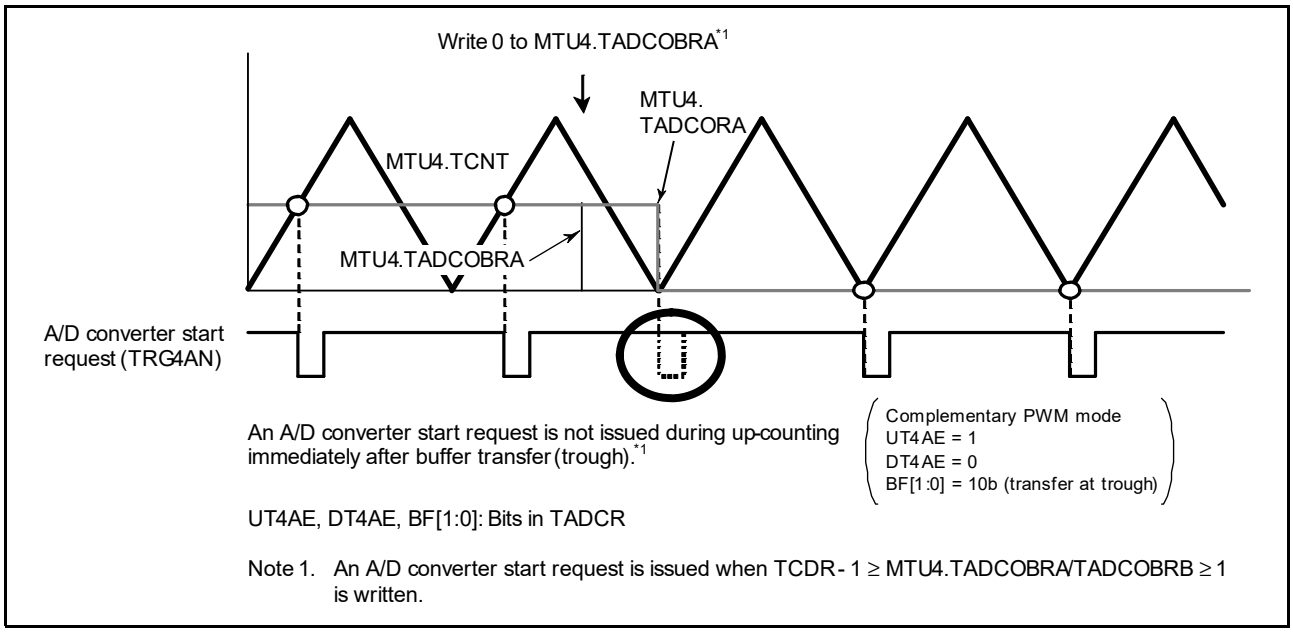

Figure 10.152 A/D Converter Start Request when TADCOBRA is Set to 0 in MTU4

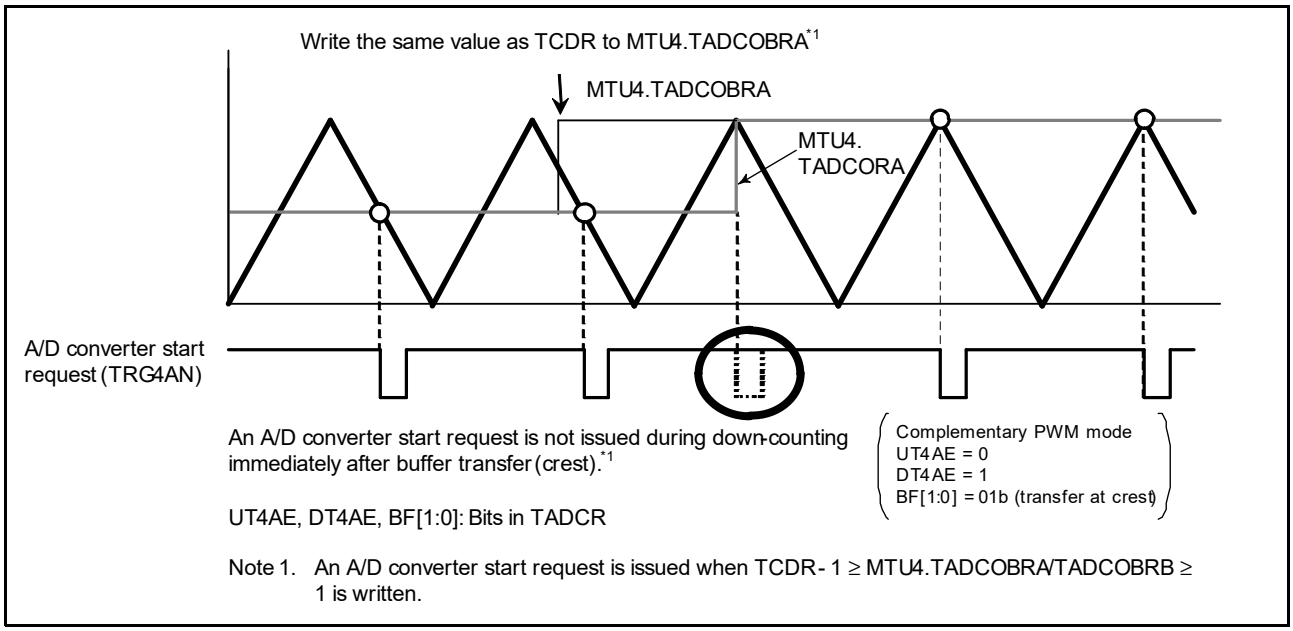

Figure 10.153 A/D Converter Start Request when TADCOBRA is Set to the Same Value as TCDR in MTU4

10.7 MTU Output Pin Initialization

10.7.1 Operating Modes

The MTU has the following six operating modes. Waveforms can be output in any of these modes.

- Normal mode (MTU0 to MTU4 and MTU6 to MTU8)
- PWM mode 1 (MTU0 to MTU4, MTU6, and MTU)
- PWM mode 2 (MTU0 to MTU2)
- Phase counting modes 1 to 5 (MTU1 and MTU2)
- Complementary PWM mode (MTU3, MTU4, MTU6, and MTU7)
- Reset-synchronized PWM mode (MTU3, MTU4, MTU6, and MTU7)

This section describes how to initialize the MTU output pins in each of these modes.

10.7.2 Operation in Case of Re-Setting Due to Error during Operation

If an error occurs during MTU operation, MTU output should be cut off by the system. The output can be cut off by allowing non-active level output from the pins by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports. MTU output can be disabled through TIOR settings. Complementary PWM output (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) should be specified through TOERA and TOERB settings. For PWM output pins, output can also be cut by hardware, using port output enable 3 (POE3). The pin initialization procedures for re-setting due to an error during operation and the procedures for restarting in a different mode after re-setting are described below.

The MTU has six operating modes, as stated above. There are thus 36 mode transition combinations, but some transitions are not available with certain channel and mode combinations. Available mode transition combinations are shown in Table 10.80.

Table 10.80 Mode Transition Combinations

	Normal	PWM1	PWM2	PCM	CPWM	RPWM
Normal	(1)	(2)	(3)	(4)	(5)	(6)
PWM1	(7)	(8)	(9)	(10)	(11)	(12)
PWM2	(13)	(14)	(15)	(16)	Not available	Not available
PCM	(17)	(18)	(19)	(20)	Not available	Not available
CPWM	(21)	(22)	Not available	Not available	(23) (24)	(25)
RPWM	(26)	(27)	Not available	Not available	(28)	(29)

Normal: Normal mode
PWM1: PWM mode 1
PWM2: PWM mode 2
PCM: Phase counting modes 1 to 5
CPWM: Complementary PWM mode
RPWM: Reset-synchronized PWM mode

10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation

- When making a transition to a mode (Normal, PWM1, PWM2, or PCM) in which the pin output level is selected by the timer I/O control register (TIOR) setting, initialize the pins by means of TIOR setting.
- In PWM mode 1, waveforms are not output to the MTIOCnB and MTIOCnD pins (n = 3, 4, 6, or 7). If the MTIOCnB or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers. If the MTIOCnm output (n = 0 to 2 and m = A to D) is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- In normal mode or PWM mode 2, if TGRC and TGRD operate as buffer registers, waveforms are not output to the corresponding MTIOCnC and MTIOCnD pins (n = 0, 3, 4, 6, or 7). If the MTIOCnC or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- In PWM mode 1, if either TGRC or TGRD operates as a buffer register, waveforms are not output to the corresponding MTIOCnC and MTIOCnD pins (n = 0, 3, 4, 6, or 7). If the MTIOCnC or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- When making a transition to a mode (CPWM or RPWM) in which the pin output level is selected by the timer output control register (TOCR1A, TOCR2A, TOCR1B, or TOCR2B) setting, temporarily disable output in MTU3 and MTU4 (or MTU6 and MTU7) with the timer output master enable register (TOERA or TOERB). If the MTIOCnm output (n =3, 4, 6, or 7 and m = A to D) is selected as the function of pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports. Switch to normal mode, perform initialization with TIOR, restore TIOR to its initial value, then operate the MTU in accordance with the mode setting procedure (TOCR1A setting, TOCR2A setting, TMDR1 setting, and TOERA setting (TOCR1B setting, TOCR2B setting, TMDR1 setting, and TOERB setting)).

Note: Channel number is substituted for “n” indicated in this section.

Pin initialization procedures are described below for the numbered combinations in Table 10.80. The active level is assumed to be low.

(1) Operation When Error Occurs in Normal Mode and Operation is Restarted in Normal Mode

Figure 10.154 shows a case in which an error occurs in normal mode and operation is restarted in normal mode after re-setting.

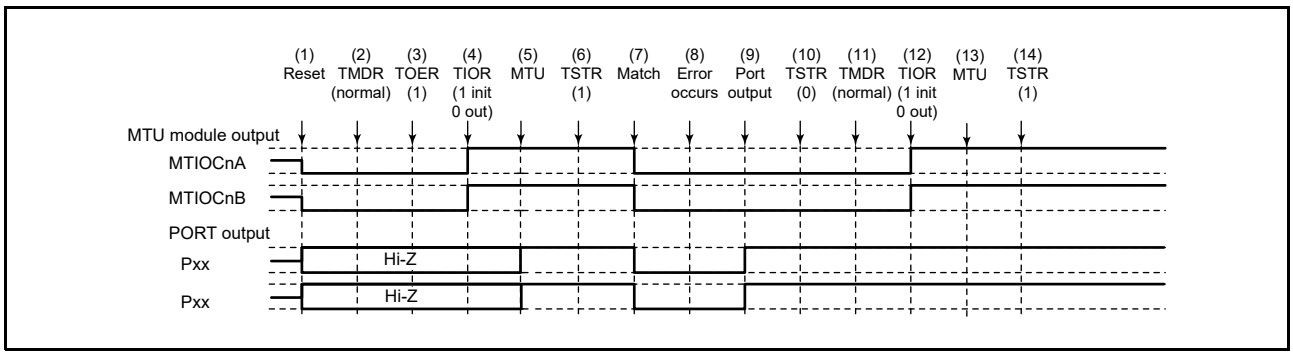

Figure 10.154 Error Occurrence in Normal Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.
(2) After a reset, the TMDR1 setting is for normal mode.
(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with TOERA (TOERB) before initializing the pins with TIOR.
(4) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)
(5) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(6) Start count operation by setting TSTRA (TSTRB).
(7) Output goes low on compare match occurrence.
(8) An error occurs.
(9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(10) Stop count operation by setting TSTRA (TSTRB).
(11) This step is not necessary when restarting in normal mode.
(12) Initialize the pins with TIOR.
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA (TSTRB).

(2) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM Mode 1

Figure 10.155 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 1 after re-setting.

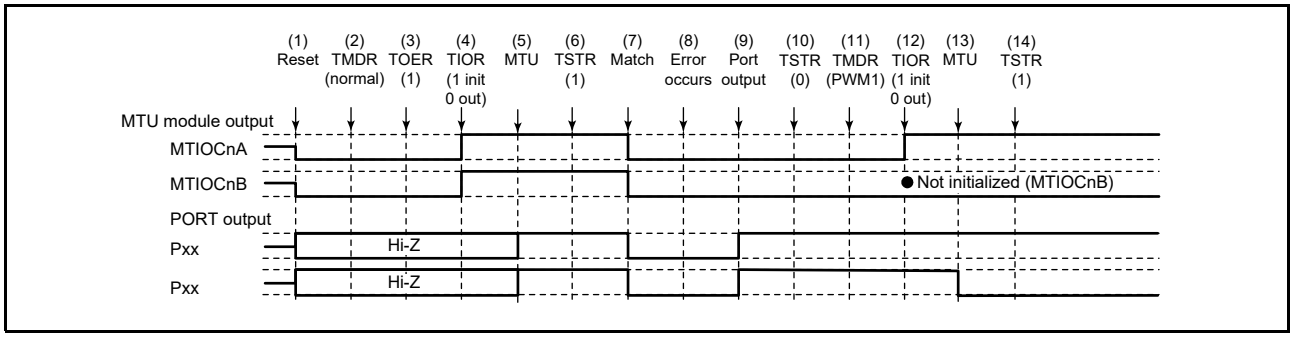

Figure 10.155 Error Occurrence in Normal Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in Figure 10.154.
(11) Set PWM mode 1.
(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA (TSTRB).

(3) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM mode 2

Figure 10.156 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 2 after re-setting.

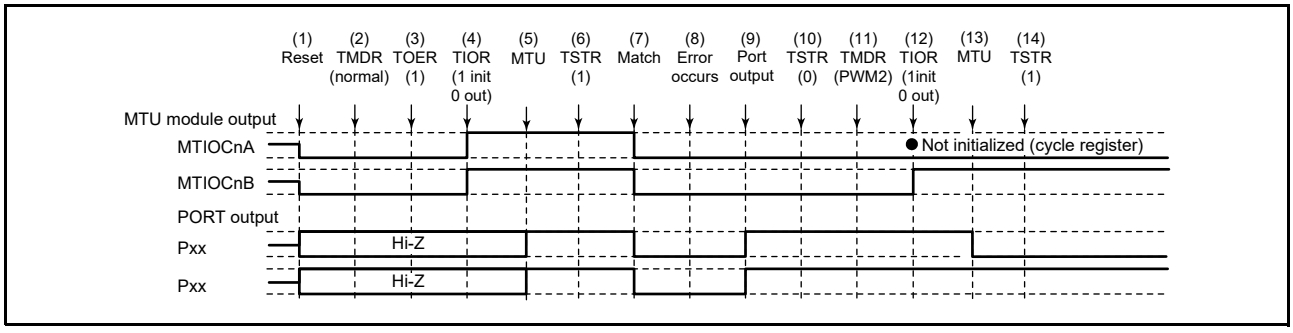

Figure 10.156 Error Occurrence in Normal Mode, Recovery in PWM Mode 2

(1) to (10) are the same as in Figure 10.154.
(11) Set PWM mode 2.
(12) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers. To output a specified level, set up the general output ports with the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA.

Note: PWM mode 2 can only be selected for MTU0 to MTU2, and therefore TOERA setting is not necessary.

(4) Operation When Error Occurs in Normal Mode and Operation is Restarted in Phase Counting Mode

Figure 10.157 shows a case in which an error occurs in normal mode and operation is restarted in phase counting mode after re-setting.

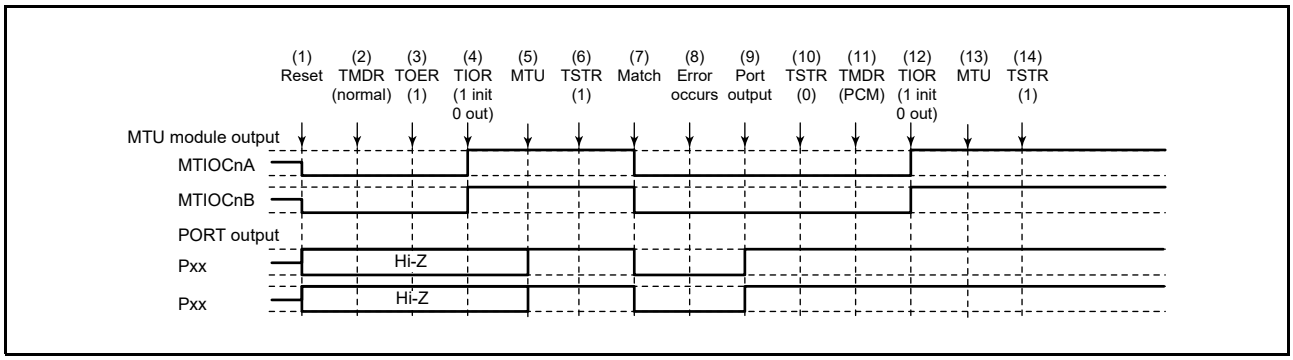

Figure 10.157 Error Occurrence in Normal Mode, Recovery in Phase Counting Mode

(1) to (10) are the same as in Figure 10.154.
(11) Set the phase counting mode.
(12) Initialize the pins with TIOR.
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA.

Note: The phase counting mode can only be selected for MTU1 and MTU2, and therefore TOERA setting is not necessary.

(5) Operation When Error Occurs in Normal Mode and Operation is Restarted in Complementary PWM Mode

Figure 10.158 shows a case in which an error occurs in normal mode and operation is restarted in complementary PWM mode after re-setting.

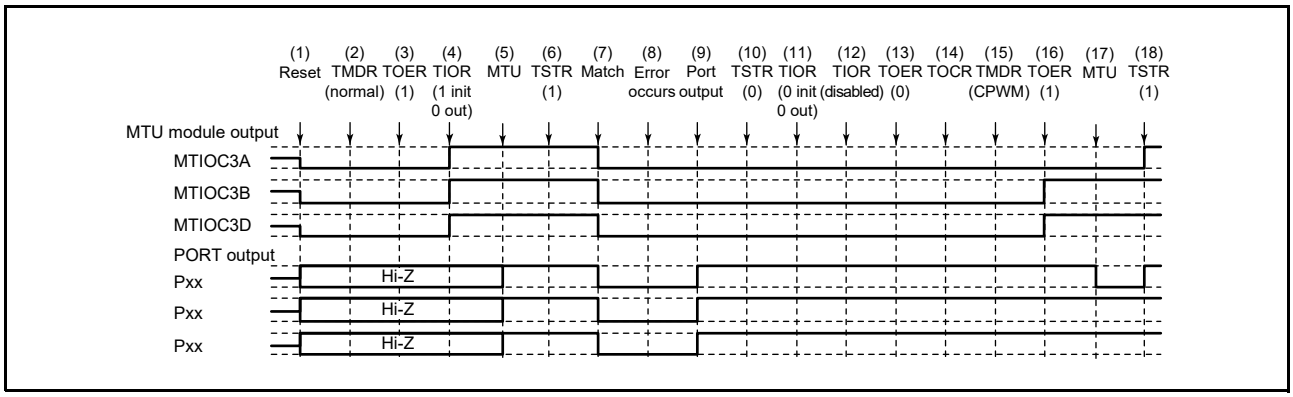

Figure 10.158 Error Occurrence in Normal Mode, Recovery in Complementary PWM Mode

(1) to (10) are the same as in Figure 10.154.
(11) Initialize the normal mode waveform generation section with TIOR.
(12) Disable operation of the normal mode waveform generation section with TIOR.
(13) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(14) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).
(15) Set complementary PWM mode.
(16) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(17) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(18) Restart operation by setting TSTRA (TSTRB).

(6) Operation When Error Occurs in Normal Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 10.159 shows a case in which an error occurs in normal mode and operation is restarted in reset-synchronized PWM mode after re-setting.

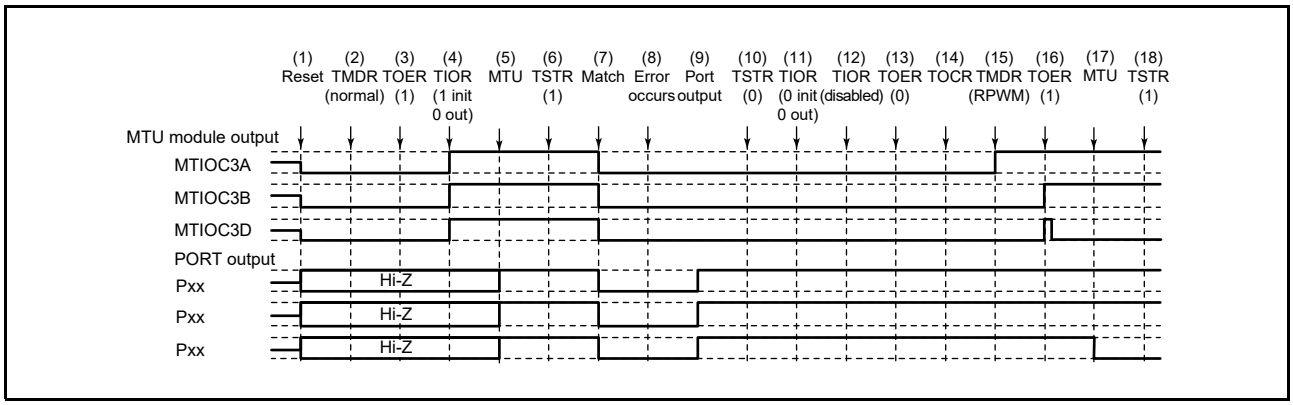

Figure 10.159 Error Occurrence in Normal Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (13) are the same as in Figure 10.156.
(14) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).
(15) Set reset-synchronized PWM mode.
(16) Enable output from MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(17) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(18) Restart operation by setting TSTRA (TSTRB).

(7) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Normal Mode

Figure 10.160 shows a case in which an error occurs in PWM mode 1 and operation is restarted in normal mode after re-setting.

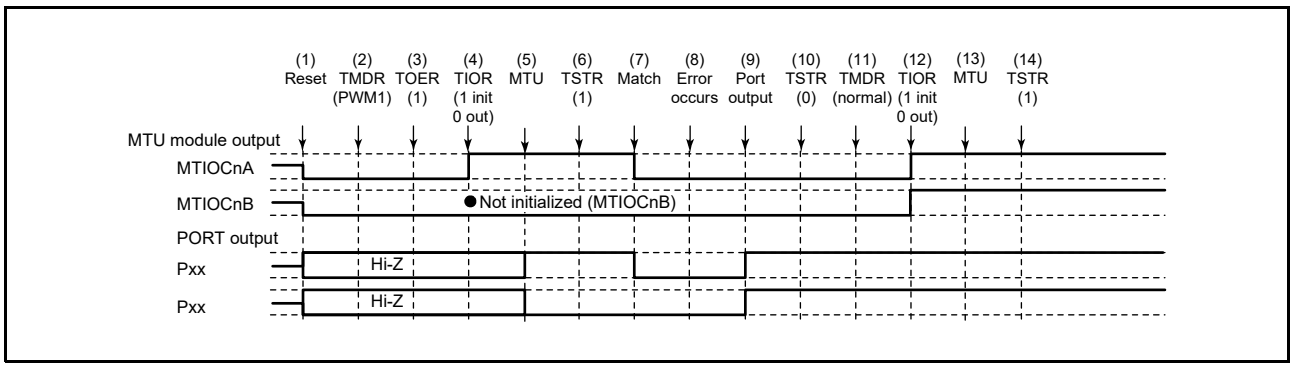

Figure 10.160 Error Occurrence in PWM Mode 1, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.
(2) Set PWM mode 1.
(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with TOERA (TOERB) before initializing the pins with TIOR.
(4) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 1, the MTIOCnB side is not initialized.)
(5) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(6) Start count operation by setting TSTRA (TSTRB).
(7) Output goes low on compare match occurrence.
(8) An error occurs.
(9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(10) Stop count operation by setting TSTRA (TSTRB).
(11) Set normal mode.
(12) Initialize the pins with TIOR.
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA (TSTRB).

(8) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 1

Figure 10.161 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 1 after re-setting.

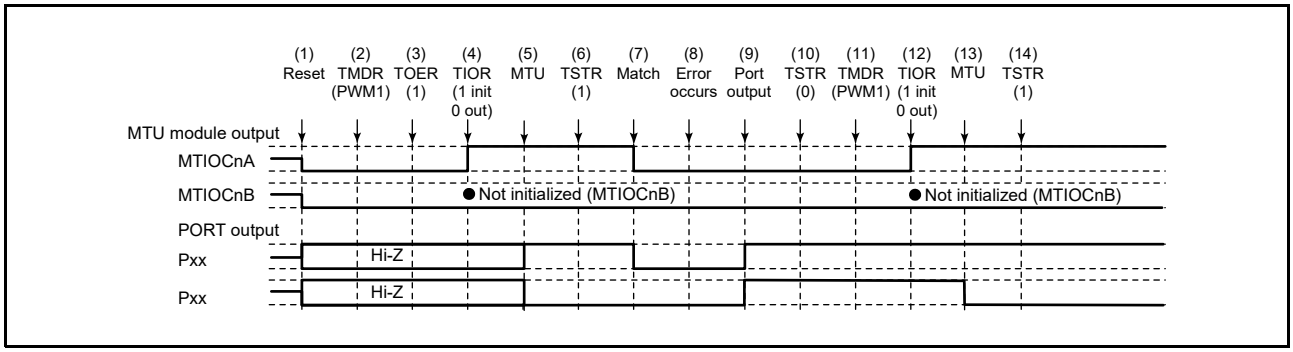

Figure 10.161 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 1

(1) to (10) are the same as in Figure 10.160.
(11) This step is not necessary when restarting in PWM mode 1.
(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins.
To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA (TSTRB).

(9) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 2

Figure 10.162 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 2 after re-setting.

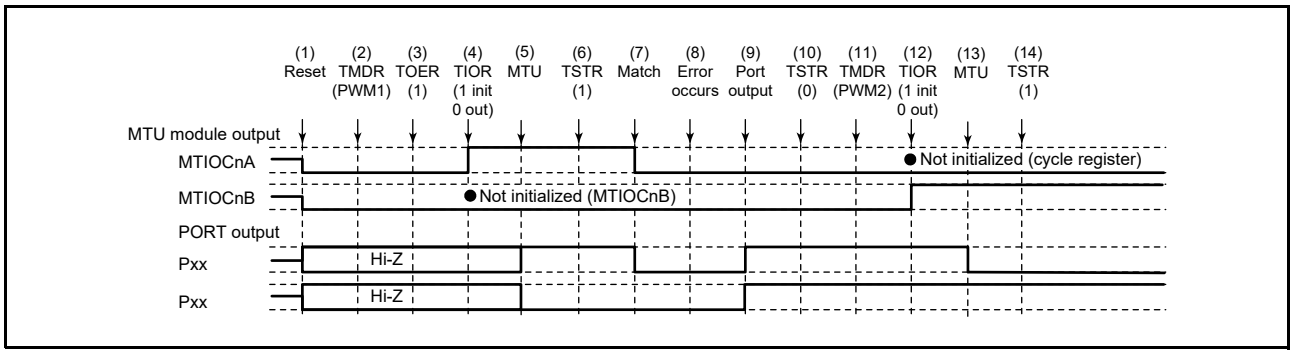

Figure 10.162 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 2

(1) to (10) are the same as in Figure 10.160.
(11) Set PWM mode 2.
(12) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA.

Note: PWM mode 2 can only be selected for MTU0 to MTU2, and therefore TOERA setting is not necessary.

(10) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Phase Counting Mode

Figure 10.163 shows a case in which an error occurs in PWM mode 1 and operation is restarted in phase counting mode after re-setting.

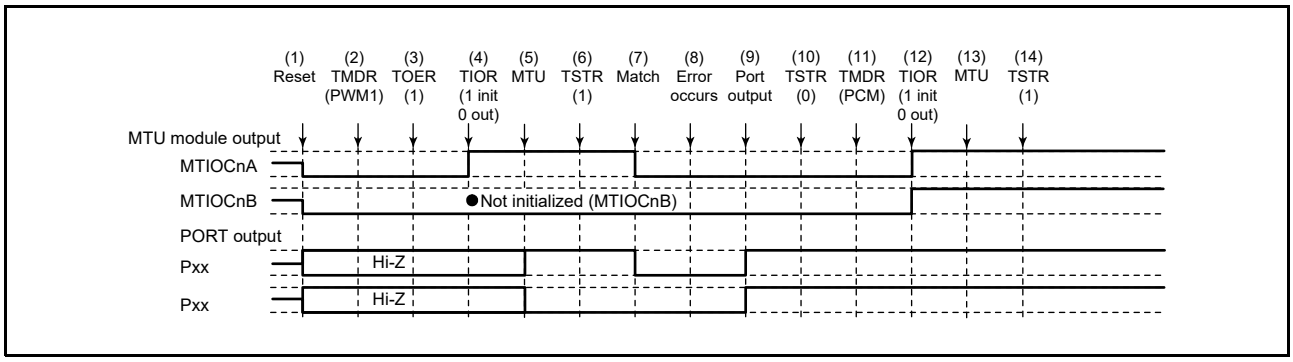

Figure 10.163 Error Occurrence in PWM Mode 1, Recovery in Phase Counting Mode

(1) to (10) are the same as in Figure 10.160.
(11) Set the phase counting mode.
(12) Initialize the pins with TIOR.
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA.

Note: The phase counting mode can only be selected for MTU1 and MTU2, and therefore TOERA setting is not necessary.

(11) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Complementary PWM Mode

Figure 10.164 shows a case in which an error occurs in PWM mode 1 and operation is restarted in complementary PWM mode after re-setting.

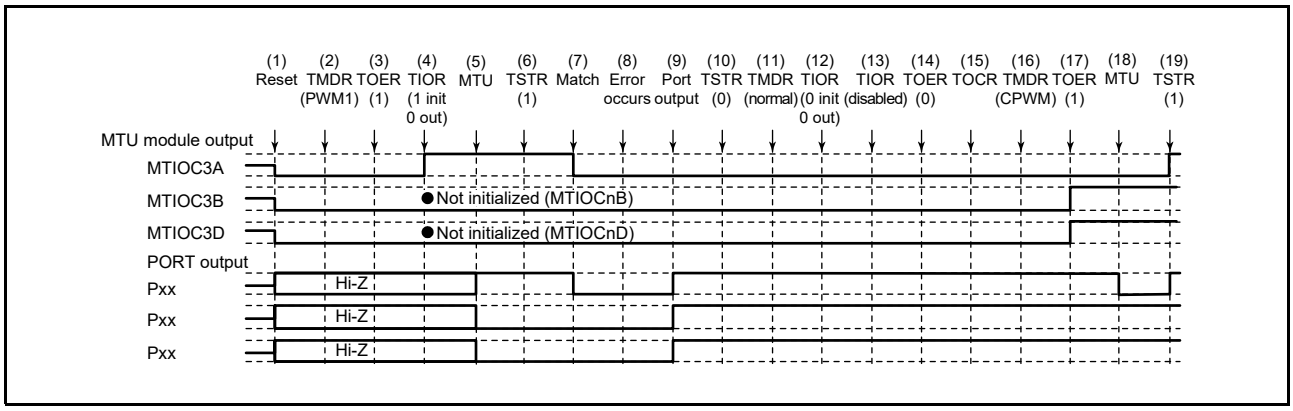

Figure 10.164 Error Occurrence in PWM Mode 1, Recovery in Complementary PWM Mode

(1) to (10) are the same as in Figure 10.160.
(11) Set normal mode to initialize the normal mode waveform generation section.
(12) Initialize the PWM mode 1 waveform generation section with TIOR.
(13) Disable operation of the PWM mode 1 waveform generation section with TIOR
(14) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(15) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).
(16) Set complementary PWM mode.
(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(18) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(19) Restart operation by setting TSTRA (TSTRB).

(12) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 10.165 shows a case in which an error occurs in PWM mode 1 and operation is restarted in reset-synchronized PWM mode after re-setting.

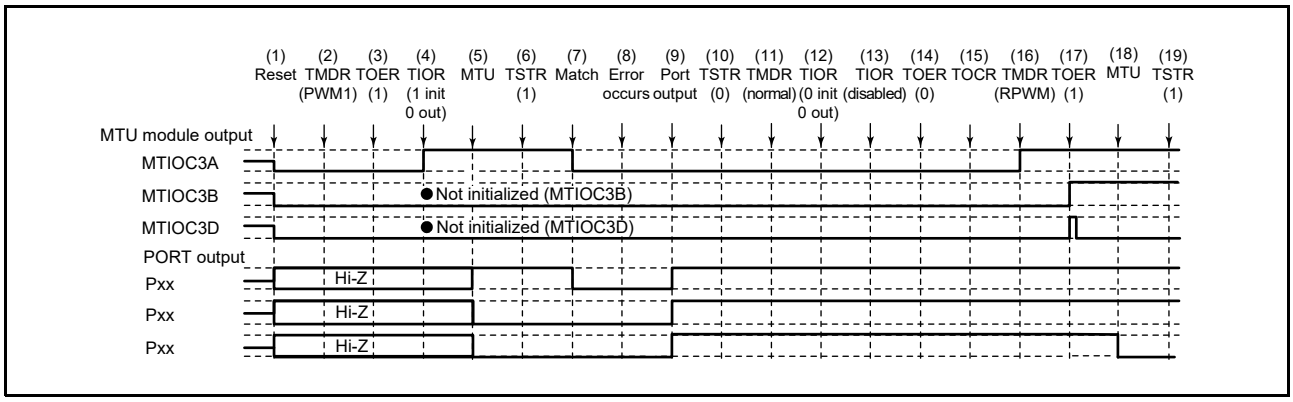

Figure 10.165 Error Occurrence in PWM Mode 1, Recovery in Reset-Synchronized PWM Mode

(1) to (14) are the same as in Figure 10.164.
(15) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).
(16) Set reset-synchronized PWM mode.
(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(18) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(19) Restart operation by setting TSTRA (TSTRB).

(13) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Normal Mode

Figure 10.166 shows a case in which an error occurs in PWM mode 2 and operation is restarted in normal mode after re-setting.

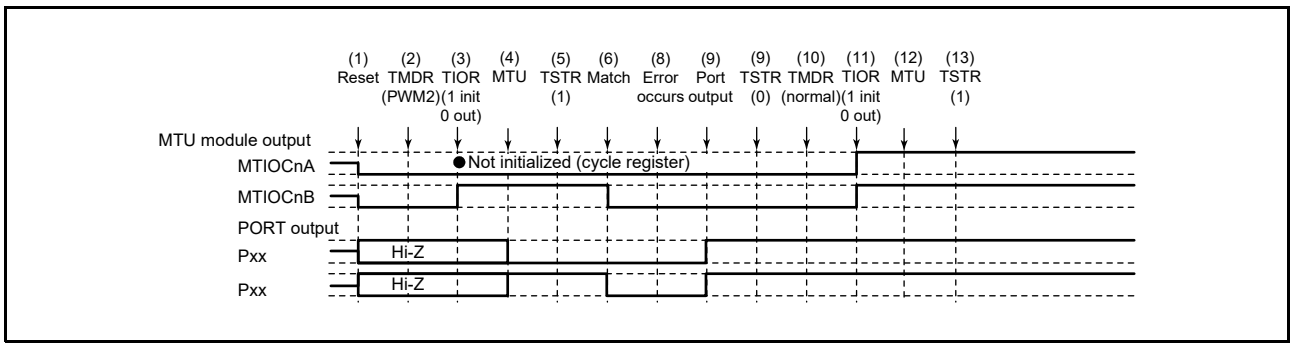

Figure 10.166 Error Occurrence in PWM Mode 2, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.
(2) Set PWM mode 2.
(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 2, the pins corresponding to the TGR registers used as cycle registers are not initialized. In the example, TGRA in MTUn is used as a cycle register.)
(4) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(5) Start count operation by setting TSTRA.
(6) Output goes low on compare match occurrence.
(7) An error occurs.
(8) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(9) Stop count operation by setting TSTRA.
(10) Set normal mode.
(11) Initialize the pins with TIOR.
(12) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(13) Restart operation by setting TSTRA.

(14) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 1

Figure 10.167 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 1 after re-setting.

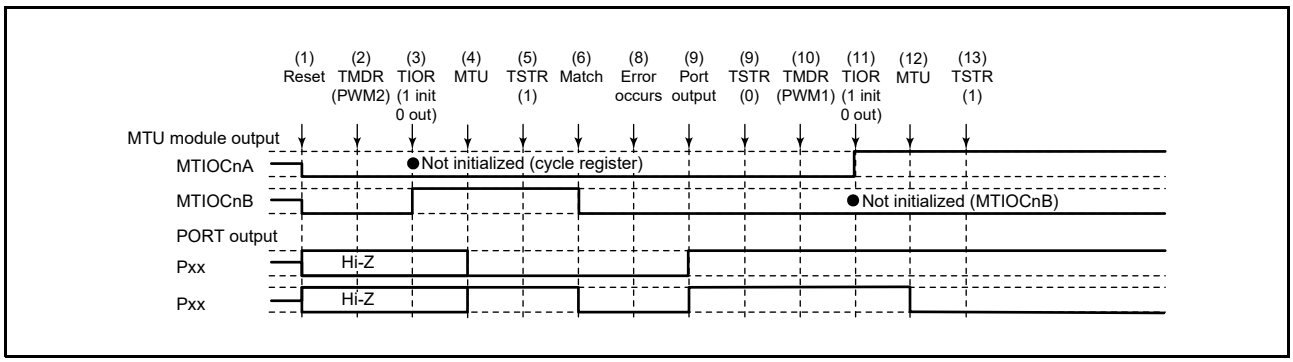

Figure 10.167 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 1

(1) to (9) are the same as in Figure 10.166.
(10) Set PWM mode 1.
(11) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(12) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(13) Restart operation by setting TSTRA.

(15) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 2

Figure 10.168 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 2 after re-setting.

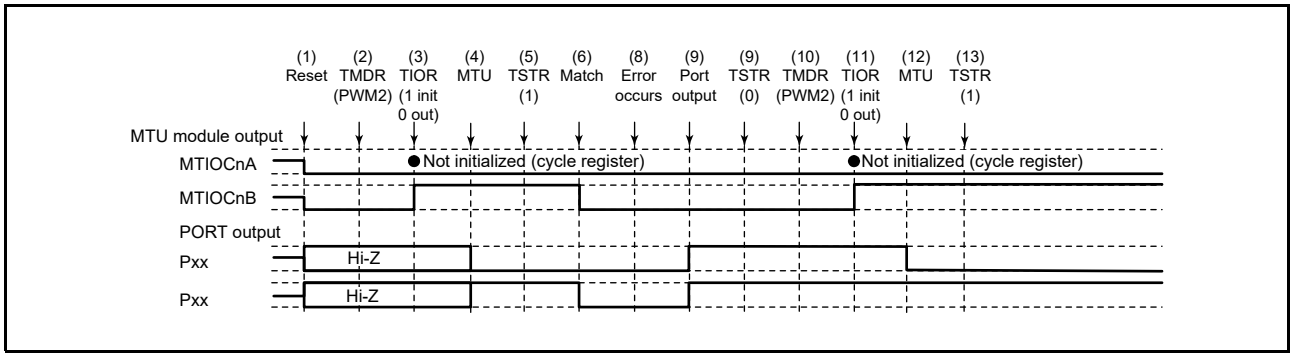

Figure 10.168 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 2

(1) to (9) are the same as in Figure 10.166.
(10) This step is not necessary when restarting in PWM mode 2.
(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(12) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(13) Restart operation by setting TSTRA.

(16) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Phase Counting Mode

Figure 10.169 shows a case in which an error occurs in PWM mode 2 and operation is restarted in phase counting mode after re-setting.

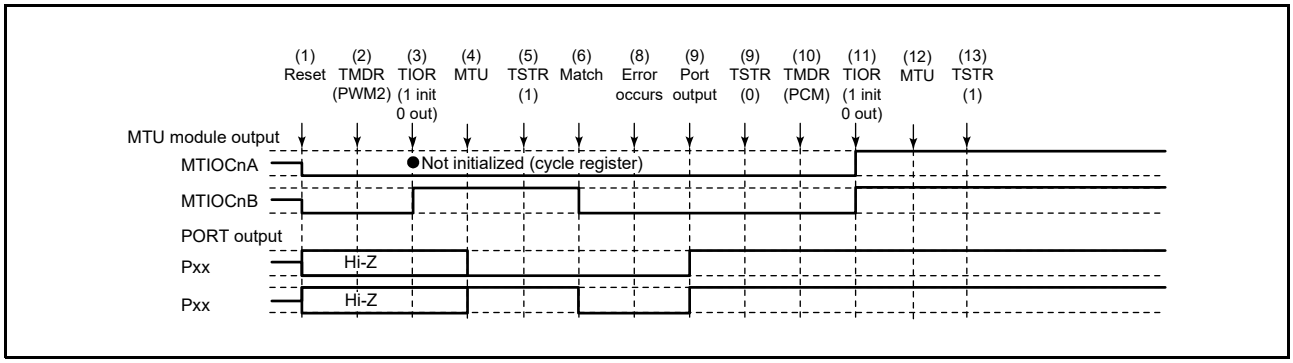

Figure 10.169 Error Occurrence in PWM Mode 2, Recovery in Phase Counting Mode

(1) to (9) are the same as in Figure 10.166.
(10) Set the phase counting mode.
(11) Initialize the pins with TIOR.
(12) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(13) Restart operation by setting TSTRA.

(17) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Normal Mode

Figure 10.170 shows a case in which an error occurs in phase counting mode and operation is restarted in normal mode after re-setting.

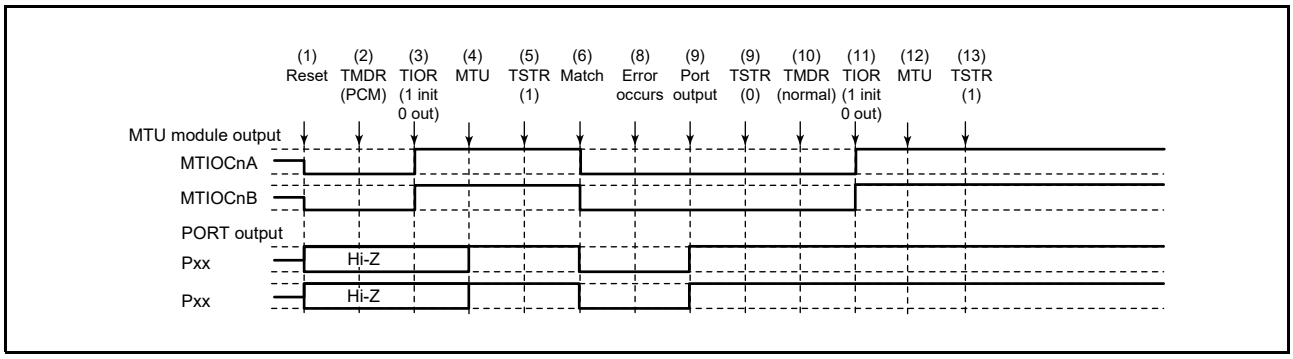

Figure 10.170 Error Occurrence in Phase Counting Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.
(2) Set phase counting mode.
(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)
(4) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(5) Start count operation by setting TSTRA.
(6) Output goes low on compare match occurrence.
(7) An error occurs.
(8) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(9) Stop count operation by setting TSTRA.
(10) Set normal mode.
(11) Initialize the pins with TIOR.
(12) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(13) Restart operation by setting TSTRA.

(18) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 1

Figure 10.171 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 1 after re-setting.

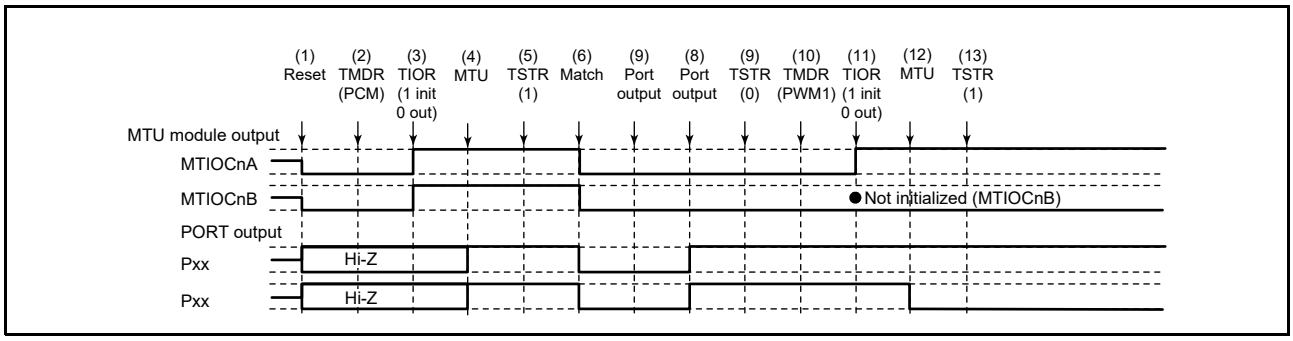

Figure 10.171 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 1

(1) to (9) are the same as in Figure 10.170.
(10) Set PWM mode 1.
(11) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(12) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(13) Restart operation by setting TSTRA.

(19) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 2

Figure 10.172 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 2 after re-setting.

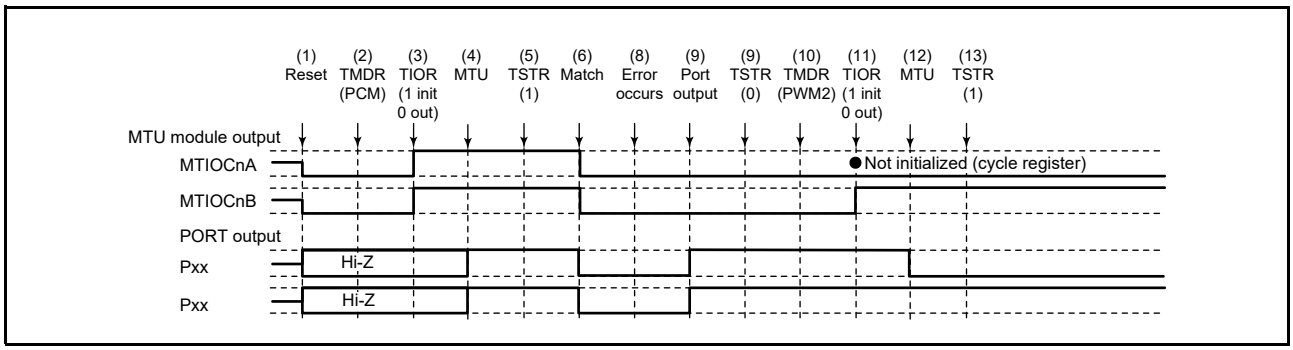

Figure 10.172 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 2

(1) to (9) are the same as in Figure 10.170.
(10) Set PWM mode 2.
(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(12) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(13) Restart operation by setting TSTRA.

(20) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Phase Counting Mode

Figure 10.173 shows a case in which an error occurs in phase counting mode and operation is restarted in phase counting mode after re-setting.

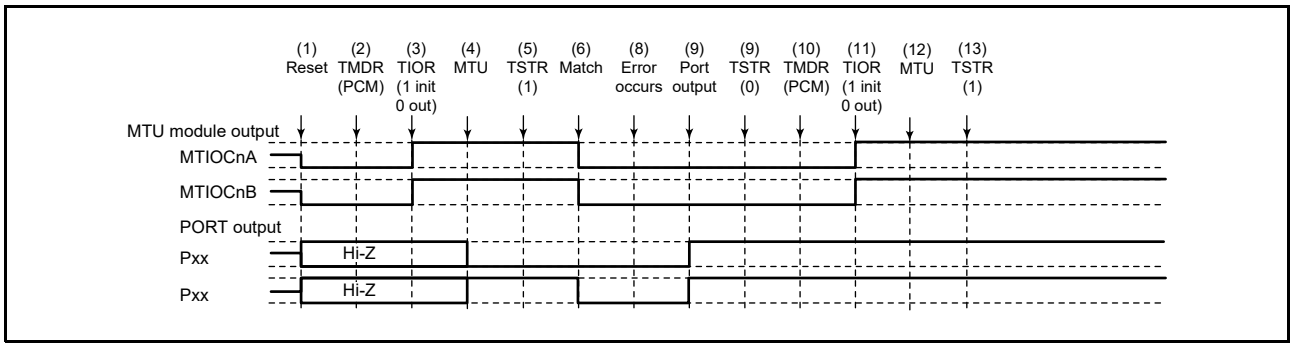

Figure 10.173 Error Occurrence in Phase Counting Mode, Recovery in Phase Counting Mode

(1) to (9) are the same as in Figure 10.170.
(10) This step is not necessary when restarting in phase counting mode.
(11) Initialize the pins with TIOR.
(12) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(13) Restart operation by setting TSTRA.

(21) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Normal Mode

Figure 10.174 shows a case in which an error occurs in complementary PWM mode and operation is restarted in normal mode after re-setting.

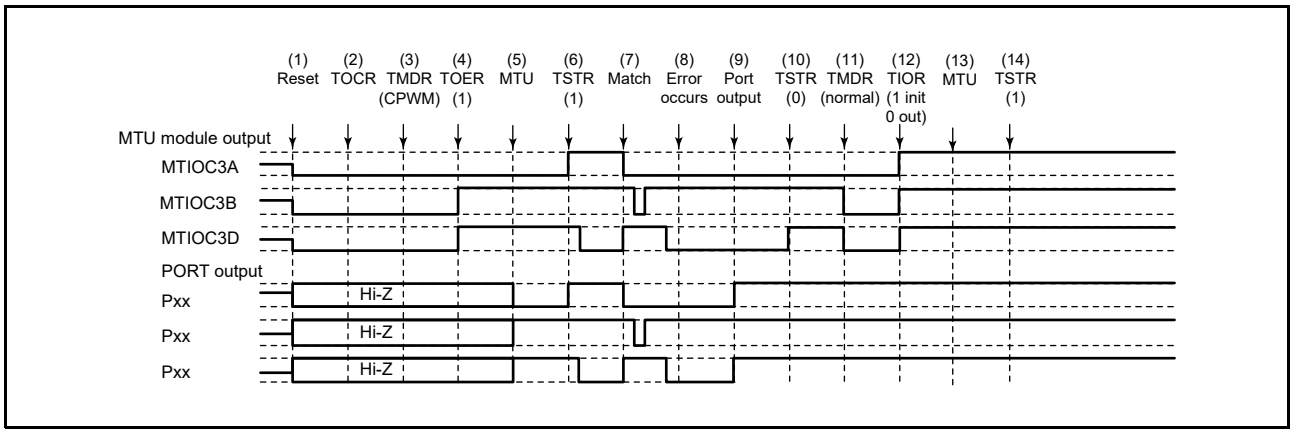

Figure 10.174 Error Occurrence in Complementary PWM Mode, Recovery in Normal Mode

(1) After a reset, the MTU3 output goes low and the ports enter high-impedance state.
(2) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).
(3) Set complementary PWM mode.
(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(5) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(6) Start count operation by setting TSTRA (TSTRB).
(7) The complementary PWM waveform is output on compare match occurrence.
(8) An error occurs.
(9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(10) Stop count operation by setting TSTRA (TSTRB). (MTU output becomes the initial complementary PWM output value).
(11) Set normal mode (MTU output goes low).
(12) Initialize the pins with TIOR.
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA (TSTRB).

(22) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in PWM Mode 1

Figure 10.175 shows a case in which an error occurs in complementary PWM mode and operation is restarted in PWM mode 1 after re-setting.

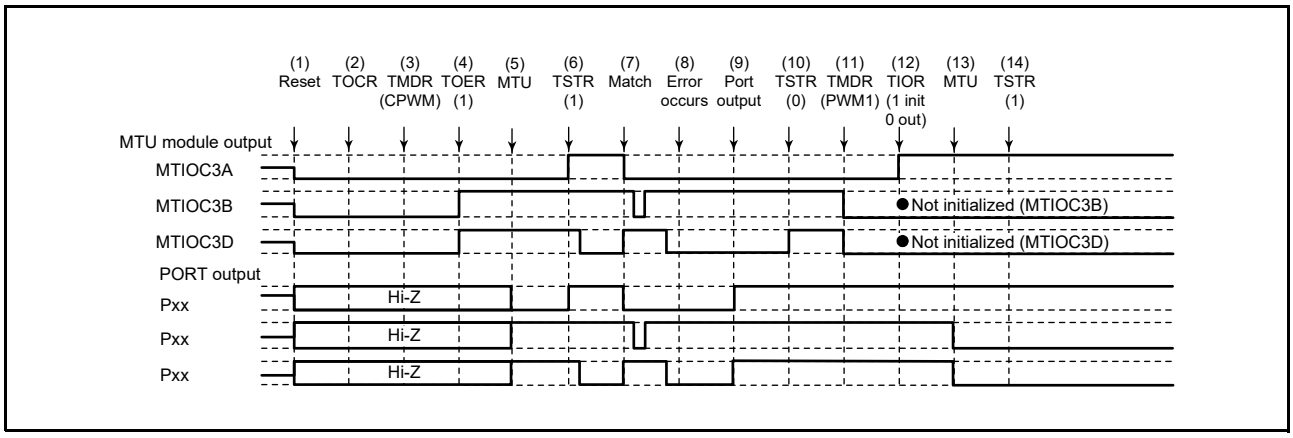

Figure 10.175 Error Occurrence in Complementary PWM Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in Figure 10.174.
(11) Set PWM mode 1 (MTU output goes low).
(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA (TSTRB).

(23) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 10.176 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using the cycle and duty settings at the time of stopping the counter).

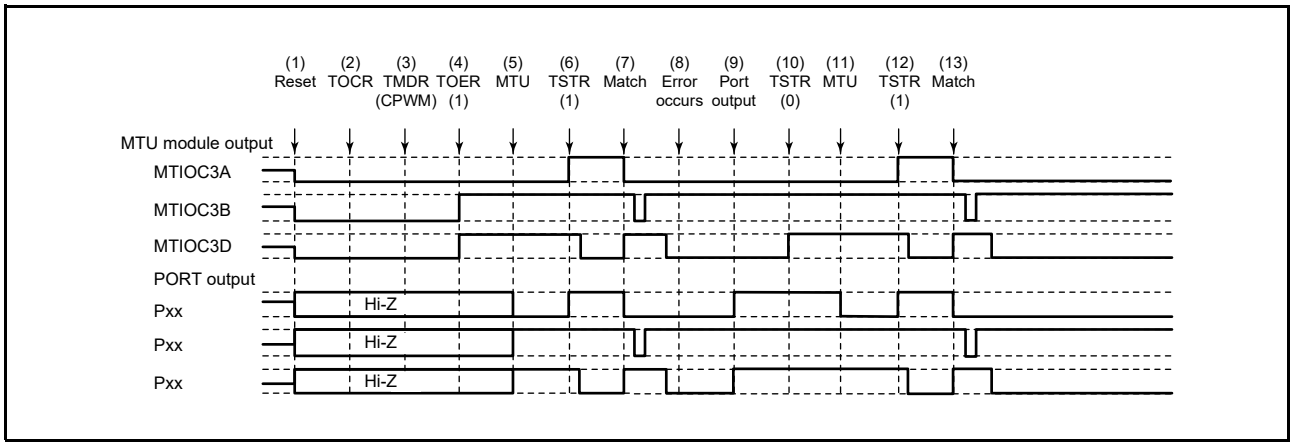

Figure 10.176 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (1)

(1) to (10) are the same as in Figure 10.174.
(11) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(12) Restart operation by setting TSTRA (TSTRB).
(13) The complementary PWM waveform is output on compare match occurrence.

(24) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode with New Settings

Figure 10.177 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (operation is restarted using new cycle and duty ratio settings).

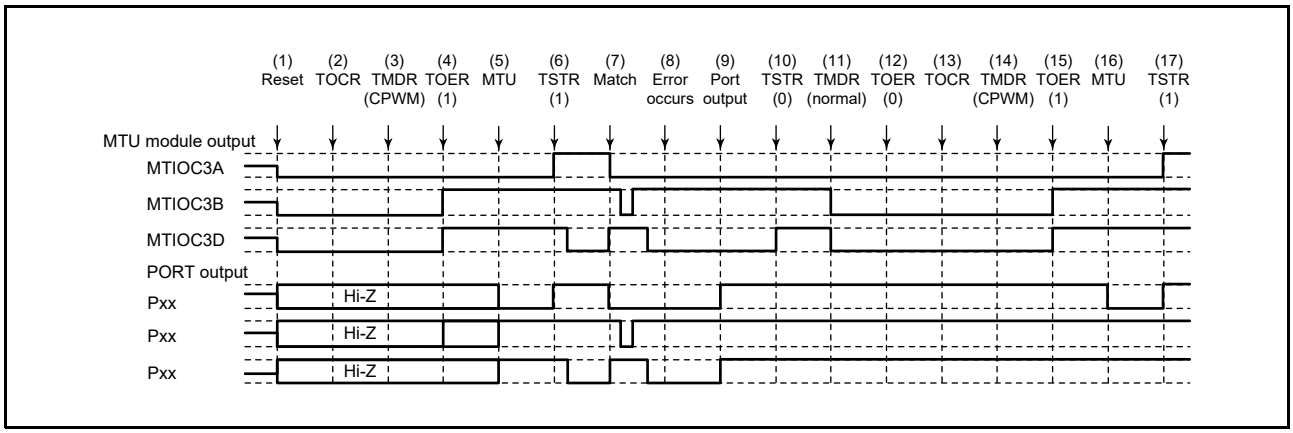

Figure 10.177 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (2)

(1) to (10) are the same as in Figure 10.174.
(11) Set normal mode and make new settings (MTU output goes low).
(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(13) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).
(14) Set complementary PWM mode.
(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(16) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(17) Restart operation by setting TSTRA (TSTRB).

(25) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 10.178 shows a case in which an error occurs in complementary PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

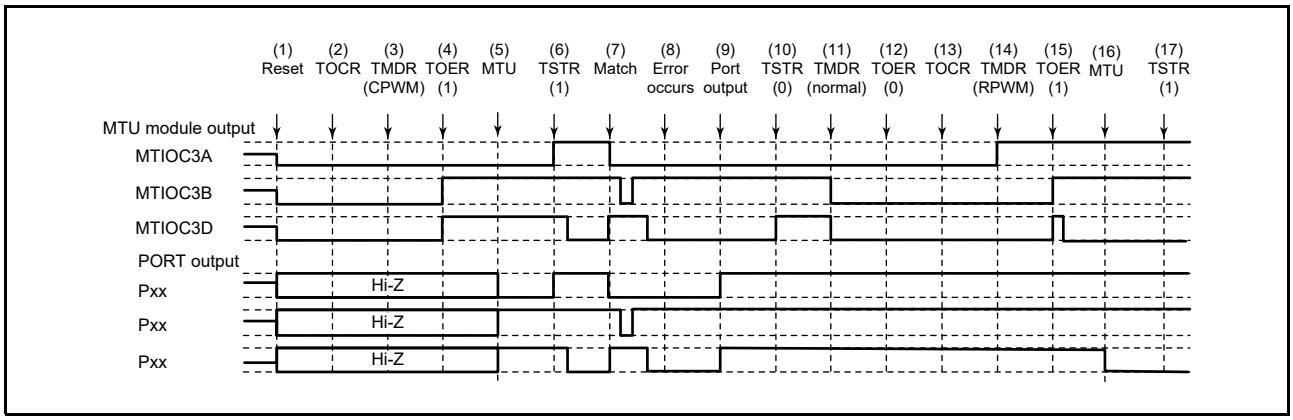

Figure 10.178 Error Occurrence in Complementary PWM Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (10) are the same as in Figure 10.174.
(11) Set normal mode (MTU output goes low).
(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(13) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).
(14) Set reset-synchronized PWM mode.
(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(16) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(17) Restart operation by setting TSTRA (TSTRB).

(26) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Normal Mode

Figure 10.179 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in normal mode after re-setting.

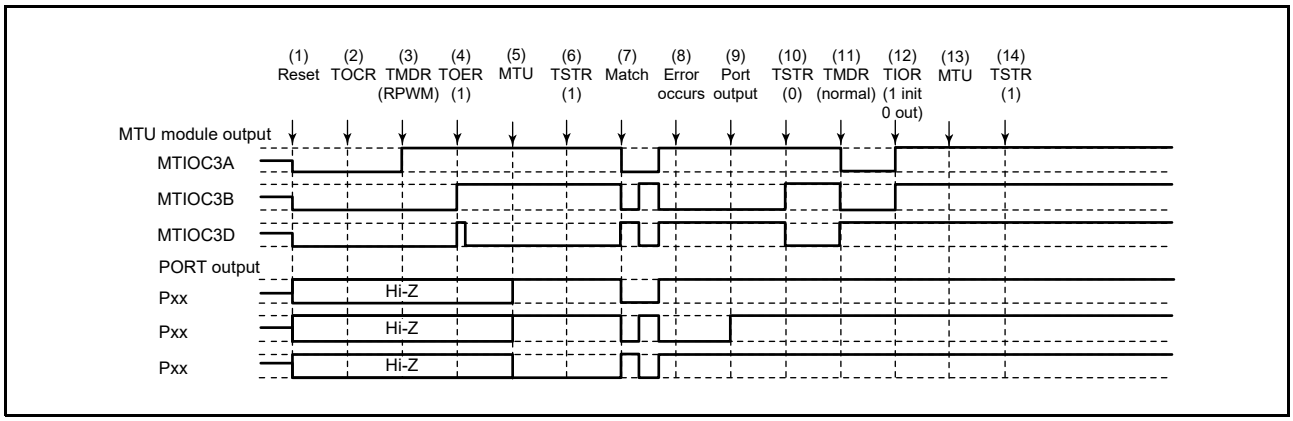

Figure 10.179 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.
(2) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).
(3) Set reset-synchronized PWM mode.
(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(5) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(6) Start count operation by setting TSTRA (TSTRB).
(7) The reset-synchronized PWM waveform is output on compare match occurrence.
(8) An error occurs.
(9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(10) Stop count operation by setting TSTRA (TSTRB). (MTU output becomes the initial reset-synchronized PWM output value.)
(11) Set normal mode (positive-phase MTU output goes low, and negative-phase output goes high).
(12) Initialize the pins with TIOR.
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA (TSTRB).

(27) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in PWM Mode 1

Figure 10.180 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in PWM mode 1 after re-setting.

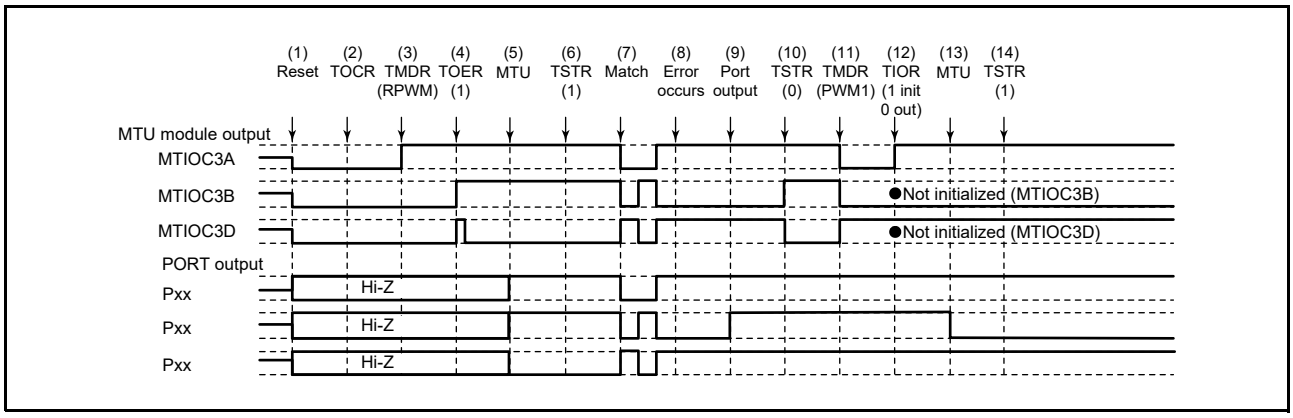

Figure 10.180 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in Figure 10.179.
(11) Set PWM mode 1 (positive-phase MTU output goes low, and negative-phase output goes high).
(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(14) Restart operation by setting TSTRA (TSTRB).

(28) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 10.181 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in complementary PWM mode after re-setting.

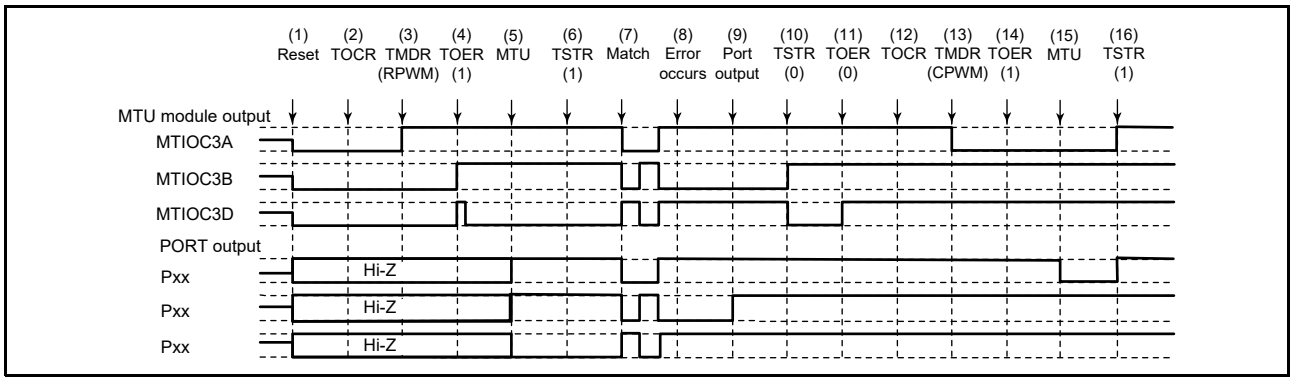

Figure 10.181 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Complementary PWM Mode

(1) to (10) are the same as in Figure 10.179.
(11) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(12) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).
(13) Set complementary PWM mode (MTU cyclic output pin goes low).
(14) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).
(15) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(16) Restart operation by setting TSTRA (TSTRB).

(29) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 10.182 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

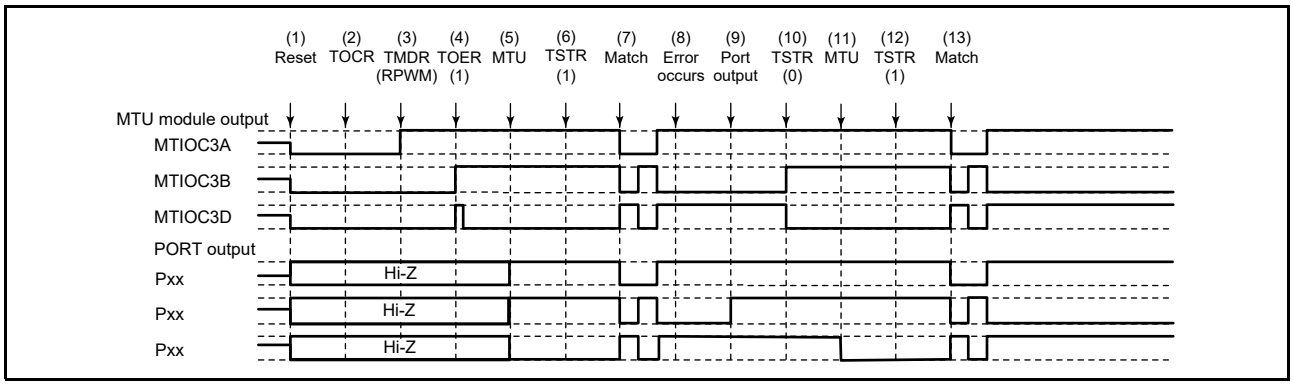

Figure 10.182 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (10) are the same as in Figure 10.179.
(11) Set MTU output using the port mode registers (PMR) and Pmn pin function control register (PmnPFS) corresponding to the GPIO ports.
(12) Restart operation by setting TSTRA (TSTRB).
(13) The reset-synchronized PWM waveform is output on compare match occurrence.

11. Port Output Enable 3 (POE3)

The port output enable 3 (POE3) can be used to place output pins for the MTU3a in the high-impedance state in response to various conditions.

11.1 Overview

Table 11.1 lists the specifications of the POE3, and Figure 11.1 shows a block diagram of the POE3.

Table 11.1 POE3 Specifications

Item	Description
Target pins to be placed in the high-impedance state	• MTU3a output pins MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D) MTU3 pin (MTIOC3B, MTIOC3D) MTU4 pin (MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D) MTU6 pin (MTIOC6B, MTIOC6D) MTU7 pin (MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D)
Conditions for the high-impedance state	• Setting pins as inputs: setting the POE0#, POE4#, POE8#, or POE10# pins as inputs (falling edge or low-level sampling). • Short-circuits between output pins: A match (short circuit) between the output signal levels at the active level over one or more cycle on (the following combination of pins) MTU complementary PWM output pins 1 MTIOC3B and MTIOC3D 2 MTIOC4A and MTIOC4C 3 MTIOC4B and MTIOC4D 4 MTIOC6B and MTIOC6D 5 MTIOC7A and MTIOC7C 6 MTIOC7B and MTIOC7D • SPOER register setting being made
Function	• Each of the POE0#, POE4#, POE8#, and POE10# input pins can be set for falling edge, P1φ/4 x 16, P1φ/16 x 16, or P1φ/128 x 16 low-level sampling. • Pins for the MTU complementary PWM output, and MTU0 pin can be placed in high-impedance state by POE0#, POE4#, POE8#, and POE10# pin falling-edge or low-level sampling. • Pins for the MTU complementary PWM output can be placed in high-impedance state when output levels of the MTU complementary PWM output pins are compared and simultaneous active-level output continues for one cycle or more. • Pins for the MTU complementary PWM output, and MTU0 can be placed in the high-impedance state by modifying the settings of the SPOER register of POE3. • Interrupts can be generated by input-level sampling or output level comparison results.

The POE3 has input level detection circuits, pin selection circuits, output level comparison circuits, and a high-impedance request/interrupt request generating circuit as shown in Figure 11.1.

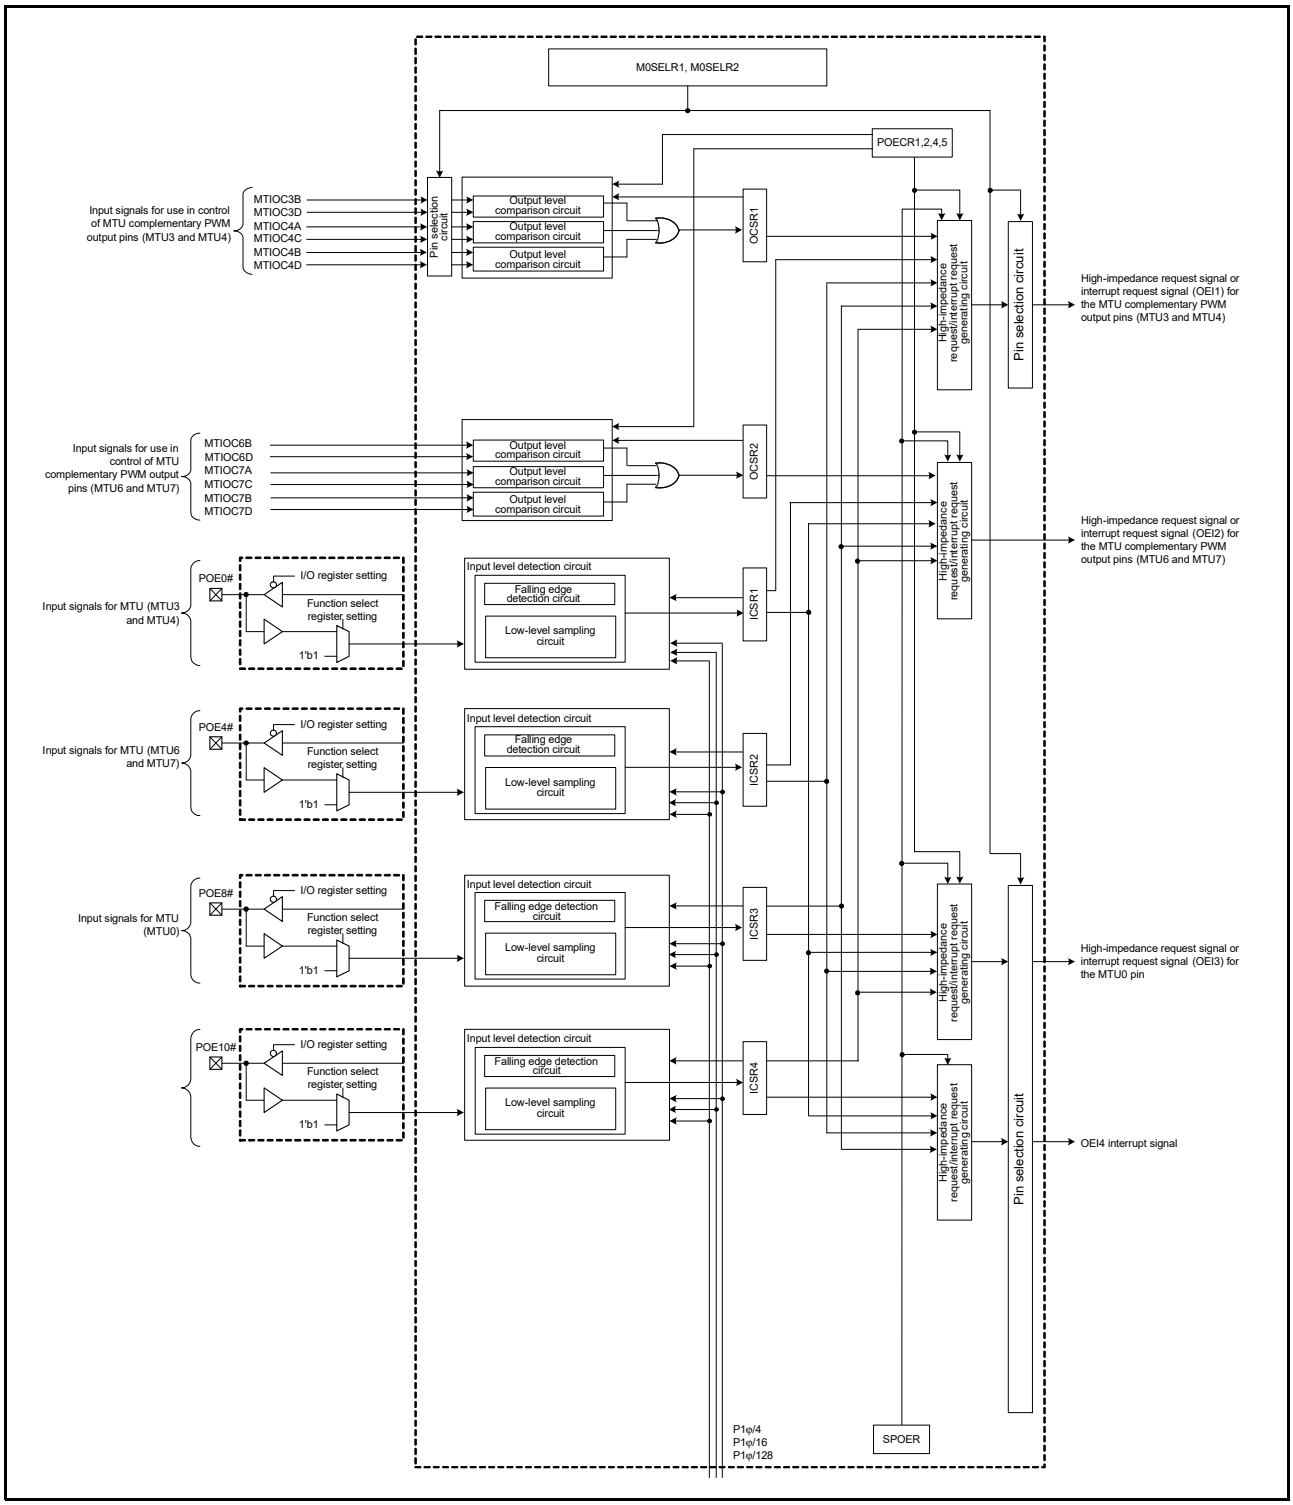

Figure 11.1 POE3 Block Diagram

Table 11.2 shows input/output pins to be used by the POE3.

Table 11.2 POE3 Input/Output Pins

Pin Name	I/O	Description
POE0#	Input	Input pin for the request signal to place the MTU3 and MTU4 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU6, and MTU7 pins in the high-impedance state.
POE4#	Input	Input pin for the request signal to place the MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU3, and MTU4 pins in the high-impedance state.
POE8#	Input	Input pin for the request signal to place the pins for MTU0 in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state.
POE10#	Input	In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output, and MTU0 pins in high-impedance state.

Table 11.3 shows output level comparisons with pin combinations.

Table 11.3 Pin Combinations

Pin Combination	I/O	Description
MTIOC3B and MTIOC3D	Output	The MTU3 and MTU4 pins for MTU complementary PWM output set in the M3SELR, M4SELR1, and M4SELR2 registers are placed in high-impedance state when both pins of a pair simultaneously output the active level*1 for one or more cycles.of the peripheral clock 1C (P1φ). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3. Note 1. The low level is output when the OLSP bit in TOCR1A of MTUn is 0 with the TOCS bit in TOCR1A of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2A of MTUn are 0 with the TOCS bit in TOCR1A of MTUn set to 1, or the high level is output when these bits are 1.
MTIOC4A and MTIOC4C	Output	
MTIOC4B and MTIOC4D	Output	
MTIOC6B and MTIOC6D	Output	The MTU6 and MTU7 pins for MTU complementary PWM output are placed in high-impedance state when both pins of a pair simultaneously output the active level*1 for one or more cycles.of the peripheral clock 1C (P1φ). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3. Note 1. The low level is output when the OLSP bit in TOCR1B of MTUn is 0 with the TOCS bit in TOCR1B of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2B of MTUn are 0 with the TOCS bit in TOCR1B of MTUn set to 1, or the high level is output when these bits are 1.
MTIOC7A and MTIOC7C	Output	
MTIOC7B and MTIOC7D	Output	

11.2 Register Descriptions

Table 11.4 shows the register configuration.
The POE3 registers are initialized by a reset.

Table 11.4 Register configuration

Register Name	Abbreviation	Address	Access size
Input level control/status register 1	ICSR1	H'E804_2000	16
Output level control/status register 1	OCSR1	H'E804_2002	16
Input level control/status register 2	ICSR2	H'E804_2004	16
Output level control/status register 2	OCSR2	H'E804_2006	16
Input level control/status register 3	ICSR3	H'E804_2008	16
Software port output enable register	SPOER	H'E804_200A	8
Port output enable control register 1	POECR1	H'E804_200B	8
Port output enable control register 2	POECR2	H'E804_200C	16
Port output enable control register 4	POECR4	H'E804_2010	16
Port output enable control register 5	POECR5	H'E804_2012	16
Input level control/status register 4	ICSR4	H'E804_2016	16
MTU0 pin select register 1	M0SELR1	H'E804_2024	8
MTU0 pin select register 2	M0SELR2	H'E804_2025	8

11.2.1 Input Level Control/Status Register 1 (ICSR1)

ICSR1 selects the input modes for the POE0# pins, controls the enable/disable of interrupts, and indicates status.

Address(es): H'E804_2000

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	POE0M[1:0]	POE0 Mode Select	b1 b0 0 0: Accepts a request on the falling edge of POE0# input. 0 1: Accepts a request when POE0# input has been sampled 16 times at P1φ/4 clock pulses and all are low level. 1 0: Accepts a request when POE0# input has been sampled 16 times at P1φ/16 clock pulses and all are low level. 1 1: Accepts a request when POE0# input has been sampled 16 times at P1φ/128 clock pulses and all are low level.	R/W*1
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	PIE1	Port Interrupt Enable 1	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	POE0F	POE0 Flag	0: Indicates that a high-impedance request has not been input to the POE0# pin. 1: Indicates that a high-impedance request has been input to the POE0# pin.	R/(W)*2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE0M[1:0] Bits (POE0 Mode Select)

These bits select the input mode of the POE0# pin.

PIE1 Bit (Port Interrupt Enable 1)

This bit enables or disables interrupt requests when any one of the POE0F bit of the ICSR1 is set to 1.

POE0F Flag (POE0 Flag)

This flag indicates that a high-impedance request has been input to the POE0# pin.
[Setting condition]

- When the input set by POE0M[1:0] occurs at the POE0# pin

[Clearing condition]

- By writing 0 to POE0F after reading POE0F = 1

11.2.2 Input Level Control/Status Register 2 (ICSR2)

ICSR2 selects the input mode for the POE4# pin, controls the enable/disable of interrupts, and indicates status.

Address(es): H'E804_2004

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	POE4M[1:0]	POE4 Mode Select	b1 b0 0 0: Accepts a request on the falling edge of POE4# input 0 1: Accepts a request when POE4# input has been sampled 16 times at P1φ/4 clock pulses and all are low level. 1 0: Accepts a request when POE4# input has been sampled 16 times at P1φ/16 clock pulses and all are low level. 1 1: Accepts a request when POE4# input has been sampled 16 times at P1φ/128 clock pulses and all are low level.	R/W*1
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	PIE2	Port Interrupt Enable 2	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	POE4F	POE4 Flag	0: Indicates that a high-impedance request has not been input to the POE4# pin. 1: Indicates that a high-impedance request has been input to the POE4# pin.	R/(W)*2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE4M[1:0] Bits (POE4 Mode Select)

These bits select the input mode of the POE4# pin.

PIE2 Bit (Port Interrupt Enable 2)

This bit enables or disables interrupt requests when the POE4F flag in ICSR2 is set to 1.

POE4F Flag (POE4 Flag)

This flag indicates that a high-impedance request has been input to the POE4# pin.
[Setting condition]

- When the input set by POE4M[1:0] occurs at the POE4# pin

[Clearing condition]

- By writing 0 to POE4F after reading POE4F = 1

11.2.3 Input Level Control/Status Register 3 (ICSR3)

ICSR3 selects the input mode for the POE8# pin, controls the enable/disable of interrupts, and indicates status.

Address(es): H'E804_2008

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	POE8M[1:0]	POE8 Mode Select	b1 b0 0 0: Accepts a request on the falling edge of POE8# input 0 1: Accepts a request when POE8# input has been sampled 16 times at P1φ/4 clock pulses and all are low level. 1 0: Accepts a request when POE8# input has been sampled 16 times at P1φ/16 clock pulses and all are low level. 1 1: Accepts a request when POE8# input has been sampled 16 times at P1φ/128 clock pulses and all are low level.	R/W*1
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	PIE3	Port Interrupt Enable 3	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b9	POE8E	POE8 High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	POE8F	POE8 Flag	0: Indicates that a high-impedance request has not been input to the POE8# pin. 1: Indicates that a high-impedance request has been input to the POE8# pin.	R/(W)*2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE8M[1:0] Bits (POE8 Mode Select)

These bits select the input mode of the POE8# pin.

PIE3 Bit (Port Interrupt Enable 3)

This bit enables or disables interrupt requests when the POE8F bit in ICSR3 is set to 1.

POE8E Bit (POE8 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE8F bit is set to 1.

POE8F Flag (POE8 Flag)

This flag indicates that a high-impedance request has been input to the POE8# pin.

[Setting condition]

- When the input set by POE8M[1:0] occurs at the POE8# pin

[Clearing condition]

- By writing 0 to POE8F after reading POE8F = 1

11.2.4 Input Level Control/Status Register 4 (ICSR4)

ICSR4 selects the POE10# pin input mode, controls the enable/disable of interrupts, and indicates status.

Address(es): H'E804_2016

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	POE10M[1:0]	POE10 Mode Select	b1 b0 0 0: Accepts a request on the falling edge of POE10# input 0 1: Accepts a request when POE10# input has been sampled 16 times at P1φ/4 clock pulses and all are low level. 1 0: Accepts a request when POE10# input has been sampled 16 times at P1φ/16 clock pulses and all are low level. 1 1: Accepts a request when POE10# input has been sampled 16 times at P1φ/128 clock pulses and all are low level.	R/W*1
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	PIE4	Port Interrupt Enable 4	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b9	POE10E	POE10 High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	POE10F	POE10 Flag	0: Indicates that a high-impedance request has not been input to the POE10# pin. 1: Indicates that a high-impedance request has been input to the POE10# pin.	R/(W)*2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE10M[1:0] Bits (POE10 Mode Select)

These bits select the input mode of the POE10# pin.

PIE4 Bit (Port Interrupt Enable 4)

This bit enables or disables interrupt requests when the POE10F bit is set to 1.

POE10E Bit (POE10 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE10F bit is set to 1.

POE10F Bit (POE10 Flag)

This flag indicates that a request for the high-impedance state has been input to the POE10# pin.
[Setting condition]

- When the input set by POE10M[1:0] occurs at the POE10# pin

[Clearing condition]

- By writing 0 to POE10F after reading POE10F = 1

11.2.5 Output Level Control/Status Register 1 (OCSR1)

OCSR1 controls the enable/disable of output level comparison and interrupts, and indicates status.

Address(es): H'E804_2002

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OSF1	—	—	—	—	—	OCE1	OIE1	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	OIE1	Output Short Interrupt Enable 1	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b9	OCE1	Output Short High-Impedance Enable 1	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b14 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	OSF1	Output Short Flag 1	0: Indicates that outputs have not simultaneously become an active level. 1: Indicates that outputs have simultaneously become an active level.	R/(W)*2

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

OIE1 Bit (Output Short Interrupt Enable 1)

This bit enables or disables interrupt requests when the OSF1 bit in OCSR1 is set to 1.

OCE1 Bit (Output Short High-Impedance Enable 1)

This bit specifies whether to place the pins in high-impedance state when the OSF1 bit in OCSR1 is set to 1.

OSF1 Flag (Output Short Flag 1)

This flag indicates that any one of the three pairs of two-phase MTU3 and MTU4 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of two-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to OSF1 after reading OSF1 = 1

11.2.6 Output Level Control/Status Register 2 (OCSR2)

OCSR2 controls the enable/disable of output level comparison and interrupts, and indicates status.

Address(es): H'E804_2006

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OSF2	—	—	—	—	—	OCE2	OIE2	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	OIE2	Output Short Interrupt Enable 2	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b9	OCE2	Output Short High-Impedance Enable 2	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b14 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	OSF2	Output Short Flag 2	0: Indicates that outputs have not simultaneously become an active level. 1: Indicates that outputs have simultaneously become an active level.	R/(W)*2

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

OIE2 Bit (Output Short Interrupt Enable 2)

This bit enables or disables interrupt requests when the OSF2 bit in OCSR2 is set to 1.

OCE2 Bit (Output Short High-Impedance Enable 2)

This bit specifies whether to place the pins in high-impedance state when the OSF2 bit in OCSR2 is set to 1.

OSF2 Flag (Output Short Flag 2)

This flag indicates that any one of the three pairs of two-phase MTU6 and MTU7 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of two-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to OSF2 after reading OSF2 = 1

11.2.7 Software Port Output Enable Register (SPOER)

SPOER controls high-impedance state of the pins.

Address(es): H'E804_200A

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	MTUCH0HIZ	MTUCH67HIZ	MTUCH34HIZ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MTUCH34HIZ	MTU3 or MTU4 Output High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W
b1	MTUCH67HIZ	MTU6 and MTU7 Output High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W
b2	MTUCH0HIZ	MTU0 Output High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

MTUCH34HIZ Bit (MTU3 or MTU4 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D) in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH34HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH34HIZ after reading MTUCH34HIZ = 1*1

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

MTUCH67HIZ Bit (MTU6 and MTU7 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH67HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH67HIZ after reading MTUCH67HIZ = 1*1

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

MTUCH0HIZ Bit (MTU0 Output High-Impedance Enable)

This bit specifies whether to place the MTU0 pins in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH0HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH0HIZ after reading MTUCH0HIZ = 1*1

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

11.2.8 Port Output Enable Control Register 1 (POECR1)

POECR1 controls high-impedance state of the MTU0 pins.

Address(es): H'E804_200B

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MTU0DZE	MTU0CZE	MTU0BZE	MTU0AZE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MTU0AZE	MTIOC0A High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b1	MTU0BZE	MTIOC0B High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b2	MTU0CZE	MTIOC0C High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b3	MTU0DZE	MTIOC0D High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

MTU0AZE Bit (MTIOC0A High-Impedance Enable)

This bit specifies whether to place the MTIOC0A output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0BZE Bit (MTIOC0B High-Impedance Enable)

This bit specifies whether to place the MTIOC0B output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0CZE Bit (MTIOC0C High-Impedance Enable)

This bit specifies whether to place the MTIOC0C output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0DZE Bit (MTIOC0D High-Impedance Enable)

This bit specifies whether to place the MTIOC0D output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

11.2.9 Port Output Enable Control Register 2 (POECR2)

POECR2 controls high-impedance state of the MTU complementary PWM output pins (MTU3, MTU4, MTU6, and MTU7 pins).

Address(es): H'E804_200C

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	Bit Name	Description	R/W
b0	MTU7BDZE	MTIOC7B/7D High-Impedance Enable*2	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b1	MTU7ACZE	MTIOC7A/7C High-Impedance Enable*2	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b2	MTU6BDZE	MTIOC6B/6D High-Impedance Enable*2	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	MTU4BDZE	MTIOC4B/4D High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b9	MTU4ACZE	MTIOC4A/4C High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b10	MTU3BDZE	MTIOC3B/3D High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.
Note 2. Set this bit to 0 when MTU6 or MTU7 is not used.

MTU7BDZE Bit (MTIOC7B/7D High-Impedance Enable)

This bit specifies whether to place the MTIOC7B output and MTIOC7D output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU7ACZE Bit (MTIOC7A/7C High-Impedance Enable)

This bit specifies whether to place the MTIOC7A output and MTIOC7C output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU6BDZE Bit (MTIOC6B/6D High-Impedance Enable)

This bit specifies whether to place the MTIOC6B output and MTIOC6D output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU4BDZE Bit (MTIOC4B/4D High-Impedance Enable)

This bit specifies whether to place the MTIOC4B output and MTIOC4D output for the MTU4 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

MTU4ACZE Bit (MTIOC4A/4C High-Impedance Enable)

This bit specifies whether to place the MTIOC4A output and MTIOC4C output for the MTU4 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

MTU3BDZE Bit (MTIOC3B/3D High-Impedance Enable)

This bit specifies whether to place the MTIOC3B output and MTIOC3D output for the MTU3 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

11.2.10 Port Output Enable Control Register 4 (POECR4)

The POECR4 is used to extend the control conditions of the high-impedance state for the MTU3, MTU4, MTU6, and MTU7 pins for the MTU complementary PWM output.
For details about the targets and conditions of high-impedance control, see Figure 11.2.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

IC2ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

IC3ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

IC4ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

IC1ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

IC3ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

IC4ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

11.2.11 Port Output Enable Control Register 5 (POECR5)

The POECR5 is used to extend the control conditions of the high-impedance for the MTU0 pin.
For details about the targets and conditions of high-impedance control, see Figure 11.2.

Address(es): H'E804_2012

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

IC1ADDMT0ZE Bit (MTU0 High-Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC2ADDMT0ZE Bit (MTU0 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

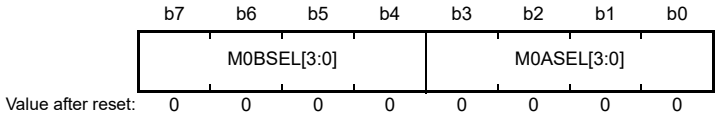
IC4ADDMT0ZE Bit (MTU0 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

11.2.12 MTU0 Pin Select Register 1 (M0SELR1)

M0SELR1 is an 8-bit readable/writable register that selects the A and B pins on MTU0 as targets for high-impedance control.

Address(es): H'E804_2024



Bit	Symbol	Bit Name	Description	R/W
b3 to b0	M0ASEL[3:0]	MTU0-A (MTIOC0A) Pin Select	b3 b0 0000: Controls the high-impedance state of PE3 when it is in use as the MTIOC0A pin. 0010: Controls the high-impedance state of PA6 when it is in use as the MTIOC0A pin. Settings other than above are prohibited.	R/W*1
b7 to b4	M0BSEL[3:0]	MTU0-B (MTIOC0B) Pin Select	b7 b4 0000: Controls the high-impedance state of PE4 when it is in use as the MTIOC0B pin. 0001: Controls the high-impedance state of PA5 when it is in use as the MTIOC0B pin. Settings other than above are prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

M0ASEL[3:0] Bits (MTU0-A (MTIOC0A) Pin Select)

These bits select the target MTIOC0A pin for high-impedance control.

M0BSEL[3:0] Bits (MTU0-B (MTIOC0B) Pin Select)

These bits select the target MTIOC0B pin for high-impedance control.

11.2.13 MTU0 Pin Select Register 2 (M0SELR2)

M0SELR2 is an 8-bit readable/writable register that selects the C and D pins on MTU0 as targets for high-impedance control.

Address(es): H'E804_2025

	b7	b6	b5	b4	b3	b2	b1	b0
	M0DSEL[3:0]				M0CSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	M0CSEL[3:0]	MTU0-C (MTIOC0C) Pin Select	b3 b0 0000: Controls the high-impedance state of PE5 when it is in use as the MTIOC0C pin. 0010: Controls the high-impedance state of PA4 when it is in use as the MTIOC0C pin. Settings other than above are prohibited.	R/W*1
b7 to b4	M0DSEL[3:0]	MTU0-D (MTIOC0D) Pin Select	b7 b4 0000: Controls the high-impedance state of PE6 when it is in use as the MTIOC0D pin. 0010: Controls the high-impedance state of PA3 when it is in use as the MTIOC0D pin. Settings other than above are prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

M0CSEL[3:0] Bits (MTU0-C (MTIOC0C) Pin Select)

These bits select the target MTIOC0C pin for high-impedance control.

M0DSEL[3:0] Bits (MTU0-D (MTIOC0D) Pin Select)

These bits select the target MTIOC0D pin for high-impedance control.

11.3 Operation

Table 11.5 shows the target pins for high-impedance control and conditions to place the pins in high-impedance state.

Table 11.5 Target Pins and Conditions for High-Impedance Control (1/2)

Pins	Conditions	Detailed Conditions
MTU3 pins (MTIOC3B and MTIOC3D)	• Operation for detection of the POE0# input level • Operation for comparison of the output levels on the MTIOC3B and MTIOC3D pins • SPOER setting • Additional conditions of the POECR4	MTU3BDZE• ((POE0F) +(OSF1•OCE1) +(MTUCH34HIZ) +(IC2ADDMT34ZE•POE4F) +(IC3ADDMT34ZE•POE8E•POE8F) +(IC4ADDMT34ZE•ICSR4.POE10E•ICSR4.POE10F)

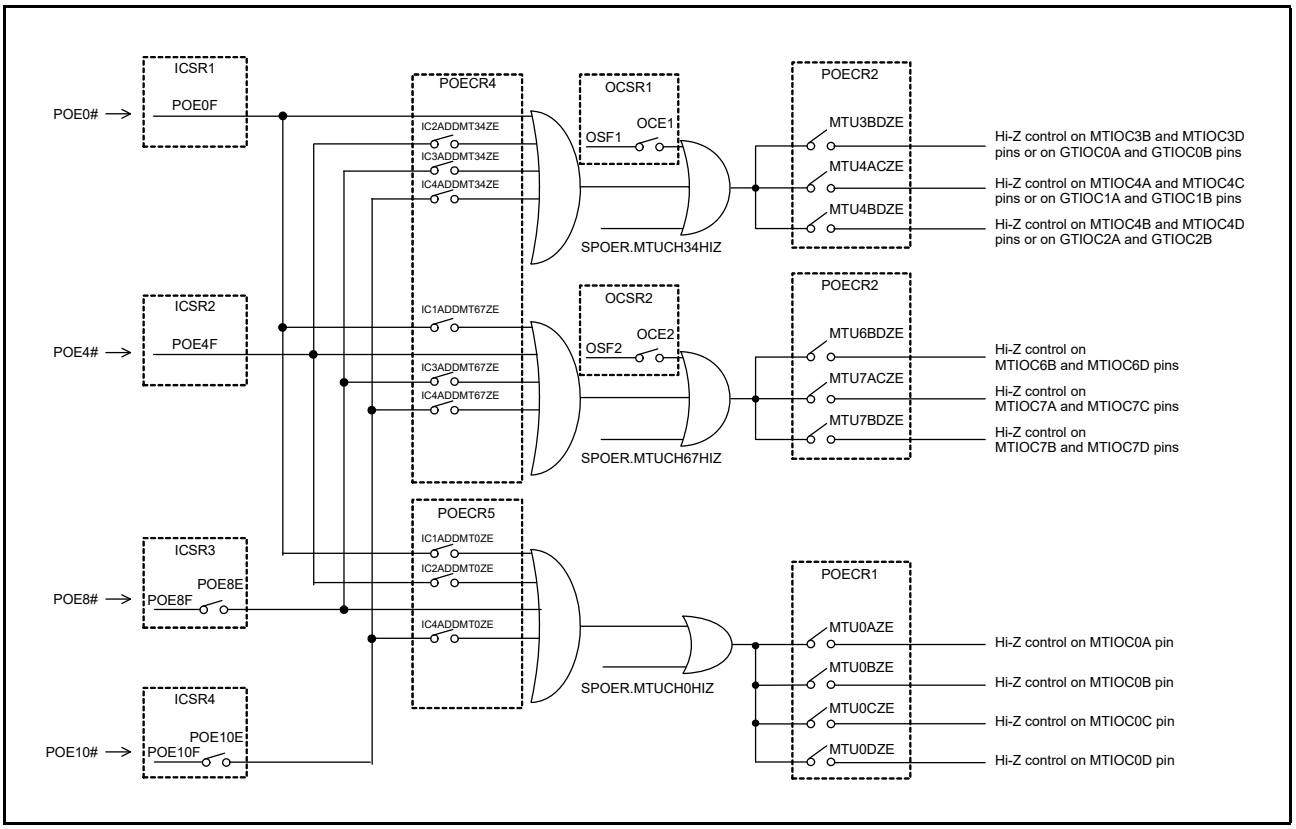

Figure 11.2 Target Pins and Conditions for High-Impedance Control

High-impedance requests to individual pins can be controlled by the settings in the POECR1 to POECR2 registers. The following input pins can be added to high-impedance control conditions by the settings in the POECR4 to POECR5 registers: input pins other than the POE0# pin for the MTU3 and MTU4 pins; input pins other than the POE4# pin for the MTU6 and MTU7 pins; input pins other than the POE8# pin for the MTU0 pins.

For example, setting the IC2ADDMT34ZE bit in POECR4 to 1 outputs high-impedance requests to the MTU3 and

MTU4 pins even when the POE4# input is detected.
High-impedance requests due to the detection of POE8# input or POE10# input can be controlled by the settings in the ICSR3 to ICSR4 registers. (The ICSR1 and ICSR2 registers do not control enabling or disabling of output of high-impedance requests.)
High-impedance requests to the MTU3, MTU4, MTU6, and MTU7 pins as the results of output level comparison can be controlled by the settings in the OCSR1 and OCSR2 registers.

11.3.1 MTU Pin Selection

In this LSI, the pin functions for MTU are respectively assigned to multiple sets of port pins. The target pins for high-impedance control can be selected by the pin selection register in POE3 (M0SELR1 or M0SELR2 register). Table 11.6 shows the correspondence between MTU pins and selection registers.
Note that settings for pins to be used as MTU must be separately made in the registers of the general purpose input/output port (GPIO). Take care so that there are no differences between the pins selected in the POE3 registers and the pins selected in the GPIO registers.

Table 11.6 Correspondence between MTU Pins

MTU Pin Functions	Corresponding Ports	Selection Registers
MTIOC0A	PA6*1	M0SELR1
	PE3	
MTIOC0B	PA5*1	
	PE4	
MTIOC0C	PA4*1	M0SELR2
	PE5	
MTIOC0D	PA3*1	
	PE6	
MTIOC3B	PG2	—
MTIOC3D	PG3	
MTIOC4A	PG4	—
MTIOC4C	PG6	
MTIOC4B	PG5	—
MTIOC4D	PG7	
MTIOC6B	PF5*1	—
	P00*2	
MTIOC6D	PH2*1	
	P02*2	
MTIOC7A	PF0*1	
	P03*2	
MTIOC7C	PF2*1	
	P05*2	
MTIOC7B	PF1*1	
	P04*2	
MTIOC7D	PF3*1	
	P06*2	

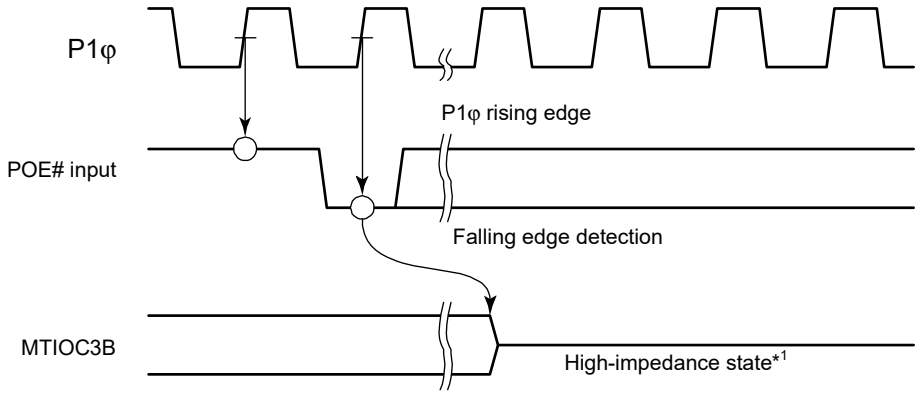
Note 1. This selection is not available in 176-pin products.
Note 2. These are not target pins for high-impedance control by the POE3.

11.3.2 Input Level Detection Operation

If the input conditions set by ICSR1 to ICSR4 occur on the POE0#, POE4#, POE8#, and POE10# pins, the MTU3 and MTU4 or MTU6 and MTU7 pins for the MTU complementary PWM output, and MTU0 pin are placed in high-impedance state. Note however, that these pins are still placed in the high-impedance state even when the MTU functions are not selected for the pins.

(1) Falling Edge Detection

When a change from a high to low level is input to the POE0#, POE4#, POE8#, and POE10# pins, the pins for the MTU complementary PWM output, and pin functions multiplexed with the MTU0 pins are placed in highimpedance state. Figure 11.3 shows a sample timing after the level changes in input to the POE0#, POE4#, POE8#, and POE10# pins until the respective pins enter high-impedance state.

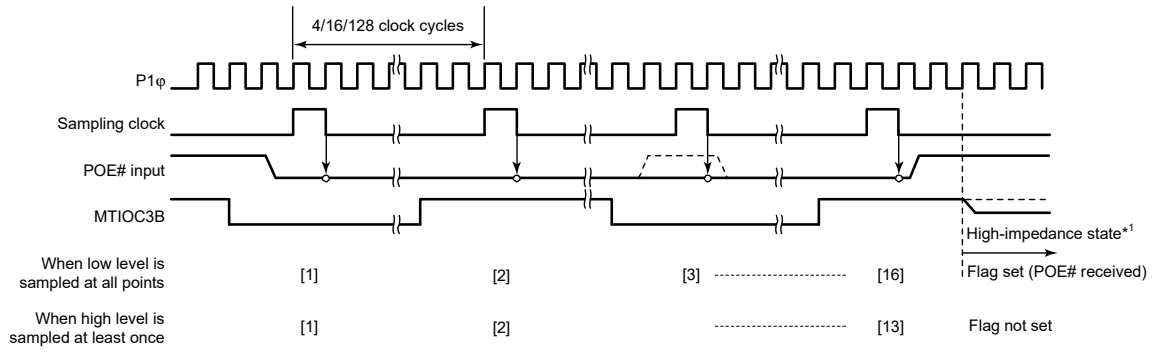


Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 11.3 Falling Edge Detection

(2) Low-Level Detection

Figure 11.4 shows the low-level detection operation. Sixteen continuous low levels are sampled with the sampling clock selected by ICSR1 to ICSR4. If even one high level is detected during this interval, the low level is not accepted. The timing when pins for the MTU complementary PWM output, and MTU0 pins enter the highimpedance state after the sampling clock is input is the same in both falling-edge detection and in low-level detection.



Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 11.4 Low-Level Detection Operation

11.3.3 Output Level Compare Operation

Figure 11.5 shows an example of the output level compare operation for the combination of MTIOC3B and MTIOC3D. The operation is the same for the other pin combinations.

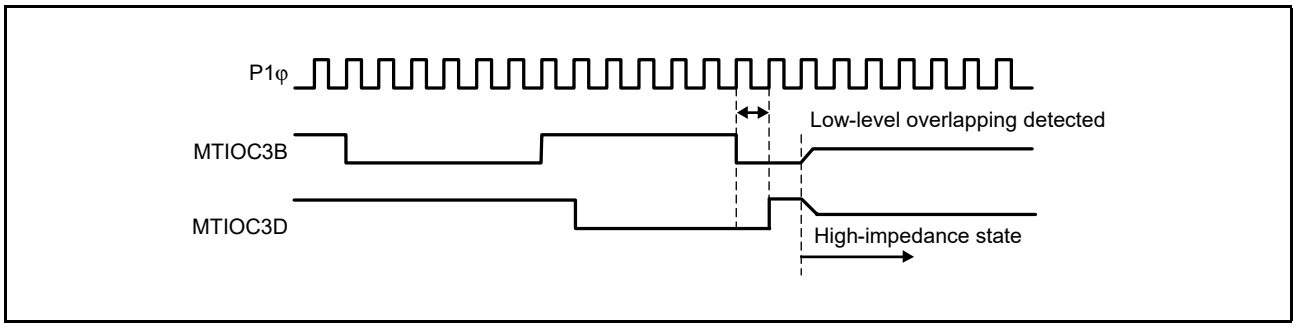


Figure 11.5 Output Level Compare Operation

11.3.4 High-Impedance Control Using Registers

The high-impedance state of the MTU pins (MTU0, MTU3, MTU4, MTU6, and MTU7) can be directly controlled by using the software port output enable register (SPOER).
For instance, setting the MTUCH34HIZ bit in SPOER to 1 places the MTU3 and MTU4 pins specified by the port output enable control register 2 (POECR2) in the high-impedance state.
The high-impedance state of other pins can also be controlled by setting the appropriate bits in SPOER.

11.3.5 Additional Functions for Controlling High-Impedance States

Settings in port enable registers 4 to 5 (POECR4 and POECR5) can add further high-impedance control conditions for the MTU complementary PWM output and MTU0 pins.
For instance, the settings listed below can be added as high-impedance control conditions for the MTU3 and MTU4 pins.

- Setting the IC2ADDMT34ZE bit in POECR4 to 1 adds the input level detection by the POE4#
- Setting the IC3ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE8#
- Setting the IC4ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE10# (ICSR4.POE10F)

The high-impedance state of other pins can also be controlled by setting the appropriate bits in the POECR4 and POECR5.

11.3.6 Release from High-Impedance State

MTU pins which have entered high-impedance state due to input-level detection can be released from the state either by returning them to their initial state with a reset, or by clearing all of the ICSR1.POE0F, ICSR2.POE4F, ICSR3.POE8F, and ICSR4.POE10F flags. However, note that when low-level sampling is selected with the ICSR1.POE0M[1:0], ICSR2.POE4M[1:0], ICSR3.POE8M[1:0], ICSR4.POE10M[1:0], and ICSR5.POE10M[1:0] bits, just writing 0 to a flag is ignored (the flag is not cleared); flags can be cleared by writing 0 to it only after a high level is input to the POE0#, POE4#, POE8#, and POE10# pins and is sampled.

MTU pins which have entered high-impedance state due to output level detection can be released from the state either by returning them to their initial state with a reset, or by clearing the OCSR1.OSF1 flag or the OCSR2.OSF2 flag.

11.4 POE3 Setting Procedure

Figure 11.6 shows the procedure for setting POE3. It illustrates an example of high-impedance control in response to comparison of the output levels on the MTU0 pins (MTIOC3B/MTIOC3D). In the figure, PG2 is selected as the MTIOC3B pin and PG3 is selected as the MTIOC3D pin.

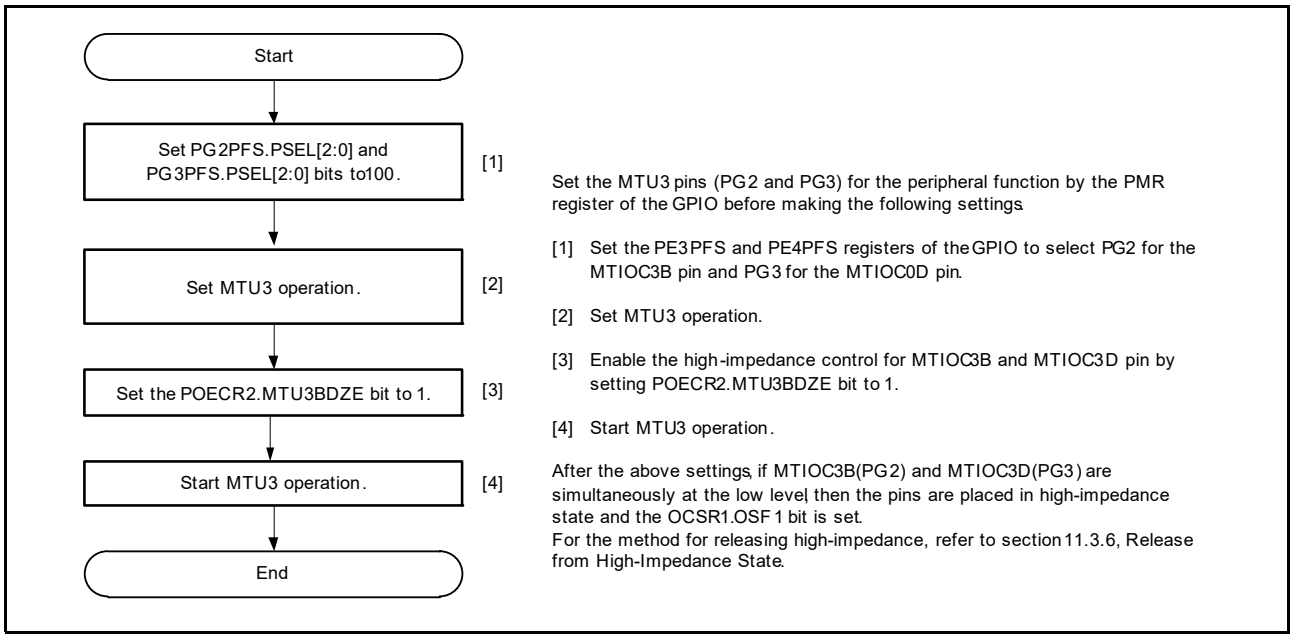

Figure 11.6 Procedure for Setting POE3

11.5 Interrupts

The POE3 issues a request to generate an interrupt when the specified condition is satisfied during input level detection or output level comparison. Table 11.7 shows the interrupt sources and their conditions.

Table 11.7 Interrupt Sources and Conditions

Name	Interrupt Source	Interrupt Flag	Condition
OEI1	Output enable interrupt 1	POE0F and OSF1	PIE1•POE0F+OIE1•OSF1
OEI2	Output enable interrupt 2	POE4F and OSF2	PIE2•POE4F+OIE2•OSF2
OEI3	Output enable interrupt 3	POE8F	PIE3•POE8F
OEI4	Output enable interrupt 4	ICSR4.POE10F	PIE4•ICSR4.POE10F

11.6 Usage Notes

11.6.1 Transition to Low Power Consumption Mode

When the POE3 is used, do not make a transition to software standby mode or deep standby mode. In these modes, the POE3 stops and thus the high-impedance state of pins cannot be controlled.

11.6.2 High-Impedance Control when the MTU Pins are not Selected

If high-impedance control for a pin having a multiplexed MTU pin function is enabled by the POECR1 or POECR2 register and the high-impedance condition is satisfied, the pin is placed in the high-impedance state even if the MTU function is not selected for the given pin at the time.
To avoid unintended high-impedance states, ensure that there are no differences between the settings for MTU pin selection in the PmnPFS registers of the GPIO and for MTU pin selection in the pin selection register of the POE3.

11.6.3 High-Impedance Control when MTU6 and MTU7 are not Used

When MTU6 and MTU7 are not to be used, set the POECR2.MTU6BDZE, MTU7ACZE, and MTU7BDZE bits to 0 to disable high-impedance control.

12. General PWM Timer (GPT)

12.1 Overview

This LSI has a general purpose PWM timer (GPT) composed of 8 channels of 32-bit timer (GPT32E). Table 12.1 lists the GPT specifications, Table 12.2 shows the GPT functions, Figure 12.1 shows the block diagram, and Table 12.3 lists the I/O pins.

Table 12.1 GPT specifications

Parameter	Specifications
Functions	• 32 bits × 8 channels • Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter. • Clock sources independently selectable for each channel • Two I/O pins per channel • Two output compare/input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms. • Registers for setting up frame cycles in each channel (with capability for generating interrupts at overflow or underflow) • Generation of dead times in PWM operation • Synchronous starting, stopping and clearing counters for arbitrary channels • Starting, stopping, clearing and up/down counters in response to a maximum of eight events • Starting, stopping, clearing and up/down counters in response to input level comparison • Starting, clearing, stopping and up/down counters in response to a maximum of four external triggers • Output pin disable function by dead time error and detected short-circuits between output pins • A/D converter start triggers can be generated (GPT32E0 to GPT32E3) • Compare match A to F event and overflow/underflow event can be output • Enables the noise filter for input capture and external trigger operation

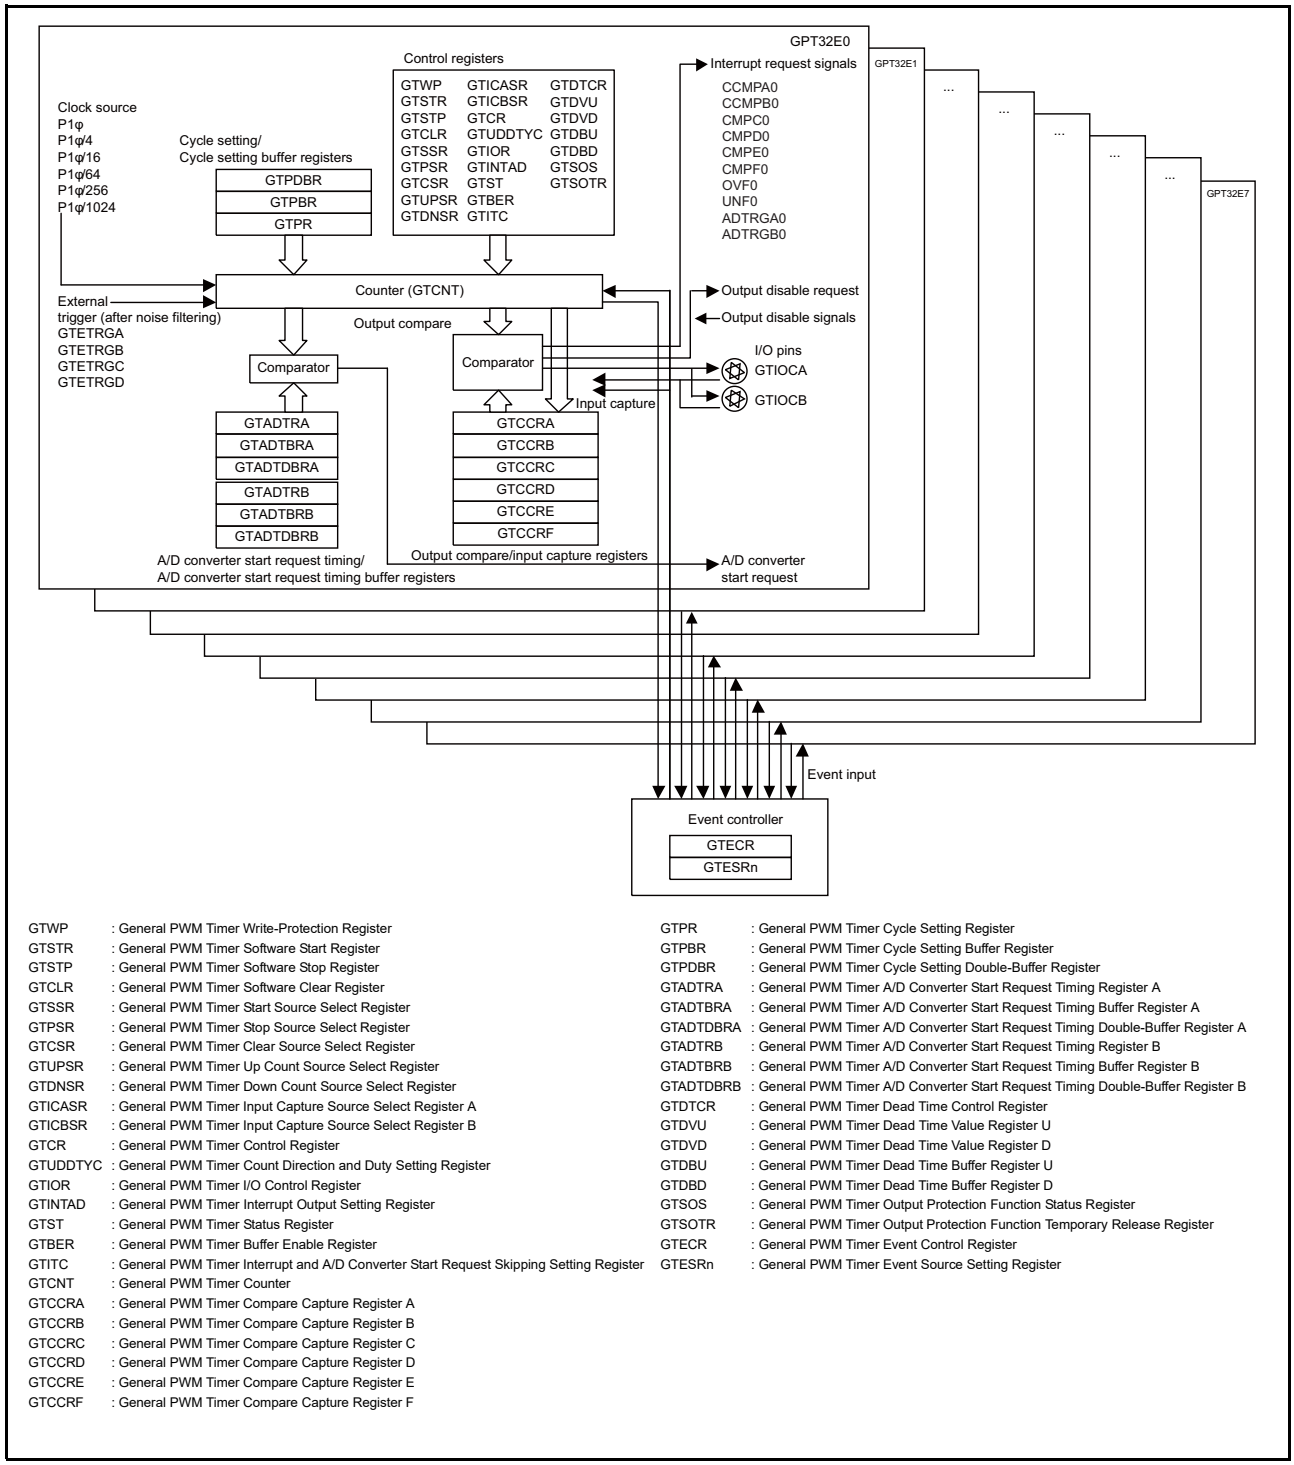
DMA activation		All the interrupt sources
A/D converter start trigger		Compare match of GTADTRA or GTADTRB (Channel 0 to 3)
Interrupt sources		10 sources • GTCCRA compare match/input capture (CCMPAn) • GTCCRB compare match/input capture (CCMPBn) • GTCCRC compare match (CMPCn) • GTCCRD compare match (CMPDn) • GTCCRE compare match (CMPEn) • GTCCRF compare match (CMPFn) • GTADTRA compare match (ADTRGAn) • GTADTRB compare match (ADTRGBn) • GTCNT overflow (GTPR compare match) (OVFn) • GTCNT underflow (UNFn)
Interrupt skipping function		Skips GTCNT overflows (GTPR compare match) (OVFn)/ GTCNT underflow (UNFn) interrupts (with interlocking function for other interrupts or A/D conversion requests).
Event cooperation function		Available
Noise filtering function		Available



GTWP : General PWM Timer Write-Protection Register

	GTIOC7B	I/O	GTCCRB register input capture input/output compare output/PWM output pin

12.2 Register Descriptions

Table 12.4 lists the registers in the GPT.

Table 12.4 GPT registers

Module symbol	Register name	Register symbol	Reset value	Address (m = 0 to 7)	Access size
GPT32Em (m=0 to 7)	General PWM Timer Write-Protection Register	GTWP	H'00000000	H'E804_3000+H'0100×m	32
	General PWM Timer Software Start Register	GTSTR	H'00000000	H'E804_3004+H'0100×m	32
	General PWM Timer Software Stop Register	GTSTP	H'FFFFFFFF	H'E804_3008+H'0100×m	32
	General PWM Timer Software Clear Register	GTCLR	H'00000000	H'E804_300C+H'0100×m	32
	General PWM Timer Start Source Select Register	GTSSR	H'00000000	H'E804_3010+H'0100×m	32
	General PWM Timer Stop Source Select Register	GTPSR	H'00000000	H'E804_3014+H'0100×m	32
	General PWM Timer Clear Source Select Register	GTCSR	H'00000000	H'E804_3018+H'0100×m	32
	General PWM Timer Up Count Source Select Register	GTUPSR	H'00000000	H'E804_301C+H'0100×m	32
	General PWM Timer Down Count Source Select Register	GTDNSR	H'00000000	H'E804_3020+H'0100×m	32
	General PWM Timer Input Capture Source Select Register A	GTICASR	H'00000000	H'E804_3024+H'0100×m	32
	General PWM Timer Input Capture Source Select Register B	GTICBSR	H'00000000	H'E804_3028+H'0100×m	32
	General PWM Timer Control Register	GTCR	H'00000000	H'E804_302C+H'0100×m	32
	General PWM Timer Count Direction and Duty Setting Register	GTUDDTYC	H'00000001	H'E804_3030+H'0100×m	32
	General PWM Timer I/O Control Register	GTIOR	H'00000000	H'E804_3034+H'0100×m	32
	General PWM Timer Interrupt Output Setting Register	GTINTAD	H'00000000	H'E804_3038+H'0100×m	32
	General PWM Timer Status Register	GTST	H'00008000	H'E804_303C+H'0100×m	32
	General PWM Timer Buffer Enable Register	GTBER	H'00000000	H'E804_3040+H'0100×m	32
	General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register	GTITC	H'00000000	H'E804_3044+H'0100×m	32
	General PWM Timer Counter	GTCNT	H'00000000	H'E804_3048+H'0100×m	32
	General PWM Timer Compare Capture Register A	GTCCRA	H'FFFFFFFF	H'E804_304C+H'0100×m	32
	General PWM Timer Compare Capture Register B	GTCCRB	H'FFFFFFFF	H'E804_3050+H'0100×m	32
	General PWM Timer Compare Capture Register C	GTCCRC	H'FFFFFFFF	H'E804_3054+H'0100×m	32
	General PWM Timer Compare Capture Register E	GTCCRE	H'FFFFFFFF	H'E804_3058+H'0100×m	32
	General PWM Timer Compare Capture Register D	GTCCRD	H'FFFFFFFF	H'E804_305C+H'0100×m	32
	General PWM Timer Compare Capture Register F	GTCCRF	H'FFFFFFFF	H'E804_3060+H'0100×m	32
	General PWM Timer Cycle Setting Register	GTPR	H'FFFFFFFF	H'E804_3064+H'0100×m	32

Table 12.4 GPT registers

Module symbol	Register name	Register symbol	Reset value	Address (m = 0 to 7)	Access size
GPT32Em (m=0 to 7)	General PWM Timer Cycle Setting Buffer Register	GTPBR	H'FFFFFFFF	H'E804_3068+H'0100×m	32
	General PWM Timer Cycle Setting Double-Buffer Register	GTPDBR	H'FFFFFFFF	H'E804_306C+H'0100×m	32

	General PWM Timer Event Source Setting Register 7	GTESR7	H'0000	H'E804_382C	16

12.2.1 General PWM Timer Write-Protection Register (GTWP)

Address(es): GPT32Em.GTWP E804 3000h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PRKEY[7:0]								—	—	—	—	—	—	—	WP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	WP	Register Write Disable	0: Enable writes to the register 1: Disable writes to the register.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b8	PRKEY[7:0]	GTWP Key Code	When A5h is written to these bits, the writes to the WP bit are permitted. These bits are read as 0.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

To prevent accidental changes, the GTWP enables or disables writing to following registers:

- GTSSR
- GTPSR
- GTCSR
- GTUPSR
- GTDNSR
- GTICASR
- GTICBSR
- GTCR
- GTUDDTYC
- GTIOR
- GTINTAD
- GTST
- GTBER
- GTITC
- GTCNT
- GTCCRA
- GTCCRB
- GTCCRC
- GTCCRD
- GTCCRE
- GTCCRF
- GTPR
- GTPBR
- GTPDBR
- GTADTRA

- GTADTBRA
- GTADTDBRA
- GTADTRB
- GTADTBRB
- GTADTDBRB
- GTDTCR
- GTDVU
- GTDVD
- GTDBU
- GTDBD
- GTSOS
- GTSOTR.

12.2.2 General PWM Timer Software Start Register (GTSTR)

Address(es): GPT32Em.GTSTR E804 3004h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CSTRT7	CSTRT6	CSTRT5	CSTRT4	CSTRT3	CSTRT2	CSTRT1	CSTRT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The GTSTR starts the GTCNT counter operation for each channel x, where x = 0 to 7.
The GTSTR bit number represents the channel number. The GTSTR register is shared by all of the channels. The GTCNT counter starts for the channel associated with the GTSTR bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTR register.

CSTRTx bit (channel x GTCNT Count Start) (x = 0 to 7)

The CSTRTx bit starts channel x of the GTCNT counter operation. Writing to GTSTR.CSTRTx bit has no effect unless GPTx.GTSSR.CSTRT bit is set to 1.
Read data shows the counter status of each channel (GTCR.CST bit). Zero means the counter stops and 1 means the counter is running.

12.2.3 General PWM Timer Software Stop Register (GTSTP)

Address(es): GPT32Em.GTSTP E804 3008h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CSTOP 7	CSTOP 6	CSTOP 5	CSTOP 4	CSTOP 3	CSTOP 2	CSTOP 1	CSTOP 0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The GTSTP stops the GTCNT counter operation for each channel x, where x = 0 to 7.
The GTSTP bit number represents the channel number. The GTSTP register is shared by all of the channels. The GTCNT counter stops for the channel associated with the GTSTP bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTP register.

CSTOPx bit (channel x GTCNT Count Stop) (x = 0 to 7)

The CSTOPx bit stops channel x of the GTCNT counter operation. Writing to GTSTP.CSTOPx bit has no effect unless GPTx.GTPSR.CSTOP bit is set to 1. Read data shows the counter status of each channel (invert of GTCR.CST bit). Zero means the counter is running and 1 means the counter stops.

12.2.4 General PWM Timer Software Clear Register (GTCLR)

Address(es): GPT32Em.GTCLR E804 300Ch + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CCLR 7	CCLR 6	CCLR 5	CCLR 4	CCLR 3	CCLR 2	CCLR 1	CCLR 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GTCLR is a write-only register that clears the GTCNT counter operation for each channel x, where x = 0 to 7.
The GTCLR bit number represents the channel number. The GTCLR register is shared by all of the channels. The GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter.

CCLRx bit (channel x GTCNT Count Clear) (x = 0 to 7).

Channel x of the GTCNT counter value is cleared on writing 1 to the CCLRx bit. This bit is read as 0.

12.2.5 General PWM Timer Start Source Select Register (GTSSR)

Address(es): GPT32Em.GTSSR E804 3010h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CSTRT	—	—	—	—	—	—	—	SSEVTH	SSEVTG	SSEVTF	SSEVTE	SSEVTD	SSEVTC	SSEVTB	SSEVTA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SSCBFAH	SSCBFAL	SSCBRAH	SSCBRAL	SSCAFBH	SSCAFBL	SSCARBH	SSCARBL	SSGTRGDF	SSGTRGDR	SSGTRGCF	SSGTRGCR	SSGTRGBF	SSGTRGBR	SSGTRGAF	SSGTRGAR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SSGTRGAR	GTETRGA Pin Rising Input Source Counter Start Enable	0: Disable counter start on the rising edge of GTETRGA input 1: Enable counter start on the rising edge of GTETRGA input	R/W
b1	SSGTRGAF	GTETRGA Pin Falling Input Source Counter Start Enable	0: Disable counter start on the falling edge of GTETRGA input 1: Enable counter start on the falling edge of GTETRGA input	R/W
b2	SSGTRGBR	GTETRGB Pin Rising Input Source Counter Start Enable	0: Disable counter start on the rising edge of GTETRGB input 1: Enable counter start on the rising edge of GTETRGB input	R/W
b3	SSGTRGBF	GTETRGB Pin Falling Input Source Counter Start Enable	0: Disable counter start on the falling edge of GTETRGB input 1: Enable counter start on the falling edge of GTETRGB input	R/W
b4	SSGTRGCR	GTETRGC Pin Rising Input Source Counter Start Enable	0: Disable counter start on the rising edge of GTETRGC input 1: Enable counter start on the rising edge of GTETRGC input	R/W
b5	SSGTRGCF	GTETRGC Pin Falling Input Source Counter Start Enable	0: Disable counter start on the falling edge of GTETRGC input 1: Enable counter start on the falling edge of GTETRGC input	R/W
b6	SSGTRGDR	GTETRGD Pin Rising Input Source Counter Start Enable	0: Disable counter start on the rising edge of GTETRGD input 1: Enable counter start on the rising edge of GTETRGD input	R/W
b7	SSGTRGDF	GTETRGD Pin Falling Input Source Counter Start Enable	0: Disable counter start on the falling edge of GTETRGD input 1: Enable counter start on the falling edge of GTETRGD input	R/W
b8	SSCARBL	GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Start Enable	0: Disable counter start on the rising edge of GTIOCA input when GTIOCB input is 0 1: Enable counter start on the rising edge of GTIOCA input when GTIOCB input is 0	R/W
b9	SSCARBH	GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Start Enable	0: Disable counter start on the rising edge of GTIOCA input when GTIOCB input is 1 1: Enable counter start on the rising edge of GTIOCA input when GTIOCB input is 1	R/W
b10	SSCAFBL	GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Start Enable	0: Disable counter start on the falling edge of GTIOCA input when GTIOCB input is 0 1: Enable counter start on the falling edge of GTIOCA input when GTIOCB input is 0	R/W

Bit	Symbol	Bit name	Description	R/W
b11	SSCAFBH	GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Start Enable	0: Disable counter start on the falling edge of GTIOCA input when GTIOCB input is 1 1: Enable counter start on the falling edge of GTIOCA input when GTIOCB input is 1	R/W
b12	SSCBRAL	GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Start Enable	0: Disable counter start on the rising edge of GTIOCB input when GTIOCA input is 0 1: Enable counter start on the rising edge of GTIOCB input when GTIOCA input is 0	R/W
b13	SSCBRAH	GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Start Enable	0: Disable counter start on the rising edge of GTIOCB input when GTIOCA input is 1 1: Enable counter start on the rising edge of GTIOCB input when GTIOCA input is 1	R/W
b14	SSCBFAL	GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Start Enable	0: Disable counter start on the falling edge of GTIOCB input when GTIOCA input is 0 1: Enable counter start on the falling edge of GTIOCB input when GTIOCA input is 0	R/W
b15	SSCBFAH	GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Start Enable	0: Disable counter start on the falling edge of GTIOCB input when GTIOCA input is 1 1: Enable counter start on the falling edge of GTIOCB input when GTIOCA input is 1	R/W
b16	SSEVTA	Event Source A Counter Start Enable	0: Disable counter start on event input A 1: Enable counter start on event input A	R/W
b17	SSEVTB	Event Source B Counter Start Enable	0: Disable counter start on event input B 1: Enable counter start on event input B	R/W
b18	SSEVTC	Event Source C Counter Start Enable	0: Disable counter start on event input C 1: Enable counter start on event input C	R/W
b19	SSEVTD	Event Source D Counter Start Enable	0: Disable counter start on event input D 1: Enable counter start on event input D	R/W
b20	SSEVTE	Event Source E Counter Start Enable	0: Disable counter start on event input E 1: Enable counter start on event input E	R/W
b21	SSEVTF	Event Source F Counter Start Enable	0: Disable counter start on event input F 1: Enable counter start on event input F	R/W
b22	SSEVTG	Event Source G Counter Start Enable	0: Disable counter start on event input G 1: Enable counter start on event input G	R/W
b23	SSEVTH	Event Source H Counter Start Enable	0: Disable counter start on event input H 1: Enable counter start on event input H	R/W
b30 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b31	CSTRT	Software Source Counter Start Enable	0: Disable counter start by the GTSTR register 1: Enable counter start by the GTSTR register	R/W

GTSSR sets the source to start the GTCNT counter.

SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables GTCNT counter start on the rising edge of GTETRGA pin input.

SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables GTCNT counter start on the falling edge of GTETRGA pin input.

SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables GTCNT counter start on the rising edge of GTETRGB pin input.

SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables GTCNT counter start on the falling edge of GTETRGB pin input.

SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)

The SSGTRGCR bit enables or disables GTCNT counter start on the rising edge of GTETRGC pin input.

SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)

The SSGTRGCF bit enables or disables GTCNT counter start on the falling edge of GTETRGC pin input.

SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)

The SSGTRGDR bit enables or disables GTCNT counter start on the rising edge of GTETRGD pin input.

SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)

The SSGTRGDF bit enables or disables GTCNT counter start on the falling edge of GTETRGD pin input.

SSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Start Enable)

The SSCARBL bit enables or disables GTCNT counter start on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

SSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Start Enable)

The SSCARBH bit enables or disables GTCNT counter start on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

SSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Start Enable)

The SSCAFBL bit enables or disables GTCNT counter start on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

SSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Start Enable)

The SSCAFBH bit enables or disables GTCNT counter start on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

SSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Start Enable)

The SSCBRAL bit enables or disables GTCNT counter start on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

SSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Start Enable)

The SSCBRAH bit enables or disables GTCNT counter start on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

SSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Start Enable)

The SSCBFAL bit enables or disables GTCNT counter start on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

SSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Start Enable)

The SSCBFAH bit enables or disables GTCNT counter start on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

SSEVTm bit (Event Source m Counter Start Enable) (m = A to H)

The SSEVTm bit enables or disables GTCNT counter start on the event input m.

CSTRT bit (Software Source Counter Start Enable)

The CSTRT bit enables or disables GTCNT counter start by GTSTR register.

12.2.6 General PWM Timer Stop Source Select Register (GTPSR)

b31	CSTOP	Software Source Counter Stop Enable	0: Disable counter stop by the GTSTP register 1: Enable counter stop by the GTSTP register	R/W

GTPSR sets the source to stop the GTCNT counter.

PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)

The PSGTRGAR bit enables or disables GTCNT counter stop on the rising edge of GTETRGA pin input.

PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)

The PSGTRGAF bit enables or disables GTCNT counter stop on the falling edge of GTETRGA pin input.

PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)

The PSGTRGBR bit enables or disables GTCNT counter stop on the rising edge of GTETRGB pin input.

PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)

The PSGTRGBF bit enables or disables GTCNT counter stop on the falling edge of GTETRGB pin input.

PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)

The PSGTRGCR bit enables or disables GTCNT counter stop on the rising edge of GTETRGC pin input.

PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)

The PSGTRGCF bit enables or disables GTCNT counter stop on the falling edge of GTETRGC pin input.

PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)

The PSGTRGDR bit enables or disables GTCNT counter stop on the rising edge of GTETRGD pin input.

PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)

The PSGTRGDF bit enables or disables GTCNT counter stop on the falling edge of GTETRGD pin input.

PSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Stop Enable)

The PSCARBL bit enables or disables GTCNT counter stop on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

PSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Stop Enable)

The PSCARBH bit enables or disables GTCNT counter stop on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

PSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Stop Enable)

The PSCAFBL bit enables or disables GTCNT counter stop on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

PSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Stop Enable)

The PSCAFBH bit enables or disables GTCNT counter stop on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

PSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Stop Enable)

The PSCBRAL bit enables or disables GTCNT counter stop on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

PSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Stop Enable)

The PSCBRAH bit enables or disables GTCNT counter stop on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

PSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Stop Enable)

The PSCBFAL bit enables or disables GTCNT counter stop on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

PSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Stop Enable)

The PSCBFAH bit enables or disables GTCNT counter stop on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

PSEVTm bit (Event Source m Counter Stop Enable) (m = A to H)

The PSEVTm bit enables or disables GTCNT counter stop on the event input m.

CSTOP bit (Software Source Counter Stop Enable)

The CSTOP bit enables or disables GTCNT counter stop by GTSTP register.

b31	CCLR	Software Source Counter Clear Enable	0: Disable counter clear by the GTCLR register 1: Enable counter clear by the GTCLR register	R/W

GTCSR sets the source to clear the GTCNT counter.

CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables GTCNT counter clear on the rising edge of GTETRGA pin input.

CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables GTCNT counter clear on the falling edge of GTETRGA pin input.

CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables GTCNT counter clear on the rising edge of GTETRGB pin input.

CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables GTCNT counter clear on the falling edge of GTETRGB pin input.

CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables GTCNT counter clear on the rising edge of GTETRGC pin input.

CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables GTCNT counter clear on the falling edge of GTETRGC pin input.

CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables GTCNT counter clear on the rising edge of GTETRGD pin input.

CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)

The CSGTRGDF bit enables or disables GTCNT counter clear on the falling edge of GTETRGD pin input.

CSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Clear Enable)

The CSCARBL bit enables or disables GTCNT counter clear on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

CSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Clear Enable)

The CSCARBH bit enables or disables GTCNT counter clear on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

CSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Clear Enable)

The CSCAFBL bit enables or disables GTCNT counter clear on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

CSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Clear Enable)

The CSCAFBH bit enables or disables GTCNT counter clear on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

CSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Clear Enable)

The CSCBRAL bit enables or disables GTCNT counter clear on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

CSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Clear Enable)

The CSCBRAH bit enables or disables GTCNT counter clear on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

CSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Clear Enable)

The CSCBFAL bit enables or disables GTCNT counter clear on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

CSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Clear Enable)

The CSCBFAH bit enables or disables GTCNT counter clear on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

CSEVTm bit (Event Source m Counter Clear Enable) (m = A to H)

The CSEVm bit enables or disables GTCNT counter clear on the event input m.

CCLR bit (Software Source Counter Clear Enable)

The CCLR bit enables or disables GTCNT counter clear by GTCLR register.

GTUPSR sets the source to count up the GTCNT counter.
When at least 1 bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In such cases, the setting of GTCR.TPCS has no effect.

USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables GTCNT counter count up on the rising edge of GTETRGA pin input.

USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables GTCNT counter count up on the falling edge of GTETRGA pin input.

USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables GTCNT counter count up on the rising edge of GTETRGB pin input.

USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables GTCNT counter count up on the falling edge of GTETRGB pin input.

USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables GTCNT counter count up on the rising edge of GTETRGC pin input.

USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)

The USGTRGCF bit enables or disables GTCNT counter count up on the falling edge of GTETRGC pin input.

USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)

The USGTRGDR bit enables or disables GTCNT counter count up on the rising edge of GTETRGD pin input.

USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)

The USGTRGDF bit enables or disables GTCNT counter count up on the falling edge of GTETRGD pin input.

USCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Count Up Enable)

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

USCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Count Up Enable)

The USCARBH bit enables or disables GTCNT counter count up on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

USCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Count Up Enable)

The USCAFBL bit enables or disables GTCNT counter count up on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

USCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Count Up Enable)

The USCAFBH bit enables or disables GTCNT counter count up on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

USCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Count Up Enable)

The USCBRAL bit enables or disables GTCNT counter count up on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

USCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Count Up Enable)

The USCBRAH bit enables or disables GTCNT counter count up on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

USCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Count Up Enable)

The USCBFAL bit enables or disables GTCNT counter count up on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

USCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Count Up Enable)

The USCBFAH bit enables or disables GTCNT counter count up on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

USEVTm bit (Event Source m Counter Count Up Enable) (m = A to H)

The USEVTm bit enables or disables GTCNT counter count up on the event input m.

GTDNSR sets the source to count down the GTCNT counter.
When at least 1 bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register. In such cases, the setting of GTCR.TPCS has no effect.

DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables GTCNT counter count down on the rising edge of GTETRGA pin input.

DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables GTCNT counter count down on the falling edge of GTETRGA pin input.

DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables GTCNT counter count down on the rising edge of GTETRGB pin input.

DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)

The DSGTRGBF bit enables or disables GTCNT counter count down on the falling edge of GTETRGB pin input.

DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)

The DSGTRGCR bit enables or disables GTCNT counter count down on the rising edge of GTETRGC pin input.

DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)

The DSGTRGCF bit enables or disables GTCNT counter count down on the falling edge of GTETRGC pin input.

DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)

The DSGTRGDR bit enables or disables GTCNT counter count down on the rising edge of GTETRGD pin input.

DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)

The DSGTRGDF bit enables or disables GTCNT counter count down on the falling edge of GTETRGD pin input.

DSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Count Down Enable)

The DSCARBL bit enables or disables GTCNT counter count down on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

DSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Count Down Enable)

The DSCARBH bit enables or disables GTCNT counter count down on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

DSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Count Down Enable)

The DSCAFBL bit enables or disables GTCNT counter count down on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

DSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Count Down Enable)

The DSCAFBH bit enables or disables GTCNT counter count down on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

DSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Count Down Enable)

The DSCBRAL bit enables or disables GTCNT counter count down on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

DSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Count Down Enable)

The DSCBRAH bit enables or disables GTCNT counter count down on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

DSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Count Down Enable)

The DSCBFAL bit enables or disables GTCNT counter count down on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

DSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Count Down Enable)

The DSCBFAH bit enables or disables GTCNT counter count down on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

DSEVTm bit (Event Source m Counter Count Down Enable) (m = A to H)

The DSEVTm bit enables or disables GTCNT counter count down on the event input m.

GTICASR sets the source of input capture for GTCCRA.

ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGA pin input.

ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGAF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGA pin input.

ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGBR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGB pin input.

ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGBF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGB pin input.

ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGCR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGC pin input.

ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGCF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGC pin input.

ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGDR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGD pin input.

ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGDF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGD pin input.

ASCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source GTCCRA Input Capture Enable)

The ASCARBL bit enables or disables input capture for GTCCRA on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

ASCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source GTCCRA Input Capture Enable)

The ASCARBH bit enables or disables input capture for GTCCRA on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

ASCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source GTCCRA Input Capture Enable)

The ASCAFBL bit enables or disables input capture for GTCCRA on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

ASCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source GTCCRA Input Capture Enable)

The ASCAFBH bit enables or disables input capture for GTCCRA on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

ASCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source GTCCRA Input Capture Enable)

The ASCBRAL bit enables or disables input capture for GTCCRA on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

ASCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source GTCCRA Input Capture Enable)

The ASCBRAH bit enables or disables input capture for GTCCRA on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

ASCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source GTCCRA Input Capture Enable)

The ASCBFAL bit enables or disables input capture for GTCCRA on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

ASCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source GTCCRA Input Capture Enable)

The ASCBFAH bit enables or disables input capture for GTCCRA on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

ASEVTm bit (Event Source m Counter GTCCRA Input Capture Enable) (m = A to H)

The ASEVTm bit enables or disables input capture for GTCCRA on the event input m.

GTICBSR sets the source of input capture for GTCCRB.

BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGAR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGA pin input.

BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGAF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGA pin input.

BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGBR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGB pin input.

BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGBF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGB pin input.

BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGCR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGC pin input.

BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGCF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGC pin input.

BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGDR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGD pin input.

BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGDF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGD pin input.

BSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source GTCCRB Input Capture Enable)

The BSCARBL bit enables or disables input capture for GTCCRB on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

BSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source GTCCRB Input Capture Enable)

The BSCARBH bit enables or disables input capture for GTCCRB on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

BSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source GTCCRB Input Capture Enable)

The BSCAFBL bit enables or disables input capture for GTCCRB on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

BSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source GTCCRB Input Capture Enable)

The BSCAFBH bit enables or disables input capture for GTCCRB on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

BSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source GTCCRB Input Capture Enable)

The BSCBRAL bit enables or disables input capture for GTCCRB on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

BSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source GTCCRB Input Capture Enable)

The BSCBRAH bit enables or disables input capture for GTCCRB on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

BSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source GTCCRB Input Capture Enable)

The BSCBFAL bit enables or disables input capture for GTCCRB on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

BSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source GTCCRB Input Capture Enable)

The BSCBFAH bit enables or disables input capture for GTCCRB on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

BSEVTm bit (Event Source m Counter GTCCRB Input Capture Enable) (m = A to H)

The BSEVTm bit enables or disables input capture for GTCCRB on the event input m.

GTCR controls GTCNT.

CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit being 1.
- Any among event input or input on the GTIOCA, GTIOCB, or GTETRGA to GTETRGD pins that is enabled in the GTSSR register as a source for the start of counting
- 1 is written by software directly.

[Clearing conditions]

- GTSTP value where the channel number associated with the bit number is set to 1 with the GTPSR.CSTOP bit being 1.

- Any among event input or input on the GTIOCA, GTIOCB, or GTETRGA to GTETRGD pins that is enabled in the GTPSR register as a source for the stop of counting
- 0 is written by software directly.

MD[2:0] bits (Mode Select)

The MD[2:0] bits select the GPT operating mode. The MD[2:0] bits must be set while the GTCNT operation is stopped.

TPCS[2:0] bits (Timer Prescaler Select)

The TPCS[2:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[2:0] bits must be set while the GTCNT operation is stopped.

12.2.13 General PWM Timer Count Direction and Duty Setting Register (GTUDDTYC)

b31 to b28	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

x: Don't care

GTUDDTYC sets the direction in which GTCNT counts (up-counting or down-counting) and sets the duty of GTIOCA/GTIOCB pin output.

Count direction:

- In saw-wave mode

When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down-counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting is stopped, the counter starts up-counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT

value becomes GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.

- In triangle-wave mode

When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.
When the UDF bit is set to 1 while counting stops, the UD value is reflected in the count direction when counting starts.

UD bit (Count Direction Setting)

The UD bit sets the count direction for up-counting or down-counting, for GTCNT.

UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only write 0 to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

Output duty :

- In saw-wave mode

When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR).
When the OADTY/OBDTY value changes during down-counting, the duty is reflected at an underflow (GTCNT = 0).
When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting is stopped, the output duty is not reflected at starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0). When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at the starting counter operation.

- In triangle-wave mode

When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow. When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation, however the output duty is reflected at an underflow.
When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

OmDTY[1:0] bits (GTIOCm Output Duty Setting) (m = A, B)

The OmDTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOCm pin.

OmDTYF bit (Forcible GTIOCm Output Duty Setting) (m = A, B)

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0 during counter operation. When this bit is set to 1 while counting is stopped, return this bit to 0 until the first period ends after the counter starts.

OmDTYR bit (GTIOCm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)

The OmDTYR bits select the value that is the object of output retained or toggled at cycle end, when the control changes from 0%/100% duty setting to compare match for GTIOCm pin and GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end).
GPT32 internally continues the compare match operation in performing 0%/100% duty operation. When the OmDTYR bit is set to 1, the GTCIOm pin outputs the value specified in the GTIOR.GTIOm[3:2] bits at the end of compare match cycle.

12.2.14 General PWM Timer I/O Control Register (GTIOR)

Bit	Symbol	Bit name	Description	R/W
b31, b30	NFCSB[1:0]	Noise Filter B Sampling Clock Select	b31 b30 0 0: P1φ/1 0 1: P1φ/4 1 0: P1φ/16 1 1: P1φ/64.	R/W

GTIOR sets the functions of the GTIOCA and GTIOCB pins.

GTIOA[4:0] bits (GTIOCA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCA pin function. For details, see Table 12.5

OADFLT bit (GTIOCA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCA pin outputs high or low when counting stops.

OAHLD bit (GTIOCA Pin Output Setting at the Start/Stop Count)

The OAHLD bit specifies whether the GTIOCA pin output level is retained or the level at the start/stop of counting depends on the register setting.

[When the OAHLD bit is set to 0]

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, it is immediately reflected in the output.

[When the OAHLD bit is set to 1]

- The output is retained when counting starts or stops.

OAE bit (GTIOCA Pin Output Enable)

The OAE bit disables or enables the GTIOCA pin output.

When the GTCCRA register is in use as an input capture register (at least one bit in the GTICASR register is set to 1), signals will not be output from the GTIOCA pin regardless of the setting of this bit.

OADF[1:0] bits (GTIOCA Pin Disable Value Setting)

The OADF bits select a value to be output from the GTIOCA pin in response to the output disable requests.

NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCA pin. Because changing the value of the bit might lead to internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCA pin. When setting these bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

GTIOB[4:0] bits (GTIOCB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCB pin function. For details, see Table 12.5

OBDFLT bit (GTIOCB Pin Output Value Setting at the Count Stop)

The OBDFLT bit sets whether the GTIOCB pin outputs high or low when counting stops.

OBHLD bit (GTIOCB Pin Output Setting at the Start/Stop Count)

The OBHLD bit specifies whether the GTIOCB pin output level is retained or the level at the start/stop of counting depends on the register setting.

[When the OBHLD bit is set to 0]

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, it is immediately reflected in the output.

[When the OBHLD bit is set to 1]

- The output is retained when counting starts or stops.

OBE bit (GTIOCB Pin Output Enable)

The OBE bit disables or enables the GTIOCB pin output.

When the GTCCRB register is in use as an input capture register (at least one bit in the GTICBSR register is set to 1), signals will not be output from the GTIOCB pin regardless of the setting of this bit.

OBDF[1:0] bits (GTIOCB Pin Disable Value Setting)

The OBDF bits select a value to be output from the GTIOCB pin in response to the output disable requests.

NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCB pin. When setting these bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

Table 12.5 Settings of GTIOA[4:0] and GTIOB[4:0] bits

GTIOA/GTIOB[4:0] bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
0	0	0	0	0	Set initial output low	Retain output at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	0	0	0	1			Output low at GTCCRA/GTCCRB compare match
0	0	0	1	0			Output high at GTCCRA/GTCCRB compare match
0	0	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	0	1	0	0		Output low at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	0	1	0	1			Output low at GTCCRA/GTCCRB compare match
0	0	1	1	0			Output high at GTCCRA/GTCCRB compare match
0	0	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	1	0	0	0		Output high at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	1	0	0	1			Output low at GTCCRA/GTCCRB compare match
0	1	0	1	0			Output high at GTCCRA/GTCCRB compare match
0	1	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	1	1	0	0		Toggle output at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	1	1	0	1			Output low at GTCCRA/GTCCRB compare match
0	1	1	1	0			Output high at GTCCRA/GTCCRB compare match
0	1	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	0	0	0	0	Set initial output high	Retain output at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	0	0	0	1			Output low at GTCCRA/GTCCRB compare match
1	0	0	1	0			Output high at GTCCRA/GTCCRB compare match
1	0	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	0	1	0	0		Output low at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	0	1	0	1			Output low at GTCCRA/GTCCRB compare match
1	0	1	1	0			Output high at GTCCRA/GTCCRB compare match
1	0	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	1	0	0	0		Output high at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	1	0	0	1			Output low at GTCCRA/GTCCRB compare match
1	1	0	1	0			Output high at GTCCRA/GTCCRB compare match
1	1	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	1	1	0	0		Toggle output at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	1	1	0	1			Output low at GTCCRA/GTCCRB compare match
1	1	1	1	0			Output high at GTCCRA/GTCCRB compare match
1	1	1	1	1			Toggle output at GTCCRA/GTCCRB compare match

Note 1. The cycle end means an overflow (GTCNT is changed from GTPR to 0 in up-counting) or underflow (GTCNT is changed from 0 to GTPR in down-counting). In this case, the GTCNT counter is cleared for saw waves and for the trough (GTCNT is changed from 0 to 1) for triangle waves.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note 3. In event count operation where at least 1 bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

12.2.15 General PWM Timer Interrupt Output Setting Register (GTINTAD)

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

GTINTAD enables or disables interrupt requests, A/D converter start requests and output disable requests.

GTINTA bit (GTCCRA Compare Match/Input Capture Interrupt Enable)

The GTINTA bit enables and disables the interrupt request (CCMPAn) in response to compare matches with or input capture by the GTCCRA register.

GTINTB bit (GTCCRB Compare Match/Input Capture Interrupt Enable)

The GTINTB bit enables and disables the interrupt request (CCMPBn) in response to compare matches with or input capture by the GTCCRB register.

GTINTC bit (GTCCRC Compare Match Interrupt Enable)

The GTINTC bit enables and disables the interrupt request (CMPCn) in response to compare matches with the GTCCRC register.

GTINTD bit (GTCCRD Compare Match Interrupt Enable)

The GTINTD bit enables and disables the interrupt request (CMPDn) in response to compare matches with the GTCCRD register.

GTINTE bit (GTCCRE Compare Match Interrupt Enable)

The GTINTE bit enables and disables the interrupt request (CMPEn) in response to compare matches with the GTCCRE register.

GTINTF bit (GTCCRF Compare Match Interrupt Enable)

The GTINTF bit enables and disables the interrupt request (CMPFn) in response to compare matches with the GTCCRF register.

GTINTPR[1:0] bits (GTPR Compare Match Interrupt Enable)

The GTINTPR[1:0] bits enable and disable the interrupt requests (OVFn and UNFn) in response to compare matches with the GTPR register (and overflows of the GTCNT counter) and underflows of the GTCNT counter.

ADTRAUEN bit (GTADTRA Compare Match (Up-Counting) A/D Converter Start Request Enable)

The ADTRAUEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT up-counting.

ADTRADEN bit (GTADTRA Compare Match (Down-Counting) A/D Converter Start Request Enable)

The ADTRADEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT down-counting.

ADTRBUEN bit (GTADTRB Compare Match (Up-Counting) A/D Converter Start Request Enable)

The ADTRBUEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT up-counting.

ADTRBDEN bit (GTADTRB Compare Match (Down-Counting) A/D Converter Start Request Enable)

The ADTRBDEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT down-counting.

GRP[1:0] bits (Output Disable Source Select)

The GRP[1:0] bits select GTIOCA pin and GTIOCB pin output disable source. The output disable requests to the POEG are output to the group selected by the GRP[1:0] bits. Each of the output disable sources, a dead time error, simultaneous output of high-level, and low-level signal, is also output in accord with the setting of its enabling bit. GTST.ODF shows the request of output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when GTIOR.OAE and OBE bits are both 0.

GRPDTE bit (Dead Time Error Output Disable Request Enable)

The GRPDTE bit enables or disables dead time error output disable request.

GRPABH bit (Same Time Output Level High Disable Request Enable)

The GRPABH bit enables or disables output disable request when GTIOCA pin and GTIOCB pin output 1 at the same time.

GRPABL bit (Same Time Output Level Low Disable Request Enable)

The GRPABL bit enables or disables output disable request when GTIOCA pin and GTIOCB pin output 0 at the same time.

12.2.16 General PWM Timer Status Register (GTST)

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to this bit. Do not write 1.

GTST indicates the status of the GPT.

TCFA flag (Input Capture/Compare Match Flag A)

The TCFS flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register function as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFC flag (Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

[Setting condition]

- GTCNT = GTCCRC

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

TCFD flag (Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

[Setting condition]

- GTCNT = GTCCRD.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (GTCCRD performs buffer operation).

TCFE flag (Compare Match Flag E)

The TCFE flag indicates the status for the compare match of GTCCRE.

[Setting condition]

- GTCNT = GTCCRE.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

TCFF flag (Compare Match Flag F)

The TCFF flag indicates the status for the compare match of GTCCRF.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or a crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR-1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or a trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

ITCNT[2:0] bits (OVFn/UNFn Interrupt Skipping Count Counter)

When the OVFn/UNFn (n=0 to 7) interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter in the ITCNT[2:0] bits increments by 1 every time the OVFn/UNFn interrupt source that is selected in GTITC.IVTC[1:0] is generated.

[Clearing conditions]

- The OVFn/UNFn interrupt skipping function is not used (GTITC.IVTT[2:0] is 000b when GTITC.IVTC[1:0] is 00b)
- The OVFn/UNFn interrupt skipping count matches the specified count (ITCNT[2:0] matches the skipping count specified in GTITC.IVTT[2:0]).

TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and is set to 0 in down-counting.

ADTRAUF flag (GTADTRA Compare Match (Counting Up) A/D Converter Start Request Flag)

The ADTRAUF flag indicates whether or not a compare match with the GTADTRA register has occurred during counting up.

[Setting condition]

- GTCNT = GTADTRA during counting up

[Clearing condition]

- 0 is written to this flag.

ADTRADF flag (GTADTRA Compare Match (Counting Down) A/D Converter Start Request Flag)

The ADTRADF flag indicates whether or not a compare match with the GTADTRA register has occurred during counting down.

[Setting condition]

- GTCNT = GTADTRA during counting down

[Clearing condition]

- 0 is written to this flag.

ADTRBUF flag (GTADTRB Compare Match (Counting Up) A/D Converter Start Request Flag)

The ADTRBUF flag indicates whether or not a compare match with the GTADTRB register has occurred during counting up.

[Setting condition]

- GTCNT = GTADTRB during counting up

[Clearing condition]

- 0 is written to this flag.

ADTRBDF flag (GTADTRB Compare Match (Counting Down) A/D Converter Start Request Flag)

The ADTRBDF flag indicates whether or not a compare match with the GTADTRB register has occurred during counting down.

[Setting condition]

- GTCNT = GTADTRB during counting down

[Clearing condition]

- 0 is written to this flag.

ODF flag (Output Disable Flag)

The ODF flag shows the request of the output disable source group that is selected by GRP[1:0] bits. When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

DTEF flag (Dead Time Error Flag)

The DTEF flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.
This flag returns to 0 when the timer output toggle point after the automatic addition of dead time is returned to the cycle.
This flag is read only. Writing 0 to clear the flag is not allowed.
When an interrupt by the DTEF flag is enabled (GTINTAD.GRPDTE = 1), the DTEF flag is output to POEG as an output disable request each time the DTEF flag changes from 0 to 1.
[Setting condition]

- The timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.
  For triangle wave in up-counting: GTCCRA – GTDVU ≤ 0
  For triangle wave in down-counting: GTCCRA – GTDVD < 0
  For saw wave 1 shot pulse mode in up-counting:
  GTCCRA – GTDVU < 0 or GTCCRA + GTDVD > GTPR
  For saw wave 1 shot pulse mode in down-counting:
  GTCCRA + GTDVU > GTPR or GTCCRA - GTDVD < 0

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the timer cycle.

OABHF flag (Same Time Output Level High Flag)

The OABHF flag indicates that GTIOCA pin and GTIOCB pin output 1 at the same time.
When GTIOCA pin or GTIOCB pin output 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is not allowed. When an interrupt by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request.
[Setting condition]

- GTIOCA pin and GTIOCB pin output 1 at the same time when both the OAE and OBE bits are set to 1.

[Clearing conditions]

- GTIOCA pin output value is different from GTIOCB pin output value when both the OAE and OBE bits are set to 1
- GTIOCA pin and GTIOCB pin output 0 at the same time when both the OAE and OBE bits are set to 1
- Either OAE bit or OBE bit is set to 0.

OABLF flag (Same Time Output Level Low Flag)

The OABLF flag indicates that GTIOCA pin and GTIOCB pin output 0 at the same time.
When GTIOCA pin or GTIOCB pin output 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is not allowed. When an interrupt by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request.
[Setting condition]

- GTIOCA pin and GTIOCB pin output 0 at the same time when both the OAE and OBE bits are set to 1.

[Clearing conditions]

- GTIOCA pin output value is different from GTIOCB pin output value when both the OAE and OBE bits are set to 1
- GTIOCA pin and GTIOCB pin output 1 at the same time when both the OAE and OBE bits are set to 1
- At least either OAE bit or OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before masked by the output disable function. When the output disable state is performed, a compare match also

performs continuously in the GPT and the OABHF/OABLF flag is updated in association with the result of the compared values.

12.2.17 General PWM Timer Buffer Enable Register (GTBER)

b29, b28	ADTTB[1:0]	GTADTRB Buffer Transfer Timing Select	• Triangle waves b29 b28 0 0: No transfer 0 1: Transfer at crest 1 0: Transfer at trough 1 1: Transfer at both crest and trough. • Saw waves b29 b28 0 0: No transfer Values other than 0 0: Transfer is triggered when the counter underflows (in down-counting), overflows (in up-counting), or is cleared.	R/W
b30	ADTDB	GTADTRB Double Buffer Operation	0: Single buffer operation (GTADTBRB ⇔ GTADTRB) 1: Double buffer operation (GTADTDBRB ⇔ GTADTBRB ⇔ GTADTRB).	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

GTBER provides settings for the buffer operation and must be set while the GTCNT operation stops.

BD[0] bit (GTCCR Buffer Operation Disable)

The BD[0] bit disables buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF of the combined GPT.
When GTDTCR.TDE is 1 and when BD[0] is set to 0, GTCCRB does not perform buffer operation and the GTCCRB register is automatically set to a compare match value for a negative-phase waveform with dead time.

BD[1] bit (GTPR Buffer Operation Disable)

The BD[1] bit disables buffer operation using GTPR, GTPBR, and GTPDBR of the combined GPT.

BD[2] bit (GTADTR Buffer Operation Disable)

The BD[2] bit disables buffer operation using GTADTRA, GTADTRB, GTADTBRA, GTADTBRB, GTADTDBRA, and GTADTDBRB of the combined GPT. In event count operation, this bit is not available and the GTADTR buffer operation is not performed.

BD[3] bit (GTDV Buffer Operation Disable)

The BD[3] bit disables buffer operation using GTDVU, GTDVD, GTDBD, and GTDBU of the combined GPT.
When the GTDTCR.TDFER bit is set to 1 and when BD[3] is set to 0, buffer operation is not performed and the GTDVD value is set as a value of GTDVU automatically. In event count operation, this bit is not available and the GTDV buffer operation is not performed.

CCRA[1:0] bits (GTCCRA Buffer Operation)

The CCRA[1:0] bits set buffer operation using GTCCRA, GTCCRC, and GTCCRD of the combined GPT. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.*1

CCRB[1:0] bits (GTCCRB Buffer Operation)

The CCRB[1:0] bits set buffer operation using GTCCRB, GTCCRE, and GTCCRF of the combined GPT. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.*1

PR[1:0] bits (GTPR Buffer Operation)

The PR[1:0] bits set buffer operation using GTPR, GTPBR, and GTPDBR of the combined GPT.

CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forcibly performs a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after 1 is written. This bit is read as 0 and is only valid when counting is stopped with a specified compare match operation.

ADTTA[1:0] bits (GTADTRA Buffer Transfer Timing Select)

The ADTTA[1:0] bits set the transfer timing for buffer operation of GTADTRA, GTADTBRA, and GTADTDBRA. These bits are not available in event count operation.

ADTDA bit (GTADTRA Double Buffer Operation)

The ADTDA bit sets buffer operation with GTADTRA, GTADTBRA, and GTADTDBRA combined. This bit is not available in event count operation.

ADTTB[1:0] bits (GTADTRB Buffer Transfer Timing Select)

The ADTTB[1:0] bits set the transfer timing for buffer operation of GTADTRB, GTADTBRB, and GTADTDBRB. This bit is not available in event count operation.

ADTDB bit (GTADTRB Double Buffer Operation)

The ADTDB bit sets buffer operation using GTADTRB, GTADTBRB, and GTADTDBRB of the combined GPT. This bit is not available in event count operation.

Note 1. The buffer operation mode is fixed in saw-wave one-shot pulse mode, or triangle-wave PWM mode 3 (64-bit transfer at trough).

12.2.18 General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register (GTITC)

Address(es): GPT32Em.GTITC E804 3044h + 0100h × m (m = 0 to 7)

GTITC sets the skipping function for the GTCNT counter overflow (GTPR compare match) interrupt (OVFn) and underflow interrupt (UNFn). It also specifies whether to link other interrupts and A/D converter start requests with the OVFn/UNFn interrupt skipping function. An output disable request to the POEG cannot be linked with the OVFn/UNFn interrupt skipping function. This bit is not available in event count operation.

ITLA bit (GTCCRA Compare Match/Input Capture Interrupt Link)

The ITLA bit specifies whether to link the GTCCRA compare match/input capture interrupt (GTCIA) with the OVFn/UNFn interrupt skipping function.

ITLB bit (GTCCRB Compare Match/Input Capture Interrupt Link)

The ITLB bit specifies whether to link the GTCCRB compare match/input capture interrupt (GTCIB) with the OVFn/UNFn interrupt skipping function.

ITLC bit (GTCCRC Compare Match Interrupt Link)

The ITLC bit specifies whether to link the GTCCRC compare match interrupt (GTCIC) with the OVFn/UNFn interrupt skipping function.

ITLD bit (GTCCRD Compare Match Interrupt Link)

The ITLD bit specifies whether to link the GTCCRD compare match interrupt (GTCID) with the OVFn/UNFn interrupt skipping function.

ITLE bit (GTCCRE Compare Match Interrupt Link)

The ITLE bit specifies whether to link the GTCCRE compare match interrupt (GTCIE) with the OVFn/UNFn interrupt skipping function.

ITLF bit (GTCCRF Compare Match Interrupt Link)

The ITLF bit specifies whether to link the GTCCRF compare match interrupt (GTCIF) with the OVFn/UNFn interrupt skipping function.

IVTC[1:0] bits (OVFn/UNFn Interrupt Skipping Function Select)

The IVTC[1:0] bits set the skipping function for the GTPR compare match (GTCNT overflow) interrupt (OVFn) and GTCNT counter underflow interrupt (UNFn).

IVTT[2:0] bits (OVFn/UNFn Interrupt Skipping Count Select)

The IVTT[2:0] bits set the skipping count for the GTPR compare match (GTCNT overflow) interrupt (OVFn) and GTCNT counter underflow interrupt (UNFn). When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

ADTAL bit (GTADTRA A/D Converter Start Request Link)

The ADTAL bit specifies whether to link the GTADTRA A/D converter start request with OVFn/UNFn interrupt skipping function.

ADTBL bit (GTADTRB A/D Converter Start Request Link)

The ADTBL bit specifies whether to link the GTADTRB A/D converter start request with OVFn/UNFn interrupt skipping function.

12.2.19 General PWM Timer Counter (GTCNT)

Address(es): GPT32Em.GTCNT E804 3048h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GTCNT is a 32-bit read/write counter and can only be written to after counting stops. GTCNT must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited. GTCNT must be set within the range of 0 ≤ GTCNT ≤ GTPR.

12.2.20 General PWM Timer Compare Capture Register n (GTCCRn) (n = A to F)

Address(es): GPT32Em.GTCCRA E804 304Ch + 0100h × m (m = 0 to 7)
GPT32Em.GTCCRB E804 3050h + 0100h × m (m = 0 to 7)
GPT32Em.GTCCRC E804 3054h + 0100h × m (m = 0 to 7)
GPT32Em.GTCCRE E804 3058h + 0100h × m (m = 0 to 7)
GPT32Em.GTCCRD E804 305Ch + 0100h × m (m = 0 to 7)
GPT32Em.GTCCRF E804 3060h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTCCRn registers are read/write registers.
GTCCRA and GTCCRB are registers used for both output compare and input capture.
GTCCRC and GTCCRE are compare match registers that can also function as buffer registers for GTCCRA and GTCCRB.
GTCCRD and GTCCRF are compare match registers that can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB).

12.2.21 General PWM Timer Cycle Setting Register (GTPR)

Address(es): GPT32Em.GTPR E804 3064h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTPR is a read/write register that sets the maximum count value of GTCNT. For saw waves, the value of (GTPR + 1) is the cycle. For triangle waves, the value of (GTPR value × 2) is the cycle.

12.2.22 General PWM Timer Cycle Setting Buffer Register (GTPBR)

Address(es): GPT32Em.GTPBR E804 3068h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTPBR is a read/write register that functions as a buffer register for GTPR.

12.2.23 General PWM Timer Cycle Setting Double-Buffer Register (GTPDBR)

Address(es): GPT32Em.GTPDBR E804 306Ch + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTPDBR is a 32-bit read/write register that functions as a buffer register for GTPBR (double-buffer register for GTPR).

12.2.24 A/D Converter Start Request Timing Register n (GTADTRn) (n = A, B)

Address(es): GPT32Em.GTADTRA E804 3070h + 0100h × m (m = 0 to 7)
GPT32Em.GTADTRB E804 307Ch + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTADTRn registers are 32-bit read/write registers that set the timing of A/D converter start request generation. When the GTADTRn value matches the GTCNT counter value, an A/D converter start request is generated. GTADTRn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited.

12.2.25 A/D Converter Start Request Timing Buffer Register n (GTADTBRn) (n = A, B)

Address(es): GPT32Em.GTADTBRA E804 3074h + 0100h × m (m = 0 to 7)
GPT32Em.GTADTBRB E804 3080h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTADTBRn registers are 32-bit read/write registers that function as buffer registers for GTADTRn. GTADTBRn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited.

12.2.26 A/D Converter Start Request Timing Double-Buffer Register n (GTADTDBRn) (n = A, B)

Address(es): GPT32Em.GTADTDBRA E804 3078h + 0100h × m (m = 0 to 7)
GPT32Em.GTADTDBRB E804 3084h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTADTDBRn registers are 32-bit read/write registers that function as buffer registers for GTADTBRn (double-buffer registers for GTADTR). GTADTDBRn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited.

12.2.27 General PWM Timer Dead Time Control Register (GTDTCR)

Address(es): GPT32Em.GTDTCR E804 3088h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TDFER	—	—	TDBDE	TDBUE	—	—	—	TDE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	TDE	Negative-Phase Waveform Setting	0: Set GTCCRB without using GTDVU and GTDVD. 1: Use GTDVU and GTDVD to set the compare match value for negative-phase waveform with automatic dead time in GTCCRB.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	TDBUE	GTDVU Buffer Operation Enable	0: Disable GTDVU buffer operation 1: Enable GTDVU buffer operation.	R/W
b5	TDBDE	GTDVD Buffer Operation Enable	0: Disable GTDVD buffer operation 1: Enable GTDVD buffer operation.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	TDFER	GTDVD Setting	0: Set GTDVU and GTDVD separately 1: Automatically set the value written to GTDVU to GTDVD.	R/W
b31 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

GTDTCR enables automatic setting of a compare match value for negative-phase waveform with dead time.

TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU and GTDVD. When GTDVU and GTDVD are used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU and GTDVD), is automatically set in GTCCRB.
The TDE bit setting is ignored in saw-wave PWM mode, and automatic setting does not take place.
The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB and the GTST.DTEF flag is set to 1. However, in triangle waves, when the obtained GTCCRB value exceeds the upper limit value, the GTST.DTEF flag is set to 0.

- Triangle waves
  Upper limit value: GTPR – 1
  Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode
  Upper limit value: GTPR
  Lower limit value: 0

TDBUE bit (GTDVU Buffer Operation Enable)

The TDBUE bit enables buffer operation with GTDVU and GTDBU combined. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves.

TDBDE bit (GTDVD Buffer Operation Enable)

The TDBDE bit enables buffer operation with GTDVD and GTDBD combined. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves. When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

TDFER bit (GTDVD Setting)

The TDFER bits sets whether or not the value written to GTDVU is also set to GTDVD automatically.

12.2.28 General PWM Timer Dead Time Value Register n (GTDVn) (n = U, D)

Address(es): GPT32Em.GTDVU E804 308Ch + 0100h x m (m = 0 to 7)
GPT32Em.GTDVD E804 3090h + 0100h x m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTDVn is a 32-bit read/write register that sets the dead time for generating PWM waveforms with dead time. GTDVU is used for up-counting and GTDVD is used for down-counting.
It is prohibited to set the GTDVn register with a value larger than or equal to that of the GTPR register.
Do not set the change point of waveform beyond the count cycle period, when the automatic dead time setting function is used. By reading the GTCCRB register, can be seen the change point for the reverse-phase waveform after the dead time added, which is set in the automatic dead time setting function.
When GTDVn is used, writing to GTCCRB is not allowed. When this register is set to 0, waveforms without dead time are output. GTDVn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited.
When GTDVn buffer operation is enabled, GTDBn can be written anytime. The value of GTDBn is transferred to GTDVn at the end of the count cycle period. When the GTDVn buffer operation is disabled, set the CST bit in the GTCR register to stop the GPT with before changing GTDVn to a new value. When GTDVn buffer operation is disabled, to change GTDVn to a new value, stop the GPT with the CST bit in the GTCR register.

12.2.29 General PWM Timer Dead Time Buffer Register n (GTDBn) (n = U, D)

Address(es): GPT32Em.GTDBU E804 3094h + 0100h × m (m = 0 to 7)
GPT32Em.GTDBD E804 3098h + 0100h × m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTDBn is a 32-bit read/write register that functions as a buffer register for GTDVn.

12.2.30 General PWM Timer Output Protection Function Status Register (GTSOS)

Address(es): GPT32Em.GTSOS E804 309Ch + 0100h x m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	SOS[1:0]	Output Protection Function Status	b1 b0 0 0: Normal operation 0 1: Protected state (set GTCCRA = 0 during transfer at trough or crest) 1 0: Protected state (set GTCCRA ≥ GTPR during transfer at trough) 1 1: Protected state (set GTCCRA ≥ GTPR during transfer at crest).	R
b7 to b2	—	Reserved	These bits are read as 0.	R
b9, b8	—	Reserved	The read value is undefined.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

GTSOS is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (GTDTCR.TDE bit = 1) in triangle-wave mode.

SOS[1:0] bits (Output Protection Function Status)

The SOS[1:0] bits indicate the status of the output protection function in triangle-wave PWM mode.

12.2.31 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR)

Address(es): GPT32Em.GTSOTR E804 30A0h + 0100h x m (m = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOTR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SOTR	Output Protection Function Temporary Release	0: Do not release protected state 1: Release protected state.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

GTSOTR temporarily releases the protected state of GTIOCB pin output when output protection is set. The protected state can be released only when GTSOS.SOS[1:0] bits = 10b (protected state in which GTCCRA ≥ GTPR has occurred during transfer at trough). The protected state cannot be released in any other case.

SOTR bit (Output Protection Function Temporary Release)

The SOTR bit specifies whether to temporarily release the protected state of the GTIOCB pin output in an output protected state. When the SOTR bit is set to 1, the output protection function is canceled from the first trough. When the SOTR bit is set to 0, output protection resumes from the first trough.

12.2.32 General PWM Timer Event Control Register (GTECR)

Address(es): GPT.GTECR E804 3800h

	b7	b6	b5	b4	b3	b2	b1	b0
	EVCON	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	EVCON	All Event cooperation function Enable	0: Disable Event cooperation function 1: Enable Event cooperation function	R/W

The GTECR register controls the event cooperation function.

12.2.33 General PWM Timer Event Source Setting Register (GTESRn) (n=0 to 7)

Address(es): GPT.GTESR0 H'E804_3810, GPT.GTESR1 H'E804_3814, GPT.GTESR2 H'E804_3818, GPT.GTESR3 H'E804_381C
GPT.GTESR4 H'E804_3820, GPT.GTESR5 H'E804_3824, GPT.GTESR6 H'E804_3828, GPT.GTESR7 H'E804_382C

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	EVS[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	EVS[6:0]	Event Source Select	0000000: Disable output of the associated event signal 0000001 to 1000000b: Number setting for the event signal to be selected Other settings are prohibited.	R/W
b15 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTESRn register specifies an event signal to be selected for each event input.
Table 12.6 shows the associations between the GTESRn registers and the event input name.

Table 12.6 Associations between the GTESRn registers and Event input name

Register name	Event name
GTESR0	Event Input A
GTESR1	Event Input B
GTESR2	Event Input C
GTESR3	Event Input D
GTESR4	Event Input E
GTESR5	Event Input F
GTESR6	Event Input G
GTESR7	Event Input H

12.3 Operation

12.3.1 Basic Operation

Each channel has a 32-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR controls the count cycle. When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated pin GTIOCA or GTIOCB can be changed. GTCCRA or GTCCRB can be used as an input capture register with hardware resources. GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

12.3.1.1 Counter Operation

(1) Counter start and stop

The counter of each channel starts the count operation by setting GTCR.CST to 1. The GTCR.CST bit value is changed by following sources.

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register.

(2) Periodic count operation in up-counting by count clock

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to 00000000h. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1. When GTCNT overflows, up-counting resumes from 00000000h.
Figure 12.2 shows an example of a periodic count operation in up-counting.

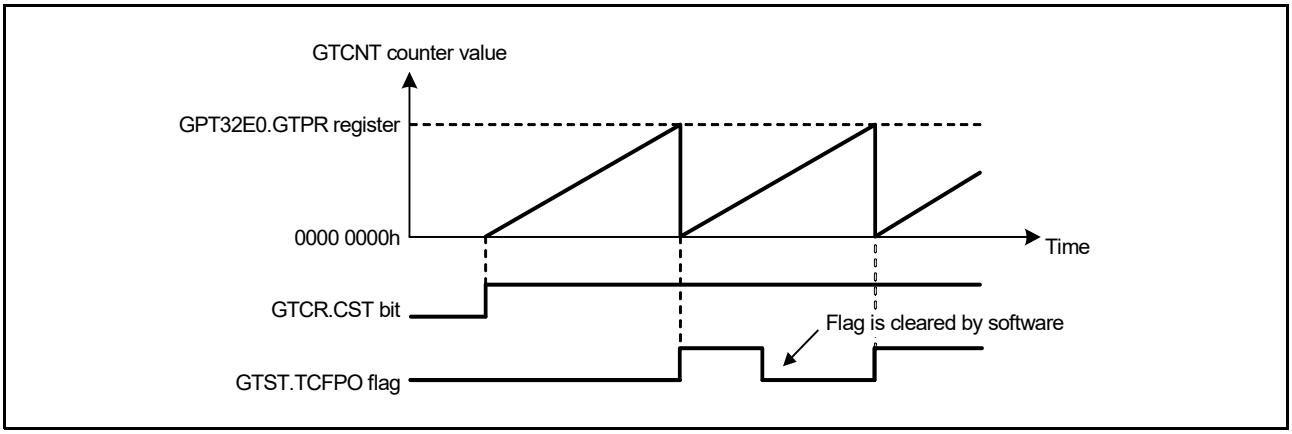

Figure 12.2 Example of periodic count operation in up-counting by the count clock

Figure 12.3 shows an example setting for periodic count operation in up-counting.

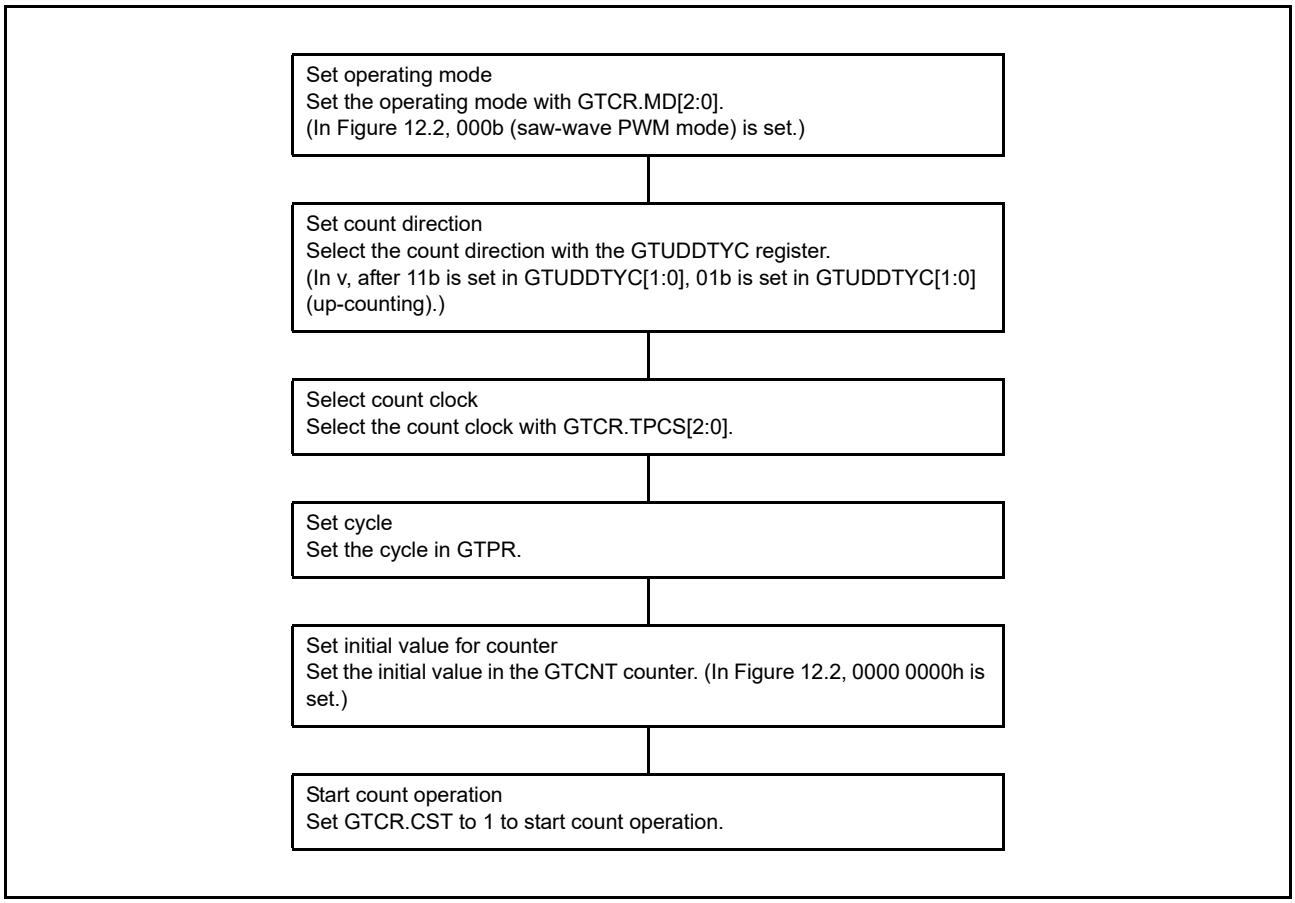

Figure 12.3 Example setting for a periodic count operation in up-counting by the count clock

(3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to 00000000h. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1. When the GTCNT counter underflows, down-counting resumes from the GTPR value.
Figure 12.4 shows an example of periodic count operation in down-counting by the count clock.

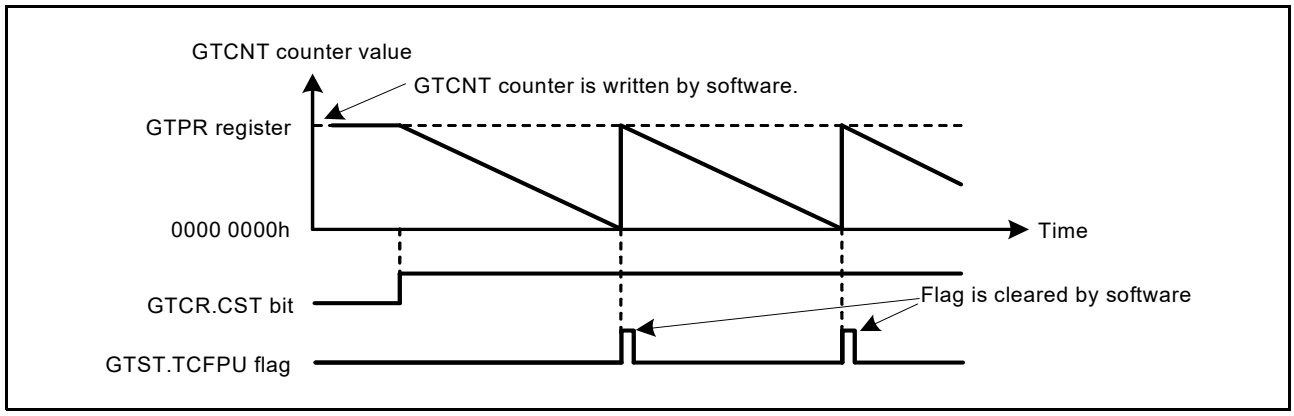

Figure 12.4 Example of periodic count operation in down-counting by the count clock

Figure 12.5 shows an example setting for periodic count operation in down-counting by the count clock.

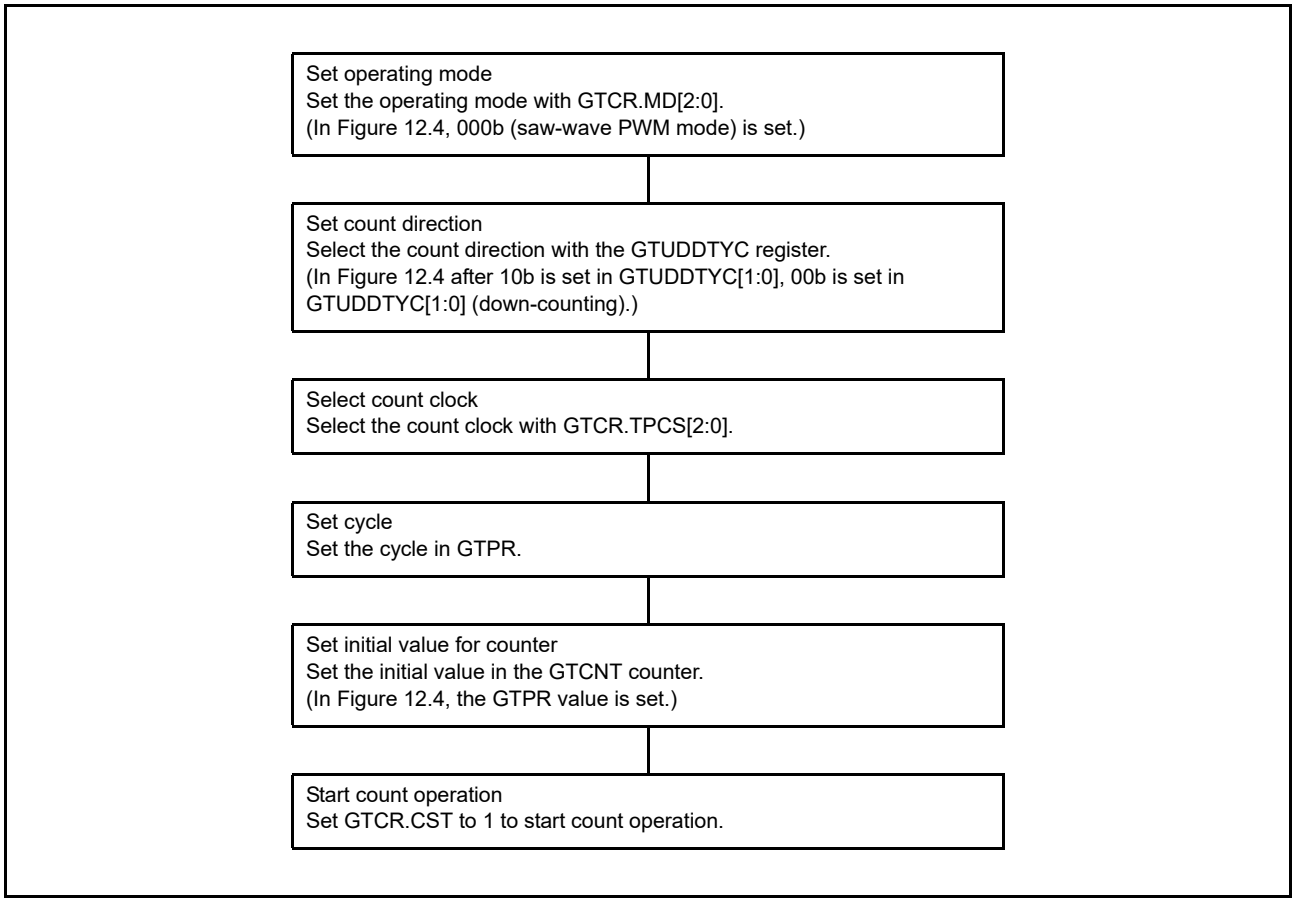

Figure 12.5 Example setting for periodic count operation in down-counting by count clock

(4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.
When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[2:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior for up-counting using hardware sources is the same as for up-counting by the count clock.
When GTCR.CST bit is set to 1 to count up using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[2:0] because the count operation is synchronized by the count clock selected by GTCR.TPCS[2:0]. Set the GTCR.TPCS[2:0] bits to 000b to select counting up of single cycles of the P1φ clock with a delay of one clock cycle after the GTCR.CST bit has been set to 1.
Figure 12.6 shows an example of a periodic count operation in up-counting by a hardware resource (rising edge of GTETRGA pin).

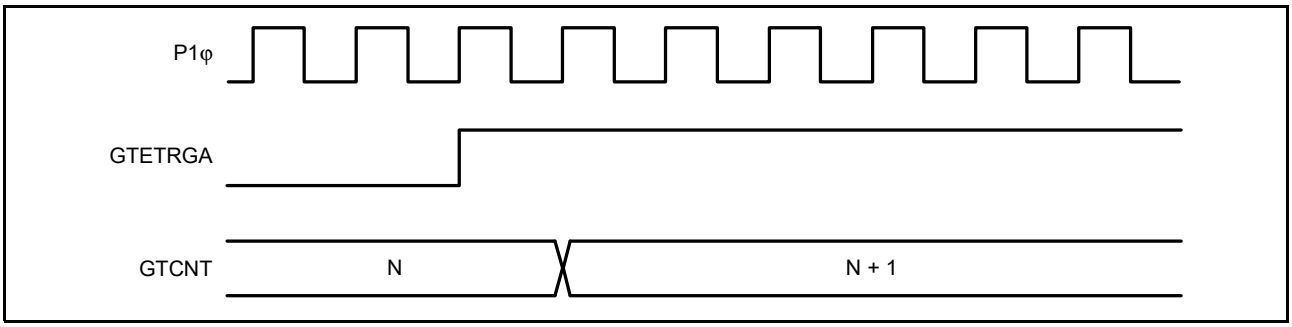

Figure 12.6 Example of periodic count operation in up-counting using hardware sources

Figure 12.7 shows an example setting for periodic count operation in up-counting by the count clock.

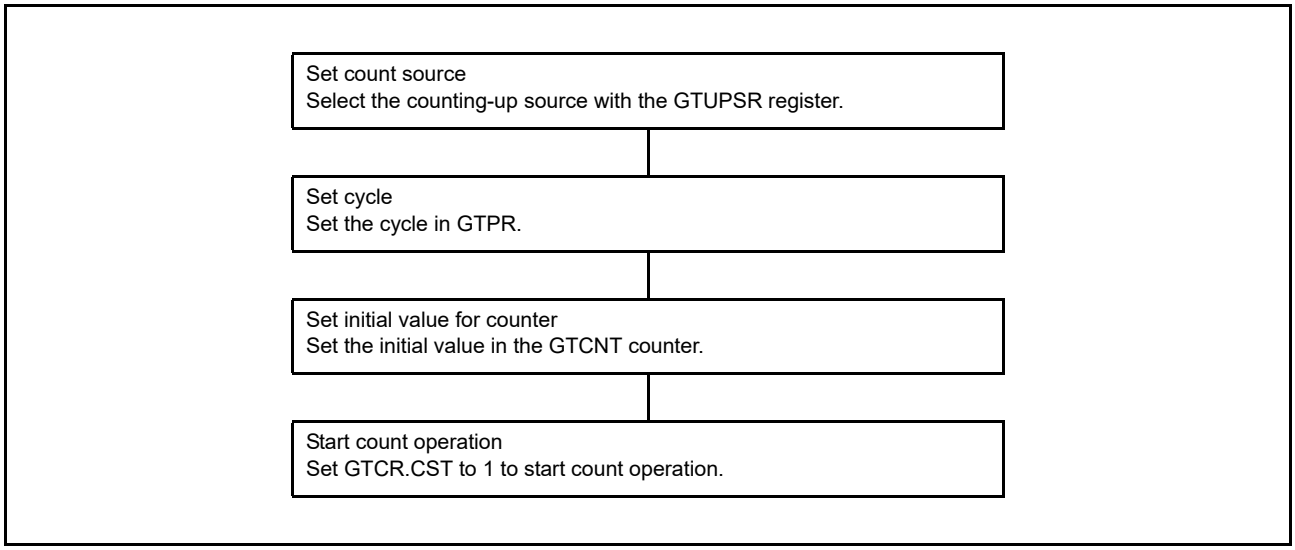

Figure 12.7 Example setting for an event count operation in up-counting using hardware sources

(5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR. When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[2:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, GTCNT counter value does not change. The underflow behavior for down-counting using hardware sources is the same as for down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[2:0] because the count operation is synchronized with the count clock selected by GTCR.TPCS[2:0]. Set the GTCR.TPCS[2:0] bits to 000b to select counting up of single cycles of the P1φ clock with a delay of one clock cycle after the GTCR.CST bit has been set to 1.

Figure 12.8 shows an example of a periodic count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).

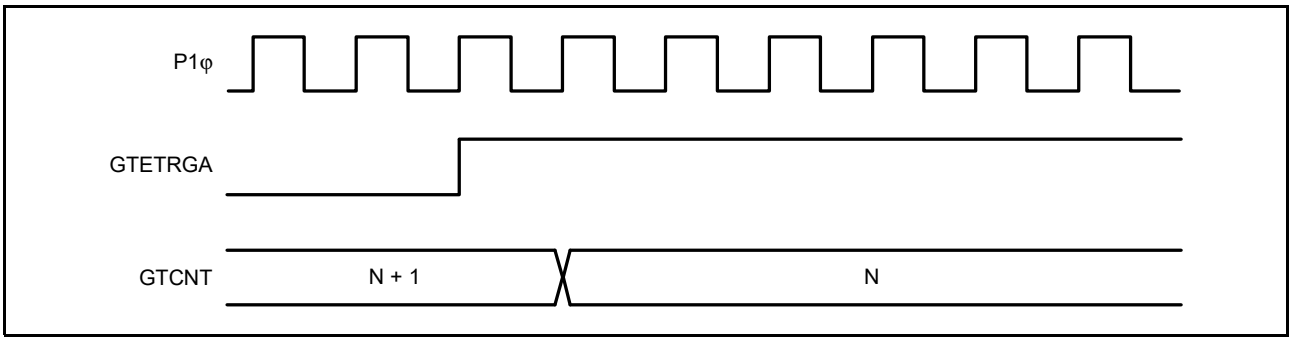

Figure 12.8 Example of event count operation in down-counting using hardware sources

Figure 12.9 shows an example setting for a periodic count operation in down-counting using a hardware resource.

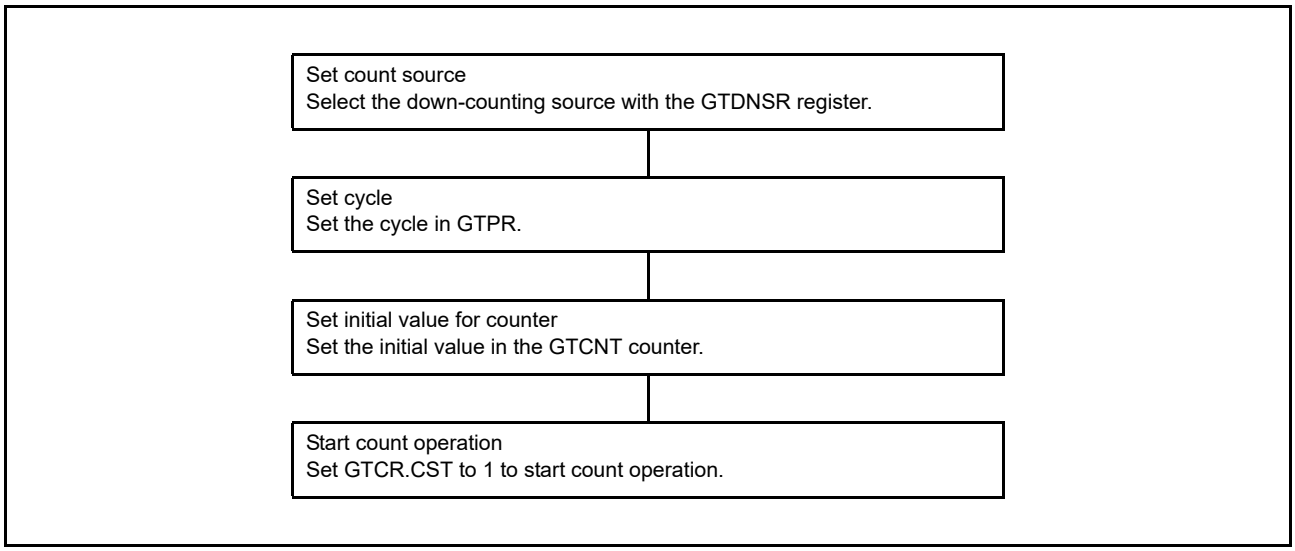

Figure 12.9 Example setting for an event count operation in down-counting using hardware sources

(6) Counter clear operation

The counter of each channel is cleared by either of the following sources.

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST = 1) or not (GTCR.CST = 0).

For saw waves selected by setting GTCR.MD[2:0] and the count direction flag showing down-counting (GTST.TUCF = 0), the GTCNT register is set to the value of the GTPR register when the counter is cleared by writing 1 to the GTCLR register or by the hardware source specified in the GTCSR register. When not in saw waves mode and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with P1φ. If other settings are used, clear is synchronized with the counter clock selected by GTCR.TPCS[2:0].

12.3.1.2 Waveform Output by Compare Match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock including the event count. At the same time the GPT can output low, high, or toggle output from the associated GTIOCA or GTIOCB output pin. In addition, the GTIOCA or GTIOCB pin output can be low, high, or toggle at the cycle end which is determined by GTPR. The cycle end is:

- For saw waves in up-counting – when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves in down-counting – when GTCNT changes from 0 to GTPR value (underflow)
- For saw waves – when the GTCNT counter is cleared
- For triangle waves – when the GTCNT changes from 0 to 1 (trough).

(1) Low and high output

Figure 12.10 shows an example of low and high output operation by a compare match of GTCCRA and GTCCRB. In this example, the GPT32E0.GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOC0A pin by a GPT32E0.GTCCRA compare match, and low is output from the GTOC0B pin by a GPT32E0.GTCCRB compare match. The pin level does not change when the specified level and pin level match.

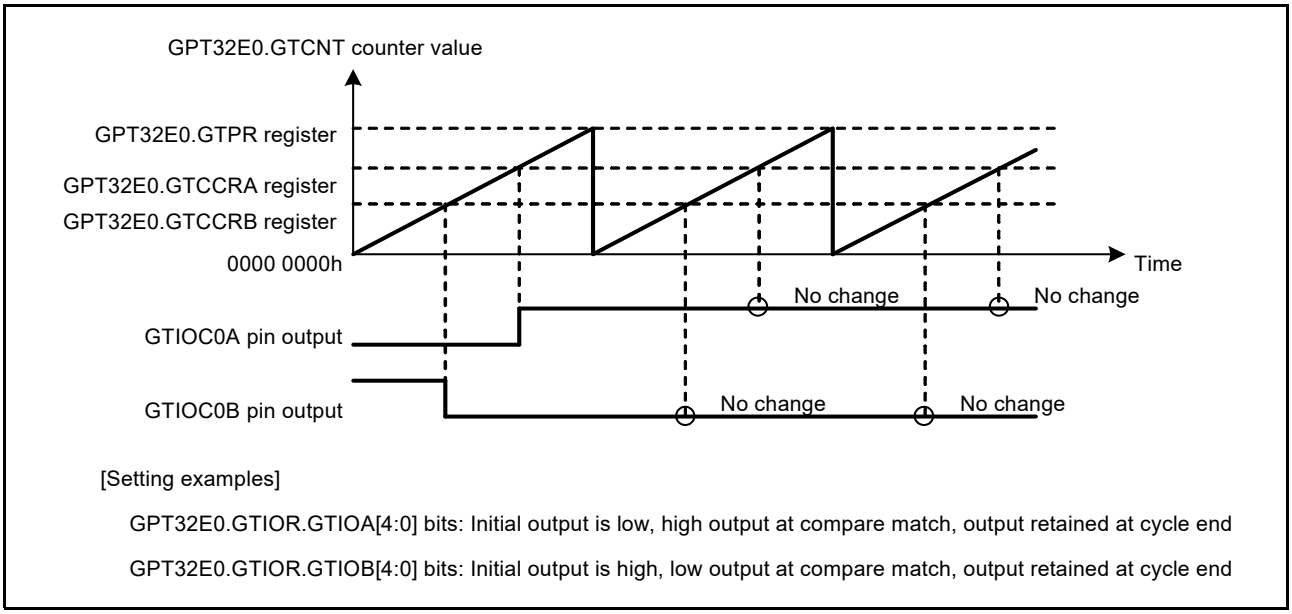

Figure 12.10 Example of low and high output operation

Figure 12.11 shows an example setting for low output and high output operation.

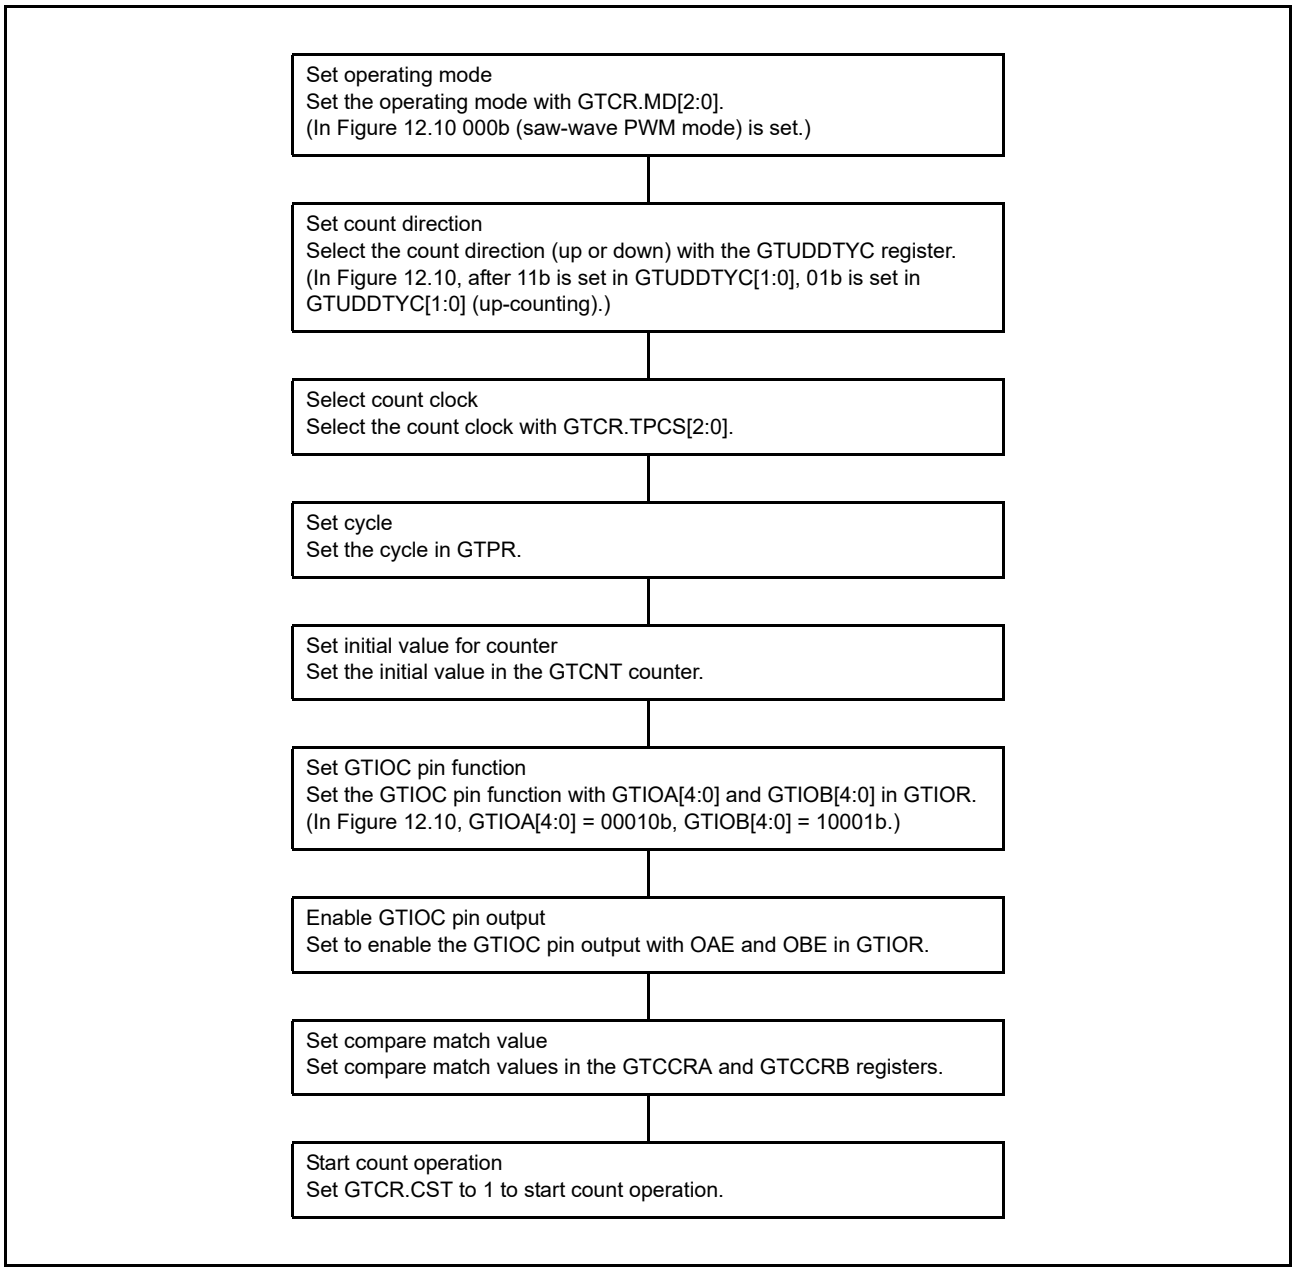

Figure 12.11 Example setting for low output and high output operation

(2) Toggled output

Figure 12.12 and Figure 12.13 show examples of toggled output operation by compare matches of GTCCRA and GTCCRB. In Figure 12.12, the GPT32E0.GTCNT counter performs up-counting, and settings are made so that the GTIOC0A pin output by a GPT32E0.GTCCRA compare match and GTIOC0B pin output by a GPT32E0.GTCCRB compare match are toggled.

Figure 12.13, the GPT32E0.GTCNT counter performs up-counting, and settings are made so that the GTIOC0A output is toggled by a compare match of GPT32E0.GTCCRA and the GTIOC0B output is toggled at the cycle end.

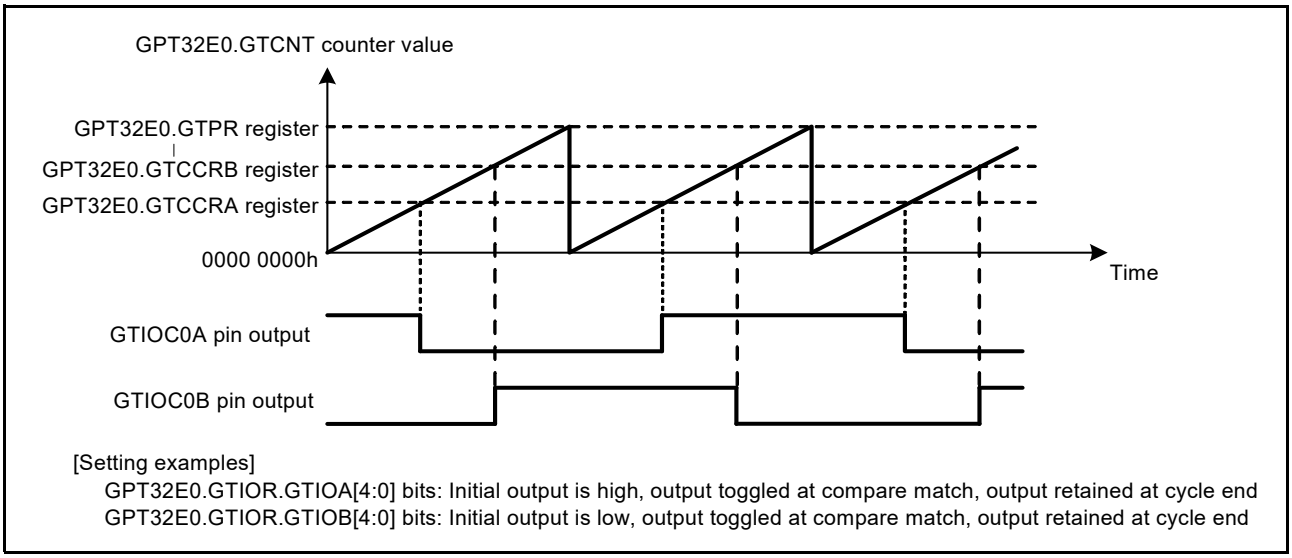

Figure 12.12 Example of toggled output operation (1)

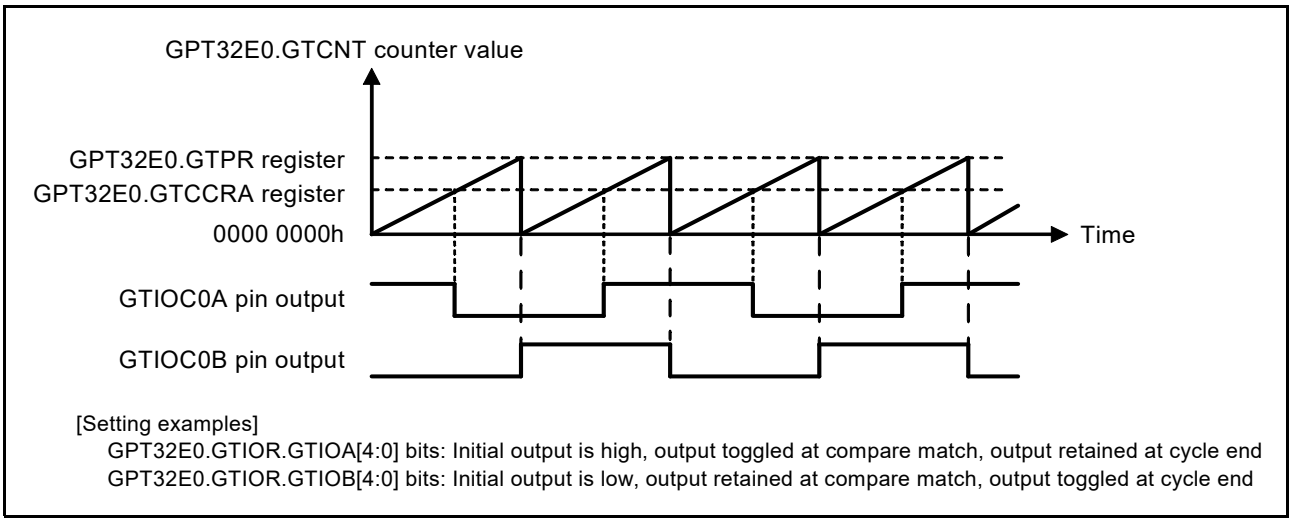

Figure 12.13 Example of toggled output operation (2)

Figure 12.14 shows an example setting for toggled output operation.

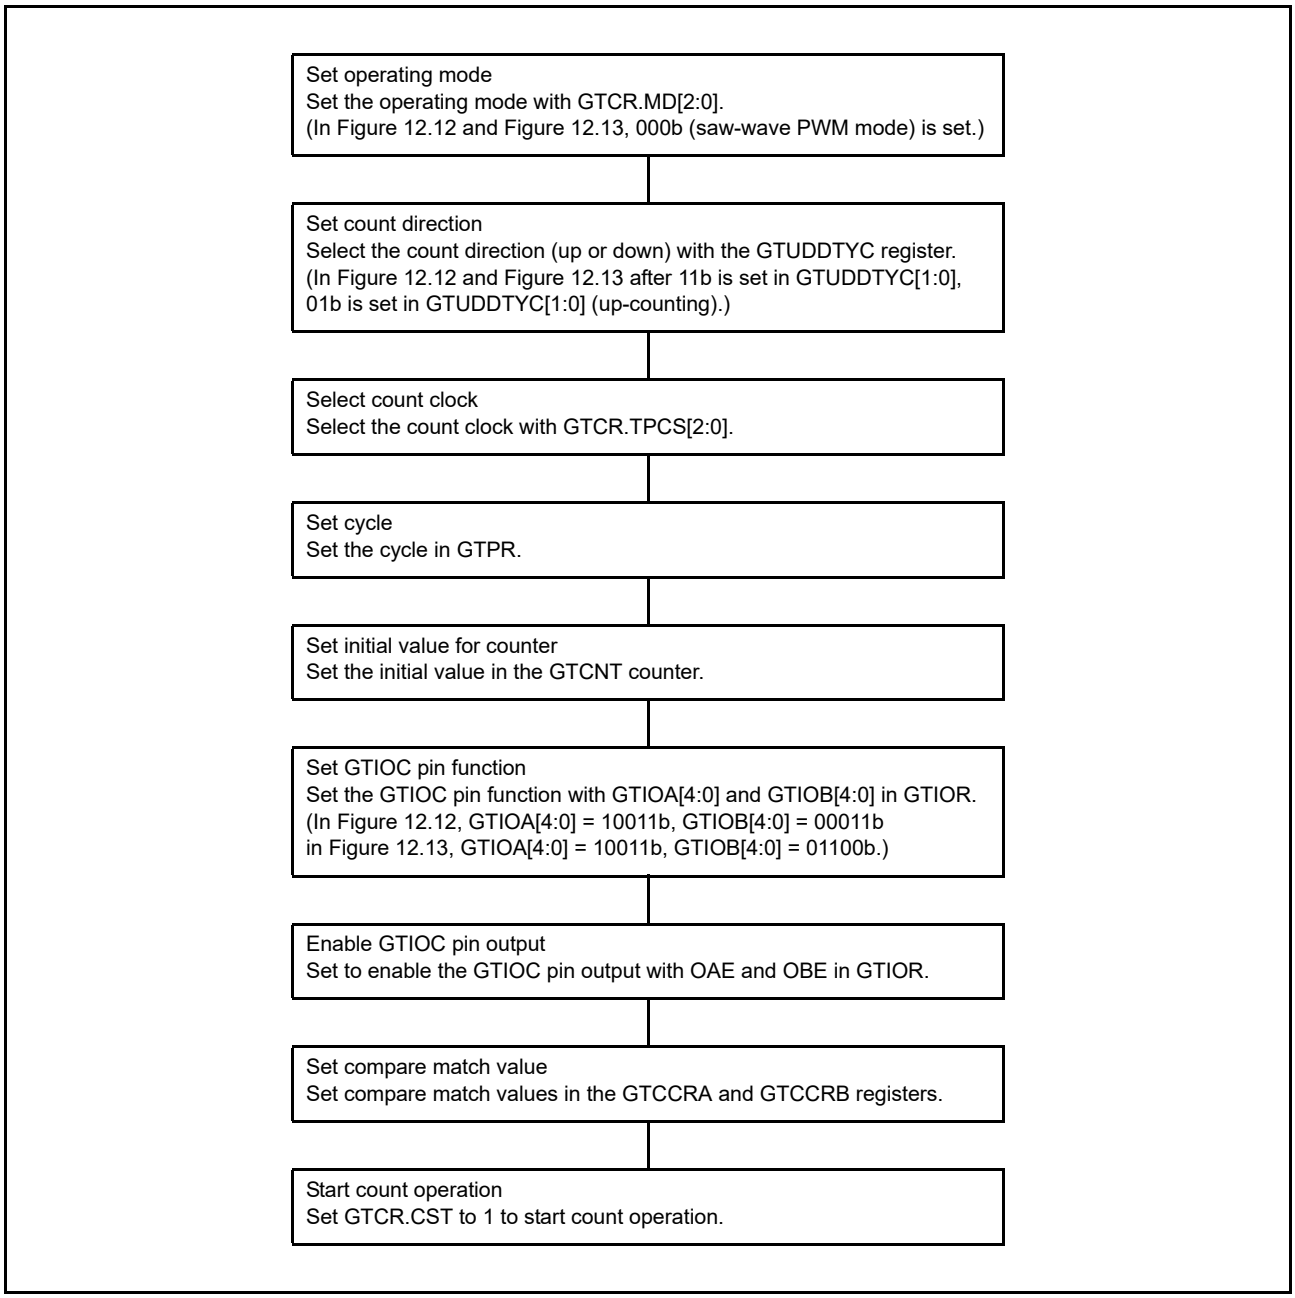

Figure 12.14 Example setting for toggled output operation

12.3.1.3 Input Capture Function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 12.15 shows an example of the input capture function.

In this example, the GPT32E0.GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTICCRA at both edges of the GTIOC0A input pin and to GTICCRB on the rising edge of the GTIOC0B input pin.

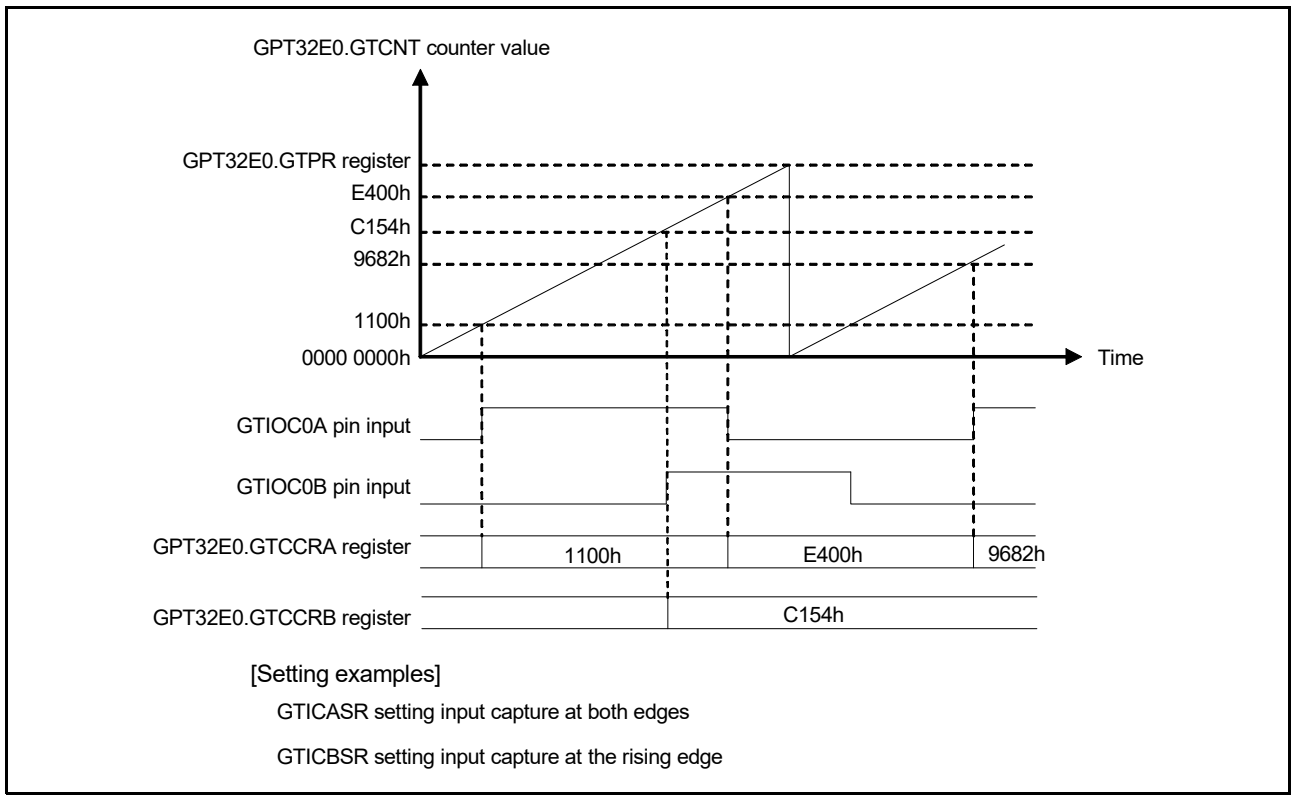

Figure 12.15 Example of input capture operation

Figure 12.16 shows an example setting for an input capture operation with count operation by the count clock.

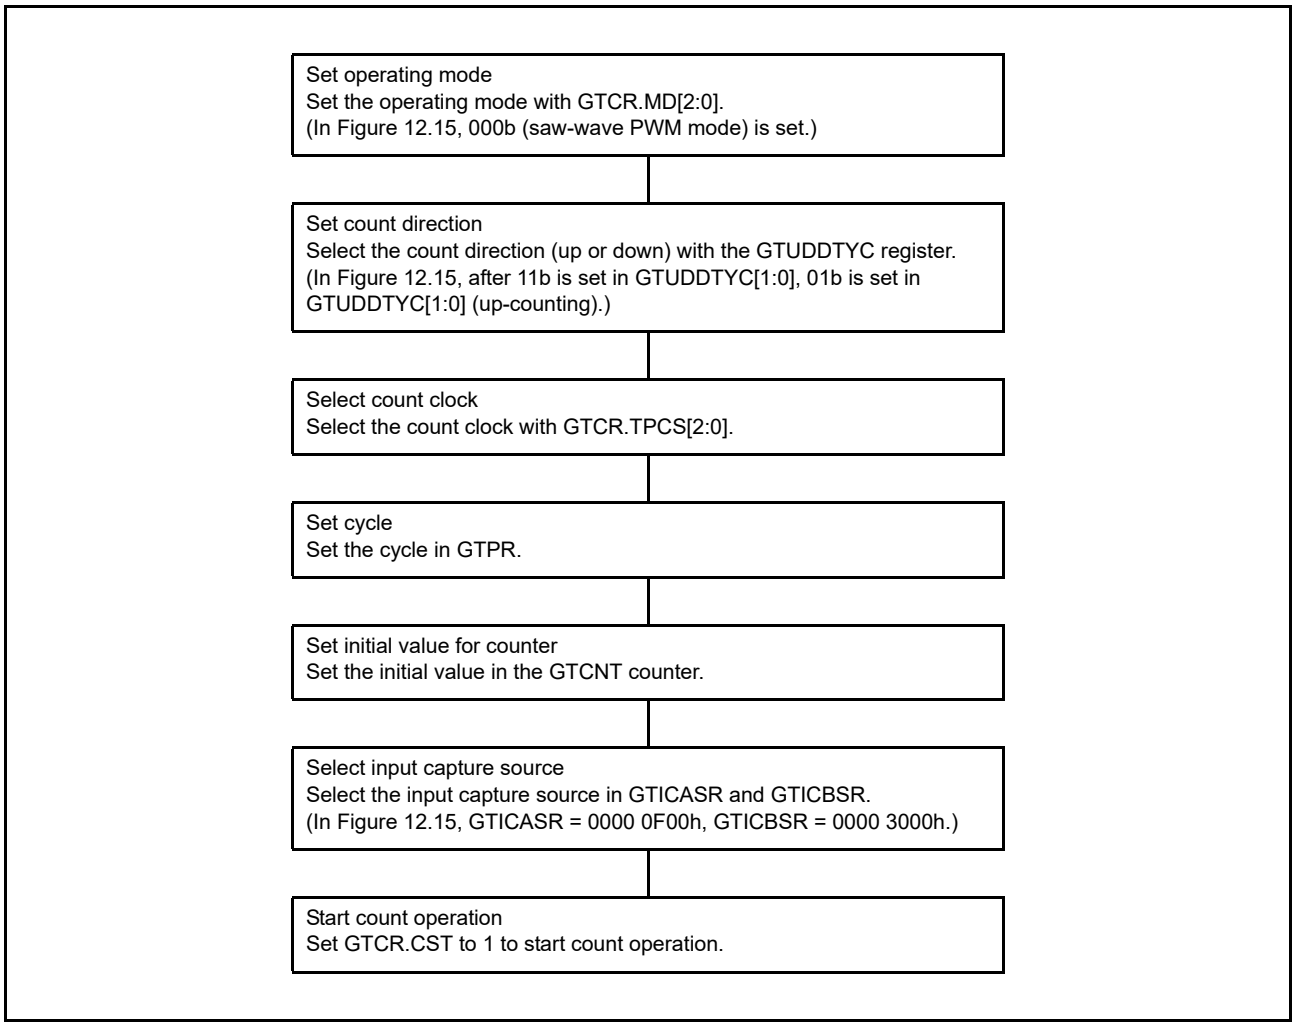

Figure 12.16 Example setting for input capture operation

12.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR, GTPBR, and GTPDBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF
- GTADTRA, GTADTBRA, and GTADTDBRA
- GTADTRB, GTADTBRB, and GTADTDBRB.

The following buffer operations can be set with GTDTCR:

- GTDVU and GTDBU
- GTDVD and GTDBD.

12.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR, and GTPDBR can function as a buffer register for GTPBR (double-buffer register for GTPR). The buffer transfer is performed at an overflow during up-counting or an underflow during down-counting in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR[23:0])
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR[n] bit is set to 1, n = channel number).

To set GTPR to function as double buffer, set GTBER.PR[1:0] to 10b or 11b. To set GTPR to not function as a buffer, set GTBER.PR[1:0] to 00b.

Figure 12.17 to Figure 12.19 show examples of GTPR buffer operation and Figure 12.20 shows an example setting for GTPR buffer operation.

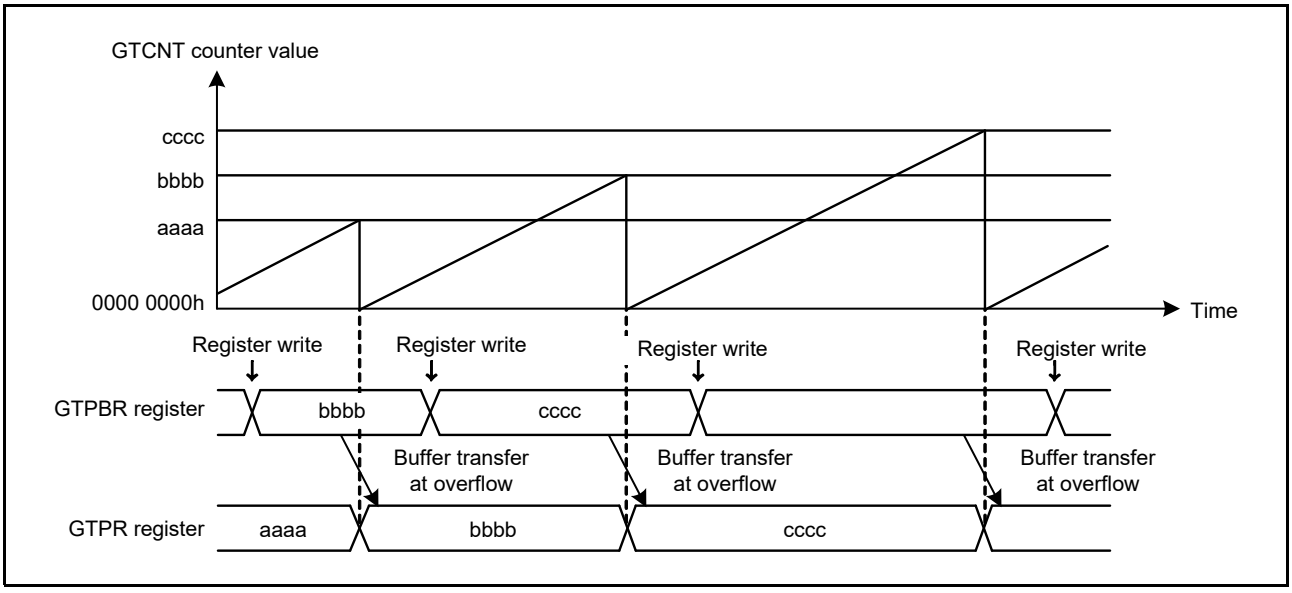

Figure 12.17 Example of GTPR buffer operation with saw waves in up-counting

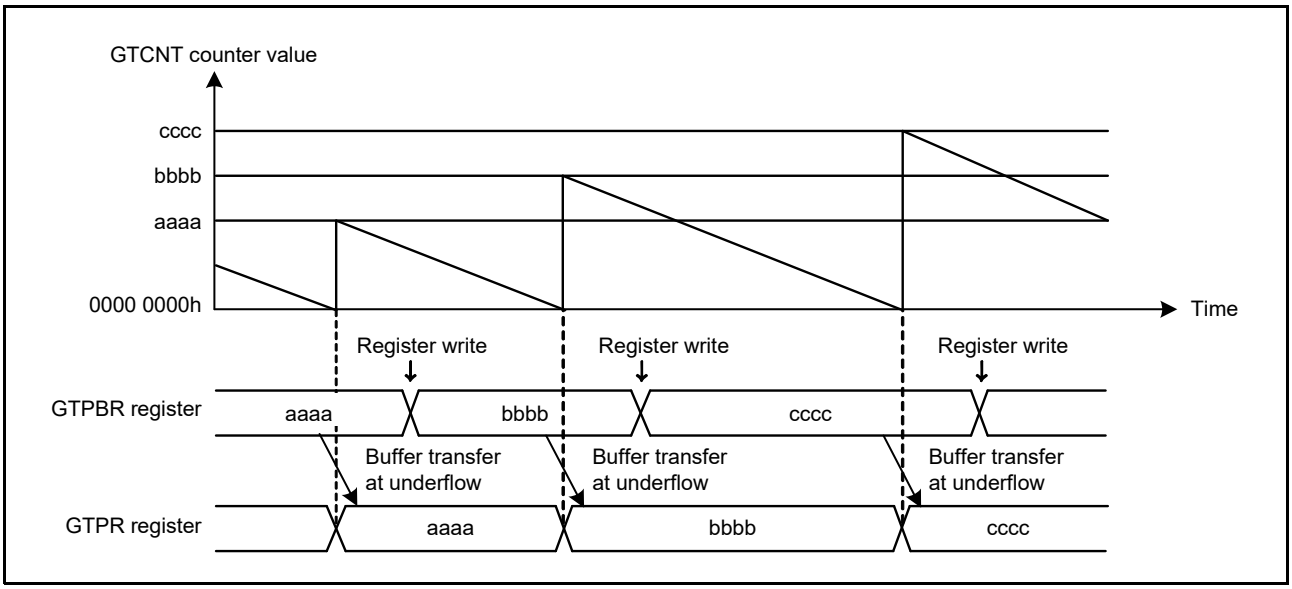

Figure 12.18 Example of GTPR buffer operation with saw waves in down-counting

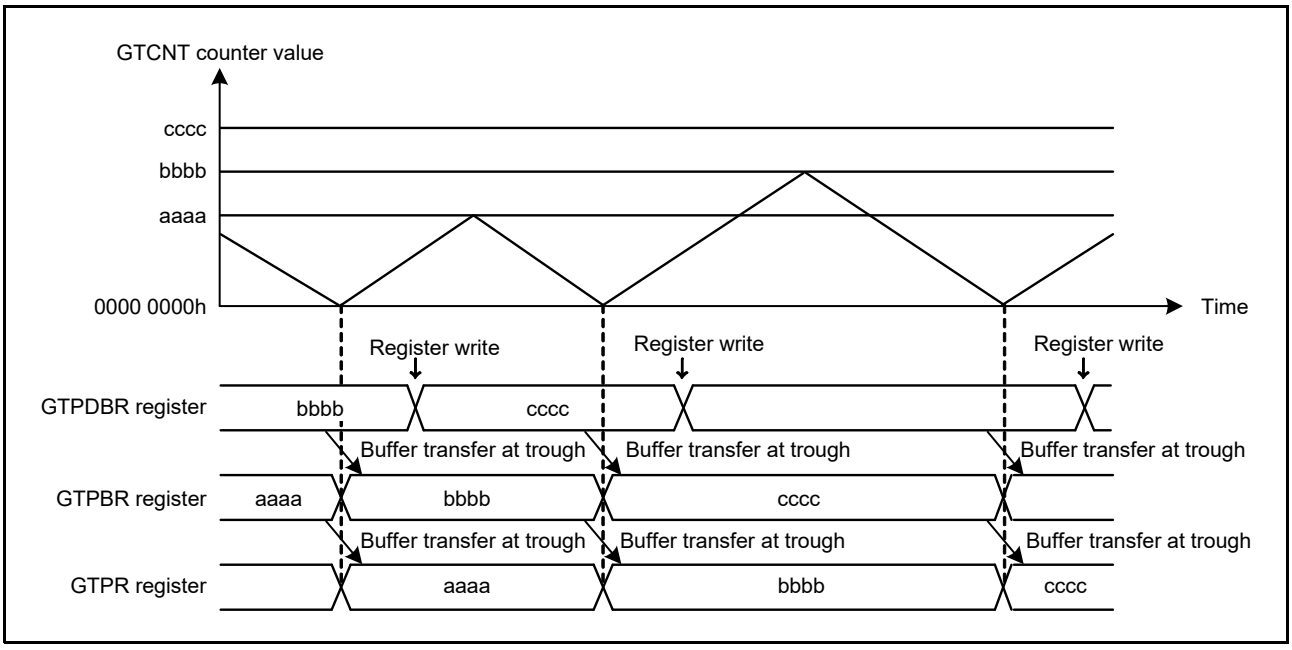

Figure 12.19 Example of GTPR double buffer operation with triangle waves

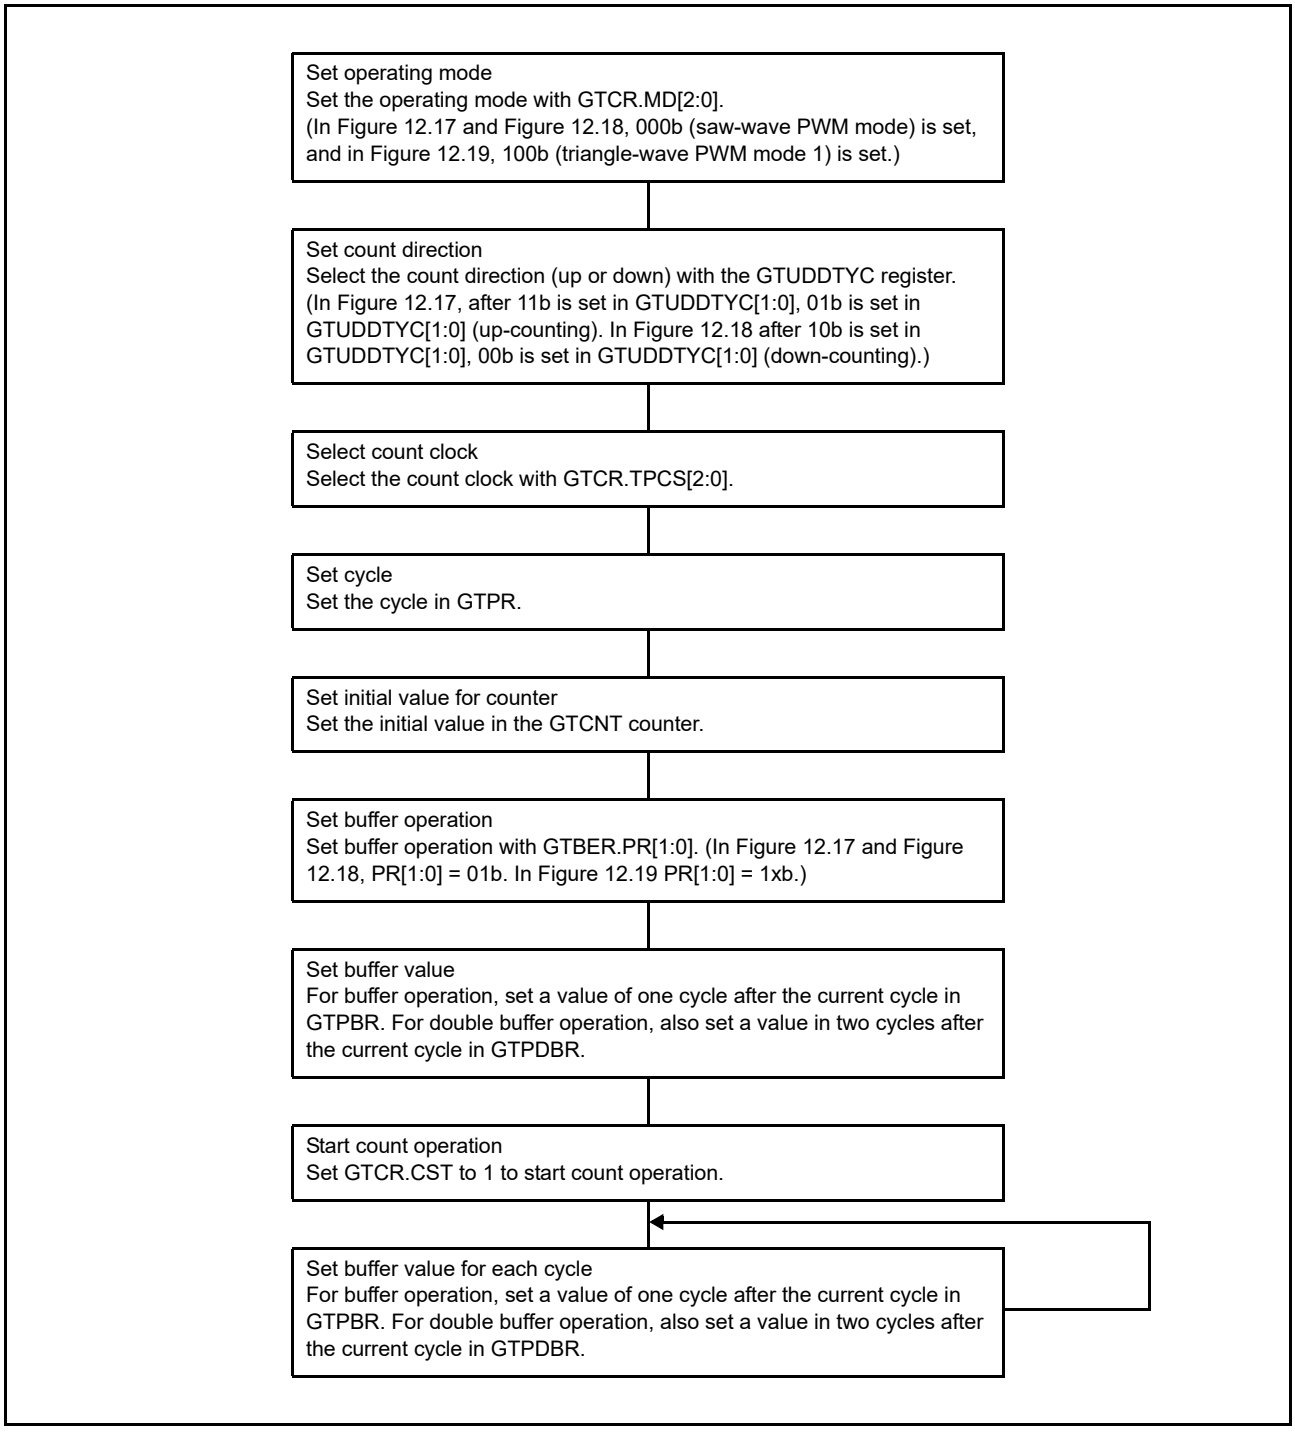

Figure 12.20 Example setting for GTPR buffer operation

12.3.2.2 Buffer Operation for GTCCRA and GTCCRB

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).
To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 01b. To set GTCCRA or GTCCRB to not function as a buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 00b.

(1) When GTCCRA or GTCCRB functions as an output compare register

Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow
  Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear
  In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources the same as shown in section 12.3.2.1, GTPR Register Buffer Operation. In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Forcible buffer transfer
  When 1 is written to the GTBER.CCRSWT bit while counting is stopped, the GTCCRA and the GTCCRB register buffer transfer are performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode. Additionally, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave 1 shot pulse mode or triangle-wave PWM mode 3.

Figure 12.21 to Figure 12.23 show examples of GTCCRA and GTCCRB buffer operation and Figure 12.24 shows an example setting for GTCCRA and GTCCRB buffer operation.

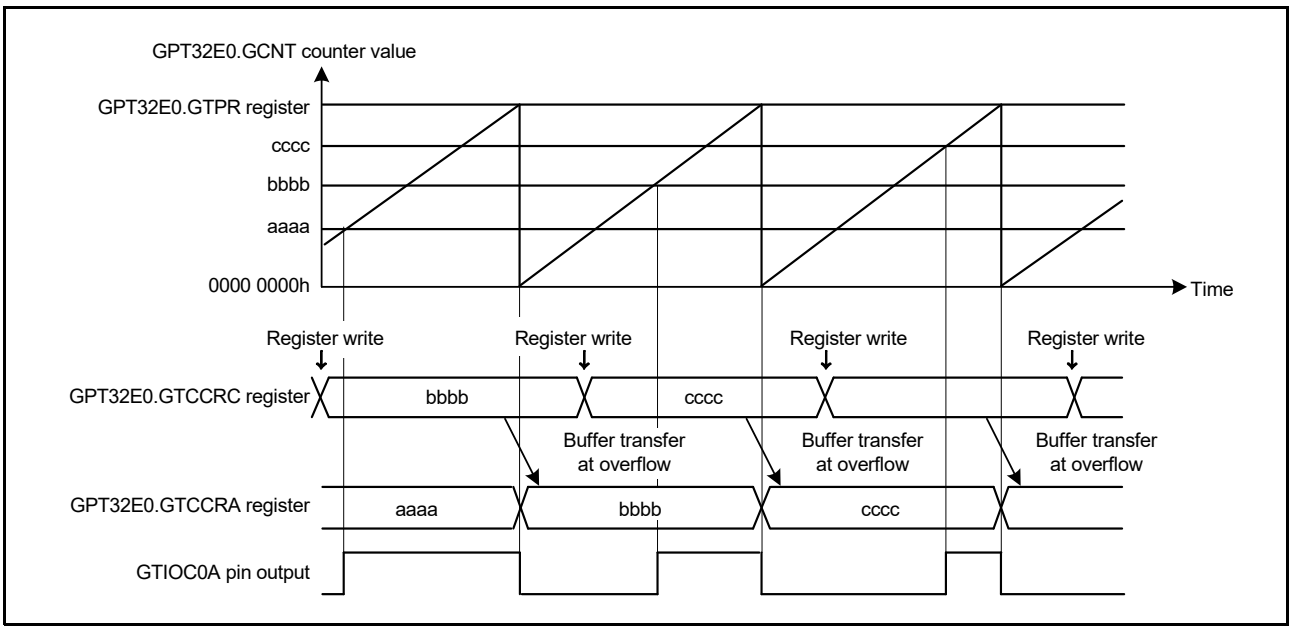

Figure 12.21 Example of GTCCRA and GTCCRB buffer operation with output compare, saw waves in up-counting, high output at GTCCRA compare match, and low output at cycle end

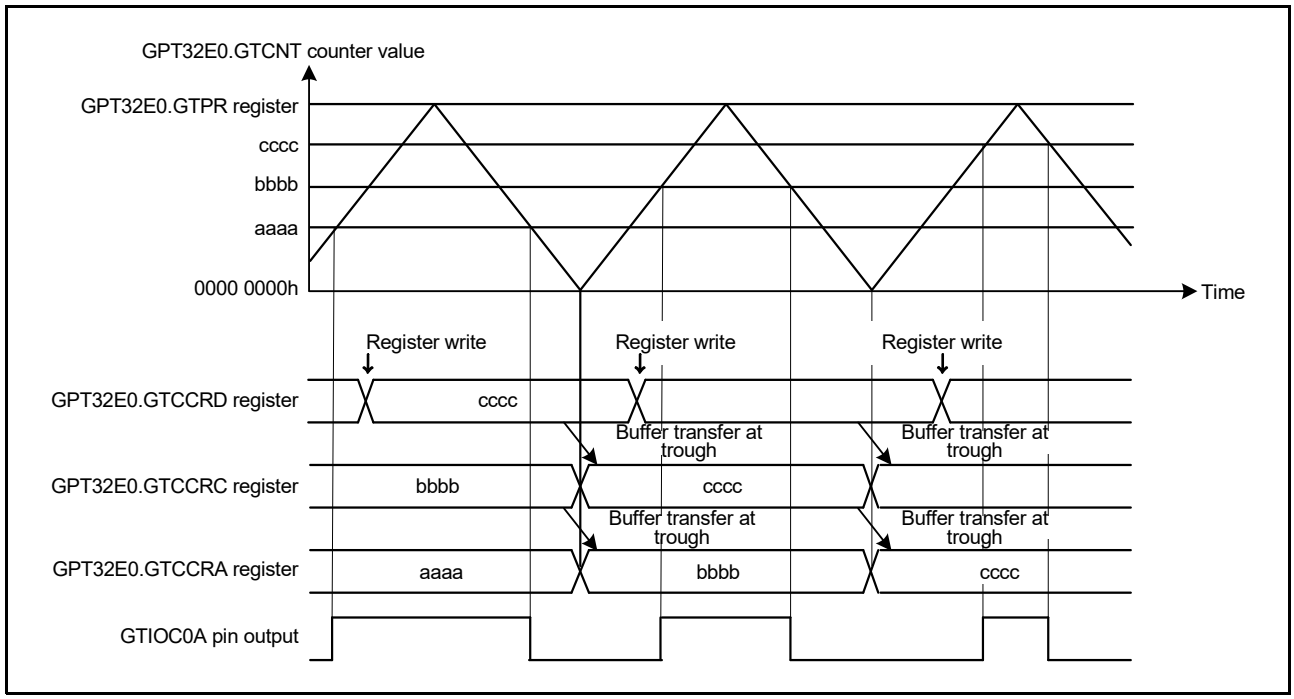

Figure 12.22 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA compare match, and output retained at cycle end

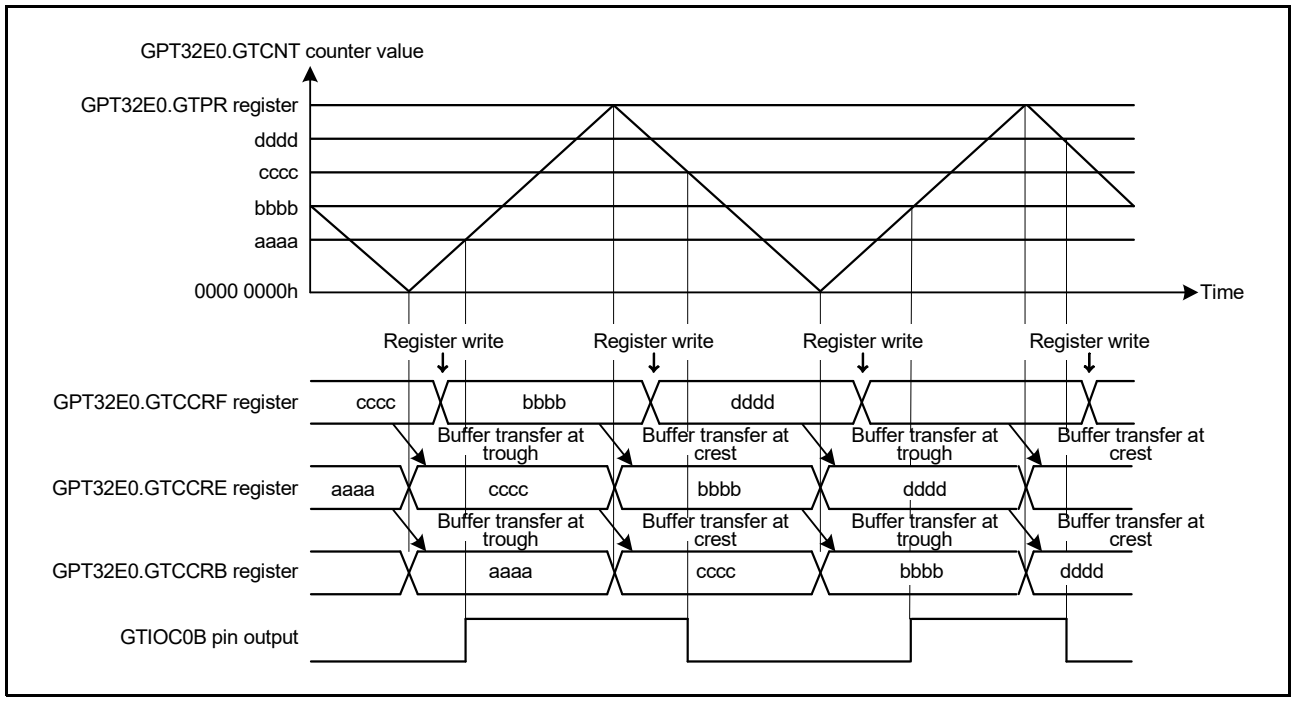

Figure 12.23 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB compare match, and output retained at cycle end

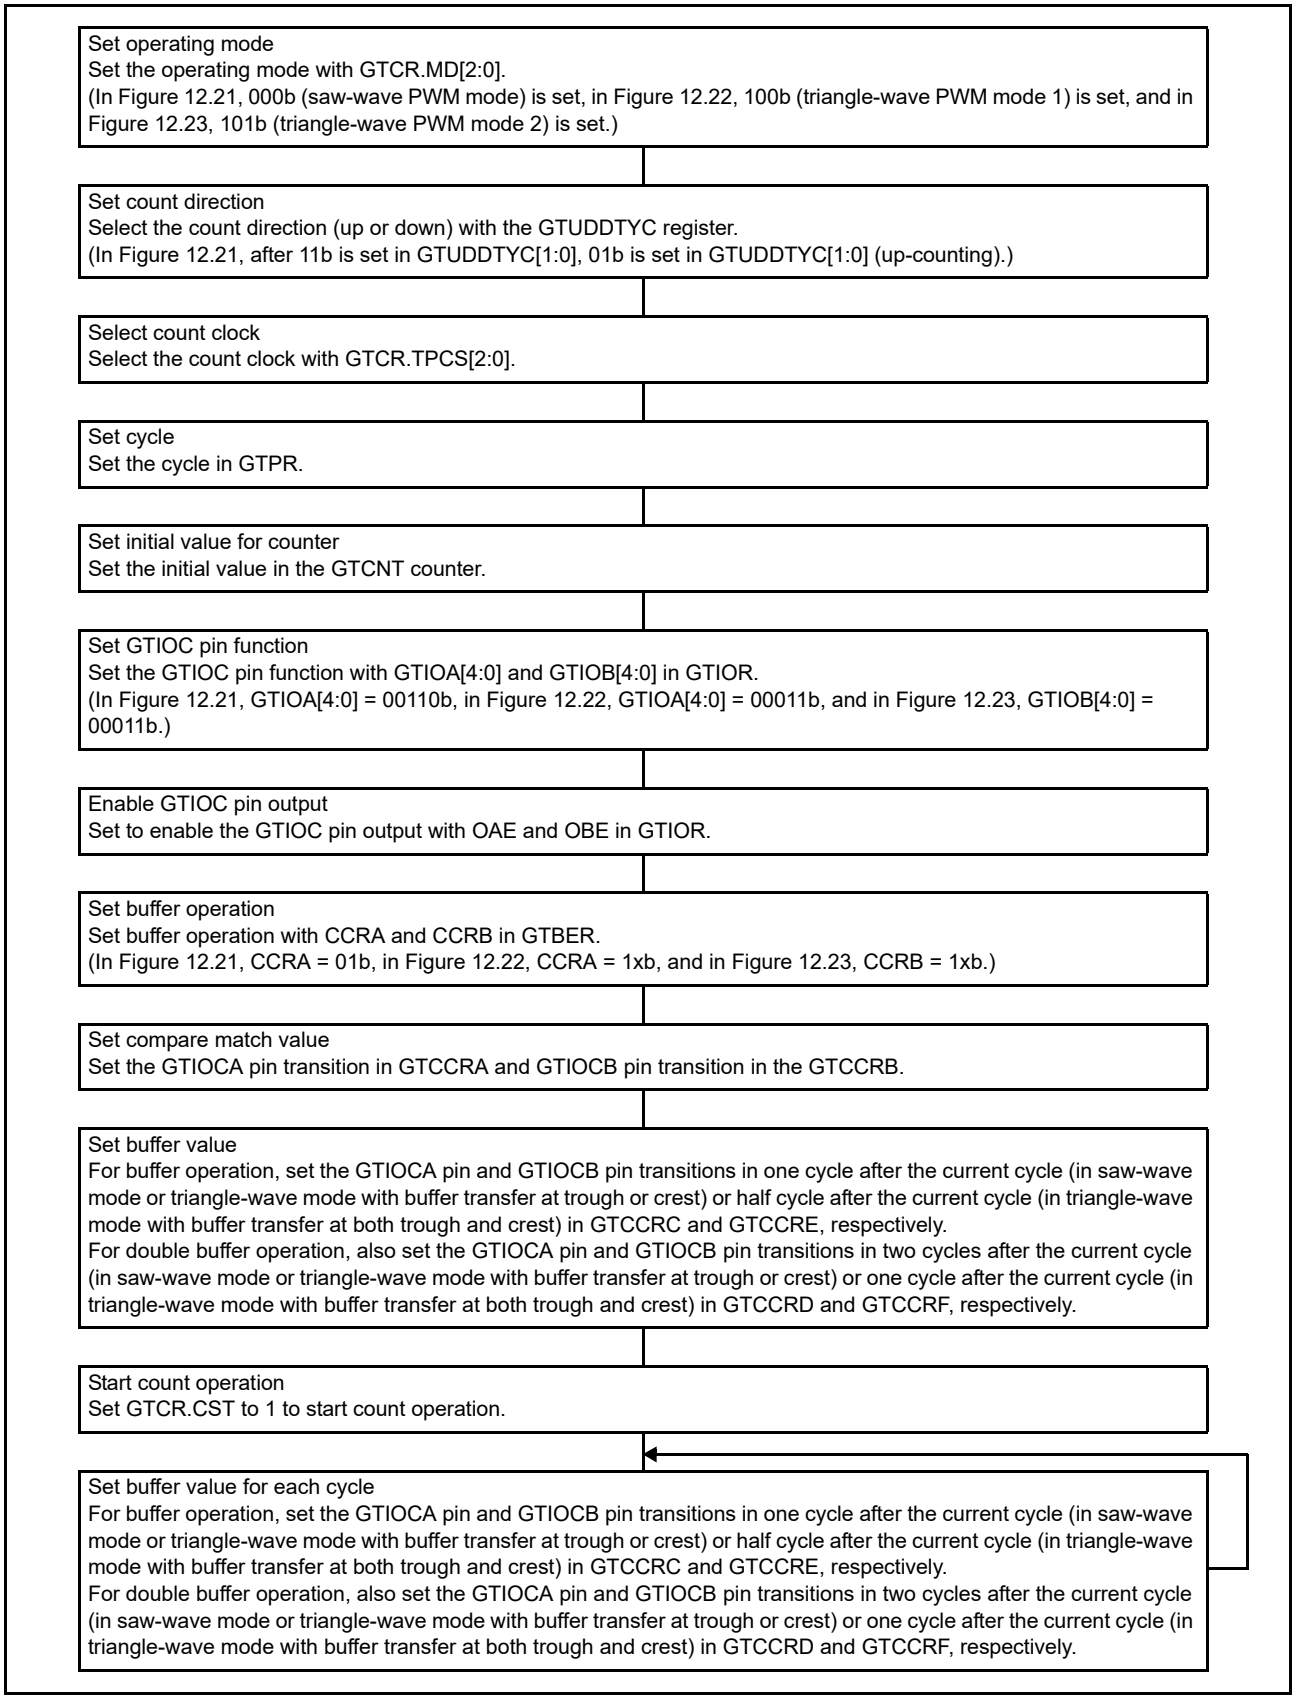

Figure 12.24 Example setting for GTCCRA and GTCCRB buffer operation with output compare

(2) When GTCCRA or GTCCRB functions as an input capture register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

Figure 12.25 and Figure 12.26 show examples of GTCCRA and GTCCRB buffer operation and Figure 12.27 shows an example setting for GTCCRA and GTCCRB buffer operation.

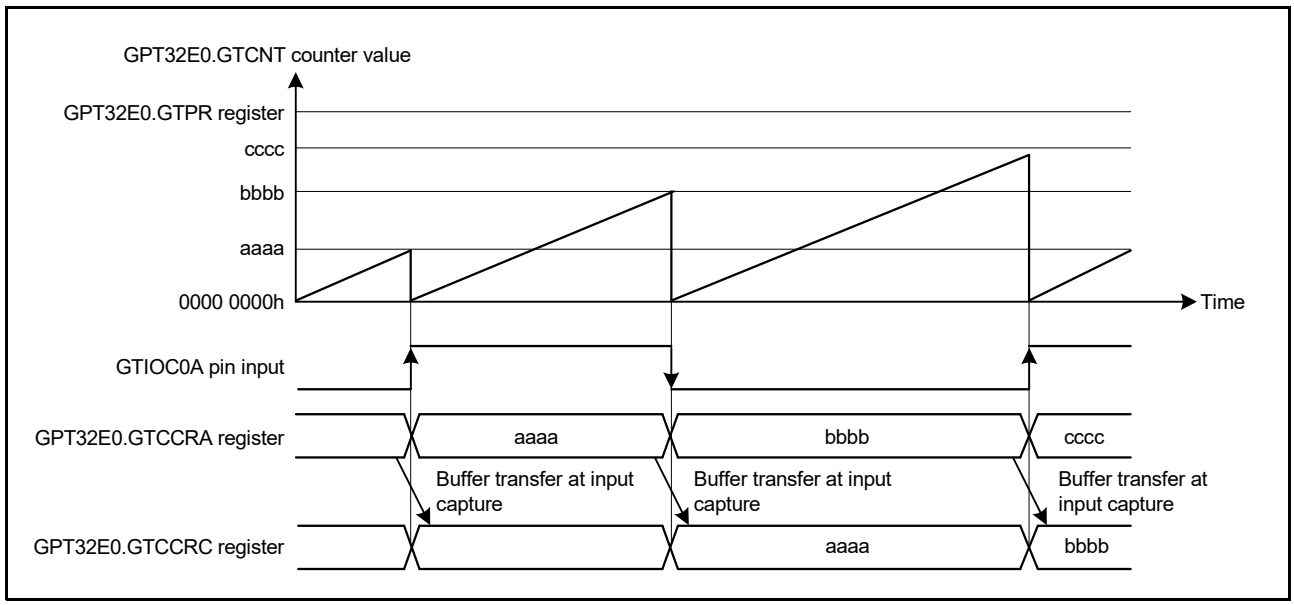

Figure 12.25 Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOC0A input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOC0A input

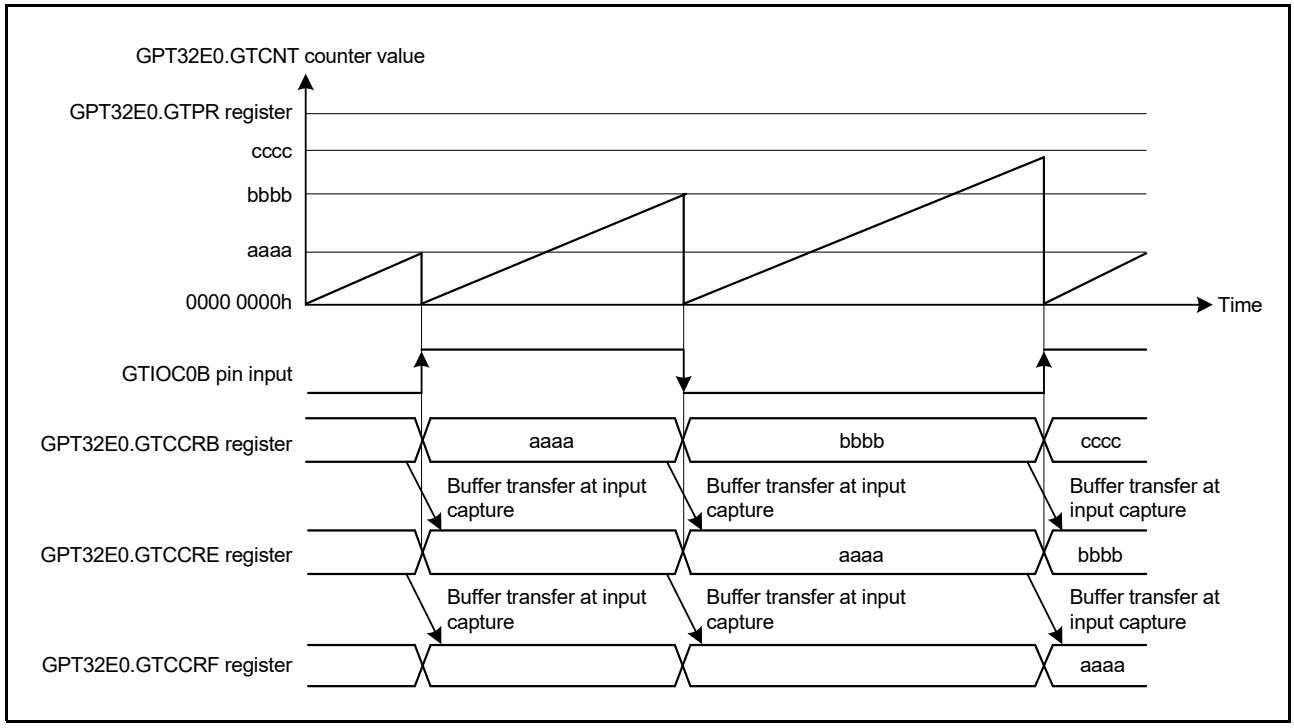

Figure 12.26 Example of GTCCRA and GTCCRB double buffer operation with input capture at both edges of GTIOC0B input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOC0B input

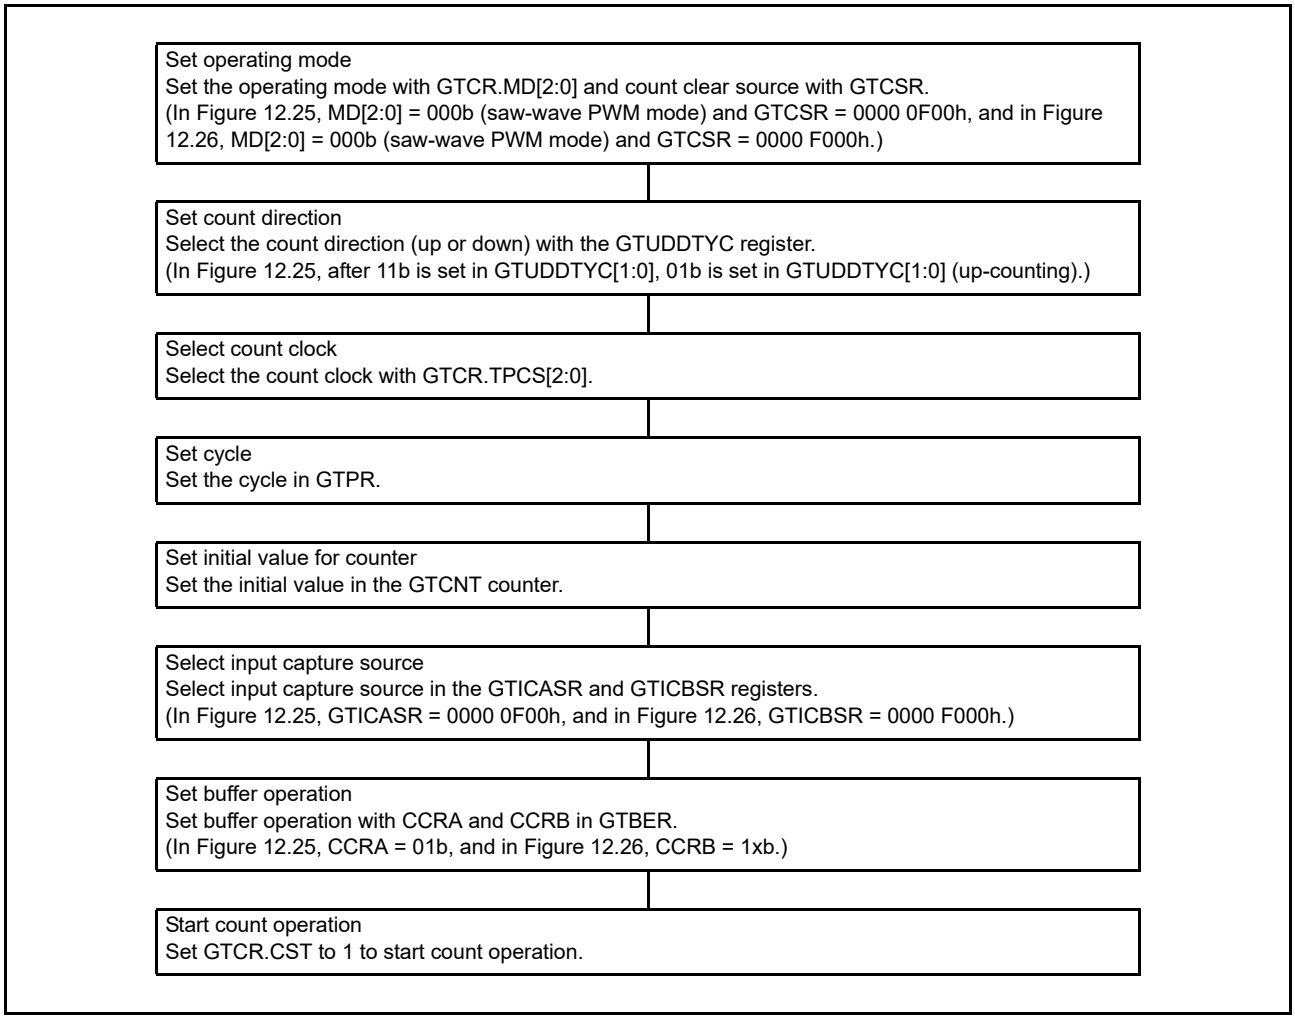

Figure 12.27 Example setting for GTCCRA and GTCCRB buffer operation with input capture

12.3.2.3 Buffer Operation for GTADTRA and GTADTRB

GTADTBRA can function as the GTADTRA buffer register and GTADTDBRA can function as the GTADTBRA buffer register (double-buffer register for GTADTRA). Similarly, GTADTBRB can function as the GTADTRB buffer register and GTADTDBRB can function as the GTADTBRB buffer register (double-buffer register for GTADTRB).
To set GTADTRA or GTADTRB to function as a double buffer, set GTBER.ADTDA or GTBER.ADTDB to 1. For single buffer operation, set GTBER.ADTDA or GTBER.ADTDB to 0. To set GTADTRA or GTADTRB to not function as a buffer, set GTBER.ADTTA[1:0] or GTBER.ADTTB[1:0] to 00b.
The buffer transfer timing can be set with the GTBER.ADTTA[1:0] bits. For saw waves, overflows (during up-counting) or underflows (during down-counting) can be selected. For triangle waves, crests are selected when GTBER.ADTTA[1:0] = 01b, troughs are selected when GTBER.ADTTA[1:0] = 10b, and both crests and troughs are selected when GTBER.ADTTA[1:0] = 11b.
Figure 12.28 to Figure 12.30 show examples of GTADTRA and GTADTRB buffer operation and Figure 12.31 shows an example setting for GTDTRA and GTADTRB buffer operation.

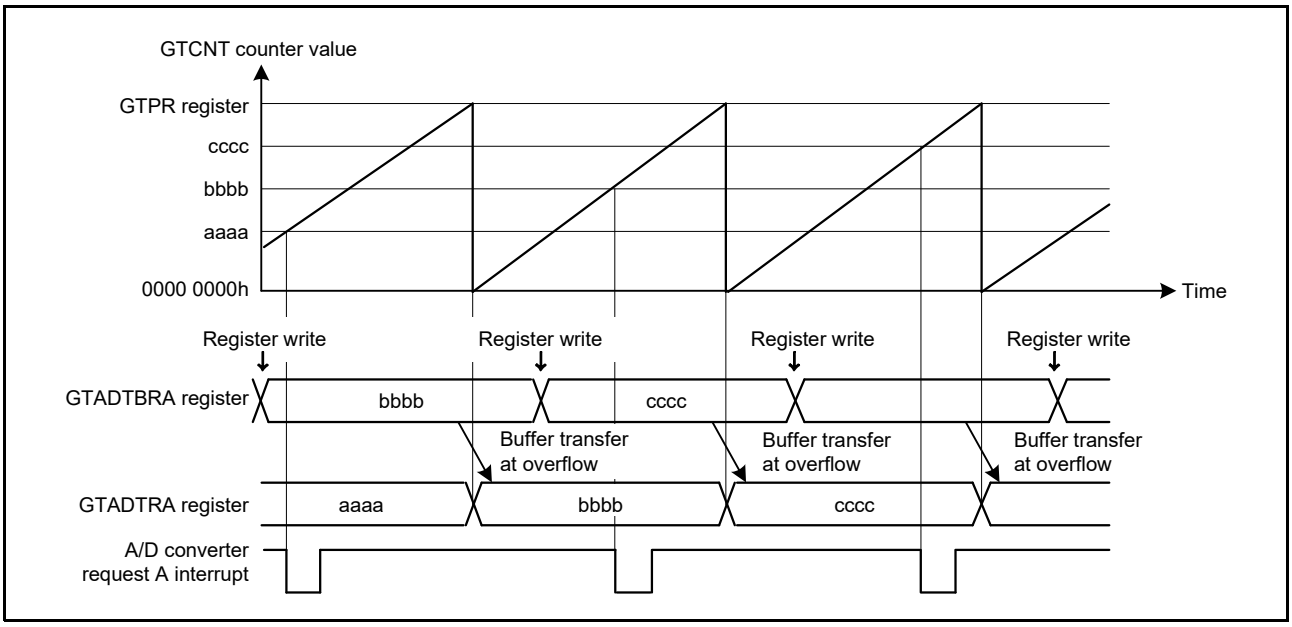

Figure 12.28 Example of GTADTRA and GTADTRB buffer operation with saw waves in up-counting and A/D converter start request interrupt generated by up-counting

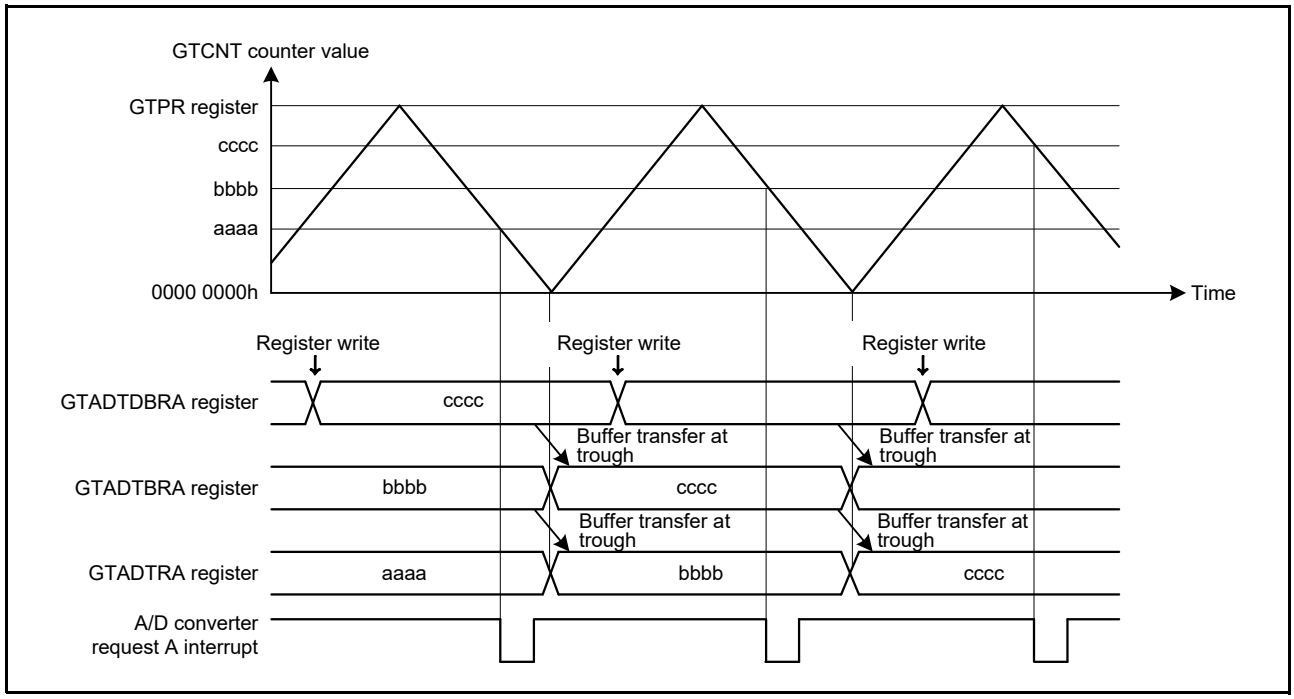

Figure 12.29 Example of GTADTRA and GTADTRB double buffer operation with triangle waves, buffer transfer at troughs, and A/D converter start request interrupt generated by down-counting

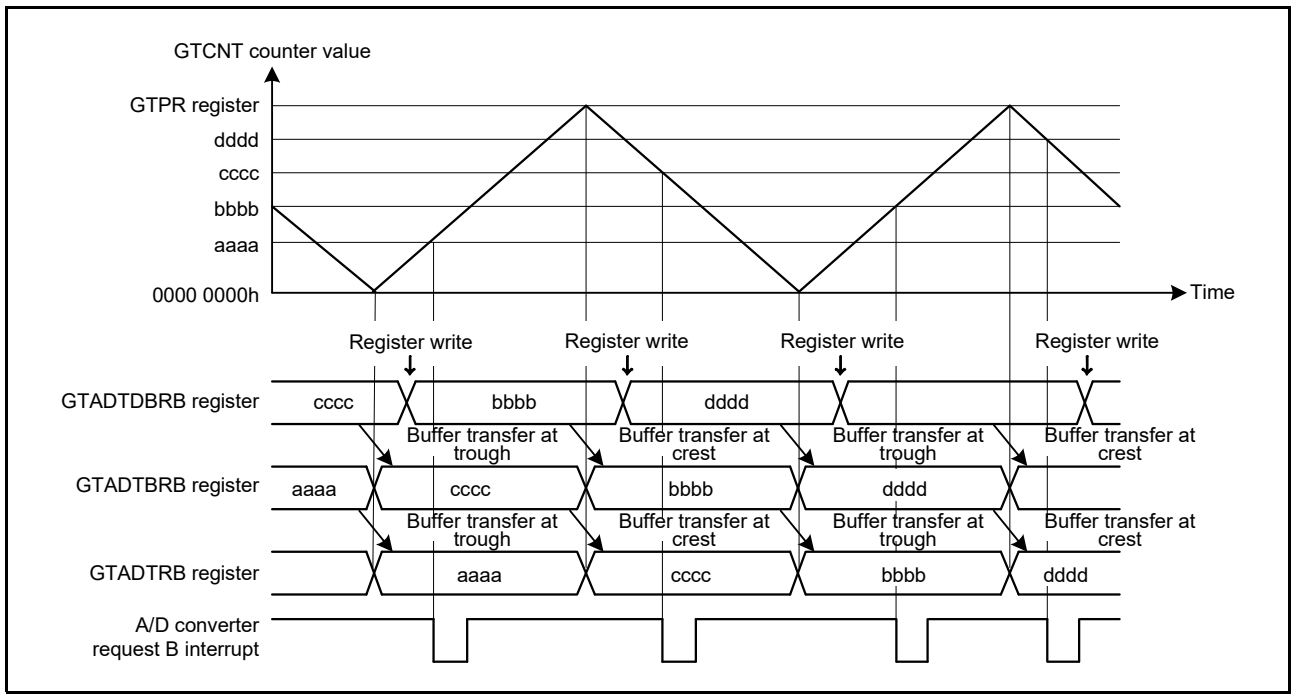

Figure 12.30 Example of GTADTRA and GTADTRB double buffer operation with triangle waves, buffer transfer at both troughs and crests, and A/D converter start request interrupt generated by both up- and down-counting

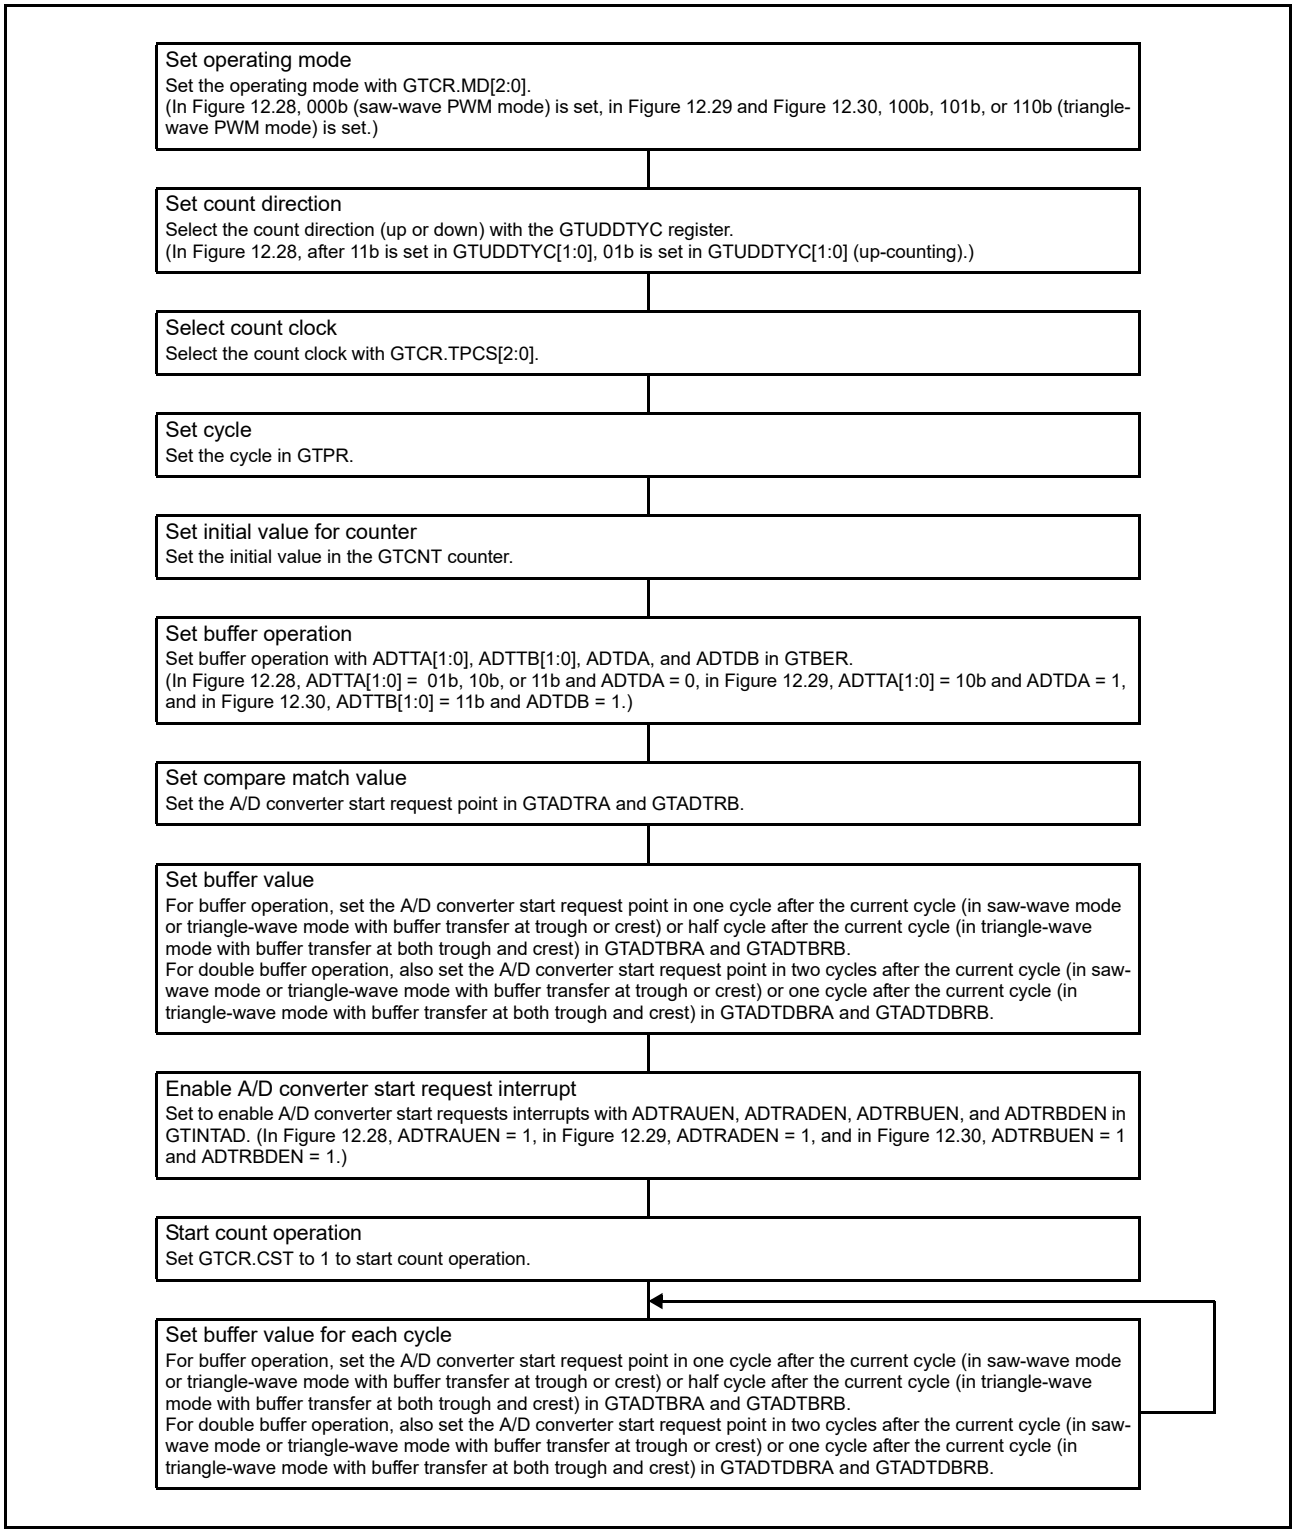

Figure 12.31 Example setting for GTADTRA and GTADTRB buffer operation

12.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOCA or GTIOCB pin by a compare match between the GTCNT counter and GTCCRA or GTCCRB.
By setting GTDTCR, GTDVU, and GTDVD, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

12.3.3.1 Saw-Wave PWM Mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR.A PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.
Figure 12.32 shows an example of saw-wave PWM mode operation, and Figure 12.33 shows an example setting for saw-wave PWM mode.

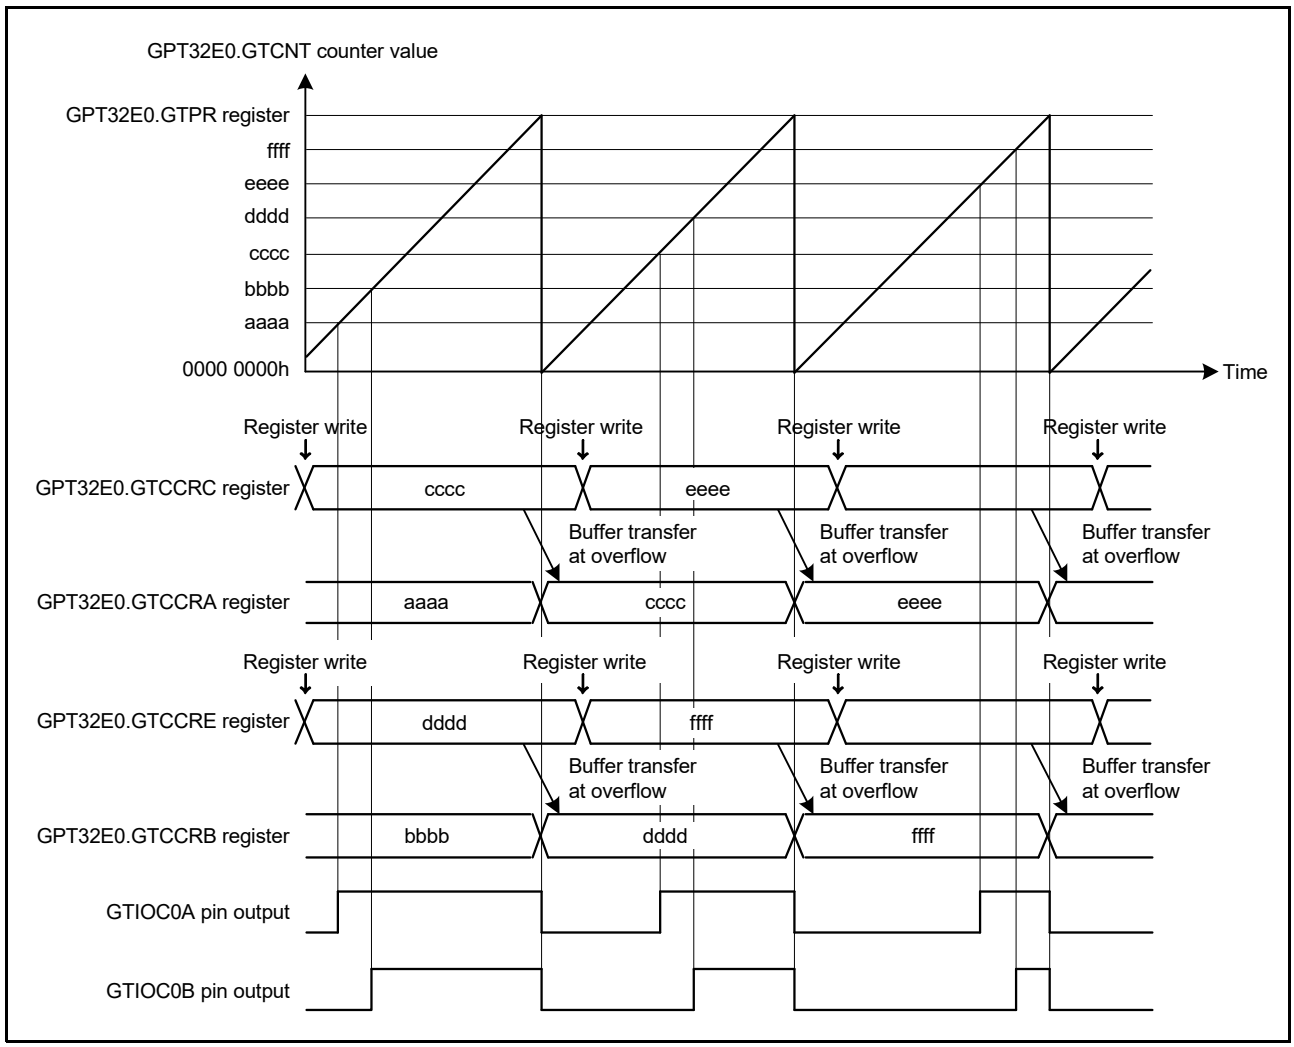

Figure 12.32 Example of saw-wave PWM mode operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, and low output at cycle end

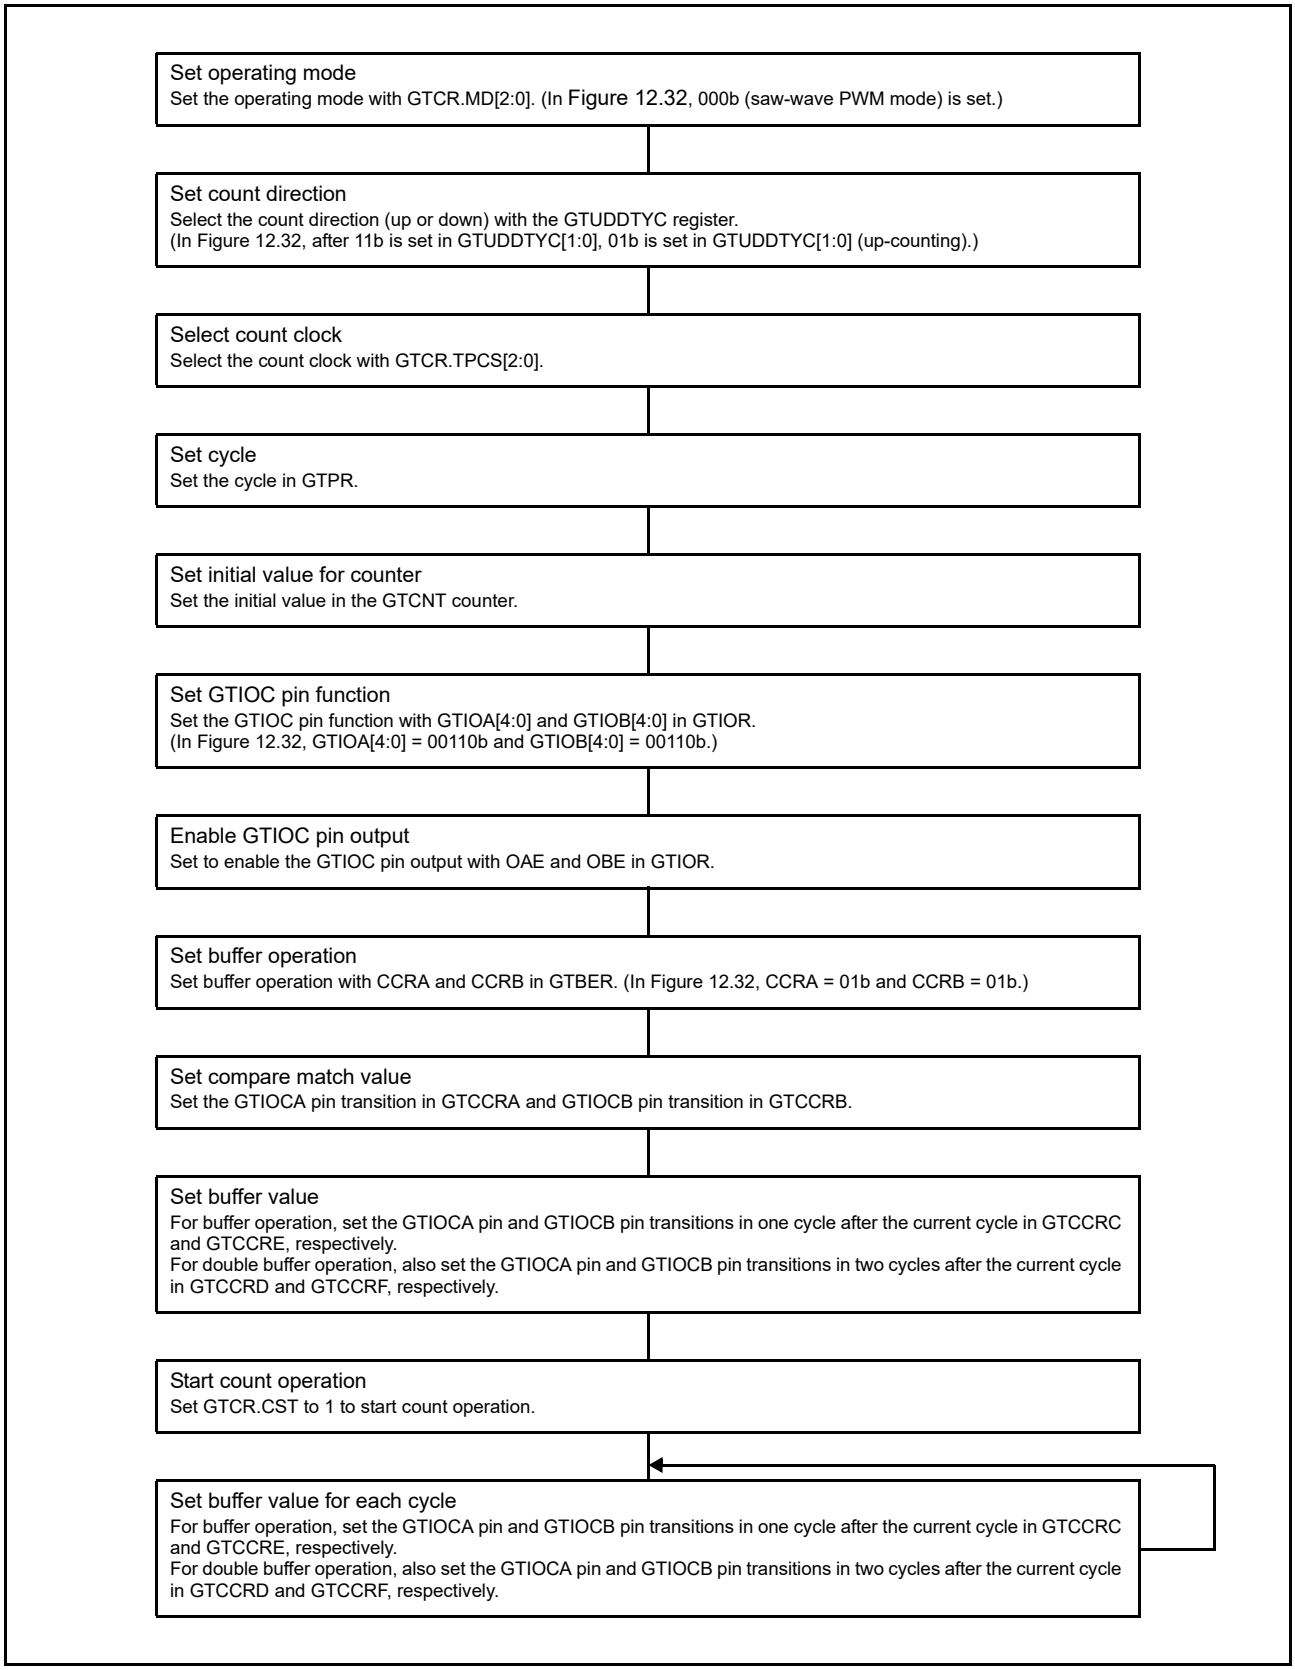

Figure 12.33 Example setting for saw-wave PWM mode

12.3.3.2 Saw-Wave One-Shot Pulse Mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR. The GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCA or GTIOCB pin at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and the cycle end based on the GTIOR setting.

When 1 is written to the GTBER.CCRSWT bit while counting is stopped, the values of the GTCCRD and GTCCRF registers are forcibly transferred to the temporary registers A and B, respectively. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 12.34 shows an example of saw-wave one-shot pulse mode operation, and Figure 12.35 shows an example setting for saw-wave one-shot pulse mode.

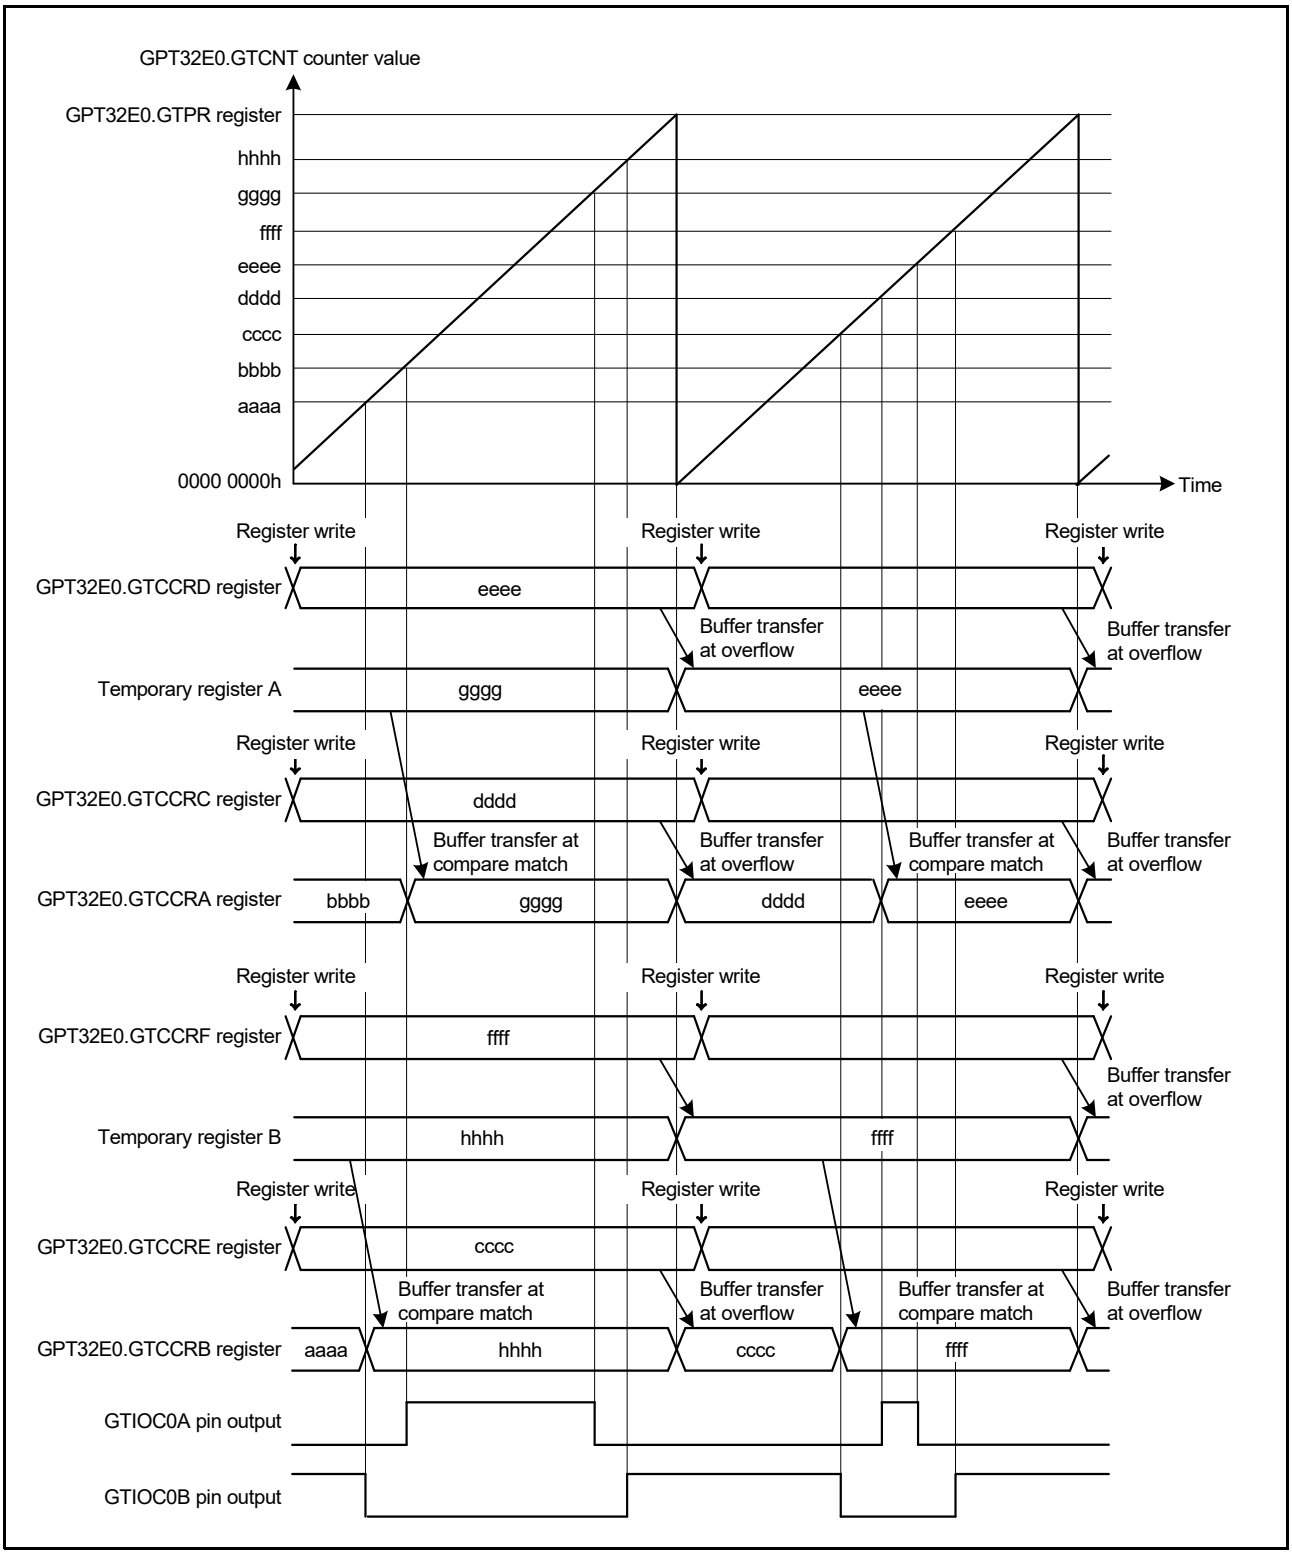

Figure 12.34 Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

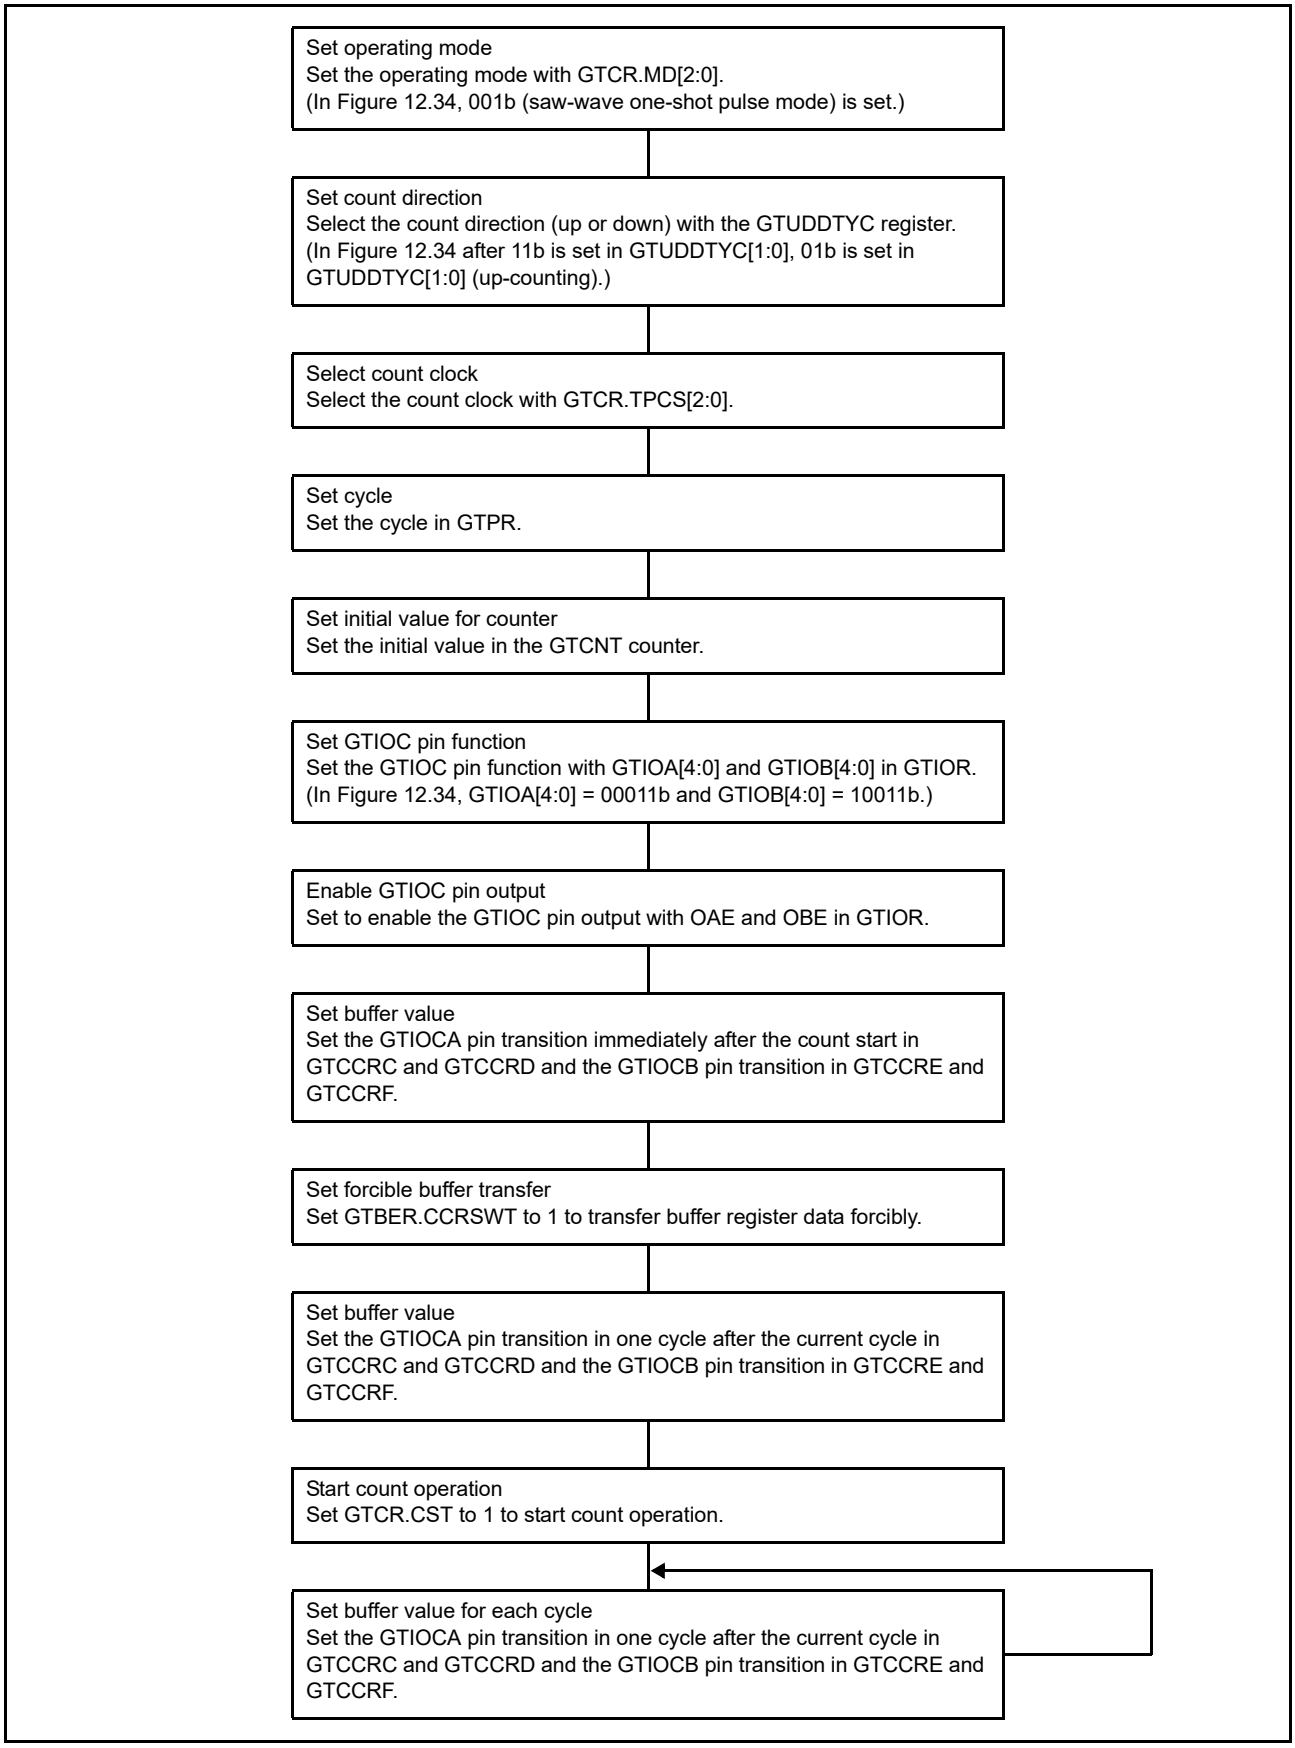

Figure 12.35 Example setting for saw-wave one-shot pulse mode

12.3.3.3 Triangle-Wave PWM Mode 1 (32-bit transfer at trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 12.36 shows an example of a triangle-wave PWM mode 1 operation, and Figure 12.37 shows an example setting for a triangle-wave PWM mode 1.

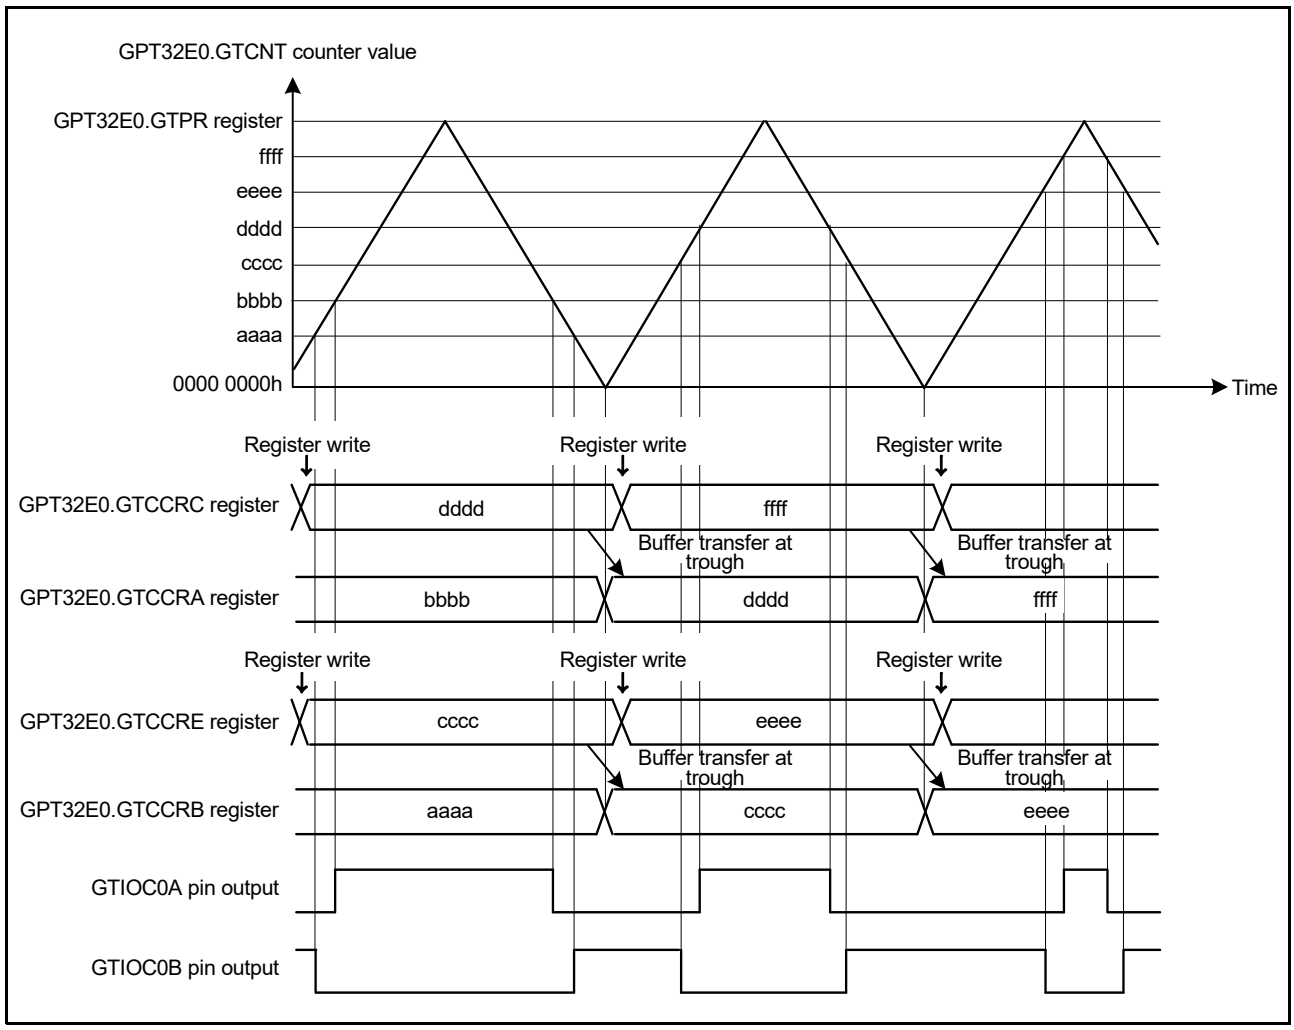

Figure 12.36 Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB register compare match, and output retained at cycle end

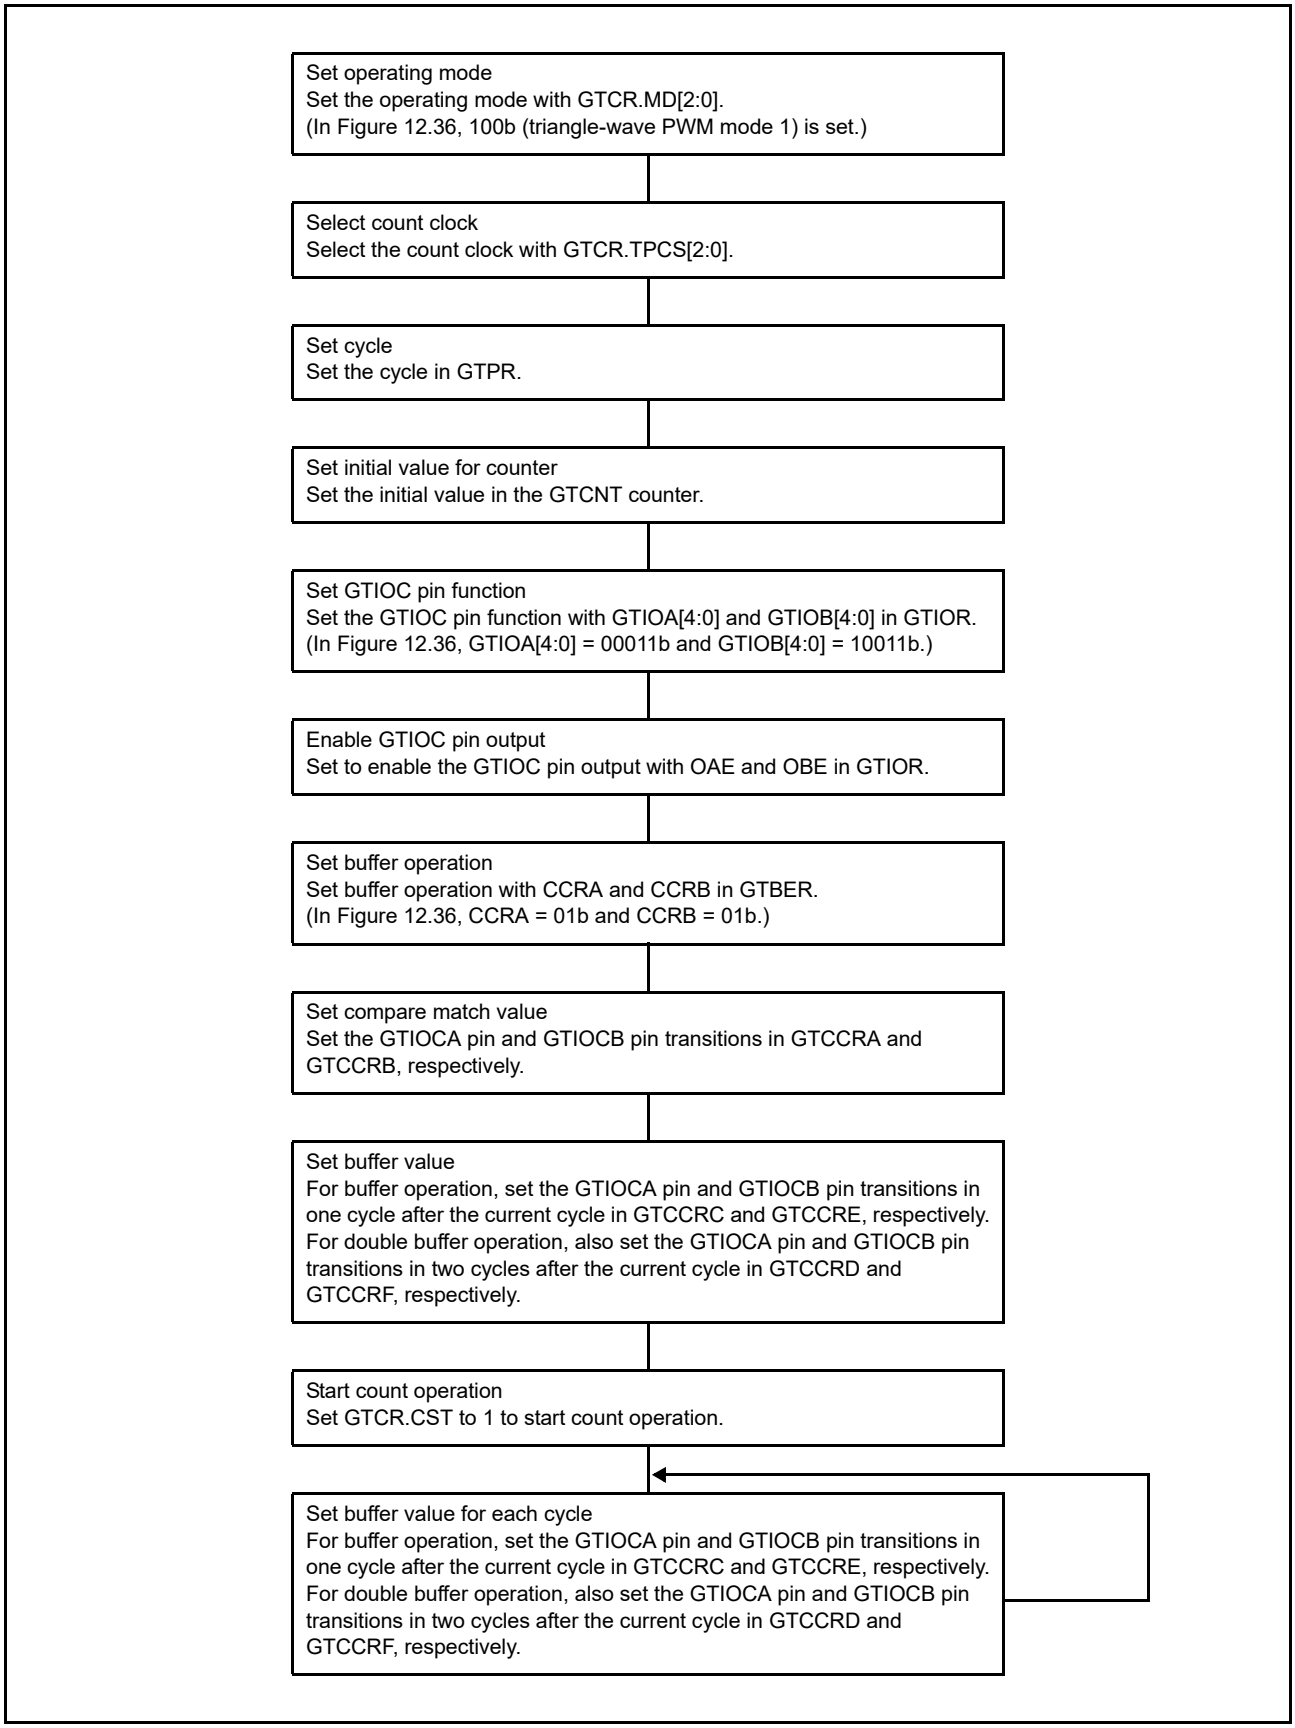

Figure 12.37 Example setting for triangle-wave PWM mode 1

12.3.3.4 Triangle-Wave PWM Mode 2 (32-bit transfer at crest and trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 12.38 shows an example of triangle-wave PWM mode 2 operation, and Figure 12.39 shows an example setting for triangle-wave PWM mode 2.

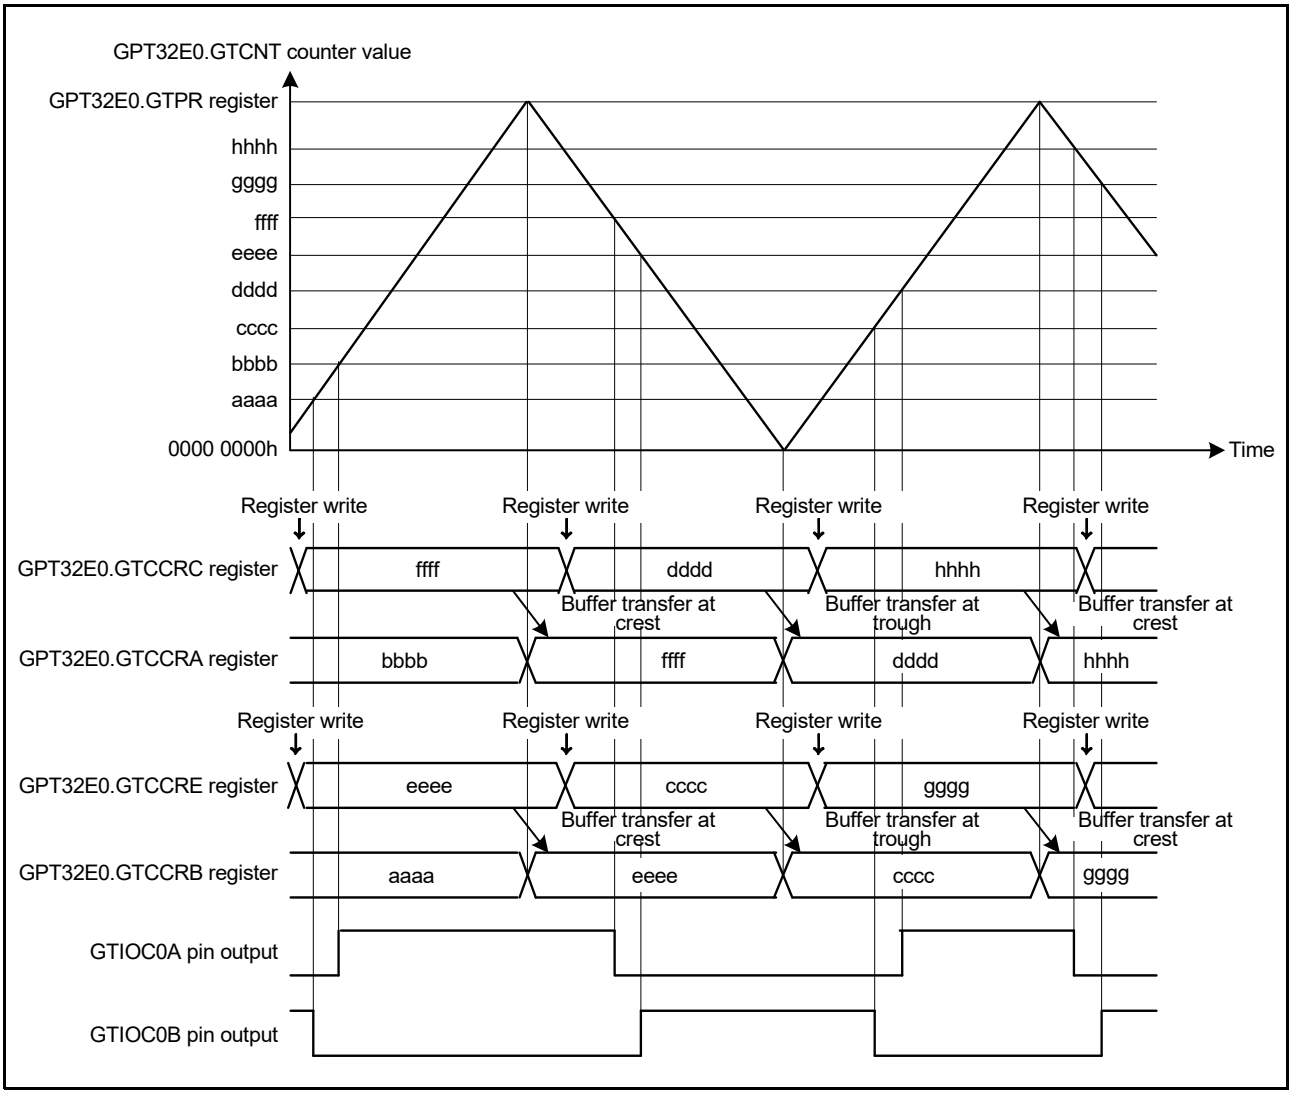

Figure 12.38 Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

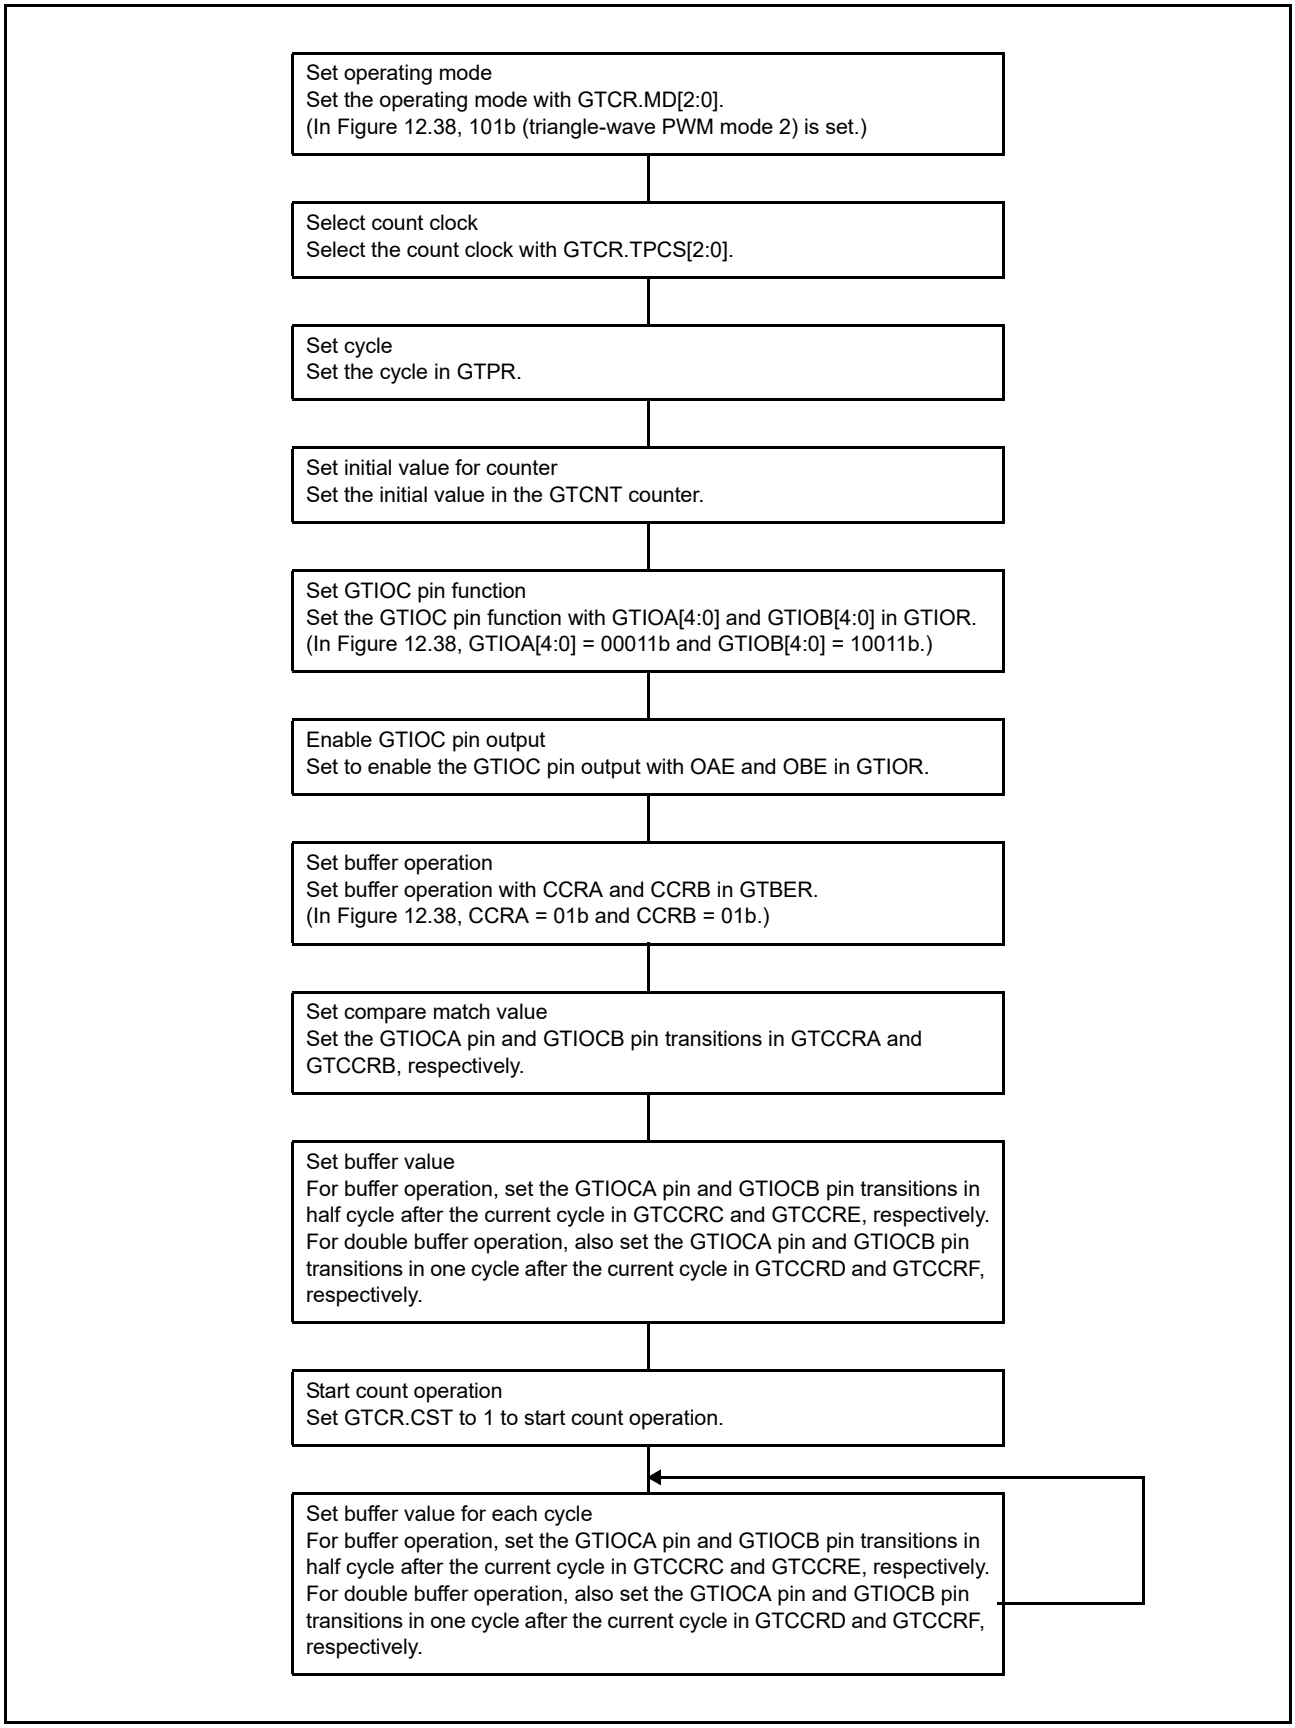

Figure 12.39 Example setting for triangle-wave PWM mode 2

12.3.3.5 Triangle-Wave PWM Mode 3 (64-bit transfer at trough)

The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCA or GTIOCB pin at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 12.40 shows an example of triangle-wave PWM mode 3 operation, and Figure 12.41 shows an example setting for triangle-wave PWM mode 3.

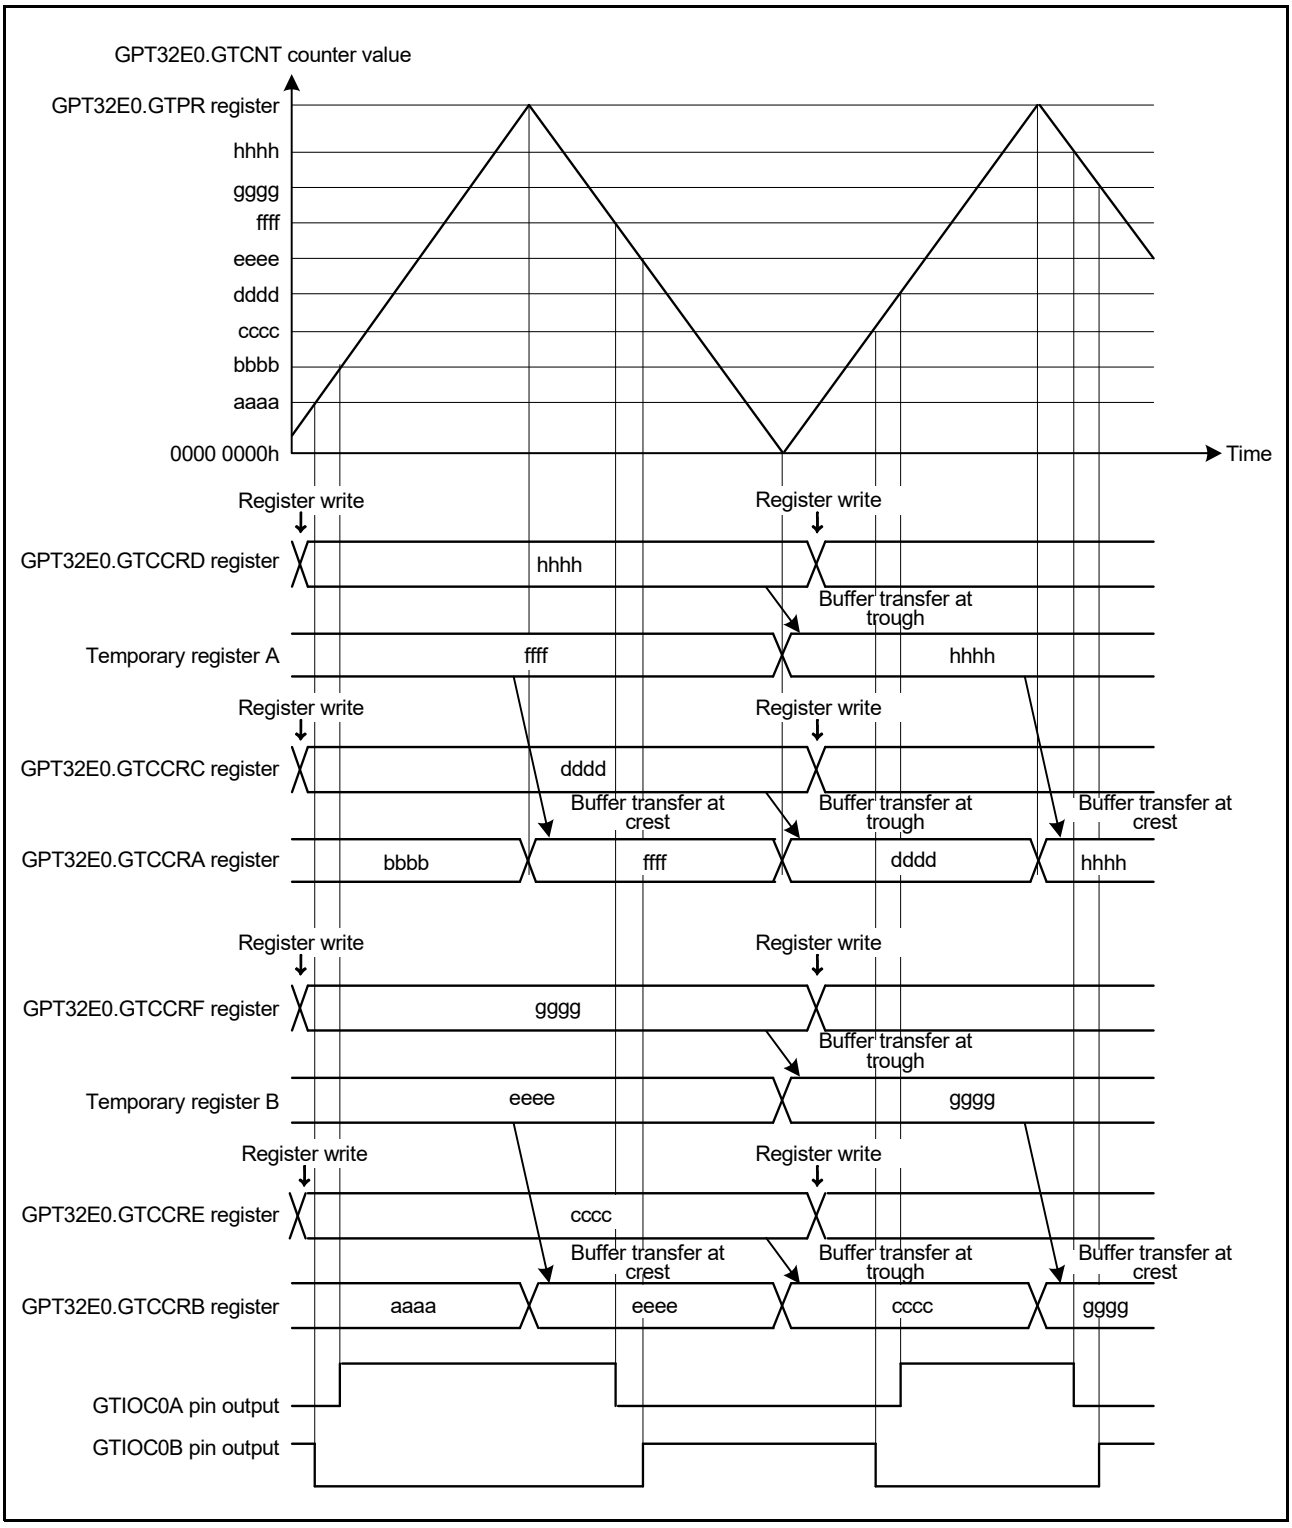

Figure 12.40 Example of triangle-wave PWM mode 3 operation with low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

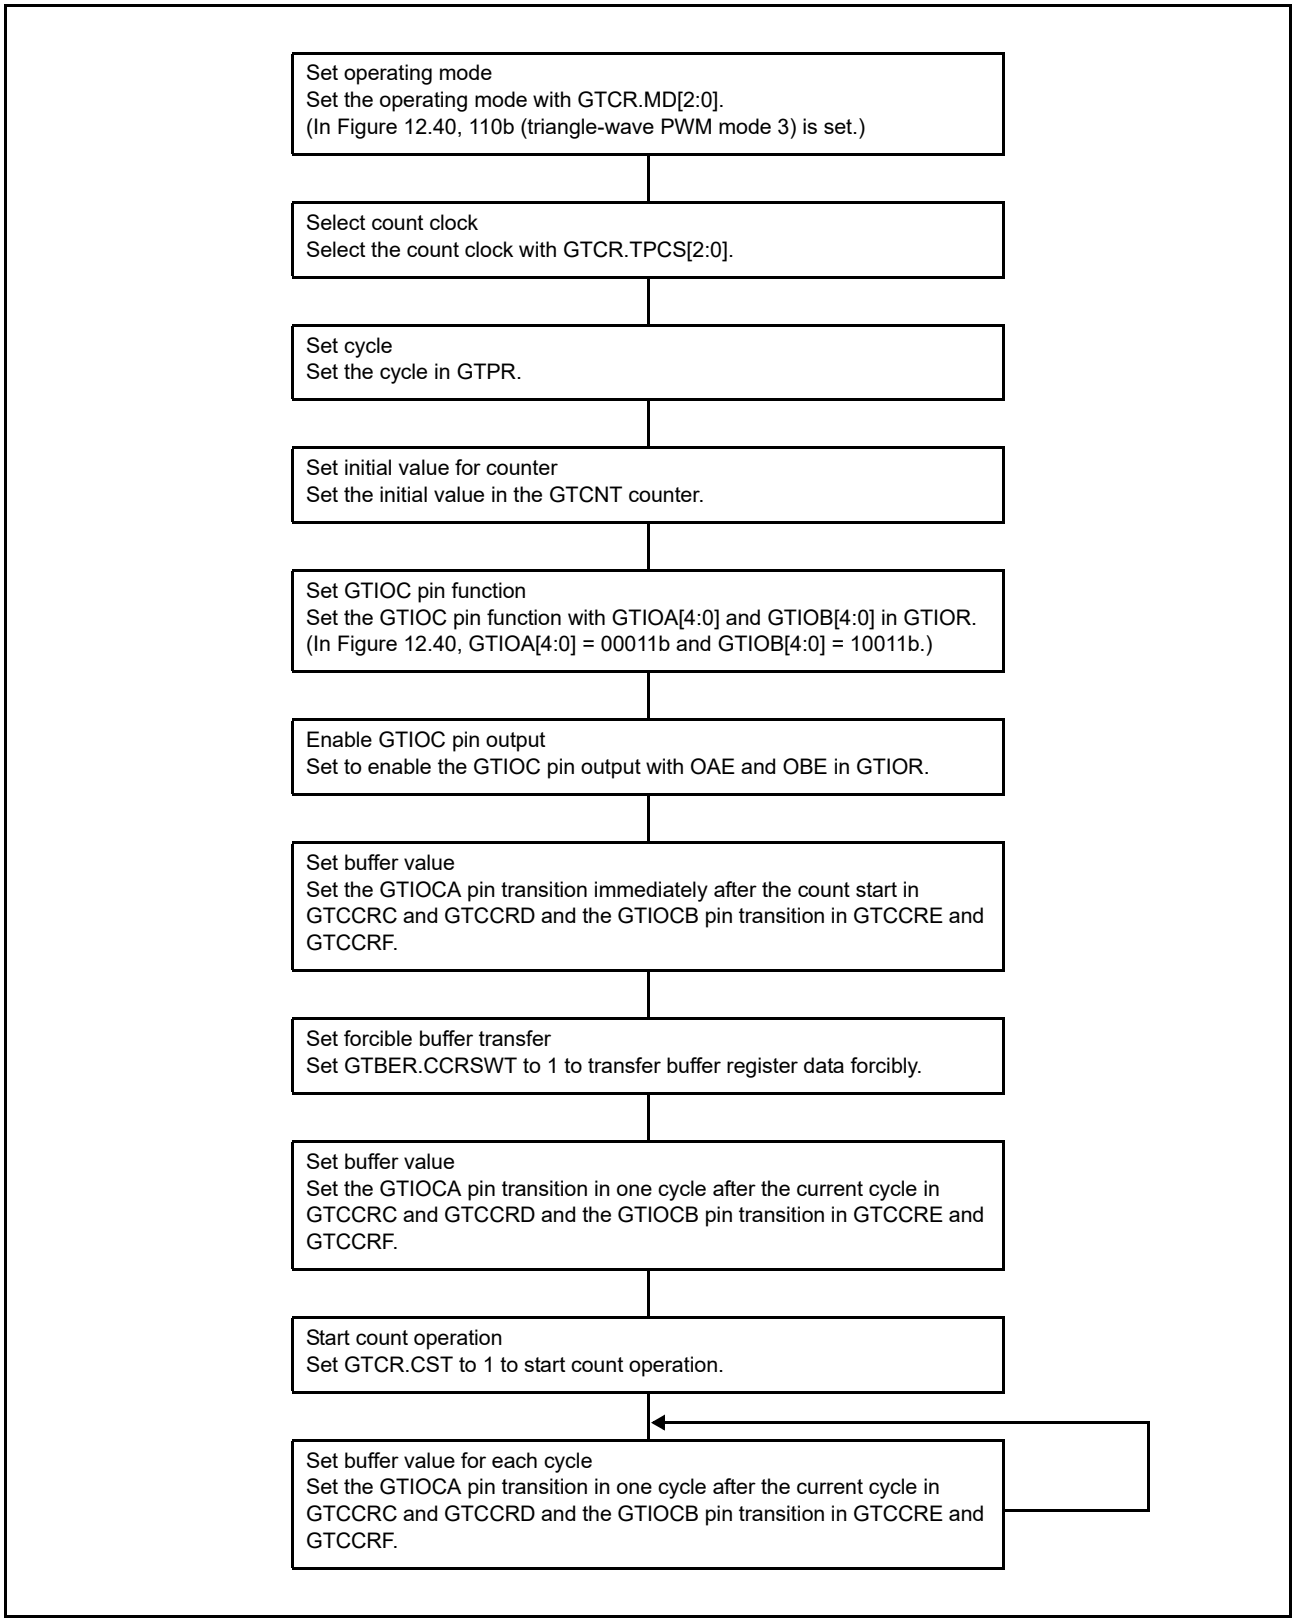

Figure 12.41 Example setting for triangle-wave PWM mode 3

12.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time values (GTDVU and GTDVD values) can automatically be set to GTCCRB. The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.
Dead time can be separately set for the first half and second half of a waveform. Dead time for the transition in the first half of a negative waveform is set in GTDVU and that in the second half is set in GTDVD. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1.
GTDBU can be used as a buffer register of GTDVU, and GTDBD can be used as a buffer register of GTDVD.
In the saw-wave mode, buffer transfer is performed when the GTCND counter overflows (up-counting), underflows (down-counting), or is cleared. In the triangle-wave mode, transfer proceeds at troughs.

The change point of the negative phase waveform with the automatic dead time setting can be confirmed by reading the GTCCRB register value.
Writing to the GTCCRB register is prohibited when using the automatic dead time setting function.
It is prohibited to set dead time such that the change point of the waveform exceeds the count cycle.
If there is an error condition on the dead time setting, be able to generate waveforms that secured dead time by correcting the transition points of the positive and negative phase waveforms, as shown in Table 12.7.

The transition point of the corrected negative-phase waveform is automatically set in the GTCCRB register. Since the internal signal is used to judge the transition point of the positive phase waveform, the GTCCRA register is not updated with the corrected value.
By correcting the waveform transition point due to a dead time error on the saw-wave one-shot pulse mode, if the order of waveform transition points is disturbed or it exceeds the count cycle period after correction, the complementary relationship between the positive-phase waveform and the negative-phase waveform is not guaranteed.
By setting the GTCCRA equal 0 or grater than or equal to the GTPR of the GTCCRA register in the triangle-wave PWM mode, if the dead time setting exceeds the count cycle period, output transition is suppressed by the output protection function. When GTCCRA ≥ GTPR + GTDVn, GTPR - 1 is set as the upper limit value in the GTCCRB register (Refer to section 12.8.4, Output Protection Function for GTIOC Pin Output).
When GTCCRA ≥ GTPR + GTDVn, GTPR - 1 is set as the upper limit value in the GTCCRB register.

Table 12.7 Correction of waveform transition point at dead time error occurrence

Wave mode	Count direction	Interval	Dead time error condition	Positive-Phase waveform transition point with corrected	Negative-phase waveform transition point with corrected
saw-wave one-shot pulse mode	Up counting	first half	GTCCRA-GTDVU < 0	GTDVU	0
		second half	GTCCRA-GTDVD > GTPR	GTPR-GTDVD	GTPR
	Down counting	first half	GTCCRA-GTDVU > GTPR	GTPR-GTDVU	GTPR
		second half	GTCCRA-GTDVD < 0	GTDVD	0
triangle PWM mode 1/2/3	Up counting	(first half)	GTCCRA-GTDVU ≤ 0	GTDVU+1	1
	Down counting	(second half)	GTCCRA-GTDVD < 0	GTDVD	0

Values for automatic dead time setting can be read from GTCCRB. The automatic dead time value setting to GTCCRB is performed at the next count clock cycle when registers that are used for calculating the automatic dead time value are updated.

The method of writing a new value to a GTDVn register depends on whether buffer operation is enabled or disabled.
When GTDVn buffer operation is enabled: The GTDBn register can be written at any time. The value in the GTDBn register is transferred to the GTDVn register at the cycle end.

When GTDVn buffer operation is disabled: Set the GTCR.CST bit to stop the GPT before changing the value of the

GTDVn register.

Figure 12.42 to Figure 12.45 show examples of automatic dead time setting function operation. Figure 12.46 and Figure 12.47 show the setting examples.

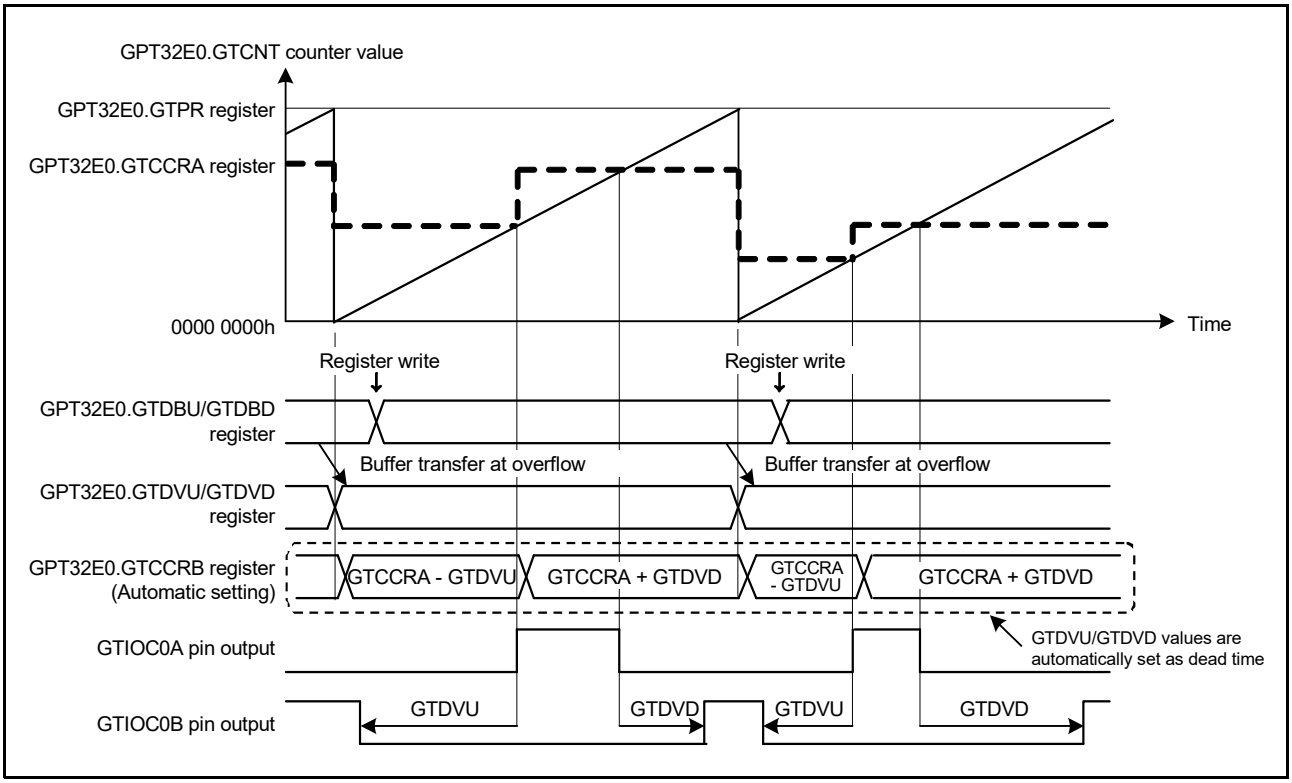

Figure 12.42 Example of automatic dead time setting function operation with saw-wave one-shot pulse mode, up-counting, GTDVU and GTDVD set to buffer operation, and active-high

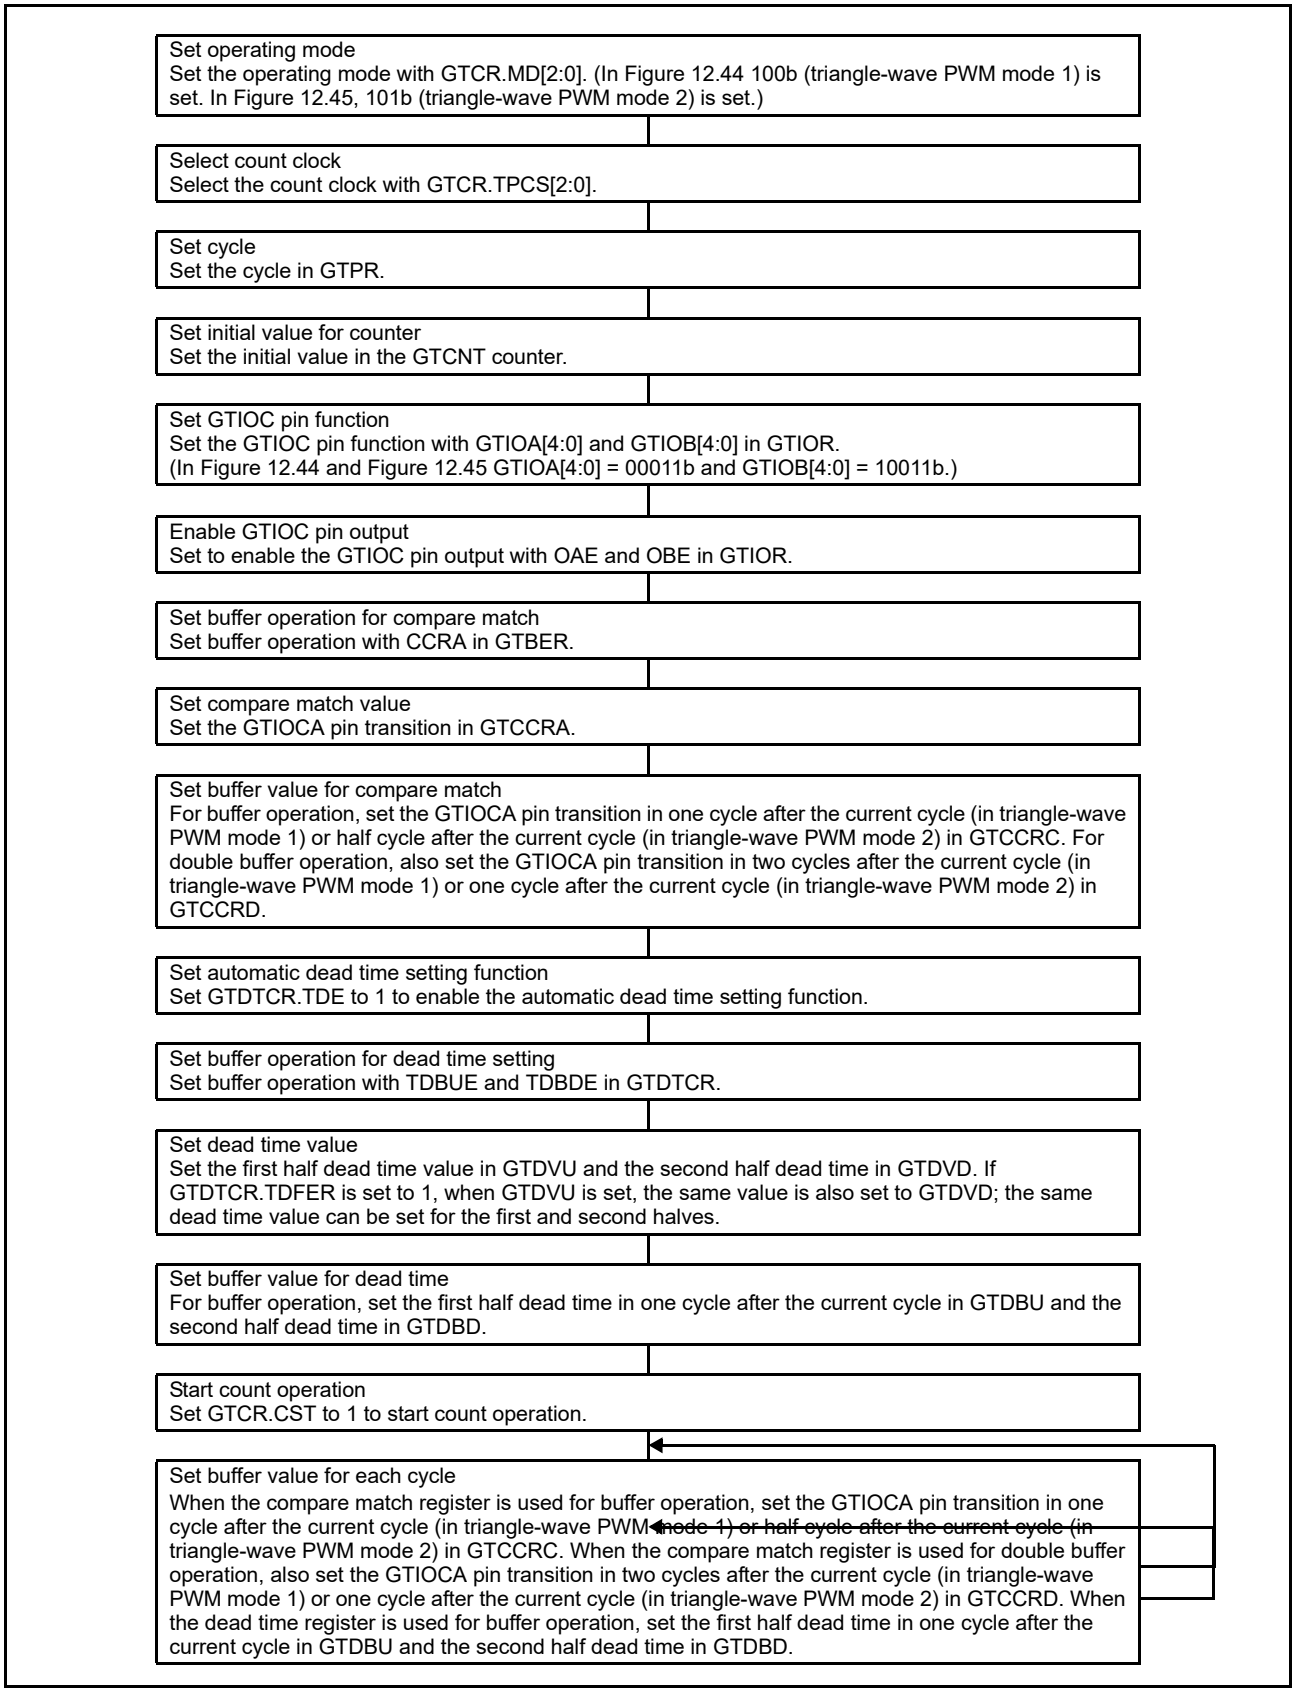

Figure 12.47 Example setting for automatic dead time setting function with triangle-wave PWM mode 1 or 2

12.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.
In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation stops and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.
In triangle-wave mode, the count direction does not change even though the UD bit in GTUDDTYC is modified during the count operation. Similarly, even though the GTUDDTYC.UD bit is modified while the count operation stops and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.
If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected to the count cycle during up-counting and the GTPR value before the start of down-counting is reflected during down-counting.
Figure 12.48 shows an example of count direction changing function operation.

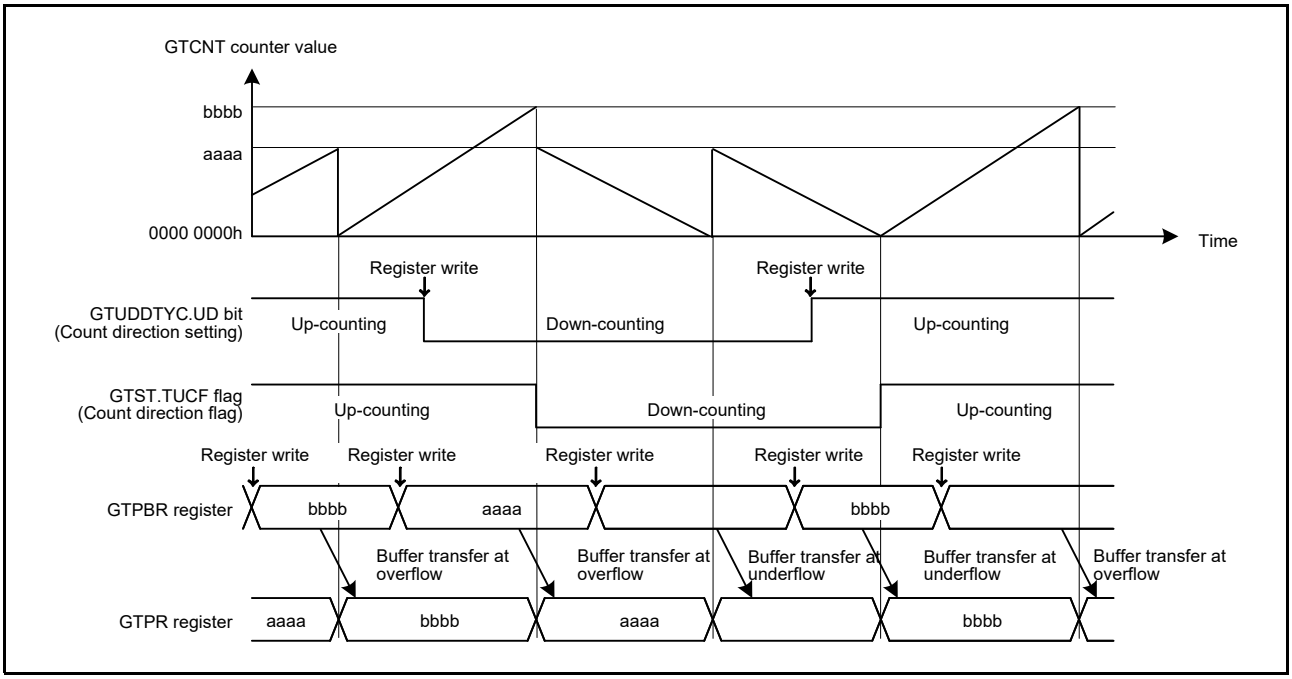

Figure 12.48 Example of count direction changing function operation during buffer operation

12.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCA pin and the GTIOCB pin are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is set to 1 while the count operation stops, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0%/100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.

When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). Table 12.8 shows the values of GTIOCA/GTIOCB pin output at cycle end.

Table 12.8 Output values after releasing 0% or 100% duty setting (m = A, B)

GTIOR.GTIOm[3:2]	Compare match value at cycle end masked by 0% or 100% duty setting	GTUDDTYC.OmDTYR in duty 0% setting		GTUDDTYC.OmDTYR in duty 100% setting	
		0	**1**	**0**	**1**
00 (Output retained at cycle end)	0	0	0	1	0
	1	0	1	1	1
01 (low output at cycle end)	—	0	0	0	0
10 (high output at cycle end)	—	1	1	1	1
11 (Output toggled at cycle end)	0	1	1	0	1
	1	1	0	0	0

Figure 12.49 shows the example of output duty 0% and 100% functions.

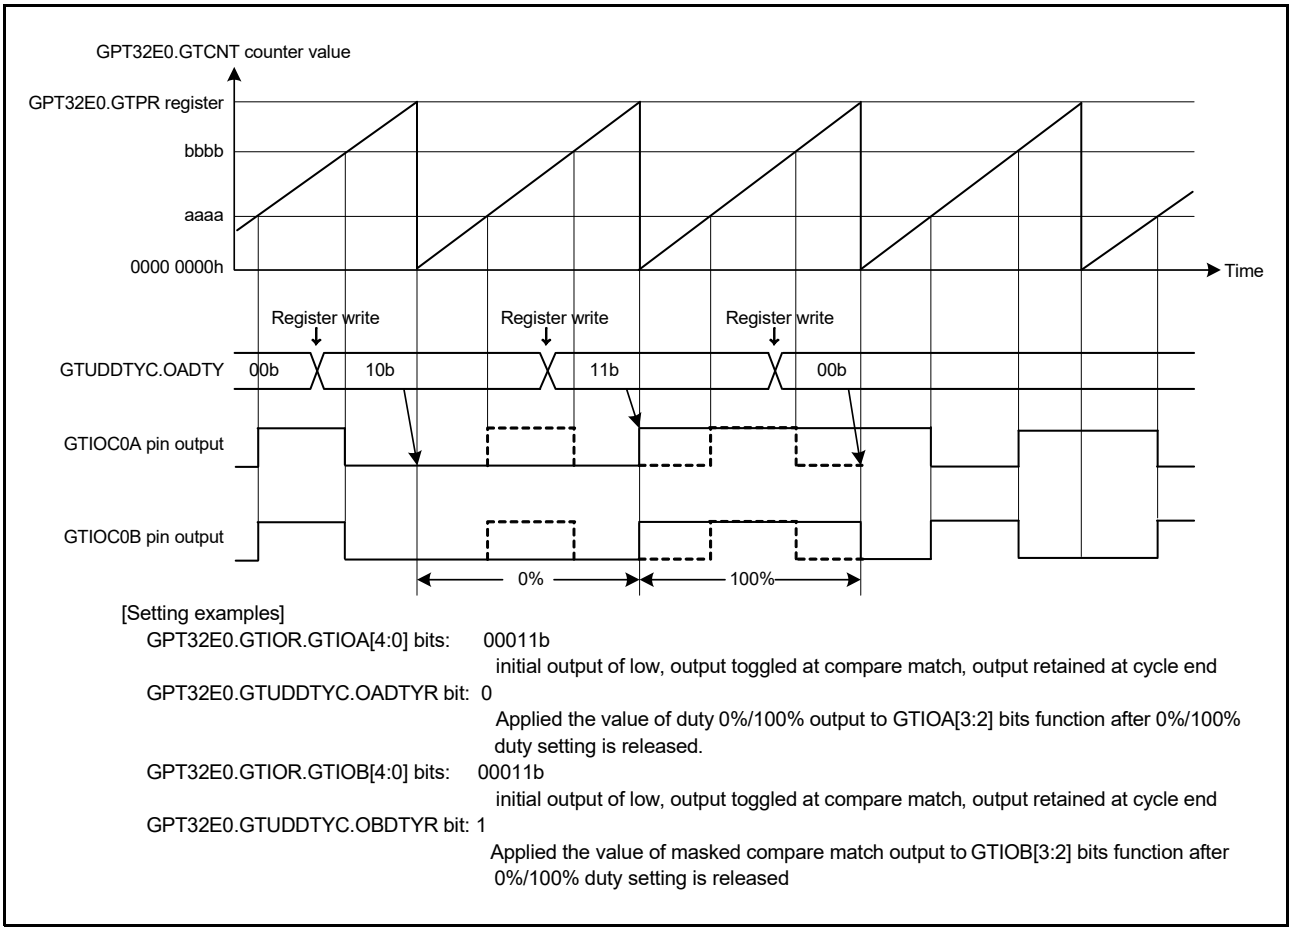

Figure 12.49 Example of output duty 0% and 100% functions

12.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- External trigger input
- Event input
- GTIOCA/GTIOCB pin input.

12.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.
Figure 12.50 shows an example of a count start operation by a hardware source. Figure 12.51 shows the setting example.

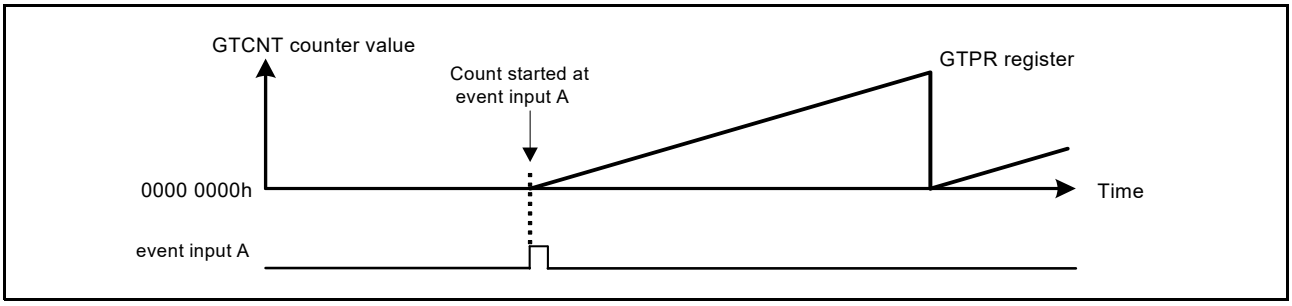

Figure 12.50 Example of count start operation by hardware source, started at the input of the signal from the event A

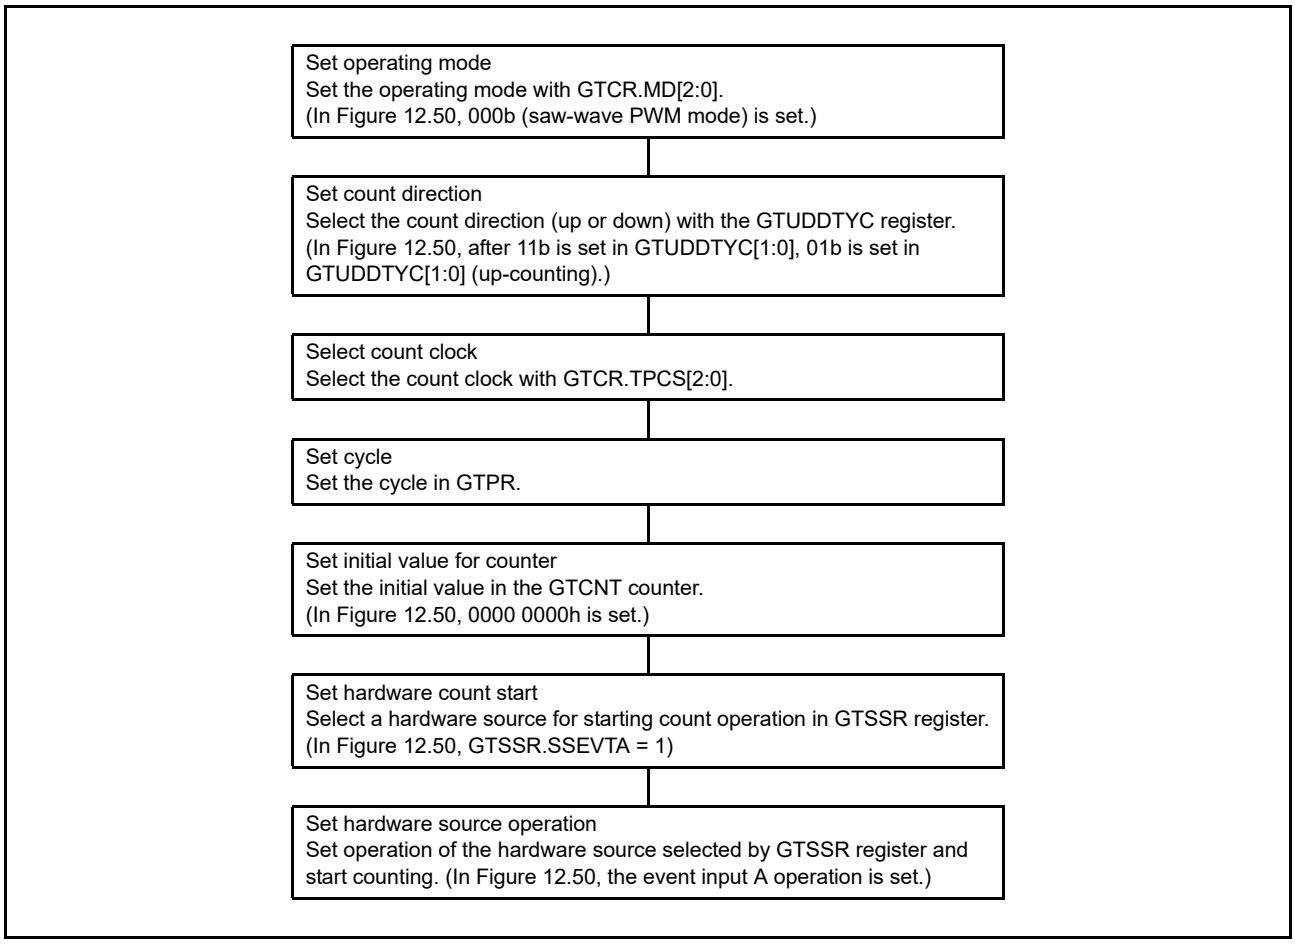

Figure 12.51 Example setting for count start operation by hardware source

12.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR. Figure 12.52 shows an example of a count stop operation by a hardware source. Figure 12.53 shows the setting example. In this example, the count operation stops at the edge of the event input A and restarts at the edges of the event input B.

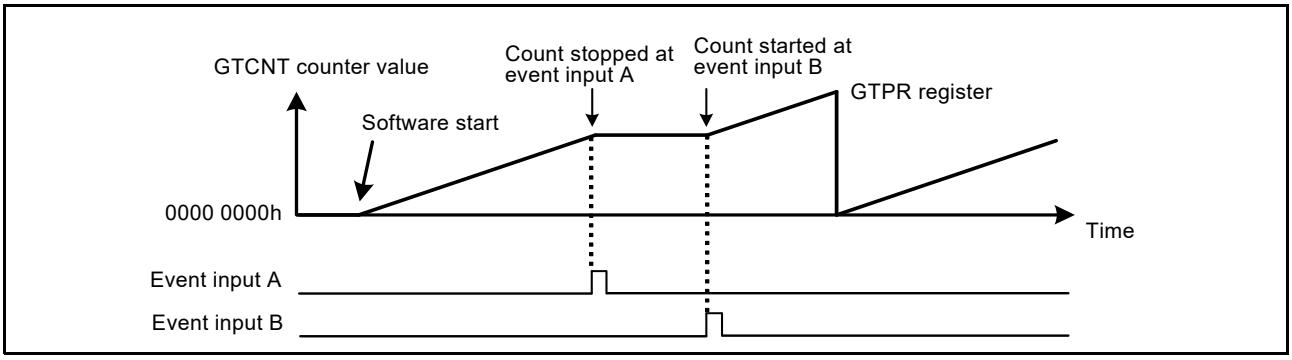

Figure 12.52 Example of count stop operation by hardware source, started by software, stopped at event input A, and restarted at event input B

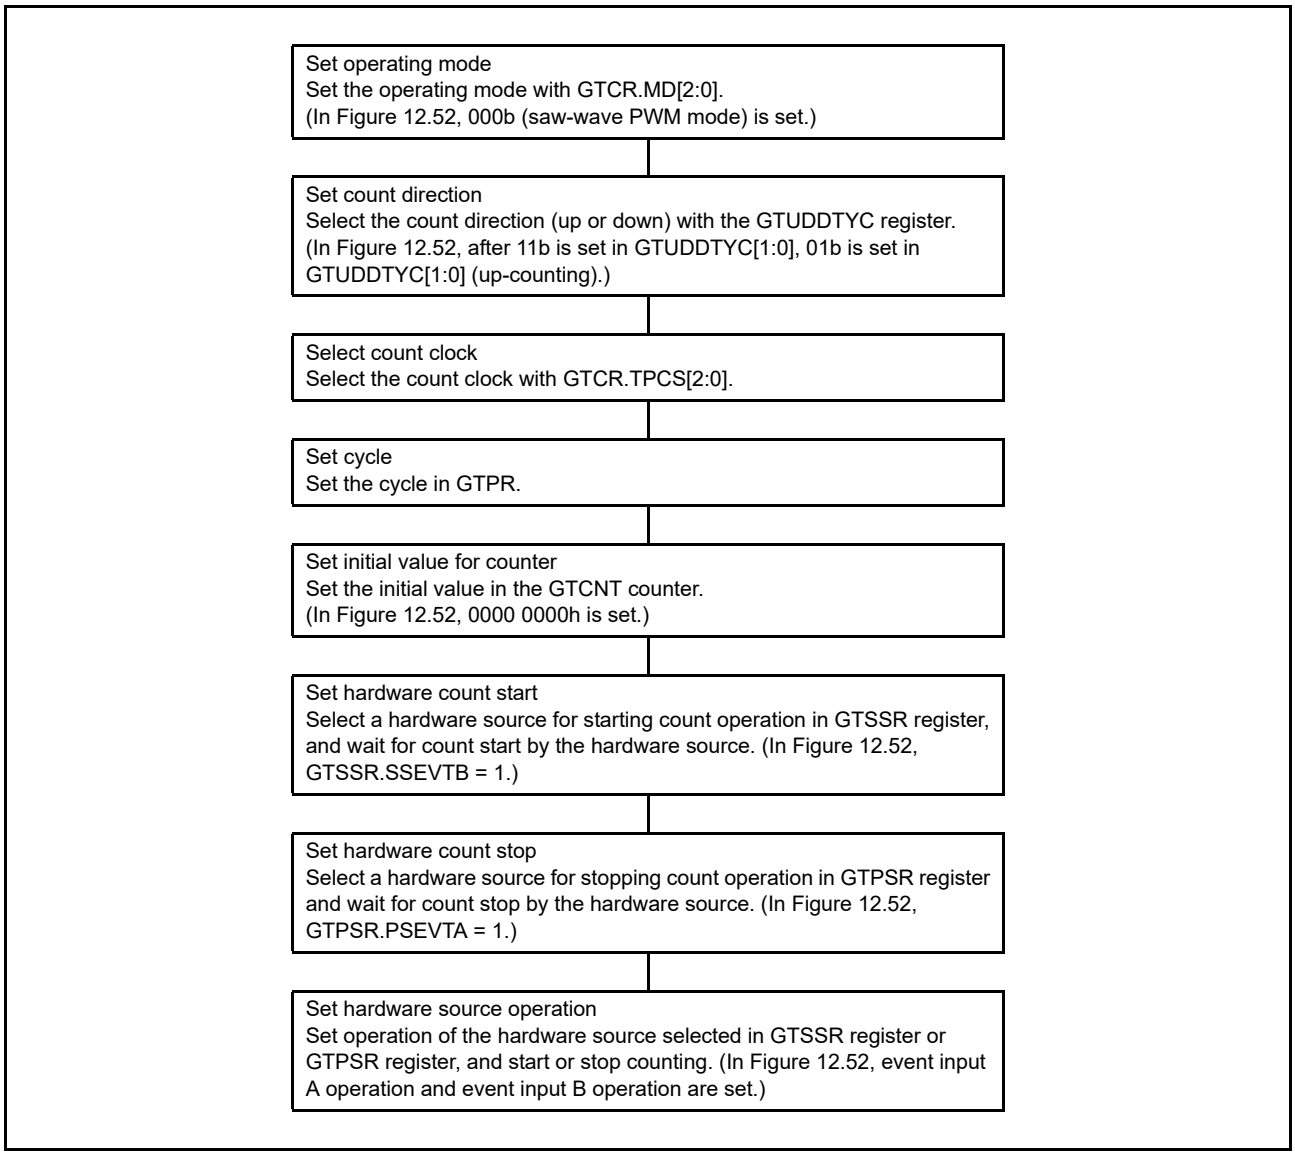

Figure 12.53 Example setting for count stop operation by hardware source

Figure 12.54 shows an example of a count start/stop operation by a hardware source. Figure 12.55 shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

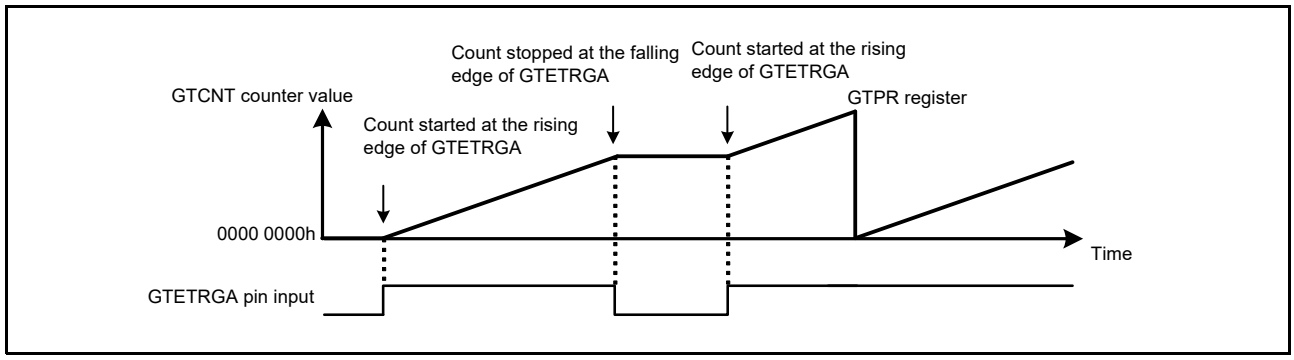

Figure 12.54 Example of count start/stop operation by hardware source, started on the rising edge of the GTETRGA pin input and stopped on the falling edge of the GTETRGA pin input

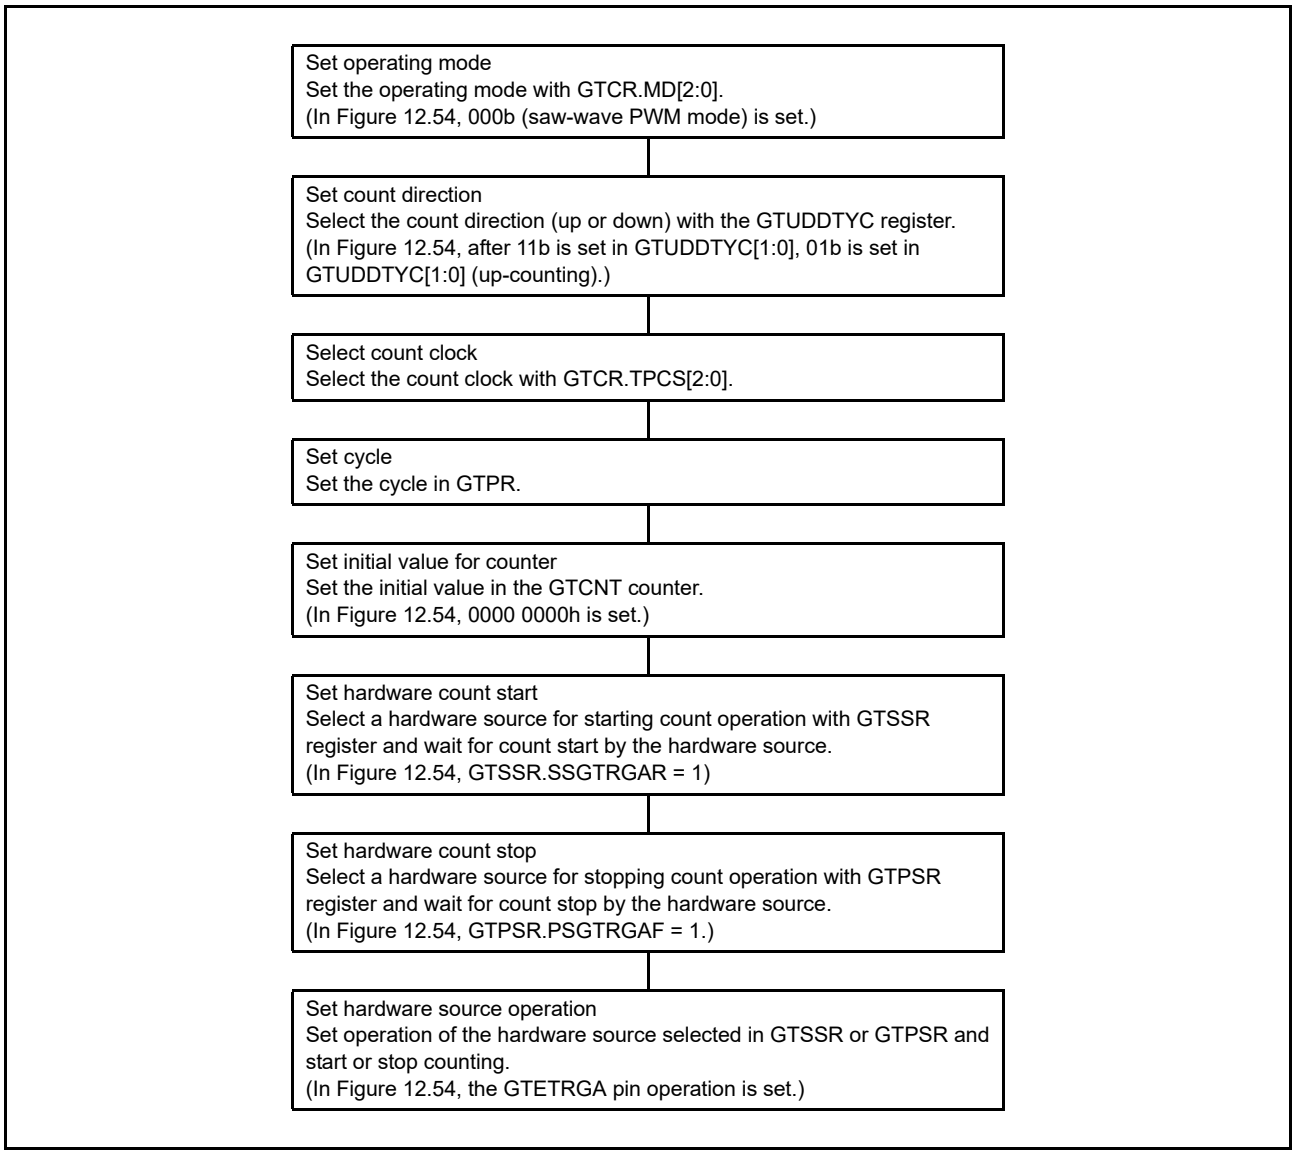

Figure 12.55 Example setting for count start/stop operation by hardware source

12.3.7.3 Hardware Clear Operation

The GTCNT counter can be cleared by selecting a hardware source using GTCSR. The OVFn/UNFn (n=0 to 7) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 12.56 and Figure 12.57 show examples of the GTCNT counter clearing operation by a hardware source. Figure 12.58 shows the setting example. In this example, the GTCNT counter starts at the edge of the event input A, and the counter stops/clears at the edge of the event input B.

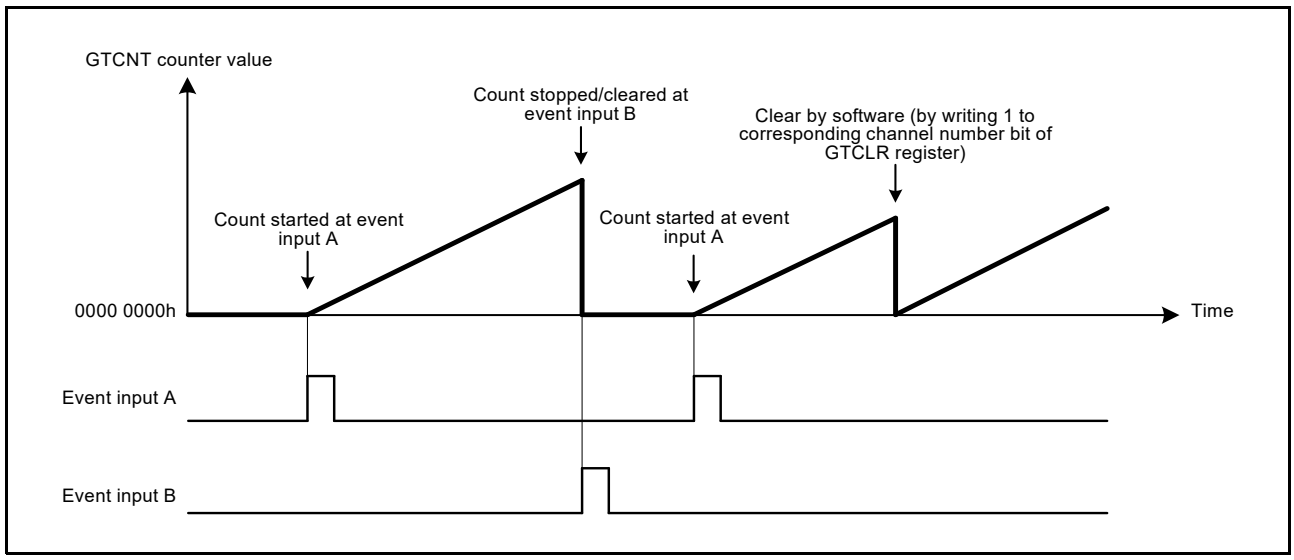

Figure 12.56 Examples of count clearing operation by hardware source with saw wave up-counting, started at event input A, and stopped/cleared at event input B

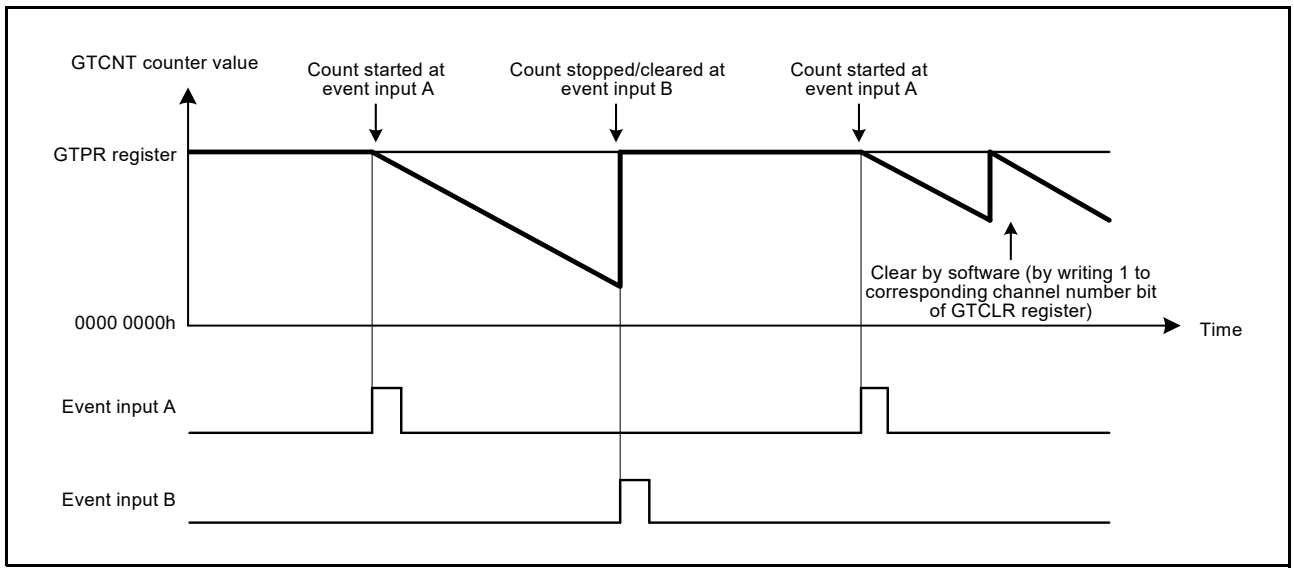

Figure 12.57 Examples of count clearing operation by hardware source with saw wave down-counting, started at event input A, and stopped/cleared at event input B

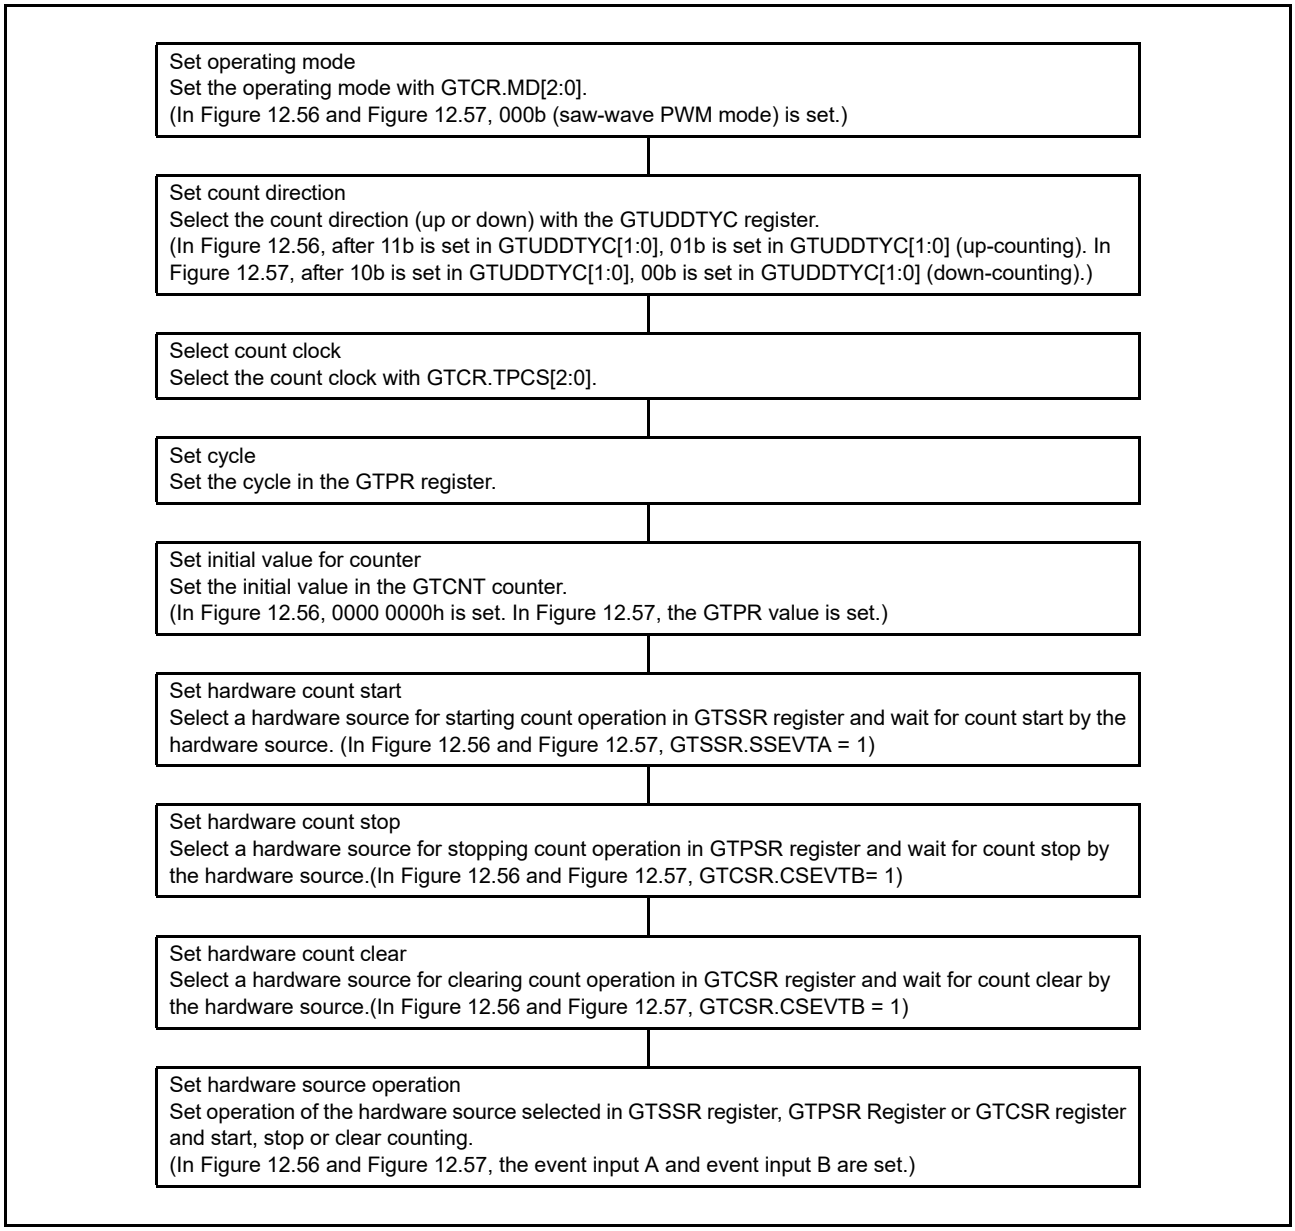

Figure 12.58 Example setting for count clearing operation by hardware source

The OVFn/UNFn (n=0 to 7) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 12.59 shows the relationship between the counter clearing by a hardware source and the OVFn (n=0 to 7) interrupt.

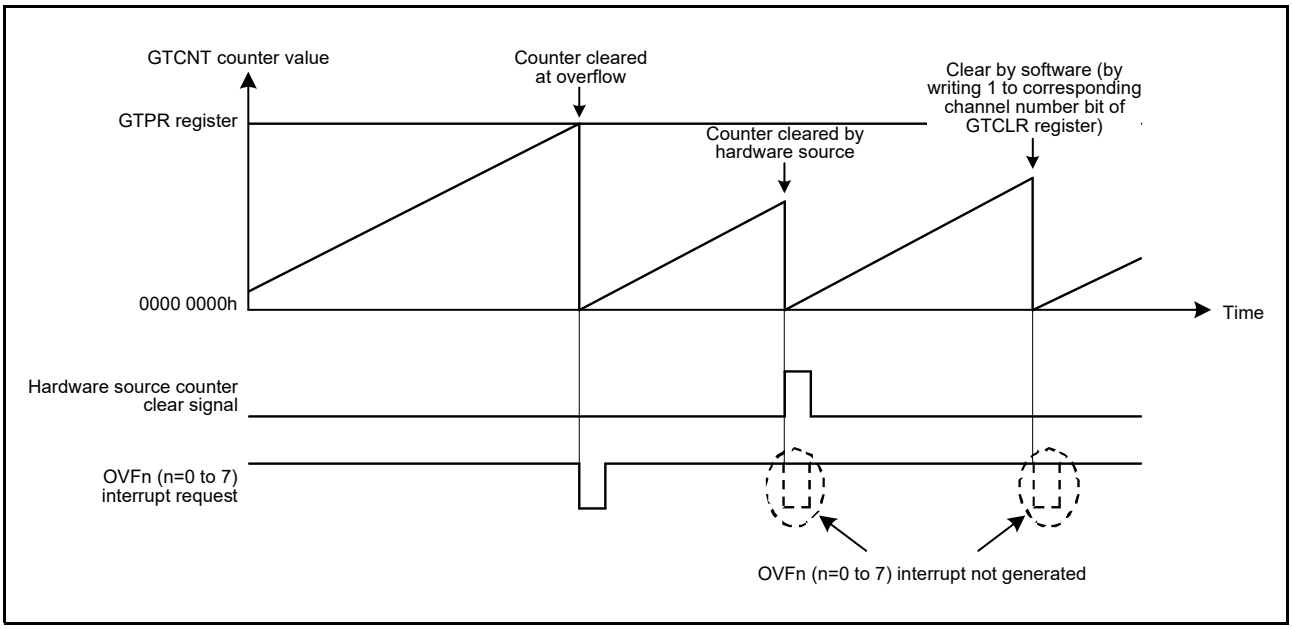

Figure 12.59 Relationship between counter clearing by hardware source and OVFn (n = 0 to 7) interrupt

12.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop and clear operation can be performed.

12.3.8.1 Synchronized Operation by Software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP or GTCLR bits simultaneously to 1.
Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.
Figure 12.60 shows an example of a simultaneous start, stop and clear by software. Figure 12.61 shows an example of phase start operation by software.

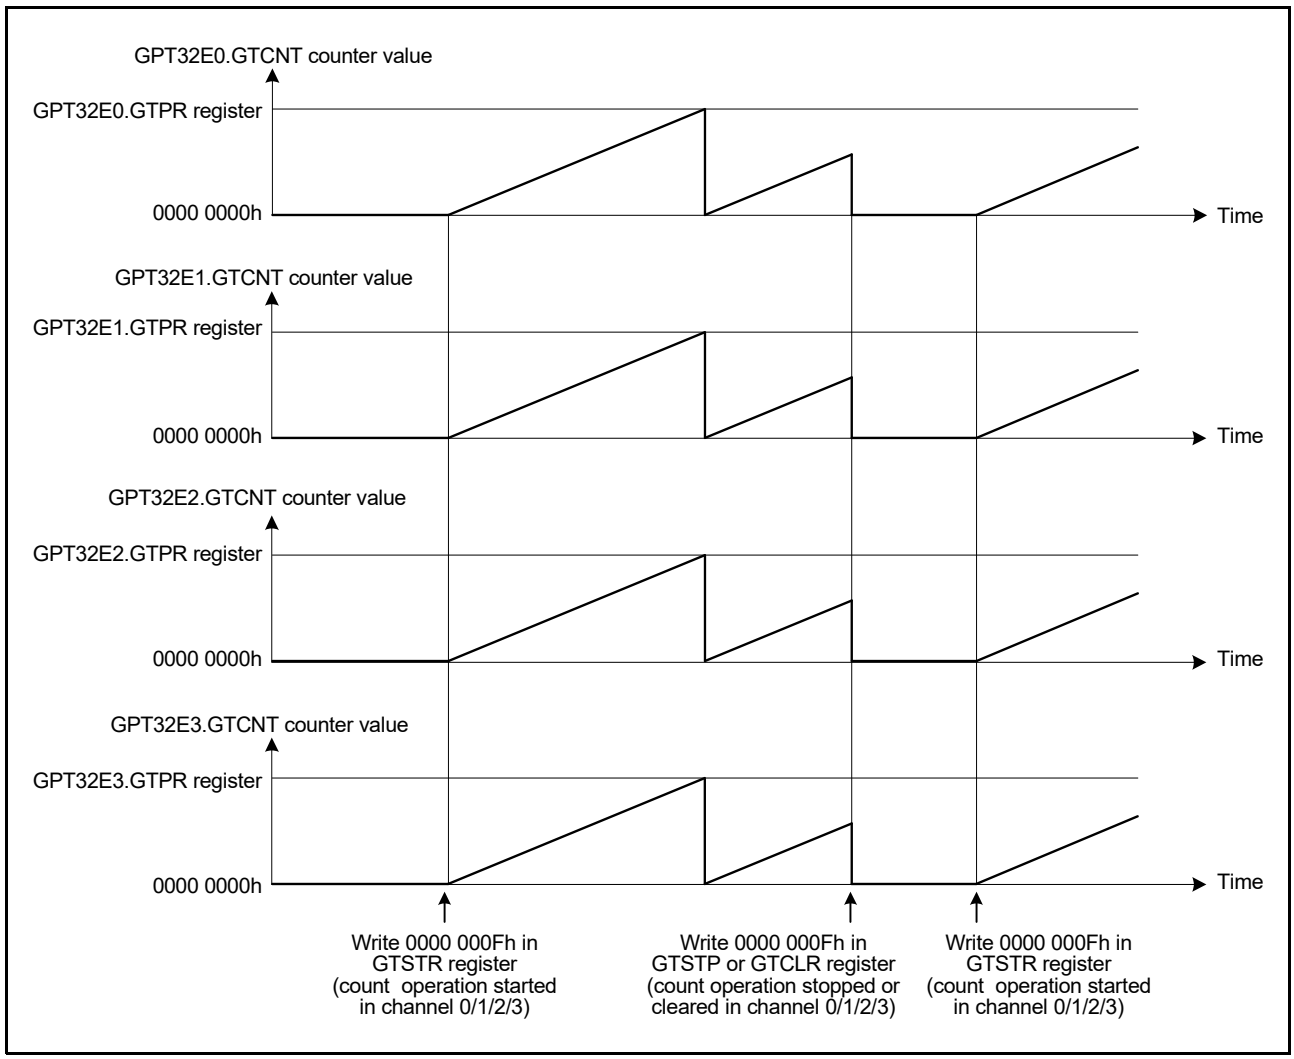

Figure 12.60 Example of a simultaneous start, stop, and clear by software, with the same count cycle (GTPR register value)

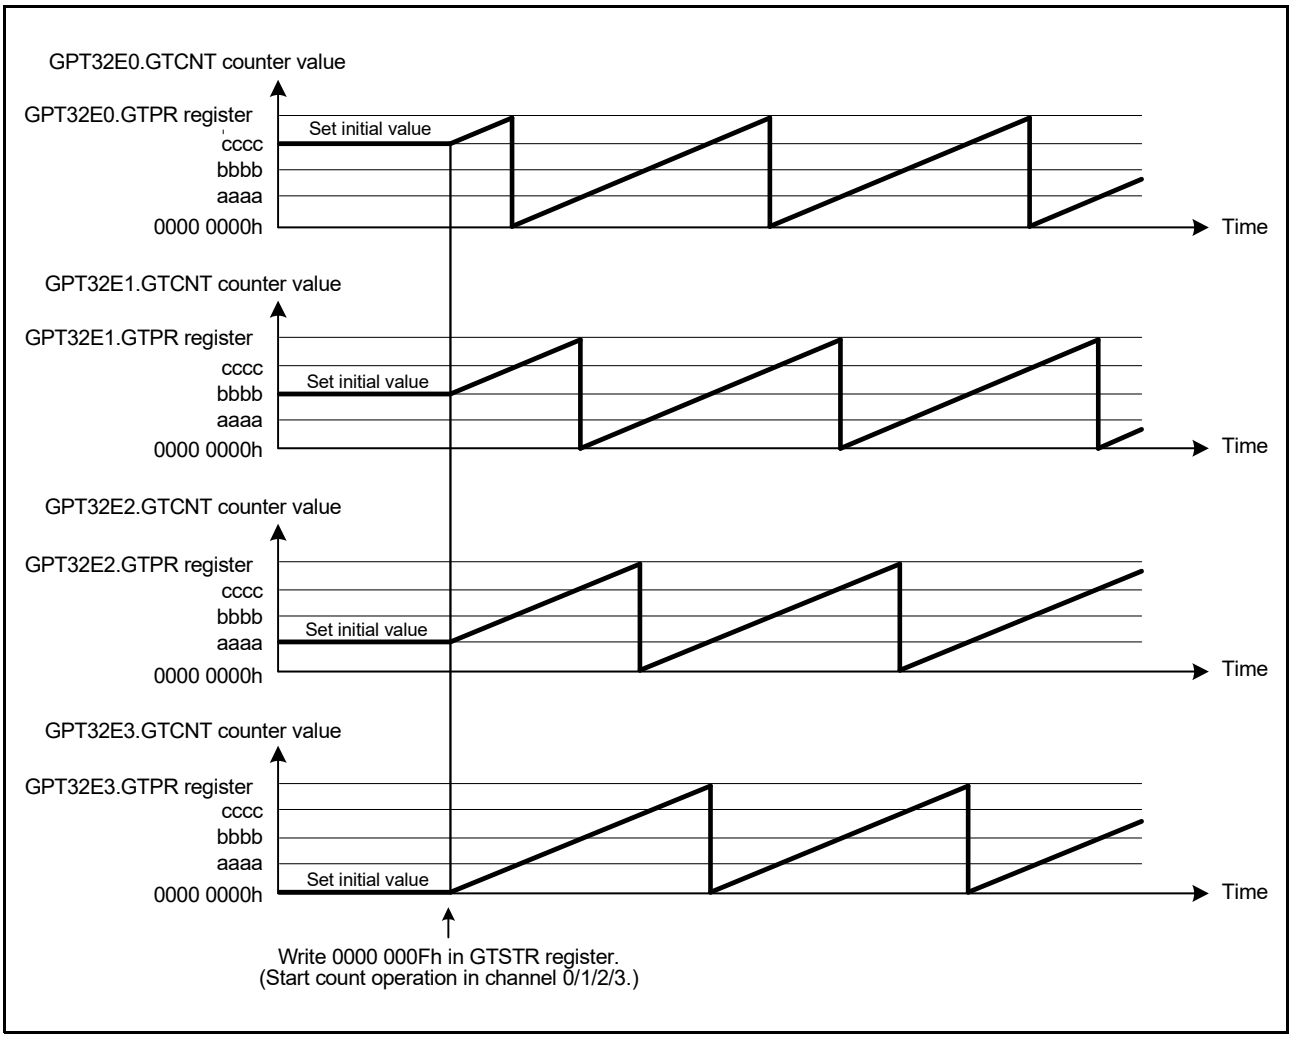

Figure 12.61 Example of software phase start with the same count cycle (GTPR register value)

12.3.8.2 Synchronized Operation by Hardware

The GTCNT counters can be started simultaneously by the following hardware sources:

- External trigger input
- Event input

Figure 12.62 shows an example of a simultaneous start, stop and clear operation by a hardware source. Figure 12.63 shows the setting example.

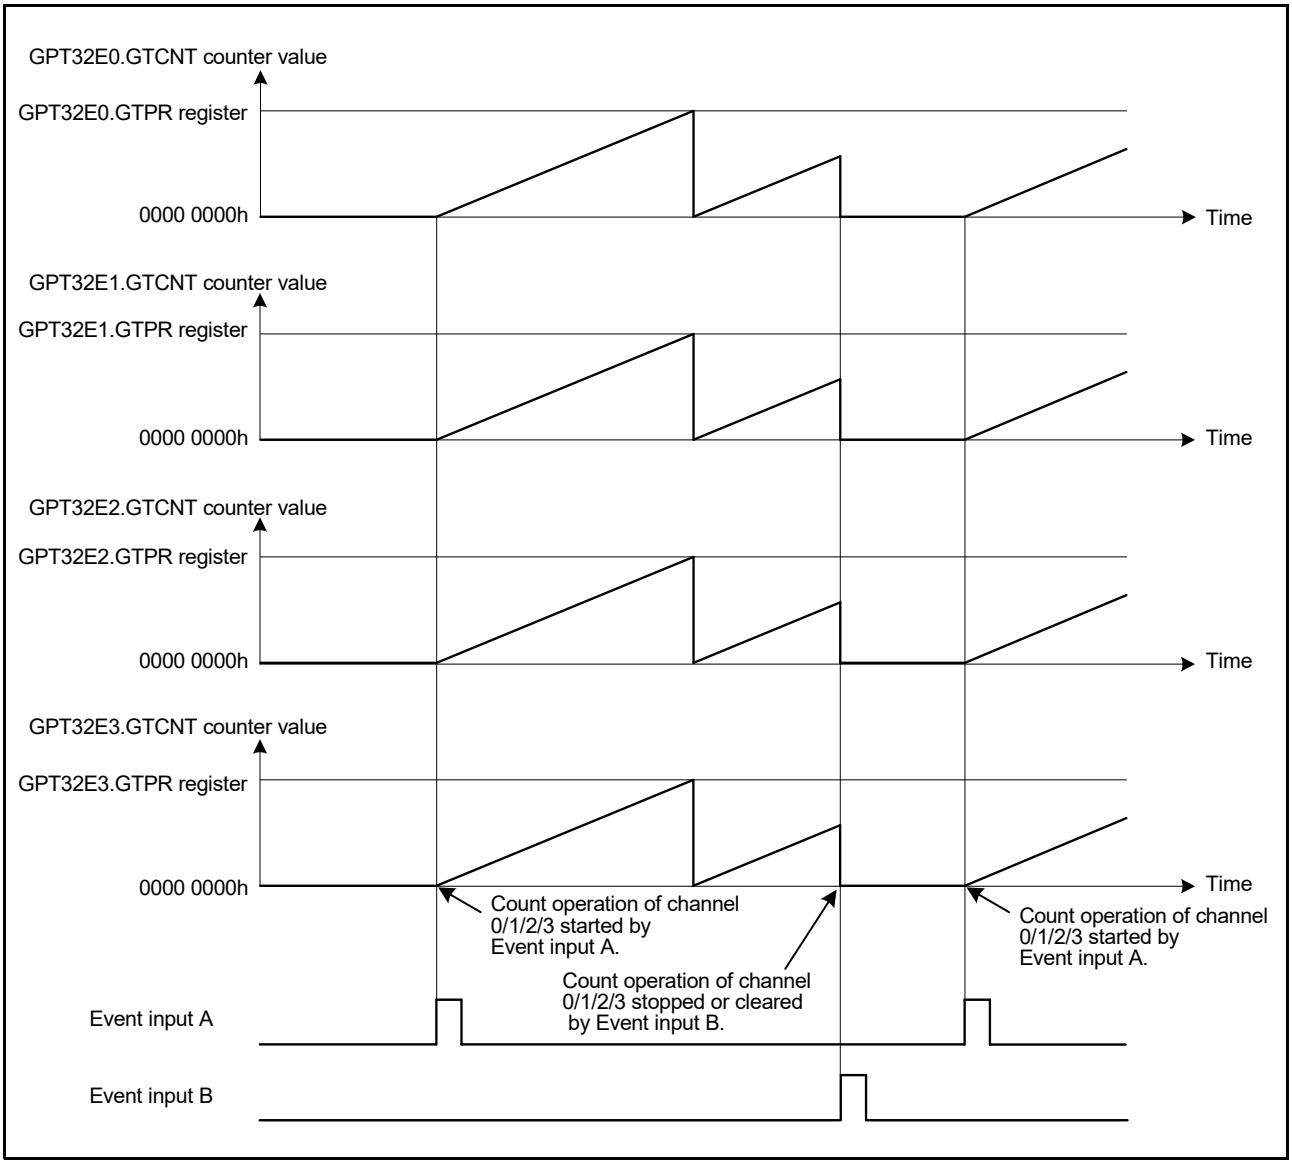

Figure 12.62 Example of a simultaneous start, stop, and clear by the hardware sources, with the same count cycle (GTPR register value)

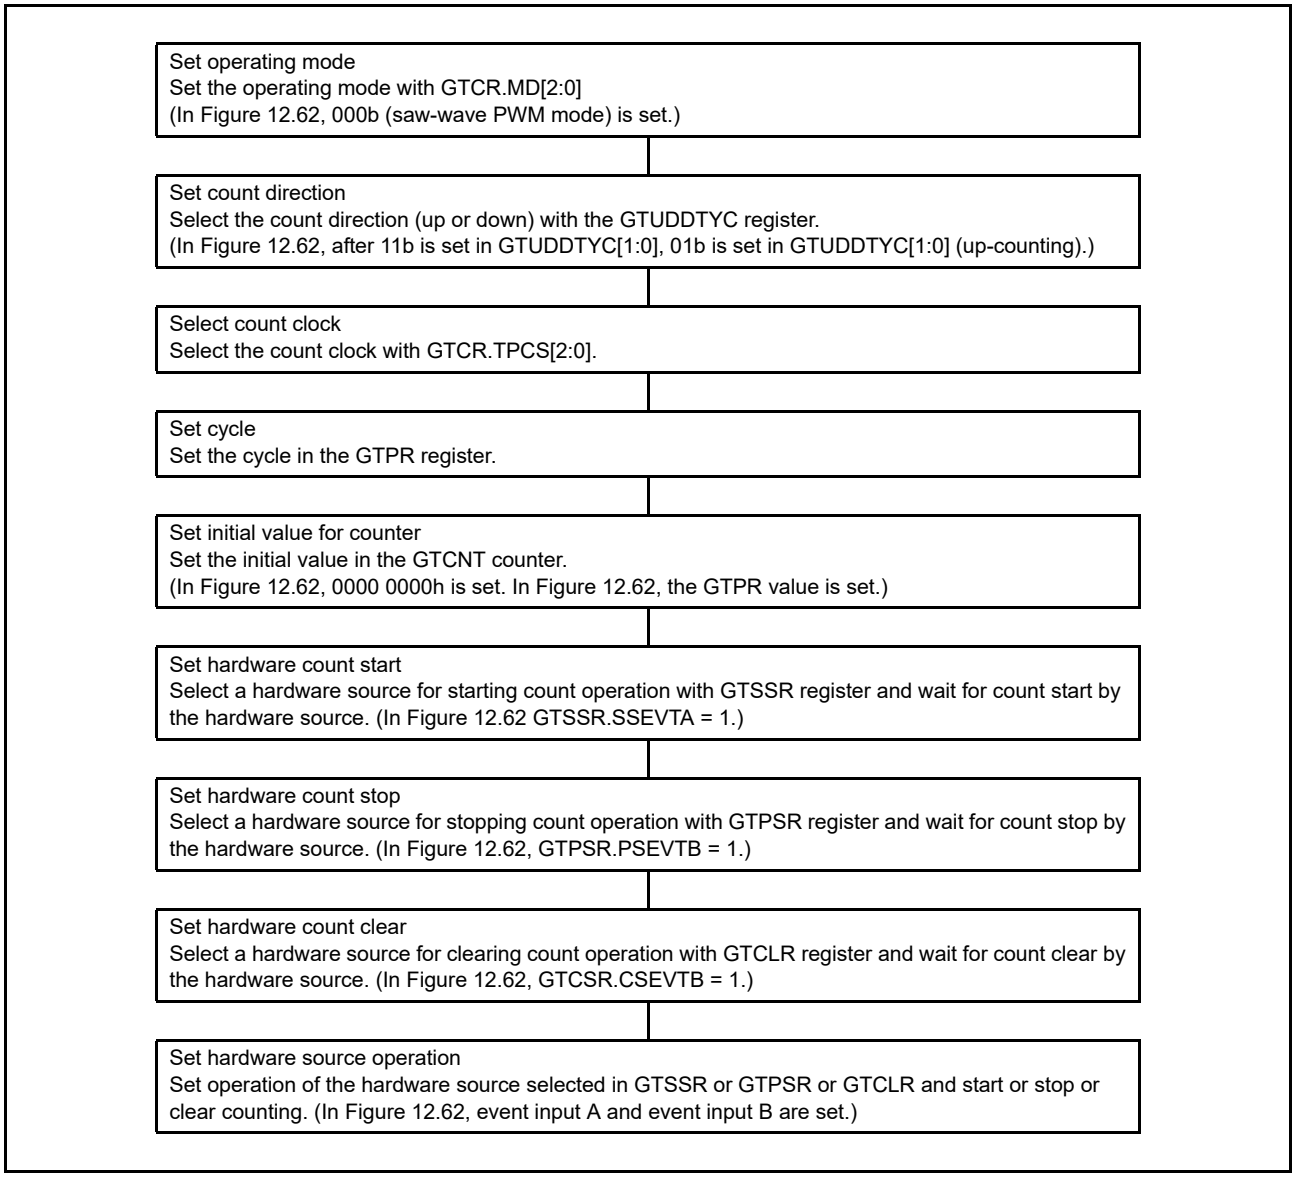

Figure 12.63 Example setting for simultaneous start by hardware source

12.3.9 PWM Output Operation Examples

12.3.9.1 Synchronized PWM Output

The GPT output 16 phases of linked PWM waveforms for a maximum of 8 channels by synchronizing operation on channels.

Figure 12.64 shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

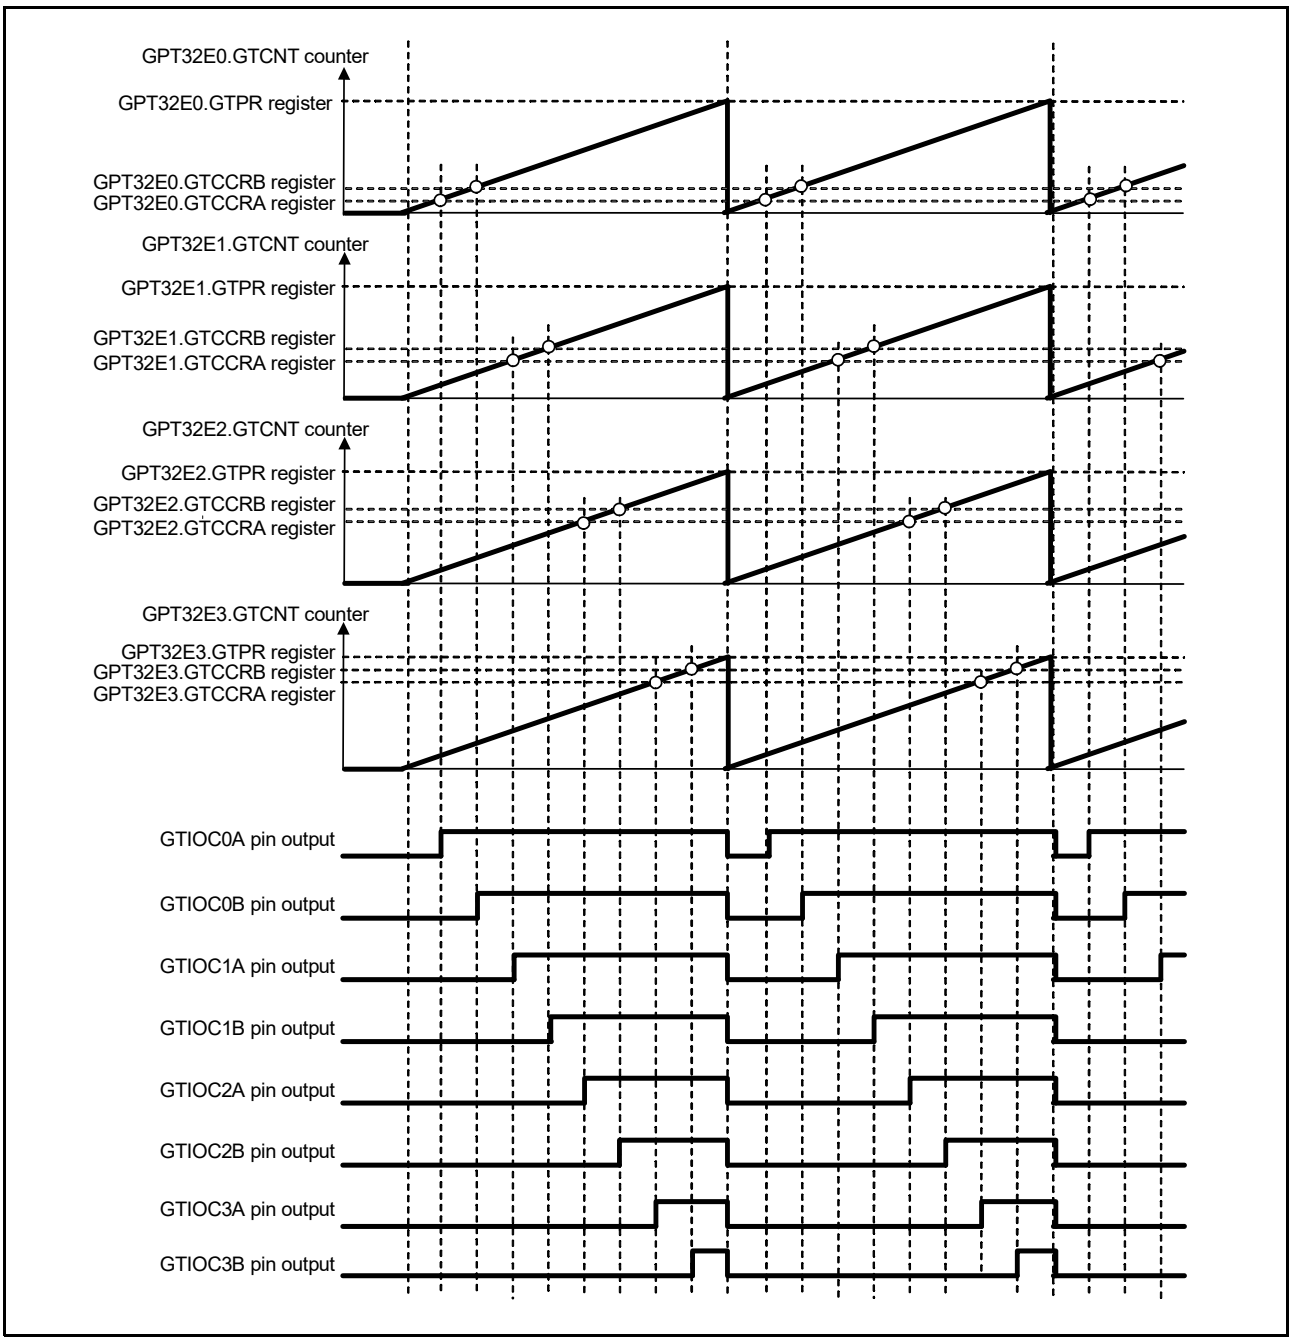

Figure 12.64 Example of synchronized PWM output

12.3.9.2 Three-Phase Saw-Wave Complementary PWM Output

Figure 12.65 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

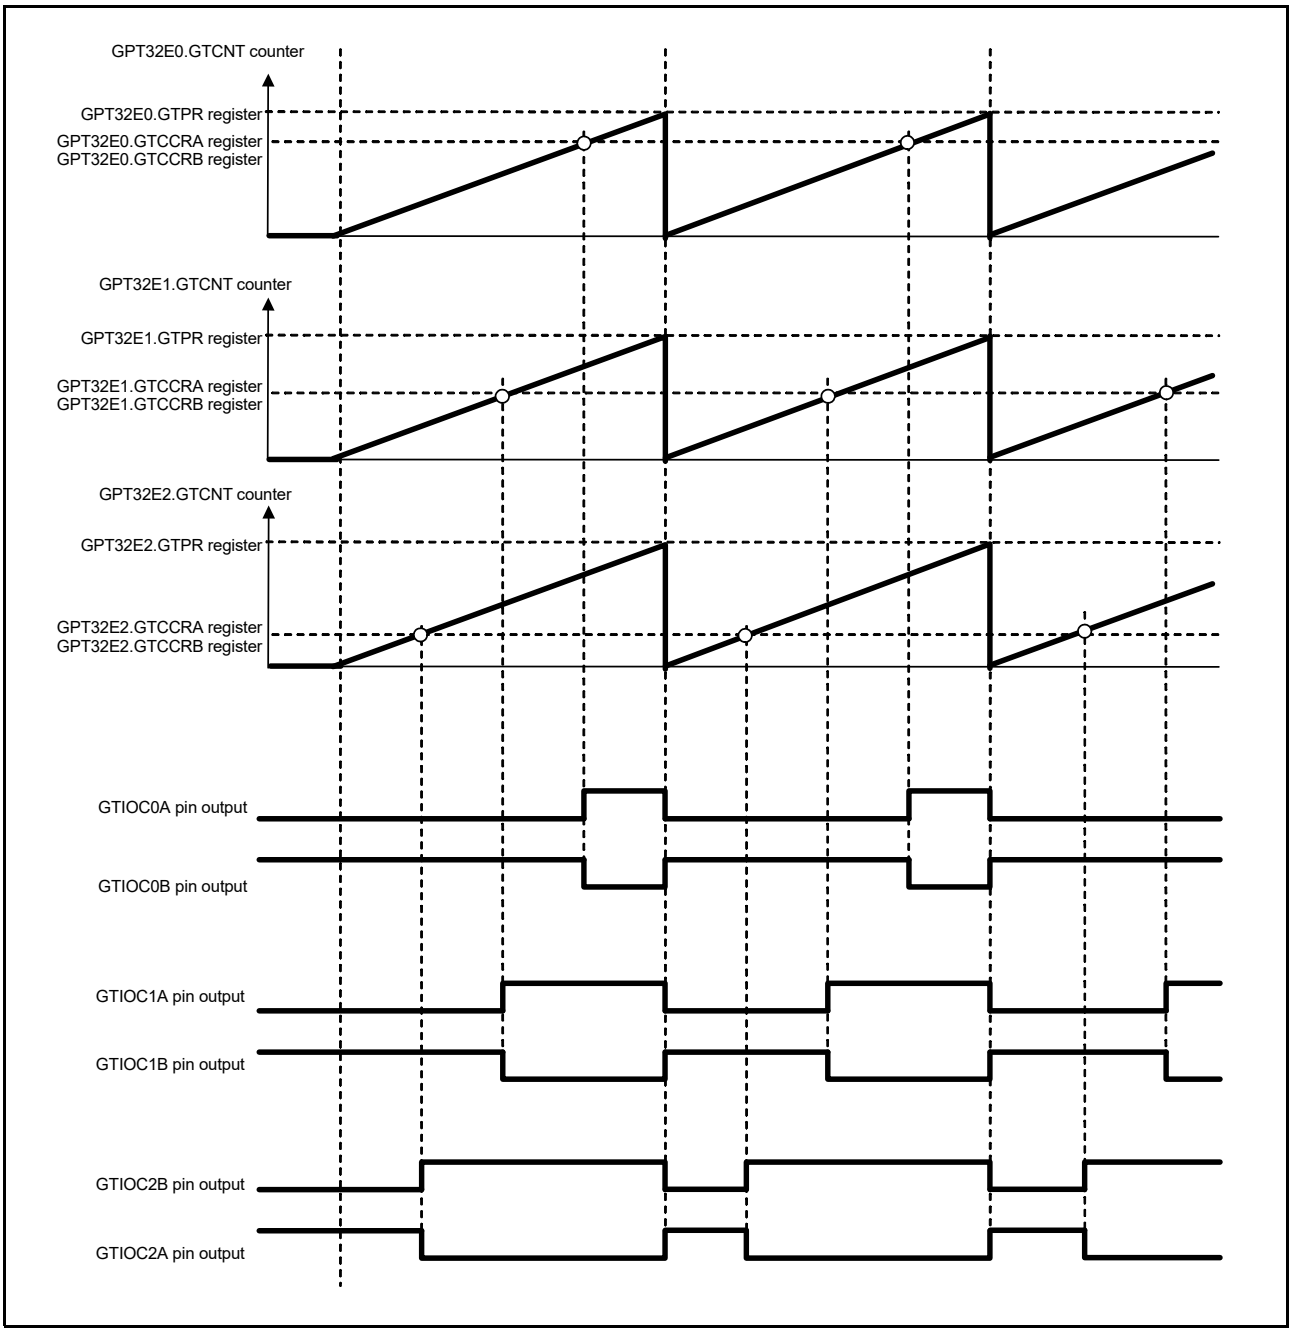

Figure 12.65 Example of 3-phase saw-wave complementary PWM output

12.3.9.3 3-Phase Saw-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 12.66 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggle the output at a GTCCRA compare match, and retain the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggle the output at a GTCCRB compare match, and retain the output at the cycle end.

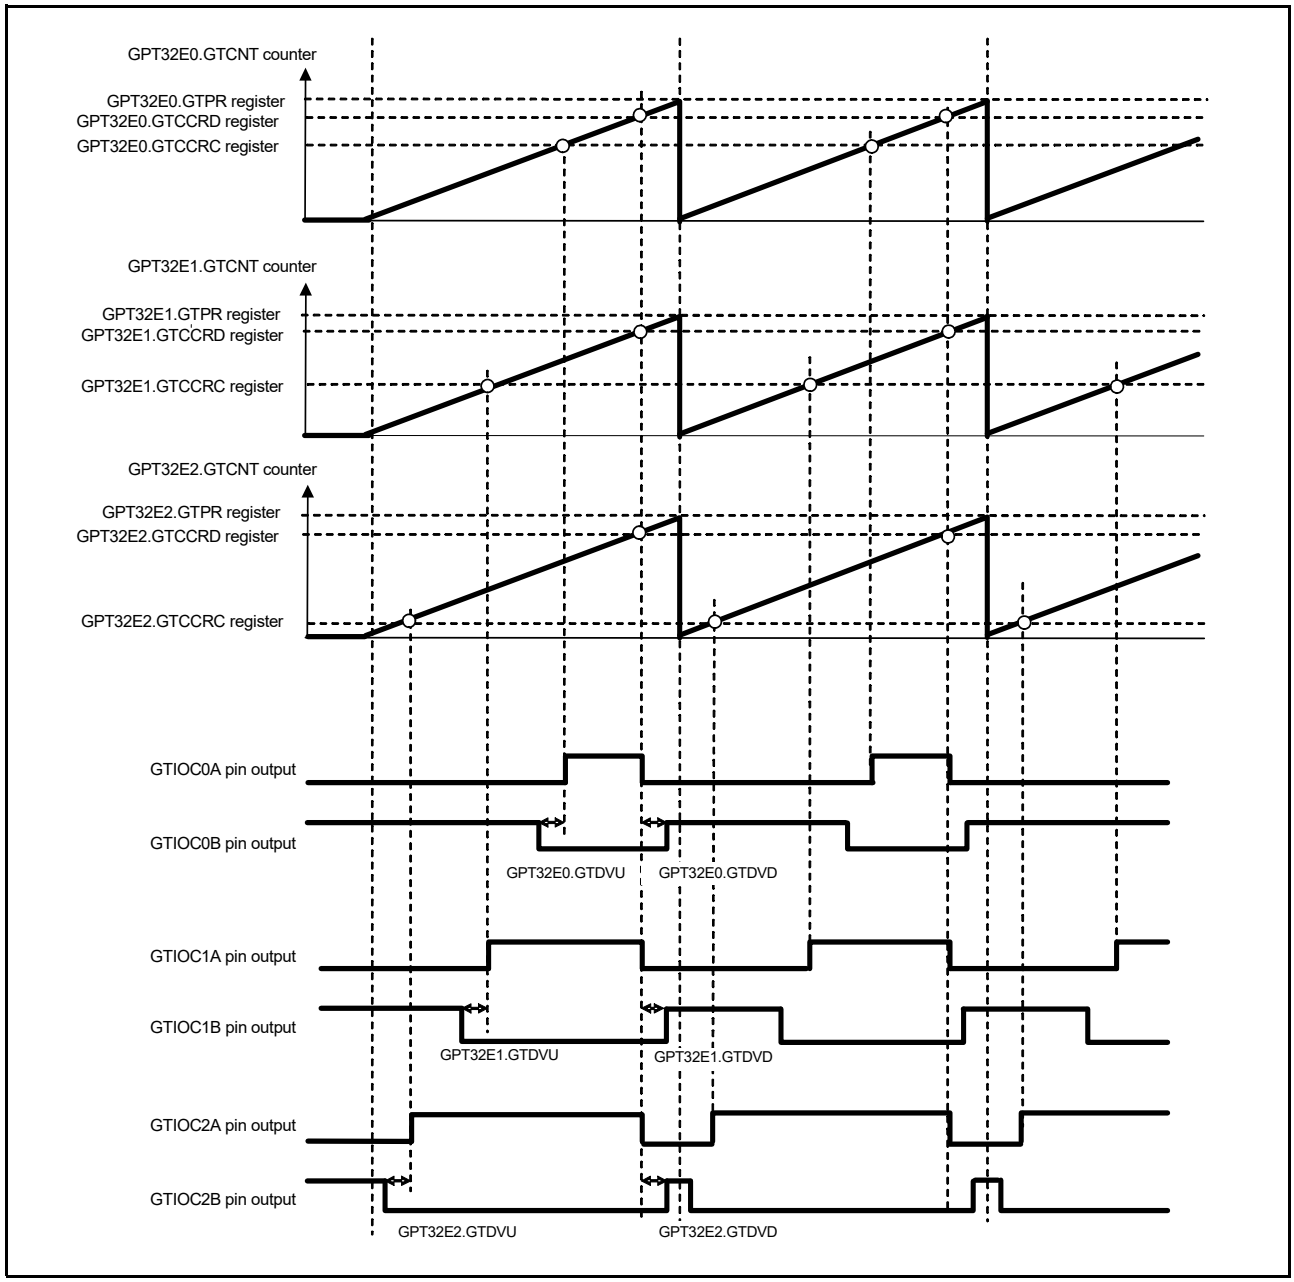

Figure 12.66 Example of 3-phase saw-wave complementary PWM output with automatic dead time setting

12.3.9.4 3-Phase Triangle-Wave Complementary PWM Output

Figure 12.67 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

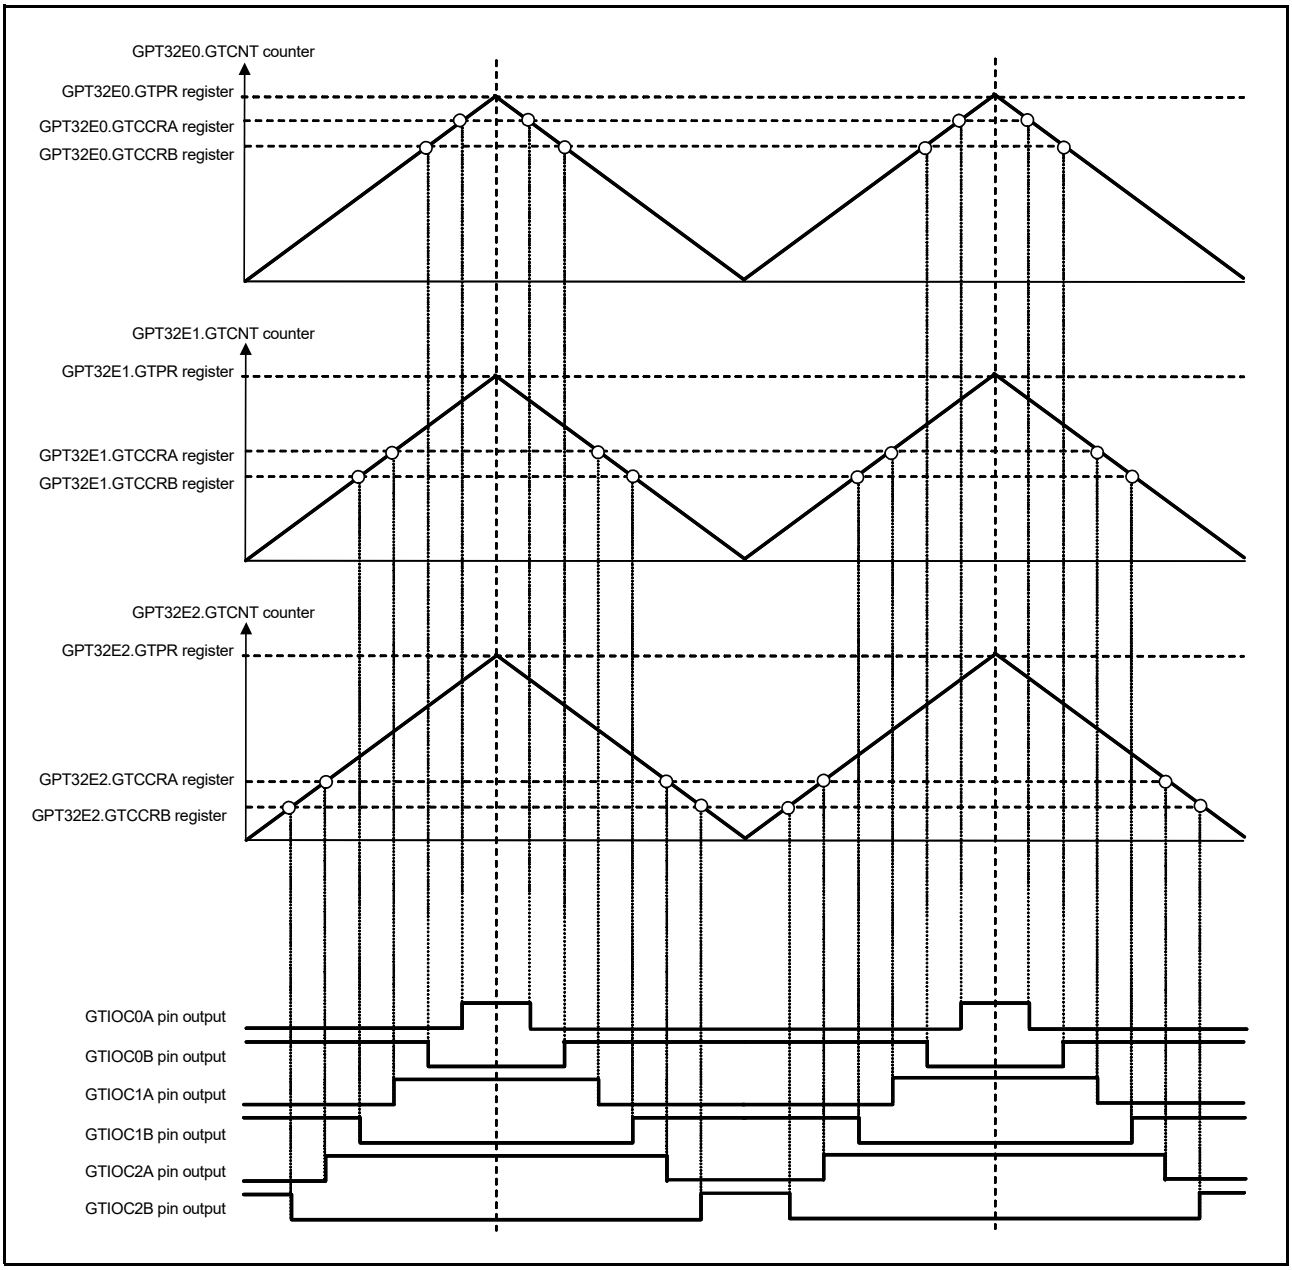

Figure 12.67 Example of 3-phase triangle-wave complementary PWM output

12.3.9.5 3-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 12.68 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

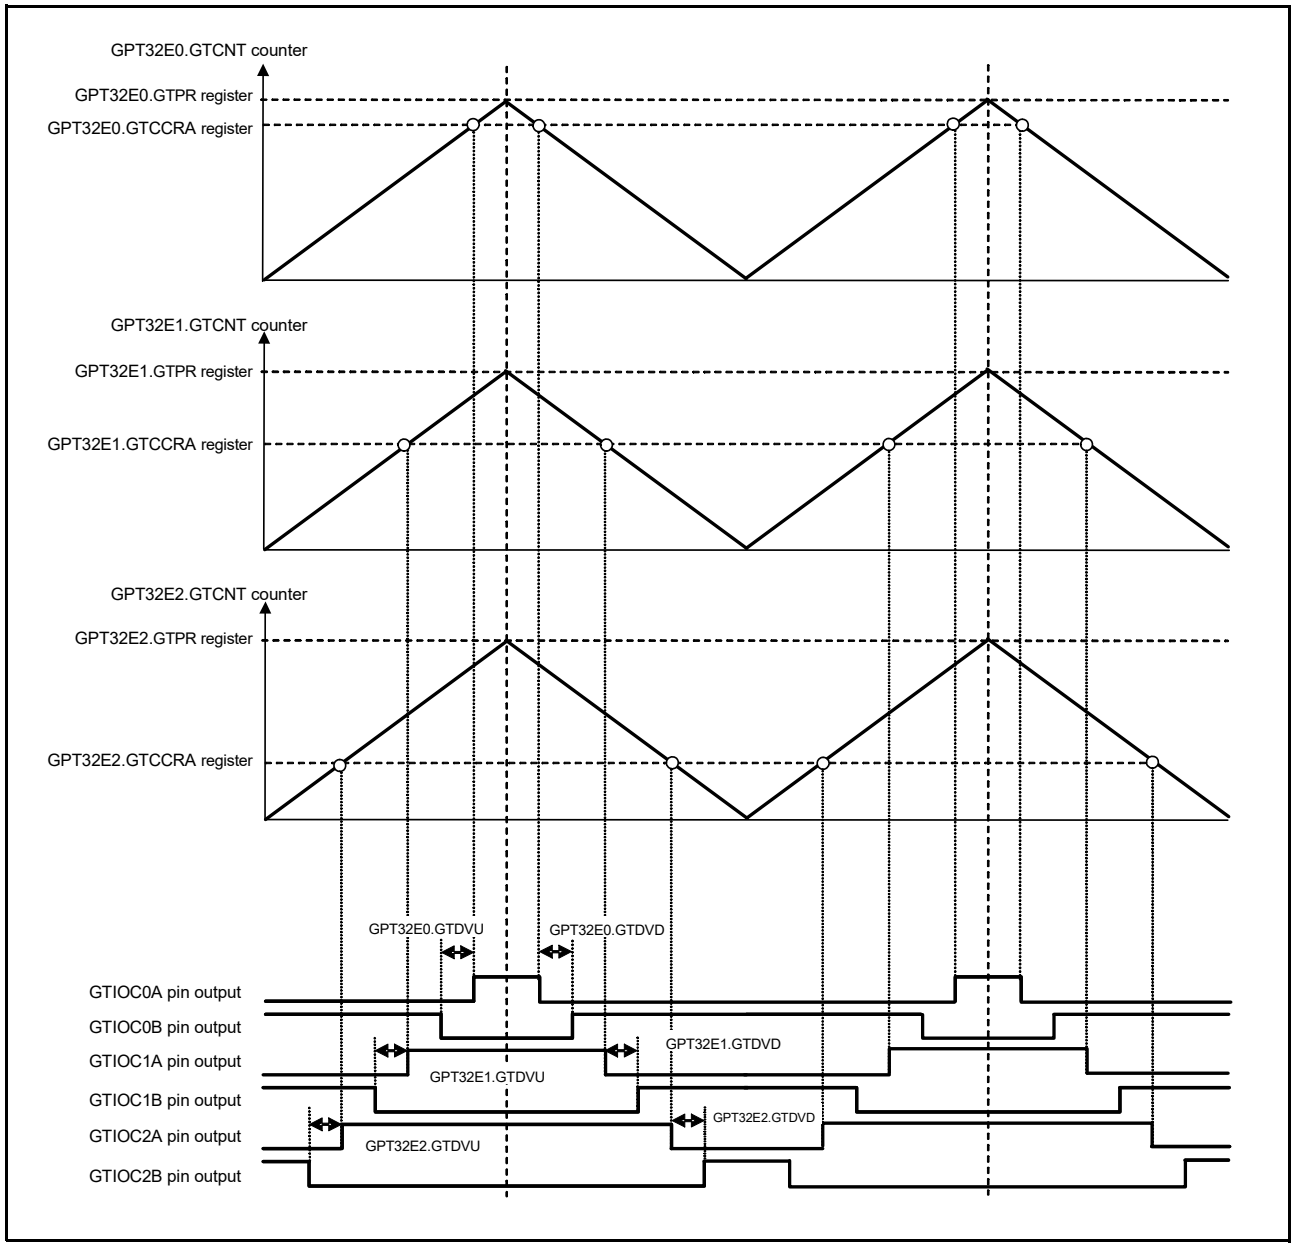

Figure 12.68 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting

12.3.9.6 3-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 12.69 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

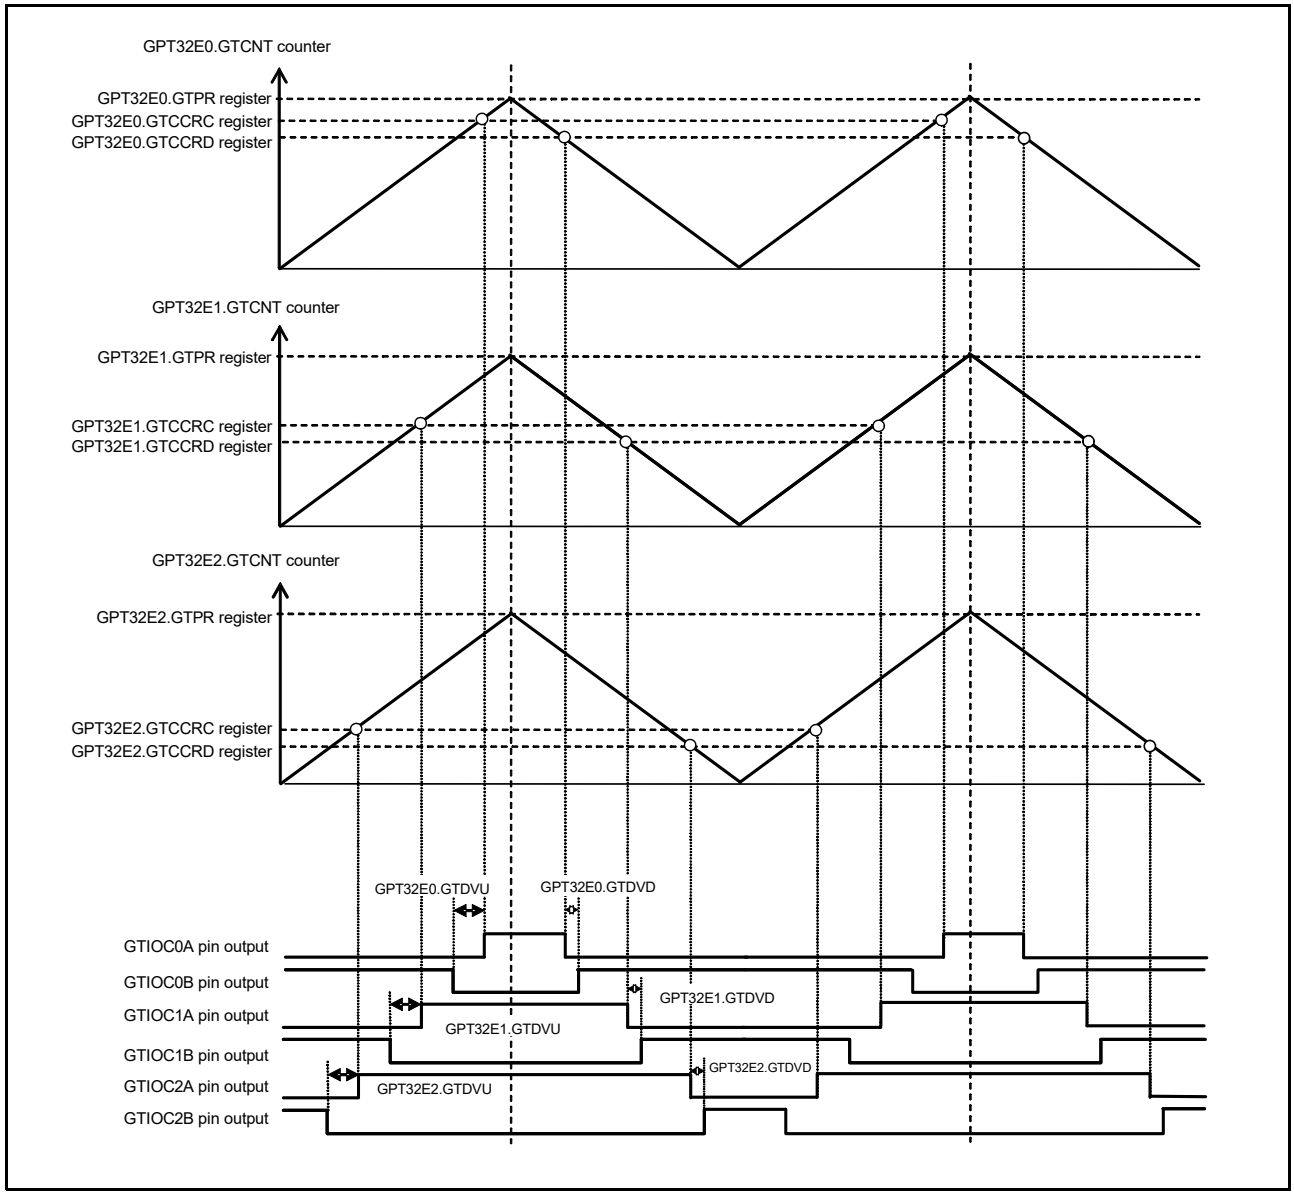

Figure 12.69 Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

12.3.10 Phase Counting Function

The phase difference between the GTIOCA pin input and GTIOCB pin input is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOCA pin and GTIOCB pin input being set in the GTUPSR and GTDNSR registers. For details on count operation, see section 12.3.1.1, Counter Operation.

Figure 12.70 to Figure 12.79 show phase counting modes 1 to 5. Table 12.9 to Table 12.18 show conditions of up-counting or down-counting and lists settings for the GTUPSR and GTDNSR registers.

12.4 Interrupt Sources

12.4.1 Interrupt Sources and Priorities

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTADTR compare match
- GTCNT counter overflow (GTPR compare match)/underflow.

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear happen at the same time, flag clear takes priority over flag set. These flags are automatically updated by internal state. Relative channel priorities can be changed by the Interrupt Controller. However the priority within a channel is fixed. For details, see section 7, Interrupt Controller. Table 12.19 lists the GPT interrupt sources.

Table 12.19 Interrupt sources

Channel	Name	Interrupt source	Interrupt flag	DMAC activation
0	CCMPA0	GPT32E0.GTCCRA input capture/compare match	TCFA	Possible
	CCMPB0	GPT32E0.GTCCRB input capture/compare match	TCFB	Possible
	CMPC0	GPT32E0.GTCCRC compare match	TCFC	Possible
	CMPD0	GPT32E0.GTCCRD compare match	TCFD	Possible
	CMPE0	GPT32E0.GTCCRE compare match	TCFE	Possible
	CMPF0	GPT32E0.GTCCRF compare match	TCFF	Possible
	ADTRGA0	GPT32E0.GTADTRA compare match	ADTRAUF ADTRADF	Possible
	ADTRGB0	GPT32E0.GTADTRB compare match	ADTRBUF ADTRBDF	Possible
	OVF0	GPT32E0.GTCNT overflow (GPT32E0.GTPR compare match)	TCFPO	Possible

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

(1) ADTRGAn interrupt (n = 0 to 7)

When the GTCNT counter value matches with the GTADTRA register, an interrupt request is generated under the following condition:

- In up-counting, the interrupt enable bit (ADTRAUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRADEN) in the GTINTAD register is 1.

In event count operation performing, this interrupt request is not generated.

(2) ADTRGBn interrupt (n = 0 to 7)

When the GTCNT counter value matches with the GTADTRB register, an interrupt request is generated under the following condition:

- In up-counting, the interrupt enable bit (ADTRBUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRBDEN) in the GTINTAD register is 1.

In event count operation performing, this interrupt request is not generated.

(3) CCMPAn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register.
- When the GTCCRA register functions as an input capture register, the GTCNT counter value is transferred to the GTCCRA register by an input capture signal.

(4) CCMPBn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register.
- When the GTCCRB register functions as an input capture register, the GTCNT counter value is transferred to the GTCCRB register by an input capture signal.

(5) CMPCn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and an interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

(6) CMPDn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and therefore interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

(7) CMPEn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition.

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and an interrupt is not requested under the following conditions.

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register)

(8) CMPFn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and therefore interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

(9) OVFn interrupt (n = 0 to 7)

An interrupt request is generated under the following conditions:

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (GTCNT changes from GTPR to GTPR-1)
- In counting by hardware sources, overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

(10) UNFn interrupt (n = 0 to 7)

An interrupt request is generated under the following conditions:

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting).
- In triangle-wave mode, interrupt requests are enabled at troughs (GTCNT changes from 0 to 1).
- In counting by hardware sources, underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

Table 12.20 Interrupt signals, interrupt permission bits, and interrupt status flags

Interrupt signal	Interrupt permission bit	Interrupt status flag
UNFn	GTINTAD[7:6] (GTINTPR[1:0])	GTST[7] (TCFPU)
OVFn		GTST[6] (TCFPO)
ADTRGBn	GTINTAD[19] (ADTRBDEN) GTINTAD[18] (ADTRBUEN)	GTST[19] (ADTRBDF) GTST[18] (ADTRBUF)
ADTRGAn	GTINTAD[17] (ADTRADEN) GTINTAD[16] (ADTRAUEN)	GTST[17] (ADTRADF) GTST[16] (ADTRAUF)
CMPFn	GTINTAD[5] (GTINTF)	GTST[5] (TCFF)
CMPEn	GTINTAD[4] (GTINTE)	GTST[4] (TCFE)
CMPDn	GTINTAD[3] (GTINTD)	GTST[3] (TCFD)
CMPCn	GTINTAD[2] (GTINTC)	GTST[2] (TCFC)
CCMPBn	GTINTAD[1] (GTINTB)	GTST[1] (TCFB)
CCMPAn	GTINTAD[0] (GTINTA)	GTST[0] (TCFA)

12.4.2 DMAC Activation

The DMAC can be activated by the interrupt in each channel. For details, see section 9, Direct Memory Access Controller.

12.4.3 Interrupt and A/D Conversion Request Skipping Function

By setting the GTITC register, the GTCNT counter overflow (GTPR compare match) interrupt (OVFn) and underflow interrupt (UNFn) can be skipped. Other interrupts and A/D converter start request signals can be skipped in coordination with the OVFn/UNFn skipping function.

The interrupt request skipping function only depends on the setting of GTITC register and is independent of the setting of interrupt permission bits in the GTINTAD register.

When both troughs and crests are counted and skipped in triangle-wave mode, if the number of times of skipping is odd, OVFn/UNFn interrupt requests cannot be generated at troughs only or at crests only depending on the skipping counter start timing. To count both troughs and crests and generate the OVFn/UNFn interrupts at troughs only or crests only in triangle-wave mode, you must set an even number of skips.

Similarly, in saw-wave mode, when both overflows and underflows are counted and skipped with the count direction changed, OVFn interrupt requests cannot be generated on either overflows or underflows only. To count both overflows and underflows with the count direction changed and generate the OVFn/UNFn interrupts on either overflows or underflows only in saw wave mode, first check the skipping state carefully.

Before changing the skipping count, you must release the skipping count setting (GTITC.IVTC[1:0] bits = 00b).

Figure 12.80 to Figure 12.85 show examples of skipping function operation.

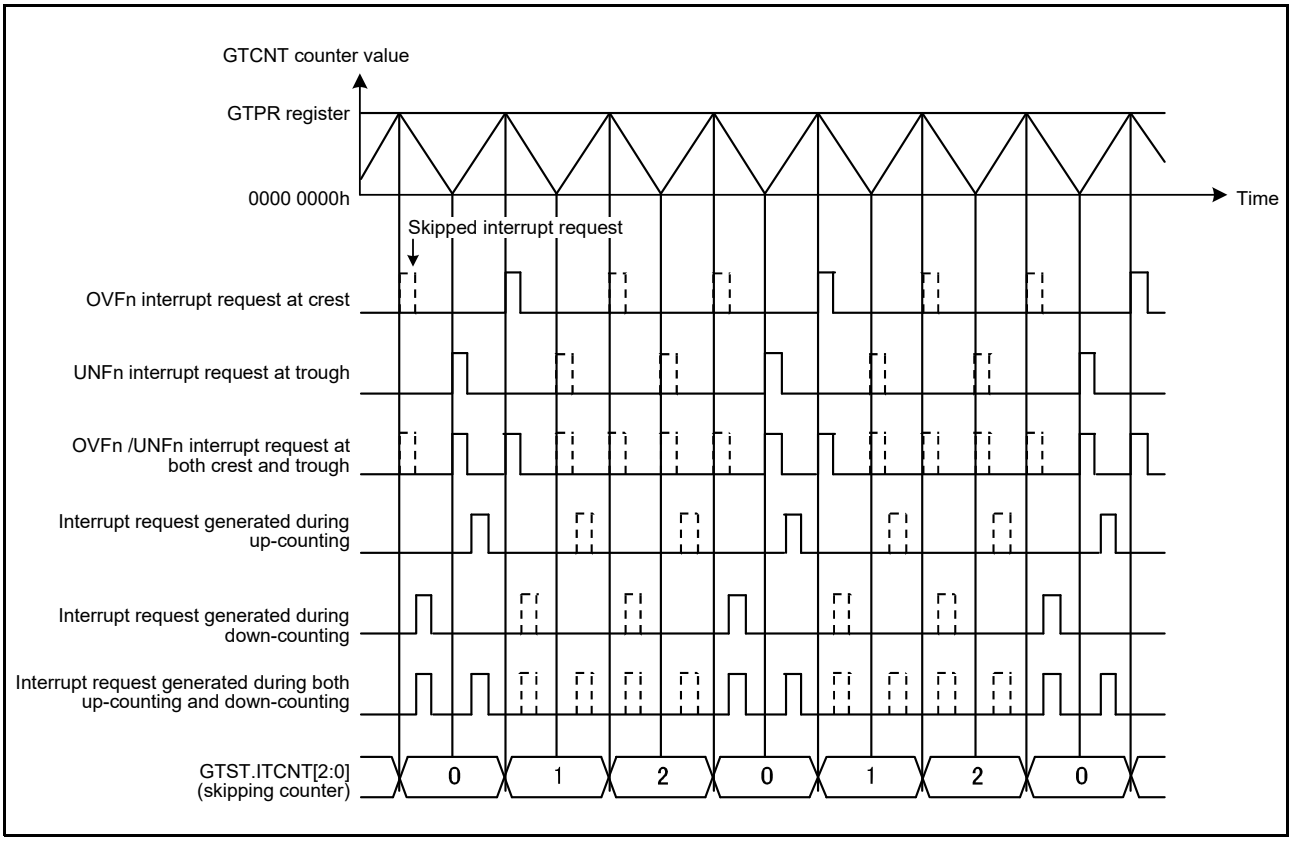

Figure 12.80 Example of interrupt skipping function operation with triangle waves, counting and skipping crests, and skipping count = 2

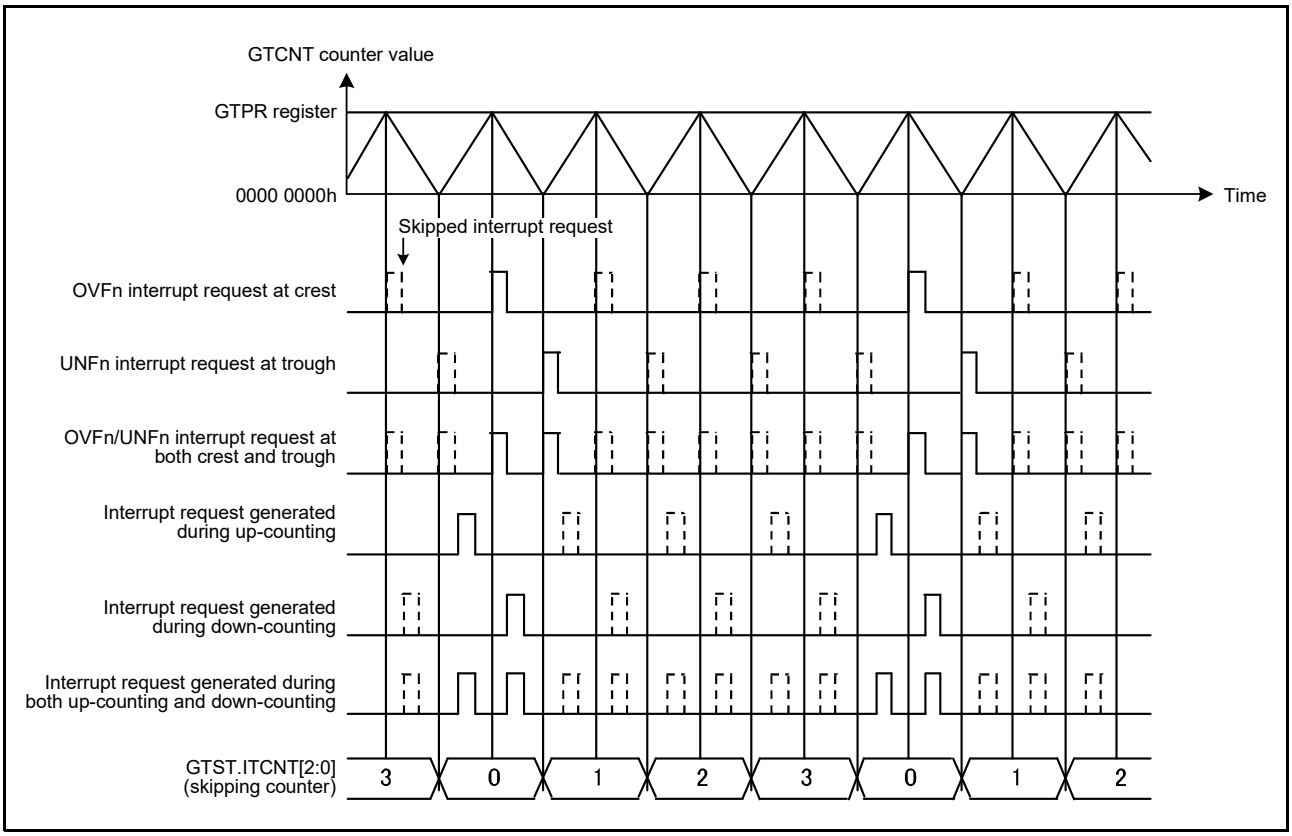

Figure 12.81 Example of interrupt skipping function operation with triangle waves, counting and skipping troughs, and skipping count = 3

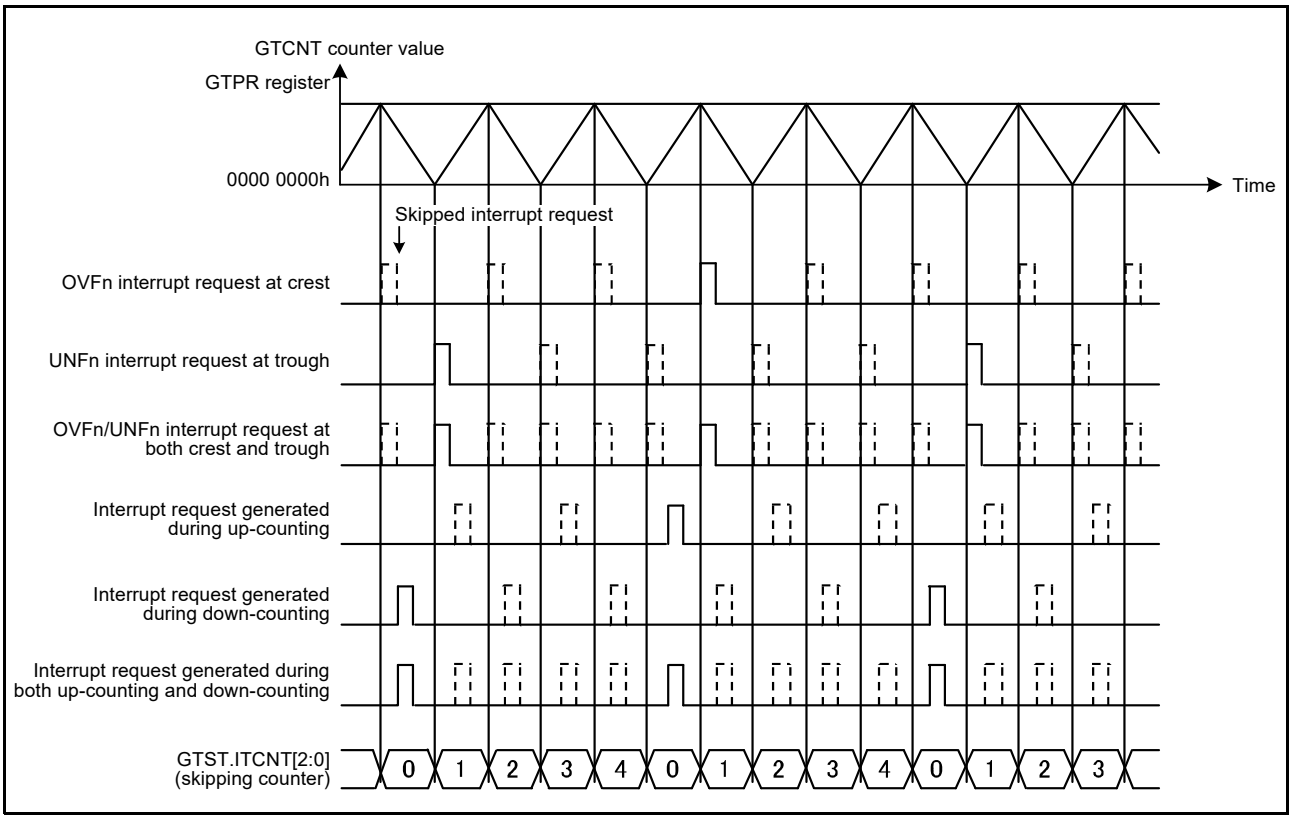

Figure 12.82 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, and skipping count = 4

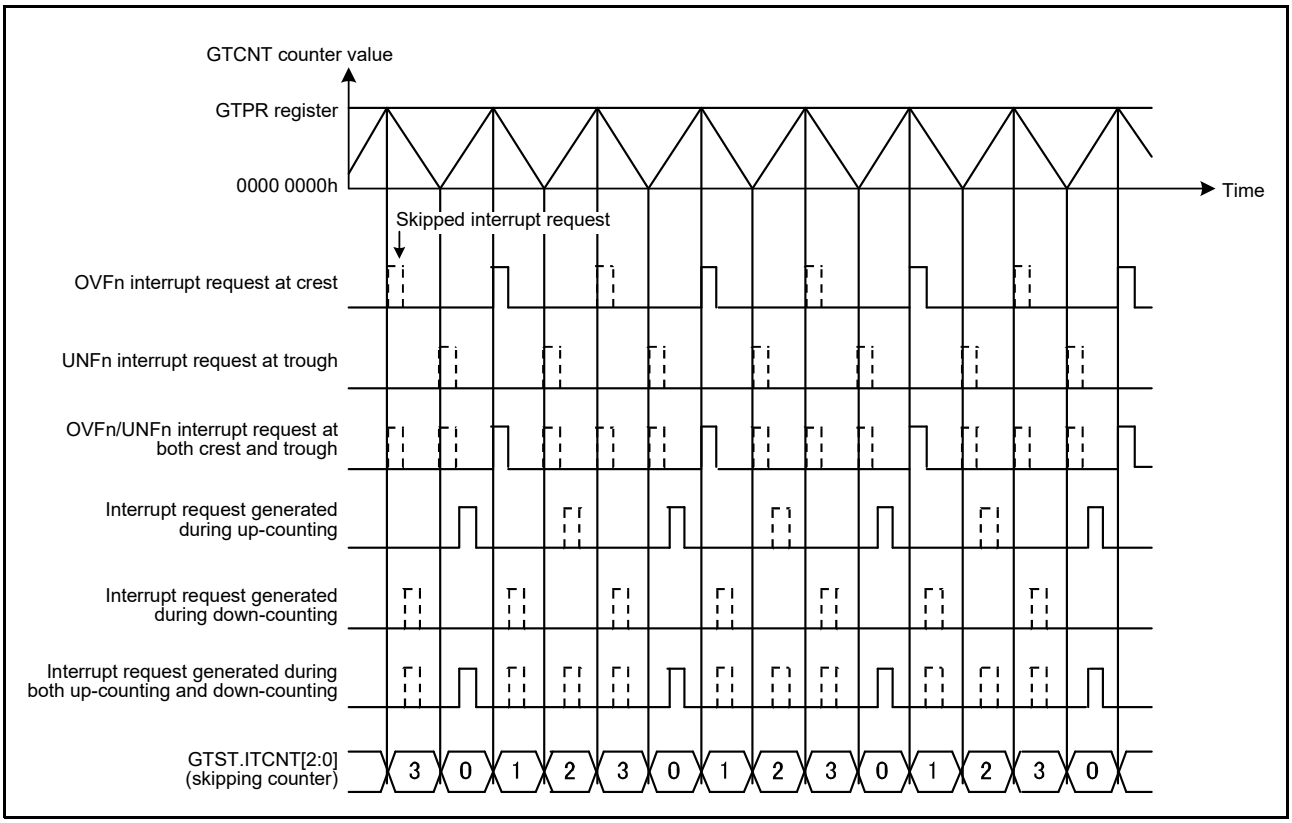

Figure 12.84 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, skipping count = 3, and skipping started at down-counting

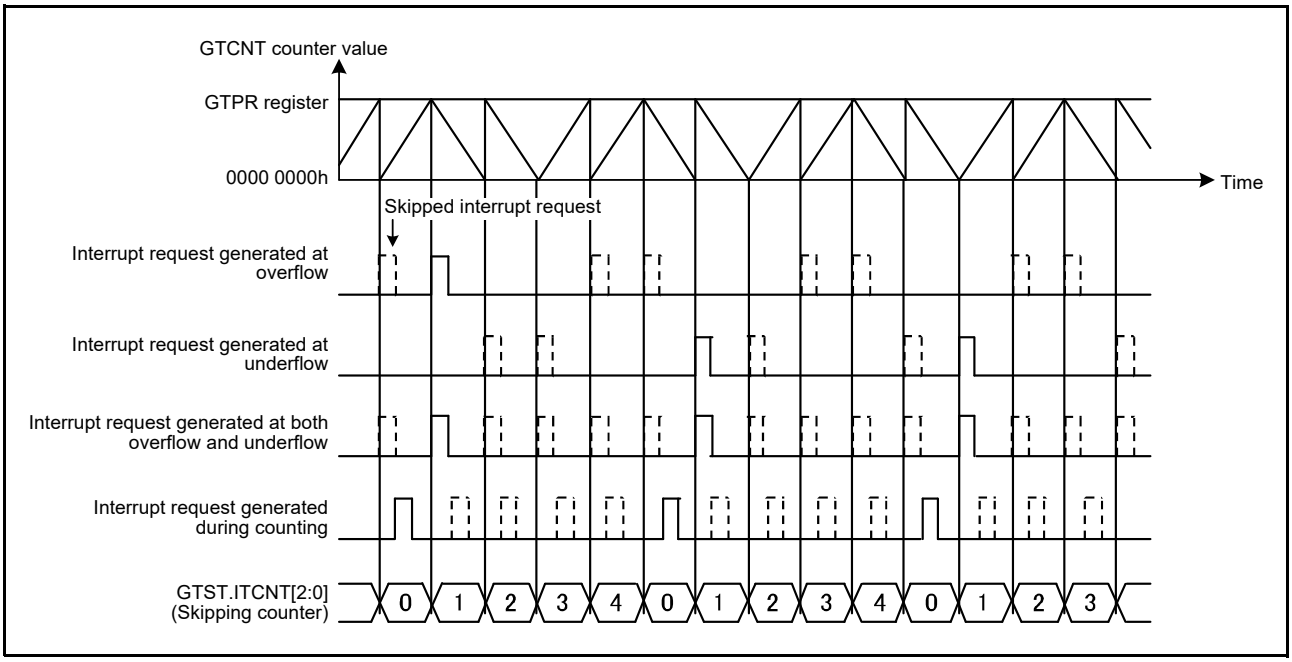

Figure 12.85 Example of interrupt skipping function operation with saw waves, operation with count direction changed, counting and skipping both overflows and underflows, and skipping count = 4

12.5 A/D Converter Start Request

An A/D converter start request can be issued at a compare match between the GTCNT counter and GTADTRA or GTADTRB, and up-counting only, down-counting only, or both up-counting and down-counting can be specified.
In event count operation performing, A/D converter start requests interrupt cannot be generated.
GTADTRA and GTADTRB each has two buffer registers. Buffer operation with GTADTRA combined with GTADTBRA and GTADTDBRA, and buffer operation with GTADTRB combined with GTADTBRB and GTADTDBRB can be performed.
Figure 12.86 shows an example of A/D converter start request operation, and Figure 12.87 shows an example setting for A/D converter start request operation.

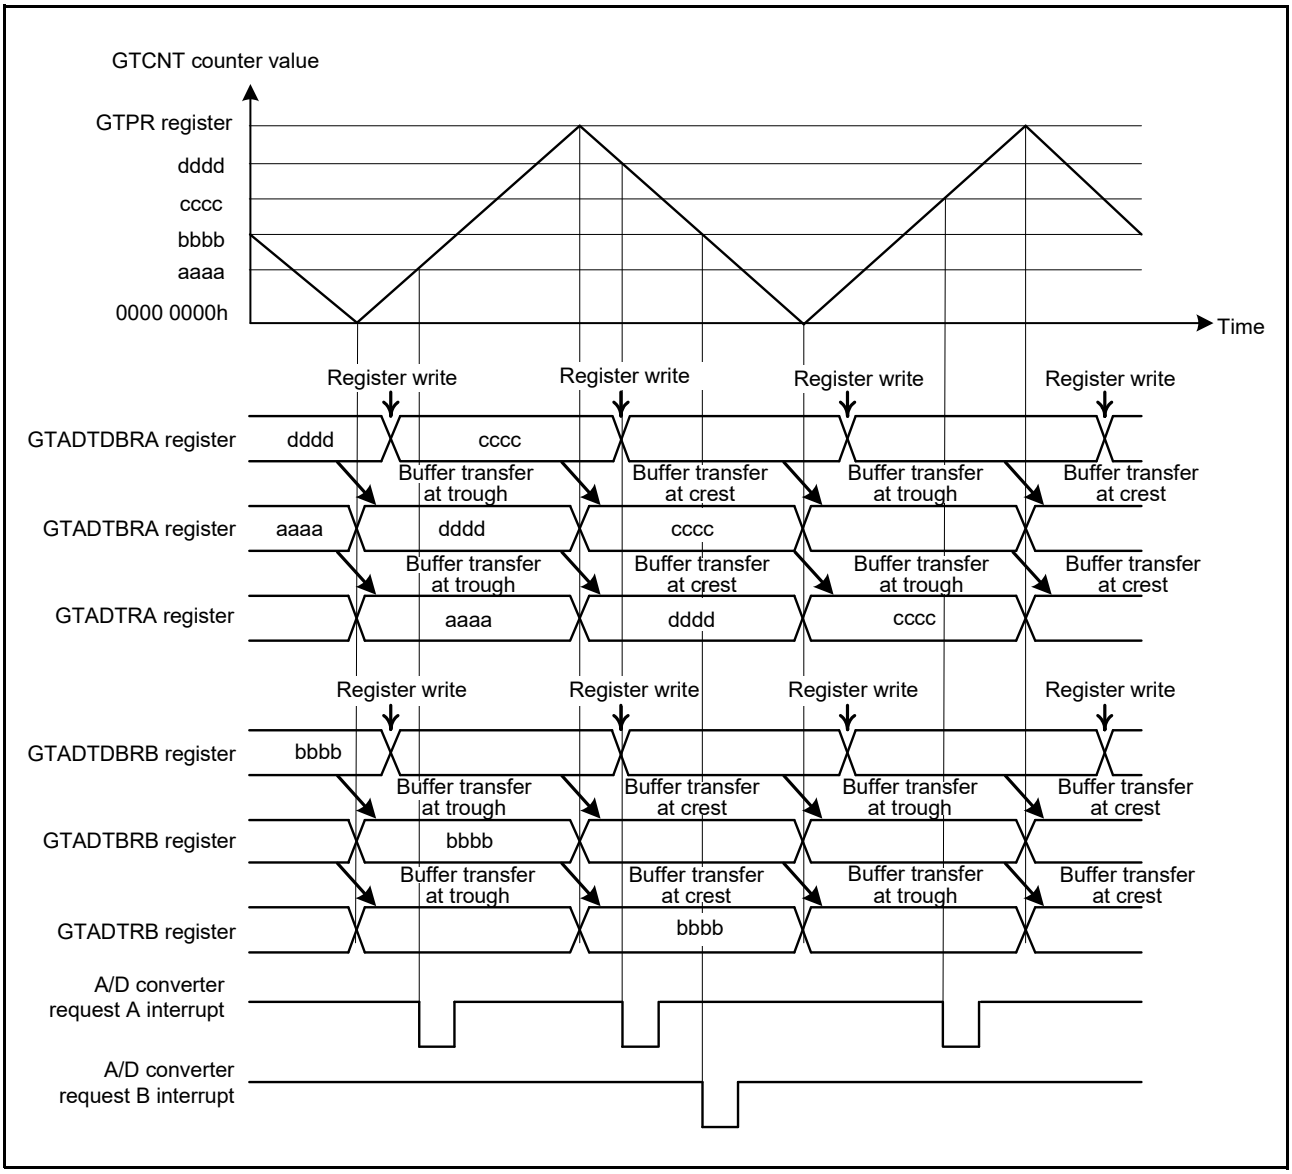

Figure 12.86 Example of A/D converter start request timing operation with triangle waves, double buffer operation, buffer transfer at both troughs and crests, A/D converter start request interrupt by GTADTRA at both up-counting and down-counting, and A/D converter start request interrupt by GTADTRB at down-counting

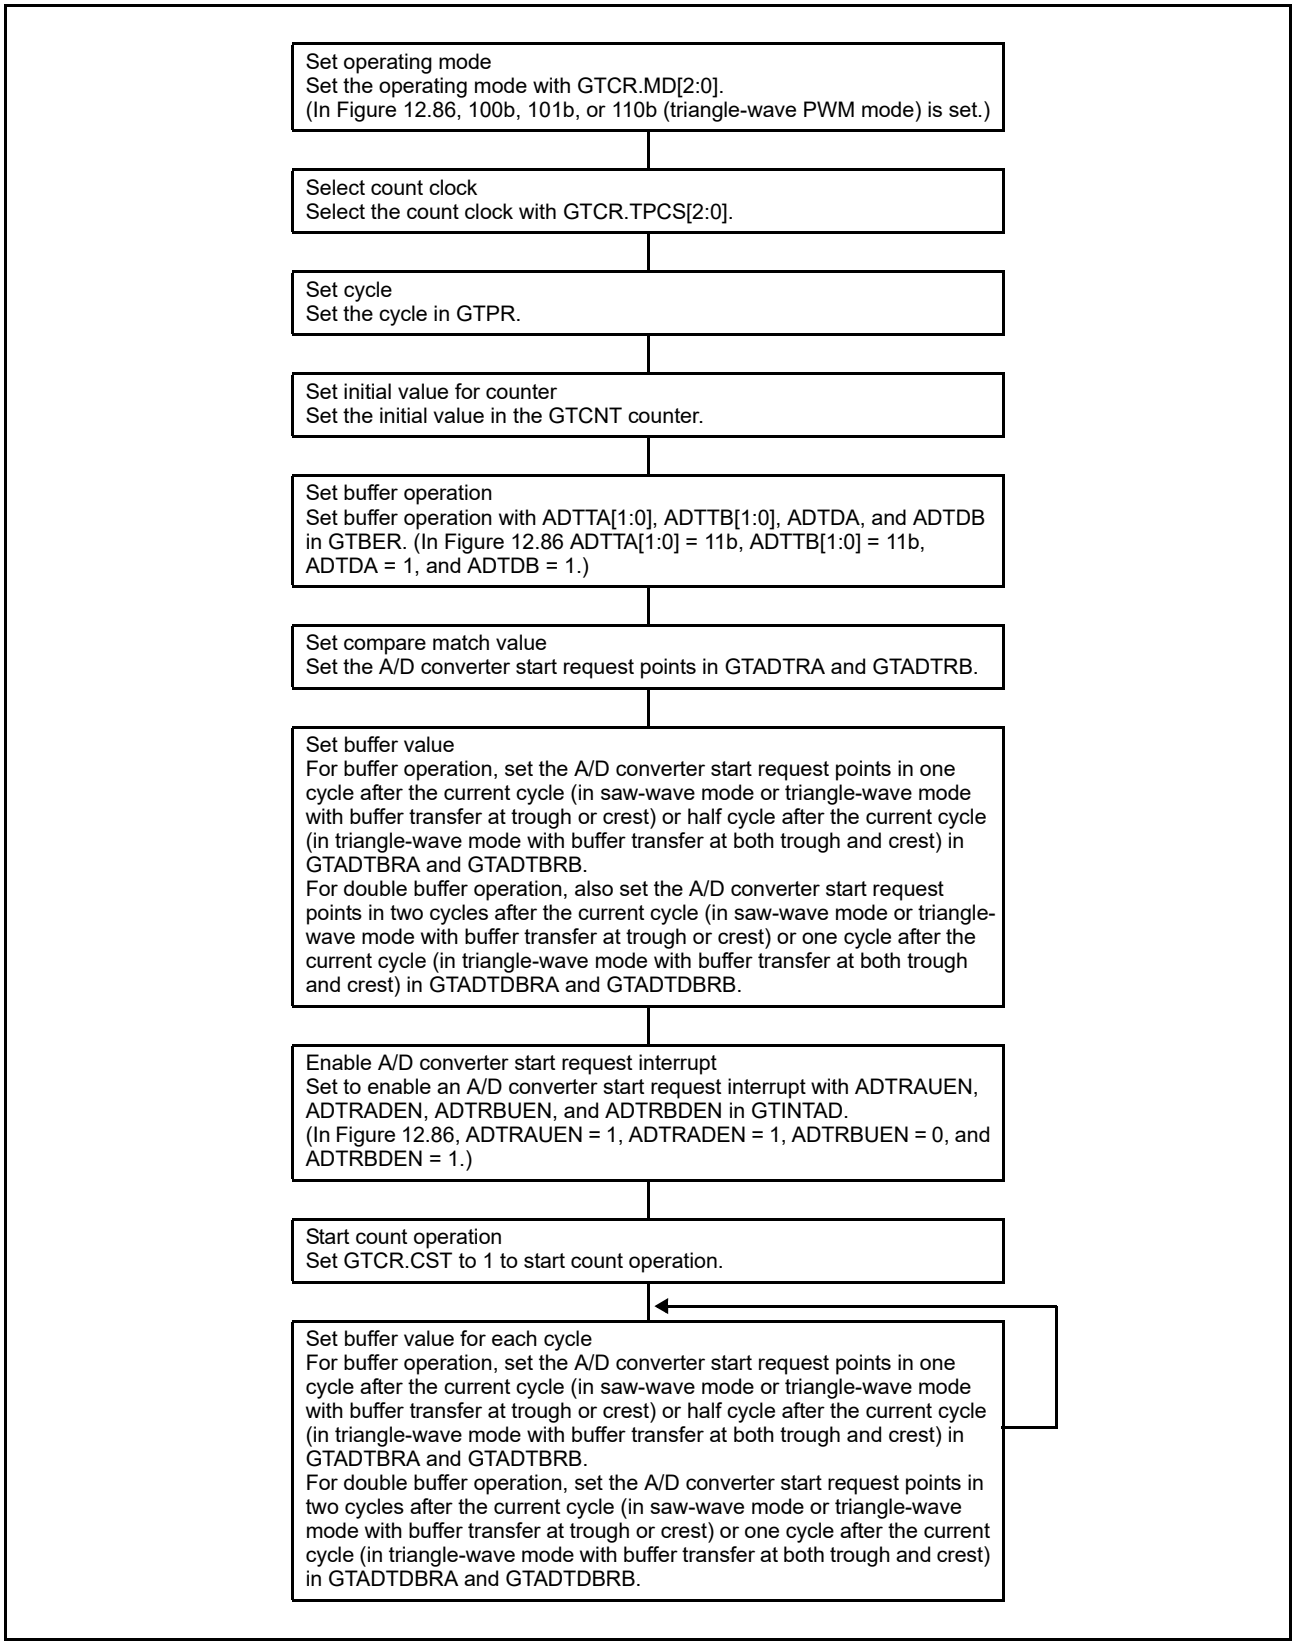

Figure 12.87 Example setting for A/D converter start request timing operation

12.6 Cooperative operation by the event

12.6.1 Generation of the event signal

The operation of GPT channels can be interlinked by using the interrupt signal generated in one channel as an event signal for another.

The GPT has the following event signals:

- Generating of compare match A interrupt (CCMPAn (n= 0 to 7))
- Generating of compare match B interrupt (CCMPBn (n= 0 to 7))
- Generating of compare match C interrupt (CMPCn (n= 0 to 7))
- Generating of compare match D interrupt (CMPDn (n= 0 to 7))
- Generating of compare match E interrupt (CMPEn (n= 0 to 7))
- Generating of compare match F interrupt (CMPFn (n= 0 to 7))
- Generating of overflow interrupt (OVFn (n= 0 to 7))
- Generating of underflow interrupt (UNFn (n= 0 to 7))

Table 12.21 shows the correspondence between the interrupt request signal and the Event Signal specified by the GTESRn registers.

12.6.2 Operation on event signal

The GPT can perform the following operations in response to a maximum of eight events:

- Start counting, stop counting, clear counting
- Up-counting, down counting
- Input capture.

See section 12.3, Operation for detail on hardware resources.

12.6.3 Example of procedure for setting cooperative action by event

The coordinated operation method is as follows.

1. Configure the operation of event input.
2. Set the interrupt request signals which are the event input in the GTESRn registers.
3. Sets the GTECR.EVCON bit to 1 for enabling all event signals.
4. Activate GPT. As a result, the cooperation action of the event becomes active.
5. To disable the event signal, set the corresponding GTESRn.EVS[6:0] bits to 0000000b. In addition, by making the GTECR.EVCON bit to 0 to disable all of the event signal.

12.7 Noise Filter Function

Each pin for use in input capture to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than three sampling cycles.
The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.
Figure 12.88 shows the timing of noise filtering.

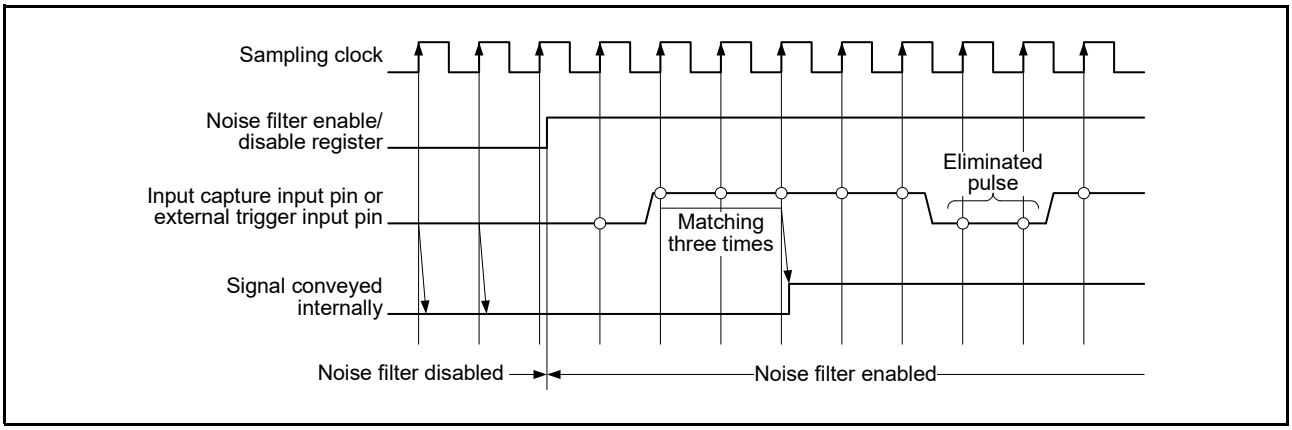

Figure 12.88 Timing of noise filtering

If noise filtering is enabled, the input capture operation or external trigger operation performs on the edges of the noise filtered signal after a delay of a sampling interval × 3 + P1φ. This is caused by the noise filtering for the input capture input or external trigger operation.

12.8 Protection Function

12.8.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:
GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD,GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR.

12.8.2 Disabling of Buffer Operation

If the timing of buffer register write is delayed in relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD setting. Buffer transfer can be temporarily disabled even when a buffer transfer condition is generated during a buffer register write. This can be done by setting the associated GTBER.BD bit to 1 (buffer operation disabled) before a buffer register write and clearing the bit to 0 (buffer operation enabled) after completion of writing to all buffer registers. Figure 12.89 shows an example of operation for disabling buffer operation.

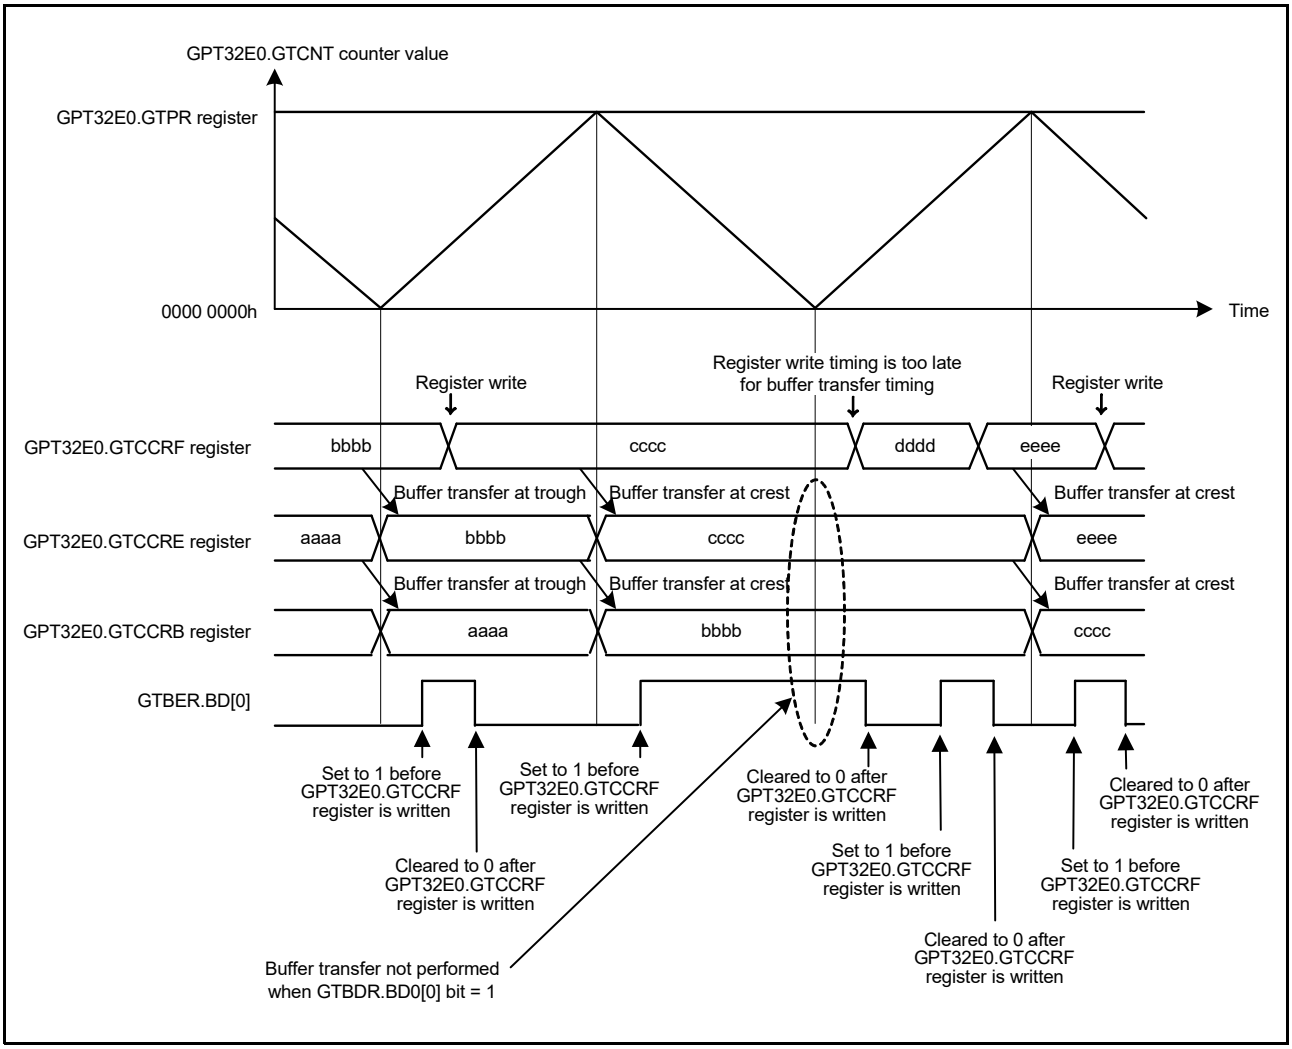

Figure 12.89 Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests

12.8.3 GTIOC Pin Output Negate Control

For protection from system failure, the output disable control that changes the GTIOC pin output value forcibly is provided for GTIOC pin output by the request of output disable from POEG.

When dead time error occurs or the GTIOCA pin output value is the same as the GTIOCB pin output value, output protection is required. GPT detects this condition and generates output disable requests to POEG based on the settings in the output disable request permission bits, such as GTINTAD.GRPDTE, GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG receives output disable requests from each channel and calculates external input using an OR operation, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCA pin and the GTIOCB pin) out of four* output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected disable output request is monitored by reading the GTST.ODF bit. The output level during output disable is based on the GTIOR.OADF[1:0] setting for the GTIOCA pin and the GTIOR.OBDF[1:0] setting for the GTIOCB pin.

The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. The timing of release of the output disable state is a minimum of 3 P1φ cycles after terminating the output disable request. To perform output disable control reliably, allow at least 4 P1φ cycles after generating the output disable request (by clearing the output disable request flag in POEG) until the output disable request is terminated.

When event count is performed or when the output disable state is to be released immediately without waiting for an end of cycle, GTIOR.OADF[1:0] must be set to 00b (for GTIOCA pin) or GTIOR.OBDF[1:0] must be set to 00b (for GTIOCB pin).

Figure 12.90 shows an example of the GTIOC pin output disable control operation.

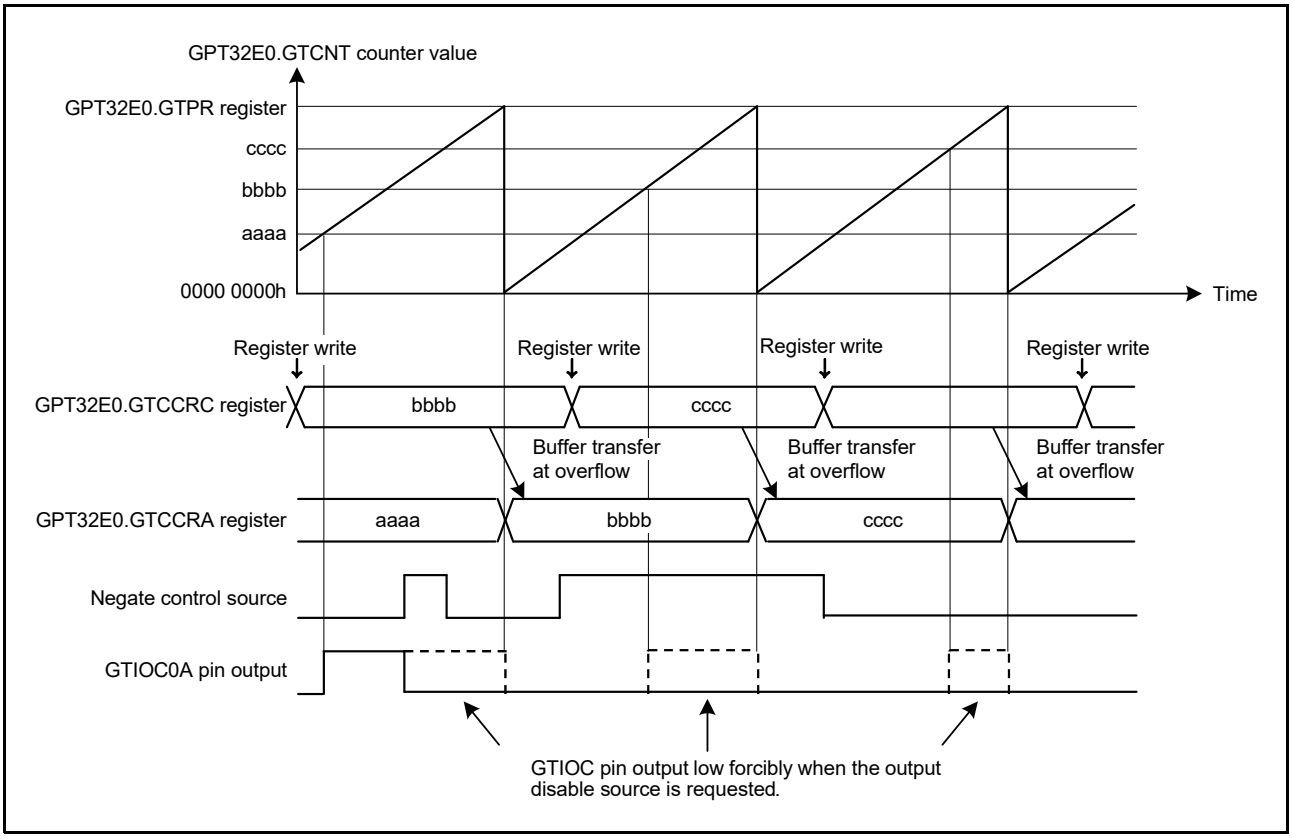

Figure 12.90 Example of GTIOC pin output disable control operation with saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable

12.8.4 Output Protection Function for GTIOC Pin Output

In preparation for incorrect settings of the GTCCRA register (settings outside the range of 0 < GTCCRA < GTPR), the output protection function for the GTIOC pin output (disabling function) is activated when the automatic dead time setting (GTDTCR.TDE = 1) is made in triangle-wave mode. The status of the output protection function can be read from GTSOS.SOS[1:0].

Figure 12.91 shows the output protection function state transition.

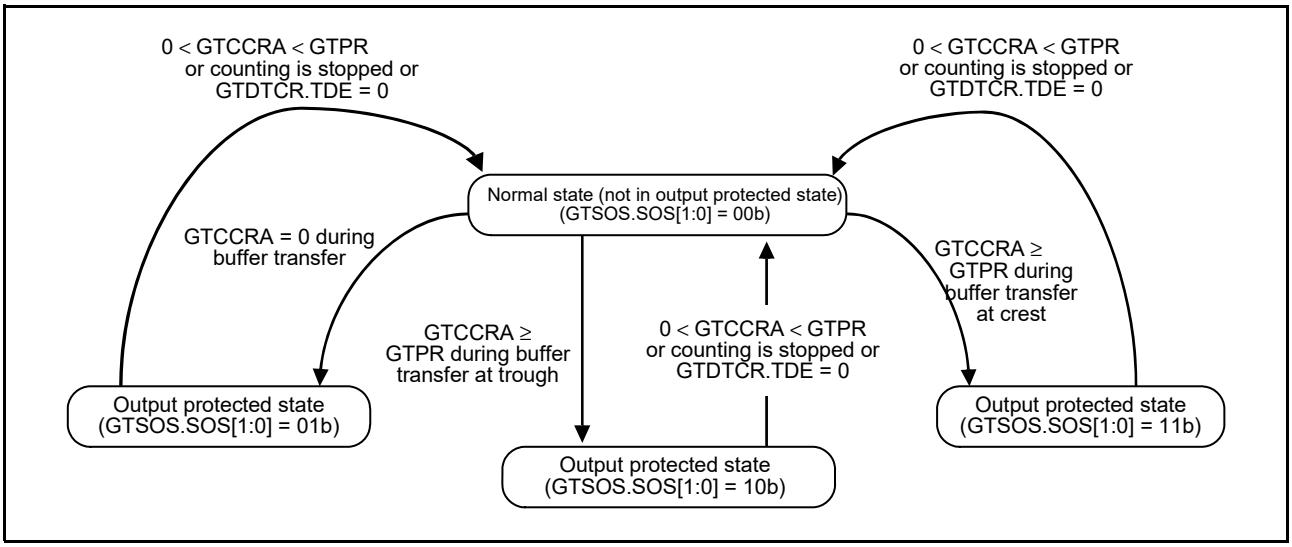

Figure 12.91 Output protection function

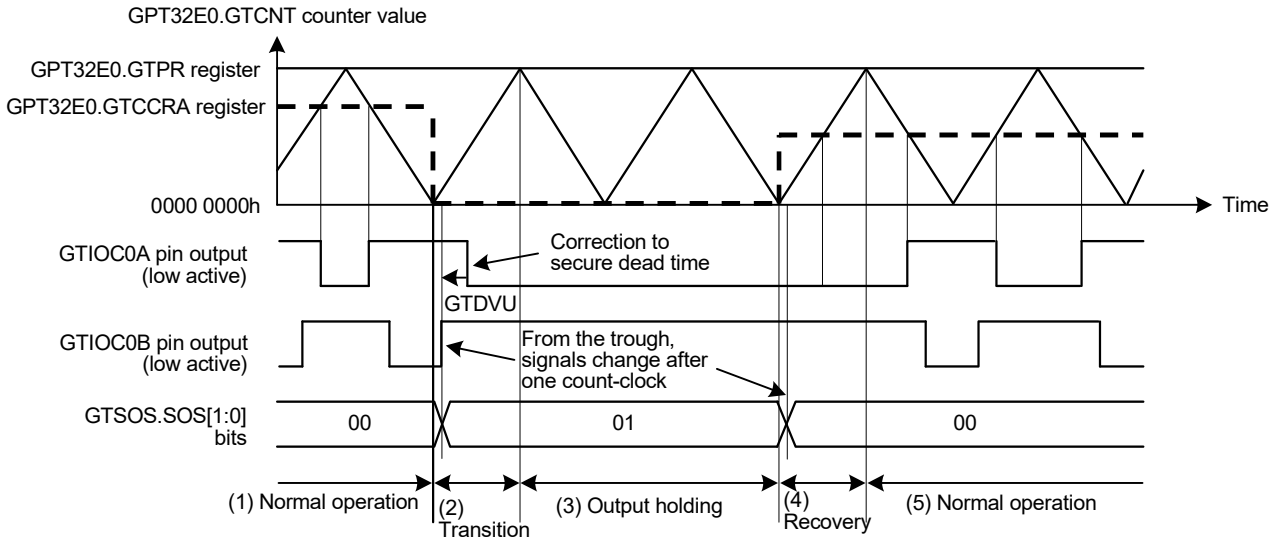
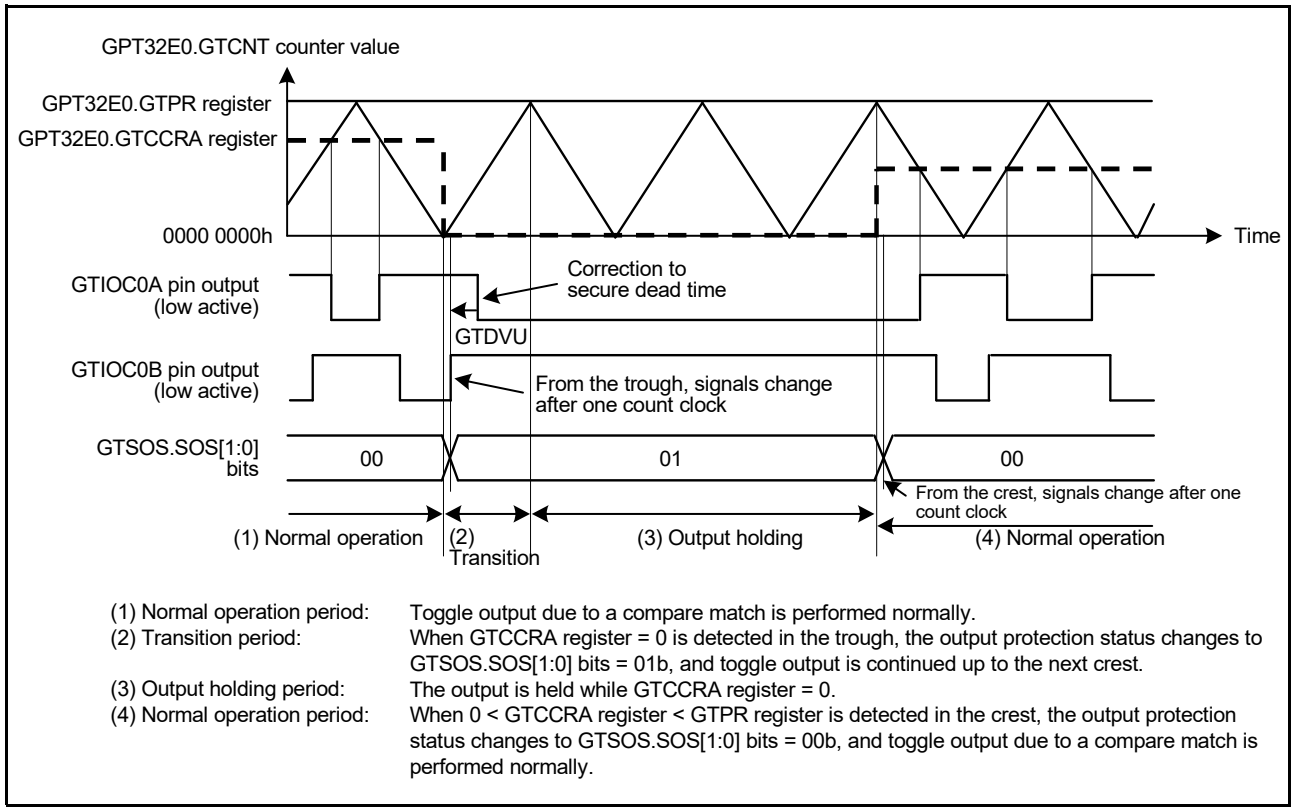
12.8.4.1 Output Protection Function When the GTCCRA Register is Set to 0 during Buffer Transfer

Figure 12.92 and Figure 12.93 show examples of output protection function operation when the GTCCRA register is set to 0 during buffer transfer at troughs, and Figure 12.94 and Figure 12.95 show examples when the GTCCRA register is set to 0 during buffer transfer at crests.



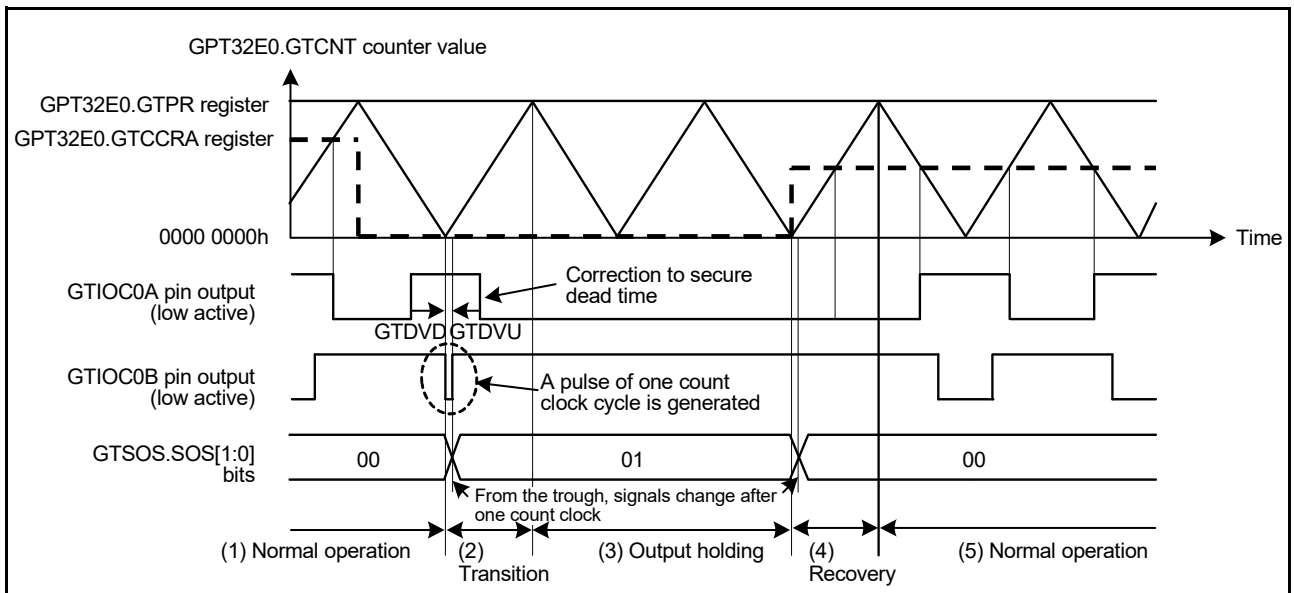
(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest
(3) Output holding period: The output is held while GTCCRA register = 0.
(4) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 12.92 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low



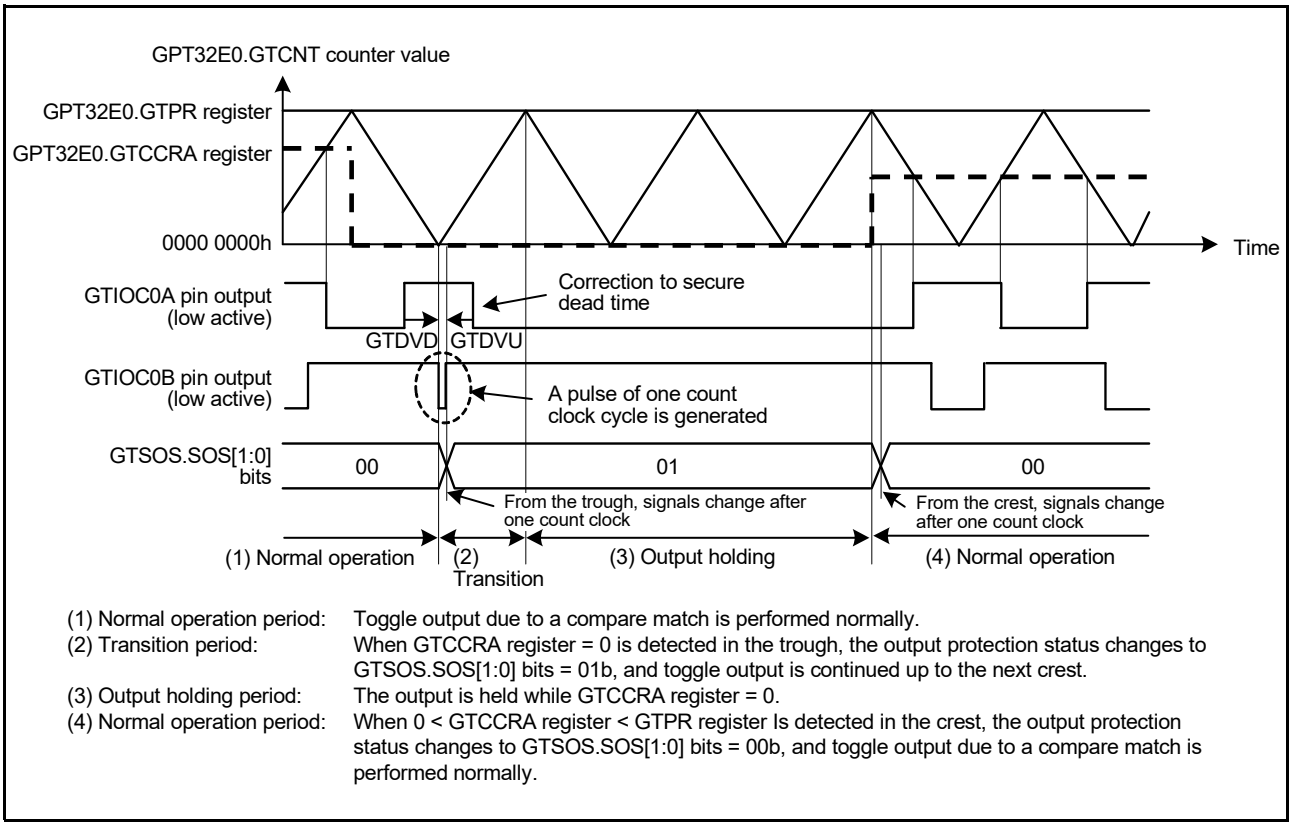
(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA register = 0.
(4) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 12.93 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA register = 0.
(4) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 12.94 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA register = 0.
(4) Normal operation period: When 0 < GTCCRA register < GTPR register Is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 12.95 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low

12.8.4.2 Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Troughs

Figure 12.96 and Figure 12.97 show examples of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs.

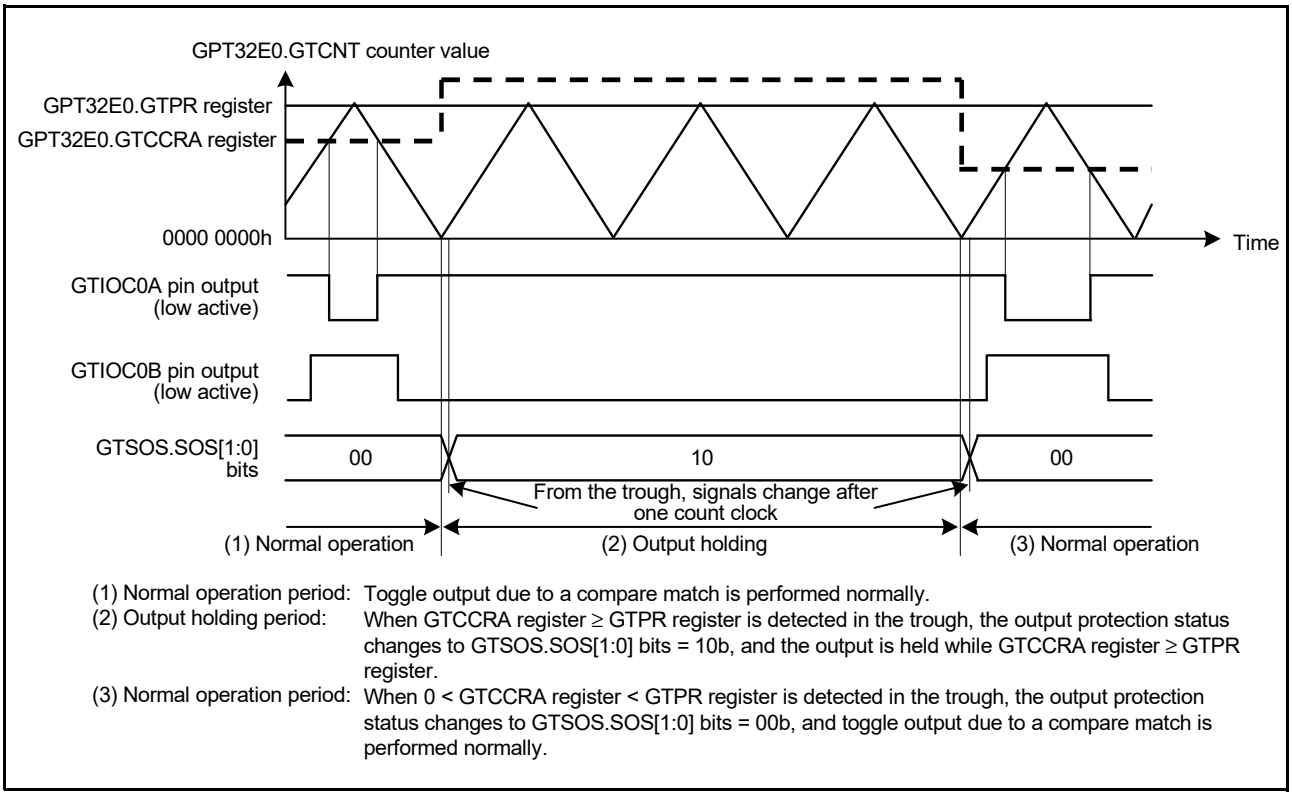


Figure 12.96 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

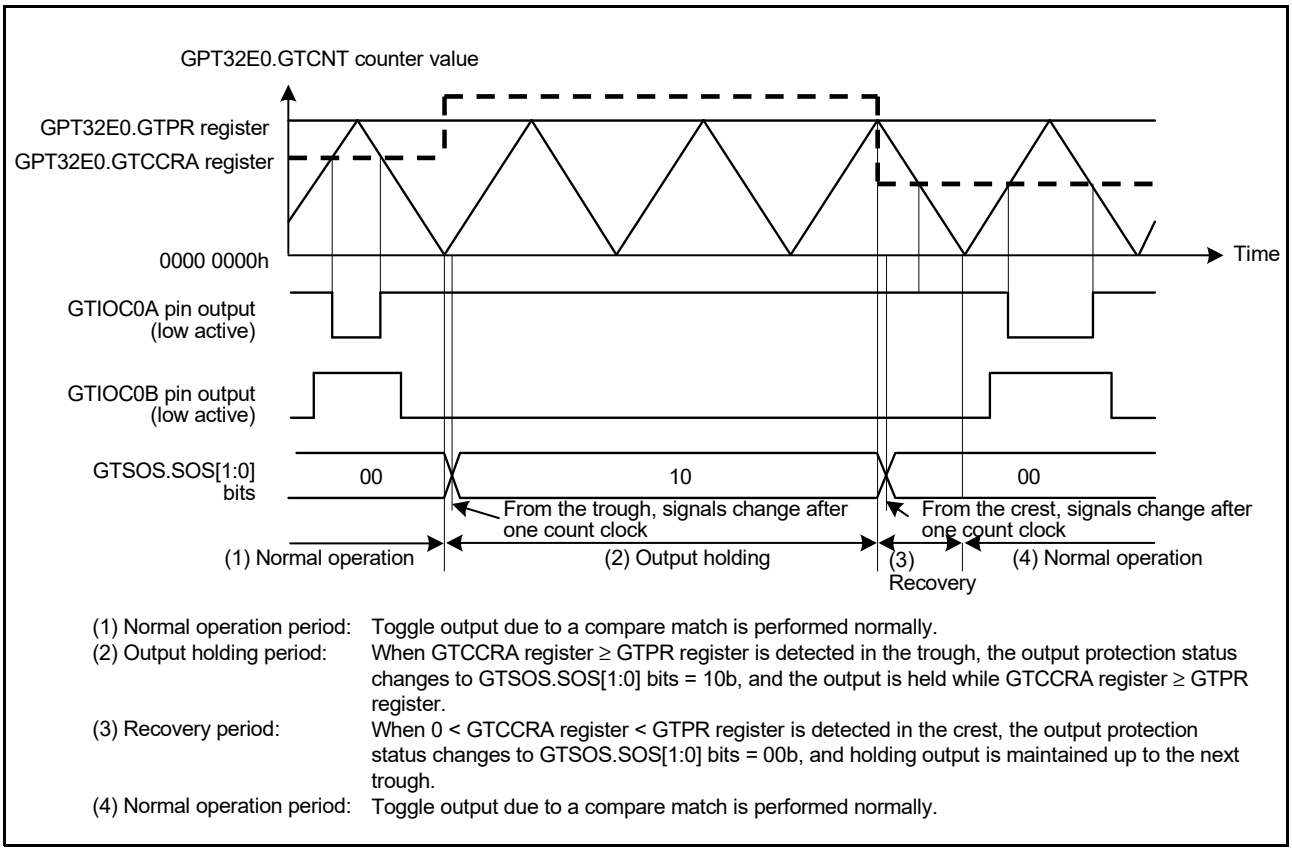

(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next trough.
(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 12.97 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low

12.8.4.3 Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Crests

Figure 12.98 and Figure 12.99 show examples of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at crests.

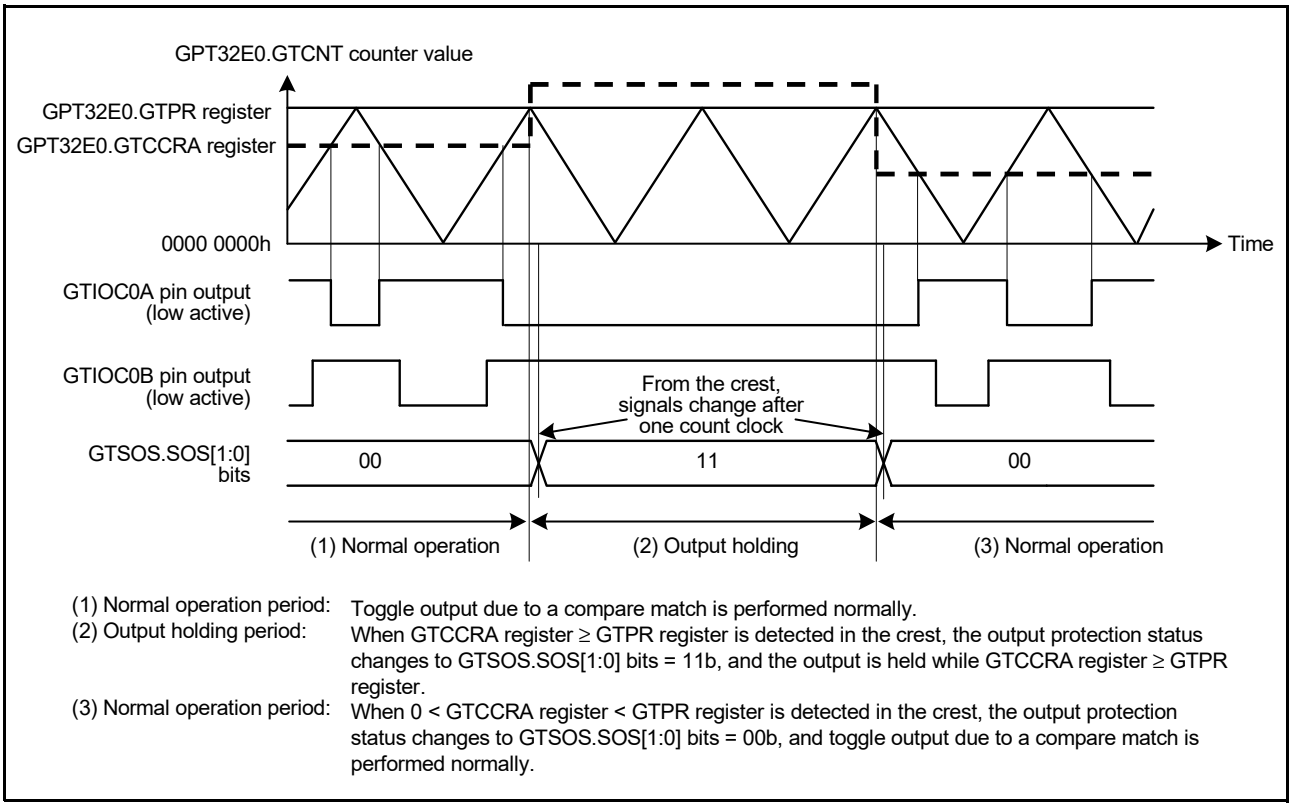

Figure 12.98 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active- low

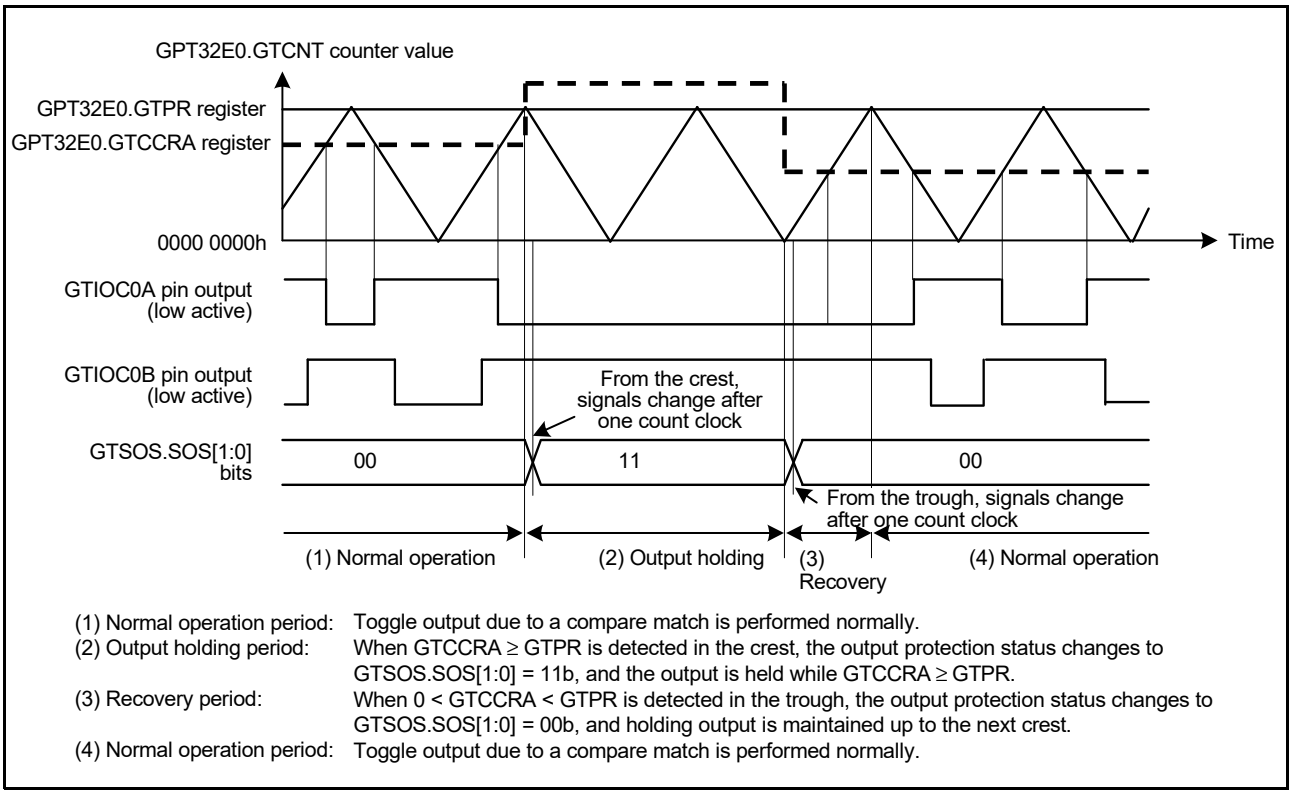

Figure 12.99 Example of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

12.8.4.4 Restricted Specification of Output Protection Function

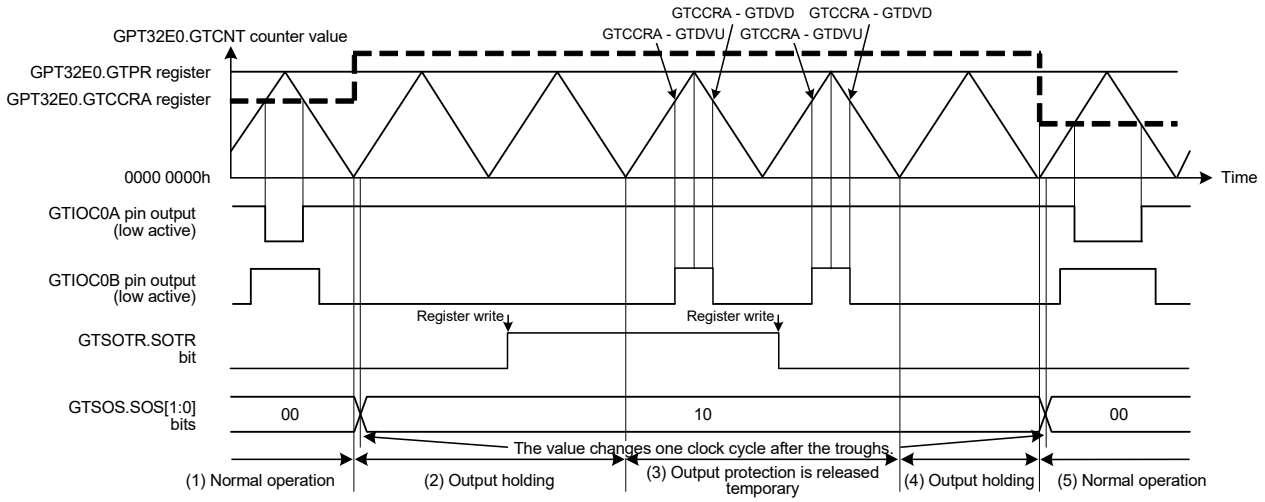
The output protection function deactivates the level of one of the positive and negative outputs, even if an incorrect value is set in the GTCCRA register during counting (a setting outside the range of 0 < GTCCRA < GTPR). However, it will not work properly unless the following conditions are satisfied.

- At count start: The value of the GTCCRA register must be set within the range of (0 < GTCCRA < GTPR).
- During buffer transfer at crest: GTCCRA - GTDVD < GTPR - 1 has to be satisfied..
- During buffer transfer at trough: If GTCCRA ≥ GTPR, GTCCRA - GTDVU > 1 has to be satisfied.

12.8.4.5 Temporary cancellation of Output Protection Function

When the GTSOTR.SOTR bit is set to 1 with GTSOS.SOS[1:0] bits equal to 10b (showing output protection state by GTCCRA ≥ GTPR during buffer transfer at troughs), the output protection function for GTIOCB pin is temporarily canceled. GTSOS.SOS[1:0] bits retain the value of 10b even when the output protection function is canceled. When the SOTR bit is set to 0, the output protection function for GTIOCB pin resumes.

Figure 12.100 shows examples of temporary cancellation of output protection function operation when the GTCCRA ≥ GTPR is set during buffer transfer at troughs.



(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Output holding period:	When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register. If GTSOTR.SOTR is set to 1 during the output holding period, the GTIOCB output is holding until the first trough after the setting.
(3) Output protection releasing period:	After GTSOTR.SOTR is set to 1, the GTIOCB output is performed normally at the first trough after the setting. If GTSOTR.SOTR is set to 0 during the output protection releasing period, the output is holding at the first trough after the setting.
(4) Output holding period:	Until 0 < GTCCRA register < GTPR register is detected in the trough, the output is holding.
(5) Normal operation period:	When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 12.100 Example of temporary cancellation of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

12.9 Initialization Method of Output Pins

12.9.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port mode, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.

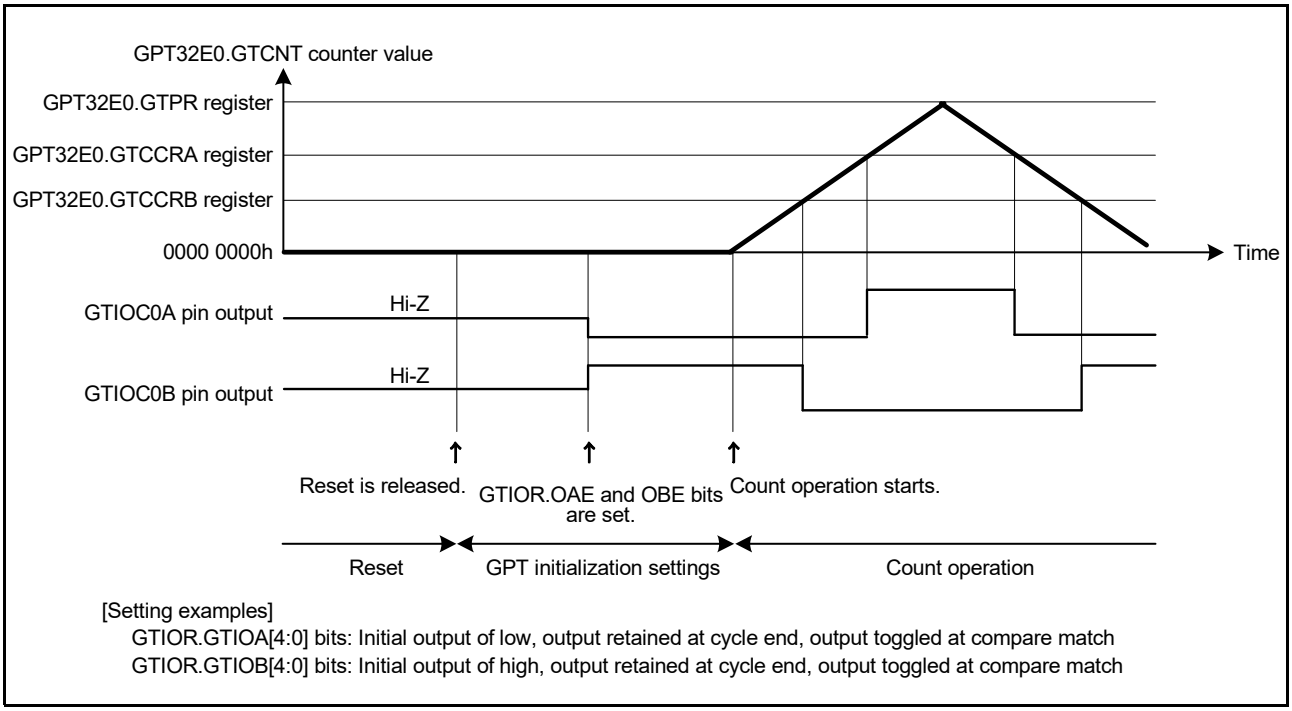


Figure 12.101 Example of pin settings after reset

12.9.2 Pin Initialization Caused by Error during Operation

If an error occurs during GPT operation, the following four types of pin processing can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop.
- Set the OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values in OADFLT and OBDFLT in GTIOR, and output the arbitrary values on count stop.
- Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR, and PMR registers of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0 and the control bit associated with the pin in the PMR to 0, to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

When the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting resumes, operation continues from where it stops. If counting stops, registers must be initialized before counting starts.

12.10 Usage Notes

12.10.1 Settings for the Module-Stop Function

GPT operation can be disabled or enabled using the standby control register. The GPT module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 52, Power-Down Modes.

12.10.2 GTCCRn Settings during Compare Match Operation (n = A to F)

(1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRA register must satisfy the following conditions: GTDVU < GTCCRA, GTDVD < GTCCRA, and GTCCRA < GTPR.
When the setting of GTCCRA = 0 or GTCCRA ≥ GTPR is made during count operation, the output protection function is activated.
However, it will not work properly unless the following conditions are satisfied.

- At count start: The value of the GTCCRA register must be set within the range of (0 < GTCCRA < GTPR).
- During buffer transfer at crest: GTCCRA - GTDVD < GTPR - 1 has to be satisfied..
- During buffer transfer at through: If GTCCRA ≥ GTPR, GTCCRA - GTDVU > 1 has to be satisfied.

For details, see section 12.8.4, Output Protection Function for GTIOC Pin Output.

(2) When automatic dead time setting is not made in triangle-wave PWM mode

The GTCCRA register must be set within the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. When GTCCRA > GTPR, no compare match occurs.
Similarly, GTCCRB must be set within the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. When GTCCRB > GTPR, no compare match occurs.

(3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following constraints. If the constraints are not satisfied, correct output waveforms with secured dead time might not be obtained.

- In up-counting: GTCCRC < GTCCRD, GTCCRC > GTDVU, GTCCRD < GTPR - GTDVD
- In down-counting: GTCCRC > GTCCRD, GTCCRC < GTPR – GTDVU, GTCCRD > GTDVD

(4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following constraints. If the constraints are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRC < GTCCRD < GTPR
- In down-counting: GTPR > GTCCRC > GTCCRD > 0

Similarly, GTCCRE and GTCCRF must be set to satisfy the following constraints. If the constraints are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRE < GTCCRF < GTPR
- In down-counting: GTPR > GTCCRE > GTCCRF > 0

(5) In saw-wave PWM mode

The GTCCRA register must be set with the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. If GTCCRA > GTPR is set, no compare match occurs.
Similarly, GTCCRB must be set with the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRB = GTPR is set, a

compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. If GTCCRB > GTPR is set, no compare match occurs.

12.10.3 Setting Range for the GTCNT Counter

The GTCNT counter register must be set with the range of 0 ≤ GTCNT ≤ GTPR.

12.10.4 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the GTCNT counter by the GTCR.CST bit synchronizes the count clock that is selected in GTCR.TPCS[2:0]. When GTCR.CST is updated, the GTCNT counter starts/stops after a count clock that is selected in GTCR.TPCS[2:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored. Note, however, that an event might be accepted or an interrupt might occur after the GTCR.CST bit is set to 0.

12.10.5 Priority On Conflicts

(1) GTCNT register

Table 12.22 shows a priority order of events updating GTCNT register.

Table 12.22 Priority order of sources updating GTCNT

Source updating GTCNT	Priority order
Writing by CPU (Writing to GTCNT/GTCLR)	High ↑
Clear by hardware sources set in GTCSR	
Count up or down by hardware sources set in GTUPSR/GTDNSR	
Count operation	Low

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

(2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), writing by CPU has a priority over starting/stopping by hardware sources.
When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. Where there is a conflict between updating the GTCR.CST bit and reading by the CPU, pre-update data is read.

(3) GTCCRn registers (n = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to GTCCRn registers, writing to GTCCRn registers has a priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. Where there is a conflict between updating the GTCCRn registers and reading by the CPU, pre-update data is read.

(4) GTPR registers

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has

a priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

(5) GTADTRn registers (n = A, B)

When there is a conflict between buffer transfer operation and writing to the GTADTRn registers, writing to the GTADTRn registers has priority over buffer transfer operation. Where there is a conflict between updating GTADTRn registers and reading by the CPU, pre-update data is read.

(6) GTDVn registers (n = U, D)

When there is a conflict between buffer transfer operation and writing to GTDVn registers, writing to GTDVn registers has priority over buffer transfer operation. When there is a conflict between updating GTDVn registers and reading by the CPU, pre-update data is read.

13. Port Output Enable for GPT (POEG)

13.1 Overview

The output pins of the general PWM timer (GPT) can be disabled by using the port output enabling function for the GPT (POEG). Specifically, either of the following ways can be used.

- Input level detection of the GTETRGA to GTETRGD pins
- Output-disable request from the GPT
- Register settings

The GTETRGA to GTETRGD pins can also be used as GPT external trigger input pins.
Table 13.1 lists the POEG specifications, Figure 13.1 shows the block diagram, and Table 13.2 lists the input pins.

Table 13.1 POEG specifications

Parameter	Specifications
Output-disable control through input level detection	GPT output pins can be disabled when a GTETRGA to GTETRGD rising edge or high level is sampled after polarity and filter selection
Output-disable request from the GPT	• When the GTIOCA pin and the GTIOCB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCA and GTIOCB pins are output-disabled • GPT output pins can be set to be disabled when the GPT output pins detect a dead time error or short circuit detection between the output terminals
Output-disable control by software (registers)	GPT output pins can be disabled by modifying the register settings
Interrupt	• Allows output-disable control by input level detection • Allows output-disable requests from the GPT
External trigger output to the GPT (count start, count stop, count clear, up-count, down-count, or input capture function)	GTETRGA to GTETRGD signals can be output to the GPT after polarity and filter selection
Noise filtering	• Three times sampling for every P1φ1, P1φ8, P1φ32, or P1φ128 can be set for any of the input pins GTETRGA to GTETRGD • Positive or negative polarity can be selected for any of the input pins, GTETRGA to GTETRGD • Signal state after polarity and filter selection can be monitored

GTETRGn (n = A to D) in the subsequent descriptions indicates the GTETRGA to GTETRGD pins. The signal input from each of the pins corresponds to the POEGGn register for which n matches the n of the pin.

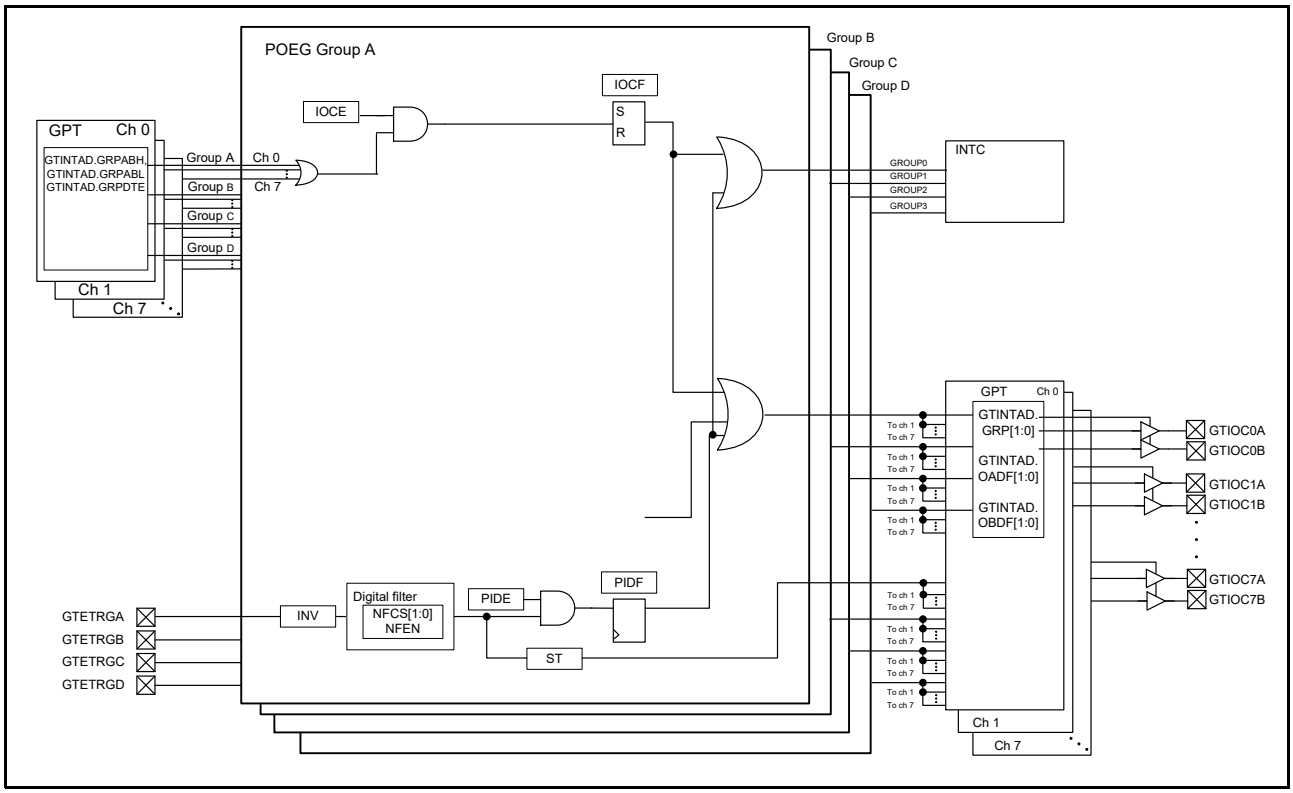

Figure 13.1 POEG block diagram

Table 13.2 POEG input pins

Pin name	I/O	Description
GTETRGA	Input	GPT output pin output-disable request signal and GPT external trigger input pin A
GTETRGB	Input	GPT output pin output-disable request signal and GPT external trigger input pin B
GTETRGC	Input	GPT output pin output-disable request signal and GPT external trigger input pin C
GTETRGD	Input	GPT output pin output-disable request signal and GPT external trigger input pin D

13.2 Register Descriptions

Table 13.3 shows the register configuration.

Table 13.3 Register configuration

Register Name	Abbreviation	Address	Access size
POEG group A setting register	POEGGA	H'E804_4000	32

Note 1. Only 0 can be written, to clear the flag.
Note 2. Can be modified only once after a reset.

The POEGGA to POEGGD registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT. In the descriptions, POEGGn represents all of the POEGGA to POEGGD registers.

13.3 Output-Disable Control Operation

The output of the GTIOCxA and GTIOCxB pins can be disabled when any of the following conditions are satisfied.

- Input level or edge detection of the GTETRGn pins
  When POEGGn.PIDE is 1, the POEGGn.PIDF flag is set to 1.
- Output-disable request from the GPT
  When POEGGn.IOCE is 1, the POEGGn.IOCF flag is set to 1.
  The output-disable requests enabled by GRPDTE, GRPABH, and GRPABL bits of the GTINTAD register in the GPT are applied to the group selected by GRP[1:0] bits of the GTINTAD register.
- SSF bit setting
  When POEGGn.SSF is set to 1.

The state of the GTIOCxA and the GTIOCxB pins when the output is disabled is controlled by the GPT module. For details, see the descriptions of the GTINTAD.GRP[1:0], GTIOR.OADF[1:0], and GTIOR.OBDF[1:0] bits of the general PWM timer (GPT).

13.3.1 Pin Input Level Detection Operation

If the input conditions set in POEGGn.PIDE, POEGGn.NFCS[1:0], POEGGn.NFEN, and POEGGn.INV occur on the GTETRGn pins, the GPT output pins are output-disabled.

13.3.1.1 Digital Filter

Figure 13.2 shows high-level detection by the digital filter. When a high level associated with the POEGGn.INV polarity setting is detected three times consecutively with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not being output, changes of the levels on the GTETRGn pins are ignored.

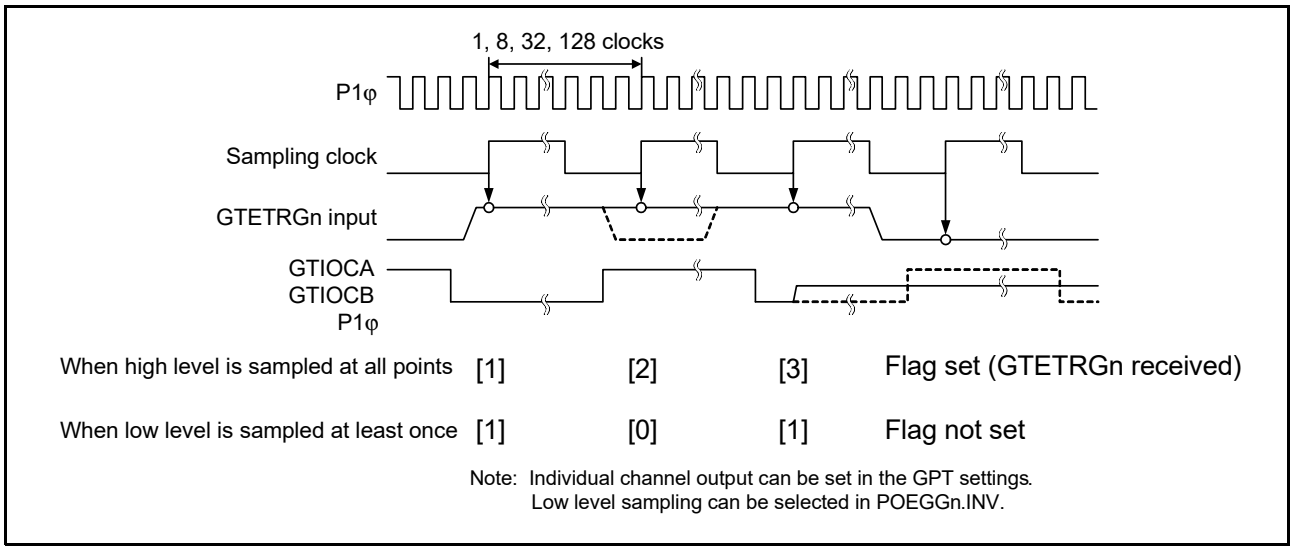

Figure 13.2 Example of digital filter operation

13.3.2 Output-Disable Requests from the GPT

For details on this operation, see the description of section 12.8.3, GTIOC Pin Output Negate Control in section 12, General PWM Timer (GPT).

13.3.3 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing to the software stop flag, POEGGn.SSF.

13.3.4 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all of the following:

- POEGGn.PIDF flag
- POEGGn.IOCF flag
- POEGGn.SSF flag.

Writing 0 to the POEGGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRGn, are not disabled and the POEGGn.ST bit is not set to 0.
Writing 0 to the POEGGn.IOCF flag is valid (the flag is cleared) only if all of the GTST.DTEF, GTST.OABHF, and GTST.OABLF flags in the GPT are set to 0.
Figure 13.3 shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.

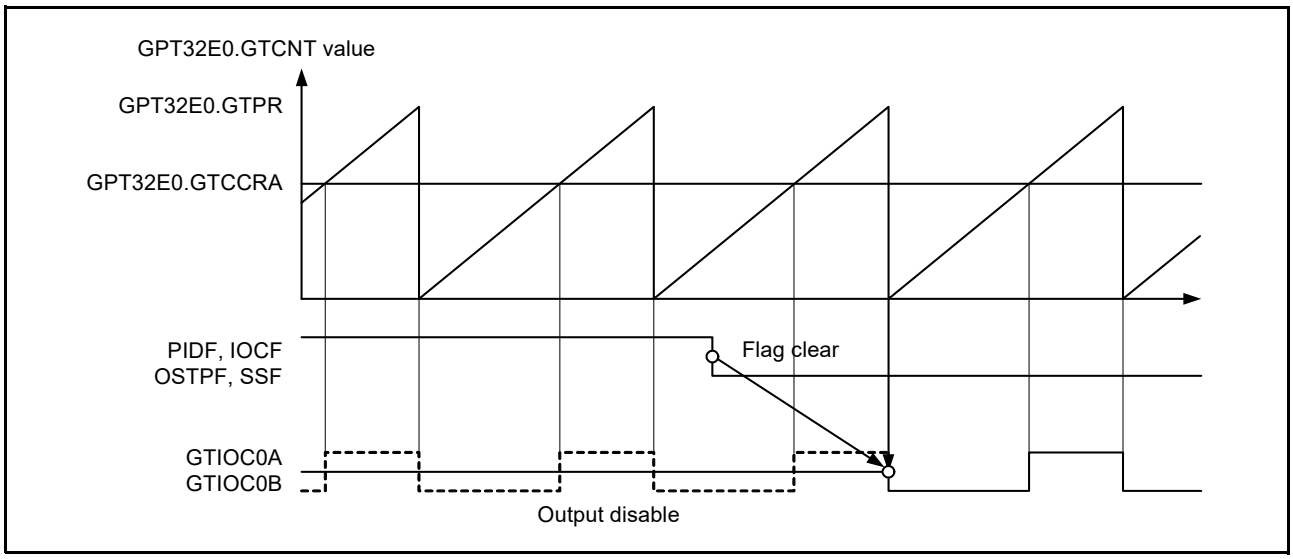

Figure 13.3 Output-disable release timing for GPT pin outputs

13.4 Interrupt Sources

The POEG generates an interrupt request when triggered by these sources:

- Output-disable control by input level detection
- Output-disable request from the GPT
- Output-disable control by the registers.

Table 13.4 lists the conditions for interrupt requests.

Table 13.4 Interrupt sources and conditions

Interrupt source	Symbol	Associated flag	Trigger conditions
POEG group A interrupt	GROUP0	POEGGA.IOCF	Output-disable request from a GPT disable request occurred
		POEGGA.PIDF	Output-disable request from the GTETRGA pin occurred
POEG group B interrupt	GROUP1	POEGGB.IOCF	Output-disable request from a GPT disable request occurred
		POEGGB.PIDF	Output-disable request from the GTETRGB pin occurred
POEG group C interrupt	GROUP2	POEGGC.IOCF	Output-disable request from a GPT disable request occurred
		POEGGC.PIDF	Output-disable request from the GTETRGC pin occurred
POEG group D interrupt	GROUP3	POEGGD.IOCF	Output-disable request from a GPT disable request occurred
		POEGGD.PIDF	Output-disable request from the GTETRGD pin occurred

13.5 External Trigger Output to the GPT

The POEG outputs the GTETRGn signals to the GPT as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear
- Up-count
- Down-count
- Input capture.

For the POEGGn.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, that value is output. Set the control registers the same as for the input level detection operation described in section 13.3.1, Pin Input Level Detection Operation. The state after filtering can be monitored in POEGGn.ST.

Figure 13.4 shows the output timing of an external trigger to the GPT.

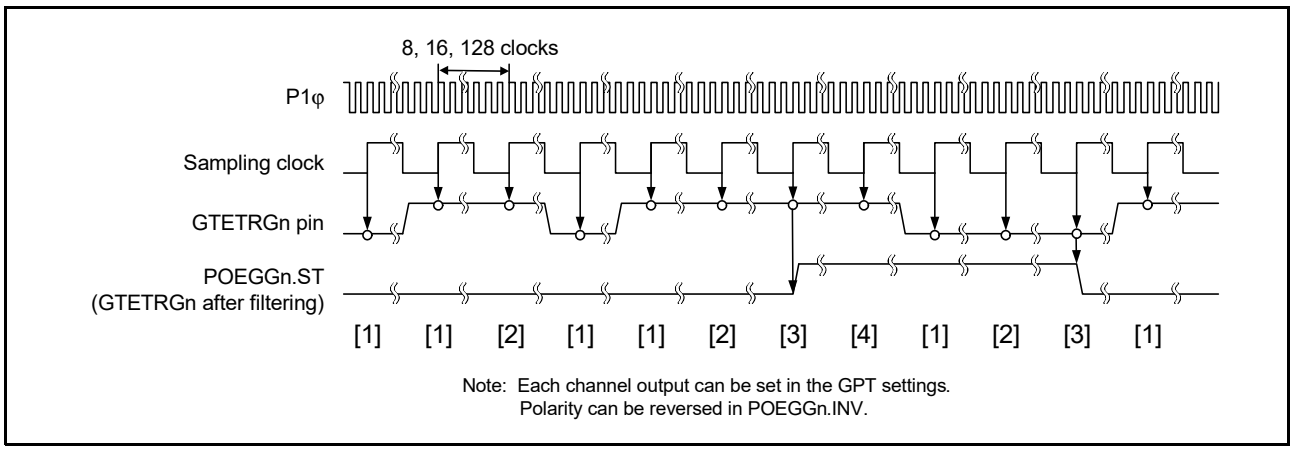

Figure 13.4 Output timing of external trigger to GPT

13.6 Usage Notes

13.6.1 Transition to Software Standby Mode

Do not invoke the Software Standby mode when using the POEG. In this mode, the POEG stops and therefore output-disable of the pins cannot be controlled.

13.6.2 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PMR register and PmnPFS.PSEL settings. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

14. OS Timer

14.1 Functional Overview

The OS timer has the following features.

- Two operating modes
  - Interval timer mode
  - Free-running comparison mode
- Choice between startup of DMA by compare match and generation of interrupt

14.1.1 Features of OSTM

Channels

This product has the following number of channels of the OS timer.

Table 14.1 Channels of OS Timer

OS Timer	
Number of Channels	3
Name	OSTMn

Note: n = 0, 1, 2

Meaning of n

Throughout this section, the individual channels of the OS timer are identified by the index "n" (n = 0, 1, 2), for example OSTMnTO for the OS timer n output register.

Register address

The register addresses of the OS timer are given as offsets from the individual base addresses <OSTMn_base>.
The register base addresses of each OSTMn are listed in the following table.

Table 14.2 Register Base Addresses

Base Address Name	Base Address
<OSTM0_base>	$E803\_B000_H$
<OSTM1_base>	$E803\_C000_H$
<OSTM2_base>	$E803\_D000_H$

Interrupts

The OS timers can generate the following interrupt requests.

Table 14.3 OSTMn Interrupt Requests

OSTMn Signal	Function	Startup of Direct Memory Access Controller
OSTM0TINT	OSTM0 interrupt	√
OSTM1TINT	OSTM1 interrupt	√
OSTM2TINT	OSTM2 interrupt	√

14.2 Registers

The OS timer is controlled by the following registers.

14.2.1 Registers Overview

The list of OSTMn (n = 0, 1, 2) registers and the memory addresses are as follows.
For the base addresses, see Table 14.2.
For the actual addresses, the offset values indicated in the following table are added to the base addresses.

Register Name	Function	R/W	Reset Value	Access Unit (bit) 8	16	32	Address
OSTMnCMP	OSTM compare register	R/W	$0000\ 0000_H$	—	—	√	<OSTMn_base> + 00_H
OSTMnCNT	OSTM counter register	R	$FFFF\ FFFF_H$	—	—	√	<OSTMn_base> + 04_H
OSTMnTE	OSTM count enable status register	R	00_H	√	—	—	<OSTMn_base> + 10_H
OSTMnTS	OSTM count start trigger register	W	00_H	√	—	—	<OSTMn_base> + 14_H
OSTMnTT	OSTM count stop trigger register	W	00_H	√	—	—	<OSTMn_base> + 18_H
OSTMnCTL	OSTM control register	R/W	00_H	√	—	—	<OSTMn_base> + 20_H

14.2.2 Details of OSTM Registers

14.2.2.1 OSTMnCMP — OSTM Compare Register

Depending on the mode of operation, this register holds the start value for the down-counter or the value for comparison with that of the counter.

Access: This register is readable/writable in 32-bit units.
Address: <OSTMn_base>
Initial value: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCMP[31:16]															
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCMP[15:0]															
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 14.4 Contents of the OSTMnCMP Register

Bit Position	Bit Name	Function
31 to 0	OSTMnCMP[31:0]	• In interval timer mode: start value of the down-counter • In free-running comparison mode: value for comparison

14.2.2.2 OSTMnCNT — OSTM Counter Register

This register indicates the counter value of the timer.

Access: This register is readable in 32-bit units.
Address: OSTMn_base> + 4_H
Initial value: The initial value depends on the operating mode of the OS timer. Refer to Table 14.6.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCNT[31:16]															
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCNT[15:0]															
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.5 Contents of the OSTMnCNT Register

Bit Position	Bit Name	Function
31 to 0	OSTMnCNT[31:0]	32-bit counter value

The following table shows the correspondence between operating mode, counting direction and initial value. The initial value is the value read from the counter after a change to the operating mode.

Table 14.6 Correspondence between Operating Mode, Counting Direction and Initial Value

Timer Operating Mode	OSTMnCTL.OSTMnMD1	Counting Direction	Initial value
Interval timer mode	0 *1	Down	FFFF FFFF$_H$
Free-running comparison mode	1	Up	0000 0000$_H$

Note 1. Value after reset

14.2.2.3 OSTMnTE — OSTM Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

Access: This register is readable in 8-bit units.
Address: <OSTMn_base>+ 10_H
Initial value: 00_H

Bit:	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	OSTMnTE
R/W:	R	R	R	R	R	R	R	R

Table 14.7 Contents of the OSTMnTE Register

Bit Position	Bit Name	Function
7 to 1	Reserved	Reserved These bits are always read as 0. The write value should always be 0.
0	OSTMnTE	This bit indicates whether the counter is enabled or disabled. 0: Counter disabled 1: Counter enabled This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1. This bit is reset to 0 in response to OSTMnTT.OSTMnTT being set to 1.

Note: When OSTMnTE = 0, the counter retains its value.
If the counter is restarted, it
- restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
- restarts counting up from the counter value 0000 0000_H if it is in free running comparison mode.

14.2.2.4 OSTMnTS — OSTM Count Start Trigger Register

This register starts the counter.

Access: This register is writable in 8-bit units. It is always read as 00_H.
Address: <OSTMn_base>+ 14_H
Initial value: 00_H

Bit:	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	OSTMnTS
R/W:	R	R	R	R	R	R	R	W

Table 14.8 Contents of the OSTMnTS Register

Bit Position	Bit Name	Function
7 to 1	Reserved	Reserved These bits are always read as 0. The write value should always be 0.
0	OSTMnTS	This bit starts the counter. 0: This setting has no effect. 1: Starts the counter and sets OSTMnTE.OSTMnTE = 1. • In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1. • In free-running comparison mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1.

14.2.2.5 OSTMnTT — OSTM Count Stop Trigger Register

This register stops the counter.

Access: This register is writable in 8-bit units. It is always read as 00_H.

Address: <OSTMn_base>+ 18_H

Initial value: 00_H

Bit:	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	OSTMnTT
R/W:	R	R	R	R	R	R	R	W

Table 14.9 Contents of the OSTMnTT Register

Bit Position	Bit Name	Function
7 to 1	Reserved	Reserved These bits are always read as 0. The write value should always be 0.
0	OSTMnTT	Stops the counter. 0: This setting has no effect. 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit.

14.2.2.6 OSTMnCTL — OSTM Control Register

This register specifies the operating mode for the counter and controls enabling/disabling of OSTMnTINT interrupt requests when counting starts.

Access: This register is readable/writable in 8-bit units. Writing to this register is only possible if the counter is disabled (OSTMnTOE.OSTMnTOE = 0).

Address: <OSTMn_base>+ 20_H

Initial value: 00_H

Bit:	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	OSTMnMD1	OSTMnMD0
R/W:	R	R	R	R	R	R	R/W	R/W

Table 14.10 Contents of the OSTMnCTL Register

Bit Position	Bit Name	Function
7 to 2	Reserved	Reserved These bits are always read as 0. The write value should always be 0.
1	OSTMnMD1	Specifies the operating mode for the counter. 0: Interval timer mode 1: Free-running comparison mode
0	OSTMnMD0	Controls enabling/disabling of OSTMnTINT interrupt requests when counting starts. 0: Disables the interrupts when counting starts. 1: Enables the interrupts when counting starts.

14.3 Functional Description

Each OS timer is a 32-bit timer/counter.
The settings for operating mode specify the direction of counting (up or down) and the generation of interrupt requests.

14.3.1 Block Diagram

The following block diagram shows the main components of OSTM.

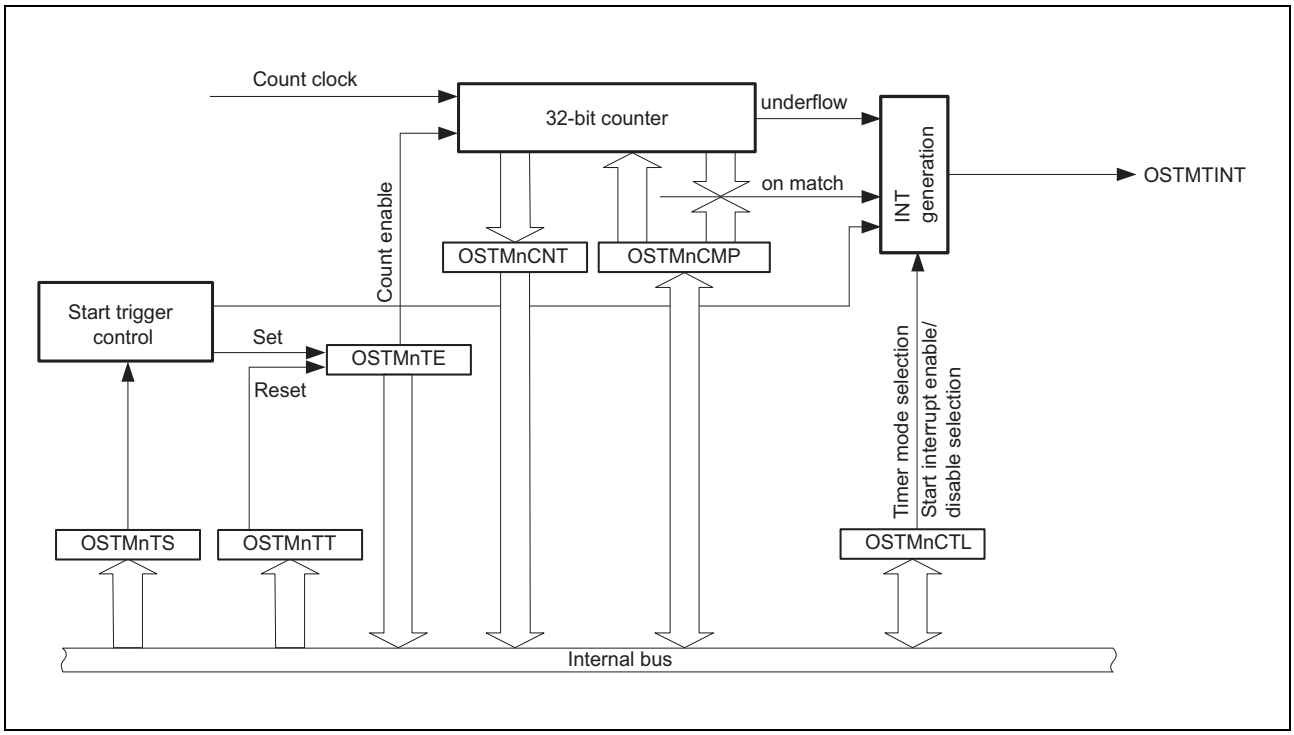

Figure 14.1 Block Diagram of OSTM

14.3.2 Count Clock

The count clock of OSTMn is P1φ.

14.3.3 Generation of Interrupt Request

An OSTMnTINT interrupt request is generated whenever the counter reaches 0000 0000_H (in interval timer mode) or matches the comparison value (in free-running comparison mode).
An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.
This operation is shown in the following figure.

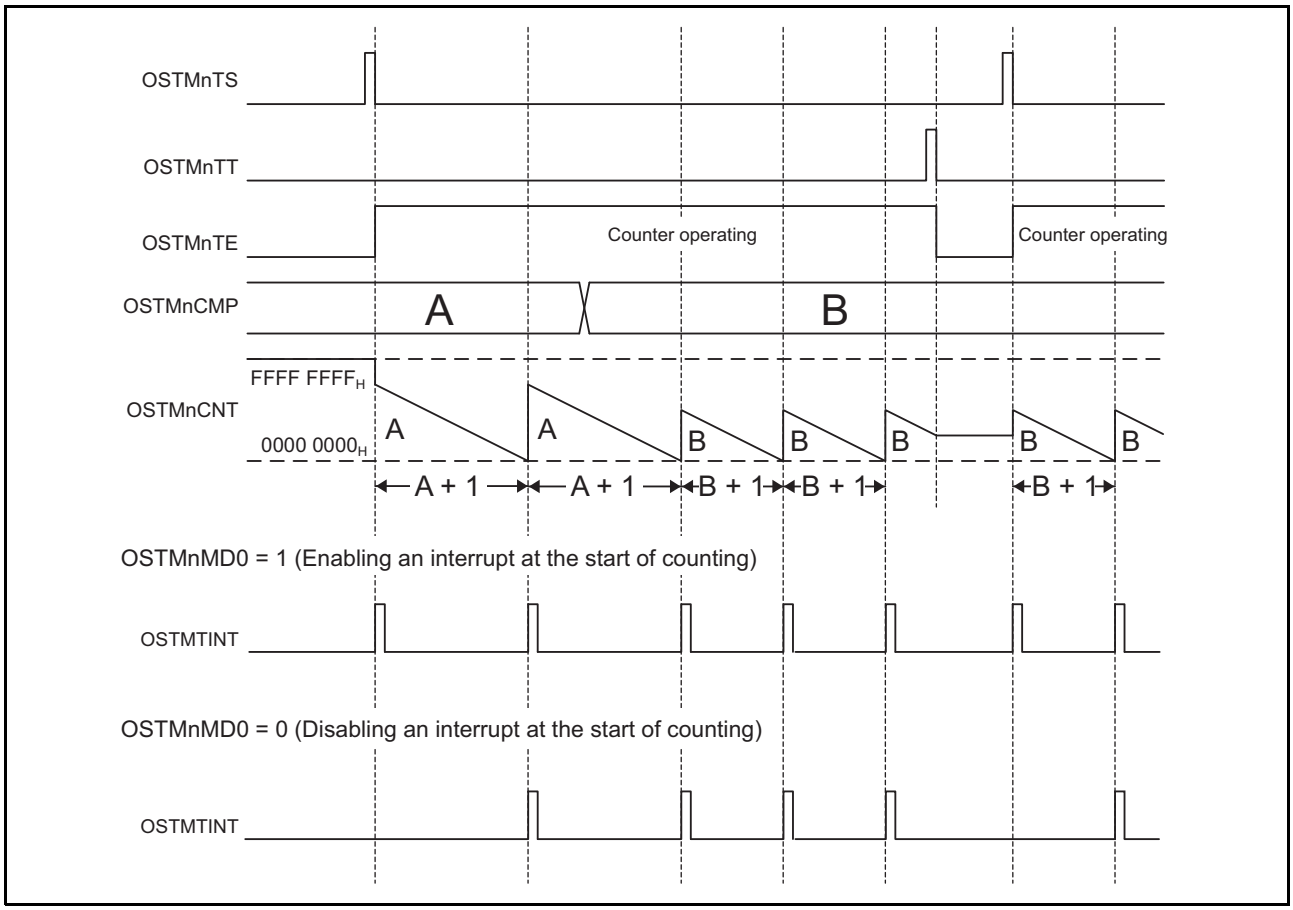

Figure 14.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

14.3.4 Starting and Stopping the Timer

The OS timer is started and stopped as follows.

Starting the timer

The timer is started in either of the following way:

- setting the OSTMnTS.OSTMnTSF bit to 1

Status bit OSTMnTE.OSTMnTE is set to 1.
The counter starts to count up or down in accord with the settings for operating mode.

Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops the timer.
This also clears the OSTMnTE.OSTMnTE status flag.

14.3.5 Interval Timer Mode

Select the interval timer mode when an OS timer is to be used as a reference timer for generating interrupt requests at a fixed interval.

14.3.5.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMnTINT interrupt request is generated when the counter reaches 0000 0000_H.
Select interval timer mode by setting OSTMnCTL.OSTMnMD1 = 0.
New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next 0000 0000_H is reached.

Cycles of OSTMnTINT output

The cycle of OSTMnTINT output is as follows.

- OSTMnTINT generation cycle = counter-clock cycle × (OSTMnCMP + 1)

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode.

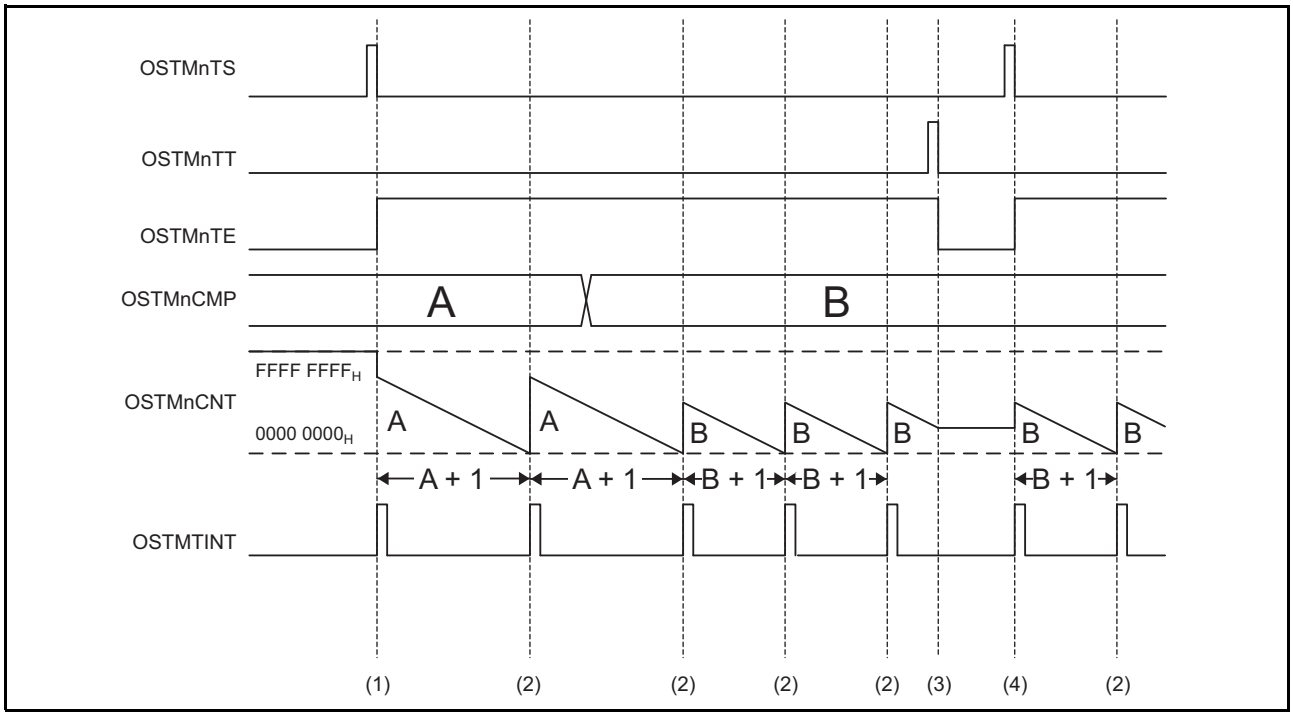

Figure 14.3 Timing Diagram of OSTM in Interval Timer Mode

The timing diagram above shows the following:

1. The counter starts counting when OSTMnTS.OSTMnTS = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
   The counter starts counting down from the value of OSTMnCMP.
   If OSTMnCTL.OSTMnMD0 is 1, OSTMTINT interrupt requests are generated at the start of counting. The OSTMnCNT register contains the current value as the counter.
2. When the counter reaches 0000 0000_H, an OSTMTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.
3. When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
4. When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

Forced restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 during counting.
The counter loads the start value from the OSTMnCMP register and continues to count down.
The following figure shows the forced restart of the OS Timer in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1).

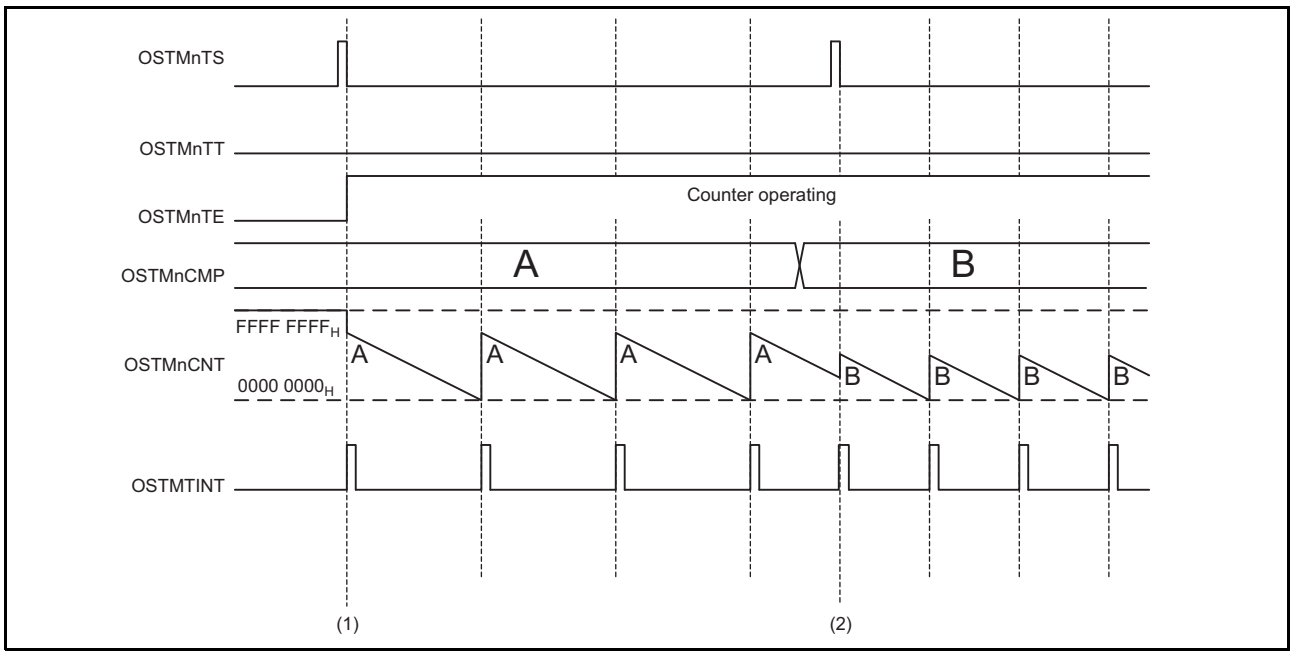

Figure 14.4 Timing Diagram of Forced Restart in Interval Timer Mode

Operations shown in the above timing diagram are as follows.

1. The counter is started and stopped as described under Figure 14.3, Timing Diagram of OSTM in Interval Timer Mode.
2. Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
   The counter immediately restarts counting down, starting with the current value of OSTMnCMP.
   When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated when counting starts.

14.3.5.2 Operation when OSTMnCMP = 0000 0000_H

When OSTMnCMP = 0000 0000_H, OSTM behaves as follows.

- When the counter is enabled, the OSTMTINT interrupt request is always set to 1.

The following figure shows operations of OSTM when OSTMnCMP = 0000 0000_H, and counter-start interrupts are enabled.

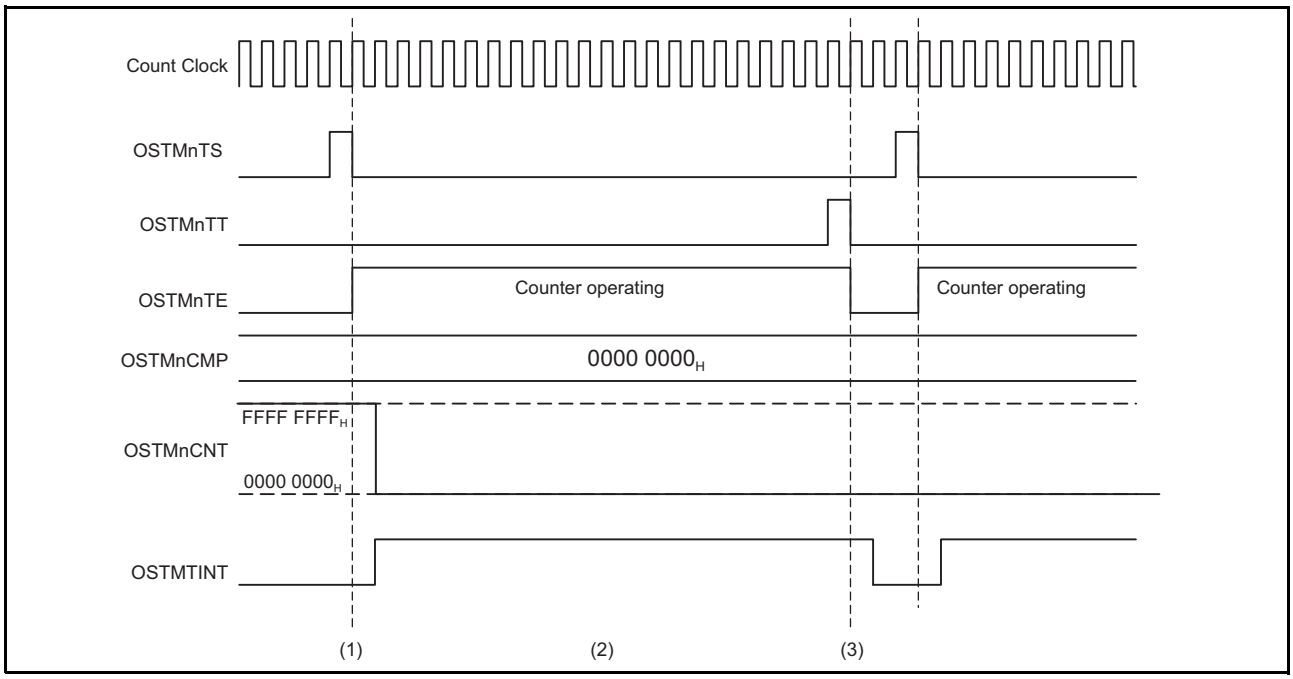

Figure 14.5 Timing Diagram when OSTMnCMP = 0000 0000H in Interval Timer Mode

The timing diagram above shows the following operations:

1. The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value 0000 0000_H is retained in OSTMnCMP.
2. The OSTMTINT interrupt request is continuously asserted.
3. After the counter stops, the OSTMTINT interrupt request signal is deasserted.
4. When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

14.3.6 Free-Running Comparison Mode

14.3.6.1 Basic Operation in Free-Running Comparison Mode

In free-running comparison mode, the counter counts up from 0000 0000_H to FFFF $FFFF_H$. An OSTMnTINT interrupt request is output when the current value of the counter matches the value of the OSTMnCMP register. The free-running comparison mode is selected by setting the OSTMnCTL.OSTMnMD1 bit to 1.
New values can be written to the OSTMnCMP register at any time.
The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

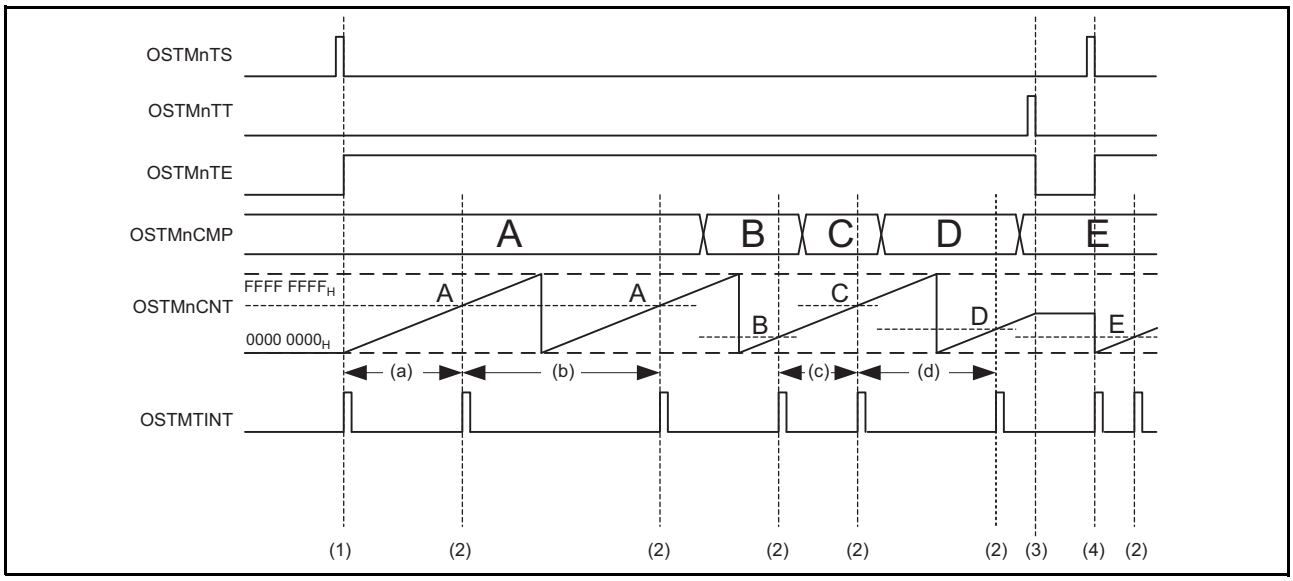

Figure 14.6 Timing Diagram of OSTM in Free-Run Compare Mode

The timing diagram above shows the following:

1. The counter starts counting when OSTMnTS.OSTMnTS = 1.
   The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from 0000 0000_H to FFFF $FFFF_H$. The OSTMnCNT register is the counter, so it contains the current value.
   When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated at the start of counting.
2. When the current counter value matches the value in the OSTMnCMP register, an OSTMTINT interrupt request is generated.
3. When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
   The counter retains its current value until it is restarted.
4. Counting by the counter restarts from 0000 0000_H when OSTMnTS.OSTMnTS = 1.

OSTMTINT period

The OSTMTINT generation period is different at the start of counting and depends on the old and new compare values if OSTMnCMP is rewritten during operation.

Table 14.11 OSTMTINT Generation Timing

Old Value for Comparison	New Value for Comparison	Counter Value at Time of Rewriting	Period of OSTMTINT Generation	Label in Timing Diagram
Counter starts			(A + 1) × counter clock period	(a)
A	A	No rewriting	(FFFF FFFF$_H$ + 1) × counter clock period	(b)
B	C > B	B < counter value < C	(C – B) × counter clock period	(c)
C	D < C	Counter value > D,C	(FFFF FFFF$_H$ – C + D + 1) × counter clock period	(d)

Forced restart

Forced restarting does not proceed during counting even if the OSTMnTS.OSTMnTS bit is set.
The counter ignores the attempted setting and continues counting.

14.3.6.2 Operation when OSTMnCMP = 0000 0000$_H$

The following figure shows the operation of OSTM when OSTMnCMP = 0000 0000$_H$, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

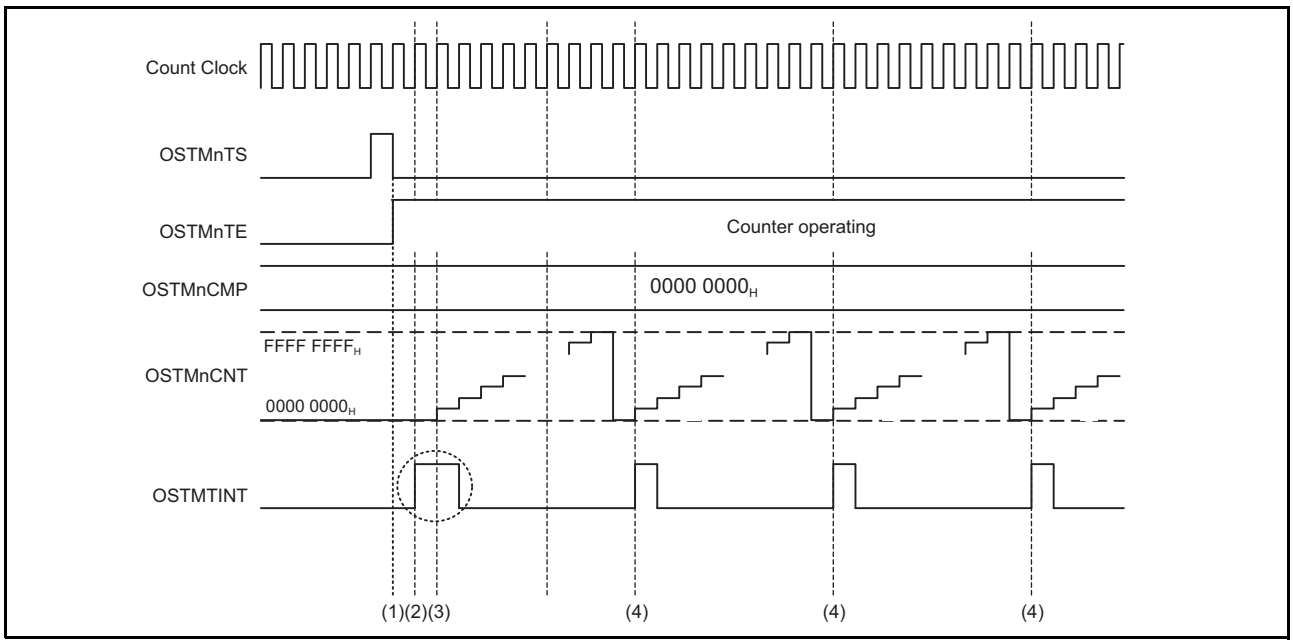

Figure 14.7 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Free-Run Compare Mode

The timing diagram above shows the following operations.

1. Once the counter starts, it counts up from 0000 0000$_H$ to FFFF FFFF$_H$.
2. An OSTMTINT interrupt request is generated when counting starts.
3. If the current counter value matches OSTMnCMP, an OSTMTINT interrupt request is generated.
   If OSTMnCMP = 0000 0000$_H$ in the above case, OSTMTINT is generated over two clock cycles.
4. Every (FFFF FFFF$_H$ + 1) clock cycles the OSTMTINT interrupt request is asserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

15. Watchdog Timer

This LSI includes the watchdog timer, which externally outputs an overflow signal (WDTOVF#) on overflow of the counter when the value of the counter has not been updated because of a system malfunction. This module can simultaneously generate an internal reset signal for the entire LSI.
In a similar manner, this module can also generate an internal reset signal in response to a CPU parity error and output the parity error signal (PERROUT#) externally.
This module is a single channel timer that counts up the clock oscillation settling period when the system leaves software standby mode. It can also be used as a general watchdog timer or interval timer.

15.1 Features

- Can be used to ensure the clock oscillation settling time
  This module is used in leaving software standby mode.
- Can switch between watchdog timer mode and interval timer mode.
- Outputs WDTOVF# signal in watchdog timer mode
  When the counter overflows in watchdog timer mode, the WDTOVF# signal is output externally. It is possible to select whether to reset the LSI internally when this happens. The internal reset signal is used as the power-on reset signal.
- Interrupt generation in interval timer mode
  An interval timer interrupt (ITI) is generated when the counter overflows.
- Choice of 16 counter input clocks
  Sixteen clocks (P0φ × 1 to P0φ × 1/4194304) that are obtained by dividing the peripheral clock can be selected.
- Generation of an internal reset signal or interrupt signal in response to a CPU parity error.
  This module generates an internal reset signal for the entire LSI and outputs the PERROUT# signal externally when generation of the internal reset signal is selected as a behavior in response to a CPU parity error.
  This internal reset signal is equivalent to the power-on reset. Similarly, this module generates an interrupt signal(CA9PEI) when the interrupt signal is selected.
- Retention of the CPU parity error sources
  The parity error sources are retained in this module and are not cleared by the internal reset.

Figure 15.1 shows a block diagram.

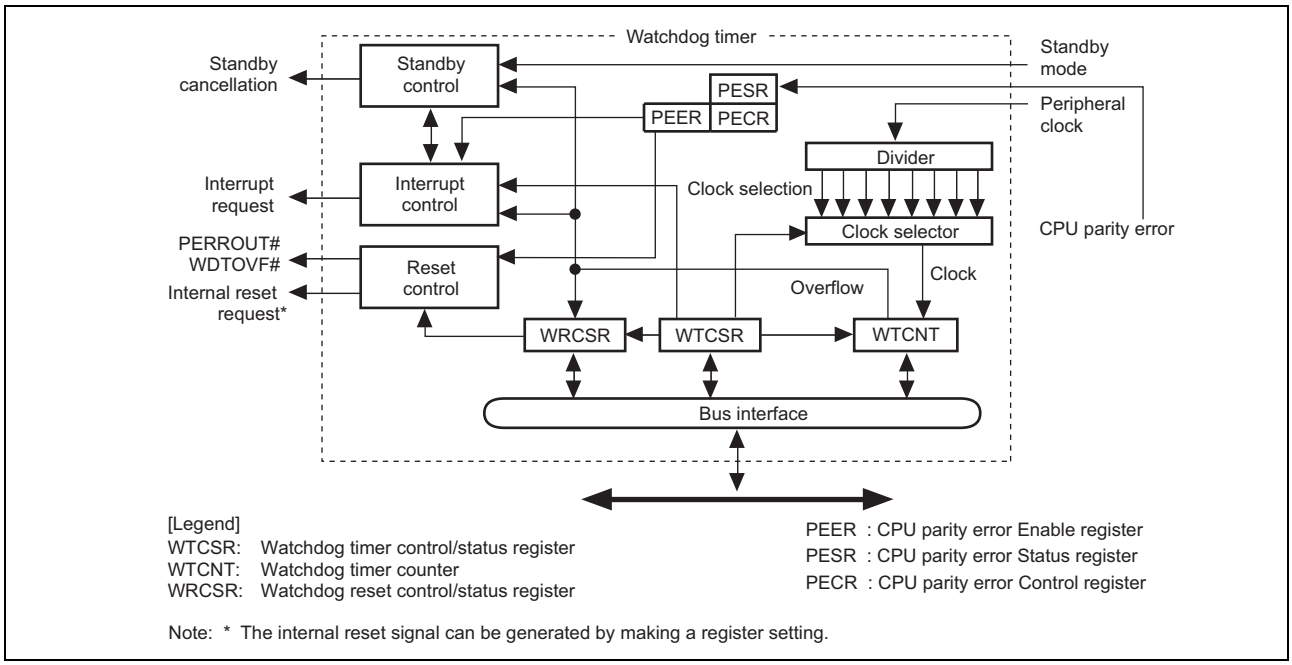

Figure 15.1 Block Diagram

15.2 Input/Output Pin

Table 15.1 shows the pin configuration.

Table 15.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Watchdog timer overflow	WDTOVF#	Output	Outputs the counter overflow signal in watchdog timer mode
CPU parity error	PERROUT#	Output	This signal goes to the active (low) level when a CPU parity error is detected.

15.3 Register Descriptions

Table 15.2 shows the register configuration.

Table 15.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Watchdog timer counter	WTCNT	R/W	H'00	H'FCFE7002	16*
Watchdog timer control/status register	WTCSR	R/W	H'10	H'FCFE7000	16*
Watchdog reset control/status register	WRCSR	R/W	H'1F	H'FCFE7004	16*
CPU parity error enable register	PEER	R/W	H'00	H'FCFE7020	16*
CPU parity error control register	PECR	R/W	H'00	H'FCFE7022	16*
CPU parity error status register	PESR	R/W	H'00	H'FCFE7024	16*

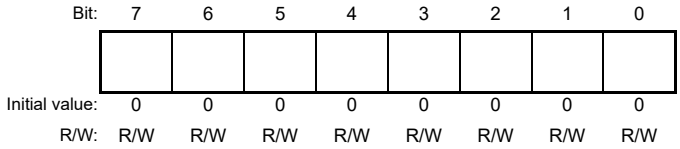
Note: * For the access size, see section 15.3.7, Notes on Register Access. Use 8-bit access to read.

15.3.1 Watchdog Timer Counter (WTCNT)

WTCNT is an 8-bit readable/writable register that is incremented by cycles of the selected clock signal. When an overflow occurs, it generates a watchdog timer overflow signal (WDTOVF#) in watchdog timer mode and an interrupt in interval timer mode.

Use 16-bit access to write to WTCNT, writing H'5A in the upper byte. Use 8-bit access to read from WTCNT.

Note: The method for writing to WTCNT differs from that for other registers to prevent erroneous writes. See section 15.3.7, Notes on Register Access for details.



15.3.2 Watchdog Timer Control/Status Register (WTCSR)

WTCSR is an 8-bit readable/writable register composed of bits to select the clock used for the count, overflow flags, and timer enable bit.

When used to count the clock oscillation settling time for canceling software standby mode, it retains its value after counter overflow.

Use 16-bit access to write to WTCSR, writing H'A5 in the upper byte. Use 8-bit access to read from WTCSR.

Note: The method for writing to WTCSR differs from that for other registers to prevent erroneous writes. See section 15.3.7, Notes on Register Access for details.

Bit:	7	6	5	4	3	2	1	0
	IOVF	WT/IT#	TME	—	CKS[3:0]			
Initial value:	0	0	0	1	0	0	0	0
R/W:	R/(W)	R/W	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	IOVF	0	R/(W)	Interval Timer Overflow Indicates that WTCNT has overflowed in interval timer mode. This flag is not set in watchdog timer mode. 0: No overflow 1: WTCNT overflow in interval timer mode [Clearing condition] • When 0 is written to IOVF after reading IOVF
6	WT/IT#	0	R/W	Timer Mode Select Selects whether to use this module as a watchdog timer or an interval timer. 0: Use as interval timer 1: Use as watchdog timer Note: When the WTCNT overflows in watchdog timer mode, the WDTOVF# signal is output externally. If this bit is modified when this module is running, incrementation may not be performed correctly.
5	TME	0	R/W	Timer Enable Starts and stops timer operation. Clear this bit to 0 when using this module in software standby mode or when changing the clock frequency. 0: Timer disabled Incrementation stops and WTCNT value is retained 1: Timer enabled
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	CKS[3:0]	000	R/W	Clock Select These bits select the clock to be used for the WTCNT count from the sixteen types obtainable by dividing the peripheral clock (P0φ). The overflow period that is shown inside the parenthesis in the table is the value when the peripheral clock (P0φ) is 33.00 MHz.

	Clock Ratio	Overflow Cycle
0000:	1 × P0 × φ	(7.75 µs)
0001:	1/64 × P0φ	(496.48 µs)
0010:	1/128 × P0φ	(992.96 µs)
0011:	1/256 × P0φ	(1.98 ms)
0100:	1/512 × P0φ	(3.97 ms)
0101:	1/1024 × P0φ	(7.94 ms)
0110:	1/4096 × P0φ	(31.77 ms)
0111:	1/16384 × P0φ	(127.10 ms)
1000:	1/32768 × P0φ	(254.20 ms)
1001:	1/65536 × P0φ	(508.40 ms)
1010:	1/131072 × P0φ	(1.01 s)
1011:	1/262144 × P0φ	(2.03 s)
1100:	1/524288 × P0φ	(4.06 s)
1101:	1/1048576 × P0φ	(8.13 s)
1110:	1/2097152 × P0φ	(16.26 s)
1111:	1/4194304 × P0φ	(32.53 s)

Note: If bits CKS[3:0] are modified when this module is running, the incrementation may not be performed correctly. Ensure that these bits are modified only when this module is not running.

15.3.3 Watchdog Reset Control/Status Register (WRCSR)

WRCSR is an 8-bit readable/writable register that controls output of the internal reset signal generated by watchdog timer counter (WTCNT) overflow.

Note: The method for writing to WRCSR differs from that for other registers to prevent erroneous writes. See section 15.3.7, Notes on Register Access for details.

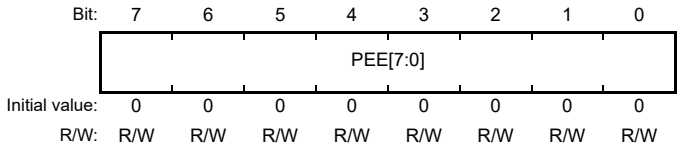
Bit:	7	6	5	4	3	2	1	0
	WOVF	RSTE	—	—	—	—	—	—
Initial value:	0	0	0	1	1	1	1	1
R/W:	R/(W)	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	WOVF	0	R/(W)	Watchdog Timer Overflow Indicates that the WTCNT has overflowed in watchdog timer mode. This bit is not set in interval timer mode. 0: No overflow 1: WTCNT has overflowed in watchdog timer mode [Clearing condition] • When 0 is written to WOVF after reading WOVF
6	RSTE	0	R/W	Reset Enable Selects whether to generate a signal to reset the LSI internally if WTCNT overflows in watchdog timer mode. In interval timer mode, this setting is ignored. 0: Not reset when WTCNT overflows* 1: Reset when WTCNT overflows Note: * LSI not reset internally, but WTCNT and WTCSR reset within this module.
5	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
4 to 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

15.3.4 CPU Parity Error Enable Register (PEER)

PEER is an 8-bit readable/writable register that controls the internal reset signal and interrupt generation due to CPU parity error.

Note: The method for writing to PEER differs from that for other registers to prevent erroneous writes. See section 15.3.7, Notes on Register Access for details.

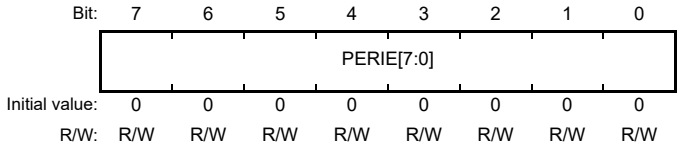


Bit	Bit Name	Initial Value	R/W	Description
7 to 0	PEE[7:0]	H'00	R/W	CPU parity error enable Each bit controls the operation of PERIE[7:0] (internal reset or interrupt generation). For the contents of the CPU parity error, refer to the CPU parity error status register (PESR). 0: Disable the internal reset or interrupt generation 1: Enable the internal reset or interrupt generation

15.3.5 CPU Parity Error Control Register (PECR)

PECR is an 8-bit readable/writable register that selects interrupt or internal reset signal generation due to CPU parity error. The selected operation is performed when the PEE bit of the CPU parity error enable register (PEER) is enabled.

Note: The method for writing to PECR differs from that for other registers to prevent erroneous writes. See section 15.3.7, Notes on Register Access for details.



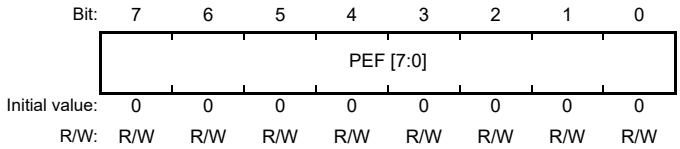
Bit	Bit Name	Initial Value	R/W	Description
7 to 0	PERIE[7:0]	H'00	R/W	CPU parity error mode select Select internal reset or interrupt generation in case of CPU parity error. It is valid only when the PEE bit of the CPU parity error enable register (PEER) is 1. 0: Select interrupt 1: Select internal reset When internal reset is selected, this module outputs the PERROUT# signal externally.

15.3.6 CPU Parity Error Status Register (PESR)

PESR is an 8-bit readable/0-writable register that holds each source due to CPU parity error. To clear each source, write 0 after reading.

It is not affected by the setting of the CPU parity error enable register (PEER).

Note: The method for writing to PESR differs from that for other registers to prevent erroneous writes. See section 15.3.7, Notes on Register Access for details.



Bit	Bit Name	Initial Value	R/W	Description
7	PEF[7]	H'00	R/(W)	CPU parity error 7 flag Indicates that BTAC parity error has occurred. When an error occurs, it operates corresponding to PEE[7], PERIE[7]. [Clear condition] • Write 0 after reading.
6	PEF[6]	H'00	R/(W)	CPU parity error 6 flag Indicates that GHB parity error has occurred. When an error occurs, it operates corresponding to PEE[6], PERIE[6]. [Clear condition] • Write 0 after reading.
5	PEF[5]	H'00	R/(W)	CPU parity error 5 flag Indicates that Instruction Cache Tag RAM parity error has occurred. When an error occurs, it operates corresponding to PEE[5], PERIE[5]. [Clear condition] • Write 0 after reading.
4	PEF[4]	H'00	R/(W)	CPU parity error 4 flag Indicates that Instruction cache data RAM parity error has occurred. When an error occurs, it operates corresponding to PEE[4], PERIE[4]. [Clear condition] • Write 0 after reading.
3	PEF[3]	H'00	R/(W)	CPU parity error 3 flag Indicates that Main TLB parity error has occurred. When an error occurs, it operates corresponding to PEE[3], PERIE[3]. [Clear condition] • Write 0 after reading.
2	PEF[2]	H'00	R/(W)	CPU parity error 2 flag Indicates that Data cache External cache attribute RAM parity error has occurred. When an error occurs, it operates corresponding to PEE[2], PERIE[2]. [Clear condition] • Write 0 after reading.
1	PEF[1]	H'00	R/(W)*	CPU parity error 1 flag Indicates that Data cache tag RAM parity error has occurred. When an error occurs, it operates corresponding to PEE[1], PERIE[1]. [Clear condition] • Write 0 after reading.
0	PEF[0]	H'00	R/(W)*	CPU parity error 0 flag Indicates that Data cache data RAM parity error has occurred. When an error occurs, it operates corresponding to PEE[0], PERIE[0]. [Clear condition] • Write 0 after reading.

15.3.7 Notes on Register Access

The watchdog timer counter (WTCNT), watchdog timer control/status register (WTCSR), and watchdog reset control/status register (WRCSR) are more difficult to write to than other registers. The procedures for reading or writing to these registers are given below.

(1) Writing to WTCNT and WTCSR

These registers must be written by a 16-bit transfer instruction. They cannot be written by an 8- or 32-bit transfer instruction.
When writing to WTCNT, set the upper byte to H'5A and transfer the lower byte as the write data, as shown in Figure 15.2. When writing to WTCSR, set the upper byte to H'A5 and transfer the lower byte as the write data. This transfer procedure writes the lower byte data to WTCNT or WTCSR.

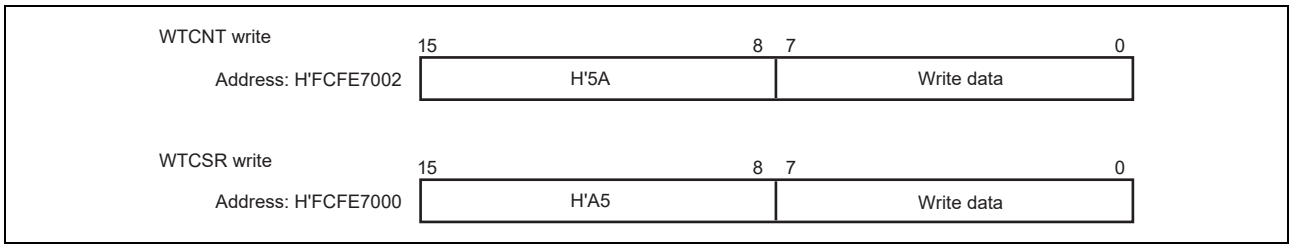


Figure 15.2 Writing to WTCNT and WTCSR

(2) Writing to WRCSR

WRCSR must be written by a 16-bit access to address H'FCFE7004. It cannot be written by 8- or 32-bit transfer instructions.

Procedures for writing 0 to WOVF (bit 7) and for writing to RSTE (bit 6) are different, as shown in Figure 15.3.

To write 0 to the WOVF bit, the write data must be H'A5 in the upper byte and H'00 in the lower byte. This clears the WOVF bit to 0. The RSTE bit is not affected. To write to the RSTE bit, the upper byte must be H'5A and the lower byte must be the write data. The value of bit 6 of the lower byte is transferred to the RSTE bit. The WOVF bit is not affected.

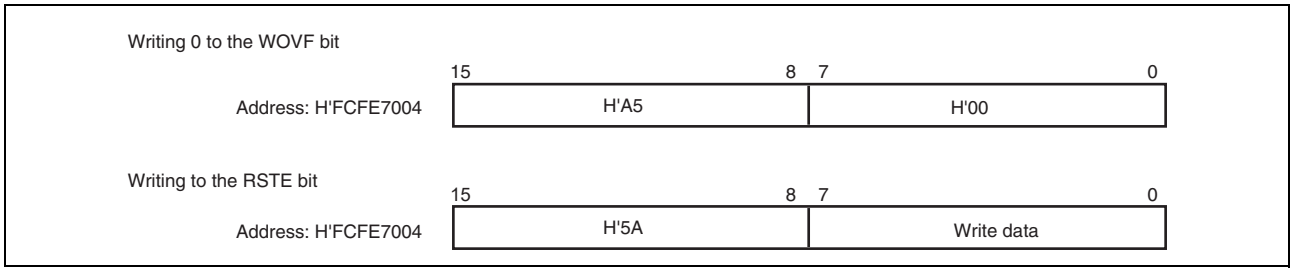

Figure 15.3 Writing to WRCSR

(3) Reading from WTCNT, WTCSR, and WRCSR

WTCNT, WTCSR, and WRCSR are read in a method similar to other registers. WTCSR is allocated to address H'FCFE7000, WTCNT to address H'FCFE7002, and WRCSR to address H'FCFE7004. Eight-bit transfer instructions must be used for reading from these registers.

(4) Writing to PEER, PECR, and PESR

These registers must be written by a 16-bit transfer instruction. They cannot be written by an 8- or 32-bit transfer instruction.
When writing to PEER, PECR, or PESR, set the upper byte to H'5A and transfer the lower byte as the write data, as shown in Figure 15.4.
This transfer procedure writes the lower byte data to PEER, PECR, or PESR.

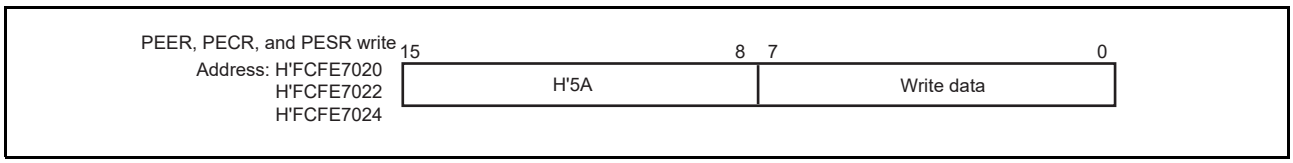

Figure 15.4 Writing to PEER, PECR, and PESR

(5) Reading from PEER, PECR, and PESR

Reading can be done in the same way as general registers. Eight-bit transfer instructions must be used for reading from these registers.

15.4 Usage

15.4.1 Canceling Software Standby Mode

This module can be used to cancel software standby mode with an interrupt such as an NMI interrupt. The procedure is described below. (This module does not operate when resets are used for canceling, so keep the RES# pin low until clock oscillation settles.)

1. Before making a transition to software standby mode, always clear the TME bit in WTCSR to 0. When the TME bit is 1, an erroneous reset or interval timer interrupt may be generated when the count overflows.
2. Set the type of count clock used in the CKS[3:0] bits in WTCSR and the initial value of the counter in WTCNT. Set these values so that the time till count overflow becomes at least the same as the clock oscillation settling time.*1
3. After setting the STBY and DEEP bits of the standby control register 1 (STBCR1: see section 52, Power-Down Modes) to 1 and 0 respectively, the execution of a WFI instruction puts the system in software standby mode and clock operation then stops.
4. This module starts counting by detecting the edge change of the NMI signal.
5. When the module count overflows, the clock pulse generator starts supplying the clock and this LSI resumes operation. The WOVF flag in WRCSR is not set when this happens.

Note 1. When the setting of the RTC1XT and RTC0XT bits in the RTCXTALSEL register is 0, the EXTAL clock stops oscillating when the chip is placed on software standby. Set the CKS[3:0] bits in the WTCSR and the initial value of WTCNT to obtain an interval that is greater than the sum of the on-chip oscillation circuit oscillation settling time (t_{ROSC}) of the EXTAL and the internal PLL circuit oscillation settling time (t_{POSC}).
When the setting of either the RTC1XT or RTC0XT bits is 1, the EXTAL clock continues oscillating even on software standby. In this case, set the CKS[3:0] bits in the WTCSR and the initial value of WTCNT to obtain an interval that is greater than the internal PLL circuit oscillation settling time (t_{POSC}).

15.4.2 Using Watchdog Timer Mode

1. Set the WT/IT# bit in WTCSR to 1, the type of count clock in the CKS[3:0] bits in WTCSR, whether this LSI is to be reset internally or not in the RSTE bit in WRCSR and the initial value of the counter in WTCNT.
2. Set the TME bit in WTCSR to 1 to start the count in watchdog timer mode.
3. While operating in watchdog timer mode, rewrite the counter periodically to H'00 to prevent the counter from overflowing.
4. When the counter overflows, this module sets the WOVF flag in WRCSR to 1, and the WDTOVF# signal is output externally (Figure 15.5). The WDTOVF# signal can be used to reset the system. The WDTOVF# signal is output for 64 × P0φ clock cycles.
5. If the RSTE bit in WRCSR is set to 1, a signal to reset the inside of this LSI can be generated simultaneously with the WDTOVF# signal. The internal reset signal is output for 128 × P0φ clock cycles.
6. When an overflow reset of this module is generated simultaneously with a reset input on the RES# pin, the RES# pin reset takes priority, and the WOVF bit in WRCSR is cleared to 0.

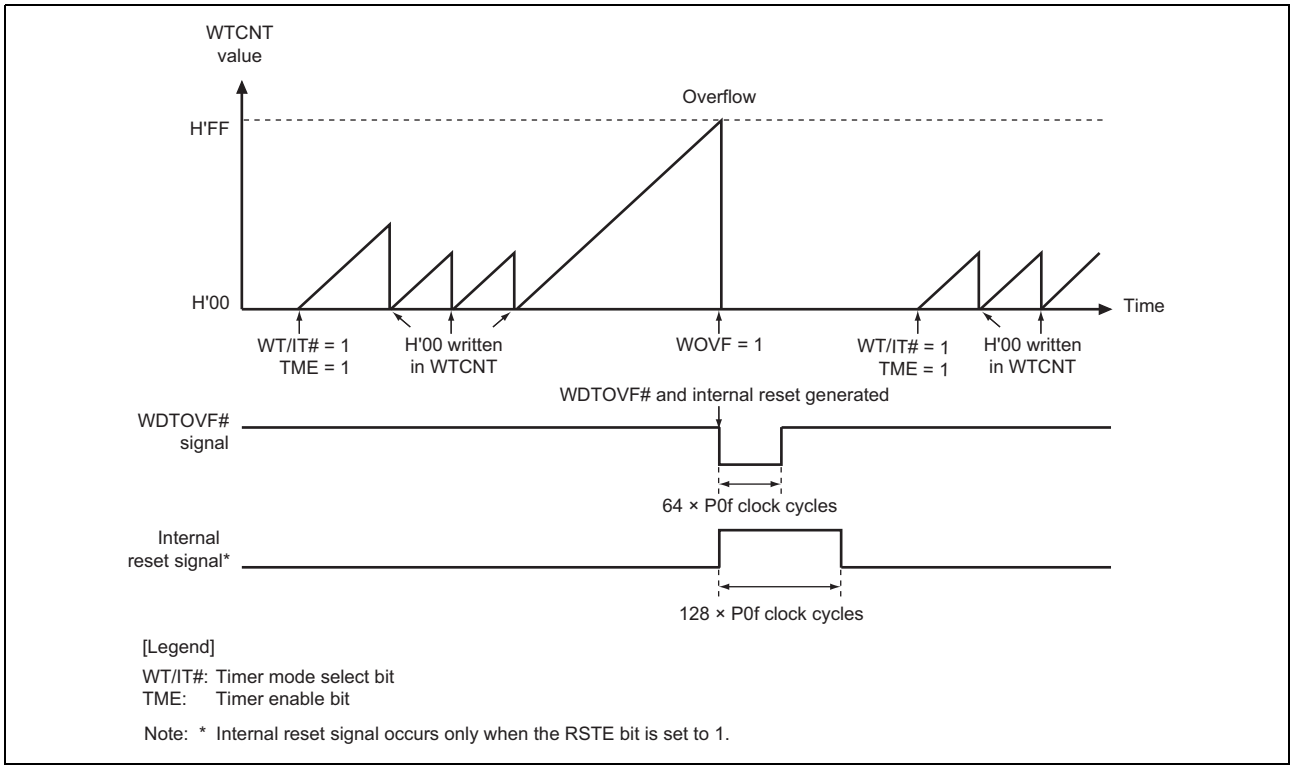

Figure 15.5 Operation in Watchdog Timer Mode

15.4.3 Using Interval Timer Mode

When operating in interval timer mode, interval timer interrupts are generated at every overflow of the counter. This enables interrupts to be generated at set periods.

1. Clear the WT/IT# bit in WTCSR to 0, set the type of count clock in the CKS[3:0] bits in WTCSR, and set the initial value of the counter in WTCNT.
2. Set the TME bit in WTCSR to 1 to start the count in interval timer mode.
3. When the counter overflows, this module sets the IOVF bit in WTCSR to 1 and an interval timer interrupt request is sent to the interrupt controller. The counter then resumes counting.

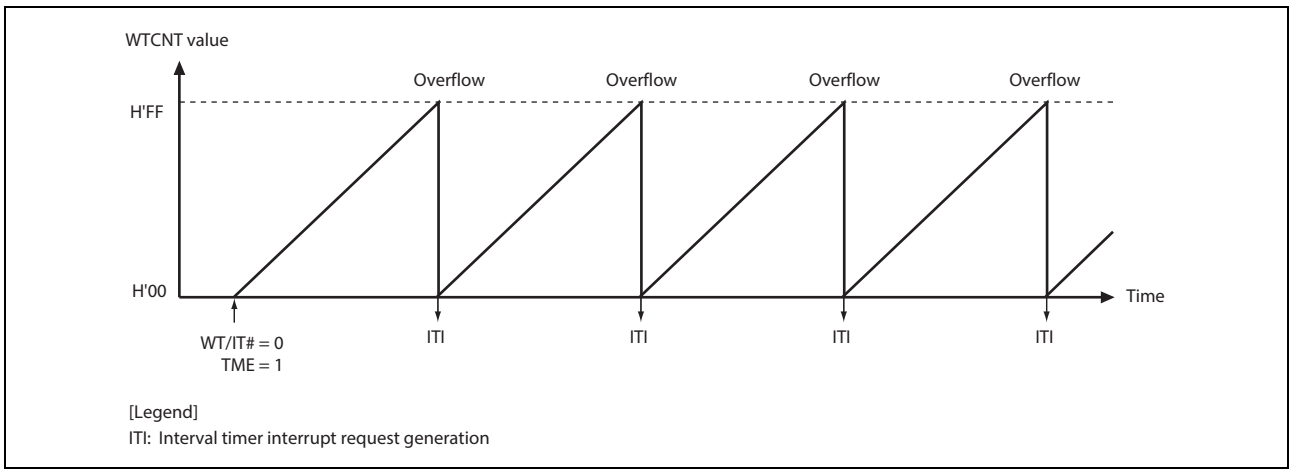

Figure 15.6 Operation in Interval Timer Mode

15.4.4 CPU Parity Error Operation

When CPU parity error corresponding to each PEE bit of the CPU parity error control register (PECR) occurs, an interrupt or internal reset can be generated.

- When PEE = 1 and PERIE = 0, generate an interrupt
  An interrupt can be generated when a CPU parity error occurs. The source of error can be confirmed by the CPU parity error status register (PESR).

- When PEE = 1 and PERIE = 1, generate an internal reset
  An internal reset is generated and PERROUT# is output externally of this module when a CPU parity error occurs. An internal reset signal is output for 128 × P0φ clock period, and the PERROUT# signal is output for 64 × P0φ clock period.
  When the RES# pin input reset signal and the parity error reset of this module occur at the same time, the RES# pin reset takes precedence and the status bit (PEF) of the PESR is cleared to 0.

15.5 Usage Notes

Pay attention to the following points when using this module in either the interval timer or watchdog timer mode.

15.5.1 Timer Variation

After timer operation has started, the period from the power-on reset point to the first incrementation timing of WTCNT varies depending on the time period that is set by the TME bit of WTCSR. The shortest such time period is thus one cycle of the peripheral clock, P0φ, while the longest is the result of frequency division according to the value in the CKS[3:0] bits. The timing of subsequent incrementation is in accord with the selected frequency division ratio. Accordingly, this time difference is referred to as timer variation.
This also applies to the timing of the first incrementation after WTCNT has been written to during timer operation.

15.5.2 Prohibition Against Setting H'FF to WTCNT

When the value in WTCNT reaches H'FF, this module assumes that an overflow has occurred. Accordingly, when H'FF is set in WTCNT, an interval timer interrupt or reset will occur immediately, regardless of the current clock selection by the CKS[3:0] bits.

15.5.3 Interval Timer Overflow Flag

When the value in WTCNT is H'FF, the IOVF flag in WTCSR cannot be cleared.

Only clear the IOVF flag when the value in WTCNT has either become H'00 or been changed to a value other than H'FF.

15.5.4 System Reset by WDTOVF# Signal

If the WDTOVF# signal is input to the RES# pin of this LSI, this LSI cannot be initialized correctly.

Avoid input of the WDTOVF# signal to the RES# pin of this LSI through glue logic circuits. To reset the entire system with the WDTOVF# signal, use the circuit shown in Figure 15.7.

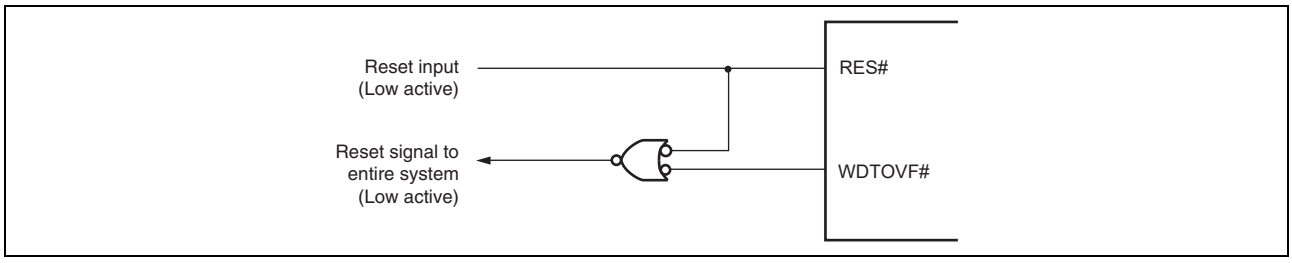

Figure 15.7 Example of System Reset Circuit Using WDTOVF# Signal

15.5.5 Internal Reset in Watchdog Timer Mode

When an internal reset is generated due to an overflow of the watchdog timer counter (WTCNT) in watchdog timer mode, the watchdog reset control/status register (WRCSR) is not initialized, so the WOVF bit retains the value 1. As long as the WOVF bit is 1, an internal reset will not be generated even if the WTCNT overflows again.

16. Realtime Clock (RTC)

This module has two channels of real time clock for secure and non secure.

Note: For details of secure/non secure access, refer to sections 5.8, AXI Protocol Control Signals, 5.8.1 (3), 5.8.2, 5.8.3, and 5.8.4.

Register address

All RTCn register addresses are given as values obtained by adding offsets to the register base address <RTCn_base> for each channel. The base address <RTCn_base> of each RTCn is listed in the following table.

Table 16.1 RTC Base Address

Base Address Name	Base Address
<RTC0_base>	FCFF D000H
<RTC1_base>	FCFF 1000H

Each channel is identified by the index "n". (n = 0: secure, 1: non-secure)

16.1 Features

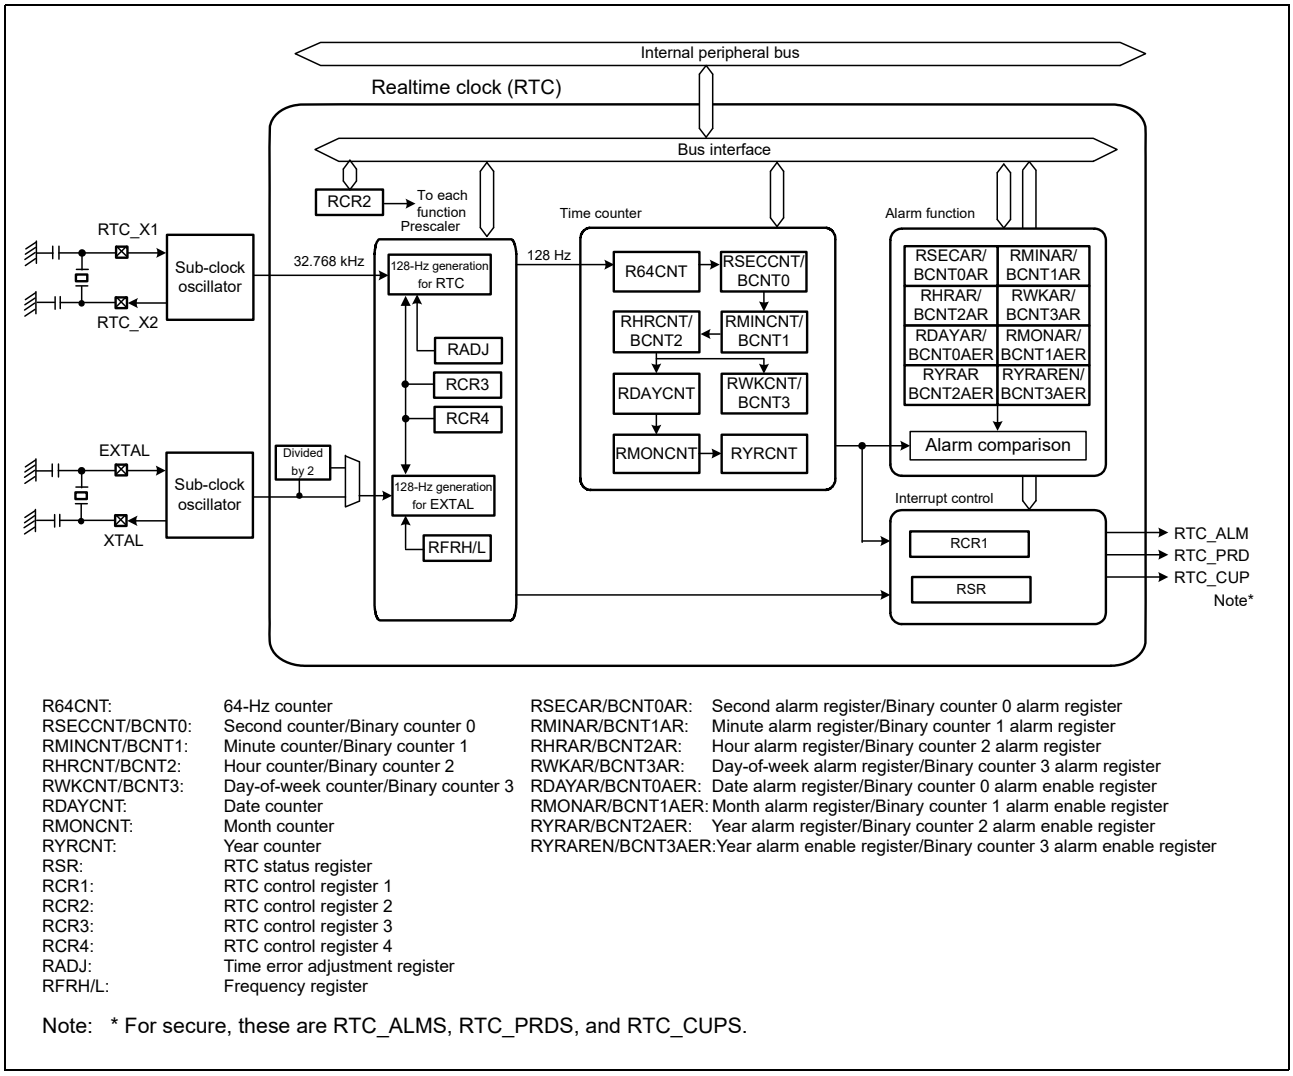
The RTC has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100 year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar.
The RTC uses a 128-Hz clock acquired by dividing the count source by a prescaler. Year, month, date, day-of-week, a.m./p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary are counted in 1/128 second units.

Table 16.2 lists the specifications of the RTC, Figure 16.1 shows a block diagram of the RTC, and Table 16.3 shows the pin configuration of the RTC.

Table 16.2 RTC specifications

Item	Description
Count mode	Calendar count mode/binary count mode
Count source*1	Realtime clock (RTC_X1) or Internal clock (EXTAL)
Clock and calendar functions	• Calendar count mode Year, month, date, day of week, hour, minute, second are counted, BCD display 12 hours/24 hours mode switching function 30 seconds adjustment function (a number less than 30 is rounded down to 00 seconds, and 30 seconds or more are rounded up to 1 minute) Automatic adjustment function for leap years • Binary count mode Count seconds in 32 bits, binary display • Common to both modes Start/stop function The sub-second digit is displayed in binary units (1 Hz, 2 Hz, 4 Hz, 8 Hz, 16 Hz, 32 Hz, or 64 Hz). Clock error correction function
Interrupts	• Alarm interrupt (RTC_ALM) As an alarm interrupt condition, selectable for comparison with the following: Calendar count mode: Year, month, date, day-of-week, hour, minute, or second can be selected Binary count mode: Each bit of the 32-bit binary counter • Periodic interrupt (RTC_PRD) 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second can be selected as an interrupt period. • Carry interrupt (RTC_CUP) An interrupt is generated at either of the following conditions: - When a carry from the 64-Hz counter to the second counter is generated. - When the 64-Hz counter is changed and R64CNT is read at the same time. • Recovery from deep standby is possible by an alarm interrupt.

Note 1. Satisfy the frequency of the peripheral module clock (clkp0d) ≥ the frequency of the count source clock.



R64CNT:	64-Hz counter
RSECCNT/BCNT0:	Second counter/Binary counter 0
RMINCNT/BCNT1:	Minute counter/Binary counter 1
RHRCNT/BCNT2:	Hour counter/Binary counter 2
RWKCNT/BCNT3:	Day-of-week counter/Binary counter 3
RDAYCNT:	Date counter
RMONCNT:	Month counter
RYRCNT:	Year counter
RSR:	RTC status register
RCR1:	RTC control register 1
RCR2:	RTC control register 2
RCR3:	RTC control register 3
RCR4:	RTC control register 4
RADJ:	Time error adjustment register
RFRH/L:	Frequency register

RSECAR/BCNT0AR:	Second alarm register/Binary counter 0 alarm register
RMINAR/BCNT1AR:	Minute alarm register/Binary counter 1 alarm register
RHRAR/BCNT2AR:	Hour alarm register/Binary counter 2 alarm register
RWKAR/BCNT3AR:	Day-of-week alarm register/Binary counter 3 alarm register
RDAYAR/BCNT0AER:	Date alarm register/Binary counter 0 alarm enable register
RMONAR/BCNT1AER:	Month alarm register/Binary counter 1 alarm enable register
RYRAR/BCNT2AER:	Year alarm register/Binary counter 2 alarm enable register
RYRAREN/BCNT3AER:	Year alarm enable register/Binary counter 3 alarm enable register

Note: * For secure, these are RTC_ALMS, RTC_PRDS, and RTC_CUPS.

Figure 16.1 RTC block diagram

Table 16.3 Pin configuration of RTC

Name	Pin name	I/O	Function
Crystal resonator terminal / External Clock for Realtime clock	RTC_X1	Input	Connect a 32.768 kHz Crystal Resonator for this module. Alternatively, External Clock can be input to the RTC_X1.
	RTC_X2	Output	
Crystal oscillator for internal clock / External clock,	EXTAL	Input	Connect a crystal resonator used for internal operation. For details, see section 6, Clock Pulse Generator.
	XTAL	Output	

16.2 Register Descriptions

Write or read from the RTC registers in accordance with section 16.5.4, Notes When Writing to and Reading from Registers.

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset.

When RTC enters the reset state or a low power consumption state during counting operations, for example while the RCR2.START bit is 1, the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate.

Note: A reset generated while writing to a register might destroy the register value. In addition, do not allow the chip to enter software standby mode immediately after setting any of these registers. For details, see section 16.5.3, Transitions to Low Power Consumption Modes after Setting Registers.

Table 16.4 lists the register configuration.

Table 16.4 Register Configuration

Register Name	Symbol	Value after reset*1	Address	Access size
64-Hz Counter	R64CNT	xxh	RTCn_BASE+00h	8
Second Counter	RSECCNT	xxh	RTCn_BASE+02h	8
Binary Counter 0	BCNT0

RTC Status Register	RSR	00h*2	RTCn_BASE+20h	8
RTC Control Register 1	RCR1	xxh	RTCn_BASE+22h	8
RTC Control Register 2	RCR2	xxh	RTCn_BASE+24h	8
RTC Control Register 3	RCR3	0xh	RTCn_BASE+26h	8
RTC Control Register 4	RCR4	0xh	RTCn_BASE+28h	8
Frequency Register H/L	RFRH	000xh	RTCn_BASE+2Ah	16
	RFRL	xxxxh	RTCn_BASE+2Ch	16
Time Error Adjustment Register	RADJ	xxh	RTCn_BASE+2Eh	8

Note 1. If the value in an RTC register after a reset is given as X (undefined bits), it is not initialized by a reset or the deep standby mode. When transitioning to the reset state or low power consumption state during count operation (RCR2.START bit is 1); the year, month, day, day of week, hour, minute, and second counters continue to operate in the 64-Hz counter mode or the calendar count mode, and the binary counter continues to operate in the binary count mode.
A reset generated while writing to a register might destroy the register value. In addition, do not allow the chip to enter Software Standby mode immediately after setting any of these registers. For details, see section 16.5.3, Transitions to Low Power Consumption Modes after Setting Registers.

Note 2. The value read from this register after a reset might vary from 01h to 07h.

16.2.1 64-Hz Counter (R64CNT)

Address(es): RTC.R64CNT FCFF D000h [secure], FCFF 1000h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	—	F1HZ	F2HZ	F4HZ	F8HZ	F16HZ	F32HZ	F64HZ
Value after reset:	0	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	F64HZ	64 Hz	Indicate the state between 1 Hz and 64 Hz of the sub-second digit.	R
b1	F32HZ	32 Hz		R
b2	F16HZ	16 Hz		R
b3	F8HZ	8 Hz		R
b4	F4HZ	4 Hz		R
b5	F2HZ	2 Hz		R
b6	F1HZ	1 Hz		R
b7	—	Reserved	This bit is read as 0. Writing to this bit has no effect.	R

R64CNT is used in both calendar count mode and in binary count mode. The 64-Hz counter (R64CNT) generates the period for a second by counting up periods of the 128-Hz clock. The state in the sub-second range can be confirmed by reading this counter.

This counter is set to 00h by an RTC software reset or an execution of a 30-second adjustment. To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

16.2.2 Second Counter (RSECCNT) / Binary Counter 0 (BCNT0)

(1) In calendar count mode:

Address(es): RTC.RSECCNT FCFF D002h [secure], FCFF 1002h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	—	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	SEC1[3:0]	1-Second Count	Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place.	R/W
b6 to b4	SEC10[2:0]	10-Second Count	Counts from 0 to 5 for 60-second counting.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

RSECCNT sets and counts the BCD-coded second value. It counts carries generated once per second in the 64-Hz counter.

The setting range is decimal 00 to 59. The RTC does not operate normally if any other value is set. Before writing to this register, be sure to stop the count operation using the START bit in RCR2.

To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

(2) In binary count mode:

Address(es): RTC.BCNT0 FCFF D002h [secure], FCFF 1002h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT0 is a read/write 32-bit binary counter b7 to b0. The 32-bit binary counter performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

16.2.3 Minute Counter (RMINCNT) / Binary Counter 1 (BCNT1)

(1) In calendar count mode:

Address(es): RTC.RMINCNT FCFF D004h [secure], FCFF 1004h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	—	MIN10[2:0]			MIN1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	MIN1[3:0]	1-Minute Count	Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place.	R/W
b6 to b4	MIN10[2:0]	10-Minute Count	Counts from 0 to 5 for 60-minute counting.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

RMINCNT sets and counts the BCD-coded minute value. It counts carries generated once per minute in the second counter.

A value from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

(2) In binary count mode:

Address(es): RTC.BCNT1 FCFF D004h [secure], FCFF 1004h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT1 is a readable/writable 32-bit binary counter b15 to b8. The 32-bit binary counter performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

16.2.4 Hour Counter (RHRCNT) / Binary Counter 2 (BCNT2)

(1) In calendar count mode:

Address(es): RTC.RHRCNT FCFF D006h [secure], FCFF 1006h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	—	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	HR1[3:0]	1-Hour Count	Counts from 0 to 9 once every hour. When a carry is generated, 1 is added to the tens place.	R/W
b5, b4	HR10[1:0]	10-Hour Count	Counts from 0 to 2 once per carry from the ones place.	R/W
b6	PM	PM	Time counter setting for a.m./p.m. 0: a.m. 1: p.m.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

RHRCNT sets and counts the BCD-coded hour value. It counts carries generated once every hour in the minute counter. The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – from 00 to 11 (in BCD)
- When the RCR2.HR24 bit is 1 – from 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. The PM bit is only enabled when the RCR2.HR24 bit is 0. Otherwise, the setting in the PM bit has no effect. To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

(2) In binary count mode:

Address(es): RTC.BCNT2 FCFF D006h [secure], FCFF 1006h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[23:16]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT2 is a read/write 32-bit binary counter b23 to b16. The 32-bit binary counter performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

16.2.5 Day-of-Week Counter (RWKCNT) / Binary Counter 3 (BCNT3)

(1) In calendar count mode:

Address(es): RTC.RWKCNT FCFF D008h [secure], FCFF 1008h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	DAYW[2:0]		
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b2 to b0	DAYW[2:0]	Day-of-Week Counting	b2 b0 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting prohibited.	R/W
b7 to b3	—	Reserved	Set these bits to 0. They are read as the set value.	R/W

RWKCNT sets and counts in the coded day-of-week value. It counts carries generated once per day in the hour counter. A value from 0 through 6 can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

(2) In binary count mode:

Address(es): RTC.BCNT3 FCFF D008h [secure], FCFF 1008h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT3 is a read/write 32-bit binary counter b31 to b24 that performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

16.2.6 Day Counter (RDAYCNT)

Address(es): RTC.RDAYCNT FCFF D00Ah [secure], FCFF 100Ah [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	0	0	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	DATE1[3:0]	1-Day Count	Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place	R/W
b5, b4	DATE10[1:0]	10-Day Count	Counts from 0 to 3 once per carry from the ones place	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RDAYCNT is used in calendar count mode to set and count the BCD-coded date value. It counts carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year. The value 00 in RYRCNT is regarded as year 2000. Leap years are determined according to whether the RYRCNT value is divisible by 400, 100, and 4.

A value from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. When specifying a value, the range of specifiable days depends on the month and whether the year is a leap year. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

16.2.7 Month Counter (RMONCNT)

Address(es): RTC.RMONCNT FCFF D00Ch [secure], FCFF100Ch [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	MON10	MON1[3:0]			
Value after reset:	0	0	0	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	MON1[3:0]	1-Month Count	Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place	R/W
b4	MON10	10-Month Count	Counts from 0 to 1 once per carry from the ones place	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RMONCNT is used in calendar count mode to set and count the BCD-coded month value. It counts carries generated once per month in the date counter.

A value from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section section 16.3.5, Reading 64-Hz Counter and Time.

16.2.8 Year Counter (RYRCNT)

Address(es): RTC.RYRCNT FCFF D00Eh [secure], FCFF 100Eh [non secure]

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	YR1[3:0]	1-Year Count	Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place.	R/W
b7 to b4	YR10[3:0]	10-Year Count	Counts from 0 to 9 once per carry from ones place.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RYRCNT is used in calendar count mode to set and count the BCD-coded year value. It counts carries generated once per year in the month counter.

A value from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time.

16.2.9 Second Alarm Register (RSECAR) / Binary Counter 0 Alarm Register (BCNT0AR)

(1) In calendar count mode:

Address(es): RTC.RSECAR FCFF D010h [secure], FCFF 1010h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	SEC1[3:0]	1 Second	Value for the ones place of seconds	R/W
b6 to b4	SEC10[2:0]	10 Seconds	Value for the tens place of seconds	R/W
b7	ENB	ENB	0: The register value is not compared with the RSECCNT value 1: The register value is compared with the RSECCNT value.	R/W

RSECAR is an alarm register associated with the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RSECAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT0AR FCFF D010h [secure], FCFF 1010h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT0AR is a read/write alarm register associated with the 32-bit binary counter b7 to b0. This register is set to 00h by an RTC software reset.

16.2.10 Minute Alarm Register (RMINAR) / Binary Counter 1 Alarm Register (BCNT1AR)

(1) In calendar count mode:

Address(es): RTC.RMINAR FCFF D012h [secure], FCFF 1012h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	MIN10[2:0]			MIN1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	MIN1[3:0]	1 Minute	Value for the ones place of minutes	R/W
b6 to b4	MIN10[2:0]	10 Minutes	Value for the tens place of minutes	R/W
b7	ENB	ENB	0: The register value is not compared with the RMINCNT value 1: The register value is compared with the RMINCNT value.	R/W

RMINAR is an alarm register associated with the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RMINAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT1AR FCFF D012h [secure], FCFF 1012h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT1AR is a read/write alarm register associated with the 32-bit binary counter from b15 to b8. This register is set to 00h by an RTC software reset.

16.2.11 Hour Alarm Register (RHRAR) / Binary Counter 2 Alarm Register (BCNT2AR)

(1) In calendar count mode:

Address(es): RTC.RHRAR FCFF D014h [secure], FCFF 1014h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	HR1[3:0]	1 Hour	Value for the ones place of hours	R/W
b5, b4	HR10[1:0]	10 Hours	Value for the tens place of hours	R/W
b6	PM	PM	Time Alarm Setting for a.m./p.m. 0: a.m. 1: p.m.	R/W
b7	ENB	ENB	0: The register value is not compared with the RHRCNT value 1: The register value is compared with the RHRCNT value.	R/W

RHRAR is an alarm register associated with the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – From 00 to 11 (in BCD)
- When the RCR2.HR24 bit is 1 – From 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. When the RCR2.HR24 bit is 0, be sure to set the PM bit. When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect. This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT2AR FCFF D014h [secure], FCFF 1014h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[23:16]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT2AR is a read/write alarm register associated with the 32-bit binary counter b23 to b16. This register is set to 00h by an RTC software reset.

16.2.12 Day-of-Week Alarm Register (RWKAR) / Binary Counter 3 Alarm Register (BCNT3AR)

(1) In calendar count mode:

Address(es): RTC.RWKAR FCFF D016h [secure], FCFF 1016h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	—	—	DAYW[2:0]		
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b2 to b0	DAYW[2:0]	Day-of-Week Setting	b2 b0 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting prohibited.	R/W
b6 to b3	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RWKCNT value 1: The register value is compared with the RWKCNT value.	R/W

RWKAR is an alarm register associated with the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the corresponding counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values all match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RWKAR values from 0 through 6 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT3AR FCFF D016h [secure], FCFF 1016h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT3AR is a read/write alarm register associated with the 32-bit binary counter b31 to b24. This register is set to 00h by an RTC software reset.

16.2.13 Day Alarm Register (RDAYAR) / Binary Counter 0 Alarm Enable Register (BCNT0AER)

(1) In calendar count mode:

Address(es): RTC.RDAYAR FCFF D018h [secure], FCFF 1018h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	DATE1[3:0]	1 Day	Value for the ones place of days	R/W
b5, b4	DATE10[1:0]	10 Days	Value for the tens place of days	R/W
b6	—	Reserved	Set this bit to 0. It is read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RDAYCNT value 1: The register value is compared with the RDAYCNT value.	R/W

RDAYAR is an alarm register associated with the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the corresponding counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RDAYAR values from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT0AER FCFF D018h [secure], FCFF 1018h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT0AER is a read/write register to set the alarm enable associated with the 32-bit binary counter b7 to b0. The binary counter (BCNT[31:0]) associated with the ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR[31:0]), and when all match, the IR flag associated with the RTC_ALM interrupt becomes 1. This register is set to 00h by an RTC software reset.

16.2.14 Month Alarm Register (RMONAR) / Binary Counter 1 Alarm Enable Register (BCNT1AER)

(1) In calendar count mode:

Address(es): RTC.RMONAR FCFF D01Ah [secure], FCFF 101Ah [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	MON10	MON1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	MON1[3:0]	1 Month	Value for the ones place of months	R/W
b4	MON10	10 Months	Value for the tens place of months	R/W
b6, b5	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RMONCNT value 1: The register value is compared with the RMONCNT value.	R/W

RMONAR is an alarm register associated with the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RMONAR values from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT1AER FCFF D01Ah [secure], FCFF 101Ah [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT1AER is a read/write register for setting the alarm enable associated with the 32-bit binary counter b15 to b8. The binary counter (BCNT[31:0]) associated with the ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR[31:0]), and when all match, the IR flag associated with the RTC_ALM interrupt becomes 1. This register is set to 00h by an RTC software reset.

16.2.15 Year Alarm Register (RYRAR) / Binary Counter 2 Alarm Enable Register (BCNT2AER)

(1) In calendar count mode:

Address(es): RTC.RYRAR FCFF D01Ch [secure], FCFF 101Ch [non secure]

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	YR1[3:0]	1 Year	Value for the ones place of years	R/W
b7 to b4	YR10[3:0]	10 Years	Value for the tens place of years	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RYRAR is an alarm register associated with the BCD-coded year counter RYRCNT. The RYRAR values from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0000h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT2AER FCFF D01Ch [secure], FCFF 101Ch [non secure]

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ENB[23:16]							
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

BCNT2AER is a read/write register for setting the alarm enable associated with the 32-bit binary counter b23 to b16. The binary counter (BCNT[31:0]) associated with the ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR[31:0]), and when all match, the IR flag associated with the RTC_ALM interrupt becomes 1. This register is set to 0000h by an RTC software reset.

16.2.16 Year Alarm Enable Register (RYRAREN) / Binary Counter 3 Alarm Enable Register (BCNT3AER)

(1) In calendar count mode:

Address(es): RTC.RYRAREN FCFF D01Eh [secure], FCFF 101Eh [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RYRCNT value. 1: The register value is compared with the RYRCNT value.	R/W

When the ENB bit in RYRAREN is set to 1, the RYRAR value is compared with the RYRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1.This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT3AER FCFF D01Eh [secure], FCFF 101Eh [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT3AER is a read/write register for setting the alarm enable associated with the 32-bit binary counter b31 to b24. The binary counter (BCNT[31:0]) associated with the ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR[31:0]), and when all match, the IR flag associated with the RTC_ALM interrupt becomes 1. This register is set to 00h by an RTC software reset.

16.2.17 RTC Status Register 1 (RSR)

Address(es): RTC.RSR FCFF D020h [secure], FCFF 1020h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	PF	CF	AF
Value after reset:	0	0	0	0	0	0*1	0*1	0*1

Note 1. The value may be read as 1 after release from the reset state.

Bit	Symbol	Bit name	Description	R/W
b0	AF	Alarm Flag	0: The value of the counter does not match that of the alarm register. 1: The value of the counter matches that of the alarm register. Note: Writing 1 to this flag has no effect.	R/W
b1	CF	Carry Flag	0: A carry from the second counter/binary counter 0 or from the 64-Hz counter was not generated during reading of the 64-Hz counter. 1: A carry from the second counter/binary counter 0 or from the 64-Hz counter was generated during reading of the 64-Hz counter.	R/W
b2	PF	Periodic Interrupt Flag	0: An interrupt was not generated after the period specified by the RCR1.PES[3:0] bits. 1: An interrupt was generated after the period specified by the RCR1.PES[3:0] bits. Note: Writing 1 to this flag has no effect.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R

RSR is the flag register for the periodic interrupt, carry, and alarm. This register is common to the calendar count mode and the binary count mode.
Each flag is set to 1 when the prescaler or the clock counter matches the given interrupt setting condition. The prescaler, clock counter, and the setting register of each interrupt are not reset, so each flag may be set by the time it is read. This register is set to 00h by an RTC software reset

AF flag (Alarm Flag)

This flag is set to 1 when the counter matches the alarm time set with the alarm registers in which the ENB bit is set to 1 (calendar count mode: RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAR; binary count mode: BCNT0AR, BCNT1AR, BCNT2AR, and BCNT3AR).
[Clearing condition]

- 0 is written to the AF flag.

[Setting condition]

- The counter matches the alarm registers (only including those registers in which the ENB bit is set to 1).

CF flag (Carry Flag)

The setting of this flag being 1 indicates that a carry from the second counter/binary counter 0 or from the 64-Hz counter was generated during reading of the 64-Hz counter. A value of the counter read when this flag is 1 is not guaranteed. Be sure to read the counter again in such cases.
[Clearing condition]

- 0 is written to the CF flag.

[Setting conditions]

- A carry from the second counter/binary counter 0 or from the 64-Hz counter during reading of the 64-Hz counter
- 1 is written to the CF flag.

PF flag (Periodic Interrupt Flag)

This flag indicates that an interrupt was generated after the period specified by the RCR1.PES[3:0] bits. This flag is set to "1" when the interrupt is generated.

[Clearing condition]

- 0 is written to the PF flag.

[Setting condition]

- An interrupt after the period specified by the RCR1.PES[3:0] bits.

16.2.18 RTC Control Register 1 (RCR1)

Address(es): RTC.RCR1 FCFF D022h [secure], FCFF 1022h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	PES[3:0]				—	PIE	CIE	AIE
Value after reset:	x	x	x	x	0	x	0	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	AIE	Alarm Interrupt Enable	0: An alarm interrupt request is disabled 1: An alarm interrupt request is enabled.	R/W
b1	CIE	Carry Interrupt Enable	0: A carry interrupt request is disabled 1: A carry interrupt request is enabled.	R/W
b2	PIE	Periodic Interrupt Enable	0: A periodic interrupt request is disabled 1: A periodic interrupt request is enabled.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7 to b4	PES[3:0]	Periodic Interrupt Select	b7 b4 0 1 1 0: A periodic interrupt is generated every 1/256 second*1 0 1 1 1: A periodic interrupt is generated every 1/128 second 1 0 0 0: A periodic interrupt is generated every 1/64 second 1 0 0 1: A periodic interrupt is generated every 1/32 second 1 0 1 0: A periodic interrupt is generated every 1/16 second 1 0 1 1: A periodic interrupt is generated every 1/8 second 1 1 0 0: A periodic interrupt is generated every 1/4 second 1 1 0 1: A periodic interrupt is generated every 1/2 second 1 1 1 0: A periodic interrupt is generated every 1 second 1 1 1 1: A periodic interrupt is generated every 2 seconds. Other than above: No periodic interrupts are generated.	R/W

Note 1. When EXTAL is selected (RCR4.RCKSEL = 1) while PES[3:0] = 0110b, a periodic interrupt is generated every 1/128 second.

RCR1 is used in both calendar count mode and in binary count mode. Bits AIE, PIE, and PES[3:0] are updated synchronously with the count source. When the RCR1 register is modified, check that all the bits are updated before proceeding.

AIE bit (Alarm Interrupt Enable)

This bit enables or disables alarm interrupt requests. When the counter matches the alarm time during deep standby, this LSI return from deep standby regardless of this bit set.

CIE bit (Carry Interrupt Enable)

This bit enables and disables interrupt requests when a carry to the RSECCNT/BCNT0 occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

PIE bit (Periodic Interrupt Enable)

This bit enables or disabled a periodic interrupt.

PES[3:0] bits (Periodic Interrupt Select)

These bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified by these bits.

16.2.19 RTC Control Register 2 (RCR2)

(1) In calendar count mode:

Address(es): RTC.RCR2 FCFF D024h [secure], FCFF 1024h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	CNT MD	HR24	AADJP	AADJE	—	ADJ30	RESET	START
Value after reset:	x	x	x	x	0	0	0	x

Bit	Symbol	Bit name	Description	R/W
b0	START	Start	0: Prescaler and time counter are stopped 1: Prescaler and time counter operate normally.	R/W
b1	RESET	RTC Software Reset	• In writing: 0: Writing is invalid 1: The prescaler and the target registers for RTC software reset*1 are initialized • In reading: 0: In normal time operation, or an RTC software reset has completed 1: During an RTC software reset.	R/W
b2	ADJ30	30-Second Adjustment	• In writing: 0: Writing is invalid 1: 30-second adjustment is executed. • In reading: 0: In normal time operation, or 30-second adjustment has completed 1: During 30-second adjustment.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	AADJE	Automatic Adjustment Enable*2	0: Automatic adjustment is disabled 1: Automatic adjustment is enabled.	R/W
b5	AADJP	Automatic Adjustment Period Select*2	0: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every minute 1: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every 10 seconds.	R/W
b6	HR24	Hours Mode	0: The RTC operates in 12-hour mode 1: The RTC operates in 24-hour mode.	R/W
b7	CNTMD	Count Mode Select	0: Calendar count mode 1: Binary count mode.	R/W

Note 1. R64CNT, RSECAR/BCNT0AR, RMINAR/BCNT1AR, RHRAR/BCNT2AR, RWKAR/BCNT3AR, RDAYAR/BCNT0AER, RMONAR/BCNT1AER, RYRAR/BCNT2AER, RYRAREN/BCNT3AER, RADJ, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP
Note 2. When EXTAL is selected, the setting of this bit is disabled.

RCR2 is related to hours mode, automatic adjustment function, 30-second adjustment, RTC software reset, and controlling count operation.

START bit (Start)

This bit stops or restarts the prescaler or time counter operation.
The START bit is updated in synchronization with the next cycle of the count source. When the START bit is modified, check that the bit is updated before proceeding.

RESET bit (RTC Software Reset)

This bit initializes the prescaler and registers to be reset by RTC software.
When 1 is written to the RESET bit, initialization starts in synchronization with the count source. When the initialization is completed, the RESET bit is automatically set to 0. Check that this bit is set to 0 before proceeding.

ADJ30 bit (30-Second Adjustment)

This bit is for 30-second adjustment.
When 1 is written to the ADJ30 bit, the RSECCNT value is rounded down to 00 seconds if it is currently less than 30 seconds and is rounded up to 1 minute if the value is 30 seconds or greater.
The 30-second adjustment is performed in synchronization with the count source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment is completed. If 1 is written to the ADJ30 bit, check that the bit is set to 0 before proceeding. When the 30-second adjustment is performed, the prescaler and R64CNT are also reset. The ADJ30 bit is set to 0 by an RTC software reset.

AADJE bit (Automatic Adjustment Enable)

This bit controls (enables or disables) automatic adjustment.
Set the plus–minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.
The AADJE bit is set to 0 by an RTC software reset.

AADJP bit (Automatic Adjustment Period Select)

This bit selects the automatic-adjustment period.
Set the plus–minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.
The AADJP bit is set to 0 by an RTC software reset.

HR24 bit (Hours Mode)

This bit specifies whether the RTC operates in 12- or 24-hour mode.
Use the START bit to stop counting before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.

CNTMD bit (Count Mode Select)

This bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.
When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated synchronously with the count source, and its value is fixed before the RTC software reset is complete.
For details on initial settings, see section 16.3.1, Outline of Initial Settings of Registers after Power On.

(2) In binary count mode:

Address(es): RTC.RCR2 FCFF D024h [secure], FCFF 1024h [non secure]

b7	CNTMD	Count Mode Select	0: The calendar count mode 1: The binary count mode.	R/W

Note 1. R64CNT, RSECAR/BCNT0AR, RMINAR/BCNT1AR, RHRAR/BCNT2AR, RWKAR/BCNT3AR, RDAYAR/BCNT0AER, RMONAR/BCNT1AER, RYRAR/BCNT2AER, RYRAREN/BCNT3AER, RADJ, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP
Note 2. When EXTAL is selected, the setting of this bit is disabled.

START bit (Start)

This bit stops or restarts the prescaler or counter (clock) operation.
The START bit is updated in synchronization with the count source. When the START bit is modified, check that the bit is updated before proceeding.

RESET bit (RTC Software Reset)

This bit initializes the prescaler and registers to be reset by RTC software.
When 1 is written to the RESET bit, initialization starts in synchronization with the count source. When the initialization is completed, the RESET bit is automatically set to 0. When 1 is written to the RESET bit, check that the bit is set to 0 before proceeding.

AADJE bit (Automatic Adjustment Enable)

This bit controls (enables or disables) automatic adjustment.
Set the plus–minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit. The AADJE bit is set to 0 by an RTC software reset.

AADJP bit (Automatic Adjustment Period Select)

This bit selects the automatic-adjustment period.
Correction period can be selected from 32 second units or 8 second units in binary count mode.
Set the plus–minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit. The AADJP bit is set to 0 by an RTC software reset.

CNTMD bit (Count Mode Select)

This bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.
When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated synchronously with the count source, and its value is fixed before the RTC software reset is completed.
For details on initial settings, see section 16.3.1, Outline of Initial Settings of Registers after Power On.

16.2.20 RTC Control Register 3 (RCR3)

Address(es): RTC.RCR3 FCFF D026h [secure], FCFF 1026h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RTCEN
Value after reset:	0	0	0	0	0	0	0	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	RTCEN	32kHz clock generator control bit	0: The 32-kHz clock oscillator is stopped. 1: The 32-kHz clock oscillator is operated.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

RCR3 controls the 32-kHz clock oscillator in the clock generation circuit. For control of the 32-kHz clock oscillator, refer to section 6, Clock Pulse Generator.
This register has the same function in calendar count mode and binary count mode.
After rewriting this register, confirm that all bit values are updated and execute the next processing.

RTCEN Bit (32kHz Clock Generator Control Bit)

This register controls the operation and stop of the 32 kHz clock oscillator.
The operation and stop of the 32-kHz clock oscillator are controlled by RTCEN bits. When either bit is set in operation, the 32 kHz clock oscillator is in operation.
To use the 32-kHz clock as count source of RTC3, set the 32-kHz clock oscillator with RTCEN bit.

16.2.21 RTC Control Register 4 (RCR4)

Address(es): RTC.RCR4 FCFF D028h [secure], FCFF 1028h [non secure]

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RCK SEL
Value after reset:	0	0	0	0	0	0	0	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	RCKSEL	Count Source Select	0: 32-kHz clock is selected. 1: EXTAL clock is selected.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RCR4 selects the count source and is used in both calendar count mode and binary count mode.
When the RCKSEL bit is set to 0, the time is counted with the 32-kHz clock. When the bit is set to 1, the time is counted with EXTAL clock.

RCKSEL bit (Count Source Select)

This bit selects the count source from the 32-kHz clock and EXTAL clock.
The count source must be selected only once before making the initial settings of the RTC registers at power on.

16.2.22 Frequency Register H/L (RFRH/L)

RFRH Register

Address(es): RTC.RFRH FCFF D02Ah [secure], FCFF 102Ah [non secure]

RFRH Register

Bit	Symbol	Bit name	Description	R/W
b0	RFC[16]	Frequency Comparison Value	Set the frequency comparison value to generate a 128-Hz clock from the EXTAL frequency.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

RFRL Register

Bit	Symbol	Bit name	Description	R/W
b15 to b0	RFC[15:0]	Frequency Comparison Value	Set the frequency comparison value to generate a 128-Hz clock from the EXTAL frequency.	R/W

RFRH and RFRL are registers for controlling the prescaler when EXTAL is selected. This register is a common feature in the calendar count mode and binary count mode.
The time counter of this module operates on a 128-Hz clock signal as the base clock. Therefore, when EXTAL is selected, EXTAL is divided by the prescaler to generate a 128-Hz clock signal. Clock mode 0, the EXTAL clock is divided only by the prescaler to generate a 128-Hz clock signal. Clock mode 1, the EXTAL clock is divided by twice, and divided by the prescaler to generate a 128-Hz clock signal. Set the frequency comparison value in the RFC[16:0] bits to generate a 128-Hz clock from the EXTAL frequency.
Change the frequency comparison value according to the EXTAL clock frequency. For calculation method, refer to the following. A value from 0000_0007h through 0001_FFFFh can be specified as the frequency comparison value. If a value outside of this range is specified, the RTC does not operate correctly.
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2. The range of EXTAL clock frequency that can generate a 128-Hz clock is 1.024-kHz to 16.777-MHz in clock mode 0 and 2.048-kHz to 33.555-MHz in clock mode 1.
The operating frequency of the peripheral module clock and the EXTAL should be such that the peripheral module clock is greater than or equal to the EXTAL.

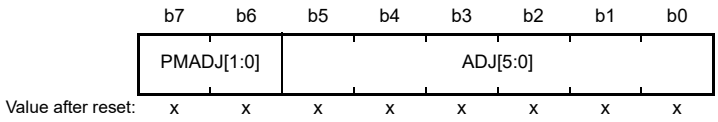
Calculation method of frequency comparison value:
Clock mode 0,
RFC[16:0] = (EXTAL clock frequency) / 128 - 1
Clock mode 1,
RFC[16:0] = (EXTAL clock frequency) / 256 - 1

Table 16.5 Setting Example

Clock Frequency			RFC Setting Value
EXTAL	Clock mode 0	10MHz	H'1312C
		12MHz	H'16E35
	Clock mode 1	20MHz	H'1312C
		24MHz	H'16E35

16.2.23 Time Error Adjustment Register (RADJ)

Address(es): RTC.RADJ FCFF D02Eh [secure], FCFF 102Eh [non secure]



x: Undefined

Bit	Symbol	Bit name	Description	R/W
b5 to b0	ADJ[5:0]	Adjustment Value	These bits specify the adjustment value from the prescaler	R/W
b7, b6	PMADJ[1:0]	Plus–Minus	b7 b6 0 0: Adjustment is not performed 0 1: Adjustment is performed by the addition to the prescaler 1 0: Adjustment is performed by the subtraction from the prescaler 1 1: Setting prohibited.	R/W

Adjustment is performed by the addition to or subtraction from the prescaler. If the automatic adjustment enable (RCR2.AADJE) bit is 0, adjustment is performed when writing to the RADJ. If the RCR2.AADJE bit is 1, adjustment is performed in the interval specified by the automatic adjustment period select (RCR2.AADJP) bit.
The current adjustment by software (disabling automatic adjustment) might be invalid if the following adjustment value is specified within 320 cycles of the count source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the count source after the register setting, then specify the next adjustment value.
RADJ is updated in synchronization with the count source. When RADJ is modified, check that all the bits are updated before continuing with further processing. This register is set to 00h by an RTC software reset. The setting of this register is enabled only when the 32-kHz clock is selected. When EXTAL clock is selected, adjustment is not performed.

ADJ[5:0] bits (Adjustment Value)

These bits specify the adjustment value (the number of 32-kHz clock cycles) from the prescaler.

PMADJ[1:0] bits (Plus–Minus)

These bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

16.3 Operation

16.3.1 Outline of Initial Settings of Registers after Power On

After the power is turned on, the initial settings for the clock setting, count mode setting, time error adjustment, time setting, alarm, interrupt, and time capture control register should be performed.

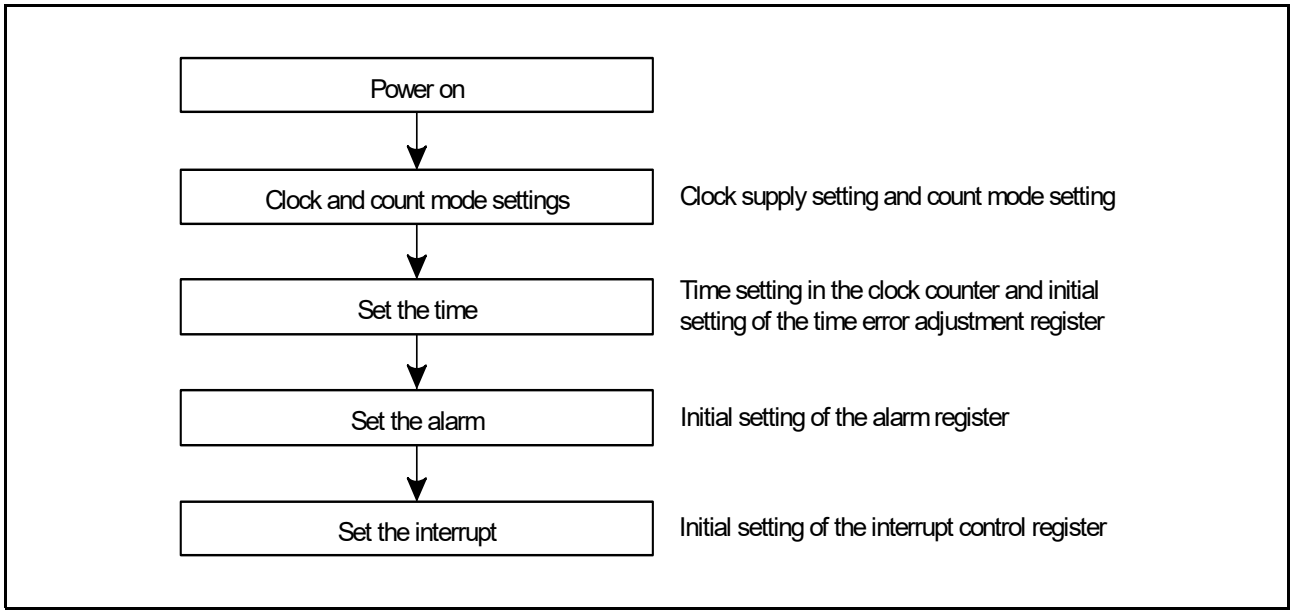


Figure 16.2 Outline of initial settings after a power on

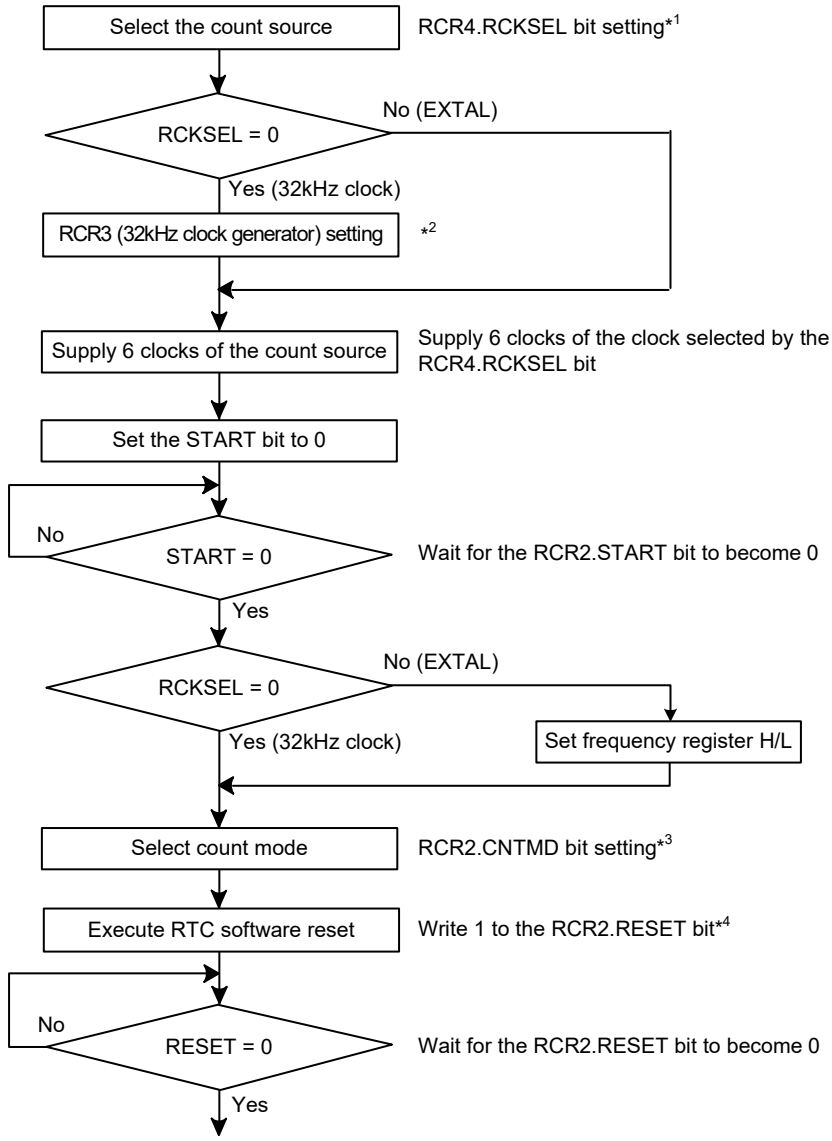
16.3.2 Clock and Count Mode Setting Procedure

Figure 16.3 shows how to set the clock and the count mode.

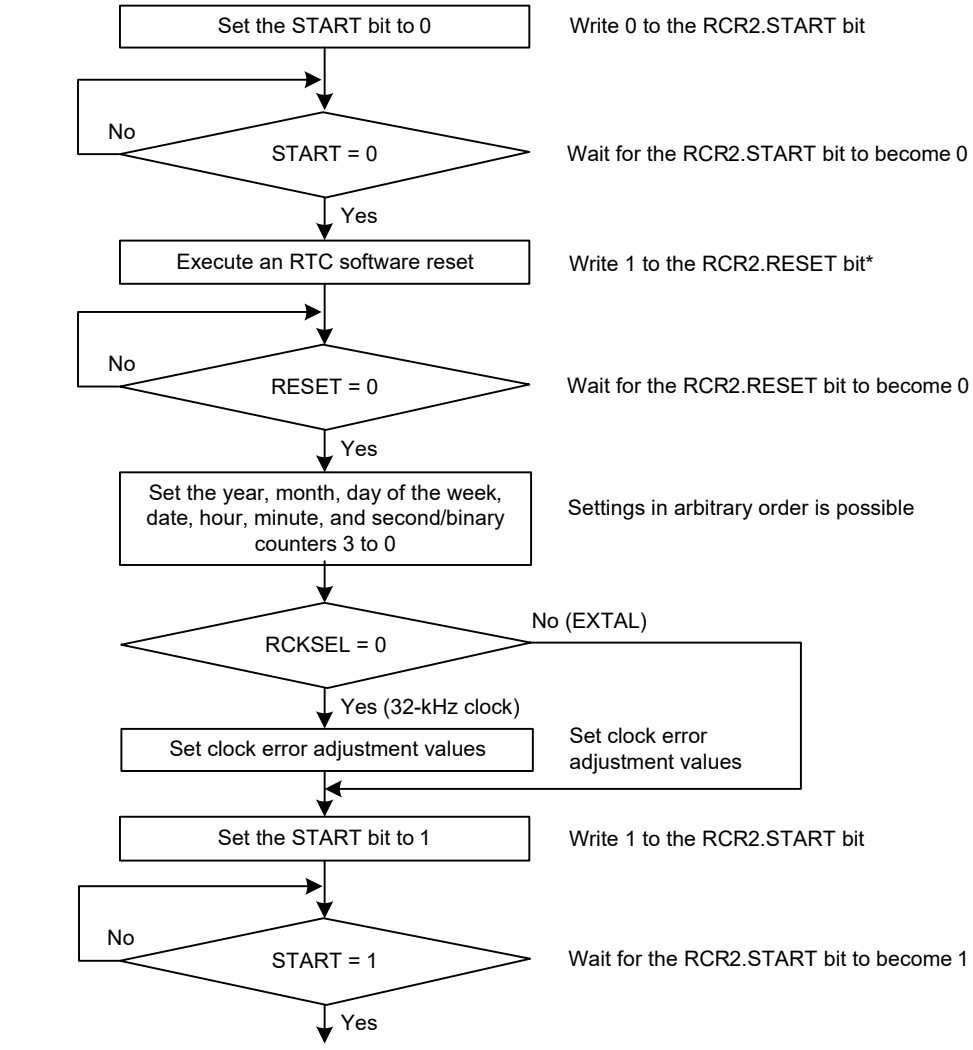


Note 1. This setting can only be made once after the power supply has been turned on.
Note 2. Waiting for the oscillation settling time (t_{ROSC}) is required after 1 has been written to RCR3.RTCEN. For the settling time, see the row with the tag “On-chip oscillation circuit oscillation settling time (RTC_X1)” in Table 56.6 of section 56, Electrical Characteristics.
Note 3. This step is not necessary if the count mode is set concurrently by setting the START bit to 0.
Note 4. A value associated with the count mode setting must be written to the RCR2.CNTMD bit.

Figure 16.3 Clock and count mode setting procedure

16.3.3 Setting the Time

Figure 16.4 shows how to set the time.



Note: This step is not necessary for the time-setting procedure because an RTC software reset is executed in the clock setting procedure of the initial settings for the power supply.

Figure 16.4 Setting the time

16.3.4 30-Second Adjustment

Figure 16.5 shows how to execute a 30-second adjustment.

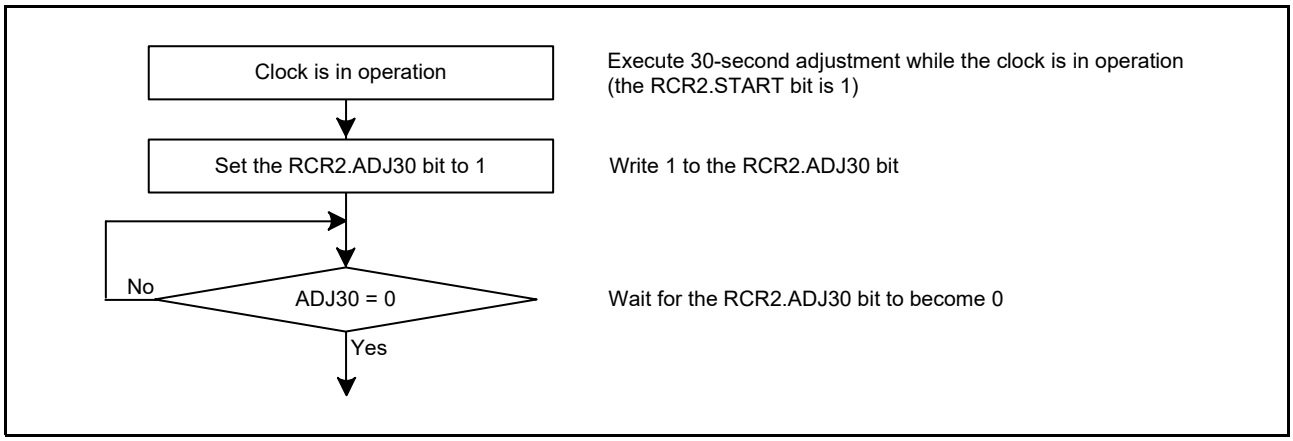


Figure 16.5 30-Second adjustment

16.3.5 Reading 64-Hz Counter and Time

Figure 16.6 shows how to read a 64-Hz counter and time.

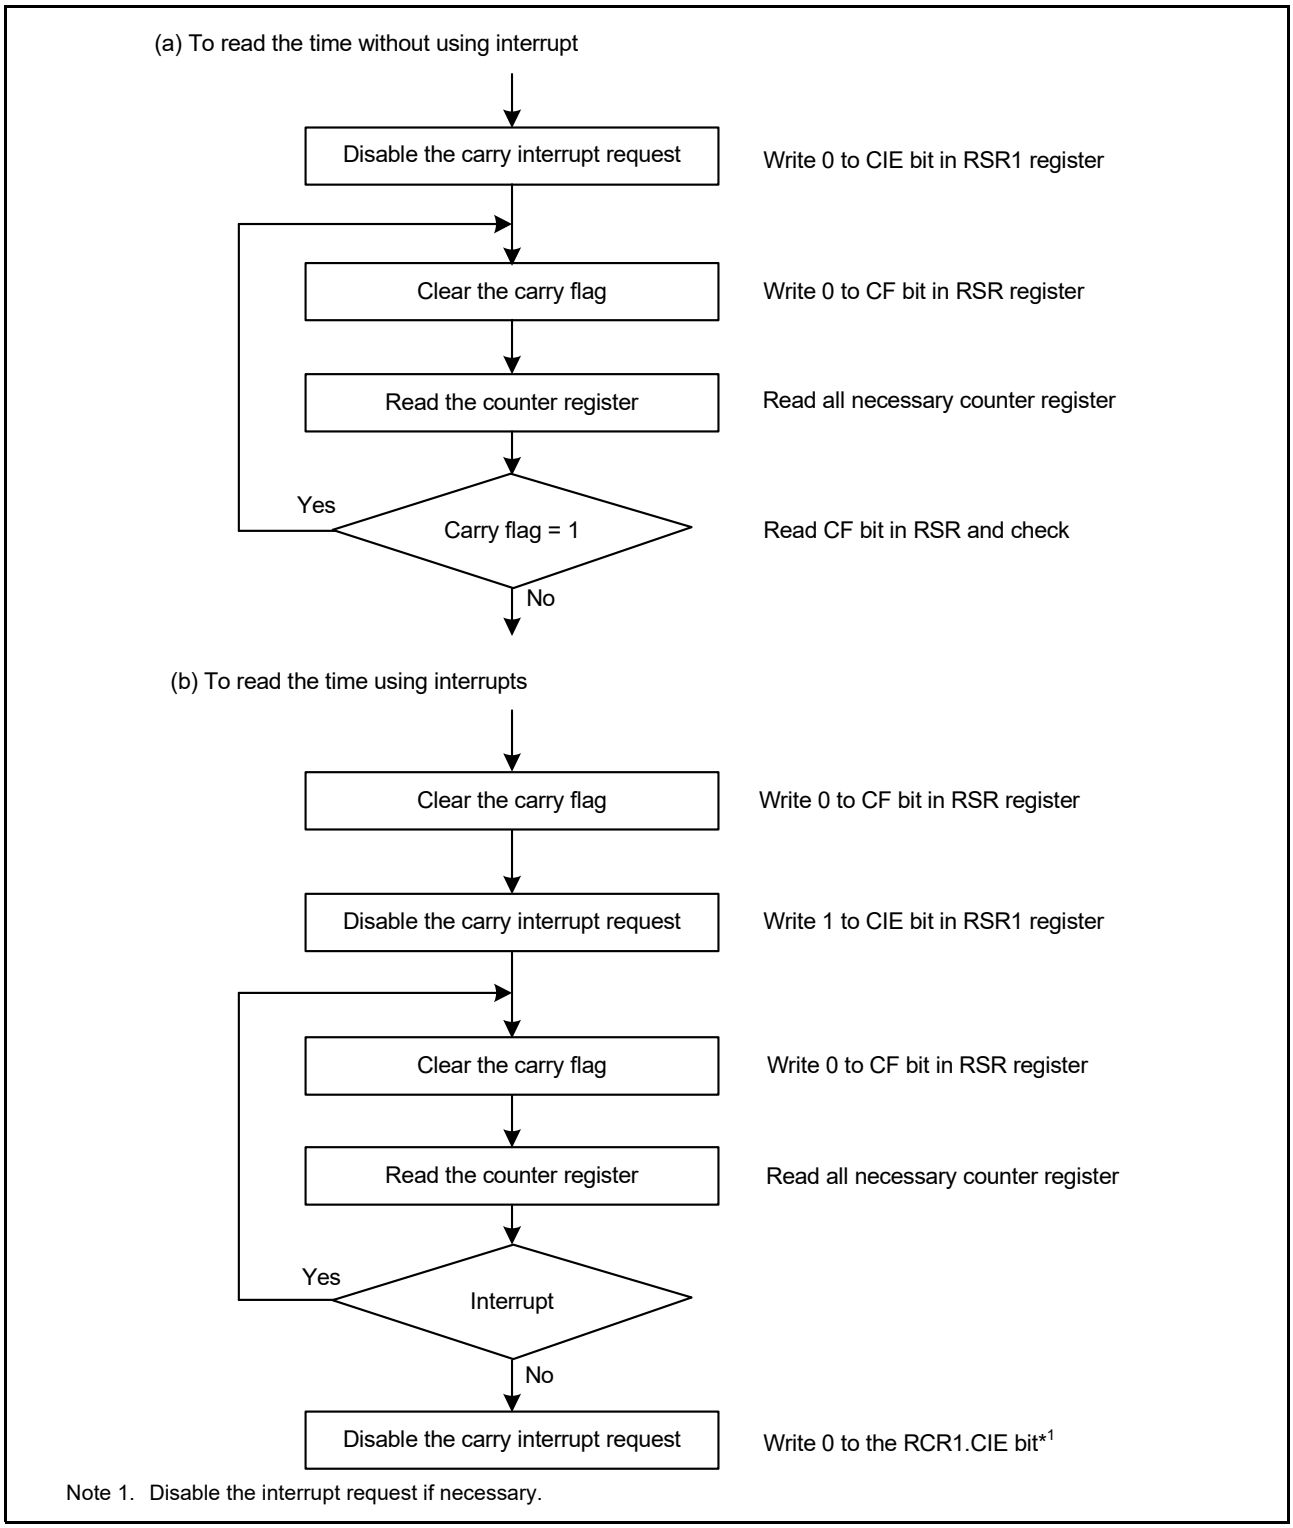

Figure 16.6 Reading time

If a carry occurs while the 64-Hz counter and time are read, the correct time is not obtained, therefore they must be read again. The procedure for reading the time without using interrupts is shown in (a) in Figure 16.6, and the procedure using carry interrupts is shown in (b). To keep the program simple, method (a) should be used in most cases.

16.3.6 Alarm Function

Figure 16.7 shows how to use the alarm function.

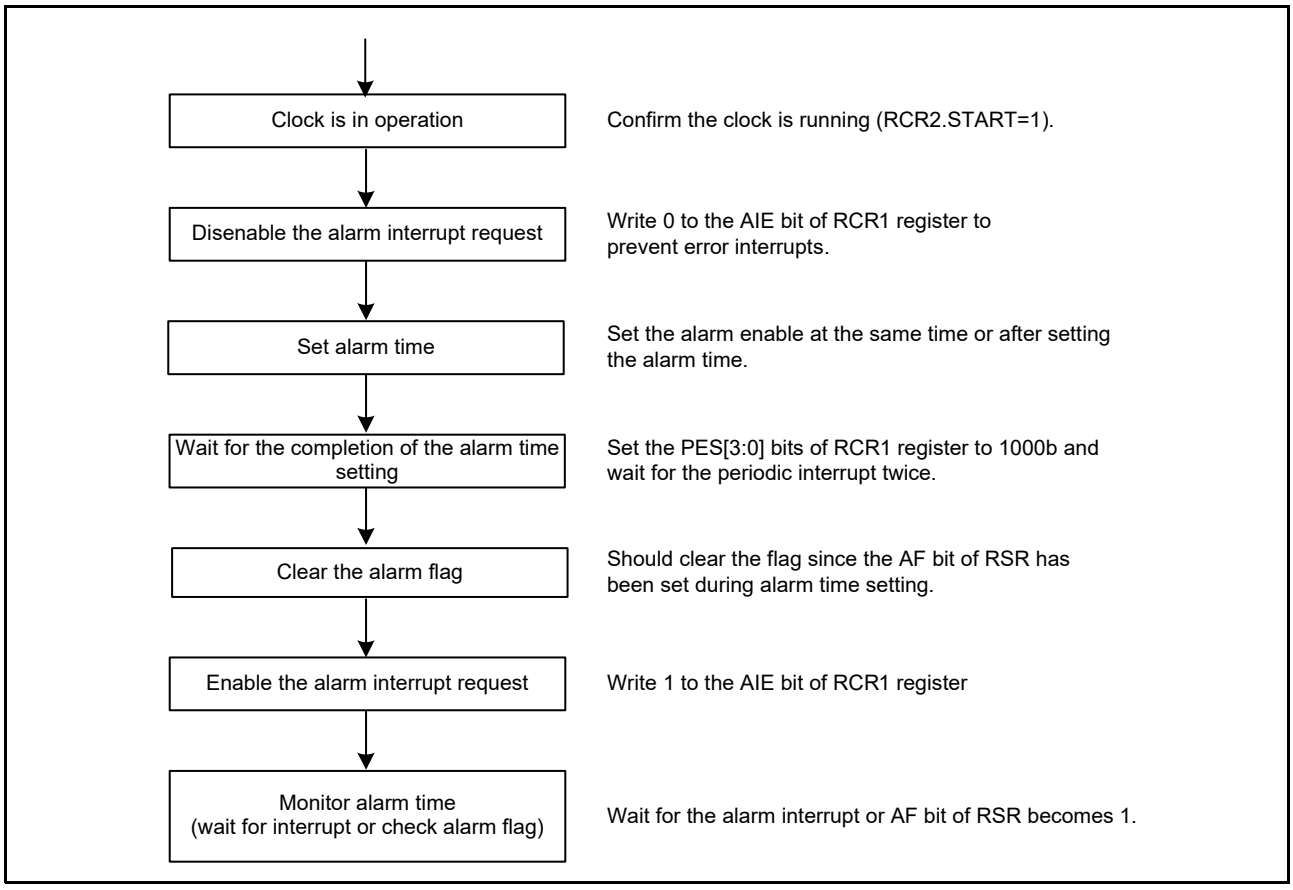

Figure 16.7 Using alarm function

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the alarm enable register associated with the target bit of the alarm, and set the alarm time in the alarm register. For bits that are not the target of the alarm, write 0 to the ENB bit of the alarm enable register.

When the counter and the alarm time match, the alarm flag of RSR is set to 1. Alarm detection can be confirmed by reading the Interrupt Set-Pending Register corresponding to the RTC_ALM interrupt, but an interrupt should be used in most cases. If 1 is set in the AIE bit of RCR1 register, an alarm interrupt is generated in the event of the alarm, enabling the alarm to be detected.

The alarm flag of RSR is cleared by writing 0.

When the counter and the alarm time match in a low power consumption state, the MCU returns from the low power consumption state.

16.3.7 Procedure for Disabling Alarm Interrupt

Figure 16.8 shows the procedure for disabling the enabled alarm interrupt request.

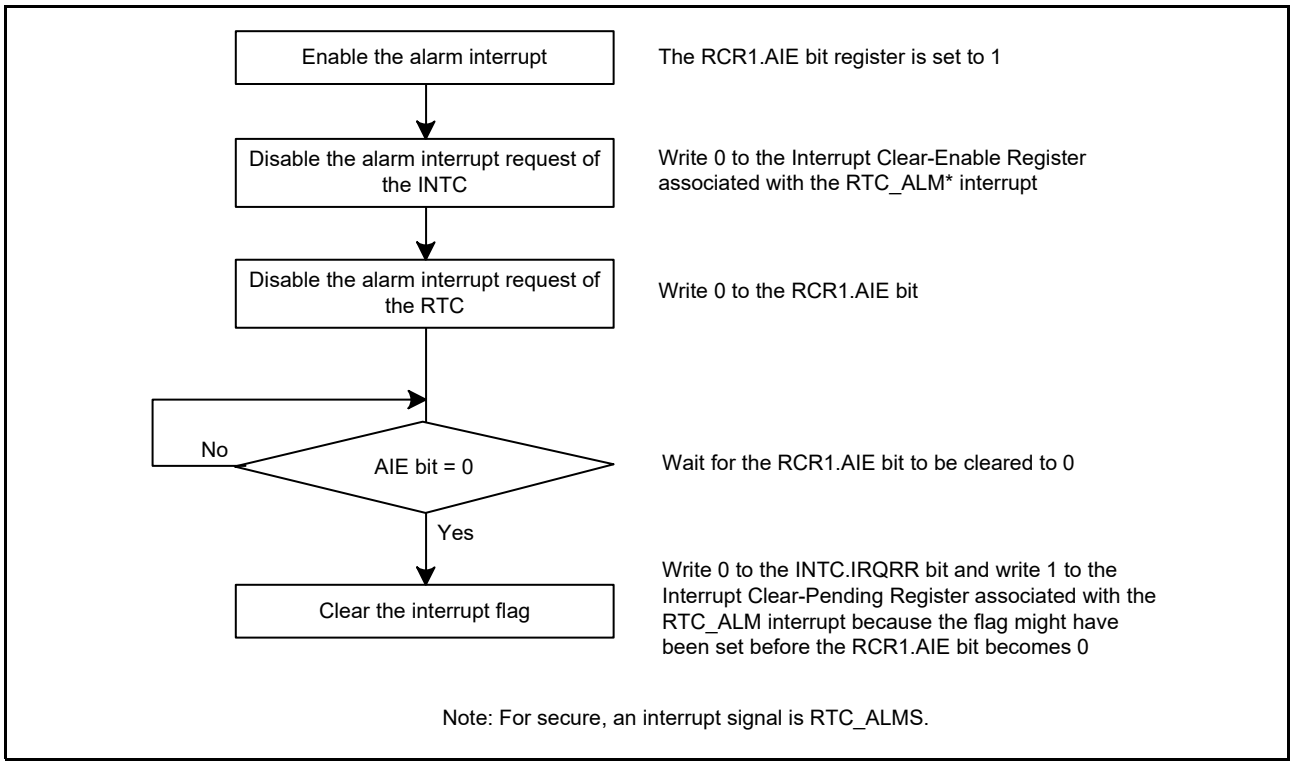

Figure 16.8 Procedure for disabling alarm interrupt request

16.3.8 Time Error Adjustment Function

The time error adjustment function is used to correct errors, running fast or slow, in the time due to variation in the precision of oscillation by the 32-kHz clock. Because 32,768 cycles of the 32-kHz clock constitute 1 second of operation when the 32-kHz clock is selected, the clock runs fast if the 32-kHz clock frequency is high and slow if the 32-kHz clock frequency is low. There are two types of time error adjustment functions:

- Automatic Adjustment
- Adjustment by Software.

Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

16.3.8.1 Automatic Adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1. Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in RADJ every time the adjustment period selected by the RCR2.AADJE bit elapses.

(1) [Example 1] 32-kHz clock running at 32.769 kHz

(a) Adjustment procedure

When the 32-kHz clock is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.
Register settings: (when RCR2.CNTMD = 0)

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 60 (3Ch).

(2) [Example 2] 32-kHz clock running at 32.766 kHz

(a) Adjustment procedure

When the 32-kHz clock is running at 32.766 kHz, 1 second elapses every 32,766 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs slow by two clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.
Register settings: (when RCR2.CNTMD = 0)

- RCR2.AADJP = 1 (adjustment every 10 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler.)
- RADJ.ADJ[5:0] = 20 (14h).

(3) [Example 3] 32-kHz clock running at 32.764 kHz

(a) Adjustment procedure

When the 32-kHz clock is running at 32.764 kHz, 1 second elapses every 32,764 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs slow by four clock cycles every second. The time on the clock is slow by 32 clock cycles every 8 seconds, so adjustment can take the form of setting the clock forward by 32 cycles every 8 seconds.

Register settings when the RCR2.CNTMD bit is 1

- RCR2.AADJP = 1 (adjustment every 8 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 32 (20h).

16.3.8.2 Adjustment by Software

Enable adjustment by software by setting the RCR2.AADJE bit to 0. Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ at the time of execution of a write instruction to the RADJ.

(1) [Example 1] 32-kHz clock running at 32.769 kHz

(a) Adjustment procedure

When the 32-kHz clock is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by one clock cycle per second, so adjustment can take the form of setting the clock back by one cycle every second.

(b) Register settings

- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 1 (01h)
  This is written to the RADJ register once per 1-second interrupt.

16.3.8.3 Procedure for Changing the Mode of Adjustment

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

To change adjustment by software to automatic adjustment:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 1 (automatic adjustment is enabled).
3. Use the RCR2.AADJP bit to select the period of adjustment.
4. In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

To change automatic adjustment to adjustment by software:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).
3. Proceed with the adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the desired time. After that, the time is adjusted every time a value is written to the RADJ register.

16.3.8.4 Procedure for Stopping Adjustment

Stop the adjustment by setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

16.4 Interrupt Sources

The RTC has three interrupt sources and are listed in Table 16.6.

Table 16.6 RTC Interrupt sources

Name	Interrupt sources
RTC_ALM	Alarm interrupt
RTC_PRD	Periodic interrupt
RTC_CUP	Carry interrupt

Note: For secure, interrupt sources are RTC_ALMS, RTC_PRDS and RTC_CUPS, respectively.

(1) Alarm interrupt (RTC_ALM, RTC_ALMS)

This interrupt is generated according to the result of comparison between the alarm registers and realtime clock counters. For details, see section 16.3.6, Alarm Function.

Because there is a possibility that the interrupt flag might be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and clear the INTC.IRQRR and the interrupt Set-Pending Register corresponding to the RTC_ALM interrupt to 0 again after modifying values of the alarm registers. After the interrupt flag for the alarm interrupt is set to 1 and the state is returned to non-matching of the alarm registers and clock counters, the flag does not set again until there is a further match or the values of the alarm registers are modified again.

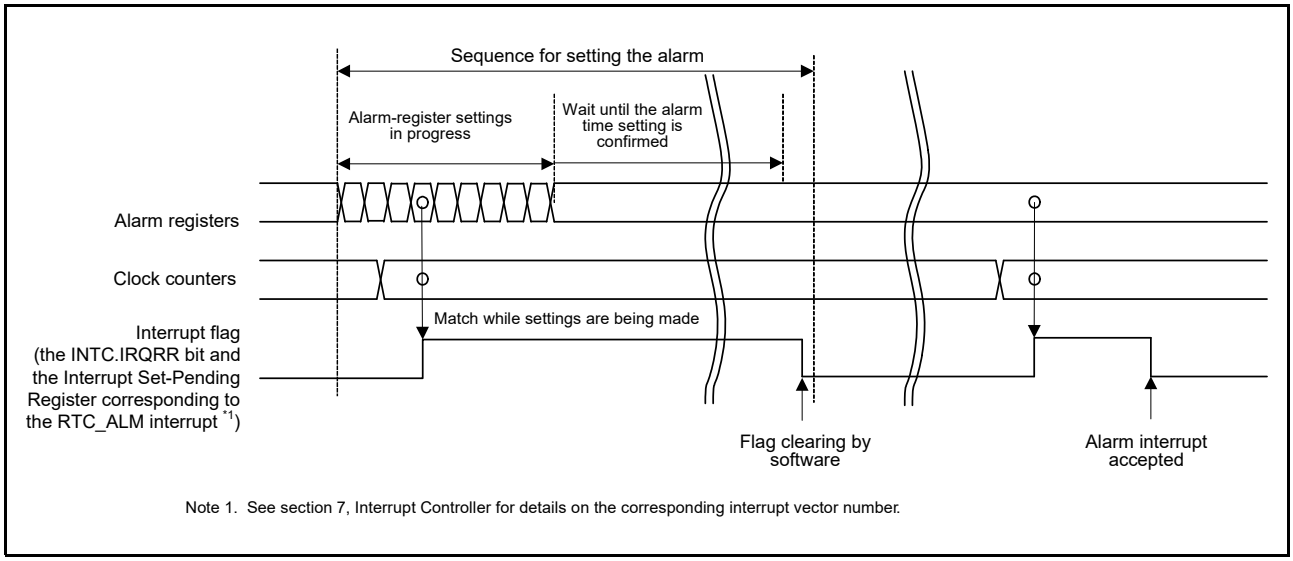

Figure 16.9 Timing chart for the alarm interrupt (RTC_ALM, RTC_ALMS)

(2) Periodic interrupt (RTC_PRD, RTC_PRDS)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected through the RCR1.PES[3:0] bits.

(3) Carry interrupt (RTC_CUP, RTC_CUPS)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

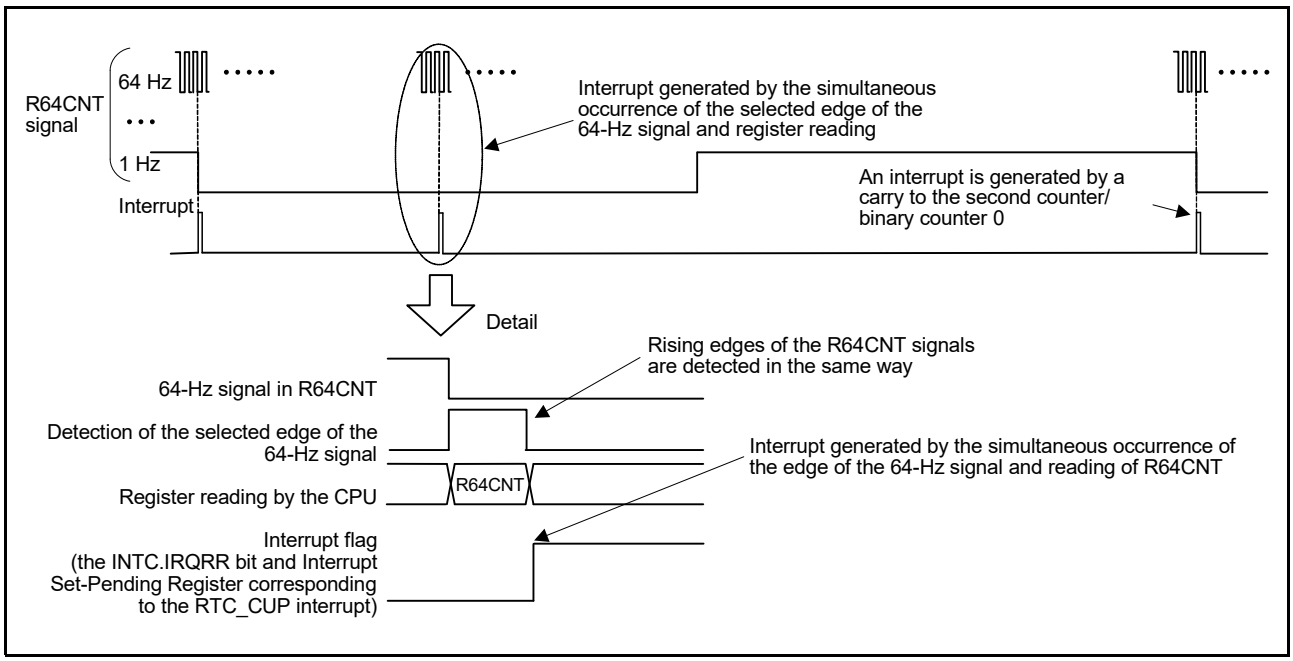

Figure 16.10 Timing chart for the Carry interrupt (RTC_CUP, RTC_CUPS)

16.5 Usage Notes

16.5.1 Register Writing during Counting

The following registers must not be written to during counting, that is, while the RCR2.START bit = 1.

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3
- RMONCNT
- RYRCNT
- RCR2.HR24
- RFRH, RFRL

The counter must be stopped before writing to any of the these registers.

16.5.2 Use of Periodic Interrupts

The procedure for using periodic interrupts is shown in Figure 16.11.
The generation and period of the periodic interrupt can be changed by setting the RCR1.PES[3:0] bits. However, because the prescaler R64CNT and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting the RCR1.PES[3:0] bits. In addition, any of the following can affect the interrupt period:

- Stopping/restarting or resetting counter operation
- Reset by RTC software
- 30-second adjustment by changing the RCR2 value.

When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted according to the adjustment value.

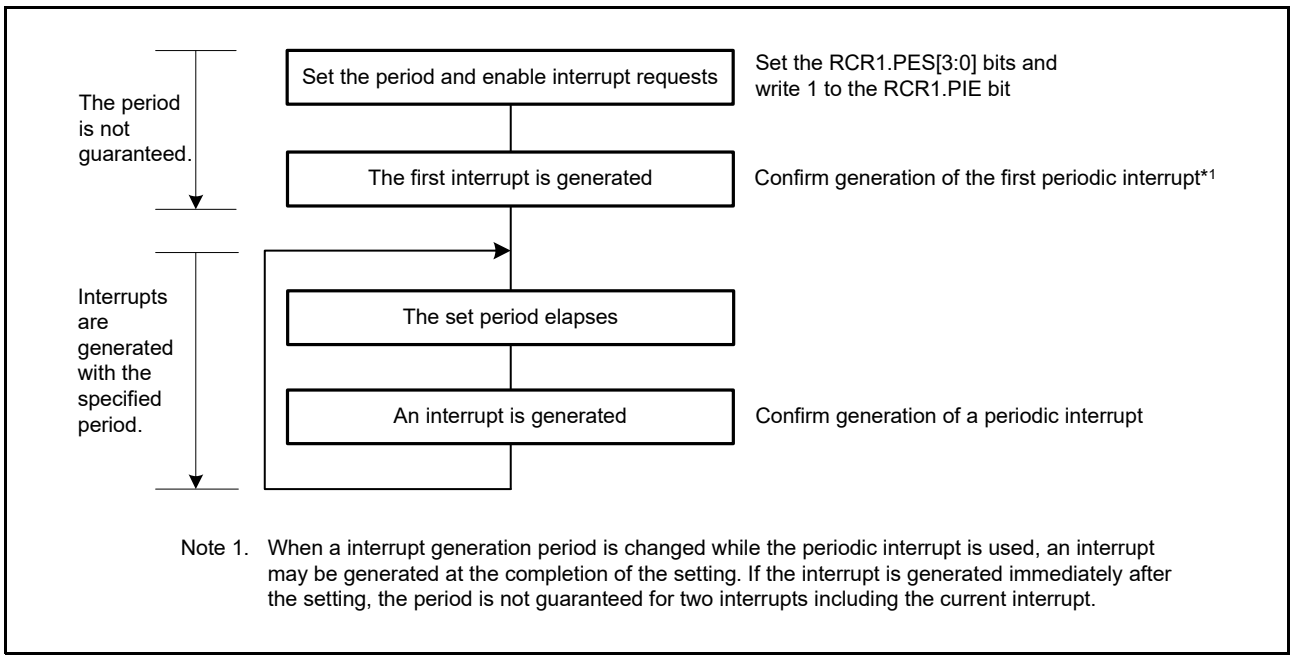

Figure 16.11 Using periodic interrupt function

16.5.3 Transitions to Low Power Consumption Modes after Setting Registers

A transition to a low power consumption state (Software Standby mode or Deep Standby mode) during writing to an RTC register might destroy the value of the register. After setting the register, confirm that the setting is in place before initiating a transition to a low power consumption state.

16.5.4 Notes When Writing to and Reading from Registers

- When reading a counter register such as the second counter after having written to the counter register, follow the procedure in section 16.3.5, Reading 64-Hz Counter and Time
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, RCR4 register, or frequency register is reflected when four read operations are performed after writing
- The values written to the RCR1.CIE bits can be read immediately after writing
- To read the value from the timer counter after return from a reset, period in Software Standby mode, or the battery backup state, wait for 1/128 second while the clock is operating (RCR2.START bit = 1)
- After a reset is generated, write to the RTC register after six cycles of the count source clock have elapsed.

16.5.5 Changing the Count Mode

When changing the count mode (calendar/binary), set the RCR2.START bit to 0, stop the counting operation, then restart it from the initial setting. For details on the initial setting, see section 16.3.1, Outline of Initial Settings of Registers after Power On.

16.5.6 Procedure when the Realtime Clock is not to be Used

When the realtime clock is not in use, stop the clock supply to the RTC as described in section 52.4.2, Usage Notes when the Realtime Clocks are Not to be Used.

17. Serial Communications Interface with FIFO (SCIFA)

This LSI has five channels of serial communication interface (SCIFA) with FIFO that support both asynchronous and clock synchronous serial communication. The SCIFA has 16-stage FIFO buffers for transmission and reception, respectively, for each channel that enable this LSI to perform efficient high-speed continuous communication.

17.1 Overview

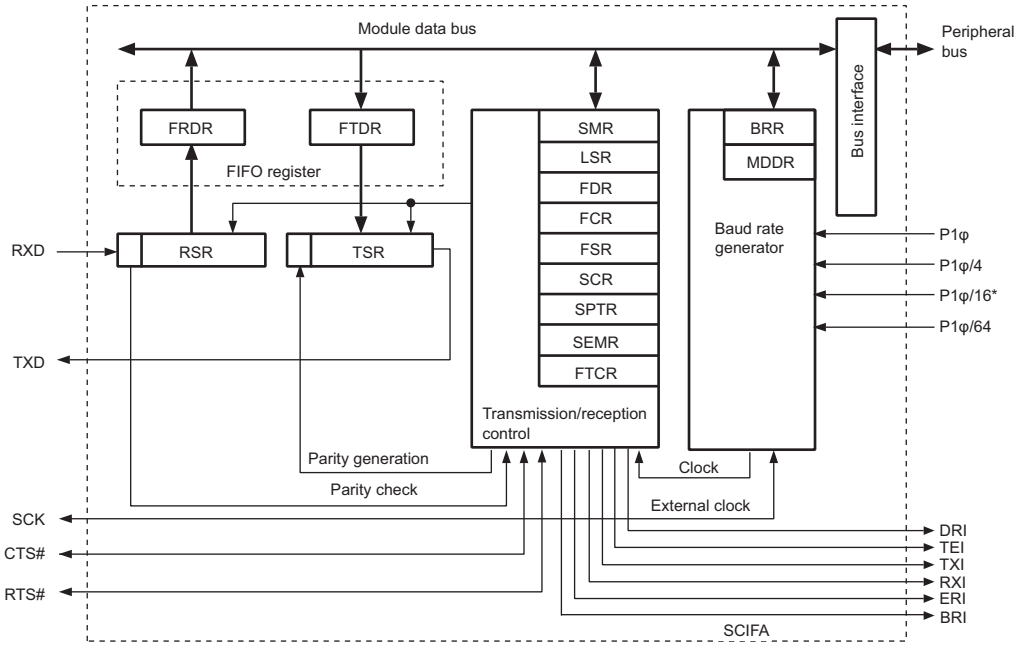
Table 17.1 lists the specifications of the SCIFA.

Table 17.1 Specifications of SCIFA

Item		Description
Channel		5 channels
Serial communication method		Asynchronous communication mode and clock synchronous communication mode
Transfer speed		Selectable bit rate with an on-chip baud rate generator
Full duplex communication		Transmitting section: realizes continuous data transmission using 16-stage FIFO buffer Receiving section: realizes continuous data reception using 16-stage FIFO buffer
Data transmission		Selectable either LSB-first or MSB-first transfer
Interrupt source		The following six sources: • Transmit-end (TEIF) • Transmit-FIFO-data-empty (TXIF) • Receive-FIFO-data-full (RXIF) • Receive-data-ready (DRIF)*1 • Receive-error (ERIF) • Break detection or overrun (BRIF)
Asynchronous communication mode	Character length	7 or 8 bits
	Transmission stop bit length	1 or 2 bits
	Parity	Even, odd, or none
	Receive error detection	Parity, overrun, and framing errors
	Hardware flow control	Controls data transmission and reception using the CTS# and RTS# pins. Not applicable to channel 3 (SCIF3) and channel 4 (SCIF4)
	Break detection	Break signal detection function by hardware.
	Clock source	Selectable from internal or external clock
	Noise cancellation	Incorporates a digital noise filter in the RXD pin input path.
Clock synchronous communication mode	Character length	8 bits
	Receive error detection	Detects an overrun error as a receive error.
	Clock source	Selectable either internal or external clock
Bit rate modulation		Enables errors to be decreased by correcting the output of the on-chip baud rate generator.

Note 1. Effective only for asynchronous communication mode

Figure 17.1 shows a block diagram of the SCIFA.



RSR:	Receive shift register	BRR:	Bit rate register
FRDR:	Receive FIFO data register	SPTR:	Serial port register
TSR:	Transmit shift register	FCR:	FIFO control register
FTDR:	Transmit FIFO data register	FDR:	FIFO data count register
SMR:	Serial mode register	LSR:	Line status register
SCR:	Serial control register	SEMR:	Serial extended mode register
FSR:	Serial status register	FTCR:	FIFO trigger control register
MDDR:	Modulation duty register		

Note: * The P1φ/16 clock is not input in the case of the channel 0 interface.

Figure 17.1 Block Diagram of SCIFA

Table 17.2 lists the input/output pins of the SCIFA.

Table 17.2 Pin Configuration of the SCIFA

Channel	Item	Pin Name	I/O	Function
0 to 4	Serial clock pin	SCK0 to SCK4	I/O	Transmission/reception clock input/output, general output
	Receive data pin	RxD0 to RxD4	Input	Receive data input
	Transmit data pin	TxD0 to TxD4	Output	Transmit data output
0 to 2	Transmission/reception start control pin	CTS#0 to CTS#2	I/O	Input for hardware flow control (transmission enable signal) / general output
		RTS#0 to RTS#2	Output	Output for hardware flow control (transmission request signal) / general output

Note: Channels of each pin is omitted.

17.2 Register Descriptions

Table 17.3 List of Registers

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	Serial mode register	SMR	R/W	0000h	H'E8007000	16
	Bit rate register	BRR	R/W	FFh	H'E8007002	8
	Modulation duty register	MDDR	R/W	FFh	H'E8007002	8
	Serial control register	SCR	R/W	0000h	H'E8007004	16
	Transmit FIFO data register	FTDR	W	Undefined	H'E8007006	8
	Serial status register	FSR	R/W	0020h	H'E8007008	16
	Receive FIFO data register	FRDR	R	Undefined	H'E800700A	8
	FIFO control register	FCR	R/W	0000h	H'E800700C	16
	FIFO data count register	FDR	R	0000h	H'E800700E	16
	Serial port register	SPTR	R/W	00xxh	H'E8007010	16
	Line status register	LSR	R/W	0000h	H'E8007012	16
	Serial extended mode register	SEMR	R/W	00h	H'E8007014	8
	FIFO trigger control register	FTCR	R/W	1F1Fh	H'E8007016	16
1	Serial mode register	SMR	R/W	0000h	H'E8007800	16
	Bit rate register	BRR	R/W	FFh	H'E8007802	8
	Modulation duty register	MDDR	R/W	FFh	H'E8007802	8
	Serial control register	SCR	R/W	0000h	H'E8007804	16
	Transmit FIFO data register	FTDR	W	Undefined	H'E8007806	8
	Serial status register	FSR	R/W	0020h	H'E8007808	16
	Receive FIFO data register	FRDR	R	Undefined	H'E800780A	8
	FIFO control register	FCR	R/W	0000h	H'E800780C	16
	FIFO data count register	FDR	R	0000h	H'E800780E	16
	Serial port register	SPTR	R/W	00xxh	H'E8007810	16
	Line status register	LSR	R/W	0000h	H'E8007812	16
	Serial extended mode register	SEMR	R/W	00h	H'E8007814	8
	FIFO trigger control register	FTCR	R/W	1F1Fh	H'E8007816	16
2	Serial mode register	SMR	R/W	0000h	H'E8008000	16
	Bit rate register	BRR	R/W	FFh	H'E8008002	8
	Modulation duty register	MDDR	R/W	FFh	H'E8008002	8
	Serial control register	SCR	R/W	0000h	H'E8008004	16
	Transmit FIFO data register	FTDR	W	Undefined	H'E8008006	8
	Serial status register	FSR	R/W	0020h	H'E8008008	16
	Receive FIFO data register	FRDR	R	Undefined	H'E800800A	8
	FIFO control register	FCR	R/W	0000h	H'E800800C	16
	FIFO data count register	FDR	R	0000h	H'E800800E	16
	Serial port register	SPTR	R/W	00xxh	H'E8008010	16
	Line status register	LSR	R/W	0000h	H'E8008012	16
	Serial extended mode register	SEMR	R/W	00h	H'E8008014	8
	FIFO trigger control register	FTCR	R/W	1F1Fh	H'E8008016	16

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
3	Serial mode register	SMR	R/W	0000h	H'E8008800	16
	Bit rate register	BRR	R/W	FFh	H'E8008802	8
	Modulation duty register	MDDR	R/W	FFh	H'E8008802	8
	Serial control register	SCR	R/W	0000h	H'E8008804	16
	Transmit FIFO data register	FTDR	W	Undefined	H'E8008806	8
	Serial status register	FSR	R/W	0020h	H'E8008808	16
	Receive FIFO data register	FRDR	R	Undefined	H'E800880A	8
	FIFO control register	FCR	R/W	0000h	H'E800880C	16
	FIFO data count register	FDR	R	0000h	H'E800880E	16
	Serial port register	SPTR	R/W	00xxh	H'E8008810	16
	Line status register	LSR	R/W	0000h	H'E8008812	16
	Serial extended mode register	SEMR	R/W	00h	H'E8008814	8
	FIFO trigger control register	FTCR	R/W	1F1Fh	H'E8008816	16
4	Serial mode register	SMR	R/W	0000h	H'E8009000	16
	Bit rate register	BRR	R/W	FFh	H'E8009002	8
	Modulation duty register	MDDR	R/W	FFh	H'E8009002	8
	Serial control register	SCR	R/W	0000h	H'E8009004	16
	Transmit FIFO data register	FTDR	W	Undefined	H'E8009006	8
	Serial status register	FSR	R/W	0020h	H'E8009008	16
	Receive FIFO data register	FRDR	R	Undefined	H'E800900A	8
	FIFO control register	FCR	R/W	0000h	H'E800900C	16
	FIFO data count register	FDR	R	0000h	H'E800900E	16
	Serial port register	SPTR	R/W	00xxh	H'E8009010	16
	Line status register	LSR	R/W	0000h	H'E8009012	16
	Serial extended mode register	SEMR	R/W	00h	H'E8009014	8
	FIFO trigger control register	FTCR	R/W	1F1Fh	H'E8009016	16

Note: BRR and MDDR are located in the same address. Setting the MDDRS bit of the SEMR register switches these registers.

17.2.1 Receive Shift Register (RSR)

The RSR register receives serial data and temporally stores the data. The SCIFA stores the serial data input via the RXD pin into the RSR register and converts the data to the parallel form. When one byte of data has been received, it is automatically transferred to the receive FIFO data register (FRDR).
The CPU cannot read from or write to the RSR register directly.

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0

17.2.2 Receive FIFO Data Register (FRDR)

The FRDR register is a 8-bit, 16-stage FIFO register that stores the received serial data. When the SCIFA receives one byte of serial data, it transfers the received data from the receive shift register (RSR) to the FRDR register and completes the receive operation. Continuous reception is possible until the received 16 bytes of data are stored. If the FRDR register is read when there is no received data in the FRDR register, an undefined value is read.
When the FRDR register is full of received data, subsequently received serial data is lost.

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0

17.2.3 Transmit Shift Register (TSR)

The SCIFA transfers the transmit data from the transmit FIFO data register (FTDR) to the TSR register, and then transmits the data serially to the TXD pin. After transmitting one byte of data, the SCIFA automatically transfers the next transmit data from the FTDR register into the TSR register and starts transmission.
The CPU cannot read from or write to the TSR register directly.

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

17.2.4 Transmit FIFO Data Register (FTDR)

The FTDR register is a 8-bit, 16-stage FIFO register that stores serial transmission data. When the SCIFA detects that the transmit shift register (TSR) is empty, it transmits data written in the FTDR register to the TSR register and starts serial transmission. Continuous serial transmission is executed until there is no transmit data left in the FTDR register. Writing the transmit data to the FTDR register should be done when a transmit data empty interrupt (TXI) request is generated. When the FTDR register becomes full of transmit data (16 bytes), no more data can be written. Even if new data is written, the data is ignored.
CPU can read from the FTDR register but cannot write to it.

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

17.2.5 Serial Mode Register (SMR)

The SMR register specifies the SCIFA serial communication format and selects the clock source for the baud rate generator.
The CPU can always read and write to the SMR register.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CM	CHR	PE	PM	STOP	—	CKS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CKS[1:0]	Clock Select	b1 b0 0 0: 1 × P1φ*1 0 1: 1/4 × P1φ*1 1 0: 1/16 × P1φ*1 *2 1 1: 1/64 × P1φ*1	R/W
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b3	STOP	Stop Bit Length	0: One stop bit 1: Two stop bits	R/W
b4	PM	Parity Mode	0: Even parity 1: Odd parity	R/W
b5	PE	Parity Enable	0: Parity bit addition or check is disabled. 1: Parity bit addition or check is enabled.	R/W
b6	CHR	Character Length	0: 8-bit data 1: 7-bit data*3	R/W
b7	CM	Communication Mode	0: Asynchronous mode 1: Clock synchronous mode	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. P1φ: Peripheral clock
Note 2. This setting is not applicable to channel 0. It is only applicable to channels 1 to 4.
Note 3. When 7-bit data is selected, the MSB (bit 7) of the transmit FIFO data register is not transmitted.

CKS[1:0] Bits (Clock Select)

Select an internal clock source for the on-chip baud rate generator. For further information on the clock source, bit rate register settings, and baud rates, see section 17.2.8, Bit Rate Register (BRR).

STOP Bit (Stop Bit Length)

Selects one bit or two bits as the stop bit length in asynchronous mode. This setting is used only in asynchronous mode. It is ignored in clock synchronous mode because no stop bits are added. When receiving, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1, it is treated as a stop bit, but if the second stop bit is 0, it is treated as the start bit of the next incoming character.

Note: When transmitting with one stop bit, a single 1 bit (stop bit) is added at the end of each transmission character.
Note: When transmitting with two stop bits, two 1 bits (stop bits) are added at the end of each transmission character.

PM Bit (Parity Mode)

Selects either the even or odd parity check. The setting of this bit is effective only when the parity enable (PE) bit of this register is set to 1 in asynchronous mode. The setting of this bit is ignored in clock synchronous mode, or when parity addition/check is disabled in asynchronous mode.

Note: If even parity is selected, the parity bit is added to data to be transmitted to make the total number of 1s even in the transmission character and parity bit combined. When receiving, the SCIFA verifies that the total number of 1s in the received character and parity bit combined is even.
Note: If odd parity is selected, the parity bit is added to data to be transmitted to make the total number of 1s odd in the transmission character and parity bit combined. When receiving, the SCIFA verifies that the total number of 1s in the received character and parity bit combined is odd.

PE Bit (Parity Enable)

Selects whether to add a parity bit on data transmission and whether to enable/disable the parity check on data reception in asynchronous mode. In clock synchronous mode, a parity bit is neither added nor checked, regardless of the setting of this bit.

Note: When this bit is set to 1, an even or odd parity bit specified in the PM bit is added to data to be transmitted. The SCIFA verifies whether the parity bit of the received data is even or odd as specified in the PM bit when receiving.

CHR Bit (Character Length)

Selects 7- or 8-bit data length in asynchronous mode. In clock synchronous mode, the data length is always 8 bits, regardless of the CHR setting.

CM Bit (Communication Mode)

Selects whether the SCIFA operates in asynchronous or clock synchronous mode.

17.2.6 Serial Control Register (SCR)

The SCR register enables or disables the SCIFA transmission/reception and interrupt requests, and selects the transmit/receive clock source. The CPU can always read from and write to the SCR register.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TIE	RIE	TE	RE	REIE	TEIE	CKE[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CKE[1:0]	Clock Enable	In asynchronous mode: b1 b0 0 0: Internal clock or SCK pin is used for input pin (input signal is ignored). The SCK pin state depends on the SCKIO and SCKDT bits in SPTR. 0 1: Internal clock or SCK pin is used for clock output (The output clock frequency is 16 or 8 times of the bit rate). 1 0: External clock or SCK pin is used for clock input (The input clock frequency is 16 or 8 times of the bit rate). 1 1: Setting prohibited In clock synchronous mode: b1 b0 0 0: Internal clock or SCK pin is used for synchronous clock output. 0 1: Internal clock or SCK pin is used for synchronous clock output. 1 0: External clock or SCK pin is used for synchronous clock input. 1 1: Setting prohibited	R/W
b2	TEIE*1	Transmit End Interrupt Enable	0: Transmit end interrupt (TEI) request is disabled. 1: Transmit end interrupt (TEI) request is enabled.	R/W
b3	REIE	Receive Error Interrupt Enable	0: Receive-error interrupt (ERI) and break interrupt (BRI) requests are disabled. 1: Receive-error interrupt (ERI) and break interrupt (BRI) requests are enabled.	R/W
b4	RE	Receive Enable	0: Data reception is disabled. 1: Data reception is enabled.	R/W
b5	TE	Transmit Enable	0: Data transmission is disabled. 1: Data transmission is enabled.	R/W
b6	RIE	Receive Interrupt Enable	0: Receive-FIFO-data-full interrupt (RXI), receive-data ready interrupt (DRI), receive-error interrupt (ERI), and break interrupt (BRI) requests are disabled. 1: Receive-FIFO-data-full interrupt (RXI), receive-data ready interrupt (DRI), receive-error interrupt (ERI), and break interrupt (BRI) requests are enabled.	R/W
b7	TIE	Transmit Interrupt Enable	0: Transmit-FIFO-data-empty interrupt request (TXI) is disabled. 1: Transmit-FIFO-data-empty interrupt request (TXI) is enabled.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. TEI interrupt requests can be cleared by reading 1 from the TEND flag, and then clearing the setting to 0, or by setting the TEIE bit to 0.

CKE[1:0] Bits (Clock Enable)

Select the SCIFA clock source and enable or disable clock output from the SCK pin. Depending on the settings of these bits, the SCK pin can be used for serial clock output or serial clock input. If the SCK pin is set for the synchronous clock output in the clock synchronous mode, set the CM bit in the SMR register to 1, and then set the CKE[1:0] bits. The settings of the CKE[1:0] bits are listed in Table 17.16.

REIE Bit (Receive Error Interrupt Enable)

Specifies whether to enable or disable a receive-error interrupt (ERI) request and a break interrupt (BRI) request. The setting of this bit is only valid when the RIE bit is set to 0.

Note: ERI interrupt requests can be cleared by reading 1 from the ER bit in the FSR register, and then clearing the setting to 0, or by clearing both the RIE and REIE bits in this register to 0. BRI interrupt requests can be cleared by reading 1 from the BRK bit in the FSR register, or from the ORER flag in the LSR register, and then clearing the setting to 0, or by clearing both the RIE and REIE bits in this register to 0.

RE Bit (Receive Enable)

Specifies whether to enable or disable the serial data reception.

Note: Setting this bit to 0 does not affect the receive flags (DR, ER, BRK, RDF, FER, and PER in the FSR register, and ORER in the LSR register). These flags retain their previous values.

Note: Serial reception starts when a start bit is detected in asynchronous mode, or a synchronous clock input is detected in clock synchronous mode. Before setting this bit to 1, be sure to set the serial mode register (SMR) and the FIFO control register (FCR) to select the receive format and reset the receive FIFO.

TE Bit (Transmit Enable)

Specifies whether to enable or disable the serial data transmission.

Note: Serial transmission starts after writing of data to be transmitted into the FTDR register under this condition. Before setting this bit to 1, be sure to set the serial mode register (SMR) and the FIFO control register (FCR) to select the transmit format and reset the transmit FIFO.

RIE Bit (Receive Interrupt Enable)

Specifies whether to enable or disable a receive-FIFO-data-full (RXI) interrupt request when the RDF flag in the serial status register (FSR) is set to 1, a receive-data ready (DRI) interrupt request when the DR flag in the FSR register is set to 1, a receive-error (ERI) interrupt request when the ER flag in the FSR register is set to 1, and a break (BRI) interrupt request when the BRK flag in the FSR register or the ORER flag in the line status register (LSR) is set to 1.

Note: RXI interrupt requests can be cleared by reading 1 from the DR or RDF flag in the FSR register, then clearing the flag to 0, or by clearing the RIE bit to 0. DRI interrupt requests can be cleared by reading 1 from the DR flag in the FSR register, and then clearing the setting to 0, or by clearing the RIE bit in this register to 0. Receive error interrupt (ERI) requests and break interrupt (BRI) requests can be cleared by clearing both the RIE and REIE bits in this register to 0.

TIE Bit (Transmit Interrupt Enable)

Specifies whether to enable or disable a transmit-FIFO-data-empty interrupt (TXI) request when the serial transmit data is transferred from the transmit FIFO data register (FTDR) into the transmit shift register (TSR), the quantity of data in the transmit FIFO data register falls below the specified trigger number for transmission, and the TDFE flag in the serial status register (FSR) is set to 1.

Note: TXI interrupt requests can be cleared either by writing a greater quantity of transmit data than the specified transmission trigger number into the FTDR register, reading 1 from the TDFE flag, and then clearing the TDFE flag to 0, or by clearing this bit to 0.

17.2.7 Serial Status Register (FSR)

The FSR register is a 16-bit register. The 8 lower-order bits indicate the status flag representing the SCIFA operating state.

The CPU can always read and write to the FSR register, but cannot write 1 to the status flags (ER, TEND, TDFE, BRK, RDF, and DR bits) in this register. These flags can be only cleared to 0 when they have first been read (after being set to 1). b3 (FER) and b2 (PER) are read-only bits that cannot be written.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ER	TEND	TDFE	BRK	FER	PER	RDF	DR
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DR	Receive Data Ready Flag	0: Reception is in progress, or no received data has remained in the FRDR register after normally completed receiving. 1: Next receive data has not been received.	R/(W)*1
b1	RDF	Receive FIFO Data Full Flag	0: The quantity of receive data in the FRDR register falls below the specified reception trigger number. 1: The quantity of receive data written in the FRDR register is equal to or greater than the specified reception trigger number.	R/(W)*1
b2	PER	Parity Error Flag*4	0: No receive parity error occurred in the next receive data read from the FRDR register. 1: A receive parity error occurred in the next receive data read from the FRDR register.	R
b3	FER	Framing Error Flag*4	0: No receive framing error occurred in the next data read from the FRDR register. 1: A receive framing error occurred in the next data read from the FRDR register.	R
b4	BRK	Break Detect Flag	0: No break signal is received. 1: A break signal is received.*2	R/(W)*1
b5	TDFE	Transmit FIFO Data Empty Flag	0: The quantity of transmit data written in the FTDR register exceeds the specified transmission trigger number. 1: The quantity of transmit data written in the FTDR register is equal to or less than the specified transmission trigger number.*3	R/(W)*1
b6	TEND	Transmit End Flag	0: Transmission is in the waiting state or in progress. 1: Transmission is completed.	R/(W)*1
b7	ER	Receive Error Flag	0: Reception is in progress or has normally completed. 1: A framing error or parity error has occurred during reception.	R/(W)*1
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. 0 can be only written to clear the flag after 1 is read.

Note 2. When a break signal is detected, transfer of the receive data (00h) to the FRDR register stops after the detection. When the break ends and the receive signal becomes mark state (high level), the transfer of receive data resumes.

Note 3. Since the FTDR register is a 16-byte FIFO register, the maximum quantity of data that can be written when TDFE is 1 is “16 minus the number of non-transmitted data units”. If additional data is written, the data is ignored. The quantity of data in the FTDR register is indicated by the 8 higher-order bits of the FDR register.

Note 4. When the DMAC is used to read data, the generation of errors cannot be checked by reading this flag.

DR Bit (Receive Data Ready Flag)

Indicates that the quantity of data stored in the receive FIFO data register (FRDR) falls below the specified reception trigger number, and that no next data has been received yet after the elapse of 15 ETUs from the last stop bit in asynchronous mode. In clock synchronous mode, this bit is not set to 1.

[Setting condition]

- DR is set to 1 when the FRDR register contains less data than the specified reception trigger number, and no next data has been received yet after the elapse of 15 ETUs*1 from the last stop bit.

[Clearing conditions]

When either of the following is satisfied:

- DR is cleared to 0 when DR = 1 is read and then 0 is written to the DR flag.
- DR is cleared to 0 when all received data in the FRDR register are read.

Note 1. This is equivalent to one and a half (1.5) frames in the 8-bit format with one stop bit (ETU: elementary time unit).
Note 2. When the RE bit in SCR is cleared to 0, the DR bit is not affected and retains its previous value.

RDF Bit (Receive FIFO Data Full Flag)

Indicates that receive data has been transferred to the receive FIFO data register (FRDR), and the quantity of data in FRDR becomes equal to or greater than the specified reception trigger number.

[Setting condition]

- RDF is set to 1 when the quantity of receive data which is equal to or greater than the specified reception trigger number are stored in the FRDR register*1.

[Clearing conditions]

- RDF is cleared to 0 when RDF = 1 is read and then 0 is written to this bit.
- RDF is cleared to 0 when the FRDR register is read.

Note 1. Since the FRDR register is a 16-byte FIFO register, the maximum quantity of data that can be read when this bit is 1 is equivalent to the specified reception trigger number. If an attempt is made to read after all the data in the FRDR register has been read, the read data is undefined. The quantity of receive data in the FRDR register is indicated by the 8 lower-order bits of the FDR register.

PER Bit (Parity Error Flag)

Indicates whether there is a parity error in the data read from the receive FIFO data register (FRDR) in asynchronous mode.

[Setting condition]

- PER is set to 1 when a parity error is present in the next data read from the FRDR register.

[Clearing condition]

- PER is cleared to 0 when no parity error is present in the next data read from the FRDR register.

FER Bit (Framing Error Flag)

Indicates whether there is a framing error in the data read from the receive FIFO data register (FRDR) in asynchronous mode.

[Setting condition]

- FER is set to 1 when a framing error is present in the next data read from the FRDR register.

[Clearing condition]

- FER is cleared to 0 when no framing error is present in the next data read from the FRDR register.

BRK Bit (Break Detect Flag)

Indicates that a break signal has been detected in receive data.

[Setting condition]

- BRK is set to 1 when data including a framing error is received, and the framing error is followed by at least one frame of data received at the space 0 level (low level).

[Clearing condition]

- BRK is cleared to 0 when software reads BRK after it has been set to 1 and then writes 0 to BRK.

TDFE Bit (Transmit FIFO Data Empty Flag)

Indicates that data has been transferred from the transmit FIFO data register (FTDR) into the transmit shift register (TSR), the quantity of data in the FRDR register becomes equal to or less than the specified transmission trigger number, and writing of transmit data to the FRDR register is enabled.

[Setting conditions]

When either of the following is satisfied:

- TDFE is set to 1 when the TE bit in SCR is 0.
- TDFE is set to 1 when the quantity of transmit data written in the FRDR register is equal to or less than the specified transmission trigger number.

[Clearing conditions]

- TDFE is cleared to 0 when 0 is written in the TDFE bit after reading TDFE = 1.
- When transmit data is written to the FTDR register

TEND Bit (Transmit End Flag)

Indicates that the FRDR register contains no more valid data and transmission is completed when transmitting the last bit of the transmit data.

[Setting condition]

When the following is satisfied:

- TEND is set to 1 when the FTDR register does not contain transmit data when the last bit of the serial transmission data is transmitted.

[Clearing conditions]

- When transmit data is written to the FTDR register
- When 0 is written to TEND after it has been read as 1

ER Bit (Receive Error Flag)

Indicates the occurrence of a framing error, or of a parity error when receiving the parity-added data*1.

[Setting conditions]

When either of the following is satisfied:

- ER is set to 1 when the stop bit is found to be 0 after checking whether the stop bit of the received data is 1 at the end of one data receive operation*1.
- ER is set to 1 when the total number of 1s in the received data and parity bit combined does not match the even or odd parity setting specified by the PM bit in the SMR register.

[Clearing condition]

- When 0 is written to ER after it has been read as 1

Note 1. Clearing the RE bit to 0 in the SCR register does not affect this bit, which retains its previous value. Even if a receive error occurs, the receive data is transferred to the FRDR register and the receive operation is continued. Whether the data read from the FRDR register includes a receive error can be detected by the FER and PER bits in the FSR register.

Note 2. In two stop bits mode, only the first stop bit is checked; the second stop bit is not checked.

17.2.8 Bit Rate Register (BRR)

The BRR register is an 8-bit register that, together with the baud rate generator clock source selected by the CKS[1:0] bits in the serial mode register (SMR), determines the serial transmit/receive bit rate.
This register is located in the same address as that of the MDDR register and selected when the MDDRS bit in SEMR is 0. The CPU can read and write to BRR. Writing to BRR should be executed when TE = RE = 0 in the SCR register.

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

The BRR setting is calculated using the following formulae.
[Asynchronous mode]

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$N = \frac{P1\varphi}{64 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$N = \frac{P1\varphi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$N = \frac{P1\varphi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$N = \frac{P1\varphi}{16 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

[Clock synchronous mode]

$$N = \frac{P1\varphi}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

B: Bit rate (bit/s)
N: Setting of the BRR register ($0 \leq N \leq 255$) (The setting must satisfy the electrical characteristics).
P1φ: Operating frequency for peripheral modules (MHz)
n: Baud rate generator clock source (n = 0, 1, 2, 3) (For the clock sources and values of n, see Table 17.4).

Note: The MDDR register is used to adjust the bit rate. For details, see section 17.2.9, Modulation Duty Register (MDDR).

Table 17.4 SMR Register Setting

		SMR Register Settings	
n	Clock Source	CKS1	CKS0
0	P1φ	0	0
1	P1φ/4	0	1
2	P1φ/16	1	0
3	P1φ/64	1	1

The bit rate error in asynchronous mode is calculated using the following formulae.

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$\text{Error (\%)} = \left\{ \frac{P1\varphi \times 10^6}{(N + 1) \times B \times 64 \times 2^{2n-1}} - 1 \right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$\text{Error (\%)} = \left\{ \frac{P1\varphi \times 10^6}{(N + 1) \times B \times 32 \times 2^{2n-1}} - 1 \right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$\text{Error (\%)} = \left\{ \frac{P1\varphi \times 10^6}{(N + 1) \times B \times 32 \times 2^{2n-1}} - 1 \right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$\text{Error (\%)} = \left\{ \frac{P1\varphi \times 10^6}{(N + 1) \times B \times 16 \times 2^{2n-1}} - 1 \right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

Table 17.5 list the examples of the BRR register setting in asynchronous mode, and Table 17.6 list the examples of the BRR register setting in clock synchronous mode.

Table 17.5 Bit Rates and BRR Register Settings in Asynchronous Mode

Bit Rate (bps)	P1φ (MHz)					
	27.5			66		
	n	N	Error (%)	n	N	Error (%)
150	3	89	-0.54	3	214	-0.53
300	3	44	-0.54	3	106	0.39
600	2	89	-0.54	2	214	-0.07
1200	2	44	-0.54	2	106	0.39
2400	1	89	-0.54	1	214	-0.07
4800	1	44	-0.54	1	106	0.39
9600	(*1)	(*1)	(*1)	0	214	-0.07
14400	1	14	-0.54	0	142	0.16
19200	(*1)	(*1)	(*1)	0	106	0.39
28800	(*1)	(*1)	(*1)	0	71	0.54
31250	(*1)	(*1)	(*1)	0	65	0.00
38400	(*1)	(*1)	(*1)	0	53	-0.53
115200	(*1)	(*1)	(*1)	0	17	-0.53
500000	(*1)	(*1)	(*1)	0	3	(*1)

Note: These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 0. When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is doubled. When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is quadrupled. Configure settings so the range of error is no greater than 1%.

Note 1. Values for the blank cells in the table can be set using the MDDR register. For details, see section 17.2.9, Modulation Duty Register (MDDR) and the Table 17.11.

Table 17.6 Bit Rates and BRR Register Settings in Clock Synchronous Mode

Bit Rate (bps)	P1φ(MHz)			
	27.5		66	
	n	N	n	N
250	—	—	—	—
500	3	214	—	—
1000	3	106	—	—
2500	3	42	3	102
5000	3	20	2	205
10000	3	10	2	102
25000	3	3	1	164
50000	3	1	1	82
100000	2	3	0	164
250000	2	1	0	65
500000	1	2	0	32
1000000	1	1	0	16
2500000	0	2	0	6
5000000	0	0*	0	2

Note: Continuous transmission or reception is not possible.

—: Setting is prohibited.

Note: Set the BRR register so that the range of error can fall within 1% or less.

Table 17.7 lists the maximum bit rates for various frequencies in asynchronous mode when the baud rate generator is used. Table 17.8 lists the maximum bit rates for various frequencies in clock synchronous mode when the baud rate generator is used. Table 17.9 and Table 17.10 list the maximum rates for external clock inputs in asynchronous mode and clock synchronous mode, respectively.

Table 17.7 Maximum Bit Rates for Various Frequencies with Baud Rate Generator (in Asynchronous Mode)

P1φ (MHz)	Maximum Bit Rate (bit/s)	Settings	
		n	N
27.5	3437500	0	0
66	8250000	0	0

Note: These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 1. When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is 1/2. When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is 1/4.

Table 17.8 Maximum Bit Rates for Various Frequencies with Baud Rate Generator (in Clock Synchronous Mode)

	Discontinuous Transmission/Reception			Continuous Transmission/Reception		
	Maximum Bit Rate	Settings		Maximum Bit Rate	Settings	
P1φ (MHz)	(bit/s)	n	N	(bit/s)	n	N
27.5	6875000	0	0	3437500	0	1
66	16500000	0	0	8250000	0	1

Table 17.9 Maximum Bit Rates with External Clock Input (in Asynchronous Mode)

P1φ (MHz)	External Input Clock (MHz)	Maximum Bit Rate (bit/s)
27.5	6.875	859375
66	16.50	2062500

Note: This is an example when the SEMR.ABCS0 bit is 1. When the ABCS0 bit is set to 0, the bit rate is 1/2 .

Table 17.10 Maximum Bit Rates with External Clock Input (in Clock Synchronous Mode)

P1φ (MHz)	External Input Clock (MHz)	Maximum Bit Rate (bit/s)
27.5	2.29	2291667
66	5.50	5500000

17.2.9 Modulation Duty Register (MDDR)

The MDDR register corrects the bit rate adjusted by the BRR register. The value after reset of this register is FFh. When the BRME bit in SEMR is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected according to the settings of MDDR (MDDR/256). The relationship between the MDDR register setting and the bit rate (B) is given by the following formula. The MDDR register is located in the same address as that of the BRR register and is selected when the MDDRS bit in SEMR is 1. This register is only writable when TE = RE = 0 in the SCR register. b7 in this register is fixed to 1.

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

The formulae below show the relationships between the MDDR setting and the bit rate (B) when the bit rate modulation function is used.

[Asynchronous mode]

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$B = \frac{P1\varphi \times 10^6}{64 \times 2^{2n-1} \times (256/MDDR) \times (N + 1)}$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$B = \frac{P1\varphi \times 10^6}{32 \times 2^{2n-1} \times (256/MDDR) \times (N + 1)}$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$B = \frac{P1\varphi \times 10^6}{32 \times 2^{2n-1} \times (256/MDDR) \times (N + 1)}$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$B = \frac{P1\varphi \times 10^6}{64 \times 2^{2n-1} \times (256/MDDR) \times (N + 1)}$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

[Clock synchronous mode]

$$B = \frac{P1\varphi \times 10^6}{8 \times 2^{2n-1} \times (256/MDDR) \times (N + 1)}$$

When the bit rate modulation is used, the bit rate average error is given by the following formulae.

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$Error\ (\%) = \left\{ \frac{P1\varphi \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/MDDR) \times (N + 1)} - 1 \right\} 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$Error\ (\%) = \left\{ \frac{P1\varphi \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/MDDR) \times (N + 1)} - 1 \right\} 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$\text{Error (\%)} = \left\{ \frac{P1\varphi \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)} - 1 \right\} 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$\text{Error (\%)} = \left\{ \frac{P1\varphi \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/MDDR) \times (N+1)} - 1 \right\} 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

B: Bit rate (bits/s)
N: BRR register setting ($0 \leq N \leq 255$)
The setting must satisfy the electrical characteristics).
P1φ:Operating frequency for peripheral modules (MHz)
MDDR: MDDR setting ($128 \leq MDDR \leq 256$)
n: Baud rate generator clock source (n = 0, 1, 2, 3) (For the clock sources and values of n, see Table 17.4).

Table 17.11 Bit Rates and BRR and MDDR Registers Settings in Asynchronous Mode

Bit Rate (bps)	P1φ (MHz)							
	27.5				66			
	n	N	MDDR	Error (%)	n	N	MDDR	Error (%)
150	—	—	—	—	3	213	255	0.00
300	—	—	—	—	3	106	255	0.00
600	—	—	—	—	2	213	255	0.00
1200	—	—	—	—	2	106	255	0.00
2400	—	—	—	—	1	213	255	0.00
4800	—	—	—	—	1	106	255	0.00
9600	1	21	252	0.14	0	213	255	0.00
14400	1	14	254	-0.93	—	—	—	—
19200	1	10	253	0.53	0	106	255	0.00
28800	1	6	242	0.74	0	70	254	0.08
31250	1	5	225	0.71	—	—	—	—
38400	1	4	230	0.53	0	52	253	0.15
115200	0	6	240	-0.09	—	—	—	—
500000	0	0	150	0.71	0	3	249	0.31

Note: These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 0. When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is doubled. When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is quadrupled. Configure settings so the range of error is no greater than 1%.

17.2.10 FIFO Control Register (FCR)

The FCR register resets the quantity of data in the transmit FIFO data register (FTDR) and the receive FIFO data register (FRDR) and specifies the number of triggers. This register also specifies whether to enable the loop-back test.
The CPU can always read and write to the FCR register.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	RSTRG[2:0]			RTRG[1:0]		TTRG[1:0]		MCE	TFRST	RFRST	LOOP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	LOOP	Loop-Back Test	0: Loop back test is disabled. 1: Loop back test is enabled	R/W
b1	RFRST	Receive FIFO Data Register Reset	0: Normal operation 1: Resets the FRDR register.	R/W
b2	TFRST	Transmit FIFO Data Register Reset	0: Normal operation 1: Resets the FTDR register.	R/W
b3	MCE	Modem Control Enable	0: Model signal is disabled.*1 1: Model signal is enabled.	R/W
b5, b4	TTRG[1:0]	Transmit FIFO Data Trigger Number Select	b5 b4 0 0: 8 (8)*2 0 1: 4 (12)*2 1 0: 2 (14)*2 1 1: 0 (16)*2	R/W
b7, b6	RTRG[1:0]	Receive FIFO Data Trigger Number Select	In asynchronous mode: b7 b6 0 0: 1 0 1: 4 1 0: 8 1 1: 14 In clock synchronous mode: b7 b6 0 0: 1 0 1: 2 1 0: 8 1 1: 14	R/W
b10 to b8	RSTRG[2:0]	RTS# Output Active Trigger Number Select	b10 b8 0 0 0: 15 0 0 1: 1 0 1 0: 4 0 1 1: 6 1 0 0: 8 1 0 1: 10 1 1 0: 12 1 1 1: 14	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The CTS# input level does not affect the transmit operation. Similarly, the RTS# input level does not affect the receive operation.
Note 2. Values in parentheses mean the number of empty bytes in the FTDR register when the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

LOOP Bit (Loop-Back Test)

Internally connects between the transmit output pin (TXD) and the receive input pin (RXD) and between the RTS# pin and the CTS# pin, to perform loop-back testing.

RFRST Bit (Receive FIFO Data Register Reset)

Disables the receive data in the receive FIFO data register (FRDR) and makes the data to the empty state. If you set this bit to 1, be sure to clear it to 0 afterward.

TFRST Bit (Transmit FIFO Data Register Reset)

Disables the transmit data in the transmit FIFO data register (FTDR) and makes the data to the empty state. If you set this bit to 1, be sure to clear it to 0 afterward.

MCE Bit (Modem Control Enable)

Specifies whether to enable or disable the modem control signals, CTS# and RTS#.
In clock synchronous mode, this bit should always be set to 0.

TTRG[1:0] Bits (Transmit FIFO Data Trigger Number Select)

Specify the reference quantity of data for transmission (i.e., the threshold number of entries to trigger the writing of further data for transmission) for setting of the TDFE flag in the serial status register (FSR). When the number of entries for transmission in the transmission FIFO, i.e. the number of entries written to the transmit FIFO data register (FTDR) that are yet to be transmitted, falls to or below the specified trigger number for transmission, the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.
The setting in these bits is valid when the TTRGS bit in the FTCR register is 0. When the TTRGS bit in the FTCR register is 1, the setting of the TFTC[4:0] bits in the FTCR register is valid.

RTRG[1:0] Bits (Receive FIFO Data Trigger Number Select)

Specify the reference quantity of receive data (i.e., the threshold number of entries to trigger the reading of received data) for setting of the RDF flag in the serial status register (FSR). When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number for reception, the RDF flag is set to 1 and a receive FIFO data full interrupt (RXI) request is generated.
The setting in these bits is valid when the RTRGS bit in the FTCR register is 0. When the RTRGS bit in the FTCR register is 1, the setting of the RFTC[4:0] bits in the FTCR register is valid.

RSTRG[2:0] Bits (RTS# Output Active Trigger Number Select)

When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number, the RTS# signal is in the high state.
The setting in these bits is only valid when a modem signal is enabled by the MCE bit in this register in asynchronous mode.

17.2.11 FIFO Data Count Register (FDR)

The FDR register indicates the quantity of data stored in the transmit FIFO data register (FTDR) and the receive FIFO data register (FRDR).

This register indicates the quantity of transmit data in the FTDR register with the 8 higher-order bits, and the quantity of receive data in the FRDR register with the 8 lower-order bits. The CPU can always read the FDR register.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	T[4:0]					—	—	—	R[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	R[4:0]	Receive Data Quantity in FRDR	Indicate the quantity of receive data stored in the FRDR register.	R
b7 to b5	—	Reserved	These bits are read as 0.	R
b12 to b8	T[4:0]	Non-Transmitted Data Quantity in FTDR	Indicate the quantity of non-transmitted data stored in the FTDR register.	R
b15 to b13	—	Reserved	These bits are read as 0.	R

R[4:0] Bits

Indicate the quantity of receive data stored in the FRDR register.

00h means no received data, and 10h means that all of the received data is stored in the FRDR register.

T[4:0] Bits

Indicate the quantity of non-transmitted data stored in the FTDR register.

00h means no transmit data, and 10h means that all of the data for transmission is stored in the FTDR register.

17.2.12 Serial Port Register (SPTR)

The SPTR register controls input/output and data of the pins multiplexed to SCIFA function.
The CPU can always read and write to the SPTR register.

Note: b6, b4, b2, and b0 of this register respectively indicate the input status of their corresponding pins. See the descriptions for each bit for details. Writings to these bits in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	x	0	x	0	x	0	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	SPB2DT	Serial Port Break Data Select	Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2IO bit. See Table 17.14.	R/W
b1	SPB2IO	Serial Port Break Input/Output	Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2DT bit.	R/W
b2	SCKDT	SCK Port Data Select	Controls the SCK pin in combination with the CM bit in the SMR register, the SCKIO bit, and the CKE1 and CKE0 bits in the SCR register. See Table 17.16.	R/W
b3	SCKIO	SCK Port Input/Output	Controls the SCK pin in combination with the CM bit in the SMR register, the SCKDT bit, and the CKE1 and CKE0 bits in the SCR register. See Table 17.16.	R/W
b4	CTS2DT	CTS# Port Data Select	Controls the CTS# pin in combination with MCE bit in FCR and CTS2IO bit. See Table 17.13. The SCIF 3 and SCIF 4 channels are not supported.	R/W
b5	CTS2IO	CTS# Port Output Specify		R/W
b6	RTS2DT	RTS# Port Data Select	Controls the RTS# pin in combination with MCE bit in FCR and RTS2IO bit. See Table 17.12. The SCIF 3 and SCIF 4 channels are not supported.	R/W
b7	RTS2IO	RTS# Port Output Specify		R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SPB2DT Bit (Serial Port Break Data Select)

This bit specifies the output level of the TXD pin when the setting of the SCR.TE bit is 0. The RXD pin input status can be read from this bit regardless of the SPB2IO bit setting. However, the RXD pin function must have been selected with the general I/O port.

SPB2IO Bit (Serial Port Break Input/Output)

Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2DT bit.

SCKDT Bit (SCK Port Data Select)

The SCK pin status can be read from this bit regardless of the SCKIO bit setting. (When the SCK pin is used for input, the input signal is invalid (has no means) but the pin status can be read.) However, the SCK pin function must have been selected with the general I/O port.

SCKIO Bit (SCK Port Input/Output)

Specifies input or output status of the SCK pin. This bit controls the SCK pin in combination with the SCKDT bit, the CM bit in the SMR register, and the CKE1 and CKE0 bits in the SCR register.

CTS2DT Bit (CTS# Port Data Select)

The status of the CTS# pin can be read from this bit regardless of the CTS2IO bit setting. However, the CTS# pin function must have been selected with the general I/O port.

RTS2DT Bit (RTS# Port Data Select)

The status of the RTS# pin can be read from this bit regardless of the RTS2IO bit setting. However, the RTS# pin function must have been selected with the general I/O port

Table 17.12 RTS# Pin Status

FCR.MCE Bit Setting	RTS2IO Bit Setting	RTS2DT Bit Setting	RTS# Pin Status
0	0	×	Setting prohibited*1
0	1	0	Low output
0	1	1	High output
1	×	×	Modem control output

×: Don't care

Note 1. There is no problem with the initial setting if the RTS# pin is not used.

Table 17.13 CTS# Pin Status

FCR.MCE Bit Setting	CTS2IO Bit Setting	CTS2DT Bit Setting	CTS# Pin Status
0	0	×	Setting prohibited*1
0	1	0	Low output
0	1	1	High output
1	×	×	Modem control input

×: Don't care

Note 1. There is no problem with the initial setting if the CTS# pin is not used.

Table 17.14 TXD Pin Status

SCR.TE Bit Setting	SPB2IO Bit Setting	SPB2DT Bit Setting	TXD Pin Status
0	0	×	Setting prohibited
0	1	0	Low output
0	1	1	High output
1	×	×	Transmit data output

×: Don't care

17.2.13 Line Status Register (LSR)

The LSR register is a 16-bit register. The PER and FER bits indicate the number of receive errors in the receive FIFO data register. 1 cannot be written to the OREER status flag. The flag should be read as 1 prior to clearing it to 0.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	PER[3:0]				—	—	FER[3:0]				—	ORER
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ORER	Overrun Error Flag	0: Reception is in progress or has normally completed. 1: An overrun error has occurred during reception.	R/(W)*1
b1	—	Reserved	This bit is read as 0.	R
b5 to b2	FER[3:0]	Framing Error Count	Indicates the quantity of data with a framing error among the receive data stored in the receive FIFO data register (FRDR).	R
b7, b6	—	Reserved	These bits are read as 0.	R
b11 to b8	PER[3:0]	Parity Error Count	Indicates the quantity of data with a parity error among the receive data stored in the receive FIFO data register (FRDR).	R
b15 to b12	—	Reserved	These bits are read as 0.	R

Note 1. To clear the flag, 0 can be only written after 1 is read.

ORER Bit (Overrun Error Flag)

Indicates that receive operation abnormally stops due to occurrence of an overrun error. This flag is not affected and retains its previous state if the RE bit in the serial control register (SCR) is cleared to 0. The receive FIFO data register (FRDR) retains the data before an overrun error occurred, and newly received data is lost. When the ORER bit is set to 1, the SCIFA cannot continue subsequent serial reception.

[Setting condition]

- When the next serial reception is completed with the receive FIFO in full state (16-byte data is received)

[Clearing condition]

- When 0 is written to ORER after being read as 1.

Note: When the internal clock is selected while the SCIFA is in clock synchronous mode, the amount of receive data can be controlled, so no overrun occurs.

FER[3:0] Bits (Framing Error Count)

The values of bits 5 to 2 indicate the quantity of data with a framing error after the ER bit in the FSR register is set. Reading 0000 from the FER[3:0] bits means all 16-byte receive data in the FRDR register have a framing error.

PER[3:0] Bits (Parity Error Count)

The values of bits 11 to 8 indicate the quantity of data with a parity error after the ER bit in the FSR register is set. Reading 0000 from the PER[3:0] bits means all 16-byte receive data in the FRDR register have a parity error.

17.2.14 Serial Extended Mode Register (SEMR)

The SEMR register specifies either LSB or MSB first, enables the noise cancellation, operation in normal or double-speed mode of the baud rate generator, and bit rate modulation, and selects the modulation register and the sampling count (either 8 or 16 times).

	b7	b6	b5	b4	b3	b2	b1	b0
	BGDM	—	BRME	MDDRS	DIR	NFEN	—	ABCS0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ABCS0	Asynchronous Base Clock Select	0: Operates on a frequency 16 times the transfer rate as the base clock. 1: Operates on a frequency 8 times the transfer rate as the base clock.	R/W
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b2	NFEN	Noise Cancellation Enable	0: Noise cancellation for the RxD pin is disabled. 1: Noise cancellation for the RxD pin is enabled.	R/W
b3	DIR	Data Transfer Direction Select	0: Transmits the data in the FTDR register by the LSB-first method. The received data is stored in the FRDR register by the LSB-first method. 1: Transmits the data in the FTDR register by the MSB-first method. The received data is stored in the FRDR register by the MSB-first method.	R/W
b4	MDDRS	Modulation Duty Register Select	0: BRR register is accessible. 1: MDDR register is accessible.	R/W
b5	BRME	Bit Rate Modulation Enable	0: Bit rate modulation is disabled. 1: Bit rate modulation is enabled.	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	BGDM	Baud Rate Generator Double-Speed Mode Select	0: Baud rate generator normal mode: Baud rate generator operates on the clock signal produced by dividing the clock source by two. 1: Baud rate generator double-speed mode: Baud rate generator operates on the clock signal produced by the clock source (no frequency division).	R/W

ABCS0 Bit (Asynchronous Base Clock Select)

Selects the base clock for 1-bit period in asynchronous mode.

This bit setting is valid only in asynchronous mode (i.e., when the CM bit in the SMR register is 0).

NFEN Bit (Noise Cancellation Enable)

Reduces noise of the input to the RxD pin. This function is only valid in asynchronous mode. For details, see section 17.7, Noise Cancellation.

In clock synchronous mode, this bit should always be set to 0.

DIR Bit (Data Transfer Direction Select)

Selects the serial communication format. This bit is valid only when the transmit/receive data is in 8-bit formats.*1

Note 1. Asynchronous mode or clock synchronous mode with the 8-bit data length

MDDRS Bit (Modulation Duty Register Select)

Selects the register to be enabled access to it.

BRME Bit (Bit Rate Modulation Enable)

Specifies whether to enable or disable the bit rate modulation.

BGDM Bit (Baud Rate Generator Double-Speed Mode Select)

Selects operating mode of the baud rate generator. When setting 1 in this bit, the baud rate generator included in the SCIFA operates in double-speed mode. The setting of this bit is only effective in asynchronous mode (SMR.CM bit = 0) when the internal clock is selected as the clock source (SCR.CKE[1:0] = 00b). Use normal mode under any other settings.

17.2.15 FIFO Trigger Control Register (FTCR)

The FTCR register is a 16-bit register that specifies FIFO trigger conditions. The CPU can always read from and write to the FTCR register.

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RTRGS	—	—	RFTC[4:0]					TTRGS	—	—	TFTC[4:0]				
Value after reset:	0	0	0	1	1	1	1	1	0	0	0	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	TFTC[4:0]	Transmit FIFO Data Trigger Number	00h: Transmit data trigger number is 0. 0Fh: Transmit data trigger number is 15. Do not set 10h to 1Fh in these bits.	R/W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	TTRGS	Transmit Trigger Select	0: TTRG[1:0] bits in FCR are valid. 1: TFTC[4:0] bits in FTCR are valid.	R/W
b12 to b8	RFTC[4:0]	Receive FIFO Data Trigger Number	01h: Receive data trigger number is 1. 10h: Receive data trigger number is 16. Do not set 00h and 11h to 1Fh in these bits.	R/W
b14, b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	RTRGS	Receive Trigger Select	0: RTRG[1:0] bits in FCR are valid. 1: RFTC[4:0] bits in FTCR are valid.	R/W

TFTC[4:0] Bits (Transmit FIFO Data Trigger Number)

Specify the reference quantity of data for transmission (i.e., the threshold number of entries to trigger the writing of further data for transmission) for setting of the TDFE flag in the serial status register (FSR).

When the number of entries for transmission in the transmission FIFO, i.e. the number of entries written to the transmit FIFO data register (FTDR) that are yet to be transmitted, falls to or below the specified trigger number for transmission, the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

RFTC[4:0] Bits (Receive FIFO Data Trigger Number)

Specify the reference quantity of receive data (i.e., the threshold number of entries to trigger the reading of received data) for setting of the RDF flag in the serial status register (FSR).

When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number for reception, the RDF flag is set to 1 and a receive FIFO data full interrupt (RXI) request is generated.

17.3 Operation

17.3.1 Overview

For serial communication, the SCIFA can select either asynchronous mode in which characters are synchronized individually or a clock synchronous mode in which communication is synchronized with clock pulses.
The SCIFA has a 16-stage FIFO buffer for both transmission and receptions, reducing the overhead of the CPU and enabling continuous high-speed communication. The RTS# and CTS# signals are provided as modem control signals.
Selection of a transmission/reception format is enabled with the serial mode register (SMR). Table 17.15 shows the transmission format which can be selected in the serial mode register (SMR). As shown in Table 17.16, the SCIFA clock source can be selected by the combination of the CKE1 and CKE0 bits in the serial control register (SCR).

(1) Asynchronous Mode

- Data length is selectable either 7 or 8 bits
- Parity addition and 1- or 2-bit stop bit addition are selectable.
  (The combination of the preceding selections determines the transmission/reception format and character length).
- In reception, it is possible to detect framing errors, parity errors, receive FIFO data full, overrun errors, receive data ready, and breaks.
- The stored data quantities are indicated in the FIFO data count register (FDR), respectively for transmit and receive FIFO data.
- An internal or external clock can be selected as the SCIFA clock source.
  When an internal clock is selected, the SCIFA operates using the clock of on-chip baud rate generator and can output the clock with a frequency 16 (or 8) times the bit rate.
  When an external clock is selected, the external clock input must have a frequency 16 (or 8) times the bit rate. (The on-chip baud rate generator is not used.)

(2) Clock Synchronous Mode

- The transmission/reception format is fixed to the 8-bit data length.
- In reception, it is possible to detect overrun errors (ORER).
- An internal or external clock can be selected as the SCIFA clock source.
  When an internal clock is selected, the SCIFA operates using the clock of the on-chip baud rate generator, and outputs this clock to external devices as the synchronous clock.
  When an external clock is selected, the SCIFA operates on the input synchronous clock not using the on-chip baud rate generator.

Table 17.15 SMR Register Settings and SCIFA Communication Formats

SMR Register					SCIFA Transmission/Reception Format		
b7	b6	b5	b3				
CM	CHR	PE	STOP	Mode	Data Length	Parity Bit	Stop Bit Length
0	0	0	0	Asynchronous mode	8 bits	Not set	1 bit
			1				2 bits
		1	0			Set	1 bit
			1				2 bits
	1	0	0		7 bits	Not set	1 bit
			1				2 bits
		1	0			Set	1 bit
			1				2 bits
1	×	×	×	Clock synchronous mode	8 bits	Not set	None

×: Don't care

Table 17.16 SMR, SCR, and SPTR Register Settings and SCIFA Clock Source Selection

SMR Register	SCR Register		SPTR Register				
b7	b1	b0	b3	b2			
CM	CKE1	CKE0	SCKIO	SCKDT	Mode	Clock Source	SCK Pin Function
0	0	0	0	×	Asynchronous mode	Internal	Input pin (input signal invalid) (Initial state)
			1	0			SCK pin state: Low
			1	1			SCK pin state: High
		1	×	×			Outputs a clock with frequency 16/8 times the bit rate*1
	1	0	×	×		External	Inputs a clock with frequency 16/8 times the bit rate*2
		1	×	×		Setting prohibited	
1	0	×	×	×	Clock synchronous mode	Internal	Outputs the synchronous clock
	1	0	×	×		External	Inputs the synchronous clock
		1	×	×		Setting prohibited	

×: Don't care

Note 1. SEMR.ABCS0 = 0: Output a clock that has a frequency 16 times the bit rate.
SEMR.ABCS0 = 1: Output a clock that has a frequency 8 times the bit rate.

Note 2. SEMR.ABCS0 = 0: Input a clock that has a frequency 16 times the bit rate.
SEMR.ABCS0 = 1: Input a clock that has a frequency 8 times the bit rate.

17.3.2 Operation in Asynchronous Mode

In asynchronous mode, each transmitted or received character begins with a start bit and ends with a stop bit. Serial communication is synchronized one character at a time.

The transmitting and receiving sections of the SCIFA are independent, so full duplex communication is possible. The transmitter and receiver are 16-stage FIFO buffered, so data can be written and read while transmitting and receiving are in progress, enabling continuous transmission and reception.

Figure 17.2 shows the general format of asynchronous serial communication.

In asynchronous serial communication, the communication line is normally held in the mark (high) state. The SCIFA monitors the line and starts serial communication when the line goes to the space (low) state, considered as a start bit. One serial character consists of a start bit (low), data (LSB first when LSB-first transfer is selected), parity bit (high or low), and stop bit (high), in that order.

When receiving in asynchronous mode, the SCIFA synchronizes at the falling edge of the start bit. The SCIFA samples each data bit on the eighth pulse of a clock with a frequency 16 or 8 times the bit rate*1. Receive data is latched at the center of each bit.

Note 1. When the SEMR.ABCS0 bit = 0, data is sampled on the eighth pulse of a clock with a frequency 16 times the bit rate.
When the SEMR.ABCS0 bit = 1, data is sampled on the fourth pulse of a clock with a frequency 8 times the bit rate.

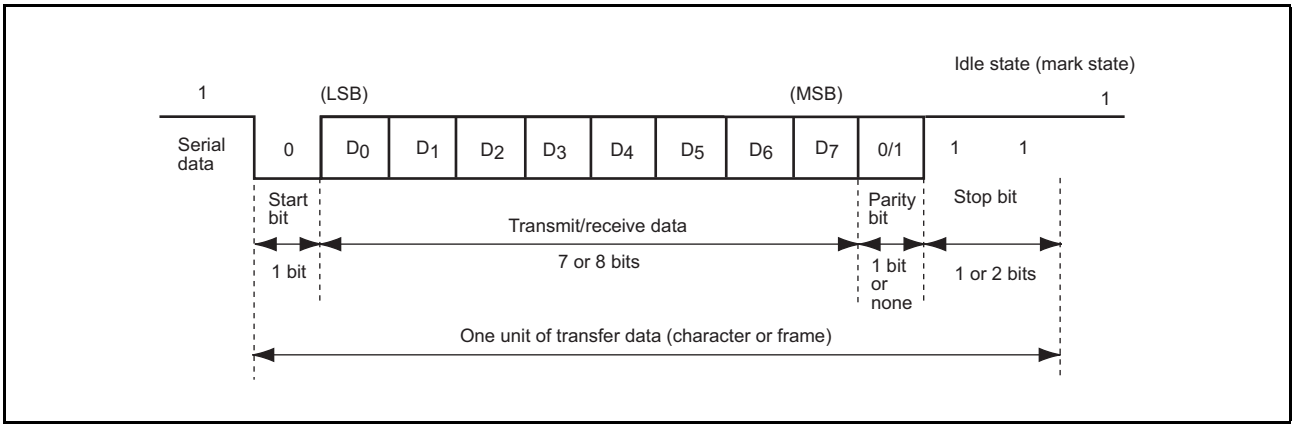

Figure 17.2 Data Format in Asynchronous Communication
(8-Bit Data with Parity and Two Stop Bits when LSB-First Transfer is Selected)

(1) Transmit/Receive Formats

Table 17.17 lists the eight communications formats that can be selected in asynchronous mode. The format is selected by setting in the serial mode register (SMR).

Table 17.17 Serial Communications Formats (in Asynchronous Mode)

SMR Setting			Serial Transmit/Receive Format and Frame Length											
CHR	PE	STOP	1	2	3	4	5	6	7	8	9	10	11	12
0	0	0	START	8-bit data								STOP		
		1	START	8-bit data								STOP	STOP	
	1	0	START	8-bit data								P	STOP	
		1	START	8-bit data								P	STOP	STOP
1	0	0	START	7-bit data							STOP			
		1	START	7-bit data							STOP	STOP		
	1	0	START	7-bit data							P	STOP		
		1	START	7-bit data							P	STOP	STOP	

START: Start bit
STOP: Stop bit
P: Parity bit

(2) Clock

An SCIFA transmit/receive clock can be selected from two types of clock sources: the internal clock generated by the on-chip baud rate generator, the external clock input from the SCK pin. The clock source is selected by the settings of the CM bit in the serial mode register (SMR), the CKE[1:0] bits in the serial control register (SCR), and the ACS0 bit in the serial extended mode register (SEMR). For clock source selection, refer to Table 17.16.

When an external clock is input at the SCK pin, it must have a frequency equal to 16/8 times the desired bit rate.

When the SCIFA operates on an internal clock, it can output a clock signal on the SCK pin. The frequency of this output clock is 16/8 times the desired bit rate.

(3) Transmitting and Receiving Data

- SCIFA Initialization (in Asynchronous Mode)

Before transmitting or receiving data, clear the TE and RE bits to 0 in the serial control register (SCR), and then initialize the SCIFA as follows.

When changing operating mode or communication format, always clear the TE and RE bits in the SCR register to 0 before following the procedure given below. Clearing TE to 0 initializes the transmit shift register (TSR). Clearing TE and RE to 0, however, does not initialize the serial status register (FSR), transmit FIFO data register (FTDR), or receive FIFO data register (FRDR), which retain their previous contents. Clear TE to 0 after all transmit data has been transmitted and the TEND flag in the FSR register is set. The TE bit can be cleared to 0 during transmission, but the transmit data (the TXD pin output level) after the TE bit is cleared to 0 depends on the settings of the SPB2IO and SPB2DT bits in the SPTR register. Set the TFRST bit in the FCR register to 1 and reset the FTDR register before TE is set to 1 again to start transmission.

When an external clock is used, the clock should not be stopped during initialization or subsequent operation. SCIFA operation becomes unreliable if the clock is stopped. Figure 17.3 shows a sample flowchart for initializing the SCIFA in asynchronous mode.

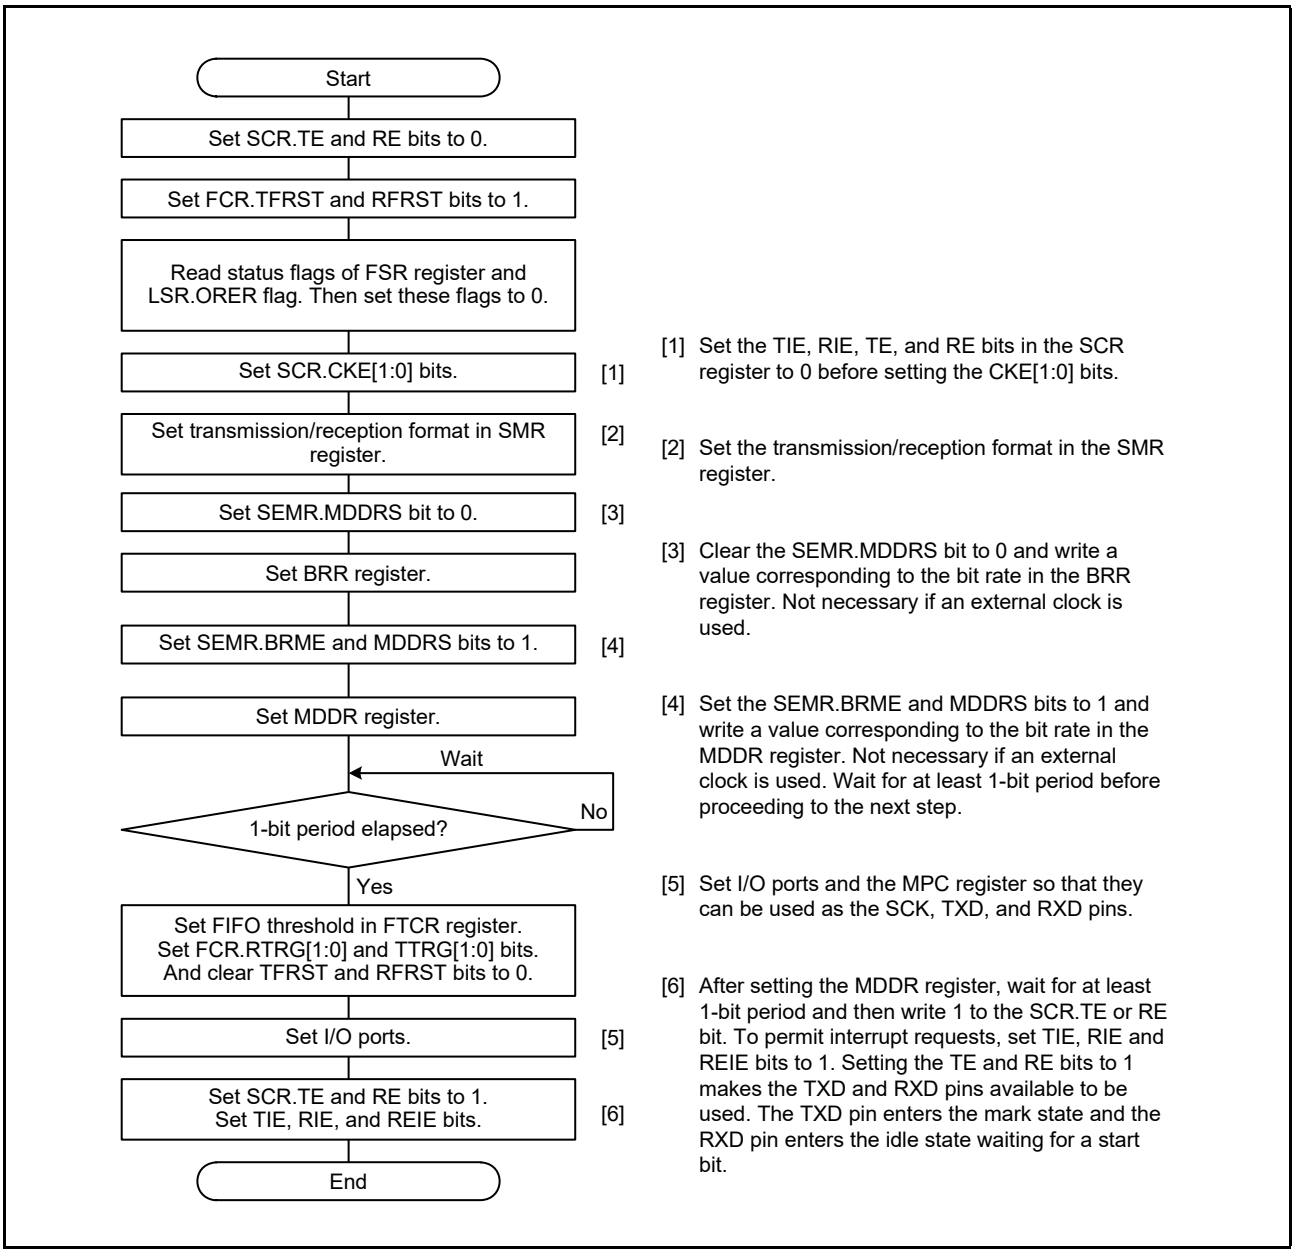

Figure 17.3 Sample Flowchart for SCIFA Initialization in Asynchronous Mode

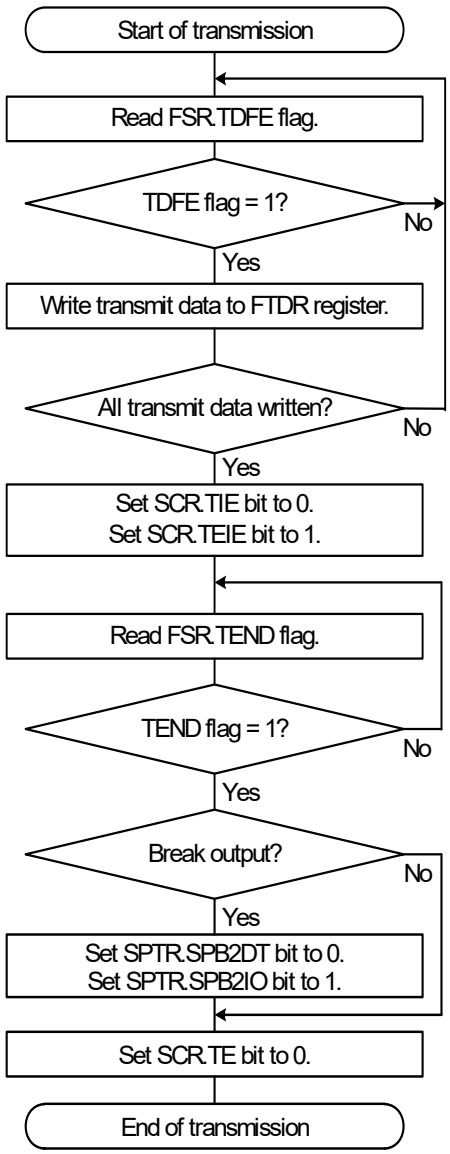
- Transmitting Serial Data (in Asynchronous Mode)

Figure 17.4 shows a sample flowchart for serial transmission in asynchronous mode.
Follow the procedure given below for serial data transmission after enabling the SCIFA for transmission.



[1] Check the SCIFA status and write the transmit data:
Read the FSR register, confirm that the TDFE flag is set to 1, and then write the transmit data to the FTDR register. The transmit data quantity that can be written is "16 - FDR.T[4:0]".
A change of the TDFE flag from 0 to 1 can be known by a TXIF interrupt request.

[2] Serial transmission continuation procedure:
When transmit data is written to the FTDR register, the TDFE flag is automatically cleared to 0.

[3] Serial transmission end procedure (when TXIF or TEIF interrupt is used):
After the last transmission data is written to the FTDR register, set the TIE bit to 0 and the TEIE bit to 1 in the SCR register. If the DMAC is activated to write the transmit data to the FTDR register, enable the transmit end interrupt. This will generate a CPU interrupt request when the last transmit data is written in the FTDR register. The TIE and TEIE bit settings will be changed by the CPU interrupt process.
This procedure is unnecessary if the TXIF or TEIF interrupt is not used.

[4] Serial transmission end confirmation:
Read the FSR register and confirm that the TEND flag has changed to 1.
A change of the TEND flag from 0 to 1 can be known by a TEIF interrupt request.

[5] Break output during serial transmission:
To cause a break to be output during serial transmission, set the SPB2DT bit to 0 and the SPB2IO bit to 1 in the SPTR register. Then set the SCR.TE bit to 0.*1

In Step [1], the number of data bytes that can be written can be checked by the FDR.T[4:0] flag (non-transmitted data quantity in the FTDR register).

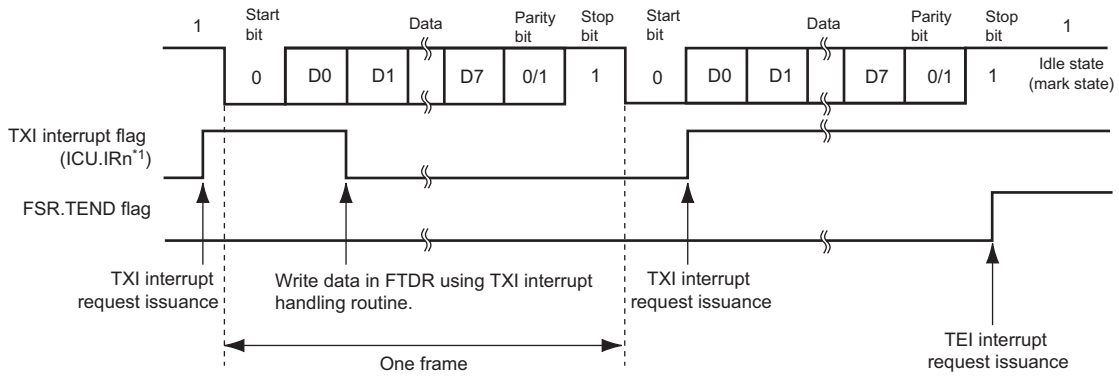
Note 1. The SPB2DT bit of the SPTR register indicates the input status of the RXD pin. Writings to the SPB2DT and SPB2IO bits of thsi register in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written to the SPB2DT bit. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

Figure 17.4 Sample Flowchart for Transmitting Serial Data in Asynchronous Mode

In asynchronous mode, the SCIFA performs serial transmission as described below.

1. When data is written into the transmit FIFO data register (FTDR) by the TXI interrupt processing routine, the SCIFA transfers the data from the FTDR register to the transmit shift register (TSR) and starts transmission. Confirm that the TDFE flag in the serial status register (FSR) is set to 1 before writing transmit data to the FTDR register. The number of data bytes that can be written is “16 minus the number of non-transmitted data units”.
2. When data is transferred from the FTDR register to the TSR register and transmission is started, consecutive transmit operations are performed until there is no transmit data left in the FTDR register. When the number of transmit data bytes in the FTDR register becomes equal to or less than the transmission trigger number specified in the FIFO control register (FCR) or FIFO trigger control register (FTCR), the TDFE flag is set. If the TIE bit in the serial control register (SR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated. The serial transmit data is output from the TXD pin in the following order.
   (a) Start bit: One-bit 0 is output.
   (b) Transmit data: 8- or 7-bit data is output in LSB-first order (when LSB-first transfer is selected).
   (c) Parity bit: One parity bit (even or odd parity) is output. (A format in which a parity bit is not output can also be selected.)
   (d) Stop bit(s): One or two 1 bits (stop bits) are output.
   (e) Mark state: 1 is output continuously until the start bit that starts the next transmission is output.
3. The SCIFA checks the transmit data of the FTDR register at the timing for sending the stop bit. If data is present, the data is transferred from the FTDR register to the TSR register, the stop bit is output, and then serial transmission of the next frame is started. If there is no data to be transmitted, the TEND flag in the FSR register is set to 1, the stop bit is output, and then the SCIFA enters the mark state (high level) in which 1 is output continuously.

Figure 17.5 shows an example of the operation for transmission in asynchronous mode.



Note 1. For the corresponding interrupt number, see section 7, Interrupt Controller.

Figure 17.5 Example of Transmit Operation in Asynchronous Mode
(8-Bit Data with Parity and One Stop Bit when LSB-First Transfer is Selected)

4. When modem control is enabled, transmission can be stopped/resumed by the input level to the CTS# pin. When a high level is input to the CTS# pin during transmission, the SCIFA enters the mark state (high level) after completion of one-frame data transmission. When a low level is input to the CTS# pin, output of the next data to be transmitted begins with a start bit. Figure 17.6 shows an example of the operation for transmission when using the modem control function.

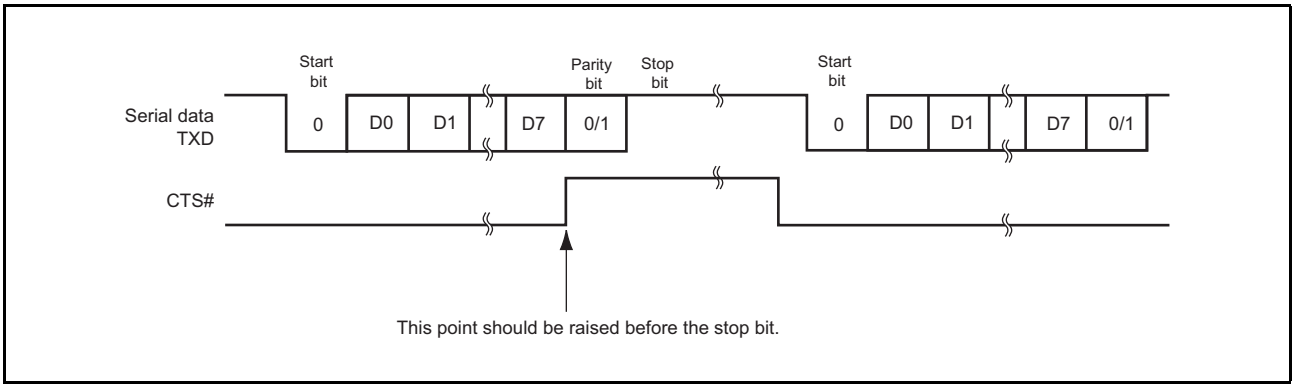


Figure 17.6 Example of Transmit Operation in Asynchronous Mode Using Modem Control Function (CTS#)

- Receiving Serial Data (in Asynchronous Mode)

Figure 17.7and Figure 17.8 show sample flowcharts for serial reception in asynchronous mode.
Follow the procedure given below for serial data reception after enabling the SCIFA for reception.

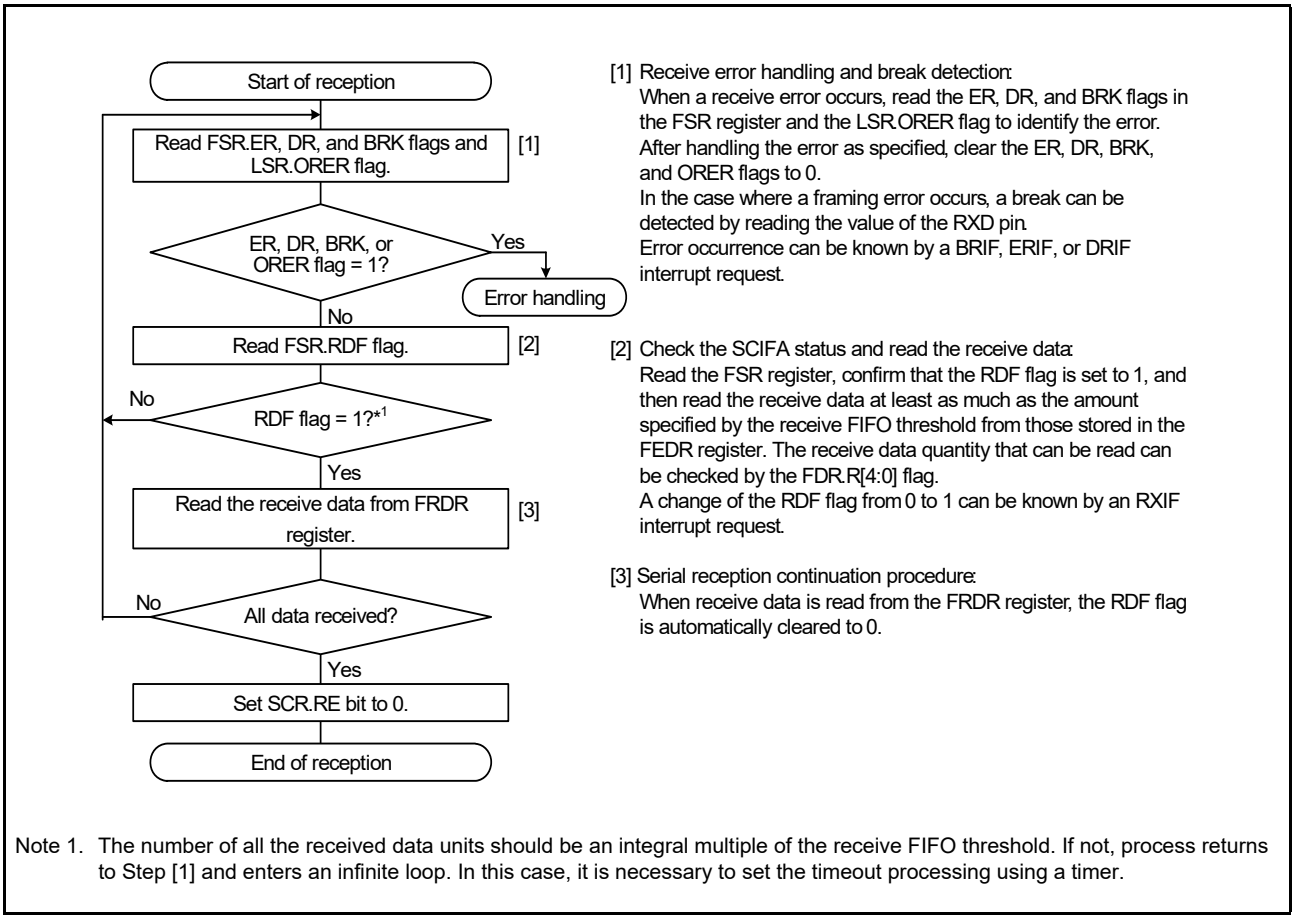

Figure 17.7 Sample Flowchart for Receiving Serial Data in Asynchronous Mode (1)

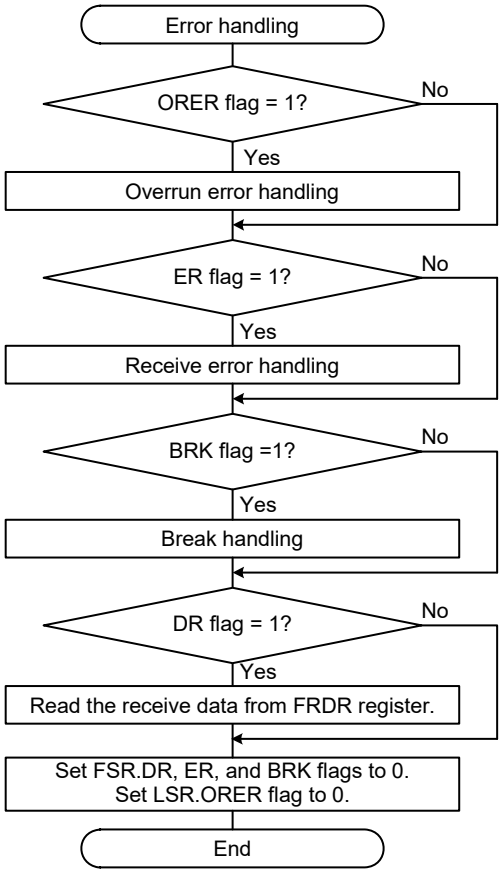


- Whether a framing error or parity error has occurred in the received data that is read from the FRDR register can be checked with the FER and PER flags in the FSR register.
- When a break signal is received, the received data is not transferred to the FRDR register while the BRK flag is set to 1. However, note that the last data in the FRDR register is 00h and the break data in which a framing error occurred is stored.

Figure 17.8 Sample Flowchart for Receiving Serial Data in Asynchronous Mode (2)

In asynchronous mode, the SCIFA performs serial reception as described below.

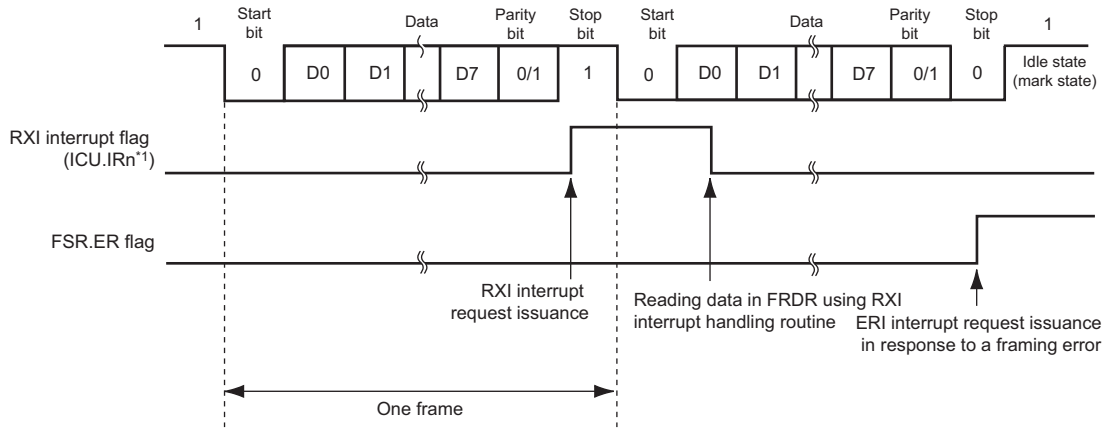
1. The SCIFA monitors the communication line, and if a 0 start bit is detected, it performs internal synchronization to start reception.
2. The received data is stored into the RSR register in LSB-to-MSB order (when LSB-first transfer is selected).
3. The parity bit and stop bit are received.
   After receiving these bits, the SCIFA carries out the following checks.
   (a) Stop bit check: The SCIFA checks whether the stop bit is 1. If there are two stop bits, only the first is checked.
   (b) The SCIFA checks whether receive data can be transferred from the receive shift register (RSR) to the receive FIFO data register (FRDR).
   (c) Parity bit check: The SCIFA checks whether the parity bit is an expected value.
   (d) Overrun error check: The SCIFA checks whether the ORER flag is 0, indicating that the overrun error has not occurred.
   (e) Break check: The SCIFA checks whether the BRK flag is 0, indicating that the break state is not set.

If all the above checks are passed, the receive data is stored in the FRDR register.
Note: When a parity error or a framing error occurs, reception is not suspended.

4. When receive data units equaling or exceeding the specified reception trigger number are stored in the receive FIFO data register (FRDR) and the RDF flag is changed to 1, a receive FIFO data full interrupt (RXI) request is generated while the RIE bit in the SCR register is set to 1. When the quantity of data in the FRDR register falls below the specified reception trigger number and the RIE bit in the SCR register is set to 1, a receive data ready interrupt (DRI) request is generated if no next data is received after the elapse of 15 ETUs*1 from the last stop bit (the DR flag in the FSR register is 1). When the ER flag in the FSR register is changed to 1, a receive error interrupt (ERI) request is generated while the RIE or REIE bit in the SCR register is set to 1. When the BRK or ORER flag is changed to 1 in the FSR register, a break reception interrupt (BRI) request is generated while the RIE or REIE bit in the SCR register is set to 1.

Note 1. It is equivalent to 1 and half frames of 8-bit format with one stop bit (ETU: Element Time Unit).

Figure 17.9 shows an example of the operation for reception in asynchronous mode.



Note 1. For the corresponding interrupt number, see section 7, Interrupt Controller.

Figure 17.9 Example of SCIFA Receive Operation in Asynchronous Mode
(8-Bit Data with Parity and One Stop Bit when LSB-First Transfer is Selected)

5. When modem control is enabled, the RTS# signal that indicates the FRDR register has space is output. When the RTS# pin is at low level, reception is possible. The RTS# pin being at the high level indicates that the number of entries in the FRDR register is equal to or greater than the threshold for output of the active level of the RTS# signal and that the transmission of further data needs to be suspended until the FRDR register has enough space. Figure 17.10 shows an example of the operation for reception in asynchronous mode when using the modem control function.

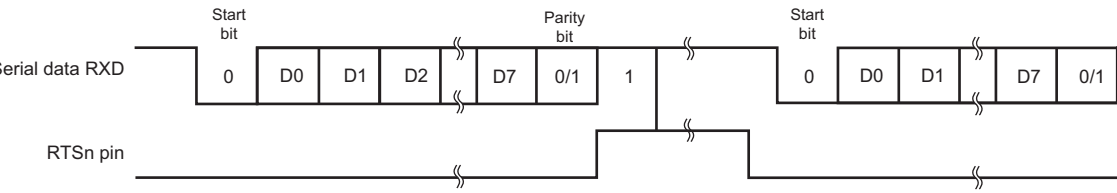


Figure 17.10 Example of SCIFA Receive Operation in Asynchronous Mode Using Model Control Function (RTS#)

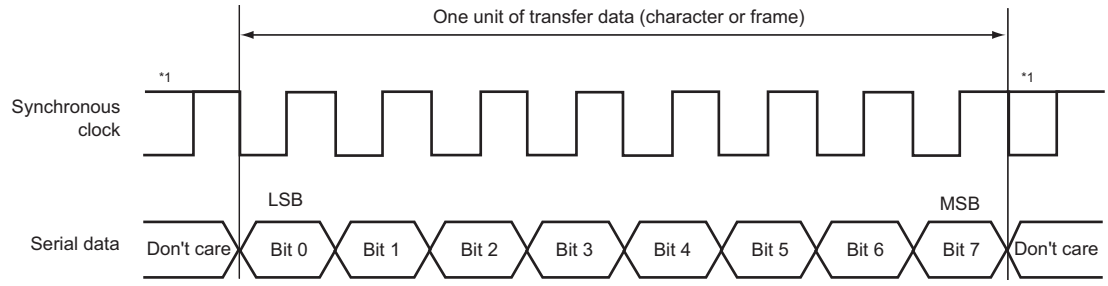
17.3.3 Operation in Clock Synchronous Mode

In clock synchronous mode, the SCIFA transmits and receives data in synchronization with clock pulses. This mode is suitable for high-speed serial communication.
Full-duplex communication is possible because the SCIFA transmitter and receiver are independent and share the same clock. Since the transmitter and the receiver have 16-stage FIFO buffers, respectively, continuous transmission or reception is possible by reading or writing data while transmission or reception is in progress.
Figure 17.11 shows the general format in clock synchronous serial communication.



Note 1. High level except in continuous transmission/reception

Figure 17.11 Data Format in Clock Synchronous Communication (when LSB-First Transfer is Selected)

In clock synchronous serial communication, each data bit is output on the communication line from one falling edge of the synchronous clock to the next. Data is guaranteed valid at the rising edge of the synchronous clock.
In each character, the serial data bits are transmitted in order from the LSB (first) to the MSB (last). After output of the MSB, the communication line remains in the state of the MSB (when LSB-first transfer is selected).
In clock synchronous mode, the SCIFA receives data by synchronizing with the rising edge of the synchronous clock.

(1) Transmit/Receive Formats

The data length is fixed at eight bits.
No parity bit can be added.

(2) Clock

An internal clock generated by the on-chip baud rate generator or an external clock input from the SCK pin can be selected as the SCIFA transmit/receive clock according to the settings of the CM bit in the serial mode register (SMR) and the CKE[1:0] bits in the serial control register (SCR).
When the SCIFA operates on an internal clock, it outputs the synchronous clock signal at the SCK pin. Eight synchronous clock pulses are output per transmitted or received character. Unless the SCIFA is transmitting or receiving, the synchronous clock signal remains in the high state. When the SCIFA only receives data on an internal clock, the internal clock signal outputs while the RE bit in the SCR register is 1 until the number of data units in the receive FIFO reaches the specified reception trigger number.

(3) Transmitting and Receiving Data

- SCIFA Initialization (in Clock Synchronous Mode)

Before transmitting or receiving, clear the TE and RE bits to 0 in the serial control register (SCR), and then initialize the SCIFA by performing the following procedure.
Similarly, before changing the mode or communication format, clear the TE and RE bits to 0, and then change it by performing the following procedure. Clearing TE to 0 initializes the transmit shift register (TSR). Clearing RE to 0, however, does not initialize the RDF, PER, FER, and ORER flags and the receive FIFO data register (FRDR), which retain their previous contents.

Figure 17.12 shows a sample flowchart for initializing the SCIFA in clock synchronous mode.

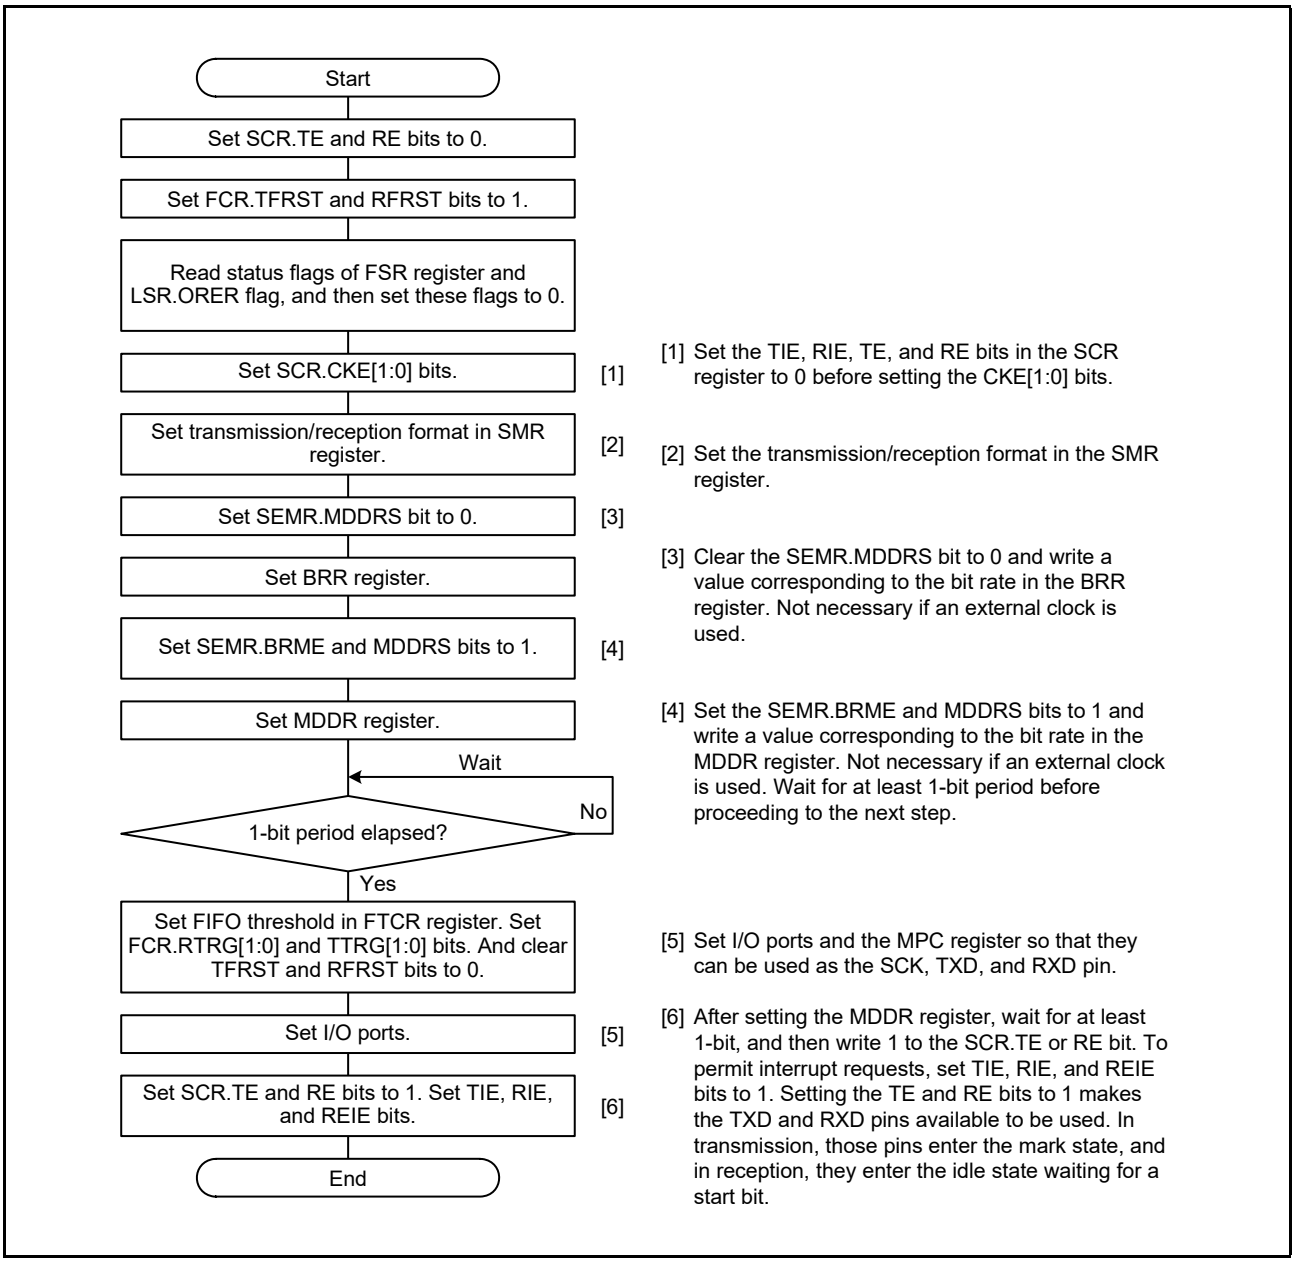


Figure 17.12 Sample Flowchart for SCIFA Initialization in Clock Synchronous Mode

- Transmitting Serial Data (in Clock Synchronous Mode)

Figure 17.13 shows a sample flowchart for transmitting serial data in clock synchronous mode.
Follow the procedure given below for serial data transmission after enabling the SCIFA for transmission.

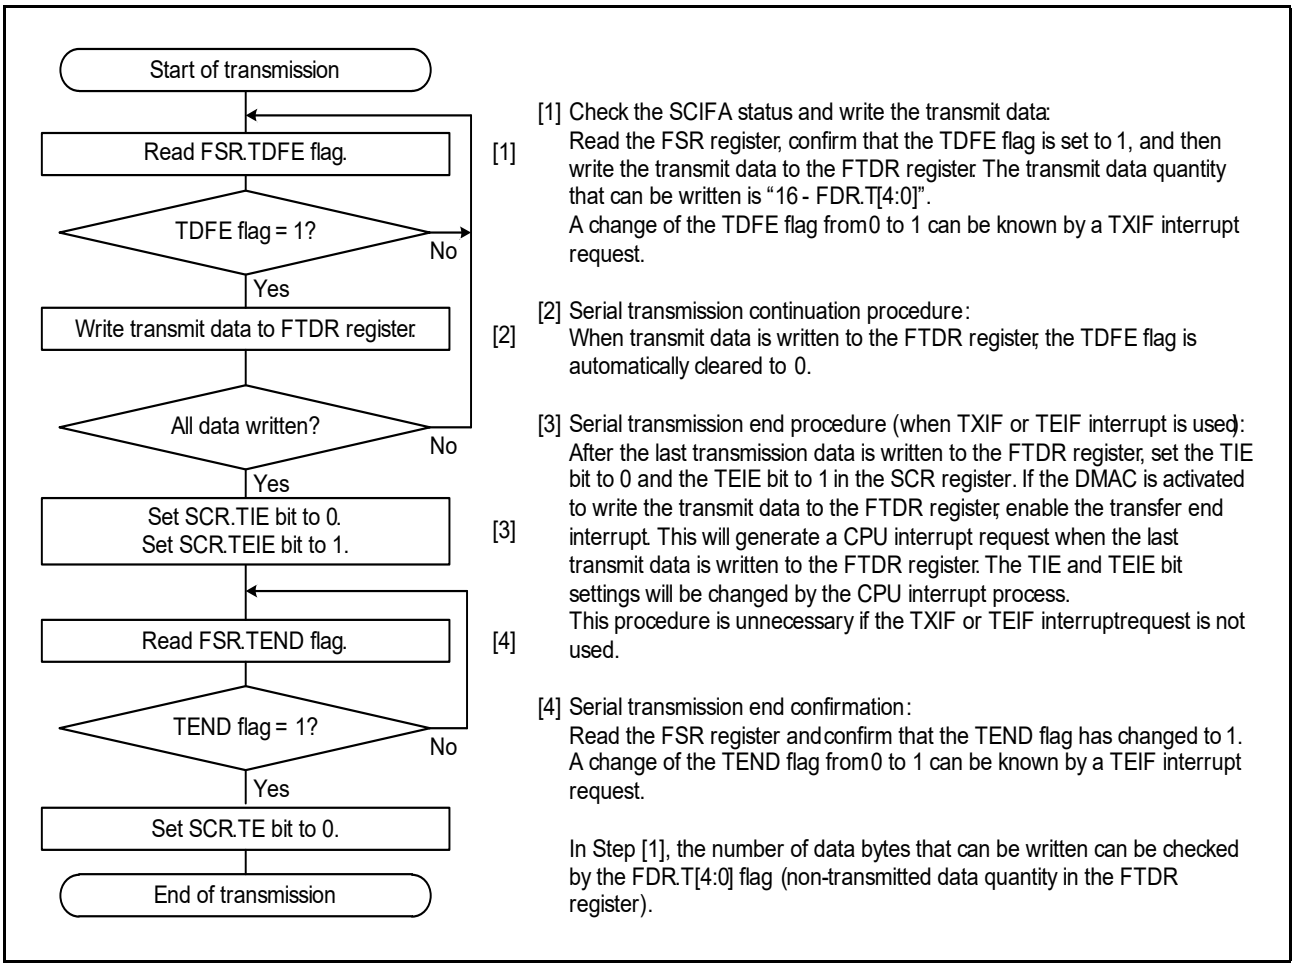

Figure 17.13 Sample Flowchart for Transmitting Serial Data in Clock Synchronous Mode

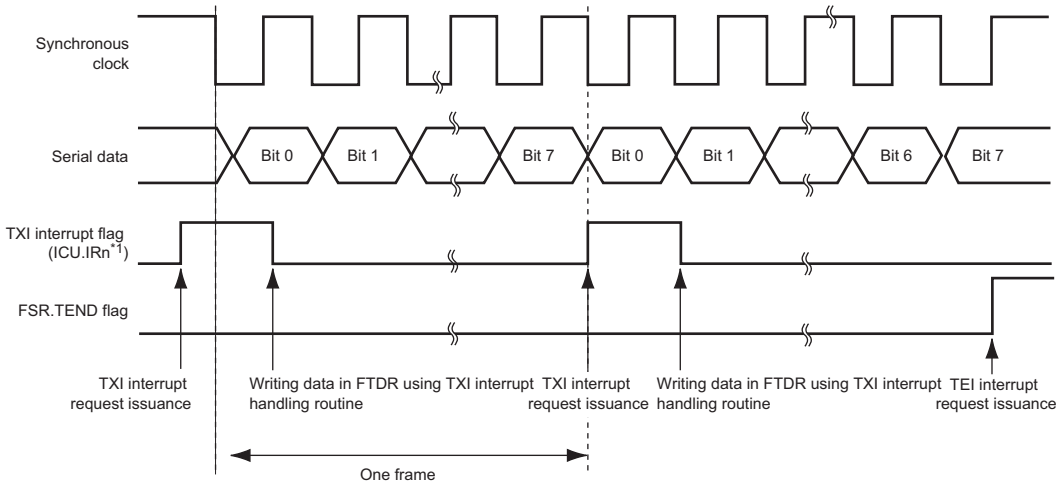
In clock synchronous mode, the SCIFA performs serial transmission as described below.

1. When data is written into the transmit FIFO data register (FTDR) by the TXI interrupt processing routine, the SCIFA transfers the data from the FTDR register to the transmit shift register (TSR) and starts transmission. Confirm that the TDFE flag in the serial status register (FSR) is set to 1 before writing transmit data to the FTDR register. The number of data bytes that can be written is “16 minus the specified number of non-transmitted data units”.
2. When data is transferred from the FTDR register to the TSR register and transmission is started, consecutive transmit operations are performed until there is no transmit data left in the FTDR register. When the number of transmit data bytes in the FTDR register becomes equal to or less than the transmission trigger number set in the FIFO control register (FCR) or FIFO trigger control register (FTCR), the TDFE flag in the FSR register is set. If the TIE bit in the serial control register (SCR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated.
   If clock output mode is selected, the SCIFA outputs eight synchronous clock pulses. If an external clock source is selected, the SCIFA outputs data in synchronization with the input clock. Data is output from the TXD pin in order from the LSB (b0) to the MSB (b7) (when LSB-first transfer is selected).
3. The SCIFA checks the transmit data of the FTDR register at the timing for sending the MSB (bit 7). If data is present, the data is transferred from the FTDR register to the TSR register, and then serial transmission of the next frame is started. If there is no data, the TXD pin holds the output level of the last data after the TEND flag in the FSR register is set to 1 and the MSB (bit 7) is output.
4. After the end of serial transmission, the SCK pin is held in the high state.

Figure 17.14 shows an example of SCIFA transmit operation in clock synchronous mode.

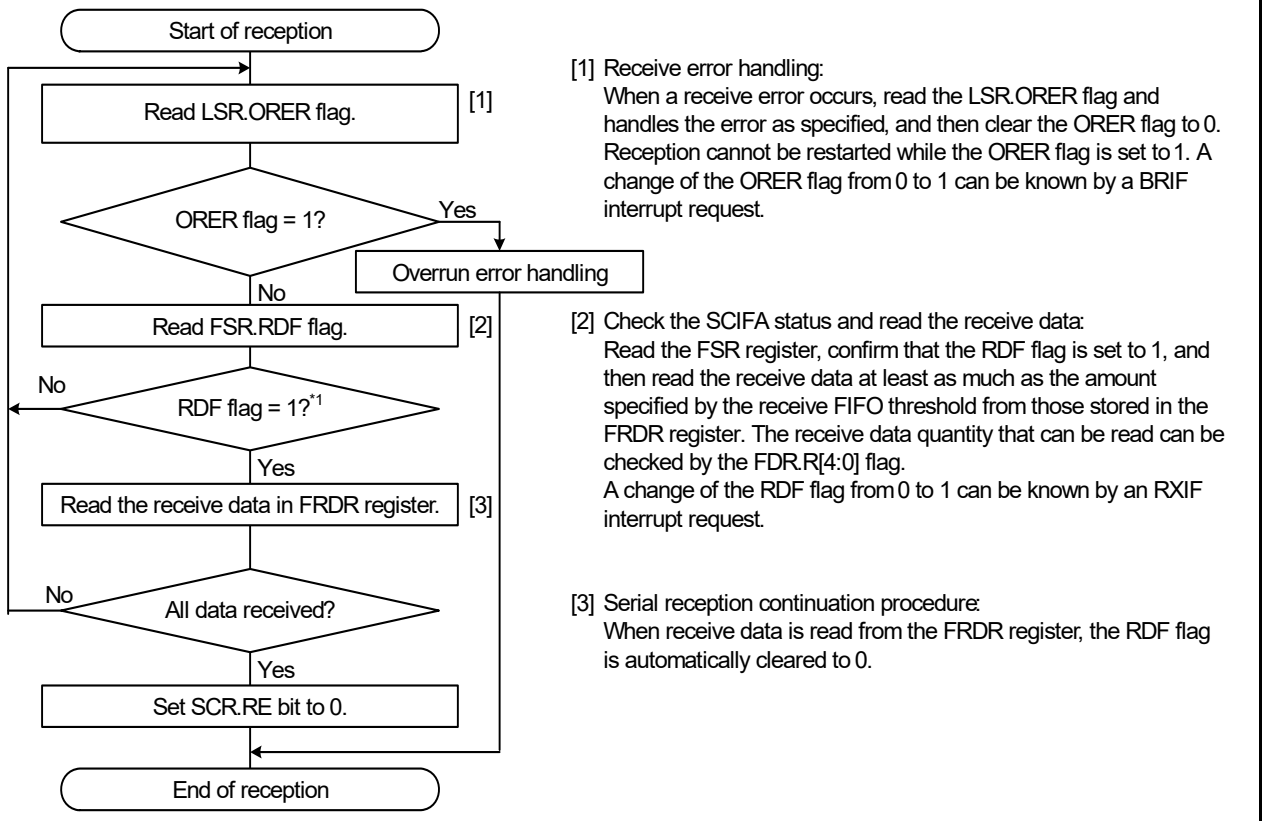


Note: For the corresponding interrupt number, see section 12, Interrupt Controller (ICUA).

Figure 17.14 Example of SCIFA Transmit Operation in Clock Synchronous Mode (when LSB-First Transfer is Selected)

- Receiving Serial Data (in Clock Synchronous Mode)

Figure 17.15 and Figure 17.16 show sample flowcharts for receiving serial data in clock synchronous mode. Follow the procedure given below for serial data reception after enabling the SCIFA for reception. When switching from asynchronous mode to clock synchronous mode without SCIFA initialization, make sure that the ORER, PER, and FER flags in the line status register (LSR) are cleared to 0.



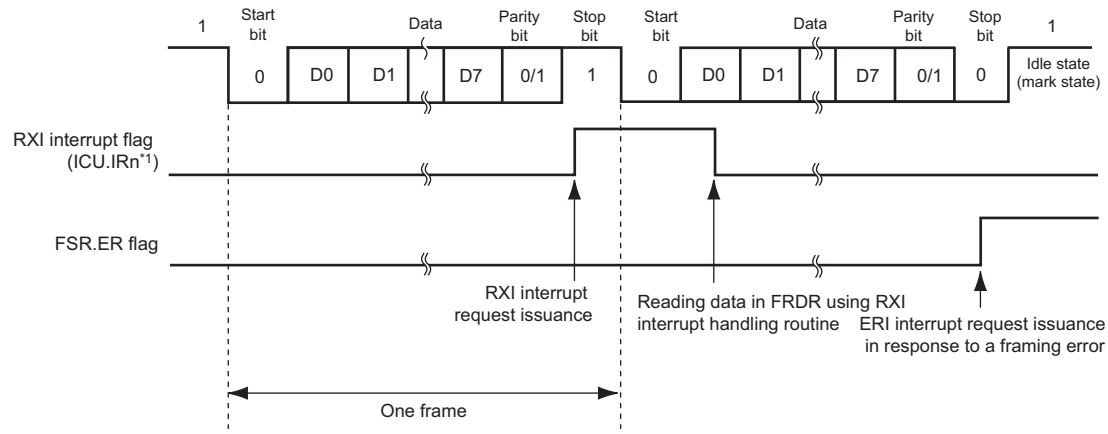
Note 1. The number of all the received data units should be an integral multiple of the receive FIFO threshold. If not, process returns to Step [1] and enters an infinite loop. In this case, it is necessary to set the timeout processing using a timer.

Figure 17.15 Sample Flowchart for Receiving Serial Data in Clock Synchronous Mode

In clock synchronous mode, the SCIFA performs serial reception as described below.

1. The SCIFA synchronizes with the synchronous clock input or output and starts reception.
2. Receive data is stored into the receive shift register (RSR) in order from the LSB to the MSB (when LSB-first transfer is selected). After receiving the data, the SCIFA checks whether the receive data can be transferred from the RSR register to the FRDR register. If data can be transferred, the SCIFA stores the received data in the FRDR register. If an overrun error is detected during the error check, further reception is not performed.
3. After the received data units equaling or exceeding the specified reception trigger number are stored in the FRDR register and the RDF flag is set to 1, a receive-data-full interrupt (RXI) request is generated when the RIE bit in the serial control register (SCR) is set to 1. When the ORER flag in the line status register (LSR) is set to 1 and the RIE or REIE bit in the SCR register is also set to 1, a break interrupt (BRI) request is generated.

Figure 17.16 shows an example of SCIFA receive operation in clock synchronous mode.



Note 1. For the corresponding interrupt number, see section 7, Interrupt Controller.

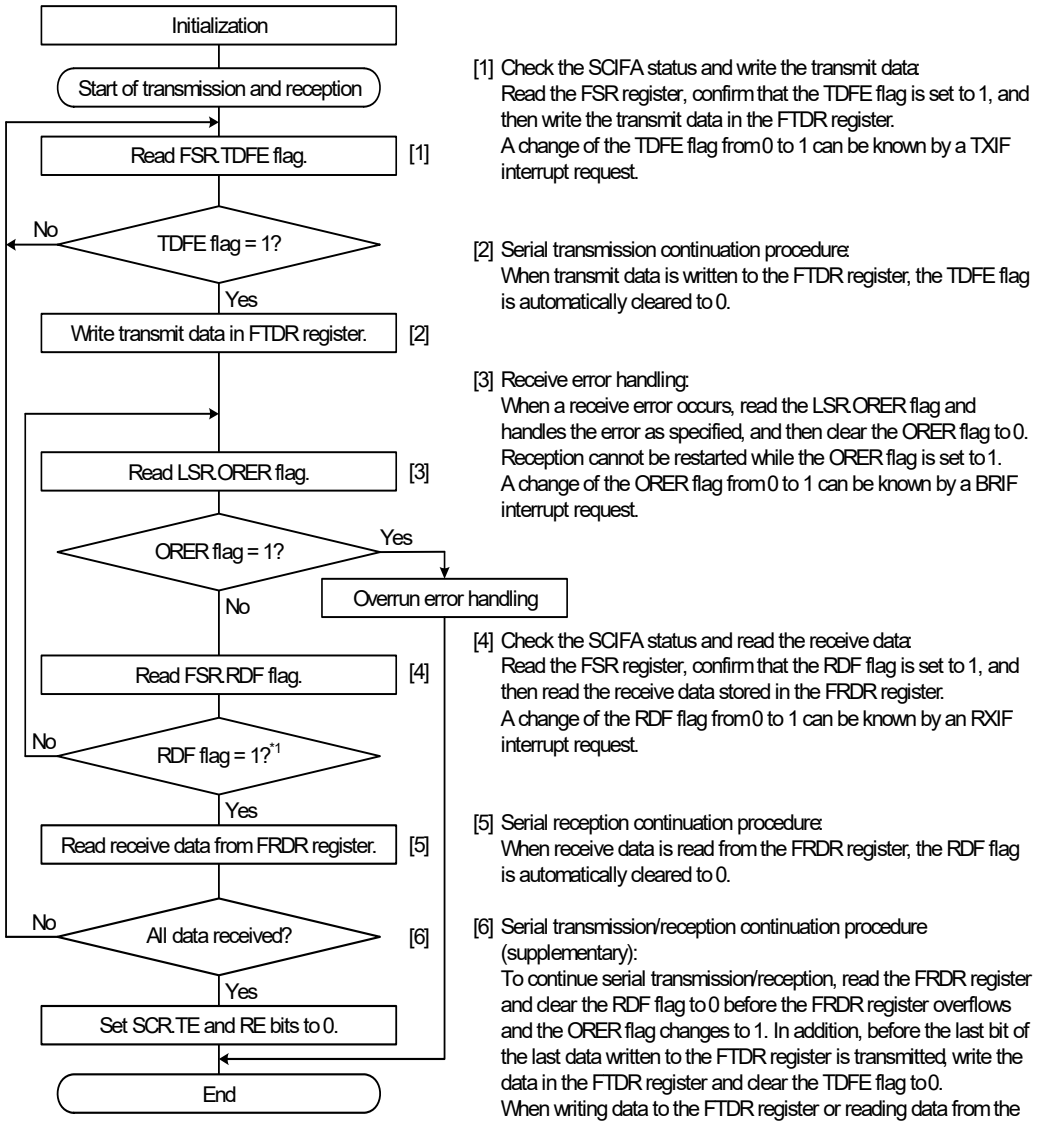
Figure 17.16 Example of SCIFA Receive Operation (when LSB-First Transfer is Selected)

- Transmitting and Receiving Serial Data Simultaneously (in Clock Synchronous Mode)

Figure 17.17 shows a sample flowchart for transmitting and receiving serial data simultaneously in clock synchronous mode.

In simultaneous transmission/reception of serial data, number of receive data = number of transmit data = number of transmit data to be written to the FTDR register.

Follow the procedure given below for the simultaneous transmission/reception of serial data, after enabling the SCIFA for transmission/reception.



Note: When switching the operation from transmission or reception to the simultaneous transmission and reception, clear the TE and RE bits to 0 and then simultaneously set these bits to 1.

Note 1. The number of all the received data units should be an integral multiple of the receive FIFO threshold. If not, process returns to Step [1] and enters an infinite loop. In this case, it is necessary to set the timeout processing using a timer.

Figure 17.17 Sample Flowchart for Simultaneous Transmitting/Receiving Serial Data in Clock Synchronous Mode

17.4 Bit Rate Modulation

Using the bit rate modulation, the bit rate can be corrected by skipping the specified number of clock pulses input to the baud rate generator. To correct the bit rate, only the number of clock pulses specified in the MDDR register are enabled among 256 internal clock pulses specified by the CKS1 and CKS0 bits in the SMR register in a way that forms average intervals.

Figure 17.18 shows an example where P1φ is selected by the CKS[1:0] bits in SMR and BRR and MDDR are set to 0 and 160, respectively, in asynchronous mode. In this example, the cycle of the base clock is evenly corrected (256/160) and the bit rate is also corrected (160/256). Note that skipping an internal clock causes bias and expansion or contraction is generated in the pulse width of the base clock.

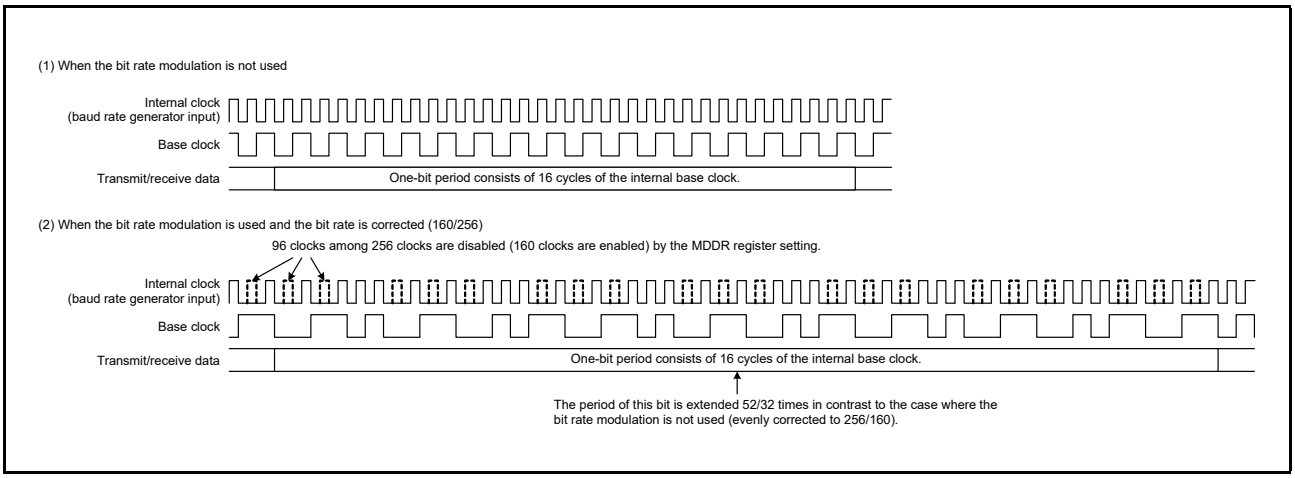


Figure 17.18 Example of Internal Base Clock when Bit Modulation is Used

17.5 Interrupt Sources

The SCIFA has six interrupt sources: transmit-FIFO-data-empty (TXI), receive-error (ERI), receive-FIFO-data-full (RXI), break (BRI), transmit-end (TEI), receive-data-ready (DRI). The TEI, DRI, ERI, and BRI interrupts share the same vector number.

Table 17.18 shows the interrupt sources and priority. The interrupt sources can be enabled or disabled using the TIE, RIE, REIE, TEIE bits in the SCR register and are separately input to the interrupt controller.

When the quantity of transmit data written in the FTDR register as a result of transmission is equal to or less than the specified transmission trigger number, the TDFE flag in the serial status register (FSR) is set to 1 and a TXI interrupt request is generated.

When the data units equaling or exceeding the specified transmission trigger number are stored in the receive FIFO register (FRDR) and the RDF flag in the FSR register is set to 1, a receive data full interrupt (RXI) request is generated.

When the quantity of received data in the FRDR register is below the specified reception trigger number and no next data has been received yet even after the period of 15 ETUs elapsed*1 from the last stop bit, the DR flag in the FSR register is set to 1 and a receive data ready interrupt (DRI) request is generated. In clock synchronous mode, a DRI interrupt request is not generated.

When the BRK flag in the FSR register or the ORER flag in the LSR register is set to 1, a BRI interrupt request is issued.

When the ER flag in the FSR register is set to 1, an ERI interrupt request is issued.

When the TEND flag in the FSR register is set to 1, a TEI interrupt request is issued.

When the RIE bit is cleared to 0 and the REIE bit in the SCR register is set to 1, an ERI and a BRI interrupt requests are issued but an RXI interrupt request is not.

An TXI interrupt indicates that transmit data can be written and an RXI interrupt indicates that receive data is stored in the FRDR register.

Note 1. It is equivalent to 1 and half frames of 8-bit format with one stop bit (ETU: Element Time Unit).

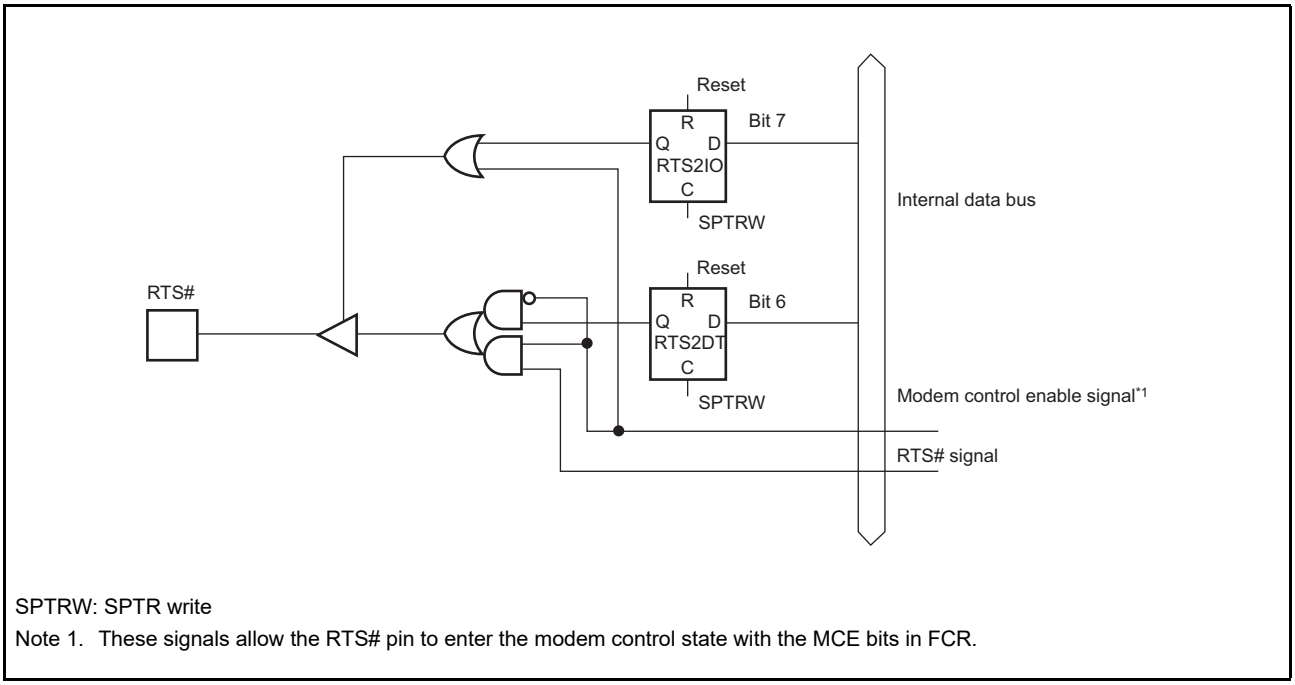
Table 17.18 SCIFA Interrupt Sources

Name	Level/ Edge	Interrupt Source	Interrupt Enable BIt	DMAC Activation	Priority
BRI	Level	Interrupt caused by break (BRK) or overrun (ORER).	RIE or REIE	Impossible	High
ERI	Level	Interrupt caused by framing or parity (ER).	RIE or REIE	Impossible	↕
RXI	Level	Interrupt caused by receive FIFO data full (RDF).	RIE	Possible	
TXI	Level	Interrupt caused by transmit FIFO data empty (TDFE).	TIE	Possible	
TEI	Level	Interrupt caused by transmit end (TEND).	TEIE	Impossible	
DRI	Level	Interrupt caused by receive data ready (DR).	RIE	Impossible	Low

Note: The TEI and DRI interrupts share the same vector number.
The ERI and BRI interrupts share the same vector number.
If CPU processing is used, clear the flag after the block transfer. If the DMAC is activated, access to the flags is prohibited.

17.6 Serial Port Register (SPTR) and SCIFA-Related Pins

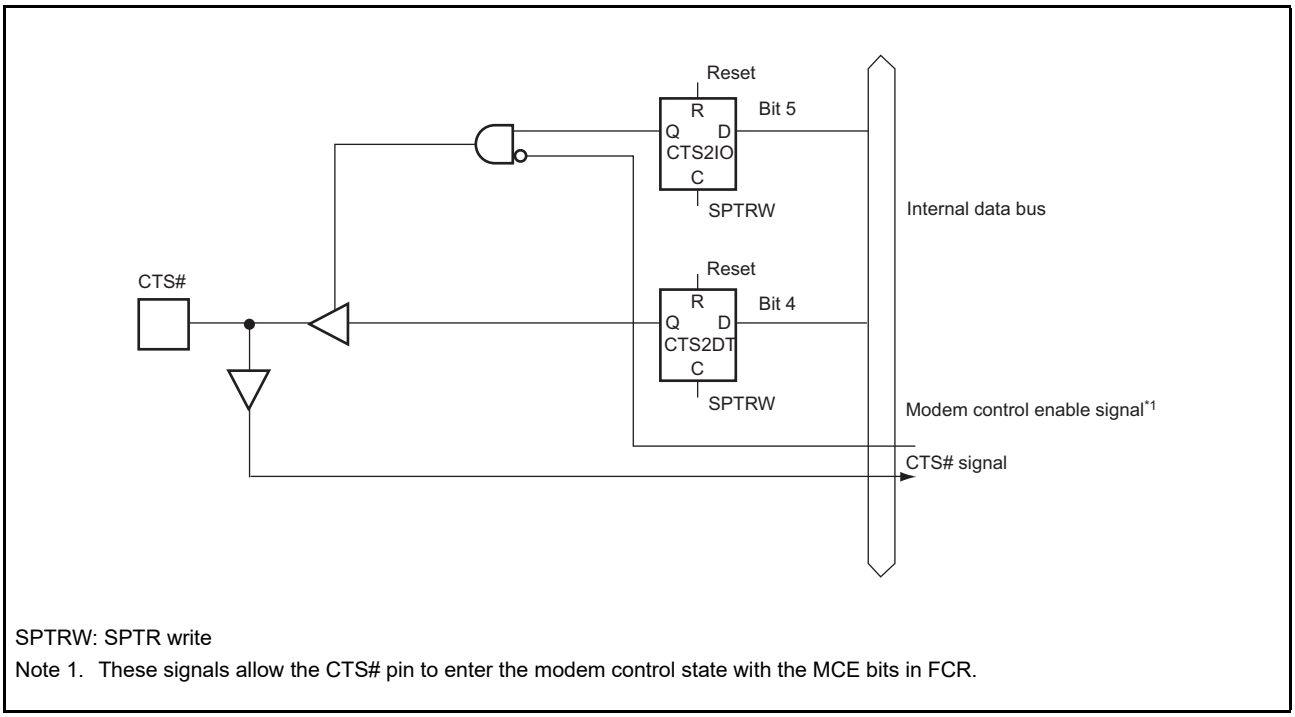
Figure 17.19 to Figure 17.22 show the relationships between the SPTR register and the SCIFA-related pins.



SPTRW: SPTR write

Note 1. These signals allow the RTS# pin to enter the modem control state with the MCE bits in FCR.

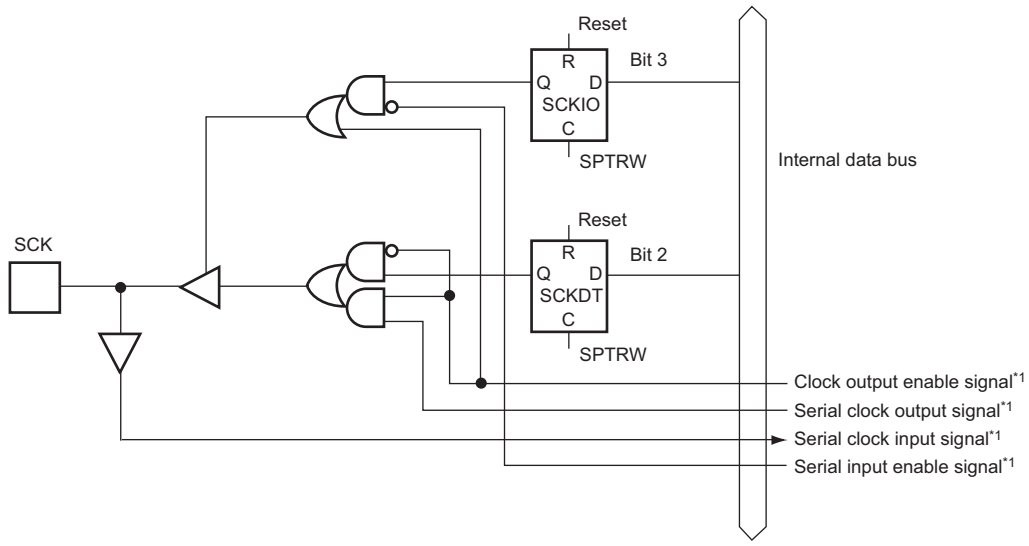
Figure 17.19 RTS2IO Bit and RTS2DT Bit in the SPTR Register, and RTS# Pin



SPTRW: SPTR write

Note 1. These signals allow the CTS# pin to enter the modem control state with the MCE bits in FCR.

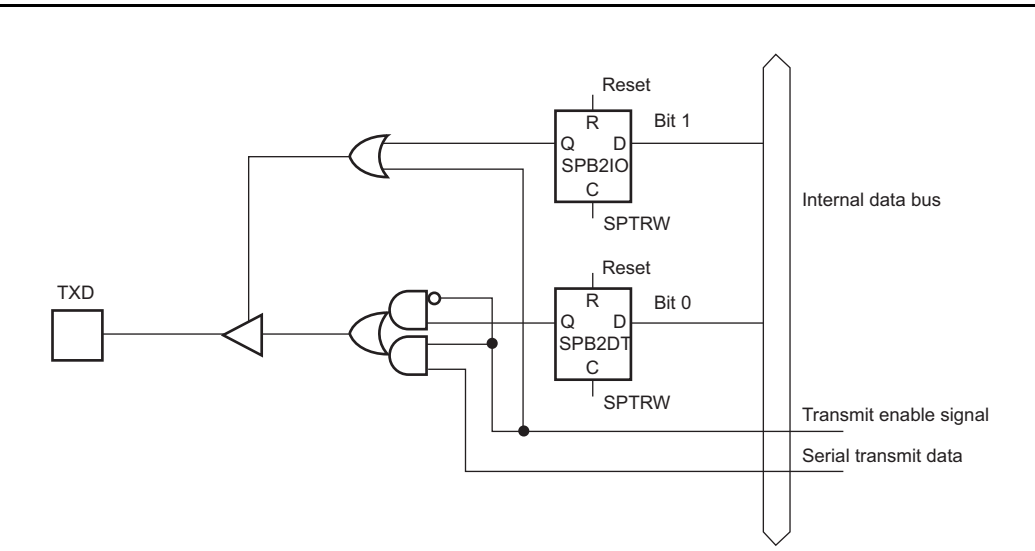
Figure 17.20 CTS2IO Bit and CTS2DT Bit in the SPTR Register, and CTS# Pin



SPTRW: SPTR write

Note 1. These signals control the SCK pin according to the settings of the CM bit in SMR and CKE[1:0] bits in SCR.

Figure 17.21 SCKIO Bit and SCKDT Bit in the SPTR Register, and SCK Pin



SPTRW: SPTR write

Figure 17.22 SPB2IO Bit and SPB2DT Bit in the SPTR Register, and TXD Pin

17.7 Noise Cancellation

Figure 17.23 shows the configuration of the noise filter used for noise cancellation. The noise filter consists of a two-stage flip-flop circuits and a match detection circuit. When the input signals of the noise filter and the output signals of the two-stage flip-flop circuits completely match, the matched level is conveyed as an internal signal. Unless otherwise matched, the previous value is retained. (When the levels sampled on three consecutive cycles of the sampling clock of the noise filter match, the signal is considered valid. If three consecutive sampled values do not match, the signal is considered to be noise rather than a received signal).

In asynchronous mode, the noise cancellation can be applied to the receive signal input to the RXDn pin. The receive level of the RXDn pin is taken in the flip-flop circuit of the noise filter on the base clock (the clock with a frequency 16 or 8 times the transfer rate*1).

If the base clock is stopped once with the noise filter enabled and then the base clock input is restarted again, the noise filter operation resumes from the state where the clock was stopped. When SCR.RE is set to 0 during input of the base clock, the noise filter outputs 0 as the internal RxDn signal. The internal match detector continues operating even while operations for reception are stopped, and the result from the last time previous consecutive samples matched is output at the same time as operations for reception are resumed.

Note 1. A frequency 16 times bit rate when the SEMR.ABCS0 bit and the SEMR.BGDM bit are both 0, and a frequency 8 times bit rate when either the SEMR.ABCS0 bit or the SEMR.BGDM bit is 1.

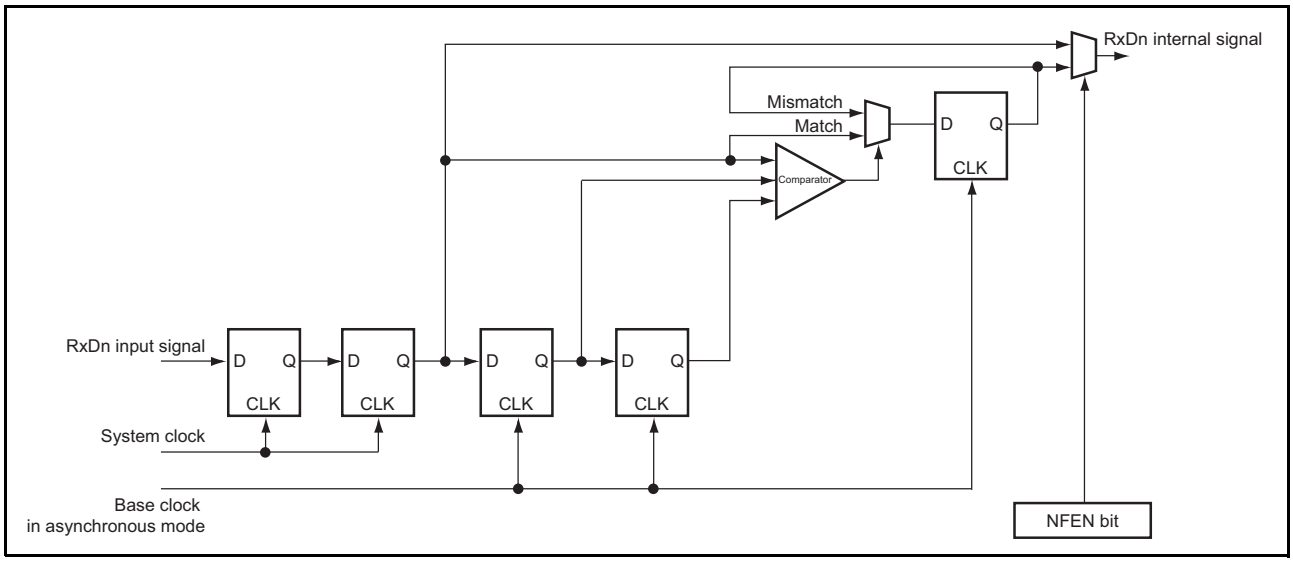


Figure 17.23 Block Diagram of Digital Noise Filter Circuit

17.8 Usage Notes

The following is the notes on using the SCIFA.

17.8.1 FTDR Register Writing and TDFE Flag

The TDFE flag in the serial status register (FSR) is set when the number of transmit data bytes written in the transmit FIFO data register (FTDR) has fallen below the transmission trigger number set by bits TTRG[1:0] in the FIFO control register (FCR) or bits TFTC[4:0] in the FIFO trigger control register (FTCR). After the TDFE flag is set, transmit data up to the number of empty bytes in the FTDR register can be written, allowing efficient continuous transmission.
However, if the number of data bytes written in the FTDR register is equal to or less than the specified transmission trigger number, the TDFE flag will be set to 1 again even after being read as 1 and cleared to 0.
The number of transmit data bytes in the FTDR register can be checked by the 8 higher-order bits of the FIFO data count register (FDR).

17.8.2 FRDR Register Reading and RDF Flag

The RDF flag in the serial status register (FSR) is set when the number of receive data bytes in the receive FIFO data register (FRDR) has become equal to or greater than the reception trigger number set by bits RTRG[1:0] in the FIFO control register (FCR) or bits RFTC[4:0] in the FIFO trigger control register (FTCR). After the RDF flag is set, receive data equivalent to the trigger number can be read from the FRDR register, allowing efficient continuous reception.
However, if the number of data bytes in the FRDR register exceeds the reception trigger number, the RDF flag will be set to 1 again even after being read as 1 and cleared to 0.
The number of receive data bytes in the FRDR register can be checked by the 8 lower-order bits of the FIFO data count register (FDR).

17.8.3 Break Detection and Processing

When a framing error (FER) is detected, a break signal can be detected by reading the RXD pin value directly. In a break, the input from the RXD pin becomes all low. Therefore, the FER flag in the serial status register (FSR) is set to 1 and the parity error flag (PER) may also be set to 1.
Upon detection of a break signal, the SCIFA stops the received data transfer to the FRDR register but continues the receive operation.

17.8.4 Writing to the SPTR Register

b6, b4, b2, and b0 of the SPTR register respectively indicate the input status of their corresponding pins. (See the description of each bit of section 17.2.12, Serial Port Register (SPTR) for details.)
Writings to these bits in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

17.8.5 Break Signal Transmission

The output signal from the TXD pin is determined by the SPB2IO bit and the SPB2DT bit in the serial port register (SPTR). The break signal can be sent by using these bits.

The TXD pin does not function as a transmit data output pin during the period from when the SCIFA is initialized to when the TE bit in the SCR register is set to 1 (transmission possible). The TXD pin status during this period is replaced by the SPB2DT bit value. Therefore, the SPB2IO and SPB2DT bits in the SPTR register must have been set to 1 (high output) at first (mark (high) status).

To transmit the break signal during serial transmission, set the SPB2IO bit in the SPTR register to 1, clear the SPB2DT bit to 0 (specify a low level), and then clear the TE bit in the SCR register to 0 (transmission stop). Clearing the TE bit to 0 initializes the transmitter regardless of the current transmission status, and outputs a low level from the TXD pin.

17.8.6 Receive Data Sampling Timing and Receive Margin in Asynchronous Mode

The SCIFA operates on a base clock with a frequency 16 times the transfer rate*1. In reception, the SCIFA internally latches the received data at the rising edge of the eighth base clock pulse*1. The timing is shown in Figure 17.24.

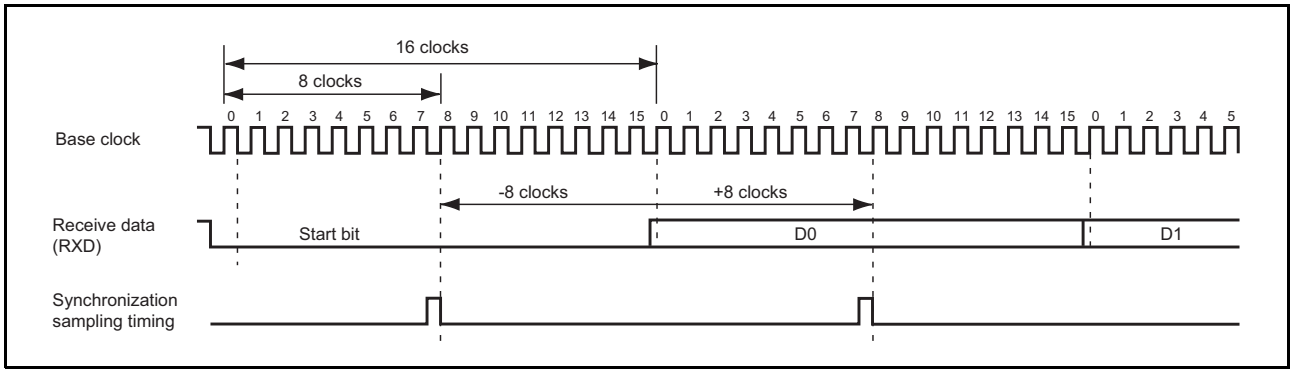

Figure 17.24 Receive Data Sampling Timing in Asynchronous Mode

Note 1. This is an example when the SEMR.ABCS0 bit is 0. When the ABCS0 bit is 1, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at the rising edge of the 4th pulse of the base clock. The receive margin in asynchronous mode can therefore be expressed as shown in equation 1.

The receive margin in asynchronous mode can therefore be expressed as shown in equation 1.

Equation 1:

$$M = \{(0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F)\} \times 100[\%]$$

Where: M: Receive margin (%)
N: Ratio of clock frequency to bit rate (N = 16)
D: Clock duty (D = 0 to 1.0)
L: Frame length (L = 9 to 12)
F: Absolute deviation of clock frequency

From equation 1, if F = 0 and D = 0.5, the receive margin is 46.875%, as given by equation 2.

Equation 2:

When D = 0.5 and F = 0:
$M = (0.5 - 1/(2 \times 16)) \times 100\% = 46.875\%$

This is a theoretical value. A reasonable margin to allow in system designs is 20% to 30%.

17.8.7 Note on FER Flag and PER Flag in Serial Status Register (FSR)

The FER flag and PER flag in the serial status register (FSR) are status flags that apply to next entry to be read from the receive FIFO data register (FRDR). After the CPU or DMAC reads the receive FIFO data register, the flags of framing errors and parity errors in the receive data will be cleared. To check the received data for the states of framing errors and parity errors, only read the receive FIFO data register after reading the serial status register.

17.8.8 Notes on External Clock Input in Clock Synchronous Mode

Before setting the TE and RE bits in the serial control register (SCR) to 1, wait for four or more cycles of the peripheral operating clock after the external clock (SCK) is changed from 0 (low) to 1 (high). To input the external clock (SCK) (to start communication), wait for one or more cycles of the external clock after the TE and RE bits in the SCR register are set to 1.

17.8.9 Module Standby Mode Setting

SCIFA operation can be disabled or enabled using the standby control register. As the initial setting, the SCIFA operation is halted. Register access is enabled by clearing module standby mode. For details, refer to section 52, Power-Down Modes.

17.8.10 Notes on Operation for Reception when an Internal Clock is Selected in Clock Synchronous Mode

When an internal clock is selected as the clock for reception in clock-synchronous mode, if the number of data stored through the receive FIFO data register (FRDR) becomes equal to or greater than the specified reception trigger number, the RDF flag is set, the RXI interrupt request is generated and, at the same time, output of the synchronizing clock and reception of serial data are stopped. Once the number of data are again less than the specified reception trigger number, output of the synchronizing clock and the reception of serial data are restarted. In addition, if an internal clock is selected for reception in clock synchronous mode, the ORER flag is not set to 1 since no overrun occurs. Accordingly, overruns (indicated by the ORER flag) cannot be used as a BRI interrupt source.

18. Serial Communications Interface (SCIg)

This MCU has two independent serial communications interface (SCI) channels. The SCIs consist of the SCI0 and SCI1 modules, referred to in common as “SCIg modules”.
The SCIg modules (SCI0 and SCI1) can handle both asynchronous and clock synchronous serial communications. Asynchronous serial data communications can be carried out with standard asynchronous communications chips such as a Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communications Interface Adapter (ACIA). As an extended function in asynchronous communications mode, the SCI also supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards).
In this section, “P1φ” is used to refer to the peripheral clock 1C.

18.1 Overview

Table 18.1 lists the specifications of the SCIg modules. Figure 18.1 shows the block diagram of the SCI0 and SCI1 modules.

Table 18.1 SCIg Specifications

Item		Description
Serial communications modes		• Asynchronous • Clock synchronous • Smart card interface • IrDA (only for channel 0)
Transfer speed		Bit rate specifiable with the on-chip baud rate generator.
Full-duplex communications		Transmitter: Continuous transmission possible using double-buffer structure. Receiver: Continuous reception possible using double-buffer structure.
I/O pins		See Table 18.2.
Data transfer		Selectable as LSB first or MSB first transfer
Interrupt sources		Transmit end, transmit data empty, receive data full, and receive error
Low power consumption function		Module stop state can be set for each channel.
Asynchronous mode	Data length	7, 8, or 9 bits
	Transmission stop bit	1 or 2 bits
	Parity	Even parity, odd parity, or no parity
	Receive error detection	Parity, overrun, and framing errors
	Hardware flow control	CTSn# and RTSn# pins can be used in controlling transmission/reception.
	Start-bit detection	Low level or falling edge is selectable.
	Break detection	When a framing error occurs, a break can be detected by reading the RXDn pin level directly.
	Clock source	An internal or external clock can be selected.
	Double-speed mode	Baud rate generator double-speed mode is selectable.
	Multi-processor communications function	Serial communication among multiple processors
	Noise cancellation	The signal paths from input on the RXDn pins incorporate digital noise filters.
Clock synchronous mode	Data length	8 bits
	Receive error detection	Overrun error
	Hardware flow control	CTSn# and RTSn# pins can be used in controlling transmission/reception.
Smart card interface mode	Error processing	An error signal can be automatically transmitted when detecting a parity error during reception
		Data can be automatically retransmitted when receiving an error signal during transmission
	Data type	Both direct convention and inverse convention are supported.
Bit rate modulation function		Correction of outputs from the on-chip baud rate generator can reduce errors.

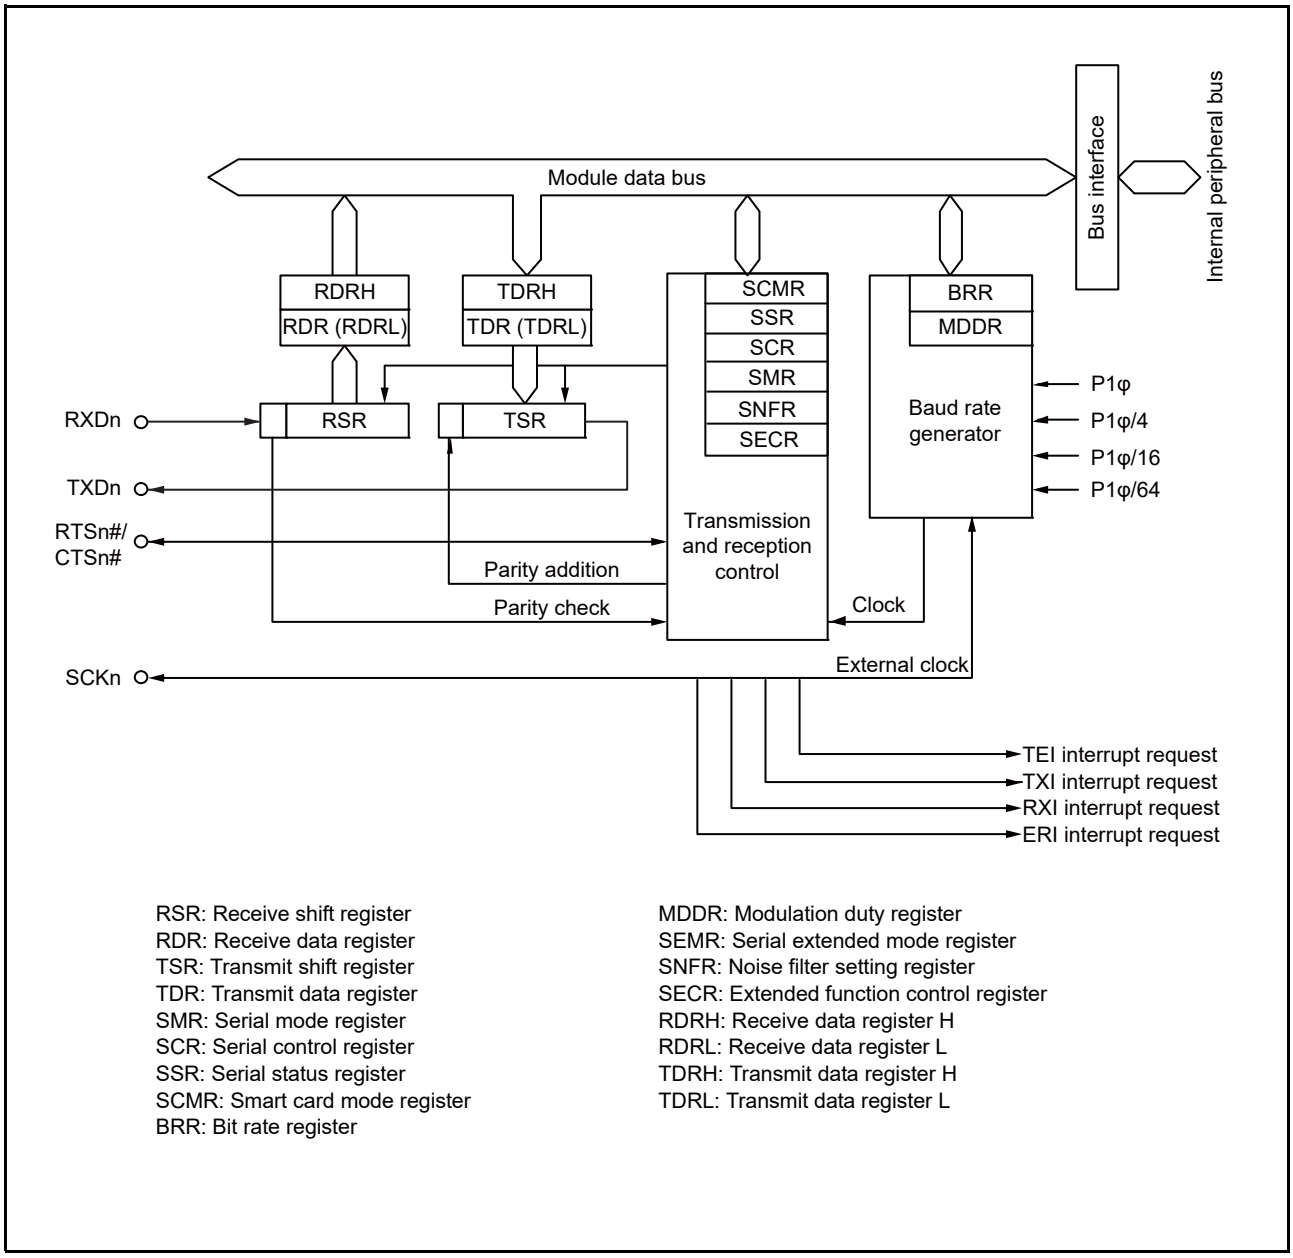

Figure 18.1 Block Diagram of SCIg (SCI0 and SCI1)

Table 18.2 lists the pin configuration of the SCIs for the individual modes.

Table 18.2 SCI Pin Configuration in Asynchronous Mode and Clock Synchronous Mode

Channel	Pin Name	I/O	Function
SCI0	SCI_SCK0	I/O	SCI0 clock input/output
	SCI_RXD0	Input	SCI0 receive data input
	SCI_TXD0	Output	SCI0 transmit data output
	SCI_CTS#0/RTS#0	I/O	SCI0 transfer start control input/output
SCI1	SCI_SCK1	I/O	SCI1 clock input/output
	SCI_RXD1	Input	SCI1 receive data input
	SCI_TXD1	Output	SCI1 transmit data output
	SCI_CTS#1/RTS#1	I/O	SCI1 transfer start control input/output

18.2 Register Descriptions

Table 18.3 Register configuration

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	Serial Mode Register	SMR	R/W	00h	H'E800B000	8
	Bit Rate Register	BRR	R/W	FFh	H'E800B001	8

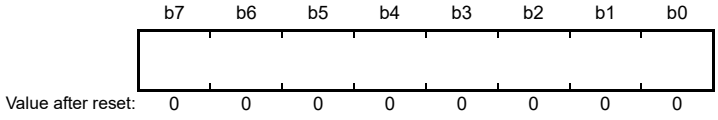
	Modulation Duty Register	MDDR	R/W	FFh	H'E800B812	8

Note: * Partly, R only

18.2.1 Receive Shift Register (RSR)

RSR is a shift register which is used to receive serial data input from the RXDn pin and converts it into parallel data. When one frame of data has been received, it is automatically transferred to the RDR register.
The RSR register cannot be directly accessed by the CPU.

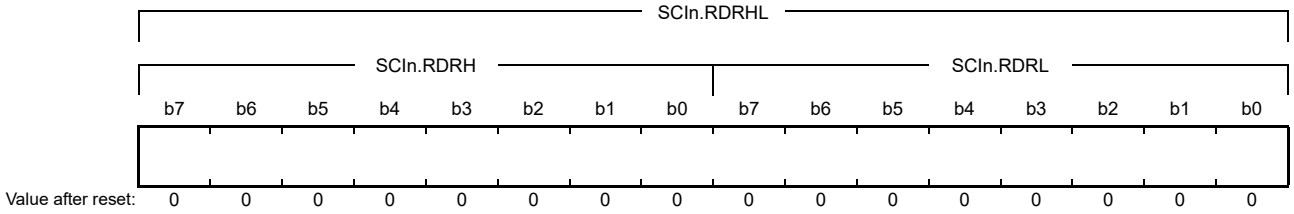
18.2.2 Receive Data Register (RDR)



RDR is an 8-bit register that stores receive data.
When one frame of serial data has been received, the received serial data is transferred from RSR to RDR. Then the RSR register can receive the next data.
Since RSR and RDR function as a double buffer in this way, continuous receive operations can be performed.
Read RDR only once after a receive data full interrupt (RXI) has occurred. Note that if next one frame of data is received before reading receive data from RDR, an overrun error occurs.
RDR cannot be written to by the CPU.

18.2.3 Receive Data Register H, L, HL (RDRH, RDRL, RDRHL)

- Receive Data Register H (RDRH)
- Receive Data Register L (RDRL)
- Receive Data Register HL (RDRHL)



RDRH and RDRL are 8-bit registers that store receive data. Use these registers when asynchronous mode and 9-bit data length are selected.

RDRL is the shadow register of RDR; i.e. access to RDRL is equivalent to access to RDR.

After one frame of data is received, the received data is transferred from the RSR register to these registers, thus allowing the RSR register to receive the next data.

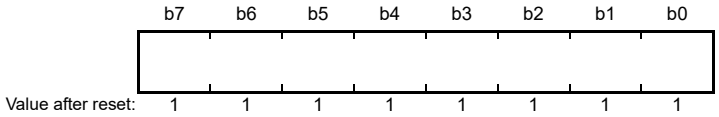
The RSR, RDRH and RDRL registers have a double-buffered construction to enable continuous reception.

Read RDRH and RDRL should be performed only once in the order from RDRH to RDRL when a receive data full interrupt (RXI) request is issued. Note that an overrun error occurs when the next frame of data is received before the received data has been read from RDRL.

The CPU cannot write to the RDRH and RDRL registers. Bits 0 to 7 in RDRH are fixed to 0. These bits are read as 0. The write value should be 0.

The RDRHL register can be accessed in 16-bit units.

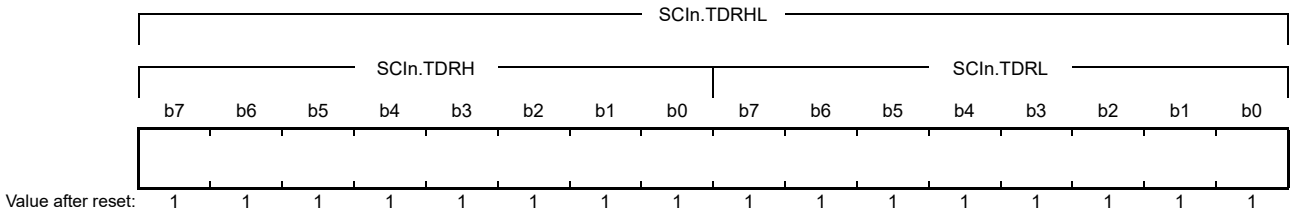
18.2.4 Transmit Data Register (TDR)



TDR is an 8-bit register that stores transmit data.
When the SCI detects that TSR is empty, it transfers the transmit data written in TDR to TSR and starts transmission.
The double-buffered structures of TDR and TSR enable continuous serial transmission. If the next transmit data has already been written to TDR when one frame of data is transmitted, the SCI transfers the written data to TSR to continue transmission.
The CPU is able to read from or write to TDR at any time. Only write transmit data to TDR once after each instance of the transmit data empty interrupt (TXI).

18.2.5 Transmit Data Register H, L, HL (TDRH, TDRL, TDRHL)

- Transmit Data Register H (TDRH)
- Transmit Data Register L (TDRL)
- Transmit Data Register HL (TDRHL)



TDRH and TDRL are 8-bit registers that store transmit data. Use these registers when asynchronous mode and 9-bit data length are selected.
TDRL is the shadow register of TDR; i.e. access to TDRL is equivalent to access to TDR.
When empty space is detected in the TSR register, the transmit data stored in the TDRH and TDRL registers is transferred to TSR; i.e., transmitting is started.
The TSR, TDRH and TDRL registers have a double-buffered construction to realize continuous reception. When the next data to be transmitted is stored in TDRL after one frame of data has been transmitted, the transmitting operation is continued by transfer to the TSR register.
The CPU can read and write to the TDRH and TDRL registers. Bits 0 to 7 in RDRH are fixed to 1. These bits are read as 1. The write value should be 1.
Writing transmit data to the TDRH and TDRL registers should be performed only once in the order from TDRH to TDRL when a transmit data empty interrupt (TXI) request is issued.
The TDRHL register can be accessed in 16-bit units.

18.2.6 Transmit Shift Register (TSR)

TSR is a shift register that transmits serial data.
To perform serial data transmission, the SCI first automatically transfers transmit data from TDR to TSR, and then sends the data to the TXDn pin.
TSR cannot be directly accessed by the CPU.

18.2.7 Serial Mode Register (SMR)

Note: Some bits in SMR have different functions in smart card interface mode and non-smart card interface mode.

(1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

	b7	b6	b5	b4	b3	b2	b1	b0
	CM	CHR	PE	PM	STOP	MP	CKS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CKS[1:0]	Clock Select	b1 b0 0 0: P1φ clock (n = 0)*1 0 1: P1φ/4 clock (n = 1)*1 1 0: P1φ/16 clock (n = 2)*1 1 1: P1φ/64 clock (n = 3)*1	R/W*4
b2	MP	Multi-Processor Mode	(Valid only in asynchronous mode) 0: Multi-processor communications function is disabled 1: Multi-processor communications function is enabled	R/W*4
b3	STOP	Stop Bit Length	(Valid only in asynchronous mode) 0: 1 stop bit 1: 2 stop bits	R/W*4
b4	PM	Parity Mode	(Valid only when the PE bit is 1) 0: Selects even parity 1: Selects odd parity	R/W*4
b5	PE	Parity Enable	(Valid only in asynchronous mode) • When transmitting 0: Parity bit addition is not performed 1: The parity bit is added • When receiving 0: Parity bit checking is not performed 1: The parity bit is checked	R/W*4
b6	CHR	Character Length	(Valid only in asynchronous mode*2) Selects in combination with the SCMR.CHR1 bit. CHR1 CHR 0 0: Transmit/receive in 9-bit data length 0 1: Transmit/receive in 9-bit data length 1 0: Transmit/receive in 8-bit data length (initial value) 1 1: Transmit/receive in 7-bit data length*3	R/W*4
b7	CM	Communications Mode	0: Asynchronous mode 1: Clock synchronous mode	R/W*4

Note 1. n is the decimal notation of the value of n in BRR (refer to section 18.2.11, Bit Rate Register (BRR)).
Note 2. In other than asynchronous mode, this bit setting is invalid and a fixed data length of 8 bits is used.
Note 3. LSB first is fixed and the MSB (bit 7) in TDR is not transmitted in transmission.
Note 4. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

CKS[1:0] Bits (Clock Select)

These bits select the clock source for the on-chip baud rate generator.
For the relation between the settings of these bits and the baud rate, refer to section 18.2.11, Bit Rate Register (BRR).

MP Bit (Multi-Processor Mode)

Disables/enables the multi-processor communications function. The settings of the PE bit and PM bit are invalid in multi-processor mode.

STOP Bit (Stop Bit Length)

Selects the stop bit length in transmission.
In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0, it is treated as the start bit of the next transmit frame.

PM Bit (Parity Mode)

Selects the parity mode (even or odd) for transmission and reception.
The setting of the PM bit is invalid in multi-processor mode.

PE Bit (Parity Enable)

When this bit is set to 1, the parity bit is added to transmit data, and the parity bit is checked in reception.
Irrespective of the setting of the PE bit, the parity bit is not added or checked in multi-processor format.

CHR Bit (Character Length)

Selects the data length for transmission and reception.
Selects in combination with the CHR1 bit in SCMR.
In other than asynchronous mode, a fixed data length of 8 bits is used.

(2) Smart Card Interface Mode (SCMR.SMIF = 1)

	b7	b6	b5	b4	b3	b2	b1	b0
	GM	BLK	PE	PM	BCP[1:0]		CKS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CKS[1:0]	Clock Select	b1 b0 0 0: P1φ clock (n = 0)*1 0 1: P1φ/4 clock (n = 1)*1 1 0: P1φ/16 clock (n = 2)*1 1 1: P1φ/64 clock (n = 3)*1	R/W*2
b3, b2	BCP[1:0]	Base Clock Pulse	Selects the number of base clock cycles in combination with the SCMR.BCP2 bit. Table 18.4 lists the combinations of the SCMR.BCP2 bit and SMR.BCP[1:0] bits.	R/W*2
b4	PM	Parity Mode	(Valid only when the PE bit is 1) 0: Selects even parity 1: Selects odd parity	R/W*2
b5	PE	Parity Enable	When this bit is set to 1, a parity bit is added to transmit data, and the parity of received data is checked. Set this bit to 1 in smart card interface mode.	R/W*2
b6	BLK	Block Transfer Mode	0: Normal mode operation 1: Block transfer mode operation	R/W*2
b7	GM	GSM Mode	0: Normal mode operation 1: GSM mode operation	R/W*2

Note 1. n is the decimal notation of the value of n in BRR (refer to section 18.2.11, Bit Rate Register (BRR)).
Note 2. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

CKS[1:0] Bits (Clock Select)

These bits select the clock source for the on-chip baud rate generator.
For the relationship between the settings of these bits and the baud rate, refer to section 18.2.11, Bit Rate Register (BRR).

BCP[1:0] Bits (Base Clock Pulse)

These bits select the number of base clock cycles in a 1-bit data transfer time in smart card interface mode.
Set these bits in combination with the SCMR.BCP2 bit.
For details, refer to section 18.6.4, Receive Data Sampling Timing and Reception Margin.

Table 18.4 Combinations of the SCMR.BCP2 Bit and SMR.BCP[1:0] Bits

SCMR.BCP2 Bit	SMR.BCP[1:0] Bits		Number of Base Clock Cycles for 1-Bit Transfer Period
0	0	0	93 clock cycles (S = 93)*1
0	0	1	128 clock cycles (S = 128)*1
0	1	0	186 clock cycles (S = 186)*1
0	1	1	512 clock cycles (S = 512)*1
1	0	0	32 clock cycles (S = 32)*1 (Initial Value)
1	0	1	64 clock cycles (S = 64)*1
1	1	0	372 clock cycles (S = 372)*1
1	1	1	256 clock cycles (S = 256)*1

Note 1. S is the value of S in BRR (refer to section 18.2.11, Bit Rate Register (BRR)).

PM Bit (Parity Mode)

Selects the parity mode for transmission and reception (even or odd).
For details on the usage of this bit in smart card interface mode, refer to section 18.6.2, Data Format (Except in Block Transfer Mode).

PE Bit (Parity Enable)

Set the PE bit to 1.
The parity bit is added to transmit data before transmission, and the parity bit is checked in reception.

BLK Bit (Block Transfer Mode)

Setting this bit to 1 allows block transfer mode operation.
For details, refer to section 18.6.3, Block Transfer Mode.

GM Bit (GSM Mode)

Setting this bit to 1 allows GSM mode operation.
In GSM mode, the SSR.TEND flag set timing is put forward to 11.0 etu (elementary time unit = 1-bit transfer time) from the start and the clock output control function is appended. For details, refer to section 18.6.6, Serial Data Transmission (Except in Block Transfer Mode) and section 18.6.8, Clock Output Control.

18.2.8 Serial Control Register (SCR)

Note: Some bits in SCR have different functions in smart card interface mode and non-smart card interface mode.

(1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

	b7	b6	b5	b4	b3	b2	b1	b0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CKE[1:0]	Clock Enable	• For SCI0 and SCI1 (Asynchronous mode) b1 b0 0 0: On-chip baud rate generator The SCKn pin functions as I/O port. 0 1: On-chip baud rate generator The clock with the same frequency as the bit rate is output from the SCKn pin. 1 x: External clock The clock with a frequency 16 times the bit rate should be input from the SCKn pin. Input a clock signal with a frequency eight times the bit rate when the SEMR.ABCS bit is 1. (Clock synchronous mode) b1 b0 0 x: Internal clock The SCKn pin functions as the clock output pin. 1 x: External clock The SCKn pin functions as the clock input pin.	R/W*1
b2	TEIE	Transmit End Interrupt Enable	0: A TEI interrupt request is disabled 1: A TEI interrupt request is enabled	R/W
b3	MPIE	Multi-Processor Interrupt Enable	(Valid in asynchronous mode when SMR.MP = 1) 0: Normal reception 1: When the data with the multi-processor bit set to 0 is received, the data is not read, and setting the status flags ORER and FER in SSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, the MPIE bit is automatically cleared to 0, and normal reception is resumed.	R/W
b4	RE	Receive Enable	0: Serial reception is disabled 1: Serial reception is enabled	R/W*2
b5	TE	Transmit Enable	0: Serial transmission is disabled 1: Serial transmission is enabled	R/W*2
b6	RIE	Receive Interrupt Enable	0: RXI and ERI interrupt requests are disabled 1: RXI and ERI interrupt requests are enabled	R/W
b7	TIE	Transmit Interrupt Enable	0: A TXI interrupt request is disabled 1: A TXI interrupt request is enabled	R/W

x: Don't care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. 1 can be written only when TE = 0 and RE = 0, while the SMR.CM bit is 1. After setting TE or RE to 1, only 0 can be written to TE and RE. While the SMR.CM bit is 0 and the SIMR1.IICM bit is 0, writing is enabled under any condition.

CKE[1:0] Bits (Clock Enable)

These bits select the clock source and SCKn pin function.
The combination of the settings of these bits and of the SEMR.ACS0 bit sets the internal TMR clock.

TEIE Bit (Transmit End Interrupt Enable)

Enables or disables a TEI interrupt request.
A TEI interrupt request is disabled by setting the TEIE bit to 0.

MPIE Bit (Multi-Processor Interrupt Enable)

When this bit is set to 1 and the data with the multi-processor bit set to 0 is received, the data is not read and setting the status flags ORER and FER in SSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, the MPIE is automatically cleared to 0, and normal reception is resumed. For details, refer to section 18.4, Multi-Processor Communications Function.
When the receive data includes the MPB bit is SSR set to 0, the receive data is not transferred from the RSR to the RDR, a receive error is not detected, and setting the flags ORER and FER to 1 is disabled.
When the receive data includes the MPB bit set to 1, the MPB bit is set to 1, the MPIE bit is automatically cleared to 0, the RXI and ERI interrupt requests are enabled (if the RIE bit in SCR is set to 1), and setting the flags ORER and FER to 1 is enabled.
MPIE should be set to 0 if multi-processor communications function is not to be used.

RE Bit (Receive Enable)

Enables or disables serial reception.
When this bit is set to 1, serial reception is started by detecting the start bit in asynchronous mode or the synchronous clock input in clock synchronous mode. Note that SMR should be set prior to setting the RE bit to 1 in order to designate the reception format.
Even if reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR are not affected and the previous value is retained.

TE Bit (Transmit Enable)

Enables or disables serial transmission.
When this bit is set to 1, serial transmission is started by writing transmit data to TDR. Note that SMR should be set prior to setting the TE bit to 1 in order to designate the transmission format.

RIE Bit (Receive Interrupt Enable)

Enables or disables RXI and ERI interrupt requests.
An RXI interrupt request is disabled by setting the RIE bit to 0.
An ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in SSR and then setting the flag to 0, or setting the RIE bit to 0.

(2) Smart Card Interface Mode (SCMR.SMIF = 1)

	b7	b6	b5	b4	b3	b2	b1	b0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CKE[1:0]	Clock Enable	• When SMR.GM = 0 b1 b0 0 0: Output disabled (The SCKn pin is available for use as an I/O port according to the I/O port settings.) 0 1: Clock output 1 x: (Setting prohibited) • When SMR.GM = 1 b1 b0 0 0: Output fixed low x 1: Clock output 1 0: Output fixed high	R/W*1
b2	TEIE	Transmit End Interrupt Enable	This bit should be 0 in smart card interface mode.	R/W
b3	MPIE	Multi-Processor Interrupt Enable	This bit should be 0 in smart card interface mode.	R/W
b4	RE	Receive Enable	0: Serial reception is disabled 1: Serial reception is enabled	R/W*2
b5	TE	Transmit Enable	0: Serial transmission is disabled 1: Serial transmission is enabled	R/W*2
b6	RIE	Receive Interrupt Enable	0: RXI and ERI interrupt requests are disabled 1: RXI and ERI interrupt requests are enabled	R/W
b7	TIE	Transmit Interrupt Enable	0: A TXI interrupt request is disabled 1: A TXI interrupt request is enabled	R/W

x: Don't care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. 1 can be written only when TE = 0 and RE = 0. After setting TE or RE to 1, only 0 can be written in TE and RE.

For details on interrupt requests, refer to section 18.8, Interrupt Sources.

CKE[1:0] Bits (Clock Enable)

These bits control the clock output from the SCKn pin.

In GSM mode, clock output can be dynamically switched. For details, refer to section 18.6.8, Clock Output Control.

TEIE Bit (Transmit End Interrupt Enable)

This bit should be 0 in smart card interface mode.

MPIE Bit (Multi-Processor Interrupt Enable)

This bit should be 0 in smart card interface mode.

RE Bit (Receive Enable)

Enables or disables serial reception.

When this bit is set to 1, serial reception is started by detecting the start bit. Note that SMR should be set prior to setting the RE bit to 1 in order to designate the reception format.

Even if reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR are not affected and the previous value is retained.

TE Bit (Transmit Enable)

Enables or disables serial transmission.

When this bit is set to 1, serial transmission is started by writing transmit data to TDR. Note that SMR should be set prior to setting the TE bit to 1 in order to designate the transmission format.

RIE Bit (Receive Interrupt Enable)

Enables or disables RXI and ERI interrupt requests.

An RXI interrupt request is disabled by setting the RIE bit to 0.

An ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in SSR and then setting the flag to 0, or setting the RIE bit to 0.

18.2.9 Serial Status Register (SSR)

Some bits in SSR have different functions in smart card interface mode and non-smart card interface mode.

(1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	RDRF	ORER	FER	PER	TEND	MPB	MPBT
Value after reset:	1	0	0	0	0	1	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MPBT	Multi-Processor Bit Transfer	Sets the multi-processor bit for adding to the transmission frame 0: Data transmission cycles 1: ID transmission cycles	R/W
b1	MPB	Multi-Processor	Value of the multi-processor bit in the reception frame 0: Data transmission cycles 1: ID transmission cycles	R
b2	TEND	Transmit End Flag	0: A character is being transmitted. 1: Character transfer has been completed.	R
b3	PER	Parity Error Flag	0: No parity error occurred 1: A parity error has occurred	R/(W)*1
b4	FER	Framing Error Flag	0: No framing error occurred 1: A framing error has occurred	R/(W)*1
b5	ORER	Overrun Error Flag	0: No overrun error occurred 1: An overrun error has occurred	R/(W)*1
b6	RDRF	Receive Data Full Flag	0: When data is transferred from RDR 1: When data has been received normally, and transferred from RSR to RDR	R/(W)*2
b7	TDRE	Transmit Data Empty Flag	0: When data is transferred to TDR 1: When data is transferred from TDR to TSR	R/(W)*2

Note 1. Only 0 can be written to this bit, to clear the flag.
Note 2. Write 1 when writing is necessary.

MPB Bit (Multi-Processor)

Holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

TEND Flag (Transmit End Flag)

Indicates completion of transmission.

[Setting conditions]

- When the SCR.TE bit is set to 0 (serial transmission is disabled)
  When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When the TDR register is not updated at the time of transmission of the tail-end bit of a character being transmitted

[Clearing condition]

- When transmit data are written to the TDR register while the SCR.TE bit is 1

PER Flag (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.
[Setting condition]

- When a parity error is detected during reception
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1
  Even when the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

FER Flag (Framing Error Flag)

Indicates that a framing error has occurred during reception in asynchronous mode and the reception ends abnormally.
[Setting condition]

- When the stop bit is 0
  In 2-stop-bit mode, only the first stop bit is checked whether it is 1 but the second stop bit is not checked. Note that although receive data when the framing error occurs is transferred to RDR, no RXI interrupt request occurs. In addition, when the FER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to FER after reading FER = 1
  Even when the SCR.RE bit is set to 0, the FER flag is not affected and retains its previous value.

ORER Flag (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.
[Setting condition]

- When the next data is received before receive data is read from RDR
  In RDR, receive data prior to an overrun error occurrence is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be performed. Note that, in clock synchronous mode, serial transmission also cannot continue.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1
  Even when the SCR.RE bit is set to 0, the ORER flag is not affected and retains its previous value.

RDRF Flag (Receive Data Full Flag)

Indicates whether RDR has received data.
[Setting condition]

- When data has been received normally, and transferred from RSR to RDR

[Clearing condition]

- When data is transferred from RDR

TDRE Flag (Transmit Data Empty Flag)

Indicates whether TDR has data to be transmitted.

[Setting condition]

- When data is transferred from TDR to TSR

[Clearing condition]

- When data is transferred to TDR

(2) Smart Card Interface Mode (SCMR.SMIF = 1)

	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	RDRF	ORER	ERS	PER	TEND	MPB	MPBT
Value after reset:	1	0	0	0	0	1	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MPBT	Multi-Processor Bit Transfer	This bit should be set to 0 in smart card interface mode.	R/W
b1	MPB	Multi-Processor	This bit is not used in smart card interface mode. It should be set to 0.	R
b2	TEND	Transmit End Flag	0: A character is being transmitted. 1: Character transfer has been completed.	R
b3	PER	Parity Error Flag	0: No parity error occurred 1: A parity error has occurred	R/(W)*1
b4	ERS	Error Signal Status Flag	0: Low error signal not responded 1: Low error signal responded	R/(W)*1
b5	ORER	Overrun Error Flag	0: No overrun error occurred 1: An overrun error has occurred	R/(W)*1
b6	RDRF	Receive Data Full Flag	0: When data is transferred from RDR 1: When data has been received normally, and transferred from RSR to RDR	R/(W)*2
b7	TDRE	Transmit Data Empty Flag	0: When data is transferred to TDR 1: When data is transferred from TDR to TSR	R/(W)*2

Note 1. Only 0 can be written to this bit, to clear the flag.
Note 2. Write 1 when writing is necessary.

TEND Flag (Transmit End Flag)

With no error signal from the receiving side, this bit is set to 1 when further data for transfer is ready to be transferred to the TDR register.

[Setting conditions]

- When the SCR.TE bit = 0 (serial transmission is disabled)
  When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When a specified period has elapsed after the latest transmission of 1 byte, the ERS flag is 0, and the TDR register is not updated
  The set timing is determined by register settings as listed below.
  When SMR.GM = 0 and SMR.BLK = 0, 12.5 etu after the start of transmission
  When SMR.GM = 0 and SMR.BLK = 1, 11.5 etu after the start of transmission
  When SMR.GM = 1 and SMR.BLK = 0, 11.0 etu after the start of transmission
  When SMR.GM = 1 and SMR.BLK = 1, 11.0 etu after the start of transmission

[Clearing condition]

- When transmit data are written to the TDR register while the SCR.TE bit is 1

PER Flag (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1

Even when the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

ERS Flag (Error Signal Status Flag)

[Setting condition]

- When a low error signal is sampled

[Clearing condition]

- When 0 is written to ERS after reading ERS = 1
  Even when the SCR.RE bit is set to 0, the ERS flag is not affected and retains its previous value.

ORER Flag (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR
  In RDR, the receive data prior to an overrun error occurrence is retained, but data received following the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be performed.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1
  Even when the SCR.RE bit is set to 0, the ORER flag is not affected and retains its previous value.

RDRF Flag (Receive Data Full Flag)

Indicates whether RDR has received data.

[Setting condition]

- When data has been received normally, and transferred from RSR to RDR

[Clearing condition]

- When data is transferred from RDR

TDRE Flag (Transmit Data Empty Flag)

Indicates whether TDR has data to be transmitted.

[Setting condition]

- When data is transferred from TDR to TSR

[Clearing condition]

- When data is transferred to TDR

18.2.10 Smart Card Mode Register (SCMR)

	b7	b6	b5	b4	b3	b2	b1	b0
	BCP2	—	—	CHR1	SDIR	SINV	—	SMIF
Value after reset:	1	1	1	1	0	0	1	0

Bit	Symbol	Bit Name	Description	R/W
b0	SMIF	Smart Card Interface Mode Select	0: Non-smart card interface mode (Asynchronous mode, clock synchronous mode,) 1: Smart card interface mode	R/W*1
b1	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b2	SINV	Transmitted/Received Data Invert	0: TDR contents are transmitted as they are. Receive data is stored as it is in RDR. 1: TDR contents are inverted before being transmitted. Receive data is stored in inverted form in RDR.	R/W*1
b3	SDIR	Transmitted/Received Data Transfer Direction	This bit can be used in the following modes. • Smart card interface mode • Asynchronous mode (multi-processor mode) • Clock synchronous mode 0: Transfer with LSB first 1: Transfer with MSB first	R/W*1
b4	CHR1	Character Length 1	(Only valid in asynchronous mode)*2 Selects in combination with the SMR.CHR bit. CHR1 CHR 0 0: Transmit/receive in 9-bit data length 0 1: Transmit/receive in 9-bit data length 1 0: Transmit/receive in 8-bit data length (initial value) 1 1: Transmit/receive in 7-bit data length*3	R/W*1
b6, b5	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b7	BCP2	Base Clock Pulse 2	Selects the number of base clock cycles in combination with the SMR.BCP[1:0] bits. Table 18.5 lists the combinations of the SCMR.BCP2 bit and SMR.BCP[1:0] bits.	R/W*1

Note 1. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).
Note 2. The setting is invalid and a fixed data length of 8 bits is used in modes other than asynchronous mode.
Note 3. LSB first should be selected and the value of MSB (b7) in TDR cannot be transmitted.

SMIF Bit (Smart Card Interface Mode Select)

When this bit is set to 1, smart card interface mode is selected.

When this bit is set to 0, non-smart card interface mode, i.e., asynchronous mode (including multi-processor mode), clock synchronous mode is selected.

SINV Bit (Transmitted/Received Data Invert)

Inverts the transmit/receive data logic level. This bit does not affect the logic level of the parity bit. To invert the parity bit, invert the PM bit in SMR.

CHR1 bit (Character Length 1)

Selects the data length of transmit/receive data.

Selects in combination with the CHR bit in SMR.

A fixed data length of 8 bits is used in modes other than asynchronous mode.

BCP2 Bit (Base Clock Pulse 2)

Selects the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set this bit in combination with the SMR.BCP[1:0] bits.

Table 18.5 Combinations of the SCMR.BCP2 Bit and SMR.BCP[1:0] Bits

SCMR.BCP2 Bit	SMR.BCP[1:0] Bits		Number of Base Clock Cycles for 1-Bit Transfer Period
0	0	0	93 clock cycles (S = 93)*1
0	0	1	128 clock cycles (S = 128)*1
0	1	0	186 clock cycles (S = 186)*1
0	1	1	512 clock cycles (S = 512)*1
1	0	0	32 clock cycles (S = 32)*1 (Initial Value)
1	0	1	64 clock cycles (S = 64)*1
1	1	0	372 clock cycles (S = 372)*1
1	1	1	256 clock cycles (S = 256)*1

Note 1. S is the value of S in BRR (refer to section 18.2.11, Bit Rate Register (BRR)).

18.2.11 Bit Rate Register (BRR)

BRR is an 8-bit register that adjusts the bit rate.
As each SCI channel has independent baud rate generator control, different bit rates can be set for each. Table 18.6 shows the relationship between the setting (N) in the BRR and the bit rate (B) for normal asynchronous mode, multi-processor communication, clock synchronous mode, and smart card interface mode.
The initial value of BRR is FFh.
BRR can be read from by the CPU, but it can be written to only when the TE and RE bits in SCR are 0.

Table 18.6 Relationship between N Setting in BRR and Bit Rate B

Mode	SEMR Settings		BRR Setting	Error
	BGDM Bit	ABCS Bit		
Asynchronous or multi-processor communication	0	0	$N = \frac{P1\varphi \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
	0	1	$N = \frac{P1\varphi \times 10^6}{32 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
	1	0		
	1	1	$N = \frac{P1\varphi \times 10^6}{16 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
Clock synchronous			$N = \frac{P1\varphi \times 10^6}{8 \times 2^{2n-1} \times B} - 1$	
Smart card interface			$N = \frac{P1\varphi \times 10^6}{S \times 2^{2n+1} \times B} - 1$	$Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1\} \times 100$

B: Bit rate (bps)
N: BRR setting for on-chip baud rate generator ($0 \le N \le 255$)
P1φ: Operating frequency (MHz)
n and S: Determined by the settings of the SMR and SCMR registers as listed in the table below.

Table 18.7 Clock Source Settings

SMR.CKS[1:0] Bit Setting	Clock Source	n
0 0	P1φ clock	0
0 1	P1φ/4 clock	1
1 0	P1φ/16 clock	2
1 1	P1φ/64 clock	3

Table 18.8 Base Clock Settings in Smart Card Interface Mode

SCMR.BCP2 Bit Setting	SMR.BCP[1:0] Bit Setting	Base Clock Cycles for 1-bit Period	S
0	0 0	93 clock cycles	93
0	0 1	128 clock cycles	128
0	1 0	186 clock cycles	186
0	1 1	512 clock cycles	512
1	0 0	32 clock cycles	32
1	0 1	64 clock cycles	64
1	1 0	372 clock cycles	372
1	1 1	256 clock cycles	256

Table 18.9 lists examples of N settings in BRR in normal asynchronous mode. Table 18.10 lists the maximum bit rate settable for each operating frequency. Examples of BRR (N) settings in clock synchronous mode are listed in Table 18.12. Examples of BRR (N) settings in smart card interface mode are listed in Table 18.14. In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, refer to section 18.6.4, Receive Data Sampling Timing and Reception Margin. Table 18.11 and Table 18.13 list the maximum bit rates with external clock input.

When either the asynchronous mode base clock select bit (ABCS) or the baud rate generator double-speed mode select bit (BGDM) in the serial extended mode register (SEMR) is set to 1 in asynchronous mode, the bit rate becomes twice that listed in Table 18.9. When both of those registers are set to 1, the bit rate becomes four times the listed value.

Note: This is an example when the ABCS and BGDM bits in SEMR are 0.
When either the ABCS bit or BGDM bit is set to 1, the bit rate doubles.
When both ABCS and BGDM bits in SEMR are set to 1, the bit rate increases four times.

7.5 M																			0	1	0	1

Space: Setting prohibited.

—: Can be set, but an error will occur.

Note 1. Continuous transmission or reception is impossible. After transmitting/receiving one frame of data, there is an interval of a 1-bit period before starting transmitting/receiving the next frame of data. The output of the synchronization clock is stopped for a 1-bit period. For this reason, it takes 9 bits worth of time to transfer one frame (8 bits) of data, and the average transfer rate is 8/9 times the bit rate.

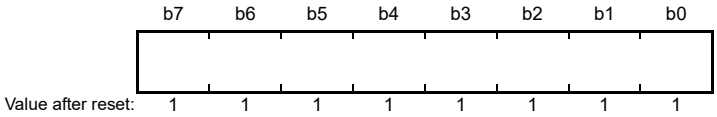
18.2.12 Modulation Duty Register (MDDR)



MDDR corrects the bit rate adjusted by the BRR register.
When the BRME bit in SEMR is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected according to the settings of MDDR (M/256). The relationship between the MDDR setting (M) and the bit rate (B) is given in Table 18.17.
The initial value of MDDR is FFh. Bit 7 in this register is fixed to 1.
The CPU can read the MDDR register, but this register is only writable when the TE and RE bits in SCR are 0.

Table 18.17 Relationship between MDDR Setting (M) and Bit Rate (B)
When Bit Rate Modulation Function is Used

Mode	SEMR Settings BGDM Bit	SEMR Settings ABCS Bit	BRR Setting	Error
Asynchronous or multi-processor communication	0	0	$N = \frac{P1\varphi \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
	0	1	$N = \frac{P1\varphi \times 10^6}{32 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
	1	0		
	1	1	$N = \frac{P1\varphi \times 10^6}{16 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
Clock synchronous*1			$N = \frac{P1\varphi \times 10^6}{8 \times 2^{2n-1} \times (256/M) \times B} - 1$	
Smart card interface			$N = \frac{P1\varphi \times 10^6}{S \times 2^{2n+1} \times (256/M) \times B} - 1$	$Error\ (\%) = \{\frac{P1\varphi \times 10^6}{B \times S \times 2^{2n+1} \times (256/M) \times (N+1)} - 1\} \times 100$

B: Bit rate (bps)
M: MDDR setting (128 ≤ MDDR ≤ 256)
N: BRR setting for baud rate generator (0 ≤ N ≤ 255)
P1φ: Operating frequency (MHz)
n and S: Determined by the settings of the SMR and SCMR registers as listed in Table 18.7 and Table 18.8, section 18, Bit Rate Register (BRR).

Note 1. Do not use this function in clock synchronous mode with the highest speed setting (SMR.CKS[1:0] = 00b, SCR.CKE[1] = 0, and BRR = 0).

18.2.13 Serial Extended Mode Register (SEMR)

	b7	b6	b5	b4	b3	b2	b1	b0
	RXDESEL	BGDM	NFEN	ABCS	—	BRME	—	ACS0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ACS0	Asynchronous Mode Clock Source Select	(Valid only in asynchronous mode) 0: External clock input 1: Reserved bit	R/W*1
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b2	BRME	Bit Rate Modulation Enable	0: Bit rate modulation function is disabled. 1: Bit rate modulation function is enabled.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	ABCS	Asynchronous Mode Base Clock Select	(Valid only in asynchronous mode) 0: Selects 16 base clock cycles for 1-bit period. 1: Selects 8 base clock cycles for 1-bit period.	R/W*1
b5	NFEN	Digital Noise Filter Function Enable	(In asynchronous mode) 0: Noise cancellation function for the RXDn input signal is disabled. 1: Noise cancellation function for the RXDn input signal is enabled.	R/W*1
b6	BGDM	Baud Rate Generator Double-Speed Mode Select	(Only valid the CKE[1] bit in SCR is 0 in asynchronous mode). 0: Baud rate generator outputs the clock with normal frequency. 1: Baud rate generator outputs the clock with doubled frequency.	R/W
b7	RXDESEL	Asynchronous Start Bit Edge Detection Select	(Valid only in asynchronous mode) 0: The low level on the RXDn pin is detected as the start bit. 1: A falling edge on the RXDn pin is detected as the start bit.	R/W*1

Note 1. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

SEMR selects the clock source for 1-bit period in asynchronous mode.

ACS0 Bit (Asynchronous Mode Clock Source Select)

Selects the clock source in the asynchronous mode.

The ACS0 bit is valid in asynchronous mode (CM bit in SMR = 0) and when an external clock input is selected (CKE[1:0] bits in SCR = 10b or 11b).

Set the ACS0 bit to 0 in other than asynchronous mode.

BRME bit (Bit Rate Modulation Enable)

Enables and disables the bit rate modulation function. The bit rate generated by on-chip baud rate generator is evenly corrected when this function is enabled.

NFEN Bit (Digital Noise Filter Function Enable)

This bit enables or disables the digital noise filter function.

When the function is enabled, noise cancellation is applied to the RXDn input signal in asynchronous mode.

In any mode other than above, set the NFEN bit to 0 to disable the digital noise filter function.

When the function is disabled, input signals are transferred as is, as internal signals.

BGDM bit (Baud Rate Generator Double-Speed Mode Select)

Selects the cycle of output clock for the baud rate generator.

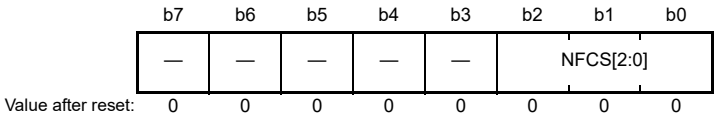
This bit is valid when the on-chip baud rate generator is selected as the clock source (SCR.CKE[1] = 0) in asynchronous mode (SMR.CM = 0). For the clock output from the baud rate generator, either normal or doubled frequency can be selected. The base clock is generated by the clock output from the baud rate generator. When the BGDM bit is set to 1,

the base clock cycle is halved and the bit rate is doubled.
Set this bit to 0 in modes other than asynchronous mode.

RXDESEL Bit (Asynchronous Start Bit Edge Detection Select)

Selects the detection method of the start bit for reception in asynchronous mode. When a break occurs, data receiving operation depends on the settings of this bit. Set this bit to 1 when reception should be stopped while a break occurs or when reception should be started without retaining the RXDn pin input at high level for the period of one data frame or longer after completion of the break.
Set this bit to 0 in modes other than asynchronous mode.

18.2.14 Noise Filter Setting Register (SNFR)



Bit	Symbol	Bit Name	Description	R/W
b2 to b0	NFCS[2:0]	Noise Filter Clock Select	In asynchronous mode, the standard setting for the base clock is as follows. b2 b0 0 0 0: The clock signal divided by 1 is used with the noise filter. Settings other than above are prohibited.	R/W*1
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR are 0 (serial reception and transmission disabled).

NFCS[2:0] Bits (Noise Filter Clock Select)

These bits select the sampling clock for the digital noise filter. To use the noise filter in asynchronous mode, set these bits to 000b.

18.2.15 Extended function control register (SECR)

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CTSE	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b1	CTSE	CTS Enable	0: CTS function is disabled (RTS output function is enabled). 1: CTS function is enabled.	R/W*1
b2 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to the bit is only possible when the SCR.RE and SCR.TE bits are 0.

SECR is used to select the extension settings in asynchronous and clock synchronous modes.

CTSE Bit (CTS Enable)

Set this bit to 1 if the SSn# pin is to be used for inputting of the CTS control signal to control of transmission and reception. The RTS signal is output when this bit is set to 0. Set this bit to 0 in smart card interface mode. Do not set both the CTSE and SSE bits to enabled (even if this setting is made, operation is the same as that when these bits are set to 0).

18.3 Operation in Asynchronous Mode

Figure 18.2 shows the general format for asynchronous serial communications.
One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level).
In asynchronous serial communications, the communications line is usually held in the mark state (high level).
The SCI monitors the communications line. When the SCI detects a low, it regards that as a start bit and starts serial communication.
Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications. Both the transmitter and the receiver also have a double-buffered structure, so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

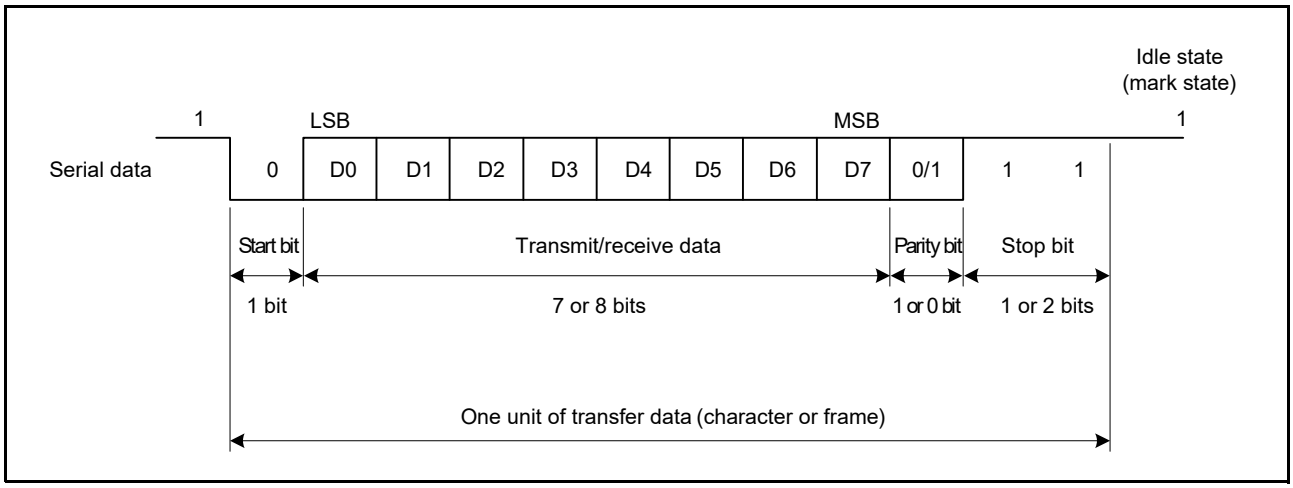


Figure 18.2 Data Format in Asynchronous Serial Communications
(Example with 8-Bit Data, Parity, 2 Stop Bits)

18.3.1 Serial Data Transfer Format

Table 18.18 lists the serial data transfer formats that can be used in asynchronous mode.
Any of 18 transfer formats can be selected according to the SMR and SCMR setting. For details of multi-processor function, refer to section 18.4, Multi-Processor Communications Function.

Table 18.18 Serial Transfer Formats (Asynchronous Mode)

SCMR Setting	SMR Setting				Serial Transfer Format and Frame Length
CHR1	CHR	PE	MP	STOP	1 2 3 4 5 6 7 8 9 10 11 12 13
0	0	0	0	0	S 9-bit data STOP
0	0	0	0	1	S 9-bit data STOP STOP
0	0	1	0	0	S 9-bit data P STOP
0	0	1	0	1	S 9-bit data P STOP STOP
1	0	0	0	0	S 8-bit data STOP
1	0	0	0	1	S 8-bit data STOP STOP
1	0	1	0	0	S 8-bit data P STOP
1	0	1	0	1	S 8-bit data P STOP STOP
1	1	0	0	0	S 7-bit data STOP
1	1	0	0	1	S 7-bit data STOP STOP
1	1	1	0	0	S 7-bit data P STOP
1	1	1	0	1	S 7-bit data P STOP STOP
0	0	—	1	0	S 9-bit data MPB STOP
0	0	—	1	1	S 9-bit data MPB STOP STOP
1	0	—	1	0	S 8-bit data MPB STOP
1	0	—	1	1	S 8-bit data MPB STOP STOP
1	1	—	1	0	S 7-bit data MPB STOP
1	1	—	1	1	S 7-bit data MPB STOP STOP

S: Start bit
STOP: Stop bit
P: Parity bit
MPB: Multi-processor bit

18.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a base clock with a frequency of 16 times*1 the bit rate.
In reception, the SCI samples the falling edge of the start bit using the base clock, and performs internal synchronization. Since receive data is sampled at the rising edge of the 8th pulse*1 of the base clock, data is latched at the middle of each bit, as shown in Figure 18.3. Thus the reception margin in asynchronous mode is determined by formula (1) below.

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)\ F - \frac{D - 0.5}{N}\ (1 + F) \right| \times 100\ [\%] \cdots \text{Formula (1)}$$

M: Reception margin
N: Ratio of bit rate to clock (N = 16 when ABCS in SEMR = 0, N = 8 when ABCS in SEMR = 1)
D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 13)
F: Absolute value of clock frequency deviation

Assuming values of F = 0 and D = 0.5 in formula (1), the reception margin is determined by the formula below.

$M = \{0.5 - 1/(2 \times 16)\} \times 100\ (\%) = 46.875\%$

However, this is only the computed value, and a margin of 20% to 30% should be allowed in system design.

Note 1. This is an example when the ABCS bit in SEMR is 0. When the ABCS bit is 1, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at the rising edge of the 4th pulse of the base clock.

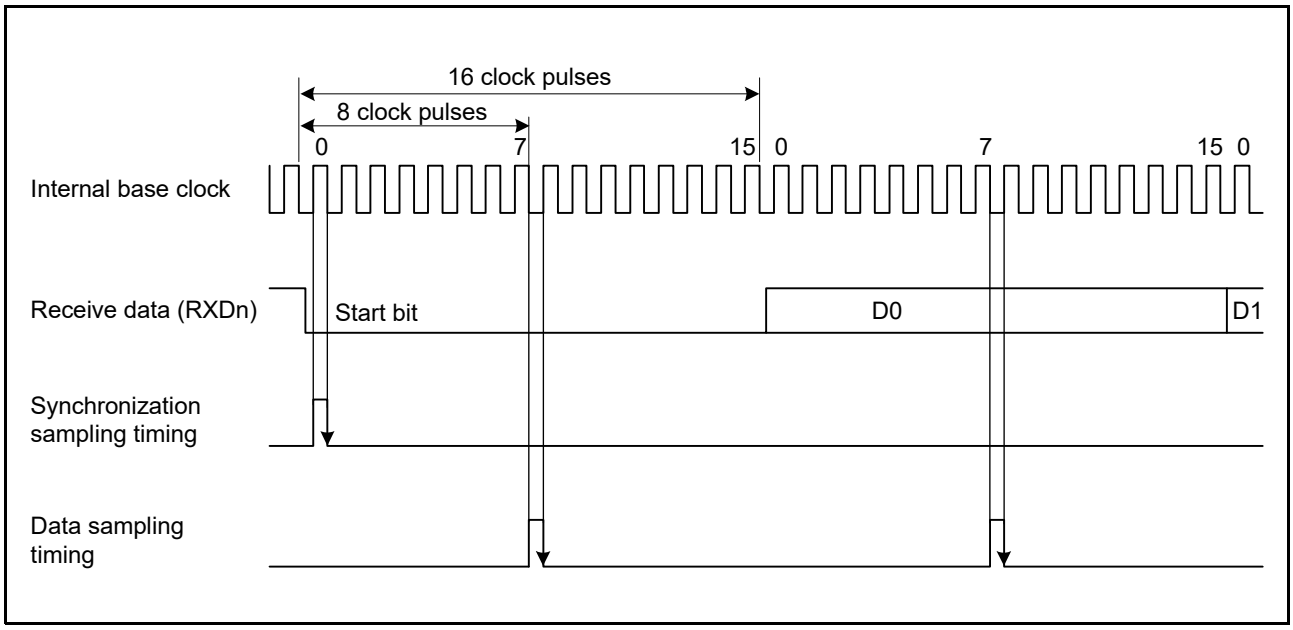

Figure 18.3 Receive Data Sampling Timing in Asynchronous Mode

18.3.3 Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input to the SCKn pin can be selected as the SCI's transfer clock, according to the setting of the CM bit in SMR and the CKE[1:0] bits in SCR.
When an external clock is input to the SCKn pin, the clock frequency should be 16 times the bit rate (when ABCS in SEMR = 0) and 8 times the bit rate (when ABCS in SEMR = 1).
When the SCI is operated on an internal clock, the clock can be output from the SCKn pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as shown in Figure 18.4.

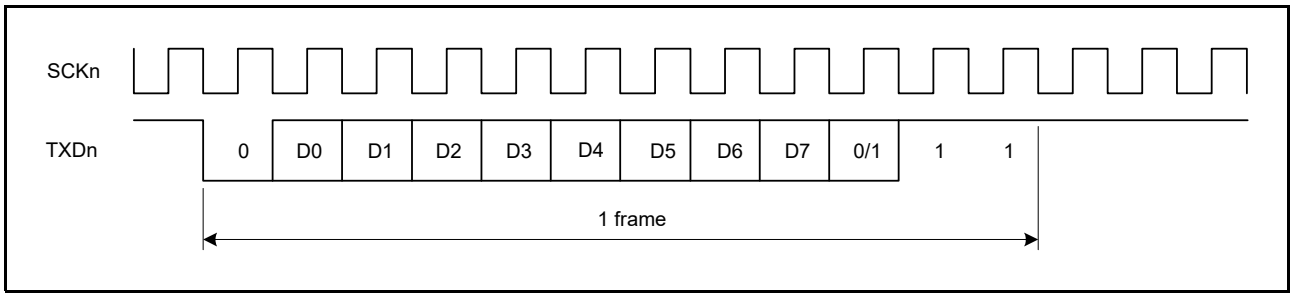

Figure 18.4 Phase Relationship between Output Clock and Transmit Data
(Asynchronous Mode: SMR.CHR = 0, PE = 1, MP = 0, STOP = 1)

18.3.4 Double-Speed Mode

The output clock frequency of the on-chip baud rate generator is doubled by setting the SEMR.BGDM bit to 1, enabling high-speed communication at a doubled bit rate. If the SEMR.ABCS bit is set to 1 under the above condition, the number of base clock cycles changes from 16 to 8, so the bit rate becomes four times faster than the initial state.
As shown by Formula (1) in section 18.3.2, Receive Data Sampling Timing and Reception Margin in Asynchronous Mode, setting the SEMR.ABCS bit to 1 changes the number of cycles to 8, and the sampling interval becomes longer. This causes the reception margin to decrease. Therefore, setting the SEMR.BGDM bit to 1 and the SEMR.ABCS bit to 0 is recommended instead of setting the SEMR.BGDM bit to 0 and the SEMR.ABCS bit to 1 for high-speed operation at a doubled bit rate.

18.3.5 CTS and RTS Functions

The CTS function is the use of input on the CTSn# pin in transmission control. Setting the SECR.CTSE bit to 1 enables the CTS function. When the CTS function is enabled, placing the low level on the CTSn# pin causes transmission to start.
Applying the high level to the CTS# pin while transmission is in progress does not affect transmission of the current frame, which continues.
In the RTS function, by using the function of output on the RTSn# pin, a low level is output when reception becomes possible. Conditions for output of the low and high level are shown below.

[Conditions for low-level output]
Satisfaction of all conditions listed below

- The value of the RE bit in the SCR is 1
- Reception is not in progress
- There are no received data yet to be read
- The ORER, FER, and PER flags in the SSR are all 0

[Condition for high-level output]

- The conditions for low-level output have not been satisfied.

18.3.6 SCI Initialization (Asynchronous Mode)

Before transmitting and receiving data, start by writing the initial value 00h to SCR and then continue through the procedure for SCI given in Figure 18.5. Whenever the operating mode or transfer format is changed, SCR must be initialized before the change is made.

When the external clock is used in asynchronous mode, ensure that the clock signal is supplied even during initialization.

Note that setting the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR nor RDR, RDRH, and RDRL.

Moreover, note that switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of a TXI interrupt request.

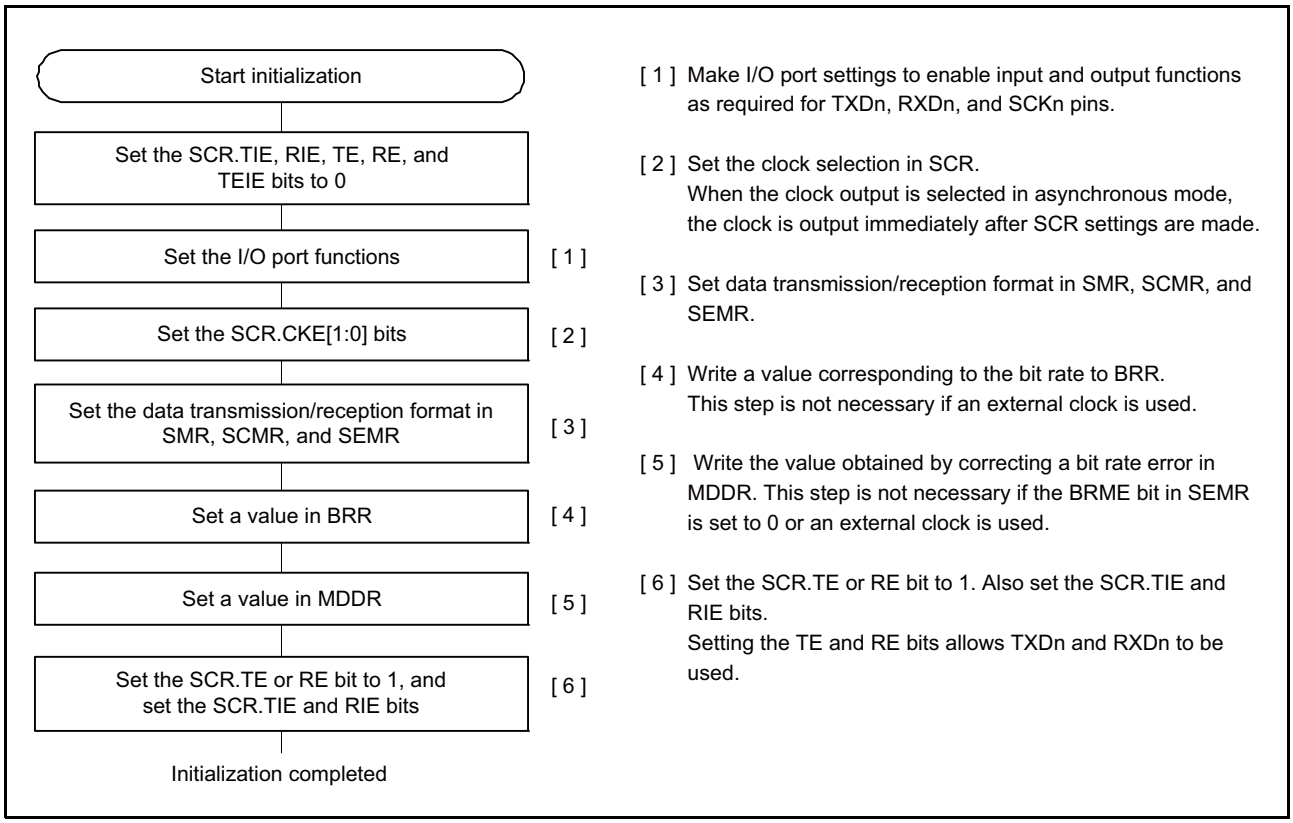

Figure 18.5 Sample SCI Initialization Flowchart (Asynchronous Mode)

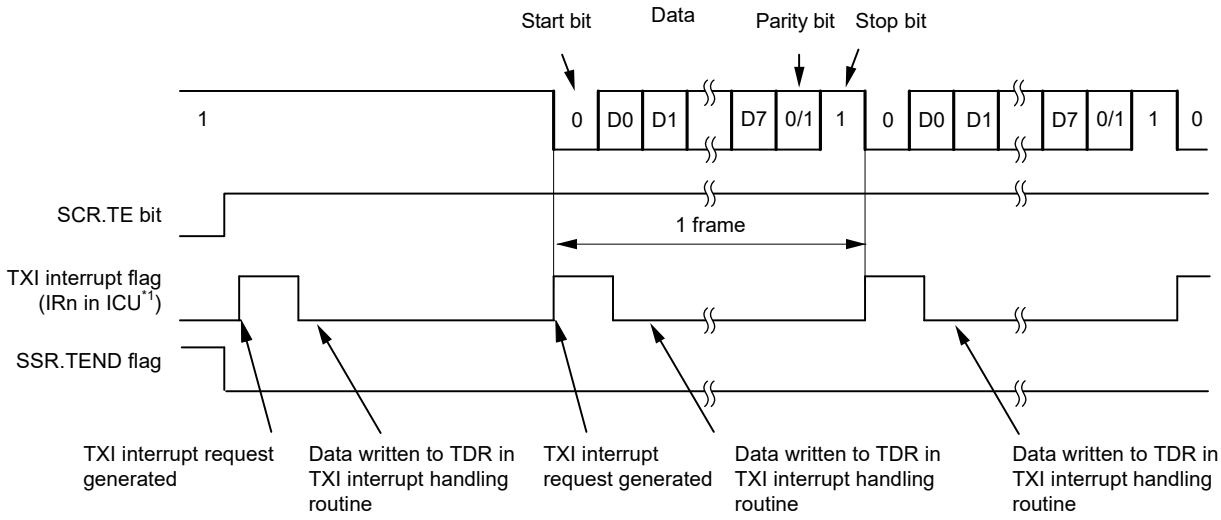
18.3.7 Serial Data Transmission (Asynchronous Mode)

Figure 18.6 to Figure 18.8 show an example of the operation for serial transmission in asynchronous mode.
In serial transmission, the SCI operates as described below.

1. The SCI transfers data from TDR*1 to TSR when data is written to TDR*1 in the TXI interrupt handling routine. The TXI interrupt request at the beginning of transmission is generated when the TE bit in SCR is set to 1 after the TIE bit in SCR is set to 1 or when these 2 bits are set to 1 simultaneously by a single instruction.
2. Transmission starts after the CTSE bit in SECR is set to 0 (CTS function is disabled) and a low level on the CTSn# pin causes data transfer from TDR*1 to TSR. If the TIE bit in SCR is 1 at this time, a TXI interrupt request is generated. Continuous transmission is obtainable by writing the next transmit data to TDR*1 in the TXI interrupt handling routine before transmission of the current transmit data is completed. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 (a TXI interrupt request is disabled) and the SCR.TEIE bit to 1 (a TEI interrupt request is enabled) after the last of the data to be transmitted are written to the TDR*1*2 from the handling routine for TXI requests.
3. Data is sent from the TXDn pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The SCI checks for updating of (writing to) TDR*3 at the time of stop bit output.
5. When TDR*3 is updated, setting of the CTSE bit in SECR to 0 (CTS function is disabled) or a low level input on the CTSn# pin cause the next transfer of the next transmit data from TDR*1 to TSR and sending of the stop bit, after which serial transmission of the next frame starts.
6. If TDR*3 is not updated, the TEND flag in SSR is set to 1, the stop bit is sent, and then the mark state is entered in which 1 is output. If the TEIE bit in SCR is 1 at this time, the TEND flag in SSR is set to 1 and a TEI interrupt request is generated.

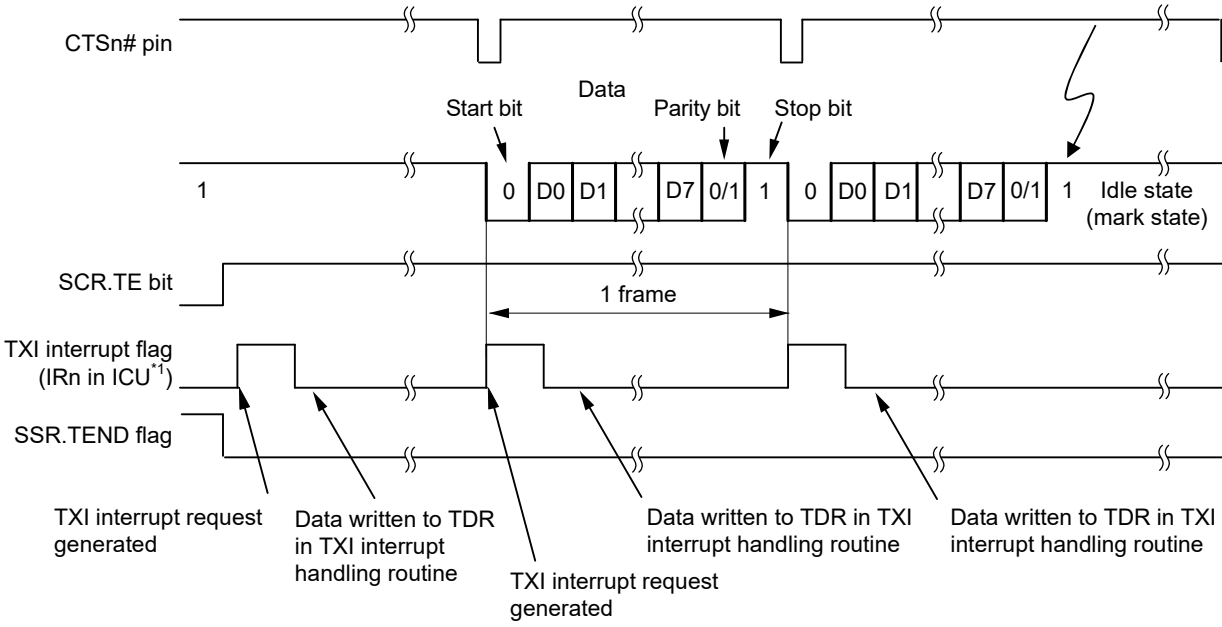
Note 1. Write data not to TDR but to the TDRH and TDRL registers when 9-bit data length is selected.
Note 2. Write data in the order from TDRH to TDRL when 9-bit data length is selected.
Note 3. The SCI checks for updating of the TDRL register only and does not check for updating of the TDRH register when 9-bit data length is selected.

Figure 18.9 shows a sample flowchart for serial transmission in asynchronous mode.



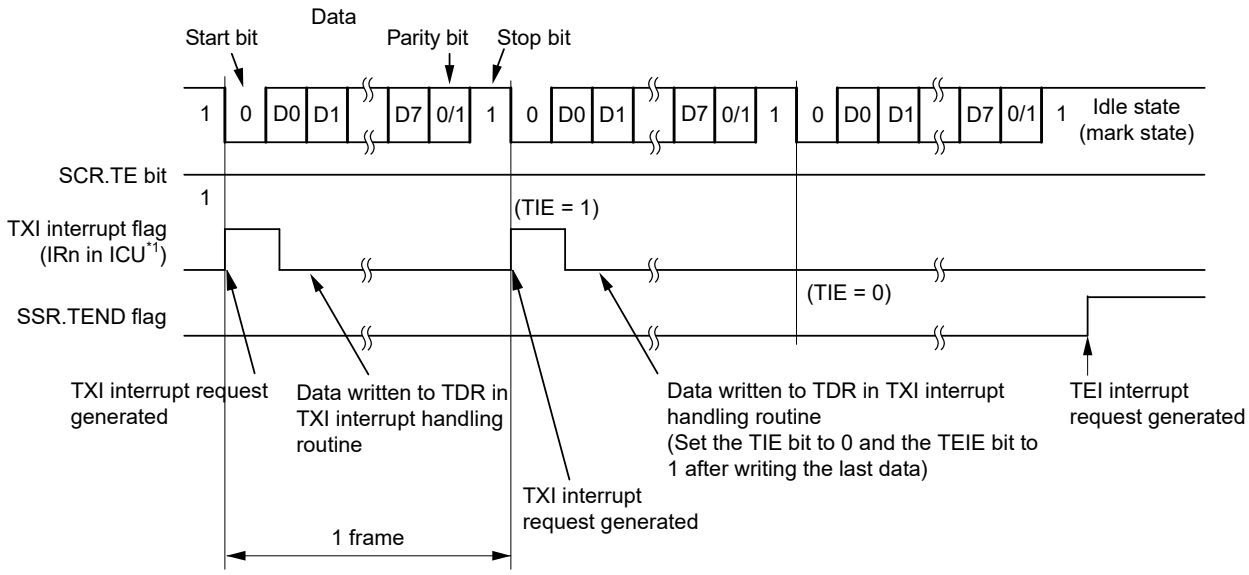
Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.6 Example of Operation for Serial Transmission in Asynchronous Mode (1)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, at the Beginning of Transmission)



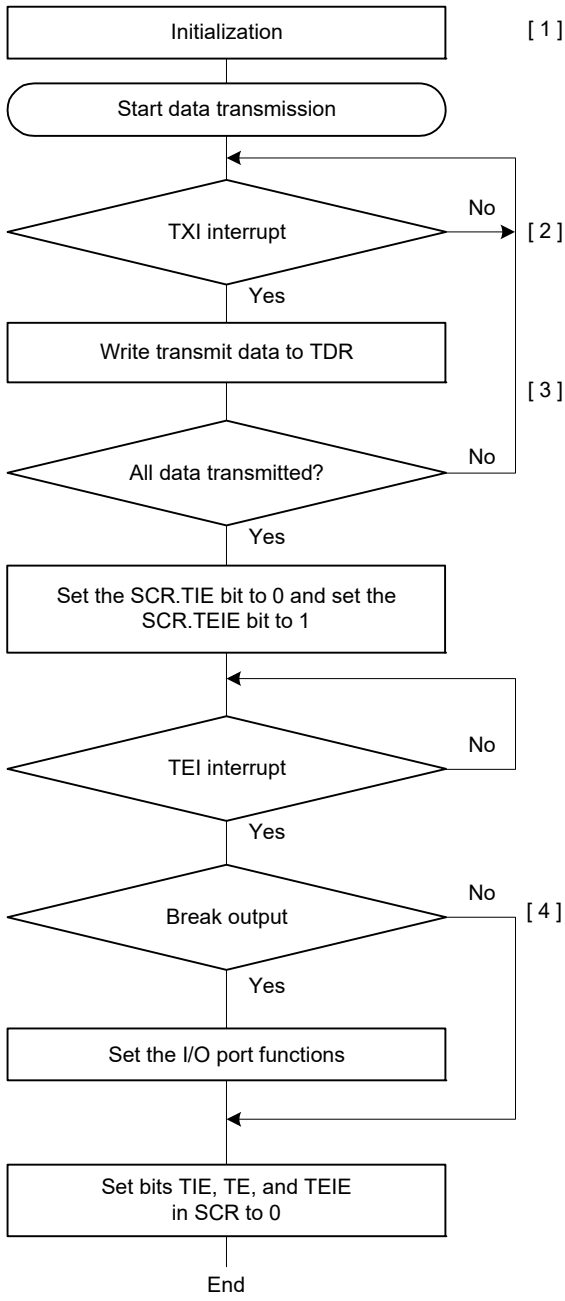
Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.7 Example of Operation for Serial Transmission in Asynchronous Mode (2)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Used, at the Beginning of Transmission)



Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.8 Example of Operation for Serial Transmission in Asynchronous Mode (3)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, from the Middle of Transmission until Transmission Completion)



[1] SCI initialization:
Set data transmission.
After the TE bit in SCR is set to 1, 1 is output for a frame, and transmission is enabled.

[2] Transmit data write to TDR by a TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Write transmit data to TDR once in the TXI interrupt handling routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR once using a TXI interrupt request.
Transmit data can also be written to TDR by activating the DMAC.
When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR

[4] Break output at the end of serial transmission:
To output a break in serial transmission, set the I/O port function corresponding to the TXDn pin (corresponding to output of the low level), and after switching the TXDn pin to the general I/O port function, set the TE bit in the SCR to 0.

Note: The TDR register becomes the TDRH and TDRL registers when 9-bit data length is selected. Write data in the order from TDRH to TDRL.

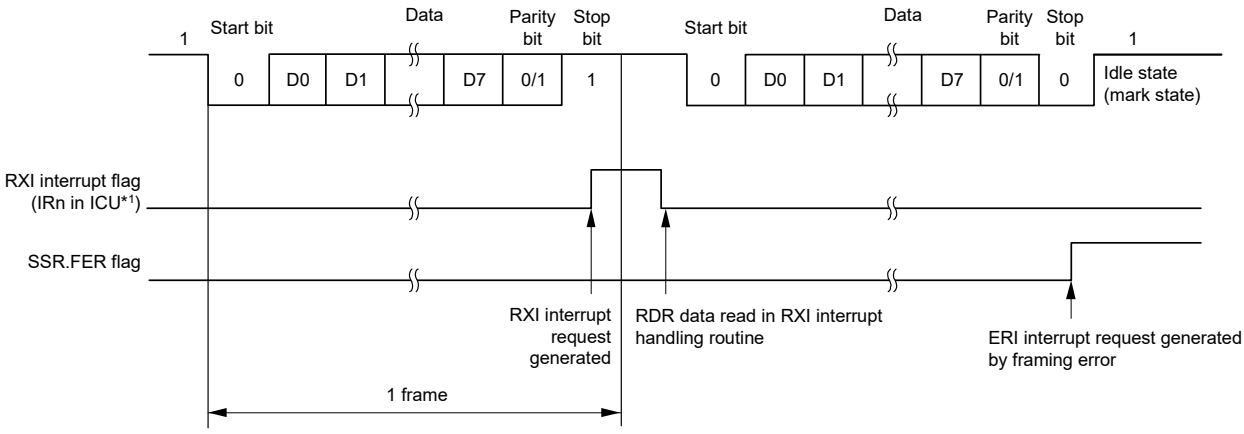
Figure 18.9 Example of Serial Transmission Flowchart in Asynchronous Mode

18.3.8 Serial Data Reception (Asynchronous Mode)

Figure 18.10 and Figure 18.11 show an example of the operation for serial data reception in asynchronous mode. In serial data reception, the SCI operates as described below.

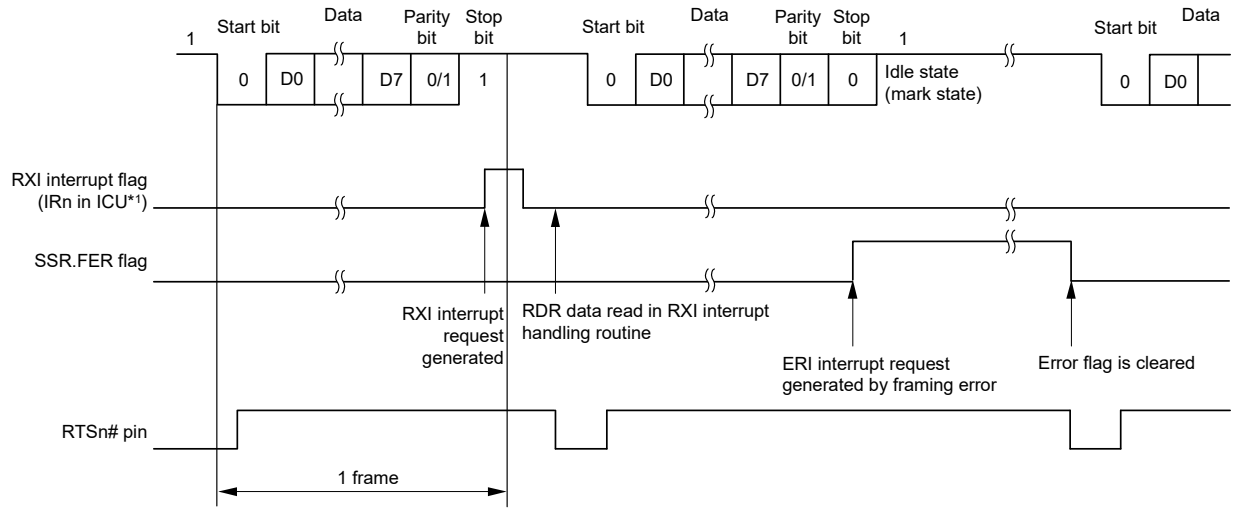
1. When the value of the RE bit in SCR becomes 1, the output signal on the RTSn# pin goes to the low level.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in RSR, and checks the parity bit and stop bit.
3. If an overrun error occurs, the ORER flag in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR*1.
4. If a parity error is detected, the PER bit in SSR is set to 1 and receive data is transferred to RDR*1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated.
5. If a framing error (when the stop bit is 0) is detected, the FER bit in SSR is set to 1 and receive data is transferred to RDR*1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated.
6. When reception finishes successfully, receive data is transferred to RDR*1. If the RIE bit in SCR is 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR*1 in this RXI interrupt handling routine before reception of the next receive data is completed. Reading the received data that have been transferred to RDR*1 causes the RTSn# pin to output the low level.

Note 1. Read data not in RDR but in the RDRH and RDRL registers when 9-bit data length is selected.
Note 2. The SCI checks for reading of the RDRL register only and does not check for reading of the RDRH register when 9-bit data length is selected.



Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.10 Example of SCI Operation for Serial Reception in Asynchronous Mode (1) (When RTS Function is Not Used) (Example with 8-Bit Data, Parity, 1 Stop Bit)



Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.11 Example of SCI Operation for Serial Reception in Asynchronous Mode (2) (When RTS Function is Used) (Example with 8-Bit Data, Parity, 1 Stop Bit)

Table 18.19 lists the states of the flags in the SSR status register and receive data handling when a receive error is detected.

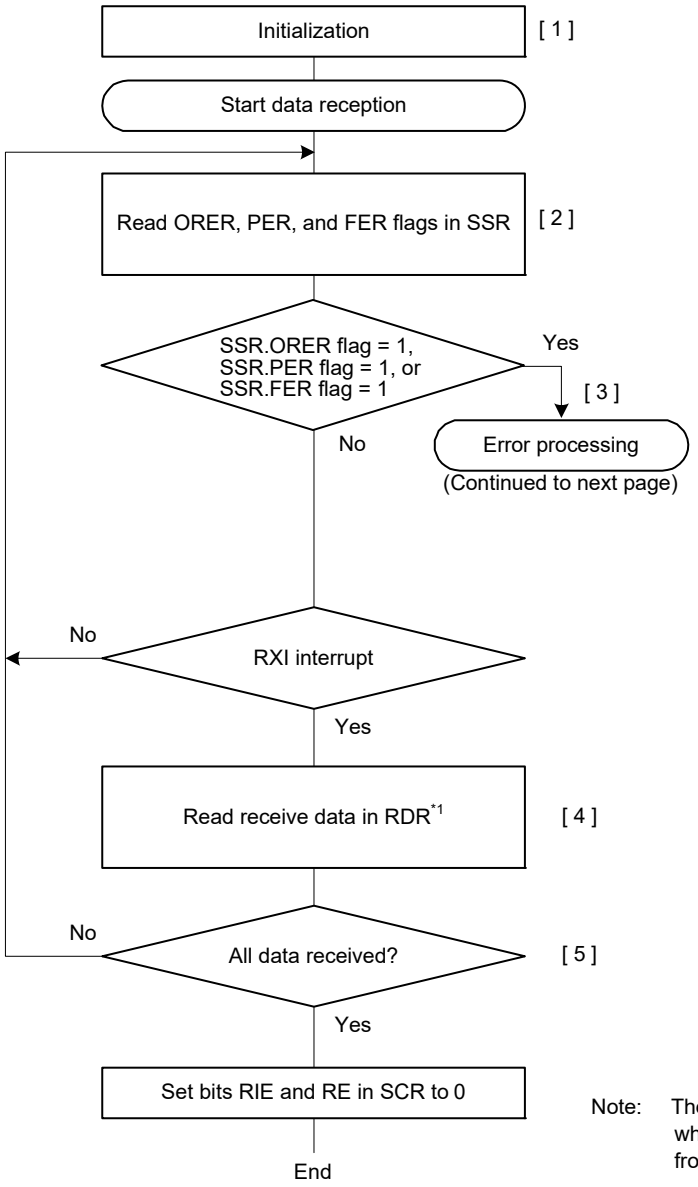
If a receive error is detected, an ERI interrupt request is generated but an RXI interrupt request is not generated. Data reception cannot be resumed while the receive error flag is 1. Accordingly, set the ORER, FER, and PER bits to 0 before resuming reception. Moreover, be sure to read the RDR (or the RDRL) during overrun error processing. When a reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read the RDR (or the RDRL) register because received data which has not yet been read may be left in RDR (or the RDRL).

Figure 18.12 and Figure 18.13 show samples of flowcharts for serial data reception.

Table 18.19 Flags in the SSR Status Register and Receive Data Handling

Flags in the SSR Status Register				
ORER	FER	PER	Receive Data	Receive Error Type
1	0	0	Lost	Overrun error
0	1	0	Transferred to RDR*1	Framing error
0	0	1	Transferred to RDR*1	Parity error
1	1	0	Lost	Overrun error + framing error
1	0	1	Lost	Overrun error + parity error
0	1	1	Transferred to RDR*1	Framing error + parity error
1	1	1	Lost	Overrun error + framing error + parity error

Note 1. Read data not in RDR but in the RDRH and RDRL registers when 9-bit data length is selected.



[1] SCI initialization:
Set data reception.

[2] [3] Receive error processing and break detection:
If a receive error occurs, an ERI interrupt is generated. An error is identified by reading the ORER, PER, and FER flags in SSR. After performing the appropriate error processing, be sure to set the ORER, PER, and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1. In the case of a framing error, a break can be detected by reading the value of the input port corresponding to the RXDn pin.

[4] Read the receive data in RDR once in the RXI interrupt handling routine.

[5] Serial reception continuation procedure:
To continue serial reception, before the stop bit of the current frame is received, read data from RDR in the RXI interrupt processing routine. The RDR data can also be read by activating the DMAC.

Note: The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 18.12 Example Flowchart of Serial Reception in Asynchronous Mode (1)

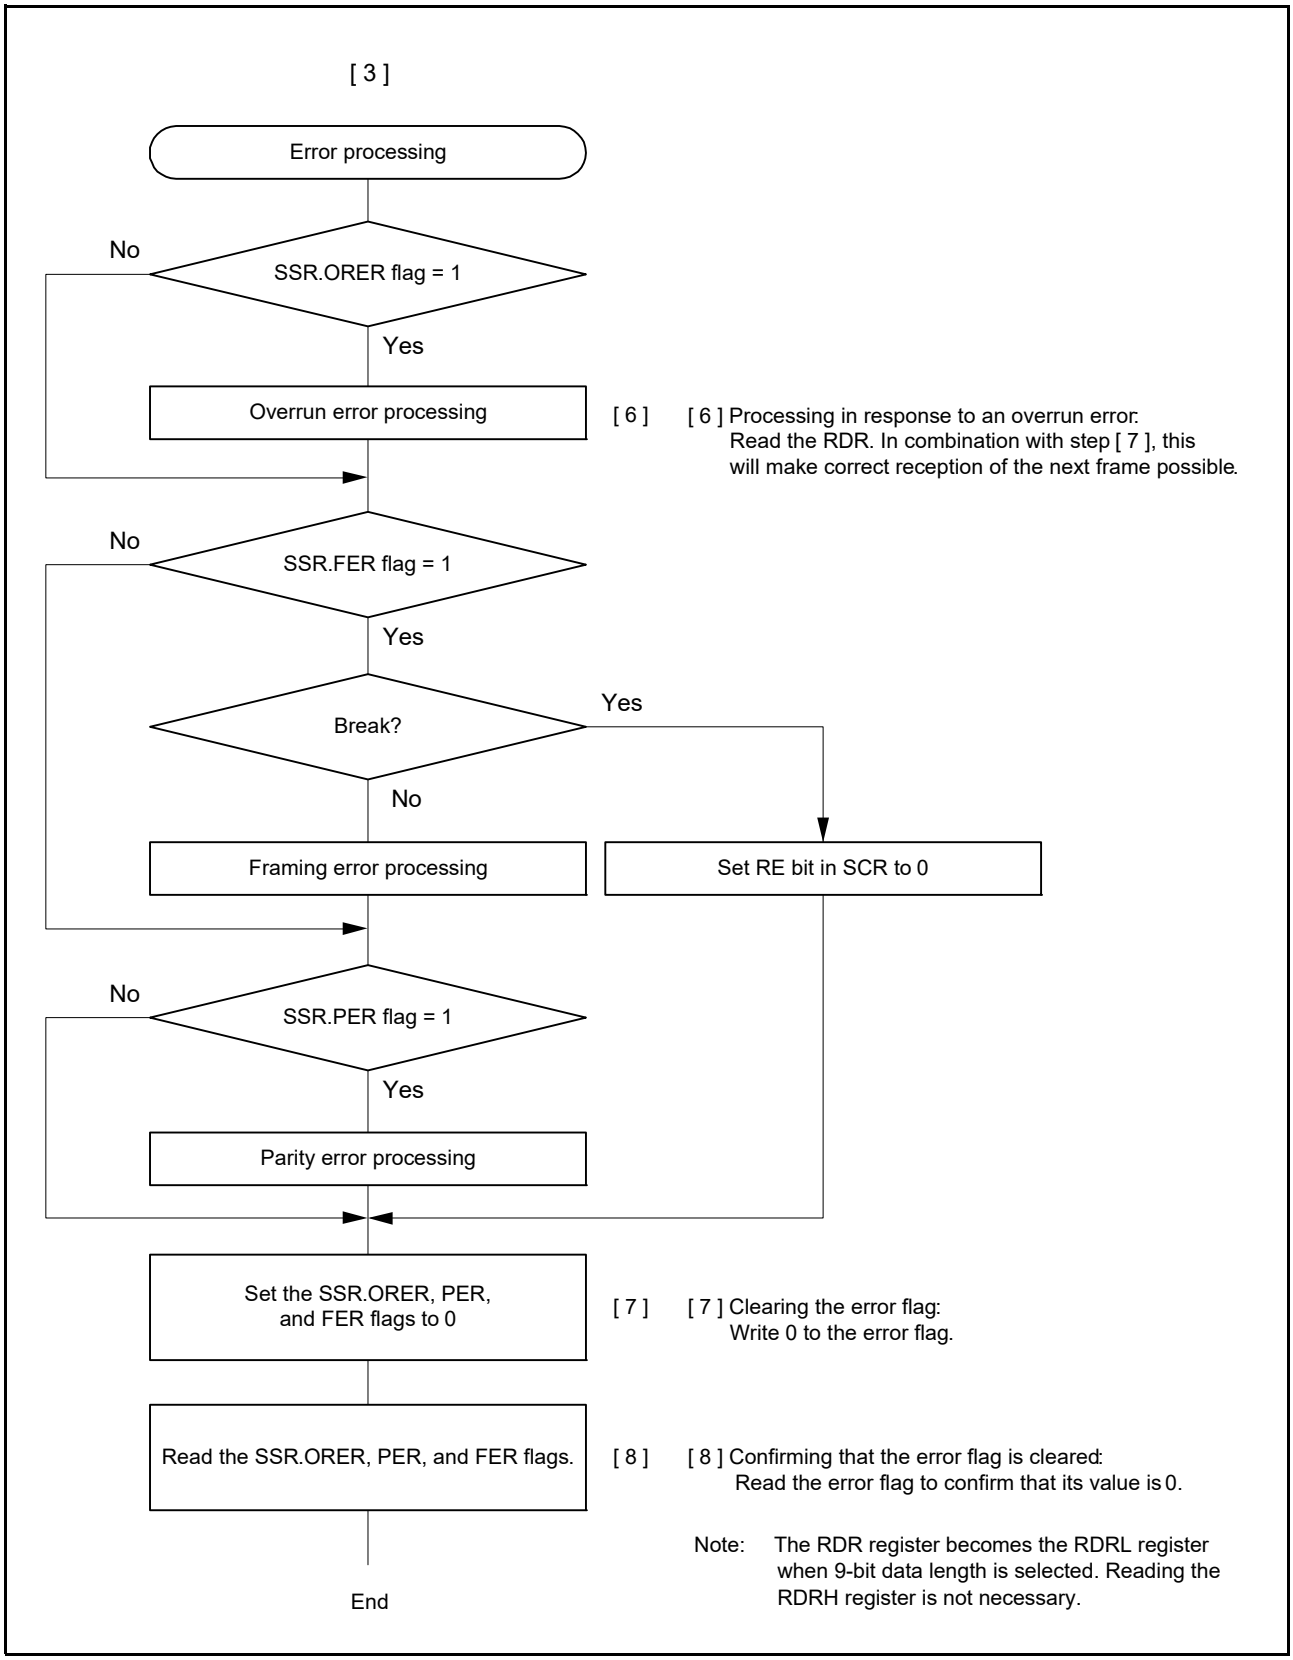


Figure 18.13 Example Flowchart of Serial Reception in Asynchronous Mode (2)

18.4 Multi-Processor Communications Function

Using the multi-processor communication functions enables to transmit and receive data by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish between the ID transmission cycle and the data transmission cycle. When the multi-processor bit is set to 1, it indicates the ID transmission cycle and when the multi-processor bit is set to 0, it indicates the data transmission cycle. Figure 18.14 shows an example of communication between processors by using a multi-processor format. First, a transmitting station transmits communication data in which the multi-processor bit set to 1 is added to the ID code of the receiving station. Next, the transmitting station transmits the communication data in which the multi-processor bit set to 0 is added to the transmit data. Upon receiving the communication data in which the multi-processor bit is set to 1, the receiving station compares the received ID with the ID of the receiving station itself and if the two match, receives the communication data that is subsequently transmitted. If the received ID does not match with the ID of the receiving station, the receiving station skips the communication data until again receiving the communication data in which the multi-processor bit is set to 1.
For supporting this function, the SCI provides the MPIE bit in SCR. When the MPIE bit is set to 1, transfer of receive data from the RSR to the RDR (the RDRH and RDRL registers when 9-bit data length is selected), detection of a receive error, and setting the respective status flags ORER and FER in SSR are disabled until reception of data in which the multi-processor bit is set to 1. Upon receiving a reception character in which the multi-processor bit is set to 1, the MPBT bit in SSR is set to 1 and the MPIE bit in SCR is automatically cleared, thus returning to a normal reception operation. During this time, an RXI interrupt is generated if the RIE bit in SCR is set.
When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the normal asynchronous mode. A clock which is used for the multi-processor communication is also the same as the clock used in the normal asynchronous mode.

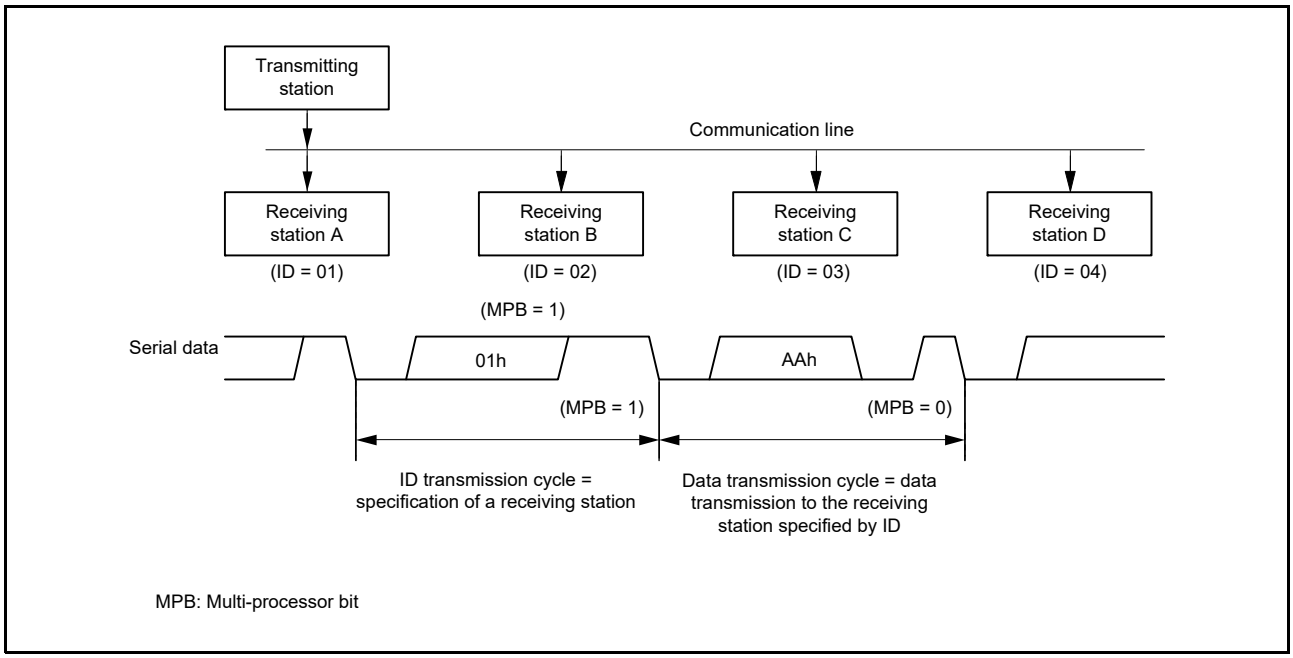

Figure 18.14 An Example of Communication using the Multi-Processor Format (Example of Transmission of Data AAh to Receiving Station A)

18.4.1 Multi-Processor Serial Data Transmission

Figure 18.15 is a sample flowchart of multi-processor data transmission. In the ID transmission cycle, the ID should be transmitted with the MPBT bit in SSR set to 1. In the data transmission cycle, the data should be transmitted with the MPBT bit set to 0. The other operations are the same as the operations in asynchronous mode.

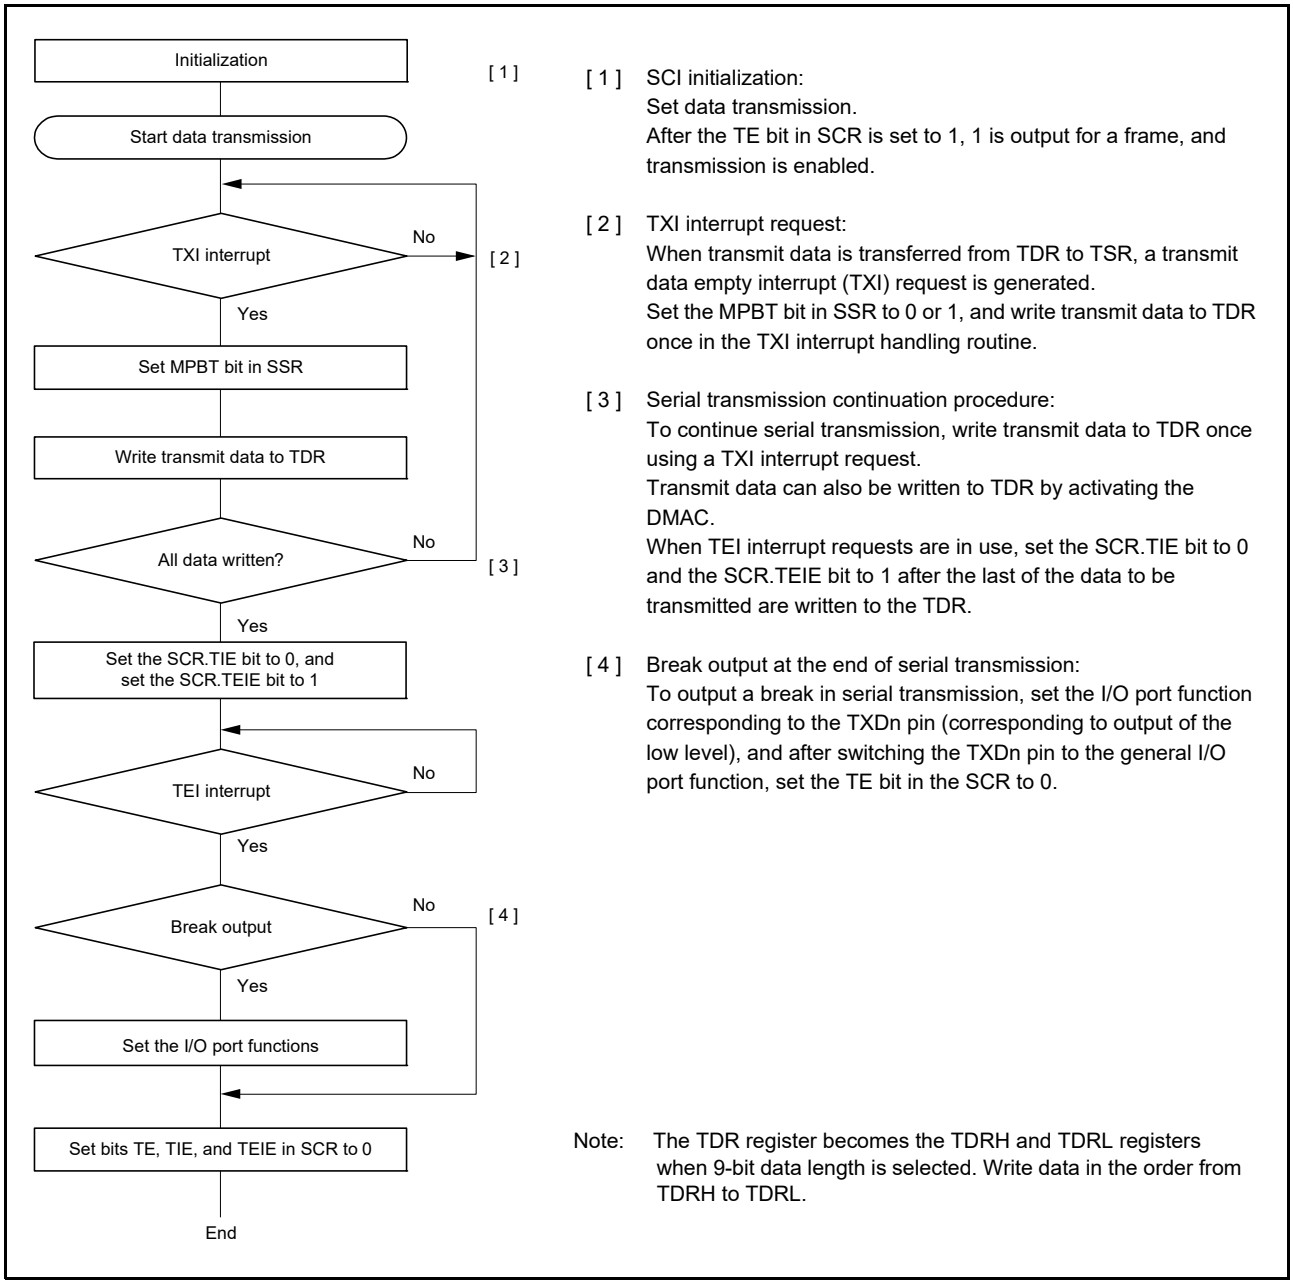

Figure 18.15 Example of Multi-Processor Serial Transmission Flowchart

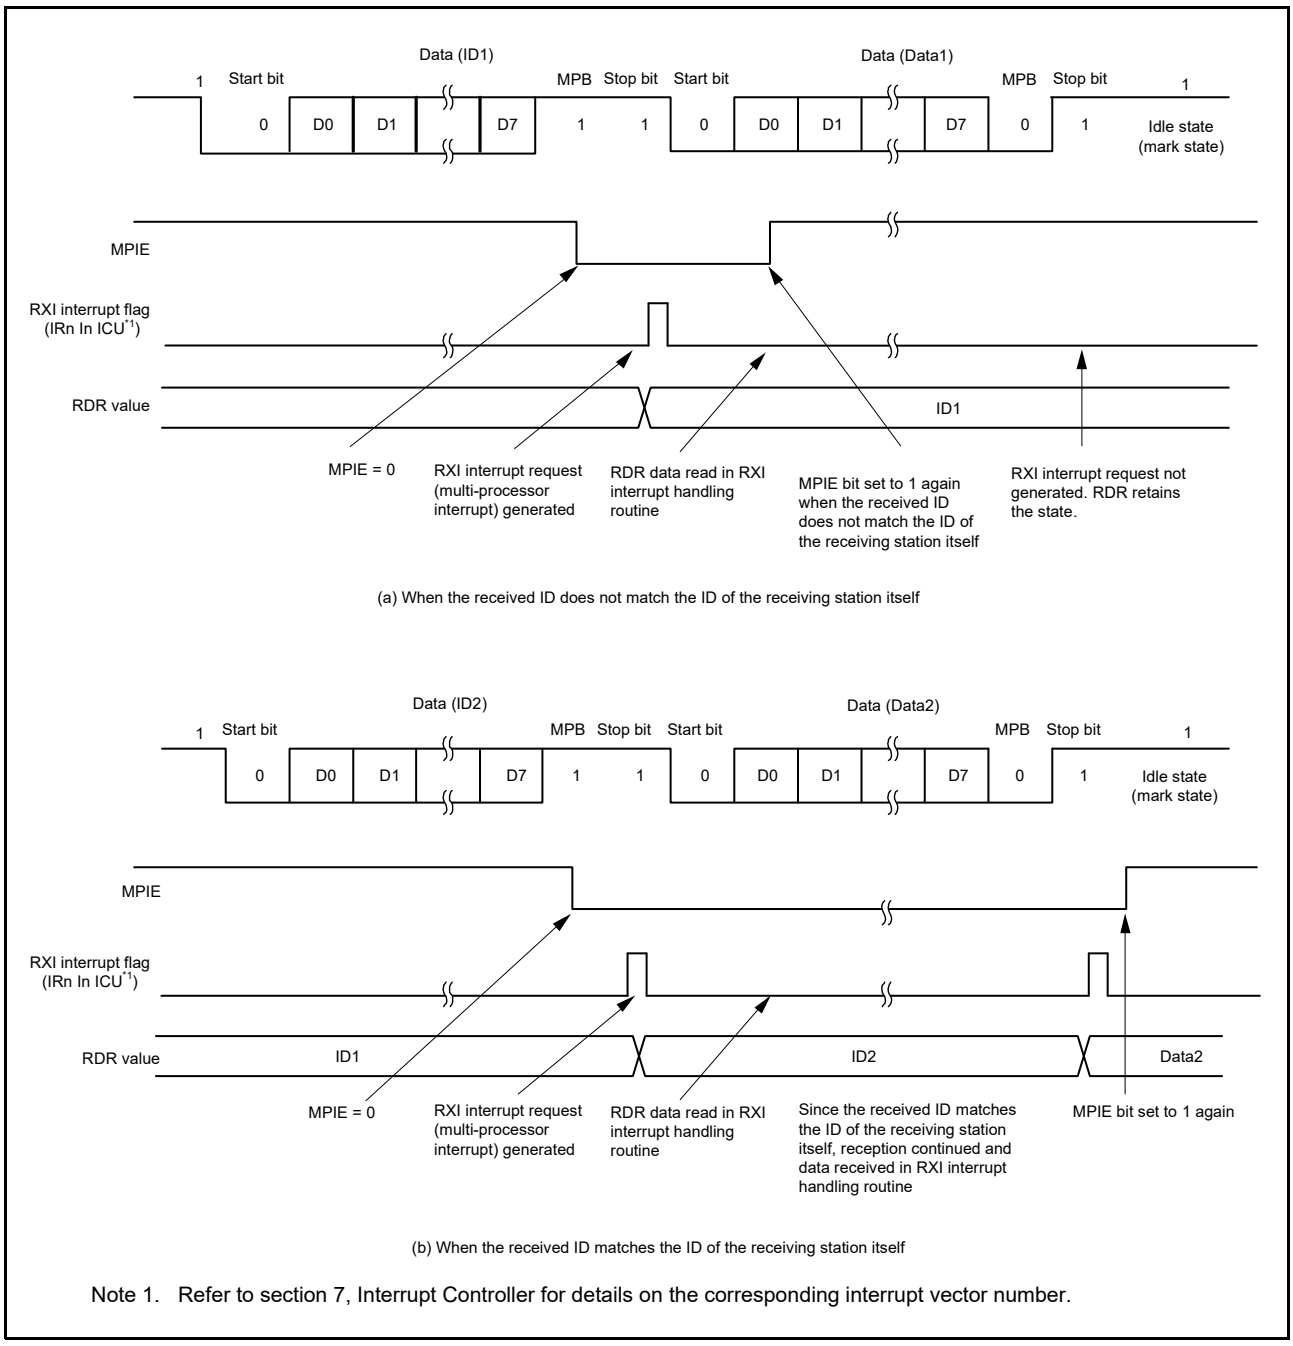
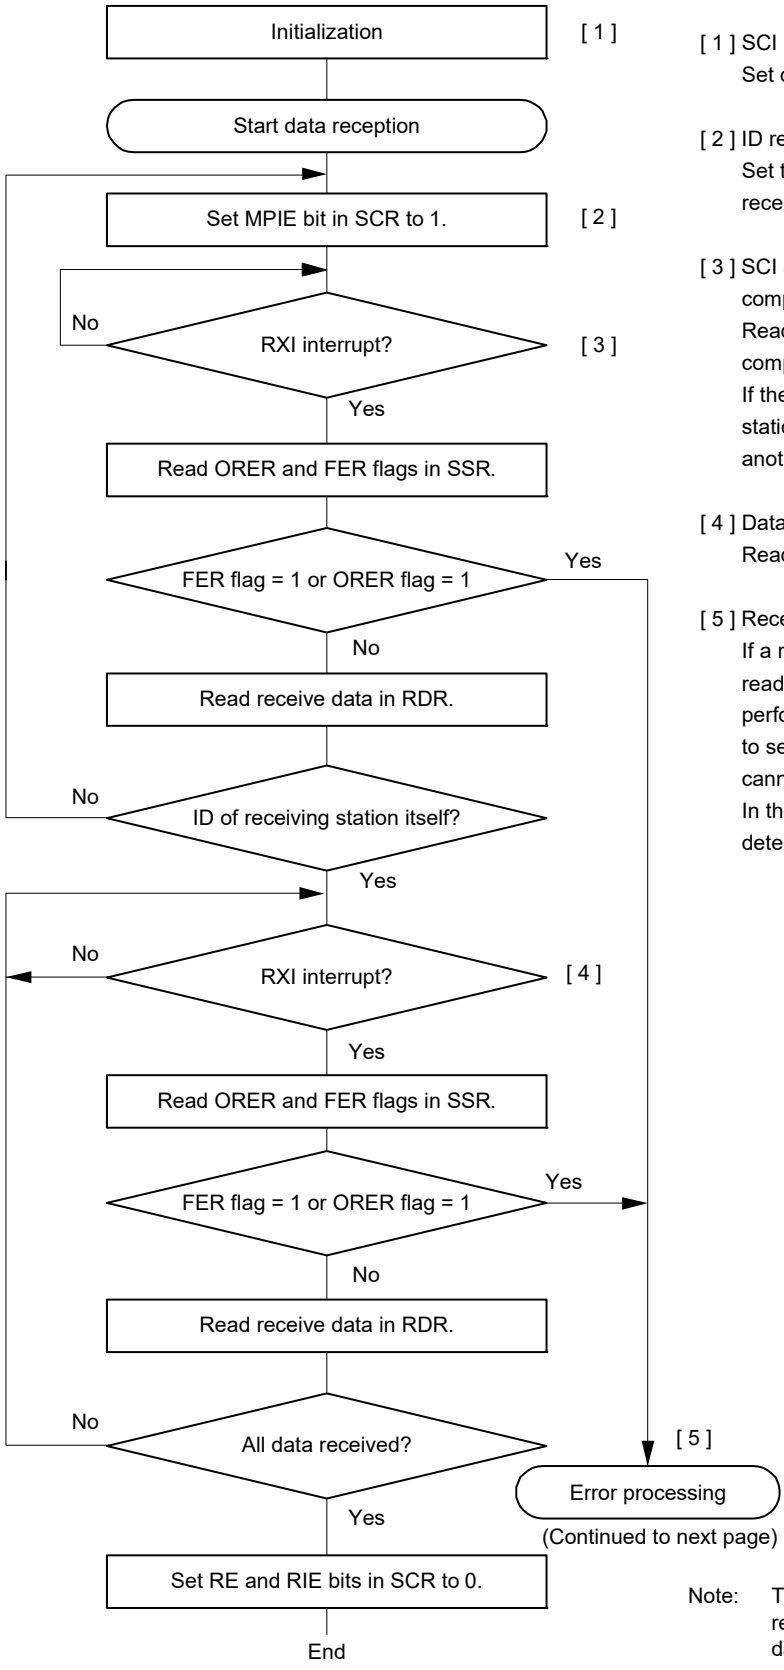
18.4.2 Multi-Processor Serial Data Reception

Figure 18.17 and Figure 18.18 are sample flowcharts of multi-processor data reception. When the MPIE bit in SCR is set to 1, reading the communication data is skipped until reception of the communication data in which the multi-processor bit is set to 1. When the communication data in which the multi-processor bit is set to 1 is received, the received data is transferred to RDR (the RDRH and RDRL registers when 9-bit data length is selected). During this time, the RXI interrupt request is generated. The other operations are the same as the operations in asynchronous mode. Figure 18.16 is the example of operation for reception.



Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.16 Example of SCI Reception (8-Bit Data/Multi-Processor Bit/1 Stop Bit)



[1] SCI initialization:
Set data reception.

[2] ID reception cycle:
Set the MPIE bit in SCR to 1 and wait for ID reception.

[3] SCI status confirmation and reception and comparison of ID:
Read data in RDR at the first RXI interrupt, and compare it with the ID of the receiving station itself. If the ID does not match the ID of the receiving station itself, set the MPIE bit to 1 again, and wait for another RXI interrupt RXI interrupt request.

[4] Data reception at an RXI interrupt:
Read data in RDR once in the RXI interrupt routine.

[5] Receive error processing and break detection:
If a receive error occurs, an error is identified by reading the ORER and FER flags in SSR. After performing the appropriate error processing, be sure to set the ORER and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1. In the case of a framing error, a break can be detected by reading the value of the RXDn pin.

Note: The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 18.17 Example of Multi-Processor Serial Reception Flowchart (1)

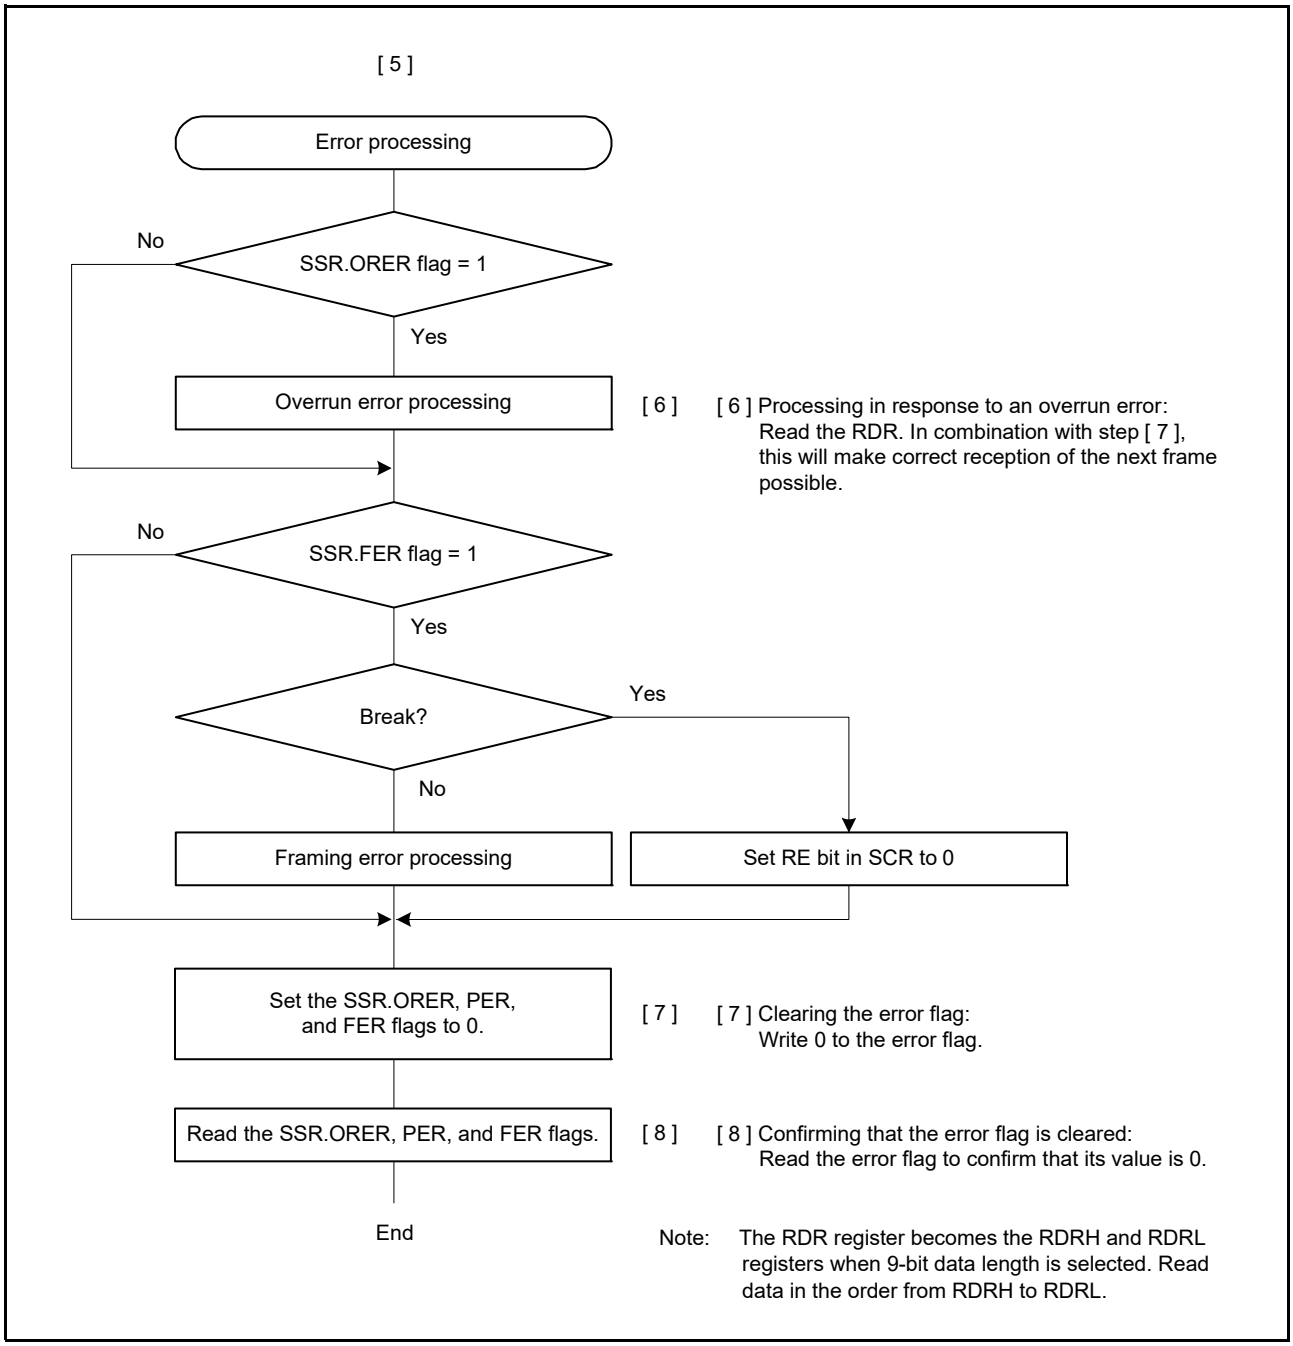


Figure 18.18 Example of Multi-Processor Serial Reception Flowchart (2)

18.5 Operation in Clock Synchronous Mode

Figure 18.19 shows the data format for clock synchronous serial data communications.
In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In clock synchronous mode, no parity bit can be added.
In data transmission, the SCI outputs data from one falling edge of the synchronization clock to the next. In data reception, the SCI receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the communication line holds the last bit output state.
Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications by use of a common clock. Both the transmitter and the receiver also have a double-buffered structure, so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.

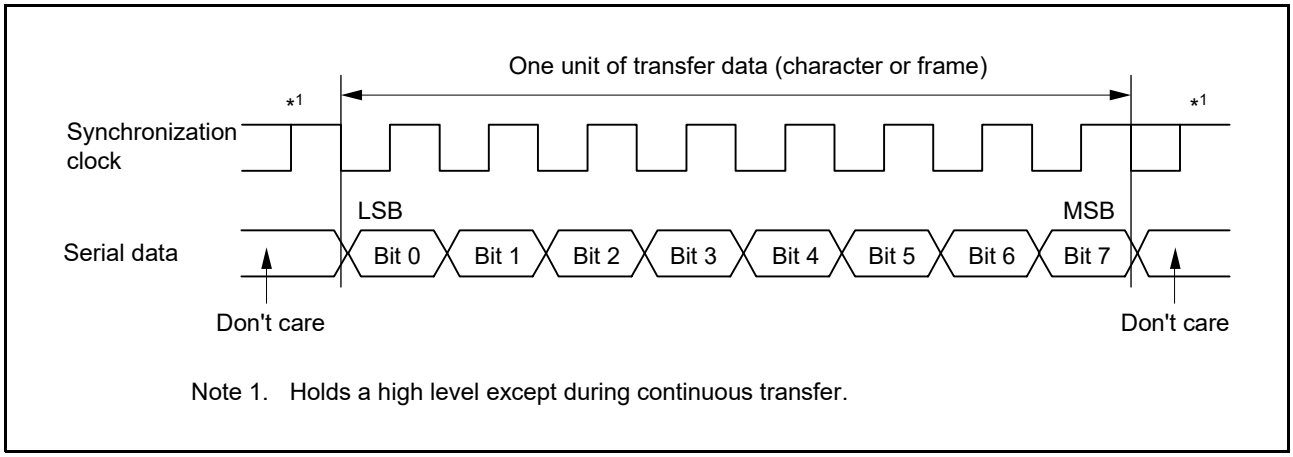

Figure 18.19 Data Format in Clock Synchronous Serial Communications (LSB First)

18.5.1 Clock

Either an internal clock generated by the on-chip baud rate generator or an external synchronization clock input at the SCKn pin can be selected, according to the setting of the SCR.CKE[1:0] bits.
When the SCI is operated on an internal clock, the synchronization clock is output from the SCKn pin. Eight synchronization clock pulses are output in the transfer of one character, and when no transfer is performed the clock is held high. However, when only data reception is performed while the CTS function is disabled, the synchronization clock output is started at the same time when the SCR.RE bit set to 1. The synchronization clock is stopped at the high level when an overrun error occurs or the SCR.RE bit is set to 0.
When only data reception is performed and the CTS function is enabled, the clock output is not started even when the SCR.RE bit set to 1 if the CTSn# pin input is high when the SCR.RE bit is 0. The synchronization clock output is started when the SCR.RE bit is set to 1 and the CTSn# pin input is low. After that, if the CTSn# pin input is high on completion of the frame reception, the synchronization clock output is stopped at the high level. If the CTSn# pin input continues to be low, the synchronization clock is stopped at the high level when an overrun error occurs or the SCR.RE bit is set to 0.

18.5.2 CTS and RTS Functions

In the CTS function, CTSn# pin input is used to control reception/transmission start when the clock source is the internal clock. Setting the SECR.CTSE bit to 1 enables the CTS function.
When the CTS function is enabled, placing the low level on the CTSn# pin causes reception/transmission to start.
In the RTS function, RTSn# pin output is used to request reception/transmission start when the clock source is an external synchronizing clock. A low level is output when serial communications become possible. Conditions for output of the low and high level are shown below.

[Conditions for low-level output]
Satisfaction of all conditions listed below

- The value of the RE or TE bit in the SCR is 1
- Neither transmission nor reception is in progress
- There are no received data yet to be read (when the SCR.RE bit is 1)
- Transmit data has been written (when the SCR.TE bit is 1)
- ORER flag in SSR is 0

[Condition for high-level output]
The conditions for low-level output have not been satisfied.

18.5.3 SCI Initialization (Clock Synchronous Mode)

Before transmitting and receiving data, start by writing the initial value 00h to the SCR and then continue through the procedure for SCI given in Figure 18.20. Whenever the operating mode or transfer format is changed, the SCR must be initialized before the change is made.
Note that setting the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR nor RDR.
Moreover, note that switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of a TXI interrupt request.

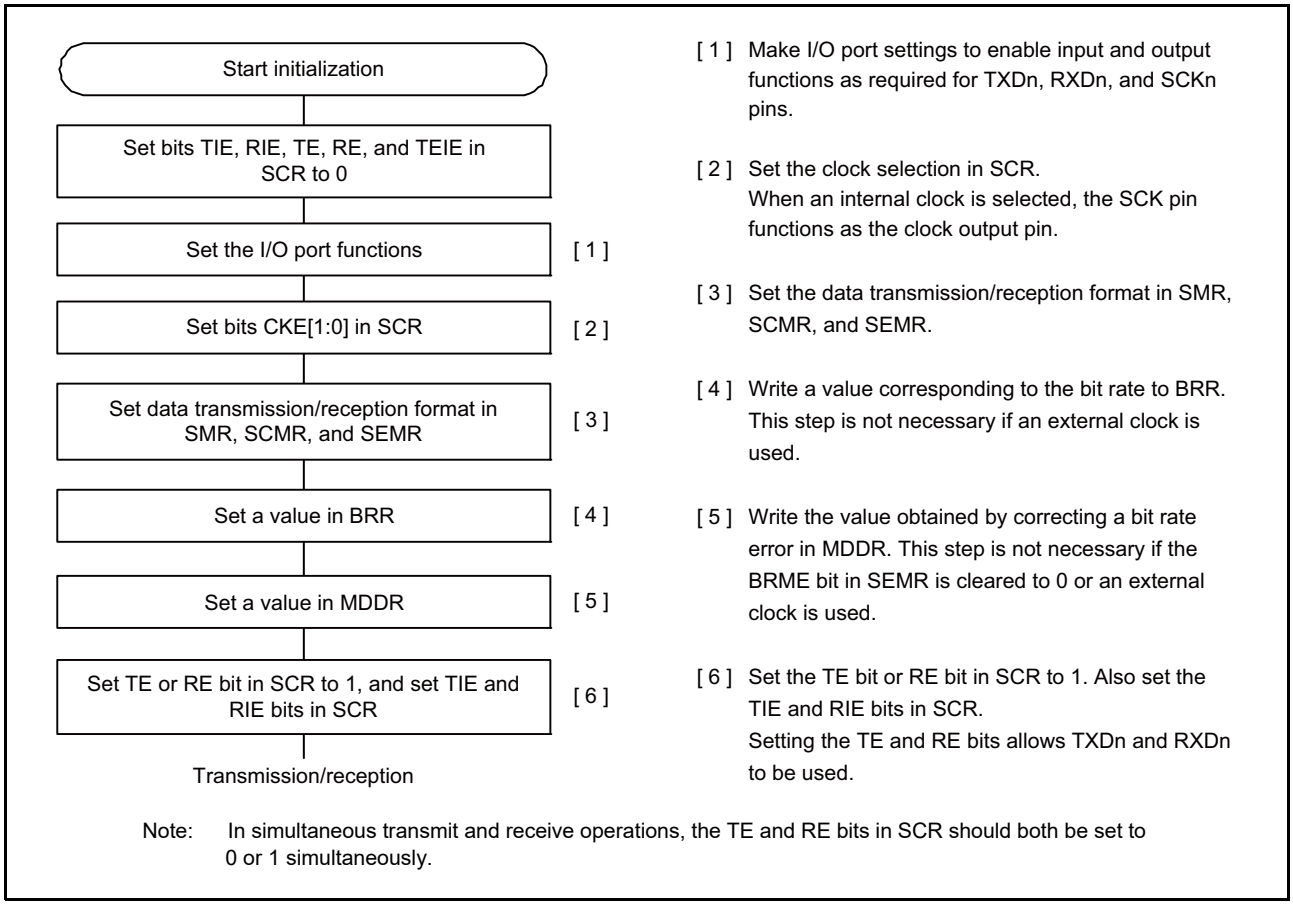

Figure 18.20 Example of SCI Initialization Flowchart (Clock Synchronous Mode)

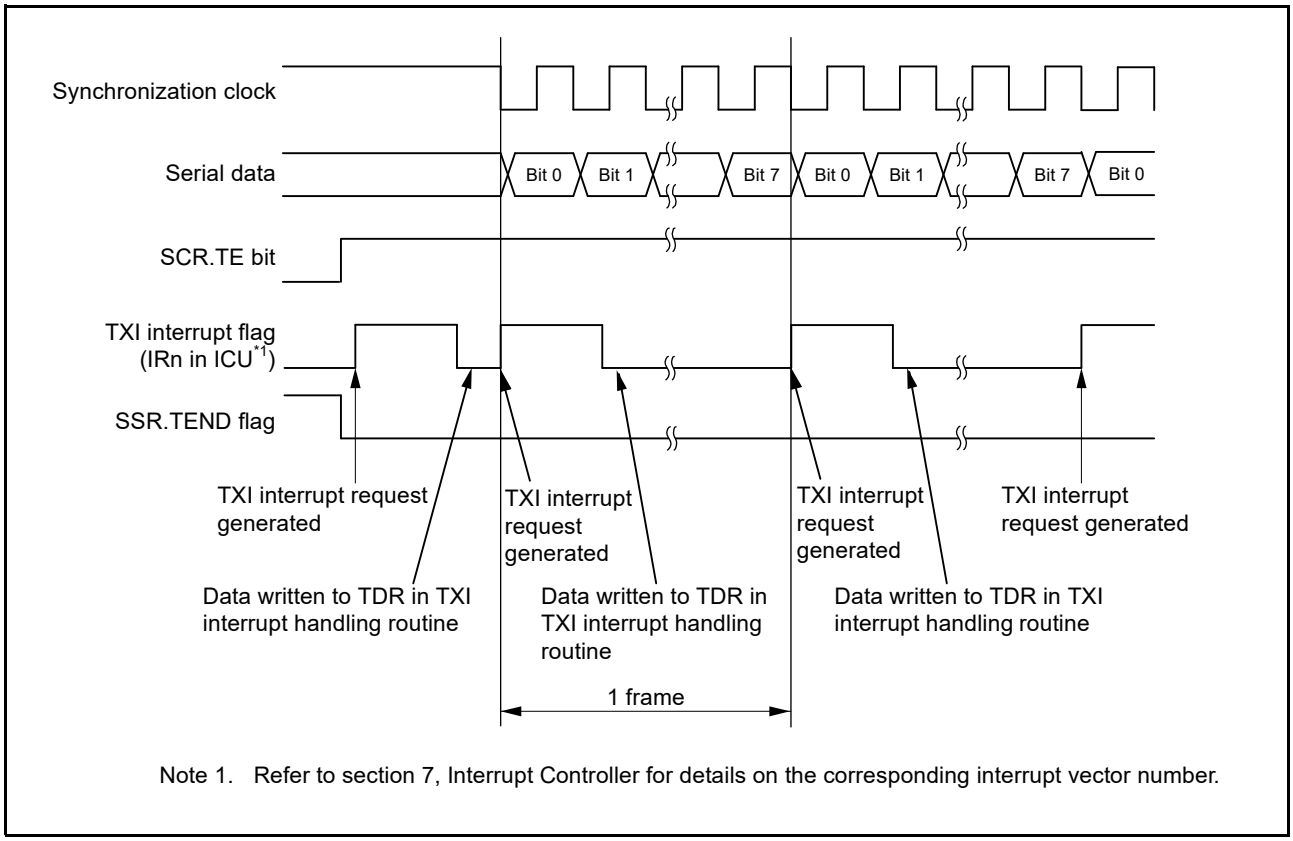
18.5.4 Serial Data Transmission (Clock Synchronous Mode)

Figure 18.20, Figure 18.21, and Figure 18.22 show an example of the operation for serial transmission in clock synchronous mode.
In serial data transmission, the SCI operates as described below.

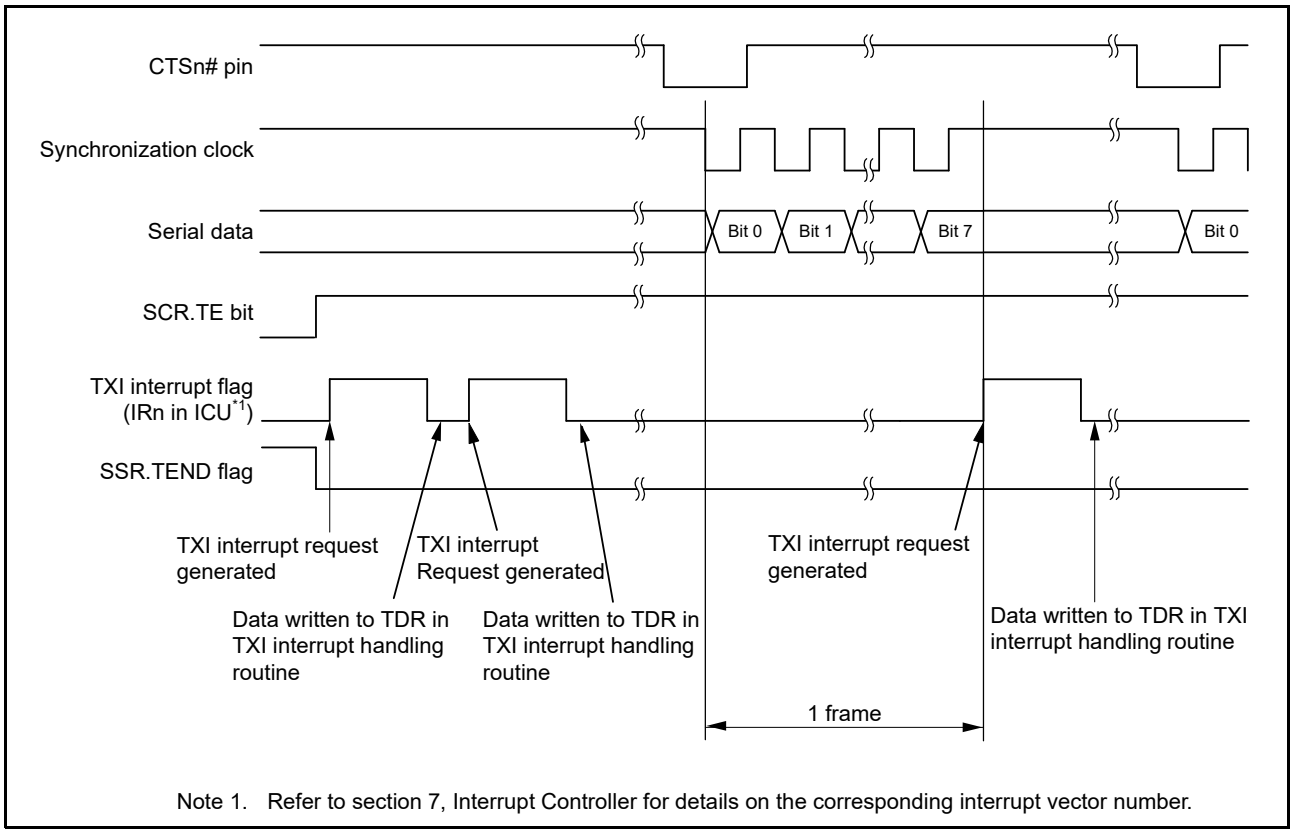
1. The SCI transfers data from TDR to TSR when data is written to TDR in the TXI interrupt handling routine. The TXI interrupt request at the beginning of transmission is generated when the TE bit in SCR is set to 1 after the TIE bit in SCR is set to 1 or when these 2 bits are set to 1 simultaneously by a single instruction.
2. After transferring data from TDR to TSR, the SCI starts transmission. When the SCR.TIE bit is set to 1 at this time, a TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to TDR in this TXI interrupt handling routine before transmission of the current transmit data has finished. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 (a TXI interrupt request is disabled) and the SCR.TEIE bit to 1 (a TEI interrupt request is enabled) after the last of the data to be transmitted are written to the TDR from the handling routine for TXI requests.
3. 8-bit data is sent from the TXDn pin in synchronization with the output clock when clock output mode has been specified and in synchronization with the input clock when use of an external clock has been specified. Output of the clock signal is suspended until the input CTS signal is at the low level while the CTSE bit in SECR is 1 (CTS function is enabled).
4. The SCI checks for updating of (writing to) the TDR at the time of the last bit output.
5. When TDR is updated, the next transmit data is transferred from TDR to TSR, and serial transmission of the next frame is started.
6. If TDR is not updated, set the SSR.TEND flag to 1 and the TXDn pin retains the output state of the last bit. If the TEIE bit in SCR is 1 at this time, a TEI interrupt request is generated. The SCKn pin is held high.

Figure 18.24 shows a sample flowchart of serial data transmission.
Transmission will not start while a receive error flag (ORER, FER, or PER in SSR) is set to 1. Be sure to set the receive error flags to 0 before starting transmission. Note that setting the RE bit in SCR to 0 does not clear the receive error flags.



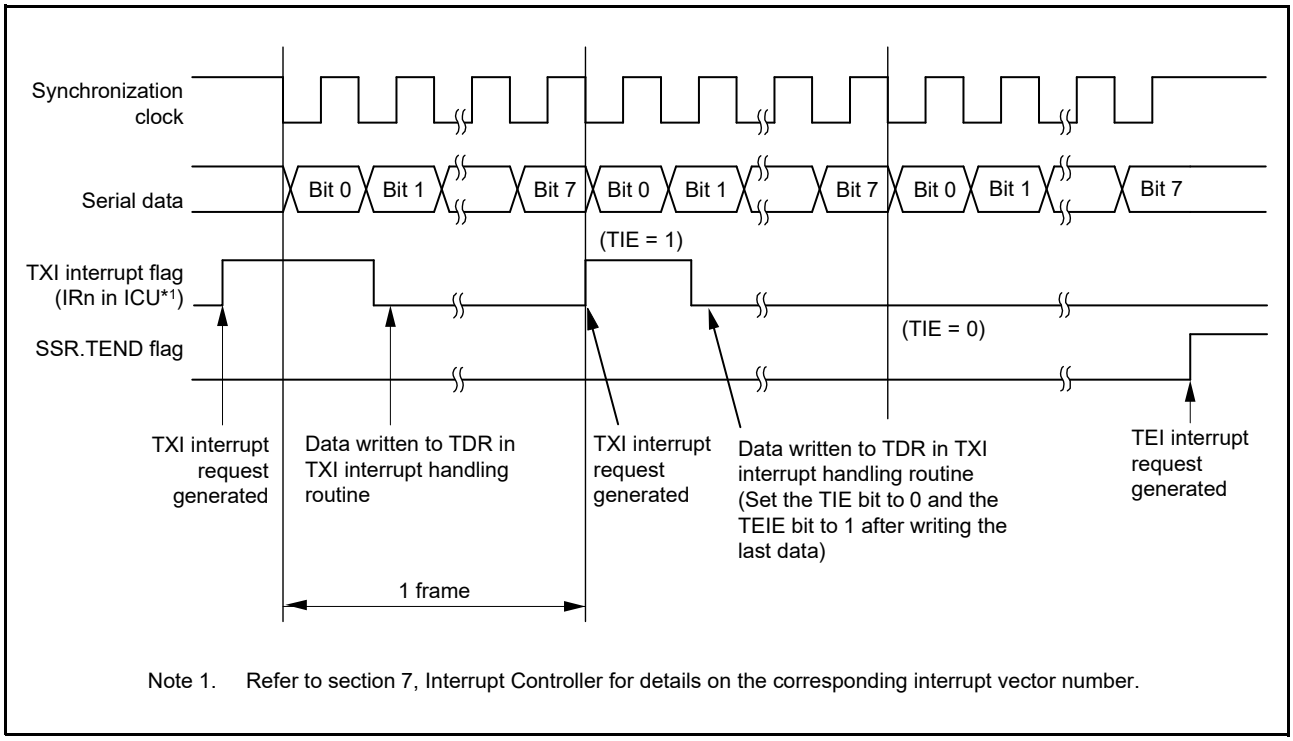
Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.21 Example of Serial Data Transmission in Clock Synchronous Mode (1)
(When the CTS Function is Not Used at the Beginning of Transmission)



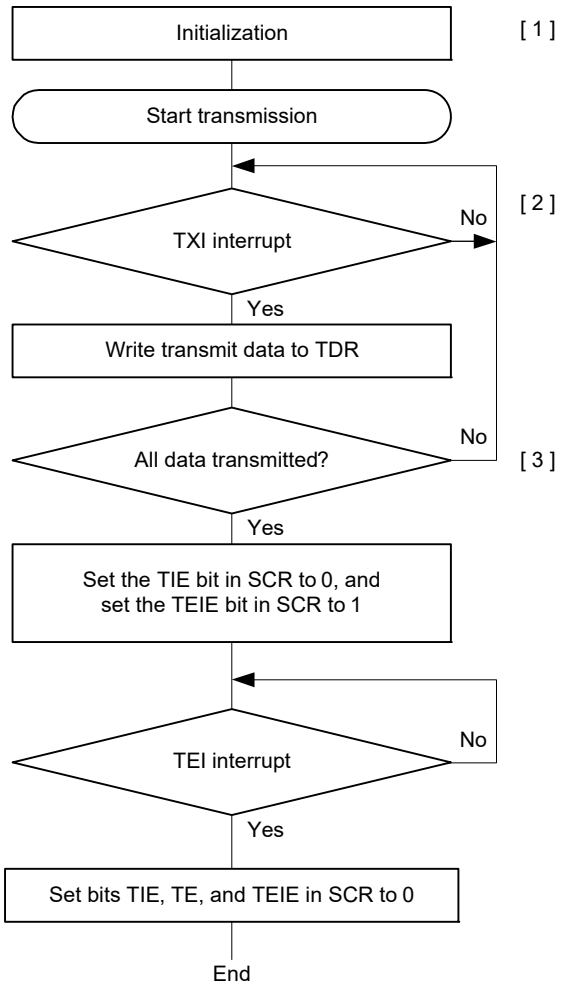
Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.22 Example of Serial Data Transmission in Clock Synchronous Mode (2)
(When the CTS Function is Used at the Beginning of Transmission)



Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.23 Example of Serial Data Transmission in Clock Synchronous Mode (3)
(From the Middle of Transmission until Transmission Completion)



[1] SCI initialization:
Set data transmission.

[2] Writing transmit data write to TDR by a TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Transmit data is written to TDR once from the handling routine for TXI requests.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR upon accepting a transmit data empty interrupt (TXI) request. Transmit data can also be written to TDR by activating the DMAC by the TXI interrupt request.
When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

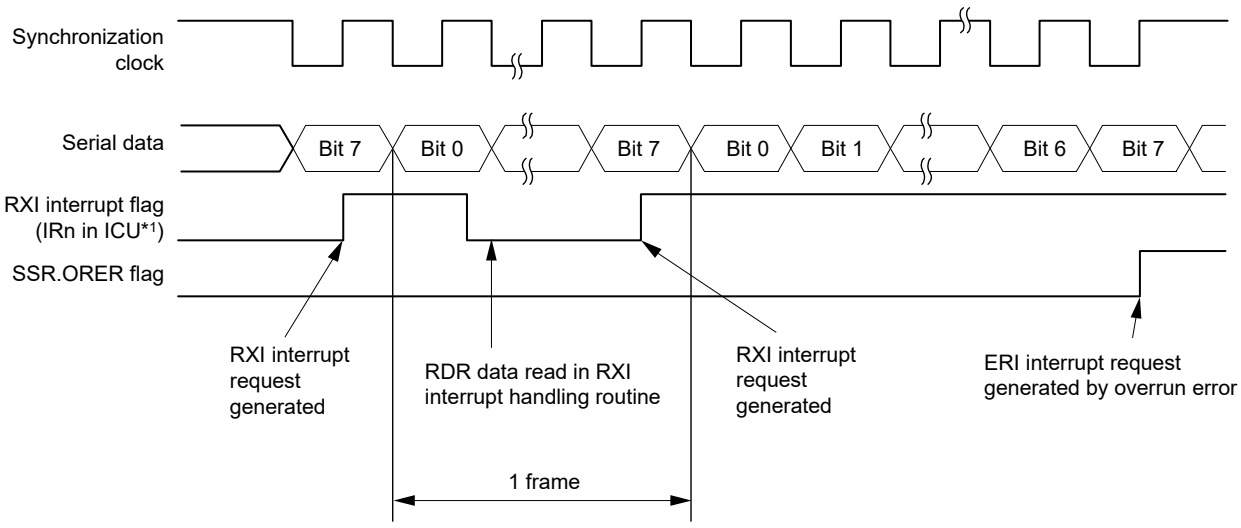
Note: When the external clock is in use (the value of the SCR.CKE[1:0] bits is 10b or 11b), the rising edge on the SCK pin for the last bit sets the SSR.TEND flag to 1. Setting the SCR.TE bit to 0 immediately after this may lead to insufficient received-data hold time on the receiver side.

Figure 18.24 Example Flowchart of Serial Transmission in Clock Synchronous Mode

18.5.5 Serial Data Reception (Clock Synchronous Mode)

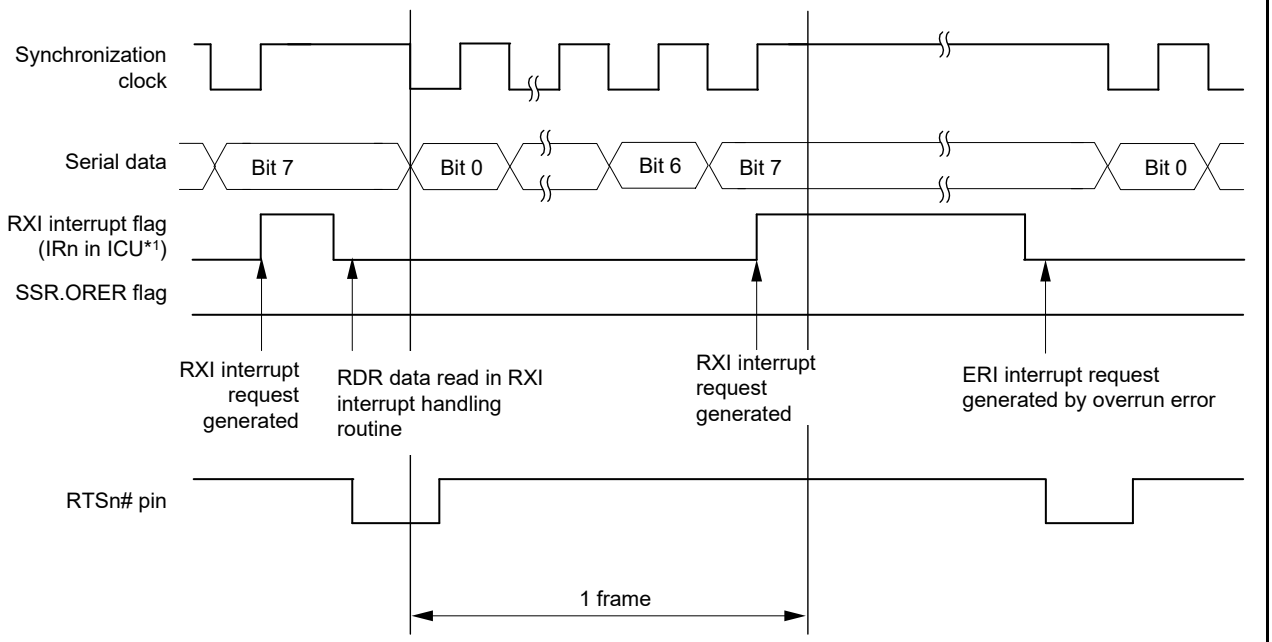
Figure 18.25 and Figure 18.26 show an example of SCI operation for serial reception in clock synchronous mode. In serial data reception, the SCI operates as described below.

1. The value of the RE bit in SCR becoming 1 places the signal output on the RTSn# pin at the low level (when the RTS function is in use).
2. The SCI performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores the receive data in RSR.
3. If an overrun error occurs, the ORER bit in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR.
4. When reception finishes successfully, receive data is transferred to RDR. If the RIE bit in SCR is 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR in this RXI interrupt handling routine before reception of the next receive data is completed. Reading out the received data that have been transferred to RDR causes the RTSn# pin to output the low level (when the RTS function is in use).



Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.25 Example of Operation for Serial Reception in Clock Synchronous Mode (1) (When RTS Function is Not Used)

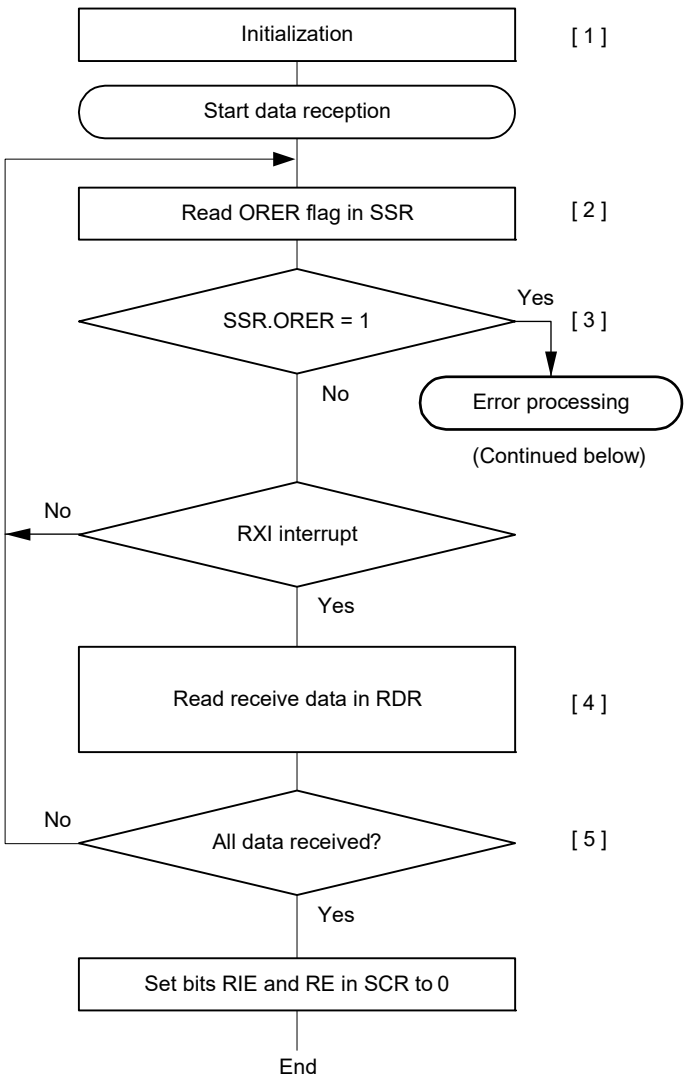


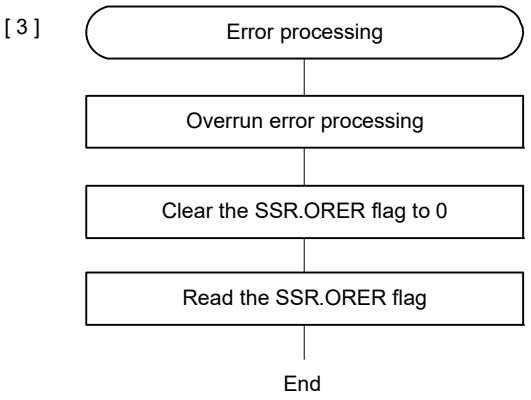
Note 1. Refer to section 7, Interrupt Controller for details on the corresponding interrupt vector number.

Figure 18.26 Example of Operation for Serial Reception in Clock Synchronous Mode (2) (When RTS Function is Used)

Data transfer cannot be resumed while a receive error flag is 1. Accordingly, clear the ORER, FER, and PER bits in SSR to 0 before resuming reception. Moreover, be sure to read the RDR during overrun error processing. When a reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read RDR because received data which has not yet been read may be left in RDR.

Figure 18.27 shows a sample flowchart for serial data reception.





[1] SCI initialization:
Make input port-pin settings for pins to be used as RXDn pins.

[2] [3] Receive error processing:
If a receive error occurs, read the ORER flag in SSR, perform the relevant error processing, and then set the ORER flag to 0. Data reception cannot be resumed while the ORER flag is 1.

[4] Read the receive data in RDR once in the receive data full interrupt (RXI) request handling routine.

[5] Serial reception continuation procedure:
To continue serial reception, before the MSB (bit 7) of the current frame is received, finish reading the receive data in RDR. The RDR data can also be read by activating the DMAC by an RXI interrupt request.

[6] Processing in response to an overrun error:
Read the RDR. In combination with step [7], this will make correct reception of the next frame possible.

[7] Clearing the error flag:
Write 0 to the error flag.

[8] Confirming that the error flag is cleared:
Read the error flag to confirm that its value is 0.

Figure 18.27 Example Flowchart of Serial Reception in Clock Synchronous Mode

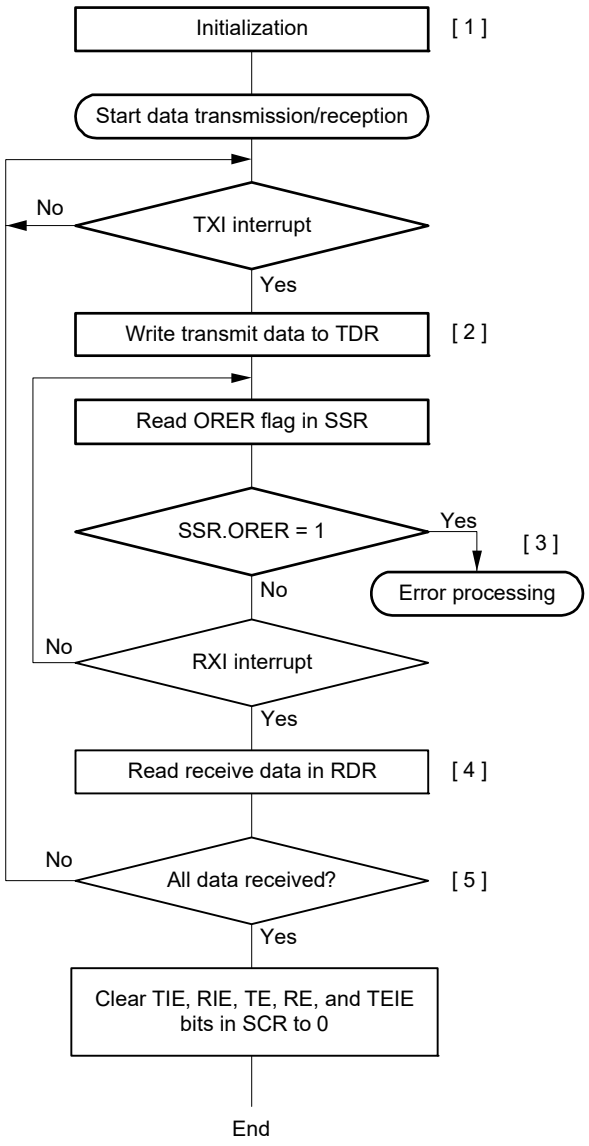
18.5.6 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode)

Figure 18.28 shows a sample flowchart for simultaneous serial transmit and receive operations in clock synchronous mode.

After initializing the SCI, the following procedure should be used for simultaneous serial data transmit and receive operations.

To switch from transmit mode to simultaneous transmit and receive mode, check that the SCI has finished transmission by reading that the TEND flag in SSR is 1, and then initialize the SCR register. Then set the TIE, RIE, TE, and RE bits in SCR to 1 simultaneously by a single instruction.

To switch from receive mode to simultaneous transmit and receive mode, check that the SCI has finished reception, and then set the RIE and RE bits to 0. Then check that the receive error flags (ORER, FER, and PER in SSR) are 0, and then set the TIE, RIE, TE, and RE bits in SCR to 1 simultaneously by a single instruction.



[1] SCI initialization:
The TXDn pin can act as the output pin for transmitted data and the RXDn pin can act as the input pin for received data at the same time.

[2] Transmit data write:
Write transmit data to TDR once in the TXI interrupt handling routine.

[3] Receive error processing:
If a receive error occurs, read the ORER flag in SSR, perform the relevant error processing, and then set the ORER flag to 0. Data reception cannot be resumed while the ORER flag is 1.

[4] Reading receive data:
Read the receive data in RDR once in the RXI interrupt request handling routine.

[5] Serial transmission/reception continuation procedure:
To continue serial transmission and reception, before the MSB (bit 7) of the current frame is received, finish reading the receive data in RDR by the RXI interrupt. Also, before the MSB (bit 7) of the current frame is transmitted, write data to TDR by the TXI interrupt.
Transmit data can also be written to TDR by activating the DMAC by a transmit data empty interrupt (TXI) request. Similarly, the RDR data can also be read by activating the DMAC by a receive data full interrupt (RXI) request.

Note: When switching from transmit or receive operation to simultaneous transmit and receive operations first set the TIE, RIE, TE, RE, and TEIE bits in SCR to 0, and then set TIE, RIE, TE, and RE bits to 1 simultaneously.

Figure 18.28 Example Flowchart of Simultaneous Serial Transmission and Reception in Clock Synchronous Mode

18.6 Operation in Smart Card Interface Mode

The SCI supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards), as an extended function of the SCI.
Smart card interface mode can be selected using the appropriate register.

18.6.1 Sample Connection

Figure 18.29 shows a sample connection between a smart card (IC card) and this MCU.
As in the figure, since this MCU communicates with an IC card using a single transmission line, interconnect the TXDn and RXDn pins and pull up the data transmission line to VCC using a resistor.
Setting the TE and RE bits in SCR to 1 with an IC card disconnected enables closed transmission/reception allowing self-diagnosis.
To supply an IC card with the clock pulses generated by the SCI, input the SCKn pin output to the CLK pin of an IC card.
The output port of the this MCU can be used to output a reset signal.

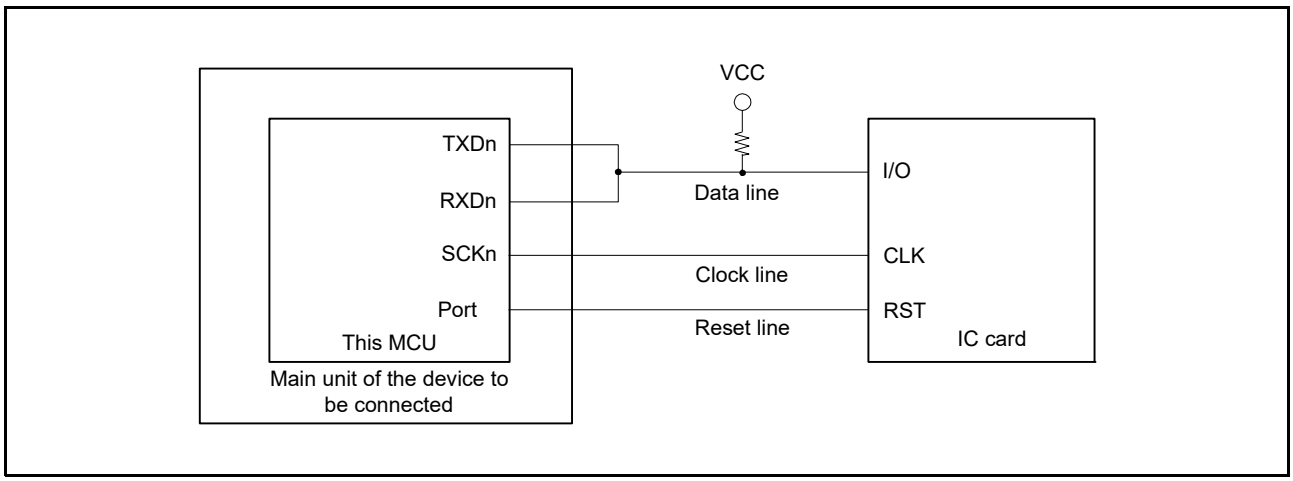


Figure 18.29 Sample Connection with a Smart Card (IC Card)

18.6.2 Data Format (Except in Block Transfer Mode)

Figure 18.30 shows the data transfer formats in smart card interface mode.

- One frame consists of 8-bit data and a parity bit in asynchronous mode.
- During transmission, at least 2 etu (elementary time unit: time required for transferring 1 bit) is secured as a guard time from the end of the parity bit until the start of the next frame.
- If a parity error is detected during reception, a low-level error signal is output for 1 etu after 10.5 etu has passed from the start bit.
- If an error signal is sampled during transmission, the same data is automatically retransmitted after at least 2 etu.

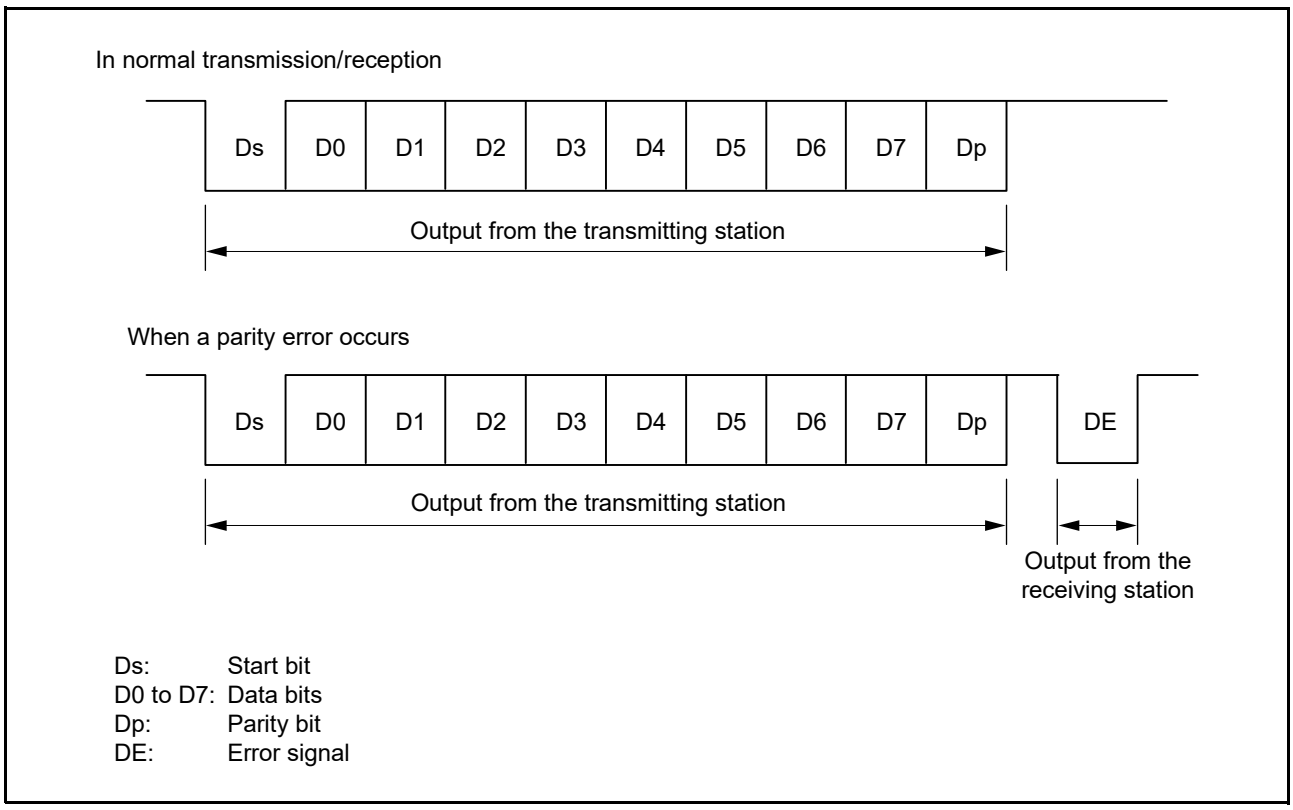

Figure 18.30 Data Formats in Smart Card Interface Mode

For communications with IC cards of the direct convention type and inverse convention type, follow the procedure below.

(1) Direct Convention Type

For the direct convention type, logic levels 1 and 0 correspond to states Z and A, respectively, and data is transferred with LSB first as the start character, as shown in Figure 18.31. Therefore, data in the start character in the figure is 3Bh. When using the direct convention type, write 0 to both the SDIR and SINV bits in SCMR. Write 0 to the PM bit in SMR in order to use even parity, which is prescribed by the smart card standard.

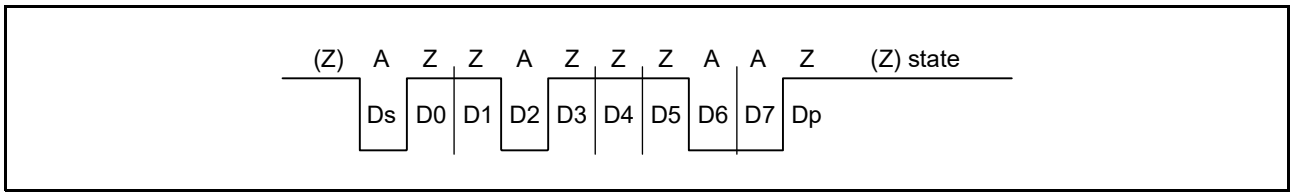

Figure 18.31 Direct Convention (SDIR in SCMR = 0, SINV in SCMR = 0, PM in SMR = 0)

(2) Inverse Convention Type

For the inverse convention type, logic levels 1 and 0 correspond to states A and Z, respectively and data is transferred with MSB first as the start character, as shown in Figure 18.32. Therefore, data in the start character in the figure is 3Fh. When using the inverse convention type, write 1 to both the SDIR and SINV bits in SCMR. The parity bit is logic level 0 to produce even parity, which is prescribed by the smart card standard, and corresponds to state Z. Since the SINV bit of the this MCU only inverts data bits D7 to D0, write 1 to the PM bit in SMR to invert the parity bit for both transmission and reception.

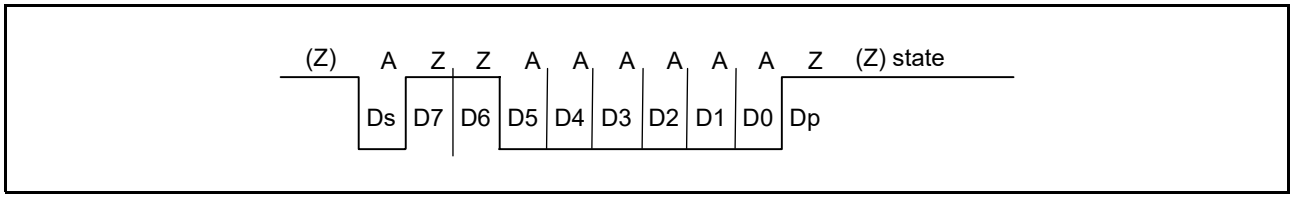

Figure 18.32 Inverse Convention (SDIR in SCMR = 1, SINV in SCMR = 1, PM in SMR = 1)

18.6.3 Block Transfer Mode

Block transfer mode is different from normal smart card interface mode in the following respects.

- Even if a parity error is detected during reception, no error signal is output. Since the PER bit in SSR is set by error detection, clear the PER bit before receiving the parity bit of the next frame.
- During transmission, at least 1 etu is secured as a guard time from the end of the parity bit until the start of the next frame.
- Since the same data is not retransmitted during transmission, the TEND flag in SSR is set 11.5 etu after transmission start.
- In block transfer mode, the ERS flag in SSR indicates the error signal status as in normal smart card interface mode, but the flag is read as 0 because no error signal is transferred.

18.6.4 Receive Data Sampling Timing and Reception Margin

Only the internal clock generated by the on-chip baud rate generator can be used as a transfer clock in smart card interface mode.

In this mode, the SCI can operate on a base clock with a frequency of 32, 64, 372, 256, 93, 128, 186, or 512 times the bit rate according to the settings of the BCP2 bit in SCMR and the BCP[1:0] bits in SMR (the frequency is always 16 times the bit rate in normal asynchronous mode).

For data reception, the falling edge of the start bit is sampled with the base clock to perform internal synchronization. Receive data is sampled on the 16th, 32nd, 186th, 128th, 46th, 64th, 93rd, and 256th rising edges of the base clock so that it can be latched at the middle of each bit as shown in Figure 18.33. The reception margin here is determined by the following formula.

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)\ F - \frac{D - 0.5}{N}\ (1 + F) \right| \times 100\ [\%]$$

M: Reception margin (%)
N: Ratio of bit rate to clock (N = 32, 64, 372, 256)
D: Duty cycle of clock (D = 0 to 1.0)
L: Frame length (L = 10)
F: Absolute value of clock frequency deviation

Assuming values of F = 0, D = 0.5, and N = 372 in the above formula, the reception margin is determined by the formula below.

$$M = \{0.5 - 1/(2 \times 372)\} \times 100\ [\%] = 49.866\%$$

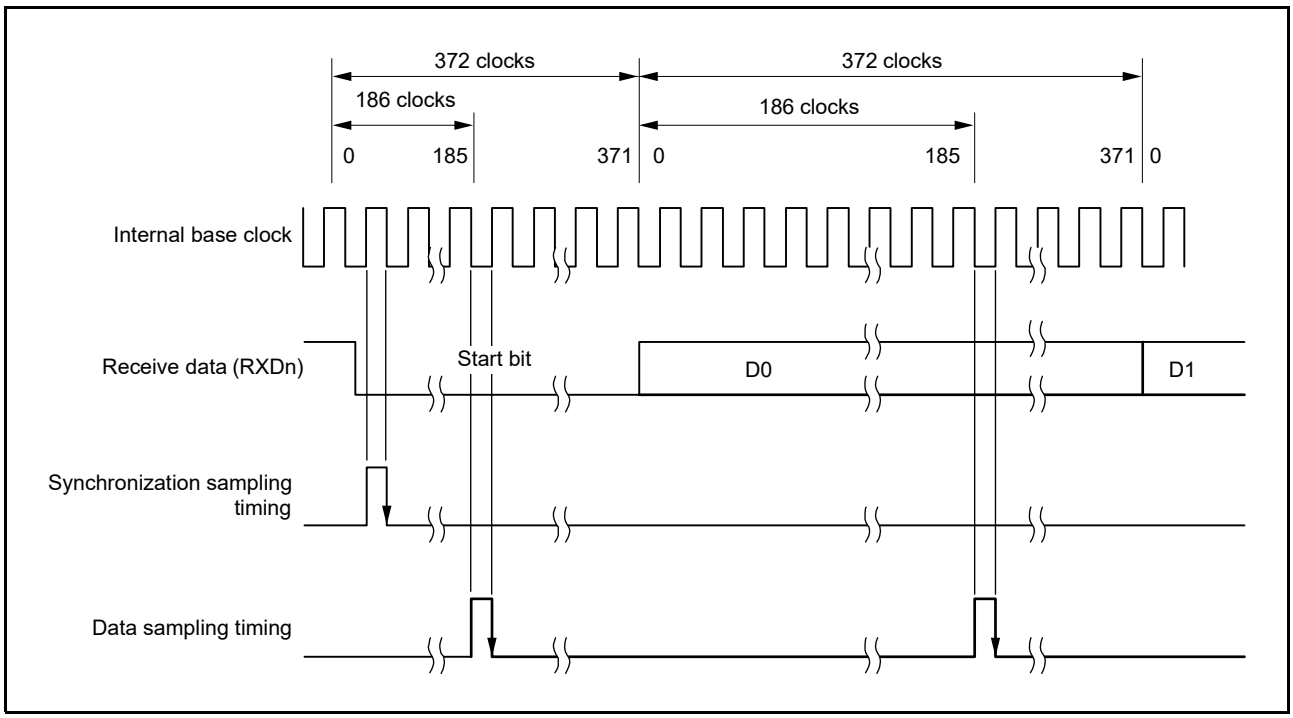

Figure 18.33 Receive Data Sampling Timing in Smart Card Interface Mode (When Clock Frequency is 372 Times the Bit Rate)

18.6.5 SCI Initialization (Smart Card Interface Mode)

Initialize the SCI following the example of flowchart shown in Figure 18.34.
Be sure to initialize the SCI before switching from transmission mode to reception mode and vice versa. Even if the RE bit is set to 0, the RDR register is not initialized.

To change reception mode to transmission mode, first check that reception has completed, and then initialize the SCI. At the end of initialization, set TE = 1 and RE = 0. Reception completion can be verified by reading the RXI request, ORER, or PER flag in SSR.
To change transmission mode to reception mode, first check that transmission has completed, and then initialize the SCI. At the end of initialization, set TE = 0 and RE = 1. Transmission completion can be verified by reading the TEND flag in SSR.

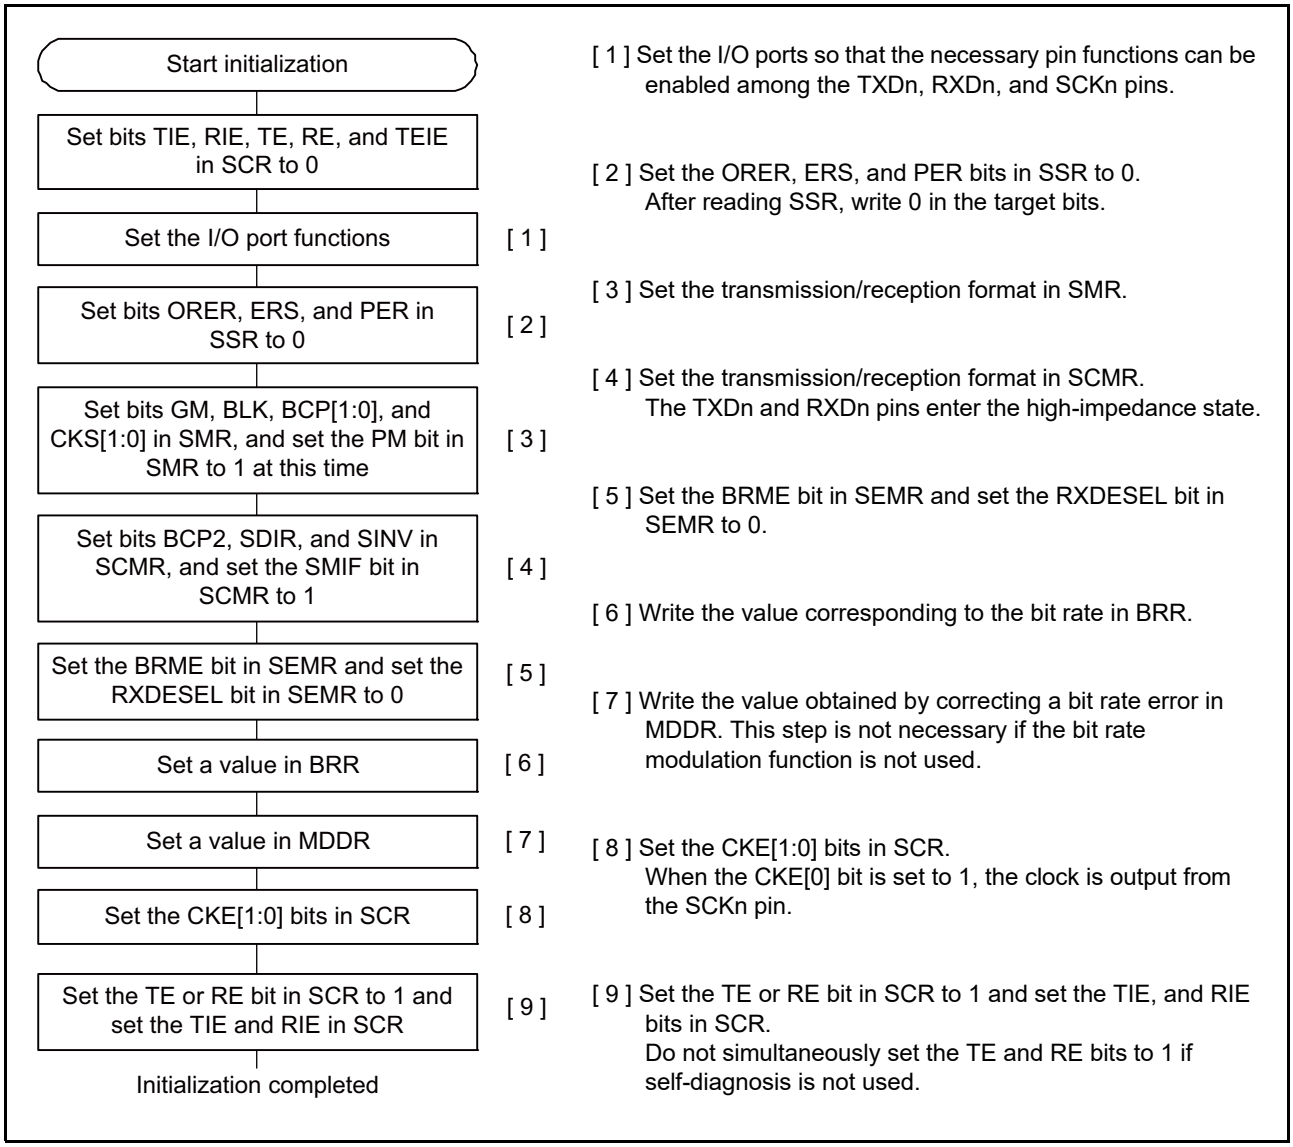

Figure 18.34 Example of SCI Initialization Flowchart (Smart Card Interface Mode)

18.6.6 Serial Data Transmission (Except in Block Transfer Mode)

Serial data transmission in smart card interface mode (except in block transfer mode), in that an error signal is sampled and data can be retransmitted, is different from that in non-smart card interface mode. Figure 18.35 shows the data retransfer operation during transmission.

1. When an error signal from the receiver end is sampled after one-frame data has been transmitted, the ERS flag in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Clear the ERS flag to 0 before the next parity bit is sampled.
2. For a frame in which an error signal is received, the TEND flag in SSR is not set. Data is retransferred from TDR to TSR allowing automatic data retransmission.
3. If no error signal is returned from the receiver, the ERS flag is not set to 1.
4. In this case, the SCI judges that transmission of one-frame data (including retransfer) has been completed, and the TEND flag is set. If the TIE bit in SCR is 1 at this time, a TXI interrupt request is generated. Writing transmit data to TDR starts transmission of the next data.

Figure 18.37 shows a sample flowchart of serial transmission. All the processing steps are automatically performed using a TXI interrupt request to activate the DMAC.
When the TEND flag in SSR is set to 1 in transmission, if the TIE bit in SCR is 1, a TXI interrupt request is generated. The DMAC is activated by a TXI interrupt request if the TXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of transmit data. The TEND flag is automatically set to 0 when the DMAC transfers the data.
If an error occurs, the SCI automatically retransmits the same data. During this retransmission, the TEND flag is kept to 0 and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, since the ERS flag is not automatically cleared, set the RIE bit to 1 beforehand to enable an ERI interrupt request to be generated at error occurrence, and clear the ERS flag to 0.
When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings.
For DMAC settings, refer to section 9, Direct Memory Access Controller.

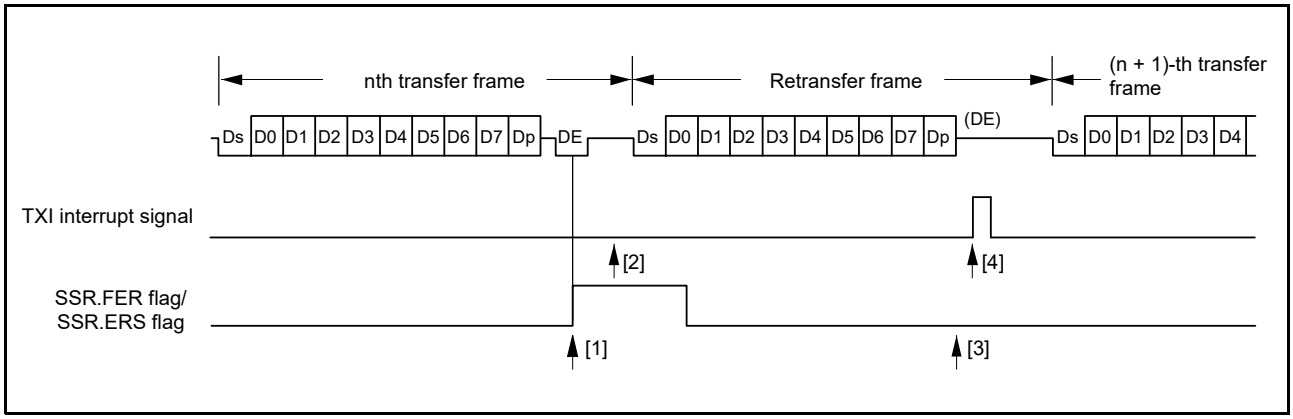

Figure 18.35 Data Retransfer Operation in SCI Transmission Mode

Note that the SSR.TEND flag is set in different timings depending on the GM bit setting in SMR. Figure 18.36 shows the TEND flag generation timing.

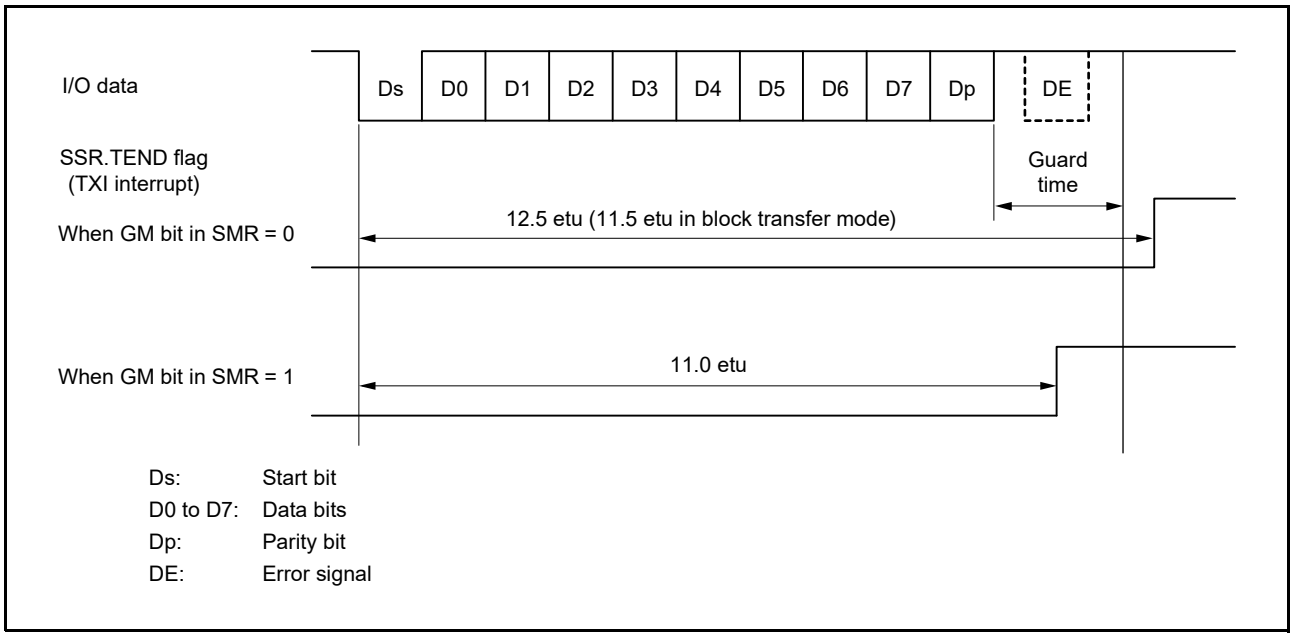

Figure 18.36 SSR.TEND Flag Generation Timing during Transmission

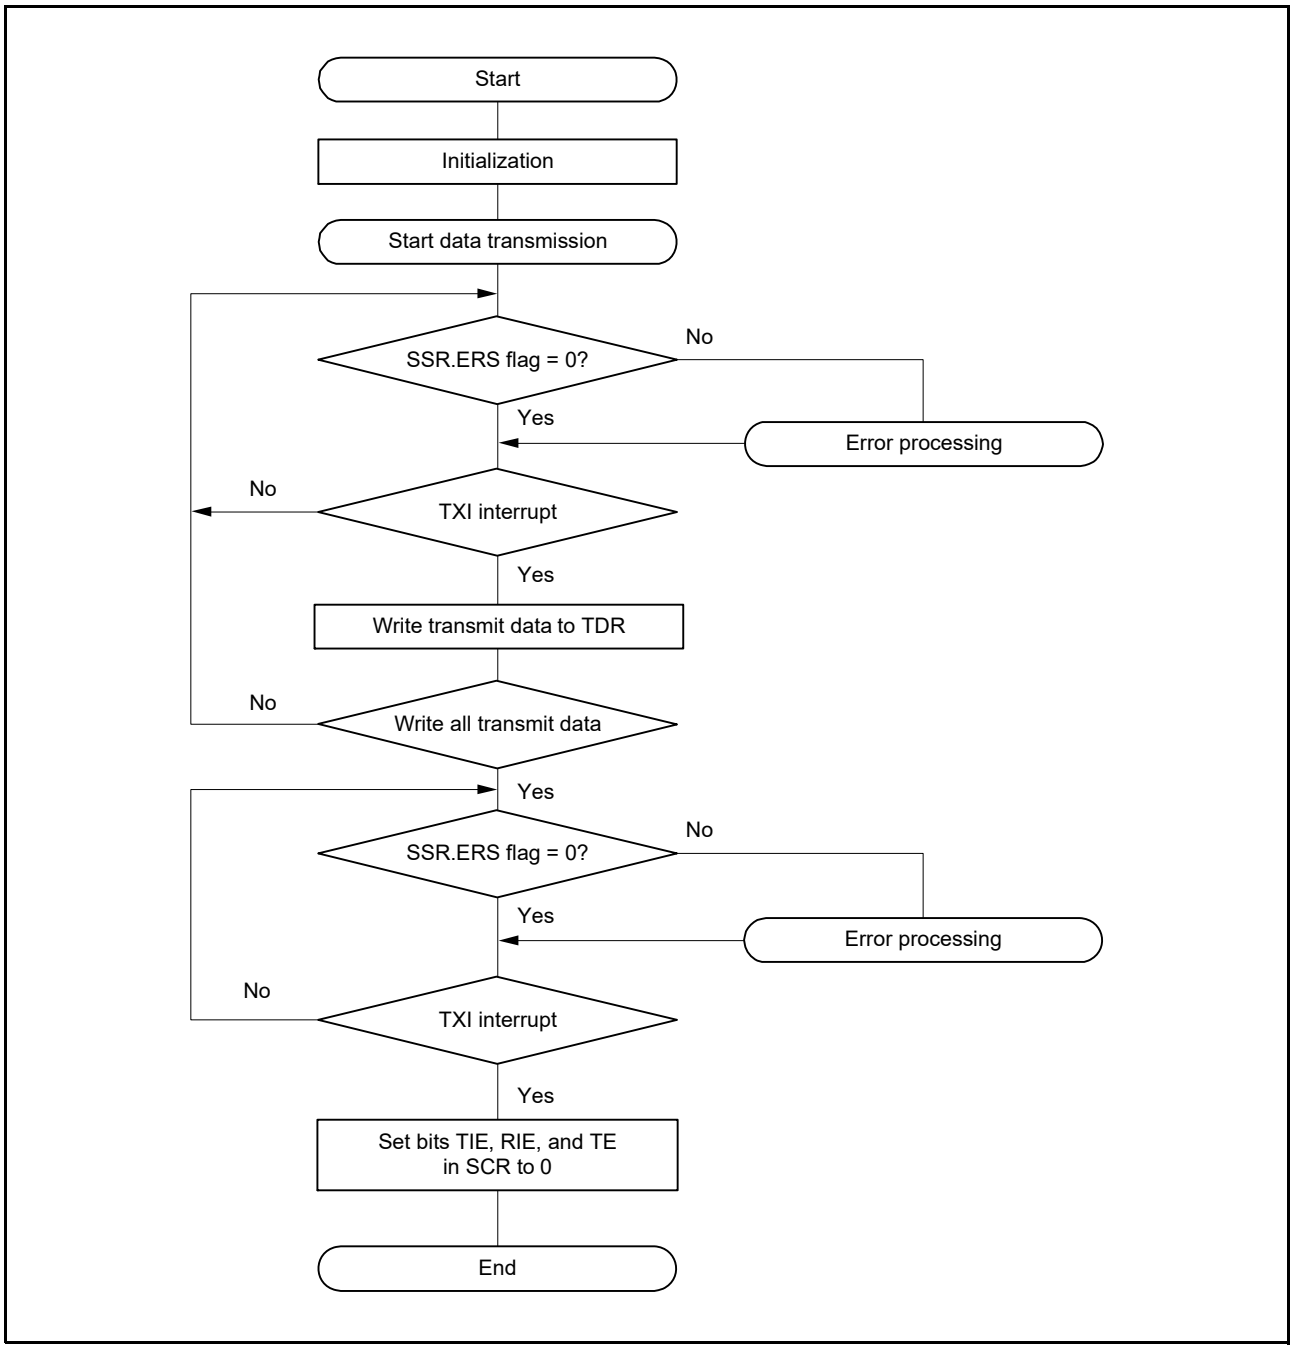

Figure 18.37 Sample Smart Card Interface Transmission Flowchart

18.6.7 Serial Data Reception (Except in Block Transfer Mode)

Serial data reception in smart card interface mode is similar to that in non-smart card interface mode. Figure 18.38 shows the data retransfer operation in reception mode.

1. If a parity error is detected in receive data, the PER flag in SSR is set to 1. When the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Clear the PER flag to 0 before the next parity bit is sampled.
2. For a frame in which a parity error is detected, no RXI interrupt is generated.
3. When no parity error is detected, the PER flag in SSR is not set to 1.
4. In this case, data is determined to have been received successfully. When the RIE bit in SCR is 1, an RXI interrupt request is generated.

Figure 18.39 shows a sample flowchart for serial data reception. All the processing steps are automatically performed using an RXI interrupt request to activate the DMAC.
In reception, setting the RIE bit to 1 allows an RXI interrupt request to be generated. The DMAC is activated by an RXI interrupt request if the RXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of receive data.
If an error occurs during reception and either the ORER or PER flag in SSR is set to 1, a receive error interrupt (ERI) request is generated. Clear the error flag after the error occurrence. If an error occurs, the DMAC is not activated and receive data is skipped. Therefore, the number of bytes of receive data specified in the DMAC is transferred.
Even if a parity error occurs and the PER flag is set to 1 during reception, receive data is transferred to RDR, thus allowing the data to be read.
When a reception is forcibly terminated by setting the RE bit in SCR to 0 during operation, read the RDR register because the received data which has not yet been read may be left in RDR.

Note 1. For operations in block transfer mode, refer to section 18.3, Operation in Asynchronous Mode.

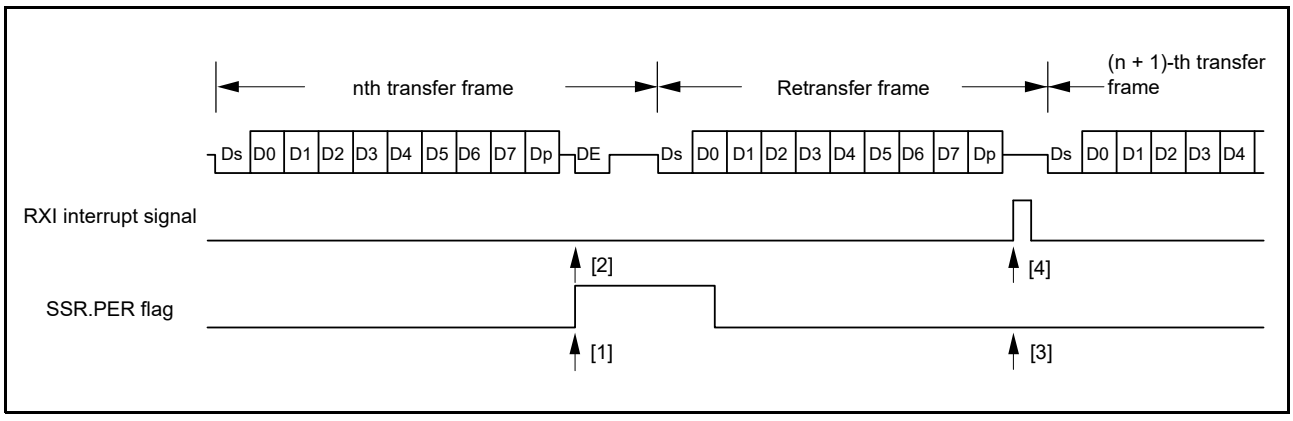

Figure 18.38 Data Retransfer Operation in SCI Reception Mode (Data Retransfer Operation during Reception)

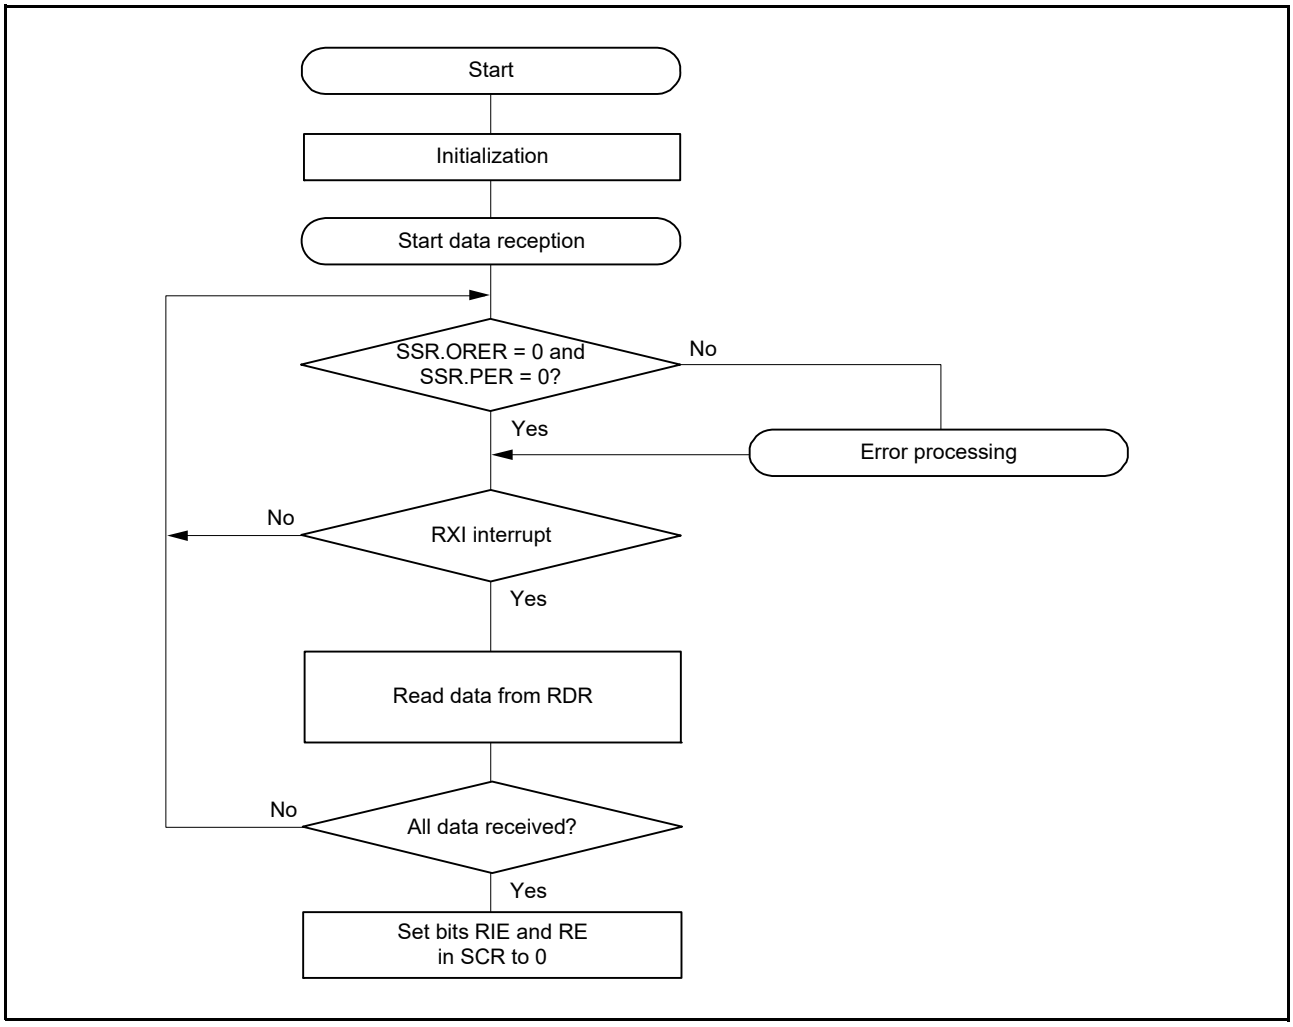

Figure 18.39 Sample Smart Card Interface Reception Flowchart

18.6.8 Clock Output Control

Clock output can be fixed using the CKE[1:0] bits in SCR when the GM bit in SMR is 1. Specifically, the minimum width of a clock pulse can be specified.

Figure 18.40 shows an example of clock output fixing timing when the CKE[0] bit is controlled with GM = 1 and CKE[1] = 0.

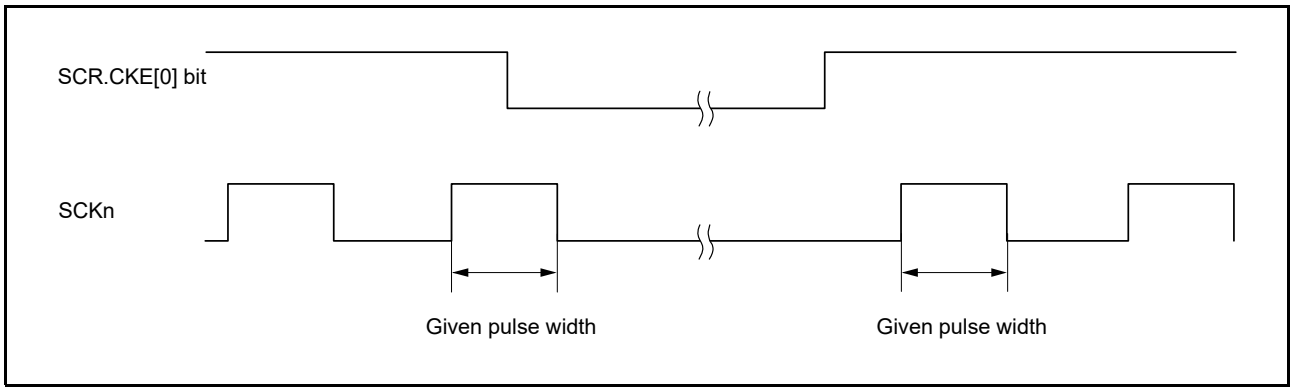

Figure 18.40 Clock Output Fixing Timing

At power-on, use the following procedure to secure the appropriate clock duty cycle.

(1) At Power-On

To secure the appropriate clock duty cycle simultaneously with power-on, use the following procedure.

1. Initially, port input is enabled in the high-impedance state. To fix the potential level, use a pull-up or pull-down resistor.
2. Fix the SCKn pin to the specified output by setting the SCR.CKE[1] bit and I/O port functions.
3. Set SMR and SCMR to enable smart card interface mode.
4. Set the SCR.CKE[0] bit to 1 to start clock output.

18.7 Noise Cancellation Function

Figure 18.41 shows the configuration of the noise filter used for noise cancellation. The noise filter consists of two stages of flip-flop circuits and a match-detection circuit. When the level on the pin matches in three consecutive samples taken at the set sampling interval, the matching level continues to be conveyed internally until the level on the pin again matches in three consecutive samples.

In asynchronous mode, the noise cancellation function can be applied on the RXDn input signal. The period of the base clock (1/16th of a bit-period when SEMR.ABCS = 0 and 1/8th of a bit-period when SEMR.ABCS = 1) is the sampling interval.

If the base clock is stopped with the noise filter enabled and then the clock input is started again, the noise filter operation resumes from where the clock was stopped. If SCR.TE and SCR.RE are set to 0 during base clock input, all of the noise filter flip-flop values are initialized to 1. Accordingly, if the input data is 1 when reception operation resumes, it is determined that a level match is detected and is conveyed to the internal signal. When the level being input corresponds to 0, the initial output of the noise filter is retained until the level matches in three consecutive samples.

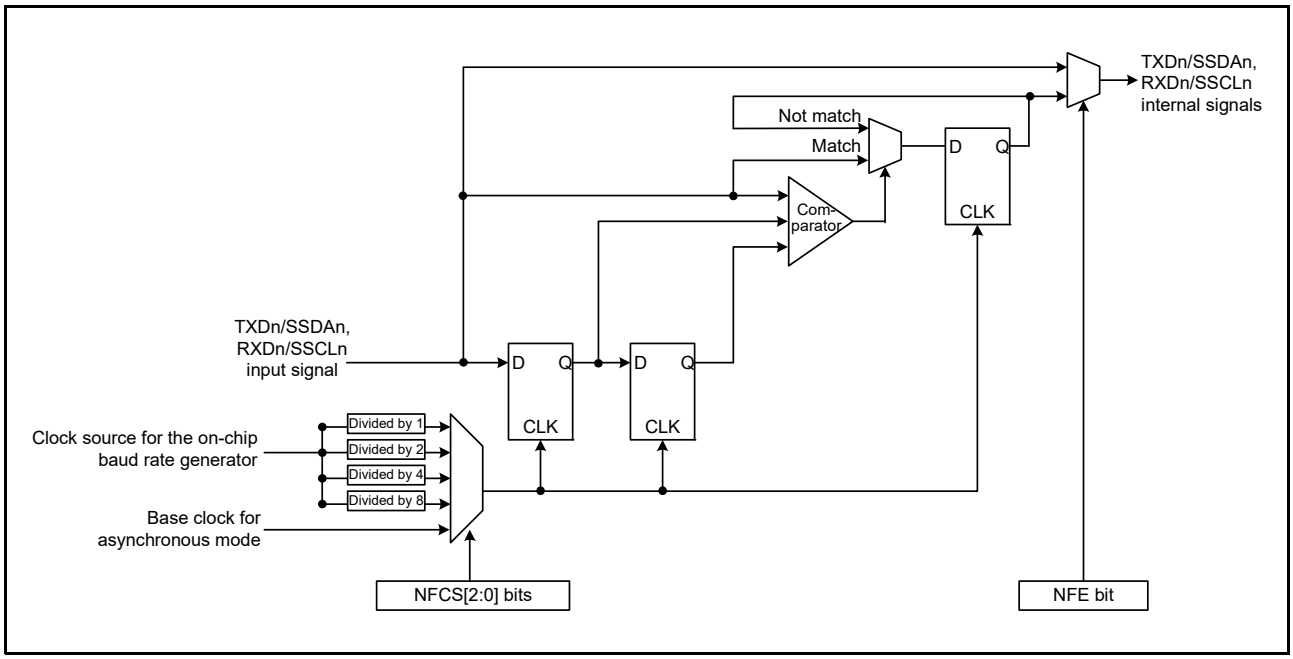

Figure 18.41 Block Diagram of Digital Noise Filter Circuit

18.8 Interrupt Sources

18.8.1 Buffer Operations for TXI and RXI Interrupts

If the conditions for a TXI and RXI interrupt are satisfied while the interrupt status flag in the interrupt controller is 1, the interrupt controller does not output the interrupt request but retains it internally (with a capacity for retention of one request per source).
When the value of the interrupt status flag in the interrupt controller becomes 0, the interrupt request retained within the interrupt controller is output. The internally retained interrupt request is automatically discarded once the actual interrupt is output. Clearing of the corresponding interrupt enable bit (the TIE or RIE bit in the SCR) can also be used to discard an internally retained interrupt request.

18.8.2 Interrupts in Asynchronous Mode and Clock Synchronous Mode

Table 18.20 lists interrupt sources in asynchronous mode and clock synchronous mode. A different interrupt vector is assigned to each interrupt source, and individual interrupt sources can be enabled or disabled with the enable bits in SCR.
If the SCR.TIE bit is 1, a TXI interrupt request is generated when transmit data is transferred from the TDR or TDRL register*1 to the TSR. A TXI interrupt request can also be generated by setting the SCR.TE bit to 1 after setting the SCR.TIE bit to 1 or by using a single instruction to set the SCR.TE and SCR.TIE bit to 1 at the same time. A TXI interrupt request can activate the DMAC to handle data transfer.
A TXI interrupt request is not generated by setting the SCR.TE bit to 1 while the setting of the SCR.TIE bit is 0 or by setting the SCR.TIE bit to 1 while the setting of the SCR.TE bit is 1.*1
When new data is not written by the time of transmission of the last bit of the current transmit data and the setting of the SCR.TEIE bit is 1, the SSR.TEND flag becomes 1 and a TEI interrupt request is generated. Furthermore, when the setting of the SCR.TE bit is 1, the SSR.TEND flag retains the value 1 until further transmit data are written to the TDR or TDRL register*1, and setting the SCR.TEIE bit to 1 leads to the generation of a TEI interrupt request.
Writing data to the TDR or TDRL register*1 leads to clearing of the SSR.TEND flag and, after a certain time, discarding of the TEI interrupt request.
If the SCR.RIE bit is 1, an RXI interrupt request is generated when received data is stored in the RDR. An RXI interrupt request can activate the DMAC to handle data transfer.
Setting of any from among the ORER, FER, and PER flags in the SSR to 1 while the SCR.RIE bit is 1 leads to the generation of an ERI interrupt request. An RXI interrupt request is not generated at this time. Clearing all three flags (ORER, FER, and PER) leads to discarding of the ERI interrupt request.

Note 1. In the case where asynchronous mode and 9-bit data length are selected
Note 2. To temporarily prohibit TXI interrupts at the time of transmission of the last of the data and so on when you wish a new round of transmission to start after handling of the transmission-completed interrupt, control prohibiting and permitting of the interrupt by using the interrupt request enable bit in the interrupt controller rather than using the SCR.TIE bit. This can prevent the suppression of TXI interrupt requests in the transfer of new data.

Table 18.20 Interrupt Sources

Name	Interrupt Source	Interrupt Flag	DMAC Activation	Priority
ERI	Receive error	ORER, FER, or PER	Not possible	High
RXI	Receive data full	—	Possible	↑
TXI	Transmit data empty	—	Possible	
TEI	Transmit end	TEND	Not possible	Low

18.8.3 Interrupts in Smart Card Interface Mode

Table 18.21 lists interrupt sources in smart card interface mode. A transmit end interrupt (TEI) request cannot be used in this mode.

Table 18.21 SCI Interrupt Sources

Name	Interrupt Source	Interrupt Flag	DMAC Activation	Priority
ERI	Receive error or error signal detection	ORER, PER, or ERS	Not possible	High
RXI	Receive data full	—	Possible	↑
TXI	Transmit data empty	TEND	Possible	Low

Data transmission/reception using the DMAC is also possible in smart card interface mode, similar to in the normal SCI mode. In transmission, when the TEND flag in SSR is set to 1, a TXI interrupt request is generated. This TXI interrupt request activates the DMAC allowing transfer of transmit data if the TXI request is specified beforehand as a source of DMAC activation. The TEND flag is automatically set to 0 when the DMAC transfers the data.
If an error occurs, the SCI automatically retransmits the same data. During the retransmission, the TEND flag is kept to 0 and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, the ERS flag in SSR is not automatically cleared to 0 at error occurrence. Therefore, the ERS flag must be cleared by previously setting the RIE bit in SCR to 1 to enable an ERI interrupt request to be generated at error occurrence.
When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings. For DMAC settings, refer to section 9, Direct Memory Access Controller .
In reception, an RXI interrupt request is generated when receive data is set to RDR. This RXI interrupt request activates the DMAC allowing transfer of receive data if the RXI request is specified beforehand as a source of DMAC activation. If an error occurs, the error flag is set. Therefore, the DMAC is not activated and an ERI interrupt request is issued to the CPU instead; the error flag must be cleared.

18.9 Usage Notes

18.9.1 Setting the Module Stop Function

Standby control register 4 (STBCR4) is used to stop and start SCI operations. With the value after a reset, SCI operations are stopped. Register access is enabled by releasing the module stop state. For details, refer to section 52, Power-Down Modes.

18.9.2 Break Detection and Processing

When a framing error is detected, a break can be detected by reading the RXDn pin value directly. In a break, the input from the RXDn pin becomes all 0s, and so the FER flag in SSR is set to 1 (framing error has occurred), and the PER flag in SSR may also be set to 1 (parity error has occurred). The SCI continues the receive operation even after a break is received. Therefore, note that even if the FER flag is set to 0 (no framing error occurred), it will be set to 1 again. When the SEMR.RXDESEL bit is 1, the SCI sets the SSR.FER flag to 1 and stops receiving operation until a start bit of the next data frame is detected. If the SSR.FER flag is set to 0 at this time, the SSR.FER flag retains 0 during the break. When the RXDn pin is set to 1 and the break ends, detecting the beginning of the start bit at the first falling edge of the RXDn pin allows the SCI to start the receiving operation.

18.9.3 Mark State and Production of Breaks

When the SCR.TE bit is 0 (serial transmission is disabled), setting the I/O port function makes selection of the level and direction (input or output) of the TXDn pin possible. If this is done, the TXDn pin can be placed in the mark state to send a break at the time of data transmission. Until the SCR.TE bit is set to 1 (serial transmission is enabled), the I/O port function is used to set the TXDn pin to output 1 and set the pin mode to a general I/O port pin, and thus place the communication line in the mark state (state of having the value 1). On the other hand, to output a break at the time of data transmission, set the TXDn pin to output 0 and make the pin mode settings for a general I/O port pin. When the SCR.TE bit is set to 0, the transmitter is initialized regardless of the current state of transmission.

18.9.4 Receive Error Flags and Transmit Operations (Clock Synchronous Mode)

Transmission cannot be started when a receive error flag (ORER) in SSR is set to 1, even if data is written to TDR. Be sure to set the receive error flags to 0 before starting transmission. Note also that the receive error flags cannot be set to 0 even if the RE bit in SCR is set to 0 (serial reception is disabled).

18.9.5 Writing Data to TDR

Data can be written to TDR, TDRH, and TDRL. However, if new data is written to TDR, TDRH, and TDRL when transmit data is remaining in TDR, TDRH, and TDRL, the previous data in TDR, TDRH, and TDRL is lost because it has not been transferred to TSR yet. Be sure to write transmit data to TDR, TDRH, and TDRL in the TXI interrupt request handling routine.

18.9.6 Restrictions on Clock Synchronous Transmission (Clock Synchronous Mode)

When the external clock source is used as a synchronization clock, the following restrictions apply.

(1) Start of transmission

Update TDR by the CPU or DMAC and wait for at least five P1φ cycles before allowing the transmit clock to be input (see Figure 18.42).

(2) Continuous transmission

(a) Write the next transmit data to TDR or TDRL before the falling edge of the transmit clock (bit 7) (see Figure 18.42).

(b) When updating TDR after bit 7 has started to transmit, update TDR while the synchronization clock is in the low-level period, and set the high-level width of the transmit clock (bit 7) to four P1φ cycles or longer (see Figure 18.42).

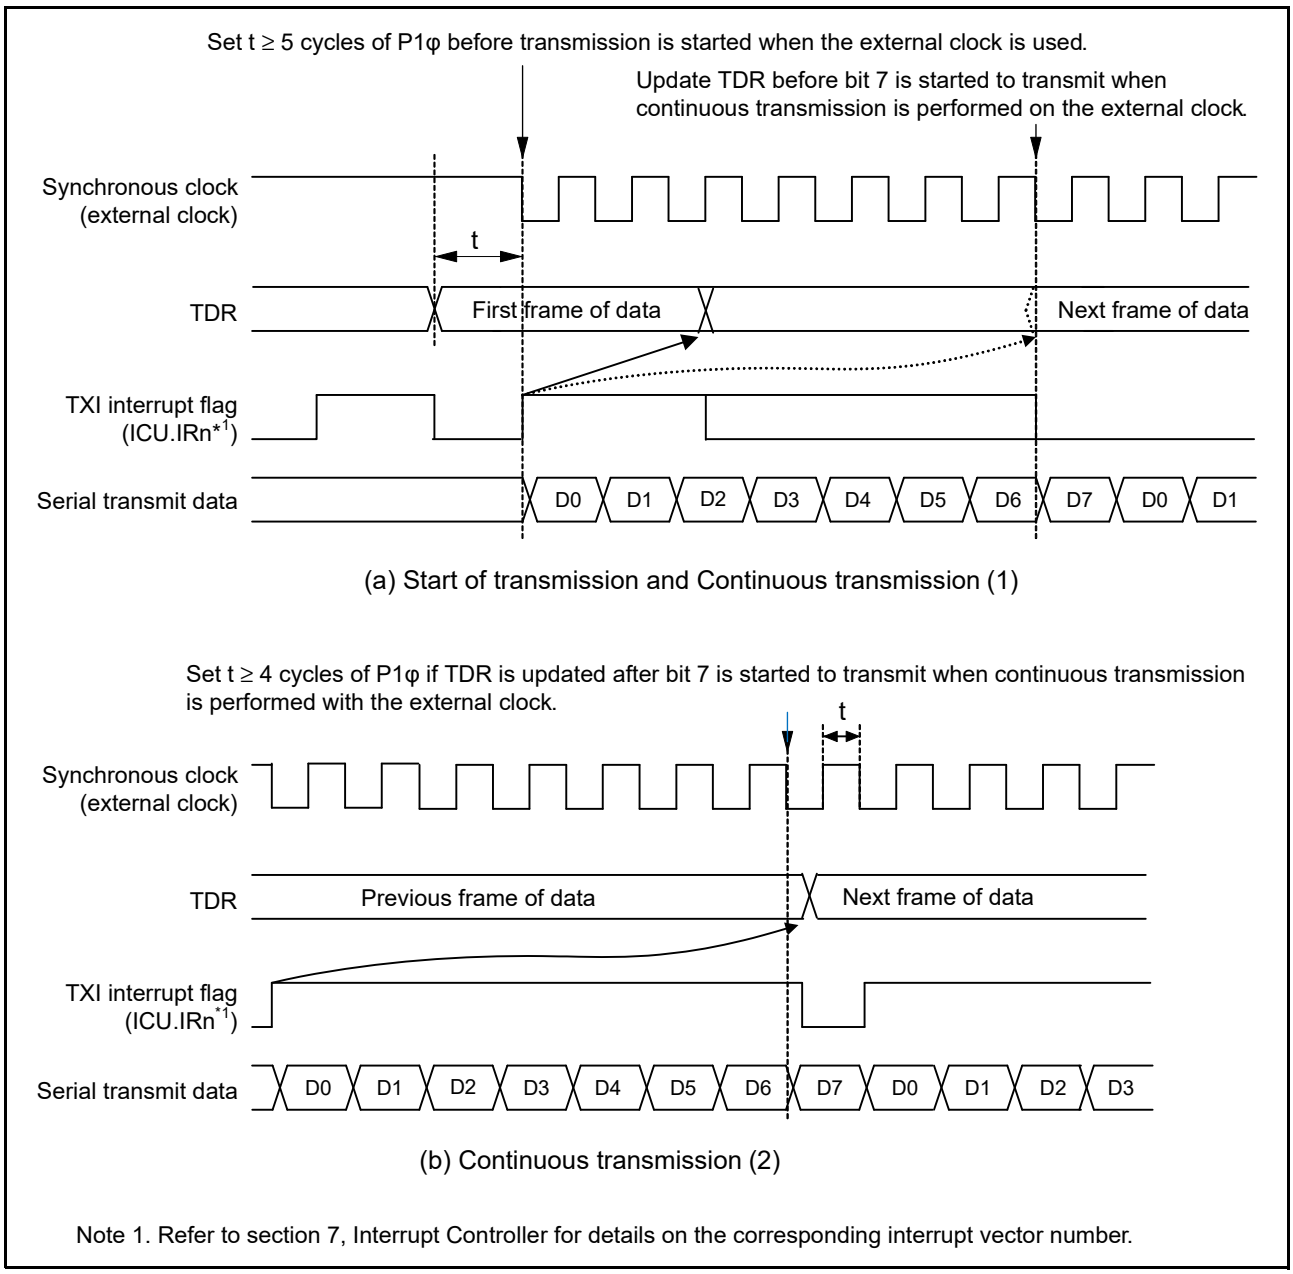

Figure 18.42 Restrictions on Use of External Clock in Clock Synchronous Transmission

18.9.7 Restrictions on Using DMAC

When using the DMAC or DTC to read RDR, RDRH, and RDRL, be sure to set the receive data full interrupt (RXI) as the activation source of the relevant SCI.

18.9.8 Notes on Starting Transfer

At the point where transfer starts when the interrupt status flag (IRn.IR bit) in the interrupt controller is 1, follow the procedure below to clear interrupt requests before permitting operations (by setting the SCR.TE or SCR.RE bit to 1). For details on the interrupt status flag, refer to section 7, Interrupt Controller.

- Confirm that transfer has stopped (the setting of the SCR.TE or SCR.RE bits is 0).
- Set the corresponding interrupt enable bit (SCR.TIE or SCR.RIE) to 0.
- Read the corresponding interrupt enable bit (SCR.TIE or SCR.RIE bit) to check that it has become 0.
- Set the interrupt status flag (IRn.IR bit) in the interrupt controller to 0.

18.9.9 SCI Operations during Low Power Consumption State

(1) Transmission

When making settings for the module stopped state or in transitions to software standby, stop operations (by setting the TIE, TE, and TEIE bits in the SCR to 0) after switching the TXDn pin to the general I/O port pin function. Setting the TE bit to 0 resets the TSR register and the TEND bit in the SSR. Depending on the port settings, output pins may output the level before a transition to the low power consumption state is made after release from the module stopped state or software standby mode. When transitions to these states are made during transmission, the data being transmitted become indeterminate.

To transmit data in the same transmission mode after cancellation of the low power consumption state, set the TE bit to 1, read SSR, and write data to TDR sequentially to start data transmission. To transmit data with a different transmission mode, initialize the SCI first.

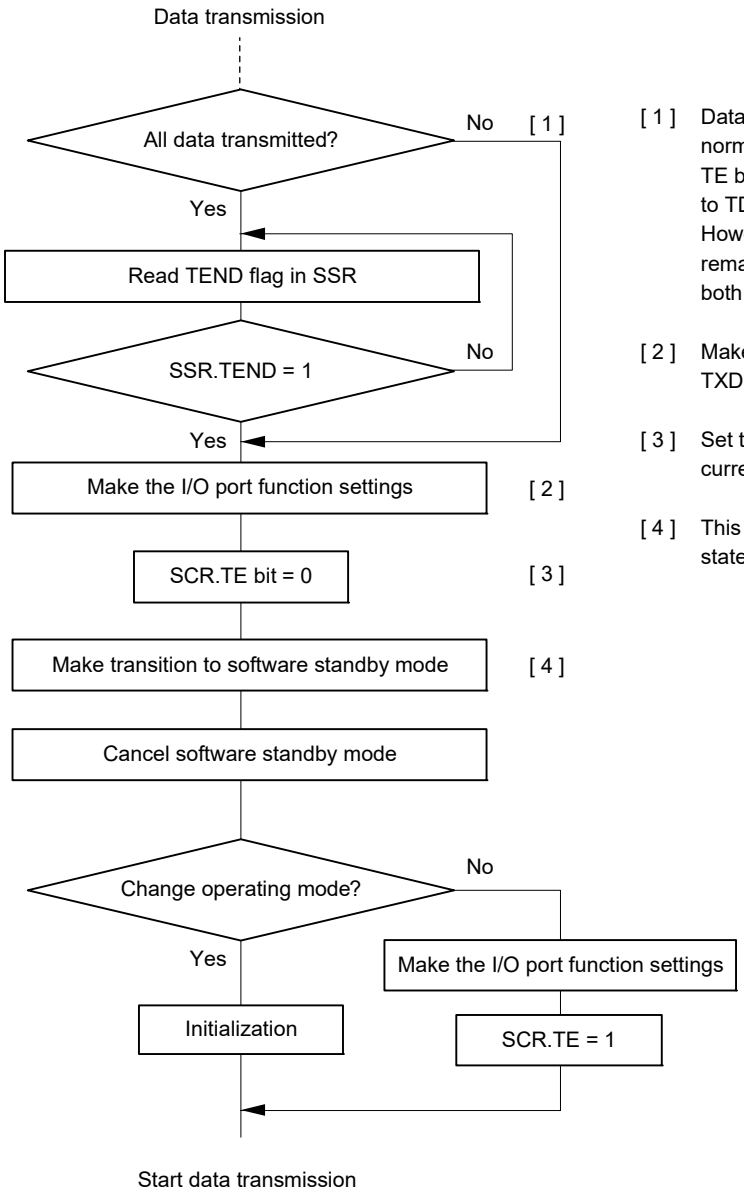
Figure 18.43 shows a sample flowchart for transition to software standby mode during transmission. Figure 18.44 and Figure 18.45 show the port pin states during transition to software standby mode.

(2) Reception

Before specifying the module stop state or making a transition to software standby mode, stop the receive operations (RE = 0 in SCR). If transition is made during data reception, the data being received will be invalid.

To receive data in the same reception mode after cancellation of the low power consumption state, set the RE bit to 1, and then start reception. To receive data in a different reception mode, initialize the SCI first.

Figure 18.46 shows a sample flowchart for transition to software standby mode during reception.



[1] Data being transmitted is lost halfway. Data can be normally transmitted from the CPU by setting the TE bit in SCR to 1, reading SSR, and writing data to TDR after canceling software standby mode. However, if the DMAC has been activated, the data remaining in the DMAC will be transmitted when both the TE and TIE bits in SCR are set to 1.

[2] Make the I/O port function settings to switch the TXDn pin to operate as a general I/O port.

[3] Set the TIE and TEIE bits in the SCR if they are currently set to 1.

[4] This includes the setting for the module stopped state.

Figure 18.43 Example of Flowchart for Transition to Software Standby Mode during Transmission

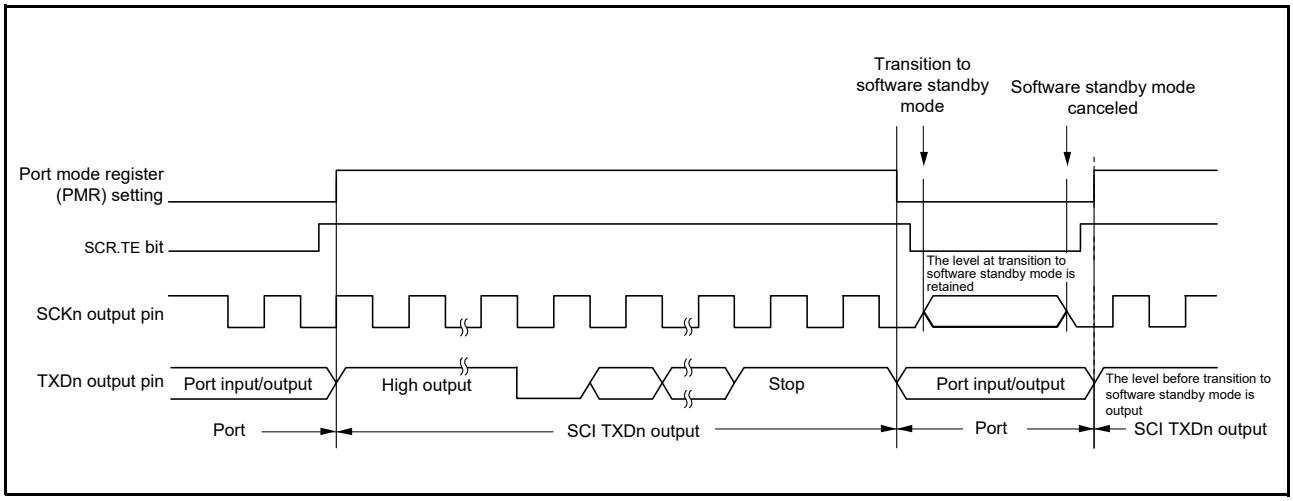


Figure 18.44 Port Pin States during Transition to Software Standby Mode (Internal Clock, Asynchronous Transmission)

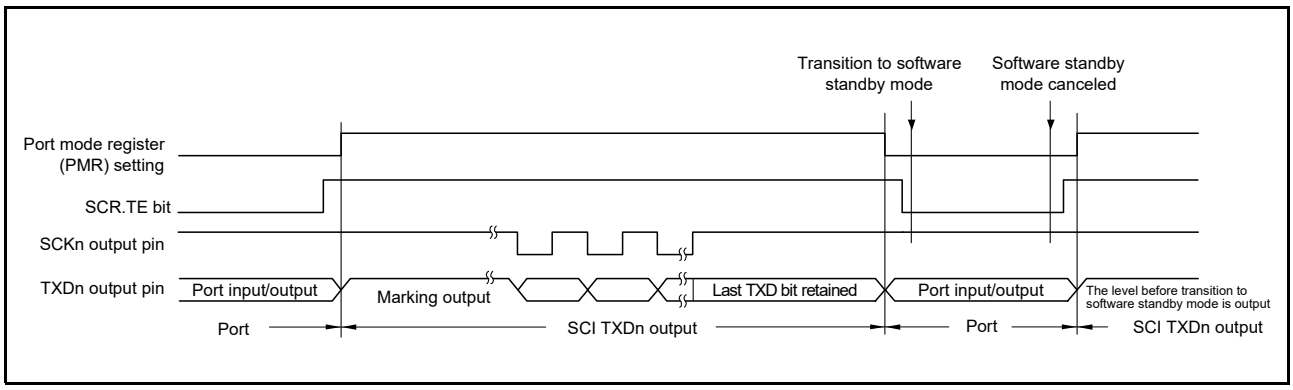

Figure 18.45 Port Pin States during Transition to Software Standby Mode (Internal Clock, Clock Synchronous Transmission)

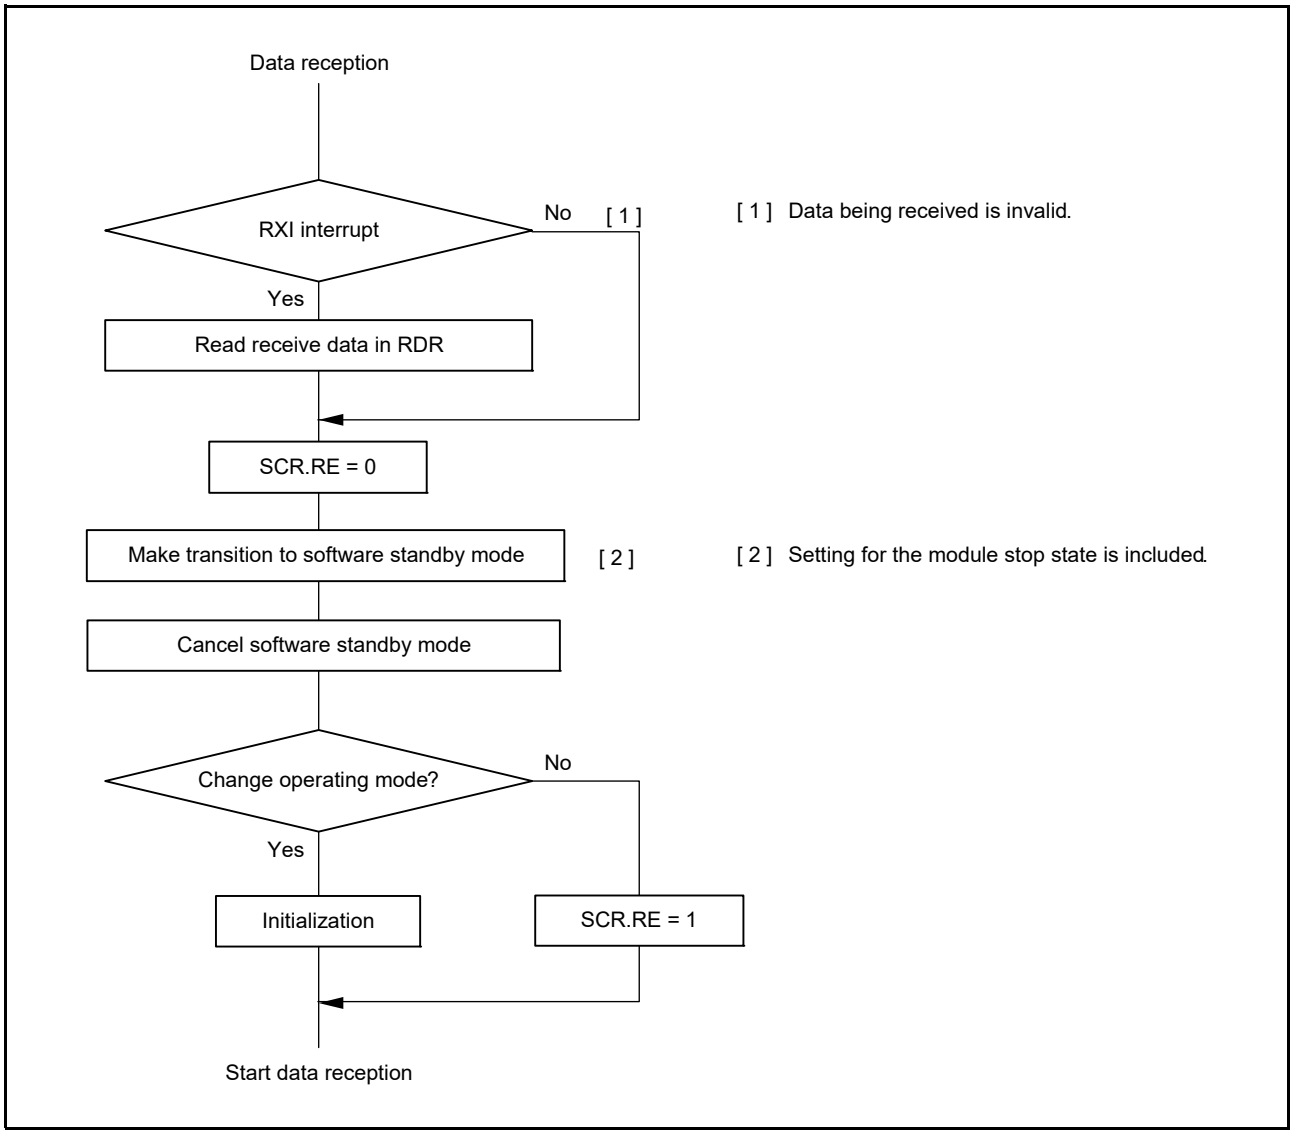

Figure 18.46 Example of Flowchart for Transition to Software Standby Mode during Reception

18.9.10 External Clock Input in Clock Synchronous Mode

In clock synchronous mode, the external clock SCKn must be input as follows:
High-pulse period, low-pulse period = 2 P1φ cycles or more, period = 6 P1φ cycles or more

18.9.11 Note on Transmit Enable Bit (TE bit)

When setting the SCR.TE bit to 0 (serial transmission is disabled) while the pin function is “TXDn”, output of the pin becomes high impedance.
Prevent the TXDn line from becoming high impedance by any of the following ways:

(1) Connect a pull-up resistor to the TXDn line.
(2) Change the pin function to “general-purpose I/O port, output” before setting the SCR.TE bit to 0.
Set the SCR.TE bit to 1 before changing the pin function to “TXDn”.

18.10 IrDA Communications

The channel 0 serial communications interface (SCI) is capable of working with the Infrared Data Association (IrDA) module to handle transfer through IrDA communications in conformance with version 1.0 of the IrDA protocol.
Using the IRE bit in IRCR to enable the IrDA function leads to encoding and decoding of the SCI_TXD0 and SCI_RXD0 signals of the channel 0 serial communications interface, respectively, to convert them to and from waveforms in conformance with version 1.0 of the IrDA protocol. Infrared transfer in conformance with version 1.0 of the IrDA protocol can be handled by connecting a transceiver for use in infrared communications.
In version 1.0 of the IrDA protocol, IrDA transfer starts at a transfer rate of 9600 bps. The transfer rate is changeable during transfer as required. The IrDA module itself does not have a function for automatically changing the transfer rate. Accordingly, change the transfer rate by changing that for the serial communications interface.

A block diagram and pin configuration for IrDA transfer are shown in Figure 18.47and Table 18.22, respectively.

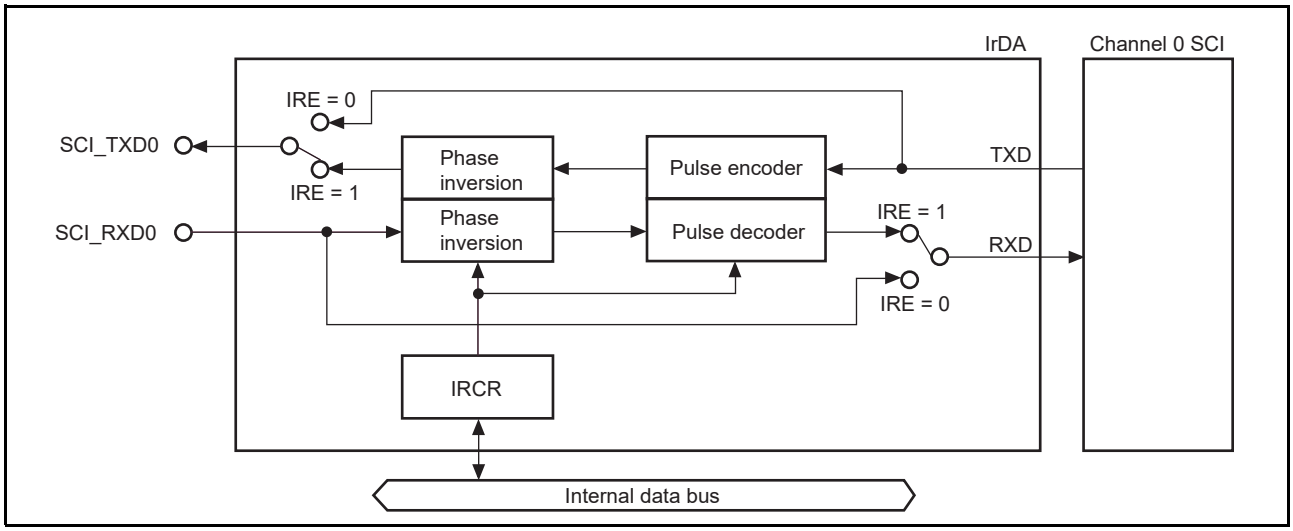

Figure 18.47 Block Diagram

Table 18.22 Pin Configuration

Pin Name	Symbol	I/O	Function
IrDA data transmission pin	SCI_TXD0	Output	IrDA data transmission output
IrDA data reception pin	SCI_RXD0	Input	IrDA data reception input

18.11 Description of the IrDA Register

Table 18.23 shows the register configuration.

Table 18.23 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
IrDA Control Register	IRCR	R/W	H'00	H'E8014000	8

18.11.1 IrDA Control Register (IRCR)

IRCR sets the operation of the IrDA module.

	b7	b6	b5	b4	b3	b2	b1	b0
	IRE	IRCKS[2:0]			IRTX INV	IRRX INV	—	—
Value after reset::	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b2	IRRXINV	SCI_RXD0 Data Level Switching	Sets inversion of the logic level of inputs on SCI_RXD0. 0: The input on SCI_RXD0 is used without change as the received data. 1: The input on SCI_RXD0 is inverted before it is treated as the received data.	R/W
b3	IRTXINV	SCI_TXD0 Data Level Switching	Sets inversion of the logic level of outputs on SCI_TXD0. 0: Data for transmission is output without change to SCI_TXD0. The pulse-width setting in the IRCKS bits determines the period over which the pulses are at the high level. 1: Data for transmission is inverted before being output to SCI_TXD0. The pulse-width setting in the IRCKS bits determines the period over which the pulses are at the low level.	R/W
b6 to b4	IRCKS[2:0]	IrDA Clock Select	Selects the pulse width for use in encoding output pulses from SCI_TXD0 when the setting of the IRE bit is 1. 000: Bit rate × 3/16 001: P1φ/2 010: P1φ/4 011: P1φ/8 100: P1φ/16 101: P1φ/32 110: P1φ/64 111: P1φ/128	R/W
b7	IRE	IrDA Enable	Sets the function for use with the SCI_TXD0 and SCI_RXD0 pins as normal serial or IrDA. 0: Disables the IrDA function. Data from the TXD pin of the channel 0 serial communications interface is output without change to SCI_TXD0. Data on SCI_RXD0 is output without change to the RXD pin of the channel 0 serial communications interface. 1: Enables the IrDA function. Data from the TXD pin of the channel 0 serial communications interface is encoded before being output through SCI_TXD0. Data on SCI_RXD0 is decoded before being output to the RXD pin of the channel 0 serial communications interface.	R/W

18.12 IrDA Operation

18.12.1 Flow of Settings for IrDA Operation

Set up IrDA operation by following the procedure listed below.

1. Make the general-purpose I/O port-pin settings.
2. Set the IRCR register.
3. Set the registers related to the serial communications interface.

18.12.2 Transmission

In transmission with the IrDA function enabled, serial data (UART frames of data) from the TXD pin of the serial communications interface are converted to IR frames (see Figure 18.48). If the IRTXINV bit is set to 0, when the value of the serial data is 0, a high-level pulse with the width equivalent to three sixteenths of the bit period is output to the SCI_TXD0 pin by default. Note that the high-level pulse width is selectable by using IRCKS[2:0] bits in the IRCR register. In the IrDA protocol, the specifiable high-level pulse widths are from a minimum of 1.41 µs to a maximum of (3/16 + 2.5%) × bit period or (3/16 × bit period) + 1.08 µs. When the frequency of P1φ is 66 MHz, the specifiable high-level pulse widths are from a minimum of 1.41 µs to a maximum of 1.94 µs. On the other hand, if the value of the serial data is 1, no high-level pulse is output.

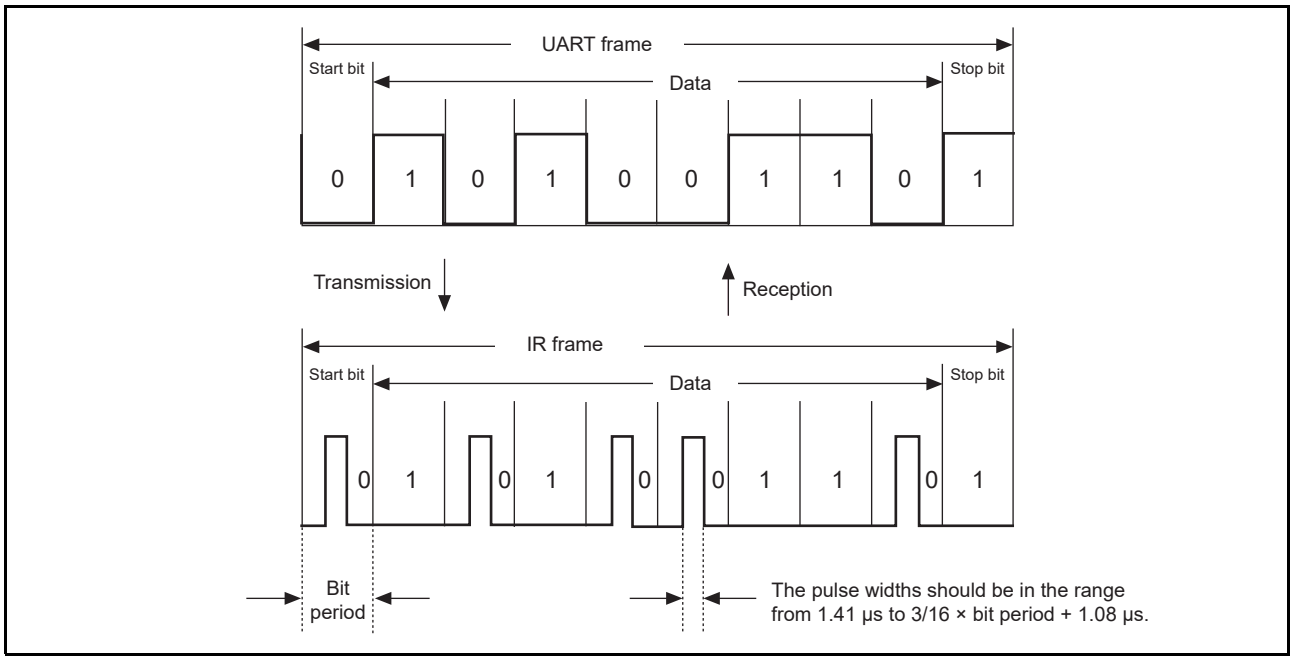

Figure 18.48 Example of the Operation in IrDA Transfer

18.12.3 Reception

In reception with the IrDA function enabled, IR frames of data from the SCI_RXD0 pin are converted to serial data and output to the RXD pin of the serial communications interface. If the setting of the IRRXINV bit is 0, the value 0 is output when a high-level pulse is detected and the value 1 is output when no high-level pulse is detected during each bit period. Note that pulses with a width shorter than the minimum pulse width of 1.41 µs cannot be recognized.

18.12.4 Selecting the High-Level Pulse Width

The correspondences between the specifiable value in the IRCKS[2:0] bits (the minimum pulse width), operating frequency of P1φ, and the bit rate for use in making the pulse width shorter than the bit period × 3/16 in transmission are given in Table 18.24.

Table 18.24 Settings of the IRCKS[2:0] Bits

	Upper Row: Bit Rate (bps); Lower Row: Bit Period × 3/16 (μs)					
	2400	9600	19200	38400	57600	115200
P1φ (MHz)	78.13	19.53	9.77	4.88	3.26	1.63
50	111	111	111	111	111	— *1
60	111	111	111	111	111	— *2
66	111	111	111	111	111	— *2

Note 1. This bit rate is not specifiable for the serial communications interface.
Note 2. No pulse width shorter than the bit period × 3/16 is specifiable.

18.13 Note on IrDA Usage

18.13.1 Minimum Pulse Width in Reception

Pulses with a width shorter than the minimum pulse width of 1.41 μs cannot be recognized.

18.13.2 Base Clock in Asynchronous Mode for the Serial Communications Interface

The IrDA module works with the serial communications interface by receiving the base clock with a frequency 16 times the bit rate for communications from the interface. For the serial communications interface, either 16 or 8 cycles of the base clock are selectable as the bit period. On the other hand, the IrDA module is only capable of operation when the setting for the bit period of the serial communications interface is 16 cycles of the base clock.

19. Renesas Serial Peripheral Interface

This LSI circuit includes three independent Renesas serial peripheral interfaces.
This module is capable of full-duplex synchronous serial communication.

19.1 Features

This module has the following features.

- SPI transfer functions
  Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (SPI clock) signals allows for serial communications through SPI operation (four-wire method).
  Capable of serial communications in master/slave mode
  Supports mode fault error detection (only in SPI slave mode)
  Supports overrun error detection (only in SPI slave mode)
  Switching of the polarity of the serial transfer clock
  Switching of the clock phase of serial transfer
- Data format
  MSB-first/LSB-first selectable
  Transfer bit-length is selectable as 8, 16, or 32 bits.
- Bit rate
  RSPCK can be divided by a maximum of 4096 in master mode
  RSPCK can be generated by dividing P1φ by the on-chip baud rate generator.
  An externally input clock can be used as a serial clock.
- Buffer configuration
  8 bytes for transmission and 32 bytes for reception
- SSL control function
  One SSL signal for each channel
  In master mode, outputs SSL signal.
  In slave mode, inputs SSL signal.
  Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay)
  Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
  Controllable delay from RSPCK stoppage to SSL output negation (SSL negation delay)
  Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
  Controllable wait for next-access SSL output assertion (next-access delay)
  Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
  Function for changing SSL polarity
- Control in master transfer
  A transfer of up to four commands can be executed sequentially in looped execution.
  For each command, the following can be set:
  SSL signal value, bit rate, RSPCK polarity/phase, transfer data length, LSB/MSB first, burst, RSPCK delay, SSL negation delay, and next-access delay.
  A transfer can be initiated by writing to the transmit buffer.
  A transfer can be initiated by clearing the SPTEF bit.
  MOSI signal value specifiable in SSL negation
- Interrupt sources
  Maskable interrupt sources:
  Receive interrupt (receive buffer full)
  Transmit interrupt (transmit buffer empty)
  Error interrupt (mode fault, overrun)

- Others
  Provides loop back mode
  Provides a function for disabling (initializing) this module

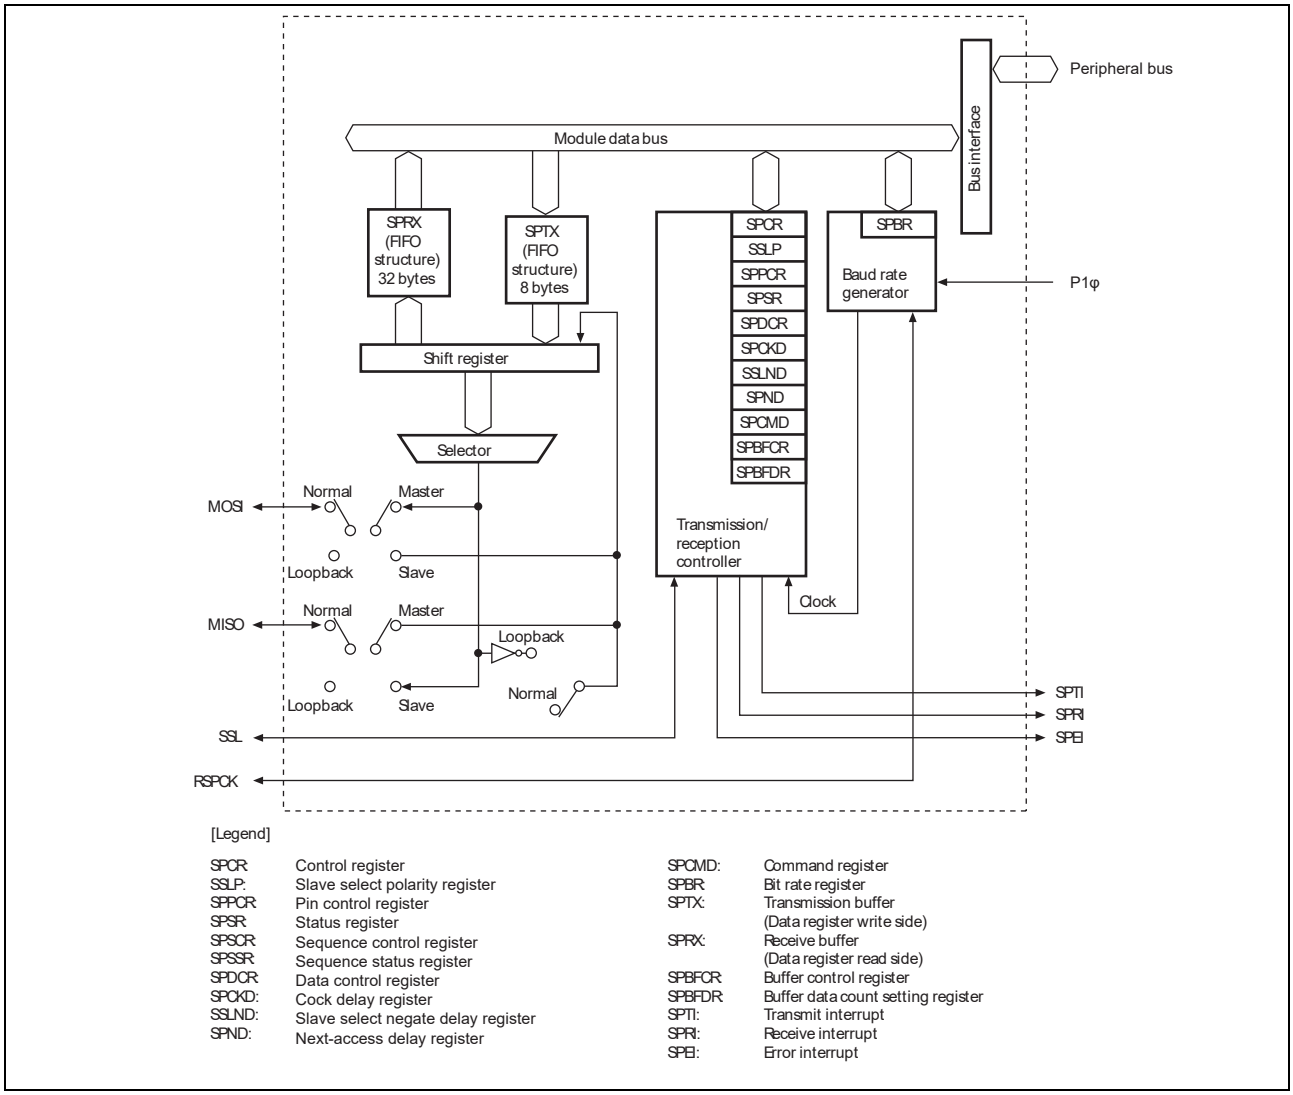

Figure 19.1 Block Diagram (for One Channel)

19.2 Input/Output Pins

Table 19.1 shows the pin configuration. This module automatically switches the input/output direction of the SSL pin. SSL is set as an output in master mode and as an input in slave mode. Pins RSPCK, MOSI, and MISO are automatically set as inputs or outputs according to the setting of master or slave and the level input on SSL (see section 19.4.2, Pin Control).

Table 19.1 Pin Configuration

Channel	Pin Name	Pin Name	I/O	Function
0	Clock pin	RSPCK0	I/O	Clock input/output
	Master transmit data pin	MOSI0	I/O	Master transmit data
	Slave transmit data pin	MISO0	I/O	Slave transmit data
	Slave select 0 pin	SSL00	I/O	Slave selection
1	Clock pin	RSPCK1	I/O	Clock input/output
	Master transmit data pin	MOSI1	I/O	Master transmit data
	Slave transmit data pin	MISO1	I/O	Slave transmit data
	Slave select 0 pin	SSL10	I/O	Slave selection
2	Clock pin	RSPCK2	I/O	Clock input/output
	Master transmit data pin	MOSI2	I/O	Master transmit data
	Slave transmit data pin	MISO2	I/O	Slave transmit data
	Slave select 0 pin	SSL20	I/O	Slave selection

Note: In the description of the pins, the channel is omitted and pin names are described as RSPCK, MOSI, MISO, and SSL.

19.3 Register Descriptions

Table 19.2 shows the register configuration. These registers enable this module to perform the following controls: specifying master/slave modes, specifying a transfer format, and controlling the transmitter and receiver.

Table 19.2 Register Configuration

Channel	Register Name	Abbreviation*1	R/W	Initial Value	Address	Access Size
0	Control register_0	SPCR_0	R/W	H'00	H'E800C800	8

Note 1. In the description of the register names, the channel is omitted.
Note 2. Only 0 can be written to clear the flag.

19.3.1 Control Register (SPCR)

SPCR sets the operating mode. If the MSTR and MODFEN bits are changed while the function of this module is enabled by setting the SPE bit to 1, subsequent operations cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	SPRIE	SPE	SPTIE	SPEIE	MSTR	MOD FEN	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Function
7	SPRIE	0	R/W	Receive Interrupt Enable Enables or disables generation of receive interrupt requests (SPRI) when the number of receive data units in the receive buffer (SPRX) is equal to or greater than the specified receive buffer data triggering number and the SPRF flag in SPSR is set to 1. 0: Disables the generation of receive interrupt requests. 1: Enables the generation of receive interrupt requests.
6	SPE	0	R/W	Function Enable Setting this bit to 1 enables the module function. When the MODF bit in the status register (SPSR) is 1, the SPE bit cannot be set to 1 (see 19.4.6 Error Detection). Setting the SPE bit to 0 disables the module function, and initializes a part of the module function (see 19.4.7 Initialization). 0: Disables the module function. 1: Enables the module function.
5	SPTIE	0	R/W	Transmit Interrupt Enable Enables or disables generation of transmit interrupt requests (SPTI) when the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the specified transmit buffer data triggering number and the SPTEF flag in SPSR is set to 1. 0: Disables the generation of transmit interrupt requests. 1: Enables the generation of transmit interrupt requests.
4	SPEIE	0	R/W	Error Interrupt Enable Enables or disables the generation of error interrupt requests when this module detects a mode fault error and sets the MODF bit in the status register (SPSR) to 1, or when this module detects an overrun error and sets the OVRF bit in SPSR to 1 (see 19.4.6 Error Detection). 0: Disables the generation of error interrupt requests. 1: Enables the generation of error interrupt requests. Note: This bit is valid only in SPI slave mode.
3	MSTR	0	R/W	Master/Slave Mode Select Selects master/slave mode. According to MSTR bit settings, this module determines the direction of the RSPCK, MOSI, MISO, and SSL pins. 0: Slave mode 1: Master mode
2	MODFEN	0	R/W	Mode Fault Error Detection Enable Enables or disables the detection of a mode fault error (see 19.4.6 Error Detection). 0: Disables the detection of a mode fault error. 1: Enables the detection of a mode fault error. Note: This bit is valid only in SPI slave mode. When master mode is specified with the MSTR bit, this bit should always be cleared to 0.
1, 0	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

19.3.2 Slave Select Polarity Register (SSLP)

SSLP sets the polarity of the SSL signal. If the contents of SSL0P are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SSL0P
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Function
7 to 1	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
0	SSL0P	0	R/W	SSL Signal Polarity Setting Sets the polarity of the SSL signal. The value of SSL0P indicates the active polarity of the SSL signal. 0: SSL signal 0-active 1: SSL signal 1-active

19.3.3 Pin Control Register (SPPCR)

SPPCR sets the modes of the pins. If the contents of this register are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	MOIFE	MOIFV	—	—	—	SPLP
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Function
7, 6	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
5	MOIFE	0	R/W	MOSI Idle Value Fixing Enable Fixes the MOSI output value when this module in master mode is in an SSL negation period (including the SSL retention period during a burst transfer). When MOIFE is 0, this module outputs the last output value from the previous serial transfer during the SSL negation period to the MOSI pin. (The value is undefined when CPHA is 0). When MOIFE is 1, this module outputs the fixed value set in the MOIFV bit to the MOSI pin. 0: MOSI output value equals the last output value from previous transfer. (The value is undefined when CPHA is 0). 1: MOSI output value equals the value set in the MOIFV bit.
4	MOIFV	0	R/W	MOSI Idle Fixed Value If the MOIFE bit is 1 in master mode, this module, according to MOIFV bit settings, determines the MOSI signal value during the SSL negation period (including the SSL retention period during a burst transfer). 0: MOSI Idle fixed value equals 0. 1: MOSI Idle fixed value equals 1.
3 to 1	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
0	SPLP	0	R/W	Loopback When the SPLP bit is set to 1, this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects (reverses) the input path and the output path for the shift register. 0: Normal mode 1: Loopback mode

19.3.4 Status Register (SPSR)

SPSR indicates the operating status.

Bit:	7	6	5	4	3	2	1	0
	SPRF	TEND	SPTEF	—	—	MODF	—	OVRF
Initial value:	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/(W)*	R	R/(W)*

Note: *Only 0 can be written to clear the flag after reading 1.

Bit	Bit Name	Initial Value	R/W	Function
7	SPRF	0	R	Receive Buffer Full Flag Indicates that the number of receive data units in the receive buffer (SPRX) is equal to or greater than the receive buffer data triggering number specified in the buffer control register (SPBFCR). 0: The number of receive data units in the receive buffer is less than the receive buffer data triggering number. 1: The number of receive data units in the receive buffer is equal to or greater than the receive buffer data triggering number. [Clearing conditions] • The receive buffer data is read until the number of data units in the receive buffer becomes less than the specified receive buffer data triggering number. • Receive buffer data reset is enabled. • Power-on reset [Setting condition] • The number of data units in the receive buffer is equal to or greater than the specified receive buffer data triggering number.
6	TEND	1	R	Transmit End This bit is set to 1 when transmission is completed, and this bit is 0 when transmission is not completed. [Clearing condition] • When transmit data are transferred from the transmit register to the shift register. [Setting condition] • When the number of data units in the transmit buffer (SPTX) is zero when a serial transfer is completed. Note: This bit is valid only in SPI master mode.
5	SPTEF	1	R	Transmit Buffer Empty Flag Indicates that the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the transmit buffer data triggering number specified in the buffer control register (SPBFCR). 0: The number of transmit data units in the transmit buffer is equal to or greater than the specified transmit buffer data triggering number. 1: The number of transmit data units in the transmit buffer is less than the specified transmit buffer data triggering number. [Clearing condition] • When data is written to the transmit buffer until the number of transmit data units in the transmit buffer exceeds the specified transmit buffer data triggering number. [Setting conditions] • When the number of transmit data units in the transmit buffer is less than the specified transmit buffer data triggering number. • When transmit buffer data reset is enabled. • Power-on reset
4, 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Function
2	MODF	0	R/(W)*	Mode Fault Error Flag Indicates the occurrence of a mode fault error. If the MODFEN bit is set to 1 when this module is in slave mode and the SSL pin is negated before the RSPCK cycle necessary for data transfer ends, this module detects a mode fault error. The active level of the SSL signal is determined by the SSL0P bit in the slave select polarity register (SSLP). [Clearing conditions] • SPSR is read when the MODF bit is 1, and then 0 is written to the MODF bit. • Power-on reset 0: No mode fault error occurred 1: A mode fault error occurred Note: This bit is valid only in SPI slave mode.
1	—	0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
0	OVRF	0	R/(W)*	Overrun Error Flag Indicates the occurrence of an overrun error. If a serial transfer ends when there is not enough space for receiving the specified length of data in the receive buffer (SPRX), this module detects an overrun error, and sets the OVRF bit to 1. [Clearing conditions] • SPSR is read when the OVRF bit is 1, and then 0 is written to the OVRF bit. • Power-on reset 0: No overrun error occurred 1: An overrun error occurred Note: This bit is valid only in SPI slave mode.

Note: * Only 0 can be written to clear the flag after reading 1.

19.3.5 Data Register (SPDR)

SPDR is a buffer that holds data for transmission and reception.
The transmit buffer (SPTX) and receive buffer (SPRX) are independent and are mapped to SPDR.
SPDR should be read or written to in byte, word, or longword units according to the access width specification bit (SPLW) in the data control register (SPDCR).
The bit length to be used is determined by the data length specification bits (SPB3 to SPB0) in the command register (SPCMD).
The access width set by SPDCR must agree with the data length set by SPCMD.
When data is written to SPDR, the data will be written to the transmit buffer from SPDR if the transmit buffer has a space equal to or more than the SPDR access width. If there is not enough space, data will not be written to the transmit buffer. Even if an attempt is made to write data to the buffer, the data is ignored.
When data is read from SPDR, receive data in the receive buffer will be read. If SPDR is read when there is no receive data in the receive buffer, the read value is undefined.
When SPDR is written to with the longword-, word-, or byte-access width, the transmit data should be written to address 0 irrespective of the access width. If data is written to the other addresses, the data is not guaranteed.
When SPDR is read with the longword-, word-, or byte-access width, the receive data should be read from address 0. If data is read from the other addresses, the data is not guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPD31	SPD30	SPD29	SPD28	SPD27	SPD26	SPD25	SPD24	SPD23	SPD22	SPD21	SPD20	SPD19	SPD18	SPD17	SPD16

Initial value:	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

19.3.6 Sequence Control Register (SPSCR)

SPSCR sets the sequence control method when this module operates in master mode. If the contents of SPSCR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SPSLN1	SPSLN0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Function
7 to 2	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
1 0	SPSLN1 SPSLN0	0 0	R/W R/W	Sequence Length Specification These bits specify a sequence length when this module in master mode performs sequential operations. This module in master mode changes command registers 0 to 3 (SPCMD0 to SPCMD3) to be referenced and the order in which they are referenced according to the sequence length that is set in the SPSLN1 and SPSLN0 bits. The relationship among the setting of bits SPSLN1 and SPSLN0, sequence length, and SPCMD0 to SPCMD3 referenced by this module is shown below. In slave mode, SPCMD0 is always referenced. Sequence Length / Referenced SPCMD # 00: 1 0 →0 → … 01: 2 0 →1 → 0 → … 10: 3 0 →1 → 2 → 0 → … 11: 4 0 →1 → 2 → 3 → 0 → …

19.3.7 Sequence Status Register (SPSSR)

SPSSR indicates the sequence control status when this module operates in master mode.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SPCP1	SPCP0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Function
7 to 2	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
1 0	SPCP1 SPCP0	0 0	R R	Command Pointer During sequence control, these bits indicate one of the command registers 0 to 3 (SPCMD0 to SPCMD3) that is currently pointed to by the pointer. The relationship between the setting of SPCP1 and SPCP0 and SPCMD0 to SPCMD3 is shown below. For the sequence control, see section 19.4.8, (1), (c) Sequence Control. 00: SPCMD0 01: SPCMD1 10: SPCMD2 11: SPCMD3

19.3.8 Bit Rate Register (SPBR)

SPBR sets the bit rate in master mode. If the contents of SPBR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	SPR7	SPR6	SPR5	SPR4	SPR3	SPR2	SPR1	SPR0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When this module is used in slave mode, the bit rate depends on the bit rate of the input clock regardless of the settings of SPBR and BRDV.

The bit rate is determined by combinations of SPBR settings and the bit settings in the BRDV1 and BRDV0 bits in the command registers (SPCMD0 to SPCMD3). The equation for calculating the bit rate is given below. In the equation, n denotes an SPBR setting (0, 1, 2, …, 255), and N denotes a BRDV1 and BRDV0 bit setting (0, 1, 2, 3).

$$\text{Bit rate} = \frac{f(P1\varphi)}{2 \times (n + 1) \times 2^N}$$

Table 19.3 shows examples of the relationship between the SPBR register and BRDV1 and BRDV0 bit settings.

Table 19.3 Relationship between SPBR and BRDV1 and BRDV0 Settings

			Bit Rate
SPBR (n)	BRDV[1:0] (N)	Division Ratio	P1φ = 66MHz
0	0	2*	33.00 Mbps
1	0	4	16.50 Mbps
2	0	6	11.00 Mbps
3	0	8	8.25 Mbps
4	0	10	6.60 Mbps
5	0	12	5.50 Mbps
5	1	24	2.75 Mbps
5	2	48	1.38 Mbps
5	3	96	687.50 Kbps
255	3	4096	16.11 Kbps

Note: * Decide the bit rate to be actually used in the system considering timing specifications.

19.3.9 Data Control Register (SPDCR)

SPDCR selects the width to access SPDR from longword-, word-, and byte-width, and enables or disables dummy data transmission for the master mode operation.

If the contents of SPDCR are changed while bit TEND in the status register (SPSR) indicates that transmission is not completed, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	TXDMY	SPLW1	SPLW0	—	—	—	—	—
Initial value:	0	0	1	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Function
7	TXDMY	0	R/W	Dummy Data Transmission Enable Enables or disables dummy data transmission. When communication is performed with this bit set to 1, dummy data is transmitted from the MOSI pin and a serial communication can be performed even if there is no transmit data in the transmit buffer. Specifically, if there is no transmit data in the transmit buffer and this bit is set to 1, dummy data is transferred to the shift register. Data previously transmitted from the pin is used as dummy data. If this bit is set to 1 after the initialization and a transfer is performed, the transmitted dummy data is undefined. 0: Disables dummy data transmission. 1: Enables dummy data transmission. Note: This bit is valid only in the master mode.
6 5	SPLW1 SPLW0	0 1	R/W R/W	Access Width Specification Specifies the width for accessing the data register (SPDR). If the length of data transferred to SPDR does not agree with these bit settings, operation is not guaranteed.* 00: Setting prohibited 01: SPDR is accessed in bytes (8 bits). 10: SPDR is accessed in words (16 bits). 11: SPDR is accessed in longwords (32 bits).
4 to 0	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

Note: * The data length is specified by the SPB3 to SPB0 bits in the command register (SPCMD). See section 19.3.5, Data Register (SPDR).

19.3.10 Clock Delay Register (SPCKD)

SPCKD sets a period from the beginning of SSL signal assertion to RSPCK oscillation (RSPCK delay) when the SCKDEN bit in the command register (SPCMD) is 1. If the contents of SPCKD are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.
When using this module in slave mode, set B'000 to SCKDL2 to SCKDL0.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	SCKDL2	SCKDL1	SCKDL0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Function
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2 1 0	SCKDL2 SCKDL1 SCKDL0	0 0 0	R/W R/W R/W	RSPCK Delay Setting These bits set an RSPCK delay value when the SCKDEN bit in SPCMD is 1. The relationship between the setting of SCKDL2 to SCKDL0 and the RSPCK delay value is shown below. 000: 1 RSPCK 001: 2 RSPCK 010: 3 RSPCK 011: 4 RSPCK 100: 5 RSPCK 101: 6 RSPCK 110: 7 RSPCK 111: 8 RSPCK

19.3.11 Slave Select Negation Delay Register (SSLND)

SSLND sets a period (SSL negation delay) from the transmission of a final RSPCK edge to the negation of the SSL signal during a serial transfer by this module in master mode. If the contents of SSLND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set B'000 to SLNDL2 to SLNDL0.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	SLNDL2	SLNDL1	SLNDL0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Function
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2 1 0	SLNDL2 SLNDL1 SLNDL0	0 0 0	R/W R/W R/W	SSL Negation Delay Setting These bits set an SSL negation delay when the SLNDEN bit in SPCMD is 1. The relationship between the setting of SLNDL2 to SLNDL0 and the SSL negation delay value is shown below. 000: 1 RSPCK 001: 2 RSPCK 010: 3 RSPCK 011: 4 RSPCK 100: 5 RSPCK 101: 6 RSPCK 110: 7 RSPCK 111: 8 RSPCK

19.3.12 Next-Access Delay Register (SPND)

SPND sets a non-active period (next-access delay) after termination of a serial transfer when the SPNDEN bit in the command register (SPCMD) is 1. If the contents of SPND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set B'000 to SPNDL2 to SPNDL0.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	SPNDL2	SPNDL1	SPNDL0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Function
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2	SPNDL2	0	R/W	Next-Access Delay Setting These bits set a next-access delay when the SPNDEN bit in SPCMD is 1. The relationship between the setting of SPNDL2 to SPNDL0 and the next-access delay value is shown below. 000: 1 RSPCK + 2 P1φ 001: 2 RSPCK + 2 P1φ 010: 3 RSPCK + 2 P1φ 011: 4 RSPCK + 2 P1φ 100: 5 RSPCK + 2 P1φ 101: 6 RSPCK + 2 P1φ 110: 7 RSPCK + 2 P1φ 111: 8 RSPCK + 2 P1φ
1	SPNDL1	0	R/W	
0	SPNDL0	0	R/W	

19.3.13 Command Register (SPCMD)

Each channel has four command registers (SPCMD0 to SPCMD3). SPCMD0 to SPCMD3 are used to set a transfer format for master mode operation. Some of the bits in SPCMD0 are used to set a transfer mode for slave mode operation. In master mode, this module sequentially references SPCMD0 to SPCMD3 according to the settings in bits SPSLN1 and SPSLN0 in the sequence control register (SPSCR), and executes the serial transfer that is set in the referenced SPCMD. While bit TEND in the status register (SPSR) indicates that transmission is not completed, correct operation of this module cannot be guaranteed if SPCMD is changed that is referred by this module. SPCMD referenced by this module in master mode can be checked by means of bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the function of this module in slave mode is enabled, operation cannot be guaranteed if the value set in SPCMD0 is changed.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SCK DEN	SLN DEN	SPN DEN	LSBF	SPB3	SPB2	SPB1	SPB0	SSLKP	—	—	—	BRDV1	BRDV0	CPOL	CPHA
Initial value:	0	0	0	0	0	1	1	1	0	0	0	0	1	1	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Function
15	SCKDEN	0	R/W	RSPCK Delay Setting Enable Sets the period from the point this module in master mode activates the SSL signal until the RSPCK starts oscillation (RSPCK delay). If the SCKDEN bit is 0, this module sets the RSPCK delay to 1 RSPCK. If the SCKDEN bit is 1, this module starts the oscillation of RSPCK at an RSPCK delay in compliance with the clock delay register (SPCKD) settings. To use this module in slave mode, the SCKDEN bit should be set to 0. 0: An RSPCK delay of 1 RSPCK 1: An RSPCK delay equal to SPCKD settings.
14	SLNDEN	0	R/W	SSL Negation Delay Setting Enable Sets the period from the point this module in master mode stops RSPCK oscillation until this module sets the SSL signal inactive (SSL negation delay). If the SLNDEN bit is 0, this module sets the SSL negation delay to 1 RSPCK. If the SLNDEN bit is 1, this module negates the SSL signal at an SSL negation delay in compliance with the slave select negation delay register (SSLND) settings. To use this module in slave mode, the SLNDEN bit should be set to 0. 0: An SSL negation delay of 1 RSPCK 1: An SSL negation delay equal to SSLND settings.
13	SPNDEN	0	R/W	Next-Access Delay Enable Sets the period from the point this module in master mode terminates a serial transfer and sets the SSL signal inactive until this module enables the SSL signal assertion for the next access (next-access delay). If the SPNDEN bit is 0, this module sets the next-access delay to 1 RSPCK + 2P1φ. If the SPNDEN bit is 1, this module inserts a next-access delay in compliance with the next-access delay register (SPND) settings. To use this module in slave mode, the SPNDEN bit should be set to 0. 0: A next-access delay of 1 RSPCK + 2 P1φ 1: A next-access delay equal to SPND settings.
12	LSBF	0	R/W	LSB First Sets the data format in master mode or slave mode to MSB first or LSB first. 0: MSB first 1: LSB first
11 10 9 8	SPB3 SPB2 SPB1 SPB0	0 1 1 1	R/W R/W R/W R/W	Data Length Setting These bits set a transfer data length in master mode or slave mode. 0100 to 0111: 8 bits 1111: 16 bits 0010, 0011: 32 bits Others: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Function
7	SSLKP	0	R/W	SSL Signal Level Keeping When this module in master mode performs a serial transfer, this bit specifies whether the SSL signal level for the current command is to be kept or negated between the SSL negation timing associated with the current command and the SSL assertion timing associated with the next command. To use this module in slave mode, the SSLKP bit should be set to 0. 0: Negates the SSL signal upon completion of transfer. 1: Keeps the SSL signal level from the end of the transfer until the beginning of the next access.
6 to 4	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
3 2	BRDV1 BRDV0	1 1	R/W R/W	Bit Rate Division Setting These bits are used to determine the bit rate. A bit rate is determined by combinations of bits BRDV1 and BRDV 0 and the settings in the bit rate register (SPBR) (see section 19.3.8, Bit Rate Register (SPBR)). The settings in SPBR determine the base bit rate. The settings in bits BRDV1 and BRDV0 are used to select a bit rate which is obtained by dividing the base bit rate by 1, 2, 4, or 8. In the bits SPCMD0 to SPCMD3, different BRDV1 and BRDV0 settings can be specified. This permits the execution of serial transfers at a different bit rate for each command. 00: Select the base bit rate. 01: Select the base bit rate divided by 2. 10: Select the base bit rate divided by 4. 11: Select the base bit rate divided by 8.
1	CPOL	0	R/W	RSPCK Polarity Setting Sets an RSPCK polarity in master or slave mode. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same RSPCK polarity should be set for both modules. 0: RSPCK = 0 when idle 1: RSPCK = 1 when idle
0	CPHA	1	R/W	RSPCK Phase Setting Sets an RSPCK phase in master or slave mode. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same RSPCK phase should be set for both modules. 0: Data sampling on odd edge, data variation on even edge 1: Data variation on odd edge, data sampling on even edge

19.3.14 Buffer Control Register (SPBFCR)

SPBFCR resets the number of data units in the transmit buffer (SPTX) or receive buffer (SPRX) and sets the number of triggering data units.

Bit:	7	6	5	4	3	2	1	0
	TXRST	RXRST	TXTRG[1:0]		—	RXTRG[2:0]		
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Function
7	TXRST	0	R/W	Transmit Buffer Data Reset Resets the transmit buffer to an empty state. Transmit data in the transmit buffer becomes invalid when this bit is set to 1. 0: Disables the reset operation.* 1: Enables the reset operation Note: * The reset operation is performed after a power-on reset.
6	RXRST	0	R/W	Receive Buffer Data Reset Resets the receive buffer to an empty state. Receive data in the receive buffer becomes invalid when this bit is set to 1. 0: Disables the reset operation.* 1: Enables the reset operation Note: * The reset operation is performed after a power-on reset.
5, 4	TXTRG[1:0]	00	R/W	Transmit Buffer Data Triggering Number Specifies the timing at which the transmit buffer empty state is determined, that is when the SPTEF flag in the status register is set. When the number of bytes of data in the transmit buffer (SPTX) is equal to or less than the specified triggering number, the SPTEF flag is set to 1. 00: 7 bytes (1)* 01: 6 bytes (2)* 10: 4 bytes (4)* 11: 0 bytes (8)* Note: * The value in the parenthesis shows the number of available bytes in the transmit buffer (SPTX).
3	—	0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2 to 0	RXTRG[2:0]	000	R/W	Receive Buffer Data Triggering Number Specifies the timing at which the receive buffer full state is determined, that is when the SPRF flag in the status register is set. When the number of bytes of data in the receive buffer (SPRX) is equal to or greater than the specified triggering number, the SPRF flag is set to 1. 000: 1 byte (31)* 001: 2 bytes (30)* 010: 4 bytes (28)* 011: 8 bytes (24)* 100: 16 bytes (16)* 101: 24 bytes (8)* 110: 32 bytes (0)* 111: 5 bytes (27)* Note: * The value in the parenthesis shows the number of available bytes in the receive buffer (SPRX).

19.3.15 Buffer Data Count Setting Register (SPBFDR)

SPBFDR indicates the number of data units stored in the transmit buffer (SPTX) and receive buffer (SPRX). The upper eight bits indicate the number of transmit data units in SPTX and the lower eight bits indicate the number of receive data units in SPRX.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	T[3:0]				—	—	R[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Function
15 to 12	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
11 to 8	T[3:0]	0000	R	Indicates the number of bytes of data to be transmitted in SPTX. B'0000 indicates that SPTX is empty. B'1000 indicates that SPTX is full.
7, 6	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
5 to 0	R[5:0]	000000	R	Shows the number of bytes of received data in SPTX. B'000000 indicates that SPRX is empty. B'100000 indicates that SPRX is full.

19.4 Operation

In this section, the serial transfer period means a period from the beginning of driving valid data to the fetching of the final valid data.

19.4.1 Overview of Operations

This module is capable of serial transfers in slave mode and master mode. A particular mode of this module can be selected by using the MSTR bit in the control register (SPCR). Table 19.4 gives the relationship between the modes and SPCR settings, and a description of each mode.

Table 19.4 Relationship between Modes and SPCR and Description of Each Mode

Mode	Slave (SPI Operation)	Master (SPI Operation)
MSTR bit setting	0	1
MODFEN bit setting	0 or 1	0
RSPCK signal	Input	Output
MOSI signal	Input	Output
MISO signal	Output/Hi-Z	Input
SSL signal	Input	Output
SSL polarity modification function	Supported	Supported
Transfer rate	Up to P1φ/8	Up to P1φ/2
Clock source	RSPCK input	On-chip baud rate generator
Clock polarity	Two	Two
Clock phase	Two	Two
First transfer bit	MSB/LSB	MSB/LSB
Transfer data length	8, 16, or 32 bits	8, 16, or 32 bits
Burst transfer	Possible (CPHA = 1)	Possible (CPHA = 0,1)
RSPCK delay control	Not supported	Supported
SSL negation delay control	Not supported	Supported
Next-access delay control	Not supported	Supported
Transfer activation method	SSL input active or RSPCK oscillation	Transmit buffer is written when SPE = 1
Sequence control	Not supported	Supported
Transmit buffer empty detection	Supported	Supported
Receive buffer full detection	Supported	Supported
Overrun error detection	Supported	Not Supported
Mode fault error detection	Supported (MODFEN = 1)	Not supported

19.4.2 Pin Control

According to the MSTR bit in the control register (SPCR), this module can automatically switch pin directions and output modes. Table 19.5 shows the relationship between pin states and bit settings.

Table 19.5 Relationship between Pin States and Bit Settings

Mode	Pin	Pin State*
Master mode (SPI operation) (MSTR = 1)	RSPCK	CMOS output
	SSL	CMOS output
	MOSI	CMOS output
	MISO	Input
Slave mode (SPI operation) (MSTR = 0)	RSPCK	Input
	SSL	Input
	MOSI	Input
	MISO*	CMOS output/Hi-Z

Note: * When SSL is at the non-active level or the SPE bit in SPCR is cleared to 0, the pin state is Hi-Z.

This module in master mode (SPI operation) determines MOSI signal values during the SSL negation period (including the SSL retention period during a burst transfer) according to MOIFE and MOIFV bit settings in SPPCR, as shown in Table 19.6.

Table 19.6 MOSI Signal Value Determination during SSL Negation Period

MOIFE	MOIFV	MOSI Signal Value during SSL Negation Period
0	0, 1	Last output value from previous transfer (The value is undefined when CPHA is 0)
1	0	Always 0
1	1	Always 1

19.4.3 System Configuration Example

(1) Master/Slave (with This LSI Acting as Master)

Figure 19.2 shows a master/slave system configuration example when this LSI is used as a master. In master/slave configuration, the SSL output of this LSI (master) is not used. The SSL input of the slave is fixed to the low level, and the slave is always maintained in a selected state. In the transfer format corresponding to the case where the CPHA bit in the control register (SPCR) is 0, there are slave devices for which the SSL signal cannot be fixed to the active level. In situations where the SSL signal cannot be fixed, the SSL output of this LSI should be connected to the SSL input of the slave device.
This LSI (master) always drives the RSPCK and MOSI. The slave always drives the MISO.

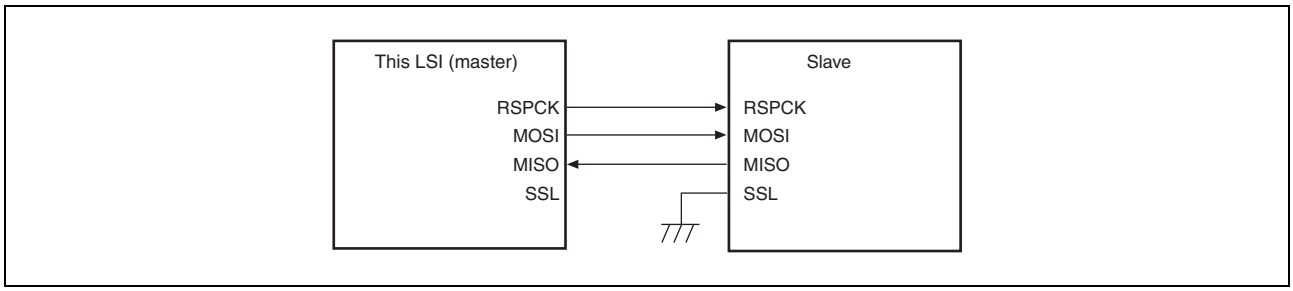

Figure 19.2 Master/Slave Configuration Example (This LSI = Master)

(2) Master/Slave (with This LSI Acting as Slave)

Figure 19.3 shows a master/slave system configuration example when this LSI is used as a slave. When this LSI is to operate as a slave, the SSL pin is used as SSL input. The master always drives the RSPCK and MOSI. This LSI (slave) always drives the MISO. When SSL is at the non-active level, the pin state is Hi-Z.
In the slave configuration in which the CPHA bit in the command register (SPCMD) is set to 1, the SSL input of this LSI (slave) is fixed to the 0 level, this LSI (slave) is always maintained in a selected state, and in this manner it is possible to execute serial transfer (Figure 19.4).

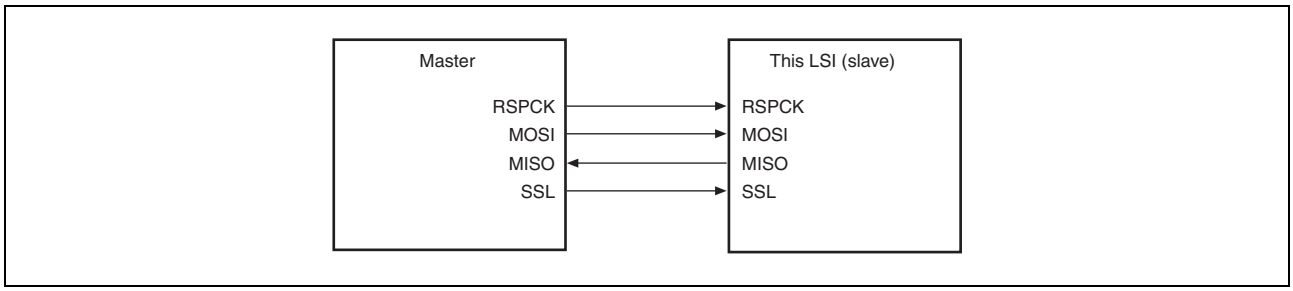

Figure 19.3 Master/Slave Configuration Example (This LSI = Slave)

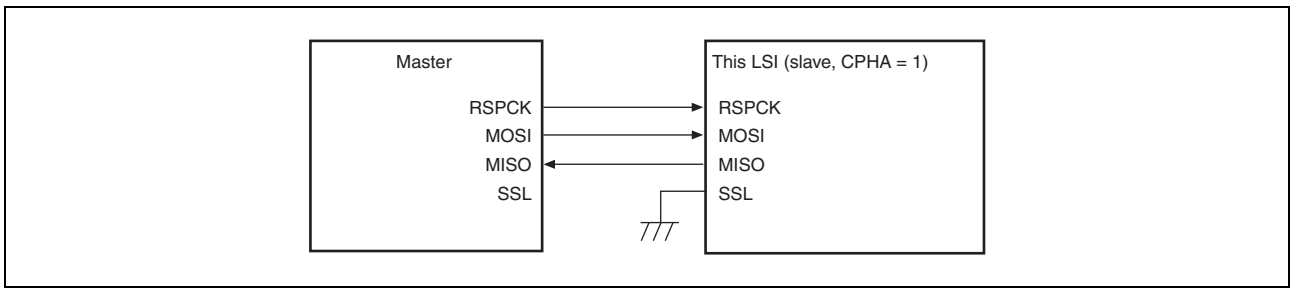

Figure 19.4 Master/Slave Configuration Example (This LSI = Slave, CPHA = 1)

(3) Master/Multi-Slave (with This LSI Acting as Slave)

Figure 19.5 shows a master/multi-slave system configuration example when this LSI is used as a slave. In the example of Figure 19.5, the system is comprised of a master and two LSIs (slave X and slave Y).
The RSPCK and MOSI outputs of the master are connected to the RSPCK and MOSI inputs of the LSIs (slave X and slave Y). The MISO outputs of the LSIs (slave X and slave Y) are all connected to the MISO input of the master. SSLX and SSLY outputs of the master are connected to the SSL inputs of the LSIs (slave X and slave Y), respectively.
The master always drives RSPCK, MOSI, SSLX, and SSLY. Of the LSIs (slave X and slave Y), the slave that receives low level input into the SSL0 input drives MISO.

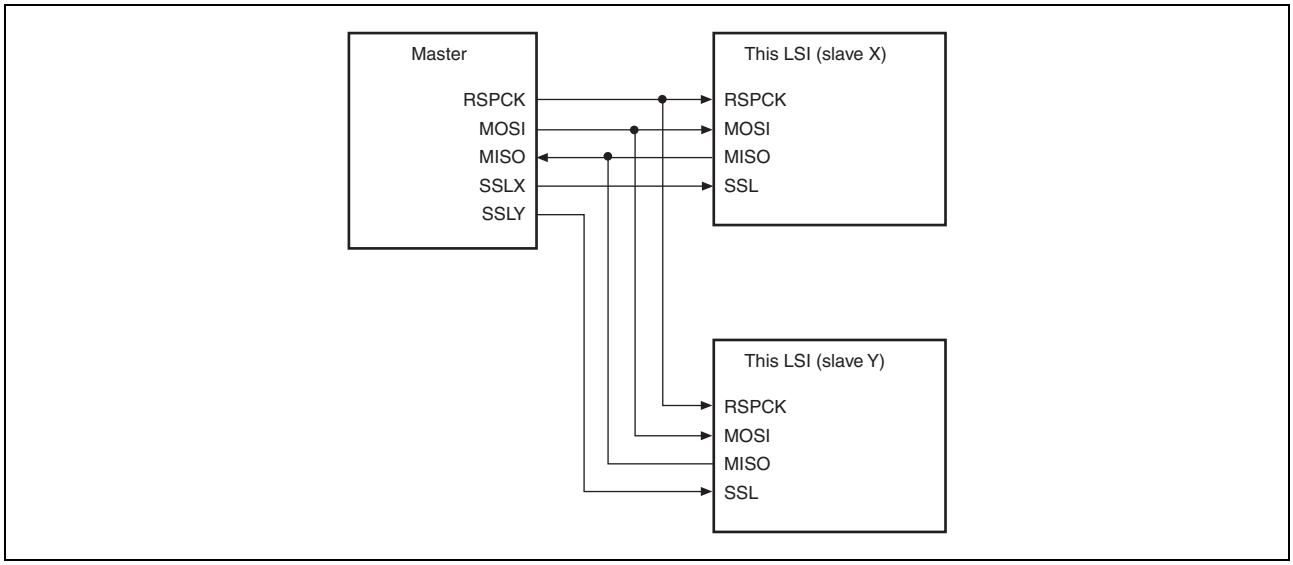

Figure 19.5 Master/Multi-Slave Configuration Example (This LSI = Slave)

19.4.4 Transfer Format

(1) CPHA = 0

Figure 19.6 shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 0. In Figure 19.6, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the settings of this module. For details, see section 19.4.2, Pin Control.

When the CPHA bit is 0, the driving of valid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The first RSPCK signal change timing that occurs after the SSL signal assertion becomes the first transfer data fetching timing. After this timing, data is sampled at every 1 RSPCK cycle. The change timing for MOSI and MISO signals is always 1/2 RSPCK cycle after the transfer data fetch timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t1 denotes a period from an SSL signal assertion to RSPCK oscillation (RSPCK delay). t2 denotes a period from the cessation of RSPCK oscillation to an SSL signal negation (SSL negation delay). t3 denotes a period in which SSL signal assertion is suppressed for the next transfer after the end of serial transfer (next-access delay). t1, t2, and t3 are controlled by a master device running on the system. For a description of t1, t2, and t3 when this module is in master mode, see section 19.4.3, (1) Master/Slave (with This LSI Acting as Master).

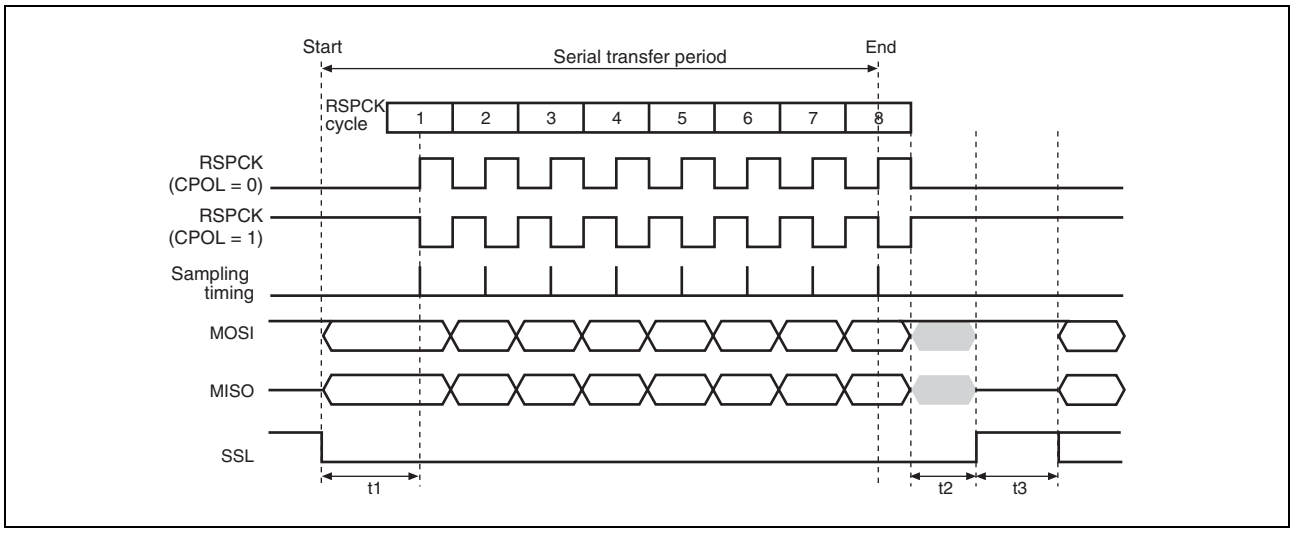

Figure 19.6 Transfer Format (CPHA = 0)

(2) CPHA = 1

Figure 19.7 shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 1. In Figure 19.7, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the modes (master or slave). For details, see 19.4.2 Pin Control.

When the CPHA bit is 1, the driving of invalid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The driving of valid data to the MOSI and MISO signals commences at the first RSPCK signal change timing that occurs after the SSL signal assertion. After this timing, data is updated at every 1 RSPCK cycle. The transfer data fetch timing is always 1/2 RSPCK cycle after the data update timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t1, t2, and t3 are the same as those in the case of CPHA = 0. For a description of t1, t2, and t3 when this module is in master mode, see section 19.4.3, (1) Master/Slave (with This LSI Acting as Master).

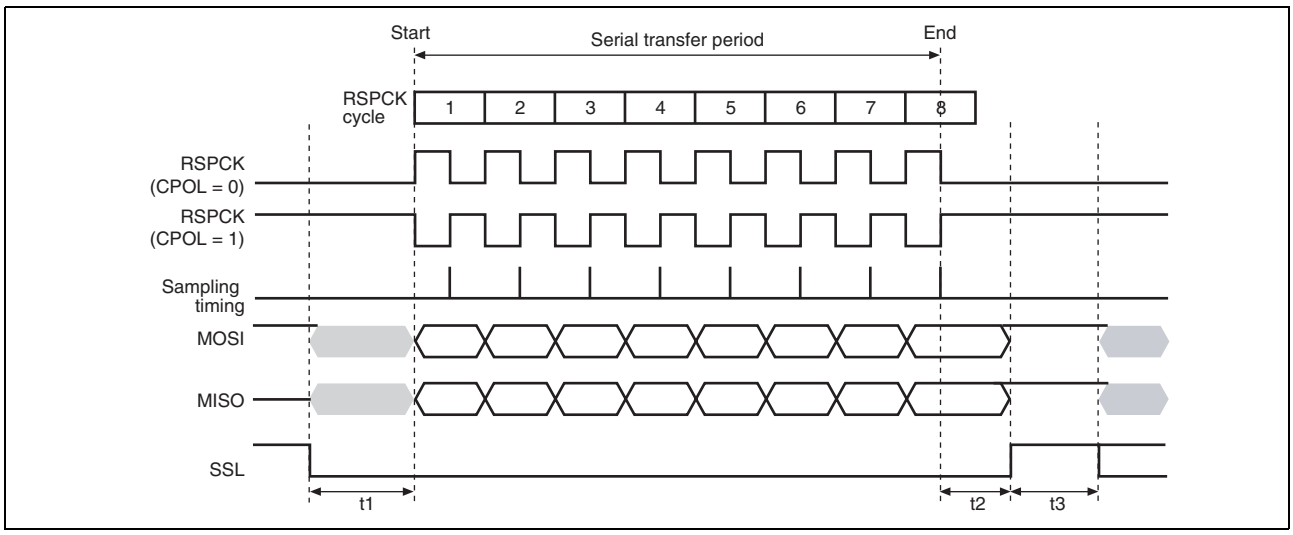

Figure 19.7 Transfer Format (CPHA = 1)

19.4.5 Data Format

The data format depends on the settings in the command register (SPCMD). Irrespective of MSB/LSB first, this module treats the range from the LSB of the data register (SPDR) to the assigned data length as transfer data.

(1) MSB First Transfer (32-Bit Data)

Figure 19.8 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer of SPDR. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R31 to R00 is stored in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R31 to R00 is shifted out from the shift register.

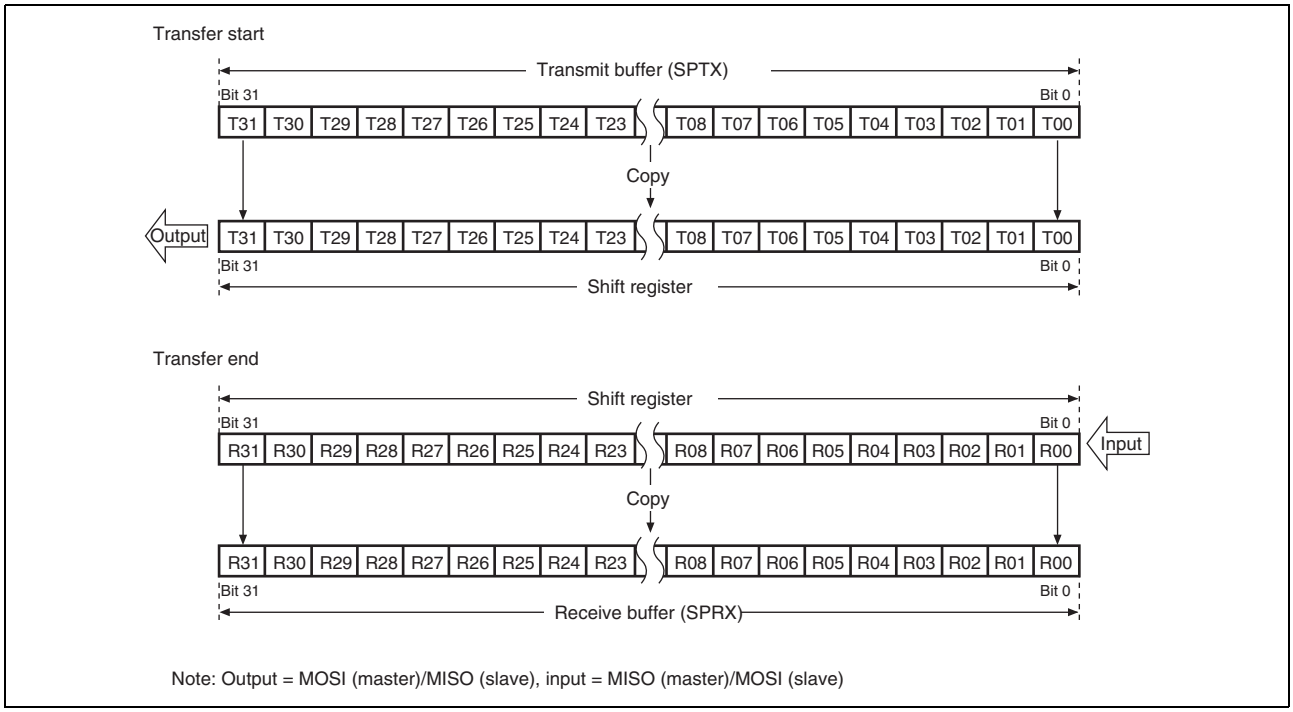

Figure 19.8 MSB First Transfer (32-Bit Data)

(2) MSB First Transfer (16-Bit Data)

Figure 19.9 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 15 in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R15 to R00 is stored in bits 15 to 0 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 16 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R15 to R00 is shifted out from the shift register.

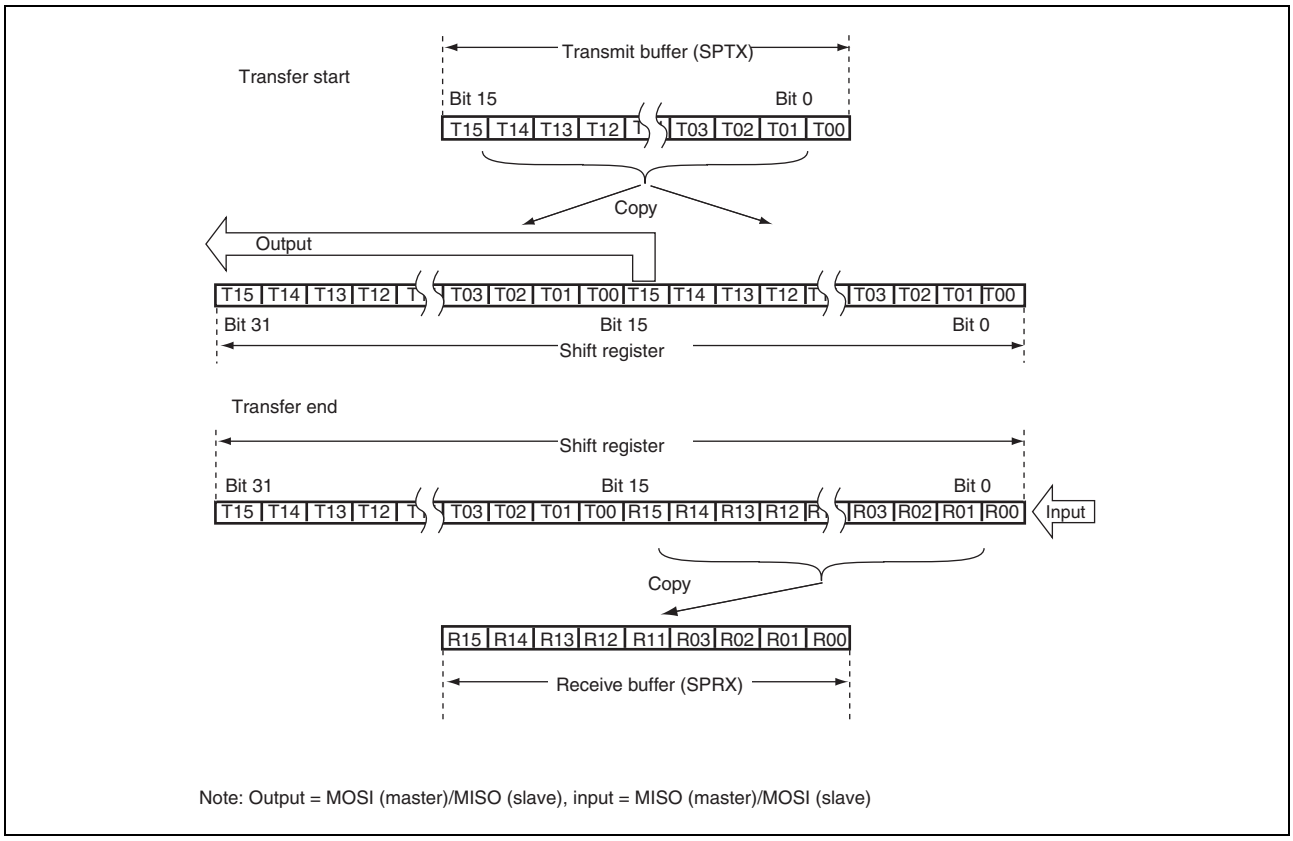

Figure 19.9 MSB First Transfer (16-Bit Data)

(3) MSB First Transfer (8-Bit Data)

Figure 19.10 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 7 in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R07 to R00 is stored in bits 7 to 0 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 8 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary area in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R07 to R00 is shifted out from the shift register.

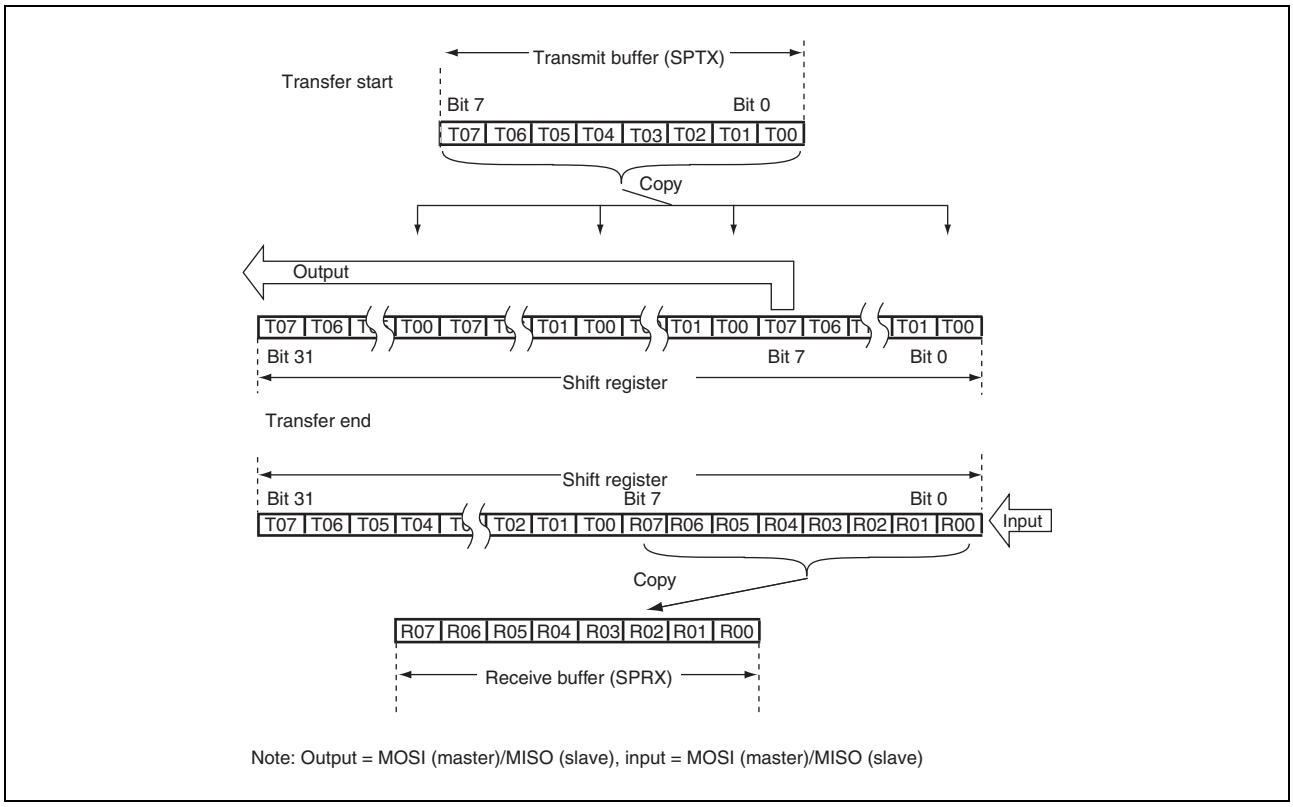

Figure 19.10 MSB First Transfer (8-Bit Data)

(4) LSB First Transfer (32-Bit Data)

Figure 19.11 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R00 to R31 is stored in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of the SPDR, received data R00 to R31 is shifted out from the shift register.

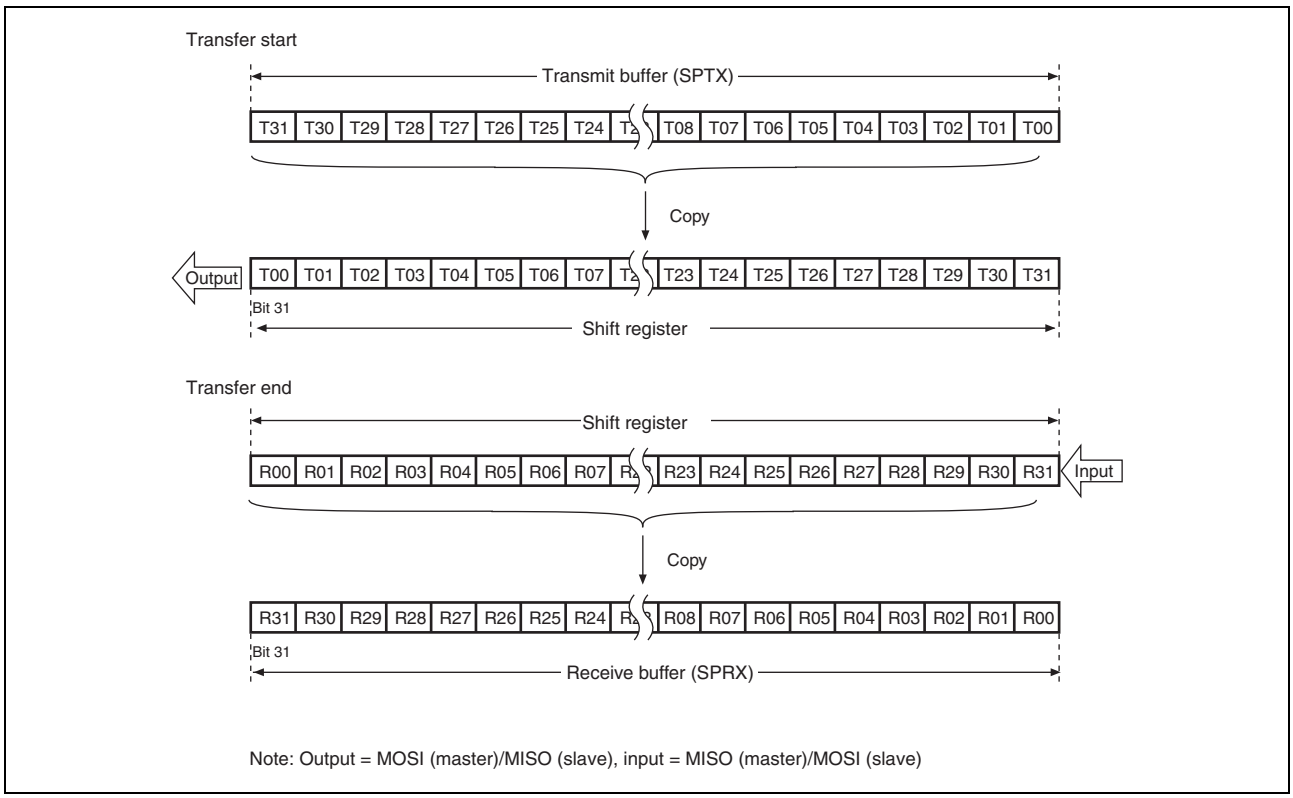

Figure 19.11 LSB First Transfer (32-Bit Data)

(5) LSB First Transfer (16-Bit Data)

Figure 19.12 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from bit 16 in the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R00 to R15 is stored in bits 31 to 16 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 15 to 0 in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register.

If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R15 is shifted out from the shift register.

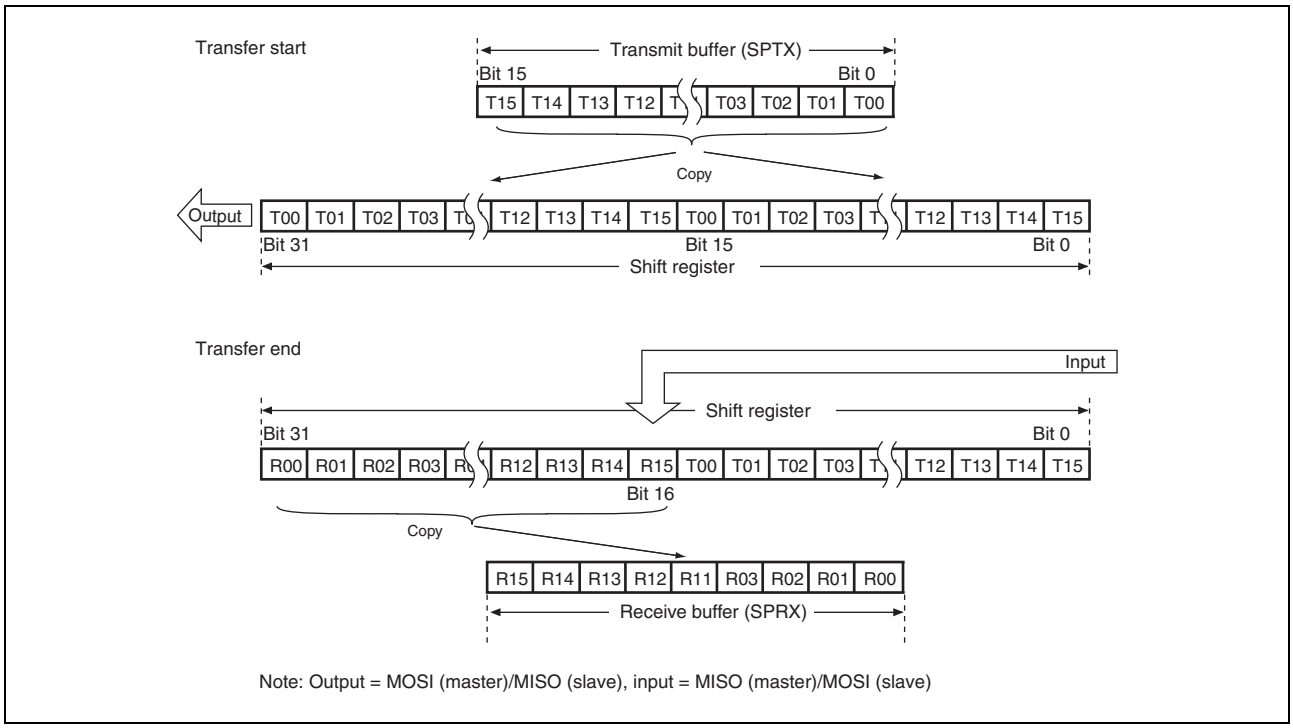

Figure 19.12 LSB First Transfer (16-Bit Data)

(6) LSB First Transfer (8-Bit Data)

Figure 19.13 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from bit 24 in the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R00 to R07 is stored in bits 31 to 24 of the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 23 to 0 in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R07 is shifted out from the shift register.

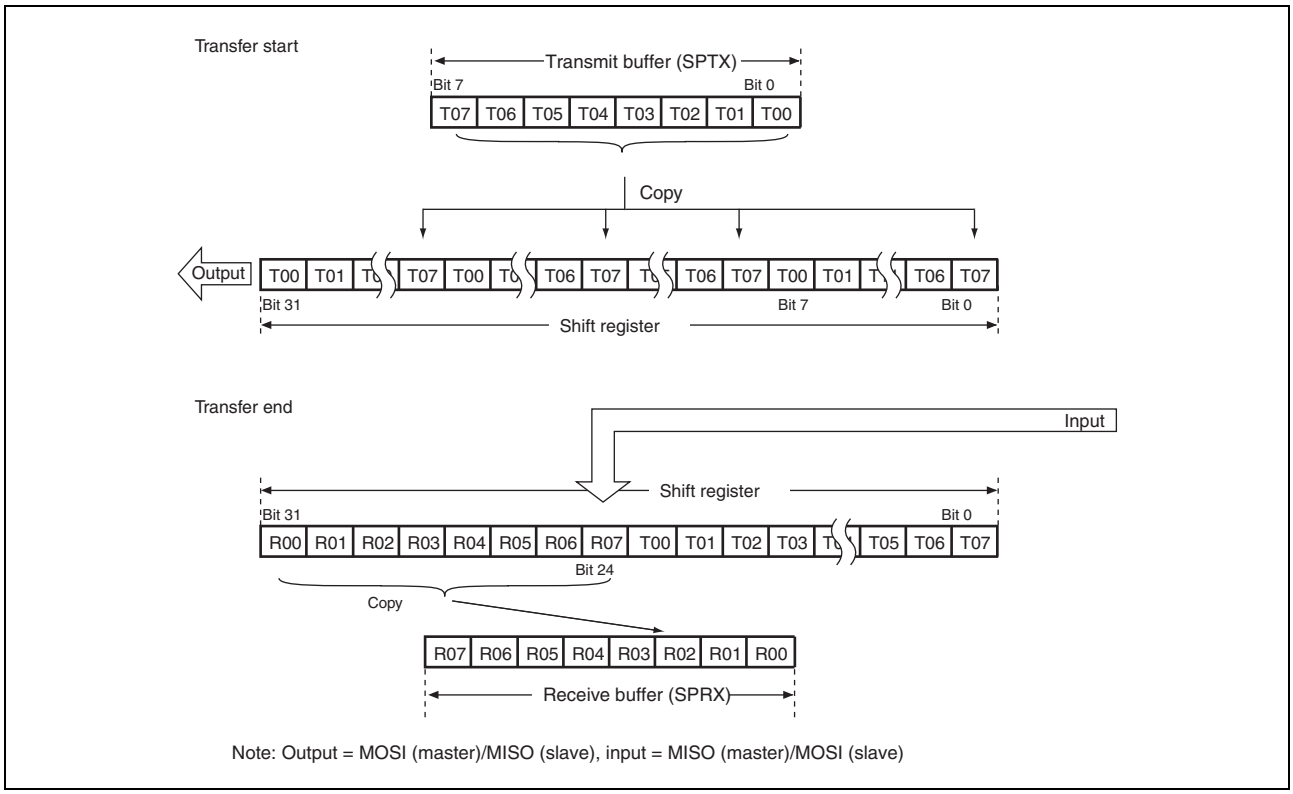

Figure 19.13 LSB First Transfer (8-Bit Data)

19.4.6 Error Detection

In the normal serial transfer, the data written to the transmit buffer of the data register (SPDR) is serially transmitted, and the serially received data can be read from the receive buffer of SPDR. If access is made to SPDR, depending on the status of the transmit buffer/receive buffer or the status at the beginning or end of serial transfer, in some cases non-normal transfers can be executed.
If a non-normal transfer operation occurs, this module detects the event as an overrun error or a mode fault error. Table 19.7 shows the relationship between non-normal transfer operations and the error detection function.

Table 19.7 Relationship between Non-Normal Transfer Operations and Error Detection Function

	Occurrence Condition	Operation	Error Detection
A	SPDR is written when the transmit buffer is full.	Missing write data.	None
B	Serial transfer is started in slave mode when transmit data is still not loaded on the shift register.	Data received in previous serial transfer is serially transmitted.	None
C	SPDR is read when the receive buffer is empty.	The output data is undefined.	None
D	Serial transfer terminates when the receive buffer is full.	Missing serial receive data.	Overrun error (only in slave mode)
E	The SSL input signal is negated during serial transfer in slave mode.	Serial transfer suspended. Missing send/receive data. Operation disabled.	Mode fault error

On operation A shown in Table 19.7, this module does not detect an error. Whether SPDR can be written to or not can be checked using the T[3:0] bits in the buffer data count setting register (SPBFDR).
Likewise, this module does not detect an error on operation B. In a serial transfer that was started before the shift register was updated, this module sends the data that was received in the previous serial transfer, and does not treat the operation indicated in B as an error. Note that the received data from the previous serial transfer is retained in the receive buffer of SPDR, thus it can be correctly read.
Similarly, this module does not detect an error on operation C. To prevent extraneous data from being read, the number of receive data units stored in the receive buffer should be read from the R[5:0] bits in the buffer data count setting register (SPBFDR).
An overrun error shown in D is described in section 19.4.6, (1) Overrun Errors. A mode fault error shown in E is described in section 19.4.6, (2) Mode Fault Error.

(1) Overrun Error

If serial transfer ends when the receive buffer of the data register (SPDR) is full, this module detects an overrun error, and sets the OVRF bit in SPSR to 1. When the OVRF bit is 1, this module does not copy data from the shift register to the receive buffer so that the data prior to the occurrence of the error is retained in the receive buffer. To reset the OVRF bit in SPSR to 0, either perform a power-on reset, or write a 0 to the OVRF bit after SPSR has been read with the OVRF bit set to 1.

Figure 19.14 shows an example of operation of the SPRF and OVRF bits in SPSR. The SPSR and SPDR accesses shown in Figure 19.14 indicate the condition of accesses to SPSR and SPDR, respectively, where I denotes an idle cycle, W a write cycle, and R a read cycle. In the example of Figure 19.14, this module performs an 8-bit serial transfer in which the CPHA bit in the command register (SPCMD) is 1, and CPOL is 0. The numbers given under the RSPCK waveform represent the number of RSPCK cycles (i.e., the number of transferred bits).

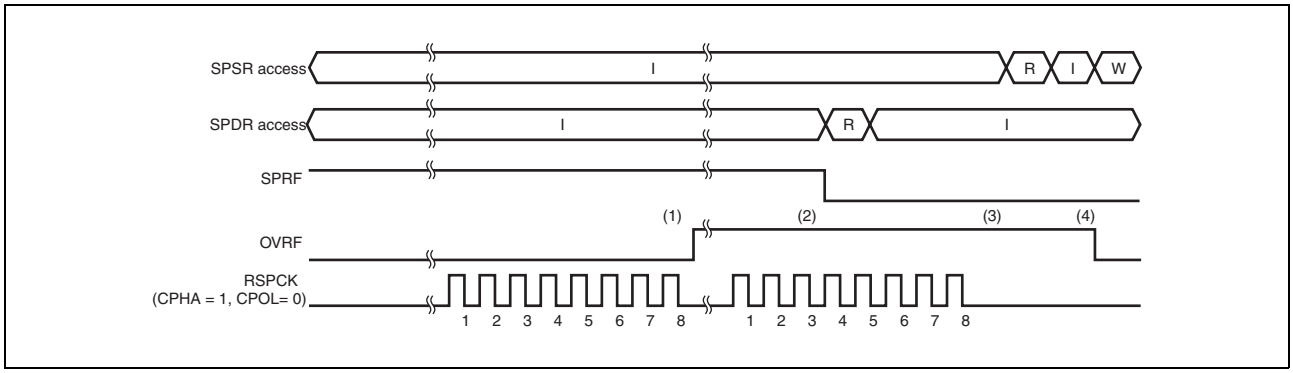

Figure 19.14 SPRF and OVRF Bit Operation Example

The operation of the flags at the timing shown in steps (1) to (4) in the figure is described below.

1. If a serial transfer terminates when the receive buffer does not have a space for the receive data length, this module detects an overrun error, and sets the OVRF bit to 1. This module does not copy the data in the shift register to the receive buffer.
2. The OVFR bit is not cleared even when SPDR is read and thus the number of data bytes in the receive buffer becomes less than the number of the receive buffer data triggering number specified by the RXTRG bits.
3. If the serial transfer terminates in an overrun error state, this module determines that the shift register is empty; in this manner, data transfer is enabled from the transmit buffer to the shift register.
4. If 0 is written to the OVRF bit after SPSR is read with OVRF = 1, this module clears the OVRF bit.

The occurrence of an overrun can be checked either by reading SPSR or by using an error interrupt and reading SPSR. When using an error interrupt, set the SPEIE bit in the control register (SPCR) to 1. When executing a serial transfer without using an error interrupt, measures should be taken to ensure the early detection of overrun errors, such as reading SPSR immediately after SPDR is read.

The OVRF bit is cleared to 0 under the following conditions:

- After SPSR is read in a condition in which the OVRF bit is set to 1, 0 is written to the OVRF bit.
- Power-on reset

Note: When the receive buffer has area enough to store receive data with an overrun error, this module receives receive data.

(2) Mode Fault Error

When the MSTR bit is 0, this module operates in slave mode. This module detects a mode fault error if the SSL input signal is negated during the serial transfer period (from the time the driving of valid data is started to the time the final valid data is fetched) when the MODFEN bit is 1 in slave mode.
Upon detecting a mode fault error, this module stops driving of the output signals and clears the SPE bit in SPCR to 0. When the SPE bit is cleared to 0, the function of this module is disabled and this module stops driving external signals. For details of disabling the function of this module by clearing the SPE bit to 0, see 19.4.7 Initialization.
The occurrence of a mode fault error can be checked either by reading SPSR or by using an error interrupt and reading SPSR. When using an error interrupt, set the SPEIE bit in the control register (SPCR) to 1. To detect a mode fault error without using an error interrupt, it is necessary to poll SPSR.
When the MODF bit is 1, writing 1 to the SPE bit is ignored. To enable the function of this module after the detection of a mode fault error, the MODF bit must be set to 0. The MODF bit is cleared to 0 under the following conditions:

- After SPSR is read in a condition where the MODF bit has turned 1, 0 is written to the MODF bit.
- Power-on reset

19.4.7 Initialization

If 0 is written to the SPE bit in the control register (SPCR) or this module clears the SPE bit to 0 because of the detection of a mode fault error, this module disables the module function, and initializes a part of the module function. When a power-on reset is generated, this module initializes all of the module function. An explanation follows of initialization by the clearing of the SPE bit.

(1) Initialization by Clearing SPE Bit

When the SPE bit in SPCR is cleared, this module performs the following initialization:

- Suspending any serial transfer that is being executed
- Stopping the driving of output signals (Hi-Z) in slave mode
- Initializing the internal state
- Initializing the TEND bit in SPSR

Initialization by the clearing of the SPE bit does not initialize the control bits of this module. For this reason, this module can be started in the same transfer mode as prior to the initialization if the SPE bit is re-set to 1.

19.4.8 SPI Operation

(1) Multi-Master Mode Operation

This section explains the operation in multi-master mode.

(a) Starting Serial Transfer

A serial transfer is started when transmit data is copied from the transmit buffer to the shift register, the shift register becomes full, and the receive buffer has a space for the receive data length. If transmit data has already been written to the shift register, data is not copied from the transmit buffer to the shift register.
For details of the transfer format, see section 19.4.4, Transfer Format.

(b) Terminating Serial Transfer

Irrespective of the CPHA bit in the command register (SPCMD), this module terminates the serial transfer after transmitting an RSPCK edge corresponding to the final sampling timing. After the serial transfer is completed, receive data is copied from the shift register to the receive buffer. If the receive buffer does not have a space for the receive data length after receive data is copied from the shift register to the receive buffer, another serial transfer will not be performed. In order to perform another serial transfer, data for the receive data length should be read from the receive buffer to secure the space for the receive data.
It should be noted that the final sampling timing varies depending on the bit length of transfer data. In master mode, the data length depends on the settings in bits SPB3 to SPB0 in SPCMD. For details on the transfer format, see section 19.4.4, Transfer Format.

(c) Sequence Control

The transfer format that is employed in master mode is determined by the sequence control register (SPSCR), command registers 0 to 3 (SPCMD0 to SPCMD3), the bit rate register (SPBR), the clock delay register (SPCKD), the slave select negation delay register (SSLND), and the next-access delay register (SPND).
SPSCR is a register used to determine the sequence configuration for serial transfers that are executed by this module in master mode. The following items are set in command registers SPCMD0 to SPCMD3: SSL output signal value, MSB/LSB first, data length, some of the bit rate settings, RSPCK polarity/phase, whether SPCKD is to be referenced, whether SSLND is to be referenced, and whether SPND is to be referenced. SPBR holds some of the bit rate settings; SPCKD, a clock delay value; SSLND, an SSL negation delay; and SPND, a next-access delay value.
According to the sequence length that is assigned to SPSCR, this module makes up a sequence comprised of a part or all of SPCMD0 to SPCMD3. This module contains a pointer to the SPCMD that makes up the sequence. The value of this pointer can be checked by reading bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the SPE bit in the control register (SPCR) is set to 1 and the function of this module is enabled, this module loads the pointer to the commands in SPCMD0, and incorporates the SPCMD0 settings into the transfer format at the beginning of serial transfer. This module increments the pointer each time the next-access delay period for a data transfer ends. Upon completion of the serial transfer that corresponds to the final command comprising the sequence, this module sets the pointer in SPCMD0, and in this manner the sequence is executed repeatedly.

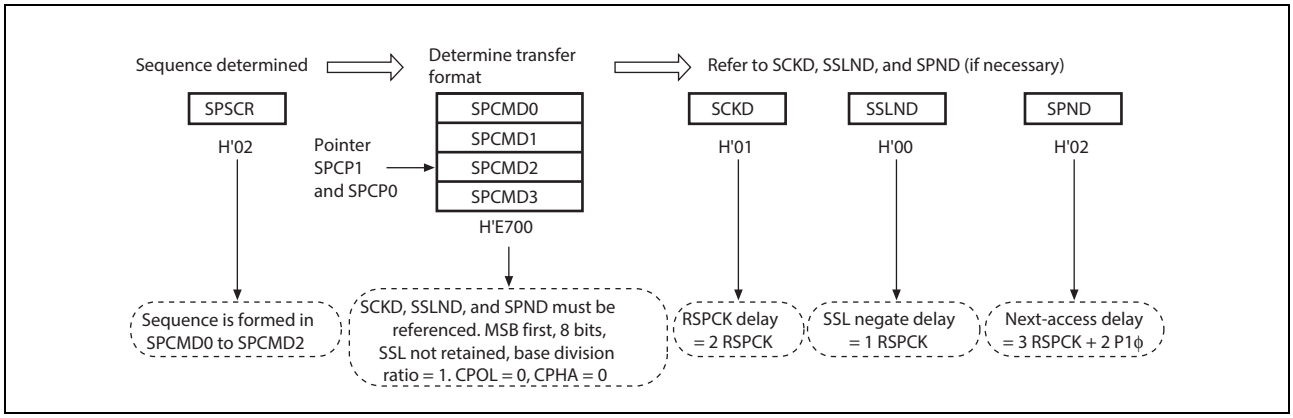

Figure 19.15 Determination Procedure of Serial Transfer Mode in Master Mode

(d) Burst Transfer

If the SSLKP bit in the command register (SPCMD) that this module references during the current serial transfer is 1, this module keeps the SSL signal level during the serial transfer until the beginning of the SSL signal assertion for the next serial transfer. If the SSL signal level for the next serial transfer is the same as the SSL signal level for the current serial transfer, this module can execute continuous serial transfers while keeping the SSL signal assertion status (burst transfer).

Figure 19.16 shows an example of an SSL signal operation for the case where a burst transfer is implemented using SPCMD0 and SPCMD1 settings. The text below explains operations (1) to (7) as depicted in Figure 19.16. It should be noted that the polarity of the SSL output signal depends on the settings in the slave select polarity register (SSLP).

1. Based on SPCMD0, this module asserts the SSL signal and inserts RSPCK delays.
2. Serial transfers are executed according to SPCMD0.
3. SSL negation delays are inserted.
4. Because the SSLKP bit in SPCMD0 is 1, this module keeps the SSL signal value on SPCMD0. This period is sustained, at the shortest, for a period equal to the next-access delay of SPCMD0. If the shift register is empty after the passage of a minimum period, this period is sustained until such time as the transmit data is stored in the shift register for another transfer.
5. Based on SPCMD1, this module asserts the SSL signal and inserts RSPCK delays.
6. Serial transfers are executed according to SPCMD1.
7. Because the SSLKP bit in SPCMD1 is 0, this module negates the SSL signal. In addition, a next-access delay is inserted according to SPCMD1.

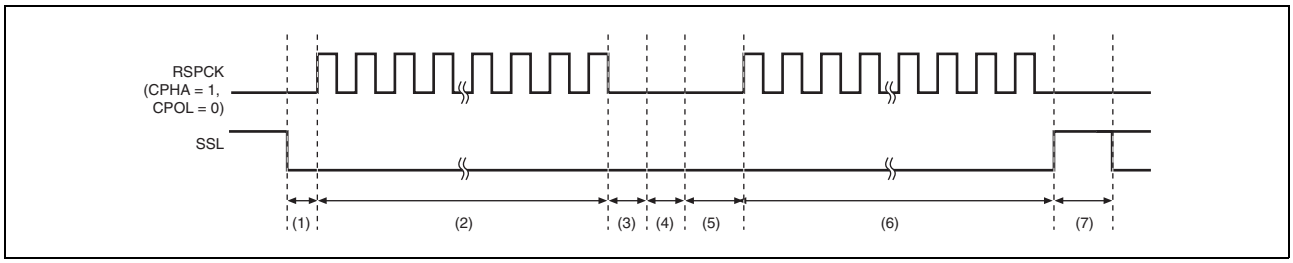

Figure 19.16 Example of Burst Transfer Operation using SSLKP Bit

If the SSL signal settings in the SPCMD in which 1 is assigned to the SSLKP bit are different from the SSL signal output settings in the SPCMD to be used in the next transfer, this module switches the SSL signal status to SSL signal assertion ((5) in Figure 19.16) corresponding to the command for the next transfer. Notice that if such an SSL signal switching occurs, the slaves that drive the MISO signal compete, and the possibility arises of the collision of signal levels.

This module in master mode references within the module the SSL signal operation for the case where the SSLKP bit is

not used. Even when the CPHA bit in SPCMD is 0, this module can accurately start serial transfers by asserting the SSL signal for the next transfer. For this reason, burst transfers in master mode can be executed irrespective of CPHA bit settings (see section 19.4.8, (2) Slave Mode Operation).

(e) RSPCK Delay (t1)

The RSPCK delay value in master mode depends on SCKDEN bit settings in the command register (SPCMD) and on clock delay register (SPCKD) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines an RSPCK delay value during serial transfer by using the SCKDEN bit in the selected SPCMD and SPCKD, as shown in Table 19.8. For a definition of RSPCK delay, see section 19.4.4, Transfer Format.

Table 19.8 Relationship among SCKDEN and SPCKD Settings and RSPCK Delay Values

SCKDEN	SPCKD	RSPCK Delay Value
0	000 to 111	1 RSPCK
1	000	1 RSPCK
	001	2 RSPCK
	010	3 RSPCK
	011	4 RSPCK
	100	5 RSPCK
	101	6 RSPCK
	110	7 RSPCK
	111	8 RSPCK

(f) SSL Negation Delay (t2)

The SSL negation delay value in master mode depends on SLNDEN bit settings in the command register (SPCMD) and on SSL negation delay register (SSLND) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines an SSL negation delay value during serial transfer by using the SLNDEN bit in the selected SPCMD and SSLND, as shown in Table 19.9. For a definition of SSL negation delay, see section 19.4.4, Transfer Format.

Table 19.9 Relationship among SLNDEN and SSLND Settings and SSL Negation Delay Values

SLNDEN	SSLND	SSL Negation Delay Value
0	000 to 111	1 RSPCK
1	000	1 RSPCK
	001	2 RSPCK
	010	3 RSPCK
	011	4 RSPCK
	100	5 RSPCK
	101	6 RSPCK
	110	7 RSPCK
	111	8 RSPCK

(g) Next-Access Delay (t3)

The next-access delay value in master mode depends on SPNDEN bit settings in the command register (SPCMD) and on next-access delay register (SPND) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines a next-access delay value during serial transfer by using the SPNDEN bit in the selected SPCMD and SPND, as shown in Table 19.10. For a definition of next-access delay, see section 19.4.4, Transfer Format.

Table 19.10 Relationship among SPNDEN and SPND Settings and Next-Access Delay Values

SPNDEN	SPND	Next-Access Delay Value
0	000 to 111	1 RSPCK + 2 P1φ
1	000	1 RSPCK + 2 P1φ
	001	2 RSPCK + 2 P1φ
	010	3 RSPCK + 2 P1φ
	011	4 RSPCK + 2 P1φ
	100	5 RSPCK + 2 P1φ
	101	6 RSPCK + 2 P1φ
	110	7 RSPCK + 2 P1φ
	111	8 RSPCK + 2 P1φ

(h) Initialization Flowchart

Figure 19.17 is a flowchart illustrating an example of initialization in SPI operation when this module is used in master mode. For a description of how to set up the interrupt controller, direct memory access controller, and input/output ports, see the descriptions given in the individual blocks.

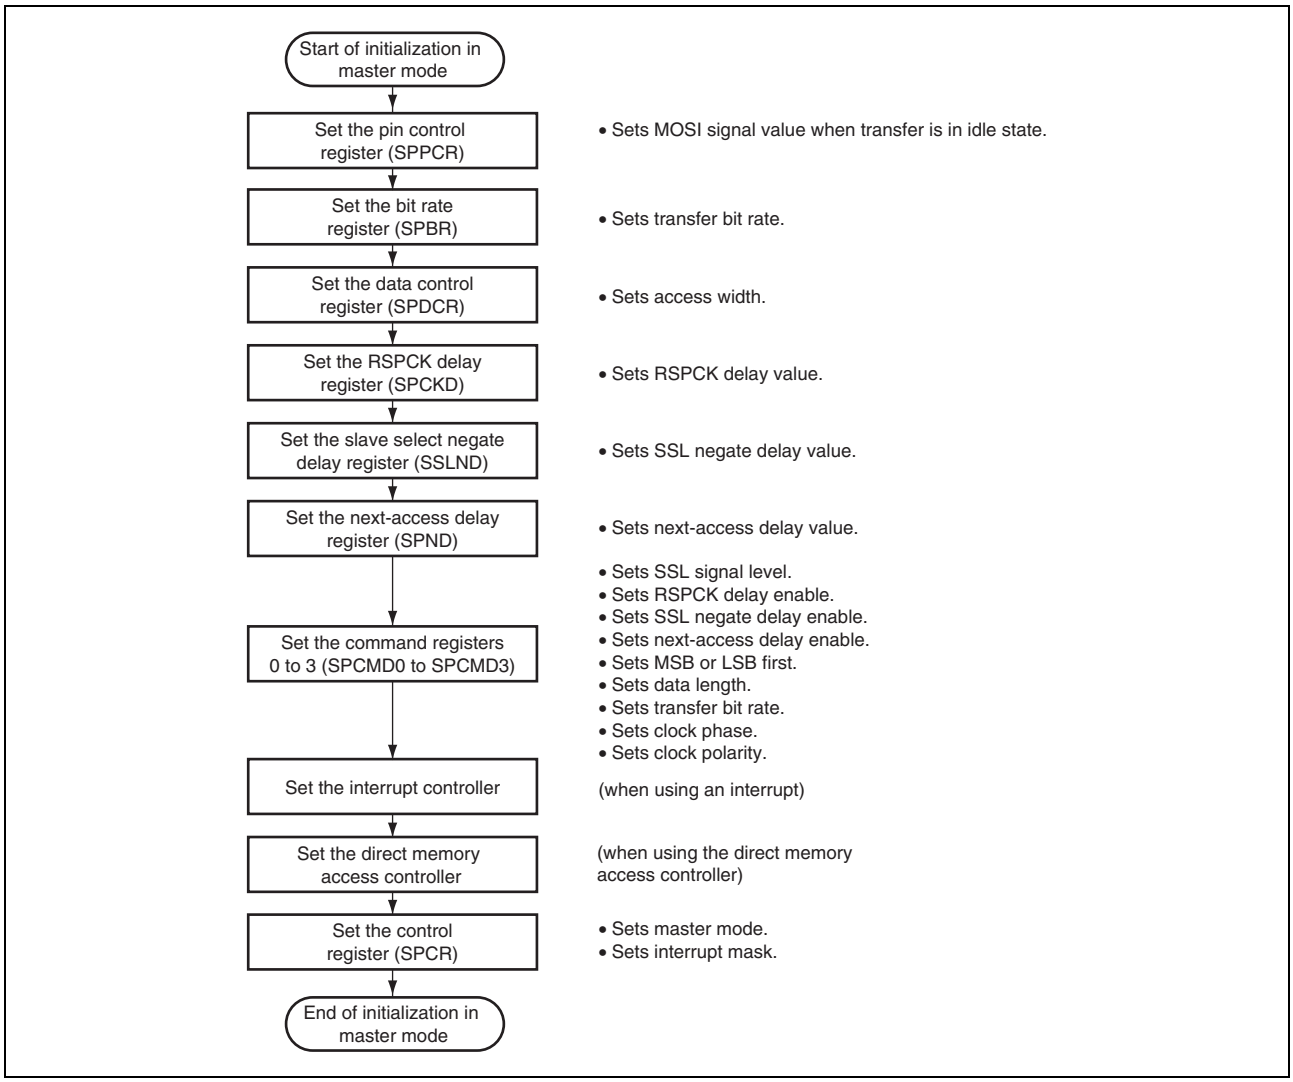

Figure 19.17 Example of Initialization Flowchart in Master Mode

(i) Transfer Operation Flowchart

Figure 19.18 is a flowchart illustrating a transfer in SPI operation when this module is used in master mode.

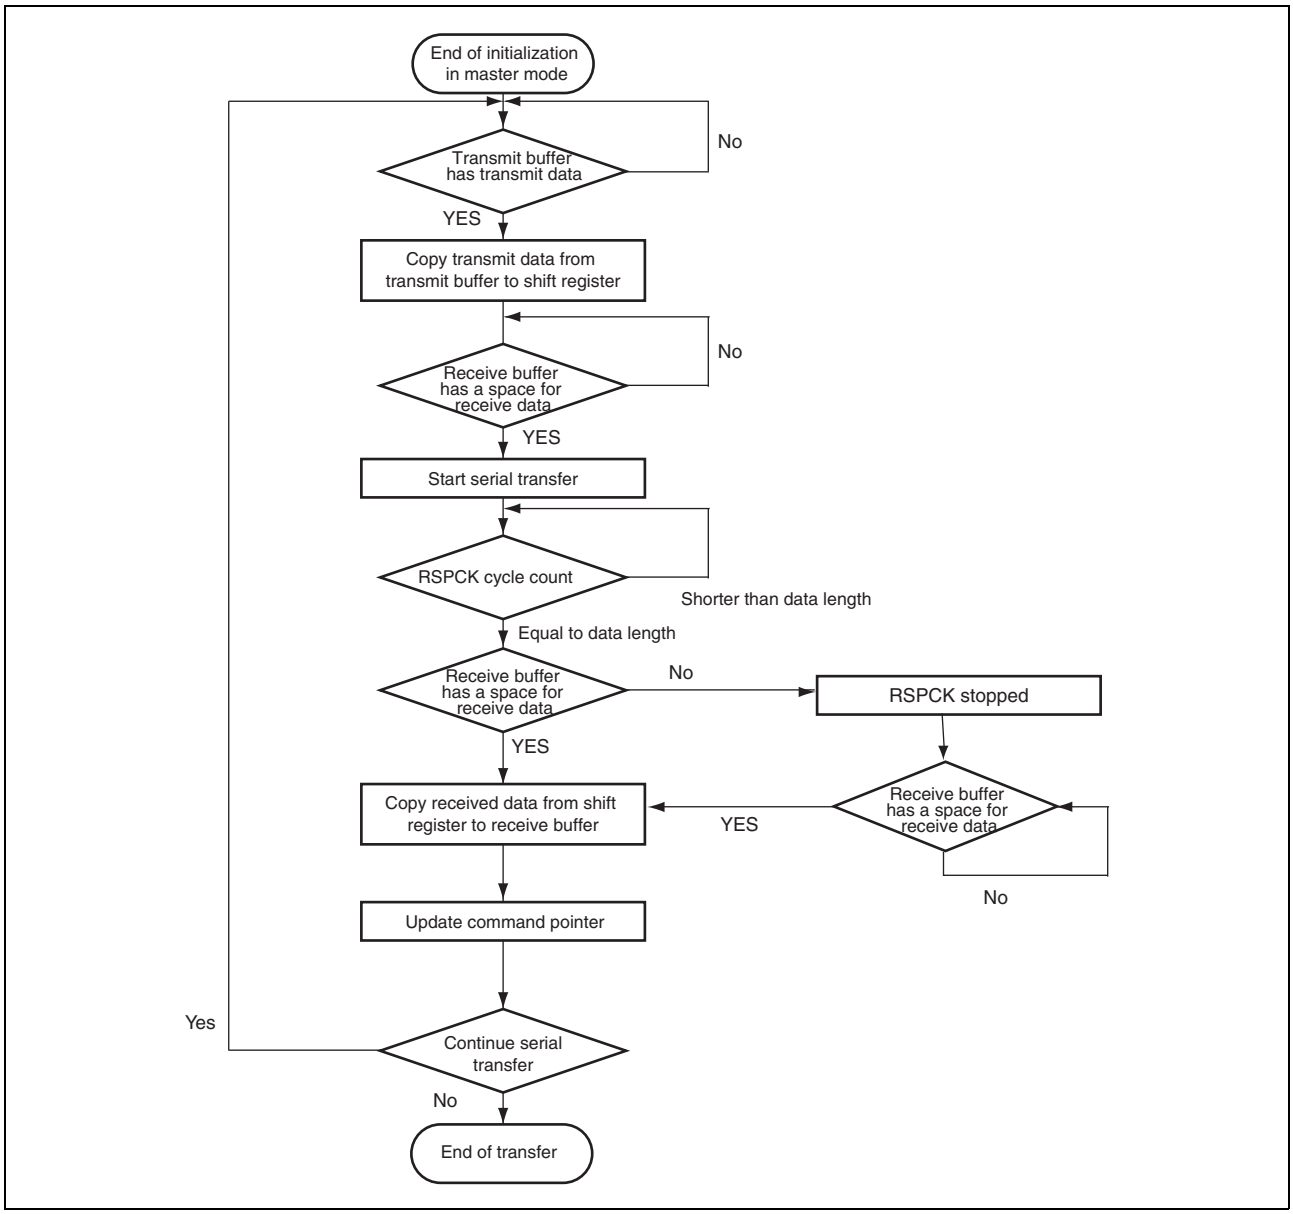

Figure 19.18 Transfer Operation Flowchart in Master Mode

(2) Slave Mode Operation

(a) Starting Serial Transfer

If this module detects an SSL input signal assertion when the CPHA bit in the command register 0 (SPCMD0) is 0, this module is required to start driving valid data to the MISO output signal. For this reason, when the CPHA bit is 0, the asserting of the SSL input signal triggers the start of a serial transfer.
If this module detects the first RSPCK edge in an SSL signal asserted condition when the CPHA bit is 1, this module is required to start driving valid data to the MISO output signal. For this reason, when the CPHA bit is 1, the first RSPCK edge in an SSL signal asserted condition triggers the start of a serial transfer.
When detecting the start of a serial transfer in a condition in which the shift register is empty, this module changes the status of the shift register to "full", so that data cannot be copied from the transmit buffer to the shift register when serial transfer is in progress. If the shift register was full before the serial transfer started, this module leaves the status of the shift register intact, in the full state.
Irrespective of CPHA bit settings, this module starts driving MISO output signals at the SSL signal assertion timing. Whether the data output from this module is valid or invalid differs depending on CPHA bit settings.
For details on the transfer format, see section 19.4.4, Transfer Format. The polarity of the SSL input signal depends on the setting of the SSL0P bit in the slave select polarity register (SSLP).

(b) Terminating Serial Transfer

Irrespective of the CPHA bit in the command register 0 (SPCMD0), this module terminates the serial transfer after detecting an RSPCK edge corresponding to the final sampling timing. When the receive buffer has an enough space for receive data, this module copies received data from the shift register to the receive buffer of the data register (SPDR) upon termination of the serial transfer. Irrespective of the value of the SPRF bit, this module changes the status of the shift register to "empty" upon termination of the serial transfer. If this module detects an SSL input signal negation from the beginning of serial transfer to the end of serial transfer, a mode fault error occurs (see section 19.4.6, Error Detection).
The final sampling timing changes depending on the bit length of the transfer data. In slave mode, the data length depends on the settings in bits SPB3 to SPB0 bits in SPCMD0. The polarity of the SSL input signal depends on the setting in the SSL0P bit in the slave select polarity register (SSLP). For details on the transfer format, see section 19.4.4, Transfer Format.

(c) Notes on Slave Operations

If the CPHA bit in the command register 0(SPCMD0) is 0, this module starts serial transfers when it detects the assertion edge for an SSL input signal. In the type of configuration shown in Figure 19.4 as an example, if this module is used in single-slave mode, the SSL signal is always fixed at active state. Therefore, when the CPHA bit is set to 0, this module cannot correctly start a serial transfer. To correctly execute send/receive operation in a configuration in which the SSL input signal is fixed at active state, the CPHA bit should be set to 1. When it is necessary to set the CPHA bit to 0, the SSL input signal should not be fixed.

(d) Burst Transfer

If the CPHA bit in the command register 0 (SPCMD0) is 1, continuous serial transfer (burst transfer) can be executed while retaining the assertion state for the SSL input signal. If the CPHA bit is 1, the period from the first RSPCK edge to the sampling timing for the reception of the final bit in an SSL signal active state corresponds to a serial transfer period. Even when the SSL input signal remains at the active level, this module can accommodate burst transfers because it can detect the start of access.
If the CPHA bit is 0, for the reason given in section 19.4.8, (2), (c) Notes on Slave Operations, second and subsequent serial transfers during the burst transfer cannot be executed correctly.

(e) Initialization Flowchart

Figure 19.19 is a flowchart illustrating an example of initialization in SPI operation when this module is used in slave mode. For a description of how to set up the interrupt controller, direct memory access controller, and input/output ports, see the descriptions given in the individual blocks.

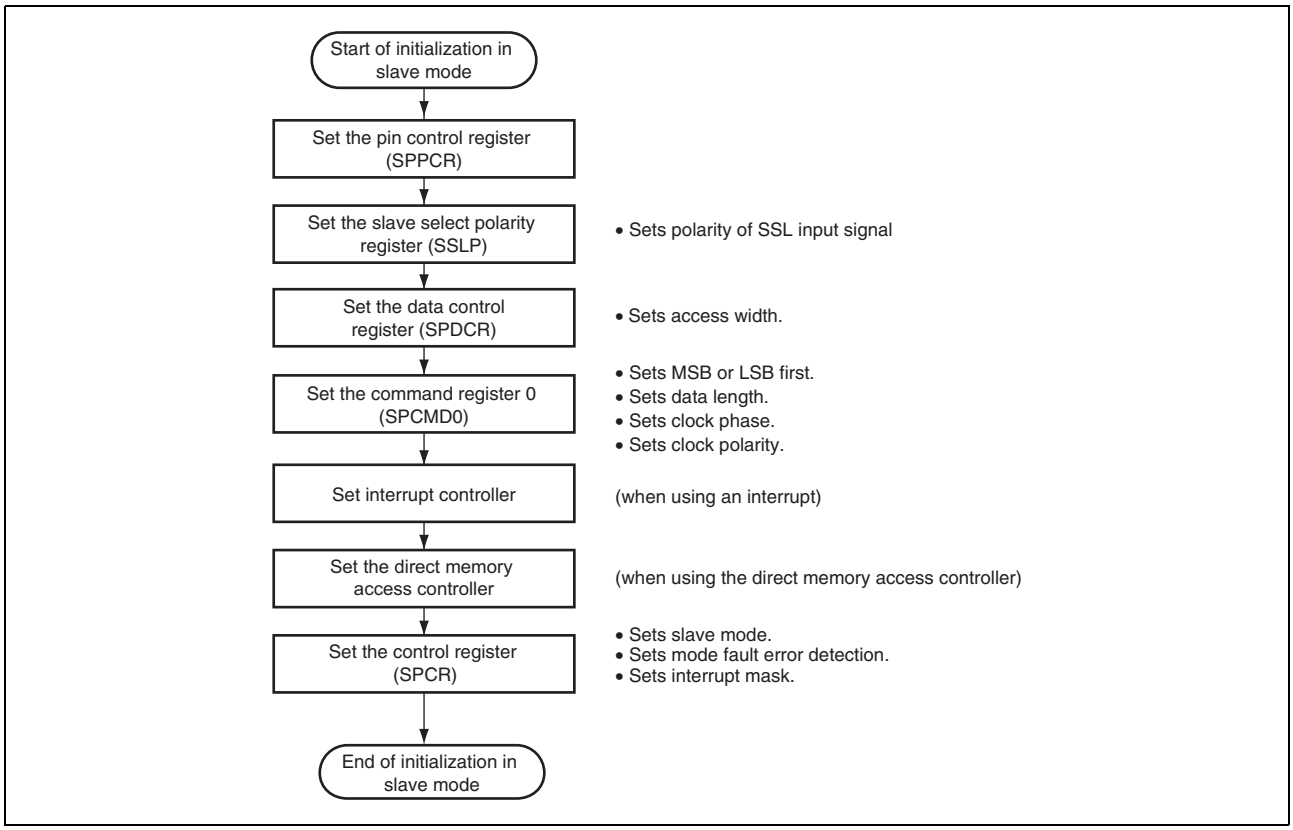

Figure 19.19 Example of Initialization Flowchart in Slave Mode

(f) Transfer Operation Flowchart (CPHA = 0)

Figure 19.20 is a flowchart illustrating a transfer in SPI operation when this module is used in slave mode with the CPHA bit in the command register 0 (SPCMD0) set to 0.

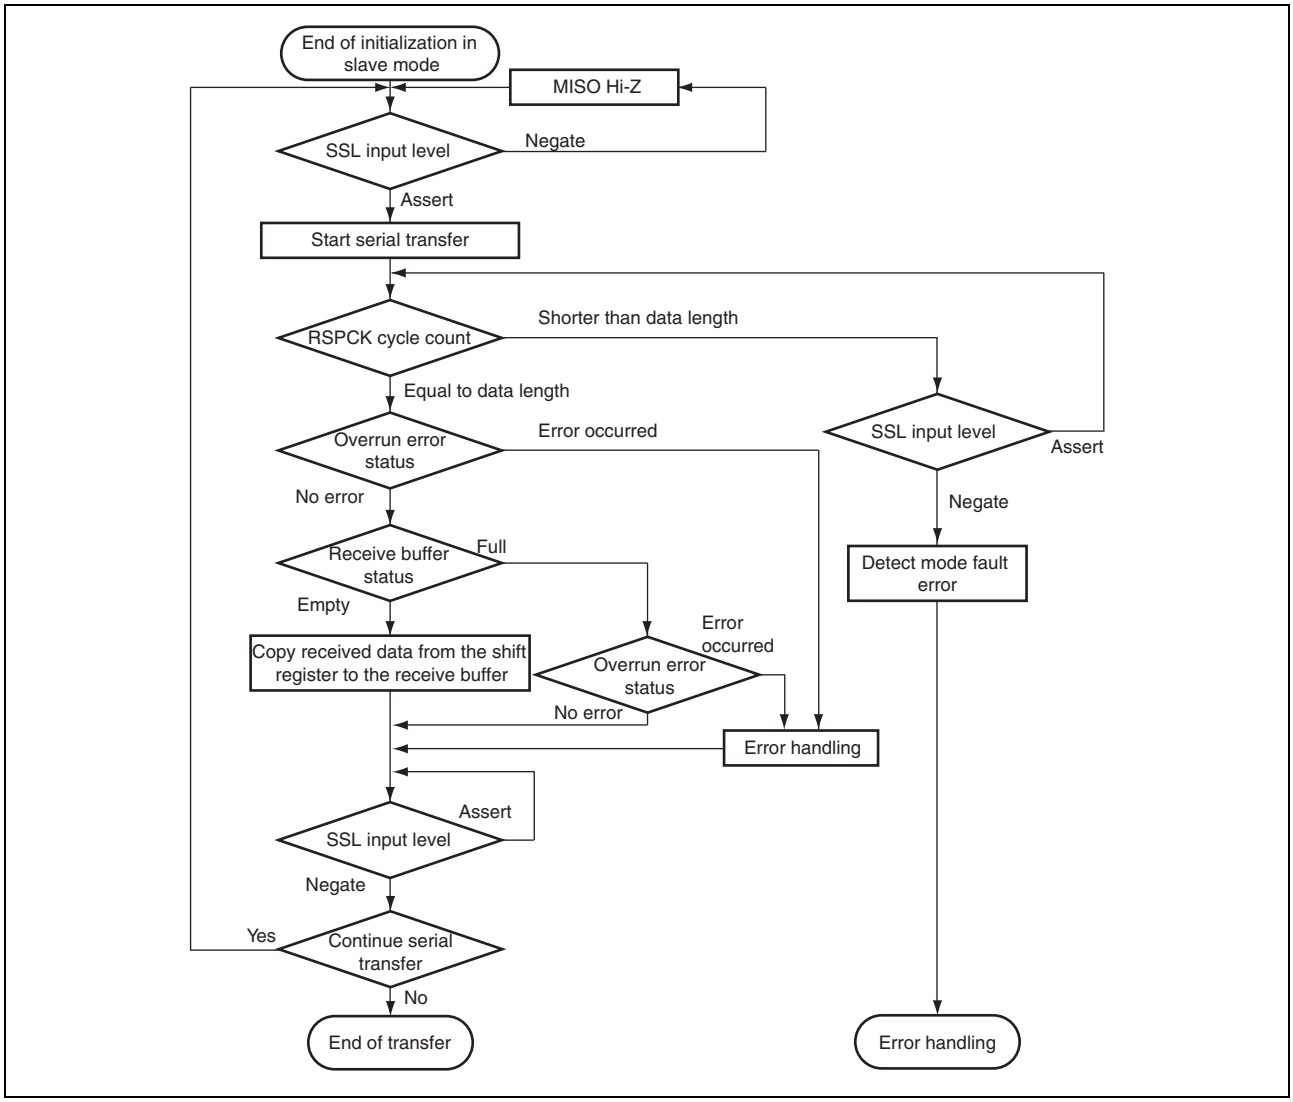

Figure 19.20 Transfer Operation Flowchart in Slave (CPHA = 0)

(g) Transfer Operation Flowchart (CPHA = 1)

Figure 19.21 is a flowchart illustrating a transfer in SPI operation when this module is used in slave mode with the CPHA bit in the command register 0 (SPCMD0) and the MODFEN bit in the control register (SPCR) set to 1, respectively. The subsequent operation is not guaranteed when the serial transfer is started with the MODFEN bit set to 0 and the SSL input level is negated with the number of RSPCK cycles shorter than the data length.

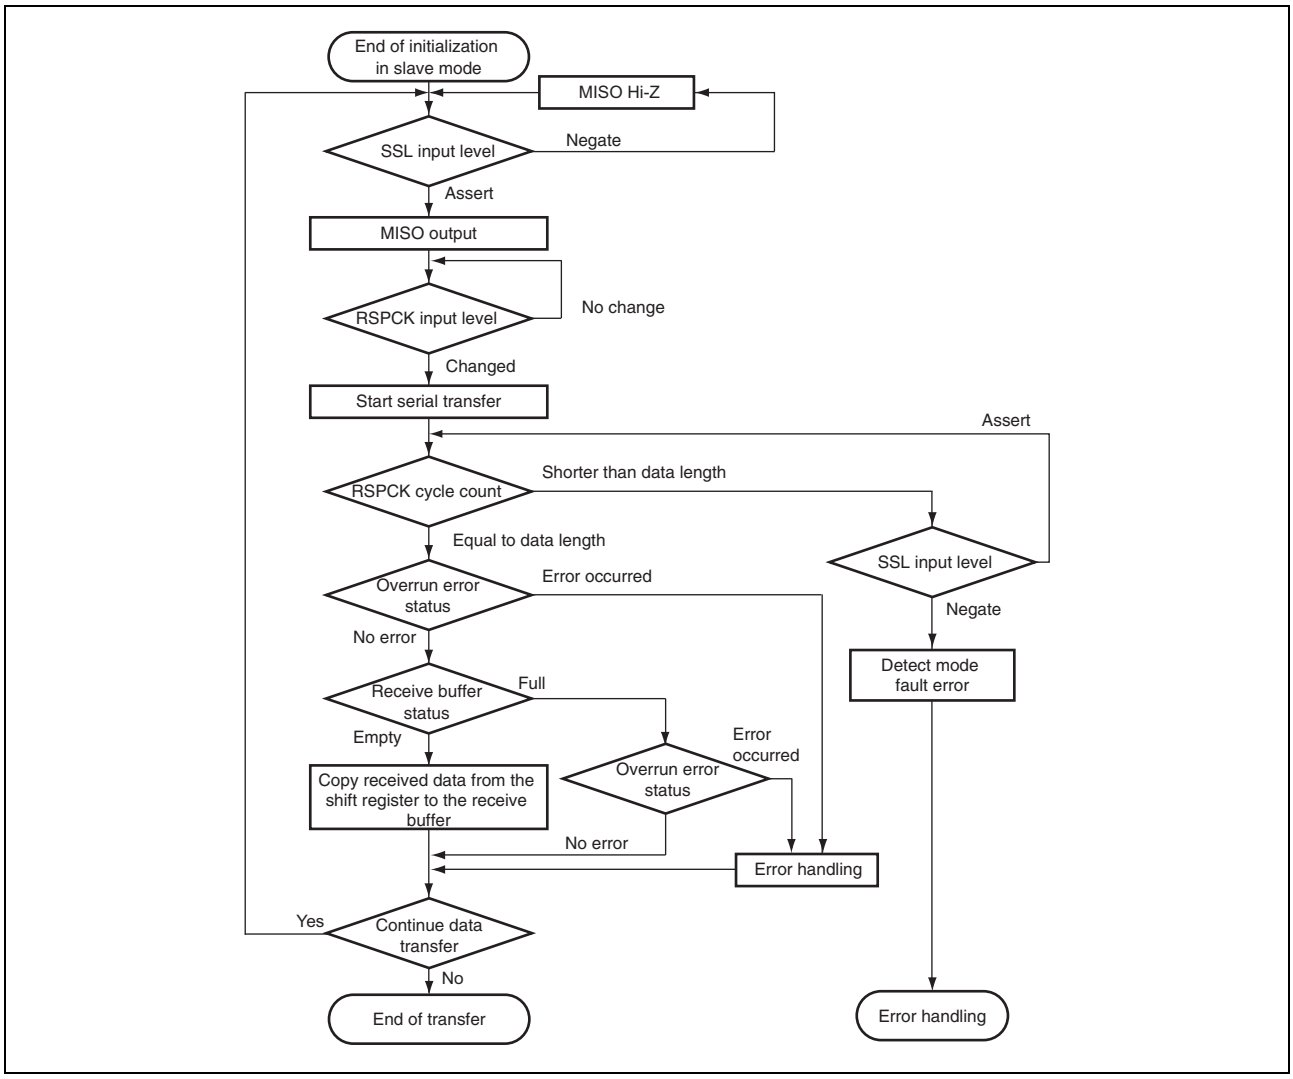

Figure 19.21 Transfer Operation Flowchart in Slave Mode (CPHA = 1)

19.4.9 Error Handling

Figure 19.22 and Figure 19.23 show the error handling. The following error handling is used to return from the error state after an error in master or slave mode.

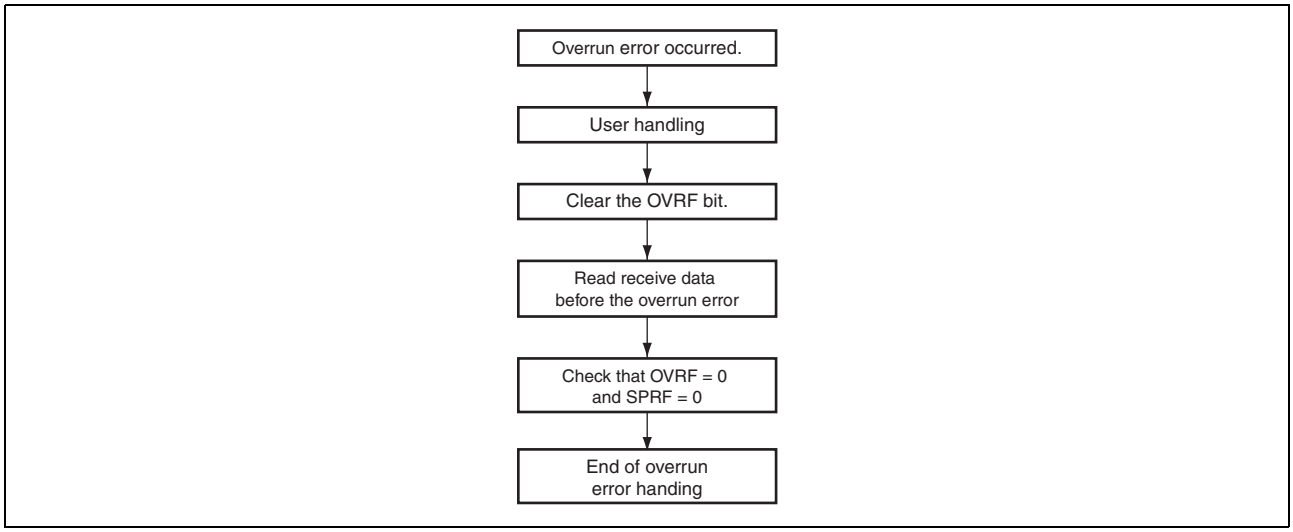

Figure 19.22 Error Handling (Overrun Error)

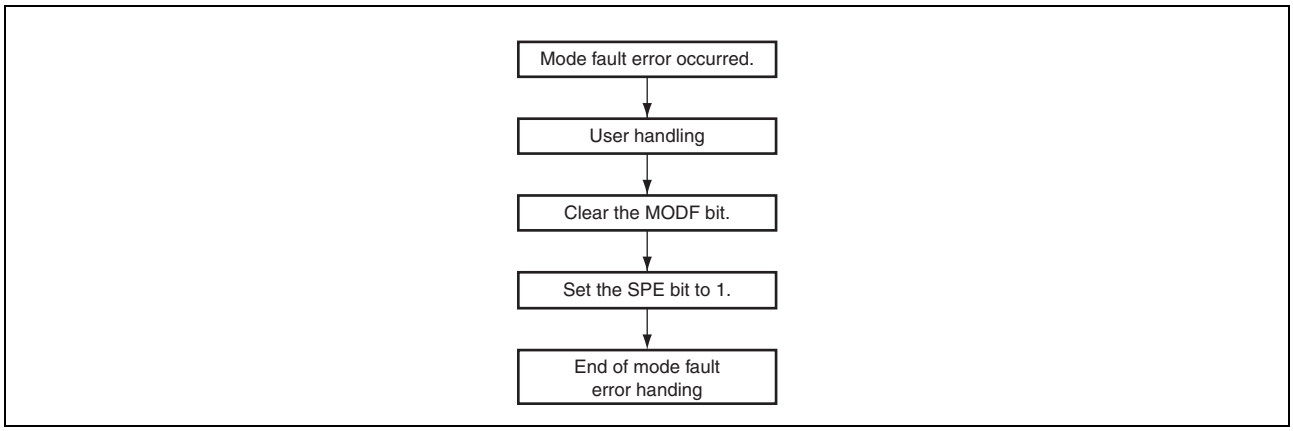

Figure 19.23 Error Handling (Mode Fault Error)

19.4.10 Loopback Mode

When 1 is written to the SPLP bit in the pin control register (SPPCR), this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects the input path and the output path (reversed) of the shift register. This is called loopback mode. When a serial transfer is executed in loopback mode, the transmit data becomes the received data. Figure 19.24 shows the configuration of the shift register input/output paths for the case where this module in master mode is set in loopback mode.

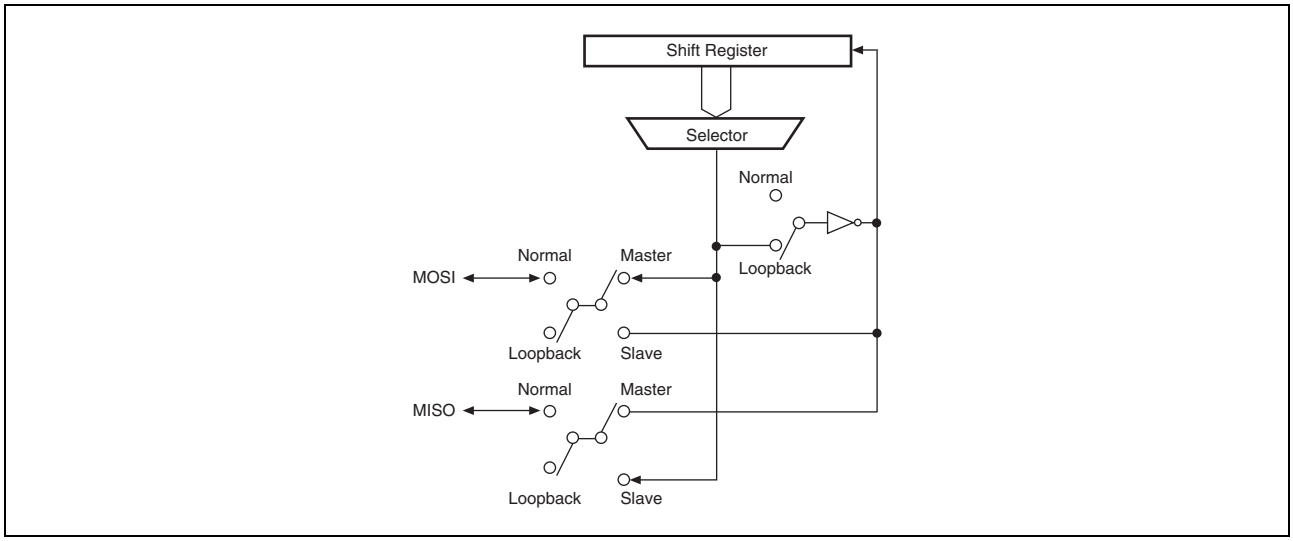

Figure 19.24 Configuration of Shift Register Input/Output Paths in Loopback Mode (Master Mode)

19.4.11 Interrupt Sources

This module has interrupt sources of receive buffer full, transmit buffer empty, mode fault, and overrun. In addition, the direct memory access controller can be activated by the receive buffer full or transmit buffer empty interrupt for data transfer.

Table 19.11 shows the interrupt sources.

When any of the interrupt conditions in Table 19.11 is met, an interrupt is generated. The interrupt sources should be cleared with data transfer by the CPU or direct memory access controller.

Table 19.11 Interrupt Sources

Name	Interrupt Source	Abbreviation	Interrupt Condition	Activation of Direct Memory Access Controller
SPRI	Receive buffer full	RXI	(SPRIE = 1) • (SPRF = 1)	Possible
SPTI	Transmit buffer empty	TXI	(SPTIE = 1) • (SPTEF = 1)	Possible
SPEI	Mode fault	MOI	(SPEIE = 1) • (MODF = 1)	—
	Overrun	OVI	(SPEIE = 1) • (OVRF = 1)	—

20. SPI Multi I/O Bus Controller

The SPI multi I/O bus controller enables the direct connection of serial flash, OctaFlash™, Xccela™ flash, or HyperFlash™ memory devices to this LSI chip.

20.1 Features

This module allows the connected serial flash, OctaFlash™, Xccela™ flash, or HyperFlash™ memory devices to be accessed by reading the external address space, or using Manual mode to transmit and receive data.

20.1.1 Serial Flash Memory Interface

- PVcc_SPI: 3.3V
- QSPI0_SPCLK: 66MHz
- Up to two serial flash memory devices are connectable per channel.
  Note: Two serial flash memory devices are connected in parallel to implement an 8-bit bus interface.
- A data bus size of 1 bit or 4 bits can be selected for one serial flash memory device.
- Both single data rate (SDR) and double data rate (DDR) transfers are supported.
- Supports master operation. (Slave operation is not supported.)

20.1.2 OctaFlash™, Xccela™ Flash Memory Interface

- PVcc_SPI: 1.8V
- QSPI0_SPCLK: 132MHz
- One Octal-SPI flash memory device is connectable.

Note: OctaFlash™ is a trademark of Macronix International Co., Ltd.
Note: Xccela™ flash memory is a trademark of Micron Technology, Inc.
Note: In this manual, an 8-bit SPI flash memory with 1 chip select, 1 clock source, and 1 data strobe configuration is called "Octal-SPI flash memory".
Note: In this manual, transfer with an 8-bit data bus width is referred to as Octal-SPI flash memory protocol mode. Transfer with a 1-bit data bus width is handled in the same way as for standard serial flash memory.

20.1.3 HyperFlash™ Interface

- PVcc_SPI: 1.8V
- QSPI0_SPCLK/QSPI1_SPCLK: 132MHz
- One HyperFlash memory device is connectable.
- The data bus is fixed to 8-bit width.
- Wrapped burst operation is not supported.

Note: HyperFlash is a trademark of Cypress Semiconductor Corporation.

20.1.4 External Address Space Read Mode

- Read access from the bus master to the SPI multi I/O space is automatically converted to a read command, and the read data is returned to the bus master.
- Normal read operation and burst read operation
- Efficient data reception due to built-in read cache (64-bit line × 32 entries)

20.1.5 Manual Mode

- Read and write commands are available for serial flash memory, Octal-SPI flash memory, or HyperFlash memory.
- A write buffer is provided to improve the efficiency of data write operations.
- The cache is not usable for reading.

20.2 Block Diagram

Figure 20.1 shows a block diagram of this module.

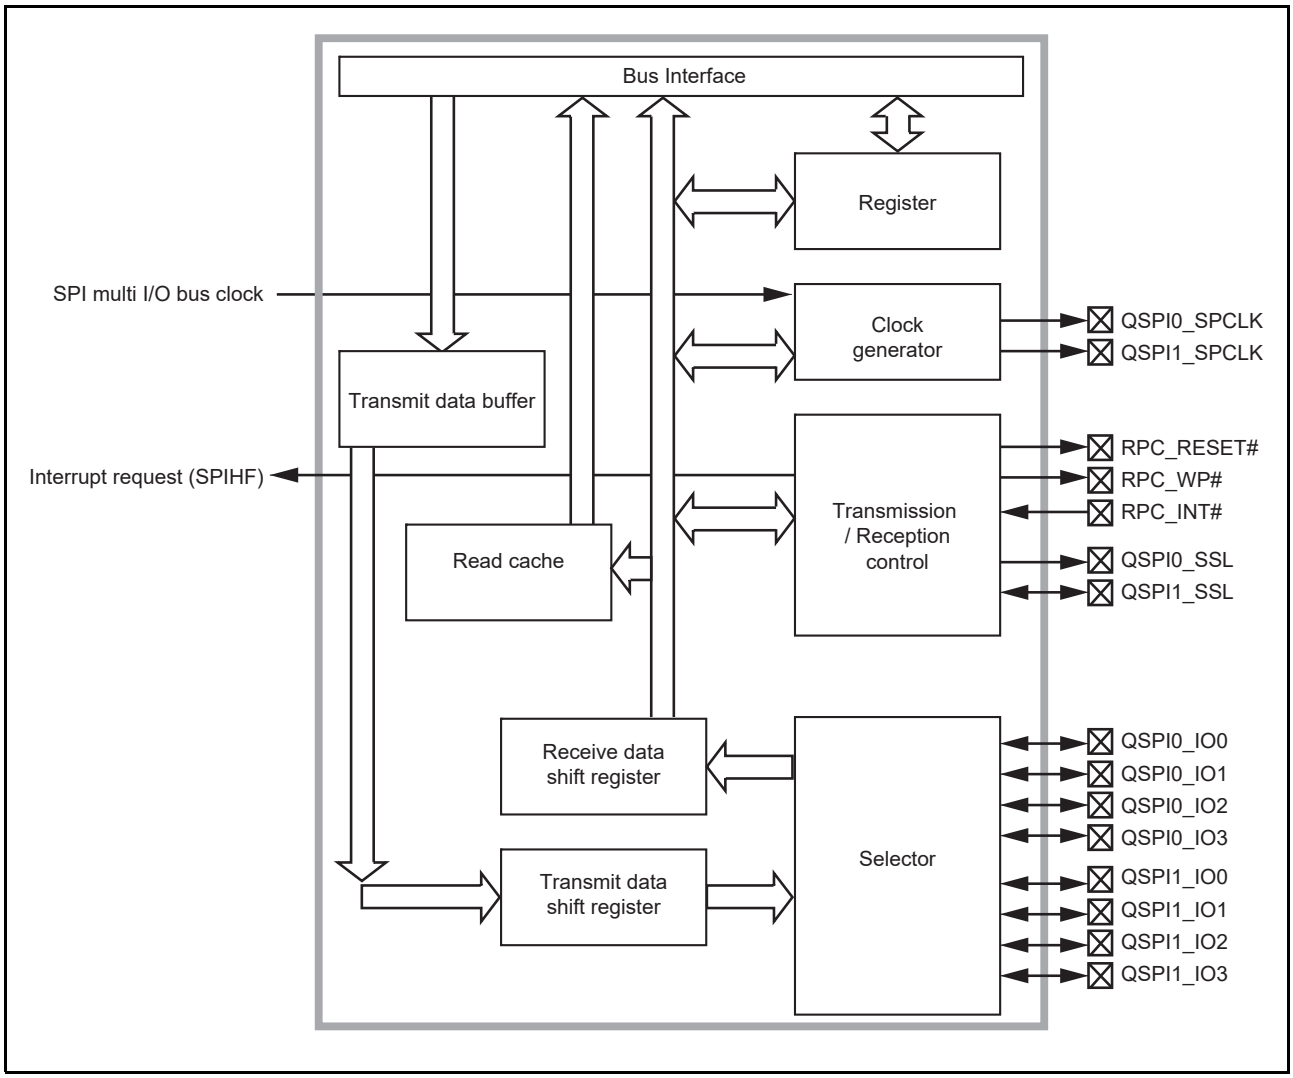

Figure 20.1 Block Diagram

20.3 Input/Output Pins

Table 20.1 shows the pin configuration for one channel.
The operating voltage on pins of the SPI multi I/O bus controller is 3.3 V or 1.8 V.
Before using the pins of the SPI multi I/O bus controller, be sure to set up the dedicated pin POC control register (PPOC) and SPI multi I/O bus controller dedicated pin driving ability control register (PSPIBSC).
For details, see section 51.3.30, Dedicated Pin POC Control Register (PPOC) and section 51.3.34, SPI Multi I/O Bus Controller Dedicated Pin Driving Ability Control Register (PSPIBSC).

Table 20.1 Pin Configuration

Note: Do not write to any address those listed in the table. Otherwise, correct operation cannot be guaranteed. Reading from a non-listed address returns an undefined value.

20.4.1 Common Control Register (CMNCR)

CMNCR is a 32-bit register that controls the SPI multi I/O bus controller. The settings of this register are reflected both in external address space read mode and manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

23, 22	MOIIO3[1:0]	01	R/W	QSPIn_SSL Output Idle Value Fix QSPIn_IO3 Fixes the output value on QSPIn_IO3 while QSPIn_SSL is negated. 00: The output value is 0. 01: The output value is 1. 10: The output value is that of the last bit in the previous transfer (the pin is placed in the Hi-Z state if that was the case in the previous transfer). 11: The pin is placed in the Hi-Z state. Note 1. When a connection is to be made in Octal-SPI flash memory protocol mode, set these bits to 01. Note 2. If a HyperFlash memory device is connected, be sure to set these bits to 10 (the output value being that of the last bit in the previous transfer, with the pin placed in the Hi-Z state if that was the case in the previous transfer).
21, 20	MOIIO2[1:0]	01	R/W	QSPIn_SSL Output Idle Value Fix QSPIn_IO2 Fixes the output value on QSPIn_IO2 while QSPIn_SSL is negated. 00: The output value is 0. 01: The output value is 1. 10: The output value is that of the last bit in the previous transfer (the pin is placed in the Hi-Z state if that was the case in the previous transfer). 11: The pin is placed in the Hi-Z state. Note 1. When a connection is to be made in Octal-SPI flash memory protocol mode, set these bits to 01. Note 2. If a HyperFlash memory device is connected, be sure to set these bits to 10 (the output value being that of the last bit in the previous transfer, with the pin placed in the Hi-Z state if that was the case in the previous transfer).

Bit	Bit Name	Initial Value	R/W	Description
19, 18	MOIIO1[1:0]	01	R/W	QSPIn_SSL Output Idle Value Fix QSPIn_IO1 Fixes the output value on QSPIn_IO1 while QSPIn_SSL is negated. 00: The output value is 0. 01: The output value is 1. 10: The output value is that of the last bit in the previous transfer (the pin is placed in the Hi-Z state if that was the case in the previous transfer). 11: The pin is placed in the Hi-Z state. Note 1. When a connection is to be made in Octal-SPI flash memory protocol mode, set these bits to 01. Note 2. If a HyperFlash memory device is connected, be sure to set these bits to 10 (the output value being that of the last bit in the previous transfer, with the pin placed in the Hi-Z state if that was the case in the previous transfer).
17, 16	MOIIO0[1:0]	01	R/W	QSPIn_SSL Output Idle Value Fix QSPIn_IO0 Fixes the output value on QSPIn_IO0 while QSPIn_SSL is negated. 00: The output value is 0. 01: The output value is 1. 10: The output value is that of the last bit in the previous transfer (the pin is placed in the Hi-Z state if that was the case in the previous transfer). 11: The pin is placed in the Hi-Z state. Note 1. When a connection is to be made in Octal-SPI flash memory protocol mode, set these bits to 01. Note 2. If a HyperFlash memory device is connected, be sure to set these bits to 10 (the output value being that of the last bit in the previous transfer, with the pin placed in the Hi-Z state if that was the case in the previous transfer).
15, 14	IO3FV[1:0]	01	R/W	QSPIn_IO3 Fixed Value for 1-bit Size Fixes the output value of QSPIn_IO3 pin for 1-bit size. 00: The output value is 0. 01: The output value is 1. 10: The output value is that of the last bit in the previous transfer (the pin is placed in the Hi-Z state if that was the case in the previous transfer). 11: The pin is placed in the Hi-Z state.
13, 12	IO2FV[1:0]	11	R/W	QSPIn_IO2 Fixed Value for 1-bit Size Fixes the output value of QSPIn_IO2 pin for 1-bit size. 00: The output value is 0. 01: The output value is 1. 10: The output value is that of the last bit in the previous transfer (the pin is placed in the Hi-Z state if that was the case in the previous transfer). 11: The pin is placed in the Hi-Z state.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	IO0FV[1:0]	11	R/W	QSPIn_IO0 Fixed Value for 1-bit Size Fixes the output value of QSPIn_IO0 pin for 1-bit size. 00: The output value is 0. 01: The output value is 1. 10: The output value is that of the last bit in the previous transfer (the pin is placed in the Hi-Z state if that was the case in the previous transfer). 11: The pin is placed in the Hi-Z state. Note: Set these bits to 11 (the pin is placed in the Hi-Z state) when data read transfer size is not 1-bit.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	BSZ[1:0]	01	R/W	Data Bus Size Specifies the number of serial flash memories to be connected. When HyperFlash connected, set to 01. 00: one serial flash memory connected 01: Two serial flash memory devices are connected, a single HyperFlash memory device is connected, or a single device is connected in Octal-SPI flash memory protocol mode. 1X: Setting prohibited Note: After changing (the value of) this bit field, all the entries in the read cache must be cleared by setting the RCF bit in DRCR to 1.

Note: The settings of the MOIIO3, MOIIO2, MOIIO1, and MOIIO0 bits for control over fixing the output values are reflected at the time QSPIn_SSL is negated on completion of data transfer.

20.4.2 SSL Delay Register (SSLDR)

SSLDR is a 32-bit register that adjusts the timing between the QSPIn_SSL signal and the QSPIn_SPCLK signal.
The settings of this register are reflected both in external address space read mode and manual mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	SPNDL[2:0]	000	R/W	Next Access Delay Sets the period from transfer end to next transfer start (next access). 000: 1 QSPIn_SPCLK (3 QSPIn_SPCLK when SSLE = 0) 001: 2 QSPIn_SPCLK 010: 3 QSPIn_SPCLK 011: 4 QSPIn_SPCLK 100: 5 QSPIn_SPCLK 101: 6 QSPIn_SPCLK 110: 7 QSPIn_SPCLK 111: 8 QSPIn_SPCLK
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	SLNDL[2:0]	000	R/W	QSPIn_SSL Negation Delay Sets the period from the time the last QSPIn_SPCLK edge is sent of a transfer to QSPIn_SSL pin negation (QSPIn_SSL negation delay). 000: 1 QSPIn_SPCLK 001: 2 QSPIn_SPCLK 010: 3 QSPIn_SPCLK 011: 4 QSPIn_SPCLK 100: 5 QSPIn_SPCLK 101: 6 QSPIn_SPCLK 110: 7 QSPIn_SPCLK 111: 8 QSPIn_SPCLK
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	SCKDL[2:0]	000	R/W	Clock Delay Sets the period from QSPIn_SSL pin assertion to QSPIn_SPCLK oscillation (clock delay). 000: 1.5 QSPIn_SPCLK 001: 2.5 QSPIn_SPCLK 010: 3.5 QSPIn_SPCLK 011: 4.5 QSPIn_SPCLK 100: 5.5 QSPIn_SPCLK 101: 6.5 QSPIn_SPCLK 110: 7.5 QSPIn_SPCLK 111: 8.5 QSPIn_SPCLK

20.4.3 Data Read Control Register (DRCR)

DRCR is a 32-bit register that sets the operation in external address space read mode.
The bits except the SSLN bit should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SSLN	—	—	—	RBURST[4:0]				
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RCF	RBE	—	—	—	—	—	—	—	SSLE
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	SSLN	0	W	QSPIn_SSL Negation Asserted QSPIn_SSL can be negated by writing 1 to this bit when both the RBE and SSLE bits are 1. This bit is always read as 0. Note: To start next access after QSPIn_SSL negation using this bit, read SSLF in CMNSR = 0 to confirm that the QSPIn_SSL has been negated.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	RBURST [4:0]	11111	R/W	Read Data Burst Length Sets the burst length (data unit count) when reading. This bit field is enabled when the RBE bit is set to 1. 00000: 1 data unit 00001: 2 continuous data units : 11110: 31 continuous data units 11111: 32 continuous data units One data unit is 64 bits long.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	RCF	0	W	Read Cache Flush When 1 is written to this bit, all the entries in the read cache are cleared. This bit is always read as 0. After using the cache area as the write buffer, the cache area must be cleared by writing 1 to the RCF bit. Note: After flushing the read cache by writing 1 to the RCF bit, read the DRCR register before proceeding to read from the external address space.
8	RBE	1	R/W	Read Burst Turns burst ON or OFF when reading. 0: Data is read according to the access size. 1: Read cache is enabled, and as many data units as the burst count specified in RBURST[4:0] bits is read. Note: When the cache is enabled and read access reaches the last address of the flash memory, the access address does not match the address held in the cache. Control the read address and access size so that read access does not reach the last address of the flash memory.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	SSLE	0	R/W	QSPIn_SSL Negation Sets the conditions for QSPIn_SSL negation during read burst. QSPIn_SSL is negated for each access during normal read. 0: QSPIn_SSL is negated after transfer of data set in burst length. 1: QSPIn_SSL is negated when the accessed address is not continuous with the previously transferred address. Note 1. Set up this bit when a serial flash memory device is connected. Note 2. When this bit is set to 1, setting the RBURST[4:0] bits to 5'h01 is prohibited.

20.4.4 Data Read Command Setting Register (DRCMR)

DRCMR is a 32-bit register that sets the commands issued in external address space read mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CMD[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	OCMD[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	CMD[7:0]	H'A0	R/W	Command Sets the command.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	OCMD[7:0]	'H00	R/W	Optional Command Sets the optional command.

20.4.5 Data Read Extended Address Setting Register (DREAR)

DREAR is a 32-bit register that is set when addresses for serial flash memory or according to the Octal-SPI flash memory protocol are to be output in 32-bit mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

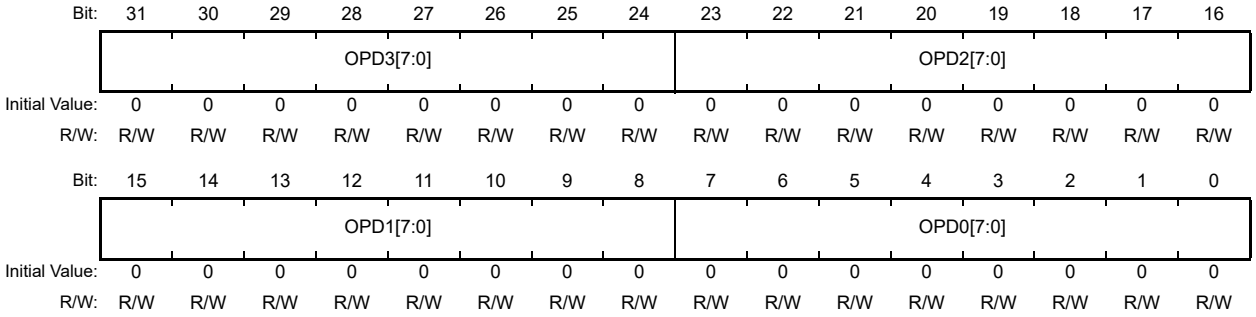
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	EAV[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	EAC[2:0]		
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	EAV[7:0]	H'00	R/W	32-Bit Extended Upper Address Fixed Value Sets the higher-order address bit values for external addresses as specified by the EAC[2:0] bits when addresses for serial flash memory or according to the Octal-SPI flash memory protocol are to be output in 32-bit mode. Bit 0 corresponds to address bit 25 of the serial flash memory or Octal-SPI flash memory, and bit 7 corresponds to bit 32. This setting is valid when the ADE[3] bit in DRENR is 1. When EAC[2:0] are 000, set a fixed value for address bits 32 to 25 of the serial flash memory or Octal-SPI flash memory in EAV[7:0]. When EAC[2:0] are 001, set a fixed value for address bits 32 to 26 of the serial flash memory or Octal-SPI flash memory in EAV[7:1]. When EAC[2:0] are 010, set a fixed value for address bits 32 to 27 of the serial flash memory or Octal-SPI flash memory in EAV[7:2]. When EAC[2:0] are 011, set a fixed value for address bits 32 to 28 of the serial flash memory or Octal-SPI flash memory in EAV[7:3]. (1) When a single serial flash memory device is connected or the Octal-SPI flash memory protocol is in use Address bits 31 to 0 of the serial flash memory are used in access. (2) When two serial flash memory devices are connected Address bits 32 to 1 of the serial flash memory are used in access.
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	EAC[2:0]	000	R/W	32-Bit Extended External Address Valid Range Sets the range of external addresses to be used as addresses of the serial flash memory or Octal-SPI flash memory when addresses for serial flash memory or according to the Octal-SPI flash memory protocol are to be output in 32-bit mode. This setting is valid when the ADE[3] bit in DRENR is 1. 000: External address bits [24:0] enabled 001: External address bits [25:0] enabled 010: External address bits [26:0] enabled 011: External address bits [27:0] enabled Other than above: Setting prohibited

20.4.6 Data Read Option Setting Register (DROPR)

DROPR is a 32-bit register that sets the option data in external address space read mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	OPD3[7:0]	H'00	R/W	Option Data 3 Sets the option data 3.
23 to 16	OPD2[7:0]	H'00	R/W	Option Data 2 Sets the option data 2.
15 to 8	OPD1[7:0]	H'00	R/W	Option Data 1 Sets the option data 1.
7 to 0	OPD0[7:0]	H'00	R/W	Option Data 0 Sets the option data 0.

Note: OPD3, OPD2, OPD1, and OPD0 are output in this order.

20.4.7 Data Read Enable Setting Register (DRENR)

DRENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and read data in external address space read mode and enables outputting them other than read data.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

When HyperFlash memory is connected or a connection is made in Octal-SPI flash memory protocol mode, refer to Table 20.6, Enable Register (HyperFlash), or Table 20.7, Enable Register (Octal-SPI Flash Memory Protocol Mode).

Bit	Bit Name	Initial Value	R/W	Description
31, 30	CDB[1:0]	10	R/W	Command Bit Size Sets the command size in bit units. 00: 1 bit 10: 4 bits Other than above: Setting prohibited
29, 28	OCDB[1:0]	10	R/W	Optional Command Bit Size Sets the optional command size in bit units. 00: 1 bit 10: 4 bits Other than above: Setting prohibited
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25, 24	ADB[1:0]	10	R/W	Address Bit Size Sets the address size in bit units. 00: 1 bit 10: 4 bits Other than above: Setting prohibited
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	OPDB[1:0]	10	R/W	Option Data Bit Size Sets the option data size in bit units. 00: 1 bit 10: 4 bits Other than above: Setting prohibited
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	DRDB[1:0]	10	R/W	Data Read Bit Size Sets the data read size in bit units. 00: 1 bit 10: 4 bits Other than above: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
15	DME	1	R/W	Dummy Cycle Enable Enables insertion of the dummy cycle before the read data. Note: A setting is prohibited for a transfer starting with a dummy cycle. 0: Dummy cycle insertion disabled 1: Dummy cycle insertion enabled
14	CDE	1	R/W	Command Enable Sets whether or not the command is to be output. 0: Command output disabled 1: Command output enabled Note: When an Octal-SPI flash memory device is connected and this bit set to 1, set the CDE bit in SMENR register to 0.
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	OCDE	1	R/W	Optional Command Enable Sets whether or not the optional command is to be output. 0: Optional command output disabled 1: Optional command output enabled Note: When an Octal-SPI flash memory device is connected, set this bit to 0.
11 to 8	ADE[3:0]	0100	R/W	Address Enable Sets the address to be output. Be sure to use the following setting; otherwise, the operation is not guaranteed. (1) When a serial flash memory device is connected 0000: Output disabled 0111: Address[23:0] 1111: Address[31:0] Other than above: Setting prohibited (2) When two serial flash memory devices are connected or a connection is made in Octal-SPI flash memory protocol mode 0000: Output disabled 0111: Address[24:1] 1111: Address[32:1] 1100: Addresses in Octal-SPI flash memory protocol mode (operation is in accord with the 8-8-8 protocol in Table 20.15) Other than above: Setting prohibited (3) When a HyperFlash memory device is connected 0100: HyperFlash addresses Other than above: Setting prohibited
7 to 4	OPDE[3:0]	0000	R/W	Option Data Enable Sets the option data to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 1000: OPD3 1100: OPD3, OPD2 1110: OPD3, OPD2, OPD1 1111: OPD3, OPD2, OPD1, OPD0 Other than above: Setting prohibited
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

20.4.8 Manual Mode Control Register (SMCR)

SMCR is a 32-bit register that sets the operation in Manual mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SSLKP	—	—	—	—	—	SPIRE	SPIWE	SPIE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SSLKP	0	R/W	QSPIn_SSL Signal Level Determines the QSPIn_SSL status after the end of transfer. 0: QSPIn_SSL signal is negated at the end of transfer. 1: QSPIn_SSL signal level is maintained from the end of transfer to the start of next access. Note: The setting to start data transfer for reading is prohibited while the setting of SSLKP is 1.
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	SPIRE	0	R/W	Data Read Enable Enables reading in manual mode. 0: Data reading disabled 1: Data reading enabled Note: When the transfer data bit size is set to 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time.
1	SPIWE	0	R/W	Data Write Enable Enables writing in manual mode. 0: Data writing disabled 1: Data writing enabled Note: When the transfer data bit size is set to 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time.
0	SPIE	0	W	SPI Data Transfer Enable Data is transferred by setting this bit to 1. This bit is enabled only when the TEND bit in CMNSR is set to 1. The operation cannot be guaranteed when this bit is set to 1 with the TEND bit set to 0. This bit is always read as 0. Note: When the QSPIn_SSL pin is de-asserted, the command, optional command, address, and option data that are output enabled are output even if the SPIRE and SPIWE bits are set to 0. When the QSPIn_SSL pin is asserted, follow the notes described in section 20.6.2, Notes on Starting Transfer from the QSPIn_SSL Retained State in Manual Mode.

20.4.9 Manual Mode Command Setting Register (SMCMR)

SMCMR is a 32-bit register that sets the commands issued in Manual mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CMD[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	OCMD[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	CMD[7:0]	H'00	R/W	Command Sets the command.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	OCMD[7:0]	H'00	R/W	Optional Command Sets the optional command.

20.4.10 Manual Mode Address Setting Register (SMADR)

SMADR is a 32-bit register that sets the addresses in Manual mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADR[31:24]								ADR[23:16]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADR[15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ADR[31:24]	H'00	R/W	Address Sets the value of bits 31 to 24 when the serial flash address is output in 32-bit units. If a serial flash memory or Octal-SPI flash memory is connected, the setting of these bits is only valid when the ADE[3] bit in the SMENR register is 1. If HyperFlash memory is connected, the setting of these bits is valid regardless of the setting of the ADE[3] bit.
23 to 0	ADR[23:0]	H'000000	R/W	Address Sets the address.

20.4.11 Manual Mode Option Setting Register (SMOPR)

SMOPR is a 32-bit register that sets the option data in Manual mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OPD3[7:0]								OPD2[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OPD1[7:0]								OPD0[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	OPD3[7:0]	H'00	R/W	Option Data 3 Sets the option data 3.
23 to 16	OPD2[7:0]	H'00	R/W	Option Data 2 Sets the option data 2.
15 to 8	OPD1[7:0]	H'00	R/W	Option Data 1 Sets the option data 1.
7 to 0	OPD0[7:0]	H'00	R/W	Option Data 0 Sets the option data 0.

Note: OPD3, OPD2, OPD1, and OPD0 are output in this order.

20.4.12 Manual Mode Enable Setting Register (SMENR)

SMENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and transfer data in Manual mode and enables their output. SMENR also enables dummy cycle insertion. Disabling all of the command, optional command, address, option data, dummy cycle, and transfer data is prohibited. At least one of them except dummy cycle must be enabled.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

When HyperFlash memory is connected or a connection is made in Octal-SPI flash memory protocol mode, refer to Table 20.6, Enable Register (HyperFlash), or Table 20.7, Enable Register (Octal-SPI Flash Memory Protocol Mode).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

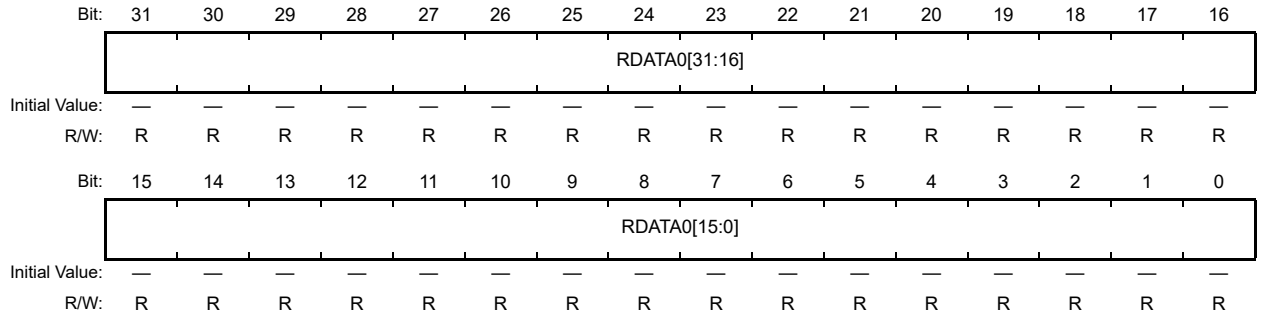
Bit	Bit Name	Initial Value	R/W	Description
31, 30	CDB[1:0]	00	R/W	Command Bit Size Sets the command size in bit units. 00: 1 bit 10: 4 bits Other than above: Setting prohibited
29, 28	OCDB[1:0]	00	R/W	Optional Command Bit Size Sets the optional command size in bit units. 00: 1 bit 10: 4 bits Other than above: Setting prohibited
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25, 24	ADB[1:0]	00	R/W	Address Bit Size Sets the address size in bit units. 00: 1 bit 10: 4 bits Other than above: Setting prohibited
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	OPDB[1:0]	00	R/W	Option Data Bit Size Sets the option data size in bit units. 00: 1 bit 10: 4 bits Other than above: Setting prohibited
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	SPIDB[1:0]	00	R/W	Transfer Data Bit Size Sets the transfer data size in bit units. 00: 1 bit 10: 4 bits Other than above: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
15	DME	0	R/W	Dummy Cycle Enable Enables insertion of the dummy cycle before the read data. Note: Dummy cycle insertion is prohibited for write in Manual mode including the case in which a transfer ends with a dummy cycle. Note: A setting is prohibited for a transfer starting with a dummy cycle. 0: Dummy cycle insertion disabled 1: Dummy cycle insertion enabled
14	CDE	1	R/W	Command Enable Sets the command to be output. 0: Command output disabled 1: Command output enabled Note: When an Octal-SPI flash memory device is connected and the CDE bit in DRENR register set to 1, set this bit to 0.
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	OCDE	0	R/W	Optional Command Enable Sets the optional command to be output. 0: Optional command output disabled 1: Optional command output enabled Note: When an Octal-SPI flash memory device is connected, set this bit to 0.
11 to 8	ADE[3:0]	0000	R/W	Address Enable Sets the address to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. (1) When a serial flash memory is connected or a connection is made in Octal-SPI flash memory protocol mode 0000: Output disabled 0100: ADR[23:16] 0110: ADR[23:8] 0111: ADR[23:0] 1111: ADR[31:0] 1100: Addresses in Octal-SPI flash memory protocol mode (operation is in accord with the 8-8-X protocol in Table 20.15) Other than above: Setting prohibited (2) When a HyperFlash memory device is connected 0100: HyperFlash memory Note: The setting of these bits is required to be 0111 or 1111 when the write buffer is in use.
7 to 4	OPDE[3:0]	0000	R/W	Option Data Enable Sets the option data to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 1000: OPD3 1100: OPD3, OPD2 1110: OPD3, OPD2, OPD1 1111: OPD3, OPD2, OPD1, OPD0 Other than above: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	SPIDE[3:0]	0000	R/W	Transfer Data Enable Sets valid transfer data. Valid data differs depending on the BSZ[1:0] bit setting in CMNCR. The following settings must be used. Otherwise, the operation is not guaranteed. (1) BSZ[1:0] bits in CMNCR = 00 (one serial flash memory connected) 0000: Not transferred 1000: 8 bits transferred (enables data at address 0 of the Manual mode read/write data registers 0) 1100: 16 bits transferred (enables data at addresses 0 and 1 of the Manual mode read/write data registers 0) 1111: 32 bits transferred (enables data at addresses 0 to 3 of the Manual mode read/write data registers 0) Other than above: Setting prohibited (2) BSZ[1:0] bits in CMNCR = 01 (two serial flash memories connected) 0000: Not transferred 1000: 16 bits transferred (enables data at addresses 0 and 1 of the Manual mode read/write data registers 0) 1100: 32 bits transferred (enables data at addresses 0 to 3 of the Manual mode read/write data registers 0) 1111: 64 bits transferred (enables data at addresses 0 to 3 of the Manual mode read/write data registers 0 and data at addresses 0 to 3 of the Manual mode read/write data registers 1) Other than above: Setting prohibited

20.4.13 Manual Mode Read Data Register 0 (SMRDR0)

SMRDR0 is a 32-bit register that stores the read data in Manual mode.
Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the Manual mode enable setting register (SMENR). Be sure to access from LSB.
The settings of this register should be read when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

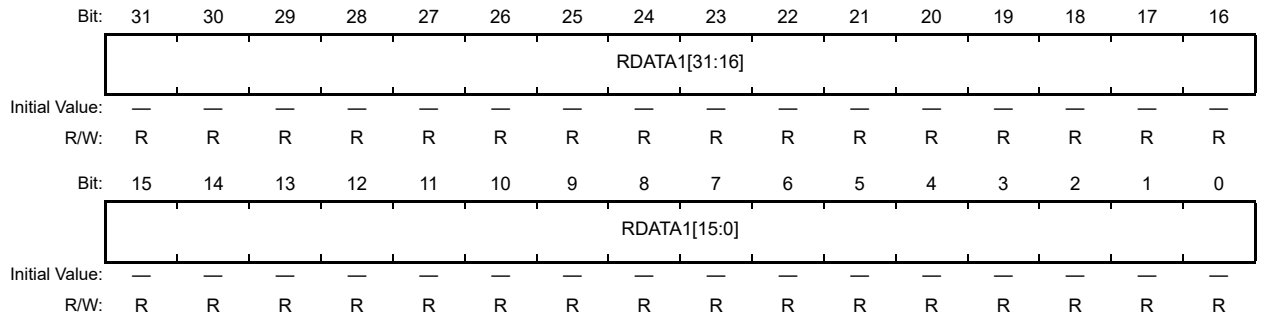


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDATA0[31:0]	Undefined	R	Read Data Holds the data read in Manual mode. Data bits differ depending on the BSZ[1:0] bit setting in CMNCR. BSZ[1:0] = 00: Read data[31:0]. BSZ[1:0] = 01: Read data[63:32].

Note: The contents of this register and SMRDR1 are modified upon completion of reception in manual mode. Be sure to read data when reception in manual mode is completed.

20.4.14 Manual Mode Read Data Register 1 (SMRDR1)

SMRDR1 is a 32-bit register that stores the read data in Manual mode.
Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the Manual mode enable setting register (SMENR). Be sure to access from LSB.
The settings of this register should be read when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDATA1[31:0]	Undefined	R	Read Data Holds the data read in Manual mode. Data bits differ depending on the BSZ[1:0] bit setting in CMNCR. BSZ[1:0] = 00: Bits in this register are disabled. BSZ[1:0] = 01: Read data[31:0]

20.4.15 Manual Mode Write Data Register 0 (SMWDR0)

SMWDR0 is a 32-bit register that sets the write data in Manual mode.
Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the Manual mode enable setting register (SMENR). Be sure to access from address 0.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WDATA0[31:16]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	WDATA0 [31:0]	All 0	R/W	Write Data Holds the data to be written in Manual mode. Data bits differ depending on the BSZ[1:0] bit setting in CMNCR. BSZ[1:0] = 00: Write data[31:0]. BSZ[1:0] = 01: Write data[63:32]. Note: In Octal-SPI flash memory protocol mode (OPI), the write data should be arranged and written as follows. • To write data D[31:0] in the STR mode WDATA0[31:0]={D[23:20], D[31:28], D[19:16], D[27:24], D[7: 4], D[15:12], D[3: 0], D[11: 8] } • To write data D[31:0] in the DTR mode WDATA0[31:0]={D[31:28], D[23:20], D[27:24], D[19:16], D[15:12], D[7:4], D[11:8], D[3:0]}

20.4.16 Manual Mode Write Data Register 1 (SMWDR1)

SMWDR1 is a 32-bit register that sets the write data in Manual mode.
This register is enabled when the BSZ[1:0] bits in CMNCR are set to 01 and disabled when the BSZ[1:0] bits in CMNCR are set to 00.
Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the Manual mode enable setting register (SMENR). Be sure to access from address 0.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WDATA1[31:16]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit: :	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WDATA1[15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	WDATA1 [31:0]	All 0	R/W	Write Data Holds the data to be written in Manual mode. Data bits differ depending on the BSZ[1:0] bit setting in CMNCR. BSZ[1:0] = 00: Bits in this register are disabled. BSZ[1:0] = 01: Write data[31:0]. Note: In Octal-SPI flash memory protocol mode (OPI), the write data should be arranged and written as follows. •To write data D[31:0] in the STR mode WDATA1[31:0]={D[23:20], D[31:28], D[19:16], D[27:24], D[7: 4], D[15:12], D[3: 0], D[11: 8]} •To write data D[31:0] in the DTR mode WDATA1[31:0]={D[31:28], D[23:20], D[27:24], D[19:16], D[15:12], D[7:4], D[11:8], D[3:0]}

20.4.17 Common Status Register (CMNSR)

CMNSR is a 32-bit register that holds flags indicating the operating state.
The settings of this register are reflected both in external address space read mode and Manual mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SSLF	TEND
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SSLF	0	R	QSPIn_SSL Pin Monitor 0: QSPIn_SSL pin is negated 1: QSPIn_SSL pin is asserted
0	TEND	1	R	Transfer End Flag Indicates whether the data transfer has ended. 0: Indicates that data transfer is in progress 1: Indicates that data transfer has ended

20.4.18 Data Read Dummy Cycle Setting Register (DRDMCR)

DRDMCR is a 32-bit register that sets the number of dummy cycles to be inserted in external address space read mode. The settings of this register are enabled when the DME bit in the data read enable setting register (DRENR) is 1.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	DMCYC[4:0]				
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	DMCYC[4:0]	H'0B	R/W	Number of Dummy Cycles Sets the number of dummy cycles to be inserted when the DME bit in the data read enable setting register (DRENR) is 1. 00001: 2 cycles 00010: 3 cycles … 10010: 19 cycles 10011: 20 cycles Other than above: Setting prohibited

20.4.19 Data Read DDR Enable Register (DRDRENR)

DRDRENR is a 32-bit register that sets SDR or DDR transfer of the address, option data, and read data in external address space read mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	HYPE			—	—	—	ADDRE	—	—	—	OPDRE	—	—	—	DRDRE
Initial Value:	0	1	0	1	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R/W	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	HYPE	101	R/W	HyperFlash, Octal-SPI flash memory DDR mode enable 101: When HyperFlash memory is connected, not only commands but also addresses and data are transferred according to the Octal-SPI flash memory protocol for DDR mode. 100: Only commands are transferred according to the Octal-SPI flash memory protocol for DDR mode. 000: SPI flash mode Other than above: Setting prohibited
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	ADDRE	1	R/W	Address DDR Enable Sets SDR or DDR transfer of the address. 0: SDR transfer 1: DDR transfer Note: Set this bit to 1 when the HyperFlash memory is connected.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OPDRE	0	R/W	Option Data DDR Enable Sets SDR or DDR transfer of the option data. 0: SDR transfer 1: DDR transfer
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DRDRE	1	R/W	Data Read DDR Enable Sets SDR or DDR transfer of the read data. 0: SDR transfer 1: DDR transfer

20.4.20 Manual Mode Dummy Cycle Setting Register (SMDMCR)

SMDMCR is a 32-bit register that sets the number of dummy cycles to be inserted in Manual mode.
The settings of this register are enabled when the DME bit in the Manual mode enable setting register (SMENR) is 1.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	DMCYC[4:0]	00000	R/W	Number of Dummy Cycles Sets the number of dummy cycles to be inserted when the DME bit in the Manual mode enable setting register (SMENR) is 1. 00001: 2 cycles 00010: 3 cycles .... 10010: 19 cycles 10011: 20 cycles Other than above: Setting prohibited

20.4.21 Manual Mode DDR Enable Register (SMDRENR)

SMDRENR is a 32-bit register that sets SDR or DDR transfer of the address, option data, and transfer data in Manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	HYPE[2:0]	000	R/W	HyperFlash, Octal-SPI Flash Memory Protocol Mode DDR mode enable 101: When HyperFlash memory is connected, not only commands but also addresses and data are transferred according to the Octal-SPI flash memory protocol for DDR mode. 100: Only commands are transferred according to the Octal-SPI flash memory protocol for DDR mode. 000: SPI flash mode Other than above: Setting prohibited
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	ADDRE	0	R/W	Address DDR Enable Sets SDR or DDR transfer of the address. 0: SDR transfer 1: DDR transfer Note: Set this bit to 1 when the HyperFlash memory is connected.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OPDRE	0	R/W	Option Data DDR Enable Sets SDR or DDR transfer of the option data. 0: SDR transfer 1: DDR transfer
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SPIDRE	0	R/W	Transfer Data DDR Enable Sets SDR or DDR transfer of the transfer data. 0: SDR transfer 1: DDR transfer Note: Set this bit to 1 when the HyperFlash memory is connected.

20.4.22 PHY Control Register (PHYCNT)

PHYCNT is a 32-bit register that sets the PHY operation mode.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CAL	0	W	PHY Calibration Specifies whether to perform PHY calibration. Be sure to perform calibration before access in Manual mode. 0: Calibration is not performed. 1: Calibration is performed.
30	ALT_ ALIGN	0	R/W	Alternative Alignment for Octal-SPI Flash Memory Protocol Mode 0: Alternative alignment for a connection in Octal-SPI flash memory protocol mode is not supported. 1: Alternative alignment for a connection in Octal-SPI flash memory protocol mode is supported.
29 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23, 22	OCTA [1:0]	00	R/W	Alignment in Octal-SPI Flash Memory Protocol Mode Specify the data alignment for DDR transfer in Octal-SPI flash memory protocol mode. For details, refer to section 20.5.14, Data Alignment in Octal-SPI Flash Memory Protocol Mode. When the connected memory is HyperFlash or serial flash memory, set these bits to 00. 00: Specify this value when a HyperFlash or serial flash memory device is connected or a connection is made in Octal-SPI flash memory protocol mode (SDR mode). 01: Alternative alignment is supported. 10: Sequential alignment is supported. 11: Setting prohibited. Note 1. When the alternative alignment of Octal-SPI flash memory protocol mode is to be used, also set the ALT_ALIGN bit to 1. Note 2. When the sequential alignment of Octal-SPI flash memory protocol mode is to be used, the setting of the ALT_ALIGN bit is treated as “don’t care”.
21	EXDS	0	R/W	External Data Strobe When the data strobe line is connected to the serial flash memory, the external data strobe signal sent from the serial flash memory is used. When a connection is made in Octal-SPI flash memory protocol mode, set this bit to 1. Note: When the HyperFlash memory is connected, set this bit to 0. 0: The external data strobe signal is not used. 1: The external data strobe signal is used.
20	OCT	0	R/W	Octal-SPI flash memory Protocol Mode 0: A mode other than the Octa protocol mode is used. 1: Octal-SPI flash memory protocol mode is used.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
18	HS	0	R/W	High-Speed Response Mode Specifies the high-speed response mode. 0: Data is read for the number of data units specified in the RBURST bits of the DRCR register and then output to the bus master. 1: The read data is output to bus master in parallel of device access when DRCR.RBE = 1. Note 1. When this bit is set to 1, use DMA transfer. The transfer size in the RBURST[4:0] bits of the DRCR register should be fixed to 5'h1F. Note 2. Do not access the register area during DMA transfer. Note 3. When this bit is set to 1, access address alignment to should be 256Byte align and clear the cache entry by setting the RCF bit in DRCR to 1 before starting DMA transfer.
17, 16	CKSEL [1:0]	00	R/W	Clock Timing Switching Adjusts the timing of the clock when serial flash is connected. Always follow the procedure for setting shown in section 20.5.17, Timing Adjustment. Be sure to set the CKSEL[1:0] bits to b'11 when a connection is made in Octal-SPI flash memory protocol mode or HyperFlash memory is connected.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
8, 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6, 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	WBUF2	0	R/W	Write Buffer Enable 2 Specifies whether to use the write buffer to write data to the flash memory. For the usage of the write buffer, refer to section 20.5.13, Write Buffer Operation. 0: The write buffer is not used. 1: The write buffer is used to write data to the flash memory.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	WBUF	0	R/W	Write Buffer Enable Specifies whether to use the write buffer to write data to the flash memory. For the usage of the write buffer, refer to section 20.5.13, Write Buffer Operation. 0: The write buffer is not used. 1: The write buffer is used to write data to the flash memory.
1, 0	PHYMEM [1:0]	11	R/W	Device Selection Selects the device to be connected. 00: Serial flash or Octal-SPI flash memory in SDR mode 01: Serial flash or Octal-SPI flash memory in DDR mode 11: HyperFlash memory Other than above: Setting prohibited

20.4.23 PHY Offset Register 1 (PHYOFFSET1)

PHYOFFSET1 is a 32-bit register with two effective bits. These are for selecting DDR or SDR operation.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	DDRTMG		—	—	—	—	—	—	—	—	—	—	—	—

Initial Value:	0	0	0	1	0	0	0	1	0	1	0	0	0	1	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29, 28	DDRTMG	10	R/W	SDR or DDR Operation Register 10: Set these bits when data are to be read by DDR transfer in the external address space read mode or manual mode. 11: Set these bits when data are to be read by SDR transfer in the external address space read mode or manual mode. Other than above: Setting prohibited
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
21	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
20	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
5 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
1, 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

20.4.24 PHY Offset Register 2 (PHYOFFSET2)

PHYOFFSET2 is a 32-bit register that sets the timing adjustment in the DDR operation.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OCTTMG			—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	1	0	0	0	0	1	1	0	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	OCTTMG	100	R/W	Octal-SPI Flash Memory Protocol Mode Operation Timing Adjusts the timing of writing in Octal-SPI flash memory protocol mode. 000: Specify this value when using the serial flash memory with write buffer operation of the bit width 1-1-4 or 1-4-4 in Table 20.14. 100: Specify this value when the serial flash or HyperFlash memory is used. 011: Specify this value when a connection is made in Octal-SPI flash memory protocol mode. Other than above: Setting prohibited Note: In Octal-SPI flash memory protocol mode and the serial flash compatible mode, set these bits to 100.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

20.4.25 PHY Interrupt Register (PHYINT)

PHYINT is a 32-bit register for making settings to do with interrupt signals and pins.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	RSTEN	WPEN	INTEN	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RST VAL	WPVAL	INT
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26	RSTEN	1	R/W	RPC_RESET# Pin Enable Enables or disables the RPC_RESET# pin. 0: The RPC_RESET# pin is disabled. 1: The RPC_RESET# pin is enabled and the value specified in the RSTVAL bit is output.
25	WPEN	1	R/W	RPC_WP# Pin Enable Enables or disables the RPC_WP# pin. 0: The RPC_WP# pin is disabled. 1: The RPC_WP# pin is enabled and the value specified in the WPVAL bit is output.
24	INTEN	1	R/W	RPC_INT# Pin Enable Enables or disables the RPC_INT# pin. 0: The RPC_INT# pin is disabled. 1: The RPC_INT# pin is enabled and the interrupt signal sent from the HyperFlash memory is enabled.
23 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	RSTVAL	0	R/W	Value Output through RPC_RESET# Pin Specifies the value to be output through the RPC_RESET# pin. This setting takes effect when the RSTEN bit is set to 1. 0: RPC_RESET# = H 1: RPC_RESET# = L
1	WPVAL	1	R/W	Value Output through RPC_WP# Pin Specifies the value to be output through the RPC_WP# pin. This setting takes effect when the WPEN bit is set to 1. 0: RPC_WP# = H 1: RPC_WP# = L
0	INT	0	R	Interrupt Status When the RPC_INT# signal goes low, this bit is set to 1 to indicate the occurrence of an interrupt in the connected device.

20.4.26 PHY Adjustment Register 1 (PHYADJ1)

PHYADJ1 is a 32-bit register used to adjust the timing when serial flash memory is connected.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADJ1[31:16]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADJ1[15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADJ1[31:0]	All 0	R/W	Serial Flash Memory Operation Timing Adjustment Set these bits by following the procedure shown in Figure 20.29, (1) Flow of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode Except in the Case of Octal-SPI Flash Memory) and Figure 20.29, (2) Flow of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode). Note: Write the setting values described in the order indicated for the flow of adjustment.

Note: Bits 31 to 6 are always read as 0.

20.4.27 PHY Adjustment Register 2 (PHYADJ2)

PHYADJ2 is a 32-bit register used to adjust the timing when serial flash memory is connected.
The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADJ2[31:16]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADJ2[31:0]	All 0	R/W	Serial Flash Memory Operation Timing Adjustment Set these bits by following the procedure shown in Figure 20.29, (1) Flow of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode Except in the Case of Octal-SPI Flash Memory) and Figure 20.29, (2) Flow of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode). Note: Write the setting values described in the order indicated for the flow of adjustment.

20.5 Operation

20.5.1 System Configuration

This module can connect one or two serial flash memory devices, an Octal-SPI flash memory device, or a HyperFlash memory device. The number of connected memories can be selected using the BSZ[1:0] bits in CMNCR.

Examples of system configuration are shown in Figure 20.2, Figure 20.3, Figure 20.4, and Figure 20.5 respectively.

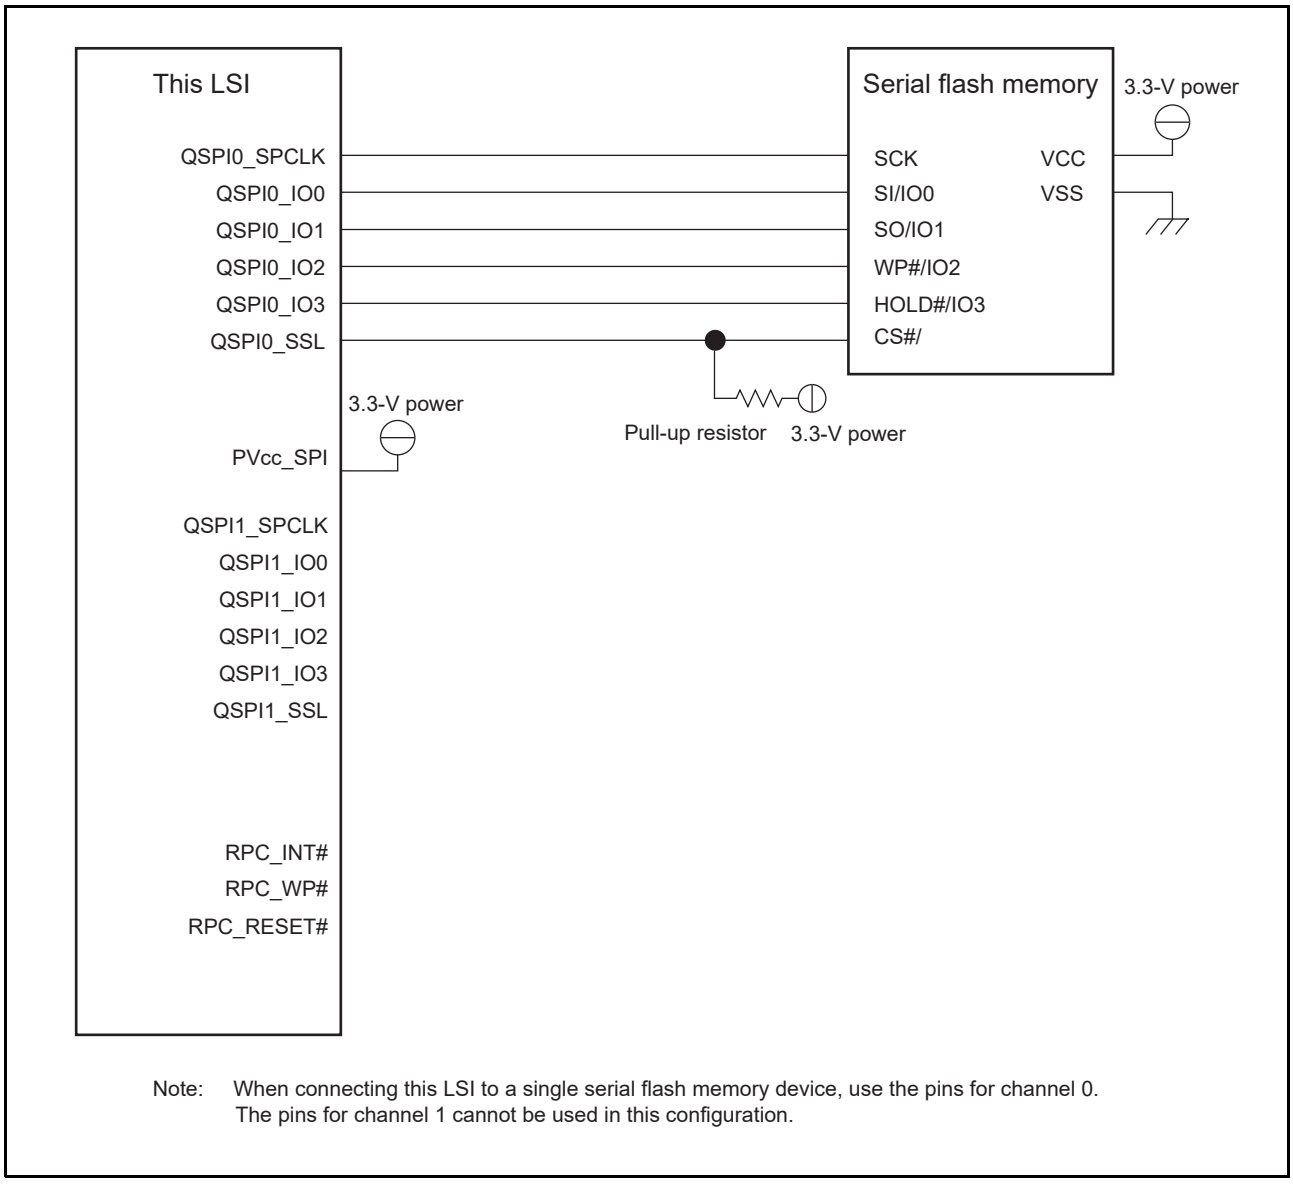

Figure 20.2 System Configuration Example with 4-Bit Data Size and One Serial Flash Memory Connected

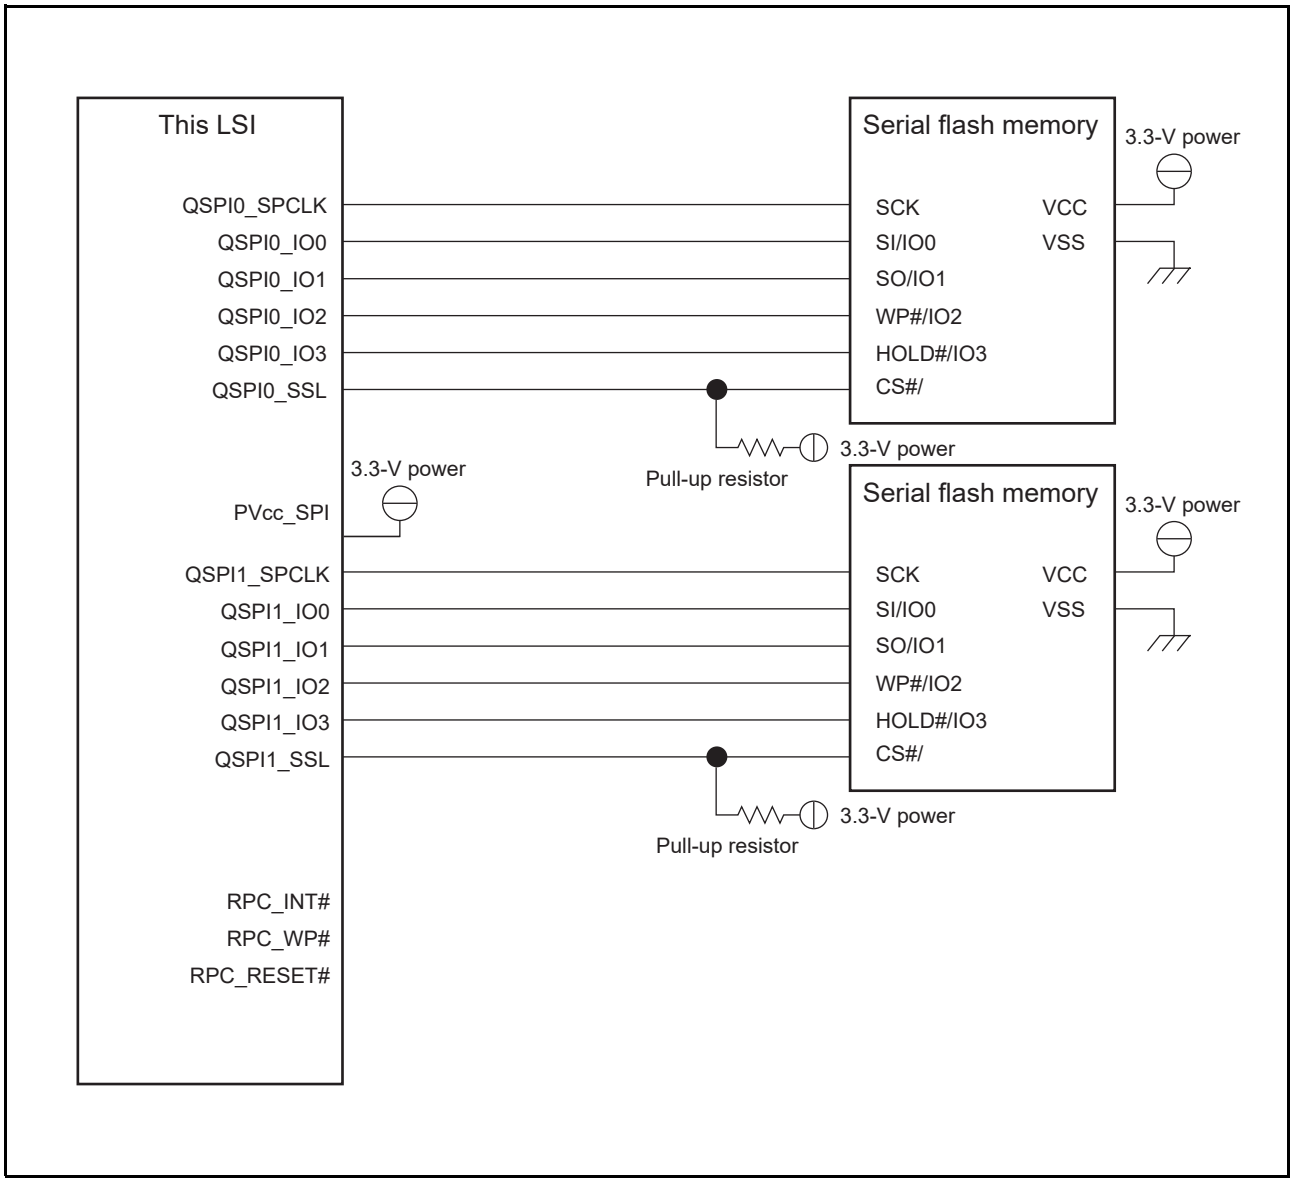

Figure 20.3 System Configuration Example with 4-Bit Data Size and Two Serial Flash Memories Connected (BSZ[1:0] Bits in CMNCR = 01)

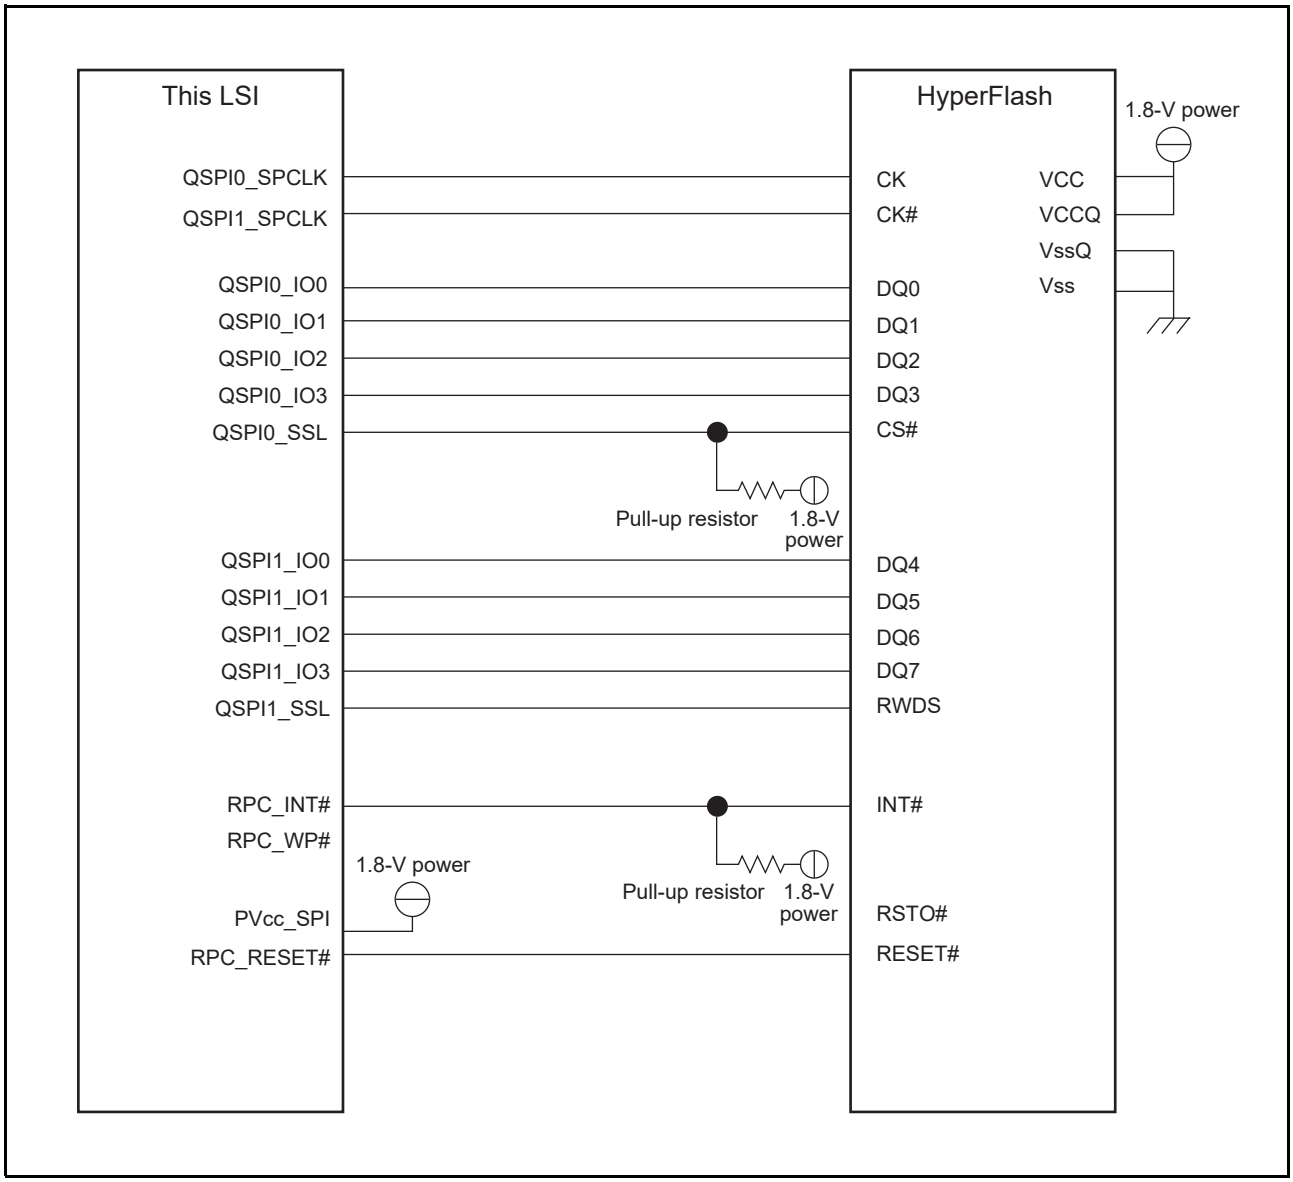

Figure 20.4 System Configuration Example with HyperFlash Connected

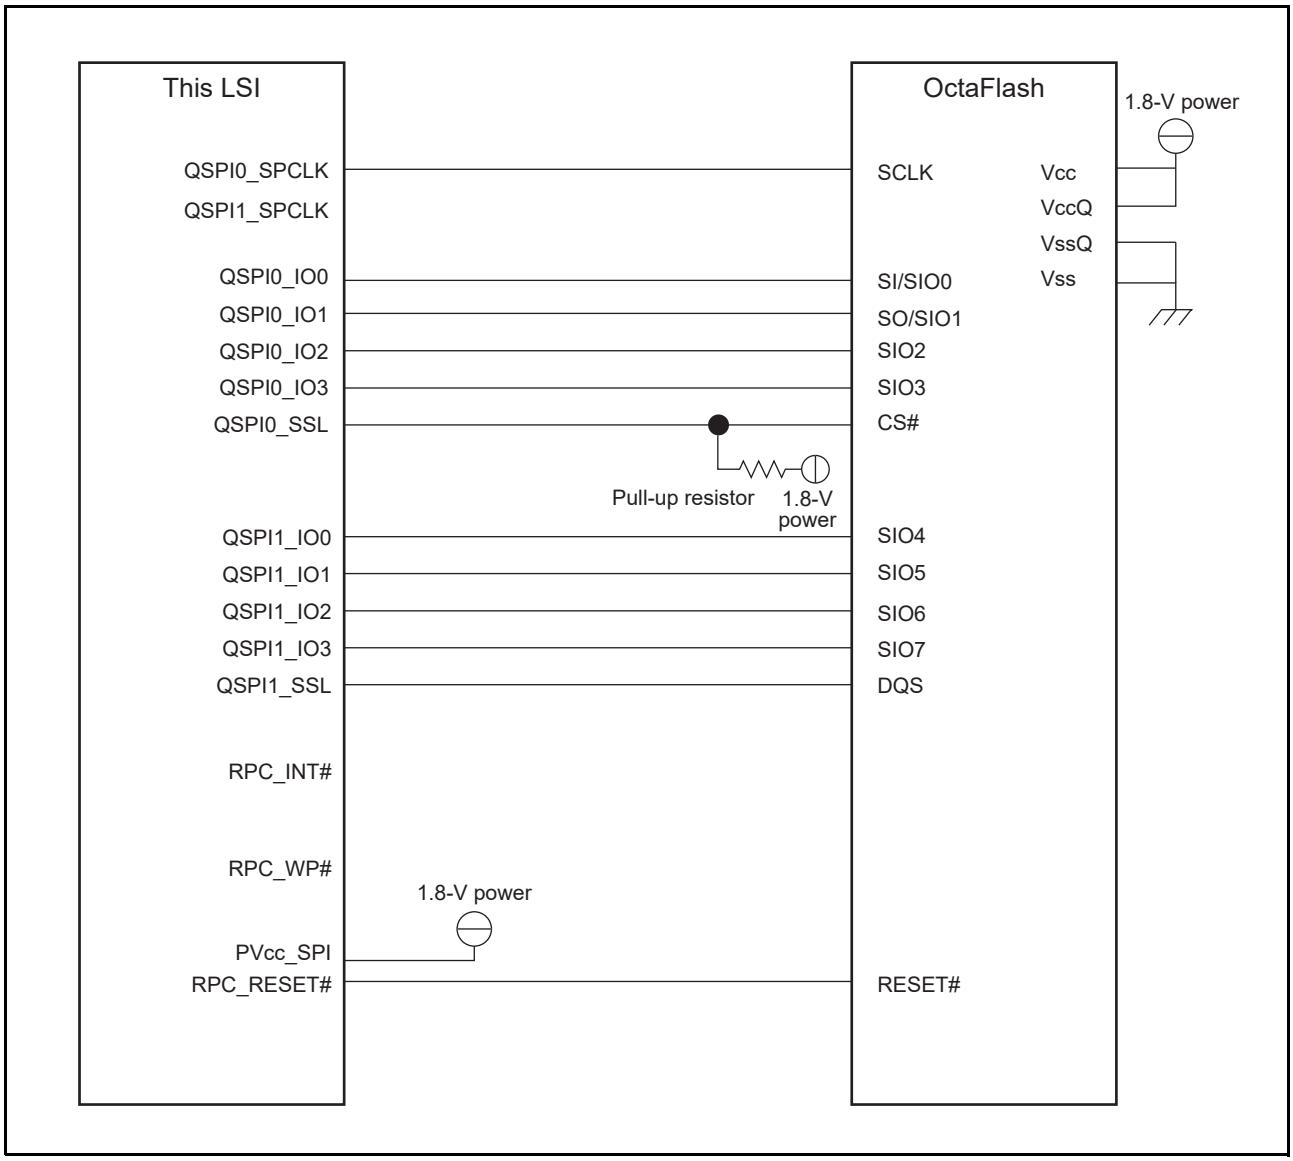

Figure 20.5 System Configuration Example with OctaFlash Connected

20.5.2 Address Map

In external address space read mode, the serial, HyperFlash, or Octal-SPI flash memory to be connected are allocated to the SPI multi I/O bus space. The internal address space is 256 Mbytes. However, specifying offset addresses in the DREAR register allows access to a maximum of 4 Gbytes when a single serial flash memory or Octal-SPI flash memory device is connected, and to a maximum of 8 Gbytes when two serial flash memory devices are connected or a single HyperFlash memory device is connected. When HyperFlash memory is connected, address expansion cannot be performed in the external address space read mode.
Use manual mode when HyperFlash memory is connected and an address range greater than 256 Mbytes is to be used.

Table 20.3 Address Map

Internal Address	Max. Access Area
H'20000000 to H'2FFFFFFF	A serial flash memory or Octal-SPI flash memory device is connected: 4 Gbytes Two serial flash memory devices are connected or a single HyperFlash memory device is connected in manual mode: 8 Gbytes

Note: When access protection is set, not only this address space, but also the register area is protected.

20.5.3 32-bit Serial Flash Addresses

Since the SPI multi I/O bus space is 256 Mbytes, only a part of the 32-bit serial flash address area can be directly accessed. Here, the fixed value set in the pertinent register is used as the upper bit value of a 32-bit address.
To output serial flash addresses in 32 bits, set the ADE[3] bit in DRENR to 1, set the range of the external addresses used as the serial flash addresses to the EAC[2:0] bits in DREAR, and set the upper bit value of the 32-bit address as the fixed value to the EAV[7:0] bits in DREAR.

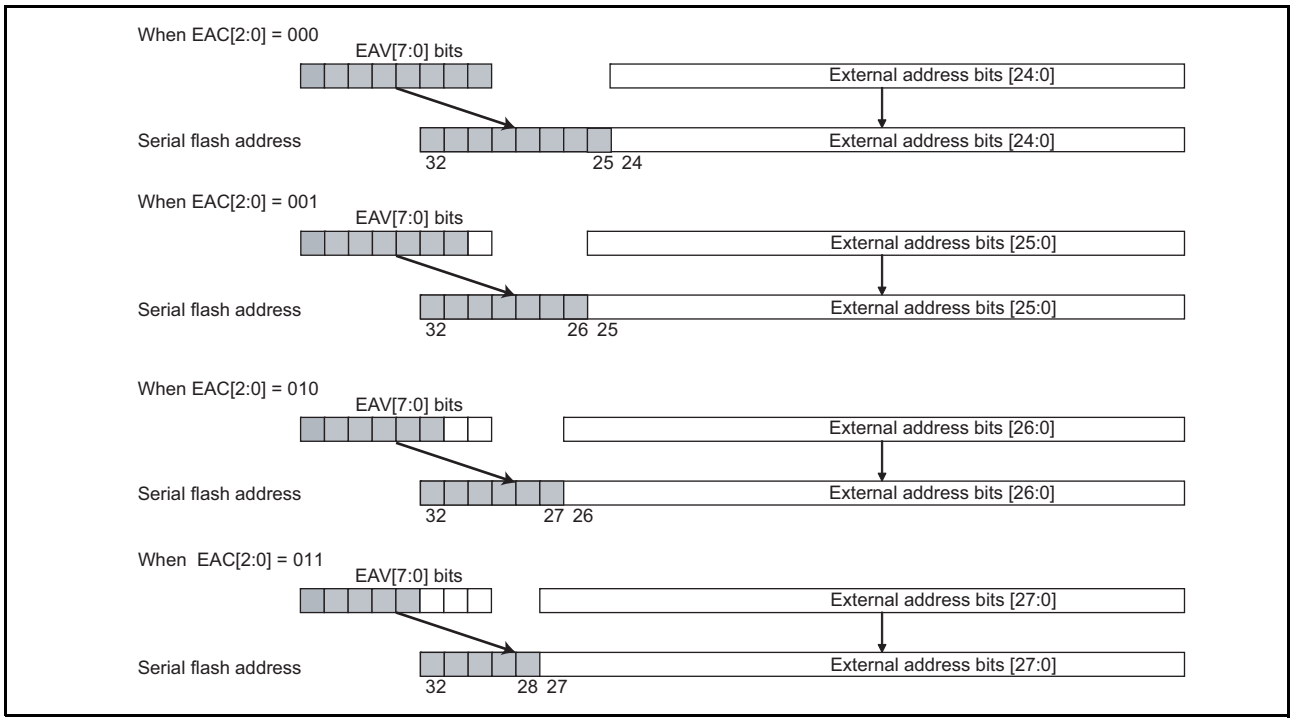

Figure 20.6 32-Bit Address Setting

Setting the ADE[3] bit in DRENR to 1 allows the serial flash address to be output using [31:0] bits.

When EAC[2:0] = 000, external address bits [24:0] are valid; set the value for [32:25] bits to EAV[7:0].
When EAC[2:0] = 001, external address bits [25:0] are valid; set the value for [32:26] bits to EAV[7:1].
When EAC[2:0] = 010, external address bits [26:0] are valid; set the value for [32:27] bits to EAV[7:2].
When EAC[2:0] = 011, external address bits [27:0] are valid; set the value for [32:28] bits to EAV[7:3].

The address bits actually used for access depend on the number of serial flash memories connected.
When a single serial flash memory device is connected or the Octal-SPI flash memory protocol is in use, address bits [31:0] are used. When two serial flash memory devices are connected, address bits [32:1] are used.

20.5.4 Operating Modes

This module has two operating modes: external address space read mode and Manual mode.
In external address space read mode, a read access to the SPI multi I/O bus space is converted into Data read protocol and data is received. After data acquisition, data is returned to the bus master that is the issuing source. For details, see section 20.5.5, External Address Space Read Mode.
In Manual mode, arbitrary protocol is carried out using register settings. For details, see section 20.5.7, Manual mode.

20.5.5 External Address Space Read Mode

A read access to the SPI multi I/O bus space can be converted into Data read protocol in external address space read mode. Further, the commands, optional commands, option data, and dummy cycle issued for reading can be modified using registers.
In external address space read mode, either normal read operation or burst read operation can be selected. The transfer format is determined based on the common control register (CMNCR), SSL delay register (SSLDR), data read control register (DRCR), data read command setting register (DRCMR), data read extended address setting register (DREAR), data read option setting register (DROPR), data read enable setting register (DRENR), data read dummy cycle setting register (DRDMCR), and data read DDR enable register (DRDRENR).

(1) Normal Read Operation

When the RBE bit in the DRCR register is set to 0, normal read operation is performed. In the normal read operation, data is read from the external device when the bus master executes read access. After data is read, the QSPIn_SSL pins are negated.
The timing of normal read operation for the serial flash memory is shown in Figure 20.7.
t1 is the time period from QSPIn_SSL pin assertion to QSPIn_SPCLK oscillation (clock delay), t2 is the time period from transmission of the last QSPIn_CLK edge of a transfer to QSPIn_SSL pin negation (QSPIn_SSL negation delay), and t3 is the time period from one transfer end to the next transfer start (next access).

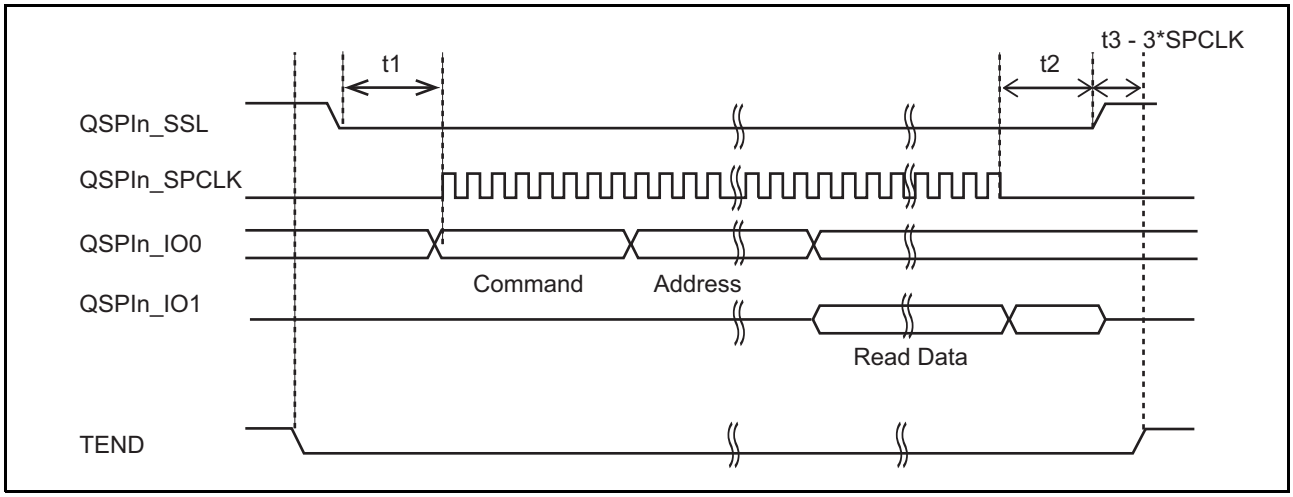

Figure 20.7 Normal Read Operation Timing

Note 1. T1 to T3 are specified with SSLDR.SCKDL, SSLDR.SLNDL and SSLDR.SPNDL bits, respectively.

(2) Burst Read Operation

When the RBE bit in DRCR is set to 1, burst read operation is performed.
Read cache is enabled in the burst read operation. For read cache operation, see section 20.5.6, Read Cache.
When the bus master executes read access, the read cache is first searched for the target data. When the read cache contains the data, it is read from the cache instead of accessing the external device. When the read cache does not contain the data, the external device is read in the burst mode and the read data is stored in the read cache and returned to the bus master. In this operation, the data transfer length is 64 bits × the value in the RBURST[4:0] bits, and data is always read from a 64-bit boundary address.
The QSPIn_SSL pin status after data transfer can be selected by using the SSLE bit in DRCR. When the SSLE bit is set to 0, the QSPIn_SSL pin is negated after data transfer. For an operation performed when the SSLE bit is set to 1, see section 20.5.5, (3), Burst Read Operation with Automatic QSPIn_SSL Negation, just below.
A pattern diagram of this operation and a burst read operation timing diagram when SSLE bit is set to 0 are shown in Figure 20.8 and Figure 20.9.

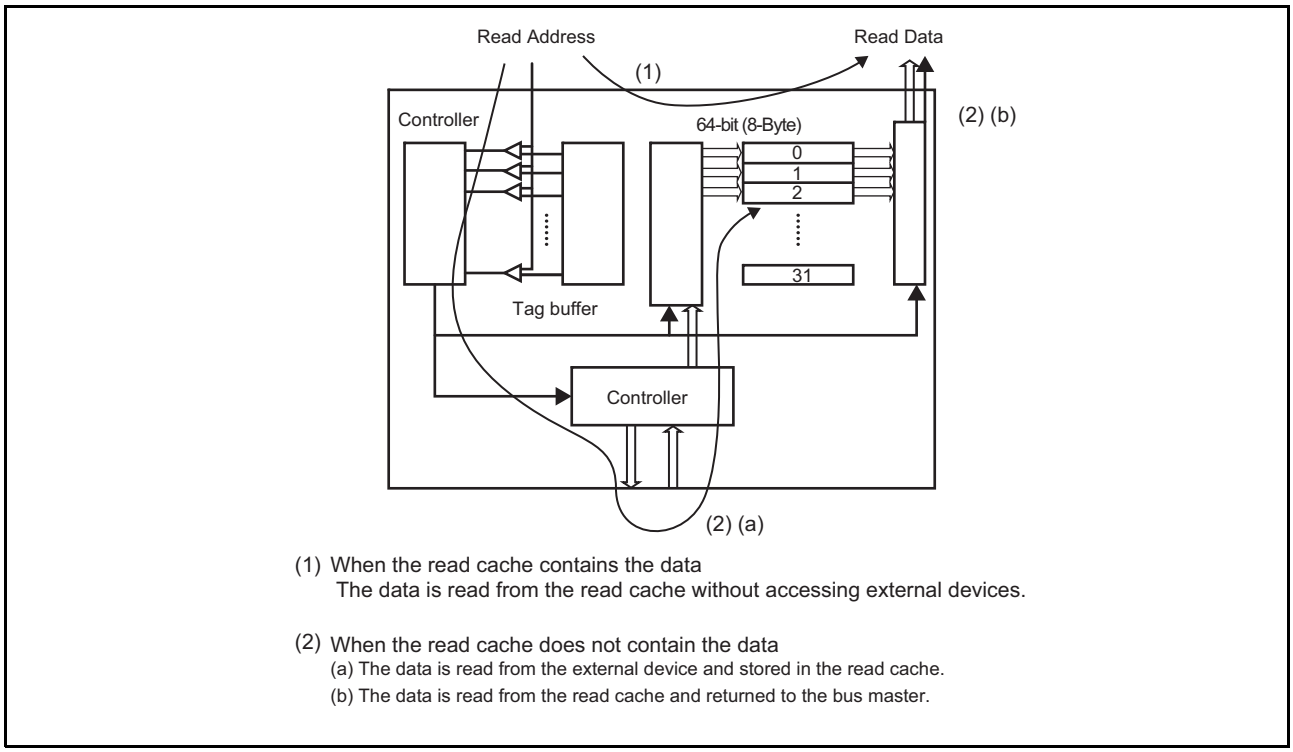

Figure 20.8 Burst Read Operation

Note: When connecting this LSI to a single serial flash memory device, use the pins for channel 0. The pins for channel 1 cannot be used in this configuration.

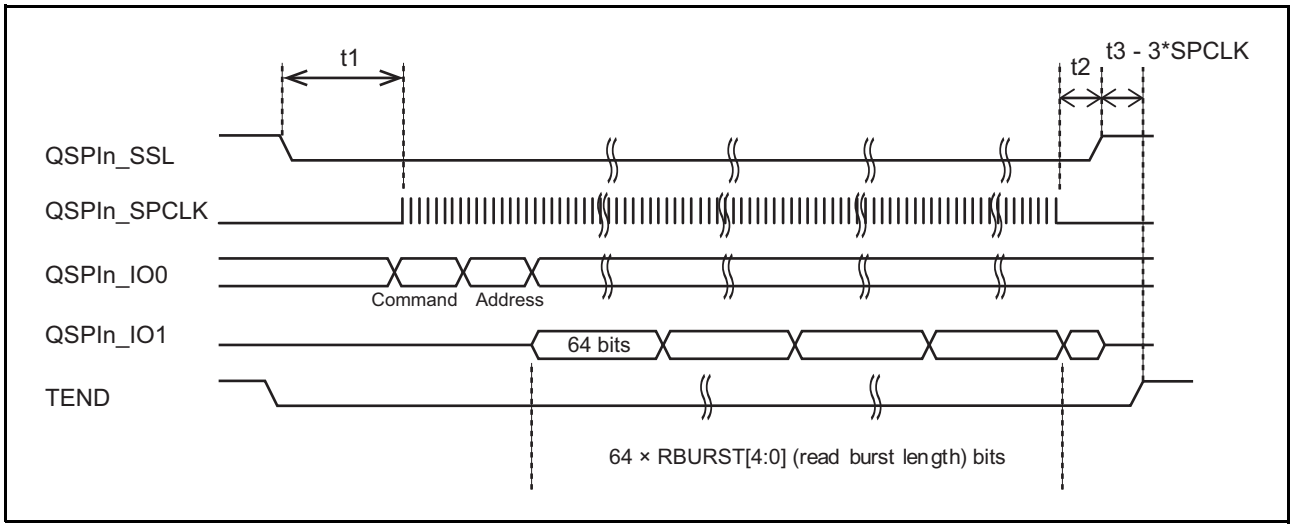

Figure 20.9 Burst Read Operation Timing

Note: T1 to T3 are specified with SSLDR.SCKDL, SSLDR.SLNDL and SSLDR.SPNDL bits, respectively.

(3) Burst Read Operation with Automatic QSPIn_SSL Negation

When SSLE bit in DRCR is set to 1, this module does not negate the QSPIn_SSL pin after the burst read transfer. When accessing the next time, if the address is continuous with the previous read address, the burst read operation is performed without issuing the command, optional command, address, option data, or dummy cycle. If the address is not continuous with the previous read address, the QSPIn_SSL pin is once negated and the burst read operation is performed after issuing the command, optional command, address, option data, or dummy cycle.
Burst read timing diagrams for continuous address and non-continuous address are shown in Figure 20.10 and Figure 20.11 .
For the next access after negation of the QSPIn_SSL with the SSLN bit in DRCR with this operation, read SSLF = 0 in CMNSR to confirm that the QSPIn_SSL has been negated.
This function is available when serial flash memory is connected.

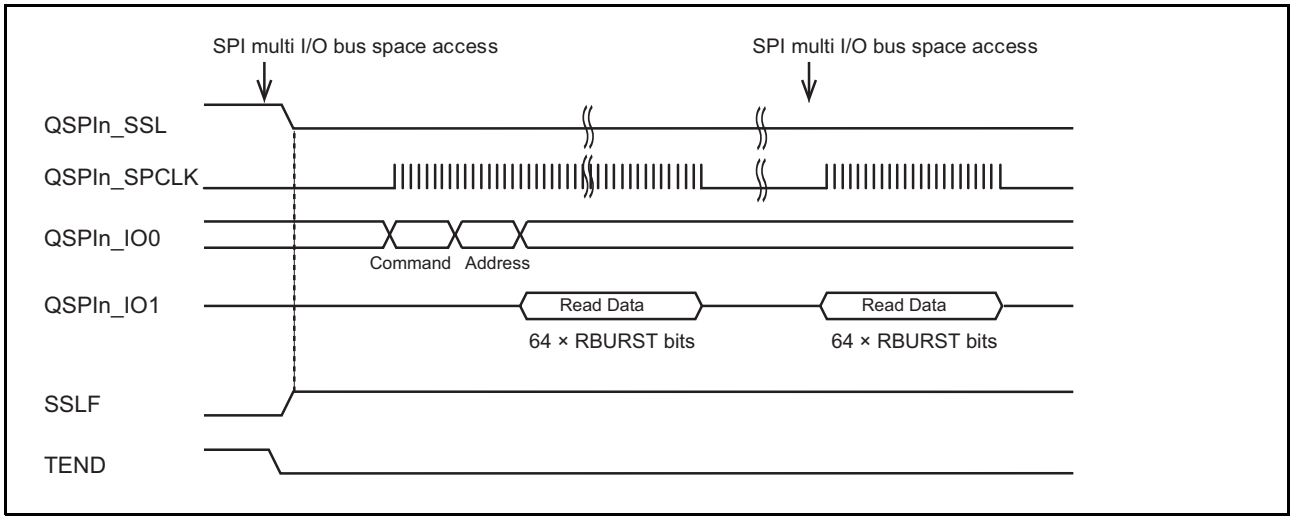

Figure 20.10 Burst Read Timing for Continuous Address (SSLE Bit = 1)

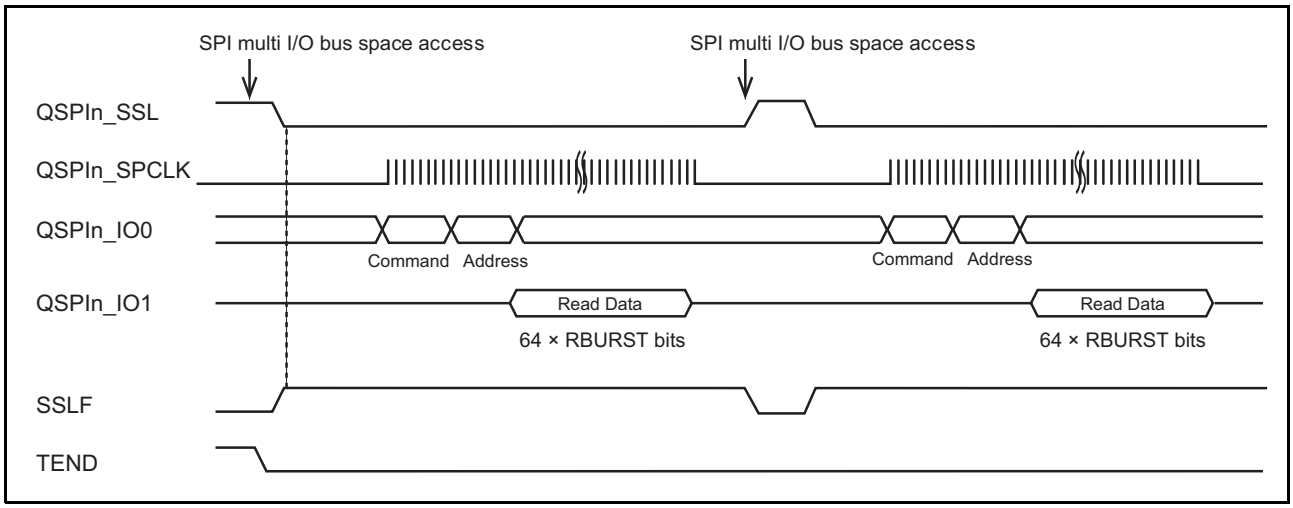

Figure 20.11 Burst Read Timing for Non-Continuous Address (SSLE Bit = 1)

(4) Initial Setting Flow

An example of an initial setting flow in external address space read mode is shown in Figure 20.12.

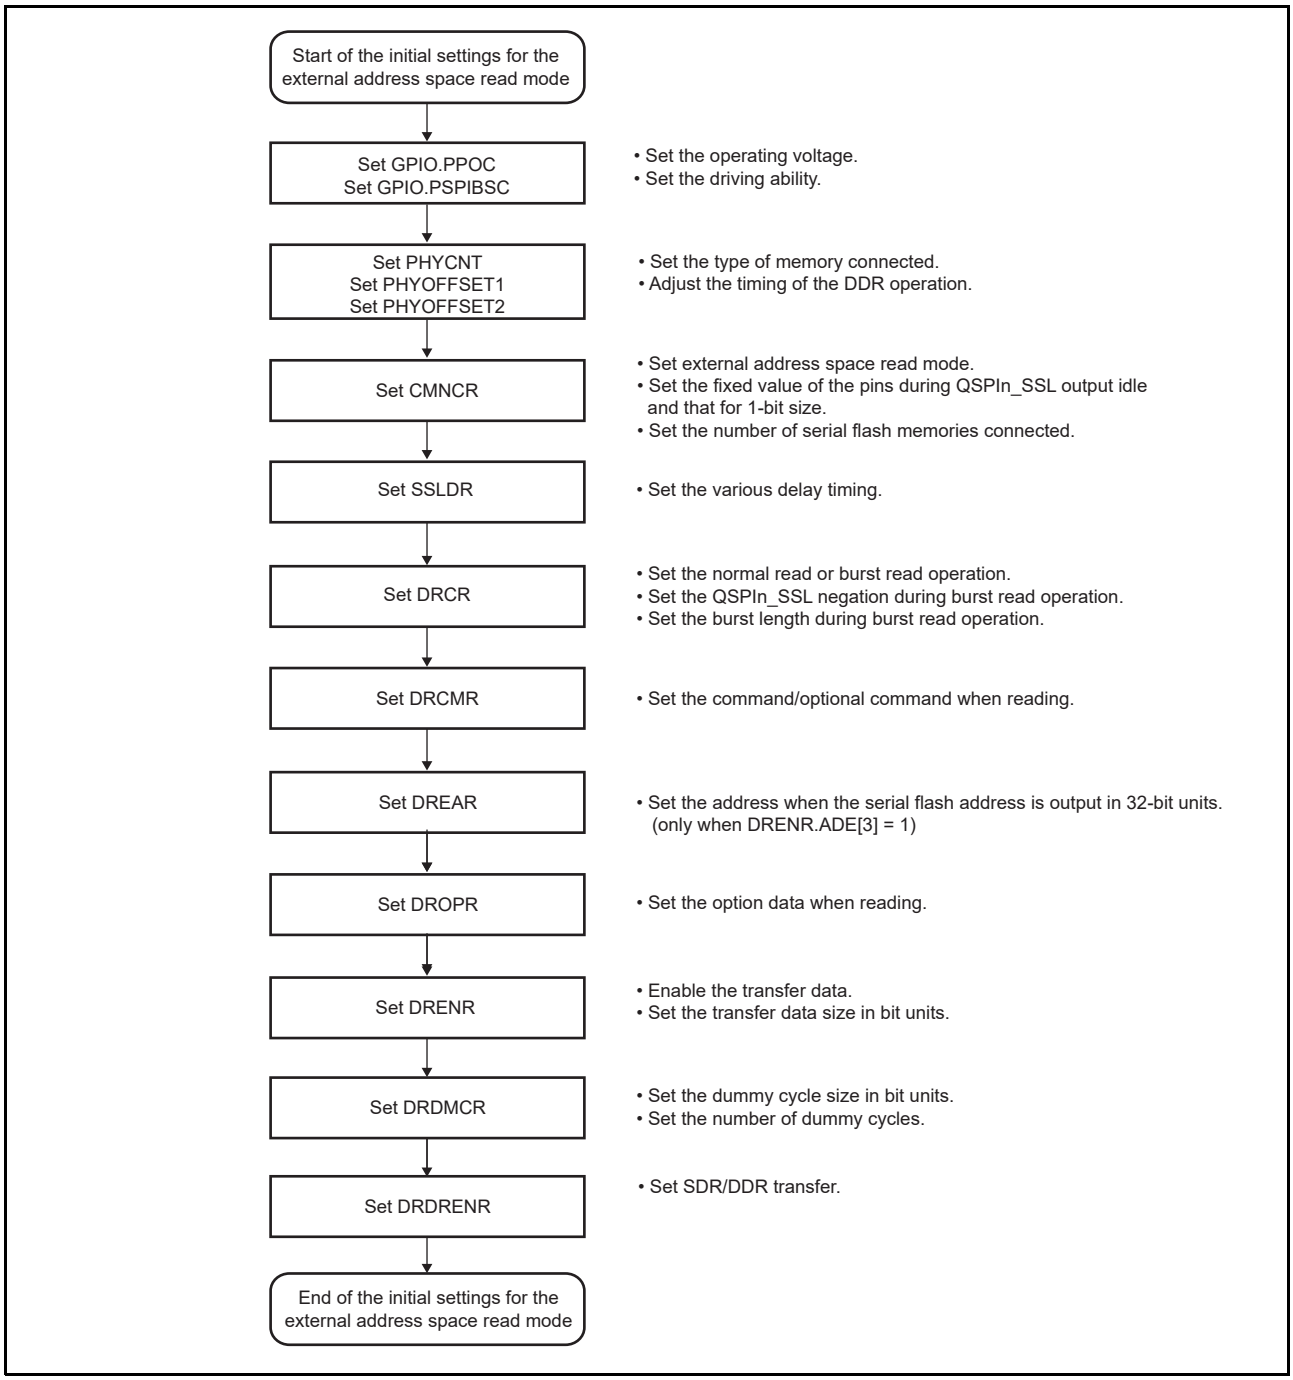

Figure 20.12 Example of Initial Setting Flow in External Address Space Read Mode

20.5.6 Read Cache

This module has a simple built-in read cache. The read cache can be used during external address space read mode and burst read operation. The read cache is configured with a line size of 64 bits and 32 entries.
Read cache configuration is shown in Figure 20.13.

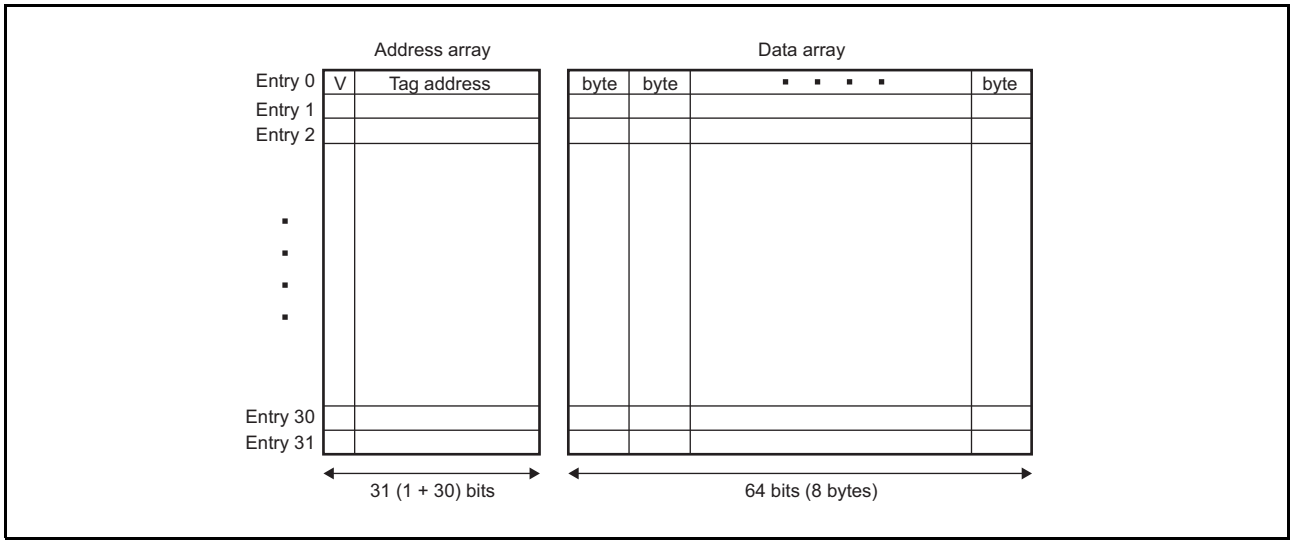

Figure 20.13 Read Cache Configuration

(1) Address Array

The V bit indicates whether the entry data is valid. When the V bit is 1, the data is valid and when V bit is 0, the data is invalid.
The tag address bits hold the address used for the serial flash memory. Address bits 32 to 3 are used for the purpose. Address bits 23 to 3 are enabled when address output is 24 bits and one serial flash memory is connected; and address bits 24 to 3 are enabled when two serial flash memories are connected.
Address bits 31 to 3 are enabled when address output is 32 bits and one serial flash memory is connected; and address bits 32 to 3 are enabled when two serial flash memories are connected.

(2) Data Array

It retains the 64-bit read data. Registration in the read cache is performed in line units.

(3) Read Operation

In case of read-hit, data is read from the read cache. In case of read-miss, after the 64 × RBURST (read burst length) data is read from the serial flash memory and the read cache is updated, the data is returned to the bus master.

(4) Data Replacement

The write pointer is used to update data. In case of read-miss, the RBURST (read burst length) portion data is replaced starting at the entry specified by the write pointer. In other words, the data is replaced in the storage order of the data. Whether data is referred to or not will not affect the replacement order of data.

20.5.7 Manual mode

This module can carry out an arbitrary serial transmission operation by using the register settings.
The transfer format is determined based on the common control register (CMNCR), SSL delay register (SSLDR), Manual mode control register (SMCR), Manual mode command setting register (SMCMR), Manual mode address setting register (SMADR), Manual mode option setting register (SMOPR), and Manual mode enable setting register (SMENR), Manual mode read data register (SMRDR), Manual mode write data register (SMWDR), Manual mode dummy cycle setting register (SMDMCR), and Manual mode DDR enable register (SMDRENR).
Manual mode can be used for reading the status of the serial flash memory and writing to the serial flash memory.
In this mode, one transfer refers to the operation from when the SPIE bit in SMCR is set to 1 to when the TEND bit is set to 1.

(1) Transfer Start

The transfer of data is started in the set transfer format by setting the SPIE bit in SMCR to 1. When write operation is enabled, the Manual mode write data register is transmitted to the serial flash memory. When read operation is enabled, data read from the serial flash memory is stored into the Manual mode read data register.
The Manual operation timing is shown in Figure 20.14.

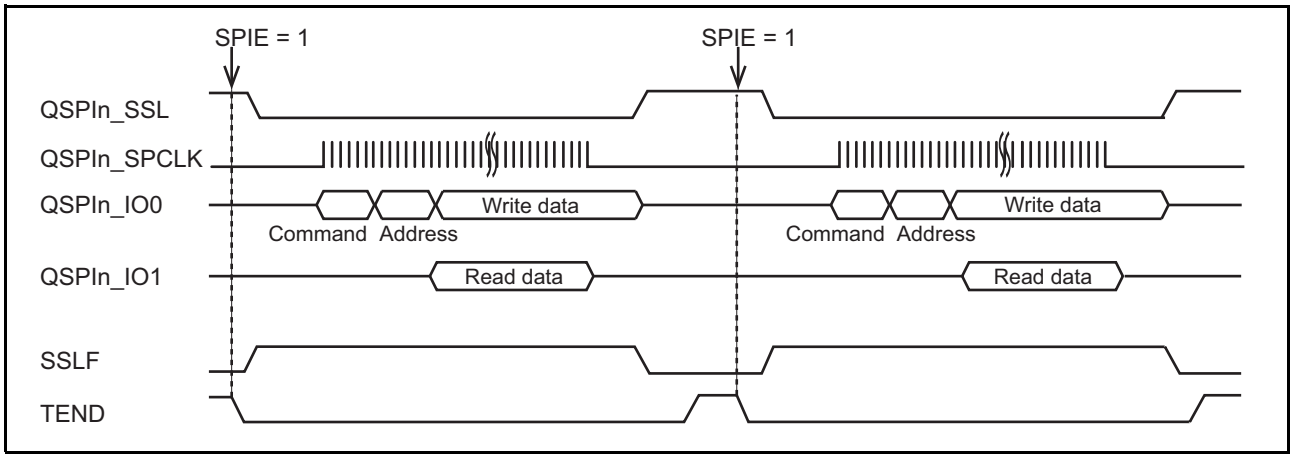

Figure 20.14 Serial transmission operation timing

(2) Read/Write Enable

- Read operation: Data can be read by setting the SPIRE bit in SMCR to 1. The read data is stored into SMRDR.
- Write operation: Data can be written by setting the SPIWE bit in SMCR to 1. The data stored in SMWDR is output.

When the data size is set to 1 bit using the SPIDB[1:0] bits in SMENR, data can be transmitted and received by setting the SPIRE and SPIWE bits to 1. However, when the data size is set to 4 bits by using the SPIDB[1:0] bits, only one of the SPIRE and SPIWE bits should be enabled. The operation is not guaranteed if the both bits are enabled.

(3) Retention of QSPIn_SSL Pin Assertion

By setting the SSLKP bit in SMCR to 1, assertion of the QSPIn_SSL pin can be continued till the next transfer. With this function, the transfer can be carried out continuously with the QSPIn_SSL kept in the asserted state.
The data transfer timing using the SSLKP bit is shown in Figure 20.15.

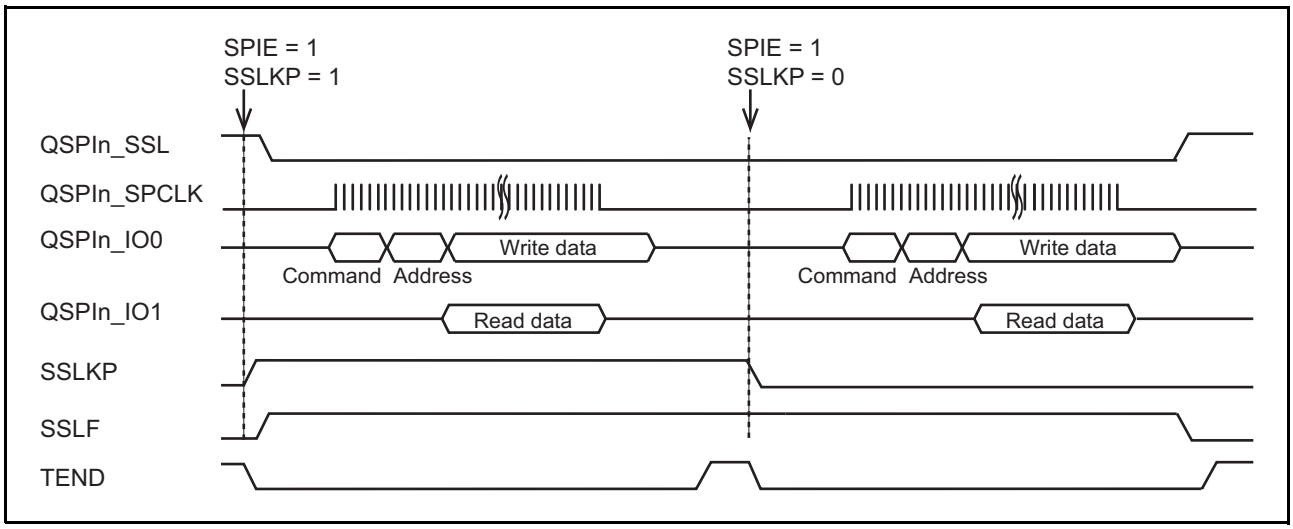

Figure 20.15 Data Transfer Timing using the SSLKP Bit

(4) Initial Setting Flow

An example of an initial setting flow in Manual mode is shown in Figure 20.16.

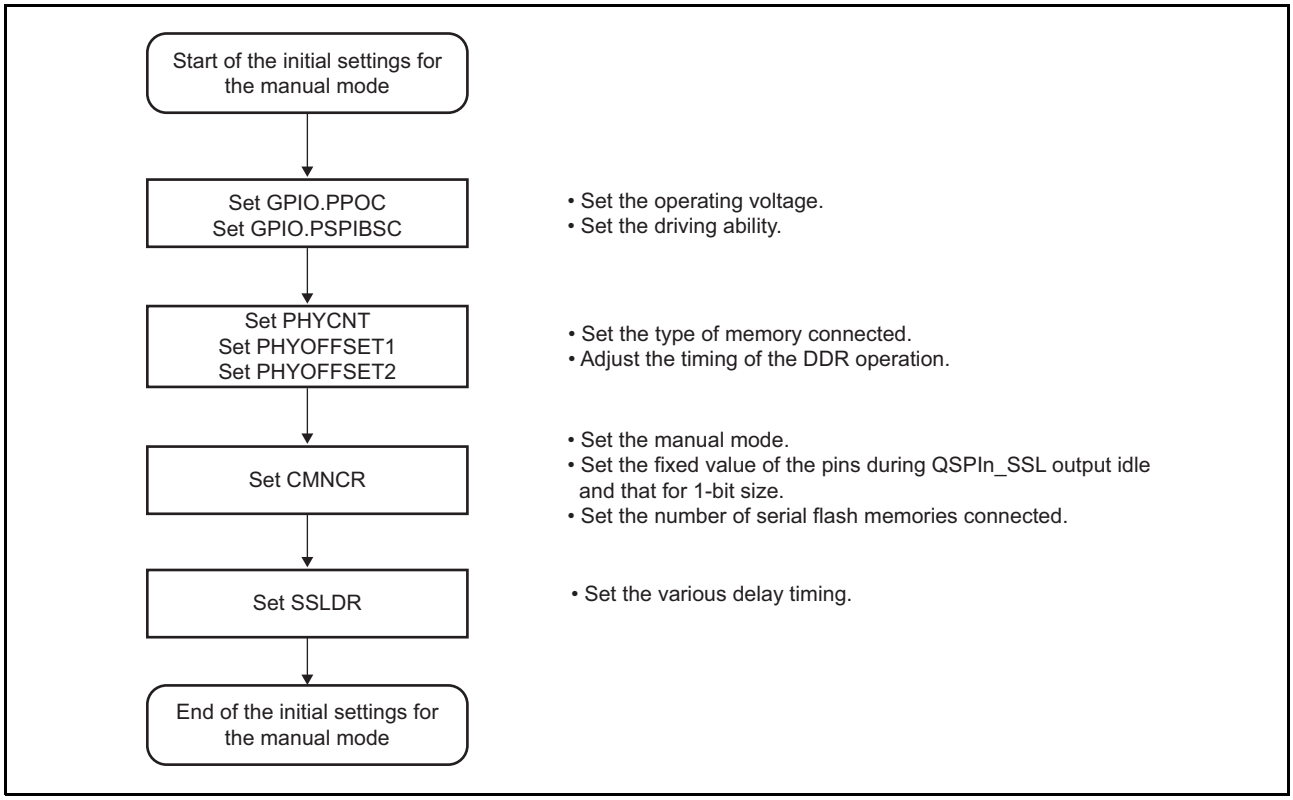

Figure 20.16 Example of Initial Setting Flow in Manual mode

(5) Data Transfer Setting Flow

An example of a data transfer setting flow in manual mode is shown in Figure 20.17.

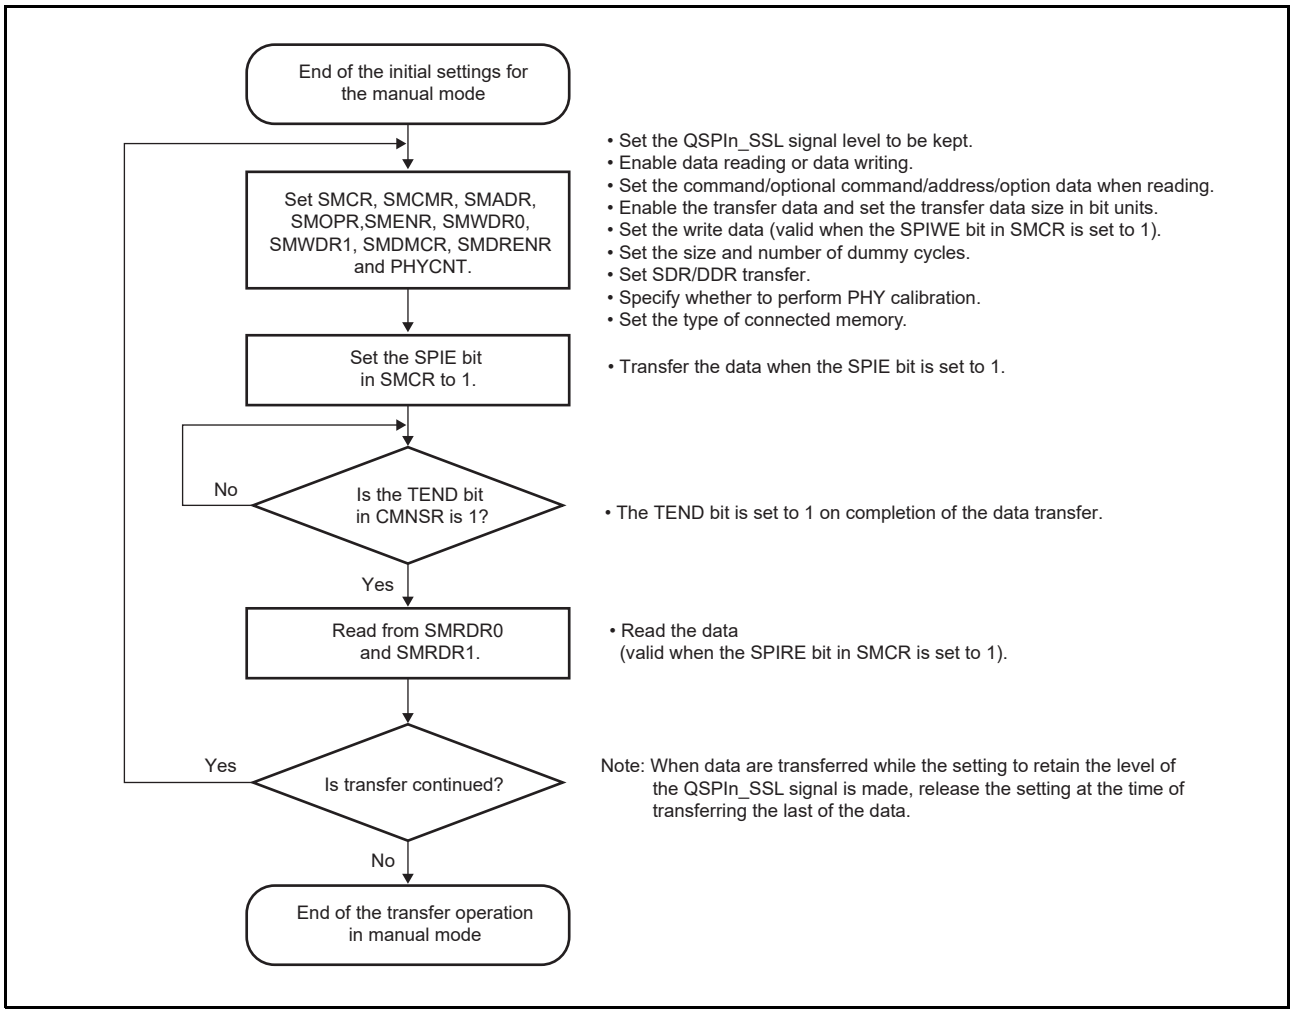

Figure 20.17 Example of a Data Transfer Setting Flow in Manual Mode

20.5.8 Command Sequence

This module can input and output data in the order of command, optional command, address, option data, dummy cycle, and data.

(1) Data Registers

Table 20.4 shows the input and output data.

Table 20.4 Data Registers

Data		External Address Space Read Mode	Manual Mode
Command (8 bits)		CMD[7:0] bits in DRCMR	CMD[7:0] bits in SMCMR
Optional command (8 bits)		OCMD[7:0] bits in DRCMR	OCMD[7:0] bits in SMCMR
Address (32/24 bits)	BSZ[1:0] = 00 (one flash memory connected)	32 bits: DREAR.EAV[6:3 to 0] bits + lower [27 to 24:0] bits of the read address. 24 bits: Lower [23:0] bits of the read address.	32 bits: ADR[31:0] bits in SMADR 24 bits: ADR[23:0] bits in SMADR
	BSZ[1:0] = 01 (two flash memories connected)	32 bits: DREAR.EAV[7:3 to 0] bits + lower [27 to 24:1] bits of the read address. 24 bits: Lower [24:1] bits of the read address.	
Option data (8 bits × 4)		DROPR	SMOPR
Dummy cycle (2 to 20 cycles)		DRDMCR	SMDMCR (only when read)
Transfer data		Normal read: 8, 16, and 32 bits Burst read: 64 × RBURST bits	Read: SMRDR0, SMRDR1 Write: SMWDR0, SMWDR1

Table 20.5 Data Registers (HyperFlash)

Data	External Address Space Read Mode	Manual Mode
CA0 (47 to 40)	DRCMR.CMD[7:5] bits + [31:27] bits of the read address.	SMCMR.CMD[7:5] + SMADR.ADR[31:27]
CA0 (39 to 32)	[26:19] bits of the read address.	ADR[26:19] bits in SMADR
CA1 (31 to 24)	[18:11] bits of the read address.	ADR[18:11] bits in SMADR
CA1 (23 to 16)	[10:3] bits of the read address.	ADR[10:3] bits in SMADR
CA2 (15 to 8)	[15:8] bits in DROPR	[15:8] bits in SMOPR
CA2 (7 to 0)	DROPR [7:3] bits + [2:0] bits of the read address.	SMOPR [7:3] bits + SMADR.ADR[2:0] bits
Dummy cycle (2 to 20 cycles)	DRDMCR	SMDMCR
Transfer data	Normal read: 8, 16, and 32 bits Burst read: 64 × RBURST bits	Read: SMRDR0, SMRDR1 Write: SMWDR0, SMWDR1

(2) Data Enable

In external address space read mode, enabling or disabling transfer of the command, optional command, address, option data, and dummy cycle can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], and DME bits in DRENR, respectively. The number of dummy cycles can be controlled with the data read dummy cycle setting register (DRDMCR).

Similarly, in manual mode, enabling or disabling the command, optional command, address, option data, dummy cycle, and transfer data can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], DME, and SPIDE[3:0] bits in SMENR, respectively. However, disabling all the above parameters is prohibited in manual mode. At least one of them except dummy cycle must be enabled. The number of dummy cycles can be controlled with the Manual mode dummy cycle setting register (SMDMCR).

For the address and option data in external address space read mode and the address, option data, and transfer data in manual mode, the enable bit setting allowed is determined according to the transfer data size. For the allowed setting combinations of the enable bits and transfer data size, refer to the description of the pertinent register.

If data is disabled, that data is skipped, and input and output of the next data is carried out. The command, optional command, address, and option data are always output. During dummy cycles, the state of the used pins is Hi-Z. In external address space read mode, data is always input; and in manual mode, input and output of data is determined based on the settings of the SPIRE and SPIWE bits in SMCR.

There are some restrictions on dummy cycle insertion; refer to the description of the DME bits in DRENR and SMENR for details.

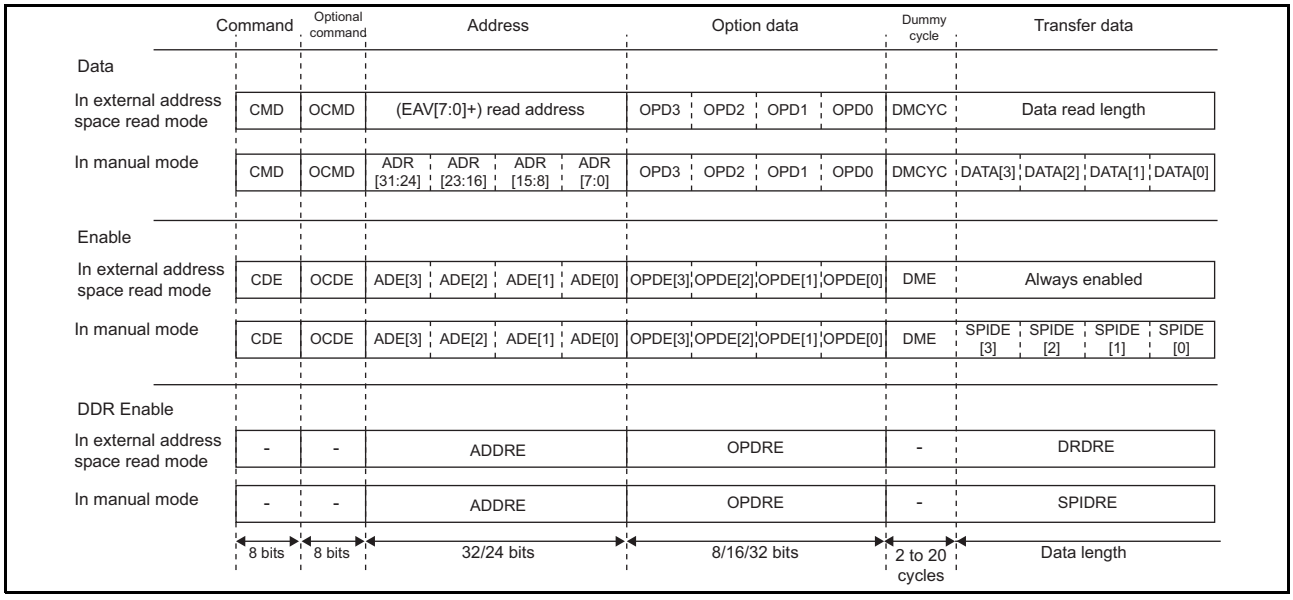

Figure 20.18 Data and Enable (Serial Flash)

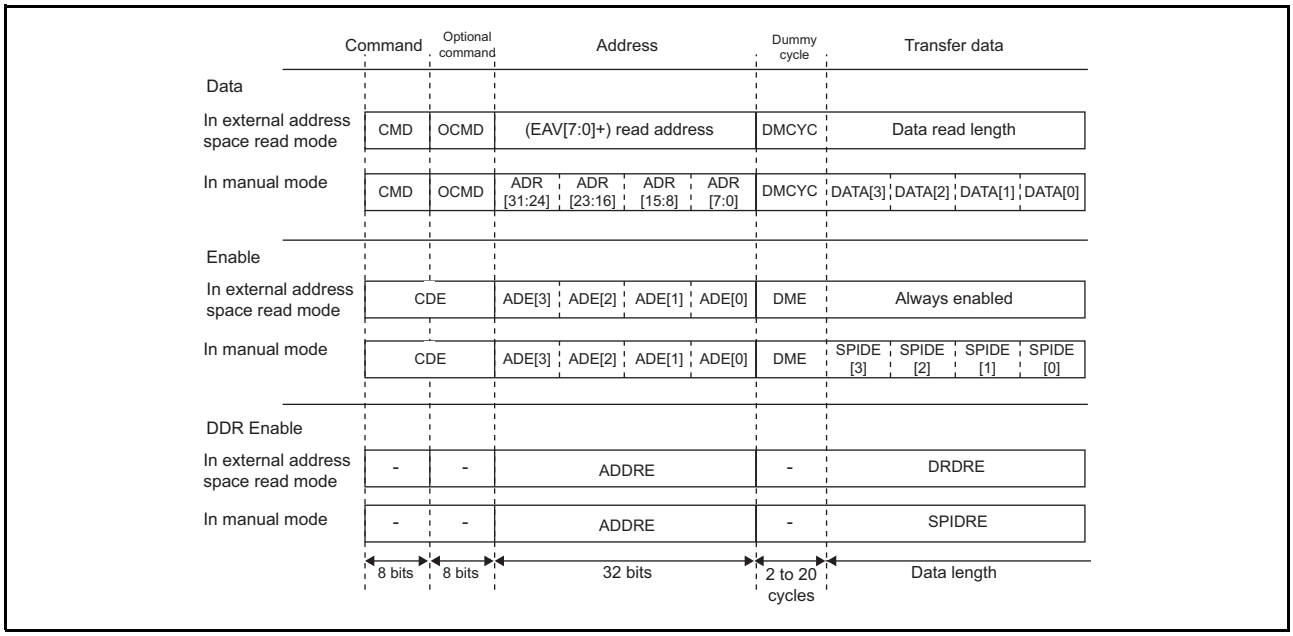

Figure 20.19 Data and Enable (Octal-SPI Flash Memory Protocol Mode)

When the HyperFlash memory is connected to this LSI, the CDE, OCDE, ADE[3:0], OPDE[3:0], and DME bits in the DRENR register and the HYPE[2:0], ADDRE, and OPDRE bits in the DRDRENR register should be set to "enabled" in external address space read mode. In Manual mode, the CDE, OCDE, ADE[3:0], OPDE[3:0], and DME bits in the SMENR register and the HYPE[2:0], ADDRE, OPDRE, and DRDRE bits in the SMDRENR should be set to "enabled".

Table 20.6 Enable Register (HyperFlash)

External Address Space Read Mode			Manual Mode		
Register	Bit	Setting Value	Register	Bit	Setting Value
DRENR	CDE	1	SMENR	CDE	1
	OCDE	1		OCDE	1
	ADE[3:0]	0100		ADE[3:0]	0100
	OPDE[3:0]	0000		OPDE[3:0]	0000
	DME	1		DME	Read: 1 Write: 0
				SPIDE[3:0]	
				16 bits	1000
				32 bits	1100
				64 bits	1111
DRDRENR	HYPE[2:0]	101	SMDRENR	HYPE[2:0]	101
	ADDRE	1		ADDRE	1
	OPDRE	0		OPDRE	0
	DRDRE	1		SPIDRE	1

Table 20.7 Enable Register (Octal-SPI Flash Memory Protocol Mode)

External Address Space Read Mode			Manual Mode		
Register	Bit	Setting Value	Register	Bit	Setting Value
DRENR	CDE	1	SMENR	CDE	1
	OCDE	0		OCDE	0
	ADE[3:0]	1100		ADE[3:0]	1100
	OPDE[3:0]	0000		OPDE[3:0]	0000
	DME	1		DME	Read: 1 Write: 0
SMENR	CDE	0		SPIDE[3:0]	
				16 bits	1000
				32 bits	1100
				64 bits	1111
DRDRENR	HYPE[2:0]	100, 101	SMDRENR	HYPE[2:0]	100, 101
	ADDRE	1		ADDRE	1
	OPDRE	0		OPDRE	0
	DRDRE	1		SPIDRE	1

Note: When only commands are to be transferred, set DRDRENR.HYPE or SMDRENR.HYPE to 100.

(3) Bit Size

In external address space read mode, the size of the command, optional command, address, option data, and the read data in bit units is respectively controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and DRDB[1:0] bits in DRENR.
Similarly, in manual mode, the size of the command, optional command, address, option data, and read write data in bit units is controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and SPIDB[1:0] bits in SMENR.

(a) 1-bit Size

When the size is set to 1 bit, QSPI0_IO1 and QSPI1_IO1 pins will be the input pins and QSPI0_IO0 and QSPI1_IO0 pins will be the output pins. QSPI0_IO2, QSPI1_IO2, QSPI0_IO3, and QSPI1_IO3 pins are not used.
Figure 20.20 and Figure 20.21 show the transfer format examples.

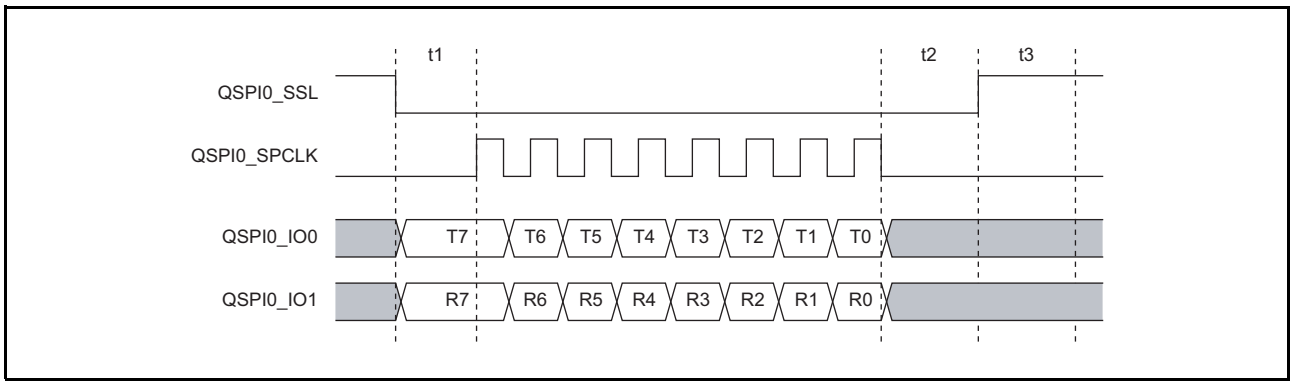

Figure 20.20 Transfer Format Example with 1-Bit Data Size and One Serial Flash Memory Connected

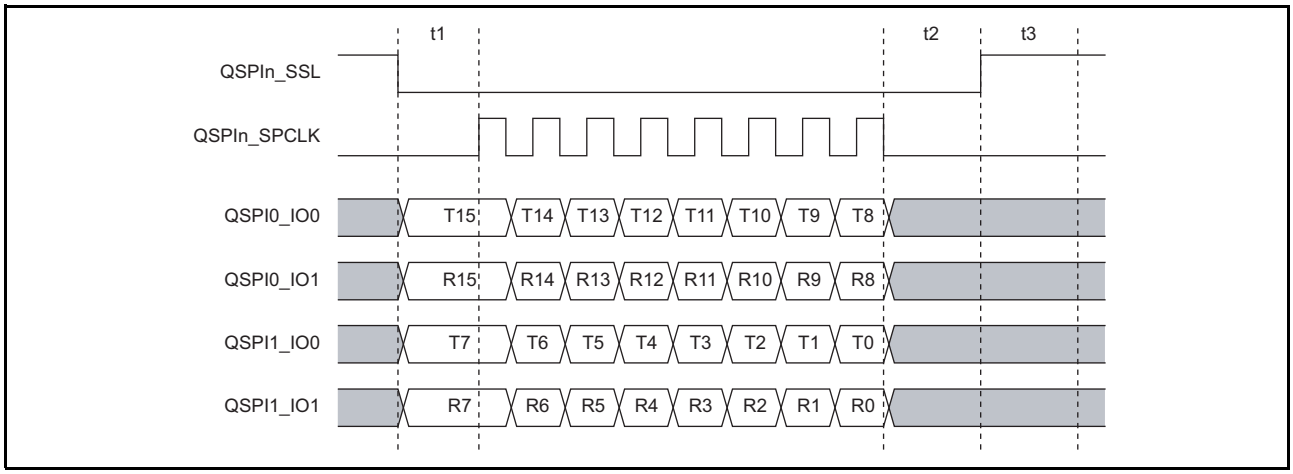

Figure 20.21 Transfer Format Example with 1-Bit Data Size and Two Serial Flash Memories Connected

(b) 4-bit Size (Serial Flash)

When the size is set to 4 bits, QSPI0_IO0, QSPI1_IO0, QSPI0_IO1, QSPI1_IO1, QSPI0_IO2, QSPI1_IO2, QSPI0_IO3, and QSPI1_IO3 pins will be either the input pins or the output pins.
Figure 20.22 and Figure 20.23 show the transfer format examples.

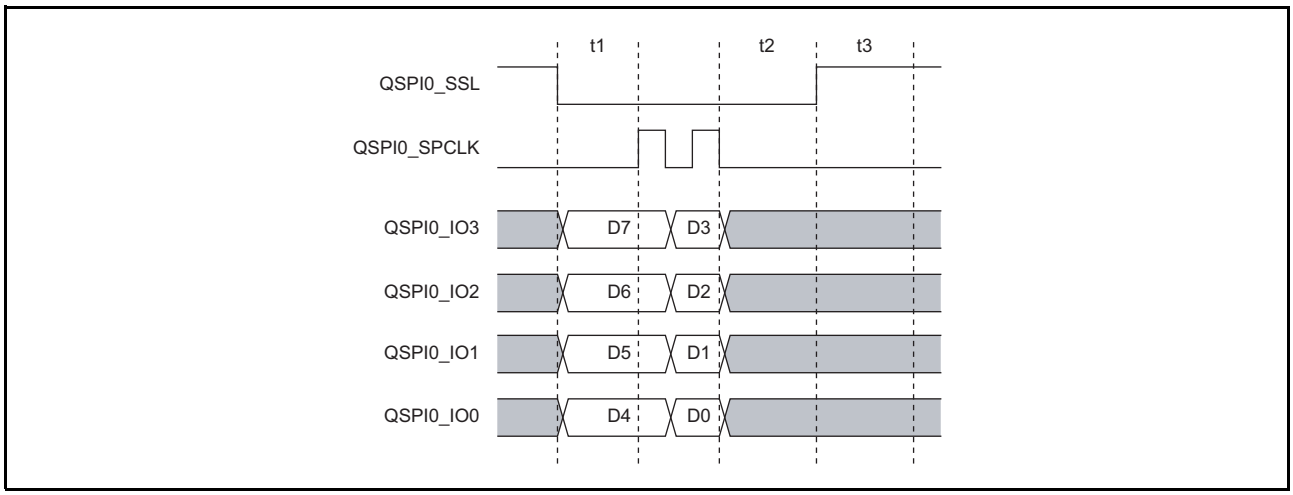

Figure 20.22 Transfer Format Example with 4-Bit Data Size and One Serial Flash Memory Connected

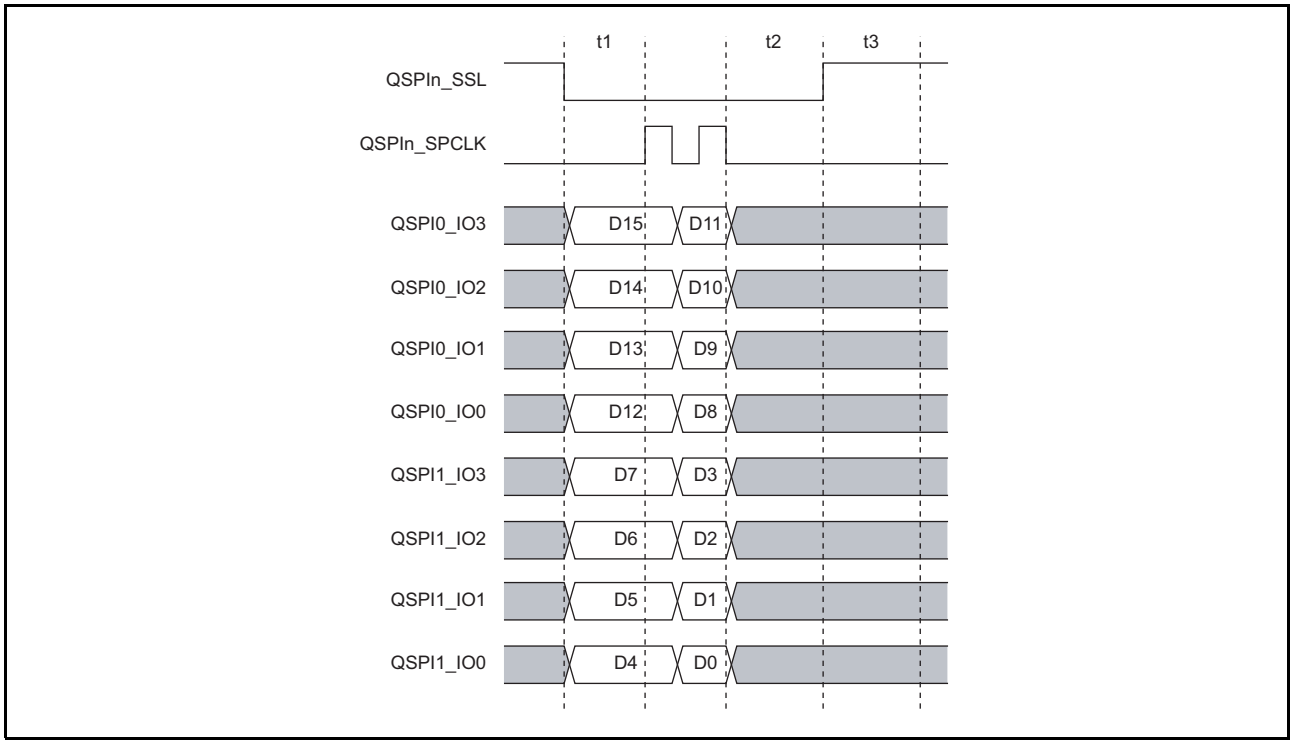

Figure 20.23 Transfer Format Example with 4-Bit Data Size and Two Serial Flash Memories Connected

(c) 8-bit Size (HyperFlash)

When the HyperFlash memory is connected to this LSI, QSPI0_SPCLK and QSPI1_SPCLK work as differential clock pins, QSPI1_SSL works as the read data strobe (RDS) input pin, and QSPI0_IO0, QSPI1_IO0, QSPI0_IO1, QSPI1_IO1, QSPI0_IO2, QSPI1_IO2, QSPI0_IO3, and QSPI1_IO3 work as either input pins or output pins.
Figure 20.24 and Figure 20.25 show the transfer format examples.

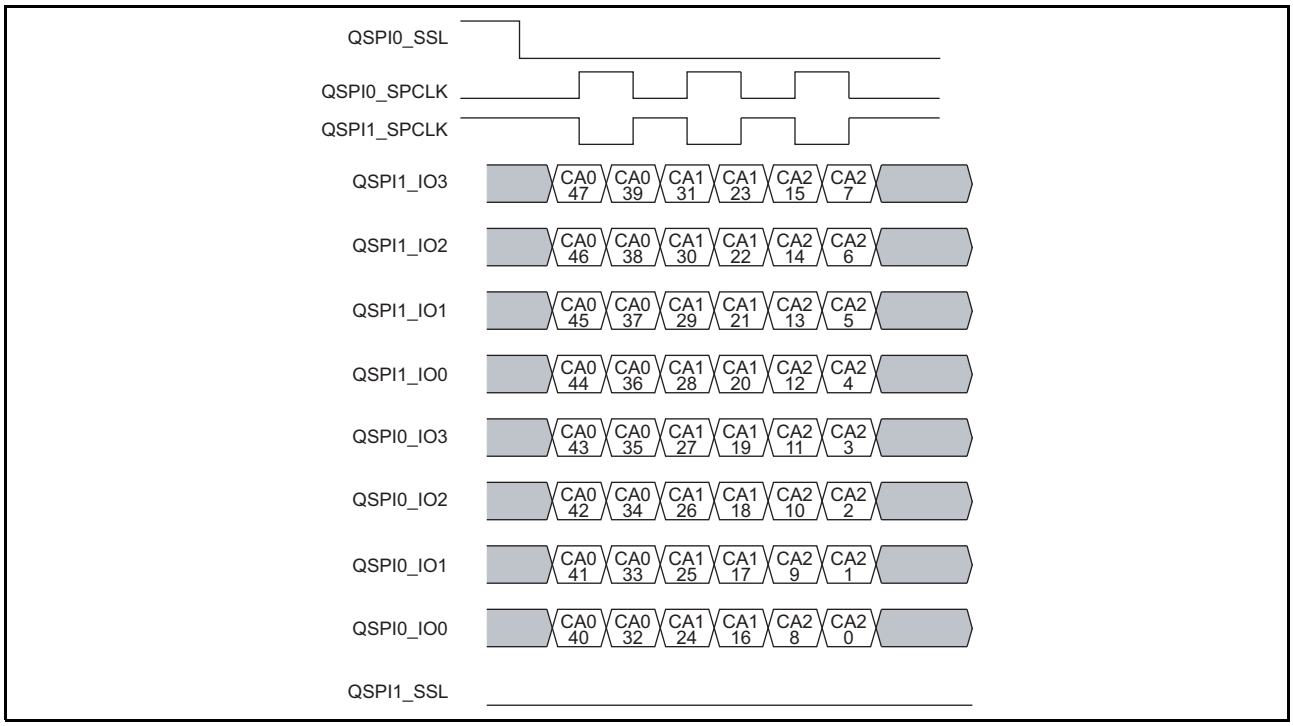

Figure 20.24 Transfer Format Example in the HyperFlash Command and Address Phase

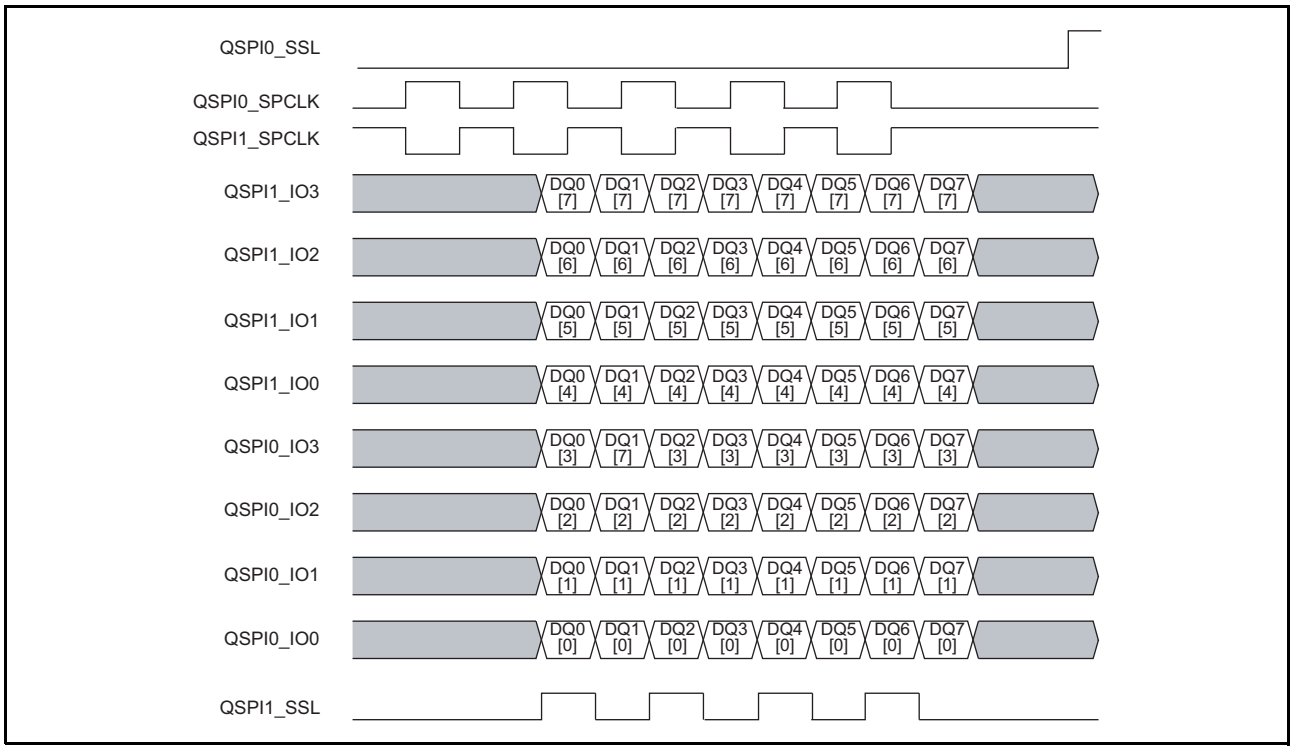

Figure 20.25 Transfer Format Example in the HyperFlash Read Phase

20.5.9 Data Pin Control

With this module, the status of pins can be automatically changed based on the data size to be used and the read/write settings. The pin status during the QSPIn_SSL negation can be set with the MOIIO3, MOIIO2, MOIIO1, and MOIIO0 bits in CMNCR. The QSPIn_SSL and QSPIn_SPCLK pins are always output pins.
The status of respective pins is specified in Table 20.8 to Table 20.11.
When using only a single serial flash memory device, note that connecting the pins for channel 1 to the serial flash memory is prohibited.

Table 20.8 Pin Status (1)

		QSPIn_SSL Assertion	
		Command, Optional Command, Address, Option Data	
Pin	QSPIn_SSL Negation	1-bit Size	4-bit Size
QSPI0_IO0, QSPI1_IO0	MOIIO0 bit value	Output	Output
QSPI0_IO1, QSPI1_IO1	MOIIO1 bit value	Hi-Z	Output
QSPI0_IO2, QSPI1_IO2	MOIIO2 bit value	IO2FV bit value	Output
QSPI0_IO3, QSPI1_IO3	MOIIO3 bit value	IO3FV bit value	Output

Table 20.9 Pin Status (2)

	Transfer Data			
	External Address Space Read Mode		SPI Operation	
			SPIRE Bit = 1, SPIWE Bit = 0	
Pin	1-bit Size	4-bit Size	1-bit Size	4-bit Size
QSPI0_IO0, QSPI1_IO0	IO0FV bit value	Input	IO0FV bit value	Input
QSPI0_IO1, QSPI1_IO1	Input	Input	Input	Input
QSPI0_IO2, QSPI1_IO2	Hi-Z	Input	Hi-Z	Input
QSPI0_IO3, QSPI1_IO3	Hi-Z	Input	Hi-Z	Input

Table 20.10 Pin Status (3)

	Transfer Data			
	SPI Operation			
	SPIRE Bit = 0, SPIWE Bit = 1		SPIRE Bit = 1, SPIWE Bit = 1	
Pin	1-bit Size	4-bit Size	1-bit Size	4-bit Size
QSPI0_IO0, QSPI1_IO0	Output	Output	Output	Setting prohibited
QSPI0_IO1, QSPI1_IO1	Hi-Z	Output	Input	Setting prohibited
QSPI0_IO2, QSPI1_IO2	IO2FV bit value	Output	IO2FV bit value	Setting prohibited
QSPI0_IO3, QSPI1_IO3	IO3FV bit value	Output	IO3FV bit value	Setting prohibited

Table 20.11 Pin Status (4)

Pin	Dummy Cycle
QSPI0_IO0, QSPI1_IO0	IO0FV bit value
QSPI0_IO1, QSPI1_IO1	Hi-Z
QSPI0_IO2, QSPI1_IO2	Hi-Z
QSPI0_IO3, QSPI1_IO3	Hi-Z

20.5.10 QSPIn_SSL Pin Control

Negation conditions of the QSPIn_SSL pin are as follows.

(1) External Address Space Read Mode

(a) Normal read operation (RBE bit in DRCR = 0)

QSPIn_SSL negated after completing the data transfer and t2 cycle.

(b) Burst read without automatic QSPIn_SSL negation (RBE bit in DRCR = 1, SSLE bit in DRCR = 0)

QSPIn_SSL negated after completing the data transfer and t2 cycle.

(c) Burst read with automatic QSPIn_SSL negation (RBE bit in DRCR = 1, SSLE bit in DRCR = 1)

- QSPIn_SSL negated after t2 cycle when the read address is not continuous with the previously read address
- QSPIn_SSL negated after the SSLN bit in DRCR is set to 1

(2) Manual Mode

(a) QSPIn_SSL pin assertion not retained (SSLKP bit in SMCR = 0)

QSPIn_SSL negated after completing the data transfer and t2 cycle.

(b) QSPIn_SSL pin assertion retained (SSLKP bit in SMCR = 1)

QSPIn_SSL not negated.
When to be negated, data should be transferred after setting the SSLKP bit to 0.

Note: When HyperFlash memory is connected or a connection is made in Octal-SPI flash memory protocol mode, the QSPIn_SSL pin is used as an input terminal for data strobe.

20.5.11 QSPIn_SPCLK Pin Control

QSPI0_SPCLK and QSPI1_SPCLK are output according to the following settings.

Table 20.12 QSPIn_SPCLK Output

Pin	HyperFlash connected. (CMNCR.BSZ = 01, PHYCNT.PHYMEM = 11)	One serial flash memory connected. (CMNCR.BSZ = 00, PHYCNT.PHYMEM = 00, 01	Two serial flash memories connected. (CMNCR.BSZ = 01, PHYCNT.PHYMEM = 00, 01
QSPI0_SPCLK	Output	Output	Output
QSPI1_SPCLK	Output (Complementary output of QSPI0_SPCLK)	Hi-Z	Output

20.5.12 Flags

This module has two flag bits SSLF and TEND in CMNSR. These bits are read-only bits.

(1) SSLF Bit

This bit indicates the QSPIn_SSL pin status. The status is 1 when the QSPIn_SSL is asserted, and the status is 0 when the QSPIn_SSL is negated.

(2) TEND Bit

This bit indicates whether transfer of data is in progress or the transfer of data has ended.
During t1 time period, data transfer, t2 time period, t3 time period, and waiting for read access by burst read and QSPIn_SSL automatic negation, the TEND bit is read as 0 to indicate that the transfer of data is in progress. Otherwise, the TEND bit is read as 1 to indicate that transfer of data has ended.

(3) Register Re-writing Timing

The status of the TEND bit determines the rewritable registers.
The registers which can be written to, except the SSLN bit in DRCR, should be modified when TEND = 1. Read SMRDR0 and SMRDR1 when TEND = 1. CMNSR can always be read.

20.5.13 Write Buffer Operation

This module uses the read cache space also as the write buffer space during write operation.
The write buffer improves the performance of write access.

Table 20.13 Write Buffer Space

Address	Access Size
H'1F80_8000 to H'1F80_80FF	4, 8, 16, 32, or 64 bytes

Note: Be sure to sequentially access this space beginning from its start address with the transfer size set to eight bytes.
If access is non-sequential or random, correct operation is not guaranteed.
After an operation in Manual mode or with the use of the cache area as the write buffer, clearing of this cache area by writing 1 to the RCF bit is required.

Figure 20.26 shows the procedure for using the write buffer. For the initial settings in Manual mode, see Figure 20.16.

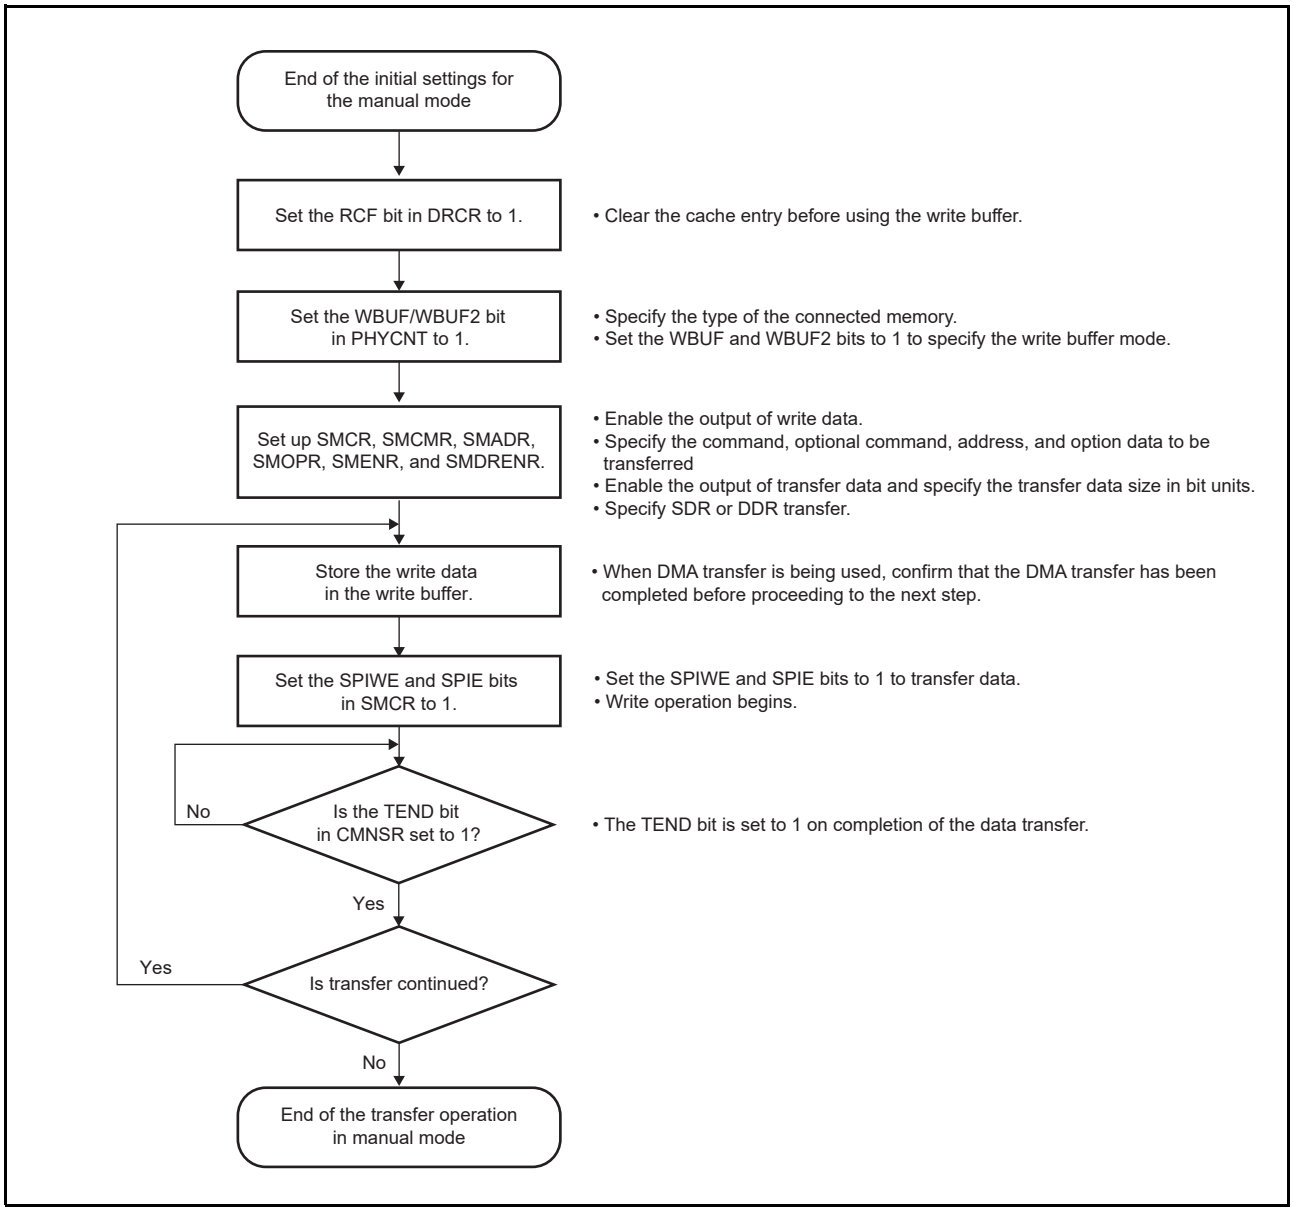

Figure 20.26 Procedure for Using the Write Buffer

20.5.14 Data Alignment in Octal-SPI Flash Memory Protocol Mode

When this LSI chip is connected in Octal-SPI flash memory protocol mode, two data alignment types are available in this module.

Figure 20.27 shows the sequential alignment type and Figure 20.28 shows the alternative alignment type.

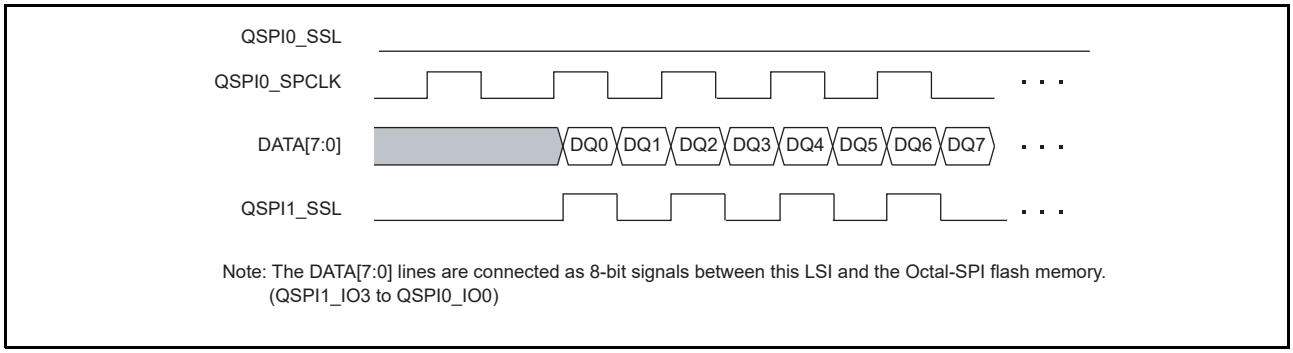

Figure 20.27 Sequential Alignment in Octal-SPI Flash Memory Protocol Mode (PHYCNT.OCTA = 10)

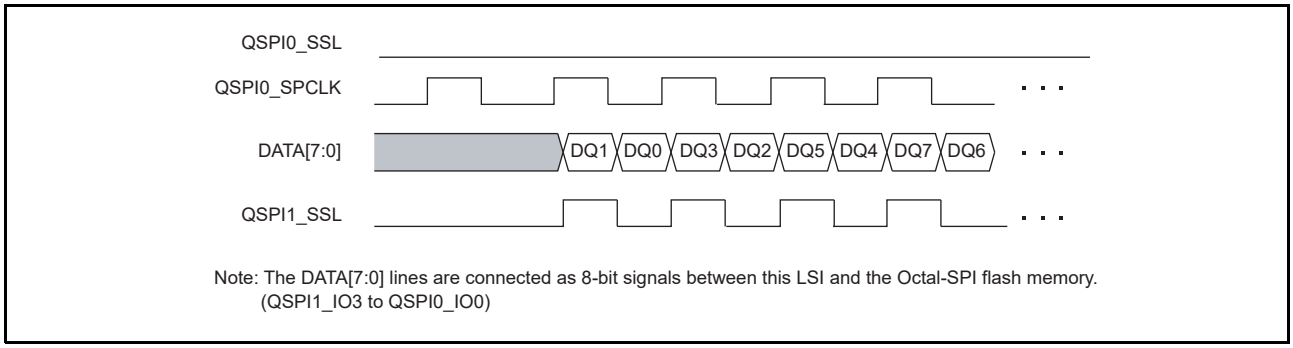

Figure 20.28 Alternative Alignment in Octal-SPI Flash Memory Protocol Mode (PHYCNT.OCTA = 01)

20.5.15 Supported Protocol for Serial Flash Memory

The protocol for serial flash memory that this LSI supports is indicated in Table 20.14.

Table 20.14 Supported Protocol for Serial Flash Memory

Bit Width (Command-Address-Data)	Command	Address	Data
1-0-0	SDR	NA	NA
1-0-1	SDR	NA	SDR
1-1-0	SDR	SDR	NA
1-1-1	SDR	SDR	SDR
	SDR	DDR	DDR
1-1-4	SDR	SDR	SDR
1-4-4	SDR	SDR	SDR
	SDR	DDR	DDR

20.5.16 Supported Protocol for Octal-SPI Flash Memory

The protocol for Octal-SPI flash memory that this LSI supports is indicated in Table 20.15.

Table 20.15 Supported Protocol for Octal-SPI Flash Memory

Bit Width (Command-Address-Data)	Command	Address	Data
1-0-0	SDR	NA	NA
1-0-1	SDR	NA	SDR
1-1-0	SDR	SDR	NA
1-1-1	SDR	SDR	SDR
8-0-0	SDR	NA	NA
	DDR	NA	NA
8-0-8	DDR	NA	DDR
8-8-0	DDR	DDR	NA
8-8-8	DDR	DDR	DDR

20.5.17 Timing Adjustment

When data is transferred with serial flash memory connected, adjustment of the timing between the clock operation and the acquisition of input data is required. When a connection is made in Octal-SPI flash memory protocol mode with the data strobe to be used or HyperFlash memory is connected, the timing of the acquisition of input data is automatically adjusted.

Figure 20.29 (1) shows the flow for timing adjustment when a serial flash memory (SDR mode except in the case of Octal-SPI flash memory) is connected.

Execute this flow before changing the setting of SCLKSEL.SPICR[1:0] from its initial value when the serial flash memory is connected (SDR mode). Execution of this flow at regular intervals is not required.

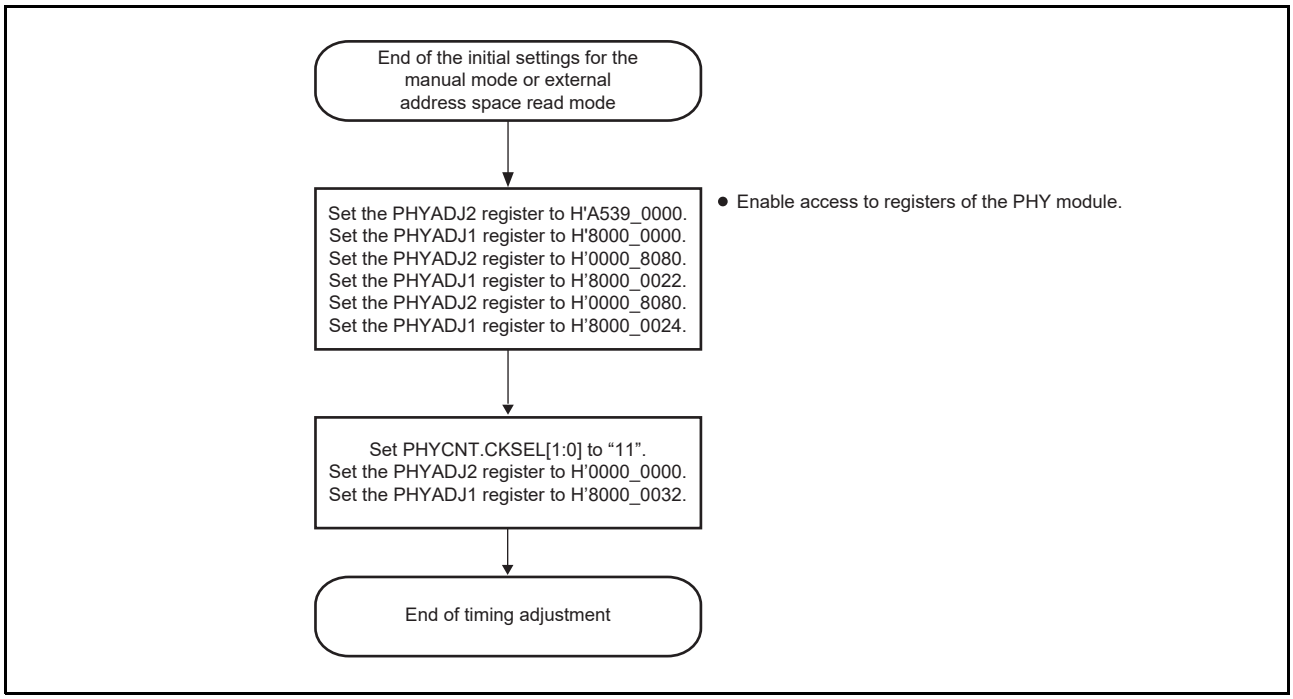

Figure 20.29 (1) Flow of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode Except in the Case of Octal-SPI Flash Memory)

Figure 20.29 (2) shows the timing adjustment flow for serial flash (DDR mode) connection.
Since the set value acquired in this timing adjustment flow is affected by voltage and temperature variation, this flow should be performed periodically.

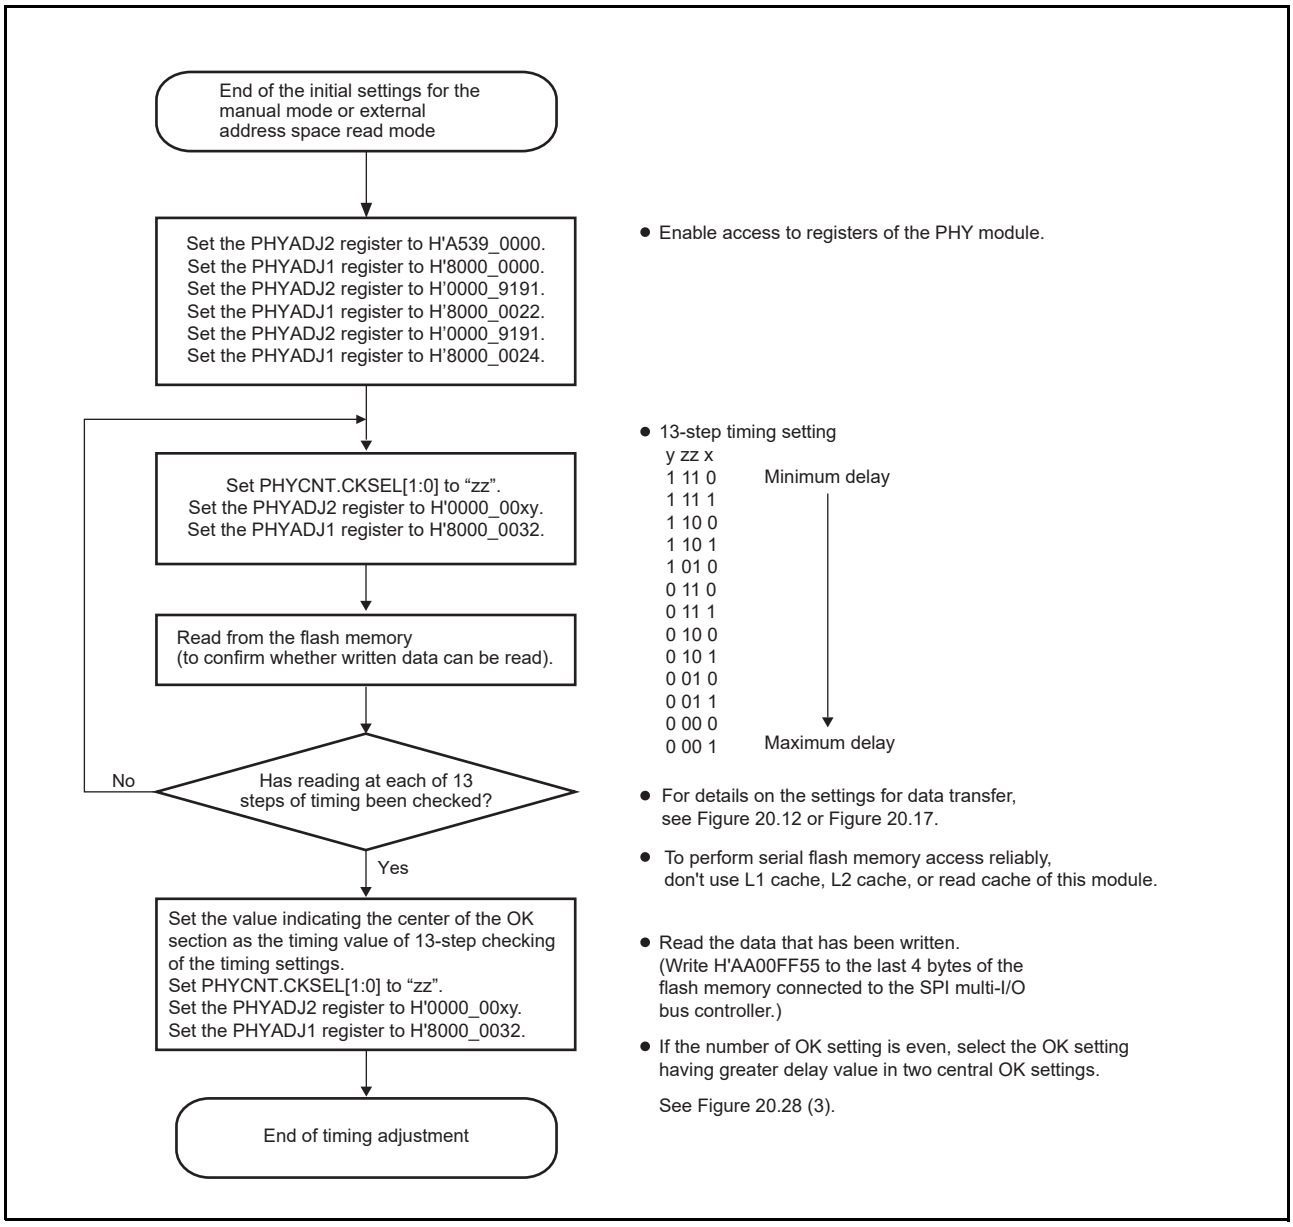

Figure 20.29 (2) Flow of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode)

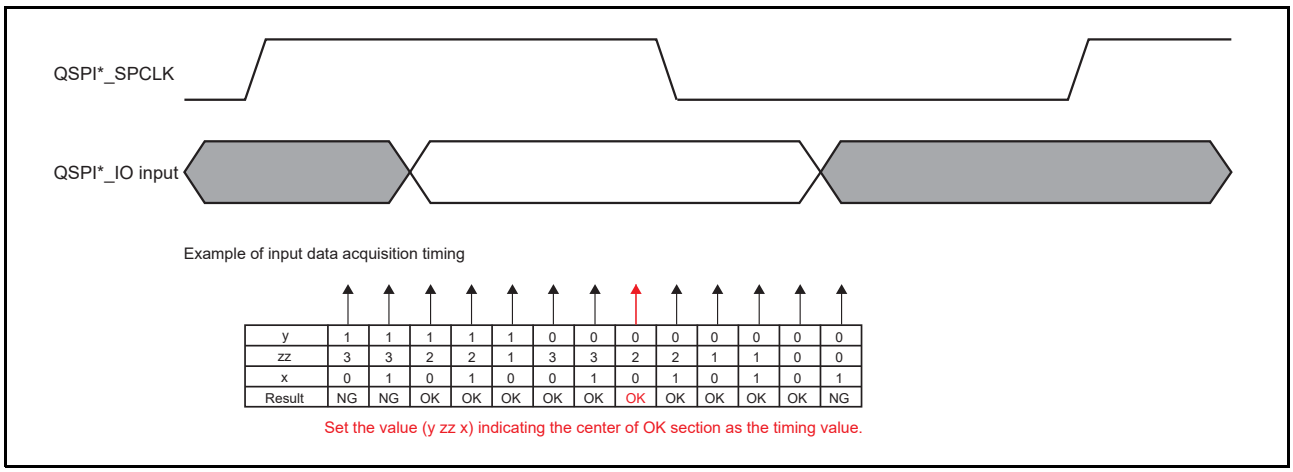
Figure 20.29 (3) shows an example of timing setting for serial flash (DDR mode) connection.



y	1	1	1	1	1	0	0	0	0	0	0	0	0
zz	3	3	2	2	1	3	3	2	2	1	1	0	0
x	0	1	0	1	0	0	1	0	1	0	1	0	1
Result	NG	NG	OK	OK	OK	OK	OK	OK	OK	OK	OK	OK	NG

Figure 20.29 (3) Example of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode)

20.5.18 Data Alignment

Data alignments in external address space read mode and Manual mode are shown in Figure 20.30 and Figure 20.31, respectively. When two serial flash memory devices are connected, the addresses of one device connected to pins QSPI0_IO0 to QSPI0_IO3 are treated as 2n and those of the other device connected to pins QSPI1_IO0 to QSPI1_IO3 are treated as 2n + 1. Be sure that access is in at least word units. Access in byte units is not supported.

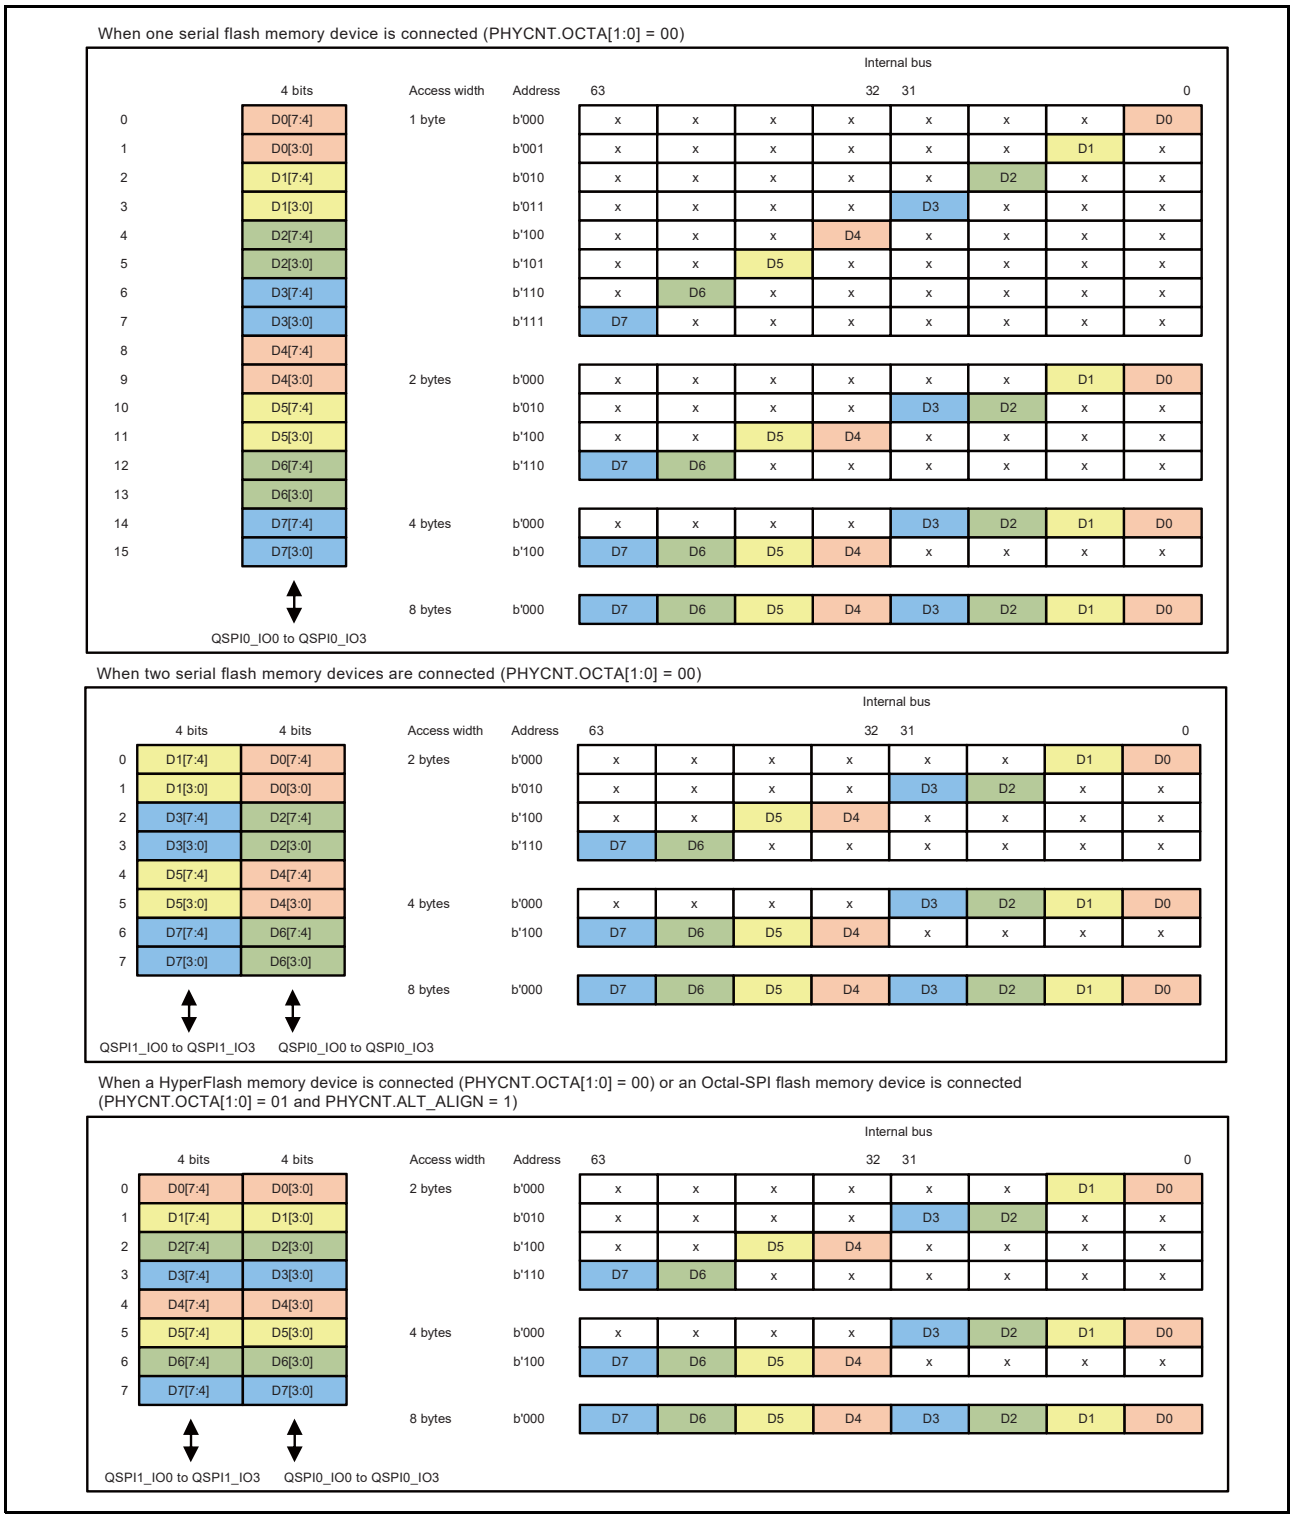


Figure 20.30 Data Alignment in External Address Space Read Mode

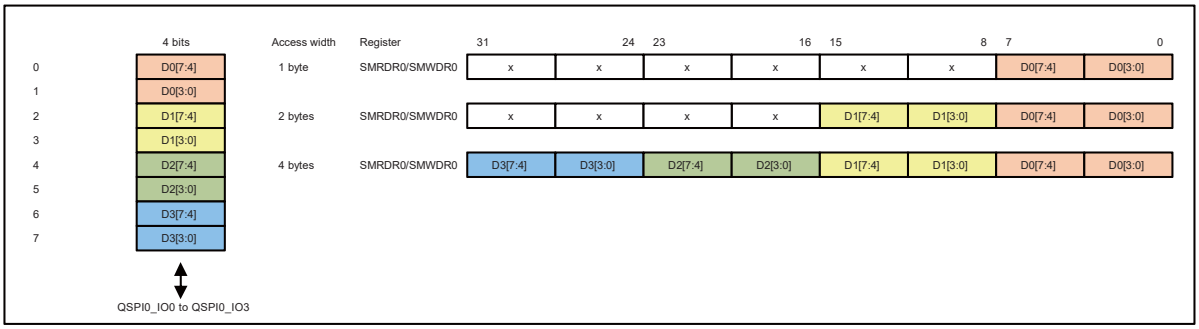
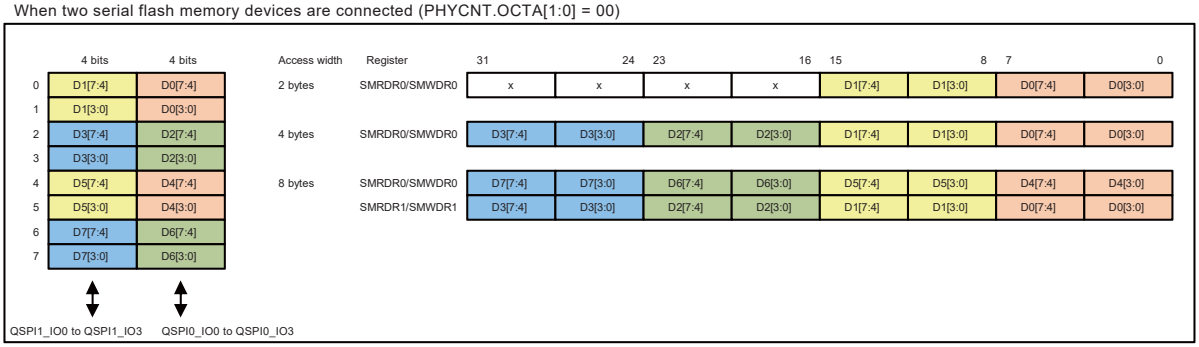
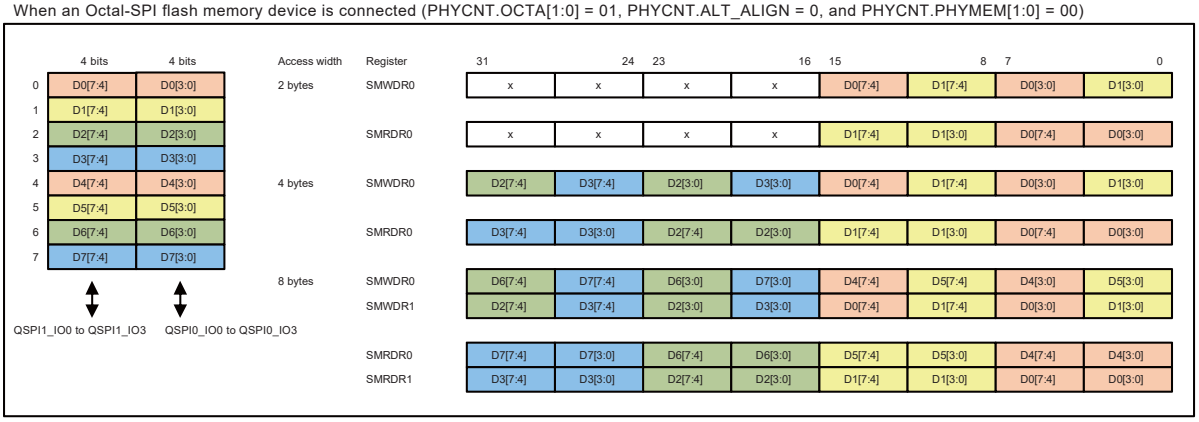
When one serial flash memory device is connected (PHYCNT.OCTA[1:0] = 00)



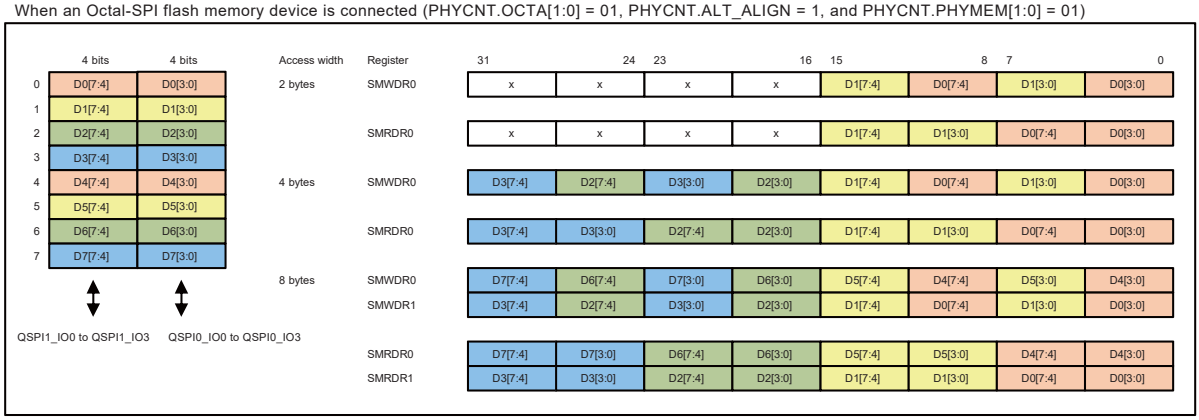
When two serial flash memory devices are connected (PHYCNT.OCTA[1:0] = 00)



When an Octal-SPI flash memory device is connected (PHYCNT.OCTA[1:0] = 01, PHYCNT.ALT_ALIGN = 0, and PHYCNT.PHYMEM[1:0] = 00)



When an Octal-SPI flash memory device is connected (PHYCNT.OCTA[1:0] = 01, PHYCNT.ALT_ALIGN = 1, and PHYCNT.PHYMEM[1:0] = 01)



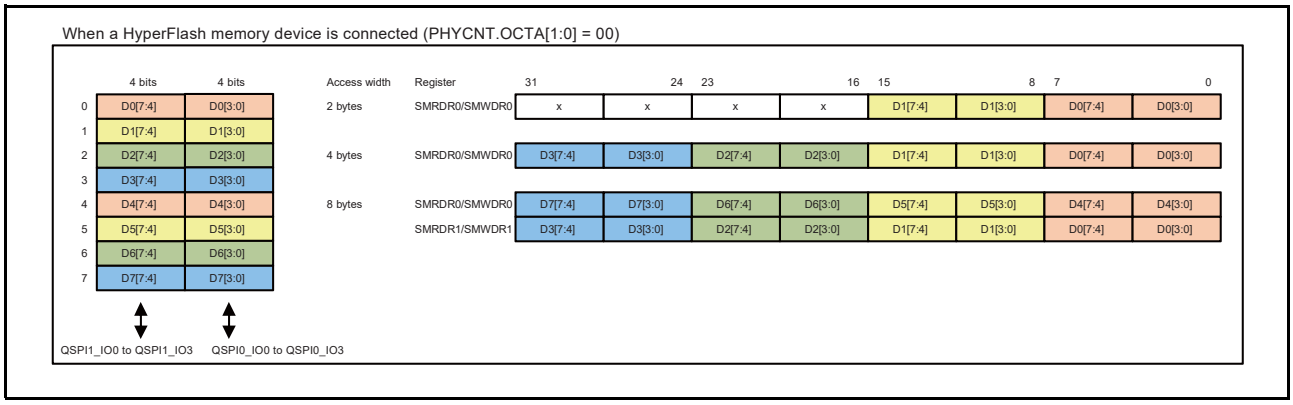


Figure 20.31 Data Alignment in Manual Mode

20.6 Usage Notes

20.6.1 Transfer to read data while the signal on the QSPIn_SSL pin is de-asserted

Set the SMENR.SPIDE[3:0] bits to 1100 or 1111 when transfer only for reading data is to proceed.
Transfer will not proceed normally if the setting of the SMENR.SPIDE[3:0] bits is 1000.

20.6.2 Notes on Starting Transfer from the QSPIn_SSL Retained State in Manual Mode

Be sure to set the SPIWE bit in the SMCR register to 1 when the transfer of a command, optional command, address, or option data is started while the QSPIn_SSL pin is being asserted in Manual mode.
In addition, while the QSPIn_SSL signal is being asserted in Manual mode, the setting to start data transfer for reading is prohibited.

20.6.3 Handling of RPC_RESET#

The state of the RPC_RESET# pin can be changed in the following two ways.

1. Use the RSTEN and RSTVAL bits in the PHYINT register.
   The state of the RPC_RESET# pin depends on the value of the RETVAL bits in the PHYINT register.
2. Activate the reset to this module.
   While a power-on reset or a software reset is applied to this LSI, the signal on the RPC_RESET# pin goes low.
   When the reset is deactivated, the signal on the RPC_RESET# pin goes high.

20.6.4 Software Reset after Release from the Module Stop State

Continue applying a software reset to this module even after the module is released from the module stop state. Note that the signal on the RPC_RESET# pin is low while a software reset is active. Be sure to satisfy the necessary reset period and accessible period for the connected device after a reset.

20.6.5 Writing Data in Octal-SPI Flash Memory Protocol Mode

When writing data in Octal-SPI flash memory protocol mode, the data to be written must be correctly aligned.
For details, refer to section 20.4.15, Manual Mode Write Data Register 0 (SMWDR0), and section 20.4.16, Manual Mode Write Data Register 1 (SMWDR1).

21. HyperBus™ Controller

The HyperBus™ controller enables the connection of HyperFlash™ and HyperRAM™ memory to this LSI chip.

Note: HyperBus™, HyperFlash™ and HyperRAM™ are trademarks of Cypress Semiconductor Corporation.

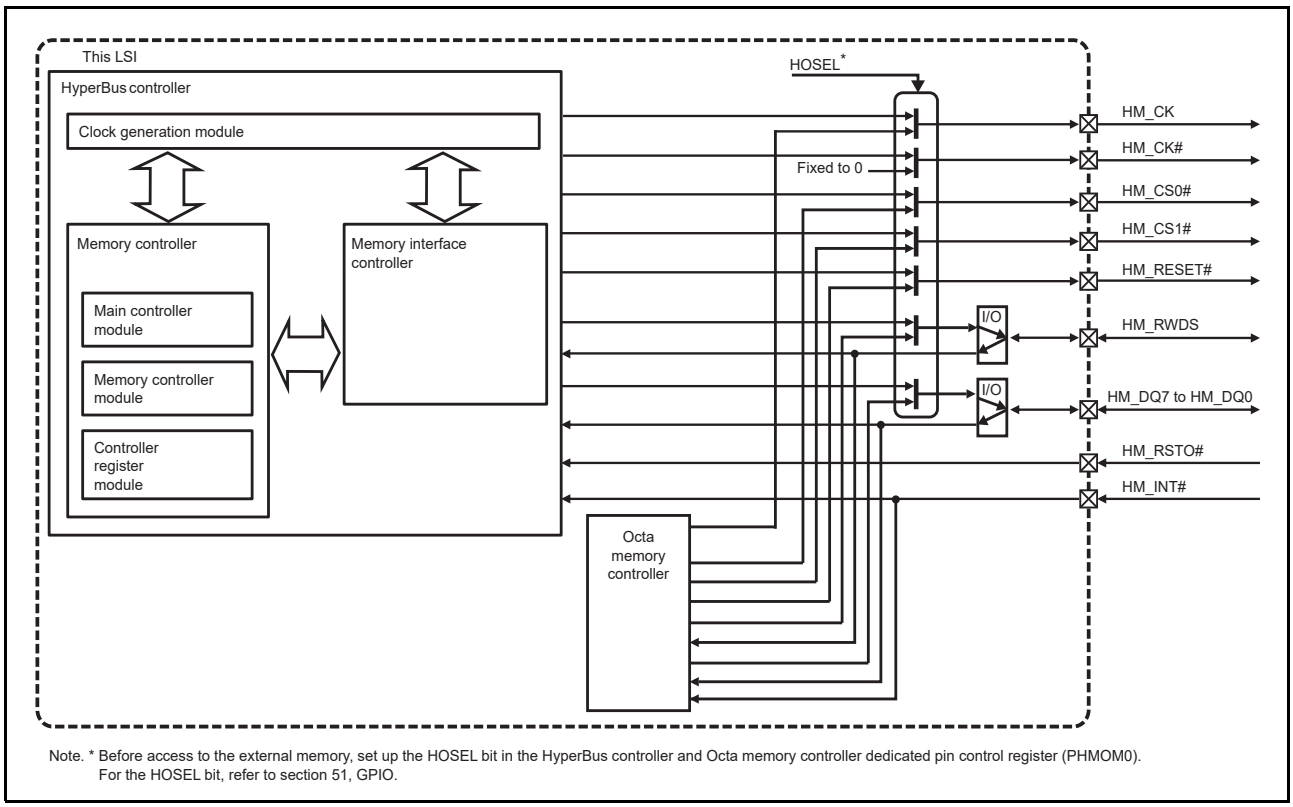
21.1 Features

- The controller supports a HyperBus interface.
- One each of a HyperFlash device and a HyperRAM device compliant with the HyperBus interface specifications are connectable.
- A chip select signal is assigned to each memory device (HM_CS0#: HyperFlash; HM_CS1#: HyperRAM).
  Note: Only one of the memory devices can operate (be read or written to) at a time.

- HM_CK and HM_CK#: 132 MHz
- PVcc_HO: 1.8 V

21.2 Block Diagram

Figure 21.1 shows a block diagram of this module.



Note. * Before access to the external memory, set up the HOSEL bit in the HyperBus controller and Octa memory controller dedicated pin control register (PHMOM0). For the HOSEL bit, refer to section 51, GPIO.

Figure 21.1 Block Diagram

21.3 System Configuration of the HyperBus

Figure 21.2 shows an example of connections between the HyperBus in this LSI and HyperFlash and HyperRAM devices.

CS0# and CS1# should respectively be connected to the HyperFlash and HyperRAM devices.

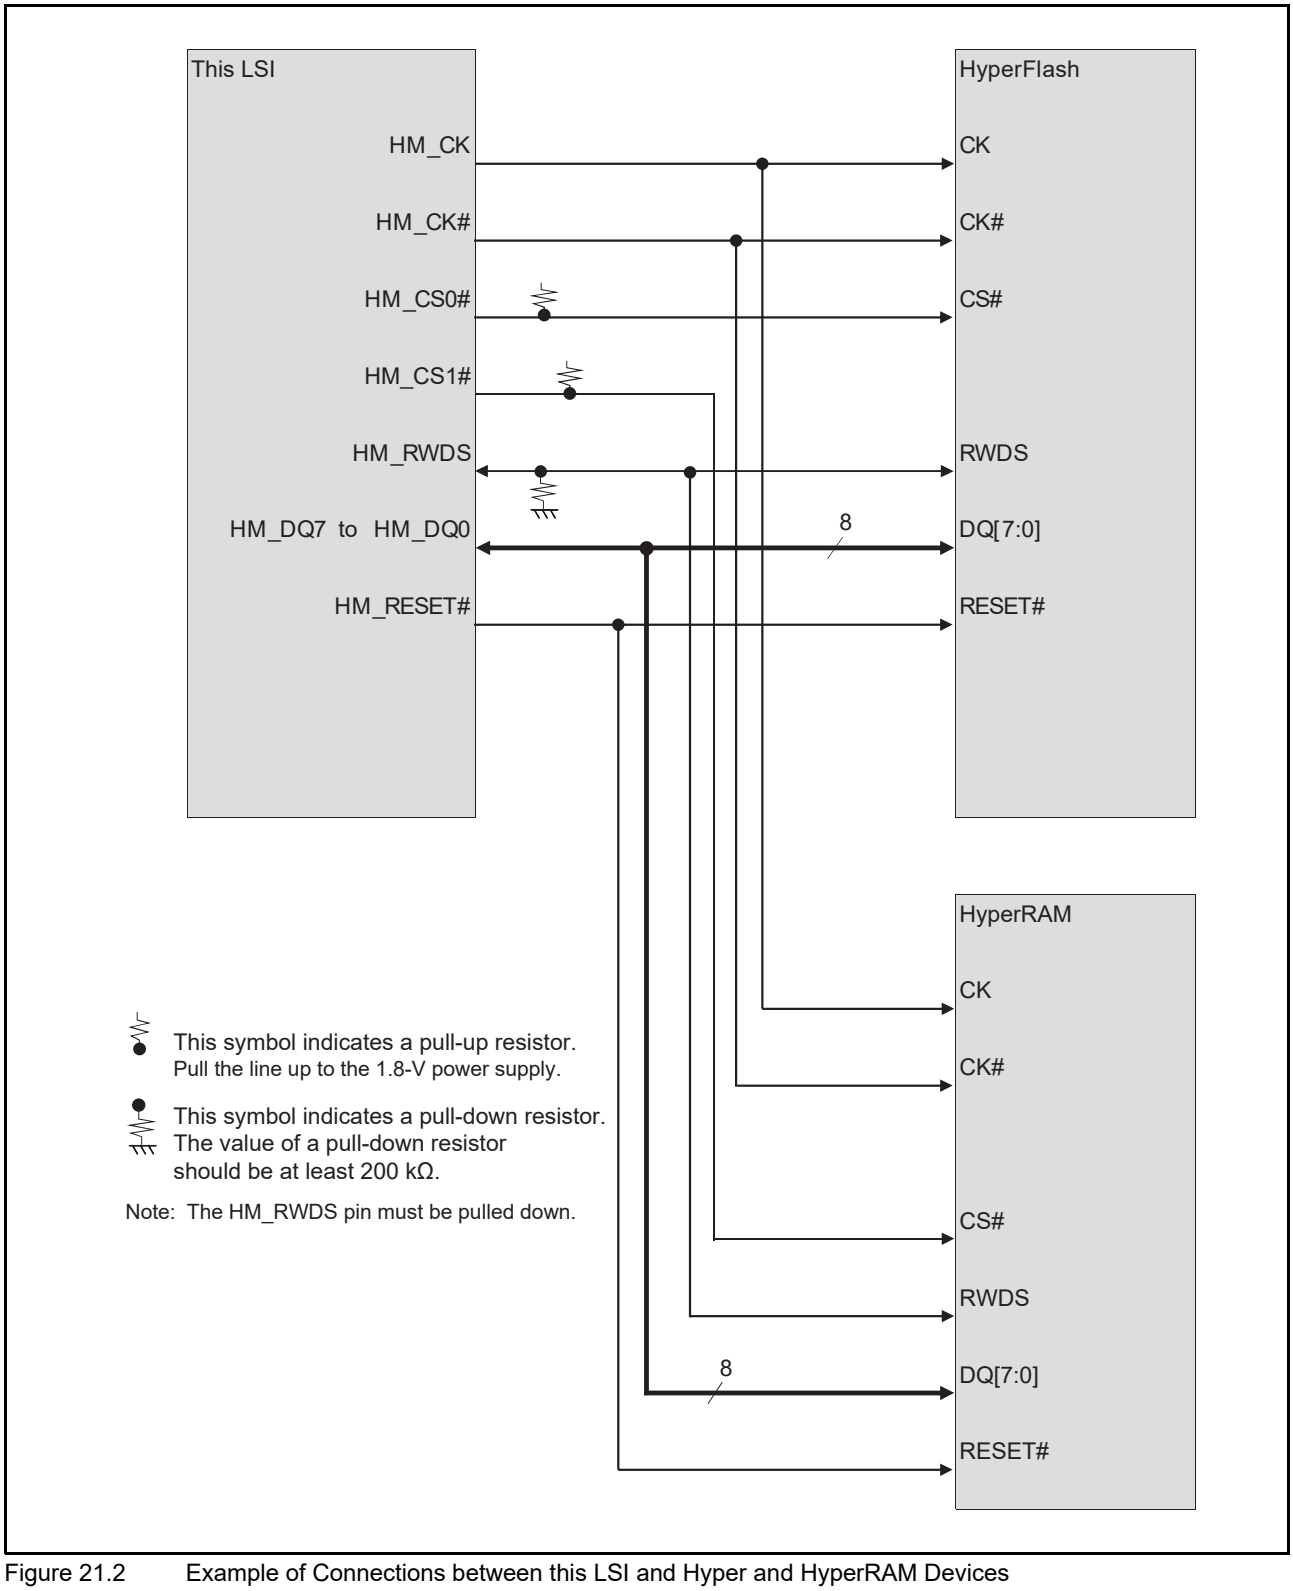


Figure 21.2 Example of Connections between this LSI and Hyper and HyperRAM Devices

21.4 Input/Output Pins

Table 21.1 lists the pins of this module.

Table 21.1 List of Input/Output Pins

Terminal	I/O	Name	Function
HM_CK	Output	Clock	Differential clock output
HM_CK#	Output	Clock	Differential clock output
HM_CS0#	Output	Chip Select 0	Chip-select signal for a HyperFlash device
HM_CS1#	Output	Chip Select 1	Chip-select signal for a HyperRAM device
HM_RWDS	Input/output	Read Write Data strobe	Read data strobe/write data mask
HM_DQ7 to HM_DQ0	Input/output	Data	Data in/out
HM_RESET#	output	Reset Output	Reset signal for both HyperFlash and HyperRAM devices
HM_RSTO#	Input	Reset Input	Reset signal from a HyperFlash device
HM_INT#	Input	Interrupt Input	Interrupt signal from a HyperFlash device

Note: HM_RSTO# and HM_INT# are input pins that are multiplexed with alternative pin functions that are driven by the 3.3-V power supply. The other pins are solely used for functions that are driven by the 1.8-V power supply.

21.5 Description of Registers

Table 21.2 lists the registers of this module.
Access to these registers is only possible in 32-bit units.
Do not attempt to access addresses other than those listed below.

Table 21.2 List of the HyperBus Controller Registers

Name	Symbol	R/W	Initial Value	Address	Access Size
Controller status register	CSR	R	0x00000000	0x1F400000	32
Interrupt enable register	IEN	R/W	0x00000000	0x1F400004	32
Interrupt status register	ISR	R	0x00000000	0x1F400008	32
CS0 memory configuration register	MCR0	R/W	0x00000003	0x1F400020	32
CS1 memory configuration register	MCR1	R/W	0x00000003	0x1F400024	32
CS0 memory timing register	MTR0	R/W	0x00000001	0x1F400030	32
CS1 memory timing register	MTR1	R/W	0x00000001	0x1F400034	32

21.5.1 Controller Status Register (CSR)

CSR indicates the internal state of the HyperBus controller.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	WRSTO ERR	WTRS ERR	WDEC ERR	—	—	—	—	—	—	—	WACT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	RDS STALL	RRSTO ERR	RTRS ERR	RDEC ERR	—	—	—	—	—	—	—	RACT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0.
26	WRSTOERR	0	R	Write RSTO Error This bit indicates if the memory was in the reset state during attempted writing. The bit is set to 1 if the HyperBus memory was in the reset state during attempted writing. 0: No error 1: The device was in the reset state and the AXI slave error signal was output.
25	WTRSERR	0	R	Write Transaction Error This bit indicates whether the attempted writing conformed to AXI protocol. This bit is set to 1 if the attempted writing did not conform to AXI protocol. 0: No error 1: The attempted writing did not conform to the AXI protocol and the AXI slave error signal was output.
24	WDECERR	0	R	Write Decode Error This bit indicates whether the destination address for writing was acceptable or not. This bit is set to 1 if there is a problem with a destination address. 0: No error 1: The destination address was not acceptable and the AXI slave error signal was output.
23 to 17	—	All 0	R	Reserved These bits are always read as 0.
16	WACT	0	R	Write State This bit indicates the state of the write transaction. This bit is set to 1 when a write command is received and set to 0 at the end of the write transaction. 0: Write transaction is idle. 1: Write transaction is in progress.
15 to 12	—	All 0	R	Reserved These bits are always read as 0.
11	RDSSTALL	0	R	RDS Timeout This bit indicates whether the read transaction timed out. This bit is set to 1 when the RWDS signal of the HyperBus memory remains low for the specified time in the read transaction. 0: No error 1: The RWDS signal of the HyperBus memory remains low for the specified time and the AXI slave error signal was output.

Bit	Bit Name	Initial Value	R/W	Description
10	RRSTOERR	0	R	Read RSTO Error This bit indicates if the memory was in the reset state during attempted reading. The bit is set to 1 if the HyperBus memory was in the reset state during attempted reading. 0: No error 1: The device was in the reset state and the AXI slave error signal was output.
9	RTRSERR	0	R	Read Transaction Error This bit indicates whether the attempted reading conformed to the AXI protocol. This bit is set to 1 when the attempted reading did not conform to the AXI protocol. 0: No error 1: The attempted reading did not conform to the AXI protocol and the AXI slave error signal was output.
8	RDECERR	0	R	Read Decode Error This bit indicates whether the destination address for reading was acceptable or not. This bit is set to 1 if there is a problem with a destination address. 0: No error 1: The destination address was not acceptable and the AXI slave error signal was output.
7 to 1	—	All 0	R	Reserved These bits are always read as 0.
0	RACT	0	R	Read State This bit indicates the state of the read transaction. This bit is set to 1 when a read command is received and set to 0 at the end of the read transaction. 0: Read transaction idle state 1: Read transaction is in progress.

21.5.2 Interrupt enable register (IEN)

IEN sets the interrupt signal.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTP	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RPC INTE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	INTP	0	R/W	Interrupt polarity control 0: The IENOn signal is active low. 1: The IENOn signal is active high.
30 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RPCINTE	0	R/W	Interrupt enable 0: Disable interrupt 1: Enable interrupt by HM_INT# signal of HyperBus memory

21.5.3 Interrupt status register (ISR)

ISR indicates the state of the interrupt signal.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RPC INTS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0.
0	RPCINTS	0	R	HyperBus memory interrupt state This bit indicates the state of the interrupt signal input to this controller from the HyperBus memory. 0: No interrupt 1: Interrupt

21.5.4 CS0 Memory configuration register (MCR0)

MCR0 specifies the operations of the HyperBus controller during access to the HyperFlash device.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MAXEN	—	—	—	—	MAXLEN[8:0]									—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	MAXEN	0	R/W	Maximum time setting enable This bit sets whether the time at low level of the HM_CS0# signal is to be controlled by MAXLEN[8:0]. 0: Time at low level of HM_CS0# is not configurable. 1: Time at low level of HM_CS0# is configured by MAXLEN[8:0].
30 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 18	MAXLEN[8:0]	All 0	R/W	Maximum time setting Sets the maximum read/write transaction time (the time at low level of the HM_CS0# signal). 000000000: 1 clock cycle (sufficient for 2 bytes) 000000001: 2 clock cycles (sufficient for 4 bytes) 000000010: 3 clock cycles (sufficient for 6 bytes) ... 111111111: 512 clock cycles (sufficient for 1024 bytes) When MAXEN is 0, this setting has no effect. Clock cycles above refers to cycles of the HM_CK and HM_CK# signals.
17 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	—	11	R	Reserved These bits are always read as 1. The write value should always be 1

21.5.5 CS1 Memory configuration register (MCR1)

MCR1 specifies the operations of the HyperBus controller during access to the HyperRAM device.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MAXEN	—	—	—	—	MAXLEN[8:0]									—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CRT	DEV TYPE	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	MAXEN	0	R/W	Maximum time setting enable This bit sets whether the time at low level of the HM_CS1# signal is to be controlled by MAXLEN[8:0]. 0: Time at low level of HM_CS1# is not configurable. 1: Time at low level of HM_CS1# is configured by MAXLEN[8:0].
30 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 18	MAXLEN[8:0]	All 0	R/W	Maximum time setting Sets the maximum read/write transaction time (the time at low level of the HM_CS1# signal). 000000000: 1 clock cycle (sufficient for 2 bytes) 000000001: 2 clock cycles (sufficient for 4 bytes) 000000010: 3 clock cycles (sufficient for 6 bytes) ... 111111111: 512 clock cycles (sufficient for 1024 bytes) When MAXEN is 0, this setting has no effect. Clock cycles above refers to cycles of the HM_CK and HM_CK# signals.
17 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	CRT	0	R/W	Access target This bit sets the access target of read/write operation. 0: Memory space 1: Register space
4	DEVTYPE	0	R/W	Device Type Set the value to 1.
3, 2	—	00	R/W	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	—	11	R	Reserved These bits are always read as 1. The write value should always be 1.

21.5.6 CS0 Memory Timing Register (MTR0)

MTR0 sets access timings of the HM_CS0# signal.

For each timing parameter specified in this register, refer to section 21.6.4, MTR0 and MTR1 Timing Parameters.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RCSHI[3:0]				WCSHI[3:0]				RCSS[3:0]				WCSS[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCSH[3:0]				WCSH[3:0]				—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	RCSHI[3:0]	0000	R/W	Setting Read Chip Select timing Minimum wait time between negating the HM_CS0# pin and starting the next read access 0000: 1.5 clock cycles … 1111: 16.5 clock cycles
27 to 24	WCSHI[3:0]	0000	R/W	Setting Write Chip Select timing Minimum wait time between negating the HM_CS0# pin and starting the next write access 0000: 1.5 clock cycles … 1111: 16.5 clock cycles
23 to 20	RCSS[3:0]	0000	R/W	Setting Read Chip Select Setup timing Sets setup time of the HM_CS0# signal for reading, after the HM_CS0# signal is asserted. 0000: 1 clock cycle … 1111: 16 clock cycles
19 to 16	WCSS[3:0]	0000	R/W	Setting Write Chip Select Setup timing Sets setup time of the HM_CS0# signal for writing, after the HM_CS0# signal is asserted. 0000: 1 clock cycle … 1111: 16 clock cycles
15 to 12	RCSH[3:0]	0000	R/W	Setting Read Chip Select Hold timing Set time from the end of the reading processing until the HM_CS0# signal is negated. 0000: 1 clock cycle … 1111: 16 clock cycles
11 to 8	WCSH[3:0]	0000	R/W	Setting Write Chip Select Hold timing Set time from the end of the writing processing until the HM_CS0# signal is negated. 0000: 1 clock cycle … 1111: 16 clock cycles
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

21.5.7 CS1 Memory Timing Register (MTR1)

MTR1 sets access timings of the HM_CS1# signal.
For each timing parameter specified in this register, refer to section 21.6.4, MTR0 and MTR1 Timing Parameters.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RCSHI[3:0]				WCSHI[3:0]				RCSS[3:0]				WCSS[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCSH[3:0]				WCSH[3:0]				—	—	—	—	LTCY[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	RCSHI[3:0]	0000	R/W	Setting Read Chip Select timing Minimum wait time between negating the HM_CS1# pin and starting the next read access 0000: 1.5 clock cycles … 1111: 16.5 clock cycles
27 to 24	WCSHI[3:0]	0000	R/W	Setting Write Chip Select timing Minimum wait time between negating the HM_CS1# pin and starting the next write access 0000: 1.5 clock cycles … 1111: 16.5 clock cycles
23 to 20	RCSS[3:0]	0000	R/W	Setting Read Chip Select Setup timing Sets setup time of the HM_CS1# signal for reading, after the HM_CS1# signal is asserted. 0000: 1 clock cycles … 1111: 16 clock cycles
19 to 16	WCSS[3:0]	0000	R/W	Setting Write Chip Select Setup timing Sets setup time of the HM_CS1# signal for writing, after the HM_CS1# signal is asserted. 0000: 1 clock cycles … 1111: 16 clock cycles
15 to 12	RCSH[3:0]	0000	R/W	Setting Read Chip Select Hold timing Set time from the end of the reading processing until the HM_CS1# signal is negated. 0000: 1 clock cycles … 1111: 16 clock cycles
11 to 8	WCSH[3:0]	0000	R/W	Setting Write Chip Select Hold timing Set time from the end of the writing processing until the HM_CS1# signal is negated. 0000: 1 clock cycles … 1111: 16 clock cycles
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	LTCY[3:0]	0001	R/W	Setting Latency Cycle These bits specify the read and write latency. These bits should only be used in a HyperRAM device. These bits have no effect when the setting of MCR1.DEVTYPE is 0 (HyperFlash is specified). 0000: 5 clock cycles of latency 0001: 6 clock cycles of latency … 0010 to 1111: Setting prohibited

21.6 Operation

21.6.1 Address Map

For read access in the memory-map mode, HyperFlash is allocated to the HyperFlash space (0x30000000 to 0x3FFFFFFF), and HyperRAM is allocated to the HyperRAM space (0x40000000 to 0x4FFFFFFF).
One each of a HyperFlash device and a HyperRAM device can be connected to this LSI chip, with up to 256 Mbytes being accessible in each of the devices.

	Internal Address	Maximum Accessible Area
HyperFlash	0x30000000 to 0x3FFFFFFF	Up to 256 Mbytes
HyperRAM	0x40000000 to 0x4FFFFFFF	Up to 256 Mbytes

21.6.2 HyperBus Memory Interface

This section describes the HyperBus memory interface.

21.6.2.1 Write Operation

This section describes the write operation of HyperBus controller.
HyperBus controller asserts HM_CS0# (HM_CS1#), HM_CK, HM_CK#, HM_DQ7 to HM_DQ0. Then, it outputs 3 words command/address, and writes 1 or more data. The cycle of writing to the HyperRAM device includes the initial clock latency before writing of the data.
Figure 21.3 shows the write waveform of HyperFlash interface Figure 21.4 shows the write waveform of HyperRAM interface.

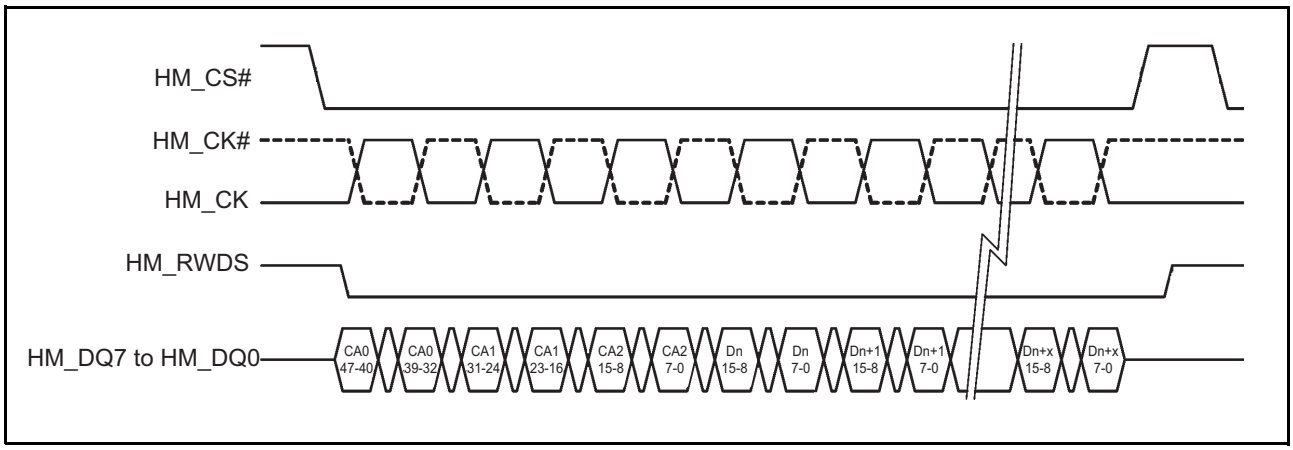

Figure 21.3 Write Waveform of HyperFlash Interface

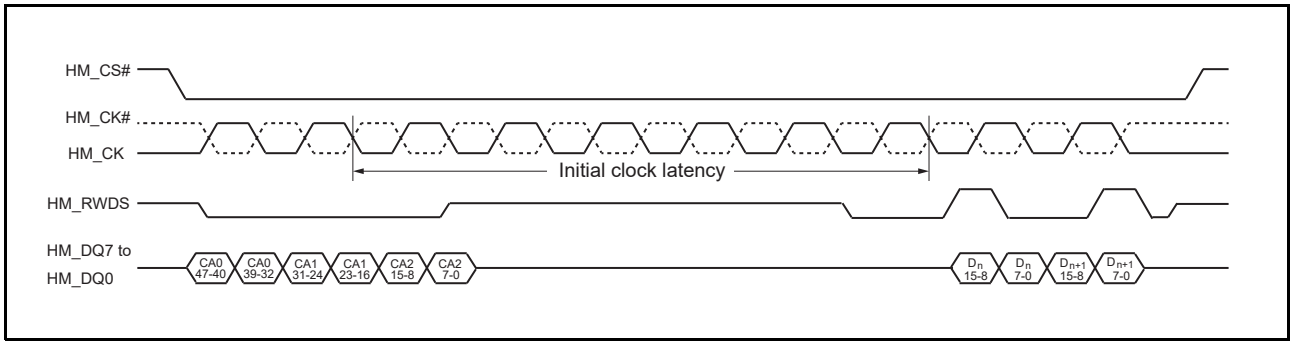

Figure 21.4 Write waveform of HyperRAM interface

21.6.2.2 Read Operation

This section describes the read operation of HyperBus memory interface controller.
HyperBus controller asserts HM_CS0# (HM_CS1#), HM_CK, HM_CK#, and HM_DQ7 to HM_DQ0. Then, it outputs 3 words command/address, and reads 1 or more data by timing of HM_RWDS.
Figure 21.5 shows the read waveform of HyperBus memory interface.

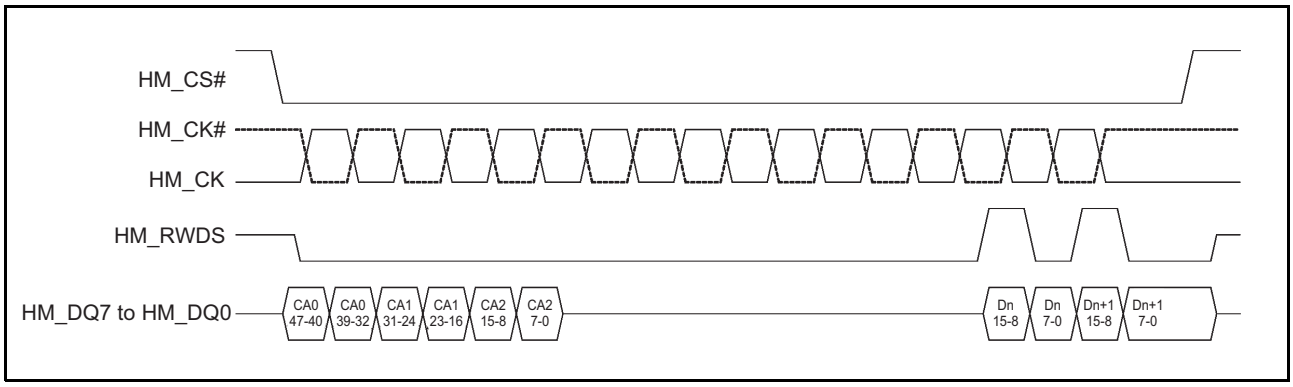

Figure 21.5 Read waveform of HyperBus memory interface

21.6.2.3 One-Byte Write Access

This section describes one-byte write access.
The HyperBus controller outputs three words of command and address data, followed after a cycle for latency by the data to be written in units of two bytes.
When the target device is HyperRAM, the output RWDS signal of the HyperBus interface can be used to mask bytes by driving it to the high level during the operation of writing. This allows the masking of invalid write data.
When the target device is HyperFlash, one-byte write access must not be attempted since HyperFlash only supports two-byte access.

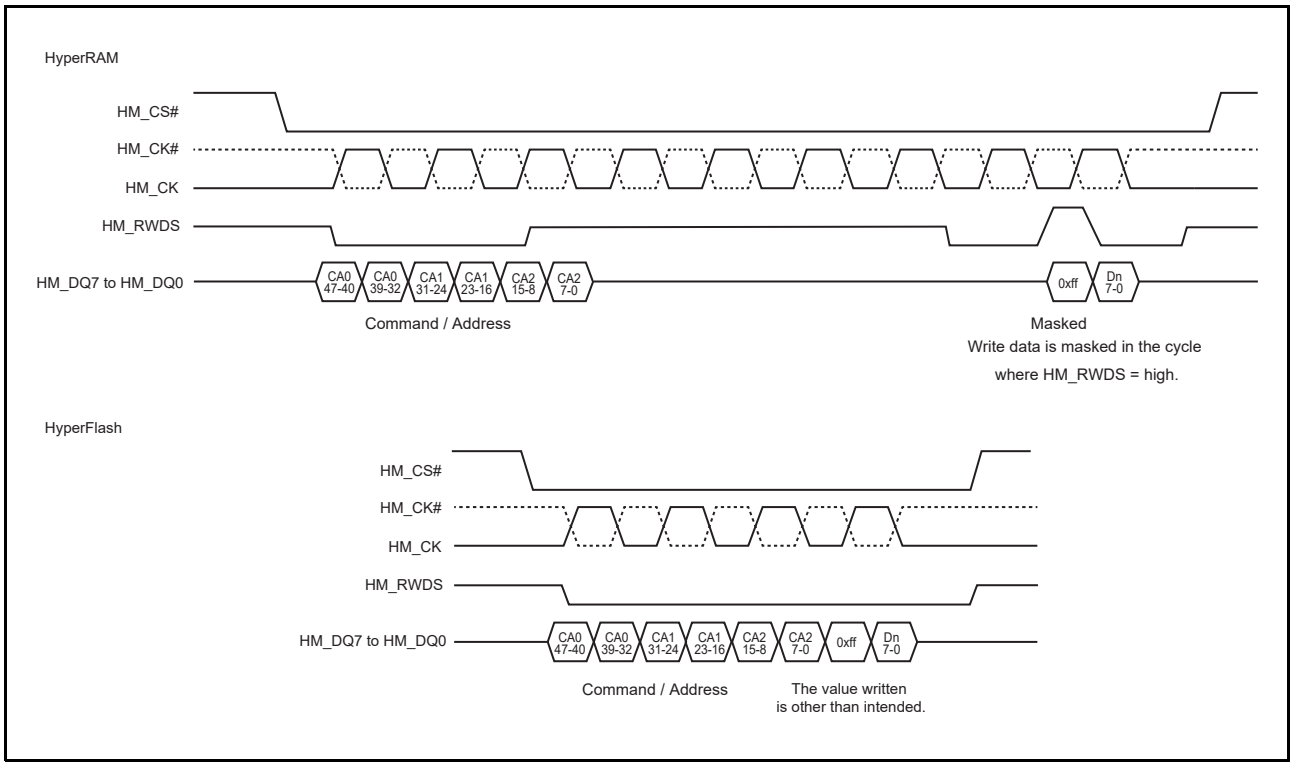

Figure 21.6 Waveforms of One-Byte Writing

21.6.2.4 Command/Address Bit Assignments

HyperBus memory device uses 6 bytes of command/address information to define the transactions characteristics. Table 21.3 shows the assignments of command/address bit in the HyperBus controller.

Table 21.3 Command/Address Bit Assignments

Bit	Bit Name	Description
47	R/W#	0: Write, 1: Read
46	Access target	0: Memory access, 1: Register access
45	Burst type	0: Wrapped burst, 1: Linear burst Note: The output of data must be in accord with the burst type of the AXI bus. The HyperBus controller only supports the transfer of 32-byte and 64-byte bursts. When the secondary cache is used, the burst-access setting of the secondary cache must match the burst-length settings for HyperFlash and HyperRAM so that the wrap boundaries of the burst addresses for the AXI bus match the address boundaries of the wrapped bursts for HyperFlash and HyperRAM.
44	Reserved	0
43 to 16	High-order address	System word address bits [30:3]
15	Reserved	0
14, 13	Reserved	11
12 to 3	Reserved	All 0
2 to 0	Low-order address	System word address bits [2:0]

Burst-Length Settings for HyperFlash and HyperRAM	Setting in the Prefetch Control Register for the Secondary Cache		
	Bit 30	Bit 27	Bit 23
32 bytes	0	0	0
64 bytes	1	0	1
Other than above: Setting prohibited	—		

21.6.2.5 Configuration Register Data Alignment in the HyperRAM Space

Figure 21.7 shows the data alignment when the configuration register in the HyperRAM space is accessed.

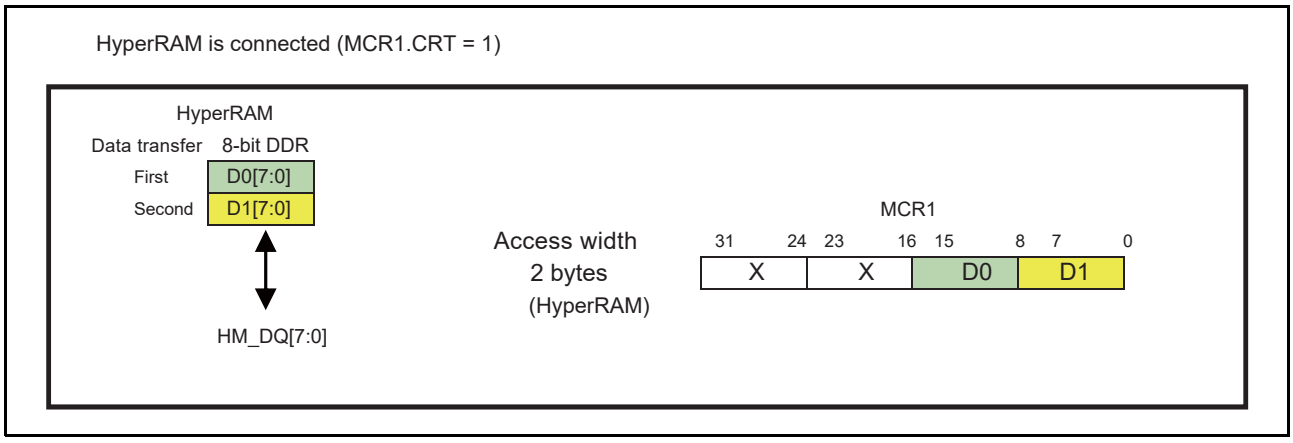

Figure 21.7 Configuration Register Data Alignment in the HyperRAM Space

21.6.3 Operation Flows

This section shows examples of flows of operation of the HyperBus controller.
Before access to the external memory, set up the HOSEL bit in the HyperBus controller and Octa memory controller dedicated pin control register (PHMOM0) and the HYMCR bit field in the SCLK select register (SCLKSEL) in the initial setting steps.
For the HOSEL bit, refer to section 51, GPIO.
For the HYMCR bit field, refer to section 6, Clock Pulse Generator.

21.6.3.1 Write Operation Flow

Figure 21.8 shows the procedure for the writing of N bytes to a HyperFlash device in 2-byte units (Word Program) as an example of the operation flow of writing.

Note: When writing four or more bytes, use a clock frequency that is compliant with the specifications of the HyperBus memory interface.

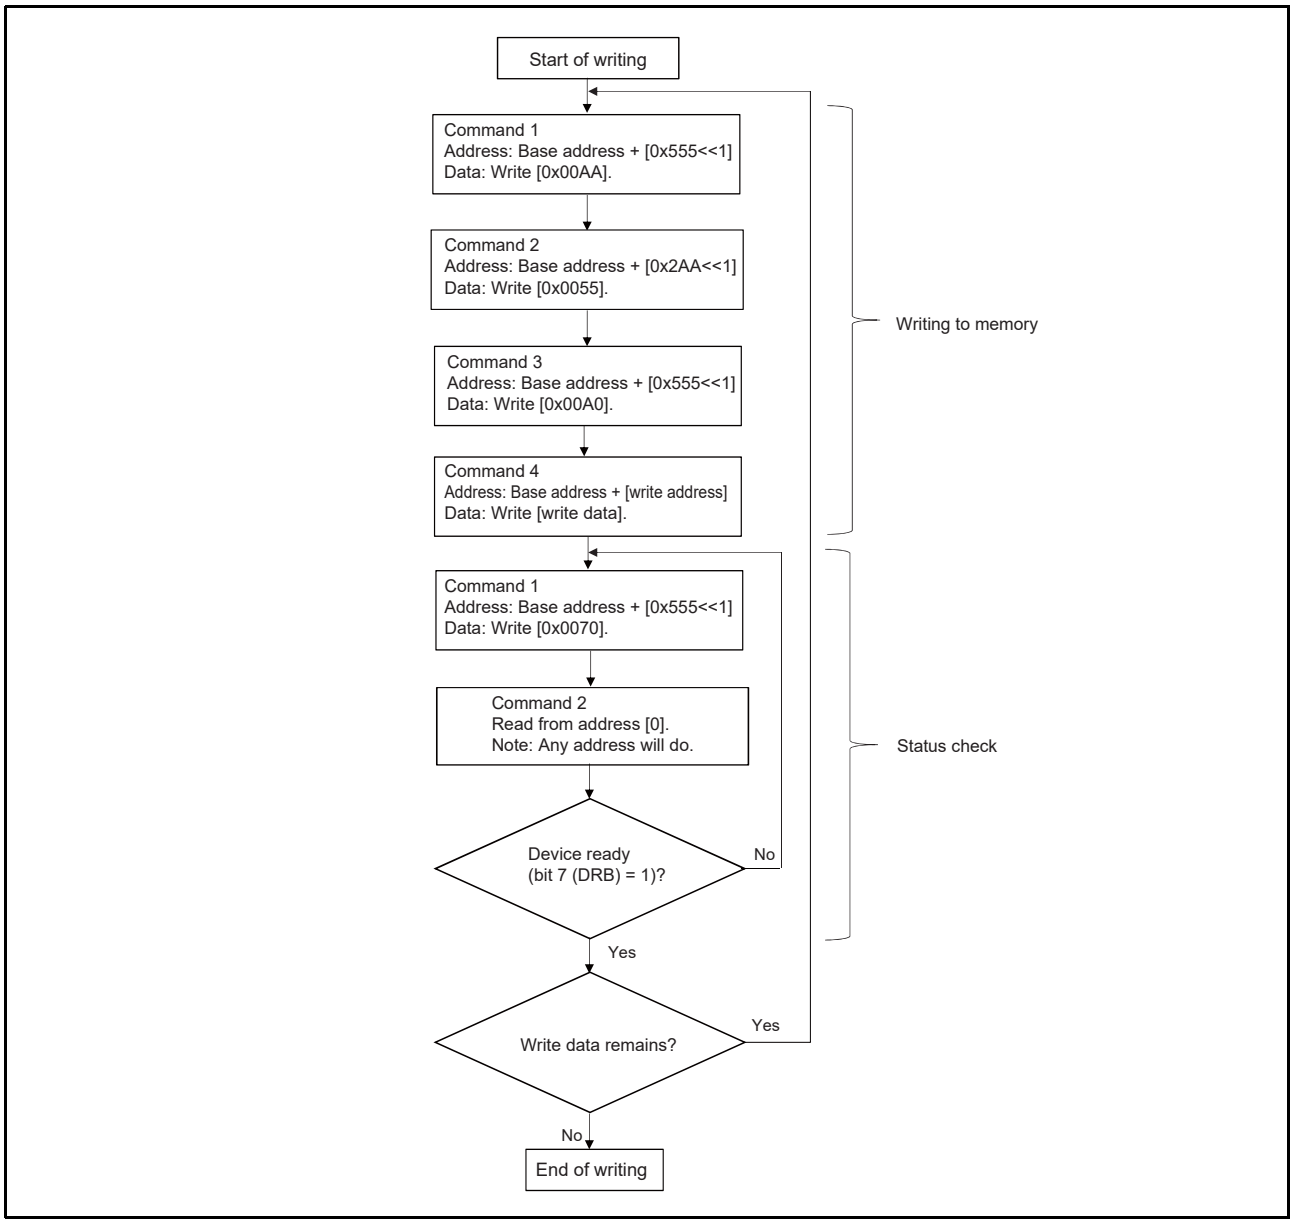

Figure 21.8 Flow of Write Operation for HyperFlash

21.6.3.2 Erase Operation Flow

Figure 21.9 shows an example of the procedure for sector erase.

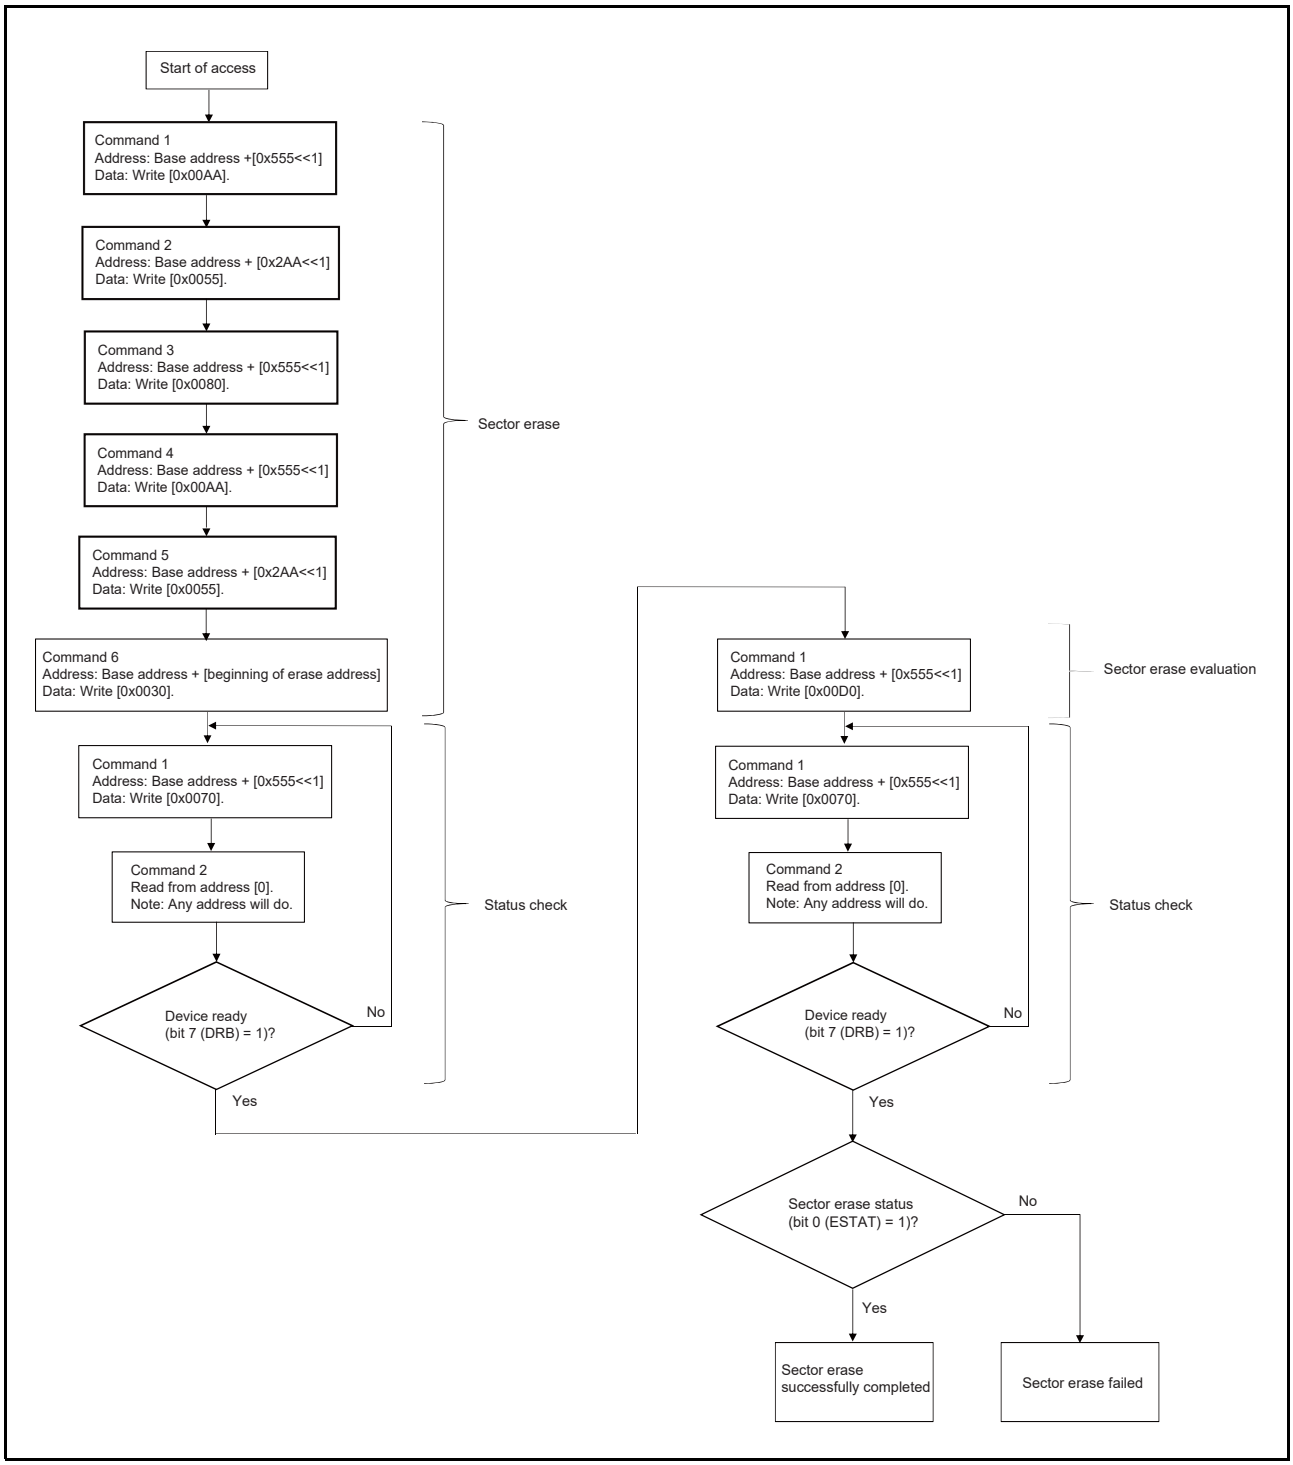

Figure 21.9 Flow of Sector Erase Operation for HyperFlash

21.6.3.3 Flow of Write and Read Operations for the Configuration Register

Figure 21.10 shows an example of writing and reading operations for the volatile configuration registers in a HyperFlash device.

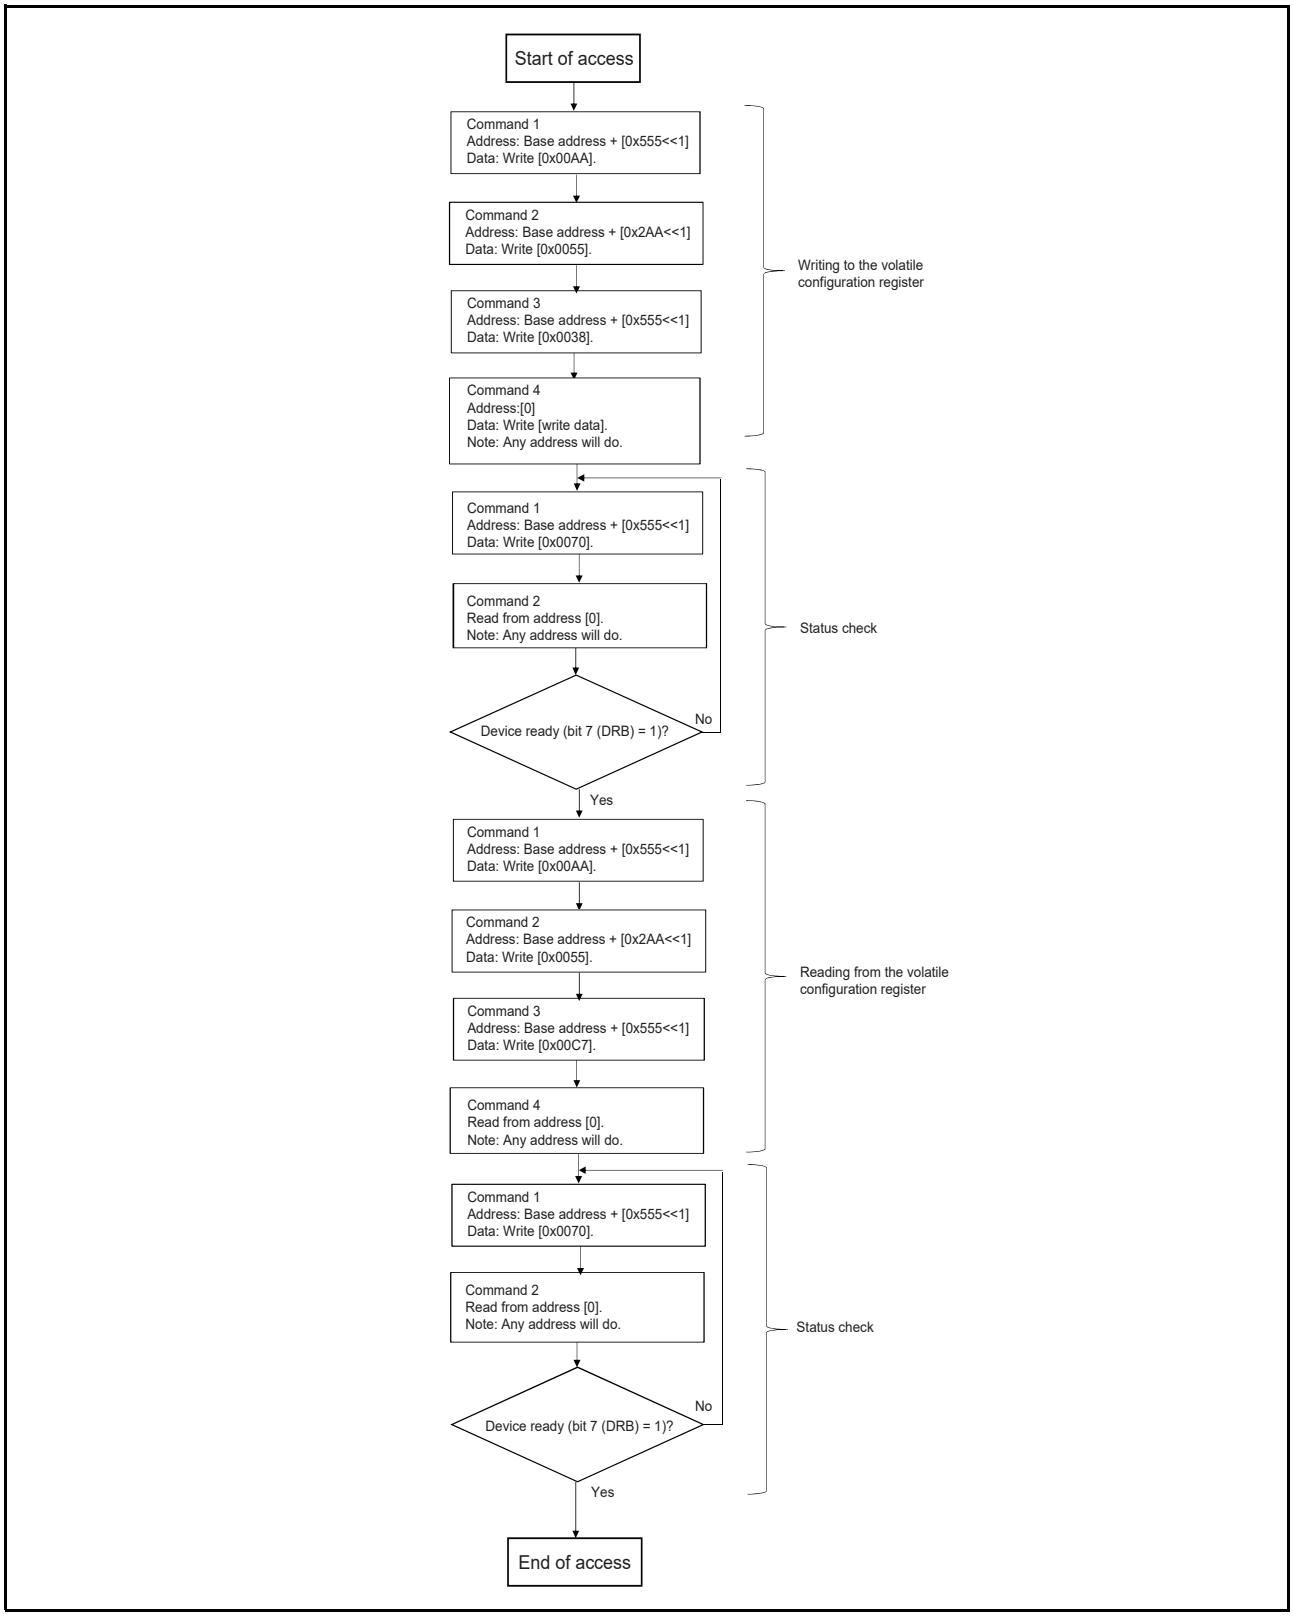

Figure 21.10 Flow of Write and Read Operations for the Volatile Configuration Register

21.6.4 MTR0 and MTR1 Timing Parameters

The timing parameters specified in the CS0 memory timing register (MTR0) and CS1 memory timing register (MTR1) described in section 21.5.6 and section 21.5.7 are shown in the following timing chart.

The chart shows the timings of read and write access by the HyperBus controller to memory (HyperFlash or HyperRAM).

(1) WCSS/RCSS is the period between assertion of the HM_CS0#/HM_CS1# signal and the first edge of the HM_CK/HM_CK# signal.
(2) WCSH/RCSH is the period between the last edge of the HM_CK/HM_CK# signal for the current data transfer and negation of the HM_CS0#/HM_CS1# signal.
(3) WCSHI/RCSHI is the period between the end of a current transfer and the beginning of the next.
(4) LTCY should only be specified in MTR1. Specifying this timing is only required for a HyperRAM device; it is not required for a HyperFlash device.

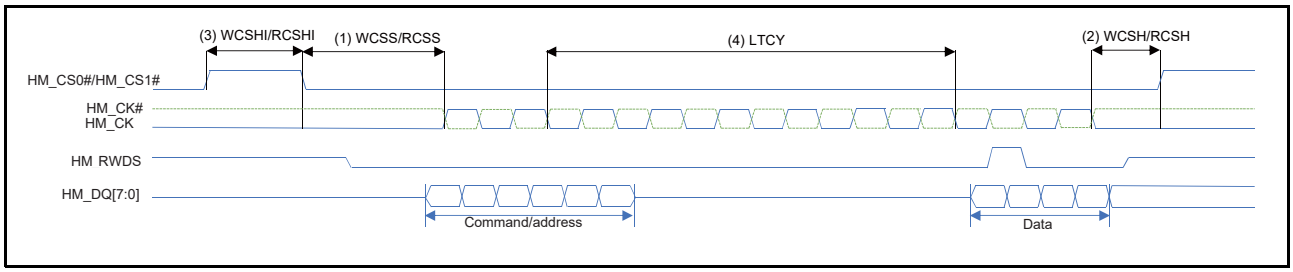

Figure 21.11 Timing Chart of Read and Write Operations

22. Octa Memory Controller

The Octa memory controller enables the connection of OctaFlash™ and OctaRAM™ to this LSI chip.

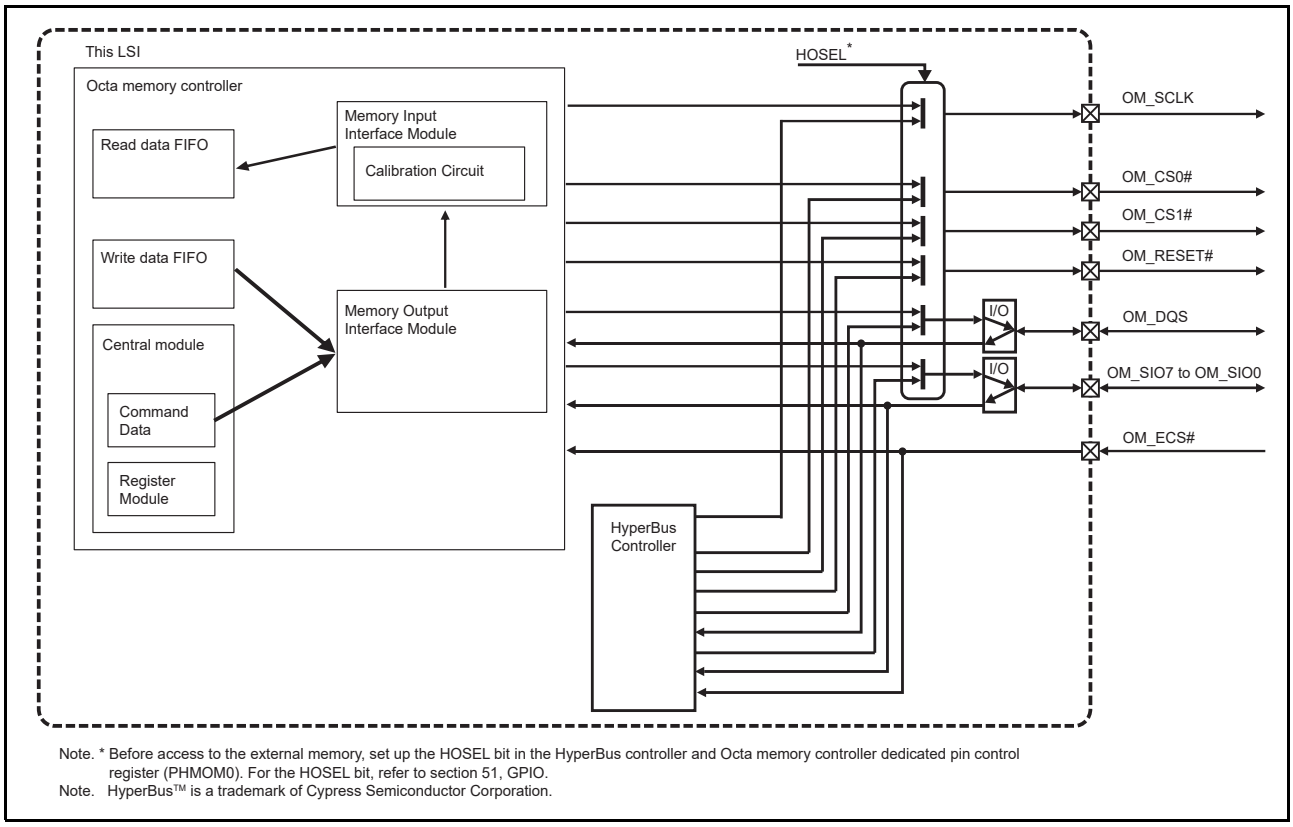
Note: OctaFlash™ and OctaRAM™ are trademarks of Macronix International Co., Ltd.

22.1 Features

- Macronix Serial Multi I/O (MXSMIO®) Octa Peripheral Interface (OPI) for high-end consumer applications is supported.
- One each of an OctaFlash device and an OctaRAM device compliant with the OPI specifications are connectable.
- A chip select signal is assigned to each memory device (OM_CS0#: OctaFlash; OM_CS1#: OctaRAM).
  Note: Only one of the memory devices can operate (be read or written to) at a time.
- Supported device interfaces
  SPI: Serial peripheral interface (OctaFlash, SPI mode)
  SOPI: Single Octa I/O (8 bits) (OctaFlash, single data rate)
  DOPI: Double Octa I/O (8 bits) (OctaFlash and OctaRAM, double data rate)
- 3-byte and 4-byte OctaFlash address commands are supported.
- 4-byte OctaRAM address commands are supported.
- The read-while-write (RWW) operation is supported.
- 1LC and 2LC (latency count) OctaRAM devices are supported.
- The error corrected signal (ECS#) is available, and ECC errors can be detected (for OctaFlash only).
- Fastboot mode is not supported.
- Direct access (memory-mapped reading and writing) by the CPU to memory devices in separate flash and RAM address spaces is supported.
- OM_CK: 132 MHz
- PVcc_HO: 1.8 V

22.2 Block Diagram

Figure 22.1 shows a block diagram of this module.



Note. * Before access to the external memory, set up the HOSEL bit in the HyperBus controller and Octa memory controller dedicated pin control register (PHMOM0). For the HOSEL bit, refer to section 51, GPIO.
Note. HyperBus™ is a trademark of Cypress Semiconductor Corporation.

Figure 22.1 Block Diagram

22.3 Input/Output Pins

Table 22.1 shows the pin configuration.

Table 22.1 Configuration of Hyper Memory Controller Pins

Pin	I/O	Name	Function
OM_SCLK	Output	Clock	Clock output
OM_CS0#	Output	Chip select 0	Chip select signal for an OctaFlash device
OM_CS1#	Output	Chip select 1	Chip select signal for an OctaRAM device
OM_DQS	Input/Output	Read/write data strobe	Read data strobe/write data mask signal
OM_SIO7 to OM_SIO0	Input/Output	Data	Data input/output
OM_RESET#	Output	Reset output	Reset signal for both OctaFlash and OctaRAM devices
OM_ECS#	Input	ECC error detection	ECC error detection signal from the external memory

Note: OM_ECS# is an input pin that is multiplexed with alternative pin functions that are driven by the 3.3-V power supply. The other pins are solely used for functions that are driven by the 1.8-V power supply.

22.3.1 Device Interface

The device interface is compatible with OctaFlash/OctaRAM interface.
When reading data from the memory or programming the memory with data, the bit order changes with the I/O mode. The bit order is shown below:

Table 22.2 Bit order in accordance with I/O mode

I/O mode	Bit order (MSB)
Read data from device	
1 I/O (SPI)	OM_SIO1 input
8 I/O (SOPI)	OM_SIO7 to OM_SIO0 input
8 I/O (DOPI)	OM_SIO7 to OM_SIO0 input. Order of data: {D1, D0}, {D3, D2}, ...
Program/Write data to device	
1 I/O (SPI)	OM_SIO0 output
8 I/O (SOPI)	OM_SIO7 to OM_SIO0 output
8 I/O (DOPI)	OM_SIO7 to OM_SIO0 output. Order of data: {D1, D0}, {D3, D2}, ...

22.4 Register Descriptions

Table 22.3 shows the register configuration.
Access to the flash memory or RAM is allowed in either of the following modes.

Memory-map mode

- Reading from and writing to the memory array areas of OctaFlash memory or RAM is possible.

Configuration mode

- Transfer of any commands and data is possible.

Table 22.3 Octa memory controller register configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Device command register	DCR	R/W	H'00000000	H'1F401000	32
Device address register	DAR	R/W	H'00000000	H'1F401004	32
Device command setting register	DCSR	R/W	H'00000000	H'1F401008	32
Device size register 0	DSR0	R/W	H'00000000	H'1F40100C	32
Device size register 1	DSR1	R/W	H'00000000	H'1F401010	32
Memory delay trim register	MDTR	R/W	H'06009400	H'1F401014	32
Auto-calibration timer register	ACTR	R/W	H'10000000	H'1F401018	32
Auto-calibration address register 0	ACAR0	R/W	H'00000000	H'1F40101C	32
Auto-calibration address register 1	ACAR1	R/W	H'00000000	H'1F401020	32
Device memory map read chip select timing setting register	DRCSTR	R/W	H'00000000	H'1F401034	32
Device memory map write chip select timing setting register	DWCSTR	R/W	H'00000000	H'1F401038	32
Device chip select timing setting register	DCSTR	R/W	H'00000000	H'1F40103C	32
Controller and device setting register	CDSR	R/W	H'00000000	H'1F401040	32
Memory map dummy length register	MDLR	R/W	H'00000000	H'1F401044	32
Memory map read/write command register 0	MRWCR0	R/W	H'00000000	H'1F401048	32
Memory map read/write command register 1	MRWCR1	R/W	H'00000000	H'1F40104C	32
Memory map read/write setting register	MRWCSR	R/W	H'00000000	H'1F401050	32
Error status register	ESR	R	H'00000000	H'1F401054	32
Configure write without data register	CWNDR	W	H'00000000	H'1F401058	32
Configure write data register	CWDR	W	H'00000000	H'1F40105C	32
Configure read register	CRR	R	H'00000000	H'1F401060	32

22.4.1 Device Command Register (DCR)

DCR sets the device commands for controller operation.

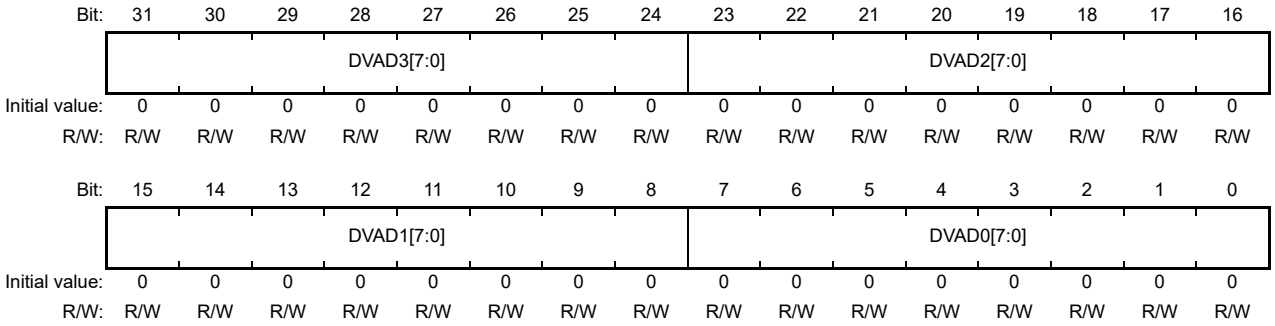
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DVCMD1[7:0]								DVCMD0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	DVCMD1[7:0]	All 0	R/W	Device Command data Sets the data to be transferred as a command to the device. If DCSR.CMDLEN[2:0] = 2, the controller will send DCR[15:8] as the 1st byte to memory.
7 to 0	DVCMD0[7:0]	All 0	R/W	Device Command data Sets the data to be transferred as a command to the device. If DCSR.CMDLEN[2:0] = 1, the controller will send DCR[7:0] as the 1st byte to memory. If DCSR.CMDLEN[2:0] = 2, the controller will send DCR[7:0] as the 2nd byte to memory.

22.4.2 Device Address Register (DAR)

DAR sets the device address for controller operation.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DVAD3[7:0]	All 0	R/W	Device Address data 3 Set the device address data. When DCSR.ADLEN[2:0] = 4 only, set as the first byte.
23 to 16	DVAD2[7:0]	All 0	R/W	Device Address data 2 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the first byte. When DCSR.ADLEN[2:0] = 4, set as the second byte.
15 to 8	DVAD1[7:0]	All 0	R/W	Device Address data 1 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the second byte. When DCSR.ADLEN[2:0] = 4, set as the third byte.
7 to 0	DVAD0[7:0]	All 0	R/W	Device Address data 0 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the third byte. When DCSR.ADLEN[2:0] = 4, set as the fourth byte.

22.4.3 Device Command Setting Register (DCSR)

DCSR sets device commands.

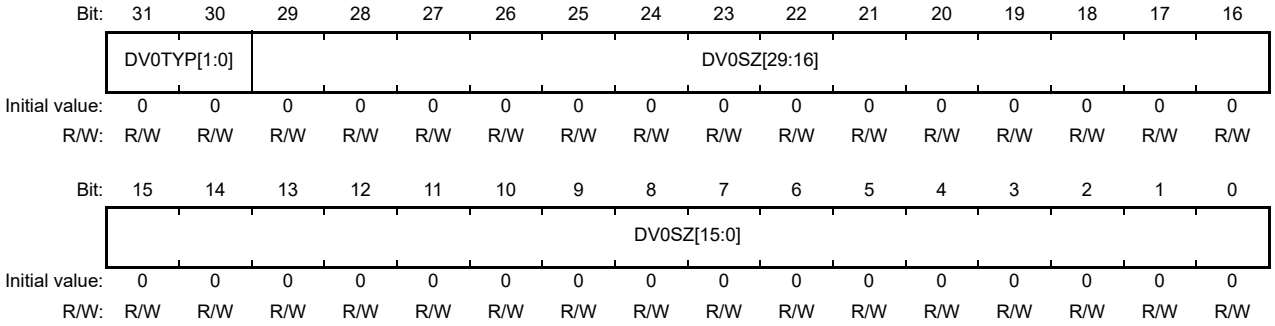
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	ACDA	DOPI	ADLEN[2:0]			DAOR	CMDLEN[2:0]			ACDV	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMLEN[7:0]								DALEN[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	ACDA	0	R/W	Data Access Control Set data access or register access 0: Register access Do not arrange the transfer data. 1: Data access (1) the address bit0 will be forced to 0 in DOPI mode. (2) If DAR[0] of the lead type command is 1, byte 0 from the device will be dropped in DOPI mode. (3) The AXI read data will be arranged according to the DAR. For example: When DAR[1:0] = 1, the first valid data is stored in RDATA[15:8]. (4) The AXI write data is used according to the DAR in DOPI mode. For example: If the target device is Flash Memory and DAR[1:0] = 1, the first byte sent to the flash memory is forced to 0xff. If the target device is RAM and DAR[1: 0] = 1, the first byte sent to RAM is masked by DQSM. (5) When the target device is RAM, the address sent to the memory changes according to RAM specification.
27	DOPI	0	R/W	DOPI single byte setting Even in DOPI mode, set this bit to 1 when the read data has only one byte in each cycle. For example: OctaFlash RDID, RDSR command 0: Each cycle has two bytes data. (normal DOPI mode) 1: Each cycle has one byte data. (The byte data changes at the rising edge of the clock and does not change at the falling edge of the clock.)
26 to 24	ADLEN[2:0]	000	R/W	Transfer address length setting Sets the length of the address to be transferred in bytes.
23	DAOR	0	R/W	Data order setting Sets the byte order of data during read and write operations. 0: byte0, byte1, byte2, byte3 1: byte1, byte0, byte3, byte2
22 to 20	CMDLEN[2:0]	000	R/W	Transfer command length setting Sets the length of the command to be transferred in bytes.
19	ACDV	0	R/W	Access Device setting Sets the device to be accessed. 0: Send commands to device 0. 1: Send commands to device 1.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	DMLEN[7:0]	All 0	R/W	Dummy cycle (latency) setting Sets the length of dummy cycle (latency) in OM_SCLK units.
7 to 0	DALEN[7:0]	All 0	R/W	Transfer data length setting Sets the length of data to be transferred in bytes. When [7:0] is 0, there are no transmission data to memory and reception data from memory.

22.4.4 Device Size Register 0 (DSR0)

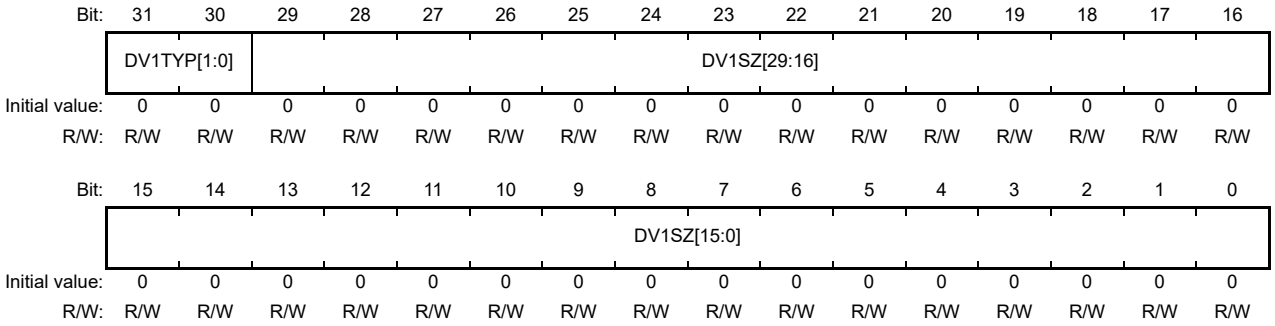
DSR0 specifies the type of memory to be accessed as device 0 and the size of the flash memory.



Bit	Bit Name	Initial Value	R/W	Description
31, 30	DV0TYP[1:0]	00	R/W	Device 0 type setting Set to 00.
29 to 0	DV0SZ[29:0]	All 0	R/W	Device 0 size setting Set a 30-bit value for the size of memory connected as device 0. Examples: H'10000000: 256-Mbyte flash memory H'08000000: 128-Mbyte flash memory

22.4.5 Device Size Register 1 (DSR1)

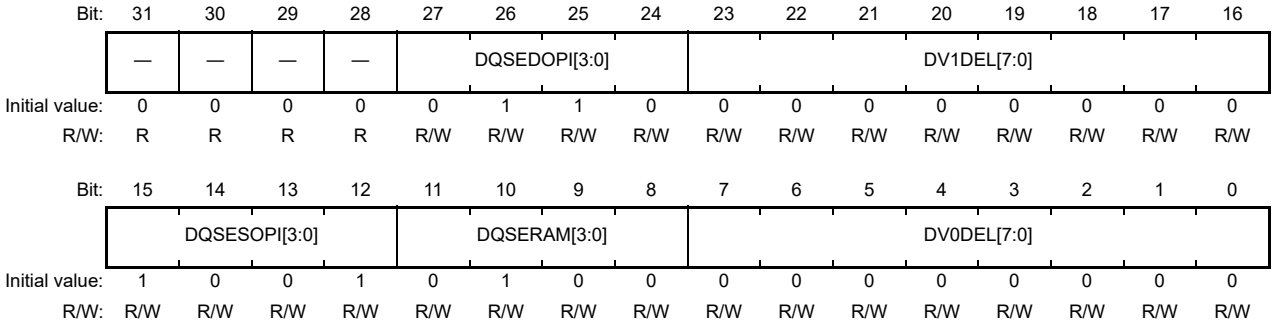
DSR1 specifies the type of memory to be accessed as device 1 and the size of the RAM.



Bit	Bit Name	Initial Value	R/W	Description
31, 30	DV1TYP[1:0]	00	R/W	Device 1 type setting Set to 01.
29 to 0	DV1SZ[29:0]	All 0	R/W	Device 1 size setting Set a 30-bit value for the size of memory connected as device 1. Examples: H'01000000: 16-Mbyte RAM H'00800000: 8-Mbyte RAM

22.4.6 Memory Delay Trim Register (MDTR)

MDTR sets the timing adjustment of memory access.
For the information about the auto-calibration, refer to section 22.5, Operation.



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	DQSEDOPI[3:0]	H'6	R/W	OM_DQS enable counter Setting for the flash memory in the DOPI mode
23 to 16	DV1DEL[7:0]	All 0	R/W	Device 1 delay setting These bits specify the number of cycles of delay to be inserted in the input strobe signal (OM_DQS) to adjust the timing for latching data during read access to device 1 in the DOPI mode (the RAM).
15 to 12	DQSESOPI[3:0]	H'9	R/W	OM_DQS enable counter Setting for the flash memory in the DOPI mode
11 to 8	DQSERAM[3:0]	H'4	R/W	OM_DQS enable counter Setting for the RAM in the DOPI mode
7 to 0	DV0DEL[7:0]	All 0	R/W	Device 0 delay setting These bits specify the delay cycles to be inserted on the input strobe signal (OM_DQS) to adjust the timing for latching data during read access to device 0 in the SOPI or DOPI mode for the flash memory.

During a read operation with the OM_DQS clock input (in the SOPI or DOPI mode), the OM_DQS clock transitions from the high-impedance state to the input state (for receiving a value of 0 from the external device) after the command and address phases are completed. To obtain valid data, adjust the DQS enable counter and delay cycles.

OM_DQS enable counter setting (OM_SCLK units)
0000: 1 clock cycle
0001: 2 clock cycles
0010: 3 clock cycles
0010: 4 clock cycles
...
1111: 16 clock cycles

OM_DQS enable counter setting examples

Table 22.4 Examples of Setting the OM_DQS Enable Counter for OctaRAM

	RAM	
Number of dummy cycles (latency)	Pre-cycle On	Pre-cycle Off
3	4	4 to 5
4	4 to 5	4 to 6
5	4 to 6	4 to 7
6	4 to 7	4 to 8
7	4 to 8	4 to 9
8	4 to 9	4 to 10

Table 22.5 Examples of Setting the OM_DQS Enable Counter for OctaFlash Memory

	SOPI	DOPI	
Number of dummy cycles (latency)	Pre-cycle On	Pre-cycle On	Pre-cycle Off
4	8 to 9	5 to 6	5 to 7
6	8 to 11	5 to 8	5 to 9
8	8 to 13	5 to 10	5 to 11
10	8 to 15	5 to 12	5 to 13
12	8 to 15	5 to 14	5 to 15
14	8 to 15	5 to 15	5 to 15
16	8 to 15	5 to 15	5 to 15
18	8 to 15	5 to 15	5 to 15
20	8 to 15	5 to 15	5 to 15

These two tables list cases of DQS delay.
If DQS delay cycle is not within this range, refer to section 22.7, OM_DQS Enable Counter, and recalculate the correct range.

22.4.7 Auto-Calibration Timer Register (ACTR)

ACTR sets the cycle at which automatic calibration is executed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CTP[31:16]															
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTP[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CTP[31:0]	H'10000000	R/W	Automatic calibration cycle time setting Sets performing cycle for the automatic calibration with 32 bits. Automatic calibration cycle time (ns) = CTP[31:0] × Bφ When automatic calibration is enabled (CDSR.ACMODE[1:0] =H'1) and the value of the internal timer is equal to that of this register, automatic calibration will start.

22.4.8 Auto-Calibration Address Register 0 (ACAR0)

ACAR0 sets the address in OctaFlash memory for writing to and reading from in auto-calibration of device 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CAD0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CAD0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CAD0[31:0]	All 0	R/W	Automatic calibration address These bits set the address in OctaFlash memory for writing to and reading from in auto-calibration of device 0. Note: Set an address in terms of the memory space of the OctaFlash device, not in the OctaFlash space within this LSI chip.

22.4.9 Auto-Calibration Address Register 1 (ACAR1)

ACAR1 sets the address in OctaRAM for writing to and reading from in auto-calibration of device 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CAD1[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CAD1[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CAD1[31:0]	All 0	R/W	Automatic calibration address These bits set the address in OctaRAM for writing to and reading from in auto-calibration of device 1. Note: Set an address in terms of the memory space of the OctaRAM device, not in the OctaRAM space within this LSI chip.

22.4.10 Device Memory Map Read Chip Select Timing Setting Register (DRCSTR)

DRCSTR sets the timing of memory-mapped reading for each device.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DVRDLO1[1:0]		DVRDHI1[2:0]			DVRDCMD1[2:0]			—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DVRDLO0[1:0]		DVRDHI0[2:0]			DVRDCMD0[2:0]			CTR0	CTRW0[6:0]

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	DVRDLO1[1:0]	00	R/W	Device 1 select signal pull-down timing setting* Indicates the timing between the select signal pull-down to the read operation for the device 1. Timing definition from OM_CS1# low to the first OM_SCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
29 to 27	DVRDHI1[2:0]	000	R/W	Device 1 select signal High timing setting* Indicates the timing, from the end of read operation to the select signal is pulled up. Timing definition from the last OM_SCLK low to OM_CS1# high DOPI or (SOPI) mode 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Setting prohibited 101: 6.5 (7) clock cycles 110: 7.5 (8) clock cycles 111: 8.5 (9) clock cycles Note: The values in parentheses apply to SOPI mode. Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
26 to 24	DVRDCMD1[2:0]	000	R/W	Device 1 Command execution interval* Indicates the timing, between command and command for device 1. Timing, until the OM_CS1# signal goes from High to the next Low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DVRDLO0[1:0]	00	R/W	Device 0 select signal pull-down timing setting* Indicates the timing between the select signal pull-down to the read operation for the device 0. Timing definition from OM_CS0# low to the first OM_SCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
13 to 11	DVRDHI0[2:0]	000	R/W	Device 0 select signal pull-up timing setting* Indicates the timing, from the end of read operation to the select signal is pulled up. Timing definition from the last OM_SCLK low to OM_CS0# high DOPI or (SOPI) mode 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Setting prohibited 101: 6.5 (7) clock cycles 110: 7.5 (8) clock cycles 111: 8.5 (9) clock cycles Note: The values in parentheses apply to SOPI mode. Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles
10 to 8	DVRDCMD0[2:0]	000	R/W	Device 0 Command execution interval setting* Indicates the timing between command to command for the device 0. Timing definition from OM_CS0# high to the next OM_CS0# low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
7	CTR0	0	R/W	Device 0 Continuous read setting When the continuous read is enabled, wait for the continuous read operation to be performed using the value set in CTRW0[6:0]. Do not set this bit to 1 except for OctaFlash DOPI mode. 0: Continuous read disabled for device 0 1: Continuous read enabled for device 0
6 to 0	CTRW0[6:0]	All 0	R/W	Device 0 continuous read cycle setting When continuous read of Device 0 is enabled, the selection signal is fixed to Low for the set clock cycle, after the read operation is performed. If the number of clock cycles exceeds twice the value set in these bits before the next read operation is performed, the select signal is returned to High.

Note: These clock cycles are values in internal clock units. In OM_SCLK units, the clock cycle is 1/2 of the above table.

22.4.11 Device Memory Map Write Chip Select Timing Setting Register (DWCSTR)

DWCSTR sets the timing of memory-mapped writing for each device.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31, 30	DVWLO1[1:0]	00	R/W	Device 1 select signal pull-down timing setting* Indicates the timing between the device 1 select signal pull-down to the write operation. Timing definition from OM_CS1# low to the first OM_SCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
29 to 27	DVWHI1[2:0]	000	R/W	Device 1 select signal pull-up timing setting* Indicates the timing, from the end of write operation to the select signal is pulled up. Timing definition from the last OM_SCLK low to OM_CS1# high DOPI mode 000: 1.5 clock cycles 001: 2.5 clock cycles 010: 3.5 clock cycles 011: 4.5 clock cycles 100: 5.5 clock cycles 101: 6.5 clock cycles 110: 7.5 clock cycles 111: 8.5 clock cycles Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
26 to 24	DVWCMD1[2:0]	000	R/W	Device 1 Command execution interval setting* Indicates the timing between command to command for the device 1. Timing definition from OM_CS1# high to the next OM_CS1# low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DVWLO0[1:0]	00	R/W	Device 0 select signal pull-down timing setting* Indicates the timing between the select signal pull-down to the write operation for the device 0. Timing definition from OM_CS0# low to the first OM_SCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
13 to 11	DVWHI0[2:0]	000	R/W	Device 0 select signal pull-up timing setting* Indicates the timing, from the end of write operation to the select signal is pulled up. Timing definition from the last OM_SCLK low to OM_CS0# high DOPI mode 000: 1.5 clock cycles 001: 2.5 clock cycles 010: 3.5 clock cycles 011: 4.5 clock cycles 100: 5.5 clock cycles 101: 6.5 clock cycles 110: 7.5 clock cycles 111: 8.5 clock cycles Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles
10 to 8	DVWCMD0[2:0]	000	R/W	Device 0 Command execution interval setting* Indicates the timing between command to command for the device 0. Timing definition from OM_CS0# high to the next OM_CS0# low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: These clock cycles are values in internal clock units. In OM_SCLK units, the clock cycle is 1/2 of the above table.

22.4.12 Device Chip Select Timing Setting Register (DCSTR)

DCSTR sets the timing of operations in configuration mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DVSELLO[1:0]		DVSELHI[2:0]			DVSELCMD[2:0]			—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DVSELLO[1:0]	All 0	R/W	Device select signal pull-down timing setting* Indicates the timing, from the device selection signal is pulled-down to the command execution. Timing definition from OM_CS# low to the first OM_SCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
13 to 11	DVSELHI[2:0]	000	R/W	Device select signal pull-up timing setting* Indicates the timing when the select signal is pulled up from the end of the command execution. Timing definition from the last OM_SCLK low to OM_CS# high DOPI or (SOPI) mode 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Setting prohibited 101: 6.5 (7) clock cycles 110: 7.5 (8) clock cycles 111: 8.5 (9) clock cycles Note: The values in parentheses apply to SOPI mode. Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	DVSELCMD[2:0]	000	R/W	Device Command execution interval setting* Indicates the timing between command to command. Timing definition from OM_CS# high to the next OM_CS# low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: These clock cycles are values in internal clock units. In OM_SCLK units, the clock cycle is 1/2 of the above table.

22.4.13 Controller and Device Setting Register (CDSR)

CDSR controls the automatic calibration, pre-cycle setting, and device transfer type of the controller and each of the devices.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DLFT	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ACMODE [1:0]		ACMEME [1:0]		—	—	—	—	DV1PC	DV0PC	DV1TTYP[1:0]		DV0TTYP[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

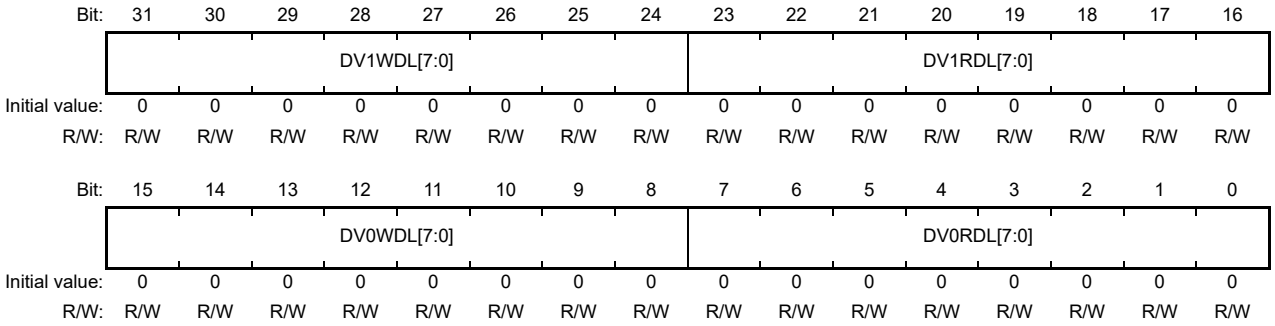
Bit	Bit Name	Initial Value	R/W	Description
31	DLFT	0	R/W	Deadlock Free Timer Enable Enable the timer to prevent the occurrence of controller deadlock. The timeout status is reset only by a system reset. 0: Enable timer 1: Disable timer Note: This function is available only when OM_SCLK is 132 MHz. Otherwise, disable the timer.
30 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	ACMODE[1:0]	00	R/W	Automatic calibration mode 00: Automatic calibration is disabled.* 01: Automatic calibration is enabled. 10: Setting prohibited. 11: Setting prohibited. The ACMODE bits should be set to disabled during read access to the OctaFlash device. Automatic calibration is only available in the DOPI mode.
11, 10	ACMEME[1:0]	00	R/W	Automatic calibration memory enable setting Automatic calibration supports only DOPI mode. To end DOPI mode, disable automatic calibration. [1]: Enable for device 1 1: Enable 0: Disable [0]: Enable for device 0 1: Enable 0: Disable
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	DV1PC	0	R/W	Device1_memory precycle setting 0: Disable 1: Enable
4	DV0PC	0	R/W	Device0_memory precycle setting 0: Disable 1: Enable
3, 2	DV1TTYP[1:0]	00	R/W	Device1_transfer_type setting 00: SPI mode 01: SOPI mode 10: DOPI mode 11: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
1, 0	DV0TTYP[1:0]	00	R/W	Device0_transfer_type setting 00: SPI mode 01: SOPI mode 10: DOPI mode 11: Setting prohibited

Note: When automatic calibration is disabled, the device 0 delay (OctaFlash) and device 1 delay (OctaRAM) should be manually specified in the memory delay trim register (MDTR) (see section 22.4.6). Set this register with reference to "initial setting MDTR (OctaFlash memory)" and "initial setting MDTR (OctaRAM)" in Figure 22.16.

22.4.14 Memory Map Dummy Length Register (MDLR)

MDLR sets the number of dummy cycles (latency) for writing and reading the memory map.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DV1WDL[7:0]	All 0	R/W	Device 1 Write dummy cycles (latency) setting Set the dummy length when writing to device 1 in OM_SCLK cycles unit.
23 to 16	DV1RDL[7:0]	All 0	R/W	Device 1 Read dummy cycles (latency) setting Set the dummy length when reading to device 1 in OM_SCLK cycles unit.
15 to 8	DV0WDL[7:0]	All 0	R/W	Device 0 Write dummy cycles (latency) setting Set the dummy length when writing to device 0 in OM_SCLK cycles unit.
7 to 0	DV0RDL[7:0]	All 0	R/W	Device 0 Read dummy cycles (latency) setting Set the dummy length when reading to device 0 in OM_SCLK cycles unit.

Note: When changing the dummy cycles (latency) for the OctaFlash device, modify the setting on the memory and then modify the setting in the DMLEN[7:0] bits in the device command setting register (DCSR) so that the dummy length becomes the same between the memory and this Octa memory controller. After that, execute the status read command to confirm the memory status.

22.4.15 Memory Map Read/Write Command Register 0 (MRWCR0)

MRWCR0 sets the read/write commands for the device 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	D0MWCMD1[7:0]								D0MWCMD0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	D0MRCMD1[7:0]								D0MRCMD0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	D0MWCMD1[7:0]	All 0	R/W	Memory map write command 1 setting, Set the memory map write command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].
23 to 16	D0MWCMD0[7:0]	All 0	R/W	Memory map write command 0 setting, Set the memory map write command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].
15 to 8	D0MRCMD1[7:0]	All 0	R/W	Memory map read command 1 setting Set the memory map read command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].
7 to 0	D0MRCMD0[7:0]	All 0	R/W	Memory map read command 0 setting, Set the memory map read command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].

22.4.16 Memory Map Read/Write Command Register 1 (MRWCR1)

MRWCR1 sets the read/write commands for the device 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	D1MWCMD1[7:0]								D1MWCMD0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	D1MRCMD1[7:0]								D1MRCMD0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	D1MWCMD1[7:0]	All 0	R/W	Memory map write command 1 setting Set the memory map write command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].
23 to 16	D1MWCMD0[7:0]	All 0	R/W	Memory map write command 0 setting Set the memory map write command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].
15 to 8	D1MRCMD1[7:0]	All 0	R/W	Memory map read command 1 setting Set the memory map read command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].
7 to 0	D1MRCMD0[7:0]	All 0	R/W	Memory map read command 0 setting Set the memory map read command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].

22.4.17 Memory Map Read/Write Setting Register (MRWCSR)

MRWCSR sets the memory map read/write operations.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	MWO1	MWCL1[2:0]			MWAL1[2:0]			—	MRO1	MRCL1[2:0]			MRAL1[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	MWO0	MWCL0[2:0]			MWAL0[2:0]			—	MRO0	MRCL0[2:0]			MRAL0[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	MWO1	0	R/W	Device 1 write order setting 0: Write order is byte0, byte1, byte2, byte3. 1: Write order is byte1, byte0, byte3, byte2.
29 to 27	MWCL1[2:0]	000	R/W	Device 1 write command length setting Set the number of bytes in the write command for device 1.
26 to 24	MWAL1[2:0]	000	R/W	Device 1 write address length setting Set the memory map write address byte length for device 1.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	MRO1	0	R/W	Device 1 read order setting 0: Read order is byte0, byte1, byte2, byte3. 1: Read order is byte1, byte0, byte3, byte2. Note: This setting is only valid in the DOPI mode. It has no effect in the SOPI or SPI mode.
21 to 19	MRCL1[2:0]	000	R/W	Device 1 read command length setting Set the read command byte length for device 1.
18 to 16	MRAL1[2:0]	000	R/W	Device 1 read address length setting Set the memory map read address byte length for device 1.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	MWO0	0	R/W	Device 0 write order setting 0: Write order is byte0, byte1, byte2, byte3. 1: Write order is byte1, byte0, byte3, byte2.
13 to 11	MWCL0[2:0]	000	R/W	Device 0 write command length setting Set the write command byte length for device 0.
10 to 8	MWAL0[2:0]	000	R/W	Device 0 write address length setting Set the memory map write address byte length for device 0.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	MRO0	0	R/W	Device 0 read order setting 0: Read order is byte0, byte1, byte2, byte3. 1: Read order is byte1, byte0, byte3, byte2. Note: This setting is only valid in the DOPI mode. It has no effect in the SOPI or SPI mode.
5 to 3	MRCL0[2:0]	000	R/W	Device 0 read command length setting Set the write command byte length for device 0.
2 to 0	MRAL0[2:0]	000	R/W	Device 0 read address length setting Set the memory map read address byte length for device 0.

22.4.18 Error Status Register (ESR)

ESR indicates the error status when performing memory map read and write commands.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MWESR[7:0]								MRESR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	0	R	Reserved These bits are always read as 0.
15 to 8	MWESR[7:0]	All 0	R	Memory map write error status H'80 = invalid command, H'01 = write data length error
7 to 0	MRESR[7:0]	All 0	R	Memory map read error status H'80 = invalid command, H'01 = ECC error, H'02 = preamble error, H'03 = wait OM_DQS timeout

22.4.19 Configure Write without Data Register (CWNDR)

CWNDR is used to execute a write command without data in the configuration mode. Writing 0 to this register makes this module issue a write command without actually writing data to memory.
Specify an address in DAR, a command in DCSR, and command data in DCR.
Set the DCSR.DALEN bit field to 0 before writing to this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	All 0	W	The write value should always be 0.

22.4.20 Configure Write Data Register (CWDR)

CWDR is used to set the data for writing when a write command is to be executed in the configuration mode. Writing to this register makes the controller to issue a write command and transfer the data to be written. The byte order of data transferred by the controller to the memory is in accord with the setting of the DAOR bit in DCSR. Specify an address in DAR, a command in DCSR, and command data in DCR.
Set the DCSR.DALEN bit field to a non-zero value before writing to this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WD3[7:0]								WD2[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WD1[7:0]								WD0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	WD3[7:0]	All 0	W	Write data 3 Set the third byte of the write data.
23 to 16	WD2[7:0]	All 0	W	Write data 2 Set the second byte of the write data.
15 to 8	WD1[7:0]	All 0	W	Write data 1 Set the first byte of the write data.
7 to 0	WD0[7:0]	All 0	W	Write data 0 Set the zeroth byte of the write data.

22.4.21 Configure Read Register (CRR)

CRR is used to execute a read command in the configuration mode and holds the data that are read. Reading from this register makes the controller issue a read command and the data that are read are stored in this register. Specify an address in DAR, a command in DCSR, and command data in DCR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RD3[7:0]								RD2[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RD1[7:0]								RD0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	RD3[7:0]	All 0	R	Read data 3 Store the third byte of the read data.
23 to 16	RD2[7:0]	All 0	R	Read data 2 Store the second byte of the read data.
15 to 8	RD1[7:0]	All 0	R	Read data 1 Store the first byte of the read data.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	RD0[7:0]	All 0	R	Read data 0 Store the zeroth byte of the read data.

22.5 Operation

22.5.1 Octa Memory Controller System Configuration

Figure 22.2 shows an example of connections between the Octa memory controller in this LSI and OctaFlash and OctaRAM devices.
CS0# should be connected to the OctaFlash device and CS1# should be connected to the OctaRAM device.

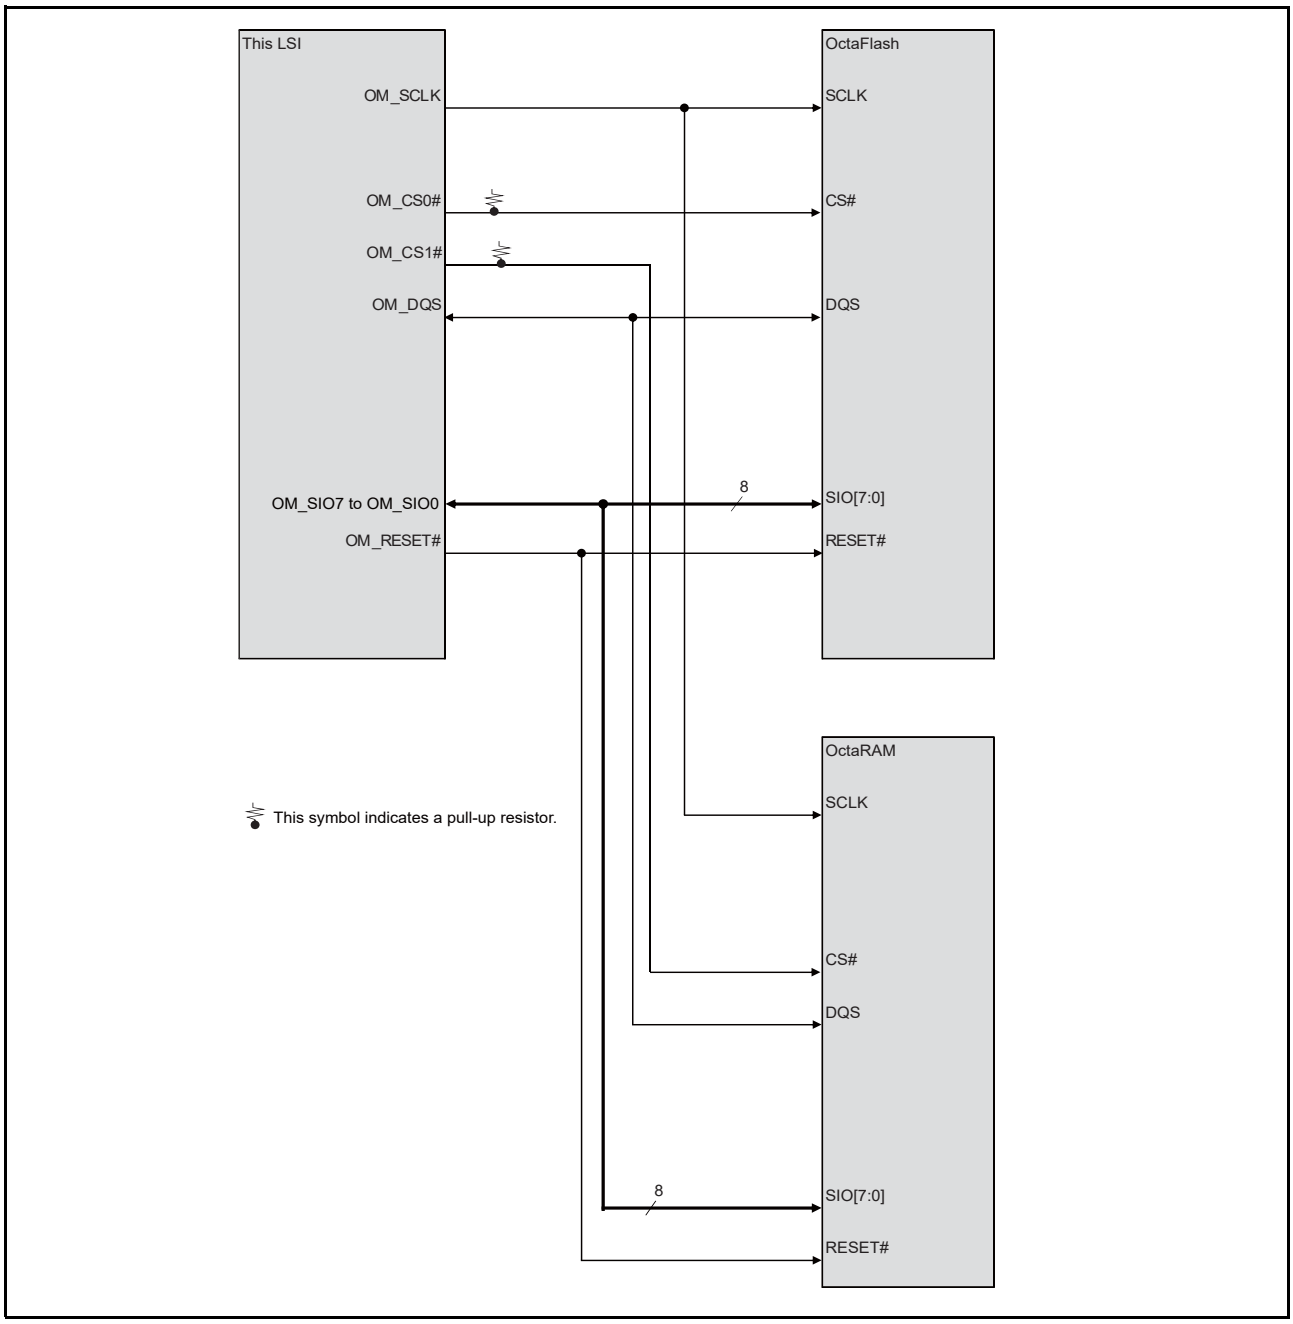


Figure 22.2 Example of Connections between this LSI and OctaFlash and OctaRAM Devices

22.5.2 Address Map

In the memory-map mode, OctaFlash is allocated to the OctaFlash space (H'50000000 to H'5FFFFFFF), and OctaRAM is allocated to the OctaRAM space (H'60000000 to H'6FFFFFFF).
One OctaFlash device and one OctaRAM device can be connected to this LSI, and up to 256 Mbytes can be accessed in each device.

	Internal Address	Maximum Accessible Area
OctaFlash	H'50000000 to H'5FFFFFFF	Up to 256 Mbytes
OctaRAM	H'60000000 to H'6FFFFFFF	Up to 256 Mbytes

22.5.3 Octa Memory Interface

This section describes the Octa memory interface.

22.5.3.1 Write Operation

The Octa memory controller outputs a command and an address and writes one or more data bytes by using lines OM_CS0# (OM_CS1#), OM_SCLK, and OM_SIO7 to OM_SIO0.
The write operation for OctaRAM has latency cycles before data is written to memory.
Figure 22.3 to Figure 22.5 show waveforms of the write operation in the OctaFlash interface, and Figure 22.6 shows a waveform of the write operation in the OctaRAM interface.

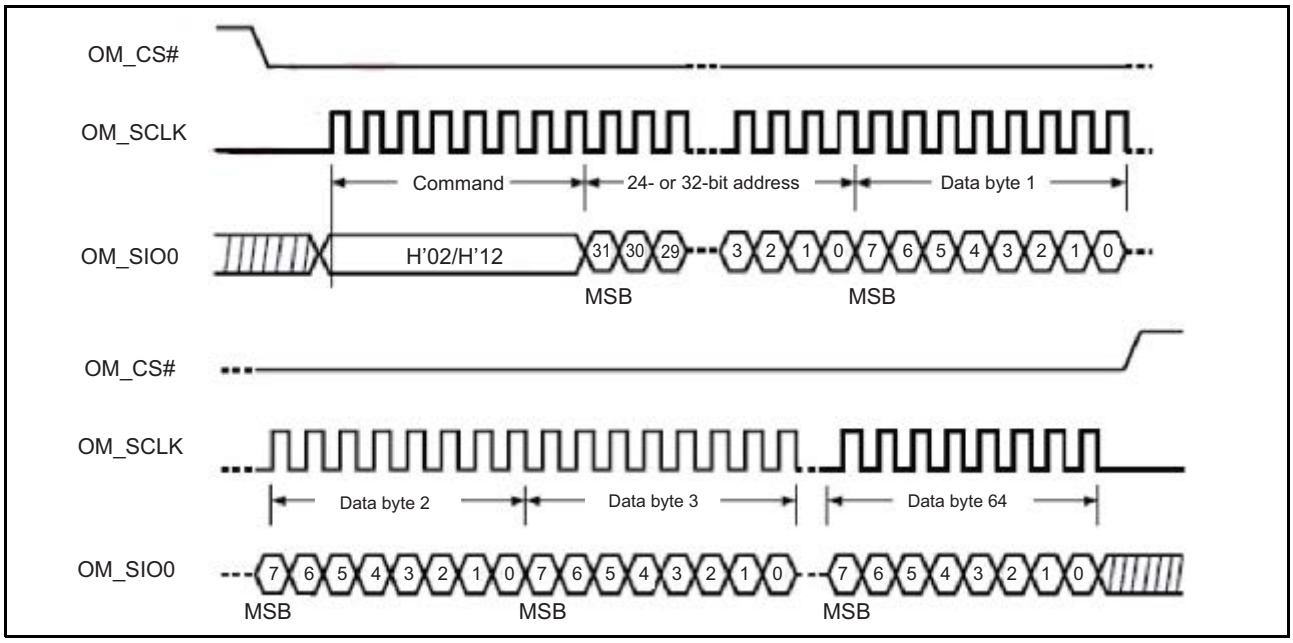

Figure 22.3 Waveform of Write Operation in OctaFlash Interface (SPI Mode)

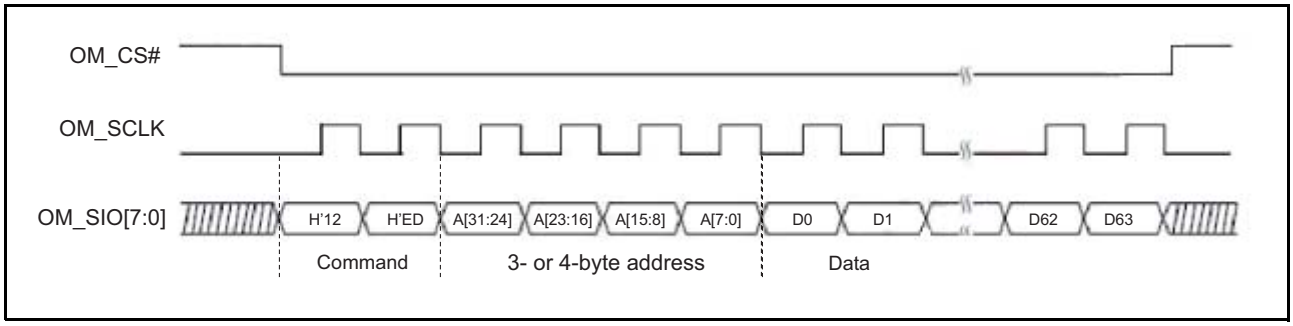

Figure 22.4 Waveform of Write Operation in OctaFlash Interface (SOPI Mode)

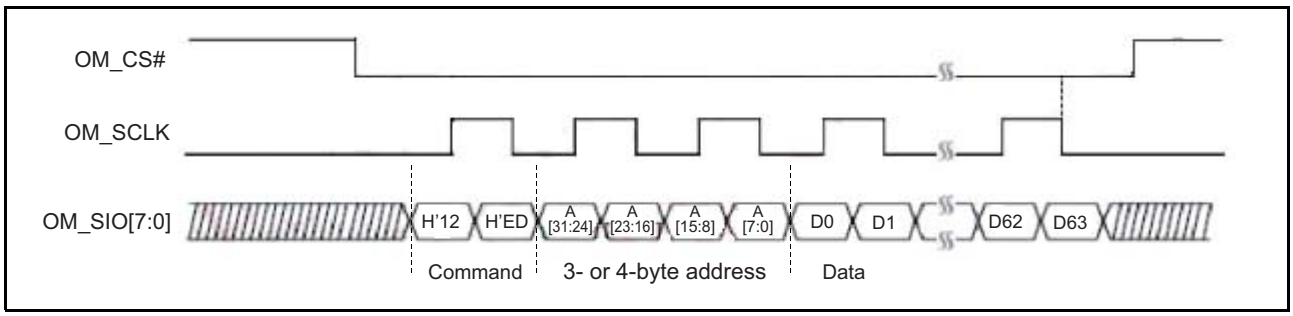

Figure 22.5 Waveform of Write Operation in OctaFlash Interface (DOPI Mode)

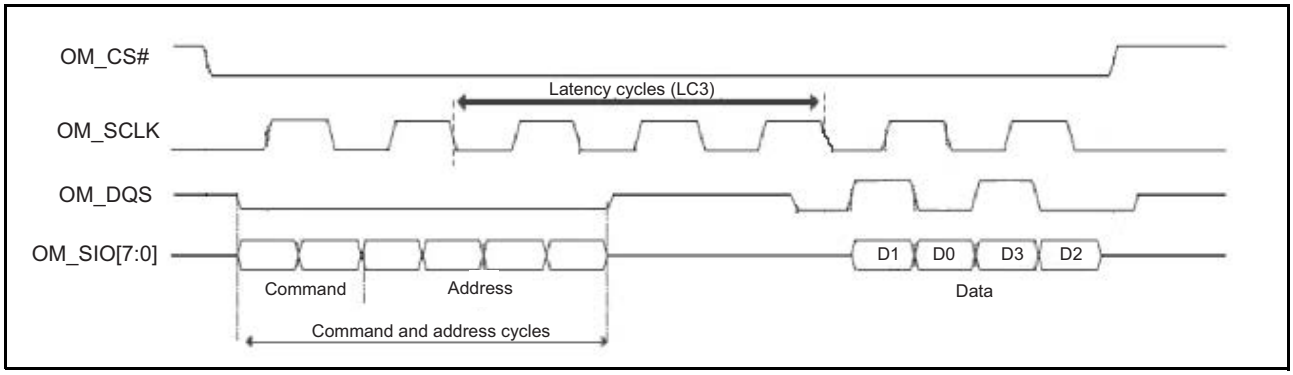

Figure 22.6 Waveform of Write Operation in OctaRAM Interface

22.5.3.2 Read Operation

The Octa memory controller outputs a command and an address and reads one or more data bytes by using lines OM_CS0# (OM_CS1#), OM_SCLK, and OM_SIO7 to OM_SIO0.
The read operation for OctaFlash and OctaRAM has latency cycles before data is read from memory.
The number of latency cycles should be specified in the memory map dummy length setting register (MDLR) (see section 22.4.14) in accordance with the setting in the memory device.
Figure 22.7 to Figure 22.9 show waveforms of the read operation in the OctaFlash interface, and Figure 22.10 shows a waveform of the read operation in the OctaRAM interface.

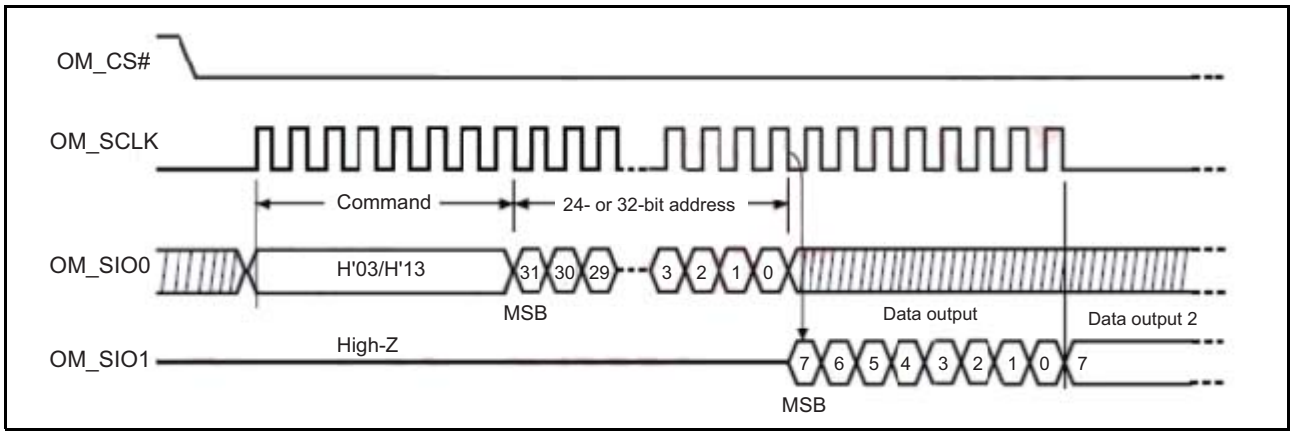

Figure 22.7 Waveform of Read Operation in OctaFlash Interface (SPI Mode)

22.5.4 Data Alignment in the OctaFlash and OctaRAM Spaces

Figure 22.11 shows the memory data alignment in the OctaFlash and OctaRAM spaces.
Figure 22.12 shows the data alignment when the configuration register in OctaFlash or OctaRAM is accessed.

When OctaFlash is connected (MRWCSR.MWO0 = 0, MRWCSR.MRO0 = 0) or
OctaRAM is connected (MRWCSR.MWO1 = 0, MRWCSR.MRO1 = 0)

Flash/RAM 8-bit DDR	Access width	Address	Internal bus 63–56	55–48	47–40	39–32	31–24	23–16	15–8	7–0
0 D0[7:0]	1 byte	b'000	X	X	X	X	X	X	X	D0
1 D1[7:0]		b'001	X	X	X	X	X	X	D1	X
2 D2[7:0]		b'010	X	X	X	X	X	D2	X	X
3 D3[7:0]		b'011	X	X	X	X	D3	X	X	X
4 D4[7:0]		b'100	X	X	X	D4	X	X	X	X
5 D5[7:0]		b'101	X	X	D5	X	X	X	X	X
6 D6[7:0]		b'110	X	D6	X	X	X	X	X	X
7 D7[7:0]		b'111	D7	X	X	X	X	X	X	X
↕ OM_SIO[7:0]	2 bytes	b'000	X	X	X	X	X	X	D1	D0
		b'010	X	X	X	X	D3	D2	X	X
		b'100	X	X	D5	D4	X	X	X	X

22.5.5 One-Byte Write Access to an Octa Memory Device in the DOPI Mode

This section describes one-byte write access in the DOPI mode.
Writing to the Octa memory device in the DOPI mode is handled in 2-byte units.
When the target device is OctaRAM, the output OM_DQS signal of the controller can be used to mask bytes by driving it to the high level during the operation of writing. This allows the masking of invalid write data.
When the target device is OctaFlash, one-byte write access must not be attempted since HyperFlash only supports two-byte access.
Figure 22.13 shows the waveforms in one-byte write access in the DOPI mode.

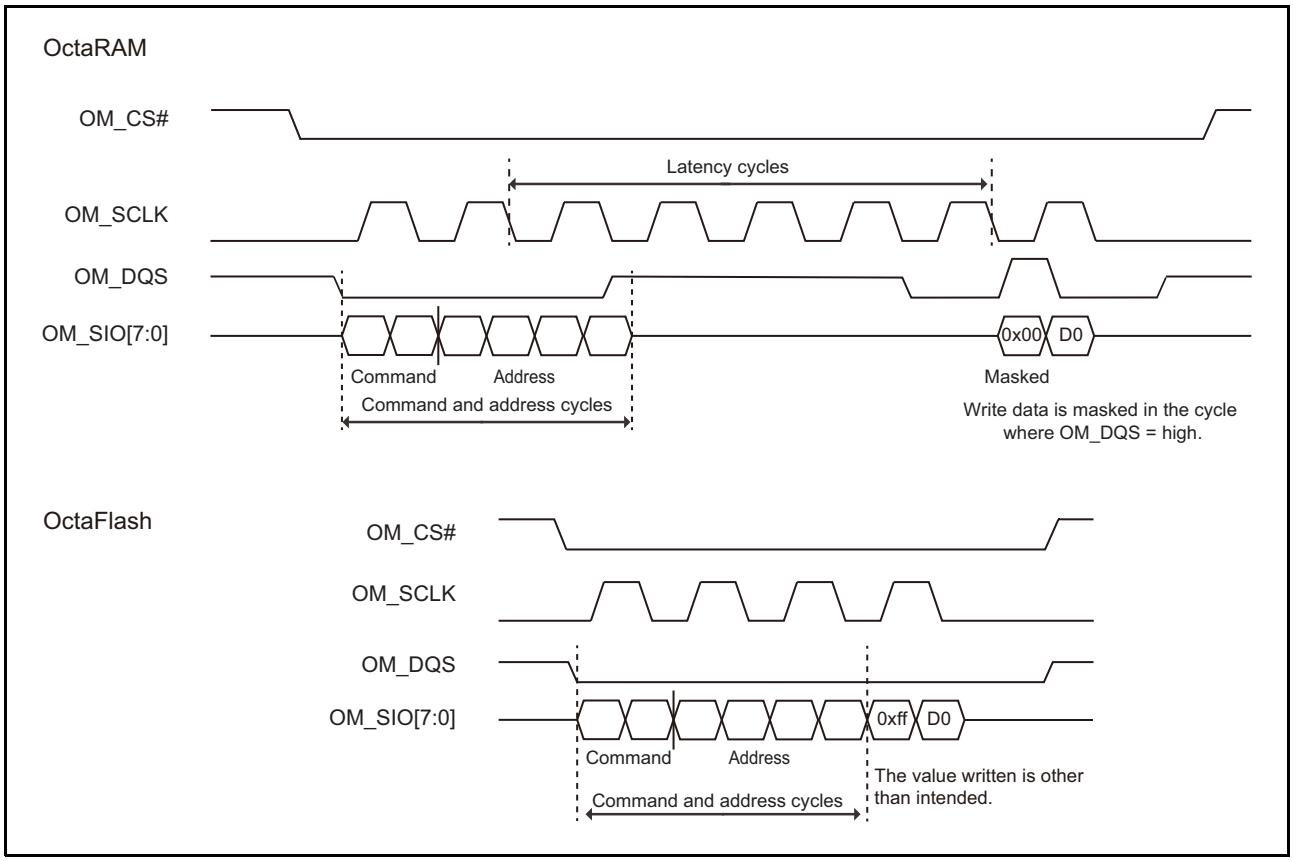

Figure 22.13 Waveforms in One-Byte Write Access in the DOPI Mode

22.5.6 Operation Flows

This section describes the flows of Octa memory controller operations for various purposes.
The following only shows sample settings, and appropriate commands and data should be specified in accordance with the specifications of the target memory device.
The sample settings assume the following environment.
(1) Memory connections: CS0 (device 0) to OctaFlash and CS1 (device 1) to OctaRAM
(2) OM_SCLK (Octa memory clock) frequency: 132 MHz

22.5.6.1 Initial Settings

The following shows an example of initial settings of the Octa memory controller.
Before access to the external memory, set up the HOSEL bit in the HyperBus controller and Octa memory controller dedicated pin control register (PHMOM0) in the initial setting steps.
For the HOSEL bit, refer to section 51, GPIO.

Table 22.6 Example of Initial Settings of the Octa Memory Controller

Step	Read/Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	DSR0	H'08000000	4	Specifies the type and size of device 0.
2	Write	DSR1	H'40800000	4	Specifies the type and size of device 1.
3	Write	MDTR	H'0740A640	4	Adjusts the memory access timings.
4	Write	DRCSTR	H'29002900	4	Specifies the read timing for each device.
5	Write	DWCSTR	H'1A001A00	4	Specifies the write timing for each device.
6	Write	DCSTR	H'00002900	4	Specifies the timings of the chip select signals.
7	Write	CDSR	H'0000000A	4	Sets up the controller functions. (1) Memory pre-cycle is enabled or disabled. (2) Transfer type is specified (SPI, SOPI, or DOPI).
8	Write	MDLR	H'05050E0E	4	Specifies number of dummy cycles (latency).
9	Write	MRWCR0	H'12EDEE11	4	Specifies the read and write commands for device 0.
10	Write	MRWCR1	H'2000A000	4	Specifies the read and write commands for device 1.
11	Write	MRWCSR	H'54545454	4	Sets up the memory-mapped reading and writing. (1) The length (bytes) of a command is specified. (2) The length (bytes) of an address is specified. (3) The order of bytes to be written is specified.

Note: Set up the HOSEL bit in the HyperBus controller and Octa memory controller dedicated pin control register (PHMOM0). For the HOSEL bit, refer to section 51, GPIO.

22.5.6.2 Basic Operation Settings

This section describes the basic operations of OctaFlash and OctaRAM.
The following only shows sample settings, and appropriate commands and data should be specified in accordance with the specifications of the target memory device.

(1) OctaFlash Operation Settings

1. Write Enable Settings

			SPI Mode		OPI Mode		
Step	Read/ Write	Register	Data	Data Length (Bytes)	Data	Data Length (Bytes)	Description
1	Write	DCR	H'00000006	4	H'000006F9	4	
2	Write	DCSR	H'00100000	4	H'00200000	4	
3	Write	CWNDR	Any value	4	Any value	4	

2. Read Status Register

			SPI Mode		OPI Mode		
Step	Read/ Write	Register	Data	Data Length (Bytes)	Data	Data Length (Bytes)	Description
1	Write	DCR	H'00000005	4	H'000005FA	4	
2	Write	DAR	—	—	H'00000000	4	
3	Write	DCSR	H'00100001	4	H'0C200401	4	
4	Read	CRR	H'000000xx	1	H'000000xx	1	The high-order 24 bits are all set to 0s, and the read data is stored in the low-order eight bits.

3. Read Configuration Register

			SPI Mode		OPI Mode		
Step	Read/ Write	Register	Data	Data Length (Bytes)	Data	Data Length (Bytes)	Description
1	Write	DCR	H'00000015	4	H'000015EA	4	
2	Write	DAR	—	—	H'00000001	4	
3	Write	DCSR	H'00100001	4	H'0C200401	4	
4	Read	CRR	H'000000xx	1	H'000000xx	1	The high-order 24 bits are all set to 0s, and the read data is stored in the low-order eight bits.

4. Write Configuration Register

			SPI Mode		OPI Mode		
Step	Read/ Write	Register	Data	Data Length (Bytes)	Data	Data Length (Bytes)	Description
1	Write	DCR	-	-	H'000001FE	4	
2	Write	DAR	-	-	H'00000001	4	
3	Write	DCSR	-	-	H'04200001	4	
4	Write	CWDR	-	-	H'000000xx	1	Set all the high-order 24 bits to 0s, and specify the write data in the low-order eight bits.

5. Read Configuration Register 2

			SPI Mode		OPI Mode		
Step	Read/ Write	Register	Data	Data Length (Bytes)	Data	Data Length (Bytes)	Description
1	Write	DCR	H'00000071	4	H'0000718E	4	
2	Write	DAR	Address	4	Address	4	
3	Write	DCSR	H'04100001	4	H'0C200401	4	
4	Read	CRR	H'000000xx	1	H'000000xx	1	The high-order 24 bits are all set to 0s, and the read data is stored in the low-order eight bits.

6. Write Configuration Register 2

			SPI Mode		OPI Mode		
Step	Read/ Write	Register	Data	Data Length (Bytes)	Data	Data Length (Bytes)	Description
1	Write	DCR	H'00000072	4	H'0000728D	4	
2	Write	DAR	Address	4	Address	4	
3	Write	DCSR	H'04100001	4	H'04200001	4	
4	Write	CWDR	H'000000xx	1	H'000000xx	1	Set all the high-order 24 bits to 0s, and specify the write data in the low-order eight bits.

7. Memory-Map Write and Read Command Settings

			SPI Mode		OPI Mode		
Step	Read/ Write	Register	Data	Data Length (Bytes)	Data	Data Length (Bytes)	Description
1	Write	MRWCR0	H'00120013	4	H'12EDEE11	4	
2	Write	MRWCSR	H'00000C0C	4	H'00005454	4	

8. Erase Sector

			SPI Mode		OPI Mode		
Step	Read/ Write	Register	Data	Data Length (Bytes)	Data	Data Length (Bytes)	Description
